-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for a basaltic termite barrier.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable items(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: This specification consists of furnishing and placing of graded basaltic sand as a physical barrier, below the concrete slab or foundation of a structure to prevent the entry of Formosan ground termites into wood components of the structure, similar to laying down a chemical barrier of soil termiticide treatments. The use of this preventive measure does not preclude the use of other preventive measures such as chemical treatment, physical termite mesh control barrier system and and pressure treated lumber for construction to provide maximum protection to the structure. In fact, it is recommended that this material be used in conjunction with chemical treatments of vulnerable areas such as around electrical conduits, plumbing pipes that penetrate the slab, and the shoulder portions of the barrier and with pressure treated lumber to provide maximum protection to the...
THE PUBLICATIONS LISTED BELOW FORM A PART OF THIS SPECIFICATION TO THE EXTENT REFERENCED. THE PUBLICATIONS ARE REFERRED TO WITHIN THE TEXT BY THE BASIC DESIGNATION ONLY.

ASTM INTERNATIONAL (ASTM)

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

An "S" following a submittal item indicates that the submittal is required for the Sustainability Notebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval.][for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability Notebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Installation ; G[, [_____]]
Shop drawings of the basaltic termite barrier installation at all interior and perimeter foundations, joint and penetration conditions.

SD-06 Test Reports

Basalt Sand ; G[, [_____]]
1.3 STORAGE AND HANDLING

Store and handle the material so as to prevent contamination by dirt, water, and organic material.

1.4 WARRANTY

*****************************************************************************************************************************************
NOTE: Use 5 years for family housing and 3 years for other types of facilities.
*****************************************************************************************************************************************

Provide a minimum 1 year warranty against infestations or reinfestation by subterranean termites of existing buildings with basaltic termite barrier (BTB) installed during repair or renovation. Furnish a 5 year written warranty against infestations or reinfestation by subterranean termites of the buildings or building additions constructed under this contract. Perform annual inspections of the building[s] or building addition[s]. If live subterranean termite infestation or subterranean termite damage is discovered during the warranty period, and building conditions have not been altered in the interim, the Contractor shall:

a. Correct defective BTB installation and perform other treatment as may be necessary for elimination of subterranean termite infestation;

b. Repair damage caused by termite infestation; and

c. Reinspect the building approximately 180 calendar days after the repair.

PART 2 PRODUCTS

2.1 BASALT SAND

Clean, dry sand material manufactured from crushed basalt rock meeting the following requirements.

a. Material gradation, ASTM C136/C136M.

b. Specific gravity, ASTM C128, 2.80.

c. Silica (S102) content, ASTM C289, 45 percent.
d. Abrasion loss, after 500 revolutions, 20 percent, when tested in accordance with ASTM C131/C131M.

PART 3 EXECUTION

3.1 INSTALLATION

Install basaltic barrier in accordance with the manufacturer's installation instructions. In addition to these requirements and prior to placing material, remove visible plant roots, construction wood scraps such as ground stakes, form boards, and scrap lumber, and standing water from the excavated area. Inspect utility trenches to ensure they are sufficiently wide to permit adequate cover under, around, and over pipes and conduit that will be encapsulated with the BTB materials. Also inspect the foundation perimeter to ensure that there is sufficient room between the sides of excavations and edges of foundations to provide the required barrier depth and width.

3.2 PLACEMENT

Place material in one lift for thicknesses of 150 mm 6 inches or less and in successive lifts of 100 to 150 mm 4 to 6 inches where the indicated thickness is greater than 150 mm 6 inches. Compact each lift prior to placing successive lifts. Use power driven, vibrating-plate type tampers for large areas and rod-and-plate type hand tampers for small areas such as utility trenches and foundation and walk edges.
3.2.1 Slab-on-Grade

**************************************************************************

NOTE: Show the required depths on the drawings.  
100 mm Four inch depth is the minimum required.  For areas where capillary action is a problem, consult a soils engineer if the depth should be increased or other capillary prevention measures are required.

**************************************************************************

Provide a barrier of the depth indicated.  Rake smooth and machine tamp, giving at least three passes over the entire area.  Hand tamp around pipe and conduit risers.

3.2.1.1 Utility Trenches

Place the required depth of material for bedding in trenches prior to placing pipes and conduits and hand tamp the material.  For pipes 75 mm 3 inches and larger in diameter:  After placing pipe, bring material up to the top of the pipe and carefully hand tamp the material.  Then, bring material up to the top of the trench and tamp.  For pipes smaller than 75 mm 3 inches in diameter and for conduit:  Bring material up to the top of the trench and tamp.

3.2.1.2 Edges

After concrete placement and form removal, remove dirt, loose concrete, and other debris and hand place and tamp additional material to existing grade.

3.2.2 CMU Block Walls

Place the material in ungrouted cells at a height of at least one course above grade of the wall.

3.2.3 Fence Posts and Utility Poles

a.  Line the designated hole with a geotextile or similar material before proceeding with the work.

b.  Once the geotextile is in place, put a 100 to 150 mm 4 to 6 inch layer of the BTB at the bottom of the hole.  Hand tamp.  After positioning the fence post or utility pole in the middle of the hole, fill around the sides, compacting the material after successive lifts of 150 to 300 mm 6 to 12 inches until the hole is completely filled.  Ensure that a 100 to 150 mm 4 to 6 inch BTB barrier exists around the perimeter of the post or pole.

3.2.4 Retaining Walls

Place the required amount of material below the footing and up to the grade level of the wall.  Place lifts of 100 to 150 mm 4 to 6 inches with compaction of each lift prior to placing successive lifts.
