UNIFIED FACILITIES CRITERIA (UFC)

DOD BUILDING CODE

Indicate the Military Department Preparing Activity responsible for the document.

U.S. ARMY CORPS OF ENGINEERS

NAVAL FACILITIES ENGINEERING SYSTEMS COMMAND (Preparing Activity)

AIR FORCE CIVIL ENGINEER CENTER

Record of Changes (changes are indicated by **1**\ ... /**1**/)

Change No.	**Date**	**Location**
1	24 FEB 2023	1-3.3.3 replaced entire paragraph; removed UFC 1-202-01 reference from Appendix C
2	12 JUN 2023	1-4.4 Add paragraph; Chapter 3 and Appendix C: removed references to OUSD Memorandum, Floodplain Management on DoD Installations;
3	26 FEB 2024	1-4.5, Inclusion of NDAA PL 117-263 Sec. 2810 Consideration of Installation of Integrated Solar Roofing. US Army Base name changes, and minor admin.
4	17 Dec 2024	Replaced all references to ICC 2021 codes to ICC 2024. Added anti-ligature requirements for barracks and dormitories. Revised Applicability and Levels of Construction paragraphs.

This UFC supersedes UFC 1-200-01, dated 01 October 2020.

This Page Intentionally Left Blank

FOREWORD

The Unified Facilities Criteria (UFC) system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and applies to the Military Departments, the Defense Agencies, and the DoD Field Activities in accordance with USD (AT&L) Memorandum dated 29 May 2002. UFC will be used for all DoD projects and work for other customers where appropriate. All construction outside of the United States, its territories, and possessions is also governed by Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA), and in some instances, Bilateral Infrastructure Agreements (BIA). Therefore, the acquisition team must ensure compliance with the most stringent of the UFC, the SOFA, the HNFA, and the BIA, as applicable.

UFC are living documents and will be periodically reviewed, updated, and made available to users as part of the Military Department's responsibility for providing technical criteria for military construction. Headquarters, U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering Systems Command (NAVFAC), and Air Force Civil Engineer Center (AFCEC) are responsible for administration of the UFC system. Technical content of UFC is the responsibility of the cognizant DoD working group. Defense Agencies should contact the respective DoD Working Group for document interpretation and improvements. Recommended changes with supporting rationale may be sent to the respective DoD working group by submitting a Criteria Change Request (CCR) via the Internet site listed below.

UFC are effective upon issuance and are distributed only in electronic media from the following source:

- Whole Building Design Guide website https://www.wbdg.org/dod.

Refer to UFC 1-200-01, *DoD Building Code*, for implementation of new issuances on projects.

CHAPTER 1 INTRODUCTION

1-1 BACKGROUND.

Unified Facilities Criteria (UFC) provide common requirements across DoD for safety, sustainability, durability, and functionality for DoD facilities. UFC incorporate a combination of consensus building codes, DoD-defined technical and user requirements, and applicable statutory and regulatory requirements.

1-2 PURPOSE AND SCOPE.

UFC 1-200-01 represents the foundational document of the UFC program in providing general building requirements and overarching criteria, establishing the use of consensus building codes and standards, establishing criteria implementation rules and protocols (including core UFC), and identifying unique military criteria. In accordance with the authority in MIL-STD-3007G, UFC are prepared by DoD committees called Discipline Working Group (DWG), and are published by the Military Services under the authority of the Engineering Senior Executive Panel (ESEP), comprised of the following:

- Deputy Assistant Secretary of Defense (Construction) Office of the Secretary of Defense
- Chief, Engineering and Construction, Headquarters United States Army Corps of Engineers (HQ USACE)
- Chief Engineer, Naval Facilities Engineering Systems Command (NAVFAC)
- Headquarters US Air Force, Deputy Director of Civil Engineers DCS/Logistics, Engineering & Force Protection (HAF/A4C)

1-3 APPLICABILITY.

This UFC applies to the planning, design, construction, sustainment, restoration, and modernization of DoD-owned and DoD-occupied facilities. It is applicable to all methods of project delivery and levels of construction as defined below.

\4 For temporary construction see paragraph 1-3.2.2, for non-permanent DoD facilities in support of military operations see paragraph 1-3.2.3, for Host Nation Facilities see paragraph 1-3.2.4, and for permanent facilities for DoD personnel outside the United States and its territories and possessions see paragraph 1-3.2.5. **/4/**

1-3.1 Implementation, Administration, and Enforcement.

UFC and their referenced codes and Criteria are effective upon issuance for projects as follows:

- Design-Bid-Build projects that have not proceeded beyond 35% design completion.

- Design-Build projects that have not proceeded beyond date of Request for Proposal (RFP) issuance. When an RFP is issued in multiple phases or steps use the date of the last phase of the RFP issuance.
- Projects that have a delay, either planned or unintentional, of more than 18 months between design completion and the solicitation of offers for construction must be re-evaluated to determine if any design revision is necessary due to changes in criteria (including codes and standards) or site infrastructure (for example, water supply for fixed fire suppression systems, water for hose stream allowances, or fire department vehicle access). Note: The evaluation must also include retroactive requirements that have been included in the new editions of the criteria.

1-3.2 Levels of Construction.

1-3.2.1 Permanent Construction.

Permanent facilities must follow Chapter 2 of this UFC, which contains modifications to the IBC. Buildings and facilities are considered permanent construction unless meeting other definitions herein. Permanent construction is intended to address a level of quality and durability to achieve a life expectancy of more than 25 years.

1-3.2.2 Temporary Construction.

\4Temporary construction includes structures erected for a period less than 180 days both inside and outside the United States its territories and possessions**./4/** Temporary structures must conform to the structural strength, fire safety, means of egress, accessibility, light, ventilation, and sanitary requirements of the IBC Section 3103, as modified in Chapter 2 of this UFC. Extension of temporary construction occupancy or usage 180 days or beyond requires a written justification request and approval from the BO/ AHJ. Extension approvals may be renewed at the discretion of the BO/AHJ; however, occupancy or facility usage cannot occur beyond 5 years from date of initial occupancy.

1-3.2.3 Non-permanent DoD Facilities in Support of Military Operations.

Use the following UFC for facilities used in non-permanent DoD facilities support of military operations **\4** both inside and outside the United States its territories and possessions**. /4/** These UFC are self-contained documents and contain all design requirements for the respective subjects. The UFC hierarchy stated in paragraph 1-3.4, and subparagraphs does not apply to these UFC. These UFC apply to all DoD components involved with planning, design, construction and renovation of non-permanent DoD facilities in support of military operations, both new construction and renovations (where renovation does not convert the facility to permanent), used by US military and DoD civilian personnel in support of military operations, actions with written Operation Orders (OPORDS); examples include Kinetic actions, Disaster Recovery, Humanitarian Assistance, and Defense Support to Civil Authorities.

1-3.2.3.1 UFC 1-201-01.

Use UFC 1-201-01 for planning, design, construction, and renovation of non-permanent facilities used by US military and DoD civilian personnel in support of military operations.

1-3.2.3.2 UFC 1-201-02.

Use UFC 1-201-02 to assess existing facilities for life safety and habitability for potential occupancy by DoD personnel in support of military operations. Requirements for preliminary evaluations do not apply when forces occupying the facility are engaged in actual combat operations.

1-3.2.4 \1\ Host Nation Facilities.

\4 Host Nation (HN) facilities are permanent and non-permanent facilities for exclusive use by HN personnel. HN facilities may be funded by the HN or the United States. In either case, follow the appropriate Status of Forces agreements (SOFA), bilateral agreements, or other Host Nation (HN) agreements. If no HN agreement exists, the agreement does not address building codes, or the HN does not address design criteria in the project directive, use the International Building Code® (IBC) for planning, design and construction of all facilities built for HN personnel use**. /4/ /1/**

1-3.2.5 \4\ Permanent Facilities for DoD personnel Outside the United States and its Territories and Possessions.

Permanent facilities for use by one or more DoD personnel outside the United States and its territories and possessions must follow the appropriate Status of Forces agreements (SOFA), bilateral agreements or other Host Nation (HN) agreements. If no HN agreement exists, or the agreement does not address building codes, requirements for permanent facilities that are for use by any DoD personnel follow the applicability of this UFC. **/4/**

1-3.3 Waivers and Exemptions.

A waiver provides authority to deviate from a criteria requirement for a specific period, typically 12 months. An exemption provides authority to deviate from a requirement indefinitely. Refer to MIL-STD-3007 for the waiver and exemption request and approval process.

1-3.4 UFC Hierarchy.

UFC 1-200-01 is the overarching document for buildings and facilities owned by DoD. UFC 1-200-01 directs the use of the International Building Code® (IBC), the International Existing Building Code® (IEBC), International Green Construction Code® (IgCC), Core UFC, other UFC as applicable to the building, facility, structure, or system, and Facility Criteria (FC) as they pertain to the applicable DoD Component.

1-3.4.1 UFC 3- Series.

The UFC 3- Series and FC 3- Series (simply referred to as UFC 3- Series) provide discipline specific criteria requirements for the various engineering disciplines.

- If conflict occurs between two UFC within the UFC 3- Series, the requirements of the UFC that is more detailed pertaining to that specific building, facility, structure, or system take precedence.

1-3.4.2 UFC 4- Series.

The UFC 4- Series and FC 4- Series (simply referred to as UFC 4- Series) provide requirements for multi-disciplinary and facility-specific design.

- If conflict occurs between two UFC within the UFC 4- Series, the requirements of the UFC that is more detailed pertaining to that specific building, facility, structure, or system take precedence.
- If conflict occurs between a UFC 4- Series and a UFC 3- Series, the requirements of the UFC 4- Series take precedence.

1-4 OVERARCHING CRITERIA OR REGULATORY REQUIREMENTS.

Design and Construction must comply with Public Laws (P.L.), Executive Orders (E.O.), Code of Federal Regulations (CFR), Department of Defense Instructions (DoDI), Department of Defense Manuals (DoDM), and Department of Defense Directives (DoDD) or other higher authority documents as applicable.

1-4.1 Vending Facilities for the Blind.

Verify with the using activity the requirement to provide blind-operated vending facilities in compliance with the Randolph-Sheppard Act and DoDI 1125.03. This requirement generally applies in buildings that are over 15,000 square feet (1,400 square meters) that will contain over 100 employees, but may also apply in other situations at the discretion of the using activity.

1-4.2 Nursing and Lactation Rooms.

Provide a private space for nursing mothers as required by the Office of the Undersecretary of Defense (OUSD) Memorandum, Department-Wide Policy for Nursing and Lactation Rooms at military installations and DoD facilities. Use the Office of Personnel Management (OPM) Guide for Establishing a Federal Nursing Mother’s Program to implement best practices for creating a successful nursing mother’s program, consistent with the demand of the workplace and the needs of the mission. This space must not be a bathroom, and must be shielded from view and free from intrusion of others. A nursing mother’s space must be functional, with a private space with a place to sit and a flat surface, other than the floor, to place the breast pump and other supplies. Although there are no size or permanency requirements, this space must provide access to electricity for the use of a breast pump, as well as good lighting, a comfortable temperature, and proper ventilation; and be near a source of hot and cold running water. In addition, comply with any command-specific policy applicable to this requirement or applicable to the establishment of a working mothers program within the facility.

1-4.3 Investigation of Microgrid Feasibility.

Planning and design for military construction projects inside the United States must include consideration of the feasibility and cost-effectiveness of installing an energy microgrid as part of the project, including intentional islanding capability of at least seven consecutive days. **2**\

1-4.4 Government Fleet Electric Vehicle Charging Capability.

Provide adequate electric charging capability, concurrently, for not less than 15 percent of Government motor vehicles planned to be parked at the facility. **/2/ \3**

1-4.5 Photovoltaic Roofs.

Consider the Installation of Integrated Solar Roofing in planning, design, and construction of DoD projects. **/3/**

1-4.6 \4\ Ligature-resistant Design. /4/

\4 Barracks and Unaccompanied Housing. For barracks and unaccompanied housing, prioritize the integration of ligature-resistant fixtures, equipment, and other appurtenances to reduce ligature risk points, as required by the Secretary of Defense memo signed on 26 SEP 2023, titled "New DoD Actions to Prevent Suicide in the Military". Incorporate ligature-resistant features such as rounded edges on furniture and fixtures, tamper-proof fixtures, anti-ligature hardware, weighted furniture, non-removable parts, sloped surfaces, flush-mounted fixtures, and secure windows that cannot be easily manipulated. Incorporate into toilet rooms, bathing facilities, bedrooms, and other living areas, while remaining residential in the nature of the design. These features enhance the safety and well-being of residents. Choose materials for their durability and resistance to tampering to ensure that every aspect of the design minimizes the risk of self-harm. **/4/**

1-5 UFC AUTHORITIES.

1-5.1 ESEP.

The ESEP represents the senior technical facilities engineering leadership within each Military Department as identified in paragraph 1-2 and exercises exclusive authority to issue UFC and FC, and to approve waivers and exemptions thereof.

1-5.2 Building Official / Authority Having Jurisdiction (BO/AHJ).

The terms “Building Official” (BO), “Code Official” and “Authority Having Jurisdiction” (AHJ) used in the UFC or FC criteria, reference codes, and standards are synonymous. The BO/AHJ represents the DoD design and construction agent responsible for accomplishing the project, and exercises authority to interpret and apply criteria to work in progress, evaluate compliance with criteria, and accept finished work that is in compliance. Chapter 2, Section 104, Duties and Powers of the Building Official, defines the authorities of the BO/AHJ. This authority does not include approval of waivers or exemptions to criteria.

1-5.3 Component Technical Representative (CTR).

The CTR represents the project sponsor or customers and exercises authority to establish project requirements on behalf of the user or facility owner in the following cases:

- When the Building Official / Authority Having Jurisdiction (BO/AHJ) has identified more than one option satisfies criteria and allows user preference, such as for different system choices that offer varying levels of performance, durability, compatibility, compatibility with other systems, esthetics, or the like. This authority would not apply where in conflict with requirements for installation-wide networks, architectural standards, or similar standards established by the installation or Component with jurisdiction of the installation.
- When the BO/AHJ has identified an approved equivalent standard that satisfies the intent of criteria (see Chapter 2, paragraph 104.11), such as a material or component meeting a host-nation standard in a foreign location.
- When the BO/AHJ has identified a design option is not specifically addressed in criteria.

1-6 GENERAL BUILDING REQUIREMENTS.

1-6.1 Building Codes.

Use **\4** 2024 IBC and 2024 **/4/** IEBC as follows:

- Use IBC, including all published errata, as the building code for DoD, except as modified by this UFC, other UFC, and FC. Where a paragraph in any chapter of IBC references a paragraph in a different chapter, modify the referenced chapter as described in CHAPTER 2.
- Use IEBC, including published errata, except as modified by this UFC, other UFC, and FC. Where a paragraph in any chapter of IEBC references a paragraph in a different chapter, modify the referenced chapter as described in CHAPTER 3.

1-6.2 Referenced Codes and Substitutions.

Treat references in the DoD Building Code (see Paragraph 2-1.1) and the DoD Existing Building Code (see Paragraph 3-1.1) to other codes as follows:

- Dismiss references to the International Fuel Gas Code® (IFGC), as IFGC is not adopted. UFC 3-430-05 is used for gaseous fuel distribution, UFC 3-460-01 is used for liquid fuel storage and distribution and specific NFPA codes are directly referenced by appropriate application in UFCs.
- References to the International Mechanical Code® (IMC) are references to UFC 3-410-01, which cites IMC.
- References to the International Plumbing Code® (IPC) are references to UFC 3-420-01, which cites IPC.
- Dismiss references to the International Property Maintenance Code® (IPMC), as IPMC is not adopted.
- References to the International Fire Code® (IFC) are references to UFC 3-600-01, which cites NFPA 1.
- References to the International Energy Conservation Code® (IECC) are references to UFC 1-200-02, which cites IECC.
- References to the International Green Construction Code® (IgCC) are references to UFC 1-200-02, which cites IgCC.
- References to NFPA 70, National Electrical Code® (NEC) are references to UFC 3-501-01, which cites NFPA 70.
- References to the International Residential Code® (IRC) are references to the IRC. See also UFC 3-600-01. The DoD adopts the **\4** 2024 **/4/** edition of the International Code Council (ICC) International Building Code® (IBC) and International Residential Code® (IRC) as the primary voluntary consensus standard for DoD Family Housing. Except as augmented or modified in this UFC, design, construct new, and improve Family Housing in accordance with the following:
  - Detached one- and two-family dwellings and multiple attached single-family dwellings (townhouses) not more than three stories above grade plane in height with a separate means of egress and their accessory structures must comply with all sections of the International Residential Code (IRC) and referenced codes and standards (IBC Article 101.2).
  - Other housing types must comply with this UFC, which augments the International Building Code® (IBC). This includes primarily multifamily (i.e., apartment style) housing.

1-6.3 Other Criteria.

In addition to IBC as modified in CHAPTER 2, and IEBC as modified in CHAPTER 3, comply with the following criteria.

1-6.3.1 UFC.

Comply with the UFC (latest version, refer to Paragraph 1-3.1) as noted herein.

1-6.3.1.1 Core UFC.

Core UFC are criteria that provide requirements for the majority of traditional building systems that are prevalent on DoD facility construction projects. Core UFC also identify additional criteria such as Antiterrorism, High Performance, and Sustainable Building requirements mandated by law and policy. Comply with the Core UFC listed here.

- 1-200-02, High Performance and Sustainable Building Requirements
- 3-101-01, Architecture
- 3-110-03, Roofing
- 3-120-10, Interior Design
- 3-190-06, Protective Coatings and Paint
- 3-201-01, Civil Engineering
- 3-201-02, Landscape Architecture
- 3-210-10, Low Impact Development
- 3-220-01, Geotechnical Engineering
- 3-230-01, Water Storage and Distribution
- 3-240-01, Wastewater Collection and Treatment
- 3-301-01, Structural Engineering
- 3-401-01, Mechanical Engineering
- 3-410-01, Heating, Ventilating and Air Conditioning
- 3-420-01, Plumbing Systems
- 3-490-06, Elevators
- 3-501-01, Electrical Engineering
- 3-520-01, Interior Electrical Systems
- 3-530-01, Interior and Exterior Lighting Systems and Controls
- 3-550-01, Exterior Electrical Power Distribution
- 3-560-01, Operation and Maintenance: Electrical Safety
- 3-580-01, Telecommunications Interior Infrastructure Planning and Design
- 3-600-01, Fire Protection Engineering for Facilities
- 4-010-01, DoD Minimum Antiterrorism Standards for Buildings

- 4-010-06, Cybersecurity of Facility-Related Control Systems
- 4-021-01, Design and O&M: Mass Notification Systems

1-6.3.1.2 Other UFC.

In addition to the “Core UFC”, comply with other UFC as applicable to the system, structure, or facility type defined in the scope of the construction project.

1-6.3.2 FC.

The designation "FC" is for criteria that are not applicable to all DoD Components.

For example: FC 4-721-10N "Navy and Marine Corps Unaccompanied Housing" has a final "N" designation because it is used by the Navy, including its Component, the U.S. Marine Corps. FC are applicable only to the DOD Component in the title and are intended for use with unified technical requirements published in UFC. Comply with the FC for the designated facility type and the DoD Component.

1-6.3.3 Specification Requirements.

Use Unified Facilities Guide Specifications (UFGS) for projects, including Design-Build submittals, and in accordance with UFC 1-300-02 no later than 35% design completion for Design-Bid-Build projects or draft Request for Proposals (RFP) completion for Design-Build projects. Download, use, and edit the most current UFGS database available from the Whole Building Design Guide website at https://www.wbdg.org/dod/ufgs. Modify and edit the UFGS as necessary to suit the work required by the specific project, including editing for metric or inch-pound and to reflect the latest proven technology, materials, and methods for the project. Follow Order of Precedence requirements for each Government Design Agent on use of Regional, Agency, Unified, and Other guide specifications. Other guide specifications may be used as a basis for information when not available in the UFGS. Provide these specifications in UFGS format and modified to meet the requirements of UFC 1-300-02.

1-6.3.4 Other Military Criteria.

Military criteria other than those listed in this UFC may be applicable to specific types of structures, building systems, or building occupancies. Such structures, systems, or buildings must meet the additional requirements of applicable military criteria.

1-6.3.4.1 Explosive Safety.

Facilities that involve DoD Ammunition and Explosives (AE) storage, handling, maintenance, manufacture or disposal, as well as facilities within the explosives safety quantity distance (ESQD) arcs of AE facilities, must comply with the requirements found in DoDM 6055.09, as well as implementing Service criteria found in DA PAM 385-64 (Army), NAVSEA OP 5 (Navy and Marine Corps), and DESR6055.09_AFMAN91-201 (Air Force). DoD facilities exposed to potential explosion effects from AE belonging to other nations are also required to meet DoD and Service explosives safety criteria.

Closely coordinate the planning and design of new facilities, and occupation, repair, alteration, and restoration of existing AE-related facilities, or other facilities within ESQD arcs with knowledgeable explosives safety professionals in theater, or with the Services' Explosives Safety Centers. Coordinate as early as possible in the planning and design process to avoid issues or problems and to ensure compliance. Facility construction or use within ESQD arcs requires review for compliance with explosives safety criteria, and must have either an approved explosives safety site plan or an approved explosives safety deviation. Refer to the DoD Service documents mentioned above for further applicable guidance.

1-6.3.4.2 Facility Systems Safety.

Safety is an important component of maintaining and operating DoD facilities. Consider safety during design. Incorporate a hazards review into the regular design review process to ensure systems safety has been considered at the earliest phases of project development to reduce and mitigate unintentional maintenance and operational hazards. For Army projects, incorporate the safety engineering practices delineated under the Facilities Systems Safety (FASS) program as prescribed under DA PAM 385-16, to the extent practicable and feasible. For Air Force projects, incorporate the safety engineering practices delineated in DAFMAN 91-203, to the extent practicable and feasible. For Navy, the Designer of Record must follow the concepts from the most current ANSI/ASSP Z590.3. DoD facilities must comply with DoDI 6055.01 and applicable Occupational Safety and Health Administration (OSHA) safety and health standards.

1-6.3.4.3 Antiterrorism.

Antiterrorism is defined as defensive measures used to reduce the vulnerability of individuals and property to terrorist acts. UFC 4-010-01 sets the minimum requirements for DoD buildings, and the Geographic Combatant Commander Antiterrorism Construction Standards address unique requirements specific to their area of responsibility. Refer to UFC 4-010-01 and the Geographic Combatant Commander Antiterrorism Construction Standards for the minimum antiterrorism requirements.

1-6.3.4.4 Physical Security.

Physical security is defined as that part of security concerned with physical measures designed and placed to safeguard personnel; to prevent unauthorized access to installations, equipment, material and documents, and to safeguard them against espionage, sabotage, damage, and theft. Many buildings require some level of physical security. When required, integrate physical measures into the site, building, room, or area as applicable. DoD requirements for physical security related to specific assets are documented in DoD publications, directives, manuals, and instructions. The Services have related documents that implement the DoD policy for the Services. The main DoD documents that contain the physical security requirements for the protection of specific DoD assets are shown in Table 1-1. This does not include the policy documents associated with the protection of nuclear and chemical assets.

Table 1-1 Policy Related to Physical Security

Controlled Inventory Items	

1-6.3.4.5 Corrosion Prevention and Control Requirements.

Use the requirements in 3-18 in conjunction with other UFC requirements to design for durability and provide for a comprehensive corrosion prevention and control strategy.

1-7 CYBERSECURITY.

Plan, design, acquire, execute, and maintain control systems (including systems separate from a utility monitoring and control system) in accordance with UFC 4-010-06, and as required by individual Service Implementation Policy.

1-8 NON-GOVERNMENT STANDARD MODIFICATIONS.

CHAPTER 2 modifies IBC and is organized by the chapter of IBC that each section modifies. CHAPTER 3 modifies IEBC and is organized by the chapter of IEBC that each section modifies. The modifications are one of four actions, according to the following legend:

- [Addition] – Add new section, including new section number, not shown in IBC or IEBC.
- [Deletion] – Delete referenced IBC or IEBC section.
- [Replacement] – Delete referenced IBC or IEBC section or noted portion and replace it with the narrative shown.
- [Supplement] – Add narrative shown as a supplement to the narrative shown in the referenced section of IBC or IEBC.

The section modifiers are identified at the end of the paragraph title. Limited commentary has been added in the chapters. Section designations for such commentary are preceded by a “[C]”, and the commentary narrative is shaded.

1-9 GLOSSARY.

APPENDIX B contains a list of acronyms, abbreviations, and definitions.

1-10 REFERENCES.

APPENDIX C contains a list of references used in this document. The publication date of the code or standard is not included in this document. Unless otherwise specified, the most recent edition of the referenced publication applies.

CHAPTER 2 MODIFICATIONS TO IBC

2-1 CHAPTER 1 – SCOPE AND ADMINISTRATION [SUPPLEMENT].

Use IBC Chapter 1 except as modified below and by UFC 3-301-01.

2-1.1 Section 101 – SCOPE AND GENERAL REQUIREMENTS.

101.1 Title [Replacement]

These regulations are to be known as the DoD Building Code, hereinafter referred to as "this code".

101.4 Referenced codes [Supplement]

Refer to Paragraph 1-6.2 for referenced codes.

101.4.7 Existing buildings [Replacement]

The provisions of the International Existing Building Code® (IEBC), including the amendments in Chapter 3 of this UFC, apply to the repair, alteration, change of occupancy, addition to and relocation of existing buildings.

2-1.2 Section 102 – APPLICABILITY.

102.1 General [Replacement]

Where there is a conflict between a general requirement and a specific requirement, the specific requirement is applicable. Where, in a specific case, different sections of this code specify different materials, methods of construction or other requirements, the most restrictive govern. Refer to Paragraph 1-3.6 for hierarchy of UFC.

102.2 Other Laws [Replacement]

The provisions of this code does not intend to nullify applicable provisions of local, state, or federal law. In overseas locations the SOFA, HNFA, and in some instances, BIA may govern requirements.

102.4 Referenced codes and standards [Supplement]

Refer to Paragraph 1-6.2 and Paragraph 1-6.3 for referenced codes and criteria.

2-1.3 Section 103 – CODE COMPLIANCE AGENCY [Deletion].

2-1.4 Section 104 – DUTIES AND POWERS OF BUILDING OFFICIAL.

104.1 General [Replacement]

The Building Official/AHJ is a person authorized and directed to enforce the provisions of this code, UFC, or FC. They have the authority to render interpretations of this code, UFC, or FC and to clarify the application of the provisions. Such interpretations will be in compliance with the intent and purpose of this code, UFC, or FC and will not have the effect of waiving or exempting requirements specifically provided for in this code, UFC, or FC. For waiver and exemption process and authority refer to Section 104.10 Waivers and exemptions.

104.10 Waivers and exemptions [\4\ Addition /4/]

Where there are practical difficulties involved in carrying out the provisions of this code, UFC, or FC; the Building Official/AHJ must first find that special individual case or reason that makes the strict letter of this code, UFC, or FC impractical resulting in noncompliance with requirements or an increased risk to: health, accessibility, life and fire safety, structural requirements, or operational requirements. Such cases will be treated as a waiver or exemption. Waivers and exemptions to specific UFC or FC requirements are approved by the Service's Chief Engineer, Engineering Senior Executive Panel signature authority for the Service. Refer to MIL-STD 3007 for waivers and exemption definitions and for specific requirements for approval.

[C] 104.10 Waivers and exemptions [**\4** Addition ***/4/***]

Avoid requests for waivers and exemptions if possible. The objective is a criteria- or code-compliant engineering solution for the facility versus a waiver or exemption request. UFC and FC requirements are intended to address code-compliant facility requirements; life, health and safety requirements; property loss prevention; lowest lifecycle cost; and facility operational requirements. For issues dealing with life, health, and safety, cost is not a valid reason to grant a waiver or exemption. Waiving or exempting requirements typically results in increased risk to safety or property loss, increased operational risk, or poor return on investment.

104.11 Alternative materials, design and methods of construction and equipment [\4\ Addition /4/]

The provisions of this code, UFC, or FC are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative has been approved. An alternative material, design, or method of construction may be approved where the Building Official/AHJ finds that the proposed design is satisfactory and complies with the intent of the provisions of this code, UFC, or FC, and that the material, method, or work offered is, for the purpose intended, not less than the equivalent of that prescribed in this code, UFC, or FC in quality, strength, effectiveness, fire resistance, durability, and safety. When the alternative material, design, or method of construction is not approved, the Building Official/AHJ will respond in writing, stating the reasons why the alternative was not approved.

104.11.1 Research reports [\4\ Addition /4/]

Supporting data, where necessary to assist in the approval of materials or assemblies not specifically provided for in this code, UFC, or FC, must consist of valid research reports from approved sources.

104.11.2 Tests [\4\ Addition /4/]

Whenever there is insufficient evidence of compliance with the provisions of this code, or evidence that a material or method does not conform to the requirements of this code, or in order to substantiate claims for alternative materials or methods, the Building Official/AHJ has the authority to require tests as evidence of compliance to be made without expense to the government. Test methods are as specified in this code, UFC, or FC or by other recognized test standards. In the absence of recognized and accepted test methods, the Building Official/AHJ must approve the testing procedures. Perform tests by an approved agency. Building Official/AHJ retains reports of such tests.

104.11.3 Overseas locations [Addition]

In overseas locations where the SOFA, HNFA, OEBGD, or BIA may govern requirements, the Building Official/AHJ will review the situation and determine what, if any, measures are appropriate to take to compensate for measures not allowed by the host nation or that present practical difficulties involved in carrying out the provisions. Measures taken must not lessen quality, strength, effectiveness, fire resistance, durability, and safety. In these instances, formal exemptions are not required. The details of action granting alternative materials, design and methods of construction and equipment will be recorded and entered in the project document files by the Building Official/AHJ. Note that alternative materials, design and methods of construction and equipment must not be misconstrued as a waiver or exemption. Waivers and exemptions are addressed in 104.10.

2-1.5 Section 105 – PERMITS [Deletion].

2-1.6 Section 106 – FLOOR AND ROOF DESIGN LOADS [Deletion].

2-1.7 Section 107 – CONSTRUCTION DOCUMENTS [Deletion].

2-1.8 Section 108 – TEMPORARY STRUCTURES AND USES [Deletion].

2-1.9 Section 109 – FEES [Deletion].

2-1.10 Section 111 – CERTIFICATE OF OCCUPANCY [Deletion].

2-1.11 Section 113 – MEANS OF APPEALS [Deletion].

2-1.12 Section 114 – VIOLATIONS [Deletion].

2-1.13 Section 115 – STOP WORK ORDER [Deletion].

2-1.14 Section 116 – UNSAFE STRUCTURES AND EQUIPMENT [Deletion].

2-2 CHAPTER 2 – DEFINITIONS [SUPPLEMENT].

Use IBC Chapter 2 except as modified by APPENDIX B and by UFC 3-301-01.

> [C] CHAPTER 2 – DEFINITIONS [SUPPLEMENT]
>
> Definitions in IBC Chapter 2 apply to terms used in the model code and are not intended to replace definitions and terms in military and other referenced documents. It is essential that the code defined meaning be known to understand the intent and correctly interpret the code.

2-3 CHAPTER 3 – OCCUPANCY CLASSIFICATION AND USE [SUPPLEMENT].

Use IBC Chapter 3.

> [C] CHAPTER 3 – OCCUPANCY CLASSIFICATION AND USE [SUPPLEMENT]
>
> IBC occupancy classifications are used as they relate to allowable construction type, building height, building area, building separation distance, occupancy separation and associated requirements. NFPA 101 occupancy classifications are used as they relate to fire/smoke resistance rating of interior non-load bearing partitions (other than occupancy separation), means of egress, interior finish, features of fire protection (including vertical openings) and associated requirements.

2-4 CHAPTER 4 – SPECIAL DETAILED REQUIREMENTS BASED ON OCCUPANCY AND USE [SUPPLEMENT].

Use IBC Chapter 4 only as specifically referenced by UFC 3-600-01 and UFC 3-301-01.

2-5 CHAPTER 5 – GENERAL BUILDING HEIGHTS AND AREAS [SUPPLEMENT].

Use IBC Chapter 5 except as modified below and by UFC 3-600-01.

> [C] CHAPTER 5 – GENERAL BUILDING HEIGHTS AND AREAS [SUPPLEMENT]
>
> UFC 3-600-01 gives direction concerning the requirements for fire-rated partitions. Note that the building area for funding and planning purposes is calculated differently than the method defined in IBC Chapter 5 for code compliance calculation.

2-5.1 Section 506 – BUILDING AREA.

2-5.1.1 Table 506.2 – Allowable Area Factor in Square Feet.

Table 506.2: Cell at I-4, S1, Type IA [Replacement]

242,000.

2-6 CHAPTER 6 – TYPES OF CONSTRUCTION [SUPPLEMENT].

Use IBC Chapter 6 except as modified by UFC 3-600-01.

2-7 CHAPTER 7 – FIRE AND SMOKE PROTECTION FEATURES [SUPPLEMENT].

Use IBC Chapter 7 only where specifically referenced by IBC Chapter 5 or 6, otherwise use UFC 3-600-01 and modifications in UFC 3-101-01.

> [C] CHAPTER 7 – FIRE AND SMOKE PROTECTION FEATURES [SUPPLEMENT]
>
> UFC 3-600-01 gives direction concerning the requirements for fire-rated partitions.

2-8 CHAPTER 8 – INTERIOR FINISHES [REPLACEMENT].

Use UFC 3-600-01, UFC 3-120-10 and UFC 3-101-01.

2-9 CHAPTER 9 – FIRE PROTECTION AND LIFE SAFETY SYSTEMS [REPLACEMENT].

Use UFC 3-600-01.

2-10 CHAPTER 10 – MEANS OF EGRESS [REPLACEMENT].

Use UFC 3-600-01. Use IBC Chapter 10 when specifically referenced by US Access Board, Architectural Barriers Act (ABA) Standards and as referenced by UFC 3-600-01.

> [C] CHAPTER 10 – MEANS OF EGRESS [REPLACEMENT]
>
> UFC 3-600-01 references IBC Chapter 10 for requirements for stair to roof access. Where the ABA Standards reference the previous versions of IBC, the applicable requirements of the **\4** 2024 **/4/** IBC are acceptable.

2-11 CHAPTER 11 – ACCESSIBILITY [REPLACEMENT].

Use the ABA Standards and the special provisions of the DoD Deputy Secretary of Defense Memorandum, Subject: Access for People with Disabilities, October 31, 2008. Use the additional requirements listed in the subparagraphs below, in addition to the ABA Standards and Defense Memorandum.

[C] CHAPTER 11 – ACCESSIBILITY [REPLACEMENT]

Refer to APPENDIX C for a link to the ABA Standards and the DoD policy memorandum.

2-11.1 Electrical vehicle charging stations.

Electrical vehicle charging stations provided to serve Group, R-3 and R-4 occupancies are not required to comply with the following sub-sections.

2-11.1.1 Number of accessible vehicle spaces.

Not less than 5 percent of vehicle spaces on the site served by electrical vehicle charging systems, but not fewer than one for each type of electric vehicle charging system, must be accessible.

2-11.1.2 Accessible electric vehicle space size.

Accessible vehicle spaces at electrical vehicle charging stations must include an accessible parking space that is 132 inches (3350 mm) minimum in width with an access aisle on each side of the space that is 60 inches (1525 mm) minimum in width to allow for a pathway around the vehicle to variable locations of charging ports. Two parking spaces are permitted to share a common access aisle.

2-11.2 Water bottle-filling stations.

Where bottle-filling stations are provided, they must be accessible.

Exception: Bottle-filling stations over drinking fountains for standing persons are not required to be accessible, provided that bottle-filling stations are also located over the drinking fountains for persons using wheelchairs.

2-12 CHAPTER 12 – INTERIOR ENVIRONMENT [SUPPLEMENT].

Use IBC Chapter 12 except as modified below and by UFC 3-101-01.

[C] CHAPTER 12 – INTERIOR ENVIRONMENT [SUPPLEMENT]

Refer to other Federal guidance and UFC for additional interior space requirements for ventilation, lighting, acoustics, and other environmental characteristics.

2-12.1 Section 1203 – TEMPERATURE CONTROL.

1203.1 Equipment and systems [Replacement]

Use UFC 3-410-01.

1203.1 Equipment and systems, Exceptions [Deletion]

2-12.2 Section 1206 – SOUND TRANSMISSION.

1206.2 Airborne sound [Replacement]

Use UFC 3-101-01 and UFC 3-120-10. For Navy and Marine Corps Unaccompanied Housing facilities, only use FC 4-721-10N.

1206.3 Structure-borne sound [Replacement]

Use UFC 3-101-01 and UFC 3-120-10. For Navy and Marine Corps Unaccompanied Housing facilities, only use FC 4-721-10N.

2-12.3 Section 1207 – ENHANCED CLASSROOM ACOUSTICS [REPLACEMENT].

Use UFC 3-101-01.

2-12.4 Section 1208 – INTERIOR SPACE DIMENSIONS.

\4\ 1208.3 Dwelling Unit Size [Replacement] /4/

\4\ 1208.4 /4/ Room area [Replacement]

Use UFC 3-101-01 and UFC 3-120-10. For Navy and Marine Corps Unaccompanied Housing facilities, only use FC 4-721-10N.

\4\ 1208.5 /4/ Efficiency dwelling units [Replacement]

Use UFC 3-101-01 and UFC 3-120-10. For Navy and Marine Corps Unaccompanied Housing facilities, only use FC 4-721-10N.

2-13 CHAPTER 13 – ENERGY EFFICIENCY [REPLACEMENT].

Use UFC 1-200-02.

\3 As per Public Law 117-263 Sec. 2810, consider the installation of integrated solar roofing to improve energy resiliency of military installation inside of the United States. Consideration includes feasibility and cost-effectiveness of installing the system. **/3/**

2-14 CHAPTER 14 – EXTERIOR WALLS [SUPPLEMENT].

Use IBC Chapter 14 except as modified by UFC 3-101-01.

2-15 CHAPTER 15 – ROOF ASSEMBLIES AND ROOFTOP STRUCTURES [SUPPLEMENT].

Use IBC Chapter 15 except as modified by UFC 3-110-03 and UFC 3-600-01.

2-16 CHAPTER 16 – STRUCTURAL DESIGN [SUPPLEMENT].

Use IBC Chapter 16 except as modified below and by UFC 3-301-01 and 3-301-02.

2-16.1 Section 1604 – GENERAL DESIGN REQUIREMENTS.

1604.11 Fall prevention and protection [Addition]

Provide fall protection features such as fixed ladders, roof hatches, handrails, guardrails and other building fall arrest systems in compliance with section titled “Hazard Prevention” in UFC 3-101-01. For fall protection features specific to roofing systems, provide in compliance with UFC 3-110-03. The anchorages and the structural elements that support these anchorages must meet the requirements of Section 1607.10.4, as modified by UFC 3-301-01. Where fall protection is required in the vicinity of weight-handling equipment, prevent conflicts between the weight-handling equipment and the fall protection measure.

2-16.2 Section 1612 – FLOOD LOADS [Supplement].

Use Section 1612 except as modified by UFC 3-201-01.

1612.3 Establishment of flood hazard areas [Supplement]

Comply with UFC 3-201-01.

2-17 CHAPTER 17 – SPECIAL INSPECTIONS AND TESTS [SUPPLEMENT].

Use IBC Chapter 17 except as modified below and by UFC 3-220-01, UFC 3-301-01, and UFC 3-600-01.

2-17.1 Section 1701 – GENERAL.

1701.1 - Scope [Supplement]

Contractual relationships and the composition of the architect / engineer / construction (AEC) team differ from that contemplated by the language of **\4** 2024 **/4/** IBC, when doing DoD construction. When performing design or construction using typical methods for in-house design, architect-engineer design, and contracting for construction, **\4** 2024 **/4/** IBC/ASCE 7-16 terms of Authority Having Jurisdiction and Building Official are to be as defined in UFC 1-200-01.

[C] 1701.1 - Scope [Supplement]

The context of the IBC terms “permit”, “permit application”, “permit applicant”, and “owner” must be modified for DoD projects. Refer to Paragraph 1-5. DoD functions as the building department/jurisdiction and the AHJ functions as the building official. When DoD advertises a project, the building permit is effectively implied/granted. However, the overall project may still require other permits related to site storm water, air quality, demolition disposal, etc.

2-17.2 Section 1704 – SPECIAL INSPECTIONS AND TESTS, CONTRACTOR RESPONSIBILITY AND STRUCTURAL OBSERVATION.

1704.2 Special inspections and tests [Replacement]

The contractor must employ one or more approved agencies to perform inspections during construction on the types of work listed under Section 1705. These inspections are in addition to the inspections defined in Section 110. The inspecting agency must provide reports of the special inspections directly to the government.

2-18 CHAPTER 18 – SOILS AND FOUNDATIONS [SUPPLEMENT].

Use IBC Chapter 18 except as modified below and by UFC 3-101-01, UFC 3-201-01, UFC 3-220-01, and UFC 3-301-01.

2-18.1 Section 1804 – EXCAVATION, GRADING, AND FILL.

1804.4 Site grading [Supplement]

Ensure that the grading and associated storm water runoff do not adversely affect surrounding sites. Establish finished floor elevations a minimum of 6 inches (150 mm) above finished grade at the perimeter of the building and provide site grading in accordance with UFC 3-201-01. Comply with UFC 3-600-01 for design of entrances and exits from buildings.

1804.4 Site grading, Exception 1 [Deletion]

1804.4 Site grading, Exception 2 [Replacement]

Impervious surfaces are permitted to be sloped less than 2 percent where the surface is a door landing or ramp that is required to comply with UFC 3-600-01.

2-19 CHAPTER 19 – CONCRETE [SUPPLEMENT].

Use IBC Chapter 19 except as modified by UFC 1-200-02 and UFC 3-301-01.

2-20 CHAPTER 20 – ALUMINUM [SUPPLEMENT].

Use IBC Chapter 20 except as modified by UFC 3-101-01 and except for aluminum use in Heating, Ventilation, and Air Conditioning (HVAC) systems. For aluminum use in HVAC systems, use UFC 3-410-01.

2-21 CHAPTER 21 – MASONRY [SUPPLEMENT].

Use IBC Chapter 21 except as modified by UFC 3-101-01 and UFC 3-301-01.

2-22 CHAPTER 22 – STEEL [SUPPLEMENT].

Use IBC Chapter 22 except as modified by UFC 3-101-01 and UFC 3-301-01.

2-23 CHAPTER 23 – WOOD [SUPPLEMENT].

Use IBC Chapter 23 except as modified below and UFC 3-101-01 and UFC 3-301-01.

2-23.1 Section 2301 – GENERAL.

2301.3 Composite Wood [Addition]

Composite wood containing materials (e.g. Plywood, Particle Board, MDF) must be specified to be moisture resistant or exterior glue grade.

2-23.2 Section 2303 – MINIMUM STANDARDS AND QUALITY.

2-23.2.1 2303.2 Fire-retardant-treated wood.

\4\ 2303.2.10 Type I and II Construction Applications [Deletion] / 4/

\4\ 2303.2.11 /4/ Roof construction [Addition]

Do not use fire-retardant-treated plywood in any part of the roof or roofing system.

2-24 CHAPTER 24 – GLASS AND GLAZING [SUPPLEMENT].

Use IBC Chapter 24 except as modified by UFC 4-010-01.

2-25 CHAPTER 25 – \4\ GYPSUM PANEL PRODUCTS AND PLASTER /4/

Use IBC Chapter 25 except as modified by UFC 3-101-01.

2-26 CHAPTER 26 – PLASTIC [SUPPLEMENT].

Use IBC Chapter 26 except as modified by UFC 3-600-01.

2-27 CHAPTER 27 – ELECTRICAL [SUPPLEMENT].

Use IBC Chapter 27 except as modified below and by UFC 3-501-01.

- Use UFC 3-520-01 for interior electrical systems criteria.
- Use UFC 3-530-01 for interior and exterior lighting and controls criteria.
- Use UFC 3-540-01 for engine-driven generator criteria.
- Use UFC 3-550-01 for exterior power distribution systems criteria.
- Use UFC 3-560-01 for electrical safety and electrical Operations and Maintenance (O&M) criteria.
- Use UFC 3-580-01 for building telecommunications criteria.
- Use UFC 3-600-01 for fire protection criteria.
- Use UFC 4-021-01 for mass notification systems criteria.

[C] CHAPTER 27 – ELECTRICAL [SUPPLEMENT].

IBC references NFPA 70, NEC. In addition, IBC Chapter 27, Section 2702 EMERGENCY AND STANDBY POWER SYSTEMS, which addresses emergency and standby power requirements, references IFC. Per Paragraph 1-6.2, this must be considered a reference to UFC 3-600-01, which cites NFPA 1.

2-28 CHAPTER 28 – MECHANICAL SYSTEMS [SUPPLEMENT].

Use IBC Chapter 28 except as modified by UFC 3-401-01. Use UFC 3-600-01 for fire protection features for mechanical systems.

[C] CHAPTER 28 – MECHANICAL SYSTEMS [SUPPLEMENT].

IBC Chapter 28 provides references to IMC which has been modified by UFC 3-410-01. However, IFGC has not been adopted. The DoD uses NFPA 54 (ANSI Z223.1), National Fuel Gas Code, for the design and installation of fuel gas piping systems.

2-29 CHAPTER 29 – PLUMBING SYSTEMS [SUPPLEMENT].

Use IBC Chapter 29 except as modified by UFC 3-420-01.

2-30 CHAPTER 30 – ELEVATORS AND CONVEYING SYSTEMS [REPLACEMENT].

Use UFC 3-490-06.

2-31 CHAPTER 31 – SPECIAL CONSTRUCTION.

Use IBC Chapter 31.

2-32 CHAPTER 32 – ENCROACHMENTS INTO THE PUBLIC RIGHT-OF-WAY.

Use IBC Chapter 32.

2-33 CHAPTER 33 – SAFEGUARDS DURING CONSTRUCTION [SUPPLEMENT].

Use IBC Chapter 33.

2-34 CHAPTER 34 – RESERVED [DELETION].

2-35 CHAPTER 35 – REFERENCED STANDARDS [SUPPLEMENT].

Use IBC Chapter 35 except as modified by Paragraph 1-6.2.

2-36 APPENDICES [DELETION]

CHAPTER 3 MODIFICATIONS TO IEBC

This Chapter covers project requirements for existing facilities. In many cases, there are project parameters that trigger discipline-specific or facility-type requirements for renovation projects.

3-1 CHAPTER 1 – SCOPE AND ADMINISTRATION.

Use IEBC Chapter 1 except as modified below. The terms "Code Official", "Building Official" (BO), and "Authority Having Jurisdiction" (AHJ) used in the UFC or FC criteria, reference codes, and standards are synonymous. The terms "Owner" and "Owner's Authorized Agent" are synonymous with "Component Technical Representative" for the DoD. See Section 1-5 of this UFC for additional information on these terms.

3-1.1 Section 101 – SCOPE AND GENERAL REQUIREMENTS.

101.1 Title [Replacement]

These regulations are to be known as the DoD Existing Building Code, hereinafter referred to as "this code."

3-1.2 Section 102 – APPLICABILITY.

102.1 General [Replacement]

Where there is a conflict between a general requirement and a specific requirement, the specific requirement is applicable. Where, in any specific case, different sections of this code specify different materials, methods of construction or other requirements, the most restrictive govern. Refer to Paragraph 1-3.6 for hierarchy of UFC.

102.4 Referenced codes and standards [Supplement]

Refer to Paragraph 1-6.2 and Paragraph 1-6.3 for referenced codes and criteria.

3-1.3 Section 103 – CODE COMPLIANCE AGENCY [Deletion].

3-1.4 Section 104 – DUTIES AND POWERS OF CODE OFFICIAL [Deletion].

3-1.5 Section 105 – PERMITS [Deletion].

3-1.6 Section 106 – CONSTRUCTION DOCUMENTS [Deletion].

3-1.7 Section 108 – FEES [Deletion].

3-1.8 Section 110 – CERTIFICATE OF OCCUPANCY [Deletion].

3-1.9 Section 112 – MEANS OF APPEALS [Deletion].

3-1.10 Section 113 – VIOLATIONS [Deletion].

3-1.11 Section 114 – STOP WORK ORDER [Deletion].

3-1.12 Section 115 – UNSAFE STRUCTURES AND EQUIPMENT [Supplement].

Use Section 115 except as modified below.

115.4 Method of service [Deletion]

3-1.13 Section 116 – EMERGENCY MEASURES [Deletion].

Use Section **\4** 116 **/4/** except as modified below.

116.2 Temporary Safeguards [Replacement]

Notwithstanding other provisions of this code, whenever, in the opinion of the BO/AHJ, there is imminent danger due to an unsafe condition, the BO/AHJ must order the necessary work to be done, including the boarding up of openings, to render such structure temporarily safe; and as the code official requires other actions as deemed necessary to meet such emergency.

116.4 Emergency repairs [Deletion]

116.5 Costs of emergency repairs [Deletion]

116.6 Hearing [Deletion]

3-1.14 Section 117 – DEMOLITION [Deletion].

3-2 CHAPTER 2 – DEFINITIONS [SUPPLEMENT].

Use IEBC Chapter 2 except as modified by APPENDIX B.

> [C] CHAPTER 2 – DEFINITIONS [SUPPLEMENT]
>
> Definitions in IEBC Chapter 2 apply to terms used in the model code and are not intended to replace definitions and terms in military documents. It is essential that the code defined meaning be known to understand the intent and correctly interpret the code.

3-3 CHAPTER 3 – PROVISIONS FOR ALL COMPLIANCE METHODS [SUPPLEMENT].

Use IEBC Chapter 3 except as modified below.

3-3.1 Section 302 – GENERAL PROVISIONS.

302.1.1 Existing Building Minimum Requirements [Addition]

Facilities, as they exist, must meet the requirements within the applicable occupancy chapter of NFPA 101. Facilities that do not meet the requirements of NFPA 101 for existing occupancies must conform to one of the following:

a. Upgrade the deficiency to meet the existing occupancy requirements, or

b. Establish management protocols to provide a level of life safety equivalent to that required by NFPA 101 for existing occupancies, until an upgrade project can be completed. Management protocols must be in writing and approved by the BO/AHJ.

[C] 302.1.1 Existing Building Minimum Requirements [Addition]

The areas of the facility where no work is being performed must meet the applicable existing occupancy chapter of NFPA 101. Thus, if the work involves 5,000 ft^2 of an existing 15,000 ft^2. office building, then the remaining 10,000 ft^2 not involved in the project must be brought up to meet the applicable existing occupancy chapter of NFPA 101 before beginning the project or be included as part of the project.

302.2.2 Requirements for High Performance and Sustainable Building Features and Systems [Addition]

For existing buildings undergoing renovations, the systems and components included in the scope of the project must meet the requirements of UFC 1-200-02. Refer to UFC 1-200-02 Table 1-1 and Chapter 2 paragraph titled “Work in Existing Buildings” for project requirements.

302.2.3 Antiterrorism Upgrades for Inhabited Buildings [Addition]

Incorporate antiterrorism upgrades as required to bring entire existing inhabited buildings into compliance with UFC 4-010-01 for all building renovations, modifications, repairs, revitalizations, and restorations where project costs exceed 50% of the replacement cost of the existing building in accordance with UFC 3-701-01 except as stated otherwise in UFC 4-010-01. The project costs used to compare against the 50% threshold are exclusive of the additional costs identified to meet these antiterrorism standards. Where project costs do not exceed the 50% threshold, compliance with the antiterrorism standards is recommended, but not required.

Incorporate antiterrorism upgrades as required in UFC 4-010-01 whenever any building, or portion of a building, is converted from low occupancy to inhabited occupancy.

302.2.4 Requirements for New Fire Protection and Life Safety Systems [Addition]

Where the Building Rehabilitation chapter of NFPA 101 requires newly constructed elements, components, and systems to comply with new construction requirements in NFPA 101, then it must also comply with new construction requirements in UFC 3-600-01.

302.2.5 Fire Protection and Life Safety Upgrades [Addition]

Where project costs exceed 50 percent of the replacement cost of the existing building in accordance with UFC 3-701-01, then the entire building must be brought up to the fire protection and life safety system requirements for new construction in UFC 3-600-01. Project costs to bring the building more into compliance with NFPA 101 do not count towards the 50 percent threshold.

[C] 302.2.5 Fire Protection and Life Safety Upgrades [Addition]

The intent of meeting requirements for new construction in this UFC is that this also applies to any requirements in applicable UFC 4-series, unless the UFC 4-series states otherwise.

302.2.6 Re-Use of Vacant Buildings [Addition]

When a vacant building is considered for reuse, the building must be evaluated for the occupancy that is planned to be in the building and all deficiencies must be corrected prior to occupancy. This includes a building to be reused for the same occupancy; for example, the last use was a warehouse and the new use will be a warehouse.

The vacant building must be evaluated to the requirements for new construction.

302.2.7 Phased Projects [Addition]

Projects or programs involving floor plan reconfiguration that will encompass more than 50 percent of the area of a floor, or project or program costs exceeding 50 percent of the replacement cost of the existing building in accordance with UFC 3-701-01, that are planned in a phased approach or have separate projects to improve various parts of the facility must conform to the requirements for new construction.

These requirements are not applicable if the time from the start of design of the first phase to the start of design of the phase involving floor plan reconfiguration that exceeds 50 percent of the area, or project cost exceeds 50 percent of the replacement cost of the existing building in accordance with UFC 3-701-01, is greater than five years.

302.2.8 Low Impact Development Requirements [Addition]

For projects in the United States, United States Territories and Possessions of the United States involving the expansion of one or more buildings as part of its primary scope (i.e., primary facilities **\4** versus ***/4/*** supporting facilities) with a “footprint” greater than 5,000 gross square feet (464.5 square meters), incorporate the low impact development (LID) requirements in UFC 3-210-10. “Footprint” does not include existing building area to be renovated or existing impervious surfaces.

For Navy only: Use UFC 1-300-09N for renovation projects exceeding $5 million with a stormwater component.

3-3.2 Section 304 – STRUCTURAL DESIGN LOADS AND EVALUATION AND DESIGN PROCEDURES.

304.3 Seismic evaluation and design procedures [Replacement]

Use UFC 3-301-01 Chapter titled “Seismic Evaluation and Retrofit of Existing Buildings” for seismic retrofit scope requirements.

3-3.3 Section 306 – ACCESSIBILITY FOR EXISTING BUILDINGS [Replacement].

Use the ABA Standards and the special provisions of the DoD Deputy Secretary of Defense Memorandum, Subject: Access for People with Disabilities, October 31, 2008.

[C] SECTION 306 – ACCESSIBILITY FOR EXISTING BUILDINGS [REPLACEMENT]

Refer to APPENDIX C for a link to the ABA Standards and the DoD policy memorandum.

3-3.4 Section 307 – SMOKE ALARMS [Replacement].

Use UFC 3-600-01.

3-3.5 Section 308 – CARBON MONOXIDE DETECTION [Replacement].

Use UFC 3-600-01.

3-4 CHAPTER 4 – REPAIRS [SUPPLEMENT].

Use IEBC Chapter 4 except as modified below.

3-4.1 Section 401 – GENERAL.

401.3 Flood hazard areas [Supplement]

\2 Use IEBC except as modified in UFC 3-201-01. ***/2/***

3-4.2 Section 403 – FIRE PROTECTION [Replacement].

Use UFC 3-600-01.

3-4.3 Section 404 – MEANS OF EGRESS [Replacement].

Use UFC 3-600-01.

3-5 CHAPTER 5 – PRESCRIPTIVE COMPLIANCE METHOD [SUPPLEMENT].

Use IEBC Chapter 5 except as modified below and by UFC 3-301-01 and UFC 3-600-01.

3-5.1 Section 502 – ADDITIONS.

\4\ 502.2 /4/ Flood hazard areas [Supplement]

\2 Use IEBC except as modified in UFC 3-201-01. **/2/**

502.6 Enhanced Classroom Acoustics [Replacement]

Use UFC 3-101-01.

3-5.2 Section 503 – ALTERATIONS.

503.2 Flood hazard areas [Supplement]

\2 Use IEBC except as modified in UFC 3-201-01. **/2/**

\4\ 503.12 Roof Diaphragms Resisting Wind Loads in High-wind Regions [Replacement]

Use UFC 3-301-01. **/4/**

3-5.3 Section 506 – CHANGE OF OCCUPANCY.

506.6 Enhanced Classroom Acoustics [Replacement]

Use UFC 3-101-01.

3-5.4 Section 507 – HISTORIC BUILDINGS.

507.3 Flood hazard areas [Supplement]

\2 Use IEBC except as modified in UFC 3-201-01. **/2/**

3-6 CHAPTER 6 – CLASSIFICATION OF WORK.

Use IEBC Chapter 6.

3-7 CHAPTER 7 – ALTERATIONS – LEVEL 1 [SUPPLEMENT].

Use IEBC Chapter 7 except as modified below.

3-7.1 Section 701 – GENERAL.

701.3 Flood hazard areas [Supplement]

\2 Use IEBC except as modified in UFC 3-201-01. **/2/**

3-7.2 Section 702 – BUILDING ELEMENTS AND MATERIALS [Supplement].

Use IEBC Section 702 except as modified below and by UFC 3-600-01.

702.4 \4\ Window Fall Protection /4/ [Supplement]

For family housing facilities, operable windows must comply with UFC 4-711-01.

702.8 Window, Skylight, Glazing and Door Replacements [Addition]

Use products/materials meeting antiterrorism requirements when projects include replacement of windows, skylights, glazing or doors in existing inhabited buildings. This applies to installation of supplemental windows behind existing windows (inside face) and to installation of windows in new openings. Refer to UFC 4-010-01 for requirements.

702.9 HVAC Systems and Associated Controls [Addition]

Incorporate antiterrorism upgrades as required in UFC 4-010-01 whenever HVAC systems including outside air intakes are being replaced or modified. Modifications include, but are not limited to, modifications such as complete air handling unit replacement, outside air control damper replacement, major ductwork reconfiguration, control system replacement, and control system reprogramming.

3-7.3 Section 703 – FIRE PROTECTION [Replacement].

Use UFC 3-600-01.

3-7.4 Section 704 – MEANS OF EGRESS [Replacement].

Use UFC 3-600-01.

3-7.5 Section 706 – STRUCTURAL.

706.3.2 Roof Diaphragms Resisting Wind Loads in High-wind Regions [Replacement]

Use UFC 3-301-01.

3-8 CHAPTER 8 – ALTERATIONS – LEVEL 2 [SUPPLEMENT].

Use IEBC Chapter 8 except as modified below.

3-8.1 Section 802 – BUILDING ELEMENTS AND MATERIALS [Supplement].

Use IEBC Section 802 except as modified by UFC 3-600-01.

3-8.2 Section 803 – FIRE PROTECTION [Replacement].

Use UFC 3-600-01.

3-8.2.1 Upgrades Required When Reconfigurations Exceed 50 Percent of the Area of a Floor.

Floor plan reconfigurations that exceed 50 percent of the area of a floor require that the entire floor be brought up to the requirements for new construction in UFC 3-600-01. The notification appliances for the fire alarm and mass notification system must be upgraded throughout the remainder of the building as required to provide a uniform notification strategy.

Floor plan reconfigurations that bring the building more into compliance with UFC 3-600-01 does not count towards the 50 percent floor area threshold.

[C] **\4** 3-8.2.1 **/4/** Upgrades Required When Reconfigurations Exceed 50 Percent of the Area of a Floor.

The intent of upgrading fire alarm and mass notification devices throughout the remainder of the building is to provide a uniform notification strategy. For example, a facility has existing clear and amber strobes throughout with no **\4** textual **/4/** signs. The new requirement may be only clear strobes with **\4** textual **/4/** signs. The floor being brought up to UFC 3-600-01 new construction requirements, and means of egress serving this floor, will require clear strobes and **\4** textual **/4/** signs installed per the new criteria. The remainder of the floors will be modified so there are only clear strobes and **\4** textual **/4/** signs, and the work must not make these other floors less conforming to UFC 3-600-01 requirements.

3-8.3 Section 804 – MEANS OF EGRESS [Replacement].

Use UFC 3-600-01.

3-8.3.1 Upgrades Required When Reconfigurations Exceed 50 Percent of the Area of a Floor.

Floor plan reconfigurations that exceed 50 percent of the area of a floor require that the entire floor be brought up to the requirements for new construction in UFC 3-600-01. The means of egress serving this floor, including portions not located on this floor, must conform to the requirements for new construction in UFC 3-600-01.

Floor plan reconfigurations that bring the building more into compliance with NFPA 101 does not count towards the 50 percent floor area threshold.

3-9 CHAPTER 9 – ALTERATIONS – LEVEL 3 [SUPPLEMENT].

Use IEBC Chapter 9 except as modified below.

3-9.1 Section 903 – BUILDING ELEMENTS AND MATERIALS.

Use IEBC Section 903 except as modified below and by UFC 3-600-01.

903.4 Enhanced Classroom Acoustics [Replacement]

Use UFC 3-101-01.

3-9.2 Section 904 – FIRE PROTECTION [Replacement].

Use UFC 3-600-01.

3-9.3 Section 905 – MEANS OF EGRESS [Replacement].

Use UFC 3-600-01.

3-10 CHAPTER 10 – CHANGE OF OCCUPANCY [SUPPLEMENT].

Use IEBC Chapter 10 except as modified below. UFC 3-600-01 replaces all references to Chapter 9 of the IBC.

3-10.1 Section 1001 – GENERAL.

1001.2.1 – Change of use [Supplement].

When a change in use occurs for the building, correct any deficiencies prior to the new occupants occupying the space. When any building with an occupant load of less than 11, is changed to a building with an occupant load greater than 10, for one year or more, the building must meet the requirements for new construction in UFC 3-600-01.

1001.2.2 – Change of Occupancy classification \4\ /4/ [Supplement].

When a change in occupancy occurs for the building **to support a mission that will exist for one year or more**, the building and its means of egress, must comply with the requirements for new construction in UFC 3-600-01. When any building with an occupant load of less than 11, is changed to a building with an occupant load greater than 10, for one year or more, the building must meet the requirements for new construction in UFC 3-600-01.

1001.2.2.1– Partial change of occupancy [Supplement].

When a partial change in occupancy occurs **to support a mission that will exist for one year or more**, the area of the change, and its associated means of egress, must comply with the requirements for new construction in UFC 3-600-01.

3-10.2 Section 1002 – SPECIAL USE AND OCCUPANCY [Replacement].

When a change in occupancy occurs **to support a mission that will exist for one year or more**, the area of change and its means of egress, must comply with the requirements for new construction in UFC 3-600-01.

3-10.3 Section 1007 – ELECTRICAL.

1007.1 Special Occupancies [Supplement]

Follow UFC 4-510-01 for design of health care facilities.

3-10.4 Section 1009 – PLUMBING.

1009.1 Increased Demand, Exception [Replacement]

Follow UFC 3-420-01 for determination of plumbing fixture quantities.

1009.5 Group I-2 [Replacement]

If the occupancy group is changed to Group I-2, follow UFC 3-420-01 for design of the plumbing systems and UFC 4-510-01 for design of medical gas systems.

3-10.5 Section 1011 – CHANGE OF OCCUPANCY CLASSIFICATION [Replacement].

Use UFC 3-600-01 except as modified below.

1011.4 Enhanced Classroom Acoustics [Replacement]

Use UFC 3-101-01.

3-11 CHAPTER 11 – ADDITIONS [SUPPLEMENT].

Use IEBC Chapter 11 except as modified below.

3-11.1 Section 1101 – GENERAL.

\4\ 1101.6 /4/ Enhanced Classroom Acoustics [Replacement]

Use IEBC Chapter 14.

3-15 CHAPTER 15 – CONSTRUCTION SAFEGUARDS.

Use IEBC Chapter 15.

3-16 CHAPTER 16 – REFERENCED STANDARDS [SUPPLEMENT].

Use IEBC Chapter 16 except as modified by Paragraph 1-6.2.

3-17 APPENDICES [DELETION].

3-18 RESOURCES [DELETION].

CHAPTER 4 CORROSION PREVENTION AND CONTROL

4-1 GENERAL.

Provide design detailing, and use materials, systems, components, and coatings that are durable and minimize the need for preventative and corrective maintenance over the life-cycle of a facility. Refer to Paragraph 1-6.3.4.5.

Many UFGS specifications include materials, coatings, or protective measures that are more durable for use in corrosive environments. However, even in benign environments, where options are stated in UFC and UFGS, use the more corrosion-resistant option whenever possible. Considerations include life-cycle maintenance costs and potential for corrosive microenvironments (for example, deicing salt effect on steel doors). General guidance and training on corrosion prevention and control issues is available at the Corrosion Prevention & Control (CPC) Source webpage at https://www.wbdg.org/dod/cpc-source.

4-1.1 Definition of Corrosion.

Corrosion is defined in 10 USC §2228(f) (1) as, "The deterioration of a material or its properties due to a reaction of that material with its chemical environment." While traditionally thought of only as deterioration of metal (for example, rusting of steel), some nontraditional examples include rotting of wood, degradation of concrete (for example, carbonation and alkali-silica reaction phenomena), and degradation of composite materials due to reaction with the environment.

4-1.2 Identification of Project Environmental Severity Classification.

Identify and use the Environmental Severity Classification (ESC) in APPENDIX A, **\4** Table A-1 ESC for United States, Its Territories and Possessions or Table A-2 ESC for Outside United States, Its Territories and Possessions **/4/**, as the basis for project design requirements. The ESC for each military location is based on ISO 9223. Also, use the ESC factor and descriptions provided in ISO 9223 to classify and design for interior, environmentally severe conditions.

Categories C1 and C2 are mildly corrosive while categories C3, C4, and C5 require added corrosion protection. Note that a project site may have a different ESC than the installation (especially in locations near the coast). Any project site within 1 mile (1.61 km) of seawater is ESC C5. Any project site within 1 to 6 miles (1.61 to 9.66 km) of seawater is ESC C4, unless the installation ESC as stated in APPENDIX A is higher. If the calculated ESC of the project site is different from the ESC of the installation, use and design to the higher of the two ESC values. A resource to determine the ESC on a site-specific basis is the ISO Corrosivity Category Estimation Tool (ICCET); it can be found at the following location: https://www.wbdg.org/ar/tools/corrosion-toolbox.

4-1.3 Corrosion Prone Locations.

Corrosion prone locations are locations with one or more of the following characteristics:

- Exterior exposed metallic elements at a location with an ESC of C3, C4, or C5. Includes areas open to the exterior (for example, mechanical rooms and hangars), and spaces that are not conditioned by design or may not be conditioned during prolonged periods due to deployment or occupancy.
- Exterior exposed nonmetallic elements at a location with an ESC of C4 or C5.
- Locations where micro-environmental factors (for example, prevailing winds, ventilation, waterfront environments, industrial emissions, deicing salt application, possible chemical splash/spillage, adverse weather events such as flooding or wind-driven rain, and penetrations of the building envelope) create a locally corrosive environment regardless of ESC.
- Humid locations identified in ANSI/ASHRAE/IES 90.1 as climate zones 0A, 1A, 2A, 3A, 3C, 4C, and 5C.
- High humidity interior areas (for example, bathrooms, locker rooms, laundry rooms, pools, natatoriums, and aquatic training facilities).

4-1.4 Requirements for Corrosion Prone Locations.

For corrosion prone locations defined in Paragraph 4-1.3, provide added corrosion protection to the design such as, but not limited to, the following:

- Where material options are provided in a UFGS, use the most durable options.
- Provide higher level of corrosion protection as defined in the appropriate corresponding UFGS.
- Do not use unprotected ferrous metal unless there are no alternatives.
- Coat galvanized steel with an industrial coating.
- Where stainless steels are used, select ones which will resist pitting and surface rusting in the intended application, and include the associated ASTM standard and stainless steel type in the contract documents. For process systems or specialized applications, refer to industry sources for recommended stainless steels to provide corrosion protection.
- Coat aluminum with an industrial protective coating or a heavy-duty anodized coating.
- Isolate dissimilar metals (for example, aluminum and steel, stainless steel and carbon steel, and zinc-coated steel and uncoated steel) by

appropriate means to avoid the creation of galvanic cells which occur when dissimilar metals come in contact.

4-1.5 Design Geometries.

Detail designs to prevent accelerated deterioration of facility components. Design geometries that prevent collection of debris, allow water to readily drain in all situations, incorporate sealed joints between components, are protected from mechanical coating damage, and avoid dissimilar materials in direct contact with each other. Follow best engineering and design practices to prevent galvanic corrosion. Slope surfaces such as windows and pavements to drain away from the structure.

Avoid designs that tend to direct corrosive elements to any specific area of a structure. Minimize the flow of water, airborne contaminants (for example, salts and pollutants), and humid air over susceptible materials when designing facility components, systems, and assemblies.

4-1.6 Environmental Severity Factors.

Design based on the Environmental Severity Factors present in the project location and application, including the following.

4-1.6.1 Elevated Temperatures.

Design projects to prevent corrosion in applications where elevated temperatures are present. Elevated temperatures have adverse effects on building materials such as paints, woods, and many asphalt-based products. High temperatures combined with high humidity cause severe deterioration.

4-1.6.2 Ultraviolet Radiation.

Use materials that are resistant to, or protected from, ultraviolet radiation. High ultraviolet exposure results in rapid deterioration of most nonmetallic roofing materials, paints, sealants, elastomeric coatings, and wood.

4-1.6.3 Humidity Resistance.

Use materials that withstand high humidity or incorporate efforts to eliminate humidity in humid locations.

Ensure vapor barrier locations prevent moisture buildup. Do not use building materials that exhibit hygroscopic properties and potentially lose their structural and functional properties when exposed to sustained humidity.

4-1.6.4 Biological Corrosivity.

When selecting materials (for example, wood), design for the presence of insects, fungi, and marine borers as applicable to the location.

4-1.7 System, Component, and Material Design Requirements.

4-1.7.1 Piping and System Corrosion.

Protect water and wastewater systems, fire water systems, and other piping from internal and external corrosion. Design factors include water quality and composition (for example, pH, alkalinity, and dissolved oxygen), ferric scale, flow conditions, biological activity, and the presence of disinfectants and corrosion inhibitors. Provide corrosion control treatment in accordance with UFC 3-230-01, UFC 3-230-03, and UFC 3-240-01.

4-1.7.2 Structural Members.

Use galvanized steel or stainless steel for structural members embedded in concrete, exterior railings, handrails, fences, guardrails, and anchor bolts.

Design systems that can be maintained over the life of the facility. Avoid concealed and inaccessible members.

4-1.7.3 Hardware and Fasteners.

Specify galvanized ferrous metals, stainless steel, brass, bronze, copper, aluminum, or other corrosion resistant metals for hardware and fasteners. Do not use ferrous metal as finishing strips or as components of other securement systems, even if a protective coating is provided.

4-1.7.4 Dissimilar Metals in Close Contact.

Protect against galvanic corrosion when dissimilar metals are in close contact. Metals such as magnesium, steel, zinc, and aluminum (anodes) tend to corrode when in contact with copper, stainless steel, and nickel (cathodes). When relatively incompatible metals must be assembled in the design, apply the following methods to minimize or prevent galvanic corrosion.

- Design metal couples where the surface area of the cathode is smaller than the surface area of the anode metal and only when the anode metal can afford loss due to local corrosion. For example, only use stainless steel bolts to fasten carbon steel parts when bolt removal is frequent and necessary, and when the loss of carbon steel at the bolt hole is acceptable. Interpose a non-absorbing, inert gasket or washer between the dissimilar materials prior to connecting them. This is applicable to couples that are not to serve as electrical conductors.
- Seal faying edges to preclude the entrance of liquids.
- Apply corrosion-inhibiting pastes or compounds under the heads of screws or bolts inserted into dissimilar metal surfaces, whether or not the fasteners had been previously plated or otherwise treated, in addition to applying an organic coating to the faying surfaces prior to assembly. In

situations where large faying surfaces are involved it may be feasible to insert a thicker barrier such as dried adhesive or sealant material. This applies to joints that are not required to be electrically conductive.

- Where practicable or where it will not interfere with the proposed use of the assembly, coat the joint externally with an effective paint system or sealant.
- Coat welded or brazed dissimilar metal assemblies with a paint system or other suitable protective coatings to at least 0.4 inch (1 cm) beyond the heat-affected zone.

4-1.7.5 Protective Coatings.

Use UFC 3-190-06 for protective coatings and paints requirements. Factory applied coatings are more life-cycle cost effective than field painting procedures most of the time. The cost to maintain protective coating systems often includes significant fixed costs (for example, scaffolding and rigging, environmental protection, and disposal of debris). This usually means that the system with the highest attainable life is the best choice. Avoid concealed and inaccessible members.

Provide coating systems durable enough to withstand mechanical damage in service. This includes gouging or chipping during normal activities in a facility. In environments such as desert climates, blowing sand can accelerate deterioration of surface coatings and lead to corrosion of materials earlier in the life cycle process.

4-1.7.6 Buried or Submerged Structures and Systems.

Include a combination of cathodic protection (CP) systems, protective coatings, proper material selection, encasement, or other methods for overall corrosion protection of buried or submerged structures or systems. For buried structures or systems, design for the corrosivity of the soil, including soil pH, resistivity, moisture content, and presence of chlorides, sulfides, and bacteria. Design for differences in soil composition, stray electrical currents, and effects of connections of new to existing structures. Use UFC 3-570-01 to determine where CP is required.

For immersed structures, consider the corrosivity of the water (primarily influenced by salinity, but also affected by pH, dissolved oxygen, temperature, current, and microbiological activity). Tidal and splash zones will experience higher corrosion than continuously immersed or atmospherically exposed zones. For submerged or partially submerged structures, account for differences in corrosion potential associated with each zone (for example, atmospheric, splash, tidal, submerged, and subsoil).

4-1.7.7 Waterfront and Coastal Structures and Systems.

For structures proximate or at the waterfront, in addition to atmospheric corrosion, design for the presence of hydrostatic forces, wind, salt spray, currents, tides, waves, ice, marine borers, insects, and pollution from waterfront operations. Some common grades of stainless alloy such as Type 304 or 316 are susceptible to corrosion when immersed in salt or brackish water.

*ESC Value Notes:

1. ESC value is based on installation location greater than 6 miles (9.66 km) from a saltwater source. If the project site is less than 6 miles (9.66 km) from a saltwater source, use next highest ESC or verify category with ICCET. If the project site is proximate to a pollution source, use the next highest ESC.

2. ESC value is based on installation location greater than 1 mile (1.61 km) from a saltwater source and less than 6 miles (9.66 km). If the project site is less than 1 mile (1.61 km) from a saltwater source, use the next highest ESC. If the project site is proximate to a pollution source, use the next highest ESC.

