21196-1 **GENERAL.** Storage facilities for miscellaneous aircraft equipment/parts/goods, etc., will be provided only where it can be individually justified. In addition to the method of determining the gross square-footage requirement, the justification should include an explanation as to why the storage requirement cannot be met through storage space provided within hangars/shops or 440 series covered general supply facilities. No specific criteria are available for this type of facility;

however, general information on normal stacking heights, SF per measurement ton, and other warehousing parameters are provided in Category Code 440 series.

211 97 PLANT SERVICES AND AIRCRAFT OVERHAUL (NAVAIR DEPOT) (m^2 / SF)

FAC: 2116
BFR Required: Y

21197-1 **GENERAL.** A Plant Services and Aircraft Overhaul Facility is required to provide space which is used in providing general support for all aircraft production operations. General support includes functions such as management, supervision, engineering, clerical functions, plant maintenance, central or general storage, quality assurance, and materials testing. This Category Code includes offices, cafeterias, supervisors' workspace, shop parts storage areas, dispatching facilities, inspection facilities, stairwells, auxiliary equipment rooms, walls, etc.

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine requirement.

211 98 AIRCRAFT ACOUSTICAL ENCLOSURE (NAVAIR DEPOT) (m^2 / SF)

FAC: 2116
BFR Required: Y

21198-1 **GENERAL.** An Aircraft Acoustical Enclosure is required to provide a covered facility for the in-frame aircraft engine run-up maintenance and testing performed by NAVAIR Depot. The aircraft acoustical enclosure, sometimes referred to as a hush house, is a total enclosure for fixed wing aircraft designed to abate noise during in-frame run-up of jet engines. The facility consists of a hangar-like aircraft enclosure, an absorptive augmenter for inducing cooling air and absorbing noise, a 45-degree blast deflector, an observation room with lavatory, and a mechanical equipment room. The observation and mechanical rooms are located adjacent to, not within, the aircraft enclosure.

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine requirement.

211 99 HAZARDOUS MATERIAL STOREHOUSE (NAVAIR DEPOT) (m^2 / SF)
FAC: 4413
BFR Required: Y

21199-1 **GENERAL.** A Hazardous Material Storehouse for Naval Air Depot (NAVAIR Depot) is required to provide space for the storage of hazardous substances and materials.

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine requirement.

211 SUPPLEMENT – MARINE CORPS AIRCRAFT MAINTENANCE FACILITIES

211-1 GENERAL

Facilities for the maintenance and repair of Navy and Marine Corps aircraft and related spares, including airframes, aircraft engines, aircraft weapons systems, avionics systems, and other related aircraft equipment are planned in accordance with maintenance functions and levels as authorized by the Chief of Naval Operations (CNO). Maintenance classifications are defined in OPNAVINST 4790.2 (series) and are the basis for the Naval Aircraft Maintenance Program (NAMP). Within the Marine Corps, the Deputy Commandant for Aviation (DC/A) is responsible for planning and coordinating staff activities for all matters relative to organization, equipment, manpower, training, and support of Marine Corps aviation units and installations, including all Aviation Logistics (AVLOG) matters. Because Marine Corps aviation is an integral part of naval aviation, DC/A is responsible to the CNO to ensure that Marine Corps aviation is in consonance with the overall Naval Aviation Program.

OPNAVINST 4790.2 (series) supports CNO/Commandant of the Marine Corps (CMC) readiness and safety objectives, and provides for optimum use of manpower, facilities, materiel, and funds. The NAMP is founded upon three-level maintenance concept: depot (“D” level) maintenance, intermediate “I” level maintenance and organizational (“O” level) maintenance. It is the authority governing management of D-level, I-level, and O-level aviation and aeronautical equipment maintenance. It provides the management tools required for efficient and economical use of personnel and material resources in performing maintenance. It also provides the basis for establishing standard organizations, procedures, and responsibilities for accomplishing all maintenance on naval aircraft, associated materiel, and equipment. The division of maintenance into the three levels allows management to:

i. Classify maintenance functions by levels.

ii. Assign responsibility for maintenance functions to a specific level.

iii. Assign maintenance tasks consistent with the complexity, depth, scope, and range of work to be performed.

iv. Accomplish any particular maintenance task or support service at a level that ensures optimum economic use of resources.

v. Collect, analyze, and use data to assist all levels of NAMP management.

211-2 DEPOT LEVEL MAINTENANCE

D-level maintenance is performed at naval aviation industrial establishments to ensure continued flying integrity of airframes and flight systems during subsequent operational service periods. D-level maintenance is also performed on material requiring major overhaul or rebuilding of parts, assemblies, subassemblies, and end items. It includes manufacturing parts, modifying, testing, inspecting, sampling, and reclamation. D-level maintenance supports O-level and I-level maintenance by providing engineering assistance and performing maintenance beyond their capabilities. D-level maintenance functions are grouped as follows:

i. Standard D-level maintenance of aircraft.

ii. Rework and repair of engines, components, and support equipment.

iii. Calibration by Navy calibration laboratories.

iv. Incorporation of technical directives (TDs).

v. Modification of aircraft, engines, and support equipment.

vi. Manufacture or modification of parts or kits.

vii. Technical and engineering assistance by field teams.

viii. Aircraft armament or aircraft and equipment under reliability-centered maintenance (RCM).

ix. Rework of expeditionary airfield (EAF) components.

211-3. D-LEVEL MAINTENANCE CATEGORY CODES AND REQUIREMENT

Facilities that are generally categorized as D-level maintenance facilities (also noted as NAVAIR depot) are shown in Table 211-5 “”D” Level Maintenance Facilities” and described in Section 211-1.10 “Facilities Categorized as “D” Level Maintenance” of the introduction to this category code series, “Series 211 Maintenance – Aircraft, Spares”. Each requirement for depot maintenance facilities must be planned and justified individually.

211-4 ORGANIZATIONAL LEVEL MAINTENANCE

O-level maintenance is performed by operating units (squadrons) on a day-to-day basis in support of their operations. The O-level maintenance mission is to maintain assigned aircraft and aeronautical equipment in a full mission-capable status while continuing to improve the local maintenance process. While O-level maintenance may be done by I-level or D-level activities, O-level maintenance is usually accomplished by maintenance personnel assigned to aircraft squadrons. Generally, O-level maintenance can be grouped under the following categories:

i. Inspections.

ii. Servicing.

iii. Handling.

iv. On-equipment corrective and preventative maintenance, including repair, removal, and replacement of defective components.

v. Class V (A) ordnance loading/unloading and arming/dearming.

vi. Incorporation of TDs

vii. Recordkeeping and reports preparation.

viii. Age exploration or aircraft and equipment under RCM.

211-4.1 **O-level Maintenance Category Codes.** Facilities that are generally categorized as O-level maintenance facilities are shown in Table 21100-2 “”O” Level Maintenance Facilities” and described in Section 211-1 “Facilities Categorized as “O” Level Maintenance” of the introduction to this category code series, “Series 211 Maintenance – Aircraft, Spares”. Marine Corps requirements for organizational level aircraft maintenance facilities are computed in the same manner as Navy requirements. See Category Codes 211 03, 211 04, 211 05, 211 06, and 211 07 for individual computation methodologies.

211-5 INTERMEDIATE LEVEL MAINTENANCE

Marine Corps air installations may be assigned limited intermediate maintenance level responsibilities for its own aircraft; however, most I-level aircraft maintenance is performed by a Marine Air Logistics Squadron (MALS). The I-level maintenance mission is to enhance and sustain the combat readiness and mission capability of supported activities by providing quality and timely material support at the nearest location with the lowest practical resource expenditure. I-level maintenance consists of on-and off-equipment materiel support and may be grouped as follows:

i. Performance of maintenance on aeronautical components and related support equipment and EAF components.

ii. Calibration of designated equipment.

iii. Processing aircraft components from stricken aircraft.

iv. Providing technical assistance to supported units.

v. Incorporation of TDs.

vi. Manufacture of selected aeronautical components, liquids, and gases (cryogenics).

vi. Performance of on-aircraft maintenance when required.

vii. Age exploration of aircraft and equipment under RCM.

viii. Weapons preparation.

211-6 MARINE AIR LOGISTICS SQUADRON

MALS was developed by the Marine Corps to enhance the aviation unit’s transition from a garrison configuration to the composite Aviation Combat Element (ACE) of a Marine Air Ground Task Force (MAGTF).

The composition and size of a MAGTF may vary, but the organizational structure will always be composed of four elements. These elements consist of the Command Element (CE), the Ground Combat Element (GCE), the Aviation Combat Element (ACE), and the Combat Service Support Element (CSSE). The composition and size of the MAGTF is structured to achieve the missions required to meet the existing world threats. The MAGTF may be employed in three sizes: a Marine Expeditionary Unit (MEU), a Marine Expeditionary Brigade (MEB), and a Marine Expeditionary Force

(MEF). The composition of the ACE is task-organized to conduct tactical air operations to support each of these MAGTF elements.

211-6.1 **MALS Organization.** The MALS is a command entity emulating the organizational structure of other Marine squadrons. A typical MALS is composed of the following Departments:

1) MALS Maintenance Department
2) Aviation Supply Department (ASD)
3) MALS Operations Department
4) Aviation Information Systems Department

211-6.1.1 **MALS Maintenance Department.** The Aviation Logistics functions of the MALS maintenance department include aircraft, avionics, support equipment maintenance, flight equipment, cryogenics, aviation ordnance, and maintenance data collection and analysis. All available talents and resources are used to ensure components are repaired to the highest standard of quality to further enhance the warfighting capabilities of the customer (the tactical squadrons). Specific responsibilities are as follows:

- Coordinate control of aircraft maintenance performed by, and in support of, squadrons and units under the cognizance of the MAG Commanding Officer, and materiel condition and combat readiness of assigned weapons systems and equipment.

- Conduct liaison among squadrons, stations, MAWs, and other activities in connection with maintenance or materiel matters.

- Ensure squadrons within the MAG provide augmentation personnel on a temporary additional duty basis as required for training in the maintenance of organic systems and subsystems by the I-level.

- Coordinate pre-deployment planning for the provisioning of personnel, facilities, support equipment, and services for supported squadrons.

- Screen supported deploying squadron materiel to ensure only materiel considered essential to support the specific deployment is embarked, and consolidation of multiple squadron requirements is made whenever possible.

- Screen appropriate Marine Aviation Logistics Support Program (MALSP) individual material readiness list (IMRL) allowances to ensure they are tailored to support the quantity and type aircraft assigned to the MAG squadrons.

- Ensure the MAG aircraft assignment board (or equivalent) is maintained and reflects current status.

- Maintain liaison with supported squadron maintenance material control centers and the ASD and ensure adequate validation and reconciliation of outstanding requirements takes place.

- Monitor MAG squadrons to ensure an effective maintenance program is being conducted.

- Monitor MAG squadrons to ensure an active and effective quality assurance monitoring program exists.

- Monitor MAG squadrons to ensure correct maintenance, administration, and material handling procedures are used, directing particular attention to the detection and removal of all administrative impediments to aircraft readiness.

- Assist squadrons in obtaining technical engineering assistance.

- Coordinate with other staff organizations to ensure maintenance facility requirements for both MALS and O-level are updated and submitted as required.

- Coordinate the assignment of aircraft parking spaces within the MAG.

- Ensure an aggressive and effective management program is in place to control cannibalization of aeronautical equipment. To the maximum extent possible, ensure selective cannibalization actions are planned to prevent aircraft from being in a non-flyable status for more than 30 consecutive days.

- Ensure inter-MALS liaison is maintained for repair of components in the secondary repair site program.

- Coordinate D-level drive-in or field modifications of assigned aircraft.

- Ensure an effective program is in place to perform a quarterly review of the MALS individual component repair list.

- Conduct regular meetings, chaired by the maintenance officer and co-chaired by the Aviation Supply Officer, with supported units to ensure optimum communication and coordination.

- Analyze the mission accomplishment and capabilities of the department using reports provided by the maintenance data system (MDS) on a continuing basis.

Within the MALS Maintenance Department there are two divisions:

a) Avionics Division
b) Aviation Ordnance Division

a) Avionics Division. The avionics division provides maximum support, coordination, and leadership to the MALS' mission in the areas of aircraft maintenance, avionics equipment maintenance, integrated logistics resource management, and professional personnel development.

All maintenance and support of the MALS and supporting activities, avionics equipment – to include weapons repairable assemblies, shop repairable assemblies, support equipment, test measuring and diagnostic equipment, and "Navy funded" computers and peripherals – will be performed by personnel assigned within the avionics division. These functions encompass programs, equipment, and support for activities both internal and occasionally external to the MAG. The avionics division, responsible to the maintenance officer, has the overall responsibility for the production effort within the MALS, on matters dealing with the scheduling, prioritization, and production of avionics equipment.

An avionics division exists within each MALS and consists of the following functional branches: avionics branch, precision measurement equipment branch, and various production branches necessary to support flying squadrons of the MAG. Each branch is responsible for the maintenance of its avionics equipment, the welfare of its personnel, an accurate accountability of work center IMRL assets, and individual branch security. The avionics branch is responsible for overall division administrative duties and I-level maintenance on avionics equipment. Depending on the type of aircraft supported, the avionics branch may contain up to five work centers: communications/navigation, electrical/instrument repair, automatic test equipment, electronic warfare, and radar.

b) Aviation Ordnance Division. The function of the aviation ordnance division is to provide the MALS with logistical and management support of class V(A) ordnance, aircraft armament equipment (AAE), and armament weapons support equipment (AWSE). This is done by interpreting and implementing the ordnance policies and procedures for the MAG. The MALS ordnance staff:

- Ensures the management and distribution of authorized noncombat expenditure allocation (NCEA).

- Assists the MAG in developing testing and training requirements for aviation ordnance.

- Ensures proper logistical support and storage requirements for prepositioned ware reserve materiel requirements assets are identified, including buildup and delivery of class V(A), ammunition stock points, advanced bases, and forward arming and refueling points.

- Manages the MAG's ordnance safety program and ensures explosive safety policies and procedures are issued as required.

- Ensures compliance with the policies and procedures set forth in OPNAVINST 8000.16A, "Naval Ordnance Maintenance Management Program (NOMMP)", when preparing quality deficiency reports, explosive mishap reports, technical publication deficiency reports, and engineering investigation requests.

- Ensures class V(A) materiel is managed per the current revision of NAVSUP P-724, "Conventional Ordnance Stockpile Management Policies and Procedures Manual", and other related directives.

- Establishes and monitors the handling, qualification, and certification program for nonnuclear aviation ordnance and nonnuclear explosive devices for the MALS.

- Establishes and maintains a satellite production control work center.

- Analyzes production and readiness division using reports provided by the MDS.

- Ensures satellite production efforts support the maintenance department's goals, objectives, and standards.

- Publishes a monthly maintenance and training plan for airborne weapons, training assets, AWSE, AAE, and formal in-Service training of aviation ordnance personnel.

- Ensures all maintenance performed on the AAE pool and AWSE is per the standards and guidelines established by the MALS maintenance department.

- Provides information on manpower, equipment, class V(A) materiel, and facilities to appropriate authorities.

- Establishes a verification program for technical manuals and directives maintained by the division.

- Establishes an AAE pool per MAW and aircraft controlling custodian/type commander (TYCOM) directives.

- Ensures the Retail Ordnance Logistics Management System (ROLMS) and the standardized conventional ammunition automated inventory record are used to manage class V (A).

- Monitors and coordinates nonexpendable aviation ordnance support provided by the MALSP.
- Ensures the division maintains the capability to operate from advanced bases and forward arming and refueling points.

- Coordinates pre-deployment planning for ordnance personnel, facilities, support equipment, ordnance materiel, and services to support squadrons (NAVSEA OP-5 Vol III, "Ammunition and Explosives Ashore, Advance Bases").

- Screens squadron materiel requests and the availability of class V (A) assets to ensure only material considered essential is embarked.

- Ensures appropriate levels of support are identified in the time-phased force and deployment data (TPFDD) database.

211-6.1.2 **Aviation Supply Department (ASD)**. The ASD executes all functions dealing with the inventory, storage, and management of Navy-provided materiel. The ASD staff functions include, but are not limited to, the direct responsibilities listed in the following paragraphs. An ASD exists within each MALS with physical location of the divisions within the ASD varying depending upon local situations. However, preferred locations are adjacent to the maintenance department production divisions. The hours of operation will be consistent with the operating hours of supported organizations.

Within the ASD there are seven divisions:

a) Supply Response Division
b) Consumables Management Division
c) Repairables Management Division
d) Supply Accounting Division

e) Squadron Support Division
f) Supply Management Division
g) Supply Personnel and Administration Division

a) Supply Response Division. The supply response division is responsible for the initial screening and technical research of all requisitions assigned by Naval Aviation Logistics Command Management Information System (NALCOMIS). The supply response division will refer consumable requisitions that cannot be filled from supply officer stores to the appropriate supply point of entry. The supply response division is also responsible for the reconciliation and monitoring of all outstanding direct turn-over (DTO) requisitions except for custodial, pre-expended bins, and service market items.

b) Consumables Management Division. The consumables management division is responsible for the procurement, receipt, storage, issue, delivery, and inventory of all consumable material.

The consumables management division consists of the following five branches:

i. Receiving Branch
ii. Consumable Delivery Branch
iii. Consumables Storage Branch
iv. Consumable Control Branch
v. Pre-Expended Branch

i. Receiving Branch. The receiving branch receipts and redistributes all material shipped to the MAG/MALS from external sources.

ii. Consumable Delivery Branch. The consumable delivery branch delivers all consumable issues, consumable DTO receipts, and processes related transactions.

iii. Consumables Storage Branch. The consumables storage branch stores, issues, and inventories all consumable material in the supply officer's stores and is divided into the consumable storage section and the consumable issue section.

iv. Consumable Control Branch. The consumable control branch manages inventory of consumable material.

v. Pre-Expended Branch. The pre-expended branch establishes, manages, and replenishes pre-expended bin sites authorized by the AVNSUPO or maintenance officer.

c) Repairables Management Division. The repairables management division is responsible for:

- Repairables allowance management, procurement, receipt, storage, issue, delivery, and inventory of all repairable materiel.

- Induction and recovery of repairables into/from the Intermediate Maintenance Activity "abd" for shipment and tracking beyond-the-capability-of-maintenance components to the appropriate activity.

- Management and control of all classified and fleet controlled material (repairable and consumable).

The repairables management division consists of the following five branches:

i. Repairables Control Branch
ii. Repairables Delivery Branch
iii. Repairables Storage Branch
iv. Awaiting Parts Branch
v. Supply Shipping Branch

i. Repairables Control Branch. The repairables control branch:

- establishes and maintains repairable allowances and is responsible for their procurement, inventory, and accountability.

- processes repairable requisitions and receipts with exceptions, and all repairables returned from the Intermediate Maintenance Activity.

- screens and tracks carcasses that are beyond-the-capability-of-maintenance.

- performs all duties on classified material (receipt, storage, issue, packaging, and shipment). Procedures for handling classified material are in Secretary of the Navy Instruction (SECNAVINST) 5510.36, "DON Information Security Program Regulation", and OPNAVINST 5218.7B, "Navy Official Mail Management Instructions".

ii. Repairables Delivery Branch. The repairables delivery branch delivers all repairable materiel (issues and DTO) to the customer. It also picks up all non-ready for issue repairable components from the customer ensuring accuracy of all documents, i.e., logbook, scheduled removal card, and maintenance action form (MAF).

iii. Repairables Storage Branch. The repairables storage branch is responsible for the receipt, issue, storage, and inventory of all repairable materiel in the supply officer's store. The storage of repairables is broken down into two separate sections – weapons repairable assembly and shop repairable assembly.

iv. Awaiting Parts Branch. The awaiting parts branch stores and manages repairable components awaiting repair parts.

v. Supply Shipping Branch. The supply shipping branch packages and ships all aeronautical-related components and equipment.

d) Supply Accounting Division. The supply accounting division is responsible for all tasks related to maintaining and reporting the financial accounts granted to the ASD.

The supply accounting division consists of the following two branches:

i. End Use Branch
ii. Stock Fund Branch

i. End Use Branch. The end use branch maintains and reports all end use accounts allocated to the ASD and is divided by operating target (OPTAR) funding.

ii. Stock Fund Branch. The stock fund branch reports transactions, which affect the Navy Working Capital Fund (NWCF) special accounting class (SAC) 207 inventory. It also verifies the financial processing of all transactions processed by the MALS.

e) Squadron Support Division. The squadron support division is responsible for receiving, processing, and monitoring all requirements for aeronautical-related custodial materiel and maintaining custody records for all organizational allowances.

The squadron support division consists of the following two branches:

i. Customer Assistance Branch
ii. Custody Records Branch

i. Customer Assistance Branch. The customer assistance branch receives, processes, and monitors all requirements for aeronautical-related custodial material.

ii. Custody Records Branch. The custody records branch maintains the custody record cards for all organizational allowance material, such as IMRL, TBA, COSAL, controlled equipage listed in the NAVAIR 00-35QH-2 (Section H), and maintenance assist modules/test bench installations. This branch also formulates the quarterly and annual budgets and the mid-year budget review for all custodial material.

f) Supply Management Division. The supply management division is composed of the most knowledgeable and experienced aviation supply personnel responsible for monitoring the overall supply department operation, technical training, and MALSP allowances and pickups (as they pertain to deployed and contingency operations).

The supply management division consists of the following two branches:

i. Audit Branch
ii. MALSP Support Branch

i. Audit Branch. The audit branch monitors all supply functions within the ASD to ensure compliance with authorized procedures and achievement of established goals.

ii. MALSP Support Branch. The MALSP support branch validates and loads MALSP allowances and monitors pickups.

g) Supply Personnel and Administration Division. The supply personnel and administration division is responsible for the administrative control of all personnel assigned. The supply personnel and administration division perform clerical functions and maintains the master files of all messages, orders, correspondence, and directives for the ASD.

The supply personnel and administration division consist of the following two branches:

i. Supply Personnel Branch
ii. Supply Administrative Branch

i. **Supply Personnel Branch.** The supply personnel branch performs functions related to administrative control of all personnel within the ASD.

ii. **Supply Administrative Branch.** The supply administrative branch provides clerical assistance for the ASD as directed by the AVNSUPO or the aviation supply chief.

211-6.1.3 **MALS Operations Department.** The MALS is a command entity similar to other Marine squadrons. The MALS operations officer is the chief advisor to the MALS Commanding Officer for all matters pertaining to planning and execution of tactical operations involving aviation logistical support (ALS). The MALS operations department is responsible for identifying, planning, coordinating, and supervising all operational AVLOG planning requirements.

The MALS operations department coordinates with both the parent MAG and each supported squadron regarding ALS for deployed squadrons and detachments. It also serves as the MALS point of contact for all deployment support involving the unit deployment program, L-Class/aircraft carrier (CV)/aircraft carrier (nuclear) (CVN) and aviation logistics support ships (T-AVB)/maritime pre-positioning force (MPF) employment plans and milestone reporting. It is also responsible for AVLOG force deployment planning and execution (FDP&E) as it relates to deliberate and crisis action planning (CAP).

211-6.1.3.1 **Deliberate Planning**. Deliberate planning is conducted during peacetime to develop and refine war plans. Planning in this fashion allows for orderly and methodical command and staff participation in the preparation of a plan. Deliberate planning is conducted when there is ample time for detailed, methodical, and comprehensive planning and coordination. The deliberate planning process culminates with the creation and refinement of time-phased force and deployment data (TPFDD) and its placement into the Joint Operation Planning and Execution System (JOPES). The following steps will be followed during the deliberate planning process. The MALS operations department:

- Coordinates the range and depth of AVLOG support required to support the concept of operations as defined by the MAW AVLOG plans section.

- Reviews all plans that require employment of AVLOG and class V(A) support and coordinates operational AVLOG as required to support each plan.

- Coordinates the review of operational and contingency plans (OPLANs/CONPLANs) with internal MALS department.

- Determines, in coordination with consolidated administration, assignment of MALS core and augments personnel to:

- Maritime prepositioning ship (MPS) survey, liaison, and reconnaissance party, arrival and assembly operations element, and offload preparation party.

- T-AVB.

- CV/CVN/general purpose amphibious assault ship (LHA)/multi-purpose amphibious assault ship (LHD).

- Ashore ACE bed-down airfield.

The MALS operations department also reviews each applicable deliberate plan and determines:

- If the commander's intent and end state for each deliberate plan/CONPLAN have been met.

- The employment, configuration, and coordination of arrival date of the T-AVB.

- The TPFDD for of AVLOG assets into the theater of operations.

- Each MALS unit line number is identified on the TPFDD.

- Site survey for the MALS bed-down sites.

- Geo-prepositioning support equipment offload distribution and assignment plan.

211-6.1.3.2 **Crisis Action Planning**. CAP performed by AVLOG planners at all levels must recognize that CAP is not governed by rigid steps as it is a flexible means of coordinating staff action. However, certain conditions may be viewed as probable with respect to the preparation of deployment data in response to any crisis action situation. If the crisis is in response to a contingency for which deliberate planning has been conducted, the existing planning data can be used as a tool to develop tailored support. If the crisis is in response to a contingency for which no deliberate planning has been previously conducted, ALS must be tailored without the benefit of existing data. During CAP, the MALS operations department is responsible for:

- Recommending to the MALS CO operational priorities for the movement of MALS support.

- Acting as the MALS point of contact for the wing staff when the CAP is established.

- Coordinating the development and implementation of troop movements from home station to the sea/airport of embarkation.

- Coordinating with other MALS departments/sections to identify and tailor ALS.

- Determining priorities for MALS replacements in coordination with the S-1.

- Coordinating MALS operations security and signal security.

211-6.1.4 **Aviation Information Systems Department**. The Aviation Information Systems Department (AISD) provides data processing support to the supply and maintenance departments. The AISD is responsible for the administration, operation, and maintenance of all computer systems and networks throughout the supply, maintenance, and ordnance departments.

Within the AISD there are five divisions:

a) Administration Division
b) Customer Support Division
c) Network Administration Division
d) Systems Processing Division
e) Maintenance Support Division

a) Administration Division. The administration division is responsible for the administrative control of all personnel assigned. Personnel within the division perform clerical functions and maintain the master files for messages, orders, correspondence, and directives for the AISD.

b) Customer Support Division. The customer support division is the primary manager for customer support within the AISD. Unit/department representatives will forward discrepancies that cannot be resolved locally to the customer support division, who will then initiate the discrepancy into the maintenance cycle. The customer support division will further operate as the department issue and receive desk, production control/help desk call center, AISD asset manager, and supply/maintenance liaison, providing monitored support to the MAG relative to aviation information systems. In addition, the customer support division will substantiate and prioritize AISD requirements submitted via the supply department.

c) **Network Administration Division.** The network administration division is responsible for the management of all automated information systems (AIS) network resources within the MAG. These responsibilities include managing and upgrading network operating systems, data assurance, user account management, network architecture documentation and upgrade planning, network security, workstation software standardization.

d) **Systems Processing Division.** The systems processing division provides data processing support to the supply and maintenance departments. The systems processing division is responsible for administrative and operational control of the Intermediate Maintenance Activity Naval Tactical Command Support System (NTCSS) systems. The systems processing division is also responsible for coordination of application workload and output to the supply applications administrator and the maintenance applications manager.

e) **Maintenance Support Division.** The maintenance support division consists of AISD technicians that provide direct maintenance and installation support for all AIS and MALS core network assets.

Marine Corps Intermediate Maintenance Requirements Example Calculation:

Because of the expeditionary nature of the Marine Corps air support mission, many of the aircraft intermediate level maintenance shops are located in deployable mobile facilities (MFs). For this reason, Marine Corps aircraft intermediate level maintenance facilities in the continental United States are a combination of permanent facilities and mobile vans while Navy aircraft intermediate maintenance facilities are all permanent facilities.

The MFs (generally 2.4 m x 2.4 m x 6.1 m (8 ft x 8 ft x 20 ft) vans) used by the MALS conform to International Organization of Standardization container dimensions and are configured to perform a multitude of missions. MFs require a concrete pad and utility support when at home base. This allows the MFs to be used, maintained, and always ready to deploy for their primary mission. See Category Code 116 65, Mobile Facility Support Pad for concrete pad and utility support requirements.

When at home base, MFs are used primarily for training. It is also crucial to keep the MFs in good working order in case of rapid deployment need. If MFs are utilized at the home base, they should not reduce the various intermediate maintenance shop requirements.

Marine Corps aircraft intermediate level maintenance facilities are planned utilizing the basic criteria for comparable Navy facilities except that it is necessary to:

a. Provide one Type I hangar module for each Marine Air Logistics Squadron (MALS) assigned to an installation. This hangar supports the intermediate level maintenance program and is in addition to hangars required for organizational maintenance.

b. Size intermediate level maintenance shops in the same manner as Navy requirements.
c. Plan airframes shop requirements as part of the MALS hangar 01 space, and this space should be categorized as 211 06 rather than 211 08.

The following is an example of how to determine the amount of permanent intermediate level maintenance shop space required for a MALS (in addition to one Type I hangar), with the gross requirements for each shop being computed utilizing the appropriate criteria.

Example: Taking a MALS which supports a group composed of 4 VMA squadrons composed of 20 AV-8B aircraft each, 2 VMAQ squadrons composed of 8 EA-6B aircraft each, and 2 VMGR squadrons composed of 7 KC-130 aircraft each. Additionally, the MALS has 10 AM32K-4 and 10 MHU-151/M armament trailers. The MALS has mobile facilities, and the air station has 60 fixed point utility stations. Intermediate level maintenance shop space requirements are computed for each basic shop. In this example, airframes, avionics, aviation armament, aviation life support systems, and ground support equipment shops are computed. Hangar space requirements for organizational maintenance are computed utilizing the same criteria as for Navy hangars. See Aircraft Maintenance Hangar, Category Codes 211 05, 211 06, and 211 07. In addition, one Type I maintenance hangar is required for the MALS.

Step 1: Select the appropriate intermediate level shop Category Codes:

i. Airframes Shop: Category Code 211 08
ii. Aircraft Intermediate Maintenance Activity Management: Category Code 211 16
iii. Engine Maintenance Shop: Category Code 211 21
iv. Avionics Shop: Category Code 211 45
v. Aviation Armament Shop: Category Code 211 54
vi. Aviation Life Support Systems Shop: Category Code 211 75
vii. Ground Support Equipment Shop: Category Code 218 60
viii. Ground Support Equipment Shed: Category Code 218 61

Step 2: Airframes Shop (211 08)

a.) Using computation methodology for Category Code 211 08:

Type of Aircraft	Number of Aircraft
AV-8B	80
EA-6B	16
KC-130	14
Total	110

In accordance with Table 21108-2, a total of 110 aircraft requires a basic area of 1,571 m^2 (16,900 SF). Using Table 21108-3, it is determined the Composite Shop required for AV-8B support adds an additional 151 m^2 (1,630 SF). This gives a gross area as follows:

Airframes Shop Summary:

Component	m^2	SF
Basic Area	1,571	16,900
Composite Shop	151	1,630
Gross Airframes Shop Area	1,722	18,530

The Airframes Shop shall be located in the Type I hangar configured for the MALS.

Step 3: Aircraft Intermediate Maintenance Activity Management (211 16)

a.) Using computation methodology for Category Code 211 16:

The management spaces provide for the control, monitoring, and administration of the Intermediate Maintenance Activity (IMA). The Aircraft Maintenance Officer and staff are responsible for the administration and supervision of the maintenance effort for the IMA. These responsibilities include production control, material control, financial accounting, training, personnel, administration, quality control, technical publications library, data analysis, and tool control for common and special tools and test equipment. The Naval Aeronautical Engineering Services Unit (NAESU) staff and personnel performing In-Service Engineering Agent (ISEA) functions for aircraft are often collocated in these same spaces.

Provide 917 m^2 (9,875 SF) for IMA management functions.

Step 4: Engine Maintenance Shop (211 21):

a.) Using computation methodology for Category Code 211 21:

Type of Aircraft	Number of Aircraft
AV-8B	80
EA-6B	16
KC-130	14

Using Table 21121-2:

Aircraft		Area	
No.	Type	m^2	SF
80	AV-8B	1,820	19,575
16	EA-6B	239	2,575
14	KC-130	332	3,575
	Subtotal	2,391	25,725

Using Table 21121-3:

Additional Space Requirement based on total space allowance computed using Table 21121-2.

Computed Space Allowance (from table 21121-2)	Square Meters (from Table 21121-3)	Square Feet (from Table 21121-3)	Percent Factor (from Table 21121-3)
2,391 m^2 25,725 SF	2,324 – 2,556	25,001 – 27,500	45%

2,391 m^2 x 45% = 1,076 m^2 or 25,725 SF x 45% = 11,576 SF

High Bay Area (Subtotal from Table 21121-2): 2,931 m^2 (25,725 SF)
Shop Wing/Mezzanine (Subtotal from Table 21121-3): 1,076 m^2 (11,576 SF)

Total Engine Maintenance Shop = (2,931 + 1,076) m^2 = 4,007 m^2
(25,725 + 11,576) SF = 37,301 SF

If authorized by higher authority, additional applicable work center space requirements from Table 21121-4 shall be added.

Using table 21121-4:

Work Center	AV-8B	EA-6B	KC-130	M2	SF
Propeller			X	272	3,375

Auxiliary Power Unit	X		X	167	1,800
Rotor Dynamics				0	0
Auxiliary Fuel Stores		X		314	3,375
			Total	753	8,550

Note: Only one work center of each type is required.

Step 5: Avionics Shop (211 45)

a.) Using computation methodology for Category Code 211 45:

Obtain the basic space requirements for all type/model aircraft by entering Table 21145-1 with quantity of aircraft to be supported. Select the lowest percentage factor for secondary type aircraft for Column (3) by crossing from that aircraft in secondary column and considering each aircraft assigned with a larger basic space requirement as a prime aircraft.

i. The AV-8B has only the EA-6B with a larger basic space requirement therefore 42% will be used in Column (3).

ii. The KC-130 has both the AV-8B (33%) and the EA-6B (36%) with larger basic requirements. The AV-8B has the lowest percentage factor (33%) so this will be entered in Column (3).

iii. The EA-6B aircraft has the largest basic space requirement, therefore it is the prime aircraft with a percentage factor of 100% entered in Column (3).

Column (1)	Column (2) (Table 21145-1)		Column (3) (Table 21145-2)	Column (4) [Col(2) x Col(3)]	
	m^2	SF		m^2	SF
80 AV-8B	1,766	19,000	0.42	742	7,980
16 EA-6B	2,342	25,200	1.00	2,342	25,200
14 KC-130	1,171	12,600	0.33	386	4,158
Gross Avionics Shop Area				3,470	37,338

Step 6: Aviation Armament Shop (211 54)

a.) Using computation methodology for Category Code 211 54:

Type of Aircraft	Number of Aircraft	Trailer Type	Number of Trailers
AV-8B	80	AM32K-4A	10
EA-6B	16	MHU-151/M	10
KC-130	14	Total	20
Total	110		

i. Basic Shop Requirement

Determine the Aircraft Classification by entering Table 21154-1.

AV-8B: Attack/Fighter
EA-6B: Attack/Fighter
KC-130: Not Applicable

Obtain the basic space allowance by entering Table 21154-2. For a total of 96 Attack/Fighter Aircraft the basic space allowance is 465 m^2 (5,000 SF).

ii. Aviation Armament Equipment Pool Requirement

Column (1) Type A/C	Column (2) Area per A/C		Number of A/C	Pool Support Space	
	m^2	SF		m^2	SF
AV-8B	3.5	38	80	280	3,040
EA-6B	7.3	78	16	117	1,248
KC-130	N/A	N/A	14	0	0
Total Equipment Pool Support Space				397	4,288

iii. Armament Weapons Support Equipment Work Center (Marine Corps requirement ONLY)

Column (1) Type Trailer	Column (2) Area per Trailer		Number of Trailers	Area for Trailers	
	m^2	SF		m^2	SF
AM32K-A4	2.3	25	10	23	250
MHU-151/M	1.4	15	10	14	150
Total Equipment Pool Support Space				37	400

Aviation Armament Shop Summary:

Area	m^2	SF
Basic Shop	465	5,000

Aviation Armament Equipment Pool	397	4,288
Armament Weapons Support Equipment Work Center	37	400
Gross Aviation Armament Shop Area	899	9,688

Step 7: Aviation Life Support Systems Shop (211 75)

a.) Using computation methodology for Category Code 211 75:

Type of Aircraft	Number of Aircraft
AV-8B	80
EA-6B	16
KC-130	14
Total	110

Obtain the Parachute Shop Factor (Column (2)), Flotation Shop size (Column (3)), and Oxygen Shop size (Column (4)) for all type/model aircraft by entering Table 21175-1.

i. The Parachute Shop Factor is 0.0016, the Flotation Shop size is M (46.5 m^2 (500 SF)), and the Oxygen Shop size is L (46.5 m^2 (500 SF)) for the AV-8B aircraft.

ii. The Parachute Shop Factor is 0.0064, the Flotation Shop size is M (46.5 m^2 (500 SF)), and the Oxygen Shop size is L (46.5 m^2 (500 SF)) for the EA-6B aircraft.

iii. The Parachute Shop Factor is 0.0064, the Flotation Shop size is L (83.7 m^2 (900 SF)), and the Oxygen Shop size is S (27.9 m^2 (300 SF)) for the AV-8B aircraft.

A/C Type	Number of A/C	Table 21175-1 Column (2)	Factor Product	Table 21175-1 Column (3)	Table 21175-1 Column (4)
AV-8B	80	0.0016	0.1280	M	L
EA-6B	16	0.0064	0.1024	M	L
KC-130	14	0.0064	0.0896	L	S
		Total:	0.3200	L	L

From Table 21175-2, Basic Allowance for 0.3200 = 279 m^2 (3,000 SF)

From Table 21175-1, Column (3), Flotation Shop, “L”= 83.7 m^2 (900 SF)

From Table 21175-1, Column (4), Oxygen Shop, “L”= 46.5 m^2 (500 SF)

Total Aviation Life Support Systems Shop = 409.2 m^2 (4,400 SF)

Step 8: Ground Support Equipment Shop (218 60)

a.) Using computation methodology for Category Code 218 60:

Type of Aircraft	Number of Aircraft
AV-8B	80
EA-6B	16
KC-130	14
Total	110

b.) From Table 21860-1:

Component	Number of Aircraft	
	80 (up to 120)	
	m^2	SF
Support Equipment Division/admin/ production control/tool room/ IMRL/ material control/SE pool	104	1,114
SE Training/License	28	300
Support	90	967
Net to gross (19%)	149	1,600
SE Gas Engine and Turbine Shop	28	300
SE Structural/Hydraulics Shop	74	800
SE Corrosion Control Shop	74	800
SE Electrical Repair Shop	28	300
SE Component Repair Shop	65	700
SE Periodic Maintenance Shop	63	680
Air Conditioning Repair Shop	-	-
SE Repair Lanes/Service Bays	229	2,460
Total Shop Area	931	10,021

c.) Shop Area size adjustment for existing Fixed Point Utility Stations (FPUS).

Number of apron parking spaces with FPUS = 60

60 apron spaces with FPUS multiplied by 1.0 m^2 (11.2 SF) = 60 m^2 (672 SF)

Reduce area by 60 m^2 (672 SF)

Total Ground Support Equipment Shop Area = (931 – 60) m^2 = 871 m^2
(10,021 – 672) SF = 9,349 SF

Step 9: Ground Support Equipment Shed (218 61)

a.) Using computation methodology for Category Code 218 61:

Type of Aircraft	Number of Aircraft
AV-8B	80
EA-6B	16
KC-130	14
Total	110

b.) From Table 21861-1:

No. of Aircraft	Shed Area	
	m^2	SF
101-125	1,771	19,050

Total Ground Support Equipment Shed = 1,771 m^2
(19,050 SF)

In summary, the Intermediate Maintenance Shop space requirements for the MALS used for this example are:

1.	Airframes Shop	=	1,722	m^2	18,530	SF
2.	IMA Management	=	917	m^2.	9,875	SF
3.	Engine Maintenance Shop	=	4,007	m^2.	37,301	SF
4.	Avionics Shop	=	3,470	m^2.	37,338	SF
5.	Aviation Armament Shop	=	899	m^2	9,688	SF
6.	Aviation Life Support Systems Shop	=	409	m^2.	4,400	SF
7.	Ground Support Equipment Shop	=	871	m^2	9,349	SF
8.	Ground Support Equipment Shed	=	1,771	m^2	19,050	SF

In addition to the shop spaces listed above, one Type I hangar is required for support of the MALS. The hangar requirement is in addition to the hangar modules for organizational level maintenance as computed in Category Codes 211-05, 211-06, and 211-07.

212 MAINTENANCE - GUIDED MISSILES

212-1 This basic category provides facilities and shops for maintenance and repair of guided missile systems, ground handling, and launching equipment. Under certain circumstances, the maintenance and storage for these missiles are integrated and the missiles are maintained where they are stored.

212 10 GUIDED MISSILE INTEGRATION FACILITY (SF)
FAC: 2121
BFR Required: Y

21210-1 **DESCRIPTION.** The purpose of this facility is to assemble new-production components of air launched guided missiles and perform any required maintenance on fleet returned All-Up-Round (AUR) missiles or components. Missiles are returned from the fleet at service inspection time when the maintenance due date is assigned to the missiles so require. This type of facility is primarily found at Naval Weapons Stations. However, it is also found at Naval Air Stations and other ordnance related activities.
21210-2 **REQUIREMENT.** A typical facility is capable of servicing four different types of missiles and is composed of six basic areas which are expressed in net square feet (NSF) as shown in Table 21210-1 below.

Table 21210-1 Basic Areas of Guided Missile Integration Facility

Description of Basic Area	NSF
De-canning and Storage Area	3,050
Open Work Area and Support Maintenance	3,050
Assembly Area (Test Cell)	4,169
Missile Storage	1,229
Office/Library	1,160
Mechanical Equipment Room & Toilet	1,146
Total	**13,804**

21210-2.1 **Net to Gross Conversion.** The net to gross conversion factor for this facility is 1.24. Therefore, multiply the NSF times 1.24 to obtain the gross square feet (GSF) for the facility (i.e., 13,804 NSF x 1.24 = 17,117 GSF).

21210-2.2 **Facilities Servicing More Than Four Missile Types.** In the event that more than four types of missiles are required to be serviced, the size of the facility may be increased by 3,451 NSF or 4,280 GSF per additional type of missile.

21210-3 **Air Launched Missile Industrial Processing Guide (ALM-IPG).** Additional information pertaining to the type of test performed and the amount of time required for each test involving the Sidewinder, Sparrow, Walleye, Shrike and Phoenix missile may be obtained from the ALM-IPG which is promulgated by Technical Manual Identification Number (TMIN) TW 800-AA-MMI-000/ALM - IPG.

21210-3.1 **Volumes in ALM-IPG.** The Guide consists of a general information volume and five additional volumes of data, each of which is dedicated to a particular missile. The Guide presently consists of the volumes shown in Table 21210-2.

Table 21210-2. Volumes Contained in ALM-IPG

Volume	Title	Technical Manual ID Number
1	General Information	TW 800-AA-MMI-010/ALM-IPG
2	SIDEWINDER AIM-9G/H/L	TW 800-AA-MMI-020-/ALM-IPG
3	SPARROW AIM-7E/F and RIM-7E/H	TW 800-AA-MMI-030/ALM-IPG
4	WALLEYE Guided Weapon	TW 800-AA-MMI-040/ALM-IPG
5	SHRIKE AGM-45A/B	TW 800-AA-MMI-050/ALM-IPG
6	PHOENIX AIM-54A	TW 800-AA-MMI-060/ALM-IPG

21210-3.2 **Ordering the ALM-IPG.** Copies of the Guide may be ordered from Code 2242 of the Pacific Missile Test Center, Point Mugu, CA, either as a complete set under TMIN-TW 800-AA- 000/ALM-IPG or as individual volumes using the individual volume Technical Manual Identification Number.

212 11 MISSILE MODULE MAINTENANCE AND LOADING FACILITY (SF)
FAC: 2121
BFR Required: Y

21211-1 **DESCRIPTION.** This facility will provide the Maintenance and Explosive Operation Location, EOL, for the Navy’s new Missile Module Weapons Systems. The facility will be sited for Ordnance handling and provide maintenance/ordnance loading high bay, a tool room, parts room, pressurized wash system, MM elevated cleaning pit(s), Male/Female locker/shower rooms, overhead crane, and administrative support space.

21211-2 No planning factors are currently available for this facility. An engineering analysis is needed to determine facility space requirements.

212 20 MISSILE EQUIPMENT MAINTENANCE SHOP (SF)
FAC: 2123
BFR Required: Y

21220-1 No planning factors are currently available for this facility. Activities with a limited amount of missile-handling equipment should consider performing their maintenance in an Automotive Vehicle Maintenance Shop (Category Code 214 20).

212 30 MISSILE ASSEMBLY AND TEST BUILDING (SF)
FAC: 2121
BFR Required: Y

21230-1 **DESCRIPTION.** This facility is required to support intermediate level maintenance of surface launched guided missiles. Component sections of the missile are tested, assembled into a missile of the required configuration, and tested as an all-up-round. Missiles may be received/shipped as bare missiles or packaged in containers.

21230-2 **REQUIREMENT.** Bridge cranes are needed to handle the missiles in the receiving/shipping area and onto the test beds in the test cells. Test cells should be constructed for an explosion hazard of 300 lbs. net explosives weight. See Table 21230-1 for guidance on sizing the facility.

Table 21230-1. Space Allowances for Surface Launched Guided Missiles

Weapons System	Gross SF
Standard	
Assembly	9,300
Control Cell	1,045
4 Test Cells	2,040
Packaging	2,500
Warheading, SW	450
Component rework, stores	6,600
Other	5,755
TOTAL	**27,690**
Harpoon	
Assembly and holding area	13,425
Control Cell	925

Weapons System	Gross SF
2 Test Cells	920
Office and stores	860
TOTAL	**16,130**

212 40 MISSILE COMPONENT SLING TEST TOWER (EA)
FAC: 2124
BFR Required: N

21240-1 **DESCRIPTION.** This facility is used to test the tensile strength of all forms of weapons handling equipment such as slings, beams, bars, etc. It is used in testing developmental equipment and the periodic testing of handling equipment.

21240-2 **REQUIREMENT.** The tower is a requirement of any station that is involved with handling heavy loads of ammunition, such as weapon stations and those activities that load and offload ammunition ships.

212 50 SUBMARINE LAUNCHED BALLISTIC MISSILE PROCESSING FACILITIES (SF)
FAC: 2126
BFR Required: Y

21250-1 **DESCRIPTION**. These facilities are required to receive components; checkout, assemble, refurbish, and repair Submarine Launched Ballistic Missiles (SLBMs) such as the TRIDENT II, D5 missile. Criteria for these facilities are dependent on the type of missile and have been developed and are available from the Navy's Strategic Systems Programs (SSP). All SLBM processing facilities are within high security areas and have special construction features such as high capacity environmental control systems, super flat floors, special trenching and conveying systems, and ordinance grounding and lightning protection systems.

21250-2 **REQUIREMENT**. No planning factors are currently available for this facility. For administrative spaces within these facilities, see Facility Class 600.

21250-2.1 Motor Transfer Facility (MTF). This facility provides the capability of receiving and transshipping SLBM missile motors and components and Active Inert Missiles (AIMs).

21250-2.2 Inert Component Control Building (ICCB). The ICCB provides for the support of missile systems level package processing, storage for guidance systems, missile assembly checkout, instrumentation sub-system/package checkout, AIM recertification, and electronic repair.

21250-2.3 Radiographic Inspection Building (RIB). The RIB provides the capability for film and computed tomography of SLBM rocket motors. It also provides a film radiographic capability for small ordnance components and low energy real-time radiography capability for gas generators.

21250-2.4 Missile Inspection Building (MIB). The MIB provides buildup and checkout of first, second, and third stage motors, Thrust Vector control (TVC) systems installation/ removal and leak test, motor pressurization (leak search), conduit installation, and igniter installation; additionally, a cell will be provided to support motor nozzle removal/installation.

21250-2.5 Missile Assembly Building (MAB). The MAB provides the assembly, disassembly, and checkout of tactical SLBMs.

21250-2.6 Limited Area Processing and Storage Complex (LAPSC). The LAPSC receives processes and stores Strategic weapons Systems (SWS) components.

21250-2.7 Vertical Missile Packaging Building (VMPB). The VMPB provides for the packaging/un-packaging of SLBMs and the mating and de-mating of their SWS systems.

212 77 GUIDED MISSILES/SPARES STORAGE (READY ISSUE/ SHOP STORES/MISC.) (SF)

FAC: 2121
BFR Required: Y

21277-1 **DESCRIPTION.** These facilities are storage facilities for miscellaneous equipment or goods related to guided missiles that will be provided only where it can be individually justified.

21277-2 **REQUIREMENT.** There are no criteria for this type of facility. General information on normal stacking heights, SF per measurement ton requirements, and other parameters are provided in the Category Code 440 series.

213 MAINTENANCE - SHIPS AND FLOATING EQUIPMENT

213-1 **FACILITY MAINTENANCE.** This basic category provides facilities for maintenance of vessels of all types. These facilities include graving dry docks, fixed cranes, marine railways, ship repair shops, and amphibian vehicle maintenance shops. For waterfront operational facilities, see Category Group 150. For administrative facilities, see Facility Class 600.

213 10 DRY DOCK (SF)
FAC: 2131
BFR Required: Y

21310-1 **DESCRIPTION.** A dry dock is a long narrow basin sited in the foreshore of a harbor. Its entrance is closed by a movable caisson or by gates. The basin is so constructed that a vessel may be placed in it and the water removed, allowing the vessel to settle on supports located on the dock floor. In this way the underwater portion of the vessel is exposed for routine maintenance and repair or for those coming into a dry dock in a damaged condition. Dry docks vary in size in accordance with the dimensional characteristics of the vessels to be serviced. Hence, each dock is designed and constructed to satisfy the special requirements of a particular vessel or class of vessels.

21310-2 **SITING A DRY DOCK.** The siting of a dry dock at an existing naval shipyard entails the analysis of many vital factors. Some recommendations for siting are the following:

1. Locate the dry dock near the shipyard shop area for access to piping, electrical, woodworking, metalworking, machining and similar shops.

2. Locate near sources of power and fresh water.

3. Orient the dry dock to require the minimum length of track for gantry cranes.

4. Provide adequate ship approaches to the docks. The approach or turning basin should have a width in front of the dock of at least two times the dock length properly oriented for turning. The depth should be no less than that at the entrance sill of the dry dock.

5. Clearance must be provided from structures flanking the approach path of the ship. A distance of not less than 150 feet should be planned between such structures and the side of the ship to provide space for tugs to operate while maneuvering the ship.

21310-3 **Dry Dock Certification.** Coordinate with the local shipyard Facilities Program Manager, Code 900F, to obtain information on the Dry Dock Certification Program.

213 20 MARINE RAILWAY (EA)
FAC: 2132
BFR Required: Y

21320-1 **DESCRIPTION.** The function of a marine railway is to bring a vessel out of the water for the purpose of making all parts available for overhaul, and to return the vessel to the water when the work is finished. The facility consists of rail trackage from a point on shore to an anchored position at a submerged depth; a railway beaching cradle or dolly for mating a vessel or small boat; and hauling machinery (hoist house) to pull the cradle-mounted vessel up the inclined track to a position on shore.

21320-2 **CAPACITY.** The capacity of a marine railway is usually given as the weight (displacement) in long tons of the largest ship that can be lifted. The maximum size and capacity of Navy marine railways has been restricted to about 3,000 tons that is the size required for the largest destroyer.

21320-3 **SITING.** The sites chosen for marine railways should satisfy the following requirements:

21320-3.1 **Distance to the Channel.** The distance from the high water line or the bulkhead line to the navigation channels must be adequate for construction of the offshore end of the railway and must provide a safe fairway for vessels approaching and leaving the cradle.

21320-3.2 **Inshore Area.** The space available on land, including the frontage along the shore, must be sufficient for the inshore end of the railway, the hoist house, necessary clearances, spur tracks, roadways, cranes and working areas. Some of the larger marine railways will extend approximately 500 feet inshore.

21320-3.3 **Hydrographic Conditions.** The natural slope of the bottom along the offshore end of the railway, to prevent silting, should be lower than the grade of the tracks.

21320-3.4 **Foundations.** The soil conditions for the length of the railway must be of sufficiently high quality to make possible a design of foundations that will assure rigid control of settlement.

21320-3.5 **Favorable Climatic and Tidal Conditions.** The proposed location should be protected as much as possible from strong winds and waves.

21320-4 **DESIGN CRITERIA.** For design criteria, see NAVFAC DM-29.

213 30 SHORE INTERMEDIATE MAINTENANCE ACTIVITY (SIMA) (SF)
FAC: 2133
BFR Required: Y

21330-1 **DESCRIPTION.** This facility (SIMA) provides space for the fleet intermediate level maintenance operations. A SIMA has two basic components: maintenance shops and administration. These components may be established separately or as a consolidated complex.

21330-1.1 **Maintenance Shops.** Following is a partial list of functions in the maintenance component:

1. Machine Shop (Inside and Outside)
2. Hydraulic Shop; Valve and Regulator Shop; Pump and Pipe Shops
3. Boiler Shop; Automatic Combustion Control Shop
4. Optical Shop; Gyro Compass Shop; Test Equipment Shop
5. Internal Combustion Engine Shop; Gas Turbine Shop
6. Air Conditioning and Refrigeration Shop
7. Electrical, Electronics and Crypto Equipment Shops; Battery Shop
8. Sheet metal, Ship fitter and Welding Shops; Foundry
9. Carpenter, Pattern and Boat Repair Shops; Lagging and Insulation Shop
10. Riggers, Canvas and Paint Shops
11. Sandblasting Shop
12. Chemical, Metallurgical and Non-Destructive Testing Laboratories
13. Instrument Repair and Calibration Laboratory
14. Noise and Vibration-Analysis Laboratory

21330-1.2 **ADMINISTRATIVE SPACES.** The administrative component provides space for:

1. Offices; Central, Technical and Study Libraries; Records Storage
2. Classrooms, Projection Room, Audio-Visual Aid Preparation
3. Computer Operations and Analyst Record Storage

213 31 SHORE DEPOT LEVEL REPAIR SHOP (SF)
FAC: 2133
BFR Required: Y

21211-1 **DESCRIPTION.** An enclosed building used to perform depot level maintenance on components and accessories of ships and amphibious vehicles that cannot be repaired on board the vessels. This shop may include areas for electronics repair, welding, painting, small item fabrication, and a variety of other repair shop functions.

21211-2 No planning factors are currently available for this facility. An engineering analysis is needed to determine facility space requirements.

213 32 SHIPYARD DEMILITARIZATION AND RECYCLING FACILITY (SF)
FAC: 2134
BFR Required: Y

21211-1 **DESCRIPTION.** A Shipyard Demilitarization and Recycling Facility that is used to provide administrative, shop, logistics, and personnel support space in direct support of demilitarization and recycling of surface ships and submarines.

21211-2 No planning factors are currently available for this facility. An engineering analysis is needed to determine facility space requirements.

213 40 FIXED CRANE STRUCTURES (EA)
FAC: 2137
BFR Required: Y

21340-1 **DESCRIPTION.** The principal types of fixed cranes are pillar, pillar-jib, and jib. The hammerhead and tower cranes are also classed as stationary when mounted on fixed towers.

21340-2 **CRITERIA.** See NAVFAC DM-38, for criteria and procedures to be followed in the selection of weight handling equipment for specific installations.

213 41 THROUGH 213 67 - SHIP REPAIR SHOPS

21341 through 21367-1 **CATEGORY CODES.** Ship repair shops and related facilities included in Category Code series 213 are shown in Table 21341 through 21367-1.

Tables 21341 through 21367-1. Ship Repair Shops and Related Facilities

Category Code	Description
213 41	Central Tool Shop
213 42	Shipfitting Shop
213 43	Sheet Metal Shop
213 44	Forge and Heat Treat Shop
213 45	Welding Shop
213 48	Quality Assurance Office
213 49	Inside Machining Shop
213 50	Optical Shop
213 51	Weapons Shop
213 52	Marine Machining Shop
213 53	Boilermaking Shop
213 54	Electrical Shop
213 55	Pipefitting Shop
213 56	Woodworking Shop
213 57	Electronics Shop
213 58	Boat Shop
213 59	Abrasive Blast Facility
213 60	Paint and Blasting Shop
213 61	Rigging Shop
213 62	Sail Loft
213 63	Foundry
213 64	Patternmaking Shop
213 65	Nuclear Repair Shop
213 66	Temporary Services Shop
213 67	Pumphouse, Dry Docks

21341 through 21367-2 **DELETED CATEGORY CODES.** The following category codes have been deleted and the functions formerly performed therein have been reassigned to other category codes as indicated:

21341 through 21367-2.1 Category Code 213 46 (Galvanizing Shop) and Category Code 213 47 (Plating Shop) are now included in Category Code 213 49 (Inside Machining Shop).

21341 through 21367-2.2 Category Codes 213 50 (Optical Shop), 213 58 (Boat Shop), 213 59 (Abrasive Blast Facility) and 213-62 (Sail Loft) are not for use at the shipyards since these functions are included in other category codes for shipyards. These category codes are intended for use by other ship maintenance activities which support the repair of ships, such as ship repair facilities located at naval stations, intermediate maintenance activities, and other activities performing intermediate level maintenance rather than depot level maintenance.

21341 through 21367-3 **REQUIREMENTS.** There are currently no criteria available for these category codes. The quantitative requirements for shop facilities in Basic Category 213 should be determined on an individual basis, based on the experience and knowledge of the activity involved and the Naval Sea Systems Command. One method which can be used to develop the requirement for a specific shop is discussed below.

21341 through 21367-3.1 **EQUIPMENT TABLE.** Determine the types and number of pieces of equipment and laydown/workstation areas that the shop requires to perform their work. Develop a table that shows the following information: (a) name of equipment or laydown/workstation area; (b) actual floor area occupied by the equipment or area; and (c) any clearances required to allow access to the equipment/area, provide safety zones, or meet operational requirements. A sample table is shown in Table 21341 through 21367-2.

Tables 21341 through 21367-2. Sample Equipment/Work Area Table

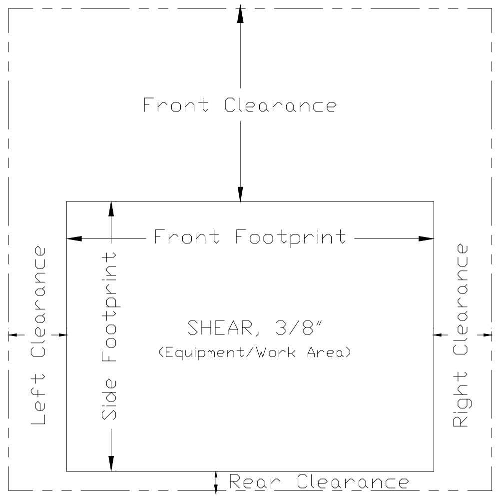
Equipment/ Work Area	Qty	Footprint (LF)		Clearance (LF)				Overall Dimension (LF)		Total Area (SF)
		Front	Side	Right	Left	Front	Rear	Front	Side	
Table, Small	4	5	4	0	0	4	4	5	12	240
Table, Large	1	13	5	4	4	4	4	21	13	273
Grinder	1	3	3	3	3	3(1)	0	9	6	54
Drill Press	1	7	3	3	3	5(1)	5	13	13	169
Shear, 3/8"	1	19	14	3	3	10	1	25	25	625
TIG Welder	2	3	2	0	0	4(2)	1(2)	3	7	42

Equipment/ Work Area	Qty	Footprint (LF)		Clearance (LF)				Overall Dimension (LF)		Total Area (SF)
		Front	Side	Right	Left	Front	Rear	Front	Side	
Storage Rack	9	9	4	0	0	10	3	9	17	1,377

Equipment/Work Area clearances can be shared with other equipment clearances and circulation unless otherwise noted:
(1) Clearances can be shared with clearances for other equipment/work areas, but not circulation.
(2) Clearances can not be shared with other clearances or circulation.

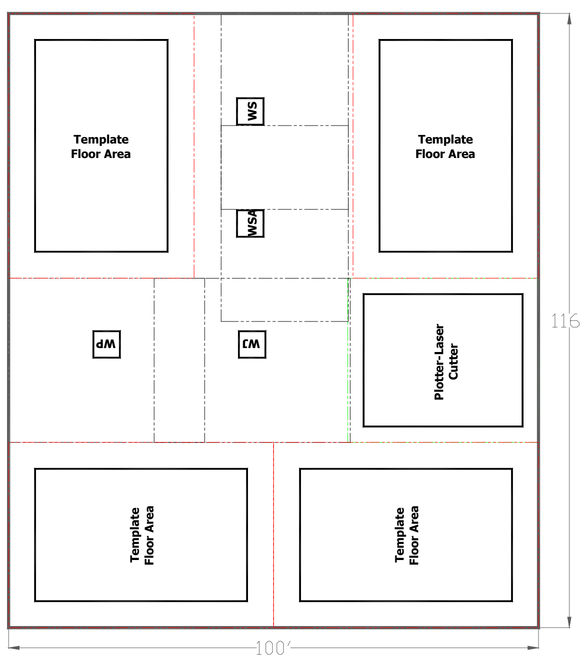
21341 through 21367-3.2 **DRAWINGS.** Once the table is completed, a conceptual drawing of an “ideal” shop containing the required equipment and areas can be completed to develop a net floor area requirement. As the drawing is developed, it is important to account for the following: (a) material and personnel flow in the shop and (b) how clearances can or cannot be shared. A sample drawing of a single piece of equipment/area is shown in Figure 21341 through 21367-1.

Figures 21341 through 21367-1. Drawing of Equipment/Area and Clearances



See Figure 21341 through 21367-2 for a sample drawing of a conceptual shop layout, where the solid lines show the actual equipment/area dimensions, and the dashed lines show the clearance requirements.

Figures 21341 through 21367-2. Sample Shop Layout Drawing



21341 through 21367-3.3 **NET TO GROSS CONVERSION.** The drawing yields a net requirement in square feet for the shop. To convert this into a gross requirement, multiply the net requirement by 1.25.

213 41 CENTRAL TOOL SHOP (SF)
FAC: 2133
BFR Required: Y

21341-1 **CENTRAL TOOL SHOP (SHOP 06).** The central tool shop is responsible for the design, development, manufacture and maintenance of prototype and conventional tooling such as cutting machines, dies, molds, cleanliness plugs, cutters, jigs, fixtures, and special tools. The shop conducts the maintenance program for electrical and mechanical maintenance of numerically controlled and conventional machine tools and plant equipment. This includes installation, preventive maintenance, repair, analytical checkout, rehabilitation, and lubrication. This shop operates all tool rooms throughout the shipyard. Additionally, the shop operates high-pressure air equipment servicing ship systems as well as refilling high-pressure cylinders.

213 42 SHIPFITTING SHOP (SF)
FAC: 2133
BFR Required: Y

21342-1 **SHIPFITTING SHOP (SHOP 11).** The shipfitting shop is responsible for the back-shop modification, fabrication, repair, and assembly of various metal structural parts of the ship's hull, superstructure and interior ship structure by using shipfitting equipment, plate and shape structures, and other metals; and then through computer design, templating, laying-out, cutting, shaping, flanging, straightening, bending, and hot forming of all types and sizes of metal plates and shapes; and then positioning, aligning, fitting-up, and securing parts and subassemblies into ship component assemblies.

213 43 SHEET METAL SHOP (SF)
FAC: 2133
BFR Required: Y

21343-1 **SHEET METAL SHOP (SHOP 17).** The sheet metal shop is responsible for developing, fabricating, and installing ventilation and air conditioning ductwork; fabricating and installing store-room workshop and stowage facilities, non-structural bulkheads and partitions; the manufacture and installation of label plates; and outfitting of galley, berthing, habitability and office space for naval vessels.

213 44 FORGE AND HEAT TREATING SHOP (SF)
FAC: 2133
BFR Required: Y

21344-1 **FORGE AND HEAT TREATING SHOP (SHOP 11).** The forge and heat treating shop is responsible for hot-forging, heat treating, inspecting, cleaning, and repairing various metal structural parts of a ship’s hull, superstructure, interior ship structure, mechanical systems, machinery systems, anchor chain, and ship’s propellers by using forging equipment, material billets, and other metals; and then through hammering, pressing, hot-rolling, heat-treating (annealing, tempering, hardening, quenching), sawing, threading, grinding, inspecting, and surface finishing (tumbling, cleaning, coating) of all types and sizes of metal shapes into a ready ship component.

213 45 WELDING SHOP (SF)
FAC: 2133
BFR Required: Y

21345-1 **WELDING SHOP (SHOP 26).** The welding shop is responsible for all of the welding, flame cutting, carbon arc gauging, and related processes required by the various shops of the Operations and Production Resources Departments of the shipyard and the Public Works Center located at the shipyard. In addition to the major involvements of cutting and welding the various structural, sheet metal, and piping materials, operations include repair of castings, combating of valves, hard-surfacing of materials subjected to abrasive wear, shooting and welding studs and fasteners, metal spraying, casting, bonding, and welding of lead shielding, and stress relieving of shipboard elements.

213 48 QUALITY ASSURANCE OFFICE
FAC: 2133
BFR Required: Y

21348-1 **QUALITY ASSURANCE OFFICE (CODE 130).** The quality assurance office is responsible for inspection and tests to determine compliance with specifications, plans, orders, directives, and sound shop and marine practices; non-destructive testing services; and technical direction, consulting and advisory services on those processes, materials, and systems for fabrication and repair to shops. It is also responsible for providing chemical and metallic laboratory services; test instrument calibration; and technical support for test, analyses, evaluation, and procedures for use of metallic and non-metallic materials.

213 49 INSIDE MACHINING SHOP (SF)
FAC: 2133
BFR Required: Y

21349-1 **INSIDE MACHINING SHOP (SHOP 31).** The inside machining shop is responsible for performing horizontal boring, vertical boring, planing and heavy lathe work in manufacturing, altering, and repairing ship machinery and shipyard manufactured items; performing engine lathe turning, horizontal and vertical turret lathe turning, boring, facing, and other turning work; performing milling, grinding, hobbing, broaching, shaping, slotting, lapping, honing, balancing work, layout work and drilling on castings and fabrications; and performing disassembly, inspection, reverse engineering, repair, reassembly, and testing of main propulsion units, pumps, valves, turbines, air compressors, propellers, and miscellaneous auxiliary machinery. This shop also assembles new manufactured equipment. Additionally, this shop is responsible for all metal finishing processes including electroplating, dalic plating, galvanizing, and metal polishing.

213 50 OPTICAL SHOP (SF)
FAC: 2133
BFR Required: Y

No criteria are currently available for this code. This category code is not for use by shipyards. See the general discussion in paragraph 21341 through 21367-2.2.

213 51 WEAPONS SHOP (SF)
FAC: 2133
BFR Required: Y

21351-1 **WEAPONS SHOP.** The weapons shop is responsible for the repair, overhaul, alignment, installation, checking out, testing and calibration of all weapons systems, integrated systems, such as missile systems and associated components, including gun mounts, turrets, saluting batteries, launching pads, mechanical components of fire control, radar antennas and sonar equipment. This shop is also responsible for the repair, overhaul, calibration, and adjustments and testing of gunsights, range-finders, torpedo directors, telescopic gunsights, periscopes, binoculars, stereo-trainers, and other miscellaneous repair of instruments, etc.

213 52 MARINE MACHINING SHOP (SF)
FAC: 2133
BFR Required: Y

21352-1 **MARINE MACHINING SHOP (SHOP 38).** The marine machining shop is responsible for the installation and testing of all main propulsion machinery, auxiliaries, rudders, shafting, sea valves, deck machinery, laundry and galley equipment, arresting gear, and catapults on ships undergoing repair and conversion. This shop repairs, installs, and performs necessary tests on main and auxiliary diesel engines and their associated equipment as well as hydraulic speed gears on ships. The marine machining shop also refuels, repairs, and tests nuclear reactor plants as well as their associated systems and components. This shop works on any mechanical component that is removed from or installed on a ship or submarine.

213 53 BOILERMAKING SHOP (41) (D) (SF)
FAC: 2133
BFR Required: Y

21353-1 **BOILERMAKING SHOP (SHOP 41).** The boilermaking shop is responsible for the repair, conversion, and building of steam generating equipment used to furnish steam to main and auxiliary machinery. This includes the fabrication, assembly, installation, testing, cleaning, and repair of the steam generators, uptakes, stacks, and blower ducts as well as the fabrication, repair and testing of pressure vessels, incinerators, and spark arrestors.

213 54 ELECTRICAL SHOP (SF)
FAC: 2133
BFR Required: Y

21354-1 **ELECTRICAL SHOP (SHOP 51).** The electrical shop is responsible for accomplishing the installation, repair, maintenance, alteration, troubleshooting, and test of all power, lighting, and interior communication systems and equipment aboard Naval ships and submarines; for manufacture of switchboards, electrical control equipment, and components; for the installation, repair and alteration of nuclear electrical components and systems; and for repair and calibration of all electrical instrumentation.

213 55 PIPEFITTING SHOP (SF)
FAC: 2133
BFR Required: Y

21355-1 **PIPEFITTING (SHOP 56).** The pipefitting shop is responsible for accomplishing the layout, fabrication, installation, dismantling, repair, cleaning, testing, and inspection of piping systems and gaskets on both nuclear and non-nuclear systems in the shop as well as onboard ships and submarines; fabrication, repair, and installation of radar waveguides; installation, repair, and testing of refrigeration systems, air conditioning systems, and oxygen-nitrogen systems; and cleaning, testing and inspection of pressure vessels.

21355-2 **PIPE AND COMPONENT INSULATING (SHOP 57).** This group insulates steam, hot water and chilled water piping systems, ductwork and bulkheads aboard ship and performs some insulation and maintenance and repair on shipyard equipment such as furnaces.

213 56 WOODWORKING SHOP (SF)
FAC: 2133
BFR Required: Y

21356-1 **WOODWORKING SHOP (SHOP 64).** The woodworking shop is responsible for accomplishing operations performed by boat builders, woodcraftsmen, and shipwrights to construct and repair wooden and plastic boats, wooden portable buildings and shelters, hollow booms, wooden tank, practice torpedoes, and flight deck panels; repairing and manufacturing furniture and cabinets; laminating all sizes of wooden members; manufacture and repair accommodation ladders; perform dry kiln operations; and install and repair all types of acoustic and thermal insulations. Working from plans and specifications, they arrange docking blocks to provide for the dry docking of all classes of naval vessels and direct the positioning of the vessel for proper landing on the blocks. Additionally, the woodworking shop repairs and installs wooden decks, erects pipe stagings and lifelines; fabricates and installs boat stowages, builds shipping cradles, shores and blocks cargo aboard ships, manufactures and repairs wooden gangways and platforms, and fabricates and constructs refrigerated spaces aboard ships. This shop also manufactures plastic items such as pipe, radomes, fairwaters, tanks, antenna cones, and submarine fairing plates. They make resin foam pours in voids and perform grouting operations. The woodworking shop also installs and repairs plastic laminates and hull dampening materials on naval vessels and installs polyethylene shielding around nuclear reactors. They provide reference lines used in construction, repair, and alteration of all types of ships as well as taking measurements of ships' characteristics. This shop applies plastisol coatings; installs linoleum, rubber, asphalt, and ceramic tile. The sail loft section fabricates, repairs and installs containments for nuclear and non-nuclear use, tents, weather covers, shrink wrap enclosures, upholstery, gun and other assorted covers.

213 57 ELECTRONICS SHOP (SF)
FAC: 2133
BFR Required: Y

21357-1 **ELECTRONICS SHOP (SHOPS 52, 66 AND 67).** The electronics shop is responsible for accomplishing installation, repair, overhaul, modification check-out, adjustment, test, and calibration of radar, sonar, communications, cryptographic data processing, antennas, navigation, and electronic countermeasure equipment and systems on and for surface ships, submarines, and shore stations. The electronics shop is also responsible for repair, calibration, and certification of electronic and nuclear instruments for the shipyard, ships, and shore activities, and installation, repair, and testing of gyro compasses.

213 58 BOAT SHOP (SF)
FAC: 2133
BFR Required: Y

No criteria are currently available for this Category Code. This Category Code is not for use by shipyards. See the general discussion in paragraph 21341 through 21367-2.2.

213 59 ABRASIVE BLAST FACILITY (SF)
FAC: 2133
BFR Required: Y

No criteria are currently available for this code. This Category Code is not for use by shipyards. See the general discussion in paragraph 21341 through 21367-2.2.

213 60 PAINT AND BLASTING SHOP (SF)
FAC: 2133
BFR Required: Y

21360-1 **PAINT AND BLASTING SHOP (SHOP 71).** The paint and blasting shop is responsible for surface preparation, including abrasive blasting, for the application or installation of protective, decorative, and functional paints, coatings, films, and for installation of deck, floor, and wall coverings. This includes design, layout, lettering, sign and poster making; silk screen processing; artificial and natural wood finishing; all types of painting and preservation on board ship; operation of pickling and chemical cleaning plant for preservation of material; abrasive blasting services; and the laying or installation of terrazzo, magnesite, and concrete.

213 61 RIGGING SHOP (SF)
FAC: 2133
BFR Required: Y

21361-1 **RIGGING SHOP (SHOP 72/CODE 700).** The rigging shop is responsible for operations performed by riggers, sailmakers, tank and component cleaners, laborers, upholsterers, fabric workers, and diving operations required for repair, overhaul, conversion, and construction of Naval vessels and equipment.

213 62 SAIL LOFT (SF)
FAC: 2133
BFR Required: Y

No criteria are currently available for this code. This category code is not for use by shipyards. See the general discussion in paragraph 21341 through 21367-2.2.

213 63 FOUNDRY (SF)
FAC: 2133
BFR Required: Y

21363-1 **FOUNDRY.** The foundry is responsible for manufacturing cores for iron, steel, and non-ferrous casting in the Core Unit; preparing and mixing sand, processing and making molds, steel castings, pouring steel from furnaces, melting, and manufacturing steel, and shaking out steel castings from molds after pouring in the steel foundry unit; pouring and melting non-ferrous metals and alloys, processing and making molds for brass castings, and shaking out non-ferrous castings in the non-ferrous unit; processing and making molds for iron castings, pouring iron, melting iron-alloys and shaking out iron castings from molds in the iron unit; clearing castings, shipping finished castings.

213 64 PATTERNMAKING SHOP (SF)
FAC: 2133
BFR Required: Y

21364-1 **PATTERNMAKING SHOP.** The patternmaking shop is responsible for the manufacture, repair, and alteration of wood patterns required to produce castings; manufacture of metal parts for wood and plastic patterns and metal patterns; manufacture of mock-ups for patterns; manufacture of sheet plastic by forming, fabricating, cementing, and dyeing; manufacture of plastic patterns; and receiving, storing and issuing pattern mock-ups and models.

213 65 SHIP PROPULSION MAINTENANCE FACILITY (SF)
FAC: 2136
BFR Required: Y

21365-1 **DESCRIPTION.** The Ship Propulsion Maintenance Facility is responsible for the repair of reactor plant components of ship propulsion systems.

213 66 TEMPORARY SERVICES SHOP (SF)
FAC: 2133
BFR Required: Y

21366-1 **TEMPORARY SERVICES SHOP (SHOP 99).** The temporary services shop is responsible for electrical, piping, and ventilation systems as related to temporary services. Temporary services include compressed air, water, steam, oxygen, electrical power and lighting, ventilation, telephones, inerting, air analysis, shipside sewage connections, communications systems, distilled water for ships' boilers, CO2 fire extinguishers, static dehumidification, electric, steam, and induction heat; besides responsibility for radioactive waste collection systems, delivery and distribution of pure water systems, distribution of temporary electric power, breathing air systems for reactor plants, chilled water and air conditioning systems, filtering for reactor plants, ventilation systems, communications systems involved in nuclear refueling operations, and deoxygenating pure water nitrogen systems. This shop also manufactures and repairs rubber products.

213 67 PUMPHOUSE, DRY DOCKS (SF)
FAC: 2134
BFR Required: Y

21367-1 **DESCRIPTION.** The dry dock pumphouse is used to house dry dock dewatering pumps and associated equipment.

213 68 DIVE SHOP (SF)
FAC: 2134
BFR Required: Y

21368-1 **CRITERIA.** No criteria are currently available for this code.

213 70 SHIP SERVICES SUPPORT BUILDING (SF)
FAC: 2134
BFR Required: Y

21370-1 **DESCRIPTION.** A ship services support building is used to provide office and shop space in direct support of maintenance and repair work for surface ships and submarines. The office area supports those individuals involved in executing work onboard ships, and includes people such as project superintendents, work supervisors, design engineers and test personnel. Additionally, quality assurance inspectors responsible for ship work inspection operate from these facilities. Another function in this type of facility is an area for kitting of material and work packaging. The purpose of the shop area is to perform rapid minor work required to support the maintenance and repair operations, i.e., rather than sending a small item requiring a minor modification back to the shop, the modification would be made at the dry dock or pier site.

21370-2 **REQUIREMENTS.** With the exception of shop space, all requirements are based upon the corresponding category codes providing those particular types of functions. For example, the administrative space for the office area is based on the criteria provided for in Category Code 610 10, Administrative Office. Required storage should be categorized under Category Code 213 77, Maintenance-Ship/Spares Storage (Ready Issue/Shop Stores/Miscellaneous). The quantitative requirements for shop facilities should be determined on an individual basis, based on the experience and knowledge of the activity involved and the Naval Sea Systems Command. See paragraph 21341 through 21367-3 for additional guidance on developing shop space requirements.

213 73 LANDING CRAFT WASH RACK (EA)
FAC: 2135
BFR Required: Y

21373-1 **DESCRIPTION.** The primary function of this facility is to wash down Landing Craft Air Cushions (LCAC) vehicles after every mission in order to remove sand and salt spray. However, this type of washdown pit may be used for other types of amphibious landing craft requiring similar purging. Wash water treatment is incorporated into the design of the facility.

21373-2 **REQUIREMENT.**

21373-2.1 **JEFF Type Craft.** A wash rack for JEFF type craft is 75 ft wide by 150 ft long. This criteria can be modified to suit other amphibious landing crafts as well.

21373-2.2 **All Other Amphibious Landing Craft.** For all other types of amphibious landing craft requiring similar cleaning, select the largest craft that the facility will service and add 27 feet to its width and 30 feet to its overall length (with all ramps, doors, etc., extended) to determine the size of the washdown pit.

213 75 AMPHIBIAN VEHICLE MAINTENANCE SHOP (SF)
FAC: 2134
BFR Required: Y

21375-1 **DESCRIPTION.** The amphibian vehicle maintenance shop provides special work areas for performing all organizational maintenance functions on the amphibian vehicles of the Marine Corps Amphibious Tractor Battalion and in the case of the Navy, all organizational and intermediate level maintenance on Landing Craft Air Cushion (LCAC) vehicles. In the case of the latter, the depot level maintenance is performed at a Naval Air Rework Facility or contractor plant.

21375-2 **REQUIREMENT FOR MARINE CORPS.** The maintenance shop for the amphibian vehicles of the Marine Corps Amphibious Tractor Battalion includes administrative and training areas as well as storage space for OEM equipment, tools and mount out. The total shop area will vary depending upon the number of companies assigned to the Amphibious Tractor Battalion. A typical Marine Corp facility that would accommodate one battalion, i.e., four companies, would have a space requirement of 42,600 gross square feet of which 700 gross square feet would be dedicated to the mechanical equipment room. The size of the facility would be adjusted accordingly as the number of companies in the battalion increase or decrease.

21375-3 **REQUIREMENT FOR LCAC (NAVY).** Criteria for a typical LCAC maintenance facility with 54 assigned craft is as follows:

21375-3.1 **Maintenance Bay.** Provide maintenance bay space for 15% of assigned craft. Note: LCAC craft is 48 ft. x 90 ft. with 15 ft. ramps on each end. Accordingly, bay space is increased to 75 ft. x 150 ft. or 11,250 net square ft. to allow sufficient work area around each craft. Net to gross conversion is 1 to1.15, or:

11,250 NSF x 1.15 = 12,937.5 GSF
12,937.5 GSF/craft x 8 craft = 103,500 GSF

21375-3.2 **Maintenance Shops.** Maintenance shops capable of providing organizational and intermediate level support are as follows:

Propeller shop	3,642 SF
Engine shop	1,101 SF
Hydraulic shop	522 SF
Skirt repair shop	2,216 SF

Welding shop	720 SF
Sheet metal shop	1,260 SF
Gluing shop	726 SF
Electrical shop	1,050 SF
Electronics shop	1,041 SF
Battery shop	396 SF
Tool room	1,185 SF
Locker room	5,375 SF
Maintenance control	900 SF
	20,134 SF

Net to Gross Conversion: 1:1.25 or 20,134 x 1.25 = 25,168 GSF

21375-3.3 **Control Tower/Operations Room.** A Control Tower/Operations Room is an additional requirement for a LCAC Operational Base and can be an integral part of the maintenance facility by providing an additional 190 GSF. This facility should have an unobstructed view of the parking apron, taxiway, ramp and waterfront in order to allow coordination of operations to preclude accidents. Communications equipment and traffic controllers are housed in this facility.

21375-3.4 **Squadron Operations/Training Space.** Squadron Operations/Training Space requirements are met by providing space for classrooms briefing room and a structural maintenance laboratory. The following areas are provided to meet the requirements for a LCAC Operational Base having 54 assigned craft.

21375-3.4.1 **Training/Maintenance Space.** Compute the requirement for training/maintenance space within the Squadron Operations/Training Space as follows:

- Classroom Requirements: Using criteria for category code 171 10 for one 20 person operational class and one 20 person maintenance class, 2 x 20 PN x 22 SF/PN = 880 NSF

- Briefing Room: A large classroom is required for general briefing and combined classes. Maximum loading is 40 persons. Accordingly, 40 PN x 21 SF/PN = 840 NSF

- Structural Maintenance Laboratory: Three mock-up equipment modules for skirt, prop, turbine, gear box and electronic bench yield 219 NSF x 3 = 657 NSF

- Therefore, the total net requirement (classroom + briefing room + structural maintenance laboratory) equals 880 NSF + 840 NSF + 657 NSF, which equals 2,377. To convert the net requirement to a gross requirement, use a conversion factor of 1.33; i.e., 2,377 NSF x 1.33 = 3,160 GSF.

21375-3.4.2 **Administrative Space.** The administrative space for 27 officers and 69 enlisted personnel = 96 personnel x 150 GSF/PN = 14,400 GSF.

21375-3.4.3 **Composite Space Requirement.** The composite space requirement equals the combined sum of the training/maintenance and administrative spaces or: 3,140 GSF (training/maintenance) + 14,400 GSF (administrative) = 17, 560 GSF (total).

21375-3.5 **Total Requirement for a LCAC Maintenance Facility.** Accordingly, the total requirement for a LCAC maintenance facility supporting 54 craft is:

Maintenance Bay Space	103,500 GSF
Maintenance Shops	25,168 GSF
Control Tower/Operations Room	190 GSF
Squadron Operations/Training Space	17,560 GSF
Total	146,418 GSF

213 77 MAINTENANCE - SHIPS/SPARES STORAGE (READY ISSUE/SHOP STORES/MISC.) (SF)
FAC: 4421
BFR Required: Y

21377-1 **DESCRIPTION.** Storage facilities for miscellaneous equipment or goods related to ship maintenance facility support will be provided only where it can be individually justified.

21377-2 **REQUIREMENT.** There are no criteria for this type of facility. General information on normal stacking heights, square feet per measurement ton requirements, and other parameters are provided in the Category Code 440 series.

214 MAINTENANCE - TANK, AUTOMOTIVE

214 Facilities for maintenance and repair of combat and noncombat motorized vehicles. For weapons, see Category Code series 215; for tracked amphibious vehicles see Category Code series 213; for construction equipment see Category Code series 218.

214 10 COMBAT VEHICLE MAINTENANCE SHOP (SF)
FAC: 2141
BFR Required: Y

21410-1 This facility provides specialized work areas, equipment, and storage for overhaul of combat vehicles such as self-propelled gun carriages and tanks. For Marine Corps Organizational Maintenance Shop, see Category Code 214 51; for Field Maintenance Shop, see Category Code 214 53.

214 20 AUTOMOTIVE VEHICLE MAINTENANCE SHOP (SF)
FAC: 2141
BFR Required: Y

21420-1 **PURPOSE AND FUNCTION**. Automotive vehicle maintenance facilities are required to provide covered work areas for inspection, maintenance, and repair of all transportation equipment assigned to an installation, and as applicable, its supported activities. For reasons of overall efficiency and economy, the maintenance and operations function for automotive, construction, materials handling, and railroad equipment are combined. In areas where combined facilities are not feasible, special facilities for construction equipment maintenance and railroad equipment maintenance will be provided. See Category Codes 218 20 and 218 40 for planning data for separate shop facilities.

21420-2 **REQUIREMENTS**. The number and types of the equipment maintained by the activity will govern the size of the facility required, that is, the size is directly proportional to the number of general repair bays required to perform the assigned maintenance task. General repair space requirements are computed from the productive space factors contained in Tables 21420-1, 21420-2 and 21420-3. A 2-bay facility will be considered as the minimum requirement. After the repair bay requirements have been computed, the area required for administrative and indirect as well as direct support functions can be determined from Table 21420-4.

21420-3 **SPACE REQUIREMENTS**. Space requirements for an automotive vehicle maintenance shop are computed as follows:

> 21420-3.1 **Step 1.** Prepare an inventory listing by equipment costs codes for all of the equipment supported (see Column 1 of Tables 21420-1, 21420-2, and 21420-3). If a combined automotive/construction equipment/weight-handling maintenance shop is planned, consider all equipment codes; if a separate construction/weight-handling equipment shop is planned under Category Code 218 20, omit equipment cost codes 2300 to 2840, 3100 to 3720, 4210 to 4952, and 8120 to 8800 (to be used for determining Category Code 218 20 requirements).

21420-3.2 **Step 2.** Multiply the total equipment inventory as listed in Step 1 for each equipment code group by its corresponding space factor, (shown in Column 3 of the tables) to determine the repair bay requirements for that specific code group.

21420-3.3 **Step 3**. Total the individual code computations to determine the number of repair bays required for all of the equipment supported. For example:

Equipment Code	Number of Pieces	Productive Space Factor	Repair Bay Requirements
0061-0099	1	0.063	0.063
0102-0299	11	0.015	0.165
0300-0700	60	0.023	1.380
0800	25	0.016	0.400
1000	26	0.020	0.520
2000	2	0.016	0.032
3000	1	0.025	0.025
4000	26	0.020	0.520
5000	47	0.016	0.752
7000	6	0.030	0.180
8000	3	0.092	0.276
Total repair bay requirements			4.313 (or 4 bays)

21420-4 Column (1) is done in even numbers. If the calculation of the number of repair bays is less than the odd number 5 as shown in the example, round down to the next even number 4. If the calculation is more than the odd number of bays (i.e., 5.313), round up to the next even number of bays (i.e., 6).

21420-5 To determine the total square-footage of area required for general repair bays multiply the number of bays determined in Step 3 by 480 (the square footage of a single 16 by 30 foot general repair bay). The number of square feet of administrative and indirect support area requirements is directly proportional to the number of repair bays, as shown in Column 3 of Table 21420-4.

21420-5.1 The administrative and indirect support area includes the following facilities:

1. Administrative office for maintenance and operations personnel.
2. Drivers and operators training, licensing, and ready room.
3. Locker, lunch, and conference room.
4. Toilet facilities.
5. Parts supply, issue, and storage room.
6. Tool room.

21420-6 In addition to repair bay and administrative area requirements, consideration must also be given to such direct support facilities as tire shop, body shop, battery shop, engine and accessories overhaul shop, paint shop, dynamometer test bay, steam cleaning and wash bay, and lube storage. Engine overhaul and paint and body shops should be provided.

21420-7 The direct support facility requirements shown in column 4 of Table 21420-4 provide for complete shop facilities. The total gross space allowance in column 5 is the maximum allowed for the indicated number of repair bays.

General Work Bay Space Factors
Table 21420-1. Automotive Equipment Codes 0061 through 0905

Equipment Cost Code (Column 1)	Abbreviated Description (Column 2)	Productive Space Factor (Column 3)
0061 to 0099	Buses	0.063
0102 to 0299	Sedans, station wagons, and ambulances	0.015
0300 to 0745	Trucks	0.023
0800 to 0897	Trailers	0.016
0900 to 0905	Motorcycles, scooters, etc.	0.004

Table 21420-2. Materials Handling Equipment Codes 1100 through 1900

Equipment Cost Code (Column 1)	Abbreviated Description (Column 2)	Productive Space Factor (Column 3)
1100 to 1900	Tractors (warehouse) Trucks (fork-lift, crane platform and side loaders)	0.020

Table 21420-3. Construction and Allied Equipment Codes 2300 Through 8800

Equipment Cost Code (Column 1)	Abbreviated Description (Column 2)	Productive Space Factor (Column 3)
2300 to 2840	Crushing, mixing, batching and paving equipment (mixers, pavers, distributors, spreaders, heaters)	0.016
3100 to 3720	Drilling, blasting, and driving equipment (compressors and drills)	0.025
4210 to 4952	Excavating and grading equipment (crawler cranes, graders, loaders, rollers, scrapers, tractors, etc.)	0.020
5110 to 5930	Miscellaneous construction and maintenance equipment (generators, pumps, cleaners, sweepers, mowers, snowplows, garbage trucks, mobile shops)	0.016
7100 to 7501	Firefighting equipment (trucks, pumps, etc.	0.030
8120 to 8800	Weight handling equipment (truck mounted, cruiser, and boat cranes)	0.092

21420-8 **SITE LOCATION**. In choosing a site for new transportation equipment maintenance facility a number of conditions should be given careful consideration. The facility should be located adjacent to or within the major industrial area which it serves. Caution should be exercised to ensure that the site selected has adequate land area to accommodate all support facilities, equipment holding and parking area, and sufficient room for employee parking. Criteria for employee parking can be found in Category Code 852 10. Site location may be influenced to some degree when railroad equipment is involved because of the track location and approach.

21420-9 **MAINTENANCE FACILITY**. When available sites for the automotive vehicle maintenance facility prove to be either inadequate or inappropriate for the inclusion of construction and/or railroad equipment maintenance, separate shop structures for the service and maintenance of these types of equipment will be provided. See Code 218 40 for planning criteria for a special railroad equipment maintenance shop.

Table 21420-4. Space Requirements for Automotive Vehicle Maintenance Facility

Repair Bays		Administrative and Indirect Support Area (Sq. ft.) (Column 3)	Direct Support Area (Sq. ft.) (Column 4)	Total Gross Space Allowance (Sq. ft.) (Column 5)
(No.) (Column 1)	(Sq. ft.) (Column 2)			
2	960	600	1,440	3,000
4	1,920	1,500	2,720	6,140
6	2,880	1,950	3,480	8,310
8	3,840	2,400	4,230	10,470
10	4,800	3,100	4,270	12,170
12	5,760	3,800	5,210	14,770
14	6,720	4,200	6,000	16,920
16	7,680	4,700	6,070	18,450
18	8,640	5,100	6,080	19,820
20	9,600	5,500	6,170	21,270
22	10,560	5,900	6,210	22,670
24	11,520	6,300	6,250	24,070
26	12,480	6,850	6,290	25,620
28	13,440	7,400	6,330	27,170
30	14,400	7,750	6,370	28,520
32	15,360	8,100	6,480	29,940
34	16,320	8,400	6,520	31,240
36	17,280	8,700	6,560	32,540
37	18,240	9,000	6,580	33,820
40	19,200	9,300	6,600	35,100
42	20,160	9,600	6,640	36,400
44	21,120	9,900	6,680	37,700
46	22,080	10,200	6,720	39,000
48	23,040	10,500	6,780	40,320

214 30 REFUELING VEHICLE SHOP (SF)
FAC: 2141
BFR Required: Y

21430-1 **AIRCRAFT REFUELER TRUCKS.** Aircraft refueler trucks and other portable fuel dispensing equipment are not serviced or repaired in the automotive vehicle maintenance shop because of the explosive hazard involved. Accordingly, a separate explosion proof and fire-resistant maintenance/repair facility is provided. The facility is located a minimum of 100 feet from other structures. See Table 21430-1 for the refueling vehicle shop space allowances.

Table 21430-1. Space Allowances - Refueling Vehicle Shop

No. of Refuelers Supported	No. of Repair Stalls	Gross Area (Sq ft)
Up to 8	1	1,080
9 to 16*	2	1,800

* One additional 720-square-foot (16 x 45 ft) stall may be planned for each increment of eight refuelers above sixteen.

One 16 x 45 foot pad for purging fuel tanks should be provided for each facility.

214 40 VEHICLE HOLDING SHED (AWAITING PARTS AND REPAIR) (SF)
FAC: 2185
BFR Required: Y

21440-1 **DEADLINED EQUIPMENT**. This facility is a part of the automotive vehicle maintenance shop with the main purpose of providing a covered area for holding deadline equipment awaiting repairs. Whenever possible, it should be located near the main repair shops. Space requirements are computed as follows:

21440-1.1 **Self-propelled Equipment**. Provide one bay or stall for every 30 pieces of self-propelled equipment supported up to 1,000 units and one additional bay for every 50 units supported over 1,000. Bays will be 12 feet by 35 feet or 420 square feet in area.

214 51 AUTOMOTIVE ORGANIZATIONAL SHOP (SF)
FAC: 2141
BFR Required: Y

21451-1 This facility provides work areas for Fleet Marine Force (FMF) units to perform maintenance on items of organizational equipment. The shop space includes administrative and dispatching areas as well as storage for OEM equipment, tools, and parts.

21451-2 This category code includes requirements previously given in Category Code 214 52, Combat Organizational Shop (now deleted).

21451-3 Conduct an engineering study to determine requirements.

214 53 FIELD MAINTENANCE SHOP (COMBAT / AUTOMOTIVE / TRACK) (SF)
FAC: 2141
BFR Required: Y

21453-1 This facility provides specialized work areas for performing 3rd and 4th echelon maintenance functions on items of tactical equipment involving primarily rolling stock items of motor transport and engineer equipment. These are limited to use by the Service Battalion of the Marine Division and appropriate elements of the Force Service Regiment. The shop space includes administrative and training areas as well as storage space for tools, parts, and maintenance float equipment.

21453-2 For other field maintenance functions see Category Codes 215 60, 217 30, and 218 80.

21453-3 Conduct an engineering study to determine requirements.

214 55 VEHICLE WASH PLATFORM (SF)
FAC: 2145
BFR Required: N

21455-1 **REQUIREMENTS.** Vehicle wash platforms equipped with hose connections should be provided on the basis of one vehicle washing space for each 50 vehicles assigned to the motor pool. Where the motor pool supports multiple commands (Expeditionary Support Units) vehicle wash platforms should be sized based on the number of self-powered Civil Engineering Support Equipment (CESE) assigned to the ESU and the largest single command's CESE in the supportive Command. Where CESE and Service Craft and Boat Accounting Report (SABAR; vehicles/boats) are both present in the command, it is to be assumed that the CESE count alone will support the wash platform requirements. Where a single motor pool supports a single command of 150 plus pieces of self-powered CESE, the wash platform will be sized on the average number of self-powered pieces of CESE withdrawn in support either training or deployment. Vehicle wash platforms are also used to clean the SABAR assigned to the command but the SABAR does not count against total component count. A sediment basin for grit and soil will be provided and will drain into an oil water separator. Gross calculated area includes the sediment basin. . Vehicle wash platform/sediment basin(s) should be covered to reduce the amount of rain water to be treated by the oil water separator (see below for property record card use). Although a BFR is not required for the CCN, a BFR is provided for planning purposes. Final platform/ sediment basin details will be developed at design/construction phases.

21455-2 **PROPERTY RECORD CARD (PRC) USE.** See below guidance on appropriate property record card use. Use CCN 14313 “Operational Vehicle and Equipment Canopy” to capture any canopies associated with wash racks:

- Capture all vehicle wash racks at single location on a single property record card. Record the quantity of wash racks using the primary UM (EA) and the total square footage amount (cumulative for all racks) under the area UM (SF).
- Capture any overhead canopies under CCN 14313 (see above) on separate property record cards from the wash platform. If the canopy is contiguous, one PRC will suffice and both its quantity (1; EA) and area (SF) should be captured. If the actual canopy dimensions or design drawings are unavailable to determine the area, an estimate can be made by measuring the structural system layout and adding an estimate of the canopy overhang on each side. Where multiple canopies are observed, each will have its own facility number and PRC.
- In the “Notes” section of all associated PRCs, delineate the site location for references purposes.

214 56 GREASE RACK (EA)
FAC: 2145
BFR Required: N

21456-1 One grease rack (two vehicles) will be provided for each 125 vehicles.

215 MAINTENANCE - WEAPONS, SPARES

215-1 This group includes facilities for maintenance of small arms, automatic weapons, mortars, artillery guns, launchers, flamethrowers, torpedo tubes, harbor protective nets, and non-electronic equipment. See UFC 4-229-01N for design criteria. For missile maintenance facilities, see Category Group 212.

215 10 SMALL ARMS SHOP (SF)
FAC: 2152
BFR Required: Y

21510-1 A small arms shop is used to support small arms maintenance and repair for various Marine Corps activities or units. This shop is required to perform the pre-fire inspection (LTI) of all small arms weapons issued and recovered and to repair those weapons which are damaged or malfunctioned. The weapons are broken down, visually inspected, inspected by use of various gages, magnifying glasses, etc., repaired, lubricated, etc., and reassembled.

21510-2 The criteria indicated for category code 143-45, Armory, should provide adequate space allocation for any type of small arms shop provided: (a) the armory services only the activity at which it is located and (b) the small arms weapons are limited to those personnel physically stationed at that activity.

21510-3 This shop is a small arms maintenance and repair facility, and the weapons serviced here are not limited to those handled by the personnel assigned to the activity at which it is located. Accordingly, the size of the shop is based upon the number of weapons repaired per month and not like the armory, whose size is determined by the number of personnel stationed at the activity.

21510-3.1 A small arms shop shall meet the following requirements:

a. Positive weapon security in a humidity controlled, secure environment.
b. A rapid, individual weapon issue/recovery system.
c. A quick, twice daily inventory capability of all weapons.
d. Weapon repair bench (each).
e. A weapon maintenance area for individual weapon maintenance by the person to whom the weapon is assigned.
f. Space for a technical library.
g. Space for the storage of sensitive or highly pilferable emergency supplies for assigned reaction forces.
h. Parts storage.
i. Weapons cleaning and coating area.
j. Secured flammable storage area.

21510-4 The size of the shop is governed by the average number of weapons serviced during an average month. See Table 21510-1 for gross square foot allowance to determine the area requirement.

Table 21510-1. Small Arms Shop

Number of Weapons Serviced per Month	Gross Square Feet per Weapon
Up to 1,000	1.25
1,000 to 2,000	1.10
2,000 to 5,000	1.00
5,000 to 10,000	0.074
For each weapon over 10,000	Add 0.20

Example: The number of gross square feet required for a small arms shop servicing 10,350 weapons per month is: 10,350 x 0.20 + 2,070 gross square feet.

215 20 LIGHT GUN (20 MM TO 5 IN) SHOP (SF)
FAC: 2152
BFR Required: Y

215 30 HEAVY GUN (6 IN TO 16 IN) SHOP (SF)
FAC: 2152
BFR Required: Y

215 40 HARBOR PROTECTIVE NET SHOP (SF)
FAC: 2134
BFR Required: N

215 50 LAUNCHER AND PROJECTOR MAINTENANCE SHOP (SF)
FAC: 2152
BFR Required: Y

21520/30/40/50-1 At present there are no criteria for Category Codes 215 20 through 215 50. However, an engineering space analysis based on maintenance throughput, ordnance equipment size, maintenance staffing, and support space should determine the space requirements.

215 60 FIELD MAINTENANCE SHOP (ORDNANCE) (SF)
FAC: 2151
BFR Required: Y

21560-1 This field maintenance shop provides specialized work areas for performing 3rd and 4th echelon maintenance on all items of ordnance equipment authorized repaired by the Force Service Support Group (FSSG). The shop space includes administrative and training areas as well as storage space for tools, parts, and maintenance float equipment. Perform an engineering space analysis based on maintenance throughput, ordnance equipment size, maintenance staffing and support space should determine the space requirements.

21560-2 For other field maintenance functions, see Category Codes 214 53, 217 30, and 218 80.

216 MAINTENANCE AMMUNITION, EXPLOSIVES & TOXICS

216-1 **DEFINITION.** This group includes facilities for maintenance of ammunition, rockets, bombs, mines, grenades, torpedoes, depth charges, demolition materials, pyrotechnics, missile fuels, and related chemicals. OPNAV Instruction 8000.16 series provides maintenance policies, procedures, and responsibilities for the conduct of the Naval Ordnance Maintenance Management Program. Siting criteria and guidance on standard operating procedures for these facilities can be found in NAVSEA OP-5 Vol. 1. Consult the design criteria, UFC 4-216-02, when developing space requirements.

216 05 CHANGE/RELIEF HOUSE (SF)
FAC: 2162
BFR Required: N

21605-1 **DEFINITION.** This is a building, typically associated with explosives operating building(s), containing facilities for employees to change to and from work clothes. This facility may provide sanitary services, drinking fountains, lockers, and lunchrooms and may house the explosive plant office. See NAVSEA OP-5 for siting considerations.

21605-2 **CRITERIA.** There is no planning criterion for this function. Given the above listed functions and the number of personnel expected to use the facility, an engineering space analysis should produce an adequate requirement.

216 10 AMMUNITION REWORK AND OVERHAUL SHOP (SF)
FAC: 2162
BFR Required: Y

21610-1 **DEFINITION.** Overhauling ammunition includes determining the serviceability of the primary components of an item, and performing exterior maintenance as required to render the item fully serviceable.

21610-2 **CRITERIA.** There is no planning criterion for this function. An engineering space analysis based on the type of ammunition, maintenance throughput, ordnance equipment size, maintenance staffing, storage and support space should determine the space requirements.

216 20 ROCKET REWORK AND OVERHAUL SHOP (SF)
FAC: 2162
BFR Required: Y

21620-1 **DEFINITION.** Overhauling rockets includes determining the serviceability of the primary components of an item, and performing exterior maintenance as required to render the item fully serviceable.

21620-2 **CRITERIA.** There is no planning criterion for this function. An engineering space analysis based on maintenance throughput, ordnance equipment size, maintenance staffing, storage and support space should determine the space requirements.

216 30 MINES AND DEPTH CHARGE REWORK AND OVERHAUL SHOP (SF)
FAC: 2162
BFR Required: Y

21630-1 **DEFINITION.** Overhauling mines and depth charges includes determining the serviceability of the primary components of an item, and performing exterior maintenance as required to render the item fully serviceable.

21630-2 **CRITERIA.** There is no planning criterion for this function. An engineering space analysis based on maintenance throughput, ordnance equipment size, maintenance staffing, storage and support space should determine the space requirements.

216 40 TORPEDO SHOP (SF)
FAC: 2162
BFR Required: Y

21640-1 **DEFINITION.** Torpedo shop functions include but are not limited to: preventive and corrective maintenance as wells as hardware and operational software upgrades on torpedo Warshot and Exercise configurations. The Exercise configuration is recovered after firing and is processed for reuse. Torpedo processing includes complete disassembly, repair and reassembly into the desired configuration. The torpedo shops require special industrial processes to handle the OTTO fuel II used in torpedo propulsion systems. Typically, suites of electronic and mechanical test equipment are required to support different torpedo functions and components.

Maintenance processes are documented in Technical Manuals series SW13-EO-PRO-10 thru 060, which are maintained by Naval Undersea Warfare Center Newport.

21640-2 **CRITERIA.** There is no planning criterion for this function. An engineering space analysis based on maintenance throughput, equipment size, maintenance staffing, storage and support space should determine the space requirements.

216 50 SPECIAL WEAPONS SHOP (SF)
FAC: 2153
BFR Required: Y

21650-1 **DEFINITION.** Special weapons shop functions include, but are not limited to, determining the serviceability of the primary components of an item, and performing exterior maintenance as required to render the item fully serviceable.

21650-2 **CRITERIA.** There is no planning criterion for this function. An engineering space analysis based on maintenance throughput, ordnance equipment size, maintenance staffing, storage and support space should determine the space requirements.

216 55 AIR/UNDERWATER WEAPONS SHOP (AIRBORNE TORPEDOES/ AIRDROP WEAPONS) (SF)
FAC: 2161
BFR Required: Y

21655-1 **AIR/UNDERWATER WEAPONS (AUW) SHOP.** An Air/Underwater Weapons (AUW) Shop is required at Navy and Marine Corps air stations as designated by the Chief of Naval Operations. The AUW shop contains space and equipment for the storage, test, check, assembly, and limited maintenance of airborne torpedoes and other airdrop weapons.

21655-2 **CRITERIA.** When an AUW Shop is authorized, the standard shop has the following requirements:

Shop Building	7,192 gross square feet
Vehicle Shelter	1,612 gross square feet

Floor plan templates are shown in UFC 4-126-02.

216 60 QUALITY EVALUATION LABORATORY (SF)
FAC: 2162
BFR Required: Y

21660-1 **QUALITY EVALUATION LABORATORY.** A Quality Evaluation Laboratory (QEL) supports the QE program by performing analysis and tests to determine and maintain quality assurance of ammunition, explosives and toxins.

21660-2 **CRITERIA.** There is no planning criterion for this function. An engineering space analysis based on throughput, equipment size, lab space requirements, staffing and support space should determine the space requirements.

216 77 AMMUNITION/EXPLOSIVES MAINTENANCE STORAGE (SF)
FAC: 2162
BFR Required: Y

21677-1 **AMMUNITION/EXPLOSIVES MAINTENANCE STORAGE.** Storage facilities for miscellaneous equipment related to ammunition/explosives maintenance facilities will be provided only where it can be individually justified.

21677-2 **CRITERIA.** There are no criteria for this type of facility. General information on normal stacking heights, net to gross multipliers, and other parameters are provided in Category Code 440 series.

217 MAINTENANCE - ELECTRONICS AND COMMUNICATION EQUIPMENT

217-1 This basic category includes facilities and shops for maintenance and repair of radio and radar equipment, antennas, radiation aids, sonar equipment, transmission and reception equipment, and guided bombs.

217 10 ELECTRONICS/COMMUNICATIONS MAINTENANCE SHOP (SF)
FAC: 2171
BFR Required: Y

21710-1 Electronics maintenance shops at Naval and Marine Corps activities provide facilities for maintenance and repair of non-airborne equipment (see Category Code 211 45, Avionics Shop (Non-NAVAIR Depot) for airborne equipment repair facilities).

21710-2 It contains office and support spaces for the Equipment Maintenance Officer (EMO) and the EMO Staff, equipment maintenance and training areas, and a small storage area for parts and supplies directly under the control of the EMO. A small electronics and communications maintenance shop integral to the function it supports should be contained within the analysis of that function and not classified as Category Code 217 10.

21710-3 No specific criteria are provided. An engineering evaluation can be conducted to determine the office space and support area requirements using guidance contained within the Category Code series 131 Introductory section. For maintenance and training area, the quantity and type of items required may be selected from Table 131 and appropriate allowances applied. For storage area, an engineering evaluation can be used to determine the volume of material required to be stored. The standard stacking height for this type of material is 1.83 meters (6 feet). A factor of 1.07nsm/cm is applied to the volume of material to determine the required net square meters (m^2). A conversion factor of 1.65 for net square meters to gross square meters is appropriate.

217 20 COLLIMATION TOWER (EA)
FAC: 2173
BFR Required: N

21720-1 Collimation facilities are required at shipyards for electronic and optical alignment of fire control and radar equipment aboard ships. This facility consists of a steel tower approximately 125 to 150 feet in height and a small instrument building at the lower base.

217 30 FIELD MAINTENANCE SHOP (COMMUNICATIONS/ ELECTRONICS) (SF)
FAC: 2171
BFR Required: Y

21730-1 This field maintenance shop provides specialized work areas for performing 3rd and 4th echelon maintenance on all items of communications/electronics equipment authorized repaired by the Service Battalion of the Marine Division and the Force Service Regiment. The shop space includes administrative and training areas as well as storage space for tools, parts, and maintenance float equipment. For other field maintenance functions, see Category Codes 214 53, 215 60 and 218 80. Conduct an engineering study to determine requirements.

217 40 ANTENNA TEST RANGE (EA)
FAC: 2173
BFR Required: N

21740-1 This facility is for testing electronic equipment and communication antennas after completion of maintenance, repair and overhaul work. This range has to be individually planned. Standard planning factors are not available.

217 50 SENSOR ACCURACY CHECK SITE (SACS) (EA)
FAC: 2173
BFR Required: Y

21750-1 The primary purpose of this facility is to measure the performance of shipboard sensors in an in-port environment on completion of overhaul or during normal port upkeep of Navy ships. This facility can be planned for only when authorized by the Commander, Naval Sea Systems Command.

21750-2 The SACS is a unique test and evaluation facility which provides an independent, real-time measure of gyrocompass, sonar, echo sounder and sonar communications set performance and accuracy. The SACS design permits sensor evaluations under test conditions especially favorable to the ship: (1) the ship is tested in port with all normal dockside facilities available; (2) measurements are external to the ship so that "at sea" performance is determined; (3) data are analyzed in real-time providing immediate identification of sensor deficiencies and verification of corrective actions; and (4) all major sonar parameters are measured in a single comprehensive test.

21750-3 **MAJOR FACILITY COMPONENTS.**

21750-3.1 **Control Center**: The building in which test points on the ship's sensors are monitored, and control is maintained over all SACS equipment. The building contains signal generating, receiving and processing devices and automatic data acquisition and analysis equipment.

21750-3.2 **Pile Mounted Transducers.** Transducers mounted to the 31 pilings of the SACS array. The transducers are spaced at 10-degree intervals and are used for sonar range and bearing error measurements.

21750-3.3 **Moveable Carriage with Transducer.** A calibrated directional transducer that can be moved vertically and in azimuth; it is used for receiver and transmitter performance measurements.

21750-3.4 **Ship's Transducer Location System (STLS).** A system of three transducers used to continuously monitor the position of the ship's sonar transducer to an uncertainty of less than one inch.

21750-3.5 **Automatic Ship's Head Measuring System (ASHMS).** A system of specially configured TV cameras that is used to provide ship's heading to an accuracy of better than 0.01 degree.

21750-3.6 **Mooring System**. A system of five hydraulic winches from which wire ropes are extended to the ship in order to maintain the ship's sonar transducer near the center of the SACS array.

21750-3.7 **Slip Services.** The ship receives 800 amps, 440 volts, steam, fresh water, telephone connections and generous parking space while in port.

21750-3.8 **Echo Sounder Test Array**: An array of four transducers placed on the bottom of the bay directly below the ship's fathometer.

21750-3.9 **Depth.** A minimum depth of 50 feet Mean Lower Low Water is required at the site of the subject facility due to the variety of vessels that can be expected to be serviced.

217 77 ELECTRONICS - SPARES AND STORAGE (READY ISSUE/SHOP STORES / MISCELLANEOUS) (SF)
FAC: 2171
BFR Required: Y

21777-1 **Electronics and Communications Storage.** Support multiple commands or multiple Departments/Divisions within a command. It is under the control of the Communications Department. Storage of material under the control of the Logistics and Supply Department should be classified within CCN 143-77. Storage areas in support of small electronics and communications maintenance shops integral to the function they support are considered part of those functions.

21777-2 **No specific criteria provided**. An engineering evaluation can be used to determine the volume, in cubic meters (cm), of material required to be stored. The standard stacking height for this type of material is 1.83 meters (6 feet). A factor of 1.07nsm/cm is applied to the volume of material to determine the required net square meters (m^2). A conversion factor of 1.65 for net square meters to gross square meters is appropriate.

218 MAINTENANCE - MISCELLANEOUS PROCURED ITEMS AND EQUIPMENT

218 10 CONTAINER REPAIR AND TEST BUILDING (SF)
FAC: 2182
BFR Required: Y

21810-1 A container repair and test facility services only empty containers. The size of the facility is relevant to processing approximately 1 percent of the containers and chassis involved in the handling and shipping operations. The facility provides for structural testing, minor repairs, and cosmetic services for damaged or structurally marginal containers.

21810-2 Assuming a 750-container throughput capability per 24-hour day, the number of bays in the repair facility can be estimated as follows:

1% x 750 = 7.5 containers per day
Assume 4 hours work per container - 4 x 7.5 = 30 hours
Assume 8 hours working day - 30 / 8 = 3.75, say 4 bays

21810-3 A typical 4-bay facility with supporting tool room, administrative space, and personnel support area is shown in Figure 218-10. The bays are serviced by a bridge crane with a lifting capacity of 5 tons. Storage space of 2,130 square yards for 16 empty containers should be provided adjacent to the facility. The 4 bays testing and repair area is 1,920 square feet. The administrative space is 800 square feet for a total gross area of 2,720 square feet.

218 20 CONSTRUCTION/WEIGHT HANDLING EQUIPMENT SHOP (SF)
FAC: 2182
BFR Required: Y

21820-1 Special shop structures for the maintenance and repair of construction/weight-handling equipment are planned only for areas where combined automotive, weight-handling, railroad and/or construction equipment maintenance facilities are not feasible. Construction/weight-handling equipment shop requirements are based on the space factors contained in Category Code 214 20, Automotive Vehicle Maintenance Shop.

21820-2 Included in this category are special construction and utility shops for Marine Corps units. These shops are normally part of the Headquarters Battalion, Force Service Regiment, and the Fleet Marine Force (FMF) Engineer Battalions. Conduct an engineering study to determine requirements.

218 25 MARINE AIR-BASE SQUADRON (MABS) FACILITY (SF)
FAC: 2181
BFR Required: Y

21825-1 This Category Code is used for inventory purposes only.

218 30 DRUM RECONDITIONING PLANT (SF)
FAC: 2182
BFR Required: Y

21830-1 The drum reconditioning plant is planned for those fuel facilities where fuel drums are returned for refilling or storage before reissue. Normal drums that require reconditioning at frequent intervals are the 55-gallon steel type. The drum reconditioning facility requires a minimum of two buildings: one for the boiler plant and the other housing the reconditioning facilities. The boiler house will be approximately 800 square feet, and the reconditioning building housing the internal washing, removal of surface depressions, internal chaining, external wire brushing, chime rolling, testing, welding, internal preservation, and painting will be approximately 3,600 square feet. This plant has a capacity of approximately 3,000 55-gallon drums per month.

218 35 CABLE REPAIR HOUSE (SF)
FAC: 2182
BFR Required: Y

21835-1 No criteria are currently available for this Category Code.

218 40 RAILROAD EQUIPMENT SHOP (SF)
FAC: 2183
BFR Required: Y

21840-1 The railroad equipment maintenance facility is a special shop structure to house material and equipment for the service and maintenance of railroad locomotives and locomotive cranes. The facility is required where installations operate and maintain railroad equipment for the handling of supplies. In areas where it is practicable, the railroad equipment maintenance shop will be combined with the Automotive Vehicle Maintenance Shop and/or the Construction/Weight-Handling Equipment Shop, and the number of repair bays (with pits) may be determined as follows:

Locomotives Supported	Repair Bays	Area SF
1-5	1	960
6-12	2	1,980
13 and over	3	2,880

21840-2 The numbers of additional bays are similarly determined from the above table.

218 45 INSTRUMENT CALIBRATION SHOP (SF)
FAC: 2182
BFR Required: Y

21845-1 **REPAIR.** This shop performs calibration, repair, and certification of all measurement instruments assigned to an activity. Space requirements are governed primarily by the number of pieces of equipment requiring calibration. The facility should be dust-free, temperature and humidity controlled and protected from electromagnetic interference. It is essential that the site selected for the location of this facility be free of ambient vibration to avoid interference with calibration operations. Normally the following spaces are included:

21845-1.1 **Calibration Laboratory**

21845-1.2 **Cleaning Room** is used for cleaning and drying equipment to be calibrated.

21845-1.3 **Utilities Room** is required so that utilities components can be isolated from the laboratory working area.

21845-1.4 **Storage Areas** for incoming and outgoing items, spare parts and equipment.

21845-1.5 **Administration Area.** The administration area provides office space, technical library, and file storage. Space allowances are planned in accordance with Category Code 610-10.

21845-2 **FOR SPECIFIC GUIDANCE.** See Joint Systems Commands publication Calibration Facility Requirements (NAVAIR 17-35 FR-02 NAVSEA OD 45842 and NAVELEX 0967-LP-465-8010) and Naval Shore Electronics Criteria (NAVELEX 0101, 114) calibration program.

218 50 BATTERY SHOP (SF)
FAC: 2181
BFR Required: Y

21850-1 A battery shop is required to service and charge batteries. As an example, typical batteries serviced at an air installation are lead-acid batteries used for ground support equipment (GSE) and nickel-cadmium and silver-zinc batteries for aircraft at the intermediate maintenance level. A shop is normally required at each Navy and Marine Corps air installation having approximately 75 or more aircraft. The gross area of the battery shop is 1,110 square feet. This shop size can accommodate a maximum workload of eight nickel-cadmium and 40 lead acid batteries per work shift. The shop size should be modified for other workloads, with the major change being in the amount of space needed for charging benches.

218 51 BATTERY RECHARGING SHOP (SF)
FAC: 2181
BFR Required: Y

21851-1 This category code is for use at activities which have a requirement to recharge battery powered equipment such as forklift trucks used at supply centers. The requirement is a function of the number and size of the equipment being serviced and must be determined on an individual basis or in the case of forklift trucks, the following criteria may be used: 100 square feet per forklift which includes 40 square feet for the average vehicle itself and 60 square feet for aisle and workspace, based on a 1.5:1.0 ratio. In all instances, compliance must be maintained to OSHA regulations regarding the venting of hydrogen gas, floor drains, flush facilities, explosion proof wiring and lighting, etc.

218 52 BATTERY RECHARGING SHED (SF)
FAC: 2185
BFR Required: Y

21852-1 This category code captures battery charging structures/sheds at activities that have a requirement to recharge battery powered equipment such as forklifts and similar equipment. It supports either charging batteries outside of equipment or for temporarily supporting the requirement to charge housing equipment batteries.

218 60 GROUND SUPPORT EQUIPMENT SHOP (SF)
FAC: 2181
BFR Required: Y

21860-1 The intermediate level maintenance of aircraft ground support equipment (GSE) is performed in this shop. Ground support equipment, often referred to as yellow gear, includes such items as tow tractors, trucks, forklifts, trailers, compressors, power generators, maintenance stands, jacks and other ground equipment which support aircraft operations.

The GSE shop requirement is based upon the average number of on-board aircraft and is sized in accordance with Table 21860-1 with the following modifications:

1. The areas shown in the table were developed for base loadings comprised mainly of VF, VA, VP, and VEW aircraft. Activities supporting primarily helicopter or basic propeller training operations normally would not require a shop size greater than 12,500 SF regardless if the station loading exceeds 100 aircraft.

2. Stations which have a Fixed Point Utility System (FPUS) installed in the aircraft parking apron shall reduce the shop requirement by 640 square feet for each full increment of 75 aircraft spaces equipped with FPUS. See the example at the end of this section.

3. Stations having less than 40 aircraft shall individually justify a requirement for a GSE shop. Consideration will be given to maintaining the GSE gear in the Automotive Vehicle Maintenance Shop (Category Code 214 20) prior to requesting a separate GSE shop.

Table 21860-1
Ground Support Equipment Shop

Number of Aircraft	Shop Area (SF)
40-50	6,250
51-75	9,400
76-100	12,500
101-125	13,950
126-150	15,400
151-175	16,850
176-200	18,300
201-250	21,200
251-300	24,100

The above shop allowance includes workspace for: battery shop, engine shop, paint shop, tire and wheel repair, jack repair and vehicle framework. Supporting space for ready issue of parts, tool storage, classrooms, locker room, offices, and a mechanical equipment room are also included. A covered storage area for GSE gear is planned in conjunction with the GSE shop (see Category Code 218 61, Ground Support Equipment Holding Shed). A sample computation for a GSE shop is given below:

Example – GSE Shop

Given: Average on board aircraft – 179
Fixed Point Utility System (FPUS) provided for 90 apron parking spaces

From Table 21860-1, shop area to support 179 aircraft equals 18,300 SF.

Reduction for FPUS:
90 apron spaces with FPUS divided by 75 = 1.2, use 1.0
Reduce area by 1.0 x 640 SF
Requirement equals 17,660 SF (18,300 – 640).

218 61 GROUND SUPPORT EQUIPMENT HOLDING SHED (SF)
FAC: 2185
BFR Required: Y

21861-1 DEFINITION. The ground support equipment (GSE) holding shed is planned in conjunction with the Category Code 218 60, Ground Support Equipment (GSE) Shop. The shed provides protective cover for GSE gear awaiting and undergoing intermediate level maintenance and is an integral part of the GSE Shop compound.

The GSE shed requirement is based upon the average number of on-board aircraft and is sized in accordance with Table 21861-1 with the following modifications:

1. The areas shown in the table were developed for base loadings comprised mainly of VF, VA, VP, and VEW aircraft. Activities supporting primarily helicopter or basic propeller training operations normally would not require a shop size greater than 19,500 SF regardless if the station loading exceeds 100 aircraft.

2. Stations which have a Fixed Point Utility System (FPUS) installed in the aircraft parking apron shall reduce the shop requirement by 640 square feet for each full increment of 75 aircraft spaces equipped with FPUS. See Category Code 218 60 for an application for a similar reduction to the GSE shop.

Table 21861-1
GSE Holding Shed

Number of Aircraft	Shed Area (SF)
40-50	9,750
51-75	14,625
76-100	19,500
101-125	19,967
126-150	20,435
151-175	20,902
176-200	21,370
201-250	22,300
251-300	23,230

218 62 SHIPBOARD AIRCRAFT SUPPORT EQUIPMENT FACILITY (SF)
FAC: 2182
BFR Required: Y

21862-1 No criteria are currently available for this Category Code.

218 65 EQUIPMENT HOLDING SHED (For Category Code 218 20) (SF)
FAC: 2185
BFR Required: Y

21865-1 This facility is required in conjunction with Construction/Weight-Handling Equipment Shop, Category Code 218 20 for the purpose of protection of equipment awaiting repairs. The number and size of holding bays has to be determined on an individual basis and is dependent upon the type of equipment to be supported.

218 68 PRODUCTION EQUIPMENT MAINTENANCE SHOP (SF)
FAC: 2182
BFR Required: Y

21868-1 No criteria are currently available for this Category Code.

218 70 OFFICE EQUIPMENT/APPLIANCE REPAIR SHOP (SF)
FAC: 2182
BFR Required: Y

21870-1 Appropriate facilities may be provided to perform maintenance and repair of office equipment and small appliances. The space requirement for this facility is governed by the number of machines supported by the activity. See Table 21870-1.

Table 21870-1. Space Allowance - Office Equipment/Appliance Repair Shop

Number of Machines Supported	Gross SF Area
500	400
1,000	600
1,500	800
2,000	1,000
2,500	1,200
3,000	1,400
5,000	1,600

218 71 DENTAL EQUIPMENT MAINTENANCE BUILDING (SF)
FAC: 2182
BFR Required: Y

21871-1 No criteria are currently available for this Category Code.

218 77 REPAIR SHOP STORAGE (SF)
FAC: 2182
BFR Required: Y

21877-1 No criteria are currently available for this Category Code.

218 80 FIELD MAINTENANCE SHOP (GENERAL SUPPLY) (SF)
FAC: 2182
BFR Required: Y

21880-1 This field maintenance shop provides specialized work areas for Fleet Marine Force (FMF) units performing 3rd and 4th echelon maintenance on all items of general supply equipment. This function is performed primarily by the General Supply

Maintenance Company, Maintenance Battalion, of the Force Service Regiment. The shop space includes administrative and storage space for tools, parts, and maintenance float equipment.

21880-2 For other field maintenance functions see Category Codes 214 53, 215 60, and 217 30.

21880-3 Conduct an engineering study to determine requirements.

218 90 AVIATION SUPPORT EQUIPMENT SHOP (NALC) (SF)
FAC: 2182
BFR Required: Y

21890-1 No criteria are currently available for this Category Code.

218 91 MOBILE VAN SHOP (NALC) (SF)
FAC: 2181
BFR Required: Y

21891-1 No criteria are currently available for this Category Code.

218 92 AVIATION SUPPORT / FEEDER SHOP (NALC) (SF)
FAC: 2182
BFR Required: Y

21892-1 No criteria are currently available for this Category Code.

219 MAINTENANCE - INSTALLATION, REPAIR AND OPERATION

219-1 This basic category includes maintenance shops for repair and overhaul of installation facilities (public works and public utilities), including installed shop and other equipment, and utility distribution systems, used in support of maintenance operations at military and/or industrial installations. The maintenance and repair of vehicles and weight-handling and construction equipment, utility plant, and maintenance shops are not included in this category. For the former, see Category Code series' 214 and 218, and the latter, see Category Code series 811.

219 10 PUBLIC WORKS SHOP (SF)
FAC: 2191
BFR Required: Y

NOTE: For shop planning in Public Work Centers, individual guidance will be provided by NAVFAC.

21910-1 This facility supports the Maintenance Division of the Public Works Department. This Division is responsible for management of the Preventive, Maintenance Inspection (PMI) program and is tasked to perform maintenance on:

21910-1.1 All buildings, grounds and ground structures.

21910-1.2 Utilities plants and distribution systems when requested by the Utilities Division.

21910-1.3 Heating, air-conditioning and refrigeration systems.

21910-1.4 Internal communications and alarm systems.

21910-1.5 Roads and trackage.

21910-2 This work includes repairs, alterations and new construction incident to maintenance; except work that may be accomplished by private contract. In addition, the Maintenance Division is responsible for the following services:

21910-2.1 Respond to emergency and/or service work requests.

21910-2.2 Provide caretaking services.

21910-2.3 Provide upkeep to all grounds of the activity.

21910-2.4 Provide for solid waste collection.

21910-2.5 Provide pest control service.

21910-3 Certain Public Works Department functions are not performed at the Public Works Shop as defined for Category Code 219 10, such as:

21910-3.1 Administration when not in direct support of a maintenance shop. This includes offices for the Public Works Officer (PWO), Assistant PWO, Maintenance Control Division, Maintenance Division supervisor and staff, Engineering Division, Administrative Division and Housing Division.

21910-3.2 Work performed by the Utilities Division such as operating utilities plants and distribution systems.

21910-3.3 Maintenance and repair of automotive equipment.

21910-4 Facilities for these functions are categorized under the following Category Groups as appropriate: 610- Administration, 218- Maintenance—Facilities for Miscellaneous Procured Items and Equipment, 214- Maintenance—Tank, Automotive, and the applicable code groups in the 800 series – Utilities and Ground Improvements.

21910-5 The maximum allowable gross area for public works shops, including space for heating and mechanical equipment, is based on the number of military and civilian maintenance personnel permanently assigned to the maintenance organization. This does not include those personnel involved in functions not directly performed by the shop as outlined above. Table 21910-1 lists the gross area for the various sizes of maintenance shops including Category Code 219 20, Pavement and Grounds Equipment Shed and 219 25, Public Works Shops Expendable/Work-in-Process Store.

Table 21910-1. Space Allowance - Public Works Shops*

Shop Type	Total Maintenance Personnel	Gross Area (SF)*
A	10-30	8,700
B	31-50	12,100
C	51-100	16,700
D	101-150	21,100
E	151-300	28,300
F	301-500	34,800
	Over 500	100 SF/Pers.

* The areas indicated in Table 21910-1 represent the entire composite area for the Public Works Maintenance Shop. Included within these figures are the areas allocated for category codes 219 20, Pavement and Grounds Equipment Shed, Table 21920-1, and 219 25, Public Works Shops Expendable/Work-In-Process Store, Table 21925-1. The requirement for the last two codes must not be added to this code but rather are considered an integral part of it. The figures indicated in the tables for these two codes are provided as a guide as to how category code 219 10 may be subdivided. In the event the requirement for category codes 219 20 and 219 25 are less than indicated, it is not necessary to reduce the figures indicated in Table 21910-1 but rather, this difference in area may be used for other functions performed by this shop.

21910-6 The gross areas listed in Table 21910-1 provide for the following functions: (1) the woodworking shop, including furniture repair, packing, and crating, excluding the packing and crating in Category Code series' 441 and 442); (2) the electrical shop, refrigeration and air conditioning shop; (3) plumbing and heating shop; (4) metal work shop, including machine shop, sheet metal, iron work, welding, and blacksmith facilities; (5) paint shop; (6) routine maintenance and service shops, including custodial, preventive maintenance, refuse collection, insect and rodent control, road maintenance facilities, moving and rigging, and emergency service shops; (7)

central tool issue, shop stores and shop toilets, and locker rooms, and (8) administrative spaces in direct support to shop operations, corridors, and necessary service space directly related to the shop. If other than the foregoing functions are required, space may be appropriately increased if justifications are documented.

219 20 PAVEMENT AND GROUNDS EQUIPMENT SHED (SF)
FAC: 4422
BFR Required: N

21920-1 The pavement and ground equipment shop will provide holding space and minor maintenance space for tractors, lawnmowers, snowplows, and other miscellaneous equipment used for roads and ground maintenance. This shop can be independent of the Public Works Maintenance Shop (Category Code 219 10) but is related for space allowances to the corresponding PW shop type. The gross square foot allowances on Table 21920-1 are provided for planning guidance only and are not additive to the Public Works shop allowances. See footnote to Table 21910-1.

Table 21920-1. Space Allowance - Pavement and Grounds Equipment Shop

Shop Type	Gross Area (SF)
A	525
B	700
C	850
D	1,100
E	1,800
F	2,200

219 25 PUBLIC WORKS SHOPS EXPENDABLE/WORK-IN-PROCESS STORE (SF)
FAC: 2191
BFR Required: N

21925-1 The public works shops expendable/work-in-process store holds the ready-issue items for public works daily maintenance, job order materials for the maintenance of station facilities and materials that are considered critical items for emergencies/service. It is independent of the General Supply Storage (Category Code 441 10). The shop can also be independent of the Public Works Shop (Category Code 219 10) but is related for space allowances to the corresponding PW shop type. See Table 21925-1. The gross square foot allowances on Table 21925-1 are provided for planning guidance only and are not additive to the Public Works shop allowances. See footnote to Table 21910-1.

Table 21925-1. Space Allowances - Public Works Shop Store

Shop Type	Gross Area (SF)
A	650
B	1,000
C	1,100
D	1,400
E	2,200
F	2,500

219 30 PAINTING AND RELATED OPERATIONS BUILDING (SF)
FAC: 2191
BFR Required: Y

21930-1 The function of the painting and related operations building is to provide space for painting and other operations which may not be functionally compatible or hazardous to the building or types of operation conducted in the public works shop, Category Code 219 10. This facility is considered as an integral part of Category Code 219 10 but may, in some instances, be a separate building if safety or functional requirements so dictate. However, in all cases, the area allocated for this facility must be considered as part of the area for the corresponding shop types listed in Table 21910-1 and must not be considered as an additional requirement.

219 31 PAINTING AND RELATED OPERATIONS STRUCTURE (EA)
FAC: 2192
BFR Required: N

21931-1 The painting and related operations structure is a facility used for painting and those operations which are not suitable to be carried on in Category Code 219 30, Painting and Related Operations Building. This code may include structures like a sandblast scaffold, paint spray booth, preservation dip tank, pickling tank, sandhopper, sandblasting facilities, open paint canopy, sand handling bin, etc. There are no specific planning criteria for these structures; each requirement must be individually justified.

219 40 SEWAGE HOSE STORAGE FACILITY (EA)
FAC: 2192
BFR Required: N

21940-1 This Category Code is for inventory purposes only.

219 77 PUBLIC WORKS MAINTENANCE STORAGE (READY ISSUE/SHOP STORES/MISC.) (SF)
FAC: 2191
BFR Required: Y

21977-1 This facility is a general warehouse for the storage of items and materials required for the maintenance of station buildings and grounds. It is independent of the ready-issue storage facilities required in direct support of the public works shops (use Category Code 219 25).
21977-2 Shed storage space is required to provide covered storage for certain items of equipment and supplies needed for base operation and maintenance, which do not require regular warehouse storage, yet must be protected from the weather. Table 21977-1 may be used to determine covered storage requirements for various sizes of public works facilities.

Table 21977-1. Public Works Storage Areas

Shop Type	Gross SF Area	
	Covered	Shed
A	3,400	2,300
B	3,400	2,300
C	3,400	2,300
D	6,000	4,000
E	12,500	8,300
F	19,200	12,800

NOTE: For Public Works Storage supporting PW shops larger than type F, add the following areas for each maintenance craftsman over 500: covered 40 SF; Shed - 25 SF

220 PRODUCTION

220-1 The production facility is part of the production system that processes raw materials, components and labor into finished goods.[1] Production facilities are typically "one-of-a-kind" therefore space requirements should be developed "from the ground up"; first for the individual workstations; then departmental requirements by summing the workstations within the department. Applying industrial engineering practices and methods would provide sufficient and accurate space requirements. Accurate future product demand forecasts are necessary so the facility can be sized for future growth. The facility should be sized for forecasted production growth 5 to 10 years beyond initial operating capability. [2]

This methodology applies for the following category codes:

221 10 AIRCRAFT ENGINE-ASSEMBLY PLANT (SF)
FAC: 2211
BFR Required: Y

221 20 AIRFRAME ASSEMBLY PLANT (SF)
FAC: 2211
BFR Required: Y

221 30 AIRCRAFT ACCESSORIES –ASSEMBLY PLANT (SF)
FAC: 2211
BFR Required: Y

222 10 MISSILE ASSEMBLY-PLANT (SF)
FAC: 2221
BFR Required: Y

222 20 MISSILE HANDLING LAUNCH EQUIPMENT (SF)
FAC: 2221
BFR Required: Y

223 10 FABRICATION & ASSEMBLY BUILDING (SF)
FAC: 2231
BFR Required: Y

223 30 SHIP-BUILDING DRYDOCKS (SF)

FACILITIES CRITERIA (FC)
FACILITY PLANNING FOR NAVY AND MARINE CORPS SHORE INSTALLATIONS

Series 300: RESEARCH, DEVELOPMENT, ACQUISITION, TEST, AND EVALUATION FACILITIES

Record of Changes:

Date	CCN #	CCN Title	Description of Change
08 May 2018	300-6	Research, Development, Acquisition, Test And Evaluation Facilities	Updated criteria to meet minor changes that reference 131 Introductory criteria.
08 May 2018	310 33	Computation And Analysis Laboratory	Minor criteria rewording.
08 May 2018	317 10	Communications Systems Laboratory	Minor criteria rewording.
08 May 2018	317 25	Electrical, Electronics And Communication Systems Integration Laboratory	Minor criteria rewording.
08 May 2018	319 15	Telecommunications Distribution Facility	Minor criteria rewording.
14 August 2019	31105	RDAT&E Maintenance Hangar-Oh Space (High Bay)	Change title to: "RDAT&E Maintenance Hangar" and consolidated 31106 and 31107 into 31105.
14 August 2019	31106	RDAT&E Maintenance Hangar - 01 Space (Crew And Equipment)	Deleted CCN
14 August 2019	31107	RDAT&E Maintenance Hangar - 02 Space (Administrative)	Deleted CCN
July 2020	31013	Chemistry and Toxicology Laboratory	Description revised to remove the word "nuclear", as per OSD direction.
July 2020	31019	Physics Laboratory	Description revised to remove the word "nuclear", as per OSD direction.
July 2020	31815	Propulsion Fuel Laboratory	Description revised to remove the word "nuclear", as per OSD direction.
2 Mar 2023	300 Series	UFC 2-000-05N	Change UFC 2-000-05N to FC 2-000-05N document due to the fact that this planning criteria is not unified among the other DoD services.

SERIES 300
RESEARCH, DEVELOPMENT, ACQUISITION, TEST, AND EVALUATION FACILITIES

Table of Contents

300 RESEARCH, DEVELOPMENT, ACQUISITION, TEST AND EVALUATION FACILITIES

300-1 INTRODUCTION

Research, development, acquisition, test and evaluation facilities include the buildings and other scientific structures and facilities used directly in theoretical and/or applied research, development, acquisition, test and evaluation operations. Category code groups pertaining to these facilities are:

300-1.1 **Category Code 310 through 321.** Research, development, acquisition, test and evaluation buildings

300-1.2 **Category Codes 371 and 390.** Research, development, acquisition, test and evaluation structures

Associated facilities assigned function in support of research, development, acquisition, test and evaluation are assigned appropriate codes such as Category Code series 200 for normal maintenance, repair and overhaul purposes; Category Code series 400 for warehouse, as opposed to storage functions; Category Code series 600 for administrative facilities; Category Code series 800 for utilities, and Category Code series 900 for real estate.

300-2 CATEGORY CODE DESIGNATION.

After a determination is made of the gross floor/building area, a specific category can be assigned to the total space, based on the primary use for the facility. As a general guideline, offices and support areas which are directly related to a particular type of research activity carry the same category code as the laboratory areas themselves.

300-3 DEFINITION OF TERMS

The following definitions of terms are used in the research criteria:

300-3.1 **Gross Floor/Building Area**. The total areas of all floors, measured between the exterior faces of outside walls. It includes full areas of basements, on-grade and above grade floors, service and equipment rooms, boiler plants and heater rooms, mezzanines, penthouses, enclosed passages and raised covered platforms. Excluded is all enclosed space with an average ceiling height of less than seven feet.

300-3.2 **Net Floor Area**. This is total gross floor area, less space taken up by outside walls, stair towers, elevator shafts, interior partitions, toilets, basements unsuited for specific use, permanent hallways, elevator machinery and machinery or equipment used for heating and/or ventilating the building, and NMCI/telecomm room servers and ducts. The net floor area does include special equipment bays peculiar to a particular laboratory function.

300-3.3 **Prime Unit Generator**. A special object (e.g., tow tank, wind tunnel, environmental chamber, multi-axis rate table) which tends to have the room built around it, rather than fitting into an existing room. Prime unit generators usually require "high bay" areas and often have overhead cranes or other heavy handling equipment associated with them.

300-3.4 **NTG Factor** (net-to-gross conversion factor) That factor which is used to convert a net floor area to a gross floor/building area (net floor area x NTG factor = gross floor/building area).

300-4 OVERALL METHODOLOGY

The basic problem in planning any research facility is the same: how to meet an existing need while at the same time providing for flexibility and growth. Research ranges from microscopic investigations to factory type testing set-ups. The methods described below provide a good prediction of the type and quantity of space that should be built to satisfy a specific program need, while at the same time allowing for flexibility to accommodate future RDAT&E program.

300-4.1 In approaching any research facility planning project, it is advisable to break down the facility requirements into basic functional components. These components consist of:

- Research Offices
- Research Support
- Bench Type Labs
- Specialized Research Facilities

300-4.2 Not all of these components will be present in all research facilities. To arrive at total requirements for a facility, each of the components which are present should be looked at separately, using the appropriate method described in succeeding paragraphs. Net floor areas should be developed first for each component, and gross floor/building areas calculated for each by multiplying the net areas by the appropriate NTG conversion factor. The total space requirement for the research facility is obtained by adding the gross floor/building areas for each of the components, as diagrammed below:

Total Area		Research Office		Research Support		Bench Type Labs		Specialized Research Facilities
(Gross)	=	(Net SF x NTG)	+	(Net SF x NTG)	+	(Net SF x NTG)	+	(Net SF x NTG)

300-4.3 There are three basic methods for developing and justifying net floor areas for research facilities. These consist of:

300-4.3.1 **Architectural Method** - This method consists of the development of scaled floor plans which depict a layout of equipment items within a required “envelope” of space. Such layouts should show the equipment as it should be placed within the space, which may not necessarily correspond to the manner in which such space is actually arranged in existing facilities. Such layouts should strive to be as efficient as possible.

300-4.3.2 **Industrial Method** - This method consists of identifying in a tabular format the net floor area required for each item of required equipment. When this method is used, the table should include three columns of information: (a) name of equipment item; (b) actual floor area occupied by the item, i.e., the size of its “footprint”; (c) size of the required working area within which the item sits, which permits all normal operations associated with the equipment as well as required services access to all sides. The sum of all the areas shown in item (c) will be the total net floor area for the space as a whole, and is equivalent to the “envelope” which would be shown graphically if the architectural method were used.

Note: the Introduction of category code 131 provides requirements for various types of workstations and for equipment mounted in racks. Table 131 provides requirements for typical equipment found in offices and labs.

300-4.3.3 **Use of Criteria** - For many types of facilities, approved rules of thumb (criteria) may be used to generate net floor areas. These are identified in terms of space per person, space per module, etc., and have been incorporated wherever possible into the P-80 guidance. Use of criteria generally requires less time and effort than either of the other methods.

300-4.3.4 In developing requirements for research facilities, any of the above methods may be used or a combination of these methods to develop the net floor areas for each functional component of the research facility.

300-5 OVERALL METHODOLOGY: RECOMMENDED PROCEDURES BY FUNCTIONAL COMPONENT

300-5.1 **Research Office**. Net floor areas for office spaces should be calculated by utilizing the criteria and guidance contained in Category Code 610 10. Gross floor/building areas should be developed using the NTG factors shown under this code. In utilizing the criteria, care must be taken to identify by administrative component, which personnel require office type space.

300-5.2 **Research Support**. The term “research support” is used to include lunch/locker spaces, libraries, auditoriums, etc., which may be required in direct support of an RDAT&E function. Studies have shown that space requirements for these types of space are similar, whether in support of a laboratory or other Navy uses. Therefore, the appropriate criteria may be used to calculate the requirements. If these criteria are to be used, refer to the appropriate category codes for guidance.

Examples of such codes are:

Installation Restaurant	Category Code 740 26
Academic Instruction Building	Category Code 171 10
Applied Instruction Building	Category Code 171 20
Auditorium	Category Code 171 25

Storage requirements are included in bench type labs or these requirements can be identified with Category Codes outside of the 300 series (Category Code 610 77 Admin storage or 171 77 Training Material Storage, etc.).

Net to gross conversion factors to be used for research support spaces are the same as for research offices.

300-5.3 **Bench Type Labs**. The bench lab component of research facilities tends (if present) to be organized into repetitive modules. Because of the nature of research, one scientist may share a laboratory module with another scientist, or in some instances, one scientist may have a need for two or more dedicated labs. Note: photographic darkrooms and control rooms are treated as bench labs, not as support space.

The basic laboratory module that is most adaptable to various types of research and which also works well within modern structural systems is 11.5 x 24 feet in size. This design allocates 276 square feet for net floor area per laboratory module.

The net to gross conversion factor to be used for bench type laboratories contains a built-in allowance for storage space, and laboratory support shop space. These are as follows:

For buildings supported by a central heating/cooling plant	1.35
For buildings containing their own HVAC equipment	1.65

300-5.4 **Specialized Research Facilities**. Specialized research facilities can be subdivided into three types: (1) Large set-ups of bench lab type activities which are too big to fit into a single bench lab module; (2) Systems Simulation including data processing laboratories, and (3) One-of-a-kind facilities such as tow tanks, environmental chambers, and wind tunnels.

300-5.5 **Large Set-Ups.** Large Set-Ups of relatively small and ordinary laboratory items arranged into a combination too large to fit into a single laboratory module, space allocation should be in multiples of a single 276 square foot bench lab module. These multiples usually range from 1 to 4 modules, only rarely exceeding 4 modules is size.

Net to gross conversion factors for large set-ups are the same as for bench labs spaces, and contain built-in allowances for storage and shop space. NTG factors to be used for large set-up spaces are as follows:

For buildings supported by a central heating/cooling plant	1.35
For buildings containing their own HVAC equipment	1.65

300-5.6 **Systems Simulation Facilities.** Allow 28 square feet of net floor area for each data processing unit such as communication hubs, data transmitters/receivers, display sets, or cryptographic modules or console. Do not count supplemental air handlers or programmers' desks—allowance for these is already included in the 28 square foot module.

Specialized equipment associated with the data processing equipment is treated as one-of-a-kind equipment (see below).

The Introduction of Category Code series 131 provides requirements for various types of workstations and for equipment mounted in racks. Table 131 provides requirements for typical equipment found in offices and labs.

NTG factors to be used for system simulation facilities are as follows:

For buildings supported by a central heating/cooling plant	1.35
For buildings containing their own HVAC equipment	1.65

300-5.7 **One-of-a-Kind Facilities.** One-of-a-kind facilities are built to house large and unique equipment such as wind tunnels, flow channels, shaker tables, environmental chambers, autoclaves, etc. A method for allocating space for one-of-a-kind facilities involves identifying the "Prime Unit Generator". The prime unit generator is the item or assemblage of equipment which is the primary justification for the facility. Because of the specialized nature of these items, (which can be as small as a 6' diameter pressure vessel, or as large as a 20 x 30 x 50 foot space shuttle avionics test fixture) it is necessary to have some special rules for defining prime unit generators. These rules include the following:

- Internal wind tunnels (where the entire tunnel is contained in a large room): Include compressors and/or suckers or reservoir vessels inside the building along with the tunnel tube itself.

- External wind tunnels (where most of the tube is outside and only a working chamber is housed inside the building): Do not include any mechanism which is outside the building. Do include the entire working chamber, even if one wall of the chamber constitutes or is in contact with the outside wall of the building.

- Tow tanks/flow channels/turning basins: Include in the prime unit generator all fundamentally necessary equipment which is inside the building and essential to the operation of the tank, channel, etc. Examples are pumps with flow channels, and wave making mechanisms with turning basins.

- Irradiation equipment including X-ray: Include as a part of the prime unit generator power generation equipment, (as with wind tunnels), flow channels, etc. For track mounted units, include the entire track as part of the prime unit generator. For remote controlled units operating in a shielded room, treat the room only as a prime unit generator, and the controls as bench lab if part of a larger building. If the controls are a freestanding building, the controls are considered a control console as described in the following paragraph.

- Control consoles: If freestanding in an otherwise open area, add 4 feet or clearance to working side and use the bench lab NTG factor. If in a separate room devoted exclusively to the control function, treat the entire room as a bench laboratory.

- Internal aisles and walk space in specialized research facility areas, and within bench labs accounted for in the NTG factor.

- General case. For RDAT&E equipment and installations not specifically discussed above, treat the primary functional unit, and any unique “custom tailored” ancillaries as the prime unit generator. Other support items of an off-the-shelf nature are not counted as part of the prime unit generator but allowed for in the NTG factor.

After the footprint (floor plan area) of the prime unit generator is identified, a 6-foot working clearance is provided on all sides. For irregular shaped items some smoothing of the outline should be allowed to simplify calculation.

Note that the 6-foot working clearance is a theoretical space allocation tool, not intended to reflect realistic working requirements. In cases where the equipment is close to a building wall, the 6-foot clearance may extend outside the building wall, but is still counted in determining the required net floor area.

The total area of the prime unit generator and its 6-foot working clearance is called the “Working Net” for that item.

The net to gross conversion factor applied to the working net of one-of-a-kind facilities depends upon the type of heating service provided to the building:

For buildings supported by a central heating/cooling plant	1.5
For buildings containing their own HVAC equipment	2.2

As an alternative to the above procedure, a scaled floor plan (Architectural Method) may be developed and provided as justification for the space requirement.

300-5.8 **Other.** Other research, development, testing, and evaluation facilities that are required but are not contained within a facility may also be required. These types of facilities may include testing ranges, outdoor testing or evaluation staging areas, or outdoor equipment laydown areas. An Engineering Analysis shall be provided to justify this type of facility.

300-6 SUMMARY OF RECOMMENDED PROCEDURES

For convenience, a brief summary is provided:

- **Offices** - Use criteria for Category Code 610 10.
- **Research Support** - Use criteria for Category Code 610 10
- **Bench Labs** - Use 276 square foot per lab. Treat darkrooms and control rooms as bench lab space. The NTG factor includes allowance for storage and direct shops support and varies with the type of building heating system.
- **Specialized Research Facilities** –

a. Large Set-Ups: Use multiple of bench lab module, same NTG factors as for bench labs.

b. Systems Simulation: Use 28 square foot module for each piece of data processing equipment. Add area for any specialized equipment (which is treated as one-of-a-kind equipment). Refer to Table 131-4 for lab equipment other than data processing equipment. The NTG factor equals 1.35 or 1.65, depending on the type of building heating system. If the facility requires back up requirements associated with Tier I-IV communications facilities, refer to 131 Introductory series NTG factors.

c. One-of-a-kind facilities: Identify prime unit generator. Add 6 foot working space to obtain working net. The NTG factor equals 1.5 or 2.2 depending on the type of building heating system.

d. Other: Use engineering analysis is to calculate the requirement for testing ranges, outdoor staging areas, outdoor equipment laydown areas, etc.

310 SCIENCE LABORATORIES

310-1 **DEFINITION.** Buildings used directly in theoretical or applied research, development and testing operations related to basic research such as chemistry, materials, medical, biological, sonic, physics, geophysics, etc.

310 11 ASTRONOMY & ASTROPHYSICS LABORATORY (SF)

FAC: 3101
BFR Required: Y

31011-1 **DEFINITION.** A facility required to support the investigation of radio astronomy equipment, satellite research, and development for navigational and communication programs. The facility is also utilized in conducting research and development in the fields of atmospheric physics, astrophysics in radio, radar and meteor astronomy, upper air physics, rocket astronomy, solar spectroscopy, and cosmic radiation, etc.

310 13 CHEMISTRY AND TOXICOLOGY LABORATORY (SF)

FAC: 3101
BFR Required: Y

31013-1 **DEFINITION.** The facility required to support the conducting of research, development, test and evaluation in the areas of physical, organic, inorganic, and biological chemistry, directed towards problems concerning fuels, lubricants, corrosion, protective coatings, electrochemistry, submarine atmosphere purification, protection against biological and chemical warfare agents, polymers, molecular structure, and related programs. This facility is further utilized to support the application of chemicals to explosives, propellants, pyrotechnics, etc., and the effects of the chemistry of the ocean as it affects acoustic absorption, sound speed, thermocline and water mass identification.

310 15 MATERIALS LABORATORY (SF)

FAC: 3101
BFR Required: Y

31015-1 **DEFINITION.** This facility is used for research, development, test and evaluation of static, pneumatic non-destructive as well as destructive testing of components and assemblies for Navy weapons, vehicles, engines, ships and aircraft. Includes testing such as Zyglo, ultra violet light, sonic, X-ray, magna-flux and other techniques for accomplishing non-destructive testing of metals, plastics, etc.

31015-2 **USAGE.** This facility also supports research in the areas of physical, mechanical, chemical and structural metallurgy directed towards marine corrosion, high temperature flow and fracture mechanics, irradiation effects on metals, fracture-safe design, and in developing materials for use in transducers, underwater structures, sensing devices, weapons ships and aircraft. Also supports the synthesizing, modifying, fabricating and studying of metallic and nonmetallic materials such as plastics, rubber, adhesives, ceramics, resins, but excluding explosives and propellants, with emphasis on resistance to unusual conditions such as high and low temperatures, stresses, aerodynamic heating, etc.

310 17 OPTICS LABORATORY (SF)

FAC: 3101
BFR Required: Y

31017-1 **DEFINITION.** This facility is used in conducting research, development, test and evaluation programs in quantum optics, optical propagation, laser physics, optical materials and optical warfare. The facility is also used in efforts directed at discovering and understanding the basic physical principles and mechanisms involved in optical devices and phenomena.

310 19 PHYSICS LABORATORY (SF)

FAC: 3101
BFR Required: Y

31019-1 **DEFINITION.** This facility is used in research, development, test and evaluation studies in the applied science of matter and energy. It includes research in such areas as acoustics, mechanics, light, thermodynamics, electromagnetism, atomic physics, cryogenics, solid state physics, particle physics and plasma physics, etc.

310 21 RADIATION EFFECTS LABORATORY (SF)

FAC: 3101
BFR Required: Y

31021-1 **DEFINITION.** This facility is used in conducting research, development, test and evaluation on radiation characteristics of various devices and their effect on performance of various systems in the air and in the ocean environment. The facility is also used in the study of effects of radiation on people and marine life (e.g., acoustic pollution, hearing damage, and radioactivity) and the accomplishment of studies to determine reliable methods for detecting radiation sources.

310 23 COMBINED RESEARCH LABORATORY (SF)

FAC: 3101
BFR Required: Y

31023-1 **DEFINITION.** This facility is used for research, development, test and evaluation of naval systems which utilized several of the sciences in a combined system applied directly to a Fleet problem or area of RDAT&E. It is also used to support research, development, test and evaluation of naval systems which do not logically fit the other categories of RDAT&E.

310 25 BIOLOGICAL LABORATORY (SF)

FAC: 3101
BFR Required: Y

31025-1 **DEFINITION.** This facility is used in research, development, test and evaluation in terrestrial and marine biology as related to structure capabilities, functioning habitat, health, growth environmental indicators, ecological relationships of living organisms and association of biological phenomenon to man's existence and operations in the land, ocean and space environment. The facility also can include research in microbiology and environmental biology and the life process or characteristic phenomena of any group.

310 27 ENVIRONMENTAL LABORATORY (SF)

FAC: 3101
BFR Required: Y

31027-1 **DEFINITION.** This facility is used to support the research, development, test and evaluation of instrumentation and computer systems for measurement and analysis of the evaluation of environmental effects on various equipment, weapons systems, facilities, etc. The principle thrust of research and development in this area is in the fields of mechanical shock, vibration, pressure, and in the natural environments of temperature, humidity, corrosion, etc. Also includes working mock-ups of environmental studies relating man to the test environment.

310 29 ANIMAL APPLICATIONS LABORATORY (SF)

FAC: 3101
BFR Required: Y

31029-1 **DEFINITION.** This facility is used to support the research, development, test and evaluation on non-human animals in pure research and ocean support applications. This would include the use of whales and dolphins as trained deep sea divers, seals for shallow water tool recovery and dogs as sentries. It can also include research and development in application and knowledge of animal capabilities in sensing, homing and identification to improve the operation of man-made ocean devices. It provides veterinary medical support for marine mammal projects including applied research on diagnosis, treatment, surgery, husbandry and nutrition.

310 31 MEDICAL LABORATORY (SF)

FAC: 3102
BFR Required: Y

31031-1 **DEFINITION.** This facility is used in conducting research toward methodology for diagnosis, treatment, or prevention of disease or damage to the body or mind.

310 33 COMPUTATION AND ANALYSIS LABORATORY (SF)

FAC: 3101
BFR Required: Y

31033-1 **DEFINITION.** This facility supports research, development, test and evaluation in the areas of information processing and data handling, especially when concerned with identification of conditions responsible for data configurations. This facility supports mathematical data analysis utilizing both digital and analog computers to research, develop, test and evaluate new naval systems from simulated and real time data.

31033-2 **FUNCTIONAL AREAS.** A Computation and Analysis Laboratory may contain the following functional areas: research offices, research support, bench type labs, and specialized research facilities. Please refer to the guidelines provided in the introduction of the 300 series Category Codes for RDAT&E to calculate the requirement.

310 37 OCEAN SCIENCES LABORATORY (SF)

FAC: 3101
BFR Required: Y

31037-1 **DEFINITION.** This facility is used to accomplish research, development, test and evaluation in marine biosystems, environmental protection and management, development of analytical systems for evaluation of the ocean environment, studies of wave dynamics, current flow, thermoclines, chemical variances, bottom sampling, as well as development of new techniques and equipment to increase man's knowledge and utilization of the total ocean environment.

310 39 LEVEL III BIOSAFETY LABORATORY (SF)

FAC: 3103

BFR Required: Y

31039-1 **DEFINITION.** This type of laboratory applies to clinical, diagnostic, and teaching, research, or production facilities for work involving indigenous or exotic agents that have the potential to transmit infection through the respiratory system, which may cause serious and potentially lethal infection. Biosafety Level III applies to Risk Group 3 agents that are associated with serious or lethal human disease for which preventive or therapeutic interventions may be available. Risk Group 3 agents are defined by the guidelines of “Biosafety in Microbiological and Biomedical Laboratories,” US Department of Health and Human Services, Public Health Service, Centers for Disease Control and Prevention, and National Institutes of Health.

31039-2 **USAGE.** Laboratory facilities must be separated from other areas that are subject to unrestricted traffic flow within a building. If a laboratory is separated into different laboratories (zones), a sink must be provided for hand washing in each zone. Access to the laboratory will be restricted to entry by a series of two self-closing doors. A clothing change room (anteroom) may be included in the passageway between the two self-closing doors. An area for decontaminating all laboratory wastes should be planned in the facility, preferably within the laboratory (e.g., autoclave, chemical disinfection, incineration, or other validated decontamination method). The facility must also include an area for decontaminating large pieces of equipment to facilitate removal of the equipment from the laboratory.

310 40 LEVEL IV BIOSAFETY LABORATORY (SF)

FAC: 3104
BFR Required: Y

31040-1 **DEFINITION.** This type of laboratory is associated with work on dangerous and exotic agents that pose a high individual risk of life-threatening disease, aerosol transmission, or related agent with unknown risk of transmission. Biosafety Level IV applies to Risk Group 4 agents that are likely to cause serious or lethal human disease for which preventive or therapeutic interventions are not usually available. Risk Group 4 agents are defined by the guidelines of “Biosafety in Microbiological and Biomedical Laboratories,” US Department of Health and Human Services, Public Health Service, Centers for Disease Control and Prevention, and National Institutes of Health.

31040-2 **USAGE.** A Laboratory facility consists of either a separate building or a clearly demarcated and isolated zone within a building. Rooms in the facility must be arranged to ensure exit by sequential passage through the chemical shower, inner (dirty) change room, personal shower, and outer (clean) changing area. A chemical shower must be provided to decontaminate the surface of the positive pressure suit before the worker leaves the laboratory. Sinks inside the suit laboratory should be placed near procedure areas and contain traps and be connected to the wastewater decontamination system. An eyewash station must be readily available in the laboratory area for use during maintenance and repair activities.

311 AIRCRAFT

311-1 Buildings used directly in the research, development and testing of air frames and related assemblies and spares, and other aircraft equipment.

311 05 RDAT&E MAINTENANCE HANGAR (SQ. M. / SF)

FAC: 2111
BFR Required: Y

Catcodes 311 06 and 311 07 are now included in catcode 311 05

311 06 RDAT&E MAINTENANCE HANGAR – 01 SPACE (CREW AND EQUIPMENT) (SQ. M. / SF)

Catcode 311 06 is now contained in catcode 311 05

311 07 RDAT&E MAINTENANCE HANGAR – 02 SPACE (ADMINISTRATIVE) (SQ. M. / SF)

Catcode 311 07 is now contained in catcode 311 05

31105/06/07-1 **DEFINITION.** This criteria is currently in development and will be posted upon completion.

311 10 AIRCRAFT FLIGHT AND NAVIGATIONAL EQUIPMENT LABORATORY (SF)

FAC: 3111
BFR Required: Y

31110-1 **DEFINITION.** This facility is utilized in conducting research, development, test and evaluation of aerodynamic design of aircraft and weapons systems and navigational systems. Equipment is evaluated to assure optimum flight performance, stability, and control characteristics and on airborne equipment. The facility is also used in conducting RDAT&E in aerodynamic science in support of advanced aircraft and weapon concepts. The facility can also be an operating test facility for air navigation systems, equipment and component acceptance testing, design and performance analysis, and diagnostic and analytic evaluation to ensure proper system equipment and component function.

311 20 AIRCRAFT GROUND SUPPORT EQUIPMENT LABORATORY (SF)

FAC: 3111
BFR Required: Y

31120-1 **DEFINITION.** This facility is used to research, development, test and evaluation of aircraft ground support equipment, systems and techniques for the takeoff, recovery, maintenance, and test of aircraft. The facility is used to test and evaluate ground support equipment for aircraft armament and weapons, aircraft handling, servicing and inspection equipment and aircraft avionics equipment. This does not include missile and missile system ground handling equipment.

311 25 AIRCRAFT SYSTEMS INTEGRATION LABORATORY (SF)

FAC: 3111
BFR Required: Y

31125-1 **DEFINITION.** This facility is used for research, development, test and evaluation of various groupings and collections of interacting aircraft systems such as the effects of airframe, structure, flight control, electrical, environmental control, fuel, hydraulic, mechanical, pneumatic, propulsion, gun, life support and related ground support systems on ECM, air to air missile launch, etc. This does not include work on aircraft engine design characteristics.

312 MISSILE AND SPACE

312-1 Buildings used directly in the research, development and testing of missiles, missile system, related ground handling, and launching equipment, and other aerospace equipment.

312 10 GUIDED MISSILE LABORATORY (SF)

FAC: 3121
BFR Required: Y

31210-1 **DEFINITION.** This facility is used in support of research, development, test and evaluation of advance simulation, instrumentation, environmental test techniques and improved serviceability and reliability characteristics of guided missile weapon systems. It includes assembly, disassembly, test modification and analysis of test firing results of guided missiles.

31210-2 **USAGE.** This facility also may support research, development, test and evaluation of missile navigation systems and related equipment. It includes design and testing of guidance and control systems for guided missiles and launch and arming systems for ballistic missiles, component testing, error diagnosis, and performance analysis as applied to missiles and missile systems.

312 20 MISSILE SUPPORT EQUIPMENT LABORATORY (SF)

FAC: 3121
BFR Required: Y

31220-1 **DEFINITION.** This facility is used for research, development, test and evaluation of equipment and techniques for the launching, recovery, maintenance, transport and testing of missiles and guided missile support equipment.

312 25 SPACECRAFT/SATELLITE LABORATORY (SF)

FAC: 3121
BFR Required: Y

31225-1 **DEFINITION.** This facility supports research, development, test and evaluation of spacecraft, satellites or components of each not otherwise classified as a missile weapon system. This facility would include related ground support/launching equipment.

312 30 MISSILE SYSTEMS INTEGRATION LABORATORY (SF)

FAC: 3121
BFR Required: Y

31230-1 **DEFINITION.** This facility is used for research, development, test and evaluation of related and interconnected systems that are necessary for launching, and in direct support of guided missile systems.

313 SHIP AND MARINE EQUIPMENT

313 10 SHIP AND MARINE LABORATORY (SF)

FAC: 3131

BFR Required: Y

31310-1 **DEFINITION.** This facility is used in conducting research, development, test and evaluation on ships, by use of models in high and low speed tow tanks, maneuvering and seakeeping basins, water tunnels, circulating water channels, fluid phenomenon basins, etc. The facility is also used in conducting fundamental and applied research related to the efficiency of ship structures, other marine vessels, including tracked amphibious vehicles, and the development of methods to assist the effect of static and dynamic loads imposed by submergence depth, wave and submarine structures.

31310-2 **USAGE.** The facility is also an operating test facility for ship and marine vessel navigation systems, equipment and component acceptance testing, design and performance analysis and diagnostic and analytic evaluation to ensure proper system equipment and component function.

313 20 SHIPS AND MARINE EQUIPMENT LABORATORY (SF)

FAC: 3131
BFR Required: Y

31320-1 **DEFINITION.** This facility is used to conduct research, development, test and evaluation of ships and marine support requirement. This includes repair and maintenance equipment as well as equipment for direct support and operation of ships and marine vessels such as periscopes, towed arrays, etc. It is further utilized to support the study of methods for designing shipboard and other marine equipment for resistance to service loads, attacks, and combat reliability.

313 25 SHIPS AND MARINE SYSTEMS INTEGRATION LABORATORY (SF)

FAC: 3131
BFR Required: Y

31325-1 **DEFINITION.** This facility is used for research, development, test and evaluation of related and interconnected ships and marine systems such as the ship platform integrated with the weapons systems, communication systems, command and control systems, surveillance systems, navigation systems, etc. The facility would include mock-up facilities for establishing adaptability, compatibility and space requirements for both man and machine.

314 TANK AND AUTOMOTIVE

314 10 GROUND TRANSPORTATION EQUIPMENT LABORATORY (SF)

FAC: 3141
BFR Required: Y

31410-1 **DEFINITION.** This facility is used in conducting research, development, test and evaluation in the field of automotive design as applied to tanks, APC's, and related military automotive equipment. This facility is also used in conducting RDAT&E on ground equipment in direct support of tank and automotive equipment such as power units, mobile maintenance, test equipment, heavy handling, lifting equipment, etc.

315 WEAPONS AND WEAPON SYSTEMS

315-1 RDAT&E facilities for guided missiles and related items are included under Category Code series 312.

315 10 AIRCRAFT WEAPON SYSTEMS LABORATORY (SF)

FAC: 3151
BFR Required: Y

31510-1 **DEFINITION.** This facility supports the research, development, test and evaluation of aircraft weapon systems including projectiles, mines and bombs, and defensive countermeasures devices/weapons.

315 15 SHIP WEAPON SYSTEM LABORATORY (SF)

FAC: 3151
BFR Required: Y

31515-1 **DEFINITION.** This facility is used for research, development, test and evaluation of weapons and weapon systems deployed from a surface ship. This would include guns, fire control, etc. This does not include aircraft or missile systems.

315 20 UNDERWATER WEAPON SYSTEM LABORATORY (SF)

FAC: 3151
BFR Required: Y

31520-1 **DEFINITION.** This facility is used for research, development, test and evaluation of undersea weaponry such as mines and torpedoes. This would include submarine mounted guns but not submarine launched missiles. Key platform components include sonar, combat control, underwater submarine warfare (USW) weapons targets, unmanned underwater vehicles (UUVs), and fleet training systems.

An underwater weapon system laboratory typically includes the following areas:

- Research offices
- Electronic assembly
- Prototype and electronic repair
- Commercial-off-the-shelf (COTS) laboratory
- Technical library
- Conference room
- Reproduction
- Lounge
- Storage

The typical net-to-gross factor for such a facility is 1.45.

315 25 GROUND WEAPON SYSTEMS LABORATORY (SF)

FAC: 3151
BFR Required: Y

31525-1 **DEFINITION.** This facility is used for research, development, test and evaluation of weaponry in use on or deployed from a ground base platform and would include small arms, automatic weapons, mortars, artillery, flame throwers, etc.

315 30 WEAPON SYSTEMS INTEGRATION LABORATORY (SF)

FAC: 3151
BFR Required: Y

31530-1 **DEFINITION.** This facility is used to accomplish research, development, test and evaluation associated with the integration of weapon systems with the weapons platform and with other interfaces between other weapons systems, guidance systems, surveillance systems, etc.

316 AMMUNITION, EXPLOSIVES AND TOXICS

316 10 AMMUNITION, EXPLOSIVES AND TOXICS LABORATORY (SF)

FAC: 3161
BFR Required: Y

31610-1 **DEFINITION.** This facility is used to support the research, development, test and evaluation of ammunition, rockets, bombs, mines, grenades, torpedoes, depth charges, demolition materials, pyrotechnics, AT0 units, related chemicals, and their components and materials. This Category Code does not include facilities for guided missiles, guided bombs, or commercial type petroleum products.

317 ELECTRONIC, COMMUNICATION AND ELECTRICAL EQUIPMENT

317-1 Buildings used directly in the research, development and testing or radio and radar equipment, signal equipment, radiation aids, electrical equipment and its controls, transmitting and receiving equipment, avionics equipment, sonar, and guided bombs.

317 10 COMMUNICATIONS SYSTEMS LABORATORY (SF)

FAC: 3171
BFR Required: Y

31710-1 **DEFINITION.** This facility is used for conducting research, development, test and evaluation in the areas of radio communication, instrumentation, satellite communication, electromagnetic propagation, radio antennas, underwater sound systems, optical systems (infrared), etc.

31710-2 **FUNCTIONAL AREAS.** A Communications Systems Laboratory may contain the following functional areas: research offices, research support, bench type labs, and specialized research facilities. Please refer to the guidelines provided in the introduction of the 300 series Category Codes for RDAT&E to calculate the requirement.

317 15 DETECTION SYSTEMS LABORATORY (SF)

FAC: 3171
BFR Required: Y

31715-1 **DEFINITION.** This facility is used in conducting research, development, test and evaluation in basic physical phenomena of importance to radar, sonar, and related sensors, also the development of systems analysis and evaluation of the sensors used in satellites, ships, submarines, and aircraft, etc. It includes surveillance for detection, localization, identification and classification of surface, aerospace and sub-surface objects.

317 20 ELECTRICAL AND ELECTRONICS SYSTEMS LABORATORY (SF)

FAC: 3171
BFR Required: Y

31720-1 **DEFINITION.** This facility is used in conducting research, development, test and evaluation in the areas of electrical power and its control, magnetic fields and ship's control systems. Research in this area involves development of motors and generators, frequency converters, voltage and current control devices, and shipboard power distribution systems. In the magnetic fields, studies are conducted in the reduction of stray fields produced by naval equipment, methods of determining ship's magnetic signature and new concepts in degaussing systems.

31720-2 **USAGE.** This facility is also used in the fields of electronics and electromagnetic phenomena in support of components, subsystems, and systems in detection, communication, navigation, countermeasures, acoustics, electromagnetics, identification, and classification as they apply to naval ordnance, submarine weapons systems, surface ships and aircrafts.

317 25 ELECTRICAL, ELECTRONICS AND COMMUNICATION SYSTEMS INTEGRATION LABORATORY (SF)

FAC: 3171
BFR Required: Y

31725-1 **DEFINITION.** This facility is used to accomplish research, development, test and evaluation associated with the integration of related systems and subsystems of electrical, electronics and communications systems with the platform (air, sea, ground, etc.) upon which they will operate and verify interface consideration with other systems operating on the respective platform.

31725-2 **FUNCTIONAL AREAS.** An Electrical, Electronics, and Communications Systems Integration Laboratory may contain the following functional areas: research offices, research support, bench type labs, and specialized research facilities. Please refer to the guidelines provided in the introduction of the 300 series Category Codes for RDAT&E to calculate the requirement.

318 PROPULSION

318 10 PROPULSION SYSTEMS LABORATORY (SF)

FAC: 3181
BFR Required: Y

31810-1 **DEFINITION.** This facility is used to support research, development, test and evaluation of propulsion systems in order to determine operational capabilities and in studying the acoustics and electromagnetic noise effects on performance and efficiency of drive units.

318 15 PROPULSION FUEL LABORATORY (SF)

FAC: 3181
BFR Required: Y

31815-1 **DEFINITION.** This facility is used to support research, development, test, and evaluation of propulsion fuels in order to maximize a propulsion system's operational characteristics. This facility would also support investigation into new fuels and propulsive energy systems.

319 MISCELLANEOUS ITEMS AND EQUIPMENT

319 10 MISCELLANEOUS EQUIPMENT AND ITEMS LABORATORY (SF)

FAC: 3191
BFR Required: Y

31910-1 **DEFINITION.** This facility supports research, development, test, and evaluation of miscellaneous military equipment such as landing mats, valves (e.g. safety, pressure reducing, fuel regulating), and hyperbaric facilities not appropriate in another category code.

319 15 RDAT&E STORAGE LABORATORY (SF)

FAC: 3191

BFR Required: Y

31915-1 **DEFINITION.** This building is a storage facility for research, development, test, and evaluation equipment and materials directly related to RDAT&E programs.

31915-2 Storage facilities for equipment related to RDAT&E facilities will be provided only where it can be individually justified. There are no criteria for this type of facility. General information on normal stacking heights, SF per measurement ton requirements, and calculation methods are provided in the Category Code 440 series.

319 20 CIVIL ENGINEERING LABORATORY (SF)

FAC: 3191
BFR Required: Y

31920-1 **DEFINITION.** This facility is used to support research, development, test and evaluation in the area of civil engineering. This would include military type bridging, hand tools, construction equipment, construction techniques, on land, in and under the ocean.

319 25 HUMAN FACTORS LABORATORY (SF)

FAC: 3191
BFR Required: Y

31925-1 **DEFINITION.** This facility is used to determine the effects of wartime atmosphere and material on military personnel and non-combatants. This facility would also deal with man-man interfacing (morale, command control, and the like) and man-machine interfacing (console design, payload design, work area requirements, etc.)

319 30 SURVIVAL EQUIPMENT AND CLOTHING LABORATORY (SF)

FAC: 3191
BFR Required: Y

31930-1 **DEFINITION.** This facility supports research, development, test and evaluation of pilot's and sailor's need for special equipment, clothing and techniques for survival in various hostile environments.

319 35 METROLOGY AND CALIBRATION LABORATORY (SF)

FAC: 3191
BFR Required: Y

31935-1 **DEFINITION.** This facility will be used in direct support of research, development, test and evaluation programs where precise weights and measures are required in calibrating RDAT&E equipment. This facility would include the metrology and calibration equipment and space for calibrating applicable equipment.

319 40 RANGE OPERATIONS AND INSTRUMENTATION LABORATORY (SF)

FAC: 3191
BFR Required: Y

31940-1 **DEFINITION.** This facility is used in support of research, development, test and evaluation of range operations to include command center, communications, surveillance, instrumentation, data collection/reduction/display, etc.

320 UNDERWATER EQUIPMENT

320 10 UNDERWATER EQUIPMENT LABORATORY (SF)

FAC: 3201
BFR Required: Y

32010-1 This facility is used in conducting research development, test and evaluation of underwater acoustics, ship vibrations and various types of underwater devices to increase man's capabilities in the ocean.

32010-2 The facility is also used to support RDT&E in hydro-acoustics, structural acoustics, mechanical vibration and signal processing, and conducting acoustic and vibration trials and instrumentation devices for sound and vibration attenuation, the RDT&E of deep ocean tools, equipment and work systems as well as support equipment for divers, submersibles and marine systems of all types.

32010-3 This building supports the RDT&E of undersea navigational systems and related equipment. This would include component design, error diagnosis, and performance analysis for location sensing, direction control, and depth control for undersea vessels. It would include devices for manned and unmanned vehicles as well as divers’ navigational equipment.

320 20 UNDERWATER SYSTEMS INTEGRATION LABORATORY (SF)

FAC: 3201
BFR Required: Y

32020-1 This facility will be used for research, development, test and evaluation of various interacting underwater systems, equipment, tools, techniques and operators working together in an underwater environment. The integration of several systems to accomplish a greater total effort will be accomplished in this facility.

321 TECHNICAL SERVICES

321 10 TECHNICAL SERVICES LABORATORY (SF)

FAC: 3211
BFR Required: Y

32110-1 Buildings used directly in RD&T manufacturing or reverse engineering of one-of-a-kind models and parts for systems or subsystems from wood, plastic, fiberglass and other materials by molding, casting, extruding and machining.

371 RANGE FACILITIES

371-1 Structures used directly in research, development and testing of small arms, artillery, weapons systems, avionics, protection equipment, shelters, etc.

371 10 SCIENCE SYSTEMS RANGE FACILITY (EA)

FAC: 3712
BFR Required: N

37110-1 Facilities used in the conduct of tests and evaluations of items identified under Category Code series 310.

371 11 AIRCRAFT SYSTEMS RANGE FACILITY (EA)

FAC: 3712
BFR Required: N

37111-1 Facilities used in the conduct of tests and evaluations of items identified under Category Code series 311.

371 12 MISSILE AND SPACE SYSTEMS RANGE FACILITY (EA)

FAC: 3712
BFR Required: N

37112-1 Facilities used in the conduct of tests and evaluations of items identified under Category Code series 312.

371 13 SHIPS AND MARINE SYSTEMS RANGE FACILITY (EA)

FAC: 3712
BFR Required: N

37113-1 Facilities used in the conduct of tests and evaluations of items identified under Category Code series 313.

371 14 TANK AND AUTOMOTIVE SYSTEMS RANGE FACILITY (EA)

FAC: 3712
BFR Required: N

37114-1 Facilities used in the conduct of tests and evaluations of items identified under Category Code series 314.

371 15 WEAPONS AND WEAPON SYSTEMS RANGE FACILITY (EA)

FAC: 3712
BFR Required: N

37115-1 Facilities used in the conduct of tests and evaluations of items identified under Category Code series 315.

371 16 AMMUNITION, EXPLOSIVES AND TOXICS RANGE FACILITY (EA)

FAC: 3712
BFR Required: N

37116-1 Facilities used in the conduct of tests and evaluations of items identified under Category Code series 316.

371 17 ELECTRONIC, COMMUNICATION AND ELECTRICAL SYSTEMS RANGE FACILITY (EA)

FAC: 3712
BFR Required: N

37117-1 Facilities used in the conduct of tests and evaluations of items identified under Category Code series 317.

371 18 PROPULSION SYSTEMS RANGE FACILITY (EA)

FAC: 3712
BFR Required: N

37118-1 Facilities used in the conduct of tests and evaluations of items identified under Category Code series 318.

371 19 MISCELLANEOUS ITEMS AND EQUIPMENT RANGE FACILITY (EA)

FAC: 3712
BFR Required: N

37119-1 Facilities used in the conduct of tests and evaluations of items identified under Category Code series 319.

371 20 UNDERWATER SYSTEMS RANGE FACILITY (EA)

FAC: 3712
BFR Required: N

37120-1 Facilities used in the conduct of tests and evaluations of items identified under Category Code series 320.

390 RDT&E OTHER THAN BUILDINGS AND RANGE FACILITIES

390-1 Scientific structures and facilities other than buildings used directly in theoretical or applied research, development, and test operations related to such items as test tracks, wind tunnels, etc. Do not include structures and buildings used for normal maintenance, repair, and overhaul purposes.

390 10 SCIENCE SYSTEMS FACILITY (EA)

FAC: 3901
BFR Required: N

39010-1 Facilities used in the conduct of research, development, test and evaluation of items identified under Category Code series 310.

390 11 AIRCRAFT SYSTEMS FACILITY (EA)

FAC: 3901
BFR Required: N

39011-1 Facilities used in the conduct of research, development, test and evaluation of items identified under Category Code series 311.

390 12 MISSILE AND SPACE SYSTEMS FACILITY (EA)

FAC: 3901
BFR Required: N

39012-1 Facilities used in the conduct of research, development, test and evaluation of items identified under Category Code series 312.

390 13 SHIPS AND MARINE SYSTEMS FACILITY (EA)

FAC: 3901
BFR Required: N

39013-1 Facilities used in the conduct of research, development, test and evaluation of items identified under Category Code series 313.

390 14 TANK AND AUTOMOTIVE SYSTEMS FACILITY (EA)

FAC: 3901
BFR Required: N

39014-1 Facilities used in the conduct of research, development, test and evaluation of items identified under Category Code series 314.

390 15 WEAPONS AND WEAPONS SYSTEMS FACILITY (EA)

FAC: 3901
BFR Required: N

39015-1 Facilities used in the conduct of research, development, test and evaluation of items identified under Category Code series 315.

390 16 AMMUNITION, EXPLOSIVES AND TOXICS FACILITY (EA)

FAC: 3901
BFR Required: N

39016-1 Facilities used in the conduct of research, development, test and evaluation of items identified under Category Code series 316.

390 17 ELECTRONIC, COMMUNICATION AND ELECTRICAL SYSTEMS FACILITY (EA)

FAC: 3901
BFR Required: N

39017-1 Facilities used in the conduct of research, development, test and evaluation of items identified under Category Code series 317.

390 18 PROPULSION SYSTEMS FACILITY (EA)

FAC: 3901
BFR Required: N

39018-1 Facilities used in the conduct of research, development, test and evaluation of items identified under the Category Code series 318.

390 19 MISCELLANEOUS ITEMS AND EQUIPMENT FACILITY (EA)

FAC: 3901
BFR Required: N

39019-1 Facilities used in the conduct of research, development, test and evaluation of items identified under the Category Code series 319.

390 20 UNDERWATER SYSTEMS FACILITY (EA)

FAC: 3901
BFR Required: N

39020-1 Facilities used in the conduct of research, development, test and evaluation of items identified under the Category Code series 320.

Version: 400.20233005

FACILITIES CRITERIA (FC)
FACILITY PLANNING FOR NAVY AND MARINE CORPS SHORE INSTALLATIONS

Series 400: Supply Facilities

Record of Changes:

Date	CCN #	CCN Title	Description of change
Jan 2017	Section 420	Ammunition Storage	Complete revision of magazine sizing and siting criteria. Implementation of Magazine Storage and Requirements Calculator (MSRC).
Jan 2017	Section 421	Ammunition Storage Depot and Installation	Revisions to magazine category codes within 421 series.
Jan 2017	42112	Fuse And Detonator Magazine	Consolidated into CCN 42122 High Explosive Magazine. CCN deleted from iNFADS.
Jan 2017	42152	Smokeless Powder And Projectile Magazine	Consolidated into CCN 42122 High Explosive Magazine. CCN deleted from iNFADS.
Jan 2017	42172	Missile Magazine	Consolidated into CCN 42122 High Explosive Magazine. CCN deleted from iNFADS.
Jan 2017	NEW-Table 420-1	Various CCNs	Provides new list of CCNs within the UFC 2-000-05N that require explosive safety site approval.
June 2018	42511	Explosive Storage Site Pad	Added new CCN for site pads for non-RP ordnance storage.
Sep 2019	Section 420	Ammunition Storage	Updated to reflect 10-digit CODEX. Added new requirement for ordnance handling loading/offloading area for all new Earth Covered Magazines.
Sep 2019	41160	Liquefied Petroleum Gas Storage	FAC Code changed to 1244
Sep 2019	42182	Submarine Launched Ballistic Missile	FAC Code changed to 4211
July 2020	42510	Open Ammunition Storage Pad	FAC code changed to 8526
July 2020	42511	Explosive Storage Site Pad	FAC code changed to 8526; revised criteria verbiage.

Date	CCN #	CCN Title	Description of change
8 August 2022	421 36	Ammunition Storage Building	1. Corrected Table 420-2 “MSRC Stowage Matrix.” 2. Added Table 420-3 “Magazine Type and Gross Square Footage.” 3. Added Containerized Long Weapons Storage (CLWS) magazine storage matrix and GSF to tables 420-2 and 420-3.
October 3 2022	420	Ammunition Storage	Updated CCN 420 hyperlinks to flankspeed site. Added CLWS Magazines to the storage matrix of Table 420-2. Changed sf for CLWS Magazines in Table 420-3 Added note to 420-10.7 concerning Army MSM magazines being sited by NOSSA.
4 January 2023	420 Series	Ammunition Storage	Updated Section 420-10.7 Estimating Future Magazines to address magazine spacing and continuous earth cover.
2 Mar 2023	400 Series	UFC 2-000-05N	Change UFC 2-000-05N to FC 2-000-05N document due to the fact that this planning criteria is not unified among the other DoD services.
17 Mar 2023	400 Series, Section 411-1	General Requirements	Change URL to access UFC 3-460-01 Petroleum Fuel Facilities.
17 Mar 2023	411-52	Cut and Cover Jet Engine Fuel Storage	Change URL to access UFC 3-460-01 Petroleum Fuel Facilities.
17 Mar 2023	411-60, Section 41160.2	Liquefied Petroleum Gas Storage	Change URL to access UFC 3-460—01 Petroleum Fuel Facilities.
13 Apr 2023	441-30, Section 44130-1	Hazardous and Flammables Storehouse	Replace references MIL-HDBK 1032/2 and UFC 4-442-01N with UFC 4-440-01.
30 May 2023	420 Series	Ammunition Storage	Updated 420-4 Ordnance Handling, Loading and Offloading Area to define paved area as a single continuous plane with a 0.5% min to 2% max slope to allow for proper drainage away from the ECM. Redefined the size of loading area for Box Type C,D,G,H, MSM, and CLWS magazines

400 SERIES
SUPPLY FACILITIES

Table of Contents

411 LIQUID FUEL STORAGE – BULK

411-1 GENERAL REQUIREMENTS

The availability of commercial facilities, intended service, and government resources (available developable area, security and safety of operations, and operation) should be considered as part of the overall planning process. Special care should be noted of site conditions to ensure design criteria can be met. This information can be found in the most current version of Unified Facilities Criteria Design: Petroleum Fuel Facilities (UFC 3-460-01), located on the Whole Building Design Guide (WBDG) website at the following link:

https://www.wbdg.org/ffc/dod/unified-facilities-criteria-ufc/ufc-3-460-01

This document also provides information on the ancillary equipment associated with liquid fuel storage (i.e., pumping station, pipelines, etc.). These facilities will typically have separate category codes.

Note that the real property components associated with the category codes having FAC codes of 4111, 4112, and 4113 include the tanks and any containment structures associated with them, such as berms, liners, and monitoring wells. In the case of "cut and cover" type fuel storage under FAC 4113, the integral deep well turbine pumps are also included in the associated category codes and are not to be counted as separate real property assets.

411-2 STORAGE QUANTITIES

The quantities and types of petroleum products to be stored are based on consumption of fuels by the ships, aircraft, vehicles and equipment at the activities served and what type of delivery system that is utilized. Depot fuel storage facilities must be of sufficient capacity to provide an adequate operating and reserve supply of fuel for the activities served. A barrel is the standard 42 U.S. gallon capacity.

411-2.1 **Capacities.** For planning purposes, the capacities of individual tanks should be approximately 25% of the ultimate storage for each type of fuel, subject to the following:

411-2.1.1 The minimum capacity of a tank for fuel depot bulk storage shall not be less than:

- Diesel Fuel 13,500 barrels
- Fuel Oil 27,000 barrels

411-2.1.2 Standard tank sizes should be used.

411-2.1.3 A minimum of two tanks will be provided for each type of fuel. One will serve as the working tank and the other the receiving tank for new deliveries.

411-2.1.4 It is necessary for impurities in MoGas, AvGas and jet fuels to settle prior to the use. The time required for jet fuel to settle is one hour per foot of depth of the fuel in the tank.

411-3 CATEGORY CODES

The category codes in this section include fuel storage tanks of the following classifications: operational; bulk fuel; cut and cover; liquefied petroleum (LP); contaminated; and heating oil. CCNs 411-10 through 411-52 represent the fuel types associated with operational (10,000-100,000 barrel capacity), bulk fuel (greater than 100,000 barrel capacity), and cut and cover storage tanks (earth covered for hostile environments). CCNs 411-60 through 411-84 represent the remaining fuel types associated with this section.

411 10 SHIP FUEL STORAGE 10K-100K (BL)

FAC: 4111
BFR Required: Y

411 11 SHIP FUEL STORAGE > 100K (BL)

FAC: 4112
BFR Required: Y

411 12 CUT AND COVER SHIP FUEL STORAGE (BL)

FAC: 4113
BFR Required: Y

411 20 AVIATION FUEL STORAGE 10K-100K (BL)

FAC: 4111
BFR Required: Y

411 21 AVIATION FUEL STORAGE > 100K (BL)

FAC: 4112
BFR Required: Y

411 22 CUT AND COVER AVIATION FUEL STORAGE (BL)

FAC: 4113
BFR Required: Y

411 30 DIESEL FUEL STORAGE 10K-100K (BL)

FAC: 4111
BFR Required: Y

411 31 DIESEL FUEL STORAGE > 100K (BL)

FAC: 4112
BFR Required: Y

411 32 CUT AND COVER DIESEL FUEL STORAGE (BL)

BFR Required: Y

411 50 JET ENGINE FUEL STORAGE 10K-100K (BL)

FAC: 4111
BFR Required: Y

411 51 JET ENGINE FUEL STORAGE >100K (BL)

FAC: 4112
BFR Required: Y

411 52 CUT AND COVER JET ENGINE FUEL STORAGE (BL)

FAC: 4113
BFR Required: Y

DEFINITION. The fuel products in these category codes 411-10 through 411-52 are organized into three basic categories: operational fuel storage, bulk fuel storage, and “cut and cover” fuel storage. Operational storage tanks are designed with capacities between 10K and 100K BL; bulk storage tanks are designed with capacities greater than 100K BL; and “cut and cover” storage tanks are designed with capacities typically between 10K and 100K BL (these are operational tanks used in potentially hostile environments). Bulk fuel storage tanks are supplied by pipelines, tank trucks, or rail tanker cars. The bulk tanks in turn, supply operational fuel tanks and “cut and cover” storage tanks, which then supply the various fueling systems at an installation.

The Fleet Fuels Officer, Code N413F, within the US Fleet Forces Command in collaboration with Defense Logistics Agency’s (DLA) Defense Energy Support Center (DESC) Code B (Bulk Fuels) will determine the fuel storage requirement. Design guidance, including safety features, can be found in the most current version of Unified Facilities Criteria Design: Petroleum Fuel Facilities (UFC 3-460-01), located on the Whole Building Design Guide (WBDG) website at the following link:

https://www.wbdg.org/ffc/dod/unified-facilities-criteria-ufc/ufc-3-460-01

Note that the real property components associated with the above category codes include the tanks and any containment structures associated with them, such as berms, liners, and monitoring wells. In the case of “cut and cover” type fuel storage, the integral deep well turbine pumps are also included in the associated category codes and are not to be counted as separate real property assets.

411 55 BULK/READY FUEL ADDITIVE STORAGE (BL)

FAC: 4114
BFR Required: Y

411 60 LIQUEFIED PETROLEUM GAS STORAGE (BL)

FAC: 1244
BFR Required: Y

41160-1 **DEFINITION.** The Navy uses liquefied petroleum gas, commonly known as LPG, for heating, metal cutting, brazing, in dental laboratories, aboard ships, and in similar installations. LPG consists predominantly of propane, propylene, with minor amounts of butane, isobutene, and butylene.

41160-2 **REQUIREMENT.** LPG is normally supplied in 100-pound cylinders or delivered by tanker truck or train car. The bulk storage capacity requirements for LPG depend on activity requirements, frequency of deliveries, and dependability of supply as well as lack LPG on base operations. Historical data is a good resource for developing a requirement looking for predictable changes in demand (i.e., loss of metal shop, increase in ship homeporting, increase in local dental operations, etc.). Otherwise, review equipment specifications for consumption rate as well as equipment usage to determine basic requirement. Again, allow for impacts from delivery schedules and dependability. Design guidance, including safety features, can be found in the most current version of Unified Facilities Criteria Design: Petroleum Fuel Facilities (UFC 3-

460-01), located on the Whole Building Design Guide (WBDG) website at the following link:

https://www.wbdg.org/ffc/dod/unified-facilities-criteria-ufc/ufc-3-460-01

411 82 CONTAMINATED FUEL STORAGE (BL)

FAC: 4211
BFR Required: Y

41182-1 **DEFINITION.** A fuel storage facility requires temporary storage for off-specification (contaminated) fuel.

41182-2 **REQUIREMENT.** Separate tanks should be provided for each type of fuel stored and consumed in large quantities. Review historical data to determine typical volume of delivery and method and schedule of disposal to determine tank size.

411 84 BULK (DEPOT) HEATING FUEL STORAGE (BL)

FAC: 4111
BFR Required: Y

41184-1 **DEFINITION.** Heating fuel oil storage may include storage tanks for kerosene and several different grades of diesel oil.

41184-2 **REQUIREMENT.** The station’s requirements and mission will determine the quantity of any type of heating fuel oil stored. Some bases may rely on contract deliveries versus depot support. In these instances, depot storage should not be provided.

412 LIQUID STORAGE OTHER THAN WATER, FUEL AND PROPELLANTS

412-1 GENERAL DESCRIPTION

This group includes tank storage, accessories and piping for organic liquids such as cottonseed, linseed or soybean oils and other non-fuel liquids such as lubricants, ballast, or waste oils. Historical data should be available to determine rate of delivery and storage requirement. For waste liquids and oils, methods and schedule of disposals should be considered when determining storage requirement.

412-2 STORAGE QUANTITIES

No specific planning factors for the following category codes are currently available. Historical data may be used to develop the basic requirement including review of delivery schedules and removal of materials. Method of delivery/removal (i.e., pipeline to barge, truck, etc.), maximum quantity delivered/removed (is incoming quantity greater than outgoing quantity) and frequency (how often is material delivered to tanks and how often is material taken from tank) should also be considered.

412-3 CATEGORY CODES

The individual category codes in this group are shown below:

412 15 ROAD OIL STORAGE (GA)

FAC: 4121
BFR Required: N

412 25 LUBRICANT STORAGE (GA)

FAC: 4121
BFR Required: N

412 35 BALLAST AND SLUDGE STORAGE (GA)

FAC: 4121
BFR Required: N

412 40 ORGANIC OIL STORAGE (GA)

FAC: 4121
BFR Required: N

412 45 MISCELLANEOUS LIQUID STORAGE (GA)

FAC: 4121
BFR Required: N

412 50 INDUSTRIAL/POL WASTE STORAGE FACILITY (GA)

FAC: 4121
BFR Required: N

420 AMMUNITION STORAGE

420-1 DEFINITION

Ammunition storage utilizes magazines, general purpose and refrigerated storehouses, tanks, open storage pads and associated stationary equipment for storage of Ammunition, Inert Ammunition Components, Liquid Propellants and Weapon-Related Batteries.

Category groups pertaining to these facilities are as follows:

Code 421 Ammunition Storage (Tables 420-l thru 420-19)

The 421 series category codes have been re-organized to simplify and make category codes more consistent with magazine construction design. 421-22 High Explosive Magazine becomes the primary category code. The following category codes have been eliminated and rolled up under 421-22 High Explosive Magazine:

- **421 12 Fuse and Detonator Magazine**
- **421 52 Smokeless Powder and Projectile Magazine**
- **421 72 Missile Magazine**
- **421 83 High Performance Magazine**

Code 423 Ammunition Storage -Liquid Propellants (Tables 420-20 thru 420-25)
Code 424 Weapon-Related Battery Storage
Code 425 Open Ammunition Storage

NOTE: All planners developing magazine BFRs must have current certification through AMMO-36 Explosives Safety for Naval Facility Planning offered by the Defense Ammunition Center.

420-2 GENERAL STORAGE REQUIREMENTS

Ammunition and bulk explosives should be stored in magazines of approved design, sited and designated for specific purposes. The type and amount of material that may be stored in any magazine is dependent on the quantity-distance requirements and permissible storages as established by the Department of Defense Explosives Safety Board (DDESB) and as approved by the Naval Sea Systems Command. These safety distance requirements are designed to provide the inhabitants of nearby communities, military personnel, and adjacent public and private property reasonable safety from injury or destruction from possible fires or explosions, and to keep to a minimum the loss of valuable ammunition stores through fire or explosions.

420-3 MAGAZINE AREA

The magazine area is the area surrounding a magazine or group of magazines, where personnel movements are restricted in the interest of safety. Magazines must be sufficiently remote from inhabited buildings, passenger railroads, and public highways, including navigable waters, so that the dangers and risks involved in storing explosives and ammunition are confined primarily to the magazine area. In order to insure this safety zone the DDESB has spacing criteria for magazines, based on the type of hazard involved and the quantity of explosives stored. See Naval Sea Systems Command Publication NAVSEA OP-5 Volume 1 (current revision) for Quantity-Distance Requirements. In the case of existing facilities, spacing criteria may limit the amount of explosives stored in a magazine to less than full capacity. In addition, limits have been set on the maximum amount of explosives that can be stored in certain types of magazines. This information is listed in the category code descriptions.

420-4 ORDNANCE HANDLING, LOADING AND OFFLOADING AREA

For new construction of Earth Covered Magazines (ECM), a concrete area will be required in front of the ECM for handling, staging, inspection, loading and offloading ordnance. This paved area will ensure adequate space is available to handle ordnance in accordance with the safety principles and tenets outlined in NAVSEA OP 5 Volume 1, Ammunition and Explosives Safety Ashore. This paved area provides safe turning distances for Material Handling Equipment (MHE) transporting ordnance and for ordnance transportation conveyances while allowing spotters and safety observers a clear view of the operation from a safe distance. The area provides critical space and clearances for ordnance staging, set-down, and maneuvering containerized weapons and pallets to/from flat bed and enclosed commercial conveyances.

For Box Types C, D, G, H, and Containerized Long Weapons Storage (CLWS) Double Bay magazines, the paved area must be approximately 175’ wide centered in front of the magazine and extend 85’ outward from the magazine. For Box Type Modular Storage Magazines (MSM) and CLWS Single Bay magazines, the paved area must be approximately 100’ wide centered in front of the magazine and extent 85’ outward from the magazine.

The paved area must drain away from the ECM in a single continuous plane and the grade must be 0.5 % min with a 2.0 % max slope from the magazine.

The paved area must not be part of an adjacent road, but must connect with the adjacent road with an adequate turning radius or short access road. The paved area must be measured from the face of either, the ECM headwall where there is no loading dock or from the face of the ECM loading dock.

Where the above paved area is not available in front of the ECM, the planner must coordinate with the Local Ordnance Handling Activity and their respective Echelon III command to review and assess the impacts to ordnance handling safety. If the appropriate area is not provided, the Echelon III command must provide written (via email) concurrence of the proposed alternative to ensure all risk management concerns have been addressed or mitigated.

The ordnance handling, loading and offloading area will be recorded under Category Code 852-40.

420-5 SEGREGATION OF MATERIALS

The dangers or hazards involved in the storage of ammunition or explosives are not measured solely by the quantity of explosives stored, but also by its sensitivity - explosives that present similar hazards may generally be stored together. Tables showing compatibility relationships can be found in the NAVSEA OP-5, Vol. I (current revision).

420-6 WEIGHT MEASUREMENT

Net Explosive Weight (hereafter referred to as NEW). This is the weight of explosive material, and is measured in pounds. In items of ammunition with a high explosive main charge, fuses containing ignition explosives, and a propelling charge of smokeless powder, the NEW is calculated in accordance with NAVSEA OP-5 Vol. I, Chapter 5. It is the NEW of ammunition or bulk explosives that is used in application of explosive safety quantity-distance (ESQD) tables.

420-7 SITING REQUIREMENTS

To ensure the prevention of unacceptable damage or injuries in the event of an accidental explosion, siting criteria have been established to define minimum required separation distances between a Potential Explosion Site (PES) and other facilities. Minimum separation distances have also been established to prevent sympathetic detonation between two PESs, and to prevent prompt propagation of an explosives event between two PES's. ESQD minimum separation distances are based upon several factors including, but not limited to:

- The level of protection mandated by the applicable explosive safety standard
- The Exposed Site (ES) type and classification
- The NEW
- The hazard classification of the ammunition and explosives at a PES
- The physical orientation between the PES and the ES
- The presence of effective barricading

Minimum ESQDs are defined in the applicable DoD and service specific explosive safety standards for various applications. These ESQDs are based on maximum levels of risk considered acceptable for various types of ES. Separation distances are not absolute safe distances, but are relative protective or safe distances.

Use greater distances than those shown in the explosive safety standards whenever practicable.

Explosives safety site plans are required for construction projects involving new PESs, new facilities (explosive or non-explosive) within the ESQD arc of existing PES, as well as for the upgrading or renovation of existing facilities (explosive or non-explosive) that might impact the explosives safety criteria applied to these facilities (e.g., removal of hardening for fragmentation that previously allowed the facility to be a lesser distance, change of mission that requires the facility to now be at a greater distance). These site plans are reviewed to ensure explosives safety criteria are being met by the proposed work. DoD requires most explosives safety site plans to be forwarded to the DDESB for review and approval. See NAVSEA explosives safety criteria for more detail on when a site plan is required and what level of site plan review and approval must be accomplished prior to commencing projects.

Table 420-1
CCNs Requiring Site Approval

116-55	148-35	216-10	226-25	226-66	421-22	425-11
116-56	148-40	216-20	226-30	226-70	421-35	
143-20	148-45	216-30	226-35	226-80	421-42	
143-21	151-10	216-40	226-40	226-81	421-48	
143-60	151-70	216-50	226-45	226-82	421-62	
148-20	212-10	216-55	226-50	226-85	421-82	
148-25	212-30	216-77	226-55	226-86	425-10	
148-30	212-50	222-10	226-56	226-88	425-30	

Explosives safety site approvals are required for facilities of the CCNs of Table 420-1. See NAVSEA explosives safety criteria, OP-5 and NAVFACINST 11010.45 (latest rev) for more detail. **The planner preparing the site approval must have current certification through AMMO-36 Explosives Safety for Naval Facility Planning offered by the Defense Ammunition Center**.

420-8 AMMUNITION LOADING

The first step in preparing requirements for ammunition storage is obtaining the authorized ammunition load plan for the installation or command for which the requirement is being prepared. To obtain the authorized load plan, the planner should contact the local or regional representative from Naval Munitions Command (NMC). When an NMC load plan is not available, the planner should contact the tenant command for which the requirement is being developed and request a copy of the Arms, Ammunition, and Explosives (AA&E) loading.

The load plan could be the Global Requirements Based Load Plan (GRBLP) or another site-specific requirement such as the tenant command’s N4 shop providing the Navy Ammunition Logistics Code (NALC) items and the quantity being used, averaged over a one year period. The GRBLP is developed and maintained by Naval Supply Systems Command, Global Logistics Support in Mechanicsburg, PA. The GRBLP will be obtained by NMC from Ordnance Information System (OIS). NMC should adjust the data to properly reflect the added ammunition maintenance load as well as a reduction factor to account for the percentage of the items that need to be stored ashore versus the items deployed afloat. Fleet Commanders Ordnance staff should be consulted for fleet ordnance download requirements from ships. NMC will provide this “adjusted” GRBLP to the planner for use.

420-9 TYPES OF MAGAZINES

The next step the planner should take is to determine the number of existing magazine assets for the installation or command and the exact type and size of each by design. This is contrary to typical requirement calculations made independent of existing facilities. A key component of the updated criteria is an accurate determination of the physical construction type of each magazine.

Earth-Covered Magazines (ECM) typically fall within one of the following categories. Details for these magazine types can be found in DDESB Technical Paper Number 15 (TP 15) Approved Protective Construction and UFC 4-420-01.

- Small “Keyport” or “Fuse & Detonator” magazines – typically smaller than 20’ x 20’
- Arch magazines – typically 25’ wide and varying in depth between 20’ and 80’ (can be standalone or one of three in a triple arch magazine facility).
- Legacy box magazines – Smokeless Powder and Projectile (SP&P), Standard Missile Magazines, Box Types A and B
- Modern box magazines – Box Types C, D, E, F and M
- Modular Storage Magazines (MSM) – 25’ wide and varying in depth between 20’ and 80’

Installations can commonly have several magazines that are modified versions of the types listed above. Both TP 15 and UFC 4-420-01 define magazine designs that are authorized for future construction. For new construction, the following magazines are recommended: Box Type C/D, Modular Storage Magazine (Navy), Modular Storage Magazine (European), Containerized Long Weapons Storage (32’ Single Bay, 50’ Double Bay). The CLWS magazine is currently under development and shall be ready 4th quarter of FY20. If a different magazine than the recommended designs listed above is being considered, the planner shall contact NOSSA to obtain approval for use.

The planner should contact the local NMC Detachment or Naval Ordnance Safety and Security Activity (NOSSA) for information on existing facilities. If this data does not exist, a detailed asset evaluation of the magazines should be conducted to identify the design of each ammunition storage facility. In addition, the planner shall consult the Magazine Design Type Identification Guide, which provides technical and detailed information on the various magazine design types (both legacy, and approved for new construction) used by the Navy and Marine Corps. The magazine type is an identifying feature on the iNFADS Property Record Card. The Magazine Design Type Identification Guide is available on the NAVFAC Criteria Management Portal page: Magazine Guide

420-9.1 MAGAZINE ASSET EVALUATION

When conducting an asset evaluation survey of an ammunition storage magazine, the planner should work with the NMC Detachment representative and have access to the installation's latest Explosives Safety Siting *(*ESS*)* software program. Planners should use the "Magazine Construction Assessment Report" (MCAR) to record the magazine physical characteristics while in the field (link to downloadable form is referenced below).

The planner should physically inspect and record the following data of each magazine:

- Interior Length - The interior measurement (to the nearest inch) of the distance from headwall to back wall.
- Interior Width - The interior measurement (to the nearest inch) of one side to the other. For arch magazines, this measurement is taken at the base of the wall.
- Interior Height - The vertical distance measured from the ground inside to the ceiling (to the nearest linear foot). For box type magazines the ceiling is sloped and the height will vary. The height should be measured at the high and low points.
- Exterior Length – The exterior measurement (to the nearest inch) of the magazine. For earth covered magazines, refer to the Magazine Design Type Identification Guide for specifications.
- Exterior Width – The exterior measurement (to the nearest inch) of the magazine. For earth covered magazines, refer to the Magazine Design Type Identification Guide for specifications.
- Doors - The number of doors, height and width (to the nearest inch), and thickness (to the nearest inch) of the door panel as well as the clear opening and location from center of headwall. Record if the door is single or double leaf design and whether the door is designed to swing open or slide open. If the door has more than one steel plate in thickness (i.e., is the door a built-up section), record details of the various plates and the channels/beams/bracing used to construct the door. Note the bracing and bearing surfaces supporting the door. Specifically, note any corbels on the ceiling or pull-up door stops in the floor.
- Headwall – Measure the thickness (to the nearest inch) of the thinnest part of the head wall. This may not be directly measurable at the door opening. Record any window or other opening in the headwall that is not concrete.
- Columns – Number, width, height and distance between (to the nearest linear half-foot) each column. Note the type and dimensions (width and height to the nearest inch) of the column header at the ceiling. Note if there are multiple

column rows and the number in each row as well as the distance between (side to side).

- Bays – Number of and distance between (front to rear) column bays.
- Miscellaneous – Indicate presence of loading dock, wing walls, IDS, revetment/berm/barricade, mechanical room and crane. Measure the loading dock length, width and total area (square feet). Measure the revetment distance from the headwall (feet). Identify IDS type and access type (rail, pallets, forklift, small missile, large missile, etc.).
- Photographs of each building, facility and structure. Photographs of the interior of the magazine, the head wall from the outside and inside, and the door from the outside and the inside. (NOTE: photographs are subject to security restrictions).
- Note any other structural feature such as HVAC openings, rails in the floor, added walls or racks

This data should be compared against known designs in the Magazine Design Type Identification Guide, available on the NAVFAC Criteria Management portal page to determine the magazine type. Both the MCAR and the Magazine Design Type Identification Guide are available on the Criteria Management portal page (located HERE). Because variations to the standard magazine types do exist at many installations, capturing the key structural features of each facility is essential. In these cases, the planner should consult with structural engineers from NAVFAC Capital Improvements or NOSSA. The CODEX is a 10-digit code which describes magazine type (including variants of the main types), strength (7 Bar, 3 Bar, and Undefined, as well as Flat Roof downgrade, and types of Above Ground Magazines (AGMs)), and exterior features such as barricades, access in/out of the magazine, and if there is or is not Intrusion Detection System (IDS) protection, and the level of security provided by the magazine. The CODEX coupled with the Magazine Construction Assessment Report (MCAR) provides the definition of a magazine which sites physical capabilities, strength and security requirements of ammunition stored. The CODEX consists of a ten-digit number represented by eight data fields in iNFADS. These fields are:

- Facility Type – 1st and 2nd digit
- Facility Sub Type – 3rd and 4th digit
- Strength Designator – 5th digit
- Barrier – 6th digit
- Access Type – 7th digit
- Intrusion Detection System (IDS) – 8th digit
- Mechanical Room – 9th digit
- Bridge Cranes/Monorails – 10th digit

Upon completion of the CODEX for each magazine, the planner shall validate the CODEX with the Installation Explosive Safety Officer (ESO). Once approved, the final MCAR shall be signed by the ESO and uploaded as an attachment to the property record card. In addition to uploading the signed MCAR, the magazine type must be entered for each facility via the “MCAR” tab located under the physical level tab of the iNFADS Facility Module (at the utilization level). The information entered will subsequently appear on the Property Record Card.

Additional data that should be captured includes:

- Maintenance Responsibility UIC
- User UIC
- Presence of a front loading dock or apron. Loading docks shall be classified as a utilization within the magazine's property record card under Category Code 85115 "Load/Unload Ramp."
- Presence of front wing walls. These are concrete walls at ECMs that flank both sides of the headwall.
- Presence of a mechanical room. Mechanical rooms shall be classified as a utilization within the magazine's property record card under Category Code 89009 "Miscellaneous Utility Building."
- Presence of an adjacent, earthen berm or engineered revetment or barricade (typically either a steel or concrete structure). This structure should be recorded under Category Code 14910 "Protective Barricade/Revetment" and each non-contiguous asset should be counted separately on the property record card.
- Where there are multiple Hazard Class/Divisions (HC/D) in a magazine, the utilization of the magazine will be determined by siting the most restrictive HC/D.
- Where there are multiple tenant commands in a magazine, the utilization of the magazine shall be determined by the most restrictive HC/D material being held by the group of tenants.
- NOTE: Prior to changing the utilization Category Code of a magazine, the planner shall contact the Installation Explosive Safety Office and discuss/verify the action is acceptable.
- NOTE: Verify that the "Predominate Design" field in iNFADS aligns with the ESO's Safety Site Approval designation for the facility. This field shall only be changed with ESO approval.

420-10 PLANNING METHOD

A facility requirement is established by comparing the required load plan to the available existing facilities to determine if sufficient space exists or if a deficit exists. The load plan could be the GRBLP or another site-specific requirement. The list of existing facilities is based on the list of explosive storage facilities with current approved site plans.

The methodology used for the comparison and the required level of detail is a factor of the relative size of the installation or area being considered. Two generic size categories are described here. These categories are not rigid and judgment should be used to determine the most effective analysis method.

- Small scenario (manual)–
    - Fewer than 5 storage magazines, or

    - Storage of less than 4 item types, or
    - Storage of a small load plan (less than 100 pallets/footprints) in which the number of pallets/footprints is already defined
- Large scenario –
    - Any scenario with 5 or greater storage magazines, or
    - Storage of 4 or greater item types, or
    - Storage of a large load plan with greater than 100 pallets/footprints, or
    - Any complex load plan of unknown characteristics

NOTE: All planners developing magazine BFRs must have current certification through AMMO-36 Explosives Safety for Naval Facility Planning offered by the Defense Ammunition Center.

The Magazine Storage and Requirements Calculator (MSRC) has been developed to facilitate the planning process. The planner has the option to use the MSRC for either scenario described above, as deemed fit. But the small scenario allows the planner to handle small/simple scenarios without using the MSRC. This tool can be obtained from the NAVFAC Criteria Management portal page along with an instruction manual for its use. The direct link to the tool and all supporting resources is located here, and requires Common Access Card (CAC) access:

Magazine Storage & Requirements Resources

420-10.1 **PLANNING METHODOLOGY**. The general planning process follows the same steps regardless of the approach used. Each of the following steps is described in more detail for each scenario size. Instances in which the MSRC can or should be used are identified.

1. Characterize the load plan.
2. Define the list of existing magazines.
3. Perform a stowage analysis.
4. (Optional in the event of a deficit of magazine space) Identify the preferred magazine type for hypothetical additional magazines and then optimize the storage of the remaining load plan items into this magazine type.
5. Magazines facilities are pre-approved, non-deviation, construction designs. The MSRC will provide the required number of magazines in whole units and if the planner is developing the requirement by hand calculation, the final requirement shall also be in whole units.

420-10.2 **CHARACTERIZE THE LOAD PLAN**. This step translates a load plan of individual items (e.g., bullets and bombs) into a defined number of stowage footprints (e.g., 46 pallets and 12 large bombs) as defined in Table 420-1. The load plan is obtained from NMC or other tenant command and has been previously adjusted by NMC to properly reflect the added maintenance load as well as a reduction factor to account for the percentage of the items that need to be stored ashore. NMC will provide this “adjusted” GRBLP to the NAVFAC planner or contractor for use.

At a minimum, the GRBLP will contain the Navy Ammunition Logistics Code (NALC) and a quantity of individual items for each NALC. The GRBLP may also include an “owner” or other designator, though this is not necessarily required.

The planning process (either using the MSRC or any “manual” process) will translate the load plan into an equivalent number of generalized footprints. The generalized footprint types used in this process are (with nominal storage Length x Width x Height provided in inches):

- Standard Pallet (48x40x34)
- Oversized Pallet (53x47x43)
- Small Bomb (65x36x32)
- Large Bomb (107x41x24)
- Small Missile (127x43x24)
- Medium Missile (159x36x49)
- Large Missile (241x40x41)
- Extra Large Missile (308x40x40)

If the MSRC is used (for either a small or large scenario), the GRBLP is entered into the spreadsheet and the equivalent number of various footprints can be output as a report.

Additional factors including Hazard Class/Division (HC/D), storage Compatibility Group (CG) and NEW of each item are also gathered for each item. If the MSRC is used, these values are obtained automatically from the technical data obtained from OIS based on the NALC for each item.

Where there are multiple Hazard Class/Division (HC/D) ordnance in the load plan, the BFR CCN will be determined by siting the most restrictive HC/D.

420-10.3 **DEFINE THE LIST OF EXISTING MAGAZINES**. In this step, magazines that are acceptable for storage of the load plan are identified with sited NEW quantities. This list should be correlated with iNFADS, NMC and NOSSA for agreement. Magazines typically fall within one of the following categories. Details for these magazine types can be found in TP 15.

- Small “Keyport” or “Fuse & Detonator” magazines – typically smaller than 20’ x 20’
- Arch magazines – typically 25’ wide and varying in depth between 20’ and 80’
- Legacy box magazines – Smokeless Powder and Projectile (SP&P), Standard Missile Magazines, Box Types A and B
- Modern box magazines – Box Types C, D, E, F and M
- Modular Storage Magazines (MSM) – 25’ wide and varying in depth between 20’ and 80’

The NAVFAC planner or contractor obtains the list of magazines from iNFADS and verifies with the local installation. Sited NEW values are obtained from the local Explosives Safety Officer, Installation Planner or NOSSA. The MSRC includes the capability to import a list of magazines generated from the ESS software. See the MSRC User's Manual for details.

Each of the magazines other than the small Keyport and Fuse & Detonator types can be modeled in the MSRC as a standard type. Other types can be modeled as user-defined magazine types in the MSRC.

420-10.4 **ANALYSIS PROCESS**. In this step, the load plan is systematically allocated throughout the existing magazines. This process may be very direct for small scenarios. For larger scenarios, the MSRC has been developed to facilitate this process using methods and requirements approved by NAVFAC, NMC, Fleet and NOSSA. The intended outcome of this step is to show that all munitions in the load plan can be stowed within the list of available magazines while satisfying CG rules, sited NEW limitations and spatial constraints.

The maximum number of footprints within a specific type of magazine can be obtained using the MSRC stowage matrix shown in Table 420-1. Small Keyport and Fuse & Detonator magazines are not accounted for in this table.

This table assumes that all items are stacked 3 containers high. If a given NALC has a different maximum allowable stack height, the values in Table 420-1 would be scaled accordingly. If the number of footprints to be stowed does not entirely fill one or more stacks, empty spaces must be accounted.
Fractions are used to account for mixing of various footprint types. As an example of this, if an 80' Arch contains 58 large bombs (50% of its capacity for large bombs), it could only accept 49 standard pallets (50% of its theoretical max capacity of standard pallets) before it is considered completely full.

The values in this table have been determined by NMC, NAVFAC and NOSSA, and NAVSEAINST 8024.2 (latest revision) and account for all rows and other wall standoff requirements.

Table 420-2
MSRC Stowage Matrix

Magazine Type (depth)	Standard Pallet	Oversized Pallet	Small Bomb	Large Bomb	Small Missile	Medium Missile	Large Missile	Extra Large Missile
Arch (20')	20	--	--	--	--	-	--	--
Arch (25')	26	--	--	--	--	--	--	--

* Box M has not been considered for any application other than Large and Extra Large Missiles

420-10.5 **SMALL SCENARIO ANALYSIS**. For a small scenario, it is not necessary to use the MSRC. If the number of equivalent footprints within the load plan has been determined (see Section 420-10.2) and the magazine types have been defined (see Section 420-10.3), the NAVFAC planner or contractor can distribute the load plan throughout the magazines manually. CG mixing rules, sited NEW quantities, as well as any other physical constraints must be considered.

The planner can directly compare the number of generalized footprints to the values shown in Table 420-2 for the available magazine types. Magazines can be filled with a mix of footprint types if necessary. In this case, fractions of a full magazine would be used as described in Section 420-10.4.

The output from this analysis would be a listing of all load plan items stowed, and if applicable, a listing of load plan items not stowed. The magazine(s) used for stowage should be listed for each load plan item. These outputs can be used to populate the BFR report.

420-10.6 **LARGE SCENARIO ANALYSIS**. These scenarios should be analyzed using the MSRC. An iterative process is used to optimize the allocation of the load plan throughout the list of available magazines. The MSRC allows the user to systematically work through the load plan to ensure that required storage constraints are met, and if desired, specific munitions are stowed in compatible magazines. Examples of this include items requiring Intrusion Detection Systems (IDS) are stowed in magazines equipped with IDS, or particular items may be required to be stowed in a specific area of the installation, depending on local guidance and discretion.

Detailed instructions for the use of the MSRC are provided in the MSRC Users' Manual provided with the tool. Here is a direct link to the user manual. Common Access Card (CAC) access is required.

MSRC User's Manual

The MSRC provides many options for output from the analysis beyond generating the BFR. Some of these options include a listing all load plan items stowed. If applicable, a listing of load plan items not stowed and a theoretically stowed items listing in each magazine are also included.

420-10.7 **ESTIMATING FUTURE MAGAZINES**. This section describes the additional magazines planning process, whether they are planned as part of a new installation or to meet an existing storage capacity deficit.

