

PART II - PRIMARY SYSTEMS INFORMATION

3. Fire Protection

1. Operation

a. System Description:

The fire alarm system provides audible and visual notification to building occupants to evacuate the building. The system also controls several systems in the building, elevators and HVAC for example, to decrease the hazards associated with smoke. The fire alarm system will also monitor the sprinkler system for valve closures that could cause the system to become non-operational.

Maintenance of this system is key to reducing nuisance alarms and providing reliable notification of building occupants when needed.