3. ESC value is based on installation location less than 1 mile (1.61 km) from a saltwater source. If the project site is proximate to a pollution source, use the next highest ESC if available.

B-2 DEFINITION OF TERMS

Discipline Working Group: Representatives from the DoD components responsible for the unification and maintenance of criteria documents. (MIL-STD-3007)

Engineering Senior Executive Panel: Panel established by the DoD Installations Policy Board to implement the UFC and UFGS system for DoD. The ESEP consists of a representative from the Office of the Secretary of Defense and the three Service Chiefs of Engineering. (MIL-STD-3007)

Facilities Criteria: A criteria document that is not adopted by all services and will be used only by services indicated in the document

Technical Representative: Author of a particular criteria document or the working-level representative from another participating organization for a particular document. (MIL-STD-3007)

Record of Changes (changes are indicated by **1**\ ... /**1**/)

Change No.	**Date**	**Location**
01	03 Jan 2022	Replaced “renovation” with “comprehensive replacement” or “SRM” as appropriate, defined; minor changes Table 1-1; revised “Component” and “Service” throughout, defined; Metering policy updates to paras 2-3.3, 2-4.4, 3-4.2.2, 2-4.3, 3-3.3, 3-4.2, 3-4.3.2, 3-4.4, updated Reference; replaced “compounds” with “substances” paras 2-6.1.3 and 3-6.1.3; App A added sentence to 1st para and replaced flowchart.
02	01 June 2022	Minor changes para 1.1 and 1.2; language change for ASRHAE 90.1-2019 and IECC 2021 in paras 2-2.2, 2-3; addressed CCRs.

FOREWORD

The Unified Facilities Criteria (UFC) system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and applies to the Military Departments, the Defense Agencies, and the DoD Field Activities in accordance with USD (AT&L) Memorandum dated 29 May 2002. UFC will be used for all DoD projects and work for other customers where appropriate. All construction outside of the United States is also governed by Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA), and in some instances, Bilateral Infrastructure Agreements (BIA). Therefore, the acquisition team must ensure compliance with the most stringent of the UFC, the SOFA, the HNFA, and the BIA, as applicable.

UFC are living documents and will be periodically reviewed, updated, and made available to users as part of the Services' responsibility for providing technical criteria for military construction. Headquarters, U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering **\1** Systems **/1/** Command (NAVFAC), and Air Force Civil Engineer Center (AFCEC) are responsible for administration of the UFC system. Defense agencies should contact the preparing service for document interpretation and improvements. Technical content of UFC is the responsibility of the cognizant DoD working group. Recommended changes with supporting rationale may be sent to the respective DoD working group by submitting a Criteria Change Request (CCR) via the Internet site listed below.

UFC are effective upon issuance and are distributed only in electronic media from the following source:

- Whole Building Design Guide web site http://www.wbdg.org/ffc/dod.

Refer to UFC 1-200-01, *DoD Building Code*, for implementation of new issuances on projects.

UNIFIED FACILITIES CRITERIA (UFC)
REVISION SUMMARY SHEET

Document: UFC 1-200-02, *High Performance and Sustainable Building Requirements*

Superseding: UFC 1-200-02, dated 01 December 2016, with Changes 1-4.

Description: This revision addresses the following:

- Required update cycle
- Approved Criteria Change Requests (CCRs) changes
- Updates that reflect “Implementing Instructions for Executive Order 13834 Efficient Federal Operations”
- Additional life cycle cost analysis guidance.

Impact: Improved mission capability through:

- Reduced total ownership costs of buildings
- Improved energy and water efficiency, and security
- Enhanced building performance and sustainability
- Promoting sustainable resource and environmental stewardship, occupant health, and productivity

Unification Issues: None

TABLE OF CONTENTS

TABLES

CHAPTER 1 INTRODUCTION

1-1 BACKGROUND.

The Energy Policy Act of 2005, Energy Independence Security Act of 2007, and **\2** Executive Order (EO) 14057 ***/2/*** require Federal agencies to increase efficiency, optimize performance, eliminate unnecessary use of resources, and protect the environment. The Federal requirements collectively are referred to as the "Guiding Principles", and are detailed in *Guiding Principles for Sustainable Federal Buildings and Associated Instructions*, February 2016, which replaces "Guiding Principles for Federal High Performance and Sustainable Buildings", 2008. Consistent with UFC program requirements, this UFC integrates DoD requirements (DoDI 4170.11 and other DoD Policies) with High Performance and Sustainable Building (HPSB) Guiding Principles and industry standards for high performance and sustainable buildings.

1-2 PURPOSE AND SCOPE.

This UFC provides minimum requirements and guidance to achieve high performance and sustainable buildings. This UFC is organized around the HPSB Guiding Principles. Per *Department of Defense Sustainable Buildings Policy*, when a building meets the requirements of this UFC, it is considered compliant with the HPSB Guiding Principles.

\2 ***/2/*****\1** ***/1/*** This UFC incorporates the sections of the **\2** International Green Construction Code (IgCC) ***/2/*** mentioned herein when appropriate and determined to be life cycle cost effective. Where the provisions of the IgCC meet the intent of the HPSB Guiding Principles, the provisions of the IgCC are referenced in this UFC as a means of compliance or provided as an alternative compliance pathway. These requirements are applicable to all new work**\1** , comprehensive replacement, and sustainment, restoration, and modernization (SRM) ***/1/*** projects, regardless of building type or configuration.

1-3 ORGANIZATION.

- CHAPTER 1 introduces the scope of this document and overall requirements
- CHAPTER 2 provides requirements for building design and construction activities.
- CHAPTER 3 details Federal HPSB Guiding Principles Existing Building Assessment requirements that must be met in order for an existing building to be reported as a High Performance and Sustainable Building (HPSB).
- CHAPTER 4 defines HPSB compliance and details tracking and reporting.
- APPENDIX A details the energy optimization and LCCA process.
- APPENDIX B contains preferred methods of execution for cited topics.

- APPENDIX C contains project requirements impacted by historic buildings, historic districts and those near historic facilities, **\1\/1/** and other designated cultural resources.
- APPENDIX D contains acronyms, abbreviations, and terms.
- APPENDIX E contains a list of references used in this document. The publication date of the code or standard is not included in this document. Unless otherwise specified, the most recent edition of the referenced publication applies.

1-4 APPLICABILITY.

This UFC applies to all planning, design and construction, **\1** comprehensive replacement, SRM, **/1/** repair, operations and maintenance, and affixed equipment installation in new and existing buildings, regardless of funding source, that result in DoD real property assets. Table 1-1 "Building Compliance Requirements and Thresholds" is applicable to all methods of project delivery and levels of construction (as defined in UFC 1-200-01, paragraph titled "Levels of Construction".)

Apply this UFC to the following construction activities to the greatest extent practical:

- Buildings outside of United States and U.S. territories
- Buildings supporting contingency operations (Refer to UFCs 1-201-01, 1-201-02, and 1-202-01)
- Non-permanent buildings
- Projects with DD1391 marked "austere"
- Military Operations in Urban Terrain (MOUT) and similar training buildings (examples: mock villages, shoot-houses)

This UFC does not apply to:

- Buildings to be demolished or deconstructed, except for demolition waste diversion reporting
- Buildings that have a status of Report of Excess (ROE) submitted, ROE accepted, or Determination to Dispose
- Unoccupied buildings, which are occupied one hour or less per person per day on average; AND have total building energy consumption (including receptacle and process loads) from all sources less than 12.7 kBTU / SF/ Yr.; AND have annual average water consumption (including process water) of less than 2 gallons per day for the building.
- Structures and linear construction that do not meet the definition of a building.

Comply with Table 1-1:

Table 1-1 Building Compliance Requirements and Thresholds

Requirements	Thresholds\1\ (Refer to each chapter's "Overview" for details) /1/
Chapter 1	All design and construction activity Assessments of existing buildings ≥10,000 GSF.
Chapter 2	All design and construction activity
Chapter 3	Assessments of existing building assets ≥10,000 GSF.
Chapter 4 For **\1**Service**/1/** policy and guidance documents, refer to paragraph titled "DoD Service Policy."	HPSB Guiding Principles Compliance Tracking and Reporting (use Service HPSB Checklist): 1. For Army and Navy, new building or stand-alone addition ≥10,000 GSF; for Air Force, all new buildings or stand-alone additions. 2. Comprehensive replacement in an existing building that is ≥10,000 GSF, with total cost >$3M and 50% or more Estimated Replacement Cost (ERC) 3. Assessments of existing building assets ≥10,000 GSF **\1\/1/** Addition of **\2** Third-Party **/2/** Certification: 1. New building or stand-alone addition ≥10,000 GSF, with construction cost >$3M 2. Comprehensive replacement in an existing building that is ≥10,000 GSF, with total cost greater than $3M and 50% or more ERC
Appendix A	All buildings that meet statutory threshold.[1]
Appendix B	All buildings as applicable.
Appendix C	All buildings as applicable.
Appendix D	All buildings as applicable.
Appendix E	All buildings as applicable.
\1\ All Chapters and Appendices	New building or additions <10,000 GSF, sustainment, modernization, and restoration building improvements must comply with UFC requirements relevant to the scope of the project/work, as determined by the Project Delivery Team as early as possible during project process. Comprehensive replacement to a building includes significant opportunities for improvement in: energy and water efficiency (such as HVAC, lighting, building envelope, and other building components); indoor air quality; other requirements in this UFC; and additions that are part of the comprehensive replacement. Total cost for comprehensive replacement includes addition, operations and maintenance, sustainment, restoration, and modernization associated with an existing building comprehensive replacement. **/1/**

[1] In addition to the new building requirements, all existing building large capital energy investments (all projects for which the cost of the systems that impact energy consumption exceeds $250K, which constitutes a capital investment, per National Defense Authorization Act) are to employ the most energy efficient designs, systems, equipment, and controls that are life cycle cost effective.

1-5 GENERAL BUILDING REQUIREMENTS.

Comply with UFC 1-200-01, *DoD Building Code*. UFC 1-200-01 provides applicability of model building codes and government unique criteria for typical design disciplines and building systems, as well as for accessibility, antiterrorism, security, high performance and sustainability requirements, and safety. Use this UFC in addition to UFC 1-200-01 and the UFCs and government criteria referenced therein.

1-6 LIFE-CYCLE COST ANALYSIS (LCCA).

The purpose of the LCCA methodology as detailed in 10 CFR Part 436 Subpart A is to identify and compare life-cycle cost-effective (LCCE) building energy and water systems that will in total achieve the energy and water requirements stated in this document. LCCA and energy optimization (paragraph titled "Energy Compliance Analysis (ECA)") work together to determine the resulting savings, and provide the information for the required narrative (paragraph titled "ECA Narrative Requirements".) An LCCA is required for the following:

1. Systems contributing to the energy footprint of the building including, but not limited to, HVAC**\1** domestic hot water ***/1/*** and the building envelope[2]

2. Renewable energy generating systems (example: photovoltaic panels)

3. When LCCE is selected as the reason any requirement of this document is "Partially compliant" or "Not Applicable" (reference paragraph "Compliance with Federal Requirements").

The LCCA methodology may also be used to evaluate multiple options, such as selecting the building construction type and comparing compliant materials; and is at the discretion of the project team. For process to develop LCCA, refer to Appendix A.

1-6.1 LCCA Format.

Prepare the LCCA in accordance with 10 CFR Part 436, Subpart A and NIST Handbook 135 Life-Cycle Costing Manual for the Federal Energy Management Program. The LCCA must be prepared using the Building Life-Cycle Costing (BLCC) program, available from the National Institute of Standards and Technology. The implied long-term inflation rate and discount rates identified in the Annual Supplement to NIST Handbook 135 must be used. A link to BLCC can also be found at the Department of Energy's building energy tools web site: Building Life Cycle Cost Programs. When needed, refer to UFC 3-410-01 for requirements to obtain weather data. The NIST handbook focuses on determining an LCCA for each design alternative modeled by acceptable software. In order to be fully acceptable, the selected design alternative must also comply with federally-mandated ASHRAE 90.1 baseline, and achieve 30%

[2] In addition to the new building requirements, all existing building large capital energy investments (all projects for which the cost of the systems that impact energy consumption exceeds $250K, which constitutes a capital investment, per National Defense Authorization Act) are to employ the most energy efficient designs, systems, equipment, and controls that are life cycle cost effective.

energy efficiency below the baseline when LCCE. Refer to Energy Optimization and LCCA Process Integration which details the mandatory framework for determining systems that contribute to the energy and water footprint of the building; and paragraph Energy Efficiency, which provides analysis details.

1-6.2 LCCA Building-Level (Whole Building) Analysis.

Any building-level LCCA must be calculated using a 40-year expectant life. Individual components or systems life expectancies must be reflected by inclusion of appropriate replacement and salvage values in the appropriate year of this analysis.

1-6.3 LCCA Individual Component or System Alternatives Analysis.

LCCAs comparing at least three individual component or system alternatives must use a life expectancy of 40 years from the beginning of beneficial use. All alternatives, along with their sub-systems, must meet mission requirements. Include the appropriate replacement and salvage values for each of the alternatives. Acceptable alternatives must not degrade the overall building performance. They must be sound technical alternatives that are user comfort-compatible, reliable, locally serviceable, user friendly, ensure safety, and at a minimum are neutral with regard to occupant productivity and design aesthetics.

Perform this analysis based on the actual conditions expected over the life of the facility including anticipated occupancies, scheduled hours of operation, and process loads. Include actual values for location utility costs and for sources used; modeled energy usage and efficiencies; realistic operations, maintenance, repair and replacement costs; and all costs or savings associated with recovered energy, solar heat, solar photovoltaic energy and any other renewable or waste heat applications. Credit any alternative funding such as rebates in the LCCA.

1-7 CYBERSECURITY.

All **\2** facility ***/2/*** control systems (including systems separate from **\2** a utility-monitoring and ***/2/*** control system) must be planned, designed, acquired, executed, and maintained in accordance with UFC 4-010-06, and as required by individual Service Implementation Policy.

This Page Intentionally Left Blank

CHAPTER 2 BUILDING DESIGN AND CONSTRUCTION

2-1 OVERVIEW.

The requirements of this chapter apply to all building design and construction, as well as each building within a project. Refer to Table 1-1 "Building Requirements Compliance and Thresholds" to determine applicability of this chapter to each building within a project. Refer to Chapter 4 for additional requirements.

2-1.1 New Construction and \1\ Comprehensive Replacement /1/.

New construction and **\1** comprehensive replacement **/1/** must comply with all requirements; or must clearly identify and provide justification when requirements are not applicable or fully achievable. Refer to paragraph titled "Compliance with Federal Requirements" for additional guidance and requirement applicability.

2-1.2 Work in Existing Buildings.

In some of the paragraphs that follow, there are specific requirements provided for **\1** sustainment, restoration, and modernization (SRM) projects **/1/**. For existing building **\1** SRM **/1/**, the goal is to improve the performance of the existing building inventory with every investment. The systems and components included in the scope of the project must meet the requirements of this UFC, by providing the most resource-efficient solutions. This UFC does not apply to systems and components not included in the scope of the project. The intent is not to expand the scope of the project.

2-2 EMPLOY INTEGRATED DESIGN PRINCIPLES.

Integrated design is the most important requirement in achieving a high performance building. A design team must have strong, consistent representation from all stakeholders throughout the project phases to maximize opportunities to improve building performance and to realize increased savings potential.

2-2.1 Integrated Design.

Incorporate the following planning and evaluation into the integrated design, as described in IgCC F101.1.1 (F1.1.1) *Charrette Process*.

Exception: subparagraph b. does not apply.

2-2.1.1 Integrated Planning.

Use a collaborative, integrated planning and design team composed of users, government support staff, and appropriate professionals, to identify requirements and to establish performance goals for siting, energy, water, materials, indoor environmental quality, and other comprehensive design goals. Ensure incorporation of these goals throughout design and construction.

2-2.1.2 Evaluation for Design Strategies

Evaluate the site and building components to determine whether passive and natural design strategies and features are cost effectively incorporated before designing the active and mechanical systems. Incorporate these features where applicable.

Take into account site attributes, including climate and local and regional context, which impact the design of the building.

2-2.1.3 Evaluation of the Site.

During the site selection process, comply with the requirements of UFC 2-100-01.

2-2.1.4 Site Integration and Design of the Building.

Use the following site development considerations and passive strategies:

- Meet the requirements of UFC 3-201-02.
- Site design elements that ensure safe and convenient pedestrian access.
- Incorporate results of site analysis in order to design the building, focusing on orientation, configuration, and massing.
- Orient building to maximize energy efficiency, passive solar, and daylighting potential.
- Select, design, and integrate into the overall building, high performance and sustainable systems (examples: HVAC, plumbing, water heating systems, lighting systems, control systems, elevators, building envelope, and fire protection systems).
- Consider opportunities for occupants to voluntarily increase physical activity early in the design process. Refer to Appendix B "Best Practice" for examples.

2-2.2 Commissioning.

In order to verify design and performance, and ensure that the Government requirements are met, employ commissioning practices appropriate to the size and complexity of the building and its system components. This must include an experienced commissioning provider, who should be independent of the project design and construction team, and from the operations team. The choice of either contracted services or Government personnel to serve as the commissioning provider will be determined at project level.

\2 To the extent practicable, based on LCCA and DoD policy[3], meet the following:

For all projects with design starts before 7 April 2023, ***/2/*** meet the requirements of IgCC 1001.3.1.2 (10.3.1.2) *Building Project Commissioning*, with the following modifications:

- For buildings and systems that are less complex, commissioning may be tailored as determined by the DoD Service AHJ. For Army projects, refer to Army policy for determination of systems to commission. For Air Force and Navy projects, the Project Delivery Team must determine the level of commissioning activities required.
- "Schematic design" is the design charrette or similar conceptual design activity prior to completion of 35% design.
- Documentation as described in ASHRAE 55 Section 6.2 is not required.

\2 For commercial and multi-family high-rise buildings with design starts on or after 7 April 2023, meet the requirements of ASHRAE 90.1-2019. For low-rise residential buildings with design starts on or after 5 April 2023, meet the requirements of 2021 IECC. ***/2/***

Exception: For Medical Treatment Facilities, refer to UFC 4-510-01 *Medical Military Facilities* for commissioning requirements.

Refer to UFGS 01 91 00.15 **\1** 10 ***/1/*** Total Building Commissioning **\1** (Army executed) or UFGS 01 91 00.15 20 Total Building Commissioning (Navy executed ***/1/***) for commissioning requirements prior to project award.

2-3 OPTIMIZE ENERGY PERFORMANCE.

Base energy efficiency design decisions on LCCA, as indicated in Chapter 1 of this UFC. The LCCA includes a minimum of three energy efficient alternatives to the baseline standard (ASRHAE 90.1, IECC, etc.) For **\1** details ***/1/***, refer to Appendix A.

2-3.1 Energy Efficiency.

2-3.1.1 Commercial and Multi-Family High-Rise Residential Buildings

\2 To the extent practicable, based on LCCA and DoD policy[4], meet the following: ***/2/***

- Meet the requirements of ASHRAE 90.1 **\2** Use ASHRAE 90.1-2013 for all projects with design starts before 7 April 2023. Use ASHRAE 90.1-2019 thereafter. ***/2/***
- Design the building to achieve at least 30% energy consumption reduction from ASHRAE 90.1 baseline.

[3] **\2** Includes any DoD policies that relate to commissioning. **/2/**
[4] **\2** Includes any DoD policies that relate to energy.

- If a 30% reduction is not LCCE, modify the design of the proposed building to achieve an energy consumption level at the highest level of energy efficiency that is LCCE.

- **\2** When using ASHRAE 90.1-2013, ***/2/*** determine energy consumption levels for both the ASHRAE Baseline Building and proposed building alternatives by using the Performance Rating Method found in Appendix G of ASHRAE 90.1, except for the formula for calculating the Performance Rating. Replace the formula in G1.2 with the following:

  Percentage improvement = 100 × ((Baseline building consumption − Receptacle and process loads) − (Proposed building consumption − Receptacle and process loads)) / (Baseline building consumption − Receptacle and process loads)[5]

- **\2** When using ASHRAE 90.1-2019: Determine energy consumption levels for both the ASHRAE Baseline Building 2019 and proposed building alternatives by using the Performance Rating Method found in Appendix G of ASHRAE 90.1-2019[6]. The formula for determining the percentage improvement is:

  Percentage Improvement = 100 x (1-PCI/PCIt)

  Where

  PCI = Performance Cost Index calculated in accordance with section G1.2 of ASHRAE 90.1-2019

  PCIt = Performance Cost Index Target calculated by formula in section 4.2.1.1 of ASHRAE 90.1-2019 ***/2/***

2-3.1.2 Low-Rise Residential Buildings

\2 To the extent practicable based on LCCA and DoD policy[7], meet the following: ***/2/***

- Meet the requirements of International Energy Conservation Code (IECC). **\2** Use 2015 IECC for all projects with design starts before 5 April 2023. Use 2021 IECC thereafter. ***/2/***

---

[5] Energy consumption for the purposes of calculating the 30 percent savings requirements in 10 CFR Part 433, §433.100 shall include the building envelope and energy consuming systems normally specified as part of the building design by ASHRAE 90.1-2013 such as space heating, space cooling, ventilation, service water heating, and lighting, but shall not include receptacle and process loads not within the scope of ASHRAE 90.1 such as specialized medical or research equipment and equipment used in manufacturing processes.

[6] **\2** Energy consumption for the purposes of calculating the 30 percent savings requirements in 10 CFR Part 433, §433.100 shall include the building envelope and energy consuming systems normally specified as part of the building design by ASHRAE 90.1-2019 such as space heating, space cooling, ventilation, service water heating, and lighting, and all process and receptacle loads, except for energy-intensive process loads that are driven by mission and operational requirements, not necessarily buildings, and not influenced by conventional building energy conservation measures.

[7] Includes any DoD policies that relate to energy. **/2/**

- Design the building to achieve at least 30% energy consumption reduction from the IECC baseline using the Simulated Performance Alternative found in Section 405 of the IECC.
- If a 30% reduction is not LCCE, modify the design of the proposed building alternatives to achieve an energy consumption level at the highest level of energy efficiency that is LCCE.

2-3.1.3 \1\ Comprehensive Replacement and SRM /1/.

\2 To the extent practicable based on LCCA and DoD policy[8], meet the following: ***/2/***

- **\1\/1/**Projects that replace everything above the foundation **\1** (comprehensive replacement) ***/1/*** must apply either paragraph "Commercial and Multi-Family High-Rise Residential Buildings" or "Low-Rise Residential Buildings".
- **\1** SRM projects ***/1/*** choose one of the following options:

  1. Reduce measured building energy use by at least 30%, below FY 2003, or earlier, energy use baseline[9].

  2. Reduce measured building energy use by at least 20% below FY 2015 energy use baseline.

  3. Reduce modeled energy use (from all sources including renewable energy) by 30% compared to the ASHRAE 90.1 baseline building design for Commercial or Multi-Family High-Rise Residential Buildings, or the IECC baseline (using the Simulated Performance Alternative found in Section 405 of the IECC) for Low-Rise Residential buildings. (Refer to paragraph "Commercial and Multi-Family High-Rise Residential Buildings" for calculation of energy consumption reduction.)

2-3.1.4 Energy Efficient Products.

If none of the reduction choices is life-cycle cost effective, modify the design of the proposed building system(s) to achieve an energy consumption level at the highest level of energy efficiency that is life-cycle cost effective.

Per EISA 2007 Section 525, acquire products that are ENERGY STAR®-qualified or meet FEMP-designated Energy-Efficient Products requirements in all covered product categories, considering cost-effectiveness and availability.

2-3.1.5 Standby Power Devices.

Per EISA 2007 Section 524, provide commercially available, off-the-shelf products that use no more than 1 watt in their standby mode, provided it is life-cycle cost effective, practicable, and performance is not compromised.

---

[8] **\2** Includes any DoD policies that relate to energy.

[9] Consult with Installation Energy Manager to determine if building metered data is available. If it isn't, this option cannot be pursued. **/2/**

2-3.2 On-Site Renewable Energy.

Provide on-site renewable energy systems in accordance with IgCC 701.4.1.1 (7.4.1.1) *On-Site Renewable Energy Systems* and UFC 3-440-01 where LCCE, considering climate, infrastructure condition, mission compatibility, and effects on base-wide electrical system (grid) power quality. When available, utilize Installation-specific studies to determine LCCE renewable energy systems. Studies must be dated within five years of project design start.

- For Army projects, if not LCCE, utilize IgCC **\2** 701.3.2 ((7.3.2) ***/2/*** *On-Site Renewable Energy Systems* for future installation of on-site renewable energy systems.
- Services may choose LCCE centralized or Installation-wide renewable energy development, in lieu of building-by-building application. Meet the requirements of UFC 3-540-08.

Exception: Do not use purchase of renewable energy certificates (RECs) as a substitute for IgCC 701.4.1.1 **\2** (7.4.1.1) ***/2/*** new building requirement.

2-3.2.1 Solar Domestic Hot Water (SDHW).

Per EISA 2007 Section 523, meet at least 30% of the annual domestic hot water requirement through the installation of solar water heating unless SDHW is not LCCE.

2-3.3 Metering.

\1 Provide meters as required by DoDI 4170.11, and as amended by DoD Utilities Meter Policy, in the standard units of measure. Where base-wide energy and utility monitoring and control systems exist, meters must be connected using the installation's advanced metering protocols. Meter configuration must comply with the requirements of UFC 4-010-06, and as required by individual Service's meter implementation policy. ***/1/***

2-4 PROTECT AND CONSERVE WATER.

2-4.1 Indoor Water.

Base water efficiency design decisions on life-cycle cost as indicated in paragraph "Life-Cycle Cost Analysis (LCCA)".

- Meet the requirements of IgCC 601.3.2 (6.3.2) *Building Water Use Reduction*, which incorporates EPA WaterSense-labeled products. Water closet replacements**\1*/1/*** may have a flush value of up to 1.6 GPF (6.1 LPF) to accommodate existing plumbing infrastructure. Fixtures used for sanitizing potential biohazards are exempt from low-flow and WaterSense labeling requirements.
- Meet the requirements of IgCC 601.3.3 (6.4.3) *Special Water Features*.

Exception: Paragraph 601.3.2.1.j is not mandatory, but encouraged.

2-4.1.1 Indoor Water Metering.

\1 Provide meters to monitor building indoor water consumption, as required by DoDI 4170.11, and as amended by DoD Utilities Meter Policy, in the standard units of measure. Where base-wide energy and utility monitoring and control systems exist, meters must be connected using the installation's advanced metering protocols. Meter configuration must comply with the requirements of UFC 4-010-06, and as required by individual Service's meter implementation policy. **/1/**

2-4.2 Outdoor Water.

2-4.2.1 Landscaping.

- In accordance with DoD Memo *Water Use for Landscape Architecture on Department of Defense Installations/Sites*, potable water use is prohibited for irrigating new landscaping, other than for plant establishment.
- For existing systems, if a building has a single water meter, reduce combined indoor and outdoor potable water use by at least 20% compared to building water use in 2007. Compare results to a baseline building, using the EPA WaterSense landscape water budget tool version 1.01 or later, or a Service approved tool.
- Show preference for irrigation contractors who are certified through a WaterSense labeled program, or other industry-recognized credentialing programs.
- Refer to UFC 3-201-02 for additional requirements

2-4.2.2 Outdoor Water Metering.

\1 Where LCCE, provide meters to monitor existing irrigation systems serving more than 25,000 square feet of landscape, as required by DoDI 4170.11, and as amended by DoD Utilities Meter Policy, in the standard units of measure. Where base-wide energy and utility monitoring and control systems exist, meters must be connected using the installation's advanced metering protocols. Meter configuration must comply with the requirements of UFC 4-010-06, and as required by individual Service's meter implementation policy. **/1/**

For all other existing irrigation systems using potable water, meters are encouraged.

2-4.3 Alternative Water.

Where life-cycle cost-effective and permitted by state and local laws and regulations, use alternative water sources for non-potable applications.**\1** Where LCCE, provide meters to monitor alternative water consumption, as required by DoDI 4170.11, and as amended by DoD Utilities Meter Policy, in the standard units of measure. Where base-wide energy and utility monitoring and control systems exist, meters must be connected using the installation's advanced metering protocols. Meter configuration must comply with the requirements of UFC 4-010-06, and as required by individual Service's meter implementation policy. **/1/**

2-4.4 Stormwater Management.

Meet the requirements of UFC 3-210-10.

2-5 ENHANCE INDOOR ENVIRONMENTAL QUALITY.

2-5.1 Ventilation and Thermal Comfort.

Comply with UFC 3-410-01 for ventilation and thermal comfort criteria. Consider the use of passive (non-mechanical) thermal comfort methods as described in paragraph entitled, "Integrated Design" in this UFC.

Exception: For Medical Treatment Facilities, refer to UFC 4-510-01 *Medical Military Facilities* for ventilation and thermal comfort criteria.

2-5.2 Daylighting and Lighting Controls.

Locate all employee work areas, such as classrooms and offices, on exterior walls or other locations where it is feasible to maximize daylighting. Maximize daylighting in break rooms and other gathering areas where feasible. **\1** For those spaces on the exterior of the building where it is feasible to maximize daylighting, m**/1/**eet the requirements of IgCC 801.4.1.2 (8.4.1.2) *Minimum Sidelighting Effective Aperture for Office Spaces and Classrooms*. Provide automated lighting, including daylighting, controls in accordance with UFC 3-530-01. For Medical Treatment Facilities, refer to UFC 4-510-01 Medical Military Facilities for additional daylighting criteria.

Exceptions: Under IgCC 801.4.1.2, Exceptions: Number 2, "for more than four daytime hours per day" does not apply.

2-5.3 Indoor Air Quality.

2-5.3.1 Moisture Control.

Establish and implement a moisture control strategy for controlling moisture flows and condensation to prevent building damage, minimize mold contamination, and reduce health risks related to moisture. Meet the requirements of IgCC 1001.3.1.6 (10.3.1.5) *Moisture Control* by including and implementing these requirements in the IAQ construction management plan; UFC 3-410-01, Chapter 3, *Ventilation Air*; and UFC 3-101-01 Chapter 3, *Building Envelope Requirements*. Refer to Appendix B "Best Practices" for Protect Indoor Air Quality.

2-5.3.2 Reduce Volatile Organic Compounds (VOC) (Low-Emitting Materials).

Specify materials and products with low or no pollutant emissions, including composite wood products, adhesives, sealants, interior paints and finishes, carpet systems, and furnishings. Meet the requirements of IgCC 801.4.2 (8.4.2) *Materials*.

Exception: Exclude compliance with the first sentence.

2-5.3.3 Protect Indoor Air Quality during Construction.

For new construction and for **\1** work in **/1/** an existing building that will be unoccupied during construction, develop and implement an IAQ construction management plan that complies with IgCC 1001.3.1.5 (10.3.1.4) *Indoor Air Quality (IAQ) Construction Management*, with maximum outdoor air consistent with achieving relative humidity no greater than 60%.

For **\1** work in **/1/** an existing building that will be occupied during construction, comply with ANSI/SMACNA 008-2008, 2nd Edition, SMACNA IAQ *Guidelines for Occupied Buildings Under Construction*. Refer to Appendix B "Best Practices" for "Protect Indoor Air Quality."

2-5.3.4 Environmental Tobacco Smoke Control.

Prohibit smoking[10] within the building and within a minimum of 50 feet (15.24 meters) of all building entrances, operable windows, and building ventilation intakes. Verify if more stringent facility criteria or Installation policy applies.

2-5.4 Occupant Health and Wellness.

Promote opportunities for occupants to voluntarily increase physical activity, as part of the Integrated Design Process.**\1** Refer to Appendix B "Best Practices" for examples.**/1/**

2-6 REDUCE ENVIRONMENTAL IMPACT OF MATERIALS.

2-6.1 Environmentally Preferable Products.

The following paragraphs require procurement of construction materials and building supplies that have a lesser or reduced effect on human health and the environment over their lifecycle, when compared with competing products or services that serve the same purpose.

2-6.1.1 Recycled Content.

Use RCRA Section 6002 compliant products that meet or exceed EPA's recycled content recommendations, available on EPA's Comprehensive Procurement Guideline (CPG) Program.

[10] Refer to Service-specific policies (may need to copy and paste hyperlink in Browser): Army: ARMY HEALTH PROMOTION Navy: NAVY AND MARINE CORPS TOBACCO POLICY Air Force: AIR FORCE INSTRUCTION 40-102

2-6.1.2 Biologically-Based Products.

Per Section 9002 of the Farm Security and Rural Investment Act, specify products composed of the highest percentage of biobased content consistent with the USDA Biopreferred Program, if products meet performance requirements and are available at a reasonable cost. Document deviation from using biobased product procurement. Include a preference for purchasing products with the highest biobased content per USDA recommendations for designated product categories in all applicable solicitations. USDA's biobased product designations and biobased content (which includes certified sustainably-harvested and rapidly renewable resources) recommendations are available on USDA Biopreferred website.

2-6.1.3 Ozone-Depleting \1\ Substances /1/.

Do not use ozone-depleting **\1** substances **/1/** and high global warming potential (GWP) chemicals where EPAs Significant New Alternatives Policy (SNAP) Program has identified acceptable substitutes or where other environmentally preferable products are available for use in construction, repair or end-of-life replacements.

Exceptions: Refer to UFC 3-600-01 for fire protection system requirements.

2-6.2 Waste and Materials Management.

2-6.2.1 Storage and Collection of Recyclables.

Meet the requirements of IgCC 901.3.4.1 (9.3.4.1) *Recyclables*, where markets or onsite recycling exist.

2-6.2.2 Waste Diversion.

Divert a minimum of 60% of the nonhazardous construction and demolition waste material from landfills.

2-7 ADDRESS CLIMATE CHANGE RISK.

Provide building design solutions responsive to any Government-provided projections of climate change and determination of acceptable risk, typically evaluated and documented in the planning process.

See UFC 2-100-01 and UFC 3-201-01 for potential climate risk considerations and requirements for work on existing buildings.

CHAPTER 3 EXISTING BUILDINGS HPSB COMPLIANCE ASSESSMENT

3-1 OVERVIEW.

3-1.1 Federal Guiding Principles Assessment.

Use this chapter when assessing the HPSB Guiding Principles compliance of an existing building, independent of design and construction activities. The assessment is used to assist in identifying opportunities to increase performance of the building until it reaches full compliance. This assessment can also be used to inform future design and construction activities in the building. Some HPSB Guiding Principles can be addressed at the Installation, Service, or DoD Agency level, versus the building level (example: no smoking policy). Align DoD Service programs that target building energy and water efficiency improvements with the requirements of this UFC. Include consideration of whole building, maintainability, and energy and water efficient solutions. Refer to Table 1-1 for requirements for compliance. HPSB tracking and reporting procedures are covered in Chapter 4, paragraph entitled, "Building Compliance Tracking" and "Building Compliance Reporting".

3-1.2 Assessment Requirements.

Use the following questions-based assessment elements to assess Guiding Principles compliance of an existing building. Each element has two designations noted under the element title: 1) "Required" or "Additional" and 2) "Installation-wide" or "Building-specific". Designation definitions are:

- "Required" means the element must be met to be in compliance.
- "Additional" means the element is an optional part of the assessment. Forty percent of these elements must be met to be in compliance.
- "Installation-wide" means the element can be met through Installation policy/specifications/contracts (where the building is located.)
- "Building-specific" means the element must be met at the building level.

3-2 EMPLOY INTEGRATED ASSESSMENT, OPERATION, AND MANAGEMENT PRINCIPLES.

3-2.1 Integrated Assessment, Operation, and Management.

(Required; Installation-wide)

a. Are sustainable operations and maintenance practices incorporated into the Installation Environmental Management System (EMS)?

Through an integrated process and team, identify and implement operations and maintenance policies that improve building environmental performance; protect natural, historic, and cultural resources; support occupant health and wellness; and improve the resiliency of facilities and operations.

b. Has there been an assessment of existing conditions and operational procedures of the building and/or major building systems, and have areas been identified for improvement?

Assess existing condition and operational procedures of the building and major building systems. Consider electric vehicle charging infrastructure and appropriate energy resiliency measures, in accordance with applicable laws and regulations. Identify areas for improvement.

c. Are there established operational performance goals for energy, water, material use, recycling, and indoor environmental quality; and is incorporation of the goals ensured throughout the lifecycle of the building?

Establish: operational performance goals for energy and water; product compliance goals for material use, recycling, and indoor environmental quality; and ensure goals are incorporated throughout the remaining life cycle of the building, including a verification process.

d. Is there a building management plan to ensure that operating decisions and user/tenant education are carried out with regard to integrated, sustainable building operations and maintenance?

Incorporate goals into building management to ensure that operating decisions and tenant education are carried out with regard to integrated building operations and maintenance.

e. In addition to the work order program/Facilities Managers, are building operations and maintenance augmented as needed, using Building Manager/occupant/user feedback on workspace satisfaction?

Engage building occupants with building environmental performance information. Augment building operations and maintenance as needed using occupant feedback on workspace satisfaction.

3-2.2 ReCommissioning and RetroCommissioning.

(Required; Building-specific)

Has the building been commissioned, recommissioned, or retrocommissioned within the last four years?

In order to verify performance and ensure that the Government requirements are met, employ retrocommissioning and recommissioning activities, tailored to the size and complexity of the existing building and its system components. Recommissioning must be led by an experienced commissioning agent, who should be independent of the facility operations team.

Use IgCC 1001.3.1.2 (10.3.1.2) *Building Project Commissioning* to assist in defining appropriate commissioning activities. For buildings and systems that are less complex, commissioning activities may be tailored as determined by the DoD Service AHJ. For Army assessments, refer to Army policy for determination of systems to commission. For Air Force and Navy assessments, the Assessment Team must determine the level of commissioning activities required.

3-3 OPTIMIZE ENERGY PERFORMANCE.

3-3.1 Energy Efficiency.

3-3.1.1 Commercial and Multi-Family High-Rise Residential Buildings or Low-Rise Residential.

(Required; Building-specific)

\1 When LCCE, h **/1/** as energy usage met any of the following performance options?

- Option 1: Reduce measured building energy use by at least 30% below the FY 2003, or earlier, energy use baseline[11].
- Option 2: Reduce modeled building energy use (from all sources including renewable energy) by at least 20% below the FY 2015 energy use baseline.
- Option 3a: Reduce modeled building energy use (from all sources including renewable energy) by at least 30% below ASHRAE 90.1 standard. (Refer to paragraph "Commercial and Multi-Family High-Rise Residential Buildings" for calculation of energy consumption reduction.)
- Option 3b: Reduce modeled building energy use (from all sources including renewable energy) by at least 30% below IECC standard.

3-3.1.2 Energy Efficient Products.

(Required; Installation-wide)

Do acquisition documents require the purchase of **\1** ENERGY STAR® **/1/** and/or FEMP-designated Energy Efficient products?

Per EISA 2007 Section 525, acquire products that are ENERGY STAR®-qualified or meet FEMP-designated Energy-Efficient Products requirements in all covered product categories, considering cost-effectiveness and availability.

3-3.2 On-Site Renewable Energy.

(Additional; Building-specific or Installation-wide)

a. Has building-level or centralized renewable energy generation been evaluated?

[11] **\2** Consult with Installation Energy Manager to determine if building metered data is available. If it isn't, this option cannot be pursued. **/2/**

b. When found to be LCCE, has renewable energy generation been implemented or planned for implementation?

Implement renewable energy generation projects on agency property for agency use, where lifecycle cost effective and when there are no adverse effects on base-wide electrical system (grid) power quality or mission. Implementation must comply with the requirements in UFC 3-440-01. When available, utilize Installation-specific studies to determine LCCE of renewable sources. Studies must be dated within five years of project design start.

Services may choose centralized renewable energy development in lieu of building-by-building application. Meet the requirements of UFC 3-540-08.

3-3.3 Metering.

(Additional; Building-specific)

a. Is there a building meter for electricity?

b. Is there a building meter for gas?

c. Is there a building meter for steam?

\1 Provide meters as required by DoDI 4170.11, and as amended by DoD Utilities Meter Policy, in the standard units of measure. Where base-wide energy and utility monitoring and control systems exist, meters must be connected using the installation's advanced metering protocols. Meter configuration must comply with the requirements of UFC 4-010-06, and as required by individual Service's meter implementation policy. **/1/**

3-3.4 \1\/1/Benchmarking (Verification).

(Additional; Building-specific)

a. Is electric metered data gathered on a monthly basis?

   If Yes: Is the data analyzed?

b. Is gas metered data gathered on a monthly basis?

   If Yes: Is the data analyzed?

c. Is steam metered data gathered on a monthly basis?

   If Yes: Is the data analyzed?

Compare annual performance data with previous years' performance data, by entering annual performance data in a measurement and tracking tool.

3-4 PROTECT AND CONSERVE WATER

3-4.1 Indoor Water.

(Required; Building-specific or Installation-wide)

Do acquisition documents require the purchase of water-conserving products (ex: EPA's WaterSense-labeled products where available for toilets, showers, urinals, faucets)?

3-4.2 Indoor Water Metering

(Required; Building-specific)

a. Is there a building meter for potable water sources?

b. Is there a measured 20% reduction in water usage from 2007 baseline; OR has a 20% reduction in water usage been determined by a Service approved method; OR has an analysis been conducted of water use, leaks been identified and repaired, single pass cooling been eliminated, cooling tower operations optimized, and water efficient products installed?

\1 Provide meters to monitor building indoor water consumption, as required by DoDI 4170.11, and as amended by DoD Utilities Meter Policy, in the standard units of measure. Where base-wide energy and utility monitoring and control systems exist, meters must be connected using the installation's advanced metering protocols. Meter configuration must comply with the requirements of UFC 4-010-06, and as required by individual Service's meter implementation policy **/1/**

3-4.3 Outdoor Water.

3-4.3.1 Water for landscaping.

(Additional; Building-specific)

If potable water is used for existing irrigation, has 20% reduction been demonstrated by metered data or modeling (such as the EPA WaterSense Landscape Water Budget Tool, version 1.01 or later, or a Service approved tool) OR is water efficient landscaping used?

3-4.3.2 Outdoor Water Metering

(Additional; Building-specific)

For irrigation systems serving more than 25,000 SF of landscaping, is an outdoor water meter installed?

\1 Where LCCE, provide meters to monitor existing irrigation systems serving more than 25,000 square feet of landscape, as required by DoDI 4170.11, and as amended by DoD Utilities Meter Policy, in the standard units of measure. Where base-wide energy and utility monitoring and control systems exist, meters must be connected using the installation's advanced metering protocols. Meter configuration must comply with the requirements of UFC 4-010-06, and as required by individual Service's meter implementation policy. **/1/**

3-4.4 Alternative Water.

(Additional; Building-specific or Installation-wide)

a. Have building-level or centralized alternative water sources been evaluated?

b. When found to be LCCE, have alternative water sources been implemented or planned for implementation?

Where life-cycle cost-effective and permitted by state and local laws and regulations, use alternative water sources for non-potable applications.**\1** Where LCCE, provide meters to monitor building alternative water consumption, as required by DoDI 4170.11, and as amended by DoD Utilities Meter Policy, in the standard units of measure. Where base-wide energy and utility monitoring and control systems exist, meters must be connected using the installation's advanced metering protocols. Meter configuration must comply with the requirements of UFC 4-010-06, and as required by individual Service's meter implementation policy. **/1/**

3-4.5 Stormwater Management.

(Additional; Building-specific or Installation-wide)

Are the requirements of UFC 3-210-10 incorporated into projects that include expansion of one or more existing buildings, and disturbance of greater than 5000 SF?

3-5 ENHANCE INDOOR ENVIRONMENTAL QUALITY.

3-5.1 Ventilation and Thermal Comfort.

(Required; Building-specific)

Does the building comply with the ventilation and thermal requirements of UFC 3-410-01?

3-5.2 Daylighting and Lighting Controls.

(Additional; Building-specific)

Are automated lighting controls, including occupancy/vacancy sensors with manual-off capability and daylighting controls, provided for appropriate spaces in accordance with UFC 3-530-01? (Appropriate spaces include: restrooms, conference and meeting rooms, employee lunch and break rooms, training classrooms, and offices.)

Maximize opportunities for daylighting within the existing structure, except where not appropriate because of building function, mission, or structural constraints. Maximize: the use of automatic dimming controls; task lighting where life cycle cost-effective; and appropriate shade and glare control. Provide automated lighting controls in accordance with UFC 3-530-01.

3-5.3 Indoor Air Quality.

3-5.3.1 Moisture Control.

(Additional; Installation-wide)

Is there a policy or specification requiring moisture control strategy for moisture flows and condensation to prevent building damage, minimize mold contamination, and reduce health risks related to moisture?

Establish and implement a moisture control strategy for controlling moisture flows and condensation to prevent building damage, minimize mold contamination, and reduce health risks related to moisture.

3-5.3.2 Reduce Volatile Organic Compounds (VOC) (Low-Emitting Materials).

(Additional; Installation-wide)

a. Is there a policy or specification requiring low emitting materials (low Volatile Organic Compounds (VOCs)) for building repairs/modifications?

b. Is there a policy or specification requiring the use of low emitting materials (low Volatile Organic Compounds (VOCs)) for cleaning?

Use reduced volatile organic compounds (VOC) (low emitting materials) for building modifications, maintenance, and cleaning. In particular, specify the following materials and products to have low or no pollutant emissions: composite wood products, adhesives, sealants, interior paints and finishes, solvents, carpet systems, janitorial supplies, and furnishings.

3-5.3.3 Integrated Pest Management.

(Additional; Installation-wide)

Is there an Integrated Pest Management Plan (IPMP) in place?

Use integrated pest management techniques as appropriate to minimize pesticide usage. When pesticides are needed, only use EPA-registered pesticides.

3-5.3.4 Environmental Tobacco Smoke Control.

(Additional; Installation-wide)

> Do all smoking structures comply with Service policy to be 50 feet from openings?

Prohibit smoking[12] within the building and within a minimum of 50 feet (15.24 meters) of all building entrances, operable windows, and building ventilation intakes. Verify if more stringent facility criteria or Installation policy applies.

3-5.4 Occupant Health and Wellness.

(Additional; Installation-wide)

> Do occupants have access to infrastructure, buildings, and interior attributes that promote voluntary increased physical movement?

Promote opportunities for occupants to voluntarily increase physical movement. Refer to Appendix B "Best Practice" for examples.

3-6 REDUCE ENVIRONMENTAL IMPACT OF MATERIALS.

3-6.1 Environmentally Preferable Products.

The following paragraphs require procurement of construction materials and building supplies that have a lesser or reduced effect on human health and the environment over their lifecycle when compared with competing products or services that serve the same purpose.

3-6.1.1 Recycled Content.

(Required; Installation-wide)

> Is there a policy or specification requiring products to meet or exceed EPA's recycled content recommendations for all building repairs/modifications?

Use RCRA Section 6002 compliant products that meet or exceed EPA's recycled content recommendations, available on EPA's Comprehensive Procurement Guideline (CPG) Program.

Encourage reuse of building materials, components, and furnishings that are in refurbishable condition and meet the quality standards of the government.

---

[12] Refer to Service-specific policies (may need to copy and paste hyperlink in Browser): Army: ARMY HEALTH PROMOTION Navy: NAVY AND MARINE CORPS TOBACCO POLICY Air Force: AIR FORCE INSTRUCTION 40-102

3-6.1.2 Biologically-Based Products.

(Required; Installation-wide)

> Is there a policy or specification requiring use of products listed by USDA's biobased content site?

Per Section 9002 of the Farm Security and Rural Investment Act, specify products composed of the highest percentage of biobased content consistent with the USDA Biopreferred Program, if products meet performance requirements and are available at a reasonable cost. Document deviation from using biobased product procurement. Include a preference for purchasing products with the highest biobased content per USDA recommendations for designated product categories in all applicable solicitations for building modifications, operations and maintenance, and cleaning. USDA's biobased product designations and biobased content (which includes certified sustainably-harvested wood products and rapidly renewable resources) recommendations are available on USDA Biopreferred website.

3-6.1.3 Ozone-Depleting \1\ Substances /1/.

(Required; Installation-wide)

> Is there a CFC management plan that includes reducing Ozone-Depleting **\1** Substances **/1/**?
>
> If Yes: does the plan include a phase out of ODCs, or have CFCs already been phased out?

Eliminate the use of ozone-depleting **\1** substances **/1/** and high global warming potential (GWP) chemicals where EPAs Significant New Alternatives Policy (SNAP) Program has identified acceptable substitutes or where other environmentally preferable products are available for use in construction, repair or end-of-life replacements.

Exception: Refer to UFC 3-600-01 for fire protection system requirements.

3-6.2 Waste and Materials Management.

3-6.2.1 Storage and Collection of Recyclables.

(Required; Installation-wide)

a. Is there reuse or recycling service for building occupants?

b. Is there policy/specifications requiring salvage, reuse, or recycling services for waste generated from building operations and maintenance, as well as discarded furnishings, equipment, and property?

Provide salvage, reuse and recycling services for waste generated from building operations, maintenance, repair and **\1** SRM projects **/1/**, where markets or on-site recycling exist.

3-6.2.2 Waste Diversion.

(Additional; Installation-wide)

> Is there policy/specifications requiring salvage, reuse, or recycling services for waste generated from **\1** work in existing buildings **/1/**?

Divert a minimum of 60% of the nonhazardous construction and demolition waste material from landfills. Provide recycling services for paper, corrugated cardboard, glass, plastics, and metals, at a minimum, where local markets or on-site recycling exist.

3-7 ADDRESS CLIMATE CHANGE RISK.

(Required; Building-specific or Installation-wide)

> Where climate change risk factors have been identified, is there a process to implement associated actions?

Provide building design solutions responsive to any Government-provided projections of climate change projection and determination of acceptable risk (typically determined, evaluated and documented in the planning process.)

See UFC 2-100-01 and UFC 3-201-01 for potential climate risk considerations and requirements for work on existing buildings.

CHAPTER 4 HPSB COMPLIANCE TRACKING, REPORTING, AND POLICIES

4-1 OVERVIEW.

Federal agencies are required to target and report annual progress toward HPSB Guiding Principles compliance, with the ultimate goal of 15% compliance of the existing building inventory by 2025. Refer to Table 1-1 "Building Requirements Compliance and Thresholds" to determine applicability of this chapter to each building within a project.

4-2 COMPLIANCE WITH FEDERAL REQUIREMENTS.

The focus of compliance with the HPSB Guiding Principles is to meet the requirements of Table 1-1 "Compliance Requirements/Thresholds." HPSB Checklist requirements are met (marked "YES") when each requirement demonstrates one of the following:

- Fully compliant – the requirement is in full compliance and is marked "Yes".
- Partially compliant – the requirement is compliant to the greatest degree possible, based on LCCE (example: SDHW serves only 20% of water use, per LCCE); mission restriction (example: 24/7 operation); location/regional restriction (example: availability of high-efficiency equipment service); locale restriction (example: proximity of existing buildings restricts daylighting), or safety (example: building orientation restriction for anti-terrorism due to existing infrastructure), and is marked "Yes" with justification.
- Not applicable – the requirement is not applicable, based on LCCE (example, LCCE excludes use of Alternative Water); mission exclusion (example, no daylighting in a theater); location/regional exclusion (example, Host Nation Agreement or no local recycling facility); locale exclusion (example, there is no steam to meter), or safety (example, building orientation restriction for AT/FP due to existing infrastructure), and is marked "Not Applicable" with justification.

Per *Department of Defense Sustainable Buildings Policy*, if a newly constructed building or renovated existing building complies with all the requirements of this UFC, it is considered compliant with all federal sustainability requirements.

\2 Guiding Principles Validation (GPV), as used in UFGS 01 33 29, is project delivery team self-assessment of compliance, and required tracking and reporting. ***/2/***

4-2.1 Compliance HPSB Checklists.

Use the DoD Service-level HPSB checklists to track and report compliance with the requirements of this UFC, found on the Tri-Services Sustainability Program "Required Tracking – Reporting" page. Additional requirements:

- Air Force –Tracking and reporting includes revising and submitting the Air Force Sustainability Requirements Scoresheet and the design analysis to

<AFCEC.CF.SustainableRpt@us.af.mil> at each design submittal and when construction is complete.

- Army – Track and report compliance by completing and submitting, per the instructions, the checklist(s) hosted under USACE Sustainable Tracking.
- Navy – Tracking includes revising and submitting the NAVFAC HPSB Checklist with the project's Final Design Submittal and as a Construction Submittal when all construction HPSB requirements are complete.

Use the Checklist of the Service that will maintain the building asset in their Real Property Record. Check with the user Command for additional requirements.

4-2.1.1 Compliance Documentation.

Compliance documentation demonstrates appropriate analysis and compliance with each of the HPSB requirements. Examples of compliance documentation are cited in the following paragraphs. Provide and update Compliance documentation in the design phase with each design submittal, preferably consolidated into a "sustainability" chapter in the Basis of Design, Scope of Work, or Design Analysis, and retained in the project folder.

Compliance documentation also includes the "S" submittals. The "S" Submittal is a required specification submittal that proves a particular sustainability requirement has been met by the post-award construction contractor. These submittals support the requirements in UFGS 01 33 29, are part of the electronic organization system called the Sustainability eNotebook, and are also used to obtain required documentation for third-party certifications. Many of the UFGS templates contain the standard language and tagging for the "S" submittals, with notes on how to edit each tagged submittal phrase. "S" submittals appear on the Submittal Register.

4-2.1.1.1 Energy Compliance Analysis (ECA).

In the design analysis, include an ECA that demonstrates compliance with all energy related requirements in this UFC. Identify the specific energy efficiency criteria that apply to the project, the software used to prepare the necessary calculations, a summary of all input to and output from the calculations, and the calculated energy consumption of the baseline and alternatives. Include in the ECA a completed "Performance Rating Report" as shown in Appendix G of the ASHRAE 90.1 *User's Manual*. Building-level energy consumption calculations (typically the responsibility of the design mechanical engineer) must be performed using a computer program or programs that integrate architectural features (such as the building envelope), air-conditioning, heating, lighting, and other energy producing or consuming systems. These programs must be capable of simulating the features, systems, and thermal loads used in the design. Include the energy savings and any parasitic energy loads associated with the utilization of recovered energy, solar heat, solar photovoltaic energy and other renewable or waste heat applications. The program must be capable of performing 8,760 hourly calculations. The Department of Energy (DoE) maintains a list of building energy tools for design (such as eQuest).

4-2.1.1.2 ECA Narrative Requirements.

ECA LCCA narratives must be prepared by each of the following individuals: Lead Project Architect, Lead Project Mechanical Engineer, and Lead Project Electrical Engineer. List in each of the three narratives the conservation features considered for that discipline, conservation measures adopted in the design, and any supporting LCCA calculations. Use the results of this analysis for design decision-making in reducing total Life Cycle Cost, while meeting mission objectives.

4-2.2 Existing Buildings, HPSB Assessment.

Existing building assessment is detailed in Chapter 3. Code an existing building meeting the HPSB Guiding Principles (all "Required" and 40% of "Additional" elements) as "Yes (1)". Indicate the appropriate sustainability status when the asset record is created, assessed, or updated.

For reporting requirements, refer to the paragraph entitled, "Compliance Reporting".

4-2.3 Building Compliance Tracking.

Refer to Table 1-1 for building compliance tracking thresholds. During the project definition, design, and construction phases of a project, compliance with requirements is tracked using DoD Service HPSB checklist referenced in the paragraph entitled, "Compliance Checklists". Individual building performance is reported in the Annual Energy Management and Resilience Report to Congress. Refer to each DoD Service for guidance on reporting systems and instructions.

Once the project is complete, track the final status for each building's HPSB Guiding Principles compliance in each Service's reporting system as detailed above.[13] A new building or **\1** comprehensive replacement **/1/** meeting the HPSB Guiding Principles also meets the existing building HPSB Guiding Principles and can be coded as "Yes (1)". Indicate the appropriate sustainability status at the completion of the project when the asset record is created or updated.

4-2.4 Building Compliance Reporting.

Compliance with this UFC is considered compliance with the HPSB Guiding Principles. DoD Services report their building compliance with HPSB Guiding Principles via the Real Property Inventory Submission, as provided in guidance promulgated by the Office of the Assistant Secretary of Defense (OASD) Energy, Installations & Environment (EI&E), Business System Integration Directorate (BSI). View policy regarding this reporting requirement in DoDI 4165.14.

BSI maintains the real property inventory data standards needed for the Enterprise Energy Information Management capability in the Real Property Information Model. The

[13] Buildings greater than 10,000 SF are reported to Congress.

specific data element identified with this reporting requirement is "RPA Sustainability Code".

The reporting codes are:

- Yes (1) – asset has been evaluated and meets HPSB Guiding Principles
- No (2) – asset has been evaluated and does not meet HPSB Guiding Principles
- Not Yet Evaluated (3) – asset has not yet been evaluated on whether or not it meets HPSB Guiding Principles
- Not Applicable (4) – One of the following:
    - Buildings that have a status of Report of Excess (ROE) submitted, ROE accepted, or Determination to Dispose:

      OR ARE
    - Unoccupied: The building is occupied one hour or less per person per day on average;

      AND

      Low/No Energy Use: The total building energy consumption from all sources is less than 12.7 kBTU / SF/ Yr.;

      AND

      Low/No Water Use: Annual average water consumption is less than 2 gallons per day for the building.

Code existing buildings ≥ 10,000 GSF (929 GSM) that have not had an HPSB Guiding Principles assessment "Not yet evaluated (3)". Code existing buildings ≥ 10,000 SF (929 SM) that have had an HPSB Guiding Principles assessment as either "Yes (1)" or "No (2)" using the guidance herein.

4-3 DOD SUSTAINABILITY POLICY REQUIREMENTS.

4-3.1 Office of Secretary of Defense Guidance.

OUSD AT&L Memorandum, *Department of Defense Sustainable Buildings Policy* requires compliance with this UFC, in alignment with Federal policy. The memo also requires the use of auditable processes to track and report this compliance.

4-3.2 Sustainable Third-Party Certification (TPC).

The requirement for TPC is in addition to tracking and reporting HPSB Guiding Principles Compliance in accordance with Table 1-1 "Building Compliance Requirements and Thresholds". Per *Department of Defense Sustainable Buildings Policy*, DoD projects must "…include green-building certification of those buildings through any of the systems approved for federal use…" The green-building rating system is also known as Third-Party Certification (TPC), and is an additional requirement to this UFC compliance, tracking, and reporting. TPC is the generic term for a third-party product that provides either certification of the third party's specific product or a validation program by the third party that this UFC's requirements have been met. TPC is required for applicable DoD **\1** Component **/1/** buildings in the US and US territories. For all other DoD building locations, apply TPC to the greatest extent practical, when not in conflict with mission objectives and Host Nation agreements. Apply TPC to each applicable building in a project. Use the TPC of the supporting Service who will maintain the building asset in their Real Property Record. See guidance for supporting Service in DoD Policy[14].

4-3.2.1 Service-Specific TPC

\1\/1/Refer to Component policy for exemption requirements if the following cannot be met:

- Air Force: Project delivery teams may use either Green Business Certification, Inc.(GBCI) "Guiding Principles Assessment for Department of Defense" program or Green Building Initiative's (GBI) "Department of Defense Guiding Principles Compliance" program.

- Army: Projects must use USGBC's LEED rating system at the minimum Silver level.

- Navy: Project delivery teams may use one of the following: Green Business Certification, Inc.(GBCI) "Guiding Principles Assessment for Department of Defense" program; USGBC's "LEED" rating system; Green Building Initiative's (GBI) "Department of Defense Guiding Principles Compliance" program; or GBI's "Green Globes" rating system.

4-3.3 Prohibition of Sharing Energy and Water Usage Data.

No energy or water usage data sharing with private, sustainable third-party certification vendors is allowed for any DoD project. The DoD has complete exemption from sharing energy or water with any third-party certifier. Some certifiers have specific procedure for registering projects to include waiver language. Contact DoD Service or Third-Party Certification provider for specific procedures.

4-3.4 DoD Service Policy.

DoD and Service-specific implementation requirements and guidance documents may be viewed at Tri-Services Sustainability Program "Policy and Mandates" page.

[14] Memorandum, Department of Defense Supplemental Guidance for Implementing and Operating a Joint Base, April 15, 2008: Facilities Investment Joint Base Supplemental Guidance (CAC with Authentication certificate required)

4-4 DOD SUSTAINABILITY REPORT AND IMPLEMENTATION PLAN (SRIP).

EO 13834 requires each Federal agency to "report…agency implementation and progress toward the goals of this order and relevant statutory requirements." The DoD SRIP provides an organized approach to meeting the requirements of the EO, including HPSB.

APPENDIX A ENERGY OPTIMIZATION AND LCCA PROCESS INTEGRATION

This appendix contains mandatory provisions for performing LCCA, unless otherwise stated. This appendix replaces Appendix "HVAC System Selection Flow Chart" in UFC 3-410-01. Execute LCCA by following the NIST Handbook 135 and utilizing the BLCC software program.**\1** DOE COMcheck-web or COMcheck desktop programs might be useful to gain energy credit, improve energy efficiency, reduce energy cost, and comply with IECC and ASHRAE 90.1. **/1/**

A-1 LCCA PROCESS INTEGRATION STEPS

Use the Process flowchart "Energy Optimization and LCCA Process" when performing the Energy Optimization and LCCA.

For projects that meet the minimum requirements of paragraph "Life-Cycle Cost Analysis (LCCA)", perform energy optimization and LCCA during parametric design process to 35% Design or earlier. Identify energy enhancements that are life-cycle cost effective (LCCE) and supported by the LCCA to meet energy efficiency requirements. Where such enhancements increase costs, request additional funds for the project prior to budget lock. Ensure that all processes, decisions, and the resultant recommended course of action are properly documented.

A-1.1 Identify Alternatives

Identify the highest efficiency building systems and features from those that are feasible. Perform energy modeling on at least three alternative sets of building envelope, and mechanical, and electrical design solutions. Exercise good engineering judgment and use past experience in identifying the best alternatives for analysis for a given project. Perform LCCA to determine which alternatives are LCCE. When appropriate, consider additional alternatives. Document all alternatives considered in the Design Analysis for the record, including those that were not pursued.

- For Navy and Air Force projects, select the most LCCE alternative out of the set of alternatives that provide at least 30% energy savings from the ASHRAE 90.1 Appendix G baseline. Refer to Chapter 2, paragraph titled "Energy Efficiency" for calculation methodology.

- For Army projects, select the alternative that provides the highest energy efficiency while remaining LCCE as the proposed design solution for the project.

A-1.2 Chosen Alternative Justification

When the LCCA process does not identify an LCCE solution that meets or exceeds 30% below baseline, provide an explanation in the Design Analysis file. For example, justification may relate to unique mission requirements, historic building requirements, resiliency requirements, operation and maintenance considerations, or factors that cannot be quantified to be included in the LCCA.

A-1.2.1 Balance Energy with O&M

Balance increases in energy efficiency against operating and maintenance (O&M) costs and initial costs. LCCE means that the proposed design solutions have a lower life-cycle cost than the life-cycle cost of the baseline.

A-1.2.2 Building Envelope

For existing buildings, the LCCA baseline for the building envelope is the existing building envelope system type with ASHRAE 90.1 Section 5 compliant U-factors, etc. Example: if an existing building has masonry wall construction, the baseline envelope will have masonry wall construction with the associated U-factors from ASHRAE 90.1 Section 5. Do not use the ASHRAE 90.1 Appendix G requirement for steel-framed wall for the baseline for LCCA in this example.

A-1.2.3 Preferred Features

In selecting alternatives for analysis, give preference to durable features and systems with lower complexity and maintenance burden. Where alternatives were considered, but not analyzed, identify those alternatives and provide an explanation in the Design Analysis. When there are less than three feasible alternatives for the project, include a justification in the documentation.

A-1.2.4 Lighting Systems

When included in the design, LED and high-intensity RF Induction lighting systems do not require LCCAs because long life, efficiency, and environmental sustainability is inherent in these technologies.

A-1.2.5 Installation Preferences

Installation preferences do not supersede service policies or this UFC without an approved exemption in accordance with MIL-STD-3007. Incorporate realistic operational and maintenance considerations into the LCCA. When non-quantitative considerations may impact alternatives selected, provide justification as noted above.

A-1.2.6 Funding of Features and Systems

Where the DD Form 1391 for a Congressionally approved project requires a particular feature or system, such feature or system must be included in the design. In such cases, a LCCA for that feature or system is not required during design. Cite the reason for no LCCA in the Design Analysis. Example: Where funding is identified for solar photovoltaic systems or ground source heat pump systems in the DD Form 1391, they will be included in the project without the need for an additional LCCA, since a required LCCA was completed in order for those systems to be added to the DD form 1391. Where connection to a central energy plant is required in the DD form 1391, LCCA for the central heating/cooling plants for a building is not required. However, a LCCA for the air systems is required. When central plant data is available, energy optimization calculations should be conducted and documented in the design analysis.

A-1.3 Energy Modeling

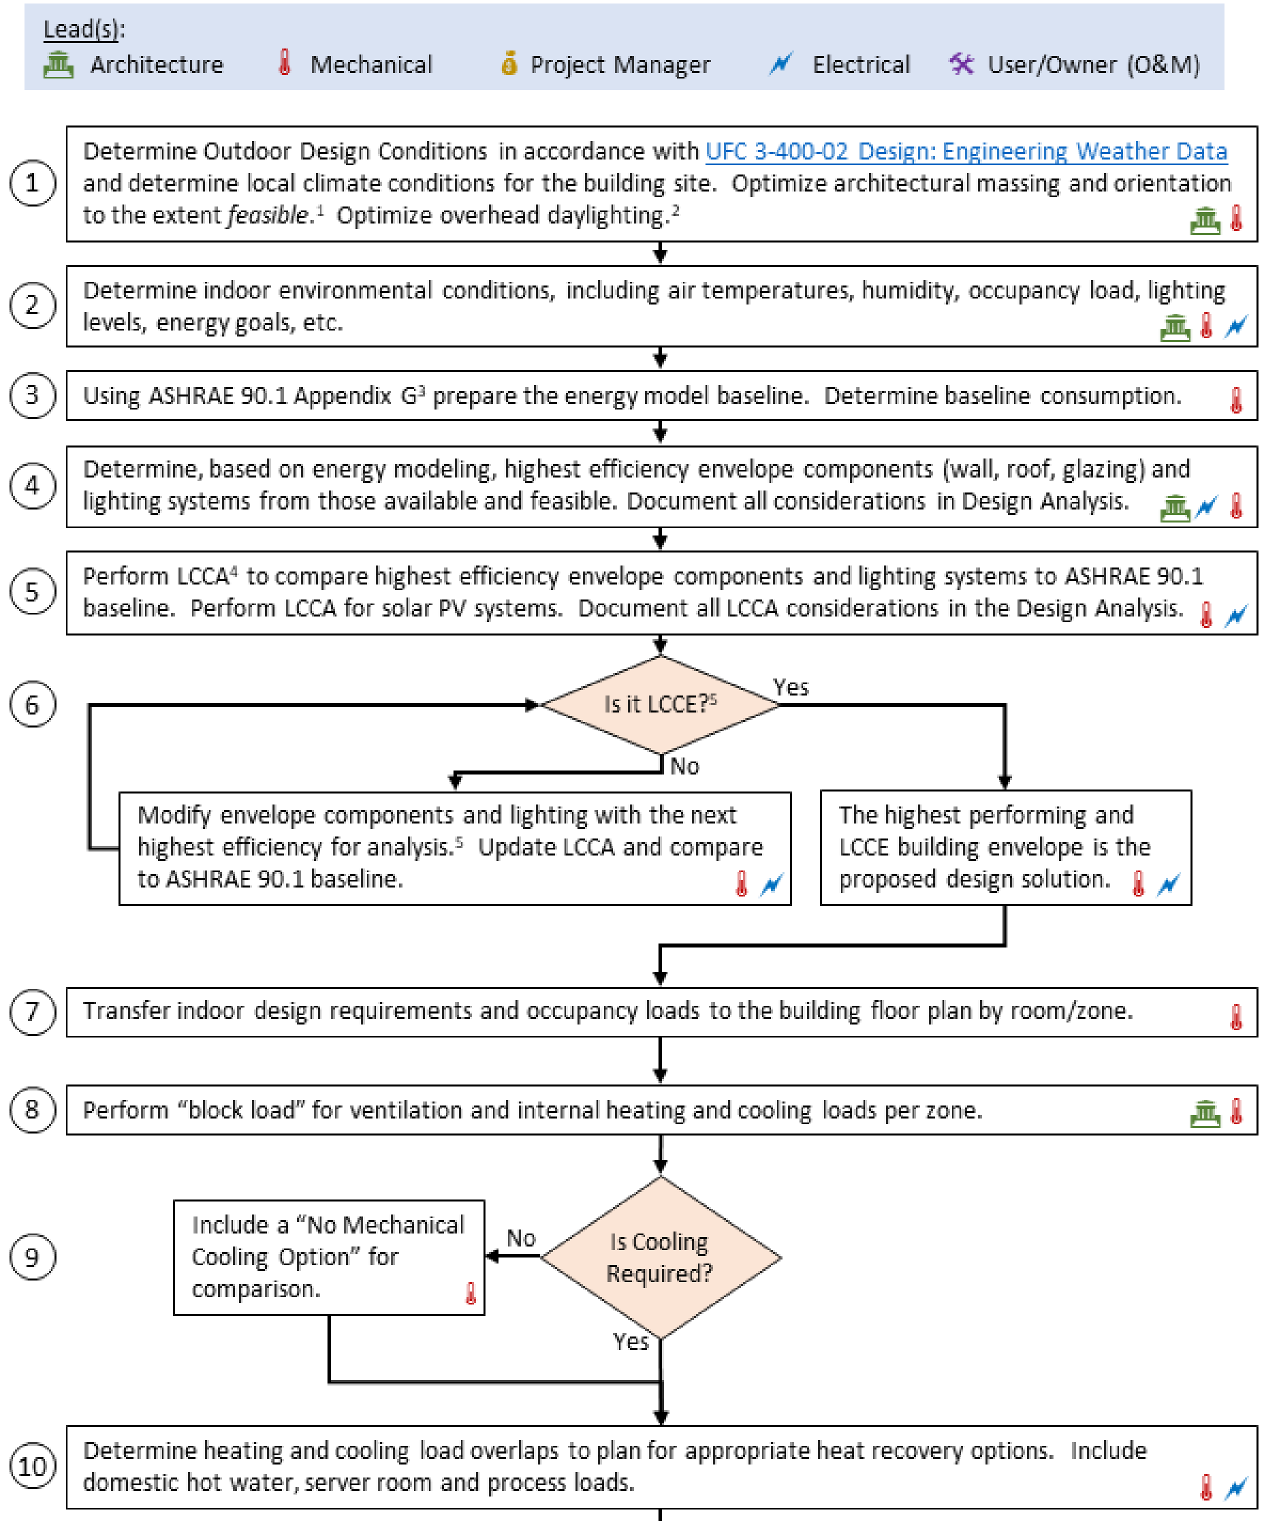
Complete the documentation of the energy optimization and LCCA, including the associated energy modeling, no later than the parametric design phase (5-35%). Any significant changes to the project scope beyond initial design that impact energy savings or project cost require an updated LCCA and energy model. Place all documentation in the Design Analysis and keep it readily available for a third-party review. The LCCA documentation forms a part of the Energy Compliance Analysis required for the project.

A-2 DESIGN BUILD PROJECTS

In Design Build (DB) projects, the LCCA is prepared during the development of the solicitation package, or Request for Proposal (RFP). The resulting system and feature selections are incorporated as requirements in the DB RFP. The DB selection criteria must require that any deviation provided by the offeror that increases energy efficiency is supported by an energy optimization and LCCA. Deviations that decrease the energy efficacy are not acceptable.

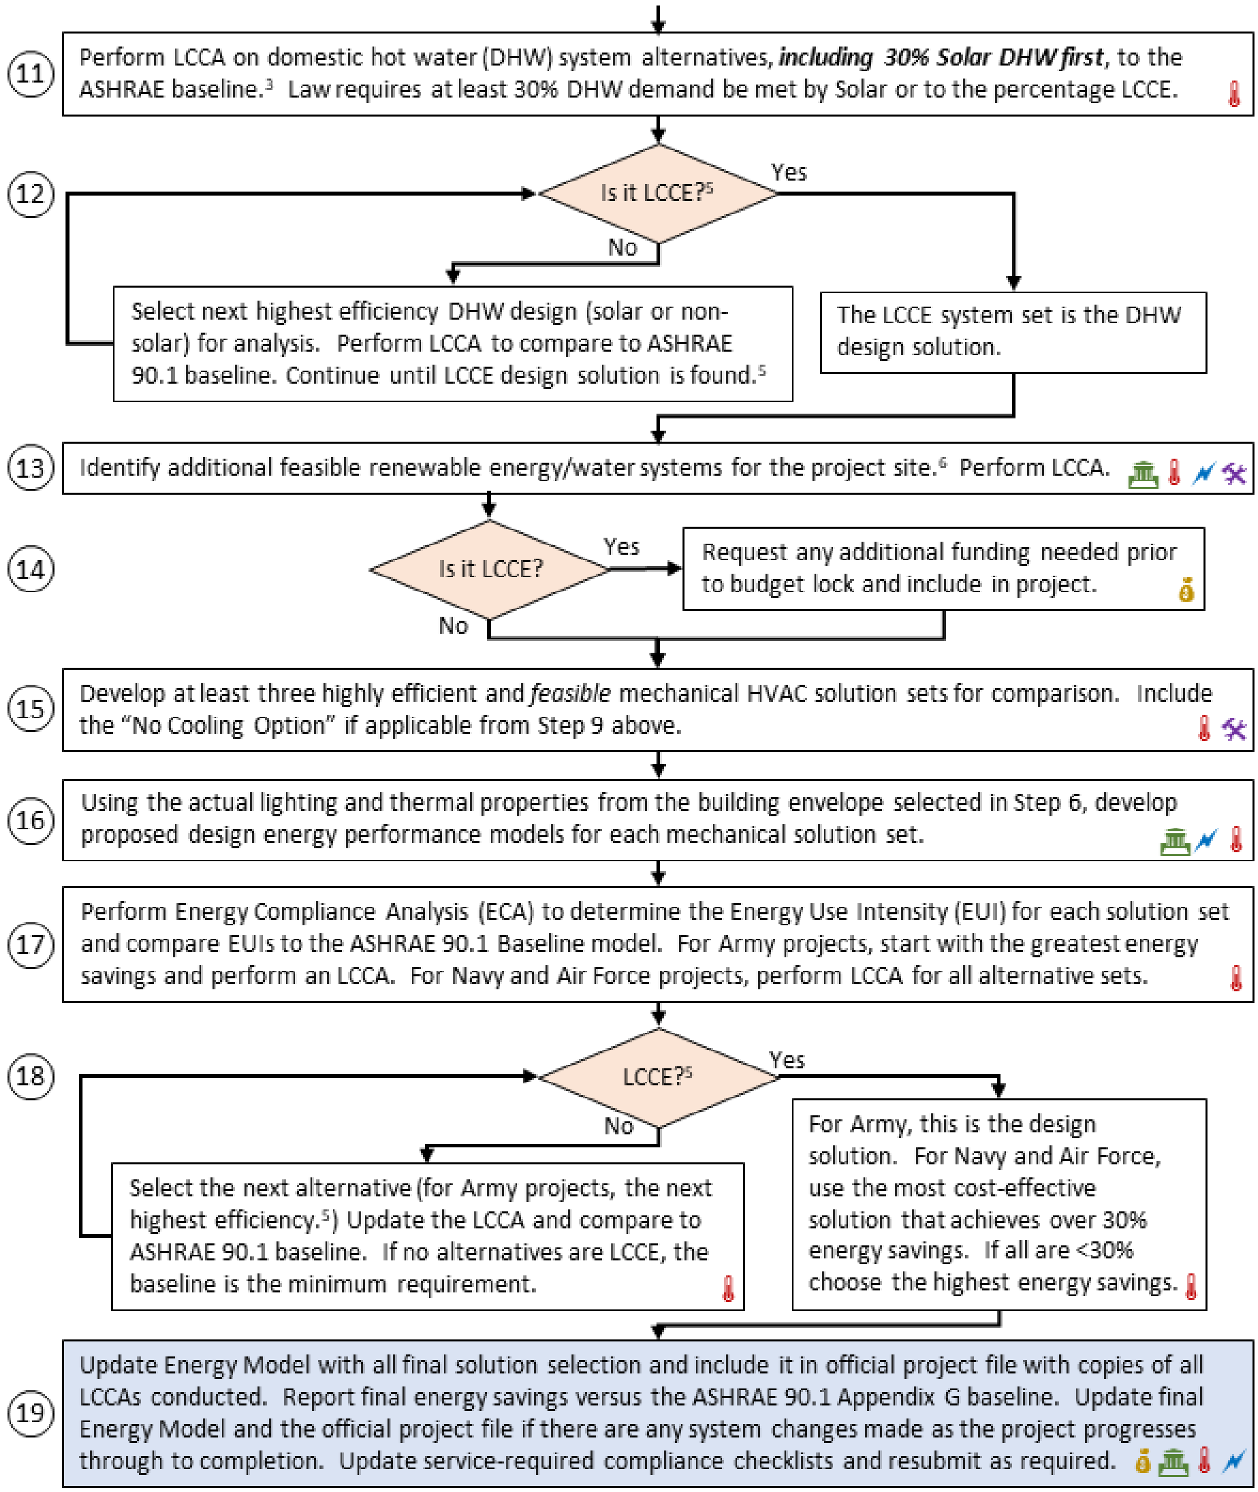
A-3 ENERGY OPTIMIZATION AND LCCA PROCESS CHART

\1\



Continued next page...