In the event that the load plan cannot be completely stowed within the existing magazines, or in the event that a potential future scenario is being studied, the MSRC can be used to estimate the number of magazines required to store this material. In this scenario, the proposed magazines' sited NEW must be determined or estimated (see Section 420-10.2) to ensure a proper required magazines quantity. The proposed sited NEW estimates may be used in the tool, but must be verified by the Explosive Safety Software (ESS) Planning Tool option prior to using the information in a BFR. To use this methodology, check with the local Explosives Safety Officer, Installation Explosive Safety Planner or NOSSA.

Where multiple magazines are proposed at less than 500,000 pounds NEW, if possible, increase the Intermagazine Distance (IMD) separation distance to 100 ft. both “Side to Side” and “Rear to Rear” and 160 ft. “Front to Rear.” This will support a temporary waiver to increase the magazine’s allowed NEW storage up to 500,000 pounds when events dictate such a waiver.

Where magazines are proposed at a “restrictive land available site” and continuous earth cover is considered, as part of the siting criteria, the following must be met:

a) the Intermagazine Distance (IMD) separation distance both Side to Side, Rear to Rear, Front to Rear and;
b) the two earth covers intersect at or below a point ½ the height of the two structures – i.e. H/2 where H is the height of the structure (at structures highest point).
    a. Example: two Box Type D magazines – 15’-8” (height of interior roof at front of magazine) + 1’6” (roof thickness) = 17’-2”, 17’-2” divided by 2 = 8’-7”. The low point of the earth cover must at or below 8’-7” as measured from finished grade.

If only one or two types of munitions need to be stowed, the MSRC Stowage Matrix can be used directly to estimate the number of required magazines. Compatibility Group mixing rules as well as sited NEW quantities and any other physical constraints must be considered.

The MSRC can be used to estimate required magazines to stow any remaining load plan for an analysis or theoretical scenarios. When using the MSRC, the user will select the preferred magazine type to be constructed. By default, Box Types C, D, CLWS Single Bay, CLWS Double Bay or any size of MSM should be selected for the analysis. Other magazine types are not permitted for new construction.

The following table is from the Whole Building Design Guide:

“Ammunition and Explosive Storage Magazines: ECM Approved For New Construction”

https://www.wbdg.org/building-types/ammunition-explosive-magazines/ecm-approved-new-construction

Table 420-3
Magazine Type and Gross Square Footage

Magazines Approved for New Construction per Department of Defense Explosive Safety Board (DDESB) Test Paper (TP)-15, “Approved Protective Construction”			

Magazine Type	**Drawing Number**	**Number of Doors/"Bays"**	**Gross Square Footage (GSF)**
RC Box Type "C"	14004689-14004720 Rev. 1 (Without Platform)	3	5,920
RC Box Type "C"	14005091-14005122 Rev 1 (With Platform)	3	5,920
RC Box Type "D"	18232899-18232936 (Without Platform)	5	10,057
RC Box Type "D"	18232899-18232978 (With Platform)	5	10,057
Modular Storage Magazine:	Army:421-80-07	1	2,124.22
Modular Storage Magazine:	**NAVY**:14063806-14063858 **ARMY**:421-80-08, 421-80-13	1	
25' w x 20' depth variant		1	894
25' w x 40' depth variant		1	1,438
25' w x 60' depth variant		1	1,978
25' w x 80' depth variant			2,518
CLWS, Single Bay, 32' w x 93'-6" depth	TBD	1	3,706
CLWS, Single Bay, 32' w x 117' depth	TBD	1	4,552
CLWS, Double Bay, 50' w x 117' depth per bay	TBD	2	13,254

Notes:

1. Army ECM, Concrete Oval-Arch, dwg. No. 421-80-09, 25' width x 90' depth is approved for new construction but door width of 8' limits the use of the magazine to Small Bombs, Oversized and Standard Pallets.
2. Army RC Box, Dwg No. 421-80-07, 24' width x 80' depth, are approved for construction but in lieu of sliding doors have two steel doors that are manually opened and there is a 4" lip at base of opening for doors to rest against, causing loading/unloading issues.

3. Army RC Box, Dwg No. 421-80-13, 25’ width x 80 depth is approved for European construction but NOSSA will required modifications to the design drawings to support Lightning and Electrical.
4. Munitionslagerhause (German Deign) magazines, although shown as approved for new construction, will require a review and design update before being avail for NOSSA/DDESB approval for construction.

420-11 CONTAINERIZED AMMUNITION

Implementation of directives for containerizing ammunition for shipment is now underway at certain ordnance activities, initially at coastal POE's. For these activities, category codes and planning factors have been developed to facilitate proper identification and sizing of the facilities that are in support of containerized ammunition shipments. The following category codes and planning factors are established for handling of ammunition by containers. As warranted, additional category codes and planning factors will be developed.

148 35 Container Holding Yard (Loaded)
148 40 Container Transfer Facility
148 45 Rail/Truck Receiving Station
151 70 Ordnance Container Handling Pier
152 70 Ordnance Container Handling Wharf
156 20 Container Operations Building
218 10 Container Repair and Test Building
425 20 Container Holding Yard (Empty)
860 20 Explosive Barricade for Suspect Trucks and Railroad Cars

421 AMMUNITION STORAGE DEPOT AND INSTALLATION

421-1 DEFINITION

Ammunition storage utilizes magazines or other suitable containers to store ammunition for the ultimate user's logistic flexibility at an activity. Planning methods are provided for the following types of ammunition storage facilities:

421 22 High Explosive Magazine
421 32 Inert Storehouse
421 35 Ready Magazine
421 42 Smokedrum Storehouse
421 48 Small Arms/Pyrotechnic Magazine
421 62 Special Weapons Magazine

421 12 FUSE AND DETONATOR MAGAZINE (SF)

FAC: 4211

BFR Required: Y

This category code is no longer in use. Please use 421 22 High Explosive Magazine or 421 48 Small Arms/Pyrotechnic Magazine as appropriate.

421 22 HIGH EXPLOSIVE MAGAZINE (SF)

FAC: 4211
BFR Required: Y

42122-1 **DEFINITION.** A high-explosive magazine is used for the storage of mass- detonating explosives. Bomb, warheads, missiles, naval mines, demolition charges are examples of munitions generally stored in high explosive magazines. Refer to the Magazine Design Type Guide for types of magazines commonly found on installations.

Please refer to Section 420-8 TYPES OF MAGAZINES for details on how to survey existing magazines and DDESB Technical Paper Number 15 (TP 15) Approved Protective Construction and UFC 4-420-01 for descriptions of magazines and those authorized for construction.

Note: The following category codes have been eliminated and rolled up under 421-22 High Explosive Magazine:

- **421 12 Fuse and Detonator Magazine**
- **421 52 Smokeless Powder Projectile Magazine**
- **421 72 Missile Magazine**
- **421 83 High Performance Magazine**

421 32 INERT STOREHOUSE (SF)

FAC: 4211
BFR Required: Y

42132-1 **DEFINITION.** Storehouses for inert material are usually 50 x 200 ft. or 106 x 204 ft. or multiples of these basic dimensions, and are similar to commercial warehouses. These storehouses are used for the storage of such non-explosive items as bomb tails, machine gun links, empty cartridge cases, and packing materials.

Although the height of stowage in these storehouses depends on the type materials, the average stacking height is about 10 feet. Storage space available for storage will meet a minimum criteria of 60 percent of net storage space used for storage operations. The net storage capacity of the 50 x 200 ft. storehouse is approximately 60,000 cubic feet. For planning of installation inert storehouses use only the 50 x 200 ft. storehouse.

421 35 READY MAGAZINE (SF)

FAC: 4221
BFR Required: Y

42135-1 **DEFINITION.** This category code and nomenclature encompasses two specific types of magazines whose requirements are determined by the function performed. The three types of magazines within this category code are identified as:

(a) **Ready Service Magazine.** When shore establishments require certain types of ammunition to be stored in a ready service condition, in order to reduce the arming time, the ammunition may be stored in designated Ready Service Magazines. A 12' x 17' box-type magazine is suitable for performing this function. This facility is usually located at an air station and is used to hold ammunition and/or weapons that are built up from a storage configuration ready for arming an aircraft, or to receive for temporary storage, ammunition and/or weapons from aborted aircraft. These paved areas for loading or unloading ordnance from an aircraft are typically captured under CCN 11656 “Combat Aircraft Loading Area (CALA)”.

(b) **Special Service Magazine**. This type of magazine is provided in or near such facilities as loading plants, filling houses, weapon assembly buildings, ammunition maintenance buildings and Weapon Quality Evaluation Laboratories. The magazine can be a special size and construction, depending upon the material(s) stored therein. However, a 6' x 8' Keyport magazine has been found to be most suitable for this application. The need to provide segregation of non-compatible, open explosives frequently gives rise to a requirement for separate magazine structures, irrespective of any loading factor. Historical data should be used to determine the number of these facilities required which is dependent upon both the amount of explosives stored and the compatibility of the explosives themselves.

Note: Ready Service Lockers (i.e. RSLs, GOLANs, RMAG, NABCOs, CONEXs, etc.) are not Class 2 Real Property and shall not be entered into iNFADS. NAVFAC HQ instruction on RSLs as equipment/non-RP can be found here: NAVFAC HQ RSL Instruction. Concrete pads supporting RSLs shall be recorded under Category Code 425 11. The Pad should be sited for RSL’s NEW limit.

421 42 SMOKEDRUM STOREHOUSE (SF)

FAC: 4211
BFR Required: Y

42142-1 **DEFINITION.** Chemical and smoke mixtures are stored separately in fire- hazard type magazines or in buildings especially designed for such storage. Drums of smoke mixture may be stored in surface buildings with special racks for support, and overhead equipment for handling. Smokedrum storehouses are of the sizes and capacities shown in Table 42142-1.

Table 42142-1
Smokedrum Storehouses

Size Number	Capacity (Drum)	Approximate Bldg Dimensions In Feet				
		W		L		H
1	120	25	x	17	x	14
2	240	25	x	34	x	14
3	360	25	x	51	x	14
4	480	25	x	58	x	14

For more than 480 drums, two or more buildings should be provided.

421 48 SMALL ARMS/PYROTECHNICS MAGAZINE (SF)

FAC: 4211
BFR Required: Y

42148-1 **DEFINITION.** This structure may be used to store Class 1 Division 3 and 4 ammunition. This type of magazine may vary considerably in size and description. The standard earth-covered concrete arch magazine without barricade and the non-earth covered two compartment magazine are commonly used for this purpose. If the land area is limited and there is a large requirement for small arms/pyrotechnics storage space, the large triple arch magazine maybe used. See section 420-9 PLANNING METHOD to calculate requirements. For ammunition class descriptions, see OPNAVINST 8020.8.

421 52 SMOKELESS POWDER PROJECTILE MAGAZINE (SF)

FAC: 4211
BFR Required: Y

This category code is no longer in use. Please use 421 22 High Explosive Magazine or 421 48 Small Arms/Pyrotechnic Magazine as appropriate.

421 62 SPECIAL WEAPONS MAGAZINE (SF)

FAC: 4211
BFR Required: Y

42162-1 **DEFINITION.** The special weapons magazine is the same type of structure as the high explosive magazine and differs only in that it is used for the storage of nuclear weapons. Magazines used for the storage of special weapons are subject to quantity-distance requirements and are limited to the maximum amount of nuclear material that can be stored in any one magazine. This information, along with the sizes and weights of nuclear weapons and security requirements can be obtained from:

- (S) SWOP 20-7, NUCLEAR SAFETY CRITERIA (U)
- (S) SWOP 50-1, NUCLEAR ORDNANCE GENERAL INFORMATION (U)
- (C) OPNAVINST C5510.83 SERIES, CRITERIA AND STANDARDS FOR SAFEGUARDING NUCLEAR WEAPONS (U)

Planning data for Category Code 421 62 related to specific locations will be classified in accordance with cognizant Navy directive.

421 72 MISSILE MAGAZINE (SF)

FAC: 4211
BFR Required: Y

This category code is no longer in use. Please use 421 22 High Explosive Magazine.

421 82 SUBMARINE LAUNCHED BALLISTIC MISSILE STORAGE FACILITY (SF)

FAC: 4211
BFR Required: Y
42182-1 No criteria are currently available for this Category Code.

421 83 HIGH PERFORMANCE MAGAZINE (SF)

FAC: 4212
BFR Required: Y

This category code is no longer in use. Please use 421 22 High Explosive Magazine or 421 48 Small Arms/Pyrotechnic Magazine as appropriate.

423 AMMUNITION STORAGE – LIQUID PROPELLANTS

423-1 DEFINITION

The siting of liquid propellant (energetic liquids) storage facilities and the amount of propellant that can be stored are subject to strict safety criteria due to the fire and/or detonation hazards involved. Factors such as the degree of hazard and the compatibility of propellants stored in close proximity to each other affect the spacing of storage facilities and the amount of propellant that can be stored. NAVSEA OP-5 Vol. 1, Ammunition and Explosives Ashore provides criteria on hazard classification, quantity-distance tables, storage compatibility, and explosive equivalents.

423 10 LIQUID PROPELLANT STORAGE (GA)

FAC: 4231
BFR Required: Y

42310-1 **DEFINITION.** Storage vessel dimensions along with relevant siting requirements can be used to develop facility requirements.

423 20 LIQUID PROPELLANT DISPENSING FACILITY (GM)

FAC: 1221
BFR Required: Y

42320-1 **DEFINITION.** Liquid propellant storage and dispensing facilities shall satisfy the operational requirements of the particular command within whose jurisdiction the facilities are located.

424 WEAPON-RELATED BATTERY STORAGE

424-1 DEFINITION

Weapon-related storage utilizes refrigerated warehouses that are capable of maintaining at least subfreezing temperatures. This code is not to be used for other cold storage facilities.

424 10 WEAPON-RELATED BATTERY STORAGE (SF)

FAC: 4241
BFR Required: Y

42410-1 **DEFINITION.** Storage requirements can be determined from the quantity to be stored and the types of equipment used to rack and stack the batteries.

425 OPEN AMMUNITION STORAGE

425-1 **DEFINITION.** Provides open hardstands (pavements or prepared/stabilized surfaces) for ammunition storage and excludes all other hardstands.

425 10 OPEN AMMUNITION STORAGE PAD (SY)

FAC: 8526
BFR Required: Y

42510-1 **DEFINITION.** Refer to NAVSEAOP-5 Vol. 1 for regulations governing open storage of explosive material. Ordnance open storage is undesirable.

42510-2 **EXPLOSIVE SAFETY SITE APPROVAL.** Explosives safety site approvals are required for facilities of this category code. See NAVSEA explosives safety criteria for more detail. The planner preparing the site approval must have current certification through AMMO-36 Explosives Safety for Naval Facility Planning offered by the Defense Ammunition Center.

425 11 EXPLOSIVE STORAGE SITE PAD (SY)

FAC: 8526
BFR Required: N

42511-1 **DEFINITION.** This category code covers the pad, which must be made of concrete or asphalt, that Ready Service Lockers or reduced Quantity Distance (QD) equipment (i.e. RSLs, GOLANs, RMAG, NABCOs, CONEXs, etc.) are placed on. The site pad must be marked with a permanent facility marker (i.e. concrete monument, bollard, or placard) in accordance with the Installation Appearance Plan. The marker must be of the same level of permanent construction as the site pad.

For a newly constructed site pad, the edges must be constructed such that there is a minimum 1’ offset from any point along the perimeter of the storage equipment. The intent is to provide a 1’ offset on all four sides of rectilinear equipment, or a minimum of a 1’ offset at any point along the perimeter of non-rectilinear equipment.

For site pad areas obtained from existing paved surfaces such as aircraft aprons, etc., the dimensional rules for new pads still apply. In these cases, the dimensional area must be delineated by permanent markings such as road striping, permanent corner markers, or similar permanent markings, such that the dimensions of the site pad area can be validated at any point in the future.

The site pad must be sited for the equipment’s NEW limit and the site pad’s NFA number shall be incorporated into the site approval process, (i.e. NFA 0001, RSL 0001-1 RO 0001-1). The equipment number shall be a follow on number of the structure (i.e. 0001-1 or 0001-A).

The tenant command is responsible for maintenance (i.e. grounding and bonding test, etc.) of the storage equipment (i.e. RSL or other reduced QD equipment) on the site pad. The Installation’s Public Works Department is responsible for maintenance of the site pad (as it is real property).

If the planner is establishing a site pad area on an existing and approved contiguous surface, the planner must subtract the area of the site pad from the property record card of the existing contiguous surface.

42511-2 **EXPLOSIVE SAFETY SITE APPROVAL.** This structure is required to support equipment that stores explosive material. Therefore, explosive safety site approvals are required for equipment placed on this structure. In accordance with NAVSEA OP 5 Volume 1 (latest revision), the facility number for the site approval must reference the structure (site pad). See NOSAAINST 8020.22 (latest revision), NAVSEA OP 5, Volume 1 (latest revision), and NAVFAC Instruction 11010.45 for more detail. The planner preparing the site approval must have current certification through AMMO-36 Explosives Safety for Naval Facility Planning offered by the Defense Ammunition Center.

Note: Ready Service Lockers (i.e. RSLs, GOLANs, RMAG, NABCOs, CONEXs, etc.) are not Class 2 Real Property and shall not be entered into iNFADS. NAVFAC HQ instruction on RSLs as equipment/non-RP can be found here: NAVFAC HQ RSL Instruction. The Pad shall be sited for RSL's NEW limit.

425 20 CONTAINER HOLDING YARD (EMPTY) (SY)

FAC: 4251
BFR Required: Y

42520-1 **DEFINITION.** An empty ISO container-holding yard should be capable of storing at least one full container shipload plus 1/3 more. As the pipeline becomes full of containers, each container ship will discharge one container for each one loaded. Additionally, empty containers awaiting testing, repairs, stuffing or shipment to inland points will be on hand. Assuming a single berth pier/wharf for a 750 container ship, planning for an empty container-holding yard should be for 1,000 empty containers. See Figure 42520.1 for a typical 1,000-container yard layout. Total area of the holding yard is 19,180 SY. Size is predicated on 8' x 8' x 20' containers stacked three high. Containers are handled with container handling equipment or straddle carriers.

Figure 42520.1-Typical 1,000 Container Yard Layout

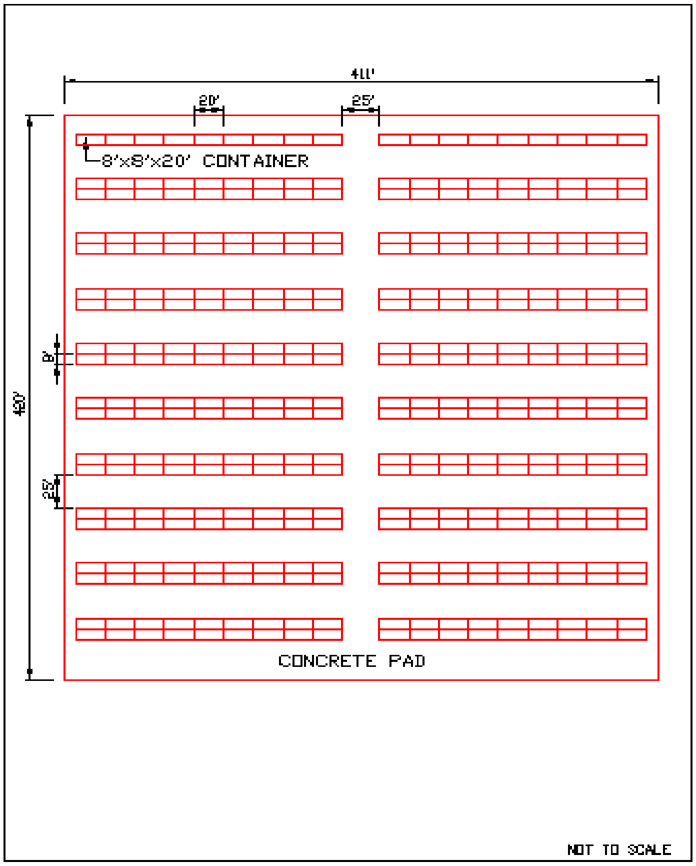

FIGURE 425-20
CONTAINER HOLDING YARD (EMPTY)

425 30 BARRICADED MODULE (SY)

FAC: 4251
BFR Required: Y

42530-1 **DEFINITION.** A barricaded module is a barricaded area comprising of a series of connected cells with hard surface storage pads separated from each other by barricades. A light shed-type metal roof or fire retardant tarpaulin installed in a manner to provide sufficient ventilation between the tarpaulin and the stored ammunition may be used to cover the individual cells. Heavy structures or flammable materials will not be used for this purpose.

The maximum net weight of explosives permitted to be stored within each cell is 250,000 pounds. Storage pads should be hard surfaced, if possible, in order to minimize the effects of earth shock from an accidental explosion. No restrictions are imposed upon the arrangement of cells within a module or upon the arrangement of groups of modules, except that all cell openings will not be faced toward each other unless they are barricaded or meet the standard quantity-distance criteria for un-barricaded above ground magazines. See Figure 42530.1 for typical module layout. See NAVSEA OP-5 for site restrictions and facility design requirements.

Figure 42530.1 Typical Module Layout

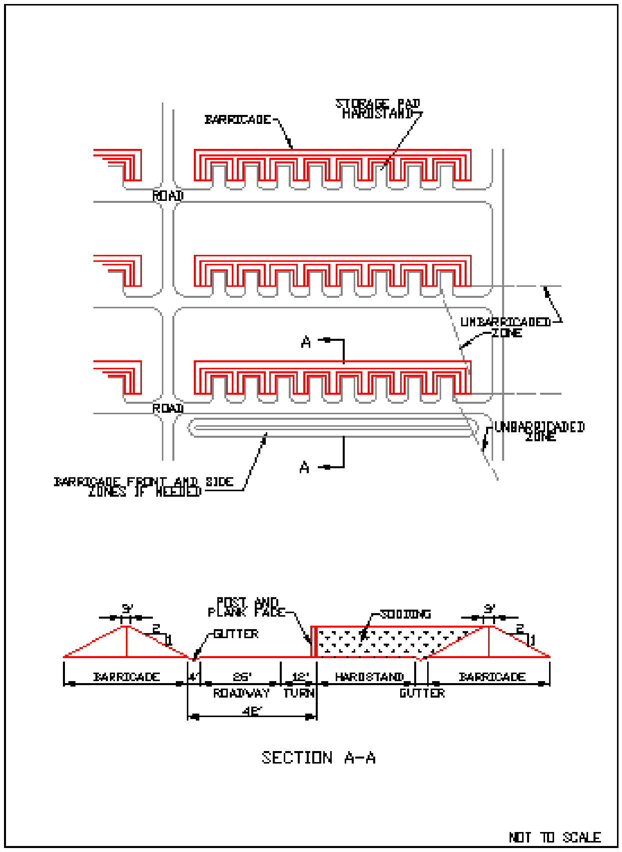

FIGURE 425-30
TYPICAL ARRANGEMENT OF EIGHT-CELL MODULES

42530-2 **EXPLOSIVE SAFETY SITE APPROVAL.** Explosives safety site approvals are required for facilities of this category code. See NAVSEA explosives safety criteria for more detail. The planner preparing the site approval must have current certification through AMMO-36 Explosives Safety for Naval Facility Planning offered by the Defense Ammunition Center.

430 COLD STORAGE

430-1 DEFINITION

Cold storage is planned to provide refrigerated warehouses for storage of General Supply Materials which require temperatures ranging from -10°F to 60°F in the following categories:

- Perishable Substances
- Photosensitized Material

- General Supply Batteries
- Medical and Dental Supplies

430-2 EXCLUSION

Excluded from this category group are cold storage for weapons-related batteries (use Category Code 424 10) and cold storage spaces that are a functional part of another facility such as an open mess, club, hospital, commissary or exchange. These cold storage spaces are planned as part of their respective main facilities and are accommodated within its space allowances.

430-3 OTHER APPLICABLE REQUIREMENTS

In most CONUS locations, Cold Storage Facility requirements have been all but eliminated through changes in supply business processes. Direct Vendor Delivery contracts provide such materials directly to end users in an as needed frequency required to effectively transfer the related warehousing from the public to the private sector vendors. These requirements guidelines are provided for those missions who do require an installation or area storage facility to hold some measure of items requiring cold storage.

430-4 STORAGE OF FARINACEOUS AND HIGH ACID FOOD PRODUCTS

These food products are properly stored in an environment where the temperature is between 50 and 70 degrees Fahrenheit. A cold storage warehouse will be required to provide chill storage at those activities where climatic conditions preclude the use of a general purpose warehouse.

431 10 COLD STORAGE WAREHOUSE (SF)

FAC: 4311
BFR Required: Y

43110-1 **DEFINITION.** A cold storage warehouse is planned to preserve the quality of perishable foods and general supply materials that require refrigeration. The warehouse will include freeze and chill space and normal processing facilities and mechanical areas. The space requirements are applicable to cold storage facilities of all sizes whether built as separate structures or in conjunction with other buildings and are determined by using the criteria furnished in the BFR guidance above. For installations with such requirements, correlated to loading, Table 43110-1 provides a means of estimating cubic feet. The facility requirements are based upon the cubic foot space required per man per 30 days. This method utilizes subsistence consumption requirements for shore facilities and provides for two types of storage requirements.

For additional information, see MIL-HKBK 1032/2.

Table 43110-1
TCF Allowances for Refrigerated
Warehouse Facilities per Man per Month

Total Cu. Ft. (TCF) Allowances for Category Code 431-10:

Type I Requirement: Allows 4 cubic feet (CF) of perishable subsistence per man per month when fresh milk and bread are received monthly.

Type II Requirement: Allows 3 CF of perishable subsistence per man per month when fresh milk and bread are received at least every other day.

Type	Net Cubic Feet Per Man Per Month	Universal Factor**	TCF Allowances Per Man Per Month*		
			Total	Chill	Freeze
I	4	1.96	7.84	4.12	3.72
II	3	1.96	5.88	4.12	1.76

* All allowances represent average values. If historical data are available that differ from these allowances, such data may be used for requirements planning if fully justified/documented.

** See derivation of "Universal Factor" in appendix P 80X. This factor states, “1.96 TCF are required per cubic foot of material to be stored or 78.4 TCF are required per M/T of material to be stored.”

440 GENERAL SUPPLY BUILDING

440-1 DESCRIPTION

This category group consists of supply-oriented covered storage and/or storage support facilities that are assigned to the Supply/Material Department or assigned for storage of operational mount-out stocks. Requirements allowance guidance can be found in the General Supply Planning Guidance under Requirements Determination.

440-2 DETERMINING GENERAL SUPPLY REQUIREMENTS

This section provides information regarding the general methods used to calculate Basic Facilities Requirements (BFRs) for supply facilities.

440-2.1 **Definitions.**

440-2.1.1 **Cubic vs. Square Feet.** Requirements for supply operations and logistics facilities planning are first found in volume and then in the associated area, as opposed to area alone. This initial measure of volume is more commonly in cubic feet (CF) or measurement tons (MT). A MT is a logistics term that is often convenient to express a palletized or material unit load - and is equal to 40 cubic feet. The second general phase of a logistics requirement calculation is the translation of a given volume into area or square feet of facility required. This second phase is wholly dependent on an assumption of facility and storage system configuration as it interjects an available height or stacking height (SH). This is the height available to the storage function. The accommodation of a given volume requirement can vary with that of different stacking heights. That is, a given volume or cubic foot requirement translates into SF – X with SH – X and translates to SF – Y with SH – Y. This height is either that of an existing or planned building and/or system.

440-2.1.2 **BFR Qualification - Existing vs. Planned Facilities.** Supply operations' dependence on available stacking height requires a BFR to carry an assumption of SH that is either based on an existing building and system (status quo), an existing building with system upgrades (modernization) or a new building. It is, therefore, important that the BFR be qualified with the assumptions related to the respective SH (used to translate cubic feet to square feet of facility required).

440-2.2 **Calculation Methods.** BFRs may be calculated using either the analytical/4-step method or an operational space analysis method as the situation dictates.

440-2.2.1 **Analytical or 4-Step Method.** There are four steps required for determining storage space requirements by this method. This method is thought to be the preferred and most practical for use in planning up to and including the activity 1391 level or as needed to feed strategic planning.

Step 1 - Total Cubic Feet. Determine the total cubic feet (TCF) required for the CF or MT of material to be stored.

The first factor in the two part equation is determining a cubic feet (CF) or MT required by the user or user group. This cubic measure can be provided by the user (e.g., via records or expert knowledge of business forecast) or determined via a survey of existing operations coupled with an interview aimed at validating observations and forecasting any changes (i.e., survey observes 1 CF, interview relates 20% forecasted increase, requirement is 1.2 CF). A normal desired forecast for requirements is five years.

The second part of this two-part equation translates the raw volumetric measurement of required material into a CF requirement of the accommodating system or facility. This adjustment or translation accounts for the inherent losses in a storage system due to normal operations (various system and operational space losses). A universal factor has been derived and found to be 1.96 for CF and 78.4 for MT. That means that for 1 CF equates to 1.96 TCF required and 1 MT equates to 78.4 TCF required. This universal loss factor, 1.96, adjusts the raw material cubic measurement for various system and operational space losses. For example, 100 CF of raw material required translates to 196 TCF storage space required.

Step 2 – Stacking Height. Determine a stacking height (SH = available stacking height) value. For an existing facility use the current SH value. For a planned facility suggested SH's are shown in Table 440-1.

Table 440-1 Suggested Stacking Heights for Planned Facilities

Type of Storage	Stacking Height (FT)
Open Storage	4 – 10
MTIS, ILO, Outfitting Facilities	4 (without racks) Up to 12 (if racks are planned)
SERVMARTS	4 feet for display gondolas 7 feet for bin shelving
Covered Storage Facilities (other than above)	12
High-Rise Facility (planned available storage height above 12 feet)	Use the planned available storage height.

Step 3 – Net Square Feet. Determine the projected net square feet or NSF requirement by dividing the projected TCF required by the SH value determined in Steps 1 and 2 above.

Step 4 – Gross Square Feet. A NSF to gross square feet (GSF) multiplier of 2.5 or 2.0 should be applied to adjust for aisle, operational, handling and all spaces within the outer portion of the exterior walls defining the notional facility. Use 2.5 with the more common, large aisle operations that normally utilize sit-down, rider counter-balance material handling equipment and are characterized by the related ten to twelve feet maneuvering aisles. Recommend using 2.0 in facilities with more dense, modern systems referred to as very-narrow aisle. These will be characterized by aisles of less than seven feet and often outfitted with vehicle guidance such as electronic wire or mechanical rail. Where this very-narrow aisle system cannot be verified or confirmed, 2.5 should be used.

Alternative GSF Multiplier. Alternatively to the net to gross factors described above, a more accurate SF to GSF multiplier can be calculated, through a notional facility layout that depicts actual floor space required for the rack or storage footprint (i.e., no aisles or collateral areas) and the resulting total facility. The ratio of total space to racked space is the SF per NSF multiplier. For additional assistance please contact the criteria manager.

Additional Support Space. The net to gross factors listed in this step are intended to accommodate some nominal area for material receiving, processing, staging and shipping areas associated with the operation. As such required support areas can vary widely, additional space may be added to the requirement 'bottom-line' to allow for a more active receipt and shipping operation. This additional space should be supported by and documented from operator input. If such additional processing space is expected to exceed fifteen percent of the total facility, the planner should consider it a separate category code as it may begin to address a transshipment operation that is related to, but additive to, the related storage requirement calculation. In any case it would be a separate and additive calculation to that arrived using the net to gross above. Such transshipment category codes would include 156-10 and 143-55.

440-2.2.2 **Operational Space Analysis Method.** This method for determining the BFR is prescribed as a more accurate process than that developed using the 4-step method. This Operational Space Analysis Method is expected for any BFR project support beyond the activity 1391 level.

440-2.2.2.1 **Total Cubic Feet.** The TCF for the operation would be determined as described in step one of the 4-step method above (paragraph 440-2.2.1.1).

440-2.2.2.2 **Operational Analysis Mapping.** An operational analysis that maps the planned operation within an existing or planned facility should then be used to determine the facility requirements. Using input from the operator, the space analysis should identify and quantify the key operational components such as: administrative, receiving, shipping, storage, aisles. etc. It is expected that the material storage or staging portion of this analysis will include consideration and identification of storage and material handling systems. Note that each of these areas may be comprised of distinguishable components (i.e., storage can be bulk, palletized, rackable and binnable). As actual or planned SH's, aisle spacing, mechanical and miscellaneous spaces are used in this method, no related estimating metrics are required.

440-2.2.2.3 **Gross Area Requirement.** The sum of the planned areas (i.e., areas comprising the operation) form the gross area requirement - the BFR. It is expected that such an analysis would be supported by narrative and graphical documentation sufficient to convey the planned operational construct that has been coordinated with and approved by the user.

440 - 2.3 DISCUSSION OF CUBE RELATIONSHIPS.

440 – 2.3.1 **Material Cube and the Measurement Ton**. The cube of material may be expressed in terms of several units of measure. However, cubic feet and Measurement Tons are the most commonly used in the Navy. A Measurement Ton (M/T) is a volumetric unit of measure defined as 40 cubic feet. An M/T of material can be configured in any shape. It can be visualized, for example, as 40 cubes of material measuring one cubic foot each. The cube of material in bin, rack and bulk storage areas is normally quantified in terms of cubic feet of material or M/Ts of material. The M/T is the preferred unit of measure in the Navy since it is the standard unit of measure used for shipboard cargo.

The following information may prove useful in estimating M/Ts of material in storage when no other data are available. A M/T of material is the appropriate average cube of pallet load of Navy shipment cargo on a standard Navy/DoD 40" x 48" pallet with a load height averaging 36", including pallet. The cube of an average Navy pallet load in storage is typically 0.8 M/Ts or 40" x 48" with a load height averaging 30", including pallet. The maximum pallet load height specified by Military Standard 147 is 54" (including pallet). A pallet load measuring 40" x 48" x 54" high (including pallet) equals 60 cubic feet or 1.5 M/Ts of material. The maximum cargo load size specified by Military Standard 147 on a 40" x 48" pallet (with material overhanging on pallet) is 43" x 52" x 54" high (including pallet). A load measuring 43" x 52"x 30.9" high (including pallet) equals 40 cubic feet or one M/T.

440-2.3.2 **Total Cubic Feet and the Universal Factor.** The Universal Factor provides for the determination of Total Cubic Feet required based on the cubic feet or M/Ts of the material to be stored. The Universal Factor allows 1.96 cubic feet of space for every cubic foot of material that is to be stored, i.e., a ratio factor of 1.96 to 1 applies. This can also be stated as a ratio factor of 78.4 to 40 if both the "1.96" and the "1" are multiplied by 40. The Universal Factor can thus be stated in either one of two ways, i.e., "1.96 TCF are allowed per M/T of material to be stored" or "78.4 TCF are allowed per M/T of material to be stored." The term Universal Factor is used because it applies equally to bin, rack and bulk storage areas. That is, it applies to all TCF in SA Facilities. This is an extremely convenient factor for determining storage space requirements since it means that TCF can be determined, on the basis of M/Ts or cubic feet of material to be stored, without regard to whether bin, rack or bulk facilities are or will be used to satisfy the requirement. Thus, the function of determining the BFR for TCF can be completely separated from the function of facility layout, equipment select ion, comparative cost analysis and integrated systems development.

440-2.4 References.

440-2.4.1 **NAVSUP Publication 529 – Warehouse Modernization & Layout Guide.** This reference is somewhat dated, but the guidance is valid regarding the layout planning related to modernization or new construction of warehousing facilities. This remains a significant publication to that end, but should be used in conjunction with some professional logistics engineering input for any purpose beyond initial activity level 1391 preparation.

440-2.4.2 **DLAM 4145.12 – Joint Services Manual (JSM) for Storage and Materials Handling.** This manual provides detailed guidance on storage and handling of material at DoD installations, by material type. While geared towards operations guidance, this information is critical to some correct planning by providing storage assumptions that impact spatial requirements.

440-2.4.3 **UFC 4-442-01N & MIL-HDBK-1032/2.** The developing UFC and the MIL HDBK which is its primary text, provide guidance on the design of covered storage facilities. It is of particular interest to planners as it provides information that is relevant to any plans (scope) for modernization or construction, including facility and site layout guidance.

440-3 REGIONAL PLANNING FOR SUPPLY

The application of requirements guidance in a regional planning perspective is meant to identify and exploit opportunities for optimizing facility use. This optimization goal of planning analysis is implied in regionalization (i.e. seeking regional economies of scale) and requires the planner to view the sum of all available assets in their aggregate, wherever practical. It is in this aggregate view of assets that a requirements summary in cubic feet is best translated into an optimal configuration in square feet. In other words, the question of a regional planning exercise is: "What is the most efficient accommodation of my cubic foot requirement within the existing or planned square footage (facilities & systems)?" For additional information on applying this criteria in a regional perspective, contact the criteria manager via e-mail.

441 10 GENERAL PURPOSE WAREHOUSE (SF)

FAC: 4421
BFR Required: Y

44110-1 **DESCRIPTION.** This code includes general warehouses with the following characteristics: heated or unheated and with/without heavy-duty (overhead crane) capability, sprinkler systems and/or alarm systems. The purpose of related missions is to provide all or some combination of materials staging or storage, handling and processing, receipt and shipping.

44110-2 **REQUIREMENT.** The general warehouse provides covered space for bulk and in storage, aisle space, space for receiving, packing and crating, office space for direct warehouse supervision (non-administrative) and toilet facilities.

441 11 GENERAL PURPOSE WAREHOUSE, MARINE CORPS DSSC (SF)

FAC: 4421
BFR Required: Y

44111-1 **DESCRIPTION.** This category code includes requirements for Marine Corps ground activities which have been designated by Marine Corps Orders as Direct Support Stock Control activities or which have specialized DSSC functions.

44111-2 **REQUIREMENT.** For new activities, Table 44111-1 may be used for requirements development. The guidance related to 440 series requirements development found in General Supply Planning Guidance under Requirements Determination, is otherwise recommended. If the 10-foot stacking height (SH) used in Table 44111-1 is not applicable, you may reduce the SF proportionate to the increase in SH as a conservative approximation (e.g., if SH is 20 feet vs. 10 feet, 330,000 SF would translate to 165,000 SF). For DSSC mission, include military strength of the base in question plus the military strength of other locally supported units. Non-DSSC activities use only the military strength of the base at which located.

Table 44111-1 Storage Space for DSSC Functions

Installation Military Strength	SF Allowed with SH of 10 feet
Up to 500	7,500
501 to 1,000	14,000
1,001 to 3,000	36,000
3,001 to 5,000	64,000
5,001 to 7,000	96,000
7,001 to 10,000	125,000
10,001 to 15,000	182,000
15,001 to 20,000	216,000
20,001 to 25,000	286,000
25,001 to 30,000	304,400
30,001 to 35,000	333,000

441 12 STORAGE OF AIR OR GROUND ORGANIC UNITS FOR MARINE CORPS (SF)

FAC: 4421
BFR Required: Y

44112-1 **DESCRIPTION.** This category code includes general purpose storage facilities assigned to Marine Corps bases, air installations and Fleet Marine Force (FMF) units for organic requirements to include Division/Wing, Battalion/Group and Company/Squadron storage areas, Special Service storerooms, base shipping and receiving functions and any other organic storage requirements.

441 13 SPECIFIC PURPOSE WAREHOUSE, MARINE CORPS LOGISTICS SUPPORT BASE (SF)

FAC: 4411
BFR Required: Y

44113-1 **DESCRIPTION.** This facility includes general-purpose warehouses designated as storage areas for Marine Corps owned material in support of logistic support base mission as Integrated Material Managers. Also included is the space utilized in support of pre-positioned war reserve stocks.

441 14 SPECIFIC PURPOSE WAREHOUSE, MARINE CORPS SUPPORTED ACTIVITY SUPPLY SYSTEM (SASSY) MANAGEMENT UNIT (SF)

FAC: 4411
BFR Required: Y

44114-1 **DESCRIPTION.** This facility includes general-purpose warehouses designated for support of the Supported Activity Supply System (SASSY) management units to include general and mount out accounts and consolidated issue point assets.

441 20 CONTROLLED HUMIDITY WAREHOUSE (SF)

FAC: 4424
BFR Required: Y

44120-1 **DESCRIPTION.** A Controlled Humidity Warehouse is similar to a General Warehouse (441 10) in every respect except that it is constructed with appropriate vapor barriers and contains humidity control equipment to maintain humidity at desired levels. This warehouse may be a separate building or contiguous with a General Warehouse. See Figure 44120-1 for some examples of requirements that justify a controlled humidity warehouse.

Figure 44120-1. Examples of Justifying Requirements

1. Readiness and immediate issue requirements dictate a low humidity environment for moisture sensitive material.
2. A low humidity environment is required to maintain the condition of material being held in temporary storage while awaiting repair, disposition, preservation or assembly of components.
3. A low humidity environment is required to allow a reduction in reactivation time and/or reactivation cost of moisture sensitive material in storage.

441 30 HAZARDOUS AND FLAMMABLES STOREHOUSE

FAC: 4423
BFR Required: Y

44130-1 **DESCRIPTION.** A hazardous materials warehouse is required for the storage and handling of materials such as flammable and combustible liquids, acids, oxidizers, poisons, water reactive materials, caustics and organic peroxides. As safe storage of such materials lies in their separation from incompatible materials, a hazardous and flammables storehouse is required as much for adequate material separation as for their storage and handling. Such separations are normally accommodated via separate rooms. Incompatible material separation accommodations will also extend to the planning and design of containment of affluent run-off basins (i.e., in case of sprinkler event). A hazardous materials warehouse will also be equipped with fire protection and ventilation (i.e., harmful or flammable gases) in accordance with National Fire Protection Association (NFPA) standards. Site evaluation of a proposed or existing hazardous materials storehouse should be done in careful consideration to compatibility with adjacent properties, facilities or operations. Due to the compartmentalized layout of such facilities, their proper planning or planning related evaluation is sensitive to a working understanding of proper facility layout and design. Information on warehouse design and sample storage segregation layouts can be obtained from UFC 4-440-01 Warehouses and Storage Facilities.

44130-2 **STORAGE OF GAS BOTTLE CYLINDERS AND DRUMMED POL.** Storage of bottle gas cylinders and drummed petroleum, oils and lubricants (POL) are not planned for storage in flammables/hazardous warehouses and should be included in shed space, category code 441 35.

441 35 GENERAL STORAGE SHED

FAC: 4422
BFR Required: Y

44135-1 **DESCRIPTION.** The general shed is a roofed structure without complete side and/or end walls and with or without sprinkler and/or alarm systems. Examples of material stored in sheds include gas cylinders, vehicles, unfinished lumber and other construction material. Considerations for the applicability of such facilities are based on the relative need for protection from expected area weather conditions.

441 40 UNDERGROUND STORAGE (SF)

FAC: 4421
BFR Required: Y

44140-1 **DESCRIPTION.** Where it is necessary, because of potential sabotage or enemy action to protect supplies either by dispersal or protective construction, instead of programming new protective construction, existing mines may be used. Suitable mines for this purpose include: limestone, marble, quartzite, granite, gold, silver, uranium, lead, zinc and copper.

44140-2 **REQUIREMENT.** Only draft-type entries should be considered. Rooms should not be less than 30 feet wide or less than 12 feet high. Optimum dimensions are 500 feet wide and 18 feet high.

441 70 DISPOSAL SALVAGE SCRAP BUILDING (SF)

FAC: 4421
BFR Required: Y

44170-1 **DESCRIPTION.** This facility is primarily to provide covered space for the receipt, processing, staging and issue of material that has been deemed excess to Navy needs and is awaiting some resale or final disposal. To the extent practical, such operations are expected to use efficient storage practice as with a ready issue material warehouse. Where the warehousing analogy is accurate, the requirements development for this category should follow those of 441 10.

441 71 INTEGRATED LOGISTICS OVERHAUL (ILO) AND OUTFITTING BUILDING (SF)

FAC: 4421
BFR Required: Y

44171-1 **DESCRIPTION.** This facility provides covered supply space used for processing materials offloaded from or assembled for loading aboard ships. It includes space required for receiving, sorting, identifying and processing materials off-loaded as well as processing and assembly of outfitting materials to be loaded aboard fleet units.

44171-2 **REQUIREMENT.** Since the performance of this operation is primarily a function of facility floor space and not stacking height (SH), the determination of requirements is not first one of cubic feet. This operation is not characterized by a significant storage requirement and is not, therefore, dependent on a facility height. These operations are, however, dependent on a case specific estimate of peak and average operational tempo, processing times, and the related summary of material and operational floor layout requirements. A requirement should be developed using a related space analysis. If an existing operation is present, its floor space can be used as a ‘baseline’ measure from which to determine requirements through documented interview with the operators. This interview would be designed to forecast operational needs and adjust the baseline accordingly.

441 72 SERVMART (SF)

FAC: 4421
BFR Required: Y

44172-1 **DESCRIPTION.** A SERVMART provides covered supply facilities used for display and sale of supply systems materials for self-service requisitioning by end users. It includes areas used to display items on shelves or gondolas, checkout counters and administrative functions. This category excludes back-up storage areas; requirements for such areas must be based on SH values and are carried under other basic category 441 codes.

44172-2 **REQUIREMENT.** Since the performance of this operation is primarily a function of facility floor space and not stacking height (SH), the determination of requirements is not first one of cubic feet. These operations are, however, dependent on an analysis that accounts for stocked items (i.e. number & type), their stock depth and their retail shelving floor layout. A requirement should be developed using a related space analysis. If an existing operation is present, its floor space can be used as a 'baseline' measure from which to determine requirements through documented interview with the operators. This interview would be designed to forecast operational needs and adjust the baseline accordingly.

441 73 MTIS BUILDING (SF)

FAC: 4421
BFR Required: Y

44173-1 **DESCRIPTION.** A Material Turned Into Store (MTIS) Facility provides covered supply space used for processing materials turned into supply for redistribution or disposal. It includes space used for receipt, screening, identification, assembly and staging for return to storage areas.

44173-2 **REQUIREMENT.** Since the performance of this operation is primarily a function of facility floor space and not stacking height (SH), the determination of requirements is not first one of cubic feet. This operation is not characterized by a significant storage requirement and is not, therefore, dependant on a facility height. These operations are, however, dependent on a case specific estimate of peak and average operational tempo, processing times, and the related summary of material and operational floor layout requirements. A requirement should be developed using a related space analysis. If an existing operation is present, its floor space can be used as a 'baseline' measure from which to determine requirements through documented interview with the operators. This interview would be designed to forecast operational needs and adjust the baseline accordingly.

451 10 OPEN STORAGE AREA (SY)

FAC: 4521
BFR Required: Y

45110-1 **DESCRIPTION.** This category group consists of non-covered storage areas, paved or otherwise established, for storage of General Supply Materials. Several of the excluded types of functions include miscellaneous materials coded under other basic category codes (e.g., ammunition on open pad coded under 425-10 and open storage areas for non-supply oriented functions coded under 425 11).

45110-2 **REQUIREMENT.** Unless known to be otherwise, a stacking height (SH) of 4 feet should be used in accordance with the Basic Facilities Requirement (BFR) 4-step method described in the requirements section of this guidance. An estimation of material requirements, likely lay-down scenario (i.e., how material is stowed on area) and material handling equipment access is also acceptable as a means of determining square foot (SF) requirements via a space analysis.

451 70 EXTRAORDINARY SUPPORT – DISPOSAL - STORAGE AREA (SY)

FAC: 4521
BFR Required: Y

45170-1 **DESCRIPTION.** This code refers to open areas primarily to provide space for the receipt, processing, staging and issue of material that has been deemed excess to Navy needs and is awaiting some resale or final disposal and whose value is not significantly impacted by uncovered exposure to the environment. This code may also be used for such open yards required for staging or storage of items being held for their scrap value to ongoing missions or systems.

45170-2 **REQUIREMENT.** To the extent practical, such operations are expected to use efficient storage practice as with a ready issue operation. There are no metrics that can serve to guide an allowance for this operational requirement. A SH of 4 feet should be used in accordance with the BFR 4-step method described in the requirements section of this guidance. Otherwise, an estimation of material requirements, likely lay-down scenario (i.e., how material is stowed on area) and material handling equipment access may also be used in a space analysis to determine requirements.

500 SERIES
MEDICAL FACILITIES

Table of Contents

500 MEDICAL FACILITIES

500-1 GENERAL

The Office of the Assistant Secretary of Defense Health Affairs (OASD (HA)) has primary responsibility for establishing functional space criteria and standards for medical facility programs necessary to fulfill the Secretary of Defense's responsibilities. The medical program is funded by the Assistant Secretary of Defense, Health Affairs (OASD (HA)); which provides annual programming guidance, performs defense-wide health care facility planning, project programming, reviews and adjusts projects for scope and cost. Using the OASD (HA) criteria, the Office of the Navy Surgeon General (BUMED) programs all medical projects for the Navy. OASD (HA) also presents medical programs to OSD and the Congress for MILCON and UMC approval.

500-2 POLICY

This section provides general guidance for planning of Military Healthcare facilities. All Military Healthcare facilities shall be planned with the Department of Defense (DoD) objective to provide facilities that are responsive to the functional requirements of the using Military Department. Joint utilization of military healthcare facilities and medical resources available in the civilian community must be considered in planning healthcare facilities. All medical facilities including medical and dental treatment facilities (MTF's), medical training facilities, medical research facilities, and veterinary treatment facilities should meet the operating requirement and should provide reasonable flexibility to accommodate future changes. The facility should be functional as well as aesthetically pleasing, while still being economical with a practicable life-cycle-cost. The facility must meet the necessary environmental requirements including applicable federal, state, and local environmental standards and criteria.

The Military Healthcare System space planning has two fundamental objectives. Within each objective, there may be multiple levels of determination. The first objective is to develop specific functional area space based upon environmental inputs. Functional areas are driven from a set of environmental inputs. The environmental inputs are defined to indicate demand for space (e.g. program obligations, activity requirements, staffing and equipment). The four major categories of space criteria are patient care, support of patient care, administration, and support of administration. To determine the Program for Design, the environmental inputs are translated into a set of specific space criteria.

The Bureau of Medicine and Surgery (BUMED), subject to approval of the Assistant Secretary of Defense for Health Affairs (OASD (HA)), is responsible for making the ultimate determination of scope and size of Naval Healthcare facilities to be planned, programmed, and constructed for major and minor projects. The following steps are a guide to Healthcare Planning.

Note: BUMED activities will be the maintenance UIC for all facilities they occupy entirely in direct support of their mission or are the preponderant user. Stand-by/ emergency electrical generation, operational fuel storage of the generators or building heat systems and electrical transformers in direct support of the medical facilities should have the BUMED activity as the User and Maintenance UIC. The BUMED facility is not a complete and useable facility without the inclusion of these directly supporting utility systems.

The Healthcare facility and local planner will coordinate with the BUMED Echelon 3 Commands (NME, NMW, NCA, and NMSC)) to identify projects to BUMED, Director of Facilities (M4B1), Installations and Logistics as potential MILCON or UMC candidates. BUMED will identify projects to TMA as potential MILCON or UMC candidates for approval.

The Healthcare facility Commanding Officer shall coordinate will the Lead Agent and their BUMED Echelon 3 command for the development of a project-specific Concept of Operations and integrated market-driven business plan. The elements of the business plan should include, but are not limited to:

- Delivery of the TRICARE health benefit to the population enrolled to the Military Treatment Facility (MTF)
- Provision of care to selected beneficiaries to maintain readiness skills
- Clinical competencies to maximize the utilization of the facility after the needs of TRICARE Prime enrollees have been satisfied
- Develop and implement joint programs in multi-service market areas
- Identify and develop sharing initiatives with VA
- Manage the care of all MTF Prime enrollees under Revised Financing and a Basic Facility Requirement (BFR)
- Planning tasks related to project identification and formulation will be programmed and funded from other than MILCON appropriations

The BUMED Echelon 3 command Project Officers shall coordinate with the medical activity to develop DD Form 1391 and provide all supporting documentation on the medical requirements at the installation, and assist the medical activities in obtaining project validations. The BUMED Echelon 3 commands will also coordinate with the installation to provide information systems requirements and cost estimates to integrate the information systems with the installation and the activity.

The BUMED Echelon 3 command Project Officers will develop explicit planning documents for future year projects, including a Healthcare Requirements Analyses (HCRA), Economic Analyses (EA), Construction cost analyses, Make-versus-Buy Analysis, and Program for Design. Each medical MILCON project is unique and circumstances may warrant modification to the guidelines provided. The analyses will normally require the assistance of outside contractors. One or all of the listed documentation may be required.

The BUMED Echelon 3 command Project Officer, Medical Consultant, outside contractor or A/E Firm will forward all completed documentation (i.e. Project Book, HCRA EA, and DEFTAB) to BUMED Facilities (M4B1) for review. BUMED will coordinate with M3 Operations Directorate for review. BUMED will then forward the required documentation to OASD (HA) for review and approval. Once approved, OASD (HA) will issue a DA to the Design/Construction Agent (NAVFAC/Army Corps of Engineers) to proceed with the Project.

500-3 FACILITY DESIGN

The following conversion factors shall be used in programming a Navy Healthcare facility. A net to gross conversion ratio for each department shall be calculated separately. The following steps are required to determine the net area for each department:

General Methodology:
1. Apply the specific net/gross ratio specific for each department.
2. Add all the department gross areas together.
3. Add the additional net/gross conversion factors to determine the overall building gross area.

Listed below are the department net/gross conversion ratios:

Table 500-1
Department Net/Gross Ratio

Administration	**Net / Gross Ratio**
General Administration	1.40
Medical and Patient Libraries	1.35
Education and Training	1.35
Information Management	1.35
Patient Administration	1.35
Outpatient Services	
Primary Care/Family Practice	1.35
Pediatrics	1.35
Flight Undersea Medicine and Readiness	1.35
Emergency Services	1.35
Women’s Health	1.35
Wellness Clinic	1.25
Occupational Therapy	1.30
Physical Therapy	1.30
Audiology / Speech	1.35
Specialty Surgical Clinics	1.35
Orthopedics / Podiatry	1.35
Ophthalmology/ Pulmonary Services	1.35
Allergy / Immunization	1.35

Mental Health	1.35
Preventative/Occupational Medicine	1.35
Dental Clinics	1.35
Inpatient Services	
Nursing Units	1.50
Labor and Delivery/ OB Unit	1.50
Nursery	1.45
Surgery	1.60
Support Ancillary Services	
Food Service	1.35
Logistics	1.25
Pathology	1.25
Radiology / Nuclear Medicine	1.50
Pharmacy	1.25
Vet services	1.35
Chapel	1.20
Patient Services	1.35
Clinical Investigation	1.35

After all the department totals are calculated and totaled, the additional net/gross ratios need to be added. Listed below are the building net/gross conversion ratios, based on building type:

Table 500-2
Net To Gross Square Feet Calculations

Allowances/ Categories	Medical/ Dental Clinics	Ambulatory/ Health Care Facility	Station/ Community Hospital	Regional Medical Centers
MECHANICAL SPACE	13.50%	14.5%	15.0%	16%
ELECTR. SPACE	2.0%	2.0%	3.0%	3.0%
CIRCULATION	14.0%	15.0%	15%	16%
HALF AREAS	1.5%	1.5%	1.5%	1.5%

Notes: For addition/alteration projects, up to 15% of the total altered net space may be added to the flexibility allowance to offset physical constraints in the existing facility. This increased allowance must be validated during design.
1. Buildings with multiple floors may need additional circulation ratios for stairs, elevators, etc.
2. For facilities with emergency power systems, other than Hospitals and Regional Medical Centers, increase electrical from 2.0% to 3.0%. Hospitals and Regional Medical Centers have a percentage that already assumes that emergency power systems are required.

3. Communication/network server spaces shall be programmed in Section 2.4: Information Management and throughout all departments.
4. Add 25% to mechanical areas for projects in Germany (requires all floor mounted equipment).
5 Add 8% to circulation areas for projects in Germany (natural daytime lighting requirements).

510 HOSPITAL AND OTHER MEDICAL TREATMENT FACILITIES

510 10 HOSPITAL (BD)
FAC: 5100
BFR Required: Y

51010-1 **GENERAL.** A Healthcare facility that provides general and specialized medical care for authorized personnel, with both inpatient and outpatient services. This facility will also normally contain clinics, such as Medical, surgical, pediatrics, obstetrical, ICU and CCU. The facility will have a Pharmacy, ambulance, and administrative area. This facility will admit for more than 24-hour stay.

510 11 MEDICAL CENTER (SF)
FAC: 5100
BFR Required: Y

51011-1 **GENERAL.** A regional medical center. These facilities support both increased surgical capabilities and a surgical graduate education program, not required in smaller hospitals. Applies to Bethesda, Portsmouth and San Diego (Balboa).

510 12 PRE-POSITIONED FLEET HOSPITAL WAREHOUSE (UNASSEMBLED) (EA)
FAC: 5306
BFR Required: Y

510 15 HOSPITAL BRANCH / ANNEX (BD)
FAC: 5100
BFR Required: Y

510 16 MEDICAL ADMINISTRATION (SF)
FAC: 6100
BFR Required: Y

51016-1 **GENERAL.** A building or space that provides administrative support for medical, dental or veterinary functions that is physically located outside of a defined hospital or clinic facility. Types of functions would include, but not limited to, TRICARE management, resource management, patient administration, medical command personnel. Medical administrative personnel provide essential work for the accomplishment of the medical mission. These individuals do not counsel, diagnosis, examine or treat patients. This category does not serve as headquarters space for command level units. Reference the following for space planning: https://www.wbdg.org/FFC/DOD/MHSSC/ARCHIVES/spaceplanning_healthfac_25_2006.pdf.

510 20 HOSPITAL LAUNDRY (SF)

FAC: 5100
BFR Required: Y

510 77 HOSPITAL MEDICAL STORAGE (SF)

FAC: 5306
BFR Required: Y

530 LABORATORIES

530 10 DISPENSARY AND OUTPATIENT CLINIC (SF)

FAC: 5500
BFR Required: Y

53010-1 **GENERAL.** Free Standing Clinic, outpatient clinic, which occupies a building or part of a building, but is not physically located with a hospital or medical center that provides routine and emergency care to authorized personnel.

530 20 MEDICAL LABORATORY (SF)

FAC: 5302
BFR Required: Y

53020-1 **GENERAL**. A facility, detached from a hospital that provides laboratory support to the hospital and/or other medical activities. The analysis and diagnostic laboratory includes chemistry, diagnostics and microbiology testing sections and a quality assurance and technical support section. Contact the Bureau of Medicine and Surgery (BUMED) or the appropriate BUMED Echelon 3 command when planning this facility.

530 25 PHARMACY (SF)

FAC: 5500
BFR Required: Y

53025-1 **GENERAL.** A pharmacy building or space that dispenses medically prescribed drugs. This category is used for standalone buildings or to delineate functional areas within facilities located outside a defined hospital or clinic facility (for example Exchange, Commissary, etc.). Pharmacy areas within hospitals or clinics will not be separately identified but will carry the same category code as the hospital or clinic. This category does not serve as headquarters space for command level units.

530 30 MORGUE (SF)

FAC: 5303
BFR Required: Y

53030-1 **GENERAL.** A facility, either detached or within a hospital, for the identification, preparation, and holding of human remains.

530 40 VIVARIUM CLINIC (SF)

FAC: 5304
BFR Required: Y

53040-1 **GENERAL.** The vivarium clinic is a medical research laboratory for keeping and raising animals and plants under natural conditions for observation and research. This clinic may also do biological defense and other research for war and peacetime protection. Contact the Bureau of Medicine and Surgery (BUMED) or the BUMED Echelon 3 command when planning this facility.

530 45 VETERINARY TREATMENT FACILITY (SF)

FAC: 5304
BFR Required: Y

53045-1 **GENERAL.** This facility is used to provide food safety and quality assurance, care for government owned animals (working dogs and horses), and animal disease prevention and control. Veterinary services are to examine, immunize and treat for the prevention and control of diseases or conditions that are transmissible to humans or animals, or may constitute a military community health problem. Conditions that are not transmissible from one animal to another or to a human generally are not treated at this facility. A veterinary treatment facility (VTF) is equipped and staffed to perform the entire spectrum of veterinary services required by a military installation. A VTF includes offices for the veterinarian and section chiefs, conference room, library, food inspection room, waiting room, x-ray facilities, pharmacy, clinical laboratory room, inside rabies quarantine kennel rooms, inside-outside kennel area for hospitalized government owned animals, toilets and showers, employee lounge, locker and dressing rooms, linen room and storage space for records, supplies and cleaning equipment. Table 53045-1 provides space allowance for individual components of a Veterinary Treatment Facility. It should be noted that not all components may be required for each Facility.

> **Note: Cat Codes 530-40 and 530-45 should be used when the tenant is an Army Veterinarian conducting food inspections. This is the only instance where it is a BUMED funding responsibility and requires the BUMED Activity as the Tenant / User and Maintenance UIC.**

For a veterinary clinic operated by MWR in support of the base populations' pet animals or for a military working dog (MWD) kennel, please use Category Code 730 76. These are not BUMED activities.

Table 53045-1

Type of Space	Net Square Feet
I. Clinical Spaces	
Exam. Rms.	120
Surgical Suite	200
Clean Utility Room	80
Dirty Utility Room	80
X-ray (incl. processing space)	250
Kennel (quarantine)	80
Pharmacy Store Room	120
Food Inspection Room and Laboratory	470
Clinic Laboratory Area	120
Stray Animal Confinement Kennels	10/40
Utility and Supply Area	150
Rabies Quarantine Kennels	40
Hospitalization Kennels	40
Utility Area for Kennels	140
Kennel Inside and Outside	60
II. Support Spaces	
Chief Veterinarian Office	140
Administrative Support Area	120
Reception Area and Control Area	140
Clinical Records Holding Area	50
Employees' Lounge	140
Patient Handler Waiting Room	200
Conference Room/Library	250

530 50 ENVIRONMENTAL PREVENTATIVE MEDICINE LABORATORY (SF)

FAC: 5302
BFR Required: Y

53050-1 Criteria for this category code are currently being written.

530 60 MEDICAL WAREHOUSE (SF)

FAC: 5306
BFR Required: Y

53060-1 **GENERAL.** A storage facility for medical equipment and supplies that is continuously withdrawn and replenished. Storage of war reserve medical supplies is included in depot storage facilities.

530 70 AMBULANCE SHELTER (SF)
FAC: 5307
BFR Required: Y

53070-1 **GENERAL.** A covered space used to shield the Ambulance, its driver and its patients from exposure to the elements.

540 DENTAL CLINICS

540-1 A dental clinic is an oral health care service facility equipped and staffed to perform dental procedures for general practices, a specialty, or a grouping of specialties. A dental facility will normally include treatment areas, administrative, support and storage areas.

540 10 DENTAL CLINIC (SF)
FAC: 5400
BFR Required: Y

54010-1 **GENERAL.** The Bureau of Medicine and Surgery (BUMED), subject to the approval of the Assistant Secretary of Defense (Health Affairs), is responsible for the determination of scope of dental clinics planned, programmed, and constructed. The following information is provided as a guide to be utilized for planning and preliminary programming purposes.

Step 1: <u>Beneficiary Population</u>. Determine the active duty beneficiary population. On average there will be 1 dental officer per 800 active duty beneficiaries.

Step 2: <u>Staffing</u>. Obtain staffing figures for the planning year from the Authorized Manpower documentation for the military personnel and the authorized positions for the civilian personnel. The planning documents must be submitted via the BUMED Echelon 3 to the BUMED Manpower Division (M1) for confirmation of support for any increased staffing, both military and civilian.

Step 3: <u>Dental Treatment Rooms (DTR's)</u>. Determine the number of required DTR’s from the following criteria.

- 1 DTR for each dentist in training.
- 2 DTR’s for each general duty dentist assigned to clinical dentistry. 2 DTR’s for each Prothsodontist, Periodontist, Endodontist, Oral Surgeon, Pedodontist, and Comprehensive General Dentist assigned to clinical dentistry.
- 3 DTR’s for each Orthodontist.

NOTE: When the total number of dentists is five (5) or less, use a DTR factor of 2 DTR's per dentist Clinics with six (6) dentists will have a minimum of 10 DTR's.

- 1 Oral Hygiene Treatment Room (OHTR) for each oral hygienist or technician functioning as oral hygienist.

Step 4: Clinic Space Required. After calculating the number of DTR's required, consult table 540-10A to determine the gross area required. Interpolation is required. These figures include space allowance for all functions that are in direct support of the dental clinic, such as administration, locker rooms, conference rooms, limited prosthetic laboratory, storage of operating supplies, a central sterile and dental X-ray. This also includes waiting rooms, mechanical spaces, restrooms, circulation, walls and partitions, and consultation rooms. Interpolation, as explained at the front of the 500 series, is necessary.

Table 54010-1
Space Allowances for Dental Clinics

Number of DTR's and OHTR's	Gross Area per DTR and OHTR (sq.m / GSF)
2	93 sq.m. / 1000 GSF
3	93 sq.m. / 1000 GSF
4	84 sq.m. / 900 GSF
6	84 sq.m. / 900 GSF
8	75 sq.m. / 800 GSF
10	75 sq.m. / 800 GSF
12	70 sq.m. / 750 GSF
18	70 sq.m. / 750 GSF
25	70 sq.m. / 750 GSF
30	65 sq.m. / 700 GSF
40	65 sq.m. / 700 GSF
50	65 sq.m. / 700 GSF
100	61 sq.m. / 650 GSF

Step 5: Optional Functions: (must be specifically justified and documented)

A. Dental Equipment Repair. For clinics with equipment repair technicians assigned, determine the number of repair technicians from Manpower Authorization and consult table 54010-2 to determine the gross area required.

Table 54010- 2
Space Allowance for Dental Equipment Repair Technicians

Number of Repair Technicians	Gross Area - sq. m. / GSF
1	25 sq. m./ 270 GSF
2	46 sq. m. / 500 GSF

3	60 sq. m. / 650 GSF

Note: Add 9 sq.m. (100 GSF) more for each additional repair technician.

B. Special Education Functions. Where specifically justified, an education training room can be planned based upon documentation of course title, frequency and duration of courses, and average on board students. A space factor of 2.6 sq.m. (28 GSF) per student will be used to size the facility based upon the average monthly student population that can be justified. Routine classroom/conference room functions are already included in table 54010-1.

C. Full Prosthetic Lab. If authorized and staffed with a full time prosthetic lab technician, additional space may be added for a full prosthetic lab. Consult table 54010-3 for the gross square area required.

Table 54010- 3
Space Allowance for a Full Prosthetic Laboratory

Function	Gross Area - sq. m. / SF
Dental Prosthetic Lab	63 sq.m./ 675 GSF
Ceramic Room	19 sq.m./ 200 GSF
Casting & Grinding	19 sq.m. / 200 GSF
Model Storage	11 sq.m. / 120 GSF
Each technician over 3	**8 sq.m.each 85 GSF**

Table 54010- 4
Space Allowance for Regional Storage

Number of Branch Clinics served	Gross Area – sq. m. / SF
Up to 5	19 sq. m. / 200 GSF
6 to 10	65 sq. m. / 700 GSF
11 to 20 (maximum allowable)	93 sq. m. / 1000 GSF

Step 6: Total Gross Square Footage Required. Add the gross square footage for the clinic obtained in step 4 to the gross square footage of the supported options obtained in step 5. The sum is the total space requirement for category code 540-10 and includes all functions that are normally associated with a Dental Clinic.

Step 7: Parking. Based on the 15 Oct 1991 MIL-HDBK-1191 (DOD Medical and Dental Treatment Facilities Design and Construction Criteria), for clinics with less than 30 DTR's, provide 3 parking spaces per DTR For larger clinics, 2.5 spaces per DTR should be planned. One space per organizational vehicle is also authorized.

Step 8: Site Selection. Site facility convenient to active duty beneficiaries. Collocation of Dental Clinics with Medical clinics is operationally efficient and desired. In site selection, provide a minimum of 25% expansion capability of the facility square meters, as calculated in step 6, & parking requirements, calculated in step 7. Facility should be sited convenient to existing utility support.

550 DISPENSARIES/ CLINICS

550 10 PRIMARY CARE CLINIC (SF)

FAC: 5500
BFR Required: Y

55010-1 **GENERAL.** A primary care clinic may be referred by various names (troop medical clinic, adult clinic, family practice clinic, OCC Health, Outpatient, and others). A primary care clinic provides the office, examination and treatment space for “primary care managers”.

550 20 AMBULATORY CARE CENTER (SF)

FAC: 5501
BFR Required: Y

55020-1 **GENERAL.** A health care facility capable of performing outpatient surgical procedures and other medical treatment, not requiring extensive patient convalescence or overnight observation.

550 30 REHABILITATION CENTER FOR DRUGS AND/OR ALCOHOL (SF)

FAC: 5500
BFR Required: Y

55030-1 This facility will provide the necessary administration, counseling, training, berthing, and recreation for rehabilitation of eligible Navy, Marine Corps and other personnel suffering from alcoholism, drug dependency and/or compulsive overeating.

55030-2 A typical Alcohol Rehabilitation Center (ARC) is composed of three major components which are: Berthing, Administration, and Operational Support area. The berthing requirements for all patients are based upon the criteria for category code 721-14, Bachelor Housing - Class A Student Barracks in order to be compatible and consistent with the Navy's treatment modality of group therapy. Each "group sized" bay or module will accommodate 12 beds and an appropriately shared head/shower. Identical berthing modules for female patients should be provided in a separate and distinct location. The number of modules required varies with patient load. A 120 patient facility requires 12 12-bed modules; the apparent extra modules are required to accommodate female patients, patients awaiting transportation and any group overflow.

55030-3 The Administration requirements are derived by using the criteria established for category code 610-10, Administration, keeping in mind that administration includes both command oriented and patient affairs.

55030-4 The Operational Support Area is composed of all those remaining facilities required for the ARC to accomplish the assigned mission. Included within this area is sufficient space for the following types of functions: group therapy rooms, some with discreet observation capability; multi-purpose room, large enough to accommodate entire facility population; a visitors lounge with some privacy; traditional classrooms with audiovisual capability; library; patients lounge; secure medical exam room and a small laboratory capability; and storage space. A planning factor of 18 square meter (190 gross square feet) per patient is used to provide for these facilities. In the event that no parking is available, the criteria for category code 852-10, Parking Area, is used to determine the parking space requirements for the organizational and non-organizational vehicles.

55030-5 The following example illustrates the methodology used to determine the space requirements for a typical ARC treating 120 patients and having a staff complement of 50 personnel.

Table 55030-1

ARC	**Component**	**Gross Area**	
		Square Meter	**Square Foot**
Berthing—Class A Student (Cat Code 721-14):	120 patients x 7 sq.m. (75.3 sf)/patient =	840	9,307
Net to gross conversion = (Includes lounges, general circulation, mechanical space, etc.)	1.71 X 840 sq.m. (9,037 sf) =	1,436	15,453
Administrative Office (Cat Code 610-10):	14 sq.m. (162.5 gsf) X 50 personnel =	700	8,125
Operational Support Area:	120 patients X 190 gsf per patient =	2,119	22,800
	Total ARC Space	5,095	55,685
Parking	**Component**	**Square Meter**	**Square Yard**
Non-Organizational			
Admin = 50 pn X 60% (factor)	35 spaces		
Patient = 120 pn X 75%	90 spaces		
	Total: 125 spaces @ 33 sq.m. (39.5 sq.yds.) =	4,125	4,933
Organizational			
Vans = 10 pn x 75%	8 spaces @ 33 sq.m. (39.5 sq.yds.) =	264	316
	Total Parking Space	4,389	5,249

NOTE: These planning factors are the maximum space allowances for this type of facility. Smaller areas are permitted as appropriate. However, in all cases, the berthing requirements must conform to the Class A Student space requirement as given in the criteria for category code 721-14, Bachelor Housing.

Version: 600.20230203

FACILITIES CRITERIA (FC)
FACILITY PLANNING FOR NAVY AND MARINE CORPS SHORE INSTALLATIONS

Series 600: Administrative Facilities

Record of Changes:

Date	CCN #	CCN Title	Change Description
Sept 2013	61010	ADMINISTRATIVE OFFICE	For simple BFRs, a maximum Admin GSF/PN allowance of 162.5 GSF/PN applies. This allowance includes office space, admin support space, break room space, conference/training room space and a net-to-gross factor of 1.25.
July 2019	61010	ADMINISTRATIVE OFFICE	Continue to use a maximum Admin GSF/PN allowance of 162.5 GSF/PN. For simple BFRs, a net-to-gross factor of 1.40 now applies. For project level BFRs, use the Admin BFR Generator to calculate the actual Admin GSF/PN allowance and Net-To-Gross factor.
Feb 2021	61010	ADMINISTRATIVE OFFICE	Section 61010-11 added to account for Telework and Workspace Sharing. Use section 61010-11 in tandem with Admin BFR Generator.
April 2022	61040	LEGAL SERVICES FACILITY	In Table 61040-1 Space Allowance for Legal Services Facilities, change Paralegal square footage per person from 64 NSF to 110 NSF.
May 2022	61010	ADMINISTRATIVE OFFICE	In Table 61010-7.2, update “shower room” justification by including support if access to a fitness center is 5 minutes or greater by walking. Additional justification includes acknowledgement of military integrity and readiness.
28 Jul 2022	61010	ADMINISTERATIVE OFFICE	Admin. BFR Generator in Excel format mad available for download. This includes various updates.
2 Mar 2023	600 Series	UFC 2-000-05N	Change UFC 2-000-05N to FC 2-000-05N document due to the fact that this planning criteria is not unified among the other DoD services.

SERIES 600
ADMINISTRATIVE FACILITIES

Table of Contents

610 ADMINISTRATIVE BUILDINGS

610-1 DEFINITION. A building that contains general office space, administrative support space, break rooms, and conference/training rooms. Other special purpose space types may apply.

610 10 ADMINISTRATIVE OFFICE (SF)

FAC 6100
BFR Required Y

61010-1 **DEFINITION.** An administrative facility is a building or portion of a building in which the administrative affairs of an organization are conducted. It accommodates the executive and staff functions of an installation or tenant organization. Administrative office space provided within non-administrative facilities under other category codes shall conform to the criteria provided herein.

61010-1.1 **BASIC PLANNING FACTORS.** There are two methods to determine administrative space requirements: Simple BFR Calculation and Project Level BFR Calculation.

- For simple Basic Facility Requirement (BFR) calculations, a maximum administrative (Admin) space allowance of 162.5 gross square feet per person (GSF/PN) applies. An Admin GSF/PN allowance includes all administrative workspace, administrative support space, break room space, and conference/training room space. Included in the 162.5 GSF/PN factor is a net-to-gross (NTG) factor of 1.40. This method is for rough order of magnitude estimates.

- For all project level BFR calculations, where multiple factors are considered (e.g. circulation, multiple stories, scale of economy, telework, workspace sharing, etc.), the maximum Admin GSF/PN allowance of 162.5 GSF/PN still applies, however; all space requirements and the NTG factor shall be calculated. Read sections below and use the online Admin BFR Generator to simplify this process.

  Note: The Admin BFR Generator has been tested with Chrome and Internet Explorer. If security settings prevent the link above from working, copy and paste following address into your browser:

Online version:
https://www.wbdg.org/FFC/DOD/UFC/600SERIES/BFR/Admin_BFR_Generator.htm

MS Excel version for download:
https://www.wbdg.org/FFC/DOD/UFC/600SERIES/BFR/Admin_BFR_Generator.xlsx

61010-2 **Admin BFR Generator Quick Start Process.** Space requirements are calculated for administrative functions using the process below.

Process:

1. Begin on 'Activity' tab and input activity data.

2. Input number of personnel that require a private office, workstation type 1 (WST1) and/or workstation type 2 (WST2) space.
   Note 2a. Private office spaces are justified for supervisory personnel.
   Note 2b. WST1 spaces are justified for general staff personnel.
   Note 2c. WST2 spaces are justified for personnel that predominantly telework.

3. Proceed to 'Space Table' tab and input space table fields if required.
   Note 3a. Space types within the General Administrative Space and Basic Allocation Groups are used to calculate an ‘Admin GSF/PN factor’, which has a maximum allowance of 162.5 GSF/PN.
   Note 3b. Space types within the Functional Support Group, Security Group and User Defined Group are used to calculate a ‘Total GSF/PN’ factor, which may exceed 162.5 GSF/PN.

4. Proceed to 'Justification' tab and input justification fields if required.
   Note 4a. Space types within the General Administrative Space Group and Basic Allocation Group do not require justification.
   Note 4b. Space types within the Functional Support Group, Security Group and User Defined Group do require justification.

5. Proceed to 'Net-To-Gross' tab and input net-to-gross fields if required.
   Note 5a. If space loading is less than 50 PN, a Net-To-Gross (NTG) factor of 1.40 is automatically applied.
   Note 5b. If space loading is equal to or greater than 50 PN, the NTG factor is calculated.

6. Proceed to 'Summary' tab, input summary data fields and 'Submit'.
   Note 6a. The ‘Submit’ function checks to ensure all required data fields are populated. Once all required data fields are populated, the BFR is converted to PDF format and sent to the user via email.

7. Optional: Proceed to ‘Telework’ tab, and follow guidance in section 61010-11.
   Note 7a. Requires completed Base Line scenario (steps 1-5 above)
   Note 7b. Requires survey results in proper format, see section 61010-11.

61010-3 **Personnel Loading.** Personnel loading is the sum of all military, civilian and other personnel associated with an organization at a particular planning area and category code. Administrative BFRs shall be based on an official personnel loading source.

61010-3.1. **Official Personnel Loading Sources.**
61010-3.1.1. Activity certified personnel loading document
61010-3.1.2. Activity manning document
61010-3.1.3. Navy Total Force Manpower Management System
61010-3.1.4. Marine Corps Total Force System
61010-3.1.5. Other - If official reports are not available, certification of the personnel loading data used as a basis for BFR development must be provided by a responsible approval authority.
61010-3.1.6. SIMNavy can provide initial personnel loading reports, but must be certified by the tenant activity for accuracy. Website requires Chrome browser and user authentication. https://fres.cnic.navy.mil/SimNAVY/SimNavy.aspx

61010-3.2. **Personnel Loading Year.** Personnel Loading Year refers to a particular fiscal year for which the projected staffing applies. For planning purposes, a five-year projection is applied.

61010-3.3. **Personnel Loading Types.** Personnel loading types include military, civilian and other personnel.
61010-3.3.1. Military personnel include all active duty personnel. Reserve personnel are justified on a case-by-case basis.
61010-3.3.2. Civilian personnel include all direct hire personnel.
61010-3.3.3. Other personnel include all contractor, foreign national and/or other miscellaneous personnel.

61010-4. **Space Loading.** Space loading is the sum of all personnel requiring private office, Workstation Type 1 (WST1) and/or Workstation Type 2 (WST2) space, associated with an organization at a particular planning area and category code. Personnel loading should be equal to space loading.

61010-5. **General Administrative Space.** General Administrative Space types are justified to support administrative or similar functions and include: private office spaces, WST1 spaces, WST2 spaces as well as secondary circulation space. As part of the General Administrative Space group, these space types are based on official personnel loading reports and do not require further justification. Tenant (personnel and/or space) loading reports must be provided as a separate attachment for project level BFRs.

Table 61010-5.1. **General Administrative Group Space Types**

Space Type:	Description:	Planning Factor:	Justification Guidelines:
Private Office	A private office provides an enclosed space, typically occupied by supervisory personnel or for those personnel whose job duties require privacy. Depending on an organization's telework and workspace sharing policies, this space type may be dedicated or shared. Private office space allocations typically range from 100-120 NSF/PN.	Allocate 120 NSF/PN requiring private office space	• The number of personnel requiring private office space is supported by an official personnel loading report. 
WST1 (WS Type 1)	A WST1 is a modular workstation, typically occupied by general administrative or support staff. Depending on an organization's telework and workspace sharing policies, this space type may be dedicated or shared. WST1 space allocations typically range from 48-64 NSF/PN.	Allocate 64 NSF/PN requiring WST1 space	• The number of personnel requiring WST1space is supported by an official personnel loading report. 
WST2 (WS Type 2)	A WST2 is an optional space type, similar to WST1 modular workstation, but provides an alternate (usually smaller) size. It may serve as contractor space, hoteling space, or swing space during renovation projects. Depending on an organization's telework and workspace sharing policies, this space type may be dedicated or shared. WST2 space allocations typically range from 36-48 NSF/PN.	Allocate 48 NSF/PN requiring WST2 space	• The number of personnel requiring WST2 space is supported by an official personnel loading report. 
Circulation	General administrative space secondary circulation includes the aisles between private office, WST1 and WST2 spaces. This circulation multiplier may range from 0.12 for all enclosed space (private offices) to 0.28 for all open office (workstation spaces)	Allocation is calculated using the Admin BFR Generator	• Space type does not require justification

61010-6. **Net General Administrative Space**. Sum of all space types listed above including secondary circulation.

61010-7. **Special Purpose Space.** Special purpose space groups include:

1. Basic Allowance Group
2. Functional Support Group
3. Security Group
4. User Defined Space Group

61010-7.1. **Special Purpose Space** – **Basic Allowance Group.** As part of the Basic Allowance Group for administrative functions, these space types are based on official personnel loading reports and do not require further justification.

Table 61010-7.1. **Basic Allowance Group Space Types**

Space Type:	Description:	Planning Factor:	Justification Guidelines:
Administrative Support Space	Admin support space includes: • Group file storage (as opposed to individual file storage provided within modular furniture) • Conference room equipment storage (audio/visual equipment, chairs, lecterns, and room dividers) • Day locker storage (cell phones and other small personnel items) • Lactation room(s) • Office equipment and supply storage • Reception area(s)	Allocate 8 NSF/PN	• Basic Allowance Group space types are based on personnel loading and do not require further justification. • Note: The degree to which administrative support spaces may be applied is dependent on the number of personnel. For small groups (<50 PN), this allocation may only include space for office equipment and supply storage only. For large groups (>100 PN), this allocation may include all of the space types listed in the description.
Break Room w/o Kitchen	A break room w/o kitchen is a staff-only space used for breaks or lunches. It typically includes some or all of the following: coffee bar, microwave oven, MWR drink/snack space, refrigerator and water cooler.	Allocate 2 NSF/PN	• Basic Allowance Group space types are based on personnel loading and do not require further justification.
Conference/Training Rooms	Conference/training rooms provide space for meetings, briefings and training. One overall space allocation is provided for conference/training rooms.	Allocate NSF based on: Conference/Training Room Table below	• Basic Allowance Group space types are based on personnel loading and do not require further justification.

Table 61010-7.1A. **Conference/Training Room Table**

Personnel Loading Ranges		Conf Rooms	Team Mtg/Mini Conf Room (5-10 PN) 15 NSF/PN			Conf Rooms	Conference Room (10 to 49 PN) 20 NSF/PN			Conf Rooms	Conference Room (50+ Persons) 20 NSF/PN plus 150 NSF spkr area			**Total**
LOWER	UPPER	QTY	PN	NSF/PN	NSF	QTY	PN	NSF/PN	NSF	QTY	PN	NSF/PN	NSF	NSF

61010-7.1.1. **Admin GSF/PN**. The sum of all space types identified above (private offices, workstations, admin support space, break rooms, conference/training rooms and secondary circulation space) multiplied by the NTG factor, make-up the Admin GSF/PN factor. This factor shall not exceed 162.5 GSF/PN.

61010-7.2. **Special Purpose Space** - **Functional Support Group.** These space types are additive to the 162.5 GSF/PN threshold and must be individually justified. The Admin BFR Generator accounts for these space types by calculating a "Total GSF/PN factor". The Total GSF/PN factor may exceed 162.5 GSF/PN where justified.

Table 61010-7.2. **Functional Support Group Space Types**

Space Type:	**Description:**	**Planning Factor:**	**Justification Guidelines:**
Archive Storage Room	An archive storage room provides space for long-term (5+ years) storage of hardcopy files. Storage space may include letter file cabinets, legal file cabinets, flat file cabinets, high density filing systems, etc. Note 1: Archive storage is different from central file storage included within the administrative support space allocations for group working files. Note 2: Archive storage is different from distributed file storage included within a private office or workstation space allocation for individual working files. No planning factors exist for this space type. A space analysis is required.	Allocate NSF requirement based on specific archive storage needs	• Mission or functions performed • Records retention requirements per SECNAV M-5210.1 apply • Records types (legal, personnel, real estate, other) • Other justification
Command Suite, Private Office	A command suite is an office area configuration containing private offices for the command leadership and key staff. Since private offices have already been accounted for in the space loading, this is an additional 80 NSF allocation for Installation Commanding Officers at the 06 level or above, and all flag and/or SES level personnel serving in a supervisory capacity.	Allocate an additional 50 NSF for each SES/O7 or ICO O6.	• Number of SES (Senior Executive Service) personnel identified in loading reports • Number of O7 or higher (Rear Admiral, Brigadier General or higher) personnel identified in loading reports • ICO O6 or higher (Installation Commanding Officer – Navy Captain, Full Colonel or higher) identified in loading reports

Table 61010-7.2. **Functional Support Group Space Types**

Space Type:	Description:	Planning Factor:	Justification Guidelines:
Hazardous Material Storage Room	A hazardous material storage room provides storage for flammable, reactive, corrosive or toxic materials. This space type is a dedicated room and does not apply to individual free standing or wall-mounted cabinets within other room types. No planning factors exist for this type of space. A space analysis is required.	Allocate NSF requirement based on specific hazardous material storage needs	• Mission or functions performed • Type of hazardous material requiring storage (corrosive, flammable, reactive or toxic) • Supported by space analysis • Other justification
Interview Room	Interview rooms are used to conduct interviews in a private and professional environment, free of distractions. Plan for up to two interview rooms, located adjacent to an observation room.	Allocate up to two interview rooms at 120 NSF each	• Mission or functions performed • Applicable to certain Echelon II IG functions • Applicable to certain NCIS functions • Address feasibility of using CCTV feeds instead of providing an observation room • Other justification (human resource functions, polygraph functions, speech therapy functions, etc.)
Lg Format Production Room	A large format production room provides space for high-quality, large scale copier, printer, plotter and/or scanner equipment. It should include space for material storage such as large format paper rolls and ink cartridges. This space type typically applies to technical or operational functions. It is not intended for traditional office equipment, which is already accounted for in the admin support space allocation. No planning factors exist for this type of space. A space analysis is required.	Allocate NSF requirement based on specific large format production equipment	• Mission or functions performed • Function(s) supported (e.g., architecture, engineering, operational) • Equipment type(s) to be housed (e.g., large scale copiers, printers, plotters, scanners, other) • Other justification

Table 61010-7.2. **Functional Support Group Space Types**

Space Type:	Description:	Planning Factor:	Justification Guidelines:
Locker Room	A locker room provides temporary storage space for a change in clothing and other personal belongings. • Lockers authorized in support of personnel performing 24-7 operations. Provide one locker per person based on the largest shift. • Lockers authorized in support of physical training requirements for military personnel at remote locations, without access to fitness centers. Provide one locker for every 10 military personnel assigned. • Lockers authorized in support of security personnel. Provide one locker per person based on the largest shift. Use the guidance above to determine the number of lockers required.	Allocate lockers at 8 NSF each	• Mission or functions performed • Access to a fitness center is greater than a 15-minute drive time • Military, civilian and/or contractor personnel may require lockers in support of 24-7 shift or emergency operations • Military personnel may require lockers in support of mandatory physical training requirements • The number of military personnel contributing to this space requirement is supported by an official personnel loading report • Other justification
Mailroom	A mailroom accommodates processing and distribution of a facility’s incoming and outgoing mail and parcels. A mailroom must be individually justified for operational, site specific or other reasons such as large size of organization. Office space for mailroom personnel is already accounted for within the office space loading above.	Allocate 40 NSF for every 50 personnel assigned	• Mission or functions performed • Organization has 200 or more personnel • Access to the central postal facility is greater than a 15-minute drive time. • Security requirements warrant a standalone mailroom • Hours of operation • Other justification

Table 61010-7.2. **Functional Support Group Space Types**

Space Type:	Description:	Planning Factor:	Justification Guidelines:
Observation Room	An observation room is for monitoring interviews. Located adjacent to one or two interview rooms, it provides sufficient space for a small table, two chairs, and audiovisual recording equipment. One-way glass windows share common walls with the interview room(s). If feasible, consider using CCTV feeds rather than providing space for an observation room.	Allocate one observation room at 100 NSF	• Mission or functions performed • Applicable to certain Echelon II IG functions • Applicable to certain NCIS functions • Address feasibility of using CCTV feeds instead of providing an observation room • Other justification (human resource functions, polygraph functions, speech therapy functions, etc.)
Secure Storage Room	A Secure Storage Room provides a separate lockable room for storage of sensitive or high-value equipment.	Allocate one secure storage room at 100 NSF	• Mission or functions performed • Applicable to certain NCIS functions • Other justification
Shipping / Receiving Area	A shipping/receiving area accommodates loading and unloading of a wide variety of supplies and services necessary for operations. Most items can be stored in racks and stacked up to eight feet in height, while heavy items such as bulk paper supplies must remain on pallets. A shipping/receiving area must be individually justified for operational, site specific or other reasons such as large size of organization.	Allocate 80 NSF for every 50 personnel assigned	• Mission or functions performed • Organization has 200 or more personnel • Access to a central shipping/receiving facility is greater than a 15-minute drive time • Security requirements warrant a standalone shipping/receiving area • Hours of operation • Other justification

Table 61010-7.2. **Functional Support Group Space Types**

Space Type:	Description:	Planning Factor:	Justification Guidelines:
Shower Room	A shower room provides one or more shower stalls and is typically collocated with a bathroom and/or locker room. • Showers authorized in support of personnel performing 24-7 operations, without access to fitness centers. Provide one shower for every 10 persons of largest shift. • Showers authorized in support of military personnel physical training requirements, without access to fitness centers. Provide one shower for every 20 military personnel assigned. In both cases, a ratio of 80 / 20, male / female (ratio may go up as staffing structure dictates but not lower than 80 / 20), should be used for planning purposes. Use the guidance above to determine the number of showers required.	Allocate showers at 20 NSF each	• Mission or functions performed • Access to a fitness center by walking is 5 minutes or greater or a 15-minute drive time. • Military, civilian and/or contractor personnel may require showers in support of 24-7 shift or emergency operations • Military personnel may require showers in support of mandatory physical fitness requirements • The number of military personnel contributing to this space requirement is supported by an official personnel loading report. • Other justification is acceptable, particularly as it applies to mission integrity and readiness.
Technical Equipment Area	A technical equipment area is used for check-in /check-out and charging of government issued equipment (cell phones, ELMRS radios, laptops, etc.)	Allocate one technical equipment area at 100 NSF	• Mission or functions performed • Applies to CCN 89051 • Other justification

Table 61010-7.2. **Functional Support Group Space Types**

Space Type:	Description:	Planning Factor:	Justification Guidelines:
Technical Publications Library	A technical publications library provides ready access to technical manuals, handbooks, and other guidance. Note that the need for this space type has diminished, as many resources are now readily available online. As a space saving measure, consider combining technical libraries within other spaces such as small conference/training rooms, rather than providing a separate allocation. No planning factors exist for this type of space. A space analysis is required.	Allocate NSF space requirement based on specific technical publications library needs of organization	• Mission or functions performed • Function(s) supported (e.g., architecture, engineering, legal, other) • Number and size of technical libraries required. • Other justification
Vault Room	A vault room is a secured area for handling classified material. It typically includes a worktable area and access to one or more shared SIPRNet workstations. Assume 48 NSF per workstation plus an additional 16 NSF per workstation to account for a central worktable area. The basic allocation factor becomes 64 NSF per workstation. The number of workstations required is provided/verified by the special security officer (SSO) or security manager.	Allocate 64 NSF per workstation	• Mission or functions performed • Number of workstations required. • Number and size of vaults required if more than one. • Other justification
Other Functional Support Space	This is a user-defined, functional support space type and allocation. It is intended for “one-off” space types not included above.	Allocate NSF for this user-defined space type	Provide justification for this user defined space requirement

61010-7.3. **Special Purpose Space - Security Group**. These space types must be individually justified in support of specific missions or functions.

Table 61010-7.3. **Security Group Space Types**

Space Type:	**Description:**	**Planning Factor:**	**Justification Guidelines:**
Entry Control Area	An entry control area may be authorized for secure facilities allowing for orderly check-in and checkout. The entry control area provides for one entry and one exit channel adjacent to one or more security watch stations. This area includes an additional 20 NSF for every 50 personnel assigned to the organization to accommodate transit of building personnel though the entry control area. Security watch station(s) are a separate allocation (see below).	Allocate one entry control area at 100 NSF plus 20 NSF for every 50 personnel assigned	• Mission or functions performed. • Applicable to certain operational functions. See 131 series justification guidelines. • Other justification
Secure Visitor Waiting Area	A secure visitor waiting area may be authorized for secure facilities. This space type may also apply to NCIS functions and certain Echelon II Inspector General functions. In this capacity, it separates individuals under investigation or awaiting interview from other visitors and ongoing investigations. This separate waiting area helps to maintain security, protect the integrity of investigations, and avoid compromising the facts and circumstances surrounding a criminal inquiry.	Allocate one secure visitor waiting area at 120 NSF	• Mission or functions performed • Applicable to certain operational functions. See 131 series justification guidelines. • Applicable to certain Echelon II IG functions and NCIS functions • Other justification
Security Watch Station	A security watch station provides space to house a security officer and security system monitoring equipment. A security watch stations is typically located adjacent to a lobby or quarterdeck area to control building ingress and egress.	Allocate NSF based on specific security office requirements	• Mission - Organization's mission requires security beyond that provided by the host installation • Size – Organization's size requires security beyond that provided by the host installation • Location – Organization's location is geographically separated from the host installation • Other justification

Table 61010-7.3. **Security Group Space Types**

Space Type:	Description:	Planning Factor:	Justification Guidelines:
Special Security Officer Suite	A special security officer (SSO) suite is a multifunctional area containing, but not limited to, a reception area, indoctrination area, photography area, vault space, and office space for the SSO. An SSO suite may be required depending on the TS/SCI classification level and where SCIF or SAP facilities are present.	Allocate NSF based on 131 series space planning factors	• Mission or functions performed • See 131 series justification guidelines • Other justification
Weapons Vestibule and Vault	A weapons vestibule and vault are for the secure storage of weapons. The vestibule and vault are actually two separate rooms. The vestibule is equipped with individual lockers for each issued weapon, a cleaning counter with proper ventilation, and a safety loading/unloading barrel. Include a hazardous materials storage cabinet for solvent and cleaning materials. The vault is equipped with racks.	Allocate one weapons vestibule and vault at 120 NSF	• Mission or functions performed • Applicable to certain operational functions • Applicable to certain NCIS functions • Applicable to certain security functions • Other justification
Other Security Space	This is a user-defined, security space type and allocation. It is intended for "one-off" space types not included above.	Allocate NSF for this user-defined space type	• Provide justification for this user defined space requirement

61010-7.4. **Net Special Purpose Space Subtotal.** Sum of all special purpose space types.

61010-7.5. **Special Purpose Space Secondary Circulation.**

Circulation	All special purpose spaces are assumed to be enclosed. A circulation multiplier of 0.12 is multiplied by the net special purpose space subtotal.	Allocate NSF based on: (0.12) (net special purpose space subtotal)	• Space type does not require justification

61010-7.6. **Net Special Purpose Space.** Sum of all special purpose space types, *including* secondary circulation.

61010-8. **Net Building Area**. Net Building Area is the sum of net general administrative space and net special purpose space.

61010-9. **Net-to-Gross Space**. Net-To-Gross (NTG) space types are used to calculate an overall NTG area and NTG factor on a case-by-case basis.

Table 61010-9. **Net-To-Gross Space Types**

Space Type:	**Description:**	**Planning Factor:**	**Justification Guidelines:**
Adjust Building Height (option)	By default, the "Adjust Building Height" option is not applied (not checked), allowing the Admin BFR Generator to optimize the number of above ground floors (stories). If preparing BFR for an entire organization, use the default option. If preparing project level BFR and the number of stories is known, apply this option and adjust the number of floors accordingly. If preparing BFR for an individual component of an organization with less than 100 personnel, apply this option and adjust the number of floors to one.	Number of above ground floors is variable	• This option does not require justification Note: Once the number of above ground floors is established, a "net average floor area" is calculated for use in follow-on calculations.
Bathrooms	The number of toilet fixtures is based on UFC 3-420-01, Plumbing Systems. Bathrooms are assumed to be located on each floor. For planning purposes, bathrooms allocations are based on standardized modules and the number of persons per floor.	Allocate NSF based on: See Bathroom Allocations table	• Space type does not require justification

Table 61010-9. **Net-To-Gross Space Types**

Space Type:	**Description:**	**Planning Factor:**	**Justification Guidelines:**
Electrical Space	An electrical room houses electrical equipment for power distribution to other areas of a building. Multi-story buildings will have at least one electrical room per floor. The total allocation is equivalent to 60% of central mechanical room allocation.	Allocate NSF based on: $x = (y/69.2)^{1.053} (0.6)$, where x = electrical space, y= net bldg.. area	• Space type does not require justification
Elevator Hoistway	An elevator used for the movement of personnel must be designed as a passenger elevator. Passenger elevators may be used for general freight loading by using a heavy-duty interior to resist damage from hand trucks. For planning purposes, assume elevator must be able to accommodate an ambulance type stretcher (84" X 24") and a 4,000-pound load capacity.	For 2 to 4 stories, allocate one hydraulic elevator per 10,000 NSF of avg. floor area at 82 NSF each x no. of floors For 5 to 10 stories, allocate one traction elevator per 10,000 NSF of avg. floor area at 91 NSF each x no. of floors	• Space type does not require justification

Table 61010-9. **Net-To-Gross Space Types**

Space Type:	Description:	Planning Factor:	Justification Guidelines:
Elevator Machine Room	An elevator machine room contains the elevator machine equipment and controller. One elevator machine room is allocated for each elevator.	For 2 to 4 story buildings, allocate one machine room per elevator per 10,000 NSF of ground floor area at 72 NSF each. For 5 to 10 story buildings, allocate one machine room per elevator per 10,000 NSF of ground floor area at 152 NSF each.	• Space type does not require justification Note: Net ground floor area is equal to net average floor area.
Janitor's Closet	A janitor's closet accommodates all equipment and supplies to include a 24-inch square mop basin, a wall-mounted mop rack, and three feet of 10-inch wide wall shelving.	Allocate NSF based on: (one per 10,000 NSF of avg. floor area) (20 NSF/each) (# floors)	• Space type does not require justification

Table 61010-9. **Net-To-Gross Space Types**

Space Type:	Description:	Planning Factor:	Justification Guidelines:
Mechanical Space	For planning purposes, assume a variable air volume system is used with a central (primary) mechanical room located on the ground floor and one or more distributed (secondary) fan rooms located on each floor. The following equation estimates the central mechanical room area for an office building: • $x=(y/69.2)^{1.053}$, where x = size of mechanical room (NSF) and y = net building area (NSF) The following equation estimates the area for all fan rooms: • $x=(y/58)^{1.087}$, where x = size of fan rooms (NSF) and y = net building area (NSF).	Allocate NSF based on: $x = (y/69.2)^{1.053} + (y/58)^{1.087}$ where x = sum of mechanical spaces and y = net building area	• Space type does not require justification
Primary Circulation Multiplier	Primary circulation consists of the main circulation routes (hallways) connecting to the building core and common spaces (elevators, stairwells). This multiplier accounts for lobby / quarterdeck areas, but not the entry control area, security watch stations or secure visitor waiting areas listed above. Primary circulation is associated with net-to-gross space, unlike secondary circulation space, which is associated with the “net building area”.	Allocate NSF based on: (primary circulation multiplier) (net building area - secondary circulation areas)	• Space type does not require justification
Stairwell	A vertical penetration in a multi-floor building for personnel egress. For planning purposes, one story is assumed to be 12 feet in height.	Allocate NSF based on: (one per 10,000 NSF of avg. floor area) (200 NSF/each) (# floors)	• Space type does not require justification

Table 61010-9. **Net-To-Gross Space Types**

Space Type:	Description:	Planning Factor:	Justification Guidelines:
Telecom Room	Telecommunication rooms enable telephone and computer connectivity throughout a building, providing space for telephone switches and rack-mounted computer equipment.	Allocate NSF based on: (one per 10,000 NSF of avg. floor area) (110 NSF/each) (# floors)	• Space type does not require justification
Vestibule	A building entrance vestibule serves a dual purpose. First, it helps mitigate temperature differences between the indoor and outdoor environment and secondly, provides an area where people entering the building can wipe their feet on an appropriate surface.	Allocate NSF based on: (one per 10,000 NSF of ground floor area) (60 NSF/ each)	• Space type does not require justification Note: Net ground floor area is equal to net average floor area.
Other NTG Space1	This is a user-defined NTG space type and allocation. It is intended for “one-off” space types not included above.	Allocate NSF requirement for this user-defined space type.	• Provide justification for this user defined space type
Other NTG Space2	This is a second user-defined NTG space type and allocation. It is intended for “one-off” space types not included above.	Allocate NSF requirement for this user-defined space type.	• Provide justification for this user defined space type
Adjust Building Width (option)	By default, this option is not applied (not checked) and the Admin BFR Generator assumes a square footprint. Using the checkbox option allows the user to adjust the width of the building. The building width slider ranges from 30 feet wide to 210 feet wide. Building width affects the building perimeter and is used to calculate the area associated with exterior walls.	Building width and length are variable	• This option does not require justification but should only be applied if site specific project requirements are known. • Note: Daylighting and natural ventilation cooling can be important energy-saving strategies, and both require one dimension of the building to be relatively narrow, in the order of 45 to 60 ft.

Table 61010-9. **Net-To-Gross Space Types**

Space Type:	Description:	Planning Factor:	Justification Guidelines:
Exterior Wall Thickness Area	Accounts for the square footage associated with exterior walls. Exterior wall thickness is assumed to be 16 inches (1.33 feet) thick. By default, the Admin BFR Generator applies this space type.	Allocate NSF based on: (average net floor area perimeter) (wall thickness) (# floors)	• Space type does not require justification

61010-9.1. **NTG Space Total.** The NTG Space Total is the sum of all NTG space types above.

61010-9.2. **NTG Factor.**

NTG Factor	Once the net building area and net-to-gross space total have been established, the Net-To-Gross (NTG) factor can be calculated.	NTG factor = (net bldg area + NTG space total) / (net bldg area)	Justification Guidelines: • Not applicable

61010-9.3. **NTG Factor Override.**

NTG Factor Override	The NTG Factor Override function is provided within the Admin BFR Generator for situations in which an alternative NTG gross factor is required. By default, this function is not applied (not checked).	NTG factor is variable	Justification Guidelines: • Admin space within another category code that has a higher or lower NTG factor • Admin buildings must conform to host nation construction standards, which may dictate a higher NTG factor • Other justification

61010-10 **Gross Building Area**. Gross Building Area accounts for a building's above-ground stories measured to the outside wall surfaces. Gross Building Area is calculated by multiplying the Net Building Area by the Net-To-Gross Factor (or NTG Factor Override). Gross Building Area represents the overall Basic Facility Requirement (BFR).

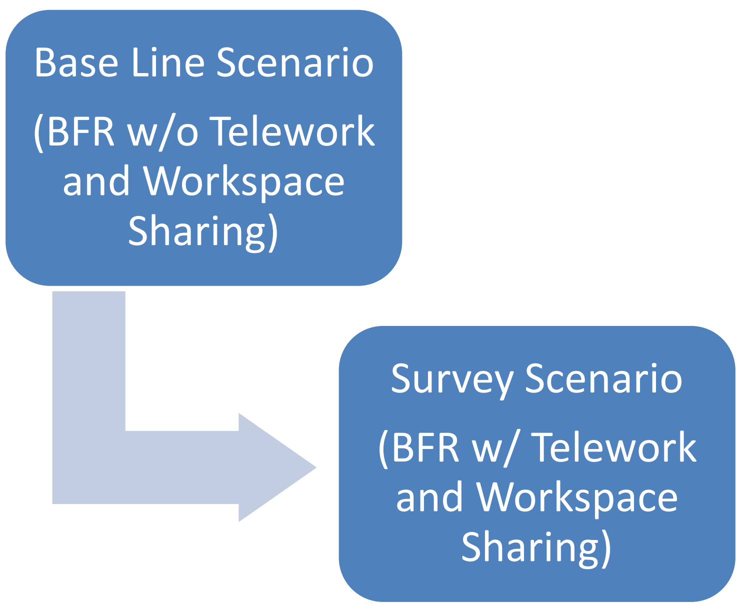
61010 -11 Telework and Workspace Sharing

61010-11.1 Introduction

Using building blocks of the existing criteria for Administrative Office and the Admin BFR Generator, this section defines the process for developing a reduced Basic Facility Requirement (BFR) that accounts for a robust telework and workspace sharing program. Individual organizations are responsible for updating telework and workspace sharing policies to meet their specific needs. The process defined here allows flexibility for consultants tasked with layout and implementation.[1]

Various federal agencies have successfully implemented reduced space requirements through the use of telework and workspace sharing. At the time of this writing, February 2021, the long-term impacts of robust and sustained telework usage for DoD organizations are unclear. Numerous DoD organizations are concurrently developing space reduction and implementation plans. It is anticipated that there will be some lessons learned from these concurrent efforts, therefore, this update provides initial guidance that will likely undergo incremental updates as part of an iterative process.

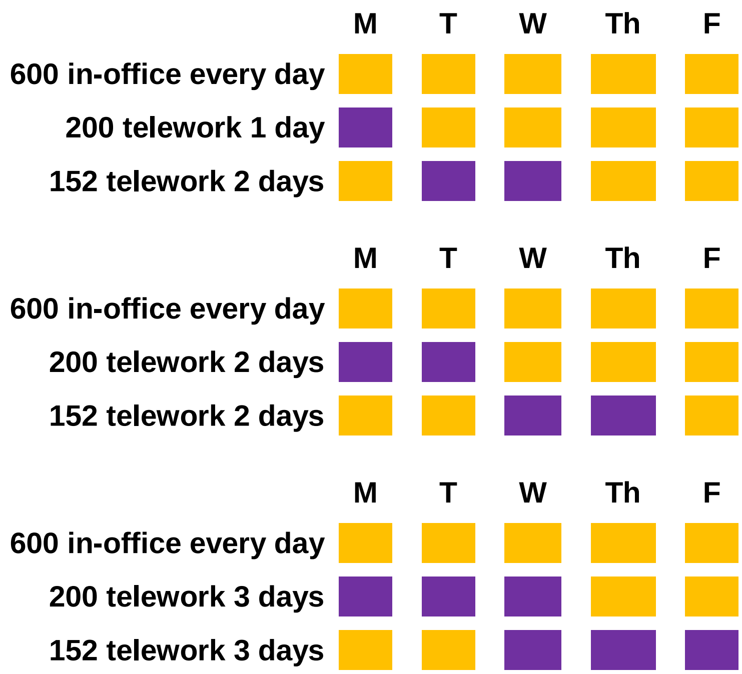
61010-11.2 Process



[1] Additional savings may be realized by accounting for employee work patterns and are best realized by consultant tasked with layout and implementation. These smaller space savings are not accounted for within this guidance.

61010-11.3 TW6+ Rationale

Savings on office space and related costs may be achieved if enough employees telework often enough. The graphic below provides three scenarios; each for an organization with 600 employees where 248 (41%) do not telework and 352 (59%) do.



In the first scenario, 200 employees telework 1 day a week and 152 telework 2 days a week. No matter how you arrange schedules, there will always be at least 2 days a week when you need space for all 600 employees.

In the second scenario, where all teleworkers work 2 days a week from home, there is still one day a week when you need space for everyone.

The third scenario identifies a minimum of 352 workspace sharing opportunities every day. Assuming schedules are arranged accordingly, a 2:1 (2 persons:1 seat) sharing ratio results in a reduction of 176 workspaces. This diagram points out the obvious fact that the more teleworkers you have working three or more days a week from home, the greater the chance of freeing up office space.

So, while an organization may start small, there is real incentive to ramp up so that a significant amount of work is home-based. This emphasizes the need for good telework managers and technology that allows workers to do any work at home that they could do in the office.

As a rule of thumb, the threshold for freeing up space is when employees are allowed to telework three or more days a week, or as with the case of the federal government, when employees are allowed to telework six or more days a pay period (*TW6+*).

The scenarios presented above are generalized to make a point, but do not consider specifics such as the type of space being shared, whether it be private office or workstation space. Guidance provided in remainder of this section does consider the specific space types and applies sizing standards.

61010-11.4 Space Sizing Standards[2]

Private Office

A private office provides an enclosed space and is typically occupied by supervisory personnel or for those personnel whose job duties require privacy. Depending on an organization's telework and workspace sharing policies, this space type may be dedicated or shared. Private office space allocations typically range from 100-120 NSF/PN.

WST1

A WST1 (WS Type 1) is a modular workstation, typically occupied by general administrative or support staff. Depending on an organization's telework and workspace sharing policies, this space type may be dedicated or shared. WST1 space allocations typically range from 48-64 NSF/PN.

WST2

A WST2 (WS Type 2) is an optional space type, similar to WST1 modular workstation, but provides an alternate (usually smaller) size. It may serve as contractor space, hoteling space, or swing space during renovation projects. Depending on an organization's telework and workspace sharing policies, this space type may be dedicated or shared. WST2 space allocations typically range from 36-48 NSF/PN.

[2] The Admin BFR Generator accounts for three standard space sizes (Office, WST1, and WST2 space). “Workspace Size Overrides” may be applied in the Activity tab if default values are not applicable.

61010-11.5 Sharing Ratios

Sharing ratios may be applied from 1:1 (no sharing) to 5:1 (maximum sharing). Sharing ratios indicate the number of persons per seat, for example, 2:1 indicates “2 persons:1 seat”. If shared WST1 spaces have a 3:1 or greater sharing ratio, they are automatically converted to WST2 space. Sharing ratios reduce the overall number of personnel in-office, but contribute to greater collaboration space allocations at the same time.

61010-11.6 Special Purpose Space

Special purpose space can impact an organizations ability to reduce space. Those that are not based on the number of personnel will invariably increase the GSF/PN factor, even as the “in-office” number of personnel decreases from workspace sharing. For instance, an Echelon II Headquarters Command will require some form of Operations Center. While specific space requirements for an operations center would be based on ‘CCN 14365 – Regional/Installation Operations Center’ criteria, the NSF results can be captured in the Admin BFR Generator via a “user defined field”.

61010-11.7 Collaboration Space

Collaboration space is another type of special purpose space, but only applies if workspace sharing is utilized. Collaboration spaces are typically enclosed and provide users with a variety of the modern technology capabilities. Collaboration space is allocated at 16 NSF/PN for each person reduced from the Base Line personnel total. This value is calculated automatically in the Admin BFR Generator. Note that collaboration space allocations are in addition to basic allowances for admin support space, break rooms and conference rooms.

61010-11.8 Sample Scenario

An organization has 614 personnel

- 111 PN occupy private office space
- 503 PN occupy WST1 space
- 0 PN occupy WST2 space

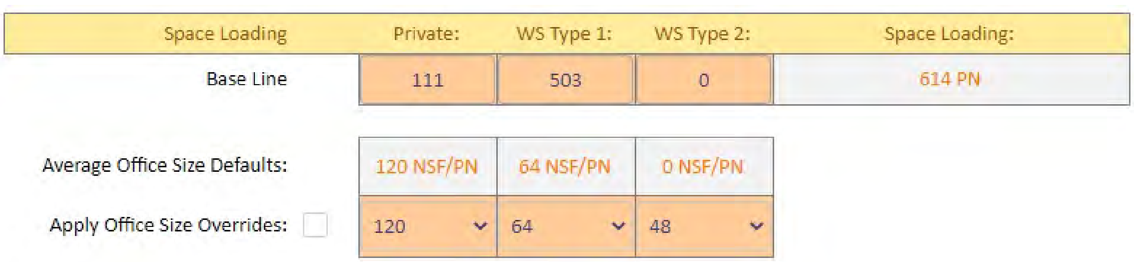
Based on a workplace survey, it is determined that:

- 65 PN require a dedicated private office space and 46 PN require shared private office space
- 143 PN require a dedicated WST1 space and 360 PN require shared WST1 space
- WST2 space is not applicable in this scenario

Sharing Ratios

- Workspace sharing ratio for private office space is 4:1
- Workspace sharing ratio for WST1 spaces is 5:1
- WST2 space is not applicable in this scenario

61010-11.9 Establishing a Base Line Scenario[3]



Base Line Scenario	Private	WST1	WST2	Space Loading
Total Persons	111	503	0	614

[3] Base Line Scenario space loading is entered in "Activity" tab of Admin BFR Generator. Workspace sizes may be adjusted in "Activity" tab.

61010-11.10 Establishing a Survey Scenario[4]

Establish a 'Survey' Scenario based on survey results that accounts for telework and workspace sharing. Note that a Base Line Scenario must be established prior to establishing a Survey Scenario. For space planning purposes, personnel will fall into one of two categories:

1. Employees that telework 0-5 days a pay period require a **dedicated** workspace

2. Employees that telework 6-10 days a pay period (TW6+) require a **shared** workspace

A Telework/Workspace Sharing Survey must be able to answer the following questions:

1. How many persons require a dedicated private office?

2. How many persons require a dedicated WST1 (WS Type 1) space?

3. How many persons require a dedicated WST2 (WS Type 2) space?

4. How many persons require a private office but are eligible and willing to share space in exchange for flexibility to telework six or more days a pay period?

5. How many persons require a WST1 space but are eligible and willing to share space in exchange for flexibility to telework six or more days a pay period?

6. How many persons require a WST2 space but are eligible and willing to share space in exchange for flexibility to telework six or more days a pay period?

[4] Base Line Scenario must be established prior to establishing Survey Scenario

Sample Survey Results:

Survey		Office Based			Telework Based		
Business / Support Line	Employees	Dedicated Private Office	Dedicated WS Type 1 Space	Dedicated WS Type 2 Space	Shared Private Office	Shared WS Type 1 Space	Shared WS Type 2 Space

Summarize sample survey results as shown below[5]

Survey Scenario	Private:	WS Type 1:	WS Type 2:	Space Loading:	Survey TW6+
Dedicated	65	143	0	208 PN	66.12%
Shared	46	360	0	406 PN	
Total	111 PN	503 PN	0 PN	614 PN	

Survey Scenario	Private	WST1	WST2	Space Loading
Dedicated	65	143	0	208
TW6+ Shared	46	360	0	406
Total Persons	*111*	*503*	*0*	*614*

Important! Survey Scenario totals must equal Base Line Scenario totals.

Base Line Scenario	*Private*	*WST1*	*WST2*	*Space Loading*
Total Persons	*111*	*503*	*0*	*614*

All necessary information is now available to establish a Survey Scenario using Admin BFR Generator and following the process below

1. Select Telework tab
2. Select ‘Base Line’ from picklist
3. Set 'GSF w/o Telework' equal to 'Gross Bldg Area' for Base Line
4. Select ‘Survey’ from picklist
5. Enter 'Survey' results
6. Apply 'Sharing Ratios'

[5] Survey Scenario space loading is entered in “Telework” tab of Admin BFR Generator

Sample Survey Scenario Output

Activity | Space_Table | Justification | Net_To_Gross | Summary | Telework

Survey BFR: 46,276 GSF

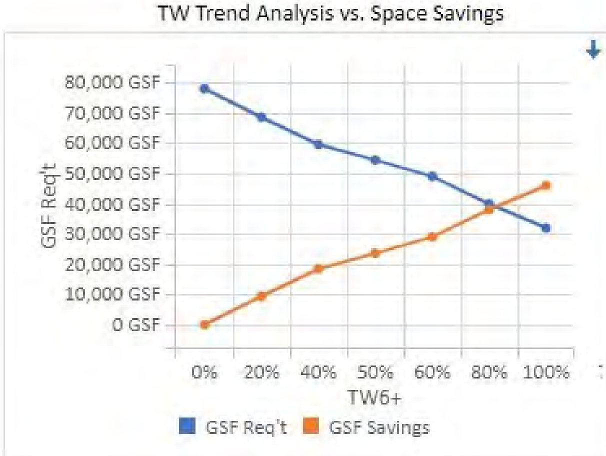
61010-11.11 Establishing a Trend Analysis[6]

The trend analysis is optional. Process steps are provided in the “Telework” tab after selecting “Trend” from picklist. This process prorates the Survey Scenario personnel loading between 0-100% and re-computes GSF space requirements at 20% intervals to generate a chart. This table and chart are useful for associating with a project timeline to show incremental space savings over time.

Sample Trend Analysis Output

TW6+	GSF Req't	GSF Savings	Savings (%)	Space Loading
0%	77,990	0	0%	614
20%	68,573	9,417	12%	517
40%	59,555	18,435	24%	419
50%	54,408	23,582	30%	370
60%	49,026	28,964	37%	322
80%	39,950	38,040	49%	224
100%	31,987	46,003	59%	159

TW Trend Analysis vs. Space Savings



Sharing Ratios

Private:	4:1
WS Type 1:	5:1
WS Type 2:	1:1

[6] The ‘Trend’ Analysis is optional. It requires that the Base Line and Survey Scenarios are established.

Conclusion

While significant space savings may be realized on paper, it is important to consider impacts of over-consolidation, future growth or surge requirements. Many Navy and Marine Corps administrative functions were able to adapt almost seamlessly from primarily working in an office environment to primarily working in a home environment as a result of the COVID-19 pandemic. A Center for Naval Analysis Study from December 2020 indicated that, “current productivity from remote working actually may be the result of previous **teamwork capital** created over time by in-person collaboration.”[7] Keep this in mind as you apply guidance contained here in Section 61010-11. It is better to err on the conservative side and let a layout and implementation consultant identify additional space savings.

Helpful Tips

If using the Admin BFR Generator and results look suspect, check if:

1. Base Line space loading fields are entered in the Activity tab
2. "Office Size Overrides" are applied in the Activity tab
3. Special purpose space allocations are hidden by using checkbox to “Show all special space types” at top of Space Table tab
4. Correct "Scenario Type" is applied in the Telework tab.
5. Value manually entered for ‘GSF w/o TW’ is correct
6. Value manually entered for ‘GSF with TW’ is correct
7. If you leave scenario picklist set to “Trend” it no longer shows the “Survey” scenario output and associated reduced BFR value. The Trend analysis is an option that shows a scenario specific linear relationship between teleworking and workspace sharing. It is recommended to set “Current Scenario Type” to “Survey” before using “Submit” function

610 30 CLASSIFIED MATTER INCINERATOR/SHREDDER AND BLDG. (SF)

FAC 6100
BFR Required Y

61030-1 No planning factors are available. Provide facilities as required.

[7] CNA Study, December 2020, Increased Teleworking: Potential Facility Savings and Policy Considerations

610 40 LEGAL SERVICES FACILITY (SF)

FAC 6100
BFR Required Y

61040-1 **DESCRIPTION.** Defense Service Offices (DSO), Regional Legal Service Offices (RLSO), Judiciary Offices, and Claims Centers provide comprehensive legal services to command and individual clients. These services include safe and secure trials by court-martial, administrative discharge proceedings and other personnel actions, adjudication of claims, legal assistance, and command advice. Properly designed and constructed, DSO/RLSO/Judiciary/Claims facilities emphasize the Navy's commitment to the administration of local, state, federal, and international law, improve the client's perception of the services provided by Navy legal personnel and allow for the most efficient provision of legal services.

61040-2 Generally, the space requirements for a DSO/RLSO/Judiciary Office/Claims Office relate to the following six functions:

1. Military Justice
2. Command Services
3. Claims
4. Legal Assistance
5. Unit Administration
6. Law Library

61040-3 Some of the space requirements can be derived from administrative space criteria, Category Code 610-10. DSOs/RLSOs/Judiciary Offices/Claims Offices, however, present a unique set of spatial constraints that must be recognized during the facility planning and design stages. These constraints include:

61040-3.1 The physical separation of the RLSO/trial counsel (prosecution, including appellate counsel), DSO/defense counsel (including appellate counsel), and judiciary (judge) spaces;

61040-3.2 Separate waiting areas for individuals waiting to be interviewed by trial and defense counsel and other clients not involved in military justice matters;

61040-3.3 Private offices for attorneys who must form attorney-client relationships that involve protected communications;

61040-3.4 Safe and secure courtrooms/courthouses where highly charged military justice proceedings routinely occur, the potential for violence is great, and the deterrence, detection and limitation of risk are paramount. Courtroom spaces must be designed to include metal detection equipment, private points of entry for various personnel, and other security measures addressed in COMNAVLEGSVCCOMINST 5530.2;

61040-3.3 Sufficient library space to allow for the continuous expansion of bound legal precedents and other legal materials.

61040-4 Table 61040-1 below delineates the functional elements of a DSO/ RLSO/Judiciary Office/Claims Office, provides planning factors, and comments on special requirements applicable to the individual elements. For the convenience of facility planners, Table 61040-1 has been designed to reflect the entire DSO/ RLSO/Judiciary Office/Claims Office operation. It may be used to calculate space requirements for the entire operation or for any of the individual components. DSO/RLSO/Judiciary Office/Claims Office facilities are planned and reported under Category Code 610 40.

Table 61040-1. Space Allowance for Legal Services Facilities

Type of Space	Allowances in NET SF (NSF)	Note
1. Unit Administration		
CO, XO, Senior Enlisted Advisor		1
Secretarial Staff	Use 610-10 Criteria	
Administrative Staff		2
Conference/Training Room	Small Activity-------1 ea 500 NSF Medium Activity----2 ea 500 NSF Large Activity-------1 ea 500 NSF + 1 ea 900 NSF	
Data Processing Space	Based upon equipment sizes	
2. Legal Assistance		
Legal Officers	120 NSF per counsel	1
Paralegals	110 NSF per person	
Staff	Use 610-10 Criteria	2
Waiting Room	9 NSF per occupant	3
Will Execution Room	100 NSF	8
3. Claims		
Legal Officers	120 NSF per counsel	1
Paralegals	64 NSF per person	
Staff	Use 610-10 Criteria	
Files	7 NSF per legal cabinet	
Archives	Small Activity-------150 NSF Medium Activity----200 NSF Large Activity-------400 NSF	
4. Law Library		
Stack Area	6.6 NSF per 100 volumes	
Work Area	25 NSF per person	
Staff	10% of stack plus reading areas	

Type of Space	Allowances in NET SF (NSF)	Note
Expansion	120 NSF	
5. Military Justice		
Courtrooms		
Trial by Court Members	1,500 NSF	4
Trial by Judge	900 NSF	4
6. Support Spaces		
Judges Chamber	250 NSF (one per judge)	
Deliberation Room	300 NSF	5
Witness Room	100 NSF (two per courtroom)	
Trial Counsel Spaces	150 NSF per Counsel	1, 6
Trial Counsel Waiting Area	9 NSF per Occupant	6
Defense Counsel Spaces	150 NSF per Counsel	1,6
Defense Counsel Waiting Area	9 NSF per Occupant	6
Detention Room	48 NSF (with W/C and Lavatory)	6
Court Reporter	150 NSF	1 , 7
Paralegals	64 NSF	
Clerks	60 NSF	
ACDUTRA Counsel/IMC Spaces	64 NSF per Counsel	
Secure Storage	100 NSF	

NOTES:

1. Private offices required
2. Private offices for staff must be individually justified.
3. Locate waiting room to serve both legal assistance and claims sections
4. Provide one courtroom for each judge, if only one courtroom is required, plan for trial by court member. If two or more are required, plan for a 1 to 1 mix of courtroom types. Provide space for 40 to 50 spectators for trial by court member type courtroom and 20 to 25 spectators for trail by judge type.
5. Provide one deliberation room with separate and integral toilet facilities for each trail by court member courtroom.
6. Plan for a minimum of two defense and trail counsel offices with separate waiting rooms and detention room as part of defense counsel spaces. It is mandatory that defense and trail counsel spaces are separated to insure confidentiality of internal proceedings.
7. If space for more than one recorder or transcriber is required, plan for general office space with acoustically treated partitioning.
8. Provide for medium and large facility.

61040-5 To obtain gross floor area, add net areas and multiply by 1.50.

61040-6 As a general rule, legal service facilities will be categorized in one of three types: small facility (with approximately 30 personnel), medium facility (approximately 45 personnel), or large facility (approximately 135 personnel).

MARINE CORPS FACILITIES

61040-7 The Marine Corps has specific requirements for courtroom facilities at certain locations. This facility provides space for the courtroom and immediately adjacent space for trial proceedings. The basic allowance provides for the following: courtroom proper, prosecution counsel, prosecution witness, defense counsel, defense witness, court reporter, judge's office, holding room, lobby, janitor, men's toilet, women's toilet and a single occupancy toilet.

61040-8 There are two facility types:

- **Type A** (large facility) - 4,440 gross sq. ft. (60' x 74'). The courtroom proper is 1,512 net sq. ft. (42' x 36') with provisions for trial by trial board members. In addition to the basic functional elements it includes a deliberation room.

- **Type B** (small facility) - 3,213 gross sq. ft. (51' x 63'). The courtroom proper is 825 net sq. ft. (30' x 27.5') with the basic functional elements as described above.

Table 61040-2. Marine Corps Requirements

Type of Function	Number of Type A Facilities	Number of Type B Facilities	Remarks
M.C.B.	1	1	Camp Pendleton requires two Type B facilities.
M.C.R.D.	1	1	
M.C.L.B.	1	1	
M.C.A.S.	1	0	New River requires a Type A facility. None at Tustin. 1st Mar Brig is serviced by M.C.A.S. Kaneohe.
COMCABS EAST/WEST	1	1	3rd Div. Requires 3 type A and 3 type B facilities
FMF (Div.)	1	2	
FMF (Wing)	1	1	
Force Troops	1	1	Force Service Support Group (F55G) is serviced by the Marine Corps air Ground Combat Center (MCAGCC).

610 50 AUSTERE ADMINISTRATIVE FACILITY (SF)

Facility planning criteria related to Austere Administrative Facilities can be found in FC 2-000-05N - Appendix F “Austere Facilities (Navy).”

610 70 DIVISION/WING HEADQUARTERS, MARINE CORPS (SF)

FAC 6100
BFR Required Y

61070-1 This category code is for a Fleet Marine Force (FMF) facility and provides the necessary administrative space to conduct the day-to-day operations of a Marine Division Headquarters or a Marine Aircraft Wing Headquarters. Determine requirements using the criteria for Category Code 610-10.

610 71 REGIMENTAL/GROUP HEADQUARTERS, MARINE CORPS (SF)

FAC 6102
BFR Required Y

61071-1 This category code is for a Fleet Marine Force (FMF) facility and provides the necessary administrative space to conduct the day-to-day operations of a Marine Regimental Headquarters or a Marine Aircraft Group Headquarters. Determine requirements using the criteria for Category Code 610-10.

610 72 BATTALION/SQUADRON HEADQUARTERS, MARINE CORPS (SF)

FAC 6102
BFR Required Y

61072-1 This category code is for a Fleet Marine Force (FMF) facility and provides the necessary administrative space to conduct the day-to-day operations of a Marine Battalion or a Squadron Headquarters. Squadron administrative facilities are often provided within the organizational maintenance hangar (Category Code 211 05) and in such cases, are not authorized under this category code. Determine requirements using the criteria for Category Code 610-10.

610 73 COMPANY/BATTERY HEADQUARTERS, MARINE CORPS (SF)

FAC 6101
BFR Required Y

61073-1 The category code is for a Fleet Marine Force (FMF) facility and is intended for those FMF units of company or battery size which require separate administrative facilities. Requirements for company or battery administrative functions are often included as part of other facilities such as bachelor enlisted quarters. Determine requirements using the criteria for Category Code 610-10.

610 74 GARRISON AID STATION, MARINE CORPS (SF)

FAC 6102
BFR Required Y

61074-1 DEFINITION. A Garrison Aid Station provides medical care at the local level for the Marine Corps and will generally be collocated with the Battalion and Regimental Headquarters facilities. The functions performed in this facility are both administrative and clinical in nature, which requires work space for the medical personnel assigned at the battalion, squadron, group, and regimental levels and space for medical file storage. Due to the functions performed at a Garrison Aid Station, it is vital to distinguish these areas from the rest of the Battalion/Squadron and Regimental/Group Headquarters facilities. This will allow for proper reporting and oversight of these facilities.

It should be noted that Garrison Aid Stations do not take the place of clinics maintained by BUMED, but rather provide the first echelon of basic medical care in a fixed facility. Access to higher echelons of care (including laboratory, radiological, or surgical services) shall be provided at BUMED facilities rather than the facility detailed here.

The Garrison Aid Station spaces may be divided up into four basic categories:

- Reception Area/Admin Area/Medical Records & Medical History Area
- Patient Areas
- Clinic Support
- Deployment Storage

61074-2 REQUIREMENTS COMPUTATION. Table 61074-1 provides space allowances or other planning guidance to calculate the facility requirements for the above components of a Garrison Aid Station.

Table 61074-1. Space Allowances for Garrison Aid Stations

Type of Space	Allowances	Notes
Reception Area/Admin Area/Medical Records & Medical History Area		
Reception Desk	64 NSF per workspace	
Waiting & Form Writing	10 NSF per patient	
History Station	40 NSF per station	
Medical Officer (MO) Office	100 NSF per workspace	1
Independent Duty Corpsman Office (IDC)	65 NSF per workspace	

Type of Space	Allowances	Notes
Administrative Support Space:		
Office Equipment (Xerox, Fax, etc.)	45 NSF average	2
Computer Support	60 NSF average	2
Records Storage, Movable	25 NSF average	2
Records Workroom	• 200 NSF for up to a battalion of 800 Marines • 25 NSF for up to an additional 100 Marines	
Reference Bookshelves	8 NSF per bookshelf	
Restrooms	25 NSF per Exam Room	3
Patient Areas		
Exam Room	100 NSF per physician	4
Treatment Room	150 NSF	5
Nourishment Center	100 NSF	5
Clinic Support		
Clean Utility	120 NSF	
Soiled Utility	90 NSF	
Equipment Storage (blood pressure cuffs, carts, monitors, spare exam items, sterilizer, open boxes of supplies, etc.)	100 NSF average	2
Janitor closet	50 NSF	
Low Volume Pharmacy	50 NSF	6
Deployment Storage		
Deployment Storage	1,000 NSF	

NOTES:

1. The MO office should be a private office. The IDC workspaces should be shared semiprivate office spaces.
2. The NSF given is an average. If the actual equipment or amount of space required is known and approved for use within the General Administrative Space, then use the actual space requirements. Medical records must be stored in locked containers and the record room must be secured by lock. Computer access to the network is required; use network support spaces of 60 NSF when needed.
3. A minimum of two private restrooms (25 NSF each) to include toilet, sink, with an additional 25 NSF restroom space for each exam room above two. Sinks shall have hot and cold running water.
4. An exam room is built for privacy and consists of an exam table, exam table paper, wall mounted ophthalmoscope, exam light, supply cabinet, exam stool, exam room desk, and access to an additional sink with hot & cold running water. The additional sink is needed to provide the clinic staff with proper hand cleansing facilities following exposure to "dirty" procedures.

5. A treatment room is used for first aid performed by support staff. A Nourishment Center provides treatment for dehydration or blood-sugar treatment.
6. The low volume pharmacy includes both dispensing and storage functions. Controlled substances must be stored within a locked storage container and the pharmacy room must be secured by a lock.

61074-3 GROSS FLOOR AREA. To compute gross floor area, the net floor area should be multiplied by an adjustment factor to compensate for common circulation, Americans with Disabilities Act (ADA) requirements, mechanical equipment spaces, NMCI equipment racks, and wall thicknesses. Apply a Net-To-Gross adjustment factor of 1.35 to determine gross floor area. Floors shall be durable and easily cleaned to maintain sanitary conditions—do not use carpeting in patient areas.

610 77 ADMIN STORAGE (READY ISSUE/SHOP STORES/MISC.) (SF)

FAC 6100
BFR Required Y

61077-1 Storage facilities for miscellaneous equipment or goods related to administrative facility support will be provided only where it can be individually justified. There are no criteria for this type of facility. General information on normal stacking heights, SF per measurement ton requirements, and other parameters are provided in Category Code 440 series.

620 ADMINISTRATIVE FACILITIES – UNDERGROUND

Criteria for the 620 series category codes are identical to Category Codes 61010 and 61077, respectively. Plan only where authorized by higher headquarters.

620 10 UNDERGROUND ADMINISTRATIVE FACILITY (SF)

FAC 6200
BFR Required Y

620 77 UNDERGROUND ADMIN STORAGE (READY ISSUE/SHOP STORES/MISC.) (SF)

27 Mar 2025	740 55	Youth and School Age Care Center	In section 74055-5, Space Program, delete existing link and add direct link to UFC4-740-06 to access the Youth Center Space Program spreadsheets.
27 Mar 2025	730 61	Dependent School - Consolidated	Rewrite criteria definition

700 SERIES
HOUSING AND COMMUNITY FACILITIES

Table of Contents

710 FAMILY HOUSING

For Design Criteria, refer to UFC 4-711-01 “Family Housing”

710-1 DESCRIPTION

A family housing requirement exists for all Navy and Marine Corps military and key civilian personnel with dependents. Housing will not be programmed where the local housing market has the capacity to provide suitable rental housing for military facilities.

710-2 BASIC CATEGORY GROUPS

The basic categories of facilities included in the 710 Family Housing group are shown in Table 710-1.

Table 710-1 Basic Categories of Facilities in the 710 Group

Group Code	Description
711	Family Housing – Dwellings and Attached Garages
712	Family Housing – Mobile Homes (Substandard)
713	Family Housing – Mobile Home Parks
714	Family Housing – Detached Facilities

710-3 GROSS HOUSING REQUIREMENT

The gross housing requirement for a naval installation is based on the number of eligible personnel with dependents. Eligible personnel are commissioned officers, warrant officers, or enlisted members and key civilian employees. Students in these categories are included if they are on permanent change of station orders for courses of 20 or more weeks. The gross housing figure for a base may be developed from its planned personnel strength projected as far as reliable estimates are available, or from a study of the base table of organization, utilizing the marriage factors developed from an actual survey of personnel assigned to a similar installation.

711 FAMILY HOUSING - DWELLINGS AND ATTACHED GARAGES

Design Criteria: refer to UFC 4-711-01 “Family Housing” for Detailed Guidance, Sample Calculations & Tables of acceptable Land Use Intensity Ratios.

71120 Through 71176-1 REQUIREMENTS. Public quarters for eligible military personnel will be planned as indicated in section 710. Housing for key civilian personnel with dependents will be planned on an individual basis. Government-owned or controlled housing will be provided for all eligible personnel required to reside on-station by reason of military necessity, and for other eligible personnel for whom it is impracticable to obtain adequate private housing at reasonable rentals and locations.

71120 Through 71176-1.1 Net Housing Requirements. In computing net housing requirements, existing housing in the following category codes will be considered as assets against gross requirements:

1. Wherry housing un-acquired.
2. All adequate public quarters.
3. All private housing leased for use as public quarters.
4. All rental guaranty housing (in foreign countries).
5. All public quarters under construction or authorized and approved for construction.
6. Private units approved for leasing but not yet under contract.
7. Rental guaranty units under the contract or approved for development.

71120 through 71176-1.1.1 Non-Federal Government Rental Housing. In addition, existing private and local government rental housing (including mobile homes) in which military personnel are accepted as tenants, will be considered as suitable community support and will be charged as assets against requirements in all cases where it is classed as satisfactory by the occupant. If not classed as satisfactory by the occupant, or if vacant, it will be considered suitable provided it meets the following criteria:

71120 through 71176-1.1.1.1 Location. The distance from the administrative area of the installation can be traversed by privately-owned vehicle in one hour or less during rush hours.

71120 through 71176-1.1.1.2 Cost. Rent plus utilities (except telephone) does not exceed 115% of the member's Basic Allowance for Quarters (BAQ) plus Variable Housing Allowance (VHA).

71120 through 71176-1.1.1.3 Condition. Must be complete dwelling unit with private entrance with bath and kitchen for sole use of occupant and so arranged that both kitchen and bathrooms can be entered without passing through bedrooms. The units must be well constructed and in good condition of repair with heating (if required) and kitchen equipment provided. It must be in a residential area not subject to offensive fumes, industrial noises, and other objectionable features.

71120 through 71176-2 Land Use Intensity. The optimum land use intensity for family housing has been established by the Department of Defense. The following parameters are to be considered in determining the land use intensity ratio for a particular site:

1. Floor area
2. Living space
3. Recreation space
4. Open space

711 20 WHERRY HOUSING (SF)
FAC: 7110
BFR Required: N

711 25 CAPEHART HOUSING (SF)
FAC: 7110
BFR Required: N

711 29 CAPEHART HOUSING – O7 THROUGH O10 (SF)
FAC: 7110
BFR Required: N

711 30 FAMILY HOUSING (SF)
FAC: 7110
BFR Required: N

711 34 FAMILY HOUSING– O7 THROUGH O10 (SF)
FAC: 7110
BFR Required: N

711 35 LEASED HOUSING (SF)
FAC: 7110
BFR Required: N

711 39 LEASED HOUSING – O7 THROUGH O10 (SF)
FAC: 7110
BFR Required: N

711 50 SURPLUS-COMMODITY HOUSING (SF)
FAC: 7110
BFR Required: N

711 55 FOREIGN-SOURCE HOUSING (SF)
FAC: 7110
BFR Required: N

711 56 FAMILY HOUSING HIGH RISE (SF)
FAC: 7113
BFR Required: N

71156-1 **DESCRIPTION.** This type of facility is a building equal to or greater in height than 7 stories above ground level, which contains family housing units/apartments. Associated space may include lobby, multipurpose room, restrooms, elevator banks, utility/control rooms, and emergency generators.

711 59 FOREIGN-SOURCE HOUSING – O7 THROUGH O10 (SF)
FAC: 7110
BFR Required: N

713 FAMILY HOUSING – MOBILE HOME PARKS

713-1 **DESCRIPTION.** This group includes single and/or double wide manufactured housing parking sites with appurtenant utility connections; roads; walks; storage sheds; laundry and community buildings; and recreational facilities.
71310-1 The use of government-owned trailers for the purposes of Family Housing is not authorized. No criteria are available.

713 11 MOBILE HOME PARK (SY)
FAC: 7130
BFR Required: N

71311-1 **DESCRIPTION.** This group includes single and/or double wide manufactured housing parking sites with appurtenant utility connections; roads; walks; storage sheds; laundry and community buildings; and recreational facilities.

71311-2 **REQUIREMENTS.** The number of trailer sites is computed from a specific study and are provided only when private facilities are not available. The sites are self-supporting – tenants supply their own trailers, pay site rent, and receive BAQ.

714 FAMILY HOUSING – DETACHED FACILITIES

714-1 **DESCRIPTION.** Detached facilities are structures separated from family quarters, but available to the occupants.

714 10 DETACHED GARAGES (SF)
FAC: 7141
BFR Required: N

Design Criteria: See UFC 4-711-01 “Family Housing”

71410-1 **REQUIREMENTS.** Detached garages are planned on the basis of one per living unit and a space allowance of one vehicle per garage at those locations subject to temperatures of -10º Fahrenheit and below or where extreme winds, salt air, or sandstorms require garages. See UFC 4-711-01 “Family Housing” for detailed guidance.

714 20 DETACHED CARPORTS (SF)
FAC: 7141
BFR Required: N

Design Criteria: See UFC 4-711-01 “Family Housing”

71420-1 **REQUIREMENTS.** Detached carports are also provided on the basis of one per living unit and a space allowance of one vehicle per carport. See UFC 4-711-01 “Family Housing” for detailed guidance.

714 30 FAMILY HOUSING - OTHER DETACHED BUILDINGS (SF)
FAC: 7143
BFR Required: N

714 31 FAMILY HOUSING - OTHER DETACHED FACILITIES (EA)
FAC: 7143
BFR Required: N

71430/71431-1 **DESCRIPTION.** These codes are for inventory purposes only and are to be used for minor detached buildings and facilities directly relating to a particular family dwelling.

714 32 COMMUNITY CENTER (SF)
FAC: 7143
BFR Required: N

Design Criteria: See UFC 4-711-01 "Family Housing" for specific criteria and procedures for planning FHCC's.

71432-1 **DESCRIPTION**. A Family Housing Community Center (FHCC) provides space for social and recreational programs at family housing projects where comparable Navy or non-navy facilities are not reasonably accessible.

71432-2 **ESTABLISHING AN FHCC**.

71432-2.1 Authorization - The establishment of an FHCC must be authorized by NAVFAC Assistant Commander for Family Housing (FAC 08) or Commandant of the Marine Corps (LFL).

71432-2.2 Justification: Normally the establishment of an FHCC should be considered only for housing projects with 250 or more family units. FHCC in support of smaller projects at isolated locations will be considered on a case by case basis.

71432-3 **REQUIREMENTS.** A typical FHCC may provide spaces for assemblies, games, hobbies and crafts, conferences, and other functions in direct support of the FHCC operation. The design emphasis will be placed on flexible space arrangements and multipurpose space utilization. Also consider indoor-outdoor function interrelationships. The size of the facility is determined by user requirements.

714 33 HOUSING WELCOME CENTER (SF)
FAC: 7143
BFR Required: N

71433-1 **DESCRIPTION.** A Family Housing Welcome Center (HWC) provides space for administrative and service functions associated with the provisions of Government and private sector housing. The establishment of a HWC must be authorized by NAVFAC Assistant Commander for Family Housing (FAC 08) or Commandant of the Marine Corps (LFF-3).

71433-2 **REQUIREMENTS.** When authorized, the size of a HWC is based upon user requirements using 610-10 criteria.

714 77 HOUSING MISCELLANEOUS STORAGE (SF)
FAC: 7142
BFR Required: Y

71477-1 **REQUIREMENTS.** Detached storage facilities in support of family housing will be provided only where it can be individually justified. There are no criteria for this type of facility. General information on normal stacking height, SF per measurement ton requirements, and other parameters are provided in category code 440 series.

71477-2 **MARINE CORPS.** This category code is not intended for Marine Corps use.

720 UNACCOMPANIED PERSONNEL HOUSING

721 ENLISTED UNACCOMPANIED PERSONNEL HOUSING (PN)

See FC 4-721-10 for design criteria.

721-1 Enlisted Unaccompanied Personnel Housing encompasses bachelor quarters for Permanent Party Enlisted Navy and Marine Corps personnel and Transient Enlisted Navy and Marine Corps personnel. Unaccompanied housing for civilian personnel shall be provided at remote installations located away from municipal areas.

721-2 Unaccompanied Enlisted Housing (UEH) for the Navy refers to apartment style, hotel style, dormitory style living quarters, and open bay barracks for recruits. If messing facilities are attached to unaccompanied personnel housing, use category code 721-45 to delineate the mess hall portion. For detached mess halls, use category group 722.

GENERAL NAVY UEH POLICY

721-2 The Enlisted Unaccompanied Personnel Housing programming requirements are derived from the Unaccompanied Housing Requirements Determination Report (R19). The R19 delineates the Effective Permanent Party Program Requirements on line 15 through analysis of personnel base loading against the projected housing inventory. At Marine Corps installations, use the Facilities Support Requirement (FSR) document issued annually by HQMC. For broad planning and programming purposes where survey figures are not available, the quarter requirements may be determined by contacting the Unaccompanied Housing Program Management Office.

The following policy outlines housing for single enlisted military personnel:

- Provide open-bay housing on the installation for recruits at the Regional Training Centers such as Great Lakes.

- House all E1-E3 single sailors on the installation.

- When in homeport, all single sailors with the rank of E1-E3 and sailors with the rank of E4 with less than 4 years of service are to be housed on the installation.

- One resident advisor per 20 E1-E3 sailors housed is authorized.

- Sailors with the rank of E4 with more than 4 years of service will be accommodated with housing on the installation where adequate quarters are available.

- Provide housing on the installation for military personnel for reasons of training and military necessities, acknowledged as “must house” on the installation.

DEFINITION OF TERMS

The following definitions are included to clarify important terminology for developing Basic Facilities Requirements (BFRs) and UH projects.

Bedroom - Sleeping area in net square feet per person; excludes the closets, kitchen, food preparation area, and bathroom area.

UH 2+0 Unit - Includes double occupancy living/sleeping area, two personal closets, a separated toilet and shower compartment, and a single bowl lavatory/vanity in the service area.

UH 1+1E Unit- Includes two occupancy living/sleeping area, four personal closets, a separated toilet and bath compartment, a double bowl lavatory/vanity, and a kitchenette.

Market Style Unit - Two bedroom/two bath apartment with living/dining room, full kitchen, laundry, and two personal closets per bedroom. One bedroom/one bathroom apartment with living/dining room, full kitchen, laundry, and two personal closets per bedroom for remote locations only when authorized.

Navy (NETC) 2+0 Dormitory Unit- Includes double occupancy living/sleeping area, two personal closets, shared toilet with a separated shower compartment, and a single bowl lavatory in the service area.

Military Necessity

1. Augmented military personnel; military personnel assigned to transient personnel units while awaiting ship’s movement or separation from Navy service;

2. Military personnel on temporary duty (TDY) regarding duty for further assignment (TEMDUFURAS) orders, waiting for medical boards;

3. Military personnel on orders for executing limited duty, or sailors under direction from the command to be housed temporarily in unaccompanied housing (UH) due to restricted duty; military protective orders; cool down, etc.

Mission Essential Housing – Housing that supports rotational / mobilized sailors outside of their homeport and crewmembers of uninhabitable ships / submarines at their normal homeport, and rotational units outside of their normal homeport.

Officer Accessions – Any of several programs that provide personnel to assume positions as commissioned officers.

Permanent Party Sailors

1. Military personnel who executed orders for permanent change of station to an installation or to units supported by the installation to include units designated as unusually arduous sea duty for purposes of housing allowances in homeport;

2. Crew members of uninhabitable ships /submarines at their normal homeport, and rotational units (air squadrons, mobile training units, Seabees, etc.) in homeport.

Recruits - Personnel undergoing basic military training who have no continuous prior enlisted service (active or reserve).

Resident Advisors - Personnel who have volunteered and been selected, because of their maturity, to live in unaccompanied housing to assist in maintaining good order and discipline and to act as mentors to E1-E3 personnel..

Rotational/Mobilized Sailors- Sailors attached to units that are "Sea Duty for rotational purposes" (air squadrons, mobile training units, Seabees, etc.) on orders as a unit to duty outside their homeport, individuals on orders to a combat zone or crewmembers of uninhabitable ships/submarines outside their normal homeport.

Training Necessity - Training programs including officer accessions (OTC) and enlisted initial skills training ("A" schools, accessions pipeline schools, etc.) where student housing is part of the training mission and separate from other unaccompanied housing, and students are considered "must house" on the installation.

721 11 ENLISTED UNACCOMPANIED PERSONNEL HOUSING

FAC: 7210
BFR Required: Y

As of Feb 2018, this CCN also includes the consolidation of the following related housing CCNs:

- **721 12, 721 13 Bachelor Enlisted Quarters (Various). See section 72111-1**
- **721 24, 721 25, 721 26 Bachelor Enlisted Quarters – Marines (Various). See section 72111-2**
- **721 30 Civilian Barracks - GS01/ GS06. See section 72111-3.**

- **721 31 Civilian Barracks - Base Operating Support Contractor. See section 72111-4.**
- **721 51, 721 52, 721 53 Transient Personnel Unit Barracks (Various). See section 72111-5.**

The aforementioned CCNs have been deleted from this document and from iNFADS.

72111-1 Navy Assignment Standards

Permanent Party Unaccompanied Housing for enlisted Navy personnel applies to E1-E4<4 (E4 with less than 4 years of service), E4>4 years-E6, and E7-E9 rank designations.

Important Note: Permanent Party Unaccompanied Housing shall be identified on all property records in the internet Assets Facility Data Store (iNFADS) based on Navy military enlisted rank as follows;

- 721-11 E1-E4<4 years of service
- 721-11 E4>4years of service-E6
- 721-11 E7-E9

See FC 4-721-10 for design criteria.

Permanent Party
The market style unit applies to this category. Each unit includes shared living/dining area and kitchen/laundry area. For E1-E3 sailors and E4 sailors with less than 4 years' service, provide a two bedroom/two bath unit to accommodate four persons with each bedroom/bathroom to be shared by sailors.

Mission Essential Housing – Housing that supports rotational / mobilized sailors outside of their homeport and crewmembers of uninhabitable ships / submarines at their normal homeport, and rotational units outside of their normal homeport.

<u>Mission Essential/Military Necessity</u>

The Navy Shared Mobilization Unit (formerly referred to as Navy 2+0) applies to this category. Each unit includes one bedroom, one full bathroom, one kitchenette/service area and two closets. The unit accommodates either two E1-E6 sailors or one E7-E9 sailor.

Reference Requirements

Table 72111-A includes space planning guidelines per housing unit.

TABLE 72111-A
PLANNING LEVEL METRICS per UNIT/PLAN

UNIT/PLAN	MAXIMUM ALLOWABLE GROSS BUILDING AREA Ft^2 (m^2)
Navy Market Unit 2-Bed/2-Bath	606 ft^2 (56.3 m^2) per bedroom, based on a two-bedroom unit. This maximum is not applicable for one-bedroom units.
Navy Market Unit 1-Bed/1-Bath 730 76	1,028 ft^2 (95.5 m^2) per bedroom, based on a one-bedroom unit.
Navy NETC 2+0 Dormitory Unit / Navy 2+0 Unit	595 ft^2 (55.3 m^2) per plan
Marine Corps 1+1E Room (OCONUS Japan)	817 ft^2(76 m^2) per plan
Marine Corps 2+0 Room	595 ft^2 (55.3 m^2) per plan
Marine Corps Officer Plan	855 ft^2 (79.4 m$^{2)}$ per plan
Open Bay Plans	140 ft^2 (13 m^2) per person housed

Refer to Tables 72111-B and 72111-C for assignment policy. All construction projects shall identify maximum occupancy or the number of E1-E4<4 personnel that can occupy the quarters and the intended use capacity. The intended use capacity cannot exceed the number from the Unaccompanied Housing Requirements Determination (R-19) report except for rounding purposes. Activities in CONUS, where facilities include an architectural style that is prominent balcony access, may request a waiver from the interior corridor style from NAVFACHQ BHPO. **In these cases where the balconies serve as the primary circulation (i.e., serving exterior room entrances), they count towards building gross area at 100%.** For high threat areas OCONUS, consider secure barracks design concepts such as locating all UH rooms toward base interior with single-loaded exterior corridors located toward the base perimeter.

NAVY PLANNING CRITERIA FOR NEW CONSTRUCTION AND RENOVATION

Example Shared Mobilization Unit (Formerly Navy 2+0 unit)	3 Stories or less	Above 3 stories**
Maximum Allowable Gross Building Area per Unit	55.3 m^2	57.3 m^2

** For construction over 3 stories, 2 additional square meters per unit is allowed. The additional 2 square meters must be identified as a separate line item on the DD1391. This also applies to special design requirements for historical preservation, etc.

Example Market Style Unit	3 Stories or less	Above 3 stories**
Maximum Allowable Gross Building Area per Bedroom / Bathroom based on a Two-Bedroom Unit	56.3 m^2	58.3 m^2

** For construction over 3 stories 2 additional square meters per bedroom/bathroom is allowed. The additional 2 square meters per bedroom/bathroom must be identified as a separate line item on the DD1391. Also applies to special design requirements for historical preservation, etc.

MARKET UNIT BUILDING COMMON AREAS (See FC 4-721-10N for specific details)

- Corridors
- Interior Stairways
- Elevators (optional/per local building code requirements)
- Mechanical, Electrical, and Telecommunications Rooms
- Building Mechanical/Electrical room and Telecommunications room
- Trash Chute Area
- Janitorial Room
- Vestibule and Lobby Areas
- Reception/Front Desk Area
- Storage Room(s)
- Public Make and Female Restrooms
- General Maintenance Room
- Multi-Purpose Room(s)
- Vending Area
- Linen/Housekeeping Room

TABLE 72111-B
NAVY PERMANENT PARTY – MARKET STYLE UNACCOMPANIED HOUSING

RANK/RATE	UNIT TYPE	OSD MINIMUM STANDARDS OF ACCEPTABILITY*	PLANNING CRITERIA FOR NEW CONSTRUCTION
E7 - E9 (721-13)	Market Style one bedroom/one bath Housing accommodation in remote locations	Private unit with one bedroom/one bath, living/dining area, and kitchen/laundry area, shall be provided in remote locations. Provide a minimum of 13.4 net m^2 (144 nsf) per bedroom area.	One bedroom/one bath, one closet, one living/dining area, and one kitchen/laundry occupied by one person. Maximum allowable gross building area for one bedroom/bathroom Market Style Unit is 95.5 m^2 (1,028 gsf).
E4>4 - E6 (721-12)	Market Style two bedroom/two bath	Shared unit with two bedrooms/two baths, living/dining area, and kitchen/laundry area. Provide a minimum of 13.4 net m^2 (144 nsf) per bedroom area.	Two bedrooms/two baths each occupied by one person with shared living/dining area and kitchen/laundry area. Maximum allowable gross building area for two-bedroom Maximum allowable gross building

RANK/RATE	UNIT TYPE	OSD MINIMUM STANDARDS OF ACCEPTABILITY*	PLANNING CRITERIA FOR NEW CONSTRUCTION
			area per 2-bedroom unit or 620 gsf.
E1-E3 – E4<4 (721-11)	Market Style two bedroom/ two bath	Shared unit with two bedrooms/two baths, living/dining area, and kitchen/laundry area. Provide a minimum of 13.4 net m^2 (144 nsf) per bedroom area. Provide one resident advisor per 20 E1-E3 military personnel.	Two bedrooms/two baths each occupied by two persons with shared living/dining area and kitchen/laundry area. Maximum allowable gross building area per 2-bedroom unit or 620 gsf.

* OSD minimum standards of acceptability apply to billeting management rather than to facility condition for NFADB reporting purposes.

TABLE 72111-C
NAVY MISSION ESSENTIAL OR MILITARY NECESSITY - SHARED MOBILIZATION UNACCOMPANIED HOUSING (NAVY 2+0)

RANK/RATE	UNIT TYPE	OSD MINIMUM STANDARDS OF ACCEPTABILITY*	PLANNING CRITERIA FOR NEW CONSTRUCTION
E7 - E9 (721-13)	Shared Mobilization/Navy 2+0 Unit - one bedroom and one bath	Private unit with one bedroom, service area with kitchenette, bathroom vanity compartment and separate toilet/shower compartment. Provide a minimum of 16.7 net m^2 (180 nsf) per bedroom area.	One sleeping room and one bath, 55.3 gross m^2 (595 gsf) per unit, includes closets and service area/kitchenette for one occupant.
E4 - E6 (721-12)	Shared Mobilization/Navy 2+0 Unit- one bedroom and one bath	Shared unit with one bedroom, service area with kitchenette, bathroom vanity compartment and separate toilet/shower compartment to accommodate two persons. Provide a minimum of 16.7 net m^2 (180 nsf) per bedroom area.	One sleeping room and one bath, 55.3 gross m^2 (595 gsf) per unit, includes closets and service area/kitchenette for two occupants.
E1 - E3 (721-11)	Shared Mobilization/Navy 2+0 Unit - one bedroom and one bath	Shared unit with one bedroom, service area with kitchenette, bathroom vanity compartment and separate toilet/shower compartment to accommodate two persons. Provide 16.7 net m^2 (180 nsf) per room.	One sleeping room and one bath, 55.3 gross m^2 595 gsf) per unit, includes closets and service area/kitchenette for two occupants.

* OSD minimum standards of acceptability apply to billeting management rather than to facility condition for NFADB reporting purposes.

RELATED FACILITIES

Unaccompanied Housing should be collocated with an unaccompanied housing check-in center. Consideration should also be given to collocating UH with single sailor service centers, food service facilities, fitness facilities and other MWR facilities. One car wash area with a water source and an oil separator will also be provided when these type facilities are not available within a reasonable commuting distance. The car wash and supporting features must be captured under CCN 72350 “Wash Rack-Detached”.

PARKING FOR NAVY PERMANENT PARTY PERSONNEL

See CCN 852-10 for parking requirements.

Note: Some Activities may have unique circumstances that require less parking. In these cases, parking will be based on a parking survey of current residents.

OUTSIDE RECREATION

Provide one full outdoor basketball court per 300 residents if not available within 1/2 km. Similar outdoor recreation facilities can be substituted. Picnic areas and barbecue areas are required for all Unaccompanied Housing.

RESTORATION – MODERNIZATION PROJECT GUIDANCE

All deficiencies within existing facilities regarding “condition and configuration,” including Quality of Life (QOL) deficiencies defined by the Unaccompanied Housing Assessment Program (UHAP) shall be identified and addressed on restoration and modernization projects. Design projects for modernization and restoration projects shall comply with OPNAVINST 11010.20H, Navy Facilities Projects, which stipulates major policy guidance. Restoration and Modernization projects shall comply in accordance with the following:

- Perform an economic analysis and/or business case analysis to determine the feasibility of whether renovation or new construction is more cost effective.

- Do not plan projects exclusive to meet new construction criteria, except where the condition and/or configuration of an existing facility is too deficient to economically correct.

- Redesigns shall adjust unit designs to work within existing structural constraints to maximize building area while minimizing investment costs.

- Freestanding columns are allowed in redesigned units, provided that they do not interfere with a functional area or use.

REPAIR STANDARDS

Repair work may be limited to original standards used for the existing buildings. Consult OPNAVINST 11010.20H, Naval Facilities Projects, for additional guidance on repair projects.

72111-2 Marine Corps Assignment Standards

Permanent Party Unaccompanied Housing for enlisted Marine Corps personnel applies to E1-E4, E5, and E6-E9 rank designations.

Important Note: Permanent Party Unaccompanied Housing shall be identified on all property records in the internet Assets Facility Data Store (iNFADS) based on Marine Corps military enlisted rank as follows;

- 721-11 E1-E4
- 721-11 E5
- 721-11 E6-E9

Permanent Party 2+0 Standard

The 2+0 room consists of one room with a bath and is sized for two enlisted E1-E3 or one enlisted E4-E9. Refer to Table 72111-D. There are two basic entry styles for the 2+0 style hotels: exterior corridor style and interior corridor style. All construction projects will identify maximum occupancy or the number of E1-E3 personnel that can occupy the quarters and the intended use capacity. The intended use capacity cannot exceed the number from the FSR except for rounding purposes. See FC 4-721-10 for design criteria.

The Marine Corps may only use the 1+1 module design when individually approved by the CMC.

MARINE CORPS PLANNING CRITERIA FOR NEW CONSTRUCTION AND RENOVATION

2+0 Room	3 Stories or less	Above 3 stories or more**
Maximum Allowable Gross Building Area per Unit	55.3 m^2	57.3 m^2

** For construction over 3 stories 2 additional square meters per bedroom/bathroom is allowed. The additional 2 square meters per bedroom/bathroom must be identified as a separate line item on the DD1391. Also applies to special design requirements for historical preservation, etc.

BUILDING COMMON SPACE OUTSIDE OF THE ROOM

The typical shared common space to be provided for all 2+0 standard plans is shown below. Required common spaces are to be provided except when similar facilities are already available within walking distance of the project. Services should not be duplicated.

REQUIRED BUILDING AREAS (See FC 4-721-10N for specific details)

- Circulation, corridors and/or balcony access
- Multi-Purpose Room
- Duty Office
- Duty Bunk
- Laundry facilities
- Building utility room
- Entry Vestibule
- Unisex Rooms
- Elevators
- Janitor Closets
- Mechanical and Electrical Equipment Room(s)
- Corridors and Breezeways
- Stair Towers

Optional Common Spaces (See FC 4-721-10N for specific details)

- Administrative/Office Space
- Vending
- Game Rooms
- Resident bulk storage, as required
- Centralized Kitchen
- Balconies are optional

TABLE 72111-D
MARINE CORPS UNACCOMPANIED HOUSING
2+0 ROOM

RANK/RATE	OSD MINIMUM STANDARDS OF ACCEPTABILITY*	PLANNING CRITERIA FOR NEW CONSTRUCTION (Permanent Party)
USMC E6 - E9 (721-26)	Private bedroom and bath. Minimum bedroom area is 151 ft^2 (56 m^2).	Private room and bath, living room, and kitchen areas, and one closet at $2m^2$. Bedroom net area is 151 ft^2. Gross room area is 603 ft^2 (56 m^2). New construction of SNCO barracks will be considered on a case-by-case basis.
USMC E4-E5 (721-25)	Private room and a bath shared with not more than two to a room. Minimum 16.7 m^2 (180 SF) net living area per bedroom.	Private room and bath plus service area at 180 ft^2 (16.7 m^2) net sleeping/ living area plus bath and two closets at 2 m^2 net area each. Gross room area is 387.5 ft^2 (36 $m^{2)}$.
USMC E1–E3 (721-24)	Not more than two to a room. Minimum of 16.7 m^2 (180 SF) net living area per bedroom.	Shared room and bath plus service area occupied by two persons at 180 ft^2 (16.7 m^2) net sleeping/ living area plus shared bath and two closets at 2 m^2 net area each. Gross room area is 387.5 ft^2 (36 m^2).

* OSD minimum standards of acceptability apply to billeting management rather than to facility condition for NFADB reporting purposes.

PARKING FOR MARINE CORPS PERMANENT PARTY PERSONNEL

See CCN 852-10 for parking requirements.

Note: Some overseas or CONUS Activities may have unique circumstances that require less parking. In these cases, parking will be based on a parking survey of current residents.

OUTSIDE RECREATION

Provide one sand-volleyball court and one full outdoor basketball court per 300 residents if not available within 1/2 km. Similar outdoor recreation facilities can be substituted. Picnic areas and barbecue areas are required for all unaccompanied personnel housing.

OUTSIDE INDIVIDUAL MILITARY WASH AREA (USMC)

Provide outdoor equipment wash facilities (when required) at USMC unaccompanied personnel housing. The number of faucets/wash outlets shall be determined by the installation commander/resident FMF unit.

72111-3 Civilian Barracks – GS01/GS06 (PN)

72111-3.1 **DESCRIPTION** Quarters and messing facilities for civilian grades GS-6 and below will be provided only at installations that are remote from municipal areas or where civilians are required to be housed on station for security reasons.

72111-3.2 **REQUIREMENTS** Facilities planning for civilians will be the same as for military personnel of equivalent rank. Table 72111-E provides the military and civilian schedule of equivalent grades as established by the Department of Defense.

Important Note: Permanent Party Unaccompanied Housing shall be identified on all property records in the internet Assets Facility Data Store (iNFADS) based on Marine Corps military enlisted rank as follows;

TABLE 72111-E
MILITARY AND CIVILIAN EQUIVALENT GRADE SCHEDULE

Military Grade Group	Civilian Grade Group	
Rank	General Schedule	Wage Grade System
E-7 to E-9	GS-6	WS-1 through WS-7 WL-1 through WL-5 WG-9 through WG-11
E-5 to E-6	GS-5	
E4	GS-4	WG-1 through WG-8
E1 to E-3	GS-1 to GS-3	

72111-4 Civilian Barracks – Base Operating Support Contractor (PN)

There is no criteria currently available for this type of facility. Contact NAVFAC Atlantic Design and Construction business line for current information.

72111-5 Transient Personnel Units Assignment Standard (Inventory Purpose)

Transient housing for enlisted Navy and Marine Corps applies to E1-E4, E5-E6, and E7-E9 rank designations.

Important Note: This category of facilities is for inventory purposes and has no separate criteria. Transient Unaccompanied Housing where applicable shall be identified on all property records in iNFADS based on enlisted Navy and Marine Corps military rank as follows.

- 721-11 E1-E4
- 721-11 E5-E6
- 721-11 E7-E9

Hotels for Transient Personnel Units (TPU) are covered under Transient Unaccompanied Housing. TPUs may be used for operational reasons such as medical holds, transfers, disciplinary problems, etc. Refer to Category Codes 740-95 (Limited Service Official Lodging-Mission) for planning criteria.

721 14 STUDENT HOUSING (PN)
FAC: 7213
BFR Required: Y

Design Criteria: refer to FC 4-721-10N

72114-1 **REQUIREMENTS:** The requirements support housing students in a Naval Education and Training Command (NETC) 2+0 Dormitory Unit. The unit provides double occupancy living/sleeping area, two closets for personnel, a share toilet with a separate shower compartment, and a single bowl lavatory. All construction projects will identify the maximum occupancy or occupancy according to E1-E3, E4-E6, and E7-E9 enlisted personnel rank.

72114-2 **NAVY NETC 2+0 DORMITORY UNIT**

2+0 module	3 Stories or less	Above 3 stories or more**
Maximum Allowable Gross Building Area per Unit	55.3 m^2	57.3 m^2

** For construction over 3 stories, 2 additional square meters per bedroom/bathroom is allowed. The additional 2 square meters per bedroom/bathroom must be identified as a separate line item on the DD1391. Also applies to special design requirements for historical preservation, etc.

72114-3 **PARKING** Automobile parking for the residents at Navy ‘A’ Schools and USMC School of Infantry must be provided. Parking criteria can be found in category code 852 10. In addition, provide motorcycle parking spaces and bicycle parking spaces as required in accordance with historical use quantities. Provide visitor parking for 1% of the residents.

72114-4 **BUILDING COMMON SPACE OUTSIDE OF THE MODULE** For each project, all shared spaces must be individually scoped and justified from the list below. Elevators will not be provided. Items to be counted as one-half scope include stairs and stairwells, enclosed or unenclosed; and vertical chases.

- Office Areas: Admin/Reception (9.3 m^2 typical), Master at Arms (9.3 m^2 typical)
- Communal Areas: Vestibule, lobby, large screen TV lounge, vending room, gang kitchen, gang laundry, public telephone alcove, public toilets, resident bulk storage
- Corridor circulation, mechanical/electrical rooms (5-10% of gross building size), janitor closets (each floor), housekeeping/linen, utility storage room

72114-5 **PARKING FOR RECRUITS AND USMC SCHOOL OF INFANTRY** Resident parking at USMC and Navy recruit barracks is not required. Provide 1% visitor parking at USMC and Navy recruit barracks, however handicapped spaces are not required.

721 15 RECRUIT BARRACKS (PN)
FAC: 7218
BFR Required: Y

Design Criteria: refer to FC 4-721-10N

72115-1 **DESCRIPTION** Recruit quarters are open bay, central head facilities with net living area sized as one equal share of the open bay sleeping area. Typical sizes are 60 people per bay. Open bay designs will be constructed only for recruits, receiving barracks, and USMC School of Infantry.

72115-2 **PLANNING CRITERIA FOR NEW CONSTRUCTION FOR 721 15**

Open Bay

Net Sleeping Area	6.7 m^2
Common Area / Circulation / MEC	6.3 m^2
Building gross m^2 per module	13.0 m^2

Also, see Table 72115-A.

Table 72115-A
Recruit Barracks

RANK/RATE	OSD MINIMUM STANDARDS OF ACCEPTABILITY*	PLANNING CRITERIA FOR NEW CONSTRUCTION
Recruit & Receiving Barracks, and USMC School of Infantry	Open bay; central bath. Minimum 6.7 net m^2 (72 SF) net living area per person.	Open bay with individual armories in lieu of closets; central bath. Minimum 6.7 net m^2 (72 SF) net sleeping area.

721 21 TRANSIENT QUARTERS – MISSION ESSENTIAL

This CCN has been consolidated into CCN 740 95 for legacy facilities. All new transient facilities are captured under CCN 74094. CCN 721 21 has been deleted.

721 40 DISCIPLINARY HOUSING (PN)
FAC: 7312
BFR Required: Y

72140-1 **DESCRIPTION** This Facility is to be used for berthing personnel in disciplinary holding of restricted status. The Disciplinary/Restricted Barracks may be an area within a regular enlisted or transient personnel quarters that is designated by the commanding officer for use as:

> 72140-1.1 Disciplinary Holding Barracks. Berthing facilities for personnel in a holding status pending legal or administrative action or when assigned extra duty status.
>
> 72140-1.2 Restricted Barracks. Berthing for personnel undergoing punitive restriction or restriction in lieu of arrest. Personnel under punitive restriction will not be co-mingled with personnel restricted in lieu of arrest.

72140-2 **REQUIREMENTS** OPNAVINST 1626 provides detailed policy and description of security features utilized in Disciplinary/Restricted Barracks. Berthing space will be in open bay with a minimum of 72 SF net living area per person. The facility is not located within an approved place of confinement (Brig).

721 41 UNIT DEPLOYED PERSONNEL (UDP) MISSION ESSENTIAL (ENLISTED), (SF)
FAC: 7214
BFR Required: Y

72141-1 **DESCRIPTIO**N: These facilities are used for housing enlisted Marine Corps Unit Deployment Program (UDP) personnel (for officer UDP housing, see CCN 72415). Criteria is being developed for this CCN. Consult with the Marine Corps Housing Command Director (GF-3) for interim requirements for BFR purposes.

721 45 GALLEY/MESS HALL BUILT-IN / ATTACHED (SF)

This CCN has been deleted. All existing assets should be reassigned to CCN 72210 GALLEY/MESS HALL

721 46 RESIDENTIAL CARE FACILITY (SF)
FAC: 7210
BFR Required: Y

There is no criteria currently available for this type of facility. Contact NAVFAC Atlantic Design and Construction business line for current information.

721 47 UNACCOMPANIED HOUSING FOR WOUNDED WARRIORS (SF)
FAC: 7215
BFR Required: Y

72147-1 No criteria for this facility type are currently available.

72151/52/53-1 **DESCRIPTION** Hotels for Transient Personnel Units (TPU) are covered under category code numbers 721-51/52/53. TPUs may be used for operational reasons such as medical holds, transfers, disciplinary problems, etc. Refer to Category Codes 721-21/22/23 for planning criteria. This category code is for inventory purposes and has no separate criteria.

722 UNACOMMPANIED HOUSING – MESS AND CONFERENCE FACILITIES

722-1 **DESCRIPTION** This group includes dining facilities for unaccompanied personnel and conference centers operated by Unaccompanied Housing that are located in, or adjacent to, Unaccompanied Housing facilities. For clubs and open mess facilities, see the appropriate codes in 740 series. For additional information, refer to the design criteria found in FC 4-722-01N “Navy and Marine Corps Dining Facilities”.

722 10 GALLEY / MESS HALL (PN)
FAC: 7220
BFR Required: Y

Design Criteria: Refer to UFC 4-722-01 Design: Dining Facilities

72210-1 **DESCRIPTION**. Dining facilities for enlisted personnel provide the functional space necessary to offer efficient and aesthetically pleasing food service facilities that improve the quality of life for military personnel living and working on military installations worldwide.

72210-2 **REVIEW**. The Basic Facility Requirements and project documentation related to the planning for new or renovation of existing Dining Facilities are subject to review by Commander, Navy Installations Command (CNIC) Code N925 for Navy projects, or Headquarters Marine Corps, Logistics Food Service (LFS-4) for USMC projects.

72210-3 **REQUIREMENT**. Planning for a dining facility requires a determination of the number of personnel to be served; the meal schedule, duration and turnover to establish the required seating capacity, and any additional functions (such as a Flight Kitchen) which will be accommodated and require space in the facility. These requirements are generated by following three basic steps:

Step 1) determination of the authorized population which must be served by a dining facility (refer to Chapter 1 of this publication for additional guidance),

Step 2) analysis of existing adequate dining facilities within an acceptable travel distance to supplement the dining requirement, and

Step 3) determination of the space allocation requirement for the population not served by existing facilities.

72210-3.1 Step 1 – Determination of Population Served.

The number of enlisted personnel to be served during a meal period shall be determined by multiplying the projected maximum unaccompanied housing occupancy by the mission utilization factor(s), as provided in Table 72210-A.

The population count may include the average number of shipboard sailors entitled to rations-in-kind while shipboard galley facilities are out of service.

Do not include personnel on separate rations in the serving requirements when planning new dining facilities, or retaining and modernizing permanent facilities.

Officers and civilians shall only be included in the projected occupancy in overseas or remote locations where support is required.

72210-3.2 Step 2 - Analysis of Existing Facilities

New dining facilities shall be justified based on the ability to show that the existing dining facilities are inadequate to provide the serving requirement for the utilizing population established in Step 1.

The BFR for dining facilities requires an evaluation of the capacity, age, condition, and location of existing dining facilities relative to work centers and housing areas.

New dining facilities are not justified solely to support the construction of an additional unaccompanied personnel housing increment. It is necessary to determine that existing dining facilities do not adequately support the mission.

Recent changes in food service operations have made it necessary to re-evaluate the capacities of existing dining facilities which were constructed utilizing earlier criteria. While overall square foot authorization for new facilities is generally applicable to the determination of capacities of existing facilities, there are many independent factors which will limit capacity and must be taken into account. Common examples of these limiting parameters are:

- Storage Capacity include dry foods, refrigerated and frozen foods, consumables, and other non-food goods.
- Service Capacity – The ability to sustain a service rate suitable for the population to be served within the service period.
- Equipment Capacity
- Seating Capacity
- Meal Periods – The amount of time that the dining facility is open.
- Service Period – The amount of time that meal lines are open.

72210-3.3 Step 3 – Determination of Space Requirements

Based on the population to be served (as established in Step 1), and deducting any excess service capacity in existing dining facilities (as determined in Step 2), the required space allowance is determined from the remaining unserved population using the guidance provided in paragraph 72210-4.

Table 72210-A
Mission Utilization Factors for Dining Facilities

Mission	Utilization Factor
Training	
Basic and/or Recruit Training	95 %
Service Schools	85 %
Permanent Party	
Construction Battalions	70 %
Naval Stations	70 %
Personnel Transfer and Overseas Processing Centers	50 %
Remote Locations (1)	90 %

Mission	Utilization Factor
Shipyards	70 %
Weapon Stations	70 %
Brig	100 %

(1) Defined as a location with minimal available other feeding sources, on- or off-installation

72210-4 **SPACE PLANNING ALLOWANCES**. The space allowance for dining facilities is provided in Table 72210-C, based on the population established in paragraph 72210-3.

72210-4.1 Assumptions. The data contained in Table 72210-C is based on the following assumptions:

- Preparation method is conventional cook-serve.
- Mission is basic or recruit training.
- Seating is based on 15 SF (1.4 SM) per seat.
- Lobby queuing, and circulation space is minimized.
- One serving line is needed for every 200 seats, with minimum of 2 lines.
- Baking operations are minimized and reflect minimum bake-off of pre-prepared dough or other items.
- Three meals per day are served, seven days per week.
- Dishwashing space reflects a rack dish machine.
- Bussing method is self-buss to remote dish room.
- No provisions for catering are allocated, except Field Feeding/Vat Chow.
- Beverages are a free standing self-serve counter.
- Staff toilets do not include showers.

72210-4.2 Net to Gross Area Factor. – The net-to-gross multiplier accounts for mechanical and other utility space, wall thicknesses and other construction requirements. It typically ranges from 15 to 25% of all net areas for dining facilities and is influenced by the demands of the mechanical system, the number of floors, and the overall functional layout of the building. After selecting the appropriate net-to-gross factor, it is then applied to the facility subtotal shown in Table 72210-C.

72210-4.3 Additional Spaces. – Space allocation for vestibules, interconnecting covered walks, enclosed corridors and other architectural devices for climate and comfort are not included in Table 72210-C and must be considered separately on the BFR, if the need is fully justified. Aesthetic embellishments which add space to dining facilities are not justifiable.

72210-4.4 Storage Capacity. – Storage area requirements typically range from 10% to 25% of the dining facility net area (public, preparation, serving and support areas) and include dry foods, refrigerated and frozen foods, consumables, and other non-food goods. Factors that influence the storage requirements are the method of preparation and the inventory period:

- Scratch preparation has different fresh, dry and refrigerated storage requirements from frozen convenience and pre-prepared (cook-chill) preparation. The mix of preparation methods must be known to correctly size and design the storage areas.
- Inventory period is the time between deliveries. It will be influenced by the facility location (CONUS vs. OCONUS and rural/remote vs. urban areas), facility mission, and the vendor location and delivery contract terms. The longer the inventory period, the larger the storage requirements.

Table 72210-B provides a grid of these storage capacity factors and net area requirements associated with different combinations of factors. The appropriate net area gain is then applied to the facility subtotal shown in Table 72210-C.

Table 72210-B
Estimated Storage Requirements

	Food Preparation Factors	
Inventory Period Factors	**Frozen / cook-chill**	**Scratch**
Often (urban)	10-15% of net area	15-20% of net area
Infrequent (rural/remote)	15-20% of net area	20-25% of net area

72210-4.3 Service Capacity – A properly equipped and manned regular meal serving line can sustain a service rate of 8 personnel per minute. A properly equipped and manned short-order to-order serving line can sustain a service rate of 5 personnel per minute.

72210-4.4 Seating Capacity – Seating capacity is determined by the total number of patrons to be served divided by the turnover rate. Turnover rates can vary according to the size of facility and seating capacities.

72210-4.5 Meal Periods – The local command determines the meal period.

72210-4.6 Service Period – For planning purposes the total service time should not be less than 72 minutes or more than 142 minutes.

72210-4.7 Dining facilities that require more space than the maximum shown in Table 72210-C can be determined as follows: Divide the increased (projected) demand/loading capacity by the max of 2200 (personnel) shown in 72210-C. This will yield a multiplier greater than 1. Apply this multiplier to the allowances shown for the specific areas within the different functional components (Public, Serving, Preparation, and Support Areas) for 2200 personnel. Calculate the subtotals for the functional components and finish by using the process given for calculating storage adjustments and computing net-to-gross area as shown in the table. Below is an example:

A new Dining Facility is required to accommodate 3500 personnel (pn).

Divide the 3500 pn capacity requirement by the current Table 72210-C maximum allowance of 2200 pn; the result is a factor of 1.59.

Using the maximum allowances for the functional components of the 2200 pn facility, work through the calculations as follows:

Public Areas:	13,140 nsf x 1.59 = 20,892.6 nsf
Serving Areas:	4,288 nsf x 1.59 = 6,817.9 nsf
Preparation Areas:	4,335 nsf x 1.59 = 6,892.7 nsf
Support Areas:	2,440 nsf x 1.59 = 3,879.6 nsf
Facility Subtotal:	38,482.8 nsf
Multiply by Storage req %:	x1.25%
Subtotal Including Storage:	48,103.5 nsf
Multiply by the facility net-to-gross:	x1.25%
Facility Total Requirement:	60,129.4 gsf

(Note: If a flight kitchen is required, add it to the final facility gsf requirement)

Table 72210-C
Space Criteria for Enlisted Personnel Dining Facilities

	Functional Components	Facility Size Classifications							
		1-80 Personnel Served		81-150 Personnel Served		151-250 Personnel Served		251-400 Personnel Served

722 35 AUSTERE GALLEY (SF)

72235-1 Facility planning criteria related to Austere Dining Facilities can be found in FC 2-000-05N - Appendix F "Austere Facilities (Navy)," located at https://www.wbdg.org/FFC/DOD/UFC/fc_2_000_05n_appendixf.pdf.

72241-1 **DESCRIPTION.** The operation of closed messes in support of unaccompanied officers' quarters is being discontinued. New Commissioned Officers' Closed Mess Facilities will not be planned for new or existing quarters.

722 50 COLD STORAGE DETACHED FROM GALLEY / MESS HALL (SF)
FAC: 7233
BFR Required: N

72250-1 **DESCRIPTION.** This code is for inventory purposes only, and applies to situations where cold storage facilities are detached from the galley facility. There is no additional space allowance for galley cold storage, and therefore this space must be provided from within the total allowance authorized for dining facilities.

722 60 CONFERENCE CENTER (SF)
FAC: 6100
BFR Required: N

72260-1 **DESCRIPTION.** This category code is for inventory purposes only, and includes only those conference rooms operated by Unaccompanied Housing. No specific criteria are provided.

72260-2 **CONVERSION OF EXISTING SPACES.** Existing unaccompanied housing may have spaces that are no longer required by current criteria or unaccompanied housing practices, such as lounges and galleys (attached or detached). If these spaces cannot be physically or economically converted to unaccompanied housing rooms, or a surplus of unaccompanied housing rooms exists at the activity and region, these spaces may be converted to conference rooms with the approval of the Regional PM for Unaccompanied Housing.

72260-3 **CONVERSION OF ROOMS.** Conversion of unaccompanied housing rooms into conference centers or meeting rooms is not allowed unless there is a projected surplus of unaccompanied housing rooms. In addition, the requirement for conference centers or meeting rooms cannot be used to justify new Unaccompanied Housing construction.

72260-4 **LOCATION.** Conference rooms should preferably be located in, or adjacent to, transient quarters so conference attendees staying in transient quarters may take advantage of the proximity.

723 UNACCOMPANIED PERSONNEL HOUSING - DETACHED FACILITIES

723 20 LATRINE DETACHED (SF)
FAC: 7234
BFR Required: N

72320-1 **DESCRIPTION.** Latrine facilities are planned as an integral part of new unaccompanied housing. This category code is provided to inventory existing detached facilities only.

723 30 LAUNDRY DETACHED (SF)
FAC: 7231
BFR Required: N

72320/30-1 **DESCRIPTION.** Laundry facilities are planned as an integral part of new unaccompanied housing. This category code is provided to inventory existing detached facilities only.

723 31 STANDALONE KITCHEN (SF)
FAC: 7233
BFR Required: N

72330-1 **DESCRIPTION.** This category code is for inventory purposes only in cases where a kitchen is separate from galley/dining hall or other type of building.

723 40 GARAGE DETACHED - UNACCOMPANIED HOUSING (VE)
FAC: 7232
BFR Required: N

72340-1 **DESCRIPTION.** Individual garages will not be planned in conjunction with troop housing. This category code should be used for inventory purposes only. See CCN 730 80 for parking buildings.

723 50 WASH RACK DETACHED (EA)
FAC: 8526
BFR Required: N

72350-1 **DESCRIPTION.** Wash racks for mess hall garbage containers, and wash racks for unaccompanied housing resident's vehicles are planned as part of dining facilities and unaccompanied housing. This category code should be used for inventory purposes only.

723 60 TROOP HOUSING – OTHER DETACHED BUILDINGS (SF)
FAC: 7231
BFR Required: N

723 61 TROOP HOUSING – OTHER DETACHED FACILITIES (EA)
FAC: 7235
BFR Required: N

72360/61-1 **DESCRIPTION.** These codes are for inventory purposes only and are to be used for minor detached buildings and facilities directly relating to unaccompanied housing functions.

723 77 TROOP HOUSING STORAGE (READY ISSUE/SHOP STORES/MISCELLANEOUS) (SF)
FAC: 7231
BFR Required: Y

72377-1 **DESCRIPTION.** Storage facilities for miscellaneous equipment an/or goods related to unaccompanied housing support will be provided only where it can be individually justified. There are no criteria for this type of facility.

724 UNACCOMPANIED PERSONNEL HOUSING - OFFICER QUARTERS (PN)

724 11 UNACCOMPANIED OFFICER HOUSING
FAC: 7240
BFR Required: Y

Refer to CCN 721-11/12/13 “Permanent Party BEQ” for additional planning criteria.
Design Criteria: Refer to FC 4-721-10N “Unaccompanied Housing” for design criteria.

724-11/12/13/14-1 **DESCRIPTION.** Bachelor Officer Quarters (BOQ) will be planned for personnel in officers' grades who come within the following classifications:

72411/12/13/14-1.1 Permanent Party unaccompanied single
72411/12/13/14-1.2 Permanent Party unaccompanied married (overseas)
72411/12/13/14-1.3 Nurses
72411/12/13/14-1.4 Students
72411/12/13/14-1.5 Transients
72411/12/13/14-1.6 Rotational

72411/12/13/14-2 **REQUIREMENT.** The 1+1E module is sized for one O1-O10, W1-W5 personnel. Refer to Table 72411-1 for assignment policy. The intended capacity cannot exceed the number from the BHRD or Facilities Support Requirement (FSR) document. For CONUS, the only basic entry style for the 1+1E module is interior corridor style. CONUS activities with a predominate BQ architectural style of balcony access may request a waiver from the interior corridor style from NAVFACHQ BHPO. For high threat areas OCONUS, consider secure barracks design concepts such as all BEQ rooms facing base interior with single loaded, exterior corridors facing base perimeter.

Table 72411-1
Navy and Marine Corps Bachelor Officer Quarters

RANK/RATE	OSD MINIMUM STANDARDS*	PLANNING CRITERIA FOR NEW CONSTRUCTION
O-3 - O-10 (724-12 and 724-14)	Private room consisting of a sleeping/living room, private bath, access to kitchen or officer's dining facility. Minimum 38 sq. m (400 NSF) net living area.	Living room and sleeping room occupied by one person, minimum 14.4 m^2 each; plus private bath, service area, approximately 3 net m^2 closets per room (total area). Module is 56.0 gross m^2.
O-1-O-2 W-1-W-5 (724-11 and 724-13)	Private suite consisting of a sleeping/living room, private bath. Minimum 24 sq. m (250 NSF) net living area.	Living room and sleeping room occupied by one person, minimum 14.4 m^2 each; plus private bath, service area, approximately 3 net m^2 closets per room (total area). Module is 56.0 gross m^2.

* OSD minimum standards of acceptability apply to billeting management rather than to facility condition for NFADB reporting purposes.

72411/12/13/14-3 **OUTDOOR INDIVIDUAL MILITARY WASH AREA (USMC).** Provide outdoor equipment wash facilities (when required) at USMC bachelor quarters. The number of faucets/wash outlets shall be determined by the installation commander/resident FMF unit.

724 15 UNIT DEPLOYED PERSONNEL (UDP) – MISSION ESSENTIAL (OFFICER) (SF)
FAC: 7214
BFR Required: Y

72415-1 **DESCRIPTIO**N. These facilities are used for housing Marine Corps Unit Deployment Program (UDP) officers (for enlisted UDP housing, see CCN 72141). Criteria is being developed for this CCN. Consult with the Marine Corps Housing Command Director (GF-3) for interim requirements for BFR purposes.

72415-2 **DESCRIPTION.** Housing and messing facilities for civilian grades comparable to officers will be provided only at installations that are remote from municipal areas or where civilians are required to be housed on-station for security reasons.

72415-3 **REQUIREMENT.** Facilities planning for civilians will be the same as for military personnel of equivalent rank. Table 72415-1 provides the military and civilian schedule of equivalent grades as established by the Department of Defense.

Table 72415-1
Military and Civilian Equivalent Grade Schedule

724 20 USNA UNACCOMPANIED HOUSING (SF)
FAC: 7242
BFR Required: Y

72420-1 **DESCRIPTION.** This type of housing is for unaccompanied housing buildings located at the US Naval Academy.

72423-1 No criteria for this facility are currently available.

72424-1 No criteria for this facility are currently available.

72430-1 The operation of closed messes in support of officers' quarters is being discontinued. New Commissioned Officers' Closed Mess dining facilities will not be planned for new or existing BOQ's.

725 UNACCOMPANIED PERSONNEL HOUSING – EMERGENCY HOUSING

725 10 TROOP HOUSING - EMERGENCY BUILDING (PN)
FAC: 7250
BFR Required: Y

725 11 TROOP HOUSING - EMERGENCY FACILITY (EA)
FAC: 7251
BFR Required: N

72510/11-1 **DESCRIPTION.** These may be hutments (Quonsets), tent frames with floors and may be permanent, semi-permanent, or temporary types of facilities. No criteria for these facilities are currently available.

730 COMMUNITY FACILITIES – PERSONNEL SUPPORT AND SERVICES

730 10 FIRE STATION (SF)
FAC: 7311
BFR Required: Y

Refer to https://www.wbdg.org/dod/unified-facilities-space-program-sustainability-spreadsheets for the "Fire Stations Space Program" spreadsheet.

Refer to UFC 4-730-10N "Fire Stations" for design criteria at https://www.wbdg.org/dod/ufc/ufc-4-730-10.

73010-1 **DEFINITION.** This space criteria applies to Installation fire station facilities which provide fire protection for structures, fight brushfires, and support fire prevention education and training.

73010-1.1 When the fire station function is part of a consolidated operations facility (fire/police/safety), this CCN is applicable only to the fire station functions and the planner must consider the appropriate space designation (such as CCN 730 20) for the other facility functions. Identify common support and administrative spaces that can be shared between CCN functional areas.

73010-1.2 This criteria shall be used in combination with CCN141-20 "Aircraft Fire and Rescue Station" when developing the total space allocation for CCN 141-25 "Combined Structural / Aircraft Fire / Rescue Station".

73010-2 **REQUIREMENT.** The number of fire stations required on an Installation will be determined by the necessary response time for the type and function of facilities requiring fire protection. This analysis will be provided by Commander Navy Installations Command (CNIC) N30 or Marine Corps Installations Command (MCICOM) G3.

73010-3 **SCOPE.** To support the firefighters' mission, it is crucial that a fire station accommodates the equipment used at that station, supports the numerous unique functional requirements for that type of station, and fulfills the safety requirements of the firefighting personnel using the station. This is reflected in by the designated type of fire station and the required class of fire station.

73010-4 **STATION TYPES.** Functionally, there are three types of fire stations:

- Structural Stations (CCN 730 10) which provide fire protection to facilities,

- Aircraft Rescue Firefighting (ARFF) Stations (CCN 141 20) which provide fire protection to aircraft and associated equipment, and
- Combination Structural/ARFF Stations (CCN 141 25), providing support for each of the first two requirements.

73010-4.1 Differences between Station Types. Generally, the differences between Structural and ARFF stations are limited to the Apparatus Bay size criteria and the facility location to support its mission.

73010-4.2 Marine Corps Requirements. The Marine Corps program includes two separate organizations—one for Structural and one for ARFF. Unlike the other Services, the Marine Corps rarely combines the stations and requires separate offices for Fire Chiefs and other personnel on their Installations.

73010-5 **STATION CLASSES.** For each type of fire station, there are two class designations which determine some of the functions at that station:

- Headquarters (or Main) stations generally house the Fire Chief and most of the general administrative functions.
- Satellite stations are located throughout the Installation to provide adequate response time coverage.

73010-5.1 Differences between Station Classes. The differences between Headquarters and Satellite stations relate only to the additional administrative functions housed in the Headquarters station.

73010-6 **FUNCTIONS.** The Station Class will primarily determine the number and type of functional spaces required. However, it is important to assess the existing fire station assets available at the Installation, as it may be necessary to provide Satellite stations with some spaces normally reserved for Headquarters stations if they are not adequately available with existing facilities. The Installation representatives, in conjunction with the facility planner, must determine which spaces are necessary and justified. The planner should obtain a Needs Validation Assessment of Installation fire station assets to determine the class and required capacity in terms of personnel and vehicles of the new or renovated station (refer to 73010-2).

73010-7 **FUNCTIONAL AREAS.** Fire stations consist of apparatus bays and support areas, equipment and gear storage areas (for fire extinguishers, self-contained breathing apparatus (SCBA), protective clothing, hoses, firefighting agents, etc.), dispatch office, administrative offices, training facilities, living quarters, recreation and dining facilities, and possibly an emergency operations center and/or apparatus and equipment maintenance areas (if required by Installation mission requirements).

73010-8 **SPACE ALLOWANCE.** Space allowances for fire stations are determined according to the planning criteria calculations which result from using the Space Planning Spreadsheet for Fire Stations, which can be found at https://www.wbdg.org/dod/unified-facilities-space-program-sustainability-spreadsheets.

73010-8.1 Apparatus rooms are sized according to the firefighting apparatus to be housed within the station. For new construction, apparatus bays shall be planned to allow drive-through access for firefighting apparatus.

73010-8.2 Table 73010-1 contains functions that may be included in a fire station with adequate justification. These space allowances are optional selections in the space planning spreadsheet and must be individually justified for inclusion in the BFR development. Any additional apparatus equipment from Table 73010-1 should be included in determining the space allocation for apparatus bays.

Table 73010-1. Validate Requirement for these Functional Areas

FUNCTION	NOTE
Assistant Chief of Fire Prevention Office	(1)
Fire Prevention bureau	(2)
Deputy Chief's Office	(3)
Deputy Chief's Bunkroom	
Emergency Response Center	(4)
Disaster Preparedness Admin	(5)
Disaster Preparedness Storage	
Emergency Medical Services - Ambulance Bay	(6)
Ambulance Admin Space	
Ambulance Storage	
Ambulance Bunks (3 personnel/ambulance)	
Hazardous Waste Vehicle	(7)
Hazardous Waste Storage	
Hazardous Waste Bunks (3 personnel/vehicle)	
Specialized Equipment (foam unit, brush truck, etc.)	(8)
Heavy Rescue Vehicle	
Boat/Trailer Bay	
Boat Equipment Storage (100 NSF/9 NSM)	
Vehicle Maintenance Bay	(9)
Vehicle Maintenance Office	
Vehicle Maintenance Parts and Tools	

Notes:
(1) Authorized where there are more than 4 inspectors.
(2) Not included in Space Planning Spreadsheet. Determine space allowance according to CCN 610-10 criteria.
(3) Authorized where there are 4 or more engine Companies.
(4) Usually only provided in HQ-class stations that are consolidated with Police/Security/EMS functions.
(5) Not included in Space Planning Spreadsheet. Determine space allowance according to CCN 610-10 criteria.
(6) When ambulances are authorized, space must be provided to accommodate the vehicles, equipment, supplies, and crew.
(7) When HazMat response team is authorized, space must be provided to accommodate the vehicles, equipment, supplies, and crew.
(8) Include these specialized vehicles in the bay count section of the spreadsheet.
(9) This space allocation in the spreadsheet is authorized only in cases where fire/rescue vehicles are maintained and/or repaired at the fire station.

730 11 FIRE HOSE DRYING STRUCTURE (EA)
FAC: 7311
BFR Required: N

73011-1 **DEFINITION**. Category Code 730 11 is provided for inventory purposes only in cases where these structures are provided in a separate building or structure. For new facility planning purposes, this requirement shall be included as part of the Fire Station, Code 730 10.

730 12 FIRE CART/HOSE DRYING FACILITY (SF)
FAC: 7311
BFR Required: N

73012-1 **DEFINITION**. Category Code 730 12 is provided for inventory purposes only in cases where these facilities are provided in a separate building or structure. For new facility planning purposes, this requirement shall be included as part of the Fire Station, Code 730 10.

730 13 ISSUE/RETAIL CLOTHING AND UNIFORM CENTER (SF)
FAC: 7343
BFR Required: N

73013-1 **DEFINITION.** This is a retail outlet for military clothing and accessories. This facility is operated by the Navy and Marine Corps Exchange Service. It is integrated with the Exchange Retail Store, CCN 740-01 at most existing and all new stores. This category code is provided for inventory purposes only.

730 15 BRIG (SF)
FAC: 7312
BFR Required: Y

Design Criteria: For Renovations, refer to MIL-HDBK-1037/4.
For New Construction, refer to the American Correctional Facilities Guidelines.

73015-1 **DEFINITION.** This code is to be used for facilities whose primary purpose is the confinement of personnel. A facility with confinement as a secondary use should be coded according to its primary use. For example, a restricted barracks is coded as a facility in the appropriate code of the 721 group.

73015-2 **REQUIREMENTS**. Requirements for brigs may only be established at activities where such facility is authorized by SECNAV. This insures strategic distribution of the facilities. Where planning for a brig is authorized, space allowances are in accordance with Table 73015-1 and Table 73015-2. The prisoner capacity is 0.5% of the total military strength in the area served by the facility. This figure may be adjusted by the Bureau of Naval Personnel to compensate for local variations in projected prisoner population. The adjusted figures are available from the Bureau of Naval Personnel (PERS-84).

Where facilities are to include space for gainful employment, they will be programmed on the basis of identified equipment requirements but not to exceed 7 m^2 (75 gsf) per prisoner.

73015-3 **APPROVAL PROCESS.** A request for approval of the establishment of a brig as a Navy place of confinement shall be submitted to the Secretary of the Navy via the chain of command and the Bureau of Naval Personnel or Commandant of the Marine Corps, as appropriate.

73015-4 **SPACE ALLOWANCES**. The gross area allowances shown include facilities for housing, training, welfare, administration, and recreation. The space for prisoner berthing in dormitories must have a minimum of 7 m^2 (72 ft^2) net sleeping area per prisoner. All cells should be planned for single occupancy and be of 6' x 8' x 8' minimum dimensions.

Table 73015-1. Space Allowances for Correctional Centers

Capacity	Gross Area Per Prisoner	
	sq. m	SF
Up to 25	51	550
50	41	440
150	33	350
250	31	330
400	28	300

73015-5 **SITING.** The brig shall be sited where it is free from safety hazards due to its extended evacuation time. The size of site and its location in relation to other activity facilities shall be agreed between the using activity and PERS-84.

73015-6 **FUNCTION.** The structure and its functional components shall be planned in accordance with the guidelines contained in SECNAVINST 1640.9B (Dec '96 @ http://neds.nebt.daps.mil/1640.htm), the American Correctional Facilities Guidelines (new construction) and MIL-HDBK 1037/4 (renovation).

The following list and Table 73015-2 highlight the components which normally should be considered when planning for a brig. The list is not intended to be all inclusive nor may all components be required at all locations. It should be used only for guidance or as a checklist. Figures shown on Table 73015-2 are net square meter (net square feet) and are intended to be utilized for planning physical layout. The size of the spaces may vary depending on the particular needs of the activity.

73015-6.1 **Administrative Section**. Admin. section; Brig Officer's office; prisoner, visitor and legal visiting rooms.

73015-6.2 **Prisoner Processing**. Receiving and release room; prisoner storage; holding cell.

73015-6.3 **Medical Exam Spaces**. Doctor, Dentist and Psychiatrist.

73015-6.4 **Dining Facilities**. Brigs with 100 prisoners or less should cater food from existing base facilities where practical; Brigs over 100 prisoners use cat. code 722-10 criteria.

73015-6.5 **Prisoners Quarters**. Cells or secure rooms will have single occupancy 6'x8'x8' minimum dimension and the total number shall not exceed 15% of prisoner capacity. Dormitories will berth 85% of prison capacity; maximum 35 prisoners per dormitory and 7 sq.m. (72 SF) net sleeping area per prisoner.

73015-6.6 **Other Miscellaneous Spaces as Required**. Staff lounge, classrooms, vocational shop, laundry, chapel counseling, library and recreation facilities should be planned based upon local needs.

Table 73015-2.
Brig Capacity Number of Prisoners

Type of Space	U/M	50	100	150	200	250	300
Administrative Section	sq. m	151	251	251	269	288	288
	SF	1620	2700	2700	2900	3100	3100

Recreational Equipment Storage	SF	140	140	140	240	240	240

730 20 SECURITY BUILDING (SF)
FAC: 7313
BFR Required: Y

73020-1 **DEFINITION.** A security building housing the shore patrol and military or civilian police forces may vary in use from a standard police station to a large security department. Security buildings are generally located well within the base perimeter, and not adjacent to gatehouses.

73020-2 **STANDARD POLICE STATIONS.** For a police force limited to law enforcement within an installation, with no detention responsibilities, plan on the basis of 5 sq.m. (50 SF) per person employed at the police station. This includes the total of all persons in administrative functions and on patrols, for all shifts.

73020-2.1 The space allowance provides space for all or part of the following: armory; administration; communication; fingerprint room, file space; storage; training and briefing; dayroom; maintenance of official vehicles; miscellaneous related support.

73020-3 **LARGE SECURITY DEPARTMENTS.** For large security departments providing a variety of services, including combined dispatch centers with fire and medical services, individual justification for space requirements is required. Spaces may include: administrative areas, waiting areas, customer service and report writing areas, dispatch centers including consolidated dispatch centers for medical, fire and security, armory, Pass and ID services, package inspection, ready issue communication equipment storage, general supply, and break lounges.

730 21 DEFENSIVE FIGHTING POSITION (SF)
FAC: 1498
BFR Required: Y

73021-1 **DEFINITION** A Defensive Fighting Position (DFP) is an elevated facility that houses operations responsible for the protection of access and/or egress to designated areas or facilities and can serve an installation’s security force or a tenant command requiring secure access within a dedicated area or compound. These are typically used at installation Entry Control Points (ECPs), at Pier Heads, and sometimes at secure areas within an installation. For landside DFP applications, the DFP must be located such that it is near the active vehicle barriers and provides the occupants the ability to oversee response zone traffic and operations at the ID check area. For waterside DFP applications, the DFP must be positioned along the waterfront (typically at the head of the pier) to allow 360 degree observation and employment of both non-lethal and lethal force. The DFP will be utilized as an elevated fighting position and as such will be equipped with gun ports to allow the occupants to respond to threats. The gun ports should be positioned to cover the likely avenues of approach and be constructed to accommodate depression angle requirements of weapons (lethal and non-lethal) employed therein. Objectively, the DFP should facilitate weapons employment throughout the entire threat zone as defined by NTTP 3-07.2.1 and as established in installation Antiterrorism Plan.

Note: Landside DFPs should have a 360 degree field of view but geographic constraints/restraints may preclude this at some locations.

73021-2 **REQUIREMENTS**

73021-2.1 DFPs must provide adequate space within the overwatch for movement of a guard and the use of handguns, shoulder fired weapons, and select non-lethal weapons systems. Gun/weapons ports shall be provided on each face of the overwatch (providing a 360 degree field of view). Note: Gun/weapons ports may not be required on all sides of the DFP if the protection plan into which these positions are being placed accommodates/establishes 360 degree protection to assets contained therein.

73021-2.2 The DFP overwatch shall consist of a 36GSF (maximum) structure as in figure 73021-1.

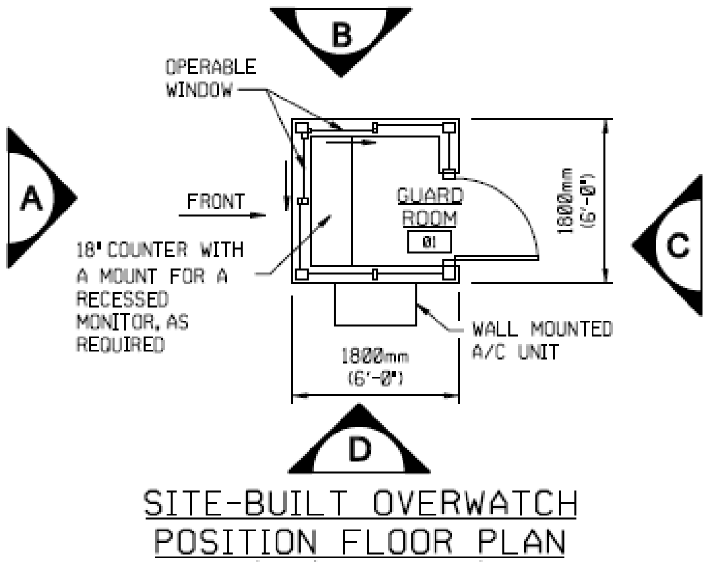
73021-3 The requirements calculation process should begin with consultation with the installation SECO (Security Officer) and ATO (Antiterrorism Officer) to determine how many DFP overwatch positions are needed. For locations within an installation where a tenant command requires a DFP for a dedicated secure area or compound, coordination with the command's OIC may be necessary to obtain requirements.

For the purposes of the BFR, all DFP requirements serving an installation's security force can be captured within a single BFR and based on the installation UIC. If the requirement is for a tenant command for a dedicated secure area or compound within an installation, the BFR should be captured using the tenant command UIC and should be exclusive of the installation's requirements.

For the purposes of identifying assets in iNFADS, use individual property record cards (PRCs) to capture the DFP assets for each landside and waterfront entry control point (ECP) and capture them using the installation UIC. Note their locations on the PRC. If the asset(s) is/are for a specific tenant command for their own secure area(s) or compound(s), use the tenant command UIC to capture all DFPs associated with the command. For the purposes of Asset Evaluations (AEs), if an existing facility is not elevated, note that it is deficient with respect to its functional or space criteria for a building or structure.

Below is a notional diagram of a typical DFP layout. Note that these facilities are typically elevated towers with occupied space on upper floor(s) and an interior stairwell below. The area below the occupied space(s) is not counted as useable area on the property record card.

Figure 73021-1 Model Defensive Fighting Position



73021-4 **SITING CRITERIA.** Several elements must be considered early on in locating the position of a DFP. It is CRITICAL that regional and installation Security Officers (SECO) and Antiterrorism Officers (ATO) be consulted early in the location process. Attention must be given to:

--Topography of the intended location and resulting field of fire.
--More than one may be necessary to adequately cover ECP field of view considerations and different avenues of approach.
-- Safety of the occupant due to firing from gate guards.
-- Safety of general public from downrange fire
--Weapon system to be utilized and its coverage capability.
--DFP should be located behind final denial barrier.
--DFP Should be located a sufficient distance from ECP to allow time for operation of final denial barrier.
-- Waterfront DFPs should be positioned in such a manner to allow for overlapping fields of fire. Objectively, there should be sufficient fields of fire established (i.e. sufficient number of DFPs) that the elimination of any single DFP does not preclude the other DFPs from employing force (lethal/non-lethal) across the entire waterfront. The exact number of DFPs required should be delineated in the installation Antiterrorism plan and/or defined by coverage factor requirements of higher headquarters or both. The number of DFPs required along the waterfront can and should also be influenced by the types/capabilities of weapons (lethal/non-lethal) planned to be employed from therein.

Note: As the urban environment has migrated to the borders of military installations, military operations are being conducted in closer proximity to the general public. Installation public works, security and antiterrorism teams must factor the proximity of the general public into the protective designs of DFPs. Installations shall consider incorporation/application of protective elements such as retaining walls (walls to absorb bullets) into the DFP design (landside application).

73021-5 **USE OF RE-LOCATABLE BUILDINGS** See OPNAVINST 11010.33C for guidance on the use of re-locatable facilities as DFPs. Make-shift facilities created from items such as concrete barricades, box culverts, and similar items are not to be captured as real property DFPs in iNFADS.

730 22 NCIS FIELD OFFICE (SF)

FAC: 7313
BFR Required: Y

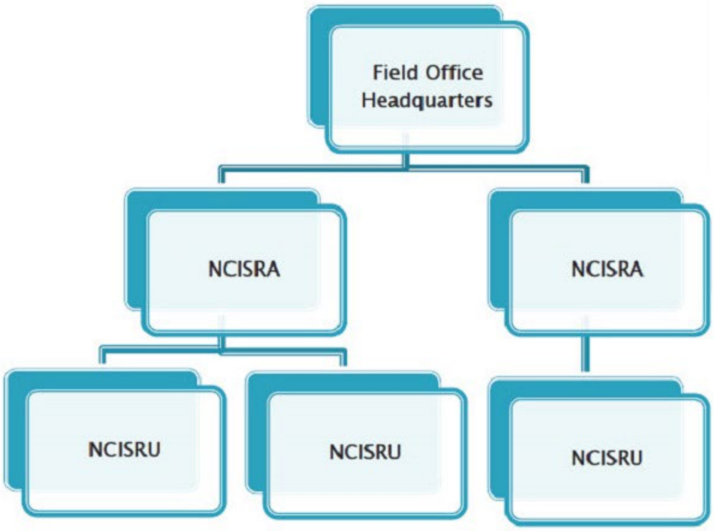
73022-1 **Definition**. A building that houses the command, operation, and administrative functions assigned to the U.S. Naval Criminal Investigative Service (NCIS). NCIS is the primary law enforcement agency of the U.S. Department of the Navy. Its primary functions are to investigate criminal activities involving the U.S. Navy and U.S. Marine Corps, though its broad mandate includes national security, counterintelligence, counterterrorism, cyber warfare, and the protection of U.S. naval assets worldwide. The criteria specifically address NCIS Field Offices, NCIS Resident Activities, NCIS Resident Units and various mission specific components.

73022-2 **Planning Factors**. Review the criteria contained herein and use this information in tandem with the NCIS BFR Template to develop space requirements for NCIS organizations.

Notional Organizational Chart and Staffing Levels

NCIS Field Office (NCISFO)

- Special Agent in Charge (SAC)
- Assistant SACs (ASACs) (Crim, CI)
- Senior Intelligence Officer (SIO)
- Field Operations Support Officer (FOSO)
- Supervisory Program Analyst (SPA)
- Field Computer Specialist (FCS)
- Investigator(s) (1801)
- Intelligence Analyst (s)
- Program Support Assistants (PSAs)



NCIS Resident Agency (NCISRA)

- Can be collocated or geographically separated from field office HQ
- Supervisory Special Agent(s) (SSA)
- Special Agents (SAs)
- PSA(s)

NCIS Resident Unit (NCISRU)

- Geographically separated from NCISRA
- One or more SAs

NCIS Field Office (NCISFO)	25-50 personnel
NCIS Resident Agency (NCISRA)	13-20 personnel
NCIS Resident Unit (NCISRU)	1-5 personnel

73022-3 **Personnel Loading.** Personnel loading must be supported by an official personnel-loading report. See CCN 61010, Sections 61010-3 and 61010-4 for additional information.

73022-4 NCIS BFR Template

When preparing a BFR for NCIS, contact and coordinate with the local NCIS office.

Two levels of approval are required to certify BFR.

1. Mission Approver (NCIS)
2. Activity/PWD Approver (NAVFAC)

The NCIS Engineering Office serves as the "Mission Approver" for all NCIS BFRs. The local installation serves as the "Activity/PWD Approver."

73022-5 General Administrative Space

For Private Office, Open Office, Flex Office and associated Circulation Space, see CCN 61010, Table 61010-5.1. Telework Design criteria is not applied for NCIS entities.

73022-6 **Basic Allowances**

For Admin Support, Break Room and Conference/Training Space, see CCN 61010, Table 61010-7.1.

Note: CCN 61010, Table 61010-7.1A. Conference/Training Room Table provides an overall Conference/Training Room space allocation. For example, if an organization has 112 personnel, an overall conference/training room allocation of 750 NSF is allocated. This overall allocation of 750 NSF can be broken down in any way that best suits the organization, for example it could consist of five conference rooms at 150 NSF each or any variation amounting to 750 NSF. This allocation includes collaboration spaces, teaming rooms, etc.

73022-7 **Functional Support**

73022-7.1 **Case File Storage**: See CCN 61010, Table 61010-7.2 for Archive Storage

Planning Factor: Allocate NSF based on a space analysis

Justification Guidelines: Approved for FO, RA and RU. All require on-site case file storage of active and on-going investigations. NCIS Case Files are "permanent records" as defined by SECNAV M-5210.1 - DON RECORDS MANAGEMENT PROGRAM. A space analysis is required. Multiply the total number of filing cabinets and safes by a planning factor of 7 NSF/EA.

73022-7.2 **Grand Jury Room**: A Grand Jury Room serves as a meeting room for review of ongoing court cases and provides storage room for active litigation documents. Although this space is similar to a conference room, it is additional to the basic conference/training room allocation. This space may require locks or key card entry, but is not necessarily a secure (classified) space.

Planning Factor: Allocate one Grand Jury Room at 150 NSF

Justification Guidelines: Justified for FO if economic crimes component is present. Approved for RA. Not approved for RU.

73022-7.3 **Graphic Workstation:** Shared computer workstation space(s) used to recreate crime scenes, sketch suspects, and develop media presentations. Each workstation requires one NMCI drop and one commercial drop. The purpose of the commercial drop is for the investigation of online evidence that would otherwise be blocked by NMCI, for example, a suspect’s social media. This room is not intended to be the primary workspace for any staff. The number of graphic workstations shall be based on regional requirements as determined by the NCIS Engineering Office.

Planning Factor: Allocate up to four workstations at 64 NSF/WS

Justification Guidelines: Not approved for FO. Approved for RA and RU. Number of graphic workstation(s) based on discussion with NCIS Engineering Office.

73022-7.4 **IT Equipment Storage**: Storage for computer and telecommunication equipment for the using organization. This space type is based on the total number of personnel.

Planning Factor: Allocate 5 NSF/PN, minimum size is 60 NSF

Justification Guidelines: Approved for FO, RA and RU.

73022-7.5 **IT Logistic Support Storage**: A dedicated shipping, receiving, laydown/IT staging, and storage area may be provided to support the IT equipment and parts storage for a NCISFO and that of component NCISRAs and/or NCISRUs. This area is in addition to any maintenance parts and consumables storage requirements that may also exist. The need for IT Logistic Storage Space shall be based on regional requirements as determined by the NCIS Engineering Office.

Planning Factor: See FC 2-000-05N, 131 Series Introduction, Section 131-13.

Justification Guidelines: Justified for FO based on regional requirements. Space analysis is required. Not approved for RA or RU.

73022-7.6 **MCRT Gear Storage**: Provides storage to support a Major Case Response Team's (MCRT) gear storage for special agents. Gear is stored primarily within pelican cases on shelves. Pelican cases are molded plastic containers that seal with an airtight and watertight gasket. Pelican cases for MCRT gear may include but are not limited to: crime scene kits for blood spatter analysis, digital and still camera kits, evidence collection kits, lighting kits for crime scenes and ultra-violet lighting kits for detection of different substances. This space type is based on the number of special agents (SA).

Planning Factor: Allocate 10 NSF/SA, minimum size is 100 NSF

Justification Guidelines: Approved for FO, RA and RU.

73022-7.7 **Secure Conference Room**: Provides space for classified meetings and briefings. This space allocation is in addition to the basic conference/training room allocation above.

Planning Factor:

- Allocate NCISFO secure conference room at 200 NSF
- Allocate NCISRA secure conference room at 120 NSF
- Allocate NCISRU secure conference room at 100 NSF
- Allocate OTHER secure conference room at 120 NSF

Justification Guidelines: Most NCIS organizations operate in secure facilities and have access to secure conference rooms and therefore do not require this space type. If an NCIS organization's primary facility is not secure and only intermittent access to classified briefings are required, a secure conference room is justified.

- Not approved for FO. For FO, apply Mini-MTAC allocation below rather than the secure conference room allocation. The Mini-MTAC is an unmanned, secure space and can also serve as a secure conference room. Ensure that secure conference room and Mini-MTAC are not both allocated at the field office level.

- Justified for NCISRA when only intermittent access to a secure conference room is required. For example, CRIM Agents typically work in an unclassified environment because they require access to their cell phones and require only intermittent access to a secure conference room.

- Approved for NCISRU. NCISRUs are so small (1-5 persons) that they are not authorized a conference room space allocation. However, even if a NCISRU consists of one person, that person must still be able to host a meeting and therefore a basic secure conference room allocation of 100 NSF is approved. Note that at the NCISRU level, the conference room does not necessarily have to be "secure", it can be an ordinary conference room.

73022-7.8 **Secure Terminals**

Note that secure terminals provide secure areas for handling classified material. This space type is not intended to be the primary workspace for any staff. The number of workstations required must be provided by the organization's Security Officer.

Planning Factor: Allocate 64 NSF per workstation

Justification Guidelines: Justified for FO, RA, and RU.

73022-8 **Evidence Storage**

Note: In rare circumstances, an exception to the justification guidelines may be required for evidence storage space types due to site constraints or regional requirements. The NCIS Engineering Office shall provide rationale and responsibility for such an exception in writing.

73022-8.1 **Bulk Evidence Processing**: Room used to process large items of evidence such as, couches, mattresses, washing machines, etc. This space type is based on the number of special agents (SA).

Planning Factor: Allocate 10 NSF/SA, minimum size is 100 NSF

Justification Guidelines: Approved for FO. Justified for RA if drive-time to FO is greater than 60 minutes.

73022-8.2 **Evidence Custodian Station**: Space is required for an evidence custodian station to control and monitor entry to the long-term evidence storage. This overall space is based on a dedicated workstation area of 144 NSF. Since the person manning this space is already accounted for within the General Admin Space allocations at 64 NSF for an open office, this space type is reduced to 80 NSF.

Planning Factor: Allocate one evidence custodian station at 80 NSF

Justification Guidelines: Approved for FO. Justified for RA if drive-time to FO is greater than 60 minutes.

73022-8.3 **Evidence Preparation Area**: This space is used by special agents to prepare evidence for long-term evidence storage.

Planning Factor: Allocate 3 NSF/SA, minimum size is 60 NSF

Justification Guidelines: Approved for FO. Justified for RA if drive-time to FO is greater than 60 minutes.

73022-8.4 **Long-Term Evidence Storage**: Long-term evidence storage is required for securely storing evidence related to ongoing investigations. Space is required primarily for evidence storage shelves and secure storage lockers. A refrigerator is required for the storage of biological evidence. A separate, more secure area is required for storage of firearms, narcotics, currency and/or high-value items. This space type is based on the number of special agents (SA).

Planning Factor: Allocate long-term evidence storage at 30 NSF/SA

Justification Guidelines: Approved for FO. Justified for RA if drive-time to FO is greater than 60 minutes.

73022-8.5 **Temporary Evidence Storage**: This space is for temporary storage of items, awaiting transfer to a long-term, secure evidence storage facility, typically located at nearest NCISFO or NCISRA. Space is required for packaging materials, personal protective equipment, an eyewash station, and a refrigerator for the storage of biological evidence. This space type is based on the number of special agents (SA).

Planning Factor: Allocate temporary evidence storage at 12 NSF/SA

Justification Guidelines: Not approved at FO. Justified for RA if not collocated with FO. Approved for RU.

73022-9 **Fitness**

73022-9.1 **Self Defense Training**: A semi-private room or enclosed area for self-defense training. At a minimum, this space includes easy-to-clean mats that will handle the impact of self-defense training. This space type is based on the number of special agents (SA). A minimum of 10 agents are required to justify this space type.

