

## **PART II - PRIMARY SYSTEMS INFORMATION**

### **V. Basic Intrusion Detection Systems (IDS)**

#### **1. Operation**

##### **i. Safety Instructions:**

**CAUTION:** Prior to connecting and/or applying any form of supply power, visually inspect each enclosure to ensure that all power connections are in the correct positions, securely terminated with no stray wire strands hanging out of the connector, and that no wires have been left unterminated or dangling where damage may result from inadvertent contact to a power wire.

**CAUTION:** Electronic circuitry is susceptible to damage caused by Electrostatic Discharge (ESD). Always take appropriate precautions to prevent component damage due to ESD while installing and working with the RTU panels and associated equipment. A grounding strap attached to the body (such as a wrist strap) is recommended for the best protection; however, if one is not available, always ground yourself to earth ground prior to touching any parts of the unit or its components.