...continued from previous page.



Flowchart Footnotes:

1. The term “feasible” throughout the flow chart means technically viable alternatives that are: 1) available in the project market; meet mission/functional requirements; 2) comply with Federal Laws and applicable Government regulations, policy, codes, and criteria (UFCs, AT/FP, etc.); and 3) realistically and economically maintainable by local facility operation and maintenance staff or contractors. Justify design solutions found to be “not feasible” in the Design Analysis for the record with documentation.

2. “Optimize daylighting” means improvement to user environmental quality, as well as providing opportunity to save energy through instantaneous automatic electronic light dimming. Optimize to the extent feasible per Footnote 1. Consider the extent of energy savings available based on most likely selected lighting system alternative. Daylighting is most effective from above. Refer to UFC 3-101-01, Architecture for guidance on Daylighting.

3. ASHRAE 90.1 Appendix G prescribed systems are the baseline and minimum energy performance requirement (presumed to be cost-effective) based on the latest version adopted in 10 CFR §433.100 Energy Efficiency Performance Standard. All Federal facilities are required to achieve at least 30% energy savings from this baseline, if life-cycle cost effective.

4. Perform Life-Cycle Cost Analysis (LCCA) in accordance with 10 CFR 436 and the NIST Handbook 135, using present-value method. Include realistic maintenance costs, based on Installation O&M capabilities.

5. Life-Cycle Cost Effective (LCCE) as determined by a Life-Cycle Cost Analysis (LCCA). LCCA are required to demonstrate that savings beyond the baseline are LCCE. A minimum of three alternative solutions to the baseline is required for a complete analysis. If none of the alternative solutions with savings beyond the baseline are LCCE, then the baseline is the design solution.

6. The consideration of solar energy systems is required by mandate. There are other forms of renewable energy that can enhance the performance and resiliency of the facility. Use the current, local Installation utility costs, to include savings attributable to demand and time-of-day charge reductions from the inclusion of renewable energy and energy storage. Evaluate the project location for available alternative renewable energy sources. Some locations may have significant wind, waste heat recovery, microhydro, biomass, cogeneration, or other options that may be included economically as a package. Based on 1391, enhance building resiliency, and when feasible (per Note 1), consider these systems to supplement critical power circuits to reduce fuel consumption by backup generators during service disruptions. Request additional funding for a line item was not included or underestimated on the DD Form 1391 that has not yet been enacted or locked. Document funding request approvals and disapprovals in the Design Analysis. **/1/**

APPENDIX B BEST PRACTICES

B-1 PROMOTE SUSTAINABLE LOCATION AND SITE DEVELOPMENT.

Coordinate with UFC 2-100-01 requirements and guidance.

B-1.1 Mitigation of Heat Island Effect.

- For Site Hardscapes – Consider the use of IgCC 501.3.5.1 (5.3.5.1) *Site Hardscape* for sidewalks, courtyards and POV parking areas
- For Walls – Consider the use of IgCC 501.3.5.2 (5.3.5.2) *Walls*.

B-2 PROTECT INDOOR AIR QUALITY (IAQ).

IAQ is a quality-of-life issue in every enclosed building. Due to lack of good IAQ, occupant absenteeism and poor performance has drawn a lot of attention over the years. In addition to moisture control, IAQ should be of concern in every project.

B-2.1 IAQ for \1\ Work in Existing Buildings /1/.

IAQ is of particular concern in **\1** work **/1/** that occur in occupied buildings.

When **\1** work occurs **/1/** in occupied buildings, include in the sequencing consideration for the occupants who remain in the building during the **\1** work **/1/**.

- Pay additional attention to sealed edges of barriers that prevent escaping dust from the construction area into corridors and other occupied areas
- Require fans and additional ventilation when potential off-gassing materials are installed
- To the greatest degree possible, plan construction activities after business hours or over weekends, for demolition or installation of materials with potential off-gassing or dust-producing properties. Examples: all dust-producing tear-outs; painting; drywall cutting; mixing and application of adhesives, caulking, and other glues; placement of insulation; asphalt (exterior that is near air intake louvers); poured or broadcast floor finishes; or any material that takes hours or days to cure, set, or dry.

B-3 OCCUPANT HEALTH AND WELLNESS.

B-3.1 Sit-Stand Workstations.

Consider the design of office space for either immediate or future addition of sit-stand workstations for all occupants. Examples:

- Consider systems furniture that allows easy adjustment of work surface height

- Consider overhead cabinet locations, relative to future work surface height changes, or addition of desktop sit-stand equipment
- Work with end users to determine type of furniture to support sit-stand environment.

B-3.2 Promoting Voluntary Physical Activity.

Include discussion and decisions in project charrettes related to how buildings address voluntary physical activity. No two projects will result in the same decisions. Always consider less mobile occupants during the decision process. The following examples are suggestions and do not comprise a complete list of possible solutions:

- Location of common use zones
- Use of under-utilized spaces as common gathering areas
- Visibility of stair locations
- Corridor locations and lengths
- Proximity and configuration of exterior walkways and bicycle commuter facilities, as promoted by UFC 2-100-01 and UFC 3-201-02.

B-3.3 Connection to Nature

Include discussion and decisions in project charrettes related to design for location for plantings. Consider strategies to extend daylighting and exterior views beyond minimum requirements, Examples:

- Low walls to allow penetration of daylighting
- Occupants' ability to have proximity to exterior views
- Locations for planters

B-4 DOMESTIC SOLAR HEATING.

Consider implementation of solar heating for domestic hot water in the 60 to 85 percent range, when determined to be life-cycle cost-effective.

B-5 OTHER SUSTAINABLE PRODUCTS.

Purchase products that meet Federally Recommendations of Specifications, Standards, and Ecolabels for Federal Purchasing; or are on the Federal Green Procurement Compilation.

B-6 TPC.

For applicable projects, the addition of TPC is required (refer to paragraph Sustainable Third-Party Certification (TPC) and Table 1-1.)

B-6.1 Design Submittal.

It is preferred that each project that applies a TPC requires a design review by the TPC at final design submittal, rather than a combined design and construction review (applies to both design-build and design-bid-build.)

B-6.2 TPC Training.

It is highly recommended that all designers and construction managers take online training webinars for third-party certification or validation programs, offered by third-party vendors.

This Page Intentionally Left Blank

APPENDIX C PROJECTS IMPACTING A HISTORIC BUILDING OR DISTRICT

C-1 APPLICABILITY TO SUSTAINABILITY GOALS.

C-1.1 Applicability.

Many buildings listed in or eligible for listing in the National Register of Historic Places are capable of meeting the HPSB Guiding Principles and should work toward compliance. Following the National Historic Preservation Act of 1966 (NHPA) Section 106 implementing regulations, 36 CFR Part 800, will facilitate the consultation needed to meet sustainability goals in proposed construction/rehabilitation/repair projects. This process will also take into account indirect impacts that the project could have on other cultural resources that could trigger project delays.

C-1.2 Building Analysis.

Sustainably rehabilitating historic buildings conserves the invested-cost of energy and materials as well as encouraging the preservation of these resources and cultural landscapes. The design, materials, type of construction, size, shape, site orientation, surrounding landscape and climate all play a role in how buildings perform. Before implementing any energy conservation measures to enhance the sustainability of a historic building, the existing energy-efficient characteristics of the building should be assessed as historic construction methods and materials often maximized natural sources of heating, lighting, and ventilation to respond to local climate conditions.

C-1.3 Consultation.

For DoD’s historic facilities, certain generic sustainable upgrades may not be the most appropriate solution. To avoid later delays, early inclusion of the DoD Service-specific Installation Cultural Resource Manager and the State Historic Preservation Office (SHPO) ensures meeting the Secretary of Interior Professional Standards. Take into consideration the character-defining features of the buildings during the design process. Historic buildings represent a previous long-term investment of resources and energy and as such these buildings were often constructed using methods and materials that maximized natural sources of heating, lighting, and ventilation to respond to local climatic conditions. Work with the Installation Cultural Resource Manager and SHPO to identify these elements of historic buildings that are functional passive design components, or inherently sustainable in nature.

C-1.4 Daylighting.

If windows, skylights and other elements allowing for daylighting are character-defining features on the historic building, discuss options with the Installation Cultural Resource Manager.

If daylighting principles do not cause an adverse effect to the historic facilities, employ them to the fullest extent practicable.

C-1.5 Cistern Use.

The use of cisterns, either sub-grade or above-ground, was a frequently used mechanism for water storage in many historic buildings and structures and may be an appropriate addition when**\1** executing work in an existing building. **/1/**

If a historic cistern is available at the site, reuse the location and equipment, as practical.

C-1.6 Reclaimed/Salvaged Materials.

When repairing or renovating historic buildings, reclamation of salvaged materials must be used instead of procurement of, or repair to, assets to meet current requirements, when timely and economical to do so (DoDI 4715.16 Paragraph 6.1). Monetary value may not be considered a limitation if reclamation will satisfy critical item requirements, or if new procurement/production is impractical. See DoD 4160.21-M Chapter 13 (Reclamation) for more information.

C-1.7 Historical Landscapes.

Consider historic landscapes when planning water efficient landscapes. Refer to UFC 3-201-02.

D-2 DEFINITION OF TERMS

Acquisition: A multidisciplinary process encompassing a variety of functions that involve all facets of life-cycle management, including determination of need, planning; design; construction, lease, or purchase; sustainment, modernization, and disposal of military installations and facilities as well as other goods and services. Acquiring supplies and services is a process governed by Federal, Defense, and service branch specific Acquisition Regulations (FAR, DFARS, and AFFARS, AFARS, or NMCARS) and Public Law (PL). Together there are more than 4,000 documents controlling the acquisition process. The acquisition process depends upon: (1) who the customer is, (2) the source of the item to be acquired, and (3) what type of funds are to be used, Appropriated (APF) or Non-Appropriated (NAF). In general, the Military Construction Program process is funded by Appropriated Funds. However, projects for Non-Appropriated Funds activities (commissaries, bowling centers, etc.) use NAF funds for building construction, upgrades, special equipment, and furnishings. APF funding is used most typically for demolition and environmental work on NAF activity sites. A combination of APF and NAF funds may be used.

Alternative Water Sources: Non-potable water from sources such as harvested rainwater (refer to UFC 3-210-10), treated wastewater, air handler condensate capture, grey water, or reclaimed water. The use of alternative water sources must comply with applicable codes and standards.

Authority Having Jurisdiction (AHJ): The term "Authority Having Jurisdiction" (AHJ) as used in the codes and standards referenced in this UFC means the **\1** Service **/1/** office of responsibility, i.e., U.S. Army, HQ USACE/CECW-CE; U.S. Navy, NAVFACENGCOM HQ Code CHE; U.S. Marine Corps, HQMC Code LFF-1; and U.S. Air Force, AFCEC. The enforcement of the codes and standards as they pertain to facility projects can be delegated to the local **\1** Service **/1/** Office's Chief Engineer's Technical Representative at the discretion of the **\1** Service's **/1/** aforementioned office.

Building: Per UFC 1-300-08, "A roofed and floored facility enclosed by exterior walls and consisting of one or more levels that is suitable for single or multiple functions."

Charrette: An intensive creative work session in which a design team focuses on a particular design problem and arrives at a collaborative solution with stakeholders from the project area. A charrette can be a breakthrough event that helps create a meaningful master plan or facility design. Properly executed, this technique can produce a master plan or facility design that is more useful, better understood, and more quickly produced than one formed by any other method.

Climate Change: Per DoD Directive 4715.21, variations in average weather conditions that persist over multiple decades or longer that encompass increases and decreases in temperature, shifts in precipitation, and changing risk of certain types of severe weather events.

Commercial and Multi-Family High-Rise Residential Buildings: All buildings, other than low-rise residential buildings.

Commissioning: Per DOE Guidance 42 USC 8253(f), “The commissioning process ensures that all of the equipment and systems within a facility are currently operating and functioning properly, and identifies items that need to be fixed or adjusted, typically in a low or no cost fashion.”

\1\ Component: One of the Military Departments, Defense Agencies, or DoD Field Activities, per USD (AT&L) Memorandum dated 29 May 2002.

Comprehensive Replacement: Comprehensive replacement to a building includes significant opportunities for improvement in: energy and water efficiency (such as HVAC, lighting, building envelope and other building components); indoor air quality; other requirements in this UFC; and additions that are part of the comprehensive replacement. **/1/**

DD Form 1391: A programming document used by the Department of Defense to submit requirements and justifications in support of funding requests for military construction to Congress.

Employee Work Areas: Per International Building Code 2015: “All or any portion of a space use by employees and only for work. Corridors, toilet rooms, kitchenettes and break rooms are not employee work areas.”

Energy Compliance Analysis (ECA): The ECA must identify specific energy conservation criteria that applies to the project, the software used to prepare the necessary calculations, a summary of all input to and output from the calculations, and the calculated energy consumption of the proposed design.

Energy Modeling: The process by which conceptual designs, including size; material choices; factors such as site, solar, and wind orientations; daylighting percentages; and energy system choices (solar water heat, underfloor vs. overhead air distribution systems) are analyzed to show how to optimize these factors for efficient building operation and resource consumption.

Energy Resiliency: Per DoDI 4170.11, “The ability to prepare for and recover from energy disruptions that impact mission assurance on military installations.”

Environmental Management System (EMS): A framework that helps to achieve environmental goals through consistent control of operations. The assumption is that this increased control will improve environmental performance.

Environmentally Preferable Products: Products or services having a lesser or reduced effect on human health and the environment when compared with competing products or services serving the same purpose. This comparison may consider raw materials acquisition, production, manufacturing, packaging, distribution, reuse, operation, maintenance, or product or service disposal.

Estimated Replacement Cost (ERC): ERC is the cost listed in the project’s DD1391 “Economic Analysis.” ERC is the cost of replacing the current physical plant with modern facilities built at today’s construction costs using today’s construction standards.

Facility: Per UFC 1-300-08, a building, structure, or linear structure out to an imaginary line surrounding a facility at a distance of five feet from the foundation that, barring specific direction to the contrary such as a utility privatization agreement, denotes what is included in the basic record for the facility (examples: landscaping, sidewalks, utility connections). This imaginary line is commonly referred to as the "five-foot line."

Historic Properties: Properties that are included in the National Register of Historic Places or that meet the criteria for the National Register.

Life-Cycle Costing (LCC): An important economic analysis used in the selection of alternatives that impact both pending and future costs. It compares initial investment options and identifies the cost alternatives for a 40-year period. As applied to building design energy conservations measures, the process is mandated by law and is defined in 10 CFR Part 436, Subpart A: *Methodology and Procedures for Life-Cycle Cost Analysis*. The National Institute of Standards and Technology has established the Building Life-Cycle Cost (BLCC) computer program to perform LCC analyses. The program incorporates user entered data for and compares the following: Sunk Costs, First Costs, Salvage Value, Future Investment, Residual Value, Annually Recurring Fixed Costs, Annually Recurring Escalating Costs, and Energy (Fuel Costs) Escalation Rates.

Life-Cycle Cost Analysis (LCCA): Assessment of the direct, indirect, recurring, nonrecurring, and other related costs incurred or estimated to be incurred in the design, development, production, operation, maintenance, support, and final disposition of a major system over its anticipated useful life span. LCCA considers all costs (capital, operating, and decommissioning expenses for the duration of a project) for various alternative approaches, including inflation and discount rates.

Life-Cycle Cost Effectiveness (LCCE): A documented statement of costs to be incurred to complete all stages of a project from planning through acquisition, maintenance, operation, remediation, disposition, long-term stewardship, and disposal. The results of a LCCA.

Low-Rise Residential Buildings: All buildings three stories or less in height above grade that include sleeping accommodations where the occupants are primarily permanent in nature (30 days or more).

Planning: Initiated by a using entity whose facility needs are driven by mission requirements. The insertion of facility projects into the official budget is based on the requirement for mission support. As mission priorities change, projects can be moved ahead of their initial scheduled fiscal year or alternatively, be dropped altogether.

Process load: The load on a building resulting from energy consumed in support of a manufacturing, industrial, or commercial process. Process loads do not include energy consumed maintaining comfort and amenities for the occupants of the building (including space conditioning for human comfort).

Programming: The data collection process done by the military project management team in order to achieve a conceptual design in enough detail to prepare a viable cost estimate. Programming data is reported on DD Form 1391 for design-bid-build and design-build projects, and is scrutinized from Installation-level through the Office of Management and Budget (OMB), Congress, and signed by the President before it is approved as a project.

Project Definition: As the military programming process often predates actual design by two to five years or more, when the design services portion of a project is funded, the project design team must validate stated project requirements and personnel assignments based upon updated mission criteria. This process is sometimes referred to as Project Definition to distinguish it from the usual private sector A/E reference to "programming."

Project Scope: Refers to the physical size, cost, and mission of a project. With historical data on facilities for various missions, experienced programmers will formulate the conceptual design for the DD Form 1391 based upon the required size of a facility to accommodate mission functions. Once the scope for a project has been enacted by Congress, changing the scope of a project will delay a project until the revision has been justified and approved. This is true whether or not the costs have also changed. Reductions of project scope (by no more than 25%) will require Congressional notification, review, and authorization before proceeding. Increasing the project scope is not authorized without reprogramming. See USC Title 10 Section 2853 for more information.

Real Property Asset: An individual building, structure, linear structure or land parcel, owned by the Department of Defense.

Receptacle Load: The load on a building resulting from energy consumed by all equipment plugged into electrical outlets.

Recommissioning: Per DOE Guidance 42 USC 8253(f), "The process of commissioning a previously commissioned facility or system after expiration of the project development and warranty phase. The primary goal of recommissioning is to optimize facility performance, in accordance with design or operating needs, over the useful life of the facility."

Resiliency: The ability to prepare for and recover from disruptions that impact mission assurance on military installations.

Resource-efficient solutions: Solutions that minimize energy, water, natural, and human resources required.

Retrocommissioning: Per DOE Guidance 42 USC 8253(f), "The retroactive commissioning of equipment or a system that was not commissioned at the time of installation or during the warranty phase. Typically, retrocommissioning is performed long after the facility is constructed and placed into service."

\1\ Service: When used to describe a DoD entity, one of the three Military Departments under the DoD, per USD (AT&L) Memorandum dated 29 May 2002. **/1/**

Stand-Alone Additions: Stand-alone additions are scoped to function like stand-alone new buildings. Although the addition is attached to an existing building, all of its new systems operate separately from the existing building.

Structure: Per UFC 1-300-08, a facility, other than a building or linear structure (road, fence, etc.), that is constructed on or in the land.

Sustainable Site: Based on the selection process, a site is considered sustainable when it uses less energy, water, and natural resources, generates less waste, and minimizes the impact on land compared to conventional design, construction, and maintenance techniques.

\1\ Sustainment, Restoration, and Modernization (SRM): Per the Office of the Assistant Secretary of Defense for Sustainment, Construction:

- Sustainment activities include scheduled and unscheduled inspection, maintenance and repair to ensure facilities remain in good working order throughout their service lives.
- Restoration activities include repair and replacement efforts to renovate facilities damaged by inadequate sustainment, excessive age, natural disaster, fire, accident, or other causes.
- Modernization activities include implementation of new or higher standards; accommodating new functions; or replacing building components that typically last more than 50 years. **/1/**

Third-Party Certification (TPC): TPC is the generic term for a third-party product that provides either certification of the third-party vendor's proprietary product requirements (examples: LEED, Green Globes), or a validation program by the third-party vendor that this UFC's requirements have been met (examples: Guiding Principles Assessment, Guiding Principles Compliance.)

Total Ownership Cost (TOC): Total of all direct and indirect costs associated with an asset or acquisition over its entire life cycle.

Tracking: Method by which each Service internally validates HPSB Guiding Principles compliance, with the use of HPSB Checklist.

FOREWORD

The Unified Facilities Criteria (UFC) system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and applies to the Military Departments, the Defense Agencies, and the DoD Field Activities in accordance with USD (AT&L) Memorandum dated 29 May 2002. UFC will be used for all DoD projects and work for other customers where appropriate. All construction outside of the United States is also governed by Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA), and in some instances, Bilateral Infrastructure Agreements (BIA). Therefore, the acquisition team must ensure compliance with the most stringent of the UFC, the SOFA, the HNFA, and the BIA, as applicable.

UFC are living documents and will be periodically reviewed, updated, and made available to users as part of the Services' responsibility for providing technical criteria for military construction. Headquarters, U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering Systems Command (NAVFAC), and Air Force Civil Engineer Center (AFCEC) are responsible for administration of the UFC system. Defense agencies should contact the preparing service for document interpretation and improvements. Technical content of UFC is the responsibility of the cognizant DoD working group. Recommended changes with supporting rationale may be sent to the respective DoD working group by submitting a Criteria Change Request (CCR) via the Internet site listed below.

UFC are effective upon issuance and are distributed only in electronic media from the following source:

- Whole Building Design Guide website https://www.wbdg.org/ffc/dod.

Refer to UFC 1-200-01, *DoD Building Code*, for implementation of new issuances on projects.

UNIFIED FACILITIES CRITERIA (UFC)
REVISION SUMMARY SHEET

Document: UFC 1-201-01, *NON-PERMANENT DOD FACILITIES IN SUPPORT OF MILITARY OPERATIONS*

Superseding: UFC 1-201-01 dated 1 January 2013

Description: This UFC provides life safety and habitability-related design requirements for non-permanent facilities designed and constructed for use by the Department of Defense (DoD) in support of military operations.

Reasons for Document:

- This UFC was developed to establish the minimum requirements for the Life Safety and Habitability aspects of non-permanent facilities in support of military operations.

Impact:

- The criteria established in this UFC may result in Doctrine, Organization, Training, Material, Leadership and Education, Personnel, Facilities, and Policy (DOTMLPF-P) impacts across the Services. Services should conduct DOTMLPF-P analysis to determine the impacts on their ability to execute construction in support of military operations.

- Review of standard facility designs for compliance with criteria in this UFC.

Unification Issues

There are no unification issues in this document.

This Page Intentionally Left Blank

TABLE OF CONTENTS

This Page Intentionally Left Blank

CHAPTER 1 INTRODUCTION

1-1 BACKGROUND.

This UFC was developed in response to US Code Title 10, "Policy and Requirements to Ensure the Safety of Facilities, Infrastructure, and Equipment for Military Operations", cited below for clarity and information.

It shall be the policy of the Department of Defense that facilities, infrastructure, and equipment that are intended for use by military or civilian personnel of the Department in current or future military operations should be inspected for safety and habitability prior to such use, and that such facilities shall be brought into compliance with generally accepted standards for the safety and health of personnel to the maximum extent practicable and consistent with the requirements of military operations and the best interests of the Department of Defense, to minimize the safety and health risk posed to such personnel.

US Code Title 10 requires addressing the following:

- Fire protection
- Structural integrity
- Electrical systems
- Plumbing
- Water treatment
- Waste disposal
- Telecommunications networks

1-2 PURPOSE AND SCOPE.

Consistent with the requirements of Public Law 111-84 Section 807 this UFC establishes the minimum design criteria for the following areas:

- Fire protection
- Structural integrity
- Electrical systems
- Plumbing and mechanical systems
- Water treatment, storage and distribution
- Wastewater collection and treatment
- Telecommunications networks

1-2.2 Exceptions and Exclusions.

The following exceptions and exclusions apply.

1-2.1.1 Ammunition and Explosives Safety.

This document does not contain requirements for explosives safety.

All facilities that involve DoD Ammunition and Explosives (AE) storage, handling, maintenance, manufacture or disposal, as well as any facilities within the Explosives Safety Quantity Distance (ESQD) arcs of AE facilities, must comply with the minimum DoD explosives safety criteria given in DoD Manual 6055.09-M, as implemented in DA PAM 385-64 (Army), NAVSEA OP5 (Navy and Marine Corps), and AFMAN 91-201 (Air Force). DoD facilities exposed to potential explosion effects from AE belonging to other nations are also required to meet DoD and Service explosives safety criteria.

It is essential that the planning and design of new facilities and occupation and renovation of existing AE-related facilities or any facilities within ESQD arcs be accomplished in close coordination with knowledgeable explosives safety professionals in theater or with the Services' explosives safety centers. This coordination should occur as early as possible in the planning/design process to avoid issues/problems and ensure compliance.

All facility construction or use within ESQD arcs requires review for compliance with explosives safety criteria and must have either an approved explosives safety site plan or an approved explosives safety deviation. Refer to the DoD and Service documents mentioned above for further guidance in this area.

1-2.1.2 Antiterrorism / Force Protection.

Expeditionary structure stand-off distances are incorporated from Chapter 4, UFC 4-010-01 DoD Minimum Antiterrorism Standards for Buildings. All other antiterrorism and force protection requirements are excluded for initial and temporary construction. Semi-permanent construction follows the complete requirements of UFC 4-010-01.

The mass notification system must comply with the requirements of UFC 4-010-01 (*DOD Minimum Antiterrorism Requirements for Buildings)* excluding the requirement for remote activation and the requirements of UFC 4-021-01.

1-2.1.3 Accessibility.

Facilities for use in military operations are designed for combat capable, able-bodied personnel. However, special use facilities, such as medical facilities, may employ more stringent requirements IAW (In Acceptance With) "Accessibility" requirements in UFC 1-200-01.

1-2.1.4 Solid Waste Disposal.

Solid waste disposal is addressed in UFC 3-240-11 Landfills In Support Of Military Operations.

The following disposal functions, must comply with the respective chapters from TM 3-34.56, MCIP 4-11.01 Waste Management for Deployed Forces:

- Non-hazardous Solid Waste
- Hazardous and Special Waste
- Medical Waste

Regulated hazardous and medical waste disposal facilities must reference host-nation final governing standards (FGS) or where the FGS does not exist, then the Overseas Environmental Baseline Guidance Document (OEBGD) prevails (DOD 4715.05-G).

1-3 APPLICABILITY.

This UFC applies to all DoD components involved with planning, design, construction and renovation of non-permanent facilities, both new construction and renovations to non-permanent facilities (where the renovation does not convert the facility to permanent), used by US military and DoD civilian personnel in support of Military Operations, actions with written Operation Orders (OPORDS), examples include Kinetic, Disaster Recovery, Humanitarian Assistance, Defense Support to Civil Authorities, etc. See JP 3-0 and JP 3-34 for more complete definition, description and guidance on operations. This UFC establishes the minimum requirements for initial, temporary, and semi-permanent construction levels.

1-3.1 Waivers and exemptions.

Section 807 of Public Law 111-84, "Policy and Requirements to Ensure the Safety of Facilities, Infrastructure, and Equipment for Military Operations" required the Department of Defense to establish minimum design criteria for the safety and health of military or civilian personnel of the Department of Defense.

Waivers are for the facility design to not comply with the requirements of this UFC for a period of time as designated by the approval authority. This time period allows for use of the facility, with mitigating measures in place, while awaiting full compliance. Treat waivers considered for an indefinite period of time as exemptions and follow the exemption approval process. An exemption provides authority to deviate from a UFC requirement indefinitely.

The procedures and requirements for the submission of a waiver are described in MIL-STD 3007, Appendix A. Lack of funds is not considered sufficient justification for a waiver.

In accordance with DFAR Clause 246.270-3, the combatant commander may waive compliance when it is impracticable to comply with such standards under prevailing operational conditions. Any waiver for reasons other than operational conditions must be approved by the appropriate Service Chief Engineer as outlined in MIL-STD- 3007.

1-3.2 Standard Designs

Standard designs are available for the construction of non-permanent facilities. These standard designs accommodate a wide range of site conditions, missions and other parameters. The use of these designs is encouraged when the project requirements can be met by the standard design.

The review of these standard designs should be completed prior to embarking upon the design of a unique non-permanent facility.

Standard Designs are available from the following sources:

- Center of Standardization for Non-Permanent Facilities (US Army Corps of Engineers, CETAM-DP-EX) https://mrsi.dren.army.mil/cos/tam/
- Joint Construction Management System (JCMS) https://jcms.army.mil requires a CAC

1-4 GENERAL BUILDING REQUIREMENTS.

Comply with 1-3.5.1 of UFC 1-200-01, *DoD Building Code*. UFC 1-200-01 provides general building requirements and overarching criteria, establishing the use of consensus building codes and standards, establishing criteria implementation rules and protocols (including core UFC), and identifying unique military criteria.

The requirements of the UFC sections cited in this document are mandatory. Other UFCs may be used as guidance but are not mandatory.

This document must be used in conjunction with Status of Forces Agreements (SOFA), bilateral agreements, and other Host Nation (HN) agreements.

1-4.1 Facility Design.

Facility Design efforts must be performed by Qualified Personnel.

1-4.2 Alterations to Facility Designs.

1-4.2.1 Standard designs for temporary facilities (Chapter 3)

Construction by military personnel - Any modification requires review and approval by qualified personnel in the discipline applicable to the feature being modified

AND

Notification of the designer of record

Construction by contractor personnel - any modifications require approval by the Contracting Officer or the Contracting Officer’s representative.”

AND

Notification of the designer of record

1-4.2.2 Standard designs for Semi-permanent facilities (Chapter 4)

The Designer of Record for a Facility Design must review and approve all alterations, outside of the parameters identified in the design prior to implementation.

1-4.3 Corrosion Protection.

Provide durability and protection from corrosive environments for systems, components, and connections required by this UFC appropriate for the life expectancy of the facility.

Protection and surface finishing will be as indicated in drawings, specifications, and/or contracts as applicable for semi-permanent facilities.

If included, DoDI 5000.67 Prevention and Mitigation of Corrosion on DoD Military Equipment and Infrastructure directs that trade-off decisions include cost, useful service life, and effectiveness.

1-4.4 Alternative Design Approaches.

Alternative design approaches that comply with the criteria in this UFC are encouraged.

1-4.5 Fuel Systems.

Follow approved technical manuals or manufacturer instructions.

1-4.6 Water Treatment, Storage, and Distribution.

Design and operate all potable water (drinking water) facilities and systems to ensure protection of health and safety. Requirements for systems may be addressed in COCOM or coalition guidance or international agreements.

Army, Navy, Marine Corps must comply with the respective chapters from ATP 4-44/MCRP 3-17.7Q Water Support Operations and NTRP 4-04.2.13/FM 3-34.469/AFMAN 32-1072, Water-Well Drilling Operations:

- Water Treatment
- Water Storage, Distribution and Issue

Air Force must comply with the respective chapters from AF TTP 3-32.33 V1.

1-4.7 Structural / Seismic.

Where site specific information is unknown, the following may be considered:

- Occupancy Category II

- Soil Site Class: D
- Mapped Seismic Spectral Response Coefficients: Ss=0.64g / S_1=0.18g

1-4.8 Equipment Used as Facilities.

Equipment (such as tents and prepackaged structures requisitioned through the supply system (*Department of Defense Dictionary of Military and Associated Terms*)), Table of Organizational Equipment, Commercial off the Shelf procurements, Relocatable Buildings, and all DOD program of record solutions will be deployed IAW all relevant manufacture specifications, technical manuals and bulletins, and with regard to the requirements of this UFC

1-4.9 Quality Management.

Combatant/Service Component Commands must establish and maintain a Quality Management (QM) system through the duration of the project life cycle to ensure that facilities comply with the requirements of this UFC.

1-4.10 Facility Data Placards.

Include a data plate on entry doors for all buildings. Data plates must include: year of construction, facility construction level, occupancy type (per basis of design or per NFPA 101 Chapter 6),

Update the data plate when the intended use of the building changes and/or to include building modifications.

See Appendix D for data plate example.

1-4.11 Inspections.

Inspect buildings prior to initial occupancy, at unit transfer, or when reaching buildings initial design life. Inspections must follow UFC 1-201-02 Assessment of Existing Facilities for Use in Military Operations.

1-5 CYBERSECURITY.

All control systems (including systems separate from an energy management control system) must be planned, designed, acquired, executed, and maintained in accordance with UFC 4-010-06, and as required by individual Service Implementation Policy.

1-6 GLOSSARY.

APPENDIX B-1 contains acronyms.

The authorities for the definition are included where applicable.

1-6.1 Authority Having Jurisdiction/Building Official/Code Official.

The terms above as used in the codes and standards referenced in this UFC are the stated entities as defined in UFC 1-200-01 1-5.

1-6.2 Billeting.

Any building or portion of a building, regardless of population density, in which 11 or more unaccompanied DoD personnel are routinely housed, including Temporary Lodging Facilities and military family housing permanently converted to unaccompanied housing. Billeting also applies to expeditionary structures with similar populations and functions. (UFC 4-010-01).

Billeting does not include sleeping spaces in facilities with 24 hour operations such as HQ, TOCs, JOCs or Air Terminals.

1-6.3 Base Operating Support Integrator (BOS-I).

BOS-I Is responsible for planning and synchronizing the efficient application of resources and contracting to facilitate unity of effort and the coordination of sustainment functions at designated contingency locations (JP 4-0).

1-6.4 Building.

A structure, usually enclosed by walls and a roof, constructed to provide support or shelter for an intended occupancy. Note that other structures, such as canopies, are not considered buildings for the purposes of these standards. (UFC 4-010-01).

1-6.5 Designer of Record

The entity that performed the original design and maintains ownership of the design. This is noted in the title block of the design drawings.

1-6.6 Exemption.

An exemption provides authority to deviate from a UFC requirement indefinitely.

1-6.7 Facility.

A real property entity consisting of one or more of the following: a building, a structure, a utility system, pavement, and underlying land (*Department of Defense Dictionary of Military and Associated Terms*).

1-6.8 Facility Construction Levels.

1-6.8.1 Organic construction level.

Organic construction level is a subset of the Initial construction level.

Intended for use up to 90 days, it may be used for up to six months. See JP 3-34.

1-6.8.2 Initial construction level.

Initial construction level is intended for immediate use by units upon arrival in theater for up to twenty-four months. See JP 3-34.

1-6.8.3 Temporary construction level.

Temporary construction level buildings and facilities are designed and constructed to serve a life expectancy of five years or less. See JP 3-34.

1-6.8.4 Semi-Permanent construction level.

Buildings and facilities designed and constructed to serve a life expectancy of less than 10 years. With maintenance and upkeep of critical building systems, the life expectancy of a facility can be extended to 25 years. See JP 3-34.

1-6.9 Occupancy Type.

The category description of a facility based on the usage.

1-6.10 Qualified Personnel.

A professionally registered technical expert.

1-6.11 Range of Military Operations.

The military instrument of national power can be used in a wide variety of ways that vary in purpose, scale, risk, and combat intensity. These various ways can be understood to occur across a continuum of conflict ranging from peace to war. (JP 1).

1-6.12 Structure Group

A cluster of independent structures, including tents, trailers, containerized housing units, or similar construction typically occupied by 200 or fewer personnel except in the case of the DEPMEDS (Deployable Medical Systems).

1-6.13 Waiver.

A waiver provides authority to deviate from an UFC requirement for no more than twelve months or for a length of time as designated by the approval authority

1-7 REFERENCES.

APPENDIX C contains a list of references used in this document. The publication date of the code or standard is not included in this document. Unless otherwise specified, the most recent edition of the referenced publication applies.

CHAPTER 2 INITIAL FACILITY CONSTRUCTION LEVEL

2-1 APPLICABILITY.

The Initial Construction Level encompasses two sublevels defined in Joint Publication (JP) 3-34 Joint Engineer Operations:

Organic – intended for use up to 3 months (90 days) which can be extended to a maximum of 6 months (180 days).

Initial – Structures with an expected use not to exceed 24 months (2 years)

Construction requirements for Initial Facility Construction Level rely primarily on manufacturers' instructions provided with Government-approved systems, Service-specific Field Manuals, and Handbooks developed for pre-packaged assemblies and equipment. This Chapter addresses requirements that affect life safety and health of personnel when establishing base operations. Typical to transient mission activities, it may require system upgrades or replacement by more substantial or durable facilities during the course of operations.

2-1.1 Organic Construction Level.

The Organic construction level is a subset of the Initial construction level intended for use up to 90 days, it may be used for up to six months. See JP 3-34.

Organic equipment is a program of record system provided under a unit's table of authorized distribution allowances. Organic Facility construction must follow manufacturers' instructions, Service- specific Manuals and Handbooks developed for pre-packaged assemblies and equipment.

2-1.2 Initial Construction Level.

The Initial construction level is intended for immediate use by units upon arrival in theater for up to twenty-four months. See JP 3-34.

Fabric shelters are Initial construction level facilities.

Container Housing units are Initial level facilities, unless specifically designed to a higher construction level.

2-2 PRIMARY CRITERIA.

The following sections must be used as criteria for organic and initial facility construction. Where conflicts existing between the UFCs, other industry codes and standards, this UFC takes precedence.

For unit organic tentage used in establishing base operations, comply with Sections 2-2.1 thru 2-2.14 of this document.

2-2.1 CIVIL/SITE.

The requirements for site water treatment, storage and distribution, and waste disposal may be included in Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA) and as required by the Military Command having jurisdiction over the operation. The information below is a listing of some, but not necessarily all of those requirements. It is the responsibility of the user to determine which criteria are to be utilized for the operation.

2-2.2 Stormwater.

Locate facilities and equipment away from areas subject to stormwater runoff and flooding. Avoid low lying, tidal, and tributary areas. Consider adjacent facilities or functional areas when planning stormwater runoff control. Control water flow with surface drainage and trenches. When available, place surface laid / shallow buried culverts.

2-2.3 Structural.

Follow manufacturers' instructions for Government-approved systems for assembly of pre-packaged shelters in theater. The authority for Government-approved shelter systems is the Joint Committee on Tactical Shelters (JOCOTAS).

2-2.4 Electrical.

Follow manufacturers' instructions for installation of Government-approved pre-packaged electrical equipment in theater.

If pre-packaged systems are not available:

- Comply with the requirements of UFC 3-550-01, *Exterior Electrical Power Distribution*, Section 3-2, "General Electrical Requirements".
- Comply with the requirements of UFC 3-520-01, Interior Electrical Systems, Section 3-12, "Grounding, Bonding, and Static Protection".
- Comply with UFC 3-550-01, Exterior Electrical Power Distribution, Section 3-14, "Distribution System Grounding".

2-2.4.2 Grounding.

Ground all electrical systems in accordance with manufacturer recommendations.

2-2.4.3 Power Cable Installation.

Surface lay or protect cables from vehicular and foot traffic over power cables where appropriate.

2-2.4.4 Circuit Lockout Requirements.

Follow manufacturers' instructions for installation of Government-approved pre-packaged electrical equipment in theater.

Non-government pre-packaged circuit breakers, disconnect switches, and other devices that are electrical energy isolating must be lockable or protected from unauthorized access.

2-2.5 Plumbing and Mechanical.

2-2.5.1 Water Treatment, Storage, and Distribution.

Design and operate all potable water (drinking water) facilities and systems to ensure protection of health and safety. Requirements for systems may be addressed in COCOM or coalition guidance or international agreements.

Army, Navy, Marine Corps must comply with the respective chapters from ATP 4-44/MCRP 3-17.7Q Water Support Operations and NTRP 4-04.2.13/FM 3-34.469/AFMAN 32-1072, Water-Well Drilling Operations:

- Water Treatment
- Air Force must comply with the respective chapters from AF TTP 3-32.33 V1.

2-2.5.2 Waste Water.

All waste water facilities and systems must be designed and operated to ensure protection of health and safety. Requirements for systems may be addressed in international agreements, COCOM or coalition guidance.

2-2.5.3 Heating, Ventilating and Air-Conditioning (HVAC).

Install ventilation and environmental control systems in accordance with manufacturers' instructions and service technical manuals for pre-packaged heating, ventilating, and air-conditioning (HVAC) systems.

2-2.6 Fire Protection.

The overarching requirement is for Life Safety.

Property Protection is a consideration only if specifically required by the facility owning entity.

Fire protection requirements for Initial Construction Level assume no active fire protection or site water supplies are to be provided.

Provide an alarm initiating device at each exit by either:

a. Push-button stations with tamper resistant covers with battery powered alarm controlling a separate strobe.

OR

b. Combined standalone sounder and strobe battery powered push button stations with interconnection capability.

2-2.6.1 Allowable Area / Population.

No more than 200 persons shall be located within a billeting structure group. Occupant loads for this determination must be calculated based on the number of beds.

See UFC 4-010-01 for antiterrorism/force protection requirements related to space separation.

2-2.6.2 Structure Separation.

Where this document uses the term structure group, this is defined as a cluster of independent structures, including tents, trailers, containerized housing units, or similar construction.

Separation of structures within structure groups consisting of fabric structures, containers, trailers, or similar structures must comply with the following:

a. The minimum separation between individual structures within a row of a billeting structure group consisting of fabric structures must be 12 ft (3.7 m).

b. The minimum separation between rows of structures within a billeting structure group must be 30 ft (9.1 m). This distance may be used for vehicle traffic, but must not be used for vehicle parking, storage, or vegetation other than a lawn.

c. The minimum separation between billeting structure groups must be 59 ft (18 m). The separation distance may be used for vehicle traffic (including emergency response vehicles), but must not be used for vehicle parking, storage or vegetation other than a lawn.

d. The minimum separation between billeting structure groups and other structures must be 100 ft (30.5 m). The separation distance may be used for vehicle traffic (including emergency response vehicles), but must not be used for vehicle parking, storage or vegetation other than a lawn.

2-2.6.3 Use of Revetments.

See UFC 4-010-01 for a diagram of the space separation requirements. If the space separations between individual structures given above cannot be achieved due to existing site constraints, then revetments may be used to reduce allowable separation distances between structures. Revetments may consist of engineered hardened walls, concrete barriers, HESCO type barriers, or similar separating barriers. Revetments adjacent to tents or other structures must be at least as tall as the height of the tent wall, or the lower eave of the building. In the event revetments are provided, adjacent structures need to be separated as stated in UFC 4-010-01.

2-2.6.4 Fire Safety Analysis for Constrained Sites

If site constraints do not permit compliance with the above space separation requirements, a fire-safety analysis must be done. This evaluation must be performed or reviewed by the Unit Safety Officer and this analysis must be approved by the first O-6 level officer in the chain of command.

2-2.6.5 Interior Finishes / Fabric Coverings

Fabric coverings for tents or membrane structures must be in accordance with NFPA 701 requirements. Typically, compliance with NFPA 701 is achieved using fire retardant chemically treated fabrics.

Other structures must comply with NFPA 101 requirements. Compliance with NFPA 101 can be achieved using painted or unpainted finishes of concrete masonry units, gypsum wallboard, sheet metal, or 3/8-inch (9.5 mm) plywood. Fabric covering or textile coverings must be fire retardant as established by the manufacturer through testing in accordance with NFPA requirements.

Use or installation of exposed Urethane foam or other exposed plastic insulations on walls or ceilings is not allowed. **\2** Use of pre-insulated panels (with any surface – metal, wood, plastic or other) containing foam insulation is not allowed. **/2/**

2-2.6.6 Fire Extinguishers.

All facilities must be provided with listed portable fire extinguishers consistent with the occupancy of the facility (see NFPA 10, Standard for Portable Fire Extinguishers). If traditional listed/approved extinguishers are not available, the use of extinguishers with equivalent rating from EU, Asian, or other countries is permitted.

2-2.7 Telecommunications.

- Army requirements are contained in FM 4-20.07, paragraphs 2-79 and 4-25.
- Air Force requirements are in AFH 10-222, Volume 1, Table 2.8, and Attachment 6.
- Navy/Marine Corps must follow assembly instructions for installation of pre-packaged equipment in theater.
- If pre-packaged systems are not available and when fabricating a grounding system from components:
- Follow UFC 3-580-01, *Telecommunications Interior Infrastructure Planning and Design*, Section 2-9, “Grounding, Bonding and Static Protection”.

- Follow UFC 3-580-01, Appendix A, Item 19: TIA-J-STD-607-B, *Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises*.
- Follow UFC 3-580-01, Appendix A, Item 23: MIL-STD-188-124B, *Grounding, Bonding And Shielding for Common Long Haul/Tactical Communication Systems Including Ground Based Communications-Electronics Facilities and Equipments*.
- Follow UFC 3-580-01, Appendix A, Item 24: MIL-HDBK-419A, *Grounding, Bonding, and Shielding For Electronic Equipments and Facilities*.

2-2.8 Cybersecurity.

All control systems (including systems separate from an energy management control system) must be planned, designed, acquired, executed, and maintained in accordance with UFC 4-010-06, and as required by individual Service Implementation Policy.

CHAPTER 3 TEMPORARY FACILITY CONSTRUCTION LEVEL

3-1 APPLICABILITY.

The Temporary Facility Construction level applies to structures with an expected use not to exceed 60 months (5 years) and a design life up to 60 months (5 years).

3-2 CIVIL.

The requirements for site water treatment, storage and distribution, and waste disposal may be included in Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA) and as required by the Military Command having jurisdiction over the operation. The information below is a listing of some, but not necessarily all of those requirements. It is the responsibility of the service component engineer staff to determine which criteria are to be utilized for the operation.

3-2.1 Potable Water Supply Source Selection and Testing.

Use TB MED 577, Sanitary Control and Surveillance of Field Water Supplies, Chapter 5 “Water Source Selection and Basic Testing for Potability”, Chapter 6 “Advanced Water Surveillance and Testing”, Chapter 7 “Evaluation of Field Tests and Analytical Results (Health Guidelines)” for water supply source selection and testing. Use UFC 3-230-03A, Water Supply, Chapter 5, “Groundwater Supplies” for construction of wells for groundwater supplies.

3-2.2 Potable Water Treatment and Disinfection.

All drinking water facilities and systems must be designed and operated to ensure protection of personnel health and safety. The environmental annex (i.e., Annex L) of the applicable CCMD OPLAN/OPORD must be reviewed and updated as required to ensure appropriate force health protection standards for drinking water are included. Additional criteria may be applied in accordance with COCOM guidance, any applicable DoD policies, or international agreements. Facilities must also comply with TB MED 577, Chapter 9 Water Treatment and Disinfection, for potable water treatment and disinfection.

3-2.3 Gray Water Collection and Disposal.

Use Army FM 4-20.07, Chapter 2, Section I, “Gray Water Collection and Disposal”; Army FM 4-20.07, Chapter 3, Section II, “Gray Water Collection Subsystem”; AFH 10-222, Volume 4, Section 2.8, “Wastewater”; and AFH 10-222, Volume 4, Section 3.4.1, “Gray Water”.

3-2.4 Black Water Collection and Disposal.

Use Army FM 4-20.07, Chapter 2, Section I, “Black Water Disposal”; AFH 10-222, Volume 4, Section 2.8, “Wastewater”; and AFH 10-222, Volume 4, Section 3.4.2, “Black Water”.

3-2.5 Stormwater.

Locate facilities and equipment away from areas subject to stormwater runoff and flooding.

3-2.6 Design Documentation

3-2.6.1 Civil Submittals

Drawings: Site plan showing location of water source supply, sanitary sewer facilities, solid waste disposal areas, and all other facilities critical to life safety and health.

Calculations: Showing compliance with potable water testing requirements contained in referenced standards.

3-3 STRUCTURAL SYSTEMS.

3-3.1 Structural Design.

Structural Design must be in accordance with the International Building Code (IBC), Chapters 16, 17, 18, 19, 20, 21, 22, and 23 as modified by the Unified Facilities Criteria 3-301-01 Structural Engineering, except as modified herein.

3-3.1.1 Serviceability [Supplement].

Frame drift discussed in UFC 3-301-01 Section 2-1.2.1 need not be limited to prevent damage to non-structural elements provided any damage sustained does not create unsafe conditions for personnel in or around the structure.

3-3.1.2 Deflections [Replacement].

Modify UFC 3-301-01 Sections 2-1.2.2 and 2-1.2.3 as follows: Deflections of structural members may exceed the limitations of IBC Sections 1604.3.2 through 1604.3.5, Table 1604.3, and Table 2-1 of UFC 3-301-01 provided: (1) The increased deflection does not cause excessive rotations in connections at ends of members that could result in connection failure or, (2) The increased deflection does not create an unsafe condition where finishes or other non-structural items could become dislodged and fall on personnel. Under no circumstances are member deflections to exceed L/120 where L is the member span in inches. Members supporting mission critical equipment sensitive to excessive member deflection or vibration must be designed to meet equipment requirements.

3-3.1.3 Live Loads [Supplement].

It is not permissible to design structures for live loads less than those shown in UFC 3-301-01 Table D-1 or IBC Table 1607.1. Additionally, the minimum design uniform floor live load is 50 psf (245 kg/m^2), even if the occupancy classification for these codes allows a lower value. Similarly, for site specific designs, the minimum design uniform roof live load is 20 psf (98 kg/m^2), even if the location map allows a lower value.

Live load reductions are not permissible.

Dead Load shall be computed from material weights and partitions, safes, equipment, etc.

3-3.1.4 Wind Loads [Supplement].

It is permissible to multiply the basic wind speed, V, as identified in UFC 3-301-01, by a reduction factor of 0.78 for structures that meet the definition of temporary construction except in regions defined as Hurricane Prone Regions.

Site Specific:

- Values in UFC 1-301-01 section 1609.1.1.

Unrestricted:

With a minimum of:

- Basic wind speed (3-sec gust) 95 mph (153 km/hr)
- Exposure category C
- Importance factor I_w = 1.0

3-3.1.5 Earthquake Loads [Supplement].

For structures that meet the definition of temporary construction, it is permissible to multiply design loads calculated per the above referenced code sections by a reduction factor of 0.6 for structures that meet the following requirements:

1. For Risk Category I, II, or III structures, Ss does not exceed 0.55 and S_1 does not exceed 0.13.
2. For Risk Category IV structures, Ss does not exceed 0.32 and S_1 does not exceed 0.08.

Site Specific:

- Within the United States use IBC Section 1613
- Outside the United States use IBC Section 1613

Unrestricted:

- Within the United States use IBC Section 1613
- Outside the United States use IBC Section 1613

With a minimum of:

- For Risk category I, II, III or IV structures,
- Short period acceleration S_s = 0.55g
- One second acceleration S_1 = 0.13g
- Site class (assumed) D
- Importance factor I_e = 1.0

3-3.1.6 Structural Test and Special Inspections [Revision].

Delete IBC Chapter 17 Structural Tests and Special Inspections. The DOR must delineate all testing and inspection requirements in the construction drawings or specifications to ensure performance of the structural system. The DOR is responsible to provide an appropriate design in which the testing and inspection requirements specified in IBC Sections 1713, 1714, and 1715 can be met based on field capability and resources. Testing and inspections should include, but not be limited to, the following:

The UFC indicates the DOR must specify, however does not indicate limits of QC, nor any QA for the manufacturing process.

1. All Materials: Inspection of suitable sub-surface conditions. Visual inspection of member sizes, locations, spacing, and configuration. Visual inspection of splice/cold joint locations, connections, and adequate bearing.
2. Wood structures: In addition to the inspections for All Materials also perform visual inspection of connector (e.g. nails, screws, bolts) sizes, spacing and locations. Visual inspection of size and location of plate connections. Visual inspection of all straps, hold downs, and connection hardware. Visual inspection of overlapping lengths at splices. Visual inspection of member material grades. Visual inspection of sheathing thickness, sheathing material grades, shear wall locations, and cross bracing.
3. Masonry: In addition to the inspections for All Materials also perform visual inspection of grout placement. Visual inspection of reinforcing steel sizes, locations, clearances, configuration, embedment, and splice lengths. Grout cylinder compression tests, CMU compression tests, and verification of mortar and grout proportions.
4. Steel: In addition to the inspections for All Materials also perform visual inspection of deck profiles, diaphragm sizes and locations, and diaphragm connections. Visual inspection of completed welds. Visual inspection of connector (e.g. bolts, screws) number and patterns, and connector sizes. Inspection confirming proper tightening of the nuts. Visual inspection of cross bracing.

5. Concrete: In addition to the inspections for All Materials also perform visual inspection of formwork. Visual inspection of reinforcing steel sizes, locations, clearances, configuration, embedment, and splice lengths. Concrete anchors and embed sizes and locations. Concrete cylinder compression test, and water/cement ratio measurement.

3-3.1.7 Geotechnical Investigations, General [Supplement].

Add exception: The DOR or qualified DoD personnel must accept simplified geotechnical investigations in lieu of the full requirements of sections 1803.3 through for one-story, simple span structures without basements that bear on shallow foundations and meet the following requirements:

1. For Risk Category I, II, or III structures, Ss does not exceed 0.55 and S_1 does not exceed 0.13.
2. For Risk Category IV structures, Ss does not exceed 0.55 and S_1 does not exceed 0.13.

In the absence of a Geotechnical Report, the DOR must design foundations for presumptive bearing capacities per IBC Section 1806.

3-3.1.8 Reporting [Supplement].

The DOR must stipulate the required items, if any, to be included in a written report of the geotechnical investigations, which need not include any or all of IBC Section 1803.6, items 1 through 10.

3-3.1.9 Permanent Wood Foundation Systems [Supplement].

Delete preservative treatment requirements except in regions with a known significant risk of destructive insect infestations.

3-3.1.10 Foundations [Supplement].

Modify second sentence to read, “Deflection and racking of the supported structure must be limited to that which will not compromise the strength or stability of the structure.”

3-3.1.11 Frost Protection [Supplement].

Add exception: One-story, simple span structures that bear on shallow foundations need not be protected.

3-3.1.12 Timber Footings [Supplement].

Delete preservative treatment requirements except in regions with a known significant risk of destructive insect infestations.

3-3.1.13 Durability Requirements [Delete].

Delete IBC Section 1904.

3-3.1.14 Corrosive Environments [Delete].

Delete UFC 3-301-01 and IBC Section 1907.7.6.

3-3.1.15 Protection [Delete].

Delete IBC Section 2203.2.

3-3.1.16 Bolting [Delete].

Delete UFC 3-301-01.

3-3.1.17 General [Supplement].

Delete UFC 3-301-01. Members supporting mission critical equipment sensitive to excessive vibration must be designed to meet equipment requirements.

3-3.1.18 Steel Structures in Corrosive Environments [Supplement].

Delete UFC 3-301-01 except for steel sections with elements thinner than 3/8”.

3-3.1.19 Floor Vibrations [Supplement].

Delete UFC 3-301-01. Members supporting mission critical equipment sensitive to excessive vibration must be designed to meet equipment requirements.

3-3.1.20 Protection Against Decay and Termites [Delete].

Delete UFC 3-301-01 section except in regions with a known significant risk of destructive insect infestations.

3-3.2 Design Documentation

Provide as a minimum:

- Drawings:
  - General Notes
  - Inspection Requirements
  - Foundation Plans
  - Framing Plans, all levels

- Roof Framing Plans
- Details
- Schedules as required (footings, columns, beams, shear walls)

- Calculations:
  - Basis of Design; summary of applicable codes, live loading, snow loading, wind and seismic loads, and dead load assumptions Gravity design; design of floor and roof framing members - beams, slabs, joists, decks, composite slabs, etc.
  - Column and bearing wall design
  - Foundation design
  - Lateral design; design of diaphragms and collectors, distribution of loads to lateral forces resisting elements (frames, walls), design of shear walls, moment frames, and braced frames, design of foundations at lateral force resisting elements, design of hold downs, straps, etc.
  - Design for AT/FP; confirm setbacks, wall construction types, and progressive collapse mitigation design requirements, check window designs, jambs and sills for AT/FP window loading requirements

- Additional Requirements:
  - Load combinations used
  - Materials used with properties and section properties
  - Connection design and details – bolted and welded
  - Wind load analysis applied to structure
  - Seismic load analysis
  - Serviceability check (deflections and overturning)
  - Wall panel design (building envelope) and connection to superstructure
  - Stated structure life-span
  - Erection plan(s)

3-4 FIRE PROTECTION.

The overarching requirement is for Life Safety.

Property Protection is a consideration only if specifically required by the facility owning entity.

The intent of this document is to provide buildings that are limited in size (overall building height and floor area) so as to not require installed active fire protection or fire alarm systems, except where explicitly required by the criteria of an allowable occupancy in this UFC.

Any installed fire alarm system shall be a local alarm only and shall not require visual appliances (strobes), unless specifically required by the facility owning entity.

An acceptable alternate local alarm system:

- Consisting of an alarm initiating device at each exit by either:
  - Push-button stations with tamper resistant covers with battery powered alarm controlling a separate strobe.

    OR

  - Combined standalone sounder and strobe battery powered push button stations with interconnection capability.

3-4.1 General requirements

Use of Spray Plastic Foam Insulation (SPFI) is not allowed. **\2** Use of pre-insulated panels (with any surface – metal, wood, plastic or other) containing foam insulation is not allowed. **/2/**

3-4.1.1 Mission Critical Facilities

For mission critical facilities, see Figure E-1 in Appendix E for a decision tree with guidance on protection of assets for these facilities.

3-4.1.2 Antiterrorism Separation Distance

Refer to UFC 4-010-01 for antiterrorism/force protection requirements related to space separation compliance.

For all buildings, provide access to at least one side of any building for the largest emergency response vehicle serving the site.

3-4.1.3 Unenclosed Vertical Openings

Unenclosed vertical openings are generally not permitted. Vertical openings include but are not limited to atriums, stairways; hoist ways for elevators, dumbwaiters, or inclined and vertical conveyors (escalators); shafts used for light, ventilation or building services.

Mezzanines shall comply with requirements for mezzanines herein and in IBC Chapter 5, General Building Heights and Areas, and are not treated as vertical openings.

All vertical openings shall be enclosed or protected with shafts constructed as fire barriers as called for by the IBC Chapter 7, Fire and Smoke Protection Features, or NFPA 101 Chapters 7, Means of Egress, and 8, Features of Fire Protection, for the fire resistance rating of the barrier.

Any planned unenclosed vertical opening needs to be approved by the AHJ.

3-4.2 Construction Level and Space Separation Requirements per Occupancy.

Classifications of buildings within this section are based on occupancy. As defined by NFPA 101, Chapter 3, Definitions, the occupancy is the purpose for which a building or other structure, or part thereof, is used or intended to be used. The occupant load of these areas is calculated per NFPA 101, Chapter 7, Means of Egress.

3-4.2.1 Fire Separation Distance

This document provides requirements for allowable fire separations between structures by occupancy classification.

3-4.2.2 Area Limits

Area limits stated within this UFC are for a stand-alone building as defined in the IBC Chapter 5, General Building Heights and Areas. If larger building areas than stated herein are needed to meet the needs of users, then the following guidance is provided to facilitate the construction of buildings with larger areas, in order of preference:

1. Provide fire separation distance between separate structures in accordance with IBC Chapter 6, Types of Construction, requirements for fire separation between buildings.
2. Provide pedestrian walkways between buildings individually compliant with IBC Chapter 31, Special Construction, fire separation requirements to provide separate buildings interconnected with enclosed, conditioned walkways.
3. Provide fire rated exterior walls or fire walls between buildings in accordance with IBC Chapter 6, Types of Construction, requirements.

4. Provide buildings of an area or height to require fixed fire protection systems in accordance with IBC Chapter 5, General Building Heights and Areas requirements, and provide these fixed protection systems.

3-4.3 Assembly Occupancy

Assembly occupancy is an occupancy used for a gathering of 50 or more persons for deliberation, worship, entertainment, eating, drinking, amusement, awaiting transportation or similar uses; or used as a special amusement building, regardless of occupant load. Assembly occupancies include but are not limited to: dining facilities, clubs, chapels, conference rooms, and morale welfare, and fitness centers for general personnel use.

3-4.3.1 Building Construction.

Buildings must be constructed in accordance with one of the following options (a or b):

a. Buildings must be limited to one story high.

    i. Buildings constructed of combustible construction must be limited to 6,000 sq. ft. (557 sq. m.) in area.

    ii. Buildings constructed of non-combustible or fire-resistive construction must be limited to 9,500 sq. ft. (883 sq. m.) in area.

b. Buildings must be provided with a sprinkler system designed in accordance with the fire sprinkler requirements of this document. Buildings provided with this protection must be constructed in accordance with IBC Chapter 5, General Building Heights and Areas, limits on building areas. Building height must be limited to 2 stories.

3-4.3.2 Building Separation.

Buildings must be separated from other buildings by one of the following options (a or b):

a. A fire separation distance of 30 ft. (9.1 m) must be provided between the building and other buildings. The clear space may be used for vehicle roadways or pedestrian walkways, but not for parking, storage or vegetation other than lawns.

b. If fire separation distances as noted in Option (a) cannot be provided due to site constraints, one of the following must be provided:

    i. Each exterior wall of the building that faces an exposing building must be rated at one hour with opening protectives in accordance with IBC Chapters 6, Types of Construction, and 7, Fire and Smoke Protection Features, requirements.

ii. Each exterior wall of the building that faces an exposing building must be provided with a full height barrier (earth-filled bastions, pre-cast concrete barrier, sandbag revetment, or other similar type) without openings. The barrier must be at least as high as the eave level of the tallest structure involved. Adjacent buildings must be separated by at least twice the height of the taller building.

3-4.3.3 Egress Requirements.

Comply with NFPA 101, Chapters 7, Means of Egress, and 12, New Assembly Occupancies, for egress, except as follows:

a. For buildings without sprinkler protection in accordance with this document, provide exits 100% above the number required by NFPA 101, Chapters 7, Means of Egress, and 12, New Assembly Occupancies. Exits must be evenly distributed along at least three sides of the building.

3-4.3.4 Fire Alarm System

Provide local fire alarm notification throughout the space for evacuation in the event of an emergency. The fire alarm notification system must be activated by manual stations at each exit. The fire alarm notification system may be integrated with the mass notification system for the building. Fire alarm systems must comply with NFPA 72 requirements.

3-4.3.5 Kitchen Requirements.

Provide an exhaust hood with a listed kitchen hood fire protection system for any commercial-type cooking operation.

Provide one-hour rated fire barrier separation between any cooking/serving operations and the seating area(s).

3-4.4 Business Occupancy.

Business occupancy is an occupancy used for the transaction of business other than mercantile. Business occupancies include the following: general offices and administrative facilities, outpatient clinics, doctors' offices, detention facilities, and fitness centers that are located within an office, solely for office personnel use (no public or common use).

Business Occupancy can include sleeping spaces in facilities with 24 hour operations such as HQ, TOCs, JOCs or Air Terminals.

3-4.4.1 Building Construction.

Buildings must be constructed in accordance with one of the following options (a or b):

a. Buildings must be limited to 3 stories above grade.

   i. Buildings constructed of combustible construction must be limited to 9,000 sq. ft. (836 sq. m.) per floor.

   ii. Buildings constructed of non-combustible or fire-resistive construction must be limited to 23,000 sq. ft. (2,137 sq. m.) per floor.

b. Buildings must be provided with a sprinkler system designed in accordance with the fire sprinkler requirements of this document. Buildings provided with this protection must be constructed in accordance with 2009 IBC Chapter 5, General Building Heights and Areas, limits on floor areas. Building height must be limited to 3 stories.

3-4.4.2 Building Separation.

Buildings must be separated from other buildings by one of the following (a or b):

a. A fire separation distance of 30 ft. (9.1 m) must be provided between the building and other buildings within the same contingency compound. A clear space of 100 ft. (30.5 m) must be provided between the building and other buildings not associated with the contingency compound. Clear space must not be used for vehicle parking, storage, or vegetation other than lawns.

b. If fire separation distances as noted in Option (a) cannot be provided, one of the following must be provided:

   i. Each exterior wall of the building that faces an exposing building must be rated at one hour with opening protectives in accordance with IBC Chapters 6, Types of Construction, and 7, Fire and Smoke Protection Features, requirements.

   ii. Each exterior wall of the building that faces an exposing building must be provided with a full height barrier (earth-filled bastions, pre-cast concrete barrier, sandbag revetment, or other similar type) without openings. The barrier must be at least as high as the eave level of the tallest structure involved. Buildings must be separated by at least twice the height of the taller building.

Comply with NFPA 101, Chapters 7 and 38, for egress except that all exits, including grade level exit doors, exit stairs, and fire-rated exit passageways must discharge directly to the exterior to public ways.

3-4.4.3 Fire Alarm System.

Provide local fire alarm notification throughout the space where any of the following conditions occur:

a. Levels of the building located on other than grade level exceed 5,000 sq. ft. (465 sq. m.) per floor.

b. The total area of all floors exceeds 30,000 sq. ft. (2,787 sq. m.).

The notification system must be activated at each exit by either:

- Manual pull stations

  OR

- Push-button stations with tamper resistant covers with battery powered alarm controlling a separate strobe.

  OR

- Combined standalone sounder and strobe battery powered push button stations.

The fire alarm notification system may be integrated with the mass notification system for the building. Fire alarm systems must comply with the installation requirements of NFPA 72.

3-4.4.4 Detention Facilities.

Detention Facilities are classified as Business Occupancy with special population requirements. Detention facilities are those buildings and structures where persons are under restraint or where security is closely supervised and are not capable of self-preservation because the conditions of confinement are not under their control (i.e. they require assistance by the facility's staff to reach safety in an emergency situation). For occupancy classification purposes the population refers only to the number of persons being secured or restrained. The number of guests or staff is not counted.

3-4.4.4.1 Detention Facilities Allowable Population.

The allowable population of a detention facility, building or structure is no more than five (5) persons who are under restraint or security.

3-4.4.4.2 Detention Facilities Fire Separation Distance.

Buildings must be separated from other buildings by one of the following (a or b):

a. A fire separation distance of 30 ft. (9.1 m) must be provided between the building and other buildings within the same contingency compound. A clear space of 100 ft. (30.5 m) must be provided between the building and other buildings not associated with the contingency compound. Clear space must not be used for vehicle parking, storage, or vegetation other than lawns.

b. If fire separation distances as noted in Option (a) cannot be provided, one of the following must be provided:

i. Each exterior wall of the building that faces an exposing building must be rated at one hour with opening protectives in accordance with IBC Chapters 6, Types of Construction, and 7, Fire and Smoke Protection Features, requirements.

ii. Each exterior wall of the building that faces an exposing building must be provided with a full height barrier (earth-filled bastions, pre-cast concrete barrier, sandbag revetment, or other similar type) without openings. The barrier must be at least as high as the eave level of the tallest structure involved. Buildings must be separated by at least twice the height of the taller building.

3-4.4.5 Fire Alarm System

The fire alarm notification system must be activated at each exit by either:

a. Manual pull stations

OR

b. Push-button stations with tamper resistant covers with battery powered alarm controlling a separate strobe.

OR

c. Combined standalone sounder and strobe battery powered push button stations

The fire alarm notification system may be integrated with the mass notification system for the building. Fire alarm systems must comply with the installation requirements of NFPA 72.

3-4.5 Industrial Occupancy.

A factory-industrial occupancy is an occupancy in which products are manufactured or in which processing, assembling, mixing, packaging, finishing, decorating, or repair operations are conducted. This occupancy includes factories, laundries, power plants, maintenance shops, and pumping stations.

3-4.5.1 Building Construction.

Buildings must be constructed in accordance with one of the following options (a or b):

a. Buildings constructed of combustible construction must be limited to 8,500 sq. ft (790 sq. m.) and one story above grade.

b. Buildings constructed of non-combustible or fire-resistive construction must be limited to 15,500 sq. ft. (1,440 sq. m.) per floor and two stories above grade.

c. Buildings must be provided with a sprinkler system designed in accordance with NFPA 13. Buildings provided with this protection must be constructed in accordance with IBC Chapter 5, General Building Heights and Areas, requirements for floor areas and heights.

3-4.5.2 Building Separation.

Buildings must be provided fire separation from other buildings by one of the following (a or b):

a. A fire separation distance of 30 ft. (9.1 m) must be provided between the building and other buildings. Clear space must not be used for vehicle parking, storage, or vegetation other than lawns.

b. If fire separation distance as noted in Option (a) cannot be provided, one of the following must be provided:

   i. Each exterior wall of the building that faces an exposing building must be rated at one hour with opening protectives in accordance with IBC requirements.

   ii. Each exterior wall of the building that faces an exposing building must be provided with a full height barrier (earth-filled bastions, pre-cast concrete barrier, sandbag revetment, or other approved type) without openings. The barrier must be at least as high as the eave level of the tallest structure involved. Fire separation distance between these buildings must be at least twice the height of the taller building.

3-4.5.3 Fire Alarm System

The fire alarm notification system must be activated at each exit by either:

a. Manual pull stations

   OR

b. Push-button stations with tamper resistant covers with battery powered alarm controlling a separate strobe.

   OR

c. Combined standalone sounder and strobe battery powered push button stations

The fire alarm notification system may be integrated with the mass notification system for the building. Fire alarm systems must comply with the installation requirements of NFPA 72.

3-4.5.4 Egress Requirements.

Comply with NFPA 101, Chapters 7, Means of Egress, and 40, Industrial Occupancies, for egress in accordance with one of the following options (a or b):

a. Provide a minimum of two means of egress from every story or section, and not less than one exit shall be reached without traversing another story

OR

b. Provide a single means of egress from any story or section in low and ordinary hazard industrial occupancies, provided that the exit can be reached within the distance permitted as a common path of travel.

3-4.5.5 Mezzanines.

Mezzanines within industrial buildings cannot be used for normally occupied spaces (such as offices). Mezzanines must be limited to storage rooms and/or mechanical/electrical rooms only.

3-4.5.6 Fire Alarm System.

Provide local fire alarm notification throughout the space where a floor area more than 7500 sq. ft. (697 sq. m.) is located above or below grade, or if the total building area of all floors exceeds 30,000 sq. ft. (2,787 sq. m.). The fire alarm notification system must be activated by manual stations at each exit. The fire alarm notification system may be integrated with the mass notification system for the building. Fire alarm systems must be installed in accordance with NFPA 72.

3-4.5.7 Hazardous Areas.

Hazardous areas such as flammable painting operations, combustible dust producing operations, areas with combustible hydraulic fluid systems over 100 gallons (379 liters), or other industrial operations with significant flammable liquid or gas storage and/or use must be protected by one of the following (a or b):

a. Provided protection in accordance with NFPA 13, 30, and 101 requirements.

b. These areas must be located in buildings with a minimum 100 ft (30.5 m) fire separation distance from adjacent buildings.

3-4.6 Residential Occupancy.

The residential occupancy is defined as an occupancy that provides sleeping accommodations for purposes other than health care or detention and correctional. Residential occupancies include one- and two-family dwellings, dormitories, barracks, billeting, Bachelor Enlisted Quarters and Bachelor Officer’s Quarters, apartment buildings, relocatable buildings and converted shipping containers.

Residential Occupancy does not include sleeping spaces in facilities with 24 hour operations such as Headquarters (HQs), Tactical Operations Center (TOCs), Joint Operation Centers (JOCs), Air Terminals or any other facility with 24 hour operations.

3-4.6.1 Building Construction.

Buildings must be constructed in accordance with one of the following requirements (a or b):

a. Buildings constructed of combustible construction must be limited to 7,000 sq. ft. (650 sq. m.) per floor, and 2 stories in height.

   i. Buildings constructed of non-combustible construction must be limited to 15,000 sq. ft. (1,394 sq. m.) per floor, and 4 stories in height.

b. Buildings must be provided with a sprinkler system designed in accordance with NFPA 13R and the fire sprinkler requirements of this document. Buildings provided with this protection must be constructed in accordance with IBC Chapter 5, General Building Heights and Areas, requirements for floor areas. Building heights must be limited to 4 stories.

3-4.6.2 Building Separation.

Buildings must be separated from other buildings by one of the following (a or b):

a. A fire separation distance of 30 ft. (9.1 m) must be provided between the building and other buildings. Clear space must not be used for vehicle parking, storage, or vegetation other than lawns.

b. If fire separation distances as noted in Option (a) cannot be provided due to site constraints, one of the following must be provided (i, ii or iii):

   i. Each exterior wall of the building that faces an exposing building must be rated at one hour with opening protectives in accordance with IBC Chapters 6, Types of Construction, and 7, Fire and Smoke Protection Features, requirements.

   ii. Each exterior wall of the building that faces an exposing building must be provided with a full height barrier (earth-filled bastions, pre-cast concrete barrier, sandbag revetment, or other similar type) without openings. The barrier must be at least as high as the eave level of the tallest structure involved. Fire separation distance must be at least twice the height of the taller building.

   iii. The residential building must be provided with sprinkler protection by a system designed in accordance with NFPA 13R and the fire sprinkler requirements of this document.