Planning Factor:

- Allocate 128 NSF for 10-29 special agents
- Allocate 256 NSF for 30 or more special agents

Justification Guidelines: Approved for FO, RA and RU. For security purposes, self-defense training is conducted within NCIS facilities as opposed to a local Installation Fitness Center. A minimum of 10 special agents are required to approve/authorize this space type.

73022-9.2 **Locker Room**: A locker room provides temporary storage lockers for a change in clothing and other personal belongings. This space type is required within NCIS facilities in support of agents working active crime scenes. This space type is based on the number of special agents (SA).

Planning Factor: Allocate one locker at 8 NSF each for every two special agents

Justification Guidelines:
Approved for FO, RA and RU. Agents must be able to shower after conducting a crime scene analysis and therefore require a locker.

73022-9.3 **Shower Room**: A shower room provides one or more shower stalls and is typically collocated with a bathroom and/or locker room. This space type is required within NCIS facilities in support of agents working active crime scenes and self-defense training.

Planning Factor: Allocate one shower at 20 NSF each for every 10 special agents

Justification Guidelines: Approved for FO, RA and RU. While locker and shower rooms do support NCIS Fitness and Self Defense Training functions, the primary requirement for lockers and showers is so agents are able to wash any blood, saliva or unknown substances off their skin with soap and lots of running water after working an active crime scene. A minimum of 10 special agents are required to approve/authorize this space type.

73022-10 **Interviews**

73022-10.1 **Booking & Fingerprinting:** Space used for processing, photographing, and fingerprinting individuals arrested, charged or accused of a crime. This space type is based on the number of special agents (SA).

Planning Factor: Allocate 3 NSF/SA, minimum size is 60 NSF

Justification Guidelines: Approved for FO, RA and RU.

73022-10.2 **Hard Interview Room**: Room used to interview a suspect or criminal. The number of hard interview rooms shall be based on regional requirements as determined by the NCIS Engineering Office.

Planning Factor: Allocate one hard interview room at 100 NSF each

Justification Guidelines: Approved for FO, RA and RU. Hard interview rooms are allocated based on regional requirements.

73022-10.3 **Soft Interview Room**: Room used to interview a victim. Unlike a hard interview room, this space may include comfortable chairs, wall decorations and soft lighting, meant to make victims of traumatic crimes feel more comfortable sharing crime details with investigators. The number of soft interview rooms shall be based on regional requirements as determined by the NCIS Engineering Office.

Planning Factor: Allocate soft interview room at 120 NSF each

Justification Guidelines: Approved for FO, RA and RU. Soft interview rooms are allocated based on regional requirements.

73022-10.4 **Observation Room**: An Interview Observation Room is located between hard interview rooms. One-way glass windows share common walls with the hard interview rooms for monitoring interviews. Consideration should be given to using CCTV feeds rather than providing space for an observation room.

Planning Factor: Allocate one interview observation room at 100 NSF each

Justification Guidelines: Approved for FO, RA and RU. Interview observation rooms are allocated on a case-by-case basis.

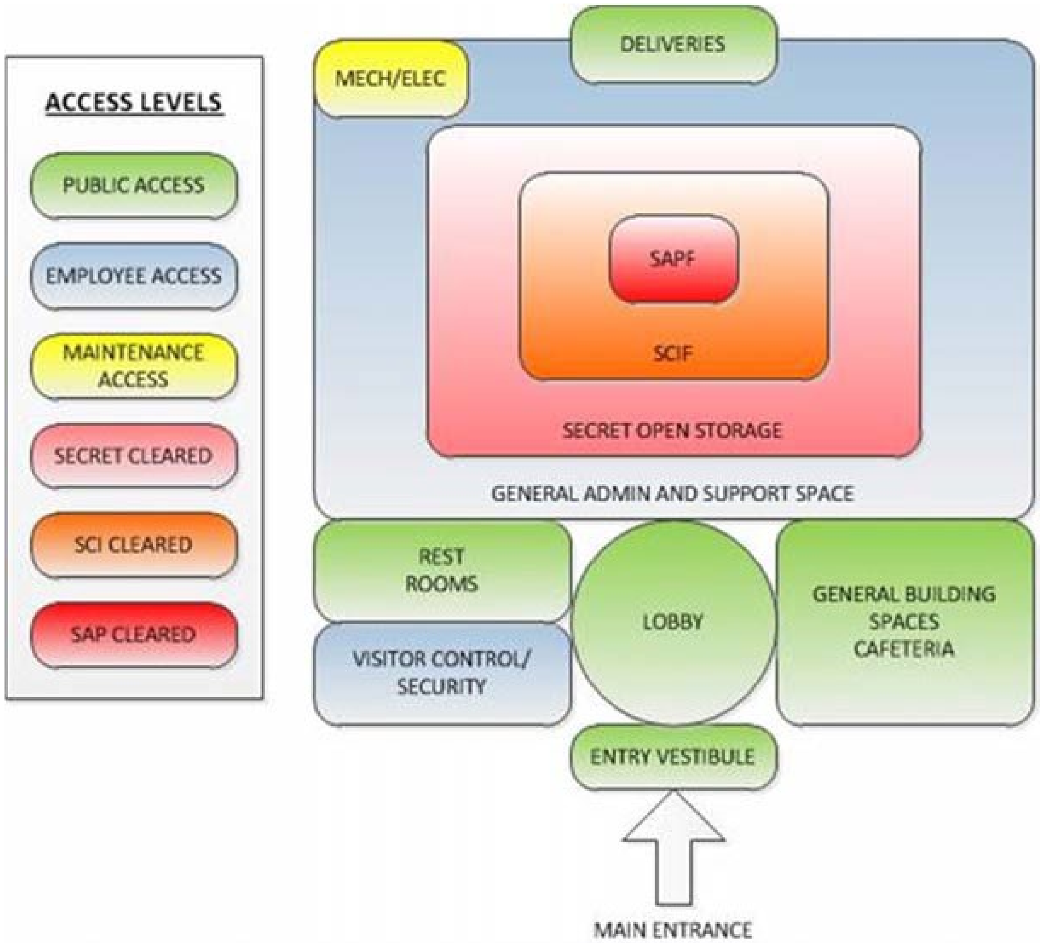
73022-11 **Secure Areas**

These space types are discussed here in general, but are not included in the NCIS BFR Template.

Depending on the mission of an organization, some secure areas may be required, ranging from secure kiosk stations, to Open Secret Storage (OSS) areas, to a Sensitive Compartmented Information Facility (SCIF), to a Special Access Program Facility (SAPF). If a portion of an organization operates at a higher classification than the rest of the facility, the space provided for them is calculated based on the overall requirements set forth in the 131 Series Introduction criteria.

Do not call-out the classification levels of space types in planning or design documents. Refer to these spaces only as “secure spaces”. For NCIS, these space types typically consist of an office space environment with dedicated office spaces. This means the secure spaces do not have to be called out specifically in the BFR, because they have already been accounted for in the office space requirements. This also supports the OPSEC goal of not identifying the level of secure area or the mission in planning or design documents.

Notional Diagram of Secure Space Types



In some cases, one or more analysis workstations may be required and must be called out separately as an "analysis workstation".

- For analysts working in a secure environment:
  - Allocate 90 NSF for an analysis workstation required to monitor up to 4 networks.
  - Allocate 130 NSF for an analysis workstation required to monitor more than 4 networks.
- If using the NCIS BFR Template, an analysis workstation can be included as a "user-defined-space".
- If using the NCIS BFR Template, ancillary secure comms spaces, can also be included as "user-defined-spaces".

73022-12 **Security**

See Table 61010-7.3 for Entry Control Area, Secure Visitor Waiting Area and Weapons Vestibule and Vault.

73022-13 **Watch Center**

73022-13.1 **Mini-MTAC**: The Multiple Threat Alert Center (MTAC) for NCIS Headquarters is a large Watch Center utilizing NCIS' worldwide presence and combination of law enforcement, counterintelligence, intelligence, and security capabilities to identify a wide range of threats to Navy and Marine Corps personnel and assets around the world.

A true Watch Center generally operates on a shift system where personnel oversee multiple systems using multiple shifts to provide coverage up to 24 hours a day. A Watch Center may include the following areas based on mission requirements: Watch Floor (containing Kiosk Workstations, Watch Stander Workstations, and Watch Workstations). Workspaces require an unobstructed view in order to see a centralized display area on a room wall consisting of multiple flat panel screens.

NCIS Field Offices may require portions of a Watch Center in the form of a Mini-MTAC[1]. This is a secure space, but is not permanently manned. At the Field office level, this space type is the equivalent of a secure conference room.

Planning Factor: Allocate Mini-MTAC area at 200 NSF

Justification Guidelines: FO requires portions of a Watch Center in the form of a scaled-down "Multiple Threat Alert Center" (MTAC) referred to here as a "Mini-MTAC". This is a secure space. At the field office level, this space type is the equivalent of a secure conference room, 200 NSF in size. Do not apply secure conference room allocation above, if allocating space for a Mini-MTAC here.

73022-13.2 **Server Room**: A server room is an air-conditioned space, devoted to the continuous operation of computer servers. An entire building or station devoted to this purpose is a data center. For Server Rooms with less than 120 racks, the recommended server room requirements are listed in Table 131-6. For a server room with less than 10 racks, multiply the total number of racks by 45 NSF/Rack.
Planning Factor: See Table 131-6 Equipment Room Requirement by Total Racks and Table 131-7. C5ISR Equipment Factor.

---

[1] The Multiple Threat Alert Center (MTAC) for NCIS Headquarters is a large Watch Center. It is a unique platform in that it merges intelligence from other agencies with information from NCIS source networks and law enforcement activities worldwide to provide the most relevant operational support to Navy and Marine Corps commanders.

Justification Guidelines: FO, RA and RU all may require a secure server room. This space type is intended for NCIS operated servers and does not apply to NMCI operated servers.

Mission Specific Components:

In addition to the NCIS Field Office space requirements identified above, some field offices have specialized component missions and require unique space types. Specialized component missions include:

- Cyber Operations
- Economic Crimes (formerly known as Fraud)
- Forensics Support
- Polygraph Services
- Protective Operations
- Security Training Assistance and Assessment Team (STAAT)
- Technical Services and Technical Surveillance Countermeasures
- Virtual Operations

73022-14 **Cyber Operations**

Cyber Operations conduct cyber investigations, proactive cyber operations, and cyber forensics support for the Department of the Navy (DON). NCIS cyber capabilities disrupt, deter and defend against criminal, terrorist, and foreign intelligence threats against the DON. NCIS Cyber Operations provides full-spectrum criminal, counterintelligence, counterterrorism investigations and operations in the cyber domain; conducts cyber forensics and analysis; coordinates and partners with law enforcement and intelligence in the U.S. and abroad; capitalizes on data by identifying existing and emerging threats to predict future trends and enhance capabilities; collaborates with industry, academia and mission partners.

Unique space types associated with Cyber Operations include:

73022-14.1 **Cyber Forensics Lab**: A shared, unclassified area NCIS agents use to analyze evidence such as recovered cell phones, laptops, desktops, and other electronic storage. This area is unclassified because it may contain cell phones and other unsecured electronic devices.

Planning Factor: Allocate one cyber forensics lab at 300 NSF

Justification Guidelines: Approved if NCISFO has a cyber-operations component.

73022-14.2 **Hard Drive Recovery Room**: A dedicated clean room used to recover data from a hard drive that may have been corrupted, lost or damaged. This space type is designed to avoid particles and contaminates that can settle on sensitive exposed hard drive components as this may affect the recovery process and cause a malfunction or permanent loss of data.

Planning Factor: Allocate one hard drive recovery room at 100 NSF

Justification Guidelines: Approved if NCISFO has a cyber-operations component.

73022-15 **Economic Crimes**

Economic Crimes safeguards DON acquisition programs and enhances fleet readiness and superiority by conducting investigations and proactive operations to identify and reduce economic crimes. Economic Crimes priorities are to identify and reduce product substitution threatening warfighter safety and battlefield superiority, to combat corruption in the acquisition process, and to ensure protection of Navy capital investment in technology. By reducing procurement fraud, defined as bribery, subcontractor kickbacks, conflict of interest, cost mischarging, and product substitution, the DON will realize cost savings and procure products that meet safety standards for the warfighter, ultimately resulting in increased operational readiness.

Unique space types associated with Economic Crimes include:

73022-15.1 **Grand Jury Room**: This space type is defined in the “Special Purpose Space - Functional Support” section above.

Justification Guidelines: Approved if NCISFO has an economic crimes component.

73022-16 **Forensics Support**

Forensics Support provides forensic crime scene support to DON investigations. The Office of Forensic Support is a team of specially trained forensic consultants that assist in the processing of crime scenes. Although all NCIS Special Agents receive basic forensic training, these consultants are experts in crime-scene reconstruction, firearms trajectory, blood spatter analysis, and human remains recovery and examination. Their input is critical to a range of investigations, from deaths to economic crimes and even counterintelligence. Unique space types associated with Forensics Support include:

73022-16.1 **Forensics Lab**: Space used to collect samples and process evidence for further evaluation, including fingerprint analysis, evidence analysis and photography.

This space includes a workstation for a forensic consultant, evidence refrigerator, secure evidence cabinet, sink, standing lab bench, work counters, and fuming/drying chambers. Forensic Support personnel use this space.

Planning Factor: Allocate one forensics lab at 20 NSF/SA

Justification Guidelines: Approved if NCISFO has a forensics support component.

73022-16.2 **Low-Bay Garage**: Space used to collect forensics data (residues, blood, fluids, finger prints, tire prints, bullet trajectories, ID of auto parts and paints). Space is required to accommodate a large SUV or van. A vehicle lift is not required; therefore, this space is not “high-bay”. Space must provide sufficient space between the roof of vehicle and room ceiling for inspection, so this space would not include a dropped ceiling. Allocate up to two vehicles (VE) requiring simultaneous storage based on interview with using activity.

Planning Factor: Allocate up to two vehicles at 375 NSF/VE

Justification Guidelines: Approved if NCISFO has a forensics support component.

73022-16.3 **Vehicle Evidence Parking Area**: A fenced and dedicated parking area for storing evidentiary impounded vehicles. This space requirement is included here for information purposes only. This asset and space requirement are recorded under CCN 85210 - PARKING AREA. The number of vehicles (VE) requiring simultaneous storage is provided by the using activity.

Planning Factor: Allocate one vehicle evidence parking area at 35 SY/VE

Justification Guidelines: Approved if NCISFO has a forensics support component.

73022-17 **Polygraph Services**

Polygraph Services is comprised of highly skilled interviewers who utilize the polygraph to obtain information in support of criminal, counterintelligence, and counterterrorism investigations for NCIS, the Department of the Navy, and the Department of Defense. Additionally, the Polygraph Services Division performs pre-employment polygraphs and administers the DON's Counterintelligence Scope Polygraph Program, helping to ensure that the DON's most sensitive national security programs are protected against the "insider threat."

Unique space types associated with Polygraph Services include:

73022-17.1 **Polygraph Exam Room**: Room used to conduct exams that measures and records physiological indicators while answering a series of questions asked by the Examiner. While the physical requirements are similar to an “Interview Room”, Polygraph Exam Rooms require specialized equipment that would not be found in an

Interview Room; therefore, these spaces cannot be shared as a dual-purpose space. The number of polygraph exam rooms shall be based on regional requirements as determined by the NCIS Engineering Office.

Planning Factor: Allocate one polygraph exam room at 120 NSF each

Justification Guidelines: Approved for NCISFO or NCISRA. Justified at a NCISRU on a case by case basis.

73022-17.2 **Observation Room**: A observation room is for monitoring polygraph exams. Located adjacent to one or more polygraph exam rooms, it provides sufficient space for a small table, two chairs, and audio/visual equipment. Consideration should be given to using CCTV feeds rather than providing space for an observation room.

Planning Factor: Allocate one polygraph observation room at 100 NSF each

Justification Guidelines: Approved for NCISFO or NCISRA. Justified at a NCISRU on a case by case basis.

73022-18 **Protective Operations**

Protective Operations provides and manages full-time protection details on key Department of the Navy personnel. Protective Operations' mission is to prevent terrorist and/or criminal attacks on principals under NCIS executive protection coverage and execute the necessary and appropriate response to a threat and/or attack on a principal. Protective Operations supports DOD/DON High Risk Billets with full or part-time personal security advisors. Protective Operations also provides executive protection to visiting foreign dignitaries and other DOD/USG officials as required by the foreign liaison offices and other DOD/USG agencies. To supplement operational forces, Protective Operations maintains an internal Protective Intelligence Unit to identify potential threats that could affect a principal, understand a principal's level of vulnerability to any given threat, and use available intelligence to mitigate threats and/or risk to a principal.

Unique space types associated with Protective Operations include:

73022-18.1 **(POFO) High Bay Garage**: Protective Operations requires a secure, climate-controlled, high-bay garage for storage of armored Government Owned Vehicles (GOVs). The GOVs are used to provide executive protection to Senior Leadership and visiting foreign dignitaries. Space is required for GOVs, maintenance, cleaning, minor repairs and retrofitting electronic equipment. A high-bay garage is necessary, as at least one vehicle lift is required. These GOVs are large, armored SUVs. The planning factor is based on number of GOVs required at any one time.

Planning Factor: Allocate up to eight vehicles at 375 NSF/VE

Justification Guidelines: Approved for protective operations detachments.

73022-18.2 **Duty/Bunk Room**: A Duty/Bunk Room is required when a mission requires continuous operations, 24 hours a day, 7 days a week. NCIS Protective Operations components meet these requirements. Note: This space type requires approval from the Installation Commanding Officer due to liability issues.

Planning factor: Allocate one duty/bunk room at 130 NSF

Justification Guidelines: Approved for protective operations detachments. Requires additional approval from the Installation Commanding Officer for liability purposes.

73022-19 **Security Training Assistance and Assessment Team (STAAT)**

NCIS Security Training Assistance and Assessment Teams (STAAT) support Navy and Marine Corps components by providing vulnerability assessments and on-site training and assistance to Naval activities worldwide (ashore and afloat) in various law enforcement, physical security, and antiterrorism disciplines. STAAT supervisors and staff work closely with Commanders to determine the level of required support to protect Navy personnel and assets. STAAT also provides support to selected foreign and domestic law enforcement agencies to enhance the protection of U.S. personnel and assets worldwide.

Unique space types associated with a Security Training Assistance and Assessment Team include:

73022-19.1 **Academic Classroom:** This space includes computer-based (laptop) training stations. In addition to STAAT LANT and STAAT PAC, this space type is approved for STAAT Detachments as well. Student loading is provided by the using activity.

Planning Factor: Allocate academic classroom space at 20 NSF/ST

Justification Guidelines: Approved only for STAAT organizations. Does not apply to FO, RA, or RU. In the “Select NCIS Region” dropdown list, select "STAAT" to locate STAAT organizations.

73022-19.2 **Student Lounge:** This space provides a student lounge area during training breaks or lunch. It typically includes some or all of the following: sitting tables, vending machines, microwave oven, and refrigerator.

Planning Factor: Allocate student lounge area at 4 NSF/ST

Justification Guidelines: Approved only for STAAT organizations. Does not apply to FO, RA, or RU. In the “Select NCIS Region” dropdown list, select "STAAT" to locate STAAT organizations.

73022-20 **Technical Services Division (TSD) and Technical Surveillance Countermeasures (TSCM)**

The Technical Services Division (TSD) provides DON technical support for criminal, counterintelligence, and counter-terrorism investigations and operations. Investigative Specialists provide specialized technical capabilities to support NCIS investigations and operations. The technical support provided by these highly trained specialists is often critical to the success of NCIS investigations and operations. Through their efforts, NCIS Special Agents and Technical Enforcement Officers are able conduct authorized interception of telephone communications, employ covert video surveillance, and take advantage of other technical innovations to help meet mission requirements. Technical Services includes Technical Surveillance Countermeasures (TSCM).

Technical Surveillance Countermeasures (TSCM) protects DON classified information and critical infrastructure from being compromised by technical means. NCIS Technical Investigators are responsible for conducting the Navy's Technical Surveillance Countermeasures mission. They conduct investigations to protect the DON's classified information and critical infrastructure from being compromised by technical means (for example, through covert listening devices or other surveillance technology) employed by foreign intelligence or other parties. These NCIS professionals assess vulnerabilities and identify and resolve technical surveillance threats. NCIS Technical Investigators serve in TSCM units at NCIS Headquarters and select NCIS field offices around the world, where they are best positioned to meet the needs of the U.S. Navy commands, they support. TSCM detects, neutralizes, and exploits technical surveillance and associated devices, technologies, and hazards that facilitate the unauthorized or inadvertent access to, removal or theft of DOD information, via technical means at any worldwide facility, ship or aircraft.

Unique space types associated with TSD/TSCM include:

73022-20.1 **(TSCM) High Bay Garage:** This is a vehicle inspection garage, large enough to examine two vehicles the size of a large van or SUV. A high-bay garage is necessary, as at least one vehicle lift is required. This area is for bullet trajectory analysis, installation of GPS tracking equipment and other technical equipment. Technical Services personnel use this space.

Planning Factor: Allocate up to two vehicles at 375 NSF/VE

Justification Guidelines: Approved if NCISFO has a Technical Service or Technical Surveillance Countermeasures (TSCM) component.

73022-20.2 **Equipment Storage:** Large room with shelving for pelican cases used to store investigative and counter-intelligence equipment for TSCM. Pelican cases for TSCM equipment includes, but is not limited to: multiple types of radio frequency detection systems such as cellular or WIFI, portable x-ray systems to look inside a car or wall, network analysis tool sets, crime scene analysis tool sets and more.

This space is similar to the (MCRT) gear storage room used by agents; however, this equipment storage room is typically larger and is used by TSCM personnel. A space analysis is required.

Planning Factor: Allocate NSF based on a space analysis

Justification Guidelines: Approved if NCISFO has a Technical Service or Technical Surveillance Countermeasures (TSCM) component.

73022-20.3 **Equipment Testing & Evaluation Lab:** This space provides for testing and evaluation of field equipment prior to field operation. The space is equipped with a workbench, shelving, and test equipment. Technical Services personnel use this space. A space analysis is required.

Planning Factor: Allocate NSF based on inspection and testing room requirements

Justification Guidelines: Approved if NCISFO has a Technical Service or Technical Surveillance Countermeasures (TSCM) component.

73022-20.4 **Shop Space:** May include a wood shop, metal shop, and/or work benches. Technical Services personnel use this space. Shop Space requirements are developed by a space analysis using the allowances provided in Table 131-4 or an architectural layout. A space analysis is required.

Planning Factor: Allocate NSF based on a space analysis

Justification Guidelines: Approved if NCISFO has a Technical Service or Technical Surveillance Countermeasures (TSCM) component.

73022-21 **Virtual Operations**

Virtual Ops Center (VOC) is a cyber-based operational counterintelligence platform to provide direct support to the DON by; protecting critical naval technologies and programs; conducting operations in the cyber domain; and protecting the DON's technological and warfighting advantage. The VOC’s goal is to detect, identify, neutralize, and exploit attempts of foreign intelligence entities attempting to penetrate the DON and erode its warfighting edge.

Unique space types associated with a Virtual Operations Center include:

73022-21.1 **Virtual Operations Center**: A VOC is a highly specialized facility and may include the following space types: cyber labs with separate IT networks, SAP-F, SCIF, unclassified areas and a watch center. VOC space types must be aligned to either the 131 or 143 Series criteria. Space requirements need to account for the heavy electrical and mechanical loads and associated space requirements. Tier Level (I, II, III) for each function must be identified.

Planning Factor: Allocate NSF based on a space analysis

Justification Guidelines: Approved for NCISFO Virtual Operations Center (VOC).

73022-21.2 **Special Purpose Processing Node**: A Special Purpose Processing Node (SPPN) is a fixed data center or data servers in a fixed facility supporting special purpose functions that cannot or should not be supported by a DoD Core Data Center (CDC) or an Installation Processing Node (IPN) due to its association with mission specific infrastructure or equipment (e.g., Meteorology, Medical, Modeling & Simulation, Test Ranges, Classrooms, RDT&E, etc.). Source: https://dodcio.defense.gov/Portals/0/Documents/DIEA/CDC%20RA%20v1_0_Final_Releaseable%20Version.pdf

Planning Factor: See Table 131-6 and Table 131-7.

Justification Guidelines: Approved for NCISFO Virtual Operations Center (VOC).

73022-22 **Net-To-Gross Factor**

The Net-To-Gross (NTG) factor for CCN 73022 - NCIS Field Office is 1.40.

730 25 GATE/SENTRY HOUSE (SF)
FAC: 1498
BFR Required: Y

73025-1 The gate/sentry house may vary in size from a simple sentry shelter to a building housing a gate guard office, clerical office, and waiting room; or a truck inspection building. See Table 73025-1 for space allowances.

Table 73025-1
Space Allowances for Gate/Sentry Houses

Location	Gross Area allowance
Gate of small activity	6 sq. m or 64 SF
Major gate at medium to large activity	56 sq. m (50 sq. m gate house & 6 sq. m sentry house) or 604 SF (540 SF gate house & 64 SF sentry house)
Secondary gate at medium to large activity	6 sq. m or 64 SF
Truck Inspection Building	Individual justification is required

73025-2 The differentiations between small and medium activities and between major and secondary gates are not given here. A reasonable approach should be taken. If the function requires no more than two guards at a time and no waiting room for persons awaiting clearance, then a sentry house is adequate. Some industrial installations may have an employment office, first aid room, and safety office located at the gate house. Space for these functions are planned and inventoried as Category Code 610 10 using the appropriate planning factors.

730 30 BAKERY (SF)
FAC: 7321
BFR Required: Y

73030-1 **DEFINITION.** The establishment of bakeries is governed by provisions of DoD instruction 4100.33 – Commercial or Industrial Activities – Operation of. Normally a bakery will be authorized where commercial sources are not available. See Table 73030-1 for space allowances. The rated capacities given are for 8-hour per day operation and increase in direct proportion to the increase in hours of operation.

Table 73030-1
Space Allowances for Bakeries

Number of Persons Served	Gross Area SQ. M./SF		Rated Capacity Kilograms/Pounds	
Bread Bakery				
3,000	418	4,500	560	1,500
8,400	483	5,200	1,570	4,200
16,000	762	8,200	3,130	8,400
26,900	929	10,000	5,010	13,425
Pastry Bakery			(servings)	
2,500	167	1,800	5,000	
5,000	274	2,950	10,000	
10,000	311	3,350	20,000	
20,000	451	4,850	40,000	

730 35 LOCKER ROOM (SF)
FAC: 7382
BFR Required: Y

73035-1 **DEFINITION**. This facility provides locker space for the belongings of military personnel who must vacate their quarters for extended periods of time, for those whose allotted storage space is not sufficient, and for other uses as deemed justified by the Commanding Officer. See Table 73035-1 for space allowances. Allowances from Table 73035-1 may be used for planning purposes; however, a detailed space analysis may give a different square footage depending on the function that is being supported. (Do not double count with other CCNs such as gyms, fitness etc.). This category code must be individually justified for Marine Corps activities.

Table 73035-1
Space Allowances for Locker Rooms

Strength Supported	Number of Lockers	Gross Area per Locker	
		sq. m	SF
Up to 500	Strength X 0.285	1.07	11.5
501 to 6,000	Strength X 0.285	0.93	10.0
Over 6,000	Strength X 0.285	0.84	9.0

730 36 LUNCH/LOCKER ROOM (SF)
FAC: 7332
BFR Required: Y

73036-1 This facility is generally provided only to support industrial operations and requires specific justification. No planning factors are available.

730 40 LAUNDRY/DRY CLEANING PLANT (SF)
FAC: 7342
BFR Required: Y

73040-1 **REQUIREMENTS.** The establishment of these facilities is governed by provisions of DOD Instruction 4100.33 - Commercial or Industrial Activities - Operation of. Normally they will be authorized only in locations where commercial facilities are not available. See Table 73040-1 for space allowances. For combination with exchange-operated facilities, see notes in Category Code 740 13 and 740 15.

Table 73040-1
Space Allowances for Laundries And Dry Cleaning Plants

Number of Persons Served	Gross Area (1) Laundry and Dry Cleaning Plants	
	sq. m	SF
0 to 2,000	Not Authorized	Not Authorized
2,001 to 4,000	790	8,500
7,001 to 10,000	1,020	11,000
15,001 to 30,000	4,180	45,000

(1) Does not include boiler plants which are sized as required and are carried under Category Code 821 50.

730 45 DEPENDENT SCHOOL - NURSERY SCHOOL (SF)

This CCN has been deleted. All existing assets should be reassigned to CCN 73061 Dependent School - Consolidated

730 50 DEPENDENT SCHOOL - KINDERGARTEN (SF)

This CCN has been deleted. All existing assets should be reassigned to CCN 73061 Dependent School - Consolidated

730 55 DEPENDENT SCHOOL - GRADE SCHOOL (SF)

This CCN has been deleted. All existing assets should be reassigned to CCN 73061 Dependent School - Consolidated

730 60 DEPENDENT SCHOOL - HIGH SCHOOL (SF)

This CCN has been deleted. All existing assets should be reassigned to CCN 73061 Dependent School - Consolidated

Ref: www.odedodea.edu

73050/55/60-1 The planning and programming for dependent school facilities overseas is currently under the cognizance of Department of Defense Education Activity (DoDEA),. Assistance related to school facility matters may be obtained from DoDEA or their overseas field offices. Each DoDEA region has comprehensive education specifications which should be used in planning dependent school facilities.

The following general notes may be of assistance for preliminary school facilities planning:

73050/55/60-1.1 Dependents school facilities in any overseas area will be planned to accommodate all DoD dependents (Army, Navy, Air Force, and Marine) and dependents of other Federal agencies in the area. In estimating the number of school-age dependents to provide for, the following may prove helpful:

- If an existing school facility is to be expanded, a local survey to determine the average number of school-age children per family may be most accurate.
- If a new school is to be established, the following Navy statistics may serve as a guide: (For Marine overseas the number of accompanied tours is a

function of available housing and is managed by CMC D C/S, manpower. These proportions should be used.)

- Of all officer personnel assigned overseas 62.14% will move families. These families average 1.73 minor dependents per family with 50% of school-age.

- Of all enlisted personnel assigned overseas 31.63% will move families. These families average 1.68 minor dependents per family with 50% school-age.

- The average number of school-age dependents per family may vary from area to area and from mission to mission and may at times exceed one per family. The superintendent/director for dependents' education may provide assistance in this area.

73050/55/60-1.2 In estimating the distribution of dependents by grade, the following average Navy statistics considering all families may help:

Kindergarten	.08 pupils/family
Grade School 1-6	.52 pupils/family
High School 7-12	.26 pupils/family

73050/55/60-1.3 Count all families, with or without children. Again the superintendent/ director for dependent's education in the area may provide assistance.

73050/55/60-2 This scope should be adequate to house the total educational program as developed by the superintendent/director for the area. However, the superintendent/director may wish to alter the utilization of the space to a degree to meet unique requirements of the educational program or the geographic location.

730 61 DEPENDENT SCHOOL – CONSOLIDATED (SF)
FAC: 7352
BFR Required: Y

73061-1 **DEFINITION**. The planning and programming for dependent schools (grades Pre-K or Sure Start program through grade 12) is currently under the cognizance of Department of Defense Education Activity (DoDEA). Assistance related to school facility matters may be obtained from DoDEA HQ which has access to comprehensive education specifications which should be used in planning dependent school facilities.

73061-2 This category code was created to primarily support overseas locations but can be used at any installation where consolidated facilities are recommended. Facilities' sizing and configuration must be completed in consultation with DODEA officials. Prior to project programming, the proposed project must be validated by DoDEA. The point of Contact for DoDEA Schools is:

Headquarters DoDEA/ Facilities Branch
4800 Mark Center Drive
Alexandria, VA. 22350

73061-3 Contact DoDEA HQ at the above address to obtain the “Program for Design” for your school. This document will supply the necessary staffing and size data to complete your BFR calculation spreadsheet.

730 65 FALLOUT SHELTER (SF)
FAC: 7383
BFR Required: N

73065-1 **DEFINITION**. There are two kinds of fallout shelters: dual-purpose and single purpose. A dual-purpose fallout shelter is one which, as a primary purpose, satisfies some other basic requirement such as housing, administrative, storage, etc. and as a secondary purpose, it can provide fallout protection. A single-purpose fallout shelter is a structure or part of a structure whose primary purpose is fallout protection. Dual-purpose shelters are designated in the real property according to their primary purpose. Single-purpose shelters are designated in the inventory as Code 730 65. The construction of single-purpose fallout shelters is not presently authorized. The designation of the number of fallout shelter spaces on existing or new military construction is not presently required.

730 66 MISCELLANEOUS PERSONNEL WEATHER SHELTER (SF)
FAC: 7384
BFR Required: N

73066-1 **DEFINITION**. Shelters may be established at bus stops or other locations as required. Provide 0.5 sq.m. (5 SF) per person.

730 67 BUS STATION (SF)
FAC: 7341
BFR Required: Y

73067-1 A bus station is a terminal with space for a waiting room and ticket sales. It may be planned as required. Provide 2 sq.m. (20 GSF) per person for the expected waiting group.

730 74 KENNEL – MORALE, WELFARE & RECREATION OPERATED (SF)
FAC: 7447
BFR Required: N

73074-1 **DEFINITION**. Use this category code for kennels and quarantine facilities operated as a function of the Morale, Welfare and Recreation (MWR) programs at the Installation. Refer to CCN 730 76 for kennels for military working dogs.

73074-2 **REQUIREMENTS.** The requirements for new kennel facilities are determined by Commander Navy Installation Command (CNIC) Code N9 (Fleet & Family Readiness). The following guidance is used in the project planning for kennel facilities:

73074-2.1 Any proposed new construction must first go through the pre-Internal Needs Validation Study (pre-INVS), full Internal Needs Validation Study (INVS), and Project Validation Assessment (PVA).

73074-2.2 The size of the facility is based upon market analysis and consequent financial projections that must justify programming of the facility.

73074-2.3 Return on Investment (ROI) analysis is based on projected demand, market, revenues, capital investment, and operating and maintenance costs. This type of analysis will determine the financial feasibility of the proposed project and the number and type of units required to ensure a viable outcome. This analysis must follow the requirements of the template developed by CNIC, which is available for download at http://navymwr.org/. This category code is for inventory purposes only.

730 75 PUBLIC TOILET (SF)
FAC: 7385
BFR Required: N

73075-1 Use this code for inventory of all detached comfort stations except for those in the bachelor housing area. Use Category Code 723 20 Latrine for the bachelor housing area.

730 76 MILITARY WORKING DOG KENNEL (SF)
FAC: 1445
BFR Required: Y

73076-1 **DEFINITION**. The Military Working Dog (MWD) Kennel consists of Dog Kennel, Dog Training/Support, and Administrative/Support areas. The following core space designations and rooms for a MWD facility are as follows:

<u>Administration Area</u>

- Kennel Master (with closet)
- Trainers
- Handlers
- Storage

<u>Special Use Areas</u>

- Tack Room
- Food Storage
- Food Preparation
- Exam Room
- Surgery Room

<u>Common Use / Support</u>

- TA-50 Lockers
- Multi-Purpose
- Storage

<u>Kennel</u>

- Dog House
- Interior Kennel
- Exterior Kennel

Support spaces for personnel consists of the following:

- Men's Toilet, Shower, and Locker
- Women's Toilet, Shower, and Locker
- Janitor Closet Area

73076-2 **REQUIREMENTS**. The table below is a space planning tool for developing the core facility space requirements for each area. Use this category code for Military Working Dog (MWD) kennels and quarantine facilities operated by the Installation security department. Activities must consider using existing facilities or consolidating support functions with other activities. Refer to Table 73076-1 for space allowance areas. Refer to CCN 730 74 for kennels operated by Morale, Welfare & Recreation (MWR).

Table 73076-1

Space Allowance for Military Working Dog Kennel

1 **Kennel Master, one per 10 dogs, user defined.**
2 **Trainers, two per 10 dogs, user defined.**
3 **Handlers, one per 2 dogs, user defined.**
4 **Reference: Standard Design – Air Force Military Working Dog Facility.**
5 **A multiplier of up to 10% may be added to the authorized net facility area to support primary circulation.**
6 **TA-50 storage lockers, one per Kennel Master, Trainer, and Handler, user defined.**
7 **Verify the number of dog kennels for each installation.**
8 **Outdoor Training / Support areas are not included in the facility floor area totals.**
9 **Male/Female ratio of 50/50. See UFC 3-420-01 Plumbing Systems for more details.**
10 **Building Support areas are estimates only. Actual sizes are dependent on climate zone, location, system, etc.**
11 **A net-to-gross multiplier of up to 25% is allowed. A 15% net-to-gross multiplier is used per standard design.**
12 **The area square footage is rounded to the nearest whole number.**
13 **This worksheet plans for a one-bay facility of 10,460 square feet (972 m^2).**

73076-3 **REQUIREMENTS.** Use the following criteria to plan MWD Kennel Facilities:

73076-3.1 Locate the kennel adjacent to or in proximity to an existing military police facility that provides 24 hour observation of the kennel and to eliminate the need for separate exterior lighting and fencing.

73076-3.2 Kennel surfaces must be impervious. Surfaces shall have a liquid glaze applied.

73076-3.3 For planning details, floor plans, and construction criteria, reference Standard Design, Air Force Military Working Dog Facility on the *Whole Building Design Guide* at https://www.wbdg.org/airforce/prototypes-standard-designs.

73076-4 **DEPARTMENT OF THE NAVY PROGRAM MANAGEMENT -** Reference OPNAVINST 5585.2C, *The Department of the Navy Military Working Dog Program dated 7 September 2012,* for policies procedures, and responsibilities for the administration of the Navy's MWD program.

The MWD Program Manager reports to the operational chain of command of U.S. Fleet Forces Command.

73076-5 **USMC PROGRAM MANAGEMENT.** For Marine Corps activities, the project manager for MWD requirements is the Security Branch. Program requirements should be submitted to Headquarters USMC D C/S for Plans, Policies, and Operations.

730 77 PERSONNEL SUPPORT STORAGE (READY ISSUE/SHOP STORES/MISC.) (SF)
FAC: 4421
BFR Required: Y

73077-1 Storage facilities for miscellaneous goods related to personnel support facilities will be provided only where it can be individually justified. There are no criteria for this type of facility. Note: This category code is not applicable for Marine Corps activities.

730 78 DAIRY PLANT (SF)
FAC: 7322
BFR Required: Y

No planning factors are available.

730 82 RECYCLING CENTER (SF)
FAC: 8331
BFR Required: Y

73082-1 This facility serves as a collection, sorting, storage, and shipping center for recyclable materials and products. Recycled materials are forwarded to together government or commercial recycling centers. There are no planning criteria for this facility, each requirement will require individual justification with detailed data on operational methods, equipment required, volume of processed containers and need for enclosed building space.

730 83 RELIGIOUS MINISTRY FACILITIES (SF)
FAC: 7361
BFR Required: Y

Project Review: CNIC HQ Force Chaplain
Design Criteria: Unified Facilities Criteria (UFC) 4-730-02 “Design: Chapels and Religious Education Facilities” dated 16 January 2004

73083-1 **DESCRIPTION.** Department of the Navy policy is that commanders and commanding officers will provide for the free exercise of religion by military personnel and their dependents through Command Religious Programs. Religious Ministry Facility (RMF) is a generic term for facility assets used to support Command Religious Programs. RMFs must therefore accommodate the religious rights and needs of a multi-faith, inter-generational, culturally diverse military population.

73083-2 **REQUIREMENTS SPONSOR -** The Chief of Chaplains (OPNAV N097) is the Director of Religious Ministries for the Department of the Navy under SECNAVINST 1730.7D dated 8 August 2008. The CNIC HQ Force Chaplain, in coordination with N097, will determine the required number of RMFs for an Installation, and validate the size of each RMF, as well as the allocation of space within each RMF. The RMFs located within hospitals are treated as a unique requirement (refer to section 73083-4 for additional guidance).

73083-3 **SPACE CRITERIA** - The space planning requirements for RMFs are determined by four factors:

1) Population for whom ministry will be provided,
2) Environmental factors, including types of religious programming provided,
3) Number of seats in each RMF, and
4) Number of RMF’s at the installation.

73083-3.1 Factor 1: **Installation Population**

73083-3.1.1 **Definition.** Installation population is defined as military strength assigned to the military installation plus their dependents.

73083-3.1.2 **Multiple Installations.** For multiple installations located in the same geographic area, installation population is defined as the military strength, plus their dependents, for which ministry should be provided at the RMF. The Chief of Chaplains will decide which military strength, plus their dependents, will be used to calculate each installation’s space allowance for an RMF (s) when there are multiple installations in the same geographic area. This should be determined when developing the Basic Facilities Requirement (BFR). The same military strength can never be used to justify a space allowance for RMFs at more than one installation. Ministry provided for personnel and their dependents remain the responsibility of the command to which the personnel are attached.

73083-3.1.3 **Training Installations.** For Training installations, a weighted average on board count of students should be included in the military strength.

73083-3.1.4 **Authorized Civilian Personnel.** Authorized civilian personnel, and their dependents, shall be included in the population count when dependent on the military installation for religious support.

73083-3.1.5 **STEP 1: Determine Installation Population.**

- Using the definition above, determine the military strength (and civilian when applicable) for whom ministry will be provided at the RMF (s).

- Determine the number of dependents from actual Family Housing Survey figures. If actual data is unavailable, estimate the number of dependents by first determining the number of military personnel (and civilian when applicable) with dependents. Multiply this number by Navy and Marine Corps service-wide average number of dependents (currently 2.6).

- Add the military strength (civilian when applicable) with the dependents from the steps above to determine the Total Installation Population = ____________ pn.

73083-3.2 Factor 2: **Environmental Adjustment Factors (EAFs)**

73083-3.2.1 **Basis for the EAF**. The EAF is based on the number of major faith group facilities in the surrounding civilian community within 8 km (5 miles) of the installation gate. For this criteria, use only these major faith groups: Baptist/Independent Fundamentalist, Disciples of Christ/ Methodist/ Presbyterian/ United Church of Christ, Episcopalian/ Lutheran/ Pentecostal, and Roman Catholic.

73083-3.2.2 Factors determining Geographical Distribution of Housing

Close **80 %** or more of installation population reside on installation or within a distance of **three kilometers (two miles).**

Normal Less than **80%** of the installation population reside on installation or within a distance of **three kilometers (two miles)** but more than **40%** reside within a distance of **eight kilometers (five miles).**

Distant Less than **40%** of installation population resides on installation or within a distance of **eight kilometers (five miles).**

73083-3.2.3 **STEP 2: Use the EAFs to adjust installation Population**.

- Count the number of **major faith groups** which have at least one facility within **eight kilometer (five miles)** of the installation gate.

- Determine the **housing distribution** from the definition above.

- **Refer to Table 73083-1 below**. Find the number of major denomination churches determined and read across the table to find the **Housing Adjustment**. **Multiply** this **factor** by the **total installation population** (determined in STEP 1) which will give you an **Adjusted Installation population = ________ pn**

Table 73083-1.
Environment Adjustment Factor for RMFs

FAITH GROUPS	HOUSING		
Number of **major faith group facilities** in the surrounding civilian community within **8 kilometers (5 miles)** of the installation gate	CLOSE	NORMAL	DISTANT
0	1.00	0.69	0.46
1	0.84	0.63	0.43
2	0.76	0.58	0.38
3	0.69	0.52	0.35
4	0.61	0.46	0.30
5	0.53	0.40	0.26

73083-3.3 Factor 3: **Number of Seats in each RMF**

73083-3.3.1 **STEP 3: Determine Total Number of Common Assembly Seats below:**

- Use **Adjusted Installation Population** (STEP 2) and **Table 73083-2** to determine the total number of **Common Assembly seats** =_______ for the installation (column 2, Table 73083-2).

Table 73083-2
Number of Seats in Common Assembly Areas at an Installation

Column 1. Adjusted Installation Population	Column 2. Number of Common Assembly Seats
Up to 500	35
501 to 1,000	200
1,001 to 1,500	300
1,501 to 2,000	400
2,001 to 2,500	500
2,501 to 3,000	600
3,001 to 3,500	700
3,501 to 4,000	800
4,001 to 5,000	900
5,001 to 6,000	1,000
6,001 to 7,000	1,100
7,001 to 8,000	1,200
8,001 to 9,000	1,300
9,001 to 10,000	1,400
10,001 to 11,000	1,500
11,001 to 12,000	1,600
12,001 to 13,000	1,700
13,001 to 14,000	1,800
14,001 to 15,000	2,000
13,001 to 14,000	1,800
14,001 to 15,000	2,000
15,001 to 16,000	2,100
16,001 to 17,000	2,100
17,001 to 18,000	2,200
18,001 to 19,000	2,200
19,001 to 20,000	2,300
20,001 to 21,000	2,400
21,001 to 22,000	2,400
22,001 to 23,000	2,500
23,001 to 24,000	2,500
24,001 to 25,000	2,600
25,001 to 26,000	2,700
26,001 to 27,000	2,700
27,001 to 28,000	2,800
28,001 to 29,000	2,900
29,001 to 30,000	3,000
For each add ’l 1,000 add:	100

73083-3.4 Factor 4: **Determine Number of RMFs**

- **STEP 4**: Use the total number of seats in common assembly areas at an installation **(STEP 3)**, the installation's mission, and the types of religious programming required to adequately meet the religious needs and rights of assigned sea service personnel and their dependents, and economical considerations to determine the number of RMFs. RMFs will normally be built in one or a combination of several sizes up to a maximum of 600 seats in common assembly areas, i.e., the sum of the seating in all of the common assembly areas within the RMF should generally not exceed 600 seats. Smaller size RMFs are intended primarily for use at small installations. For example, to satisfy a requirement for 1200 seats, two 600 seat RMFs should be planned rather than three 400 seat RMFs on a typical Navy base; a 1200 seat RMF is more practical at a training center. **Typically, RMFs will be built with the largest common assembly space seating from 250pn to 500pn.** Some installation, such as training centers, may want the convenience of one large RMF assembly area under one roof to accommodate the different congregations in separate areas. Except in unique situations, and with the concurrence of the Chief of Chaplains, the total requirements at an installation will not exceed that authorized by Table 73083-3.

73083-3.5 **Space Allocations for RMFs**

73083-3.5.1 **RMFs** are comprised of six (6) different types of spaces (an approximate percentage of total space is in parentheses): **1. Worship** (35-85%), **2. Religious Education** (10-40%), **3. Pastoral Counseling** (1-12%), **4. Fellowship** (1-20%), **5. Pastoral Administration** (1-20%), and **6. Utility/Support** (1-5%). Adequate and appropriate provisions for all six types should be provided within the criteria. These are contingent on the mission of the installation, religious programming, and needs/rights of assigned personnel and their dependents. **The Chief of Chaplains will decide space allocations within RMFs.**

73083-3.5.2 Within each of the six different types of space, part of the requirement will depend primarily upon the **number of RMFs at an installation** and part of the requirement will depend primarily upon the **adjusted installation population**. Examples of the former include **sacristy, reconciliation room, chancel, reception**, and **kitchen**. Examples of the latter include **religious education spaces, chaplain's offices** and **fellowship halls.** Thus the square foot requirement for each RMF has two separate components each of which must be determined separately.

73083-3.5.3 **STEP 5: Determine Total First Component Requirement Based Primarily upon the Number of RMFs.**

- Use the **number of seats for each RMF** (STEP 4) to determine the **first component** of the gross square foot requirement for the RMF from Column 2 in Table 73083-3. The first component is that portion of the requirement which is primarily dependent upon the number of common assembly seats in the RMF. First component total of **RMF Gross Area Requirement** = _____________ (sum of the first components of RMF Gross Req. for each RMF).

Table 73083-3
First Component of RMF Gross Area Requirement (for each RMF)

Column 1 Number of Assembly Seats	Column 2 First Component RMF Gross Area	
	sq.m.	SF
35	186	2,000
200	604	6,500
300	794	8,550
400	948	10,200
500	1,070	11,500
*600[1]	1,240	13,320
700	1,370	14,700
800	1,490	16,000
900	1,590	17,100
1,000	1,670	18,000
1,100	1,740	18,700
(Maximum for one RMF) 1,200	1,780	19,200

Note 1: When greater than 600 seats, consider the use of multiple RMFs. Use this table to size each one.

73083-3.5.4 **STEP 6: Determine Second Component Requirements Based Primarily upon the Adjusted Installation Population.**

- Use the **adjusted installation population** (STEP 2) to determine the **second component** of the gross square meter (square foot) requirement for RMFs at the installation from the Column 2 of Table 73083-4. The second component is that portion of the requirement which is primarily dependent upon the adjusted installation population. Total second component of **RMF Gross Area Requirement for the installation = __________.**

Table 73083-4
Second Component of RMF Gross Area Requirement

Column 1 Adjusted Installation Population	Column 2 Second Component RMF Gross Area	
	sq.m	SF
Up to 500	93	1,000
501 to 1,000	372	4,000
1,001 to 1,500	411	4,420
1,501 to 2,000	450	4,840
2,001 to 2,500	489	5,260
2,501 to 3,000	528	5,680
3,001 to 3,500	567	6,100
3,501 to 4,000	606	6,520
4,001 to 5,000	684	7,360
5,001 to 6,000	762	8,200
6,001 to 7,000	840	9,040

21,001 to 22,000	2,010	21,640
22,001 to 23,000	2,090	22,480
23,001 to 24,000	2,170	23,320
24,001 to 25,000	2,240	24,160
25,001 to 26,000	2,320	25,000
26,001 to 27,000	2,400	25,840
27,001 to 28,000	2,480	26,680
28,001 to 29,000	2,560	27,520
29,001 to 30,000	2,530	28,360
For each additional 1,000 add	78	840

73083-3.5.5 **STEP 7: Allocate Second Component of Gross Area Requirement to each RMF.**

- Apportion the total installation second component Gross Area requirement determined in STEP 6 among each of the RMFs authorized for the installation in STEP 4. Factors to be considered in the apportionment of Gross Area in each RMF are the **Installation's Mission, the Installation's Geography, and Religious Programming**. The Chief of Chaplains shall approve the apportionment.

Examples:

1. *A large installation with a remote family housing may want one RMF in the housing area and another adjacent to the BEQs*
2. *A training command may want on RMF for students and another for permanent population.*

73083-3.5.6 **STEP 8: Determine the Total Gross Area Requirement for each RMF at the installation.**

- To determine the total gross area requirement for each RMF at an installation, add the first component requirement (STEP 5) to the second component (STEP 7) and multiply the sum by a factor of 1.1 (this allows for mechanical, electrical, and communication equipment spaces).

Total Gross Area Requirement for the RMF = (STEP 5 ___ + STEP 7 ___) x (1.1) RMF = ________ Gross Area

73083-3.5.7 **STEP 9: Determine the Total Installation RMF Gross Area Requirement**

- Repeat STEP 8 for each RMF at the installation.

- The **total installation RMF Gross Area Requirement** is the **sum** of the **Gross Area Requirements for each RMF** at the installation (include any RMF within a hospital which is part of the installation).

Total Installation RMF Requirement = ________ Gross Area

73083-4 **HOSPITAL RMFs**.

73083-4.1 To serve patients and staff personnel on duty within composite medical facilities, in-hospital RMFs may be provided. The hospital RMF will be coded as Category Code 730-83. **Space allocated to the hospital RMF is to be included in**

the installation totals computed above. Use Table 73083-5 to compute Hospital RMFs.

Table 73083-5. Space Allocation for Hospital RMFs

Hospital Size (Beds)	Gross Area Note (1)	
	sq.m	SF
26 to 99	34	364
100 to 199	102	1,100
Over 200	130	1,400

(1) Add an additional 5-10% (dependent on local conditions) of the buildings gross area for mechanical, electrical, and communication equipment space (s).

730 85 POST OFFICE
FAC: 7344
BFR Required: Y

73085-1 **CENTRAL POST OFFICE**. Space allowances for central post offices are given in Table 73085-1. These figures represent normal allowances and are given for general guidance. Additional space may be provided if a central post office serves specialized functions on an installation such as:

- Postal directory.
- Nonresident schools
- Major and subordinate headquarters, commands, personnel centers, service schools, major hospitals, air material areas, supply depots.
- Carrier delivery to family housing units.
- Activities generating high volume of accountable mail that requires overnight vault storage.
- Self-service postal units installed within the lobby of the facility.

73085-2 **CONUS INSTALLATIONS.** At CONUS installations (see footnote 4 of Table 73085-1), the determination of specific total requirements and provisions for the specialized functions listed above, shall be coordinated with the U.S. Postal Services Regional Postmaster General. This should be accomplished during the initial planning stage and the DD Form 1391 should be annotated to that effect.

73085-3 **POSTAL SERVICE CENTER.** When justified by specific requirements and approved by the U.S. Postal Services Regional Postmaster General, a postal service center may be provided at which mail may be deposited and picked up by individual post office box holders, as opposed to bulk distribution of mail to the various elements on a military installation. A postal service center may be combined with, or separate from, a central or branch post office. The number of boxes shall not exceed the number of unmarried and unaccompanied married military civilian personnel plus 25% to accommodate specific key personnel and compensate for box reassignment vacancy period. Space allowances per box are given in Table 73085-1.

73085-4 **BRANCH POST OFFICES**. At large installations with personnel concentrations located at such a distance from the central post office that service through the latter is impractical, branch offices, each not exceeding 139 sq.m. (1,500 GSF) may be provided.

73085-5 **FOR BASIC FACILITY REQUIREMENTS PURPOSES**, the total requirement for Code 730 85 is the sum total of central post offices, postal service centers and branch post offices.

Table 73085-1.
Space Allowances for Post Offices

Installation Population (1)	Central Post Office Gross Area (2)		Postal Service Center Gross Area Per Box (3)			
			CONUS (4)		OVERSEAS (5)	
	sq.m	SF	sq.mm	SF	sq.mm	SF
Up to 500	37	400	55700	0.60	55700	0.60
501 to 1,000	56	600	55700	0.60	55700	0.60
1,001 to 2,500	162	1,750	55700	0.60	46500	0.50
2,501 to 4,500	272	2,925	55700	0.60	46500	0.50
4,501 to 7,500	418	4,500	55700	0.60	41800	0.45
7,501 to 11,500	588	6,325	55700	0.60	37200	0.40
11,501 to 16,500	766	8,250	55700	0.60	37200	0.40
16,501 to 22,500	941	10,125	55700	0.60	37200	0.40
22,501 to 28,500	1,160	12,525	55700	0.60	37200	0.40
28,501 to 34,500	1,390	14,925	55700	0.60	37200	0.40
34,501 to 40,500	1,610	17,325	55700	0.60	37200	0.40
40,501 to 46,500	1,830	19,725	55700	0.60	37200	0.40
46,501 to 52,500	2,060	22,125	55700	0.60	37200	0.40
52,501 to 58,500	2,280	24,525	55700	0.60	37200	0.40

Notes:

(1) The space criteria for a military postal facility shall be based on the total population, including: military personnel and approved DoD civilians/dependents and contractors, serviced by the postal facility. Consider a sponsor and

authorized family members as one person. (Department of Defense Postal Manual, DoD 4525.6-M as amended)

(2) Excludes space required for loading platforms.

(3) Allowed only when justified by specific requirements and approved by the U.S. Postal Services Regional Postmaster General. Number of boxes shall not exceed the number of unmarried and unaccompanied married military and civilian personnel plus 25% for key official military and civilian personnel needs.

(4) CONUS include the 50 States and all other geographical areas in which the U.S. Postal Service operates.

(5) Use 55700 sq.mm. (0.60 SF) per box throughout when the postal service center is separated from the central post office. Do not assign a receptacle to more than one person. Consider a sponsor and authorized family members as one person. The square footage of postal service centers is in addition to the central post office. (Department of Defense Postal Manual DoD 4525.6-M as amended)

740 COMMUNITY FACILITIES

740-1 MORALE, WELFARE AND RECREATION (MWR), NAVY EXCHANGE (NEX), AND OTHER SUPPORT FACILITIES (INDOOR)

740-1.1 **General Notes**

740-1.2 **Space Allowances**

740-1.2.1 **Construction Allowances.** These allowances apply to all funding sources and types of construction.

740-1.2.2 **Installation Requirements.** Facilities shall be planned to meet the specific requirements of an installation and not arbitrarily to the maximum allowances indicated. An installation will not automatically qualify for all facilities listed but only for those for which specific requirements exist.

740-1.2.3 **Activities.** Minor exchange facilities operated for the convenience of non-exchange activities that are an integral part of these activities such as barber shops in clubs; food, retail outlets in air terminals, hospitals, schools or large administration buildings; food service in bowling alleys, operations buildings, and service clubs; and snack facilities in theaters are included in the space allowances authorized for the non-exchange activities.

740-1.2.4 **Mechanical Equipment Rooms**. Mechanical equipment room space as required should be added to the gross area in the criteria tables. This space varies from 5-10% of the gross area.

740-1.3 Conversion of Existing Facilities

740-1.3.1 A new facility will be provided only when no existing available structure will satisfy the requirements. When an existing structure is converted for morale, welfare or recreational uses, the space allowances may be increased by not more than 20 percent when necessary to effect economical use of the existing structure. This increase is not allowed in cases where an existing structure is expanded by new construction to accommodate such uses.

740-1.4 Anti-Terrorism / Force Protection (AT/FP) Considerations

740-1.4.1 For High Density facilities, such as many of the 740 series MWR facilities and Exchange facilities, AT/FP must be considered in the planning process. AT/FP siting and setback requirements should be considered early on. Please reference the Navy Minimum Standards for AT/FP for definitions, set back requirements, and additional information. Webpage: https://www.wbdg.org.

740-1.5 Covered/Enclosed Malls and Sidewalks

740-1.5.1 Where elements of a community shopping center, such as the exchange main retail store, snack bar, exchange service outlets, commissary, credit union and a bank, are combined in a common structure and connected by a covered mall, space occupied by the mall will not be charged against (deducted from) space allowances for the respective elements. Likewise, where such elements are in proximity to each other and are connected by a covered walkway, space occupied by the covered walkway will not be charged against space allowances for the respective elements. Entrance canopies should not be counted against the building space allowance.

740-1.6 Construction from Private Funds / PPV Initiatives

740-1.6.1 The construction of exchange facilities on military installations may be accomplished from funds of commercial concerns or private individuals subject to the approval of the Secretary of their cognizant Military Department, when pertinent contracts between commercial concerns or private individuals and the exchange specifies that immediately upon completion title thereto passes to the government and stipulate conditions and restrictions that should prevent any future conflict with military requirements, and eliminate any future obligations against appropriated funds. The requirement for passage of the title should not apply to portable or relocatable buildings.

740-2 MORALE, WELFARE AND RECREATION (INDOOR)

740-2.1 General instructions

740-2.2 Using the criteria

740-2.2.1 **Size to Accommodate Demand.** These criteria provide the current approach to determining allowances for Morale, Welfare and Recreational (MWR) facilities. Facility allowances are sized to accommodate the projected demand for the anticipated functions. This sizing involves a three-step procedure:

740-2.2.1.1 **Estimate Projected Demand.** Calculate the demand for each functional component of the facility using the demand calculation tables. Then apply any special adjustment factors in the criteria.

740-2.2.1.2 **Determine Capacity Requirements.** Derive the number of required functional units by multiplying the demand by the capacity factors in the criteria.

740-2.2.1.3 **Calculate Space Allowances.** Apply the space allocation factors to determine the square footage required for each functional component. Add the areas for all components, plus support area factors indicated in the criteria, to determine the total facility allowance. For each step in this planning process, follow the calculations and instructions provided in the criteria for each facility type. In addition to the criteria stated in *NAVFAC P-80*, attention should be given to relevant planning information in the Base Master Plan, Overview and Functional Regional Plans (RSIPs), UFC Criteria, Design Manuals, Military Handbooks or Instructions for the specific facility type.

740-2.2.2 For **Marine Corps Installations** results of the **MWR Construction Program Patron Survey** will be used to provide Marine Corps specific patron desires. Construction Program Patron Survey data is available from the **Commandant of the Marine Corps**.

740-2.2.3 Space Allowance Flexibility

740-2.2.3.1 **Modular Space Allowances**

For many of these criteria, usage demand, capacity requirements and space allowances are calculated separately for component function-areas of the facility and then totaled to derive overall facility space allowances. This procedure is designed to respond to local variations in the set of activities and spaces provided, and the relative demand for different activities depending on the needs of the installation population. This approach can also accommodate diverse existing facility situations, when considering additions or complementary new facilities.

740-2.2.3.2 **Space Programs versus Facility Allowances**

These criteria are used to determine the total space allowance for a facility. Even though area calculations for functional components of the facility are used in deriving the overall allowance, this does not fix the space sizes of the component program areas of the facility. Local installation decisions, in the space programming and design process, should determine the appropriate allocation of areas for each function-space within the total facility allowance.

740-2.2.3.3 **Local Variation**

Local demand for program activities may depend on a variety of factors, in addition to the overall installation population, including:

- Proportion and relative participation of different user groups among the population.
- Specific program of activities provided.
- Competing on-base and off-base facilities providing similar programs.
- Geographic distribution and accessibility of the user populations.
- Local climate conditions and operating seasons.
- Overseas situations and local customs.

740-2.2.4 Population Basis for Demand Calculations

Chapter 1 of this instruction for information on population definitions and base loading data.

740-3 MWR FACILITIES, GENERAL NOTES

740-3.1 The involvement of MWR representatives in the planning process is required, especially for all Category C business-based projects, to ensure a match between program needs, and the types and sizes of spaces to be provided. See below for a listing of Category A-C facilities as defined by MWR.

740-3.2 MWR programs are funded by a combination of non-appropriated funds (NAFs) and appropriated funds (APFs). MWR activities are divided into three categories following DoD policy on funding and function:

740-3.2.1 **Category A** operations are considered essential in meeting the organizational objectives of the Military Services. They shall be funded almost entirely with APF, with the use of NAF limited to specific instances where APF support is prohibited by law or where the use of NAF is essential for the operation of a facility or program. These facilities do not generate any NAF revenues. Examples are gymnasiums, libraries, and sports programs.

740-3.2.2 **Category B** operations are mission enhancing community support programs that support military members and their families. These programs are primarily supported by APF support but do generate NAF revenues. Examples are outdoor recreation, child development, hobby shops, ITT, community pools, school age care, and youth development programs.

740-3.2.3 **Category C** operations are business-based activities and are authorized minimal APF (such as SRM, environmental compliance, security, and health and safety support; interior renovation and new construction/additions are NAF funded) except at isolated/remote and OCONUS installations where Category C operations are treated the same as Category B operations. Examples are food and beverage operations, bowling centers, cottages, RV parks, slip rental marinas, and golf courses.

For Category B and C facilities an initial market survey and financial analysis or pro forma is required to determine if the facility will be self-sustaining or profitable, in the case of Category C operations. Once the Installation has completed their analysis, the proposal will be submitted via the regional command to NPC (after 1 October 2004, CNIC Field Support Activity) through an Internal Needs Validation Study (INVS). If the project earns sufficient points through the INVS, it will move on to the Project Validation Assessment stage where the demand and scope will be confirmed through independent review.

740-3.3 For overseas activities the net to gross factor (typical net to gross is 1.25 or 25%) will increase as necessary to meet host nation building codes.

740-3.4 **Recreational Planning Context**

Planning for MWR facilities should involve consideration of the individual facility in relationship to a comprehensive recreational program and facilities plan for the installation. Consider the following factors, in addition to those relationships specifically indicated in the criteria for each facility:

- If other MWR facilities serving the same user population provide the same program activities, reduce the allowed capacity of the proposed facility by the capacity provided elsewhere at the installation.

- Consider collocating the facility with other recreational facilities providing complementary programs, to provide the users with the increased convenience and attractiveness of clustered activities, and to take advantage of potential savings in support space requirements and operating costs.

- Size and locate an individual facility appropriately to the target population and geographical area its particular function is designed to serve. Convenient access for users should be considered in balance with the need for efficient facility operation and avoidance of duplicate facilities.

740-4 NAVY EXCHANGE FACILITIES, GENERAL NOTES

740-4.1 Navy Exchange facilities requirements are developed by the Navy Exchange Service Command, 3280 Virginia Beach Blvd, Virginia Beach, VA 23452-5724, Head Planning Branch, 757-631-3535.

740-4.2 The Navy Exchange Service Command, Planning Branch uses a Business Case Analysis model to plan new Navy Exchange facilities. They calculate square footage of new facilities based on sales costs for various product lines and expected sales costs and product lines for new facilities compared to existing facilities. They also incorporate a Market analysis of like facilities in the area. Exchange facilities Navy Facility Category Codes and descriptions are included in this Criteria document; however Navy Planners are instructed to contact the Navy Exchange Service Command for requirements development when a new facility is potentially required. If BFRs are being updated or calculated for existing facilities, in most cases it is reasonable to assume that the requirements are equal to the assets for NEX facilities. Recommend that the Navy facilities planners confirm this determination with NEXCOM prior to setting requirements equal to assets.

740 01 EXCHANGE RETAIL STORE (SF)
FAC: 7346
BFR Required: Y

74001-1 Navy Exchange facilities requirements are developed by the Navy Exchange Service Command, 3280 Virginia Beach Blvd, Virginia Beach, VA 23452-5724, Head Planning Branch, 757-631-3535. See General Notes for NEX facilities at the beginning of the 740 Series.

74001-2 The exchange retail store is planned as part of an authorized Navy or Marine Corps Exchange. The store includes sales area, immediate back-up stock area, store office, toilets and circulation space. The space allowances for exchange retail stores are determined by the Navy Exchange Services Command, 3280 Virginia Beach Blvd, Virginia Beach, VA 23452, 757-631-3535. The Patron base for the Main NEX Retail Store is all active duty, retirees and families/dependents. All merchandise categories are included in the Main NEX Retail Store. Some categories may be stronger or weaker according to age or rank classifications or base or command populace.

740 02 LOCATION EXCHANGE (SF)

This category code has been deleted. All existing assets should be reassigned to category code 740 01, Exchange Retail Store.

740 03 EXCHANGE CENTRAL ADMINISTRATION (SF)
FAC: 7387
BFR Required: Y

74003-1 Navy Exchange facilities requirements are developed by the Navy Exchange Service Command, 3280 Virginia Beach Blvd, Virginia Beach, VA 23452-5724, Head Planning Branch, 757-631-3535. See General Notes for NEX facilities at the beginning of the 740 Series.

74003-2 This is space required for the general administrative effort of an exchange such as accounting, payroll, personnel, purchasing or warehousing. Space required for this facility will be calculated using code 610 10, Administrative Office criteria. Administrative space required for an individual exchange facility, such as office space in warehouses, cafeterias, main retail store or location exchange, shall be provided out of the space authorized for the individual facility.

740 04 EXCHANGE FOOD SERVICE (SF)
FAC: 7331
BFR Required: Y

74004-1 These facilities include: cafeterias, specialty shops similar to deli, fast food and pizza, bake shops, ice cream shops, etc. Non-Exchange food service facilities (standalone) are captured under category code 740 46. Food service facilities operated in and for the sole convenience of non-exchange activities such as bowling alleys, theaters, air terminals and similar functions are already included in the basic space allowance for such activities.

74004-2 Navy Exchange facilities requirements are developed by the Navy Exchange Service Command, 3280 Virginia Beach Blvd, Virginia Beach, VA 23452-5724, Head Planning Branch, 757-631-3535. See General Notes for NEX facilities at the beginning of the 740 Series.

74004-3 MWR Facilities will be coordinated with CNI (N9, N25) and local MWR personnel. See MWR General Notes at the beginning of the 740 Series.

740 06 NON-EXCHANGE INSTALLATION RESTAURANT (MWR) (SF)
FAC: 7332
BFR Required: Y

74006-1 This type of facility includes Category “C” MWR dining facilities, including commercial restaurants. Examples of standalone commercial restaurants are Applebee’s, McDonald’s, etc. For other restaurants found in an Exchange building, or walk-up commercial eateries with common seating areas such as Subway, Taco Bell, Kentucky Fried Chicken (KFC), etc. is covered under category code 740 04, Exchange Food Service.

740 08 EXCHANGE FOOD STORE (GROCERY) (SF)

This CCN has been deleted. All existing assets should be reassigned to CCN 74001 EXCHANGE RETAIL STORE

740 09 EXCHANGE SERVICE OUTLETS (BARBER, UNIFORM, ETC) (SF)
FAC: 7346
BFR Required: Y

74009-1 Navy Exchange facilities requirements are developed by the Navy Exchange Service Command, 3280 Virginia Beach Blvd, Virginia Beach, VA 23452-

5724, Head Planning Branch, 757-631-3535. See General Notes for NEX facilities at the beginning of the 740 Series.

74009-2 Exchanges are authorized outlets for basic services in conjunction with the retail store, such as Barber Shop, Tailor/Uniform Shop, Radio/TV Repair Shop, Portrait Studio, Watch Repair Shop, Optical Shop, Beauty Salon, and Personal Services. In addition to specific outlets as listed above, special outlets may be authorized for which no distinct space allowances are given. Examples of such outlets are: CONUS and OVERSEAS - taxicab and bus service spaces, toy lands, flower shops, baggage checkpoints; OVERSEAS only - steam-bath facilities, new car sales points, stock investment offices.

740 11 NEX DEPOT (SERVMART) (SF)
FAC: 7346
BFR Required: Y

74011-1 Navy Exchange facilities requirements are developed by the Navy Exchange Service Command, 3280 Virginia Beach Blvd, Virginia Beach, VA 23452-5724, Head Planning Branch, 757-631-3535. See General Notes for NEX facilities at the beginning of the 740 Series.

74011-2 An NEX Depot may be provided as dictated by NEXCOM. NEX Depots are similar to traditional Navy Servmarts, and offer the same type of inventory, in a more convenient setting.

740 12 RED CROSS/NAVY RELIEF (SF)
FAC: 6100
BFR Required: Y

74012-1 Space for Red Cross and/or Navy Relief functions can be provided within the Family Services Center (Code 740 25) when available. This space however should not be counted against the requirements for Family Services Center. Space may be provided in other facilities on base when available. This space is not counted against Navy requirements.

740 13 EXCHANGE LAUNDRY AND DRY CLEANING FACILITY (SF)
FAC: 7342
BFR Required: Y

74013-1 Navy Exchange facilities requirements are developed by the Navy Exchange Service Command, 3280 Virginia Beach Blvd, Virginia Beach, VA 23452-

5724, Head Planning Branch, 757-631-3535. See General Notes for NEX facilities at the beginning of the 740 Series.

74013-2 Laundry and dry cleaning plants, which may be operated under the exchange service, normally shall be limited to non-appropriated fund, cleaning and laundering.

740 16 EXCHANGE MAINTENANCE SHOP (SF)
FAC: 7387
BFR Required: Y

74016-1 Navy Exchange facilities requirements are developed by the Navy Exchange Service Command, 3280 Virginia Beach Blvd, Virginia Beach, VA 23452-5724, Head Planning Branch, 757-631-3535. See General Notes for NEX facilities at the beginning of the 740 Series.

74016-2 An exchange maintenance shop may be provided for the local repair of exchange equipment, fixtures repair of refrigeration equipment and vending machines, and to provide shop space for facility maintenance crews and personnel.

740 18 BANK (SF)
FAC: 7347
BFR Required: Y

74018-1 Banks may be established only when they are authorized by the U.S. Treasury Department. Normally there will be only one banking facility at each installation. Branch banks, providing complete services, shall not be established without prior approval. Space allowances are given in Table 74018-1.

Table 74018-1. Space Allowances For Banks

Personnel Strength (1)	Gross SF
Up to 1,000	1,500
1,001 to 2,000	2,375
2,001 to 3,000	3,250
3,001 to 4,000	3,625
4,001 to 5,000	4,000
5,001 to 6,000	4,375
6,001 to 7,000	4,750

Personnel Strength (1)	Gross SF
7,001 to 9,000	5,560
9,001 to 11,000	6,375
11,001 to 13,000	7,190
13,001 to 15,000	8,000
15,001 to 17,000	10,000
17,001 to 20,000	13,000
Over 20,000	See Note (2)

Notes:

(1) Active duty military personnel assigned to an installation and stationed within a commuting area not served by another military banking office plus civilian employees of the installation.

(2) Determined by Engineering Study.

740 19 CREDIT UNION (SF)
FAC: 7347
BFR Required: Y

74019-1 **DESCRIPTION.** Credit unions are private cooperative savings and loan organizations. Facilities for a properly chartered credit union may be provided to serve military personnel, their dependents, and other personnel as permitted in the bylaws of the credit union. If a credit union on an installation restricts or limits membership of installation personnel, it will be denied free use of installation facilities. In such cases another credit union which meets DOD requirements may be organized and provided with logistic support.

74019-2 **SPACE ALLOWANCE.** Space allowances for credit unions are predicated on size of membership, number of transactions, assets, accounting methods, and number of employees. Each of the variables contributes a number of points, and the total number of points determines the space allowance. The allowance may be increased by 10 percent to accommodate future business expansion. Refer to Table 74019-1 for point values and Table 74019-2 for space allowances.

Table 74019-1. Point Values for Credit Unions

Number of Members	Points Allowed	Point Subtotals
0 to 1,000	2	
1,000 to 2,500	4	
2,501 to 7,500	6	
7,501 to 12,000	8	
12,001 to 20,000	10	
For Each Additional 10,000, add	2	
Accounting	**Points**	
Machines	1	
Manual	2	
Assets (Dollars)	**Points**	
0 to 100,000	1	
100,001 to 500,000	2	
500,001 to 1,500,000	3	
1,500,001 to 5,000,000	4	
Over 5,000,000	5	
Transactions Per Day	**Points**	

Number of Members	Points Allowed	Point Subtotals
0 to 99	1	
100 to 299	2	
300 to 499	3	
500 to 749	4	
750 to 999	5	
For Each Additional 500, add	1	
Number of Employees	**Points**	
2 to 5	1	
6 to 9	2	
10 to 13	3	
14 to 17	4	
18 to 21	5	
22 to 25	6	
For Each Additional 3, add	1	
TOTAL NUMBER OF POINTS =		

Refer to Table 74019-2 for Space Allowance.

740 20 PCS OFFICIAL LODGING (SF)
FAC: 7441
BFR Required: N

74020-1 **REQUIREMENT.** Navy Exchange facilities requirements are developed by the Navy Exchange Service Command, 3280 Virginia Beach Blvd, Virginia Beach, VA 23452-5724, Head Planning Branch, 757-631-3535. See General Notes for NEX facilities at the beginning of the 740 Series. This category code should not be used to compute a Basic Facility Requirement (BFR).

74020-2 **DESCRIPTION.** These facilities are temporary living accommodations which normally are rented for a service charge for overnight or short term use to authorized personnel such as: official military or civilian visitors to the installation, visitors to installation personnel, transient personnel or families awaiting assignment to quarters. Included are motels, hotels, and apartments. Where such facilities are authorized for new construction, they shall be of motel type with bath and with kitchenettes, if required. Living units with kitchenettes shall contain no more than 450 square feet of living area and those without kitchenettes no more than 425 square feet. Appropriate circulation, administration, mechanical and service space will be provided.

74020-3 **REVIEW.** All leasing, conversion, or construction projects for temporary lodging facilities, regardless of scope and funded by non-appropriated fund activities will be forwarded for review and approval to Assistant Secretary of Defense (I&L).

740 21 VISITOR'S RECEPTION CENTER (RECRUIT TRAINING ONLY) (SF)
FAC: 7440
BFR Required: Y

74021-1 A visitor's reception center is limited to installations performing basic training. It serves as a point of contact between trainees and visiting relatives or friends. Approximate planning factor is 1.5 gross square feet per recruit.

74022-1 **NAVY**

Transient housing is Commander Naval Installations (CNIC)-operated living accommodations rented for a service charge to fleet personnel families of ships undergoing repair. This code is for inventory purposes only and is applicable only to housing units removed from the family housing inventory (Category Group 710) and designated for this purpose by the Chief of Naval Operations.

74022-2 **MARINE CORPS**

These quarters are operated primarily to provide a service to duty transient personnel and TAD students, and to conserve appropriated funds through reduced per diem payments. Guidance is provided in the Marine Corps Order P11000.22.

740 23 COMMISSARY (INCLUDING BACK UP STORAGE) (SF)
FAC: 7349
BFR Required: Y

74023-1 The Navy Commissary Systems were consolidated into the Defense Commissary Agency (DeCA) along with the other services on 1 October 1991. All Commissary construction planning, programming and execution has been transferred to that organization.

74023-2 Questions regarding Commissary construction plans, policies, procedures and sizing should be directed to the Defense Commissary Agency, Directorate of Facilities, Plans and Programs Division, Fort Lee Virginia, 23801-6300. Commercial telephone number is (804) 734-8000 ext. 4-8976.

740 24 COMMISSARY COLD STORAGE (DETACHED) (SF)
FAC: 4321
BFR Required: Y

74024-1 The Navy Commissary Systems were consolidated into the Defense Commissary Agency (DeCA) along with the other services on 1 October 1991. All Commissary construction planning, programming and execution has been transferred to that organization.

74024-2 Questions regarding Commissary construction plans, policies, procedures and sizing should be directed to the Defense Commissary Agency, Directorate of Facilities, Plans and Programs Division, Fort Lee Virginia, 23801-6300. Commercial telephone number is (804) 734-8000 ext. 4-8976.

740 25 FAMILY SERVICES CENTER (SF)
FAC: 7372
BFR Required: Y

Design Criteria: UFC 4-730-01 webpage:
https://www.wbdg.org/dod/ufc/ufc-4-730-01

74025-1 **DEFINITION.** The Family Services Center (FSC) facility supports the programs that provide the information and family services necessary to support qualified single and married Department of Defense (DoD) personnel and their family members in meeting the unique demands of the military lifestyle, as defined by DoD Instruction 1342.22, Family Centers. The program and services provide information to DoD personnel and their family members, improve life skills by fostering competencies and coping skills, encourage self-sufficiency, and offer short-term support and assistance when necessary.

74025-2 **FAMILY SERVICE CENTERS (FSCs)** may be established as required to provide information and referral services, education and training services, and counseling services for the active duty population with services usable to dependents and retirees. The centers require open areas such as visiting rooms and conference areas with the majority of space allotted to individual offices conducive to execution of high quality and confidential service delivery.

74025-3 **SPACE ALLOWANCES.** They provide for baby/toddler play areas, waiting room, record storage, individual counselor offices, administrative areas, and storage areas for hospitality kit, general storage, conference rooms, staff areas, and classroom spaces for training exercises conducted by all FSCs.

74025-4 **LOCATION DETERMINENTS.** Several factors determine the most appropriate and cost effective location for a FSC.

74025-4.1 **Site Size**. Ensure adequate site space for the following elements when selecting the FSC site: criteria for parking space for customers and staff can be found in category code 852-10. Site must also meet Antiterrorism/Force Protection (AT/FP) set-back criteria.

74025-4.2 **Customer Access.** The FSC should be easily accessible both by Military personnel and by Military personnel family members and reservists. The importance of access by civilians or non-active duty personnel must not be overlooked. Consider locations such as near the Installation gate or other high-traffic areas such as the commissary, retail exchange, or medical facilities. As an alternative, consider locating the FSC off-installation like the Installation visitor's center or local high-traffic commercial/retail centers. If the FSC is located off-base, consider the AT/FP impacts to the design of the facility.

74025-4.3 **Capacity**. Capacity shall be determined by actual count of active duty and full time reserve military personnel receiving installation support who are entitled to FSC services. Overseas areas should include the number of DOD employees entitled to services. Justification remains the responsibility of the sponsoring command with requirements based on local needs. Adjust these figures for any projected increase/decrease in military population or mission changes. The population served by the FSC is determined by adding a multiplier to the active duty population. The multiplier varies depending on the location of the proposed FSC.

CONUS: FSC population equals active duty (AD) times **1.6**,

OCONUS: FSC population equals AD population times **2.4**, and
Military (Fleet or Navy) Concentration Areas: FSC population equals AD population times **2.4**.

74025-4.4 **New activities.** Determine the total number of active duty and full time reserve personnel receiving direct installation support.

Table 74025-1
Family Service Center Size Classifications

Size Classification	Population Served
Small	500 to 3,000
Medium	3,001 to 10,000
Large	10,001 to 40,000
Extra Large	40,000 and Up

Table 74025-2
Family Service Center Gross Areas

FSC	Gross Area (sq.m./SF)	Gross Area (sq.m./SF)	Estimated Staffing (PN)	Estimated Staffing (PN)
	Navy	Marine Corps	Navy	Marine Corps
Small	321.96 / 3,466	281.38 / 3,029	6-8	4-8
Medium	667.55 / 7,185	463.31 / 4,987	13-17	5-13
Large	1,160.29 / 12,489	813.14 / 8,753	19-26	6-19
Extra Large	1,763.39 / 18,981	1,310.78 / 14,109	31-36	12-31

Notes for Table 74025-2:
For full space program for the FSC small, medium, large, extra-large please see the UFC 4-730-01 at https://www.wbdg.org/dod/ufc/ufc-4-730-01

1. Many service agencies such as NADSAP, Navy-Marine Corps Relief, American Red Cross and CAA are collocated with FSCs. These areas are not a part of the Family Services Center and should not be counted against the requirements. For Red Cross see CC 740 12.
2. For populations fewer than 500, accommodate the FSC functions in other, non-dedicated facilities.

740 26 INSTALLATION RESTAURANT (MWR) (SF)

This CCN has been deleted. All existing assets should be reassigned to category code 740 04, Exchange Food Service / Restaurant.

740 27 ARMED FORCES RADIO/TV STATION (SF)
FAC: 1441
BFR Required: Y

74027-1 A radio and/or TV station is normally established in overseas locations to provide U.S. installation population with entertainment and news coverage. As a rule, the coverage radius is limited to the installation and immediate vicinity and the facilities are restricted for transmission of prerecorded program material, however if justified, limited studio facilities may be provided. At the present, no space criteria are available for this type of facility. Requirements must be developed on an individual basis.

740 28 AMUSEMENT CENTER / RECREATION MALL (SF)

This category code has been deleted. All existing assets are to be reassigned to category code 740 42 Community Recreation Center.

740 30 EXCHANGE GAS/SERVICE AND AUTO REPAIR STATION (SF)
FAC: 7345
BFR Required: Y

74030-1 Navy Exchange facilities requirements are developed by the Navy Exchange Service Command, 3280 Virginia Beach Blvd, Virginia Beach, VA 23452-5724, Head Planning Branch, 757-631-3535. See General Notes for NEX facilities at the beginning of the 740 Series.

74030-2 This facility provides space for gasoline and oil sales, automotive parts and accessories sales, emergency service and automotive repair service.

740 31 POV FILLING STATION (OL)
FAC: 1231
BFR Required: Y

74031-1 **DESCRIPTION.** This category code is for fueling stations associated with Personally Owned Vehicles (POVs) at an installation such as those associated with NEXCOM/MCCS facilities or similar.

740 32 NEX CAR WASH BUILDING (SF)
FAC: 7348
BFR Required: Y

74032-1 This facility is associated with the Navy Exchange (NEXCOM) for the washing of vehicles. The surrounding pavement is captured with either FAC 8521 –

Vehicle Parking, Surfaced or FAC 8526 – Miscellaneous Paved Area, depending on the particular situation of usage. For MWR car wash structures, use category code 740 33 - MWR Car Wash Structure.

74032-2 Navy Exchange facilities requirements are developed by the Navy Exchange Service Command, 3280 Virginia Beach Blvd, Virginia Beach, VA 23452-5724, Head Planning Branch, 757-631-3535. See General Notes for NEX facilities at the beginning of the 740 Series.

74032-3 MWR facilities should be programmed through OPNAV N46 Deputy Base Ops and Support, (703) 695-5541.

740 33 MWR CAR WASH STRUCTURE (SF)
FAC: 7350
BFR Required: Y

74033-1 This structure is associated with MWR for the washing of vehicles. The footprint of the structure typically includes a mechanical room, a water separator, wash bays (both covered and uncovered), and pavement area. All other surrounding pavement is captured with either FAC 8521 – Vehicle Parking, Surfaced or FAC 8526 – Miscellaneous Paved Area depending on the particular situation of usage. For NEXCOM car wash buildings, use category code 740 32, NEX Car Wash Building.

74033-2 Navy Exchange facilities requirements are developed by the Navy Exchange Service Command, 3280 Virginia Beach Blvd, Virginia Beach, VA 23452-5724, Head Planning Branch, 757-631-3535. See General Notes for NEX facilities at the beginning of the 740 Series.

74033-3 MWR facilities should be programmed through OPNAV N46 Deputy Base Ops and Support, (703) 695-5541.

740 34 THRIFT SHOP (SF)
FAC: 7340
BFR Required: Y

74034-1 This is a nonprofit facility for the sale and purchase by military personnel of used apparel, furnishings and equipment. See Table 74034-1 for space allowances.

Table 74034-1. Space Allowances for Thrift Shops

Military Strength	Gross SF
Up to 2,000	1,400

Military Strength	Gross SF
2,001 to 4,000	2,000
4,001 to 6,000	2,700
6,001 to 8,000	3,400
8,001 to 10,000	4,000
10,001 to 12,000	4,500
12,001 to 14,000	4,950
Over 14,000	5,350

740 36 HOBBY SHOP – CRAFTECH (SF)
FAC: 7411
BFR Required: N

This CCN is for inventory purposes only.

740 37 MWR OUTDOOR RECREATION CENTER (SF)
FAC: 7446
BFR Required: Y

Design Criteria: UFC 4-740-03
Design: Navy and Marine Corps Outdoor Adventure Centers and Rental Centers

74037-1 **DEFINITION**: There are three categories of outdoor recreation centers included under this category code:

- Outdoor Adventure Centers (OAC),
- Rental Centers (RC), and
- Outdoor Centers & Other Rentals (OCOR).

Generally, these facilities rent and/or sell goods that are associated with Outdoor Recreation Programs (ORP) and other outdoor activities. There is a significant variety in the equipment and goods provided by each of these facility category types, however the general criteria and basic design approach for all three facility categories are similar. The three facility categories are described in paragraphs 74037-1.1, 74037-1.2 and 74037-1.3, and their respective missions are compared in Table 74037-1 with regard to equipment and programs.

74037-1.1 **Outdoor Adventure Centers (OAC)** provide human powered equipment which is specific to outdoor recreation and adventure activities. An OAC supports an Outdoor Recreation Program (ORP). The Marine Corps does not require that OAC or ORP operations be human powered. The activities offered take place in a natural area, front-country, backcountry, or wilderness environment. The name of the operation may reflect anything related to pursuits that fall within the respective Service's ORP. Of the three facilities, the OAC is the preferred option within the Navy Morale Welfare and Recreation's (MWR's) Outdoor Recreation Program Master Plan.

74037-1.2 **Rental Centers (RC)** carry a variety of equipment unrelated to outdoor recreation but may also carry outdoor recreation equipment. Equipment from both categories may include trailers, boats, dunk tanks, home and garden tools, camping gear, athletic equipment, party items, catering items, rental trucks and trailers, etc. While and RC may rent and/or sell goods associated with outdoor and adventure activities, it does not support and ORP, and as such, it differs from and OAC or OCOR. Anything can be in the rental inventory that is appropriate and within the policies or local agreements, for example, agreements between Navy Exchange (NEX) and MWR. Instruction, repairs, and sales related to the equipment are appropriate. The name, image, and theme will be consistent with what is offered.

74037-1.3 **Outdoor Center and Other Rentals (OCOR)** facility is a combination of the first two categories and rents both home and garden type equipment and outdoor adventure activity type equipment that falls with the respective Service's ORP. The two classifications of items must be physically and visually separated into their own unique areas of the facility. They are marketed separately and have specialized employees for each area. An OCOR also supports an Outdoor Recreation Program.

Table 74037-1. Facility Types

Facility Type	Equipment Offered	Support ORP
Outdoor Adventure Center (OAC)	OR	Yes
Rental Center (RC)	H&G and/or OR	No
Outdoor Center & Other Rentals (OCOR)	H&G and OR	Yes

OR= Outdoor Recreation equipment
H&G= Home and Garden equipment/tools
ORP = Outdoor Recreation Program

74037-2 **SIZE CLASSIFICATIONS -** The five facility size classifications and the typical active duty populations they serve are shown in Table 74037-2. The customer base is the primary size determinant. The active duty population directly relates to the potential customer base; however, the customer base may also include active duty family members, youth and teen program participants, and others. Consider all potential users when determining the customer base.

Table 74037-2
MWR Outdoor Recreation Center Facility Size Classifications and Active Duty Populations Served

Size Classification	Active Duty Population Served	Total Building Gross Area	Total Site Support Area
Regional/Extra Large	Greater than 14,000	1,434 m2 / 15,440 ft2	1,060 m2 / 11,410 ft2
Large	7,001 – 14,000	871.59 m2 / 9,382 ft2	788.72 m2 / 8,490 ft2
Medium	3,001 – 7,000	651.39 m2 / 7,012 ft2	579.70 m2 / 6,240 ft2
Small	500 - -3,000	433.88 m2 / 4,670 ft2	373.46 m2 / 4,020 ft2
Extra Small	Less than 500	401.82 m2 / 4,325 ft2	373.46 m2 / 4,020 ft2

74037-3 **LOCATION DETERMINANTS.** Prior to initiating the facility planning of the OAC, RC, or OCOR, perform a space analysis of the existing Installation. This analysis should identify any existing functions which are programmatically considered an essential element of the ORP program. Following that analysis, consider the following factors to determine the location of the facility.

74037-3.1 **Overall Business Viability**: Business viability is the primary location determinant. A location favorable to sustaining a self-sufficient operation is needed. Patron access is one major component of business viability, but the entertainment and adventure elements of the facility must also be considered. The location should be attractive with proximity to natural areas and other retail or recreational services.

74037-3.2 **Existing Program Elements.** On some bases, existing program elements may be clustered in one area. Consider any existing program elements when locating the new facility to take advantage of the population's activity patterns, habits, and knowledge base. This will help with advertising the new facility. This determinant is more important in siting the OAC and OCOR facilities but should also be considered when site planning an RC.

74037-3.3 **Goods Access.** These facilities handle large and cumbersome goods and equipment. The site should offer easy access and room to maneuver the goods and equipment both for delivery and rental.

74037-3.4 **Patron Access.** The facility needs to be visible and easily accessible to the users. Consider locating near other high-visibility areas and related functions. This could be along the pedestrian paths to the existing barracks, existing MWR/NEX/MCCS facilities, and/or the dining facility. To accommodate moving equipment and quick patron access, provide adequate parking (per category code 852-10) as close as possible to the facility, taking into account Antiterrorism/Force Protection (ATFP) requirements.

740 38 MWR AUTO SKILLS CENTER (SF)
FAC: 7412
BFR Required: Y

SECNAV Approved Standards and Metrics are available for this CCN at http://mwr.navy.mil/mwrprgms/programstand.htm.

74038-1 **GENERAL**. See General Notes to 740 series category codes for General Instructions regarding facility allowance planning procedures.

74038-2 **DEFINITION**. The mission of Automotive Skills Center is to provide their customers with a quality, value-based program for the maintenance, repair, modification and improvement of their own vehicles including cars, trucks, trailers, motorcycles, and bicycles. Automotive Skills Centers are not full-service stations, but rather facilities where patron self-help is fostered and automotive skills are learned. Such facilities may also provide space for instructional programs, club meetings, administration, tool issuance, storage and parts sales.

74038-3 **RELATED FACILITIES**. Automotive Skills Centers may be collocated with complementary facilities such as self-service carwashes. Such collocations will have the advantage of drawing more patrons to a single location offering a wider assortment of services.

74038-4 **AUTO BAY DEMAND**. The primary functional component of an Automotive Skills Center is Auto Bays which are sized on the basis of the peak hour demand at each installation as follows:

74038-4.1 Use projected base loading data to determine the population for each significant population category, as listed in Table 74038-1.

74038-4.2 Calculate peak hour demand for Auto Bays by multiplying the population for each category by participation factors found in Table 74038-1. Add the demand for all population categories to derive peak hour Total Demand for Auto Bays.

74038-4.3 Apply the installation mission adjustment factor (divide by 2) for those bases with large numbers of personnel in training schools or on routine deployment.

74038-4.4 Determine the number of indoor or outdoor Auto Bays required to satisfy peak hour demand by dividing the Total Demand by the following capacities per bay per hour and rounding to the nearest whole unit:

- 1.5 users per indoor bay per hour
- 1.0 user per outdoor bay per hour

The split between indoor verses outdoor Auto Bays may be determined at the discretion of the local command. Facility planning considerations based on climatic factors are discussed below under section 4, Space Allowances.

Table 74038-1. Auto Bay Demand Calculation

Note	Population Category	Population (per Base Loading)	x	Participation Factor	=	Peak Hour Demand
(1), (2)	Enlisted	____	x	0.0034	=	____ users
(1), (2)	Officers	____	x	0.0022	=	+ ____ users
(1), (2)	Retirees	____	x	0.0004	=	+ ____ users
(1), (2)	Authorized Civilians	____	x	0.0006	=	+ ____ users
Total Demand (round to the nearest whole unit)						____ users
(3)	Divide by installation mission adjustment (for installations with more than 50 percent of their active-duty personnel in training schools or on routine deployment)					divide by 2.0
Adjusted Total Demand (round to the nearest whole unit)						____ users
(4)	To calculate the number of Indoor Auto Bays divide by the capacity per auto bay					divide by 1.5
Total Demand number of Indoor Auto Bays required to satisfy peak demand (round to the nearest even numbered whole unit)						____ bays
(4)	LOCAL OPTION: If Outdoor Auto B Bays are locally desired, substitute 3 Outdoor Bays for every 2 Indoor Bays					

Notes for Demand Calculation -- Table 74038-1:

(1) Population numbers should be consistent with projected base loading data. Officers are O-1 through O-10 and enlisted are E-1 through E-9. Civilians are authorized DoD employees. Retirees are all military retirees within a 30-minute drive of the installation.

For facility planning purposes at installations with deployable forces, the active duty demand population is comprised of all the non-deployable population, plus two-thirds of the deployable population, to reflect time away on deployment. However, calculation of the deployable population may be adjusted based on the actual deployment experience at individual installations.

(2) Use of facilities by spouses and dependents has been statistically incorporated in the participation factors used in the tables. These participation factors may be revised periodically by NPC, and the most current figures must be used in all demand calculations.

(3) Installation Mission Adjustment Factor
A factor that influences the use of an Automotive Skills Center is the type of installation and it's particular mission. For example, Naval Stations have significant numbers of active-duty personnel routinely deployed, thereby losing potential patronage. Statistics show that even though the automobiles of active-duty personnel are routinely used by spouses and dependents during times of deployment, the skills center facilities are seldom used by these population groups. Likewise, naval installations which have a large percentage of their residents in training schools, with demanding study schedules, suffer declines in the use of Automotive Skills Center since those residents have fewer personally-owned vehicles and/or less leisure time. Therefore, if an installation has a large number of personnel in schools or on routine deployment -- greater than 50 percent of the active-duty population -- the total demand calculation derived in the steps indicated below in Table 74038-1 should be adjusted by dividing by 2.

(4) The number of Indoor versus Outdoor Auto Bays may be determined by the local Command. If Outdoor Auto Bays are provided, they will substitute for Indoor Auto Bays at the rate of 3 Outdoor Bays for every 2 Indoor Bays.

74038-5 **SPACE ALLOWANCE**. The maximum space allowance for an Automotive Skills Center is determined according to the sizing criteria presented in Table 74038-2. For new construction projects, the actual size is determined through a Project Validation Assessment.

74038-5.1 In warm climates, many skills center activities can be performed outdoors or under canopies. Outdoor Auto Bays may, therefore, be used to increase the total work space allowed for an auto skills center located in a warm climate. Such covered outdoor spaces, however, should be properly shielded from climatic conditions such as wind-driven rain or dust and sand.

74038-5.2 Conversely, in very cold climates, care should be exercised with designs which are drafty, uncomfortable and difficult to heat because of the large number of vehicular openings. The number of vehicular openings may be minimized be adopting a layout more common in commercial garages, with interior circulation to auto bays. However, a facility with a limited number of vehicular entrances will require more interior space for maneuvering cars. In such circumstances, an economic analysis of the options is recommended. This analysis should balance the additional cost of constructing extra space for internal vehicular circulation against the reduced operating cost, the possible savings in perimeter walls, and the improved comfort and, therefore, potentially greater use by customers.

74038-5.2.1 Full compliance with all applicable local, state and federal environmental regulations is required in the planning and development of Automotive Skills Centers at all naval installations. All facilities which have the potential for causing environmental contamination, such as, hydraulic lifts, oil tanks, drains, etc. must be appropriately designed with adequate safeguards. Furthermore, to avoid problems related to the safety of patrons and staff, provision of paint booths is not recommended; however, one may be provided if the local installation and patrons agree. The paint booth must be capable of receiving required environmental permits. In many areas of the country, new permits are not being issued in non-attainment areas.

Table 74038-2. Space Allowance for Auto Skills Center

Note	Table	Functional Component	# Units	x	Space Allocation Factor	=	Total NSF	Minimum or Maximum NSF
		ACTIVITY AREAS						
(1)	740 38A	Auto Stalls/Bays	___	X	300 NSF per bay	=	___	
		Machine Shop Workbenches (@ one bench per bay)	___	X	65 NSF per bench	=	+ ___	
		Welding Area			25% total NSF for workbenches	=	+ ___	
		Engine Cages (@ one cage per bay)	___	X	40 NSF per cage	=	+ ___	
		Resale/Tool Issue		X	30 NSF per bay	=	+ ___	
		Classroom Teaching Area	___	X	15 NSF per seat	=	+ ___	225 min./ 450 max.
		Storage Area		X	25% total NSF for classroom	=	+ ___	
					Subtotal Activity Areas (Net Square Feet)	=	_____	
		ACTIVITY SUPPORT						
		Customer Lounge			15% total NSF workbenches	=	___	40 min.
		Patron Support (including lockers, toilets, vending machines)			7-14% X subtotal Activity Areas	=	+ ___	300 min.
		Administration			12-16% X subtotal Activity Areas	=	+ ___	285 min.
					Subtotal Activity Support (Net Square Feet)	=	_____	
		BUILDING SUPPORT						
		Entrance/Lobby/Circulation/ Housekeeping Supplies/Janitor's Closet/ Structure/Partitions			13-17% X subtotal Activity Areas + subtotal Activity Support Areas	=	___	
		Mechanical/Electrical/ Communication Equipment Space			9-13% X subtotal Activity Areas + subtotal Activity Support Areas	=	+ ___	
					TOTAL FACILITY ALLOWANCE (Gross Square Feet)	=	_____	

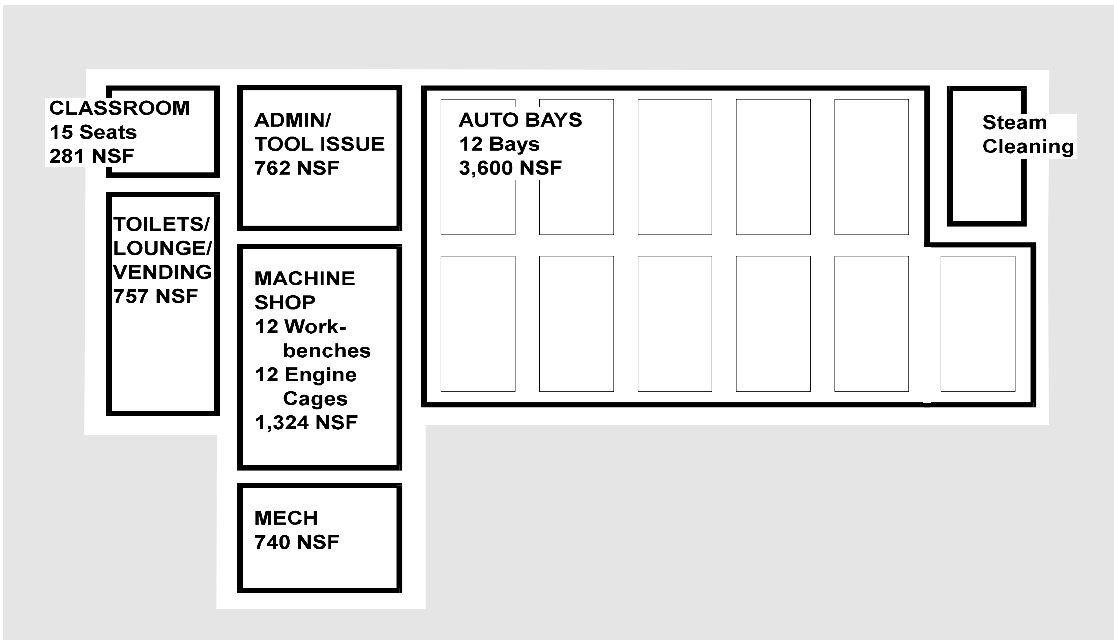
Notes for Space Allowance -- Table 74038-2:

(1) 300 NSF per auto bay is an average figure. Actual bay sizes may vary, ranging from typically, 288 NSF for muffler/tire/lubrication bays to 336 NSF for general repair/bodywork/steam cleaning bays.

NSF = Net Square Feet
GSF = Gross Square Feet
Minimum or Maximum NSF = Minimum or maximum space allowance to be provided for the particular function or activity.

74038-5 **SAMPLE LAYOUT DIAGRAM**. A layout diagram is presented for a medium size Automotive Skills Center. This diagram is an example of the composition of such a facility in terms of its functional components, their respective sizes and adjacencies. The layout diagram is for illustrative purposes only.

Figure 74038-1
Layout Diagram – Automotive Hobby Shop, Medium Size Facility



740 40 BOWLING CENTER (SF)
FAC: 7415
BFR Required: Y

SECNAV Approved Standards and Metrics are available for this CCN at http://mwr.navy.mil/mwrprgms/programstand.htm

74040-1 **GENERAL**. See General Notes to 740 series category codes for General Instructions regarding facility allowance planning procedures.

74040-2 **DEFINITION**. Bowling Centers are recreational facilities which accommodate bowling and related functions, which may include: open bowling, leagues, tournaments, youth bowling, instruction, exhibitions, and support activities such as equipment sales and rental, food and beverage service, electronic and table games, and meetings.

74040-3 **RELATED FACILITIES**. Consideration should be given to collocating the Bowling Center with the following recreational facilities in order to (i) take advantage of potential savings in space requirements and operating costs, and (ii) provide users with the increased convenience of clustered facilities:

- 740 42 Community Recreation Center
- MWR recreational and foodservice facilities, generally

74040-4 **BOWLING DEMAND**. The number of bowling lanes required in a Bowling Center is based on the usage demand at each installation, as follows:

74040-4.1 Use projected base loading data to determine the population for each significant population category, as listed in Table 74040-1.

74040-4.2 Calculate the annual bowling linage demand by multiplying the population for each category by participation factors drawn from the installation's most recent demand survey, and by adjustment factors as indicated in Table 74040-1.

74040-4.3 Find the number of lanes required to accommodate the bowling linage demand in Table 74040-2. These allowances are based on the minimum number of lines required to generate sufficient revenues to meet standard operating expenses.

74040-4.4 Calculate the capacity requirements for foodservice and games components by multiplying the numbers of bowling lanes and of projected non-bowling patrons by the usage factors in Tables 74040-3 through 74040-7. See Section 5, below, for explanation of these Tables.

74040-4.5 Multiply the number of units required for each functional component by the space allocation factors in Table 74040-8. Add the net square footage (NSF) for all components and add support area factors as directed in Table 74040-8, to derive the Total Facility Allowance.

* For **Marine Corps Installations** use historical patron data to determine the participation factor.

Table 74040-1. Bowling Linage Demand Calculation

Note	Population Category	Population (per Base Loading)	x	Participation Factor	x	Adjustment Factor	=	Lines Bowled per Year
(1), (2), (3)	Officers	____	x	___ %	x	111	=	_____
(1), (2), (3)	Enlisted	____	x	___ %	x	17	=	+ _____
(1), (2), (3)	Retirees	____	x	___ %	x	31	=	+ _____
(1), (2), (3)	Family Members	____	x	___ %	x		=	+ _____
(1), (2), (3)	DoD Civilians	____	x	___ %	x		=	+ _____
						Total Lines Bowled per Year	=	
(4)	Add linage for installations in locations with harsh or long winter							+ 32,500
						Adjusted Total Linage Demand	=	_____

Notes for Bowling Linage Demand Calculation:

(1) Population numbers should be consistent with projected base loading data. Officers are O-1 through O-10 and enlisted are E-1 through E-9. Retirees are all military retirees within a 30-minute drive of the installation.
For facility planning purposes at installations with deployable forces, the active duty demand population is comprised of all of the non-deployable population, plus two-thirds of the deployable population, to reflect time away on deployment. However, calculation of the deployable population may be adjusted based on the actual deployment experience at individual installations.

(2) The adjustment factors modify linage demand to reflect differential usage patterns among the different user population categories.

(3) Linage demand for installations in locations with harsh or long winters is adjusted by adding an extra 32,500 lines to the total number of lines bowled per year. This includes all installations located in the following states: Alaska, Colorado, Connecticut, Delaware, Idaho, Illinois, Indiana, Iowa, Kansas, Maine, Maryland, Massachusetts, Michigan, Minnesota, Missouri, Montana, Nebraska, New Hampshire, New Jersey, New York, North Dakota, Ohio, Oregon, Pennsylvania, Rhode Island, South Dakota, Utah, Vermont, Virginia, Washington, West Virginia, Wisconsin, Wyoming and the District of Columbia.

Table 74040-2. Lane Allowances for Bowling Centers

Note	Lines Bowled per Year	Number of Lanes Authorized CONUS	Number of Lanes Authorized OCONUS
	Fewer than 10,000	0	0
(1)	10,000 - 18,000	2	2
(1)	18,001 - 36,000	4	4
(1)	36,001 - 54,000	6	6
(1)	54,001 - 69,120	8	8
(1)	69,121 - 86,400	10	10
(1)	86,401 - 107,640	12	12
	107,641 - 124,200	14	18
	124,201 - 140,760	16	20

Note	Lines Bowled per Year	Number of Lanes Authorized CONUS	Number of Lanes Authorized OCONUS
	140,761 - 165,600	18	24
	165,601 - 231,840	24	32
	231,841 - 298,080	32	40
	298,081 - 364,320	40	50
	Each incremental increase of 17,280	additional 2	additional 2

Note for Bowling Lane Allowances:

(1) Bowling Centers with 12 lanes or fewer are generally considered uneconomic to operate. Centers of such size can only be approved in exceptional cases, with substantial justification of economic viability.

74040-5 **DEMAND FOR FOODSERVICE AND GAMES**. The numbers of seats in the snack bar and lounge and the numbers of video games and pool/billiards tables required in the Bowling Center should represent the sum of the demand from both bowling patrons and other users -- guests, spectators, and patrons primarily using the food service or games areas of the center. The size of the non-bowling clientele will depend on such local installation factors as the location of the facility, proximity of potential patron populations, competing food service and amusement center facilities, type and attractiveness of food service and games program operations, and historic usage patterns.

74040-5.1 Demand for meeting/function room space must be based on other users than bowling patrons. The seat capacity requirement should be based on the type and size of specific functions for which there is a justifiable local demand.

74040-5.2 Tables 74040-3 through 74040-7 provide usage factors for calculating the demand for the functional components in the foodservice and games areas.

Notes for Foodservice and Games Demand Calculation - Tables 74040-3 through 74040-7:

(1) Use number of bowling lanes as derived in Table 74040-2.

(2) The projected number of non-bowling patrons for each functional component must be determined by the installation and justified based on analysis of specific local experience and requirements. In the absence of local installation data, assume that the numbers of seats required for non-bowling patrons in the foodservice areas, and the numbers of machines and tables for non-bowling patrons in the games area, are equal to those calculated for the bowling patrons.

Table 74040-3. Snack Bar Demand Calculation

Note	# Demand Units	x	Usage Factor	=	Peak Demand
(1)	____ Bowling Lanes	x	0.50 seats per lane	=	____ seats
(2)	____ Non-Bowling Patrons per Peak Hour	x	0.25 seat-hours per patron	=	+ ____ seats
	Total Demand (round to the nearest whole unit)			=	____ seats

Table 74040-4. Lounge Demand Calculation

Note	# Demand Units	x	Usage Factor	=	Peak Demand
(1)	____ Bowling Lanes	x	0.44 seats per lane	=	____ seats
(2)	____ Non-Bowling Patrons per Peak Hour	x	0.50 seat-hours per patron	=	+ ____ seats
	Total Demand (round to the nearest whole unit)			=	____ seats

Table 74040-5. Combined Snack Bar/Lounge Demand Calculation

Note	# Demand Units	x	Usage Factor	=	Peak Demand
(1)	____ Bowling Lanes	x	0.72 seats per lane	=	____ seats
(2)	____ Non-Bowling Patrons per Peak Hour	x	0.33 seat-hours per patron	=	+ ____ seats
	Total Demand (round to the nearest whole unit)			=	____ seats

Table 74040-6. Video Games Demand Calculation

Note	# Demand Units	x	Usage Factor	=	Peak Demand
(1)	____ Bowling Lanes	x	1.0 machines per lane	=	____ machines
(2)	____ Non-Bowling Patrons per Peak Hour	x	1.0 machine-hours per patron	=	+ ____ machines
	Total Demand (round to the nearest whole unit)			=	____ machines

Table 74040-7. Pool/Billiards Demand Calculation

Note	# Demand Units	x	Usage Factor	=	Peak Demand
(1)	____ Bowling Lanes	x	0.22 machines per lane	=	____ tables
(2)	____ Non-Bowling Patrons per Peak Hour	x	0.20 table-hours per patron	=	+ ____ tables
	Total Demand (round to the nearest whole unit)			=	____ tables

74040-6 **SPACE ALLOWANCES**. Space allowances for Bowling Centers are determined according to the planning criteria presented in Table 74040-8 below. The total allowance for a facility is the sum total of the space allowances for each functional component. The number of units of each component required to meet the demand is obtained from the calculations in Tables 74040-1 through 74040-7.

Table 74040-8. Space Allowances for Bowling Centers

Note	Table	Functional Component	# Units	x	Space Allocation Factor	=	Total NSF	Minimum or Maximum NSF
		ACTIVITY AREAS						
		Bowling						
	A, B	Bowling Lanes (incl. pin spotting, settee, promenade, lockers)	___	x	650 NSF per lane	=	___	
	A, B	Workroom	___	x	70 NSF per lane	=	+___	120 NSF min. 840 NSF max.
		Food Service						
	C	Snack Bar (incl. seating, kitchen, serving counter, storage)	___	x	27 NSF per lane	=	+___	
	D	Lounge (incl. seating, bar, storage)	___	x	20 NSF per lane	=	+___	
(1)	E	Combined Snack Bar/Lounge (incl. seating, kitchen, serving counter, bar, storage)	___	x	25 NSF per lane	=	+___	
(2)		Meeting/Function Room	___	x	12 NSF per lane	=	+___	
		Games						
		Video Games	___	x	30 NSF per lane	=	+___	
		Pool/Billiards	___	x	370 NSF per lane	=	+___	
					Subtotal Activity Areas	=	+___	
		ACTIVITY SUPPORT AREAS						
		Toilets			3% x Subtotal Activity Areas	=	+___	
		Administration (incl. pro shop, control counter, storage)			3% x Subtotal Activity Areas	=	+___	1,000 NSF max.
					Subtotal Activity Support Areas	=	+___	
		BUILDING SUPPORT AREAS						
(3)		Lobby/Circulation/Structure/ Partitions/Janitor			4-5% x (Subtotal Activity Areas + Subtotal Activity Support Areas)	=	+___	
		Mechanical/Electrical/ Communication Equip. Space			5-10 % x (Subtotal Activity Areas + Subtotal Activity Support Areas)	=	+___	
					TOTAL FACILITY ALLOWANCE	=	____	GSF

Notes for Space Allowance Table:

(1) Combined snack bar/lounge may be provided as an alternative to separate snack bar and lounge spaces.

(2) Meeting/function room seating capacity should be based on usage by other than bowling patrons. Usage projection must be justified by demand and economic operations analysis, serving local function requirements.

(3) Lobby/circulation/structure/partitions/janitor area -- use 5% factor for centers of 24 lanes or less; 4% for 26 lanes or more.

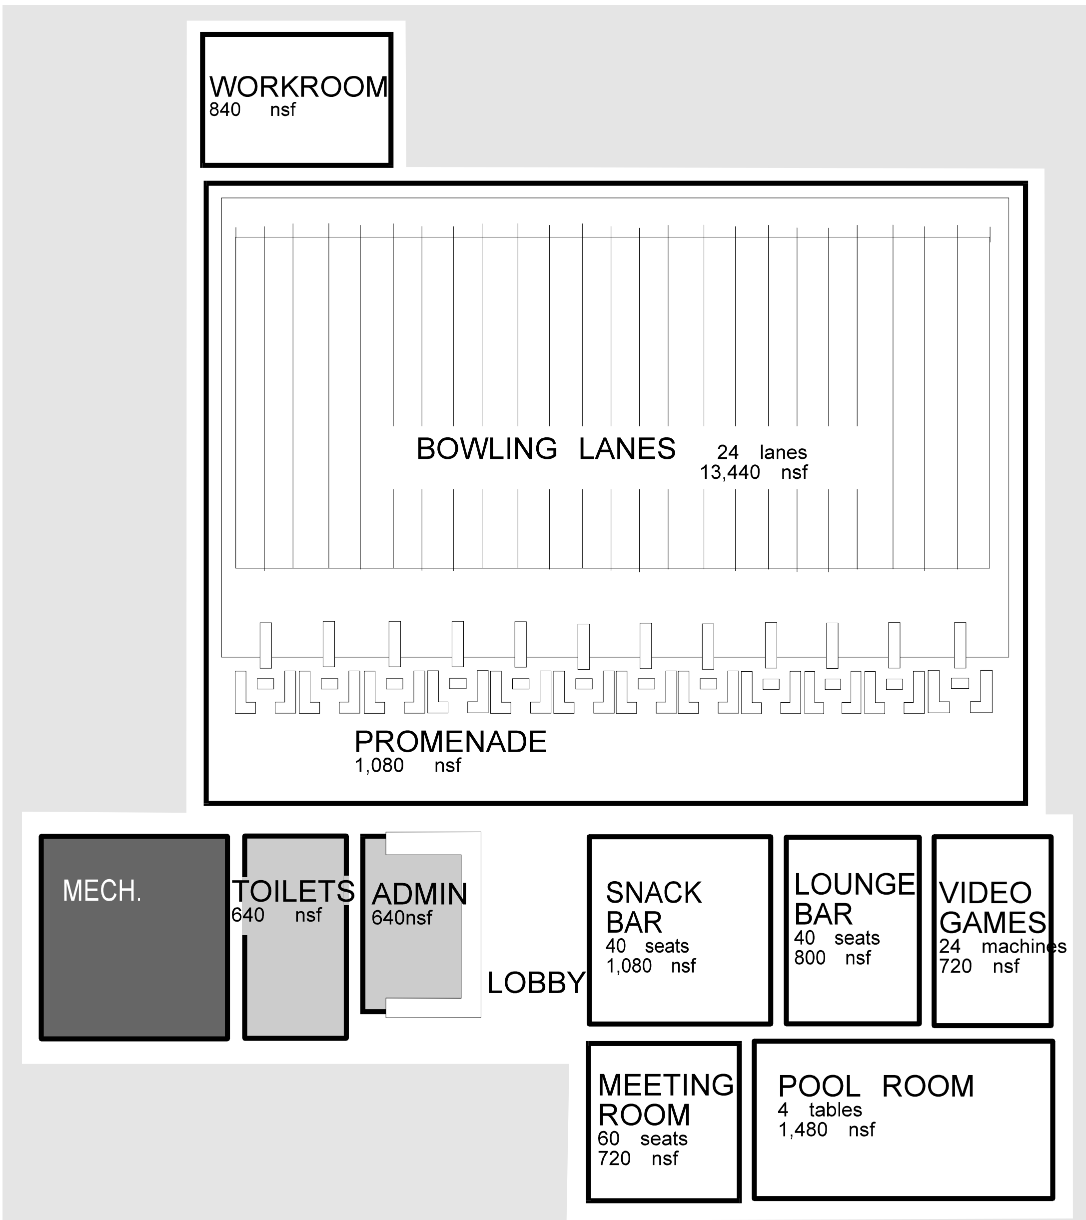
NSF = Net Square Feet

GSF = Gross Square Feet

Minimum or Maximum NSF = Minimum or maximum space allowance to be provided for the particular function or activity.

74040-7 **SAMPLE LAYOUT DIAGRAM**. A layout diagram is presented for a medium-size Bowling Center. This diagram is an example of the composition of such a facility in terms of its functional components, their respective sizes and adjacencies. The layout diagram is for illustrative purposes only.

Figure 74040-1. Bowling Center – Medium Capacity



740 42 COMMUNITY RECREATION CENTER (SF)
FAC: 7417
BFR Required: Y

SECNAV Approved Standards and Metrics are available for this CCN at http://mwr.navy.mil/mwrprgms/programstand.htm

74042-1 **GENERAL**. See General Notes to 740 series category codes for general instructions regarding facility allowance planning procedures.

74042-2 **DEFINITION**. The primary customer for the Community Recreation Center is the ship-based sailor, primarily younger (ages 18-24) enlisted personnel (mostly E1-E6). The mission of a Community Recreation Center is to support fleet readiness and enhance the morale of sailors through a professionally staffed, customer-oriented recreation program that serves the leisure needs of Fleet sailors. The Recreation Center is not for family use, but is intended for active duty personnel. A typical Community Recreation Center is located within convenient walking distance (5-10 minutes) of the piers where Navy vessels are berthed and should be conveniently located within a 5-10 minute walking radius of the majority of BEQ's. Activities accommodated in Community Recreation Centers include: “hanging out”, informal group activities, sports, parties, contests, tournaments, intra-ship competitions, special events, theme activities for holidays, music practice and "jam" sessions, talent shows, movie marathons, game show nights, demonstrations, classes, lectures, board games, card games, television, trivia contests and special programs for women, and other programs structured to meet the special needs of Fleet sailors. Some basic services such as vending and snack bars, laundromats and telephone banks, individual private telephone booths with seats (supervised by a cashier/control desk, and limited space for waiting) may be included for the convenience of patrons.

The local Command has the option of providing the total space allowance as one Recreation Center or distributing the square footage among several smaller facilities. The latter approach may be appropriate on larger bases with multiple concentrations of E1-E6 residential populations.

At installations with smaller populations, Rec. Center functions may be accommodated in a Community Center which serves both younger single sailors and older personnel with families. Facility planning criteria for Community Centers are addressed separately under Category Code 714 32.

Each location where a Navy fleet is based should be individually analyzed to understand its specific situation, and determine the mix of Community Recreation Center functions most appropriate to meet local needs. The space allowance should be based on the development of a justifiable program of functions, capacities and sizes, comparable to the Sample Space Programs contained in this criteria section.

74042-3 **RELATED FACILITIES**. Consideration should be given to collocating Community Recreation Centers with related facilities in order to (i) take advantage of potential savings in space requirements and operating costs (for example, consolidation of administrative and support spaces, site development and staffing), and (ii) provide users with the increased convenience of a clustered recreation complex. These related facilities include:

- 740 40 Bowling Center
- 740 44 Indoor Physical Fitness Center
- 740 53 Swimming Pool
- 740 64 Enlisted Mess, Open.
- Foodservice facilities such as Clubs
- Other MWR indoor and outdoor recreational facilities.

74042-4 **SPACE ALLOWANCE**. The maximum facility allowance for Community Recreation Centers is according to sizing criteria presented in Table 74042-1. The maximum gross square footage indicated in the table is the maximum total allowance per base, and may be used for a single large complex or multiple facilities.

Table 74042-1. Space Allowances for Community Recreation Centers

Ship-based Population (rounded to the nearest thousand)	Max. Gross Square Feet (total allowance per base)	Note
less than 1,500	0 GSF	(1), (2), (3)
2,000 to 5,000	6,600 GSF	(2), (3)
6,000 to 15,000	15,500 GSF	(2), (3)
16,000 and over	31,000 GSF	(2), (3), (4)

Notes for Table 74042-1:
(1) For installations with a ship-based population of 1,500 or less, the base Gymnasium, Bowling Center, Community Center, and other MWR facilities may serve the fleet sailor's recreational needs in lieu of a Community Recreation Center.
(2) Population numbers should be consistent with projected base loading data. For facility planning purposes at installations with deployable forces, the active duty demand population is comprised of all the non-deployable population, plus two-thirds of the deployable population, to reflect time away on deployment. However, calculation of the deployable population may be adjusted based on the actual deployment experience at individual installations.
(3) Round-off population up or down to the nearest thousand.
(4) For extra-large installations, the space allowance should be split up into a minimum of two facilities at separate sites conveniently located within proximity to ship-based population concentrations.

74042-5 **SAMPLE LAYOUT DIAGRAMS**. Layout diagrams are presented for a medium and large size Community Recreation Center. The diagrams are an example of the composition of such a facilities in terms of their functional components, and their respective sizes and adjacencies. The layout diagrams are for illustrative purposes only.

Figure 74042-1. Community Recreation Center – Medium Size Facility

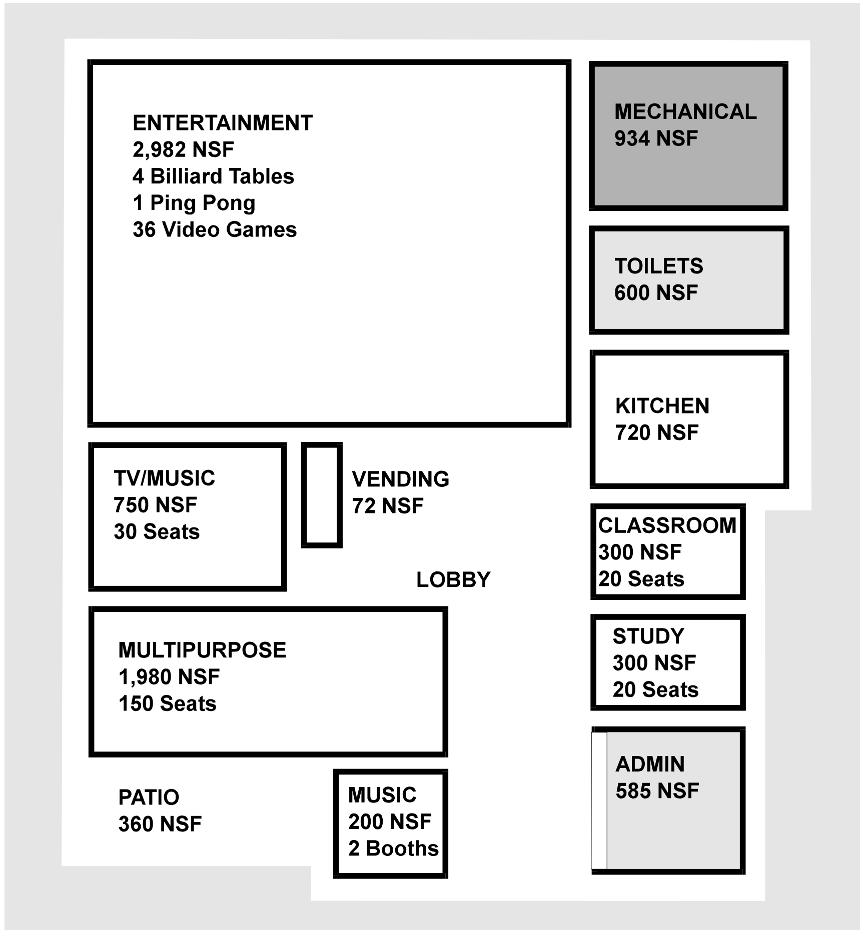


Figure 74042-2. Community Recreation Center – Large Size Facility

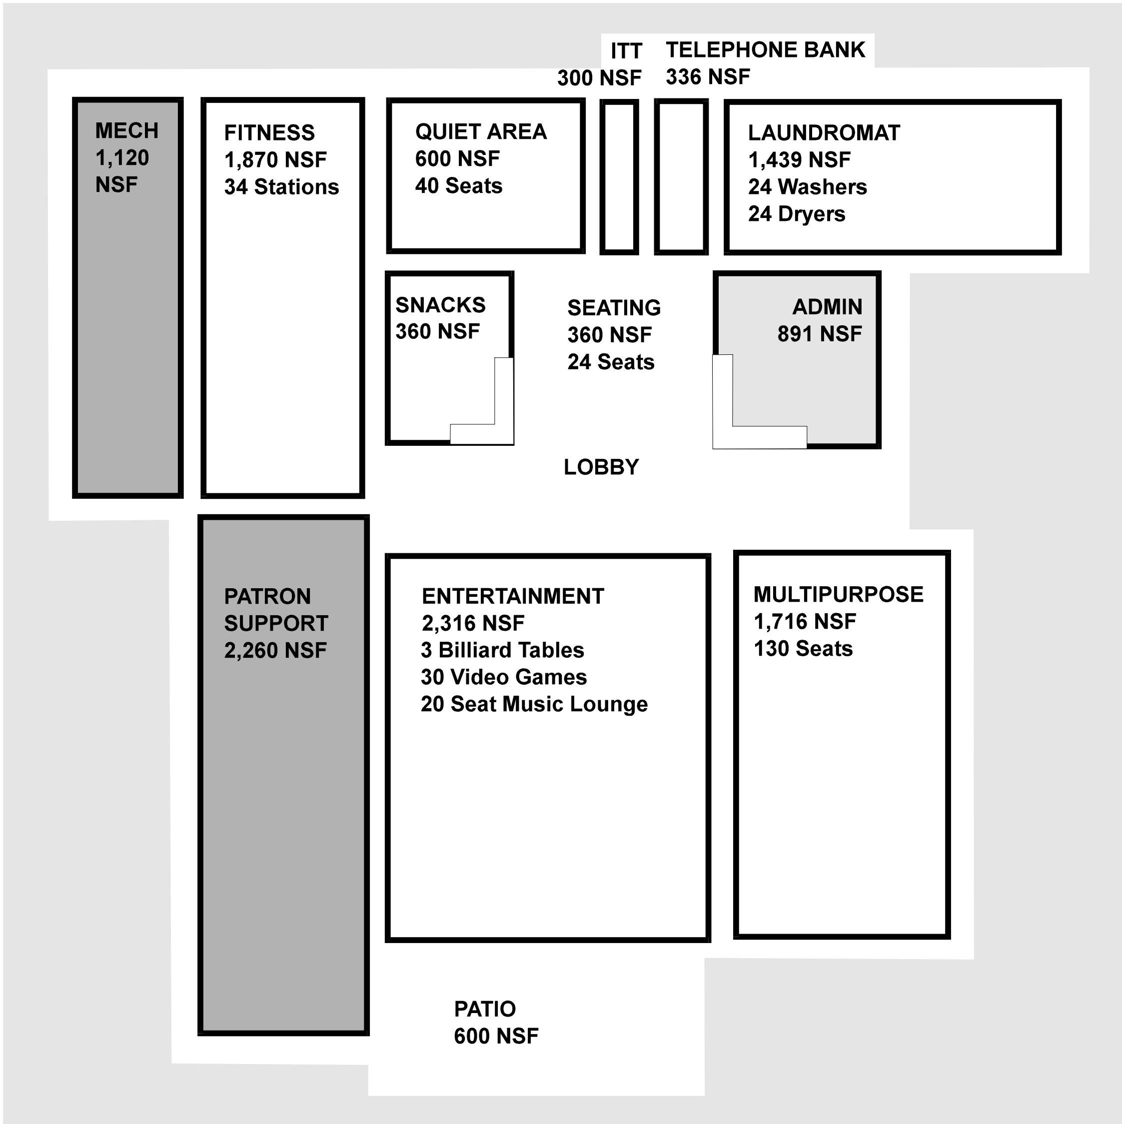


740 44 INDOOR PHYSICAL FITNESS CENTER (GYM) (SF)
FAC: 7421
BFR Required: Y

SECNAV-approved Fitness Standards and Metrics are available at http://www.navyfitness.org/fitness/fitness_standards_and_metrics/

- Facility design criteria is available in FC 4-740-02N, “Navy and Marine Corps Fitness Centers” at https://www.wbdg.org/dod/ufc/ufc-4-740-02

74044-1 **GENERAL**. Refer to the introductory material in 740-1, 740-2 and 740-3 found at the beginning of the 740 series category codes for general instructions regarding facility allowance planning procedures. Also, potential loading data sources are discussed in Chapter 1 of this criteria manual.

74044-2 **DEFINITION**. Physical fitness facilities provide facilities and support services to meet the individual physical fitness, coordination, skills development, and recreation and training needs of military personnel. Depending on the geographic location of the Installation, the facilities may also allow usage by family members, retirees and authorized civilians (refer to paragraph 74044-4.1).

Activities which may be accommodated in a facility include: aerobics, athletic gear issue, badminton, basketball, boxing, calisthenics, cardiovascular training, gymnastics, handball, jogging, martial arts, physical fitness training, racquetball, volleyball, Wally ball, weight-training, wrestling, group meetings, etc.

74044-3 **RELATED FACILITIES**. Consideration should be given to co-locating the facility with the following recreational facilities in order to: (1) take advantage of potential savings in space requirements and operating costs, and (2) provide users with the increased convenience of clustered facilities:

- 740 53 Indoor Swimming Pool
- 750 10 Outdoor Playing Courts
- 750 20 Playing Fields
- 750 30 Outdoor Swimming Pool.

74044-4 **SPACE ALLOWANCE**. The primary functional components of an Indoor Fitness Facility—Basketball Court, Aerobics/Exercise Area, Cardiovascular Training Area, Weight Training Area, and Indoor Playing Court—are sized based on installation population. Installation population ranges are as follows:

XSMALL	=	Population 0 - 500
SMALL	=	Population 501 - 3,000
MEDIUM	=	Population 3,001 - 7,000
LARGE	=	Population 7,001 - 14,000
XLARGE	=	Population 14,001 - 30,000
JUMBO	=	Population greater than 30,000

74044-4.1 Installation population is defined as Active Duty enlisted and officers, average on board students, transients, and reservists (see introductory paragraph 740-2.2.4). For overseas locations, include authorized civilians and family members in the installation population total. Population numbers should be consistent with projected base loading data.

74044-4.2 For facility planning purposes at installations with deployable forces, the active duty demand population is comprised of all the non-deployable population, plus two-thirds of the deployable population, to reflect time away on deployment. However, calculation of the deployable population may be adjusted based on the actual deployment experience at individual installations.

74044-4.3 Based on the calculated installation population size, determine the authorized facility space allowance from the interactive Fitness Space Program spreadsheet referred to in paragraph 74044-5.

74044-4.4 Space allowances developed from the spreadsheet are minimum allowances. For areas with large concentrations of military population, actual facility usage data may be used to justify additional space.

74044-4.5 Usage of stateside facilities by family members and retirees has been statistically incorporated in the space allowances used in the spreadsheet. These allowances are reviewed periodically by NAVFAC HQ, BUPERS, and CMC.

74044-4.6 MARINE CORPS INSTALLATIONS ONLY: For installations with a population exceeding 3,000 personnel, determine the fitness area space requirements as follows:

(a) Peak Load = 3.5% of installation population

(b) Fitness Area = 4.21 sq.m. (45.32 SF) per patron at peak load

Example: 6,000 population x 0.035 = 210 patrons at peak load.
210 patrons x 4.21 sq.m. (45.32 SF) = 884 sq.m. (9,517 SF)

For the purposes of this formula, the fitness areas include only the free weight, other resistance weight training equipment, and cardiovascular equipment areas and do not include space for stretching/warm-up/cool-down and the fitness assessment office.

74044-5 **SPACE PLANNING SPREADSHEET**. Minimum space allowances for Indoor Physical Fitness Centers are determined according to the planning criteria incorporated into the Fitness Space Program Spreadsheet, which can be found at https://www.wbdg.org/dod/unified-facilities-space-program-sustainability-spreadsheets.

The total allowance for the planned facility is shown as the sum total of the space allowances for each functional component. The number of units of each component required to meet the demand is obtained from the calculations associated with the installation population.

74044-5.1 Spectator seating (minimum capacity 200 for a small facility, maximum capacity 600 for a large facility) should be provided in the basketball court at 0.4 sq. m. (4.3 NSF) per person. The seating capacity should be justified by the use of the court for activities drawing significant numbers of spectators. Portable or telescopic bleachers may be used.

74044-5.2 Fitness area includes warm up/cool down area, free weights, circuit/weight training machines, and cardiovascular equipment (bicycle, stepper, and rower). Space for one Instructor station should be included in each separate Weight Training Area.

74044-5.3 Staff support spaces consist of:

(a) Control Counter and Administrative Area.
(b) Gear Issue and Laundry Room: Check out of athletic gear and recreation equipment for leisure use.
(c) Gym Equipment Storage Room: Equipment and supplies, such as roll-away baskets goals, volleyball standards, and gym floor coverings, roll-away bleachers, etc.

740 45 FITNESS ROOM (SF)
FAC: 7421
BFR Required: N

74045-1 **DESCRIPTION** Fitness Rooms are stand-alone, unsupervised gym facilities, usually containing cardio equipment and weight machines or free weights, in a single room or small group of rooms within a facility which is classified under a different CCN.

74045-2 **REQUIREMENT** This CCN is primarily for inventory purposes, and the quantity of “fitness rooms” at an installation should be considered when planning new facilities under CCN 740-44.

74045-3 **GUIDANCE** Refer to Commander, Navy Installations Command (CNIC) Instruction 1710.1 dated August 1, 2011 for policy and guidance concerning the operation of unmanned fitness spaces.

740 46 ROLLER/ICE SKATING RINK (SF)
FAC: 7418
BFR Required: N

74046-1 This category code is for inventory only and is no longer approved for new construction.

Table 74046-1
Space criteria for Roller/ice skating rinks

Military Strength (1)	Gross SF
Up to 2,000	10,000 note (2)
2,001 to 20,000	15,000 note (3)
20,001 and up	20,000 note (3)

Gross area is exclusive of mechanical room space.

(1) Military strength is defined as military population plus 50% of the dependent personnel.
(2) Plus additional space for support functions.
(3) Includes space for support functions.

740 47 INFORMATION, TICKETS AND TRAVEL OFFICE (SF)
FAC: 7446
BFR Required: Y

SECNAV Approved Standards and Metrics are available for this CCN at http://mwr.navy.mil/mwrprgms/programstand.htm

74047-1 **GENERAL**. See General Notes to 740 series category codes for General Instructions regarding facility allowance planning procedures.

74047-2 **DEFINITION**. The mission of the Recreation Information, Tickets and Travel (ITT) Office is to serve the military community's leisure needs by providing information on what to see and do locally, offering tours to nearby attractions, selling tickets for musical and theatrical performances, concerts, sporting and other special events, and providing options for Leisure Travel (this may include cruise and airline ticket service).

ITT facilities can vary according to local needs and may range from ticket selling booths and information counters to travel agency type accommodation with display and office desk/seating/waiting area configurations.

74047-3 **RELATED FACILITIES**. ITT operations may benefit from collocation with high traffic uses such as Base Exchanges.

74047-4 **SPACE ALLOWANCE**. The space allowance for ITT Offices is presented below in Table 74047-2.

74047-4.1 The number and appeal of local attractions and recreational opportunities will have a direct impact on the volume of ticket sales and information requests handled by an ITT Office. This volume is the primary determinant of the number of staff required to serve the market at individual bases. Based on analysis of existing operations, the staffing ratio indicated in Table 74047-1 is recommended.

Table 74047-1. Recommended Staffing For ITT Office

Active-Duty Installation Population	Full-Time Staff	Part-Time Staff	Note
250 or less	0	2	(1)
251-1,000	1	1	(1)
1,001-5,000	1	2	(1)
5,001-10,000	3	3	(1)
more than 10,000	3	4	(1)

Note for Staffing Table:

(1) Population numbers should be consistent with projected base loading data. For facility planning purposes at installations with deployable forces, the active-duty demand population is comprised of all of the non-deployable population, plus two-thirds of the deployable population, to reflect time away on deployment. However, calculation of the deployable population may be adjusted based on the actual deployment experience at individual installations.

Table 74047-2. Space Allowance for ITT Office

# Staff	Min. Gross Square Feet (rounded up to the next FTE)	Max. Gross Square Feet
1	200 GSF	450 GSF
2	300 GSF	720 GSF
3	500 GSF	990 GSF
4	840 GSF	1,210 GSF
5	1,100 GSF	1,410 GSF

Note for Space Allowance Table:

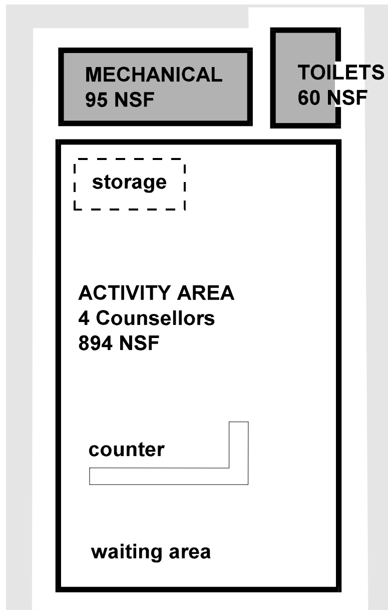
FTE = Full Time Equivalent, in situations where staffing is made up of full- and part-time employees.

74047-4.2 A good location is critical for running a successful ITT operation -- offices should be located in convenient, high visibility locations. Adequate parking should be available near the office per category code 852-10.

74047-4.3 Ticket booths may be located separately from other ITT facilities. On large bases requiring multiple booths, such booths may be clustered in one location or occupy several sites. When siting ticket booths, space for lines to form should be taken into account. Booth locations should allow for long lines to spill over into adjacent parking lots on those occasions when tickets for events drawing large audiences go on sale.

74047-5 **SAMPLE LAYOUT DIAGRAM**. A layout diagram is presented for an extra-large size ITT Office. This diagram is an example of the composition of such a facility in terms of its functional components, their respective sizes and adjacencies. The layout diagram is for illustrative purposes only.

Figure 74047-1. ITT Office – Extra Large Size Facility



740 49 AUSTERE INDOOR PHYSICAL FITNESS CENTER (GYM) (SF)
Facility planning criteria related to Austere Indoor Physical Fitness Centers can be found in FC 2-000-05N - Appendix F "Austere Facilities (Navy)," located at https://www.wbdg.org/FFC/DOD/UFC/fc_2_000_05n_appendixf.pdf.

740 52 GUN, SKEET AND/OR TRAP BUILDING (SF)

This CCN has been deleted. All existing assets should be reassigned to CCN 74090 Recreational Support Building.

740 53 SWIMMING POOL - INDOOR (INCLUDING POOLSIDE DECK) (SF)
FAC: 7422
BFR Required: Y

74053-1 **GENERAL**. See General Notes to 740 series category codes for General Instructions regarding facility allowance planning procedures.

The planning criteria presented below for Category Code 740 53 are also applicable to Category Code 750 30, Outdoor Swimming Pool -- Installation.

74053-2 **DEFINITION**. The primary purpose of Swimming Pools is to support physical readiness programs as well as instructional, informal and intramural activities, and to serve the recreational needs of active-duty military personnel and their spouses and children, retirees and DoD authorized civilians. Note that pools with training and fitness missions are funded as MILCON and purely recreational pools are funded as NAFCON. With the exception of extra-small and small bases, each installation must provide either an all-hands indoor or outdoor pool, or access to aquatic resources in the local community to meet patron recreational demands. All on-base aquatics facilities must be ADAAG/ABA compliant.

74053-2.1 The local Command has discretion over the decision to provide indoor or outdoor Swimming Pools. However, in general, large installations requiring more than one Swimming Pool to meet patron demand, may develop only one indoor pool. The Navy Fitness Program Manager (CNIC N-9) strongly supports an indoor pool collocated with the Fitness Center for all Medium and larger installations to support fitness swimming for Navy Physical Readiness Testing. Additional indoor pools may be developed on the basis of facility planning criteria specified for Combat Training Pool/Tank under Category Code 179 55.

74053-2.2 In addition to the swimming pool, special features such as diving wells, water slides and wading pools (refer to relevant UFC criteria at https://www.wbdg.org/dod/ufc and zero-depth entry areas may be incorporated in the facility if there is sufficient local justification.

74053-2.3 At smaller installations, the potential for shared use of a single pool for both recreational and training needs should be examined.

74053-3 **RELATED FACILITIES**. Consideration should be given to collocating the Swimming Pool with related recreational facilities in order to (i) take advantage of potential savings in space requirements and operating costs, and (ii) provide users with the increased convenience of clustered facilities. These related recreational facilities include:

- 740 44 Indoor Physical Fitness Center (Gym)
- Other MWR recreational and foodservice facilities such as Clubs and Recreation Centers (for purely recreational pools).

74053-4 **DEMAND**. Swimming Pool facilities are sized on the basis of the peak hour demand at each installation, as follows:

74053-4.1 Use projected base loading data to determine the population for each significant population category, as listed in Table 74053-1.

74053-4.2 Calculate peak hour demand by multiplying the population for each category by participation factors found in Tables 74053-1. Add the demand for all population categories to derive Total Demand for each functional component. Adjust the calculated Total Demand as indicated in Table 74053-1 for installations with alternative on-base recreational swimming facilities such as lakes or beaches.

74053-4.3 The determination of the length of the pool is a local Command decision which should be based primarily on patron demand and programmatic considerations. A 25-meter length pool is sufficient to satisfy most fitness and recreational swimming needs. The advantage of a 50-meter length is that the pool may be divided up into 2 or 3 areas and utilized simultaneously for different programs. For example, given sufficient demand, a 50-meter length pool divided into three separate areas may be used simultaneously for recreational swimming, lap swimming for fitness training, and an instructional class in life-saving techniques.

74053-4.4 Calculate the number of lanes required by dividing the Total Demand by the maximum capacity per hour per lane, indicated in Tables 74053-2 or 74053-3, depending on whether the local Command opts for a 25 meter length or 50 meter length Swimming Pool. In general, the development of Swimming Pools with fewer than 6 lanes and more than 10 lanes is not recommended.

Table 74053-1. Swimming Facility Demand Calculation

Note	Population Category	Population (per Base Loading)	x	Participation Factor	=	Peak Hour Demand	
(1), (2)	Enlisted	____	x	.0043	=	____	users
(1), (2)	Officers	____	x	.0045	=	+ ____	users
(1), (2)	Retirees	____	x	.0025	=	+ ____	users
(1), (2)	Authorized Civilians	____	x	.0015	=	+ ____	users
(1), (2), (3)	Dependents	____	x	.0093	=	+ ____	users
Total Demand (rounded to the nearest whole unit)					=	_______	users
Adjustment (**subtraction**) for installations with alternative on-base swimming facilities (such as developed beaches or lakes)						- 30	users
Total Demand (rounded to the nearest whole unit)					=	_______	users

Notes for Demand Calculation -- Table 74053-1:

(1) Population numbers should be consistent with projected base loading data. Officers are O-1 through O-10 and enlisted are E-1 through E-9. Civilians are authorized DoD employees. Retirees are all military retirees within a 30-minute drive of the installation.
For facility planning purposes at installations with deployable forces, the active duty demand population is comprised of all the non-deployable population, plus two-thirds of the deployable population, to reflect time away on deployment. However, calculation of the deployable population may be adjusted based on the actual deployment experience at individual installations.

(2) The participation factors used in the table may be revised periodically by NAVFAC HQ and CNIC (N-9), and the most current figures must be used in all demand calculations.

(3) Dependent population data may be obtained from the base MWR or Housing Offices.

Table 74053-2. Swimming Pool Capacity Calculation—25 Meter Length

Total Demand (rounded to the nearest whole unit)	=	____ users
Divide by maximum capacity per hour per lane (for a 25 meter length Swimming Pool)		÷ 4 users
Total number of lanes for a 25 meter length Swimming Pool	=	____ lanes

Table 74053-3. Swimming Pool Capacity Calculation—50 Meter Length

Total Demand (rounded to the nearest whole unit)	=	____ users
Divide by maximum capacity per hour per lane (for a 50 meter length Swimming Pool)		÷ 6 users
Total number of lanes for a 50 meter length Swimming Pool	=	____ lanes

74053-5 **SPACE ALLOWANCE**. In addition to determining the length of the pool and the number of lanes, a Swimming Pool facility requires a poolside deck area and concession area, as required. Space allowance criteria for these support facilities are presented in Table 74053-4. Furthermore, an adequately sized bathhouse is required and should be sized separately based on the criteria presented under Category Code 74089.

Table 74053-4. Space Allowances for Swimming Pools

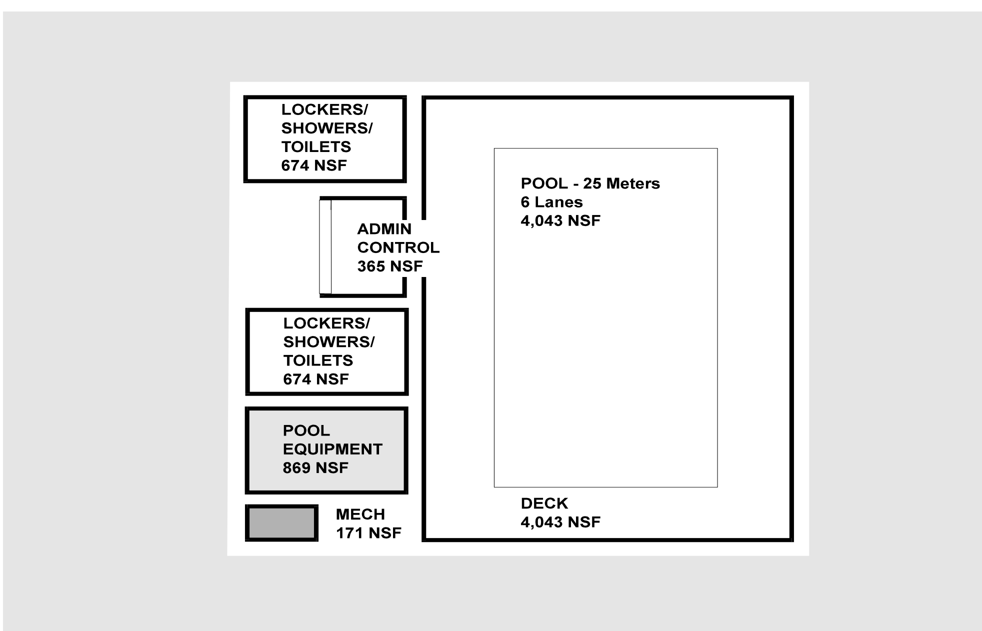
Note	Table	Functional Component	# Units	x	Space Allocation Factor	=	Total NSF	Min. or Max. NSF
		ACTIVITY AREAS						
(1), (2)	74053-2	Swimming Pool—25 meter length	____	X	674 NSF per lane	=	____	
(1), (2)	74053-3	Swimming Pool—50 meter length	____	X	1,348 NSF per lane	=	____	
		Poolside Deck Area						
		for Indoor Pool			100% total NSF lanes	=	____	
		for Outdoor Pool			300% total NSF lanes	=	____	
		BUILDING SUPPORT						
		Entrance/Circulation/Housekeeping			10-15% X subtotal NSF Activity Support Areas	=	____	
		Supplies/Janitor's Closet/ Structure/Partitions						
		Mechanical/Electrical/ Communication Equipment Space			5-10% X subtotal NSF Activity Support Areas	=	____	

Note	Table	Functional Component	# Units	x	Space Allocation Factor	=	Total NSF	Min. or Max. NSF
		Pool Plant Room (pump, filter, etc.)			20% total NSF lanes	=	____	
		Chemical Storage Room(s)			60 NSF per room	=	____	60 min.
		[Separate rooms for different chemicals, as per safety requirements]						
TOTAL FACILITY ALLOWANCE FOR SUPPORT FACILITIES (Gross Square Feet)						=	____	

Notes for Space Allowance -- Table 74053-4:
(1) The determination of the length of the pool is a local Command decision which should be based primarily on patron demand and programmatic considerations.
(2) Minimum lane width of 7' is recommended, with an additional 1'-6" outside lanes on both sides of the swimming pool.
NSF = Net Square Feet
GSF = Gross Square Feet
Minimum or Maximum NSF = Minimum or maximum space allowance to be provided for the particular function or activity.

74053-6 **SAMPLE LAYOUT DIAGRAM**. A layout diagram is presented for a 6-lane, 25-meter length Indoor Swimming Pool facility. This diagram is an example of the composition of such a facility in terms of its functional components, their respective sizes and adjacencies. The layout diagram is for illustrative purposes only.

Figure 74053-1. Indoor Swimming Pool – 25 Meters



740 54 MWR MILITARY RECREATION CENTER (SINGLE SAILOR CENTER / MARINE CENTER) (SF)

This CCN has been deleted. All existing assets should be reassigned to CCN 74042, Community Recreation Center.

740 55 YOUTH (6-18 YRS) & SCHOOL AGE CARE (SAC) (6-12 YRS) CENTER (SF)
FAC: 7417
BFR Required: Y

SECNAV Approved Standards and Metrics are available for this CCN at http://mwr.navy.mil/mwrprgms/programstand.htm

Design Criteria: UFC 4-740-06, webpage: https://www.wbdg.org/dod/ufc/ufc-4-740-06

74055-1 **GENERAL**. See introduction to 740 series category codes for General Instructions regarding facility allowance planning procedures.

74055-2 **DEFINITION**. The Youth Center is a social and recreational center primarily for use by children ages 6 to 18 in support of a Youth Program, as defined by DoD Instruction 6060.3 for School Age Care and DoD Instruction 6060.4 for Youth Programs. The Youth Center supports opportunities for youth to develop their physical, social, emotional, and cognitive abilities and to experience achievement, leadership, enjoyment, friendship, and recognition. Youth Program activities are generally offered free of charge or at a reasonable cost to parents to encourage participation and make them affordable to families. Included in the Youth Center facility, but generally separated from the youth program functions, is a School-Age Care (SAC) program. The SAC program provides accountable childcare (ages 6-12) for a fee. This includes picking children up after school or having them dropped off by school bus and keeping them until parents can pick them up from the center.

74055-3 **RELATED FACILITIES**. The location of Youth Centers should be determined primarily for proximity to the family housing areas served - preferably accessible by the youth within fifteen minutes’ walk or bicycle ride. Collocation of Youth Centers with other MWR facilities is recommended, in particular with youth playing fields, outdoor playing courts, and playgrounds. Consideration should be given to potential savings in Youth Center space requirements for specific Activity Areas, if other MWR facilities provide the same functions conveniently accessible and available for use by the youth.

74055-4 **SIZE DETERMINANTS**. Several factors determine the size of the facility:

Needs Validation Assessment. Conduct a Needs Validation Assessment to determine the need for each of the three core program areas (SAC Program, Youth Program, and Teen Program), the optional spaces, and the size of the populations to be served by each program. The three core program areas may be sized differently within a single facility. In some cases, one or more core program areas may not be needed if the population served is too small or if that population is served by other, existing facilities. When reviewing existing facilities, consider both facilities on the installation and facilities within the community, such as the Boys & Girls Clubs of America, 4-H, and other community centers.

74055-4.1 **SAC Program Size.** Once the need and population size for the SAC program area has been determined, the SAC area is sized based on the number of SAC activity rooms needed. Each room serves two ratio groups or a total of 30 children. The maximum number of SAC rooms permitted per facility is eight. If the needs assessment determines that more than eight rooms are required, provide multiple facilities.

74055-4.2 **Youth Program Size.** Once the need for the Youth Program area has been determined, the size is classified by the number of youth to be accommodated. Each size category provides for appropriate space in the Commons (including the Game Area, Snack and Eating Areas, and circulation space) and support areas and provides the appropriate number of activity rooms.

Table 74055-1. Youth Program Size Classifications

Size Class (No. of Youth)	Navy and Marine Corps Activity Rooms (General or Special)	Navy and Marine Corps Homework / Computer Rooms
Up to 60 Youth	1	1
61 to 90 Youth	2	1
91 to 135 Youth	3	2
136 to 155 Youth	4	2

74055-4.3 Teen Program Size Classifications: Once the need for the Teen Program area has been determined, classify the size as follows: Up to 15 teens, 16 to 30 teens, 21 to 45 teens, and 45 to 60 teens.

74055-4.4 Optional Spaces: Once the Core program areas have been sized (above), determine which optional spaces should be included. Optional spaces include administrative space, multipurpose room, music or multimedia room, laundry room, and outdoor activity area or open area.

74055-5 **SPACE PROGRAM**. The space program for the Youth Centers is developed using interactive Youth Center Space Program spreadsheets. Right click on https://www.wbdg.org/dod/ufc/ufc-4-740-06 to download the spreadsheet.

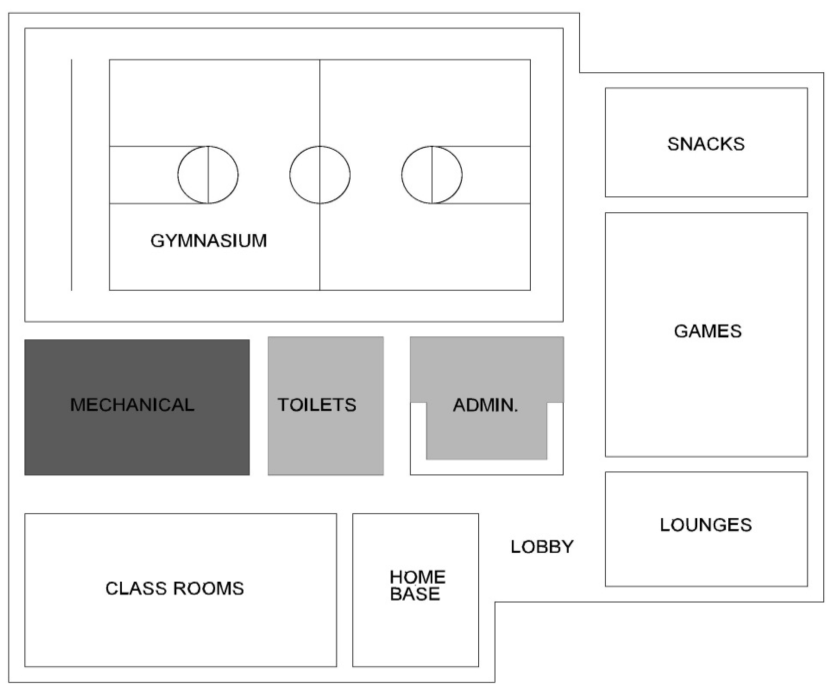
74055-6 **LOCATION DETERMINANTS.** Several factors determine the most appropriate and cost-effective location for a Youth Center.

74055-6.1 **Access.** The Youth Center should be easily accessible by busses (dropping off), privately-owned vehicles (either dropping off/picking up or parking), and by youth patrons via foot or bicycle. Weigh these considerations against the effect on traffic during peak pick-up/drop-off times. For example, a location near or adjacent to a school or child development center may be convenient for patrons, but it may cause traffic congestion at peak times. To accommodate parent/patron access, provide adequate parking as close as possible with a covered walkway to the facility, taking into account AT/FP requirements and parking criteria 852-10.

74055-6.2 **Safety.** Consider the above-noted pedestrian and bicycle traffic by the youth patrons. Minimize the degree to which the pedestrian and bike paths cross vehicular paths in the approach to the Youth Center site. If pedestrian and bike paths cross or run adjacent to busy streets and intersections, provide mitigation measures, such as bollards, to increase safety. Also consider the location of bus access for drop-off and pick-up.

74055-6.3 Other Factors: Consider locating near other facilities such as youth sports fields, open park space, etc.

Figure 74055-1. Youth Center – Medium Capacity



740 56 THEATER (SF)
FAC: 7431
BFR Required: Y

74056-1 **GENERAL:** See introduction to 740 series category codes for General Instructions regarding facility allowance planning procedures.

74056-2 **DESCRIPTION:** A facility for the presentation of motion pictures selected primarily for the entertainment of active duty Navy and Marine Corps personnel and their dependents, as well as other supported Services located at an Installation.

74056-3 **RELATED FACILITIES:** The mini theater that may be provided in the Military Recreation Center (Single Sailor Center) should not be counted against this allowance since it is not accessible to families and is a Category A facility. Theaters are operated as Category C facilities (see General Notes MWR) except for the 8-mm.-film program provided to the ships, Single Sailor Centers, and some Youth Centers. Consequently, to be programmed as a NAF project, any new or replacement theaters would have to be financially justified.

74056-4 **REQUIREMENT:** Space allowances for theaters will be determined by the following method:

74056-4.1 **Step 1:** Determine basic authorized number and seating capacity from Table 74056-1.

Table 74056-1
Authorized Numbers and Seating Capacities for Theaters

Military Population (see note 1)	**Authorized Number of Facilities**	**Seat Capacity**	**Dressing Rooms**
Up to 300	(see note 2)	n/a	n/a
301 to 1,000	1	General Purpose	Without
1,001 to 2,000	1	350	With
2,001 to 3,000	1	500	With
3,001 to 25,000	Program as an auditorium CCN 171-25		

Notes for Table 74056-1:

(1) Military population military strength plus 50% of dependents.

(2) Accommodate in either CCN 740-42 “MWR Community Recreation Center” or CCN 740-54 “MWR Military Recreation Center”.

74056-4.2 **Step 2:** Determine Environmental Adjustment Factor (EAF) from Table 74056-2 and adjust the seat capacity value obtained from Step 1 accordingly. The maximum allowances obtained from Table 74056-1 must be adjusted to reflect available community support and other recreational facilities available on the Installation. Table 74056-2 gives the environmental variables and the individual EAF's for each variable. The product of these individual EAF's is the final EAF to be used. (An example of EAF use follows Table 74056-2.)

Table 74056-2. Environmental Adjustment Factors for Theaters

Condition	**Civilian Community Facilities** (see note 1)	**Other Recreational Facilities** (see note 2)	**Current Installation Theater** (see note 3)
Normal	0.70	0.70	1.00
Poor	1.00	1.00	0.50

Notes for Table 74056-2:

(1) Civilian Community Facilities
Normal: At least one civilian theater or drive-in within 30 minutes driving time of installation and local TV or CATV reception.
Poor: No civilian theater or drive-in within 30 minutes driving time or no local TV or CATV.

Notes for Table 74056-2 (continued):

(2) Other Recreational Facilities (On-installation)
Normal: Three or more of the following five facilities are either available or construction funds have been appropriate:
1) a club or open mess
2) bowling alley
3) hobby shop
4) gymnasium;
5) playing courts and fields.
Poor: Two or less of the five facilities are available and no construction funds have been appropriated for them.

(3) Current Installation Theater (assuming films are shown nightly and changed weekly)
Normal: At least two shows per week have audiences in excess of 67% of capacity.
Poor: At least two shows per week have audiences less than 50% of capacity.

EXAMPLE:	*Assume the military strength is 6,000. There are several theaters close by and the TV reception is good. The installation has only open messes and a gymnasium that currently doubles as a theater. Current attendance is less than one-third full for two shows.*

1. ***Maximum seating allowance*** *from Table 74056-1 is:* *1,000 seats*

2. ***Environmental Adjustment Factors:***
(a) Civilian community – ***normal:*** *select 0.70*
(b) Other recreational facilities - ***poor*** *select 1.00*
(since only two of the five types are available)
(c) Current attendance - ***poor:*** *select 0.50*
Therefore the Environmental Adjustment Factor is (0.70) x (1.00) x (0.5) = 0.35

3. ***Adjusted seating capacity*** *is: 1,000 x 0.35 =* ***350 seats***
(Use Table 74056-3 for GSF Allowance)

74056-4.3 **Step 3:** Determine the gross square footage (GSF) requirements for the facility, based on the adjusted seating capacity from steps 1 and 2, and applied to Table 74056-3. All facilities, except the General Purpose facility, will be provided with a stage.

Table 74056-3. Space Allowances For Theaters

Adjusted Seat Capacity	Gross Square Feet (with dressing rooms)	Gross Square Feet (without dressing rooms)
General Purpose	3,500	3,500
350	6,500	5,800
500	10,900	9,600
1,000	17,200	15,500

740 60 COMMISSIONED OFFICERS' CLUB (SF)
FAC: 7333
BFR Required: N

74060-1 This category code has been deleted. All existing assets should be reassigned to category code 740 67, All Hands Club, and new facilities will be programmed under category code 740 67 and require CNIC N925 and N944 concurrence.

740 64 ENLISTED CLUB (SF)
FAC: 7333
BFR Required: N

74064-1 This category code has been deleted. All existing assets should be reassigned to category code 740 67 All Hands Club, and new facilities will be programmed under category code 740 67 and require CNIC N925 and N944 concurrence.

740 67 ALL HANDS CLUB (SF)
FAC: 7333
BFR Required: Y

Design Criteria: (This category code will become a primary facility in future revisions as: Food / Beverage / Entertainment / Facilities - Clubs) New projects will be reviewed by CNIC N925, N944. Design guidance can be found in FC 4-722-01N Navy and Marine Corps Dining Facilities.

74067-1 **DEFINITION.** This code is used to plan the space requirements for a single facility to accommodate on-base facilities, surrounding competitive environment and size of the supporting population. The facility may include one or more of the following components: Full Table Service Restaurant, Quick Service (over the counter) Restaurant, Banquet/Catering Room(s), Cafeteria, Bingo space, Gaming Room (OCONUS, non-US), Beverage Lounge(s) (may be rank specific) with or without Entertainment. Support spaces such as offices, restrooms, storage, etc. would also be included.

74067-2 **SPACE ALLOWANCE.** For space requirement purposes only, the space allowances in Table 74067-1 may be used. However, the actual size of any programmed club project is based upon market analysis and consequent financial projections that must justify programming of the facility and comply with the financial performance requirements of DODINST 7700.18. Contact CNIC N925, N944 for additional information.

Table 74067-1. Space Allowances for All Hands Clubs

Size Classification	Installation Population	Gross Area (SQ.M./SF)
Small	< 3,000	743.22 sq.m/8,000 SF
Medium	3,001 – 7,000	1,300.64 sq.m/14,000 SF
Large	7,001 – 14,000	1,858.06 sq.m/20,000 SF
Extra Large	> 14,000	2,415.48 sq.m/26,000 SF

740 68 MWR OPERATED CATERINGING AND CONFERENCE CENTER (SF)
FAC: 7333
BFR Required: Y

74068-1 This facility may be stand alone or combined with and Officers' Club, Enlisted Club, All Hands Club, Bowling Center, Marina Clubhouse, or Golf Clubhouse. The Catering facility often includes bingo operations in at least one room. The size of the facility is based upon market analysis and consequent financial projections that must justify programming of the facility. New projects will be reviewed by CNI N9.

740 70 CHIEF PETTY OFFICERS CLUB (SF)
FAC: 7333
BFR Required: Y

74070-1 This category code has been deleted. All existing assets should be reassigned to CCN 74067 All Hands Club and new facilities will be programmed under CCN 74067 and require CNIC N925, N944 concurrence.

740 71 EXCHANGE PACKAGE STORE (SF)
FAC: 7346
BFR Required: Y

74071-1 Navy Exchange facilities requirements are developed by the Navy Exchange Service Command Planning Branch, 3280 Virginia Beach Blvd, Virginia Beach, VA 23452-5724. See General Notes for NEX facilities at the beginning of the 740 Series.

74070-2 This facility provides for retail sales to authorized customers and the transfer (wholesale) of alcoholic beverages to clubs and open messes. A select few locations have package stores operated by MWR as permitted by Congress.

740 74 CHILD DEVELOPMENT CENTER (SF)
FAC: 7371
BFR Required: Y

Child Development Center Space Program spreadsheet, located at:
https://www.wbdg.org/dod/unified-facilities-space-program-sustainability-spreadsheets

Design Criteria: FC 4-740-14N "Navy and Marine Corps Child Development Centers"
https://www.wbdg.org/dod/ufc/fc-4-740-14n

74074-1 **DESCRIPTION.** A Child Development Center (CDC) is a facility which provides full and part-day developmental child care services for children from ages of 6 weeks old through 5 years of age.

74074-2 REQUIREMENT. Access to developmental child care programs are available to the dependents of active duty military, activated reservists and guardsmen, DoD civilian personnel, and DoD contractors.

74074-2.1 **Demand:** The demand shall be determined by actual count of military dependents through age 5 receiving Installation support who will be using the facility. Actual count must be determined by questionnaire, survey, documented historical data or similar process. Dependents of Civilian Employees through age 5 may be included as per DOD Instruction 6060.2 "Child Development Programs" of March 3, 1989. Justification remains the responsibility of the sponsoring command with requirements based on local needs. Adjust these figures for any projected increase or decrease in military and civilian employee population or mission changes.

74074-2.2 **Demand for New Activities:** Determine the total number of married military families receiving direct Installation support and multiply by 15 percent, plus the number of children of single parent military families receiving direct Installation support. When including dependents of civilian employees, determine the total number of civilian employees and multiply by 2.5 percent.

74074-2.3 **Facility Classification:** The CDC facility sizes are classified as follows, according to the capacity of children it can accommodate:

Table 74074-1 - CDC Size Classifications

Size	Capacity
Small	48 to 100 children
Medium	100 to 200 children
Large	201 to 300 children
Extra Large	More than 300 children

74074-2.4 **Capacity:** The minimum capacity for a CDC is 48 children. When a need is identified to accommodate more than 300 children (an extra-large facility size), consideration should be given to expanding the Family Home Care Program to supplement the requirement for center-based care. Contact the CNIC Child and Youth Programs (CYP) Facilities Specialist (N926) to determine Family Care options before developing requirements for additional CDC’s.

74074-2.5 **Program Requirement:** Planners developing the requirement for a new facility must combine the facility space allowances provided in the space program spreadsheet (refer to paragraph 74074-2) and the outdoor activity areas referred to in paragraph 74074-2.6.

74074-2.5.1 Entrance canopies may be provided for pickup and discharge of passengers in inclement weather regions.

74074-2.6 **Outdoor Activity Areas:** Provide an area for outdoor activity equipment and play, based on 130 SF per child for 50% of the facility capacity. Larger areas can be programmed if authorized by CNIC N926.

74074-2.6.1 Outdoor shade structure(s) are required for locations where extreme sun conditions occur 80% of the time. In these locations, provide for shade structures over 50% of the total outdoor activity area. If there are trees providing natural shade, then the shade structures could be reduced accordingly. Shade structures (not enclosed) are provided without adding to the building gross square footage calculation and may be provided either by extending building overhangs over the activity area or by providing stand-alone structures.

74074-2.6.2 Outdoor storage (for playground materials) may be provided as part of the primary facility or as a separate storage shed. This area is included in the results of the space programming spreadsheet.

74074-2.7 **Impact on Neighborhood.** The planner and program manager must give significant consideration to the impact that a large CDC will have on land use, peak traffic patterns and safety of the children. Providing CDC facilities adjacent to or in close proximity to another CDC, youth center, or school facility may have an impact on traffic, but doing so should not be precluded. Adjacent facilities may be more customer responsive in that a parent may have children in both facilities. Additional site criteria can be found in FC 4-740-14N. In addition, OPNAVINST 1700.9E should be reviewed as a source for site and facility guidance.

74074-2.8 **Location**: Significant consideration must be given by the facility planner, in coordination with CNIC and the Installation Commander, to properly locate the CDC in an appropriate and compatible location with regard to the health and safety of the children. Also take into account the practical future expansion of the CDC, adjacent facilities and associated Force Protection issues.

74074-2.9 **Land area requirements**. Table 74042-2 provides planning guidance for the minimum land area that is required to properly site a new CDC facility. This estimated area will accommodate the CDC facility, the outdoor activity area, parking, service areas, and vehicular and pedestrian circulation.

Table 74074-2 - CDC Site Size Requirements

CDC Size	Min Site Size- (Acres)	Min Site Size (Hectares)
Small	2.07	0.84
Medium	3.78	1.53
Large	5.15	2.08
Extra Large	6.35	2.57

74074-3 **SPACE PLANNING SPREADSHEET**. Minimum space allowances for Child Development Centers are determined according to the planning criteria incorporated into the Child Development Center Space Program spreadsheet, which can be found at https://www.wbdg.org/dod/unified-facilities-space-program-sustainability-spreadsheets

74074-3.1 Space allowances provide for infant, pre-toddler, toddler, and pre-school age activity rooms/spaces, infant crib space, isolation area with toilet, lobby/reception, food service/kitchen, staff training / lounge / curriculum development spaces, offices, laundry, toilets, janitor closet(s), and storage.

740 75 NAVY FLYING CLUB FACILITY (SF)
FAC: 7414
BFR Required: Y

Design Reference: Federal Aviation Regulation (Part 141)

74075-1 The Navy Flying Club is a recreational flying activity located on or near military installations used by authorized personnel and approved by the Department concerned. Flying Clubs are Category C facilities (See General Notes MWR) and must be financially justified for new construction. The space allowances shown in the table below for aero clubs are intended to provide hangar space to be used to maintain aircraft and for aircraft storage during inclement weather to provide ramp space for outdoor aircraft tie-down area, and to provide multipurpose space for administrative, training, classrooms, operations scheduling, safety meetings, and flight planning. Space requirements are based on the number of aircraft operated by the club.

74075-2 Each Navy Flying Club facility must have adequate area for refueling operations, i.e. fuel truck or permanent tanks that meet all local, state, and federal regulations pertaining to that operation.

Table 74075-1. Space Allowances for Aero Clubs

Number of Aircraft	Gross SF Hangar Space	Gross SF Multi-Purpose Space	Gross SF + Ramp Space (Approx. 45' x 20')
1	900	500	Note (1)
2 to 5	2,300	1,000	Note (1)
6 to 10	3,800	1,200	Note (1)
11 to 15	5,300	1,500	Note (1)
16 to 20	6,800	1,700	Note (1)
For each additional 5, add	1,500	375	Note (1)

Note (1): For each aircraft operated multiply by 1350 SF to obtain the required Ramp Space. (Number of aircraft_ X 1350 SF = Ramp SF)

740 76 LIBRARY (SF)
FAC: 7416
BFR Required: Y

SECNAV Approved Standards and Metrics are available for this CCN at http://mwr.navy.mil/mwrprgms/programstand.htm

74076-1 **Main Libraries.** This facility is for recreational reading and study. Space allowances are given in Table 74076-1. The allowances may be increased to 10% where the facility is also designated as a command reference center. If bookmobiles are operated from the main library, an additional 300 SF per bookmobile will be required for book storage, trucks, and work space for bookmobile staffs.

74076-2 **Branch Libraries.** Based on individual justification, branch libraries may be provided in support of an educational services office or for each increment of 3,000 military strength over 10,000. Each branch library shall not exceed 4,000 gross SF area. Where practical, the individual incremental allowances may be combined in one branch library.

For BFR purposes: The total allowance is the main library plus the branch libraries.

Table 74076-1. Space Allowances For Main Libraries

Military Population (1)	Gross SF
Up to 500	2,500 (2)
501 to 1,500	4,500
1,501 to 2,500	6,250

Military Population (1)	Gross SF
2,501 to 4,000	8,000
4,001 to 6,000	10,500
6,001 to 8,000	12,000
8,001 to 12,000	18,000
12,001 to 16,000	20,000
16,001 to 20,000	24,000
20,001 to 26,000	30,000
26,001 to 32,000	36,000
32,001 to 40,000	44,000
40,001 to 50,000	54,000
50,001 to 60,000	64,000
60,001 to 70,000	72,800
70,001 to 80,000	81,000
80,001 to 90,000	90,000
90,001 to 100,000	98,000
For each additional 10,000, add	8,000

(1) Military population is active duty military plus 40% of dependents.
(2) Accommodate in other facilities.

740 77 MWR READY ISSUE/SHOP STORES/MISC. STORAGE (SF)
FAC: 4421
BFR Required: Y

(Not applicable to Marine Corps activities)

74077-1 Storage facilities for miscellaneous equipment and/or goods related to community support will be provided only where they can be individually justified. There are no criteria for this type of facility. General information on normal stacking heights, SF per measurement ton requirements and other parameters are provided in Category Code 440 series.

740 78 RECREATION PAVILION (SF)
FAC: 7531
BFR Required: Y

74078-1 The purpose of this facility is to support recreation areas such as parks, playgrounds, picnic areas, beaches, etc. This facility may include lounge, toilets, bathhouses, storage areas, snack bars, and/or concession stand for limited and related items as required. This CCN also includes concessions stands, restrooms, and announcer's booth facilities associated with ball fields. Space allowances may be utilized in varying numbers and sizes of pavilions. See Table 74078-1 for space allowances.

Table 74078-1
Space Allowances For Recreation Pavilions

Military Population (1)	Gross SF
Up to 1,000	800
1,001 to 3,000	1,350
3,001 to 7,000	2,600
7,001 to 10,000	3,200
10,001 to 15,000	4,000
15,001 to 20,000	4,900
20,001 to 25,000	5,600
25,001 to 30,000	6,300
30,001 to 40,000	7,300
40,001 to 50,000	8,500
50,001 to 60,000	9,600
60,001 to 70,000	10,600
70,001 to 80,000	11,500
80,001 to 90,000	12,400
90,001 to 100,000	13,300
For each additional 10,000 add	900

(1) Military population consists of active duty military plus 60% of dependent population and 25% of retirees supported by the installation.

740 79 RIDING STABLES (SF)
FAC: 7444
BFR Required: Y

74079-1 Provides space for single stalls, box or double stalls, treatment stalls, quarantine areas, quarters for one operator, hay storage area, grain room, tack lockers, sweat pad and blanket drying area, office, and toilets. See Table 74079-1 for space allowances. This CCN also includes boarding stable operations. Both stable types are Category C facilities (See General Notes MWR) and require financial justification for new construction.

Table 74079-1
Space Allowances for Riding Stables

Military Population (1)	Gross SF
Up to 100	None
101 to 1,000	2,100
1,001 to 3,000	2,500
3,001 to 5,000	3,600
5,001 to 7,000	4,700
7,001 to 10,000	5,900
10,001 to 15,000	7,700
15,001 to 20,000	9,600
20,001 to 25,000	11,250
25,001 to 30,000	12,800
30,001 to 40,000	17,800
40,001 to 50,000	18,600
50,001 to 60,000	20,400
60,001 to 70,000	22,800
70,001 to 80,000	24,900
80,001 to 90,000	27,000
90,001 to 100,000	29,000
For each additional 10,000 add	1,600

(1) Military population consists of military strength plus 25% of dependent population.

740 80 GOLF CLUBHOUSE (SF)
FAC: 7413
BFR Required: Y

74080-1 **GENERAL**. See General Notes to 740 series category codes for General Instructions regarding facility allowance planning procedures. Contact CNIC (N9) for additional information.

74080-1.1 In siting golf clubhouses, it is important for sight lines from the pro shop to the first and tenth holes to be maintained. It is also desirable for sight lines from the patio or snack bar areas to the ninth and eighteenth greens to be maintained.

74080-1.2 All golf clubhouse projects must be financially justified as Category C operations. See General Notes MWR at the beginning of the 740 Series.

74080-1.3 Catering Facilities (740-68) may be constructed as part of a golf clubhouse to serve both golf functions and other catering business. When this is done, the restroom support areas should be calculated separately for the golf clubhouse and the catering facility.

74080-2 **DEMAND.** The primary functional components of a Golf Clubhouse - Foodservice and Golf Equipment Areas - are sized based on the number of holes of the golf course and other user demand factors, as follows:

74080-2.1 Use Table 74080-1 to determine the seating demand for each foodservice area. Calculate the number of snack bar and lounge or combined snack bar/lounge seats required to serve golfing patrons, based on the number of golf course holes. Additional capacity may be required to serve non-golfing patrons in snack bar, lounge, and function room spaces, as directed in Notes (1) and (2) to Table 74080-1. Add golfing and non-golfing patron demand to determine number of seats required for each functional component. Food service seating areas should be sufficient to seat a full golf scramble at one time. This would indicate a capacity of 72 seats for 9-hole courses and 144 seats for 18-hole or larger courses. This seating could be in a function room, a snack bar/dining area, a covered patio, or a combination of adjacent areas. Demand for both dining space and pro shop is developed not only by population and number of holes, but also by the number of rounds of golf played on an annual basis.

74080-2.2 Multiply the number of seats required for each functional component by the space allocation factors in Table 74080-2.

74080-2.3 Demand for golf equipment facilities - pro shop, golf bag and cart storage - is directly related to the number of golf course holes. Multiply the number of 9-hole units by the space allocation factors in Table 74080-2. Golf Club Storage for privately owned clubs is not generally a primary functional component because the return on investment for the space required is insufficient to break even financially. Storage of rental clubs is a subset of the Pro Shop along with retail merchandise stock storage.

74080-2.4 Add the net square footage (NSF) for all components and add support area factors as directed in Table 74080-2, to derive the Total Facility Allowance for the Golf Clubhouse.

74080-2.5 Demand for golf course support facilities—golf cart storage—is directly related to the number of golf course holes and golf cars. Criteria for maintenance and storage facilities can be found in Category Code 740 82 "Golf Storage and Maintenance Facility" Cart storage facilities are supported for the number of MWR owned or leased carts. The number of MWR golf carts should be approximately 18 per 9 holes. The number may increase for snack/beverage service carts and course marshal carts. Where the cart storage is located away from the golf maintenance facility a separate maintenance area should be included within the facility. Construction of space for rental to private golf cart owners is not authorized. Multiply the number of units for each functional component by the space allocation factors in Table 74080-3 to determine the space allowances.

Table 74080-1. Golf Clubhouse Foodservice Seating Capacities

Note	Number of Golf Course Holes	Snack Bar	Lounge	Combined Snack Bar/Lounge	Function Room
(1), (2)	9-18	20	10	25	--
(1), (2)	27-36	40	20	50	--
(1), (2)	45-54	60	30	75	--

Notes for Foodservice Seating Capacities:

(1) The figures for seating capacities accommodate only golfing patron demand. Additional snack bar, lounge, and combined snack bar/lounge capacity for non-golfing patrons must be justified by demand analysis and economic operations projections based on local conditions. For example, if the golf course is situated near other installation facilities with significant numbers of workers, there may be a substantial number of non-golfing patrons at lunchtime. In the absence of specific local installation data, assume that non-golfing patron demand requires a 100% increase in snack bar seating and 50% increase in lounge seating from that required to meet the demand of golfing patrons alone.

(2) The capacity of a function room should be based on the size of special events and large group functions for which there is a local requirement, justified by demand analysis and economic operations projections.

74080-3 **SPACE ALLOWANCES**. Space allowances for Golf Clubhouse facilities are determined according to the planning criteria presented in Tables 74080-2 and 74080-3, below. The total allowance for a facility is the sum total of the space allowances for each functional component. Seating capacity requirements for foodservice components are obtained from Table 74080-1.

Table 74080-2. Space Allowances For Golf Clubhouses

Note	Table	Functional Component	# Units	x	Space Allocation Factor	=	Total NSF	Minimum NSF
		ACTIVITY AREAS						
		Foodservice						
	A	Snack Bar (including seating, kitchen, storage)	___	x	27 NSF per seat	=	____	
	A	Lounge (including seating, bar, storage)	___	x	20 NSF per seat	=	+ ____	
(1)	A	Combined Snack Bar/ Lounge (including seating, kitchen, bar, storage)	___	x	25 NSF per seat	=	+ ____	
	A	Function Room (including seating, service kitchen)	___	x	17 NSF per seat	=	+ ____	

Note	Table	Functional Component	# Units	x	Space Allocation Factor	=	Total NSF	Minimum NSF
		Pro Shop (including sales area, stockroom)	___	x	500 NSF per 9 holes	=	+ ____	530
(2)		Golf Cart Storage/Rental	___	x	150 NSF per 9 holes	=	+ ____	200
					Subtotal Activity Areas	=	____	
		ACTIVITY SUPPORT AREAS						
		Patron Support (including lockers, showers, toilets)			20% x Subtotal Activity Areas	=	____	
		Administration/Storage/ Support			5% x Subtotal Activity Areas	=	+ ____	120
					Subtotal Activity Support Areas	=	____	
		BUILDING SUPPORT AREAS						
		Lobby/Circulation/ Structure/ Partitions			25% x (Subtotal Activity Areas + Subtotal Activity Support Areas)	=	+ ____	
		Mechanical/Electrical/ Communication Equip. Space			5-10% x (Subtotal Activity Areas + Subtotal Activity Support Areas)	=	+ ____	
(3)					**TOTAL FACILITY ALLOWANCE**	=	____	GSF

Table 74080-3. Space Allowances for Golf Course Support Facilities

Note	Table	Functional Component	# Units	x	Space Allocation Factor	=	Total NSF	Minimum NSF
(4)		Golf Car Storage	_____	x	65 NSF per car	=	_____	

Notes for Space Allowance Tables 74080-2 and 74080-3:

(1) A combined snack bar/lounge may be provided as an alternative to separate snack bar and lounge areas.

(2) Minimum 200 NSF for golf bag and cart storage allows for 60 club sets (both patron-owned and rental), with bags and carts.

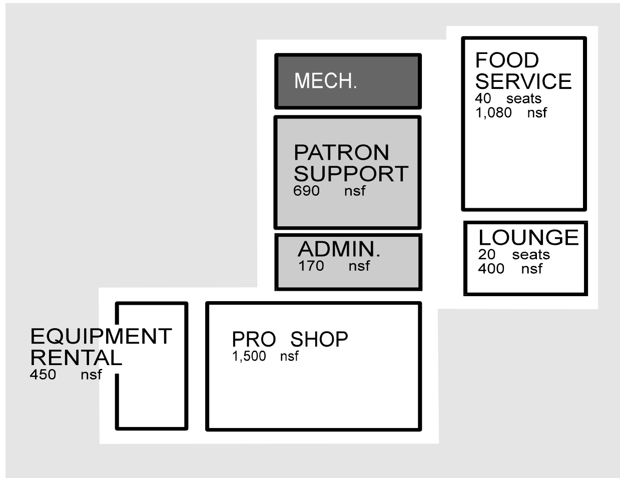
(3) Covered outdoor space (such as an entrance canopy or sheltered patio) is counted at 50% of its area, and must be included within the total gross square footage allowance for the facility.

(4) For safety reasons, the golf car storage facility should be a separate structure, or designed for safety separation if accommodated in the same structure.

NSF = Net Square Feet
GSF = Gross Square Feet
Minimum NSF = Minimum space allowance to be provided for the particular function or activity.

74080-4 **SAMPLE LAYOUT DIAGRAM**. A layout diagram is presented for a medium-size Golf Clubhouse facility. This diagram is an example of the composition of such a facility in terms of its functional components, their respective sizes and adjacencies. The layout diagram is for illustrative purposes only.

Figure 74080-1 Golf Clubhouse – Medium Capacity



740 81 MWR RENTAL ACCOMMODATIONS (SF)
FAC: 7442
BFR Required: Y

74081-1 **GENERAL**. See General Notes to 740 series category codes for General Instructions regarding facility allowance planning procedures. Contact CNIC (N944) for additional information.

74081-2 **DEFINITION.** MWR Rental Accommodations are permanent "stand-alone" or multiplex structures. They may take the form of modern motels, multi-level hotels, primitive camping cabins with no utility connections, or almost anything in between, depending on the geography, the market being served, and demand. Such MWR Rental Accommodation facilities are typically developed to provide recreation overnight and extended stay units in locations which offer outdoor leisure opportunities such as boating, canoeing, fishing, hiking, skiing, golfing, swimming/beach-going, and leisure travel/tourism.

In addition to sleeping rooms/areas, each Rental Accommodation may include a living/dining space, bathroom, kitchen (or kitchenette), and storage area. An open or covered outdoor seating terrace/deck/patio may be provided in appropriate locations.

Where clusters of cottages are planned, a support facility may be included to provide for a janitor closet, laundry, linen storage, and housekeeping supplies/equipment storage.

74081-3 **RELATED FACILITIES.** Locations suitable for the development of MWR Rental Accommodation facilities may also include RV Parks, camping sites, marinas, golf courses, beachfronts, other waterfronts, other outdoor recreation venues, or support facilities to provide patrons with a range of options for accommodation. Support facilities may include recreation/amusement centers, snack bars/restaurants, administrative/check-in offices, supply stores, swimming pools, cabanas, or bathhouses.

74081-4 **SPACE ALLOWANCE.** Space allowances for rental accommodations need to address the following issues:

74081-4.1 **Total Number of Accommodation Units**
The total number of rental accommodation units planned for a site should be based on the following considerations:

- Capacity of the site to accommodate the development of units in a manner which is economical, environmentally appropriate, aesthetically pleasing, and appropriate for the market to be served. Critical site planning considerations include vehicular access and parking, utilities, Antiterrorism/Force Protection (ATFP) considerations, privacy, views, and preservation of flora and fauna. For example, the development of a sufficient number of units in a location with steep, densely wooded slopes would need to weigh the costs of infrastructure provision and the clearing of areas with the impact on the environment.

- Return on Investment (ROI) analysis is based on projected demand/market, revenues, capital investment, and operating and maintenance costs. This type of analysis will determine the financial feasibility of the proposed project, and the number and type of units required to ensure a viable outcome. This analysis must follow the requirements of the template developed by Navy Personnel Command (PERS-652). This template may be obtained by e-mailing your request to either P652D2@persnet.navy.mil or P656D@persnet.navy.mil.

74081-4.2 **Types and Sizes of Individual Rental Cottages/Units**

The type/size of individual units is based on the customer/patron demand determined through a market research/survey process. The research should determine whether individual cottages, efficiencies, primitive camping cabins, or motel/hotel-type lodging is required to meet the documented demand. The space allowance guidance for the different sizes of cottages, efficiencies, cabins, and motel spaces is presented in Table 74081-1 below. The space shown should normally be considered the maximum, with larger units requiring additional justification. Individual units may also include porches, patios, balconies, or deck, etc. that may be covered, open, or screened that are not counted against the respective space allowance guidance.

Table 74081-1 Space Allowances for MWR Rental Accommodations

CAPACITY	SPACE ALLOWANCE GUIDANCE (Gross Area)	
2 Bedroom Cottage	800	74.32
3 Bedroom Cottage	1,000	92.90
Efficiency	500	46.45
Primitive cabin	150	13.94
Single Room	240	22.30
Double Room	350	32.52
Queen Room	400	37.16
King Room	440	40.88
Queen Suite	500	46.45
King Suite	550	51.10
Group Camp (per 8 bunks) (Accommodates 16 people)	1600	148.64

74081-5 **SPACE PROGRAMS.** Space programs for two-bedroom MWR Rental Accommodation (Cottages) are presented to illustrate the possible breakdown of the overall space allowances into functional components, with their respective sizes and capacities. This space program is for illustrative purposes only.

74081-6 **SAMPLE LAYOUT DIAGRAM.** A layout diagram is presented for a two-bedroom MWR Rental Accommodation (Cottage), illustrating the relative sizes and adjacencies of component areas.

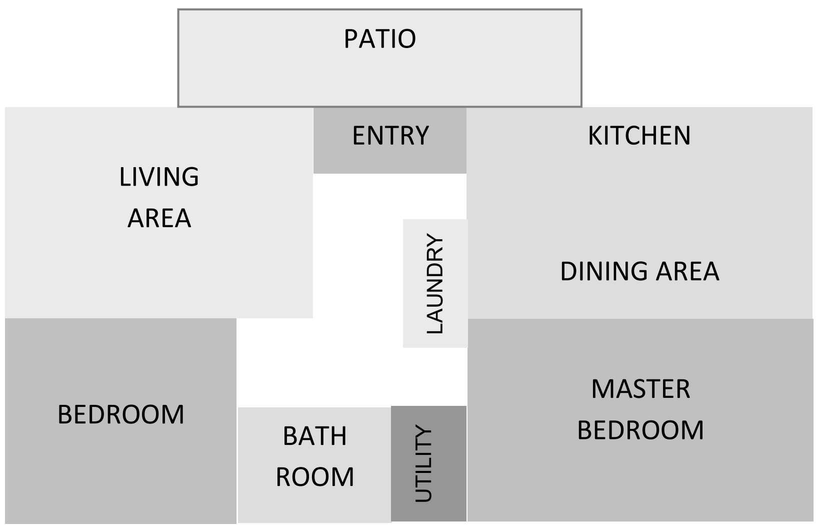
74081-7 **SITE PLANNING.** When site planning for a group of MWR Rental Cottages, keep in mind that privacy between cottages is important and that subdivision or zero-lot-line development is discouraged as it detracts from the quality of the experience for the intended patrons.

Table 74081-2 MWR Rental Accommodation Sample Space Program

ROOM / SPACE	FLOOR AREA (SF)			No. of Occupants Design
	No. Req'd	Net Area Per Room	Total Net Area	
2-Bedroom Unit				
Entry Foyer	1	20	20	3
Living Area	1	200	200	6
Kitchen/Eating Area	1	140	140	4
Master Bedroom	1	155	155	2

ROOM / SPACE	FLOOR AREA (SF)			No. of Occupants Design
	No. Req'd	Net Area Per Room	Total Net Area	
Bedroom 2	1	125	125	2
Bathroom	1	70	70	-
Laundry Closet	1	30	30	-
Utility Room	1	As required		-
Net Area & Occupant Totals			740	6
Allowance for porch, deck, or lanai	23,600		150	6

Figure 74081-1. MWR Rental Accommodation Sample Layout



74080-1 **GENERAL**. See General Notes to 740 series category codes for General Instructions regarding facility allowance planning procedures. Contact CNIC (N9) for additional information.

74080-1.1 In siting golf clubhouses, it is important for sight lines from the pro shop to the first and tenth holes to be maintained. It is also desirable for sight lines from the patio or snack bar areas to the ninth and eighteenth greens to be maintained.

74080-1.2 All golf clubhouse projects must be financially justified as Category C operations. See General Notes MWR at the beginning of the 740 Series.

74080-1.3 Catering Facilities (740-68) may be constructed as part of a golf clubhouse to serve both golf functions and other catering business. When this is done, the restroom support areas should be calculated separately for the golf clubhouse and the catering facility.

740 85 EXCHANGE DISTRIBUTION CENTER (WAREHOUSE) (SF)
FAC: 7388
BFR Required: Y

74085-1 Navy Exchange facilities requirements are developed by the Navy Exchange Service Command, 3280 Virginia Beach Blvd, Virginia Beach, VA 23452-5724, Head, Planning Branch. See General Notes for NEX facilities at the beginning of the 740 Series.

74085-2 This type warehouse may be provided for bulk back-up storage (exchange stock and operating supplies) to support all exchange operations within a geographical area as determined by NEXCOM or Marine Corps Exchange Services.

74085-3 This central warehouse allowance does not void the need for the installation exchange warehouse, Code 740-86, preferably located contiguous to the exchange main retail store. Space allowances for central warehouses shall be provided by NEXCOM.

740 86 EXCHANGE INSTALLATION WAREHOUSE (SF)
FAC: 7388
BFR Required: Y

74086-1 Navy Exchange facilities requirements are developed by the Navy Exchange Service Command, 3280 Virginia Beach Blvd, Virginia Beach, VA 23452-5724; Head, Planning Branch. See General Notes for NEX facilities at the beginning of the 740 Series.

74086-2 The total storage space that may be provided in installation exchange warehouses to accommodate back-up storage for exchange retail activities on an installation will be provided by NEXCOM. Wherever practicable, the installation exchange warehouses shall be located contiguous to the exchange main retail store in order to reduce the cost of moving stock from the warehouse to the main store sales area.

740 87 MARINA SUPPORT BUILDING (SF), Revised Dec 2011
FAC: 7445
BFR Required: Y

74087-1 This facility provides space for office, equipment check-out, repair, and storage. It does not include docks, marina slips, and walkways which are listed under Code 750 60. This is a special facility which is required only at outdoor recreation areas which have waterfront facilities available for boating activities.

74087-2 This facility may be made up of more than one individual building. Generally, repair facilities would be located in a separate building spaced away from the marina dock, clubhouse and patron parking. The marina clubhouse may include space for dock master/marina manager's office, meeting/training, yacht club office, chandlery/store with convenience items, customer service counter, shower room/restrooms, and equipment storage/checkout. The marina may also support a stackable boat storage facility and a dry land storage operation in either a fenced compound or in small, individual boat storage facilities attached to each other in a T-hangar fashion. All marina facilities must be justified financially. See Category C facilities, General Notes MWR, beginning of 740 Series Section.

See Table 74087-1 for space allowances.

Table 74087-1
Space Allowances for Marina Support Building

Military Population (1)	Gross SF
Up to 100	None
101 to 1,000	3,500
1,001 to 3,000	5,800
3,001 to 5,000	8,450
5,001 to 7,000	10,500
7,001 to 10,000	12,650
10,001 to 15,000	15,600
15,001 to 20,000	18,700
20,001 to 25,000	20,800
25,001 to 30,000	22,000
30,001 to 40,000	23,600
40,001 to 50,000	25,400
50,001 to 60,000	27,000
60,001 to 70,000	28,300
70,001 to 80,000	29,500
80,001 to 90,000	30,600
90,001 to 100,000	31,600
For each additional 10,000 add	1,000

(1) Population consists of retirees and military strength plus 15% of dependent population.

740 88 EDUCATIONAL SERVICES OFFICE (SF)
FAC: 7351
BFR Required: Y

74088-1 The space allowances shown in Table 74088-1 are intended to provide facilities for the advancement of the academic, technical, and vocational education of military personnel of all grades and ranks in order to enhance their potential to the service. These facilities shall make joint use of existing classrooms or other suitable facilities to the maximum extent possible. In cases where joint use is impractical and separate educational facilities are requested, detailed supporting justification is required. When justified by installation requirements, a supporting branch library may be provided in accordance with criteria for Code 740 76.

Table 74088-1. Space Allowances for Educational Services Offices

Military Strength	Basic	OJT (1)	CAC (2)
Up to 250	(3)	None	None
251 to 1,000	4,125	300	500
1,001 to 3,000	8,700	500	500
3,001 to 5,000	13,500	700	500
5,001 to 7,000	16,100	900	500
7,001 to 10,000	19,800	1,200	500
10,001 to 15,000	26,300	1,700	500
15,001 to 20,000	31,800	2,200	500
20,001 to 25,000	36,300	2,700	500
25,001 to 30,000	40,500	3,200	500
30,001 to 40,000	48,000	3,700	500
40,001 to 50,000	55,000	4,200	500
50,001 to 60,000	60,000	4,700	500
For each additional 10,000 add	4,000	500	500

(1) On-The-Job Training program management personnel space. This added space is authorized only in newly constructed facilities.
(2) Career Advisory and Counseling section. This added space is authorized only in newly constructed facilities. If more than one counselor is required, add 80 square feet per counselor.
(2) Accommodate in other facilities.

740 89 BATHHOUSE (SF)
FAC: 7385
BFR Required: Y

74089-1 **GENERAL**. See General Notes to 740 series category codes for General Instructions regarding facility allowance planning procedures.

74089-2 **DEFINITION**. The primary purpose of a bathhouse is to provide a facility for pool and beach users to store their belongings while using the recreational facility, to clean up, and have a place to use the restroom. In addition, the bathhouse contains the offices for the administrative staff and lifeguards.

74089-3 **RELATED FACILITIES**. This category code should be used in conjunction with the following category codes:

- 740 53 Swimming Pool - Indoor
- 750 30 Outdoor Swimming Pool - Installation

74089-4 **SPACE ALLOWANCE**. The space authorized for a bathhouse should be calculated based on the criteria presented in Table 74089-1. This space allowance is valid for bathhouses supporting pools not collocated with Fitness Centers. Where pools are built with Fitness Centers, the lockers, showers and Toilets are intended to be joint use between the Fitness Center and the pool. For that reason, Fitness Center Unified Facilities Criteria (UFC 4-740-02) support family changing rooms where the pool is collocated. The remaining spaces to support a control desk, pool office, lifeguard office and storage are supported for collocated pools.

Table 74089-1. Space Allowances for Bathhouses

Note	Table	Functional Component	# Units	x	Space Allocation Factor	=	Total NSF	Min. or Max. NSF
		ACTIVITY SUPPORT						
		Bathhouse						
(1), (2)	74053-4	Lockers, Showers, Toilets			33.33% total NSF lanes	=	____	
		Control Desk	____	X	45 NSF per station	=	____	45 min.
		Administrative Office	____	X	120 NSF per office	=	____	120 min.
		Lifeguard Office	____	X	40 NSF per station	=	____	80 min.
		Storage (equip., supplies, etc.)	____	X	20 NSF per lane	=	____	100 min.
		Subtotal Activity Support Areas				=	____	
TOTAL FACILITY ALLOWANCE (Gross Square Feet)						=	____	

Notes for Space Allowance -- Table 74089-1:

(1) The total NSF lanes should be determined in Table 74053-4.

(2) For undeveloped beaches use a six-lane, 25-meter pool equivalent and for developed beaches use an eight-lane, 50-meter pool equivalent.

NSF = Net Square Feet
GSF = Gross Square Feet
Minimum or Maximum NSF = Minimum or maximum space allowance to be provided for the particular function or activity.

740 90 MWR EQUIPMENT MAINTENANCE SHOP (SF)
FAC: 7448
BFR Required: Y

74090-1 An MWR Equipment Maintenance Shop is required at installations where MWR equipment such as NAF vehicles and grounds maintenance equipment (non-golf), must be maintained. Size according to amount of equipment and equipment size with typical workspace, circulation, and net to gross factors, using a space analysis and equipment inventory list.

74090-2 For MWR Equipment Maintenance Shops previously captured under CCN 74052 “Gun/Skeet and/or Trap Building”:

74090-2.1 These facilities support respective ranges and contain an operator's office, storage, sales area, gun maintenance shop, toilets and lounge. The Gun, Skeet and/or Trap Building is an MWR Category C facility (see General Notes MWR) and must be financially self- sustaining.

74090-2.2 Refer to Table 74090-1. The space allowances in the table may be used in one facility or divided between multiple facilities. Refer to Category Code 750 52 for land requirements.

Table 74090-1
Space Criteria for Gun, Skeet and/or Trap Building

Military Strength (1)	Gross Area (GSF)
Up to 100	None
101 to 10,000	3,950
10,001 to 15,000	4,300
15,001 to 20,000	4,550
20,001 to 25,000	4,800
25,001 to 30,000	5,100
30,001 to 40,000	5,300
Over 40,000	5,500

(1) Military population consists of military strength assigned to installations.

740 91 MWR OPERATED CAR WASH (SF)
FAC: 7348
BFR Required: Y

This category code has been deleted. All existing assets and future programmed car wash facilities are to be assigned to either category code 740 32 or category code 740 33 depending on the facility type, building or structure.

740 92 MWR RV PARK SUPPORT FACILITIES (SF), Revised Dec 2011
FAC: 7443
BFR Required: Y

74092-1 **GENERAL**. See General Notes to 740 series category codes for General Instructions regarding facility allowance planning procedures. Contact CNIC (N944, N92) for additional information.

74092-2 **DEFINITION**. Recreational RV Parks provide the military community with outdoor recreation opportunities at locations with attractive natural resources. To complement the camping experience, and depending on location, Recreational RV Parks may offer activities such as boating, canoeing, fishing, hiking, hunting, skiing and swimming. Facilities should be designed to take advantage of the natural features of the site, from vegetation to good views to unusual topography. At the same time, development should be environmentally appropriate, and not threaten the preservation of the natural heritage and scenic resources.

The planning criteria in this Category Code addresses the campground support facilities such as camp offices; camp stores; bathhouses; laundry facilities; storage buildings; rental centers, etc. RV park main office facilities may include areas for check-in desks, vending areas, game/activity/community rooms with WIFI service, kitchens, convenience stores, and any necessary ancillary spaces. Bathhouse/laundry facilities should be planned in accordance with Table 74092-1.

Recreational RV Parks are encouraged to make use of the Camp Host concept to assist in the management of the RV Park. Space allowances for MWR Rental Accommodations are addressed under Category Code 740 81. RV Parks may also be associated with Golf Operations and MWR Rental Accommodations. Where an RV Park includes a Rental Accommodation operation, a staff laundry may be included as part of the Support Building.

74092-3 **RELATED FACILITIES**. Where such locations are adjacent to the sea or other body of water, support facilities such as marinas, boat ramps and RV/vehicle/boat storage compounds maybe sited in close proximity to Recreational RV Parks.

74092-4 **SPACE ALLOWANCE**. RV Park Support Buildings will be sized in accordance with a market survey approach. As a Category C facility, the RV Park with a Support Building must be profitable and a financial analysis or pro forma will be provided as well as the CNIC Internal Needs Validation Study (INVS), and finally the Project Validation Assessment. The Planner will accomplish the initial demand investigation and review along with local MWR personnel. If the project is financially sound it will be forwarded via the region to CNIC Fleet & Family Readiness (N944A) for INVS Scoring and possible Project Validation Assessment.

74092-5 **SANITARY FACILITIES**. Once the total number of campsites at a location has been determined under CCN 750-59 Recreation Campground, the required patron sanitary facilities may be selected from the criteria in Table 74092-1. This includes allowances for bath/shower facilities as well as laundry facilities. Sanitary facilities should be consolidated with other support buildings such as main offices or camp stores whenever possible. Note that all bathhouse facilities associated with RV Parks should always be captured under CCN 740-92 and never under CCN 740-89 Bathhouse.

Table 74092-1
Sanitary Facilities Requirements for Recreational Campgrounds

#Tent/Trailer	#Water Closets (M/F)	#Lavatories (M/F)	#Showers (M/F)	#Urinals
1-15	1/1	1/1	1/1	1
16-30	1/2	2/2	1/1	1
31-45	2/2	3/3	1/1	1
46-60	2/3	3/3	2/2	2
61-80	3/4	4/4	2/2	2
81-100	3/4	4/4	3/3	2

Notes for Table 74092-1:

(1) For recreational areas having more than 100 tent/trailer/camper/RV sites, provide one additional water closet and lavatory per each additional 30 sites, and one additional urinal per each additional 60 sites.

(2) For laundry facilities, provide one washer and two dryers for every increment of 12 sites or portion thereof.

(3) Use the following gross square foot (GSF) guidelines for fixture/appliance unit sizing. Allowances include net areas plus associated support areas such as shower drying areas; laundry works areas; janitor’s closets; mechanical/electrical areas; and circulation space. Net-to-gross area calculations are already included in the following:

(a) When only (1) water closet is required it must be handicapped accessible; use 56 GSF per unit.
(b) Where multiple water closets are required, use 56 GSF for the first unit and 22 GSF for all subsequent units.

(c) Lavatories: 22 GSF per unit
(d) Showers: 21 GSF per unit
(e) Urinals: 22 GSF per unit
(f) Washer/dual-dryer module: 43 GSF per module

740 93 SMOKING GAZEBO (SF)
FAC: 7384
BFR Required: N

74093-1 Smoking Gazebo's are provided as designated smoking areas outside of Navy and Marine Corps facilities. Size is standard. This CCN is for inventory purposes.

740 94 TDY OFFICIAL LODGING (SF)
FAC: 7441
BFR Required: Y

Note: Category Code (CCN) 740-94 now includes transient Navy personnel originally captured under CCNs 740-94 and 740-96. All facilities originally captured under CCN 740-96 should be corrected in iNFADs.

74094-1 **GENERAL.** Navy Gateway Inns and Suites (NGIS) Visitor's Quarters provide temporary lodging facilities for visiting personnel at an installation. Initial/preliminary requirements can be generated by local planning staff by following the steps in section 74094-3 "Space Planning." Preliminary site selection will also be performed during the initial planning phase. Once the initial scope is determined, planners will forward the findings to CNIC (N944), Fleet & Family Readiness, Millington, TN (Facilities Support) for review and a subsequent independent assessment will be performed to determine the final project scope. This assessment validates the site selection; determines the final number of room types, support areas, and guest services to be provided; and identifies any companion projects necessary to provide a complete and usable facility.

Table 74094-1 provides a list of potential spaces allowed for a Visitor's Quarters facility and Table 74094-2 provides standardized space allowances for the same. Both tables can be found in UFC 4-720-01 "Lodging Facilities", dated 23 February 2011.

74094-2 **DEFINITION.** These facilities are temporary living accommodations that are rented for a service charge for overnight or short term use to authorized personnel such as official military or civilian visitors to the installation, transient personnel, or families awaiting assignment to quarters. There are two types of lodging facilities:

1. Central. Central facilities accommodate the main check-in function, the majority of the guest services and administration, and the guest rooms and suites. There will always be at least one central facility on an installation that includes visitor lodging.
2. Satellite. Satellite facilities accommodate additional guest rooms, suites and limited services and support functions. They may be located

remotely from the central facility to serve additional installation areas or near the central facility as part of a visitor lodging complex.

Note that the type of facility needs to be defined in order to determine the total allowable space for the project. Table 74094-1 provides a listing of all the LF functional program areas, indicates if each area is included in each type of facility, and describes the function of the area.

Table 74094-1
Functional Program Areas

Functional Program Area	Central	Satellite	Description
Guest Services			
Covered entry	X		Covered vehicle drive for loading/drop-off at main entry
Entrance vestibule	X	X	Entry airlock
Central lobby	X		Central facility lounge seating and circulation space between reception and other central guest services
Satellite lobby		X	Satellite seating/waiting and circulation space adjacent to main entry
Reception	X		Reception desk for check-in/out and guest service
Bell cart station	X	X	Area near the entrance vestibule for storage of bell carts.
Luggage storage	X		Secure room adjacent to reception for storage of guest luggage
ATM	X	X	ATM kiosk
Public toilets	X	X	Public toilets
Fitness room	X	X	Small, guest fitness room
Staff conference room	X		Conference room to accommodate 20 people
Business center	X		Guest-use computers and office equipment
Guest laundry	X	X	Self-service guest laundry
Vending	X	X	Self-service guest vending
Ice	X	X	Self-service ice dispenser on each floor
Guest corridors/ circulation	X	X	Access to guest rooms and remote services
Guest room[1]	X	X	Standard room with a combined living/sleeping area and private bath
Family/business suite (Suite)[1]	X	X	Suite with separate living and sleeping areas, a compact kitchen and private bath
Administration Services			
Lodging communications	X		IT/communications room including guest and staff Internet, television, and administrative file server.
Manager’s office	X		Private office
Asst. manager	X		Optional for larger programs; must be validated via CNIC/N9
Front desk supervisor	X		Private office

Functional Program Area	Central	Satellite	Description
Accounting office	X		A single office or up to 3-4 workstations depending upon operation size
Clerical	X		Workstations for clerical staff in an open office area
Work space	X		Copier, printers, facsimile machines, work space, common files, and administrative storage
Cash room	X		Secure room where front desk agents reconcile shift cash functions and store cashier banks
Floor Support			
Janitor areas	X	X	Janitor closet on each floor or wing.
Housekeeping areas	X	X	Housekeeping support and supplies on each floor or wing
Utility rooms	X	X	Mechanical, electrical, communications, and sprinkler rooms located for efficient utility distribution
Back-of-House Support			
Training office	X		Office and/or training material storage area
Central Janitor areas	X	X	Central janitor closet with additional supply storage
Housekeeping manager	X	X	Private office
Soiled linen storage	X	X	Separate storage from clean linens, adjacent to receiving or laundry
Clean linen storage	X	X	Separate storage from soiled linens
Receiving	X	X	Service entrance/loading dock
Receiving/supply office	X		Private office
Linen laundry	X		Space with industrial-grade equipment, based on local service contract linen costs and availability
Supply/general storage areas	X	X	Storage and warehousing of facility supplies
Cleaning fluid storage	X	X	Separate storage for cleaning chemicals
Utility rooms	X	X	Central facility mechanical, electrical, communications, and sprinkler rooms **(note: counted in net to gross ratio)**
Break area	X	X	Staff break area with kitchenette and lockers
Staff toilets	X	X	Staff facilities
Maintenance workshop	X		Includes limited storage and accommodates repair of small equipment and furnishings
Grounds equipment storage	X		Space with direct exterior access for grounds and exterior building maintenance supplies and equipment
Service circulation	X	X	Separate stairs, corridors and elevators from guest circulation

[1] The final number, mix and variations of room types will be determined by the individual assessment by CNIC/N9. See 74094-1 GENERAL section for more information.

74094-3 **SPACE ALLOWANCE.** Initial project scope for a new or renovated facility will be determined by performing a series of three steps:

1. Obtain occupancy rate information for the facility or facilities in question for the previous two year period.

2. Calculate the necessary quantity of rooms needed to satisfy the TOTAL demand for an 80% occupancy rate (see the below example for details on calculating an 80% occupancy rate). This is the complete total requirement, and not just the difference between what is currently available, and the perceived number of rooms thought to be needed. Note that there are two room types available in a Visitor's Quarters facility and they are both single occupancy: standard rooms (300 NSF) and guest suites (450 NSF.) For planning purposes, apply a 95/05 mix of standard rooms to guest suites once the total room quantity requirement is determined. For example, if 500 rooms are needed, plan for 475 standard rooms and 25 guest suites.
3. Apply the new room quantity requirements (from step 2) and the applicable functional area requirements from Table 74094-1, depending on facility type (Central or Satellite) against the space allowances in Table 74094-2 to obtain a comprehensive facility size. For initial planning purposes, allow for all spaces (required and optional, based on facility type) shown in Table 74094-1.

Below is an example showing the method to calculate projected room quantity requirements based on a two year historical data table. It shows a hypothetical two year occupancy rate for an imaginary facility, as well as a hypothetical list of Certificates of Non-Availability (CNA):

Step1: Obtain loading information from the local MWR lodging staff for the facility or facilities in question. Below is an example of the data that is typically provided:

FY10 Data

Month	**FY10**	Oct	Nov	Dec	Jan	Feb	Mar	Apr	May	June	July	Aug	Sept	Total/ Overall
# days in month		31	30	31	31	28	31	30	31	30	31	31	30	365
# rooms in the inventory		342	342	342	342	342	342	342	342	342	342	342	342	
Total # room nights per month (RNM)		10602	10260	10602	10602	9576	10602	10260	10602	10260	10602	10602	10260	124830
Total # room nights sold (RNS)		9888	10260	9700	9200	8200	8900	10100	10200	10260	10600	9500	9788	116596
% Occupancy is		93%	100%	91%	87%	86%	84%	98%	96%	100%	100%	90%	95%	93%

FY11 Data

Month **FY11**	Oct	Nov	Dec	Jan	Feb	Mar	Apr	May	June	July	Aug	Sept	Total/ Overall
# days in month	31	30	31	31	28	31	30	31	30	31	31	30	365
# rooms in the inventory	342	342	342	342	342	342	342	342	342	342	342	342	
Total # room nights per month (RNM)	10602	10260	10602	10602	9576	10602	10260	10602	10260	10602	10602	10260	124830
Month	**FY11**	Oct	Nov	Dec	Jan	Feb	Mar	Apr	May	June	July	Aug	Sept
Total # room nights sold (RNS)	10211	9899	10500	10602	9576	10200	9866	10154	9200	10098	9956	9233	119495
% Occupancy is	96%	96%	99%	100%	100%	96%	96%	96%	90%	95%	94%	90%	96%

Total/ Overall

Notes:

Step 4) The total # of rooms in the inventory is the total room capacity for a building or series of buildings

Step 5) The total # of room nights per month = number of days in the month (x) the number of rooms in inventory

Step 6) The total # of room nights sold is the sum of rooms sold each night for the month

Step 7) % Occupancy Equation = Total # room nights sold / Total # room nights

Step 8) CNA = Certificate of Non-Availability

Step 2: For this example, assume the total number of CNAs is 62 for FY10 and 34 for FY11. CNAs must be counted as booked rooms even though in reality they were not actually available.

a) Calculate the Room Nights per Month capacity (RNM) by multiplying the number of rooms in the facility by the number of nights in each month and then determine the total number of RNM for the two year period. In this case the total RNM is 249,660 (FY10 124,830 +FY11 124,830.)

b) Calculate the total number of Room Nights Sold (RNS) for the two year period. Add the RNS data for each year PLUS the number of CNAs: RNS =116,596 + 119,495 + 62 + 34 = 236,187.

c) Determine the average occupancy rate for the two year period by dividing the RNS by the RNM. In this example the current occupancy rate is 236,187/249,660 = .94603, or 94.6%

d) Programming for an occupancy rate of 80% is accomplished by applying the aforementioned results to the equation:

Where “X” is the projected number of rooms required to fulfill an 80% occupancy rate, multiply the quantity of existing rooms and the current occupancy rate, then divide the product by .8 to determine “X”.

For this example, the equation is: X = [342 x .946] /.8 = 404.42, or 404 rooms. The intent of the 80% occupancy rate is to allow greater capacity than the projected need to facilitate room turnover, facility maintenance, mission surges, etc. The percentage of standard rooms to guest suites should be 95% and 05% respectively and all rooms/suites are single occupancy. Thus the final requirement is for 384 standard rooms and 20 guest suites. To check for confirmation that the 404 room projection satisfies the 80% average capacity, substitute 404 for the existing facility room count of 342 and re-calculate numbers based on step 2(a) - 2(c) and the FY 10/11 tables. The results will show occupancy rates at 79% and 81% for the next two years, thus fulfilling the 80% average rate requirement.

Step 3: For this example, the plan calls for a central facility and space requirements will be applied for all the functional areas called out in Table 74094-1. These spaces along with the required room quantities will be applied to Table 74094-2 to define overall preliminary requirements for the facility. The example will use a six floor facility with two wings per floor.

Table 74094-2. Space Allowances for NGIS Visitor’s Quarters

Functional Program Area		**Base Area (See Note 1)**		**Space Standard (planning factor)**	**Notes/explanation**	**Sample (See Notes 2 & 4)**		
		ft2	**m2**			**Option/Qty.**	**ft2**	**m2**
Guest Services	Entrance Vestibule	100	9.3	Per Facility	Standard size	Required	100	9.3
	Central Lobby	4	0.4	Per Central Facility guest room (gst rm)	Includes lobby circulation and seating areas	Required	1616	150.1
	Satellite Lobby	260	24.2	100sf + 1sf per Satellite gst rm	Reduced circulation and seating	N/A		0.0
	Reception	150	13.9	150sf <100 Program gst rm + 75sf per ea addl 100 gst rms up to 375sf max	75sf per staff, minimum two staff. Count all program guest rooms	Required	375	34.8
	Bell Cart Station	20	1.9	20sf <100 Facility gst rm + 10sf per ea addl 50 gst rms	10sf per cart	Required	80	7.4
	Luggage Storage	75	7	75sf <100 Program gst rm + .25sf per ea addl gst rm to 150sf max	Count all program guest rooms	Required	150	13.9
	ATM	10	0.9	Per optional Central Facility space	Optional one ATM machine	Yes	10	0.9

Functional Program Area		Base Area (See Note 1) ft2	Base Area (See Note 1) m2	Space Standard (planning factor)	Notes/explanation	Sample (See Notes 2 & 4) Option/Qty.	Sample ft2	Sample m2
	Public Toilets	100	9.3	Minimum for Central Facility toilets is 100 sf ea (male/ female) up to 100 guest rooms + 40sf per ea addl 45 guest rooms. Satellite facilities do not have a public restroom requirement	Based on information in UFCs 3-420-01, and 4-740-03. Applicable codes will dictate final requirement during the independent assessment phase. See General section 74094-1	Required	340	31.6
	Unisex Toilet	50	4.6	Unisex toilet for satellite facility	Satellite facilities only	N/A		0.0
	Fitness Room	300	27.9	300sf <100 Central Facility gst rms +50sf per ea addl 200 gst rm. 600sf max	Calculated at 50sf per cardio machine	Required	350	32.5
	Staff Conference Room	440	40.9	Per optional Central Facility space	Standardized room accommodates 20 people	Yes	440	40.9
	Business Center	75	7	Optional space at 75sf <100 Central Facility gst rms +25sf per ea addl 100 gst rm. 300sf max.	75sf for two workstations and circulation with 25sf for each addl workstation	Yes	175	16.3
	Guest Laundry	110	10.2	Per 40 Facility gst rm	Accommodates two to four washers and two to four dryers per every 40 gst rm	Required	1100	102.2
	Vending	60	5.6	Per optional Facility floor	Accommodates two optional vending machines	Yes	360	33.4
	Ice	30	2.8	Per Facility floor	Accommodates one ice dispenser	Required	180	16.7
	Standard Guest Rooms **(See Note 3)**	300	27.9	Each room **(See Note 3)**	Quantity and distribution of rooms and suites to be determined by an independent assessment.	364	115,200	10,702.4
	Suites **(See Note 3)**	450	41.8	Each suite **(See Note 3)**	Quantity and distribution of rooms and suites to be determined by an independent assessment.	40	9,000	836.1
Administrative Services	Lodging Communications	150	13.9	Per Facility	150 sf min; 1 sf per each addl guest room over 100pn	Required	454	42.2
	Administrative areas							
	Manager	120	11.1	Per office	Typically one per Central Facility	1	120	11.1
	Asst. manager	80	7.4	Per optional office	Only in larger programs with more than 500 guest rooms	0	0	0.0

Functional Program Area		Base Area (See Note 1)		Space Standard (planning factor)	Notes/explanation	Sample (See Notes 2 & 4)		
		ft2	m2			Option/Qty.	ft2	m2
	Front desk super	80	7.4	Per office	Typically one per Central Facility	1	80	7.4
	Accounting	64	5.9	Per Person	1 for every 200 guest rooms, not to exceed 256 sf total	2	128	11.9
	Clerical	64	5.9	Per program	One person; typically combined with reservations and work space	1	64	5.9
	Work space	40	3.7	Per person in admin area: Mg;, Asst Mgr; and Front Desk Super	Typically combined with clerical and reservations	2	80	7.4
	Cash Room	80	7.4	Per Program	For front desk staff to reconcile shift cash	Required	80	7.4
Floor Support	Janitor Areas	25	2.3	Per Facility floor wing		Required	300	27.9
	Housekeeping Areas	200	18.6	Per 30 Facility gst rm	Accommodates two carts and storage	Required	2,600	241.5
	Utility Rooms	16	1.5	Per 25 guest rooms	Comm rooms only; other utility rooms programmed by code and included in the multiplier	Required	256	23.8
	Training Office	80	7.4	Per optional private office/storage closet	Typically one per Central Facility	Yes	80	7.4
	Central Janitor Areas	80	7.4	Per Facility	Serves first floor public and administrative spaces	Required	80	7.4
	Housekeeping Manager	80	7.4	Per Program	Typically one per Facility	1	80	7.4
	Soiled Linen Storage	145	13.5	100sf +15sf per 40 Facility gst rm	Includes carts and sorting space; one cart per 40 gst rm	Required	250	23.2
	Clean Linen Storage	150	13.9	25sf per 16 Facility gst rm	Shelving	Required	400	37.2
	Receiving	150	13.9	150sf <150 Program gst rm + 1sf per ea addl gst rm	Loading dock	Required	404	37.5
	Receiving/supply Office	80	7.4	Per program	Office	Required	80	7.4
	Linen Laundry	450	41.8	Optional central facility space at 450sf <100 Program gst rm + 1sf per ea addl gst rm	Includes space for extractors, dryers and folding activities	Yes	754	70.0
	Addl space for folding machine	60	5.6	Per optional folding machine	Additional laundry room space for optional folding machine	Yes	60	5.6
	Supply Areas/general Storage	600	55.7	600sf <300 Program gst rm + 1sf ea addl gst rm	Includes separate cleaning fluid storage	Required	704	65.4

Functional Program Area	Base Area (See Note 1) ft2	Base Area (See Note 1) m2	Space Standard (planning factor)	Notes/explanation	Sample (See Notes 2 & 4) Option/Qty.	Sample ft2	Sample m2
Central Staff Break (includes staff lockers)	150	13.9	150sf <100 Central Facility gst rm + 1sf per ea addl gst rm	Base area typically includes 4-top tables, other seating, kitchenette, and staff lockers	Required	454	42.2
Addl space if training function	300	27.9	Per optional training module	Additional break room space if this area is to dual function as a training room	Yes	300	27.9
Staff Toilets	100	9.3	100sf <150 Facility gst rm + 100sf ea addl 150 gst rm	Each 100 sf module includes 50sf for each gender	Required	200	18.6
Maintenance Workshop	150	13.9	150sf <100 Program gst rm + .5sf per ea addl gst rm	Work and tool storage space	Required	302	28.1
Grounds Equipment Storage	40	3.7	Per optional Program space	Small shed or exterior closet	Yes	40	3.7
					Sample Subtotal	**137,906**	**12811.6**
					Net-to-Gross Factor @ 30%	41,372	3,843.5
					Sample Total	**179,278**	**16,655.1**

Notes:

1. Base area assumes 100 guest room facility.
2. Sample is for a 404 room, 6 floor Central Facility in a 404 room program, 5% suites.
3. Ratio of Standard Rooms/Suites is 95/05 for planning purposes.
4. The "Option/Quan" column shows whether or not a space is allowed based on the facility type (Central or Satellite) shown in Table 74094-1 "Functional Program Areas." In this example, all of the spaces shown for a "Central" facility are allowed in the "Space Allowance Table" but this may not always be the case when planning for a "Satellite" facility. For this, some spaces will not be planned.