3-4.6.3 Fire/Smoke Alarms.

Multiple station type smoke alarms must be provided throughout each room of the living quarters. Actuation of any smoke alarm must cause all smoke alarms within the living unit to generate an audible signal.

A manual fire alarm system must be provided throughout each building, with notification appliances provided in each living unit.

The fire alarm notification system must be activated at each exit by either:

a. Manual pull stations

OR

b. Push-button stations with tamper resistant covers with battery powered alarm controlling a separate strobe.

OR

c. Combined standalone sounder and strobe battery powered push button stations

3-4.6.4 Range-Top Extinguishing Systems.

For all living units with residential range-top cooking units, an approved residential range-top extinguishing system must be provided. Actuation of the residential range-top extinguishing system must cause a general building alarm, and automatically shut off all sources of fuel and electrical power to the cooking unit.

3-4.6.5 Egress Requirements.

Comply with NFPA 101, Chapters 7, Means of Egress, and 28, New Hotels and Dormitories, for egress, except as modified below:

Means of egress from sleeping rooms must be provided in accordance with one of the following (a or b):

a. A secondary means of escape must be provided, consisting of a door or window readily operable from inside with no special tools or knowledge. The window must be sized at a minimum of 5.7 sq. ft, (0.53 sq. m.) with a width of at least 20 inches (508 mm) and an open height of at least 24 inches (610 mm). The secondary means of escape must be located on a different exterior wall than the main entrance door to the sleeping room.

b. For sleeping rooms where it is not practical to provide a secondary means of escape as noted in (a), the following must be provided (i and ii):

   i. Walls between sleeping rooms must be rated at a minimum of 30 minutes.

ii. Sprinkler protection must be provided throughout the building installed in accordance with NFPA 13R or NFPA 13D requirements.

3-4.7 \4\ Storage.

Storage occupancy is an occupancy used primarily for the storage or sheltering of goods, merchandise, products, or vehicles. Storage occupancies include barns, cold storage, freight terminals, parking structures, truck and marine terminals, and warehouses. See section 3-4.9 of this document for requirements of fuel and hazardous materials storage areas.

3-4.7.1 Building Construction.

Buildings must be constructed in accordance with one of the following requirements (a, b, or c):

a. Buildings of combustible construction must be limited to 9,000 sq. ft. (836 sq. m.) in area and one story. Storage heights must be limited to 12 ft. (3.66 m) maximum.

b. Buildings of noncombustible or fire resistive construction must be limited to 17,500 sq. ft. (1,626 m.) and one story. Storage heights must be limited to 12 ft. (3.66 m) maximum.

c. Sized based on IBC Chapter 5, General Building Heights and Areas, and provided with sprinkler protection in accordance with UFC 3-600-01 and NFPA 13 requirements.

3-4.7.2 Building Separation.

Storage buildings must be provided with fire separation distance from surrounding buildings by one of the following options (a or b):

a. Fire separation distance of at least 60 feet (18.3 m) from any adjacent building must be provided.

b. Exterior walls must be rated at two hours or more, in accordance with IBC Chapters 6, Types of Construction, and 7, Fire and Smoke Protection Features, with 1-1/2 hour opening protectives provided for all openings on building sides where fire separation is less than 60 feet (18.3 m).

3-4.7.3 Egress Requirements.

Comply with NFPA 101, Chapters 7, Means of Egress, and 42, Storage Occupancies, for egress.

3-4.7.4 Mezzanines.

Mezzanines cannot be used for occupied spaces (such as offices). Any mezzanines can only be used for storage or mechanical/electrical equipment. ***/4/***

3-4.8 Aircraft Hangars.

Aircraft hangars must be protected as follows:

a. Single hangars over 15,000 sq. ft. (1,394 sq. m.) must be provided with fire protection as called for by UFC 3-600-01 Section 6-16, “Aircraft Facilities”.

b. Multiple hangars less than 15,000 sq. ft. (1,394 sq. m.) per hangar, that are separated by less than 50 ft. (15.2 m.) from each other, must be provided with fire protection as called for by UFC 3-600-01 Section 6-16, “Aircraft Facilities”.

c. Any hangar within 100 ft. (30.5 m.) of a normally occupied structure (office, shop, lodging building, etc) must be provided with fire protection as called for by UFC 3-600-01 Section 6-16, “Aircraft Facilities”.

3-4.8.1 Fire Alarm System

The fire alarm notification system must be activated at each exit by either:

a. Manual pull stations

OR

b. Push-button stations with tamper resistant covers with battery powered alarm controlling a separate strobe.

OR

c. Combined standalone sounder and strobe battery powered push button stations

3-4.9 Fuel Depots (Petroleum, Oil and Lubricants (POL) and Hazardous Material Storage Areas).

3-4.9.1 Fixed POL Storage

Fixed POL installations, including cut and cover type tanks, must comply with UFC 3-460-01.

3-4.9.2 Hazardous Materials and Hazardous Waste Storage

Hazardous materials and hazardous waste must be protected in accordance with UFC 3-600-01.

3-4.9.3 Flammable Liquid Storage

Flammable liquid storage tanks must be located as follows:

a. Above-ground tanks containing liquids with flash points less than 100 degrees F (38 degrees C) (gasoline, most solvents) must be separated from adjacent tanks or important buildings by 100 ft. (30.5 m.) or one tank diameter, whichever is greater.

b. Above-ground tanks containing liquids with flash points over 100 degrees F (38 degrees C) (typical diesel fuel and fuel oil) and more than 50,000 gallons (189,270 liters) must be separated from important buildings by 100 ft. (30.5 m.).

c. Above-ground tanks containing liquids with flash points over 100 degrees F (38 degrees C) and less than 50,000 gallons (189,270 liters) must be separated from important buildings by a minimum of 60 ft. (18.3 m.).

d. Underground storage tanks and bladders must be separated from adjacent underground tanks or important buildings by a minimum of 25 ft. (7.6 m.). Each underground bladder or tank must be provided an independent berm sized for containment of the largest tank’s volume.

e. All flammable liquid tanks must be provided with fire response vehicle access within one tank diameter of the tank on at least one side.

3-4.10 Mixed-use Occupancies and Co-locating of Occupancies.

Residential occupancies with accommodations for more than 10 persons must be located in separate buildings from dining, offices, and recreational occupancies. Dining, offices, and recreational occupancies may be co-located in a single building.

Conference rooms, lunch rooms, gymnasiums, or other assembly spaces located within a business or other occupancy may have an occupant load of up to 49 persons in a single space without the facility being considered a mixed-use occupancy. Occupant loads shall be calculated using NFPA 101 Chapter 7, Means of Egress.

Comply with NFPA 101 Chapter 6, Classification of Occupancy and Hazard of Contents, requirements for occupancy classifications and egress related to mixed-use occupancies and with IBC Chapter 5, General building Heights and Areas, for all other requirements related to mixed-use occupancies.

3-4.11 Medical Facilities.

Medical facilities are those that house inpatients. Refer to the applicable Service Medical Group for guidance in constructing medical facilities. These facilities will require a fire sprinkler system.

3-4.12 Sprinkler System Design Criteria.

3-4.12.1 Non-Residential Buildings

For the purposes of non-residential military facilities in the temporary or semi-permanent construction level, NFPA 13 serves as the sprinkler standard for sprinkler systems. In situations where it may not be possible to construct systems meeting the requirements of NFPA 13 related to water storage volume, the number of design sprinklers from NFPA 13R and an amended water supply duration may be used in lieu of the NFPA 13 requirements for non-storage buildings or non-hazardous occupancies.

NFPA 13R requires that all (or 4 at most if more than 4 exist in compartment) sprinklers in the hydraulically most remote compartment must be able to operate at the required density for 30 minutes. For the purposes of this document, the water supply must be required to supply sprinklers for 20 minutes, with a maximum supply volume of 2,000 gallons (7,571 liters) of water (based on 4 sprinklers operating at 25 gpm for 20 minutes).

For non-residential buildings, all other aspects of sprinkler installation, including scope of sprinkler system coverage and installation standard must be per NFPA 13.

3-4.12.2 Non-Residential Buildings

For the purposes of non-residential military facilities in the temporary or semi-permanent construction level, NFPA 13 serves as the sprinkler standard for sprinkler systems. In situations where it may not be possible to construct systems meeting the requirements of NFPA 13 related to water storage volume, the number of design sprinklers from NFPA 13R and an amended water supply duration may be used in lieu of the NFPA 13 requirements for non-storage buildings or non-hazardous occupancies.

NFPA 13R requires that all (or 4 at most if more than 4 exist in compartment) sprinklers in the hydraulically most remote compartment must be able to operate at the required density for 30 minutes. For the purposes of this document, the water supply must be required to supply sprinklers for 20 minutes, with a maximum supply volume of 2,000 gallons (7,571 liters) of water (based on 4 sprinklers operating at 25 gpm for 20 minutes).

For non-residential buildings, all other aspects of sprinkler installation, including scope of sprinkler system coverage and installation standard must be per NFPA 13.

3-4.12.3 Residential Buildings.

For residential buildings requiring sprinkler protection, sprinkler systems must be designed per NFPA 13R and this section, or NFPA 13D as applicable.

3-4.13 Design Documentation

- Drawing / Narrative Basis of Design (can be combined)

- A fire protection summary is required for all designs. Provide a summary discussing the following minimum fire protection provisions:
- Building code analysis summary drawing (i.e., type of construction, height and area limitations, and building separation or exposure protection),
- Classification of occupancy, mixed use requirements, any hazardous areas,
- Requirements for fire and smoke barriers, fire rated walls,
- Life safety plan showing locations of fire rated walls, egress paths, travel distances, and emergency response vehicle access,
- Fire protection plan (include type of system and location of equipment), and water supply information (if system is required),
- Fire alarm system (and mass notification system if integrated into the fire alarm) plan showing type of system and location of equipment, indicating reporting method to a central station/base location (if system is required),
- Interior finish ratings required and provided
- Coordination with security and antiterrorism requirements.

3-5 PLUMBING AND MECHANICAL SYSTEMS.

Provide interior spaces intended for occupancy with ventilation by natural or mechanical means in accordance with the International Mechanical Code (IMC), Chapter 4, “Ventilation”.

Recommend interior spaces intended for occupancy be provided with active or passive air-conditioning systems capable of maintaining the spaces at an ASHRAE effective maximum temperature of 93 degrees Fahrenheit (33.9 deg. C), and effective minimum temperature of 60 degrees Fahrenheit (15.5 deg. C).

3-5.1 Requirements for Specific Systems.

The requirements listed below in the remainder of this section are additional life safety and habitability requirements that must be incorporated if these features are included in order to meet the functional requirements as defined by the COCOM.

3-5.2 Engineering Weather Data.

Follow UFC 3-400-02, Design: Engineering Weather Data.

3-5.3 HVAC Systems and Controls.

Follow IMC Chapter titled “General Regulations”.

3-5.4 Exhaust Systems.

Follow IMC Chapter 5, Exhaust Systems.

3-5.5 Noise.

Noise levels shall not exceed the permissible exposures of 29 CFR 1910.95, Table G-16.

3-5.6 Plumbing - Introduction and Administration.

Follow UFC 3-420-01, *Plumbing Systems*, Section titled “Purpose and Scope,” through Section titled “Primary Voluntary Consensus Standard Reference,” and Section titled “Conflicts in Criteria.”

Requirements in UFC 3-420-01, Section titled “Energy Efficiency in Water Conservation” and Section titled “Reliability” do not apply; however, consideration must be given to resource conservation where and when practical. See paragraph 1-11 of this UFC, “Resource Conservation.” Follow UFC 3-420-01, Section titled “Piping Arrangement.” Piping is not required to be concealed or painted.

Follow UFC 3-420-01, Appendix A: IPC Chapter 1 “Administration” Supplements, Item A, Delete Chapter 1 in its entirety.

Follow UFC 3-420-01, Appendix A: IPC Chapter 2 “Definitions” Supplements.

3-5.7 Plumbing - General Regulations.

Follow the International Plumbing Code (IPC), Chapter 3, General Regulations, with the following exceptions:

- Section Titled, “Protection Against Contact”: does not apply
- Section Titled, “Protection Against Physical Damage”: does not apply
- Section Titled, “Equipment Efficiencies”: does not apply
- Section Titled.1, “Condensate Disposal”: does not apply with the exception of the last sentence that does apply (i.e., “Condensate cannot discharge into a street, alley, or other areas so as to cause a nuisance”).
- Section Titled, “Drain Pipe Materials and Sizes”: does not apply; instead refer to IPC Table 314.2.2, Condensate Drain Sizing, for condensate drain sizing.
- Section Titled, “Auxiliary and Secondary Drain Systems”: does not apply
- Follow UFC 3-420-01, *Plumbing Systems*, Appendix A: IPC Chapter 3 ”General Regulations” Supplements, Item F, Section 305.6 Freezing, with the exception of the third, fourth, and fifth sentences regarding piping freeze protection that do not apply.

- Follow UFC 3-420-01, *Plumbing Systems*, Appendix A: IPC Chapter 3 ”General Regulations” Supplements, Item G, Section 305.6.1 Sewer Depth, with the following revision: Revise to state: “Replace with the following: ‘Building sewers must be installed not less than 6 inches (150 mm) below the frost line.’”
- Follow UFC 3-420-01, *Plumbing Systems*, Appendix A: IPC Chapter 3 ”General Regulations” Supplements, Item H, Section 312.4 Drainage and Vent Final Test, with the following revision: Revise to state “Add after the last sentence: ‘A peppermint test may be accepted as a final test for the drainage and vent systems, provided the contractor submits a testing procedure for approval.’”

3-5.8 Plumbing Fixtures.

Follow the International Plumbing Code, Chapter 4, Fixtures, Faucets, and Fixture Fittings, with the following exceptions:

- Section Titled, “Minimum Plumbing Facilities”: does not apply. Instead provide a minimum of one water closet and one showerhead for every 20 occupants and a maximum of one water closet and one showerhead for every 10 occupants.
- Section Titled, “Accessible Plumbing Facilities”: does not apply except for special use facilities, such as medical, where more stringent standards may apply.
- Section Titled, “Setting”: does not apply
- Section Titled.1, “Floor Flanges”: does not apply
- Section Titled.3, “Securing Wall-hung Water Closet Bowls”: does not apply
- Section Titled, “Water-tight Joints”: does not apply
- Section Titled, “Plumbing in Mental Health Centers”: does not apply
- Section Titled.1, “Connection of Overflows”: does not apply
- Section Titled, “Slip Joint Connections”: does not apply
- Section Titled, “Design and Installation of Plumbing Fixtures”: does not apply
- Follow UFC 3-420-01, *Plumbing Systems*, Appendix A: IPC Chapter 4 "Fixtures, Faucets, and Fixture Fittings” Supplements, Item A, Section 401.2 Prohibited fixtures and connections, Item J, Add ”Section 411.3 Design guidance for emergency shower and eyewash stations”, Item K, Add ”Section 412.5 Required locations and construction“, and Item L, Add ”Section 412.6 Floor drains for emergency shower and eyewash stations”.

3-5.9 Water Heaters.

Follow the International Plumbing Code, Chapter 5, Water Heaters, with the following exceptions:

- Section 501.2, “Water Heater as a Space Heater”: does not apply
- Section 502.3, “Water Heaters Installed in Attics”: does not apply
- Section 503, “Connections”: does not apply
- Section 505, “Insulation”: does not apply
- Follow UFC 3-420-01, *Plumbing Systems*, Appendix A: IPC Chapter 5 ”Water Heaters” Supplements, Item H, Add “Section 506 Sizing Hot Water Systems, 506.1 Sizing Calculations” with the following revision: Revise to state: “Design in accordance with American Society of Heating Refrigerating and Air Conditioning Engineers (ASHRAE) Handbook – *HVAC Applications*, Chapter 49 ‘Service Water Heating’; and in accordance with ASHRAE Standard 90.1, *Energy Efficient Design of New Buildings Except Low-Rise Residential Buildings*. Size hot water system and set service water heater (SWH) storage temperature set point for not less than 140°F (60°C) to limit the potential for growth of Legionella pneumophila. Provide a hot water and cold water blending, tempering valve immediately downstream of the SWH storage tank to provide anti-scalding protection. Provide a balanced-pressure-type tempering valve. Set the blending valve to deliver 110°F (43°C) water to the fixtures except where higher temperatures are required by specialized equipment”.

3-5.10 Water Supply and Distribution.

Follow the International Plumbing Code Chapter 6, Water Supply and Distribution, with the following exceptions:

- Section 604.10, “Gridded and Parallel Water Distribution Systems”: does not apply
- Section 604.11, “Individual Pressure Balancing In-line Valves for Individual Fixture Fittings”: does not apply
- Section 608.8.3, “Size”: does not apply
- Follow UFC 3-420-01, *Plumbing Systems*, Appendix A: IPC Chapter 6 ”Water Supply and Distribution” Supplements, Item B, Add ”Section 602.2.1 Non-potable water exception”, Item J, Add ”Section 607.1.1 Legionella Pneumophila (Legionnaire’s Disease)”, Item M, Section 608.1 “General”, and Item N, Section 611.2 “Reverse osmosis systems”.

3-5.11 Sanitary Drainage.

- Follow International Plumbing Code, Chapter 7, “Sanitary Drainage”.

- Follow UFC 3-420-01, *Plumbing Systems*, Appendix A: IPC Chapter 7, “Sanitary Drainage Supplements”, Item B, Section 712.3.2 “Sump Pit”, and Item D, Section 712.3.6 “Controls”.

3-5.12 Indirect/ Special Waste.

Follow International Plumbing Code, Chapter 8, “Indirect/Special Waste”.

3-5.13 Vents.

Follow International Plumbing Code, Chapter 9, “Vents”.

3-5.14 Traps, Interceptors, and Separators.

Follow International Plumbing Code, Chapter 10, “Traps, Interceptors, and Separators”, with the following exceptions:

- Section 1002.4, “Trap Seals”: applies with the exception of the second sentence that does not apply (i.e. “Where a trap seal is subject to loss by evaporation, a trap seal primer valve must be installed”).
- Follow UFC 3-420-01, *Plumbing Systems*, Appendix A: IPC Chapter 10, “Interceptors and Separators Supplements”; Item A, Section 1002.4, “Trap Seals”.

3-5.15 Storm Drainage.

Follow International Plumbing Code, Chapter 11, “Storm Drainage”.

Follow UFC 3-420-01, *Plumbing Systems*, Appendix A: IPC Chapter 11 “Storm Drainage” Supplements, Item B, Section 1104.2, “Combining Storm with Sanitary Drainage”, and Item C, Add ”Section 1104.4 Insulation of rainwater conductors”.

3-5.16 Special Piping and Storage Systems.

Follow UFC 4-510-01, *Design: Medical Military Facilities*, Section titled “Medical Gas Systems” for medical gas and vacuum systems.

3-5.17 Gray Water Recycling Systems.

Follow International Plumbing Code, Appendix C, “Gray Water Recycling Systems”, Sections C101 and C102.

3-5.18 Emergency Shower and Eyewash Stations.

Follow UFC 3-420-01, Appendix D, “Design Guidance for Emergency Shower and Eyewash Stations”.

3-5.19 Structural Safety.

Follow International Plumbing Code, Appendix F, “Structural Safety”.

3-5.20 Compressed Air Systems.

Follow Compressed Air and Gas Institute’s *Compressed Air and Gas Handbook* and ASME Boiler and Pressure Vessel Codes.

3-5.21 Fuel Oil Piping and Storage.

Follow requirements in IMC Chapter 13 for fuel storage and piping supporting building systems.

3-5.22 Boilers, Water Heaters, and Pressure Vessels.

Follow requirements in IMC Chapter 10 for facilities that are provided with boilers or water heaters, and pressure vessels.

3-5.23 Refrigeration.

Follow requirements in IMC Chapter 11 for facilities that are provided with refrigerant systems.

3-5.24 Design Documentation

Drawings:

- Natural ventilation - Floor plans showing the layout of the ventilation system, dimensions of openings and associated equipment, and the means of controlling the system.
- Mechanical ventilation - Floor plans showing the layout of the ventilation system, equipment schedules and details, schematic diagrams, and control sequences and diagrams.

Calculations based on facility function and local climatic conditions:

- Natural ventilation – Calculations showing ventilation opening areas.
- Mechanical ventilation – Calculations showing required ventilation air quantities based on facility occupancy.
- For any specific systems as defined in Section 3-4.1.1, Requirements for Specific Systems, provide Mechanical System documentation in accordance with UFC-3-400-10N, Chapter 3-4, “Calculations”, and Chapter 3-5, “Drawings”, and Plumbing System documentation per UFC 3-420-01, Chapter 1-10.2, “Calculations”, and Chapter 1-11, “Drawings”.

3-6 ELECTRICAL SYSTEMS.

3-6.1 Hazardous Material and Waste.

Comply with the requirements of UFC 3-501-01, *Electrical Engineering*, Section 2-1.1, “Hazardous Materials and Waste, and Controlled Materials”.

3-6.2 Arc Flash Analysis.

Comply with the requirements of UFC 3-501-01, *Electrical Engineering*, Section 3-2.2, “Electrical Calculations Overview”, with the exception of the list of required calculations as outlined at the end of the referenced section. The only required calculations are short circuit, arc flash and lightning protection analyses.

Comply with the requirements of UFC 3-501-01, Section 3-2.6, “Arc Flash Analysis”.

Comply with the requirements of UFC 3-501-01, Section 2-1.12, “Arc Flash Warning Labels”.

3-6.3 Short Circuit Analysis.

Comply with the requirements of UFC 3-501-01, *Electrical Engineering*, Section 3-2.2, “Electrical Calculations Overview”, with the exception of the list of required calculations as outlined at the end of the referenced section. The only required calculations are short circuit, arc flash and lightning protection analyses.

Comply with the requirements of UFC 3-501-01, Section 3-2.4, “Short Circuit Analysis”.

3-6.4 Lightning Protection.

Comply with the requirements of UFC 3-501-01, *Electrical Engineering*, Section 3-2.2, “Electrical Calculations Overview”, with the exception of the list of required calculations as outlined at the end of the referenced section. The only required calculations are short circuit, arc flash and lightning protection analyses.

Comply with the requirements of UFC 3-501-01, Section 3-2.15, “Lightning Protection Calculations”.

Comply with the requirements of UFC 3-520-01, *Interior Electrical Systems*, Section 3-14, “Lightning Protection Systems”.

3-6.5 Service Entrance and Distribution Equipment.

Comply with the requirements of UFC 3-520-01, *Interior Electrical Systems*, Section 3-2, “Service Entrance and Distribution Equipment”, third paragraph. First, second and fourth paragraphs are not applicable.

3-6.6 Circuit Lockout Requirements.

Comply with the requirements of UFC 3-520-01, *Interior Electrical Systems*, Section 3-2.9, “Circuit Lockout Requirements”.

3-6.7 Raceway and Wiring.

Comply with the latest edition of NFPA 70, *National Electrical Code*, Chapter 2, “Wiring and Protection”; Chapter 3, “Wiring Methods and Materials”; and Chapter 4, “Equipment for General Use”.

3-6.8 Emergency and Exit Lighting.

Comply with the requirements of UFC 3-530-01, *Interior and Exterior Lighting Systems and Controls, Appendix B Best Practices: Interior, “Emergency and Exit Lighting”.*

3-6.9 General Electrical Requirements.

Comply with the requirements of UFC 3-550-01, *Exterior Electrical Power Distribution*, Section 3-2, “General Electrical Requirements”.

3-6.10 Configuration for Pad-mounted Distribution Transformers, Switchgears, and Sectionalizing Termination Cabinets.

Use dead-front construction for pad-mounted distribution transformers, switchgears, and sectionalizing termination cabinets unless not available within system parameters.

In rare cases when “live-front construction” is required due to equipment ratings (available system fault current values), obtain approval from the authority having jurisdiction.

3-6.11 Distribution System Grounding.

Comply with the requirements of UFC 3-520-01, *Interior Electrical Systems*, Section 3-12, “Grounding, Bonding, and Static Protection”.

Comply with UFC 3-550-01, *Exterior Electrical Power Distribution*, Section 3-14, “Distribution System Grounding”.

3-6.12 Fire Protection System for Oil-filled Equipment.

Comply with the requirements of UFC 3-550-01, *Exterior Electrical Power Distribution*, Section 3-19, “Fire Protection Considerations”.

3-6.13 Underground Structures (Manholes and Handholes).

Where required, power and communication systems must be in separate manholes.

3-6.14 Emergency and Standby Power Systems.

Comply with the requirements of International Building Code (IBC) latest edition, Chapter 27, Electrical, Section 2702, with the exception of the following subsections: 2702.2.8, Semiconductor Fabrication Facilities; 2702.2.9, Membrane Structures; 2702.2.14, Covered Mall Buildings; and 2402.2.18, Airport Traffic Control Towers.

Comply with the requirements of UFC 3-520-01 *Interior Electrical Systems*, Section 3-8, “Emergency Generators”.

3-6.15 Design Documentation.

Provide as a minimum:

- Drawings

Comply with the requirements of UFC 3-501-01, *Electrical Engineering*, Section 3-3, “Drawing Requirements”, and the following subsections:

- Section 3-3.2, “Site Plans”
- Section 3-3.9, “Lightning Protection Plans”
- Section 3-3.11, “Power One-line/Riser Diagrams”
- Section 3-3.18, “Grounding Diagram”
- Calculations

Comply with the requirements of UFC 3-501-01, *Electrical Engineering*, for the following calculations:

- Section 3-2.4, “Short Circuit Analysis”
- Section 3-2.6, “Arc Flash Analyses”
- Section 3-2.15, “Lightning Protection Calculations”

3-7 TELECOMMUNICATIONS SYSTEMS.

3-7.1 Grounding and Bonding.

Follow UFC 3-580-01, Telecommunications Interior Infrastructure Planning and Design, Section 2-9, “Grounding, Bonding and Static Protection”.

Follow UFC 3-580-01, Appendix A, Item 19: TIA-J-STD-607-B, Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises.

Follow UFC 3-580-01, Appendix A, Item 23: MIL-STD-188-124B, Grounding, Bonding And Shielding for Common Long Haul/Tactical Communication Systems Including Ground Based Communications- Electronics Facilities and Equipments.

Follow UFC 3-580-01, Appendix A, Item 24: MIL-HDBK-419A, Grounding, Bonding, and Shielding For Electronic Equipments and Facilities.

3-7.2 CYBERSECURITY.

All control systems (including systems separate from an energy management control system) must be planned, designed, acquired, executed, and maintained in accordance with UFC 4-010-06, and as required by individual Service Implementation Policy.

CHAPTER 4 SEMI-PERMANENT FACILITY CONSTRUCTION LEVEL

4-1 APPLICABILITY.

Buildings and facilities designed and constructed to serve a life expectancy of less than 10 years (120 months). With maintenance and upkeep of critical building systems, the life expectancy of a facility can be extended to 25 years (300 months). See JP 3-34.

4-2 CIVIL.

The requirements for site water treatment, storage and distribution, and waste disposal may be included in Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA) and as required by the Military Command having jurisdiction over the operation. The information below is a listing of some, but not necessarily all of those requirements. It is the responsibility of the service component engineer staff to determine which criteria are to be utilized for the operation.

4-2.1 Potable Water Supply Source Selection and Testing.

Use TB MED 577, *Sanitary Control and Surveillance of Field Water Supplies*, *Chapter* 5 “Water Source Selection and Basic Testing for Potability”, Chapter 6 “Advanced Water Surveillance and Testing”, Chapter 7 “Evaluation of Field Tests and Analytical Results (Health Guidelines)” for water supply source selection and testing. Use UFC 3-230-03A, *Water Supply*, Chapter 5, “Groundwater Supplies” for construction of wells for groundwater supplies.

4-2.2 Potable Water Treatment and Disinfection.

All drinking water facilities and systems must be designed and operated to ensure protection of personnel health and safety. The environmental annex (i.e., Annex L) of the applicable CCMD OPLAN/OPORD must be reviewed and updated as required to ensure appropriate force health protection standards for drinking water are included. Additional criteria may be applied in accordance with COCOM guidance, any applicable DoD policies, or international agreements. Facilities must also comply with TB MED 577, Chapter 9 Water Treatment and Disinfection, for potable water treatment and disinfection.

4-2.3 Gray Water Collection and Disposal.

Use Army FM 4-20.07, Chapter 2, Section I, “Gray Water Collection and Disposal”; Army FM 4-20.07, Chapter 3, Section II, “Gray Water Collection Subsystem”; AFH 10-222, Volume 4, Section 2.8, “Wastewater”; and AFH 10-222, Volume 4, Section 3.4.1, “Gray Water”.

4-2.4 Black Water Collection and Disposal.

Use Army FM 4-20.07, Chapter 2, Section I, “Black Water Disposal”; AFH 10-222, Volume 4, Section 2.8, “Wastewater”; and AFH 10-222, Volume 4, Section 3.4.2, “Black Water”.

4-2.5 Semi-Permanent Wastewater Treatment System.

If a wastewater treatment system is to be constructed to support facilities, use UFC 3-240-04A, *Wastewater Collection*, for wastewater collection, and use UFC 3-240-09FA, *Domestic Wastewater Treatment*, for wastewater treatment.

4-2.6 Stormwater.

Locate facilities and equipment away from areas subject to stormwater runoff and flooding.

4-2.7 Design Documentation.

Drawings: Site plan showing location of water source supply, sanitary sewer facilities, solid waste disposal areas, and all other facilities critical to life safety and health.

Calculations: Showing compliance with potable water testing requirements contained in referenced standards.

4-3 STRUCTURAL SYSTEMS.

4-3.1 Structural Design.

Structural Design must be in accordance with the International Building Code (IBC), Chapters 16, 17, 18, 19, 20, 21, 22, and 23 as modified by the Unified Facilities Criteria 3-301-01 *Structural Engineering*.

4-3.1.1 1604.3 Serviceability [Supplement].

Frame drift discussed in UFC 3-301-01 Section 2-1.2.1 need not be limited to prevent damage to non-structural elements provided any damage sustained does not create unsafe conditions for personnel in or around the structure.

4-3.1.2 1604.3.1 Deflections [Replacement].

Modify UFC 3-301-01 Sections 2-1.2.2 and 2-1.2.3 as follows: Deflections of structural members may exceed the limitations of IBC Sections 1604.3.2 through 1604.3.5, Table 1604.3, and Table 2-1 of UFC 3-301-01 provided: (1) The increased deflection does not cause excessive rotations in connections at ends of members that could result in connection failure or, (2) The increased deflection does not create an unsafe condition where finishes or other non-structural items could become dislodged and fall on personnel. Under no circumstances are member deflections to exceed L/120 where L is the member span in inches. Members supporting mission critical equipment sensitive to excessive member deflection or vibration must be designed to meet equipment requirements.

4-3.1.3 1607 Live Loads [Supplement].

It is not permissible to design structures for live loads less than those shown in UFC 3-301-01 Table D-1 or IBC Table 1607.1

Additionally, use the following minimum design loads:

- Reference UFC 3-301-01 Table D-1 with no live load reduction, or Floor minimum 100 psf for 1st floor loads (490 kg/m^2) more stringent than table G-1, minimum 50 psf for 2nd floor loads (245 kg/m^2)
- Roof Live Load as required by the facility location but not less than 20 psf (98 kg/m^2)
- Snow Load as required by the facility location but not less than 50 psf (245 kg/m^2)
- Dead Load shall be computed from material weights and partitions, safes, equipment, etc.

Live Load reductions are not permissible.

4-3.1.4 1609 Wind Loads [Supplement].

Site Specific:

- Values in UFC 1-301-01 section 1609.1.1

Unrestricted:

- Basic wind speed (3-sec gust) 110 mph (177km/hr)
- Exposure category C
- Importance factor I_w = 1.0

4-3.1.5 1613 Earthquake Loads [Supplement].

\3\ /3/

Site Specific:

- Within the United States use IBC Section 1613 **\3** 49 **/3/**
- Outside the United States use IBC Section 1613

Unrestricted:

- Within the United States use IBC Section 1613

- Outside the United States use IBC Section 1613

With a minimum of:

- For Risk category I, II, III or IV structures,
- Short period acceleration S_s = 0.55g
- One second acceleration S_1 = 0.13g
- Site class (assumed) D
- Importance factor I_e = 1.0

4-3.1.6 Structural Test and Special Inspections [Revision].

Delete IBC Chapter 17 Structural Tests and Special Inspections. The DOR must delineate all testing and inspection requirements in the construction drawings or specifications to ensure performance of the structural system. The DOR is responsible to provide an appropriate design in which the testing and inspection requirements specified in IBC Sections 1713, 1714, and 1715 can be met based on field capability and resources. Testing and inspections should include, but not be limited to, the following:

1. All Materials: Inspection of suitable sub-surface conditions. Visual inspection of member sizes, locations, spacing, and configuration. Visual inspection of splice/cold joint locations, connections, and adequate bearing.
2. Wood structures: In addition to the inspections for All Materials also perform visual inspection of connector (e.g. nails, screws, bolts) sizes, spacing and locations. Visual inspection of size and location of plate connections. Visual inspection of all straps, hold downs, and connection hardware. Visual inspection of overlapping lengths at splices. Visual inspection of member material grades. Visual inspection of sheathing thickness, sheathing material grades, shear wall locations, and cross bracing.
3. Masonry: In addition to the inspections for All Materials also perform visual inspection of grout placement. Visual inspection of reinforcing steel sizes, locations, clearances, configuration, embedment, and splice lengths. Grout cylinder compression tests, CMU compression tests, and verification of mortar and grout proportions.
4. Steel: In addition to the inspections for All Materials also perform visual inspection of deck profiles, diaphragm sizes and locations, and diaphragm connections. Visual inspection of completed welds. Visual inspection of connector (e.g. bolts, screws) number and patterns, and connector sizes. Inspection confirming proper tightening of the nuts. Visual inspection of cross bracing.

5. Concrete: In addition to the inspections for All Materials also perform visual inspection of formwork. Visual inspection of reinforcing steel sizes, locations, clearances, configuration, embedment, and splice lengths. Concrete anchors and embed sizes and locations. Concrete cylinder compression test, and water/cement ratio measurement.

4-3.1.7 1803.1 Geotechnical Investigations, General [Supplement].

Add exception: The DOR or qualified DoD personnel must accept simplified geotechnical investigations in lieu of the full requirements of sections 1803.3 through for one-story, simple span structures without basements that bear on shallow foundations and meet the following requirements:

1. For Occupancy Category I, II, or III structures, Ss does not exceed 0.55 and S1 does not exceed 0.13.
2. For Occupancy Category IV structures, Ss does not exceed 0.32 and S1 does not exceed 0.08.

In the absence of a Geotechnical Report, the DOR must design foundations for presumptive bearing capacities per IBC Section 1806.

4-3.1.8 1803.6 Reporting [Supplement].

The DOR must stipulate the required items, if any, to be included in a written report of the geotechnical investigations, which need not include any or all of IBC Section 1803.6, items 1 through 10.

4-3.1.9 1808.6.1 Foundations [Supplement].

Modify second sentence to read, “Deflection and racking of the supported structure must be limited to that which will not compromise the strength or serviceability of the structure.”

4-3.1.10 1809.5 Frost Protection [Supplement].

Add exception: One-story, simple span structures that bear on shallow foundations need not be protected.

4-3.1.11 1904 Durability Requirements [Delete].

Delete IBC Section 1904.

4-3.1.12 1907.7.6 Corrosive Environments [Delete].

Delete UFC 3-301-01 Section 2-4.2.1 and IBC Section 1907.7.6.

4-3.1.13 2203.2 Protection [Delete].

Delete IBC Section 2203.2.

4-3.1.14 2204.2 Bolting [Delete].

Delete UFC 3-301-01 Section 2-6.1.1.

4-3.1.15 2205.1 General [Supplement].

Delete UFC 3-301-01 Section 2-6.2.1. Members supporting mission critical equipment sensitive to excessive vibration must be designed to meet equipment requirements.

4-3.1.16 2205.4 Steel Structures in Corrosive Environments [Supplement].

Delete UFC 3-301-01 Section 2-6.2.2 except for steel sections with elements thinner than 3/8”.

4-3.1.17 2210.8 Floor Vibrations [Supplement].

Delete UFC 3-301-01 Section 2-6.4.3. Members supporting mission critical equipment sensitive to excessive vibration must be designed to meet equipment requirements.

4-3.1.18 2304.11 Protection Against Decay and Termites [Delete].

Delete section except in regions with a known significant risk of destructive insect infestations.

4-3.1.19 Semi-Permanent Construction Level Requirements.

Structural Design must be in accordance with the International Building Code (IBC), Chapters 16, 17, 18, 19, 20, 21, 22, and 23, and UFC 3-301-01 *Structural Engineering*.

4-3.1.20 Structural Test and Special Inspections [Revision].

Comply with testing and inspection requirements in Section 3-2.1.7 of this document.

4-3.2 Design Documentation.

Provide as a minimum:

- Drawings:
  - General Notes
  - Inspection Requirements
  - Foundation Plans
  - Framing Plans, all levels
  - Roof framing plans

  - Details
  - Schedules as required for footings, columns, beams, shear walls)

- Calculations:
  - Basis of Design: summary of applicable codes, live loading, snow loading, wind and seismic loading, dead load assumptions, gravity design, design of floor and roof framing members – beams, slabs, joist, decks, composite slabs, etc.
  - Column and bearing wall design
  - Foundation design
  - Lateral design: design of diaphragms and collectors, distribution of loads to lateral forces resisting elements (frames, walls), design of shear walls, moment frames, and braced frames, design of foundations at lateral force resisting elements, design of hold downs, straps, etc.
  - Design for AT/FP: confirm setbacks, wall construction types, and progressive collapse mitigation design requirements, check window designs, jambs and sills for AT/FP window loading requirements.
  - Load combinations used
  - Materials used with properties and section properties
  - Connection design and details – bolted and welded
  - Wind load analysis applied to structure
  - Seismic load analysis
  - Serviceability check (deflections and overturning)
  - Wall panel design (building envelop) and connection to superstructure
  - Stated structure life-span
  - Erection plan(s)

4-4 FIRE PROTECTION.

The overarching requirement is for Life Safety.

Property Protection is a consideration only if specifically required by the facility owning entity.

The intent of this document is to provide buildings that are limited in size (overall building height and floor area) so as to not require installed active fire protection or fire alarm systems, except where explicitly required by the criteria of an allowable occupancy in this UFC.

Any installed fire alarm system shall be a local alarm only and shall not require visual appliances (strobes), unless specifically required by the facility owning entity.

An acceptable alternate local alarm system:

a. Consisting of an alarm initiating device at each exit by either:

    i. Push-button stations with tamper resistant covers with battery powered alarm controlling a separate strobe.

    OR

b. Combined standalone sounder and strobe battery powered push button stations with interconnection capability.

4-4.1 General requirements.

Use of Spray Plastic Foam Insulation (SPFI) is not allowed, except for commercially procured insulated metal roof panels. **\2** Use of pre-insulated panels (with any surface – metal, wood, plastic or other) containing foam insulation is not allowed. **/2/**

4-4.1.1 Mission Critical Facilities.

For mission critical facilities, see Figure E-1 in Appendix E for a decision tree with guidance on protection of assets for these facilities.

4-4.1.2 Antiterrorism Separation Distance.

Refer to UFC 4-010-01 for antiterrorism/force protection requirements related to space separation compliance.

For all buildings, provide access to at least one side of any building for the largest emergency response vehicle serving the site.

4-4.1.3 Unenclosed Vertical Openings.

Unenclosed vertical openings are generally not permitted. Vertical openings include but are not limited to atriums, stairways; hoist ways for elevators, dumbwaiters, or inclined and vertical conveyors (escalators); shafts used for light, ventilation or building services.

Mezzanines shall comply with requirements for mezzanines herein and in IBC Chapter 5, General Building Heights and Areas, and are not treated as vertical openings.

All vertical openings shall be enclosed or protected with shafts constructed as fire barriers as called for by the IBC Chapter 7, Fire and Smoke Protection Features, or NFPA 101 Chapters 7, Means of Egress, and 8, Features of Fire Protection, for the fire resistance rating of the barrier.

Any planned unenclosed vertical opening needs to be approved by the AHJ.

4-4.2 Construction Level Requirements and Space Separation Requirements per Occupancy.

Classifications of buildings within this section are based on occupancy. As defined by NFPA 101, Chapter 3, Definitions, the occupancy is the purpose for which a building or other structure, or part thereof, is used or intended to be used. The occupant load of these areas is calculated per NFPA 101, Chapter 7, Means of Egress.

4-4.2.1 Fire Separation Distance.

This document provides requirements for allowable fire separations between structures by occupancy classification.

4-4.2.2 Area Limits.

Area limits stated within this UFC are for a stand-alone building as defined in the IBC Chapter 5, General Building Heights and Areas. If larger building areas than stated herein are needed to meet the needs of users, then the following guidance is provided to facilitate the construction of buildings with larger areas, in order of preference:

1. Provide fire separation distance between separate structures in accordance with IBC Chapter 6, Types of Construction, requirements for fire separation between buildings.
2. Provide pedestrian walkways between buildings individually compliant with IBC Chapter 31, Special Construction, fire separation requirements to provide separate buildings interconnected with enclosed, conditioned walkways.
3. Provide fire rated exterior walls or fire walls between buildings in accordance with IBC Chapter 6, Types of Construction, requirements.

4. Provide buildings of an area or height to require fixed fire protection systems in accordance with IBC Chapter 5, General Building Heights and Areas requirements, and provide these fixed protection systems.

4-4.3 Assembly Occupancy

Assembly occupancy is an occupancy used for a gathering of 50 or more persons for deliberation, worship, entertainment, eating, drinking, amusement, awaiting transportation or similar uses; or used as a special amusement building, regardless of occupant load. Assembly occupancies include but are not limited to: dining facilities, clubs, chapels, conference rooms, and morale welfare, and fitness centers for general personnel use.

4-4.3.1 Building Construction.

Buildings must be constructed in accordance with one of the following options (a or b):

a. Buildings must be limited to one story high.

    i. Buildings constructed of combustible construction must be limited to 6,000 sq. ft. (557 sq. m.) in area.

    ii. Buildings constructed of non-combustible or fire-resistive construction must be limited to 9,500 sq. ft. (883 sq. m.) in area.

b. Buildings must be provided with a sprinkler system designed in accordance with the fire sprinkler requirements of this document. Buildings provided with this protection must be constructed in accordance with IBC Chapter 5, General Building Heights and Areas, limits on building areas. Building height must be limited to 2 stories.

4-4.3.2 Building Separation.

Buildings must be separated from other buildings by one of the following options (a or b):

a. A fire separation distance of 30 ft. (9.1 m) must be provided between the building and other buildings. The clear space may be used for vehicle roadways or pedestrian walkways, but not for parking, storage or vegetation other than lawns.

b. If fire separation distances as noted in Option (a) cannot be provided due to site constraints, one of the following must be provided:

    i. Each exterior wall of the building that faces an exposing building must be rated at one hour with opening protectives in accordance with IBC Chapters 6, Types of Construction, and 7, Fire and Smoke Protection Features, requirements.

ii. Each exterior wall of the building that faces an exposing building must be provided with a full height barrier (earth-filled bastions, pre-cast concrete barrier, sandbag revetment, or other similar type) without openings. The barrier must be at least as high as the eave level of the tallest structure involved. Adjacent buildings must be separated by at least twice the height of the taller building.

4-4.3.3 Egress Requirements.

Comply with NFPA 101, Chapters 7, Means of Egress, and 12, New Assembly Occupancies, for egress, except as follows:

a. For buildings without sprinkler protection in accordance with this document, provide exits 100% above the number required by NFPA 101, Chapters 7, Means of Egress, and 12, New Assembly Occupancies. Exits must be evenly distributed along at least three sides of the building.

b. Provide local fire alarm notification throughout the space for evacuation in the event of an emergency. The fire alarm notification system must be activated by manual stations at each exit. The fire alarm notification system may be integrated with the mass notification system for the building. Fire alarm systems must comply with NFPA 72 requirements.

4-4.3.4 Kitchen Requirements.

Provide an exhaust hood with a listed kitchen hood fire protection system for any commercial-type cooking operation.

Provide one-hour rated fire barrier separation between any cooking/serving operations and the seating area(s).

4-4.4 Business Occupancy.

Business occupancy is an occupancy used for the transaction of business other than mercantile. Business occupancies include the following: general offices and administrative facilities, outpatient clinics, doctors' offices, detention facilities, and fitness centers that are located within an office, solely for office personnel use (no public or common use).

4-4.4.1 Building Construction.

Buildings must be constructed in accordance with one of the following options (a or b):

a. Buildings constructed of combustible construction must be limited to 9,000 sq. ft. (836 sq. m.) per floor, and 3 stories above grade.

   i. Buildings constructed of non-combustible or fire-resistive construction must be limited to 23,000 sq. ft. (2,137 sq. m.) per floor, and 3 stories above grade.

b. Buildings must be provided with a sprinkler system designed in accordance with the fire sprinkler requirements of this document. Buildings provided with this protection must be constructed in accordance with 2009 IBC Chapter 5, General Building Heights and Areas, limits on floor areas. Building height must be limited to 3 stories.

4-4.4.2 Building Separation.

Buildings must be separated from other buildings by one of the following (a or b):

a. A fire separation distance of 30 ft. (9.1 m) must be provided between the building and other buildings within the same contingency compound. A clear space of 100 ft. (30.5 m) must be provided between the building and other buildings not associated with the contingency compound. Clear space must not be used for vehicle parking, storage, or vegetation other than lawns.

b. If fire separation distances as noted in Option (a) cannot be provided, one of the following must be provided:

   i. Each exterior wall of the building that faces an exposing building must be rated at one hour with opening protectives in accordance with IBC Chapters 6, Types of Construction, and 7, Fire and Smoke Protection Features, requirements.

   ii. Each exterior wall of the building that faces an exposing building must be provided with a full height barrier (earth-filled bastions, pre-cast concrete barrier, sandbag revetment, or other similar type) without openings. The barrier must be at least as high as the eave level of the tallest structure involved. Buildings must be separated by at least twice the height of the taller building.

Comply with NFPA 101, Chapters 7 and 38, for egress except that all exits, including grade level exit doors, exit stairs, and fire-rated exit passageways must discharge directly to the exterior to public ways.

4-4.4.3 Fire Alarm System.

Provide local fire alarm notification throughout the space where any of the following conditions occur:

a. Levels of the building located on other than grade level exceed 5,000 sq. ft. (465 sq. m.) per floor.

b. The total area of all floors exceeds 30,000 sq. ft. (2,787 sq. m.).

The notification system must be activated at each exit by either:

a. Manual pull stations

   OR

b. Push-button stations with tamper resistant covers with battery powered alarm controlling a separate strobe.

   OR

c. Combined standalone sounder and strobe battery powered push button stations.

The fire alarm notification system may be integrated with the mass notification system for the building. Fire alarm systems must comply with the installation requirements of NFPA 72.

4-4.4.4 Detention Facilities.

Detention Facilities are classified as Business Occupancy with special population requirements. Detention facilities are those buildings and structures where persons are under restraint or where security is closely supervised and are not capable of self-preservation because the conditions of confinement are not under their control (i.e. they require assistance by the facility's staff to reach safety in an emergency situation). For occupancy classification purposes the population refers only to the number of persons being secured or restrained. The number of guests or staff is not counted.

4-4.4.4.1 Detention Facilities Allowable Population.

The allowable population of a detention facility, building or structure is no more than five (5) persons who are under restraint or security.

4-4.4.4.2 Detention Facilities Fire Separation Distance.

Buildings must be separated from other buildings by one of the following (a or b):

a. A fire separation distance of 30 ft. (9.1 m) must be provided between the building and other buildings within the same contingency compound. A clear space of 100 ft. (30.5 m) must be provided between the building and other buildings not associated with the contingency compound. Clear space must not be used for vehicle parking, storage, or vegetation other than lawns.

b. If fire separation distances as noted in Option (a) cannot be provided, one of the following must be provided:

   i. Each exterior wall of the building that faces an exposing building must be rated at one hour with opening protectives in accordance with IBC

Chapters 6, Types of Construction, and 7, Fire and Smoke Protection Features, requirements.

ii. Each exterior wall of the building that faces an exposing building must be provided with a full height barrier (earth-filled bastions, pre-cast concrete barrier, sandbag revetment, or other similar type) without openings. The barrier must be at least as high as the eave level of the tallest structure involved. Buildings must be separated by at least twice the height of the taller building.

4-4.5 Industrial Occupancy.

A factory-industrial occupancy is an occupancy in which products are manufactured or in which processing, assembling, mixing, packaging, finishing, decorating, or repair operations are conducted. This occupancy includes factories, laundries, power plants, maintenance shops, and pumping stations.

4-4.5.1 Building Construction.

Buildings must be constructed in accordance with one of the following options (a or b):

a. Buildings constructed of combustible construction must be limited to 8,500 sq. ft (790 sq. m.) and one story above grade.

    i. Buildings constructed of non-combustible or fire-resistive construction must be limited to 15,500 sq. ft. (1,440 sq. m.) per floor and two stories above grade.

b. Buildings must be provided with a sprinkler system designed in accordance with NFPA 13. Buildings provided with this protection must be constructed in accordance with IBC Chapter 5, General Building Heights and Areas, requirements for floor areas and heights.

4-4.5.2 Building Separation.

Buildings must be provided fire separation from other buildings by one of the following (a or b):

a. A fire separation distance of 30 ft. (9.1 m) must be provided between the building and other buildings. Clear space must not be used for vehicle parking, storage, or vegetation other than lawns.

b. If fire separation distance as noted in Option (a) cannot be provided, one of the following must be provided:

    i. Each exterior wall of the building that faces an exposing building must be rated at one hour with opening protectives in accordance with IBC requirements.

ii. Each exterior wall of the building that faces an exposing building must be provided with a full height barrier (earth-filled bastions, pre-cast concrete barrier, sandbag revetment, or other approved type) without openings. The barrier must be at least as high as the eave level of the tallest structure involved. Fire separation distance between these buildings must be at least twice the height of the taller building.

4-4.5.3 Egress Requirements.

Comply with NFPA 101, Chapters 7, Means of Egress, and 40, Industrial Occupancies, for egress.

4-4.5.4 Mezzanines.

Mezzanines within industrial buildings cannot be used for normally occupied spaces (such as offices). Mezzanines must be limited to storage rooms and/or mechanical/electrical rooms only.

4-4.5.5 Fire Alarm and Mass Notification Systems.

Provide local fire alarm notification throughout the space where **1**\ any of the following conditions occur:

a. Levels of the building located on other than grade level exceed 5,000 sq. ft. (465 sq. m.) per floor.

b. The total area of all floors exceeds 30,000 sq. ft. (2,787 sq. m.).

The notification system must be activated at each exit by either:

a. Manual pull stations

OR

b. Push-button stations with tamper resistant covers with battery powered alarm controlling a separate strobe.

OR

c. Combined standalone sounder and strobe battery powered push button stations.

The fire alarm notification system may be integrated with the mass notification system for the building. Fire alarm systems must comply with the installation requirements of NFPA 72. /**1**/

4-4.5.6 Hazardous Areas.

Hazardous areas such as flammable painting operations, combustible dust producing operations, areas with combustible hydraulic fluid systems over 100 gallons (379 liters), or other industrial operations with significant flammable liquid or gas storage and/or use must be protected by one of the following (a or b):

a. Provided protection in accordance with NFPA 13, 30, and 101 requirements.

b. These areas must be located in buildings with a minimum 100 ft (30.5 m) fire separation distance from adjacent buildings.

4-4.6 Residential Occupancy.

The residential occupancy is defined as an occupancy that provides sleeping accommodations for purposes other than health care or detention and correctional. Residential occupancies include one- and two-family dwellings, dormitories, barracks, billeting, Bachelor Enlisted Quarters and Bachelor Officer’s Quarters, apartment buildings, relocatable buildings and converted shipping containers.

4-4.6.1 Building Construction.

Buildings must be constructed in accordance with one of the following requirements (a or b):

a. Buildings constructed of combustible construction must be limited to 7,000 sq. ft. (650 sq. m.) per floor, and 2 stories in height.

    i. Buildings constructed of non-combustible construction must be limited to 15,000 sq. ft. (1,394 sq. m.) per floor, and 4 stories in height.

b. Buildings must be provided with a sprinkler system designed in accordance with NFPA 13R and the fire sprinkler requirements of this document. Buildings provided with this protection must be constructed in accordance with IBC Chapter 5, General Building Heights and Areas, requirements for floor areas. Building heights must be limited to 4 stories.

4-4.6.2 Building Separation.

Buildings must be separated from other buildings by one of the following (a or b):

a. A fire separation distance of 30 ft. (9.1 m) must be provided between the building and other buildings. Clear space must not be used for vehicle parking, storage, or vegetation other than lawns.

b. If fire separation distances as noted in Option (a) cannot be provided due to site constraints, one of the following must be provided (i, ii or iii):

i. Each exterior wall of the building that faces an exposing building must be rated at one hour with opening protectives in accordance with IBC Chapters 6, Types of Construction, and 7, Fire and Smoke Protection Features, requirements.

ii. Each exterior wall of the building that faces an exposing building must be provided with a full height barrier (earth-filled bastions, pre-cast concrete barrier, sandbag revetment, or other similar type) without openings. The barrier must be at least as high as the eave level of the tallest structure involved. Fire separation distance must be at least twice the height of the taller building.

iii. The residential building must be provided with sprinkler protection by a system designed in accordance with NFPA 13R and the fire sprinkler requirements of this document.

4-4.6.3 Fire/Smoke Alarms.

Multiple station type smoke alarms must be provided throughout each room of the living unit in accordance with NFPA 72 residential fire alarm system requirements. Actuation of any smoke alarm must cause all smoke alarms within the living unit to generate an audible signal.

A manual alarm system must be provided throughout each building, with notification appliances provided in each living unit in accordance with NFPA 72 for residential type occupancies.

The notification system must be activated at each exit by either:

a. Manual pull stations

OR

b. Push-button stations with tamper resistant covers with battery powered alarm controlling a separate strobe.

OR

c. Combined standalone sounder and strobe battery powered push button stations

4-4.6.4 Range-Top Extinguishing Systems.

For all living units with residential range-top cooking units, an approved residential range-top extinguishing system must be provided. Actuation of the residential range-top extinguishing system must cause a general building alarm, and automatically shut off all sources of fuel and electrical power to the cooking unit.

4-4.6.5 Egress Requirements.

Comply with NFPA 101, Chapters 7, Means of Egress, and 28, New Hotels and Dormitories, for egress, except as modified below:

Means of egress from sleeping rooms must be provided in accordance with one of the following (a or b):

a. A secondary means of escape must be provided, consisting of a door or window readily operable from inside with no special tools or knowledge. The window must be sized at a minimum of 5.7 sq. ft, (0.53 sq. m.) with a width of at least 20 inches (508 mm) and an open height of at least 24 inches (610 mm). The secondary means of escape must be located on a different exterior wall than the main entrance door to the sleeping room.

b. For sleeping rooms where it is not practical to provide a secondary means of escape as noted in (a), the following must be provided (i and ii):

    i. Walls between sleeping rooms must be rated at a minimum of 30 minutes.

    ii. Sprinkler protection must be provided throughout the building installed in accordance with NFPA 13R or NFPA 13D requirements.

4-4.7 \4\ Storage.

Storage occupancy is an occupancy used primarily for the storage or sheltering of goods, merchandise, products, or vehicles. Storage occupancies include barns, cold storage, freight terminals, parking structures, truck and marine terminals, and warehouses. See section 4-4.9 of this document for requirements of fuel and hazardous materials storage areas.

4-4.7.1 Building Construction.

Buildings must be constructed in accordance with one of the following requirements (a, b, or c):

a. Buildings of combustible construction must be limited to 9,000 sq. ft. (836 sq. m.) in area and one story. Storage heights must be limited to 12 ft. (3.66 m) maximum.

b. Buildings of noncombustible or fire resistive construction must be limited to 17,500 sq. ft. (1,626 m.) and one story. Storage heights must be limited to 12 ft. (3.66 m) maximum.

c. Sized based on IBC Chapter 5, General Building Heights and Areas, and provided with sprinkler protection in accordance with UFC 3-600-01 and NFPA 13 requirements.

4-4.7.2 Building Separation.

Storage buildings must be provided with fire separation distance from surrounding buildings by one of the following options (a or b):

a. Fire separation distance of at least 60 feet (18.3 m) from any adjacent building must be provided.

b. Exterior walls must be rated at two hours or more, in accordance with IBC Chapters 6, Types of Construction, and 7, Fire and Smoke Protection Features, with 1-1/2 hour opening protectives provided for all openings on building sides where fire separation is less than 60 feet (18.3 m).

4-4.7.3 Egress Requirements.

Comply with NFPA 101, Chapters 7, Means of Egress, and 42, Storage Occupancies, for egress.

4-4.7.4 Mezzanines.

Mezzanines cannot be used for occupied spaces (such as offices). Any mezzanines can only be used for storage or mechanical/electrical equipment. **/4/**

4-4.8 Aircraft Hangars.

The requirements of UFC 4-211-01 do not apply, unless specifically required by the facility owning entity.

Aircraft hangars must be protected as follows:

a. Single hangars over 15,000 sq. ft. (1,394 sq. m.) must be provided with fire protection as called for by UFC 3-600-01 Section 6-16, “Aircraft Facilities”.

b. Multiple hangars less than 15,000 sq. ft. (1,394 sq. m.) per hangar, that are separated by less than 50 ft. (15.2 m.) from each other, must be provided with fire protection as called for by UFC 3-600-01 Section 6-16, “Aircraft Facilities”.

c. Any hangar within 100 ft. (30.5 m.) of a normally occupied structure (office, shop, lodging building, etc) must be provided with fire protection as called for by UFC 3-600-01 Section 6-16, “Aircraft Facilities”.

4-4.9 Fuel Depots (Petroleum, Oil and Lubricants (POL) and Hazardous Material Storage Areas).

4-4.9.1 Fixed POL Storage.

Fixed POL installations, including cut and cover type tanks, must comply with UFC 3-460-01.

4-4.9.2 Hazardous Materials and Hazardous Waste Storage.

Hazardous materials and hazardous waste must be protected in accordance with UFC 3-600-01.

4-4.9.3 Flammable Liquid Storage.

Flammable liquid storage tanks must be located as follows:

a. Above-ground tanks containing liquids with flash points less than 100 degrees F (38 degrees C) (gasoline, most solvents) must be separated from adjacent tanks or important buildings by 100 ft. (30.5 m.) or one tank diameter, whichever is greater.

b. Above-ground tanks containing liquids with flash points over 100 degrees F (38 degrees C) (typical diesel fuel and fuel oil) and more than 50,000 gallons (189,270 liters) must be separated from important buildings by 100 ft. (30.5 m.).

c. Above-ground tanks containing liquids with flash points over 100 degrees F (38 degrees C) and less than 50,000 gallons (189,270 liters) must be separated from important buildings by a minimum of 60 ft. (18.3 m.).

d. Underground storage tanks and bladders must be separated from adjacent underground tanks or important buildings by a minimum of 25 ft. (7.6 m.). Each underground bladder or tank must be provided an independent berm sized for containment of the largest tank’s volume.

e. All flammable liquid tanks must be provided with fire response vehicle access within one tank diameter of the tank on at least one side.

4-4.10 Mixed-use Occupancies and Co-locating of Occupancies.

Residential occupancies with accommodations for more than 10 persons must be located in separate buildings from dining, offices, and recreational occupancies. Dining, offices, and recreational occupancies may be co-located in a single building.

Conference rooms, lunch rooms, gymnasiums, or other assembly spaces located within a business or other occupancy may have an occupant load of up to 49 persons in a single space without the facility being considered a mixed-use occupancy. Occupant loads shall be calculated using NFPA 101 Chapter 7, Means of Egress.

Comply with NFPA 101 Chapter 6, Classification of Occupancy and Hazard of Contents, requirements for occupancy classifications and egress related to mixed-use occupancies and with IBC Chapter 5, General building Heights and Areas, for all other requirements related to mixed-use occupancies.

4-4.11 Medical Facilities.

Medical facilities are those that house inpatients. Refer to the applicable Service Medical Group for guidance in constructing medical facilities.

4-4.12 Sprinkler System Design Criteria.

4-4.12.1 Non-Residential Buildings.

For the purposes of non-residential military facilities in the temporary or semi-permanent construction level, NFPA 13 serves as the sprinkler standard for sprinkler systems. In situations where it may not be possible to construct systems meeting the requirements of NFPA 13 related to water storage volume, the number of design sprinklers from NFPA 13R and an amended water supply duration may be used in lieu of the NFPA 13 requirements for non-storage buildings or non-hazardous occupancies.

NFPA 13R requires that all (or 4 at most if more than 4 exist in compartment) sprinklers in the hydraulically most remote compartment must be able to operate at the required density for 30 minutes. For the purposes of this document, the water supply must be required to supply sprinklers for 20 minutes, with a maximum supply volume of 2,000 gallons (7,571 liters) of water (based on 4 sprinklers operating at 25 gpm for 20 minutes).

For non-residential buildings, all other aspects of sprinkler installation, including scope of sprinkler system coverage and installation standard must be per NFPA 13.

4-4.12.2 Storage Buildings, Factory-Industrial and Hazardous Areas.

Storage buildings, factory-industrial, and hazardous areas, if sprinklered, must be protected by systems designed per NFPA 13, including supply duration and flow volume requirements.

4-4.12.3 Residential Buildings.

For residential buildings requiring sprinkler protection, sprinkler systems must be designed per NFPA 13R and this section, or NFPA 13D as applicable.

4-4.13 Design Documentation.

- Drawing / Narrative Basis of Design (can be combined)
- A fire protection summary is required for all designs. Provide a summary discussing the following minimum fire protection provisions, based on UFC 1-200-01, UFC 1-201-01 and UFC 3- 600-01:
- Building code analysis summary drawing (i.e., type of construction, height and area limitations, and building separation or exposure protection),

- Classification of occupancy, mixed use requirements, any hazardous areas,
- Requirements for fire and smoke barriers, fire rated walls,
- Life safety plan showing locations of fire rated walls, egress paths, travel distances, and emergency response vehicle access,
- Fire protection plan (include type of system and location of equipment), and water supply information (if system is required),
- Fire alarm system (and mass notification system if integrated into the fire alarm) plan showing type of system and location of equipment, indicating reporting method to a central station/base location (if system is required),
- Interior finish ratings required and provided
- Coordination with security and antiterrorism requirements.

4-5 PLUMBING AND MECHANICAL SYSTEMS.

Provide interior spaces intended for occupancy with ventilation by natural or mechanical means in accordance with the International Mechanical Code (IMC), Chapter 4, “Ventilation”.

Recommend interior spaces intended for occupancy be provided with active or passive air-conditioning systems capable of maintaining the spaces at an ASHRAE effective maximum temperature of 93 degrees Fahrenheit (33.9 deg. C), and effective minimum temperature of 60 degrees Fahrenheit (15.5 deg. C).

4-5.1 Requirements for Specific Systems.

The requirements listed below in the remainder of this section are additional life safety and habitability requirements that must be incorporated if these features are included in order to meet the functional requirements as defined by the COCOM.

4-5.2 Engineering Weather Data.

Follow UFC 3-400-02, Design: Engineering Weather Data.

4-5.3 HVAC Systems and Controls.

Follow IMC Chapter titled “General Regulations*”.*

4-5.4 Exhaust Systems.

Follow IMC Chapter 5, Exhaust Systems.

4-5.5 Noise.

Noise levels shall not exceed the permissible exposures of 29 CFR 1910.95, Table G-16.

4-5.6 Plumbing - Introduction and Administration.

Follow UFC 3-420-01, *Plumbing Systems*, Section titled “Purpose and Scope,” through Section titled “Primary Voluntary Consensus Standard Reference,” and Section titled “Conflicts in Criteria.”

Requirements in UFC 3-420-01, Section titled “Energy Efficiency in Water Conservation” and Section titled “Reliability” do not apply; however, consideration must be given to resource conservation where and when practical. See paragraph 1-11 of this UFC, “Resource Conservation.” Follow UFC 3-420-01, Section titled “Piping Arrangement.” Piping is not required to be concealed or painted.

Follow UFC 3-420-01, Appendix A: IPC Chapter 1 “Administration” Supplements, Item A, Delete Chapter 1 in its entirety.

Follow UFC 3-420-01, Appendix A: IPC Chapter 2 “Definitions” Supplements.

4-5.7 Plumbing - General Regulations.

Follow the International Plumbing Code (IPC), Chapter 3, General Regulations, with the following exceptions:

- Section 310.5, “Urinal Partitions”: does not apply
- Section 313, “Equipment Efficiencies”: does not apply
- Section 314.2.1, “Condensate Disposal”: does not apply with the exception of the last sentence that does apply (i.e., “Condensate cannot discharge into a street, alley, or other areas so as to cause a nuisance”).
- Section 314.2.2, “Drain Pipe Materials and Sizes”: does not apply; instead refer to IPC Table 314.2.2, Condensate Drain Sizing, for condensate drain sizing.
- Follow UFC 3-420-01, *Plumbing Systems*, Appendix A: IPC Chapter 3 ”General Regulations” Supplements, Item F, Section 305.6 Freezing, with the exception of the third, fourth, and fifth sentences regarding piping freeze protection that do not apply.
- Follow UFC 3-420-01, *Plumbing Systems*, Appendix A: IPC Chapter 3 ”General Regulations” Supplements, Item G, Section 305.6.1 Sewer Depth, with the following revision: Revise to state: “Replace with the following: ‘Building sewers must be installed not less than 6 inches (150 mm) below the frost line.’”

- Follow UFC 3-420-01, *Plumbing Systems*, Appendix A: IPC Chapter 3 ”General Regulations” Supplements, Item H, Section 312.4 Drainage and Vent Final Test, with the following revision: Revise to state “Add after the last sentence: ‘A peppermint test may be accepted as a final test for the drainage and vent systems, provided the contractor submits a testing procedure for approval.’”

4-5.8 Plumbing Fixtures.

Follow the International Plumbing Code, Chapter 4, Fixtures, Faucets, and Fixture Fittings, with the following exceptions:

- Section 402, “Minimum Plumbing Facilities”: does not apply. Instead provide a minimum of one water closet and one showerhead for every 20 occupants and a maximum of one water closet and one showerhead for every 10 occupants.
- Section 404, “Accessible Plumbing Facilities”: does not apply except for special use facilities, such as medical, where more stringent standards may apply.
- Section 405.3, “Setting”: does not apply
- Section 405.4.1, “Floor Flanges”: does not apply
- Section 405.4.3, “Securing Wall-hung Water Closet Bowls”: does not apply
- Section 405.5, “Water-tight Joints”: does not apply
- Section 405.6, “Plumbing in Mental Health Centers”: does not apply
- Section 405.7.1, “Connection of Overflows”: does not apply
- Section 405.8, “Slip Joint Connections”: does not apply
- Section 405.9, “Design and Installation of Plumbing Fixtures”: does not apply
- Follow UFC 3-420-01, *Plumbing Systems*, Appendix A: IPC Chapter 4 ”Fixtures, Faucets, and Fixture Fittings” Supplements, Item A, Section 401.2 Prohibited fixtures and connections, Item J, Add ”Section 411.3 Design guidance for emergency shower and eyewash stations”, Item K, Add ”Section 412.5 Required locations and construction“, and Item L, Add ”Section 412.6 Floor drains for emergency shower and eyewash stations”.
- Follow UFC 3-420-01, Plumbing Systems, Appendix A: IPC Chapter 4, “Fixtures, Faucets, and Fixture Fittings” Supplements, Items D or E, and F.

4-5.9 Water Heaters.

Follow the International Plumbing Code, Chapter 5, Water Heaters, with the following exceptions:

- Section 501.2, “Water Heater as a Space Heater”: does not apply
- Section 502.3, “Water Heaters Installed in Attics”: does not apply
- Section 503, “Connections”: does not apply
- Section 505, “Insulation”: does not apply
- Follow UFC 3-420-01, *Plumbing Systems*, Appendix A: IPC Chapter 5 ”Water Heaters” Supplements, Item H, Add “Section 506 Sizing Hot Water Systems, 506.1 Sizing Calculations” with the following revision: Revise to state: “Design in accordance with American Society of Heating Refrigerating and Air Conditioning Engineers (ASHRAE) Handbook – *HVAC Applications*, Chapter 49 ‘Service Water Heating’; and in accordance with ASHRAE Standard 90.1, *Energy Efficient Design of New Buildings Except Low-Rise Residential Buildings*. Size hot water system and set service water heater (SWH) storage temperature set point for not less than 140°F (60°C) to limit the potential for growth of Legionella pneumophila. Provide a hot water and cold water blending, tempering valve immediately downstream of the SWH storage tank to provide anti-scalding protection. Provide a balanced-pressure-type tempering valve. Set the blending valve to deliver 110°F (43°C) water to the fixtures except where higher temperatures are required by specialized equipment”.

4-5.10 Water Supply and Distribution.

Follow the International Plumbing Code Chapter 6, Water Supply and Distribution, with the following exceptions:

- Section 604.10, “Gridded and Parallel Water Distribution Systems”: does not apply
- Section 604.11, “Individual Pressure Balancing In-line Valves for Individual Fixture Fittings”: does not apply
- Section 608.8.3, “Size”: does not apply
- Follow UFC 3-420-01, *Plumbing Systems*, Appendix A: IPC Chapter 6 ”Water Supply and Distribution” Supplements, Item B, Add ”Section 602.2.1 Non-potable water exception”, Item J, Add ”Section 607.1.1 Legionella Pneumophila (Legionnaire’s Disease)”, Item M, Section 608.1 “General”, and Item N, Section 611.2 “Reverse osmosis systems”.

4-5.11 Sanitary Drainage.

Follow International Plumbing Code, Chapter 7, “Sanitary Drainage”.

Follow UFC 3-420-01, *Plumbing Systems*, Appendix A: IPC Chapter 7, “Sanitary Drainage Supplements”, Item B, Section 712.3.2 “Sump Pit”, and Item D, Section 712.3.6 “Controls”.

4-5.12 Indirect/ Special Waste.

Follow International Plumbing Code, Chapter 8, “Indirect/Special Waste”.

4-5.13 Vents.

Follow International Plumbing Code, Chapter 9, “Vents”.

4-5.14 Traps, Interceptors, and Separators.

Follow International Plumbing Code, Chapter 10, “Traps, Interceptors, and Separators”, with the following exceptions:

- Section 1002.4, “Trap Seals”: applies with the exception of the second sentence that does not apply (i.e. “Where a trap seal is subject to loss by evaporation, a trap seal primer valve must be installed”).
- Follow UFC 3-420-01, *Plumbing Systems*, Appendix A: IPC Chapter 10, “Interceptors and Separators Supplements”; Item A, Section 1002.4, “Trap Seals”.

4-5.15 Storm Drainage.

Follow International Plumbing Code, Chapter 11, “Storm Drainage”.

Follow UFC 3-420-01, *Plumbing Systems*, Appendix A: IPC Chapter 11 “Storm Drainage” Supplements, Item B, Section 1104.2, “Combining Storm with Sanitary Drainage”, and Item C, Add ”Section 1104.4 Insulation of rainwater conductors”.

4-5.16 Special Piping and Storage Systems.

Follow UFC 4-510-01, *Design: Medical Military Facilities*, Section titled “Medical Gas Systems” for medical gas and vacuum systems.

4-5.17 Gray Water Recycling Systems.

Follow International Plumbing Code, Appendix C, “Gray Water Recycling Systems”, Sections C101 and C102.

4-5.18 Emergency Shower and Eyewash Stations.

Follow UFC 3-420-01, Appendix D, “Design Guidance for Emergency Shower and Eyewash Stations”.

4-5.19 Structural Safety.

Follow International Plumbing Code, Appendix F, “Structural Safety”.

4-5.20 Compressed Air Systems.

Follow Compressed Air and Gas Institute's *Compressed Air and Gas Handbook* and ASME Boiler and Pressure Vessel Codes.

4-5.21 Fuel Oil Piping and Storage.

Follow requirements in IMC Chapter 13 for fuel storage and piping supporting building systems.

4-5.22 Boilers, Water Heaters, and Pressure Vessels.

Follow requirements in IMC Chapter 10 for facilities that are provided with boilers or water heaters, and pressure vessels.

4-5.23 Refrigeration.

Follow requirements in IMC Chapter 11 for facilities that are provided with refrigerant systems.

4-5.24 Duct Systems.

Follow IMC Chapter 6, Duct Systems.

4-5.25 Hydronic Systems.

Follow IMC Chapter 12, Hydronic Piping.

4-5.26 Design Documentation

Provide as a minimum:

1. Drawings:

   a. Natural ventilation - Floor plans showing the layout of the ventilation system, dimensions of openings and associated equipment, and the means of controlling the system.

   b. Mechanical ventilation - Floor plans showing the layout of the ventilation system, equipment schedules and details, schematic diagrams, and control sequences and diagrams.

   c. Calculations based on facility function and local climatic conditions:

   d. Natural ventilation – Calculations showing ventilation opening areas.

   e. Mechanical ventilation – Calculations showing required ventilation air quantities based on facility occupancy.

f. For any specific systems as defined in Section 3-4.1.1, Requirements for Specific Systems, provide Mechanical System documentation in accordance with UFC-3-400-10N, Chapter 3-4, "Calculations", and Chapter 3-5, "Drawings", and Plumbing System documentation per UFC 3-420-01, Chapter 1-10.2, "Calculations", and Chapter 1-11, "Drawings".

4-6 ELECTRICAL SYSTEMS.

4-6.1 Hazardous Material and Waste.

Comply with the requirements of UFC 3-501-01, *Electrical Engineering*, Section 2-1.1, "Hazardous Materials and Waste, and Controlled Materials".

4-6.2 Arc Flash Analysis.

Comply with the requirements of UFC 3-501-01, *Electrical Engineering*, Section 3-2.2, "Electrical Calculations Overview", with the exception of the list of required calculations as outlined at the end of the referenced section. The only required calculations are short circuit, arc flash and lightning protection analyses.

Comply with the requirements of UFC 3-501-01, Section 3-2.6, "Arc Flash Analysis".

Comply with the requirements of UFC 3-501-01, Section 2-1.12, "Arc Flash Warning Labels".

4-6.3 Short Circuit Analysis.

Comply with the requirements of UFC 3-501-01, *Electrical Engineering*, Section 3-2.2, "Electrical Calculations Overview", with the exception of the list of required calculations as outlined at the end of the referenced section. The only required calculations are short circuit, arc flash and lightning protection analyses.

Comply with the requirements of UFC 3-501-01, Section 3-2.4, "Short Circuit Analysis".

4-6.4 Lightning Protection.

Comply with the requirements of UFC 3-501-01, *Electrical Engineering*, Section 3-2.2, "Electrical Calculations Overview", with the exception of the list of required calculations as outlined at the end of the referenced section. The only required calculations are short circuit, arc flash and lightning protection analyses.

Comply with the requirements of UFC 3-501-01, Section 3-2.15, "Lightning Protection Calculations".

Comply with the requirements of UFC 3-520-01, *Interior Electrical Systems*, Section 3-14, "Lightning Protection Systems".

4-6.5 Service Entrance and Distribution Equipment.

Comply with the requirements of UFC 3-520-01, *Interior Electrical Systems*, Section 3-2, “Service Entrance and Distribution Equipment”, third paragraph. First, second and fourth paragraphs are not applicable.

4-6.6 Circuit Lockout Requirements.

Comply with the requirements of UFC 3-520-01, *Interior Electrical Systems*, Section 3-2.9, “Circuit Lockout Requirements”.

4-6.7 Raceway and Wiring.

Comply with the latest edition of NFPA 70, *National Electrical Code*, Chapter 2, “Wiring and Protection”; Chapter 3, “Wiring Methods and Materials”; and Chapter 4, “Equipment for General Use”.

4-6.8 Emergency and Exit Lighting.

Comply with the requirements of UFC 3-530-01, *Design: Interior and Exterior Lighting and Controls*, Section 5-6, “Emergency and Exit Lighting”.

4-6.9 General Electrical Requirements.

Comply with the requirements of UFC 3-550-01, *Exterior Electrical Power Distribution*, Section 3-2, “General Electrical Requirements”.

4-6.10 Configuration for Pad-mounted Distribution Transformers, Switchgears, and Sectionalizing Termination Cabinets.

Use dead-front construction for pad-mounted distribution transformers, switchgears, and sectionalizing termination cabinets unless not available within system parameters.

In rare cases when “live-front construction” is required due to equipment ratings (available system fault current values), obtain approval from the authority having jurisdiction.

4-6.11 Distribution System Grounding.

Comply with the requirements of UFC 3-520-01, *Interior Electrical Systems*, Section 3-12, “Grounding, Bonding, and Static Protection”.

Comply with UFC 3-550-01, *Exterior Electrical Power Distribution*, Section 3-14, “Distribution System Grounding”.

4-6.12 Fire Protection System for Oil-filled Equipment.

Comply with the requirements of UFC 3-550-01, *Exterior Electrical Power Distribution*, Section 3-19, “Fire Protection Considerations”.

4-6.13 Underground Structures (Manholes and Handholes).

Where required, power and communication systems must be in separate manholes.

4-6.14 Emergency and Standby Power Systems.

Comply with the requirements of International Building Code (IBC) latest edition, Chapter 27, Electrical, Section 2702, with the exception of the following subsections: 2702.2.8, Semiconductor Fabrication Facilities; 2702.2.9, Membrane Structures; 2702.2.14, Covered Mall Buildings; and 2402.2.18, Airport Traffic Control Towers.

Comply with the requirements of UFC 3-520-01 *Interior Electrical Systems*, Section 3-8, "Emergency Generators".

4-6.15 Underground Distribution General Criteria – Cable Identification in Manholes.

Tag all underground cables in all accessible locations such as in manholes, transformers, switches and switchgear. Install a detectable locator tape above all buried underground circuits.

4-6.16 Design Documentation

As a Minimum Provide:

- Drawings:
  - Comply with the requirements of UFC 3-501-01, *Electrical Engineering*,
  - Section 3-3, "Drawing Requirements", and the following subsections:
  - Section 3-3.1, "Legends and Abbreviations"
  - Section 3-3.2.2, "Transformer Details"
  - Section 3-3.2.3, "Underground Distribution"
  - Section 3-3.4, "Lighting Plans and Details"
  - Section 3-3.5, "Power Plans"
  - Section 3-3.12, "Telecommunications Riser Diagram"
  - Section 3-3.13, "Intercommunication/Paging Riser Diagram"
  - Section 3-3.14, "Fire Alarm Riser Diagram"
  - Section 3-3.16, "Schedules and Elevations"

Calculations:

- Comply with the requirements of UFC 3-501-01, *Electrical Engineering*, for the following calculations:
  - Section 3-2.4, “Short Circuit Analysis”
  - Section 3-2.6, “Arc Flash Analyses”
  - Section 3-2.15, “Lightning Protection Calculations”

4-7 TELECOMMUNICATIONS SYSTEMS.

4-7.1 Grounding and Bonding.

Follow UFC 3-580-01, Telecommunications Interior Infrastructure Planning and Design, Section 2-9, “Grounding, Bonding and Static Protection”.

Follow UFC 3-580-01, Appendix A, Item 19: TIA-J-STD-607-B, Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises.

Follow UFC 3-580-01, Appendix A, Item 23: MIL-STD-188-124B, Grounding, Bonding And Shielding for Common Long Haul/Tactical Communication Systems Including Ground Based Communications- Electronics Facilities and Equipments.

Follow UFC 3-580-01, Appendix A, Item 24: MIL-HDBK-419A, Grounding, Bonding, and Shielding For Electronic Equipments and Facilities.

4-7.2 CYBERSECURITY.

All control systems (including systems separate from an energy management control system) must be planned, designed, acquired, executed, and maintained in accordance with UFC 4-010-06, and as required by individual Service Implementation Policy.

This Page Intentionally Left Blank

APPENDIX A CONSTRUCTION LEVEL CHECKLISTS

A-1 INITIAL CONSTRUCTION LEVEL CHECKLIST.

CIVIL				
	Are facilities and equipment located away from areas subject to stormwater runoff and flooding?	YES	NO	Comment
	Are low lying, tidal, and tributary areas avoided?			
	Were adjacent facilities or functional areas considered for stormwater runoff control?			
	Is water flow controlled with surface drainage and trenches?			
	Were available surface laid / shallow buried culverts utilized?			
STRUCTURAL				
	Were manufacturers’ instructions for Government-approved systems for assembly of pre-packaged shelters in theater followed?	YES	NO	Comment
ELECTRICAL				
	Were manufacturers’ instructions for installation of Government-approved pre-packaged electrical equipment in theater followed?	YES	NO	Comment
Complete the following only if pre-packaged systems are not available:				
	In compliance with the requirements of UFC 3-550-01, *Exterior Electrical Power Distribution*, Section 3-2, “General Electrical Requirements”.	YES	NO	Comment
	In compliance with the requirements of UFC 3-520-01, Interior Electrical Systems, Section 3-12, “Grounding, Bonding, and Static Protection”.			
	In compliance with UFC 3-550-01, Exterior Electrical Power			

	Distribution, Section 3-14, “Distribution System Grounding”.			
Grounding.	Are all electrical systems grounded in accordance with manufacturer recommendations?			
Power Cable Installation.	Were cables surface laid or protected from vehicular and foot traffic?			
Circuit Lockout Requirements.	Were manufacturers’ instructions for installation of Government-approved pre-packaged electrical equipment in theater followed?			
	Are non-government pre-packaged circuit breakers, disconnect switches, and other devices that are electrical energy isolating lockable or protected from unauthorized access?			
PLUMBING AND MECHANICAL				
Water Treatment, Storage, and Distribution.	Does design and operation of all potable water (drinking water) facilities and systems to ensure protection of health and safety meet requirements in COCOM or coalition guidance or international agreements?	YES	NO	Comment
	Are Army, Navy, Marine Corps systems in compliance with the respective chapters from ATP 4-44/MCRP 3-17.7Q Water Support Operations and NTRP 4-04.2.13/FM 3-34.469/AFMAN 32-1072, Water-Well Drilling Operations?			
Water Treatment	Are Air Force systems in compliance with the respective chapters from AF TTP 3-32.33 V1?			
Waste Water.	Are waste water facilities and systems designed and operated to ensure protection of health and safety in compliance with requirements in international			

	agreements, COCOM or coalition guidance?			
Heating, Ventilating and Air-Conditioning (HVAC).	Were ventilation and environmental control systems installed in accordance with manufacturers' instructions and service technical manuals for pre-packaged heating, ventilating, and air-conditioning (HVAC) systems?			
FIRE PROTECTION				
	Is Spray Plastic Foam Insulation (SPFI) used?	YES	NO	Comment
	Is exposed Urethane foam or other exposed plastic insulations on walls or ceilings used?			
Allowable Area / Population.	Are more than 200 persons shall be located within a billeting structure group?			
Structure Separation.	Where this document uses the term structure group, this is defined as a cluster of independent structures, including tents, trailers, containerized housing units, or similar construction. Separation of structures within structure groups consisting of fabric structures, containers, trailers, or similar structures must comply with the following:			
	Are UFC 4-010-01 requirements for antiterrorism/force protection requirements related to space separation met?			
	Is the minimum separation between individual structures within a row of a billeting structure group consisting of fabric structures of 12 ft (3.7 m) met?			
	Is the minimum separation between rows of structures within a billeting			

	structure group of 30 ft (9.1 m) met?			
	Is the minimum separation between billeting structure groups and other structures of 100 ft (30.5 m) met?			
	Is the minimum separation between billeting structure groups of 59 ft (18 m) met?			
	Use of Revetments.			
	Are the requirements of UFC 4-010-01 met for the use of revetments?			
Fire Safety Analysis for Constrained Sites	If site constraints do not permit compliance with the above space separation requirements, has a fire-safety analysis been done performed or reviewed by the Unit Safety Officer and approved by the first O-6 level officer in the chain of command.			
Interior Finishes / Fabric Coverings	Are fabric coverings for tents or membrane structures in accordance with NFPA 701 requirements?			
	Do other structures comply with NFPA 101 requirements? (Compliance with NFPA 101 can be achieved using painted or unpainted finishes of concrete masonry units, gypsum wallboard, sheet metal, or 3/8-inch (9.5 mm) plywood. Fabric covering or textile coverings must be fire retardant as established by the manufacturer through testing in accordance with NFPA requirements.)			
Fire Extinguishers.	Are all facilities provided with listed portable fire extinguishers consistent with the occupancy of the facility? (If traditional listed/approved extinguishers are not available, the			

	use of extinguishers with equivalent rating from EU, Asian, or other countries is permitted.)			
TELECOMMUNICATIONS				
	Are Army requirements in FM 4-20.07, paragraphs 2-79 and 4-25 met?	YES	NO	Comment
	Are Air Force requirements in AFH 10-222, Volume 1, Table 2.8, and Attachment 6 met?			
	Were Navy/Marine Corps assembly instructions for installation of pre-packaged equipment in theater followed?			
	If pre-packaged systems are not available and when fabricating a grounding system from components:			
	Was UFC 3-580-01, *Telecommunications Interior Infrastructure Planning and Design*, Section 2-7, “Grounding” followed?			
	Was UFC 3-580-01, Appendix A, Item 19: TIA-J-STD-607-B, Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises followed?.			
	Was UFC 3-580-01, Appendix A, Item 23: MIL-STD-188-124B, *Grounding, Bonding And Shielding for Common Long Haul/Tactical Communication Systems Including Ground Based Communications-Electronics Facilities and Equipments* followed?			
	Was UFC 3-580-01, Appendix A, Item 24: MIL-HDBK-419A, *Grounding, Bonding, and Shielding For Electronic Equipments and Facilities* followed?			

CYBERSECURITY				
	Are all control systems (including systems separate from an energy management control system) planned, designed, acquired, executed, and maintained in accordance with UFC 4-010-06, and as required by individual Service Implementation Policy.	YES	NO	Comment

A-2 TEMPORARY CONSTRUCTION LEVEL CHECKLIST.

CIVIL				
Drawings	Site plan showing location of water source supply, sanitary sewer facilities, solid waste disposal areas, and all other facilities critical to life safety and health.	YES	NO	Comment
Calculations	Showing compliance with potable water testing requirements contained in referenced standards.

FOREWORD

The Unified Facilities Criteria (UFC) system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and applies to the Military Departments, the Defense Agencies, and the DoD Field Activities in accordance with USD (AT&L) Memorandum dated 29 May 2002. UFC will be used for all DoD projects and work for other customers where appropriate. All construction outside of the United States is also governed by Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA), and in some instances, Bilateral Infrastructure Agreements (BIA.) Therefore, the acquisition team must ensure compliance with the most stringent of the UFC, the SOFA, the HNFA, and the BIA, as applicable.

UFC are living documents and will be periodically reviewed, updated, and made available to users as part of the Services' responsibility for providing technical criteria for military construction. Headquarters, U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering Command (NAVFAC), and Air Force Civil Engineer Center (AFCEC) are responsible for administration of the UFC system. Defense agencies should contact the preparing service for document interpretation and improvements. Technical content of UFC is the responsibility of the cognizant DoD working group. Recommended changes with supporting rationale should be sent to the respective service proponent office by the following electronic form: Criteria Change Request. The form is also accessible from the Internet sites listed below.

UFC are effective upon issuance and are distributed only in electronic media from the following source:

- Whole Building Design Guide web site http://dod.wbdg.org/.

Refer to UFC 1-200-01, *General Building Requirements*, for implementation of new issuances on projects.

AUTHORIZED BY:

UNIFIED FACILITIES CRITERIA (UFC)
NEW DOCUMENT SUMMARY SHEET

Document: UFC 1-201-02, Assessment of Existing Facilities for Use in Military Operations

Superseding: None.

Description: This UFC provides assessment guidelines for evaluating existing facilities for the potential use in military operations. Options are also included for mitigation of common building deficiencies.

Reasons for Document: This UFC was developed to accomplish the following:

- Provide contingency personnel with procedures to assess an existing facility to determine if the building achieves the minimum Life Safety and Habitability requirements to allow for occupancy in support of military operations.
- Provides options for mitigating the risks inherent with common building deficiencies

Impact: The following will result from the publication of this UFC:

- There is currently no UFC for evaluating existing facilities for use in military operations. This UFC establishes assessment protocols for evaluating existing facilities to ensure protection of life safety and health of personnel occupying these facilities.

Non-Unification Issues: None.

TABLE OF CONTENTS

TABLES

CHAPTER 1 INTRODUCTION

1-1 PURPOSE.

This UFC provides procedures for assessing life safety and habitability aspects of existing facilities for potential occupancy by the Department of Defense (DoD) personnel in support of military operations.

1-2 APPLICABILITY.

This UFC applies to all DoD components involved in the expedient assessment of existing buildings in support of military operations primarily outside of the United States and its territories and possessions. Joint Publication JP 3-0, *Joint Operations*, provides typical examples of military operations where use of this UFC is appropriate. Requirements for preliminary evaluations do not apply when forces occupying the facility are engaged in actual combat operations.

1-3 SCOPE OF DOCUMENT.

The technical requirements in this UFC establish procedures for expedient assessment of existing facilities to ensure the minimum standards for safety and health of personnel consistent with the requirements of military operations in the following topics:

- Fire protection (includes Life Safety)
- Structural integrity
- Electrical systems
- Plumbing and Mechanical systems
- Telecommunications networks
- Other Hazards

1-4 ADDITIONAL DESIGN CRITERIA.

The Appendices provide references to related documents.

1-5 CRITERIA FOR NEW FACILITIES AND ALTERATIONS.

Refer to UFC 1-201-01, *Non-Permanent DoD Facilities in Support of Military Operations*, for life safety and habitability-related design requirements for new construction of non-permanent facilities for use by the Department of Defense (DoD) in support of military operations. Also follow the requirements in UFC 1-201-01 for additions and alterations to existing facilities.

1-6 AUTHORITY HAVING JURISDICTION.

The terms "Building Official" and "Authority Having Jurisdiction" (AHJ) as used in the codes and standards referenced in this UFC mean the Service office of responsibility, i.e., U.S. Army, HQ USACE/CECW-CE; U.S. Navy, NAVFACENGCOM HQ Code CHE; U.S. Marine Corps, HQMC Code LFF-1; and U.S. Air Force, HQ AFCEC/CL. The Service's Chief Engineer can delegate to their Technical Representative the enforcement of the codes and standards.

1-7 REACHBACK SUPPORT.

When deficiencies found require technical expertise for assessment or corrective measures, resources are available through Reachback capabilities within each branch of Service. See Appendix B for Service Reachback Contacts.

1-8 ENVIRONMENTAL ISSUES.

This UFC minimally addresses visual identification of potential environmental and health hazards. See the Initial Interior Walk-Thru portion of the Preliminary Evaluation as itemized in the checklist in Appendix D for the limited Environmental items being assessed in these Evaluations.

If such hazards or contaminants are observed or suspected during inspections, vacate the building and notify the Officer-in-Charge.

1-9 ANTITERRORISM/FORCE PROTECTION.

Force protection requirements are not covered by this document; however, when assessing any existing facility for use in military operations they should be integrated into facility planning when the operational environment requires it. DoD minimum antiterrorism standards for expeditionary and temporary structures are covered in Appendix D of UFC 4-010-01, *DoD Minimum Antiterrorism Standards for Buildings*, and geographic Combatant Command supplemental Operational Orders. The *Joint Forward Operations Base (JFOB) Protection Handbook*, GTA 90-01-011, provides force protection planning and protective construction concepts for military operations facilities.

1-10 EXPLOSIVES SAFETY.

Explosives safety requirements are not covered by this document. When assessing any existing facility for use in military operations, exposure to the potential accidental explosive effects of U.S., host nation or multi-national Ammunition and Explosives (AE) in the surrounding area must be taken into consideration. Assessment of all facilities potentially falling within any explosive safety arcs should be performed in close coordination with knowledgeable explosives safety professionals. Explosive safety arcs around, but not limited to, AE storage, handling, maintenance, manufacturing, and disposal must be taken into consideration.

1-11 SPECIAL-USE FACILITY.

When the facility being assessed is proposed for special usage (e.g., hazardous material/hazardous waste storage, medical facility) additional criteria must be considered, and evaluation must be performed by specialists in that field.

CHAPTER 2 ASSESSMENT PROCESS

2-1 EVALUATION LEVELS.

The three levels of evaluation for facility occupancy are “Preliminary Evaluation”, “Detailed Evaluation” and “Engineering Evaluation”, further defined and described in the following sub-sections and chapters of this UFC. The items assessed are limited to requirements that affect life safety and health of occupants. Successful completion of an evaluation and mitigation of any deficiencies provides a level of safety to building occupants as described for the given evaluation level, for the duration defined for the given evaluation level. If the use of the building changes or the building systems are impacted by an adverse event (high winds, earthquakes or other battle damage), previous evaluations are no longer valid. In this situation, re-evaluate the building to re-establish the desired level of safety.

The Preliminary and Detailed Evaluations assess different items, and both evaluations are necessary to insure building safety and habitability. If time and skilled evaluators are available for the initial assessment, the Preliminary and Detailed Evaluations should be performed concurrently. Appendices D and E of this UFC contain checklists of specific items to be assessed during the evaluations. See Table 2-1 for a comparison of the evaluation level required and the inspector qualifications, based on the desired duration of building occupancy.

Copies of completed evaluation paperwork are to be maintained within the facility itself. In addition, copies of the Detailed and Engineering Evaluations are to be forwarded in accordance with operational requirements of the command’s Engineer Support Plan.

Table 2-1 Evaluation Level Comparison

	Preliminary	Detailed	Engineering
UFC chapter	Chapter 3 & Appendix D	Chapter 4 & Appendix E	Chapter 5
Purpose	Minimal level of safety for expedient, limited-use occupancy	Moderate level of safety for broader-use occupancy	Full compliance with all safety requirements for DoD Semi-Permanent facilities
Evaluators	Non-technical	Technical knowledge	Professional engineers
Focus	Extreme hazards posing imminent danger, less electrical and mechanical systems	Near-term risks to safety and health, including electrical and mechanical systems	Long-term risks from all building systems and functions
Valid period	90 days	5 years	10 years (extendable to 25 years)

2-2 PAST BUILDING USAGE.

Prior usage of the building being evaluated is important in identifying potential hazards that could exist. For instance, a building with a prior use as an industrial facility could likely have chemical contamination or other hazards that may classify the building as unsafe for occupancy.

Attempt to obtain documentation that would indicate past building usage or detailed design and construction documents (as-built drawings). Interviewing local residents as to prior building usage is also a valuable source of data.

CHAPTER 3 PRELIMINARY EVALUATIONS

3-1 PURPOSE.

The Preliminary Evaluation is a limited assessment to identify extreme hazards that pose an imminent risk to life safety or health, and to provide limited safety for immediate but limited-use occupancy. It is a tool for an Officer-in-Charge to identify buildings or portions of buildings that are safe to occupy for short periods of time. The evaluation is intended to be completed expeditiously with limited resources. Most buildings can be evaluated in 1-2 hours by field personnel, typically non-commissioned officers (NCO's).

The evaluation focuses on identification of structural damage, identification of hazardous materials, and verification of emergency egress pathways. The procedure includes mitigations for common deficiencies. It does not assess electrical or mechanical systems due their technical complexity. These systems are considered unsafe to operate pending completion of a Detailed Evaluation.

Due to the minimal scope of the Preliminary Evaluation and the limited experience of the evaluators, significant risks may exist even with a successful evaluation. Some of the risk, noted below, will increase with the duration of occupancy. For this reason, the preliminary evaluation is valid for a period of only 90 days which can be extend to 180 days with a second preliminary evaluation, to confirm that the condition of the building has not changed or that appropriate mitigations are in place. Performing successive Preliminary Evaluations to extend the occupancy beyond 180 days without performing a Detailed Evaluation is risky due to the potential for unknown or undiscovered hazards. The Detailed Evaluation is intended to better assess risks associated with longer term occupancy periods.

- Structural collapse from moderate or extreme environmental events, existing condition defects or overload.
- Fire or poisoning from combustible or hazardous materials
- Entrapment during fire due to lack of egress pathways.
- Electrical shock, severe burns or electrocution from improperly installed, damaged material, equipment or inadequate grounding system

3-2 GENERAL PERSONAL SAFETY.

Primary concern should be the evaluator's own personal safety. The following are basic parameters to ensure safety when conducting occupancy assessments:

1. Always wear standard issue personal protective equipment (PPE).
2. Work in teams of at least 2 people or have means of communication to response personnel
3. Be alert for falling objects or tripping hazards

3-3 EQUIPMENT FOR PRELIMINARY EVALUATIONS OF ALL SYSTEMS.

The following equipment is needed to assess all buildings and systems:

- Tape Measure
- Flashlight
- Camera
- Screwdriver

3-4 PRELIMINARY EVALUATION PROCESS.

A Preliminary Evaluation is performed utilizing the checklist in Appendix D of this document. The checklist is arranged in the order in which the evaluation should take place. In order to ensure personal safety, the inspector initially assesses the building and site for basic hazards from the exterior by traversing the perimeter of the facility prior to entering the building for interior assessments. The building can be entered only if the exterior visual assessment deems the building as safe. The Evaluation then proceeds with an initial interior walk-thru to expeditiously assess issues that may prevent occupancy. After completion of the exterior assessment and initial interior walk-thru, the building systems are evaluated by discipline to identify hazards that threaten life safety or health. If de-energized prior to assessment, building mechanical and electrical systems should not be turned on during preliminary evaluations to assess for short-term occupancy.

CHAPTER 4 DETAILED EVALUATIONS

4-1 PURPOSE.

The Detailed Evaluation identifies hazards that pose near-term risks to life safety and health, and provides minimal safety and habitability for longer occupancy periods than the Preliminary Evaluation. It also reduces risks to occupants by providing a broader assessment of buildings including electrical mechanical systems compared to the Preliminary Evaluation. The procedure includes mitigations for common deficiencies and focuses on:

- Identification of damaged, deteriorated or overloaded structures or elements
- Fire Protection
    - Occupancy based egress
    - Occupancy or building separation (via distance or physical separation)
    - Automatic fire sprinklers
    - Fire detection and notification
- Electrical system configuration, material and equipment installation and grounding
- Water distribution and sanitary systems

The Detailed Evaluation does not address all safety and habitability requirements that are specified in UFC 1-201-01 which are addressed in an Engineering Assessment. Occupancy limits or restrictions are intended to improve safety for higher risk occupancies (billeting, assembly and cooking operations).

Due to its limited scope, the detailed evaluation is valid for a period of five (5) years. Risks from building occupancy or failure to adequately mitigate deficiencies include:

- Structural collapse from extreme environmental events or from continuing deterioration of structural elements
- Fire
- Entrapment during fire due to lack of egress pathways
- Electrical shock, severe burns or electrocution from improperly installed, damaged material, equipment or inadequate grounding system
- Contamination or illness from water supply or sanitary systems

The Detailed Evaluation may take a full day, and could require longer for larger buildings. This evaluation must be performed by a trade-specific team with knowledge of building construction and building systems, such as technically-qualified Senior NCO's or Junior Officers.

4-2 FIELD EQUIPMENT.

The following equipment is needed to conduct a Detailed Evaluation.

4-2.1 Equipment for Detailed Evaluation of Structural Systems.

The following equipment is typically used to assess building structural systems:

- Ruler: Used to measure deflection, displacement, leaning, section loss, crack size, or separation.
- String: Used to measure member deflection or displacement.
- Plumb Bob: Used to measure leaning or out-of-plumb members.
- Level: Used to measure floor slope, settlement, and member deflection or displacement.
- Hammer: Used to locate delaminated or unsound portions of concrete or fully grouted masonry members.
- Knife: Used to probe wood members to identify decay or insect damage.
- Binoculars: Used to visually identify damage or deficiencies in portions of the structure that are inaccessible or at a distance.

4-2.2 Equipment for Detailed Evaluation of Fire Protection Systems.

The following equipment is typically used to assess building fire protection systems, active and passive:

- Step Ladder: Access Ceilings
- Camera
- Tape Measure
- Hand tools
- Flash light

4-2.3 Equipment for Detailed Evaluation of Plumbing and Mechanical Systems.

The following equipment is typically used to assess building plumbing and mechanical systems:

- Portable Water Temperature Sensor (in piping)
- Portable Water Test Kit (for collecting and testing water samples)
- Portable Air Temperature Sensor

4-2.4 Equipment for Detailed Evaluation of Electrical Systems.

The following equipment is typically used to assess building electrical systems:

- Voltage/Amp Meter
- Receptacle Tester
- Wrench
- Screwdriver

4-3 STRUCTURAL SYSTEMS.

This section includes assessment and risk mitigation of common deficiencies found with regard to structural systems in existing facilities. The structural deficiencies and conditions listed in this section are numerous, but not intended to be all inclusive. Judgment must be exercised by assessors for deficiencies observed that are not listed. All structural system evaluations outlined in this section are performed by visual inspections, field surveys, and on-site measurement and testing.

4-3.1 Field Surveys and On-Site Testing.

Perform visual inspection, measurement, and testing of building and structural components to assess the structural framing system, primary gravity and lateral force resisting systems, materials, and potential structural deficiencies identified in the section entitled, “Acceptance Criteria”. Begin with a survey of the exterior of the building on all sides looking to identify overall deficiencies listed in the section entitled, “Overall Structural Damage”. If no deficiencies are found, perform a survey of the interior of the structure looking to identify deficiencies to individual framing components as indicated in the section entitled, “Damage to Structural Framing Components”.

As necessary, perform on-site measurement and testing of structural components and materials including, but not limited to, the following:

- General Displacements: Measure the following typical displacements as follows:
    - Leaning or out-of-plumb structural members using a plumb bob and tape measure/ruler; floor slope or settlement using a level and tape measure/ruler; crack widths using a tape measure or crack width ruler; and member deflections or displacements using a string with a line level and tape measure/ruler.
    - Structural Steel: Measure section loss due to corrosion using calipers or ruler.
    - Masonry or Concrete: Tap on concrete or fully grouted masonry with hammer to locate delaminated or unsound portions of members. Measure section loss in any exposed corroding reinforcing steel.

Identify and measure the widths and extents of all significant cracks (typically 1/8 inches (3 mm) or wider).

- o Wood: Probe wood members with a screwdriver or knife to identify decay or insect damage. Measure section loss with a ruler.

Visual inspection, tests, and measurements must be executed as thoroughly and carefully as required to detect the presence and extent of any of the conditions outlined in the following the section entitled, “Acceptance Criteria”.

4-3.2 Acceptance Criteria.

Perform inspection of building to identify the existence of any of the conditions listed below. If any of the following conditions are identified, see the section entitled “Mitigation Measures”.

4-3.2.1 Overall Structural Damage.

Perform inspection of the exterior of the building to determine the existence of any of the following conditions:

- Collapse or partial collapse.
- Building or individual story leaning more than 4 inches (100 mm) total or more than H/200 (where H= height of building or story height in inches).
- Base of building pulled apart with cracks or separations exceeding ¼ inch (6 mm), or differentially settled, with fractured foundations, broken anchor bolts, or displaced soils. Building shifted off foundation.
- Building in zone of suspected major soil slope movement, sinkholes, or severe erosion.
- Building in danger of being impacted by sliding or falling landslide debris from upslope.
- Significant exterior wall cracks or out of plane wall offsets at cracks.
- Significant blast or fire damage.
- Any loose or damaged finishes, parapets, canopies, built up ice or snow on roofs, or other items that could fall on occupants, especially at entrances.

4-3.2.2 Damage to Structural Framing Components.

Perform inspection of the interior of the building to determine the existence of any of the following conditions:

- Leaning: Columns, piers, or bearing walls (including foundation walls) substantially out of plumb as measured by a horizontal offset exceeding 4 inches (100 mm) total or more than H/200 where H is the height of the vertical member being measured (column, building story, etc.) in inches.

- Buckling: Columns, piers, diagonal bracing, or bearing walls (including foundation walls) that are buckled or bowed.
- Damage to horizontal framing members: Roof or floor framing exhibiting cracks, spalls, splits, or other damage, sloping or sagging in excess of L/180 at any point along the span where L = span length in inches, or separation from walls or other supports.
- Damage to vertical framing members: Any cracking with vertical or horizontal displacements in columns, walls, piers, pilasters, diagonal bracings, or corbels.
- Connections: Visible damage of floor-to-wall, roof-to-wall, beam-to-beam, beam-to-column, column-to-floor, or diagonal bracing connections; steel framing, missing bolts or rivets, cracks or breaks in welds, bolts, or connection plates and angles; wood framing, split members at joints or gaps between ends of connected members; concrete and masonry framing, significant cracks at joints between members and/or exposed reinforcing steel at connections.
- Bracing: Broken, bent or damaged bracing members or elements and their connections in horizontal and vertical planes.
- Connection to foundation: Damaged connections between superstructure and foundation that would allow uplift of structure or movement off foundation during wind or seismic event.
- Fire: Evidence of fire resulting in significant reduction in member depth or width in wood framing, twisting or warping of steel framing, or spalling of concrete or masonry and damage to reinforcing steel.
- Deterioration of structural elements from exposure to weather or contact with earth: Rotting or insect infestation in wood framing; corroded structural steel members; corroded reinforcing steel and concrete spalling and cracking in concrete structures; freeze-thaw splitting and cracking damage in structural masonry or concrete. Effective loss of member width/depth or weakening of any structural element due to deterioration.
- Falling hazards: Any loose or damaged structural framing, non-structural finishes, ductwork, equipment, or architectural elements that could fall on building occupants.

4-3.3 Mitigation Measures.

Should any of the conditions from the section entitled, “Acceptance Criteria” be observed, the building is unsafe to occupy until mitigation measures outlined below for specific conditions have been implemented, or Reachback has been engaged and specified mitigation has been completed.

For single story structures, cordon off damaged portions of structures with areas of localized damage or collapse totaling less than 25% of the overall building footprint.

Damaged or partially collapsed multi-story buildings or structures with damage to more than 10% of the overall building footprint are unsafe to occupy; consult Reachback.

Remove any non-structural debris and loose finishes that are considered a falling hazard. Engage professional engineering personnel to determine appropriate repair measures or to evaluate the potential for removal of damaged or loose structural elements that could pose a falling hazard. To prevent overloading of the structure, locate storage and/or heavy equipment on ground supported floor slabs.

4-4 FIRE PROTECTION

This section includes survey methods and lists of common deficiencies found with regard to fire protection in existing facilities. The information herein is limited to fire protection requirements that affect life safety of occupants, without consideration for mission continuity. Survey the building by conducting a walk-through of each room. Complete the checklist for Detailed Evaluations that is included in Appendix E.

This document provides guidance related to fire separation of buildings for preventing fire spread between buildings. For requirements for space separation between buildings related to anti-terrorism/force protection, refer to UFC 4-010-01. It is not the intent of this document to supersede UFC 4-010-01.

For definitions of terms used in this section, see Appendix C.

Reachback assistance is required for any modification or additions to any fire protection systems.

4-4.1 Fire Protection Detailed Evaluations.

These requirements are not for use in engineering evaluations.

4-4.1.1 Building Separation.

Perform the following assessments:

- Determine the building separation from any nearby buildings as defined in Appendix C-1.
- If the building is less than 30 ft. (9.1 m.) from adjacent buildings, the following criteria must be met:

Table 4-1 Separation Requirements

Separation Distance "X"	Exterior Wall Construction of Building to be Occupied	
	Factory Industrial, Business or Storage Occupancies	**Billeting, Institutional or Assembly Occupancies**
X < 10 ft. (X < 3.1 m.)	Contiguous Exterior wall with No Openings	Contiguous Exterior wall with: 1) Noncombustible Exterior Facing, 2) No Openings or Protected Openings
10 ≤ X < 30 ft. (3.1 m. ≤ X < 9.1 m.)	Contiguous Exterior wall with No Openings, or Protected Openings	Contiguous Exterior Wall with No Openings, or Protected Openings
X ≥ 30 ft. (X ≥ 9.1 m.)	No restrictions	No restrictions

4-4.1.2 Building Height.

Perform the following assessments on the building:

- Determine the number of stories of the building as defined in Appendix C-1.
- Determine the construction type of the building, combustible or non-combustible, as defined in Appendix C-1.
- Determine the existence of vertical openings as defined in Appendix C-1.

Building requirements or restrictions based on Building Height are as follows:

- Buildings of non-combustible construction, or of any construction with a functional automatic sprinkler system throughout, and with no vertical openings connecting more than 2 stories, can be safely occupied up to 3 floors above grade.
- Buildings of combustible construction, without an automatic sprinkler system, or with unprotected vertical openings between more than 2 floors, can be safely occupied up to 2 floors above grade.
- Building basement levels can be safely occupied by occupancies other than billeting, institutional or assembly.
- Sub-basement levels as defined in Appendix C-1 cannot be safely occupied.

4-4.1.3 Occupancy.

Determine the following:

- Confirm the planned occupancy (ies) as defined in Appendix C-3.

Building requirements based on Occupancy type are as follows:

- Dining, medical (non-inpatient), administrative, and/or recreational facilities may be collocated in a single structure.
- Where mixed occupancies as defined in Appendix C-3 exist, the most restrictive life safety requirements (including allowable travel distances, building separation requirements, fire protection requirements, and fire alarm requirements herein) for the occupancies involved are applied.

4-4.1.4 Means of Egress.

Perform the following assessments and calculations regarding Means of Egress:

- Survey all building areas to be occupied and determine the following:
  a. Number of exits (as defined in Appendix C-2) per floor,
  b. Width of exit doors as defined in the Exit Capacity definition in Appendix C-2,
  c. Internal width of exit stairs as defined in the Exit Capacity discussion in Appendix C-2,
  d. Longest travel distance per floor as defined in Appendix C-2,
  e. Length of any dead end corridors as defined in Appendix C-2,
  f. Existence of any large areas (over 2000 sq. ft. (186 sq. m.)) with only one door or path leading to an exit.
  g. Measure the area(s) to be used as assembly spaces.
  h. Confirm if any assembly occupancies are provided with only one door or exit path leading to an exit from the assembly space.
- Confirm one of the following:
  - o Each exit remains unlocked in the direction of egress when the area is occupied, OR:
  - o Any locked doors in an exit path are under the control of the occupants of the room/space, and are provided with panic hardware as defined in Appendix C-2.
- Confirm that exits are not blocked or obstructed by materials, so that access to exits is available.
- Confirm that enclosed exit stairs are not used to store materials.

- Calculate occupant loads based on the parameters given in Appendix C-3. Measure overall areas of spaces to be occupied.
- Calculate the exit capacity as defined in Appendix C-2 based on the number of exits for a space.
- Compare the calculated exit capacity to the calculated occupant load. It is unsafe to occupy the space if the occupant load is higher than the exit capacity.
- Compare the measured travel distance to the travel distance limits for the occupancy involved from the definitions section in Appendix C-2.

4-4.1.5 Automatic Sprinkler Systems and Fire Suppression Systems.

Automatic sprinkler system is required for billeting occupancy and a fire suppression system is required for kitchen grills/hoods.

Perform the following assessments on the automatic sprinkler systems (if provided):

- Identify any existing sprinkler, standpipe, hose stations, or other fire suppression system in the building.
- A qualified person should confirm that existing water supplies (fire pump, water storage tanks, or public water system) are in service. Fire pumps should be operated by decreasing the sprinkler system pressure or flowing water in the system to determine if the fire pump starts automatically on pressure drop.
- Qualified persons include persons trained specifically within the trades of building engineering or maintenance, or active fire protection systems maintenance or installation. Contact Reachback for assistance before conducting any testing of these systems.

4-4.1.6 Fire Alarm Systems.

Fire alarm systems are required for the following:

a. A building with billeting occupancy (smoke detection is strongly recommended to be included)

b. A building with assembly occupancy.

c. A building with institutional occupancy.

d. A building with business occupancy over 5,000 sq. ft. (465 sq. m.) in a basement, second or third floors.

Perform the following assessments on the fire alarm systems (if provided):

- If building has existing fire alarm notification systems, a person, specifically trained in building engineering or maintenance, or trained in fire alarm system installation or maintenance, should determine if the notification systems are functional by operating the system. Confirm that notification appliances produce audible levels of sound in all areas of the building, or record what portions of the building have fire alarm notification appliances. If speakers are provided, confirm that the language used in the announcement is understood by the planned occupants.

- If a fire detection system is present, determine the extent of the system's coverage.

Fire alarm systems provided for the purpose of compliance with this document may be battery operated multiple station type smoke alarm systems, interconnected either by wires or wireless type.

4-4.1.7 Hazardous Areas.

Perform the following assessments:

- Identify hazardous areas and equipment as defined in Appendix C-1.
- Existence of hazardous areas or equipment without fixed separation by walls or space separation is not safe, see the section entitled, "Hazardous Areas" for mitigation.

4-4.1.8 Interior Finish.

Perform the following assessments of the building's interior finishes:

- Determine the interior finish in occupied areas through observations.
- Gypsum wallboard (or sheetrock), unpainted or painted metal, 3/8 inch (9.5 mm) painted or unpainted plywood, concrete block or other stone materials provide acceptable interior finish. Combustible fabrics or textiles, and rigid or sprayed-on plastic foam insulations are not acceptable as interior finishes for occupied areas.

4-4.1.9 Vertical Openings.

Perform the following assessments:

- Identify any vertical openings as defined in Appendix C-1 that exist within occupied floors.
- Vertical openings connecting more than 2 stories is not safe.

4-4.2 Mitigation Measures.

4-4.2.1 Building Separation.

For single story structures, if the fire separation criteria are not met, a mitigating measure to provide protected openings can be provided with HESCO or other similar barriers, free-standing pre-cast concrete type barriers, or sandbag revetments between buildings. If these barriers are at least as tall as the eave of the taller of the two buildings to be separated, separation between the building under consideration can be considered adequate. For taller buildings, it is also acceptable to cover existing glazed openings in exterior walls from the interior side with plywood, metal or gypsum board, or to locate sandbags along the interior side of the wall opening. Open doorways can be protected by providing solid core wood or metal doors with no glazed openings and an automatic closer. Open louvers can be provided with an extended metal cover. If this issue cannot be addressed through these field mitigation measures, obtain Reachback assistance to identify additional options.

4-4.2.2 Building Height.

Limiting occupancy to lower levels and to a single basement promotes more timely and safe relocation of persons. If it is possible to reliably limit occupancy of higher floors through administrative procedures, then it would not be necessary to physically block access to higher floors.

If building height issues cannot be resolved with field modifications given herein, if it is desired to occupy levels higher or lower than those stated herein, or if repairs to vertical openings are planned, use Reachback for technical assistance.

4-4.2.3 Occupancy.

It may be possible to mitigate existing occupancy deficiencies by providing passive or active fire protection systems.

Reachback for technical assistance is necessary for technical solutions to mixed occupancy issues that cannot be addressed by the mitigation measures presented herein.

4-4.2.4 Means of Egress.

If there are not a sufficient number of exits, the exits do not provide sufficient exit capacity, or actual travel distances exceed the travel distance limits provided herein, an exit (or exits as needed) can be added by providing an exterior exit in an exterior wall if practical. If on an upper level floor, an exit door to a fire escape can be built if practical, with Reachback assistance. Fire escapes must be constructed of noncombustible materials and supported by surrounding grade if practical (rather than hung from the building). If security or other constraints do not permit installation of a fixed external fire escape ladder, provide a portable fire escape ladder in each room near an above grade window. Newly provided second exits or escape ladders should be separated by as much distance as practical from the other existing exit within a space. Contact Reachback assistance before beginning any new construction work or modifying existing construction.

Exit paths from spaces must be provided only through spaces of less hazardous occupancies that are under control of the persons egressing, and not subject to locking. For example, an exit path from one office through another office that is not subject to locking is acceptable. An egress path from an office through a storage room subject to locking, or through a boiler room is not acceptable. A second option for exiting should be provided in this situation, or the office area should not be occupied. It is not safe for Assembly occupancies to be located in areas with only one exit path, and should be relocated if it is not possible to provide a second exit path from the space.

One option for compliance is to only occupy the portion of a space within the allowable travel distance for the occupancy. If functioning sprinkler systems are provided for the occupied areas, contact Reachback if additional travel distance and dead end allowances are needed.

4-4.2.5 Automatic Sprinkler Systems.

For a billeting occupancy, the lack of automatic sprinkler systems in a building is a deficiency. For buildings with planned occupancy for billeting limit the total area of billeting occupancy to less than 7,000 sq. ft. (650 sq. m.) per level, and provide **one** of the following four options to mitigate this deficiency(a or b or c or d):

a. A fire watch covering all areas of the building.

b. Direct exits from each living unit, or from each open area to the exterior.

c. Solid, contiguous, full height stud or Concrete masonry unit type (CMU) wall partitions subdividing each living unit, and functioning battery operated smoke alarms within each living unit. Smoke alarms must be either wired multiple station, or wireless multiple station type.

d. Limit the number of beds to less than 10 within an occupied building.

For open bays planned for billeting occupancy greater than 7000, sq. ft. (650 sq. m.), contact Reachback support for assistance. Occupancy load, egress and ceiling height must be evaluated in order to determine appropriate mitigating fire protection system, active and/or passive requirements.

For occupancies other than billeting, building automatic sprinkler systems can be mitigating factors for certain other deficiencies. The lack of an automatic sprinkler systems throughout the occupancy or building is not a deficiency for occupancies other than Billeting.

4-4.2.6 Fire Alarm Systems.

Fire alarm systems (notification) are required in certain occupancies as noted in the section entitled, “Fire Alarm Systems” located in Fire Protection Detailed Evaluation paragraphs.

The existence of a complete, functional sprinkler system in all areas of a building, with water flow alarms is sufficient mitigation for a fire detection and alarm system or fire alarm notification system.

A 24 hour fire watch is a mitigating factor for the lack of a fire notification system. A person on duty having a portable horn or sounding device to notify all occupants in case of a fire event is a mitigating factor for an automatic alarm system. If the building is not occupied 24 hours a day, the fire watch is only necessary while the building is occupied.

New equipment installation or repairs beyond simple corrections need to be conducted under the guidance of Reachback assistance. If fire alarm systems are not provided and are needed, or if it is desired to provide a fire alarm system as a mitigating factor or any other reason, contact Reachback support for assistance.

4-4.2.7 Hazardous Areas.

Hazardous areas or hazardous equipment without fixed separation by walls is a deficiency. For hazardous equipment, as defined in Appendix C-1, this issue can be resolved by the existence of, or by providing a fixed suppression system (wet or dry chemical system typically), or providing a separating wall around the equipment area. Space separation of at least 25 ft. (7.6 m) from occupied buildings is also mitigation for unprotected hazardous equipment.

Existing or planned hazardous areas need segregation and/or fire protection (as discussed herein) if these areas are to remain in service within a building. Relocation of hazardous areas outside the building in a separated area is the preferred option, if possible. It is acceptable to remove hazardous equipment from service by administrative controls if it can be confirmed that the system will remain unused.

The preferred method of mitigating hazardous material or waste storage is removal of the storage to a location outside and separated from occupied buildings by at least 50 ft. (15.2 m). Any detailed evaluations of ventilation or containment systems, or improvements for these systems needs to be through Reachback assistance.

Installation of new construction enclosure walls, automatic sprinkler system, fire suppression systems, repairs or modifications of existing hazardous equipment to reduce its hazard, needs to be conducted with Reachback for technical assistance. It needs to be confirmed that a new hazard (inadequate ventilation, etc.) is not created by enclosing a hazardous operation.

4-4.2.8 Interior Finish.

In order to provide a thermal/fire barrier, exposed combustible insulation (polystyrene, polyurethane, paper or similar types of insulation), or combustible finishes (cork, plastic or fiberglass panels, cloth or similar finishes) can be covered with ½ inch (12.7 mm) layer of gypsum wallboard, 3/8 inch (9.5 mm) plywood, 22 gage corrugated steel, or removed, if possible. Exposed foam-in-place insulation is considered a highly combustible material; unless specific documentation is provided to the contrary. Combustible decorations must be removed from occupied areas.

4-4.2.9 Vertical Openings.

Vertical openings connecting more than 2 stories is not safe. The measures given in the section entitled, "Building Height" to only occupy two floors above grade level provides sufficient mitigation of a vertical opening issue. If it is desired to occupy levels more than two stories above grade, and a vertical opening exists within the planned space that is more than 2 stories, use Reachback assistance to see if the facility, considered in its entirety, can be occupied as planned.

One field measure that can be taken to resolve a vertical opening issue in buildings higher than two stories is enclosing the open shaft (for example, enclosing one level of a 3-story opening to create a 2-story vertical opening) with gypsum wall board. It should be confirmed that enclosing a shaft used for supplying air will allow the shaft to provide mechanical ventilation, and that this modification may not cause structural issues. Any construction modifications should be completed under the guidance of Reachback assistance.

4-5 PLUMBING AND MECHANICAL SYSTEMS.

This section includes assessment and risk mitigation of common deficiencies found with regard to plumbing and mechanical systems in existing facilities. A checklist for use during assessments for Detailed Evaluations is included in Appendix E.

All plumbing and mechanical system evaluations outlined in this section are performed by visual inspection and tests. Refer to TM 3-34.70/MCRP 3-17.7E, *Plumbing, Pipe Fitting, and Sewerage*, for assistance in these Plumbing and Mechanical inspections.

4-5.1 Features Evaluated.

The following features are to be evaluated by visual inspection and tests.

4-5.1.1 Domestic Water System.

Perform the following assessments on the domestic water system:

- Take samples and test domestic water to verify water is safe to use and safe to drink.
- Visually inspect facility water storage tank (when located on roof or inside the facility) and all exposed domestic water piping and examine condition of ceilings, walls, and floors for signs of domestic water piping leaks.
- Determine if cross connections exist in piping systems.
- Determine and record location of domestic water service and main shutoff valve.

4-5.1.2 Domestic Water Heating Equipment.

Perform the following assessments on the domestic water heating equipment:

- Examine domestic water heating systems to determine if the systems have the following safety features.
  - Anti-siphon device, such as a cold water drip tube or a vacuum relief valve installed in the cold water supply line
  - Electrical disconnect or fuel supply shut off valve
  - Self-closing pressure relief and temperature valve
  - Pressure relief valve discharge pipe
- Determine if water is being heated and equipment is functioning properly, and if the hot water equipment consists of pressurized or non-pressurized tanks.

4-5.1.3 Sanitary Drainage and Vent System.

Perform the following assessments on the sanitary drainage and vent system:

- Visually inspect all exposed sanitary drainage and vent piping and examine condition of ceilings, walls, and floors for signs of sanitary system piping leaks.
- Examine fixture piping to ensure traps are present.
- Examine vents through roof to ensure they are free from blockages.

4-5.1.4 Roof and Overflow Drainage Systems.

Perform the following assessments on the roof and overflow drainage systems:

- Visually inspect all exposed roof drainage and overflow drainage piping and examine condition of ceilings, walls, and floors for signs of roof drainage and overflow drainage system piping leaks.
- Visually inspect all roof drains to ensure they are free from blockages.

4-5.1.5 HVAC Distribution System.

Perform the following assessments on the HVAC system:

- Before visual inspection and tests are conducted on the HVAC system, obtain local climatic conditions and validate required indoor environmental conditions for various occupancies and functions proposed for the facility.
- Inspect all HVAC equipment and perform functional testing to determine if safe and operational.
- Measure and record HVAC system air and water temperatures where possible.

- Inspect system filters and replace as necessary.

4-5.1.6 HVAC Piping Systems.

Perform the following assessments on the HVAC piping system:

- Visually inspect all exposed piping and ceiling areas to determine if pipes are leaking.
- For piping associated with HVAC systems, measure and record water system temperatures where possible.

4-5.2 Mitigation Measures.

4-5.2.1 Domestic Water System.

If water tests show that domestic water is not safe, shut off or disable water supply and post signs that state “Do Not Use Water”. If water tests show that water is safe but not potable, post signs that state “Do Not Drink Water”.

If pipes are found to be leaking, trace leaks back to their source and determine feasibility of repairs. If leaks are repairable, then shut off water, repair leaks, and re-fill domestic water system. If it is not feasible to repair the leaks, determine if severity of leaks necessitates a new piping system or if leaks can be tolerated without negative impact on the mission.

Determine if domestic water system has any direct connections to the building drainage system that would indicate a cross connection. If cross connections exist, record locations and piping arrangement and submit for Reachback support.

4-5.2.2 Domestic Water Heating Equipment.

Determine power or fuel source for domestic water heating equipment and ensure all connections to domestic water heating equipment are securely made.

Determine if necessary safety devices are installed on the domestic water heating equipment. Install any devices that are missing or not operating properly. The following safety devices are required:

- Vacuum relief valve on cold water piping located above water heater or tank for down-feed hot water systems or bottom-fed domestic water heaters.
- Means for disconnecting an electric water heater from its power source or a shutoff valve for piped fuel sources
- Temperature relief valve, pressure relief valve, or combination temperature and pressure relief valve.

Determine temperature of hot water storage and delivery systems. If the systems are not set at the temperatures listed below, change equipment settings to obtain the desired storage and distribution temperatures. Install a thermostatic mixing valve with the following set points to regulate water heater outlet temperatures if not already installed and operational.

- Hot water storage systems - 140°F (60°C)
- Hot water delivery systems - maximum temperature 120°F (49°C)

4-5.2.3 Sanitary Drainage System.

If pipes are found to be leaking, trace leaks back to their source and determine feasibility of repairs. If leaks are repairable, repair leaks on sanitary system. If it is not feasible to repair the leaks, determine which fixtures are upstream of leaks and decommission fixtures or post signs that state “Do Not Use Fixtures”.

Run water through fixture drains to ensure that all fixture traps have a trap seal.

Remove any blockages from vents through roof.

4-5.2.4 Roof and Overflow Drainage System.

If pipes are found to be leaking, trace leaks back to their source and determine feasibility of repairs. If leaks are repairable, repair leaks on roof drainage and overflow drainage system. If it is not feasible to repair the leaks, determine which roof drains or overflow drains are upstream of the leaks and determine if severity of leaks necessitates another means of roof drainage such as scuppers or if leaks can be tolerated without negative impact on the mission.

Remove any blockages from roof drains and overflow drains.

4-5.2.5 HVAC System.

If system operation is found to be faulty or potentially hazardous, system must be disabled by disconnecting power to the system.

4-5.2.6 HVAC Piping System.

If pipe leaks are found, the system should be traced and shut off if possible using existing shutoff valves.

4-6 ELECTRICAL SYSTEMS.

This section includes assessment and risk mitigation of common deficiencies found with regard to electrical systems in existing facilities. A checklist for use during assessments for Detailed Evaluations is included in Appendix E.

Electrical systems are inherently dangerous and all survey work requires a trained electrician. All equipment found to be de-energized must remain de-energized until a Detailed Evaluation can be performed. Proper personal protective equipment (PPE) must be used when testing or inspecting energized equipment.

Evaluate facilities against NFPA 70, *National Electrical Code (NEC)*, requirements for 60 hertz (Hz) systems and BS 7671, *Requirements for Electrical Installations*, requirements for 50 Hz systems.

4-6.1 Electrical Detailed Evaluations.

The Detailed Evaluation checklist included in Appendix E contains a sample Panel Schedule. This schedule format can be used to gather much of the electrical system data as outlined in this section and the accompanying checklist.

4-6.1.1 Short Circuit Ratings.

Using proper Personal Protective Equipment (PPE), collect the following information and provide to Reachback resources:

- Obtain volts, amps, number of phases and AIC rating for each panel.
- Obtain electrical equipment nameplate data such as horsepower, voltage, phase, and ampere for each feeder, panel, motor, transformer and major equipment item.
- Obtain feeder types, sizes, lengths, and quantity of feeders in each run, and the type of raceway in which each feeder is installed.

Reachback to perform the following after obtaining data above:

- Conduct infinite bus theory to estimate utility fault current if utility's data is unavailable.
- Perform short circuit calculations utilizing industry-recognized software in compliance with the IEEE Standard 399, *Recommended Practice for Industrial and Commercial Power Systems Analysis*, recommended practices.
- Compare the results of calculations with actual equipment ratings.
- Create an up to date one-line diagram showing existing electrical system, refer to sample one-line diagram in Appendix E.
- Determine if electrical equipment has an AIC rating higher than the available fault current. The equipment must include, but is not limited to switchgear, switchboards, panelboards, busways, and safety switches.

4-6.1.2 Distribution System Grounding and Bonding.

Perform the following assessments and calculations:

- Inspect and test the facility's grounding system per NFPA 70 (60 Hz) or BS 7671 (50 Hz) and NFPA 780, *Standard for the Installation of Lightning Protection Systems*, for buildings with lightning protection, in addition to the following:

- Ensure there are no loose connections. Utilize infrared camera if available to look for hot spots when the system is energized.
- Ensure the system neutral is bonded to equipment grounding system at the service entrance including the connection to the grounding electrode for 60 Hz systems. Many 50 Hz systems, such as TN-S only require bonding at the source, i.e. transformer. This complies with BS 7671.
- Ensure ground rods are installed; if possible verify that the measured ground resistivity is 25 ohms or less at the service entrance for 60 Hz systems or at the source for 50 Hz systems.
- Check for electrical continuity between any metallic cold water pipes and the main grounding bus bar.
- Ensure separately derived systems (such as transformers, generators, battery/inverter systems, photovoltaic systems) are properly grounded.
- Record all grounding conductor sizes.
- Ensure grounding systems within the facility are bonded together at ground level or below.
- Ensure all access control fencing surrounding electrical equipment (generators, transformers, and switching stations) is properly grounded and bonded.
- Ensure facility has surge protection installed on all entering or exiting metallic electrical conductors, intrusion detection, communication antenna, and instrumentation lines. Surge protection is a requirement for all facilities with lightning protection systems installed.
- Test grounding system by using the 3 point fall-of-potential method.

4-6.1.3 Branch Circuit and Feeder Ratings.

Perform the following assessments and calculations:

- Determine the conductor sizes by either the conductors’ manufacturer marking or actual field measurements.
- Record conductor size and size of the over current protection device.
- Check for signs of damage, burning, or corrosion.
- Note if the conductors are copper or aluminum.
- Note the insulation type.
- Determine that the combination of the circuits’ conductors and circuit breakers/fuses are in compliance with the NFPA 70 (60 Hz) or BS 7671 (50 Hz) requirements for the loads being served.

4-6.1.4 Lightning Protection System.

Inspect the facility's lightning protection system per NFPA 780 in addition to the following:

- Check for loose connections.
- Check for missing conductors or components.
- Inspect system components for any signs of corrosion.
- Ensure all down conductors, roof conductors, and ground terminals are intact.
- Ensure conductors and system components are securely fastened to mounting surfaces.
- Ensure lightning protection system is bonded to the distribution grounding system.

Where a lightning protection system is not found, have a risk assessment performed per NFPA 780 via Reachback resources.

4-6.1.5 Raceways.

Perform the following assessments of the electrical raceways:

- Confirm the raceways are of the following approved types: Galvanized Rigid Steel (GRS) Conduit, Intermediate Metal Conduit (IMC), Electrical Metallic Tubing (EMT), Flexible Metallic Conduit (FMC), Polyvinyl Chloride (PVC), Liquid tight Flexible Metal Conduit and Surface Metal Raceways.
- Inspect for mechanical damage or missing raceway section or component.
- Inspect the raceway system for signs of corrosion
- Assess as to whether the raceway system is installed as defined per Uses Permitted by NFPA 70 (60 Hz) or BS 7671 (50 Hz).

4-6.1.6 Emergency and Exit Lighting.

Perform the following assessments of the emergency and exit lighting:

- Test batteries in all the egress and exit lighting fixtures. Battery must keep the fixture on for 90 minutes.
- Note the location of all exit signs. A minimum of one exit sign must be visible at every point along the path of egress. Verify exit lights at all exterior doors.
- Exit light placements are in compliance with the requirements of NFPA 101, *Life Safety Code*, and *International Building Code (IBC)*.

4-6.1.7 Transformers.

Perform the following assessments:

- Note the location of all transformers, transformer sizes, type, voltage, and nameplate information.
- Determine if the transformer is installed in accordance with NFPA 70 (60 Hz) or BS 7671 (50 Hz).

4-6.1.8 Receptacles.

Perform the following assessments of the grounded and GFCI protected receptacles:

- Note the location of all receptacles.
- Identify those receptacles that require GFCI protection and ensure protection functions are provided as required.
- Receptacles must be protected per NFPA 70 (60 Hz) or BS 7671 (50 Hz).

4-6.1.9 Foreign Voltages and Frequencies.

Obtain nameplate electrical data of the equipment and components and assure compatibility of the of the facility's electrical system voltage and frequency with the referenced electrical equipment and components which include but are not limited to HVAC equipment, transformers, fluorescent and HID lamps, motors, and circuit breakers. Refer to UFC 3-510-01, *Foreign Voltages and Frequencies Guide,* Appendix C, Derating Factors.

4-6.1.10 Circuit Lockout Requirements.

Review operational procedures for the military unit to occupy the facility to determine if they contain appropriate coverage of circuit lockout procedures.

4-6.2 Mitigation Measures.

4-6.2.1 Short Circuit Rating.

If electrical equipment's short circuit rating is not higher than the available fault current, do not energize electrical system (or de-energize if energized) and obtain guidance from Reachback resources.

4-6.2.2 Distribution System Grounding & Bonding.

Perform the following mitigation actions based on deficiencies found:

- Tighten all loose connections.
- Bond grounded (neutral) system to grounding system where required.
- Replace all grounding conductors that do not meet the NFPA 70 (60 Hz) or BS 7671 (50 Hz) requirements.

- Install ground rods.
- Repair or replace grounding and bonding system's conductors and components to meet the NFPA 70 (60 Hz) or BS 7671 (50 Hz) requirements and UFC 3-550-01*, Exterior Electrical Power Distribution*.

4-6.2.3 Branch Circuit and Feeder Rating.

Perform the following mitigation actions based on deficiencies found:

- Replace conductors and breakers/fuses as necessary to comply with the NFPA 70 (60 Hz) or BS 7671 (50 Hz) requirements for branch and feeder circuit sizing.

4-6.2.4 Lightning Protection System.

Perform the following mitigation actions based on deficiencies found:

- Tighten all loose connections.
- Provide missing conductors and components matching existing conditions.
- Replace all parts showing any sign of corrosion.
- Provide conductors for any missing down conductors and roof conductors.
- Securely fasten loose conductors and system components to mounting surfaces.
- Bond the lightning protection system to the distribution grounding system.
- Where a lightning protection system is not found and is needed, based on Reachback guidance, install a lightning protection system or abandon the building.

4-6.2.5 Raceway.

Perform the following mitigation actions based on deficiencies found:

- Replace any raceways that are not within the approved types noted above.
- Replace all damaged or missing raceway sections and components.
- Replace all corroded raceway system components.
- Exposed wiring must have sufficient mechanical protection.
- Correct raceway deficiencies to comply with NFPA 70 (60 Hz) or BS 7671 (50 Hz) requirements.

4-6.2.6 Emergency and Exit Lighting.

Perform the following mitigation actions based on deficiencies found:

- Replace defective egress and exit lighting fixture batteries.

- Provide additional exit signs such that an exit sign is always visible along the path of egress.
- Provide additional egress lighting fixtures to meet NFPA 101.
- Provide additional exit lights where necessary to comply with the requirements of NFPA 101 and IBC.

4-6.2.7 Transformers.

Perform the following mitigation actions based on deficiencies found:

- If transformers, located inside the facility, are not installed in compliance with NFPA 70 (60 Hz) or BS 7671 (50 Hz), contact Reachback for appropriate mitigation.
- Be aware of health hazards when replacing aged electrical equipment. Dry type equipment may contain asbestos. Liquid cooled components may contain oils with PCB's. Take all correct safety protections including specialized PPE when handling this equipment. Assume all equipment manufactured before 1970 to contain potentially hazardous or carcinogenic materials. Ensure proper disposal of replaced equipment is followed.

4-6.2.8 Grounded and GFCI Receptacle Test.

Perform the following mitigation actions based on deficiencies found:

- Where no grounding conductor is found, the receptacle must be GFCI protected.
- Where receptacles are located within 6 feet (2.0 m) of a water source, the receptacle must be GFCI protected. For facilities constructed in accordance with BS 7671 or similar codes, verify that GFCI protection for the entire circuit is located at the distribution board.
- GFCI protected receptacles that fail to trip must be replaced with similar.

4-6.2.9 Circuit Lockout Requirement.

If the circuit lock-out procedures are insufficient, or do not exist, then develop and utilize procedures in accordance with UFC 3-520-01*, Interior Electrical Systems*.

4-7 TELECOMMUNICATION SYSTEMS.

This section includes assessment and risk mitigation of common deficiencies found with regard to telecommunications systems in existing facilities. A checklist for use during assessments for Detailed Evaluations is included in Appendix E.

4-7.1 Telecommunications Detailed Evaluations.

4-7.1.1 Distribution System Grounding and Bonding.

Perform assessments and calculations per the section entitled, “Distribution System Grounding and Bonding”.

4-7.2 Mitigation Measures.

4-7.2.1 Distribution System Grounding & Bonding.

Perform mitigation actions based on deficiencies found per the section entitled “Distribution System Grounding and Bonding”.

CHAPTER 5 ENGINEERING EVALUATIONS

The Engineering Evaluation is a verification of compliance with minimum life safety and habitability requirements at the Semi-Permanent Construction Level specified in UFC 1-201-01. Facilities deemed to conform are safe to occupy for a period of up to 10 years. With maintenance and upkeep of critical building systems, this period can extend to 25 years. This evaluation requires extensive time and detailed information on the building, and must be performed by Professional Engineers with building design experience.

APPENDIX C TECHNICAL FIRE PROTECTION DEFINITIONS AND GLOSSARY

C-1 GENERAL DEFINITIONS.

Above-grade Floor: A level in a building with all exits that are above grade, such that it's necessary to use interior stairs to exit.

Basement: A level in a building with all exits that are below grade, such that it is necessary to use interior stairs to exit. Exception: An otherwise below grade area with a "walk-out" exit, and otherwise complying with other egress requirements can be considered to be located "at grade."

Building Area: The area of the building, per floor, determined based on plans or measurements, inside the exterior walls. For buildings with areas per floor that are not equal, the effective area is the largest floor area.

Building Separation: The horizontal separation distance between the building under consideration and neighboring buildings on all sides. For multiple buildings on the same compound, assume an imaginary line halfway between buildings. The distance from building under consideration to adjacent existing buildings, or from the building under consideration to the imaginary line, whichever is shorter, is the fire separation distance.

Combustible Construction: A building with a wooden frame or floor structure is combustible. The frame of a building consists of columns, beams and/or joists. Combustible framing may not always be apparent without observing un-covered framing. Uncovered framing can often be seen in mechanical/electrical rooms or penthouses. Buildings of mixed construction types (combustible frame and noncombustible frames) are treated as combustible. If it is not possible to determine the construction type, assume it is combustible.

Combustible Storage: Combustible storage consists of paper, plastic, wooden, or cardboard materials. Metal objects, glass, and inorganic minerals (sand, salt) are non-combustible. Mixtures of combustible and non-combustible materials are combustible.

Fire Alarm Systems: These consist of speakers, horns or bells, and/or strobes or flashing lights that are operated by the fire alarm control panel in the event that an alarm condition exists.

Fire Detection Systems: Typically these systems consist of smoke or heat detectors in corridors, in elevator lobbies, or throughout all spaces. Manual pull stations are typically located near exit stairs and exterior exits. These fire detectors are connected by wires to the fire alarm system that is operated by one or more fire alarm control panel(s).

Fire Protection System, Active: Consists of any system such as automatic fire sprinkler system, manual hose station system, fixed automatic extinguishing systems (i.e., Carbon Dioxide, chemical extinguishing systems, or clean agent suppression system), fire alarm system, or fire detection system.

Fire Protection System, Passive: Consists of any system such as fire wall, fire door, firestopping, spray-applied fireproofing, etc.

Fire Suppression System: Automatic wet or dry chemical extinguishing system, clean agent fire extinguishing system, or carbon dioxide extinguishing system.

Flammable Gases: Gases such as propane or natural gas.

Flammable Liquids: Liquids such as gasoline, fuel oil, jet fuel, or paint thinner. Water based latex paint is non-flammable.

Fuel-fired Equipment: Building support equipment such as furnaces, boilers, or hot water heaters.

Hazardous Areas / Hazardous Equipment: For purposes of these evaluations, hazardous areas include, but are not limited to, the following:

a. An area with flammable liquid storage or use, or flammable gas storage.

b. A battery storage area with batteries sized over 10 cubic feet (0.283 cubic m.) in total volume.

c. An area with fuel-fired equipment (boiler, incinerator, gas water heater or similar equipement).

d. A kitchen grill or fryer within a building.

e. Oil-filled transformers.

f. Areas with over 1,000 sq. ft. (92.9 sq. m.) of stored combustible materials.

g. An area with combustible storage areas with combustible materials stacked over 12 ft. (3.7 m) high above the floor.

h. An area used for hazardous waste material storage (flammable, corrosive or noxious chemicals).

HESCO Barrier: Metal chain link assemblies assembled into rectangular enclosures, filled with gravel or sand.

Kitchen Grill: Heated appliance surface used for cooking.

Kitchen Hood: Liquid tight duct assembly typically located above a kitchen grill for carrying grease-laden vapors and cooking fumes away from the cooking surface.

Living Unit: In a billeting occupancy, the occupied area consisting of at least a sleeping room. This may also include a kitchen area, bathroom or living room assessable only to the bedroom.

Mezzanine: An intermediate floor located between the floor and ceiling of any building story.

Non-combustible Construction: Buildings constructed of metal joists, beams, and columns, or concrete beams, columns and/or floor slabs.

Officer in Charge: The officer identified by the safety program, risk management process, charged with identifying, assessing, and controlling risks arising from operational factors and making decisions that balance risk cost with mission benefits.

The JFC reduces the chance of mishap by conducting risk assessments, assigning a safety officer and staff, implementing a safety program. To assist in risk management, commanders and their staffs may develop or institute a risk management process tailored to their particular mission or operational area. (Refer to JP 3-0, Joint Operations Chapter III, paragraph 2.k)

Protected Opening: A wall opening within a fire-resistive wall such as a window, door or louver that has been provided with a protective cover that maintains the fire-resistivity of the wall assembly.

Shaft: An enclosed floor opening between two or more stories. Typically these are enclosed with construction typical of walls.

Smoke Alarms, Single or Multiple Station: A device that incorporates the smoke detector and the alarm sounding device in one unit operated from either a battery or building power. They can function independently (Single Station), or can be interconnected (Multiple Station) such that when one goes into alarm, all smoke alarm sounding devices activate.

Standpipe System: Standpipes are typically located within or near exit stairways, and have hose connection valves for large (usually 2½ inch (65 mm) diameter) use by fire responders. Small hose stations (usually 1½ inch (40 mm) diameter) are typically for occupant use, and have smaller diameter hose.

Story: The portion of the building between a floor and the next floor above, or between the floor and the roof. A mezzanine is not a story; it is part of the story below. A mechanical penthouse does not count as a story unless there are occupied spaces such as offices in the penthouse.

Sub-basement: A level in a building more than one level below grade. Exception: See exception in basement definition for certain walk-out basements. A space located one level beneath a walk-out basement meeting the exception given under “Basement” in this section is not a sub-basement.

Vertical Openings: Openings in the floor of a building such as atriums, open stairs, air shafts or pipe chases that are not enclosed by wall assemblies. Multiple vertical openings that are not separated horizontally by a wall are considered one vertical opening (e.g., a vertical opening connecting Levels 1 and 2, and a separate vertical opening connecting Levels 2 and 3, without a contiguous wall between them, are considered one vertical opening connecting Levels 1 through 3).

C-2 EGRESS DEFINITIONS.

Corridor: A pathway through a building enclosed by full height (floor to ceiling) walls that leads to an exit.

Dead end corridor: A section of corridor that does not lead to an exit stair or an exterior exit door. For example, for a building with 2 interior exit stairs and a corridor connecting these 2 stairs, any extension length of the corridor "outboard" of the 2 exit stairs is a dead end corridor length. The maximum dead end corridor limit for all occupancies of this document is 25 feet (7.6 m). If functioning sprinkler systems are provided for the occupied areas, contact Reachback if longer dead end allowance is needed.

Egress: The path of travel for persons from occupied areas through rooms or exits to reach areas outside of a building.

Exit: A door in the exterior wall of the building accessing the outdoors, a stairway interior to the building that is enclosed by walls and leads to the outdoors, or a stairway located on the exterior of the building, leading to the outdoors.

Exit Capacity: The calculated number of persons a given exit component (stair or exit door) can accommodate for determining the maximum allowable occupant load. Door width is the width of the opening through the door. Stair width is the width of a flight of stairs. If the stairs vary in width, measure the stairs at the narrowest point.

Exit Capacity			
Clear Width		Occupants per	
in	(mm)	Door	Stair
24	(610)	100	65
28	(710)	120	75
30	(762)	130	80
32	(812)	135	85
34	(863)	145	90
36	(915)	155	100
40	(1,015)	170	110
44	(1,117)	185	120

If the egress path consists of a door and a stair, the occupant load is limited by the smaller of the two exit capacities. For example, if the door is 34 inches (863 mm) wide (exit capacity of 145) and the stair is 44 inches (1117 mm) wide (exit capacity of 120), the stair is the limiting factor for determining the Exit Capacity.

Where there are two or more exits from a room or floor, the maximum allowable occupant load is determine by adding the exit capacities for each exit from that room or floor. For example, if there are two doors from the ground floor leading directly to the exterior, one door is 28 inches (710 mm) (exit capacity of 120) and the other 32 inches (812 mm) (exit capacity of 135); the total maximum occupant load for the ground floor is 255.

Means of Escape: A way out of the building other than by the use of enclosed exit stairs, exterior stairs, or exterior doors. For purposes of this document, two methods are allowed, subject to detailed evaluations:

a. Means of escape consisting of an operable window sized at no less than 6 sq. ft. (0.56 sq. m.) and with the bottom of the window located no more than 4 ft. (1.2 m.) above the floor. The window needs to open into an area having access to a yard or street area for rescue. If below grade, the window needs to open into a window well sized to allow personnel access, and if the window is more than 1 story above grade, the window needs to open above a platform or ladder allowing access to grade.

b. Fire escape ladders: An exterior ladder, usually metal, mounted on the side of a multi-story building that is accessed through a window or a door, and provides access to grade level.

Panic Hardware: A door latching assembly that typically includes a bar across part of the width, or across the entire width of the door; pushing on the bar in the direction of egress automatically opens the lock (if provided) and retracts the latch, opening the door.

Travel Distance Limit (Maximum Allowable): The distance a person needs to travel from the point that is most remote on a given floor to the nearest exit. Travel distance is measured along normal walking paths, taking a direct route. Allowable travel distance limits for occupants are established for occupancies as follows:

- Billeting: 175 ft. (53.3 m.)
- Assembly: 200 ft. (61.0 m.)
- Institutional: 150 ft. (45.7 m.)
- Business: 200 ft. (61.0 m.)
- Factory/Industrial: 200 ft. (61.0 m.)
- Storage: 200 ft. (61.0 m.)

The travel distance limits presented herein are based on unsprinklered buildings. If functioning sprinkler systems are provided for the occupied areas, contact Reachback if additional travel distance is needed.

C-3 OCCUPANCY DEFINITIONS.

Occupancy: For purposes of this document, occupancy consists of one or more of the following building uses:

a. Billeting (sleeping areas with more than 10 beds)

b. Institutional (hospital, confinement) areas over 1,000 sq. ft. (92.9 sq. m.)

c. Assembly (gathering places, cafeterias, etc.) exceeding 500 sq. ft. (46.5 sq. m.)

d. Business (offices) exceeding 1,000 sq. ft. (92.9 sq. m.)

e. Factory-Industrial (shops, mechanical spaces) areas over 1,000 sq. ft. (92.9 sq. m.)

f. Storage (including hangars and parking garages) areas over 1,000 sq. ft. (92.9 sq. m.)

Spaces of a lesser size than noted above are considered a part of the overall occupancy. If no occupancy as defined above exists, use the area of the largest use that exists.

Mixed Occupancies: Where more than one occupancy exists, base the requirements for life safety described herein on the most restrictive occupancy present. In the list of occupancies above, Billeting is the most restrictive, and Storage is the least restrictive, and the occupancies between are in descending order of restrictiveness with regard to life safety.

Occupied Spaces: spaces that are normally used by personnel other than building maintenance persons. Occupied spaces do not include unmanned storage rooms, lookout towers or guard positions, mechanical/electrical equipment rooms, or computer server rooms.

Occupant Load: The total number of people on a given floor. This number is calculated based on the number of chairs, desks, beds, or other suitable number. To calculate occupant loads for the given occupancies use the following:

a. Billeting: Use the maximum number of beds to be used.

b. Institutional: Use the maximum number of beds or maximum number of persons in detention.

c. Assembly: Number of seats if seats are provided. If seats are not provided, use 7 sq. ft. (0.65 sq. m.) per person through the area of Assembly use, deducting area for access/circulation paths that are maintained in the space.

d. Business: Use number of desks.

e. Factory/Industrial: Use 300 sq. ft. (27.9 sq. m.) per person, using the overall area of the occupancy.

f. Storage: Use 300 sq. ft. (27.9 sq. m.) per person, using the overall area of the occupancy.