Based on the above example for a 404 room Central lodging facility, the requirement is 179,278 gsf/16,655.1 sm. This provides for an average occupancy rate of 80% based on the room requirements information obtained from section 74094-3 "Space Planning", steps 1 & 2.

Parking. Parking must follow the criteria set forth in category code 852-10. Parking spaces shall be 10 ft. wide (3.1m) minimum. In addition to standard guest parking, provide a minimum of three short-term check-in parking spaces at central facilities. For programs with more than 200 rooms, provide a check-in space at the central facility for 1.5% of all guest rooms. As an option, identify each check-in space with a sign. Additional visitor parking with the exception of accessible parking is not required, but may be an option based on local requirements. Provide one staff parking space for each daytime lodging staff person. Staff parking shall be separated from guest parking.

Based on site size and layout, consider providing an optional sign to indicate staff-only parking with close access to the staff entrance. Parking areas will be sized to local conditions.

740 95 LIMITED SERVICE OFFICIAL LODGING - MISSION (SF),
FAC: 7441
BFR Required: N

74095-1 **GENERAL.** This category code is reserved to capture all existing transient lodging facilities that serve the same function as CCN 740-94 but have been renovated based on previous and outdated criteria. Because of this, the rooms/suites within these facilities vary in size and standardization is not possible. This category code is for inventory purposes only and is not authorized for new construction. All subsequent new construction or renovation projects used to fulfill transient housing requirements shall use CCN 740-94.

740 97 FISHER HOUSE (SF)
FAC: 7441
BFR Required: N

74097-1 **GENERAL.** This category code is for inventory purposes only and should be used to capture Fisher House facility assets once they are turned over to the federal government by the Fisher House Foundation.

DON Fisher Houses provide temporary, convenient, and affordable lodging to Navy Medical Treatment Facility (MTF) patients (“wounded warriors”), members of the families of such patients, and others providing the equivalent of familial support for such patients. Fisher Houses are located at or near military medical treatment facilities and are gifted to the Navy once the facilities are constructed and furnished. The Fisher House Foundation typically coordinates any repairs during the initial 12 month warranty period but all subsequent repairs are the Navy’s responsibility. The Fisher House Foundation holds no interest in the property following transfer to the Navy; however, Fisher Houses will always bear the “Fisher House” name and may never be recapitalized for use as a different type of facility.

For dedicated housing (unaccompanied) for wounded service members please refer to CCN 72147 “Unaccompanied Housing for Wounded Warriors”.

74097-2 **DEFINITION.** Fisher Houses are housing facilities that fit the following conditions:

A. Are located in proximity to a military health care facility;

B. Are available for temporary residential use by patients of that health care facility, family members of such patients, individuals providing the equivalent of family support for such patients and/or individuals who meet Service eligibility requirements; and

C. Are constructed and donated by the Fisher House Foundation or designated by the Secretary of the Navy.

74097-3 **SPACE ALLOWANCE.** Fisher House space allowances are based on a variety of factors and are determined by a collaborative validation of need between the Fisher House Foundation, the receiving medical center, and Commander, Navy Installations Command. (CNIC). There is no standard size requirement, but Fisher Houses typically range in size between 5,000 and 16,000 SF, provide 8 to 21 suites, and accommodate 16 to 42 family members. Fisher Houses typically feature a common kitchen, laundry facilities, large dining room, and spacious living room with library.

740 98 NGIS-OPERATED CONFERENCE CENTER (SF)
FAC: 6100
BFR Required: N

74098-1 **GENERAL**. This criteria is currently being written and will be posted upon completion.

741 40 PRIVATE/ORGANIZATION CLUB BUILDING (Marine Corps only) (SF)
FAC: 7414
BFR Required: Y

74140-1 **GENERAL**. A facility for use by active duty military personnel, authorized civilians, and their family members for private organization/club meetings and activities that are not affiliated with the US government.

744 80 GOLF STORAGE MAINTENANCE FACILITY (SF)
FAC: 7448
BFR Required: Y

74480-1 **GENERAL**. Any proposed new construction must first go through the pre-Internal Needs Validation Study (pre INVS), full Internal Needs Validation Study (INVS), and Project Validation Assessment (PVA). This is a special facility which is required only at installations which have a minimum nine-hole golf course. See also: 740 90 “MWR Maintenance Shop” for non-golf related MWR maintenance facilities.

74480-2 SPACE ALLOWANCE. The Golf Storage/Maintenance Facility consists of space for two separate functions: storage area and maintenance area.

Storage Area (see Figure 74082-1): This area consists of spaces for maintenance equipment (e.g. mowers, aerators, etc.), fertilizer, pesticide and herbicide storage and secure chain link storage cage for small equipment (e.g. weed eaters, hand tools, etc.). This area has a standard size of 4,500 SF.

Maintenance Area (see Figure 74082-2): This consists of space for: administrative offices, men's & women's staff locker rooms with showers, restrooms, break room, maintenance area, an equipment lift, mechanics work area, an enclosed blade grinding room, air compressor and used oil recovery. This area will require 4,000 SF.

Table 74480-1
Storage Area

Note	Table	Functional Component	# Units	X	Space Allocation Factor	=	Total NSF	Minimum NSF
		Storage Area	1	X	4,500 sf	=	4,500	4,500
		Maintenance Area	1	X	4,000 sf	=	4,000	4,000

Table 74480-2
Maintenance Area

ROOM/SPACE:		NET FLOOR AREA				OCCUPANCIES		
		No. Req'd	Net Area/Rm	Total Net Area		Staff		Total
1	Superintendent Office	1	120	120				
2	Mechanical Repair Area (which includes a 170 SF grinding room and 140 SF for Equipment Parts Storage)	1	2,570	2,570				
3	Mechanic's Office	1	120	120				
4	Female Locker Room	1	200	200				
5	Break Room	1	270	270				
6	Open Staff Work Area	1	120	120				
7	Male Locker Room	1	250	250				
8	Janitor's Closet	1	50	50				
9	Elec/Comm/Tele Room	1	150	150				

ROOM/SPACE:		NET FLOOR AREA				OCCUPANCIES		
		No. Req'd	Net Area/Rm	Total Net Area		Staff		Total
10	Mechanical Room	1	150	150				
	Totals		4,000	4,000				

Generally, Golf Support/Maintenance Facilities would be located on the periphery of the golf course but away from the clubhouse and patron parking. Note that golf cart storage is not included here and is supported under CCN 740-80 GOLF CLUBHOUSE.

See next page for concept diagrams for maintenance and storage areas.

Figure 74480-1
Maintenance Area Concept Diagram

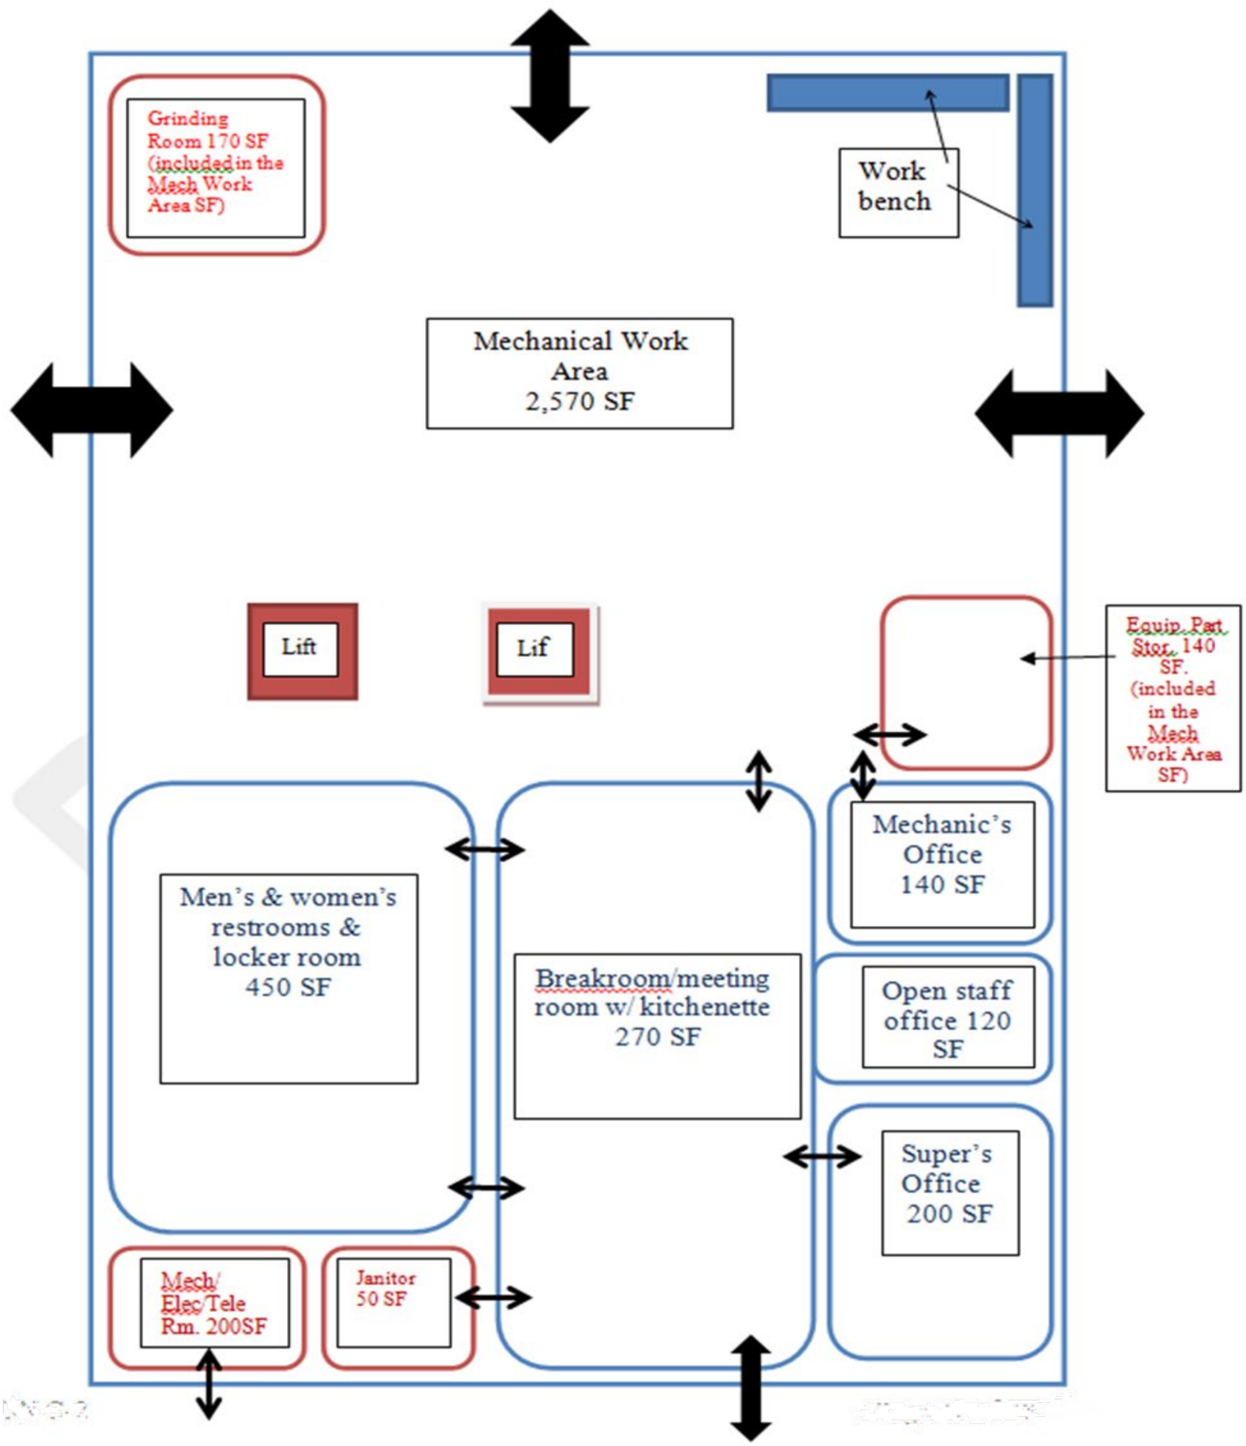


Figure 74480-2
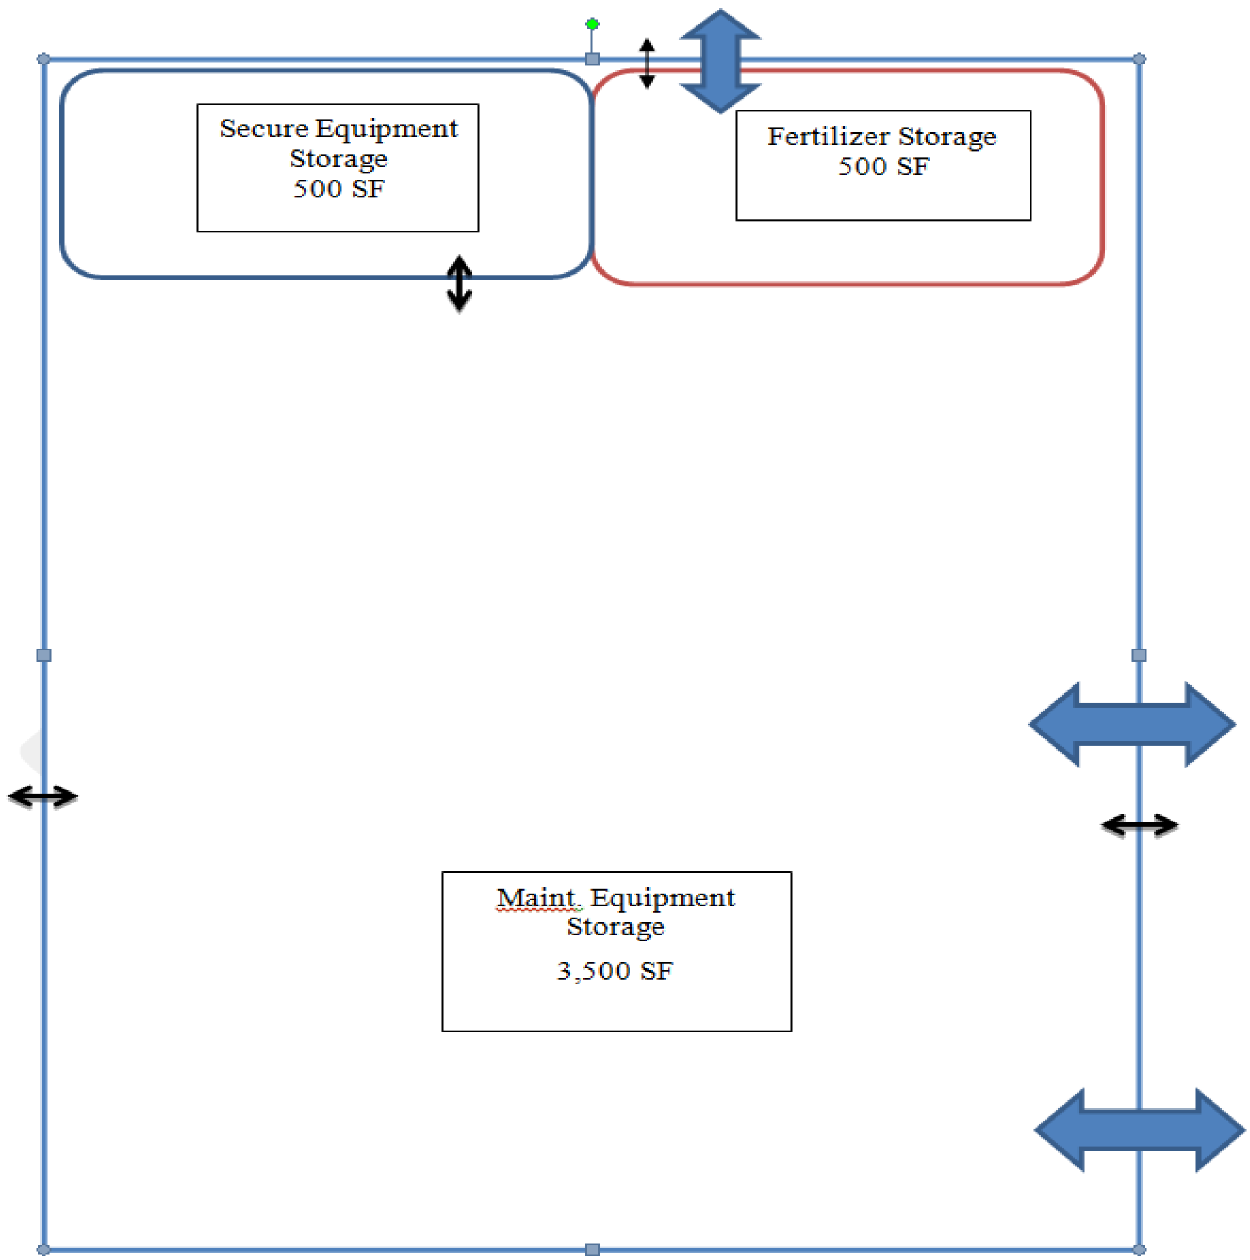
Storage Area Concept Diagram



750 COMMUNITY FACILITIES - MORALE, WELFARE AND RECREATION (OUTDOOR)

750-1 GENERAL

The Navy's Outdoor Recreation Program introduces Sailors and their families to lifetime outdoor recreation activities, and provides them with participation opportunities. The associated values and benefits of participating in outdoor-related activities effectively contribute to Navy quality of life and retention efforts. Outdoor recreation has long lasting, broad scope effects on other areas of a participant's life. Benefits include increased self-esteem, overall happiness and general well-being. The Outdoor Recreation Program promotes physical fitness, teamwork, leadership, skill development and environmental ethics. Examples of human powered outdoor recreation programs include:

Backpacking	Nordic Skiing	White Water Rafting
Canoeing	Rock Climbing	Scuba Diving
Sea Kayaking	Hiking	Orienteering
Snowshoeing	Mountain Biking	Surfing
Fishing	Camping	Alpine Skiing
Snowboarding	Rope Courses	Urban Bicycling
Adventure Races	In-line Skating	Adventure Travel
Skateboarding	BMX Biking	

The Outdoor Recreation Program also includes traditional outdoor recreation activities such as:

Golf	Basketball	Tennis
Volleyball	Baseball	Softball
Football	Soccer	Track and Field
Swimming	Sailing	

The extent and type of Outdoor Recreation Program depends on the Installation location, local geography, and patron interest. The 750 Series of Navy Category Codes provides for the various types of facilities that may be required to support the above programs. Facilities should be attractive, clean, uncluttered, and well maintained. Space should be available to support all core program activities.

750-1.1 **Morale Welfare and Recreation (MWR), Navy Personnel Command (NPC) Role:** The involvement of MWR representatives in the planning process is required, especially for all Category C business-based projects, in order to ensure a match between program needs, and the types and sizes of spaces to be provided. MWR programs are funded by a combination of non-appropriated funds (NAFs) and appropriated funds (APFs). MWR activities are divided into three categories following DoD policy on funding and function:

- **Category A** operations are authorized full APF funding and directly support mission essential requirements. Examples are gymnasiums, fitness centers, and sports programs.

- **Category B** operations are mission enhancing community support programs and are authorized significant APF support. Examples are outdoor recreation, child development, hobby shops, ITT, community pools, school age care, and youth development programs.

- **Category C** operations are business-based activities and are authorized minimal APF (such as SRM, environmental compliance, security, and health and safety support; interior renovation and new construction/additions are NAF funded) except at isolated/remote and OCONUS installations where Category C operations are treated the same as Category B operations. Examples are food and beverage operations, bowling centers, cottages, RV parks, slip rental marinas, and golf courses.

For Category B and C facilities an initial market survey and financial analysis or pro forma is required to determine if the facility will be self-sustaining or profitable, in the case of Category C operations. Once the Installation has completed their analysis, the proposal will be submitted via the regional command to NPC (after 1 October 2004, CNI Field Support Activity) through an Internal Needs Validation Study (INVS). If the project earns sufficient points through the INVS, it will move on to the Project Validation Assessment stage where the demand and scope will be confirmed through independent review.

750-1.4 **Overseas Adjustment:** For overseas activities the net to gross factor (typical net to gross is 1.25 or 25%) will increase as necessary to meet host nation building codes.

750-2 USING THE CRITERIA.

750-2.1 **Size to Accommodate Demand**. The below criteria provide the current approach for determining allowances for Morale, Welfare and Recreational (MWR) facilities. Facility allowances are sized to accommodate the projected demand for the anticipated functions. The projected demand will be estimated using a Market Survey approach. Existing Navy wide surveys (under 2 years old), MWR Pulse Point Surveys, and other local surveys can be used to determine the demand. Existing community facilities will be considered in the Market Analysis approach. The facility capacity requirements will be estimated using industry standards and comparable existing facilities, Navy, DoD, municipal, or commercial.

In addition to the above criteria, attention should be given to relevant planning information in the Base Master Plan, Regional or Functional Plan (RSIP), existing

Unified Facilities Criteria (UFC) as developed, Design Manuals, Military Handbooks or Instructions for the specific facility type.

For Marine Corps Installations results of the MWR Construction Program Patron Survey will be used to provide Marine Corps specific patron desires. Construction Program Patron Survey data is available from the Commandant of the Marine Corps (MW).

750-2.2 **Space Allowance Flexibility**

750-2.2.1 **Aggregate Space Allowances**. For many of these criteria, usage demand, capacity requirements and space allowances are calculated separately for component function-areas of the facility, and then totaled to derive overall facility space allowances. This procedure is designed to respond to local variations in the set of activities and spaces provided, and the relative demand for different activities depending on the needs of the installation population. This approach can also accommodate diverse existing facility situations, when considering additions or complementary new facilities.

750-2.2.2 **Space Programs versus Facility Allowances**. These criteria are used to determine the total space allowance for a facility. Even though area calculations for functional components of the facility are used in deriving the overall allowance, this does not fix the space sizes of the component program areas of the facility. Local installation decisions, in the space programming and design process, should determine the appropriate allocation of areas for each function-space within the total facility allowance. Any such decisions should be fully justified to the regional and CNI MWR program management to ensure compliance with Navy and DoD standards.

750-2.2.3 **Local Variation.** Local demand for program activities may depend on a variety of factors, in addition to the overall installation population, including

- Proportion and relative participation of different user groups among the population.
- Specific program of activities provided.
- Competing on-base and off-base facilities providing similar programs.
- Geographic distribution and accessibility of the user populations.
- Local climate conditions and operating seasons.
- Overseas situations and local customs.
- Installation geography.

750-2.3 Population Basis for Demand Calculations

See Chapter 1 of this instruction for general information on population definitions and base loading data.

750-2.4 Recreational Planning Context

Planning for MWR facilities should involve consideration of the individual facility in relationship to a comprehensive recreational program and facilities plan for the installation and the region. Consider the following factors, in addition to those relationships specifically indicated in the criteria for each facility:

- If other MWR facilities serving the same user population provide the same program activities, reduce the allowed capacity of the proposed facility by the capacity provided elsewhere at the installation or other nearby regional installations.
- Consider collocating the facility with other recreational facilities providing complementary programs, to provide the users with the increased convenience and attractiveness of clustered activities, and to take advantage of potential savings in support space requirements and operating costs.
- Size and locate an individual facility appropriately to the target population and geographical area its particular function is designed to serve. Convenient access for users should be considered in balance with the need for efficient facility operation and avoidance of duplicate facilities. Consider the DoD INST 1015.15 (Enclosure 3, Attachment 1) requirement for the use of appropriated funds (APF) for site development costs, archeological and ammunition clearances, water purification, demolition, excessive utility connections, and road service when selecting sites.
- Consider local community facilities. If the local community has a robust program and facilities for outdoor recreational activities consider partnerships with the local community for services, and/or other Public Private Venture initiatives.

750 10 OUTDOOR PLAYING COURTS (EA)
FAC: 7521
BFR Required: Y

Design Criteria: UFC 4-750-02N - Design: Outdoor Sports and Recreational Facilities

75010-1 **GENERAL**. See introduction to 750 series category codes for General Instructions regarding facility allowance planning procedures.

75010-2 **DEFINITION**. Outdoor Playing Courts provide facilities and support services to meet the individual physical fitness and recreation needs of military personnel. The facilities may also serve dependents, retirees and authorized civilians. Activities that may be accommodated in Outdoor Playing Courts include: basketball, tennis, volleyball, skate/skateboard parks, and outdoor skating/roller hockey rink

75010-3 **RELATED FACILITIES**. Consideration should be given to collocating the Outdoor Playing Courts with the following recreational facilities in order to (i) take advantage of potential savings in space requirements and operating costs, and (ii) provide users with the increased convenience of clustered facilities:

- 740 44 Indoor Physical Fitness Center (Gym)
- 740 45 Fitness Room
- 740 84 Indoor Playing Courts
- 750 20 Playing Fields
- 740 55 Youth Center

75010-4 **DEMAND AND ALLOWANCES**. Demand, market analysis and survey information, as well as the number of existing leagues/teams if applicable determine the number of Outdoor Playing Courts provided at each installation. Provision of lighted courts is recommended where there is a high demand and/or climate warrants later usage by patrons. Youth Outdoor Playing Courts will be provided as needed. They should be sized and located for the youth population, i.e. near the youth center if there is one. The Courts will be sized in accordance with industry standards for the youth age group or adult age group as appropriate.

750 20 PLAYING FIELDS (EA)
FAC: 7522
BFR Required: Y

Design Criteria: UFC 4-750-02N - Design: Outdoor Sports and Recreational Facilities

75020-1 **GENERAL**. See introduction to 750 series category codes for General Instructions regarding facility allowance planning procedures.

75020-2 **DEFINITION**. Playing Fields provide facilities and support services to meet the individual physical fitness, coordination, skills development, training and recreation needs of military personnel. The facilities may also serve dependents, retirees and authorized civilians. Activities which may be accommodated in Playing Fields include: baseball, football, soccer, softball, track and field, etc.

75020-3 **RELATED FACILITIES**. Consideration should be given to collocating the Playing Fields with the following recreational facilities in order to (i) take advantage of potential savings in space requirements and operating costs, and (ii) provide users with the increased convenience of clustered facilities:

- 740 44 Indoor Physical Fitness Center (Gym)
- 740 45 Fitness Room
- 740 53 Indoor Swimming Pool
- 750 10 Outdoor Playing Courts.
- 740 55 Youth Center

75020-4 **DEMAND AND ALLOWANCES**. Demand, market analysis and survey information, as well as the number of existing leagues/teams if applicable determine the number of Outdoor Playing Fields provided at each installation. Provision of lighted fields is recommended for expanded usage. Provision of lighted fields and use of artificial turf or installed sprinkler systems may serve to reduce the total requirement for filds by allowing extended playing hours, extended play without the need for field maintenance/recovery. Youth Outdoor Playing Fields will be provided as needed. They should be sized and located for the youth population, i.e. near the youth center if there is one. The Fields will be sized in accordance with industry standards for the youth age group or adult age group as appropriate.

750 21 BATTING CAGE (EA)
FAC: 7542
BFR Required: N

75021-1 Batting cages may be provided at Installations where there is a demand, where a MWR survey supports the requirement, and there is no convenient local alternative. Size according to industry standards.

750 22 JOGGING TRACK (KM/MI)
FAC: 7542
BFR Required: N

75022-1 Jogging tracks are provided and sized as required.

750 23 GO-CART TRACK (KM/MI)
FAC: 7542
BFR Required: N

75023-1 Go-Cart Tracks may be provided as a Category C facility where they are determined to be profitable enterprises. Market analysis for this facility must be provided by MWR. Size according to demand and industry standards.

750 30 OUTDOOR SWIMMING POOL - INSTALLATION (SQ.M./SF)
FAC: 7512
BFR Required: Y

75030-1 (Use Category Code 740 53 SWIMMING POOL - INDOOR for sizing standards). With appropriate demand analysis, outdoor pools may include water park features and spray parks.

750 33 POOL PUMP/FILTER/TREATMENT FACILITY (SF)
FAC: 7448
BFR Required: N

75033-1 This code is for inventory purposes and only in those cases where such facilities are located in a structure remotely situated from the swimming pool proper.

750 34 WADING POOL/SPLASH POOL (EA)

This CCN has been deleted. All newly programmed and existing assets should be assigned to CCN 75030 Outdoor Swimming Pool-Installation.

750 36 COOPER COAX CCTV AND CATV (LS)
FAC: 1351
BFR Required: N

75036-1 This Category Code is for inventory purposes only. Such facilities are used for the distribution of CCTV, cable TV services and commercial internet services.

750 37 OUTDOOR ADVENTURE AREA (EA)
FAC: 7542
BFR Required: N

75037-1 Includes Ropes Courses, Natural Recreation Features (rock climbing, hiking trails, mountain bike trails, paintball ranges, and motocross/BMX areas). Requirement is based on local availability (geography) and local demand. Size according to industry standards.

750 38 OUTDOOR MWR EQUIPMENT RENTAL STORAGE (SQ.M./SF)
FAC: 4521
BFR Required: Y

75038-1 Outdoor fenced area with lighting for storage of MWR rental equipment (not enclosed). Facility should be co-located with the Outdoor Recreation Center CCN 740-37, if there is one.

750 39 MWR VEHICLE/RV/BOAT STORAGE COMPOUND (SQ.M./SY)
FAC: 8523
BFR Required: Y

75039-1 Vehicle/RV/Boat Storage Compounds may be provided as Category C facilities where they are determined to be profitable enterprises. Market analysis for this facility must be provided by MWR. Size according to demand and industry standards. Covered spaces may be included where justified by demand.

750 40 GOLF COURSE (EA)
FAC: 7513
BFR Required: Y

Design Criteria: UFC 4-750-02N - Design: Outdoor Sports and Recreational Facilities

75040-1 **GENERAL**. See introduction to 750 series category codes for General Instructions regarding facility allowance planning procedures.

75040-2 **DEFINITION**. Golf Courses are recreational facilities which may accommodate: recreational golfing, practice, instruction, tournaments, exhibitions, special events, and winter recreational activities such as cross-country skiing, ice skating, sledding and tobogganing. In addition to the Golf Course, space permitting, the facility may include a driving range, practice hole, chipping green with sand trap, and putting green(s). A Golf Course is a Category C MWR facility.

75040-3 **RELATED FACILITIES**. The Golf Course must be collocated with the following recreational facilities in order to (i) take advantage of potential savings in space requirements and operating costs, and (ii) provide users with the increased convenience of clustered facilities:

- 740 80 Golf Club House (including golf maintenance building/storage compound, chemical/fertilizer/pesticide storage and mixing building, and cart storage facilities).
- 750 56 Golf Driving Range.

75040-4 **DEMAND**. The Golf Course will be sized in accordance with a market survey approach. As a Category C facility, the Golf Course must be profitable and a financial analysis or pro forma will be provided as well as the NPC Internal Needs Validation Study (INVS), and finally the Project Validation Assessment. The Planner will accomplish the initial demand investigation and review along with local MWR personnel. If project is financially sound it will be forwarded via the region to NPC (after 1 October 2004, CNI Field Support Activity) for INVS scoring and possible Project Validation Assessment.

75040-5 **FACILITY ALLOWANCE.** The Golf Course will be sized in accordance with industry standards. One resource for sizing criteria is the National Golf Foundation (NGF). Siting, water availability, and existing land area available will be the key considerations when planning a new Golf Course.

750 50 OUTDOOR THEATER (EA)
FAC: 7532
BFR Required: Y

75050-1 No planning factors are available. If an outdoor theater (either seat- type or drive-in) is provided, the requirements for theaters (Code 740 56) must be reduced accordingly.

750 52 SKEET AND/OR TRAP RANGE (EA)
FAC: 7542
BFR Required: Y

75052-1 Skeet and/or Trap Ranges may be provided as Category C facilities where they are determined to be profitable enterprises. Market analysis for this facility must be provided by MWR. Size according to demand and industry standards. In addition, suitable land must be available, and the activity must have a military population over 100. If a range building is authorized, see Category Code 740 52 for criteria. Table 75052-1 gives the corresponding land requirements. This facility must be self-sustaining.

Table 75052-1. Land Requirements for Skeet and Trap Ranges Land Area

Military Population (1)	Skeet Range	Trap Range
Up to 100	None	None
101 to 10,000	335m x 732m /1100’ x 2400’	335m x 549m / 1100’ x 1800’
10,001 to 15,000	335m x 732m /1100’ x 2400’	335m x 576m / 1100’ x 1890’
15,001 to 20,000	335m x 732m /1100’ x 2400’	335m x 604m / 1100’ x 1980’
20,001 to 25,000	335m x 732m /1100’ x 2400’	335m x 631m / 1100’ x 2070’
25,001 to 30,000	335m x 732m /1100’ x 2400’	335m x 658m / 1100’ x 2160’
30,001 to 40,000	335m x 777m /1100’ x 2550’	335m x 686m / 1100’ x 2250’
Over 40,000	335m x 823m / 1100’ x 2700’	335m x 713m / 1100’ x 2340’

(1) Military population consists of active duty military supported by the installation.

750 54 BAND STAND (EA)
FAC: 7531
BFR Required: N

75054-1 No planning factors are available. Requests for this facility will require individual justification.

750 56 GOLF DRIVING RANGE (EA)
FAC: 7514
BFR Required: Y

75056-1 Installations, where the necessary land is already available, and the facility will be profitable as a Category C facility, are authorized a golf driving range. See category code 750 40.

750 57 MWR OPERATED RECREATION GROUNDS (EA)
FAC: 7516
BFR Required: Y

75057-1 No specific guidance is available. Local conditions usually will govern the development of any parks, playgrounds, or picnic areas. Recreation Pavilions (Code 740 78) are authorized in conjunction with these facilities.

750 58 RECREATIONAL CAMPGROUND-TENT (SQ.M./SF)

This category code has been deleted. All newly programmed and existing assets should be assigned to category code 750 59, Recreational Campground.

750 59 RECREATIONAL CAMPGROUND (AC)
FAC: 7541
BFR Required: Y

75059-1 **GENERAL**. See General Notes to 750 series category codes for General Instructions regarding facility allowance planning procedures.

75059-2 **DEFINITION**. Recreational Campgrounds provide the military community with outdoor recreation opportunities at locations with attractive natural resources. To complement the camping experience, and depending on location, Recreational Campgrounds may offer activities such as boating, canoeing, fishing, hiking, hunting, skiing and swimming. Facilities should be designed to take advantage of the natural features of the site, from vegetation to good views to unusual topography. At the same time, development should be environmentally appropriate and not threaten the preservation of the natural heritage and scenic resources.

The planning criteria in this Category Code addresses only the camping sites and other support elements such as RV dump stations; dumpster stations; playgrounds and courts (associated with the RV Park only); standalone picnic shelters; and any other associated facilities or site features other than buildings. Facilities such as camp offices; camp stores; bathhouses; laundry facilities; storage buildings; campground rental centers, etc. should be categorized under CCN 740-92 MWR RV Park Support Building. Requirements for these facilities can also be found under CCN 740-92. Recreational campgrounds are encouraged to make use of the Camp Host concept to assist in the management of the campground. Space allowances for MWR Rental Accommodations are addressed under CCN 740-81.

Dump stations should generally be provided at campgrounds that accommodate RV's. The sizing and design of dump stations will vary according to local conditions (such as topography, soil conditions, proximity to water sources, etc.). All dump station facilities must comply fully with all applicable environmental regulations.

75059-3 **RELATED FACILITIES**. Where such locations are adjacent to the sea or other body of water, support facilities such as marinas, boat ramps and RV/vehicle/boat storage compounds may be sited in close proximity to Recreational Campgrounds.

75059-4 **SPACE ALLOWANCE**. The total number of camping and/or RV sites provided at a location is primarily determined by two considerations:

- The Recreational Campground will be sized in accordance with a market survey approach. As a Category C facility, the Campground must be profitable and a financial analysis or pro forma will be provided as well as the CNIC Internal Needs Validation Study (INVS), and finally the Project Validation Assessment. The Planner will accomplish the initial demand investigation and review along with local MWR personnel. If the project is financially sound it will be forwarded via the region to CNIC Fleet & Family Readiness (N944A) for INVS Scoring and possible Project Validation Assessment.

- Capacity of the location to accommodate the proposed facilities at a recommended level of use density, and other site planning requirements for access and provision of utilities.

75059-4.1 The number of campsites which may be accommodated per acre will vary depending on the natural features (topography, geology, vegetation, etc.) of the proposed location and the desired degree of privacy between individual sites. Development of as few as 2.4 sites per hectare (6 sites per acre) to a maximum of 5.7 sites per hectare (14 sites per acre) is recommended as a planning guideline. However, this guideline may be modified by the financial analysis, which may, for example, indicate that 2.4 sites per hectare (6 sites per acre) may be too low to justify the investment required to provide the necessary infrastructure (paths, roads, patron support facilities, utilities, etc.). Furthermore, the financial analysis may also indicate a total minimum number of sites required to justify the investment in this recreational resource and the corresponding support building (CCN 740-92). RV Campsites should be planned with a vehicle/picnic pad 20 feet by 40 feet that will accommodate the RV and either towed or towing vehicle, picnic table, fire ring/grill and lantern pole. The adjacent utilities pedestal should offer 20/30/50A electrical service, drinking water hose bibb and sewer connection. WIFI service is also a standard for all RV spaces. Minimum separation between campsites should be 37 feet centerline to centerline of each pad. It is recommended that, where financially feasible, the RV Campground include a mix of back-in and pull-through sites.

75059-4.2 All facilities, which have the potential for causing environmental contamination — for example, dumpsters and dump stations —, must comply fully with all applicable local, state and federal regulations. The planning of Recreational Campgrounds located in areas under the jurisdiction of other agencies such as State Parks and Forests Divisions, the U.S. Forest Service and the National Park Service, must adhere to all applicable development guidelines and review procedures.

750 60 MARINA / BOAT RAMP (EA)
FAC: 7518
BFR Required: Y

75060-1 This facility requires special considerations and must be developed based on local conditions and supported by a detailed analysis. As a Category C facility, the Marina must be profitable and a financial analysis or pro forma will be provided as well as the CNIC Fleet & Family Readiness (N944A) Internal Needs Validation Study (INVS), and finally the Project Validation Assessment (PVA). A marina may also be operated as a Category B operation without resale or private boat berthing. In this case, boats and equipment are MWR-owned and -operated. For a Category B program marina, it is necessary to document the demand and to ensure that APF will be available to support operation of the sailing program. In this case the INVS and PVA goal is to build only to demand capacity and attempt to breakeven financially. The operation of a snack bar, restaurant, or resale outlet is only authorized as a Category C program. The Planner will accomplish the initial demand investigation and review along with local MWR personnel. If the project is financially sound it will be forwarded via the Region to CNIC Fleet & Family Readiness (N944A) with a pre-INVS for evaluation, comment and questions. Once any comments or questions are resolved submission of a full INVS will be invited and scored followed by a possible PVA. CCN 75060 Marina/Boat Ramp includes any combination of boat launch ramps for personal watercraft; boat launch piers that support the ramp; and/or any piers associated with boat slips. Stand-alone recreational piers not affiliated with a marina should be captured under CCN 75061 Recreational Pier. A marina support building or boathouse is authorized in conjunction with a marina and should be programmed as a part of the project nomination and validation process. See category code 74087, Marina Support Building, for marina support building criteria. There are two categories of Marina: Category B is the MWR boating/sailing program and Category C is the rental slip operation.

750 61 RECREATIONAL PIER (EA)
FAC: 7517
BFR Required: Y

75061-1 This CCN is used for stand-alone recreational pier facilities (e.g. fishing piers) where there is no existing Marina.

751 OUTDOOR RECREATION FACILITIES

751 10 PLAYGROUND (EA)
FAC: 7511
BFR Required: N

75110-1 **DEFINITION.** Formerly titled “Community Playground”. Playgrounds are outdoor activity areas provided for children and are an integral part of the functions associated with schools, family housing areas, outdoor athletic and recreational areas, and child development, school age care and youth centers. The playgrounds may utilize traditional playground equipment or may be constructed with zero-depth splash park features.

A playground will have a defined boundary with one or more types of play equipment or features, and fall-protection surfacing appropriate for the equipment provided and anticipated activities. (A playground is differentiated from an open play area which does not have a defined boundary or engineered surfacing, which generally consists of a rubberized, poured surface but may be wood chips, rubber chips, or rubber tiles).

Each playground is specifically planned and designed to meet the age-appropriate activity needs of children playing in these areas. Refer to UFC 3-201-02 “Landscape Architecture” and the US Consumer Product Safety Commission “Public Playground Safety Handbook” for guidance.

Each playground must be Architectural Barriers Act (ABA) compliant for the appropriate age group. For Child Development Centers having multiple outdoor activity areas for each age group, only a single area per age group must be ABA compliant, however all outdoor activity areas must meet the requirements of the Child Development Center UFC 4-740-14. Outdoor activity areas supporting Youth or School Age Care (SAC) Centers must comply with UFC 4-740-06.

Playgrounds do not include purpose-built fields or tracks to support specific sports (refer to the 750 series of Category Codes for sports facilities).

75110-2 **PROPERTY RECORD CARD USAGE.** Each playground location should be shown on a separate property record card, which will include the site and all equipment associated with the playground.

This Category Code is for inventory purposes only.

752 OUTDOOR ATHLETIC FACILITIES

752 40 ATHLETIC STADIUM (EA)

FAC: 7524
BFR Required: N

75240-1 For inventory purposes only.

760 MUSEUMS AND MEMORIALS

760 10 MUSEUM / MEMORIAL BUILDING (SQ.M./SF)

FAC: 7601
BFR Required: Y

Project Approval (Museums): Assistant Secretary SECNAV INSTRUCTION 5755.2A (Museums) (http://neds.nebt.daps.mil/Directives/5755_2a.pdf)

76010-1 No specific planning factors are available for this group. Requirements for each of the above facilities will be established based on individual studies and supporting justification. Museums must be approved by SECNAV.

76010-2 The Office of the Comptroller of the Navy has ruled the use of appropriated funds (including OM&N funds) for the construction and maintenance of memorials is restricted to those memorials specifically approved by Congressional authority. Alternative funding sources should be explored.

760 20 OUTDOOR MONUMENT / MEMORIAL (EA)
FAC: 7602
BFR Required: N

76020-1 The Office of the Comptroller of the Navy has ruled that the use of appropriated funds (including OM&N funds) for the construction and maintenance of memorials is restricted to those memorials specifically approved by Congressional authority. Alternative funding sources should be explored.

760 30 CEMETERY (EA)
FAC: 7603
BFR Required: N

76030-1 No specific planning factors are available for this group. Requirements for each of the above facilities will be established based on individual studies and supporting justification. SECNAV approval will be required.

Version: 800.20253103

FACILITIES CRITERIA (FC)
FACILITY PLANNING FOR NAVY AND MARINE CORPS SHORE INSTALLATIONS

Series 800: UTILITIES AND GROUND IMPROVEMENTS FACILITIES

Record of Changes:

Date	CCN	CCN Title	Description of Change
13 June 2018	83143	Hazardous Waste Storage Building	Remapped to FAC 4423 per OSD/RPCP FY18.
13 June 2018	892 Series	NA	Added 892 Series “Miscellaneous Utilities-Each”
13 June 2018	89210	Monitoring Wells	CCN added
24 Oct 2018	82112 82122 82130 82140 82310	Heating Plant - Oil / Gas Heating Plant - Coal Heating Plant - Non - Fossil Fuel Steam Plant – Nuclear Gas Generating Plant	Changed Unit of Measure from millions of BTU per hour (MB) to BTU per hour (BH)
28 Jan 2020	81220	Exterior Lighting, Pole Mounted	Title changed from “Street Lighting” to “Exterior Lighting, Pole Mounted”. Primary unit of measure changed from LF to EA.
28 Jan 2020	81240	Perimeter and Security Lighting	CCN 81240 deleted in FY19. Assets consolidated into CCN 81220.
28 Jan 2020	83340	Garbage House/Recycle Center Building	Title changed from “Garbage House” to “Garbage House/Recycle Center Building”.
28 Jan 2020	85215	Bicycle Shelter	Title changed from “Parking Building, Bicycle” to “Bicycle Shelter”. FAC Code changed from 8531 to 7384.
28 Jan 2020	89045	Valve House or Other Enclosure	Title changed from “Valve House or Other Shed/Shelter” to “Valve House or Other Enclosure”.
28 Jan 2020	89210	Monitoring Wells	FAC Code changed from 1499 to 8840.

Date	CCN	CCN Title	Description of Change
28 Jan 2020	87110	Storm Sewer	FAC Code changed from 8321 to 8711
28 Jan 2020	81340	Lightning Protection System, Standalone	Added category code 81340 – Lightning Protection System
20 July 2020	85210	Parking Area	Updated Table 85210-1, Allowances for Non-Organizational Vehicle Parking
20 July 2020	82140	Steam Plant-Nuclear	CCN deleted
20 July 2020	83142	Hazardous Waste Storage Area	FAC code changed from 8926 to 8526
20 July 2020	83231	Sewage Lift Stations	CCN deleted. Redundant. Use 83230.
12 Mar 2021	81220	Exterior Lighting, Pole Mounted	Removed conflicting statement regarding units of measure.
24 Aug 2021	87210	Station Security and Perimeter Fencing and Walls	Added Security Fencing for Magazine Storage and Security Risk (SRC) Categories I and II ordnance.
31 Aug 2021	84441	Stormwater Filtration – Permeable Surface	New Category Code added.
31 Aug 2021	84442	Stormwater Filtration - Swales	New Category Code added.
31 Aug 2021	84451	Stormwater Treatment Structure	New Category Code added.
11 Nov 2021	84420	Water Well	Note that the Real Property Categorization Panel will change the FAC to 8414. Change CCN 84420 title to "Water Well" and change CCN definition information to include the words “either potable or non-potable.”
11 Nov 2021	81340	Lightning Protection System, Standalone	Change definition verbiage.
11 Nov 2021	85235	Other Paved Areas Not Coded In The 100 or 400 Series	CCN definition change only. Removes term "vehicular" from original description.
11 Nov 2021	85240	Miscellaneous Open Storage or Laydown Area – Paved	Change title to add word "Paved"
11 Nov 2021	83320	Garbage Grinder Building	Note that the Real Property Categorization Panel will change the FAC to 8330. Change Unit of Measure (UM) to SF Delete outdated definition and include new

Date	CCN	CCN Title	Description of Change
			information regarding refuse and recycling.
19 August 2022	83312	Refuse/Solid Waste Collection Facility – (Non Hazardous)	Add new category code.
19 August 2022	85239	Miscellaneous Open Storage or Laydown Area - Unpaved	Add new category code.
12 September 2022	85240	Miscellaneous Open Storage or Laydown Area - Paved	In section 85240-1, Reference the use of Table 85240-1 in lieu of Table 852 40.
6 October 2022	81240 81241	Level 1 / Level 2 Electric Vehicle Charging Facility Level 3 Direct Current Fast Charging Facility	Add new category code. Add new category code.
2 Mar 2023	800 Series	UFC 2-000-05N	Change UFC 2-000-05N to FC 2-000-05N document due to the fact that this planning criteria is not unified among the other DoD services.
15 June 2023	81240 81241	Level 1 / Level 2 Electric Vehicle Charging Facility Level 3 Direct Current Fast Charging Facility	Add requirement for electric charging capability to support no less than 15 percent of Government motor vehicles.
15 Jan 2024	87250	Entry Gate	Add new category code.
15 Jan 2024	89018	Utility Vault-Non Communications	Modify category code description.
15 Jan 2024	89046	Utility Tunnel-Non Communications	Modify the category code title and description.
15 Jan 2024	89210	Monitoring Well	Modify the category code description.
15 Jan 2024	89320	Utility Channel-Non Communications	Modify the category code title and description.
27 Feb 2024	81340	Lightning Protection System, Standalone	Change “DEFINITION” and PROPERTY RECORD CARD USAGE” sections to 81340-1 and 81340-2, respectively.
12 Mar 2024	83230	Sewage Waste Pumping Station	Change the word “PUMP” in the title to “PUMPING.” Change the primary unit of measure from EA to KG, which is equivalent to “Thousand Gallons per Day (KG).”

Date	CCN	CCN Title	Description of Change
16 Oct 2024	87230	Mechanical Security Barricade	Include verbiage that drop arms meet the definition of a mechanical security barricade and are included.
16 Oct 2024	83141	Hazardous Waste Storage and Transfer Facility	Renumber individual paragraphs to read 83141-1 through 83141-7.
16 Oct 2024	85120	Vehicular Bridges	Add reference of the Federal Highway Administration regarding the planning of roads, streets, and bridges.
31 Mar 2025	81320	Substation	Under section, "Property Record Card Usage," change 6,000 kVA to 7,500 kVA.
31 Mar 2025	81240 81241	Level 1 / Level 2 Electric Vehicle Charging Facility Level 3 Direct Current Fast Charging Facility	Include Section 81240-3, Parking Space and Access Aisle, siting requirements information for both Category Codes.
31 Mar 2025	83309	Incinerator Building and Incinerator	A definition has been included for defining this type of facility.

800 SERIES
UTILITIES AND GROUND IMPROVEMENTS FACILITIES

Table of Contents

810 ELECTRIC POWER

810-1 DEFINITION

The electric power demand of a Navy or Marine Corps installation will normally be predicated upon an engineering study of personnel and industrial-type consumption load of the installation activities. However, in the absence of an engineering study the following should be utilized for broad planning purposes:

Table 810-1. Electric Demand Planning Factors

Category Group	Description	Unit of Measure	Maximum Demand Per Unit of Measure (Watts)
130	Communication & Navigational Aid	SF	13, 5
	Airfield Lighting	LF	6
140	Land Operations Facilities	SF	7.5
150	Waterfront Operational Facilities	SF FB	5 5×10^3
170	Training Facilities	SF	7.5
210	Maintenance. Shops & Facilities	SF	7.5
220	Production Buildings. & Plants	SF	7.5
310	Research, Development & Test Bldg.	SF	7.5
440	Storage, Covered	SF	2
510/20	Hospital Buildings	SF BD	6 4×10^3
230/40/50	Labs, Clinics, Dispensaries	SF	8
610	Administration Buildings	SF	6
710	Family Housing	SF FA	4.5* 6×10^3*
720	Troop Housing	SF MN	5.5 500
730/40	Community Facilities	SF	7
821	Heating Plants	SF MBH	5 3×10^3
830	Sewage Treatment Plants	MGPD	200×10^3

* Coincident demand for multiple units.

811 ELECTRIC POWER-SOURCE

811-1 DEFINITION. Electric power for base facilities is normally derived from local commercial sources. Where commercial sources are used, transformer substations are required to transform the electrical energy to satisfy the station's load requirement.

Category Code Numbers (CCNs) 81110, 81125, 81145, 81146, and 81150 power generation plants may be used as a primary power source in lieu of commercial power or for reducing dependency on commercial power. CCN 81160 may only be used for standby power generation plants.
Primary power generation plants are real property. Standby generator plants may be real or personal property, depending on what they support. In general, a standby generator shall be considered real property if it supports real property and shall be considered personal property if it supports personal property. See OPNAVINST 11010.20H, Chapter 1, Paragraph 2c for definitions of real property and personal property.

811-2 PROPERTY RECORD CARD. Regardless of whether the real property power plant is within the footprint of another building, in a standalone building, sheltered by a structure or on a pad, or if it is generating primary or auxiliary power, the primary power or standby power generator plant is assigned its own property record card. If the power plant is located within a standalone building, use CCN 81109 for primary power plants or CCN 81159 for standby power plants.

811 09 ELECTRIC POWER PLANT BUILDING (SF)

FAC 8910
BFR Required: N
Revised: August 2015

81109-1 DEFINITION. This category code is used for the buildings or shelters that house the electric power plant and associated equipment included in category codes 81110, 81125, 81145, 81146, 81150 and 81160. If an access road is required, the road is inventoried separately; see 85110 and 85111 for more information.

81109-2 PROPERTY RECORD CARD USAGE. Each electric power plant building, shelter or pad should be captured on a single, individual property record card as a structure. If a separate standalone building is used, then CCN 81109 should be assigned as the utilization on that property record card. If the power generation plant is housed in an existing multi-purpose facility, then the space used for the power generation plant should be assigned a utilization of 81109.

811 10 - 811 50 ELECTRIC POWER PLANTS

81110/81150 – 1 DEFINITION. Consideration as to whether an electric power generating plant is to be planned will depend on the station's geographical location, the availability of a firm uninterrupted adequate power supply from a local electric utility, the economics of using byproduct steam for space heating and industrial process work, and the availability of the required fuel. The electric generating plant (diesel or steam) shall have a total installed capacity equal to the station's total kilowatt demand and in the case of diesel generators there must be one additional standby generating unit with a capacity equal to the largest unit on the line.

In the planning and determination of power plant capacity, due consideration should be given to the estimated demand of all of the station's consumption, both domestic and industrial, plus the anticipated load growth. For initial planning purposes, power plant capacity may be computed by either (1) utilizing the factors indicated under 810 above, or (2) totaling all of the estimated demands in kilowatts of all existing and proposed station buildings and multiplying this total by an appropriate diversity factor. Where a diversity factor is not provided, a factor of eighty percent (80%) may be used. The resultant total is the estimated power plant capacity or the estimated amount of electrical power needed by the station facilities.

811 10 ELECTRIC POWER PLANT - DIESEL (KW)

FAC 8111
BFR Required: N
Revised: August 2015

81110-1 DEFINITION. This category code is used for power plants that use diesel generators as the primary power source for the production of electricity. Additionally, these plants may also be used in auxiliary capacity for peak shaving or other energy reduction. This category includes all necessary equipment for the production of the commodity including fuel tanks, pumps, electrical equipment, plant controls, and all required process equipment for commodity generation. Dual-fuel engines and piston engines utilizing natural gas or other alternate fuels will use this category code.

81110-2 PROPERTY RECORD CARD USAGE. All equipment is inclusive to the power generation plant and shall not be accounted for separately. The power generation plant should be captured on a single, individual property record card. Any switching stations or substations located inside or outside the power plant but associated with the power distribution system of the installation should be shown on a separate property record card. The building that houses the power plant should be reflected on a separate property record card; see 81109 for more information.

811 25 ELECTRIC POWER PLANT - STEAM TURBINE (KW)

FAC 8111
BFR Required: N
Revised: August 2015

81125-1 DEFINITION. A central plant using steam turbine generators for the production of electricity. This category includes all necessary equipment for the production of the commodity. Included are fuel tanks, pumps, electrical equipment, and all required process equipment for commodity generation. The primary unit of measure is kilowatts of generation installed (KW). **NOTE:** All cogeneration plants should be classified using Category Code 81125. A steam turbine typically uses coal, natural gas, or fuel oil, but could also use refuse or a nuclear energy source. Each of these fuel sources has differing components and storage requirements that would be noted during an asset evaluation, but that are considered real property installed equipment (RPIE) of the plant and not called out as separate facilities (e.g., a conveyor system for delivery of coal or storage tanks for fuel).

81125-2 PROPERTY RECORD CARD USAGE. All equipment internal to the power plant shall be included on an individual property record card. Any switching stations or substations located inside or outside the power plant that are associated with the power distribution system of the installation should be shown on a separate property record card. The building that houses the power plant should be on a separate property record card using CCN 81109.

811 45 ELECTRIC POWER PLANT - GAS TURBINE (KW)

FAC 8111
BFR Required: N
Revised: August 2015

81145-1 DEFINITION. A central plant using gas fired turbine generators for the production of electricity. This category includes all necessary equipment for the production of the commodity. Included are fuel tanks, pumps, electrical equipment, and all required process equipment for commodity generation. The primary unit of measure is kilowatts of generation installed (KW). A gas turbine is typically run off of a jet propellant (JP) fuel source. Gas turbines are a source of primary power and are classified as real property.

81145-2 PROPERTY RECORD CARD USAGE. All equipment internal to the power plant should be included on a single, individual property record card. Any switching stations or substations located inside or outside the power plant but associated with the power distribution system of the installation should be shown on a separate property record card.

811 46 ELECTRIC POWER PLANT - WIND TURBINE (KW)

FAC 8114
BFR Required: N
Revised: August 2015

81146-1 DEFINITION. A central plant using wind turbines for the production of electricity. This category includes all necessary equipment for commodity generation. The primary unit of measure is kilowatts of generation installed (KW). These plants generate electricity by capturing the kinetic energy of the wind to drive the turbine. This power generation source is a form of renewable energy and is primarily used for energy reduction. Wind turbines are a passive source of primary power and shall be considered real property.

81146-2 PROPERTY RECORD CARD USAGE. The equipment internal to the power plant should be included on an individual property record. Any switching stations or substations associated with the power distribution system of the installation should be shown on a separate property record card.

811 50 ELECTRIC POWER - PHOTOVOLTAIC SYSTEM (KW)

FAC 8115
BFR Required: N
Revised: August 2015

81150-1 DEFINITION. A power source using photovoltaic (PV) panels for the production of electricity. This category code includes all necessary equipment for the production of the commodity. These plants generate electrical power by converting sunlight into direct current electricity using semiconducting panels. This power generation source is a form of renewable energy and is primarily used for energy reduction. PV systems are a passive source of primary power and are classified as real property.

81150-2 PROPERTY RECORD CARD USAGE. All photovoltaic systems are classified as real property and inventoried in iNFADS. All equipment associated with a photovoltaic system shall be included on a single property record card. The primary unit of measure is the rated output capacity of the inverter in kilowatts (KW) generated by the PV system. Note that roof top mounted units are typically maintained by the tenant command, whereas carport mounted and/or ground mounted units are maintained by the public works utilities department.

811 59 STANDBY GENERATOR BUILDING (SF)

FAC 8910
BFR Required: N
Revised: August 2015

81159-1 DEFINITION. This category code is used for standalone buildings associated with emergency standby generator plants (81160).

81159-2 PROPERTY RECORD CARD USAGE. Each building shall be recorded on an individual property record card. All equipment associated with a standby generator plant shall be included on a separate property record card utilizing CCN 81160.

811 60 STANDBY GENERATOR PLANT (KW)

FAC 8112
BFR Required: N
Revised: August 2015

81160-1 DEFINITION. Standby generator plants include all necessary equipment for the production of power. Such equipment may include day tanks, pumps, power panels, switchgear, controls, battery storage, and automated transfer switches. When dealing with standby generator plants, it is necessary to verify the characteristics of the plant with appropriate facility POC to ensure accuracy of real property status and rated capacity (KW).

There are several categories of standby generator plants:

a. Utilities Standby Power - Utilities standby power generation plants act as auxiliary sources of power and do not require full-time operation. Utilities standby generation plants serve utility production and distribution facilities such as water treatment plants or sewage lift stations, during power outages. Utilities standby power generation plants are classified as real property.

b. Emergency Standby Power - Emergency standby power generation plants provide power upon loss of the primary power source and are classified as Emergency Systems by NFPA 70. They are essential for safety to human life and legally required by municipal, state, federal or other codes or by a governmental agency having jurisdiction. Examples include generators for hospitals or air traffic control towers. Emergency standby power generation plants are classified as real property.

c. Mission Specific Standby Power – Mission specific standby power generation plants support mission specific operations. These essential loads must be supported with emergency standby power generation and provide an adequate uninterrupted power supply in the event (and throughout the period) of power outages and other emergencies. There are two types of mission specific standby power.

1. Where an entire operation must be supported with power, (such as a command operation center, SCIF, or other mission essential operation), these mission specific standby power generators may support a single

building, multiple buildings or a space within the building. Since these generators are supporting a real property, these mission specific standby power generators and associated UPS systems would be classified as real property.

2. Where only critical personal property equipment such as servers, computer room air conditioning (CRAC) units or other telecommunication gear is supported, these generators and associated UPS will be classified as personal property. In these instances, the generators are sized only to support specific critical pieces of personal property equipment. These generators would not be used for building system or task lighting, central or comfort air conditioning system, or power to support personnel operations.

81160-2 PROPERTY RECORD CARD USAGE. A real property standby generator plant should be inventoried on its own property record card. The associated plant equipment (day tanks, UPS, battery bank, transfer switch, etc.) is classified as Real Property Installed Equipment (RPIE) and should not be inventoried separately. Bulk fuel storage tanks must be inventoried separately. Whether real or personal property, in many instances CNIC will not be owner or operator of the standby generator plant and the maintenance fund source codes will vary accordingly. There are many possible owner-operators that could have maintenance responsibility, including CNIC, NAVAIR, NAVFAC, or other non-Navy tenant command such as DLA or BUMED. The primary unit of measure is the rated capacity in kilowatts (KW) generated.

812 ELECTRIC POWER TRANSMISSION AND DISTRIBUTION LINES

812-1 DEFINITION. Distribution and transmission lines are required to supply electricity to buildings, street lighting, floodlighting, and perimeter lighting. Lines may be either overhead or underground and will include poles, duct banks, and controls to distribute electrical energy from the source to each using facility. Planning for distribution and transmission lines will require engineering calculation of critical power demand loads and future load growth. Airfield pavement lighting is planned as described under Category Code 136.

812 09 ELECTRIC DISTRIBUTION BUILDING (SF)

FAC 8910
BFR Required N

81209-1 DEFINITION. This category code should be used for buildings associated with electric distribution system that are not included under Switching

Station/Substation buildings, Category Code 813 10. This Category Code will rarely be used. The unit of measure is square feet.

81209 – 2 PROPERTY RECORD CARD USAGE. Each building should be on a single property record card.

812 12 TRANSFORMERS (KV)

FAC 8133
BFR Required N

81212-1 DEFINITION. Transformers transform electrical power on the primary side to a lower or higher voltage on the secondary side to serve a facility or several facilities. Use the kilovolt ampere (KVA) rating that is found on the nameplate on the transformer or obtained from the manufacturer. It is the lowest rating when multiple ratings are provided (i.e. 12000/16000/20000 – OA/FA/FOA)]. The primary unit of measure is kilovolt ampere (KV) and the alternate unit of measure of EA should be entered into iNFADS. Enter the alternate unit of measure, each (EA), by including the total quantity of transformers listed on the record.

81212-2 PROPERTY RECORD CARD USAGE. A separate property record card shall be created which aggregates all distribution transformers in each special area of an installation, separated by voltage class and also separated by those transformers connected to the overhead distribution system and the underground distribution system. A detailed list of individual transformers totaled on the property record card should be kept in Maximo or by another method (e.g. Excel) and the file attached to the property record card.

Example: Transformers on a 15 KV system will be shown on separate property record cards, one PRC for the overhead distribution system, and one PRC for the underground system for each special area of the installation. If there are 40-500 KVA transformers on a 15 KV overhead electric distribution system, the property record card should reflect a total adequate other measure of 20,000 KVA.

812 20 EXTERIOR LIGHTING, POLE MOUNTED (EA)

FAC 8122
BFR Required N

81220-1 DEFINITION. A utility consisting of secondary power distribution lines (either above or below ground), exterior light fixtures, and poles or standards for mounting the fixtures. This utility includes all forms of exterior lighting (other than that mounted on buildings or other facilities), including that for airfield perimeter lighting; street lighting for traffic circulation; parking lot lighting for traffic circulation, personnel safety, and security; area lighting for personnel safety, security, and night-time use of facilities; and security lighting for arms and ammunition storage areas or facilities, airfield or heliport perimeters, or other mission-essential vulnerable areas. The primary unit of measure is EA (Each) per pole.

NOTE: Pole-mounted floodlighting systems associated with athletic fields are already accounted for under CCN 75020 Playing Fields. For Traffic Control Signals, use CCN 85123.

81220-2 PROPERTY RECORD CARD USAGE. A separate property record card shall be created for each special area of an installation.

812 31 OVERHEAD ELECTRICAL DISTRIBUTION LINES (LF)

FAC 8121
BFR Required N

81231-1 DEFINITION. The overhead lines are for the transmission of electrical power between source, substations and switching stations, and end users. Includes all required wire, poles, pole mounted switches, supports, insulation, metering, etc.(Excluding transformers and sectionalizing switches) necessary for a complete and useable distribution system.
Other Unit of Measure - linear feet of circuit [pole-to-pole distance X number of circuits on pole, NOT number of wires] (LF). Example: A span of electrical overhead distribution 1500 feet in length supporting 2 circuits would be 1500 ft X 2 circuits = 3000 linear feet.

81231-2 PROPERTY RECORD CARD USAGE. A separate property record card shall be created for each special area of an installation for each voltage class.

812 32 UNDERGROUND ELECTRICAL DISTRIBUTION LINES (LF)

FAC 8123
BFR Required N

81232-1 DEFINITION. The underground lines are for the transmission of electrical power between source, substations and switching stations, and end users. It includes all required cable, conduit, duct bank, manholes, switches, insulation, metering, etc. (Excluding transformers and sectionalizing switches) necessary for a complete and useable distribution system.

Other Unit of Measure - linear feet of circuit [manhole-to-manhole distance and pole-to-manhole distance X number of circuits NOT number of cables] (LF). Example: 1000 feet of cable run in duct bank containing 4 circuits would be 1000 ft X 4 circuits = 4000 linear feet.

81232-2 PROPERTY RECORD CARD USAGE. A separate property record card shall be created for each special area of an installation for each voltage class.

812 40 LEVEL 1 / LEVEL 2 ELECTRIC VEHICLE CHARGING FACILITY (KW)

FAC 8124
BFR Required N

81240-1 DEFINITION. An electric vehicle (EV) charging facility delivers either a 120V or 208/240V AC power for charging government-owned vehicles and/or personally owned vehicles at an installation.

81240-2 PARKING REQUIREMENT. Provide adequate electric charging capability concurrently for no less than 15 percent of Government motor vehicles planned for parking at a facility (See UFC 2-100-01 DOD Building Code).

81240-3 PARKING SPACE AND ACCESS AISLE. Provide an EV charging parking space with a minimum width of 132 inches (11 feet) and a minimum length of 240 inches (20 feet) for each vehicle parked. Include an aisle space at least 60 inches (5 feet) wide adjacent to the vehicle parking space. Larger parking spaces may be required to accommodate electric trucks. Designate all vehicle charging parking spaces by markings and include markings for access aisles to prevent non-charging vehicular parking in such areas. One access aisle may be shared between two EV vehicle parking spaces, or a regular parking space adjacent to an EV charging space. However, overlap of the shared aisle should be limited to 60 inches (5 feet).

Note that access aisles should not be encumbered or encroached upon by curbs, wheel stops, bollards, or loose charging cables.

81240-4 PROPERTY RECORD CARD USAGE. EVCFs are permanently constructed to include charging stations (ports**),** electric meters, associated electrical service lines and conduits, dedicated transformers, and concrete pads/footings as required.

The unit of measure (UM) of EVCF systems is kilowatt (KW) and is cumulative for each charging port station associated with the asset.

Example: A row of five charging stations (ports) is considered a single asset with a unit of measure equal to the sum of each port’s KW output.

812 41 LEVEL 3 DIRECT CURRENT FAST CHARGING FACILITY (KW)

FAC 8124
BFR Required N

81241-1 DEFINITION. An electric vehicle (EV) charging facility delivers 50kW-400kW DC power for charging government-owned vehicles and/or personally owned vehicles at an installation.

81241-2 PARKING REQUIREMENT. Provide adequate electric charging capability concurrently for no less than 15 percent of Government motor vehicles planned for parking at a facility (See UFC 2-100-01 DOD Building Code).

81240-3 PARKING SPACE AND ACCESS AISLE. Provide an EV charging parking space with a minimum width of 132 inches (11 feet) and a minimum length of 240 inches (20 feet) for each vehicle parked. Include an aisle space at least 60 inches (5 feet) wide adjacent to the vehicle parking space. Larger parking spaces may be required to accommodate electric trucks. Designate all vehicle charging parking spaces by markings and include markings for access aisles to prevent non-charging vehicular parking in such areas. One access aisle may be shared between two EV vehicle parking spaces, or a regular parking space adjacent to an EV charging space. However, overlap of the shared aisle should be limited to 60 inches (5 feet).

Note that access aisles should not be encumbered or encroached upon by curbs, wheel stops, bollards, or loose charging cables.

81241-4 PROPERTY RECORD CARD USAGE. EVCFs are considered real property when they are constructed as a charging system. EVCFs are permanently constructed to include charging stations (ports), electric meters, associated electrical service lines and conduits, dedicated transformers, and concrete pads/footings as required.

The unit of measure (UM) of EVCF systems is kilowatt (KW) and is cumulative for each charging port station associated with the asset.

Example: A row of five charging stations (ports) is considered a single asset with a unit of measure equal to the sum of each port’s KW output.

813 ELECTRIC POWER SUBSTATIONS AND SWITCHING STATIONS

813 10 SWITCHING STATION / SUBSTATION BUILDING (SF)
FAC 8910
BFR Required N

81310-1 DEFINITION. This Category Code is used for the buildings associated with a substation or switching station (813 20 or 813 30). These are the buildings that contain the switchgear, batteries, charging panels and other equipment located within the substation or switching station.

81310-2 PROPERTY RECORD CARD USAGE. A separate property record card shall be created for each building.

813 20 SUBSTATIONS (KV)
FAC 8131
BFR Required N

81320-1 DEFINITION. Distribution substations, normally consisting of transformers and their associated switchgear, structures, buses, grounding systems, and protective devices; transform electrical power to a lower or higher voltage and put it on the distribution system. This category code shall also be used for unit substations. A unit substation is defined as consisting of one or more transformers, an incoming primary section and a transition section (connected to secondary switchgear). The unit substation may be connected to the electrical distribution system of the activity or to the electrical distribution system of one or more facilities. The rated capacity of the substation or unit substation is the sum of all distribution transformers in the substation. The unit of measure is kilovolt ampere (KV). This rating is found on the nameplate on the transformer or obtained from the manufacturer. It is the lowest rating when multiple ratings are provided (i.e. 12000/16000/20000 kVA – OA/FA/FOA)]

81320-2 PROPERTY RECORD CARD USAGE. Each distribution substation shall be listed on a separate property record card. All unit substations shall be aggregated separately by voltage class (high side of the transformer) and by overhead and underground distribution systems, for each special area. A detailed list of individual unit substations combined on the property record card should be kept in Maximo or by another method (i.e. Excel) and the file attached to the property record card.

Example: Five unit substations of 1,500 KVA each on the underground distribution system at NWS Yorktown – Main Base would be aggregated on a single property record card using CCN 813 20 with a total value of 7,500 kVA.

813 30 SWITCHING STATION FOR SECTIONALIZED DISTRIBUTION CIRCUITS (KV)

FAC 8132
BFR Required N

81330-1 DEFINITION. A switching station is equipment in an electric distribution system where electric power is switched without transformation. Switching stations are located at points where it is necessary to branch off from a main feeder or feeders with smaller components due to physical location of the facilities to be served or to isolate portions of feeders for maintenance or repair. Switching Stations equipment may include circuit breakers, sectionalizing switches, structures, buses, grounding systems, security lighting, and protective devices. The primary unit of measure is kilovolt ampere (KV). It is obtained by multiplying the rated capacity of the switch in kilovolts times the rated capacity of the bus in amperes times the square root of three (1.732). The alternate unit of measure of total number of switches in and out of the switching station (EA) shall be entered on the property record card.

81330-2 PROPERTY RECORD CARD USAGE. All switching stations that are comprised of a group of functionally integrated assets, such as circuit breakers and associated outdoor bus work, which are typically surrounded by a fence and given its own facility number shall be shown on a separate property record card. All other sectionalizing switches shall be totaled separately by voltage class and by overhead and underground distribution systems, for each special area. A detailed list of individual switches totaled on the property record card should be kept in Maximo (SPM) or by another method (e.g. Excel or Access) and the file attached to the property record card.

813 40 LIGHTNING PROTECTION SYSTEM, STANDALONE (EA)

FAC 8134
BFR Required N

81340-1 DEFINITION. Standalone Lightning Protection Systems are those that are not included as part of a specific facility's installed equipment. These are usually constructed to protect a compound, a single building (where the system is constructed of masts and is not a part of the facility) or series of buildings.

81340-2 PROPERTY RECORD CARD USAGE. Capture an entire “system” or “array” on an individual property record card. For example, an array consisting of 12 poles would be captured on an individual property record card, with a count of 12 each (EA). Note that FAC 8134 has an upper limit of four because the most common configuration consists of a wire net held up by four poles. Since systems can differ in number of poles and cables/nets/rods, any system or array consisting of more than four poles requires a size certification code of “C”, indicating that the size of allocation is greater than the FAC upper limit. Otherwise, the Facilities Sustainment Model (FSM) will automatically change the size of the allocation to the “Reset value”.

820 HEAT AND REFRIGERATION (A/C)

820-1 HEAT AND REFRIGERATION

The requirements for heat, hot water, and industrial steam at naval installations will be based on an engineering study of the overall station demand. A central heating facility will include a heating plan, fuel storage, distribution system, and controls. Planning information for heating facilities under the following basic category codes:

- Code 821 Heat, Steam—Source
- Code 822 Heat, Transmission and Distribution Lines
- Code 823 Heat, Gas—Source
- Code 824 Heat, Gas—Transmission
- Code 826 Refrigeration/Air Conditioning

821 HEAT SOURCE

821-1 HEAT SOURCE

The source of heat from steam or high temperature water (HTW) includes a complete central plant and associated fuel storage. The source of heat and steam/HTW are coded to indicate the type of fuel used by the plant. The Navy codes are as follows:

821 09 - 821 50 HEATING PLANTS

82109/82150-1 HEATING PLANTS. A central heating plant will include a structure, piping, equipment, controls, fuel, storage, and all equipment necessary to make a complete usable facility. Central heating plants are justified only when the total owning and operating costs for central plants and distribution systems are less than similar costs for heating systems in individual buildings. Central heating plants are also justified when the overall energy use for providing heat from extraction steam in a steam-electric-power plant would be less than a central plant plus purchased electricity. The type of fuel for the plant, whether an electric power generating plant with by-product heat and steam, or a heating plant, will be selected on the basis of an economic analysis. The heating plant capacity will be based on BTU per hour (BH) rating, and this rating will be determined from an engineering analysis of the need for steam, heat, and hot water at the station.

821 09 HEATING PLANT BUILDING (SF)
FAC 8910
BFR Required N

82109-1 DEFINITION. This Category Code is used for buildings associated with a heating plant including Category Codes 821 12, 821 22, or 821 30.

82109-2 PROPERTY RECORD CARD USAGE. Each heating plant building should be listed on a single, individual property record card. The equipment internal to the power plant should not be listed in this Category code; it should be listed separately on a single separate property record card.

821 12 HEATING PLANT- OIL / GAS (BH)
FAC 8211
BFR Required N

82112-1 DEFINITION. This Category Code is used for a plant that utilizes oil or gas for the production and distribution of heat. This includes steam, hot water, high pressure/low pressure, etc., serving more than one separate facility.
This category code includes all necessary equipment for the production of the commodity including boilers, boiler feedwater, make-up water, controls, compressed air, condensate and blowdown, fuel tanks, pumps, electrical equipment, labs, storage and all required process equipment for commodity generation. The primary unit of measure is plant design capacity in BTU per hour (BH).

82112-2 PROPERTY RECORD CARD USAGE. All equipment for heating plant should be listed on a single, individual property record card. Plants typically contain water treatment facilities as part of the thermal plant and are not reported separately. However, where additional water treatment is required to meet NAVSEA clean steam requirements, the water treatment should be reported separately using Category Code 841 10.

821 22 HEATING PLANT- COAL (BH)
FAC 8211
BFR Required N

82122-1 DEFINITION. This Category Code is used for a plant that utilizes coal for the production and distribution of heat. This includes steam, hot water, high pressure/low pressure, etc., serving more than one separate facility.
This category code includes all necessary equipment for the production of the commodity including boilers, boiler feedwater, make-up water, controls, compressed air, condensate and blowdown, fuel tanks, pumps, electrical equipment, labs, storage and all required process equipment for commodity generation. The primary unit of measure is plant design capacity in BTU per hour (BH).

82122-2 PROPERTY RECORD CARD USAGE. All equipment for heating plant should be listed on a single, individual property record card. Plants typically contain water treatment facilities as part of the thermal plant and are not reported separately. However, where additional water treatment is required to meet NAVSEA clean steam requirements, the water treatment should be reported separately using Category Code 841 10.

821 30 HEATING PLANT- NON - FOSSIL FUEL (BH)

FAC 8211
BFR Required N

This CCN contains assets previously listed in Category Code 821 32 and 821 50.

82130-1 DEFINITION. This Category Code is used for a plant that utilizes a non-fossil fuel for the production and distribution of heat. This includes steam, hot water, high pressure/low pressure, etc., serving more than one separate facility. This category code includes all necessary equipment for production of the commodity including boilers, boiler feedwater, make-up water, controls, compressed air, condensate and blowdown, fuel tanks, pumps, electrical equipment, labs, storage and all required process equipment for commodity generation. The primary unit of measure is plant design capacity in BTU per hour (BH).

NOTE: Geothermal plants should also be listed under this category code.

82130-2 PROPERTY RECORD CARD USAGE. All equipment for heating plant should be listed on a single, individual property record card. Plants typically contain water treatment facilities as part of the thermal plant and are not reported separately. However, where additional water treatment is required to meet NAVSEA clean steam requirements, the water treatment should be reported separately using Category Code 841 10.

821 60 - 821 61 HEATING FUEL OIL STORAGE

82160/82161-1 HEATING FUEL OIL STORAGE. The following criteria pertain to both category codes 821-60 and 821-61. The planning factor is based upon the combined fuel oil consumption at the activity for heating.

82160/82161-1.1 Amount of Storage. The amount of storage varies with the number of personnel attached to the station and the activity. In temperate zones the normal average consumption is 70 gallons per person per month (including civilian employees). This figure would be revised in zones of extreme temperatures. Use this planning factor only if historical data is not available.

Department of Defense policy is that heating plants burning fuel oil must have a minimum of 30 day storage capability based on the coldest 30 day requirement.

Installations that have direct access to and/or are supported directly by major military bulk fuel distribution systems should establish storage requirements based on detailed support agreement with the supply terminal command. Installations that do not have direct access to major fuel distribution systems should investigate logistic support factors (transportation modes; delivery times; precipitation, temperature and weather histories; etc.) to determine if it may be necessary to have storage capability exceeding the 30 day requirements. Activities utilizing fuels for dual purposes (i.e., diesel fuel for heating/transportation) should consider combined consumption when computing storage requirements. Installations should fill all storage tanks by late summer each year in order to reduce cold weather delivery problems, and tanks should be kept as full as possible at all times. This policy has been promulgated by OPNAV Instruction 4100.6 series. Additional justification is necessary for the fuel requirements associated with the generation of steam, operation of power plants, etc. The same 30-day storage requirement is also applicable.

82160/82161-1.1 Types of Oil Stored for Each Category Code. The category codes and corresponding types of oil stored by each facility are as follows:

- Category Code 821-60:

  - Grade No. 1. A light distillate oil intended for use in burners of the vaporizing type in which the oil is converted to a vapor by contact with a heated surface or by radiation. (Includes kerosene and JP-5 aviation turbine fuel).

  - Grade No. 2. A heavier distillate than grade no. 1. It is intended for use in atomizing-type burners which spray the oil into a combustion chamber where the tiny droplets burn while in suspension. The grade of oil is used in most domestic burners and in many medium-capacity commercial industrial burners where its ease of handling and ready availability sometimes justify its higher cost over the residual grade S. (Includes Diesel Marine Fuel (DMF), DF-2 and commercial diesel fuels).

  - Grade No. 3. Usually a light residual but sometimes a heavy distillate. It is intended for use in burners equipped with devices that atomize oils of higher viscosity than domestic burners can handle. Its permissible viscosity range allows it to be pumped and atomized at relatively low storage temperatures. Thus, except in extreme cold weather, it required no preheating for handling.

- Category Code 821-61:

  - Grade No. 4 (light). A residual fuel of intermediate viscosity for burners capable of handling fuel more viscous than grade no. 5 without preheating. Preheating may be necessary in some types of equipment for burning and in colder climates for handling. (Includes Navy Special Fuel Oil (NSFO)).

- Grade No. 5 (heavy). A residual fuel more viscous than grade no. 6 (light). It is intended for similar service. Preheating may be necessary in some types of equipment for burning and in colder climates for handling.

- Grade No. 6. A high-viscosity oil, sometimes referred to as "Bunker C", used mostly in commercial and industrial heating. It requires preheating in the storage tank to permit pumping and additional preheating at the burner to permit atomizing. The extra equipment and maintenance required to handle this fuel usually preclude its use in small installations.

821 60 DISTILLATE HEATING FUEL OIL STORAGE (GA)

FAC 1244
BFR Required N

82160-1 DEFINITION. This Category Code is used for fuel oil tanks used for heating buildings, generation of steam, power plant requirements, and for other heat generating facilities as required. No. 1 fuel oil, No. 2 fuel oil and No. 3 fuel oil are variously referred to as distillate fuel oils. Tanks listed under Category code 821 60 are not day tanks; they are bulk storage for the utility system. The primary unit of measure of gallons (GA).

NOTE: Day tanks are included as part of the plant they serve rather than being reported separately.

82160-2 PROPERTY RECORD CARD USAGE. Each storage tank should be listed on a separate property record card with other unit of measure of total storage capacity of the tank in gallons (GA).

821 61 RESIDUAL HEATING FUEL OIL STORAGE (GA)

FAC 1244
BFR Required N

82161-1 DEFINITION. This Category Code is used for fuel oil tanks used for heating buildings, generation of steam, power plant requirements, and for other heat generating facilities as required. No. 4 fuel oil, No. 5 fuel oil and No. 6 fuel oil are variously referred to as residual fuel oils. Tanks listed under Category code 821 61 are not day tanks; they are bulk storage for the utility system. The primary unit of measure of gallons (GA) and the other unit of measure of storage capacity in gallons (GA) should be entered into iNFADS.

NOTE: Day tanks are included as part of the plant they serve rather than being reported separately.

82160-2 PROPERTY RECORD CARD USAGE. Each storage tank should be listed on a separate property record card with other unit of measure of total storage capacity of the tank in gallons (GA).

822 HEAT TRANSMISSION AND DISTRIBUTION LINES

822-1 HEAT TRANSMISSION AND DISTRIBUTION LINES

This basic category encompasses the transmission and distribution lines for steam and associated hot water lines throughout an installation. In temperate and tropical climates and at locations where the water table is high, steam lines will be aboveground. Routing of steam or hot water lines requiring underground installation under runways and taxiways should be held to a minimum to avoid interference by maintenance and repair operations. Adequate clearances shall be provided above roads, railroads, streets, walks, and tow-ways. Other restrictions such as flight clearances must be maintained. Steam and hot water transmission lines are coded as follows:

822 09 STEAM / HEAT BUILDING / SHELTER (SF)

FAC 8910
BFR Required N

82209-1 DEFINITION. Buildings associated with a heating distribution system (Category Codes 822 12, 822 14, 822 16 or 822 26). The requirement for steam and condensate or hot water pipelines is determined from an engineering study.

82209-2 PROPERTY RECORD CARD USAGE. Each building shall be listed on a single property record card. The equipment contained within the building shall be shown on a separate property record card.

822 10 CONDENSATE RETURN PUMP STATION (EA)

FAC 8924
BFR Required N

82210-1 DEFINITION. A condensate return pump station may serve steam, condensate, hot water, and high temperature water return line pump stations.

82210-2 PROPERTY RECORD CARD USAGE. All pump station equipment and condensate return lines are to be listed on a single property record card. Use the ‘Facility Name’ field to identify the facility as a steam, condensate, hot water or high temperature pump station. If the structure is aboveground, use 'CCN 89009 - Miscellaneous Utility Building' for the pump house building on a separate property record card. If the structure is underground, use 'CCN 89018 – Utility Vault' for the pump house structure (vault) on a separate property record card. Use the ‘Facility Name’ field to identify the building or structure to identify the facility as a steam, condensate, hot water or high temperature pump station building or structure (vault).

822 12 STEAM LINES (LF)
FAC 8221
BFR Required N

This category code contains assets previously listed under CCN 822 22.

82212-1 DEFINITION. This Category Code contains all distribution system pipes that convey steam. The requirement for steam and condensate or hot water pipelines is determined from an engineering study.

82212-2 PROPERTY RECORD CARD USAGE. There may be multiple property record cards for a single steam distribution system after the utilities Maximo team has divided the installation into service areas as part of the linear segmentation. Each service area of the steam distribution system is considered a linear structure and shall have its own property record card.

822 14 CONDENSATE LINES (LF)
FAC 8221
BFR Required N

This category code contains assets previously listed under CCN 822 24.

82214-1 DEFINITION. This Category Code contains all collection system pipes that convey condensate. The requirement for steam and condensate or hot water pipelines is determined from an engineering study.

82214-2 PROPERTY RECORD CARD USAGE. There may be multiple property record cards for a single condensate collection system after the utilities Maximo team has divided the installation into service areas as part of the linear segmentation. Each service area of the condensate collection system is considered a linear structure and shall have its own property record card.

822 16 HOT WATER LINES (LF)
FAC 8221
BFR Required N

82216-1 DEFINITION. This Category Code contains all pipes that convey hot water less than 250 degrees. The requirement for steam and condensate or hot water pipelines is determined from an engineering study.

82216-2 PROPERTY RECORD CARD USAGE. There may be multiple property record cards for a single hot water system after the utilities Maximo team has divided the installation into service areas as part of the linear segmentation. Each service area of the hot water system is considered a linear structure and shall have its own property record card. **Note: Use Category Code 822 14 for condensate lines.**

822 26 HIGH TEMPERATURE HOT WATER LINES (LF)

FAC 8221
BFR Required N

82226-1 DEFINITION. This Category Code contains all pipes that convey hot water heated above 250 degrees. The requirement for steam and condensate or hot water pipelines is determined from an engineering study.

82226-2 PROPERTY RECORD CARD USAGE. There may be multiple property record cards for a single high temperature hot water distribution system after the utilities Maximo team has divided the installation into service areas as part of the linear segmentation. Each part of the high temperature hot water distribution system is considered a linear structure and shall have its own property record card.

NOTE: Use Category Code 822 14 for condensate lines.

823 HEAT/GAS-SOURCE

823-1 HEAT/ GAS-SOURCE

This basic category includes a central plant for generation of gas and related facilities including connected fuel storage for plant operation and storage of gas for direct heating or as a fuel for central plants. An engineering study is needed to determine the requirements for receipt, storage, distribution and vaporizing capacities of Liquefied Petroleum Gases (LPG). Gas generating and storage facilities are coded as follows:

823 09 GAS GENERATING BUILDING (SF)

FAC 8910
BFR Required N

82309-1 DEFINITION. This Category Code contains buildings associated with a gas generating plant.

82309-2 PROPERTY RECORD CARD USAGE. Each building shall be shown on a separate property record card. The primary unit of measure is square feet.

823 10 GAS GENERATING PLANT (BH)

FAC 8231
BFR Required N

82310-1 DEFINITION. This Category Code contains plant equipment that generates gas for use in the utility system.

82310-2 PROPERTY RECORD CARD USAGE. All equipment in the gas generating plant is included on a single property record card with a facility type code of 4. The buildings that house the gas generating plant equipment is shown on a separate property record card with a Category Code of 82309. The primary unit of measure for a gas generating plant is installed generating capacity in BTUs per hour (BH). The alternate unit of measure is installed generating capacity in cubic feet per minute (CM).

823 15 GAS METER BUILDING (SF)

FAC 8910
BFR Required N

82315-1 DEFINITION. This Category Code contains buildings associated with gas metering.

82315-2 PROPERTY RECORD CARD USAGE. Each building shall be shown on a separate property record card. The primary unit of measure is square feet.

823 20 GAS STORAGE TANKS (CF)

FAC 8232
BFR Required N

82320-1 DEFINITION. This Category Code contains tanks for the storage of liquid natural gas and/or propane connected to a gas distribution system serving multiple facilities.

82309-2 PROPERTY RECORD CARD USAGE. Each tank shall be shown on a separate property record card. The primary unit of measure is each (EA) and the alternate unit of measure is the storage capacity of the tank in cubic feet (CF). Convert gallons to cubic feet by dividing gallons by 7.48.

824 HEAT/GAS TRANSMISSION

824-1 HEAT/ GAS TRANSMISSION.

This basic category applies to exterior lines, mains, and systems for transmission of gas for direct heating or as fuel for central plants.

824 10 GAS MAINS (LF)

FAC 8241
BFR Required N

82410-1 DEFINITION. The planning of gas pipelines includes trenching, piping, valve boxes, controls, and meters. The pipe capacity, strength, and linear footage requirements will be determined by an engineering study.

82410 -2 PROPERTY RECORD CARD USAGE. There may be multiple property record cards for a single gas distribution system after the utilities Maximo team has divided the installation into service areas as part of the linear segmentation. Each part of the gas distribution system is considered a linear structure and shall have its own property record card. The unit of measure is length of the pipe in linear feet (LF).

826 REFRIGERATION/AIR CONDITIONING

826-1 REFRIGERATION / AIR CONDITIONING. This category code group is for chilled water and air conditioning plants Exclude cold storage facilities (see Category Code 430 series).

826 10 - 826 40 COOLING SYSTEM PLANTS

82610 THRU 82640-1 COOLING SYSTEM PLANTS. A central refrigeration/air conditioning plant will include buildings with all equipment necessary to make a complete usable facility. If cooling towers are to be used for heat rejection, prevailing winds shall be considered when siting the facilities to avoid problems with moisture drift from the cooling towers, i.e., parking facilities should not be downwind from cooling towers. Vehicle access for equipment maintenance and replacement should be considered. Central plants should be considered when a life cycle cost analysis demonstrate that the owning and operating cost of the plant will be less than that for individual building refrigeration equipment. For planning purposes, central refrigeration/air conditioning plant capacities can be determined by totaling the cooling requirements for all existing and for planned station buildings.

826 10 COOLING SYSTEM PLANT BUILDING (SF)

FAC 8910
BFR Required N

82610-1 DEFINITION. Buildings associated with a cooling system plant (Category Code 826 20).
82610-2 PROPERTY RECORD CARD USAGE. Each building shall be listed on a single property record card. The equipment contained within the building shall be shown on a separate property record card with a category code of 82620.

826 20 COOLING SYSTEM PLANT (TR)

FAC 8261
BFR Required N
This category code contains assets previously listed in CCN 826 25, 826 30, 826 40, and 890 42.

82620-1 DEFINITION. A plant for the production and distribution of a chilled fluid for more than one separate facility.

82620-2 PROPERTY RECORD CARD USAGE. This Category Code includes all the cooling system plant equipment: water systems, electrical systems, chilled water, make-up water, chiller, chiller feedwater, chemical feed, condenser, controls, compressed air, fuel systems, and cooling towers, on a single property record card. The building that houses the cooling system equipment is included on a separate property record card in CCN 826 10. The primary unit of measure is installed cooling system capacity in tons (TR).

827 CHILLED WATER-AIR CONDITIONING TRANSMISSION/DISTRIBUTION

827-1 CHILLED WATER-AIR CONDITIONING TRANSMISSION / DISTRIBUTION.

This basic category encompasses the transmission/distribution of chilled water from a central refrigeration/air conditioning plant to buildings throughout an installation for space air conditioning with water being returned to the plant. Routing of chilled water lines under runways, taxiways, and buildings should be held to a minimum to avoid interference by maintenance and repair operations to the chilled water lines. If lines are located above ground, adequate clearances shall be provided above roads, railroads, walks and tow-ways. Other restrictions such as flight clearance must be considered. See NAVFAC Publication P-80.3. Underground lines have the advantage of reducing undesired heat gains and may not require insulation depending on ground temperatures.

827 10 COOLING SYSTEM VALVE BUILDING (SF)

FAC 8910
BFR Required N

82710-1 DEFINITION. Buildings associated with a cooling distribution system (Category Code 827 20).

82710-2 PROPERTY RECORD CARD USAGE. Each building shall be listed on a single property record card. The equipment contained within the building shall be shown on a separate property record card.

827 20 CHILLED FLUID LINES (LF)

FAC 8271
BFR Required N

This Category Code includes assets previously contained in CCN 827 25.

82720-1 DEFINITION. All distribution system pipes that convey chilled fluid.

82720-2 PROPERTY RECORD CARD USAGE. There may be multiple property record cards for a single chilled fluid distribution system after the utilities Maximo team has divided the installation into service areas as part of the linear segmentation. Each part of the chilled fluid distribution system that is considered a service area is a linear structure and shall have its own property record card. The unit of measure is length of piping in linear feet (LF).

830 SEWAGE AND WASTE

830-1 DEFINITION

Category group 830 describes the facilities required for the collection, transportation, treatment, and disposal of sewage and industrial waste, and disposal of storm drainage water in storm and sanitary sewer systems. Components of sewage and refuse facilities include sewage treatment plants, outfall sewer lines, septic tanks, septic tank drain fields, sanitary sewers, sewage pumping stations, and incinerators. Certain industrial waste must be kept separately and treated separately from the sanitary sewage. In planning for sewage and waste facilities cognizance shall be taken of the Federal Water Pollution Control Act as amended, applicable to municipalities, industries, and others that may contribute to the pollution of surface and underground waters in the United States.

831 SEWAGE AND INDUSTRIAL WASTE, TREATMENT AND DISPOSAL

831/83109/83110-1 DEFINITION

The preferred method of sewage disposal is by discharge to a municipal or regional sewage system. Where this is not feasible, an on-station sanitary sewage treatment plant will be necessary to provide for the processing of sanitary sewage for ultimate disposal. Disposal of sewage is usually in a stream or other body of water or on land by subsurface irrigation or by direct absorption into the soil. A sewage treatment plant may include aeration tanks or trickling filters, settling basins, sump or storage wells, dry wells, pumps, screens, and accessories. The type and capacity of sewage treatment plant is determined by an engineering study that considers planned population, number of family quarters, and industrial peak loads.

831 09 SEWAGE TREATMENT BUILDING (SF)
FAC 8910
BFR Required N

83109-1 DEFINITION. This Category Code includes the buildings associated with the sewage treatment plant (Category Code 831 10).

83109-2 PROPERTY RECORD CARD USAGE. Each building shall be included on a single property record card. The equipment contained within the building shall be shown a separate property record card.

831 10 SEWAGE TREATMENT PLANT (KG)
FAC 8311
BFR Required N

83110-1 DEFINITION. This category code is used for all type of sewage treatment plants; primary, secondary, or tertiary. Please identify the level of treatment in Facility Use/ Description. All the plant equipment; equalization, preliminary treatment, clarification, holding tanks, biological treatment, chemical treatment, filtration, disinfection, dewatering, digestion, sludge disposal, electrical system, controls, compressed air, storage, and communications, is included as a single wastewater treatment plant. The primary unit of measure is the installed plant processing capacity in thousands of gallons per day (KG). Do not use the permitted capacity for the units of measure.

83110-2 PROPERTY RECORD CARD USAGE. This category code includes all the sewage treatment plant process equipment on a single property record card. The buildings (not tanks) that house the sewage treatment equipment are shown on separate property record cards with Category Code 831 09.

831 11 - 831 16 SPECIALIZED TREATMENT FACILITIES

831 11 BALLAST CONTAMINATION SKIMMER (KG)
FAC 8313
BFR Required N

No criteria are currently available for this Category Code.

831 14 INDUSTRIAL WASTEWATER TREATMENT BUILDING (SF)
FAC 8910
BFR Required N

83114-1 DEFINITION. This category code is used for buildings associated with an industrial wastewater treatment plant (Category Code 831 15).

83114-2 PROPERTY RECORD CARD USAGE. Each building shall be included on a separate property record card. The equipment contained within the building shall be shown on a separate property record card using Category Code 831 15.

831 15 INDUSTRIAL WASTEWATER TREATMENT FACILITY (KG)

FAC 8312
BFR Required N

83115-1 DEFINITION. This Category Code is used for a dedicated industrial wastewater treatment plant. All plant equipment: equalization, preliminary treatment, clarification, holding tanks, biological treatment, chemical treatment, filtration, disinfection, dewatering, digestion, sludge disposal, electrical system, controls, compressed air, storage, and communications, is included as a single wastewater treatment plant. The primary unit of measure is the installed processing capacity of the plant in thousands of gallons per day (KG). Do not use the permitted capacity as the unit of measure.

83115-2 PROPERTY RECORD CARD USAGE. This Category Code includes all the industrial wastewater treatment plant equipment on a single property record card. The buildings (not tanks) that house the industrial wastewater treatment equipment is included on separate property record cards with Category Code 831 14.

831 16 OIL/WATER SEPARATOR (KG)

FAC 8313
BFR Required N

83116-1 DEFINITION. This Category Code is used for oil/water separators that discharge to the sanitary sewer or industrial waste collection system. The primary unit of measure is the installed processing capacity of the equipment in thousands of gallons per day (KG).

83116-2 PROPERTY RECORD CARD USAGE. This category code is used for oil/water separators that discharge to the sanitary sewer or industrial waste collection system. Oil/water separators belong to the facility which it serves. If the oil/water separator discharges to storm sewer, it should be included under Category Code 871 11.

831 20 OUTFALL SEWER LINE (KG)

FAC 8321
BFR Required N

83120-1 DEFINITION. An outfall sanitary sewer line receives the sewage from a collecting system or the effluent from a sanitary sewage plant and carries it to a point of final discharge. Planning for outfall sewer lines will include land acquisition. The primary unit of measure is the capacity of the pipe in thousands of gallons per day (KG).

83116-2 PROPERTY RECORD CARD USAGE. A separate property record card for all the piping for each wastewater treatment plant shall be created.

831 30 SEPTIC TANK AND DRAIN FIELD (GA)
FAC 8314
BFR Required N

83130-1 DEFINITION. A septic tank and drain field facility provides sewage treatment for human waste at isolated facilities where an extension of the central sewer collection system would not be economically feasible. The planning of a septic tank and drain field will include a concrete or protected steel tank and a drain field system including headers, laterals, open joint clay or concrete pipe, gravel, ditching, and land acquisition. The primary unit of measure is tank capacity in gallons per day (GA).

83130-2 PROPERTY RECORD CARD USAGE. If these assets support a single facility, they are considered RPIE of the facility that they serve and a separate property record card should not be created. Where multiple facilities are served with a single tank and drain field a separate property record card shall be created.

831 31 SEPTIC LAGOON AND / OR SETTLEMENT POND (GA)
FAC 8315
BFR Required N

83131-1 DEFINITION. A structure used for collecting and holding sewage to allow for settlement and evaporation. These structures are typically concrete encased. If the lagoon or pond is part of a wastewater treatment or power generation plant, the structure is considered part of the plant and is not listed separately.

83131-2 PROPERTY RECORD CARD USAGE. A separate property record card shall be created for each lagoon or pond.

831 39 RADIOACTIVE WASTE HANDLING BUILDING (SF)
FAC 8910
BFR Required N

831 40 RADIOACTIVE WASTE HANDLING FACILITY (EA)
FAC 8926
BFR Required N

83139/83140-1 DEFINITION. No planning criteria for Category Codes 831 39 and 40 are currently available. Each facility requires individual justification.

831 41 HAZARDOUS WASTE STORAGE AND TRANSFER FACILITY (EA)

FAC 8926
BFR Required N

83141-1 DEFINITION. Use this category code for facilities that are structures (non-buildings). For hazardous waste facilities that are buildings, use category code 83143 “Hazardous Waste Storage Building”. The requirement for this facility is the result of the necessity to ensure that the transfer and storage of hazardous wastes will meet the Federal Criteria mandated by Title 40 of the Code of Federal Regulations (CFR), Parts 260 thru 266 as well as complying with OPNAVINST 6240,3 Series, which implements the requirements of the Resource Conservation and Recovery Act (PL 94-580) (42 USC 6901-6987), the Clean Water Act (PL 92-500), and the Navy Hazardous Materials Environmental Management Program by expanding controls on hazardous materials management in order to protect the environment. It is the intent of Congress and the Policy of the President (Executive Order 12088) that naval activities comply with these requirements to the same extent as any other entity or person.
Hazardous waste is any substance that cannot legally be disposed of in a normal sanitary landfill or into a refuse incinerator designated to handle municipal type refuse or cannot be discharged into a sanitary sewerage system. This facility is not intended to handle certain hazardous materials such as radioactive or ordnance wastes, for which other category codes have been designated. Any hazardous material can become a waste after having served its intended purpose, after exceeding its shelf life, by becoming contaminated, or by having been spilled. However, hazardous materials that have served a primary purpose and/or are excess to their primary user may have a secondary use. Such recyclable materials, though "excess" or "waste" to one organization, are not considered waste if their disposition is to a secondary user. By elimination, a hazardous waste is a non-reusable material that must be treated and/or disposed of in a specially designated facility that meets the regulatory requirements of the Resource Conservation and Recovery Act (RCRA) of 1976 (PL 94-580). It might be noted that sludge generated from treatment facilities may also be hazardous wastes.

83141-2 FACILITY TYPES. There are basically two types of facilities to handle hazardous waste 1) a short-term storage facility where materials are stored for periods of less than 90 days and 2) a long term storage facility where materials are stored for more than 90 days. The short-term facility does not require a permit to operate but is required to meet all packaging and labeling requirements and to date the receipt of hazardous wastes. The requirements for short-term facilities are given in 40 CFR 262.34. The long-term facility is subject to the requirements of 40 CFR, parts 264 and 265 and the permit requirements of 40 CFR, part 122.

83141-3 DESIGN REQUIREMENTS. The design requirements are found in UFC 3-201-01. It has been assumed that covered storage will be required to minimize the run-off from the facility and that the run-off will be packaged. In climate where runoff will not create a problem, open storage is acceptable and category code 831-41, Hazardous Waste Storage Area, may be used. The modification of existing facilities is an acceptable alternative to the construction of new facilities.

83141-4 SQUARE FOOTAGE REQUIREMENTS. The square footage requirements for this facility are directly related to the Hazardous Waste Management Plan that must be filed by every identified activity handling this type of material in accordance with OPNAVINST 6240. This plan must indicate the type of hazardous waste collected, the rate of accumulation, and the frequency of movement from the activity in accordance with prescribed procedures. The selection of a short-term facility vs. a long-term facility is dependent upon the permits requested by the activity for the disposal of said waste.

83141-5 PLANNING PREPARATION. Prior to planning and establishing hazardous waste storage and transfer facilities, any actions must be cleared with the cognizant NAVFAC FEC which has the responsibility for area-wide coordination of the Navy Hazardous Materials Environmental Management program.

83141-6 SITING. A buffer zone of 150 meters (500 feet) shall be provided between the facility and the nearest inhabited area, stream, body of water, or critical mission areas such as ammunition, POL, or flammable stores.

83141-7 SPACE ALLOCATIONS FOR OTHER FUNCTIONS. Provide space for the following types of functions: laboratory, operation room office/lunchroom, enclosed loading dock and storage for the following kinds of waste: reactive, unknown, acid, general, organic, oxidizer and caustic.

831 42 HAZARDOUS WASTE STORAGE AREA (SY)

FAC 8526
BFR Required N

83142-1 DEFINITION. The requirements for this facility are similar to those for category code 831 41 Hazardous Waste Storage and Transfer Facility. This type of storage facility is acceptable in climates where run-off will not create a problem. A buffer zone of 150 meters (500 feet) shall be provided between this facility and the nearest inhabited area, stream, body of water, or critical mission area such as ammunition, POL and inflammable stores.

However, this facility may be located in the proximity of the Hazardous Waste Storage and Transfer Facility when it is used to augment it.

83142-2 SEGREGATION OF MATERIAL. The danger involved in the storage of hazardous material are not measured solely by the quantity of material stored, but also by its sensitivity to reaction with one type of material with another.

83142-3 PLANNING PROCEDURES:

1. Determine the number and types of hazardous waste to be stored and their compatibility.
2. Determine rate of accumulation by past records.
3. Determine length of storage required (i.e. less than 90 days, etc.).
4. Items 1, 2 and 3 determine maximum number of drums to be stored at any given time. Note: Not all drums will be filled and sometimes more than one drum will be required for any given type of waste.
5. Criteria: Use 2.1 gross square yards per drum stored when each 55 gallon drum is stored in clusters of 4 per pallet or area.

Example: Given: 24 drums in six clusters, four per cluster.
Solution: A typical layout for this type of facility would be a concrete pad 23.0 ft. long and 19.5 ft. wide. An 8.0 ft. access aisle in the middle of the 19.5 ft. wide pad would provide room for the forklift truck to deposit and retrieve pallets, which are orientated at a 45 degree angle to the aisle. Each four foot square pallet would support four drums, and the apex of each pallet would be three feet from the adjacent pallet. The centerline of the aisle would also serve as the high point of the slab so that any accidental spillage of the waste would not react with any of the surrounding material.

831 43 HAZARDOUS WASTE STORAGE BUILDING (SF)

FAC 4423
BFR Required Y

83143-1 DEFINITION. Use this category code for facilities that are buildings used for hazardous waste storage (non-structures). For hazardous waste facilities that are structures, use category code 83141 “Hazardous Waste Storage and Transfer Facility”. Use the information found under CCN 83141, sections 83141-1 through 83141-8 to develop space requirements.

832 SEWAGE AND INDUSTRIAL WASTE - COLLECTION

832-1 DEFINITION

This basic category includes collection systems and lines including pumping stations for sewage and industrial waste and collection of storm drainage. Planning for the sanitary sewer system will include piping, fittings, pumps, lift stations, and accessories. A sanitary sewer collection system will be required at all Naval installations, and it will be based primarily on the population. The requirements will be determined by an engineering survey.

832 10 SANITARY SEWER LINE (LF)

FAC 8321
BFR Required N

83210-1 DEFINITION. All distribution system pipes that collect and transport sanitary sewage. Types include gravity or forced main systems. The primary unit of measure is linear feet of pipe (LF).

83210-2 PROPERTY RECORD CARD USAGE. There may be multiple property record cards for a single sanitary sewer collection system after the utilities Maximo team has divided the installation into service areas as part of the linear segmentation process. Each part of the sanitary sewer collection system is considered a linear structure and shall have its own property record card.

832 20 COMBINED SEWER LINE (LF)

FAC 8321
BFR Required N

83220-1 DEFINITION. All distribution pipes that collect and transport both sanitary sewage and storm water. The primary unit of measure is linear feet of pipe (LF).
83220-2 PROPERTY RECORD CARD USAGE. There may be multiple property record cards for a single combined sewer collection system after the utilities Maximo team has divided the installation into service areas as part of the linear segmentation process. Each part of the combined sewer collection system is considered a linear structure and shall have its own property record card.

832 29 SEWAGE PUMP STATION BUILDING (SF)

FAC 8910
BFR Required N

83229-1 DEFINITION. Buildings associated with a sewage pump station. The primary unit of measure is square feet (SF).

83229-2 PROPERTY RECORD CARD USAGE. Each pump station building shall be shown on a separate property record card. The equipment inside the pump station shall be shown on a separate property record card with a Category Code of 83230.

832 30 SEWAGE WASTE PUMPING STATION (KG)

FAC 8316
BFR Required N

83230-1 DEFINITION. A sewage pumping station is a facility used to move sewage through mains to a treatment plant, to serve where a gravity system is not feasible, and/or to lift sewage from one level to another in a gravity system. A sewage pumping station will include at least a sump or storage well and other pumping equipment, automatic controls, and hose equipment for cleaning the tanks. The primary unit of measure is pump station capacity "Thousand Gallons per Day" (KG). Use Category Code 832 30 for all sewage pump stations.

83230-2 PROPERTY RECORD CARD USAGE.
Any lift station associated with a single building, either inside the basement of the building or just outside the foundation of the building, should be considered RPIE to the building. Any lift station serving multiple facilities is considered part of an installation utility sewage or storm drainage system and shall be shown on a separate property record card. Include the building that houses the equipment for sewage pump stations on a separate property record card under Category Code 832 29.

832 40 INDUSTRIAL WASTEWATER LINE (LF)

FAC 8321
BFR Required N

83240-1 DEFINITION. This Category Code includes all distribution system pipes that collect and transport industrial wastewater. Types include gravity or forced main. The primary unit of measure is linear feet of piping (LF).

83240-1 PROPERTY RECORD CARD USAGE. There may be multiple property record cards for a single industrial wastewater collection system after the utilities Maximo team has divided the installation into service areas as part of the linear segmentation process. Each part of the industrial wastewater collection system that is considered a service area is considered a linear structure and shall have its own property record card.

832 41 INDUSTRIAL WASTEWATER PUMP STATION (EA)

FAC 8316
BFR Required N

83241-1 DEFINITION. Industrial wastewater pump stations are required to transport waste streams to holding tanks or industrial waste treatment plants, to serve where a gravity system is not feasible, and/or to lift waste streams from one level to another in a gravity system. The waste streams result from shore-based activities such as plating operations, painting and stripping operations, degreasing operations, firefighting schools and similar industrial processes.
Industrial process waste streams may contain both standard wastes and toxic pollutants. Typical pollutants found in industrial wastewater are oils, greases, heavy metals, acids, alkalis, non-metallic materials (such as arsenic or selenium), phenols and halogenated phenols, paint stripping agents, solvents, surfactants, and degreasers.
An industrial wastewater pumping station will include at least a sump or storage well and a structure to house pumping equipment, automatic controls, and hose facilities for cleaning the tanks. Where space is available, the lift station should include a ships ladder. The capacities and other requirements for industrial wastewater pump stations

will be determined by an engineering survey.

NOTE: Pump Stations supporting Oily Water/Waste Oil (OWWO) discharges and Ship's Overboard Discharge (SOD) operations from naval vessels should also be listed under CCN 83241.

83241-2 PROPERTY RECORD CARD USAGE. All pump station equipment is listed on a single property record card. If the pump station supports OWWO operations, use the 'Facility Name' field to identify the facility as an OWWO Pump Station. For the building component which houses the pump station equipment, use 'CCN 89009 - Miscellaneous Utility Building' and modify the "Facility Name" field to identify the facility as an Industrial Wastewater or OWWO Pump Station Building.

833 SOLID WASTE MANAGEMENT

833-1 DEFINITION OF SOLID WASTE

The term "solid waste" used here is defined as non-hazardous solid waste. For the incinerator and landfill functions and possibly others listed below, the historical tonnage generation data is a necessity to determine accurate facility requirements. If the historical tonnage data cannot be determined, estimates can be developed from:

a) Population: estimates the tonnage generated based upon the population served.
b) Land use factors: estimates tonnage based upon the type and quantity of facilities served.

These factors can be found in solid waste textbooks or from the EPA or other regulators.

833 09 INCINERATOR BUILDING AND INCINERATOR (TN)

FAC 8332
BFR Required N

83309-1 DEFINITION. An incinerator building is associated with an incinerator. An incinerator is a facility for burning combustible refuse to reduce it to stable gases and inert solids. An incinerator structure not associated with a building must be permanently attached in place to be considered real property. See Category Code 833 10 for information about an exterior incinerator.

833 10 INCINERATOR - EXTERIOR (TN)

FAC 8332
BFR Required N

83309/83310-1 DEFINITION. An incinerator is a facility for burning combustible refuse to reduce it to stable gases and inert solids. An incinerator may be justified when the refuse of the Naval installation cannot be disposed of in a sanitary fill; when such method of disposal would create an unhealthy condition or nuisance and the land is not available for such purposes; when local municipal facilities or other Government facilities for disposal are not suitable or available at reasonable prices; or when contract prices for collection and disposal of refuse are economically excessive as opposed to collection and disposal by station personnel. Incinerator capacity will not exceed the capacities listed for applicable populations.

Table 83309/83310-1. Incinerator Capacities

Population (military-civilian residing on station)	Incinerator capacity (tons per 8 hr day)
up to 2,000	5
2,001 to 4,000	10
4,001 to 6,000	15
6,001 to 8,000	20
8,001 to 10,000	25

The capacities, as shown, include 25 percent excess over average hourly needs to allow for irregularity in delivery of refuse to the incinerator. The planner should consider the merits of the dump and charge method where the refuse may be stored for periodic regular burning with resultant economy of operation.

833 12 REFUSE/SOLID WASTE COLLECTION FACILITY – NON HAZARDOUS (SF)

FAC 8331
BFR Required N

83312-1 DEFINITION. This facility serves as the collection center for non-hazardous solid waste awaiting disposal.

833 15 SANITARY/CUT-FILL DISPOSAL AREA (EA)

FAC 8333
BFR Required N

83315-1 DEFINITION. Landfilling solid waste is the technology of last resort. Consult EPA and State regulations and the latest solid waste textbooks for engineering principles and practices in siting and scoping a landfill. Because of the large land requirements associated with a landfill, consider the size of the landfill first.

833 20 GARBAGE GRINDER BUILDING (SF)

FAC 8330
BFR Required N

83320-1 DEFINITION. A building used for the collection of refuse or recyclable materials before they are processed for disposal or recycling.

833 21 GARBAGE GRINDER (TN)

FAC 8331
BFR Required N

833 30 GARBAGE STAND (EA)

FAC 8526
BFR Required N

833 40 GARBAGE HOUSE/RECYCLE CENTER BUILDING (SF)

FAC 8910
BFR Required N

83320/83321/83330/83340-1 DEFINITIONS. No planning criteria for Category Codes 833 20 through 833 40 are currently available. Each facility requires individual justification.

840 WATER FACILITIES

840-1 DEFINITION.

Water facilities at naval installations provide potable water for domestic and industrial use; purification of raw water from deep wells, lakes, and rivers; storage of water in bulk storage tanks or reservoirs; and distribution of water to demand areas. The location of the supply sources may be determined by topographic maps, soil maps, climate data, and geologic surveys. The selection of water sources must be consistent with economic considerations, such as gravity delivery if possible. Separate nonportable water fire protective systems may be provided where applicable.

Planning information is provided for the following facility groups:

- Code 841 Potable Water - Supply, Treatment, and Storage
- Code 842 Water Distribution System - Potable
- Code 843 Water - Fire Protection

- Code 844 Water Supply/Storage – Nonpotable
- Code 845 Water Distribution System – Nonpotable

841 POTABLE WATER - SUPPLY, TREATMENT, AND STORAGE

841-1 DEFINITION

Planning for the treatment of water will include, as applicable, screening, settling, coagulation and sedimentation, filtration, disinfection, softening, and aeration. The water treatment systems are normally planned in millions of gallons (MG) per day capacity and distribution is in linear feet (LF). The systems must be adequate to meet the domestic and industrial requirements and to provide fire protection if a separate fire protection system is not provided. If separate nonpotable water protective systems are not provided, the capacity of the water supply system will be determined by the fire flow demand (see Code 843). Planning requirements for water treatment facilities will be based on the results of an engineering survey and an economic analysis to determined sources of water versus commercial or municipal supply. For water treatment methods see MIL HDBK-1005/7.

841 09 WATER TREATMENT FACILITY BUILDING (SF)

FAC 8910
BFR Required N

84109-1 DEFINITION. This Category Code includes buildings associated with a Water Treatment Plant (841 10), Desalinization Plant (841 25), or Wells - Potable Water (841 50).

84109-2 PROPERTY RECORD CARD USAGE. Each building shall be included on a single property record card. The equipment contained within the building shall be shown a separate property record card.

841 10 WATER TREATMENT PLANT - POTABLE (KG)

FAC 8412
BFR Required N

84110-1 DEFINITION. This Category Code includes the structures, equipment, and processes required to treat potable water.

84110-2 PROPERTY RECORD CARD USAGE. All the water treatment plant equipment; clear wells, preliminary treatment, coagulation flocculation, sedimentation, adsorption, filtration, chemical treatment and storage, disinfection, electrical, water and compressed air systems, controls, and communication, is included on a single property record card. The Unit of Measure is installed capacity in thousands of gallons per day (KG). Use CCN 841-09 in conjunction with CCN 841-10 to capture the both the treatment plant and the associated building on separate property record cards.

841 15 NUCLEAR REACTOR WATER TREATMENT FACILITY (KG)

FAC 8412
BFR Required N

84115-1 DEFINITION. No criteria for this facility are currently available.

841 20 WATER SUPPLY LINE (LF)

FAC 8421
BFR Required N

84120-1 DEFINITION. The pipe that conveys water from source to point of treatment or to the point of consumption. A pressure main will be needed if the water is pumped. However, if topography permits, a gravity system is planned. A twin conduit may be used to insure uninterrupted water supply. The unit of measure is linear feet of each pipe.

84120-2 PROPERTY RECORD CARD USAGE. There may be multiple property record cards for a single water supply system after the utilities Maximo team has divided the installation into service areas as part of the linear segmentation process. Each part of the water supply system that is considered a linear structure shall have its own property record card.

841 25 DESALINIZATION PLANT (KG)

FAC 8415
BFR Required N

84125-1 DEFINITION. A water treatment plant that utilizes a process, such as distillation, reverse osmosis, or electro dialysis, that removes dissolved mineral salts and other dissolved solids from water. The primary unit of measure is installed capacity of the plant in thousands of gallons per day (KG).

84125-2 PROPERTY RECORD CARD USAGE. All the equipment involved in the desalination process; clear wells, preliminary treatment, coagulation flocculation, sedimentation, adsorption, filtration, chemical treatment and storage, disinfection, electrical, water and compressed air systems, controls and communication, is included on a single property record card.

841 30 STORAGE TANKS - ELEVATED, POTABLE (GA)

FAC 8413
BFR Required N

841 40 STORAGE TANKS - GROUND LEVEL, POTABLE (GA)
FAC 8413
BFR Required N

83130/84140-1 DEFINITION. Water storage tanks for potable water are elevated or ground-level structures used to store bulk quantities of potable water. Elevated tanks for potable water provide both storage and static pressure for the distribution system. Ground-level tanks accommodate peak demand requirements without affecting the capability of the source. The planning for potable water storage tanks will be based on the requirements determined by an engineering survey. These surveys will determine the capacities and pressures required for the water system. Elevated tanks will not be planned in the immediate vicinity of an airfield. Water uses which must be considered in estimating potable water requirements for shore installations are (a) domestic, (b) industrial, and (c) fire protection.

84130/84140 – 2 PROPERTY RECORD CARD USAGE. Water storage tanks located at the water treatment facility that are part of the plant process are included with the water treatment facility (841 10) and are not classified as separate real property. Water storage tanks that are considered part of the distribution system shall be listed on individual property record cards. The unit of measure is rated storage capacity of the tank in gallons (GA).

841 50 WATER WELLS - POTABLE (KG)
FAC 8414
BFR Required N

84150-1 DEFINITION. Equipment that pumps water from underground sources to treatments plants or directly to distribution with minor treatment possibly injected. The building that houses the well equipment shall be listed on a separate property record card utilizing category code 841 09. The primary unit of measure is well capacity in thousands of gallons per day (KG) and the alternate unit of measure - installed capacity in gallons per minute (GM) shall both be included on the property record card.

84150-2 PROPERTY RECORD CARD USAGE - All equipment associated with a single well shall be shown on an individual property record card. Each well shall be shown on a separate property record card.

841 51 RESERVOIR - POTABLE WATER (MG)
FAC 8443
BFR Required N

84151-1 DEFINITION. An open body of water for the collection and storage of water used by a water treatment facility or water distribution system. The Unit of Measure is reservoir capacity in millions of gallons (MG)

84151-2 PROPERTY RECORD CARD USAGE – Each reservoir shall be shown on a separate property record card.

841 52 WATER CATCHMENT STRUCTURE (GA)
FAC 8442
BFR Required N

84152-1 DEFINITION. A man-made structure designed to capture or collect rainwater and used to produce potable water. The primary unit of measure is linear feet around the structure (LF).

84151-2 PROPERTY RECORD CARD USAGE – Each structure shall be shown on a separate property record card.

842 WATER DISTRIBUTION SYSTEM, POTABLE

84209/84210-1 DEFINITION. Potable water will be transmitted from a storage tank or a treatment plant to all station demand points through a pipeline. An engineering study of the pressures and quantities of water required at the demand points will serve as the basis for planning the sizes and lengths of pipe required for the water distribution pipelines. Planning for a potable water distribution pipeline will include requirements for piping, valves, pumps, connections, excavation, and backfilling. The pipeline shall be listed in linear feet (LF). Requirements will be determined by an engineering study.

842 09 WATER DISTRIBUTION BUILDING, POTABLE (SF)
FAC 8910
BFR Required N

84209-1 DEFINITION. This Category Code includes buildings associated with the distribution of potable water, typically housing distribution pumps and equipment.

84209-2 PROPERTY RECORD CARD USAGE – Each building shall be included on a single property record card. The equipment contained within the building shall be shown on a separate property record card using category code 842 15.

842 10 WATER DISTRIBUTION LINE, POTABLE (LF)
FAC 8421
BFR Required N

84210-2 DEFINITION. All pipes that convey potable water from the treatment plant to the end user. The primary unit of measure is linear feet of pipe (LF).

84210-2 PROPERTY RECORD CARD USAGE. There may be multiple property record cards for a single water distribution system after the utilities Maximo team has divided the installation into service areas as part of the linear segmentation process.

Each part of the water distribution system that is considered a linear structure shall have its own property record card.

842 15 PUMP STATION - POTABLE WATER (KG)

FAC 8422
BFR Required N

84215-1 DEFINITION. This category code will include the pump(s) and appurtenant piping, valves, and other mechanical and electrical equipment for pumping water in the potable water system. The primary unit of measure is installed pumping capacity of the station in thousands of gallons per day (KG) and the alternate unit of measure is the installed pumping capacity of the station in gallons per minute (GM) .

84215-2 PROPERTY RECORD CARD USAGE. All equipment in a single pump station is contained on one property record card.

843 WATER, FIRE PROTECTION

843-1 DEFINITION. Fire protection requirements often dominate the plans of a water supply system. When the supply of fresh water is not adequate, salt water may be used. Since fire flow demands are usually greater than either the domestic or industrial demands, the capacity of the system will generally be determined by the fire flow demands. Fire flows are expressed in gallons per minute and are separate from the other water requirements.

Normal fire flow demands are as follows:

843-1.1 Dwellings. The fire flow requirements for residential areas shall be as follows:

Individual and duplex units--1 story--500 gallons per minute
Individual and duplex units--2 stories--750 gallons per minute
Multifamily (3 or more) units--1 story--750 gallons per minute
Multifamily (3 or more) units--2 stories --1,000 gallons per minute

843-1.2 Light and Ordinary Hazards. In both light and ordinary hazard areas, the fire flow requirements for both hose streams and automatic sprinkler systems shall be as indicated in the table below.

Table 843-1
Fire Flow Requirements (Gallons Per Minute)

Height and Area (Sq Ft)	Unsprinkered		Sprinklered				
	Hose Streams		Hose Streams		Sprinkler Demand	Total	
	Fire Resistive, N.C. (Masonry) Ordinary, and Heavy Timber	Frame, N.C. (All Metal)	Fire Resistive, N.C. (Masonry) Ordinary, and Heavy Timber	Frame, N.C. (All Metal)		Fire Resistive, N.C. (Masonry) Ordinary, and Heavy Timber	Frame, N.C. (All Metal)
1 Story							
0-10,000	750	1,250	250	250	500	750	750
10,000-20,000	1,000	1,750	250	250	750	1,000	1,000
20,000-80,000	1,250	2,500	250	500	1,000	1,250	1,500
Multistory							
0-10,000	1,000	2,000	250	500	500	750	1,000
10,000-20,000	1,250	2,500	250	500	750	750	1,250
20,000-80,000	1,750	3,000	300	750	1,000	1,500	1,750

Notes:
1. All one-story buildings above 20 feet in height shall be classified as multistory.
2. Flows for hose streams shall be provided at 20 psi residual pressure.
3. Sprinkler demand requirements shall be based on a residual pressure at grade to provide a minimum pressure of 15 psi at the highest sprinkler.
4. In unsprinklered one-story buildings, less than 1,000 square feet ground floor area, hose streams requirement of 500 gallons per minute (gpm) generally will be satisfactory.

843-1.3 Special Areas. If the source demands are for a combination system, then it must be of sufficient capacity to provide for the domestic, industrial, and fire flow requirements simultaneously. If the source of supply is unreliable, a storage system may be justified. Normally the most practical facility is the ground-level reservoir. Water storage requirements for fire protection are as listed in the following table

Table 843-2
Water Storage Requirements For Fire Protection

Fire Flow Demands (gallons per minute)	Storage Requirements (hours)	Storage Requirements (gallons)
up to 750	1-1 ½	66,500
up to 1,250	2	150,000
up to 1,750	2	210,000
up to 2,250	2-2 ½	338,000
up to 3,000	3	540,000
over 3,000	4	960,000

843 10 FIRE PROTECTION LINES (LF)
FAC 8432
BFR Required N

84310-1 DEFINITION. Fire protection pipelines are used exclusively in the transmission of water for fire protection, not domestic use. Planning for protection pipelines includes hydrants, valves, connections, pumps, piping, excavating, and backfill. The primary unit of measure is linear feet of pipe (LF).

84310-2 PROPERTY RECORD CARD USAGE. There may be multiple property record cards for a single water distribution system after the utilities Maximo team has divided the installation into service areas as part of the linear segmentation process. Each part of the water distribution system that is considered a linear structure shall have its own property record card.

843 20 FIRE PROTECTION PUMP STATION (KG)
FAC 8434
BFR Required N

84320-1 DEFINITION. A fire protection pumping station is a collection of pumps and supporting equipment used to increase the pressure in the fire protection system.

84310-2 PROPERTY RECORD CARD USAGE. All equipment in a single pump station is contained on one property record card. The building that houses the equipment shall be listed on a separate property record card using Category Code 843 50.

843 30 WATER STORAGE TANK - FIRE PROTECTION WATER (MG)
FAC 8435
BFR Required N

84330-1 DEFINITION. Tanks that provide fire protection water storage to accommodate peak demand requirements. The primary unit of measure is tank capacity in millions of gallons (MG) and the alternate unit of measure is tank capacity in gallons (GA).

84330-2 PROPERTY RECORD CARD USAGE – Each tank shall be shown on a separate property record card.

843 35 RESERVOIRS - FIRE PROTECTION WATER (MG)
FAC 8433
BFR Required N

84335-1 DEFINITION. This Category Code is for a reservoir that has a capacity greater than or equal to one million gallons and typically provides water reserves to insure an uninterrupted flow for fire protection. The primary unit of measure denoting reservoir capacity is millions of gallons (MG).

84335-2 PROPERTY RECORD CARD USAGE – Each reservoir shall be shown on a separate property record card.

843 40 WELLS - FIRE PROTECTION WATER (GM)

FAC 8431
BFR Required N

84340-1 DEFINITION. This Category Code is for equipment that pumps water from underground sources to the fire protection system. The primary unit of measure is well capacity in gallons per minute (GM). The building that houses the well equipment shall be shown on a separate property record card utilizing Category Code 843 50.

84340-2 PROPERTY RECORD CARD USAGE – Each well shall be shown on a separate property record card.

843 50 FIRE PROTECTION BUILDING (SF)

FAC 8910
BFR Required N

84350-1 DEFINITION. This Category Code includes buildings associated with the distribution of fire protection water, typically housing distribution pumps and equipment.

84350-2 PROPERTY RECORD CARD USAGE. Each building shall be included on a single property record card. The equipment contained within the building shall be shown a separate property record card using Category Code 843 20.

844 WATER SUPPLY/STORAGE, NONPOTABLE WATER

844-1 DEFINITION

The water from these facilities will be used primarily for industrial purposes or as an emergency supply should there be a failure of the principal source. When a requirement for nonpotable water source exists, firefighting water requirements usually will be combined with this group. Requirements for this facility group are similar to that for Category Group 841 and 843. The Category Group 844 contains the following individual codes:

844 10 WATER DISTRIBUTION BUILDING, NONPOTABLE WATER (SF)

FAC 8910
BFR Required N

Note: This Category Code contains assets that were previously listed in CCN 845 10.

84410-1 DEFINITION. This Category Code includes all buildings associated with the supply or distribution of non-potable water, typically housing distribution pumps and equipment. All former property record cards with category code 845 10 should be listed using this category code number.

84410-2 PROPERTY RECORD CARD USAGE. Each building shall be included on a single property record card. The equipment contained within the building shall be shown a separate property record card using category code 844 30 or 844 20.

844 20 WATER WELL (KG)

FAC 8414
BFR Required N

84420-1 DEFINITION. This Category Code includes equipment that pumps water from underground sources to a dedicated water distribution system, either potable or non-potable. The primary unit of measure is well capacity in thousands of gallons per day (KG).

84420-2 PROPERTY RECORD CARD USAGE. Each well and associated equipment shall be included on a single property record card with a facility type code of 4. The building that houses that houses the equipment shall be shown on a separate property record card using category code 844 10.

844 30 PUMP STATION - NONPOTABLE WATER (KG)

FAC 8452
BFR Required N
This Category code contains assets that were previously shown in 845 30.

84430-1 DEFINITION. This Category Code includes the collection of pumps and supporting equipment used to supply water to the non-potable water system. The primary unit of measure is the installed pumping capacity of the station in thousands of gallons per day (KG).

84430-2 PROPERTY RECORD CARD USAGE. The equipment in a single pump station is contained on a single property record card. The building that houses the equipment shall be listed on a separate property record card using Category Code 844 10.

844 40 STORAGE TANKS - NONPOTABLE WATER (GA)
FAC 8442
BFR Required N

84440-1 DEFINITION. This Category Code includes tanks that provide non-potable water storage to accommodate peak demand requirements.

84440-2 PROPERTY RECORD CARD USAGE. Each tank shall be shown on a separate property record card.

844 41 STORMWATER FILTRATION – PERMEABLE SURFACE (SY)
FAC 8716
BFR Required N

84441-1 DEFINITION. A stormwater management structure where runoff passes through the pavement surface and subbase layers, infiltrating into the soils below, e.g., Permeable Pavers, Pervious Concrete, Porous Asphalt, Reinforced Turf, Reinforced Gravel.

844 42 STORMWATER FILTRATION – SWALES (SY)
FAC 8716
BFR Required N

84442-1 DEFINITION. A Stormwater management structure that provides routing and damming of stormwater to achieve needed water filtration and reduce stormwater discharge rates, e.g., Dry Swale, Wet Swale.

844 50 RESERVOIRS - NONPOTABLE WATER (MG)
FAC 8443
BFR Required N

84450-1 DEFINITION. This Category Code includes a reservoir that has a capacity greater than or equal to one million gallons and typically provides water reserves to insure an uninterrupted flow for non-potable water requirements. The primary unit of measure is reservoir capacity in millions of gallons (MG).

84440-2 PROPERTY RECORD CARD USAGE. Each reservoir shall be shown on a separate property record card.

844 51 STORMWATER TREATMENT STRUCTURE (GM)
FAC 8717
BFR Required N

84451-1 DEFINITION. A stormwater control structure that uses chambers, gradations, or other built-in feature(s) in combination with filter media to remove sediment and other pollutants from stormwater before entering the storm sewer system. This includes manufactured filter structures.

845 WATER DISTRIBUTION SYSTEM - NONPOTABLE

845-1 DEFINITION. Facilities in this group support non-potable water supply systems and are similar to those described under Category Group 842. This group contains the following individual codes:

845 20 WATER DISTRIBUTION LINE, NONPOTABLE (LF)
FAC 8451
BFR Required N

84520-1 DEFINITION. This Category Code includes all pipes that transmit water in a dedicated nonportable water distribution system. The primary unit of measure is linear feet of pipe (LF).

84520-2 PROPERTY RECORD CARD USAGE. There may be multiple property record cards for a single non-potable water distribution system after the utilities Maximo team has divided the installation into service areas as part of the linear segmentation process has been completed. Each part of the non-potable water distribution system that is considered a linear structure shall have its own property record card.

850 ROADS AND STREETS

851 10 ROADS (SY)
FAC 8511
BFR Required N

851 11 ROADS, UNSURFACED (SY)
FAC 8512
BFR Required N

851 15 LOAD/UNLOAD RAMP (SY)
FAC 8928
BFR Required N

851 20 VEHICULAR BRIDGES (SY)
FAC 8513
BFR Required N

85110/85111/85115/85120-1 DEFINITION. Roads, streets, and bridges are generally planned to conform to the standards and practices of the American Association of State Highway Officials (AASHO), Federal Highway Administration (FHWA), and State and local governments.

851 21 VEHICULAR PARKING, UNSURFACED (SY)
FAC 8522
BFR Required Y

85121-1 DEFINITION. An unpaved surface for parking and/or staging private and/or government owned vehicles and equipment. The surface is usually graveled. Use the criteria under CCN 85210 Parking Area to develop parking requirements.

851 22 VEHICLE STAGING AREA (SY)
FAC 8523
BFR Required Y

85122-1 DEFINITION. This category code represents surfaced areas for the temporary holding of vehicles and equipment awaiting deployment. It is not intended to be used for vehicle parking identified under CCN 85210 or un-surfaced parking and storage designated under CCN 85235 or CCN 85240.

851 23 TRAFFIC CONTROL SIGNALS (EA)
FAC 8541
BFR Required N

85123-1 DEFINITION. Traffic control signals are devices used for directing pedestrian, vehicular or rail traffic by means of power-operated controls. Costs include signal devices, necessary supports, and electric power cables.

85123-2 PROPERTY RECORD CARD USAGE. Each (EA) is defined as one "intersection" as the unit of measure regardless of how many individual traffic signals or supports are in place at an intersection, with the understanding that in some cases the individual signal count may be low and in other cases it may be high - it averages out. List all traffic control signals on one PRC per site.

851 25 VEHICULAR TUNNELS (LF)
FAC 8514
BFR Required N

85125-1 DEFINITION. Vehicular tunnels are used for slope stabilization and automobile access in areas where steep slopes limit development and require innovative access solutions. These tunnels serve vehicular and pedestrian traffic as well as housing utility runs. They are also often used to combat soil erosion and protect facilities and personnel.

852 SIDEWALKS AND OTHER PAVEMENTS

852 10 PARKING AREA (SY)
FAC 8521
BFR Required Y

85210-1 ORGANIZATIONAL VEHICLE PARKING. The paved and/or stabilized area within an organizational motor pool and parking lot, including space required for entrance and exit roads and aisles within the lot, will not exceed the following:

85210-1.1 Navy and Marine Corps installations (except Marine Corps installations with FMF Ground Units assigned). Forty square yards per unit for 75% of the equipment supported. The 40 square yards per unit takes into account the varied sizes and types of automotive, construction, and materials handling equipment to be parked.

85210-1.2 Marine Corps installations with FMF Ground Units assigned. Seventy-five square yards for each vehicle to be accommodated. The 75 SY will be reduced to 50 SY per vehicle if more than 50% of the vehicles to be accommodated have an overall length of 18 feet or less and a width of 6 1/2 feet or less (such as administrative-type vehicles).

85210-2 NON-ORGANIZATIONAL VEHICLE PARKING. Authorized parking spaces for non-organizational vehicles are listed in Table 852-10. The space allowance for each parking space is 35 square yards. This provides room for the parked vehicle and for normal interior lanes, entrances, and exits.

Parking spaces for a facility not listed in the table shall be based on a special study of traffic analysis considering eligible vehicles, multiple utilization, time and space intervals, available public transportation, group-car riding and government-furnished transportation. For example, no planning factor has been established for parking space required for shipboard personnel while in homeport. Therefore, a special study would be required to determine parking space needed to support this requirement. Such a study would take into consideration the number of ships which would be in the homeport at any one time and a derivation there from of the number of shipboard personnel requiring parking space. Where there is no direct experience, valid projections of available data may be made. Parking space for a listed facility, whether existing or planned, may be increased when justified by a special study or traffic analysis.

Table 85210-1
Allowances for Non-Organizational Vehicle Parking

Facility	Number of Parking Spaces
Administration, Headquarters, and Office Buildings	60% of assigned personnel
Bakeries	75% of employees
Bank and Credit Union, when not included in a Community Shopping	2% of customers served
Cafeteria, Civilian, when not included in a Community Shopping Center	15% of seating capacity
Central Food Preparation Facilities	38% of employees
Chapels	30% of seating capacity
Child Development Centers (Patron Parking)	10% of children served
Child Development Centers (Staff Parking)	80% of staff
Commissary Stores, Food Sales, when not included in a Community Shopping Center	Contact DeCA for parking requirements.
Community Shopping Center, including such elements as Main Exchange, Miscellaneous Shops, Restaurant, Commissary Stores, Food Sales, Bank, Theater, Post Office	4% of customers served
Dental Clinic Parking	3 spaces per treatment room
Dormitories (BEQ, Enlisted Unaccompanied Personnel Housing)	70% of design capacity
Enlisted Personnel Dining Facilities (Staff Parking)	38% of employees

Facility	Number of Parking Spaces
Enlisted Personnel Dining Facilities (Patron Parking)	8% of enlisted personnel served
Exchanges, Main, when not included in a Community Shopping Center	25% of customers served
Family Housing	2.5 spaces per living unit
Field House, combined with Football and Baseball Facilities	1% of military strength
Fire Stations	100% of largest shift
Guard Houses, Brigs, Military Police Stations	30% of guard and staff strength
Fitness Center	1 percent of military strength served
Laundries and Dry Cleaning Plants	38% of employees
Libraries (Central)	1 space for each 46 m2 (500 ft2) of gross floor area
Libraries (Branch)	8 spaces
Maintenance Shops	40% of employees
Medical Facilities (Staff Parking)	Use UFC 4-510-01
Medical Facilities (Outpatient / Visitor Parking)	Use UFC 4-510-01
Naval Criminal Investigation Service Field Offices, Resident Agencies and Resident Units	60% of assigned personnel
Officers' Quarters (BOQ, Officer Unaccompanied Personnel Housing)	100% of living suites
Reserve Training Center Parking	80% of reservists, largest drill period
Schools, Dependent, with Auditorium	2 spaces per classroom plus 15 percent of auditorium seats
Schools, Dependent, without Auditorium	2 spaces per classroom
Security Offices: Population served 100 to 2,000	5 spaces
Security Offices: Population served 2,001 to 4,000 population	10 spaces

Facility	Number of Parking Spaces
Security Offices: Population served 4,001 to 6,000 population	15 spaces
Security Offices: Population served 6,001 to 10,000 population	20 spaces
Security Offices: Population served 10,001 and over	To be based on a special study.
Service Clubs (Open Mess and Club Facility)	2% of military strength served
Swimming Pools	20 percent of the pool capacity
Temporary Lodging Facilities	90% of bedrooms
Theaters, when not included in a Community Shopping Center	25% of seating capacity
Training Buildings (Staff Parking)	70% of staff
Training Buildings (Student Parking)	60% of students
Warehouses	40% of employees

85210-3 REFUELING VEHICLE PARKING. A paved area to provide parking for partially or fully loaded refueling units is required where such units are employed to provide fuel for aircraft. This area is to be differentiated from line vehicle parking (Category Code 116 45) which may provide operational parking for some refueling units requiring immediate access to aircraft apron. To determine the area required, a planning factor of 400 square yards per vehicle (refueling semi-trailer with tractor) may be used as a guide. The following criteria shall be adhered to:

85210-3.1 Separation Distances. One hundred feet is the optimum separation between fueling vehicle parking areas and surrounding buildings. This separation should be applied in the planning of new areas. For existing areas this separation should be used wherever possible without requiring extensive relocation or ground improvement. In such cases the 100-foot distance may be modified on the basis of local conditions, taking into consideration the size, nature, and importance of nearby exposed buildings. However, this separation distance should not be reduced below 50 feet.

A separation of 25 feet of centers will be maintained between parked fueling vehicles in designated areas. Distance between rows will vary depending upon the type and the length of the individual vehicles and their turning characteristics. However, the distance between rows will not exceed 50 feet.

85210-3.2 Vehicle Alignment. Vehicles should be aligned in single rows and should be capable of being driven out of storage areas in a single turn.

NOTE: The above-mentioned requirements do not apply to spacing and/or placing fueling vehicles in structures designed for servicing equipment of this nature.

852 15 BICYCLE SHELTER (SF)

FAC 7384
BFR Required Y

A facility to protect bicycles from the elements.

852 20 SIDEWALK (SY)

FAC 8524
BFR Required N

852 30 PEDESTRIAN BRIDGES (SY)

FAC 8525
BFR Required N

85220/85230-1 DEFINITION. Planning of sidewalks and pedestrian bridges is derived from the general development map of the activity. See TM 5-822-2 / AFM 88-7 CHAP 5 for design criteria.

852 35 OTHER PAVED AREAS NOT CODED IN THE 100 OR 400 SERIES (SY)

FAC 8526
BFR Required N

85235-1 OTHER PAVED AREAS NOT CODED IN THE 100 OR 400 SERIES. This code is for miscellaneous pavements not captured in other 100 or 400 series category codes.

852 39 MISCELLANEOUS OPEN STORAGE OR LAYDOWN AREA – UNPAVED (SY)

FAC 8522
BFR Required N

85239-1 DEFINITION. This area is an unpaved laydown area for staging private and/or government-owned vehicles and equipment but is not used as parking lots. The unpaved surface is typically gravel. See CCN 85121 for unpaved parking lots.

852 40 MISCELLANEOUS OPEN STORAGE OR LAYDOWN AREA - PAVED (SY)

FAC 8526
BFR Required N

85240-1 MISCELLANEOUS OPEN STORAGE OR LAYDOWN AREA - PAVED. This code is for open storage areas other than those used for general supply operations (Category Code 451 10). It includes Public Works Open Storage facilities. See Table 85240-1 for allowances.

Table 85240-1
Allowances for Public Works Open Storage

PW Shop Type	Square Yards
A, B, C	225
D	380
E	780
F	1,180

NOTE: For Public Works Open Storage supporting PW shops larger than type F, add 2 SY of open storage for each maintenance craftsman over 500.

852 41 BUILDING/TRAILER PAD WITH UTILITY CONNECTIONS (SY)

FAC 8526
BFR Required N

85241-1 BUILDING/TRAILER PAD WITH UTILITY CONNECTIONS. Paved surface constructed to support a temporary facility or trailer. Utility connections are part of the trailer pad requirements and allow temporary facilities (often Class 3 property) to be easily installed.

853 PARKING BUILDINGS, MISCELLANEOUS

853 10 PARKING BUILDING (SF)

FAC 8531
BFR Required Y

85310-1 DEFINITION. A structure or building designed for parking private and/or government owned vehicles and equipment in individual parking spots/locations. The facility may be above ground or underground. The parking building should be justified by land restrictions and economic considerations. Allow 33 m2/ 40 SY for each passenger vehicle. See table 85210-1 for authorized spaces.

860 RAILROAD TRACKS

860-1 RAILROAD TRACKS DESCRIPTION

This category group covers all two-rail tracks including spurs, sidings, yards, turnouts, with accessories and appurtenances such as barricades. It includes trackage on ship repair facilities, marine railways and portal crane structures.

860 10 RAILROAD TRACKAGE (MI)

FAC 8601
BFR Required N

86010-1 RAILROAD TRACKAGE. The planning of railroad trackage will be based on an economic analysis of the cost of truck haulage versus the cost of the proposed use of railroad facilities. Trackage is planned to connect the base with the common carrier and for holding and unloading freight cars as required. The amount of railroad trackage to be constructed by the government is determined by the proximity of the common carrier lines and the traffic volume.

860 20 EXPLOSIVE BARRICADE FOR SUSPECT TRUCKS AND RAILROAD CARS (EA)

FAC 1495
BFR Required N

86020-1 EXPLOSIVE BARRICADE FOR SUSPECT TRUCKS AND RAILROAD CARS. A suspect cargo site is for placing trucks and railcars containing ammunition or explosives that are suspected of being in a hazardous condition. These sites may be used jointly for railcars, motor vehicles and cargo containers. This facility should have effective barricades on three sides and sited in accordance with OP-5 Vol.1. Barricaded rail or truck spurs used for temporary holding of railcars and/or motor vehicles (non-suspect) may be captured under this function. This Category Code is for inventory purposes only, a BFR is not required.

860 30 RAILROAD BRIDGE AND TRESTLE (MI)

FAC 8611
BFR Required N

860 40 CRANE TRACKAGE (MI)
FAC 8601
BFR Required N

86030/86040-1 RAILROAD BRIDGE AND TRESTLE AND CRANE TRACKAGE. When planning track layouts, railroad trackage should be separated from portal crane trackage, because, apart from the similarity of the rails, portal crane trackage requirements are completely different from railroad trackage. Where separation is impossible, both cranes and rolling stock will utilize a common rail, and the other railroad trackage rail shall be placed inside the crane gauge.

860 41 RAILROAD SCALEHOUSE (SF)
FAC 8612
BFR Required N

86041-1 RAILROAD SCALEHOUSE. A railroad scale house is a facility designed to weigh rail cargo. Typically, tracks are laid to allow railcars to be pulled through the scale house.

870 GROUND IMPROVEMENT STRUCTURES

870-1 DEFINITION. This category group includes drainage and storm sewer systems, boundary fencing, gates, guard towers and shelters and other related facilities.
871 GROUNDS, DRAINAGE

871 10 STORM SEWER (LF)
FAC 8711
BFR Required N

871/87110-1 DEFINITION. Storm sewers are components of a storm drainage system that collects the surface runoff water and conveys it to outlet points. Storm sewers are required at installations or areas where open drainage ditches would create a hazard to the operation of vehicles and aircraft or would prove hazardous to pedestrians. Storm sewers shall not be combined with sanitary sewers.

871 11 OIL/WATER SEPARATOR - RUNOFF WATER (KG)
FAC 8313
BFR Required N

87111-1 DEFINITION. A facility for the separation of grease, oil, or grit from wastewater.

871 15 STORM WATER PUMPING STATION (EA)

FAC 8452
BFR Required N

87111/87115-1 DEFINITION. Requirements for Category Codes 871 11 and 15 must be individually justified. No criteria are available.

871 16 STORMWATER RETENTION PONDS (MG)

FAC 8715
BFR Required N

87116-1 DEFINITION. An impoundment for the temporary storage of water resulting from runoff and drainage.

871 20 DRAINAGE DITCH (LF)

FAC 8711
BFR Required N

87120-1 DEFINITION. Drainage ditches serve the same purpose as storm sewers. They are preferable to covered structures to minimize construction, to conserve materials, and to facilitate maintenance. Ditches should be planned to provide adequate depth to contain all runoff water anticipated from snow, ice, thaws, frozen ground, and severe rainfalls. In the planning of the drainage system, consideration should be given to the location of ditches to minimize the creation of hazards to vehicles or personnel. See MIL HDBK-1005/3 for technical information.

871 25 DAM (LF)

FAC 8714
BFR Required N

87125-1 DEFINITION. A dam is an artificial or natural barrier usually constructed across a stream channel to impound water. Timber, rock, concrete, earth, steel or a combination of these materials may be used to build the dam. Dams must have spillway systems to safely convey normal stream and flood flows over, around, or through the dam. Spillways are commonly constructed of non-erosive materials such as concrete. Dams should also have a drain or other water-withdrawal facility to control the water level and to lower water levels for normal maintenance and emergency purposes.

87125-2 Dimensions and Capacity: A dam is at least six feet in height, measured vertically from top of barrier to elevation of lower downstream toe, and has an impounding capacity greater than 50 acre-feet; or is at least 25 feet in height, and has an impounding capacity greater than 15 acre-feet.
Toe of Dam: The junction of the downstream face of a dam with the natural ground surface. This is also referred to as the downstream toe.

87125-3 Requirements for a new dam must be individually justified by an engineering study. When planning for this category code, consult with NAVFAC Engineering Service Center, Code CIOFP4.

871 26 LEVEE AND/OR DIKE (LF)

FAC 8714
BFR Required N

87126-1 DEFINITION. A levee is a type of dam that runs along the banks of a river or canal. Levees reinforce the banks and help prevent flooding. By confining the flow, levees can also increase the speed of the water. Levees can be natural or man-made. A natural levee is formed when sediment settles on the riverbank, raising the level of the land around the river. To construct a man-made levee, workers pile dirt or concrete along the riverbanks, creating an embankment. This embankment is flat at the top, and slopes at an angle down to the water. For added strength, sandbags are sometimes placed over dirt embankments.

871 30 IRRIGATION FACILITY (LF)

FAC 8451
BFR Required N

871 35 RETAINING WALL (LF)

FAC 8712
BFR Required N

871 45 DREDGED SPOIL HANDLING FACILITY (GM)

FAC 8714
BFR Required N

87130/87135/87145-1 DEFINITION. Requirements for Category Codes 871 30 through 45 must be individually justified. No criteria are available.

872 GROUNDS FENCING, GATES AND GUARD TOWERS

872-1 DEFINITION

This basic category provides boundary security in the form of fencing, walls, gates, watch towers, guard walks, and guard shelters. The type and amount of security planned is a function of the security classification required, and the economical utilization of security guards.

872 10 STATION SECURITY AND PERIMETER FENCING AND WALLS (LF)

FAC 8721
BFR Required N

87210-1 DEFINITION. Security fencing and walls define the limits of security areas and facilitate the effective and economical use of security personnel. Fencing is planned on the basis of a study of the security classification requirements of the installation. The permanency of the installation, availability of materials, presence of natural aids to security, guard personnel, security hazards, and problems and degree of security required, must be considered in all fence construction. Security fencing is generally of the type known as chain link or cyclone, or under certain conditions it may be barbed wire. Fences should be 50 to 150 feet from buildings or critical supplies to be protected. There should be at least 20 feet between perimeter fences and structures, parking areas, or natural features outside the fenced area which could offer concealment or assistance to unauthorized access to area protected. When this is not possible, perimeter fencing should be increased in height or otherwise designed to compensate for the proximity of aids to concealment or access. See Table 87210-1 for appropriate applications and characteristics of fences.

87210-1.1 Standard Security Fencing. The average standard security fence of the so-called man proof type is the 7-foot cyclone, chain link fence with 1-1/2 foot outriggers mounting 3 barbed wire strands at 45 degrees, increasing the overall height of the fence to 8 feet. See UFC 4-022-03, Security Fences and Gates, for additional design details.

87210-1.2 **Security Fencing for Storage of Security Risk Categories I and II**. The fence fabric, height, installation, clear zones, and number of gates for SRC I and II Ammunition and Explosive (A&E) storage facilities must meet DoDM 5100.76, latest revision requirements. Additional design details are promulgated in UFC 4-022-03, Security Fences and Gates.

87210-1.3 Barbed Wire. There are instances such as in isolated air stations, where three strand barbed wire cattle fence will suffice around the entire perimeter of the station, augmented by standard security fencing of critical areas, if such exist and can be adequately patrolled.

87210-1.4 Walls. Where walls, floors, and roofs serve as barriers, they should be constructed and arranged to provide uniform protection equivalent to that provided by chain link fencing as specified.

Table 87210-1
Applications and General Characteristics Of Fences

Application	Location or Special Requirement	Suitable Type	Height	
			Feet	Inches
Restricted Area Security	Restricted Areas — as defined in OPNAVINST 5530.14E	Chain link security fence with three strands of barbed wire mounted on outriggers (facing out except for brigs).	Refer to OPNAVINST 5530.14E	
Magazines storing SRC I & II A&E	Restricted Areas — as defined in DoDM 5100.76	Fence fabric shall be chain link, i.e., galvanized, aluminized, or plastic-coated woven steel, 2-inch square mesh made from 9-gauge diameter wire, excluding coating that meets Federal Specification RR-F-191K.	Refer to DoDM 5100.76	
Non-metallic Security Fence Requirement	Where restrictions of visibility into activity is desired.	Wooden Security fence	Refer to OPNAVINST 5530.14E	
	At radio direction-finder structures.	Wooden Security fence		
	Where chain link materials are not available.	Wooden Security fence		
Protection of sports facilities, users and spectators	Athletic courts.	Chain link.	10-12	--
	Swimming pools.	Chain link or decorative wood.	6	--
	Playgrounds.	Chain link or decorative wood.	5	--
Snow fencing	Where drifting snow is a problem.	Picket interwoven with wire-studded metal posts	4	--
Right-of-way fencing	Railways, highways	Woven wire fencing or wooden or metal posts with or without barbed wire.	4.5	--
Animal Fencing	*Woven wire fencing with wooden or metal posts—barbed wire as indicated:*			
	Horses, mules, cattle, general.	1 strand top	--	47
	Hogs.	1 strand at bottom	--	32-39
	Sheep and goats.	1 strand at top	--	39-47
	Poultry.	None	--	48-72
Perimeter marking	Property lines, firing ranges, outside security barrier of high security area	Two strand barbed wire.	--	42
		Three strand barbed wire (wood or metal posts).	--	48
Decorative wood fencing	To discourage passage or access.	Picket fence.	3-5	--
		Post and rail or horizontal board.	4	--
	To provide privacy and screening.	Stockade fence.	6-8	--
		Louver fence.	6-7	--

Application	Location or Special Requirement	Suitable Type	Height	
			Feet	Inches
		Basket weave fence.	6-8	--

Refer to OPNAVINST 5530.14E “Navy Physical Security and Law Enforcement Program” for definitions of critical areas.

872 11 HARDENED SECURITY FENCE (SF)

FAC 8722
BFR Required N

87211-1 DEFINITION. Security is a key issue for all military installations; hardened security fencing is used very effectively but will not stop a determined intruder. To be effective, such barriers must be augmented by security force personnel and other means of protection, detection, delay, and assessment. Security fences are used primarily to:

a) Define the perimeter of a restricted area.
b) Provide a physical and psychological deterrent to entry while serving notice that entry is not freely permitted.
c) Prevent accidental entry.
d) Optimize security force operations.
e) Enhance detection and apprehension of intruders.
f) Channel and control the flow of personnel and vehicles through designated portals.

87211-2 Prior to making decisions to employ security fencing, perform a thorough risk and threat analysis to determine the degree of physical security required. As indicated in Chapter 2 of Chief of Naval Operations Instruction (OPNAVINST) 5530.14E “Navy Physical Security and Law Enforcement Program”, extensive and costly security measures may be justified in certain cases to protect certain assets of security interest; however, ultimately the commanding officer of an activity is responsible for complying with established security requirements while at the same time working to achieve economy. To achieve this objective, higher echelon security requirements must be clearly understood. Additionally, evaluate the relative criticality and vulnerability of the security interest in relation to a ranking of potential threats, and calculate the specific level of security to ensure the best possible protection for that threat level in a cost-effective manner. Only after the above preliminary factors are addressed can a proper design be initiated. See MIL-HDBK-1013/1A, “Design Guidelines for Physical Security of Facilities”, for guidance and more detailed procedures which may be helpful in the decision process.

872 15 INTERIOR FENCING (NOT CODED IN 872 10) (LF)

FAC 8721
BFR Required N

This Category Code is for inventory purposes only, a BFR is not required.

872 20 GUARD AND WATCH TOWERS (EA)
FAC 1499
BFR Required N

87220-1 DEFINITION. Where authorized, guard or watchtowers should be constructed at locations that will provide the best observation of security areas. The general building of guard towers at other than correctional facilities and certain special weapons projects is not presently considered appropriate. Each local security situation should be solved on its own merits.

872 30 MECHANICAL SECURITY BARRICADE (EA)
FAC 1458
BFR Required N

87230-1 DEFINITION. Mechanically operated barricade consisting of pop-up bollards, rising road plates, or wedges designed to control vehicle or other traffic. Drop arm barriers found at gates or railroad crossings and floating barrier systems around ships meet the definition of a mechanical security barricade and are included. Costs include barrier installation, remote controls, safety loops, traffic arm, and traffic lights. CCTV, cameras, and alarms are considered equipment and are not included.

87230-2 PROPERTY RECORD CARD USAGE. EA is defined as a single barricade blocking a lane of traffic. A lane may have two barricades, one inside the gate entrance and one outside the gate entrance, therefore the count for that lane would be 2 (EA).

872 50 ENTRY GATE (LF)
FAC 8721
BFR Required N

87250-1 ENTRY GATE. An entry gate is the frame, gate, or other apparatus that allows or restricts vehicle and animal entrance on access roads and pedestrian access through the perimeter fences or walls of an installation.

880 FIRE AND OTHER ALARM SYSTEMS

880-1 FIRE AND OTHER ALARM SYSTEMS

This basic category includes separate integral signal systems such as fire alarm, watch reporting, and security. Telephone reporting systems are planned with telephone systems (see Code 130).

880 10 FIRE ALARM SYSTEM (MI)

FAC 1351
BFR Required N

88010-1 FIRE ALARM SYSTEM. Fire alarm systems are of two general types: exterior systems and interior systems. Exterior systems normally have alarm initiating devices outside buildings but may have components within buildings. Interior systems service a single building or group of buildings and may be connected to an exterior system.

88010-1.1 Exterior Fire Reporting Facilities. Exterior fire reporting systems of either telegraphic radio or supervised telephonic types are authorized for installation in built-up areas at military installations. The type of system selected for use shall be established on the basis of dependability, initial cost, and ability to maintain the system in operating condition. Extension of fire reporting systems will require consideration of compatibility with existing equipment. Fire reporting facilities will not normally be provided at isolated small areas, ammunition and ordnance storage, and similar restricted areas where personnel are not generally present to detect fires.

88010-1.2 Interior Fire Reporting Facilities

88010-1.2.1 Automatic Fire Alarm Systems. Automatic fire detection and alarm systems are authorized for installation in:

1. Buildings, for protection of life, or in isolated and/or important facilities where automatic sprinkler protection would normally be provided but is not economically or technically feasible.
2. Combustible buildings used for the confinement of military prisoners where automatic sprinklers, normally provided, cannot be made available.
3. Combustible buildings of hospital groups and specific areas of noncombustible buildings of hospital groups, where automatic sprinklers are not provided.
4. One and two-story combustible dormitory-type living quarters, including bachelor officers' quarters, guesthouses, nurses' quarters, civilian dormitories, and similar buildings used for sleeping purposes.

88010-1.2.2 Manual Fire Alarm Systems. Manual fire and evacuation alarms are authorized for installation in:

1. Barracks, dormitories, bachelor officers' quarters and similar sleeping quarters involving 20 or more persons not otherwise provided with automatic fire detection alarms.
2. Combustible buildings used for confinement of military prisoners, not otherwise provided with automatic sprinkler or automatic fire detection systems.
3. Buildings involving personnel occupancy such as administration, clubs, schools, classrooms, hospitals, laboratories, industrial and similar structures.

Normally, such buildings having occupancy of 20 or more persons will be provided with this type of alarm system.

880 20 WATCH REPORTING SYSTEM (MI)
FAC 1351
BFR Required N

88020-1 WATCH REPORTING SYSTEM. A watch reporting system provides a method for the automatic and non-automatic detection of fire and for security protection (Intrusion Detection System) throughout designated areas, buildings, and structures. The watch reporting system provides local alarms and central station alarms to building occupants and to station security and firefighting personnel. Watch reporting systems are planned on the basis of engineering surveys to determine the degree of fire protection and security required.

880 30 BASE ALERT SYSTEMS (MI)
FAC 1351
BFR Required N

88030-1 BASE ALERT SYSTEMS. Base alert systems shall be planned for all Navy installations. The system may alert base personnel to air raids, chemical/biological attacks or any other type of terrorist attack. Horns of high-power type may be used as signal devices. Their locations shall be coordinated with structures and buildings to spread audible signals evenly and with enough intensity to be heard over a whole area or activity.

880 40 AIR CRASH/ALERT (MI)
FAC 1351
BFR Required N

88040-1 AIR CRASH/ALERT. No planning criteria are currently available.

890 MISCELLANEOUS UTILITIES

890 09 MISCELLANEOUS UTILITY BUILDING (SF)
FAC 8910
BFR Required N

89009-1 DEFINITION. This Category Code is used for structures associated with public works utilities shops and other miscellaneous utility buildings. If a utility building cannot be classified under one of the other utility type buildings, this Category Code should be used. Specific the general use of the building in the facility name field.

890 10 ACETYLENE PLANT (EA)
FAC 8921
BFR Required N

890 11 ACETYLENE DISTRIBUTION SYSTEM (LF)
FAC 8930
BFR Required N

89010/89011-1 DEFINITION. Generally, the generation of acetylene is a function of private industry. Where commercial sources are nonexistent or of poor quality, a generating plant may be built. The quantity of acetylene required and the siting of an acetylene plant within safety criteria are determined by an engineering study. A typical acetylene generator building has an approximate gross area of 2,200 square feet.

890 15 NITROGEN PLANT (EA)
FAC 8921
BFR Required N

89015-1 DEFINITION. A nitrogen plant is required for the provision of large quantities of nitrogen for special applications. Nitrogen is used where an inert gas is required. It prevents oxidation in welding and soldering. It prevents spoilage of perishable supplies by displacing air in special storage facilities. Nitrogen is also used in the quick freezing of food. Nitrogen is provided by commercial sources where available. A requirement for a nitrogen plant shall be determined by a special study. Nitrogen and oxygen are by-products of each other so preliminary guidance may be taken from oxygen plant criteria (Category Code 141 87 Liquid Oxygen Facility and 890 30 Industrial Oxygen Plant).

890 18 UTILITY VAULT-NON COMMUNICATIONS (EA)
FAC 8927
BFR Required N

89018-1 DEFINITION. A utility vault is an enclosed structure generally made of concrete that contains utility equipment, connections and/or lines (non-communications). A utility vault is typically an underground structure. For communications maintenance vaults, use category code 131 12. This category code is for inventory purposes only.

890 20 COMPRESSED AIR PLANT (EA)
FAC 8921
BFR Required N

890 21 COMPRESSED AIR DISTRIBUTION SYSTEM (LF)

FAC 8930
BFR Required N

89020/89021-1 DEFINITION. Compressed air is used by the Navy in numerous applications, such as for pneumatic tools, laundry equipment, instrumentation and control equipment, and in hospitals and laboratories. If the requirement is sufficiently large at an installation, a central compressed air plant and distribution system should be installed. A careful analysis of all compressed air operating requirements is necessary to determine the capacity and pressure of the distribution system. Usually, compressed air is distributed at 100 to 125 psig from a central system for general purpose needs. Special, high-pressure systems are required for ordnance plants, ammunition depots, catapults, and submarine facilities.

89020/89021-1 PROPERTY RECORD CARD USAGE. There may be multiple property record cards for a single compressed air distribution system after the linear segmentation process has been completed. Each part of the compressed air distribution system that is considered a linear structure shall have its own property record card. There will be multiple linear segments within a linear structure, and they will be recorded in GIS. They do not need to be shown on the property record card. All property record cards for a single network are related by a RPNUID.

890 25 CARBON DIOXIDE PLANT (EA)

FAC 8921
BFR Required N

89025-1 DEFINITION. A carbon dioxide plant at a naval activity provides space for the storage and transfer of carbon dioxide. The space contains a storage tank and a distribution system used for refilling carbon dioxide fire extinguishers. The space required will approximate 1,200 to 2,000 square feet.

890 27 ICE-MAKING PLANT (TN)

FAC 7322
BFR Required N

89027-1 DEFINITION. No planning criteria are currently available.

890 30 INDUSTRIAL OXYGEN PLANT (EA)

FAC 8921
BFR Required N

890 31 OXYGEN DISTRIBUTION SYSTEM (LF)

FAC 8930
BFR Required N

89030/89031-1 DEFINITION. Industrial oxygen is obtained from private industry where feasible. Where oxygen must be produced, it is obtained by breakdown of air into oxygen and nitrogen. Nitrogen is a by-product. Breathing oxygen is handled separately from industrial oxygen because of more stringent purity requirements. See Category Code 141 87 Liquid Oxygen Facilities for breathing oxygen.

890 45 VALVE HOUSE OR OTHER ENCLOSURE (SF)

FAC 8910
BFR Required N

89045-1 DEFINITION. This Category Code is used for any structure used for housing valves or other utility equipment that is not contained in any other CCN.

890 46 UTILITY TUNNEL–NON COMMUNICATIONS (LF)

FAC 8931
BFR Required N

89046-1 DEFINITION. This category code is for an underground tunnel in which utility systems (non-communications) are routed. There may be multiple utility systems in a single tunnel network. Utility tunnels are of a large enough cross section to allow walk-through access. For communications maintenance tunnels, use category code 131 13.

890 50 ICS COMMUNICATION LINES (MI)

FAC 1351
BFR Required N
Revised August 2015

89050-1 DEFINITION. This category code is used for Industrial Control System (ICS) communication lines. By definition, wireless ICS communications are not addressed or inventoried in iNFADS.

89050-2 PROPERTY RECORD CARD USAGE. Industrial Control System communication lines shall be listed on a single property record card. Large installations with multiple geographic service areas will require a property record card for each geographic service area containing ICS communication lines.

890 51 ICS MONITORING STATION (SF)

FAC 8910
BFR Required: Y
Created August 2015

89051-1 BACKGROUND. The Navy and Marine Corps Smart Grid Program aggregates building energy information, utility information, and operational technologies (i.e. Industrial Control System (ICS)) in order to reduce facility maintenance costs, reduce energy consumption, and support mission assurance. Centralization of an ICS requires the establishment of regional and installation level ICS Monitoring Stations where various building and utility systems can be monitored and controlled.

89051-2 DEFINITION. The ICS Monitoring Station is the utility support facility that houses the operational components of the ICS as well as the personnel that operate the system. The ICS Monitoring Station is a component of the ICS and makes the ICS complete and usable. An ICS Monitoring Station should not be confused with a National Operations Center (NOC), Regional Operations Center (ROC) or Emergency Operations Center (EOC).

89051-2.1 Types of ICS Monitoring Stations.

Although a variety of ICS Monitoring Station types exist, they all encompass processes that enable the intelligent monitoring, forecasting, response to and control of Navy and Marine Corps building and utility systems. ICS Monitoring Stations are organized around a central master control space, ranging from a large room with multiple workstations to a single computer workstation. For this UFC, it is assumed that an ICS Monitoring Station will be one of two basic types:

- Consolidated: Integrates all required systems and components into one facility
- Distributed: Locates required spaces and components throughout two or more facilities or locations

Many variations are possible within these two basic types. Consult FC 4-141-05N for design criteria.

Table 89051-1 below is provided for reference purposes and itemizes the various components of an Industrial Control System, of which the ICS Monitoring Station is just one component

Table 89051-1: Components of an Industrial Control System

ICS Components Located OUTSIDE of a Controlled Building or Utility		
Component	**Picture**	**Property Classification**
ICS Monitoring Station (Building – Square Feet)		Real Property (CCN 89051)

89051-3 SPACE TYPES AND PLANNING FACTORS

89051-3.1. Office and General Purpose Spaces.

89051-3.1.1. Private Offices. Allocate 120 NSF/PN per Private Office required.

89051-3.1.2. Open Offices. Allocate 64 NSF/PN per Open Office required.

89051-3.1.3. Administrative Support Space. This space supports the administrative functions and includes all such functions not included in personal office space. It includes space for working office storage, copiers, working files, printers, scanners, shredders, safes, and facsimile machines. Allocate 8 NSF/PN for all personnel in office spaces.

89051-3.1.4. Conference Room. For a Regional ICS Monitoring Station with up to 24 total personnel, provide one conference room at 400 NSF. For an Installation Level ICS Monitoring Station conference room (if required), allocate 200 NSF.

89051-3.1.5. Reception Area. A Reception Area is used for receiving visitors and controlling access to ICS Monitoring Station spaces and are justified only for large, consolidated ICS Monitoring Stations. Allocate 64 NSF for a reception desk and include space for up to 5 visitors @ 20 NSF/visitor.

89051-3.1.6. Circulation. This is space used to provide for circulation in and around the administrative space types above. Apply an Office and Assembly Space Circulation multiplier of 10% to the NSF allocation.

89051-3.2. Special Purpose Spaces

89051-3.2.1. ICS Integration and Application Space. ICS Integration and Application Space is used for training and work bench space, but it is not continuously manned. Allocate 200 NSF for ICS Integration and Application Space.

89051-3.2.2. IT Storage Space. IT Storage Space is used for storage of IT equipment and supplies. Allocate 150 NSF for IT Storage Space.

89051-3.2.3. Master Control Room. A Master Control Room (MCR) is the central monitoring and action function within the ICS Monitoring Station. Sizing of the MCR is based on the number of operators and associated workstations. It includes a minimum of two operator workstations and may include a large, centralized, flat panel display area with a minimum of 24" deep enclosed computer space on video walls. The MCR is rectangular in shape; depth is based on operator visual range, and width is based on the number of operators and necessary display information. Allocate 90 NSF/operator station.

89051-3.2.4. Server Room. A Server Room contains computer equipment mounted in racks. The average rack size is assumed to 24"W x 40"D x 81"H. An evaluation shall be done to determine the total number of racks required. Once the required number of racks has been determined, use "Table 131-6, Equipment Room Requirement by Total Racks" (in the 100 series document) to determine NSF requirement:

89051-3.2.5. Technical Equipment Area. A Technical Equipment Area is required for charging, check-out network update, and maintenance of laptop, ELMRS radios, etc. Allocate 100 NSF for a Technical Equipment Area.

89051-3.2.6. Bunk Room. A Bunk Room may be justified due to base emergency event protocols for self-sufficiency as determined by the base commanding officer. For a Consolidated ICS Monitoring Station, allocate 130 NSF for Bunk Room.

89051-3.2.7. Break Room. A Break Room is justified for all ICS monitoring stations unless a kitchen is justified in its place. Allocate 20 NSF/PN based on the number of people in MCR during the largest shift.

89051-3.2.8. Kitchen. A Kitchen may be justified due to base emergency event protocols for self-sufficiency as determined by the base commanding officer. Allocate 30 NSF/PN based on the number of people in MCR during the largest shift.

89051-3.2.9. Locker Room. A Locker Room area may be justified based on permanent staff within the MCR. Allocate 10 NSF/Locker/PN based on the number of people in MCR during the largest shift.

89051-3.2.10. Shower Room. A Shower Room may be justified due to base emergency event protocols for self-sufficiency as determined by the base commanding officer. Allocate 20 NSF/Shower when required, up to a maximum of two showers.

89051-3.2.11. Special Purpose Space Circulation. This space used for circulation within the Special Purpose Spaces. Apply a Special Purpose Space Circulation factor of 10% to the NSF allocated.

89051-3.2.12. Electrical, Mechanical and Rest Rooms and other common areas are included within the Net to Gross factor.

For an ICS Monitoring Station, apply an overall Net to Gross Factor of 1.35.

Table 89051-4: Planning Factors for ICS Monitoring Station

Space Type	NSF Factor/Multiplier
Office and Assembly Space:	
Private Offices	120 NSF/person
Open Offices	64 NSF/person
Administrative Support Space	8 NSF/PN for office space personnel.
Conference Room at Installation Level ICSMS	200 NSF
Conference Room at Regional Level ICSMS	400 NSF
Reception Area at Regional Level ICSMS	164 NSF
Office and Assembly Space Circulation Multiplier	10%
Special Purpose Space:	
ICS Integration and Application Space	200 NSF
IT Storage Space	150 NSF
Master Control Room	90 NSF/Operator Work Station
Reception Area	164 NSF
Server Room	See Table 89051-4
Technical Equipment Area	100 NSF
Bunk Room (for emergency events)	130 NSF
Break Room (apply in lieu of Kitchen)	20 NSF/PN
Kitchen (for emergency events)	30 NSF/PN justified
Locker Room	10 NSF/Locker/PN justified
Shower Room (for emergency events)	20 NSF/Shower
Circulation Multiplier	10%
ICS Monitoring Station NTG Factor:	1.35

Table 89051-5: Example BFR for an ICS Monitoring Station

Space Type: Office and General Purpose Space	Qty	NSF Factor or Multiplier	Subtotal NSF	Total Area NSF
Private Office Space (PN)	4	120		480
Open Office Space (PN)	8	64		512
Administrative Support Space Factor (PN)	12	8		96
Conference Room (EA) Installation	0	200		0
Conference Room (EA) Regional	1	400		400
Reception Area (EA) Regional	1	164		164
Office and Assembly Space Subtotal (NSF)			1,652	
Office and Assembly Space Circulation (NSF)		10%	165	
Total Office and Assembly Space (NSF):				1,817

Technical Equipment Area (EA)	1	100		100
Break Room (based MCR personnel during largest shift)	8	160		160
Bunk Room for Emergency Events (EA)	0	130		0
Kitchen (based MCR personnel during largest shift)	0	20		0
Locker Room (based MCR personnel during largest shift)	0	10		0
Shower Room (Up to two showers)	0	20		0
Special Purpose Space Subtotal (NSF)			1390	
Circulation Multiplier: (NSF)		10%	139	
Total Special Purpose Space (NSF)				1,529
Total Net Area Subtotal			3346	
Net-to-Gross Factor (NTG)		35%	1,171	
Total Gross Area (GSF)				4,517

89051-4 PROPERTY RECORD CARD USAGE. Each ICS Monitoring Station should be listed on an individual property record card. At smaller installations where an ICS Monitoring Station may consist of a single room for an ICS workstation within a public works facility, use CCN 89051 as the utilization for that area of the building.

890 56 WEIGHTING FACILITY (EA)

FAC 8923
BFR Required N

No criteria are currently available for this Category Code.

890 77 STORAGE FOR UTILITY SYSTEMS (READY ISSUE/SHOP STORES/MISC.) (SF)

FAC 8910
BFR Required Y

89077-1 DEFINITION. This facility provides covered storage for large items and materials required for the maintenance of base utility systems to include, but not limited to: spare pole mounted transformers, power cable spools, and large diameter piping. It is independent of the facilities required for the storage of items and materials required for the maintenance of station buildings and grounds (use Category Code 219 77). Because of the size and variation of specific items or materials requiring covered storage included in this category code, warehouse stacking methodology may not apply. When this is the case, a space analysis must be used to develop the BFR.

892 MISCELLANEOUS UTILITIES-EACH

892 10 MONITORING WELLS (EA)

FAC 8840
BFR Required N

89210-1 DEFINITION. Monitoring wells are for inventory purposes only. Monitoring wells are installed around a site in order to detect the discharge of any leachate. Samples from the wells are to be analyzed prior to the disposal of any waste in order to establish baseline data. Report all wells associated with a single contamination site or single fuel monitoring requirement as one asset and record the quantity of wells per site in the associated property record.

893 MISCELLANEOUS UTILITIES-LINEAR FEET

893 20 UTILITY CHANNEL NON-COMMUNICATIONS (LF)

FAC 8932
BFR Required N

89320-1 DEFINITION. A utility channel is an underground channel for utility distribution systems (non-communications) that both protects systems and provides relatively easy access for maintenance. A utility channel has a much smaller cross-section than a utility tunnel and does not provide walk-through access. These are generally concrete channels with a series of ground level concrete access panels that constitute the top of the channel structure. For communications maintenance channels, use category code 131 17.

900 SERIES
REAL ESTATE FACILITIES

Table of Contents

900 REAL ESTATE

900-1 DEFINITION

This Facility Class applies to real estate in which the Navy has, or intends to obtain, a vested interest. The interest may be acquired by purchase, condemnation, donation, or exchange, and may be held in fee simple, leasehold, or easement. Real estate planned for the Navy is defined under the category codes for classifying real property as found in NACFAC P-72 / Classification is done according to the methods of acquisition and the type of real estate acquired as follows:

- Category Group 910 Land – Government Owned
- Category Group 920 Other Rights
- Category Group 930 Site Improvements

900-2 POLICY

As a general policy, all permanent Naval installations within the United States and its possessions shall be established on land owned in fee by the Federal Government under the custody and accountability of the Department of the Navy. This policy is based on the need for the unconditional use of the land for the unrestricted execution of the assigned military mission.

Additional real estate will not be acquired for the Department of the Navy by any method unless a determination has been made that consistent with the requirements of the military mission, such needs cannot be fulfilled by maximum utilization of the real estate under the control of the three military departments. Current requirements will, in the absence of unusual circumstances, be given preference over anticipated future needs and mobilization requirements. Care must be taken however, to prevent modifications that would interfere with mobilization plans for the property. The following are broad policies of the Department of the Navy in connection with the real estate transactions:

1. To acquire only the real property necessary to meet present and immediately foreseeable requirements;
2. To acquire title or other interest to real property by negotiation and direct purchase wherever possible;
3. To base estimate of value upon appraisals made by private local appraisers or by staff appraisers;
4. To take prompt action to dispose of real property excess to current and foreseeable needs of the Navy;
5. To authorize for private use, after advertising, real property which is temporarily excess to the needs of the Navy and is not required for use by other Federal agencies;
6. To require the payment of fair value for easements granted and for property which is made available for private use under out-leases, licenses or otherwise; and

7. To construct buildings or improvements of permanent type only on lands in which the rights of the Government are fee title or permanent easements.

900-3 DETERMINATION OF REQUIREMENTS

Prior to acquisition of additional land, it shall be determined that the requirements cannot be met by:

1. Exercise of recapture-of-use rights;
2. Use of property excess to the needs of other military departments or another government agency;
3. Exercise of joint use with other agencies;
4. Acquisition of land from public domain; or
5. Transfer from state or municipal governments.

900-4 ACQUISITION CODE VERSUS RETENTION CODE

Real estate is acquired under the 900 Code but is transferred, usually at the end of the fiscal year, to the code under which it is used. Coding in the 900 series denotes the type of interest acquired in the property and the means of acquisition.

900-5 REASONS FOR ACQUISITION

Land is acquired to supply operational and building areas and to provide security and safety clearances. Requirements for real estate are generated by the assignment of missions for which facilities are not available. When a mission has been assigned to a specific activity, the Commanding Officer reviews available facilities and such deficiencies as exist from the basis of a requirement for the expansion of the installation or the development of a new one. These requirements are submitted for CNO approval through the Military Construction Review Board procedures. See NAVFAC P-73, Real Estate Administration, for the detailed procedures.

900-6 AUTHORITY TO ACQUIRE REAL PROPERTY

The authority to acquire real property and execute real estate functions is vested in the Naval Facilities Engineering Command. Authority to acquire real property must be supported by legislative authorization with an appropriation of funds available for that purpose.

900-7 DELEGATION OF AUTHORITY

Authority is delegated to the field offices from time to time for certain functions in relation to real property. This delegation is made to the Commanders/CC's, Naval Facilities Engineering Command Field Divisions.

900-8 LEGISLATIVE AUTHORIZATION (MCON ACTS)

Navy Department land acquisitions usually are provided for in Acts of Congress authorizing construction projects at naval installations. These Acts are commonly known as Military Construction Acts (MCON Acts). They are sometimes referred to as Public Works Authorization Acts.

900-9 ACQUISITION COST

Acquisition exceeding $50,000 is included with the MCON Acts as a line item for action of the Congress. Acquisition not exceeding $25,000 is vested in the Secretary of the Navy. This authority is for land or real property interest determined necessary for national defense. The authority for expenditure of up to $25,000 may not be used to acquire two or more contiguous parcels that together cost more than $50,000. The detailed method of acquisition is found in NAVFAC P-73, Real Estate Procedural Manual.

910 LAND - GOVERNMENT OWNED

910-1 **GOVERNMENT OWNED LANDS.** All land interests are included in Category Group 910 with the exception of easement rights, in-lease rights, and foreign rights which are in Category Group 920.

911 LAND - PERMANENT USE LAND

911-1 **PERMANENT USE LAND.** This basic category includes lands acquired in fee purchase, condemnation, donation, exchange or transfer, which is owned in fee by the Federal Government, and under custody and accountability of the Department of the Navy.

911 10 LAND – PURCHASE (AC)
FAC 9110
BFR Required N

91110-1 **PURCHASE.** Land acquired in fee by purchase is a negotiated sale of the property from private owners to the Federal Government by conveyance of deed.

911 20 LAND – DONATION (AC)
FAC 9110
BFR Required N

91120-1 **DONATION.** Land acquired in fee by donation usually consists of a conveyance of fee title by the donor without monetary consideration.

911 30 LAND – TRANSFER (AC)
FAC 9110
BFR Required N

911 40 LAND – CONDEMNATION (AC)
FAC 9110
BFR Required N

91140-1 **CONDEMNATION.** Land is acquired by condemnation where land is essential for a project which affects national defense or security, and the consideration for purchase cannot be mutually agreed upon between the owner and the Navy.

911 50 LAND – EXCHANGE (AC)
FAC 9110
BFR Required N

91150-1 **EXCHANGE.** Land acquired by exchange is similar in principle to acquisitions by purchase except that the consideration is by land value rather than cash. Land exchange may be negotiated at the Field Engineering Division level between the Navy and private owners after approval by the interested bureau or office and the Naval Facilities Engineering Command. For value exceeding $50,000, approval by the Congressional Armed Services Committees is required.

912 LAND - PUBLIC DOMAIN WITHDRAWAL

912-1 **GENERAL.** The Navy Department may acquire land by withdrawal from public domain under jurisdiction of the Department of the Interior. Withdrawals of less than 5,000 acres are made by Public Land Order. Withdrawal of more than 5,000 acres for any one project must be approved by Act of Congress. In addition to securing authorization from the Armed Services Committees of Congress, a bill must be introduced in the Committees on Public Land and Insular Affairs for acquisition of public domain lands in excess of 5,000 acres. Land withdrawn from public domain is coded as follows:

912 10 FEDERAL WITHDRAWN PUBLIC LAND-PERMANENT (AC)
FAC 9110
BFR Required N

91210-1 **GENERAL.** This category code involves Federal Government land permanently excluded from some or all forms of entry, use, sale, or other disposal under the public lands laws as specified in the public land order, executive order, or act of Congress and those lands that are reserved for a specified department or agency for a specific public purpose.

912 15 STATE OWNED LAND-HAWAII (AC)
FAC 9110
BFR Required N

91215-1 **GENERAL.** This category code includes Federal Government land reserved through land trust in the State of Hawaii.

912 20 FEDERAL WITHDRAWN PUBLIC LAND-TEMPORARY (AC)
FAC 9110
BFR Required N

91220-1 **GENERAL.** This category code involves Federal Government land permanently excluded from some or all forms of entry, use, sale, or other disposal under the public lands laws as specified in the public land order, executive order, or act of Congress and those lands that are reserved for a specified department or agency for a specific public purpose for a specified period of time.

913 LAND - LICENSE OR PERMIT (AC)

913-1 **GENERAL.** This category code does not include land acquired by a withdrawal from public domain.

913 10 LICENSED AND PERMITTED LAND (AC)
FAC 9110
BFR Required N

91310-1 **GENERAL.** This land is acquired for temporary use under license or permit. The license or permit is a privilege, revocable at will, to use the property of the licenser, for a specified purpose and period of time.

913 20 LAND – PUBLIC DOMAIN – TEMPORARY PERMIT (AC)
FAC 9110
BFR Required N

91320-1 **GENERAL.** Land from Public Domain used under temporary permit is obtained under agreement between the Navy Department, and the Department of the Interior. The temporary permit implies no use detrimental to the land such as contamination.

914 PUBLIC LAND - TERRITORIES AND POSSESSIONS

914-1 **GENERAL.** Land from U.S. possessions is acquired for temporary or long-term use by Executive Order or permit agreement for a limited specific use.

914 10 PUBLIC LAND OF TERRITORIES OR POSSESSIONS- TEMPORARY OR LONG-TERM (AC)
FAC 9110
BFR Required N

91410-1 **GENERAL.** This code is used for public land of U.S. possessions acquired and used under long-term agreements or temporary agreements.

914 20 PUBLIC LAND OF TERRITORIES OR POSSESSIONS (AC)
FAC 9110
BFR Required N

91420-1 **GENERAL.** This code is used to designate public land of U.S. possessions assigned to the Navy on temporary permit.

920 LAND OTHER RIGHTS

920-1 **GENERAL.** This category group includes easements, leases, and foreign rights.

921 LAND – EASEMENT

921-1 **GENERAL.** An easement is a conveyance of interest in real property for particular purposes and needs of the Navy. An easement is acquired by deed for a term of years or in perpetuity. The grantor of an easement may continue to use the land within the stipulations of the easement.

921 10 LAND EASEMENT – AVIATION - BY PURCHASE (AC)
FAC 9900
BFR Required N

92110-1 **GENERAL.** An aviation easement is purchased to convey certain property rights from the private owner to the Federal Government. This is done by conveyance of deed. Easements are acquired to insure free and unobstructed aircraft passage through the airspace. The easement provides the right to limit structure height and natural growth.

921 20 LAND EASEMENT- AVIATION - BY CONDEMNATION (AC)
FAC 9900
BFR Required N

92120-1 **GENERAL.** This code varies from 921 10 only in the method of acquisition. Possession is obtained by condemnation only when the purchase price cannot be mutually agreed upon between the owner and the Navy.

921 30 LAND EASEMENT - BY PURCHASE (AC)
FAC 9110
BFR Required N

92130-1 **GENERAL.** Easements other than for navigation are acquired by negotiated sale. These easements provide rights-of-way for typical utility lines and access roads as well as many other purposes, including restrictions on use.

921 40 LAND EASEMENT - BY CONDEMNATION (AC)
FAC 9110
BFR Required N

92140-1 **GENERAL.** This is similar to 921 30 but differs in that agreement on a negotiated easement cannot be reached, and the easement is obtained by condemnation for reason of national defense or security.

921 50 LAND - EASEMENT BY EXCHANGE (AC)
FAC 9110
BFR Required N

92150-1 **GENERAL.** This category code is similar to 92130, but differs in that consideration is land value in lieu of cash.

922 LAND - IN-LEASED

922-1 **GENERAL.** An in-lease is a conveyance of a possessory interest in real property for a term of years for rent or other consideration. Leased property is categorized under three groups as follows.

922 10 LAND - IN-LEASE - PRIVATE ENTERPRISE (AC)
FAC 9110
BFR Required N

92210-1 **GENERAL.** This land is leased from private owners for periods under 25 years.

922 20 LAND - IN-LEASE - STATE AND LOCAL GOVERNMENTS (AC)
FAC 9110
BFR Required N

92220-1 **GENERAL.** This land is leased from State and local governments for periods under 25 years.

922 30 LAND - IN-LEASE - LONG-TERM (AC)
FAC 9110
BFR Required N

92230-1 **GENERAL.** Land in-lease for 25 years or more is categorized as "long-term". The land may be leased from private enterprise, or State or local governments.

923 LAND - FOREIGN RIGHTS

923-1 **GENERAL.** This is land under custody and accountability of the Navy Department comprising a Navy installation in a foreign country except land under easement, Code 921. The method of acquisition or use of real property in a foreign country depends upon, and is accomplished by, diplomatic agreement and subsidiary military agreements or, where applicable, by lease or other agreement. Fee simple title to real property in a foreign country is not acquired. The extent of interest which may be acquired in such property depends upon the agreement. Acquisition or use of real property in an occupied country is accomplished by requisition or other local arrangements. The Navy codes for foreign rights are as follows:

923 10 LAND - FOREIGN, 99-YEAR LEASE
FAC 9110
BFR Required N

923 20 LAND - FOREIGN, BASE RIGHTS
FAC 9110
BFR Required N

923 30 LAND - FOREIGN RECIPROCAL AID
FAC 9110
BFR Required N

923 40 LAND - FOREIGN, OCCUPIED AREA
FAC 9110
BFR Required N

923 50 LAND - FOREIGN, IN-LEASE
FAC 9110
BFR Required N

923 60 LAND - FOREIGN, MISCELLANEOUS
FAC 9110
BFR Required N

931 BUILDINGS

932 STRUCTURE/UTILITY SITE IMPROVEMENTS

932-1 **GENERAL.** This code group is for site improvements which are not associated with a specific building or structure within its own category code such as clearing, grading, landscaping, erosion control, and similar. This group contains the following individual codes:

933 DEMOLITION

933-1 **GENERAL.** This group is for demolition of buildings, structures, or utilities and removal of debris performed primarily to make usable or disposable an otherwise unusable site. Demolition directly related to a construction project is assigned the same code as for the project.

990 LAND RIGHTS

990 02 WATER EASEMENT CLEARANCE, PERPETUAL (AC)
FAC 9900
BFR Required N

99002-1 **GENERAL.** This category code applies to non-possessory interest in waterways used for mitigating encroachment that can limit or restrict military training, testing, and operations.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
100					OPER & TRNG FAC		
110					AIRFIELD PAVEMENTS		
111					RUNWAYS		

Series 111 Category Codes include criteria for runways for fixed wing aircraft and runways or landing pads for rotary wing aircraft. Runways are prepared surfaces for the landing and takeoff of both fixed wing and rotary wing aircraft. Landing pads are prepared surfaces for the Vertical Takeoff and Landing (VTOL) of rotary wing aircraft (including V-22).

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
11110	1111	LS	[SY]	LF	RUNWAY / FW	Y	PREPARED SURFACES FOR THE LANDING AND TAKEOFF OF AIRCRAFT.
11112	1114	LS	[SY]	LF	RUNWAY/FIXED-WING-UNSURFAC	Y	RUNWAYS FOR ROTARY WING AIRCRAFT THAT DO NOT CONSIST OF A PAVEMENT OR HARDSTAND SURFACE.
11115	1112	LS	[SY]	LF	RUNWAY / ROTARY WING	Y	PREPARED SURFACES FOR THE LANDING AND TAKEOFF OF HELICOPTERS.
11120	1112	LS	[SY]		HELICOPTER LANDING PAD	Y	PREPARED AREA FOR THE HOVERING, VERTICAL TAKEOFF AND LANDING (VTOL) OF HELICOPTERS AND OTHER VTOL AIRCRAFT.
11125	1111	LS	[SY]		FW A/C (VTOL) LANDING PAD	Y	A LANDING/TAKEOFF PAD FOR VTOL AIRCRAFT SUCH AS THE HARRIER AND JOINT STRIKE FIGHTER.
11130	1113	LS	[SY]		RUNWAY OVERRUN - PAVED	Y	AREAS EXTENDING AT EACH END OF A RUNWAY. THE RUNWAY OVERRUN AREAS ARE REQUIRED TO REDUCE SERIOUS DAMAGE TO AN AIRCRAFT IN THE EVENT THAT THE AIRCRAFT RUNS OFF OF THE RUNWAY END DURING TAKEOFF OR LANDING.
112					TAXIWAYS		
11210	1121	LS	[SY]	LF	TAXIWAY	Y	TAXIWAYS ARE PAVED SURFACES ON WHICH AIRCRAFT, BOTH FIXED AND ROTARY WING, MOVE UNDER THEIR OWN POWER TO AND FROM LANDING, SERVICE AND PARKING AREAS.
113					APRONS		

All outdoor pavements used for parking aircraft, and for the loading, unloading and servicing of aircraft in addition to providing parking space.

124						OPERATING FUEL STORAGE		
125						POL PIPELINE		

This category is for pipelines and accessory equipment between tank farms and operating fuel storage facilities and intermediate points.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
12510	1251	LS		[LF]		POL PIPELINE MULTI SITES	N	TRANSFER PIPELINES USED FOR THE TRANSFER AND TRANSPORT OF PETROLEUM, OILS, LUBRICANTS AND FUELS BETWEEN SITES.
12516	1262	S		[GM]	EA	POL PIPELINE PUMP STA	N	PUMPING STATIONS AND ANCILLARY EQUIPMENT USED TO MOVE THE FUEL THROUGH THE PIPES. THIS FACILITY MAY ALSO INCLUDE CONTROLS, GAUGES, METER, LIGHTING, FIRE PROTECTION, AND VENTILATION.
12520	1459	S	[SF]		EA	SHLTR FOR PUMP STA	N	THIS IS USED FOR STRUCTURES HOUSING PUMPING STATIONS AND ANCILLARY EQUIPMENT.
12521	1252	LS		[LF]		POL PIPING-SINGLE SITE	N	POL PIPELINES USED FOR THE TRANSFER AND TRANSPORT OF PETROLEUM, OILS, LUBRICANTS AND FUELS WITHIN A SITE (EXCEPT THOSE WITHIN A MARINE OR AIRCRAFT FUELING FACILITY).
12530	1244	S		[GA]		SURGE STORAGE	N	A SURGE TANK IS USED WHERE THERE IS A RISK OF HYDRAULIC SHOCK. HYDRAULIC SHOCK CAN OCCUR WHEN THE PUMP USED TO DELIVER FUEL IS GREATER THAN THE PIPELINE CAPACITY; UNLOADING RATE OF THE DELIVERY TANKER/BARGE EXCEEDS THE RATE OF THE SHORE PUMPING SYSTEM; OR WATER, AIR OR OTHER BLOCKAGE OCCURS IN THE PIPELINE.
126						OTHER LIQUID FUELNG/DISPNG		

Category Code Report (All Series)

Use this Category Code for liquid fuel or petroleum products facilities not specifically related to aviation, marine craft, or ground vehicle fuel requirements (see Category Codes series 121, 122, and 123, respectively). Use Category Code 821 60 or 821 61 for heating plant fuel storage. This Category Code includes fuel loading and unloading; drum storage, loading and maintenance; and miscellaneous fuel storage (i.e., heating fuel, kerosene, propane, fuel oil, etc.). See Category Code series 411 for depot level storage.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
12610	1261	S		[OL]	EA	DRUM AND CAN LDING FACY	Y	A DRUM AND CAN LOADING FACILITY IS A FUEL FACILITY EQUIPPED TO FILL DRUMS WITH FUEL OIL, DIESEL, KEROSENE, JET ENGINE FUEL, MOTOR GASOLINE, AVIATION GASOLINE, AND LUBRICATING OILS. THE FACILITY MAY ALSO BE PROVIDED WITH A DRUM RECONDITIONING PLANT.
12615	1244	S		[GA]		PETROLEUM RDY FUEL STOR FA	Y	THIS CATEGORY SHALL BE USED FOR THE STORAGE OF PETROLEUM PRODUCTS USED TO FILL DRUMS AS PROVIDED IN CATEGORY CODE 126 10, HEATING OIL TANKS (SEE CATEGORY CODE 821-60 OR 61 FOR HEATING PLANT FUEL STORAGE), LUBE OIL TANKS, GREASE, PROPANE TANKS, OR FUEL STORAGE TANKS FOR GENERATORS AND OTHER EQUIPMENT.
12630	1261	S		[OL]		TANK TRUCK/CAR LOAD FAC	Y	A TANK TRUCK LOADING FACILITY (EITHER A TRUCK FILL STAND OR STANDS) DISPENSE FUELS OTHER THAN AIRCRAFT FUELS TO DELIVERY TRUCKS. EACH STAND HAS ONE DUAL OUTLET, A METER, STATIC LINE, PLATFORM, ROADWAY, STRAINER AND NECESSARY VALVES, PIPING, PUMP, AND ELECTRICAL CONTROLS
12640	1261	S		[OL]		TANK TRUCK/CAR UNLOAD FAC	Y	A TANK CAR UNLOADING FACILITY UNLOADS LIQUID PRODUCTS FROM TANK CARS. EACH FACILITY HAS STATIC LINES, STRAINER, ACCESS ROAD, SECURITY FENCING, LIGHTING, NECESSARY VALVES, PIPING, PUMP, ELECTRICAL CONTROLS, AND A SHELTER STRUCTURE FOR USE OF ACCOUNTING AND/OR CONTROL HOUSE.

130 COMMS/NAV AIDS & AFLD LTNG

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
131						COMMUNICATIONS - BUILDINGS		

This group of Shore Facilities supports the reception, processing, distribution, and/or transmission of classified and unclassified voice, data, and video communications in support of the Department of Navy operational missions.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
13110	1311	B	[SF]			CABLE HOUSE	Y	A CABLE HOUSE IS AN UNMANNED FACILITY THAT FUNCTIONS EITHER AS AN EXTERNAL JUNCTION POINT FOR COAXIAL CABLES, OR AS MECHANICAL SPACE FOR SUPPORT EQUIPMENT ASSOCIATED WITH EXTREMELY LOW FREQUENCY (ELF) AND VERY LOW FREQUENCY (VLF) ANTENNAS.
13115	1311	B	[SF]			COMM, INFO, OR INTEL FAC	Y	COMMUNICATIONS, INFORMATION, OR INTELLIGENCE FACILITIES ARE RESPONSIBLE FOR INFORMATION PROCESSING, DELIVERY OF INFORMATION SERVICES, AND INFORMATION/DATA STORAGE. THESE ULTIMATELY SUPPORT THE JOINT INFORMATION ENVIRONMENT (JIE). THE JIE IDENTIFIES SEVERAL DIFFERENT TYPES OF FUNCTIONAL NODES: COMPUTING NODES (E.G. DATA CENTERS), COMMUNICATION NODES (E.G. NETWORK GATEWAYS), AND OPERATIONS NODES (E.G. ENTERPRISE OPERATION CENTERS). THESE NODES SHOULD BE VIEWED AS FUNCTIONAL ENCLAVES, NOT SEPARATE FACILITIES; IN FACT, MULTIPLE NODES AND NODE TYPES MAY BE PRESENT IN A SINGLE PHYSICAL FACILITY.
13120	1311	B	[SF]			COMMS RELAY BLDG	Y	A COMMUNICATIONS RELAY FACILITY IS AN UNMANNED FACILITY OR ENCLOSURE ASSOCIATED WITH THE OPERATION OF MICROWAVE (MW) COMMUNICATIONS SYSTEMS. IT CONTAINS RACK MOUNTED COMMUNICATIONS RECEIVING, AMPLIFICATION, AND TRANSMITTING EQUIPMENT, ALONG WITH AN UNINTERRUPTIBLE POWER SOURCE (UPS) AND AN EMERGENCY GENERATOR.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
13122	1311	B	[SF]			VHF/UHF COMMS FAC	Y	A VHF/UHF COMMUNICATIONS FACILITY CAN EITHER BE CONTAINED WITHIN A PERMANENT FACILITY OR WITHIN CLASS III PROPERTY. IT CONTAINS A LIMITED AMOUNT OF RACK MOUNTED COMMUNICATIONS RECEIVING, AMPLIFICATION, AND TRANSMITTING EQUIPMENT ASSOCIATED WITH AIRFIELD OPERATIONS, SECURITY AND FIRE OPERATIONS, OR AN TACTICAL COMMUNICATIONS SYSTEM INTEGRAL TO UNIQUE SPECIAL OPERATIONS.
13124	1312	B	[SF]			SAT COMMS FAC	Y	A SATELLITE COMS FACILITY IS OFTEN REFERRED TO AS A `GATEWAY FACILITY¿ SUPPORTING WORLDWIDE, REGIONAL, AND AREA OF RESPONSIBILITY (AOR) COMS. IT CONTAINS DIVISION LEVEL OFFICE AND SUPPORT REQUIREMENTS, EQUIPMENT AND OPERATIONAL AREAS, MAINTENANCE AND TRAINING AREAS, AND LIMITED STORAGE AREAS FOR READY-TO-ISSUE COMS SYSTEMS AND SUBSYSTEMS REQUIRED FOR INCOMING AND OUTGOING COMS TRAFFIC.
13125	1311	B	[SF]			TELEMETRY BUILDING	Y	A TELEMETRY BUILDING IS AN EXTREMELY SPECIALIZED AND UNIQUE FACILITY SPECIFICALLY DESIGNED FOR THE TRACKING OF MISSILES AND SATELLITES.
13130	1311	B	[SF]			HELIX HOUSE	Y	A HELIX HOUSE CONTAINS A HELICAL COIL AND ASSOCIATED ANTENNA TUNING DEVICES DIRECTLY ASSOCIATED WITH, AND INTEGRAL TO, THE TRANSMISSION OF LOW FREQUENCY (LF), VERY LOW FREQUENCY (VLF), AND EXTREMELY LOW FREQUENCY (ELF) COMMUNICATIONS.
13135	1311	B	[SF]			RECEIVER BUILDING	Y	A RECEIVER BUILDING SUPPORTS A 24 HOUR A DAY, 7 DAY A WEEK OPERATIONAL REQUIREMENT FOR SHORE TO SHORE AND SHIP TO SHORE ADMINISTRATIVE, TACTICAL, AND STRATEGIC HIGH FREQUENCY (HF) COMMUNICATIONS.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
13140	1311	B	[SF]			TELEPHONE EXCHANGE BLDG	Y	A TELEPHONE EXCHANGE BUILDING CAN SUPPORT WORLDWIDE, REGIONAL AND AREA COMMUNICATIONS FOR A NAVAL SHORE ACTIVITY. THE TELEPHONE EXCHANGE BUILDING CAN CONTAIN THE TELEPHONE SWITCH, MAIN DISTRIBUTION FRAME, INTERMEDIATE DISTRIBUTION FRAME, STAFF SUPPORT SPACES, OPERATORS WORK POSITIONS, MAINTENANCE AND STORAGE SPACES, AND IS SUPPORTED BY UPS AND EMERGENCY GENERATORS.
13142	1311	B	[SF]			AUTO COMMS SWITCH CNTR	Y	AN AUTOMATIC-COMMUNICATIONS SWITCHING-CENTER IDENTIFIES A FACILITY THAT CONTAINS THE TELEPHONE SWITCH AND ITS IMMEDIATE SUPPORT INFRASTRUCTURE. ALTHOUGH IT IS POSSIBLE THAT SOME ISOLATED EXAMPLES OF THIS CONFIGURATION MAY STILL EXIST, THE CURRENT COMMUNICATIONS ARCHITECTURE FOR THIS EQUIPMENT PLACES IT WITHIN A TELEPHONE EXCHANGE BUILDING
13145	1311	B	[SF]			TERMINAL EQUIPMENT BLDG	Y	THIS FACILITY ORIGINALLY, AND CURRENTLY TO A MINOR EXTENT, PERFORMS AS A SINGLE-FUNCTION BUILDING THAT IS IN DIRECT SUPPORT OF HIGH FREQUENCY (HF) OR LOW FREQUENCY (LF) COMMUNICATIONS. IT PROVIDES AN INTERMEDIATE CONNECTION POINT THAT IS REQUIRED TECHNICALLY TO SUPPORT COMMUNICATIONS CONFIGURATION, OR IS REQUIRED AS THE RESULT OF WAVEGUIDE OR CABLE LOSS.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
13150	1311	B	[SF]			TRANSMITTER BUILDING	Y	A TRANSMITTER BUILDING SUPPORTS A 24 HOUR A DAY, 7 DAY A WEEK OPERATIONAL REQUIREMENT FOR SHORE TO SHORE AND SHORE TO SHIP ADMIN, TACTICAL, AND STRATEGIC HIGH FREQUENCY (HF), LOW FREQUENCY (LF), VERY LOW FREQUENCY (VLF) AND EXTREMELY LOW FREQUENCY (ELF) COMS. A SMALL PERSONNEL SUPPORT SPACE CONTAINING A TOILET FACILITY AND BREAK AREA IS CONSIDERED PART OF THE FACILITY.
13155	1311	B	[SF]			CIRC DISP ANT ARRAY BLDG	N	A CIRCULARLY DISPOSED ANTENNA ARRAY (CDAA) BUILDING IS A HIGH FREQUENCY DIRECTION FINDING (HFDF) FACILITY THAT CONTAINS THE TUNING AND RECEIVING EQUIPMENT ASSOCIATED WITH THE AN/FRD-10 ANTENNA.
13156	1311	B	[SF]			DIRECTION FINDER BUILDING	N	A DIRECTION FINDER BUILDING IS A HIGH FREQUENCY DIRECTION FINDING (HFDF) FACILITY THAT CONTAINS THE TUNING AND RECEIVING EQUIPMENT ASSOCIATED WITH THE AN/FRD-13 ANTENNAS. IT IS ASSOCIATED WITH FUNCTIONS PERFORMED BY VARIOUS DON COMMUNICATIONS, INTELLIGENCE, AND OPERATIONAL MISSIONS.
13160	1311	B	[SF]			MIL AFFIL RADIO STA (MARS)	N	THE MILITARY AFFILIATE RADIO SYSTEM IS PART OF NAVY TELECOMMUNICATIONS COMPLEX. SIZE OF THE STATION VARIES WITH THE TYPE OF OPERATIONS AND EQUIPMENT USED. AS A GENERAL RULE, THE SPACE FOR A MARS STATION IS PROVIDED WITHIN EXISTING NAVY FACILITIES AND NO SPECIFIC PROJECTS SHOULD BE PLANNED. THIS CODE IS MAINLY INTENDED FOR INVENTORY PURPOSES.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION

This facility group encompasses radio antennas, switching stations and public address systems. The antennas required are a function of the number and type of radio circuits to be incorporated in the communications system.

13210	1321	S		[EA]		ANTENNA - COMMUNICATIONS	N	THIS FACILITY GROUP ENCOMPASSES RADIO ANTENNAS, SWITCHING STATIONS AND PUBLIC ADDRESS SYSTEMS. THE ANTENNAS REQUIRED ARE A FUNCTION OF THE NUMBER AND TYPE OF RADIO CIRCUITS TO BE INCORPORATED IN THE COMMUNICATIONS SYSTEM.
13250	1321	S		[EA]		P/A SYSTEM OUTDOOR	N	OUTDOOR PUBLIC ADDRESS SYSTEMS (GIANT VOICE) WILL BE PLANNED AND INSTALLED TO MEET INDIVIDUAL NEEDS OF A FACILITY
13255	1321	S		[EA]		CIRC DISP ANT ARRAY	N	THIS ANTENNA ARRAY IS GENERALLY PLANNED IN CONJUNCTION WITH A CIRCULARLY DISPOSED ANTENNA ARRAY BUILDING. SEE CATEGORY CODE 131 55 FOR ADDITIONAL GUIDANCE.

133						NAV & TRAFFIC AIDS - BLDGS		

Basic Category Code group 133 applies to those Air Traffic Control Facilities (ATCFs) that contain the equipment, devices, and personnel responsible for air traffic control and navigational aids. This group discusses complete air traffic control classes and systems, which are defined below. Other elements of air traffic control and navigation aids that are remotely located around the airfield can be found in the 133, 134 and 135 series of Category Codes.

13315	1331	B	[SF]			RAWIN BUILDING	Y	A RAWIN BUILDING (RADAR WIND SOUNDING) IS A SPECIALIZED WEATHER REPORTING FACILITY. IT HOUSES TRACKING EQUIPMENT USED IN CONJUNCTION WITH BALLOONBORNE RADIOSONDE TRANSMITTERS.
13320	1331	B	[SF]			VHF OMNI-DIR RNG (VOR) FAC	Y	THE VERY HIGH FREQUENCY (VHF) OMNI-DIRECTIONAL RANGE (VOR) BUILDING HOUSES A VHF, FIXED GROUND-BASED STATION WHICH CONTINUOUSLY TRANSMITS BEARING, IDENTIFICATION, AND WITH PROPER EQUIPMENT, DISTANCE INFORMATION TO PROPERLY EQUIPPED AIRCRAFT.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
13325	1331	B	[SF]			TACAN BUILDING	Y	THE TACTICAL AIR NAVIGATION (TACAN) BUILDING HOUSES UHF GROUND-BASED STATION WHICH TRANSMITS BEARING, IDENTIFICATION, AND DISTANCE INFORMATION TO PROPERLY EQUIPPED AIRCRAFT. THE TACAN IS PRIMARILY A MILITARY SHORT-RANGE 322 KM (200 MILE) NAVIGATIONAL AID THAT IS GENERALLY PLANNED FOR EACH NAVY AND MARINE CORPS AIR STATION.
13330	1331	B	[SF]			VHF RNG TACAN FACILITY	Y	THE VERY HIGH FREQUENCY (VHF) OMNI-DIRECTIONAL RANGE/TACTICAL AIR NAVIGATION (VORTAC) BUILDING HOUSES VHF/UHF FIXED GROUND-BASED STATION THAT CONTINUOUSLY TRANSMITS BEARING, IDENTIFICATION, AND DISTANCE INFORMATION TO PROPERLY EQUIPPED AIRCRAFT WHEN DISTANCE MEASURING EQUIPMENT (DME) IS INSTALLED.
13335	1331	B	[SF]			NDB FACILITY	Y	THIS NON-DIRECTIONAL BEACON (NDB) FACILITY IS AN UNATTENDED FACILITY WHICH HOUSES ELECTRIC EQUIPMENT (RADIO BEACON) USED TO TRANSMIT A NON-DIRECTIONAL RADIO SIGNAL PATTERN TO AIRCRAFT EQUIPPED WITH AUTOMATIC RADIO DIRECTION AND FINDING (ADF) EQUIPMENT.
13365	1331	B	[SF]			AIR NAVIGATION BUILDING	Y	AN AIR NAVIGATION BUILDING IS A SPECIALIZED FACILITY FOR PROVIDING A READILY AVAILABLE SOURCE OF OPERATIONAL AND AERONAUTICAL INTELLIGENCE INFORMATION; STORAGE AND ISSUE OF AERONAUTICAL MAPS AND CHARTS; AND SECURE STORAGE OF CLASSIFIED MATERIAL UP TO TOP SECRET DOCUMENTS.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
13371	1331	B	[SF]			RATCF FACILITY	Y	THE RADAR AIR TRAFFIC CONTROL FACILITY (RATCF) PROVIDES HOUSING FOR EQUIPMENT AND PERSONNEL TO SUPPORT INSTRUMENT FLIGHT RULES (IFR) CONTROL OF AIRCRAFT ON APPROACH TO OR DEPARTURE FROM THE TERMINAL RADAR FACILITY OR AIRPORT. OTHER FUNCTIONS INCLUDE PRECISION APPROACH RADAR (PAR) FOR LANDING AIRCRAFT DURING INCLEMENT WEATHER AND LIMITED VISIBILITY.
13372	1331	B	[SF]			MTRACON	Y	A MILITARY TERMINAL RADAR APPROACH CONTROL (MTRACON) FACILITY IS USED TO CONTROL AIR TRAFFIC TO PROVIDE SAFE, EXPEDITIOUS, AND ORDERLY MOVEMENT OF AIRCRAFT UNDER ALL WEATHER CONDITIONS. JUSTIFICATION FOR A MTRACON IS ESTABLISHED BY THE CHIEF OF NAVAL OPERATIONS.
13373	1331	B	[SF]			FACSFAC	Y	THE FLEET AREA CONTROL SURVEILLANCE FACILITY (FACSFAC) BUILDING HOUSES THE FACSFAC TRACKING SYSTEM (FACTS) AND NAVY TACTICAL DATA SYSTEM/ADVANCED COMBAT DIRECTION SYSTEM (NTDS/ACDS) EQUIPMENT AND PERSONNEL TO PROVIDE A VARIETY OF SERVICES TO AIR, SURFACE AND SUBSURFACE UNITS.
13374	1331	B	[SF]			JCF FACILITY	Y	THE JOINT CONTROL FACILITY (JCF) IS AN AIR TRAFFIC CONTROL FACILITY, A RADAR AIR TRAFFIC CONTROL FACILITY (RATCF), AND A RANGE OPERATIONS CENTER (ROC) UNDER ONE ROOF.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
13375	1331	B	[SF]			AIR SURVEILLANCE RADAR FAC	Y	THE AIR SURVEILLANCE RADAR (ASR) FACILITY IS AN UNATTENDED FACILITY WHICH SERVES AS A MAJOR COMPONENT OF THE RADAR AIR TRAFFIC CONTROL FACILITY (RATCF); THE MILITARY TERMINAL APPROACH CONTROL FACILITY (MTRACON); AND THE JOINT CONTROL FACILITY (JCF). IT PROVIDES DETECTION AND IDENTIFICATION FOR CONTROL OF AIRCRAFT OPERATING IN A LINE-OF-SIGHT RANGE AND ALTITUDES DETERMINED BY SYSTEM DESIGN.
13376	1331	B	[SF]			ARSR FACILITY	Y	THE AIR ROUTE SURVEILLANCE RADAR (ARSR) FACILITY HOUSES THE ELECTRONIC LONG RANGE RADAR SYSTEM USED TO OBTAIN THE RANGE AND AZIMUTH OF AN AIRCRAFT.
13380	1331	B	[SF]			WHEELS WATCH SHELTER	Y	A PORTABLE WHEELS WATCH BOOTH IS PROVIDED WITH THE RUNWAY WHEELS-UP/WAVE-OFF LIGHTING SYSTEM, CATEGORY CODE 136 45. THE SHELTER IS LOCATED APPROXIMATELY 302 METERS (990 FEET) SHORT OF THE RUNWAY THRESHOLD NEAR THE WHEELS-UP/WAVE-OFF LIGHTING SYSTEM. THE FACILITY MAY BE EITHER A TRAILER OR TRUCK.
134						NAV & TRAFFIC AIDS - OTHER		

Basic Category Code group 134 applies to structures which function as aircraft navigation/ traffic aids.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
13410	1341	S		[EA]		ANTENNA - NAVIGATION	N	AN ANTENNA SYSTEM FOR NAVIGATION AID WILL VARY WITH THE TYPE AND PURPOSE OF THE NAVIGATIONAL AID. THIS CATEGORY CODE SHALL BE USED TO INDICATE ENTIRE ANTENNA SYSTEMS.
13420	1341	S		[EA]		AP/HP BEACON	N	AN AIRPORT AND/OR HELIPORT BEACON IS AN INTERNATIONALLY RECOGNIZED ROTATING OR FLASHING ILLUMINATED BEACON OPERATED AS A VISUAL AID TO AIR NAVIGATION TO ASSIST AIRCREWS IN LOCATING AND IDENTIFYING AIRPORTS AND/OR HELIPORTS.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
13440	1341	S		[EA]		GROUND CONTROL APPR SYST	Y	A GROUND CONTROL APPROACH (GCA) SYSTEM IS A RADAR APPROACH SYSTEM OPERATED FROM THE GROUND BY AIR TRAFFIC CONTROL PERSONNEL TRANSMITTING INSTRUCTIONS TO THE PILOT BY RADIO.
13441	1341	S			[EA]	PREC APPR RADAR	Y	THE PRECISION APPROACH RADAR (PAR) IS AN UNATTENDED SELF-CONTAINED RADAR SYSTEM. THE PAR DETECTS AZIMUTH, ELEVATION, AND RANGE INFORMATION OF AIRCRAFT ON FINAL LANDING APPROACH TO PAR INSTRUMENTED RUNWAYS. THE INFORMATION IS DISPLAYED IN THE MILITARY TERMINAL RADAR APPROACH CONTROL (MTRACON) FACILITY.
13442	1341	S			[EA]	PREC APPR LAND SYS	Y	THE PRECISION APPROACH LANDING SYSTEM (PALS) IS AN UNATTENDED, SELF-CONTAINED RADAR SYSTEM. THE PALS DETECTS AZIMUTH, ELEVATION, AND RANGE INFORMATION OF AIRCRAFT ON FINAL APPROACH TO PALS INSTRUMENTED RUNWAYS.
13443	1341	S			[EA]	INSTR LAND SYS	Y	THE INSTRUMENT LANDING SYSTEM (ILS) PROVIDES AZIMUTH, DISTANCE, ELEVATION, AND GLIDE PATH POSITION TO AIRCRAFT ON A PRECISION APPROACH TO THE ILS INSTRUMENTED RUNWAY. THE ILS OPERATES IN THE VHF AND UHF RADIO BANDS.
13444	1341	S			[EA]	MICROW LAND SYS	Y	THE MICROWAVE LANDING SYSTEM (MLS) PROVIDES AZIMUTH, DISTANCE, ELEVATION, AND GLIDE PATH POSITION TO AIRCRAFT ON A PRECISION APPROACH TO THE MLS INSTRUMENTED RUNWAY. THE MLS OPERATES IN A NARROW BAND MICROWAVE FREQUENCY.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
13445	1341	S			[EA]	SHORE AUTOM CARR LAND SYS	Y	THE SHORE-BASED AUTOMATIC CARRIER LANDING SYSTEM (ACLS) IS AN UNATTENDED, SELF-CONTAINED RADAR SYSTEM. THE ACLS CONSISTS OF PRECISION TRACKING RADAR COUPLED TO A COMPUTER DATA LINK TO PROVIDE CONTINUOUS INFORMATION TO THE AIRCRAFT, MONITORING CAPABILITY TO THE PILOT, AND A BACKUP APPROACH SYSTEM.
13450	1341	S		[EA]		OBSTRUCTION LTG / MARKINGS	N	OBSTRUCTION LIGHTING PROVIDES VISUAL IDENTIFICATION OF OBJECTS AT NIGHT, OR IN SOME CASES IN DAY TIMES, THAT ARE POTENTIALLY HAZARDOUS TO AIR NAVIGATION.
13455	1341	S		[EA]		VISUAL APPR SLOPE INDICTR	N	THE VISUAL APPROACH SLOPE INDICATOR (VASI) SYSTEM IS AN UNATTENDED SYSTEM THAT PROVIDES VISUAL GLIDE SLOPE GUIDANCE TO PILOTS OF AIRCRAFT DURING THE FINAL LANDING APPROACH. THE VASI IS HELPFUL DURING DAY AND NIGHT OPERATIONS AND FOR VISUAL FLIGHT RULES (VFR) AND INSTRUMENT FLIGHT RULES (IFR) OPERATIONS.
13456	1341	S			[EA]	PREC APPR PATH IND SYS	Y	THE PRECISION APPROACH PATH INDICATOR (PAPI) SYSTEM IS AN UNATTENDED SYSTEM WHICH PROVIDES VISUAL GLIDE SLOPE GUIDANCE TO PILOTS OF AIRCRAFT DURING THE FINAL LANDING APPROACH. THE PAPI SYSTEM PROVIDES THIS INFORMATION DURING THE DAY AND NIGHT FOR VISUAL FLIGHT RULES (VFR) AND INSTRUMENT FLIGHT RULES (IFR) OPERATIONS AS LOW AS CATEGORY I CONDITIONS.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
13460	1341	S		[EA]		OPT LANDING AIDS	N	OPTICAL LANDING AIDS PROVIDE THE PILOT APPROACHING FOR A LANDING WITH A VISUAL SIGNAL TO ASSIST IN INTERCEPTING AND MAINTAINING THE CORRECT APPROACH GLIDE SLOPE. THE OLA IS A REQUIRED VISUAL AID FOR LANDINGS ON AIRCRAFT CARRIERS, BUT ON SHORE-BASED AIRFIELDS THE OLA IS PRIMARILY AN AID FOR TRAINING OR PRACTICE. THE OLA MAY BE USED DURING DAY OR NIGHT OPERATIONS AND IN ALL WEATHER CONDITIONS.
13462	1341	S		[EA]		WIND DIRECTION INDICATOR	N	A WIND DIRECTION INDICATOR PROVIDES VISUAL INFORMATION OF THE SURFACE WIND DIRECTION AND GENERAL INDICATION OF THE WIND SPEED TO THE AIRCREW. THIS WIND INFORMATION IS MOST USEFUL DURING TAKEOFF, FOR ORIENTATION TO MAKE AN APPROACH, AND IN THE FINAL PHASE OF APPROACH PRIOR TO TOUCHDOWN.
13464	1341	S		[EA]		RUNWAY DISTANCE MARKERS	N	THE PURPOSE OF RUNWAY DISTANCE MARKERS IS TO INDICATE TO AIRCREWS THE DISTANCE REMAINING TO THE END OF THE RUNWAY DURING TAKEOFF AND LANDING. THE RDM PROVIDE THIS INFORMATION FOR DAY AND NIGHT OPERATIONS IN ALL WEATHER CONDITIONS. THE RDM SHOULD BE PROVIDED FOR ALL RUNWAYS WHERE FIXED WING JET AIRCRAFT OPS ARE CONDUCTED AND ARE RECOMMENDED FOR RUNWAYS INTENDED FOR OPS OF PROPELLER TYPE AIRCRAFT.
13466	1341	S		[EA]		VOR/TACAN CHK SIGN	N	A VOR/TACAN CHECK SIGN PROVIDES INFORMATION FOR THE PILOT WHEN VERIFYING THE OPERATION OF THE NAVIGATIONAL AID IN THE AIRCRAFT BEFORE TAKING OFF. THIS CHECK SIGN IS A VISUAL IDENTIFICATION MARKER ERECTED IN THE AREA ADJACENT TO THE AIRCRAFT HOLDING POINT AT THE TAXIWAY ACCESS TO RUNWAY ENDS.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
13470	1341	S		[EA]		RADAR TOWER	N	RADAR TOWERS ARE TOWERS HOSTING VARIOUS RADAR SYSTEMS AND MUST BE PLANNED ON AN INDIVIDUAL BASIS.
13471	1341	S		[EA]		AVIATION METEORLOGICAL FAC	N	WEATHER FORECASTING FACILITY THAT SUPPORTS AIR OPERATIONS.

135 COMM & CONTROL LINES

Communication lines provide circuits between the various activities on or off the station.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
13510	1351	LS		[MI]		COMM LINES EXCL TELEPHONE	N	COMMUNICATION LINES PROVIDE CIRCUITS BETWEEN THE VARIOUS ACTIVITIES ON OR OFF THE STATION. THE COMMUNICATIONS NET MAY INCLUDE TRUNK LINE SERVICE CABLE, FEEDER LINES, AND DIRECT CIRCUITS DEPENDING ON THE COMPLEXITY OF THE SYSTEM.
13520	1351	LS		[MI]		TELEPHONE LINES	N	COMMUNICATION LINES, TO INCLUDE OVERHEAD, UNDERGROUND, AND MARINE CABLES AND LINES.

136 AIRFIELD PAVEMENT LIGHTING

Airfield pavement lighting includes facilities for lighting all airfield pavements and approaches including airfield Visual Landing Aids for approaches, landings, takeoffs, taxiing, and surface maneuvering of aircraft on Navy and Marine Corps airfields. The visual landing aids include lighting and markings.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
13610	1361	S		[LF]		APPROACH LIGHTING	N	APPROACH LIGHTING ENHANCES THE AIRCREW¿S ABILITY TO ACQUIRE THE RUNWAY ENVIRONMENT VISUALLY WHEN MAKING AN APPROACH FOR LANDING DURING PERIODS OF REDUCED VISIBILITY. VISUAL CUES FOR DIRECTIONAL AND ROLL GUIDANCE ARE PROVIDED TO THE AIRCREW FOR OPERATIONS AT NIGHT AND IN MARGINAL WEATHER CONDITIONS BY DAY. THE SYSTEM INCLUDES BOTH APPROACH LIGHTS AND SEQUENCED FLASHERS.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
13620	1361	S		[LF]		APRON & PKG APRN LIGHTING	N	APRON AND PARKING AREA LIGHTING ENABLES THE AIRCREW TO GUIDE THEIR AIRCRAFT INTO POSITION FOR LOADING, SERVICING, OR PARKING AND PROVIDES ILLUMINATION TO PERFORM SUCH FUNCTIONS AS FUELING, MAINTENANCE, LOADING, UNLOADING, AND SECURITY.
13630	1361	S		[LF]		RUNWAY EDGE LIGHTING	N	THIS CATEGORY CODE INCLUDES TWO GROUPS OF LIGHTS, RUNWAY EDGE LIGHTS, WHICH DEFINE THE LATERAL LIMITS OF THE PAVEMENT, AND CIRCLING GUIDANCE LIGHTS (CGLS), WHICH ENABLE AN AIRBORNE AIRCREW TO LOCATE THE RUNWAY WHILE OFF TO THE SIDE OF THE RUNWAY, AND ESTABLISH THE PROPER TRAFFIC PATTERN.
13635	1361	S		[LF]		RUNWAY CENTERLINE LIGHTING	N	RUNWAY CENTERLINE LIGHTING PROVIDES VISUAL AID TO ASSIST THE AIRCREW IN KEEPING THE AIRCRAFT CENTERED ON THE RUNWAY DURING TAKE-OFF AND AFTER LANDING AT NIGHT OR IN CONDITION OF REDUCED VISIBILITY. IT IS A SUPPLEMENT TO RUNWAY EDGE LIGHTING AND MARKINGS AND CIRCLING GUIDANCE LIGHTING, CATEGORY CODE 136 30.
13636	1362	S		[EA]		SIMULATE CARRIER DECK LTG	Y	A SIMULATED CARRIER DECK IS USED TO TRAIN PILOTS ASHORE FOR LANDING AIRCRAFT UNDER SIMULATED CONDITIONS OF A CARRIER AT SEA. SIMULATED CARRIER DECK LIGHTING AND MARKINGS PERMITS TRAINING DURING THE DAY, NIGHT, AND ADVERSE VISIBILITY CONDITIONS.
13645	1362	S		[EA]		WHEELS UP / WAVE OFF LTG	N	WHEELS-UP AND WAVE-OFF LIGHTS ARE PROVIDED TO ALLOW EITHER THE WHEEL WATCH, THE LANDING SIGNAL OFFICER (LSO), OR CONTROL TOWER PERSONNEL TO DETERMINE IF A LANDING AIRCRAFT HAS ITS LANDING GEAR FULLY EXTENDED AND/OR TO SIGNAL TO AN AIRCREW TO ABORT OR ¿WAVE-OFF¿ A LANDING ATTEMPT.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
13650	1361	S		[LF]		TAXIWAY LIGHTING	N	TAXIWAY LIGHTING AND MARKINGS DEFINE THE LATERAL LIMITS AND DIRECTION OF A TAXIWAY, CATEGORY CODE 112-10, TO GUIDE AIRCRAFT MOVEMENT BETWEEN THE RUNWAY OPERATIONAL AREA AND THE AIRCRAFT PARKING AREA DURING NIGHT OPERATIONS OR CONDITIONS OF POOR VISIBILITY.
13655	1362	S		[EA]		TOUCHDOWN ZONE LIGHTING	N	TOUCHDOWN ZONE LIGHTING DELINEATES THE TOUCHDOWN ZONE AND PROVIDES DIRECTIONAL AND ROLL GUIDANCE FOR AIRCRAFT APPROACHING THE THRESHOLD. IT PROVIDES VISUAL CUES FOR MORE ACCURATELY CENTERING THE AIRCRAFT ON THE RUNWAY, ADJUSTING ATTITUDE FOR TOUCHDOWN, AND DETERMINING THE TOUCHDOWN POSITION. THE LIGHTING CONSISTS OF BARS OF WHITE LIGHTS IN THE PAVEMENT ON EACH SIDE OF THE RUNWAY CENTERLINE.
13660	1362	S		[EA]		THRESHOLD LIGHTING	N	THRESHOLD LIGHTING IS A SYSTEM OF LIGHTS DEFINING THE ENDS OF THE USABLE RUNWAY SURFACE. THEY INCLUDE THRESHOLD LIGHTS, DISPLACED THRESHOLD LIGHTS, RUNWAY END IDENTIFICATION LIGHTS (REIL) AND RUNWAY END LIGHTS. THE THRESHOLD LIGHTS ARE DISPLACED FROM THE EXTREMITY OF THE RUNWAY WHEN A PORTION IS UNAVAILABLE FOR NORMAL OPERATIONS
13665	1361	S		[LF]		HELIPORT LIGHTING	N	HELIPORT LIGHTING IS A SYSTEM OF LIGHTS ARRANGED TO CLEARLY DEFINE THE HELICOPTER LANDING PAD FOR OPERATIONS AT NIGHT AND DURING PERIODS OF POOR VISIBILITY. HELIPORT LIGHTING INCLUDES ALL VISUAL REFERENCE ASPECTS OF THE APPROACH AND LANDING OF ROTARY WING AIRCRAFT. THIS INCLUDES VISUAL AIDS, MARKINGS, PERIMETER AND APPROACH LIGHTS, AND RUNWAY AND TAXIWAY LIGHTS.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION

All buildings, which are non-ship related, used for housing operational types of activities and equipment

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
14111	1412	B	[SF]			AIR PASSENGER TERMINAL	Y	THE AIR PASSENGER TERMINAL PROVIDES FACILITIES FOR PROCESSING AUTHORIZED PASSENGERS AND THEIR BAGGAGE AND FOR PROCESSING INCIDENTAL FREIGHT. SPACE IS PROVIDED IN THE TERMINAL FOR THE FOLLOWING FUNCTIONAL AREAS: ADMINISTRATIVE SPACE, BAGGAGE CLAIM ROOM, CHECK-IN COUNTER, MINOR FREIGHT STORAGE, INFORMATION COUNTER, AND WAITING LOUNGE WITH FOOD CONCESSIONS.
14112	1412	B	[SF]			AIR CARGO TERMINAL	Y	AN AIR CARGO TERMINAL IS PLANNED FOR AIR STATIONS WHERE CARGO AND FREIGHT HANDLING EXCEEDS 10,000 POUNDS PER DAY. THE AIR CARGO TERMINAL IS SEPARATE FROM THE AIR PASSENGER TERMINAL WHERE ONLY INCIDENTAL FREIGHT IS HANDLED. AIR CARGO TERMINAL FUNCTIONS INCLUDE RECEIPT OF PACKAGES, CONTROL DOCUMENTATION, PALLETIZATION, HOLDING FOR SHIPMENT, AIRCRAFT LOADING AND UNLOADING.
14113	1412	B	[SF]			COURIER STATION	Y	THIS FACILITY IS USED TO STORE AND DISSEMINATE CLASSIFIED MATERIAL FOR MISSION PLANNING, PILOT TRAINING AND BRIEFINGS IN SUPPORT OF ATTACK AIRCRAFT OPERATIONS.
14120	1411	B	[SF]			ACFT FIRE AND RESCUE STA	Y	THE AIRCRAFT FIRE AND RESCUE STATION PROVIDES FIRE AND EMERGENCY RESCUE PROTECTION FOR PILOTS AND AIRCRAFT. WHEN FEASIBLE, THE AIRCRAFT FIRE AND RESCUE STATION IS COMBINED WITH THE STRUCTURAL FIRE STATION (CATEGORY CODE 730 10) TO FORM ONE COMPLETE EMERGENCY FACILITY, CATEGORY CODE 141 25, COMBINED STRUCTURAL/ AIRCRAFT FIRE/RESCUE STATION.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
14125	1411	B	[SF]			COMBINED FIRE/RESCUE STA	Y	A COMBINED STRUCTURAL/AIRCRAFT FIRE/RESCUE STATION IS PLANNED UNDER CERTAIN CONDITIONS TO SERVE THE FUNCTION OF A STRUCTURAL FIRE STATION (CATEGORY CODE 730 10) AND AN AIRCRAFT FIRE AND RESCUE STATIONS. FIRE AND RESCUE STATION. THE COMBINED FACILITY IS PLANNED FOR A LOCATION THAT SATISFIES THE RESPONSE TIME AND DISTANCE REQUIREMENTS FOR BOTH THE STRUCTURAL FIRE AND THE AIRCRAFT FIRE.
14130	1412	B	[SF]			ACFT LINE OPERATIONS BLDG	Y	THE AIRCRAFT LINE OPERATIONS BUILDING IS USED TO CENTRALIZE GROUND OPERATIONS OF THE FLIGHT LINE. THE BUILDING IS UTILIZED IN KEEPING OF SQUADRON DAILY FLIGHT BOOKS, AIRCRAFT STATUS BOARDS, AND BULLETIN BOARDS AND AS SUPPORT FOR LINE OPERATIONS PERSONNEL BY PROVIDING SHELTER, A WATER COOLER, AND A CHEMICAL TOILET.
14140	1412	B	[SF]			ACFT OPS BLDG *EXC 141-70*	Y	AN AIRCRAFT OPERATIONS BUILDING IS PLANNED FOR ALL NAVY AIR STATIONS, AUXILIARY AIR STATIONS, AND AIR FACILITIES. THE BUILDING HOUSES THE ADMINISTRATION OF FLIGHT OPERATIONAL ACTIVITIES WITH ALL SUPPORTING FUNCTIONS INCLUDING FLIGHT CONTROL, COMMUNICATIONS, AND WEATHER SERVICES.
14141	1412	B	[SF]			MATCU OPERATIONS BUILDING	Y	THE MATCU PERFORMS A COMBINED FUNCTION SIMILAR TO THAT ACCOMPLISHED WITH GROUND CONTROL APPROACH (GCA) SYSTEM; TACAN BUILDING; AND, AIR SURVEILLANCE RADAR (ASR) BUILDING. DEPENDING ON THE LEVEL OF AIRCRAFT OPERATIONS, THE MATCU OPERATIONS BUILDING MAY PROVIDE THE SOLE GCA SUPPORT AT AN AIR INSTALLATION OR MAY SUPPLEMENT AND BE IN ADDITION TO PERMANENT ASR, TACAN, AND GCA FACILITIES

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
14142	1444	B	[SF]			AIR INTELLIGENCE SUPPT CTR	Y	THIS FACILITY IS USED TO STORE AND DISSEMINATE CLASSIFIED MATERIAL FOR MISSION PLANNING, PILOT TRAINING AND BRIEFINGS IN SUPPORT OF ATTACK AIRCRAFT OPERATIONS.
14160	1441	B	[SF]			VISUAL INFORMATION FAC	Y	A PHOTOGRAPHIC BUILDING IS PLANNED TO SUPPORT THE PHOTOGRAPHIC MISSION OF AN ACTIVITY. IT PROVIDES THE LABORATORY COMPLETE WITH EQUIPMENT AND STORAGE THAT APPLIES TO THE SPECIFIC MISSION.
14165	1441	B	[SF]			FLEET RECON PHOTO LAB	Y	A FLEET RECONNAISSANCE PHOTOGRAPHIC LABORATORY IS PLANNED ONLY WHERE THE STATION SUPPORTS THE MISSION OF PHOTOGRAPHIC RECONNAISSANCE SQUADRONS AND THERE IS NO PHOTOGRAPHIC BUILDING (CATEGORY CODE 141 60) TO PROVIDE THE SUPPORT.
14170	1413	B	[SF]			CONTROL TWR ATTD/FREE STD	Y	A CONTROL TOWER PROVIDES SPACE FOR EQUIPMENT AND PERSONNEL TO CONTROL AIRCRAFT TRAFFIC. IT IS AN ELEVATED BUILDING HAVING AN UNOBSTRUCTED LINE-OF SIGHT TO THE AIRFIELD APPROACH AREAS, RUNWAYS, TAXIWAYS, AIRCRAFT PARKING AREAS, AND ALL OTHER AREAS OVER WHICH AIRCRAFT MOVEMENTS MUST BE CONTROLLED.
14181	1412	B	[SF]			GCA CREW FACILITY	Y	THE GROUND CONTROL APPROACH (GCA) CREW FACILITY PROVIDES A READY ROOM FOR ON DUTY PERSONNEL ASSIGNED TO THE GCA VAN. THE FACILITY CONSISTS OF TWO (2) STANDARD DESIGN SKID-MOUNTED SHELTERS (EACH 12 FEET BY 20 FEET). THE CREW FACILITY IS AUTHORIZED WHENEVER THE MOBILE GCA UNIT IS FURNISHED.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
14182	1412	B	[SF]			FULL PRESSURE SUIT FAC	Y	PRESSURE SUIT MAINTENANCE PERFORMED UNDER THIS CATCODE, NORMALLY IN THE PARACHUTE AND SURVIVAL EQUIPMENT SHOP (CATEGORY CODE 211 34). SPECIAL JUSTIFICATION IS REQUIRED TO PROVIDE A SEPARATE FACILITY FOR THIS PURPOSE.
14187	4122	B	[SF]	GA		LIQUID OXY/NIT FAC(NONIND)	Y	A LIQUID OXYGEN/NITROGEN FACILITY IS REQUIRED AT EACH NAVY AND MARINE CORPS AIR STATION WHERE 50 OR MORE ATTACK AND FIGHTER-TYPE AIRCRAFT ATE ASSIGNED. THE FACILITY PROVIDES FOR STORAGE, VAPORIZATION, AND TRANSFER OF NON-INDUSTRIAL OXYGEN AND NITROGEN AND FOR TEST AND REPAIR OF CRYOGENIC EQUIPMENT ASSOCIATED WITH AVIATOR AND AIRCRAFT SUPPORT.
14188	1465	S	[SF]			HARDENED AIRCRAFT SHELTER	Y	A REINFORCED HANGAR OR SHELTER USED TO PROTECT AIRCRAFT FROM ATTACK AND OFTEN USED IN FORWARD DEPLOYED LOCATIONS.

142 OPERTNL HELIUM PLANTS&STRG

Facilities for receipt, storage, processing and reprocessing helium gas. Includes tanks, pipes, valves, valve chambers, and similar equipment and facilities.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
14210	1421	B	[SF]			HELIUM PROCESSING PLANT	Y	A BUILDING FOR THE RECEIPT, BULK STORAGE, PROCESSING, AND DISPENSING OF HELIUM GAS. INCLUDED ARE TANKS, VALVES, VALVE CHAMBERS, AND SIMILAR EQUIPMENT.
14219	1421	B	[SF]			HELIUM STORAGE BUILDING	Y	A BUILDING FOR THE STORAGE OF BULK HELIUM GAS.
14220	1422	S		[EA]		HELIUM STORAGE FACILITY	Y	A FACILITY, OTHER THAN A BUILDING, FOR THE BULK STORAGE OF HELIUM GAS.

143 SHIP & OTHER OPERTNL-BLDGS

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION

All buildings, which are ship related, used for housing operational types of activities and equipment

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
14309	1444	B	[SF]			EXP OPS SUP FAC	Y	AN EXPEDITIONARY OPERATIONS SUPPORT MODULE (EOSM) PROVIDES SPACES FOR THE FOLLOWING: ADMIN, MEDICAL, MISSION PLANNING CELL (MAY OR MAY NOT BE PART OF SCIF), TRAINING CLASSROOMS, ARMORY, STORAGE, AND LOCKER AND SHOWER SPACES.
14310	5307	B	[SF]			EMERGENCY VEHICLE GARAGE	Y	THIS IS A SHELTER FOR OFFICIAL EMERGENCY AND ALERT VEHICLES, SUCH AS AN AMBULANCE. IT IS JUSTIFIED IN INSTANCES WHEN IMMEDIATE RESPONSE REQUIRED BY SPECIAL WATERFRONT OPERATIONAL VEHICLE.
14311	1444	B	[SF]			OPERATIONAL VEHICLE GARAGE	Y	AN OPERATIONAL VEHICLE GARAGE IS USED FOR THE STORAGE OF VEHICLES WHICH ARE NOT UTILIZED ON A DAILY BASIS AND WHICH ARE EXPOSED TO ADVERSE WEATHER CONDITIONS THAT WOULD HAVE A DETRIMENTAL EFFECT UPON THEM IF STORED OUT IN THE OPEN. ACCORDINGLY, THE TYPE OF VEHICLE STORED, FREQUENCY OF USE AND CLIMATIC CONDITIONS, WILL DETERMINE WHETHER THIS TYPE OF FACILITY IS WARRANTED.
14312	8523	LS	[SY]			OPRTNL VEHICLE LAYDWN AREA	Y	AN OPERATIONAL VEHICLE PARKING AND/OR LAYDOWN AREA CONSISTS OF AN ASPHALT OR CONCRETE PAVED AREA LARGE ENOUGH TO STORE AND PROVIDE CIRCULATION FOR THE VEHICLES AND EQUIPMENT FOR WHICH THE COMMAND IS RESPONSIBLE.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
14315	1731	B	[SF]			RANGE OPERATIONS CENTER	Y	A RANGE OPERATIONS CENTER IS THE CONTROL POINT FOR TESTING TORPEDOES, CALIBRATING SHIPS¿ FIRING SYSTEMS, AND TRAINING PILOTS AND TESTING AIRCRAFT ON GUNNERY AND BOMBING RANGES. THE CENTER WILL VARY WITH THE EQUIPMENT AND CONTROL AREAS REQUIRED. STANDARD PLANNING FACTORS FOR A CENTER ARE NOT AVAILABLE. ITS SIZE MUST BE PLANNED TO SUPPORT THE EQUIPMENT AND CONTROL AREAS TO BE HOUSED.
14317	1444	B	[SF]			SPACE SURVEILANCE FACILITY	Y	FACILITIES TYPICALLY SUPPORT GLOBAL SPACE SURVEILLANCE NETWORK WHICH DETECTS, TRACKS, IDENTIFIES, AND CATALOGS MAN-MADE OBJECTS IN SPACE AND PROVIDES POSITION INFORMATION ON THESE OBJECTS. REQUIREMENTS ARE DETERMINED BY NAVAL NETWORK AND SPACE OPERATIONS COMMAND.
14320	1444	B	[SF]			ORDNANCE OPERATIONS BLDG	Y	AN ORDNANCE OPERATIONS BUILDING IS AUTHORIZED WHERE THERE IS A NEED TO CONTROL AN ORDNANCE OPERATION. ORDNANCE OPERATIONS ARE THOSE INVOLVING AMMUNITION STORAGE, HANDLING OR DISPOSAL AND ORGANIZATIONAL LEVEL MAINTENANCE. THE FACILITIES WHOSE PRIMARY FUNCTION IS ORDNANCE MAINTENANCE, INTERMEDIATE LEVEL AND ABOVE, ARE ADDRESSED IN THE 200 SERIES CATEGORY CODES.
14321	1443	B	[SF]			AMMUNITION SEGREGATION FAC	Y	A SEGREGATION FACILITY IS A BUILDING OR SERIES OF BUILDINGS WHERE FLEET RETURN EXPLOSIVE AND INERT MATERIAL ARE SCREENED AND GROUPED BY TYPE AND PHYSICAL CONDITION.
14322	1444	B	[SF]			NAVY EOD SHORE DET	Y	THIS FACILITY PROVIDES SUPPORT FOR EOD SHORE DETACHMENTS PERMANENTLY ASSIGNED TO NAVY INSTALLATIONS.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
14323	1444	B	[SF]			NAVY EODMU	Y	A FACILITY THAT SUPPORTS EXPLOSIVE ORDNANCE DISPOSAL MOBILE UNITS. EODMUS ARE RESPONSIBLE FOR MANNING, EQUIPPING AND TRAINING OF ANY NUMBER OF DEPLOYABLE EOD DETACHMENTS: MOBILE DETACHMENTS, AREA SEARCH DETACHMENTS, ORDNANCE CLEARANCE DETACHMENTS, MOBILE COMMUNICATIONS DETACHMENTS, COMBAT SERVICE SUPPORT DETACHMENTS, FLY AWAY RECOMPRESSION CHAMBER DETACHMENTS, MINE COUNTER MEASURES DETACHMENTS
14324	1444	B	[SF]			MARINE CORPS EOD FAC	Y	THESE FACILITIES PROVIDE SUPPORT FOR MARINE CORPS EOD SHORE TEAMS AND PLATOONS PERMANENTLY ASSIGNED TO MARINE CORPS INSTALLATIONS. THE MANNING STRUCTURE FOR EOD TEAMS AND PLATOONS HAS INCREASED AND IS REFLECTED BELOW IN CATEGORY CODES 143 24 AND 143 26.
14325	1444	B	[SF]			SEAL TEAM BUILDING	Y	THIS FACILITY IS FOR THE SUPPORT OF SEAL TEAMS. THE REQUIREMENTS FOR THESE FACILITIES ARE DEVELOPED BY AN INDUSTRIAL ANALYSIS FOR THE SPECIFIC FACILITY. SEE CATEGORY CODE 610 10 FOR ADMINISTRATIVE SPACE GUIDELINES AND CATEGORY CODE 159 64 FOR WATERFRONT OPERATIONS BUILDING GUIDELINES.
14326	1444	B	[SF]			MARINE CORPS EOD PLATOON	Y	THIS FACILITY IS RESPONSIBLE FOR MANNING, EQUIPPING, AND TRAINING FOR EOD OPERATIONS IN SUPPORT OF FLEET MARINE FORCES.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
14335	1444	B	[SF]			REGISTERED PUB ISSUE OFF	Y	A REGISTERED PUBLICATIONS ISSUING OFFICE (RPIO) HAS A PRIMARY MISSION OF SUPPORTING COMMUNICATIONS OPERATIONS OF THE FLEET, NAVAL AVIATION, U.S. MARINE CORPS, AND THE U.S. COAST GUARD. RPIO¿S RECEIVE, STORE, ISSUE, ACCOUNT FOR, AND-OFFICIATE DURING THE DESTRUCTION OF HIGHLY CLASSIFIED CRYPTOLOGICAL PUBLICATIONS, EQUIPMENT, AND DEVICES CIRCULATING IN THE REGISTERED PUBLICATIONS SYSTEM (RPS).
14341	1431	B	[SF]			AMPHIBIOUS OPERATIONS BLDG	Y	ORGANIZATIONAL FACILITY FOR EXPEDITIONARY AMPHIBIOUS OPERATIONS.
14345	4427	B	[SF]			ARMORY	Y	A NAVY INSTALLATION ARMORY PROVIDES SPACE FOR STORAGE AND ROUTINE MAINTENANCE OF SMALL ARMS AND EMERGENCY GEAR. THE MATERIALS STORED WILL PROVIDE FOR EMERGENCIES AND FOR TRAINING OF SELECTED PERSONNEL IN THE HANDLING OF STATION EMERGENCIES, CIVIL DISORDERS, AND AREA DISASTERS.
14346	1446	B	[SF]			MARINE BRKS-GEN PURP BLDG	Y	THE CRITERIA CONTAINED HEREIN ARE APPLICABLE TO CNO COMMANDED MARINE BARRACKS. THE PURPOSE OF THE MARINE BARRACKS IS TO PROVIDE SUCH SECURITY AS APPROVED BY THE CHIEF OF NAVAL OPERATIONS, IN COORDINATION WITH THE COMMANDANT OF THE MARINE CORPS, AND TO PERFORM SUCH ADDITIONAL FUNCTIONS AS DIRECTED BY CMC.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
14347	1446	B	[SF]			ALERT FORCE BUILDING	Y	AN ALERT FORCE BUILDING IS PROGRAMMED IN CONJUNCTION WITH AN AIR/UNDERWATER WEAPONS SHOP, WHEN REQUIRED TO MEET THE ALERT FORCE RESPONSE TIMES ESTABLISHED FOR THE SHOP. THE ALERT FORCE BUILDING BARRACKS FACILITIES, INCLUDING LIMITED FACILITIES NECESSARY TO SUPPORT THE GUARD OF THE DAY FOR AN AUW SHOP. IT ALSO CONTAINS A DUTY OFFICE, PROVISION FOR WEAPONS STORAGE AND AN ALARM REPEATER PANEL.
14355	1444	B	[SF]			TRANSIT SHED	Y	A TRANSIT SHED IS PLANNED TO SUPPORT THE RAPID AND ORDERLY TRANSFER OF TRUCK AND RAIL FREIGHT IN SHIPMENT FROM ONE CARRIER TO ANOTHER WITH MINIMUM STORAGE. FOR A WATERFRONT TRANSIT SHED, SEE CATEGORY CODE 156 10. THE TRANSIT SHED IS OF THE MINIMUM DESIGN THAT WILL PROTECT THE FREIGHT FROM THE WEATHER AND PROVIDE ANY SECURITY NECESSARY.
14360	1431	B	[SF]			EXPLOSIVES SHIP/TRAN DEP	Y	AN EXPLOSIVES TRANSFER DEPOT IS A FACILITY USED TO TRANSFER BREAK-BULK AMMUNITION AND EXPLOSIVES BETWEEN AUTOMOTIVE VEHICLES AND RAILCARS FOR FURTHER SHIPMENT, OR FOR DELIVERY TO A STORAGE MAGAZINE, LOADING BUILDING, WATERFRONT OR AIRFIELD.
14365	1431	B	[SF]			REG/INST EMER OPS CTR	Y	A REGION/INSTALLATION EMERGENCY OPERATIONS FACILITY IS A SHORE MISSION SPECIFIC COMMAND, CONTROL, AND COORDINATION (C3) AREA IN DIRECT SUPPORT OF THE OPERATIONAL MISSION OF A REGION/INSTALLATION NAVY OR MARINE CORPS ACTIVITY. THIS FACILITY CAN ALSO BE DESIGNATED AS A REGIONAL OPERATIONS CENTER (ROC), EMERGENCY CONTROL CENTER (ECC), OR EMERGENCY ACTION CENTER (EAC).

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
14370	1442	B	[SF]			RADIATN INST CALIBRTN FAC	Y	A HEALTH PHYSICS CALIBRATION BUILDING CONTAINS FACILITIES REQUIRED FOR CALIBRATION OF HEALTH PHYSICS SURVEY INSTRUMENTS AND AREA MONITORING DEVICES. THESE DEVICES ARE USED TO PROTECT PERSONNEL AGAINST IONIZING RADIATION FROM X-RAYS AND ATOMIC PARTICLES.
14375	1442	B	[SF]			POL OPN/SAMPLING/TEST BLDG	Y	THE POL OPERATION BUILDING PROVIDES SPACE REQUIRED FOR QUALITY CONTROL AND ADMINISTRATION OF FUEL ACTIVITY. SPACE IS PROVIDED IN THE BUILDING FOR AN ADMINISTRATIVE OFFICE, CONTROL/GAUGE MONITORING CENTER, AND FUELS TESTING LABORATORY. PHYSICAL OPERATION AND CONTROL OF THE FUEL SYSTEM WILL BE ACCOMPLISHED ELSEWHERE (SUCH AS THE PUMP HOUSE).
14377	1443	B	[SF]			OPERATIONAL STORAGE	Y	OPERATIONAL STORAGE SUPPORTS MULTIPLE DEPARTMENTS/DIVISIONS WITHIN A COMMAND. IT IS UNDER THE CONTROL OF THE LOGISTICS AND SUPPLY DEPARTMENT. THIS CATEGORY CODE IS USED TO IDENTIFY AREAS USED FOR BULK STORAGE AREAS OF MAJOR END ITEMS, AND OPERATIONAL MATERIAL.
14378	1443	B	[SF]			OP HAZARD/FLAMMABLE STRGE	Y	THIS CATEGORY WILL BE USED TO PROVIDE A FACILITY FOR THE STORAGE OF MATERIALS USED IN DAILY OPERATIONS THAT REQUIRE SPECIAL ENVIRONMENTAL SEPARATION. THESE MATERIALS SUCH AS PAINT, ACETONE, OIL, ETC. ARE CONSIDERED TO BE HAZARDOUS AND/OR FLAMMABLE.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
14380	1404	B	[SF]			MISSION OPS COMM/CONTR FAC	Y	A MISSION OPERATION COMMAND AND CONTROL FACILITY IS A SPECIALIZED FACILITY THAT IS ONLY REQUIRED IN SELECT LOCATIONS TO SUPPORT THE OPERATIONS OF FORCE COMMANDERS AND FLEET COMMANDERS (E.G. US FLEET FORCES COMMANDER, PACIFIC FLEET) AND SELECTED OTHERS AS ESTABLISHED BY DOD. A MISSION OPERATION COMMAND AND CONTROL FACILITY MAY ALSO CONTAIN FACILITY REQUIREMENTS FOR TYPE COMMANDS (E.G. AIRLANT, SUBPAC), OPERATIONAL SUPPORT COMMANDS (E.G. CTF AND CTG) AND A MARITIME OPERATIONS CENTER (MOC).
14385	1311	B	[SF]			JOINT RESERVE INTEL CENTER	Y	JOINT RESERVE INTELLIGENCE CENTER (JRIC). A JRIC IS A JOINT INTELLIGENCE PRODUCTION AND TRAINING ACTIVITY THAT USES INFORMATION NETWORKS TO LINK RESERVIST INTELLIGENCE PERSONNEL, ACTIVE DUTY UNITS AND CONTRACTORS WITH THE COMBATANT COMMANDS, SERVICES, AND/OR COMBAT SUPPORT AGENCIES.

144

145

146

148 SHIP OPRTNL FAC-OTHER

This category group contains facilities and structures which support tactical or organizational ship and other land operations in which do not fall readily into another category. For facilities supporting aircraft operations, use category group 149.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
14810	1481	S		[EA]		NUCLEAR PROPULSN SUPP FAC	Y	A FACILITY, OTHER THAN A BUILDING, DIRECTLY RELATED TO NUCLEAR PROPULSION OPERATIONS. PLANNING AND PROGRAMMING FOR THIS FACILITY REQUIRES CONCURRENCE AND PLANNING GUIDANCE BY NAVSEA CODE 08 (NUCLEAR POWER DIRECTORATE).

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
14815	1491	S		[EA]		NUCLEAR WPNS HANDLING FAC	Y	A FACILITY, OTHER THAN A BUILDING, DIRECTLY RELATED TO NUCLEAR WEAPONS HANDLING OPERATIONS. PLANNING AND PROGRAMMING FOR THIS FACILITY PLEASE CONTACT DIRECTOR, STRATEGIC SYSTEMS PROGRAM (SSP) OFFICE.
14817	1456	S		[EA]		SPACE SURVEILLANCE ANTENNA	N	REQUIREMENTS ARE DETERMINED BY NAVAL NETWORK AND SPACE OPERATIONS COMMAND. FACILITIES TYPICALLY SUPPORT GLOBAL SPACE SURVEILLANCE NETWORK WHICH DETECTS, TRACKS, IDENTIFIES, AND CATALOGS MAN-MADE OBJECTS IN SPACE AND PROVIDES POSITION INFORMATION ON THESE OBJECTS.
14820	1497	S		[EA]		ORDNANCE DEMOLITION AREA	Y	AN ORDNANCE DEMOLITION (TREATMENT) AREA IS A LOCATION SPECIFICALLY DESIGNATED AND RESERVED FOR DESTROYING EXPLOSIVES AND EXPLOSIVES-LOADED DEVICES. THE FUNCTION TYPICALLY MEANS BURNING OR DETONATING EXPLOSIVES IN A BERMED OPEN BURN/OPEN DETONATION (OB/OD) AREA.
14825	1492	S	SY	[EA]		EXPLOSIVE TRUCK HOLDG YD	Y	THIS YARD IS WHERE TRUCKS CONTAINING AMMUNITION AND/OR EXPLOSIVES ARE HELD FOR INTERIM PERIODS OF TIME PRIOR TO STORAGE OR SHIPMENT. SAFE HAVENS AND WHARF YARDS NEAR PIERS AND WHARVES SHOULD BE CATEGORIZED UNDER THIS FUNCTION. EACH FACILITY REQUIRES INDIVIDUAL JUSTIFICATION. DEPENDING ON LAND CONSTRAINTS AND EXPLOSIVE SAFETY CRITERIA THESE FACILITIES MAY OR MAY NOT BE BARRICADED.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
14830	1493	S		[EA]	LF	EXPLOSIVES RR CAR HOLDG YD	Y	THIS IS A TEMPORARY HOLDING AREA FOR RAILCARS CONTAINING ORDNANCE PRIOR TO STORAGE OR SHIPMENT. EACH FACILITY REQUIRES INDIVIDUAL JUSTIFICATION. DEPENDING ON LAND CONSTRAINTS AND EXPLOSIVE SAFETY CRITERIA THESE FACILITIES MAY OR MAY NOT BE BARRICADED. FOR CONTAINERIZED ORDNANCE USE CATEGORY CODE 148 35, CONTAINER HOLDING YARD.
14835	1492	S	SY	[EA]		CONTAINER HOLDING YARD	Y	THIS IS AN OPEN AREA THAT PROVIDES A TEMPORARY HOLDING OR STAGING AREA FOR CONTAINERS LOADED WITH EXPLOSIVE ORDNANCE. WHARF YARDS NEAR PIERS AND WHARVES ARE ALSO DESCRIBED BY THIS FUNCTION.
14840	1492	S	SY	[EA]		CONTNR TRANSFER FAC (ORD)	Y	A CONTAINER TRANSFER FACILITY IS USED TO TRANSFER CONTAINERS BETWEEN RAIL FLATCARS AND TRUCK FLATBEDS OR CHASSIS, ON A PAVED HARDSTAND AREA, BY MEANS OF A BRIDGE CRANE OR CONTAINER HANDLING EQUIPMENT. SCALE EQUIPMENT SHOULD BE EXPECTED TO A PART OF THIS FUNCTION. THE AREA MAY BE BARRICADED OR UNBARRICADED.
14845	1492	S	SY	[EA]		RAIL/TRUCK RECEIVING STA	Y	A RAIL/TRUCK RECEIVING STATION WEIGHS AND INSPECTS ALL INCOMING SHIPMENTS OF BREAK-BULK AND CONTAINERIZED ORDNANCE ARRIVING BY RAIL OR TRUCK AND ALSO A PERCENTAGE OF THE OUTGOING SHIPMENTS. THIS STATION CAN BE USED AS A SHORT TERM STORAGE FACILITY LIMITED TO OVERNIGHT AND WEEKEND PERIODS AND AS AN INTERCHANGE STORAGE FACILITY LIMITED TO OVERNIGHT AND WEEKEND PERIODS AND AS AN INTERCHANGE YARD.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION

This category group contains facilities such as towers and structures which support tactical or organizational aircraft related operations and which do not fall readily into another category. It includes protective construction.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
14910	1495	S		[EA]		PROT BARR/REVETMENT	Y	PROTECTIVE BARRICADES (ALSO KNOWN AS REVETMENTS) ARE CONSTRUCTED AT LOCATIONS WHERE EXPLOSIVES SAFETY DICTATES THE NEED, SUCH AS IN MAGAZINE AREAS, COMBAT AIRCRAFT LOADING AREAS, EXPLOSIVE HOLDING YARDS, ETC.
14915	1467	S		[EA]	SP	FIXED PT UTIL SYS	Y	FIXED POINT UTILITIES SYSTEMS SUPPLY UTILITIES TO AIRCRAFT PARKING APRON SERVICE POINTS AND AIRCRAFT MAINTENANCE HANGAR SERVICE POINT. THE FPUS CAN PROVIDE COMPRESSED AIR, PRECONDITIONED AIR FOR HANGARED AIRCRAFT, AND/OR ELECTRICAL POWER. IT CAN CONSIST OF AN ENCLOSED PUMP HOUSE AND STORAGE TANKS, AN IN-GROUND DIST. SYSTEM AND SERVICE POINTS IN AIRCRAFT PARKING APRONS OR AIRCRAFT HANGARS.
14920	1462	S		[EA]		AIRCRAFT CATAPULT	N	THIS IS A FACILITY FOR AIR INSTALLATIONS WHERE SPECIALIZED TRAINING, TEST AND EVALUATION, OR RESEARCH AND DEVELOPMENT ARE PERFORMED ON CATAPULT TAKEOFFS.
14930	1461	S		[EA]		AIRCRAFT ARRESTING GEAR	N	AIRCRAFT ARRESTING GEAR IS DESIGNED TO BRING AN AIRCRAFT TO A STOP IN CASE OF AN ABORTED TAKEOFF OR AN EMERGENCY LANDING.
14945	3901	S		[EA]		MISSILE LAUNCH FACILITY	N	THIS CATEGORY CODE IS FOR LOCATIONS LAUNCHING MISSILES OR DRONES, IT ALSO IS PROVIDED FOR INVENTORY PURPOSES OF MISSILE AND DRONE LAUNCH PADS. SEE NAVSEA OP-5 FOR EXPLOSIVE SAFETY SITING CRITERIA OF ENERGETIC LIQUIDS ASSOCIATED WITH LAUNCH PADS.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
14950	1464	S		[EA]	LF	BLAST DEFLECTOR FENCE	N	BLAST DEFLECTOR FENCES ARE STRUCTURES THAT DIRECT THE EXHAUST FROM JET ENGINES UPWARD. THEY ARE USED IN CONGESTED AREAS AND PARKING AND MAINTENANCE AREAS TO PROTECT PERSONNEL AND FACILITIES FROM THE BLAST EFFECT OF JET ENGINE EXHAUST. BLAST FENCES ARE ALSO USED TO PREVENT EROSION OF PAVED AND UNPAVED AREAS AND TO PROVIDE PROTECTION FROM FLYING DEBRIS.
14985	1467	S	SY	[EA]		EXPEDITIONARY AIR CONTROL	Y	THESE ARE MARINE CORPS FACILITIES REQUIRED TO ACCOMMODATE, IN-GARRISON, THE EQUIPMENT USED FOR EXPEDITIONARY AIRCRAFT COMMAND AND CONTROL. THESE FACILITIES ARE ASSIGNED TO SPECIALIZED MARINE CORPS SQUADRONS, AND THE EXPEDITIONARY EQUIPMENT USED IN CONJUNCTION WITH THESE FACILITIES IS NORMALLY SQUADRON PROPERTY.
14986	4422	S	SF	[EA]		OPERATIONS SUPPORT SHED	Y	STORAGE SHED OR OTHER COVERED AREA USED FOR OPERATIONAL SUPPORT. NOT FOR WEAPONS CLEANING AREAS.

150 WATERFRONT OPRTNL FAC

151 PIERS

Includes all piers regardless of function served, protective dolphins at pier heads, fendering systems, mooring fixtures, original dredging performed specifically for the purpose of providing the pier facility, all trackage on the pier, and all supporting utilities and services.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
15110	1511	S	SY	[FB]	DW	AMMUNITION PIER	Y	AMMUNITION PIERS ARE DESIGNED FOR USE IN THE RECEIPT OF AMMUNITION FOR STORAGE AND FOR THE OUTLOADING OF AMMUNITION ONTO BARGES AND SHIPS. IN SOME CASES OUTGOING AMMUNITION IS FIRST LOADED FROM THE AMMUNITION PIER ONTO BARGES FOR TRANSFER TO SHIPS MOORED OFFSHORE OR IN A ROADSTEAD.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
15120	1511	S	SY	[FB]	DW	GENL PURP/BERTHING PIER	Y	GENERAL PURPOSE BERTHING PIERS ARE USED PRIMARILY FOR MOORING HOME PORTED AND TRANSIENT SHIPS THAT DO NOT REQUIRE PIERS EQUIPPED WITH SHIPYARD FACILITIES. BERTHING PIERS ARE CLASSIFIED AS ACTIVE OR INACTIVE. THE ACTIVE BERTHING PIERS ARE USED WHEN SHIPS ARE BERTHED FOR A RELATIVELY SHORT TIME; THE INACTIVE CLASSES ARE USED WHEN SHIPS ARE TO BE TIED UP FOR LONG PERIODS IN A DECOMMISSIONED STATUS.
15140	1511	S	SY	[FB]	DW	FUELING PIER	Y	FACILITIES FOR BERTHING SHIPS WHILE DISCHARGING FUEL TO STORAGE OR RECEIVING FUEL FROM STORAGE ARE PROVIDED AT FUELING PIERS. SUCH PIERS WILL PROVIDE SALT WATER FOR FIREFIGHTING, TELEPHONE AND FIRE ALARM FACILITIES AND MAY PROVIDE FRESHWATER, STEAM IN COLD CLIMATES, ELECTRIC POWER.
15150	1511	S	SY	[FB]	DW	REPAIR PIER	Y	REPAIR PIERS ARE CONSTRUCTED AND EQUIPPED TO PERMIT OVERHAUL OF THOSE PORTIONS OF A VESSEL ABOVE THE WATERLINE. THESE STRUCTURES WILL NORMALLY BE EQUIPPED WITH A GANTRY CRANE AND STANDARD-GAGE RAILROAD TRACKS AND HAVE FACILITIES TO PROVIDE SALT AND FRESHWATER, STEAM, COMPRESSED AIR, TELEPHONE AND FIRE ALARM SERVICE, AND ELECTRIC POWER FOR SHIP SERVICE, LIGHTING AND WELDING.
15160	1511	S	SY	[FB]	DW	SUPPLY PIER	Y	SUPPLY PIERS ACCOMMODATE BERTHING FOR THE TRANSFER OF MATERIALS BETWEEN SHIP AND SHORE. A LARGE BUILDING OR TRANSIT SHED NORMALLY OCCUPIES THE CENTRAL PORTION OF A SUPPLY PIER.

Category Code Report (All Series)

15170	1511	S	SY	[FB]	DW	ORDNANCE CONT HANDL PIER	Y	AN ORDNANCE CONTAINER HANDLING PIER IS USED PRIMARILY FOR THE OUTLOADING AND RECEIVING OF EXPLOSIVE ORDNANCE IN CONTAINERS FROM NON-SELF-SUSTAINING CONTAINER SHIPS.
15171	1511	S	SY	[FB]	DW	DEGAUSSING PIER	Y	THESE PIERS ARE USED TO ERASE THE MAGNETIC SIGNATURE OF A SHIP OR SUBMARINE. SIZING FOR THIS CATEGORY CODE IS BASED ON THE TYPE OF VESSELS TO BE SERVICED AND IS DRIVEN BY THE NAVSEA SPECIFIED EQUIPMENT. SPECIAL STUDIES ARE REQUIRED ON A CASE BY CASE BASIS.
15180	1511	S	SY	[FB]	DW	DEPERMING PIER	Y	THESE PIERS ARE USED TO ERASE THE MAGNETIC SIGNATURE OF A SHIP OR SUBMARINE. SIZING FOR THIS CATEGORY CODE IS BASED ON THE TYPE OF VESSELS TO BE SERVICED AND IS DRIVEN BY THE NAVSEA SPECIFIED EQUIPMENT. SPECIAL STUDIES ARE REQUIRED ON A CASE BY CASE BASIS.
15190	1513	S	[SY]		SF	ACCESS TRESTLE PIERS WHRVS	Y	A VEHICULAR AND/OR RAILROAD TRESTLE CONNECTING SHORE FACILITIES TO A PIER OR WHARF.

152 WHARFS

A wharf is an open type marginal structure for the berthing of vessels; it is usually connected to the shore at more than one point. In general, the planning criteria that apply to piers are also applicable to wharves. Either may serve the same practicable purpose, however, since their physical design and layout will be much different, their capacities for berthing and cargo handling will vary. Piers are generally preferable structures; however, certain locations will dictate the use of a wharf rather than a pier because of the marginal fairway and topography involved.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
15210	1512	S	SY	[FB]	DW	AMMUNITION WHARF	Y	AMMUNITION WHARVES ARE DESIGNED FOR USE IN THE RECEIPT OF AMMUNITION FOR STORAGE AND FOR THE OUTLOADING OF AMMUNITION ONTO BARGES AND SHIPS. IN SOME CASES OUTGOING AMMUNITION IS FIRST LOADED FROM THE AMMUNITION PIER ONTO BARGES FOR TRANSFER TO SHIPS MOORED OFFSHORE OR IN A ROADSTEAD.

15220	1512	S	SY	[FB]	DW	GENL PURP/BERTHING WHARF	Y	GENERAL PURPOSE BERTHING WHARVES ARE USED PRIMARILY FOR MOORING HOME PORTED AND TRANSIENT SHIPS THAT DO NOT REQUIRE PIERS EQUIPPED WITH SHIPYARD FACILITIES. BERTHING PIERS ARE CLASSIFIED AS ACTIVE OR INACTIVE. THE ACTIVE BERTHING PIERS ARE USED WHEN SHIPS ARE BERTHED FOR A RELATIVELY SHORT TIME; THE INACTIVE CLASSES ARE USED WHEN SHIPS ARE TO BE TIED UP FOR LONG PERIODS IN A DECOMMISSIONED STATUS.
15230	1512	S	SY	[FB]	DW	FITTING OUT WHARF	Y	WHARVES FOR FITTING OUT ARE VERY SIMILAR TO THOSE USED FOR REPAIR PURPOSES, PROVIDING APPROXIMATELY THE SAME FACILITIES. HOWEVER, FITTING OUT PIERS WILL HAVE, IN ADDITION TO LIGHT AND HEAVY GANTRY CRANES, A LARGE FIXED TOWER CRANE FOR HANDLING GUNS, TURRETS, ENGINES, AND HEAVY ARMOR.
15240	1512	S	SY	[FB]	DW	FUELING WHARF	Y	FACILITIES FOR BERTHING SHIPS WHILE DISCHARGING FUEL TO STORAGE OR RECEIVING FUEL FROM STORAGE ARE PROVIDED AT FUELING WHARVES. SUCH WHARVES WILL PROVIDE SALT WATER FOR FIREFIGHTING, TELEPHONE AND FIRE ALARM FACILITIES AND MAY PROVIDE FRESHWATER, STEAM IN COLD CLIMATES, ELECTRIC POWER.
15250	1512	S	SY	[FB]	DW	REPAIR WHARF	Y	REPAIR WHARVES ARE CONSTRUCTED AND EQUIPPED TO PERMIT OVERHAUL OF THOSE PORTIONS OF A VESSEL ABOVE THE WATERLINE. THESE STRUCTURES WILL NORMALLY BE EQUIPPED WITH A GANTRY CRANE AND STANDARD-GAGE RAILROAD TRACKS AND HAVE FACILITIES TO PROVIDE SALT AND FRESHWATER, STEAM, COMPRESSED AIR, TELEPHONE AND FIRE ALARM SERVICE, AND ELECTRIC POWER FOR SHIP SERVICE, LIGHTING AND WELDING.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
15260	1512	S	SY	[FB]	DW	SUPPLY WHARF	Y	SUPPLY WHARVES ACCOMMODATE BERTHING FOR THE TRANSFER OF MATERIALS BETWEEN SHIP AND SHORE. A LARGE BUILDING OR TRANSIT SHED NORMALLY OCCUPIES THE CENTRAL PORTION OF A SUPPLY WHARF.
15270	1512	S	SY	[FB]	DW	ORDNANCE CONT HANDL WHARF	Y	AN ORDNANCE CONTAINER HANDLING WHARF IS USED PRIMARILY FOR THE OUTLOADING AND RECEIVING OF EXPLOSIVE ORDNANCE IN CONTAINERS FROM NON-SELF-SUSTAINING CONTAINER SHIPS.
15271	1512	S	SY	[FB]	DW	DEGAUSSING WHARF	Y	THESE WHARVES ARE USED TO ERASE THE MAGNETIC SIGNATURE OF A SHIP OR SUBMARINE. SIZING FOR THIS CATEGORY CODE IS BASED ON THE TYPE OF VESSELS TO BE SERVICED AND IS DRIVEN BY THE NAVSEA SPECIFIED EQUIPMENT. SPECIAL STUDIES ARE REQUIRED ON A CASE BY CASE BASIS.
15280	1512	S	SY	[FB]	DW	DEPERMING WHARF	Y	THESE WHARVES ARE USED TO ERASE THE MAGNETIC SIGNATURE OF A SHIP OR SUBMARINE. SIZING FOR THIS CATEGORY CODE IS BASED ON THE TYPE OF VESSELS TO BE SERVICED AND IS DRIVEN BY THE NAVSEA SPECIFIED EQUIPMENT. SPECIAL STUDIES ARE REQUIRED ON A CASE BY CASE BASIS.

153 CARGO HANDLING FACILITIES

A cargo staging area is an open hardstand for temporary storage of cargo awaiting further transshipment.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
15310	1531	S		[SY]		CARGO STAGING AREA	Y	A CARGO STAGING AREA IS AN OPEN HARDSTAND FOR TEMPORARY STORAGE OF CARGO AWAITING FURTHER TRANSSHIPMENT.

154 SEAWLS/BULKHDS/QUAYWLS

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION

Shore protective structures not intended primarily for berthing vessels. Bulkheads and quaywalls have the principal advantage of affording accessibility for their entire length along the foreshore.

CATEGORY CODE	FAC CODE	RPA TYPE	AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
15410	1541	S		[LF]		BLKHD QW NO RELIEVG PLATFM	N	THIS TYPE OF BULKHEAD OR QUAYWALL IS A STRUCTURE TO RETAIN EARTH ALONG A SHORELINE IN SHALLOW WATER. THE DEPTH OF WATER IS TYPICALLY LIMITED TO A 25 FEET AND THE STRUCTURE HAS NO RELIEVING PLATFORM. THIS STRUCTURE DOES NOT PROVIDE SHIP BERTHING (151 PIERS AND 152 WHARVES SHOULD BE USED FOR ANY SHIP BERTHING REQUIREMENT).
15420	1512	S	SY	[LF]		BLKHD QW WITH R PLATFM	Y	THIS TYPE OF BULKHEAD OR QUAYWALL IS A STRUCTURE TO RETAIN EARTH ALONG A SHORELINE IN DEEP WATER. TYPICALLY WITH A WATER DEPTH EXCEEDING 25 FEET AND INCLUDES A RELIEVING PLATFORM TO SUPPORT HEAVY LOGISTICS OPERATIONS. THIS STRUCTURE DOES NOT PROVIDE SHIP BERTHING (151 PIERS AND 152 WHARVES SHOULD BE USED FOR ANY SHIP BERTHING REQUIREMENT).
15430	1541	S		[LF]		SEAWALLS AND RIP RAP	N	THESE ARE STRUCTURES BUILT ALONG AND PARALLEL TO A SHORELINE (RIVER OR COAST LINE) PROTECTING AND STABILIZING THE SHORE AGAINST EROSION RESULTING FROM WAVE AND CURRENT ACTION. THIS IS A FUNCTIONAL DEFINITION AND VARIOUS TYPES OF CONSTRUCTION CAN BE USED TO SUPPORT THIS FUNCTION.

155						SMALL CRAFT BERTHING		

All facilities supporting small craft operations. Included in this category are, but not limited to, yard craft, tug boats, security and service craft.

CATEGORY CODE	FAC CODE	RPA TYPE	AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
15510	1551	S		[FB]		FLEET LANDING	Y	A FLEET LANDING IS A FIXED OR FLOATING PIER DESIGNED FOR THE LOADING AND/OR UNLOADING OF A SHIP'S PERSONNEL ONTO OR FROM A PERSONNEL BOAT OR FERRY.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
15511	1552	B	[SF]			FLEET LANDING BUILDING	Y	A FLEET LANDING BUILDING IS USED TO ACCOMMODATE SHIP'S PERSONNEL BEING LOADED OR UNLOADED FROM A PERSONNEL BOAT OR FERRY.
15520	1551	S		[FB]		SMALL CRAFT BERTHING	Y	THIS CATCODE SHOULD INCLUDE FACILITIES FOR HARBOR AND PILOT LAUNCHES, SURVEY BOATS, WORK BOATS, SPECIAL SERVICE CRAFT, RESCUE BOATS, AND OTHER SMALL CRAFT.
15521	1552	B	[SF]			SMALL CRAFT BOATHOUSE	Y	A BOATHOUSE IS NECESSARY WHERE AN ALERT CREW IS REQUIRED, WHERE A BOAT FACILITY IS REMOTE FROM THE SUPPORTING ACTIVITY, OR WHERE BOAT REPAIR FACILITIES ARE ESSENTIAL.
15522	1593	S	SY	[EA]		SM CRAFT BOAT RAMP FAC	Y	SMALL BOAT LAUNCH RAMPS FOR OPERATIONAL OR SECURITY FORCES THE PURPOSES OF CONDUCTING IN-SHORE TRAINING MANEUVERS OR SECURITY PATROLS.
156						CARGO HANDLING FAC/BLDGS		
15610	1443	B	[SF]			WATERFRONT TRANSIT SHED	Y	A WATERFRONT TRANSIT SHED IS A BUILDING OR SHED FOR STORAGE OF CARGO AWAITING FURTHER TRANSSHIPMENT AND REQUIRING PROTECTION.
15620	1443	B	[SF]			CONTAINER OPERATIONS BLDG	Y	A CONTAINER OPERATIONS BUILDING IS ESSENTIAL FOR SAFE DIRECTION AND CONTROL OF CONTAINER OPERATIONS TO PROMOTE EFFICIENT AND CONTINUOUS FLOW TO, WITHIN, AND FROM THE HANDLING AREA.
159						OTHER WATERFRONT OPERATION		

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION

This basic category group provides for facilities which cannot be coded in basic groups 151 through 156.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
15910	1593	S	SY	[EA]		AIRCRAFT DOCKING FACILITY	N	WATERFRONT FACILITIES THAT WERE ORIGINALLY CREATED TO SUPPORT SEAPLANES SUCH AS PBY CATALINAS AND SIMILAR FROM THE WWII ERA AND LATER. IT IS NOT ASSOCIATED WITH ANY AIRFIELD CRITERIA AND NEW FACILITIES WILL NOT BE PLANNED UNDER THIS CCN.
15920	1431	B	SF	[EA]		DEGAUSSING BUILDING	Y	DEGAUSSING IS THE SCIENCE DEALING WITH THE METHODS AND TECHNIQUES OF REDUCING A SHIP'S MAGNETIC FIELD SO THAT THE POSSIBILITY OF DETECTION BY MAGNETIC MINES AND OTHER MAGNETIC INFLUENCE DETECTION DEVICES IS MINIMIZED. IT CONSISTS OF TWO FUNCTIONALLY INTERDEPENDENT INSTALLATIONS: AN UNDERWATER DEGAUSSING RANGE INSTALLATION AND THIS FACILITY, WHICH SERVES AS AN INSTRUMENT STATION.
15921	1591	S		[EA]		DEGAUSSING RANGE	N	A DEGAUSSING RANGE IS AN AREA SET ASIDE IN A CHANNEL OR HARBOR THAT CONTAINS SUBMERGED INSTRUMENTS, CONNECTED TO THE COMPUTER IN THE DEGAUSSING BUILDING (CATEGORY CODE 159 20), WHICH REGISTERS A SHIP'S MAGNETIC SIGNATURE AS IT PASSES THROUGH THE RANGE.
15930	1431	B	SF	[EA]		DEPERMING BUILDING	Y	A DEPERMING BUILDING IS A FACILITY THAT CONTAINS ELECTRICAL INSTRUMENTS USED TO REGULATE AND MONITOR THE DEPERMING OPERATION. DEPERMING, THE SECOND PHASE OF DEGAUSSING, IS THE PROCESS BY WHICH A SHIP'S PERMANENT LONGITUDINAL AND ATHWARTSHIP MAGNETISM IS REMOVED AND ITS PERMANENT VERTICAL MAGNETISM STABILIZED AT A LOW LEVEL.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
15950	1551	S		[FB]		FERRY SLIP	N	A FERRY SLIP PROVIDES THE ANCHORAGE FOR FERRIES WHILE LOADING OR UNLOADING. IT CONSISTS OF WATER AREAS DIRECTLY IN FRONT OF TRANSFER BRIDGES AND IS USUALLY BORDERED BY FENDER RACKS.
15964	1431	B	[SF]	EA		WATERFRONT OPERATIONS BLDG	Y	A WATERFRONT OPERATIONS BUILDING, PROVIDES FOR ALL SHIP BERTHING, SMALL CRAFT MAINTENANCE INCLUDING RELATED ELECTRONICS SYSTEMS, AND PROVIDING SUCH FACILITIES AS A DUTY CREW BUNK ROOM, CREW'S LOUNGE, BOATSWAIN¿S LOCKER, BERTHING FOR SMALL BOATS IF AN INTEGRAL PART OF THE BUILDING, SPACE FOR STORAGE OF BOAT GEAR AND PAINT, OIL SPILL EQUIPMENT AND A BATTERY CHARGING ROOM.
15966	1593	S	SY	[EA]		LANDING CRAFT RAMP	Y	A WATERFRONT LAUNCH RAMP FOR PURPOSES OF LAUNCH AND RETRIEVAL OF LANDING CRAFT.
160						HARBOR AND COASTAL FAC		
161						HARBOR PROTECTION FAC		

This basic category provides facilities for protecting the harbor against military action.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
16120	1611	S		[EA]		FIXED NET ANCHORAGE	N	THIS CATEGORY CODE INCLUDES SUCH FUNCTIONS AS PILE CLUSTERS AND PLATFORMS USED TO SUPPORT ANTI-TERRORISM/FORCE PROTECTION (AT/FP) FLOATING BARRIERS. IF A TRADITIONAL SUBMERGED HARBOR NET IS USED, THIS TYPE OF FEATURE WOULD ALSO BE REQUIRED.
16130	1611	S	SF	[EA]		WINCH HOUSE	N	A WINCH HOUSE IS A STRUCTURE USED IN CONTROL OF HARBOR NETS, FLOATING BARRIERS AND OIL BOOMS.
162						COASTAL PROTECTION FAC		

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION

This basic category provides facilities for protecting the coast against military action.

CATEGORY CODE	FAC CODE	RPA TYPE	AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
16210	1499	S		[EA]		GUN EMPLACEMENTS	N	SPACE IN STRATEGIC SITES IS PROVIDED ON BASE FOR THE INSTALLATION OF GUN EMPLACEMENTS, INCLUDING ANTI-AIRCRAFT GUNS, FOR USE IN HARBOR DEFENSE.

163 MOORINGS

Fixed structures for mooring vessels.

CATEGORY CODE	FAC CODE	RPA TYPE	AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
16310	1631	S		[EA]		MOORING DOLPHIN	N	MOORING DOLPHINS ARE INDEPENDENT STRUCTURES THAT ARE OFTEN PLACED AT THE OUTBOARD ENDS OF PIERS OR WHARVES TO PROVIDE A MOORING POINT THAT PERMITS TYING MOORING LINES AT FAVORABLE ANGLES WITHOUT HAVING TO EXTEND THE ENTIRE PIER OR WHARF STRUCTURE.
16320	1631	S		[EA]		MOORING PLATFORM	N	A MOORING PLATFORM IS AN ISOLATED STRUCTURE CONSISTING OF A TIMBER, STEEL OR CONCRETE DECK SUPPORTED ON PILING OR CAN BE A STEEL PILE, SHEET PILE OR CONCRETE TYPE CAISSON. TWO OR MORE PLATFORMS ARE PROVIDED IN LINE FOR BERTHING OF ONE OR MORE VESSELS ALONGSIDE.
16330	1631	S		[EA]		STAKE PILE MOORING	N	A STAKE PILE MOORING CONSISTS OF A STAKE PILE DRIVEN BELOW THE SURFACE OF THE FIRM BOTTOM OF THE OCEAN FLOOR. A CHAIN ATTACHED TO THE STAKE IS USED TO MOOR THE VESSEL.

164 MARINE IMPROVEMENTS

Structures for protecting the harbor, land area, or coastline from current or wave action and from flood conditions.

CATEGORY CODE	FAC CODE	RPA TYPE	AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
16410	1641	S		[LF]	EA	BREAKWATER	N	A BREAKWATER IS A FREESTANDING BARRIER DESIGNED TO BREAK UP AND DISPERSE HEAVY SEAS AND TO SHIELD THE WATERS OF A HARBOR FROM WAVE ACTION.
16420	1641	S		[LF]	EA	GROINS AND JETTIES	N	GROINS AND JETTIES ARE STRUCTURES BUILT TO INTERCEPT AND DEFLECT CURRENTS TO CONTROL LITTORAL DRIFT AND DEPOSIT OF SAND AND SILT.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
16430	8714	S		[LF]	EA	LEVEES	N	LEVEES ARE EARTHEN EMBANKMENTS DESIGNED TO PROTECT PROPERTY FROM WATER DAMAGE DURING THE FLOOD STAGE OF RIVERS AND/OR OTHER HIGH WATER.

165 DREDGING

Original dredging such as channel and turning basin dredging not directly related to the specific construction of a facility is planned under Basic Category 165. Dredging performed primarily to provide fill shall be coded under Basic Category 932, Site Improvement. Dredging directly related to the specific construction of an item shall bear the same code as the item. Do not use this category code for inventory purposes.

169 OTHER HARBOR & COASTAL

Harbor and entrance control points and signal towers.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
16910	1611	S		[EA]		HARBOR ENTRANCE CONTR FAC	N	A LARGE PAVED SITE FOR LAYOUT AND ASSEMBLY OF HARBOR NETS AND ALLIED EQUIPMENT. THE LAYOUT AREA SHOULD BE NEAR THE WATERFRONT AND ACCESSIBLE TO MOBILE CRANES FOR NET AND EQUIPMENT HANDLING. THE AREA IS KNOWN AS THE NET DEPOT AND IS USED FOR NET MAINTENANCE AND FOR TRAINING IN NET HANDLING.

170 TRAINING FACILITIES

Facilities designated for the service career and reserve training of Navy and Marine Corps personnel. There are two basic categories under this code: 171 TRAINING BUILDINGS, and 179 TRAINING FACILITIES OTHER THAN BUILDINGS

171 TRAINING BUILDINGS

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION

Class room/special buldings designed to provide space for training and general instruction. Facilities in this basic category are identified according to the nature of instruction provided. The major building types are: 171-1.1 Academic Instruction Building, 171-1.2 Reserve Training Building, 171-1.3 Applied Instruction Building, and 171-1.4 Operational Trainer Space.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
17110	1711	B	[SF]		PN	ACADEMIC INSTRUCTION BLDG	Y	THERE ARE GENERALLY TWO TYPES OF CLASSROOM: GENERAL ACADEMIC CLASSROOM - IS ONE WHICH SUPPORTS APPROVED TRAINING PROGRAMS AND PROVIDES ACCOMMODATIONS FOR CLASSROOM LECTURE INSTRUCTION, AND MODIFIED ACADEMIC CLASSROOM - IS ONE WHICH IS EQUIPPED WITH DESKS OR OTHER WORKING SURFACES
17115	1714	B	[SF]		PN	NAVY & MC RSRV TRNG BLDG	Y	THIS CATEGORY CODE REFERS TO THE RESERVE TRAINING CENTER ONLY. CRITERIA FOR OTHER FACILITIES NOT INCLUDED IN THIS SECTION (E.G., UNACCOMPANIED HOUSING, DINING, AIRCRAFT MAINTENANCE HANGARS, ETC.) FOLLOW THE SAME CRITERIA AS ACTIVE DUTY, AND CAN BE FOUND IN THE SUBSEQUENT CATEGORY CODES. REFER TO NAVFAC P-72 FOR A FUNCTION / CATEGORY CODE CROSS-REFERENCE.
17117	1441	B	[SF]			TV CTR/INSTRUCTION MATTER	Y	THIS FACILITY MAY BE PROVIDED ONLY WHEN SPECIFICALLY AUTHORIZED BY CNET. REQUIREMENTS WILL BE DETERMINED FOR EACH INDIVIDUAL CASE, WITH CNET GUIDANCE.
17120	1712	B	[SF]		PN	APPLIED INSTRUCTION BLDG	Y	THIS FACILITY PROVIDES FOR TRAINING PERSONNEL THROUGH THE APPLIED USE OF TECHNICAL EQUIPMENT AND TOOLS.
17125	7431	B	[SF]		SE	GEN PRPSE AUDITORIUM	Y	AN AUDITORIUM MAY BE AUTHORIZED WHEN REQUIRED AS AN ADJUNCT TO TRAINING OR OTHER FUNCTIONS (EXCEPT ADMINISTRATION). THE PRIMARY PURPOSE OF THE AUDITORIUM IS AN ASSEMBLY AREA FOR INSTRUCTION AND TRAINING.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
17130	1715	B	[SF]			PE FACILITY	Y	A SERVICCE ACADEMY LEVEL PHYSICAL FITNESS TRAINING FACILITY FOR USE BY THE US NAVAL ACADEMY.
17135	1721	B	[SF]			OPERATIONAL TRAINER FAC	Y	THIS FACILITY HOUSES LARGE OPERATIONAL TRAINERS, USUALLY DUPLICATING PART OR ALL OF SURFACE OR AIR WEAPONS SYSTEM.
17136	1724	B	[SF]			RADAR SIMULATOR FACILITY	Y	THIS FACILITY HOUSES VARIOUS RADAR TRAINING FACILITIES AND MAY BE PROVIDED ONLY WHEN SPECIFICALLY AUTHORIZED BY CNET. REQUIREMENTS WILL BE DETERMINED FOR EACH INDIVIDUAL CASE, WITH CNET GUIDANCE.
17140	1714	B	[SF]			DRILL HALL	Y	A COMPONENT OF A RESERVE TRAINING FACILITY USED PRIMARILY TO PRACTICE DRILLING AND MARCHING.
17145	1732	B	[SF]			MOCK-UP TRNG AID PREP CTR	Y	FACILITY FOR THE CONSTRUCTION, MAINTENANCE, AND REPAIR OF TRAINING MOCK UPS FOR TRAINING FACILITIES.
17150	1718	B	[SF]		FP	SMALL ARMS RANGE - INDOORS	Y	AN INDOOR SMALL ARMS RANGE PROVIDES TRAINING SPACE FOR THE USE OF PISTOLS AND SMALL CALIBER (22) RIFLES. RANGES WILL BE USED BY ALL SERVICES ON A JOINT BASIS WHEN FEASIBLE, AND THEY MUST BE OF SUFFICIENT SIZE AND CAPACITY TO PROVIDE CONTINUAL TRAINING AND RETRAINING FOR ALL MILITARY PERSONNEL THAT REQUIRE WEAPONS TRAINING/QUALIFICATION.
17160	6100	B	[SF]		PN	RECRUIT PROCESSING BLDG	Y	A RECRUIT PROCESSING BUILDING IS A FACILITY FOR RECEIVING, EXAMINING, AND OUTFITTING RECRUITS. THE PROCESSING BUILDING MUST PROVIDE SPACE FOR THE COMPLETE ORIENTATION, EXAMINATION, AND PROCESSING (MEDICAL, DENTAL, SUPPLY, ADMINISTRATIVE) OF ALL NEWLY INDUCTED AND RECRUITED PERSONNEL.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
17177	1732	B	[SF]			TRNG MATRL STRG	Y	STORAGE FACILITIES FOR MISCELLANEOUS GOODS OR EQUIPMENT RELATED TO TRAINING FACILITY SUPPORT WILL BE PROVIDED ONLY WHERE IT CAN BE INDIVIDUALLY JUSTIFIED. THERE ARE NO CRITERIA FOR THIS TYPE OF FACILITY.
172						SIMULATION FACILITIES		
17230	1723	B	[SF]			GAS CHAMBER	Y	A GAS CHAMBER IS A BUILDING USED FOR TRAINING PERSONNEL IN THE USE OF PROTECTIVE MASKS AND THE EFFECTS OF CHEMICAL WARFARE.
173						TRAINING SUPPORT FACILITIES		
17310	1731	B	[SF]			RANGE OPERATIONS BLDG	Y	RANGE OPERATIONS BUILDINGS ARE DESIGNED FOR DIRECT SUPPORT TO RANGE OPERATIONS. SUCH BUILDINGS CAN SUPPORT A VARIETY OF OPERATIONS FOR A FIRING RANGE, SUCH AS : RANGE OPERATIONS, ADMINISTRATIVE SUPPORT, TARGET STORAGE AND ISSUE, EQUIPMENT STORAGE AND MAINTENANCE, AND AMMUNITION BREAKDOWN AND DISTRIBUTION (NOT STORAGE).
17311	1731	B	[SF]			RANGE SUPPORT BLDG	Y	A RANGE SUPPORT BUILDING WOULD BE A BUILDING WHICH HOUSES SUPPORT FUNCTIONS CONDUCTED AT THE RANGE COMPLEX, BUT NOT COVERED ELSEWHERE. THIS INCLUDES RANGE BILLETS, CLASSROOM SPACE AT A RANGE, BUILDINGS TO CONDUCT AFTER ACTION REVIEWS, AND ALL OTHER RANGE SUPPORT ACTIVITIES WITH THE EXCEPTION OF ACTIVITIES DESCRIBED IN RANGE OPERATIONS BUILDING, WEAPONS RANGE OBSERVATION TOWER, AND PUBLIC TOILET.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA OTHER ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
17320	1732	B	[SF]	TRAINING AIDS CENTER	Y	A TRAINING AIDS CENTER IS A BUILDING THAT IS USED TO FABRICATE, MAINTAIN, STORE, AND ISSUE TRAINING DEVICES AND MATERIALS INCLUDING MULTIPLE INTEGRATED LASER EQUIPMENT SYSTEM (MILES) AND VISUAL INFORMATION (VI) AIDS; IT ALSO PROVIDES THE ADMINISTRATIVE SPACE FOR THE TRAINING SUPPORT DIVISION (TSD) MANAGEMENT STAFF.
17330	1733	S	[SF]	COVERED TRAINING AREA	Y	COVERED TRAINING AREAS ARE STRUCTURES WHICH PROVIDE A COVERED AREA TO SUPPORT AND CONDUCT TRAINING OR FOR FEEDING OF PERSONNEL ON A TRAINING FACILITY WHILE PROVIDING PROTECTION FOR EQUIPMENT AND PERSONNEL FROM THE ELEMENTS.

174 IMPACT, MANVR, TRNG AREAS

All space for ground and air combat forces to practice movements and tactics. This includes all area having designated boundaries within which all ordnance will detonate or impact.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA OTHER ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
17410	1741	S	[AC]	MNVR/TRNG AREA, LT FORCES	N	THIS CATEGORY INCLUDES ALL SPACE FOR GROUND AND AIR COMBAT FORCES TO PRACTICE MOVEMENTS AND TACTICS. DIFFERENT TYPES OF UNITS MAY SUPPORT ONE ANOTHER (COMBINED ARMS), OR A UNIT MAY OPERATE INDEPENDENTLY. THE ¿LIGHT¿ DESIGNATION REFERS TO AREAS WHERE MANEUVER IS RESTRICTED TO ONLY SMALL UNITS OR UNITS HAVING ONLY WHEELED VEHICLES.
17411	1741	S	[AC]	MNVR/TRNG AREA, AMPHIB	N	THIS CATEGORY INCLUDES ALL SPACE FOR GROUND AND AIR COMBAT FORCES TO PRACTICE MOVEMENTS AND TACTICS DURING AMPHIBIOUS (SHIP-TO-SHORE) OPERATIONS.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
17412	1741	S	[AC]	EA		LAND NAVIGATION COURSE	N	A LAND NAVIGATION COURSE IS AN AREA LOCATED WITHIN THE TRAINING COMPLEX WHICH IS PRINCIPALLY SCHEDULED AND USED FOR MAP READING, TERRAIN ASSOCIATION, OR NAVIGATIONAL TRAINING.
17413	1741	S	[AC]	EA		FIELD TRAINING AREA	N	A FIELD TRAINING AREA IS A SPECIFIC AREA THAT IS INTENDED FOR THE TRAINING OF PERSONNEL OR ANIMALS IN A FIELD ENVIRONMENT THAT CANNOT BE CATEGORIZED BY THE OTHER CATEGORY CODES IN THE 174 BASIC SERIES. TRAINING CONDUCTED IN SUCH AN AREA MAY INCLUDE MEDICAL, K-9, OR COMMUNICATIONS EQUIPMENT.
17420	1742	S	[AC]			MNVR/TRNG AREA, HEAVY	N	THIS CATEGORY INCLUDES ALL SPACE FOR GROUND AND AIR COMBAT FORCES TO PRACTICE MOVEMENTS AND TACTICS. DIFFERENT TYPES OF UNITS MAY SUPPORT ONE ANOTHER (COMBINED ARMS), OR MAY OPERATE INDEPENDENTLY. THE ¿HEAVY¿ DESIGNATION REFERS TO AREAS WHERE MANEUVER IS UNRESTRICTED AND CAN CONSIST OF ALL TYPES OF VEHICLES AND EQUIPMENT, INCLUDING TRACKED VEHICLES.
17430	1743	S	[AC]			IMPACT AREA DUDDED	N	AN AREA HAVING DESIGNATED BOUNDARIES WITHIN WHICH ALL ORDNANCE WILL DETONATE OR IMPACT SHALL BE CATEGORIZED AS IMPACT AREA DUDDED. THIS AREA INCLUDES ALL IMPACT AREAS THAT DO NOT CONTAIN AUTOMATED TARGETS OR TARGETS CLASSIFIED AS REAL PROPERTY.
17431	1743	S	[AC]			IMPACT AREA NON-DUDDED	N	AN AREA HAVING DESIGNATED BOUNDARIES WITHIN WHICH ORDNANCE THAT DOES NOT PRODUCE DUDS WILL IMPACT IS AN IMPACT AREA NON-DUDDED. THIS AREA IS COMPOSED MOSTLY OF THE SAFETY FANS FOR SMALL ARMS RANGES.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
17440	1744	S	[AC]	EA		PERS/EQUIP DROP ZONE	N	A LARGE, FLAT, CLEARED AREA FOR PERSONNEL AND EQUIPMENT TO LAND FOLLOWING A PARACHUTE JUMP SHALL BE CATEGORIZED AS A PERSONNEL/EQUIPMENT DROP ZONE.
175						SMALL ARMS RANGES		
17501	1750	S	AC		[FP]	AUTOMATIC RIFLE RANGE	Y	THE AUTOMATIC RIFLE RANGE IS DESIGNED FOR TRAINING TARGET ENGAGEMENT TECHNIQUES WITH RIFLES AND SQUAD AUTOMATIC WEAPON (SAW). THIS RANGE IS USED TO TRAIN PERSONNEL ON THE SKILLS NECESSARY TO EMPLOY AUTOMATIC AND SEMI-AUTOMATIC FIRING TECHNIQUES.
17502	1750	S	AC		[FP]	NON-STD SMALL ARMS RANGE	Y	THE NON-STANDARD SMALL ARMS RANGE IS DESIGNED FOR TRAINING REQUIREMENTS THAT ARE NOT ASSOCIATED WITH CURRENT PUBLISHED DOCTRINE, BUT FALL WITHIN A COMMANDER¿S TRAINING REQUIREMENTS. THIS RANGE INCLUDES ALL SMALL ARMS RANGES THAT DO NOT FIT INTO OTHER CATEGORIES.
17510	1751	S	AC		[FP]	BASIC ZERO FIRING RANGE	Y	A BASIC ZERO FIRING RANGE IS DESIGNED FOR TRAINING SHOT-GROUPING AND ZEROING EXERCISES WITH RIFLES AND MACHINE GUNS. THIS RANGE IS USED TO TRAIN INDIVIDUAL PERSONNEL ON THE SKILLS NECESSARY TO ALIGN THE SIGHTS AND PRACTICE BASIC MARKSMANSHIP TECHNIQUES AGAINST STATIONARY TARGETS.
17520	1752	S	AC		[FP]	AUTO FLD FIRE (AFF) RANGE	Y	AN AUTOMATE FIELD FIRE RANGE IS DESIGNED FOR TRAINING TARGET ENGAGEMENT TECHNIQUES WITH RIFLES. THIS RANGE IS USED TO TRAIN AND FAMILIARIZE PERSONNEL ON THE SKILLS NECESSARY TO IDENTIFY, ENGAGE, AND HIT STATIONARY INFANTRY TARGETS.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
17530	1753	S	AC		[FP]	RECORD FIRE RANGE	Y	A RECORD FIRE RANGE IS DESIGNED FOR TRAINING AND DAY/NIGHT QUALIFICATION REQUIREMENTS WITH RIFLES. THIS RANGE IS USED TO TRAIN AND TEST PERSONNEL ON THE SKILLS NECESSARY TO IDENTIFY, ENGAGE, AND HIT STATIONARY INFANTRY TARGETS.
17531	1753	S	AC		[FP]	AUTO RECORD FIRE RANGE	Y	AN AUTOMATED RECORD FIRE RANGE IS DESIGNED FOR TRAINING AND DAY/NIGHT QUALIFICATION REQUIREMENTS WITH RIFLES. THIS RANGE IS USED TO TRAIN AND TEST PERSONNEL ON THE SKILLS NECESSARY TO IDENTIFY, ENGAGE, AND HIT STATIONARY INFANTRY TARGETS. ALL TARGETS ARE FULLY AUTOMATED AND THE EVENT SPECIFIC TARGET SCENARIO IS COMPUTER DRIVEN AND SCORED FROM THE RANGE OPERATIONS CENTER.
17532	1753	S	AC		[FP]	MOD RECORD FIRE RANGE	Y	A MODIFIED RECORD FIRE RANGE IS DESIGNED FOR TRAINING AND DAY/NIGHT QUALIFICATION WITH RIFLES.
17550	1755	S	AC		[FP]	RIFLE (KD) RANGE	Y	A RIFLE KNOWN DISTANCE RANGE IS DESIGNED FOR TRAINING RIFLE MARKSMANSHIP AND TARGET ENGAGEMENT TECHNIQUES. THIS RANGE IS USED TO TRAIN PERSONNEL ON THE SKILLS NECESSARY TO IDENTIFY, ENGAGE, AND HIT STATIONARY TARGETS IN A STATIC ARRAY FROM A KNOWN DISTANCE.
17560	1756	S	AC		[FP]	SNIPER FIELD FIRE RANGE	Y	A SNIPER FIELD FIRE RANGE IS DESIGNED TO MEET TRAINING AND QUALIFICATION REQUIREMENTS WITH THE SNIPER RIFLE. THIS RANGE IS USED TO TRAIN AND TEST SNIPERS ON THE SKILLS NECESSARY TO DETECT, IDENTIFY, ENGAGE, AND HIT STATIONARY AND MOVING INFANTRY TARGETS IN A TACTICAL ARRAY IN ACCORDANCE WITH APPLICABLE FIELD MANUALS. IN THIS RANGE TARGETS ARE NOT FULLY AUTOMATED.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
17561	1756	S	AC		[FP]	AUTO SNIPER FLD FIRE RNG	Y	AN AUTOMATED SNIPER FIELD FIRE RANGE IS DESIGNED TO MEET THE TRAINING AND QUALIFICATION REQUIREMENTS WITH THE SNIPER RIFLE. THIS RANGE IS USED TO TRAIN AND TEST SNIPERS ON THE SKILLS NECESSARY TO DETECT, IDENTIFY, ENGAGE, AND HIT STATIONARY AND MOVING INFANTRY TARGETS IN A TACTICAL ARRAY IN ACCORDANCE WITH APPLICABLE FIELD MANUALS.
17570	1757	S	AC		[FP]	PISTOL (KD) RANGE	Y	A PISTOL KNOWN DISTANCE (KD) RANGE IS DESIGNED FOR TRAINING PISTOL AND REVOLVER MARKSMANSHIP AND TARGET ENGAGEMENT TECHNIQUES. THIS RANGE IS USED TO TRAIN PERSONNEL ON THE SKILLS NECESSARY TO IDENTIFY, ENGAGE, AND HIT STATIONARY TARGETS IN A STATIC ARRAY FROM A KNOWN DISTANCE.
17571	1757	S	AC		[FP]	COMBAT PISTOL QUAL CRSE	Y	A COMBAT PISTOL/MP FIREARMS QUALIFICATION COURSE IS A RANGE DESIGNED TO MEET TRAINING AND QUALIFICATION REQUIREMENTS WITH COMBAT PISTOLS AND REVOLVERS. THIS RANGE IS USED TO TRAIN AND TEST PERSONNEL ON THE SKILLS NECESSARY TO IDENTIFY, ENGAGE, AND HIT STATIONARY INFANTRY TARGETS.
17572	1757	S	AC		[FP]	AUTO COMBAT PSTL QUAL	Y	AN AUTOMATED COMBAT PISTOL/MP FIREARMS QUALIFICATION COURSE IS A RANGE DESIGNED TO MEET TRAINING AND QUALIFICATION REQUIREMENTS WITH COMBAT PISTOLS AND REVOLVERS. THIS RANGE IS USED TO TRAIN AND TEST PERSONNEL ON THE SKILLS NECESSARY TO IDENTIFY, ENGAGE, AND HIT STATIONARY INFANTRY TARGETS.
17573	1758	S	AC		[FP]	SUBMACHINE GUN RANGE	Y	A SUBMACHINE GUN RANGE IS DESIGNED FOR TRAINING TARGET ENGAGEMENT TECHNIQUES WITH THE SUBMACHINE GUN. THIS RANGE IS USED TO TRAIN PERSONNEL ON THE SKILLS NECESSARY TO IDENTIFY, ENGAGE, AND HIT STATIONARY INFANTRY TARGETS.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
17580	1758	S	AC		[FP]	MACHINE GUN TRANS RANGE	Y	A MACHINE GUN TRANSITION RANGE IS DESIGNED TO MEET THE TRAINING REQUIREMENTS WITH MACHINE GUNS. THIS RANGE IS USED TO TRAIN PERSONNEL ON THE SKILLS NECESSARY TO IDENTIFY, ENGAGE, AND HIT STATIONARY INFANTRY TARGETS AT KNOWN DISTANCES.
17581	1758	S	AC		[FP]	MACHINE GUN FF RANGE	Y	A MACHINE GUN FIELD FIRE RANGE IS DESIGNED TO TRAIN TARGET ENGAGEMENT TECHNIQUES WITH SQUAD ASSAULT WEAPONS AND MACHINE GUNS. THIS RANGE IS USED TO TRAIN PERSONNEL ON THE SKILLS NECESSARY TO IDENTIFY, ENGAGE, AND HIT STATIONARY INFANTRY, VEHICLE, AND BUNKER TYPE TARGETS.
17582	1758	S	AC		[FP]	AUTOMATED MPMG RANGE	Y	AN AUTOMATED MULTIPURPOSE MACHINE GUN (MPMG) RANGE IS DESIGNED FOR ZEROING, TRAINING, AND QUALIFICATION REQUIREMENTS WITH SQUAD ASSAULT WEAPONS (SAW) AND MACHINE GUNS. THIS RANGE IS USED TO TRAIN PERSONNEL ON THE SKILLS NECESSARY TO IDENTIFY, ENGAGE, AND HIT STATIONARY INFANTRY TARGETS.
176						WEAPONS RANGES		
17610	1761	S	AC		[FP]	GRENADE LAUNCHER RANGE	Y	A GRENADE LAUNCHER RANGE IS DESIGNED TO MEET TRAINING AND QUALIFICATION REQUIREMENTS OF THE 40MM M203 GRENADE LAUNCHER. THIS RANGE IS USED TO TRAIN AND TEST PERSONNEL ON THE SKILLS NECESSARY TO ENGAGE AND DEFEAT STATIONARY TARGET EMPLACEMENTS WITH THE 40MM GRENADE LAUNCHER.

17620	1762	S	AC	LN	[FP]	40MM QUALFICATION RANGE	Y	A 40MM MACHINE GUN QUALIFICATION RANGE IS DESIGNED TO CONDUCT TRAINING QUALIFICATION FIRING WITH THE GRENADE MACHINE GUN (E.G., MK-19). THIS RANGE IS USED TO TRAIN PERSONNEL WITH THE WEAPON EITHER GROUND OR VEHICLE MOUNTED. TARGETS IN THIS RANGE MAY BE EITHER NON-AUTOMATED OR FULLY AUTOMATED AND THE EVENT SPECIFIC TARGET SCENARIO IS COMPUTER DRIVEN AND SCORED FROM THE RANGE OPERATIONS CENTER.
17630	1763	S	AC		[FP]	LAW RANGE SUBCALIBER	Y	A LIGHT ANTI-ARMOR WEAPONS RANGE IS DESIGNED FOR TRAINING TARGET ENGAGEMENT TECHNIQUES WITH LIGHT ANTI-ARMOR WEAPONS (E.G., LAW/AT-4). THIS RANGE IS USED TO TRAIN PERSONNEL ON THE SKILLS NECESSARY TO EMPLOY THE WEAPON AND HIT STATIONARY AND MOVING TARGETS USING A SUB-CALIBER TRAINING DEVICE.
17631	1763	S	AC		[FP]	LAW RANGE LIVE	Y	A LIGHT ANTI-ARMOR WEAPONS RANGE LIVE IS DESIGNED FOR TRAINING TARGET ENGAGEMENT TECHNIQUES WITH LIGHT ANTI-ARMOR WEAPONS (E.G., LAW/ AT-4). THIS RANGE IS USED TO TRAIN PERSONNEL ON THE SKILLS NECESSARY TO EMPLOY THE WEAPON AND HIT STATIONARY AND MOVING TARGETS USING LIVE ROCKETS OR A SUB-CALIBER TRAINING DEVICE.
17640	1764	S	AC	LN	[FP]	ANTIARMOR TRK/ FIRE RANGE	Y	AN ANTI-ARMOR TRACKING AND LIVE-FIRE RANGE IS A COMPLEX DESIGNED TO MEET TRAINING AND QUALIFICATION REQUIREMENTS WITH MEDIUM AND HEAVY ANTI-ARMOR WEAPONS SYSTEMS. THIS COMPLEX IS USED TO TRAIN AND TEST SOLDIERS ON THE SKILLS NECESSARY TO EMPLOY THE WEAPON, IDENTIFY, TRACK, ENGAGE, AND DEFEAT STATIONARY AND MOVING ARMOR TARGETS PRESENTED INDIVIDUALLY OR AS PART OF A TACTICAL ARRAY.

17991	1799	S	AC	[EA]		CONFIDENCE COURSE	Y	A CONFIDENCE COURSE IS DESIGNED FOR DEVELOPING INDIVIDUAL SOLDIER CONFIDENCE AND STRENGTH THROUGH A SERIES OF OBSTACLES. NO AUTOMATION IS REQUIRED FOR THIS FACILITY.
17992	1799	S	AC	[EA]		OBSTACLE COURSE	Y	AN OBSTACLE COURSE IS A FACILITY CONTAINING NUMEROUS OBSTACLES DESIGNED FOR DEVELOPING AND MEASURING INDIVIDUAL SOLDIER SPEED, AGILITY, AND COORDINATION UTILIZING VARIOUS OBSTACLES IN AN EFFORT TO REACH THE OBJECTIVE.
200						MAINT AND PRODUCTION FAC		
210						MAINTENANCE FACILITIES		
211						MAINTENANCE-AIRCRAFT		

Facilities for the maintenance and repair of Navy and Marine Corps aircraft and related spares, including airframes, aircraft engines, aircraft weapons systems, avionics systems, and other related aircraft equipment.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
21101	2114	B	[SF]	EA		AIRCRAFT ENGINE TEST BLDG	Y	A BUILDING OR UTILIZATION IN A BUILDING USED AS AN ENGINE TEST CELL FOR EITHER IN-FRAME OR OUT-OF-FRAME ENGINE TESTING. SOMETIMES REFERRED TO AS A "HUSH HOUSE."
21103	2113	B	[SF]			CORROSION CONTROL HANGAR	Y	THIS HANGAR PROVIDES SPACE FOR WASHING, RINSING, PAINT STRIPPING, CORROSION REMOVAL, PROTECTIVE COATING AND PAINTING OF AIRCRAFT AT THE INTERMEDIATE AND ORGANIZATIONAL MAINTENANCE LEVELS.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
21104	2111	B	[SF]			PRE-ENGIN MAINTENCE HANGAR	Y	THIS PRE-ENGINEERED MAINTENANCE HANGAR PROVIDES A FACILITY FOR AN ORGANIZATIONAL LEVEL MAINTENANCE OF NAVY AND MARINE CORPS AIRCRAFT. ITS INTENDED USE IS PRIMARILY AT OVERSEAS LOCATIONS FOR THE SUPPORT OF A DETACHMENT SIZE UNIT OF FROM THREE TO FIVE AIRCRAFT.
21105	2111	B	[SF]			MAINT HANGAR-O/H SPACE	Y	MAINTENANCE HANGARS ARE REQUIRED TO PROVIDE WEATHER-PROTECTED SHELTER FOR THE SERVICING AND REPAIR OF NAVY AND MARINE CORPS AIRCRAFT AT THE ORGANIZATIONAL LEVEL AND EMERGENCY SHELTER FOR OPERABLE AIRCRAFT.
21106	2112	B	[SF]			MAINT HANGAR-01 SPACE	Y	(01) IN ADDITION TO PROVIDING A WEATHER-PROTECTED SHELTER FOR THE SERVICING AND REPAIR OF NAVY AND MARINE CORPS AIRCRAFT AT THE ORGANIZATIONAL LEVEL AND EMERGENCY SHELTER FOR OPERABLE AIRCRAFT, IT ALSO CONTAINS SPACE FOR CREW AND EQUIPMENT.
21107	6100	B	[SF]			MAINT HANGAR-02 SPACE	Y	(02) IN ADDITION TO PROVIDING A WEATHER-PROTECTED SHELTER FOR THE SERVICING AND REPAIR OF NAVY AND MARINE CORPS AIRCRAFT AT THE ORGANIZATIONAL LEVEL AND EMERGENCY SHELTER FOR OPERABLE AIRCRAFT, IT ALSO CONTAINS ADMINISTRATIVE SPACE.
21108	2112	B	[SF]			AIRFRAMES SHOP (NON-DEPOT)	Y	AN INTERMEDIATE MAINTENANCE LEVEL IS REQUIRED AT NAVY AND MARINE CORPS AIR INSTALLATIONS FOR THE TESTING, MAINTENANCE AND REPAIR OF AIRFRAMES COMPONENTS. THIS SECTION PROVIDES THE METHOD FOR DETERMINING THE SPACE REQUIREMENTS FOR THIS DIVISION. THE PRIMARY FUNCTION OF THE AIRFRAMES SHOP IS TO REPAIR AIRCRAFT BOTH STRUCTURAL AND HYDRAULIC.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
21109	1791	S		[EA]		AIRCRAFT BORESIGHT RANGE	Y	ONE AIRCRAFT BORESIGHT RANGE IS REQUIRED AT NAVY AND MARINE CORPS AIR INSTALLATIONS THAT SERVICE AIRCRAFT EQUIPPED WITH FIXED GUNS OR GUN PODS. A TAXIWAY, CATEGORY CODE 112 10 IS REQUIRED FOR ACCESS TO THIS FACILITY. AN AIRCRAFT PARKING APRON WITH TIE-DOWNS, CATEGORY CODE 113 20 IS REQUIRED TO PARK AND SECURE THE AIRCRAFT DURING GUN ALIGNMENT.
21110	2116	B	[SF]			A/C OVERHAUL & REPAIR SHOP	Y	AN AIRCRAFT OVERHAUL AND REPAIR SHOP IS REQUIRED FOR THE AIRFRAME PRODUCTION SHOP OF THE NAVAL AIR DEPOT (NAVAIR DEPOT). THERE ARE GENERALLY TWO TYPES OF AIRCRAFT OVERHAUL AND REPAIR SHOPS. ONE SUPPORTS AIRCRAFT OVERHAUL AND REPAIR OF TRAINER AIRCRAFT, FIGHTER AIRCRAFT, AND HELICOPTERS AND ONE SUPPORTS AIRCRAFT OVERHAUL AND REPAIR OF CARGO, TRANSPORT, AND PATROL AIRCRAFT.
21111	2116	B	[SF]			COROSION CONTRL-CLEAN SHOP	Y	THIS SHOP IS REQUIRED TO PROVIDE SPACE FOR AIRCRAFT CORROSION CONTROL AND DECONTAMINATION FACILITIES DESIGNED FOR CLEANING, PAINT STRIPPING, ETC., OF THE COMPLETE AIRCRAFT FOR THE AIRFRAME PRODUCTION SHOP OF THE NAVAL AIR DEPOT (NAVAIR DEPOT).
21112	2116	B	[SF]			PAINT & FINISHING HANGAR	Y	THIS HANGER IS REQUIRED FOR THE AIRFRAME PRODUCTION SHOP OF THE NAVAL AIR DEPOT (NAVAIR DEPOT). THIS FACILITY PROVIDES SPACE TO REPAINT AN ENTIRE AIRCRAFT.
21113	2116	B	[SF]			A/C NON-DESTRUCT TEST SHP	Y	THIS SHOP IS REQUIRED TO PROVIDE SPACE FOR THE NON-DESTRUCTIVE INSPECTION OF AIRFRAMES FOR THE AIRFRAME PRODUCTION SHOP OF THE NAVAL AIR DEPOT (NAVAIR DEPOT).

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
21139	2116	B	[SF]			OPTICAL & PHOTOGRAPHIC COM	Y	OPTICAL AND PHOTOGRAPHIC COMPONENTS SHOP SUPPORTS THE ACCESSORIES AND COMPONENTS PRODUCTION SHOP OF THE (NAVAIR DEPOT). INCLUDED WITHIN THIS CATEGORY CODE ARE: PHOTOGRAPHIC EQUIPMENT REPAIR SHOP AND OPTICAL COMPONENT REPAIR SHOP.
21140	2116	B	[SF]			ELECTRON,COMM & ARM SYS SH	Y	A SHOP THAT PROVIDES SPACE ASSOCIATED WITH PROCESSING AIRBORNE COMMUNICATION AND NAVIGATION EQUIPMENT, INSTRUMENTS, AIRBORNE DATA COMPUTERS, FIRE CONTROL AND BOMBING SYSTEM EQUIPMENT, GYROSCOPES, INERTIAL GUIDANCE SYSTEMS, AND OTHER AVIONICS EQUIPMENT.
21141	2116	B	[SF]			DED ELEC,COM & ARM GEN PRO	Y	SPECIALIZED SHOP THAT SUPPORTS THE ELECTRONIC, COMMUNICATION, AND ARMAMENT SYSTEMS PRODUCTION SHOP OF THE NAVAIR DEPOT. INCLUDED WITHIN THIS CATEGORY CODE ARE ELECTRONICS, COMMUNICATION, AND ARMAMENT SYSTEMS DEDICATED: CLEANING SHOP; PAINT SHOP; MACHINE SHOP; WELDING SHOP; PLATING SHOP; BEARINGS SHOP; AND INSTRUMENT OVERHAUL SHOP.
21142	2116	B	[SF]			ELECTRONIC SYS COMPONENTS	Y	SPECIALIZED SHOP THAT SUPPORTS ELECTRONIC, COMMUNICATION, AND ARMAMENT SYSTEMS PRODUCTION SHOP OF THE NAVAIR DEPOT. INCLUDED WITHIN THIS CATEGORY CODE ARE: ARMAMENT AND AVIONICS SHOP; AIRBORNE SYSTEMS SOFTWARE SHOP; NAVIGATIONAL AIDS REPAIR SHOP; AND AVIONICS TESTING SHOP.
21143	2116	B	[SF]			INERTIAL QUAL INSTRU OH SH	Y	INERTIAL QUALITY INSTRUMENT OVERHAUL SHOP OF THE NAVAIR DEPOT. INCLUDED WITHIN THIS CATEGORY CODE ARE: INERTIAL QUALITY GYROSCOPE OVERHAUL SHOP AND INERTIAL GUIDANCE SYSTEM OVERHAUL AND CALIBRATION SHOP.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
21144	2116	B	[SF]			NON-INERTIAL QUAL INSTR OH	Y	SPECIALIZED SHOP THAT SUPPORTS THE ELECTRONIC, COMMUNICATION, AND ARMAMENT SYSTEMS PRODUCTION SHOP OF THE NAVAIR DEPOT. INCLUDED WITHIN THIS CATEGORY CODE ARE: ELECTRONIC INSTRUMENT OVERHAUL SHOP; MECHANICAL INSTRUMENT OVERHAUL SHOP; NON-INERTIAL GYROSCOPE OVERHAUL SHOP; AND MAGNETIC INSTRUMENT OVERHAUL AND TEST SHOP.
21145	2112	B	[SF]			AVIONICS SHOP (NON-DEPOT)	Y	AVIONICS DIVISION INTERMEDIATE MAINTENANCE LEVEL SHOP IS USED FOR THE TESTING, MAINTENANCE AND REPAIR OF AVIONICS SYSTEMS. IT UTILIZES STANDARD SIZE WORK CENTERS, VARIABLE SIZE WORK CENTERS AND SUPPORT SPACES.
21150	2116	B	[SF]			A/C ARMAMENT/MISILE REWORK	Y	AIRCRAFT ARMAMENT/MISSILE REWORK SHOP IS REQUIRED TO PROVIDE SPACE ASSOCIATED WITH PROCESSING AIRCRAFT WEAPONS INCLUDING GUNS, MISSILES, BOMB RACKS, WEAPON PYLONS, ETC.
21151	2116	B	[SF]			DED A/C ARM/MISSL GEN PURP	Y	A DEDICATED AIRCRAFT ARMAMENT/MISSILE REWORK ¿ GENERAL PURPOSE SHOP SUPPORTS THE ARMAMENT PRODUCTION SHOP OF THE NAVAL AIR DEPOT (NAVAIR DEPOT). INCLUDED WITHIN THIS CATEGORY CODE ARE ARMAMENT DEDICATED: CLEANING SHOP; PAINT SHOP; MACHINE SHOP; WELDING SHOP; PLATING SHOP; WEAPON OVERHAUL AND TEST SHOP; ORDNANCE EQUIPMENT SHOP; AND WEAPON ACCESSORIES REPAIR SHOP.
21152	2116	B	[SF]			A/C WEAPON OVERHAUL & TEST	Y	A SHOP IS REQUIRED TO PROVIDE SPACE FOR THE REPAIR OF AIR LAUNCHED MISSILES FOR THE ARMAMENT PRODUCTION SHOP OF THE NAVAIR DEPOT. INCLUDED WITHIN THIS CATEGORY CODE ARE: AIRCRAFT WEAPON OVERHAUL AND TEST SHOP; ORDNANCE EQUIPMENT SHOP; AND WEAPON ACCESSORIES REPAIR SHOP.

21250	2126	B	[SF]			SUB BAL MISSILE PROCES FAC	Y	THESE FACILITIES ARE REQUIRED TO RECEIVE COMPONENTS; CHECKOUT, ASSEMBLE, REFURBISH, AND REPAIR SUBMARINE LAUNCHED BALLISTIC MISSILES. NO PLANNING FACTORS ARE CURRENTLY AVAILABLE FOR THIS FACILITY.
21277	2121	B	[SF]			MISSILE/SPARE STRG(MISC)	Y	THESE FACILITIES ARE STORAGE FACILITIES FOR MISCELLANEOUS EQUIPMENT OR GOODS RELATED TO GUIDED MISSILES. THERE ARE NO CRITERIA FOR THIS TYPE OF FACILITY.

213 MAINT - SHIPS/SPARES

Facilities for maintenance of vessels of all types. These facilities include graving dry docks, fixed cranes, marine railways, ship repair shops, and amphibian vehicle maintenance shops. For waterfront operational facilities, see Category Group 150. For administrative facilities, see Facility Class 600.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
21310	2131	S	[SF]	LF	DS	DRYDOCK	Y	A DRY DOCK IS A LONG NARROW BASIN SITED IN THE FORESHORE OF A HARBOR. ITS ENTRANCE IS CLOSED BY A MOVABLE CAISSON OR BY GATES. THE BASIN IS SO CONSTRUCTED THAT A VESSEL MAY BE PLACED IN IT AND THE WATER REMOVED, ALLOWING THE VESSEL TO SETTLE ON SUPPORTS LOCATED ON THE DOCK FLOOR.
21320	2132	S		[EA]	TN	MARINE RAILWAY	Y	THE FUNCTION OF A MARINE RAILWAY IS TO BRING A VESSEL OUT OF THE WATER FOR THE PURPOSE OF MAKING ALL PARTS AVAILABLE FOR OVERHAUL, AND TO RETURN THE VESSEL TO THE WATER WHEN THE WORK IS FINISHED.
21330	2133	B	[SF]			SHORE INTERMED MAINT FCTY	Y	THIS FACILITY (SIMA) PROVIDES SPACE FOR THE FLEET INTERMEDIATE LEVEL MAINTENANCE OPERATIONS. A SIMA HAS TWO BASIC COMPONENTS: MAINTENANCE SHOPS AND ADMINISTRATION.

21931	2192	S		[EA]		PAINTG & RELTD OPNS STRC	N	THE PAINTING AND RELATED OPERATIONS STRUCTURE IS A FACILITY USED FOR PAINTING AND THOSE OPERATIONS WHICH ARE NOT SUITABLE TO BE CARRIED ON IN CATEGORY CODE 219 30, PAINTING AND RELATED OPERATIONS BUILDING. THIS CODE MAY INCLUDE STRUCTURES LIKE A SANDBLAST SCAFFOLD, PAINT SPRAY BOOTH, PRESERVATION DIP TANK, PICKLING TANK, SANDHOPPER, SANDBLASTING FACILITIES, OPEN PAINT CANOPY, SAND HANDLING BIN.
21940	2192	S		[EA]		SEWAGE HOSE STORAGE FAC	Y	SEWAGE HOSE STORAGE FACILITY. FOR INVENTORY PURPOSES ONLY.
21977	2191	B	[SF]			PW MAINTENANCE STORAGE	Y	THIS FACILITY IS A GENERAL WAREHOUSE FOR THE STORAGE OF ITEMS AND MATERIALS REQUIRED FOR THE MAINTENANCE OF STATION BUILDINGS AND GROUNDS.

220 PRODUCTION

The production facility is part of the production system that processes raw materials, components and labor into finished goods.1 Production facilities are typically ¿one-of-a-kind¿ therefore space requirements should be developed ¿from the ground up¿; first for the individual workstations; then departmental requirements by summing the workstations within the department. Applying industrial engineering practices and methods would provide sufficient and accurate space requirements. Accurate future product demand forecasts are necessary so the facility can be sized for future growth. The facility should be sized for forecasted production growth 5 to 10 years beyond initial operating capability.

221 PRODUCTION - AIRCRAFT

Facilities for constructing and assembling new components, air frames and related assemblies and spares, aircraft engines and related spares, and aircraft equipment and spares.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION

22130	2211	B	[SF]			ACFT ACCESSORY ASSEMBLY	Y	AIRCRAFT ACCESSORIES ASSEMBLY PLANT.

222 PROD - GUIDED MISSILES

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION

Facilities for constructing and assembling new components, guided missile systems and parts, ground handling and launching equipment.

22210	2221	B	[SF]			MISSILE ASSEMBLY PLANT	Y	MISSILE ASSEMBLY PLANT THAT ACCOMODATES MOTOR FINISHING, PARTS STORAGE, ADMIN, CONTROL HOUSE, SHIPPING, INGREDIENT SCREENING, PROPELLANT STORAGE, TOOL STORAGE, BURNING CAGE, BLENDING, GRINDING, DARKROOM, UTILITY STORAGE ETC.
22220	2221	B	[SF]			MISSILE HANDL LAUNCH EQUIP	Y	MISSILE HANDLING LAUNCH EQUIPMENT PLANT.

223 PRODUCTION - SHIPS, SPARES

Ship-ways, ground ways, graving docks, marine railways, appurtenant shipyard facilities for the construction of vessels of all types, of floating cranes and dry docks, and of tracked amphibious vehicles. Does not include facilities principally for use in ship maintenance and repair which fall in other categories.

22310	2231	B	[SF]			FABRICATION/ASSEMBLY BLDG	Y	FABRICATION AND ASSEMBLY BUILDING THAT ACCOMODATES FABRICATION, PROTOTYPE ASSEMBLY, TECH LAB STORAGE, CONSTRUCTION WOOD SHOP, SAND BLAST FACILITY, TECHNICAL SERVICES, AND PROTOTYPE FABRICATION.
22330	2233	S	SF	[EA]	LF	SHIP BUILDING DRYDOCKS	Y	SHIP-BUILDING DRYDOCKS.

224 PROD - TANK-AUTOMOTIVE

Facilities for constructing and assembling new components, combat vehicles, non-combat vehicles and related components, self-propelled gun carriages, ambulances, and other motorized vehicles. Excludes production facilities for weapons (225 series), tracked amphibious vehicles (223 series), and construction equipment (228 series.)

22410	2241	B	[SF]			COMBAT VEHICL ASSEMBL PLT	Y	COMBAT VEHICLE ASSEMBLY PLANT
22420	2241	B	[SF]			AUTO VEHICL ASSEMBL PLT	Y	AUTOMOTIVE VEHICLE ASSEMBLY PLANT.

225 PROD - WEAPONS/SPARES

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION

Facilities for constructing and assembling new components, small arms, automatic weapons, mortars, artillery, guns, launchers, projectors (for arming ships, vehicles, and aircraft,) flame throwers, torpedo tubes, harbor protective nets, non-eletronic equipment and related components, Use Basic Category 222 for facilities for producing guided missile equipment.

22510	2251	B	[SF]			SMALL ARMS PLANT	Y	SMALL ARMS PLANT.
22520	2251	B	[SF]			LIGHT GUN (20MM/5IN) PLANT	Y	LIGHT GUN PLANT.
22530	2251	B	[SF]			HEAVY GUN(6/16IN) PLANT	Y	HEAVY GUN PLANT.
22540	2251	B	[SF]			HARBOR PROTECT NET PLANT	Y	HARBOR PROTECTIVE NET PLANT.
22550	2251	B	[SF]			LAUNCHER/PROJECTOR PLANT	Y	LAUNCHER AND PROJECTOR PLANT.
22560	2251	B	[SF]			ARMOR PLATE PLANT	Y	ARMOR PLATE PLANT.

226 PROD - AMMO/EXPLSV/TOXICS

Facilities for constructing and assembling new components, ammunition, rockets, bombs, mines, grenades, torpedoes, depth charges, demolition materials, pyrotechnics, ATO units, guided missile fuels, ammunition parts and related components and chemicals. For facilities for producing guided bombs use Basic category 227; for commercial-type petroleum products use basic category 228.

22610	2261	B	[SF]			BAG CHARGE FILLING PLANT	Y	BAG CHARGE FILLING PLANT.
22615	2261	B	[SF]			CASE FILLING PLANT	Y	CASE FILLING PLANT.
22620	2261	B	[SF]			CASE O/H TANK REPAIR FAC	Y	CASE OVERHAUL TANK REPAIR FACILITY.
22625	2261	B	[SF]			40MM LOADING PLANT	Y	40MM-LOADING PLANT.
22630	2261	B	[SF]			20MM LOADING PLANT	Y	20MM-LOADING PLANT.
22635	2261	B	[SF]			MAJ-CAL PROJECTL LOAD PLT	Y	LARGE CALIBER PROJECTILES LOADING FACILITY.
22640	2261	B	[SF]			MED-CAL PROJECTL LOAD PLT	Y	MEDIUM CALIBER PROJECTILE LOADING FACILITY.
22645	2261	B	[SF]			LARGE CAL ROCKET LOAD PLT	Y	LARGE CALIBER ROCKET MOTOR LOADING PLANT.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
22650	2261	B	[SF]			MED CAL ROCKET LOAD PLT	Y	MEDIUM CALIBER ROCKET LOADING PLANT.
22655	2261	B	[SF]			CAST HI EXPLOS FILL PLT	Y	CAST HIGH EXPLOSIVES FILLING PLANT.
22656	2262	S	SF	[EA]		CAST HI EXPLOS FILL FAC	N	CAST HIGH EXPLOSIVES FILLING FACILITY.
22660	2261	B	[SF]			SPECIAL WEAPONS PLANT	Y	SPECIAL WEAPONS PLANT.
22665	2261	B	[SF]			PROPELLANT CHEMICAL PLT	Y	PROPELLANT AND RELATED CHEMICAL PLANT.
22666	2262	S	SF	[EA]		PROPELLANT CHEMICAL FAC	N	PROPELLANT AND RELATED CHEMICAL FACILITY.
22670	2261	B	[SF]			READY AMMO BELTING PLT	Y	READY AMMUNITION BELTING PLANT.
22675	2261	B	[SF]			UNDRWTR DEMO EQUIP PLT	Y	UNDERWATER DEMOLITION EQUIPMENT PLANT.
22680	2261	B	[SF]			AMMUNITION LOADING PLANT	Y	AMMUNITION LOADING PLANT.
22681	2264	B	[SF]			DEMILITARIZATION BUILDING	Y	DEMILITARIZATION BUILDING.
22682	2265	S		[EA]		DEMILITARIZATION FACILITY	N	DEMILITARIZATION FACILITY.
22685	2261	B	[SF]			FUSE ASSEMBLY PLANT	Y	FUZE ASSEMBLY PLANT.
22686	2261	B	[SF]			MINE ASSEMBLY PLANT	Y	MINE ASSEMBLY PLANT.
22688	2261	B	[SF]			PYROTECHNIC PRODUCTION FAC	Y	PYROTECHNIC PRODUCTION FACILITY.

227 PROD - ELECNX/COMM EQUIPT

Facilities for constructing and assembling new components radio and sonar equipment, radiation aids, sonar equipment, transmission and reception equipment, guided bombs and related components.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
22710	2271	B	[SF]			RADIO/RADAR EQUIP PLT	Y	RADIO AND RADAR EQUIPMENT PLANT.
22720	2271	B	[SF]			SONAR EQUIPMENT PLANT	Y	SONAR EQUIPMENT PLANT.
22730	2271	B	[SF]			GUIDANCE EQUIPMENT PLANT	Y	GUIDANCE EQUIPMENT PLANT.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
22735	2271	B	[SF]			PRINTED CIRCUIT SHOP	Y	PRINTED CIRCUIT SHOP.
228						PROD - MISC MATL & EQUIPT		
22810	2281	B	[SF]			PARACHUTE/SURVVL EQUIP PLT	Y	PARACHUTE AND SURVIVAL EQUIPMENT SHOP.
22820	2281	B	[SF]			CONSTRUCTION EQUIP PLT	Y	CONSTRUCTION EQUIPMENT PLANT.
22830	2281	B	[SF]			RAILROAD EQUIPMENT PLANT	Y	RAILROAD EQUIPMENT PLANT.
22835	5302	B	[SF]			OPHTHALMIC SUPPORT BUILDIN	Y	OPTHALMIC SUPPORT BUILDING.
229						PROD - DOD MNT,REP & OP		

Plants and facilities for production and processing in support of the maintenance, repair, and operation function at military or industrial installations.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
22910	2291	S		[EA]	TH	ASPHALT PLANT	Y	ASPHALT BATCH PLANT.
22920	2291	S		[EA]	TH	CONCRETE BATCHING PLANT	Y	CONCRETE BATCH PLANT.
22930	2291	S		[EA]	TH	ROCK CRUSHER PLANT	Y	ROCK CRUSHER PLANT.
22950	6103	B	[SF]	EA		PRINTING PLANT	Y	PRINTING PLANT.
22977	2281	B	[SF]			MAINT/PROD STRG (MISC)	Y	MAINTENANCE PRODUCTION STORAGE-READY ISSUE FACILITY.
22980	2281	B	[SF]			CONTAINER ASSEMBLY BLDG	Y	CONTAINER (CONEX) ASSEMBLY BUILDING.
300						RDT&E - FACILITIES		

Research, development, acquisition, test and evaluation facilities include the buildings and other scientific structures and facilities used directly in theoretical and/or applied research, development, acquisition, test and evaluation operations.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
310						SCIENCE LABORATORIES		

Category Code Report (All Series)

Buildings used directly in theoretical or applied research, development and testing operations related to basic research such as chemistry, materials, medical, biological, sonic, physics, geophysics, etc.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
31010	6100	B	[SF]			RDAT&E ADMINISTRATIVE OFC	Y	BUILDINGS USED DIRECTLY IN THEORETICAL OR APPLIED RESEARCH, DEVELOPMENT AND TESTING OPERATIONS RELATED TO BASIC RESEARCH SUCH AS CHEMISTRY, MATERIALS, MEDICAL, BIOLOGICAL, SONIC, PHYSICS, GEOPHYSICS, ETC.
31011	3101	B	[SF]			ASTRONOMY/ASTROPHYSICS LAB	Y	A FACILITY REQUIRED TO SUPPORT THE INVESTIGATION OF RADIO ASTRONOMY EQUIPMENT, SATELLITE RESEARCH, AND DEVELOPMENT FOR NAVIGATIONAL AND COMMUNICATION PROGRAMS.
31013	3101	B	[SF]			CHEMISTRY/TOXICOLOGY LAB	Y	THE FACILITY REQUIRED TO SUPPORT THE CONDUCTING OF RESEARCH, DEVELOPMENT, TEST AND EVALUATION IN THE AREAS OF PHYSICAL, ORGANIC, INORGANIC, NUCLEAR, AND BIOLOGICAL CHEMISTRY, DIRECTED TOWARDS PROBLEMS OF FUELS, LUBRICANTS, CORROSION, PROTECTIVE COATINGS, ELECTROCHEMISTRY, SUBMARINE ATMOSPHERE PURIFICATION, PROTECTION AGAINST BIOLOGICAL AND CHEMICAL WARFARE AGENTS, AND RELATED PROGRAMS.
31015	3101	B	[SF]			MATERIALS LABORATORY	Y	THIS FACILITY IS USED FOR RESEARCH, DEVELOPMENT, TEST AND EVALUATION OF STATIC, PNEUMATIC NON-DESTRUCTIVE AS WELL AS DESTRUCTIVE TESTING OF COMPONENTS AND ASSEMBLIES FOR NAVY WEAPONS, VEHICLES, ENGINES, SHIPS AND AIRCRAFT.
31017	3101	B	[SF]			OPTICS LABORATORY	Y	THIS FACILITY IS USED IN CONDUCTING RESEARCH, DEVELOPMENT, TEST AND EVALUATION PROGRAMS IN QUANTUM OPTICS, OPTICAL PROPAGATION, LASER PHYSICS, OPTICAL MATERIALS AND OPTICAL WARFARE.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
31019	3101	B	[SF]			PHYSICS LABORATORY	Y	THIS FACILITY IS USED IN RESEARCH, DEVELOPMENT, TEST AND EVALUATION STUDIES IN THE APPLIED SCIENCE OF MATTER AND ENERGY. IT INCLUDES RESEARCH IN SUCH AREAS AS ACOUSTICS, MECHANICS, LIGHT, THERMODYNAMICS, ELECTROMAGNETISM, ATOMIC AND NUCLEAR PHYSICS, CRYOGENICS, SOLID STATE PHYSICS, PARTICLE PHYSICS AND PLASMA PHYSICS, ETC.
31021	3101	B	[SF]			RADIATION EFFECTS LAB	Y	THIS FACILITY IS USED IN CONDUCTING RESEARCH, DEVELOPMENT, TEST AND EVALUATION ON RADIATION CHARACTERISTICS OF VARIOUS DEVICES AND THEIR EFFECT ON PERFORMANCE OF VARIOUS SYSTEMS IN THE AIR AND IN THE OCEAN ENVIRONMENT. IT IS ALSO USED IN THE STUDY OF EFFECTS OF RADIATION ON PEOPLE AND MARINE LIFE AND THE ACCOMPLISHMENT OF STUDIES TO DETERMINE RELIABLE METHODS FOR DETECTING RADIATION SOURCES.
31023	3101	B	[SF]			COMBINED RESEARCH LAB	Y	THIS FACILITY IS USED FOR RESEARCH, DEVELOPMENT, TEST AND EVALUATION OF NAVAL SYSTEMS WHICH UTILIZED SEVERAL OF THE SCIENCES IN A COMBINED SYSTEM APPLIED DIRECTLY TO A FLEET PROBLEM OR AREA OF RDAT&E. IT IS ALSO USED TO SUPPORT RESEARCH, DEVELOPMENT, TEST AND EVALUATION OF NAVAL SYSTEMS WHICH DO NOT LOGICALLY FIT THE OTHER CATEGORIES OF RDAT&E.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
31025	3101	B	[SF]			BIOLOGICAL LABORATORY	Y	THIS FACILITY IS USED IN RESEARCH, DEVELOPMENT, TEST AND EVALUATION IN TERRESTRIAL AND MARINE BIOLOGY AS RELATED TO STRUCTURE CAPABILITIES, FUNCTIONING HABITAT, HEALTH, GROWTH ENVIRONMENTAL INDICATORS, ECOLOGICAL RELATIONSHIPS OF LIVING ORGANISMS AND ASSOCIATION OF BIOLOGICAL PHENOMENON TO MAN'S EXISTENCE AND OPERATIONS IN THE LAND, OCEAN AND SPACE ENVIRONMENT.
31027	3101	B	[SF]			ENVIRONMENTAL LABORATORY	Y	THIS FACILITY IS USED TO SUPPORT THE RESEARCH, DEVELOPMENT, TEST AND EVALUATION OF INSTRUMENTATION AND COMPUTER SYSTEMS FOR MEASUREMENT AND ANALYSIS OF THE EVALUATION OF ENVIRONMENTAL EFFECTS ON VARIOUS EQUIPMENT, WEAPONS SYSTEMS, FACILITIES, ETC.
31029	3101	B	[SF]			ANIMAL APPLICATIONS LAB	Y	THIS FACILITY IS USED TO SUPPORT THE RDT+E ON NON-HUMAN ANIMALS IN PURE RESEARCH AND OCEAN SUPPORT APPLICATIONS. INCLUDING THE USE OF WHALES AND DOLPHINS AS TRAINED DEEP SEA DIVERS, SEALS FOR TOOL RECOVERY AND DOGS AS SENTRIES. IT ALSO INCLUDES R+D IN APPLICATION AND KNOWLEDGE OF ANIMAL CAPABILITIES IN SENSING, HOMING AND IDENTIFICATION TO IMPROVE THE OPERATION OF MAN-MADE OCEAN DEVICES.
31031	3102	B	[SF]			MEDICAL LABORATORY	Y	THIS FACILITY IS USED IN CONDUCTING RESEARCH TOWARD METHODOLOGY FOR DIAGNOSIS, TREATMENT, OR PREVENTION OF DISEASE OR DAMAGE TO THE BODY OR MIND.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
31033	3101	B	[SF]			COMPUTATION/ANALYSIS LAB	Y	THIS FACILITY SUPPORTS RESEARCH, DEVELOPMENT, TEST AND EVALUATION IN THE AREAS OF INFORMATION PROCESSING AND DATA HANDLING, ESPECIALLY WHEN CONCERNED WITH IDENTIFICATION OF CONDITIONS RESPONSIBLE FOR GIVEN DATA CONFIGURATIONS. MATHEMATICAL DATA ANALYSIS UTILIZING BOTH DIGITAL AND ANALOG COMPUTERS TO RESEARCH, DEVELOP, TEST AND EVALUATE NEW NAVAL SYSTEMS
31037	3101	B	[SF]			OCEAN SCIENCES LABORATORY	Y	THIS FACILITY IS USED TO ACCOMPLISH RDT+E IN MARINE BIOSYSTEMS, ENVIRONMENTAL PROTECTION AND MANAGEMENT, DEVELOPMENT OF ANALYTICAL SYSTEMS FOR EVALUATION OF THE OCEAN ENVIRONMENT, STUDIES OF WAVE DYNAMICS, CURRENT FLOW, THERMOCLINES, CHEMICAL VARIANCES, AS WELL AS DEVELOPMENT OF NEW TECHNIQUES AND EQUIPMENT TO INCREASE MAN'S KNOWLEDGE AND UTILIZATION OF THE TOTAL OCEAN ENVIRONMENT.
31039	3103	B	[SF]			LEVEL III BIOSAFETY LAB	Y	THIS TYPE OF LABORATORY APPLIES TO CLINICAL, DIAGNOSTIC, AND TEACHING, RESEARCH, OR PRODUCTION FACILITIES FOR WORK INVOLVING INDIGENOUS OR EXOTIC AGENTS THAT HAVE THE POTENTIAL TO TRANSMIT INFECTION THROUGH THE RESPIRATORY SYSTEM, WHICH MAY CAUSE SERIOUS AND POTENTIALLY LETHAL INFECTION.
31040	3104	B	[SF]			LEVEL IV BIOSAFETY LAB	Y	THIS TYPE OF LABORATORY IS ASSOCIATED WITH WORK ON DANGEROUS AND EXOTIC AGENTS THAT POSE A HIGH INDIVIDUAL RISK OF LIFE-THREATENING DISEASE, AEROSOL TRANSMISSION, OR RELATED AGENT WITH UNKNOWN RISK OF TRANSMISSION.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
Buildings used directly in the research, development and testing of air frames and related assemblies and spares, and other aircraft equipment.								
31105	3111	B	[SF]			RDAT&E MAINT HGR	Y	A BUILDING USED FOR THE RESEARCH, DEVELOPMENT, AND TESTING OF AIR FRAMES, RELATED ASSEMBLIES, AND OTHER AIRCRAFT EQUIPMENT. THE FACILITY INCLUDES HIGH BAY/HANGER SPACES, CREW AND EQUIPMENT SPACES, AND ADMIN SUPPORT SPACES.
31106	2112	B	[SF]			RDAT&E MAINT HGR-01 SPC	Y	RDAT&E MAINTENANCE HANGAR CREW AND EQUIPMENT AREA.
31107	2112	B	[SF]			RDAT&E MAINT HGR-02 SPC	Y	RDAT&E MAINTENANCE HANGAR ADMINISTRATIVE AREA.
31110	3111	B	[SF]			AIRCRAFT/FLIGHT EQUIP LAB	Y	THIS FACILITY IS UTILIZED IN CONDUCTING RESEARCH, DEVELOPMENT, TEST AND EVALUATION OF AERODYNAMIC DESIGN OF AIRCRAFT AND WEAPONS SYSTEMS AND NAVIGATIONAL SYSTEMS.
31120	3111	B	[SF]			AIRCRAFT GRD SUP EQUIP LAB	Y	THIS FACILITY IS USED TO RESEARCH, DEVELOPMENT, TEST AND EVALUATION OF AIRCRAFT GROUND SUPPORT EQUIPMENT, SYSTEMS AND TECHNIQUES FOR THE TAKEOFF, RECOVERY, MAINTENANCE, AND TEST OF AIRCRAFT.
31125	3111	B	[SF]			AIRCRAFT SYS INTEGRAT LAB	Y	THIS FACILITY IS USED FOR RESEARCH, DEVELOPMENT, TEST AND EVALUATION OF VARIOUS GROUPINGS AND COLLECTIONS OF INTERACTING AIRCRAFT SYSTEMS SUCH AS THE EFFECTS OF AIRFRAME, STRUCTURE, FLIGHT CONTROL, ELECTRICAL, ENVIRONMENTAL CONTROL, FUEL, HYDRAULIC, MECHANICAL, PNEUMATIC, PROPULSION, GUN, LIFE SUPPORT AND RELATED GROUND SUPPORT SYSTEMS ON ECM, AIR TO AIR MISSILE LAUNCH, ETC.
312						MISSILE AND SPACE		

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION

Buildings used directly in the research, development and testing of missiles, missile system, related ground handling, and launching equipment, and other aerospace equipment.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
31210	3121	B	[SF]			GUIDED MISSILE LAB	Y	THIS FACILITY IS USED IN SUPPORT OF RESEARCH, DEVELOPMENT, TEST AND EVALUATION OF ADVANCE SIMULATION, INSTRUMENTATION, ENVIRONMENTAL TEST TECHNIQUES AND IMPROVED SERVICEABILITY AND RELIABILITY CHARACTERISTICS OF GUIDED MISSILE WEAPON SYSTEMS. IT INCLUDES ASSEMBLY, DISASSEMBLY, TEST MODIFICATION AND ANALYSIS OF TEST FIRING RESULTS OF GUIDED MISSILES.
31220	3121	B	[SF]			MISSILE SUPPORT EQUIP LAB	Y	THIS FACILITY IS USED FOR RESEARCH, DEVELOPMENT, TEST AND EVALUATION OF EQUIPMENT AND TECHNIQUES FOR THE LAUNCHING, RECOVERY, MAINTENANCE, TRANSPORT AND TESTING OF MISSILES AND GUIDED MISSILE SUPPORT EQUIPMENT.
31225	3121	B	[SF]			SPACECRAFT / SATELLITE LAB	Y	THIS FACILITY SUPPORTS RESEARCH, DEVELOPMENT, TEST AND EVALUATION OF SPACECRAFT, SATELLITES OR COMPONENTS OF EACH NOT OTHERWISE CLASSIFIED AS A MISSILE WEAPON SYSTEM. THIS FACILITY WOULD INCLUDE RELATED GROUND SUPPORT/LAUNCHING EQUIPMENT.
31230	3121	B	[SF]			MISSILE SYS INTEGRAT LAB	Y	THIS FACILITY IS USED FOR RESEARCH, DEVELOPMENT, TEST AND EVALUATION OF RELATED AND INTERCONNECTED SYSTEMS THAT ARE NECESSARY FOR LAUNCHING, AND IN DIRECT SUPPORT OF GUIDED MISSILE SYSTEMS.

313						SHIP AND MARINE EQUIPMENT		

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION

Facilities used directly in the research, development and testing of ships and marine equipment and tracked amphibious vehicles.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
31310	3131	B	[SF]			SHIP AND MARINE LAB	Y	THIS FACILITY IS USED IN CONDUCTING RESEARCH, DEVELOPMENT, TEST AND EVALUATION ON SHIPS, BY USE OF MODELS IN HIGH AND LOW SPEED TOW TANKS, MANEUVERING AND SEAKEEPING BASINS, WATER TUNNELS, CIRCULATING WATER CHANNELS, FLUID PHENOMENON BASINS, ETC.
31320	3131	B	[SF]			SHIPS/MARINE EQUIPMENT LAB	Y	THIS FACILITY IS USED TO CONDUCT RESEARCH, DEVELOPMENT, TEST AND EVALUATION OF SHIPS AND MARINE SUPPORT REQUIREMENT. THIS INCLUDES REPAIR AND MAINTENANCE EQUIPMENT AS WELL AS EQUIPMENT FOR DIRECT SUPPORT AND OPERATION OF SHIPS AND MARINE VESSELS SUCH AS PERISCOPES, TOWED ARRAYS, ETC.
31325	3131	B	[SF]			SHIPS/MAR SYS INTEGRAN LAB	Y	THIS FACILITY IS USED FOR RESEARCH, DEVELOPMENT, TEST AND EVALUATION OF RELATED AND INTERCONNECTED SHIPS AND MARINE SYSTEMS SUCH AS THE SHIP PLATFORM INTEGRATED WITH THE WEAPONS SYSTEMS, COMMUNICATION SYSTEMS, COMMAND AND CONTROL SYSTEMS, SURVEILLANCE SYSTEMS, NAVIGATION SYSTEMS, ETC.

314 TANK AND AUTOMOTIVE

Facilities used directly in the research, development and testing of tank and other automotive equipment.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
31410	3141	B	[SF]			GROUND TRANSPORT EQUIP LAB	Y	THIS FACILITY IS USED IN CONDUCTING RESEARCH, DEVELOPMENT, TEST AND EVALUATION IN THE FIELD OF AUTOMOTIVE DESIGN AS APPLIED TO TANKS, APC'S, AND RELATED MILITARY AUTOMOTIVE EQUIPMENT.

315 WEAPONS AND WEAPON SYSTEMS

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION

Facilities used directly in the research, development and testing of small arms, automatic weapons, mortars, artillery, guns, launchers, projectors (for arming ships, vehicles, and aircraft,) flame throwers, torpedo tubes, harbor protrction, and non-electronic equipment. RDAT&E facilities for guided missiles and related items are included under Category Code series 312.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
31510	3151	B	[SF]			AIRCRAFT WEAPON SYS LAB	Y	THIS FACILITY SUPPORTS THE RESEARCH, DEVELOPMENT, TEST AND EVALUATION OF AIRCRAFT WEAPON SYSTEMS INCLUDING PROJECTILES, MINES AND BOMBS, AND DEFENSIVE COUNTERMEASURES DEVICES/WEAPONS.
31515	3151	B	[SF]			SHIP WEAPON SYSTEM LAB	Y	THIS FACILITY IS USED FOR RESEARCH, DEVELOPMENT, TEST AND EVALUATION OF WEAPONS AND WEAPON SYSTEMS DEPLOYED FROM A SURFACE SHIP. THIS WOULD INCLUDE GUNS, FIRE CONTROL, ETC. THIS DOES NOT INCLUDE AIRCRAFT OR MISSILE SYSTEMS.
31520	3151	B	[SF]			UNDERWATER WEAPON SYS LAB	Y	THIS FACILITY IS USED FOR RESEARCH, DEVELOPMENT, TEST AND EVALUATION OF UNDERSEA WEAPONRY SUCH AS MINES AND TORPEDOES. THIS WOULD INCLUDE SUBMARINE MOUNTED GUNS BUT NOT SUBMARINE LAUNCHED MISSILES. KEY PLATFORM COMPONENTS INCLUDE SONAR, COMBAT CONTROL, UNDERWATER SUBMARINE WARFARE (USW) WEAPONS TARGETS, UNMANNED UNDERWATER VEHICLES (UUVS), AND FLEET TRAINING SYSTEMS.
31525	3151	B	[SF]			GROUND WEAPON SYSTEM LAB	Y	THIS FACILITY IS USED FOR RESEARCH, DEVELOPMENT, TEST AND EVALUATION OF WEAPONRY IN USE ON OR DEPLOYED FROM A GROUND BASE PLATFORM AND WOULD INCLUDE SMALL ARMS, AUTOMATIC WEAPONS, MORTARS, ARTILLERY, FLAME THROWERS, ETC.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
31530	3151	B	[SF]			WEPS SYS INTEGRTN LAB	Y	THIS FACILITY IS USED TO ACCOMPLISH RESEARCH, DEVELOPMENT, TEST AND EVALUATION ASSOCIATED WITH THE INTEGRATION OF WEAPON SYSTEMS WITH THE WEAPONS PLATFORM AND WITH OTHER INTERFACES BETWEEN OTHER WEAPONS SYSTEMS, GUIDANCE SYSTEMS, SURVEILLANCE SYSTEMS, ETC.

316 AMMO,EXPLOSIVES & TOXICS

Facilities used directly in the research, development and testing of ammunition, rockets, bombs, mines, grenades, torpedoes, depth charges, demolition materials, pyrotechnics, ATO units, ammunition parts and related components and chemicals. This Category Code does not include facilities for guided missiles, guided bombs, or commercial type petroleum products.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
31610	3161	B	[SF]			AMMO,EXPLOSIVE & TOXIC LAB	Y	THIS FACILITY IS USED TO SUPPORT THE RESEARCH, DEVELOPMENT, TEST AND EVALUATION OF AMMUNITION, ROCKETS, BOMBS, MINES, GRENADES, TORPEDOES, DEPTH CHARGES, DEMOLITION MATERIALS, PYROTECHNICS, AT0 UNITS, RELATED CHEMICALS, AND THEIR COMPONENTS AND MATERIALS. THIS CATEGORY CODE DOES NOT INCLUDE FACILITIES FOR GUIDED MISSILES, GUIDED BOMBS, OR COMMERCIAL TYPE PETROLEUM PRODUCTS.

317 ELECTRON,COMM & ELEC EQUIP

Buildings used directly in the research, development and testing or radio and radar equipment, signal equipment, radiation aids, electrical equipment and its controls, transmitting and receiving equipment, avionics equipment, sonar, and guided bombs.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
31710	3171	B	[SF]			COMMUNICATIONS SYSTEM LAB	Y	THIS FACILITY IS USED IN CONDUCTING RESEARCH, DEVELOPMENT, TEST AND EVALUATION IN THE AREAS OF RADIO COMMUNICATION, INSTRUMENTATION, SATELLITE COMMUNICATION, ELECTROMAGNETIC PROPAGATION, RADIO ANTENNAS, UNDERWATER SOUND SYSTEMS, OPTICAL SYSTEMS (INFRARED), ETC.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
31715	3171	B	[SF]			DETECTION SYSTEMS LAB	Y	THIS IS USED IN CONDUCTING RESEARCH, DEVELOPMENT, TEST AND EVALUATION IN BASIC PHYSICAL PHENOMENA OF IMPORTANCE TO RADAR, SONAR, AND RELATED SENSORS, ALSO THE DEVELOPMENT OF SYSTEMS ANALYSIS AND EVAL. OF THE SENSORS USED IN SATELLITES, SHIPS, SUBMARINES, AND AIRCRAFT, ETC. IT INCLUDES SURVEILLANCE FOR DETECTION, IDENTIFICATION AND CLASSIFICATION OF SURFACE, AEROSPACE AND SUB-SURFACE OBJECTS.
31720	3171	B	[SF]			ELEC & ELECTRONICS SYS LAB	Y	THIS FACILITY IS USED IN CONDUCTING RDT+E IN THE AREAS OF ELECTRICAL POWER AND ITS CONTROL, MAGNETIC FIELDS AND SHIP'S CONTROL SYSTEMS. RESEARCH IN THIS AREA INVOLVES DEVELOPMENT OF MOTORS AND GENERATORS, FREQUENCY CONVERTERS, VOLTAGE AND CURRENT CONTROL DEVICES, AND SHIPBOARD POWER DISTRIBUTION SYSTEMS.
31725	3171	B	[SF]			ELEC/COMM SYS INTEGRAT LAB	Y	THIS FACILITY IS USED TO ACCOMPLISH RESEARCH, DEVELOPMENT, TEST AND EVALUATION ASSOCIATED WITH THE INTEGRATION OF RELATED SYSTEMS AND SUBSYSTEMS OF ELECTRICAL, ELECTRONICS AND COMMUNICATIONS SYSTEMS WITH THE PLATFORM (AIR, SEA, GROUND, ETC.) UPON WHICH THEY WILL OPERATE AND TO VERIFY INTERFACE CONSIDERATION WITH OTHER SYSTEMS OPERATING ON THE RESPECTIVE PLATFORM.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION

Facilities used directly to support research, development, testing and evaluation of propulsion hardware and appurtenances thereto and propellant type fuels.

31810	3181	B	[SF]			PROPULSION SYS LAB	Y	THIS FACILITY IS USED TO SUPPORT RESEARCH, DEVELOPMENT, TEST AND EVALUATION OF PROPULSION SYSTEMS IN ORDER TO DETERMINE OPERATIONAL CAPABILITIES AND IN STUDYING THE ACOUSTICS AND ELECTROMAGNETIC NOISE EFFECTS ON PERFORMANCE AND EFFICIENCY OF DRIVE UNITS.
31815	3181	B	[SF]			PROPULSION FUEL LAB	Y	THIS FACILITY IS USED TO SUPPORT RESEARCH, DEVELOPMENT, TEST, AND EVALUATION OF PROPULSION FUELS IN ORDER TO MAXIMIZE A PROPULSION SYSTEM'S OPERATIONAL CHARACTERISTICS. THIS FACILITY WOULD ALSO SUPPORT INVESTIGATION INTO NEW FUELS AND PROPULSIVE ENERGY SYSTEMS INCLUDING CONTROLLED NUCLEAR ENERGY.

319 MISC ITEMS & EQUIP

Facilities used directly to support research, development, testing and evaluation of miscellaneous military equipment such as clothing, survival equipment, landing mats, military type bridging, hand tools, construction equipment, valves (e.g. safety, pressure reducing, fuel regulating), and hyperbaric facilities not appropriate in another category code, etc.

31910	3191	B	[SF]			MISC EQUIP & ITEMS LAB	Y	THIS FACILITY SUPPORTS RESEARCH, DEVELOPMENT, TEST, AND EVALUATION OF MISCELLANEOUS MILITARY EQUIPMENT SUCH AS LANDING MATS, VALVES (E.G. SAFETY, PRESSURE REDUCING, FUEL REGULATING), AND HYPERBARIC FACILITIES NOT APPROPRIATE IN ANOTHER CATEGORY CODE.
31915	3191	B	[SF]			RDT&E STORAGE	Y	THIS BUILDING IS A STORAGE FACILITY FOR RESEARCH, DEVELOPMENT, TEST, AND EVALUATION EQUIPMENT AND MATERIALS DIRECTLY RELATED TO RDAT&E PROGRAMS.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
31920	3191	B	[SF]			CIVIL ENGINEERING LAB	Y	THIS FACILITY IS USED TO SUPPORT RESEARCH, DEVELOPMENT, TEST AND EVALUATION IN THE AREA OF CIVIL ENGINEERING. THIS WOULD INCLUDE MILITARY TYPE BRIDGING, HAND TOOLS, CONSTRUCTION EQUIPMENT, CONSTRUCTION TECHNIQUES, ON LAND, IN AND UNDER THE OCEAN.
31925	3191	B	[SF]			HUMAN FACTORS LAB	Y	THIS FACILITY IS USED TO DETERMINE THE EFFECTS OF WARTIME ATMOSPHERE AND MATERIAL ON MILITARY PERSONNEL AND NON-COMBATANTS. THIS FACILITY WOULD ALSO DEAL WITH MAN-MAN INTERFACING (MORALE, COMMAND CONTROL, AND THE LIKE) AND MAN-MACHINE INTERFACING (CONSOLE DESIGN, PAYLOAD DESIGN, WORK AREA REQUIREMENTS, ETC.)
31930	3191	B	[SF]			SURVIVAL EQUP/CLOTHING LAB	Y	THIS FACILITY SUPPORTS RESEARCH, DEVELOPMENT, TEST AND EVALUATION OF PILOT'S AND SAILOR'S NEED FOR SPECIAL EQUIPMENT, CLOTHING AND TECHNIQUES FOR SURVIVAL IN VARIOUS HOSTILE ENVIRONMENTS.
31935	3191	B	[SF]			METROLOGY & CALIBRATON LAB	Y	THIS FACILITY WILL BE USED IN DIRECT SUPPORT OF RESEARCH, DEVELOPMENT, TEST AND EVALUATION PROGRAMS WHERE PRECISE WEIGHTS AND MEASURES ARE REQUIRED IN CALIBRATING RDAT&E EQUIPMENT. THIS FACILITY WOULD INCLUDE THE METROLOGY AND CALIBRATION EQUIPMENT AND SPACE FOR CALIBRATING APPLICABLE EQUIPMENT.
31940	3191	B	[SF]			RANGE OPERATON & INSTR LAB	Y	THIS FACILITY IS USED IN SUPPORT OF RESEARCH, DEVELOPMENT, TEST AND EVALUATION OF RANGE OPERATIONS TO INCLUDE COMMAND CENTER, COMMUNICATIONS, SURVEILLANCE, INSTRUMENTATION, DATA COLLECTION/REDUCTION/DISPLAY, ETC.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
Facilities used directly in the research, development and testing of underwater equipment.								
32010	3201	B	[SF]			UNDERWATER EQUIPMENT LAB	Y	THIS FACILITY IS USED IN CONDUCTING RESEARCH DEVELOPMENT, TEST AND EVALUATION OF UNDERWATER ACOUSTICS, SHIP VIBRATIONS AND VARIOUS TYPES OF UNDERWATER DEVICES TO INCREASE MAN'S CAPABILITIES IN THE OCEAN.
32020	3201	B	[SF]			UNDERWATER SYS INTEGRA LAB	Y	THIS FACILITY WILL BE USED FOR RESEARCH, DEVELOPMENT, TEST AND EVALUATION OF VARIOUS INTERACTING UNDERWATER SYSTEMS, EQUIPMENT, TOOLS, TECHNIQUES AND OPERATORS WORKING TOGETHER IN AN UNDERWATER ENVIRONMENT. THE INTEGRATION OF SEVERAL SYSTEMS TO ACCOMPLISH A GREATER TOTAL EFFORT WILL BE ACCOMPLISHED IN THIS FACILITY.
321						TECHNICAL SERVICES		
Buildings used directly in RD&T manufacturing or reverse engineering of one-of-a-kind models and parts for systems or subsystems from wood, plastic, fiberglass and other materials by molding, casting, extruding and machining.								
32110	3211	B	[SF]			TECHNICAL SERVICES LAB	Y	BUILDINGS USED DIRECTLY IN RD&T MANUFACTURING OR REVERSE ENGINEERING OF ONE-OF-A-KIND MODELS AND PARTS FOR SYSTEMS OR SUBSYSTEMS FROM WOOD, PLASTIC, FIBERGLASS AND OTHER MATERIALS BY MOLDING, CASTING, EXTRUDING AND MACHINING.
371						RANGE FACILITIES		
Structures used directly in research, development and testing of small arms, artillery, weapons systems, avionics, protection equipment, shelters,								
37110	3712	S		[EA]		SCIENCE SYS RANGE FACILITY	N	FACILITIES USED IN THE CONDUCT OF TESTS AND EVALUATIONS OF ITEMS IDENTIFIED UNDER CATEGORY CODE SERIES 310.
37111	3712	S		[EA]		AIRCRAFT SYS RANGE FACILTY	N	FACILITIES USED IN THE CONDUCT OF TESTS AND EVALUATIONS OF ITEMS IDENTIFIED UNDER CATEGORY CODE SERIES 311.

41155	4114	S		[GA]		BULK/READY FUEL ADDTV STRG	N	STORAGE TANKS FOR FUEL ADDITIVES SUCH AS DEICING CHEMICALS.
41160	1244	S		[BL]	GA	LIQ PETROLM FUEL GAS STRG	Y	THIS CATCODE IS FOR THE STORAGE OF LIQUEFIED PETROLEUM GAS, COMMONLY KNOWN AS LPG, FOR HEATING, METAL CUTTING, BRAZING, IN DENTAL LABORATORIES, ABOARD SHIPS, AND IN SIMILAR INSTALLATIONS. LPG CONSISTS PREDOMINANTLY OF PROPANE, PROPYLENE, WITH MINOR AMOUNTS OF BUTANE, ISOBUTENE, AND BUTYLENES.
41182	4111	S		[BL]		CONTAMINATED FUEL STORAGE	Y	THIS CATCODE IS FOR FUEL STORAGE FACILITY TEMPORARY STORAGE FOR OFF-SPECIFICATION (CONTAMINATED) FUEL.
41184	4111	S		[BL]		BULK HEATING FUEL STRG	Y	THIS CATCODE IS FOR HEATING FUEL OIL STORAGE FACILITIES AND IT MAY INCLUDE STORAGE TANKS FOR KEROSENE AND SEVERAL DIFFERENT GRADES OF DIESEL OIL.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION

This group includes tank storage, accessories and piping for organic liquids such as cottonseed, linseed or soybean oils and other non-fuel liquids such as lubricants, ballast, or waste oils. Historical data should be available to determine rate of delivery and storage requirement. For waste liquids and oils, methods and schedule of disposals should be considered when determining storage requirement.

CATEGORY CODE	FAC CODE	RPA TYPE	AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
41215	4121	S		[GA]		ROAD OIL STORAGE	N	STORAGE FACILITIES FOR ROAD OIL. ROAD OIL IS OIL USED TO CONTROL DUST IN CERTAIN UNPAVED ROADWAY SITUATIONS.
41225	4121	S		[GA]		LUBRICANT STORAGE	N	THIS CATCODE IS FOR THE STORAGE OF LUBRICATING OIL.
41235	4121	S		[GA]		BALLAST AND SLUDGE STORAGE	N	THIS CATCODE IS FOR THE STORAGE OF BALLAST AND SLUDGE LIQUIDS.
41240	4121	S		[GA]		ORGANIC OIL STORAGE	N	THIS CATCODE IS FOR THE STORAGE OF ORGANIC OILS.
41245	4121	S		EA	[GA]	MISC LIQUID STORAGE	N	THIS CATCODE IS FOR THE STORAGE OF MISCELLANEOUS LIQUIDS.
41250	4121	S		[GA]		INDUS/POL WASTE STORGE FAC	N	THIS CATCODE IS FOR THE STORAGE OF INDUSTRIAL WASTE/POL LIQUIDS.

420 AMMUNITION STORAGE

Ammunition storage utilizes magazines, general purpose and refrigerated storehouses, tanks, open storage pads and associated stationary equipment for storage of Ammunition, Inert Ammunition Components, Liquid Propellants and Weapon-Related Batteries.

421 AMMUNITION STRG DEP/INSTLN

Above/underground ammunition and ammunition component magazines and storehouses (including their explosion barriers.)

CATEGORY CODE	FAC CODE	RPA TYPE	AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
42122	4211	B	[SF]		CF	HIGH EXPLOSIVE MAGAZINE	Y	A HIGH-EXPLOSIVE MAGAZINE IS USED FOR THE STORAGE OF HAZARD CLASS 1 DIVISION 1 (CH/D 1.1) ENERGETIC MATERIALS. EXAMPLES OF CH/D 1.1 MATERIALS ARE: BOMBS, MISSILES, WARHEADS, NAVAL MINES, DEMOLITION CHARGES. HC/D 1.3 AND 1.4 ENERGETICS MAY ALSO BE STORED IN A HIGH EXPLOSIVE MAGAZINE WHEN THE UTILIZATION REQUIRES IT AND COMPATIBILITY ALLOWS IT.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
42132	4211	B	[SF]		CF	INERT STOREHOUSE	Y	THESE STOREHOUSES ARE USED FOR THE STORAGE OF SUCH NON-EXPLOSIVE ITEMS AS BOMB TAILS, MACHINE GUN LINKS, EMPTY CARTRIDGE CASES, AND PACKING MATERIALS.
42135	4221	B	[SF]		CF	READY MAGAZINE	Y	THIS CATEGORY CODE IS USED SPECIFICALLY FOR ORDNANCE REQUIRED TO BE STORED IN A READY SERVICE CAPACITY AND IS USED TO CAPTURE READY SERVICE MAGAZINES. THIS DOES NOT INCLUDE READY SERVICE LOCKERS AND SIMILAR ITEMS OF EQUIPMENT, WHICH ARE NOT CAPTURED IN INFADS.
42142	4211	B	[SF]		CF	SMOKEDRUM STOREHOUSE	Y	THIS CATCODE IS FOR THE STORAGE OF CHEMICAL AND SMOKE PRODUCING MIXTURES.
42148	4211	B	[SF]		CF	SMALL ARMS/PYROTECHNIC MAG	Y	THIS MAGAZINE MAY BE USED TO STORE CLASS 1 DIVISION 3 AND 4 AMMUNITION. PREDOMINANTLY SMALL ARMS AMMUNITION AND PYROTECHNICS.
42162	4211	B	[SF]		CF	SPECIAL WEAPONS MAGAZINE	Y	THE SPECIAL WEAPONS MAGAZINE IS SIMILAR TO THE HIGH EXPLOSIVE MAGAZINE BUT IS USED FOR THE STORAGE OF DIFFERENT TYPES OF ORDNANCE. FOR MORE DETAILS, REFER TO FC 2-000-05N.
42182	4211	B	[SF]			SUB BALLISTIC MSL STO FAC	Y	THIS CATCODE IS PRIMARILY FOR THE STORAGE OF SUBMARINE LAUNCHED BALLISTIC MISSILES

422

423 AMMUNITION STRG LIQ PRPLNT

Facilities for receipt of bulk storage in tanks, and dispensing from storage of liquid propellants under explosive safety distances criteria including tanks, pipes, valves, valve chambers and similar appurtenant equipment and facilities.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
42310	4231	S		[GA]		LIQUID PROPELLANT STORAGE	Y	THIS CATCODE IS FOR THE STORAGE OF LIQUID PROPELLANTS
42320	1221	S		OL	[GM]	LIQ PROPELLANT DISPENS FAC	Y	THIS CATCODE IS FOR LIQUID PROPELLANT STORAGE AND DISPENSING FACILITIES

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
424						WPN-RELATED BATTERY STRG		

Weapon-related storage utilizes refrigerated warehouses that are capable of maintaining at least subfreezing temperatures. This code is not to be used for other cold storage facilities.

CATEGORY CODE	FAC CODE	RPA TYPE	AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
42410	4241	B	[SF]	NS	SH	WPN-RELATED BATTERY STRG	Y	THIS CATCODE IS FOR FACILITIES RELATED TO THE STORAGE OF WEAPONS RELATED BATTERIES.
425						OPEN AMMUNITION STORAGE		

Includes open hardstands (pavements or prepared/stabilized surfaces) for ammunition storage and excludes all other hardstands.

CATEGORY CODE	FAC CODE	RPA TYPE	AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
42510	4251	S	[SY]			OPEN AMMUNITION STRG PAD	Y	THIS CATCODE IS FOR FACILITIES RELATED TO AN OPEN AMMUNITION STORAGE PAD
42511	4251	S	[SY]			EXPLOSIVE STORAGE SITE PAD	N	A CONCRETE OR ASPHALT PAD, CONSTRUCTED AS A BASE ON WHICH TO PLACE NON-PERMANENT ORDNANCE STORAGE CONTAINERS SUCH AS READY SERVICE LOCKERS (RSLS) AND GOLANS. THE PADS CAN BE NEW OR A PORTION OF AN EXISTING PAVEMENT SUCH AS AN AIRCRAFT APRON OR SIMILAR.
42520	4251	S	[SY]			CONTAINR HOLDG YARD (EMPT)	Y	THIS CATCODE IS FOR FACILITIES RELATED TO AN EMPTY ISO CONTAINER-HOLDING YARD.
42530	4251	S	[SY]			BARRICADED MODULE	Y	A BARRICADED MODULE IS A BARRICADED AREA COMPRISING OF A SERIES OF CONNECTED CELLS WITH HARD SURFACE STORAGE PADS SEPARATED FROM EACH OTHER BY BARRICADES.
430						COLD STORAGE		
431						COLD STORAGE		

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION

Cold storage warehouses for preserving the quality of perishable foods and general supply materials that require refrigeration. The warehouse will include freeze and chill space and normal processing facilities and mechanical areas. The space requirements are applicable to cold storage facilities of all sizes whether built as separate structures or in conjunction with other buildings.

43110	4311	B	[SF]	TC	SH	COLD STORAGE WAREHOUSE	Y	A COLD STORAGE WAREHOUSE IS PLANNED TO PRESERVE THE QUALITY OF PERISHABLE FOODS AND GENERAL SUPPLY MATERIALS THAT REQUIRE REFRIGERATION. THE WAREHOUSE WILL INCLUDE FREEZE AND CHILL SPACE AND NORMAL PROCESSING FACILITIES AND MECHANICAL AREAS.

432

440 GENERAL SUPPLY BUILDINGS

This category group consists of supply-oriented covered storage and/or storage support facilities that are assigned to the Supply/Material Department or assigned for storage of operational mount-out stocks. Requirements allowance guidance can be found in the General Supply Planning Guidance under Requirements Determination.

441 GEN SUPPLY STRG DEP/INSTLN

Navy buildings assigned to/required by Supply/Materials Departments including any space assigned for storage of operational mount-out stocks . 2. Marine Corps buildings required for storage of "out-of-stores" material, or organic mount out stocks. 3. Marine Corps buildings at activities designated as Remote Storage Activities (RSA), or Direct Support Stock Control activities. 4. Excludes buildings not assigned to the Supply/Material Department or for storage of operational mount-out stocks. also, excluded are facilities for operational hazardous flammable storage, storage of aircraft maintenance materials, storage of public works equipments and material, and commissary and exchange materials.

44110	4421	B	[SF]	TC	SH	GENERAL PURP WAREHOUSE	Y	THIS CODE INCLUDES GENERAL WAREHOUSES WITH THE FOLLOWING CHARACTERISTICS: HEATED OR UNHEATED AND WITH/WITHOUT HEAVY-DUTY (OVERHEAD CRANE) CAPABILITY, SPRINKLER SYSTEMS AND/OR ALARM SYSTEMS.
44111	4421	B	[SF]	TC	SH	GENERAL WAREHOUSE MARCORPS	Y	THIS CATEGORY CODE INCLUDES REQUIREMENTS FOR MARINE CORPS GROUND ACTIVITIES WHICH HAVE BEEN DESIGNATED BY MARINE CORPS ORDERS AS DIRECT SUPPORT STOCK CONTROL ACTIVITIES OR WHICH HAVE SPECIALIZED DSSC FUNCTIONS.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
44112	4421	B	[SF]	TC	SH	STG AIR/GRD ORG UTS MARCOR	Y	THIS CATEGORY CODE INCLUDES GENERAL PURPOSE STORAGE FACILITIES ASSIGNED TO MARINE CORPS BASES, AIR INSTALLATIONS AND FLEET MARINE FORCE (FMF) UNITS FOR ORGANIC REQUIREMENTS TO INCLUDE DIVISION/WING, BATTALION/GROUP AND COMPANY/SQUADRON STORAGE AREAS, SPECIAL SERVICE STOREROOMS, BASE SHIPPING AND RECEIVING FUNCTIONS AND ANY OTHER ORGANIC STORAGE REQUIREMENTS.
44113	4411	B	[SF]	TC	SH	MARCOR LOGSUPBASE WRHSE	Y	THIS FACILITY INCLUDES GENERAL-PURPOSE WAREHOUSES DESIGNATED AS STORAGE AREAS FOR MARINE CORPS OWNED MATERIAL IN SUPPORT OF LOGISTIC SUPPORT BASE MISSION AS INTEGRATED MATERIAL MANAGERS. ALSO INCLUDED IS THE SPACE UTILIZED IN SUPPORT OF PRE-POSITIONED WAR RESERVE STOCKS.
44114	4411	B	[SF]	TC	SH	MARCOR SASSY WAREHOUSE	Y	THIS FACILITY INCLUDES GENERAL-PURPOSE WAREHOUSES DESIGNATED FOR SUPPORT OF THE SUPPORTED ACTIVITY SUPPLY SYSTEM (SASSY) MANAGEMENT UNITS TO INCLUDE GENERAL AND MOUNT OUT ACCOUNTS AND CONSOLIDATED ISSUE POINT ASSETS.
44120	4424	B	[SF]	TC	SH	CONTROLLED HUMIDITY WRHSE	Y	A CONTROLLED HUMIDITY WAREHOUSE IS SIMILAR TO A GENERAL WAREHOUSE (441 10) IN EVERY RESPECT EXCEPT THAT IT IS CONSTRUCTED WITH APPROPRIATE VAPOR BARRIERS AND CONTAINS HUMIDITY CONTROL EQUIPMENT TO MAINTAIN HUMIDITY AT DESIRED LEVELS.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
44130	4423	B	[SF]	TC	SH	HAZARDOUS/FLAMMABL STRHSE	Y	A HAZARDOUS MATERIALS WAREHOUSE IS REQUIRED FOR THE STORAGE AND HANDLING OF MATERIALS SUCH AS FLAMMABLE AND COMBUSTIBLE LIQUIDS, ACIDS, ETC. AS SAFE STORAGE OF SUCH MATERIALS LIES IN THEIR SEPARATION FROM INCOMPATIBLE MATERIALS, A HAZARDOUS AND FLAMMABLES STOREHOUSE IS REQUIRED AS MUCH FOR ADEQUATE MATERIAL SEPARATION AS FOR THEIR STORAGE AND HANDLING.
44135	4422	S	[SF]	TC	SH	GENERAL STORAGE SHED	Y	THE GENERAL SHED IS A ROOFED STRUCTURE WITHOUT COMPLETE SIDE AND/OR END WALLS AND WITH OR WITHOUT SPRINKLER AND/OR ALARM SYSTEMS.
44140	4421	B	[SF]	TC	SH	UNDERGROUND STORAGE	Y	THIS CATEGORY CODE PERTAINS TO UNDERGROUND STORAGE; WHERE IT IS NECESSARY, BECAUSE OF POTENTIAL SABOTAGE OR ENEMY ACTION TO PROTECT SUPPLIES EITHER BY DISPERSAL OR PROTECTIVE CONSTRUCTION, INSTEAD OF PROGRAMMING NEW PROTECTIVE CONSTRUCTION, EXISTING MINES MAY BE USED.
44170	4421	B	[SF]	NS	SH	DISPOSL/SALVAGE/SCRAP BLDG	Y	THIS FACILITY IS PRIMARILY TO PROVIDE COVERED SPACE FOR THE RECEIPT, PROCESSING, STAGING AND ISSUE OF MATERIAL THAT HAS BEEN DEEMED EXCESS TO NAVY NEEDS AND IS AWAITING SOME RESALE OR FINAL DISPOSAL.
44171	4421	B	[SF]	TC	SH	INTEGRATE LOG OH & OUTFIT	Y	THIS FACILITY PROVIDES COVERED SUPPLY SPACE USED FOR PROCESSING MATERIALS OFFLOADED FROM OR ASSEMBLED FOR LOADING ABOARD SHIPS. IT INCLUDES SPACE REQUIRED FOR RECEIVING, SORTING, IDENTIFYING AND PROCESSING MATERIALS OFF-LOADED AS WELL AS PROCESSING AND ASSEMBLY OF OUTFITTING MATERIALS TO BE LOADED ABOARD FLEET UNITS.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
44172	4421	B	[SF]	TC	SH	SERVMART	Y	A SERVMART PROVIDES COVERED SUPPLY FACILITIES USED FOR DISPLAY AND SALE OF SUPPLY SYSTEMS MATERIALS FOR SELF-SERVICE REQUISITIONING BY END USERS. IT INCLUDES AREAS USED TO DISPLAY ITEMS ON SHELVES OR GONDOLAS, CHECKOUT COUNTERS AND ADMINISTRATIVE FUNCTIONS.
44173	4421	B	[SF]	TC	SH	MTIS BUILDING	Y	A MATERIAL TURNED INTO STORE (MTIS) FACILITY PROVIDES COVERED SUPPLY SPACE USED FOR PROCESSING MATERIALS TURNED INTO SUPPLY FOR REDISTRIBUTION OR DISPOSAL. IT INCLUDES SPACE USED FOR RECEIPT, SCREENING, IDENTIFICATION, ASSEMBLY AND STAGING FOR RETURN TO STORAGE AREAS.
442								
450						STORAGE OPEN		
451						STORAGE-OPEN DEPOT/INSTLN		

This category group consists of non-covered storage areas, paved or otherwise established, for storage of General Supply Materials. Several of the excluded types of functions include miscellaneous materials coded under other basic category codes (e.g., ammunition on open pad coded under 425-10 and open storage areas for non-supply oriented functions coded under 852-35). This code also refers to open areas primarily to provide space for the receipt, processing, staging and issue of material that has been deemed excess to Navy needs and is awaiting some resale or final disposal and whose value is not significantly impacted by uncovered exposure to the environment. This code may also be used for such open yards required for staging or storage of items being held for their scrap value to ongoing missions or systems.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
45110	4521	S	[SY]	NS		OPEN STORAGE AREA	Y	THIS CATEGORY GROUP CONSISTS OF NON-COVERED STORAGE AREAS, PAVED OR OTHERWISE ESTABLISHED, FOR STORAGE OF GENERAL SUPPLY MATERIALS.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
45170	4521	S	[SY]	NS		EXTRAORDY SUP DISPL STG AR	Y	THIS CODE REFERS TO OPEN AREAS PRIMARILY TO PROVIDE SPACE FOR THE RECEIPT, PROCESSING, STAGING AND ISSUE OF MATERIAL THAT HAS BEEN DEEMED EXCESS TO NAVY NEEDS AND IS AWAITING SOME RESALE OR FINAL DISPOSAL AND WHOSE VALUE IS NOT SIGNIFICANTLY IMPACTED BY UNCOVERED EXPOSURE TO THE ENVIRONMENT.
452								
500						HOSPITAL-MEDICAL FACILITY		
510						MEDICAL CENTER/HOSPITAL		

Facilities that provides general and specialized medical care for authorized personnel, with both inpatient and outpatient services. This facility will also normally contain clinics, such as Medical, surgical, pediatrics, obstetrical, ICU and CCU. The facility will have a Pharmacy, ambulance, and administrative area. This facility will admit for more than 24-hour stay.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
51010	5100	B	SF	[BD]	LC	HOSPITAL	Y	A HEALTHCARE FACILITY THAT PROVIDES GENERAL AND SPECIALIZED MEDICAL CARE FOR AUTHORIZED PERSONNEL, WITH BOTH INPATIENT AND OUTPATIENT SERVICES. THIS FACILITY WILL ALSO NORMALLY CONTAIN CLINICS, SUCH AS MEDICAL, SURGICAL, PEDIATRICS, OBSTETRICAL, ICU AND CCU.
51011	5100	B	[SF]	LC	BD	MEDICAL CENTER	Y	A REGIONAL MEDICAL CENTER. THESE FACILITIES SUPPORT BOTH INCREASED SURGICAL CAPABILITIES AND A SURGICAL GRADUATE EDUCATION PROGRAM, NOT REQUIRED IN SMALLER HOSPITALS. APPLIES TO BETHESDA, PORTSMOUTH AND SAN DIEGO (BALBOA).
51012	5306	B	SF	[EA]		PREPOS FLT HOSP WAREHOUSE	Y	FLEET (DEPLOYABLE) HOSPITAL STORAGE FACILITY.
51015	5100	B	SF	[BD]	LC	HOSPITAL BR/ANEX	Y	HOSPITAL FACILITY ASSOCIATED WITH A MAIN HOSPITAL BUT IN A SEPARATE LOCATION.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
51016	6100	B	[SF]			MEDICAL ADMIN	Y	ADMINISTRATIVE FUNCTIONS ASSOCIATED WITH A HOSPITAL OR MEDICAL CENTER. CAN BE WITHIN A MEDICAL FACILITY ITSELF, OR IN A STANDALONE ADMIN FACILITY ASSOCIATED WITH A HOSPITAL OR MEDICAL CENTER.
51020	5100	B	[SF]			HOSPITAL LAUNDRY	Y	LAUNDRY FACILITIES LOCATED WITHIN A HOSPITAL (CATCODE 510 10), USED FOR LAUNDERING OF HOSPITAL LINENS AND OTHER NECESSARY ITEMS.
51077	5306	B	[SF]			HOSPITAL/MED STRG(MISC)	Y	SPACE USED FOR STORAGE OF MEDICAL SUPPLIES WITHIN THE HOSPITAL FACILITY.

530 LABORATORIES

Laboratory, veterinary, preventive medicine and other ancillary facilities.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
53010	5500	B	[SF]			DISP & OUT PATIENT CLINIC	Y	FREE STANDING CLINIC, OUTPATIENT CLINIC, WHICH OCCUPIES A BUILDING OR PART OF A BUILDING, BUT IS NOT PHYSICALLY LOCATED WITH A HOSPITAL OR MEDICAL CENTER THAT PROVIDES ROUTINE AND EMERGENCY CARE TO AUTHORIZED PERSONNEL.
53020	5302	B	[SF]			MEDICAL LABORATORY	Y	A FACILITY, DETACHED FROM A HOSPITAL THAT PROVIDES LABORATORY SUPPORT TO THE HOSPITAL AND/OR OTHER MEDICAL ACTIVITIES. THE ANALYSIS AND DIAGNOSTIC LABORATORY INCLUDES CHEMISTRY, DIAGNOSTICS AND MICROBIOLOGY TESTING SECTIONS AND A QUALITY ASSURANCE AND TECHNICAL SUPPORT SECTION.
53025	5500	B	[SF]			NAVY MEDICAL PHARMACY	Y	A DETACHED FACILITY THAT PROVIDES ROUTINE AND EMERGENCY HEALTH CARE TO AUTHORIZED PERSONNEL.
53030	5303	B	[SF]			MORGUE	Y	A FACILITY, EITHER DETACHED OR WITHIN A HOSPITAL, FOR THE IDENTIFICATION, PREPARATION, AND HOLDING OF HUMAN REMAINS.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
53040	5304	B	[SF]		VIVARIUM CLINIC	Y	THE VIVARIUM CLINIC IS A MEDICAL RESEARCH LABORATORY FOR KEEPING AND RAISING ANIMALS AND PLANTS UNDER NATURAL CONDITIONS FOR OBSERVATION AND RESEARCH.
53045	5304	B	[SF]	EA	VET TREATMENT FAC	Y	THIS FACILITY IS USED TO PROVIDE FOOD SAFETY AND QUALITY ASSURANCE, CARE FOR GOVERNMENT OWNED ANIMALS (WORKING DOGS AND HORSES), AND ANIMAL DISEASE PREVENTION AND CONTROL. VETERINARY SERVICES ARE TO EXAMINE, IMMUNIZE AND TREAT FOR THE PREVENTION AND CONTROL OF DISEASES OR CONDITIONS THAT ARE TRANSMISSIBLE TO HUMANS OR ANIMALS, OR MAY CONSTITUTE A MILITARY COMMUNITY HEALTH PROBLEM.
53050	5302	B	[SF]		ENVIRONMNTL PREVNTV MED LB	Y	MEDICAL LABORATORY OPERATING IN SUPPORT OF A HOSPITAL OR MEDICAL CENTER.
53060	5306	B	[SF]		MEDICAL WAREHOUSE	Y	A STORAGE FACILITY FOR MEDICAL EQUIPMENT AND SUPPLIES THAT IS CONTINUOUSLY WITHDRAWN AND REPLENISHED. STORAGE OF WAR RESERVE MEDICAL SUPPLIES IS INCLUDED IN DEPOT STORAGE FACILITIES.
53070	5307	B	[SF]		AMBUL SHELTER	Y	A COVERED SPACE USED TO SHIELD THE AMBULANCE, ITS DRIVER AND ITS PATIENTS FROM EXPOSURE TO THE ELEMENTS.

540 DENTAL CLINICS

A dental clinic is an oral health care service facility equipped and staffed to perform dental procedures for general practices, a specialty, or a grouping of specialties. A dental facility will normally include treatment areas, administrative, support and storage areas.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
54010	5400	B	SF	[OU]	DENTAL CLINIC	Y	A DENTAL CLINIC IS AN ORAL HEALTH CARE SERVICE FACILITY EQUIPPED AND STAFFED TO PERFORM DENTAL PROCEDURES FOR GENERAL PRACTICES, A SPECIALTY, OR A GROUPING OF SPECIALTIES.

Category Code Report (All Series)

810						ELECTRIC POWER		
811						ELECTRIC POWER-SOURCE		

Category Code Report (All Series)

Electric power for base facilities operation is normally derived from local commercial sources. Where commercial sources are used, transformer substations are required to transform the electrical energy to satisfy the station's load requirement. Where commercial electricity is not available, power plants will be planned. Standby generator plants are planned to provide adequate uninterrupted power supply in emergencies. Planning for power plants will include the building, the power generating equipment, and supporting appurtenances such as fuel storage for plant operation, auxiliary power, and switching stations.

81320	8131	S		[KV]		SUBSTATIONS	N	DISTRIBUTION SUBSTATIONS, NORMALLY CONSISTING OF TRANSFORMERS AND THEIR ASSOCIATED SWITCHGEAR, STRUCTURES, BUSES, GROUNDING SYSTEMS, AND PROTECTIVE DEVICES; TRANSFORM ELECTRICAL POWER TO A LOWER OR HIGHER VOLTAGE AND PUT IT ON THE DISTRIBUTION SYSTEM.
81330	8132	S		[KV]	EA	SWITCHG STA/SECT DIST CIRC	N	A SWITCHING STATION IS EQUIPMENT IN AN ELECTRIC DISTRIBUTION SYSTEM WHERE ELECTRIC POWER IS SWITCHED WITHOUT TRANSFORMATION. SWITCHING STATIONS ARE LOCATED AT POINTS WHERE IT IS NECESSARY TO BRANCH OFF FROM A MAIN FEEDER OR FEEDERS WITH SMALLER COMPONENTS DUE TO PHYSICAL LOCATION OF THE FACILITIES TO BE SERVED OR TO ISOLATE PORTIONS OF FEEDERS FOR MAINTENANCE OR REPAIR.
81340	8134	S		[EA]		LGHTNG PROT SYS	N	STANDALONE LIGHTNING PROTECTION SYSTEMS ARE THOSE THAT ARE NOT INCLUDED AS PART OF A SPECIFIC FACILITY'S INSTALLED EQUIPMENT. THESE ARE USUALLY CONSTRUCTED TO PROTECT A COMPOUND, A SINGLE BUILDING (WHERE THE SYSTEM IS CONSTRUCTED OF MASTS AND IS NOT A PART OF THE FACILITY) OR SERIES OF BUILDINGS. UM IS "EA", WHICH CONSTITUTES UP TO FOUR LIGHTNING PROTECTION MASTS/STRUCTURES. FOR SYSTEMS WITH MORE THAN FOUR, INCREASE UM QUANTITY ACCORDINGLY.
820						HEAT & REFRIGERATION(A/C)		
821						HEAT-SOURCE		

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION

The source of heat from steam or high temperature water (HTW) includes a complete central plant and associated fuel storage. The source of heat and steam/HTW are coded to indicate the type of fuel used by the plant. A central heating plant will include a structure, piping, equipment, controls, fuel, storage, and all equipment necessary to make a complete usable facility. Central heating plants are justified only when the total owning and operating costs for central plants and distribution systems are less than similar costs for heating systems in individual buildings. Central heating plants are also justified when the overall energy use for providing heat from extraction steam in a steam-electric-power plant would be less than a central plant plus purchased electricity. The type of fuel for the plant, whether an electric power generating plant with by-product heat and steam, or a heating plant, will be selected on the basis of an economic analysis. The heating plant capacity will be based on BTU rating, and this rating will be determined from an engineering analysis of the need for steam, heat, and hot water at the station.

CATEGORY CODE	FAC CODE	RPA TYPE	AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
82109	8910	B	[SF]			HEATING PLANT BUILDING	N	THIS CATEGORY CODE IS USED FOR BUILDINGS ASSOCIATED WITH A HEATING PLANT INCLUDING CATEGORY CODES 821 12, 821 22, OR 821 30.
82112	8211	S		[BH]		HTG PLNT - OIL/GAS	N	THIS CATEGORY CODE IS USED FOR A PLANT THAT UTILIZES OIL OR GAS FOR THE PRODUCTION AND DISTRIBUTION OF HEAT. THIS INCLUDES STEAM, HOT WATER, HIGH PRESSURE/LOW PRESSURE, ETC., SERVING MORE THAN ONE SEPARATE FACILITY.
82122	8211	S		[BH]		HTG PLNT-COAL	N	THIS CATEGORY CODE IS USED FOR A PLANT THAT UTILIZES COAL FOR THE PRODUCTION AND DISTRIBUTION OF HEAT. THIS INCLUDES STEAM, HOT WATER, HIGH PRESSURE/LOW PRESSURE, ETC., SERVING MORE THAN ONE SEPARATE FACILITY.
82130	8211	S		[BH]		NON-FOSL FUEL HTG PLT	N	THIS CATEGORY CODE IS USED FOR A PLANT THAT UTILIZES A NON-FOSSIL FUEL FOR THE PRODUCTION AND DISTRIBUTION OF HEAT. THIS INCLUDES STEAM, HOT WATER, HIGH PRESSURE/LOW PRESSURE, ETC., SERVING MORE THAN ONE SEPARATE FACILITY.

Report Date: 27-JUN-2019 08:33:51

82161	1244	S		[GA]		RESIDUAL HEATING OIL STG	N	THIS CATEGORY CODE IS USED FOR FUEL OIL TANKS USED FOR HEATING BUILDINGS, GENERATION OF STEAM, POWER PLANT REQUIREMENTS, AND FOR OTHER HEAT GENERATING FACILITIES AS REQUIRED. NO. 4 FUEL OIL, NO. 5 FUEL OIL AND NO. 6 FUEL OIL ARE VARIOUSLY REFERRED TO AS RESIDUAL FUEL OILS.

822 HEAT-TRNSMSN/DISTR LINES

This basic category encompasses the transmission and distribution lines for steam and associated hot water lines throughout an installation. In temperate and tropical climates and at locations where the water table is high, steam lines will be aboveground. Routing of steam or hot water lines requiring underground installation under runways and taxiways should be held to a minimum to avoid interference by maintenance and repair operations. Adequate clearances shall be provided above roads, railroads, streets, walks, and tow-ways.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
830						SEWAGE AND WASTE		

Category group 830 describes the facilities required for the collection, transportation, treatment, and disposal of sewage and industrial waste, and disposal of storm drainage water in storm and sanitary sewer systems. Components of sewage and refuse facilities include sewage treatment plants, outfall sewer lines, septic tanks, septic tank drain fields, sanitary sewers, sewage pumping stations, and incinerators. Certain industrial waste must be kept separately and treated separately from the sanitary sewage. In planning for sewage and waste facilities cognizance shall be taken of the Federal Water Pollution Control Act as amended, applicable to municipalities, industries, and others that may contribute to the pollution of surface and underground waters in the United States.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
831						SEWAGE-IND WASTE TRTMT&DSP		

Plant Buildings, and sanitary sewage treatment plant will be necessary to provide for the processing of sanitary sewage for ultimate disposal. Disposal of sewage is usually in a stream or other body of water or on land by subsurface irrigation or by direct absorption into the soil. A sewage treatment plant may include aeration tanks or trickling filters, settling basins, sump or storage wells, dry wells, pumps, screens, and accessories. The type and capacity of sewage treatment plant is determined by an engineering study that considers planned population, number of family quarters, and industrial peak loads.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
83109	8910	B	[SF]			SWGE TRMT BLDG	N	THIS CATEGORY CODE INCLUDES THE BUILDINGS ASSOCIATED WITH THE SEWAGE TREATMENT PLANT (CATEGORY CODE 831 10).
83110	8311	S		[KG]		SWGE TRMT PLT	N	THIS CATEGORY CODE IS USED FOR ALL TYPE OF SEWAGE TREATMENT PLANTS; PRIMARY, SECONDARY, OR TERTIARY.
83111	8313	S		[KG]		BALLAST CONTAMTN SKMR	N	A FACILITY TO REMOVE GREASE, OIL, AND OTHER CONTAMINENTS FROM THE WATER REMOVED FROM SHIP BALLAST TANKS.
83114	8910	B	[SF]			INDUSTRY WAST TREATMT BLDG	N	THIS CATEGORY CODE IS USED FOR BUILDINGS ASSOCIATED WITH AN INDUSTRIAL WASTEWATER TREATMENT PLANT (CATEGORY CODE 831 15).

83139	8910	B	[SF]			RADIOACTV WASTE HANDL BLDG	N	RADIOACTIVE WASTE HANDLING BUILDING.
83140	8926	S		[EA]		RADIOACTV WASTE HANDL FAC	N	RADIOACTIVE WASTE HANDLING FACILITY.
83141	8926	S	[SF]		EA	HAZARD WSTE STOR & TRANSFR	N	A STORAGE FACILITY FOR THE CONTAINMENT AND SHIPMENT OF HAZARDOUS WASTES. CAN BE SHORT TERM (HW STORAGE LESS THAN 90 DAYS) OR LONG TERM (HW STORAGE 90 DAYS OR MORE).
83142	8926	S	[SY]		EA	HAZARD WASTE STORAGE AREA	N	AN EXTERIOR LAYDOWN AREA FOR THE STORAGE OF HAZARDOUS WASTE MATERIALS THAT DO NOT POSE ANY THREATS TO THE ENVIRONMENT VIA CONTAMINATED RUNOFF.
83143	4423	B	[SF]			HAZ WASTE BLDG	Y	A BUILDING THAT HAS BEEN PROPERLY CERTIFIED TO STORE SUBSTANCES THAT CANNOT LEGALLY BE DISPOSED OF IN A NORMAL SANITARY LANDFILL OR INTO A REFUSE INCINERATOR DESIGNATED TO HANDLE MUNICIPAL TYPE REFUSE, OR CANNOT BE DISCHARGED INTO A SANITARY SEWERAGE SYSTEM.

832 SEWAGE/IND WASTE COLLECTN

This basic category includes collection systems and lines including pumping stations for sewage and industrial waste and collection of storm drainage in combined storm and sanitary sewer systems. Planning for the sanitary sewer system will include piping, fittings, pumps, lift stations, and accessories. A sanitary sewer collection system will be required at all Naval installations and it will be based primarily on the population. The requirements will be determined by an engineering survey.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION

LANDFILLING SOLID WASTE IS THE TECHNOLOGY OF LAST RESORT. CONSULT EPA AND STATE REGULATIONS AND THE LATEST SOLID WASTE TEXT BOOKS FOR ENGINEERING PRINCIPLES AND PRACTICES IN SITING AND SCOPING A LANDFILL.
83320	8331	S	SF	[TN]	EA	GARBAGE GRINDER BLDG	N	A GARBAGE GRINDER FACILITY THAT IS FULLY ENCLOSED BY A BUILDING.
83321	8331	S		[TN]	EA	GARBAGE GRINDER	N	A GARBAGE GRINDER FACILITY THAT IS PARTIALLY ENCLOSED BY AN OPEN STRUCTURE.
83330	8526	LS	SY	[EA]		GARBAGE STAND	N	AN OPEN STRUCTURE USED TO PARTIALLY ENCLOSE TRASH RECEPTACLES, USUALLY DUMPSTERS.
83340	8910	B	[SF]			GARBAGE/RECYCLE BUILDING	N	SMALL BUILDING USED FOR TEMPORARY STORAGE OF TRASH OR RECYCLABLES PRIOR TO REMOVAL AND PROCESSING BY A COLLECTION SERVICE.

840 WATER

Water facilities at naval installations shall provide sufficient quantities of potable water for domestic and industrial use; purification of raw water from deep wells, lakes, and rivers; storage of water in bulk storage tanks or reservoirs; and distribution of water to demand areas. Facilities included are Wells, pre-treatment supply mains, pumping, treatment and filtration plants, plant buildings, tanks, and storage for potable water. For separate fire protection systems, see basic category code 843.

841 POTABLE WATER-SUP/TMT/STRG

Category Code Report (All Series)

Planning for the treatment of water will include, as applicable, screening, settling, coagulation and sedimentation, filtration, disinfection, softening, and aeration. The water treatment systems are normally planned in millions of gallons (MG) per day capacity and distribution is in linear feet (LF). The systems must be adequate to meet the domestic and industrial requirements and to provide fire protection if a separate fire protection system is not provided. If separate demand (see Code 843). Planning requirements for water treatment facilities will be based on the results of an engineering survey and an economic analysis to determined sources of water versus commercial or municipal supply.nonpotable water protective systems are not provided, the capacity of the water supply system will be determined by the fire flow

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION

Potable water will be transmitted from a storage tank or a treatment plant to all station demand points through a pipeline. An engineering study of the pressures and quantities of water required at the demands points will serve as the basis for planning the sizes and lengths of pipe required for the water distribution pipelines. Planning for a potable water distribution pipeline will include requirements for piping, valves, pumps, connections, excavation, and backfilling. The pipeline shall be listed in linear feet (LF). Requirements will be determined by an engineering study.

CATEGORY CODE	FAC CODE	RPA TYPE	AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
84209	8910	B	[SF]			WATER DISTRIBTN BLDG, PTBL	N	ALL BUILDINGS ASSOCIATED WITH THE DISTRIBUTION OF POTABLE WATER. POTABLE WATER WILL BE TRANSMITTED FROM A STORAGE TANK OR A TREATMENT PLANT TO ALL STATION DEMAND POINTS THROUGH A PIPELINE. THIS CATEGORY CODE INCLUDES BUILDINGS ASSOCIATED WITH THE DISTRIBUTION OF POTABLE WATER, TYPICALLY HOUSING DISTRIBUTION PUMPS AND EQUIPMENT.
84210	8421	LS		[LF]		WATER DISTBTN LINE, POTBL	N	ALL PIPES THAT CONVEY POTABLE WATER FROM THE TREATMENT PLANT TO THE END USER.
84215	8422	S		KG	[GM]	PUMP STATION - POTABLE	N	THIS CATEGORY CODE WILL INCLUDE THE PUMP(S) AND APPURTENANT PIPING, VALVES, AND OTHER MECHANICAL AND ELECTRICAL EQUIPMENT FOR PUMPING WATER IN THE POTABLE WATER SYSTEM.

843 WATER, FIRE PROTECTION

Fire protection requirements often dominate the plans of a water supply system. When the supply of fresh water is not adequate, salt water may be used. Since fire flow demands are usually greater than either the domestic or industrial demands, the capacity of the system will generally be determined by the fire flow demands. Fire flows are expressed in gallons per minute and are separate from the other water requirements.

CATEGORY CODE	FAC CODE	RPA TYPE	AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
84310	8432	LS		[LF]		FIRE PROTECTION LINES	N	FIRE PROTECTION PIPELINES ARE USED EXCLUSIVELY IN THE TRANSMISSION OF WATER FOR FIRE PROTECTION, NOT DOMESTIC USE.

Roads, streets, and I ncidental parking area, curbs and gutters and culverts for vehicular traffic, including highway and vehicular bridges.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
85110	8511	LS	[SY]	MI		ROADS	N	ROADS, STREETS, AND BRIDGES ARE GENERALLY PLANNED TO CONFORM TO THE STANDARDS AND PRACTICES OF THE AMERICAN ASSOCIATION OF STATE HIGHWAY OFFICIALS (AASHO), BUREAU OF PUBLIC ROADS (BPR), AND STATE AND LOCAL GOVERNMENTS.
85111	8512	LS	[SY]		MI	ROADS, UNSURFACED	N	VEHICULAR ROADWAYS THAT DO NOT HAVE A PERMANENT/IMPERVIOUS SURFACE SUCH AS ASPHALT OR CONCRETE.
85115	8928	S	[SF]	EA		LOAD / UNLOAD RAMP	N	A RAMP, USUALLY CONCRETE OR STEEL/IRON THAT IS UTILIZED TO ASSIST IN THE LOADING OF TRUCKS AND RAILCARS.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
85120	8513	S	[SY]	LF		VEHICULAR BRIDGES	N	BRIDGES ARE GENERALLY USED TO CROSS AREAS OF DIFFERING ELEVATIONS. GENERALLY THEY ARE PLANNED TO CONFORM TO THE STANDARDS AND PRACTICES OF THE AMERICAN ASSOCIATION OF STATE HIGHWAY OFFICIALS (AASHO), BUREAU OF PUBLIC ROADS (BPR), AND STATE AND LOCAL GOVERNMENTS.
85121	8522	LS	[SY]			VEH. PARK, UNSURFACED	Y	AN AREA FOR PARKING PRIVATE AND/OR GOVERNMENT OWNED VEHICLES AND EQUIPMENT THAT DO NOT HAVE A PERMANENT/IMPERVIOUS SURFACE SUCH AS ASPHALT OR CONCRETE.
85122	8523	LS	[SY]			VEHICLE STAGING AREA	N	AN AREA, PAVED OR UNPAVED, THAT IS FOR TEMPORARY STORAGE OF VEHICLES PRIOR TO SHIPMENT OR FURTHER DEPLOYMENT.
85123	8541	S		[EA]		TRAFFIC CONTROL SIGNALS	N	DEVICES USED FOR DIRECTING PEDESTRIAN, VEHICULAR OR RAIL TRAFFIC BY MEANS OF POWER-OPERATED CONTROLS. COSTS INCLUDE SIGNAL DEVICES, NECESSARY SUPPORTS, AND ELECTRIC POWER CABLES AND ARE COUNTED PER INTERSECTION.
85125	8514	LS			[LF]	VEHICULAR TUNNEL	N	VEHICULAR TUNNELS ARE USED FOR SLOPE STABILIZATION AND AUTOMOBILE ACCESS IN AREAS WHERE STEEP SLOPES LIMIT DEVELOPMENT AND REQUIRE INNOVATIVE ACCESS SOLUTIONS. THESE TUNNELS SERVE VEHICULAR AND PEDESTRIAN TRAFFIC AS WELL AS HOUSING UTILITY RUNS.

852 SIDEWALKS & OTHER PAVEMENT

Walks and stairs for pedestrian traffic including pedestrian bridges, separate parking lots, and paved or stabilized areas for vehicular use and work or service areas.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
85210	8521	LS	[SY]			PARKING AREA	Y	THE PAVED AND/OR STABILIZED AREA WITHIN AN ORGANIZATIONAL MOTOR POOL AND PARKING LOT,
85215	7384	S	[SF]			BICYCLE SHELTER	Y	A STRUCTURE USED FOR TEMPORARY PARKING OF BICYCLES.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
85220	8524	S	[SY]			SIDEWALK	N	A PATHWAY CONSTRUCTED TO SUPPORT PEDESTRIAN TRAFFIC. CONSTRUCTION IS OF CONCRETE, ASPHALT, PAVING BLOCKS, GRAVEL, OR THE LIKE.
85230	8525	S	[SY]	LF		PEDESTRIAN BRIDGES	N	BRIDGES THAT SUPPORT WALKWAY CROSSING OF A RIVER, UNDERPASS, OR SIMILAR GAP.
85235	8526	LS	[SY]			OTHER PAVED AREA	N	THIS CODE IS FOR MISCELLANEOUS VEHICULAR PAVEMENTS NOT CAPTURED IN OTHER 100 OR 400 SERIES CATEGORY CODES.
85240	8526	LS	[SY]			MISC OPEN STRG/LAYDOWN	N	THIS CODE IS FOR OPEN STORAGE AREAS OTHER THAN THOSE USED FOR GENERAL SUPPLY OPERATIONS (CATEGORY CODE 451 10). IT INCLUDES PUBLIC WORKS OPEN STORAGE FACILITIES.
85241	8526	LS	SY	[EA]		BLDG/TRLR PAD W/ UTIL CNCT	N	PAVED SURFACE CONSTRUCTED TO SUPPORT A TEMPORARY FACILITY OR TRAILER. UTILITY CONNECTIONS ARE PART OF THE TRAILER PAD REQUIREMENTS AND ALLOW TEMPORARY FACILITIES (OFTEN CLASS 3 PROPERTY) TO BE EASILY INSTALLED.

853 PARKING BLDG

A structure or building designed for parking private and/or government owned vehicles and equipment in individual parking spots/locations. The facility may be above ground or underground. The parking building should be justified by land restrictions and economic considerations. Allow 33 m2/ 40 SY for each passenger vehicle.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
85310	8531	S	[SF]	VE		PARKING BLDG	Y	A STRUCTURE OR BUILDING DESIGNED FOR PARKING PRIVATE AND/OR GOVERNMENT OWNED VEHICLES AND EQUIPMENT IN INDIVIDUAL PARKING SPOTS/LOCATIONS. THE FACILITY MAY BE ABOVE GROUND OR UNDERGROUND. THE PARKING BUILDING SHOULD BE JUSTIFIED BY LAND RESTRICTIONS AND ECONOMIC CONSIDERATIONS.

860 RAILROADS

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION

This category group covers all two-rail tracks including spurs, sidings, yards, turnouts, with accessories and appurtenances such as barricades. It includes trackage on ship repair facilities, marine railways and portal crane structures.

CATEGORY CODE	FAC CODE	RPA TYPE	AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
86010	8601	LS		[MI]		RAILROAD TRACKAGE	N	RAIL TRACK TO INCLUDE SPURS, SIDINGS, YARDS, AND TURNOUTS. TRACK INCLUDES TWO PARALLEL RAILS, CROSSTIES, AND ROADBED.
86020	1495	S		[EA]		EXPLOSV BARICD,TRUCK/CAR	N	A CONCRETE AND EARTHEN STRUCTURE PLACED ALONGSIDE A SUSPECT CARGO SITE FOR TRUCKS AND RAILCARS CONTAINING AMMUNITION OR EXPLOSIVES THAT ARE SUSPECTED OF BEING IN A HAZARDOUS CONDITION.
86030	8611	S		[MI]	LF	RR BRIDGE&TRESTLE	N	BRIDGES THAT SUPPORT RAILROAD TRACK CROSSING OF A RIVER, ROAD UNDERPASS, OR SIMILAR GAP.
86040	8601	LS		[MI]		CRANE TRACKAGE	N	TRACKAGE USED IN OPERATIONAL AREAS TO ALLOW CRANE TRAVEL BETWEEN OPERATIONAL FACILITIES OR WATERFRONT AREAS SUCH AS PIERS AND WHARVES.
86041	8923	S	[SF]	EA		RAILROAD SCALEHOUSE	N	A RAILROAD SCALEHOUSE IS A FACILITY DESIGNED TO WEIGH RAIL CARGO. TYPICALLY, TRACKS ARE LAID TO ALLOW RAILCARS TO BE PULLED THROUGH THE SCALEHOUSE.

861

870 GROUND IMPROVEMENT STRC

This category group includes drainage and storm sewer systems, bo

871 GROUNDS, DRAINAGE

Drainage and storm sewer systems including appurtenant dykes, dams, and retaining walls. For combined storm and sanitary sewer systems, use basic category codes 831 and 832.

CATEGORY CODE	FAC CODE	RPA TYPE	AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
87110	8321	LS		[LF]		STORM SEWER	N	STORM SEWERS ARE COMPONENTS OF A STORM DRAINAGE SYSTEM THAT COLLECTS THE SURFACE RUNOFF WATER AND CONVEYS IT TO OUTLET POINTS.
87111	8313	S		[KG]		OIL/WATER SEPARATOR-RUNOFF	N	OIL/WATER SEPARATOR USED FOR SEPARATING PETROLEUM CONTAMINANTS FROM STORMWATER PRIOR TO BEING REINTRODUCED INTO THE NATURAL ENVIRONMENT.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
87115	8452	S		[EA]	KG	STORM WATER PUMPING STA	N	PUMP STATION FACILITY USED FOR MOVING STORMWATER RUNOFF FROM ONE ELEVATION/LOCATION TO ANOTHER.
87116	8715	S			[MG]	STORM WATER POND	N	A STORM WATER RETENTION POND IS UTILIZED TO CONTAIN AND CONTROL STORM WATER RUNOFF AT A PREDETERMINED RATE.
87120	8711	LS		[LF]		DRAIN DITCH,EXC ROAD DITCH	N	DRAINAGE DITCHES SERVE THE SAME PURPOSE AS STORM SEWERS. THEY ARE PREFERABLE TO COVERED STRUCTURES TO MINIMIZE CONSTRUCTION, TO CONSERVE MATERIALS, AND TO FACILITATE MAINTENANCE.
87125	8714	S		[LF]	EA	DYKE / DAM	N	A DAM IS AN ARTIFICIAL OR NATURAL BARRIER USUALLY CONSTRUCTED ACROSS A STREAM CHANNEL TO IMPOUND WATER.
87126	8714	S		LF	[EA]	LEVEE &/OR DIKE	N	A LEVEE IS A TYPE OF DAM THAT RUNS ALONG THE BANKS OF A RIVER OR CANAL. LEVEES REINFORCE THE BANKS AND HELP PREVENT FLOODING.
87130	8451	LS		EA	[LF]	IRRIGATION FACILITY	N	THESE FACILITIES ARE USED TO SUPPLY WATER TO AREAS THAT NEED WATER ABOVE THE AMOUNT OF NATURAL RAINFALL. THEY CAN CONSIST OF A SERIES OF PUMPS, PIPES AND OTHER ASSOCIATED EQUIPMENT.
87135	8712	S		[LF]		RETAINING WALL	N	A STRUCTURE CONSTRUCTED TO RESTRICT OR PREVENT THE HORIZONTAL MOVEMENT OF EARTH.
87145	8714	S		EA	[LF]	DREDGED SPOIL HNDLG FAC	N	FACILITY FOR STORAGE OF DREDGE SPOILS PRIOR TO PROCESSING AND REMOVAL.
872						FENCING/WALLS/GUARD TOWERS		

Category Code Report (All Series)

This basic category provides boundary security in the form of fencing, walls, gates, watch towers, guard walks, and guard shelters. The type and amount of security planned is a function of the security classification required, and the economical utilization of security guards.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
87210	8721	LS		[LF]		SECURTY/PERIMTR FENCE/WALL	N	SECURITY FENCING AND WALLS DEFINE THE LIMITS OF SECURITY AREAS AND FACILITATE THE EFFECTIVE AND ECONOMICAL USE OF SECURITY PERSONNEL. FENCING IS PLANNED ON THE BASIS OF A STUDY OF THE SECURITY CLASSIFICATION REQUIREMENTS OF THE INSTALLATION.
87211	8722	LS			[LF]	HARDENED SEC FENCE	N	A LINEAR STRUCTURE INTENDED TO RESTRICT ACCESS TO A SPECIFIC AREA OR TO RESTRICT AND DIRECT THE FLOW OF TRAFFIC. THESE STRUCTURES INCLUDE HARDENING OR SPECIAL CHARACTERISTIC BEYOND STANDARD FENCES AND WALLS SUCH AS INTRUSION DETECTION, RAZOR WIRE, OR BARRIER IMPACT/PENETRATION RESISTANCE MEASURES.
87215	8721	LS		[LF]		INTERIOR FENCE*EXC 87210*	N	MISCELLANEOUS FENCING INTERIOR TO AN INSTALLATION PERIMETER FENCE. THIS CATEGORY CODE IS FOR INVENTORY PURPOSES ONLY.
87220	1734	S	SF	[EA]		GUARD AND WATCH TOWERS	N	WHERE AUTHORIZED, GUARD OR WATCHTOWERS SHOULD BE CONSTRUCTED AT LOCATIONS THAT WILL PROVIDE THE BEST OBSERVATION OF SECURITY AREAS.
87230	1458	S			[EA]	MECH SEC BARRICADE	N	MECHANICALLY OPERATED BARRICADE CONSISTING OF POP-UP BOLLARDS, RISING ROAD PLATES, OR WEDGES DESIGNED TO CONTROL VEHICLULAR OR OTHER TRAFFIC. UNIT OF MEASURE IS EA AND INCLUDES DEVICES USED FOR A SINGLE TRAFFIC LANE.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
This basic category includes separate integral signal systems such as fire alarm, watch reporting, and security. Telephone reporting systems are planned with telephone systems (see Code 130).								
88010	1351	LS		[MI]		FIRE ALARM COMM LINES	N	THIS CATEGORY CODE IS USED TO CAPTURE THE FIRE ALARM REPORTING SYSTEM RELATED COMMUNICATION LINES THAT ARE EXTERIOR TO THE BUILDINGS THEY SERVE. FACILITY FIRE ALARM EQUIPMENT AND RELATED BUILDING INFRASTRUCTURE ARE EITHER RPIE OR PPE AND ARE NOT INCLUDED IN THIS CATEGORY CODE.
88020	1351	LS		[MI]		WATCH RPTG SYSTEM LINES	N	A WATCH REPORTING SYSTEM PROVIDES A METHOD FOR THE AUTOMATIC AND NON-AUTOMATIC DETECTION OF FIRE AND FOR SECURITY PROTECTION (INTRUSION DETECTION SYSTEM) THROUGHOUT DESIGNATED AREAS, BUILDINGS, AND STRUCTURES. THE WATCH REPORTING SYSTEM PROVIDES LOCAL ALARMS AND CENTRAL STATION ALARMS TO BUILDING OCCUPANTS AND TO STATION SECURITY AND FIREFIGHTING PERSONNEL.
88030	1351	LS		[MI]		BASE ALERT SYSTEMS LINES	N	BASE ALERT SYSTEMS SHALL BE PLANNED FOR ALL NAVY INSTALLATIONS. THE SYSTEM MAY ALERT BASE PERSONNEL TO AIR RAIDS, CHEMICAL/BIOLOGICAL ATTACKS OR ANY OTHER TYPE OF TERRORIST ATTACK. HORNS OF HIGH-POWER TYPE MAY BE USED AS SIGNAL DEVICES.
88040	1351	LS		[MI]		AIR CRASH/ALERT COMM LINES	N	ALARM SYSTEM INTENDED TO ALERT IN THE EVENT OF AN AIR CRASH

892								
89210	1499	S		[EA]		MONITORING WELLS	N	WELLS INSTALLED AROUND A SITE IN ORDER TO DETECT THE DISCHARGE OF ANY LEACHATE. SAMPLES FROM THE WELLS SHOULD BE ANALYZED PRIOR TO THE DISPOSAL OF ANY WASTE IN ORDER TO ESTABLISH BASELINE DATA.
893						MISCELLANEOUS UTILITIES-LF		
89320	8932	LS		[LF]		UTILITY CHANNEL	N	A UTILITY CHANNEL IS AN ENCLOSED UNDERGROUND CHANNEL FOR UTILITY, COMMUNICATION OR OTHER LINES THAT BOTH PROTECTS THE LINES, AND PROVIDES RELATIVELY EASY ACCESS FOR THEIR MAINTENANCE.
895								
900						REAL ESTATE		
910						LAND - GOVERNMENT OWNED		
911						LAND PURCH,COND,DONA/ TRANS		

This basic category includes lands acquired in fee purchase, condemnation, donation, exchange or transfer, which is owned in fee by the Federal Government, and under custody and accountability of the Department of the Navy.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	UNITS OF MEASURE OTHER	UNITS OF MEASURE ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
91110	9110	L	[AC]			LAND - PURCHASE	N	LAND ACQUIRED IN FEE BY PURCHASE IS A NEGOTIATED SALE OF THE PROPERTY FROM PRIVATE OWNERS TO THE FEDERAL GOVERNMENT BY CONVEYANCE OF DEED.
91120	9110	L	[AC]			LAND - DONATION	N	LAND ACQUIRED IN FEE BY DONATION USUALLY CONSISTS OF A CONVEYANCE OF FEE TITLE BY THE DONOR WITHOUT MONETARY CONSIDERATION.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
91130	9110	L	[AC]			LAND - TRANSFER	N	TRANSFERS OF FEDERAL GOVERNMENT-OWNED LAND AMONG DEPARTMENTS AND AGENCIES OF THE FEDERAL GOVERNMENT
91140	9110	L	[AC]			LAND - CONDEMNATION	N	LAND IS ACQUIRED BY CONDEMNATION WHERE LAND IS ESSENTIAL FOR A PROJECT WHICH AFFECTS NATIONAL DEFENSE OR SECURITY, AND THE CONSIDERATION FOR PURCHASE CANNOT BE MUTUALLY AGREED UPON BETWEEN THE OWNER AND THE NAVY.
91150	9110	L	[AC]			LAND - EXCHANGE	N	LAND ACQUIRED BY EXCHANGE IS SIMILAR IN PRINCIPLE TO ACQUISITIONS BY PURCHASE EXCEPT THAT THE CONSIDERATION IS BY LAND VALUE RATHER THAN CASH.

912 LAND-PUB DOMAIN WITHDRAWAL

The Navy Department may acquire land by withdrawal from public domain under jurisdiction of the Department of the Interior. Withdrawals of less than 5,000 acres are made by Public Land Order. Withdrawal of more than 5,000 acres for any one project must be approved by Act of Congress. In addition to securing authorization from the Armed Services Committees of Congress, a bill must be introduced in the Committees on Public Land and Insular Affairs for acquisition of public domain lands in excess of 5,000 acres.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
91210	9120	L	[AC]			LAND - PUB DOMAIN,PERM	N	FEDERAL GOVERNMENT LAND PERMANENTLY EXCLUDED FROM SOME OR ALL FORMS OF ENTRY, USE, SALE, OR OTHER DISPOSAL UNDER THE PUBLIC LANDS LAWS AS SPECIFIED IN THE PUBLIC LAND ORDER, EXECUTIVE ORDER, OR ACT OF CONGRESS AND THOSE LANDS THAT ARE RESERVED FOR A SPECIFIED DEPARTMENT OR AGENCY FOR A SPECIFIC PUBLIC PURPOSE.
91215	9111	L	[AC]			LAND - SET ASIDE- HAWAII	N	FEDERAL GOVERNMENT LAND RESERVED THROUGH LAND TRUST IN STATE OF HAWAII

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
91220	9120	L	[AC]			LAND-PUB DOMAIN,TEMPORY	N	FEDERAL GOVERNMENT LAND EXCLUDED FROM SOME OR ALL FORMS OF ENTRY, USE, SALE, OR OTHER DISPOSAL UNDER THE PUBLIC LANDS LAWS AS SPECIFIED IN THE PUBLIC LAND ORDER, EXECUTIVE ORDER, OR ACT OF CONGRESS AND THOSE LANDS THAT ARE RESERVED FOR A SPECIFIC PUBLIC PURPOSE FOR A SPECIFIED PERIOD OF TIME.

913 LAND - LICENSE OR PERMIT

Land is acquired for temporary use under license or permit. The license or permit is a privilege, revocable at will, to use the property of the licenser, for a specified purpose and period of time. Land from Public Domain used under temporary permit is obtained under agreement between the Navy Department, and the Department of the Interior. The temporary permit implies no use detrimental to the land such as contamination.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
91310	9130	L	[AC]			LAND-TEMP USE,LIC,PMT,AGMT	N	THIS LAND IS ACQUIRED FOR TEMPORARY USE UNDER LICENSE OR PERMIT. THE LICENSE OR PERMIT IS A PRIVILEGE, REVOCABLE AT WILL, TO USE THE PROPERTY OF THE LICENSER, FOR A SPECIFIED PURPOSE AND PERIOD OF TIME.
91320	9130	L	[AC]			LAND-PUB DOMAIN -TEMP/PMT	N	LAND FROM PUBLIC DOMAIN USED UNDER TEMPORARY PERMIT IS OBTAINED UNDER AGREEMENT BETWEEN THE NAVY DEPARTMENT, AND THE DEPARTMENT OF THE INTERIOR. THE TEMPORARY PERMIT IMPLIES NO USE DETRIMENTAL TO THE LAND SUCH AS CONTAMINATION.

914 PUBLIC LAND- TERRIT & POSS

Land from U.S. possessions is acquired for temporary or long-term use by Executive Order or permit agreement for a limited specific use. This includes public land of U.S. possessions acquired and used under long-term agreements or temporary agreements, and public land of U.S. possessions assigned to the Navy on temporary permit.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
91410	9140	L	[AC]			LAND-PUBLIC- TEMPO/LNG TERM	N	THIS CODE IS USED FOR PUBLIC LAND OF U.S. POSSESSIONS ACQUIRED AND USED UNDER LONG-TERM AGREEMENTS OR TEMPORARY AGREEMENTS.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
91420	9140	L	[AC]			LAND-PUBLIC-TEMP PERMIT	N	THIS CODE IS USED TO DESIGNATE PUBLIC LAND OF U.S. POSSESSIONS ASSIGNED TO THE NAVY ON TEMPORARY PERMIT.
920						LAND - OTHER RIGHTS		
921						LAND - EASEMENT		

An easement is a conveyance of interest in real property for particular purposes and needs of the Navy. An easement is acquired by deed for a term of years or in perpetuity. The grantor of an easement may continue to use the land within the stipulations of the easement.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA	OTHER	ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
92110	9210	L	[AC]			LND-AVTN EASEMENT-PURCHASE	N	AN AVIATION EASEMENT IS PURCHASED TO CONVEY CERTAIN PROPERTY RIGHTS FROM THE PRIVATE OWNER TO THE FEDERAL GOVERNMENT. THIS IS DONE BY CONVEYANCE OF DEED. EASEMENTS ARE ACQUIRED TO INSURE FREE AND UNOBSTRUCTED AIRCRAFT PASSAGE THROUGH THE AIRSPACE. THE EASEMENT PROVIDES THE RIGHT TO LIMIT STRUCTURE HEIGHT AND NATURAL GROWTH.
92120	9210	L	[AC]			LND-AVTN EASEMT-CONDEMN	N	THIS CODE VARIES FROM 921 10 ONLY IN THE METHOD OF ACQUISITION. POSSESSION IS OBTAINED BY CONDEMNATION ONLY WHEN THE PURCHASE PRICE CANNOT BE MUTUALLY AGREED UPON BETWEEN THE OWNER AND THE NAVY.
92130	9210	L	[AC]			LAND-OTH EASEMENT-PURCHASE	N	EASEMENTS OTHER THAN FOR NAVIGATION ARE ACQUIRED BY NEGOTIATED SALE. THESE EASEMENTS PROVIDE RIGHTS-OF-WAY FOR TYPICAL UTILITY LINES AND ACCESS ROADS AS WELL AS MANY OTHER PURPOSES, INCLUDING RESTRICTIONS ON USE.
92140	9210	L	[AC]			LAND-OTH EASEMENT-CONDEMNA	N	THIS IS SIMILAR TO 921 30 BUT DIFFERS IN THAT AGREEMENT ON A NEGOTIATED EASEMENT CANNOT BE REACHED, AND THE EASEMENT IS OBTAINED BY CONDEMNATION FOR REASON OF NATIONAL DEFENSE OR SECURITY.

Category Code Report (All Series)

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA OTHER ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
92150	9210	L	[AC]	LAND-OTH EASEMENT-EXCHANGE	N	THIS IS SIMILAR TO 92130 BUT DIFFERS IN THAT CONSIDERATION IS LAND VALUE RATHER THAN CASH.

922 LAND - IN-LEASE

An in-lease is a conveyance of a possessory interest in real property for a term of years for rent or other consideration. Leased property is categorized under three groups as follows: Land is leased from private owners for periods under 25 years, land is leased from State and local governments for periods under 25 years, and Land in-lease for 25 years or more is categorized as "long-term". The land may be leased from private enterprise, or State or local governments.

CATEGORY CODE	FAC CODE	RPA TYPE	UNITS OF MEASURE AREA OTHER ALT	TITLE	RQMTS RPTG IND.	DESCRIPTION
92210	9220	L	[AC]	LAND-IN-LEASE-PRIV ENTERPR	N	THIS LAND IS LEASED FROM PRIVATE OWNERS FOR PERIODS UNDER 25 YEARS.
92220	9220	L	[AC]	LAND- IN-LEASE-STAT&LOC	N	THIS LAND IS LEASED FROM STATE AND LOCAL GOVERNMENTS FOR PERIODS UNDER 25 YEARS.
92230	9220	L	[AC]	LAND-IN LEASE-LONG TERM	N	LAND IN-LEASE FOR 25 YEARS OR MORE IS CATEGORIZED AS "LONG-TERM". THE LAND MAY BE LEASED FROM PRIVATE ENTERPRISE, OR STATE OR LOCAL GOVERNMENTS.

923 LAND - FOREIGN RIGHTS

Land under custody and accountability of the Navy Department comprising a Navy installation in a foreign country except land under easement, Code 921. The method of acquisition or use of real property in a foreign country depends upon, and is accomplished by, diplomatic agreement and subsidiary military agreements or, where applicable, by lease or other agreement. Fee simple title to real property in a foreign country is not acquired. The extent of interest which may be acquired in such property depends upon the agreement. Acquisition or use of real property in an occupied country is accomplished by requisition or other local arrangements.

FOREWORD

This appendix to NAVFAC P-80 provides planning procedures to determine and evaluate practical hourly and daily capacity of various runway/taxiway configurations at Naval and Marine Corps Air Installations supporting fixed wing aircraft. The procedures developed herein are not applicable to helicopter or joint use (Navy-Marine Corps/Civilian) installations.

Procedures, examples and worksheets are provided for the computation of capacities for Instrument Flight Rules (IFR), Visual Flight Rules (VFR) and Carrier Practice Landings (CPL).

TABLE OF CONTENTS

****

LIST OF FIGURES AND TABLES

****

Note: Figures and Tables used in Section III (EXAMPLES) are not listed above.

Section I. INTRODUCTION

This Appendix describes the procedures necessary to compute the hourly and daily aircraft handling capacity of an air station's runway system. The following basic factors are considered in the process:

- Type of aircraft (Not including Helicopters)
- Type of operations performed
- Runway/taxiway design
- Use of runways
- IFR Capability

This procedure does not consider such items as personnel support, fueling requirements, ramp/gate/apron size, civilian landing OPS at joint use installations (will require special studies), etc. These factors could be a limiting constraint on an air station's ability to accommodate a specific aircraft demand and would have to be considered in an overall station capacity evaluation.

It should be recognized that there is a range of capacity values for any given station depending on the number of individual or combinations of runways that can be used. Runway use at any one time is related to the runway layout as well as operational factors including wind direction and velocity (crosswind and tailwind limitations), prevailing visibility and ceiling (VFR and IFR conditions), available runway lengths, location of arresting gear, position of navigational facilities, environmental considerations (noise abatement procedures) and applicable air traffic control rules and regulations.

Typical air station runway layouts showing possible runway uses (operating configurations) are included on Figure 1-1. The selection of all possible operating configurations is necessary to calculate the range of capacities associated with a station. However, the selection of the primary operating configuration may be sufficient for study purposes in some cases.

Throughout the capacity procedures, reference is made to aircraft class (I, II, and III). These classes have been developed for capacity calculation purposes. A description of the classes and aircraft type they represent are shown on Table 1-1.