APPENDIX D PRELIMINARY EVALUATION CHECKLIST

This Preliminary Evaluation checklist can be printed and used to assess existing facilities being considered for occupancy up to 90 days.

Preliminary Evaluation Checklist for Building Occupancy

BUILDING DESCRIPTION: ____________________

LOCATION: ____________ **BLDG NO.:** ____________

INSPECTOR: ____________ **DATE/TIME:** ____________

General Personal Safety:
Basic parameters to ensure safety when conducting occupancy assessments:

- Always wear standard issue personal protective equipment (PPE).
- Work in teams of at least 2 or have means of communication to response personnel
- Be alert for falling objects or tripping hazards

Equipment:
See Chapter 3 of the UFC for a list of equipment typically used for these evaluations.

Evaluation Process:
Complete the checklist in the order it is arranged. Initially assess the building from the exterior. Then perform an initial interior walk-thru to expeditiously assess issues that may prevent occupancy. Finally, assess interior discipline-specific issues.

PRELIMINARY EVALUATION SUMMARY

Complete summaries below and outline results of the evaluation regarding the following:

- Any conditions discovered that restrict/prevent occupancy
- Any required or recommended mitigations to allow safe occupancy
- Any conditions requiring “Reachback” assistance

Entries must be signed by each inspector and the Officer in Charge If resources are available, Preliminary and Detailed Evaluations should be performed together.

Discipline/System	Inspection Summary
Structural Systems	Inspector Signature:
Fire Protection	Inspector Signature:
Electrical/ Telecom	Inspector Signature:
Mechanical/ Plumbing	Inspector Signature:

INSPECTION RECOMMENDATION

PRELIMINARY EVALUATION	
Building can be occupied as-is for 90 days (no deficiencies found)	
Building can be occupied for 90 days following mitigations summarized above	
Prior to initial occupancy “Reachback” is required as outlined above	
Building occupancy can be extended for an additional 90-day period	

Officer-in-Charge Signature:____________________

Preliminary Evaluation Checklist for Building Occupancy

BUILDING DESCRIPTION: ____________________
LOCATION: ____________________ **BLDG NO.:** ____________________
INSPECTOR: ____________________ **DATE/TIME:** ____________________

PRELIMINARY EVALUATION

Note: The Preliminary Evaluation is a limited assessment to identify extreme hazards that pose an imminent risk to life safety or health, and to provide limited safety for immediate but limited-use occupancy. Due to the minimal scope of the preliminary evaluation, significant risks may exist even with a successful evaluation. Valid for 90 days. For extended occupancy, Primary and Detailed Evaluations can be performed concurrently

BUILDING CHARACTERISTICS

Proposed Building Usage	
Number of Stories	
Building Height	
Footprint Area (square feet)	
Past Building Usage	
Type of Construction	
Year Constructed	
GPS Coordinates	

HISTORY OF BUILDING/FACILITY DATA

Note: the following valuable information can be obtained from Host Nation or local residents

Building documentation (as-builts) available?	
When was building last occupied?	
Who lived/worked in building?	
Are prior occupants still in area?	
What activities were performed in the building?	

BUILDING SKETCH

Preliminary Evaluation Checklist for Building Occupancy

BUILDING DESCRIPTION: ______________________________
LOCATION: ______________ **BLDG NO.:** ______________
INSPECTOR: ______________ **DATE/TIME:** ______________

CONDITION ASSESSED	CONDITION FOUND?	INSPECTOR: SUGGESTED ACTION
Exterior Assessment		
Collapse or partial collapse of building		Do not enter
Building noticeably leaning		Do not enter
Building shifted off foundation		Do not enter
Numerous cracks more than 1/8 in. wide in exterior walls		Do not enter
Building has significant blast or fire damage		Do not enter
Items that could fall on personnel - Loose pieces of building walls - Broken or loose parapets - Built up snow or ice on roof - Damaged low roof over entrance		Remove loose items or block access to areas under loose items.
Downed power lines		De-energize power systems
Damaged or displaced gas lines		Shut off gas, or vacate area
Signs of previous industrial operations or hazardous material/waste release. Signs of hazardous material/waste releases include: - Open or damaged containers - Observed spills or releases - Detection of odors or physical reactions (e.g., dizziness, nausea, eye/skin irritation) - Broken or ruptured piping		Do not enter, report in accordance with reporting requirements
Partial control of site by DoD		Do not occupy unless control allows safe occupancy
Initial Walk-Thru		
Partial control of building by DoD		Do not occupy unless security controls allow safe occupancy
Existence of unexploded ordnance, explosives, or chemicals		Evacuate and report in accordance with reporting requirements
Rodent, insect or animal infestations		Do not occupy
Waste, sewage or standing water in bldg.		Do not occupy
Signs of excessive mold		Do not occupy
Exposed/disturbed insulation		Do not occupy unless determined not to be hazardous
Isolated collapse of building structure		Evacuate collapsed area
Open flames		Evacuate
Evidence of gas leaks		Evacuate
Inspect roof for loose equipment and falling hazards		Mitigate hazard
Structural Interior Issues		
Walls or columns visibly leaning, bent, cracked, or broken		Do not occupy
Floor or roof structural members sagging, cracked, broken, or separated from their supports		Do not occupy or if problem areas are localized, block access to damaged areas.
Structural members significantly deteriorated – rust, rot, or infested by termites		Do not occupy or if problem areas are localized, block access to damaged areas.
Structural members badly burned or twisted/sagging from fire		Do not occupy or if problem areas are localized, block access to damaged areas.

Preliminary Evaluation Checklist for Building Occupancy

BUILDING DESCRIPTION: ______________________________
LOCATION: ______________ **BLDG NO.:** ______________
INSPECTOR: ______________ **DATE/TIME:** ______________

CONDITION ASSESSED	CONDITION FOUND?	SUGGESTED ACTION
Items that could fall on personnel - Loose pieces of walls, ceilings, or finishes - Loose ductwork or overhead equipment - Other miscellaneous non-structural items		Remove loose items or block access to areas under loose items.
Fire Protection Issues		
Building occupied at levels more than 2 stories above grade Building occupied in a sub-basement (more than one story below grade). (Occupancy includes use of the space for other than mechanical/electrical rooms, lookout/security rooms, or storage rooms)		Locate occupied spaces of building only 2 stories above grade. Do not occupy sub-basements. Conduct detailed evaluation to determine if allowable to occupy higher stories.
Areas inside buildings occupied by fueled airplanes or vehicles		Mitigation measures (complete one of the following prior to and during occupancy): 1) Remove airplanes, vehicles from building, 2) Remove fuel from this equipment, store fuel outside building
Hazardous Areas or equipment that is not enclosed by walls on all sides (cut-off rooms). - An area with flammable liquid use or storage, fuel storage, or flammable gas storage - Battery storage with batteries sized over 10 cu. ft. (0.283 m^3) in volume (total size) - An area with fuel-fired equipment (boilers, air handlers, hot water heaters) - An area with Oil-filled transformers - Areas with over 1,000 sq. ft. (92.9 sq. m) of stored combustible materials (paper, plastic, or wooden materials) - An area with combustible storage stacked over 12 ft. (3.66 m) high above the floor -An area with hazardous waste storage (flammable, corrosive or noxious chemicals)		Prior to occupancy: 1) Remove flammable liquids use and storage from premise, 2) Remove hazardous equipment from service, 3) For storage areas, remove storage, or provide a minimum 50 ft. (15.2 m) of space separation between occupied space and storage and a 24 hour fire watch, 4) Remove hazardous waste from building prior to occupancy.

Preliminary Evaluation Checklist for Building Occupancy

BUILDING DESCRIPTION: ______________________________
LOCATION: ______________ **BLDG NO.:** ______________
INSPECTOR: ______________ **DATE/TIME:** ______________

CONDITION ASSESSED	CONDITION FOUND?	SUGGESTED ACTION
Deficient Egress Issues exist, including: - Number of exits from any building story is less than two (exits are doors to the exterior, an exterior stairway, or an interior stairway enclosed by walls) - Dead-bolt type locks on egress doors from occupied spaces - Paths to exits from occupied spaces through storage areas with no other exit path available - Paths to exits from occupied areas through hazardous areas with no other exit path available - Paths to exits are blocked by storage. - Exit stairs are used for storage.		Prior to occupancy: 1) Do not occupy a story with less than 2 exits. 2) Remove dead bolt type locks from egress doors. 3) Remove storage or hazardous process from building. 4) Remove hazardous process from service. 5) Provide additional exit option avoiding storage area or hazardous area. 6) Remove storage from exit paths.
Exposed plastic foam insulation or corkboard on walls or ceilings in occupied spaces		Remove insulation or corkboard prior to occupancy
Mechanical and Plumbing Issues		
Sanitary piping and venting is not properly configured and traps are not sealed		Occupy, but do not use systems and apply warning signs
Roof drainage and overflow drainage piping show evidence of leakage		Occupy, but perform any readily achievable drainage system repairs prior to occupancy
Roof drains show evidence of blockages		Occupy , but remove any roof drain blockages prior to occupancy
Fuel-fired heating system is in operation		Occupy, but de-energize heating system until Detailed Evaluation is completed
Hazardous or chemical storage areas do not have appropriate containment, ventilation and safety features		Occupy, but do not store chemicals in these areas
*Electrical and Telecommunications Systems		
Is existing electrical system de-energized		Do not energize electrical system until Detailed Evaluation is completed
Is existing electrical power system energized and was facility recently occupied		Do not de-energize and do not use electrical power system until proven safe through completion of a Detailed Evaluation
Survey the building and look for any exposed conductors.		Occupy, close off any rooms with exposed wiring and provide a warning sign. Where exposed wiring is found in areas that cannot be closed off, de-energize the systems per info below.
*Note: De-energized existing electrical systems cannot be energized until a Detailed Evaluation is conducted. Energized existing electrical systems cannot be used until a Detailed Evaluation is conducted.		

Additional Notes on Preliminary Evaluation Issues and Mitigation Actions:

APPENDIX E DETAILED EVALUATION CHECKLIST

This checklist can be printed and used to assess existing facilities being considered for extended occupancy up to 5 years. The checklist covers Detailed Evaluations and correlates to the technical content within Chapter 4 of this UFC.

Detailed Evaluation Checklist for Building Occupancy

BUILDING DESCRIPTION: ______________________________
LOCATION: ______________ **BLDG NO.:** ______________
INSPECTOR: ______________ **DATE/TIME:** ______________

DETAILED EVALUATION SUMMARY

Complete the summaries below and outline the results of the building evaluation regarding the following conditions:

- Any conditions discovered that restrict/prevent occupancy
- Any required or recommended mitigations to allow safe occupancy
- Any conditions requiring "Reachback" assistance

Entries must be signed by each inspector and the Officer-in-Charge.

Discipline/System	Inspection Summary
Structural Systems	Inspector Signature:
Fire Protection	Inspector Signature:
Electrical/ Telecom	Inspector Signature:
Mechanical/ Plumbing	Inspector Signature:

INSPECTION RECOMMENDATION

DETAILED EVALUATION	
Building can be occupied as-is for 5 years (no deficiencies found)	
Building can be occupied for 5 years following mitigations summarized above	
Prior to extended occupancy "Reachback" is required as outlined above	

Officer-in-Charge Signature:______________________________

Detailed Evaluation Checklist for Building Occupancy

BUILDING DESCRIPTION: ______________________________
LOCATION: ______________ **BLDG NO.:** ______________
INSPECTOR: ______________ **DATE/TIME:** ______________

DETAILED EVALUATION

Note: The Detailed Evaluation identifies hazards that pose near-term risks to life safety and health, and provides minimal safety and habitability for longer-term occupancy (5 years) than the preliminary evaluation. The Detailed Evaluation does not address all safety and habitability requirements that are specified in UFC 1-201-01 and addressed in an Engineering Assessment. For items answered as “Yes”, see section number reference in UFC for mitigation options.

STRUCTURAL SYSTEMS INSPECTOR:

CONDITION ASSESSED	CONDITION FOUND?	MITIGATION SECTION #	SUGGESTED MITIGATION
Overall Structural Damage			
Collapse or partial collapse		4-3.3	
Building or story leaning more than 4 in. (100 mm) or H/200 (H=bldg or story height in inches)		4-3.3	
Foundation damage or building shifted off foundation		4-3.3	
Building in zone of suspected slope instability, sinkholes, or erosion		4-3.3	
Building below region of potential landslide		4-3.3	
Significant exterior wall cracks or offsets		4-3.3	
Significant blast or fire damage		4-3.3	
Items that could fall on personnel - Loose pieces of parapets and facades - Built up snow or ice on roof - Damaged or poorly attached entrance canopies		4-3.3	
Damage to Structural Framing Components			
Leaning: Columns, piers, or bearing walls more than 4 in. (100 mm) or H/200 (H=bldg or story height in inches)		4-3.3	
Buckling: Columns, piers, diagonal bracing, or bearing walls		4-3.3	
Damage to horizontal framing members: Cracking with vertical or horizontal displacement in any horizontal framing member.		4-3.3	
Roof or floor framing sloping or sagging in excess of L/180, or separation from walls or other supports		4-3.3	
Damage to vertical framing members: Cracking with vertical or horizontal Displacement in any vertical framing member.		4-3.3	
Connections: Visible damage to connections		4-3.3	
Bracing: Broken, bent, or damaged bracing members		4-3.3	
Connection to foundation: Damaged connections between structural members and foundations.		4-3.3	
Fire: Section loss, twisting, warping, or spalling in structural members from fire		4-3.3

INSPECTOR: ____________ **DATE/TIME:** ____________

DETAILED EVALUATION (continued)

FIRE PROTECTION ISSUES — INSPECTOR:

CONDITION ASSESSED	CONDITION FOUND?	MITIGATION SECTION #	SUGGESTED MITIGATION
Conditions Requiring Field Mitigation or Reachback			
Building separation not adequate.		4-4.2.1	Seal up openings in exterior walls.
Planned occupancy of floors more than 3 stories above grade.		4-4.2.2	Occupy building only to a maximum of 3 stories above grade. Contact Reachback for assistance.
Planned occupancy of floors more than 2 stories above grade in building with any of the following: a. Combustible construction. b. No automatic sprinkler system c. Vertical openings connecting more than 2 stories.		4-4.2.2	Occupy building only to a maximum of 2 stories above grade. Contact Reachback for assistance.
Planned occupancy of basement levels by billeting, institutional or assembly occupancies.		4-4.1.2	Occupy basement levels by occupancies other than billeting, institutional or assembly.
Planned occupancy of sub-basement levels.		4-4.1.2	Do not occupy sub-basement levels.
Travel distance to exits exceeds allowable maximum distance.		4-4.2.4	Do not occupy remote space, occupy space by an occupancy with longer allowable travel distance, provide an additional exit option, or provide means of escape.
Dead end corridors longer than 25 ft. (7.6 m).		4-4.2.4	Provide additional exit path, means of escape, or do not occupy area with dead end corridor.
Less than 2 exits on each occupied level.		4-4.2.4	Provide additional remote exit or remote means of escape. Do not occupy floor with less than 2 exits.
Suite over 2,000 sq. ft. (186 sq m) with single exit path.		4-4.2.4	Provide additional remote exit path, remote means of escape, or do not occupy this area.
Assembly occupancy with less than 2 exit paths available from space.		4-4.2.4	Provide additional remote exit path or relocate assembly occupancy
Exit capacity is insufficient for any occupied area.		4-4.2.4	Provide additional exits, means of escape, or only allow what the exit capacity allows.
Exits blocked, obstructed, or enclosed stairs contain storage.		4-4.2.4	Remove obstructions or storage
Exit doors are locked, or not under control of occupants.		4-4.2.4	Remove locks or do not occupy area not controlling egress.
Exit paths routed from occupied areas through hazardous areas or areas of storage.		4-4.2.4	Provide exiting so it is not routed through hazardous areas or storage.

Detailed Evaluation Checklist for Building Occupancy

BUILDING DESCRIPTION: ______________________________
LOCATION: ______________ **BLDG NO.:** ______________
INSPECTOR: ______________ **DATE/TIME:** ______________

FIRE PROTECTION ISSUES INSPECTOR:

CONDITION ASSESSED	CONDITION FOUND?	MITIGATION SECTION #	SUGGESTED MITIGATION
Billeting occupancy without an automatic sprinkler system.		4-4.2.5	Area < 7,000 sq. ft. (650 sq. m.): Provide fire watch, direct exits to the exterior, subdividing walls separating this billeting area from other areas of the building including other billeting areas, and smoke alarms in billeting units; or limit occupancy to less than 10 beds. Area > 7,000 sq. ft. (650 sq. m.): Contact Reachback
Billeting occupancy with no installed fire evacuation alarm system.		4-4.2.6	Provide fire watch.
Kitchen grill/fryer with no hood.		4-4.2.5	Remove kitchen grill from service, or provide fixed wall around kitchen area.
Kitchen hood with no fixed fire suppression system		4-4.2.5	Provide fixed wall around kitchen area.
Assembly occupancy with partial, or no fire alarm system in building.		4-4.2.6	Provide manual notification and a fire watch when occupied.
Institutional occupancy with partial, or no fire alarm system in building.		4-4.2.6	Provide manual notification and a fire watch.
Business occupancy over 5,000 sq. ft. (465 sq m) in basement, second or third floors with partial, or no fire alarm system in building.		4-4.2.6	Provide manual notification and a fire watch when occupied.
Hazardous areas or hazardous equipment are not segregated from other occupancies by fixed walls.		4-4.2.7	Remove hazardous equipment from service, relocate equipment or materials, or provide fire suppression system (kitchen hood system) or automatic sprinkler system.
Hazardous or chemical storage areas are not provided with containment or ventilation.		4-4.2.7	Remove hazardous material storage.
Interior finishes consists of exposed combustible (plastic, foam) insulations, cork board, fabric assemblies, or combustible decorations.		4-4.2.8	Remove combustible finishes or cover with noncombustible fire barrier. Remove combustible decorations.
Vertical openings connecting more than 2 stories.		4-4.2.9, 4.4.2.2	Provide gypsum wallboard around one level to limit floor opening to 2 stories. See building height restrictions also.

Additional Notes on Fire Protection Issues and Mitigation Actions:

Detailed Evaluation Checklist for Building Occupancy

BUILDING DESCRIPTION: ____________________

LOCATION: ____________ **BLDG NO.:** ____________

INSPECTOR: ____________ **DATE/TIME:** ____________

Partial Definition List:

Building Separation: The horizontal separation distance between the building under consideration and neighboring buildings on all sides. For multiple buildings on the same compound, assume an imaginary line halfway between buildings. The distance from building under consideration to adjacent existing buildings, or from the building under consideration to the imaginary line, whichever is shorter, is the fire separation distance.

Dead end corridor: A section of corridor that does not lead to an exit stair or an exterior exit door. For example, for a building with 2 interior exit stairs and a corridor connecting these 2 stairs, any extension length of the corridor "outboard" of the 2 exit stairs is a dead end corridor length. The maximum dead end corridor limit for all occupancies of this document is 25 feet (7.6 m).

Egress: The path of travel for persons from occupied areas through rooms or exits to reach areas outside of a building.

Exit: A door in the exterior wall of the building accessing the outdoors, a stairway interior to the building that is enclosed by walls and leads to the outdoors, or a stairway located on the exterior of the building, leading to the outdoors.

Exit Capacity: The calculated number of persons a given exit component (stair or exit door) can accommodate for determining the maximum allowable occupant load. Door width is the width of the opening through the door. Stair width is the width of a flight of stairs. If the stairs vary in width, measure at its narrowest point. Stairs are assumed to have inconsistent rise and run; however the run should not be less than 6 inches (127 mm).

Exit Capacity			
Clear Width		Occupants per	
in	(mm)	Door	Stair
24	(610)	100	65
28	(710)	120	75
30	(762)	130	80
32	(812)	135	85
34	(863)	145	90
36	(915)	155	100
40	(1,015)	170	110
44	(1,117)	185	120

If the egress path consists of a door and a stair, the occupant load is limited by the smaller of the two exit capacities. For example, if the door is 34 inches wide (exit capacity of 145) and the stair is 44 inches wide (exit capacity of 120), the stair is the limiting factor for determining the Exit Capacity.

Where there are two or more exits from a room or floor, the maximum allowable occupant load is determine by adding the exit capacities for each exit from that room or floor.

An Occupant Load greater than the Exit Capacity is unsafe.

Occupied Spaces: Spaces that are normally used by personnel other than building maintenance persons. Occupied spaces do not include unmanned storage rooms, lookout towers, guard positions, mechanical/electrical equipment rooms, or computer server rooms.

Occupancy: For purposes of this document, occupancy consists of one or more of the following building uses:

a) Billeting (sleeping areas with more than 10 beds)
b) Institutional (hospital, confinement) areas over 1,000 sq. ft. (92.9 sq. m.)
c) Assembly (gathering places, cafeterias, etc.) exceeding 500 sq. ft. (46.5 sq. m.)
d) Business (offices) exceeding 1,000 sq. ft. (92.9 sq. m.)
e) Factory-Industrial (shops, mechanical spaces) areas over 1,000 sq. ft. (92.9 sq. m.)
f) Storage (including hangars and parking garages) areas over 1,000 sq. ft. (92.9 sq. m.)

Detailed Evaluation Checklist for Building Occupancy

BUILDING DESCRIPTION: ______________________________
LOCATION: ____________ **BLDG NO.:** ____________
INSPECTOR: ____________ **DATE/TIME:** ____________

Spaces of a lesser size than noted above are considered a part of the overall occupancy. If no occupancy as defined above exists, use the area of the largest use that exists.

Occupant Load: The total number of people on a given floor. This number is calculated based on the number of chairs, desks, beds, or other suitable number. To calculate occupant loads for the given occupancies use the following:

a) Billeting: Use the maximum number of beds to be used.
b) Institutional: Use the maximum number of beds or maximum number of persons in detention.
c) Assembly: Number of seats if seats are provided. If seats are not provided, use 7 sq. ft. (0.65 sq. m.) per person through the area of Assembly use, deducting area for access/circulation paths that are maintained in the space.
d) Business: Use number of desks.
e) Factory/Industrial: Use 300 sq. ft. (27.9 sq. m.) per person, using the overall area of the occupancy.
f) Storage: Use 300 sq. ft. (27.9 sq. m.) per person, using the overall area of the occupancy.

An Occupant Load greater than the Exit Capacity is unsafe.

Travel Distance Limit (Maximum Allowable): The distance a person needs to travel from the point that is most remote on a given floor to the nearest exit. Travel distance is measured along normal walking paths, taking a direct route. Allowable travel distance limits for occupants are established for occupancies as follows:

a) Billeting: 175 ft. (53.3 m.)
b) Assembly: 200 ft. (61.0 m.)
c) Institutional: 150 ft. (45.7 m.)
d) Business: 200 ft. (61.0 m.)
e) Factory/Industrial: 200 ft. (61.0 m.)
f) Storage: 200 ft. (61.0 m.)

Vertical Openings: Openings in the floor of a building such as atriums, open stairs, air shafts or pipe chases that are not enclosed by wall assemblies. Multiple vertical openings that are not separated horizontally by a wall are considered one vertical opening (e.g., a vertical opening connecting Levels 1 and 2, and a separate vertical opening connecting Levels 2 and 3, without a contiguous wall between them, are considered one vertical opening connecting Levels 1 through 3).

This UFC supersedes UFC 1-300-01, dated 18 July 2018.

This Page Intentionally Left Blank

FOREWORD

The Unified Facilities Criteria (UFC) system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and applies to the Military Departments, the Defense Agencies, and the DoD Field Activities in accordance with USD (AT&L) Memorandum dated 29 May 2002. UFC will be used for all DoD projects and work for other customers where appropriate. All construction outside of the United States, its territories, and possessions is also governed by Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA), and in some instances, Bilateral Infrastructure Agreements (BIA). Therefore, the acquisition team must ensure compliance with the most stringent of the UFC, the SOFA, the HNFA, and the BIA, as applicable.

UFC are living documents and will be periodically reviewed, updated, and made available to users as part of the Military Department's responsibility for providing technical criteria for military construction. Headquarters, U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering Systems Command (NAVFAC), and Air Force Civil Engineer Center (AFCEC) are responsible for administration of the UFC system. Technical content of UFC is the responsibility of the cognizant DoD working group. Defense Agencies should contact the respective DoD Working Group for document interpretation and improvements. Recommended changes with supporting rationale may be sent to the respective DoD working group by submitting a Criteria Change Request (CCR) via the Internet site listed below.

UFC are effective upon issuance and are distributed only in electronic media from the following source:

- Whole Building Design Guide website https://www.wbdg.org/dod/ufc.

Refer to UFC 1-200-01, *DoD Building Code*, for implementation of new issuances on projects.

CHAPTER 1 INTRODUCTION

1-1 PURPOSE AND SCOPE.

This document provides a unified approach to the appearance, formatting and content of Unified Facilities Criteria (UFC) and Facilities Criteria (FC) documents. UFC and FC are used to provide technical information to plan, design, construct, operate, and maintain DoD facilities. FCs are criteria documents that are not unified with all Military Departments.

In accordance with the authority in MIL-STD-3007, UFC are prepared by DoD committees called Discipline Working Group (DWG) and are published by the Military Departments under the authority of the Engineering Senior Executive Panel (ESEP).

1-2 REISSUES AND CANCELS.

This UFC reissues and cancels UFC 1-300-01, 18 July 2018.

1-3 APPLICABILITY.

This document applies to the preparation of UFC and FC documents prescribed by MIL-STD 3007. **\1** This UFC follows the same applicability as UFC 1-200-01, paragraph 1-3, with no exceptions. **/1/**

1-4 VARIATIONS IN FORMAT.

The format prescribed herein is intended to provide uniformity.

Variations in format must be approved by the Coordinating Panel (CP). The DWG will forward the request to vary from the prescribed format to the CP for approval early in the development process.

1-5 PUBLICATION.

Criteria documents are published in electronic media only. The Memorandum of Agreement for the Whole Building Design Guide establishes the Whole Building Design Guide (WBDG) (https://www.wbdg.org) as the sole distribution method for internet access.

Exception: Controlled Unclassified Information CUI documents will not be maintained on the WBDG. **\1** Instructions on how to obtain the document will be posted on the WBDG. **/1/** CUI documents must be marked, handled and distributed in accordance with DODI 5200.48.

1-5.1 Assigning Publication Numbers.

The DWG responsible for the criteria document will recommend the most appropriate numerical series based on APPENDIX A (for example: UFC 4-010-XX). Series 4 numbering is based on the DoD hierarchical scheme of real property types, functions and Category Groups found in DoDI 4165.03. Ensure proposed number does not duplicate or conflict with publication numbers of other planned, published, or archived criteria. Prior to initial review submittal, the DWG will forward the proposed number recommendation to the CP for approval.

1-5.2 Document Size.

Criteria documents are distributed in electronic format. Therefore; at the discretion of the DWG, documents exceeding 20 Mb in size may be separated into volumes. For criteria separated into volumes, list the issuance title, followed by a colon and the volume-specific title.[1] Each volume will be a separate document with individual tables of content, chapters, appendices and paragraph numbers specific to that volume.

1-5.3 Publication Date.

The DWG coordinates the publication date with the National Institute of Building Sciences (NIBS) after ESEP approval.

1-6 DOCUMENT UPDATES.

Updates to an existing document may be a change or a revision. The responsible DWG will determine whether the update will be a change or a revision.

1-6.1 Changes.

\1 A change amends no more than 40 percent of an existing issuance and has the full authority of the issuance. The 40 percent is based on either a single update or the cumulative total of multiple updates. Changes may include the addition of entire chapters or appendices.

- The number of changes is limited to the number of years in the designated document refresh rate, after which the document must be revised.
- Exception: UFC 3-701-01 may exceed the maximum number of changes established by its refresh rate due to the bi-annual update of the data tables. However, UFC 3-701-01 must undergo a revision in accordance with its refresh rate. **/1/**
- Changes are published upon DWG approval.

1-6.2 Identifying Changes.

Mark the start of changed text with the number of the change enclosed with backslash virgule symbols (**\X**) and the end of changed text with forward slash virgule symbols (**/X/**) in bold type. Provide a **\1** space both before and after the change **/1/** mark for

[1] DoD Issuances Standards

readability. Respectively, the letter "X" represents the number of the change, see Figure 1-1. Simple typographic or grammar changes do not need to be marked.

Figure 1-1 Example Marking Changes

> **CHAPTER 2 PRELIMINARY DESIGN DATA**
>
> **2-1 GENERAL.**
>
> **\1** The need for subsurface drainage and frost protection must be identified during the design stage to enable incorporation of appropriate features into the pavement design. **/1/** Verification of design assumptions is important to obtain reliable designs. If during construction any of the site conditions were found different than those assumed in the design, the design may have to be modified. Some site-related factors affect the need for frost protection and the need for subsurface drainage. In this section, investigation of those site factors is discussed.

1-6.3 Revisions.

If more than **\1** 40 **/1/** percent of an issuance requires change, when the number of changes **\1** will exceed the number of years in the designated document refresh rate **/1/**, or if there are significant program or project cost implications (for example, updating to new versions of industry standards) the issuance must be a revision. Revisions are approved by the DWG, CP and ESEP. The Preparing Activity will forward the completed criteria document to the CP when the revision has been approved by the DWG and is ready for ESEP approval and signature.

- **\1** Exception: UFC 3-701-01 may exceed the maximum number of changes established by its refresh rate due to the bi-annual update of the data tables. However, UFC 3-701-01 must undergo a revision in accordance with its refresh rate. **/1/**

- Revisions are published upon ESEP approval.

1-6.3.1 Formatting Revision.

Update to current UFC Template, remove previous recorded changes from the title page, delete previous change markings, and provide a new publication date.

1-7 ELECTRONIC FORMAT.

Criteria documents will be created and modified using the current UFC Template. The UFC Template can be found on the Whole Building Design Guide at: https://www.wbdg.org/dod/ufc. Published documents are distributed in Portable Document Format (PDF).

1-7.1 UFC Template.

The UFC Template includes customized styles for chapter headings, subparagraphs, figure titles, table titles, and general text with custom multilevel lists. The customized styles enable consistent formatting, PDF generation with bookmarks and the ability to generate Table of Contents, List of Figures, and a List of Tables.

- For new documents, use the current UFC Template.
- For revisions, update to the current UFC Template.
- For changes, updating to the current UFC Template is not required.

1-7.2 PDF.

Final criteria documents are published in PDF. The final PDF for publication must have bookmarks for the Table of Contents, Chapters, Appendices, Figures, Tables and level 1 and 2 paragraphs to allow prompt navigation through the PDF. Make the Table of Contents, Chapters and Appendices a level one bookmark. Make the level 1 paragraphs (for example, 4-2) a level two bookmark. Make paragraph level 2 (for example, 4-2.1), Tables and Figures a level three bookmark.

1-8 COPYRIGHT RELEASES.

For copyrighted materials, obtain written permission from the copyright holder. Identify the material properly in the UFC according to the requirements of the copyright holder.

1-9 REGISTERED TRADEMARKS.

Identify all registered trademarks by the appropriate symbol (® or ™).

1-10 GLOSSARY.

APPENDIX B contains acronyms, abbreviations, and terms.

1-11 REFERENCES.

APPENDIX C contains a list of references used in this document. The publication date of the code or standard is not included in this document. Unless otherwise specified, the most recent edition of the referenced publication applies. Refer to UFC 1-200-01, for the applicable publication date for International Building Code®. **\1** Refer to UFC 1-200-02, for the applicable publication date for ASHRAE Standard 90.1, Energy Standard for Buildings Except Low-Rise Residential Buildings. **/1/**

CHAPTER 2 STYLE AND FORMAT

2-1 INTRODUCTION.

The style and format **\1** are **/1/** designed to facilitate ease of preparation and use. The DWG is responsible for the format, technical content, and overall quality of its criteria document in accordance with the following guidelines:

- Provide documents that meet the format and content requirements in accordance with UFC 1-300-01.
- Provide technical information in a well-written, straightforward manner.
- Reference non-Government standards to the greatest extent possible and avoid repeating commercially available criteria.
- Clearly state unique government requirements and exceptions to non-Government standards and commercially available criteria. Each exception to the industry standards should be verifiable as to the functional need and to assure it promotes the lowest life cycle cost.
- Maximize functionality while addressing security, sustainability, energy, life safety, and health requirements. Using lessons learned and innovative technology, develop the criteria to promote lowest life-cycle cost, maximum environmental responsiveness, energy efficiency, quality of life, and productivity.
- Write criteria to the level of the experienced engineer and architect. Focus on performance criteria. Exclude textbook information, charts and figures, and other information that is available in non-Government standards, commercial and industry references. Documents are not intended to be training manuals or compilations of reference material.
- Exception: Operations and Maintenance criteria may be written in procedural language at the level of the experienced field personnel. Operations and Maintenance criteria may also include textbook information, charts, figures and other information readily needed for use in the document, refer to MIL-STD-38784A.
- **\1** Do not reference Unified Facilities Guide Specifications (UFGS) without qualifying how the reference is to be applied. In UFC, do not rely on UFGS to communicate requirements, and use them only to contextualize specific information and processes. **/1/**
- Generally, larger criteria documents that contain multiple topics may be broken into separate volumes to facilitate updating; see paragraph 1-5.2. However, document size and content must also address the following:
    - User/usage
    - Use in design and construction contracts

- Types of projects affected
- Other documents that reference or work with the criteria document
- Ease to maintain the criteria

2-2 WRITING STYLE.

Write in a direct, active voice with simple, concise sentences in the present tense. Use language appropriate for the user with the experience level required by the subject matter. Avoid ambiguous, indefinite terms such as "too short" or "relatively simple." Quantify whenever possible. Define what applies before using "applicable."

Avoid using the Latin abbreviations for “for example” (e.g.) and “that is” (i.e.) in text. Write out the lead-in to your example: “for example” or “such as.” The use of Latin abbreviations is acceptable within tables and figures. For additional guidance, see Federal Plain Language Guidelines or the Writing Style Guide and Preferred Usage for DoD Issuances.

2-2.1 Mood, Tense, and Voice.

Use the imperative mood (for example, install equipment). Use “must” instead of “shall” to prescribe mandatory requirements, actions and procedures. “Shall” imposes an obligation to act but may be confused with prediction of future action. “Must” imposes obligation and indicates a necessity to act.

In documents that are likely to become part of legal contracts, use imperative mood or “must” to impose a legal obligation. Use "will" to predict future action. Use "can" and "may" to permit choice and identify guidance. Use "should" to indicate desirable procedures that are advisory in nature. Don’t use “he” or “she” or “his” or “her” separately as generic (possessive) pronouns. Use “they” or “their” to avoid gender specificity. Often, rewriting a sentence eliminates the need for repetitive "he or she"; for example, "Information managers complete their training" rather than "the information manager completes his or her training."

2-2.2 Abbreviations, Acronyms, and Symbols.

Refer to the U.S. Government Printing Office, Style Manual for standard government abbreviations, acronyms and symbols. Refer to the Writing Style Guide and Preferred Usage for DoD Issuances for DoD abbreviations, acronyms. Refer to Joint Publication 1-02 for standard military acronyms and terms.

2-2.2.1 Abbreviations.

Use abbreviations consistently throughout a document. Spell out proper names on first use, and present the abbreviation immediately following in parentheses; use the abbreviation thereafter. Abbreviations for standard units of measure can be spelled out on the first use or included in the Glossary.

2-2.2.2 Acronyms.

Use established DoD and industry standard acronyms when the use will improve reader understanding of the text. Provide the complete term the first time it appears, followed by the acronym in parentheses. Then, use the acronym consistently throughout the remainder of the document. The acronyms “DoD,” “OSD,” and “U.S.” do not need to be established upon first use[2] . Acronyms other than DoD or industry standard must be used a minimum of three times in a document to be established; if the acronym is not used at least three times, spell out the term.

2-2.2.3 Symbols.

Symbols may be used in figures tables, and equations. Do not use symbols in the text; for example, use the word "feet" or the abbreviation “ft.”, not the symbol (‘). However, Greek symbols, the percent symbol (%) and the degree mark (°) are acceptable to use in the text.

2-2.3 Capitalization, Punctuation, Grammar, and Syntax.

Refer to U.S. Government Printing Office, Style Manual for rules on capitalization, punctuation, grammar, and syntax.

2-2.4 Metric System of Measurement.

Provide measurements in English inch-pound units with metric dimensions in parentheses[3] including tables and figures. Calculate metric dimensions to the same level of significance as the English inch-pound units. Refer to IEEE/ASTM SI 10 for metric practices such as methods of converting and rounding.

2-2.5 Forms.

Forms may be developed for specific data collection tasks required to use the criteria. To make **\1** printing **/1/** easier, each form should occupy a separate page.

2-3 FORMAT.

The format of criteria documents is standardized for uniformity. Use the format described in this UFC which is preset in the UFC Template.

2-3.1 Page Layout.

Use 8.5- by 11-inch (215 by 280 mm) page size. Foldout sheets should be avoided.

---

[2] *WRITING STYLE GUIDE AND PREFERRED USAGE FOR DOD ISSUANCES*
[3] SD-10, *Guide for Identification and Development of Metric Standards*

2-3.2 Margins.

Use 1-inch (25 mm) margins left, right and top, 0.75-inch (19 mm) margin on bottom. Position marginal copy (headers and page numbers) 0.5-inch (13 mm) from the top and bottom edge of the page. All text is left-aligned at the margin, including paragraph numbers, except as noted for headers, page numbers, chapter/appendix titles, figure, table, and equation titles.

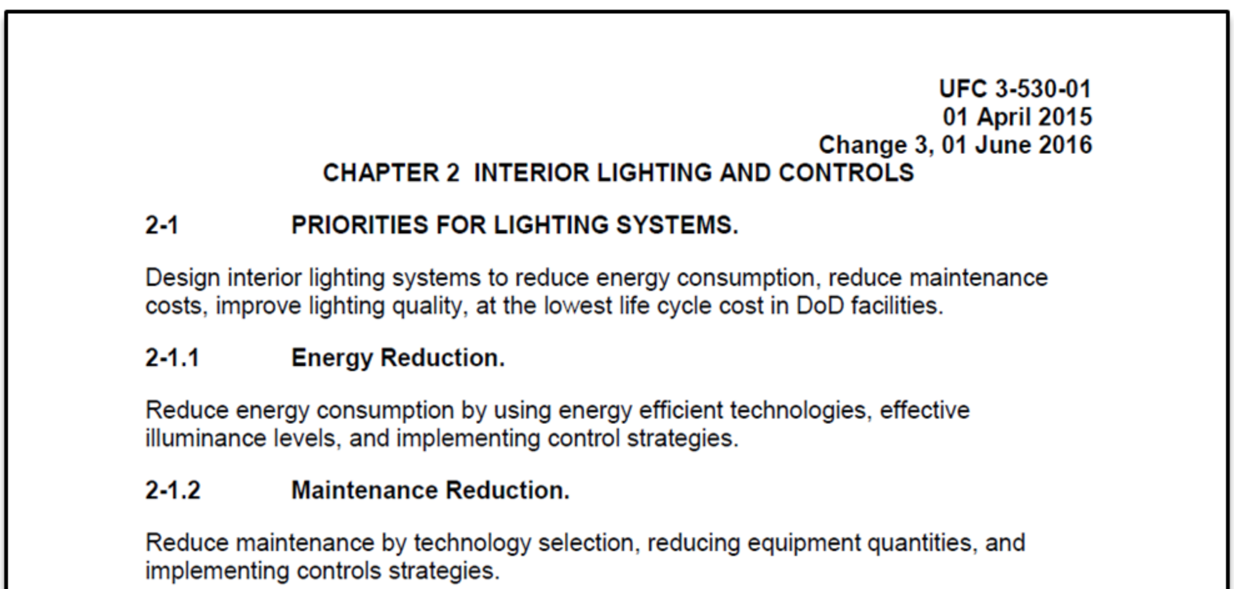
2-3.3 Font.

Use 12-point Arial unless otherwise indicated. Ensure color fonts appear legible when printed black and white.

2-3.4 Headers.

Each page, including the cover and the title page, will bear the criteria designation and publication number (short title) and the publication date as marginal copy, right-justified, one-half inch from the top of the page. The short title occupies the first line; the publication date appears directly beneath the short title. If the issuance is one volume in a multi-volume issuance, add “[comma] Volume #” after the issuance number (e.g., UFC 1-300-01, Volume 1). If the document is a Change, the change number and date will appear directly below the publication date. For an example, see Figure 2-1.

Figure 2-1 Example Header



UFC 3-530-01
01 April 2015
Change 3, 01 June 2016

CHAPTER 2 INTERIOR LIGHTING AND CONTROLS

2-1 PRIORITIES FOR LIGHTING SYSTEMS.

Design interior lighting systems to reduce energy consumption, reduce maintenance costs, improve lighting quality, at the lowest life cycle cost in DoD facilities.

2-1.1 Energy Reduction.

Reduce energy consumption by using energy efficient technologies, effective illuminance levels, and implementing control strategies.

2-1.2 Maintenance Reduction.

Reduce maintenance by technology selection, reducing equipment quantities, and implementing controls strategies.

2-3.5 Footers.

All pages starting with the Table of Contents (TOC) must have a footer consisting of the page number. Do not include Chapter or Appendix modifiers with page numbers. Center page numbers horizontally in the bottom of the footer (bottom marginal copy area) of each page.

2-3.5.1 Front Matter.

Page numbers will not appear on the cover, title page, and foreword. Beginning with the first page of the table of contents, number pages consecutively with lowercase roman numerals.

2-3.5.2 Main Text.

Beginning with the first page of main text and continuing through the last page of the document (including chapters and appendices), number pages consecutively with Arabic numerals. Do not include chapter numbers in the page numbers.

2-3.6 Paragraph Numbering.

Number all main text and appendix text paragraphs. Use the bold paragraph numbering preset in the UFC Template. Do not change the formatting of the paragraph numbering in the UFC Template. In main text, number paragraphs and subparagraphs consecutively from beginning to end, using a period to separate the numbers representing each breakdown. Where a document is divided into chapters, number each paragraph consecutively within the chapter, beginning each paragraph number with the applicable chapter number followed by a dash and then the paragraph number (for example, 2-1, 2-1.1). Where the document has appendices, number appendix and paragraphs consecutively within each appendix, beginning each paragraph with the letter designation of the appendix followed by a dash and then the paragraph number (for example, A-1, A-1.1). Limit subparagraphs to four numbers separated by periods (for example (2-1.1.1.1). Generally, if there is a subordinate paragraph there should be a minimum of two subordinate paragraphs.

2-3.7 Paragraph Titles.

Numbered subparagraphs must have a title. Titles of level 1 paragraphs must be bold uppercase. Titles of subparagraphs (level 2 and below) must be bold with initial capital letters only. Indent paragraph titles 1 inch (25mm) from left margin and end with a period. Place the paragraph text flush with the left margin on the line below the paragraph title. For consistency, follow this rule even for numbered and titled paragraphs that will not appear in the Table of Contents.

2-3.8 Paragraph Text.

Use no more than two paragraphs beneath any paragraph or subparagraph title. Place all lines flush with the left margin. Leave a maximum of 12 point of space between paragraphs. This may be reduced to a minimum of 6 point if it is necessary to adjust the content on an individual page.

2-3.9 Bullet Styles.

Choose a bullet style that is appropriate to the context of the material being presented. Use alphabetical or numerical bullets when listing must be followed in order and use symbol bullets when no order is required. Bullets should be used to list items or brief points. They should not substitute for paragraph headings. Bulleted lists exceeding one page should be re-organized under appropriate paragraph headings. Lettered or numbered steps may exceed one page in length, as required. Leave a maximum of 6 point of space between bullets and 12 point before the next paragraph. This may be reduced to a minimum of 6 point if it is necessary to adjust the content to fit on an individual page.

2-3.10 Tables.

Use a table to present information that is best communicated in tabular rather than paragraph form. All tables must be referenced in the text. Center tables and position each table after the paragraph which first references it. If this causes the table to break between two pages, the entire table may be placed on the next page. If tables are not able to fit on one page, table headers must be repeated at the top of the following pages. Number tables consecutively within each chapter or appendix, using the chapter number or appendix letter first, followed by a dash (for example: for Chapter 2, Tables 2-1, 2-2, 2-3), see Table 2-1 for an example. Column headings should be bold face type and consider 25% darker shading for column header background and 1-pt line for bottom border of column header row and the table outline, see Table 2-1 and 3-1. Font size may be reduced to a minimum 8-point to enhance the presentation of data within a table. Tables may be rotated to Landscape format if required.

Table 2-1 Example Table

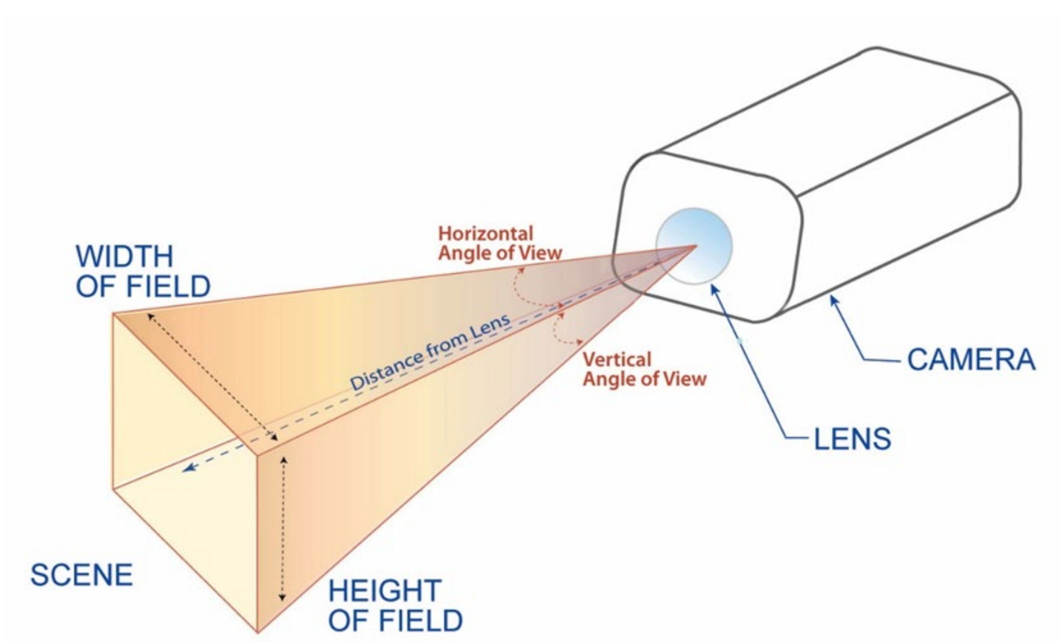
Control Strategy Name	**Control Strategy Description**
Manual On/Manual Off	The lights are manually turned on and manually turned off. This approach can only be used when other control strategies cannot be implemented due to operational requirements.
Photo sensor on/ photo sensor off	At sunset or shortly after, the lights automatically turn on. At sunrise or shortly before, the lights automatically turn off.
Photo sensor on/ timeclock off	At sunset or shortly after, the lights automatically turn on. At a preset time, the lights turn off.
Timeclock on/ timeclock off	At a preset time, the lights automatically turn on. At a preset time, the lights automatically turn off.

Timeclock on/ vacancy adjust/ timeclock off	At a preset time, the lights automatically turn on. Upon sensing vacancy, the lights switch or dim to 50% of full light output. At a preset time, the lights automatically turn off
Timeclock on/ conflict level adjust/ timeclock off	At a preset time, the lights automatically turn on. Upon sensing a reduction in conflict level (pedestrian or vehicular), the lights switch or dim to 50% of full light output.
\1\ /1/	**\1\ /1/**

2-3.11 Figures.

Use a figure to present information that is best communicated as an illustration. Figures must be referenced in the text. Figures may be color or black and white drawings or images. Ensure color figures appear legible when printed black and white. Center figures and position the figure after the paragraph which first references it. If the figure is too large for the remaining space on the page, allow text to fill the remainder of the page and place the figure at the top of the next page. If figures are so numerous they disrupt the flow of text, group them at the end of the chapter. If more than one chapter is affected, group all figures in an appendix. Embed (do not link) figures within the document file. Minimum font size for labels and callouts within figures is 8-point. Number figures similar to tables. Figures may be rotated to Landscape format if required. See Figure 2-2 for an example.

Figure 2-2 Example Figure



2-3.12 Equations.

Minimum font size for equations is 8-point. Leave a maximum of 24 point of space between equations and 12 point before the next paragraph. This may be reduced to a minimum of 6 point if it is necessary to adjust the content to fit on an individual page. In mathematical equations, use italic for all letter symbols, capitals, lowercase, small capitals, and superiors and inferiors (exponents and subscripts); use roman for figures, including superiors and inferiors.[4]

- If an equation or a mathematical expression needs to be divided, break before +, −, = or other mathematical symbol.
- A short equation in text should not be broken at the end of a line. Space out the line so that the equation will begin on the next line; or better, center the equation on a line by itself.
- An equation too long for one line is set flush left, the second half of the equation is set flush right, balance the two parts as nearly as possible.
- When there are two or more equations in a series, center the longest equation in the group and aligned the equal signs of the addition equations.

If equations do not immediately follow the associated text or if they are referenced in a different paragraph or equation, they must be numbered. Number equations similar to tables, see Equation 2-1 for an example.

Equation 2-1. Example Equation

$$T_S = D\left(\frac{vm^{0.5}\cos^{0.8}\theta}{1.125D^{1.5}\log_{10}BHN}\right)^{1.25}$$

Where:
v = impact velocity (m/s)
D = projectile diameter (mm)
T_S *= thickness of steel plate to prevent perforation (mm)*
θ = angle of obliquity (degrees)
m = mass of projectile (kg)
BHN = Brinnell Hardness Number

2-3.13 Warnings, Cautions, and Notes Headings.

For Operations and Maintenance documents, it may be necessary to include warnings, cautions, and notes headings in the text to highlight essential operating or maintenance procedure, practice, condition or statement, which, if not strictly observed could result in

[4] U.S. Government Printing Office, *Style Manual*

an injury, death or long-term health hazard. For guidance on warnings, cautions, and notes headings, refer to MIL-STD-38784A.

2-3.14 External References in Text.

Identify documents referenced in the text by publication number only. Add volume number when applicable. Document titles normally will not be cited in the text; locate full titles in the reference list. When references are issued without number identifiers, include their titles in the text in italics according to the examples in this UFC. If the reference is a web site, provide the name of the web site, followed by the uniform reference locator (URL) in parenthesis. For example, Whole Building Design Guide (https://www.wbdg.org/)

Do not use criteria to republish material available from another source. Information extracted from other publications for inclusion must not exceed one page in length. Present such extracted material in quotation marks, indented 0.5 inch (12.5 mm) from both right and left margins with 6-point space at the top and bottom, and provide appropriate references.

2-3.15 Internal References in Text (Cross-Reference).

Do not use vague terms such as 'previously discussed,' 'prior,' or 'in following paragraphs. Identify cross-references in the text by the number such as chapter number, paragraph number, figure number, table number, or equation number. An example would be, “See paragraph 3-2.5” or, “See Figure 3-2”.

2-3.16 Footnotes.

Use footnotes to give credit for a regulatory or functional authority requirement, legal citation, copyrighted, or quoted material. Identify the footnote with an Arabic superscript number. Number footnotes consecutively from 1 to 99 and then begin with 1 again. If the document is divided into chapters, number the first footnote in each chapter as "1." In supplemental sections, such as appendixes, footnotes begin with 1. Footnotes to tables are numbered independently from footnotes to text. Place footnotes at the bottom of the same page containing the referenced text, separating them from the main text by a hairline rule.

This Page Intentionally Left Blank

CHAPTER 3 ORGANIZATION AND CONTENT

3-1 ORGANIZATION.

Use the following outline:

- Front Matter
  - *Cover*
  - *Title page*
  - *Foreword*
  - *Table of Contents*
- Chapter 1 – Introduction
  - *Background*
  - *Purpose and Scope*
  - *Reissues and Cancels*
  - *Incorporates and Cancels*
  - *Applicability*
  - *Overarching Criteria or Regulatory Requirements*
  - *Regulatory or Functional Authorities*
  - *General Building Requirements*
  - *Cybersecurity*
  - *Glossary*
  - *References*
- Chapter 2 (and following chapters)
  - *Technical requirements*
- Appendix A – Best Practices and other content
- Appendix B – Glossary
- Appendix C – References

3-2 FRONT MATTER.

The front matter includes Cover Page, Title Page, Foreword, Summary Sheet, and Table of Contents. These pages are mandatory for each document including volumes. The latest version of the front matter is maintained in the UFC Template.

3-2.1 Cover Page.

The cover page will include criteria type, document title, DoD Symbol and distribution statement.

3-2.1.1 Criteria Type.

Criteria Type is either Unified Facilities Criteria (UFC) or Facilities Criteria (FC) center justified in bold uppercase.

3-2.1.2 Document Title.

Title will be the title of the criteria in bold uppercase and include modifier when applicable. The first line of the document title will contain only the description of the system, engineering discipline, or facility type. Provide a second line modifier to the title when the document is other than design criteria. Modifiers include but are not limited to, Planning, Design and Construction, Operations Manual, Maintenance Manual, or Inspection Procedures. If no modifier, it will be assumed that the document contains design requirements. If possible, the title should not exceed two lines. Do not use the same title for more than one issuance.

For issuances separated into volumes, list the issuance title, followed by a colon and the volume-specific title (Criteria Title: Volume-Specific Title)[5].

3-2.1.3 DoD Symbol.

DoD symbol will be centered on page, refer to UFC Template.

3-2.1.4 Distribution Statement.

Include distribution statement A or C in accordance with DoDI 5230.24, as follows:

- DISTRIBUTION STATEMENT A. Approved for public release; distribution is unlimited.
- DISTRIBUTION STATEMENT C. Distribution authorized to U.S. Government Agencies and their contractors (fill in reason) (date of determination). Other requests for this document will be referred to the preparing activity.

Most unclassified criteria documents will require Distribution Statement A. Criteria documents determined to be CUI, will require Distribution Statement C and be marked, handled and distributed in accordance with DoDI 5200.48. For these Distribution C documents, the reason will be for “administrative” or “operational” use, the date will be the date determination was established (not necessarily the publication date). Requests for these documents using the Freedom of Information Act (FOIA) will be coordinated with the preparing activity in accordance with DoDI 5230.24.

3-2.2 Title Page.

The title page has a standard copyright statement, a list of the participating Activities and the Record of Changes.

[5] DoD Issuances Standards

3-2.2.1 Participating Activities.

List the participating activities and identify the Preparing Activity parenthetically. See this UFC for an example.

3-2.2.2 Record of Changes.

Record of Changes is applicable when issuing a Change. List each change on the title page under the Record of Changes. Editorial and simple changes may be listed with a general statement such as, "Modified paragraphs 2-1.5, 2.2.3, 2-2.4, 2-4.1.1, 2-4.2.1, 2-8, 2-8.2, 2-8.3 and 3-2". Changes that add requirements, direction or content should be individually identified such as, "Adopts 2015 IBC" or "Added Appendix C Daylighting Best Practices". Simple typographic or grammar changes do not need to be listed. For Revisions, remove all previous changes from the title page, and delete all change markings in the text of the document.

3-2.3 Foreword.

The foreword is identical for all criteria documents and includes general information and the authorization signatures. Prior to publication, refer to the UFC Template for the latest version of the foreword to include current authorized signature authorities.

Exception: For FC, include the signatures of the applicable DoD Components and substitute FC for UFC as applicable.

3-2.4 Summary Sheet.

The original Summary Sheet including Impact and Unification Issues has been deleted from the Front Matter of new and revised UFCs. Provide a separate Impact and Unification issues form to justify service specific requirements and document criteria impacts. See UFC Template for additional information.

3-2.5 Table of Contents.

A Table of Contents (TOC) is mandatory for all criteria documents. As a minimum, the TOC should list Chapters and Appendices with titles and subparagraphs down to second level. Do not list the front matter in the TOC. TOC is generated based on the styles used in the document. Do not manually change the text in the TOC itself. Instead, adjust the appropriate content within the body of the document and update the TOC. The UFC Template will facilitate the automatic generation of the table of contents. If document is one volume in a multi-volume issuance, each volume must have a TOC and each TOC will only include the information for the individual volume.

3-2.5.1 Table of Figures and Tables.

Include a list of figures and tables when there are figures or tables included in the document or volume. If so, format these listings similarly to the rest of the table of contents under the separate headings of "Figures" or "Tables". Format the list of Figures and Tables using the UFC Template.

3-3 CHAPTER 1 CONTENT.

Chapter 1 provides an introduction to define its content, applicability, use and includes the overarching criteria or regulatory requirements. In general, Chapter 1 may contain the following sections:

- *Background*
- *Purpose and Scope*
- *Reissues and Cancels*
- *Incorporates and Cancels*
- *Applicability*
- *General Building Requirements*
- *Cybersecurity*
- *References*
- *Glossary*

3-3.1 "Background" Paragraph.

This paragraph is optional but included when it is important to inform the user why the criteria was created. Here is an example from UFC 1-200-02:

> "The Energy Policy Act of 2005, Energy and Independence Security Act of 2007, and Executive Order (EO) 13693 mandate Federal agencies to lead by example, promoting sustainable Federal buildings through environmentally-sound, economically-sound, and fiscally-sound design, construction, and operating decisions. The Federal requirements collectively are referred to as the "Guiding Principles" and are detailed in "Guiding Principles for Sustainable Federal Buildings and Associated Instructions", February 2016, which replaces "Guiding Principles for Federal High Performance and Sustainable Buildings", 2008. Consistent with UFC program requirements, this UFC integrates DoD requirements (DoDI 4170.11 and other DoD Policies) with High Performance and Sustainable Building (HPSB) Guiding Principles and industry standards for high performance and sustainable buildings."

3-3.2 "Purpose and Scope" Paragraph.

This paragraph is mandatory and at a minimum, this paragraph defines the purpose and scope of the criteria. Here is an example from UFC 3-530-01:

> "This UFC provides requirements for the design of interior and exterior lighting systems and controls based on the Illuminating Engineering Society of North America's (IES) Lighting Handbook Reference and Application, 10th Edition (hereafter called IES Lighting Handbook), Energy Policy Act of 2005, and current recommended practices. This UFC meets

the current IES standard of practice and addresses general lighting requirements for DoD facilities."

3-3.3 "Reissues and Cancels" Paragraph.

This paragraph is mandatory for document updates. List the UFC number, title, version, and publication date of the current online version this UFC is replacing. Do not include the current publication in the reference list. If the document is a new UFC, remove the entire paragraph.

3-3.4 "Incorporates and Cancels" Paragraph.

This paragraph is mandatory for UFCs incorporating and cancelling other documents. List the type, number, title, and publication date of the documents being incorporated and cancelled. If multiple documents are being incorporated and cancelled, list the documents alphabetically on subsequent lines. If the issuance is not incorporating and cancelling another document, remove the entire paragraph.

3-3.5 "Applicability" Paragraph.

This paragraph is mandatory and must define the applicability of the criteria. UFC 1-200-01 defines the applicability of the DoD Building Code and should be used as a baseline. To define applicability, include:

- Facility, building or system type
- Triggers or exceptions
- Service element(s) for non-unified facility criteria.

Here is an example from UFC 3-530-01:

"This UFC applies to interior or exterior lighting systems for construction, repair, and maintenance projects."

3-3.5.1 Facility, Building or System Type.

Facility, building or system type typically follows the title of the criteria. In some cases, it may be necessary to include modifiers such as temporary, semi-permanent, non-permanent facilities that support Military Operations or non-DoD Tenant Buildings on DoD Installations.

3-3.5.2 Triggers or Exceptions.

In some cases it may be required to include applicable triggers or exceptions in the applicability. Typical examples are:

- Effective date

- Location (example: CONUS, OCONUS, within or outside the United States and its territories)
- Occupancy (example: inhabited, primary gathering, billeting)
- Size (example: For buildings greater than 25,000 SF (2,322 m2)
- Replacement cost. Do not use Plant Replacement Value (PRV)
- Acquisition method (example: Military Construction, Public Private Venture, leases)

3-3.6 "Overarching Criteria or Regulatory Requirements" Paragraph.

Additional paragraphs may be included in Chapter 1 to reference overarching criteria, policy or regulatory requirements that are the basis for the requirements determination. Examples are:

- Public Law
- Executive Orders
- DoD Directives, Instructions, Manuals and Directive-Type Memorandums
- Applicable regulatory requirements

3-3.7 "Regulatory or Functional Authorities" Paragraph.

In some criteria documents, it may be necessary to include the regulatory or functional authority for reference, coordination and waiver and exemption coordination. These regulatory or functional authorities may be associated with a facility type or program. The information should include:

- Project or criteria coordination requirements
- Waiver and exemption approval authorities, if other than that defined in MIL-STD-3007.
- Program or regulatory authorities
- Overview of a criteria or policy that are linked together to include their hierarchy.

The following example is from the FC for Navy Child Development Centers:

"**1-7 REGULATORY AUTHORITIES.**

The program regulatory authorities are included below.

1-7.1 Military Authorities.

The comprehensive authorities having jurisdiction for CDCs are the following:

1-7.1.1 Navy.

The following authorities must approve the acquisition methodology, the design team composition, site selection, facility requirements, the DD Form 1391, concept development, and the final design-build request for proposal (RFP) or final design:

- Commander of Naval Installations Command (CNIC) N926 Child and Youth Programs, and N944 Fleet and Family Readiness, Integrity Drive, Millington, TN 38055-6560.
- NAVFAC FAC/FEC

Planners must contact N926 and N944 during planning development and prior to final signature of the DD Form 1391.

1-7.1.2 Marine Corps.

The following authorities must approve the acquisition methodology, the design team composition, site selection, facility requirements, the DD Form 1391, concept development, and the final DB RFP or final design:

- HQMC, Marine Corps Installations Command (GF-4)
- HQMC, Marine and Family Programs Division (MFY-3)
- HQMC, Semper Fit and Exchange Services Division (MRD)"

3-3.8 "General Building Requirements" Paragraph.

The General Building Requirements paragraph is mandatory for all design criteria documents. Refer to the UFC Template for the latest version of the standard paragraph. The current version contains the following:

> "Comply with UFC 1-200-01, DoD Building Code (General Building Requirements). UFC 1-200-01 provides applicability of model building codes and government unique criteria for typical design disciplines and building systems, as well as for accessibility, antiterrorism, security, high performance and sustainability requirements, and safety. Use this UFC in addition to UFC 1-200-01 and the UFC and government criteria referenced therein."

3-3.9 "Cybersecurity" Paragraph.

The Cybersecurity paragraph is mandatory for all design criteria documents that include control systems. Refer to the UFC Template for the latest version of the standard paragraph. The current version contains the following:

> "All facility-related control systems (including systems separate from a utility monitoring and control system) must be planned, designed,

acquired, executed, and maintained in accordance with UFC 4-010-06, and as required by individual Service Implementation Policy."

3-3.10 "Non-Government Standard Modification" Paragraph.

For criteria intended to amend, delete, replace or supplement a building code or a non-government standard, include a paragraph similar to the following:

"1-4 2015 IBC and ASCE/SEI 7-10 Modifications.

UFC 1-200-01 uses and supplements 2015 IBC as the building code for DoD. Chapter 2 of this UFC further modifies the IBC for structural-specific design requirements and is organized by the chapter of IBC that each section modifies. Chapter 3 of this UFC further modifies ASCE/SEI 7-10 for structural-specific design requirements and is organized by the chapter of ASCE/SEI 7 that each section modifies. The 2015 IBC and ASCE/SEI 7-10 section modifications are one of four actions, according to the following legend:

[Addition] – Add new section, including new section number, not shown in 2015 IBC or ASCE/SEI 7-10.

[Deletion] – Delete referenced 2015 IBC or ASCE/SEI 7-10 section.

[Replacement] – Delete referenced 2015 IBC or ASCE/SEI 7-10 section or noted portion and replace it with the narrative shown.

[Supplement] – Add narrative shown as a supplement to the narrative shown in the referenced section of 2015 IBC or ASCE/SEI 7-10."

The section modifiers are identified at the end of the paragraph title. Use the level one and two paragraphs to identify the primary code sections. The third level paragraphs may be the code paragraphs. Here is an example:

"2-4 CHAPTER 19 – CONCRETE.

2-4.1 Section 1901 – GENERAL.

1901.7 - Construction Joints [Addition]

Provide construction, contraction, and expansion joints in structures in accordance with ACI 224.3R and ACI 318, Section 26.5.6.

1901.8 – Tension Ties [Addition]

Where reinforcement is used as a tension tie, splices must be made with a full mechanical or full welded splice per ACI 318 Section 25.4.

1901.9 – Drying Shrinkage [Addition]

Concrete drying shrinkage must be determined for the approved concrete mixture per ASTM C157/C157M as modified by ACI 364.3R and must not exceed 0.05."

3-3.10.1 Tables, Figures and Equations from Non-Government Standards.

Tables, Figures and Equations that are taken from or modified from a non-government standard may use the designation from the Non-Government Standard. The Tables and Figures from the non-government standard do not have to be listed in the Table of Figures or Table of Tables.

3-3.10.2 Commentary.

Limited commentary is allowed when modifying non-government standard to explain or provide the rationale for the standard modification. Commentary should be brief and to the point. Provide a commentary paragraph in chapter 1 and precede commentary with a "[C]" and highlight the narrative with 25% gray. The following example is from UFC 3-301-01.

"**1-7 COMMENTARY.**

Limited commentary has been added to the chapters. Section designations for such commentary are preceded by a "[C]" and the commentary narrative is **\1** shaded.

[C] 1613.1 – Scope [Supplement]

Although Chapter 14 of ASCE 7-16 is not adopted by the 2021 IBC, occasional references to ASCE 7-16 Chapter 14 sections are made in this UFC." **/1/**

3-3.11 "Glossary" Paragraph.

A Glossary is mandatory for all criteria documents using acronyms other than "DoD," "OSD," or "U.S.". The Glossary is always in the second to last appendix. When referring to the Glossary in text, always capitalize "Glossary." List the acronyms, abbreviations and terms that are cited in the text to include the appendices. If the definition of a term has a source, provide citation. Refer to the UFC Template for the latest version of the standard paragraph. The current version contains the following:

"Appendix X contains a list of acronyms, abbreviations, and definitions".

3-3.12 "References" Paragraph.

A reference list is mandatory for all criteria documents that refer to other documents or sources. The reference list is always in the last Appendix. List all publications cited in the text, including appendices in the reference list[6]. Do not include references that are not referenced in the text. Refer to the UFC Template for the latest version of the standard paragraph. The current version contains the following:

> "Appendix X contains a list of references used in this document. The publication date of the code or standard is not included in this document. Unless otherwise specified, the most recent edition of the referenced publication applies. **\1** Refer to UFC 1-200-01, for the applicable publication date for International Building Code®. Refer to UFC 1-200-02, for the applicable publication date for ASHRAE Standard 90.1, Energy Standard for Buildings Except Low-Rise Residential Buildings." **/1/**

In some cases it may be warranted to include additional sources of information about the criteria subject. See 3-7.6 for information on supplemental resources.

3-4 TECHNICAL CHAPTERS.

The technical chapters provide the technical requirements for the criteria starting with Chapter 2. Additional chapters may be added depending on the organization of the subject matter. For example, if discipline-specific criteria include interior and exterior systems, a separate chapter may be provided for each system. Include the unique government requirements and any modifications to non-government standards or existing criteria in the technical chapters. Minimize and streamline content by:

- Including only the technical requirements
- Utilizing performance criteria to the greatest extent possible
- Referencing non-government standards to the greatest **\1** extent **/1/** possible
- Referencing other criteria documents to the greatest **\1** extent **/1/** possible
  - Do not include content from UFC 1-200-01
  - Do not include content contained in the core UFC
- Locating supporting information, best practices and guidance in the Best Practices or other appendices

3-4.1 Exceptions.

An exception is something that is excluded from a criteria requirement and is identified within the criteria. Exceptions can be described in the requirement or listed after the requirements. Follow the methodology in the International Building Code (IBC) to identify exceptions. Example from the IBC:

[6] DoD Issuances Standards

- "Stages greater than 1,000 square feet in area (93 m2) shall be equipped with a Class III wet standpipe system with 1-1/2-inch and 2-1/2-inch (38 mm and 64 mm) hose connections on each side of the stage."
- "Exception: Where the building or area is equipped throughout with an automatic sprinkler system, a 1-1/2- inch (38 mm) hose connection shall be installed in accordance with NFPA 13 or in accordance with NFPA 14 for Class II or III standpipes."

3-4.2 Facility Systems Safety.

Safety is an important component of maintaining and operating DoD facilities and must be incorporated in criteria development and the design process. Incorporating facility system safety in criteria and ultimately the design process will provide the greatest opportunity to reduce risk at the lowest life cycle cost. Therefore, criteria must incorporate concepts from ANSI/ASSE Z590.3, which provides guidance for a life-cycle assessment and a design model that balances environmental and occupational safety and health goals over the life span of a facility.

3-4.3 Multi-Disciplinary and Facility-Specific Design Criteria.

Multi-disciplinary and facility-specific design criteria must convey a wide variety of information. Organize the information in the following order.

- Sustainability and Energy-High Performance and Sustainable Building Requirements (Only if information is needed above what is covered in UFC 1-200-01)
- Physical Security and Antiterrorism (Only if information is needed above what is covered in UFC 1-200-01)
- Architecture
- Interior Design
- Civil Engineering
- Landscape Architecture
- Geotechnical Engineering
- Structural Engineering
- Mechanical Engineering
- Electrical Engineering
- Fire Protection

3-4.3.1 Functional Data Sheets.

A Functional Data Sheet (FDS) is a table intended to provide design criteria for a specific room or space. FDSs are not required if the minimum design criteria is provided in UFC 1-200-01, the applicable core criteria documents or the contents of the technical chapters of the facilities type criteria. The criteria in the FDS should be performance based when possible. For example, do not indicate that an interior wall must be concrete masonry unit (CMU) because CMU may not be standard construction in regions outside the U.S. Instead, describe the desired performance. An example for an interior CMU wall could be "durable wall assembly that is resistant to physical damage, moisture, insects and fire". If required, the FDSs are provided in a separate chapter. See Figure 3-1 for an example of a blank FDS. The FDS generally follows the Uniformat II/Work Breakdown Structure (WBS). The Interior Construction/Built-In Equipment category includes anything physically attached or plumbed to the building such as counters, cabinets, casework, toilet accessories, window shades or blinds, and recessed projection screens. The Furnishings and Equipment category includes loose or moveable items that have no permanent connection to the structure of a building or utilities such as desks, chairs, and shelving.

The Functional Data Sheets are intended to provide the minimum requirements for the respective rooms and spaces for the designer, planner, or RFP preparer. These minimum requirements apply in addition to the requirements of the criteria document and the referenced documents. Blank spaces found in the Functional Data Sheets indicate building components or systems should follow standard guidance per UFC 1-200-01.

Figure 3-1 Example Functional Data Sheet

Description/Usage

Min. net Ft^2 (m^2)	

3-5 "BEST PRACTICES" APPENDIX.

Best Practices; if required, begins with Appendix A. Do not include requirements in the Best Practices. Best Practices appendices are not intended to be a textbook or to repeat information from industry standards and other non-government references. The Best Practices appendix contains commentary and guidance which are not enforceable in contracts. The main purpose is to communicate proven facility solutions, systems, and lessons learned, but may not be the only solution to meet the requirement. In general, follow the associated formatting and content in the associated technical chapter. For example, if there were a technical chapter for interior systems and one for exterior systems, then the best practices should be separated into two appendices. Include the following at the beginning of the any Best Practices appendix,

"The Best Practices Appendix is considered to be guidance and not requirements. Its main purpose is to communicate proven facility solutions, systems, and lessons learned, but may not be the only solution to meet the requirement."

3-6 "GLOSSARY" APPENDIX.

The Glossary is always the second to last appendix[7]. It is broken up into two parts, Acronyms and Abbreviations and Definitions, as appropriate. Present acronyms as they appear within the UFC text; for example, ESEP, CUI, kPa, mm. If the Acronym or definition of a term has a source, provide citation. An example is included in UFC Template. Use the font, spacing, and alignment provided in the template.

3-7 "REFERENCES" APPENDIX.

The reference list is always the last appendix[7]. Use the Appendix to list references in alphabetical order. Generally, include a standard designation, title, and publisher. Specific information for different reference types, and the order to present this information, is provided in the paragraphs below.

If the appendix is several pages, consider breaking the references into categories. For example, a document may use the categories "Government" and "Non-government"; or it may categorize the references by military agencies: "Air Force," "Army," and "Navy" or Standards organization. Choose categories that break the references into manageable lists that are logical for the user. An example is included in UFC Template. Use the font, spacing, and alignment provided in the template.

3-7.1 Publisher Information.

Provide the user with the necessary publisher information to obtain the reference. For the purposes of this UFC, "publisher" is defined as the entity with control and authority over distribution. In cases where more than one entity wields such control and authority, list the lead or authoring entity as publisher. If the reference can only be obtained from a single source, include the address, telephone number, or web site. If

[7] DoD Issuances Standards

this information is not listed, it will be assumed that the reference may be obtained through the web search or the normal means of obtaining any book or magazine.

3-7.2 Government Standards.

List government standards (UFC, Military, or Federal Standards, or other government standards or specifications) using the appropriate standard designation (UFC 1-200-01, MIL-STD-3007), followed by the title in italics and web site, if applicable.

3-7.3 Non-government Standards.

List non-government standards (for example, ASTM Standards, ASME Standards) in alphabetical order using the appropriate standard designation (ASTM A 38) followed by the title in italics and web site, if applicable.

3-7.4 Books and Periodicals.

If the reference is a book or a complete journal, list these documents in alphabetical order by title in italics, author name, publisher and web site, if applicable.

If the reference is a distinct portion of a book or journal (an article or a chapter,) list in alphabetical order by title in quotation, followed by the title in italics, the author's name, publisher, and web site, if applicable.

3-7.5 Web Sites.

If the reference is a web site, list in alphabetical order by the name of the web site in all upper case, followed by the uniform reference locator (URL).

3-7.6 Supplemental Resources.

It may be warranted to include additional sources of information about the criteria subject, such as web sites or journals that publish new findings about a subject on a regular basis. In such cases, include these resources in a separate appendix titled "Supplemental Resources," and list in the same manner as for References. Limit supplemental resources to a single page.

3-8 “INDEX” APPENDIX.

An index is not required and is not to be included. Indexes are difficult to develop and maintain, and electronic format allows for simple searches to locate occurrences of words and phrases.

APPENDIX A NUMBERING OF UNIFIED FACILITIES CRITERIA

A-1 UFC SERIES 1 - POLICY, PROCEDURES, AND GUIDANCE.

- 1-100 Series - General
- 1-200 Series - Policy
- 1-300 Series - Procedures and Guidance
- 1-400 Series - Reserved
- 1-500 Series - Reserved
- 1-600 Series - Reserved
- 1-700 Series - Reserved
- 1-800 Series - Reserved
- 1-900 Series – Miscellaneous

A-2 UFC SERIES 2 - MASTER PLANNING.

- 2-100 Series - Comprehensive Master Planning
- 2-200 Series - Land Use Planning
- 2-300 Series - Utility System Planning
- 2-400 Series - Transportation System Planning
- 2-500 Series - Spatial Data Systems
- 2-600 Series - Installation Design Guides
- 2-700 Series - Outdoor Recreation Planning
- 2-800 Series - Planning in the Noise Environment
- 2-900 Series - Reserved

A-3 UFC SERIES 3 - DISCIPLINE-SPECIFIC CRITERIA.

A-3.1 3-100 Series - Architecture and Interior Design.

- 3-101 General
- 3-110 Architectural Design
- 3-120 Interior Design
- 3-130 Arctic and Subarctic Construction
- 3-140 Reserved
- 3-150 Reserved

- 3-160 Reserved
- 3-170 Reserved
- 3-180 Reserved
- 3-190 Miscellaneous

A-3.2 3-200 Series - Civil / Geotechnical / Landscape Architecture.

- 3-201 General
- 3-210 Site Planning and Design
- 3-220 Geotechnical
- 3-230 Water
- 3-240 Sanitary
- 3-250 Vehicle Roadway Design
- 3-260 Airfield Pavements
- 3-270 O&M for Airfield Pavements
- 3-280 Environmental Remediation
- 3-290 Miscellaneous

A-3.3 3-300 Series - Structural and Seismic Design.

- 3-301 General
- 3-310 Structural Design Criteria
- 3-320 Structural Design Guidance
- 3-330 Structural Design Commentary
- 3-340 Hardened Structures – Conventional Weapons Effects
- 3-350 Hardened Structures – Nuclear Weapons Effects
- 3-360 Reserved
- 3-370 Reserved
- 3-380 Reserved
- 3-390 Miscellaneous

A-3.4 3-400 Series - Mechanical.

- 3-401 General
- 3-410 HVAC

- 3-420 Plumbing Systems
- 3-430 Central Plants and Energy Distribution Systems
- 3-440 Renewable Energy Systems
- 3-450 Acoustics and Vibration Control
- 3-460 Fuel Storage and Distribution Systems
- 3-470 Energy Monitoring and Control Systems
- 3-480 Reserved
- 3-490 Miscellaneous

A-3.5 3-500 Series - Electrical.

- 3-501 General
- 3-510 Foreign Voltages
- 3-520 Interior Electrical Systems
- 3-530 Lighting Design and Controls
- 3-535 Airfield Lighting Systems
- 3-540 Electric Power Generation
- 3-550 Electric Power Supply and Distribution
- 3-555 400Hz Power Systems
- 3-560 Electrical Safety
- 3-570 O&M: Cathodic Protection
- 3-575 Lightning Protection
- 3-580 Telecommunications
- 3-590 Miscellaneous

A-3.6 3-600 Series - Fire Protection.

- 3-601 General
- 3-610 Reserved
- 3-620 Reserved
- 3-630 Reserved
- 3-640 Reserved
- 3-650 Reserved
- 3-660 Reserved

- 3-670 Reserved
- 3-680 Reserved
- 3-690 Miscellaneous

A-3.7 3-700 Series - Cost Engineering.

- 3-701 Pricing Guides
- 3-710 Code 3 Design with Parametric Estimating
- 3-720 Economic Analysis Guides
- 3-730 Programming and Budget Cost Estimating
- 3-740 Construction Cost Estimating
- 3-750 Reserved
- 3-760 Reserved
- 3-770 Reserved
- 3-780 Reserved
- 3-790 Miscellaneous

A-3.8 3-800 Series - Environmental.

- 3-801 General

A-3.9 3-900 Series - Reserved.

A-4 UFC SERIES 4 - MULTI-DISCIPLINARY & FACILITY-SPECIFIC DESIGN.

Series 4 numbering is based on the DoD hierarchical scheme of real property types, functions and Category Groups found in DoDI 4165.03.

A-4.1 4-000 - General.

- 4-010 Multi-Disciplinary Requirements
- 4-020 Security Engineering
- 4-021 Electrical Engineering
- 4-022 Civil Engineering
- 4-023 Structural Engineering
- 4-024 Chemical, Biological, Radiological, Nuclear (CBRN)
- 4-025 Waterfront

- 4-026 Threats
- 4-027 Expeditionary/Contingency
- 4-030 Sustainable Development

A-4.2 4-100 Series - Operational and Training Facilities.

- 4-120 Liquid Fuel Dispensing Facilities
- 4-121 Aircraft Dispensing
- 4-130 Communications, Navigational Aids and Airfield Lighting
- 4-133 Navigation and Traffic Aids - Buildings
- 4-134 Navigation and Traffic Aids - Other than Buildings
- 4-140 Land Operational Facilities
- 4-141 Operational - Buildings
- 4-150 Waterfront Operational Facilities
- 4-152 Wharfs
- 4-159 Other Waterfront Operational
- 4-160 Harbor and Coastal Operational
- 4-170 Training Facilities
- 4-171 Training Buildings
- 4-179 Training Facilities - Other Than Buildings

A-4.2.1 4-200 Series - Maintenance and Production Facilities.

- 4-210 Maintenance
- 4-211 Maintenance – Aircraft
- 4-212 Maintenance – Guided Missiles
- 4-213 Maintenance - Ships, Spares
- 4-214 Maintenance - Tank, Automotive
- 4-215 Maintenance – Weapons, Spares
- 4-216 Maintenance - Ammunition, Explosives, Toxins
- 4-218 Maintenance - Facilities for Miscellaneous Procured Items and Equipment
- 4-220 Production
- 4-229 Production - DoD Maintenance, Repair, and Operation of Installations

A-4.3 4-300 Series - Research, Development, Test, and Evaluation Facilities.

- 4-310 Science Laboratories
- 4-390 Other Than Buildings

A-4.4 4-400 Series - Supply Facilities.

- 4-420 Ammunition Storage
- 4-440 Storage - Covered
- 4-442 Storage - Covered - Installation and Organizational
- 4-450 Storage - Open
- 4-451 Storage - Open - Depot

A-4.5 4-500 Series - Hospital and Medical Facilities.

- 4-510 Medical Center / Hospital

A-4.6 4-600 Series - Administrative Facilities.

- 4-610 Administrative Buildings

A-4.7 4-700 Series - Housing and Community Facilities.

- 4-710 Family Housing
  - 4-711 Family Housing - Dwellings
- 4-720 Unaccompanied Personnel Housing
  - 4-721 Unaccompanied Personnel Housing - Enlisted Personnel
  - 4-722 Unaccompanied Personnel Housing - Mess Facilities
  - 4-724 Unaccompanied Personnel housing - Officers' Quarters
- 4-730 Community Facilities - Personnel Support and Service
- 4-740 Community Facilities - Morale, Welfare and Recreation - Interior
- 4-750 Community Facilities - Morale, Welfare and Recreation - Exterior
- 4-760 Museums and Memorials

A-5 4-800 SERIES - UTILITIES AND GROUND IMPROVEMENTS.

- 4-820 Heat and Refrigeration (Air Conditioning)
- 4-826 Refrigeration (Air Conditioning) - Source
- 4-830 Sewage and Waste

APPENDIX B GLOSSARY

B-1 ACRONYMS.

AFCEC	Air Force Civil Engineer Center
BIA	Bilateral Infrastructure Agreement
CMU	Concrete Mason Unit
CONUS	Continental United States
CP	Coordinating Panel
CUI	Controlled Unclassified Information
DWG	Discipline Working Group
ESEP	Engineering Senior Executive Panel
FC	Facilities Criteria
HQUSACE	Headquarters, U.S. Army Corps of Engineers
HNFA	Host Nation Funded Construction Agreements
IBC	International Building Code
NAVFAC	Naval Facilities Engineering Systems Command
OCONUS	Outside the continental United States
PDF	Portable Document Format
PRV	Plant Replacement Value
SOFA	Status of Forces Agreements
TOC	Table of Contents
USACE	U.S. Army Corps of Engineers
UFC	Unified Facilities Criteria
URL	Uniform Reference Locator
WBDG	Whole Building Design Guide
WBS	Work Breakdown Structure

B-2 DEFINITION OF TERMS.

Continental United States: United States territory, including the adjacent territorial waters, located within North America between Canada and Mexico. Also called CONUS. (JP 1-02)

Coordinating Panel: A four-member panel composed of a senior representative of each Military Department and the Office of the Secretary of Defense (OSD) responsible for day-to-day administration and management of the UFC program under the direction of the ESEP. (MIL-STD-3007)

Discipline Working Group: Lead representative from each Military Department responsible for the unification and maintenance of criteria documents. (MIL-STD-3007)

Engineering Senior Executive Panel: A four-member panel composed of a Senior Executive Service (SES) representative from each Military Department and the OSD responsible for directing and resourcing the UFC program consistent with statutory requirements and DoD policy. (MIL-STD-3007)

Facilities Criteria: FC define functional requirements for specific types of facilities within a Military Department. (MIL-STD-3007)

Military Department: One of the departments within the Department of Defense created by the National Security Act of 1947, which are the Department of the Army, the Department of the Navy, and the Department of the Air Force. (JP 1-02)

Preparing activity (PA): Lead activity assigned responsibility for the management of the criteria document. (MIL-STD-3007)

Replacement Cost: Replacement costs include construction of standard foundations, all interior and exterior walls and doors, the roof, utilities out to the 5-foot line, all built-in plumbing and lighting fixtures, security and fire protection systems, electrical distribution, wall and floor coverings, heating and air conditioning systems, and elevators. Not included are project costs such as design, supporting facility costs, special foundations, equipment acquired with other funding sources (e.g. mission-funded range targets), contingency costs, and supervision, inspection, and overhead (SIOH). Also not included are items generally considered personal property such as computer systems, telephone instruments, and furniture. (UFC 3-701-01)

Technical Proponent: A representative from a participating organization responsible for developing or coordinating the project-level effort to update a criteria document. The technical proponent can be a DWG or FWG member or other member of a participating organization or technical agency. (MIL-STD-3007)

Technical Representative: Technical working-level representative from another participating organization for a particular document assigned to assist the technical proponent in the DoD component review, unification, and maintenance of a criteria document. (MIL-STD-3007)

Record of Changes (changes are indicated by **1**\ ... /**1**/)

Change No.	**Date**	**Location**
1	4/1/2017	Addition of corrosion control requirements and Sustainability Reporting submittals. Clarified text paragraphs, notes to the designer, tailoring, and Operation and Maintenance Data and Manuals.
2	4/1/2019	Deleted paragraphs 1-4.4, 2-2.11 and 2-2.12.5. Editorial changes to paragraphs 2-1.3.1, 2-2.2, 2-2.12 and 2-3.4. Updated paragraph 2-2.12.3 to clarify submittal designations. Added paragraphs 2-2.10 and 2-2.12.3.3.
3	5/18/2021	Added requirements for referencing FAR clauses, listing items in the SUBMITTALS article, using unique submittal item names, avoiding gender-specific pronouns, and adding change date in section date tag.

This UFC supersedes UFC 1-300-02, dated 1 September 2004, with Changes 1-4.

FOREWORD

The Unified Facilities Criteria (UFC) system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and applies to the Military Departments, the Defense Agencies, and the DoD Field Activities in accordance with USD (AT&L) Memorandum dated 29 May 2002. UFC will be used for all DoD projects and work for other customers where appropriate. All construction outside of the United States is also governed by Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA), and in some instances, Bilateral Infrastructure Agreements (BIA.) Therefore, the acquisition team must ensure compliance with the most stringent of the UFC, the SOFA, the HNFA, and the BIA, as applicable.

UFC are living documents and will be periodically reviewed, updated, and made available to users as part of the Services' responsibility for providing technical criteria for military construction. Headquarters, U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering Command (NAVFAC), and Air Force **\2** Civil Engineer Center (AFCEC) **/2/** are responsible for administration of the UFC system. Defense agencies should contact the preparing service for document interpretation and improvements. Technical content of UFC is the responsibility of the cognizant DoD working group. Recommended changes with supporting rationale should be sent to the respective service proponent office by the following electronic form: Criteria Change Request. The form is also accessible from the Internet sites listed below.

UFC are effective upon issuance and are distributed only in electronic media from the following source:

- Whole Building Design Guide web site http://dod.wbdg.org/.

Hard copies of UFC printed from electronic media should be checked against the current electronic version prior to use to ensure that they are current.

UNIFIED FACILITIES CRITERIA (UFC)
REVISION SUMMARY SHEET

Document: UFC 1-300-02, *UNIFIED FACILITIES GUIDE SPECIFICATIONS (UFGS) FORMAT STANDARD*

Superseding: UFC 1-300-02, dated 1 September 2004, with Changes 1-4

Description of Changes:

- This document is a complete update to UFC 1-300-02, establishing criteria and standards for development and preparation of UNIFIED FACILITIES GUIDE SPECIFICATIONS (UFGS).

Reasons for Document:

- Further unify requirements for preparation of the UFGS.
- Comply with Construction Specifications Institute (CSI) MasterFormat®**\3** latest version.**/3/**
- Coordinate with enhancements to SpecsIntact software capabilities.

Impact:

- There are negligible cost impacts.

Unification Issues

- Submittal processes for Army, Navy, and Air Force are not unified. Thus, designations after the submittal items in the Submittal Article are different for the Army, Navy, and Air Force. The Army uses the Resident Management System (RMS) to automatically track and manage submittal items, while the Navy and Air Force do not. The methodology used in a project is dependent on who the construction agent is for the project, as defined in DoD Directive (DoDD) 4270.5. Design-Build (D-B) procedures are different for each DoD Component; thus, this UFC only addresses D-B as necessary for the Submittal Article. Requirements for each Component are provided in separate criteria.
- Processes for submittal of project specifications packages by each DoD Component are not unified due to differences among organizational, operational, and administrative structure and processes.

TABLE OF CONTENTS

TABLES

CHAPTER 1 INTRODUCTION

1-1 PURPOSE AND SCOPE.

This UFC provides guidance for the preparation of Unified Facilities Guide Specifications (UFGS). The Services under the auspices of the Tri-Service Engineering Senior Executive Panel (ESEP) publish the UFGS. A definition of the ESEP is contained in MIL-STD-3007. Tri-Service committees called Discipline Working Groups (DWG) prepare the UFGS. Publication of UFGS is only by electronic media available from the distribution sources indicated in the Foreword of this UFC. UFGS are not proprietary and are available at no cost to the user.

1-2 APPLICABILITY.

This UFC applies to all Tri-Service elements and Contractors preparing UFGS. Requirements referencing Army, Navy, or Air Force only are applicable where that DoD Component is the construction agent as defined in DoDD 4270.5, and responsible for the preparation of the construction contract drawings and specifications as the designated design and construction agent in executing Military Construction Program responsibilities.

1-4 CONTENT AND FORMAT.

UFGS are for the purpose of translating design criteria into construction requirements that have been coordinated with industry, thereby providing requirements for specifiers to incorporate into construction Contracts. Each DWG is responsible for the technical content, format, and overall quality of their UFGS. This UFC establishes the general content and appearance of UFGS publications. The UFGS format is based on the Construction Specifications Institute (CSI) *SectionFormat*™ and is designed to be used with SpecsIntact software. An example layout of UFGS is included in Appendix A, and SpecsIntact software includes an electronic UFGS section template in the proper format for use in creating a new UFGS section.

1-4.1 Content Guidance.

Since UFGS are a basis for construction Contract documents, write the UFGS in a manner that will facilitate use on the job and **\1** avoid **/1/** misinterpretations **\1** that may lead **/1/** to legal complications. **\1\/1/** Reference non-Government standards to the greatest extent **\1** possible and **/1/** avoid repeating the requirements of commercially available criteria and standards. UFGS are broad in their applicability and non-geographical in technical content. In general, requirements or restrictions for specific localities should not be included in **\3**a master UFGS; instead, requirements or limitations for various climatic, environmental,**/3/** or operating conditions are appropriate.

\1 Provide bracketed or tailored options, and Notes to the Designer, in the UFGS sections when the selection of a material, component, or system for corrosion prevention, life cycle cost effectiveness, or durability depends on the location, application, conditions, or atmospheric and chemical environment. In the notes, provide direction on identifying and selecting those variables. Use International Organization for Standardization (ISO) 9223 and Environmental Severity Classification (ESC) factors, to help specify when to use materials, coatings, and other design elements in a given project location or atmospheric environment. Additionally, provide direction on what item to use based on other relative criteria such as soil corrosivity, ultraviolet exposure, solar radiation, biological, or other factors causing deterioration of a material or its properties because of a reaction of that material with its chemical environment. **/1/**

1-4.2 Editing UFGS for Projects.

\1\ /1/\3 The UFGS are master guide specifications that provide the minimum level of quality. Edit the specification sections for project requirements. Add, modify, and delete content as required for each project scope. Do not specify lesser quality requirements than are provided in the UFGS.**/3/**

\2\ /2/

This Page Intentionally Left Blank

CHAPTER 2 UFGS REQUIREMENTS

2-1 UFGS SECTION ORGANIZATION.

\1 This paragraph describes the organization of a UFGS section. **/1/**

2-1.1 Construction Specifications Institute (CSI).

CSI prescribes the use of three parts in each section, and further recommends that a consistent sequence of subject matter be maintained within each PART. These recommendations are included in Appendix A and must be followed to the extent practical in UFGS. Insert the text “Not used.” when a PART has no content.

2-1.2 Table of Contents (TOC).

\1 SpecsIntact has two options for printing the Table of Contents using the Process and Print/Publish function: 1) For the entire project or master, and 2) For the section. The project or master TOC is printed as a separate document. The section TOC is printed within the section when the “Combine Sections and Section TOC” is selected. **\1** For instructions, refer to the SpecsIntact QuickStart Guide, Process & Print/Publish Settings. **/1/**.

2-1.3 Attachments.

Section attachments (such as Appendices, Figures, Forms) can be listed in the section table of contents by the using the attachment tag, <ATT>, around the attachment title in the section text. Full instructions are provided in the *SpecsIntact QuickStart Guide*. **/1/**

2-1.3.1 Appendices.

Attaching appendices to a UFGS section is rarely necessary. Create a simple appendix at the end of a section in SpecsIntact when necessary for project specifications. **\2** An **/2/**exception **\2** is when there is **/2/** a complex appendix **\2**, which **/2/** may be a separate PDF file and manually inserted into the final electronic portable document format (PDF) file for the project specification.

2-1.3.2 Figures.

Do not include figures in UFGS sections. When a project requires a figure in the specification, attach PDF figures to the final electronic specification PDF file.

2-2 FORMAT.

\1 Use of SpecsIntact software and the UFGS database is mandatory. SpecsIntact includes a UFGS section template that complies with this UFC and can be used as a starting point for preparing new UFGS sections. **\3**Specifications must be in UFGS format, comply with this UFC, and be prepared in SpecsIntact.**/3/ /1/**

2-2.1 Electronic File Format.

\1 The section **/1/** template assures that page layout, banners, notes, text paragraphs, tables, fonts, page numbers, headers, and other basic elements of a UFGS are consistent within each UFGS document and within the UFGS system. SpecsIntact files are Extensible Markup Language (XML) format with the extension SEC. SpecsIntact will also publish UFGS in Adobe Acrobat (PDF extension) and Microsoft Word (DOC extension) formats. Download SpecsIntact from the SpecsIntact web site (http://specsintact.ksc.nasa.gov/Index.shtml), and download the PDF SpecsIntact QuickStart Guide, which provides instructions for its use.

The most current version of UFGS is available from the Whole Building Design Guide (WBDG) DoD web page (https://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs). Individual sections are available in both PDF and SEC formats. The entire UFGS Master is available in SEC format in a zipped file with the extension ZIP.

2-2.2 Section Numbering.

Each UFGS carries an identifying document or section number and title in accordance with the CSI MasterFormat® **\2\ /2/** Update Numbers & Titles (**\2\ /2/** latest version). If a number listed in Masterformat® is used, then use its exact title as listed.

UFGS with the 5th level designator denote UFGS on the same subjects: "10" for Army, "20" for Navy, "30" for Air Force, and "40" for the National Aeronautics and Space Administration (NASA) (for example, 01 45 00.00 10). These 5th level designators facilitate management of specifications and provide identification within WBDG, the Internet, and the SpecsIntact systems.

2-2.3 Part and Subpart Numbering.

Number Parts and subparts (paragraph and subparagraphs) within the UFGS in accordance with the SpecsIntact numeric system described in *SpecsIntact QuickStart Guide Numeric*. Each Part and subpart down to the sixth level is numbered as shown in Table 2-1.

Table 2-1 Parts and Subpart Numbering

Parts and Subpart Numbering
PART 1 GENERAL (Part Level)
1.1 ARTICLE (1st Level)
1.1.1 Paragraph (2nd Level)
1.1.1.1 Subparagraph (3rd Level)
1.1.1.1.1 Subparagraph (4th Level)
1.1.1.1.1.1 Subparagraph (5th Level)
1.1.1.1.1.1.1 Subparagraph (6th Level)

2-2.4 Subpart Titles.

Each numbered subpart must have a title; uppercase for the first level (ARTICLE) and title case for the lower level subparts as shown above. **\1**

2-2.5 Text Paragraphs within Parts and Subparts.

Use no more than two untitled text paragraphs within a part or subpart.

2-2.6 Notes to the Designer.

\3Notes provide directions and criteria for the designer to choose options and alternatives available in the pertinent subpart, and to identify when tailoring options are present. **/3/**Provide notes between the subpart title and text paragraph to indicate when to use the paragraph, how to choose bracketed items, and to indicate what tailoring tags are in the text paragraph. Provide the note itself within tailoring tags if the note only applies if the tailoring option is selected; thus, the note will be deleted if the tailoring option is not selected. **/1/**

2-2.7 Units of Measure (English or Metric).

\1 For UFGS Masters, provide measurements in both English and Metric units, with Metric units first. The format is:"…text<MET> 50 mm</MET><ENG> 2 inches</ENG> text;" with no space between the text before the MET tag, a space before the measurement within the tags, and no space between tags. Provide conversions in accordance with ASTM SI 10 or industry practice or standard. Do not use parenthesis to show both English and Metric units.

For projects, select either English or Metric units when setting up the Job. **/1/**

2-2.8 Reference Publications.

All references in the UFGS section subparts are also listed in the section paragraph "REFERENCES." **\1** In the UFGS, the reference identifier (RID) for the reference must appear and be tagged in the reference paragraph and at all occurrences in the text using the SpecsIntact software. **/1/\1**

2-2.8.1 Standards Organizations.

/1/ Identify standards producing organizations cited in the paragraph with the acronym in the Unified Master Reference List (UMRL) or provide an appropriate acronym if the Data Base Manager has assigned none. If there are conflicting acronyms, use the acronym approved by the database manager. Where dual acronyms may be used to identify the standards-producing organization and an underwriting organization, such as American National Standards Institute/Institute of Electrical and Electronics Engineers (ANSI/IEEE), use the issuing organization only, IEEE in this case. The RID must consist of the organization acronym and publication number as stated in the UMRL. **\1\\3**

2-2.8.2 Federal Acquisition Regulations (FAR) Clauses

Avoid referencing FAR clauses, as they are provided in the contract's procurement requirements. When referencing a clause cannot be avoided, use the FAR number followed by the title (in title case) in the text. Do not include the date of the FAR clause. Do not include the FAR clause in the REFERENCES paragraph. Verify FAR titles at Acquisition.gov.

Examples:

- FAR 52.243-4 Changes
- FAR 52.236-2 Differing Site Conditions**/3/**

2-2.8.3 Reference Dates and Titles.

/1/ Use the most current reference standard in the UFGS unless specific reason exists to cite an earlier version of the standard. The reference title must consist of the year of publication in parenthesis followed by the title as stated in the UMRL. **\1**Separate the date of a reference revision (R), change (C), or similar edition (for example, editions and errata), from the original date with a semi-colon (2009; R 2010; C 2011: errata 2012), and exactly as it appears in the UMRL **/1/**. Use the UMRL in conjunction with the SpecsIntact software to automatically update the standards referenced in the UFGS. Use industry reference standards to the maximum extent possible for products and their installation to reduce the written text in the body of the UFGS. **\1**

2-2.8.4 Quoting Reference Standards.

/1/ Do not quote or repeat portions of the referenced standard in the text of the guide specifications unless it is necessary to improve clarity and readability.

2-2.9 Cross References.

Avoid cross-referencing other specification sections and paragraphs in other sections or in the same section. When a section cross-reference is necessary, the format is Section <SRF>01 23 40</SRF> MISCELLANEOUS (where MISCELLANEOUS is the full Section title). When necessary to reference paragraphs within the same section, reference by paragraph title, not by paragraph number, for example, paragraph EQUIPMENT. Paragraphs automatically renumber after changes, but paragraph titles do not change.

2-2.10 \2\ Tailoring /2/.

\2 Tailoring options in the UFGS allow pre-editing of information such as materials, methods, DoD Service-specific, or regional requirements in the creation of the project specification. The tailoring option provides a higher level of editing that reduces editing time.

2-2.10.1 Service-Specific Tailoring.

Master UFGS writers must reconcile agency differences to the greatest extent possible to avoid the need for Service-specific paragraphs within a specification. In most cases when more than one Service-specific paragraph is required within a specification, incorporate Service-specific tailoring. In most cases:

- Do not use both tailoring and bracketed paragraphs for a particular DoD Service's requirements within one specification.
- Along with tailoring, provide a Note to the Designer to indicate what tailoring is in the text and the criteria for choosing the tailored option.
- For clarity in viewing a UFGS in a format other than SpecsIntact, provide tailored items as part of a complete sentence, rather than items within a sentence. Example: show as "<TAI OPT>Use galvanized steel. </TAI> <TAI OPT>Use stainless steel.</TAI>" Do not show as "Use <TAI OPT>galvanized </TAI><TAI>stainless </TAI>steel."

2-2.10.2 Design-Build or Design-Bid-Build Tailoring.

Some masters are developed to have tailoring options for design-build or design-bid-build contracts, as well as options for Service-specific requirements. Ensure that design-only requirements for design-build projects are captured in tailoring tags. Use these tailoring options to distinguish between Design-Build versus Design-Bid-Build requirements that are service-specific:

- Air Force Design-Build
- Air Force Design-Bid-Build

- Army Design-Build
- Army Design-Bid-Build
- NASA Design-Build
- NASA Design-Bid-Build
- Navy Design-Build
- Navy Design-Bid-Build **/2/**

\3Use the following where requirements apply to all Services:

- Design-Build
- Design-Bid-Build**/3/**

2-2.11 Brackets.

Use brackets for choices of two or more items, and for blank options requiring designer input. In addition, brackets may be used to identify text that may not be applicable to all projects, for example, regional requirements, agency requirements, or non-standard technical requirements. If the same bracketed choices are used more than one time in the UFGS section, consider tailoring. Consider using brackets or tailoring, but not both.

\1 Organize bracketed options in the order of the most commonly used item first (such as [galvanized steel] [stainless steel]). **/1/** Provide brackets around five blank underscored characters ([_____]) to indicate the designer is to provide wording. **\1** Unless the bracketed choices are known industry practices, provide a Note to the Designer to assist in the editing of the bracketed items or filling in the blank. Provide a space between bracketed items; an example follows: Provide [galvanized steel] [stainless steel] enclosure. **/1/**

\2\ /2/

2-2.12 Submittal Items.

\3Only submittal items are allowed in the SUBMITTALS article; do not include instructions or other explanatory text. Format submittals within the SUBMITTALS article as shown in Appendix A. Each submittal item must be within one set of submittal tags, for example, _{Item}, do not list multiple submittal items separated by commas within submittal tags, for example, _{Item 1, Item 2}. Commas are field separators in the submittal register data file and commas within submittal tags will cause problems when imported into the Resident Management System (RMS) or Excel spreadsheets. Double-space submittal items.**/3/**

2-2.12.1 Submittal Descriptions (SD).

Section 01 33 00 SUBMITTAL PROCEDURES contains general requirements for each submittal description number, for example, SD-01, SD-02. UFGS authors must compare the requirements of each submittal item in a technical section to the item descriptions provided in Section 01 33 00 Submittal Descriptions paragraph. **\1\/1/\3**

2-2.12.2 Submittal Naming Convention.

Use unique names for submittal items to define or differentiate. For example, if the submittal item, “Wall Louvers” is required under both SD-02 Shop Drawings and SD-04 Samples, use the unique submittal names, “Wall Louvers” under SD-02 and “Wall Louver Samples” under SD-04.

2-2.12.3 Submittal Items Tagged in the Section Subpart Text.

Each submittal item in the SUBMITTALS article must appear only once outside the SUBMITTALS article in the section subpart text. In cases where the submittal item is part of tailored or bracketed text, the submittal item may appear more than once in the section subpart text. Submittal items must appear, within the tags, exactly as written in the SUBMITTALS article and in the section subpart text with the exception of the case; submittal items are not case-sensitive. Provide a detailed description of the submittal item and its requirements in the section subpart text, and not in the SUBMITTALS article. Do not repeat information already provided in UFGS 01 33 00.

2-2.12.4 \2\ Submittal Classifications. /2/

\2\/3/

2-2.12.4.1 Government (G) Submittals.

When a "G" follows a submittal item, it indicates Government approval is required for that item. Only use a "G" in submittal tags for items deemed sufficiently critical, complex, or aesthetically significant to merit approval by the Government. For example:

<ITM>_{Fire Hydrants}; _{G<TAI OPT=ARMY>[, [_____]]</TAI>}</ITM>

2-2.12.4.2 Information Only Submittals.

Submittal items for information only or approved by the Contractor QC System, depending on terminology used by the agency, have no additional designation following the submittal item. For example:

<ITM>_{Fire Hydrants}</ITM>

2-2.12.4.3 Sustainability (S) Submittals.

Use an “S” following a submittal item to designate Sustainability submittals required by **\3**UFGS 01 33 00 and described in more detail in UFGS 01 33 29 when used. These submittals are compiled by the awarded Contractor into the electronic Sustainability eNotebook.**/3/** Provide these “S” submittal items under the appropriate submittal description (SD) in the SUBMITTALS article. Unlike a whole product submittal, these submittals are intended to only provide and highlight the information required to validate compliance with UFGS 01 33 29 Sustainability Reporting. When revising Masters:

- Ensure each product within a Master has been researched for industry minimum availability.
- Add the minimum compliance supported by industry as the default requirement.
- Ensure that the sustainability requirement is provided in the related subpart text.
- Ensure submittal tagging is added for each individual sustainable requirement per product. This ensures when Masters are edited, deleted products that have associated “S” submittals will also be deleted.

For example:

\3<LST>_{SD-03 Product Data}</LST>

<ITM>_{Recycled Content for Carpeting}; _S</ITM>

<LST>_{SD-07 Certificates}</LST>

<ITM>_{Indoor Air Quality for Rubber Cushion}; _S<ITM>

<ITM>_{Indoor Air Quality for Polyurethane-Foam Cushion}; _S<ITM> **/2//3/**

2-2.12.5 Submittal Item Reviewers.

2-2.12.5.1 Army.

For Army only, the brackets following a "G" on a submittal item indicate a specific Government reviewer and approval is required for that item. Navy, Air Force, and NASA do not typically use codes following the "G" in their projects. For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may follow the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are “AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office.

2-2.12.5.2 Navy.

For Navy only, do not use the brackets following the “G.” For projects, edit UFGS 01 33 00 SUBMITTAL PROCEDURES, paragraph FORWARDING SUBMITTALS REQUIRING GOVERNMENT APPROVAL, to designate who approves Government Approved submittals.

2-2.12.6 Design-Build Submittals for Design after Award.

2-2.12.6.1 Army.

For Army only, when a "D" follows a submittal item, it indicates Designer of Record Approval (DA) is required for that item. When a "C" follows a submittal item, it indicates Government Conformance Review of Design (CR) is required for that item. When an "R" follows a submittal item, it indicates both a Designer of Record Approval and Government Conformance Review (DA/CR) is required for that item. When an "A" follows a submittal item, it indicates both a Designer of Record Approval and Government Approval (DA/GA) is required for that item.

2-2.12.6.2 Navy.

For Navy only, comply with **\1** FC 1-300-09N **/1/** and contract documents.

\2\ \1\ /2/

2-2.12.7 Operation and Maintenance Data.

2-2.12.7.1 Operation and Maintenance Data Packages.

Data packages are provided for a complete assembly, and specified in the technical sections. Use UFGS 01 78 23, Operations and Maintenance Data, paragraph SCHEDULE OF OPERATION AND MAINTENANCE DATA PACKAGES to choose which data package to specify. Create a submittal item for that package in the SUBMITTALS paragraph under SD-10 Operation and Maintenance Data. Annotate the data package type after the submittal item, and as shown in the example below. The data package required depends on the complexity of the system; package complexity increases from Data Package 1 to Data Package 5. Generally, technical specifications with complex equipment or systems that contain commissioned or energized moving parts (for example, Fire Protection, Mechanical, and Electrical systems), require a Data Package submittal. A detailed description of the contents of the data packages are described in UFGS 01 78 23, paragraph TYPES OF INFORMATION REQUIRED IN O&M DATA PACKAGES. If additional or detailed content is required in the data package, add that information into the section’s subpart text where the submittal item is specified. An example showing the submittal item in SD -10, and text describing additional or detailed content of the package within a subparagraph of the section, follows:

Example:**\3**

<SPT=1.3>1.3 <TTL>SUBMITTALS</TTL>

<LST>_{SD-10 Operation and Maintenance Data}</LST>

<ITM>_{Electrical Systems}, Data Package 5;
_G</ITM>

<ITM>_{Metering}, Data Package 5; _G</ITM>

</SPT=1.3>

Within the section text:

<SPT=1.5.1>1.5.1 <TTL>_{Electrical Systems}</TTL>

<TXT>Provide operation and maintenance manuals for electrical systems in accordance with Section <SRF>01 78 23<SRF/> OPERATION AND MAINTENANCE DATA that provide basic data relating to the design, operation, and maintenance of the electrical distribution system for the building. In addition to the requirements, include the following:<TXT>

<LST INDENT=-0.33>a. Single line diagram of the "as-built" building electrical system.</LST>

<LST INDENT=-0.33>b. Schematic diagram of electrical control system (other than HVAC, covered elsewhere).</LST>

<LST INDENT=-0.33>c. Manufacturers' operating and maintenance manuals on active electrical equipment.<\LST>

</SPT=1.5.1>**/3/**

2-2.12.7.2 Operation and Maintenance Manuals.

Operation and Maintenance (O&M) Data Packages, when required by the technical UFGS sections, are assembled into Operation and Maintenance (O&M) Manuals for the project. The requirements and format of the O&M Manuals are provided in UFGS 01 78 23. Additional O&M Manual requirements for the Army are provided in UFGS 01 78 24.00 10, and additional requirements for the Navy are provided in UFGS 01 78 24.00 20. **/1/**

2-3 WRITING STYLE.

Write in a direct, active voice with simple, concise sentences as much as possible. Avoid ambiguous, indefinite terms such as "too short" or "relatively simple." UFGS should supplement the dimensions, sizes, and relationships shown on the drawings with requirements for materials, installation, and other non-graphic requirements. Define what applies in lieu of using "applicable" or other indefinite wording. Do not use "and/or"; do not use the virgule (/) to substitute for "and" or "or." Do not use "etc."; use "e.g.," "for instance," or "such as." Do not use "as shown on the drawings" as this phrase is frequently overlooked by the project specification writer or editor; if used in the text and the item is not shown on the drawings, then the item is not specified.

2-3.1 Mood, Tense, and Voice.

Project specifications are directed to the construction Contractor. Do not use the term "the Contractor shall." The Contractor is responsible for performing the work as shown and specified; therefore, there is no reason to use the phrase. In general, use the imperative mood (such as, Install equipment) except when clarity requires the use of the indicative mood (such as, equipment must). Avoid the use of "shall" and "must;" if use cannot be avoided, use “must” instead of “shall” unless it changes the meaning of the sentence. The term “will” indicates Contract requirements performed by the Government. Specify execution of alternatives with guidance. Use “may” only when specifying discretionary Government options. Do not use the word “should” in the specification text for mandatory requirements as “should” implies a recommendation. “Should” may be in the Notes to indicate desirable procedures that are advisory in nature. Do not use the term "furnish" unless only delivery of material to the site is required. Use "provide" to mean "furnish and install." Do not use the word "per" but use "in accordance with" instead.

Speak only to the Contractor, not the subcontractor, supplier, or manufacturer. The Contractor cannot be directed through the manufacturer or supplier or vice versa. Stating "the manufacturer must provide," could be interpreted as simply informing the Contractor that a party other than the Contractor is responsible, comparable to "the Government will provide." Likewise, there is usually no reason to differentiate between actions expected of the "Contractor" and the Contractor's various suppliers, to attempt to do so borders closely on an assignment of work. Do not use the specification to instruct the Contracting Officer.

2-3.2 Abbreviations and Acronyms.

Use of abbreviations and acronyms must follow the practices within the discipline involved**\1\/1/**. At the first use, write out the term completely and follow with the abbreviation or acronym in parentheses. Use abbreviations for units such as psi, cfm, and kW, and be consistent in their use.

2-3.3 Units.

Spell out numbers under 10, except units of time and measurement, and use numerals for numbers 10 and above. Always present dimensions as numerals, but always spell out "one" and "zero" when used singly. Do not repeat a spelled-out number with a numeral in parentheses.

2-3.4 Terminology.

- **\2** Avoid the use of colloquial terms or jargon. For example, do not use "bulkhead" for wall, "deck" for floor, or "head" for toilet.
- Eliminate redundant and superfluous wording such as "conforming to," "all," and "type."
- **\1**Do not use **/1/**indefinite items such as "etc.," "any," and "and/or."
- **\1**Do not use **/1/**vague words and phrases or escape clauses such as “in this specification,” "as may be required," "as necessary," "an approved

type," "as approved/directed/determined by the Contracting Officer," "first class workmanship," "securely," "thoroughly," "suitable," "properly," "good working order," "neatly," "carefully," and "installed in a neat and workmanlike manner."

- Avoid the use of long, compound, or hyphenated words such as "hereinbefore" and "hereinafter." **/2/**

2-3.5 Symbols.

Because of potential problems, do not use the symbols **\1** shown in Table 2-2 **/1/** in the UFGS.**\3** Instead, replace the symbol with the corresponding terminology.**/3/**

Table 2-2 Symbols

Symbol	For
‘	foot
“	inch
#	pound
%	percent
°	degree
+	plus
-	minus
+/-	plus or minus
•	by
/	per
@	at

However, feet and inch symbols are acceptable when both are in a dimension (for example, 8’-8”) and in tables. Avoid or minimize the use of parentheses and quotation marks. **\1\/1/ \3\/3/**

2-3.6 Pronouns.

Avoid the use of pronouns "he," "his," "this," "they," "their," "who," "it," and "which." **\1** Use pronouns **/1/** sparingly if at all; it is usually better to repeat the noun. **\3**Use generic “they” and “their” in lieu of gender-specific pronouns if use cannot be avoided.**/3/**

2-3.7 Capitalization.

Capitalize "Contractor," "Contracting Officer," "Government," and “Contract**”** in specifications. Use the term "Contracting Officer" **\1**; do not use terms such as **/1/** “Officer in Charge of Construction,” “Contracting Officer Representative,” or “Government Representative.”

2-3.8 Brand Name Specifications.

Do not use brand name or restrictive requirements unless it is conclusively established that no substitute will serve the purpose. Use of brand name items is prohibited unless formal written approval is obtained from a Level One Contracting Officer. **\1 /1/\3**To preclude the product from being considered proprietary, follow agency FAR requirements on acceptable number of manufacturers or suppliers capable of providing the product. **/3/**If use of brand name is authorized, provide a cost estimate in relation to the total project cost **\1** to the Government, **/1/** specify the brand name item by manufacturer's name and catalog number, followed by the phrase: "notwithstanding any other provision of the Contract, no other product will be acceptable." This statement is necessary to override the Contract clause that permits substitution of any supposedly equal product unless such language is used.

Any specification section that contains brand name items must include a notice to that effect on the first page of the section. Place the following above the section number and title at the top of the first page of the section:

****

This Specification Contains Brand Name Products.

****

The use of brand name items has been the subject of many Contract claims. Project designers and specifiers must be aware of the restriction on the specification of brand name items and take special precautions to avoid their use unless formal written approval is obtained.

2-3.9 “Brand Name or Equal” Specifications.

Refer to Federal Acquisition Regulations (FAR) Clause 52.211-6 Brand Name or Equal. **\1** Do not **/1/** use “Brand Name or Equal,” **\1** unless approved by the Contracting Officer. If allowed to **/1/** specify an item as “brand name or equal,” provide salient characteristics of the brand name items **\1** in the UFGS, **/1/** to determine equality.

2-3.10 Warranty Clauses.

Ordinarily, do not include warranty clauses in the UFGS. A warranty clause is any provision that modifies terms of the normal 1-year warranty required by the Contract clause. There are two classes of exceptions. First, in rare instances, it is acceptable to extend the period of the warranty based on the judgment of the author, if the industry routinely provides such extended periods of warranty and the unusually complex nature of the product makes the provision cost effective on a life-cycle basis, or if UFGS suggest the extension. Second, it is possible to add terms to a warranty, but only in the rarest of circumstances and with written approval from an appropriate authority or when UFGS indicate such an extension has been reviewed and approved by a Level 1 Contracting Officer.

2-3.11 Contract Clauses.

Do not repeat the Contract clauses in UFGS. The Contract clauses in the Contract contain requirements which affect the general conduct of the work in the Contract. If these are randomly modified within the specifications, it may weaken or void the Contract clauses.

2-3.12 Specifying New Items.

From time-to-time, requests are made to consider the use of materials that are relatively new. While the Government encourages innovative solutions, manage risk appropriately. Take care in specifying items that have not gained widespread acceptance and use. Usually, service records of new materials do not exist. It is therefore necessary to base performance on laboratory tests. These tests:

- Must have been made under the conditions of actual use,
- Must have been conducted by a reputable, independent laboratory, and
- Must have factual documentation sufficient to support evaluation of the material.

Most manufacturers will furnish all requested information about a product and answer all reasonable questions. The manufacturer may also provide a suggested, competitive, generic type specification section that may be edited for the UFGS. Ensure the item specified is not a brand name.

2-4 TABLES AND FORMS.

Tables and forms developed with SpecsIntact may be included within the UFGS section. Otherwise, provide tables, figures, and forms that cannot be included in the UFGS section file on a web site for download, for example, **\3**UFGS Forms, Graphics, and Tables http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/forms-graphics-tables**/3/ /1/** Provide instructions to the designer in the UFGS notes to download and append to the end of section in the final electronic PDF file. Otherwise, provide the hyperlink uniform resource locator (URL) for the Contractor to download.

2-4.1 Formatted Tables.

Formatted tables in UFGS are restricted to the portrait format. The table text font will be the same as used for the section text. Notes may contain tables.

2-4.2 Forms, Hyperlinks and URLs.

Provide instructions in the notes to verify that all forms, hyperlinks and URLs in the UFGS are valid and current before publishing the project specifications.

2-5 MODIFICATIONS.

2-5.1 Clerical Repairs.

\1\/1/ A clerical repair consists of non-technical modifications to the specification section. The modifications are administrative in nature, such as typographical corrections, reference updates, spacing corrections, tagging corrections, CSI conformance, and formatting. Do not document clerical repairs in the section banner, Change List or Revision List.

2-5.2 Change.

A Change consists of technical modifications to a specific aspect or subject of the specification section. The modifications are often associated with resolution of a criteria change request (CCR). A Change only addresses the specific issue without a review of the entire specification section. Note the most recent Change **\3**number and Change date in the section banner and in the section date tag;**/3/** however, do not revise the section date. Provide the nature of the changes to the Database Managers to incorporate in the Change List. **\1**Use the following format in the section banner to indicate a change:

Example:

USACE / NAVFAC / AFCEC / NASA	**UFGS-08 34 73 (November 2009** **Change 2 – 08/16** --
Preparing Activity: NASA	**Superseding** **UFGS-08 34 73 (October 2006) /1/**

\3Add change number to the Section Date below the Section Title. For example, the following shows a revision date of November 2009 and a Change 2 date of August 2016:

<DTE>11/09, CHG2: 8/16</DTE>/3/

2-5.3 Revision.

A Revision is an updating of various requirements in a UFGS and republication of the UFGS with a revised date and a superseded section date. A Revision could also be a complete rewrite or refresh of the UFGS section. Provide the nature of the revisions to the Database Managers to incorporate in the Revision List.

2-5.4 Superseding Dates.

If there is a Revision to the section, change the date in the Section Header (Banner) to reflect the current release month and year. The previous section number/date will become the Superseding section number/date.

Example:

\3\USACE / NAVFAC / AFCEC / NASA/3/	**UFGS-08 34 73 (November 2009)**
	--
Preparing Activity: NASA	**Superseding UFGS-08 34 73 (October 2006)**

If a section number change has occurred, the previous section number / date will become the Superseding section number / date.

Example:

USACE / NAVFAC / AFCESA / NASA	**UFGS-08 34 73.00 40 (November 2009)**
	--
Preparing Activity: NASA	**Superseding UFGS 08 34 73 (August 2009)**

Change Section Date below the Section Title to the current Release Date.

Example:

<DTE>11/09</DTE>

2-6 UFGS APPROVAL.

Coordinate UFGS for approval in accordance with MIL-STD-3007. DWG technical representatives must review each UFGS. When appropriate, extend the opportunity for review to major commands, facility users, and private industry. Preparing activities must coordinate new and changed UFGS within their agency and with their counterparts in the other agencies. Upon completion, submit new and revised UFGS to the Technical Proponent for final review and approval. Changes to UFGS are subject to coordination and approval of the other agencies whenever the change affects the technical content of the UFGS. However, the Preparing Activity is always obligated to consider and resolve requests from other agencies for changes to UFGS.

APPENDIX A UFGS ORGANIZATION GUIDANCE

The following guidance is based on the paragraph titles and sequence recommended in the CSI SectionFormat™ Outline. This format has been adopted by the agencies supporting the SpecsIntact software. Use this arrangement to the extent applicable in the preparation of UFGS by eliminating paragraphs which do not apply and adding additional paragraphs, as necessary. It is important that UFGS authors understand that the paragraphs listed below are not mandatory. Use only those paragraphs that are applicable to the specified subject, and add any applicable requirements not listed. It is important to follow the sequence of information provided herein even when adjusting the paragraph titles to fit the specified subject matter.

Paragraph and subparagraph numbering to the third level must have titles and be completely numeric. Below the paragraph or subparagraph level, titles are optional, and list and item tags may be used with an alternating alpha-numeric designation. This format will not translate to the Alphanumeric format and will not automatically renumber. For example:

Table A-1 Examples of Numeric Format

Numeric without Tags	**Numeric with Tags (highlighted in red)**
PART 1 GENERAL (Part Level)	<PRT =1> <TTL>PART 1 GENERAL</TTL>
1.1 ARTICLE (1st Level)	**\1**<SPT =1.1>1.1 <TTL>ARTICLE</TTL>
1.1.1 Paragraph (2nd Level)	<SPT =1.1.1>1.1.1 <TTL>Paragraph</TTL>
1.1.1.1 Subparagraph (3rd Level)	<SPT =1.1.1.1>1.1.1.1 <TTL>Subparagraph</TTL>
a. Example	<LST INDENT=-0.33>a. Example</LST>
(1) Example	<ITM INDENT=-0.33>(1) Example</ITM>

\11.1.1.1.1 Subparagraph	<SPT =1.1.1.1.1>1.1.1.1.1 <TTL>Subparagraph</TTL>
1.1.1.1.1.1 Subparagraph	<SPT =1.1.1.1.1.1>1.1.1.1.1.1 <TTL>Subparagraph</TTL>
/1/(Do not use ITM progression beyond this level.)	</SPT =1.1.1.1.1.1></SPT =1.1.1.1.1>**/1/**</SPT =1.1.1.1></SPT =1.1.1></SPT =1.1>

Refer to the *SpecsIntact QuickStart Guide Numeric* for instructions for how to tag paragraphs using the SpecsIntact software.

PART 1 GENERAL

1.1 UNIT PRICES

Specify measurement and payment requirements for work subject to extreme variation in estimated quantity when unit price bidding is required. Do not use this paragraph for guide specifications covering building components or for other construction features when quantities can be reasonably calculated from information included in the Contract.

1.2 REFERENCES

List only the publications cited in the text of the guide specification in this paragraph by organization, designation, date, and title. Reference the publications in the text by basic designation (Reference Identifier (RID)) only.

1.3 DEFINITIONS

Only use this paragraph to define terms used in the specification section that are not defined by a commercial or Government standard and to provide a common interpretation of a term for Contractual purposes.

1.4 ADMINISTRATIVE REQUIREMENTS

Use this paragraph to categorize the requirements as related to the specific section when more than one of the subordinate titles is required. Omit this when only one of the subordinate titles is required and use the subordinate title as a primary paragraph title.

1.4.1 Pre-Installation Meetings

Specify requirements for meetings to coordinate the work or to sequence related work for sensitive and complex items in this paragraph.

1.4.2 Sequencing

Specify requirements for coordinating work done in sequence with, or at the same time as, work in another section. Specify the particular sequence of events here.

1.4.3 Scheduling

Specify requirements for coordinating work that requires unusual scheduling with work in other sections. Specify the particular schedule of events here.

1.5 SUBMITTALS

Limit Submittals to those necessary for adequate quality control. Organize submittal requirements using the following eleven classifications:

SD-01 Preconstruction Submittals

SD-02 Shop Drawings

SD-03 Product Data

SD-04 Samples

SD-05 Design Data

SD-06 Test Reports

SD-07 Certificates

SD-08 Manufacturer's Instructions

SD-09 Manufacturer's Field Reports

SD-10 Operation and Maintenance Data

SD-11 Closeout Submittals

1.5.1 Example: Submittal Item Format shown with Tags

<LST>_{SD-03 Product Data}</LST>

<ITM>_{Submittal Item}; _{G<TAI OPT=ARMY>[, [_____]] </TAI>}</ITM>

1.6 MAINTENANCE MATERIAL SUBMITTALS

Categorize maintenance materials requiring no action other than confirmation of receipt under an explanatory heading.

1.6.1 Spare Parts

\3Spare parts are generally not allowed. If allowed by the contracting agency, use this paragraph to specify extra stock materials and items provided for Government use. Identify the type and quantity here but include the actual characteristics of the materials in Part 2. If allowed by the contracting agency, include items that might be difficult to obtain because of color or pattern match, or spare parts needed to ensure continued operation of critical equipment. **/3/**Identify the items, state the quantities required, and indicate delivery to whom, when, and where.

1.7 QUALITY CONTROL

1.7.1 Regulatory Requirements

This paragraph includes obligations for compliance with specific code requirements for Contractor-designed items such as wood trusses, labeling such as Underwriters Laboratory, Inc., and requirements of public authorities such as state highway departments.

1.7.2 Qualifications

This paragraph includes statements of qualifications for Contractor designers, manufacturers, fabricators, welders, installers, and applicators of products and completed work.

1.8 DELIVERY, STORAGE, AND HANDLING

This paragraph includes the necessary requirements on packing and shipping, acceptance at site, and storage and protection.

1.9 PROJECT/SITE CONDITIONS

1.9.1 Environmental Requirements

This paragraph establishes any physical or environmental limitations or criteria. Such conditions might include temperature, weather, humidity, ventilation, and illumination required for proper installation or application.

1.9.2 Existing Conditions

This paragraph includes statements or references to documents where information may be found pertaining to such items as existing structures or geophysical reports.

1.10 WARRANTY

This paragraph describes special or extended (more than one year) warranty or bond covering the conformance and performance of the work of the section. A thorough understanding of warranties is necessary to develop this paragraph.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Describe performance or design requirements and tolerances of a complete system in this paragraph. Limit descriptions to composite and operational properties to the extent necessary to link multiple components of a system together, and to interface with other systems.

2.1.1 Design Requirements

Design requirements may include criteria for structural, thermal, acoustical, or other properties. State required tolerances here only as they apply to the performance of the complete system. Include tolerances of fabrication and installation in their respective paragraphs under Part 1.

2.1.2 Performance Requirements

Performance requirements may include criteria for structural, thermal, acoustical, or other properties. State required tolerances here only as they apply to the performance of the complete system. Include tolerances of fabrication and installation in their respective paragraphs under Part 2.

2.2 ASSEMBLY [OR] FABRICATION

This paragraph describes items that must be shop manufactured, fabricated, or assembled before delivery to the site.

2.2.1 Factory Assembly

This paragraph states factory assembly as a result.

2.2.2 Shop Fabrication

This paragraph states shop fabrication as a result, but may include statements of required methods, trial or permanent assembly of equipment and components away from the construction site.

2.2.3 Tolerances

Specify allowable variations from specified requirements here.

2.2.4 Finishes

Specify any shop or factory finishing requirements here.

2.3 MANUFACTURED UNITS

This paragraph provides statements describing a complete manufactured unit, usually a standard catalog item. Statements may include descriptive requirements for the materials, specific fabrication, finishes, and function. Use separate paragraphs for each different item when appropriate. The name used for the manufactured unit must be consistent throughout the guide specification.

2.4 EQUIPMENT

This paragraph provides statements describing the function, operation, and other specific requirements of equipment installed in the work. Use separate paragraphs for each different item when appropriate.

2.5 COMPONENTS

This paragraph provides statements describing the specific components of a system, manufactured unit, or type of equipment installed in the work. Use separate paragraphs for each different item when appropriate.

2.6 MATERIALS

Identify the material, system, assembly, or product furnished. Independently incorporate Materials specified here into the work under PART 3 EXECUTION. Consistently use the name for the material throughout the guide specification. Omit this paragraph when the materials can be included with the description of a particular manufactured unit, equipment, component, or accessory.

2.7 MIXES

This paragraph provides proportions and procedures for mixing materials. Mixing is the preparation of materials for use and considered to be part of the manufacturing process even when this work done onsite. This paragraph is required for products such as asphaltic concrete, Portland cement, concrete, mortar, and plaster.

2.8 ACCESSORIES

Provide requirements for subordinate or secondary items that aid and assist primary products specified above or are necessary for preparation or installation of those items. This paragraph should not include basic options available for manufactured units and equipment.

2.9 TESTS, INSPECTIONS, AND VERIFICATIONS

Specify tests, inspections, or verifications of products required at the source here, i.e., plant, mill, factory, or shop.

PART 3 EXECUTION

3.1 EXAMINATION

Specify the act of physically determining that conditions are acceptable to receive the primary products of the section. Specify requirements for verifying suitability of conditions for installation here. Specify requirements for verifying the absence of defects or errors that would cause defective installation or application of products, or cause latent defects in workmanship and function, here.

3.2 PREPARATION

This paragraph covers actions required to physically prepare the surface, area, or site to incorporate the primary products of the section.

3.2.1 Protection

This paragraph specifies requirements for protecting the surrounding areas and surfaces.

3.2.2 Surface Preparation

This paragraph describes preparatory work required prior to installation, application, or erection of primary products.

3.3 ERECTION

This paragraph covers actions required to accomplish a specified unit of work in the section, and may include requirements necessary for installation of products furnished under other sections. If products are to be installed according to manufacturer's instructions, then the manufacturer's instructions should be a required submittal as evidence of those requirements. Separate paragraphs for each different item, as appropriate, may be used. The names of the products or the type of work may be incorporated into the paragraph titles, in which case the wording should reflect the generic product or terminology used throughout the Contract documents.

3.4 INSTALLATION

This paragraph may be used when more appropriate than paragraph ERECTION.

3.5 APPLICATION

This paragraph may be used when more appropriate than paragraph ERECTION.

3.5.1 Special Techniques

This paragraph describes special procedures for incorporating products. These procedures may include spacing, patterns, or unique treatments. The wording of the paragraph title should reflect the subject matter.

3.5.2 Interface with Other Products

This paragraph provides descriptions specific to compatibility and transition to other materials. This may include incorporating accessories, anchorage, and any special separation or bonding.

3.5.3 Tolerances

This paragraph covers allowable variations in application thickness or from indicated locations.

3.6 FIELD QUALITY CONTROL

3.6.1 Tests

This paragraph defines the tests required for installed or completed work. These tests are different and separate from those required for materials and products prior to installation or application.

3.6.2 Inspection

This paragraph defines the inspections required for installed or completed work. These inspections are different and separate from those required for materials and products prior to installation or application.

3.6.3 Manufacturer Field Service

This paragraph covers specific requirements when manufacturers are to provide field quality control with onsite personnel for instruction or supervision of the installation or application of their products, or for startup or demonstration.

3.7 SYSTEM STARTUP

This paragraph lists actions applicable to the startup of operational systems and equipment.

3.8 ADJUSTING AND CLEANING

This paragraph provides final actions to prepare installed equipment or other completed work to properly function or perform.

3.9 CLOSEOUT ACTIVITIES

This paragraph covers requirements for demonstrating, instructing, and training owner's personnel on sequence of operations, general facility operation, and facility maintenance procedures.

3.9.1 Demonstration

This paragraph covers requirements of the installer or manufacturer to demonstrate the proper operation of equipment.

3.9.2 Training

This paragraph covers requirements of the installer or manufacturer to train the Owner's personnel in the operation and maintenance of equipment for ongoing facility management and maintenance.

3.10 PROTECTION

This paragraph includes provisions for protecting installed work prior to acceptance of the project. Protection of surrounding areas and surfaces during application or installation is included in paragraph PREPARATION. Include only statements unique to the particular section.

3.11 MAINTENANCE

This paragraph covers provisions for maintenance as applicable to critical systems, equipment, and Storm Water Pollution Protection Plan (SWPPP) landscaping. Service agreements, if not paid in advance, should be separate from the construction agreement to avoid delaying the final payment and holding the contract open for extended periods.

3.12 SCHEDULES

This paragraph includes schedules that indicate where to put what or provides other coordinating data. Schedules are sometimes placed here in the specification section rather than on the drawings. (Only the format for a schedule would normally be included in a UFGS.)

This Page Intentionally Left Blank

FOREWORD

The Unified Facilities Criteria (UFC) system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and applies to the Military Departments, the Defense Agencies, and the DoD Field Activities in accordance with USD (AT&L) Memorandum dated 29 May 2002. UFC will be used for all DoD projects and work for other customers where appropriate. All construction outside of the United States, its territories, and possessions is also governed by Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA), and in some instances, Bilateral Infrastructure Agreements (BIA). Therefore, the acquisition team must ensure compliance with the most stringent of the UFC, the SOFA, the HNFA, and the BIA, as applicable.

UFC are living documents and will be periodically reviewed, updated, and made available to users as part of the Military Department's responsibility for providing technical criteria for military construction. Headquarters, U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering Systems Command (NAVFAC), and Air Force Civil Engineer Center (AFCEC) are responsible for administration of the UFC system. Technical content of UFC is the responsibility of the cognizant DoD working group. Defense Agencies should contact the respective DoD Working Group for document interpretation and improvements. Recommended changes with supporting rationale may be sent to the respective DoD working group by submitting a Criteria Change Request (CCR) via the Internet site listed below.

UFC are effective upon issuance and are distributed only in electronic media from the following source:

- Whole Building Design Guide website https://www.wbdg.org/ffc/dod.

Refer to UFC 1-200-01, *DoD Building Code*, for implementation of new issuances on projects.

CHAPTER 1 INTRODUCTION

1-1 BACKGROUND.

DoD initially published processes, business rules, and data standards for real property accountability in the Real Property Inventory Requirements (RPIR) document in January 2005. The RPIR was developed by representatives of the Military Departments, Defense Agencies, and was facilitated by the Office of the Secretary of Defense. The RPIR document fully describes the Real Property Unique Identifier (RPUID) and its uses. RPUIDs are assigned by the Data Analytics Integration Support (DAIS) platform, which interfaces with the authoritative source system for each Service's real property inventory. These organizations also developed the Real Property Acceptance Requirements (RPAR) document, August 2006, which clarifies the role of the RPUID in the DD Form 1354 process.[1] All of these requirements have been integrated into DoD's Business Enterprise Architecture (BEA), the blueprint for DoD's business transformation.[2]

1-2 REISSUES AND CANCELS.

This UFC reissues UFC 1-300-08, dated 16 April 2009 (with Change 2). It incorporates guidance for use of DD Form 1354, Transfer and Acceptance of DoD Real Property, dated August 2022.

1-3 PURPOSE AND SCOPE.

This UFC provides for consistent guidance throughout DoD and provides a consolidated reference for:

- Identifying use of a draft, interim, and final version of the DD Form 1354.
- Describing how the DD Form 1354 is used as part of a real property business process.
- Defining the roles and responsibilities in the DD Form 1354 development process.

This UFC covers the entire process, beginning with the identification of the requirement for a DD Form 1354, continuing through updating an interim DD Form 1354, and concluding with steps taken to produce a final. At the time of publication of this UFC, the current version of DD Form 1354 was August 2022. Refer to the Washington Headquarters Service publishing site to ensure the most current version of DD Form 1354 is used.

https://www.esd.whs.mil/portals/54/documents/dd/forms/dd/dd1354.pdf

---

[1] RPIR and RPAR are available online at the OASD(EI&E) RPA library: https://www.acq.osd.mil/eie/bsi/bei_rpa.html.

[2] The BEA is available online at: https://bea.osd.mil/.

1-3.1 Methods of Acquisition.

Although there are other types of acquisition, this UFC establishes the process required for documenting the following:

- Acquisition by construction: Transfer and acceptance of accountability of a newly constructed real property asset from a construction agent to the receiving Service; also provides for the relief of the construction in progress (CIP) account.
- Capital improvement to existing facilities: Transfer and acceptance of accountability for an improvement to a real property asset from a construction agent to the receiving Service; also provides for the relief of the CIP account.
- Intra-DoD transfers: Transfer and acceptance of real property asset accountability between the Services or Washington Headquarters Services (WHS).
- Inventory adjustment: Provides documentation for an undocumented real property asset found on site; includes, but not limited to, “found on site,” category-code adjustments (conversions or diversions), and impairment adjustments (unit of measure quantity or value changes).

These acquisition types are most common. Others include, but are not limited to, gifts, donations, capital leases, seized/condemned, and forfeited, and may use the DD Form 1354 if there is not sufficient supporting documentation. Refer to DoDI 4165.71 and DoD 7000.14-R FMR Vol 4, Chapter 24, Table A4-1, for additional details on acceptable supporting documentation for various acquisition methods. The installation RPAO will work the higher headquarters point of contact for additional assistance.

1-3.2 GSA Form 1334.

Transfer of property from non-DoD Federal Agencies requires GSA Form 1334, Request for Transfer of Excess Real and Related Personal Property. A DD Form 1354 may still be required to ensure proper accountability and valuation of the asset. RPAO will work with their higher headquarters points of contact for additional assistance as required.

1-4 APPLICABILITY.

This UFC applies to Military Departments and WHS. It applies to all organizations having accountability for real property assets throughout the DoD and their respective DoD Construction Agent (DCA), such as U.S. Army Corps of Engineers (USACE), Naval Facilities Engineering Systems Command (NAVFAC), Air Force Civil Engineer Center (AFCEC), the United States Property and Fiscal Officers (USPFO) of the National Guard Bureau (NGB), and the Pentagon workforce. Host nation-funded construction on DoD-managed property will follow the same procedures outlined in paragraph 2-2.1 for acquisition by construction. DoD Construction Agents are responsible for completing the DD Form 1354 for construction funded by other project sponsors to include Defense agencies and DoD field activities.

1-5 GLOSSARY.

Appendix B contains acronyms, abbreviations, and terms.

1-6 REFERENCES.

Appendix C contains a list of references used in this document. The publication date of the code or standard is not included. Unless otherwise specified, the most recent edition of the referenced publication applies.

This Page Intentionally Left Blank

CHAPTER 2 PREPARING THE DD FORM 1354

2-1 WHAT IS DD FORM 1354?

DD Form 1354 is an instrument used by Military Services and WHS to document the acceptance and valuation of Real Property assets and the addition of the asset to the Accountable Property System of Record (APSR). This UFC covers the four most commonly used cases for changes to the APSR (new construction, capital improvements, transfer of real property assets between Services and WHS, and inventory adjustments). DD Form 1354 may be used for other acquisition types where appropriate documentation does not exist to accurately document the asset. (See Table 24-2, DoD 7000.14-R FMR, Vol. 4, Chapter 24, for examples of acceptable documentation.) DD Form 1354 is part of the life cycle of real property asset accountability business processes that crosses communities such as planning, programming, construction, contracting, financial management and real estate. It is used to document the cost of preparing an asset for use, which includes documenting demolition changes to the footprint for new construction.

2-2 ACQUISITION TYPES.

Acquisition is the process by which DoD acquires a legal interest in a real property asset and accepts the asset into the inventory of the DoD for the first time. A complete listing of all acquisition methods can be found in the Real Property Information Model (RPIM) at https://extranet.acq.osd.mil/ie/. Acquisition by construction and by lease are two common acquisition types.

- Acquisition by construction: Acceptance of a new real property facility (buildings, structures, or linear structures) into DoD inventory and accountability and valuation resulting in a new “footprint.”
- Acquisition by lease: Acceptance of a real property asset via a contract (leasehold agreement) that conveys a real property asset for a specified period of time for a specified consideration. A leasehold agreement must include the right of possession.

2-3 CAPITAL IMPROVEMENTS/ENHANCEMENTS TO EXISTING FACILITIES.

Capital improvements/enhancements for real property are often referred to as modifications, modernizations, upgrades, and improvements. A capital improvement is any improvement that increases the useful life, capacity, or size or modifies functionality of an existing asset, regardless of the source of funding or capitalization threshold. Improvements to real property assets must be capitalized when (1) the improvement increases the asset's useful life by two or more years or increases its capacity or size; and (2) the cost of the improvement equals or exceeds the capitalization threshold (see DoD 7000.14 FMR Volume 4, Chapter 24, paragraph 2.5 (240205)). Examples of capital improvements include:

- Increasing the useful life by two or more years: Major replacements, renovations, or reconstruction to restore facilities deteriorated through years of use.
- Increasing capacity: Changes in internal structural systems with the intent of increasing usable space. Example: raising the roof on a warehouse to increase cubic feet.
- Increasing size: An addition, expansion, or extension to the building (increasing footprint).
- Modifying functionality: Conversion of facility type (change of category code), as in changing an office to a warehouse; or upgrading architectural elements of a facility that are not failing (for example, upgrading a flat roof to a pitched roof or installing an elevator where none existed).

2-4 INTRA-DOD SERVICES TRANSFERS.

A transfer between Services is a real estate action which changes the accountability for DoD real property and installed equipment to or from one Military Department or WHS to another. In accordance with Section 2696 of Title 10, United States Code (U.S.C.), a transfer between DoD Components occurs in the real property asset's life cycle when there is a change in accountability of any type (physical, legal, or financial). DoD Components must manage real property by periodically reviewing their real property holdings, both land and facilities, to identify unneeded and underused property eligible for transfer. This transfer shifts accountability between DoD Components but does not culminate in an acquisition or disposal to overall DoD inventory and does not require compensation.

2-5 INVENTORY ADJUSTMENT (FOUND ON SITE)

This acquisition method is the discovery of a real property asset that is not currently included in the inventory or correction of inventory when key elements of the APSR are incorrect. Inventory adjustment is used to document assets missing the original acquisition documentation. Often these assets are considered "found on site." A "found on site" transaction provides documentation for a real property addition to the real property inventory as a result of a physical inventory discrepancy (the asset is not currently in the inventory). Inventory adjustment is also used for correcting discrepancies from the actual asset characteristics and the real property record (changes in size or category code, often because a previous renovation project was not accurately documented as described in paragraph 2-3).

2-6 VERSIONS OF DD FORM 1354.

The three versions of the DD Form 1354 are:

- Draft
- Interim
- Final

Different acquisition methods typically require a different version of the DD Form 1354. Table 2-1 summarizes appropriate uses for each version.

Table 2-1 Use of DD Form 1354 by Acquisition Type

Acquisition Type	Draft	Interim	Final
New Construction	X	X	X
Capital Improvement	X	X	X
Transfer Between Services			X
Inventory Adjustment			X

Roles and responsibilities for completing the various versions of the DD Form 1354 are found in Chapter 3. Instructions for completing the form are found in Chapter 4. Requirements for supporting documentation are found in Chapter 5.

2-6.1 Draft DD Form 1354.

2-6.1.1 Purpose.

The purpose of the draft DD Form 1354 is to capture the information obtained once funding has been authorized, to request the RPUID(s), and to forecast the changes to the real property inventory. It serves as the baseline between the DCA and the RPAO. The draft establishes the level of detail and the different components of a project and must be provided by the DCA in accordance with the Services' guidelines.

2-6.1.2 When to Use the Draft Version.

The draft version of DD Form 1354 is used as a working document for acquisition by construction and capital improvement to existing facilities acquisition methods. It is used to effectively capture information during the design or Request for Proposal (RFP) preparation stage. This information may be updated upon:

- changes in scope.
- changes in cost estimates.
- addition or deletion of RPUID.

2-6.1.3 Included Costs.

The draft may include expected project costs to be capitalized by RPUID and costs such as acquisition; planning and design (P&D) after funding and design approval; supervision, inspection and overhead (SIOH); and estimated acquisition and/or construction contract costs. Appendix A-2 provides a list of the costs typically included. This list is part of the Real Property Construction in Progress Requirements (CIPR) document, developed by representatives of the Military Departments, Defense Agencies, and OSAD(EI&E).[3]

2-6.1.4 Tenant Organizations.

Tenants on DoD installations, who are responsible for the acquisition of a new asset, must submit the elements included on the draft DD Form 1354 to the Installation Management Organization (IMO) Real Property Accountable Officer (RPAO) to facilitate assignment of appropriate facility numbers and RPUIDs.

2-6.2 Interim DD Form 1354.

2-6.2.1 Purpose.

The interim DD Form 1354 allows transfer of accountability from the DCA to the accountable Service or WHS on the placed-in-service date prior to determination of final costs, such as in contract closeout or claims settlement. The interim DD Form 1354 may be used for all acquisition methods or transaction types to include both the Acquisition by Construction and Capital Improvement to Existing Facilities.

2-6.2.2 When to Use the Interim Version.

An interim DD Form 1354, usually based on the latest draft DD Form 1354 iteration, is prepared at the placed-in-service date after substantial completion of construction in preparation for facility acceptance or building occupancy.

2-6.2.3 Included Costs.

The draft DD Form 1354 includes actual project costs to be capitalized as reflected in the CIP account by RPUID. It includes costs such as, but not limited to, P&D, SIOH, and construction contracts. The cost matrix illustrating the types of construction costs to be accumulated in the CIP account is available in the CIPR document. The interim DD Form 1354 includes the Unit of Measure Accountability (UMA) and the Unit of Measure Operational (UMO), where appropriate, quantities by category code(s) for each RPUID. These costs will support the valuation used for financial reporting.

2-6.2.4 Use of Multiple Interim Forms.

Multiple interim DD Forms 1354 may be required when a construction project contains multiple facilities with different turnover dates, or when a portion of a single large facility or a phase of a multi-phase construction project is placed into service. At this time, all cost information accumulated in the CIP account is transferred to the real property asset account. All additional project costs incurred following the placed-in-service date must be transferred from the CIP account to the real property asset account by RPUID and documented on the final DD Form 1354.

[3] CIPR is available online at the OASD(EI&E) library: https://www.acq.osd.mil/eie/bsi/bei_rpa.html.

2-6.2.5 Placed-in-Service Date.

The placed-in-service date will be established on an interim DD Form 1354 and is not to be updated with the final DD Form 1354. If there are multiple interim DD Forms 1354 for a single project, the final DD Form 1354 will include the placed-in-service date from the first interim DD Form 1354. The placed-in-service dates for subsequent interim DD Forms 1354 will be annotated on the final DD Form 1354 in block 28, **PROJECT REMARKS**.

2-6.2.6 Box 14 (Sustainability Code).

The sustainability code indicates project achievement of High Performance and Sustainable Building requirements as defined in UFC 1-200-02. See Paragraph 4-1.17 for instructions.

2-6.3 Final DD Form 1354.

2-6.3.1 Acquisition by Construction and Capital Improvement to Existing Facilities.

The final DD Form 1354 must be completed after the final costs for the project are known. The DCA furnishes the final DD Form 1354 to the accountable Service or WHS. There is only one final project DD Form 1354 even where there are multiple interim DD Forms 1354. The final DD Form 1354 establishes the final costs incurred for each facility in a project. All additional expenses incurred following the placed-in-service date on the interim DD Form 1354 must be transferred from the CIP account to the real property asset account in accordance with DoD 7000.14-R, Vol. 4, Chapter 24, paragraph 2.4.1.2.1. The final DD Form 1354 distributes unallocated costs across the assets as appropriate and marks financial closeout of the CIP account for the project. This process updates the final valuation cost of the assets.

2-6.3.2 Transfer Between Services and/or WHS.

The final DD Form 1354 (and associated supplemental information) lists all real property assets, and all data/information required as specified in RPAR, to complete the transfer from one Military Service or WHS to another. A carrying memorandum signed by the Deputy Assistant Secretaries of the losing and gaining Services is included with the DD Form 1354 for transfers of real property.

2-6.3.3 Inventory Adjustment.

Undocumented real property assets discovered on site should have a Final DD Form 1354 prepared, with all known information, to initiate the real property inventory record and asset information file which will eventually contain, at a minimum, audit supporting documentation. Due diligence must be performed to locate supporting documentation and document this information on the DD Form 1354. If supporting documentation is not located, an estimated acquisition date can be established, method of acquisition should be Inventory Adjustment (Found on Site), and date should be the date of like or similarly-aged assets on the installation. Additional methods of determining estimated placed-in-service dates are listed in Table A4-3, DoD 7000.14-4-R FMR, Chapter 24, Vol 4. Any other missing information must be determined and recorded. Any cost information must be substantiated in accordance with DoD 7000.14-4-R FMR, Chapter 24, Vol 4.

2-6.3.4 Acquisition by Lease.

Although not detailed in this UFC, the DD Form 1354 can be used for lease acquisitions if there is not sufficient supporting documentation (e.g., lease agreement). Requirements are similar to those for Transfer Between Services. RPAOs will work with their headquarters POC to ensure complete documentation requirements.

CHAPTER 3 ROLES AND RESPONSIBILITIES

3-1 ROLES.