Capacity procedures are separately described for three types of operations; namely,

- Under VFR conditions
- Under IFR conditions
- Carrier Practice Landing (CPL) procedures

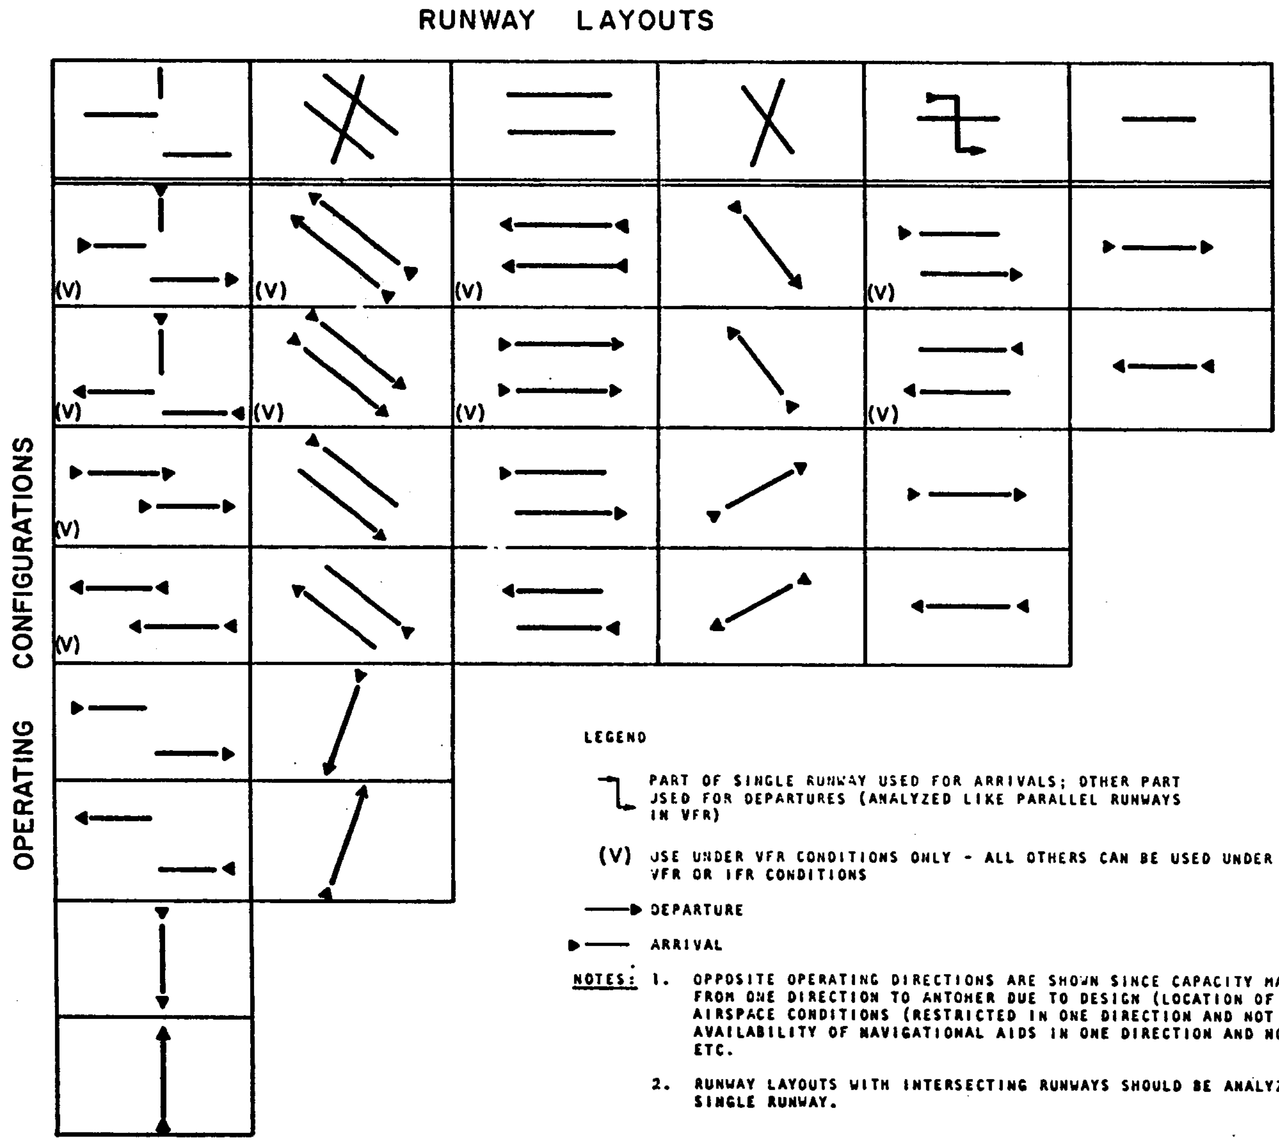
As applicable, these procedures should be followed for each individual runway operating configuration for which capacity is required.

In order to calculate capacity, a forecast of aircraft activity has to be developed. Where an existing station with its current activity is being analyzed, a field survey can be used to develop forecast data. Where aircraft traffic changes are contemplated for an existing station or a new station is being planned for, other forecast techniques will have to be employed. For each analysis the forecast activity should be grouped into the three aircraft classes shown on Table 1-1. A further breakdown may then be required with respect to number of aircraft landing, taking off, performing touch and go's, taking off in pairs (side by side; not formations of two aircraft), and/or operating in formations of two, three or four. It should be noted that the forecast activity breakdown may differ significantly between VFR, IFR and CPL operating conditions.

Helicopter operations are not treated in these capacity procedures. At installations which support both helicopter and fixed wing aircraft on the same runway, consideration shall be given to providing a separate helicopter landing area before any evaluation is made as to the need for an additional fixed wing runway.

Figure 1-1

TYPICAL RUNWAY LAYOUTS AND OPERATING CONFIGURATIONS



LEGEND

PART OF SINGLE RUNWAY USED FOR ARRIVALS; OTHER PART USED FOR DEPARTURES (ANALYZED LIKE PARALLEL RUNWAYS IN VFR)

(V) USE UNDER VFR CONDITIONS ONLY - ALL OTHERS CAN BE USED UNDER VFR OR IFR CONDITIONS

DEPARTURE

ARRIVAL

NOTES:

1. OPPOSITE OPERATING DIRECTIONS ARE SHOWN SINCE CAPACITY MAY VARY FROM ONE DIRECTION TO ANTOHER DUE TO DESIGN (LOCATION OF EXITS), AIRSPACE CONDITIONS (RESTRICTED IN ONE DIRECTION AND NOT ANOTHER), AVAILABILITY OF NAVIGATIONAL AIDS IN ONE DIRECTION AND NOT ANOTHER, ETC.

2. RUNWAY LAYOUTS WITH INTERSECTING RUNWAYS SHOULD BE ANALYZED AS SINGLE RUNWAY.

Table 1-1

U. S. NAVY AIRCRAFT CLASSES
FOR CAPACITY CALCULATIONS

Class	Description	Final Approach Speed (Knots)	Type
I	Jet Aircraft	100-150	A4, A6, A7, F4, F8, T-1, T-2, T-33, F9, F-10, T-39, C-141, A-3, A-5, A-2
II	Turbo-Prop and Piston Aircraft	100-150	C-54, C-118, T-29, C-130, C-121, P-2, P-3, C-119, C-131
III	Turbo-Prop and Piston Aircraft	Less than 100	C-47, C-117, C-45, T-28, T-34, U11A, OV-10, S-2, C-1, E-1, U-6

Section II. CAPACITY PROCEDURES

This section describes the procedures necessary to calculate VFR, IFR, Carrier Landing Practice and Daily Capacities.

1. DEFINITIONS. Before proceeding, the following definitions should be reviewed:

   a. Hourly Arrival Capacity (HAC): the hourly aircraft movement rate which can be sustained at a reasonable average delay imposed on aircraft using a runway for arrivals only.

   b. Hourly Departure Capacity (HDC): the hourly aircraft movement rate which can be sustained at a reasonable average delay imposed on aircraft using a runway for departures only.

   c. Hourly Mixed Capacity (HMC): the hourly aircraft movement rate which can be sustained at a reasonable average delay imposed on aircraft using a runway for arrivals and departures at the same time.

   d. Hourly Total Capacity (HTC): the summation of all available hourly capacities. In the case of a single runway used for arrivals and departures at the same time, HTC = HMC; where multiple runways are used for arrivals (only) and departures (only), HTC = the sum of HAC and HDC.

   e. Daily Capacity: number of aircraft that can be accommodated on a daily basis on an air station's runway system.

only necessary to forecast the extent to which any of these operations are likely or planned to occur, during any period of interest such as an hour, two hours, half day, etc., in order to determine a runway capacity appropriate for the intended use. VFR Runway Capacity Analysis Work Sheets with provisions for logging the forecast of aircraft activity and calculations of HDC, HAC and HMC are presented on Tables 2-3, 2-4 and 2-5 respectively. Instructions for application of these Tables follow later in this Section.

b. Aircraft Takeoff Considerations. A runway used exclusively for takeoff will have a capacity dependent on the class of aircraft using the runway, and on the extent to which takeoffs are conducted singly, in formations or paired. When aircraft of a given class are operated singly, an average hourly departure capacity (HDC) can be established which is typical for VFR operations of the class from most any runway. This movement rate is largely controlled by average speed and the separation required for aircraft of the particular class and are noted below:

HDC - Hourly Departure Capacity-Movements Per Hour

Class of Aircraft	HDC
I	49
II	63
III	90

If some of the takeoffs are conducted in formations or in pairs (side-by-side), then the number of aircraft which can be accommodated in a given time is increased.

2. VFR RUNWAY CAPACITY ANALYSIS. This paragraph describes the procedures to determine hourly capacity of a runway used for normal air station operations in VFR conditions. For procedures to determine the capacity of the same runway in IFR conditions, or when it is used for CLP - see paragraphs 3 or 4 respectively.

These procedures should be repeated for each runway for which a capacity determination is required. A single analysis may be applicable to both directions of a runway if the operations are forecast to be identical, and the runway is symmetrical in terms of effective landing length and turnoffs available, for either landing direction.

a. Forecast of Aircraft Activity. The capacity of a runway for accommodating aircraft operations depends significantly on how the runway is used, specifically in consideration of the following:

(1) The degree of mixing of various aircraft classes.

(2) Whether it is used for takeoffs only, landings only, or the degree to which they are mixed on a single runway.

(3) The type of takeoff operations, namely, made singly, in formations, or paired (side by side).

(4) The type of landing operations, namely, singly, in formations, performing touch-and-go's, or at reduced separation.

These procedures allow for accountability of these variables normally encountered in air station operations. In application of the procedures to a given runway it is then

Stated another way, the time required to handle each aircraft in formation, or paired, is less than the equivalent of one movement when aircraft takeoff singly.

The runway capacity analyses uses procedures which consider the effect of formations and paired takeoffs by converting this activity to "equivalent" single aircraft movements, i.e. two aircraft taking off paired equal one equivalent movement (equivalent movement factor equals 0.50); ten Class I aircraft taking off in formations of two equals six equivalent movements (equivalent movement factor equals 0.60). A breakdown of takeoff equivalent movement factors are listed below:

TAKEOFF EQUIVALENT MOVEMENT FACTOR

	Class of Aircraft		
Type of Takeoff	I	II	III
Single	1.00	1.00	1.00
Formation of 2	.60	.63	.69
Formation of 3	.47	.51	.59
Formation of 4	.41	.45	.54
Pairs	.50	.50	.50

The takeoff factors appropriate for the various classes of aircraft and number of aircraft in each formation are also shown on the appropriate Analysis Work Sheets.

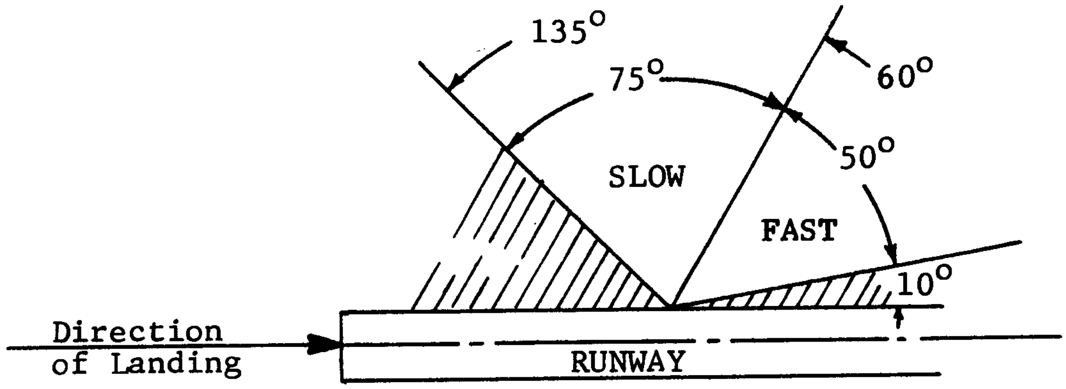
When more than one class of aircraft is using the same runway, the hourly departure capacity (HDC) will be influenced by the relative amount each class of aircraft contributes to the total operations during the period under consideration. The Work Sheets describe the steps necessary to properly account for the mix of aircraft by class. A weighted HDC is computed for each class and totaled for the mix of operations forecast for the runway analysis.

c. Runway Rating. A runway used for landing, either exclusively or mixed with takeoff operations, will have a capacity influenced by the length of time that landing aircraft occupy the runway. Subsequent arriving or departing aircraft must wait until a landing aircraft has cleared the runway at an exit (or is a sufficient distance along the runway if reduced runway separation criteria are in use).

Average runway occupancy time (Runway Rating) will be influenced by landing speed (Class of Aircraft), field elevation, length of runway and by the number, type and location of turnoffs (exits) available along the runway.

Turnoffs which will contribute most to a favorable Runway Rating are those which are located along the runway close to the point where landing aircraft will have slowed to a safe turnoff speed in a normal deceleration. Turnoffs too close to the threshold will not be usable for fast aircraft. Turnoffs far down the runway will require a time consuming rollout. The contribution of each turnoff may thus vary depending on the speed class of aircraft using the runway.

The type of turnoff will also influence Runway Rating. A low angled turnoff in the direction of landing may normally be used at higher speed than one requiring close to a 90° turn. For purposes of determining Runway Rating, the types of usable turnoffs will be classified as follows:



Note: Shaded areas outside usable turnoff range.

The usability of each available runway exit should be considered when determining the number of equivalent usable turnoffs which contribute to the Runway Rating. For example, one class of aircraft destined for a parking area on one side of the runway cannot reasonably use a turnoff leading to the opposite side, and some turnoffs may lead to conflict with takeoffs or other ground traffic.

A chart for use in determining Runway Rating for each aircraft class is provided on Figure 2-1. Examples illustrating use of the Runway Rating chart are included in Section III of this Handbook. When using the chart the following considerations should be kept in mind.

> Usable turnoffs are in terms of equivalent "slow" turnoffs. A "fast" turnoff within the "Range of Usable Turnoffs" should be counted as two "slow" turnoffs.

- Turnoffs which are located outside the "Range of Usable Turnoffs" on the chart should not be used in determining Runway Ratings.
- "Fast" turnoffs which are located outside the "fast" range but are in the "slow" range on the chart should be counted as equivalent to only one "slow" turnoff.
- When no usable turnoffs exist except at the end of the runway use the "End Only" line on the chart.
- If only one turnoff exists (before the end of the runway) and it is located beyond the "Range of Usable Turnoffs" on the chart, use the "0" line to determine Runway Rating.

When "Reduced Separation" is authorized for any class of aircraft, the average time interval between landings will no longer be controlled by Runway Rating. An effective Runway Rating of 25 seconds is used for all operations of aircraft using "Reduced Separation".

d. Aircraft Landing Considerations. A runway used exclusively for landing will have a capacity dependent on the class of aircraft using the runway, and the extent to which landings are conducted singly, in formations or as touch-and-go's. When aircraft of a given class are operated singly, an average hourly arrival capacity (HAC) can be established for each Runway Rating, which is typical for VFR operations of the class onto most any runway with the same rating. Intermittent low approaches are considered as touch-and-go's. HAC values for each class of aircraft for a range of Runway Ratings are presented in Table 2-1.

Similar considerations as those used for takeoff are included in the runway capacity analysis procedure. Landings in formation and touch-and-go's are converted to "equivalent" single aircraft movements. The "equivalent movement factors" to be used for the conversion of aircraft landings to equivalent movements will vary with HAC, since a formation interval or touch-and-go, takes the same amount of time regardless of aircraft class or Runway Rating.

The landing equivalent movement factors appropriate for the various classes of aircraft and number of aircraft in each formation are presented on Table 2-2.

When more than one class of aircraft is using the same runway, the total hourly arrival capacity (HAC) will be influenced by the relative amount each class of aircraft contributes to the total operations during the period under consideration. To properly account for the mix of aircraft by class, the Work Sheet include the steps necessary to compute weighted HAC.

e. Mixed Takeoff and Landing Considerations. Runways used for mixed takeoffs and landings will have an average hourly mixed capacity (HMC) dependent on the mix of aircraft by class and on the mix of operations between takeoffs and landings. Aircraft types are designated by class depending on their typical terminal area operating speeds. When more than one class of aircraft is using a runway, a fast aircraft may follow a slow one, and vice versa, in landing or takeoff. The efficiency with which runways and airspace can be used decreases when speed classes are mixed.

When takeoffs and landings are mixed, the runway capacity will vary depending on the percent of total operations, during the period under consideration, which are reserved for landings, considering that landing operations will most always be given priority. A typical runway may display variations in HMC as the percent of landings changes as shown in the following example:

% Landings	HMC
0%	49 (HDC)
25	42
50	43
75	39
100	32 (HAC)

To properly account for the mix of aircraft by class and the mix of operations by percent of landings, the Work Sheet includes the steps necessary to compute the equivalent takeoff and landing movements by class, and the percent of equivalent movements which are landing.

A chart showing the relationship of Runway Rating, mix of aircraft classes, and percent landings, is presented on Figure 2-2. This chart is used in conjunction with the procedures outlined on the Work Sheet to determine HMC for the appropriate aircraft and operating mix.

f. Aircraft Capacity. The values of HDC - hourly departure capacity; HAC - hourly arrival capacity, and HMC - hourly mixed capacity, determined by these procedures, calculates the number of equivalent single aircraft movements which could take place on the runway being analyzed considering the factors described above under "Forecast of Aircraft Activity"; these capacities are identified on the Work Sheets with a subscript "E", for example, $(HAC)_E$. The procedures also then allow for conversion of the "equivalent" capacities into a value representative of the actual number of aircraft involved, that is, a pair equals two aircraft and a formation of 2, 3 and 4, equals 2, 3 and 4 aircraft; the actual capacity is identified on the Work Sheet with a subscript "A", for example, $(HAC)_A$. It is noted that throughout these procedures, touch-and-go traffic are considered arrivals only and are not counted twice (an arrival and takeoff) as is the normal control tower traffic counting procedures. Therefore the forecast of touch-and-go traffic must count such operations as arrivals only.

g. Use of Capacity Analysis Work Sheets. As applicable, the following three work sheets are to be used for the calculation of hourly capacity:

(1) Table 2-3: "VFR Hourly Departure Capacity (HDC) Analysis Work Sheet" - used to calculate the capacity of a runway used for departures only.

(2) Table 2-4: "VFR Hourly Arrival Capacity (HAC) Analysis Work Sheet" - used to calculate the capacity of a runway used for arrivals only.

(3) Table 2-5: "VFR Hourly Mixed Capacity (HMC) Analysis Work Sheet" - used to calculate the capacity of a runway used for arrivals and departures (at the same time).

Each Work Sheet provides step by step procedures requiring either simple arithmetic computations or use of specified tables or charts. The following items regarding use of these tables are noted:

(1) Most steps require use of previously computed values (from prior steps) and the "procedure" identifies the applicable steps and process.

(2) Where "boxes" are shown below each step adjacent to sub-total and grand total lines, the appropriate addition of values should be made and entered; subsequent steps require use of sub-total and grand total values and are denoted in the procedures with subscripts "S" and "G" respectively.

(3) Some values are constants and have therefore been pre-printed on the Work Sheets.

3. IFR CAPACITY PROCEDURES. Determination of an air station's IFR capability is dependent primarily upon the availability of radar ATC services. Such services may be provided by D.O.D. or F.A.A. ATC facilities or a combination of military and civil units in a joint operation. In joint facilities the F.A.A. normally is responsible for the radar approach control function while the military operates the Precision Approach Radar (PAR) positions of Ground Controlled Approach (GCA) facilities.

At those airfields not provided with their own radar facilities, surveillance radar service for departures and arrivals may be provided by adjacent F.A.A. or D.O.D. terminal radar air traffic control units or by the enroute Air Route Traffic Control Center (ARTCC) of the area.

Stations without terminal radar services may operate IFR with conventional air traffic control service provided by the ARTCC or by the NAS control tower.

a. The following variables must be determined to compute IFR capacity:

- Forecast of Activity in terms of Aircraft Class (I, II, III); if more than one class is involved, capacity is computed by weighting individual class capacity by percent distribution of each class.
- Availability of radar service
- Type Approach Aid: PAR (single or multiple); Conventional (VOR, TACAN, NDB).
- Airspace Limitations:
  Restrictive - single departure path
  Unrestrictive - more than one departure path

- Runway Operating Configuration: (single, multiple dependent or multiple independent runways)

b. Tables 2-6 and 2-7 respectively are to be used to compute IFR capacity of a single or parallel runway configurations. Application of these tables is illustrated through use of examples contained in Section III of this Handbook.

The capacity of a runway used exclusively for low approaches is computed using Table 2-7 for "unrestricted airspace" and "independent runway" conditions at a Ratio = 4.0.

4. CARRIER PRACTICE LANDING CAPACITY PROCEDURES. The capacity of Carrier Practice Landing activities on a runway whether performed at an outlying field or on a runway set-aside for that purpose at a conventional station, has been established at a standard 80 approaches per hour. This value is based on:

- normal rectangular practice pattern
- four aircraft within pattern

Increasing number of aircraft in pattern will not materially increase capacity.

Therefore HTC = 80 arrivals per hour; 160 total movements by count.

5. DAILY CAPACITY ANALYSIS. This paragraph describes the procedures to determine total daily capacity of an air station. The procedure derives the total number of aircraft which can be accommodated within a specified operating period (such as a day or part of a day), for the runway configurations forecast to be available, and for the mix of aircraft and types of aircraft movements forecast to be operated during the period.

The procedure requires that the following data be developed for each daily capacity analysis:

- Choice of runway configurations which will be available during the period for operational use, considering forecast wind direction, wind velocity, ceiling and visibility.
- The number of hours of the day when each runway configuration will be used, considering daylight hours, weather forecasts and other operational factors bearing on choice and availability of runways.
- The hourly capacities for each runway operating configuration forecast to be used during the period of the analysis. The hourly runway capacity should be determined in accordance with Paragraphs 2 (VFR), 3 (IFR), or 4 (CPL) as appropriate for the forecast operating conditions.

a. For a single runway airport, or for the periods of time at any airport when a runway is used for both arrivals and departures, the runway capacity will be the mixed capacity of the runway, in aircraft per hour, multiplied by the number of hours the particular runway is usable. If during the day a change of operating condition is to be considered, such as a period of IFR operation, or a different runway is used, the new mixed capacity for this runway configuration multiplied by the hours it is usable, will give the partial day capacity for this condition. The total daily capacity will then be the sum of the capacities of all the single runway operating configurations usable.

b. For multiple runway operations when two runways are used simultaneously, one for takeoff and one for landing, the total hourly capacity is the sum of the separate capacities of the two runways. However, the total hourly capacity of such a two runway operating configuration may not be representative of the number of aircraft that can be accommodated over a longer term (daily or partial day). This will be true whenever the forecast mix of takeoff and landing operations does not match the relationship of the takeoff to landing capacity of the two runways. For example: two runways, one with HAC=40 and the other with HDC=60 will have a total hourly capacity of 100; however, an aircraft activity forecast of 200 movements with 50% landings will not be accommodated in two hours since only 40 landings per hour will take place. The effective capacity of the two runways is only 80 movements per hour, limited by HAC=40. In this case since the ratio* of arrivals to departures equals 1.00 (as indicated by "50% of landings"), the total capacity is twice the limiting (lowest value).

* $\text{Ratio} = \frac{\text{Arrivals}}{\text{Departures}}$

However, where ratios other than 1.00 are involved, it is necessary to compute hourly total capacity as follows:

$$\text{Hourly Total Capacity} = \frac{\text{HAC x (1 + Ratio)}}{\text{Ratio}}$$

"or"

HDC x (1 + Ratio),

whichever is less - application of this procedure is demonstrated through use of examples in Section III of this Handbook.

It is noted that in the calculation of Ratio, touch and go operations are considered as arrivals only. For example, given a traffic demand of 200 aircraft performing touch and go's, 300 "full-stop" arrivals and 250 departures, the

$$\text{Ratio} = \frac{200 + 300}{250} = \frac{500}{250} = 2.0$$

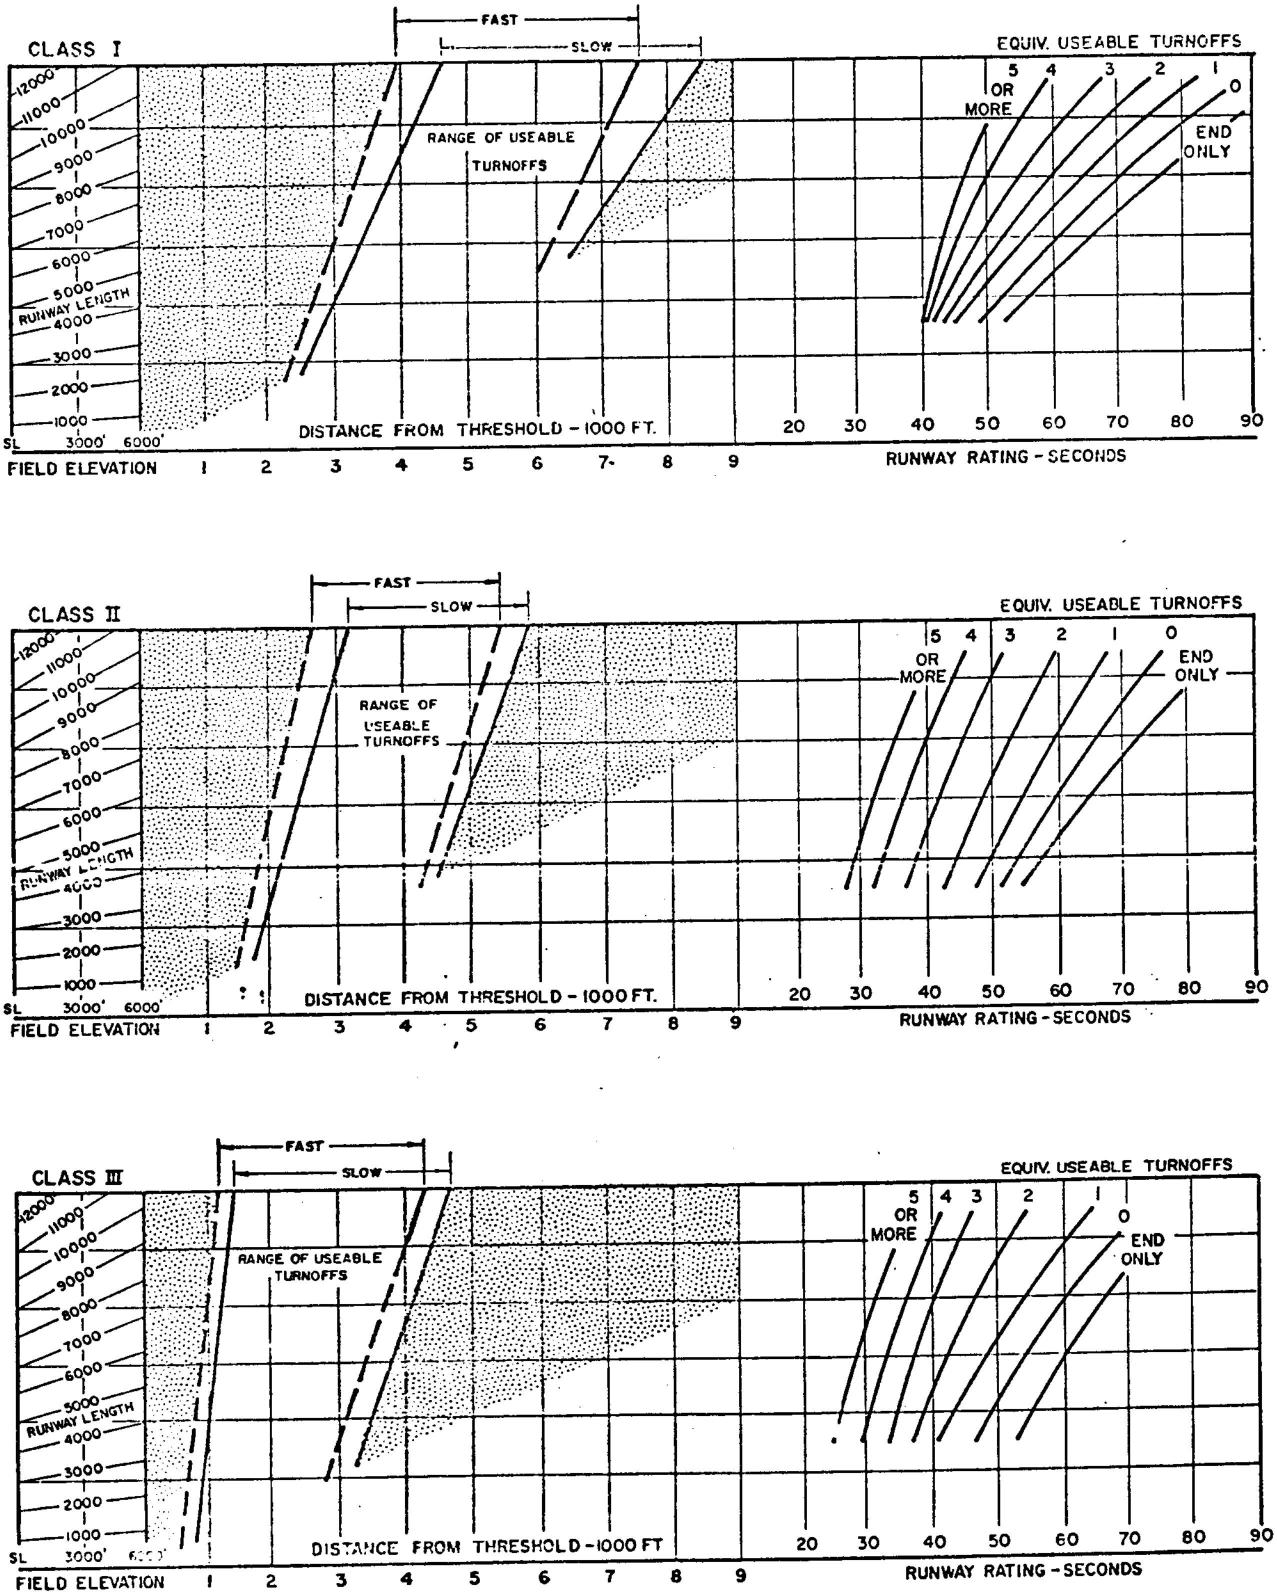


FIGURE 2-1

RUNWAY RATING

AVERAGE LANDING OCCUPANCY TIME-SECONDS

Table 2-1

HAC - HOURLY ARRIVAL CAPACITY - Movements Per Hour

Aircraft Class	Runway Rating					
	30	40	50	60	70	80
I	50	47	44	40	35	30
II	57	52	47	42	38	33
III	63	62	58	53	47	41

Use of Table: Enter with Runway Rating for each aircraft class as obtained in Step 2 on Tables 2-4 or 2-5 and read HAC below. Interpolate as required.

PAR (2) - PAR with multiple approach capability
Con. - Conventional navaid (VOR, TACAN, NDE)
I, II, III - Indicates applicable aircraft class
Dep. - Release of departure dependent on assured landing on parallel runway (per ATC criteria)
Ind. - Release of departure not dependent on assured landing on parallel runway (per ATC criteria)

Ratio = $\frac{\text{Arrival Demand}}{\text{Departure Demand}}$

Section III. EXAMPLES

Using the procedures outlined in Section II, this section demonstrates the techniques involved by means of examples, covering the following basic areas:

- Runway Rating
- VFR Capacity
- IFR Capacity
- Daily Capacity
- Application of Figure 2-2

a. Runway Rating. To successfully calculate the runway rating for a given runway direction, adherence to 6 steps is necessary. These steps, listed below, apply to Figure 2-1 which is reproduced in this section for clarification.

(1) For each class, enter the runway rating figure with the field elevation.

(2) Proceed upward until the proper runway length line is intersected.

(3) Draw a line representing the runway, directly across the figure. On this "runway" plot the runway exits where they actually exist based on distance from threshold.

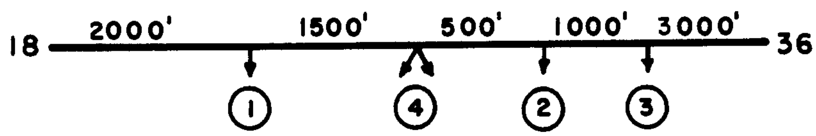
(4) Sum up the number of "slow" exits within the slow range.

(5) Sum up the number of "fast" exits within the fast range; multiply this number by two. If a fast exit falls in the "slow" range, but out of the fast range, count it as a "slow" exit.

(6) The sum of steps 4 and 5 are the equivalent usable exits. Extend the horizontal runway line over to the appropriate usable turnoff lines and read the runway rating on the axis below.

(Example 1)

R/W 18-36 is 8,000 feet long and is at sea level (sl). Calculate the runway rating in the R/W 18 direction for all three classes of aircraft. The plan view of Runway 18-36 looks like:



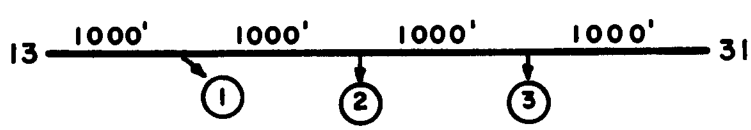
Exits ① ② and ③ are "slow."
Exit ④ is "fast."

Utilizing the aforementioned steps and Figure 2-1 (Example) on page C-33, the runway ratings are calculated to be:

Class I	48 sec.
Class II	38 sec.
Class III	39 sec.

(Example 2)

R/W 13-31 is 4,000 feet long and is 3,000 feet above sea level. The layout of exits as shown below:



Exits ② and ③ are "slow."
Exit ① is "fast."

Calculate the runway rating in the R/W 13 direction for Class III aircraft. The calculations are shown on Figure 2-1 (Example) on page C-34 with the rating calculated at 30 sec.

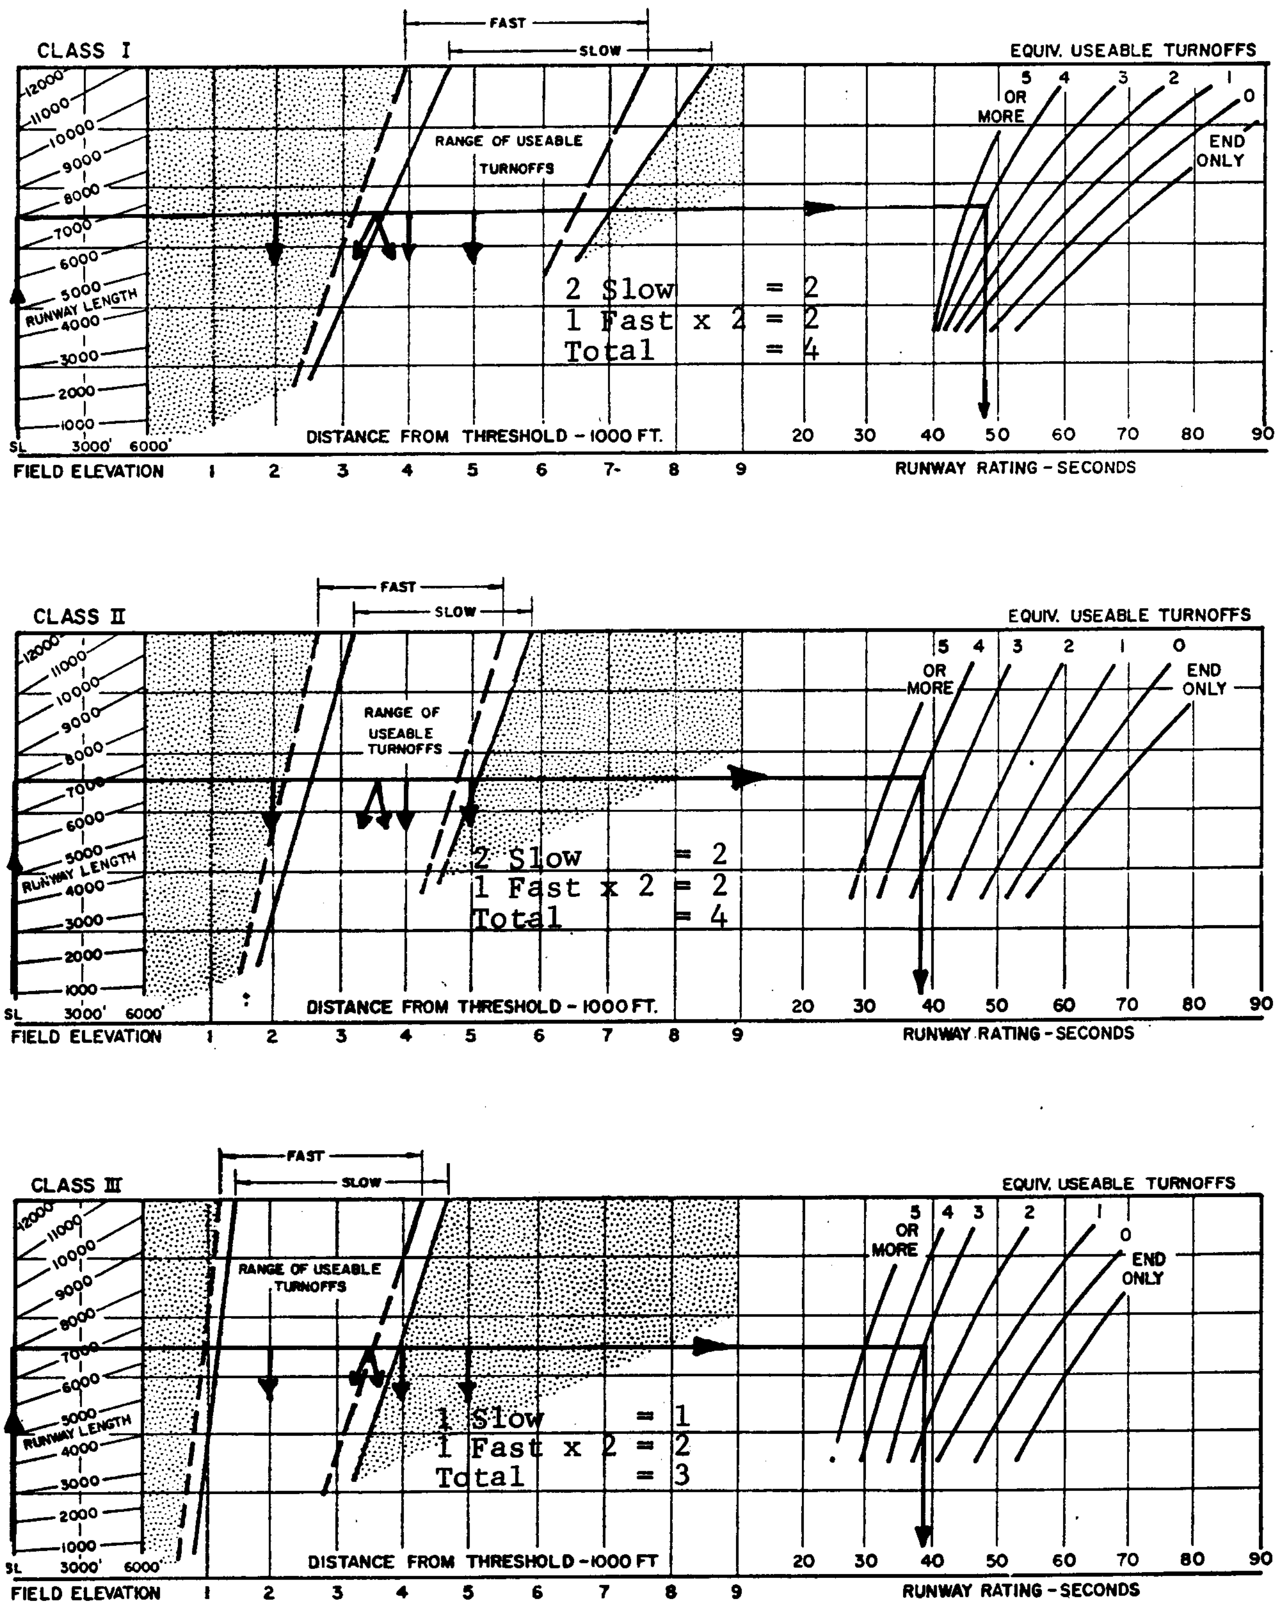


FIGURE 2-1 (Example)

RUNWAY RATING

AVERAGE LANDING OCCUPANCY TIME-SECONDS

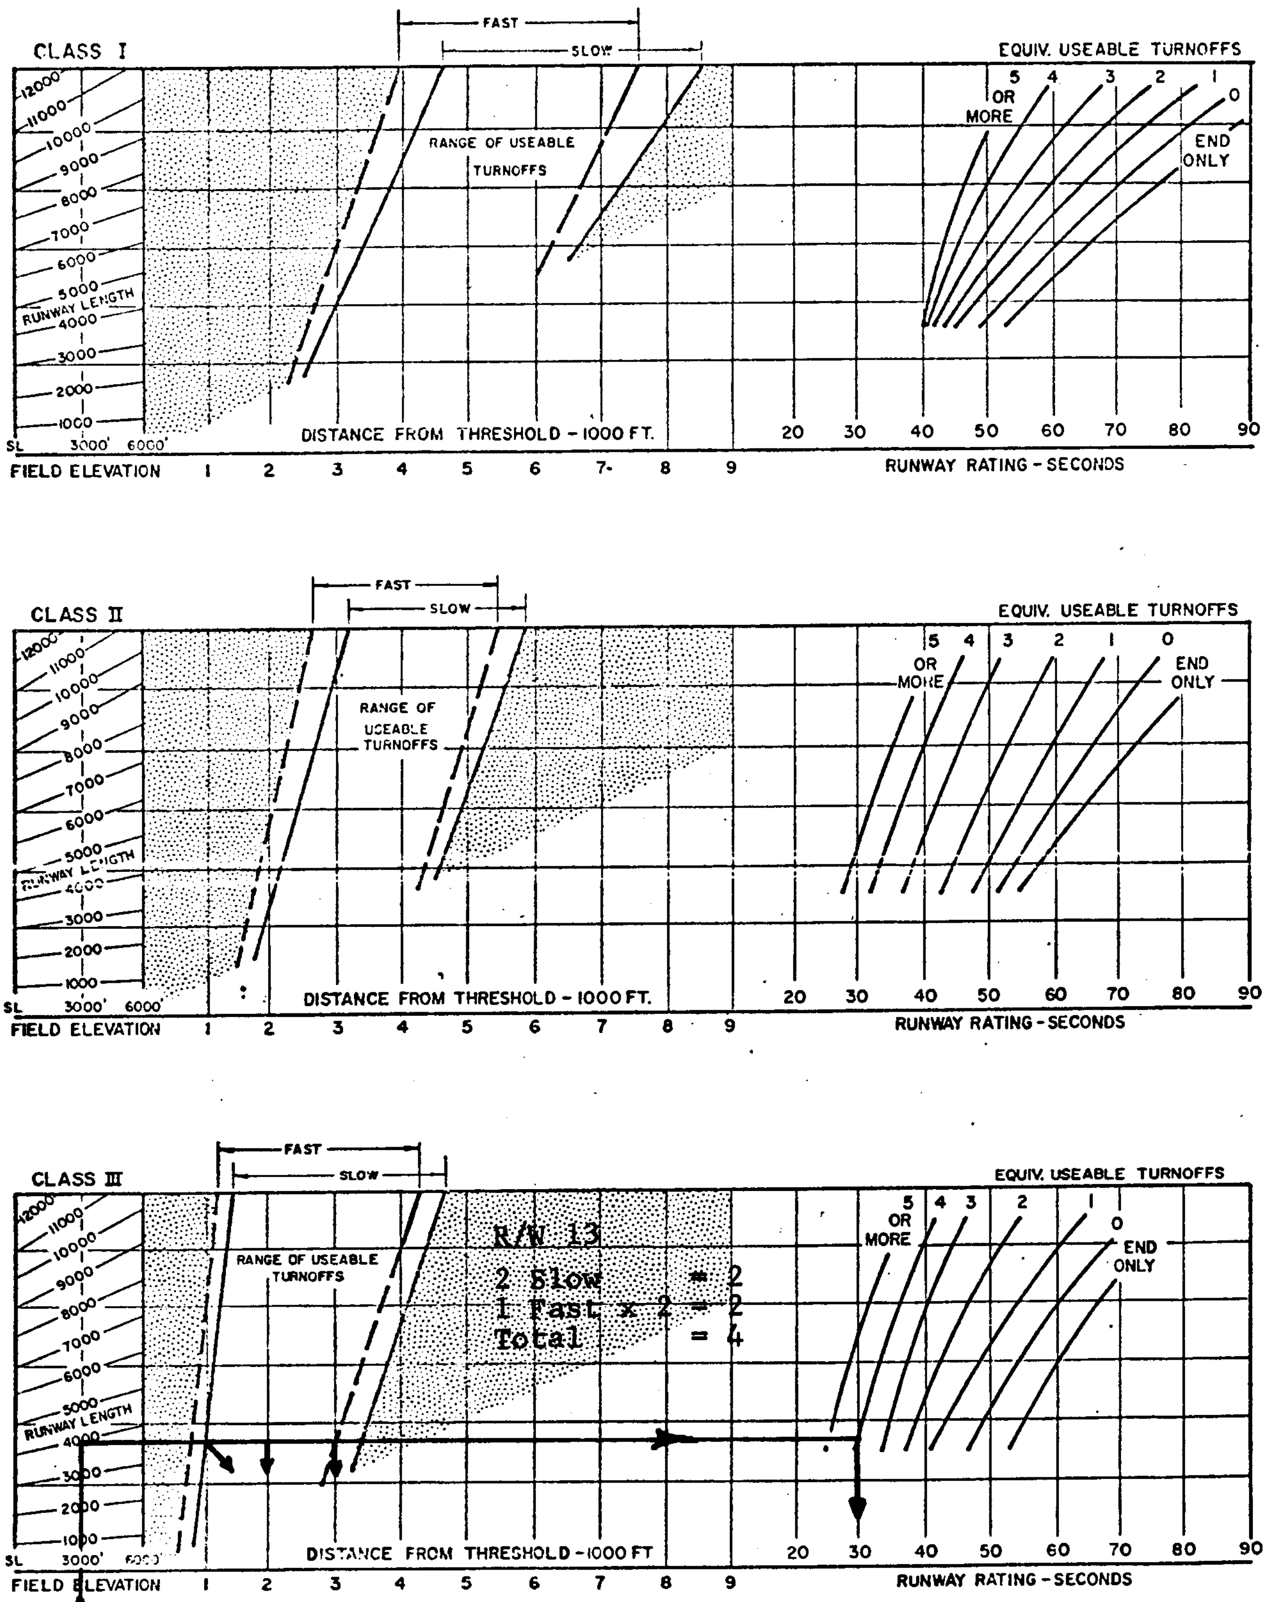

FIGURE 2-1 (Example)

RUNWAY RATING

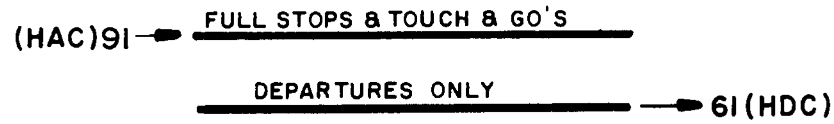
AVERAGE LANDING OCCUPANCY TIME-SECONDS

b. VFR Capacity. In these examples, the calculation of VFR runway capacities use Figure 2-2, Tables 2-1, 2-2, 2-3, 2-4, and 2-5. These figures and tables are reproduced for these examples on page numbers C-40 to C-44 (Example 1) and C-45 to C-49 (Example 2).

(Example 1)

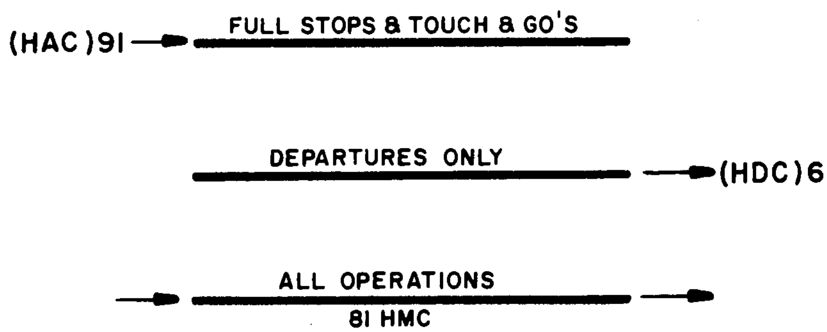
Mission	Jet fighter base.
Base Layout	Two 10,000' parallel runways, 1,500' centerline separation. 3,000' above sea level.
Manner of Operations	Arrivals on one runway; departures on the other.
Type of Aircraft	A6, A4, F4
Aircraft Classification	Class I
Operations Conducted	Formation arrivals and departures; Touch and Go's
Daily Activity (from survey)	300 single departures, 300 single arrivals, 100 aircraft in formation departures of 2, 100 aircraft in formation departures of 4, 100 aircraft in formation arrivals of 2, 100 aircraft in formation arrivals of 4, 600 Touch and Go's.
Exits	Two usable slows) = 4 equivalent One usable fast) turnoffs Runway Rating = 55 sec. (Assumed previous calculation)

Results



At a ratio of 2.2 (1100 arrivals divided by 500 departures per example "daily activity" input), the hourly total capacity equals 132 operations per hour; refer calculation procedure discussed on page numbers C-20 and C-21.

Question: What is the capacity if a third parallel is added 5,000' from the existing outboard runway? Mixed operations on new runway.



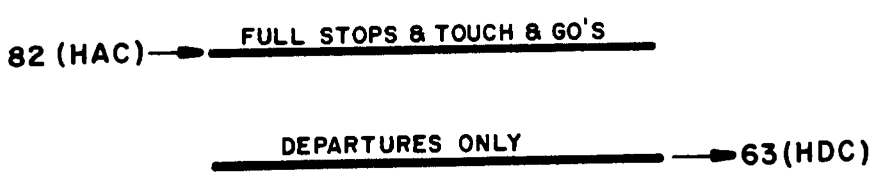
Total capacity = 132 (from above calculation) + 81 = 213 operations per hour.

(Example 2)

The air station undergoes a partial change in mission. Several squadrons of P-3's are moved in to serve as a coastal anti-submarine group. It is now necessary to recompute capacity with this new demand.

Mission	Jet fighter training, Coastal watch
Base Layout	Same as previous example.
Aircraft Classification	I and II
Manner of Operation	Same as previous example.
Operations Conducted	Touch and Go's; Formations
Daily Activity	Same as previous example except for a 200 movement increase in single arrivals and departures generated by the P-3's.
Exits	Runway rating = 55 (Class I) Runway rating = 43 (Class II) (assumed previous calculation)

Results:



At a ratio of 1.86 (1300 arrivals divided by 700 departures per example "daily activity" input), the hourly total capacity equals 126 operations per hour; refer calculation procedure discussed on page numbers C-20 and C-21.

Question: What is the capacity if the ratio of arrivals to departures equals 2.0?

$$\text{Hourly Total Capacity (HTC)} = \frac{\text{HAC x (1 + Ratio)}}{\text{Ratio}}$$

"or"

HDC x (1 + Ratio),

whichever is less.

$$\text{Therefore, HTC} = \frac{82 \text{ x } (1 + 2)}{2} = \frac{82 \text{ x } 3}{2} = 123$$

(Other formula results in higher value of 189.)

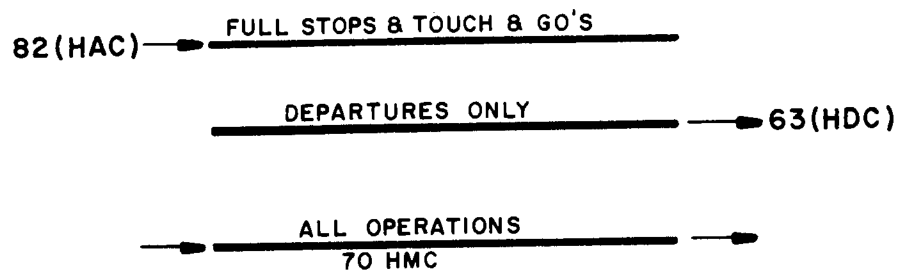
Question: What is the capacity if the ratio equals 0.8?

HTC = HDC x (1 + Ratio) =

63 x 1.8 = 113.4 (113)

(Other formula results in higher value of 184.5.)

Question: What is the capacity if a third parallel is added 5,000' from the existing outboard runway? Mixed operations are to be conducted on this runway.



Total Capacity = 126 (from above calculation based on Ratio = 1.86) + 70 = 196 operations per hour.

Table 2–4 / EXAMPLE 2

VFR HOURLY ARRIVAL CAPACITY (HAC) ANALYSIS WORK SHEET

Table 2-1/Example 2

HAC - HOURLY ARRIVAL CAPACITY - Movements Per Hour

Aircraft Class	Runway Rating 30	40	50	60	70	80
I	50	47	(44)	(40)	35	30
II	57	(52)	(47)	42	38	33
III	63	62	58	53	47	41

Class I: Interpolate between 44 & 40; Use 42.

Class II: Interpolate between 52 & 47; Use 51.

Table 2-2/Example 2

EQUIVALENT MOVEMENT FACTORS
For Touch & Go or Landings in Formation

Landing Procedure	HAC - Movements per Hour 30	35	(40)	(45)	50	55	60	65
Formation of 2	.58	.59	.61	.62	.64	.65	.67	.68
Formation of 3	.45	.47	.49	.50	.52	.55	.56	.57
Formation of 4	.37	.40	.42	.44	.46	.48	.50	.52
Touch and Go	.17	.20	.23	.25	.27	.30	.33	.37

Class I: Interpolate between 40 & 45; Use .61/.49*/.43/.24

Class II: Values not needed in this example.

*Value not needed in this example.

Table 2–5/EXAMPLE 2

VFR HOURLY MIXED CAPACITY (HMC) ANALYSIS WORK SHEET

1. Enter with Runway Ratings = 46 from column 14C, Table 2-5 on page C-48
2. Parallel line to Percent Operations:
   Class I = 82
   Class II = 18
   from Column 13, Table 2-5.
3. Proceed vertically at Operating Mix Percent Landings = 55, from Column 12, Table 2-5.
4. Read $(HMC)_E$ = 47 at intersection of lines.

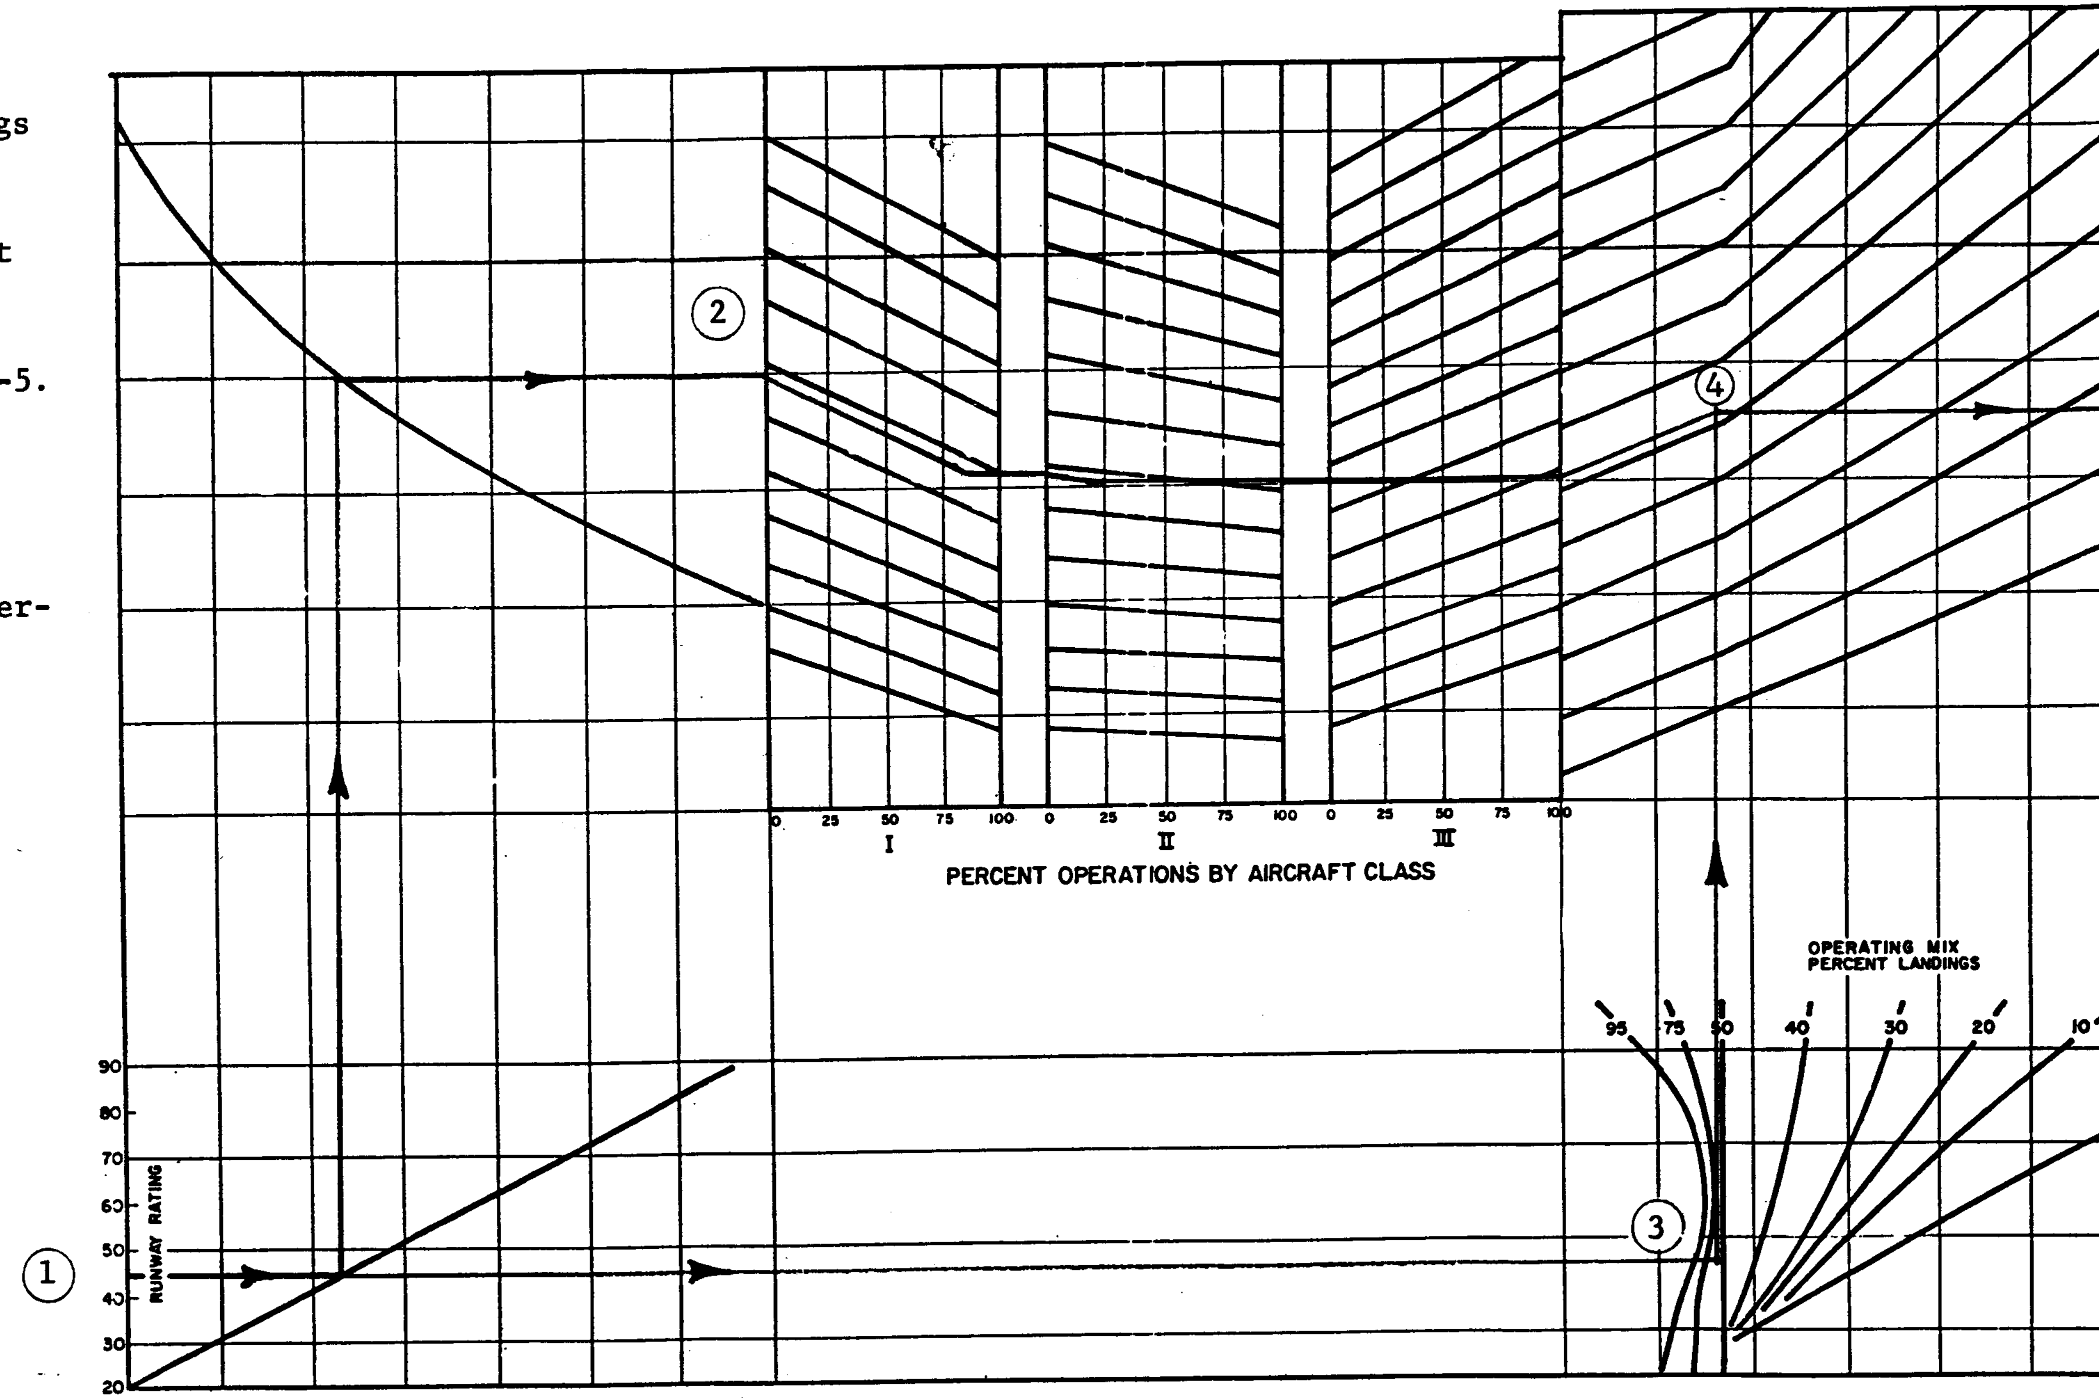

Figure 2-2/EXAMPLE 2
VFR RUNWAY CAPACITY FOR MIXED OPERATIONS

c. <u>IFR Capacity</u>. IFR runway capacities are computed using Tables 2-6 and 2-7. A series of examples follow indicating the use of these tables, which are reproduced here for convenience.

Examples.

(1) Compute the IFR capacity of:

Layout	Single Runway
Type Navaid	Conventional
Airspace	Unrestricted
Radar	Yes
Aircraft Class	III
Ratio (Arrivals/ Departures)	1.0
Runway Rating	60

Refer Table 2-6 (Example) on page C-53; Capacity = 32 operations/hour.

(2) Compute the IFR capacity of

Layout	Single Runway
Type Naviad	PAR (1)
Airspace	Unrestricted
Radar	Yes
Aircraft Class	II
Ratio (Arrivals/ Departures	1.2
Runway Rating	90

Refer Table 2-6 (Example) on page C-54; Capacity = 29 operations/hour.

(3) Compute the IFR capacity of:

Layout	Single Runway
Type Navaid	Conventional
Airspace	Restricted
Radar	No
Aircraft Class	III
Ratio (Arrivals/ Departures)	1.0
Runway Rating	75

Refer to Table 2-6 (Example) on page C-55; Capacity = 16 operations/hour.

(4) Compute the IFR capacity of:

Layout	Close Parallels - Dependent
Type Navaid	PAR (2)
Airspace	Unrestricted
Radar	Yes
Aircraft Class	50% I 50% III
Ratio (Arrivals/ Departures)	1.0
Runway Rating	75

Refer to Table 2-7 (Example) on page C-56;
Capacity = 46 operations/hour (Class I)
Capacity = 44 operations/hour (Class II)
Average = (0.5 x 46) + (0.5 x 44) = 45

(5) Compute the IFR capacity of:

Layout	Parallels - Dependent
Type Navaid	PAR (1)
Airspace	Restricted
Radar	Yes
Aircraft Class	I
Ratio (Arrivals/ Departures)	1.5
Runway Rating	60

Refer to Table 2-7 (Example) on page C-57;
Capacity = 25 operations/hour.

(6) Compute the IFR capacity of:

Layout	Single Runway
Type Navaid	PAR (1)
Airspace	Restricted
Radar	Yes
Aircraft Class	30% I; 50% II, 20% III
Ratio (Arrivals/ Departures)	1.0
Runway Rating	I @ 60; II @ 90; III @ 30

Refer to Table 2-6 (Example) on page C-58;
Capacity: Class I = 22; II = 20; III = 26

Weighted Capacity = Sum of each class capacity times percent class distribution

$$= (22 \times 0.30) + (20 \times 0.50) + (26 \times 0.20)$$
$$= 6.6 + 10 + 5.2$$
$$= 21.8 \text{ (Use 21)*}$$

* Always drop fractional values.

Table 2-6 (Example 1)

PAR (1) - PAR with single approach capability
PAR (2) - PAR with multiple approach capability
Conventional - Conventional navaid (VOR, TACAN, NDE)
I, II, III - Indicates applicable aircraft class
Unrestricted Airspace - More than one departure path capability
Restricted Airspace - Single departure path capability

Ratio = $\frac{\text{Arrival Demand}}{\text{Departure Demand}}$

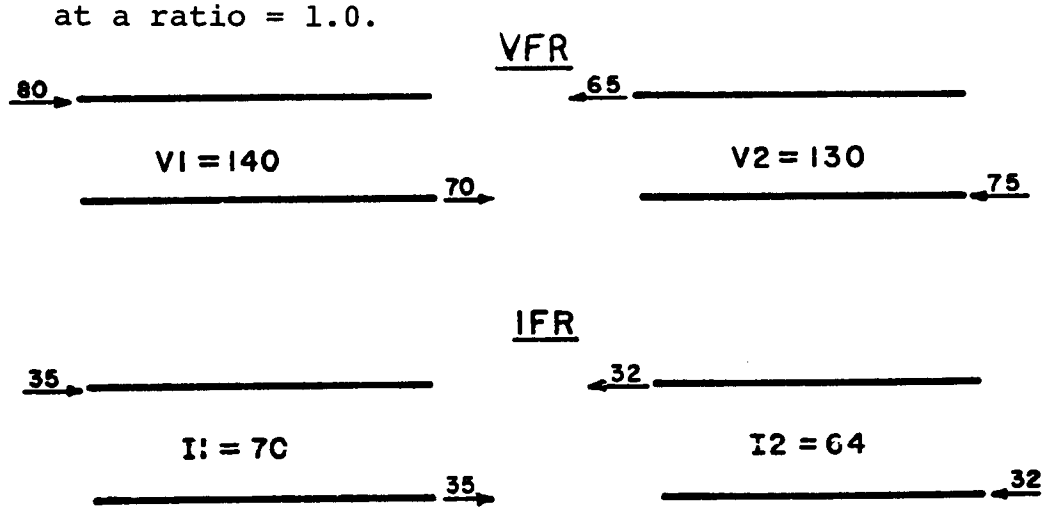
d. <u>Daily Capacity</u>. Daily capacity is computed by applying the following steps:

(1) List all possible operating configurations; for this example assume touch and go traffic is negligible. In other words, the air station is assumed to operate at a ratio = 1.0.



(2) Estimate the % VFR and IFR weather during the average day. It may also be desirable to calculate the daily capacity on a basis of 100% VFR weather or 100% IFR weather. This example assumes the following:

85% VFR 15% IFR

(3) Estimate the % use of each operating priority; assumed as follows:

V 1	60%
V 2	25%
I 1	10%
I 2	5%

(4) Calculate a "weighted" average hourly capacity

$$\begin{array}{rcr} 140 \times .6 & = & 84.0 \\ 130 \times .25 & = & 32.5 \\ 70 \times .10 & = & 7.0 \\ 64 \times .05 & = & \underline{3.2} \\ & & 126.7 \quad (127) \end{array}$$

(5) It is unrealistic to assume that all available hours would be subject to peak hour demand. It can be assumed that the hours of peak demand and hours of slack demand could be identified (or stipulated) for any particular air station. This can be accomplished as follows:

- For each operating hour determine the expected demand level as a decimal percentage of 1.
- Sum these percentages to obtain the hours of utilization.

Assuming the following hourly utilization, the hourly utilization sum = 8.8.

Hour	1	2	3	4	5	6	7	8	9	10	11	12
% of Peak Demand	.3	.8	1	1	.8	.6	.9	1	1	.7	.4	.3

Note: Facility assumed open only 12 hours per day in this example.

.. Subjectively reduce "hours utilization" to account for periods of time that the runway facilities are not available for aircraft operations; as for example, emergencies, missed approaches, runway maintenance, other non-pilot utilization, etc.

.. Consider reduction of up to 15% for conventional operation and up to 50% for Carrier Practice Landing Operations - suggested per recommendation of NATRACOM as contained in Technical Report 583, Volume II of IV, prepared by Operations Research, Inc., under contract for the Department of Navy.

In the example, 8.8 hours would reduce to approximately 7.5 hours.

(6) Multiply the weighted hourly capacity times the total hours of utilization.

$$127 \times 7.5 = 952.5$$

Daily capacity = (953) operations/day

e. <u>Application of Figure 2-2</u>. The following additional examples demonstrate the particular use of Figure 2-2:

(1) Given: Runway Rating = 65
Percent Operations by Class: 100% I
Operating Mix Percent Landings: 30%

Determine $(HMC)_E$

Answer: 42 (Refer Figure 2-2/EXAMPLE on page C-63)

(2) Given: Runway Rating = 60
Percent Operations by Class: 100% II
Operating Mix Percent Landings: 30%

Determine $(HMC)_E$

Answer: 51 (Refer Figure 2-2/EXAMPLE on page C-64)

(3) Given: Runway Rating = 45
Percent Operations by Class: 100% III
Operating Mix Percent Landings: 45%

Determine $(HMC)_E$

Answer: 65 (Refer Figure 2-2/EXAMPLE on page C-65)

(4) Given: Runway Rating = 60
Percent Operations by Class: 50% I
50% III
Operating Mix Percent Landings: 15%

Determine $(HMC)_E$

Answer: 55 (Refer Figure 2-2/EXAMPLE on page C-66)

Given: Runway Rating = 65

Percent Operations:
Class I = 100%

Percent Landings = 30%

Answer: $(HMC)_E$ = 42

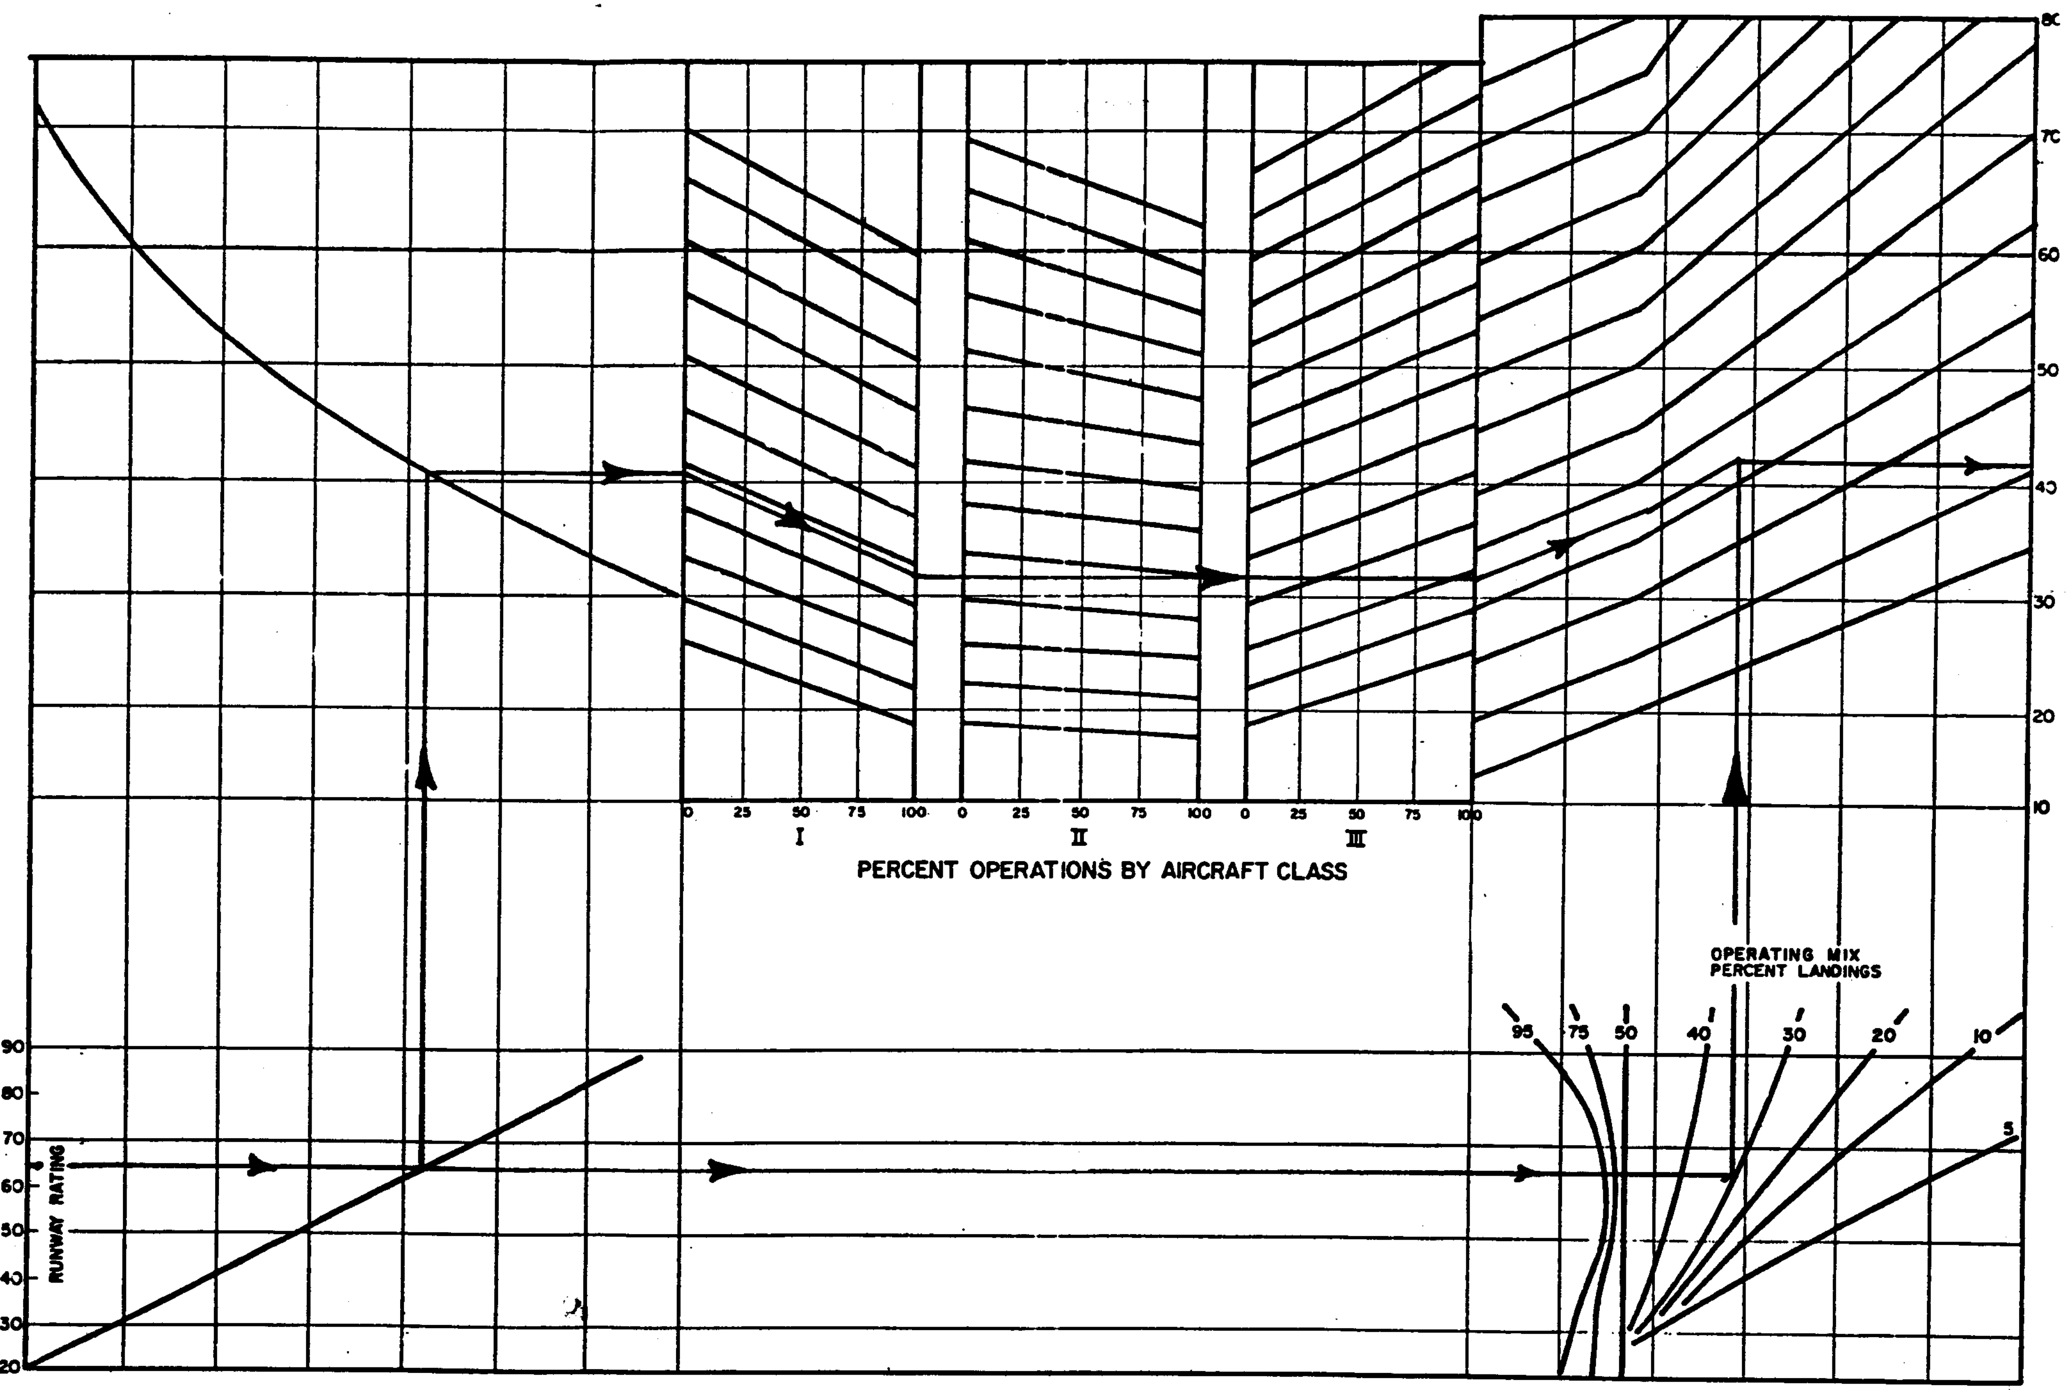


Figure 2-2/EXAMPLE
VFR RUNWAY CAPACITY FOR MIXED OPERATIONS

Given: Runway Rating = 60

Percent Operations:
Class II = 100%

Percent Landings = 30%

Answer: $(HMC)_E$ = 51

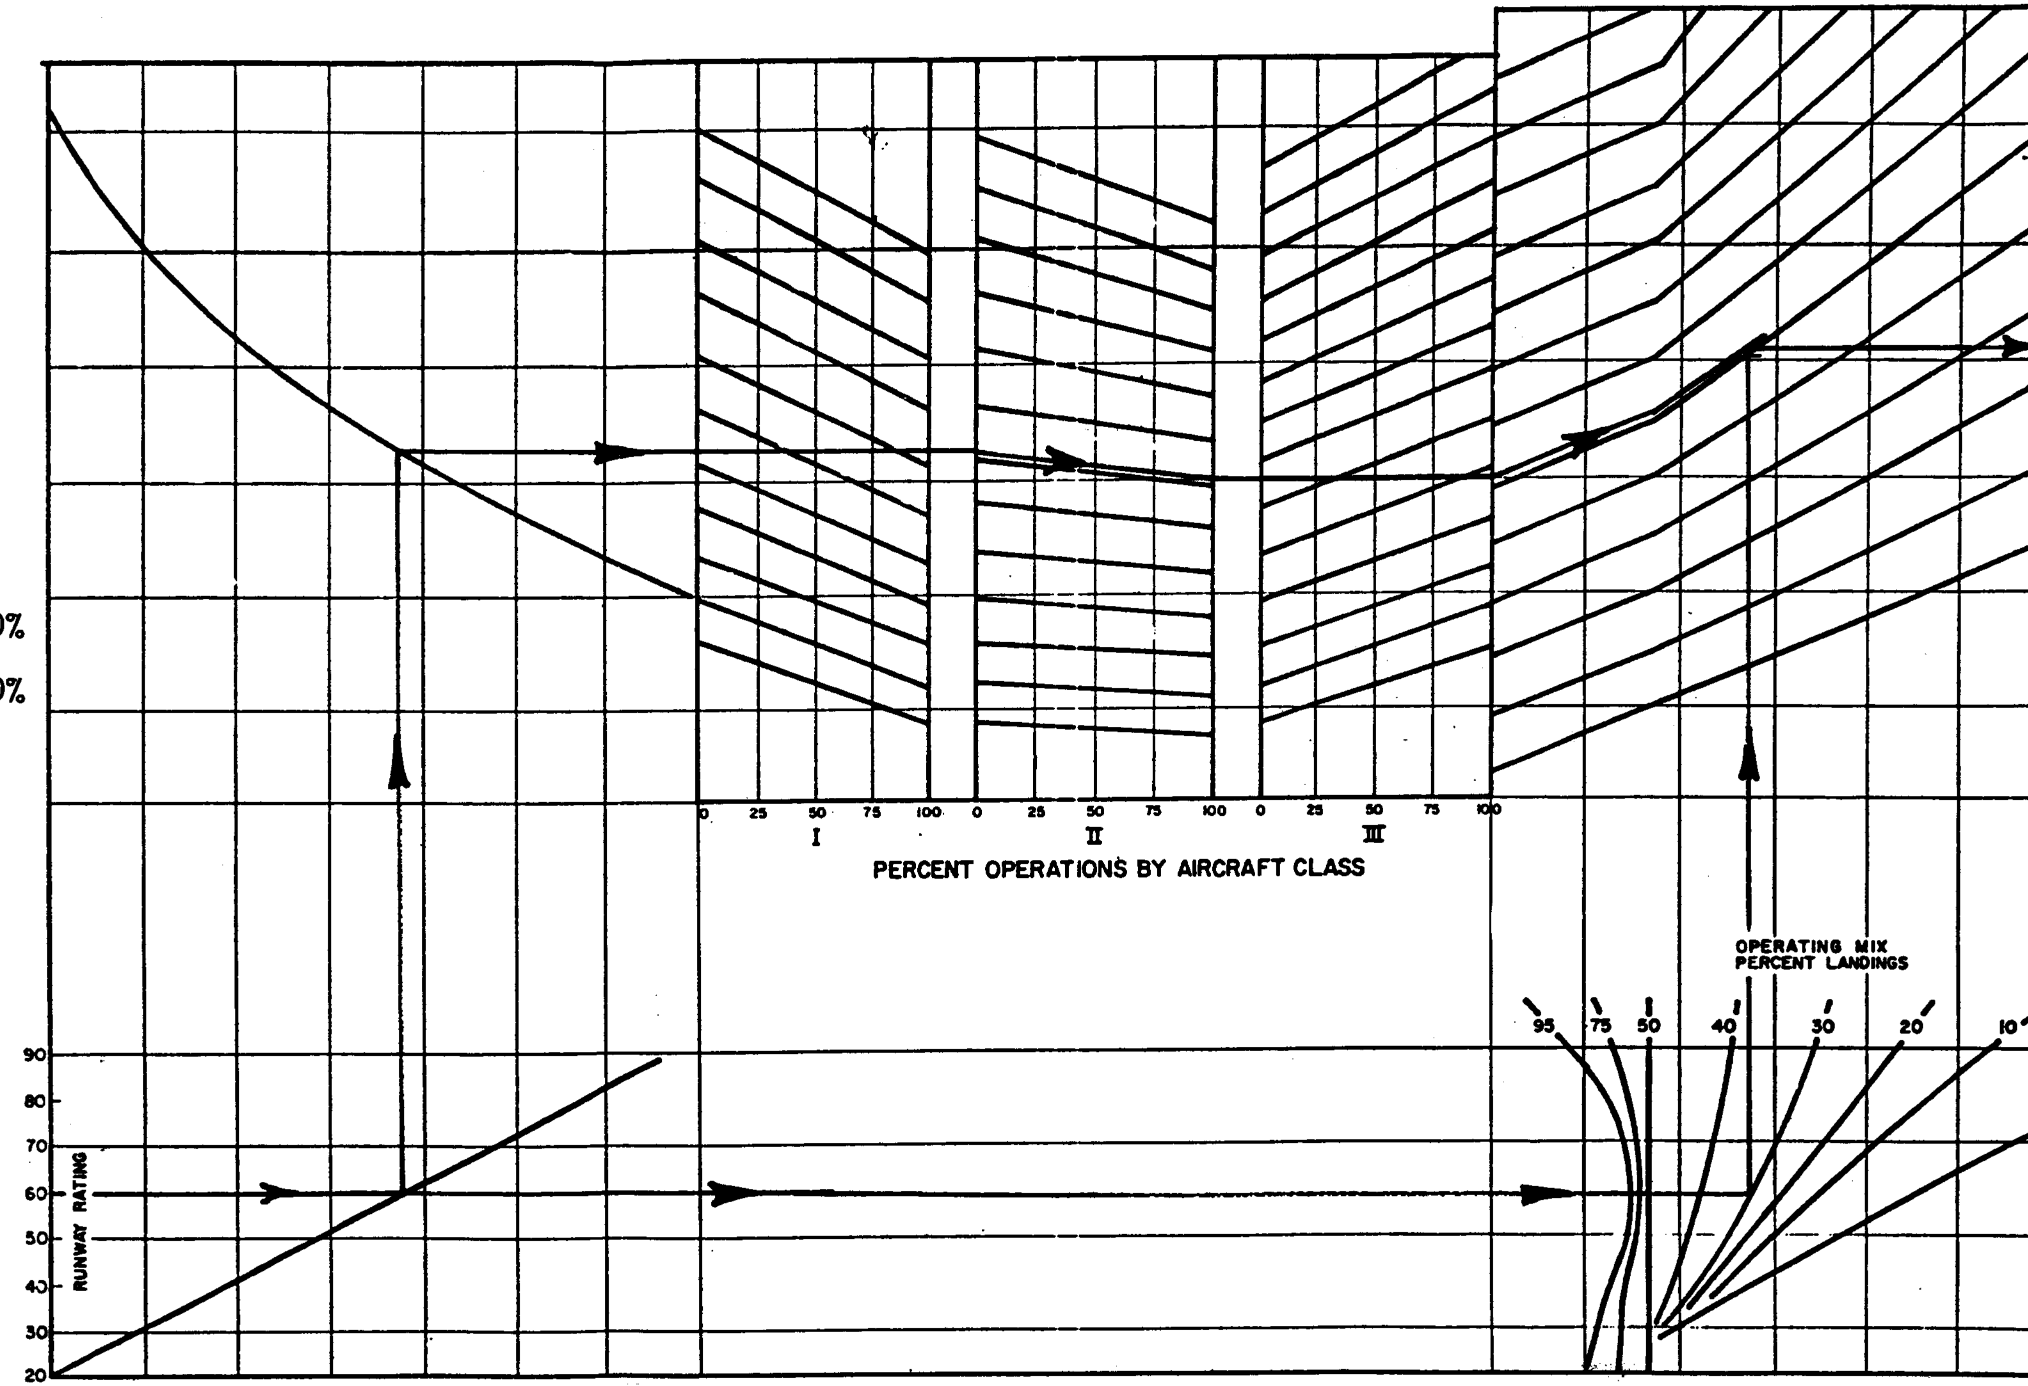

Figure 2-2/EXAMPLE
VFR RUNWAY CAPACITY FOR MIXED OPERATIONS

iven: Runway Rating = 45

Percent Operations:
Class III = 100%

Percent Landings = 45%

nswer: $(HMC)_E$ = 65

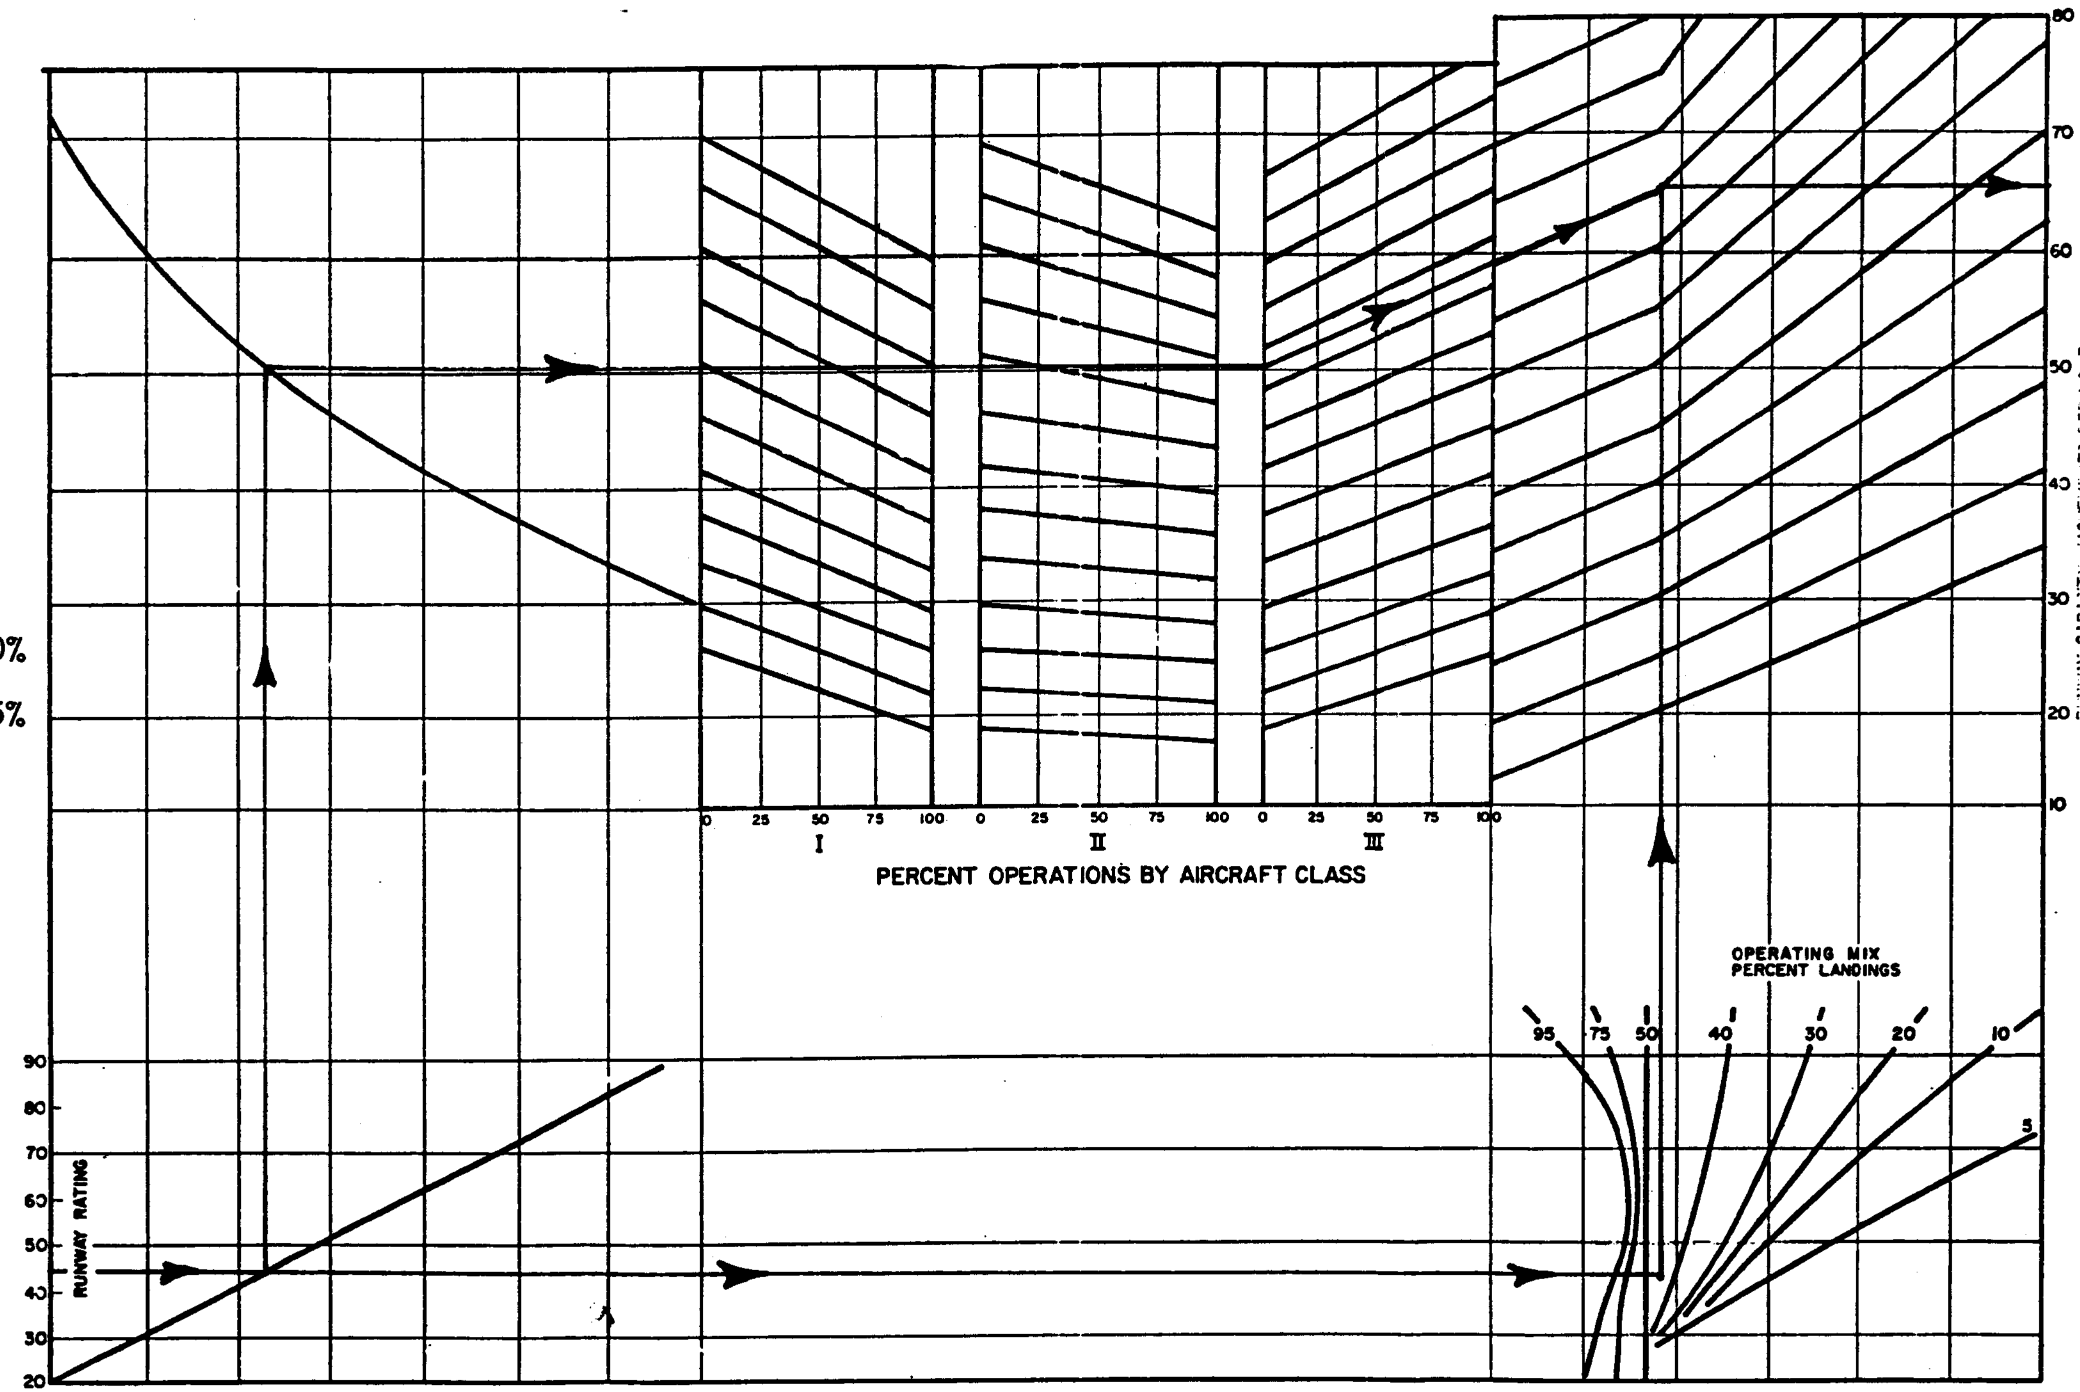

Figure 2-2/EXAMPLE
VFR RUNWAY CAPACITY FOR MIXED OPERATIONS

ven: Runway Rating = 60

Percent Operations:
Class I = 50%
Class III = 50%

Percent Landings = 15%

swer: $(HMC)_E$ = 55

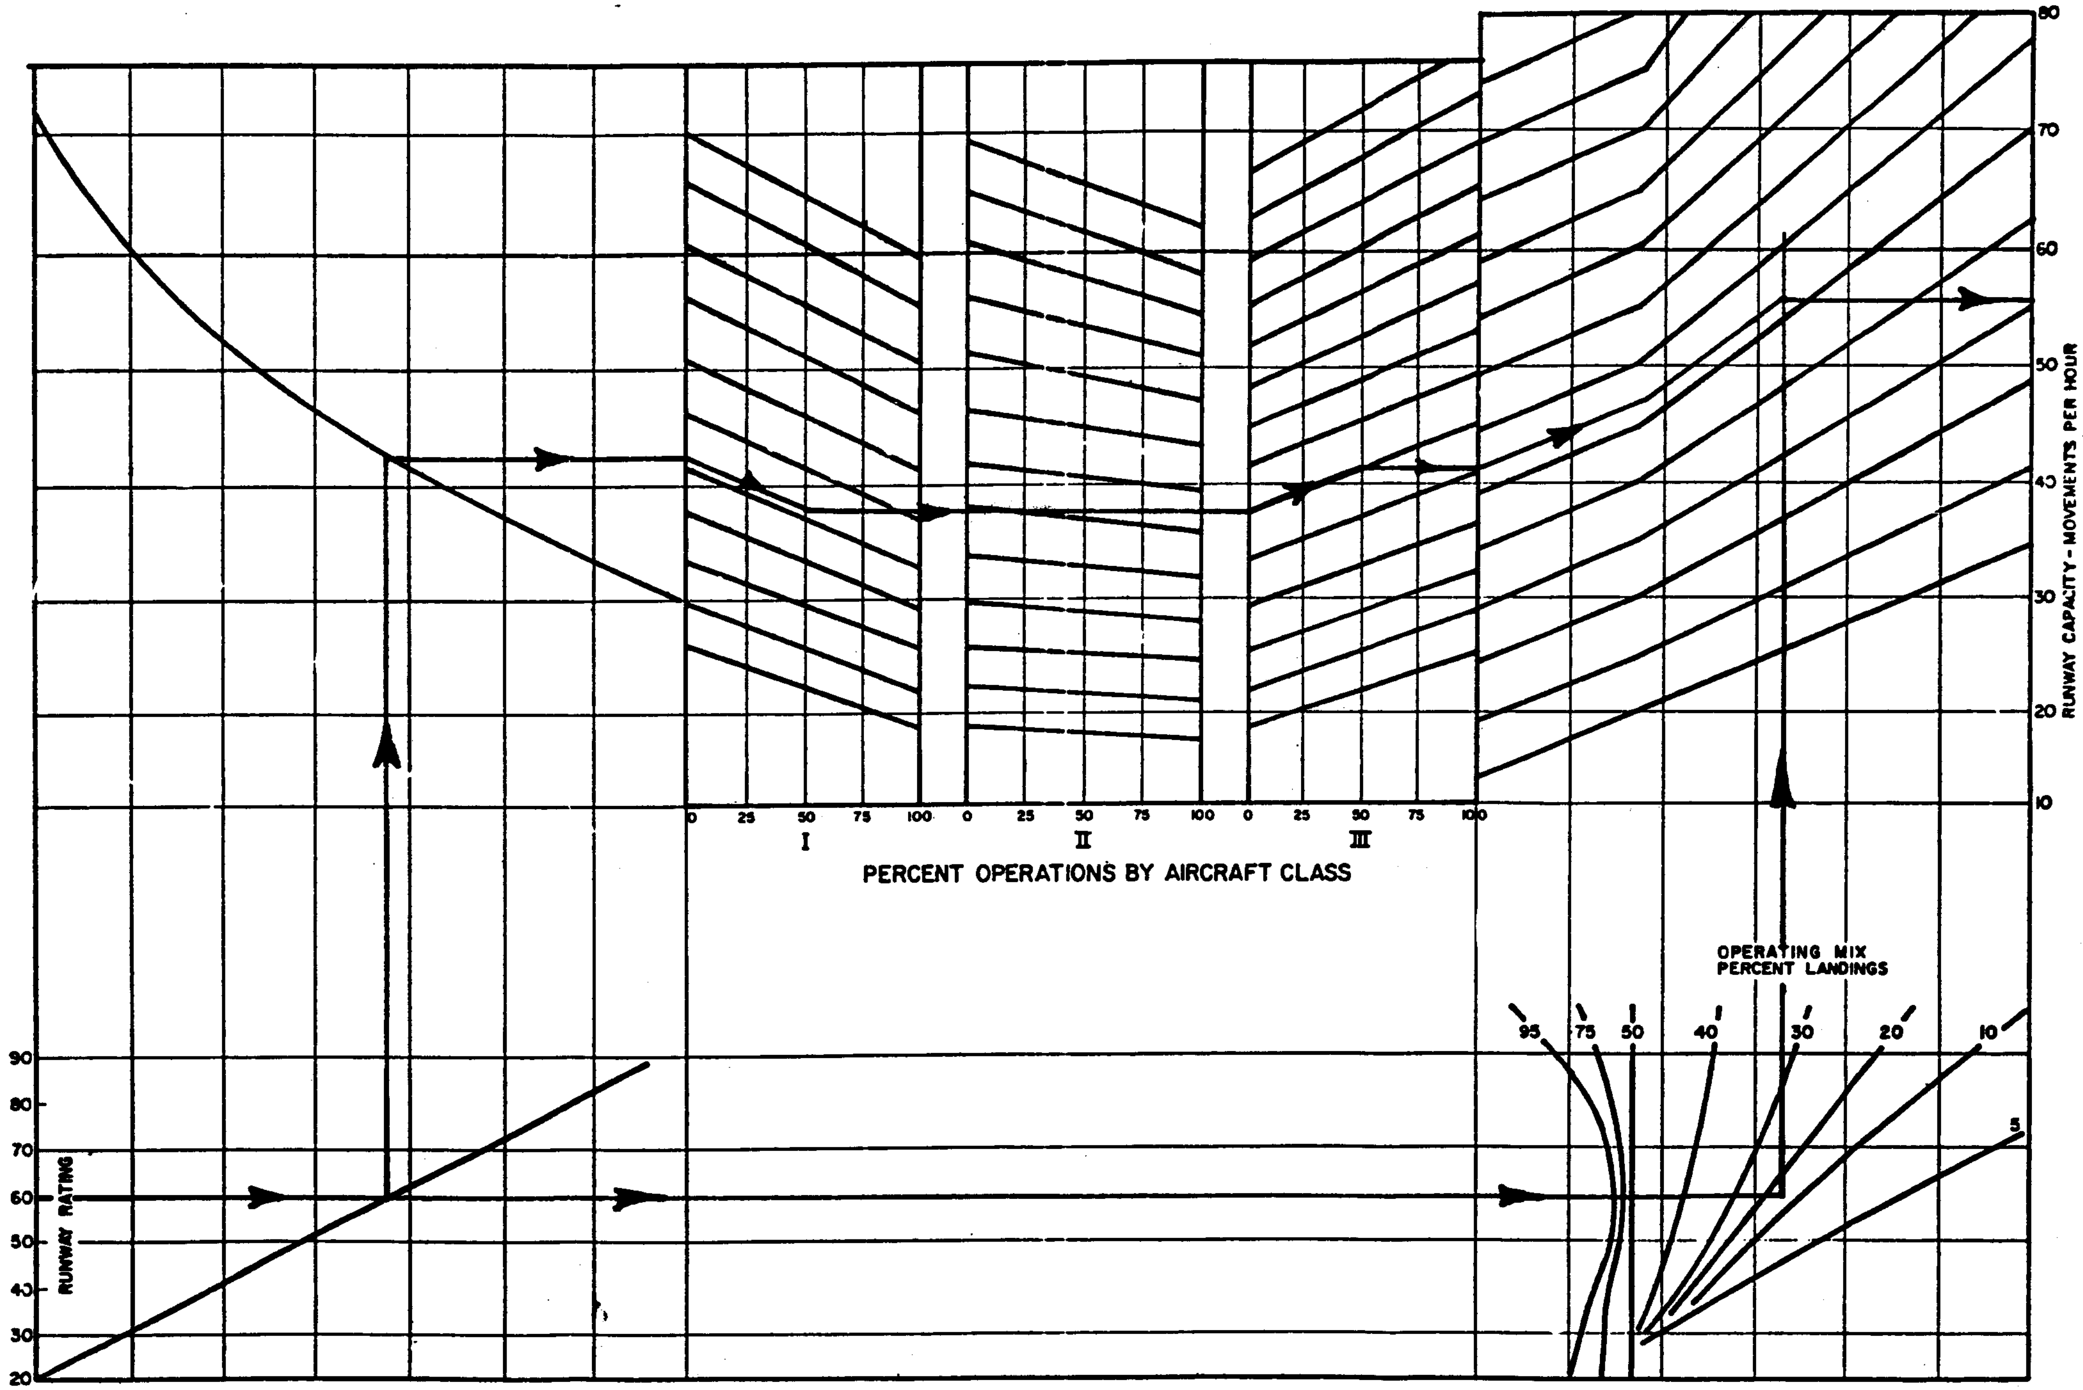

Figure 2-2/EXAMPLE
VFR RUNWAY CAPACITY FOR MIXED OPERATIONS

Section IV. WORK SHEETS

For use in the calculation of runway capacities, extra copies of the following figures and tables are provided:

Figure 2-1: Runway Rating

Figure 2-2: VFR Runway Capacity for Mixed Operations

Table 2-1: HAC - Hourly Arrival Capacity

Table 2-2: Equivalent Movement Factors

Table 2-3: VFR Hourly Departure Capacity (HDC) Analysis Work Sheet

Table 2-4: VFR Hourly Arrival Capacity (HAC) Analysis Work Sheet

Table 2-5: VFR Hourly Mixed Capacity (HMC) Analysis Work Sheet

VFR HOURLY MIXED CAPACITY (HMC) ANALYSIS WORK SHEET

Supersession to FC 2-000-05N Appendix D (formerly NAVFAC P80.2 and UFC 2-000-05N)

Appendix D – Naval Mobile Construction Battalion Facilities (formerly P-80.2) was published on May 1, 1976 and is no longer an accurate description of the planning criteria required for facilities supporting a Naval Mobile Construction Battalion. Therefore, this supersession document has been created as a replacement and all category code and criteria information now reside in the FC 2-000-05N.

Naval Mobile Construction Battalion facilities utilize a number of expeditionary, operational, and base operations related category code numbers (CCNs) to define requirements. Some of these CCNs were added or updated in 2018 and 2019. Specific production or revision dates can be found on the revision pages included at the beginning of every FC sub section document (100-900 series). The following facilities are typically required to support a Naval Mobile Construction Battalion:

14309 Expeditionary Ops Support Facility

14311 Operational Vehicle Garage

14312 Operational Vehicle Laydown Area

12317 Overhead Cover, Miscellaneous

21451 Automotive Organizational Shop

21455 Vehicle Wash Platform

21710 Electronics/Communications Maintenance Shop

85210 Parking Area

This is the current list of NMCB related CCNs as of April 2019 and detailed descriptions of each are provided in the FC 2-000-05N. This list will be updated here and in the FC as mission dictates in the future.

TABLE OF CONTENTS

E-iii

SECTION I - GENERAL

A. RJR:EOSE. The purpose of this Appendix is to (1) provide facility planners with g'Jidance for identifying obstructions to air navigation and (2) establish airfield safety clearances for fixed winq aircraft and helicopter installations • The Appendix amplifies information provided in Federal Aviation Regulation Part 77, Objects Affecting Navigable Airspace and includes airfield clearance criteria specified in the Joint Service Manual NAVFAC P-971 (Airfield and Heliport Planning criteria) . Standards herein identify three types of airfield safety criteria:

(a) Height restrictions. Restrictfons in the f-:Jrm of specific height limits or imaginary surfaces through which objects shall not penetrate.

(b) Lateral Clearances. Standards as to how close objects may be sited to airfield pavements regardless of their height incl'Jding separations between airfield pavements.

(c) Clear Zones/Takeoff Safety Zones. The areas immediately adjacent to runway and helipad thresholds provide for unobstructed takeoffs and landings and serve as emergency overrun areas. Detailed q'Jidance is required to prevent obstructions in these areas•

The clearances and imaginary surfaces defined herein are to be used solely for siting facilities and determining obstructions as differentiated from standards to determine flight paths, qlide slopes, etc; actually flown by aircraft.

As a secondary purpose, the A?pendix identifies some other factors related to aircraft operations such as noise and accident potential which should be considered when sitinq facilities at air installations. The criteria in this Appendix conform to that established by the Department of Defense for the Air Installations Compatible Use Zone (AICUZ) Program.

The following manuals and instructions are pertinent to planning and siting facilities at Navy and Marine Corps air installations.

Federal Aviation Regulation, Part 77	Objects Affecting Navigable Airspace
DOD 4270.1-M	Department of Defense construction Criteria Manual
DOD INST 4165.57	Air Installation Compatible Use Zones
OPNAVINST 11010.36	Air Installations compatible Uses Zones (AICUZ) Program
NAVFACINST 11010.57B	Site Approval of Naval Shore Facilities
MCO P 11000.12A	Real Proberty Facilities Manual, Vol II, Facilities Planning and Programming
NAVFAC DM-21 (Series)	Airfield Pavements
NAVSEA OP-5, Vol I	Ammunition and Explosives Ashore

B. APPLICABILITY/WAIVERS. The criteria in this Appendix apply to Navy and Marine Corps air installations located in the United States, its territories, trusts, and possessions. Where a Navy or Marine Corps air installation is a tenant on a civil airport use these criteria to the extent practicable, otherwise FAA criteria apply. Where a Navy/Marine Corps air installation host a civilian airport, these criteria shall apply. Also apply these standards to the extent practicable at overseas locations where the Navy and Marine Corps have vested base rights. While the criteria in this Appendix are not intended for use in a theater-of-operations situation, they may be used as a guideline where prolonged use is anticipated and no other standard has been designated.

The criteria shall be us.ed for planning all new air installations and new airfield pavements at existing air installations. (Exception: Primary surfacewidth for Class B runways, See Section II, paragraph Cl.) Existing air installations have been developed using previous standards which may not conform to the criteria herein. Safety clearances at existing air installations need not be upgraded solely for the purpose of conforming to these criteria. However, at existingair installations where few structures have been sited/constructed in accordance with previous safety clearances, it may be feasible to apply the revised standards herein. The changes in standards primarily affect criteria for: (1) Class A designated runways (2) runways at basic training outlying fields used by T-34 aircraft and (3) helicopter landing facilities operating under Visual Flight Rules. Approval from Headquarters NAVFACENGCOM shall be obtained prior to revising-·safety clearances at existing airfield pavements to conform with new standards herein. NAVFACENGCOM will coordinate the approval with the Naval Air Systems Conunand and CNO/CMC as required.

Once safety clearances have been established for an air installation, there may be occasions where it is not feasible to meet the designated standards. In these cases a waiver must be obtained from the Naval Air Systems Conunand. The waiver and its relationship to the site approval process is defined in NAVFACINST 11010.57, Site Approval of Naval Shore Facilities.

C. EXEMPTIONS FROM WAIVER. Certain navigational and operational aids normally are sited in violation of airspace safety clearances in order to operate effectively. The following aids are within this group and reqvire no waiver from NAVAIR, provided they are sited in accordance with NAVFAC Definitive Designs (P-272) and/or the NAVFAC Design Manuals (DM Series):

a. Approach lighting systems
b. Visual Approach Slope Indicator (VASI) systems
c. Permanent Optical Lighting System (OLS), portable OLS and Fresnel lens equipment
d. Runways distance markers
e• Arresting Gear (A/G) systems including A/G signs
f. Taxiway guidance, holding and orientation signs
h. All beacons and obstructions lights
i. Arming and de-arming pad

D. DEFINITIONS.

Airfield Reference Point. The designated geographical location of an airfield. It is given in terms of the nearest second of latitude and longitude. The position of the reference point must be as near to the geometric center of the landing area as possible, taking future development of the airfield into account.

Established Airfield, Heliport or Helipad Elevation. The established elevation of the highest point of the usable landing area in terms of the nearest foot above mean sea level•

SECTION II – AIRFIELD CLEARANCES-FIXED WING AIRCRAFT

A. RUNWAY CLASSIFICATION. This Appendix uses the same runway classification system, Class A and B, established by the Office of the Secretary of Defense as a means of defining accident potential zones (APZs) for the Air Installations Compatible Use Zones (AICUZ) proqram. The r1Jnway classification must be known in order to determine the proper clear zone and air space criteria for a runway. The classification is dependent on the type of aircraft which operate from the runway:

TABLE A
RUNWAY CLASSIFICATIONS BY AIRCRAFT TYPE

Class A R1Jnways

C-1	C-47	OV-10	T-44
C-2	C-117	S-2	u-10
C-4	E-1	T-28	u-11
C-6	E-2	T-34	u-21
C-7	O-1	T-41	UV-18
c-12	0-2	T-42	
C-45	OV-1		

Class B Runways

A-3	c-10	F-4	P-2
A-4	C-14	F-5	P-3
A-5	C-15	F-8	S-3
A-6	C-118	F-14	SR-71
A-7	c-121	F-15	T-2
A-8	C-123	F-16	T-29
A-10	C-130	F-17	T-33
A-18	C-131	F-18	T-37
AV-8	C-135	F-100	T-38
B-1	C-137	F-101	T-39
B-52	C-140	F-104	TR-1
B-57	C-141	F-105	U-2
C-5	E-3	F-106	
C-9	E-4	F-111	

Class A runways are primarily used by small light aircraft as indicated in Table A and the runway should not have the potential for developmet for use by heavier aircraft or have a foreseeable requirement for such use. Ordinarily, Class A runways are less than 8000 feet long and less than 10 pe cent of the o erations involve class B type aircraft. Class B runways are a o er runways except sic training out y ng ields used by T-34 aircraft for which special criteria are specified.

: The classification of Navy and Marine Corps runways is determined as a part of the AICUZ program and is published in the AICUZ study for a particular installation. NAVPACENGCOM and NAVAIRSYSCOM concurrence and CMC/CNO approval is required prior to classifying any runway Class A or B. This approval is obtained via approval of the AICUZ study.

B. OBSTRUCTIONS TO AIRSPACE. The following paragraphs set standards for determining whether an object or structure is an obstruction to air navigation. It applies to existing and proposed objects including objects of natural growth or terrain. Facilities shall be sited so as no1r to be an obstruction to airspace.

An existing object (including a mobile object) is, and a future object would be, an obstruction to air navigation if it is higher than any of the following heights or surfaces.

- A height of- 500 feet above ground level at the site of the object.

A height that is 200 feet above ground level or above the established airfield elevation, whichever is higher, within 3 nautical miles of the established reference point of an airfield. This height increases in the proportion of 100 feet for each additional nautical mile of distance from the airfield up to a maximum of 500 feet.

Flight pers.

c. A height that results in raising an established or proposed Minimum Descent Altitude (MDA) within the initial approach segment, or the intermediate approach segment; or that which raises the Decision Height (DH) for Precision Approach Radar (PAR) or Instrument Landing system (ILS) glide slopes within the final approach segment; or that which affects a departure or missed approach climb gradient within the departure area or missed approach segment; or that which affects the MDA within the circling approach area.

Flight pers

d. A height within an enroute obstacle clearance area, including turn and termination areas, of a federal airway or approved off-airway route that would increase the minimum obstacle clearance altitude.

e. The surface of a takeoff and landing area of an airfield or any imaginary surface as defined in Section II, paragraph C (Section III, Paragraph C for helicopter facilities). However, no part of the takeoff or landing area itself is considered an obstruction.

The height restrictions in paragraphs (a), (b) and (e) can be evaluated by planning personnel. The restrictions imposed by paragraphs (c) and (d) should be evaluated by flight operations personnel, however the planner should be aware of their existence.

Traverse ways (roads, railroads, canals etc) must be considered in terms of height of the objects using them. This is done by establishing a minimum vertical clearance (the clearance represents the height of the object using the traverse way) which must be maintained bet'N'een the traverse way and the imaginary surfaces. The clearances are given in Table B and must be maintained except when:

a. Use of the traverse way is controlled. Control in this sense is exercised by Air Traffic Control (ATC) facility or through an agreement between the responsible ATC facility and another agency with the capability to exercise control.

b. Use of an existing traverse way is physically limited to lesser heights. For example, overpasses along a public highway have a clearance of 13 feet thereby restricting use of the highway to vehicles of 13 feet in height or less. Thirteen feet could then be used as the minimum vertical clearance requirement•

TABLE B

Highway, Railroad and Waterway Clearances

Item Description	Traverse Way	Clearance
Minimum vertical clearance between established imaginary surfaces and traverse ways	Interstate highway that is part National System of Military and Interstate Highways	17 ft
	Other public highways not covered above	15 ft
	Private or military road	10 ft minimum, or height of highest mobile object that normally would traverse them, whichever is greater
	Railroads	23 ft
	Waterway or other traverse way not previously covered	A distance equal to the height of the highest mobile object that normally would traverse them

C. IMAGINARY SURFACES. The following imaginary surfaces are defined for fixed wing aircraft facilities and are shown on the figures at the end of Section II.

1. Primary Surface. A/'surface .on iiAe !Jround--or--wattr centered lengthwise on the runway and extending 200 feet beyond each end of the runway. The width of the primary surface is:

(a) 1000 feet - Class A runways
- Basic Training Outlying Fields (OLFs) used by T-34 aircraft

(b) 1500 feet - Class B runways constructed prior to June 1981

(c) 2000 feet - Class B runways constructed at new air installations where no runway existed prior to June 1981

NAVAIRSYSCOM, in coordination with NAVFACENGCOM, will determined on an individual basis whether a 1"500 or 2000 foot wide primary surface shall be applied for new Class B runways constructed at air installations having existing runways with a 1500 foot wide primary surface.

2. Clear Zone Surface. See section II, paragrah D for Clear Zone standards.

3. Approach Departure Clearance Surface. An inclined or combination inclined and horizontal plane, symmetrical about the runway centerline extended. The inclined plane flares outward and upward from the primary surface, beginning with the same width as the primary surface and starting with the centerline elevation at the runway end. The slope and dimensions of the surface vary by runway class:

a. Class A runway. The slope of the surface is 40 to 1 until it reaches an elevation of 500 feet above the established airfield elevation. It then continues horizontally at this elevation to a point 50,000 feet from the point of beginning. The outer width is 16,000 feet.

b. Class B runway. The slope of the surface is 50 to 1 until it reaches an elevation of 500 feet above the established airfield elevation. It then continues horizontally at this elevation to a point 50,000 from the point of beginning. The outer width is 16,000 feet.

c. OLF Basic Training Outlying Field (for T-34 aircraft). The slope of the surface is 20:1 and the surface continues until it rises 400 feet in elevation. The surface flares outward at an angle of 50 43'.

4. <u>Inner Horizontal Surface.</u> An oval shaped plane at a height of 150 feet above the established airfield elevation. For Class A and B runways it is constructed by scribing an arc with a radius of 7,500 feet about the centerline at each end of each runway and interconnecting these arcs with tangents. The radius is reduced to 3,200 feet at Basic Training outlying Fields (for T-34 aircraft).

5. Conical Surface. An inclined plane that extends from the periphery of the inner horizontal surface outward and upward at a 20 to 1 slope. For Class A and B runways it extends for horizontal distance of 7,000 feet and to a height of 500 feet above the established a'irfield elevation. For Basic Training OLF (T-34 aircraft) runways, it extends for a horizontal distance of 5,000 feet and to a height of 400 feet above the established airfield elevation.

6. Outer Horizontal Surface. For Class A and B runways, a plane located 500 feet above the established airfield elevation, extending outward from the outer periphery of the conical surface for horizontal distance of 30,000 feet. This surface is not applied at Basic Training Outlying fields (T-34 aircraft).

7. <u>Transitional Surface</u>.

a. Class A and B runways. Inclined planes which connect the primary surface and the approach -,departure clearance surface to the inner horizontal surface, conical surface, outer horizontal surface or other transitional surfapes. The slope is 7 to 1 outward and upward from the primary and approach-departure clearance surfaces at right angles to the runway centerline and runway centerline extended. To determine the elevation for the beginning of the transitional surface at any point along the lateral boundary of the primary surface, draw a line from the point, perpendicular to the runway centerline or the runway centerline extended. The elevation of the runwa e or centerline extended at t at intersection s the elevation for t,tle b9 !ling--()£- the--7to 1 sloee.

14 Clear

b. Basic Training OLF (T-34 aircraft). Same definition as for the Class A and B runway except the slope is 2:1.

O. CLEAR ZONES. The areas adjacent to the runway thresholds require special restrictions to provide· aircraft overrun areas and unrestricted visibility of airfield lighting. To accomplish this, clear zones are specified for each class of runway and further, the clear zone is subdivided into 'rypes I, II and III to define the degree of restrictive use. The standards herein are in conformance with clear zone sizes specified in the AICUZ program•

Type Runway	Clear zone	Clear Zone Width	Remarks
Class A		1000 FT	NOTE 1.
Class B	Length 3000	Same as approach departure-clearance surface	NOTE 2.
Basic Training OLF (T-34)	3000 Ft	1000 Ft	NOTE 3.

NOTE 1. The class A runway and clear zone are new to Navy and Marine Corps planning standards. Previously, all air installations except OLF's for basic training propeller aircraft received a clear zone equivalent to what is now specified for Class B runways. The criteria for Class A runway clear zones should only be applied after CID/CMC has approved the classification of a particular runway as Class A.

NOTE 2. The DOD AICUZ program allows for a rectangular clear zone with a 3000 foot width for new construction, however, Navy accident data indicates the fan shaped clear zone is adequate for Navy installations. Clear zones with 3000 foot width shall not be planned unless coordinated with Headquarters, NAVFACENGCOM.

NOTE 3. The width of clear zone for basic training OLF's used by propeller aircraft was previously defined by the width of the approach-departure clearance surface. The criteria have been revised to conform with AICUZ guidelines.

The restrictions on land use within a clear zone vary. Therefore, the clear zone has been divided into three areas, Type I, II and III, for which specific restrictions are specified.

a. Clear Zone (Type-I) - This zone is inunediately adjacent to the end of the runway. It should be cleared, graded and free of above ground objects (except airfield lighting) and is to receive special ground treatment or pavement in the area designated as the runway overrun. This type clear zone is required at both ends of all runways.

b. Clear Zone (Type - II) - This zone is used only for class B runways and is an extension of the Type I clear zone except that the width is reduced. The Type II clear zone shall be graded and cleared of all above ground objects except airfield lighting•

c. Clear Zone {Type III). This zone is laterally adjacent to the type II clear zone for Class B runways and is used in lieu of the type II clear zone at Class A runways and basic trainlng OLFs used by T-34 aircraft. Objects in this zone shall not penetrate the approach departure clearance surface. Trees, shrubs, bu§hes, or any other na _l,IJ;J, g_rgwt:h _ _. hall, be ped 10 et below the appach aepa-rtre clearance surface or to a lesser . !!_i9!1_--- if neces'sary . to... inun.-:Y. slofl ! X_?!._ a:i.;-I!<r-::n91 1Rmf:..-· Bull.dings for human habitation 'shalY not be sited in the e III Clear Zone yen ▪. ey would }}Q_t, _pJnS..-!;----t;h_ aeEroach dep!1rture clearance .. su'rface-'"' 'T'he '-land in this type clear zone is best utilfzed for agricull:ure or permanent open space exclusive of agricultural uses which would attract birds or water-fowl. Land uses which would include. human activity for extended periods or group activities should be avoided. Tr.aJ[erse ways (ds, railroads, canals, etc.,) are permitted provided they woUid not penetrate airfield imaginary surfaces after the - I.9Jit'"(){ the traverse way has been increased by the distanc.E!:; _SJ>E!c_!.!- in Section II, par _9raph _" ..:

E. LATERAL CLEARANCES. In order to insure the safe operation of aircraft on the ground there are later.al clearances established for most airfield pavements. For example, no structures shall be sited within 100 feet of the edge of a f--bœa- wlnq.:;. Jrqr- --P rkin9 apron· i!ncC· - ;ret.iines:2f a runwa"? -- ahd" parallel ta_j,way shall be a minimum of 500 feet.-ARa..rt. The lateral clearances are listed in P-80 under the category code for the pavement to which they apply.

F. OTHER CONSIDERATIONS.

1. Air Installations Compatible Use Zones (AICUZ) Program. The criteria herein related to clear zones conforms to Navy AICUZ guidelines established by OPNAVINST 11010.36, Air Installation Compatiable Use Zones (AICUZ) Program. The AICUZ concept embodies a method of defining, quantifying and mapping aircraft noise, potential aircraft accident areas and existing or -potential incompatible land uses, both on and off an air installation. The criteria herein is concerned with avoiding obstructions to air navigation and therefore does not address the aircraft accident potential zones, noise descriptions or compatible land use guidelines identified in the AICUZ program. OPNAVINST 11010.36 should be used as a basis for applying AICUZ guidelines.

2. Airfield Exolosives Prohibited Areas. The Naval Sea Systems Command has established criteria with respect to handling and storing ammunition and explosives which are published in NAVSEA OP-5, Volume 1, Ammunition and Explosives Ashore. This publication addresses areas near runways and under flight paths where ammunition and explosives are prohibited and NAVSEA OP-5 should be used for ordnance safety criteria.

G. DRAWINGS. The following Figures are provided to illustrate the imaginary surfaces, typical airfield layouts and clear zones•

NOTES

(1) See Section II, paragraph C for exception to primary surface width.

(2) See Figure 11-9 for clear zone dimensions.

FIGURE II-7

CLASS B RUNWAY- TYPICAL LAYOUT - SINGLE RUNWAY

GENERAL NOTES

- THE LAYOUT SHOWN IS SCHEMATIC IN THAT IT ASSUMES THAT THE ENDS OF THE PARALLEL RUNWAYS ARE AT THE SAME ELEVATION. WHERE THE RUNWAY ENDS ARE AT DIFFERENT ELEVATIONS (OR IF THE RUNWAYS ARE STAGGERED), APPLY THE AIRSPACE CRITERIA TO EACH RUNWAY SEPARATELY AND THEN SUPERIMPOSE THE IMAGINARY SURFACES FOR EACH RUNWAY. WHERE SURFACES OVERLAP, THE LOWER ONE GOVERNS.
- THE DATUM ELEVATION IS THE ESTABLISHED AIRFIELD ELEVATION.

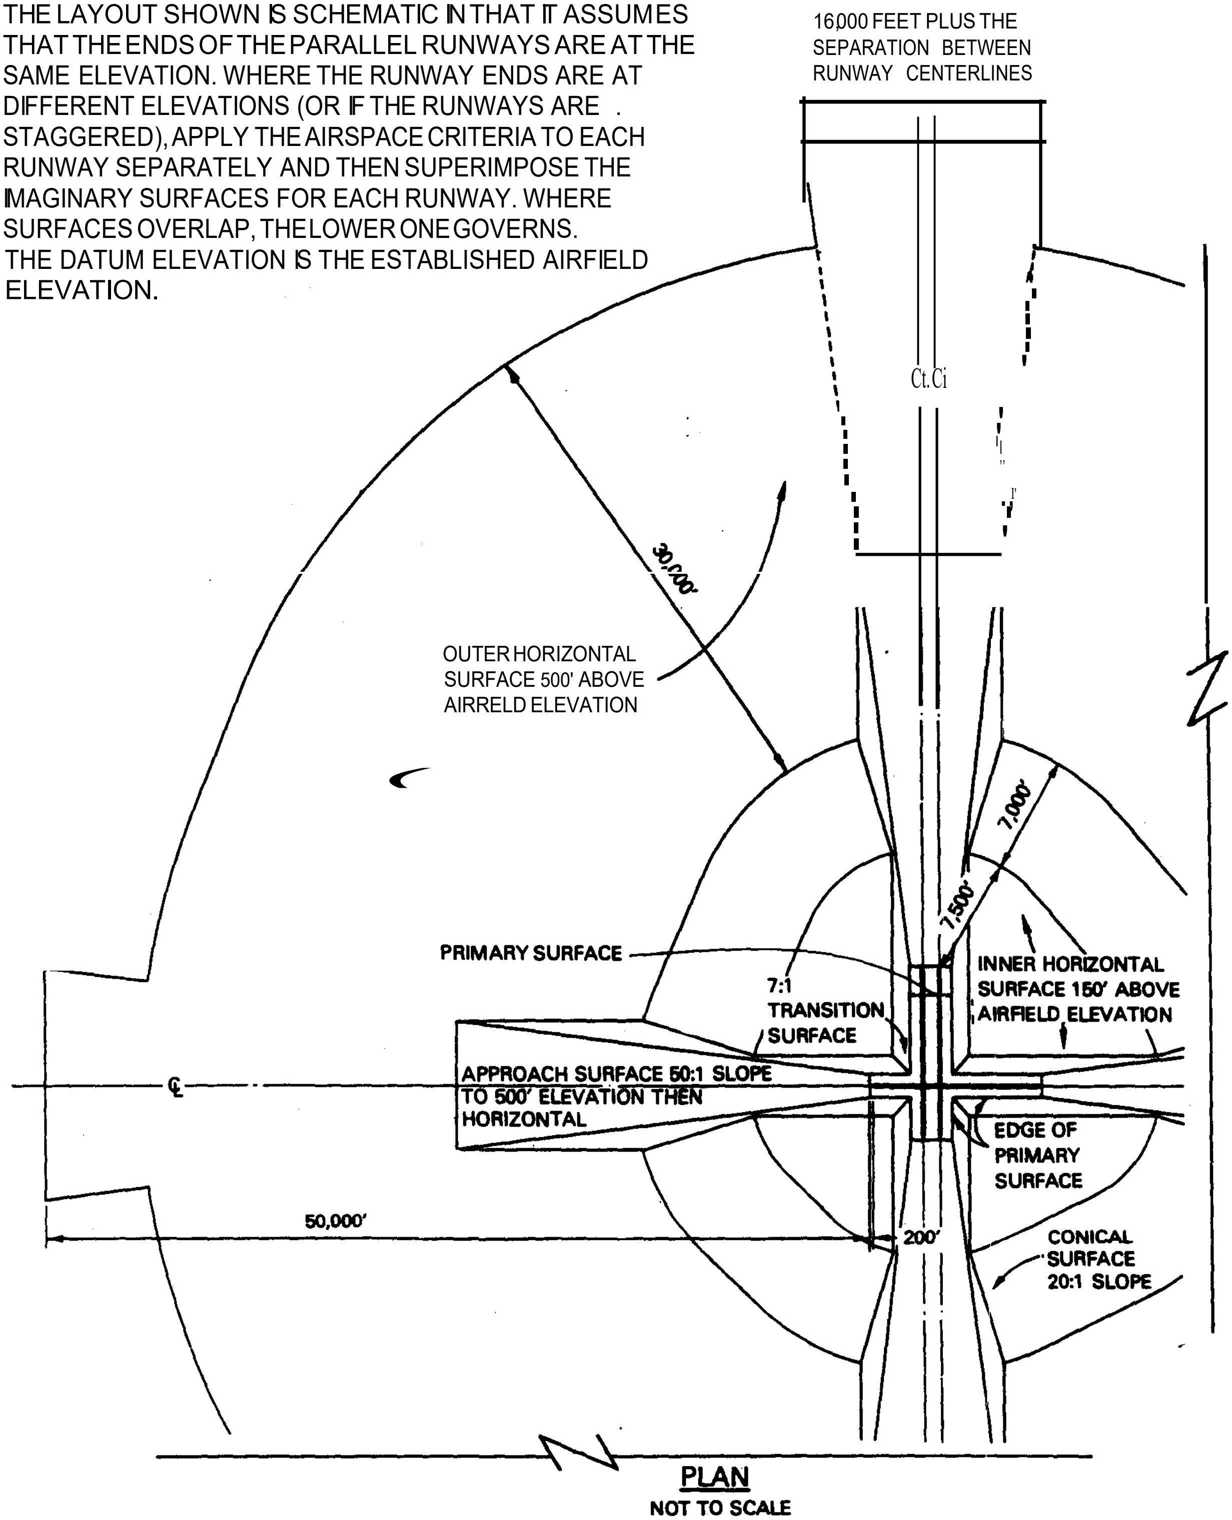

FIGURE II-8
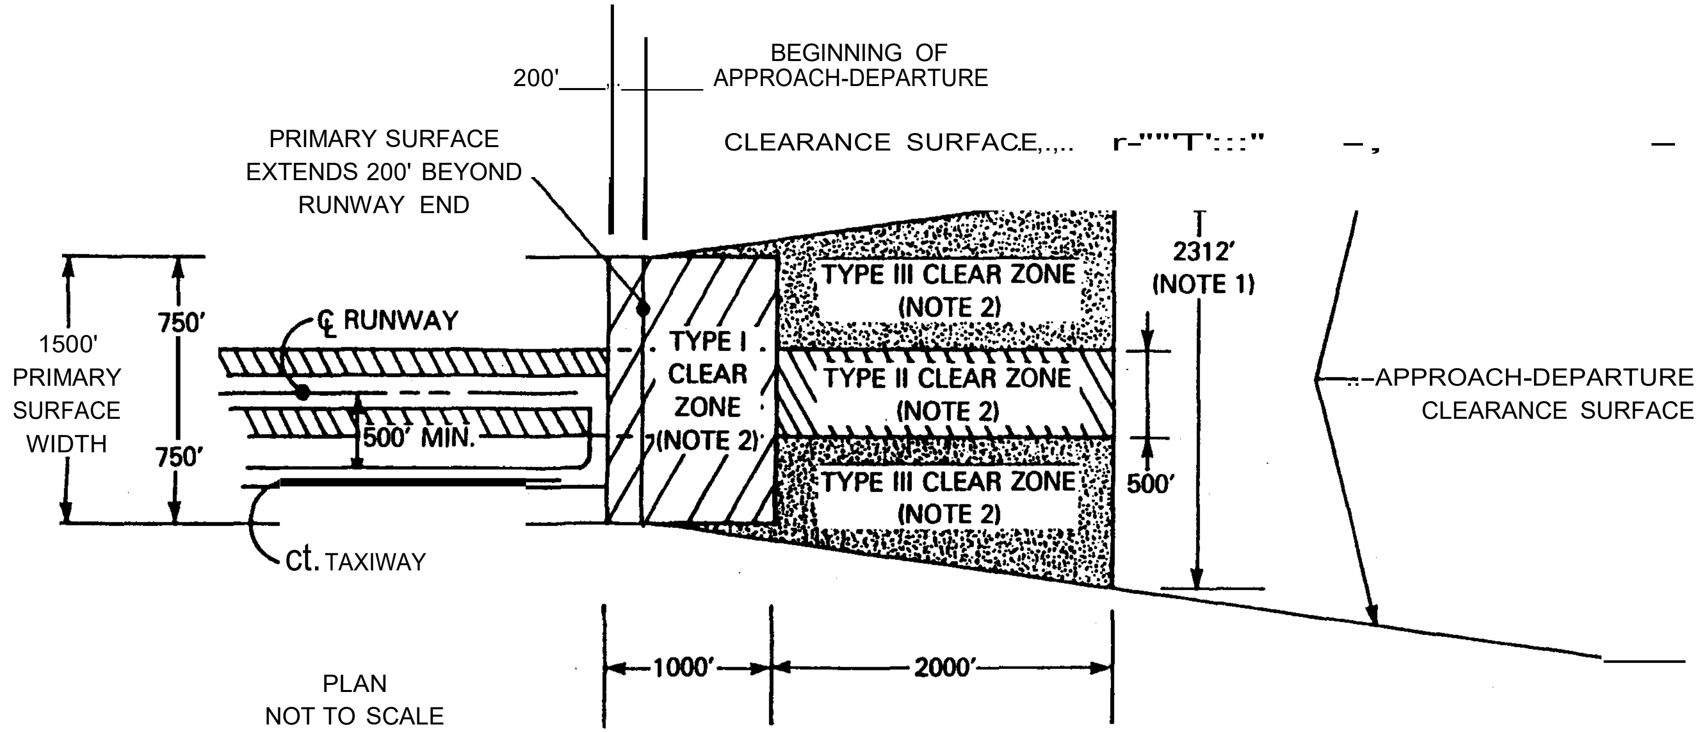
CLASS B RUNWAY - TYPICAL LAYOUT - PARALLEL & CROSSWIND RUNWAYS

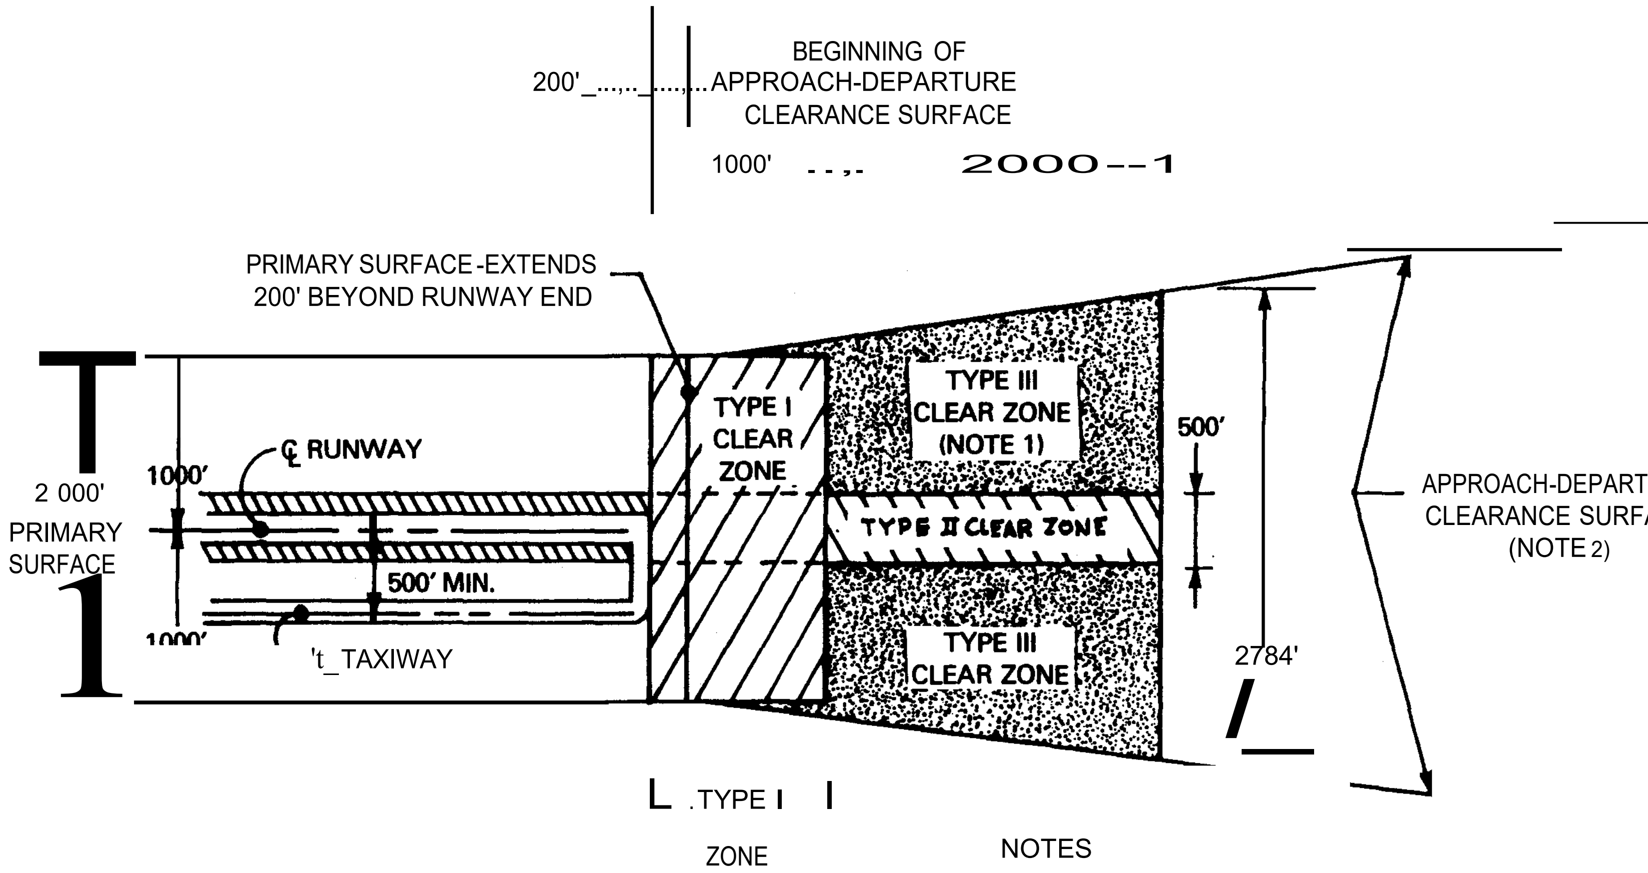


NOTES

(1) This dimension is based on criteria herein whic revises outer width of approach-departure clearance surface to 16,000 feet. At runways where the outer width has been established at 15,500 feet (based on previous criteria of 7°-58'-11" flare angle for approach-departure clearance surface), this dimension is 2284 feet.

(2) See Section II, paragraph D for land use restrictions in Types I, II, and III clear zones.

FIGURE II-9
CLASS B RUNWAY - CLEAR ZONE
(1500 WIDE PRIMARY SURFACE)



NOTES

(1) See Section II, paragraph D for land use restrictions for Types I, II, and III clear zones and for possible variance from the dimensions shown.

(2) The approach-departure clearance surface begins 200 feet from the runway end with a width of 2000 feet and flares outward to a width of 16,000 feet at a point 50,000 feet (measured horizontally) from its beginning.

BASIC TRAINING OUTLYING FIELD (T-34 AIRCRAFT) AIRSPACE ISOMETRIC AND CLEAR ZONE DETAIL

SECTION III - AIRFIELD CLEARANCES - HELICOPTERS

A. TYPES OF FACILITIES. The major helicopter landing facilities consist of helipads and helicopter runways. The airspace clearances for helicopter facilities differ for Instrument Fight Rules (IFR) and Visual Flight Rules (VFR), therefore, the type of flight operations (IFR or VFR) must be identified before the obstruction standards may be applied.

B. OBSTRUCTIONS TO AIRSPACE. The standards for determining, obstruction to air navigation for helicopter facilities are the same as specified for fixed wing aircraft in Section II, paragraph B, except that different imaginary surfaces are defined for helicopter facilities.

C. IMAGINARY SURFACES. The following imaginary surfaces are defined for helicopter facilities and are shown on the figures at the end of Section III:

1. Primary Surface. A horizontal plane symetrically centered on the helicopter runway or helipad at the established elevation of the landing surface. The area beneath the primary surface (referred to as the primary surface area) shall be free of obstructions. The dimensions of the primary surface are:

Type Facility	Length of Primary Surface	Width of Primary Surface
VFR Helipad	150 FT	150 FT
VFR Runway	Runway length plus 75 feet at each end	300 FT
IFR Helipad	1550 FT	750 FT
IFR Runway (Single GPI) (Note 1)	1550 FT	750 FT
IFR Runway (Double GPI) (Note 1)	2450 FT	750 FT

Note 1. The GPI (Ground point intercept) is the point on the centerline of the landing surface where the straight line extension of the glide slope intersects the approach surface baseline. For planning purposes, the GPI can be considered to be the helicopter touchdown point. The primary surface xtends beyond the runway a distance of 775 feet from the GPI. The lengths shown are based on a single GPI at the middle of a 450 foot runway and a 1000 foot runway with two GPIs, each 50 feet in from the runway end.

2. Horizontal Surface (IFR only). A circular or oval level plane, located 150 feet above the established runway or helipad elevation, defined by scribing an arc with a 4,600 radius from the GPI. For multiple

GPI's, connect the arcs with tangents.

3. Transitional Surface. Planes that connect the primary sur·face and the approach-departure clearance surface and horizontal surface. &ach surface is outward and upward from the edge of the primary surface or approach-departure clearance surface at a specified slope measured perpendicular to the runway centerline or helipad longitudinal centerline.

a. VFR Facilities. The slope ratio is 2:1 and for runways it rises to 150 feet above the established elevation of the landing surface. For helipads, the surface rises at a 2:1 slope until it reaches a horizontal distance of 250 feet from the centerline of the pad, it then rises vertically to an elevation of 150 feet above the established elevation of the landing surface.

b. IFR Facilities. The slope ratio is 4:1 and rises to the horizontal surface. At the intersection of the horizontal surface and the approach departure surface, it continues adjacent to the approach-departure clearance surface for the entire length, at which point an elevation of 375 feet above the approach-departure clearance surface is reached.

4. Approach-Departure Clearance Surface. An inclined plane which flares outward and upward above the runway or helipad lc>ngitudinal centerline extended. It starts at the end of the primary surface with the same width as the primary surface at the established elevation of the landing surface. '!be area under this surface is referred to as the approach - departure zone•

Type Facility	Width at Start	Width at End	Length	Slope
VFR Helipad	150 FT	500 FT	1,200 FT	8:1 (Note 1)
VFR Runway	300 FT	600 FT	1,200 FT	8:1 (Note 1)
IFR Helipad and Runway	750 FT	8,000 FT	24,225 FT	25:1

Note 1. When VFR helicopter facilities are located such that they do not fall under the horizontal surface of a fixed wing runway or FR helicopter landing area, the approach departure surface shall be continued on an 8:1 slope until the minimum in route altitude is reached. The width for the extension of the surface shall be 500 feet for helipads and 600 feet for runways.

D. TAKE OFF SAFETY ZONE. A take off safety zone is required under the first 400 feet of VFR approach departure clearance surfaces. and has the same width as the approach-departure clearance surface. i;iafety zone shall be free of obstructions, rough graded .amt turfed where pract.foa6le:--- Takii off Efafety ·zonesare-ot-req\lire-d ··al-·· IFR faciiltiesoue to-eb-;;;;tensive primary surface provided for these facilities. An 800 foot long take-off safety zone is provided at Marine Corps Helicopter

Training Outlying fields, see Figure III-6•

E. LATERAL CLEARANCES. In order to insure the safe operation of helicopters on the ground,, there are lateral clearances established for many airfield pavements. For example, no structures shall be siteli• within 100 feet of the edge of a fixed wing aircraft parking apron.. The lateral clearances are listed in NAVFAC P-80 under the category code for the pavement to which they apply.

F. OTHER CONSIDERATIONS.

1. Air Installations Compatiable Use Zones (AICUZ) Program. The AICUZ concept embodies a method of defining, quantifying and mapping aircraft noise, potential aircraft accident areas and existing or potential incompatible land uses, both on and off an air installation. AICUZ guidelines are specified in OFNAVINST 11010.36 and apply to helicopter as well as fixed wing aircraft installations.

2. Airfield Explosives Prohibited Areas. The Naval Sea Systems Conunand has established criteria with respect handling and storing ammunition and explosives which are published in NAVSEA OP-5, Volume 1, Ammunition and Ex:plosives Ashore. This publication addresses areas near runways and helipads and .under flight paths where ammunition and explosives are prohibited and should be used for ordnance safety criteria.

G. DRAWINGS. The following figures are provided to illustrate the imaginary surfaces, typical helicopter facility layout and take off safety zones•

HELICOPTER LANDING LANES - TYPICAL LAYOUT

SECTION IV - LAND REQUIREMENTS

Land acquisition guidance for Navy and Marine corps air installations is given in OPNAVINST 11010.36, Air Installations compatible Land Use zones (AICOZ) Program. The AICOZ land acquisition policies address the area beyond runways under flight paths. No policy is provided for the primary surface and laterally adjacent areas, which fall under the transitional surfaces. Land requirements in these areas are usually dictated by the requirement to site supporting facilities such as aprons, hangars, station buildings, etc. However as a minimum, the area within the primary surface and laterally out from the primary surface until the transitional surface is 50 feet above the ground should be controlled by fee purchase or restrictive easement. Fee purchase is preferred for the primary surface area.

Record of Changes

Change No.	Date	Location
1	05/01/2013	Revised **“FOREWORD”** by removing images of draft CNIC Instruction and providing hyperlink to CNIC document site; updated language in Introduction to focus on Planning functions; updated 61050-2 allowance for office GSF; updated 72127-3 and Table 72127-2 for space allowances in centralized bathrooms.
2	02/16/2017	CCN 721-27: Revised Title of CCN, revised CNIC N93 as POC to verify scope, replaced term “Lodging” with “Unaccompanied Housing” in correspond with N-code responsibilities within the CNIC organization.
3	01/10/19	Corrected Table 72235-A to correct typo error showing 151-200 capacity to 151-250 capacity.
4	06/12/2022	CNIC reference information is deleted under “**Description of Changes.”** CNIC broken link is removed under “**FOREWORD.”**
5	03/02/2023	Change UFC 2-000-05N to FC 2-000-05N document due to the fact that this planning criteria is not unified among the other DoD services.
6	03/17/2023	Change URLs to access the following: 1. Under 610-50, UFC 4-610-01 2. Under 721-27, FC 4-722-10N 3. Under 722-35, FC 4-722-01N 4. Under 740-49, FC 4-740-02N

Description of Changes:

The following significant changes were made in this UFC revision:

- Criteria updates and coordination align with references in UFC 4-610-01, FC 4-721-10N, FC 4-722-01N, and FC 4-740-02N.

FOREWORD

This publication, "*Appendix F - Austere Facilities (Navy)"* is a supplement to FC 2-000-05N *"Facility Planning for Navy and Marine Corps Shore Installations"*, and provides facility planning criteria for use in computing quantitative austere facility requirements at specifically designated Navy installations.

TABLE OF CONTENTS

INTRODUCTION

PURPOSE

The purpose of this appendix is to provide planning guidance for developing Basic Facility Requirements (BFRs) for the following category code numbers (CCNs):

- CCN 610-50 Austere Administrative Facility
- CCN 721-27 Austere Unaccompanied Housing
- CCN 722-35 Austere Dining Facility
- CCN 740-49 Austere Indoor Fitness Center

DEFINITION AND SCOPE

An austere facility is defined as a structure which has been planned, designed and constructed with minimal footprint area, infrastructure, and finishes, while incorporating the applicable building codes and facility criteria to assure adherence to all health, life safety, force protection, sustainability and accessibility standards and regulations necessary to fulfill the required mission.

Austere construction is intended for facilities in locations determined by CNIC and approved by OPNAV to be eligible for austere facilities construction. The austere standards are intended to be applied flexibly and in varying degrees to all facilities at locations designated as austere. The flexibility should be allowed to ensure the criteria are appropriate for individual austere locations.

Austere facilities should be built with the least total ownership costs (TOC) possible, including purchase, maintenance and use of consistently available alternative local goods.

APPLICABILITY

This Appendix should be used for proper space planning of all facilities that are designated as austere during project programming by CNIC and OPNAV.

610 50 AUSTERE ADMINISTRATIVE FACILITY (SF)

For austere administrative facilities design criteria, refer to UFC 4-610-01 Appendix C, located here: https://www.wbdg.org/ffc/dod/unified-facilities-criteria-ufc/ufc-4-610-01

61050-1 DEFINITION.

Austere administrative facilities accommodate the executive and staff functions at designated austere naval installations. The functions performed in an administrative office are primarily logistical and personnel management. These facilities are intended to provide the minimum footprint area and finish supporting administrative functions while providing minimal up front and total ownership costs in comparison to non-austere facilities.

Austere administrative buildings will be no more than two stories tall and do not include elevators. These facilities will utilize open office space layouts with provisions for a single private office and conference room.

Building size, shape, and area-to-perimeter ratio have a direct impact on the cost and efficiency of the facility, and all of these aspects should be considered during the planning phase. A simple shape with efficient structural layout and a high area-to-perimeter ratio yields the most economical facility.

61050-2 BASIC PLANNING FACTORS. The basic factors required to size austere administrative facilities are:

- The number of occupants, which drives the open office space requirement
- The special purpose rooms or spaces required

Note that all austere administrative space requirements below are provided in terms of Gross Square Feet (GSF).

61050-2.1 Open Office Space. The basic planning factor for open office space within an austere administrative facility is 80 GSF per building occupant. This figure includes all circulation spaces, hallways, bathrooms, mechanical rooms, electrical rooms and stairwells. Workstations/cubicles in austere administrative facilities shall be 6 x 8 ft (1.8 x 2.4 m). Requirements for special purpose rooms (shown below) are additive to the open office space requirement.

61050-2.2 Special Purpose Rooms. Any rooms/spaces not included as part of the open office space above, are to be considered as special purpose rooms/spaces. Examples of authorized spaces are listed below. Other types of special purpose rooms such as a SCIF, training room, or dedicated storage room must be individually justified based on mission requirements.

- Private office – 135 GSF

- Weather Vestibule - 64 GSF per vestibule
- Telecommunications/server room – 100 GSF per floor
- Administrative support space - includes space for photocopy machine space and work area, printers, files, facsimile machine space and work area, scanners, non-secured office supply storage, shredders, and safes.
    - File Area. An allowance of 7 GSF will be made per letter file cabinet, and 8 GSF per legal file cabinet.
    - Office Equipment. This category of space includes printers, copiers, shredders, fax machines, digital senders, and other similar equipment. The size is largely dependent on the number and types of machines used. Plotters should be considered in addition to the average square foot number used.
    - Safes. The space required will be dependent on the size and number of safes required.
- Conference Areas. Conference requirements must be carefully tailored to an organization's mission and experience, and then adjusted to take into consideration the availability of building conference facilities that can be shared. Based upon the number of building occupants, the following allowances should be made:

No. of Persons	Floor Area in GSF
8	160
Up to 14	280
Up to 24	480

61050-3 ACCESS AND PARKING. Access and parking is not authorized for Privately Owned Vehicles (POVs). Fire truck access and fire lanes are authorized. Service vehicle access is authorized for pickups, deliveries, maintenance, etc as needed. Minimal parking for official vehicles, particularly alternative modes of transportation such as electric vehicles is authorized where applicable. Access drives for pickup and drop off areas for shuttle buses, etc. are authorized. Total parking areas for residents, visitors, staff, and service personnel should be extremely minimal and limited to mission support.

721 27 AUSTERE UNACCOMPANIED HOUSING (PN)

For austere unaccompanied housing design criteria, refer to FC 4-721-10N Appendix E, located here: https://www.wbdg.org/ffc/dod/unified-facilities-criteria-ufc/fc-4-721-10n.

72127-1 GENERAL Austere Unaccompanied Housing provides berthing facilities at enduring Naval installations that exclusively support missions in designated austere locations and are staffed with personnel on rotational deployments

Initial/preliminary requirements are determined by following the steps in section 72127-3 "Space Allowance". Preliminary site selection is also performed during the initial planning phase.

Once the initial scope is determined, the findings are forwarded to CNIC (N93), for review. A subsequent independent assessment will be performed to determine the final project scope. This assessment will validate the site selection, determine the final number of rooms and minimal support areas necessary to meet the requirements of austere quarters, and identify any companion projects necessary to provide a complete and usable facility.

The space planning methodology included in this category code will accommodate the projected enduring and surge base population based on official loading and deployment projections relative to the unique nature of staffing with rotational personnel that will yield 90% average projected occupancy for the proposed facility/complex (see details under 72127-3 Space Allowance).

72127-2 DEFINITION. Austere unaccompanied personnel housing facilities will only be located at designated Naval installations. The current austere facility guidance provides for standardized room modules with centralized shower/toilet facilities for active duty personnel and reservists. The guidance in Section 72127-3 provides standardized room modules, with variable occupancy determined by the rank structure of the personnel occupying each module and the surge status of the installation.

Table 72127-1 provides a listing and description of all potential functional program areas for these facilities.

Table 72127-2 tabulates space requirements based on the installation population being served by the facility.

Table 72127-1 Austere Quarters Functional Program Areas

Functional Program Area	Description
Resident Services (required)	
Entrance vestibule	Entry airlock
Resident corridors/circulation	Access to guest rooms, toilets, showers and support areas.
Resident module [1]	Standard multi-occupant room with sleeping area, desks and clothes storage.
Centralized toilets & showers	Space provided in central, convenient location on each floor for resident access to toilets and showers.
Facility Floor Support (required)	
Janitorial areas	Janitor closet on each floor or wing.
Housekeeping areas	Housekeeping support and supplies on each floor or wing.
Utility rooms	Mechanical, electrical, communications and sprinkler rooms located for efficient utility distribution.
Optional Support Areas (supporting justification necessary)	
Laundry, linens	Spaces equipped with industrial-grade laundry equipment. Justified only for installations which do not provide a centralized laundry service.
Laundry, resident use	Spaces equipped for self-service resident laundry requirements. Justified only for installations which do not provide a centralized laundry service.
Linen storage, clean	Storage area for distribution of clean linens.
Linen storage, soiled	Storage area for soiled linens, adjacent to receiving area or laundry spaces.
Receiving	Service entrance for equipment and service supplies.
Reception	Reception desk for check-in and check-out. Justified only for installations which do not have a centralized billeting assignment office.
Storage, cleaning fluid	Separate storage for chemicals used for cleaning, etc.
Storage, general supply	Storage and warehousing of facility supplies.

[1] The final number of rooms will be determined through individual assessment by CNIC/N9.

72127-3 SPACE ALLOWANCE. Berthing modules under CCN 72127 are intended for variable occupancy depending on the rank of the occupants. Each standard module has 288 net square feet (NSF) of living/sleeping area. The maximum steady-state (non-surge) occupancy per module is four persons, resulting in a minimum 72 NSF per person.

For planning purposes, the steady-state module occupancy standards are:

4 persons per module ----- (72 NSF per person)------------------- E1 through E6
2 persons per module ----- (144 NSF per person)------------------- E7 through E8
2 persons per module ---WO1 through WO4
2 persons per module -- O1 through O4
2 persons per module ---Civilian equivalent
1 person per module ------- (288 NSF per person)-----------------------------------E9
1 person per module -- WO5
1 person per module -- O5 and above
1 person per module --Civilian equivalent

Refer to the space allowances shown in Table 72127-2 to obtain a comprehensive facility size. For initial planning purposes, allow for all required austere spaces shown in Table 72127-1. Omit the optional support areas shown in the table, unless justified by the lack of centralized services located elsewhere on the installation (include justification in the project documentation) .

Initial project scope is determined by actual loading capacity requirement (i.e., the number of personnel needing housing for a given steady-state period). Austere berthing facilities should be planned for a 90% occupancy rate. The modules will accommodate the use of bunks to allow for doubled maximum occupancy during periods of temporary population surge.

The facility shall incorporate space on each floor for interior, centralized toilets and showers sufficient for the planned steady-state population. The initial project scope shall provide for one water closet with lavatory per 10 persons allowing 30 NSF per wc/lavatory, and one shower per 8 persons allowing 20 NSF per shower.

No space allowances shall be provided for common gathering areas or kitchen spaces. Elevators are not authorized. Provide a concrete pad and removable railing section for each floor above the pad for use of a portable lift for the movement of furniture to upper floors.

72127-4 ACCESS AND PARKING. Access and parking is not authorized for Privately Owned Vehicles (POVs). Fire truck access and fire lanes are authorized. Service vehicle access is authorized for pickups, deliveries, maintenance, etc as needed. Minimal parking for official vehicles, particularly alternative modes of transportation such as electric vehicles is authorized where applicable. Access drives for pickup and drop off areas for shuttle buses, etc. are authorized. Total parking areas for residents, visitors, staff, and service personnel should be extremely minimal and limited to mission support.

Table 72127-2. Space Allowances for Austere Quarters

Functional Program Area	Base Area		Space Standard (planning factor)	Description	Sample (see notes)		
	ft^2	m^2			Req't	NSF	NSM
Entrance Vestibule	100	9.3	Per facility	Standard size	Req'd	100	9.3
Standard Resident Module	288	26.8	Standard 4-person berthing module		Req'd	51,840	4,816.1
Central Gang Toilet/ Shower	50	4.6	Water Closet and Lavatory = 30 NSF @ 1 per 10 PN Shower and drying area = 20 NSF @ 1 per 8 PN	Based on information in UFC 3-420-01 and UFC 4-740-03	Req'd	3960	367.9
Janitor Areas	25	2.3	Per Facility floor wing	Includes mop sink, janitor supplies and equipment	Req'd	75	7.0
House-keeping Areas	50	4.6	Per Facility floor wing	Accommodates housekeeping supplies and storage	Req'd	150	13.9
Utility Rooms	16	1.5	Per 25 modules	Comm. rooms only; other utility rooms are included in net-to-gross multiplier	Req'd	128	11.9
Laundry, Linen	450	41.8	Optional facility space at 450 SF for up to 25 modules + 4 SF per ea additional module	Only authorized when no centralized laundry service is available at the installation.	Opt.	0	0.0
Laundry, Resident	110	10.2	110 NSF per 10 modules	Two to four washers and two to four dryers per every 10 room modules	Opt.	0	0.0
Linen Storage, Clean	150	13.9	25 NSF per 16 modules	Shelving	Opt.	0	0.0
Linen Storage, Soiled	100	9.3	100 NSF +15 NSF per 10 modules	Includes carts and sorting space	Opt.	0	0.0
Receiving	150	13.9	150 NSF	Service entrance to receive goods and equipment	Opt.	0	0.0
Reception Desk	64	5.9	64 NSF	Desk area to assign rooms and issue linens. Allowed if central billeting not used on installation.	Opt.	0	0.0
Storage, General Supply	600	55.7	600 NSF	Includes segregated space for cleaning fluid storage	Opt.	0	0.0
					Sample Subtotal	**56,253**	**5,226.1**
					Net-to-Gross Factor @ 30%	16,876	1,567.8
					Sample Total	**73,129**	**6,793.9**

Notes:
1. Sample is for a 180 module, three floor facility.
2. The "Req't" column indicates whether or not space is authorized for designated austere facilities.

722 35 AUSTERE DINING FACILITY (SF)

For Austere Dining Facilities design criteria, refer to FC 4-722-01N Appendix C, located here: https://www.wbdg.org/ffc/dod/unified-facilities-criteria-ufc/fc-4-722-01n.

72235-1 GENERAL. Austere dining facilities shall provide for cafeteria style feeding of short order and regular meals much like traditional facilities, but with reduced footprint and finish requirements.

72235-2 DEFINITION. Austere dining facilities provide core dining, food preparation, and support areas for locations determined austere by CNIC. These facilities are intended to provide the minimum footprint area and finishes to support galley functions while providing minimal up front and total ownership costs in comparison to non-austere locations.

72235-3 SPACE ALLOWANCE. Projects are subject to review by Naval Supply Systems Command and subsequently by DOD Food Planning Board. Austere dining facility requirements are generated in two basic steps: (1) Determination of the installation dining loading, and (2) Determination of space allowances using Table 72235-A.

Step 1 – Determination of Installation Dining Loading

72235-4 The number of personnel to be served during a meal period shall be determined by multiplying the maximum military, authorized civilian, and authorized contractor installation population by the austere utilization factor of 90%. Personnel on separate rations shall not be included in the serving requirements when planning new dining facilities, or retaining and modernizing permanent facilities. Include the average on-board count of crews of ships entitled to rations-in-kind while shipboard dining facilities are out of service in the projected occupancy figure.

Step 2 – Determination of Space Allowances

72235-5 FUNCTIONAL COMPONENTS. The authorized floor areas are based on the number of personnel to be served as determined by Step 1. The facility size shall conform to Table 72235-A. The following assumptions have been made in the planning methodology contained herein:

- For austere facility dining, seating is based on 12 SF (1.1 SM) per seat.
- Three meals per day are served, seven days per week as a minimum.
- Bussing method is self-buss to remote dish room.
- The service capacity of a properly equipped and manned regular meal serving line will sustain a service rate of eight personnel per minute. A properly equipped and manned short-order to-order serving line will sustain a service rate of five personnel per minute.

- Seating capacity is traditionally determined by dividing the total number of patrons to be served by the turnover rate. Turnover rates can vary according to the size of facility and seating capacities. Table 72235-A lists the turnover rates upon which each facility size has been based. For situations that require variations in the turnover rate, the space allowances must be adjusted accordingly. See UFC 4-722-01 for more information on turnover rates and minimum seating capacity.
- The local command determines the meal period.
- For planning purposes the total service time should not be less than 72 minutes or more than 142 minutes.

72235-6 STORAGE. Storage area requirements shall be calculated as 20% of the facility subtotal (see Table 72235-A) and shall include areas for the storage of dry foods, refrigerated and frozen foods, consumables, and other non-food goods. Storage areas may be integral to the dining facility or may be stand-alone facilities in appropriate environments, but are included in the dining facility square footage and do not warrant a separate property record card. Storage allowance may be increased based on remote locations with longer delivery cycles, but must be justified by the user and approved by CNIC/N9.

72235-7 NET TO GROSS FACTOR. The net-to-gross multiplier accounts for mechanical and other utility space, wall thicknesses and structural columns, and common areas throughout the building. For planning purposes, apply a net-to-gross factor of 1.25 to the facility subtotal (see Table 72235-A).

72235-8 SPACE ALLOWANCE TABLE. The area allowances shown in Table 72235-A on the following pages are provided for various dining facility sizes based on population to be served (see 72235-4). Total size of a facility shall be based on the number of personnel served as shown at the top of each of the following tables. NOTE: The facility total allowances shown include provisions for a flight kitchen. If this space is not applicable, deduct the appropriate allowance from the facility total.

TABLE 72235-A

Storage: 20% of facility subtotal		1,984	184.3	2,469	229.3	2,917	271.0	3,869	359.4
Net-to-Gross: 25% of facility subtotal		2,480	230.4	3,086	286.7	3,646	338.7	4,836	449.3
Flight Kitchen		125	11.6	125	11.6	150	13.9	150	13.9
FACILITY TOTAL		**14,506**	**1,347.7**	**18,022**	**1,674.3**	**21,295**	**1,978.4**	**28,199**	**2,619.8**

Notes:

(1) Not all locations will require a flight kitchen. A flight kitchen is a staging area where food products are assembled and packaged for delivery to aircraft. Remove the allowable area form the total requirement where flight kitchens are not needed

(2) Dining area seating and circulation is based on 12 NSF per person.

(3) Office area is based on accommodating office staff at 106 SF per person. Use of individual offices in lieu of a single office will be determined during the design phase.

(4) For planning purposes, including recordation in iNFADS, loading docks must be counted at full size, or 100%. For cost purposes, loading docks can be counted at 50% of the allowable area.

(5) For a breakdown of the staff lockers, refer to UFC 4-722-01 Dining Facilities, Appendix C, Section B-8.2. Lockers for staff personnel up to 150 PN should be integrated into the gross area of the building.

72235-9 OVERSIZED FACILITIES. Dining facilities that require more space than the maximum shown in Table 72235-A shall be sized as follows: Divide the projected increased demand/loading capacity by 2,200 (maximum personnel) shown in the table. This will yield a multiplier greater than "1". Apply this multiplier to the allowances shown for the specific areas within the various functional components (Public, Serving, Prep, and Support Areas) for 2,200 personnel. Calculate the subtotals for the functional components and use the process provided for calculating storage adjustments and computing net-to-gross area as shown in Table 72235-A.

The following is provided as an example:

A new dining facility is required to accommodate 3,500 personnel (PN). Divide the 3,500 PN capacity requirement by the Table 72235-A maximum allowance of 2,200 PN; the result is a factor of 1.59. Using the maximum allowances for the functional components of the 2,200 PN facility, calculate as follows:

Public Areas:	13,140 NSF x 1.59 =	20,892.6 NSF
Serving Areas:	4,288 NSF x 1.59 =	6,817.9 NSF
Preparation Areas:	4,335 NSF x 1.59 =	6,892.7 NSF
Support Areas:	2,440 NSF x 1.59 =	3,879.6 NSF
Facility Subtotal:	=	38,482.8 NSF
Storage Req't (20% of Facility Subtotal):	=	7,696.6 GSF
Net to Gross Allowance (25% of Fac. Sub.):	=	9,620.7 GSF
Facility Total Requirement:	=	55,800.1 GSF

(Note: If a flight kitchen is required, it is added to the final facility GSF requirement; see Table 72235-A)

72235-10 ACCESS AND PARKING. Access and parking is not authorized for Privately Owned Vehicles (POVs). Fire truck access and fire lanes are authorized. Service vehicle access is authorized for pickups, deliveries, maintenance, etc as needed. Minimal parking for official vehicles, particularly alternative modes of transportation such as electric vehicles is authorized where applicable. Access drives for pickup and drop off areas for shuttle buses, etc. are authorized. Total parking areas for residents, visitors, staff, and service personnel should be extremely minimal and limited to mission support.

740 49 AUSTERE INDOOR PHYSICAL FITNESS CENTER (GYM) (SF)

For Austere Fitness Centers design criteria, refer to UFC 4-740-02 Appendix F located here: https://www.wbdg.org/ffc/dod/unified-facilities-criteria-ufc/ufc-4-740-02

This is the link to the Whole Building Design Guide (WBDG) Federal Facilities Criteria web page that hosts both the UFC 4-740-02 and the associated Fitness Space Program Spreadsheet (for non-Austere facilities). For Austere Dining Facilities, use space planning criteria located within this document.

The Department of the Navy Fitness Standards and Metrics which influence requirements for physical fitness facilities are available at this CNIC website: http://www.navyfitness.org/fitness/.

74049-1 GENERAL. Refer to the introduction to 740-series category codes (in the "700 Series - Housing and Community Facilities" section of this UFC) for general instructions regarding planning procedures and allowances for community facilities.

74049-2 DEFINITION. Austere physical fitness facilities provide facilities and support services to meet the individual physical fitness, coordination, skills development, recreational and training needs of military personnel stationed in designated austere operating environments. These facilities may also serve authorized civilians. Activities that are typically accommodated in these facilities include: athletic gear issue, calisthenics, cardiovascular training, physical fitness training, and weight-training.

74049-3 RELATED FACILITIES. Consideration should be given to collocation of the facility with other existing or planned recreational facilities in order to (1) take advantage of potential savings in space requirements and operating costs, and (2) provide users with the increased convenience of clustered facilities. These facilities would include:

- 740 53 Indoor Swimming Pool
- 750 10 Outdoor Playing Courts
- 750 20 Playing Fields
- 750 30 Outdoor Swimming Pool.

74049-4 INSTALLATION POPULATION. The primary functional components of an Indoor Fitness Facility - Basketball Court, Aerobics/Exercise Area, Cardiovascular Training Area, Weight Training Area, and Indoor Playing Court - are sized based on installation population. Installation population ranges are as follows:

XSMALL = Population 0-500
SMALL = Population 501-3,000
MEDIUM = Population 3,001-7,000

LARGE = Population 7,001-14,000
XLARGE = Population 14,001-30,000

74049-4.1 Installation population is defined as Active Duty enlisted and officers, average on board transients, reservists and authorized civilians. Population numbers should be consistent with projected base loading data.

For facility planning purposes at installations with deployable forces, the active duty demand population is included all of the non-deployable population, plus two-thirds of the deployable population, to reflect time away on deployment. However, calculation of the deployable population may be adjusted based on the actual deployment experience at individual installations.

74049-5 SPACE ALLOWANCES. Space allowances for Austere Indoor Physical Fitness facilities are determined using Tables 74049-1 through 74049-5 on the following pages. The space allowance required for each component to meet the demand is obtained from the calculations of the installation population served by the facility. The total allowance for a facility is the sum total of the net space allowances for each functional component, adjusted using the net-to-gross factors reflected in the tables.

Notes for Space Allowance Tables 74049-1 through 74049-5:

(1) Indoor Basketball Courts are discouraged in austere environments, and must be justified to, and authorized by, CNIC N944 prior to project scoping.

(2) Fitness area includes warm-up/cool-down area, free weights, circuit/weight training machines, and cardiovascular equipment (bicycle, stepper, rower). Space for one Instructor Station should be included in each separate Weight Training Area.

(3) Staff support spaces consist of:

- (a) Control Counter and minimal administrative area.
- (b) Gear Issue and Laundry Room for check-out of athletic gear and recreation equipment for leisure use.
- (c) If gymnasium is authorized, include a Gymnasium Equipment Storage Room for equipment and supplies, such as roll-away baskets goals, volleyball standards, gymnasium floor coverings, roll-away bleachers, etc.

(4) Space allowances in the tables are minimum allowances.

Table 74049-1
Space Allowance for Extra-Small Facility

AUSTERE INDOOR FITNESS CENTER					
Size = Base Population 1-500 = EXTRA SMALL					
	Functional Components	Qty	Allowance Per Qty (NSF)	NSF	SM
PUBLIC SPACES	Entry Lobby (qty = module)	1	100	100	9.3
	Control Counter (qty = module)	1	125	125	11.6
	Equip Issue Storage (qty = module)	2	175	350	32.5
	Subtotal			**575**	**53.4**
FITNESS SPACES	Unit PT/Group Exercise Partionable Room(s) (qty = # of persons)	0	50	0	0.0
	Unit PT/Group Exercise Storage (10% of Unit PT/Group Exercise Room(s)		0.1	0	0.0
	Stretching Space	3	50	150	13.9
	Cardiovascular Equipment	20	50	1000	92.9
	Selectorized (machine) Weights	10	50	500	46.5
	Free/Plate Weights	15	65	975	90.6
	Fitness Assessment	1	125	125	11.6
	Gymnasium	**** See Notes ****			
	Subtotal			**2750**	**255.5**
ADMIN SPACES	Support Staff Workstations (qty = workstations)	0	64	0	0.0
	Copy/file/work/break Room (qty = workroom module)	1	80	80	7.4
	Subtotal			**80**	**7.4**
LOCKER ROOMS	Men's (60% of pop.) (qty = slots; see notes)	29	12	348	32.3
	Women's (40% of pop.) (qty = slots; see notes)	19	12	228	21.2
	Subtotal			**576**	**53.5**
SUPPORT	Laundry Room (1/2 machine combo laundry room)	1	180	180	16.7
	Laundry Storage Room	1	131	131	12.2
	Loading Dock	1	90	90	8.4
	Subtotal			**401**	**37.3**
	FACILITY SUBTOTAL			**4,382.0**	**407.1**
	Net-to-Gross: 20% of facility subtotal			876	81.4
	FACILITY TOTAL			**5,258**	**488.5**

Notes:
1) Gymnasiums (basketball/volleyball courts) are optional and MUST be approved in writing by CNIC/N9. Approval letters must be attached to the Basic Facilities Requirement (BFR) document. Where approved, add: 8892 NSF (gym) + 700 NSF (storage) * 1.2 = **11,510 GSF/1069.4 SM.**
2) Locker distribution shown above is planned as a 60% male and 40% female split. This ratio can be changed based on mission needs but the final ratio needs to be represented on the appropriate BFR document(s).
3) For locker distribution, provide two slots (spaces) for every three lockers (66%). This includes one full-sized and two half-sized lockers for every three required.
4) Men's locker room includes space for 2 showers and 1 watercloset/lavatory modules.
5) Women's locker room includes space for 1 showers and 1 watercloset/lavatory modules.
6) The net to gross factor is based on a single story facility. In cases where the facility requires multiple floors, change the net to gross factor to 28%, or 1.28.

6) The net to gross factor is based on a single story facility. In cases where the facility requires multiple floors, change the net to gross factor to 28%, or 1.28.

74049-6 ACCESS AND PARKING. Access and parking is not authorized for Privately Owned Vehicles (POVs). Fire truck access and fire lanes are authorized. Service vehicle access is authorized for pickups, deliveries, maintenance, etc as needed. Minimal parking for official vehicles, particularly alternative modes of transportation such as electric vehicles is authorized where applicable. Access drives for pickup and drop off areas for shuttle buses, etc. are authorized. Total parking areas for residents, visitors, staff, and service personnel should be extremely minimal and limited to mission support.

FOREWORD

The Unified Facilities Criteria (UFC) system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and applies to the Military Departments, the Defense Agencies, and the DoD Field Activities in accordance with USD (AT&L) Memorandum dated 29 May 2002. UFC will be used for all DoD projects and work for other customers where appropriate. All construction outside of the United States, its territories, and possessions is also governed by Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA), and in some instances, Bilateral Infrastructure Agreements (BIA). Therefore, the acquisition team must ensure compliance with the most stringent of the UFC, the SOFA, the HNFA, and the BIA, as applicable.

UFC are living documents and will be periodically reviewed, updated, and made available to users as part of the Military Department's responsibility for providing technical criteria for military construction. Headquarters, U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering Systems Command (NAVFAC), and Air Force Civil Engineer Center (AFCEC) are responsible for administration of the UFC system. Technical content of UFC is the responsibility of the cognizant DoD working group. Defense Agencies should contact the respective DoD Working Group for document interpretation and improvements. Recommended changes with supporting rationale may be sent to the respective DoD working group by submitting a Criteria Change Request (CCR) via the Internet site listed below.

UFC are effective upon issuance and are distributed only in electronic media from the following source:

- Whole Building Design Guide web site http://www.wbdg.org/ffc/dod.

Refer to UFC 1-200-01, *DoD Building Code*, for implementation of new issuances on projects.

UNIFIED FACILITIES CRITERIA (UFC)
REVISION SUMMARY SHEET

Document: UFC 2-100-1, *Installation Master Planning*

Superseding: UFC 2-100-1, *Installation Master Planning*, dated 25 October 2019, with Change 1.

Description: 10 USC 2864 requires all major military installations to have a Master Plan. This specific document is issued under the authority of DoDI 4165.70, Real Property Management, which implements the requirement for installation Master Plans.

Reasons for Document:

- Updates master planning processes and products, including energy and **\2\ /2/** resilience and requirements for transportation and military installation resilience components as required by 10 USC 2864.
- Updates master planning processes and products to incorporate **\2** requirements of **/2/** FY20 National Defense Authorization Act
- Administrative revisions to comply with UFC 1-300-01, *Criteria Format Standard*.

Summary of Changes:

FY20 NDAA Changes:

- FY20 NDAA Section 2801(a): 3-4.b, 3-10.2, 4-2.1 (Requirement to have a Military Installation Resilience Component **\2** [MIRC] **/2/** to the Master Plan).
- FY20 NDAA Section 2804(c) (i): 2-2.16, 2-5.1.1, 2-6, 2-8, 2-9, 2-9.1, 2-9.3, 3-5.6.1, 3-6.1.6, 3-5.5, 3-5.6.1, 3-5.7, 3-6.1.1, 3-6.1.3.c, 3-6.1.6, 3-6.4, 3-7, Appendix B (Verbiage changes to specifically identify **\2** resilience **/2/** and weather considerations in planning processes).
- FY20 NDAA section 2804(c)(ii): 3-5.6.2.a, 3-5.6.2.2 (Specifies certain agencies for **\2\ /2/** information).
- FY20 NDAA section 2804(c)(iv): 2-2.17.1, 3-10.2 **\2** Follow Service-specific guidance, as appropriate. **/2/**

Summary of Other Changes:

- Specific updates to institute **\2** DoD Regional Sea Level **/2/** (DRSL) database **\2\ /2/**: 2-2.17.1.2 (new paragraph), 3-5.6.1.
- Include use of the DoD **\2** Extreme Conditions **/2/** Assessment Tool: 2-2.17.1.1.

- Updates to incorporate explosive safety quantity-distance arcs: 2-2.1, 2-3.2, 2-9, 3-5.6.1, 3-5.7.1, D-3.
- Updates to reflect changes in UFC 4-010-01, DoD Minimum Antiterrorism Standards for Buildings; adds reference to 4-020-01, DoD Security Engineering Facilities Planning Manual: 2-5.2
- Updates to the descriptions of aesthetics and Network Plan to provide greater fidelity on the requirement: 2-8.1.
- Clarification to Illustrative Plan description: 2-9.1.
- Clarifications to Plan-Based Programming: 2-11.
- Removed requirement for a land pattern matrix: 3-4.1.
- Clarifications to the Installation Street and Transit Plan for consistency with 10 USC 2864: 3-6.4.3.
- Clarifications to Program Development: 3-8.2.
- Added description of Functional Annexes to the requirements of the Master Plan to accommodate additional components of the Master Plan as required by 10 USC 2864: 3-4.2, 4-2.1.
- Add requirement for Installation Energy Plan per OSD Memo and 10 USC 2864: 3-10.1, 4-2.1, Appendix E.
- Added description of optional Functional Annexes: 3-10.
- Clarified the applicability of Appendix B and removed references to use LEED-ND criteria.
- Updated training courses in Appendix C.
- **\1** Added requirement to identify coordination efforts maintaining or enhancing military installation resilience or resilience of the community infrastructure: 3 10.2.7. **/1/**
- **\2** Removed ICRP Section (3-10.2) and replaced with reference to law; made related terminology changes throughout. **/2/**

Impact:

- Additional costs to complete the Installation Energy Plan (IEP) and **\2** MIRC **/2/** will be needed.
- Improved installation efficiency, safety, resilience, and mission **\2** sustainment **/2/**.
- Enhanced integration of comprehensive planning and project programming activities.

Unification Issues: There are no unification issues.

CHAPTER 1 INTRODUCTION

1-1 BACKGROUND.

DoD is one of the world's largest builders, owners, and operators of infrastructure and is responsible for managing millions of acres of land and billions of dollars' worth of facilities and infrastructure worldwide. Effective long-term development and management of these resources requires thoughtful and thorough master planning. Master planning is a continuous analytical process that involves evaluating factors affecting the present and future physical development and operation of an installation. This evaluation forms the basis for determining development objectives and planning proposals to solve current problems and meet future needs. Each step of the process builds upon the preceding step, providing a logical framework for the planning effort. For military installations, planning is accomplished primarily at the installation level through a comprehensive and collaborative planning process resulting in a Master Plan. This process provides a means for resilient and energy-efficient installation development that supports mission requirements.

1-2 PURPOSE AND SCOPE.

10 USC 2864 requires all major military installations have a Master Plan. DoDI 4165.70, *Real Property Management*, establishes the requirement for installation Master Plans. This UFC prescribes DoD minimum requirements for master planning processes and products in accordance with DoDI 4165.70. The process includes the use of a Master Plan and its components as a tool to provide ongoing planning for installations in support of the mission. DoD planners utilize this UFC, the DoDI, and applicable agency instructions to prepare Master Plans and other planning documents. Affiliated design and programming professionals will refer to the Master Plan as they prepare site-specific design proposals. By incorporating today's needs and mission requirements into a compelling vision with clear goals and measurable objectives, installation planners can prepare a Master Plan that **\2** supports future mission and installation requirements **/2/**. This UFC outlines a complete process for master planning (and ultimately the development of a Master Plan) through the preparation of linked plans (Functional Annexes) that can be implemented entirely or incrementally based on each installation's needs and resources. A successful Master Plan:

- Provides timely and correct planning information and real property support for installation missions and supports informed decision-making.
- Promotes cooperative and interactive intra- and inter-Service and inter-governmental relationships.
- Incorporates infrastructure, assurance, and anti-terrorism considerations.
- Incorporates resilience analysis to ensure mission sustainment over the intended lifespan of the infrastructure and assets.

- Incorporates environmental planning to identify environmental impacts and protect and enhance natural, cultural, and environmental resources while supporting mission requirements.
- Supports and encourages **\2** resilient **/2/** and energy-efficient development.
- Provides scope for all programs involving real property acquisition, design, and construction; real property management and operation; real property facility utilization and accounting; real property sustainment (maintenance and repair); and disposal of land and facilities.
- Maintains an accurate audit trail of master planning and real property decisions.
- Ensures efficient and compatible land use (identifying and respecting natural and man-made constraints) and maximizes facility utilization.
- Provides input to the privatization of family housing, utilities, and services.
- Sustains ranges and training areas to meet training and testing missions on a consistent and long-term basis.
- Identifies resource requirements directly and indirectly associated with real property sustainment and development.
- Protects an installation's long-term viability by providing capability for growth, expansion of requirements, and flexible facility and land-use decisions that can accommodate changes to missions and/or users.
- Encourages policies and interaction with the local community to avoid encroachment and maximizes opportunities for joint use while preserving mission capability and growth potential.
- Supports federal energy mandates.
- Creates connected and visually pleasing environments by coordinating development, removing clutter, enforcing consistent architectural themes, creating appropriate pedestrian and vehicle circulation patterns, and focusing attention on installation appearance, which can enhance quality of life and contribute to the overall mission.
- Informs and is informed by related plans at each installation, including energy plans, utility capacity plans, range complex Master Plans (RCMP), anti-terrorism (AT) plans, integrated cultural and natural resource management plans,**\2** resilience **/2/** plans, and transportation plans.
- Supports**\2** risk reduction **/2/** of environmental hazards and encroachment as well as effective integration of air installation compatible use zone (AICUZ) and range air installation compatible use zone (RAICUZ) constraints and mission synergy.

1-3 APPLICABILITY.

\2 This UFC follows the same applicability as UFC 1-200-01, paragraph 1-3, with no exceptions. **/2/**

1-4 GENERAL BUILDING REQUIREMENTS.

Comply with UFC 1-200-01, *DoD Building Code*. UFC 1-200-01 provides applicability of model building codes and government unique criteria for typical design disciplines and building systems, as well as for accessibility, antiterrorism, security, high performance and **\2** resilient building **/2/** requirements, and safety. Use this UFC in addition to UFC 1-200-01 and the UFCs and government criteria referenced therein.

1-5 CYBERSECURITY.

All control systems (including systems separate from an energy management control system) must be planned, designed, acquired, executed, and maintained in accordance with UFC 4-010-06, *Cybersecurity of Facility-Related Controls*, and as required by individual Service implementation policy.

1-6 GLOSSARY.

Appendix E contains acronyms, abbreviations, and terms.

1-7 REFERENCES.

Appendix F contains a list of references used in this UFC. The publication date of the code or standard is not included in this UFC. Unless otherwise specified, the most recent edition of the referenced publication applies.

This Page Intentionally Left Blank

CHAPTER 2 MASTER PLANNING STRATEGIES AND GENERAL REQUIREMENTS

2-1 INTRODUCTION.

One of the primary purposes of the planning process is to apply comprehensive planning strategies through facility and infrastructure development, including planning, programming, engineering and design, construction, reuse, real estate actions, public-private ventures, operations and maintenance, and disposal. The following ten strategies support the DoD-wide overarching installation planning philosophy, which is to develop a **\2** resilient **/2/** platform to support the effective execution of assigned military missions as efficiently as possible.

- **\2** Resilience **/2/** planning
- Natural, historic and cultural resource management
- Healthy community planning
- Defensible planning
- Capacity planning
- Area development planning
- Network planning
- Form-based planning
- Facility standardization
- Plan-based programming

2-2 \2\ RESILIENCE /2/ PLANNING.

\2 Resilience **/2/** planning leads to lasting development—meeting present mission requirements without compromising the ability of future generations to meet their needs. The goal of such development is to make the most effective use of limited resources, reduce fossil fuel use and increase the use of alternative fuels, and create more compact, and resilient communities while meeting security and safety requirements. Incorporate the following key principles of **\2\ r**esilience **/2/** planning into Master Plans, Area Development Plans (ADP), and other planning products.

2-2.1 Compact Development.

Conserve land as a resource to be utilized to the maximum extent possible. This can be achieved through compact development patterns that support an appropriate mix of uses, encourage walking and other alternative modes of transportation, accommodate appropriate residential and commercial densities, and incorporate a more integrated grid network of streets and sidewalks. Land use patterns and transportation systems may have to be reconfigured to create opportunities for future development. Compact development patterns include multi-story buildings, increased residential densities, mixed-uses, and minimal spacing between buildings while maintaining consideration of

AT requirements as well as other constraints (e.g., airfield clearances or explosive safety quantity-distance arcs).

2-2.2 Infill Development.

To conserve limited land resources, to the maximum extent possible, focus plan development within the installation core (existing cantonment area) and on previously developed land. Place buildings or designated open spaces in gaps between existing developed areas and buildings while taking care to ensure preservation or addition of greenspace. Infill development results in greater density at the core of the installation and supports integrated land use and transportation networks to include transit-oriented development. Removing/replacing aging low-density development with higher density development may also be appropriate. Take into account the potential impacts of all proposed actions on historic properties when considering infill within an historic district.

2-2.3 Transit-Oriented Development.

Transit-oriented development focuses compact, mixed-use development around transit corridors. Locate public transit stops along these corridors (for buses, streetcars, light rail) at approximately half-mile intervals. Development intensity and density should be greatest along these corridors and around the transit stops. On military bases, such development typically takes the form of three- to five-story buildings for administrative, commercial, and residential uses. Transit-oriented development has many advantages, including lowering traffic congestion and vehicular accidents, reducing parking requirements, and lowering CO_2 emissions. Transit-oriented developments also promote healthy communities by focusing on pedestrian use and encouraging more walking and cycling. With appropriate building typologies (e.g., rowhouses, apartments, multi-level office buildings) and with sufficient transit intervals, vehicle miles traveled can decrease by up to 50%. Seek out ways to connect mass transit systems on the installation to outside transit systems.

2-2.4 Horizontal Mixed Uses.

To make compact development feasible:

- Create synergies.
- Reduce land use and construction costs.
- Integrate compatible uses into horizontal mixed-use development.t
- Segregate incompatible uses (e.g., industrial areas should be separate from housing).

Uses typically found on military installations, community support (retail, recreation, schools, lodging), housing, medical, administrative, and classroom training uses are generally compatible. Consider integrating these uses into horizontal mixed-use districts to enable walking or biking from one use to another. Ideally, uses within walkable areas are within a 10-minute walking radius (roughly 2,500 feet [760 meters]). Where appropriate, create a campus or town center-like atmosphere since these places are tested examples of horizontal mixed-use districts. Use compact mixed-use zones to support combined heat and power district systems, which can increase the efficiency of primary energy use in a district. Use mixed-use districts to appropriately balance out energy use. In areas where living and working are within one district, the system can operate at increased efficiencies since energy-use peaks are offset.

2-2.5 Vertical Mixed Uses.

Vertical mixed-use is compatible uses located within the same building, enabling maximize land use and infrastructure efficiencies. Synchronizing future requirements is required to achieve vertical mixed-use development. Ground floor education and training centers with unaccompanied housing on upper floors is an example of vertical mixed-use construction using appropriated funds. Collaboration with agencies such as the Army Air Force Exchange Service (AAFES), the Defense Commissary Agency (DeCA), and privatized housing partners enables the creation of mixed-use buildings and neighborhoods using non-governmental funds. Use collaborative efforts to combine non-appropriated and appropriated funds in one facility using conjunctive funding. Identify and program costs associated with each funding category separately. An example of conjunctively funded vertical mixed-use is military family housing (appropriated funds) located above a commissary (non-appropriated funds).

2-2.6 Connected Transportation Networks.

Connect uses within each district, as well as the districts themselves, by roads, sidewalks, and bikeways. Size transportation networks to support mission requirements through properly programming projects. A connected network of streets is based on a modified grid pattern that affords multiple route options for vehicles, bicyclists, and pedestrians. The grid network uses appropriately scaled roads to define smaller block sizes that can accommodate a mix of compatible uses. Multi-way boulevards, parkways, main streets, residential streets, and alleys are examples of street types appropriate for integration into grids and for use on military installations. When streets are built with integrated bikeways and continuous sidewalks buffered from the street by planting strips, users have more safe transportation options. When establishing the transportation network, incorporate concepts that maximize safety for all users. A connected transportation network of streets with sidewalks, pedestrian pathways, and bicycle trails reduces the distance between origins and destinations and increases transportation alternatives. Short blocks and an absence of cul-de-sacs characterize a connected street network. Sidewalk easements improve connectivity in extremely long blocks and sidewalks should incorporate best practices for fitness such as mile markers. Installation gates are part of the transportation network. Coordinate the transportation plan with local/state/regional government agencies to ensure the installation’s transportation network is linked with surrounding transportation access and systems.

2-2.7 \2\ Resilient /2/ Landscape Elements.

Ensure plans incorporate appropriate use of street trees, shrubs, and ground cover. These landscape elements can control soil erosion, reduce the heat island effect, absorb stormwater, improve air quality, provide comfortable places for recreation, and support AT measures. In addition, trees improve the environment and provide shade, aesthetics, and security protection on an installation. Space street trees 25 feet to 30 feet (7.6 meters to 9 meters) on center on roadways to improve pedestrian safety by slowing vehicle traffic; provide shade for paving, vehicles, and pedestrians; and shade buildings, which can reduce energy consumption. To the greatest extent possible, use native plant materials that are suitable for the particular **\2** plant hardiness zone (consistent with USDA's Plant Hardiness Zone Map) **/2/** and soil conditions to limit maintenance requirements and conserve water resources. Refer to UFC 3-201-02, *Landscape Architecture*, for additional information.

2-2.8 Low-Impact Development and Stormwater Management.

The use of on-site natural features to control stormwater runoff quantity and quality in lieu of traditional "end-of-the-pipe" solutions is a land planning and engineering design approach termed Low Impact Development (LID). LID is required by the Energy Independence and Security Act of 2007, § 438, and DoD policy. UFC 3-210-10, *Low Impact Development,* defines the design requirements associated with compliance. This approach implements engineered small-scale hydrologic controls to replicate the pre-development hydrologic condition of watersheds through infiltrating, filtering, storing, evaporating, and detaining runoff close to its source. These controls include not only open space and natural features but also manmade features such as building roofs, streets, and parking surfaces. Other examples include bioswales, car parks, and on-street parking, which use substantially less paving per car than off-street parking. LID applies equally to new construction and redevelopment and is best accomplished at the installation level.

2-2.8.1 LID and Area Development Planning.

Include LID practices and strategies in the development of the Vision Plan, Area Development Plans (ADPs), planning design standards, and other planning studies. When developing plans defined in this UFC, minimize impervious surfaces and ensure there is adequate space available on-site to offset the increase in impervious areas associated with siting new facilities and structures. Reduce the amount of impervious surface areas by implementing the following best management practices (BMP):

- Pervious pavements
- On-street parking
- Compact alignment, including in-fill, mixed-use, and multi-story solutions
- Minimized street widths that maintain adequate fire protection access
- Structured parking

2-2.8.2 LID and Integrated Management Practices.

Adding additional site area will allow the use of low-cost integrated management practices (IMP) such as bioretention and bioswales. A general rule of thumb for planning purposes is to allow an additional 10% of site area for increases in impervious areas. A more detailed estimate can be obtained if soil conditions are known or by evaluating existing IMP features from adjacent sites. Anti-terrorism and force protection (AT/FP) setbacks may be used to provide bioretention features given the unobstructed space and concealment requirements of UFC 4-010-01, *DoD Minimum Antiterrorism Standards for Buildings*, are met. In addition, provide a minimum of 20 feet (6.1 meters) of separation from the structure/building foundation to the face of the bioretention feature. Use surface parking areas with integrated bioswales to minimize perimeter bioretention facilities.

2-2.8.3 LID and Project Programing.

If site constraints prevent the use of low-cost features, identify additional LID costs during project development and on DD Form 1391, *FY_ Military Construction Project Data*. High-cost IMP features include rainwater harvesting**, \2** vegetated **/2/** roofs, underground storage, or other structural IMP. Refer to UFC 3-260-01, *Airfield and Heliport Planning and Design*, paragraph 2-5.5, “Storm Water Management Facilities,” and paragraph 2-3.3, “Safety,” and UFC-3-201-01, *Civil Engineering*, paragraph 3-6.2, “Airfields,” for restrictions to certain LID measures for certain installation areas, in particular airfields, to control bird air strike hazards (BASH).

2-2.9 Multi-Story Construction.

One-story buildings inefficiently use valuable land. Plan for and specify multi-story buildings when possible. Land efficiency improves with multi-story construction and can be justified, even with progressive collapse requirements, when balanced against the cost of land and utilities required to serve multiple buildings. As appropriate, combine multiple users into multi-story buildings. If planning multi-story construction within or adjacent to an historic district or historic properties, contact the installation Cultural Resources Manager early in the planning process. This minimizes project delays or changes resulting from the presence of historic properties. Consider multi-story buildings as a flood **\2** risk reduction **/2/** strategy.

2-2.10 Building Orientation and Configuration.

Plan sites to provide flexibility for building orientation and configuration. This strategy optimizes building performance, conserves energy, and enhances indoor environmental quality such as thermal comfort and day-lighting. Minimize existing and planned obstructions from landscaping, structures, topography, and adjacent developments to preserve solar access and natural ventilation. Buildings of any configuration with footprint elements of approximately 50 feet (15 meters) or less (wings, central courtyards) can allow natural light deep into the building, which, when combined with energy-efficient glazing, reduces energy consumption. Narrow buildings with operable windows allow natural ventilation to effectively flow through the interiors, which can reduce energy costs associated with air conditioning. Use narrow buildings to define outdoor spaces and for infill development. When laying out building footprints on Illustrative Plans, strive to use building footprints no wider than 50 feet (15 meters). Use buildings wider than 50 feet (15 meters) to optimize energy performance, especially in colder **\2** regions **/2/**. Special-purpose buildings like hangars, large-format retail, and warehouses need not comply with this strategy.

2-2.11 Energy Conservation.

Include energy conservation as part of the planning goals. Employ energy demand reduction and the development of installation-wide and building-level **\2** resilience **/2/** supplies as strategies to attain the energy conservation goals. **\2** Resilience **/2/** planning also includes consideration of **\2** alternative energy **/2/** production, energy security improvements, and energy efficiency enhancements. Leverage opportunities to produce **\2** alternative **/2/** energy through the use of solar, geothermal, biomass, and other production sources. Reducing dependence on energy from outside sources increases energy security. Installations are responsible for fulfilling the goals associated with EO 13834, *Efficient Federal Operations*, which sets various federal energy and environmental management goals, including reduction of energy intensity, increasing the use of energy sources, including **\2** alternative energy types **/2/**, and designing and operating **\2** **r**esilient **/2/** buildings.

2-2.11.1 Building Automation.

Consider installation-wide building automation systems as part of the master planning process. The proper use of this tool is a cost-efficient way for an installation to manage and reduce energy consumption. Coordinate with the appropriate personnel to implement **\2** resilient **/2/** energy strategies, as appropriate.

2-2.11.2 District and Nodal Energy.

Nodal energy plants, which produce hot water, chilled water, and/or steam for nearby facilities, are generally more efficient than large central plants or individual building-level systems. Nodal plants combine the benefits of economies of scale and load leveling, and avoid system duplication. Nodal plants support medium- to large-scale **\2** alternative **/2/** energy systems and can make **\2** alternative energy types **/2/** more cost effective. Large central energy plants are generally less cost-effective due to line losses and operations and maintenance costs. Individual building-scale energy systems are often less cost-effective due to limitations of system size, efficiency, and optimization of system type. Infill development and increased density reduces runs and makes nodal energy more efficient. Follow UFC 3-410-01, *Heating, Ventilating, and Air Conditioning Systems*, when considering district or nodal energy generation and distribution.

2-2.12 Water Conservation.

Incorporate strategies to reduce water consumption at the planning level. Strategies include the use of greywater, designing low-maintenance landscaping features, and using synthetic turf when applicable (e.g., youth and adult sports fields.) Planners should be engaged throughout the design process to ensure water conservation measures are applied whenever feasible.

2-2.13 Waste Management.

Incorporate strategies to reduce waste at the planning level. Adaptive reuse (as opposed to demolition) can reduce construction waste.

2-2.14 Facility Utilization and Building Reuse.

Support and use outputs of the installation facility utilization processes. Effective facility utilization maximizes the capacity of an installation's infrastructure and minimizes the installation's real property operations costs. Use existing facilities, to the extent possible, to meet installation requirements. This principle includes fully utilizing existing facilities and reuse, repurposing, or removal of existing assets. This also supports **\2** energy savings **/2/** objectives as installations should not heat, cool, or maintain excess facilities. Ensure facility utilization is in compliance with the Vision Plan and Regulating Plan.

2-2.15 Lifecycle Planning.

Consider the full lifecycle cost of planning decisions with a focus on return on investment. Lifecycle cost analysis (LCCA) instructions are in UFC 1-200-02, *High Performance and Sustainable Building Requirements*. Include the opportunity cost of land as a focus.

2-2.16 Flood Protection.

Identify flood hazard areas during the planning process. EO 11988, *Floodplain Management*, and UFC 3-201-01 require the construction of buildings above the 100-year floodplain elevation. Changes in 2009 to the International Building Code (IBC) require the use of ASCE 24, *Flood Resistant Design and Construction*, when designing buildings in a flood hazard area. Facilities sited within a flood hazard area require extensive and costly foundations and ground floor framing systems. Master plans must identify flood hazard areas as a constraint. Avoid siting facilities in a flood hazard area if other practical alternatives are available. For facilities that must be sited in a flood hazard area with no practical alternative, identify additional costs on DD Form 1391 and ensure compliance with **\2** risk reduction **/2/** and reporting requirements as identified in UFC 3-201-01. For CONUS installations, contact the installation public works/civil engineer organization or the FEMA Map Service Center to obtain flood hazard areas. For OCONUS installations, contact the installation public works/civil engineer organization and/or obtain host nation resources for accurate flood hazard area information. When flood maps are not available, perform additional studies to delineate flood hazard areas and the 100-year flood plain elevation.

2-2.17 Planning for \2\ Extreme Weather Resilience /2/.

Identify and assess risks to the installation from the effects of extreme weather and develop plans to address and **\2** reduce **/2/** those risks. Weather is the day-to-day environmental conditions at a particular locale measured in terms of temperature, atmospheric pressure, wind, and moisture. Weather phenomena are short-term occurrences, including snowfall or rain events, storm surge, thunderstorms, tornados, cold fronts, or heat waves. **\2** Extreme weather means recurrent flooding, drought, desertification, wildfires, thawing permafrost, sea level fluctuation, changes in mean high tides, or any other weather-related event, or anticipated change in environmental conditions, that present (or are projected to present) a recurring annual threat to the security of the United States or of allies and partners of the United States. **/2/** Each DoD location is affected differently by local weather and geography. Assess the risks related to extreme weather events applicable to a specific location as part of **\2** an extreme **/2/** weather and **\2\ r**esilience **/2/** analysis to develop appropriate recommendations and plans for the installation.

2-2.17.1 Scenario Planning.

a. Scenario planning is an accepted method for planning when future conditions are uncertain. Scenarios do not have an associated likelihood of occurrence. Rather than addressing a single plausible future condition, installation planners work with several **\2** scenarios **/2/** to bracket the range of potential future conditions for their installation. Using and evaluating the potential effects from multiple plausible future conditions enables the understanding of whether the installation is (or could be) resilient to different future **\2** extreme weather **/2/** conditions. Master plans identify opportunities for future development, usually within the next 20 years; scenario planning acknowledges completed facility and infrastructure projects last longer than the plan timeframe. To support decision-making such as future facility siting, scenarios should cover the design life of a new asset, which is typically 50 or more years.

b. Develop a list of the scenarios for evaluation, impacts at the installation level, and a list of preparedness and resilience measures that will be implemented alone or as a group. **\2** Use Service-specific guidance to conduct scenario planning, as appropriate. **/2/**

c. Be aware of (and document) the uncertainties relating to **\2** projected natural resource changes **/2/**, current knowledge, and planning assumptions used during the planning process. Evaluate a range of scenarios informed by the data sources as described in paragraph 3-5.6. **\2** Provide **/2/** information on the potential risks **\2** and help formulate potential solutions **/2/**.

d. **\2** Extreme **/2/** weather considerations in planning should include, as applicable to the installation: storm surge flooding, non-storm surge (riverine or surface) flooding, hurricanes/typhoons, high winds, tornados, drought, wildland fires/wildfires, permafrost, desertification, volcanic, seismic, tsunamis, subsidence, **\2** extreme water level (EWL) **/2/**, precipitation change, annual average temperature increases, and extreme heat/cold. Not all phenomena are applicable to all installations. Document those phenomena applicable to an installation in the constraints mapping process and **\2** Military Installation Resilience Component (MIRC) **/2/**. The following two resources are available to aid in the scenario planning process and other tools, models, or databases may be used, if available.

2-2.17.1.1 DoD \2\ Extreme Conditions Assessment Tool (DECAT) /2/.

DoD **\2** developed, at Congressional direction, a method to assess **/2/** the exposure to extreme weather **\2\ /2/** for selected U.S. and foreign locations for each Department. The Extreme **\2** Conditions **/2/** Assessment Tool is a geospatial indicator-based **\2\ /2/** web **\2\ /2/** tool **\2** that **/2/** includes indicators (current and future) for many **\2\ /2/** factors, including coastal total water levels, coastal erosion, riverine flooding, drought, desertification, wildfires, thawing permafrost, and historic extreme weather events.

The tool is Common Access Card (CAC) -enabled and available at the following web sites:

- CONUS, Alaska, Hawaii: **\2** https://dodresilience.cwbi.mil/ords/f?p=118:1 **/2/**
- Rest of the World (ROW): **\2** https://dodresilience.cwbi.mil/ords/f?p=119:1 **/2/**

2-2.17.1.2 /2/ DoD Regional Sea Level (DRSL) Database.

For coastal or tidally influenced installations, use **\2\ /2/** the DoD Regional Sea Level (DRSL) database **\2** housed within DECAT **/2/** to ensure DoD uses a consistent, authoritative data set for DoD sites. Scenarios are not predictions **\2\ /2/** but plausible future conditions. The DRSL database is CAC-enabled **\2\ /2/.**

The DRSL database **\2** encompasses regional sea level fluctuations and EWL scenarios for three time horizons for DoD sites worldwide. **/2/** The DRSL database may be used for determining floodplains and flood design elevations. For installations, sites, or data not included in the DRSL database (primarily OCONUS), consult your Service-specific guidance. Incorporate at least one projection from each timeframe—2035, 2065, and 2100—into constraints mapping (paragraph 3-5.6).

2-3 NATURAL, HISTORIC AND CULTURAL RESOURCE MANAGEMENT.

Consider natural, historic, and cultural resources in the planning process. Natural resources include threatened and endangered species, wetlands, habitat areas, forests, undisturbed land, and important viewsheds. Historic and cultural resources include historic buildings, structures, objects, districts, landscapes, and archaeological sites, as well as sites sacred to Native American tribes. Coordinate planning decisions with installation cultural and natural resource managers early in the planning process to avoid project delays and additional funding needs from the inadvertent discovery of historic, cultural, and natural resources within proposed project areas. Consider and prioritize actions required by environmental laws, requirements, and policies to drive actions throughout the planning process.

2-3.1 Land Preservation.

Land is a valuable natural resource to DoD for installation **\2** mission requirements **/2/** and future viability. It is critical for training, sustaining, and deploying our forces. Employ policies and plans that preserve land to the maximum extent possible. On many installations, land is a training resource and preservation of training capabilities is a national priority. All installations should include land preservation as a primary consideration in installation master planning since they may have training missions now or in the future.

2-3.2 Mission Compatibility.

Another important function of land preservation is to provide and maintain a buffer between the civilian community and key functions of a military installation, including ranges, impact areas, airfields, heliports, and maneuver areas. Ensure on-base mission-required buffers, such as airfield clearances and explosive safety quantity-distance arcs, are maintained. Military land requirements are constantly changing and it is becoming increasingly difficult to acquire new land to meet expanding requirements. Whether the goal is to preserve valuable range and training land, land for future installation development, or to conserve irreplaceable environmental habitat or cultural resources, land preservation will be a key objective of the Master Plan.

2-3.3 Management of Historic and Cultural Resources.

DoD is required to take into account the potential effects of its actions on historic properties eligible for or listed in the National Register of Historic Places and areas considered sacred sites by federally recognized Native American tribes. When historic properties have the potential to be affected, comply with the requirements of the National Historic Preservation Act (NHPA) (16 USC 470). In accordance with § 106 of the NHPA, codified in 36 CFR Part 800, federal agencies will take into account the potential effects of their proposed actions on historic properties and avoid, minimize, **\2** or **/2/** reduce **\2\ /2/** any adverse effects to historic properties in consultation with the state historic preservation office, Native American tribes, and other relevant consulting parties. Effects to historic properties can be direct (e.g., demolition) or indirect (e.g., adverse impacts to the setting or viewshed of a historic district). Involve the installation's Cultural Resource Manager early in the planning process to avoid delays. Refer to UFC 1-200-02, Appendix D, "Projects Impacting a Historic Building or District," for strategies for improving performance of historic properties.

2-4 HEALTHY COMMUNITY PLANNING.

Regular physical activity is critically important for the health and well-being of people of all ages and reduces the negative impact from many chronic diseases. Physical fitness is key to military readiness. Incorporate health considerations and opportunities for physical activity based on advice from representatives of the installation's medical staff. Include installation health representatives and Morale, Welfare, and Recreation (MWR) representatives in visioning sessions and planning charrettes.

2-4.1 Planning for Walking, Running, and Biking.

Effective planning creates conditions that encourage physical activity, connect land uses and facilities, and provide safe, protected pathways for physical fitness training for Service members and their families. High connectivity, mixed land uses, and well-designed pedestrian and bicycle infrastructure decrease auto dependence and increase levels of walking, running, and cycling. Pedestrians and cyclists require contiguous and safe pathways that connect origins and destinations. Include key destinations such as the main gate, fitness center, food locations, and accommodations for walkers, runners, formation runners, bicyclists, and motor vehicle users on plans.

2-4.2 Community Gardens.

Healthy communities not only provide for physical activity through walking and biking but also provide opportunities to grow healthier food choices. In accordance with installation policy, incorporate locations for community gardens and local food production.

2-5 DEFENSIBLE PLANNING.

Military installations must be safe and secure to operate effectively and efficiently. Two key programs impact planning: the DoD Mission Assurance (MA) program as it relates to Defense Critical Infrastructure (DCI) and AT. Integrate the strategies of defensible planning with the goal of achieving a resilient installation to multi-spectrum types of natural and/or man-made threats.

2-5.1 Defense Critical Infrastructure (DCI).

The DoD Mission Assurance (MA) program guides protection of DCI, which is a capability-focused risk management program that seeks to manage risk to installation assets and infrastructure (see DoDD 3020.40, *Mission Assurance (MA)*, and DoDI 3020.45, *Mission Assurance (MA) Construct*. The DoD uses MA as a process to protect or ensure the continued function and resilience of capabilities and assets that directly relate to mission execution. MA enables mission success and supports commanders in both deliberate and adaptive planning as well as strategic risk management. DCI contributes to mission assurance and complements other DoD programs, such as strategic mobilization, industrial preparedness, supply chain risk management, AT, physical security, and continuity of operations. It addresses assets on the installation and in surrounding communities critical to mission accomplishment and overall **\2** resilience **/2/** of the installation.

2-5.1.1 DCI and the Master Plan.

Incorporate a DCI analysis in the Master Plan to minimize risk to the installation's strategic infrastructure and networked assets that support the critical missions necessary to provide combat capabilities. Critical infrastructure may include both on-post assets and off-post assets such as buildings, bridges, dams, facilities, and utility and transportation systems essential to planning, mobilizing, deploying, executing, and sustaining U.S. military operations. Assets become critical as dependencies upon them to support missions become critical (i.e., without the assets the mission will fail). As identified in the DCI analysis, develop contingencies in the Master Plan to **\2** reduce **/2/** or remediate risks, including existing or future projected risk resulting from extreme weather events, **\2\ /2/** sea level **\2** fluctuations, EWL **/2/**, wildfires, flooding, and other changes in environmental condition. Identification of elements of defense critical infrastructure may lead to classification issues. Coordinate with installation operational elements to identify any restrictions and find alternate means to identify such elements. Avoid incorporating anything into Master Plans that would lead them to be classified.

2-5.1.2 Stationing Actions.

As part of a stationing action, consider DCI requirements to ensure a single point of failure is not created that could adversely impact mission success. As an all-hazards based program, DCI ensures the capability to detect and assess information, provide timely warning, execute planned actions to **\2** reduce risks **/2/** or prevent disruptions to critical assets, and, if necessary, recover full mission capability.

2-5.2 Antiterrorism (AT) and Master Planning.

Coordinate with the installation antiterrorism officer (ATO) early in the planning process to ensure AT requirements are incorporated into Master Plans while pursuing other planning goals (such as compact development and **\2** resilient **/2/** design) that may be spatially interrelated. Determining the facility design basis threat (DBT) is the first step in planning antiterrorism requirements. Consider site-specific threats, the value of assets within the building, mission-related issues, and constraints that might dictate measures beyond the minimum requirements. Use UFC 4-020-01, *DoD Security Engineering Facilities Planning Manual*, to establish project AT and security requirements and determine if the minimum standards are adequate or if additional **\2** risk reduction **/2/** measures are required. The geographic combatant command (GCC) may provide additional prescriptive AT requirements or raise the DBT related to a specific asset, installation, or region. Installation commanding officers, regional commanders, or geographic combatant commanders may raise the DBT for a project, installation, or geographic region. Inhabited buildings within the installation boundary are generally low risk and will not warrant a defined threat or level of protection. In this instance, only the minimum standards in UFC 4-010-01, *DoD Minimum Antiterrorism Standards for Buildings*, apply. For the majority of facilities, the Master Plan need only incorporate the

19 minimum antiterrorism construction standards within UFC 4-010-01, regardless of the asset value and without an established threat.

2-5.2.1 Antiterrorism Officer (ATO).

The ATO is responsible for working with the installation planner and other base security personnel in evaluating the local threat environment, the installation's access control screening capabilities, and determining the risk to the asset within the building. This analysis, using the procedures within UFC 4-020-01, will yield a building DBT and **\2** risk reduction **/2/** measures that provide a measurable level of protection for the asset(s). The DBT may drive consolidation of parking areas, parking garages, and pedestrian-only areas as well as the consolidation or dispersal of critical assets.

2-5.2.2 Site Security Considerations.

Consider the following three key physical security principles of natural surveillance, territorial reinforcement, and physical access control, which are elements of defensible space/crime prevention through environmental design. Additional strategies to enhance site security and provide AT **\2** risk reduction **/2/** include clustering facilities into compounds or pods providing a higher density core with parking and vehicle circulation on the perimeter. Place low-occupancy facilities within standoff space for other high-occupancy buildings. Provide a pedestrian-friendly space with AT **\2\ /2/** benefits. For more information, refer to the master planning considerations chapter in UFC 4-020-01.

2-5.2.2.1 Natural Surveillance.

To enhance physical security, site buildings to allow for natural surveillance of the built environment. Designate entry placements and window locations to give occupants opportunities to observe the built environment. Site buildings within view of other occupied facilities. Give careful consideration before minimizing windows in building designs. Doing so reduces the opportunity for natural surveillance or "eyes on the street," thereby reducing building protection and making the buildings more susceptible to crime, vandalism, and terrorism. Special-purpose buildings like hangars, large-format retail buildings, athletic and recreation facilities, and warehouses need not comply with this strategy.

2-5.2.2.2 Territorial Reinforcement.

Another physical security strategy is territorial reinforcement. Use physical design to shape defensible areas with clear property lines, landscape elements that define public and private spaces, and buildings sited to frame identifiable realms. Cluster facilities that are functionally compatible to reduce the perimeter, limit access points, and provide compact security areas. Arrange buildings in proximity to one another to create defensible spaces that can be protected more efficiently than scattered buildings.

2-5.2.2.3 Natural Access Control.

Natural access control can enhance physical security. Design streets, sidewalks, and building entries to mark public routes as distinct from private routes. Design landscaping, fencing, and building orientation to naturally and unobtrusively control unauthorized access.

2-6 CAPACITY PLANNING.

Capacity planning is a process to determine an installation's maximum development capacity based on conformance to the planning vision, goals, and objectives. While known requirements need to be sited in the Master Plan, room needs to be reserved for unknown future requirements. The difference between the existing condition and the future build-out is the capacity. Planning precedes project programming, is proactive, and does not just account for current known requirements. Show capacity on Illustrative Plans through the use of "notional buildings" or areas designated for "potential future growth." Account for changes in developable areas over time. Identify currently constrained sites as future developable areas contingent upon resolving factors such as restoring a contaminated site or demolishing out-of-service buildings. Future developable areas may also be limited because of factors such as **\2** EWL **/2/** or increases in wetland **\2** areas **/2/**.

2-6.1 Capacity Planning and Parking.

Capacity planning addresses organizational and non-organizational parking needs through a combination of parking strategies, including on-street parking, off-street parking, and structured parking. Strive to minimize parking to the maximum extent possible through land-use practices that support shared-use parking, transit, and alternative modes of transportation. Parking for the commissary and exchange is typically placed with direct access to the main entrances of these facilities. For safety reasons, limit on-street parking to only parallel parking. Provide roadway markings to identify parallel parking stalls. Avoid perpendicular and angled parking on roadways. Perpendicular and angled parking is generally unsafe and increases the hazard of starting, stopping, and turning in moving traffic. Avoid on-street parking on roads designed to move high traffic volumes at moderate or high speeds. On lower speed roadways, such as main streets or residential streets, on-street parking is acceptable because it calms traffic and thus reduces vehicle speeds. On-street parallel parking on local access lanes parallel to arterials is also an acceptable solution for multiway boulevards.

2-6.2 Growth Boundary.

Establish a growth boundary around an installation's cantonment area(s) to focus development toward the core and preserve the periphery for ecological functions, range and training, or other appropriate uses. With the exception of range and training and related functions, all projected future development will occur within the growth boundary. This boundary identifies opportunities to accommodate future missions in both contiguous and non-contiguous development areas and should also be identified on every ADP-level plan as appropriate. Review the growth boundary every five years; determination of the installation's capacity for growth occurs within the area defined by the growth boundary.

2-7 AREA DEVELOPMENT PLANNING.

As part of the master planning process, divide installations into identifiable and connected districts based on geographical features, land use patterns, building types, and/or transportation networks. Prepare an ADP for each district. This leads to developing the Master Plan in logical planning increments. The number of ADP districts will vary based on the size and geographic features of the installation.

2-7.1 District Area Focus.

By focusing planning at the district level, ADPs can be updated as mission requirements or command priorities change without redoing the entire Master Plan. Planning at the district level allows the ADPs to be incorporated in the installation's Master Plan updates. Complete Illustrative Plans and Regulating Plans for each ADP.

2-7.2 Incremental Development.

As resources allow, target specific districts for new ADPs and update the Master Plan accordingly. This ensures the Master Plan is a living document relevant to current requirements and future needs. The incremental approach to updating the Master Plan recognizes the resource limitations and district development priorities common across all installations.

2-8 NETWORK PLANNING.

While significant planning is at the ADP level, ADPs are linked through network planning. Networks consider linkages and systems that span ADP district boundaries. These include installation-wide utility systems, transportation networks, and parks and open space networks. Network Plans consider holistic approaches to energy-efficient development and installation-level resilience measures. Network planning also includes coordination and integration of planning with privatized housing or privatized utility partners.

2-8.1 Aesthetics and Network Planning.

2-8.1.1 When creating Network Plans, aesthetics should be a key consideration. The appearance of an area can be improved by reducing the visual clutter of utility wires. Placing utility wires underground allows communities to highlight their unique beauty without poles and wires in the way. Without overhead utilities, communities can more readily undertake improvement projects such as sidewalk widening and tree planting without having to snake around poles or trim vegetation to make way for power lines.

2-8.1.2 Burying lines eliminates extreme weather hazards, fire hazards, accidents, and safety risks from power outages due to downed lines. Placing utility lines underground reduces possible health risks from electromagnetic radiation and improves road safety by removing or reducing the chance of motorists striking poles.

2-8.1.3 Underground cables are insulated, electrically shielded, and out of the way. Underground transmission allows for no electrocution hazard for people or wildlife, no collision or entanglement hazards for aircraft, no risk of line exposure from traffic collisions, and no fire risk to people, wildlife, nature, or homes from arcing power lines during windy conditions.

2-8.1.4 Using this development strategy minimizes the visual impact of utilities on an installation. As a result, more green space can create biophilic interactions and boost overall morale. Coordinate with the installation maintenance department for successful implementation of this strategy.

2-8.2 Coordination of Plan Efforts.

Various components of underground utilities are often constructed independently without coordination, which results in severe second-order effects including repeated road resurfacing and landscaping. Communications infrastructure is the component most often considered as an afterthought. Additionally, there are network planning considerations where redundancies in both electrical and communications linkage are critical. Develop integrated plans for the components of the various infrastructure networks to prevent such deleterious effects and address these mission and coordination opportunities when developing Network Plans.

2-9 FORM-BASED PLANNING.

Form-based planning guides programming, design, and construction by identifying the form for installation development through the specification of building types, building floor elevations, number of stories or maximum height, set-backs, circulation patterns, orientation, landscaping, and land use. Form-based planning translates that form into a set of specific planning directives based on the specified allowances. The directives use products typically developed by planners, including Illustrative Plans, Capacity Plans, and street, building, and landscape standards to flexibly guide development. This approach supports mission needs, program requirements, environmental constraints and opportunities, and other development factors, including identifying parcels with significant constraints to future development (e.g., flood hazard areas, cultural resources, explosive safety quantity-distances arcs, airfield and heliport clearances). Form-based planning gives installation commanders the ability to exercise more control in the installation development process by creating planning practices based on a **\2** resilient **/2/** form that supports the installation’s planning vision. This approach provides direction for both short- and long-term development. Form-based planning promotes horizontal and vertical mixed-uses, compact and walkable development patterns, and emphasizes spatial principles that support **\2\ /2/** resilient development.

Form-based planning uses the components described in paragraphs 2-9.1 through 2-9.5.

2-9.1 Illustrative Plan.

This plan illustrates potential development that supports the overarching planning vision. At a minimum, the Illustrative Plan must show relevant project sites for known projects, notional building footprints for unspecified long-term development, as well as proposed transportation networks, street trees, open spaces, and parks. The detail shown in this plan can vary depending on the scale of the district. In all cases, the Illustrative Plan should reflect the documented installation vision, include parameters as explained in the Regulating Plan, and represent the preferred alternative.

2-9.2 Regulating Plan.

The Regulating Plan identifies the most important elements of the Illustrative Plan such as build-to lines, required entry and/or parking locations, minimum and maximum building heights, building ground elevations, setbacks for constraints, and acceptable uses. Regulating Plans are enhanced land-use plans that define allowable uses as well as building form requirements. The Regulating Plan replaces the traditional land-use plan by addressing land uses and building form together. In addition, the Regulating Plan provides specific guidance to shape development in accordance with the planning vision.

2-9.3 Building Envelope Standards (BES).

The BES regulate acceptable massing, height, fenestration, exterior envelopes, and uses. The BES also addresses requirements for minimum building floor elevations, where appropriate.

2-9.4 Street Envelope Standards (SES).

The SES describe and graphically present allowable street types and circulation elements in plan and section.

2-9.5 Landscape Standards.

The Landscape Standards show, at a minimum, appropriate type and placement of major landscape elements (street trees). These standards may also include other natural landscape features (trees, shrubs, ground cover) and manmade hardscape features (street furniture, signage, lighting). Landscape Standards must meet the requirements outlined in UFC 3-201-01.

2-9.6 Implications for Designers/Developers.

The key standards are tied to parcels identified on the Regulating Plan. When development is proposed for a particular parcel, the standards are given to the designer/developer to ensure proposed projects conform to the overall installation planning vision.

2-10 FACILITY STANDARDIZATION.

Service-developed standard area requirements and spatial relationships recognize the need for consistency in building types repeated across installations. These area requirements and spatial relationships can be maintained within a variety of building designs that are consistent with the installation's Regulating Plan and Installation Planning Standards. When appropriate, standardized area requirements and spatial relationships will be included in the development of Illustrative and Regulating Plans. Site standard designs consistent with the Master Plan. If standard designs are not used, pursue waivers as appropriate.

2-11 PLAN-BASED PROGRAMMING.

Program requirements include all facility needs required to enable mission support. Validate facility requirements and projects against the Master Plan and the planning strategies before they are programmed. Installation planning and programming staff need to capture facility requirements and propose solutions to meet those requirements from the options available: better utilization of existing facilities; renovation or modernization of existing facilities; leased facilities; and new construction. Most requirements come from established Service-specific criteria and by industry or commercial standards. Requirements can be developed to ensure compliance with the Regulating Plan and form-based code and requirements identified in associated plans or Functional Annexes. Funding source requirements include all fund sources: major construction, minor construction, operations and maintenance, NAF, the exchange, DeCA, private entities.

Document program requirements on DD Form 1391 in accordance with DoD 7000.14-R, *Department of Defense Financial Management Regulation*, Volume 2B, Chapter 6, and Service-specific processes and procedures. Ensure programming documentation includes holistic programming requirements, including mission facility requirement/facility sizing authorization, and any planning site requirements (parking per the form-based code, on-street parking and curb and gutter, LID practices, **\2** energy/water/resilience **/2/** practices) as identified in the plan.

CHAPTER 3 MASTER PLANNING PROCESS AND PRODUCTS

3-1 INTRODUCTION.

The installation Master Plan documents a comprehensive planning process using a standard set of products. The planning process is as important as the Master Plan documents themselves. An effective master planning process continually collects the constantly changing information affecting the installation and its mission, and communicates them and the installation's Master Plan to affected stakeholders.

3-2 PLANNING PHASES.

While not entirely linear, the planning process consists of the four primary phases described in the following subsections. The master planning process and the Master Plan result from the application of these phases.

3-2.1 Identification.

This phase prepares the foundation for detailed planning through identification of a planning vision, specific goals that support the vision, and measurable planning objectives supporting one or more goals. The product that results from this phase is the Vision Plan.

3-2.2 Evaluation.

In the evaluation phase, development alternatives are prepared and evaluated for all scales of planning, from individual districts to the overall installation.

3-2.3 Implementation.

In the implementation phase, prepare a preferred alternative to implement the vision and prepare detailed documents to guide installation development and implementation of the plan. The products that document this phase are the Installation Development Plan (IDP) and the Installation Planning Standards. Prepare the Installation Development Program and the Plan Summary at the end of this phase.

3-2.4 Monitoring and Amending.

Change is inevitable because of resource constraints, mission changes, or changes in environmental, social, or political conditions. Revise and update the Master Plan to reflect changes to maintain its relevance as a useful planning and management tool. At a minimum, review Master Plans annually and update as mission requirements dictate. Each Service identifies the appropriate level and type of review.

3-3 STAKEHOLDER INVOLVEMENT.

During the development of the Master Plan, talk with stakeholders to fully understand the scope of their vision and mission requirements. Stakeholders include anyone using or maintaining a facility within the scope of a planning boundary, installation leadership, members of the civil engineering/planning/public works staff, environmental, natural and cultural resources staff, installation AT personnel, military police, fire department staff, mission operators, tenants, privatized housing and lodging partners, private utility partners. Stakeholders also include members of higher-level headquarters and echelons with oversight over the installation. The importance of stakeholder involvement cannot be overemphasized—it is essential to walk the sites in each ADP district and talk with users and stakeholders. In addition to internal DoD stakeholders, external stakeholders are also important sources of information and input. These include local municipalities, state governments, transportation agencies, other federal agencies, and federally recognized tribes. Involve relevant stakeholders in all stages of the process.

3-3.1 Retail Stakeholder Involvement.

Retail stakeholders on installations provide invaluable community support to the installation community. Engage retail stakeholders in all phases of the planning process. Their facilities are multi-faceted and require special planning attention. In planning for these facilities, retail stakeholders include the following planning considerations: the business case analysis, convenience for the customer, and parking/traffic/circulation and site layout.

3-3.2 Business Case.

Military retailers need to generate earnings to support the customer and support MWR programs for the Services. If the demographics or location cannot justify the business need, the risk is often too great to invest the capital. When retail or commercial development is desired, engage the military retailer early in the planning process to ensure the business case is met.

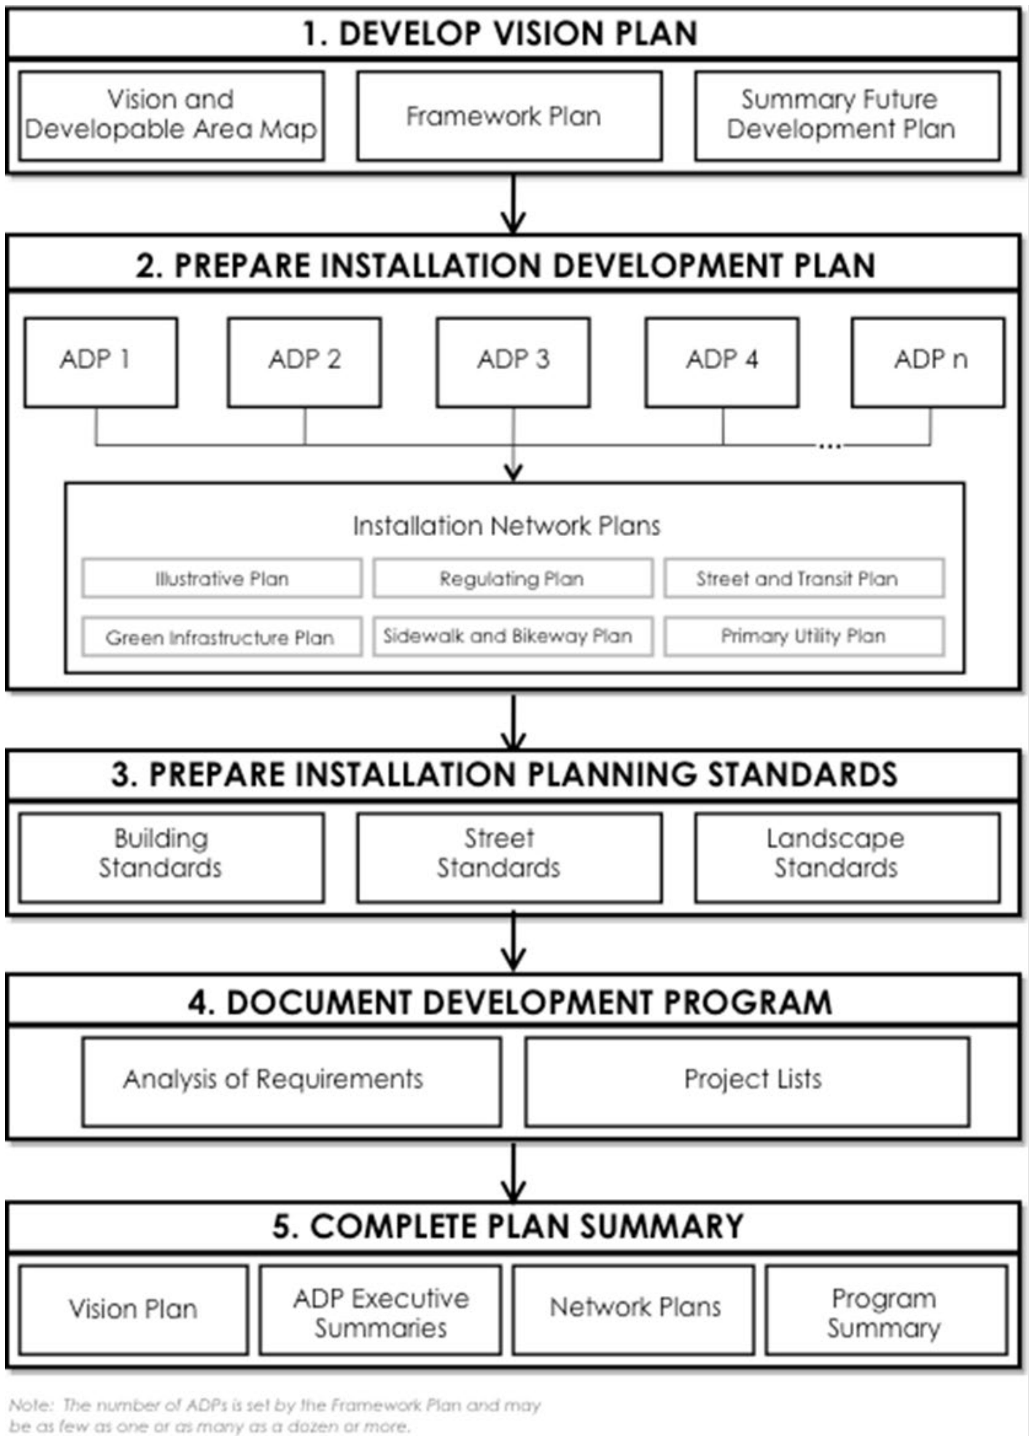
3-3.3 Convenience.

Military retailers focus on customer convenience. Co-locate the exchange and commissary when possible. Locate parking for convenience and accessibility for customers. Consider many customers will drive from off-installation locations. Locate fast food and convenience stores along the outbound lane of traffic leading toward an exit gate or in high-traffic areas for convenient customer access.

3-3.4 Parking/Traffic Circulation and Site Layout.

Convenient, accessible, and safe parking is a primary focus for retail operations. Ensure layouts support safe pedestrian access. The delivery areas should be separate from the building entrance. For functionality and safety, locate customer parking and refueling operations with direct access to the building entry. Locate receiving in the rear of the building. Screen large parking areas from streets and the pedestrian realm with linear buildings and appropriate landscaping. Vehicular access to all sides of the building is necessary for convenience and life safety.

Figure 3-1 Planning Process and Product Graphic



3-4 PRODUCTS.

The Master Plan includes the following products. See Figure 3-1.

3-4.1 Vision Plan.

The Vision Plan includes a statement of the planning vision, planning goals, and planning objectives, any installation-wide constraints and opportunities map(s), a developable area map, a Framework Plan for the entire installation, and a summary future development plan.

3-4.2 Installation Development Plan (IDP).

The IDP includes ADPs (including detailed constraints and opportunities maps, Regulating Plans, Illustrative Plans, Implementation Plans, capacity analysis, and supporting sketches and renderings) and applicable Network Plans.

3-4.3 Installation Planning Standards.

Installation Planning Standards include the BES, the Landscape Standards, and the SES.

3-4.4 Installation Development Program.

The Installation Development Program is the overall strategy for using and investing in real property. It includes a list of current known projects needed to support installation missions.

3-4.5 Plan Summary.

The Plan Summary is an executive summary of each the above planning products. Create the Plan Summary in a severable format to facilitate sharing with local communities and the public.

3-4.6 Functional Annexes to the Master Plan.

The Functional Annexes include stand-alone planning products that support the master planning process, including, but not limited to, Installation Energy Plans (IEP), **\2** MIRCs **/2/**, Area Development Execution Plans (ADEP), Complex Plans, and Project Development Plans (PDP).

3-5 VISION PLAN.

A vision for planning differs from an overall installation mission by defining ideal development principles for maximizing the installation’s long-term capabilities. The installation mission statement cites the specific responsibilities the installation must support. It is near-term and meets the current military needs for our nation. Installation missions can change as our nation’s military requirements change.

3-5.1 Installation Mission.

In order to begin a holistic planning process and build an effective vision statement for planning, it is imperative to understand the installation's missions. Identify principal mission objectives and activity types, such as support, training, administration, and production. Identify installation units, organizations, and their relationships to installation missions. Determine planning end-strengths. Identify and quantify the supported population, including assigned billeting units, tenant activities, community support organizations, and supported populations (e.g., active-duty military, civilians, military dependents and retirees, government-authorized space for contractors). Address functional relationships among activities and facilities and identify issues and opportunities for operating and developing the installation.

3-5.2 Planning Vision and Goals.

Establishing a vision statement for planning is the first step in the planning process. Engage senior installation leadership and ask for their input into the overall vision and goals for the installation planning process. Be prepared to help the installation leadership understand how to develop a vision to ensure priorities for future installation-wide development are met.

3-5.3 Vision Statement.

The vision statement is a clear and concise description of a desired end state and captures the essence of the entire planning effort. A strong vision creates a mental picture of what the installation will look like. Collaborate with stakeholders and decision-makers to create the vision statement. Engage stakeholders in a series of workshops and community surveys, and conduct a visioning charrette that includes mission operators, military members, family members, civilian staff, and installation leadership to create the vision statement. Include stakeholders from non-military, community, and other local and state agencies in the visioning process. Examples of strong vision statements include:

- "In support of the mission, Service members, and families, we will create a **\2** resilient **/2/** community of walkable neighborhoods with identifiable town centers connected by great streets."
- "This installation will be a **\2** resilient **/2/** research and development community that fosters mission excellence through energy-efficient buildings organized into a walkable campus."

3-5.4 Planning Goals.

The goals of the Master Plan flow from the vision and focus on long-term redevelopment and construction projects necessary to fulfill mission requirements and reshape the installation. Ideally, the key development goals are embedded within the vision statement. The key development goals are underlined in the vision statements in paragraph 3-5.3.

3-5.5 Planning Objectives.

Planning objectives support the vision and goals and incorporate inputs from the planning process and the planning strategies described in Chapter 2. The objectives define how to achieve the goals in the vision. Each objective is specific and measurable, enabling plan implementation monitoring. In the sample vision statement, the goal of a **\2** resilient **/2/** community can include planning objectives consisting of compact, mixed-use, multi-story development. Consider the installation mission and analysis of on- and off-post conditions in selection of specific objectives. Incorporate the ten DoD planning strategies discussed in Chapter 2 into the planning objectives. Select other objectives based on installation design themes, developmental opportunities and constraints, potential encroachment situations, weather-related **\2** resilience **/2/** challenges, and consideration of community planning agencies, groups, businesses, and affected individuals' views and plans.

3-5.6 Constraints and Opportunities Maps.

Collection and analysis of two major types of data, on-installation data and off-installation data, enables a full understanding of the existing landscape and holistically incorporate mission requirements into the Master Plan. Collect this data using a variety of methods, including electronic collection and stakeholder input. Compile and consolidate data to create a narrative and a set of maps indicating the overall site constraints and developable areas (opportunities) as described in the following paragraphs. This analysis helps form the basis for planning decisions.

3-5.6.1 On-Installation Data Collection.

On-installation data collection incorporates analysis of existing natural and man-made conditions, including land use, circulation, and utilities. Identify restrictions on land use due to mission requirements, such as airfield clearances and explosive safety quantity-distance arcs, as well as any environmental contamination (chemical, munitions, asbestos) such as remediation sites or unexploded ordnance areas. Include potential changes in the natural environment due to **\2** extreme **/2/** weather in the evaluation. Identify areas affected by a 1% annual chance flood event and other current and projected flood hazard areas, to include 1% annual chance flood events and potential permanently inundated areas. For coastal or tidally influenced areas, evaluate and document multiple **\2** EWL scenarios **/2/** using the DRSL database (see paragraph 2-2.17.1.2) to support decision-making. Incorporate **\2** EWL **/2/** projections reflecting the installation's mission and risk tolerance in base flood elevations (BFE) in coastal or tidally influenced areas. Evaluate the natural environment with a particular focus on those elements that may create significant limitations on the operation or construction of buildings, roadways, utility systems, runways, training ranges, airfields, heliports, and other facilities. Data collected also includes analysis of the human environment, including the location of all historic districts, historic properties, and known archaeological sites. Current and forecasted demographics, military community services, outdoor recreation/physical conditioning areas, training ranges, maneuver areas, existing facilities and their uses, traffic patterns and intensity, and utility systems use and capacities must all be incorporated.

3-5.6.1.1 Mission Data.

Mission requirements largely determine land and facility support requirements. Utilize data on current and proposed mission requirements to establish limitations and conditions that directly affect the installation's ability to execute mission support. Consult the real property database of record and/or the realty specialist concerning real property inventory data and the gross and net square footage of facilities. Analyze existing land uses and land use restrictions and collect and analyze installation-specific and headquarters-driven plans, planning guidance, and facility allowances.

3-5.6.1.2 Demographic Data.

Develop an understanding of the installation’s demographics and identify appropriate principles to meet the needs of each major demographic group. Demographics to consider include personnel working on the installation, personnel living on the installation, personnel living off the installation, and retirees.

3-5.6.1.3 Data Layers.

The analysis includes an in-depth look at development constraints and opportunities across the installation and within districts when planning at the district level. Data is not effective unless a regional perspective is portrayed. Because some of the information is likely to be sensitive, installation security personnel should review the document for suitability for public release. Use GIS, GeoMapping, or other similar systems. When preparing a Master Plan, incorporate and integrate with local GIS systems. Develop all deliverables in compatible formats to ensure ease of use. Typical layers referenced are in Appendix D. Follow Service-specific guidance for geospatial data requirements (AFI 32-10112, *Installation Geospatial Information and Services (IGI&S)*, USACE ECB 2018-7, *Advanced Modeling Requirements on USACE Projects - Category: Directive and Policy*, or OPNAVINST 11000, *Facilities and Land Management Ashore*, Ser N/420U045).

3-5.6.2 Off-Installation Data Collection.

Contact local, state, and federal agencies for off-installation data, reports, and plans that may be helpful to the planning process. It is vital to understand regional and vicinity conditions that affect the installation. Leverage these data request interactions to interview local and regional stakeholders for their thoughts on the installation planning process and priorities. In some cases, opportunities to share costs on infrastructure or link to local development initiatives may be available. Review existing regional and vicinity maps, analyze regional transportation systems (roads, railroads, commuter mass transit systems, airports), and collect data on socioeconomic conditions, demographic patterns, **\2** extreme weather **/2/**, and community land use and planning. This effort includes assessments of community services, land leases/easements, encroachment issues, and federal support services. Sources of data include, but are not limited to:

- Federal agencies, including the Census Bureau, National Academy of Sciences, US Geological Survey, US Global Change Research Office (or any similar successor entities), National Weather Service, Environmental Policy Agency, Department of Transportation, including the Federal Aviation Administration.
- State and county departments, including Highways and Transportation, Natural Resources and Conservation, Fish and Wildlife, Planning and Community Affairs, Housing, Public Health, Environmental Policy, State Historic Preservation Officers/Offices.
- Local government offices, including City Hall, Public Works, Public Health, Parks and Recreation, school districts, fire and police departments.
- Other local agencies, including utility and power companies, Chamber of Commerce, regional planning agencies.
- Installation staff activities working directly with the local governments, agencies, and departments.

3-5.6.2.1 Off-Installation Personnel.

Make every effort to understand the needs of various populations that live off the installation but rely on the installation for services. Retirees, reservists, spouses, and civilian and military staff who work, shop, recreate, and train on the installation may live outside the fence line. These populations may outnumber those who live on the installation and have distinctly different needs with respect to accessibility and transportation.

3-5.6.2.2 Environmental Conditions.

Where changing external conditions impact planning decisions, seek to understand, monitor, and adapt to these changes. Such conditions include, but are not limited to, changes in land use and population density near installations; changes in climatic conditions such as temperature, rainfall patterns, storm frequency and intensity, and water levels; and changes in infrastructure assets and configurations beyond and linking to the installation. Use projections from reliable and authorized sources to anticipate changing environmental conditions during the design life of existing or planned new facilities and infrastructure. Include sources such as the following:

- Census Bureau (for population projections)
- The National Academy of Sciences (for land use change projections)
- The U.S. Geological Survey (for land use change projections)

3-5.7 Developable Area Map.

3-5.7.1 Planning accounts for known requirements and provides a framework for future undefined requirements. Effective plans identify areas for future requirements on a developable area map. The developable area map highlights and calculates those areas that, given the identified vision, constraints, and opportunities, are open for development and areas for future development to support growth. This plan shows the general overall development capacity of an installation. Developable area maps designate where the type of development may be limited or require special consideration due to specific constraints, such as AT, airfield clearances, explosive safety quantity-distance arcs, or **\2** extreme **/2/** weather-related impacts. See Figure 3-2.

3-5.7.2 The Framework Plan is part of the planning visioning process. The Framework Plan is a map of the entire installation showing the ADP districts, key transportation and land use concepts, and other significant features that influence development patterns. The plan can also graphically represent priority ADP districts. To establish ADP boundaries, planners should use geographic features, key transportation systems, open space networks, existing land-use patterns, and boundaries of any identified historic districts or other architectural style. An ADP district may incorporate one or more identified historic districts. See Figure 3-3.

3-5.8 Summary Future Development Plan.

This plan locates known projects on an installation map using a numbered key tied to a project list. The intent is not to show building footprints or other planning details, but simply to identify locations targeted for known requirements and deconflict project site selections. See Figure 3-4.

Figure 3-2 Developable Area Map Graphic

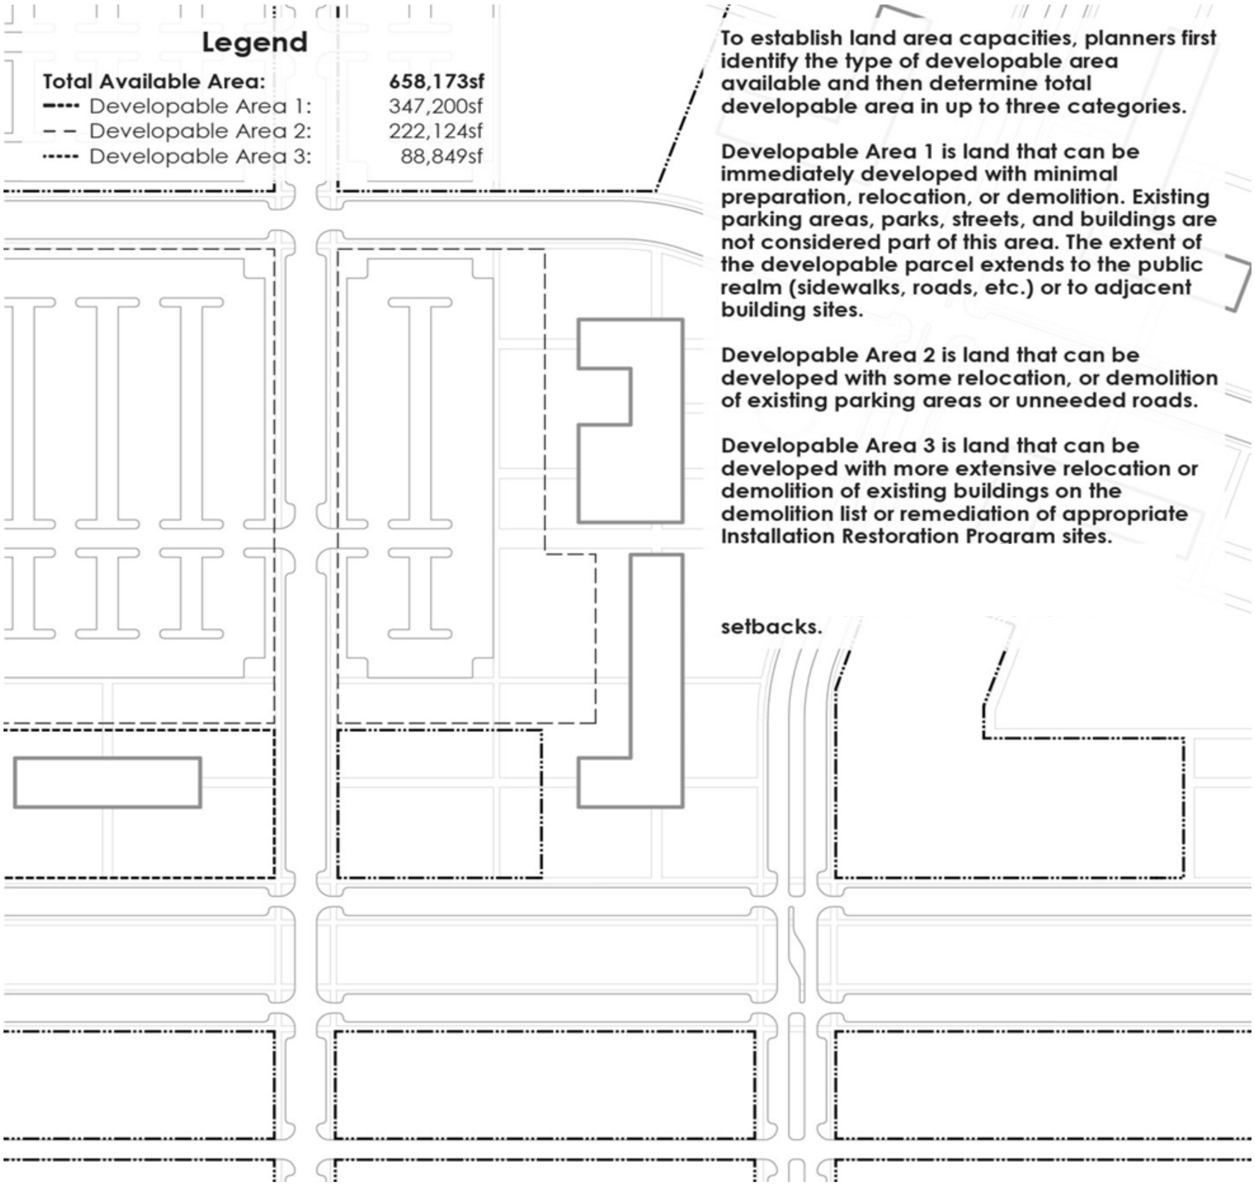


Figure 3-3 Framework Plan Graphic

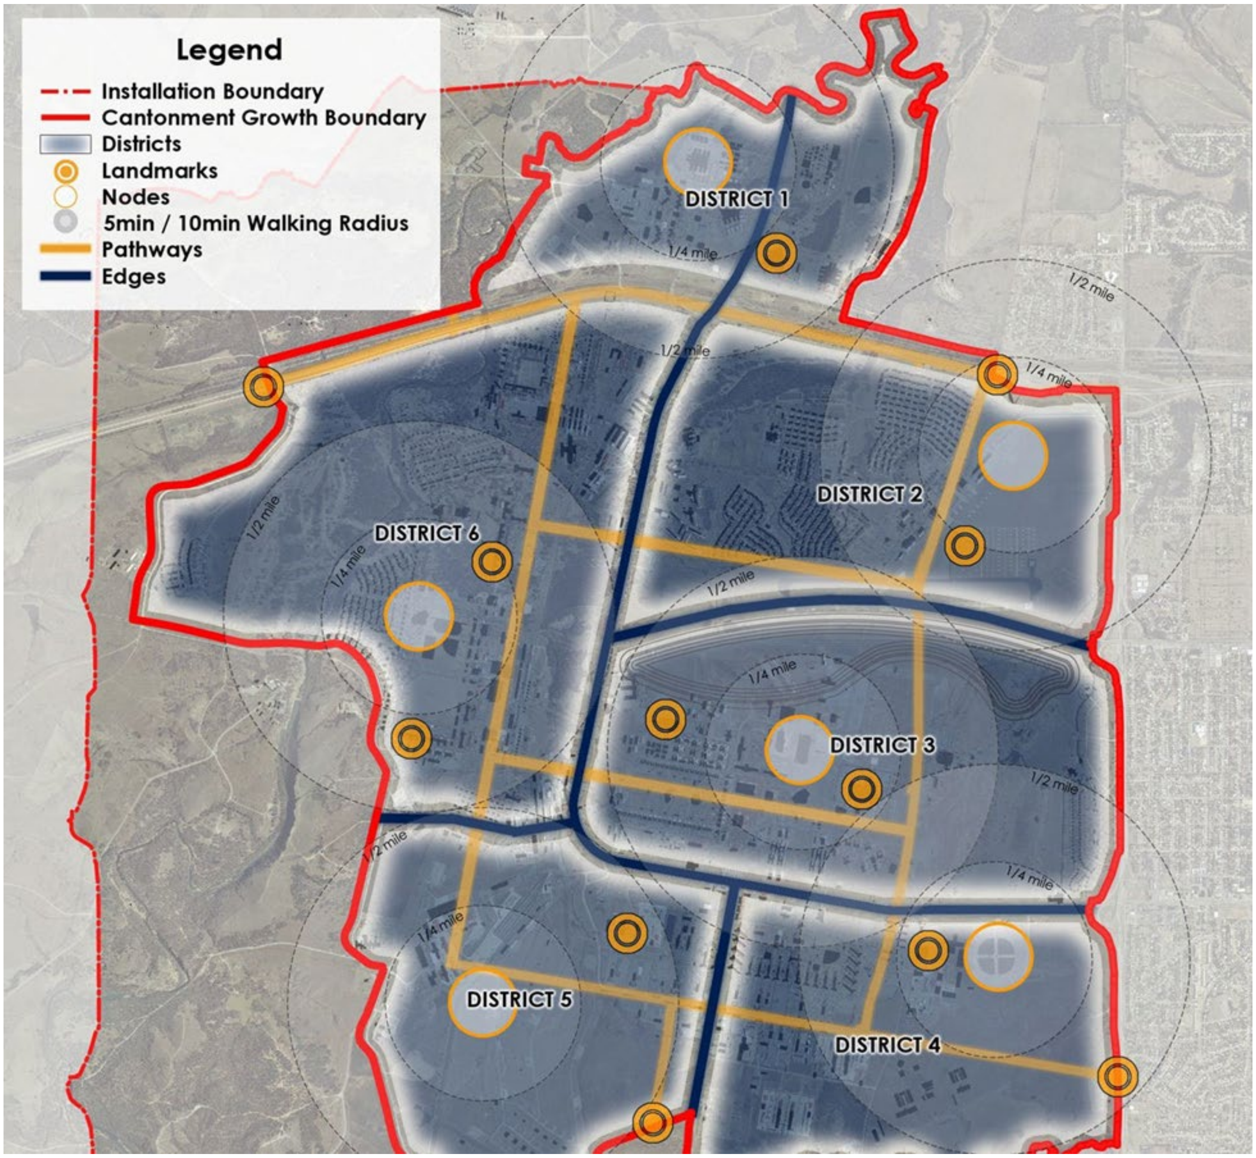

Figure 3-4 Summary Future Development Plan Graphic

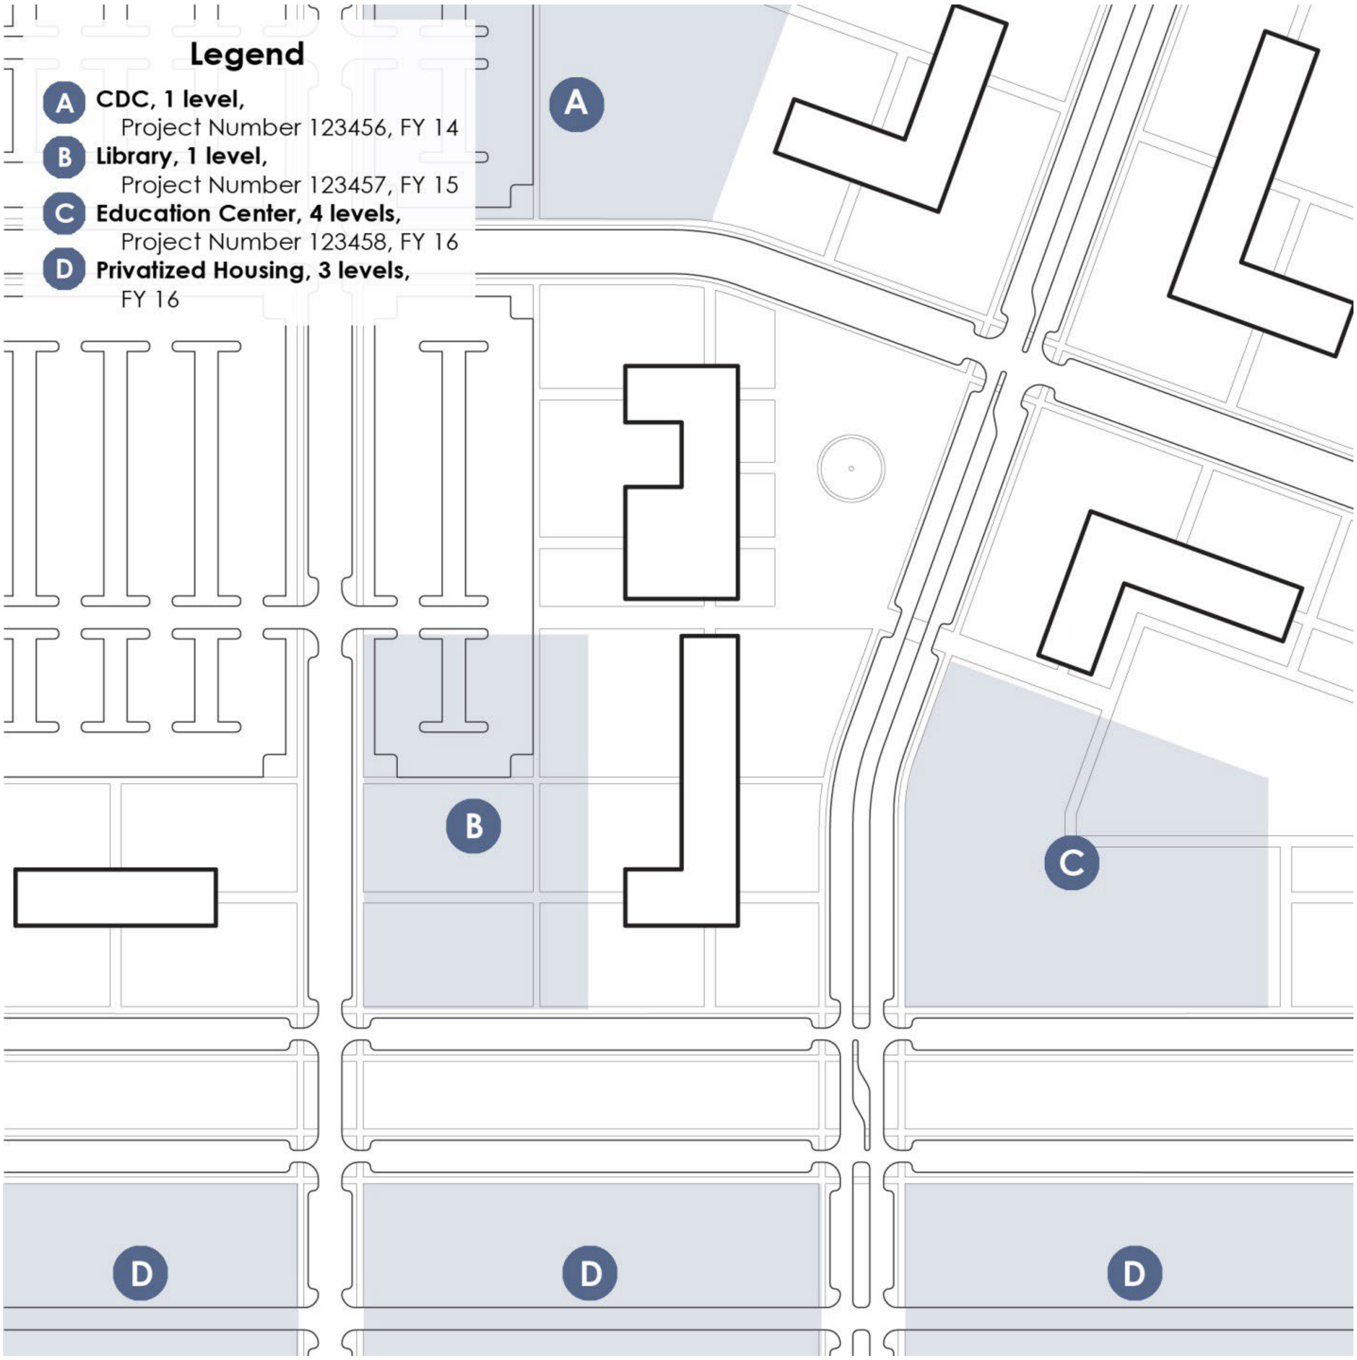


3-6 INSTALLATION DEVELOPMENT PLAN (IDP).

The IDP includes ADPs and applicable Network Plans.

3-6.1 Area Development Plan (ADP).

The bulk of the installation planning effort occurs at the scale of an ADP, which is a detailed plan for a district that includes detailed constraints and opportunities maps, Illustrative Plans, Regulating Plans, Implementation Plans, and capacity analysis. Include other supporting plans, maps, and graphics that illustrate the planning/development intent as needed. ADPs describe constraints and opportunities, system studies, existing facility assessments, program requirements, and alternatives analysis. Master plans must address a level of development appropriate for each installation and are applicable for small- and large-scale development efforts, such as renovation or new construction, respectively. Project programming and funding processes achieve the Master Plan vision. ADPs are ideally suited for the task of identifying, coordinating, and synchronizing competing requirements, and as such, they are useful at installations focused on sustainment, restoration, and modernization (SRM) funding and installations focused on military construction (MILCON) funding. In order to support the Master Plan requirements, scope ADPs to address the methodology set forth in this UFC and meet the specific product requirements. Other related planning documents cited in this UFC are dependent on the information in the ADPs to build a comprehensive planning picture, including the Network Plans and Functional Annexes.

3-6.1.1 ADP Analysis.

Before beginning the ADP process, perform a thorough analysis of the existing conditions, identify existing program requirements, and a review of the installation's planning vision, goals, and objectives. Assess the constraints and opportunities map to identify existing and potential impacts to developable areas. Review the installation's planning standards and Functional Annexes, including the IEPs and **\2** MIRCs **/2/**, to identify impacts on future development and development guidelines.

3-6.1.2 ADP Design.

After the analysis, develop conceptual alternatives, evaluate those alternatives against measurable criteria, and then select and design in detail a preferred alternative. Develop an ADP for each district on the installation as determined in the Framework Plan.

3-6.1.3 Developing Alternatives.

Developing alternatives is a critical component of the master planning process. The National Environmental Policy Act (NEPA) requires considering various alternatives to minimize adverse impacts on the environment. Creating multiple options allows planners, stakeholders, and installation leadership to ensure the ADP best fulfills the development vision. In developing alternatives, planners review functional and spatial relationship concepts as well as the reality of existing facility locations and the existing off-post and on-post environment. Develop alternatives depicting the long-range development of the ADP district, including arrangement of functional areas, circulation, and utility systems. In documenting this phase of the ADP process, describe and show the alternatives and discuss the results of the alternative evaluation. When preparing alternatives, keep the following in mind:

- Address new mission requirements, improvements to, replacement, or relocation of existing mission support facilities, and implementation of the Installation Planning Standards.
- Each alternative may be based on a theme or point of emphasis to allow comparisons and tradeoffs.
- Consider the constraints associated with future flood hazards and other factors, and evaluate the ability of the installation to adapt to existing or future hazards, including from **\2** extreme **/2/** weather, **\2** sea level fluctuations, EWL **/2/**, wildfires, flooding, and other effects over the time horizons identified during scenario planning.
- Define and evaluate alternatives to satisfy deficiencies, eliminate excess, and preserve room for future growth.
- Include determining the maximum capacity of an installation, or even critical sub-areas of an installation, whether or not there is currently an identified need.
- If appropriate, present the alternatives to the Installation Planning Board for discussion and decision before the recommended solution becomes part of the ADP.

3-6.1.4 Evaluating Alternatives.

This analysis supports the NEPA process by considering several alternatives and evaluating potential environmental impacts of each alternative. The process for evaluating alternatives should be presented to the Installation Planning Board to demonstrate how the preferred course of action was selected.

3-6.1.5 Designing the Preferred Alternative.

After evaluating the ADP alternatives, fully develop a preferred alternative that best meets the planning vision, goals, and objectives for the district. The preferred alternative is a graphical and narrative description of the fully developed plan for the district that emerges from the alternatives analysis phase and consists of the Regulating Plan, Illustrative Plan, and Implementation Plans.

3-6.1.6 Regulating Plan.

The Regulating Plan provides specific information on permitted development for each building parcel within a district and functions as an enhanced land-use plan. This plan designates the locations where different uses or building form standards apply. Instead of solely defining land uses, this method defines building form (e.g., height and frontage) while allowing for a range of possible uses. See Figure 3-5.

3-6.1.6.1 Regulating Plan Designations.

The Regulating Plan establishes development regulations for specific parcels on the installation. Use existing and planned roads, permanent fence lines and borders, and natural features like riparian corridors to establish parcel lines. Each ADP district will be composed of parcels defined by parcel lines. Parcels may correspond to entire blocks. Blocks may also be subdivided to create smaller parcels in response to site-specific design requirements. The parcels, whether they are entire blocks or portions of a block, have the same accompanying regulations governing building form, placement, and use across the parcel. Refer to the criteria established for that parcel to guide the design process when a building is proposed for a specific parcel.

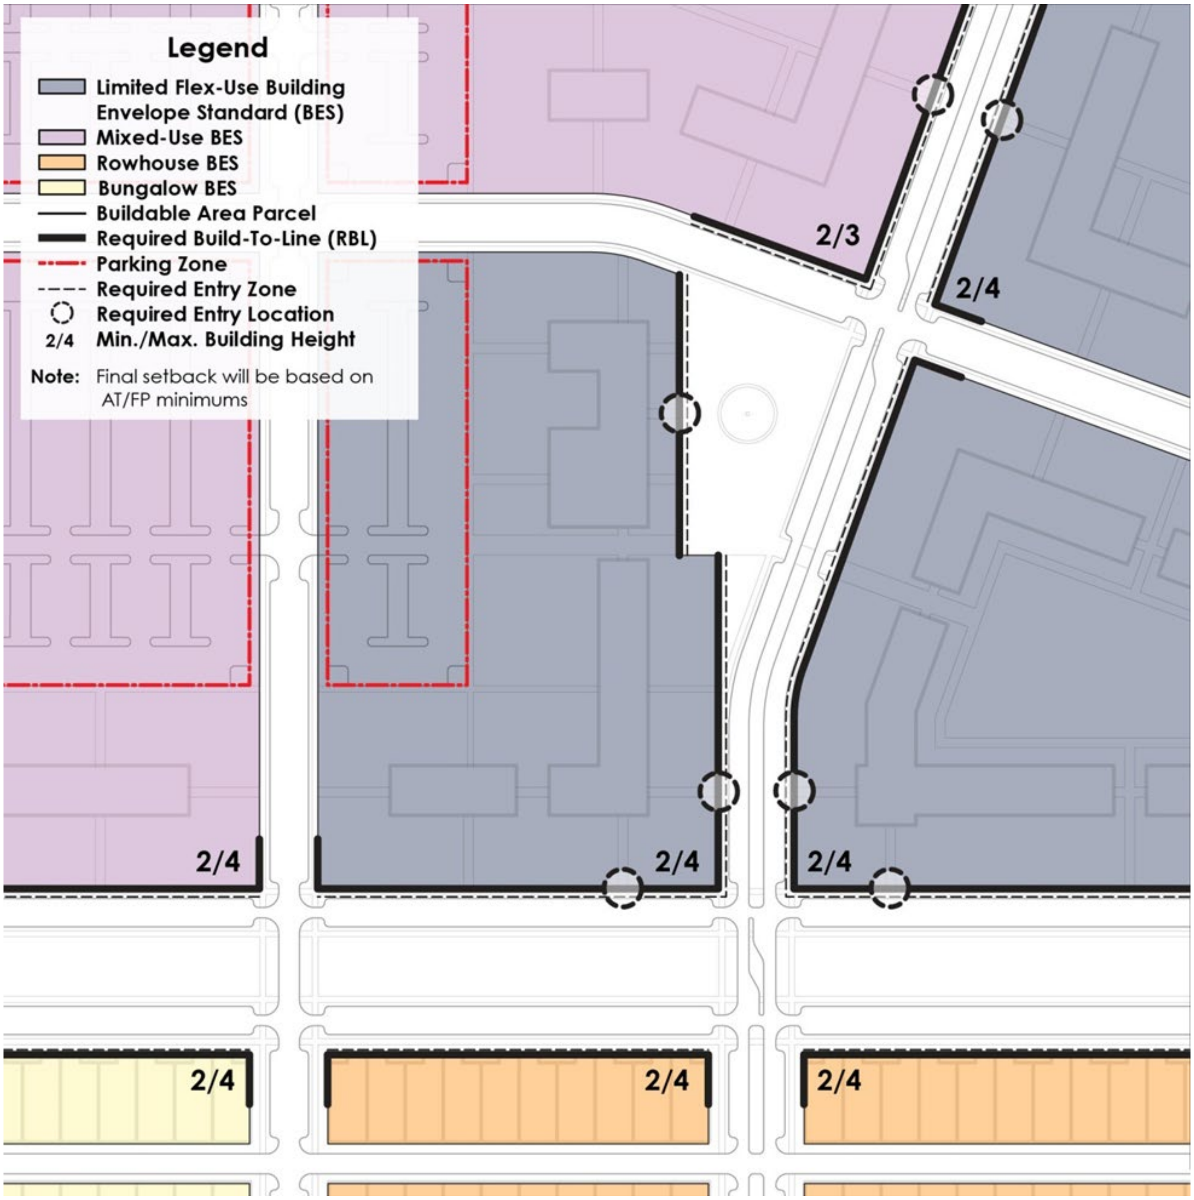
3-6.1.6.2 Regulating Plan Components.

Only the most important aspects of the Master Plan are regulated. These include build-to lines, minimum and maximum building heights, key entry locations, appropriate uses, parking and roadway configurations, and any conditions for development based on the constraints analysis. The Regulating Plan identifies the designated BFE within flood hazard areas, accounting for coastal and riverine flooding risks, as applicable.

3-6.1.6.3 Regulating Plan Functions.

The Regulating Plan ensures facilities, parks, parking, and other uses are sited in alignment with the overall master planning vision over time. The Regulating Plan specifies allowable building types on individual parcels in a district, assigns development standards to specific physical locations, shows how each parcel relates to public spaces and the surrounding neighborhood, and references the more detailed building, street, and landscape standards contained in the Installation Planning Standards.

Figure 3-5 Regulating Plan Graphic



3-6.1.7 Illustrative Plan.

The Illustrative Plan graphically illustrates development within a district that conforms to the Regulating Plan. The Illustrative Plan shows only one possible outcome allowed by the Regulating Plan; it is a sample diagram and does not imply any policy requirements but graphically shows how to portray planning principles. Figure 3-6 illustrates a sample Illustrative Plan graphic. The Illustrative Plan is a valuable tool for developing the Capacity Plan and Regulating Plan and communicates future development potential. It can be confusing to installation stakeholders as it only represents one possible outcome, rather than all the possibilities allowed by the Regulating Plan.

3-6.1.7.1 Illustrative Plan Requirements.

The Illustrative Plan shows project site selections for known projects, notional building footprints for unspecified long-term development to facilitate capacity analysis, as well as existing and proposed roads, sidewalks, bicycle networks, street trees, open spaces, and parks. The various facility requirements will be translated into building “footprints,” utilizing appropriate siting considerations. Identify short-term stopgaps and recommended long-term solutions to satisfy mission, land-use, and real property requirements.

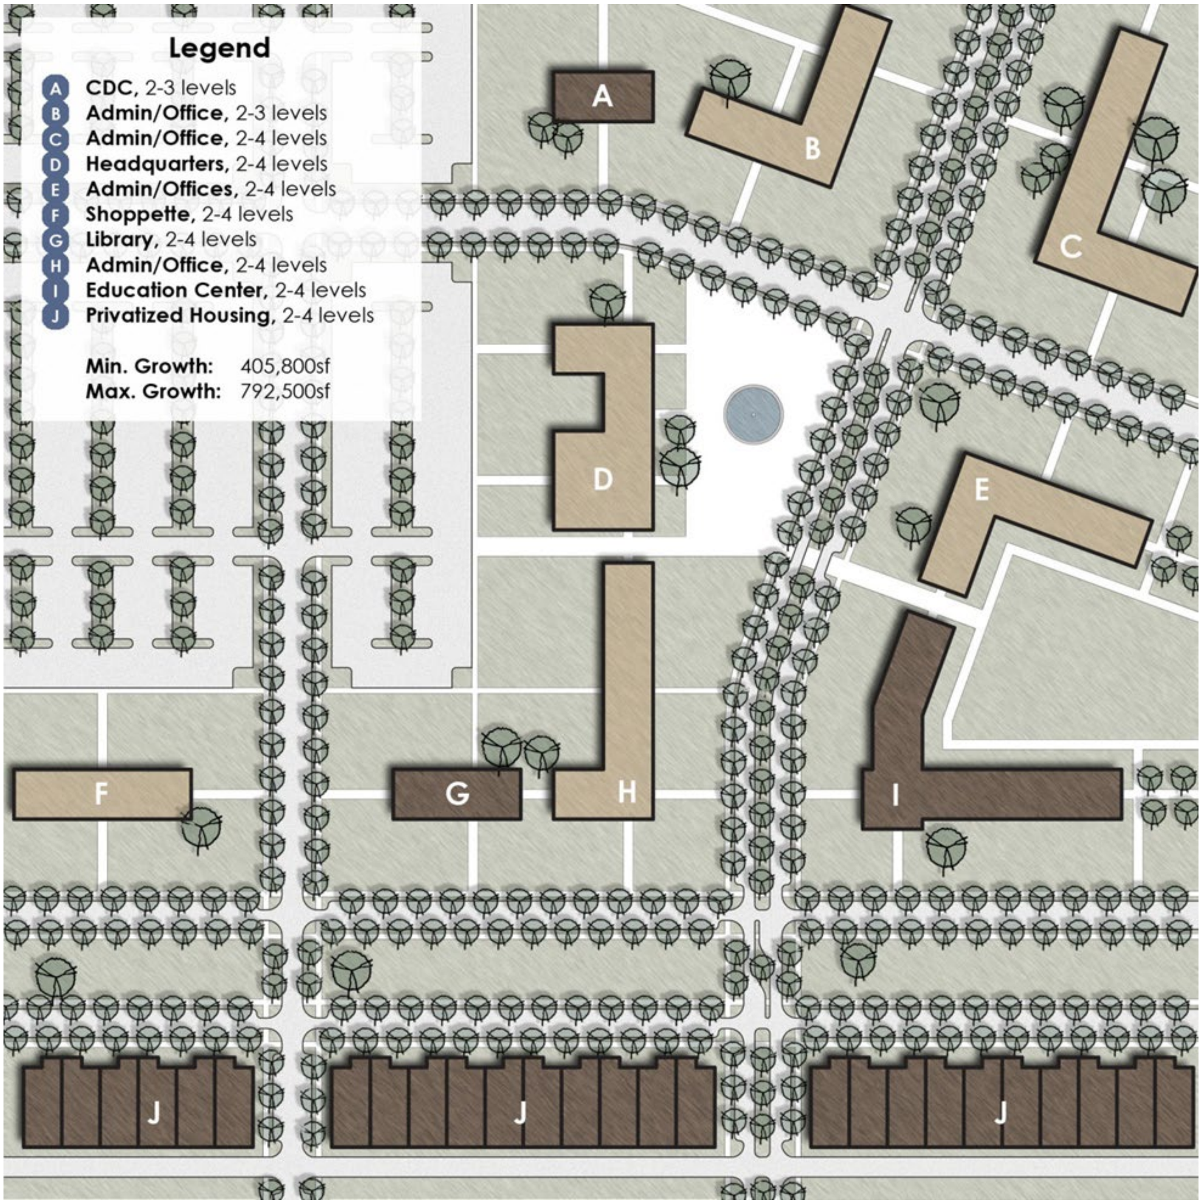
3-6.1.7.2 Relationship Between Regulating Plan and Illustrative Plan.

The Regulating Plan guides the development of the area and is created iteratively with the Illustrative Plan. The Regulating Plan allows for more flexibility than an Illustrative Plan and serves as an underlay to the Illustrative Plan.

3-6.1.7.3 Capacity Analysis.

Effective plans identify future requirements and provide room for notional facilities and specific facilities that have not been programmed. Capacity analysis also accounts for the carrying capacity of the land and developable area on an installation. A capacity analysis should be calculated and shown on Illustrative Plans as “notional buildings designated for potential future growth.” Calculate additional square footage of future facilities to indicate the potential capacity of an area.

Figure 3-6 Illustrative Plan Graphic



3-6.2 Implementation Plans.

Implementation plans depict sequencing of key relocation, demolition, and construction actions required to move the installation from its current state to the final state shown on the Illustrative Plan.

3-6.3 Environmental Documentation.

Revise environmental documentation as necessary to include an analysis of the anticipated environmental impacts of plan implementation, identification of appropriate **\2** risk reduction **/2/** measures, and documentation of the results. Follow all Service-specific environmental regulations and requirements.

3-6.4 Network Plans.

After completion of the ADPs for the priority districts on the installation, combine relevant information into appropriate Network Plans. Network Plans show future development for the installation as a whole, consist of the Installation Illustrative Plan, Regulating Plan, Street and Transit Plan, Sidewalk and Bikeway Plan, Green Infrastructure Plan, and Primary Utility Plan. Network Plans are also an appropriate place to identify **\2** cost-saving **/2/** net-zero planning strategies and forecasts for energy, waste, and water, as well as **\2** resilience **/2/** impacts.

3-6.4.1 Installation Illustrative Plan.

This plan combines all of the ADP Illustrative Plans onto one graphic plan. This is a simple plan to create once the Illustrative Plan for each ADP has been completed. Indicate where ADPs have not been accomplished on the Installation Illustrative Plan. The primary purpose of the Installation Illustrative Plan is to graphically illustrate all major future development.

3-6.4.2 Installation Regulating Plan.

This plan combines all of the ADP Regulating Plans onto one graphic plan. This is a simple plan to create once the Regulating Plan for each ADP has been completed. Indicate where ADPs have not been accomplished on the Installation Regulating Plan.

3-6.4.3 Installation Street and Transit Plan.

This Network Plan identifies and maps all current and proposed streets across the installation and forms the preferred end state for the installation street network. This plan should also identify how the street network is connected to the network outside the installation and how street networks outside the installation affect the installation network. Installation street types will be keyed to the Installation Planning Standards. Additionally, this plan identifies current or proposed transit routes and transit stops. Develop and update the transit plan in consultation with the metropolitan planning organization designated for the metropolitan planning area in which the military installation is located, if one exists. Include considerations of ways to diversify and connect transit systems (if one exists).

3-6.4.4 Installation Sidewalk and Bikeway Plan.

This Network Plan identifies and maps all current and proposed sidewalks and bikeways across the installation and forms the preferred end state for the installation sidewalk and bikeway networks. The sidewalk and bikeway types will be keyed to the Installation Planning Standards.

3-6.4.5 Installation Green Infrastructure Plan.

This Network Plan identifies and maps all major parks and open space elements and will include, at a minimum, current and proposed parks, open spaces, riparian corridors, wetlands, and significant bodies of water.

3-6.4.6 Installation Primary Utility Plan.

This Network Plan identifies all current and proposed primary utility lines across the installation and forms the preferred end state for the installation primary utility network. Primary utilities include, but are not limited to, lines for water, wastewater, storm sewer, electricity, natural gas, steam, telephone, and cable systems. Show all granted easements and rights of way for utilities, as well as central and alternative (e.g., solar) energy sites. Development of an Installation Primary Utility Plan must be closely coordinated with the owner(s) of privatized utility system(s), as appropriate.

3-7 INSTALLATION PLANNING STANDARDS.

Installation Planning Standards provide a clear set of guidelines to ensure the installation’s vision and planning objectives for development are achieved, even if drastic changes to missions or programs occur. These standards are developed to 1) meet **\2** extreme **/2/** weather and **\2** military installation **/2/** resilience, and energy efficiency requirements; 2) promote visual order and architectural consistency; 3) enhance the natural and man-made environments through consistent architectural themes and standards; and 4) improve the functional aspects of the installation. At a minimum, include BES, SES, and landscape standards.

3-7.1 Building Envelope Standards (BES).

The intent of BES is to shape and detail public space that is safe, comfortable, and functional through placement and envelope controls for each building type. The standards aim for the minimum level of control necessary to meet the planning goals and include BES, site-planning standards, and building-related force protection standards. Relate the BES to existing environments where appropriate and feasible. Typical elements defined in each BES are massing, height, placement (e.g., required build-to lines and percentage of building that must be built to the required build-to lines), allowable parking locations, materials, and use. Also included is a general description of the building type. Each BES is coded to the Regulating Plan. Installations will develop a BES for each applicable building type on the installation, including the following:

- Mission building types (flightline facilities, hangars, and simulator facilities)
- Industrial building types (warehouses, maintenance facilities, research labs, and production facilities)
- Administrative building types (headquarters facilities and general offices)
- Medical building types (medical centers, hospitals, and clinics)
- Mixed-use building types (mixed-use building types incorporate commercial uses on the ground floor and any other type of approved uses above)
- Flex-use building types (flex-use building types incorporate any approved type of use on any floor)
- Commercial community support building types (large-format retail stores, religious buildings, schools, lodges, restaurants, bowling centers, recreation facilities, clubs, and stand-alone retail)
- Residential building types (single-family homes, row houses, townhomes, apartments, and unaccompanied personnel housing)

3-7.2 Street Envelope Standards (SES).

These standards illustrate typical configurations for all street types on an installation through SES. Each SES addresses vehicular traffic-lane widths, curb radii, sidewalk and tree planting area dimensions, and on-street parking configurations. An SES is required for every type of street specified on the installation. After a street type (or section of a street, as an entire street need not follow the same standard throughout its length) is selected, the characteristics desired for that street section will be documented in plan and section. The street types are coded to the Regulating Plan developed for each ADP and for the installation.

3-7.3 Landscape Standards.

Landscape standards show the appropriate type and placement of landscape elements, which may include natural landscape features (trees, ground cover), man-made hardscape features (street furniture, signage, lighting), and landscape-related force protection standards. Landscape standards identify the installation's landscape theme(s), addressing both design intent and allowable plant materials and site furnishing elements. At a minimum, these standards will address street tree placement and type. Ensure compliance with UFC 3-201-02, *Landscape Architecture*.

3-8 INSTALLATION DEVELOPMENT PROGRAM.

The Installation Development Program is the overall strategy for using and investing in real property to support installation missions and DoD objectives. It describes permanent comprehensive/holistic solutions, as well as short-term actions necessary to correct deficiencies and meet current and future mission needs through a method that ensures infrastructure reliability and contributes to **\2** resilient **/2/** development.

3-8.1 Program Elements.

The Installation Development Program will be completed at the installation level and reflected in component parts in each ADP. It will include the following elements:

3-8.1.1 Narrative.

Begin with an executive summary describing the key facility areas requiring the most attention in the near future, including a listing of required facilities and existing surplus or deficits. The program narrative provides a description of key development issues and strategies used to overcome these issues. The program narrative includes all interim steps required to achieve the desired end state.

3-8.1.2 Project Listing.

Include a list of major projects planned for the installation and identify all funding sources and project types: MILCON, major renovation or recapitalization projects (O&M), military family housing (MFH), non-appropriated funds (NAF), Army and Air Force Exchange Service (AAFES), Navy Exchange (NEX), Marine Corps Community Services (MCCS), Defense Commissary Agency (DeCA), MWR, resilience, and energy projects, real estate actions, public-private initiatives, and privatized housing, lodging, or utilities initiatives. Include projects identified in the Functional Annexes in this list and identified as supporting those efforts. Include demolition projects in the listing. Include information such as title, project number, fiscal year, and estimated program amount. The listing should address all programmed projects as well as other known projected requirements that may not yet be programmed. If no fiscal year or program amount is known at the time, note that the project requires programming.

3-8.2 Program Development.

Program development is the process of developing the Implementation Plan for ADPs and allocating resources (funding) to each of the projects. Planners will consult with programmers to identify the program requirements. A portion of programmed requirements on military installations will focus on recapitalization, sustainment, and restoration of existing infrastructure. Program development will be based in part on Service-specific facility evaluation systems and condition assessments.

3-9 PLAN SUMMARY.

Once the above planning processes and products are completed, prepare a Plan Summary that includes the Vision Plan, executive summaries of the ADPs, appropriate Network Plans, and a summary of the Installation Development Program. Prepare the Plan Summary to allow sharing with community partners.

3-10 FUNCTIONAL ANNEXES.

Functional Annexes support the master planning process by providing inputs to planning framework and the Vision Plan, especially with goals and objectives for long-term development and constraints to be considered at all stages of installation planning. Functional Annexes identify gaps in facilities and infrastructure which are addressed in the master planning process. Functional annexes include, but are not limited to, IEPs, **\2** MIRCs **/2/**, ADEPs, Complex Plans, and PDPs. Planners should include the associated updates to the Master Plan core documents for these planning efforts, including constraints and opportunities maps, ADPs, and Installation Development Programs. The IEP and **\2** MIRC **/2/** are required under this UFC to meet the requirements of 10 USC 2864. Follow Service-specific guidance on additional Functional Annexes.

3-10.1 Installation Energy Plan (IEP).

\2 The requirements for **/2/** preparing the energy resilience portion of the IEP **\2** are **/2/** contained in DoDI 4170.11, *Installation Energy Management.* This instruction is supplemented by the guidance provided in the OASD (EI&E) Memorandum, "**\2** Installation Energy Plans – Energy Resilience and Cybersecurity Update and Expansion of the Requirement to All DoD Installations **/2/**," effective **\2** May 2018 **/2/**. Follow the guidance in these two documents when developing IEPs. **\2\ /2/**

3-10.2 \2\ Military Installation Resilience Component (MIRC) /2/.

\2 The requirements for MIRCs are described in 10 USC 2964(a), 10 USC 2864(c), and FY25 NDAA Section 2847 on water resilience, coastal erosion resilience, and stormwater management. **/2/**

3-10.3 Area Development Execution Plans (ADEP).

Use ADEPs to synchronize project requirements identified in the programming phase. Use Service-specific tools and methods or processes identified during the planning phase as part of the plan-based programming approach. Develop ADEPs at the district level but each Service or installation may develop ADEP plans by parcel or grid. The outcome is a technical plan depicting all projects and a database for integration into the installation’s five-year work plan.

3-10.4 Complex Plan.

A Complex Plan, also referred to as a campus plan or nodal plan, bridges the scale between district-wide ADPs and building-specific site plans. These plans are useful when a tenant or user has a need for a grouping of facilities within a district built from the district’s Regulating Plan and Planning Standards to synchronize the identified requirements with the district’s planning goals. A Complex Plan includes specific building footprints scaled to the program for known projects, existing buildings, buildings under construction, buildings slated for demolition, and existing and proposed horizontal infrastructure, including streets, sidewalks, parking areas, and open spaces.

3-10.5 Project Development Plan (PDP).

The PDP (also known as Customer Concept Documents [CCD] or Planning Charrette Report [PCR]) documents the concept for a proposed new building or renovation project. Designers prepare a PDP following completion of an ADP or Campus Plan to connect the PDP to the planning direction for the district or campus. This allows architecture and planning to work together in support of the installation's planning vision. A PDP results in products planners can relay to designers to complete the design process.

A PDP includes:

- Room-by-room program development
- Construction budget
- Energy model tied to the district's **\2** IEP **/2/** if one is in place
- Weather **\2** resilience **/2/** analysis
- Site plan tied to the district's Regulating Plan and Planning Standards
- Conceptual floor plans, elevations, building sections and major system narratives to inform the development of follow-on programming documentation which may include DD 1391s or site approval forms
- Rendering(s) to illustrate the quality of the proposed project

Designers can develop PDPs for MILCON, SRM, and other applicable project types with input from a focused group of stakeholders using a participatory planning process in preparation for completion of the programming documentation (i.e., DD Form 1391). The intent is to bridge planning to programming and the design process.

3-11 SITE APPROVAL PROCESS.

Site all facility acquisition or construction projects in accordance with an approved Master Plan. An approved Master Plan siting means the project meets all guidelines and objectives set forth in the Regulating Plan and Installation Planning Standards. All projects must have approved site selections prior to the start of design. Attain site approval during the project programming process for SRM projects and during development of the DD Form 1391 for MILCON projects. All projects must remain in compliance with the Master Plan through the design process. Projects proposed by affiliated agencies, including, but not limited to, privatized housing contractors, MCCS, NEX, AAFES, DeCA, Defense Health Agency, and Department of Defense Education Activity (DoDEA) must also have the sites approved. Refer to Service-specific guidance for the detailed site approval process.

3-12 PROJECT REQUIREMENTS AND THE REGULATING PLAN.

Requirements for construction projects must be succinct, clear, and in conformance with the Master Plan. The Regulating Plan provides the required regulatory guidance to ensure the installation's vision for development is met. Apply the Regulating Plan to all forms of acquisition used to implement the Master Plan. Include the Regulating Plan and supporting BES, Landscape Standards, and SES in the solicitation for proposed construction projects and subsequent contract documents for design and development of a project. Include single-line drawings (floor plans, elevations) if they are developed as part of an ADP to illustrate a way to meet the intent of the Regulating Plan. Evaluate project designs on how well they conform to the Regulating Plan and supporting standards.

3-13 INSTALLATION PLANNING BOARD (IPB) MASTER PLAN ENDORSEMENT AND APPROVAL PROCESS.

The IPB (Facilities Board for the Air Force) will approve the installation's Master Plan and it will be endorsed by the appropriate approval authority designated by each Service. The Master Plan is the result of an iterative process and can be approved in parts or as a whole, depending upon completion timelines. Approve the Vision Plan, IDP, Program, and Installation Planning Standards as they are completed. Specific approval procedures are developed by each Service.

3-13.1 Installation Planning Board (IPB).

Each Service determines the responsible authority to establish and convene an IPB. The IPB will assist the installation leadership to manage, develop, and, in some cases, realign, clean up, and close the installation, supported sites, or area facilities and real estate. Every installation will have an IPB. See Appendix A for recommended roles, responsibilities, membership, and operations of an IPB.

3-13.2 Endorsement.

An appropriate authority determined by each Service will endorse the installation's overall Master Plan. This endorsement can take the form of a separate letter or a letter integral to the document. Update the endorsement with each change of command. A new commander, however, does not drive the need for an updated Master Plan; do not update Master Plans solely due to a change of command. The intent of the collaborative, integrated planning process described in this UFC is to produce **\2** an Installation **/2/** Master Plan that can be updated as mission needs (not command changes) dictate.

3-13.3 Headquarters Approval.

Installations must submit their master planning products to the appropriate headquarters agency for approval in accordance with Service-specific policy and regulations.

This Page Intentionally Left Blank

CHAPTER 4 KEY PERFORMANCE INDICATORS

4-1 GENERAL.

This UFC establishes key performance Indicators or metrics used to track compliance with the requirements herein. Each Service will establish procedures to track these indicators for every installation. In addition, in recognition of the complexities of planning at today's military installations and the need for continuous training, this UFC recommends each Service establish minimum training requirements for planners and installation leadership.

4-2 MASTER PLAN COMPLIANCE.

Master Plan compliance will be evaluated using three tiers. Tier 1 is required compliance with minimum products. Tier 2 is required compliance with the planning strategies. Tier 3 is optional conformance to a suggested set of planning principles tied to the installation vision. Evaluate installation Master Plans against the following key performance indicators.

4-2.1 Tier 1: Product Compliance.

Each Service will ensure installations have the appropriate planning products that document their planning process. At a minimum, every installation will have a Master Plan that includes:

- Vision Plan and its elements
- IDP, including ADPs, and its elements
- Installation Planning Standards (BES, Landscape Standards, and SES)
- Installation Development Program and its elements
- Plan Summary
- IEP and **\2** MIRC ***/2/*** as a Functional Annex

An appropriate higher level of authority will evaluate planning products. Per DoDI 4165.70, Master Plans will cover at least a ten-year period and be reviewed and updated at least every five years. Services will report the number of Master Plans with all products complete and current on an annual basis during the Program Objective Memorandum briefings to OSD.

4-2.2 Tier 2: Strategy Compliance.

All Master Plans will incorporate the appropriate planning strategies identified in Chapter 2 of this UFC. An appropriate higher level of authority will evaluate integration of the strategies into installation Master Plans.

4-2.3 Tier 3: Principle Compliance.

Compliance with the planning principles in Appendix B is optional. Planners should, however, incorporate the relevant principles into their Master Plans to support the installation's planning vision. Conformance can be measured using a variety of quantitative methods. For examples, refer to Appendix B.

4-3 TRAINING REQUIREMENTS.

Training on installation master planning is an essential function and will be supported by each Service. This includes training for DoD master planners, installation commanders and contractors. The DoD Master Planning Institute, hosted by USACE, is an appropriate source for planning training. See Appendix C for more information.

4-4 CERTIFICATION.

For master planners working in and with DoD, successfully passing and maintaining certification through the American Institute of Certified Planners (AICP) is encouraged.

APPENDIX A BEST PRACTICES

A-1 JOINT BASE LEWIS-MCCHORD REAL PROPERTY MASTER PLAN.

Starting in August 2007, planners at Joint Base Lewis-McChord began developing a new real property Master Plan that incorporates many of the strategies and requirements of this UFC. The result is an award-winning plan that has successfully guided development at the installation. The American Planning Association's Federal Planning Division honored the Historic Downtown Area Development Plan in 2008 and the entire Real Property Master Plan as "Outstanding Federal Planning Project (Honorable Mention)" in 2010.

A-1.1 Planning Strategies.

The focus of the effort is on **\2** resilience **/2/** planning using the following principles: compact, infill, and transit-oriented development; horizontal and vertical mixed-uses; multi-story and narrow buildings; and connected transportation networks. The plan also incorporates other strategies in this UFC, including natural and cultural resource preservation, healthy community planning, defensible planning, and capacity planning. The plan was created using area development planning tied together with network planning and implemented through the use of form-based planning—a first for DoD. With the plan in place, installation staff are now able to implement plan-based programming.

A-1.2 Planning Process.

A-1.2.1 The process described in this UFC was applied at Joint Base Lewis-McChord.

A-1.2.2 Installation planners and stakeholders first met in a series of public workshops to create the Vision Plan. **\2\ /2/**

A-1.2.3 The Vision Plan included a Framework Plan and an overall constraints and opportunities map. The Framework Plan subdivided the installation into planning districts and identified key planning concepts to guide the district planning effort.

A-1.2.4 Upon completion of the Vision Plan, the team began work on the IDP by focusing first on completing Regulating Plans, Illustrative Plans, Implementation Plans, and supporting sketches and renderings for each district's ADP. When the ADPs were completed, the planning team created overall Network Plans that include an overall Regulating Plan (Figure A-1), Illustrative Plan, Transportation Plan (Figure A-2), Pedestrian and Bikeway Plan (Figure A-3), and Open Space Plan (Figure A-4).

Figure A-1 Regulating Plan

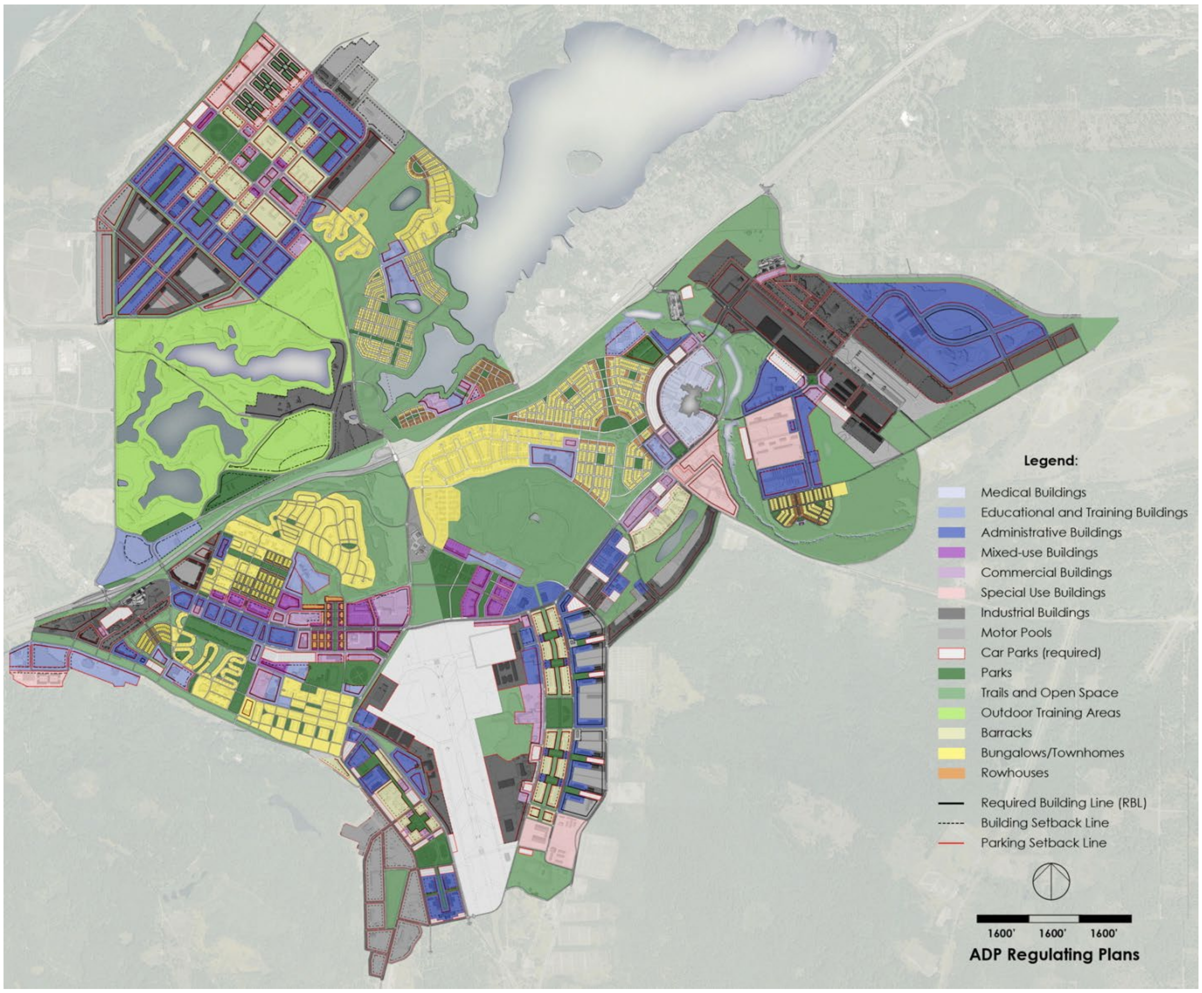


Figure A-2 Transportation Plan

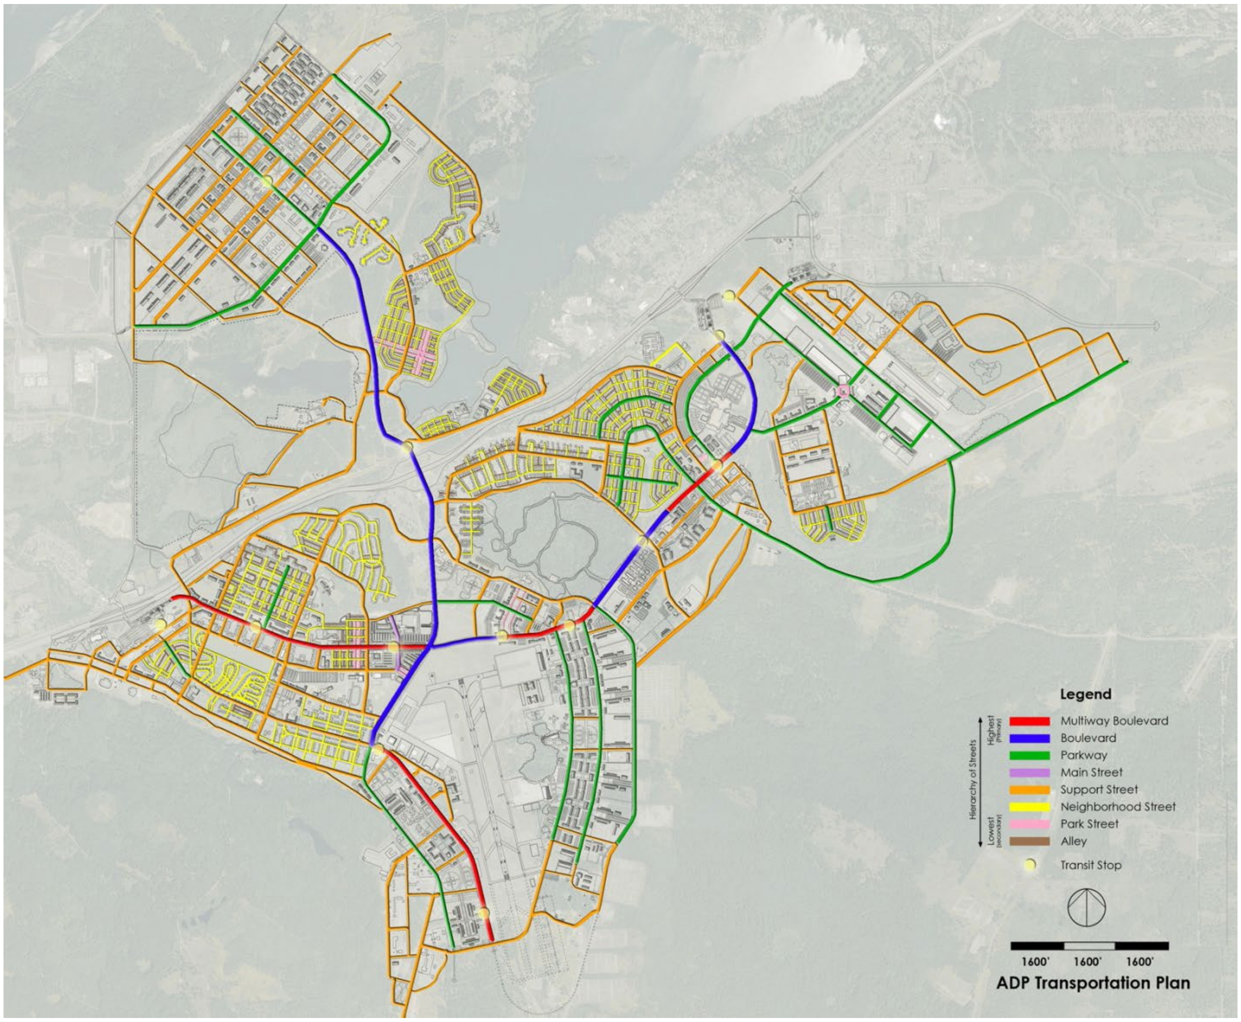

Figure A-3 Pedestrian and Bikeway Plan

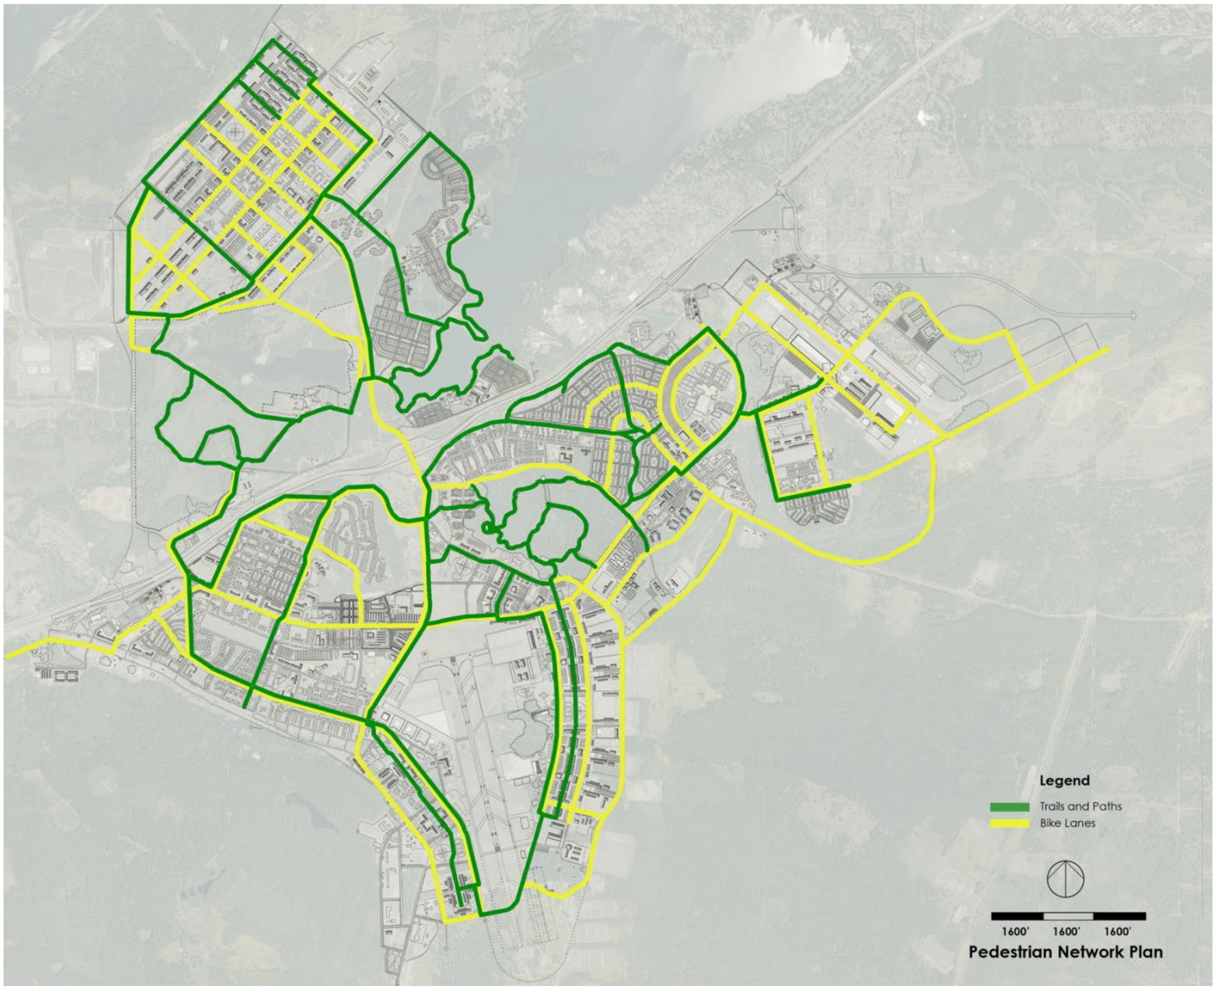

Figure A-4 Open Space Plan

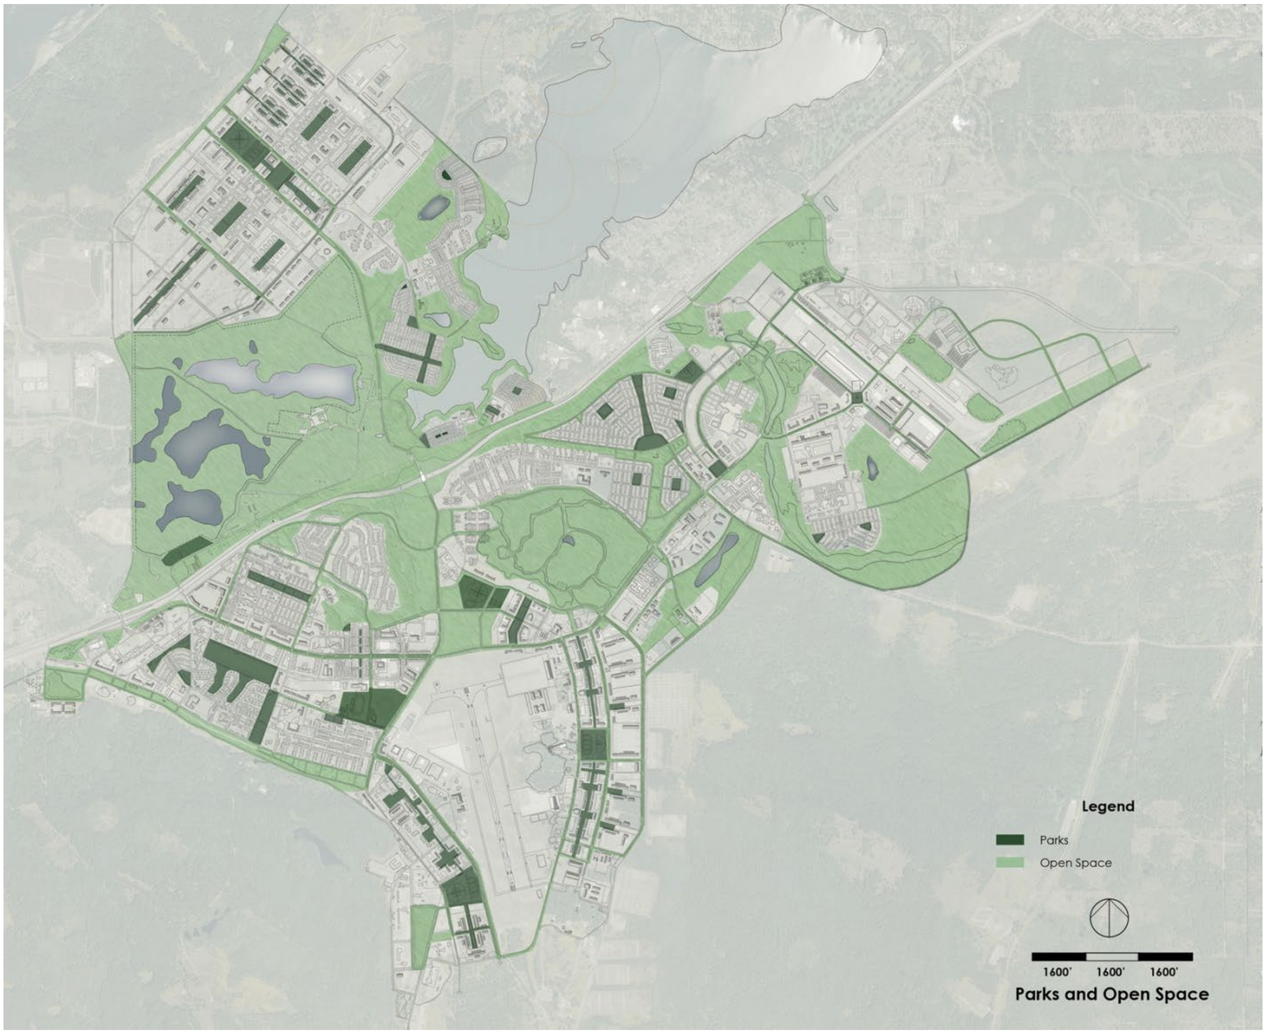


A-1.2.5 As part of the area development planning process, the planning team developed Installation Planning Standards for streets, buildings, and landscapes. Additionally, within each ADP, the team documented the Installation Development Program. A Plan Summary, referred to by the Army as the Real Property Master Plan Digest, documented the entire effort.

A-1.3 Plan Implementation.

A-1.3.1 The plan integrated into the installation's planning process. Upon completion, the garrison commander and the senior mission commander endorsed the plan. Perhaps most importantly, the Regulating Plan is used in the site approval process, and when proposed projects do not conform to the regulations, they are sent back to the project proponents for revision or reconsideration. Additionally, relevant elements of the plan are used to guide decisions of the IPB and **\2** other installation boards and committees.**/2/**

Figure A-5 Street Transformation

A-1.3.2 The images in Figure A-5 are from a street transformation at Joint Base Lewis-McChord and demonstrate how planning can be used to synchronize infrastructure and facility investments.

A-1.4 Key Performance Indicators.

Installation planning staff created a**\2\ /2/** system to identify how well the installation is performing with regards to the Master Plan. Based on the planning vision, they identified **\2\ /2/** planning goals, **\2** for example, **/2/** mission capabilities, **\2\ /2/** walkable neighborhoods, identifiable town centers, and great streets. **\2** Each goal was **/2/** operationalized through **\2\ /2/** design principles. Each principle **\2** was assigned **/2/** a rating **\2\ /2/** used to score conformance at any stage in the development cycle, from the current condition to complete build-out. The metric **\2** was **/2/** based on a point system similar to the LEED Reference Guide for Neighborhood Development (LEED-ND) **\2** where **/2/** planning staff assign scores for each principal based on their assessment of the condition. This process **\2** was **/2/** completed for each district on a regular basis to assess progress towards fulfillment of the planning vision.

\2\ /2/

A-1.5 Benefits.

At Joint Base Lewis-McChord, the plan has been used to focus and guide development across the installation. It helps planners, stakeholders, and installation leadership make effective development decisions that conform to the planning vision but also gives them flexibility through the Regulating Plan to accommodate new and changing mission requirements. The plan found room for two new brigade combat teams and over 2,000 new housing units in a growth boundary defined by cantonment that was previously considered built-out. As a result of incorporating principles of **\2** resilience **/2/** planning, at build-out, the plan will result in forecasted annual reductions of 11.4 million vehicle miles travelled, 12.9 million pounds of carbon emissions, and per-household gasoline costs of $1,500.

A-2 FORT HUNTER LIGGETT INSTALLATION DESIGN GUIDE (IDG).

In 2010 and 2011, planners and other installation staff worked together to create a series of planning documents for Fort Hunter Liggett, California. In addition to crafting ADPs that conform to this UFC, they drafted a new IDG for Fort Hunter Liggett. The Fort Hunter Liggett IDG sets a new standard for these types of planning documents. Previously, such documents were several hundred pages long. Yet, despite the length, they provided little specific guidance for planners. Rather, these documents provided details regarding construction, signage, and interior systems. The intent was that these detailed guides could be included in construction requests for proposals (RFP). The reality, however, was different. These documents were typically too cumbersome to be used in RFPs and, as a result, they were not heavily used. At Fort Hunter Liggett, the goal was to use the IDG to provide specific guidance to planners in as few pages as possible. The Fort Hunter Liggett IDG sets the planning standards for streets, buildings, and landscapes.

A-2.1 Process.

Installation personnel and leaders worked to develop a vision, goals, and a complementary design language to address key planning issues facing Fort Hunter Liggett. The resulting planning vision, principles, and Framework Plan guided the preparation of three ADPs. Using an evaluation of images of the built environment, analysis of the planning strengths and weaknesses found on the installation, and through a series of collaborative workshops and discussions, the group developed a vision for planning at Fort Hunter Liggett:

> “To create a flexible training environment surrounding an attractive small town with walkable main streets and a usable town square, where soldiers, civilians, and their families enjoy living and working.”

A-2.2 Purpose.

The purpose of the IDG is to provide specific design guidance for standardizing and improving the quality of the total environment of the installation. This includes not only the visual impact of features on the installation, but also the impact of projects on the total built and natural environment. The improvement of the quality of visual design and development, and the use of **\2** resilient **/2/** design and development practices has a direct impact on the quality of life for those who live, work, or visit the installation. The IDG is to be used by all individuals involved in decision-making, design, construction, and maintenance of facilities. The primary users include the following: senior mission commander; garrison commander and staff; installation facility planning and design personnel; installation facility maintenance personnel; USACE project managers, design, and construction staff; consulting planners, architects, engineers, interior designers, and landscape architects; as well as supporting agencies such as the exchange, DeCA, DoDDS, MEDCOM, tenants. The IDG is organized to facilitate the preparation and execution of projects to improve the visual image on the installation and ensure the design conforms to Army standards **\2\ /2/**. Part I discusses the process, use, and implementation of the IDG. Part II addresses the BES, including setbacks, building form, building heights, and parking requirements. Part III establishes Street Envelope Standards (SES) for streets, intersections, service areas, and the pedestrian environment, and includes recommended dimensions, treatment of bicycle lanes, street tree spacing, and methods of incompatible use screening. Part IV outlines Landscape Standards, including objectives, guidelines, recommended plant selections, and plant spacing. Appendix A includes installation Regulating Plans for reference purposes. Appendix B describes aesthetic design guidelines, including recommended colors and materials. Appendix C documents the vision, goals, and principles for the installation. Appendix D is a technical design guide that outlines specific requirements for key installation construction elements.

A-2.3 Using the Installation Design Guide (IDG).

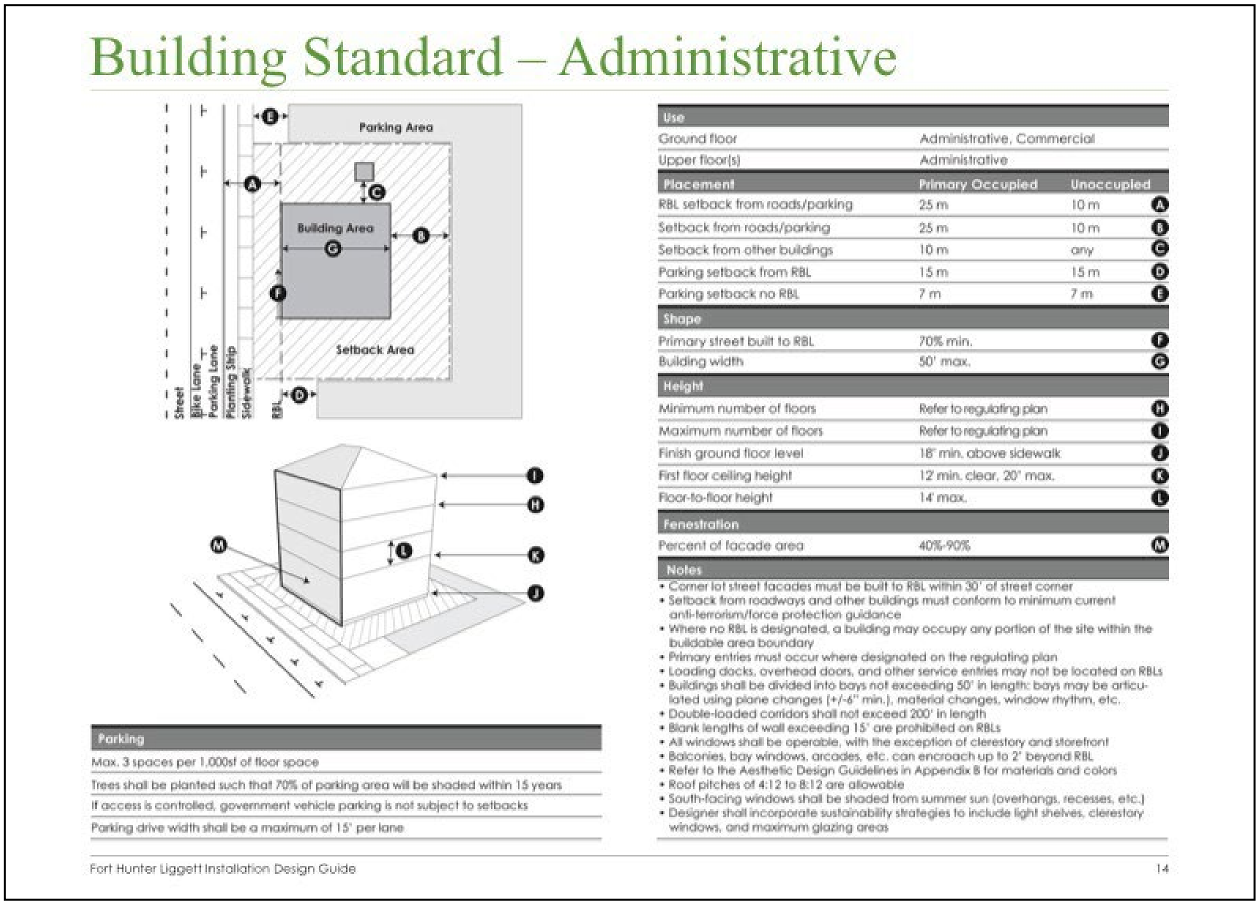
The IDG provides installation-specific design data. The general design concepts, recommendations, and standards addressed therein are applicable to construction and renovation projects at Fort Hunter Liggett, California. Planners use the IDG to determine the general design and construction considerations in the preparation of project plans. The IDG provides design guidelines and Army-wide design standards intended to be used in all projects, regardless of the funding source. The IDG is also used to develop requirements for programming documents for MCA construction (DD Form 1391), as well as cost estimates and preliminary and final designs (from both in- house and external design sources) involving exterior visual elements on the installation. The following steps illustrate how the design guide is used for the preparation of plans for new construction, renovation, and maintenance and repair projects on the installation:

- Step 1: Review the design goals, objectives, and principles included in ADP reports and Appendix C of the IDG.
- Step 2: Consult the regulating plan to determine the applicable standards for buildings, streets, and landscapes.
- Step 3: Review the applicable standards in Parts II through IV of the IDG.
- Step 4: Carefully analyze the existing conditions on the site and pay special attention to mature trees, riparian corridors, and building entries.
- Step 5: Design building form and site the project according to the Regulating Plan and appropriate standards.
- Step 6: Select building materials and colors from Appendix B of the IDG.
- Step 7: Select the appropriate landscape materials.
- Step 8: Assemble all plans documenting conformance to applicable standards and guidelines.

A-2.4 Building Envelope Standards (BES).

The design character of an installation’s buildings affects the installation’s overall image. The building design component encompasses the character of the buildings as well as their relationships to one another and the environment. The continued preservation of historically and culturally significant structures adds to an installation’s character. This section includes BES to regulate the form, setbacks, uses, and support requirements of any given construction project at Fort Hunter Liggett. Together with the Regulating Plan, these standards create a form-based planning practice that will facilitate mission readiness, energy-efficiency, and walkable development patterns in support of the installation’s vision.

Figure A-6 Building Envelope Standards (BES) Graphic



Building Standard – Administrative

Use			
Ground floor	Administrative, Commercial		
Upper floor(s)	Administrative		
Placement	**Primary Occupied**	**Unoccupied**	
RBL setback from roads/parking	25 m	10 m	A
Setback from roads/parking	25 m	10 m	B
Setback from other buildings	10 m	any	C
Parking setback from RBL	15 m	15 m	D
Parking setback no RBL	7 m	7 m	E
Shape			
Primary street built to RBL	70% min.		F
Building width	50' max.		G
Height			
Minimum number of floors	Refer to regulating plan		H
Maximum number of floors	Refer to regulating plan		I
Finish ground floor level	18" min. above sidewalk		J
First floor ceiling height	12' min. clear, 20' max.		K
Floor-to-floor height	14' max.		L
Fenestration			
Percent of facade area	40%-90%		M

Notes

- Corner lot street facades must be built to RBL within 30' of street corner
- Setback from roadways and other buildings must conform to minimum current anti-terrorism/force protection guidance
- Where no RBL is designated, a building may occupy any portion of the site within the buildable area boundary
- Primary entries must occur where designated on the regulating plan
- Loading docks, overhead doors, and other service entries may not be located on RBLs
- Buildings shall be divided into bays not exceeding 50' in length; bays may be articulated using plane changes (+/-6" min.), material changes, window rhythm, etc.
- Double-loaded corridors shall not exceed 200' in length
- Blank lengths of wall exceeding 15' are prohibited on RBLs
- All windows shall be operable, with the exception of clerestory and storefront
- Balconies, bay windows, arcades, etc. can encroach up to 2' beyond RBL
- Refer to the Aesthetic Design Guidelines in Appendix B for materials and colors
- Roof pitches of 4:12 to 8:12 are allowable
- South-facing windows shall be shaded from summer sun (overhangs, recesses, etc.)
- Designer shall incorporate sustainability strategies to include light shelves, clerestory windows, and maximum glazing areas

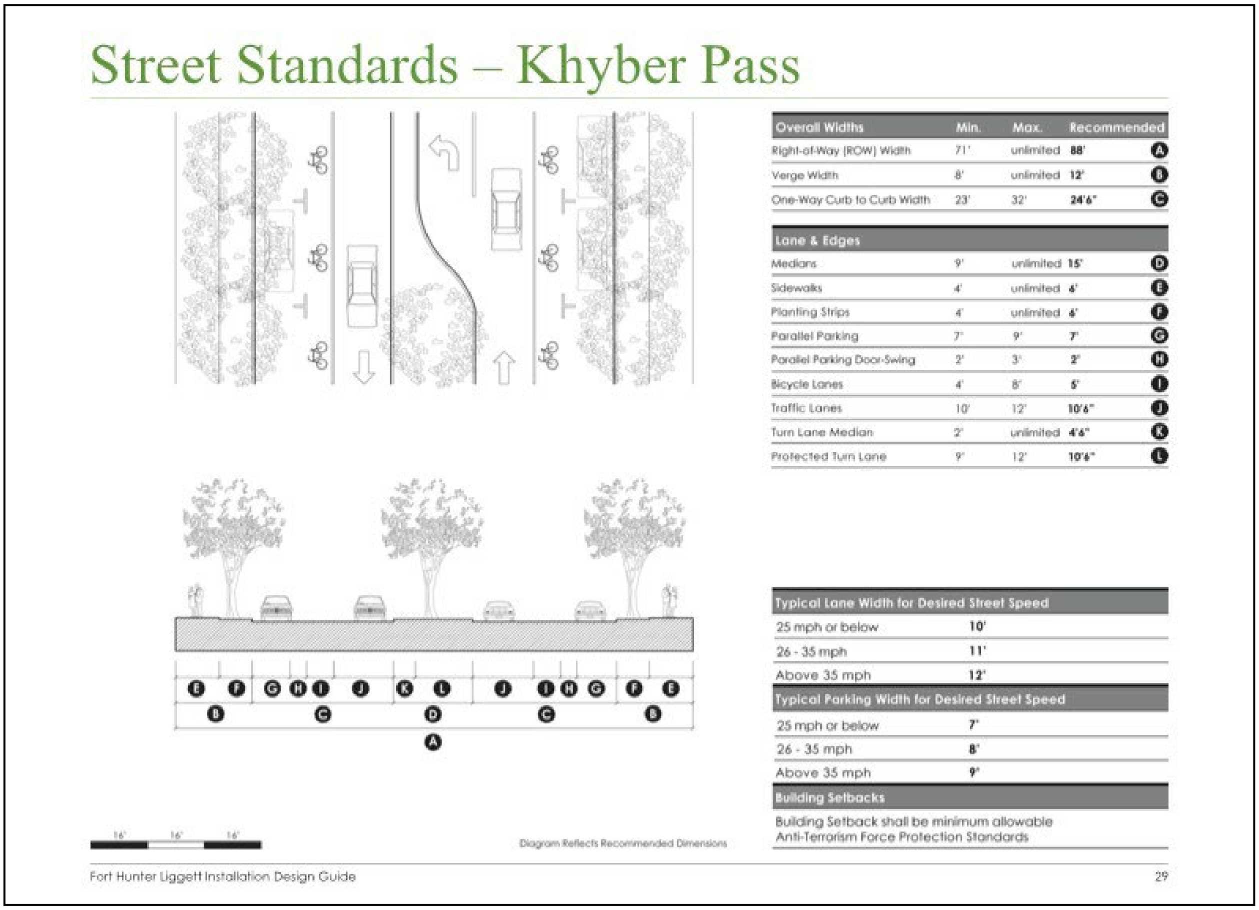
Parking
Max. 3 spaces per 1,000sf of floor space
Trees shall be planted such that 70% of parking area will be shaded within 15 years
If access is controlled, government vehicle parking is not subject to setbacks
Parking drive width shall be a maximum of 15' per lane

Fort Hunter Liggett Installation Design Guide 14

A-2.5 Street Envelope Standards (SES).

The image and functionality of the installation is greatly determined by the design and location of roadways, walkways, entrances, and parking lots. The primary roadway system and parking lots utilize considerable amounts of land and are a visually dominant element of any installation. This section provides detailed street, intersection, and parking standards for the installation.

Figure A-7 Street Envelope Standards (SES) Graphic



A-2.6 Landscape Standards.

The Landscape Standards address the selection, placement, and maintenance of trees, shrubs, and ground cover on the installation. The visual image conveyed by a military installation is defined not just by architectural character and site organization, but also by an attractive, organized landscape design. The presence of plant material on the installation greatly enhances the visual character and environmental quality of the installation. Plantings add an element of human scale to open spaces and can be used functionally to screen undesirable views, buffer winds, reinforce the hierarchy of the circulation system, or provide a visual transition between dissimilar land uses.

Figure A-8 Landscape Standards Graphic

Plant Material Selection – Trees

Pages 58-60 list various trees, shrubs, and ground cover plants to be used at Fort Hunter Liggett. The charts illustrate appropriate usage and spacing for each species. For additional recommendations, reference the plant list provided by Fort Hunter Liggett's Environmental Department.

Tree Species	Street Tree	Specimen/ Individual	Shade	Park	Fire-Tolerant	Drought-Tolerant	Spacing
California Sycamore Platanus racemosa	●	●		●			20' o.c.
Coast Live Oak Quercus agrifolia	●		●		●		25' o.c.
Box Elder Acer negundo var. californicum	●		●	●			30' o.c.
Hollyleaf Cherry Prunus ilicifolia		●			●	●	15' o.c.
California Laurel Umbellularia californica	●	●	●	●			30' o.c.
Western Redbud Cercus occidentalis		●	●	●		●	10-15' o.c.
California Juniper Juniperus californica		●	●	●		●	Individual
Valley Oak Quercuse lobata		●	●	●	●		Individual
Desert Ironwood Olneya tesoto		●				●	15' o.c.

Fort Hunter Liggett Installation Design Guide 59

A-3 OPERATION OF AN INSTALLATION PLANNING BOARD (IPB).

A-3.1 Primary Responsibilities.

The IPB (also called the Facilities Board) ensures the orderly development and management of installation real property in support of the planning vision and the installation mission. The IPB guides the development and maintenance of all components of the Master Plan and helps ensure the Master Plan addresses all real property requirements for all agencies and activities on the installation and supported areas, and reflects changes in installation missions and the military community's current or future development plans, with full consideration of, and respect for, regional and local communities.

A-3.1.1 Coordination.

The IPB ensures the Master Plan is coordinated with:

- Adjacent and nearby installations

- Other activities and land use of DoD and federal agencies
- Federally recognized Native American tribes, recognized Alaskan native entities, and Native Hawaiian organizations
- Local agencies and planning commissions of neighboring cities, counties, and states for mutual development concerns, encroachment issues impacting range operations and training, and environmental issues (Established intergovernmental coordination processes will typically be followed.)
- Interested non-governmental groups and associations, state recognized tribes, businesses, and concerned individuals
- State historic preservation officer (SHPO)

A-3.2 Additional Responsibilities of the IPB.

The IPB will also:

- Approve installation architectural and design themes, as set forth in the Installation Planning Standards; monitor compliance; and adjudicate conflicts and variances from the established standards.
- Develop plans and programs that are in harmony with, protect, and enhance the environment and are observant of **\2** resilient **/2/** design and development policies and objectives.
- Ensure maximum use of existing facilities; oversee the assignment and reassignment of space within existing facilities; monitor land use; and adjudicate conflicts in facility, land use, or assignments.
- Oversee actions to realign, clean up, impose land use controls, and close the installation or locations supported by the installation, as required.
- Resolve Master Plan disputes between competing organizations on the installation.
- Adjudicate variances from the Installation Planning Standards and forward for approval.

A-3.3 Composition of the IPB.

The IPB is comprised of members or alternates, appointed on orders, and organized as follows:

- **Chair.** The chair is designated by each Service and could be the senior commander or garrison/base/installation commander.
- **Voting Members:**
    - Chair

  - Military or civilian commanders of Civil Engineering, Public Works, or appropriate equivalent. This individual also serves as the Executive Secretary of the Board.
  - The director/chief of each principal and special staff section of the organization, the environmental coordinator or NEPA planner, and other staff members designated by the IPB Chair.
  - The commander or appointed representative of each unit or independent activity designated by the commander, including Guard and Reserve activities occupying real property administered by the commander. This includes all activities located within the boundaries of the installation or at physically separate sites for which the commander has real property master planning responsibilities.
  - For installations with a high number of historic properties, recommend including the installation Cultural Resource Manager as an IPB member.
- **Guests.** The Chair may invite guests to IPB meetings. Guests may include representatives of U.S. or host nation regional and local governments, representatives of planning agencies in the community, non-governmental groups, Federally recognized tribes, Alaska Native corporations, Native Hawaiian organizations, and property or business owners in the community affected by IPB planning decisions.

Service-specific requirements may override composition and voting members of the IPB, as appropriate.

A-3.4 Meetings of the IPB.

Each Service determines the meeting schedule and operations of the IPB. Generally, the secretary will prepare the meeting agenda, read-ahead packages, and perform other administrative tasks. The minutes will record voting members present and absent; associate member attendance; and topics discussed, including issues, points of discussion, board recommendations with vote tally, if appropriate, and decisions made.

A-3.5 Approval Responsibilities.

The IPB will recommend formal approval of:

- All components of the Master Plan and the resources required to prepare and maintain them
- Variances from planning requirements established by the Regulating Plan and the Planning Standards
- Priorities and funding of Master Plan projects and other related resource issues

- Real property utilization and space assignment resolutions
- Other items within the purview of the Board’s charter, as designated by the Commander

This Page Intentionally Left Blank

APPENDIX B PLANNING PRINCIPLES

B-1 PURPOSE.

The purpose of this appendix is to outline specific planning principles applicable to military planning. Below is an example scorecard tool that organizes the principles into categories to support the planning strategies discussed in this UFC. This example of a score card is adopted from the principles in the LEED-ND program and adds appropriate principles tailored to military needs. Using a scorecard as a tool is effective in guiding **\2** resilient **/2/** energy-efficient development. While this scorecard is a good foundation, Services and their installations are encouraged to leverage their innovation, originality, and flexibility formulating their unique measurement tools.

B-2 PROCESS.

To use this scorecard, evaluate the existing condition at each district to determine a baseline score and then evaluate the approved ADP to determine the maximum possible score. In this example, requirements are identified with an “R” in the table and credits are identified with maximum points allowable.

Figure B-1 Principles for Military Development Criteria Table

\2\

	Military Development Resilience Credit Designation	Credits Available (note 1)
	Resilience Planning	**59 max**
SP1	Compact Development*	R
SP2	Compact Development*	6
SP3	Mixed-Use Neighborhood Centers*	4
SP4	Reduced Parking Footprint*	1
SP5	Street Network*	2
SP6	Transit Facilities*	1
SP7	Community Outreach and Involvement* (note 3)	2
SP8	Tree-Lined and Shaded Streets*	2
SP9	Water-Efficient Landscape*	1
SP10	Existing Building Reuse*	1
SP11	Historic Resource Preservation and Adaptive Use*	1
SP12	Stormwater Management*	4
SP13	Heat Island Reduction*	1
SP14	Solar Orientation*	1
SP15	On-Site Energy Sources*	3
SP16	District Heating and Cooling*	2
SP17	Wastewater Management*	2
SP18	Solid Waste Management Infrastructure*	1
SP19	Close-in Training	2
SP20	Hidden Parking	6
SP21	Car Parks	6
SP22	Mixed-Use Building	5
SP23	On-Installation Housing	5
	NATURAL AND CULTURAL RESOURCE PRESERVATION	**5 Max**
RP1	Imperiled Species and Ecological Communities*	R
RP2	Wetland and Water Body Conservation*	R
RP3	Floodplain Avoidance*	R
RP4	Range and Training Land Conservation	R
RP5	Steep Slope Protection*	1
RP6	Site Design for Habitat or Wetlands and Water Body Conservation	1
RP7	Restoration of Habitat or Wetlands and WaterBodies*	1
RP8	Long-term Conservation Management of Habitat or Wetlands and Water Bodies*	1
RP9	Minimize Site Disturbance in Design and Construction*	1
	HEALTHY COMMUNITY PLANNING	**17 Max**
HP1	Walkable Streets*	R
HP2	Porches	R
HP3	Walkable Streets*	12
HP4	Access to Civic and Public Spaces*	1
HP5	Access to Recreation Facilities*	1

HP6	Visitability and Universal Design* (note 4)	1
HP7	Local Food Production* (note 5)	1
HP8	Neighborhood Schools*	1
DEFENSIBLE PLANNING		
DP1	AT/FP Compliance	R
MAXIMUM POSSIBLE SCORE		81

/2/

Note 1 – R refers to a required item and credits are indicators of the relative importance of each area.
Note 2 – Deleted
Note 3 – Community outreach and involvement applies to on-installation populations only.
Note 4 – Follow local requirements for accessible housing requirements.
Note 5 – Deleted

B-3 APPLICABILITY.

The principles are applicable at the ADP scale prior to construction. Early in the planning process, establish the planning strategies applicable to the district and in the vision, establish the strategies that are important. In the example criteria above, a successful ADP will score more than 50 points. Districts without housing are exempt from the housing requirements of the criteria.

B-4 MILITARY DEVELOPMENT CRITERIA.

Planners can refer to LEED-ND for detailed explanations for the LEED-ND criteria noted in Figure B-1. However, for military development criteria, refer to the following descriptions.

B-4.1 Prerequisite: AT Compliance – Required.

Ensure that personnel are protected from possible terrorist attack. All new facilities sited as part of the project conform to the latest UFC criteria or approved local guidance on AT.

B-4.2 Prerequisite: Range and Training Land Conservation – Required.

Preserve mission-critical resources by protecting a range complex with associated surface danger zones (SDZ), impact areas, buffer areas, and training land from development. Locate the project such that 0% of the development area is located on installation-designated range and training land.

B-4.3 Prerequisite: Narrow Buildings – Required.

Improve productivity and indoor air quality and reduce energy costs using natural lighting and ventilation.

- As measured by total floor area, 90% of administrative, medical, commercial, and residential type facilities are designed at a maximum width of 50 feet. Hangars, warehouses, and retail facilities are exempt from this requirement.

AND

- The same facilities must be designed to include operable windows that provide daylight and natural ventilation to 75% of all regular occupants of building.

B-4.4 Prerequisite: Multi-Story Buildings – Required.

Reduce automobile use, infrastructure requirements, and land consumption by using vertical construction.

- As measured by total floor area, 90% of all new facilities sited must be two stories or more. Hangars, weapon storage facilities, and warehouses are exempt from this requirement.

B-4.5 Prerequisite: Alleys – Required.

Improve pedestrian safety, reduce automobile use, and support neighborhood cohesion by using alleys in all military family housing neighborhoods, whether funded by MILCON or privatized housing partners.

- Alleys with paving widths of no more than 15 feet will be used for all new housing and incorporated into redevelopment plans for existing housing except in areas with extreme topographic conditions.
- All garages and carports will be placed off of the alleys.

B-4.6 Prerequisite: Porches – Required.

Improve pedestrian safety, reduce automobile use, and support neighborhood cohesion by placing front porches on all single-family, duplex, and triplex homes in military family housing neighborhoods.

- Porches are a minimum 6 feet deep and 10 feet wide.
- Porches should be elevated from the street level by at least three risers. Ensure universal access through alley access or ramps.

- Rowhouses and townhomes with at least four connected units can use stoops in place of porches. Stoops must be a minimum 4 feet deep and 6 feet wide and must be at least three risers above the street level.

B-4.7 Prerequisite: Planting Strips – Required.

Improve pedestrian safety, enhance stormwater management, and provide locations for regularly placed street trees by using planting strips between the curb and sidewalks.

- Ensure planting strips are a minimum of 5 feet wide and located on both sides of all streets where sidewalks are used. This does not apply to "downtown" streets that have sidewalk widths of greater than 14 feet and regularly spaced street trees in tree gates no farther than 25 feet on center.

B-4.8 Credit: Close-In Training – 2 Points.

Provide mission-critical open spaces for physical training and formations needed to train Soldiers within close proximity of their workplaces.

- Site 1 square foot per Soldier of open space within a ¾-mile radius of any company operations facility. The number of Soldiers is determined by the number of occupants currently using (or planned) for that facility.
- Consolidated open spaces are encouraged, provided they fall within the required radius.

B-4.9 Credit: Hidden Parking – up to 6 Points.

Improve health and safety of residents and reduce impacts of automobile use by improving walkability of streets by placing commercial and residential parking to the rear or to the side.

- Locate 90% of off-street parking commercial uses to the rear or to the side of the structure (3 points)
- With the exception of visitor parking, locate all off-street parking for residential units to the rear of the structure and provide alley access (3 points)

B-4.10 Credit: Car Parks – up to 6 Points.

Improve stormwater retention, reduce heat islands, reduce land consumption per parked vehicle, and improve life of paving areas through parking lot design.

- In all surface parking lots with more than one bay of parking, place planting strips between every bay. Planting strips must be at least 15 feet wide and planted with shade-providing trees, placed 25 feet apart (2 points).

- An additional 2 points can be gained if the planting strips are designed to handle the entire stormwater runoff requirements of the parking lot. Design to accommodate a one-year 24-hour design storm (2 points).
- An additional 2 points can be gained if the paving is pervious surfacing (2 points).

B-4.11 Credit: Mixed-Use Buildings – up to 5 Points.

Reduce land use and automobile usage through mixing compatible uses in a single structure.

- Locate at least one mixed-use building within the highest density square mile of the project (1 point), or
- Locate at least two mixed-use buildings within the highest density square mile of the project (2 points), or
- Locate at least three mixed-use buildings within the highest density square mile of the project (3 points), or
- Locate at least four mixed-use buildings within the highest density square mile of the project (4 points), or
- Locate at least five or more mixed-use buildings within the highest density square mile of the project (5 points).

B-4.12 Credit: On-Installation Housing – up to 5 points.

Increase the amount of family housing on the installation to reduce **\2** impact **/2/** associated with commuting, reduce congestion at gates and on local roads, reduce family expenses associated with commuting, and support a more vibrant installation. To calculate the amount of housing per district, first identify the total military population and the total area of the cantonment (installation land area less range and training land). Then identify the total area of the district and determine the percentage of total installation land area within the district. Each district should hold the percentage of housing proportional to its land area. For example, if the installation is providing housing for 30% of assigned military families and the area of the district represents 50% of the area of the cantonment, then, to get 1 point of credit, the district needs to provide for 15% of the total housing inventory.

- Provide proportional housing within the district for 30% of assigned military families on the installation (1 point), or
- Provide proportional housing within the district for 40% of assigned military families on the installation (2 points), or
- Provide proportional housing within the district for 50% of assigned military families on the installation (3 points), or

- Provide proportional housing within the district for 60% of assigned military families on the installation (4 points), or
- Provide proportional housing within the district for 70% of assigned military families on the installation (5 points).

This Page Intentionally Left Blank

APPENDIX C MASTER PLANNING TRAINING

Master planning training is highly encouraged throughout DoD. Noted below are recommended guidelines for continuing education.

C-1 TRAINING FOR DOD MASTER PLANNERS.

All DoD employees employed as master planners are highly encouraged to complete at least 32 hours of professional continuing education related to master planning topics every two years. Training may count for multiple requirements (e.g., for AICP, PE, USGBC, AIA, ASLA, and/or continuing education credits and the fulfillment of this requirement) simultaneously. In addition, training and educational opportunities to support pursuit of AICP certification should be supported by each Service.

C-2 TRAINING FOR INSTALLATION COMMANDERS.

New garrison commanders (Army), installation commanding officers (Navy and Marine Corps), and Wing commanders, mission support group commanders, and civil engineers (Air Force) are highly encouraged to have at least four hours of master planning training before or within the first six months of assuming command, in a venue determined by each Service.

C-3 TRAINING FOR CONTRACTORS.

Contractor training is highly encouraged and joint training with military planners should be made available whenever possible.

C-4 MASTER PLANNING INSTITUTE (MPI).

The MPI, hosted by USACE, is a source for master planning training. The MPI coordinates opportunities to provide education and training for personnel working in planning throughout DoD. The MPI coordinates and publicizes courses available for master planners in each Service. These programs offer a series of planning courses, symposiums, and practicums to promote the strategies of master planning as emphasized in this UFC.

Relevant Army PROSPECT courses include:

- Master Planning Principles (75)
- Master Planning Practices (241)
- Master Planning Programming and Siting (326)
- Master Planning Visualization Techniques (948)
- Master Planning Advanced Techniques (952)

Relevant Air Force Institute of Technology Civil Engineer School Courses include:

- Introduction to Air Force Planning (WENG 519)
- Comprehensive Planning Fundamentals (WENG 520)
- Introduction to Asset Management (WMGT 301)
- Project Programming (WENG 423)

Relevant Naval Civil Engineer Corps Officers School courses include:

- Facilities Planner (A-4A-0016) - Naval Civil Engineer Corps Officers School (CECOS)
- Navy Master Planning – Commander, Navy Installations Command (CNIC)

Additional training opportunities available for master planners are offered through non-government sources, including the American Planning Association (APA). The Federal Planning Division (FPD) hosts a training workshop each year in conjunction with the APA's annual conference. The American Institute of Certified Planners (AICP) also offers courses and various training opportunities throughout the year.

APPENDIX D GIS DATA LAYERS

D-1 When preparing a constraints map, planners should refer to data embedded in the installation's GIS system. DoDI 8130.01 establishes policy, assigns responsibility and provides governance for the collection and maintenance of geospatial data related to DoD installations. The program is the Installation Geospatial Information & Services (IGI&S). Each Service requires adherence to the Spatial Data Standards for Facilities, Infrastructure, and Environment (SDSFIE); refer to Service-specific guidance for the most recent guidance. Geospatial data developed at or for the installation under this guidance and reported to the Service Headquarters is in turn reported and delivered to the Defense Installations Spatial Data Infrastructure (DISDI).

D-2 Datasets such as those identifying buildings, roads and road networks, utilities and utility networks, and environmental and cultural features such as habitat, nesting sites, and burial grounds, are usually collected via GPS or remotely acquired using appropriate technology. Coordinate with their local geospatial staff to ensure the most current datasets are being used for planning products.

D-3 A second group of geospatial datasets are a product of analysis. Airfield constraints, quantity distance arcs, noise contours, anti-terrorism and force protection (AT/FP) buffers, **\2** flood inundation mapping, **/2/** and areas proposed for disposal are layers that fit into the above category. These datasets require subject matter expert (SME) input and control. Acquire current and/or validated datasets from the appropriate SME prior to starting a planning project requiring these data.

D-4 The last group of geospatial datasets are those national datasets governed by non-DoD entities such as soils, wetlands, and floodplains. Coordinate with installation geospatial staff to be sure current and targeted data is acquired for planning projects. For constraints and opportunities maps, typical data layers referenced include, but are not limited to:

- airfield, heliports and isolated helipads, constraints
- at restrictions
- quantity-distance arcs (munitions safety)
- noise contours
- safety buffers (setbacks required)
- former firing ranges and impact areas
- impact areas (dudded and non-dudded)
- chemical storage areas
- topography
- wetlands
- threatened/endangered species habitat

- protected natural/cultural areas
- flood hazard areas
- soil restrictions
- environmental contamination
- desirable and undesirable land use features off the installation
- land use controls
- landfills
- historic districts
- transportation systems
- open space systems
- utility systems
- encroachment areas
- areas proposed for disposal/deconstruction
- cultural resource/archeological sites
- pesticide storage areas
- pesticide-sensitive application facilities and areas
- surface and subsurface hazardous material storage
- existing facility assessment
- future development
- in/out grants
- overall real estate boundaries (borders, easements)
- access control points
- open and closed installation restoration program (irp) sites.
- high-resolution aerial photography/lidar contour mapping
- range complex surface danger zones

USACE	U.S. Army Corps of Engineers
USC	United States Code

E-2 DEFINITION OF TERMS

Area Development Plan (ADP): These plans show the proposed detailed development of a district on the installation. The ADP should show both short-term and long-range development. Each ADP includes an Illustrative Plan, Regulating Plan, and Implementation Plan. The ADP supports the Master Plan by addressing and resolving localized comprehensive planning issues. ADPs are created for geographically identifiable districts.

Base Flood Elevation (BFE): The computed elevation to which floodwater is anticipated to rise during the base flood. BFEs are shown on flood insurance rate maps (FIRMs) and flood profiles. The BFE is the regulatory requirement for the elevation or floodproofing of structures.

Biophilic: Relating to, showing, or being the human tendency to interact or be closely associated with other forms of life in nature. Biophilic design recognizes how much human physical and mental well-being relies on the quality of our relationship to the natural world.

Biomass: Plant materials and animal waste used as a source of fuel.

Bioswale: A long, channeled depression or trench that receives rainwater runoff (as from a parking lot) and has vegetation (such as grasses, flowering herbs, and shrubs) and organic matter (such as mulch) to slow water infiltration and filter out pollutants.

Building Envelope Standard (BES): These standards regulate acceptable massing, height, fenestration, exterior envelopes, and uses.

Carrying Capacity: The carrying capacity is the maximum capability of the installation to support designated functions or activities without seriously degrading the function, activity, or assets of the installation or some portion thereof. Some examples are ability of the land to support training at certain levels of intensity, or availability of utilities (water, electricity, sewer) to support an activity, or ability of the transportation network to carry levels of traffic safely and efficiently.

Charrette: An intensive creative work session in which a design team focuses on a particular design problem and arrives at a collaborative solution with stakeholders from the project area. A charrette can be a breakthrough event that helps create a meaningful Master Plan or facility design. Properly executed, this technique can produce a Master Plan or facility design that is more useful, better understood, and more quickly produced than one formed by any other method.

Defense Critical Infrastructure (DCI): Mission Assurance (MA) is a DoD risk management program that seeks to ensure the availability of Defense Critical Infrastructure (DCI). Activities include identifying and determining risks to DCI, implementing DoD-wide procedures to respond to DCI risks, and supporting DoD initiatives to respond to risks to national critical infrastructure. The public works sector, which includes the Services' installations, is the backbone infrastructure that supports most of DoD's mission requirements. The DCI public works sector ranges from the commercial utility provider to the installation distribution system.

District: A district is an identifiable geographic area based on compatible uses. For example, a single district may contain administrative, commercial, and residential uses. All installation real estate should be assigned to a district.

Edge: An edge is the dividing line between districts. When two districts are joined at one edge, they form a seam. The termination of a district is an edge. Edges are linear elements (e.g., shores, railroads, edges of development, riparian corridors, installation boundaries). Paths (e.g., roads) may be considered edges unless they clearly mark a demarcation between geographic areas.

Expansion Capacity: The expansion capacity is the potential for an installation to successfully accommodate mobilization requirements or the stationing of additional missions, units, activities, individuals, or functions.

\2 Extreme Weather: Recurrent flooding, drought, desertification, wildfires, thawing permafrost, sea level fluctuation, changes in mean high tides, or any other weather-related event, or anticipated change in environmental conditions, that present (or are projected to present) a recurring annual threat to the security of the United States or of allies and partners of the United States. **/2/**

Facility: A real property entity consisting of one or more of the following: a building, a structure, a utility system, pavement, and underlying land.

Flood hazard area: A geographic area that has been or could be inundated with water. Water inundation can be caused by multiple sources, independently or in combination, such as precipitation, snowmelt, or riverine, coastal, or tidal flooding. Common types of flood hazard areas are floodplain designations such as the 1% annual chance event (ACE) or 100-year floodplain and the 0.2% ACE or 500-year floodplain. Flood hazard areas can also represent past flooding events (e.g., storm of significant impact) or future inundation areas reflective of **\2** EWL **/2/** scenarios.

Form-Based Planning: Form-based planning guides construction by identifying the form for installation development (building types, height, set-backs, circulation patterns, landscaping, land use) and translating that form into a series of planning requirements. The form that this practice supports reflects mission needs, program requirements, environmental constraints and opportunities, and other development factors.

Framework Plan: This conceptual plan of the entire installation shows the identified ADP districts, key transportation and land use concepts, and other significant features that will influence development patterns. To establish ADP boundaries, planners should use geographic features, key transportation systems, and existing land use patterns. Within the installation, where succinct districts are not identifiable, specific land uses should be identified.

Future Development Plan: The Future Development Plan is an installation-level plan with all projects in the IDP assigned to developable sites in order to deconflict future development.

Geographic Information System (GIS): This is a collection of computer hardware, software, and geographic data for capturing, storing, manipulating, analyzing, and displaying all forms of geographically referenced information.

Historic District: An identifiable geographic area that has been determined to be eligible for or has been listed on the National Register of Historic Places.

Historic Property: As defined in § 106 of the National Historic Preservation Act, an historic property is a building, structure, object, district or site (archaeological) that has been determined eligible for or is listed on the National Register of Historic Places

Illustrative Plan: Illustrative Plans are graphic plans that illustrate potential development supporting the overall planning vision. The Illustrative Plan shows existing and future streets, building footprints, sidewalks, parking, major landscape features, and key mission areas. Each ADP has an Illustrative Plan.

Installation Development Plan (IDP): The IDP is a combined plan that integrates all the installation's ADPs, Illustrative Plans, and Regulating Plans into one consolidated plan. The IDP also includes installation-wide Network Plans for streets, sidewalks, parks and open spaces, and primary utilities.

Installation Energy Plan (IEP): The IEP is an integration of installation- and higher-level strategic guidance, plans, and policies into a holistic roadmap enabling the installation to work constructively towards its goals in energy efficiency, **\2** alternative energy sources **/2/**, and energy resilience.

Installation Planning Board (IPB): The IPB is a board consisting of members of the command, operational, engineering, planning, and tenant interests of the installation or community that advises mission commanders regarding planning decisions. The IPB will assist the installation leadership to manage, develop, and, in some cases, realign, clean up, and close the installation, supported sites, or area facilities and real estate.

Landmarks: Landmarks are readily identifiable objects that serve as reference points. Examples include gates, memorials, and headquarters buildings. Landmarks are singular points on a map.

Landscape Standards: Landscape standards show appropriate type and placement of major landscape elements (street trees). These standards may also include other natural landscape features (trees, ground cover) and manmade landscape features (street furniture, signage, lighting).

\2\ Military Installation Resilience: The capability of a military installation to avoid, prepare for, minimize the effect of, adapt to, and recover from extreme weather events or from anticipated or unanticipated changes in environmental conditions, that do, or have the potential to, adversely affect the military installation or essential transportation, logistical, or other necessary resources outside of the military installation that are necessary to maintain, improve, or rapidly reestablish installation mission assurance and mission-essential functions. **/2/**

Network Plans: Network Plans cover linkages and systems that span ADP district boundaries. These include installation-wide utility systems, street and transit networks, and parks and open space networks.

Nodes: Nodes are centers of activity within a district (e.g., town squares, community centers, plazas, intersections). Walking radii of 0.25 mile and 0.5 mile should be shown around each node, identifying amenities within a 5- and 10-minute walk.

Path: Paths are channels in which people travel. At the installation level, primary roads and transit routes are paths. In a more detailed plan, sidewalks, trails, and secondary streets can also be considered paths.

Phasing Plan: A phasing plan depicts all relocation, demolition, and construction actions as they occur over time and in a way that moves the installation from its current state to the final state shown on the Illustrative Plan.

Regulating Plan: These graphic plans regulate the most important elements of the Illustrative Plan. They are like enhanced land-use plans. Each Regulating Plan will show buildable area, required build-to lines, required entry and parking locations, minimum and maximum building heights, and acceptable uses (as designated by facility envelope standards). Each ADP has a Regulating Plan.

Resilience: Resilience is the ability to anticipate, prepare for, and adapt to changing conditions; and withstand, respond to and recover rapidly from disruptions.

\2\ Resilience Planning: Resilience planning meets the needs of the present without compromising the ability of future generations to meet their needs. The inter-relationship between environments, resources consumed, waste products, and use of facilities and land must be designed and developed to preclude permanent damage to the future environment. In context of a military installation, resilience planning includes preserving the land and operating space for future mission requirements while meeting today's mission requirements. **/2/**

Stationing or Basing Actions: Stationing or basing actions involve the process of combining force structure and installation structure at a specific location to satisfy mission requirements.

Street Envelope Standards (SES): These standards describe and graphically present allowable street types and circulation elements in plan and section. They are also referred to as Street Standards.

Tenant Unit, Agency, or Activity: These terms refer to a unit, agency, or activity that occupies facilities on an installation and receives support services from that installation.

Viewshed: Viewsheds are view corridors that should not be blocked. Development should be appropriately sited to take advantage of natural viewsheds.

Vision: This is the commander's statement on how the installation will develop and improve over the next 20 years to adapt to the modernizing world, the changing military mission, and our changing society. It expresses the desired relationship between the installation and the surrounding communities and the desired interaction of installation functions, activities, and land uses. It also expresses how the installation commander will satisfy future mission needs while maintaining excellent stewardship of the environment. Installations consist of people as well as land and infrastructure; therefore, the vision should express how quality of life remains a paramount issue in operating, managing, and developing the installation.

This UFC supersedes UFC 3-101-01, dated 28 November 2011, with Changes 1-5, dated 25 September 2019.

FOREWORD

The Unified Facilities Criteria (UFC) system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and applies to the Military Departments, the Defense Agencies, and the DoD Field Activities in accordance with USD (AT&L) Memorandum dated 29 May 2002. UFC will be used for all DoD projects and work for other customers where appropriate. All construction outside of the United States is also governed by Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA), and in some instances, Bilateral Infrastructure Agreements (BIA). Therefore, the acquisition team must ensure compliance with the most stringent of the UFC, the SOFA, the HNFA, and the BIA, as applicable.

UFC are living documents and will be periodically reviewed, updated, and made available to users as part of the Services' responsibility for providing technical criteria for military construction. Headquarters, U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering **\3** Systems **/3/** Command (NAVFAC), and Air Force Civil Engineer Center (AFCEC) are responsible for administration of the UFC system. Defense agencies should contact the preparing service for document interpretation and improvements. Technical content of UFC is the responsibility of the cognizant DoD working group. Recommended changes with supporting rationale may be sent to the respective DoD working group by submitting a Criteria Change Request (CCR) via the Internet site listed below.

UFC are effective upon issuance and are distributed only in electronic media from the following source:

- Whole Building Design Guide website http://www.wbdg.org/ffc/dod.

Refer to UFC 1-200-01, *DoD Building Code*, for implementation of new issuances on projects.

UNIFIED FACILITIES CRITERIA (UFC)
[NEW][REVISION] SUMMARY SHEET

Document: UFC 3-101-01, *Architecture*

Superseding: UFC 3-101-01, dated 28 November 2011, with Changes 1-5, dated 25 September 2019

Description: This UFC unifies the architectural criteria for DOD. The format is updated to the standard format of the Criteria Standard Format for all UFC.

Reasons for Document:

- Required update cycle
- Approved Criteria Change Request (CCRs)
- Conform the format to the UFC 1-300-01 *Criteria Format Standard* including alignment of requirements with the International Building Code (IBC).
- Incorporate latest technologies, policies and references

Impact: Improved mission capability through:

- Reduced total ownership costs of buildings through corrosion resistant design requirements
- Use of reference model codes to greatest extent possible
- Unification of service requirements

Unification Issues

- Referenced space planning criteria is contained in service specific publications.
- Service differences in Air Barrier Testing criteria are noted in this UFC.

TABLE OF CONTENTS

FIGURES

TABLES

CHAPTER 1 INTRODUCTION

1-1 PURPOSE AND SCOPE.

This UFC provides technical requirements, model code modifications, and requirements for architectural design services. Architects must use the information in this document in the development of plans, specifications, calculations, construction contract documents, and Design-Build Requests for Proposals (RFP). The information in this UFC serves as the minimum architectural requirements. Project conditions and programmatic requirements may dictate the need for designs that exceed these requirements.

1-2 APPLICABILITY.

This UFC applies to agencies of the U.S. Armed Services and their contractors that are preparing construction contract documents for Department of Defense-owned facilities. These criteria are applicable in the 50 states, the District of Columbia, Puerto Rico, U.S. territories and possessions, and as far as practical, at installations in foreign countries. This UFC applies to all types of construction regardless of funding, including properties listed or eligible for listing on the National Register of Historic Places, as well as National Guard and Reserve projects constructed on military installations or non-military DoD property. Certain specialized facilities carry more stringent requirements. See UFC or other criteria that are applicable to the respective specialized facility that is being designed. This UFC is applicable to the traditional architectural services customary for Design-Bid-Build design services and for Design-Build construction contracts.

1-3 GENERAL BUILDING REQUIREMENTS.

Comply with UFC 1-200-01, DoD Building Code. UFC 1-200-01 provides applicability of model building codes and government unique criteria for design disciplines and building systems, as well as for accessibility, antiterrorism, security, high performance and sustainability requirements, and safety. Use this UFC in addition to UFC 1-200-01 and the UFCs and government criteria referenced therein.

1-3.1 Environmental Severity and Humid Locations.

The architectural design must incorporate systems and details to meet the environmental corrosivity conditions for the specific project location, as defined by its Environmental Severity Classification (ESC). See UFC 1-200-01 for determination of ESC for project locations. The humidity conditions must also be considered during design; humid locations are those in ASHRAE climate zones 0A, 1A, 2A, 3A, 3C, 4C, and 5C (as identified in ASHRAE 90.1).

1-4 BACKGROUND.

UFC 1-200-01 implements and supplements International Building Code (IBC) as the building code for the DoD. Chapter 2 of this UFC further modifies the IBC for architecture-specific design requirements and is organized by the chapter of the IBC that each section modifies. Apply any section in the IBC that is not specifically referenced as it is written in the IBC.

The IBC section modifications are one of four actions, according to the following legend:

[Addition] – Add new section, including new section number, not shown in IBC.

[Deletion] – Delete referenced IBC section or noted portion of a section.

[Replacement] – Delete referenced IBC section or noted portion and replace it with the narrative shown.

[Supplement] – Add narrative shown as a supplement to the narrative shown in the referenced section of IBC.

1-5 OVERVIEW OF THIS UFC.

Brief descriptions of the various chapters and appendices of this UFC follow.

- CHAPTER 2 – MODIFICATIONS TO THE IBC. Chapter 2 provides supplemental requirements for applying the IBC architectural provisions to conventional DoD building design by listing required modifications for specific IBC sections.
- CHAPTER 3 – DESIGN. Chapter 3 includes architectural design requirements, such as design quality, building orientation, and hazard prevention.
- CHAPTER 4 – PROGRAMMING AND PLANNING. Chapter 4 includes requirements for space planning and building area calculations.
- CHAPTER 5 – PRE-DESIGN, DESIGN AND POST-DESIGN SERVICES. Chapter 5 includes a detailed description of these services, including design charrettes, Architectural Compatibility Submittals, Architectural Basis of Design, Specifications, and Drawings.
- APPENDIX A – BEST PRACTICES. This chapter contains useful recommendations and guidance on a number of important topics, such as planning issues, local construction methods, building envelope considerations, air barrier testing, and daylighting data.
- APPENDIX B – GLOSSARY. This section includes acronyms and definitions of terms.
- APPENDIX C – REFERENCES. This section contains a list of references used in this document. The publication date of the code or standard is not included in this document. Unless otherwise specified, the most recent edition of the referenced publication applies.

1-6 CYBERSECURITY.

Control systems (including systems separate from an energy management control system) must be planned, designed, acquired, executed, and maintained in accordance with UFC 4-010-06, and as required by individual Service Implementation Policy.

1-7 ADDITIONAL REQUIREMENTS.

When performing work for different Activities within the U.S., additional regional or service-specific requirements apply. Confirm with the Authority Having Jurisdiction (AHJ) the applicability of any regional requirements.

This Page Intentionally Left Blank

CHAPTER 2 MODIFICATIONS TO THE IBC

2-1 CHAPTER 7 – FIRE AND SMOKE PROTECTION FEATURES.

2-1.1 SECTION 721 - PRESCRIPTIVE FIRE RESISTANCE.

721.1 – General [Supplement]

Use the UL Fire Rated Assemblies Directory or Nationally Recognized Testing Laboratories for design of fire-resistance-rated wall, floor, and roof assemblies in addition to this section.

2-1.2 SECTION 722 - CALCULATED FIRE RESISTANCE.

722.1 – General [Supplement]

Use the UL Fire Rated Assemblies Directory or Nationally Recognized Testing Laboratories for design of fire-resistance-rated wall, floor, and roof assemblies in addition to this section.

2-2 CHAPTER 8 – INTERIOR FINISHES.

2-2.1 SECTION 802 GENERAL.

802.8 - Paint and Coatings Selection [Addition]

Base paint selection on Master Painters Institute's (MPI's) Detailed Performance Standards for the coating materials and MPI's Architectural Painting Specification Manual for the system. Do not use MPI's "Intended Use" standards. Refer to The Society for Protective Coatings (SSPC) standards, National Association of Corrosion Engineers (NACE) standards, and UFC 3-190-06 for painting steel and concrete structures, particularly in marine and other severe environmental locations.

2-3 CHAPTER 12 – INTERIOR ENVIRONMENT.

2-3.1 SECTION 1202 – VENTILATION.

1202.2.3 - Enclosed Roof Spaces [Addition]

Ventilate enclosed roof spaces created outside the building thermal envelope. For sloped roofs, ventilation must comply with IBC Section 1202 Ventilation. Ensure that moisture transfer from ventilated attics into the building is minimized.

2-3.2 SECTION 1206 - SOUND TRANSMISSION.

1206.1 - Scope [Supplement]

Section 1206.4 applies to other occupancies.

1206.4 - Interior Acoustics for Other Occupancies [Addition]

Design so that interior acoustics coordinate with the architecture, fire protection, mechanical, and structural design. A comprehensive acoustical design must include considerations for sound isolation, building mechanical system noise and vibration control, room finishes, and space adjacencies.

There are basically two types of sound transmission; airborne and structure-borne. Structure-borne sound is transmitted through a material by vibrations and re-radiated to another point (such as upper floor foot traffic). Sound transmission requirements are performance-based. Refer to the Glossary in this guidance for added explanations and definitions of acoustical terms such as STC (Sound Transmission Class) and NIC (Noise Isolation Class). Table 2-1 provides acoustic requirements for common facility and space types.

1206.4.1 - Interior Acoustics Reference Criteria [Addition]

Spaces such as Special Access Program Facilities (SAPF) and Sensitive Compartmented Information Facilities (SCIF) must comply with specific criteria to be accredited for operation. Specialty spaces including television and radio broadcast facilities, music auditoria, large lecture halls (50 people or more), network operations centers, or other spaces will require an acoustical consultant as an integral member of the design team.

The following references include explanations, guidelines, design strategies, and prediction tools to aid in meeting the above required acoustic criteria.

- UFC 3-450-01 “Noise and Vibration Control”
- UFC 4-010-05 “**\3** SCIF/SAPF ***/3/*** Planning, Design and Construction”
- *Sound Matters* from General Services Administration
- ANSI/ASA S12.2, *Criteria for Evaluating Room Noise*
- ASTM E1130, *Standard Test Method for Objective Measurement of Speech Privacy in Open Plan Spaces Using Articulation Index*
- ASTM E2638, *Standard Test Method for Objective Measurement of the Speech Privacy Provided by a Closed Room*

Table 2-1 Interior Acoustic Requirements for Typical Spaces

	Space Acoustic Requirements			
	Sound Isolation [1]		Background Noise Level [3]	Reverberation Time
	Partitions	Doors [2]		
Auditorium [4]	STC 60 or greater	STC 50 or greater	25	< 1.0 sec
Unaccompanied Housing (UH)	STC 50	STC 25	30	n/a
Child Care	STC 50	STC 25	35	< 0.8 sec
Clinic/ Health Unit	STC 50	STC 25	35	< 1.0 sec
Conference Room	STC 50 or greater	STC 30 or greater	30	< 0.8 sec
Classroom	STC 50	STC 30	35	< 0.6 sec
Firing Range	STC 65 or greater	STC 55 or greater	n/a	n/a
Food Service	STC 55	STC 25 or greater	40	< 1.4 sec
Hearing Room	STC 55	STC 35	30	0.6-0.7 sec
Laboratory: Dry	STC 50	STC 25	45	< 1.4 sec
Library	STC 50	STC 30	40	< 1.2 sec
Open Office	n/a	STC n/a	40 [5]	< 1.0 sec
Private Office [6]	STC 35-50	STC 25	35	n/a
Place of Worship	STC 55	STC 35	30	0.8-1.4 sec [7]

1. Sound Isolation requirements are stated in terms of Sound Transmission Class (STC), a laboratory performance metric. See also Facility-Specific UFC for more detailed requirements, which take precedence.
2. STC requirements for most doors (STC 30 and below) can be achieved by using door seals on standard doors. For higher sound isolation requirements, consider using a vestibule, sound rated door(s) or a combination of the two.
3. Background Noise Level requirements are stated in terms of Noise Criteria (NC) or RC Mark II levels. NC and RC Mark II levels are considered equivalent for design purposes; however, RC Mark II noise levels provide additional means to describe the quality of a sound for assessment purposes.
4. Assumes space is primarily used for speech functions. Multipurpose auditoria with music programming must have criteria established by the Government or project acoustical consultant in the response to a proposal.
5. Consider a sound masking system if privacy is important in open office areas. A sound masking system will not alleviate NIC project requirements in other areas of a building. Refer to ASTM E2638 for additional information regarding privacy design considerations in open office areas
6. Criteria dependent on privacy requirements of the occupants.
7. Criteria to be refined by the Government or project acoustical consultant based on specific worship type.

If a space type is not included in the above Table 2-1, the standards in Table 2-2 include interior acoustic requirements for other space/building types.

Table 2-2 Acoustic Requirements for Typical Facilities

Facility/ Space Type	Reference Standard to Meet Project Acoustic Requirements [1, 2]			
	Sound Isolation	Background Noise Level	Room Finishes	Mechanical System Noise & Vibration
Administrative/ Office Buildings • Open Offices • Private Offices • Conference Rooms • Training Rooms • Lobbies	GSA PBS-P100 (see Section 3.5.3)	ASHRAE HVAC Applications Handbook, Ch. 49 – Noise & Vibration Control	GSA PBS-P100 (see Section 3.5.3)	ASHRAE HVAC Applications Handbook, Ch. 49 – Noise & Vibration Control
Child Facilities • Child Care • Day Care • Child Development • K-12 Schools	ANSI S12.60 Parts 1 and 2	ANSI S12.60 Parts 1 and 2	ANSI S12.60 Parts 1 and 2	ASHRAE HVAC Applications Handbook, Ch. 49 – Noise & Vibration Control
Housing • UH • Multifamily Residences • Single Family Residences	IBC (See Section 1206)	ASHRAE HVAC Applications Handbook, Ch. 49 – Noise & Vibration Control	UFC 3-450-01, Noise and Vibration Control	ASHRAE HVAC Applications Handbook, Ch. 49 – Noise & Vibration Control
Medical Care • Hospitals • Clinics	FGI – Sound & Vibration: Design Guidelines for Health Care Facilities	FGI – Sound & Vibration: Design Guidelines for Health Care Facilities	FGI – Sound & Vibration: Design Guidelines for Health Care Facilities	FGI – Sound & Vibration: Design Guidelines for Health Care Facilities
Research Facilities • Laboratories • Associated Lab Support Spaces	NIH – Design Requirements Manual	NIH – Design Requirements Manual (see Section 6.5)	NIH – Design Requirements Manual	NIH – Design Requirements Manual (Section 6.5)
SCIF and SAPF	IC Tech Spec for ICD/ICS 705	ASHRAE Applications Handbook, Ch. 49 – Noise & Vibration Control	UFC 4-010-05	ASHRAE HVAC Applications Handbook, Ch. 49 – Noise & Vibration Control
Legal Facilities • Courts • Associated Court Support Spaces	U.S. Courts Design Guide (Chapter 14)	U.S. Courts Design Guide (Chapter 14)	U.S. Courts Design Guide (Chapter 14)	ASHRAE HVAC Applications Handbook, Ch. 49 – Noise & Vibration Control

1. Chapters and sections referenced are intended to facilitate quick reference of the above standards and not exclude the requirements in the rest of the document.
2. Requirements in the above referenced standards do not supersede requirements stated in Table 2-1 if there is a discrepancy.

2-4 CHAPTER 14 – EXTERIOR WALLS.

2-4.1 SECTION 1401 – GENERAL.

1401.2 - Corrosive Environments [Addition]

For corrosion prone locations as defined in UFC 1-200-01, protect steel surfaces by hot-dipped galvanizing or providing stainless steel. Use Type 316L stainless steel when using stainless steel. Protect hot-dipped galvanized metal with an industrial coating in addition to galvanizing, as galvanized metal will still corrode in these environments. Isolate dissimilar metals (for example, aluminum and steel, stainless steel and carbon steel, and zinc-coated steel and uncoated steel) by appropriate means to avoid the creation of galvanic cells which occur when dissimilar metals come in contact.

2-4.2 SECTION 1404 - INSTALLATION OF WALL COVERINGS.

\2 1404.3.3 **/2/** - Building Envelope Vapor Retarders [Addition]

For building enclosure systems or environmental conditions not covered elsewhere in IBC Article 1404, design the enclosure using simplified or transient design tools referenced in the *ASHRAE Handbook of Fundamentals*, Chapter 25, Heat, Air and Moisture Control in Building Assemblies, and the following sections. Do not provide multiple vapor retarders that trap moisture between the retarders. Select vapor retarders in accordance with ASTM C755. Based on the results of the analysis described in this section, design the assemblies for appropriate diffusion control.

\2 1404.3.3.1 **/2/** Vapor pressure differential calculation.

First determine the vapor pressure difference between indoor and outdoor climates. For exterior vapor pressure, use the mean outdoor dry bulb and dew-point temperatures for the coldest and hottest months in UFC 3-400-02. If the vapor pressure difference is less than 0.25" Hg (847 Pa), place the vapor retarder with appropriate permeance for the application on the predominantly high vapor pressure side of the assembly.

\2 1404.3.3.2 **/2/** Vapor pressure differential greater than 0.25 Hg (847 Pa).

If the vapor pressure difference between indoor and outdoor climates is greater than 0.25" Hg (847 Pa), perform a job-specific simplified or transient vapor transmission (hygrothermal) analysis for walls, roofs, and exposed floors (and floors over crawlspaces) based on project specific climate as defined by UFC 3-400-02, and the specified components and materials. Indicate the temperature and relative humidity for the inside and the outside of the building; a complete listing of building components, including the vapor retarder; their thickness, location, thermal resistance and permanence; and building location and use.

\2 1404.3.3.2.1 ***/2/*** Simplified Hygrothermal Analysis.

Use the steady state dewpoint or Glaser methods described in the *ASHRAE Handbook of Fundamentals (*Chapter 25), using the mean outdoor dry bulb and dew point temperatures for the hottest and coldest months.

\2 1404.3.3.2.2 ***/2/*** Transient Hygrothermal Analysis.

Use a mathematical model that simulates transient hygrothermal conditions, such as WUFI/ORNL (ASTM Manual 40 reviews these models). If the WUFI model is selected, use the climate data included in the WUFI program in lieu of UFC 3-400-02. Users of such methods must understand their limitations, and interpretation of the analysis results must be done by a trained person to reasonably extrapolate field performance approaching the design results. For the mathematical model method, use interior conditions based on a dewpoint of 53°F (12°C) in summer conditions and a dewpoint of 40°F (5°C) in winter conditions. The maximum threshold must be a surface relative humidity of 80% averaged over a period of 30 days to achieve a successful building enclosure assembly for temperatures between 40°F and 120°F (5°C and 50°C) and other criteria described in Chapter 6 of ASHRAE Standard 160. These are thresholds above which mold can grow and building assemblies deteriorate.

\2 1404.3.4 ***/2/*** - Floor Slab Vapor Retarders. [Addition]

Floor slabs on grade must have a vapor retarder of 0.05 perms or less meeting the requirements of ASTM E1745 Class A. Under slab vapor retarders must be durable enough to withstand construction activity and must be terminated around the perimeter and penetrations detailed according to the manufacturer’s instructions. Additionally, specifications must require measurement of slab relative humidity in accordance with ASTM F2170 to meet the requirements of the floor finish manufacturer or must include an application of a topical moisture mitigation material.

\2 1404.3.5 ***/2/*** - Roof Vapor Retarders. [Addition]

Provide moisture analysis of the roof assemblies per paragraph titled, Building Envelope Vapor Retarders. Roof assemblies on concrete slabs must include a vapor retarder on top of the concrete and a vented metal deck to control moisture in the concrete from affecting roof assemblies. However, design low-slope roof assemblies using rigid insulation without a vapor retarder whenever possible. Install vapor retarder in accordance with guidance in the *NRCA Roofing and Waterproofing Manual*.

1404.4.3 - Sill Pan Flashing [Addition]

Penetrations such as windows and louvers in the exterior wall assemblies must have pan flashing installed in the rough opening sill. This pan sill flashing must have end dams at both jambs a minimum of 2 in. (50 mm) high and a rear dam of 2 in. (50 mm) high. Comply with ASTM E2112, the requirements in Chapter 4, Masonry, Brick Industry of America (BIA) Tech Notes, and the *SMACNA Architectural Sheet Metal Manual* recommendations.

1404.13.2 - Selection of Windows and Glazing. [Addition]

Based on a life cycle cost analysis (LCCA), select windows and glazing with the best possible performance from a U-factor, Solar Heat Gain Coefficient (SHGC), daylighting, and Visible Transmittance (VT) for the fenestration. Optimize the emissivity coatings to control both heat gain into the building due to solar radiation and heat loss from the building. Select frames with thermal breaks. Include flashings under fenestration in an appropriate manner. Fenestration must meet both code and UFC 4-010-01 requirements. Do not use steel, wood, or plastic-clad wood windows in locations with Environmental Severity Classifications (ESC) of C4 or C5. See UFC 1-200-01 for determination of ESC for a project location.

1404.13.3 - Aluminum Windows. [Addition]

Aluminum windows must be heavy-duty commercial quality systems; conforming to AAMA/WDMA/CSA 101. For window reinforcing purposes, concealed 316L stainless steel or aluminum reinforcing inserts are required. Internal fasteners must be 316L stainless steel. Aluminum windows must have anodized aluminum finish and color to meet the requirements in the applicable installation exterior architectural guidelines.

1404.13.4 - Operable Windows. [Addition]

Provide locks which discourage the opening of windows during HVAC system operation. Provide window guards at upper floor operable windows of housing projects in compliance with ASTM F2090.

1404.13.5 - Window Installation and Details. [Addition]

Install windows according to ASTM E2112. Provide concrete step detail that prevents water from being driven directly under window sills. Seal exterior window and door rough openings to prevent water infiltration into wall cavities including sealing exterior wall and interior side furred out walls.

1404.13.6 - Window Screens. [Addition]

Window screen must be mounted on the inside of the window frame with aluminum window frame screens matching the color of the window frame. Provide the anodized aluminum screen frames with 316L stainless steel spring clips to hold screen frame securely in window frame. Screen material must be plastic-coated fiberglass or aluminum mesh.

1404.13.7 - Weatherstripping. [Addition]

Provide nonferrous metal and UV-resistant vinyl weather stripping. Weatherstripping must be factory applied, and limit infiltration to 0.25 cubic feet/min/square foot (1.698 cubic meter/min/square meter) in accordance with ASTM E283.

1404.13.8 - Storefronts [Addition]

Exterior storefront systems must be heavy-duty commercial quality aluminum system with anodized aluminum finish and color to meet the requirements in the applicable installation exterior architectural guidelines; and conform to AAMA/WDMA/CSA 101. Storefront doors must be medium stile. Install storefronts according to ASTM E2112.

1404.13.9 - Exterior Glazing [Addition]

Exterior windows must have insulated glazing system (outer lite low E with an air space and interior lite meeting the IBC requirements for wind and windborne debris protection, where applicable, and UFC requirements for Antiterrorism protection). Consider building energy efficiency, occupant comfort, daylighting, acoustic performance, and security when selecting exterior window and glazing systems. Coordinate glazing tint with applicable installation exterior architectural guidelines unless otherwise noted, sustainability recommendations and energy requirements. Unless otherwise required, unshaded glazing must be factory tinted; shaded glazing at storefront requiring see-through visibility may be clear, non-tinted.

2-4.3 SECTION 1407 - EXTERIOR INSULATION AND FINISH SYSTEMS (EIFS).

1407.7 - Exterior Insulation and Finish Systems (EIFS) Use and Detailing [Addition]

Selection of EIFS systems must be based on a LCCA that considers maintenance requirements and frequency of recoating. Use only self-draining EIFS systems. Do not install EIFS within 6 in (150 mm) of grade, or in areas where it will be subject to abuse by moving vehicles or equipment, such as a loading dock. Do not use EIFS in areas of heavy pedestrian traffic, or if such use cannot be avoided, specify high-impact resistant system. Use high-impact systems a minimum of 4 ft. (1220 mm) above grade where subject to damage from pedestrian traffic or lawn maintenance equipment. Construction documents must provide specific design details for windows, trim, expansion joints, and drainage planes. Comply with the criteria listed in the latest version of EIFS Standards & ICC-ES Acceptance Criteria document produced by the EIFS Industry Members Association (EIMA). Where EIFS is applied to a (side) wall which has an eave from the roof, a premolded polypropylene / use PVC kickout flashing to channel the water away from the exterior wall.

1407.7.1 EIFS in High Wind Zones.

In areas with design wind loads up to 35 psf (170 Kg/m2) (118 mph or 190km/h), adhered EIFS must only be permitted provided the EIFS assembly includes a minimum 5/8-in.- (16-mm-) thick glass-fiber-faced siliconized gypsum sheathing fastened with corrosion-resistant screws that have a minimum 3/8-in- (10-mm-) diameter washer heads fastened to engineered light-gage metal framing spaced 16 in (405 mm) on center with screws spaced 4 in (100 mm) on center. In areas with higher wind speeds, the contractor must provide **\1** wind-tested assemblies and submit test documentation establishing performance under design **/1/** wind-loads in accordance with ASCE/SEI 7.

2-4.4 SECTION 1410 - GYPSUM BOARD CONSTRUCTION.

1410.1 - Prevention of Mold [Addition]

Use glass mat gypsum (paperless or non-cellulose facing) sheathing for exterior applications and use glass mat or moisture/mold resistant gypsum wall board for the interior face of exterior walls (prevents food source for mold). On exterior walls, use only interior wall finishes that allow water vapor within the wall to escape into the conditioned space. Do not use vinyl wall coverings, oil-based paint, and other vapor-resistant materials as interior finishes for exterior walls.

2-5 CHAPTER 18 – SOILS AND FOUNDATIONS.

2-5.1 SECTION 1805 - DAMPPROOFING AND WATERPROOFING.

1805.2.2 - Walls [Supplement]

If required to address hydrostatic pressure or as recommended by the geotechnical report, provide drainage planes combined with waterproofing material and a footing drain on below-grade walls.

1805.4.2 - Foundation Drain [Supplement]

Footing drains and under-slab drainage must be incorporated based on the recommendations of the geotechnical engineering report.

2-5.2 SECTION 1808 – FOUNDATIONS.

1808.6.5 - Insulation [Addition]

Where the energy model or code requires insulation for slab-on-ground floors, use high-density (40-100 psi [276-689 kPA] depending on floor loading with a safety factor of 5) extruded polystyrene under the vapor retarder. Apply requirements of ASCE 32-01 to keep soils thawed to minimize frost action in cold regions. Coordinate final assembly U-Factors with the mechanical engineer to comply with overall facility energy requirements. Protect insulation from weather, including rain, ultraviolet solar radiation, mechanical abuse, compression, or accidental or deliberate movement from its location during its service life.

2-6 CHAPTER 20 - ALUMINUM.

2-6.1 SECTION 2002 - MATERIALS.

2002.2 - Corrosion Prone Locations. [Addition]

For corrosion prone locations as defined in UFC 1-200-01, protect aluminum surfaces with an industrial coating or heavy-duty anodized coating. Isolate dissimilar metals (for example, aluminum and steel, stainless steel and carbon steel, and zinc-coated steel and uncoated steel) by appropriate means to avoid the creation of galvanic cells which occur when dissimilar metals come in contact.

2-7 CHAPTER 21 - MASONRY.

2-7.1 SECTION 2115 - MASONRY DETAILING AND MISCELLANEOUS PROVISIONS. [Addition].

2115.1 - Masonry Details [Addition]

Comply with the Brick Industry Association (BIA) Technote 7, Technote 18A, and Technote 21 for specific brick masonry recommendations and other topic specific Technotes as applicable.

2115.2 - Expansion Joint Position and Location [Addition]

No single recommendation for positioning and spacing of vertical expansion joints can be applicable to structures. Analyze each building to determine the potential horizontal and vertical movements and make provisions to relieve excessive stress that might be expected to result from such movement. Place expansion and crack control joints in accordance with BIA Technote 18A. Place expansion joints symmetrically on building elevations. Indicate expansion joints on the contract drawings.

2115.3 - Plastic and Membrane Through-Wall Flashing [Addition]

Plastic flashings and asphalt-impregnated felt flashings are prohibited.

2115.4 - Clearance Between Masonry and Back-up Construction [Addition]

Provide a 2-in. (50 mm) minimum clear dimension from the face of cavity insulation or sheathing material to the back of the exterior wythe of masonry. See American Concrete Institute, ACI 530 for additional information. See BIA Technote 21 for additional guidance.

2115.5 - Flashing at Penetrations and Projections [Addition]

Do not design structural steel frame members to be exposed inside a cavity wall. Provide flashing at penetrations exposed into the cavity such as columns or beams, and at floor slabs, wall projections and recesses, and wall bases. Projections, recesses, and caps must be flashed and sloped away from the wall to ease drainage.

2115.6 - Location of Weep Holes [Addition]

Provide open-head joint weeps at through-wall flashing for brick masonry. Locate weeps on the same course as the flashing. Space weep holes at 24 in. (610 mm) on center for brick masonry and 32 in. (815 mm) on center for concrete masonry. Locate weeps above the level of the finished grade, including landscape mulching, to prevent the weeps from becoming clogged with foreign material. Weeps must be designed to be open-head joints with corrugated plastic inserts only. Provide masonry vents at top of walls and below continuous shelf angles. These provide better ventilation of cavity spaces to prevent buildup of warm, moist air at the tops of cavities. For single-wythe exterior CMU walls, provide a flashing/weep system for open CMU cells to drain to the exterior.

2-8 CHAPTER 22 - STEEL.

2-8.1 SECTION 2203 - PROTECTION OF STEEL FOR STRUCTURAL PURPOSES.

2203.2 - Corrosive Environments [Addition]

For corrosion prone locations as defined in UFC 1-200-01, protect steel surfaces by hot-dipped galvanizing or providing stainless steel. Use Type 316L stainless steel when using stainless steel. Protect hot-dipped galvanized metal with an industrial coating in addition to galvanizing, as galvanized metal will still corrode in these environments. Isolate dissimilar metals (for example, aluminum and steel, stainless steel and carbon steel, and zinc-coated steel and uncoated steel) by appropriate means to avoid the creation of galvanic cells which occur when dissimilar metals come in contact.

2-8.2 SECTION 2211 COLD-FORMED STEEL LIGHT-FRAME CONSTRUCTION.

2211.3 - Above-Grade Finished Floor Elevation [Addition]

Provide a minimum of 18 inches (455 mm) clear space above finished grade for light frame metal floor construction.

2-9 CHAPTER 23 - WOOD.

2-9.1 SECTION 2304 – GENERAL CONSTRUCTION REQUIREMENTS.

2304.12.1.1 - Joists, girders, and subfloor [Replacement]

Provide a minimum of 18 inches (455 mm) clear space above finish grade and crawlspaces for light-frame wood construction. Wood girders that are closer than 12 inches (305 mm) to the exposed ground in crawlspaces or unexcavated areas located within the perimeter of the building foundation must be naturally durable or preservative-treated wood.

2-10 CHAPTER 25 – GYPSUM BOARD, GYPSUM PANEL PRODUCTS AND PLASTER.

2-10.1 SECTION 2515 - TRIM AND MOLDINGS [Addition].

2515.1 - Materials.

In high humidity interior areas (for example, bathrooms, locker rooms, pools, trainers), areas open to the exterior (for example, mechanical rooms, and hangars), and spaces that are not conditioned by design or may not be conditioned during prolonged periods due to deployment, use PVC or plastic trims, casings, and accessories in lieu of metal, which may rust over time.

CHAPTER 3 DESIGN

3-1 DESIGN QUALITY.

The following principles are adapted from GSA's *Guiding Principles for Federal Architecture*:

- Provide facilities in an architectural style and form that is distinguished, and which will reflect the dignity, enterprise, vigor, and stability of the Federal Government. Place emphasis on the choice of designs that embody the finest contemporary American architectural thought relative to the building's function. Pay specific attention to the possibilities of incorporating into such designs qualities that reflect the regional architectural traditions of that part of the country in which buildings are located. Designs must adhere to sound construction practice and utilize materials, methods, and equipment of proven dependability. Buildings must be economical to build, operate and maintain; resilient, sustainable, and accessible.
- The development of an official style must be avoided. Design must flow from the architectural profession to the Services and not vice versa.
- Consider the choice and development of the building site as the first step of the design process. Pay special attention to the general ensemble of streets and public places of which these buildings will form a part. Where appropriate, locate buildings to permit a generous development of landscape.

3-1.2 Installation Exterior Architecture.

Most military installations and service design agencies have published design guidelines that contain criteria relative to achieving, maintaining, and emphasizing a positive exterior visual environment. Follow the design guidance contained in these documents. In the absence of such guidelines, design facilities to harmonize with the character of existing facilities considered historically or architecturally significant to the area. Air Force projects must comply with the Air Force Corporate Facilities Standards and applicable Installation Facilities Standards.

3-1.3 Historic Architecture.

Follow the Secretary of Interior's Standards for Rehabilitation and Guidelines for Rehabilitating Historic Buildings for repair or renovation of historic facilities and new construction near historic facilities.

3-1.4 Projects in the National Capital Region (NCR).

In accordance with the National Capital Planning Act of 1952, as amended, submit all master plans and designs for proposed construction projects in the NCR to the National

Capital Planning Commission (NCPC) for appropriate reviews and approvals consistent with the timelines issued by the NCPC.

3-2 BUILDING ORIENTATION.

Establish building siting in **\1** in accordance with the Regulating Plan of the Installation Master Plan, see UFC 2-100-01, section 2-9.1.2. **/1/** Optimize building layout and orientation with regard to functional arrangement, access, exterior appearance, views, present and expected future site acoustic conditions, and other considerations.

Utilize the site environmental factors to orient buildings to minimize annual facility energy use and to optimize daylighting. Consider seasonal solar angles and prevailing winds to enhance energy performance of the building within the site-specific micro climate. See Appendix A Best Practices, paragraph Daylighting for additional information. See also UFC 1-200-02.

3-3 HAZARD PREVENTION.

Design facilities to comply with 29 CFR Occupational Safety and Health Act (OSHA). Pay particular attention to lead and asbestos particulates, which may be lying on top of materials to be removed, and polychlorinated biphenyls (PCBs) that are part of caulking and sealant materials that may have been absorbed into adjacent building materials and require grinding.**\1**

Design fixed ladders and roof hatches in accordance with 29 CFR 1910.23 and the IBC, according to the most stringent requirements. Design handrails, guardrails, and fall arrest systems to comply with 29 CFR 1910.28, 29 CFR 1910.140, and the IBC, according to the most stringent requirements. **/1/**

3-3.1 Radon.

Evaluate and mitigate radon per the appropriate Service and Installation regulations.

3-3.1.1 Identification of Radon.

3-3.1.1.1 Army, Air Force and Navy.

Check the Environmental Protection Agency’s (EPA's) Map of Radon Zones (by state), EPA 402-R-93-071, to determine the radon area.

3-3.1.1.2 Navy.

For Navy requirements follow OPNAV M-5090.1C Chapter 30 “Radon Assessment and Mitigation”, and the Navy Radon Assessment and Mitigation Program (NAVRAMP) Guidebook for Naval Shore Installations. NAVRAMP provides for compliance with the procedural requirements of the Toxic Substances Control Act (TSCA) related to radon. For existing buildings check the results of the NAVRAMP survey by contacting the NAVFAC Facility Engineering Systems Command (FEC) Air Pollution Engineer.

3-3.1.1.3 Air Force.

Check the results of the AF Radon Assessment and Mitigation Program (RAMP) study of 1987. During that study, Air Force Installations were screened for radon in existing structures. Installations were classified as being of low, medium, or high risk. Incorporate radon reduction measures in the construction of new facilities at those installations designated as medium or high risk if installation not included in EPA Priority Areas No. 1. See AFMAN 48-148 for additional guidance on radon sampling and mitigation.

3-3.1.1.4 Lack of Radon Data.

If no data is available for the area or site to make a prediction of radon levels, then a radon survey must be done, or a passive radon mitigation system installed.

3-3.1.2 Radon Mitigation System Design.

Provide passive under-slab depressurization systems for projects located in Priority Areas No. 1 (predicted average radon level is greater than 4/pCi/L). Change the system to active, if needed, based on follow-up testing. Check the following EPA documents available from the EPA’s Publications about Radon website, https://www.epa.gov/radon/publications-about-radon

- EPA's Model Standards and Techniques for Control of Radon in New Residences, U.S. Environmental Protection Agency, Air and Radiation (6604-J), EPA 402-R-94-009,
- Radon Prevention in the Design and Construction of Schools and Other Large Buildings, EPA/625/R-92-016,

3-3.2 Paints with Lead, Cadmium, and Chromium.

Painted surfaces containing lead, cadmium, and chromium, as well as operations involving these and other heavy metals are regulated by the Occupational Safety and Health Act (OSHA) and the Resource Conservation and Recovery Act (RCRA). Paints containing lead, cadmium, and chromium are often found as protective coatings on structural steel, tanks, piping, metal building components, exterior coatings on metal surfaces, aircraft, and ships. Paints containing lead, cadmium, chromium, and other heavy metals are used in current operational processes in various facilities, such as aircraft maintenance hangars, and ship maintenance and repair facilities. If not properly controlled and managed, dust and particulates containing lead, cadmium, chromium, and other heavy metals can be generated from operational activities resulting in contaminated dust deposits on building surfaces that must be remediated during renovation, alteration, repair, or demolition activities. For Navy and Marine Corps projects involving renovation, alteration, repair, or demolition, comply with UFC 3-810-01N.

Facilities with heavy metal paints or coatings, or facilities that operated or will operate utilizing heavy metals or chemicals in their operations, must comply with the Occupational Safety and Health Act 29 CFR 1910.141 General Environmental Controls, 29 CFR 1910.1025 Lead, 29 CFR 1910.1026 Chromium (VI), and 29 CFR 1910.1027 Cadmium. The requirements found in the CFR may affect facility design requirements, which include but are not limited to: separate toilets and washing/bathing areas, change rooms, decontamination areas, clothes washing facilities, areas for controlled disposal of contaminated waste and work clothes, high-efficiency particulate air (HEPA) systems and filters, and deluge showers. Designate areas of facilities utilizing these heavy metals or chemicals as regulated areas whenever exposure can be expected to be in excess of the permissible exposure limit(s), and demarcate from the rest of the workplace in a manner that adequately establishes and alerts building occupants of the boundaries of the regulated area. Design facilities to allow the performance of the OSHA and EPA air sampling and monitoring as required for the specific hazardous metal or chemical in use.

3-3.3 Beryllium Coatings and Compounds.

Beryllium is an essential material used in the aerospace, electronics, energy, telecommunications, information technology, defense, medical, and nuclear industries. Beryllium is classified as a strategic and critical material by the U.S. Department of Defense. Beryllium is used industrially in three forms: as a pure metal, as beryllium oxide, and most commonly as an alloy with copper, aluminum, magnesium, or nickel. Workers in industries where beryllium is present may be exposed to beryllium by inhaling or contacting beryllium in the air or on surfaces. Beryllium is a highly toxic metal and workers who inhale beryllium are at an increased risk of developing chronic beryllium disease (CBD) or lung cancer. Coatings and compounds containing beryllium are used in current operational processes in various facilities, such as aircraft maintenance hangars, and ship maintenance and repair facilities. If not properly controlled and managed, dust and particulates containing beryllium can be generated from operational activities resulting in contaminated dust deposits on building surfaces which must be remediated during renovation, alteration, repair, or demolition activities. For Navy and Marine Corps projects involving renovation, alteration, repair, or demolition, comply with UFC 3-810-01N.

Facilities that operated or will operate utilizing beryllium in their operations must comply with the Occupational Safety and Health Act 29 CFR 1910.1024 Beryllium, 29 CFR 1915.1024 Beryllium, and 29 CFR 1926.1124 Beryllium. The requirements found in the CFR may affect facility design requirements, which include but are not limited to: separate toilets and washing/bathing areas, change rooms, decontamination areas, clothes washing facilities, areas for controlled disposal of contaminated waste and work clothes, high-efficiency particulate air (HEPA) systems and filters, and deluge showers. Designate areas of facilities utilizing these heavy metals or chemicals as regulated areas whenever exposure can be expected to be in excess of the permissible exposure limit(s), and demarcate from the rest of the workplace in a manner that adequately establishes and alerts building occupants of the boundaries of the regulated area.

Design facilities in a manner to allow the performance of the OSHA and EPA air sampling and monitoring that are required for beryllium.

3-4 MECHANICAL/ELECTRICAL/TELECOMMUNICATION ROOMS.

Design adequate mechanical equipment rooms, electrical rooms, and telecommunication rooms. Provide sufficient floor-to-floor height, vertical distribution space, and mechanical equipment space to accommodate a ducted system to supply preconditioned ventilation air (when a ducted system is used). Provide an adequate volume of space for all building distribution systems and provide access for maintenance. For mechanical equipment room sizing, coordinate with the mechanical designer at the earliest stage to ensure the required clearances for maintenance, servicing, and safety are included. Provide mechanical rooms in accordance with UFC 3-410-01. For telecommunications rooms, coordinate with the electrical designer. Do not route water or sanitary piping above electrical rooms or telecommunication rooms. See UFC 3-580-01 for additional telecommunications system requirements. For noise control, refer to Chapter 2 paragraph, Sound Transmission.

3-5 PLUMBING.

Refer to UFC 3-420-01 for plumbing fixture count and requirements.

3-6 AIR BARRIER DESIGN AND TESTING.

3-6.1 New Construction.

Clearly identify air barrier components of each envelope assembly on construction documents and detail the joints, interconnections, and penetrations of the air barrier components. Clearly identify the boundary limits of the building air barriers and of the zone or zones to be tested for building air tightness on the drawings. Include the calculated six-sided area of the air barrier envelope on the drawings for each test area.

Compartmentalize spaces under negative pressure, such as boiler rooms and laundry rooms, and provide make-up air for combustion. **\1**

3-6.2 Modifications.

When a building is undergoing a modification **/1/** of the building envelope, see Appendix A, paragraph Air Barrier for Modifying an Existing Building, for guidance.

3-6.3 Inspections and Testing.

Continuous air barrier inspection and testing must be in accordance with the requirements of the International Green Construction Code (IgCC) with **\2** building air leakage rate not exceeding 0.25 cfm/ft2 (1.25 L/s-m2) under a pressure differential of 0.3 inches of water (75 Pa) when tested. **/2/**

Detailed inspection and testing requirements and acceptance criteria must be included in the project specifications. Include UFGS Section **\3** 01 91 19 /**3**/ as part of the project specification when testing of the air barrier is required.

The following facility air barriers require inspection only:

- Those facility types outside the scope of ASHRAE 90.1
- **\4** New and existing buildings and conditioned spaces under 10,000 ft2 (929 m2) **/4/**
- Semi-heated buildings
- **\3** Spaces with large exterior doors, such as sliding hangar doors, overhead coiling and, or sectional doors. **/3/**
- Building additions onto non-renovated structures if the interface cannot be adequately sealed for testing.

3-6.4 Mock-Ups.

Mockups for air barrier installation require approval by the AHJ. See Appendix A, Best Practices for guidance.

3-7 FENESTRATION DESIGN.

Develop a comprehensive design that considers both exterior shading devices, including horizontal sunscreens and vertical fins (beneficial in hot southern climates), and interior shading devices (necessary to control glare when direct solar intrusion is inevitable). Optimize the window-to-wall ratio to (1) reduce lighting energy when using daylighting controls and (2) avoid the glare and added energy consumption that can result from large window areas. Glazing areas above 7 ft. (2135 mm) high are useful in increasing daylight penetration, especially when coupled with light-reflecting shelves. Base design on life cycle cost effectiveness. Design glazing to optimize daylighting and views, which has been proven to enhance occupant well-being.

Coordinate the selection among windows, storefronts, and curtain walls with the structural design. Coordinate the final fenestration design with the mechanical and electrical engineers to comply with overall facility energy requirements.

3-7.1 Daylighting \3\ Design /3/.

Design DoD projects to optimize daylight entering occupied spaces while minimizing the effects of solar heat gain and glare. See Appendix A for daylighting best practices.

3-8 ACOUSTICS – OUTSIDE TO INSIDE NOISE CONTROL.

3-8.1 Design.

Design the facility to provide a comfortable inside acoustical environment that limits exterior noise intrusion to noise-sensitive spaces. Develop a comprehensive acoustical design for individual facilities based on the acoustic analysis that uses the tools below. Identify outside noise sources. Utilize the Air Installation Compatible Use Zones (AICUZ) map and determine the Day Night Average Sound Level (DNL) or Community Noise Equivalent Level (CNEL) of the project site. In addition to the AICUZ map noise level, determine if other noise sources are near the project site. Other noise sources include engine test facilities, vehicle traffic, rail line, small arms ranges, or any site noise source that can be identified. Determine if any of the following noise sources are within the following distances:

- Major Road within 1,000 ft. (305 m) project site
- Rapid Transit Line or Rail Line within 3,000 ft. (915 m) of project site
- Engine Test Facility within 3,000 ft. (915 m) of project site
- Firing Range within 3,000 ft. (915 m) of project site

If an AICUZ map is available, use Table 3-1 for noise mitigation measures. If the project site is within the specified distance of a noise generating element listed above, the project will require an acoustical engineer to conduct an analysis including a site noise test for a continuous 72 hours to determine the DNL or CNEL.

If an AICUZ map is unavailable, and the project site is within the specified distance of a noise generating element listed above, the project will require an acoustical engineer to conduct an analysis including a site noise test for a continuous 72 hours to determine the DNL or CNEL. The measurement period must include two weekdays and one weekend day to capture typical site activity and be conducted in accordance with ANSI S12.9 Parts 1 & 2 – Quantities and Procedures for Description and Measurement of Environmental Sound. Based on the AICUZ map and testing results, the table below summarizes the required composite Outdoor Indoor Transmission Class (OITC) values for the building envelope.

Table 3-1 Building Façade Sound Isolation

Required Composite(1) Isolation of Building Façade and Roof Construction Based on Interior Background Noise Levels				
Interior Background Noise Level (2)	Exterior Sound Level at the Site (DNL or CNEL)			
	< 65 dBA	65 dBA - 70 dBA	70 dBA - 75 dBA	> 75 dBA
NC-25 or Lower	OITC 35	OITC 40	OITC 45	OITC 50
NC-30	OITC 30	OITC 35	OITC 40	OITC 45
NC-35	OITC 28	OITC 30	OITC 35	OITC 40
Above NC-35	OITC 25	OITC 28	OITC 30	OITC 35

1. Composite calculations must include all envelope elements including doors, windows, louvers, and other openings.
2. Equivalent RC Mark II noise levels may be used.

Apply the more stringent criteria when the project site has both AICUZ map information and site noise testing measurements.

CHAPTER 4 PROGRAMMING, PLANNING, AND PRE-DESIGN SERVICES

4-1 SPACE PLANNING CRITERIA.

Program non-standardized facility sizes based on a functional analysis of activities to be accommodated to determine the actual amount of space required. Base facility planning on specific requirements for each project, to include all functional, technical, and economic considerations. To obtain the most economical and efficient use of space, design facilities based on the functional organization of adequately sized spaces. The following publications contain tables of allowances for general planning purposes; however, the final size of each project must be based on actual requirements:

- AFMAN 32-1084, “Facility Requirements”
- AR 405-70, Utilization of Real Property
- TM 5-803-5, “Installation Design” and model design-build RFP and standard designs, as applicable
- UFC 2-000-05N, Facility Planning Criteria for Navy/Marine Corps Shore Installations

The documents above are used to determine general facility requirements. Refer to other facility-specific UFC for more detailed requirements.

4-2 BUILDING AREA CALCULATIONS.

Include net and gross floor area calculations in the Basis of Design/Design Analysis to confirm scope and code/criteria compliance. Include a block diagram indicating the building outline and all areas that contribute to the building area. Conform to gross area calculation methods and definitions for military programming and scope validation in this UFC. For Type of Spaces and Definitions, see Table 4-1. Other area calculations and definitions may be required to establish compliance with the IBC and Life Safety codes. Figures 4-1 and 4-2 illustrate a sample gross building area calculation and block diagram.

4-2.1 Scope Changes.

Changes to scope are governed by Title 10 USC 2853, as documented in project Change Management Plans included in the Project Management Plans.

4-2.2 Calculations of Gross Building Area.

Other facility-specific UFC such as those for medical facilities, family housing, and unaccompanied housing provide additional guidance regarding how to calculate the gross area for those facility types. For other facilities, calculate the gross area of a building using Table 4-1 (definitions of spaces per the IBC).

Table 4-1 Gross Building Area

Type of Space	Definition
Enclosed Spaces	The total area of all floors measured from the exterior face of exterior walls or from centerline of walls separating adjoined buildings including: - mezzanines - basements - penthouses - enclosed spaces such as pre-engineered metal building's housing equipment. - enclosed stairwells, elevators, utility chases are included as part of the area of the floor that they occupy.
Unenclosed Programmed Facilities	For covered outdoor facilities with no exterior walls, where the area is programmed by the space function (for example, walls are not required and only a roof is necessary to perform its designated function) the facility gross square footage is the total area measured under the roof. Refer to individual service component planning documents for programmed areas of these spaces.
One-Half Spaces	Include one-half of the gross area of paved or finished attached covered areas, such as: - balconies and porches - covered but not enclosed entrances - covered raised loading platforms - covered ground level or depressed loading facilities - covered but not enclosed walks or passageways - covered and uncovered but not enclosed exterior stairs - covered ramps For Army Unaccompanied Enlisted Personnel Housing (UEPH) calculate interior shared corridors as one-half space; calculate circulation spaces within the living unit as full area.
Excluded Spaces	Exclude the following spaces from the gross area calculations when the average ceiling height is less than 7 ft (2.1 m) measured from the underside of a structural system and with perimeter walls measuring a minimum of 59 in. (1500mm) in height: - mezzanines - interstitial spaces - penthouses - enclosed crawl and utility spaces such as tunnels, raceways, and trenches-catwalks - equipment platforms - exterior uncovered walks, ramps, and stoops - uncovered loading platforms or facilities, either depressed, ground level, or raised

Excluded Spaces	- open courtyards - open paved terraces - roof overhangs - glazing shading devices, and awnings - Prefabricated enclosures provided by the equipment manufacturer which house equipment are considered equipment and are also excluded - the void areas of atria (only include the floor area of the lowest level of atria)

Figure 4-1 Sample Gross Building Area Calculation

PROJECT LOCATION

4-3 PRE-DESIGN SERVICES.

This process involves meeting with the using activity to review the programmed requirements for a new project. Based on these meetings the program documents and the DD Form 1391 are updated for submission to Congress. Prepare DD Form 1391 using the Electronic Project Generator (EPG) for Navy projects. For Army and Air Force projects, use the DD Form 1391 Processor System. Government personnel normally complete this process, but often an Architect/Engineer is contracted to provide planning support for preliminary programming, studying functional adjacencies, providing sketches, and other design-related support. A planning charrette is used to define the user's requirements.

This Page Intentionally Left Blank

CHAPTER 5 DESIGN AND POST-DESIGN SERVICES

5-1 GENERAL.

Provide architectural design services in accordance with this chapter. For the Navy, provide architectural design services in accordance with FC 1-300-09N. For Air Force, projects comply with the Air Force Corporate Facilities Standards and applicable Installation Facility Standards.

5-2 DESIGN SERVICES.

Provide the following design services unless modified by the contract.

5-2.1 Design Charrettes.

Functional Analysis Concept Developments (FACDs) and design charrettes are cooperative efforts by the design team, user/customer representatives, Government design and contract personnel, and other interested parties. They may last a few days, or a week or more, and include on-site development of a consensus conceptual design in response to functional, aesthetic, environmental, base planning, site, budgetary, and other requirements. For Air Force projects, the final document is called a Planning Charrette Report (PCR). In addition to Charrettes, the Navy also uses FACD studies; see FC 1-300-09N for additional information on FACDs. The scope of FACDs, PCRs, and design charrettes are project specific and will be defined in the Scope of Work.

5-2.2 Architectural Compatibility Submittal.

If the project Scope or Statement of Work requires an Architectural Compatibility Submittal, it must meet the requirements herein. On high visibility projects, the designer of record may be asked to provide a presentation of this submittal. If a project does not require a separate Architectural Compatibility Submittal, address exterior building design and compatibility in the Basis of Design, as defined herein, using applicable installation exterior architectural guidelines.

When required, the Architectural Compatibility Submittal documents the exterior architectural design of a new facility or major renovation. Determine architectural compatibility at the concept stage of the project. Provide adequate documentation that indicates that the materials, colors, and design elements used on the exterior of the building are compatible with other facilities nearby and with other design guidance required by the installation or customer. Clearly show that the design meets the requirements of Chapter 3 paragraph, Design Quality.

5-2.2.1 Exterior Finish and Color Schedule.

The Architect is responsible for selection and coordination of final exterior finish and color selections using installation architectural guidelines, after obtaining input from the using activity and the Government’s architectural reviewer. Indicate these selections on a comprehensive schedule located on the contract drawings.

5-2.2.2 Format.

The Architectural Compatibility Submittal consists of the following four elements:

5-2.2.2.1 Statement of Compatibility.

Provide a brief description of the design, stating concisely the architectural compatibility of the project with respect to the existing nearby permanent facilities and the applicable installation exterior architectural guidelines. Include not only building characteristics, but also a site analysis, visual environment concept, and appropriateness of construction materials and colors.

5-2.2.2.2 Drawings.

Provide the following drawings as applicable:

1. Site Plan - Indicate site boundaries, building locations (existing, proposed, and future), drives and roads, parking, pedestrian circulation, pedestrian and service entrances, **\2** dumpsters **/2/** and landscaping.
2. Floor Plans - Indicate main entrances, service areas, room designations, and exterior stairs and ramps.
3. Elevations - Provide all building elevations, and indicate all exterior materials, architectural characteristics and design elements. As an option, provide concept renderings.

5-2.2.2.3 Exterior Color Boards.

Provide tangible samples of all exterior materials and colors. When matching existing materials and colors, it is not sufficient to state, “match existing.”

5-2.2.2.4 Photographs.

Provide enough digital photographs to indicate the character of the existing nearby facilities that have influence on the architectural design of the project. Reference photograph locations on the Site Plan or with a key plan.

5-2.3 Architectural Basis of Design/Design Analysis.

The Basis of Design/Design Analysis is a written document that describes the project at the Preliminary Stage and is updated at each subsequent stage. The Navy uses the term Basis of Design. The Army and Air Force use the term Design Analysis. Include the following items:

1. Scope of Work – Summarize the architectural program or scope of work, listing the overall square footage, the functional requirements of the facility, and a tabulation of rooms with square footages of each space.

2. Type of Construction - Describe the type of construction selected and justify its use relative to building permanency, life cycle cost, functionality, and fire resistance. Coordinate with the Fire Protection Engineer.

3. Life Safety Code Analysis - Provide an analysis of the design to include the required number of exits, travel distances, egress capacity of exits, and fire area separations. Coordinate with the Fire Protection Engineer.

4. Gross Floor Area Calculations - Provide a tabulated breakdown of the net and gross programmed areas to confirm project scope and statutory criteria compliance. Provide a supplemental drawing keyed to the area tabulation. Indicate method of take-off based on calculation and diagram guidance in Chapter 4.

5. Accessibility - Describe accessibility features included in the project and indicate how the design meets the accessibility requirements noted in UFC 1-200-01. If a partial or full exclusion to accessibility requirements has been or is being pursued indicate proper documentation and the status of the exclusion.

6. Architectural Compatibility - Identify the design guidelines that pertain to this project and describe how the proposed design incorporates these guidelines. Discuss the approach to achieving architectural compatibility with other surrounding architecture in accordance with the installation exterior architectural guidelines. Exterior color boards are required for all projects. For Air Force projects, refer to the Air Force Corporate Facilities Standards and applicable Installation Facilities Standards.

7. Roof System Selection - Indicate the construction of the roof, roof membrane selection, substrate, roof slope, roof drainage system, and justify the use of parapets.

8. Thermal Insulation - Describe the types of insulation to be provided and indicate specific “U” values for the wall, roof, and floor construction. Provide a description of all architectural energy conserving and generating features, including any passive solar systems. Provide a moisture vapor analysis in accordance with Chapter 2 of this UFC.

9. Security Requirements - Describe the physical security or hardening requirements such as controlled access, SCIF, and Secure Room requirements that will be used in the design.

10. Antiterrorism – Per UFC 4-010-01, DoD buildings are categorized as low occupancy, inhabited, primary gathering, high-occupancy family housing, or billeting. Describe the occupancy of the facility, if progressive collapse avoidance will be included in the design, if the facility is within a controlled perimeter, and what the standoff distances will be. Include sketches as required to depict the site of the project and standoff distances. Include a summary of how the facility meets each of the applicable Standards in UFC 4-010-01 and Geographic Combatant Commander (GCC) Antiterrorism construction standards. Outline any special requirements, including any requirement for hardening of the facility. Provide the construction information necessary for the installation of all applicable Standards in UFC 4-010-01 and the Geographic

Combatant Commander (GCC) Antiterrorism construction standards. Do not include information on force protection methods, philosophy, explosive weights, and design threats, as this information is considered sensitive and Controlled Unclassified Information.

11. Architectural Acoustics – Include a statement of adherence to the applicable criteria per Chapters 2 and 3 of this UFC. This statement must include, but not be limited to:

- Identify design team members responsible for the acoustical engineering.
- Provide a detailed identification of conditions, materials, or features which will impact the acoustic design of the project.
- Describe Testing, Mock-up, Commissioning, and Quality Control processes.

Upon the completion of a project, if post-construction testing is not included in the project scope, the Government may elect to test the airborne or impact isolation sound isolation, background noise level, or other parameters established as project criteria. Additional modifications or remediation to meet the project acoustical criteria will be at the expense of Design-Build or Construction team.

12. Sustainable Design – Include the architectural description of the sustainable design in the separate chapter “Sustainable Design”. Describe the overall sustainability and energy performance of the project, with the architectural portion leading the process of compliance. Describe the sustainable design features included in the design. Provide an analysis of compliance with applicable requirements of UFC 1-200-02; the High Performance and Sustainable Building (HPSB) Checklist and description of how targets will be met, or justifications for missed targets. When applicable, include the sustainable Third Party Certification checklist and describe how applicable credits align with the HPSB Checklist requirements.

13. Doors and Windows - Indicate the types of doors and windows selected for the project and explain the basis for their selection. Use operable windows where feasible. Indicate any special door requirements such as STC ratings, cipher locks. Indicate any special window requirements such as OITC ratings.

14. Demolition or Deconstruction – Describe the extent of any architectural demolition or deconstruction and items to be salvaged.

15. Special Construction Features - Describe the special construction features built into the facility, such as barred windows, special wall/roof construction, raised flooring, radio frequency electromagnetic radiation (RF) shielding, High-Altitude Electromagnetic Pulse (HEMP) protection, and vaults.

16. Commissioning – Identify architectural systems scheduled for commissioning as required by the Commissioning Plan.

5-2.4 Specifications.

Design-Bid-Build and Design-Build projects have differing specification requirements. Specifications must be concise, definitive, and free of ambiguities and omissions that may result in controversy and contractor claims for additional compensation. For Army and Navy design-bid-build specifications, the use of SPECSINTACT and Unified Facilities Guide Specifications (UFGS) is required. These documents are available on the WBDG website. For Air Force projects, the use of UFGS or other commercial guide specifications is at the discretion of the Air Force Project Manager. For projects using UFGS, comply with UFC 1-300-02. For Navy projects, see also FC 1-300-09N. When preparing a Design-Build Request for Proposal (RFP), see the NAVFAC Design Build Master website located at https://www.wbdg.org/ffc/navy-navfac/design-build-request-proposal.

5-2.5 Architectural Drawings.

Confirm drawing size with the Government Project Manager prior to starting drawings. Provide architectural drawings that comply with the National CAD Standard and Spatial Data Standard (SDSFIE) for Facilities, Infrastructure, and Environment/ Computer-Aided Design and Drafting (SDS/CADD Standards). For projects accomplished using Building Information Modeling (BIM) use the National BIM Standard, along with published Service supplemental standards. Include the following requirements in the final drawings as applicable:

1. Title and General Sheets: Lists all drawings in the set, project title, project name, location map, and vicinity map.

   Floor Plans: Fully dimensioned and referencing other drawings. Indicate plan orientation. Draw building plans parallel to the sheet border with north generally up or to the left or right edge if better suited. Orient floor plans consistently throughout all discipline drawings. Orient site and building plans in approximately the same orientation.
2. Building Code/Life Safety Code Analysis: Conduct a diagrammatic analysis and indicate code compliance (such as remoteness of exits, common path of travel, compartmentalization, and fire extinguisher locations) to graphically demonstrate compliance with the Life Safety Code. Coordinate with Fire Protection Engineer as required.
3. Furniture Placement Plans: Indicate furniture arrangement if separate interior design drawings are not provided in the drawing set.
4. Roof Plans: Completely dimensioned and referencing other details.

   Reflected Ceiling Plans: Fully coordinated with disciplines.
5. Building Elevations: For elevations indicate location of control joints and expansion joints.
6. Building Sections and Wall Sections: For differing conditions, identify air barrier, moisture barrier, and insulation barrier systems.

7. Wall Types: Provide all interior and exterior wall and partition types. Indicate wall type locations on the floor plans.
8. Air Barrier: Indicate the boundary limits of the air barrier components (pressurization area for air barrier testing) on the plan and section. Indicate the actual area of the pressure boundary (ft.2/m2).
9. Interior Elevations: Indicate differing conditions and coordinate with other drawings.
10. Doors, Windows, and Louvers: Provide types, schedules, and details.
11. Room Finish Schedule, Legend, and Finish Notes: For all finishes.
12. Signage Plan, Schedule, Legend, and Notes if not provided on separate interior design drawings.
13. Detail all conditions. Pay particular attention to the moisture barrier system, the continuous air barrier, wall and roof penetration flashing details, surface termination and transitions, roof ridges, roof edges, and parapet and drainage details.

Provide drawing requirements suitable for the project type and scope of work.

5-2.5.1 Exterior Finishes and Colors.

Provide a comprehensive exterior finish and color schedule, indicating selections for all exterior materials. Locate this schedule on the finish schedule sheet or on the sheet with the exterior building elevations. When matching existing materials and colors, it is not sufficient to state, “match existing.” Do not indicate that the Contracting Officer will make color selections.

5-2.5.2 Dimensioning.

Provide floor plans with sufficient dimensions to avoid difficulties during construction. Provide adequate dimensions on each floor plan so that it is not necessary to refer to other drawings in order to determine dimensions. Dimensioning guidelines are as follows:

5-2.5.3 Exterior Dimensions.

- Provide overall building dimensions.
- Provide dimensions to include building expansion joints.
- Provide continuous dimension strings from column centerlines to exterior building surfaces.
- Provide continuous dimension strings from column centerlines to exterior building wall line breaks.
- Provide dimensions to wall and masonry openings.
- Provide vertical dimensions for elevations and sections.

- Coordinate overall architectural dimensions with structural dimensions on the structural drawings.

5-2.5.4 Interior Dimensions.

- Dimensions must indicate design intent. For example, if a door is to be centered on a space, indicate dimensions as “equal-equal.”
- Indicate all statutory dimensions, such as accessibility requirements and egress.
- Provide continuous strings of dimensions through the building in each direction that extend through the exterior wall.
- Dimension masonry walls and stud partitions to one side of the wall. Wall thickness may be indicated with dimensions or by wall types.
- When a dimension string passes through a space that is shown elsewhere at a larger scale, this space may be provided with an overall dimension. The large-scale plan must show additional dimensions. To ensure continuity, take dimensions from the same wall face as shown on the overall plan.
- Where a wall or partition aligns with a column, wall opening, window jamb, or other feature, ensure that other dimensions to that wall or partition are to the same face. Additionally, if a dimension is to a particular wall or partition face, then other dimensions to that wall must be to that face.

5-2.5.5 Referencing.

1. Use reference symbols (section and detail cuts) liberally on the drawings to indicate which section or detail applies. Use material indications to clearly identify construction materials. Generally, provide the following:
2. Floor Plans – Indicate building and wall sections, major details, and areas of large-scale plans.
3. Building Elevations – Indicate building and major wall sections, expansion, control and seismic joints, construction materials.
4. Building Sections – Indicate wall sections, major details, such as air barrier interfaces, and construction materials.
5. Details – Indicate construction materials. Where several sections or details are provided on the same drawing, it is acceptable to reference a single section or detail for materials with additional call-outs as needed for differing conditions.

5-2.6 Color Boards and Binders.

Exterior finish material color boards or binders displaying actual samples of all proposed finishes are required during the design of a project. If binders are provided, provide in accordance with UFC 3-120-10.

This Page Intentionally Left Blank

APPENDIX A BEST PRACTICES

A-1 INTRODUCTION.

This appendix identifies background information, good architectural design practices, and DoD preferences. The designer is expected to review and interpret this guidance and apply the information according to the needs of the project.

A-2 WHOLE BUILDING DESIGN GUIDE.

The Whole Building Design Guide provides additional information and discussion on architectural practice and facility design, including a holistic approach to integrated design of facilities.

The WBDG provides access to all Construction Criteria Base (CCB) criteria, standards, and codes for the DoD Military Departments, National Aeronautics and Space Administration (NASA), and others. These include Unified Facilities Criteria (UFC), Unified Facilities Guide Specifications (UFGS), Performance Technical Specifications (PTS), design manuals, and specifications. For approved Government employees, it also provides access to non-government standards.

A-3 PLANNING ISSUES.

Consider the following issues when planning a facility:

A-3.1 Building Orientation.

In general, minimize east- and west-facing glazing. The orientation for rectilinear CONUS buildings is with the long axis parallel to the east/west direction for optimum energy conservation. Typically, orient glazing north (south in the southern hemisphere) to provide daylighting while minimizing glare. South-facing glazing (north in the southern hemisphere) should be appropriately shaded on the exterior to exclude summer (winter in the southern hemisphere) sun.

A-3.2 Design for Flexibility.

Flexibility in architectural design facilitates the change or expansion of an existing structure to accommodate changing functional requirements with minimum expenditure of resources. DoD usually owns and operates its facilities from the time of construction until the end of its useful life. During this long tenure of use, functional requirements of buildings will change, often drastically. Careful planning for reconfigurable technology infrastructure and utility distribution, minimizing permanent interior walls and using systems furniture and demountable partition systems enhances flexibility. When feasible, design facilities to facilitate future expansion in response to mission requirements.

A-3.3 Design for Function and Life Cycle.

- Permanent Construction. Buildings must be energy efficient, and have finishes, materials, and systems selected for low maintenance and low life cycle cost over a life cycle of more than 25 years.
- Temporary Construction. Buildings must use low cost construction, with finishes, materials, and systems selected with maintenance factors as secondary considerations to meet a life cycle of 5 years or less.
- Mobilization and Emergency Construction. Buildings must minimize design and construction time and maximize conservation of critical materials and funds. Maintenance factors and longevity are secondary considerations.
- Contingency Construction. Such structures may not be used for the purpose of satisfying requirements of a permanent nature at the conclusion of combat or contingency operations.
- Manufactured and Pre-engineered Buildings. This type of construction should be considered where it meets the quality, performance, and functional requirements of the project, when it will be architecturally compatible with adjacent structures, and when justified by life cycle cost. Also consider this building technique when there is limited time for on-site construction erection activities due to weather conditions.

A-4 LOCAL CONSTRUCTION METHODS, MATERIALS AND SKILLS.

Design to take advantage of economies resulting from the use of suitable local construction methods, materials, and skills that are consistent with the intent of these criteria. This is particularly important in overseas locations, where local materials may not be common to architects from the United States. Construction means and methods are the responsibility of the construction contractor.

A-5 BUILDING ENVELOPE.

This section provides background on the science of building envelope design and includes additional design recommendations. Review this section in conjunction with the requirements in Chapter 2. The building enclosure functions to control the transfer of the following elements: heat, air, moisture, light/radiation, and noise.

A-5.1 Heat.

Heat, which is energy, is transferred from warm to cold in one of three ways: conduction, convection, and radiation.

A-5.1.1 Conduction.

Conduction is most effectively resisted by low-conduction materials such as insulation. Highly conductive materials when inserted through the insulating layer can cause a loss of efficiency in the overall assembly's ability to resist heat transfer in a phenomenon called thermal bridging. Examples of high-conduction materials interrupting insulation include the following:

- Steel studs
- Cantilever concrete balconies and projections
- Structural steel and aluminum that are outside the thermal envelope and connected to the building structure
- Z-furring supporting cladding interrupting the insulation
- Shelf angles attached continuously and directly to the structure.

Many of these materials can be designed to reduce thermal bridging by intermittent support through insulation and maintaining them outside the insulation layer. Others like cantilever balconies or exterior structure, can be thermally broken by specially designed structural thermal breaks. Structural steel should be within the insulated enclosure, unless thermally broken. Thermal bridges impact energy efficiency and are a likely cause of condensation.

A-5.1.2 Convection.

Convection is the movement of heat transported by fluids, including air. Air movement can transport heat as well as water vapor from warm to cold. Surfaces that can cool the air adjacent to them, such as slabs on grade and basement walls, and cause the air to become heavier and sink. This draws warm, moist air in to replace it in a continuous convective loop. Warm air can have a dew-point higher than the cold surface, which can cause condensation and the ensuing mold, rot and corrosion. Convection in exterior assemblies is caused by designing air spaces adjacent to cold materials. This can happen in a basement on a concrete wall insulated by glass fiber batts (fibrous insulation is mostly air), or adjacent to glass in fenestration. Eliminating air gaps or separating them from warm air by an air barrier is an effective strategy in reducing convective flow of heat and condensation.

A-5.1.3 Radiation.

Radiation is the flow of heat, across space or fluid or gas, from a warm body to a colder one. One example of radiational heat transfer is from the interior to a cold glass surface. Radiational heat gain is direct or reflected solar radiation coming in to a building through glazing or heating up building materials of the enclosure. Heat can be radiated from one sheet of glass to the other in insulating glass. Low emissivity coatings in glass assemblies can be effective in reducing the radiational transfer of heat from the exterior and from the interior, improving both the U-factor and Solar Heat Gain Coefficient. Heat gain from the sun can be effectively reduced by including radiant barriers, such as aluminum foil with an adjacent air gap. Radiant barriers in wall and roof assemblies will only work with an adjacent air gap (see above paragraph on air gaps and convection). Quadruple glazing using heat mirror foils, two low emissivity low-e layers and filled with inert gas such as argon or krypton, is the state of the art for glass selection today and should be considered for extreme climates.

A-5.2 Air.

Air leakage, or unintentional air movement through the enclosure under a pressure difference between inside and out, transfers heat (energy loss), water vapor, smoke, odors, dust, and other pollutants, including chemical, biological, and radiological agents, into and out of buildings. Infiltrating air is unconditioned for temperature and moisture content and can contain pollutants. It causes discomfort and can unbalance spaces such as patient isolation rooms, protected environment rooms, or chemical storage areas that are designed for controlled pressure, thus compromising pollutant control. Mechanical systems attempt to reduce uncontrolled infiltration by introducing more air than is exhausted. This theoretically puts the building under positive pressure, reducing infiltration. The success of this strategy is dependent on how leaky the building is. (As an analogy, a balloon with a big hole in it can't be inflated.)

Air leakage can be the major source of water vapor transfer through building enclosures. Unlike the moisture transport mechanism of diffusion due to a vapor pressure difference, air pressure differentials can transport hundreds of times more water vapor through air leaks in the envelope over the same period of time ("The Difference Between a Vapor Barrier and an Air Barrier," Quirouette, 1985). This water vapor can condense within the envelope in a concentrated manner, depending on the pathway, if the enclosure includes surfaces below the dewpoint of the air, causing building deterioration and mold growth. Internal compartmentalization of a building (floors and demising partitions) is also a key to the control of the unwanted transfer of air, pollutants, noise, and smoke. See the following resources for more information and sample design details

- Building Envelope Design Guide: http://www.wbdg.org/design/envelope.php
- WBDG Resource Webpage for Air Barrier Systems: http://www.wbdg.org/resources/airbarriers.php
- Also see ECB 2012-16 Building Air Tightness And Air Barrier Continuity Requirements Applicability: Directive and Guidance https://www.wbdg.org/ffc/dod/engineering-and-construction-bulletins-ecb/usace-ecb-2012-16.

A-5.3 Moisture.

Moisture in its different forms is the major cause of water intrusion, condensation, shortening of service life, and disruption of operations. Walls leak when three conditions exist simultaneously: (1) Rainwater is on a wall, (2) Openings exist through which the rainwater can pass, and (3) Forces are present to drive or draw the rainwater inward. If any of these three essential conditions is eliminated, rainwater will not penetrate the enclosure.

A-5.4 Walls are Porous.

It is difficult and impractical to keep wind-driven rain off the exterior walls of a building. Overhangs, cornices, and solar shading can be effective in minimizing, but will not prevent, wetting of a wall. Thus, it should be expected that exterior walls will be covered by a film of water during a rain event, and that this film thickens when rain flows down the building wall. It is virtually impossible to build an exterior wall without any unintentional openings or leakage paths. Such openings may be pores, cracks, incompletely filled or poorly adhered mortar joints, or moving joints between elements or different materials. A typical masonry wall contains multiple apertures of various types and sizes yielding many joints between dissimilar materials prone to movement and joint failure. One square foot of brick masonry contains 6.75 modular brick, 6 lineal ft. (1830 mm) of mortar joint, and 12 lineal ft. (3660 mm) of brick-mortar joint interface. For 20,000 ft2 (1858 m2) of wall surface, this equates to 135,000 modular brick, 22.7 miles (36.5 km) of mortar joint, and 45.5 miles (73.2 km) of brick-mortar joint interface. Water can penetrate openings as small as 0.005 in. (.1 mm), which is just slightly more than the thickness of a sheet of bond paper.

A-5.4.1 Drainage Plane.

Even if a good seal is achieved initially, odds are that the seal will deteriorate over time under the action of temperature, water, deterioration due to ultraviolet radiation, and differential movement. For these reasons, a single 4-in. (100-mm) -wythe of masonry conventionally laid up in the field (or any cladding for that matter) should not by itself be expected to be watertight. It is also why sealants cannot be expected to keep water out of building enclosures. There needs to be an underlying drainage plane or WRB and flashings to lead water that penetrates building assemblies out again.

A-5.4.2 Forces Acting on the Wall.

Forces acting on an exterior wall during a rain event that individually or in combination can contribute to rain penetration include the following: (1) raindrop momentum or kinetic energy, (2) capillary suction; (3) external or internal air pressure; (4) gravity, and (5) surface tension. Water hits and wets the tops of buildings first, as well as projections. Water tends to travel over and flow down reveals and channels in the façade in a concentrated manner.

A-5.4.3 Rain Screen Design.

When the joints are well-pointed, brick masonry tends to absorb moisture for 4 - 6 in. (100 to 150 mm) depth after a rain event, and to dry out in dry periods. All masonry mass walls must have ventilation on the interior face of the exterior wall (and parapets) to assure proper drying. Single-wythe concrete block walls are undesirable because they do not manage moisture well. Wall design should be a rainscreen design; in other words, cladding should have a WRB in the wall assembly behind the cladding, with flashings to lead water out. This is true for claddings including EIFS; face-sealed assemblies are not acceptable.

A-5.4.4 Tool Masonry Joints.

Exterior masonry wall joints must be tooled. This will densify the mortar bonding. Joints must be tooled concave, vee, beaded, or weathered types.

A-5.4.5 Coatings on Exterior Walls.

Dependent upon the moisture migration study, it is advisable in cavity or double exterior wall construction to apply a low permeable coating to the exterior walls to help minimize the amount of moisture transfer through the wall. Apply a high permeable coating to the interior side of wall surfaces to ensure that any water vapor that passes through the exterior coating and vapor barriers enters the air-conditioned space and does not remain trapped within the insulation and wall material. Vinyl wall covering may be used in air-conditioned buildings as a vapor barrier if it is required by the moisture migration study and no other vapor barrier is used. Otherwise, vinyl wall covering should not be used on the interior surface of exterior walls as it may act as a vapor barrier.

A-5.5 Air Barrier for Modifying an Existing Building.

The following are five possible scenarios relating to air barriers in existing buildings:

A-5.5.1 Major Envelope Modifications with Existing Air Barrier.

For a renovation project that includes modifying the building envelope that has an existing air barrier: Pressure test the air barrier prior to the renovation to verify the air barrier meets its designated leakage rate goal. The result of this initial pressure test can serve as baseline for comparison to a second pressure test performed after the renovation is completed. If air leakage data for this building envelope is not available prior to design kick-off, develop a separate scope to conduct an initial pressure test with diagnostic evaluation, which may include thermographic evaluation methods. If the air barrier will be disturbed or is damaged during renovation, then repair to maintain its integrity. If, after an initial pressure test is performed, its results indicate that the air barrier failed to meet the current air leakage goal, perform a cost analysis to determine if the building should be outfitted with a new air barrier. The cost analysis evaluation should produce the lowest Life-Cycle Cost (LCC), highest Net Savings (NS), or a Savings to Investment Ratio (SIR) of at least one, or greater. Use Building Life Cycle Cost (BLCC5) to perform cost evaluation; reference the National Institute of Standards and Technology (NIST) *Handbook 135* for cost evaluation guidelines. If SIR is less than one, use best judgment within the scope of the project to determine air barrier feasibility. After construction of the air barrier has been completed, perform a second pressure test to verify that it meets the established leakage rate goal. If the air barrier fails to meet its leakage rate goal, use diagnostic methods to determine the source of leaks. After additional sealing is applied, based on the results of the diagnostic tests, determine the economic feasibility of performing another pressure test.

A-5.5.2 Minor Envelope Modifications without Existing Air Barrier.

For a building undergoing only a minor modification to the building envelope, such as removing/installing new windows or doors or replacing the roofing system: Greater challenges in easily, fully, and cost effectively accessing surfaces upon which to apply a complete air barrier may exist. For this case, sealing select building components may help reduce infiltration; however, component sealing is unlikely to achieve the same level of air tightness that would be achieved in applying a complete air barrier to the building. Install windows and doors with an air leakage rate in accordance with the Unified Facility Guide Specifications (UFGS) or the National Fenestration Rating Council (NFRC).

A-5.5.3 Major Envelope Modifications without Existing Air Barrier.

For projects that include modifying the existing building envelope that are not equipped with an air barrier: Determine if the modification to the envelope is sufficiently extensive, (generally, wherein only the building's structure remains). Perform a cost analysis to determine the cost effectiveness of installing a new air barrier. The cost analysis evaluation should produce the lowest Life-Cycle Cost (LCC), highest Net Savings (NS), or a Savings to Investment Ratio (SIR) of at least one, or greater. Use Building Life Cycle Cost (BLCC5) to perform cost evaluation; reference the National Institute of Standards and Technology (NIST) *Handbook 135* for cost evaluation guidelines. If SIR is less than one, use best judgment within the scope of the project to determine air barrier feasibility. If it is cost effective, install a new air barrier as required for a new building and pressure test it if required to ensure the air barrier meets the current air leakage goal.

A-5.5.4 New Addition to Existing Building.

For a new addition to an existing building that has no air barrier: Install an air barrier on the new addition as required for a new building. If the addition does not have an air plenum in common with the existing building, with some modifications to the testing protocol, it can likely be pressure tested in a manner similar to a freestanding new building. If the addition shares a common air plenum with the existing building, pressure testing just the addition is not possible, unless a temporary air barrier is installed to separate the two spaces.

A-5.5.5 Minor Non-Envelope Modifications without Existing Air Barrier.

For a building undergoing modifications not directly impacting the envelope: Sealing methods can be used in an effort to reduce air infiltration. However, sealing in this manner is not likely to result in achieving a level of airtightness that is nearly as tight as that of a complete air barrier. These sealing methods involve materials intended to achieve airtightness, such as applying closed-cell spray foam or sealant to the assembly, but are not limited to these materials. These materials should meet the permeance criteria of ASTM E2178. Removable ceiling tiles allow easy access to problem areas, and walls require destruction of finishes to expose gaps in the building envelope, such as those around windows. Stuffing glass-fiber insulation in cracks is not an acceptable sealing method, because glass-fiber merely acts as a dust filter and allows air under a pressure differential to pass through it. Also, glass-fiber insulation will hold moisture, which can lead to hidden moisture and mold problems. For minor renovation and repair projects, seal air leaks in building components in the following order of priority:

1. Top of building
    - Attics
    - Roof/wall intersections and plenum spaces
    - Mechanical penthouse doors and walls
    - HVAC equipment
    - Other roof penetrations

2. Bottom of Building
    - Soffits and ground floor access
    - Underground parking access doors
    - Exhaust and air intake vents
    - Pipe, duct, cable, and other service penetrations into core of building
    - Sprinkler hangar penetrations, inspection hatches, and other holes
    - Seal core wall to floor slab
    - Crawl spaces

3. Vertical shafts
    - Gasket stairwell fire doors
    - Fire hose cabinets or toilet room recessed accessories connected to shafts
    - Plumbing, electrical, cable, and other penetrations within service rooms
    - Elevator rooms and electric rooms (reduce size of cable holes, firestop, and seal bus bar)
    - Openings

4. Exterior Walls

- Weatherstrip windows, doors, including balcony/patio doors and seal window trim
- Exhaust fans and ducting
- All service penetrations
- Baseboard heaters
- Electrical receptacles
- Baseboards

5. Compartmentalize

- Garages
- Vented mechanical rooms
- Garbage compactor rooms
- Emergency generator rooms
- High voltage rooms
- Shipping dock
- Elevator rooms
- Workshops
- Compartmentalized walls are sealed at the top, bottom, and penetrations. Include weatherstripping/gasketing on doors and windows.

A-5.6 Light / Radiation.

Generally speaking, light is desirable while the accompanying heat (radiation) is not. They penetrate through the fenestration, which is the least energy-efficient component of the envelope. In addition to effective glazing design and shade structures, building orientation plays a large role in managing the light/heat gain balance. See discussions under Building Orientation and Radiation in this Appendix for more information.

A-5.7 Noise.

Noise by definition is unwanted sound. Project acoustical considerations are intended to limit noise to the building occupants so that the building function is not limited due to noise within or around a building. Best practices will be achieved by meeting the project requirements as stated in Chapters 2 and 3. Standards referenced in Chapter 2 include best practices and suggestions to provide an appropriate acoustic environment for most space types. Thoughtful consideration of the project acoustic requirements is very beneficial early in the design process.

Proper preparation of the required statement of adherence outlined in Chapter 5 to meet requirements established in Chapters 2 and 3 of this UFC is an important basis to understanding the project acoustical requirements; however, the Design or Design-Build team will still need to be mindful of implementing the requirements during the design and meeting the requirements during the construction of the project.

A-6 AIR BARRIER MOCK-UP TESTING.

A-6.1 Guidance on When to Test Mock-Ups.

See Table A-1, Construction Mock-up Guidance Matrix, for recommendations. Approximate suggested definitions of sizes to use for the matrix:

- Small: Up to 10,000 sf (929 sm)
- Medium: 10,000 to 50,000 sf (929 to 4645 sm)
- Large (Common): above 50,000 sf (4645 sm)
- Large (Unique): above 25,000 sf (2323 sm)

Table A-1 Construction Mock-Up Guidance Matrix

Guidance: The Authority Having Jurisdiction (AHJ) may give consideration to implementing construction mock-ups based upon the following decision matrix.		
FACILITY TYPE	**APPLICATION**	**RECOMMENDED GUIDANCE**
Small size facility Common facility such as: mech building; pump house; small and medium warehouses. Size range: square feet	Small facilities that are not unique and provide support functions on an installation	Recommend not requiring construction mock-ups
Medium size facility Common facility types such as MWRs; chapels; child care centers; small and medium size administrative facilities, post offices; post exchanges. Size range: square feet	Medium size facilities that are not unique and utilize typical and proven construction materials, methods and processes. The application of these systems carries littles to no risk of not being constructed satisfactorily.	Recommend not requiring construction mock-ups
Large size facility: Common facility types such as barracks buildings; large dining facilities; laboratories; highly visible headquarters facilities; large company operations facilities, maintenance facilities, large storage warehouses. Size range: square feet	Large size facilities that do not necessarily employ unique construction technology or innovative features but due to size, visibility and interest on the installation; failure of this facility would be detrimental to mission execution and would reflect poorly on the installation command.	Recommend consideration be given to providing construction mock-up at critical connections for windows; advanced structural systems
Large size facility: Unique facilities that utilize un-common or prototype systems; advanced technology or innovative technology for structural systems or window walls. Size range: square feet	Large size facilities that employ unique construction technology or innovative features; maintenance problems or systems failure within this facility would be detrimental to mission execution and would reflect poorly on the installation command.	Strongly recommend providing construction mock-ups at critical connections for window; advanced structural systems or unique curtain wall systems that employ daylighting sensors or integral shading screens.

A-6.2 On Site Mock-Ups.

When approved by the AHJ, a mockup of the wall system will include a representative wall and window constructed on site, complete with its components, and must be tested for air and water infiltration.

Each item that contributes to the moisture control and air barrier performance must be included in the mockup. The installed fenestration must be tested first using ASTM E783 to determine air tightness. ASTM E1105 can then be used to determine if fenestrations and their connections to walls are meeting liquid water leakage requirements.

A-7 EXTERIOR INSULATION AND FINISH SYSTEM (EIFS).

EIFS is not recommended for exterior wall finish, especially in regions where hurricanes and typhoons are a concern and in other regions where water penetration is a particular problem. If EIFS is used, follow the guidance provided in Chapter 2 and also consider the new generations of self-cleaning EIFS finish coatings to reduce maintenance costs.

A-8 DAYLIGHTING.

The introduction of daylight into interior spaces has a well-documented effect on the productivity of occupants and the education of students. In a study done by the Heschong Mahone Group, students who worked in daylighted classrooms progressed 26% faster on reading exams and 20% faster on math exams than students working in a classroom with less daylight. In another study completed by the Heschong Mahone Group, office workers were found to perform 10%-25% better on tests of mental function when the best daylight views were available to them.

Daylighting strategies can be divided into passive or active systems. Passive systems such as overhangs are the most common and refer to the location, profile, orientation, and shading of glazing on a building. See Figure A-2 for passive daylighting strategies. Optimizing these components result in a building that admits daylight without excessive heat gain or glare. Because the devices and components are stationary, these techniques are categorized as passive. In comparison, active daylighting systems have moving parts, typically to track the sun throughout the day. An example of an active system includes a skylight with a moving mirror that captures direct sunlight and redirects it through the skylight, into the building.

A-8.1 Benefits of Daylight.

Daylight in interior spaces has multiple benefits. Daylighted environments provide a connection to the outdoors, are healthier for occupants and have the potential to save energy. Research has shown that children learn better[1], retail stores sell more

[1] The Heschong Mahone Group, “Daylighting in Schools”, http://www.h-m-g.com/projects/daylighting/summaries%20on%20daylighting.htm

product[2], and office workers are more productive[3] [4]in daylighted environments. Since daylight also helps to regulate our circadian cycle [5], introducing daylight into interior spaces is a top priority. Daylight is a natural resource that is more efficient than electric light and should be utilized to its fullest potential. See http://www.wbdg.org/references/mou_daylight.php

A-8.1.1 Maximize Daylight Potential.

Building orientation, views, side and top lighting, shading devices, and selective glazing are critical to maximizing daylight potential. The following recommendations are for the northern hemisphere. In the southern hemisphere, recommendations regarding north and south orientations are reversed. Also, interior spaces should have high ceilings and light reflective surfaces to allow deep daylight penetration. Provide architectural and shading devices for daylight and view windows. In areas of high threat, light shelves tend to be discouraged because of blast mitigation. These objects can become additional projectiles during a blast. Refer to the Whole Building Design Guide, Balancing Security/Safety with Sustainability Objectives, http://www.wbdg.org/resources/balancing_objectives.php.

Over 60% of existing square footage of interior spaces (within the US) has access to roofs for top-lighting and 25% of existing national square footage has access to side-lighting. [6]

A-8.1.2 Considerations.

- Use the building shape to access daylight
- Maximize view windows on the north and south facades
- Provide high ceilings to allow deeper daylight penetration
- Bring daylight high into the space to maximize penetration
- Consider external light shelves to provide shading for view windows, where possible
- Consider internal light shelves to provide shading for clerestories and also a surface for reflecting light onto the ceiling, where possible
- Provide separate shading devices for daylight windows and view windows.

---

[2]The Heschong Mahone Group, "Skylighting and Retail Sales," http://www.h-m-g.com/projects/daylighting/summaries%20on%20daylighting.htm#Skylighting_and_Retail_Sales - PG&E 1999
[3] California Energy Commission. (2003). Windows and Offices: A study of office worker performance and the indoor environment (Catalogue No. P500-03-082-A-9).
[4] "Design Objectives, Productive", Whole Building Design Guide, 22 August 2002 http://www.wbdg.org/design/productive.php
[5] New Buildings Institute, Inc. "Lighting and Human Performance", Advanced Lighting Guidelines, Chapter 2. 2001 Edition, p.2-12-13
[6] Heschong, Lisa, "Daylighting Workshop", Pacific Energy Center, (March 2003).

- Use selective glazing to maximize visible transmittance (high Tvis) and minimize solar radiation (low shading coefficient).
- Use high reflectance values on ceiling and wall surfaces to balance out the daylight.
- Avoid daylight barriers such as solid walls near the building perimeter.

A-8.1.3 Building Shape.

The building shape and massing has a significant impact on how much daylight can reach the occupied spaces and therefore, how well various daylighting strategies will work in the building. Deep floor plates create dark interior spaces that will necessitate electric lighting even during the day. Narrower plates allow daylight penetration throughout the entire building section. See Figure A-1 for the effects of building shape and massing on daylight availability.

Figure A-1 Effects Of Building Massing on Daylight Availability

These four building footprints have equal floor area but provide very different levels of daylight availability.

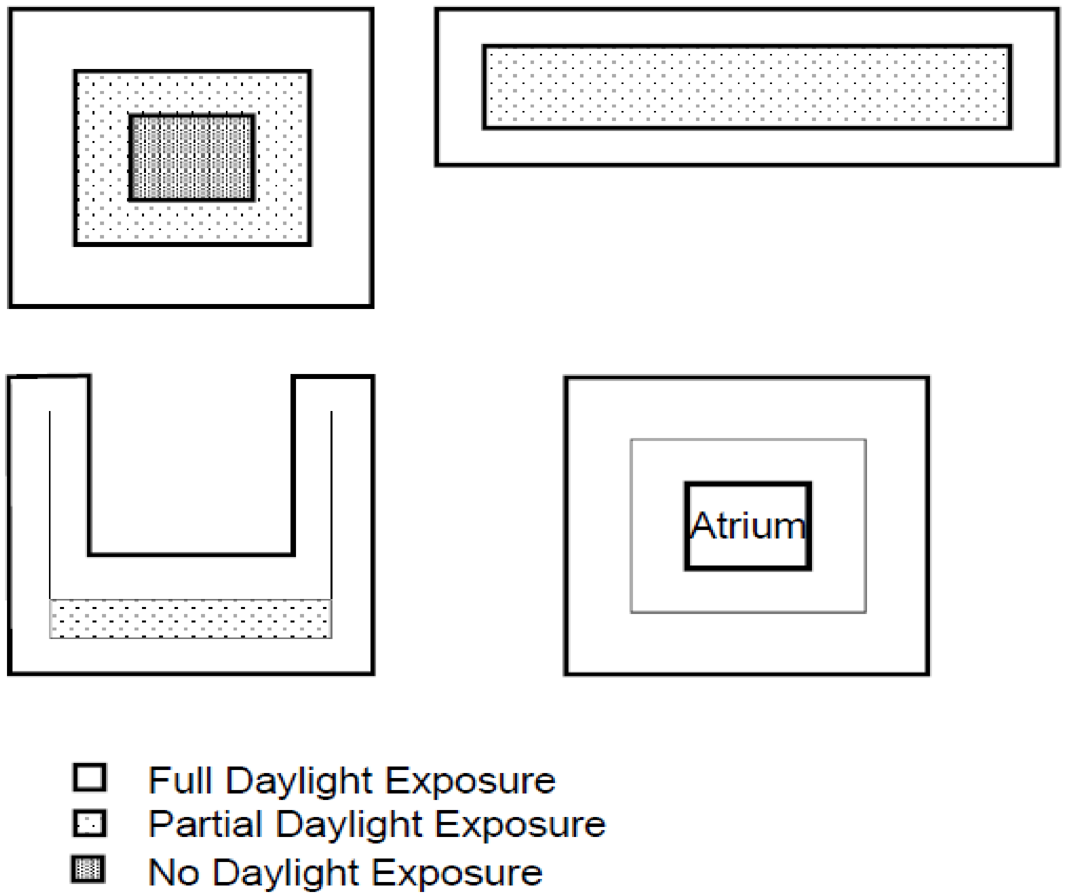

Figure A-2 Examples of Passive Daylighting Strategies

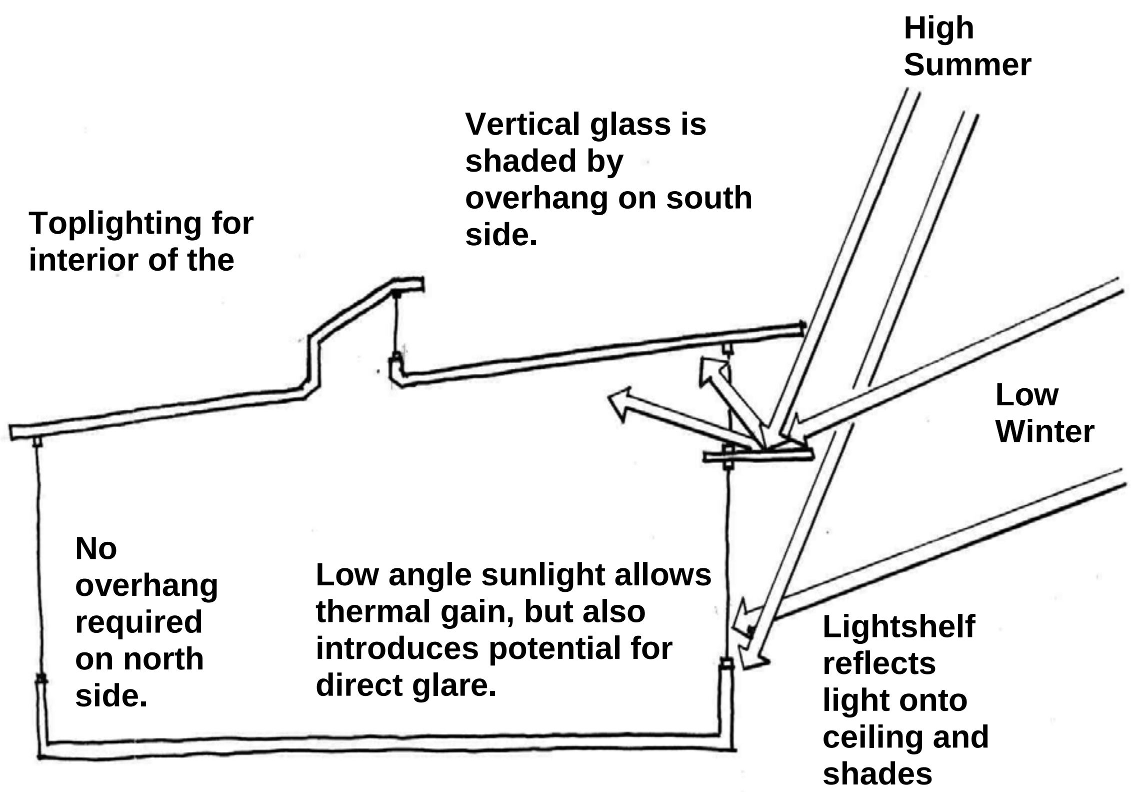

A-8.1.4 Project Types that Benefit from Daylight.

The introduction of daylight into any space has the potential to provide these benefits for the occupants as well as reduce building energy use. However, some project types are better suited than others to take advantage of daylight.

- Open spaces with high ceilings such as hangars, warehouses, recreation centers, and maintenance areas offer good opportunities for toplighting with skylights and clerestories.
- Perimeter spaces such as offices, lobbies, classrooms, cafeterias, and residential areas are all good sidelighting applications. See Figure A-8 for examples of sidelighting applications.

A-8.1.5 Economics.

The use of daylight can produce more comfortable work environments. This benefit may be difficult to quantify, but the energy saved by dimming or switching electric light in response to daylight can be quantified. The implementation of skylights and clerestories as well as lighting control equipment such as dimming ballasts and photocells all increase initial cost. Refer to UFC 4-010-01 for potential additional requirements for Antiterrorism.

A-8.2 Glazing Orientation.

Building orientation is critical to maximizing daylight potential. Building orientations that maximize north and south exposures provide the most effective orientations while East and West exposures may allow excessive heat gain and are hard to control direct sun penetration, see Figure A-3. Southern exposures have the potential of providing over 50% of the daylight for the building space. The success to daylighting on southern exposures is controlling the direct sunlight penetration with shading devices, see Figure A-4 for an example of an Architectural shading device. Northern exposures require minimal shading in the winter months. East and West orientations require manual shading devices. Vertical blinds control daylight well on this orientation.

Figure A-3 Building Orientation Can Maximize Daylight Exposure

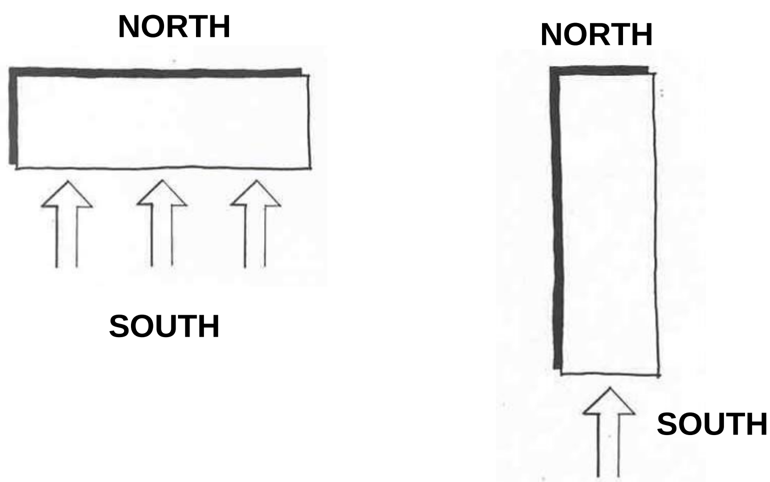

Figure A-4 Example of Architectural Shading Devices

A-8.2.1 Considerations.

- Orient building to maximize north and south exposures.
- North facing windows provide the most even illumination.
- If orientation is off-axis from north and south, provide shading devices for south-east and south-west exposures.
- Provide architectural shading devices for south orientations.
- Provide manual shading devices for south orientations. Horizontal blinds best control the high angle light on southern exposures.
- Provide manual shading devices for east and west orientations. Vertical blinds best control the low angle light on east and west exposures.
- In spaces that include daylight harvesting, provide automated shading devices to maximize the electric lighting energy savings.

A-8.3 Glazing Characteristics.

Use selective glazing to optimize and tune glass based on its purpose and use (clerestory or vision). Clerestory glass may require high visibility transmittance without color distortion while minimizing infrared penetration. See Table A-2 for comparison of glass types.

Table A-2 Comparison Of Glass Types (From Alpenglass Heat Mirror)

Sample Glass Types	Total Daylight Transmittance %	Solar Heat Gain Coefficient
Clear Double Insulating Glass (1/8" thick)	81	0.75
Laminated Glass (1/2" clear)	85	0.72
HM 88/Clear	72	0.57
HM SC75/Clear	62	0.36
HM 55/Clear	47	0.30

A-8.3.1 Considerations.

- Maximize glazing transmittance (Tvis) for daylight glazing (0.70 or greater) for clerestories and other daylight fenestrations.
- Although the visible transmittance selected depends on personal preference, typically, use Tvis values in the medium range for view windows (0.40 or greater).
- Minimize infrared transmittance by specifying a moderate to low shading coefficient (SC) or low solar heat gain coefficient (SHGC) (50% or lower).
- Use high transmittance glazing greater than 60% to maximize daylight. Glazing should also have a high thermal resistance ratio in order to minimize heat gain.
- Do not use tinted or mirrored coatings. Use clear glazing.

A-8.4 Quantity of Glazing.

Toplighting optimization varies between 3% and 9% skylight to floor area ratio. The optimal amount of toplighting area factors in daylight contribution, cooling loads, and potential energy savings. In order to calculate toplighting area optimization, use a calculation program similar to “SkyCalc” . Sunny climates with a cooling load dominated environment will require less toplighting than cooler overcast climates. See Figures A-5, A-6 and A-7 for toplighting strategies and applications.

Figure A-5 Diagram of Toplighting Strategies

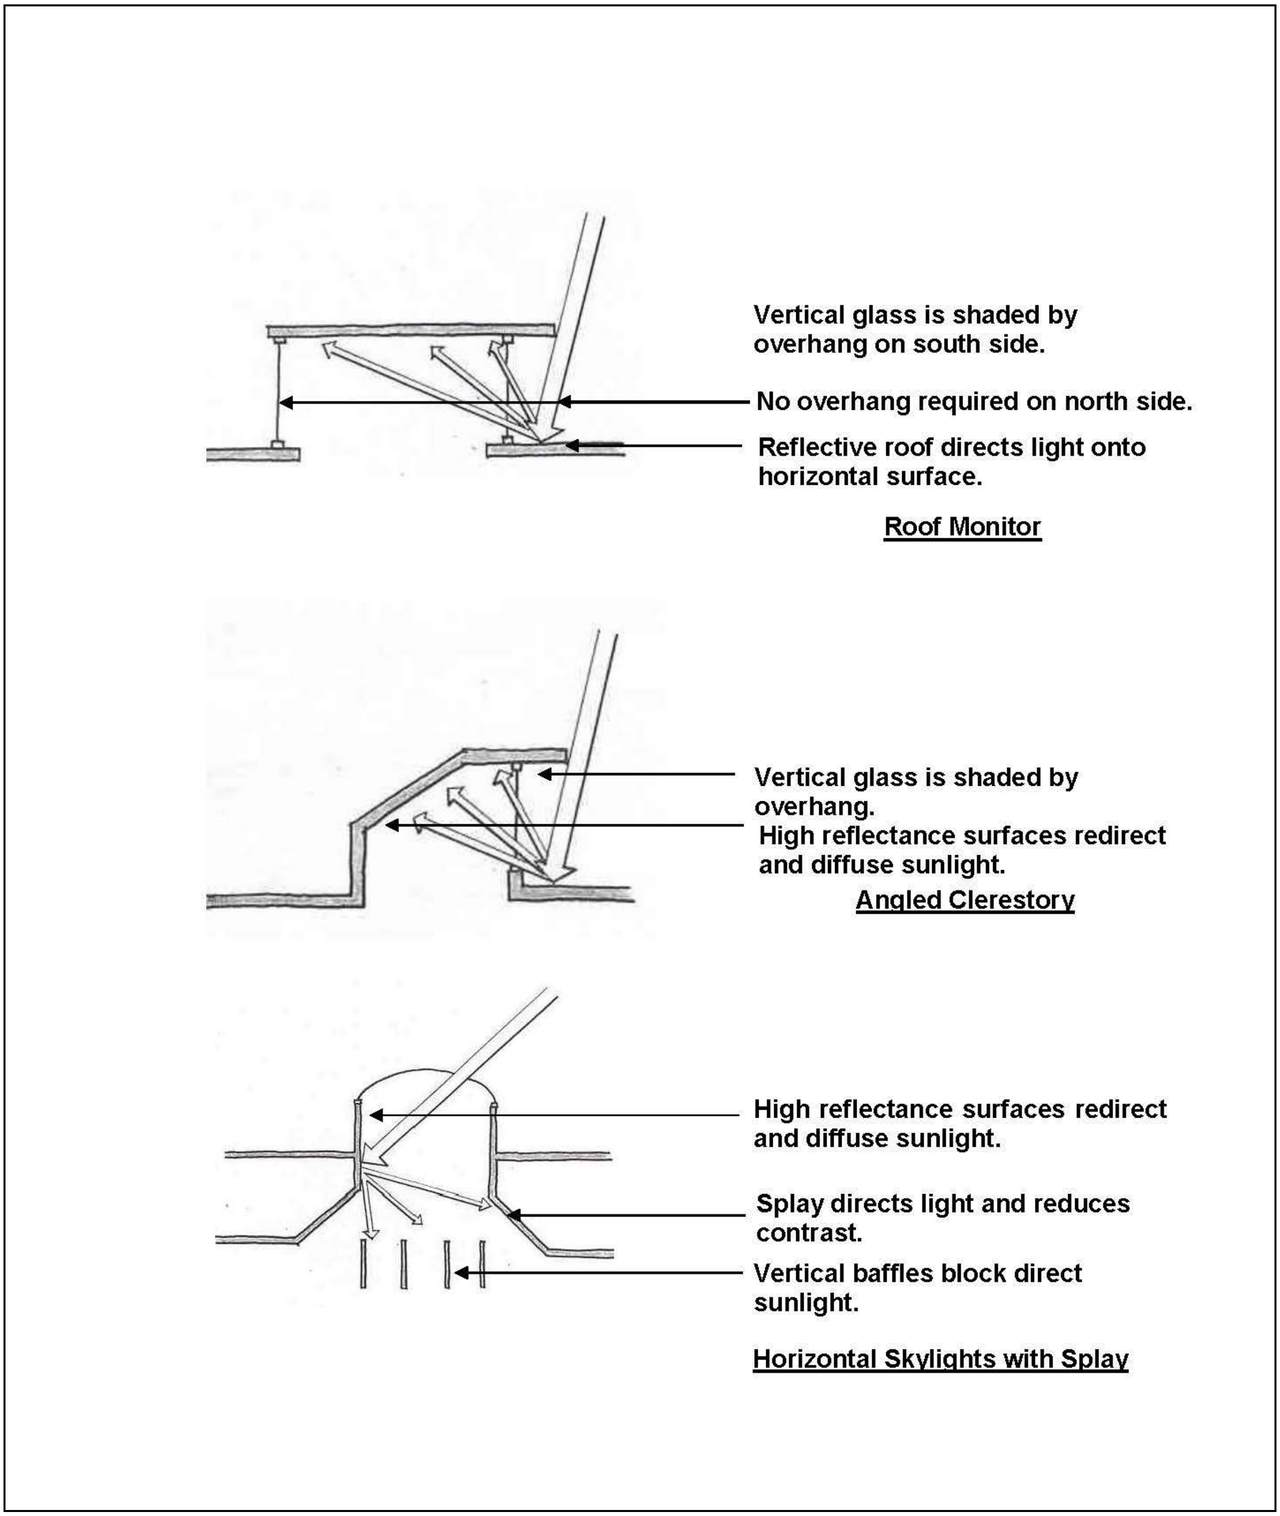

Figure A-6 Examples of Toplighting Applications

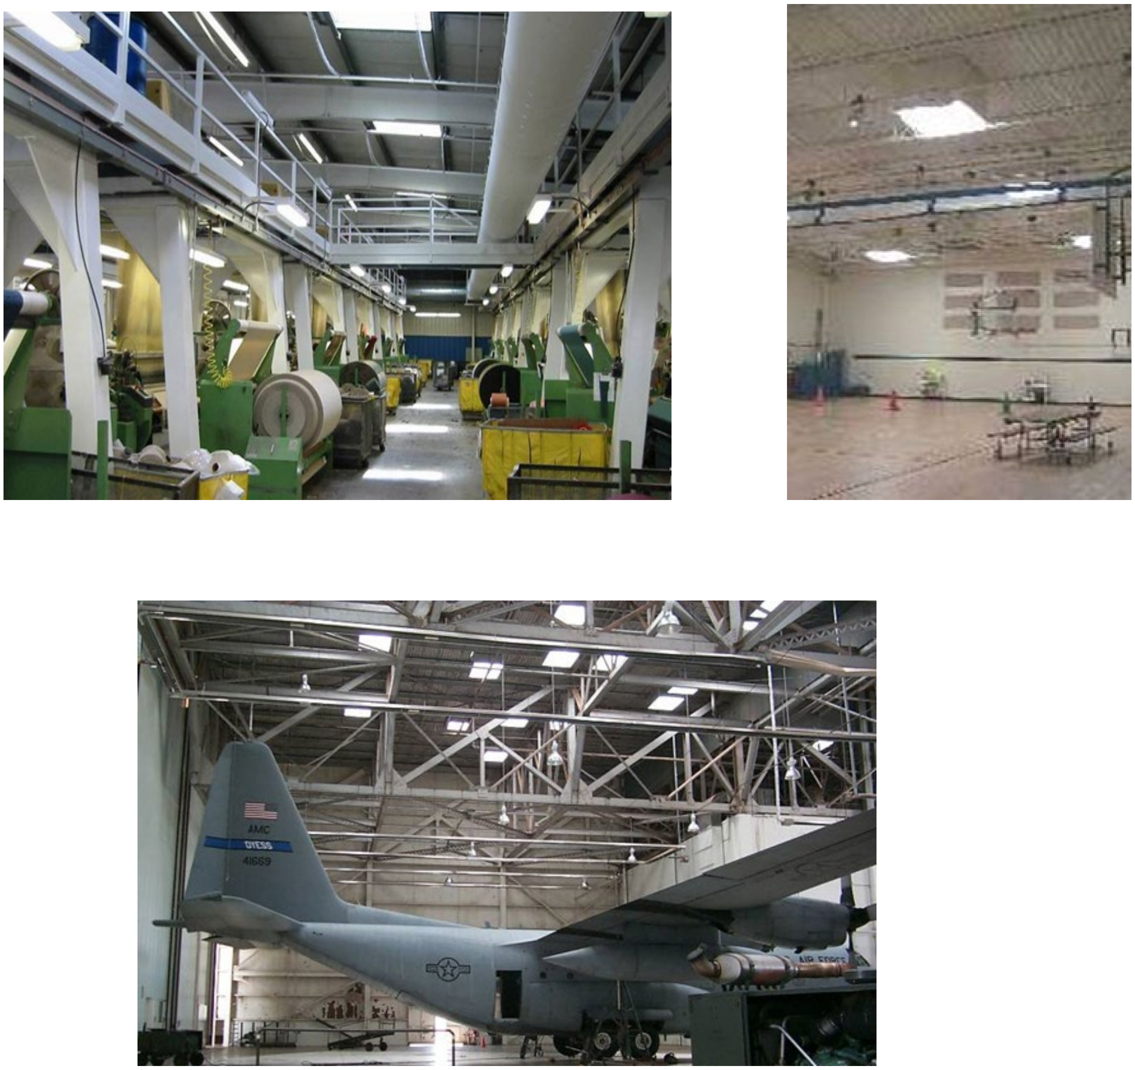

Figure A-7 Example of Clerestory Application

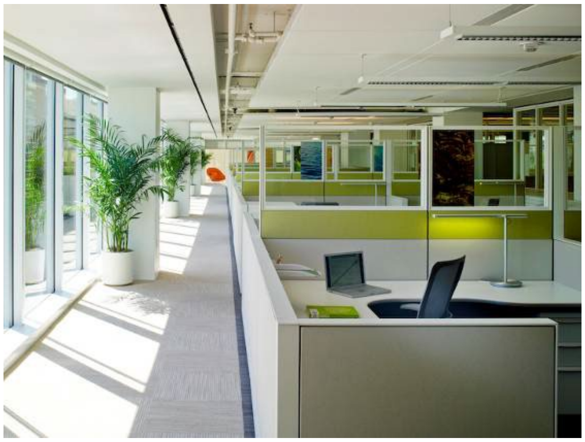
Figure A-8 Examples of Sidelighting Applications



Photograph: Eric Laignel

A-8.4.1 Considerations.

- Sidelighting windows should be located as high as possible since effective daylight penetration from windows is 1.5 times the height of the window .
- Use high continuous clerestories for the deepest daylight penetration and uniformity.
- Provide glazing at eye level in order to provide exterior views,
- Use view windows that have minimal wall area between windows. Avoid small windows located in large wall areas because of the uncomfortable contrast and glare that result.
- 1 sq ft (0.09 m2) of top lighting can provide illumination to about 10 times the area that sidelighting provides yet does not provide the view.
- Space top lighting apertures approximately one and a half times the ceiling height for even illumination. Recess and splay (45º to 60º) skylights to minimize glare.
- Toplighting systems located at least 1.5 times the mounting height on center can provide even daylight distribution.
- Skylight area should be between 2% to 9% of the floor area depending on the climate optimization

A-8.5 Glare and Contrast Control.

Glare and excessive contrast occur when side and top lighting devices allow direct sunlight penetration. Quality daylighting allows skylight and only reflected sunlight to reach the task. Punched openings also can cause uncomfortable contrast ratios. Figures A-9 and A-10 are examples of how the use of roof shapes and splayed skylights can be used to minimize glare and excessive contrast.

Figure A-9 Examples of Roof Shapes

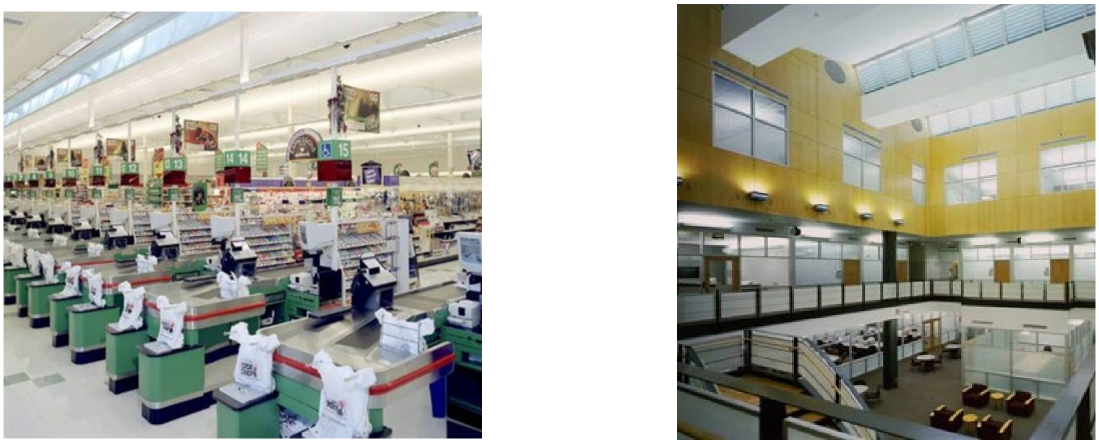


Figure A-10 Example of Splayed Skylights

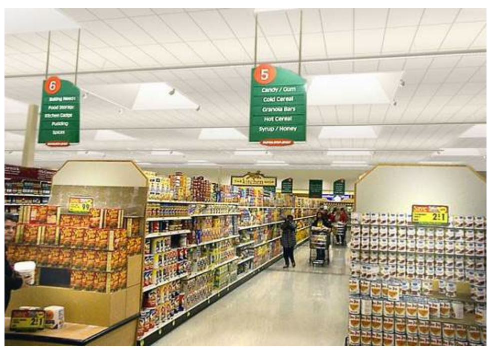

A-8.5.1 \2\ Considerations. /2/

- Coordinate external and internal shading with architect.
- Utilize top-lighting systems with vertical glazing to control direct radiation.
- If horizontal glazing is designed for top lighting systems, then provide splayed openings or translucent shielding below the skylight in order to minimize the contrast.
- Avoid punched windows; use continuous or mostly continuous side lighting.
- Use high reflectance surfaces for ceiling and walls (90% for ceilings and 60% for walls).
- Consider integrating use of automated window shading or dynamic glazing with the electric lighting control system to optimize the amount of daylight entering the space while minimizing the effects of solar heat gain and glare.

A-8.6 \2\ Automated Shading. /2/

Automated shading should be considered in spaces utilizing daylight harvesting to preserve the functionality of the daylight harvesting system and maximize the energy savings of the system. The shades may be controlled to reduce glare and unwanted heat gain while still allowing natural light to enter the space. When utilizing automated shading the following may be considered:

- For ease of use the automated shades will be operated by common controls with the lighting control system; the controls should have the same appearance and design.
- For maximum energy savings, the automated shading system should position the shades based on a combination of time of day, façade direction, and sky conditions.
- For maximum design flexibility and ease of installation, shade systems should have the capability to address each shade individually.
- The shading system may have a manual override that allows the occupant to temporarily adjust the shades to any desired position. The system will revert back to automatic control after a specified period of time.
- Based on the application and size of the windows or skylights, the shading system may employ drive (motor) technology that is either line-voltage or low-voltage in nature; an overall installed cost assessment of the shading system and the necessary equipment to integrate to the lighting control and building management systems may be done to determine the overall best value, installed cost solution for the project.

A-8.7 \2\ Active Daylighting. /2/

Active daylighting strategies and devices utilize a mechanical component to collect and distribute daylight. Such devices differ from the passive strategies that have previously been discussed which are stationary. The example shown in Figure A-11 turns a series of reflectors as the sun moves throughout the day. These reflectors catch the direct sunlight and redirect it through the skylight.

Such devices add extra initial cost and also pose additional maintenance issues. However, they also can make use of daylight for a longer period of time throughout the day. With tracking devices, effective daylighting can begin earlier in the morning and last later in the day than with stationary skylights.

Figure A-11 Example off an Active Daylighting System that Tracks the Sun and Directs Daylight into the Building

A-8.7.1 \2\ Solar-adaptive Shading. /2/

Another active daylight control technology is solar-adaptive window shading whereby shades automatically adjust throughout the day based on sky conditions or the sun's location. This type of shading system blocks and reflects direct sunlight during the day to reduce solar heat gain and demand on the building's air conditioning system. An example of solar-adaptive shading is shown in Figure A-12.

Figure A-12 Example of Solar-Adaptive Shading

A-8.8 \2\ Physical Modeling. /2/

Daylight levels depend on many factors such as window shapes, orientation, shading, and time of day. Therefore, physical models built to scale can provide information on light quality, shade, shadows, and actual light levels. By building the model with the actual proposed materials and orienting it with adjustments for latitude, season, and time of day, the light quality can be seen in the model. Such models inform the designer about quality issues including light patterns, shade, shadows, contrast, and penetration in the space. An illuminance meter inside the model will provide accurate predictions of expected light levels in the building.

A-8.9 \2\ Computer Simulation. /2/

A wide range of software programs model the sun's path and its impact on building geometry in addition to how it affects heat gain and energy use. In using any of the software, be aware of its limitations and assumptions, as well as the variables under the users' control. These tools provide a prediction of how building components will behave throughout changing conditions. They do not provide actual light levels or energy use. The following web sites detail the features of some of these programs and their applications.

B-2 DEFINITION OF TERMS

Air Barrier. The term "air barrier" refers to the "continuous air barrier" the combination of interconnected materials, assemblies, and sealed joints and components of the building envelope that minimize air leakage into or out of the building envelope specified by ASHRAE 90.1.

Building System and Subsystems. An assembly of dimensionally and functionally pre-coordinated subsystems which, when combined, produces an essentially complete building. A subsystem is one of many building components designed and manufactured to be integrated with other subsystems to produce an entire building system.

Building Information Model (BIM). A BIM is a three-dimensional digital model of a facility. It incorporates all disciplines and facilitates coordination, calculations of relevant building parameters, and the development of construction documents.

Corrosion. Corrosion is the deterioration of a material or its properties due to a reaction of that material with its chemical environment and is inclusive of the deterioration of all materials, which can be caused through sun exposure, mold and mildew, wind, and other environmental elements.

Environmental Severity Classification (ESC). Environmental severity is defined as the corrosivity of the local environment of a given location or region. Environmental severity contributes directly to the occurrence of corrosion. The effects of corrosion and the rate at which they occur are consequences of the corrosion system, which is comprised of a material or physical system, the environment, and operational conditions.

Noise Isolation Class (NIC). NIC is a method for field transmission ratings. The higher the number the better the noise control. NIC rates a partition's ability to block airborne noise transfer. NIC testing is preferable to STC testing as it is specified on more specific space types (such as spaces with operable walls, unaccompanied housing sleeping rooms to each other or to the adjacent corridor, and the actual work spaces in administration facilities). For a field STC test, the individual transmission loss measurements are modified based upon the reverberation time, the size of the room, and the size of the tested partition. The NIC does not include these modifications and simply measures the transmission loss between 125 and 4,000Hz. The value of this rating is that it better tests the performance of the assembly in the field, though it is highly dependent on field conditions of the tested space.

Outdoor-Indoor Transmission Class (OITC). OITC is defined as the A-weighted sound level reduction of a test specimen (or a space) in the presence of an idealized mixture of transportation noises; aircraft takeoff, freeway, and railroad pass-by. It assigns a single number rating to measure Sound Transmission Loss (TL) data obtained in accordance with ASTM E-90. The higher the number, the better the control.

Sound Transmission Class (STC). STC is a single number developed under laboratory conditions that represents the effectiveness of materials or construction to retard the transmission of air-borne sound. It is not as effective for measurement in low frequency noise sources such as mechanical equipment.

Record of Changes (changes are indicated by **1**\ ... /**1**/)

Change No.	**Date**	**Location**
1	22 May 2014	1-8.4, 2.2, 2-3.5, 2-3.6, 2-5.1, 2-8.1.3, 6-9.2: Miscellaneous editorial changes 2-8.4: Thickness of weldable thermoplastic membranes changed to 60 mil (1.52 mm) 5-2.4: Insulated metal roof panels allowed in limited circumstances. 6-3.1, 6-3.2, 6.4: MREC rewritten
2	01 Jan 2017	1-8.5 ccr #5041 revisions. 1-8.8 ccr #4878 clarification on cool roofing; removed date from ASHRAE 90.1 reference. 1-8.9 ccr #5222 rewrote to clarify application to new and existing roof. 2-3.1 ccr #4153 added ref to IPC. Ccr #4476, #5098 and #4668 TPO changes: Paragraphs 2-7 and 2-8 rewritten to include TPO membranes as suitable roofing type. Table 2-1 updated. B-8 revised. B-14 added. These are USACE TPO Roofing lessons learned.
3	06 Mar 2019	Added Environmental Severity Classification and humidity design requirements and updated corrosion prevention requirements in 1-8.4, 2-8, 2-8.3, 2-8.3.2, 2-8.3.4, 3-5, 5-2.5, 6-10 and Appendix C. ccr# 6437; ccr #6514 Misc. fall protection updates; ccr #6852 1-8.12 clarify warranty; ccr #6743 1-8-11 clarify projects for RRC; ccr #5919 5-2.11 clarify metal roof terminations; ccr #6089 2-4.2.3 FRT wood and plank prohibited per UFC 3-600-01.

4	29 Oct 2019	Reinforced requirement in 2-8.2.1 to evaluate roofing materials for combustibility and prohibit use of torch applications when combustible materials are present; added note for modified bitumen reroofing to Table 6.1; added requirement for inspection of existing conditions to confirm the presence of combustible materials to 6-4.1; added Chapter 7, “Roof Systems Operations and Maintenance”; added Appendix G to provide decision criteria for installation of an extensive vegetative green roof.
5	12 Jun 2020	3-5 Deleted prohibition on clay tile roofs in humid environments;3-5.3 added when to use lead-coated copper flashing; 3-5.10 Added “Eave closure” paragraph.3-5.1 ccr#8849 fall protection on tile roofs

This UFC supersedes UFC 3-110-03, dated 26 September 2006; UFC 3-320-03A, dated 1 March 2005; UFC 3-330-02A, dated 1 March 2005; MIL-HDBK-1001/5, dated 28 February 1990; UFC 3-110-04, *Roofing Maintenance and Repair*, dated 11 January 2007; and Air Force ETL 11-8, *Decision Criteria For Installing Vegetative Green Roofs at CONUS Installations*, dated 13 January 2011.

This Page Intentionally Left Blank.

FOREWORD

The Unified Facilities Criteria (UFC) system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and applies to the Military Departments, the Defense Agencies, and the DoD Field Activities in accordance with USD (AT&L) Memorandum dated 29 May 2002. UFC will be used for all DoD projects and work for other customers where appropriate. All construction outside of the United States is also governed by Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA), and in some instances, Bilateral Infrastructure Agreements (BIA.) Therefore, the acquisition team must ensure compliance with the most stringent of the UFC, the SOFA, the HNFA, and the BIA, as applicable.

UFC are living documents and will be periodically reviewed, updated, and made available to users as part of the Services' responsibility for providing technical criteria for military construction. Headquarters, U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering Command (NAVFAC), and Air Force Civil Engineer Center (AFCEC) are responsible for administration of the UFC system. Defense agencies should contact the preparing service for document interpretation and improvements. Technical content of UFC is the responsibility of the cognizant DoD working group. Recommended changes with supporting rationale should be sent to the respective service proponent office by the following electronic form: Criteria Change Request. The form is also accessible from the Internet sites listed below.

UFC are effective upon issuance and are distributed only in electronic media from the following source:

- Whole Building Design Guide web site http://dod.wbdg.org/.

Refer to UFC 1-200-01, *General Building Requirements*, for implementation of new issuances on projects.

UNIFIED FACILITIES CRITERIA (UFC)
NEW DOCUMENT SUMMARY SHEET

Subject: UFC 3-110-03, *Roofing,* dated 1 May 2012.

Cancels: UFC 3-110-03, *Roofing*, dated 26 September 2006, UFC 3-320-03A, *Structural Considerations for Metal Roofing*, dated 1 March 2005 with Change 2 dated October 2010, UFC 3-330-02A, *Commentary On Roofing Systems*, dated 1 March 2005 and MIL-HDBK-1001/5, *Roofing and Waterproofing*, dated 28 February 1990.

Description of Changes: UFC 3-110-03 updates the roofing design criteria for DOD.

Reasons for Changes: Updated to coordinate with the latest editions of the National Roofing Contractor Association's Roofing Manual and Metal Building Manufacturer's Association Roofing Manual and to meet the latest DOD requirements.

Impact: There are negligible cost impacts. However, the following benefits should be realized.

- Elevates awareness that maintenance is necessary to achieve expected service life of roofing systems.
- Makes UFC 3-110-04 rescindable by including pertinent criteria in this publication and updating references.

CHAPTER 1 INTRODUCTION

1-1 PURPOSE AND SCOPE.

Use this UFC in conjunction with the current editions of the National Roofing Contractors Association (NRCA) *Roofing Manual*s (NRCA Manual) and the NRCA technical bulletins and the Metal Building Manufacturers Association (MBMA) *Metal Roofing Systems Design Manual* (MBMA Roofing Manual) to provide specific design guidance for Military roofing projects. This UFC explains how to apply the NRCA Manual and the MBMA Roofing Manual to the design of Military projects (including **Army**, **Navy**, and **Air Force**).

1-2 APPLICABILITY.

This UFC is applicable to all military projects and planners, design professionals and contractors responsible for roofing planning, system design, installation, and maintenance. Family housing requirements may differ from the requirements stated herein. Where one Military Service's criteria vary from the other Services' criteria, it is noted in the text.

1-3 GENERAL BUILDING REQUIREMENTS.

UFC 1-200-01, "DoD Building Code (General Building Requirements)", provides applicability of model building codes and government-unique criteria for typical design disciplines and building systems, as well as for accessibility, antiterrorism, security, sustainability, and safety. Use this UFC in addition to UFC 1-200-01 and the UFCs and government criteria referenced therein.

1-4 CONTENTS.

Roofing design begins with system selection documented in this UFC, the NRCA Manual, and the MBMA Roofing Manual.

1-4.1 System Design.

The NRCA Roofing Manual and the MBMA Roofing Manual provide information regarding the design and construction of roofing systems. However, because of the emphasis on low life cycle cost, this UFC limits the applicability of certain techniques permitted by NRCA and MBMA. The NRCA Roofing Manual CD 2010 comprises five volumes (collectively referred to as NRCA Manual). Table 1-1 illustrates the relationship of this UFC with the NRCA Manual. Use the MBMA Roofing Manual for the design of metal roof systems in combination with the NRCA Manual.

TABLE 1-1. RELATIONSHIP WITH NRCA MANUAL

UFC 3-110-03	Primary Design Criteria	Additional Criteria (Reference Only)
Chapter 2 - Low-slope Roofing Design Requirements (except metal roofing)	The NRCA Manual: Membrane Roof Systems – 2007 The NRCA Manual: Metal Panel and SPF Roof Systems – 2008 NRCA Construction Details CD – 2010	
Chapter 3- Steep-slope Roofing Design Requirements (except metal roofing)	The NRCA Manual: Steep-slope Roof Systems – 2009 NRCA Construction Details CD - 2010	
Chapter 4 – Roof System Related Sheet Metal Flashing	The NRCA Manual: Architectural Metal Flashing, Condensation Control & Reroofing – 2010	SMACNA Architectural Sheet Metal Manual
Chapter 5 – Standing Seam Metal Roofing Design Requirements	MBMA Roofing Manual (for Hydrostatic systems) NRCA Construction Details CD – 2010 (for Hydrokinetic systems)	The NRCA Manual: Metal Panel and SPF Roof Systems – 2008 & SMACNA Architectural Sheet Metal Manual
Chapter 6 - Reroofing Requirements	The NRCA Manual: Architectural Metal Flashing, Condensation Control and Reroofing	

1-4.2 Appendices.

Appendix A is a reference list. Appendix B provides background information and design best practices. Appendix C is the glossary of acronyms and abbreviations. Appendix D provides considerations on roof warranties. Appendix E provides quality assurance guidelines. Appendix F provides other resource documents.

1-5 BACKGROUND.

There are a variety of materials and roofing systems available. Satisfactory roofing performance comes from careful system and material selection, design, contract document preparation, specification, installation, and maintenance.

Roofing systems are exposed to the full brunt of the weather and can allow moisture intrusion or fail prematurely if not properly designed, installed, and maintained. Moisture intrusion can be costly, adversely affect the functions within the building, and result in roof system failure. Since modern roofing systems contain considerable thermal insulation, moisture intrusion lowers thermal efficiency and hinders energy conservation. Wet materials support fungus or mildew, cause deterioration of other roofing system components, and can emit odors leading to sick buildings and occupants.

1-6 SYSTEM SELECTION.

There are two starting points in roofing system selection.

1-6.1 New Construction.

In new construction, the roof system selection is an integral part of the overall building design and must take into account interior building usage and climate. For example, the building can be designed to prevent outward moisture drive, support heavy roof systems (such as garden roofs or paver systems), or sloped for the desired durability (life cycle cost benefit) and aesthetic considerations.

1-6.2 Existing Structures.

See Chapter 6 for more information on reroofing. When dealing with existing structures, weight, slope, existing and hazardous materials, and historic preservation may become constraints. For example, the thickness, weight, and reflectivity of the roof system has a major impact on roof/structure as already designed. Further, with an occupied building, construction noises, fumes, fire hazards, and roof access all take on increased importance.

1-7 SYSTEM TYPES.

For the purposes of this UFC, roofing is categorized as low-slope, steep-slope and metal roofing. Low-slope roofing systems are weatherproof membrane types of roof systems installed on slopes at or less than 3:12 (14 degrees). Steep-slope roofing systems are water-shedding types of roof coverings installed on slopes greater than 3:12 (14 degrees). Standing-seam metal roofing (SSMR) systems are either hydrostatic that are designed and constructed to be totally water resistive (like a roof membrane) or hydrokinetic that are not totally resistive to water intrusion and rely on slope to shed water.

1-8 GENERAL DESIGN REQUIREMENTS

The following requirements apply to all military roofing projects, regardless of system type:

1-8.1 Unified Facilities Guide Specifications (UFGS).

All roofing projects, including both design-build and design-bid-build, shall be designed consistent with this UFC and requirements of the applicable UFGS. Design-bid-build projects are required to utilize the applicable UFGS. Appendix A lists the applicable UFGS documents.

1-8.2 Wind Resistance Rating.

The designer of record shall determine wind uplift pressures and dimensions of the corners, perimeter, and field of the roof in accordance with ASCE-7, *Minimum Design Loads for Buildings and other Structures*. Delineate calculated values in the roof specification or drawings. Utilize independently tested and rated roof systems, such as Factory Mutual (FM), Underwriters Laboratory (UL), and Single Ply Roofing Industry (SPRI).

1-8.3 Thermal Expansion.

The design of the roof and building thermal expansion systems shall consider the selected roof system and shall comply with the roofing system manufacturer requirements.

1-8.4 Environmental Severity and Humid Locations.

\3\ The roof design must incorporate systems and details to meet the environmental corrosivity conditions for the specific project location, as defined by its Environmental Severity Classification (ESC). See UFC 1-200-01 for determination of ESC for project locations. The humidity conditions must also be considered during roof design - humid locations are those in ASHRAE climate zones 0A, 1A, 2A, 3A, 3C, 4C, and 5C (as identified in ASHRAE 90.1). /3/

1-8.5 Air and Vapor Barriers.

Coordinate the roofing design with UFC 3-101-01, "Architecture", which provides design criteria for the building envelope as a whole, including the roof. UFC 3-101-01 includes requirements for air and vapor barriers associated with roofing systems as well as the required \1\ /1/ calculation to determine the need for a vapor retarder and to verify that the vapor retarder has been positioned correctly in the roof assembly. Care must be taken to maintain the continuity of the roof vapor retarder, which is critical to its performance. Moist air leakage through poorly installed vapor retarders defeats their purpose and creates interior moisture problems.

1-8.6 Elimination, Prevention and Control of Fall Hazards.

\2\Incorporate fall protection control measures in the design of roofs. Any part or component of the building, facility, structure or equipment requiring future maintenance work at roofs must incorporate in the design fall prevention \3\and control/3/ methods or techniques to eliminate fall hazards during occupancy and when performing maintenance work. \3\/3/The preferred order of control measures or the hierarchy of controls is to eliminate the need to work at heights (design out fall hazards), followed by prevention (installing guards) and protection and control of fall hazards by identifying, designing and installing anchorages (hard points) for safe use of \3\restraint or/3/ fall arrest equipment and systems. Select materials used in fall protection equipment for metal compatibility in order to minimize corrosion; type 316 stainless steel is recommended.

Elimination, prevention or control of fall hazards must comply with the provisions and requirements of American National Standards Institute, ANSI/ASSE Z359 Fall Protection Code, ANSI/ASSE A1264.1 Standard and DOL - 29 CFR Part 1910, Subpart D \3\and Subpart 1. /3/ For Navy projects, comply with the *Department of the Navy Fall Protection Guide. /2/*

1-8.7 Roof Hatches.

All buildings over two stories, excluding family housing, shall have a roof hatch with an interior ladder or building-attached exterior ladder for roof access. This includes metal roof overbuilds. Provide roof hatches with fully lined and insulated curbs. Coordinate curb height with tapered insulation heights; standard curb height is 12 in. (305 mm), 16, 18, and 24 in. (405, 455, and 610 mm) are available. The height of the roof curb shall be selected to provide 8 inch minimum curbing above the surface of the roof. Also, provide ladders up to the roof hatch, ladder up safety posts, and safety rails per OSHA requirements. Coordinate with UFC 4-010-01, “DoD Minimum Antiterrorism Standards for Buildings”.

1-8.8 Skylights.

If skylights are included, specify fully lined and insulated curbs. Coordinate curb height with tapered insulation heights; standard curb height is 12 in. (305 mm), 16, 18, and 24 in. (405, 455, and 610 mm) are available. The height of the roof curb shall be selected to provide 8 inch minimum curbing above the surface of the roof. Skylight framing and flashing shall extend over and beyond the curb’s vertical wall.

1-8.9 Cool Roofs.

\2\If a cool roof is selected; meet the ASHRAE 90.1 Chapter 5 values for cool roofing. If a cool roof is not selected in climate zones 1-3, meet one of the exception requirements listed in ASHRAE 90.1 Chapter 5./2/

Mechanically fastened single-ply roof systems shall comply with the requirements for mechanically fastened single-ply systems in Chapter 2. Condensation on the underside of mechanically fastened systems can result in ice build-up in winter, mold growth on the facers, moisture dripping into the interior, and replacement of the roofs with less than four years of service. See Appendix B for more information.

1-8.10 Photovoltaic Systems – Rack Mounted Systems

If a photovoltaic system is selected, the contractor must adhere to the following guidelines:

- Building Owners Guide to Roof-mounted Photo Voltaic Systems published by NRCA.
- Guidelines for Roof-mounted Photovoltaic Systems published by NRCA.

\2\PV supports must be permanently affixed stanchions that are anchored to the building structure.

Undertake installation of a photovoltaic roof system over roof systems with caution. Include the following when planning and designing PV systems located on new or existing roofs:

- Determine if the roof structure can handle the anticipated roof load increase. /2/
- Design to ensure that roof drainage is maintained considering the additional roof deflection due to load.
- Design the roof related details for anticipated roof replacement work. Coordinate with the photovoltaic system designer to anticipate and plan for future roof replacement.
- PV equipment on a roof places an entirely new set of roof protection requirements during initial installation and throughout the maintenance cycle. Specify a roof protection program to be applied during the PV system installation.
- Inspect and determine that the existing roof system has at least 10 years of service life remaining. If not, the existing roof shall be removed and a new replacement roof system designed in tandem with the photovoltaic system.
- If 10 years remaining service life remains, contact the warranty holder and involve them in the design of the intersecting details, required roof protection, re-inspections, and their requirements for maintaining the roofs guarantee.

1-8.11 Design Professional Qualifications.

Both design-build and design-bid-build projects with more than 15,000 ft.2 (1400 m2) of roof area or that are defined as “critical use” or “mission critical” in the project DD Form 1391 shall have a Registered Roof Consultant (RRC) or a registered PE or RA that derives his or her or in-house time charges or principal income from roofing design on the quality control staff of the In-house Design, \3\AE Design or Contractor/3/ Design-Build (DB) team. However, it is also highly recommended that this requirement be applied to all projects with more than 15,000 ft.2 (1400 m2) of roof area.

1-8.12 Warranty Requirements.

Any new \3\ roof on a/3/ permanent construction facility shall be designed and specified with a warranty that meets the following requirements:

- Has "no dollar limit,"
- Covers full system water-tightness,
- Is from the single source manufacturer, and
- Has a minimum duration of 20 years.

Manufacturers' warranties that require periodic inspections or repairs at the Government's expense to maintain the warranty are not permitted. The warranty terms, exclusions, and limits must be enumerated in the specifications and require that all roof curbs and penetration flashings \1\ (these include snow guard and lightning protection attachments) /1/ integrated into the roof system are covered under the warranty. For additional background on warrantees, refer to Appendix D.

1-8.13 Roof Information Card.

Per the UFGSs for each roof installation, furnish a typewritten information card for facility records and a card laminated in plastic and framed for interior display at roof access point.

This Page Intentionally Left Blank

CHAPTER 2 LOW-SLOPE ROOFING DESIGN REQUIREMENTS

2-1 GENERAL.

The NRCA Manual provides a wide range of information for design and construction of low-slope roofing assemblies. This chapter does not address low-slope metal roofing (see Chapter 5). This chapter reinforces particularly salient information with regard to military use or limits the applicability of certain techniques in the NRCA Manual. Where contents of the NRCA Manual are acceptable without modification, those sections are not mentioned herein.

2-2 DESIGN-BUILD.

Because of the wide variety of materials available and the variation in quality in similar materials, design-build contracts for low-slope roofing systems must name the specific desired low-slope roofing system (BUR, \1\ Modified Bitumen, MREC, /1/ EPDM, etc.) and identify relevant performance requirements to be provided under the contract. It is not sufficient to simply specify a low-slope roofing system per this UFC.

2-3 GENERAL LOW-SLOPE ROOFING REQUIREMENTS.

2-3.1 Positive Drainage.

The minimum slope for construction of new buildings is ½:12 to achieve positive drainage. Consult with a plumbing engineer to determine the appropriate number of roof drains and the size of drain pipes. \2\ Refer to the International Plumbing Code (IPC), Chapter 11, Storm Drainage. /2/ Retrofit drains are not permitted.

2-3.2 Roof Curb Heights.

Curbs height shall be a minimum of 8 in. (200 mm) above the roof surface, but shall not be less than 6 in. (150 mm) above the high point of a cricket. Roofs with slope may need additional crickets on the upslope side of all non-round penetrations to assure positive drainage around equipment. Crickets are required on the upslope side of all penetrations greater than 24-in. (610-mm) wide

2-3.3 Horizontal Roof Top Duct Work.

Horizontal roof-top ductwork shall have a minimum clearance of 18 in. (455 mm) above the roof plane to ensure ease of re-roofing. Ductwork larger than 48-in. (1220-mm) wide will require a minimum clearance of 24-in. (610-mm) and shall be coordinated with the HVAC engineer.

2-3.4 Snow and Ice.

Over-the-eaves drainage in cold climates can be problematic if snow and ice issues are not addressed early in the design process. Issues that designers shall address are contained in the Cold Regions Research & Engineering Laboratory (CRREL) report MP-01-5663, *Minimizing the Adverse Effects of Snow and Ice on Roofs.*

Locate downspouts to avoid ice build-up on pedestrian circulation paths.

2-3.5 Hail.

Some geographical areas of the United States are more prone to severe hail events. Roof assemblies shall be capable of resisting impact from reasonably expected hail storms for a given geographical area in accordance with IBC-2009 Paragraph 1504.7. Typical enhancements include a thicker membrane combined with a rigid coverboard directly below the membrane.

Owners of critical facilities, such as hospitals, schools, computer centers, airports and sensitive government buildings have come to realize the importance of installing a hail resistant roof assembly over critical facilities. Hail-resistant roof assemblies shall incorporate high-density cover boards when fully-adhered roof covers are specified. Examples of roof covers that have been shown to perform well in hail prone areas (up to 2-in. (50-mm) hail stone size) include the following:

- Aggregate surfaced built up roofing
- Aggregate surfaced modified bitumen
- \1\ /1/
- Fully adhered 90 mil (2.28 mm) EPDM
- Granule or smooth with coating polyester reinforced modified bitumen

2-3.6 Vegetative Roofing Systems.

Vegetative roof systems are a roof area of plantings/landscaping installed above a waterproofed substrate at any building level that is separated from the ground beneath by its manmade structure. A vegetative roof system consists of a waterproofing system and its associated components such as protection course, root barrier, drainage layer, thermal insulation and aeration layer, and an overburden of growth medium and plantings. See *NRCA Vegetative Roof Systems* for additional information.

Vegetative roof systems must be installed over newly installed roof systems and cannot be installed over existing roof systems. Knowledgeable selection of compatible building materials, quality vegetative roof system materials, and systems that will withstand the conditions of the location where a building is located are vital to a quality vegetative roof assembly design. Properly prepared contract documents with accurate drawings and details are essential. Vegetative roof systems shall be designed by an RRC or a registered PE or RA that derives his or her principal income from roofing design. Test the final assembly with a 48-hour water test per ASTM D5957 and/or using an electric field vector mapping (EFVM) system (see Appendix B for more info on EFVM).

Recommended waterproof membrane systems for use in vegetative roofs include:

- Hot fluid applied modified asphalt membrane, fabric reinforced – 215 mils minimum thickness
- Atactic polypropylene polymer (APP) and Styrene butadiene styrene (SBS) polymer modified bitumen sheet membrane, 2-layer minimum
- 1\ /1/
- PVC reinforced – 72 mils (1.82 mm) minimum thickness

2-4 ROOF DECKS.

2-4.1 Deck Slope.

For new construction, the minimum slope noted in Chapter 2, Positive Drainage, must be accomplished in the structural deck.

2-4.2 Types of Roof Decks.

2-4.2.1 Steel Decks.

Steel roof decks are common on military facilities. When properly designed, they provide an economical and dependable roof deck. They are lightweight and are particularly useful where relatively large clear spans are desired. Mechanically attach roof insulation for this type of roof deck. Design to prevent mechanical fasteners from backing out enough to disengage the deck. In addition, the design of the roof insulation must be tolerant of a small degree of fastener back out. Two layers of insulation are required. Depending on wind resistance requirements, all layers of insulation may be mechanically fastened or the bottom layer may be mechanically fastened and the top layer adhered. Wood fiberboard may not be in direct contact with steel decks.

2-4.2.2 Structural Concrete Decks.

Structural precast and poured-in-place concrete roof decks are also commonly used on military projects. They are heavy and are best suited to roof decks with relatively short spans. Use mechanically fastened insulation only when fully adhered roof systems will not meet the required wind uplift resistance. Due to the inherent moisture in the concrete, proper drying time is required. Ensure during system selection and installation that adequate bonding takes place between the roof system and the deck. Prior to installing any roof system on a concrete deck, conduct a test per ASTM D4263. The deck is acceptable for roof system application when there is no visible moisture on underside of plastic sheet after 24 hours.

2-4.2.3 Wood-Plank and Structural Wood-Panel Decks.

Wood-plank and structural wood-panel decks were used in the past on many military facilities. Generally, this material may only be used on small buildings or in reroofing when the existing material is in fair or better condition. Use of this material on new buildings must be supported with strong arguments demonstrating that neither steel nor structural concrete decks fulfill the specific functional requirements. \3\Use of FRT treated plywood and FRT treated wood panels is prohibited. /3/

2-4.2.4 Cement-Wood Fiber Deck Panels.

Cement-wood fiber deck panels have limited utility due to concerns about moisture susceptibility. This type of deck shall not be used for new construction.

2-4.2.5 Lightweight Insulating Concrete Decks.

Lightweight insulating concrete decks have limited utility due to its hydroscopic nature and difficulty of reroofing. Do not use this type of roof deck for new construction.

2-4.2.6 Poured Gypsum Concrete Decks.

Poured gypsum concrete decks have limited utility due to difficulty in attaching membranes to the deck and difficulty in repair. Do not use this type of roof deck for new construction.

2-4.2.7 Precast Gypsum Panel Decks.

Precast gypsum panel roof decks have been used on many military facilities. However, where membrane leaks have occurred, these roof decks pose a safety hazard due to structural instability. Do not use this type of roof deck for new construction.

2-4.2.8 Thermosetting Insulating Fills.

Thermosetting insulating fills have limited utility. Do not use this type of roof deck for new construction.

2-5 RIGID BOARD ROOF INSULATION.

2-5.1 General.

Roof insulation is a very cost-effective means of reducing energy consumption. Depending on climate and the type of membrane selected, the position of the insulation in the roof system greatly affects the performance of the roof system. Insulation system shall be selected and designed to meet the requirements in UFC 3-101-01, “Architecture”, and \1\ UFC 1-200-02, “High Performance and Sustainable Building Requirements”. /1/

2-5.2 Types of Roof Insulation.

2-5.2.1 Cellular Glass Insulation.

Cellular glass roof insulation is not widely used due to its high cost. It is most commonly used in cold storage facilities and other areas where excessive amounts of moisture would degrade the insulating capabilities of other types of insulation.

2-5.2.2 Perlite Board Insulation.

Perlite board insulation is commonly used and may be specified where factors other than insulating efficiency per unit thickness are the primary design considerations. It is particularly useful in roof assemblies where fire resistance is of primary concern and the potential for water vapor intrusion is limited. Perlite board shall not be used in high-wind areas.

2-5.2.3 Polyisocyanurate Foam Board Insulation.

Polyisocyanurate foam board is the most commonly used roof insulation. It is often specified where insulating ability is the primary design consideration. The minimum compressive strength of polyisocyanurate foam board shall be 25 psi (172 kPa).

2-5.2.4 Polystyrene Board Insulation.

Polystyrene board roof insulation is used by the military and is made in two types: expanded polystyrene board (EPS) and extruded polystyrene board (XPS). In terms of moisture resistance and insulating capability, XPS is superior to EPS. It is also more expensive but appropriate for use in inverted membrane systems and cold storage facilities. Do not use polystyrene in direct contact with hot mopped systems. It is typically necessary to use underlayment board and cover board with polystyrene insulation in order to provide for necessary fire interior and exterior ratings and membrane adhesion properties, except when used as part of a loose-laid, inverted roof system assembly on concrete deck. When polystyrene is used on the interior of a building, it must be encased with a fire resistive material.

2-5.2.5 Composite Board Insulation.

Composite board roof insulation may be specified where a multiple layer type of insulation does not satisfy all design requirements, and where there are cost savings available from reducing the number of construction operations needed to install two different kinds of roof insulation. Single layer applications shall be limited when possible.

2-5.2.6 Phenolic Foam Board Insulation.

Phenolic foam board insulation causes severe corrosion when in contact with steel roof decks. It is no longer manufactured in the United States. Phenolic foam board insulation shall not be specified for use.

2-5.2.7 Tapered Insulation Systems.

Tapered rigid board roof insulation systems are more expensive per square unit than non-tapered insulation. As a result, do not use tapered insulation to create the primary slope in new construction. Use tapered insulation in crickets and saddles to ensure positive drainage when adequate drainage already exists in the roof deck as a whole. The slope of crickets and saddles shall be twice that of the main slope.

2-6 COVER BOARDS.

2-6.1 General.

Coverboards installed directly below the roof membrane shall be used within all roof assembles except single-ply ballasted roof systems. Coverboards provide the following functions:

1. Separate incompatible material
2. Minimize the effects of thermal drift; and
3. Protect the thermal insulation and provide a rigid support for the roof membrane.

2-6.2 Types of Cover Boards.

2-6.2.1 Glass Mat Silicon-modified Gypsum Boards.

Provides improved impact and moisture resistance to roof covers and improved fire resistance.

2-6.2.2 High Density Wood Fiber.

Provides improved impact resistance to roof covers, but is hydroscopic in nature.

2-6.2.3 Paper-faced Gypsum Board.

This shall not be used as a cover board.\2\

2-7 SUITABLE ROOF MEMBRANES.

The NRCA Manual discusses all available roof membranes; however, some membranes do not provide the long-term performance requirements for military buildings. Some new products may not be judged suitable because of the lack of proven performance. Other membrane systems may not be suitable because experience has shown a lack of cost effectiveness over the required life cycle.

Generally, low-slope roof membranes that are suitable for use by the military are limited to the following:

1. Asphalt built-up roof (BUR) membranes
2. Styrene butadiene styrene (SBS) or atactic polypropylene polymer (APP) modified bitumen (MB) membranes
3. Ethylene propylene diene monomer (EPDM) single-ply membranes
4. Weldable thermoplastic polyvinyl chloride (PVC) single-ply membranes
5. Weldable Thermoplastic Polyolefin (TPO)
6. Spray applied polyurethane foam (SPF) membranes
7. Hot rubberized reinforced fluid-applied membranes. /2/

2-8 GUIDANCE FOR ROOF MEMBRANES.

This Section provides requirements and considerations for the design and construction of the above roof membrane types. \2\ Consider the use of any membrane type for which there is not a corresponding UFGS on a case-by-case basis, subject to approval by the project manager. \3\

a) Acrylic Elastomers are usually water based, which makes them easy to apply and to clean up; and they are relatively inexpensive. Select material that has a short cure time.

b) Polyurethane Elastomers can be either one- or two-component and are usually spray applied. Granules are often added to the final coat to provide traction (silicone can be slippery) and to harden the final coat. These coatings are prone to pinholing when applied in thick coats (over 30 mils (0.76 mm) wet).

c) Vinyl, Hypalon, and Neoprene are not recommended because of their low volume solids. Butyl coatings are not recommended because they are not resistant to high levels of ultraviolet light. /3/

2-8.1 Asphalt BUR Membranes.

/2/ BUR systems have broad applicability for dependable low-slope roof systems with low service life cost. Consider this roof system unless it can be shown that it fails to meet important design criteria. Positive attributes of BUR membranes include:

- Durability with long service life
- Low maintenance
- Well-understood maintenance procedures

However, the success of this roofing system is based upon sound installation techniques accompanied by suitable quality control. Quality control can be influenced by the warranty. More information on warranties may be found in Appendix D and more information on quality assurance may be found in Appendix E.

2-8.1.1 Cant Strips.

Provide cant strips for all built-up roof systems.

2-8.1.2 Fiberglass Mat Material.

BUR systems must use fiberglass mat material and no less than three-ply or as limited by the UFGS.

2-8.1.3 Roof Vents.

\1\ Ventilating base sheets are required on all concrete roof deck systems. Roof vents are not permitted for new construction. /1/

2-8.1.4 Types of BUR Membrane Surfacing.

The allowable types of top surfacing for BUR membranes are granulated modified bitumen cap sheet and aggregate.

2-8.1.4.1 Granulated Modified Bitumen Cap Sheet.

Ceramic granules reduce the temperature effect on BUR systems. However, as granules are lost, degradation due to ultraviolet (UV) radiation will negatively affect performance. Longevity of these systems on average is not as great as aggregate surfaced BUR systems.

2-8.1.4.2 Aggregate Surface.

The most common type of BUR surfacing is aggregate embedded in a bituminous flood coat. The thickness of 400 lb. (180 kg) gravel surfacing per square of roofing is 0.5 to 0.75 in. (12 to 18 mm). This surfacing allows the temperature of the BUR membrane to remain somewhat cooler than mineral surfaced cap sheet BUR systems. Aggregate surface BUR systems tend to have a longer expected service life than mineral surfaced cap sheet BUR systems because of lower membrane temperature and due to protection of the membrane by the aggregate.

Aggregate surfaced roof system coverings shall be designed and installed in accordance with the IBC Code and Table 1504.4 based on the exposure category and basic wind speed at the building site. The aggregate shall comply with the ASTM D1863 No. 6 aggregate in hurricane prone regions as defined by the IBC Section 1609.2. Aggregate is not permitted when the basic wind speed is 100 mph or greater or at airfields.

2-8.2 MB Membranes.

MB roofing systems have low maintenance cost, and must be considered when long service life is required. The polymers used to modify the asphalt bitumen improve the performance characteristics of the asphalt. The addition of polymers increases low temperature flexibility and high temperature stability. MB membranes are reinforced with fiberglass, polyester, or a combination of both. MB membranes must have at least two-ply or as specified by the UFGS.

\4

2-8.2.1 Polymer Modifiers and Application Methods.

The two major types of bitumen modifiers are an elastomeric styrene butadiene styrene (SBS) polymer and a thermoplastic atactic polypropylene (APP) polymer. SBS systems are usually applied by hot mopping asphalt; however, torch varieties of SBS membranes are gaining prominence. Some SBS products are applied with cold adhesive or torching. APP systems are typically applied with propane torches, which necessitates special requirements for safe handling and storage.

2-8.2.2 System Selection and Fire Safety.

Evaluate roofing materials and characteristics of roof decks and structures for combustibility. If materials or structures are “combustible” as defined by NFPA 101, torch application of the roofing system is prohibited and an alternate method of application must be used.

Use non-combustible materials for torch-applied systems, including the roof deck, parapets, insulation, cant strips, nailers, and structure. In addition, the roofing contractor must conduct an on-site two-hour fire watch after the last torch is extinguished. Provide access to the building interior for the fire watch personnel. **/4/**

2-8.2.3 MB Membrane Surfacings.

The three common types of surfacing used for the top sheet of MB systems are granulated surfaced, metal foil faced, and coated smooth surfaced.

2-8.2.3.1 Granulated Surface.

Ceramic granules reduce the temperature effect on MB systems. However, as granules are lost, degradation due to ultraviolet (UV) radiation will negatively affect performance. Longevity of these systems on average is not as great as aggregate surfaced MB systems.

2-8.2.3.2 Metal Foil Surface.

Metal foils surfaced MB roof systems may be used to achieve solar reflectivity or to improve fire resistance.

2-8.2.3.3 Smooth Surface.

Uncoated smooth surfaced systems are not permitted. Smooth surface membranes must be factory coated for heat reflection and UV protection.

2-8.3 Thermoset EPDM Membranes.

EPDM roof membranes provide predictable serviceability in roof systems in all climates. The minimum sheet thickness shall be 90 mil. All lap seams shall be fabricated with 6-in. (150 mm) seam tape and stripped-in with self-adhering, semi-cured EPDM cover strips.

\3\ EPDM roofing is not resistant to grease and oil and therefore should not be installed near exhaust vents from food preparation areas. /3/

\1\ /1/

2-8.3.1 Mechanically fastened EPDM Systems.

Mechanically fastened EPDM are not permitted.

2-8.3.2 Fully Adhered EPDM Systems.

Fully adhered EPDM systems do not allow billowing of the membrane and are the preferred method of EPDM installation. \3\ Fully-adhered systems, only, are recommended for use in ESC locations C4 and C5, and especially in the areas subject to hurricanes and typhoons. /3/

2-8.3.3 Ballasted EPDM Systems.

Ballasted EPDM roof systems use larger sheets with factory made seams, which are proven superior to field seams. The downside of ballasted roof systems is the need for stone ballast or concrete pavers, and the increased difficulty in detecting sources of leaks. The ballast is relatively heavy at 10 to 12 lbs. per sf. (49 to 59 kg per sm) and may affect the structural system. All ballasted systems shall comply with ANSI/SPRI RP-4, *Wind Design Standard for Ballasted Single-ply Roofing Systems.* \2\\3\

2-8.3.4 Coating of EPDM Systems.

In ESC locations C4 and C5, coat the EPDM. Recoating will be necessary in 3 to 5 years to maintain high reflectivity. A factory-laminated reflective surface is recommended as the life of the membrane will far out last the field-applied coating. After the factory-applied surface has deteriorated (about 10 years in tropical locations) the EPDM membrane can be field-coated for reflectivity. /3/

2-8.4 WeldableThermoplastic Membranes.

Thermoplastics are materials that soften when heated and regain their physical properties upon cooling. Weldable thermoplastic membranes are appealing as roofing systems because when the seams are properly heat welded they can exhibit seam strengths comparable to the membrane sheet. \2\ Weldable thermoplastic membranes are available in many different colors and are often rated as a cool roof. to reduce energy consumption. While the material costs are higher than bituminous-based roofing, labor costs are generally lower. Properly constructed weldable thermoplastic membrane systems may last 15 years or more. Thermoplastic systems permitted in DON are Polyvinyl Chloride (PVC), and Thermoplastic Polyolefin (TPO). Both systems have been used successfully for over 15 years. The minimum thickness of weldable thermoplastic membranes shall be \1\ 60 mils (1.52 mm) /1/ for PVC and 72 mils for TPO. /2/

2-8.4.1 Mechanically Fastened Weldable Thermoplastic Systems.

Mechanically fastened weldable thermoplastic systems allow some billowing of the roof membrane ; however, this is greatly limited by reinforcement fabrics. Cool roofs in ASHRAE Climate Zones 4-8 shall be fully adhered and not mechanically fastened. \2\ Mechanically fastened TPO is not allowed.

2-8.4.2 Fully Adhered Weldable Thermoplastic Systems.

Fully adhered weldable thermoplastic systems do not allow billowing of the roof membrane and are the preferred method of installation.

2-8.5 Thermoplastic Polyolefin (TPO).

TPO membranes are typically white in color and, as a thermoplastic, the seams are heat welded. Specify TPO with 72 mil (1.8 mm) minimum thickness.

Mechanically fastened systems are popular but are restricted to the ‘rhino bond’ system and therefore not allowed due to lack of competition. Fully adhered systems are required. A cover board shall be utilized in all systems. /2/

2-8.6 Hot Rubberized Reinforced Fluid-applied Membranes.

Hot rubberized reinforced fluid-applied membranes are only permitted when designed and shop drawings reviewed by an RRC or a registered PE or RA that derives his or her principal income from roofing design. Further, the membrane shall be applied to a minimum 4-inch (100-mm) thick concrete surfacing. \2\ /2/

2-9 LOW-SLOPE CONSTRUCTION DETAILS.

Use the NRCA Construction Details CD - 2010 construction details as applicable, except as noted in Table 2-1 in this UFC. For details pertaining to low-slope metal roofing, refer to Chapter 5 of this document. Design documents for individual projects must supplement these standard details with additional information related to closures, terminations, transitions, corners, lap and joint conditions, materials interface, sealant requirements, and other project specific conditions. Address all flashing requirements with a complete set of detail drawings. Minimize the use of pitch (or pourable sealer) pans.

\2

TABLE 2-1. LOW-SLOPE ROOFING CONSTRUCTION DETAIL LIMITATIONS	
NRCA Detail	**Comments**
BUR-4	For use only with concrete parapet walls where installation of a reglet and counter flashing inserted into the reglet joint is not possible.

This Page Intentionally Left Blank

CHAPTER 3 STEEP-SLOPE ROOFING DESIGN REQUIREMENTS

3-1 GENERAL.

Steep-slope roofs provide more efficient drainage than low-slope systems and, as a result, are less likely to leak. This chapter does not cover steep-slope metal roofing (see Chapter 5). Chapter 3 limits the applicability of certain techniques permitted by the NRCA to focus on long life cycle military requirements. Where contents of the NRCA Manual are acceptable without modification, those sections are not mentioned.

3-2 DESIGN-BUILD.

Because of the wide variety of materials available and the variation in quality in similar materials, design-build contracts for steep-slope roof systems must name the specific roofing material desired and identify relevant performance requirements to be provided under the contract. It is not sufficient to simply require a steep-slope roof system per this UFC.

3-3 GENERAL STEEP-SLOPE ROOFING REQUIREMENTS.

3-3.1 Self-Adhering Underlayment.

At a minimum, the self-adhering polymer-modified asphalt bitumen membrane underlayment shall be placed as follows:

- At a minimum in ASHRAE Climate Zones 4 and above, place from the eave roof edge to 36 in. (915 mm) past the interior face of the exterior wall on rafter lengths of up to 30 ft. (9.1 m). On rafter lengths between 30 and 45 ft. (9.1 and 13.7 m) place 72 in. (1830 mm) past the interior face. On rafter lengths greater than 45 ft. (13.7 m) place 98 in. (2490 mm) past the interior face.
- 36 in. (915 mm) out from the centerline of all valleys
- 24 in. (610 mm) out from side walls and 8 in (200 mm) vertically up sidewalls
- Over roof curbs and 24 in. (610 mm) out from each side of the curb
- 18 in. (455 mm) out from plumbing vents
- 36 in. (915 mm) along all rake roof edges

Additionally, locate self-adhering polymer-modified asphalt bitumen membrane where moisture intrusion due to snow and ice build-up and/or where frequent infiltration is anticipated. Coordinate self-adhering underlayment design with other roof system vapor barriers (see Chapter 1, Air and Vapor Barriers) to prevent creating two vapor barriers that will not allow the roof system to breath.

3-3.2 Overhangs.

The roof deck and the roof panels shall extend a minimum of 8 in. (200 mm) beyond the exterior wall, with 12 to 24 in. (305 to 610 mm) preferred.

3-3.3 Curb Heights.

Provide crickets on the up-slope side of all non-round penetrations on steep-slope roofs. Curbs shall be a minimum of 8 in. (200 mm) above the roof surface, but shall not be less than 6 in. (150 mm) above the high point of a cricket.

3-3.4 Metal Flashing.

Flashing (excluding gutters, copings, and expansion joints) must be one of the following materials:

- Pre-finished aluminum at a minimum thickness of 0.050 in. (1.30 mm) and shall not come in direct contact with mortar,
- Aluminum at a minimum thickness of 0.050 in. (1.30 mm) and shall not come in direct contact with mortar,
- Copper at a minimum thickness of 16 ounces (454 g),
- Stainless steel at a minimum thickness of 24 ga. (0.64 mm),
- Pre-finished galvanized (G90) at a minimum 24 ga. (0.70 mm) may be used in locations expecting significant physical abuse or a building/roof life less than 15 years,
- Pre-finished 55% AlZn (such as Galvalume) at a minimum 24 ga. (0.70 mm) may be used in locations expecting significant physical abuse or a building/roof life less than 15 years,
- Galvanized steel (G90) at a minimum 24 ga. (0.70 mm) may be used for a building/roof life less than 10 years,
- 55% AlZn (such as Galvalume) at a minimum 24 ga. (0.70 mm) may be used for a building/roof life less than 10 years, and
- Tin-Zinc Alloy coated copper 16 oz. (454 g) minimum may be used at historical sites.

In extreme environments, also refer to *Materials Selection Guide for Army Installations Exposed to Severely Corrosive Environments.*

3-3.5 Gutters and Downspouts.

Prepare calculations to determine the minimum drainage requirement using the calculation method as specified in the Sheet Metal and Air Conditioning Contractors National Association's (SMACNA) Architectural Sheet Metal Manual (current edition).

Obtain the rainfall component for the project site from UFC 3-400-02, "Design: Engineering Weather Data". Locate downspouts and leaders to preclude water and ice build-up on pedestrian paths.

3-3.6 Snow and Ice Considerations.

Most steep roofs drain over their eaves. Some low-slope roofs also drain to eaves, but most drain internally. Over the eaves drainage in cold climates can be problematic if snow and ice issues are not considered early in the design process. Consider design contained in the CRREL report MP-01-5663, *Minimizing the Adverse Effects of Snow and Ice on Roofs*; CRREL MP 5106, *Attic Ventilation Guidelines to Minimize Icings at Eaves;* and CRREL MP 5420, *Ventilating Cathedral Ceilings to Prevent Problematic Icings at their Eaves.*

3-3.7 Hail Resistance.

Roof assemblies shall be capable of resisting impact from reasonably expected hail storms for a given geographical area. In geographical areas of the United States prone to severe hail events, specify impact resistant shingles conforming to UL 2218/ASTM 2218 Class 4 (there are four classes).

3-3.8 Fall Protection.

\3\If maintenance work is required,/3/ roofs with a slope greater than 3:12 shall have permanently installed fall protection per Chapter 1.

3-4 ASPHALT SHINGLES.

Asphalt shingles provide versatile, low-cost steep-slope roofing. As with all roof system selections, a life cycle cost analysis must be performed to determine the appropriate system for a specific project application. To ensure a quality consistent with other roofing systems the following requirements apply.

3-4.1 Wind Pressure.

In areas where the roof deck design is required to resist wind pressures of 45 lbs./ft.^{2} (220 kg/m^2) or more as determined by ASCE 7, the manufacturers' high wind design and installation requirements apply. This may include requiring six nails per shingle as determined by applicable building code, wind speed, slope, and building height.

3-4.2 Perimeter Drip Edge.

Perimeter drip edges are required for all steep-slope roof systems.

3-4.3 Valley Flashing.

Open metal valleys are the preferred system. Woven valleys are allowed on family housing only. Closed cut valley flashing may be used with architectural-grade shingles.

3-4.4 Underlayments.

The use of underlayment requires a continuous substrate to support the underlayment material. The underlayment shall be a minimum 30-pound, non-perforated organic asphalt saturated roofing felt meeting ASTM D226/D226M Type 2 or ASTM D4869/D4869M Type 4. The underlayment shall be applied over the entire roof deck and the self-adhering underlayment before or during the application of shingles. On roofs with a slope less than 4:12, apply two layers of underlayment with staggered side laps. Underlayment(s) shall be vapor-permeable unless it is intentionally designed to perform as a vapor retarder. An underlayment performs several functions:

- Weather protection for a limited time until a roof covering is installed.
- A secondary weatherproofing barrier should moisture infiltrate the asphalt shingles
- Separation between a roof covering and a substrate

In addition, underlayments generally are necessary with asphalt shingle roof systems for the following reasons:

- To comply with the applicable building code
- To maintain a Class A, B or C fire rating for a roof assembly
- To meet the requirements of the manufacturer for a material or system warranty

3-5 TILE ROOFING.

Clay and standard concrete tiles are the preferred tile system. Avoid using lightweight concrete tiles unless required for structural and aesthetic reasons. Use tile for reroofing projects to match existing when required on projects included on the National Register of Historic Places. For other historic reroofing projects, consult with the State Historic Preservation Office (SHPO) or equivalent host nation organization prior to commencing design work. \5\ /5/ The following requirements apply to tile roofing.

3-5.1 Slope.

Tile roofing systems shall not be placed on slopes greater than 6:12.\5\ Install permanent fall protection at clay or concrete tile roofs of any slope at locations where roof access for maintenance may occur./5/

3-5.2 Fasteners.

All roof tiles shall be anchored using stainless steel or copper fasteners, 1-in. (25 mm) engagement in the substrate. Fastener heads shall be of sufficient diameter to prevent pull over of tile. Galvanized fasteners may not be used. Do not use wire ties to fasten tiles to the roof deck.

3-5.3 Flashing.

Flashings must be copper, lead, or stainless steel. \5\Copper must be lead coated when run-off from copper would stain the building./5/

3-5.4 Perimeter Drip Edge.

Perimeter drip edges are required for all steep-slope roof systems.

3-5.5 Batten Boards.

Provide batten boards under tiles in cold climates to assure the coldest roof surface possible. Batten board applications also promote ventilation and drying of tile and under tile. Battens should be considered in all climates where tiles can be lug-hung.

3-5.6 Snow Guards.

Evaluate the need for snow guards and/or fences in cold climates, considering roof slope and anticipated snowfall, and provide the guards over entryways, pedestrian walkways, and parking areas. Also, provide where one roof eave is above another roof.

On roofs with slopes of 10:12 or greater, install a snow fence at the eave. Continuous snow guards around the building perimeter and above all roof penetrations are strongly recommended in ASHRAE Climate Zones 4 and above.

3-5.7 Roof Cement.

Use polymer modified bitumen roof cement.

3-5.8 Self-Adhering Underlayment.

Use a self-adhering modified bitumen membrane installed per Chapter 3, General Steep-slope Roofing Requirements, Self-Adhering Underlayment. Use high temperature polymer modified bitumen membrane as underlayment at high altitudes and the extreme south and southwest regions of CONUS.

3-5.9 Felt Underlayment.

Use non-self-adhering polymer modified bitumen membrane as felt underlayment installed per Chapter 3, Underlayments. \5\

3-5.10 Eave Closure

In order to prevent bat and bird access, pack stainless steel mesh for 3 feet minimum up under the barrel trim tiles at the eaves of hips and gables, and at rake walls, depending on how it is trimmed and flashed. /5/

3-6 SLATE ROOFING.

Slate roofing materials are extremely long lasting but expensive. Consider slate for new construction only when it is required for architectural compatibility with adjacent buildings. Use slate for reroofing projects to match existing when required on projects included on the National Register of Historic Places. For other historic reroofing projects, consult with SHPO or equivalent host nation organization prior to commencing design work. In order to receive full value for the use of slate roofing, other building materials shall provide comparable longevity. A structural analysis must be made prior to installing slate where other roofing systems were used before. Comply with the National Slate Associations, *Slate Roofs: Design and Installation Manual.* Only slate conforming to ASTM C406/C406M *Standard Specification for Roofing Slate* may be used.

3-6.1 Roof Cement.

Use polymer modified bitumen roof cement.

3-6.2 Self-Adhering Underlayment.

Use a self-adhering modified bitumen membrane installed per Chapter 3, General Steep-slope Roofing Requirements, Self-Adhering Underlayment.

3-6.3 Felt Underlayment.

Use non-self-adhering polymer modified bitumen membrane as felt underlayment installed per Chapter 3, Underlayments.

3-6.4 Snow Guards and Fences.

Evaluate the need for snow guards and/or fences in cold climates, considering roof slope and anticipated snowfall; provide the guards over entryways, pedestrian walkways, and parking areas. Also, provide where one roof eave is above another roof.

Continuous snow fences around the building perimeter and above all roof penetrations are strongly recommended in ASHRAE Climate Zones 4 and above. On roofs with slopes of 10:12 or greater, install a continuous snow fence at the eave.

3-7 OTHER STEEP-SLOPE ROOFING.

Other roofing materials are presented in the NRCA Manual. Designers who chose to specify these materials must research the products and demonstrate their life-cycle cost benefits.

Wood roofing materials shall not be used.

3-8 STEEP-SLOPE CONSTRUCTION DETAILS.

Use the NRCA Manual Volume 4 details as applicable, except as noted in Table 3-1 in this UFC.

TABLE 3-1. STEEP-SLOPE ROOFING CONSTRUCTION DETAIL LIMITATIONS	
NRCA Vol 4 Details & Figures	**Comments**
Shingles	
Figure 1, page 26	Do not use.
Figure 25, page 45	Do not use.
Figure 32, page 48	Use only when building life expectancy is less than 20 years.
Figure 35B, page 49	Do not use.
Figure 35C, page 49	Do not use.
Asphalt Shingles	
SM-44-1	Flashing to be 200 mm (8 in.) minimum height.
SM-47	Flashing to be 200 mm (8 in.) minimum height.
SM-46-1	Must have an integral (welded) cricket attached to curb for roof penetrations greater than 305 mm (12 in.) (i.e. no dead valleys wider than 305 mm (12 in.).
ASPH 1	Eave and rake flashing to extend a minimum of 305 mm (12 in.) under shingles.
ASPH 10	Closed cut valleys strongly discouraged (woven or open valley encouraged).
Clay Tile	Historic Roof Consultant to design or review details.
Figure 9, page 102	Do not use flat interlocking, French interlocking, plain tiles.
Figure 10, page 103	Do not use unless matching existing.
Figure 21, page 111	Do not use.
Slate Tile	Roof Design Professional to design or review details, consult National Slate Associates Manual.
Wood Shakes	Not allowed.
Wood Shingles	Not allowed.
Sheet Metal	
SM 11-18	Sealant beneath cover plate to be high quality non-curing butyl, Depth of face side metal to be 200 mm (8 in.) minimum
SM 14,16,18	Fasteners may not penetrate both pieces of sheet metal, must allow for thermal expansion.
SM 23	Surface mounted counter flashing should be limited to non-permanent construction. Use thru wall or recessed counter flashing with lead wedge securement in permanent construction.
SM 3, 5-7, 27	Concealed sealant to be non-curing butyl.
SM 6	Not allowed.
SM-7	Not allowed.
SM-3	Not recommended for permanent construction.
SM-27	Not recommended for permanent construction.
SM-28	Not allowed.
SM-42	Minimum of two lines of non-curing butyl tape, three lines for permanent const.
SM-35	Not allowed.
SM-36	Not allowed.
SM 36	Recommended but normally will include two end dams with UV resistant sealant.
SM-1	Not recommended: Lap seam, mechanically fastened seam, overlap standing seam.
A-Mtl	Do not reference NRCA details, use SMACNA.
S-Mtl	Do not reference NRCA details, use MBMA.

CHAPTER 4 ROOF SYSTEM RELATED SHEET METAL FLASHINGS

4-1 GENERAL.

Architectural sheet metal is integrated into both low- and steep-slope roof systems to assist those systems in achieving protection against moisture intrusion. Typical uses include copings, fascias, gutters, downspouts, and counter-flashings.

4-2 REFERENCE STANDARDS.

Use the latest edition of the NRCA Roofing Manual: Architectural Metal Flashing, Condensation Control, and Reroofing as the primary design guide reference. Additional design assistance can be found in SMACNA *Architectural Sheet Metal Manual.* Certain codes will require compliance with ANSI/SPRI ES1.

4-3 SHEET METAL.

4-3.1 Sheet Metal Type.

Use pre-finished aluminum, pre-finished galvanized steel, 55% AlZn (such as Galvalume), or stainless steel. On historic projects copper, terne coated copper or terne coated stainless steel may be required.

4-3.2 Sheet Metal Gauge and Thickness.

Sheet metal thickness is defined by either gauge or thickness depending on the material. Steel is defined by gauge such as 22 and 24 gauge. Aluminum is defined by thickness such as .040, .050 and .063. Stainless steel is defined by gauge such as 22 and 24 gauge and shall be a minimum of 304 alloy. The architectural sheet metal location on the roof, its width and vertical face will define the thickness or gauge required to prevent distortion. Use minimum 24 gauge pre-finished steel and .063 aluminum for large sheet metal components such as copings, fascias, expansion joint covers, gutters and counterflashings.

4-3.3 Organic Coatings.

When paint coatings are used for exterior applications they must be 1 mil (0.0254 mm) dry film thickness consisting of 0.25 mil (.00635 mm) prime coat and 0.75 mil (0.019 mm) finish coat minimum applied by the continuous coil coating method. Paint resin, with noted exceptions, must be 70% polyvinylidene fluoride (PVDF) containing 100% inorganic pigments. Many other resin types (including PVF) are available but shall only be considered for unusual environments or uses.

Paint coatings must be applied over metallic coatings for carbon steel. Organic coatings must be directly applied to aluminum material.

4-4 MATERIAL COMPATIBILITY.

Use sheet metal anchors that are compatible with the main material. Use stainless steel with pre-finished steel material and use aluminum or type 304 stainless steel with the pre-finished aluminum material. When exposed, fasteners shall incorporate a stainless steel washer with an EPDM washer below. Mill-finished or clear anodized aluminum shall not be used with alkali masonry mortar exposure.

Separate sheet metal components from contact with preservative pressure-treated wood to avoid the corrosive effects of the wood treatment. The following shall be used to attach sheet metal components to pressure-treated wood:

- Type 304 or type 316 stainless steel,
- Double hot dipped galvanized complying with ASTM A153/A153M
- Other specially treated corrosion-resistant fasteners complying with ASTM A653/A653M, Class G185

4-5 EXPANSION AND CONTRACTION.

Allow for the sheet metal expansion and contraction in both the main metal and continuous cleats per SMACNA. This can be accomplished with cleated joints such as drive cleats and predrilled pilot holes for fastener locations.

Wood blocking shall be designed and installed per FM 1-28 and sheet metal designed and installed per ANSI/SPRI ES-1.

CHAPTER 5 STANDING SEAM METAL ROOFING SYSTEM DESIGN REQUIREMENTS

5-1 INTRODUCTION.

SSMR systems can be either hydrostatic that are designed and constructed to be totally water resistive (like a roof membrane) or hydrokinetic that are not totally resistive to water intrusion and rely on slope to shed water. Both hydrostatic and hydrokinetic systems are permitted per the requirements of MBMA and this chapter.

5-2 GENERAL REQUIREMENTS.

The following general requirements apply to all SSMR, regardless if they are hydrostatic or hydrokinetic.

SSMR systems may be installed over open structural framing, or over structural decks. They may be used for new roofing, roofing removal and replacement, and are notably effective for recover of aged metal roofs. They can also be used in low-slope to steep-roof conversions without tear-off. There are many metal roof types. This chapter addresses steel and aluminum materials. Materials and roof types other than described herein may only be used when approved by the appropriate Service Subject Matter Expert (SME). These include special site-formed projects, curved applications of profiles other than described herein, crafted metals (soft metals such as copper, terne, and zinc), and all face-fastened panel types. The roof geometry and layout shall be simplified to the degree possible for SSMR systems. Complicated geometries increase the potential for performance problems.

5-2.1 Design-Build.

Design-build contracts for metal roofing systems must name the specific type of metal roofing system desired (including rib type and watertight or water shedding detailing) and identify all critical performance requirements. It is not sufficient to simply require a metal roofing system per this UFC.

5-2.2 Panels Type.

Ultimately, the panel type decision is aesthetic, economic, and functional. It may also be dictated by wind uplift performance. The effects of oil canning are minimized by fluting, striation, pencil rib or other formations to disrupt the flat panel. However, formations such as these that result in an offset dimension greater than 0.125 in. (3 mm) in height are not allowed due to excessive voids created at panel termination points. When flat pan configurations are used (no disruptions in the flat), tension level coil must be specified to ensure flatness. Panel width must be between 12 and 24 in. (305 and 610 mm). A 16 in. (405 mm) panel type is widely available. Panels must be furnished in lengths of 60 ft. (18.3 m) or longer, when possible, to minimize or eliminate end-to-end joints (panel laps). Panels must be factory fabricated wherever possible.

Site forming can be considered when a roof panel exceeds the allowed length for shipping. Avoid end laps in metal roofs.

5-2.3 Overhangs.

The roof deck and the roof panels shall extend a minimum of 8 in. (200 mm) beyond the exterior wall, with 12 to 24 in. (305 to 610 mm) preferred.

5-2.4 Insulated Metal Panels.

Insulated metal panel roof systems \1\ must only be used without end lap joints and should be limited to maximum 25 foot (7.62 m) length of panel due to thermal expansion/1/

5-2.5 Corrosion Treatment.

The preferred protective coating for carbon steel is 55% (by weight) aluminum-zinc alloy (such as Galvalume) in application rate of .55 oz. minimum per $ft.^2$ (15.6 g minimum per 0.1 m^2) for unpainted material (AZ55) and .50 oz. minimum per $ft.^2$ (14.2 g minimum per 0.1 m^2) for pre-painted material (AZ50). When unpainted 55% AlZn (such as Galvalume) material is used it must have an additional protective coating of acrylic applied at a nominal thickness of 0.3 mil (.0076 mm).

In environments \3\with an Environmental Severity Classification (ESC) C3 or higher, /3/ aluminum metal panels with PVDF coating is the preferred material. Steel with AZ55 with PVDF coating is also acceptable. Galvanized steel (G90) with or without a coating is not acceptable unless the building is temporary. These environments also require careful design of dissimilar metals. The underside of metal roof panels in these areas must have a minimum 0.5 mil (.0127 mm) DFT factory applied primer.

Steel and aluminum shall not be in contact in any environment unless separated with a coating, sealant, or other impervious non-metallic or non-conductive material.

5-2.6 Organic Coatings.

When paint coatings are used for exterior applications they must be a minimum 1 mil (0.0254 mm) dry film thickness consisting of 0.2 mil (.0051 mm) prime coat and 0.8 mil (0.02 mm) finish coat minimum applied by the continuous coil coating method. Paint resin, with noted exceptions, must be 70% polyvinylidene fluoride containing 100% inorganic pigments. Exceptions include interior applications, soffit applications, and surfaces painted white. Many other resin types (including PVF) are available but shall only be considered for unusual environments or uses. Paint coatings must be applied over the corrosion treatment for carbon steel.

If aluminum is used it shall be pre-finished with a factory-applied polyvinylidene fluoride (PVDF) coating. Organic coatings must be directly applied to aluminum material.

5-2.7 Metal Thickness.

When aluminum substrates are used the minimum required thickness is .032 in. (.81 mm). When coated steel substrates are used, the minimum required thickness is 24 ga. (0.0239 in. (0.6071 mm)) not including metallic coating. The minimum thickness is 0.0209 in. (0.5309 mm).) Heavier gauges may be necessary to meet wind uplift criteria per Chapter 1 of this UFC. The specification mandate of heavier section thickness such as 0.040 in. (1 mm) for aluminum and 22 ga. (0.76 mm) for steel may improve the aesthetic with respect to oil canning.

The minimum panel material thickness must be consistent with the material thickness as it was tested for structural capacity in ASTM E1592 *Standard Test Method for Structural Performance of Sheet Metal Roof and Siding Systems by Uniform Static Air Pressure Difference.*

5-2.8 Panel Attachment.

Attach panels with concealed clips. Thermal expansion clips are to be of a two-piece design with a top portion that folds into the panel seam and a base that attaches to the structure with two screw fasteners. The joining of base to top components must anticipate the full range of thermal cycling of the panels, using panel temperature differential of 200 degrees Fahrenheit (93 degrees Celsius). In northern/cold climates, at elevations over 8000 ft. (2440 m), or when using dark roof colors use a panel temperature differential of 220 degrees Fahrenheit (104 degrees Celsius). Maximum frictional resistance between top and base components must not exceed 5 lbs. (2.25 kg) in the finished, folded seam. When eave-to-ridge in-plane dimensions are less than 25 ft. (7.6 m), fixed (one-piece) clips may be employed.

Concealed clips shall accommodate twice the anticipated maximum panel series expansion and contraction based on the temperature differentials noted above.

5-2.8.1 Fixed Point.

Panels must be rigidly fixed (pinned) to the building structure at a single point along their length and allowed to float at other attachment points in order to accommodate inherent thermal movement. Normally that point is at the panel’s ridge or eave end. Such attachment must be designed to resist all in-plane service loads including snow and other environmental loads, thermal cycling and frictional resistance experienced at the clips, and the interface of the panel to the supporting structure or deck. Fixed clips shall be used in addition to the through panel fasteners to provide fixity.

5-2.8.2 Exposed Fasteners.

Minimize the use of fasteners that penetrate the weathering surface of the roof panels and flashings. Use these fasteners in panels only at end-to-end joining and at the lower termination point (point of fixity) of the panel. Fastening through the flat of the roof panel in the ridge or hip areas shall be concealed behind rib closures and under flashings. Sealing washers shall be EPDM (not neoprene) to improve durability and service life. When fastening sheet-to-sheet, back-up plates are required to stiffen the joint and provide solid attachment for screws.

5-2.9 Flashings and Penetrations.

In the design phase, care needs to be taken to locate penetrations within the central portion of the panel and design flashings that will accommodate the anticipated climate. At all times the thermal movement characteristics and hydrostatic performance shall be preserved. Panels shall be free to cycle thermally independent of building structure. Curbs, flashings, and penetrations shall not restrict movement by pinning the panels to the structure. With limited exception, all connections of flashings, curbs, and penetrations must be hydrostatic in design to a minimum height of 6 in. (150 mm) above the drainage plane, above which they may be hydrokinetic. In some cases, especially where differential thermal movement occurs, consider using sheet membrane material, such as EPDM, for a hydrostatic connection. When doing so, the membrane shall be protected from exposure using a sheet metal shroud flashing.

Exceptions to these practices may be where a ridge is a venting design. In these cases, hydrostatic construction will be to the height of the panel rib seam (top of ridge closure). Such exceptions to hydrostatic construction should be scrutinized. Concealed sealants must be non-curing polyisobutylene tapes, supplemented with butyl tube grade when necessary to improve flow characteristics into crevices and other difficult areas. These compounds shall be sandwiched between joint components, in concealed locations, and not exposed. Curing compounds are not permitted. Exposed sealants are to be high-grade polyurethane.

5-2.9.1 Round Pipes, Flues, and Soil Stacks.

Flash small, round penetrations with pre-manufactured EPDM black rubber boots having a laminated aluminum compression ring at their base and secure at the top using a stainless steel draw band. Penetrations shall be coordinated to be in the center of the panels and the application of the pre-manufacturer flashing boot shall not interrupt a seam location. Large penetrations (wider than roof panel width minus 5 in. (mm)) require a fully detailed curb.

5-2.9.2 Roof-mounted HVAC Equipment Curb Flashing.

Large and heavy roof-mounted HVAC equipment is not recommended on metal roof systems. If the HVAC equipment is not to be at ground level, provide a platform with access within the roof system and that uses a single-ply roof system such as PVC (with good watertight details). For smaller hoods, ducts and fans, use minimum 0.080-in (2-mm) thick aluminum or 304 type stainless steel, welded prefabricated curbs for curb-mounted HVAC. The upslope curb flange must underlay roof panels and the down slope flanges must overlay the roof panels. The side curb flanges shall extend to the vertical seam on either side. Panel seams must terminate well before the curb wall and use built-in curb crickets to prevent ponding at curb wall.

5-2.9.3 Perimeter, Parapet, and other Miscellaneous Flashings.

Utilize the same factory finished material as roof panels for exposed flashings and shrouds. Provide slope for all parapet and coping caps and all horizontal projections of transitions.

5-2.10 Other Rooftop Appurtenances.

Minimize other roof accessories that penetrate the roof panels. When painted products are used, every effort shall be made to use the same sheet material as the roof, incorporating the same factory finish.

5-2.10.1 Snow Retention Devices.

In ASHRAE climate zones 4 and above, all metal roofs shall include continuous snow retention devices at all eaves that are non-corrosive, non-penetrating, and mechanically attached with convex setscrews to the standing seams and penetrations and roof curbs. Select snow retention devices to resist all in-service loads considering roof slope and design snow load. Prove adequacy on a site-specific basis by calculation and lab-tested holding strengths of devices. Snow retention devices that glue to panel surfaces or use attachments that penetrate roof panels are prohibited. Avoid using any device that voids material and coating warranties.

5-2.10.2 Lightning Protection.

Use aluminum lightning protection on metal roofs where appropriate. Install lightning protection system in accordance with the roof system warranty requirements (no penetration of roof panel at the valley or eave, limited or no penetrations elsewhere). If lightning protection is included on a roof that also includes snow retention devices, attach the lightning protection system to the snow retention devices.

5-2.10.3 Dormers and Mountings.

When possible, avoid interrupting roof planes with geometries that impede drainage, interrupt the drainage surface, or require valleys. Ensure positive drainage on the upslope side of dormers.

All mountings must be attached to the seams with non-penetrating seam clamps—avoiding breach of the weathering surface. Attach other appurtenances (lightning arrestors, condensate lines, conduits, roof walks, satellite dishes, etc.) with non-penetrating seam clamps. Avoid the use of dissimilar metals. Jacket any copper lines to isolate and prevent copper ion water runoff.

5-2.10.4 Fall Protection.

\3\If maintenance work is required,/3/ roofs with a slope greater than 3:12 shall have permanently installed fall protection in accordance with Chapter 1. Select the fall-protection equipment metal and fasteners to minimize corrosion.

5-2.11 Wind Design.

5-2.11.1 In submittals provide a roof assembly which has been tested in accordance with ASTM E1592; and the roof manufacturer's technical staff will provide the necessary clip spacing based on the ASTM E1592 test results. The metal roof assembly shall replicate the ASTM E1592 tested assembly with respect to clip type, gauge, spacing, and attachment. Because the ASTM E1592 test is conducted with attachment to heavy gauge purlins, the actual construction assembly needs to match the pullout resistance of the tested assembly but may attach to a steel deck or other structural element. The ASTM E1592 tested assembly and the structural performance characteristics must be used when performing the ASCE 7 wind uplift calculations.

5-2.11.2 The maximum clip spacing for metal roof assemblies shall be \3\ as designed by ASCE 7 and tested per ASTM 1592.or UL 1897./3/

5-2.11.3 \3\Eaves and rakes must have metal flashing of heavier gauge than roof panel material. Terminate structural metal panels at ridge with heavy-gauge end stiffening metal panel closure. Wood blocking (treated or untreated) must /3/not be used in metal roof assemblies.

5-3 HYDROSTATIC SYSTEM REQUIREMENTS.

5-3.1 General.

A hydrostatic system is a metal roof system in which the metal standing seam, laps at the eave and valley are constructed with positive attachment and non-curing sealant to provide a watertight assembly. Fixity will typically be at the eave and valleys in this roof system.

Use the MBMA Roofing Manual, latest edition, as the primary reference for design. This chapter limits the applicability of certain techniques permitted by the MBMA Roofing Manual. Where contents of the MBMA Roofing Manual are acceptable without modification, those sections are not mentioned herein.

5-3.2 Material.

Material must be either sheet aluminum or Galvalume coated sheet steel. Galvalume coated steel materials may be pre-finished, and in either case, substrate life will exceed paint life. Galvalume steel does not perform as well when in direct contact with salt spray. It is commonly used in coastal applications but will render a shorter service life. In some of the environments, aluminum may be the better choice, albeit at increased cost, greater thermal expansion and lesser availability. Contact of either metals with strong acids and alkalis shall be avoided. Avoid the use of dissimilar metals. Jacket any copper lines to isolate and prevent copper ion water runoff.

5-3.3 Panel Type.

Use a flat pan (pencil ribs and/or striations are recommended) standing seam profile with minimum finished seam height of 2.0 in. (50.8 mm), with a double fold (180 degree) seam or single fold (90 degree), bulb rib or trapezoidal rib. In general, greater seam heights lead to greater beam bending strength. This increases the wind resistance of the panel and reduces the potential to leak in ice damming situations.

5-3.3.1 Seam Configuration.

5-3.3.1.1 Panel edges must be of male and female interlocking design with integral sealant and machine folded (mechanically seamed) finishing of the seam. There can be no gap between any surface of interlocking male and female seam portions. Finished seam configuration may be either 90-degree, single fold (resembling an inverted “L”) with horizontal dimension of 0.62 in. (16 mm) minimum, or a 180-degree, double fold.

5-3.3.1.2 There are a variety of hydrostatic roof panel seam profiles. Metal roofs are most often 90-degree mechanically seamed, single-lock, vertical rib. The trapezoidal seam profile is also common and provides a raised standing seam elevated out of the water plane by a series of offsets, which also allow for cross seam (roof) expansion and contraction. The trapezoidal seam has an industrial appearance and requires end plugs to seal the profile at the end of the panel at eaves, penetrations, and valleys, which can be problematic. Trapezoidal rib panels shall only be used on roofs with minimal/no curbs and minimal/no valleys.

5-3.3.1.3 The raised mechanically seamed panel seam is made possible due to the profiles of the panel, which allow it to span between purlins. The vertical rib profile is seamed by a mechanical fold and either single or double locked depending on wind uplift requirements and desired aesthetics. A modification on this seam type is the mechanically seamed T rib.

5-3.3.1.4 The bulb seam is a raised standing seam that uses a bulbous top profile to provide seam strength. A differing look, the seam can easily be rendered watertight and can provide a unique seam profile.

5-3.3.1.5 Illustrations of a variety of hydrostatic roof panel seam profiles can be found in Appendix B.

5-3.3.2 Panel Attachment.

Clips must be “wetted” to the male seam component with butyl sealant as necessary to ensure complete hydrostatic performance of the joint and as required by ASTM E2140.

5-3.3.3 Seam Sealant.

Each seam must have a pre-applied bead of non-curing, non-hardening polyisobutylene-isoprene copolymer or terpolymer (butyl) to ensure complete hydrostatic performance. Sealant may be a hot melt butyl formulation if applied at the point of panel manufacture. Gas entrainment of sealant is permitted. The roll-forming machine must apply sealant. Continuity of seal with field applications through all panel termination points is critical. Silicone sealant is not allowed. Primary seals must always be concealed within a joint. When secondary seals are used, they may be exposed one-part polyurethane.

5-3.4 Slope.

The minimum allowable slope for hydrostatic roofs is 1:12.

5-3.5 ASTM Test Method.

Hydrostatic joint performance shall be tested per ASTM E2140, *Standard Test Method for Water Penetration of Metal Roof Panel Systems by Static Water Pressure Head.* The test normally tests only the panel side and end-joints, but it can be adapted to test other assemblies also. In addition to the standard standing seam testing, test the eave of the metal roof system.

5-3.6 Hydrostatic Specifications.

Use the UFGS instead of the specifications shown in the MBMA Roofing Manual.

5-3.7 Recommended Hydrostatic Construction Details.

Regardless of actual project slope, use the “Vertical Rib Low-slope Details” (2-1 through 2-30) in the MBMA Roofing Manual, as applicable, as the basis for the design and detailing principals. Do not use NRCA or SMACNA details for hydrostatic metal roofing.

5-4 HYDROKINETIC SYSTEM REQUIREMENTS.

5-4.1 General.

A hydrokinetic system is a metal roof system in which the metal standing seam, eaves, and valleys accommodate expansion and are constructed in a way that allows some water infiltration. The infiltrating water is drained through weeps in the roof assembly and with a watertight underlayment membrane under the roof. The fixity will typically be at the ridge in this roof system.

Use the NRCA Manual: Metal Panel and SPF Roof Systems – 2008, NRCA Manual: Architectural Metal Flashing and the SMACNA Architectural Sheet Metal Manual to guide the design of the roof system and details.

5-4.1.1 General Hydrokinetic Roof System Requirements

5-4.1.1.1 Hydrokinetic metal roof panels require support and need to be installed over a roof deck. Insulation can be installed over the roof deck if desired. The hold-down clips shall be secured to the roof deck for wind uplift resistance.

5-4.1.1.2 The seams and laps of a hydrokinetic metal roof system are not watertight themselves, so a watertight continuous high-temperature self-adhering underlayment shall be provided under the entire roof. Designer will evaluate the required vapor permanence of the underlayment. In ASHRAE climate zones 3 and above, high-temperature self-adhering ice dam protection shall be installed to the substrate to a height of 36 in. (915 mm) minimum above the interior face of the exterior wall. In these zones, the underlayment can be laid over the self-adhering ice dam protection.

5-4.1.1.3 Roof panels with lengths less than 50 ft. (15.2 m) shall be fixed at the ridge with the expansion being accommodated at the eaves and valleys.

5-4.1.1.4 Rosin paper is not allowed as a separation sheet.

5-4.1.1.5 When roof panels run parallel to masonry sidewalls, the through-wall flashing shall incorporate a counter-flashing receiver and the transitional flashing incorporated into the stepped counter-flashing receiver. The counter-flashing receiver shall be integral with the through-wall flashing.

5-4.2 Material.

Material must be either sheet pre-finished aluminum or pre-finished steel. In some of the environments, aluminum may be the better choice. Contact of either metals with strong acids and alkalis shall be avoided. Avoid the use of dissimilar metals. Jacket any copper lines to isolate and prevent copper ion water runoff.

On historic projects raw copper, pre-patinized copper, zinc coated copper or terne coated stainless steel may be appropriate to match the existing historical context.

5-4.3 Panel Type.

Panels are typically flat with upturned ribs of 1.5 in. (40 mm) minimum. For Military projects, use panel widths from 12 to 18 in. (305 to 455 mm).

5-4.3.1 Seam Configuration.

Panel edges may be either male or female interlocking design or vertical matching legs designed to be covered with a separate seam cover cap installed over the vertical legs. Wood batten strips are only allowed on historic projects.

Illustrations of a variety of hydrokinetic roof panel seam profiles can be found in Appendix B.

5-4.3.2 Seam Sealant.

Factory applied sealant within the standing seams is recommended.

5-4.4 Flashing Details.

All flashings at vertical surfaces shall be integrated and coordinated with the through-wall flashing to assure water tightness and drainage. A water resistant membrane shall be incorporated into the flashing detail to prevent moisture intrusion from wind driven rain and water from ice damming.

5-4.5 Slope.

The minimum slope for hydrokinetic roofs is 4:12. In ASHRAE Climates Zones 4 and above, which have the potential for ice damming, use a minimum slope of 6:12.

5-4.6 Hydrokinetic Roofing Specifications.

Use the UFGS instead of the specifications shown in the NRCA Manual.

5-4.7 Recommended Hydrokinetic Construction Details.

Use the NRCA Construction Details CD - 2010 listed in and as modified by Table 5-1 in this UFC. SMACNA Manual details may also be used. Use these details as the basis for design and detailing principals.

TABLE 5-1. HYDROKINETIC METAL ROOFING CONSTRUCTION DETAIL LIMITATIONS	
NRCA Detail	**Additional Requirements**
AM-1	Must have self-adhesive underlayment or sealant between underlayment and flashing
AM-1A	
AM-2	
AM-3	
AM-3A	
AM-4	Must have fixity provided at the ridge(a structural attachment at ridge closure fasteners)
AM-5	Must have fixity provided at the ridge(a structural attachment at ridge closure fasteners)
AM-6	Vertical joints will be sealed and fixity will be provided at hip
AM-7	
AM-7A	Only if skilled sheetmetal workmanship to be provided
AM-8	Must have fixity at head wall
AM-8A	Must have fixity at head wall
AM-10	
AM-11	
AM-12	
AM-13	With rain collar

CHAPTER 6 RE-ROOFING REQUIREMENTS

6-1 OVERVIEW.

Eventually every roofing system will reach the end of its economic life. Reroofing options are presented under Terminology below.

6-2 GENERAL CONSIDERATIONS.

The NRCA Manual provides typically allowable re-roofs over existing roofing. See below for other considerations.

6-2.1 Terminology.

For the purposes of this UFC, use the following terminology to describe the re-roofing options:

- Roof Replacement: The removal of the existing roof system down to the roof deck and the installation of a new roof system.
- Roof Recover: The installation of a new roof system over an existing roof system. Table 6-1 notes the roof systems allowable for recover.
- Metal Roofing Retrofit: The process of installing a new metal roof system over an existing metal roof system.
- Metal Roofing Overbuild: The installation of a new metal roof system, including structural framing system over a low-slope roof system.

6-2.2 Life Cycle Cost Analysis.

It is unlikely that a recover will last as long as a total tear-off and replacement. Therefore, carefully weigh the life-cycle cost of recover versus replacement. See Appendix B for information on how to conduct at Life Cycle Cost Analysis. The cost of replacement is greatly affected by ease of access, the need for slope buildup, and the need to raise mechanical equipment for access. Reroofing is an excellent time to remove obsolete equipment and stacks from the roof.

6-2.3 Low-sloped Versus Steep-Sloped Considerations.

The low-slope and steep-sloped roof present different challenges in reroofing. An attic space, typically found in steep-slope roof construction, provides separation of construction activities from the interior of the building. However, on steeper slope roofs, scaffolding and protected access to the building may be major construction cost items.

TABLE 6-1. ALLOWABLE RECOVER OVER EXISTING ROOFING*									
Existing Roofing	**New Overlay Roofing Material**								
	Built-up	**Shake**	**Asphalt Shingle**	**Tile Roof**	**Metal Roof**	**Mod Bit****	**SPF**	**MREC[2]**	**Single-ply**
Slate	No	No	No	No	No	No	No	No	No

Modified Bitumen	Yes	No	No	No	Yes (w/ framing)	Yes**	Yes	Yes	Yes
Single-ply	No	No	No	No	No	No	No	No	No

* See Chapter 3 for Military limitations on roofing types.
4\ **See Chapter 2 for prohibition of torch application when combustible materials are present. /**4**/
(X:X) = (Minimum Roof Slope)
[1] See specific requirements
[2] Mesh reinforced elastomeric coatings.

\1\

6-3 MESH REINFORCED ELASTOMERIC ROOF COATINGS (MREC).

6-3.1 Mesh reinforced elastomeric roof coatings can be used in two general ways:

- Mesh Reinforced Elastomeric Roof Coating (MREC): The application of a liquid applied elastomeric coating to an existing roof in order to sustain the roof at low cost.
- Mesh Reinforced Elastomeric Roof: The application of a liquid applied elastomeric coating to an existing substrate such as concrete or mechanically fastened overlayment.

For either application, the minimum dry film thickness is 40 mils (1 mm) applied in stages over 100% polyester fabric reinforcing.

6-3.2 MREC has a wide range of use in reroofing, repair, and sustainment. As indicated in Table 6-1, MREC may be used over most roof systems such as built up, metal, and modified bitumen. These coatings provide not only waterproofing, but can achieve cool roof ratings as well. At a fraction of the cost of replacing, MREC offers a high return on investment with low risk.

/1/

6-3.3 Elastomeric coatings may provide an inexpensive alternative to metal roof removal and replacement.

6-4 LOW-SLOPE ROOFING REMOVAL AND REPLACEMENT.

6-4.1 Analysis of Existing System.

Replacement of an existing roof requires a detailed analysis of the existing roof deck, roof insulation and the roof structure. **4**\ This analysis must include a test cut of the existing roof system to determine the composition of the existing roofing system; a thorough inspection using non-destructive and/or destructive methods as necessary to confirm combustibility of existing roofing materials, and penetration treatments to include the underside of the roof deck, attic, and plenum spaces; a non-destructive moisture test; core sampling; and a review of the structure by a licensed structural engineer. /**4**/

Examine the clearances between the anticipated re-covered roof plane and any above-roof horizontal ductwork, mechanical units, and wall flashings. Based on the required clearances, determine if they will need to be raised. \1\ If this would result in significant cost or disruption of operations, consider MREC to prolong life until equipment can be raised. /1/See NRCA Manual for additional information.

6-4.2 Phenolic Foam Board Insulation.

When this material is found in existing installations with steel roof decks, it must be replaced as part of the project and an in-depth evaluation of the steel deck condition conducted to determine if replacement is required. Even if replacement is not required, the steel roof deck shall be painted prior to the installation of the new roof system. Following are approved paints:

- (IL) Rust-Oleum High Performance Epoxy 9100 System Coating, manufactured by Rust-Oleum, 11 Hawthorn Parkway, Vernon Hills, IL; (708) 367-7700.
- Rust-Inhibitive Steel Deck Coating: DTM Acrylic Primer/Finish manufactured by Sherwin Williams, 161 Greenwood Drive, Bridgeville, PA; (412) 247-2228.
- Amerlock 400 High Solids Epoxy Coating, mixed with equal amount Amerlock resin; manufactured by Ameron Protective Coatings, 201 N. Berry Street, Brea, CA 92622; (714) 529-1951.

- ZRC Cold Galvanizing Compound; manufactured by ZRC Products Company; 21 N. Newport Avenue, Quincy, MA; (617) 328-6700.

6-4.3 Testing for Asbestos Containing Materials (ACM).

If testing of the existing roof system to be removed uncovers the presence of ACM, this fact shall be communicated to the roofing contractor in the contract documents so that the appropriate removal and disposal efforts can be determined by the contractor and included in their costs.

6-4.4 Slope.

In existing construction, every effort must be made to achieve the ½:12 slope required for new construction. However, where ½:12 slopes cannot be achieved, ¼:12 may be used with specific approval by the following authorities:

- Army. District-level Authority Having Jurisdiction
- Navy. Project Manager
- Air Force. Project manager

When increasing slopes of existing roof decks, clearances for rooftop structures such as curbs, base flashings, access doorsills, etc. must be increased to the minimums recommended in the NRCA Manual. Comply with the following:

- Four-way tapered insulation is the most effective method to drain a roof, followed by two-way tapered with saddles. The width of the saddles is critical to move water to the drains.
- Saddles and crickets to the high side of curbs shall be a minimum of twice the roof slope.
- Consult with a plumbing engineer to determine the appropriate number of roof drains and the size of drainpipe.
- See Metal Roofing Overbuild below for additional slope issues.

6-5 REPLACING SINGLE-PLY SYSTEMS.

Single-ply systems shall not be recovered but shall be replaced in full. If the existing membrane is not removed, it may drag and distort the new membrane. The removed membranes shall be recycled.

6-6 LOW-SLOPE CONVERSIONS.

In poorly draining low-slope roofs where the use of tapered insulation cannot improve drainage, the roof may be a candidate for conversion to a steep-slope system. Refer to CERL Technical Report M85/05 *Steep Roof Conversions*. Slope conversions are often more expensive than in-kind reroofing, but may offer the opportunity to convert to a system that requires less maintenance.

6-7 TAPERED ROOF INSULATION SYSTEMS.

Tapered rigid board insulation shall be used when the existing facility has inadequate slope, and other means of providing adequate slope are more expensive over the lifecycle of the facility. Tapered rigid board roof insulation systems are more expensive per square unit than non-tapered insulation. Do not use wet fill to accomplish slope in existing systems. Use tapered rigid board in crickets and saddles to ensure positive drainage.

6-8 RECOVERING STEEP-SLOPE ROOFS.

Re-covering steep roofing such as asphalt shingles is easily done, provided that shingles being overlaid are in acceptable condition and the shingle being installed is of the same size. Building codes permit either one or two direct recovers with missing shingles replaced first and curled shingles flattened. No more than one layer of re-cover roofing may be specified on Military buildings. In recover, new metal flashing is required. Do not re-cover over wet or deteriorated materials. See Table 6-1.

Generally, underlayment is not required in shingle re-covers. Wood shakes and shingles are not a suitable substrate for new shingle or shake recover and must be removed.

6-8.1 Historic Buildings.

Existing roof system shall be replaced in kind, if possible.

6-9 METAL ROOFING.

6-9.1 Metal Roofing Recover.

When tearing off and replacing a failed hydrostatic SSMR system that is attached to a structurally sound roof substructure, one option is to use a standing seam metal roof and retrofit sub-purlin framing system. A structural evaluation of the framing system and the attached roof panels is required. The sub-purlins are custom fabricated with slot depth and spacing to nest over the existing metal roof profile and provide a level surface on which to attach the new metal roof panels.

6-9.2 Metal Roofing Overbuild.

Metal roofing is frequently selected for steep roof conversion since new lightweight structural members easily accommodate increased slope requirement, and the new metal roof may not need a new deck. The fire hazard concern about the newly created attic space must be addressed (FM Global Data Sheet 1-31). Ventilation concerns must also be addressed. Provide a watertight seal at penetrations of new framing connections through the old roof and maintain adequate drainage of the old roof during construction. In hurricane-prone areas, the original roof watertightness shall be maintained. The existing drainage system shall be disconnected and overflows provided at the roof surface level.

Also comply with the following:

- The new truss system shall be installed to the existing structure. This will require cutting the roof and removing in the attachment areas. Therefore, the old roof assembly will not be considered a complete vapor barrier, vapor retarder, air barrier, or insulation layer.
- All wet insulation shall be removed.
- The new attic space shall comply with all code and UFC requirements and may require a separate sprinkler system. The new attic space needs to be detailed to either be a venting attic space or semi-conditioned attic space.
- Although some slope built-up systems have a structural system of trusses and purlins, a roof assembly using a metal deck is recommended. If trusses and purlins are used, the trusses shall be no more than 36 in. (915 mm) apart (even if this exceeds the ASCE 7 wind uplift requirements). The spacing of trusses will not exceed 60 in. (1525 mm) on center (oc). The cross members will be spaced in accordance with the clip spacing determined to meet the wind uplift forces and will not exceed 60 in. (1525 mm) oc. If the cross members are steel hat channels on a spacing of 48 in. (1220 mm) oc or greater, they will be 20 gage and a minimum of 1.5 in. (37 mm) in height.
- New slope built-up metal roofs will have a minimum of 2 in. (50 mm) fiberglass batt insulation and continuous sealed vapor barrier installed directly underneath the roof panels to prevent corrosion from condensation.
- In ASHRAE climates zones 4 and up, it is strongly recommended that the assembly provided include an insulation layer and vented attic. \1\ Use of cool roofs in these climate zones can result in condensation and deterioration of the roof system, see Appendix B Best Practices Chapter 8. /1/
- The new roof system will provide overhangs over the existing building unless infeasible.
- It is strongly recommended that an RRC or a registered PE or RA that derives his or her principal income from roofing design be used in the design and shop drawing review.

6-10 SPRAY APPLIED POLYURETHANE FOAM.

Spray Applied Polyurethane Foam (SPF) roof systems may be considered as a repair option. It is particularly useful for repairing leaking metal roof systems and there is a desire to insulate or add insulation to the existing metal roofed building. SPF is also suitable for curvilinear shapes that do not permit the use of other approved roof systems. 3\In the tropics, due to windy conditions or difficulty in obtaining skilled applicators, the use of polyurethane foam as a roof insulation is not recommended. /3/

SPF roof integrity is highly dependent on the proper mechanical field mixing of components, weather conditions at time of application, the foam's surface texture, and full coverage of the foam with the waterproofing coating materials. Manufacturer involvement during the application is encouraged and final inspection by the manufacturer is required prior to Government acceptance.

6-10.1 Foam.

Trained and certified applicators are required for installation because the foam is difficult to apply in uniform thickness and is highly sensitive to moisture, UV radiation, and wind velocities in excess of 12 miles/hr (19 km/hr). Even brief exposure to UV radiation in sunlight significantly degrades the foam. Degradation is progressive and will eventually result in system failure.

6-10.2 Coating.

Coatings are required for all SPF roof systems and ceramic granules shall be broadcast into the coatings installed over SPF. The coating protects the foam from UV degradation and must be applied to the foam as soon as possible after the foam has cured, but not more than 72 hours after foam installation. The granules provide protection against birds “pecking” the foam, provide better tracking on the coating when wet, and improve UV protection.

The base coating shall be a distinctly different color to provide an indication of the need for re-coating the roof system. The cost of replacing coatings is a significant component of the life cycle cost of SPF roof systems.

6-11 NEW TRUSSES AND DECKING.

Adding lightweight steel or wood trusses or rafters and a nailable deck permits the use of most conventional steep roofing systems.

6-12 SECONDARY PROTECTION.

Re-roofing invariably means disruption of building operations. For some sensitive occupancies (e.g., top floor computer rooms, surgical suites, laboratories, or telephone equipment) a total tear-off may be an unacceptable risk. The addition of a secondary membrane should be analyzed for condensation considerations.

6-13 CLIMATE/WEATHER CONSIDERATIONS.

A complete tear-off requires good weather since the building is usually occupied and nightly tie-offs may not provide adequate protection. The demands of protecting the building may prompt the use of a temporary roof—especially when a thicker insulation system is being added and it is not feasible to run from eave to ridge in a single day.

6-13.1 Night Seals.

At the end of each work period on a re-roofing project, the existing and new roof system shall be completely sealed from moisture intrusion and able to withstand a head of water. Existing drains must remain in working order until the new roof and associated drainage system is completely functional.

6-13.2 Upgrading Insulation.

Adding new insulation and/or an air space above the existing roof will change snow-melting characteristics. Generally, the added insulation reduces vapor condensation problems; however, the effect of the new insulation on vapor condensation must be determined.

6-14 LOGISTICAL CONSIDERATIONS.

Planning a re-roofing project must include all the logistics of the project, especially if the re-roofing occurs over an occupied building. Items to consider in the planning include the following:

- Protecting the newly applied roof covering from tear-off debris and construction traffic. This is critical to the longevity of the new roof;
- Planning for the possible presence of asbestos-bearing materials and landfill or recycling rules and regulations that may require separation of construction materials;
- Staging of new materials when existing materials are being torn off;
- Providing for material removal when dust management is used;
- Removing surface dirt and loose aggregate on aggregate-surfaced roofs prior to tear-off;
- Providing protection of building interior and protection of exterior finishes to remain;
- Providing interior dust control;
- Evaluating potential impact of new work on deck underside fireproofing; and

- Identifying and controlling fire risk from roof installation—especially torch-applied systems.

6-14.2 System and Site Safety Considerations.

Safety is of paramount importance. Protect occupants from fumes by coordinating the shutdown of air handling units. Protect occupants in areas where roofing work is taking place directly overhead by directly cordoning off the area, especially if deck repairs are taking place. Protect all occupants entering or leaving the building from falling materials. Exercise extreme care when reroofing over existing gypsum or wet fill deck systems. Identify the location of underground tanks and other sensitive, sub-surface items so that heavy vehicles do not overload these areas.

6-14.3 Deck Replacement.

If deck replacement is necessary, the operations directly beneath the deck being replaced will require shut down for safety and leakage reasons. Additionally, since it may be impossible to maintain HVAC services, humidity control, and air exchange with the building roof being open, a more extensive shutdown may be required.

CHAPTER 7 ROOF SYSTEMS OPERATIONS AND MAINTENANCE

7-1 PURPOSE AND SCOPE.

The objective of a roof management program is to optimally manage roof systems over their life-cycle to meet the required levels of service for Department of Defense (DoD) real property. Roof management involves an asset management approach, taking into account performance measures, periodic inspections, routine maintenance and repair, and correct application of quality roofing products.

7-2 ASSET MANAGEMENT OF ROOF SYSTEMS.

Executive Order (EO) 13327, *Federal Real Property Asset Management* (2004), requires all DoD components to adopt a common process for conducting built infrastructure assessment. A roof system database is helpful to effectively manage those assets by tracking the life-cycle cost attributes of a roof system that are important for developing and executing investment strategies. A DoD Memorandum, *Standardizing Facility Condition Assessments* (2013), requires all DoD components to adopt a common process that incorporates the BUILDER™ Sustainment Management System (SMS) modules developed by the United States Army Corps of Engineers' (USACE) Engineering Research & Development Center's (ERDC) Construction Engineering Research Laboratory (CERL). The Memorandum also requires all DoD components to properly record a facility condition index (FCI) for each real property asset on their installations in their respective real property databases. BUILDER™ SMS can serve as the roof system database when roof system data is maintained. It tracks information on the type and age of the roof and helps to assign a condition to the roof based on a fixed set of criteria. With this information, it can provide a remaining service life prediction and reveal when to execute corrective maintenance or repair actions. There are several commercial off-the-shelf (COTS) tools available and in use at DoD installations; there is no prohibition against continuing to use these. However, the condition rating of the roof system must be assigned using the SMS criteria that is the DoD standard, namely the condition rating using BUILDER™ SMS criteria. Contact your Service's subject matter expert (SME) for information regarding continued use of other COTS tools as the roof system management database for your installation. Maintenance of the database is best accomplished by in-house shops.

7-3 NONDESTRUCTIVE INSPECTIONS.

Nondestructive inspections can aid inspectors when conducting condition assessments. Nondestructive inspection methods can reveal roof areas where leaks are occurring or have occurred. Three methods are infrared thermography, electrical capacitance, and nuclear detection. The infrared method has the advantage of surveying 100 percent of the roof surface area while the others survey only 2 percent when using a typical 10-foot by 10-foot (3-meter by 3-meter) grid pattern. These methods can supplement but never replace a visual inspection. Confirm an anomaly identified by nondestructive methods by taking a roof core sample and testing it.

7-4 INSTALLATION-LEVEL SURVEY.

An aerial infrared survey of the installation is an excellent aid to a roof management program. Combined with a rooftop visual inspection and destructive verification of aerial findings, these surveys confirm leak tightness of newly constructed roofs, pinpoint leak sources and extent of wet insulation to allow spot repairs or partial replacement, or confirm the total number of roof sections that need to be replaced.

7-5 MAINTENANCE.

Maintenance is the proactive effort expended on a recurrent, periodic schedule that is necessary to preserve the condition of the roof components and systems as they were designated for their anticipated service life. Preventive maintenance efforts generally occur prior to failure of the roof system to perform as intended and include periodic inspections and resulting diagnosis of required repairs. The work may consist of the correction of minor defects in small areas, such as resurfacing bare spots, or it may involve the treatment of the entire roof area, such as recoating smooth-surfaced built-up roofing. With good maintenance, the service life of a roof is extended many years and the life-cycle cost of roofing is reduced.

7-6 MAINTENANCE INSPECTION PROCEDURES.

Inspect all roofs at least once annually (NRCA recommends inspecting roofs at least twice annually and after significant storm events like high winds, hail, heavy rain, or snow accumulation). At a minimum, conduct housekeeping, clear drainage system, secure loose fasteners, replace sealant, and note conditions that require further attention. Pay special attention to flashings because most leaks originate at these areas. Make a detailed inspection of flashings at locations such as skylights, perimeters, walls, penetrations, equipment curbs, and drains. Inspect the field of a roof for items such as surface wear, lap integrity, and overall degradation. Identify signs of weakness, unnecessary or improperly installed items, deterioration, or hazard. Identify needed repairs.

7-6.1 Use the NRCA Manuals.

Supervisors and roof maintenance personnel should use the NRCA manuals to the fullest extent possible, consistent with local operating conditions and capabilities. See Appendix A for NRCA manual resources.

7-6.2 Qualifications of Personnel.

Roofing work can be difficult and dangerous for inexperienced, untrained workers. The repair standards and procedures cited in this UFC require varying levels of competency and training to be effective. The use of hot asphalt, torches, and solvent-containing materials is common in roof repair work and misuse can create problems. To make roof work safer and more effective, ensure that qualified personnel are assigned or contracted to accomplish repair work, routinely review fall protection procedures, and conduct the work with at least two people.

7-6.3 Identifying Leaks.

The initial phase of repairing defects in roofs related to moisture infiltration is accurately identifying and locating the defect that is the source of the moisture infiltration. This can be relatively simple or complex, depending on the circumstances. Interior moisture infiltration that is observed and reported as a roof leak can be a result of defects or inadequate systems at adjacent elements of the structure, such as walls, windows, and mechanical units. Maintenance personnel shall perform an investigation to identify and locate leak damage related to roof defects prior to repairs.

7-6.4 Locating Leaks.

Locate the interior leak damage by measuring from a reference point on the roof. If roof defects are apparent at the correlated location on the roof, proceed with the roof repair work. If roof defects are not readily apparent and adjacent building elements are located close enough to be potential sources of the moisture infiltration, continue to investigate to determine the source of the leak causing the damage.

7-7 ROOFS UNDER WARRANTY.

Roofs under warranty, guarantee, or performance agreement must be inspected in accordance with the terms of the warranty. The appropriate personnel shall determine the applicability of warranties prior to performing repairs to roof components or systems. If a warranty is in effect, the warrantor should be contacted for recommendations as to the correct course of action. The warranty should cover most leaks and defects in the membrane and flashing systems. Debris must not be allowed to accumulate on the roofs and minor defects should be noted and relayed to the warranty provider.

7-8 ROOFS AWAITING REPLACEMENT.

If a roof continues to leak despite repeated repair efforts, that roof should be scheduled for replacement. Normal maintenance efforts on these roofs are ineffective and will only result in neglect of essential preventive maintenance on the fully functioning roofs. Perform safety inspections only on these roofs. Check drainage systems and remove all debris from roofs to prevent excessive ponding of water and possible roof collapse. These roofs should be replaced or the building evacuated and demolished.

7-9 REPAIRS.

Repairs are the efforts necessary to restore functionality to roof components and systems. This is the treatment to repair at least partial failures. Repairs may be minor, involving small areas such as the replacement of a broken slate or tile, or it may be major, involving the whole roof such as the application of additional layers of felt over built-up roofing.

7-10 NON-GOVERNMENT STANDARDS.

This UFC adopts available industry reference sources as non-government standards describing repair methods and materials for various types of roof systems. The following publications form a part of this UFC to the extent specified herein.

- Refer to *NRCA Repair Manual for Low-Slope Roof Systems*, 2nd Edition, for membrane, flashing, and sheet metal, and penetration repairs of BUR, modified bitumen, thermoplastic, and thermoset membranes. See paragraph 7-11.
- Refer to the SMACNA *Architectural Sheet Metal Manual* for technical information, specifications, and drawings related to replacement of sheet metal components.
- SPFA-127, *Maintenance Manual for Spray Polyurethane Foam Roof Systems*

7-11 DETAILED REPAIR REQUIREMENTS.

See the referenced sections of *NRCA Repair Manual for Low-Slope Roof Systems*, 2nd Edition, for certain roof systems and repairs, as follows:

- Built-up roof membranes: Section 1
- Modified bitumen membranes: Section 2
- Thermoplastic membranes: Section 3
- Thermoset membrane repairs: Section 4
- Mechanically attached metal flashings: Section 5. /**4**/

APPENDIX B BEST PRACTICES

B-1 INTRODUCTION.

This appendix identifies background information, good design practices, and DoD preferences. The designer is expected to review and interpret this guidance and apply the information according to the needs of the project.

B-2 SUSTAINABILITY.

Over the past two decades, responsible roofing professionals have sparked a drive toward greater interest in and adherence to the concept of sustainability. Beyond the desire to improve return on investment on such a significant part of the building envelope, adopting roof systems to fit within environmental parameters has great resonance in modern times.

In the roofing industry, the essence of sustainability is long-term performance. Except for very large roof areas, steep-slope roofs often offer the most life-cycle cost effective solution when considering maintenance, repair, and replacements costs. Military roof systems should be designed to meet the recommended warranty coverages in Appendix D.

As roofing professionals have applied the concept of sustainability to their construction and reroofing projects, they have come to learn that several key areas provided opportunities for improvement. These areas were identified by the CIB (International Council for Research and Innovation in Building Construction) Working Commission W.83 or RILEM (International Union of Testing and Research Laboratories for Materials and Structures) Technical Committee 166RMS (CIBW.83/RILEM166RMS). The areas that were identified include:

1) Minimize the burden on the environment by responsible use of materials.
2) Conserve energy by improving thermal efficiency of roofs; and
3) Extend roof lifespan by improving long-term performance.

B-2.1 21 Tenets of Sustainability.

Within this framework, 21 Tenets of Sustainability were developed for design compliance as follows:

A. Minimize Burden on the Environment

1. Use products made from raw materials whose extraction is least damaging to the environment.
2. Adopt systems and working practices that minimize wastage.
3. Avoid products that result in hazardous waste.
4. Recognize regional climatic and geographical factors.

5. Where logical, use products that can be reused or recycled.
6. Promote the use of 'green roofs' supporting vegetation, especially on city center roofs.
7. Consider roof designs that ease the sorting and salvage of materials at the end of the roof life.

B. Conserve Energy

8. Optimize the real thermal performance, recognizing that thermal insulation can greatly reduce heating or cooling costs over the lifetime of a building.
9. Keep insulation dry to maintain thermal performance on durability of the roof.
10. Use local labor, materials and services wherever practical to reduce transportation.
11. Recognize that embodied energy values are a useful measure for comparing alternative constructions.
12. Consider the roof surface color and texture with regard to climate and the effect on energy and roof system performance.

C. Extend Roof Lifespan

13. Employ designers, suppliers, contractors, trades people and facility managers who are adequately trained and have the appropriate skills.
14. Adopt a responsible approach to design, recognizing the value of the robust and durable roof.
15. Recognize the importance of a properly supported structure.
16. Provide effective drainage to avoid ponding.
17. Minimize the number of penetrations through the roof.
18. Ensure that high maintenance items are accessible for repair or replacement.
19. Monitor roofing works in progress and take corrective action, as necessary.
20. Control access onto completed roofs to reduce punctures and other damage, providing defined walkways and temporary protections.
21. Adopt preventative maintenance, including periodic inspections and timely repairs.

B-3 ROOFING SYSTEMS.

B-3.1 Low-slope Roof Drains.

Roof drains should incorporate sump pans provided by the roof drain manufacturer, under-deck clamps to prevent wind uplift, and a clamping ring with bolts. Generally, the best performing roof drains and strainers are made of galvanized cast iron.

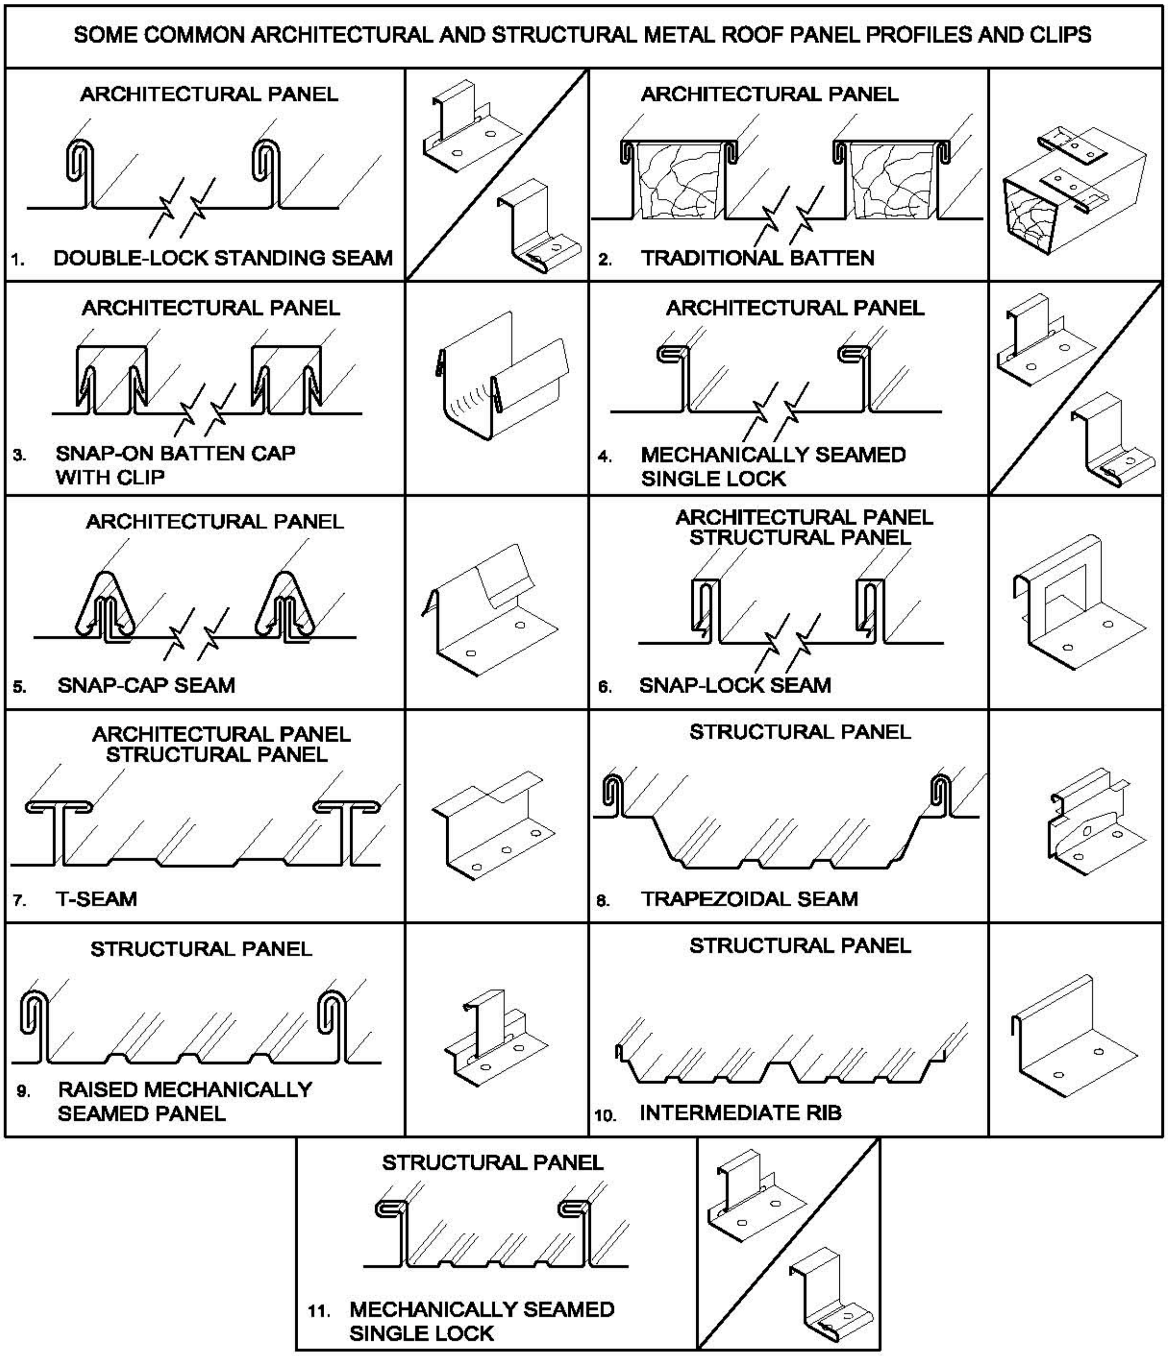
B-3.2 Cover Boards.

Per Chapter 3, cover boards are required on all low-slope roof systems except ballasted. Note that cover boards also protect the polyisocyanurate insulation from physical damage, improve fire resistance, and provide a suitable surface for adherence of the roof membrane.

B-3.3 Common Metal Roof Panel Profiles.

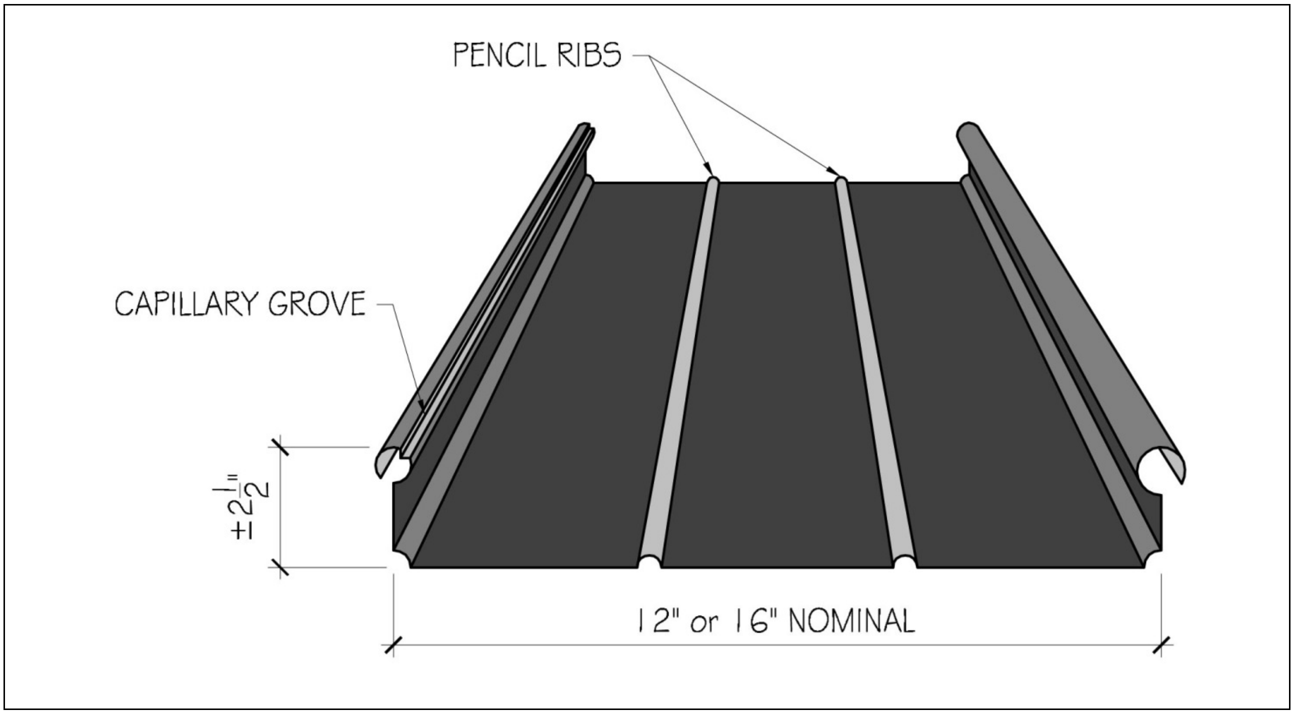
Figures B-1 and B-2 illustrate some common metal roof panel profiles.

FIGURE B-1. COMMON METAL ROOF PANEL PROFILES AND CLIPS



Used with permission, National Roofing Contractors Association

FIGURE B-2. BULB SEAM ZIP RIB



B-4 TEMPORARY ROOFS

Roof system design and construction can often be enhanced by the use of a temporary roof, often a vapor retarder. However, there are conditions and climates where caution must be taken to ensure a second vapor barrier is not created that will trap moisture once the new roof is completed. In southern climates (ASHRAE Climate Zones 1 thru 3), the temporary roof and resulting vapor barrier shall be removed once the new roof is completed. When used appropriately, this design element provides several key quality assurance benefits during new construction:

- Allows for roof related construction such a wood blocking and HVAC work to take place over the temporary roof and not the final roof thus reducing the potential for physical damage to the new roof system.
- Allows for building construction above the roof, such as masonry walls, curtain walls, metal panels, etc., to take place over the temporary roof, thus reducing the potential for physical damage to the new roof system.

Temporary roofs provide the following quality assurance benefits during roof removal projects:

- Permits the full removal of the existing roof without the need to install the new roof in small sections that would result in multiple tie-ins.

- Allows for roof interfacing work such as the installation of new roof drains or renovation of existing roof drains. Wood blocking installation, masonry restoration, HVAC equipment disconnection, curb installation and reinstallation can take place over the temporary roof rather than the new roof system.
- Allows for the large monolithic installation of the new roof system.
- Enhances the roof installation quality.

B-5 ELECTRIC FIELD VECTOR MAPPING (EFVM).

Electric Field Vector Mapping (EFVM) is a non-destructive leak detection method recommended for all waterproofing membranes particularly when waterproofing systems are to be covered with over burden, such as soil for vegetative roofing, pavers for a plaza, or an inverted roofing membrane assembly (IRMA). It is suitable for all waterproofing membranes possessing electrically insulating properties.

B-5.1 How EFVM Works.

EFVM detects the concentration of current flowing across a membrane indicating a breach. If water has flowed through a breach in the membrane, an electrical pathway is set up, which when wetted and energized creates a completed circuit. Whether the membrane is exposed or overburdened, EFVM quickly and accurately locates all breaches.

B-5.2 Locating a Breach in the Membrane.

EFVM locates breaches by measuring electrical flow. One lead from the pulse generator goes to a conductor, placed on the membrane while the other is grounded to the structure. The area of the membrane to be tested is wetted to create continuity that will carry an electrical charge. The trained and certified inspector applies a low voltage electrical potential above and below the membrane in regular pulsed intervals and reads a potentiometer while systematically measuring the current flow at the surface of the roof membrane or any other component of the wet field such as wetted drainage mat, insulation or overburden. Each area of membrane must be thoroughly wetted.

Sensitive equipment reads through all typical water permeable overburden medium such as soil, sand, crushed stone or even pavers and garden plants to measure current flow. Any breach allowing even minute amounts of water past it will conduct electricity, completing a circuit and creating a concentration of current flow measurable by the inspector reading the gauge attached to the probes.

The EFVM trained and certified inspector quickly detects and locates with pinpoint accuracy any individual defect that allows the flow of water from above the membrane to structure. EFVM tests commonly reveal breaches missed by previous flood testing. The contractor can repair the defects found and have them retested within the same day.

B-6 RECYCLING.

The ability to recycle roofing material is now available. When existing roof systems are being removed various components such as the following can be recycled:

- Ballasted and mechanically attached EPDM
- Ballasted and mechanically attached PVC
- Roof related sheet metal
- Extruded and expanded polystyrene
- Chlorosulfonated Polyethylene (CSPE)

Designers are encouraged to specify the recycling of these roof related materials and require certification of same. Refer to the UFGS 01 62 35 on Recycled/Recovered Materials.

B-7 LIFE CYCLE ASSESSMENT.

Consider conducting a Life Cycle Cost Analysis (LCCA) on major roof components, such as the membrane and insulation, to determine the lowest life cycle cost for the component. LCCA is a scientific approach to compiling and evaluating the inputs, outputs and the potential environmental impact of a product or system throughout its life cycle. The environmental impact of all the materials used to manufacture building products, including roofing is slowly making its way into standards. Each product will have a LCCA number and will influence building design in the future. Additional information on LCCA and definition of terms can be found at the American Center for Life Cycle Assessment (ACLCA) web site: www.lcacenter.org/about-lca.aspx

B-8 COOL ROOFING AND HEAT ISLAND ISSUES.

\2\Sustainable Third Party Certifiers (TPC) and industry standards promote the use of cool roofing, and increased energy conservation through additional insulation, when appropriate for climate zone. For cool roof design follow the requirements in Chapter 1, Cool Roofs. /2/ Consider that when cool roofing is used with insulation R values greater than 24, the ‘cool roof’ surface has little if no influence on the energy performance of the building. Additionally, designers should be aware of the possible negative impacts of using cool roofing that may result in unintended consequences.

Poor design of cool roofs in ASHRAE climate zones 4 and higher have resulted in the unintended consequence of condensation below the membrane—a result of the material’s inability to warm and drive moisture downward. Roofs that experience this condensation have had to be replaced. Other unintended consequences include the overheating of masonry walls, interior spaces, roof top piping and mechanical equipment because of the reflected UV rays.

B-9 GUTTERS AND DOWNSPOUTS.

Consider methods to ensure gutters and downspouts do not become clogged. The best options for DoD projects include oversizing downspouts, minimizing turns or offsets in the downspouts, providing strainers at the downspouts, and providing clean-outs at the base of the downspouts. Strainers should not be used in areas with a lot of leaves or tree debris.

B-10 PARAPETS.

If parapets are to be used, the metal coping will have an ice and water shield membrane completely lapping the wall from edge to edge. If a stone/masonry coping is used, it will have through wall flashing under the coping including watertight welded caps over the posts used to secure the coping stone.

On all masonry drainage plane walls with roofs running beside, stepped through wall flashing will be provided to protect the interior wall below.

B-11 DESIGN PROFESSIONAL QUALIFICATIONS.

In addition to the criteria required in Chapter 1, all projects that have more than 15,000 $ft.^2$ (1400 m^2) of roof area or that are defined as “critical use” or “mission critical” in the project DD Form 1391 should have an RRC or a registered PE or RA that derives his or her principal income from roofing design on the design team.

B-12 REROOFING.

Re-roofing can be considered a problem or an opportunity. Re-roofing can be a problem since the work is typically performed while the structure is occupied. Often there are concerns with noise, fumes, access, and interruption of building use. Re-roofing can be an opportunity since there is no better time to upgrade the roof system than while re-roofing. Changes in the roof system may be mandated by revisions to ASCE 7 or by needed improvement in drainage or thermal performance. It can be an opportunity to elevate or redesign problem roof elements, to install deck supported curbs that are flashed independently of the wall (resolving persistent flashing problems due to differential movement), and to resolve condensation problems or thermal insulation deficiencies.

Re-roofing decisions begin with a survey of existing conditions. This may include visual inspection, infrared moisture surveys, and roof cut analysis. Structural analysis may also be required, especially if a different type of roof is contemplated which affects dead load, drainage, or seismic behavior. One method of analyzing the condition of an existing roof is to use the ROOFER *Sustainment Management System* (SMS). The ROOFER SMS is a decision-making tool to help manage an installation’s low-slope membrane and asphalt shingle roofing assets. It includes procedures for collecting inventory and inspection information, evaluating roof conditions, identifying repair/replacement strategies, prioritizing projects, and developing work plans. ROOFER, a Web-based application, provides data storage and analysis and generates management reports.

B-13 RECOVERING.

Re-covering of existing low-slope roofs is not recommended. When the best option based on a detailed analysis, including risk analysis, LCCA, and a moisture survey, is to recover a low-slope roof, comply with the criteria in Chapter 6.

Re-cover of existing built-up and MB roofing may take the form of mechanically or spot attaching a base sheet (to aggregate-free substrates), or mechanically or spot attaching re-cover insulation when aggregate is present (where only the loose aggregate is removed). Full attachment to a severely compromised membrane is never recommended. \2\

B-14 TPO ROOFING

TPO Roofing has energy efficient properties as well as being recyclable. These features and cost effectiveness makes TPO membranes an attractive roof system for large scale industrial applications. Below are some considerations for obtaining the best life cycle performance when this roof type is selected:

- Reduce the number of rooftop mounted items which significantly reduce the number of roofing membrane penetrations.
- Wherever penetrations in the roofing membrane must occur, encapsulate penetration by using either a preformed TPO boot or a pitch pocket. This method of encapsulation should be used whether the penetration is vertical or horizontal.
- Require test strips for the membrane hot air welder on any day the contractor is performing hot air welding of seams. The test strips can be inspected to assure that the machine is hot enough and reduces chances of non-adhered seams.
- Scuppers contained in the TPO roof system require hand welded seams. Special attention should be given to performing inspection in these areas due to the space constraints to assure the membrane is fully adhered.
- It is important to address/control fall protection early in the project to avoid having to install fall protection measures that penetrate the TPO membrane after installation or use heavy objects that may get dragged across the TPO membrane.
- Due to TPO membranes being a single-ply system, it is important to ensure that any structural components that are underneath the membrane and may rub against the membrane are fully protected so that they do not

inadvertently puncture the membrane. An example may be structural welded plates or other components along the perimeter edge of the roof. /2/

DEFINITIONS

See UFC 3-101-01 and the NRCA Roofing Manual for a more complete list of definitions.

Aggregate. (1) Crushed stone, crushed slag, or water-worn gravel used for surfacing a built-up roof. (2) Any granular mineral material.

Alloys, polymeric. A blend of two or more polymers, e.g., a rubber and a plastic to improve a given property, e.g., impact strength.

Asphalt. A dark brown to black elastomeric cementitious material whose predominating constituents are bitumen's that occur in nature or are obtained in petroleum processing.

Asphalt felt. An asphalt-saturated felt.

Atactic. A chain of molecules in which the position of the side methyl groups is more or less random. (Amorphic; Low Crystallinity)

Ballast. Loose aggregate, concrete pavers, or other material designed to prevent wind uplift or flotation of a loose-laid roof system.

Base sheet. A saturated or coated felt placed as the first ply in a multi-ply bituminous roofing membrane.

Batten. (1) Raised rib, in a metal roof, or a separate part or formed portion in a metal roofing panel. (2) One of a series of strips laid in a matrix under tile roof applications.

Bitumen. (1) A class of amorphous, black or dark colored, (solid, semisolid, or viscous) cementitious substances natural or manufactured, composed principally of high molecular weight hydrocarbons, soluble in carbon disulfide, and found in asphalts, tars, pitches, and asphaltites; (2) A generic term used to denote any material composed principally of bitumen; (3) In the roofing industry there are two basic bitumens: asphalt and coal-tar pitch. Before application, they are either (a) heated to a liquid state, (b) dissolved in a solvent, or (c) emulsified.

Bituminous (adj.). Containing or treated with bitumen. Examples: bituminous concrete, bituminous felts and fabrics, bituminous pavement.

Bond. The adhesive and cohesive forces holding two roofing components in intimate contact.

Boot. A bellows type covering to exclude dust, dirt, moisture, etc., forming a flexible closure.

British thermal unit (BTU). Heat energy required to raise the temperature of one pound of water by 1^0F (= 1055 joules).

Building Code. Published regulations and ordinances established by a recognized agency describing design loads, procedures, and construction details for structures. Usually applying to designated political jurisdiction (city, county, state, etc.). Building codes control design, construction, and quality of materials, use and occupancy, location and maintenance of buildings and structures within the area for which the code was adopted (see Model Codes).

Built-Up Roofing (BUR). A continuous, semiflexible membrane consisting of plies of saturated felts, coated felts, fabrics or mats assembled in place with alternate layers of bitumen, and surfaced with mineral aggregate, bituminous material, or a granule surfaced sheet (abbreviation, BUR).

Butyl Rubber. A synthetic rubber based on isobutylene and a minor amount of isoprene. It is vulcanizable and features low permeability to gases and water vapor and good resistance to aging, chemicals and weathering.

Cant. In SPF-based roofing, a beveling of foam at horizontal/vertical joints to increase strength and promote water runoff.

Cant strip. A beveled strip used under flashings to modify the angle at the point where the roofing or waterproofing membrane meets any vertical element.

Cap flashing. See Flashing.

Cap sheet. A granule-surfaced coated felt used as the top ply of a built-up roofing membrane.

Caulk. To seal joints, seams, or voids by filling with a waterproofing compound or material.

Caulking. A composition of vehicle and pigment, used at ambient temperatures for filling joints, that remains plastic for an extended time after application.

Chalk Resistance. A measurement of performance for paint systems; the ability to resist a dusty/chalky appearance over time.

Chalking. A powdery residue on the surface of a material resulting from degradation or migration of an ingredient, or both.

Chlorinated polyethylene (CPE). Family of polymers produced by chemical reaction of chlorine on the linear backbone chain of polyethylene. The resultant rubbery thermoplastic elastomers presently contain 25- 45 % chlorine by weight and 0-25% crystallinity. CPE can be vulcanized but is usually used in a nonvulcanized form.

Chlorosulfonated polyethylene (CSPE). Family of polymers that are produced by polyethylene reacting with chlorine and sulfur dioxide. Present polymers contain 25-43% chlorine and 1.0-1.4% sulfur. They are used in both vulcanized and nonvulcanized forms. Most membranes based on CSPE are nonvulcanized. ASTM designation for this polymer is CSM. Best known by the DuPont Tradename “Hypalon.”

Closure Strip. A resilient strip such as neoprene, flat on one side and formed to the contour of ribbed sheets on the other, used to close openings created by joining metal sheets and flashings.

Coal Tar. A dark brown to black cementitious material produced by the destructive distillation of coal.

Coal Tar Felt. A felt saturated with refined coal tar.

Coating Weight. Weight of coating on surface (both sides), usually expressed in g/m^2 or $oz./ft.^2$.

Coefficient of Thermal Expansion. The change in length per unit of length for a unit change in temperature. (Thus the coefficient per ^oF must be multiplied by 1.8 for the coefficient per ^oC.)

Condensation. The conversion of water vapor or other gas to liquid as the temperature drops or atmospheric pressure rises (see also Dew point).

Conductance, Thermal. The thermal transmission in unit time through unit area of a particular body or assembly having defined surfaces, when unit average temperature difference is established between the surfaces. C=(W/ m^2•K) C=(Btu/h•ft^2•^{0}F).

Conductivity, Thermal. The time rate of transfer of heat by conduction through a unit thickness across unit area for unit difference of temperature.

Copolymer. A mixed polymer, the product of polymerization of two or more substances at the same time.

\3\ Corrosion. The deterioration of a material or its properties due to a reaction of that material with its chemical environment; it is inclusive of the deterioration of all materials, which can be caused through sun exposure, mold and mildew, wind, and other environmental elements. /3/

Counterflashing. Formed metal or elastomeric sheeting secured on or into a wall, curb, pipe, rooftop unit, or other surface, to shield the upper edge of a base flashing and its associated fasteners.

Coverage. The surface area to be continuously covered by a specific quantity of a particular material.

Covering. The exterior roof and wall covering for a metal building system.

Cricket. A relatively small, elevated area of a roof constructed to divert water from a horizontal intersection of the roof with a chimney, wall, expansion joint or other projection.

Curb. A raised member used to support roof penetrations such as skylights, hatches, etc.

Cure. To change the properties of a polymeric system into a more stable, usable condition by the use of heat, radiation, or reaction with chemical additives. NOTE: Cure may be accomplished, for example, by removal of solvent or cross-linking.

Deck. The structural substrate to which the roofing or waterproofing system (including insulation) is applied.

Degree-Days. The sum of the positive or negative differences between a reference temperature (usually 18ºC (65ºF)) and the mean temperature for each day in the heating or cooling season). Degree-days are used to compare the severity of cold or heat during the heating or cooling season

Delamination. Separation of the plies in a membrane or separation of insulation layers after lamination.

Design loads. The “live load” and “environmental load” (i.e. superimposed loads) that a structure is designed to resist (with appropriate safety factor) plus “dead load” (i.e., weight of permanent loads).

Dew point. The temperature at which water vapor starts to condense in cooling air at the existing atmospheric pressure and vapor content.

Dry (n.). A material that contains no more water than one would find at its equilibrium moisture content.

Eave. The line along the sidewall formed by the intersection of the planes of the roof and wall.

Eave Height. The vertical dimension from finished floor to the eave.

Edge venting. The practice of providing regularly spaced protected openings at a low-slope roof perimeter to relieve water vapor pressure in the insulation. (It is of doubtful efficacy.)

Elasticity. The property of matter by virtue of which it regains its original size and shape after removal of stress.

Elastomer. A macromolecular material that returns rapidly to its approximate initial dimensions and shape after subsequent release of stress.

Embedment. (1) the process of pressing a felt, aggregate, fabric, mat, or panel uniformly and completely into hot bitumen or adhesive to ensure intimate contact at all points; (2) the process of pressing granules into coating in the manufacture of factory prepared roofing, such as shingles.

Emulsion. A dispersion of fine particles or globules of a liquid in a liquid. Asphalt emulsions consist of asphalt globules, an emulsifying agent such as bentonite clay and water.

Endlap. The overlap where one panel or felt nests on top of the end of the underlying panel or felt.

\3\ Environmental Severity Classification (ESC) - Environmental severity is defined as the corrosivity of the local environment of a given location or region. Environmental severity contributes directly to the occurrence of corrosion. The effects of corrosion and the rate at which they occur are consequences of the corrosion system, which is comprised of a material or physical system, the environment, and operational conditions. /3/

EPDM. A synthetic elastomer based on ethylene, propylene, and a small amount of a non-conjugated diene to provide sites for vulcanization. EPDM features excellent heat, ozone and weathering resistance, and low temperature flexibility.

EVA. Family of copolymers of ethylene and vinyl acetate used for adhesives and thermoplastic modifiers. They possess a wide range of melt indexes.

Fabric. A woven cloth of organic or inorganic filaments, threads, or yarns.

Fabrication. (1) The manufacturing process performed in a plant to convert raw material into finished metal building components. The main operations are cold-forming, cutting, punching, welding, cleaning, and painting; (2) the creation of large panels of rubber from smaller calendar width sheets as in EPDM.

Fascia. A decorative trim or panel projecting from the face of a wall, serving as a weather closure at gable and end wall.

Felt. A flexible sheet manufactured by the interlocking of fibers through a combination of mechanical work, moisture, and heat, without spinning, weaving, or knitting. Roofing felts are manufactured from vegetable fibers (organic felts), glass fibers (glass fiber felts) or polyester fibers (synthetic fiber mats).

Fiberglass insulation. Blanket insulation, composed of glass fibers bound together with a thermoset binder, faced or unfaced, used over or under purlins to insulate roofs and walls; semi-rigid boards, usually with a facer.

Field. The “job site,” “building site,” or general market area.

Fixity. Fixity is the location in which a single metal roof panel is attached to the building structure and is the point from which all thermal expansion radiates. The line of fixity is the line created from the individual points of fixity.

Flashing. The system used to seal membrane edges at adjacent perpendicular surfaces (walls), expansion joints, drains, gravel stops, and other places where the membrane is interrupted or terminated. Base flashing covers the edges of the membrane. Cap or counterflashing shields the upper edges of the base flashing.

Flood coat. The top layer of bitumen used to hold the aggregate on an aggregate surfaced roofing membrane.

Fluid-applied elastomer. An elastomeric material, fluid at ambient temperature, that dries or cures after application to form a continuous membrane. Such systems may not incorporate reinforcement.

Galvalume. Trade name for steel coated with aluminum-zinc alloy for corrosion protection (55% AIZn).

Galvanized steel. Steel coated with zinc for corrosion resistance.

Glass felt. Glass fibers bonded into a sheet with resin and suitable for impregnation in the manufacture of bituminous waterproofing, roofing membranes, and shingles.

Granule. See Mineral Granules.

Gravel. Coarse, granular aggregate, with pieces larger than sand grains, resulting from the natural erosion of rock.

Green Building Technology. Technology that reduces impact on the earth. Includes recyclability, reduction in carbon dioxide, ozone or other atmospheric pollutants, and reduction of urban heat islands.

Gutter. A channel member installed at the eave of the roof for the purpose of carrying water from the roof to the drains or down spouts.

Heat Seaming. The process of joining two or more thermoplastic films or sheets by heating areas in contact with each other to the temperature at which fusion occurs. The process is usually aided by a controlled pressure. In dielectric seaming, the heat is induced within films by means of radio frequency waves.

Heat transfer. The transmission of thermal energy from a location of higher temperature to a location of lower temperature. This can occur by conduction, convection or radiation.

Humidity. The amount of moisture contained in the atmosphere. Generally expressed percent relative humidity. (The ratio of the vapor pressure to the saturation pressure for given conditions times 100.)

Hydrocarbons. An organic chemical compound containing mainly the elements carbon and hydrogen. Aliphatic hydrocarbons are straight chain compounds of carbon and hydrogen. Aromatic hydrocarbons are carbon-hydrogen compounds based on the cyclic or benzene ring. They may be gaseous (CH4, ethylene, butadiene), liquid (hexene, benzene), or solid (Natural rubber, napthalene, cispolybutadiene).

Hydrokinetic Metal Roof System. This is a metal roof system in which the metal standing seam, eaves and valleys accommodate expansion and are constructed in a way which allows some water infiltration. The infiltrating water is drained through weeps in the roof assembly and with a watertight underlayment membrane under the roof. The fixity will typically be at the ridge in this roof system.

Hydrostatic Metal Roof System. The metal standing seam, laps at the eave and valley are construction with positive attachment and non-curing sealant to provide a watertight assembly in this metal roof system. Fixity will typically be at the eave and valleys in this roof system.

Inorganic (adj.). Comprising matter other than hydrocarbons and their derivatives, or matter not of plant or animal origin.

Insulation. See Thermal Insulation.

Internal Pressure. Pressure inside a building, a function of wind velocity, building height, and number and location of openings.

Isocyanate. A highly reactive chemical grouping composed of a nitrogen atom bonded to a carbon atom bonded to an oxygen atom: =N=C=O; a chemical compound, usually organic, containing one or more isocyanate groups.

Isoboard. Abridgement of polyisocyanurate foam insulation board.

Lap. Dimension by which a felt covers an underlying felt in BUR membrane. “Edge” or side lap indicates the transverse cover; “End” lap indicates the cover at the end of the roll. These terms also apply to single-ply membranes.

Lapped joint. A joint made by placing one surface to be joined partly over another surface and bonding the overlapping portions.

Loose-laid Membrane. An unadhered roofing membrane anchored to the substrate only at the edges and penetrations through the roof and ballasted against wind uplift by loose aggregate or pavers.

Mastic. Caulking or sealant normally used in sealing roof panel laps.

Membrane. A flexible or semi-flexible roof covering or waterproofing whose primary function is the exclusion of water.

Metal flashing. See Flashing—frequently used as through-wall, cap, or counterflashing.

Mineral fiber. Inorganic fibers of glass, asbestos or mineral wool (slag).

Mineral granules. Natural or synthetic aggregate, ranging in size from 500µm (1µm = 10-6m) to 1/4 in. diameter, used to surface BUR or modified bitumen cap sheets, asphalt shingles, and some cold process membranes.

Model Codes. Codes established to provide uniformity in regulations pertaining to building construction. Example: International Building Code published by the ICC.

Moisture conduction. Migration by wicking as contrasted to vapor movement.

Monomer. A simple molecule which is capable of combining with a number of like or unlike molecules to form a polymer.

Mopping. Application of hot bitumen with a mop or mechanical applicator to the substrate or to the plies of a built-up or modified-bitumen roof. There are four types of mopping: (1) solid—a continuous coating; (2) spot—bitumen is applied in roughly circular areas, generally about 460 mm (18 in.) in diameter, leaving a grid of unmopped, perpendicular area, (3) strip— bitumen is applied in parallel bands, generally 200 mm (8 in.) wide and 300 mm (12 in) apart; (4) sprinkle—bitumen is shaken on the substrate from a broom or mop in a random pattern.

Nailer. Wood member bolted or otherwise anchored to a nonnailable deck or wall to provide nailing anchorage of membrane or flashing.

Nailing. (1) Exposed nailing of roofing wherein nail heads are bare to the weather; (2) Concealed nailing of roofing wherein nail heads are concealed from the weather (see also blind nailing).

Neoprene. Synthetic rubber (polychloroprene) used in liquid or sheet-applied elastomeric roofing membranes or flashing.

Nondestructive Testing (NDT). Methods for evaluating the strength or composition of materials without damaging the object under test.

Nonwoven Fabric. A sheet material produced by bonding or interlocking of fibers (or both) by mechanical, thermal or solvent means (or combinations thereof).

Olefin. An unsaturated open-chain hydrocarbon containing at least one double bond: ethylene or propylene.

Olefin Plastics. Plastics based on polymers made by the polymerization of olefins or copolymerization of olefins with other monomers, the olefins being at least 50 percent of the mass.

Organic (adj.). Composed of hydrocarbons or their derivatives; or matter of plant or animal origin.

Organic coating. Coatings that are generally inert or inhibited. May be temporary (e.g., slushing oils) or permanent (paints, varnishes , enamels, etc.).

Organic content. Usually synonymous with volatile solids in an ashing test; e.g., a discrepancy between volatile solids and organic content can be caused by small traces of some inorganic materials, such as calcium carbonate, that lose weight at temperatures used in determining volatile solids.

Panel clip. Independent clip used to attach roof panels to substructure.

Panel Creep. Tendency of the transverse dimension of a roof panel to gain in modularity due to spring-out or storage-distortion.

Parapet. Portion of wall above the roofline.

Pea Gravel. Small gravel with a diameter approaching that of a pea. Size roughly defined by ASTM D448 *Standard Classification for Sizes of Aggregate for Road and Bridge Construction,* Number 7 or smaller.

Peak. The uppermost point of a gable.

Penetration. The consistency of a bituminous material expressed as the distance in tenths of a millimeter (0.1 mm) that a standard needle or cone vertically penetrates a sample of material under specified conditions of loading, time, and temperature.

Percent Elongation. In tensile testing, the increase in the gauge length, measured after fracture of the specimen within the gauge length.

Perlite. An aggregate used in lightweight insulating concrete and in preformed perlite insulating board, formed by heating and expanding siliceous volcanic glass.

Permeability. (1) The capacity of a porous medium to conduct or transmit fluids; (2) The amount of liquid moving through a barrier in a unit time, unit area and unit pressure gradient not normalized for but directly related to thickness; (3) The product of vapor permeance and thickness (for thin films, ASTM E96-00e1 *Standard Test Methods for Water Vapor Transmission of Materials*—over 3.2 mm (.125 in.), ASTM C355 Usually reported in perm inches or grain/h•ft2•in. Hg per inch of thickness. 1 perm inch = 1.46 x 10-12 kg/Pa•s•m.

Permeance. The rate of water vapor transmission per unit area at a steady state through a membrane or assembly, expressed in ng/Pa•s•m^2 (grain/ft^2•h•in. Hg).

Phenolic Plastics. Plastics based on resins made by the condensation of phenols, such as phenol and cresol, with aldehydes.

Pitch. See Incline, Coal tar pitch, or Petroleum pitch.

Plastic. A material that contains as an essential ingredient one or more organic polymeric substances of large molecular weight. It is solid in its finished state and at some stage in its manufacture or processing into finished articles can be shaped by flow.

Plasticizer. Material, frequently solvent-like, incorporated in a plastic or a rubber to increase its ease of workability, flexibility, or extensibility. Adding the plasticizer may lower the melt viscosity, the temperature of the second order transition, or the elastic modulus of the polymer.

Plasticizers. May be monomeric liquids (phthalate esters), low molecular weight liquid polymers (polyesters) or rubbery high polymers (EVA). The most important use of plasticizers is with PVC where the choice of plasticizer dictates under what conditions the membrane may be used.

Ply. A layer of felt in a roofing membrane; a four-ply membrane should have at least four plies of felt at any vertical cross section cut through the membrane.

Plywood. A flat panel built up of sheets of wood veneer called plies, united under pressure by a bonding agent to create a panel with an adhesive bond between plies as strong as or stronger than, the wood. Plywood is constructed of an odd number of layers with grain of adjacent layers perpendicular. Layers may consist of a single ply or two or more plies laminated with parallel grain direction. Outer layers and all odd numbered layers generally have the grain direction oriented parallel to the long dimension of the panel.

Polyester Fiber. Generic name for a manufactured fiber in which the fiber-forming substance is any long chain synthetic polymer composed of an ester of a dihydric alcohol and terephthalic acid. Scrims made of polyester fiber are used for fabric reinforcement.

Polyisobutylene. The polymerization product of isobutylene varying in consistency from a viscous liquid to a rubberlike solid, with corresponding variation in molecular weight from 1,000 to 400,000.

Polyisocyanurate. Thermoset polymer formed by polymerization of isocyanate; rigid foam insulation meeting ASTM C1289 *Standard Specification for Faced Rigid Cellular Polyisocyanurate Thermal Insulation Board;* a thermal insulation similar in appearance to polyurethane foam, but with improved fine resistance or rating.

Polymer. A macromolecular material formed by the chemical combination of monomers having either the same or different chemical composition. Plastics, rubbers, and textile fibers are all high molecular weight polymers.

Polyvinyl Chloride (PVC). A synthetic thermoplastic polymer prepared from vinylchloride. PVC can be compounded into flexible and rigid forms through the use with plasticizers, stabilizers, filler, and other modifiers; rigid forms used in pipes; flexible forms used in manufacture of sheeting.

Ponding. Water in low or irregular roof areas that remains longer than 48 hours after the cessation of rainfall, under conditions conducive to evaporation.

Preventive Maintenance. The regular, scheduled, inspection for and the repair of normal, expected breakdown of materials and equipment.

Prime coat. First liquid coat applied in a multiple coat system.

Primer (bituminous). A thin liquid bitumen applied to a surface to improve the adhesion of heavier applications of bitumen and to absorb dust.

Protected Membrane Roof (PMR). Roof assembly with insulation on top of membrane instead of vice versa, as in conventional roof assembly (also known as inverted or upside-down roof assembly).

Puncture Resistance. Index of a material's ability to withstand the action of a sharp object without perforation.

R-Factor. Resistance to heat flow. The summation of individual thermal resistances in an assembly.

Rake. The sloped edge of a roof at the first or last rafter.

Rake trim. A flashing designed to close the opening between the roof and end wall panels.

Re-covering. The process of covering an existing roof system with a new roof.

Reglet. A groove in a wall or other surface adjoining a roof surface for the insertion and attachment of counterflashing.

Relative Humidity. The ratio of the mass per unit volume (or partial pressure) of water vapor in an air-vapor mixture to the saturated mass per unit volume (or partial pressure) of the water vapor at the same temperature, expressed as a percentage.

Replacement. The removal of all roof system components down to the structural deck followed by installation of a completely new roofing system.

Reroofing. Replacement or re-cover of an existing roof system.

Resistance, Thermal. See Thermal resistance.

Retrofit. The modification of an existing building or facility to include new systems or components.

Ridge. Highest point on the roof of the building, a horizontal line running the length of the building.

Ridge Cap. A transition of the roofing materials along the ridge of a roof. Sometimes called ridge roll or ridge flashing.

Roll Goods. A general term applied to rubber and plastic sheeting, usually furnished in rolls.

Roll Roofing. Coated felts, either smooth or mineral surfaced.

Roof Curb. An accessory used to mount and level units (such as air conditioning and exhaust fans) on the sloped portion of the building roof.

Roof Jack. An accessory used to cover pipes (such as vents or flues) that penetrate the roof covering.

Roof Seamer. Machine that crimps panels together or that welds laps of E/P systems using heat, solvent or dielectric energy.

Roof Slope. The angle a roof surface makes with the horizontal, measured in a ratio such as ½:12.

ROOFER Sustainment Management System (SMS). The ROOFER SMS is a practical decision-making tool to help manage an installations or bases low-slope membrane and asphalt shingle roofing assets. It includes procedures for collecting inventory and inspection information, evaluating roof condition, identifying repair/replacement strategies, prioritizing projects, and developing work plans. Micro ROOFER, software provides data storage and analysis, and generates management reports. Contact the Service-specific SME to gain access to ROOFER SMS.

Roofing System. A combination of interacting components designed to weatherproof, and normally to insulate, a building's top surface; does not include the roof deck.

Rubber. A material capable of quickly recovering from large deformations, normally insoluble in boiling solvent such as benzene, methyl ethyl ketone, and ethanol toluene azeotrope. A rubber in its modified state retracts within 1 mm to less than 1.5 times its original length after being stretched to twice its length.

Sacrificial Protection. Reducing the extent of corrosion of a metal in an electrolyte by coupling it to another metal that is electrochemically more active in the environment, i.e., galvanic protection.

Scupper. Channel through a low-slope roof edge or parapet, designed for peripheral drainage of the roof, usually a safety overflow to limit accumulation of ponded rainwater caused by clogged drains or intense rainfall.

Scrim. A woven, open mesh reinforcing fabric made from continuous filament yarn. Used in the reinforcement of polymeric sheeting.

Sealant. Any material used to close up cracks or joints to protect against leaks. Lap sealant is applied to exposed lap edges in E/P systems.

Sealing Washer. A metal-backed rubber washer assembled on a screw to prevent water from migrating through the screw hole.

Seam Strength. Strength of a seam of material measured either in shear or peel modes, reported either in absolute units, e.g., pounds per inch of width—or as a percent of the sheeting strength.

Service Life. Anticipated useful life of a building, building component or building subsystem (e.g., roof system).

Shelf Life. Maximum safe time to store a fluid construction material or non-cured sheet before use.

Shingle. (1) A small unit of prepared roofing designed for installation with similar units on overlapping rows on inclines normally exceeding 25%; (2) To cover with shingles, and (3) To apply any sheet material in overlapping rows like shingles.

Shingling. (1) The procedure of laying parallel felts so that one longitudinal edge of each felt overlaps, and the other longitudinal edge underlaps an adjacent felt. (See also Ply). Normally, felts are shingled on a slope so that the water flows over rather than against each lap; (2) The application of shingles to a sloped roof.

SI. The international symbol for the metric unit (Le Systeme International d'Unites).

Sidelap. The continuous overlap of closures along the side of a panel or sheet material.

Sill. The bottom horizontal framing member of an opening such as a window or door.

Single Slope. A sloping roof with one surface. The slope is from one wall to the opposite wall of rectangular building.

Skylight. A roof accessory to admit light, normally mounted on a curbed, framed opening.

Slippage. Relative lateral movement of adjacent felts (or sheets) in a roof membrane. It occurs mainly in roofing membranes on a slope, sometimes exposing the lower plies or even the base sheet to the weather.

Slope. Tangent of the angle between the roof surface and the horizontal plane, expressed as a ratio. (See also roof slope)

Smooth Surfaced Roof. A roof membrane without mineral aggregate surfacing.

Soffit. The underside covering of any exterior overhanging section of a roof, gable or sidewall.

Softening Point. Temperature at which a bitumen becomes soft enough to flow as determined by an arbitrary, closely defined method.

Square. A roof area of 100 ft^2 (9.29 m^2), or enough material to cover 100 ft^2 (9.29 m^2) of deck.

Stack Vent. A vertical outlet designed to relieve pressure exerted by water vapor between a membrane and the vapor retarder or deck.

Stainless Steel. An alloy of steel which contains a high percentage of chromium. Also may contain nickel or copper. Has excellent resistance to corrosion.

Standing Seam. Watertight seam type featuring an upturned rib, which may also be structural. It is made by turning up the edges of two adjacent metal panels and then folding them over in one of a variety of ways.

Stress. (1) A measure of the load on a structural member in terms of force per unit area (MPa) (kips per in.^{2}); (2) The force acting across a unit area in solid material in resisting the separation, compacting or sliding that tends to be induced by external forces. Also the ratio of applied load to the initial cross sectional area, or the maximum stress in the outer fibers due to an applied flexural load.

Stress Concentration. A condition in which stress is highly localized, usually induced by an abrupt change in the shape of a member or at a substrate joint (e.g., between insulation joints)

Substantial Completion. The stage in the progress of the work when it is sufficiently complete for the owner to occupy or utilize the space for its intended use.

Surface Cure. Curing or vulcanization which occurs in a thin layer on the surface of a manufactured polymeric sheet or other items.

Susceptibility. When not otherwise qualified, the degree of change in viscosity with temperature.

Tear off. Removal of a failed roof system down to the structural deck surface.

Tensile Strength. (1) The maximum tensile stress per unit of original cross sectional area applied during stretching of a specimen to break; units: SI-metric—Megapascal or kilopascal, customary—lb. per in.^{2}; (2) The longitudinal pulling stress a material can bear without tearing apart; (3) The ratio of maximum load to original cross-sectional area. Also called ultimate strength.

Tensile Test. A test in which a specimen is subjected to increasing longitudinal pulling stress until fracture occurs.

Therm. A unit of heat commonly used by utilities, equivalent to 100,000 BTU = 1.05 x 108 joules.

Thermal Conductivity (k). The rate of heat flow through a stated thickness of material with a stated temperature differential Btu/h.ft^2•^{0}F (W/m2•^{0}C).

Thermal Insulation. A material designed to reduce the conductive heat flow.

Thermal Resistance (R). Resistance to heat flow. The reciprocal of conductance (C).

Thermal Shock. Stress-producing phenomenon resulting from sudden temperature drops in a roof membrane—when, for example, a rain shower follows brilliant sunshine.

Thermoplastic Elastomers. Polymers capable of remelt, but exhibiting elastomeric properties; related to elasticized polyolefins. They have a limited upper temperature service range.

U-Factor. The heat flow across an entire assembly e.g., from air within a building to outside air; the inverse of R-Factor. Also known as U-value.

Uplift. Wind load on a building which causes a load in the upward direction.

Vapor Barrier. See Vapor retarder.

Vapor Pressure. The pressure exerted by a vapor that is in equilibrium with its solid or liquid form.

Vapor Retarder. A material that resists the transmission of water vapor.

Vent. Opening designed to convey water vapor or other gas from inside a building or a building component to the atmosphere.

Viscoelastic. Characterized by changing mechanical behavior, from nearly elastic at low temperature to plastic, like a viscous fluid, at high temperature.

Viscosity. Index of a fluid's internal resistance to flow, measures in centistokes (cSt) for bitumens. (Water has a viscosity of roughly 1 cSt, light cooking oil 100 cSt.)

Waterproofing. Treatment of a surface or structure to prevent the passage of water under hydrostatic pressure.

APPENDIX D WARRANTIES

D-1 GENERAL.

Many roofing systems include a warranty or guarantee. To safe guard the interest of the client, it is necessary to have a thorough understanding of what is and is not covered by the installer or manufacturer under the warranty. Careful attention to written details of the contractor's obligations and field installation of the products will improve the viability of the roof and enhance its performance. Although warranties by themselves will not guarantee a long lasting, watertight roof, they can be an important part of the process.

Meet the requirements of Chapter 1, Warranty Requirements. In addition, a 20-year full system water-tightness warranty is recommended on all projects regardless of anticipated service life because this yields better materials, better design details, and improved construction quality. A five-year general contractor warranty is also recommended. This appendix provides additional background information on warranty options.

D-2 WARRANTY TYPES.

D-2.1 Manufacturers' Warranties.

Manufacturer's warranties are often offered as an "off the shelf" item. Most manufacturers offer several different warranties for the same products and systems based on level of installation quality.

D-2.1.1 Materials Warranty (five to 20 years).

Material warranties focus on the durability of the product installed on the roof. Labor to remove and reinstall may not be included in this warranty unless specifically required by the contract. Exclusions should be carefully reviewed since they vary widely—from reasonable exclusions such as unusual weather conditions and owner neglect to unreasonable exclusions.

D-2.1.2 Water-tightness Warranty (System Warranty) (five to 20 years)

Watertight warranties are used to obtain quality installation. Manufacturers will list requirements in the warranty necessary for the warranty to remain intact—such as regular inspections (two or more times a year). The watertight roof system warranty should include all roof penetrations and flashing (interface with all adjacent surfaces). To maintain the warranty, the roof must be installed according to manufacturer's requirements—which often specify the roof installers. When other than an approved roof installer installs features on the roof (mechanical contractors, etc.), problems may occur in obtaining watertight warranty coverage for those features. This issue should be addressed in the contract specification. Signatures on Warranty must be from the roof SYSTEM manufacturer and the Government User, not the General Contractors. This helps to avoid issues if the general contractor goes out of business. Watertight warrantees include Weathertight, Pro-Rated and Non Pro-rated. The Pro-Rated warranty functions much as a Tire or Battery warranty that reduces coverage the longer the roof is in use—do not use Pro-Rated warranties.

Full System Warrantees are single sources warranties in which all materials provided by the roof cover manufacturer are covered under the terms of the warranty. Full system warranties should be required if possible as they eliminate the ‘finger pointing’ if and when concerns arise. However, note that Full System Warrantees are issued jointly by the manufacturer and the roofing contractor. The manufacturer does not warrant workmanship. Should the roofing contractor go out of business there is no recourse through the manufacturer for workmanship issues.

D-2.1.3 No Dollar Limit Warranty (System Warranty) (10 to 20 years).

The best standard warranty issued in the roofing industry today is the No Dollar Limit Warranty. No Dollar Limit means there is no cap on what the manufacturer must pay to bring the roof back to a watertight condition. This warranty is issued by the manufacturer and covers both labor and materials.

It is standard in the industry for the roofing contractor to have responsibility for workmanship issues the first two years of a warranty. However, with a No Dollar Limit Warranty, if a contractor goes out of business during that time the material manufacturer automatically picks up the responsibility.

D-2.2 General Contractor’s Warranties (one to five years).

Recently some government roof specifications call for a General Contractor’s Watertight Warranty to add another method of ensuring a quality roof installation.

Unless stated otherwise in the Scope of Work in the RFP, all permanent new construction and replacement roofs require a Five Year General Contractor Bonded Watertightness Warranty. The scope of work in the RFP may waive the Bonding requirement, but if not specified, the Bonded 5 year watertightness warranty is required. The required wording of the warranty will be provided in the applicable UFGS.

D-2.3 Roof Installers Warranty to General Contractor (one to two years).

The government does not have a direct contractual relationship with any subcontractor, including a roof subcontractor. General Contractors will attempt to achieve the same legal protection as the government by requiring the roof subcontractor be responsible to maintain the roof. Because the roof subcontractor may go out of business, the government specification shall require the General Contractor be responsible for the required repairs.

D-3 BONDING.

Bonding may be appropriate for mission critical buildings. The signatures on the bond must be between the Bonding Company and the Government User. A bond is an insurance policy with a maximum monetary value. The holder of the bond will receive the bond value in case of default, so it is important that the government be the agency named on that bond. Bonds are typically for one or five years. Bonding may be an issue for some contractors because it reduces their bonding capacity for those five years.

D-4 WARRANTY REVIEW.

The warranty wording must be carefully reviewed during the shop drawing review.

D-5 CONTRACTOR'S WARRANTY.

The final Contractor's warranty wording must be compared to the requirements included in the contract specification.

D-5.1 Roof Manufacturer's Warranty.

The wording of the roof manufacturer's warranty must be carefully reviewed. The Roofing Materials Guide published each year by NRCA is a good source of information on what different manufacturers offer in manufacturer warranties. Key elements to review are listed below:

D-5.1.1 Qualified Installer.

Most if not all manufacturers' warranties are available ONLY if a certified contractor is used to install the material. As a quality assurance item, specify that only contractors certified to install twenty-year, no-monetary-limit full-system warranties be allowed to install the roof system.

D-5.1.2 Length of Warranty.

Verify that the length of full-system warranty matches the contract specification. Verify that the full-system warranty value is not prorated over the warranty period.

D-5.1.3 Exclusions.

Exclusions can reduce the value of the warranty to user AND prevent normal legal options to enforce standard construction rights. Some typically exclusions include the following:

D-5.1.3.1 Legal.

Note that the term "sole and exclusive remedy" often takes away other legal rights.

D-5.1.3.2 Technical.

Technical exclusions must be carefully reviewed. As an example, excluding wind coverage for commonly occurring wind speeds shall not be allowed.

D-5.2 Warranty Claim.

Review process for claiming under warranty. Verify that the warranty's procedure for creating a warranty claim is reasonable and alert the building user and all stakeholders to the procedures.

D-6 CLOSE-OUT.

Warranty information needs to be provided to the building user during the project close-out phase.

D-7 BUILDING MAINTENANCE.

Roof maintenance is a key element to maintaining a roof warranty. While contracts that include prepaid yearly inspections to comply with manufacturer's requirements are common in the private sector, they are less common for the Military. Annual inspections shall be the responsibility of the building facility support personnel and will not void warranties when not performed.

D-8 POST-CONSTRUCTION ROOF MODIFICATIONS.

User requirements may result in roof modifications. Generally this means cutting into an existing roof that is under warranty. Such modifications must be in accordance with warranty requirements in order to not void the warranty.

APPENDIX E QUALITY ASSURANCE CONSIDERATIONS

E-1 GENERAL.

The success of a roof's performance over its expected lifespan depends upon using qualified designers familiar with local conditions and engaging qualified contractors to construct the project. Quality Assurance is the determination that the designer and contractor followed established quality control guidelines.

The NRCA Manual provides excellent guidance. Quality control requirements must be clearly defined and enforced. The cost and benefits of roof installation observation by a registered roof consultant (RRC) or a registered roof observer (RRO) or a registered PE or RA that derives his or her principal income from roofing design should be considered for all Military roofing projects.

The NRCA Quality Control Guidelines are particularly well suited for reference in design-build contract requirements where BUR, MB and single-ply systems are to be constructed. The benefits of full time observation through an RRC or a registered PE or RA that derives his or her principal income from roofing design are particularly high when this type of contract is used. In addition to inspecting the construction process, the full-time inspector shall review contract documents prior to the commencement of construction.

E-2 DESIGN.

Roof system design is the purvey of RRC or a registered PE or RA that derives his or her principal income from roofing design. A qualified architect or engineer shall be employed to design and oversee the preparation of contract documents. One of the major decisions in developing a quality roofing system is the choice of roof type. Many factors will influence a designer's roof choice, and many of these factors will be regional. The critical elements are climate, wind force, resistance to ultraviolet rays, and design for local conditions. In addition to these critical elements, the experience of the local contractor will greatly affect the quality of the installation.

E-3 SPECIFICATIONS.

Once the roof system is designed, the project specifications will be developed. The UFGS must serve as the basis for the project specifications. Key elements to consider in development of the specifications are listed below:

E-3.1 Roof System.

Specify a complete roof system—not just the components—to assure clear responsibility for correction. The requirement of a full system warranty will also provide a level of enhanced coverage.

E-3.2 Maintainability.

The designer will factor into the design process the ability of the user to maintain the roof. Some roof systems require more maintenance than others. The warranties of some roofs require inspection at least two times a year.

E-3.3 Submittals.

Require submittals (shop drawings) to verify quality in the details and in components. Assure that the roof specification requires complete shop drawings.

E-3.4 Roof Manufacturer Inspection.

Consider requiring roof manufacturer's representative to inspect the roof at least three times (beginning, middle, and end) during installation. If so desired, this requirement needs to be specified in the contract documents. These types of inspections shall only be required on projects of some complexity and intricacy.

E-3.5 Warranty Selection.

Warranties shall be utilized for fully conditioned human occupied spaces. Refer to Appendix D for more information on warranties.

E-3.6 Pre-installation/Pre-construction Meeting.

Attendance at the pre-installation/pre-construction meeting is required for all key players, including the government representative, general contractor, roof contractor, and representatives from all trades whose work impinges upon the roof system: plumbing, HVAC, carpentry, masonry, steel deck erectors. The roof manufacturer's technical staff shall be present at this meeting if the project is unique, has special conditions, and/or questions in regard to various concerns exist.

E-3.7 Minimum Installer Qualifications.

Require sufficient qualifications from the installer to achieve good workmanship. Minimum installer qualifications include the following:

- Proof of at least three years of membership in a professional or trade roofing-related organization such as NRCA, RCI, a state Roofing Contractors Association or SMACNA.
- Documented five years of experience and five jobs of similar complexity, size and cost.
- Proof of certification by the manufacturer that the installer is qualified to install the roofing system specified.

- Letter from a RRC, RA or PE that they are familiar with the installer's work and the installer has demonstrated the skill and workmanship necessary to meet NRCA, SMACNA and industry standards.

E-4 FIELD INSPECTION(S)/CQM.

E-4.1 Installation.

The field inspector shall verify that roof is installed according to shop drawing details. The inspector shall look for complex situations not previously identified and discuss with QC personnel and the on-site roof installer foreman. He must also spot check critical areas for quality watertight construction.

The field inspector shall keep a daily journal of roofing activities, weather conditions, number of workers, visitors to the job site and accidents or incidents. In addition, daily photos of the work and worksite shall be taken. Many things are hidden in roofing. Photos take the guesswork out of reconstructing what actually took place and can benefit the contractor as well as the owner. All photos and daily journal shall be part of the close out documents.

E-4.2 Leaks.

If leaks exist before closeout, do not accept the roof per the contract or pay the General Contractor in full. Test and remove defective material/installation to locate problem and repair. Consult a roof consultant with an RRC or a registered PE or RA that derives his or her principal income from roofing design if local expertise is not adequate.

E-5 CLOSE OUT OF CONTRACT.

Warranties are the legal means of users to get a new roof repaired. The facility manager shall be provided a copy of the warranty and be familiar with all requirements to keep the warranty in force.

APPENDIX G DECISION CRITERIA FOR INSTALLATION OF VEGETATIVE GREEN ROOFS AT CONUS INSTALLATIONS BASED ON COST

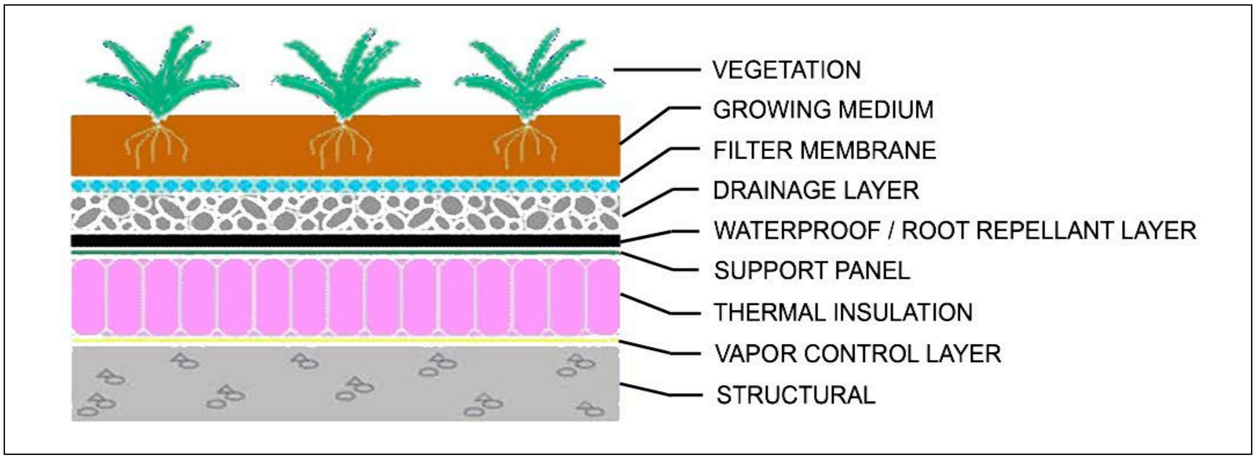
G-1 PURPOSE.

This paper was written to provide guidance for determining if installing a vegetative roof on an Air Force facility is suitable. The wording is Air Force-focused but offered as useful information to all UFC users. The intent is to give the base a simple tool to justify selection or non-selection of a green roof based entirely on return on investment (ROI). Selection of a vegetative green roof for environmental or social reasons can certainly be valid but is not part of the selection criteria here. Vital to the ROI are the facility characteristics, occupancy type, and the local climate. Tables G-1 and G-2 list installation locations and facility types along with their potential to benefit from a vegetative roofing system.

G-2 REQUIREMENTS.

Green roofs are building roof systems planted with vegetation to achieve a variety of benefits. They are categorized as “intensive,” “semi-intensive,” or “extensive,” depending on the depth of planting medium and the amount of maintenance required. Intensive green roofs have the greatest depth, support a variety of plants (including trees), and have significant structural and maintenance requirements. Extensive green roofs have a shallow planting medium and a low-growing, easily maintained vegetative installation. Semi-intensive roofs have characteristics somewhere in between the other two. This document will focus on extensive systems, since they are the most likely type of green roof to be constructed on installations. They are the most economical, easily maintained, and somewhat lightweight.

Figure G-1 Typical Green Roof Components



G-2.1 The use of vegetative green roofs is beneficial in many ways. It reduces storm water runoff, improves the quality of storm water runoff, improves air quality, can extend roof membrane service life, and saves energy. The cost to install this type of roof is typically about 75 percent higher than a conventional low-sloped roof. Service life expectancy is 40 years but this is a projection without historical data to support it and assumes diligent inspection and maintenance of the roof's waterproofing and drainage components. If this service life is achieved, an ROI of 145 percent to 204 percent is realized. Table G-1 shows which CONUS installations have the greatest potential to benefit while Table G-2 shows which types of facilities are most appropriate.

G-2.2 There is a requirement to irrigate the roof during the establishment period, and possibly beyond that, so the plants do not perish. It is important to note that ASHRAE 189.1 stipulates the use of potable water for irrigating green roofs is prohibited once the plants have been established. ASHRAE 90.1 is the current standard but ASHRAE intends AHRAE 189.1 to be used for high-performance green buildings. In addition, knowledgeable inspection and maintenance of the vegetative cover is required. Since locating and repairing leaks in the membrane will be difficult, leak-detection sensors should be installed under the roof membrane. These requirements and the associated maintenance burden should be considered prior to choosing a green roof. Maintenance requirements will depend on the selection of vegetative cover, rooftop equipment and penetrations, foot traffic, and even BASH considerations.

G-2.3 Suitability of a green roof to provide a positive ROI is determined by regional climate, building dimensions, structural capacity, and building occupancy.

G-2.4 Hot locations see the greatest benefits from lowering the roof temperature but dry climates require more irrigation. Table G-1 provides climate-related information for every CONUS Air Force installation. OCONUS installations were not included in the study. Hawaii and Guam are worth investigating. Each CONUS base is given a total that corresponds to a poor, fair, or good potential to benefit from a green roof.

G-2.5 High roof-to-wall ratios are desirable and the structure should be able to support the additional weight without extensive upgrades. The building should be fully conditioned and occupied for long hours. Table G-2 shows suitability by facility type.

G-2.6 The Green Roof Installation Decision Tree in Figure G-2 will help guide the selection of vegetative green roofs.

G-2.7 Maintenance costs for green roof systems vary depending on roof size and the entity selected to provide this service. Typically, the larger the roof, the more labor hours are required to maintain its healthy upkeep. Regularly scheduled maintenance is intended to keep major repairs at a minimum. Proper performance of maintenance tasks should catch significant cost issues before they happen. Other items that may drive up cost are difficult roof access and equipment accessibility to the roof. Maintenance staff members that are not trained for green roof upkeep may drive up costs by inflicting damage on the green roof system, drainage system, or roofing membrane.

G-2.8 The ROI over the 40-year projected service life of the green roof ranges from 145 percent to 204 percent, depending on the local climate. The most significant factor affecting the ROI is not energy savings but the savings derived from the extended service life of the roof membrane system. Successfully achieving this service life demands a sustained commitment to maintenance. A green roof may be considered for reasons other than energy savings. They improve storm water runoff, improve air quality, and have other social benefits. If installation of a green roof is for these reasons, this UFC serves to remind and highlight the maintenance requirements for a green roof to perform as expected.

G-2.9 Green roofs will continue to grow in North America as their environmental, economic, and social benefits are recognized and green design is embraced by the public and private sectors. Relationships between conventional roof manufacturers and green roof manufacturers and installers are now well established. It is anticipated that as the green roof market expands and the industry matures in North America, green roof systems will become more commonplace, more competitive, and more standardized. Green roofs can save energy at facilities. They also make financial sense as long as they are properly designed, properly installed, and a long-term commitment is made to ensure appropriate maintenance throughout their potentially long service lives. Without this commitment, consider a cool roof, if appropriate, which will provide similar energy savings and maintenance requirements at a cost comparable to traditional low-slope roof construction.

Table G-1 Appropriateness Table - Green Roof Benefits By Location

Base	Energy Benefits[a]	Irrigation Demands[b]	**Total score[c]**
Air Force Region 1			
Beale AFB, California	8	2	**10**
Edwards AFB, California	9	2	**11**

a. Energy benefits scoring: 4 (minimum) to 10 (maximum)
b. Irrigation demand scoring: 1 (high), 2 (medium), 3 (low)
c. Total Score <7 is poor; 7 ≤ total score <11 is fair; total score ≥ 11 is good

Table G-2 Green Roof Suitability Based on Facility Type

General Facility Type or Use/Activity	Recommended?	Comments - Conditions
AIR TERMINALS		
Freight	No	—
Freight/passenger	Yes	passenger only - fully conditioned
Passenger	Yes	depending on frequency of use
BAKERIES	No	—
COMMUNICATIONS AND IT FACILITIES (ALL)	Yes	fully conditioned
Air Force communications-computer maintenance facility	Yes	fully conditioned
Audiovisual & TV facilities	Yes	fully conditioned
COMMUNITY & SUPPORT FACILITIES		
Commissary	Yes	fully conditioned
Post office	Yes	fully conditioned
Exchange	Yes	fully conditioned
Commercial shops	Yes	fully conditioned
Religious facilities	No	part-time use
Dependent school support facilities	Yes	fully conditioned
Dependent school	No	unless year-round use and fully conditioned
Banks, credit unions	Yes	fully conditioned
Day care center - preschool	Yes	fully conditioned
Community activity center	Yes	fully conditioned
Theater	No	—
Recreation facilities	Yes	excludes gyms - fully conditioned
Library	Yes	fully conditioned
DINING HALLS	Yes	depending on make-up air requirements - fully conditioned
FITNESS FACILITIES	No	high make-up air requirements
FIRE STATION	Yes	excludes apparatus bays - fully conditioned
GUARD AND RESERVE FACILITIES	No	part time use
HANGARS	No	
HOUSING		
Housing - all types - fully conditioned	Yes	depending on configuration
Housing - all types - heat only	No	—
LAUNDRY AND DRY-CLEANING PLANTS	No	
MEDICAL/DENTAL		
Clinics - all types	Yes	fully conditioned
Ambulatory health care center	Yes	fully conditioned
Composite medical facility	Yes	fully conditioned

NOTE: If facility type is not listed, compare with most similar type listed. Facility should be recommended if it meets the following criteria:

- Fully conditioned building with normal and not high make-up air requirements.
- Facility is occupied a minimum of 8 hours per day for 5 days a week
- Building has a high roof area to wall area ratio (tall buildings have a low roof area to wall area ratio)

General Facility Type or Use/Activity	Recommended?	Comments - Conditions
Hospitals	Yes	fully conditioned
Aerospace medical facility	Yes	fully conditioned
Occupational health clinic	Yes	fully conditioned
MUSEUM	No	if part-time use
OPERATIONS FACILITIES & OFFICES		
Offices - all types	Yes	fully conditioned
Squadron operations facilities	Yes	fully conditioned
Base operations facilities	Yes	fully conditioned
Administrative facilities - all types	Yes	fully conditioned
Legal facilities	Yes	fully conditioned
PARKING FACILITIES	No	
SHOPS & MAINTENANCE FACILITIES		
Shops/maintenance facilities - all types - fully conditioned	Yes	only if standard make-up air requirements
Shops/maintenance - unconditioned or semi-conditioned	No	—
STORAGE & WAREHOUSE FACILITIES	No	
TRAINING FACILITIES		
Education center	Yes	fully conditioned
Classroom facilities	Yes	fully conditioned
Automotive skills centers	No	—
Airman Leadership School	Yes	fully conditioned

NOTE: If facility type is not listed, compare with most similar type listed above. Facility should be recommended if it meets the following criteria:

- Fully conditioned building with normal and not high make-up air requirements.
- Facility is occupied a minimum of 8 hours per day for 5 days a week
- Building has a high roof area to wall area ratio (tall buildings have a low roof area to wall area ratio)

G-3 GREEN ROOF INSTALLATION DECISION TREE.

The decision tree shown in Figure G-2 should be used in combination with Tables G-1 and G-2 to help determine whether an existing or proposed new building is an appropriate candidate for a green roof.

The fourth question in the decision tree addresses the capacity of a structure to support the anticipated saturated green roof loading. A structural engineer should provide the appropriate analysis both for existing facilities and new construction. System weights vary and may be a determinant in the specific system selected.

Record of Changes (changes are indicated by **1**\\…/**1**/)

Change No.	**Date**	**Location**
1	May 2014	Revised paragraph 2-2.5; revised Figures 4-1 through 4-6, 4-10, 4-11, 4-13 through 4-15
2	October 2014	Revised paragraph 3-7.2; revised Figures 3-12, 3-13, 4-1, and 4-2
3	December 2017	Revised Figure 3.8 and 4-2.
4	February 2023	Revised paragraph 3-2.1

This UFC supersedes UFC 3-120-01, dated February 6, 2003.

FOREWORD

The Unified Facilities Criteria (UFC) system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and applies to the Military Departments, the Defense Agencies, and the DoD Field Activities in accordance with USD (AT&L) Memorandum dated 29 May 2002. UFC will be used for all DoD projects and work for other customers where appropriate. All construction outside of the United States is also governed by Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA), and in some instances, Bilateral Infrastructure Agreements (BIA.) Therefore, the acquisition team must ensure compliance with the most stringent of the UFC, the SOFA, the HNFA, and the BIA, as applicable.

UFC are living documents and will be periodically reviewed, updated, and made available to users as part of the Services' responsibility for providing technical criteria for military construction. Headquarters, U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering Command (NAVFAC), and Air Force Civil Engineer Center (AFCEC) are responsible for administration of the UFC system. Defense agencies should contact the preparing service for document interpretation and improvements. Technical content of UFC is the responsibility of the cognizant DoD working group. Recommended changes with supporting rationale should be sent to the respective service proponent office by the following electronic form: Criteria Change Request. The form is also accessible from the Internet sites listed below.

UFC are effective upon issuance and are distributed only in electronic media from the following source:

- Whole Building Design Guide web site http://dod.wbdg.org/.

Refer to UFC 1-200-01, *General Building Requirements*, for implementation of new issuances on projects.

UNIFIED FACILITIES CRITERIA (UFC)
REVISION SUMMARY SHEET

Document: UFC 3-120-01, *Design: Sign Standards*

Superseding: UFC 3-120-01, *Air Force Sign Standards*

Description: This document is a wholesale change from the previous version, which was based on AFPAM 32-1097, dated 1 November 1997.

Reasons for Document:

- Purpose: The purpose of this change is to provide clear standards and guidelines for all Service branches to develop consistent signage programs.