The following offices/individuals have a role in the DD Form 1354 process:

- DoD Construction Agent (DCA) (NAVFAC, USACE, AFCEC)
- Project Sponsor (PS)
- Installation Management Office (IMO) (e.g., Directorate of Public Works/Facilities Management Office/Base Civil Engineer (DPW/FMO/BCE))
- IMO Real Property Accountable Officer (RPAO) or approved accepting official
- IMO Realty staff

The above are key participants in the transfer and acceptance process. In some instances, the same person may perform more than one role. Other participants, such as safety and fire inspectors, contracting officers, and construction contractors are not specifically addressed in this UFC, but they may also play a role in the transfer and acceptance process. Table 3-1 shows these roles for the acquisition methods discussed in Chapter 2.

3-1.2 DoD Construction Agent (DCA)

The DCA has primary responsibility for the DD 1354 process for construction and capital improvement acquisitions. The DCA does not have a role in transfers between services or inventory adjustments.

The DCA documents the design/scoping phase by applying the rules in DoD FMR 7000.14-R, Volume 4, Chapter 24, "Real Property," or Volume 11B, *Reimbursable Operations Policy - Working Capital Funds (WCF)*, as well as specific Service guidance. DCA actions in paragraphs 3-1.2.1 through 3-1.2.1.3 may be performed by the project manager, construction manager or field office, dependent on the management structure for the specific contract.

3-1.2.1 Management of DD Form(s) 1354.

3-1.2.1.1 Draft and Interim DD Form 1354 Preparation, Facility Inspection and Acceptance.

The DCA will initiate the draft DD Form 1354 when requesting an RPUID and facility number at the beginning of the construction project. The DCA will complete the Interim DD Form 1354s in collaboration with the PS and RPAO and ensure they are signed and furnished to the PS and RPAO. The DCA notifies the PS and RPAO when construction is substantially complete and schedules an inspection (sometimes referred to as the building occupancy inspection or the Red Zone inspection). The DCA, or representative, sets up an acceptance inspection with the contractor, the PS, and the RPAO or designated representative, to review the facility and inspect for quality workmanship prior to signing the interim DD Form 1354, and occupying the facility.

Once the DCA, PS, inspection engineers, RPAO and other approving parties attending the inspection have agreed the construction is acceptable, the DCA accepts the construction from a contractor on behalf of the government using contract procedures. This is the placed-in-service date recorded in block 7a. The DCA signs the interim DD Form 1354 and provides it and supporting documentation to the RPAO, or approved accepting official, for acceptance into the federal inventory. The DCA must include a copy of contractual deficiencies (“punchlist”) as an enclosure to the Interim DD Form 1354 and reference it in block 27. Government liability starts upon the placed-in-service date of the real property asset. Occupancy of new construction or improvements should not occur prior to the placed-in-service date.

3-1.2.1.2 Post-Acceptance Oversight.

After acceptance of the real property asset, the DCA operates in an oversight capacity to ensure contract deficiencies, if any, are corrected. If a phased project, additional interim DD Forms 1354 may need to be issued. Upon contract completion, the final DD Form 1354 is completed and signed. The DCA’s signature on the final DD Form 1354 indicates all the contract requirements have been met (all invoices have been paid, all claims resolved) and the contract files are ready to be retired. The DCA maintains any required supporting documents per DoD 7000.14-R FMR Vol 4 Chapter 24, Table 24-2.

3-1.2.1.3 Preparation of Final DD Form 1354 and Project Closeout.

The DCA will complete a final DD Form 1354 at the close-out of the project, updating any differences in costs from the interim DD Form 1354 and provide it, along with any additional supporting documentation, to the RPAO. The placed-in-service date does not change with the Final DD Form 1354.

3-1.3 Project Sponsor (PS).

The PS is the DoD Component that establishes the project requirements, priorities, program, and budget. DoD agencies and combatant commands are not authorized to hold real property assets; these assets are held in the real property inventory of the real property accountable Service for the site where the asset is located. DoD agencies and combatant commands must obtain approval from the Military Department that will hold the real property asset in their inventory before approval of the DD Form 1391.

The PS should participate in the acceptance walk-through of the facility, working with the DCA to identify any discrepancies between the contract documents and completed facility (for example, punch list items). The PS is not the accepting organization but is informed of the placed-in-service date (building occupancy) when the DCA accepts the facility from the contractor. The placed-in-service date is the date used to reconcile all costs incurred and accumulated in the CIP account. The PS provides all costs to the DCA, whether incurred by or provided to the DCA, for inclusion in the full cost of the asset prior to the DCA signing the final DD Form 1354 statement of completion (block 24). See DoD 7000.14-R FMR, Vol. 4 Chapter 24, 2.4.1.2.2.

3-1.4 Real Property Accountable Officer (RPAO) or Approved Accepting Official.

The RPAO has been delegated the responsibility by an appropriate authority to ensure individual real property assets are accepted into and accurately accounted for in the real property inventory. RPAO is responsible for custody, records maintenance, and safekeeping of records for all lands and facilities (building, structures, and linear structures) under their purview. The RPAO must ensure documentation is retained in accordance with applicable laws, regulations, and instructions. See Table 5-1.

3-1.4.1 Delivery of RPUID to DCA.

The RPAO or approved accepting official ensures at least one RPUID is provided to the DCA for the draft DD Form 1354, no later than the time both design and funding authorizations are received. All other necessary RPUIDs will be provided to the DCA for completion of acceptance documentation, including interim DD Forms 1354.

3-1.4.2 Recording Construction Project Assets into APSR.

For construction projects, the RPAO, or delegated representative, accepts and accurately records the real property assets into the APSR, as verified by the RPAO signing and dating the interim DD Form 1354 in block 25. The accepted-by date and the placed-in-service date represent different actions in the process and are not usually the same. A copy of the RPAO-signed DD Form 1354 will be provided to the DCA and PS, if required, upon signature. The RPAO must update the real property inventory as needed after receipt of the interim and final DD Form 1354s.

3-1.4.3 Real Property Transfers.

For transfers of real property, the losing MILDEP or WHS RPAO prepares the Transfer DD Form 1354.

3-1.4.4 Assets Found On-Site.

For assets found on site, the RPAO ensures the DD Form 1354 and appropriate supporting documentation are prepared and entered into the real property inventory.

3-1.5 Other Involved Personnel.

The Realty staff is responsible for all real property actions for their assigned properties from the beginning of the acquisition/disposal process through final acceptance/release. The RPAO will coordinate with the Realty staff to ensure real property transactions are appropriately prepared and executed, and the real property inventory is updated accurately.

The DPW/FMO/BCE directs master planning services, construction, and real property maintenance at the installation and its sites. The individuals performing these tasks within these organizations may be known as the Public Works Officer, Director of Public Works, or the Staff Civil Engineer.

Table 3-1 Roles per Acquisition Method

Acquisition Method	Role	Primary Actions
Construction and Capital Improvements	Project Sponsor (PS)	• Initiates, sponsors, and funds construction project. • Obtains at least one RPUID from the Installation Management Organization's RPAO at the start of the project. • Attends final inspection. • Acknowledges to DCA that asset meets PS requirements. • Receives copy of all DD Forms 1354. • Provides a copy of all auditable supporting documentation to RPAO for its respective portion of the project for which it has financial responsibility. • Ensures all capitalized project costs incurred by the PS and accumulated in the CIP account are provided to DCA for inclusion in the full cost of the asset.
	DCA or Public Works Officer/Engineer (responsibility usually based on construction threshold)	• Ensures at least one RPUID is initially assigned to the project. • Has primary responsibility for construction. • Ensures DD Form(s) 1354 is/are prepared and furnished to the RPAO and PS IAW Service directed timeline. • Notifies PS of substantial construction completion and schedules inspection. • Verifies acceptable contract performance and receives constructed facilities from contractor on behalf of the government establishing the placed-in-service date. • Ensures contract deficiencies, if any, are corrected. • Ensures contract is closed out and retains supporting documents.

Acquisition Method	Role	Primary Actions
	RPAO	• Ensures RPUID(s) for the project are provided to the DCA and/or PS upon request. • Signs the DD Form 1354 on behalf of the accountable organization to accept the RP into the APSR as of the placed-in-service Date IAW Service timeline. • Ensures data recorded is accurate, complete, and retained in accordance with applicable laws and regulations.
Transfer Between Services	Public Works Officer/ Base Civil Engineer	• Facilitates logistics of transfer.
	RPAO of losing installation	• Ensures all required forms, source materials, and transfer documents, along with supporting documentation, are accurately prepared and transmitted for appropriate signature in accordance with applicable laws and regulations. • Ensures all transfers are accurately recorded in the inventory.
	RPAO of gaining installation	• Ensures the forms, source materials, and transfer documents, along with supporting documentation received from the losing installation, are complete and used to accurately place the assets on the inventory and are retained in accordance with applicable laws and regulations. • Ensures all assets are accurately recorded in the inventory.
	Realty staff	• Supports RPAO.
Inventory Adjustment (Found on Site)	Public Works Officer/ Base Civil Engineer	• Assists in determining and substantiating the category code and acquisition cost.
	RPAO	• Ensures DD Form 1354 is prepared and supporting documentation is collected for real property assets found on site. • Ensures information recorded is accurate, complete, and retained in accordance with applicable laws and regulations. • Accepts the asset into the real property inventory.
	Realty staff	• Supports RPAO.

CHAPTER 4 COMPLETING DD FORM 1354

4-1 FORMAT AND INSTRUCTIONS.

This chapter focuses on completing the DD Form 1354 for a military construction (MilCon) project, which is one of the more common uses. In most cases, the data elements will be the same for other acquisition types and capital improvements. Detailed block-by-block instructions are provided with examples and a description of the source of the information for preparing the DD Form 1354. Associated RPIR or CIPR data elements are also included. Because this form is used for a variety of purposes, not all of the data blocks are required for each usage. When a block is not to be filled out, enter N/A for "not applicable." There should be no blank data fields except in block 23, **ITEM REMARKS**, where blanks are allowed.

Most of the information needed for MilCon projects on the DD Form 1354 is originally contained in the DD Form 1391, "FY __ Military Construction Project Data" and the project folder. During the construction process, some of the information may change. Table 4-1 shows a crosswalk from blocks in the enacted DD Form 1391 to the blocks in the DD Form 1354. The latest DD Form 1391 should be validated by the project designers prior to use in preparing a DD Form 1354. In the absence of a DD Form 1391, a work request often provides similar data needed to complete the DD Form 1354. Reference the latest version of the RPIM available on the OSD Real Property Accountability web site https://www.acq.osd.mil/eie/bsi/bei_rpa.html (right hand navigation bar, located under the Tools heading; Common Access Card required).

Table 4-1 Crosswalk from DD Form 1391 to DD Form 1354

	Quantity	16/18	Total Quantity UM 1/Total Quantity UM 2
	Cost	19	Cost
10	Description of Proposed Construction	28	Project Remarks

A blank DD Form 1354 is provided as Appendix A. Note the reverse of the form provides a brief description for each block on the form.

Table 4-2 summarizes the narrative information in paragraphs 4-1.1 through 4-1.31. A single example is used for all the example entries to the DD Form 1354 data fields in the narrative portion of this chapter. The example is a Military Construction, Army (MCA) project to construct a new battalion headquarters and classroom, and associated structures and utilities. Although a data element may be a code in the system that is using the data element, it should not be displayed without meaningful text.

Table 4-2 RPIM Data Elements by DD Form 1354 Block

Block Number	Block Name	RPIM Data Element
	PAGE OF PAGES	N/A
1	FROM	Asset Construction Agent Code Address information
2	DATE PREPARED	N/A
3	PROJECT/JOB NUMBER	Project Number
4	SERIAL NUMBER (Optional)	N/A
5	TO	Installation Code Installation Name Installation Reporting Component Code
6	RPSUID/INSTCODE/INSTNAME	Real Property Site Unique Identifier Installation Code Installation Name Site Name
7	CONTRACT NUMBER(S)	Instrument Number Instrument Amendment Number Project/Work Order Number
7a.	RPA PLACED-IN-SERVICE DATE	RPA Placed-in-Service Date
8	TRANSACTION DETAILS	Acquisition Method Type Code
9	ITEM NO.	Asset Configuration Design Use CATCODE Code Land Acquisition Tract Identifier Asset Configuration Design Use Total Size Unit of Measure Code
10	FACILITY NO./RPUID	Facility Number Real Property Unique Identifier
11	CATCODE	Asset Configuration Design Use CATCODE Code
12	CATCODE DESCRIPTION	N/A

Block Number	Block Name	RPIM Data Element
13	CONS TYPE CODE	Construction Type Code
14	SUST CODE	Facility Sustainability Code
15	UMA	RPA Total Unit of Measure Code Asset Configuration Design Use Unit of Measure Code Site Land Total Area Unit of Measure Code
16	QUANTITY	RPA Total Unit of Measure Quantity Asset Configuration Design Use Size Quantity Site Land Total Area Quantity
17	UMO	N/A
18	QUANTITY	N/A
19	COST	Acquisition Original Asset Recorded Cost Amount Project Detail Fund Cost Amount Project Total Fund Cost Amount Acquisition Basic Cost Acquisition Cost to Government Amount Acquisition/Capital Improvement Cost Amount Facility Total Accumulated Depreciation Amount Facility Book Value
20	FUND SOURCE	Acquisition Fund Source Code Project Detail Fund Code
21	FUND ORG	Acquisition Organization Code Project Detail Organization Code
22	RPA INT TYPE CODE	RPA Interest Type Code
23	ITEM REMARKS	N/A
24	STATEMENT OF COMPLETION	N/A
25	ACCEPTED BY	N/A
26	PROPERTY VOUCHER NUMBER	N/A
27	CONSTRUCTION DEFICIENCIES	N/A
28	PROJECT REMARKS	N/A

4-1.1 PAGE OF PAGES.

Enter the page number and the total number of pages comprising each DD Form 1354 project or transaction. When two or more pages are required to describe the information required for blocks 1 through 23, complete blocks 24 through 26 only on the first or signature page. Signing officials should initial subsequent or unsigned pages.

4-1.2 1. FROM.

Enter the name of the construction or transfer agent accomplishing the new acquisition, construction, or capital improvement of existing facilities or initiating the transfer of existing real property.

Example:	U.S. Army Corps of Engineers Kansas City District Area Engineer
RPIM Data Element:	Asset Construction Agent Code Address information (address data elements are those in BEA)

4-1.3 2. DATE PREPARED.

Enter the date the DD Form 1354 is prepared. Use *YYYYMMDD* format for all dates. This is the date used to track different editions when revisions are necessary. The form is considered prepared when it is ready for signatures in blocks 24 and 25.

Example:	Use 20080715 for date: 15 JUL 2008
RPIM Data Element:	N/A

4-1.4 3. PROJECT/JOB NUMBER.

Enter the PS's project number. Specifically for new MilCon, use the project number assigned on a DD Form 1391. For transfers and inventory adjustments, this field is optional.

Example:	DD Form 1391 project number 20027
RPIM Data Element:	Project Number

4-1.5 4. SERIAL NUMBER – designed to be used for version control as needed.

This is an optional number that may be assigned to the DD Form 1354 for version control. Each version of the DD Form 1354 for the same project can have a new serial number.

Example:	2008-0001, 2008-0002, where 2008 is the fiscal year and the last four digits are the sequence number. Note: The Navy uses a serial number like W25G1Q04TU12345, where W25G1Q is the Unit Identification Code (UIC) of the organization in block 1, 04 is the fiscal year, TU is the standard document type, and 12345 is a 5-digit serial number.
RPIM Data Element:	N/A

4-1.6 5. TO.

Enter the name of the organization or agency to which the transfer will be made. Always include the installation code and name of the gaining installation. Installation codes are available from individual Service databases of installations or provided by the gaining installation RPAO.

Example:	Directorate of Public Works Fort Riley Installation Code 20605
RPIM Data Elements:	Installation Code Installation Name Installation Reporting Component Code

4-1.7 6. RPSUID/SITENAME/INSTCODE/INSTNAME.

Enter the Real Property Site Unique Identifier (RPSUID), site name, installation code, and installation name of the physical location for the real property asset being transferred/accepted.

Example:	5502 Hunter Army Airfield Installation Code 13395 Fort Stewart
RPIM Data Elements:	Real Property Site Unique Identifier Installation Code Installation Name Site Name

4-1.8 7. CONTRACT NUMBER(S).

Enter the construction contract number (multiple contract numbers, if applicable) in this block if any project work is performed under a contract. Include the delivery order number in addition to the contract number if the contract could authorize work under different delivery orders that are not related to the project described in the DD Form 1354. For internally executed projects, enter the Work Order Number(s). These are Service-specific number(s) related to the project. For transfers and inventory adjustment (found on site), the field is optional.

Example:	DACA31-98-D-0052.
RPIM Data Elements:	Instrument Number Instrument Amendment Number Project Number
or	
CIPR Data Element:	Work Order Number

4-1.9 7a. RPA PLACED-IN-SERVICE DATE.

This is the date the real property asset (or a portion of the asset) is available and accepted for use by DoD. Complete in accordance with paragraph 3-1.2.1.3 and DoD 7000.14-R FMR Vol. 4, Chapter 24, section 2.4.1.3. The Accepted By date (block 25c) and the placed-in-service date are not usually the same date; the placed-in-service date is typically prior to the signatures on the DD Form 1354. For new construction and capital improvements, the placed-in-service date is the date warranties begin and the government assumes liability for the asset from the contractor.

For transfers between Services, the placed-in-service date is the date the asset was originally constructed to capture the actual age of the facility or asset for depreciation calculations.

For inventory adjustments, the placed-in-service date is the date the asset was acquired or the date the adjustment was made which necessitates the DD Form 1354 (date the renovation or conversion was completed). If the date is unknown, estimate the date and document with an attestation memorandum outlining the process used to research the date and rational for establishing the estimated date. DoD 7000.14-R FMR Vol 4 Chapter 24, paragraph 4.6.5 contains order of precedence for establishing age of an asset, and assumed placed-in-service dates in Table A4-3.

4-1.10 8. TRANSACTION DETAILS.

This block is divided into three subparts:

- Subpart a identifies the type of acquisition for this project.

- Subpart b provides the reason the DD Form 1354 is being issued, in terms of an event. Check only one box.
- Subpart c identifies the version of this DD Form 1354 (draft, interim, or final). Check only one box.

4-1.10.1 8a. TYPE.

Insert an "X" in the appropriate box of Subpart a to indicate whether the transaction involves acceptance of new construction, transfer of existing facilities, capital improvements to existing facilities, or inventory adjustment (found on site). Select the acquisition type for the primary facility. If there are multiple acquisition types (for example, construction and capital improvement), select the acquisition type for the preponderance of the project.

4-1.10.1.1 ACQUISITION ________________.

Fill in the acquisition method. The acquisition method code for construction is CONS; reference the latest version of RPIM for all other acquisition methods.

4-1.10.1.2 TRANSFER BETWEEN SERVICES.

This denotes transfer of accountability for existing real property asset(s) and includes transfers between WHS and the Services.

4-1.10.1.3 CAPITAL IMPROVEMENT.

This denotes the real property asset size or capacity, useful life, or operating efficiency of an existing real property asset.

4-1.10.1.4 INVENTORY ADJUSTMENT.

This is the discovery of a real property asset not currently included in the real property inventory, or discovery of a change to the asset not accurately listed in the Real Property record.

RPIM Data Element: Project Type Code

4-1.10.2 8b. WHEN/EVENT.

Insert an "X" in the appropriate box of Subpart b to indicate when (in terms of an event) the DD Form 1354 is issued (transfer and acceptance occurs). Check only one box.

4-1.10.2.1 TOTAL ASSET PLACED-IN-SERVICE.

Check when the transfer or acceptance of the whole asset occurs.

RPIM Data Elements: RPA Placed-in-Service Date

Capital Improvement Placed-in-Service Date

4-1.10.2.2 PARTIAL ASSET PLACED-IN-SERVICE.

Check when the transfer or acceptance documented by this interim DD Form 1354 is for only a portion of the project or a phased turnover of one or more facilities in a multiple facilities project. When each phase is placed-in-service, it will have its own interim DD Form 1354.

RPIM Data Elements: RPA Placed-in-Service Date
Capital Improvement Placed-in-Service Date

4-1.10.3 8c. VERSION.

Use this to indicate whether the DD Form 1354 is a draft, interim, or final. Check only one box.

4-1.11 9. ITEM NO.

A key step in preparing a DD Form 1354 is identifying the various components or items of the project. Enter a separate line and item number for each new real property asset, facility addition, capital improvement, or deletion, including additions to, or deletions from, utility systems or other previously existing facility records. If there are more item numbers than will fit on a single page, attach the list of additional items as a separate document or spreadsheet (hard copy or electronic).

4-1.11.1 Multiple Use Assets.

If the real property asset has more than one use, identify each with the appropriate facility category code and unit of measure. List these multiple uses such that the multi-purpose facility has one item number and several different lines, one for each category code.

RPIM Data Elements: Asset Configuration Design Use CATCODE Code (may be more than one) – blocks 11 and 12

Asset Configuration Design Use Total Size Unit of Measure Code (may be more than one) – block 15 or 17, as appropriate

If land is purchased as part of the project, show it as a separate line item.

RPIM Data Element: Land Acquisition Tract Identifier (may be more than one) – block 23

4-1.11.2 Demolition.

There are two ways to account for the demolition portion of the project within the footprint of the new construction and to document the reduction of real property:

1. Attach an Authorization for Demolition form (Service-specific form) to the DD Form 1354 to document category codes and quantities of demolished real property. These should be listed separately from constructed/ transferred item numbers.
2. Indicate as additional DD Form 1354 item numbers all demolished real property facility numbers (block 10a.) and category codes (blocks 11 and 12) using negative numbers (shown in parentheses) for units of measure (block 16 or 18, as appropriate), and indicate N/A for costs in block 19.

Disposal cost within the footprint of the project is added into total construction cost of the new facility prompting the demolition. Capture demolition on the interim DD Form 1354 to allow for timely updates to the Real Property record.

4-1.11.3 IBE and EIP Lists.

Separate lists of installed building equipment (IBE) (real property) and equipment in place (EIP) (personal property) may be attached to the DD Form 1354 in accordance with Service guidance.

4-1.12 10a. FACILITY NO.

Enter the facility number assigned to each item number. The facility number is assigned in accordance with the installation's master numbering plan of the host installation and is unique within the installation. The installation RPAO provides the facility number(s) to the DCA early in the design phase for construction. For capital improvements and transfers between Services, the facility number is already available. For inventory adjustment (found-on-site) real property assets, the facility number is supplied by the RPAO or delegated representative.

RPIM Data Element: Facility Number

4-1.13 10b. RPUID.

Enter the RPUID assigned to each real property asset provided by the host installation. The RPUID is a unique non-intelligent code used to permanently identify a real property asset (land parcel, building, structure, or linear structure). The installation RPAO provides these numbers to the DCA after the funding and design authorizations have been received.

RPIM Data Element: Real Property Unique Identifier

4-1.14 11. CATCODE.

Record the appropriate accountable Service's design use category code for each facility use itemized. Category codes crossing Military Department host-tenant relationships must be within the same FAC. When a constructed facility has more than one design use, each use must be identified as a separate line under the same item number and captured at 100% of its measured area. Lesser gross square footage may be captured. Real property assets listed may be land parcels, buildings, linear structures (for example, utility distribution lines, roads, and streets), or structures, and must be classified in accordance with the Service implementation of DoDI 4165.03. Reference the Real Property Classification System (RPCS) to find the facility category code, category description, and the various units of measure associated with each facility category code. The RPCS is available on the OASD(EI&E) Real Property Accountability web site https://extranet.acq.osd.mil/ie/ (Common Access Card required). See also https://www.acq.osd.mil/eie/bsi/bei_rpa.html. Identification of items and their category codes and costs is essential for the interim and Final DD Form 1354.

RPIM Data Elements: Asset Configuration Design Use CATCODE Code

4-1.15 12. CATCODE DESCRIPTION.

Use the current version of RPCS to determine the correct facility category code title corresponding to the category code entered in block 11.

4-1.16 13. CONS TYPE CODE.

Indicate the type of construction: P = Permanent, S = Semi-permanent.

RPIM Data Element: Construction Type Code

4-1.17 14. SUST CODE.

This data element is required for all non-disposed buildings meeting the following:

- Greater than or equal to 10,000 gross square feet (GSF).
- Located in the United States and its territories.
- Legal interest of owned (G) or museum trust (M).

This data element is optional for:

- Owned or museum trust buildings greater than 5,000 GSF and less than 10,000 GSF.
- Leased or state government-owned buildings of any size.

Do not report this data element for:

- Non-building assets.
- Buildings located outside the United States and its territories.
- Buildings of 5,000 or less GSF.
- Buildings with the status of excess, surplus, or disposed.

Valid codes are in parentheses:

- **Yes (1)**: The building has been evaluated and qualifies as a sustainable Federal building as outlined in the E.O. 13834 Implementing Instructions[4]. If the project is a new building or new work in an existing building which is subject to the requirements; and the resulting building is projected to be 100% compliant when work is completed; and the High Performance and Sustainable Building or Third-Party Certification checklist for the building is attached to the DD Form 1354, mark box 14 as "1."
- **No (2)**: The building has been evaluated and does not qualify as a sustainable building Federal building as outlined in the E.O. 13834 Implementing Instructions[4].
- **Not Yet Evaluated (3)**: The building has not yet been evaluated.
- **Not Applicable (4)**: The building is excluded because it meets all of the following conditions:
  - o Unoccupied: The building is occupied 1 hour or less per person per day on average.
  - o Low/No Energy Use: Total energy consumption from all sources is less than 12.7 kBtu/GSF/year.
  - o Low/No Water Use: Water consumption is less than 2 gallons per day on average.

RPIM Data Element: Facility Sustainability Code

4-1.18 15. PRIMARY/UMA.

Enter the primary unit of measure for each design use category code for each item of real property. The Service implementation of DoDI 4165.03 identifies the primary/secondary unit of measure for each real property category code. Refer to the RPCS (current version) for the associated Unit of Measure Accountability for the category code (reference the 5-6 digit CC tab).

RPIM Data Elements: RPA Total Unit of Measure Code

[4] At the time of publication, EO 13834 had been rescinded by EO 14057; however, implementation guidance for EO 14057 had not been issued. Continue to use the implementation guidance for EO 13834 for determining sustainability eligibility (https://www.sustainability.gov/pdfs/eo13834_instructions.pdf).

Asset Configuration Design Use Unit of Measure Code
Site Land Total Area Unit of Measure Code

4-1.19 16. PRIMARY/QUANTITY.

Enter the total area quantity in the unit of measure specified in column 15 for each item of real property. For buildings, enter the gross area. For demolition, enter negative numbers in parentheses or attach an Authorization for Demolition.

For capital improvements increasing the size of the existing facility, the quantity entered here should be the quantity by which the capital improvement increased the size (area), not the total quantity (including the capital improvement) for the facility. For example, if there is an existing 10,000-square-foot facility to which a capital improvement adds 5,000 square feet, then 5,000 would be the quantity entered, not 15,000. If a capital improvement does not increase the size, enter N/A in this block.

RPIM Data Elements: RPA Total Unit of Measure Quantity
Asset Configuration Design Use Size Quantity
Site Land Total Area Quantity

4-1.20 17. SECONDARY/UMO.

Refer to the RPCS (current version) to determine if a Unit of Measure Operational is required. For category codes with a UMO, it is required. Note not all category codes have a UMO. For each item of real property, enter the appropriate unit of measure for capacity/other as applicable to the design use category code. The Service implementation of DoDI 4165.03 identifies the appropriate capacity/other unit of measure for each real property category code.

RPIM Data Element: N/A

4-1.21 18. SECONDARY/QUANTITY.

Enter the total quantity of capacity/other in the unit of measure specified in column 17 for each item of real property, if applicable. For demolition, enter negative numbers in parentheses or attach an Authorization for Demolition. For capital improvements increasing the capacity of the existing facility, the quantity entered here should be the quantity by which the capital improvement increased the capacity, not the total quantity (including the capital improvement) for the facility. If a capital improvement does not increase the capacity, enter N/A in this block.

RPIM Data Element: N/A

Note for blocks 15 through 18: Each Service category code reference stipulates an area (primary) or another unit of measure (secondary; for example, capacity), or both. If both units of measure are stipulated in the reference, then both are required on the DD Form 1354. If only one measure is required, place N/A in the other set of columns.

4-1.22 19. COST.

The DD Form 1354 identifies the cost of individual real property assets listed on the form. These costs are required as part of the Service's financial statements. The preparer must identify the total project cost and determine which elements are to be capitalized as real property, as well as costs assigned to each facility. All costs for a multi-purpose facility should be shown against the facility's predominant design use category code, and the cost column for the other categories of the multi-purpose facility should be annotated as N/A.

The DCA must provide distinct breakout costs for each different building, linear structure, and structure constructed as part of the project. For example, if the project consists of two buildings, parking, sidewalks, water supply branch lines, sewer branch lines, and exterior lighting, costs must be provided for all separate items in block 9. Each one of these seven items would be identified with a separate RPUID. No maintenance or repair work costs should be entered on the DD Form 1354.

CIPR Data Element:	Capital Improvement Recorded Cost
RPIM Data Element	Acquisition Original Asset Recorded Cost Amount

4-1.22.1 Demolition Costs.

If demolition is within the footprint of a new construction project, then demolition costs are considered site preparation costs and included as part of the new facility costs on the DD Form 1354. If demolition is not within the footprint of new construction, its cost is expensed and is not included on the DD Form 1354.

4-1.22.2 Preliminary and Final Costs.

Costs provided in a DD Form 1354 can be either preliminary or final. Costs on the interim DD Forms 1354 are preliminary costs entered in the APSR. Costs on a final DD Form 1354 are the final costs. The office preparing an interim DD Form 1354 must maintain a suspense file to ensure the accepting RPAO is furnished with an updated DD Form 1354 with the final l costs (total costs -- not the difference between the interim and final) entered upon financial closeout. Final costs are typically available several months, or if legal claims are involved, one or more years after physical completion and facility transfer. For real property assets found on post/site, or for other existing facilities with unknown original construction costs, an effort should be made to determine the actual costs. If the actual costs cannot be determined, then develop and thoroughly document an estimate of these costs. In these cases, the estimates will become the final costs.

4-1.22.3 Total Project Cost.

Record total project cost in **PROJECT REMARKS** (block 28), which includes:

- P&D, including project management costs.
- Construction contract supervision and administration (SIOH and post-award project management costs).
- Construction costs (including site preparation, which also includes demolition within the footprint of the existing facilities).

Report project-funded equipment costs in accordance with Service guidance. If applicable, include project-funded equipment costs as separate line items on the DD Form 1354 in Block 28. Project-funded equipment costs are recorded in block 28 for information, but are not recorded in the APSR. The DCA prorates P&D and SIOH costs among the real property assets comprising the project and includes the prorated P&D and SIOH costs in the real property asset costs in column 19 for each real property asset. Estimated costs may be used to prorate P&D and SIOH costs to the individual item number in column 9.

RPIM Data Elements: Project Detail Fund Cost Amount
Project Total Fund Cost Amount

4-1.22.4 Acquisition Costs.

The cost in column 19 is the sum of real estate transaction costs and the actual purchase or fee costs. Show these two components of real estate costs in **PROJECT REMARKS** (block 28).

RPIM Data Elements: Acquisition Original Asset Recorded Cost Amount
Acquisition Basic Cost

4-1.22.5 Transfer Costs.

The cost in column 19 is the sum of actual costs that were on the losing agency's facility records. This is the depreciated acquisition cost to government, also known as the facility book value.

RPIM Data Element: Acquisition/Capital Improvement Cost Amount
Facility Total Accumulated Depreciation Amount
Facility Book Value

4-1.22.6 Cost Methodology

For construction or capital improvements, the DCA can use the following step-by-step procedure for computing the costs in block 19:

1. Identify all assets, including facilities and infrastructure and their associated direct construction costs, on the DD Form 1354. Identify site preparation costs including footprint demolition, equipment (if project-funded), or other costs included with the costs directly attributable to those facilities. Identify costs associated with facilities that would increase existing supporting facility records, such as utility lines or pavements.
2. Allocate the P&D and SIOH costs (including project management costs) (indirect costs) among the facilities listed on the DD Form 1354. If P&D and SIOH costs are known for the entire project but are not known for individual facilities, prorate total P&D and SIOH costs among the different facilities. Prorate based on either individual area/size of the facility or individual facility construction working estimates. Annotate in **PROJECT REMARKS** the basis used to prorate or allocate P&D and SIOH costs to individual facilities.
3. Compute the individual facility and incremental consolidated facility costs by summing the actual direct and allocated indirect costs computed in steps one and two.
4. Check to ensure the sum of the individual facility direct costs equals the total project contract cost. List the total project cost and the individual total project cost contributions of construction, P&D, SIOH, EIP, and any non-capitalizing costs (for example, non-footprint demolition) in **PROJECT REMARKS**. If the sum of the individual facilities (RP and EIP) on the DD Form 1354 does not equal the project total, explain in **PROJECT REMARKS**.

4-1.23 20. FUND SOURCE.

When recording costs, the preparer must identify the types of funds obligated or lines of accounting for the funds. It is important for compliance with Chief Financial Officers to identify the fund source in this column for each real property asset or item. When there is more than one fund source for a single real property asset, show all fund sources. The construction authorization document usually identifies the fund source(s) or lines of accounting. Use space in **PROJECT REMARKS** for continuation of data that does not fit in column 20.

Example: MilCon or O&M

RPIM Data Elements: Acquisition Fund Source Code (may be more than one)
Project Detail Fund Code (may be more than one)

4-1.24 21. FUND ORG.

Identify the organization(s) responsible for funding the acquisition of this real property asset.

Example: ARMY

RPIM Data Element: Acquisition Organization Code (may be more than one)
Project Detail Organization Code

4-1.25 22. RPA INT TYPE CODE.

Document the government's interest or ownership in the real property asset. Interest reflects ownership from a legal perspective, not who has control of, or accountability for, the real property asset.

Example: DoD government owned

RPIM Data Element: RPA Interest Type Code

4-1.26 23. ITEM REMARKS.

Use this column to note any information or remarks about the specific item number from column 9. Explain any prorating of costs among various items, as well as any removals or demolitions. If more space is required for item remarks, use block 28. It is not necessary to duplicate in column 23 the project level remarks that appear in block 28. Also use space in **PROJECT REMARKS** for continuation of data that does not fit in column 23.

RPIM Data Element: N/A

4-1.27 24. STATEMENT OF COMPLETION.

This block is signed (either electronically or manually) by an individual responsible for and authorized to transfer accountability. Normally, the DCA signs (either electronically or manually) and dates block 24 for new construction and capital improvements once the asset(s) is/are substantially complete as part of the interim DD Form 1354 process. This signature evidences verification of construction details. The DCA will continue to monitor costs through completion of the asset(s) and will include the final costs as part of executing the final DD Form 1354.

The Installation Management Organization's RPAO signs (either electronically or manually) when transferring real property from one installation to another. Enter the date at the time of signature. To simultaneously transfer property responsibility and accountability for transfers, the date must be prior to, or the same as, the date of acceptance in block 25 on the DD Form 1354. Use the standard date format *YYYYMMDD*.

For inventory adjustments, the preparer (for example, the Real Property Specialist) of the final DD Form 1354 will sign in block 24.

RPIM Data Elements: N/A

4-1.28 25. ACCEPTED BY.

ACCEPTED BY is the final step and occurs when a portion of the project is completed for an interim DD Form 1354 or after the project is closed out for a final DD Form 1354. This block is signed (either electronically or manually) by the individual responsible for and authorized to accept accountability for the assets described in accordance with the Service directed timeline. In most cases, the RPAO signs (either electronically or manually) block 25. The properties accepted must have been inspected and determined to meet standards except for the deficiencies listed in block 27.

Enter the date at the time of signature. The date must be after, or the same as, the date of **STATEMENT OF COMPLETION** in block 24 on the DD Form 1354. **ACCEPTED BY** date is generally after the **RPA PLACED-IN-SERVICE DATE** (block 7a). This signature must occur in accordance with the Service directed timeline. Once the form is signed, electronically or manually, do not update unless it is re-signed by the transferring/accepting officials.

Barring mitigating circumstances (such as litigation or claims), complete final costs within the fiscal quarter of the **RPA PLACED-IN-SERVICE DATE** to facilitate financial closeout.

RPIM Data Element N/A

4-1.29 26. PROPERTY VOUCHER NUMBER.

The preparer should leave this field blank. The receiving installation RPAO fills in the property voucher number when the DD Form 1354 information is recorded in the installation real property voucher register in accordance with Service guidance.

RPIM Data Element N/A

4-1.30 27. CONSTRUCTION DEFICIENCIES.

Enter any significant construction deficiencies for the project. Do not list any perceived deficiencies in the scope or design of the project, as this transfer identifies only deficiencies in the awarded construction contract performance the Government needs completed before declaration of completion of the contracted work. If there are more entries than fit on a single page, attach the construction deficiencies as a separate document or spreadsheet or as an electronic file.

Example:	Restore all grassed areas disturbed by construction. Replace/repair iron rod fence that was damaged during construction.
RPIM Data Element:	N/A

4-1.31 28. PROJECT REMARKS.

Enter any project-related text that would help others understand the real property transaction identified on the DD Form 1354. Remarks pertaining to only one Item should be listed in column 23. block 28 may contain:

- Full description of capital improvements.
- Continuation of data that does not fit in blocks 1 through 8, and columns 20 through 23.
- List of attachments to DD Form 1354 (such as the Building Information Checklist).
- Total project cost and four individual components of total project cost.
- Contact information for DD Form 1354 preparer.

If there are more remarks than fit in block 28 on a single page, attach the additional remarks as a separate document or spreadsheet (hard copy or electronic).

CHAPTER 5 SUPPORTING DOCUMENTATION

5-1 ATTACHMENTS.

Typically, a DD Form 1354 does not stand alone. Tables 5-1 through 5-3 provide a list of the physical, legal, and financial supporting documentation that could be added by the preparer to ensure a complete DD Form 1354 for the types of acquisition methods discussed in this UFC. The preparer of the DD Form 1354 should supply the documentation necessary according to specific requirements of the project/transaction. Documentation must be included with the DD Form 1354 at signature; however, updates may occur until final documentation is provided. Once documentation is attached to the DD Form 1354, it is expected to remain with the DD Form 1354 for the required period of legal retention as determined by the National Archives and Records Administration and the DoD Records Management Program.

5-1.1 Acquisition by Construction and Capital Improvements to Existing Facilities.

Table 5-1 Construction/Capital Improvement Typical Physical, Legal, and Financial Supporting Documentation

Evidential Matter	Examples
Evidence of project approval	Such as, but not limited to: • Approved work order • Approved DD Form 1391 • Statute • Authorization memorandum
Evidence of obligation on behalf of the government	Such as, but not limited to: • For contracts and contract modifications, the following information is utilized: o Title/first page from contract o Contract statement of work or specifications o Contract Accounting Cite page o Dollar amount of contract o Location o Parties to the contract o Signature page [signature of all parties] o
Evidence of costs	Such as, but not limited to: • Approved invoices reflecting the amount submitted for payment • Evidence of in-house construction costs, including labor • Other costs (such as SIOH)

Evidential Matter	Examples
Evidence of project closeout	Such as, but not limited to: • Pictures before and after construction • Evidence of demolition, if applicable • Certified copies of pertinent real estate documents, such as deeds of acquisition, leases, or judgments from condemnation procedures • List of EIP with models, serial numbers, and warranty information • High Performance and Sustainable Building Checklist • Third Party Certification Checklist

5-1.2 Transfer Between Services and/or WHS.

Table 5-2 provides a list of the typical supporting documentation for this acquisition method. DoD Directive 4165.06 and DoD Instructions 4165.14 and 4165.70 provide further guidance for this acquisition method.

If the Service transferring assets has assets under construction or pending final acceptance at the time of transfer, this Service's assigned DCA will maintain responsibility for the construction project until final acceptance. The Service which is receiving the assets will conduct the final acceptance transaction to fully relieve the construction-in-progress account.

Table 5-2 Transfer Between Services Typical Physical, Legal, and Financial Supporting Documentation

Evidential Matter	Examples
Evidence of transfer	Such as, but not limited to: • List of assets • Memorandum between Deputy Assistant Secretaries of losing and gaining Services

5-1.3 Inventory Adjustment (Found on Site).

The ultimate goal for this acquisition method is to have as complete a file as for the other acquisition methods. Make all reasonable efforts to ascertain the original acquisition method and locate any information required to complete the file. In the absence of documentation to support the value of the asset, the Service must determine an acquisition date, valuation method and prepare an attestation memorandum as to how the valuation was determined. Table 5-3 provides a list of the typical supporting documentation for this acquisition method.

Table 5-3 Inventory Adjustment (Found on Site) Typical Physical, Legal, and Financial Supporting Documentation

Evidential Matter	Examples
Evidence of obligation on behalf of the Government or legal interest	Dependent on probable method of acquisition. See RPIM for complete list of acquisition methods); refer to Tables 5-1 and 5-2 above.
Evidence of valuation	If evidence of actual acquisition cost cannot be determined, attestation memorandum identifying method used to determine alternative valuation

INSTRUCTIONS

GENERAL. This form has been designed and issued for acceptance of real property or transfer between the DoD Components.

For detailed instructions on how to fill out this form, please refer to Unified Facilities Criteria 1-300-08.

Existing instructions issued by the DoD Components relative to the preparation of DD Form 1354 are applicable to this revised form to the extent that the various items and columns on the superseded forms have been retained. The DOD Components may promulgate additional instructions, as appropriate.

For detailed information on data inputs and codes, please refer to the latest version of the Real Property Information Model (RPIM) Report and use the RPIM Pick Lists for Block responses: https://extranet.acq.osd.mil/ie/

SPECIFIC DATA ITEMS.

1. From. Name of the DoD Component.

2. Date Prepared. Date of actual preparation. Enter all dates in YYYYMMDD format (Example: March 31, 2010 = 20100331).

3. Project/Job Number. Project number on a DD Form 1391 or Individual Job Order Number.

4. Serial Number. Sequential serial number assigned by the preparing organization (e.g.,Item 17. 2010-0001).

5. To. Name and address of the receiving installation, activity, and Service of the Real Property Accountable Officer (RPAO).

6. RPSUID/SITENAME/INSTCODE/INSTNAME. Site Unique Identifier and name or installation code and name where the constructed facility is located.

7. Contract Number(s). Contract number(s) for this project.

7a. RPA Placed-In-Service Date. The calendar date the asset is accepted for use by DoD.

8. Transaction Details.
a. Type of Transaction. X only one box.
For Acquisition Type, refer to the Acquisition Method Code pick list in RPIM.
b. When/Event. When or event causing preparation of DD Form 1354. X only one box.
c. Version. Draft, interim, or final DD Form 1354. X only one box.

9. Item Number. Use a separate item number for each facility, no item number for additional usages.

10a. Facility Number. An installation specific asset identification number.

10b. RPUID. A unique non-intelligent code to permanently identify an asset.

11. CATCODE. The real property Category Code (CATCODE) that classifies the designed use of the asset (original or current) and corresponds to the largest quantity of the asset that is utilized for a single purpose (RPA Predominant Design Use CATCODE).

12. CATCODE Description. The CATCODE name corresponding with Item 11.

13. Construction (CONS) Type Code. The code represents the Construction Type Code and valid values can be found in the RPIM pick list by the same name. Type of construction will be PERM for Permanent or SEMI for Semi-permanent.

14. Sustainability (SUST) Code. : This code is also known as the Facility Sustainability Code and valid values can be found in the RPIM pick list by the same name. It indicates whether a facility meets the Guiding Principles of Federal Leadership in High Performance and Sustainable Buildings for buildings greater than 10,000 sq. ft. The list of valid values is: 1, 2, 3, 4.

15. UMA. Enter the primary unit of measure accountability for each design use category code for each item of real property.

16.Quantity. Enter the total quantity in the unit of measure accountability specified for each item of real property.

17. UMO. Enter the appropriate unit of measure operational for capacity/configuration as applicable for the design use category code.

18. Quantity. Enter the total quantity of capacity/configuration in the unit of measure operational specified for each item of real property.

19. Cost. Enter the total project cost for each item of real property. UFC 1-300-08 contains additional guidance.

20. Fund Source. Identify the fund source in this column for each real property asset or item. UFC 1-300-08 contains additional guidance.

21. Funding Organization. Identify the organization(s) responsible for funding the acquisition of this real property asset.

22. RPA Interest Type Code. This code represents the RPA Interest Type Code and valid values can be found in the RPIM pick list by the same name. The code is used to identify the type of legal interest that DoD holds in a real property asset.

23. Item Remarks. Remarks pertaining only to the item number identified in Item 9; show cost sharing.

24. Statement of Completion. Typed name, signature, title, and date of signature by the responsible transferring individual or agent. In the case of a real property acceptance action this is signed by the DoD Construction Agent. In the case of a real property transfer this is signed by the Installation Management Organization.

25. Accepted By. Typed name, signature, title, and date of signature by the Installation Management Organization RPAO or accepting official.

26. Property Voucher Number. Next sequential number assigned by the RPAO in voucher register.

27. Construction Deficiencies. List construction deficiencies in project during contractor turnover inspection.

28. Project Remarks. Project level remarks and continuation of blocks.

DD FORM 1354, AUG 2022 PREVIOUS EDITION IS OBSOLETE. **Page 2 of 2**

A-2 PROJECT COST TYPES.

Cost Type	Description
Total labor cost	The total cost of government burdened labor directly associated with the construction project. Includes both military and civilian labor costs, in accordance with current published DoD Comptroller annual reimbursable rates.
Direct cost of materials and supplies	The purchase price, the cost of inspection, and loading assumed by the carrier.

Cost Type	Description
Cost of Supervision, Inspection, and Overhead (SIOH)	A fee applied to the cost of a construction contract to recover direct and indirect expenses for a project's construction management services. Examples may include, but are not limited to: administration of social programs, claims analysis, constructability review, contract/project administration, cost estimation, cost management, labor rates, materials testing, post construction activities, procurement of materials, equipment, project management, quality assurance, scheduling, and value engineering.
Cost of transportation	Amounts paid for transportation of workers, materials, and supplies in connection with the construction project.
Cost of handling and storage	Amount paid for packaging and storing the materials, supplies, and equipment used in the construction project.
Cost of injuries and damages	Costs resulting from injuries to people or damage to property incurred directly as a result of the construction project.
Cost of legal and recording fees	Legal fees incurred to bring the asset to its intended use (such as title or recording fees).
Cost of architecture and engineering studies	Amounts paid for engineering, architectural, and other outside services for designs, plans, surveys, and specifications. May include design reviews, environmental impact studies, and soil testing for the new construction projects.
Cost of site and asset preparation	Amounts paid to prepare the site for new construction, such as soil removal, grading, and infill. Includes amount paid to prepare the asset for its intended use, such as installation of utilities into an asset.
Cost of installed equipment	Fixed equipment and related installation costs required for a complete and usable asset.
Usage cost of government furnished equipment or material (GFE, GFM)	The usage cost of the government furnished equipment, material, and facilities used in construction work. Example: Use of a government owned grader for site preparation billed at the assigned hourly rate.
Cost of donated assets	The fair market value of real property and installed equipment donated to the government.

A-3 CONSTRUCTION-IN-PROGRESS COST TYPES.

Costs must be accumulated for constructed assets. Reference DoD 7000.14-R FMR, Vol. 4, Chapter 24, Annex 1 for more information.

Cost Type	Description
Cost of contract work	Amounts paid for work performed under contract, as well asany incentive fees paid to contractors to reward performance goals.
Direct cost of labor	The direct cost of labor and all associated fringe benefits inconnection with the construction project. Includes both military and civilian labor costs.
Direct cost of materials and supplies	The purchase price and the cost of inspection.
Cost of Supervision, Inspection, and Overhead (SIOH)	Support associated with the administration of contracts for facility projects. Support may include processing of contract award and payments, performing inspections, and other actions taken during project execution.
Cost of transportation	Amounts paid for transportation of workers, materials, and supplies in connection with the construction project.
Cost of handling and storage	Amount paid for packaging and storing the materials andsupplies and equipment used in the construction project.
Cost of legal and recording fees	Legal fees incurred to bring the asset to its intended use(such as title or recording fees).
Cost of architecture and engineering studies	Amounts paid for engineering, architectural, and other outside services for designs, plans, specifications, and surveys after funding and design authorization. May includedesign reviews, environmental impact studies, and soil testing for the new construction projects.
Cost of facility and site preparation	Amounts paid to prepare the site for new construction, such as soil removal and restoration. Includes amount paid to prepare the asset for its intended use, such as installation of utilities in a facility.
Cost of installed equipment	Fixed equipment and related installation costs required for activities in a facility.
Cost of government furnished property	An appropriate share of the cost of the government furnishedequipment and material used in construction work.
Cost of donated assets	The fair market value of equipment donated to the government, as authorized by a special legislation, inconnection with the construction project.

APPENDIX B GLOSSARY

B-1 ACRONYMS.

AFCEC	Air Force Civil Engineer Center
APSR	Accountable Property System of Record
BCE	Base Civil Engineer
BEA	Business Enterprise Architecture
BIA	Bilateral Infrastructure Agreement
CATCODE	Category Code
CC	Category Code
CCMD	Combatant Command
CCR	Criteria Change Request
CFOA	Chief Financial Officers Act
CIP	Construction in Progress
CIPR	Construction in Progress Requirements
CJCS	Chairman, Joint Chiefs of Staff
CWE	current working estimate
DAIS	Data Analytics and Integration Support Platform
DCA	DoD Construction Agent
DoD FMR	Department of Defense Financial Management Regulation
DoDD	Department of Defense Directive
DoDI	Department of Defense Instruction
DPW/FMO/BCE	Directorate of Public Works/Facilities Management Office/Base Civil Engineer
EIP	Equipment In Place
FAC	Facility Analysis Category
FacMgr or FACMGR	Facility Manager

FMR	Financial Management Regulation (DoD)
G	Government
GFE	Government Furnished Equipment
GFM	Government Furnished Material
GSA	General Services Administration
GSF	gross square feet
HNFA	Host Nation Funded Agreement
HQUSACE	Headquarters, U.S. Army Corps of Engineers
HVAC	heating, ventilation, and air conditioning
IBE	Installed Building Equipment
IG	Inspector General
IMO	Installation Management Organization
JS	Joint Staff
kBtu	thousand British thermal units
MCA	Military Construction, Army
MilCon	Military Construction
N/A	not applicable
NAVFAC	Naval Facilities Engineering Command
NGB	National Guard Bureau
O&M	operations and maintenance
OASD(EI&E)	Office of the Assistant Secretary of Defense for Energy, Installations, and Environment
OSD	Office of The Secretary of Defense
P&D	Planning and Design
PCE	project cost estimate
POC	point of contact

PS	Project Sponsor
RFP	Request for Proposal
RPAO	Real Property Accountable Officer
RPAR	Real Property Acceptance Requirements
RPCS	Real Property Categorization System
RPI	Real Property Inventory
RPIM	Real Property Information Model
RPIR	Real Property Inventory Requirements
RPO	Real Property Office
RPSUID	Real Property Site Unique Identifier
RPUID	Real Property Unique Identifier
SF	square feet
SIOH	Supervision, Inspection, and Overhead
SOFA	Status of Forces Agreement
UIC	Unit Identification Code
UMA	Unit of Measure Accountability
UMO	Unit of Measure Operational
U.S.C.	United States Code
USACE	United States Army Corps of Engineers
USPFO	United States Property and Fiscal Officer
WCF	working capital fund
WHS	Washington Headquarters Services
WIP	work in progress

B-2 DEFINITION OF TERMS.

Administrative Accountability: The Service accountable for the real property does not use the real property for which it is accountable; another Service or agency controls the use of the property.

Accountable Property System of Record (APSR): The business system/application used to account for and maintain accountability of DoD government property.

Building: A roofed and floored facility enclosed by exterior walls and consisting of one or more levels suitable for single or multiple functions which protects human beings and their properties from direct harsh effects of weather such as rain, wind, and sun.

Capital Improvement: Includes any improvement that increases the useful life, efficiency, capacity, or size of an existing asset, or modifies the functionality or use of the asset, regardless of the source of funding or capitalization threshold.

Capital Improvement Placed-in-Service Date: The calendar date when an improvement to a real property facility is available for use by DoD; the date on which the leasehold improvement (capital improvement) is made to a leased facility. On this date, the government assumes liability and the warranties begin for the capital improvement to which they have received title. Also includes date of leaseholds.

Chief Financial Officers Act (CFOA): The federal law requiring government agencies to produce auditable financial statements and timely, accurate financial data. Includes accounting for costs spent on construction and capital improvements of government facilities.

Construction in Progress (CIP) Account: In the context of real property construction, the accumulations of costs of construction for or by the Project Sponsor since project inception. (See **Work-in-Progress**, this Appendix. Not to be confused with the Capital Investment Program, also referred to as CIP.

Current Working Estimate (CWE): The estimated cost of a new construction project. As the design process proceeds, the current working estimate will change, and only becomes fixed when a construction bid is accepted.

DoD Construction Agent (DCA): The DoD organization authorized pursuant to Section 2851 of Title 10, U.S.C., and DoD policy (DoDD 4270.05) to administer design and construction contracts for DoD facilities projects in accordance with applicable laws and regulations.

DoD Components: The Office of the Secretary of Defense (OSD); the Military Departments; the Chairman, Joint Chiefs of Staff (CJCS) and the Joint Staff (JS); the combatant commands (CCMD); the Office of the Inspector General (IG) of the DoD; the Defense agencies; DoD field activities; and all other organizational entities within DoD.

Equipment in Place (EIP): A special category of personal property (not real property). EIP consists of capital equipment and other nonexpendable equipment of a movable nature that has been fixed in place or attached to real property, but not as an integral part of the facility, and therefore may be severed or removed from a facility without severely damaging, destroying, or reducing the usefulness of the facility. EIP is personal property and does not include installed building equipment. It is accounted for on property book records (not real property records). EIP costs may be included as a funded construction cost.

Execution Authority: The individual authorized to sign the DD Form 1354. For new construction or alteration executed with MilCon funding, this is a senior representative of the DCA. Execution authority for conversion, diversion, alteration, minor construction, and inventory adjustments (found on site) may be the installation/ garrison/base commander. However, this authority is often delegated to the Director of Public Works/Facilities Manager/Base Civil Engineer (DPW/FacMgr/BCE). The actual execution authority is a Service-, or WHS-specific decision.

Facility: A building, structure, or linear structure that includes in the basic record for the facility such things as landscaping, HVAC equipment, utility connections, stairs, ramps, passageways, and other real property installed equipment that facilitates the use of and is inclusive/intrinsic to the facility itself.

Installation Management Organization (IMO): The Military Department (or WHS for the Pentagon Reservation) with custody and accountability for the physical infrastructure and real property of the military installation on which construction will occur. The IMO may authorize another DoD Component with physical control over an installation, or portion thereof, to perform roles and responsibilities of the IMO, provided it does so in writing and with specificity.

Installed Building Equipment (IBE): Synonymous with real property installed equipment.

Land: A portion of the earth's surface distinguishable by boundaries. The types of land assets in the RPI include everything from unimproved wilderness areas to central urban developments. Land must be inventoried by parcel, starting when the parcel was transferred into a custody and control of a Military Department or the WHS.

Land Parcel: A specific area of land with a perimeter delineated by a cadastral survey.

Linear Structure: A facility whose function requires it traverse land (such as a road, rail line, pipeline, fence, pavement). Includes distribution systems providing a common service or commodity to more than one building or structure.

Military Construction (MilCon): Per Title 10, U.S.C., Section 2801, includes any construction, development, conversion, or extension of any kind, carried out with respect to a military installation. A military construction project includes all military construction work necessary to produce a complete and usable facility or a complete and usable improvement to an existing facility.

Project Cost Estimate (PCE): The estimated costs for an entire project (up to the limit of funds received), to include planning and design, site preparation, construction, and overhead. The PCE may include costs that will not be capitalized, such as any work designated as repairs or design breakage. The DCA Project Manager uses the PCE to manage the project against funds available.

Placed-in-Service Date: Calendar date the real property asset is available for use by DoD and the government assumes liability, receives legal interest, and the warranties and depreciation begin.

Planning and Design (P&D): Costs associated with design of military construction projects. These costs are accounted for separately since Congress funds them as a separate line item for future MilCon projects. P&D is one of the four cost components (along with SIOH, construction, and equipment costs) reflected in **PROJECT REMARKS** (block 28) on DD Form 1354.

Project Sponsor (PS): The DoD Component that establishes project requirements, priorities, program, and budget. DoD agencies and combatant commands are not authorized to hold real property, and as such, these assets are under the jurisdiction of, and held in the real property inventory of the real property accountable Service for the site where the asset is located.

Real Property: Land and improvements to land (such as buildings, structures, and linear structures (see **Facility**, this Appendix)).

Real Property Installed Equipment (RPIE). An item of equipment that is affixed and built into a facility as an integral part of the facility. To qualify as RPIE, the equipment must be necessary to make the facility complete, and if removed, would destroy or severely reduce the designed usefulness and operation of the facility. RPIE costs are included as a funded initial construction or renovation cost. RPIE may be accounted for as a real property equipment asset record, but not as a separate facility record in the real property inventory. RPIE includes such items as control systems, heating, cooling, electrical, emergency lighting, and is synonymous with IBE.

Real Property Asset: An individual building, structure, linear structure, or land parcel.

Real Property Asset Placed-in-Service Date: Calendar date the real property asset is available for use by DoD. On this date, title for assets listed on the acceptance form is transferred, the government assumes liability, and the warranties begin for the asset to which DoD has received title.

Real Property Site Unique Identifier (RPSUID): A unique non-intelligent code used to permanently identify real property sites. A real property site is a specific geographic location that has individual land parcels and/or facilities assigned to it.

Real Property Unique Identifier (RPUID): As defined in the RPIR, the RPUID is a non-intelligent code used to permanently and uniquely identify a real property asset. Each real property asset in which the DoD has a legal interest must be assigned an RPUID.

Repair: A project to restore a real property facility, system, or component to such a condition allowing it to effectively be used for its designated functional purpose (source: 10 U.S.C. 2811).

Structure: A facility, other than a building or linear structure, which is constructed on or in the land.

Supervision, Inspection, and Overhead (SIOH): SIOH is a fee applied to the cost of a construction contract to recover direct and indirect expenses for a project's construction management services. Examples of SIOH may include but are not limited to administration of social programs; claims analysis; constructability review; contract/project administration; cost estimation; cost management; labor rates; materials testing; post construction activities; procurement of materials; equipment; project management; quality assurance; scheduling; and value engineering.

Work-in-Progress (WIP): In the context of real property construction, this represents the accumulation of costs by the DCA billed to the PS since project inception. Billed costs are recorded in the corresponding CIP account by the PS, but only costs that must be capitalized. (See **CIP**, this Appendix).

Change No.	**Date**	**Location**
1	17 April 2025	Reorganization of Chapter 1 paragraphs; removed AFFF from Chapters 6 and 7; cost changes in Chapter 9; updated para 12-4 and 13-5; mods to B-3.3.1 b,c,d; addressed CCRs; added FRCS consideration for existing buildings; broken weblinks fixed; minor word changes throughout, in accordance with para 7-5.

This FC supersedes FC 1-300-09N, dated May 2014, with Change 6 dated July 2021.

This Page Intentionally Left Blank

FOREWORD

Facilities Criteria (FC) provide functional requirements (i.e., defined by users and operational needs of a particular facility type) for specific DoD Component(s), and are intended for use with unified technical requirements published in DoD Unified Facilities Criteria (UFC). FC are applicable only to the DoD Component(s) indicated in the title, and do not represent unified DoD requirements. Differences in functional requirements between DoD Components may exist due to differences in policies and operational needs.

All construction outside of the United States is also governed by Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA), and in some instances, Bilateral Infrastructure Agreements (BIA). Therefore, the contracting team must ensure compliance with the most stringent of the FC, the SOFA, the HNFA, and the BIA, as applicable.

Because FC are coordinated with unified DoD technical requirements, they form an element of the DoD UFC system applicable to specific facility types. The UFC system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and applicable to the Military Departments, Defense Agencies, and the DoD Field Activities in accordance with USD (AT&L) memorandum dated 29 May 2002. The UFC System also includes technical requirements and functional requirements for specific facility types, both published as UFC documents and FC documents.

FC are living documents and will be periodically reviewed, updated, and made available to users as part of the Services' responsibility for providing criteria for military construction. Headquarters, U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering Systems Command (NAVFAC), and the Air Force Civil Engineer Center (AFCEC) are responsible for administration of the UFC system. Defense agencies should contact the preparing service for document interpretation and improvements. Technical content is the responsibility of the cognizant DoD working group. Recommended changes with supporting rationale should be sent to the respective service proponent office by the following electronic form: Criteria Change Request. The form is also accessible from the Internet site listed below.

FC are effective upon issuance and are distributed only in electronic media from the following source:

- Whole Building Design Guide website https://www.wbdg.org/dod.

Refer to UFC 1-200-01, *DoD Building Code*, for implementation of new issuances on projects.

CHAPTER 1 INTRODUCTION

1-1 REISSUES AND CANCELS.

This FC reissues FC 1-300-09N, **\1** dated 1 May, 2014, with Change 6 dated 9 July 2021. **/1/**

1-2 PURPOSE AND SCOPE.

This FC provides policy and standards for planning, design, development, and revision of project documents, including drawings, specifications, and Requests for Proposal, for facilities under the cognizance of NAVFAC. This FC has been developed to ensure consistency and clarity of project documents that form the basis of contracts for planning, design, and construction of facilities. **\1** Use this FC for projects where NAVFAC is the construction agent, as defined in DoDD 4270.5, for preparation of construction contract drawings, specifications, and Request for Proposals for shore facilities, for both Design-Bid-Build (DBB) and Design-Build (DB) projects. The Design and Submittal procedures contained herein are pertinent to standards, software, and templates used, required, and unified within NAVFAC, and centered around the NAVFAC organization and operation. Procedures for NAVFAC may not work for USACE and Air Force operations due to organizational and operational differences. **/1/**

1-2.1 Organization of Document.

This document is organized into design policy, roles and responsibilities, design deliverables, and design phases. The design deliverables chapters contain general requirements that apply throughout the design process. For the disciplines, additional information is provided only if it is not already in another UFC; thus, a discipline paragraph may not be provided if the Core UFC already provides the requirements for that deliverable, or the level of completion of that deliverable. Core UFCs are defined and listed in UFC 1-200-01.

Detailed level of completion for each type of submittal, and for each discipline, only beyond what is specified in other UFCs, are included in each design phase.

This FC provides specific guidance on how and when to provide a project design deliverable for NAVFAC. This document is organized into design deliverables and design phases. Requirements for design deliverables, beyond or in more detail of what is already required by a Core UFC, are provided for NAVFAC-only. The requirements for when or to what extent these deliverables are provided are in the Phase chapters.

1-3 APPLICABILITY.

\1 This FC follows the same applicability as UFC 1-200-01, paragraph 1-3, with no exceptions. **/1/**.

1-4 GENERAL BUILDING REQUIREMENTS.

Comply with UFC 1-200-01, *DoD Building Code* and UFC 1-200-02 *High Performance and Sustainable Building Requirements*. Use 1-200-02 in conjunction with UFC 1-200-01 and the UFC and government criteria referenced therein. UFC 1-200-01 provides applicability of model building codes and government unique criteria for typical design disciplines and building systems, as well as for accessibility, antiterrorism, physical security, cybersecurity, high performance and sustainability requirements, and safety. UFC 1-200-02 provides minimum unified requirements and coordinating guidance for planning, designing, constructing, renovating, and maintaining high performance and sustainable facilities that will enhance DOD mission capability by reducing total ownership costs. Use this FC in addition to UFC 1-200-01, UFC 1-200-02, and the UFC and government criteria referenced therein.

1-5 CYBERSECURITY.

Plan, design, acquire, execute, and maintain facility-related control systems (FRCS) (including systems separate from a utility monitoring and control system) in accordance with UFC 4-010-06, and when required by individual Service Implementation Policy.

1-6 EXCEPTIONS.

Austere Requirements may be invoked on a per-project basis, and only by formal letter from Commander, Naval Installations Command (CNIC). Austere requirement options are included in FC 4-721-10N, UFC 4-610-01, UFC 4-722-01, and UFC 4-740-02.

1-7 GLOSSARY.

APPENDIX D contains acronyms, abbreviations, and terms.

1-8 REFERENCES.

APPENDIX E contains a list of references used in this document. The publication date of the code or standard is not included in this document. Unless otherwise specified, the most recent edition of the referenced publication applies.

CHAPTER 2 POLICY

2-1 CRITERIA.

Design Naval shore facilities in accordance with Navy and Department of Defense (DoD) Criteria. DoD Design Criteria are available from the Whole Building Design Guide (WBDG) (https://www.wbdg.org/dod). Design criteria include general criteria, as well as specific criteria on particular elements of the work (such as Geotechnical Engineering) and facility types (such as Bachelor Quarters). Design requirements are typically in the form of Unified Facilities Criteria (UFC). The contract will reference the specific requirements applicable to a particular project. Deviations from criteria must be approved by the NAVFAC Chief Engineer and in accordance with MIL-STD-3007.

2-2 METRIC POLICY.

Comply with MIL-STD-3007 for the use of SI in projects and criteria documents. NAVFAC policy is to use the metric system of measurement (International System of Units, SI) in planning and design criteria, Unified Facilities Guide Specifications (UFGS), and construction contract documents for MCON/MILCON, BRACON, and family housing, regardless of contracting method. See exception under paragraph 2-2.2 General Policy.

2-2.1 SI Definitions.

Hard Metric measurement: The actual size, capacity, or other measurement characteristic of a product is changed to a rational metric value. This measurement is used in the manufacturing process.

Soft Metric measurement: A simple arithmetical change from inch/pound to SI units, using a conversion factor, so that actual measurable characteristics remain virtually unchanged, or at least within the former tolerance limits.

Example: 4 foot by 8 foot panel is hard converted to 1200 mm by 2400 mm, or soft converted to 1219.2 by 2438.4 mm.[1].

2-2.2 General Policy.

In accordance with Public Law 94-168, design and construction of new or renovated facilities must use the metric system of measurement, unless its use is impractical or is likely to cause significant inefficiencies or loss of markets to United States firms. Specify hard metric products unless such products are unavailable or uneconomical. Do not use dual units on drawings on any type of project. The design agent project manager is responsible for making the determination on whether or not to use the metric system of measurement on a project-by-project basis. Decisions to not use the metric system must be justifiable and documented in permanent project files. Comply

[1] Definitions and example extracted from Fishman, Bernard L./Loshak, Lionel/Strelka, Charles S. Metric Architectural Drawing. Canada: John Wiley and Sons, Inc., 1981, p. 11.

with Facilities Engineering Systems Command (FEC) process for determination of exception for the metric system.

2-3 OWNERSHIP OF PROJECT DOCUMENTS AND DATA.

The clauses set forth in DFARS 252.227-7023, DFARS 227.71, and DFARS 227.72 apply to project documents and data.

2-4 OPERATION SECURITY (OPSEC).

The OPSEC process provides a means of screening information prior to public release in order to prevent aggregation with other information, ultimately revealing DoD intentions or capabilities. Publicly released documents such as field investigations, reports, studies, Basis of Design, calculations, drawings, specifications, or DB Request for Proposals (RFP) must not reveal sensitive or critical information.

2-4.1 OPSEC Review.

Include an OPSEC review by the requesting activity as part of the normal review process; prior to public release to identify information that may require protection. Where applicable, modify details and identifying information in order to eliminate information the requiring activity has identified as sensitive or critical. When CUI cannot be redacted from documents, mark and handle documented in accordance with DoDI 5200.48.

2-4.2 Mission Information.

DoD installations support units and missions that may be considered sensitive, critical or even classified. In addition, every DoD command performs a core, unclassified mission. Although unclassified, individual tasks required for a command to accomplish its mission may contain information that when pieced together with other information, reveal sensitive, critical, or even classified information.

2-4.3 Information Compilation.

The compilation of information that is individually unclassified may be classified as a result of the compilation. Classification requires a classification decision by an Original Classification Authority (OCA). NAVFAC is not an OCA.

2-4.4 Sensitive or Critical Information.

Sensitive or critical information is unclassified or controlled unclassified information (CUI) concerning the DoD activities, intentions, capabilities, limitations, or vulnerabilities. **\1** SECNAVINST 3070.2A **/1/** contains a critical information list. In addition, the following is provided to help avoid the disclosure of sensitive or critical information that must not be included in publicly releasable materials.

- Do not identify a command if their mission or portion of their mission is considered critical or classified.
- Do not identify a command's mission or the mission supported by a facility if the mission is considered critical or classified.
- Do not identify the capabilities or vulnerabilities of physical security or antiterrorism protective measures.
- Do not identify the location of a Sensitive Compartmented Information Facility (SCIF).
- Do not identify location of a Special Access Program Facility (SAPF).
- Do not identify Defense Critical Infrastructure.
- Do not identify the location of Communications Security (COMSEC) Equipment.
- Do not identify Take Charge and Move Out (TACAMO) systems or mission.
- Do not identify Nuclear Command, Control and Communications (NC3) systems or mission.
- Do not identify Military Strategic and Tactical Relay (MILSTAR) systems or mission.
- Do not identify Advanced Extremely High Frequency (AEHF) systems or mission.
- Do not identify purpose or frequency range of antennas or communication systems.
- Do not identify Low Frequency (LF) or Very Low Frequency (VLF) transmission systems, missions, or specific location or site of the LF or VLF system.

Sensitive area locations such as SCIF and SAPF, may be labeled as "Controlled Area" and may be shown on public releasable documents with the approval from the requesting activity's Site Security Manager or Officer.

2-5 REGISTRATION.

Develop stateside project documents under the direction of a Registered Architect or a Professional Engineer currently licensed in accordance with FAR 52.236-25. Develop foreign project documents under the direction of a Registered Architect or a Professional Engineer currently licensed by a United States state, commonwealth, or territory, the District of Columbia, or as permitted otherwise by the contract.

Each drawing must only be signed, sealed, and dated by the Registered Architect or the Professional Engineer who is registered to practice in the particular field involved for work depicted on that drawing, serves as the Designer of Record (DOR) for that work, and complies with requirements of FAR 52.236-25. Sign Record Documents in accordance with Chapter 12.

2-5.1 Certification.

Where special certifications are required for the design, certify in accordance with the contract and local requirements.

2-6 PROHIBITION OF POSTING CONTROLLED UNCLASSIFIED INFORMATION DESIGN DELIVERABLES ON UNSECURED SERVERS.

Design deliverables may contain Controlled Unclassified Information (CUI) or Department of Defense Unclassified Controlled Nuclear Information (DoD UCNI). The release of this information into the public domain may compromise an installation or facility's Antiterrorism (AT) or physical security protective measures. Examples include the design analysis where the design basis threat (DBT) is an explosive weight and the location of a SCIF or SAPF. Protect deliverables, such as drawings, specifications, calculations, cost estimates, and other design related information, that contain CUI, in accordance with DODI 5200.48.

2-7 DESIGN DELIVERABLES FOR NAVAL CONSTRUCTION FORCES - MARINE LOGISTICS GROUPS AND NAVY CONSTRUCTION BATTALIONS (SEABEES).

Due to the nature of the work performed by the Marine Logistics Groups and the Seabees, the design deliverables for their use must be tailored for expedient construction. Deployed battalions may be in remote locations under austere conditions. Researching materials and transmitting submittals can be difficult, if not impossible. Specify materials and performance requirements on the drawings to the most practical extent. Specify materials available on the Federal schedule supply lists, the battalion's supply schedules, or by product name (Contracting to include brand name or equal FAR clause in the solicitation). Avoid referencing codes or standards where possible, as reference materials may be difficult for the Battalion to obtain in the field.

2-8 OVERSEAS LOCATIONS TRANSLATIONS.

Prepare construction drawings in dual language at a majority of the overseas locations. Unless the contract scope indicates otherwise, translation of specifications is not required. Where dual language is required, the Host Nation A&E must accurately translate required documents such that they are clear and comprehendible to the local construction community. The Host Nation A&E may also be contracted to translate Government furnished studies, surveys, geotechnical reports, product specifications, host country requirements or other technical documents prepared in a foreign language and serve as an interpreter when meeting with local officials and contractors. Include translations with the Pre-Final (100%) submittal, and through project completion.

CHAPTER 3 ROLES AND RESPONSIBILITIES

3-1 DESIGNER OF RECORD (DOR).

3-1.1 Coordination with Command, Major Claimant, Region, and Activity.

Engage in and provide liaison with the Activity, and appropriate Activity personnel, in accordance with the contract, and during early design-development or RFP development.

The DOR is responsible for architectural and engineering aspects of the project to ensure reasonable facility cost appropriate for the functions performed through design and RFP development.

3-1.2 Coordination with Other Government Organizations.

Coordinate design input and reviews with other Government organizations described in this chapter in paragraph 3-2 Other Government Organizations and in accordance with the contract.

3-1.3 Document Review and Checking System.

The Document Review and Checking System (DrChecks) facilitates the formal review of complex project documents. DrChecks automatically tracks, collates, and measures technical discussions. Project documents can be uploaded into the project folders for download and review. Provide design reviews in DrChecks in accordance with the Contract. Contact the Government Design Manager to obtain registration information. DrChecks can be accessed at ProjNet.org (https://www.projnet.org).

3-1.4 Response to Review Comments.

Respond to comments in DrChecks or in accordance with Contract requirements. The DOR or Contractor is responsible for the resolution and incorporation of government comments into the project design. At each submittal, return and address previous review comments. Provide responses to review comments that clearly indicate what action is being taken to resolve the comment. If the comment was incorporated into the design, a response must so indicate; otherwise, provide acceptable technical justification for comments not being incorporated. Prior to the next submittal, contact the Government reviewer to discuss and resolve each comment that will not be incorporated.

The DOR is responsible for using professional judgment and technically evaluating user comments that suggest technical changes to design.

3-1.5 Final Approval.

The DOR reviews and gives final approval for contract project documents prepared under their direction. The DOR must be registered in the discipline for the documents they approve as described in Chapter 2, paragraph 2-5 Registration.

3-2 OTHER GOVERNMENT ORGANIZATIONS.

3-2.1 Commander, 1st Naval Construction Division.

Projects scheduled for accomplishment by Naval Construction Forces are reviewed at an early Design Development stage by Commander, 1st Naval Construction Division, for construction methods and procedures.

3-2.2 Reviews for Health Hazards During Facilities Design Process.

For facilities projects that require industrial hygiene technical assistance and that involve potential health hazards such as toxic materials, non-ionizing radiation, noise, or other health hazards, consult the appropriate Naval Environmental Health Center (NEHC) for the activity. The NEHC activity is required to participate in design and RFP development reviews and reviews of plans, specifications, or RFP for these projects. The NEHC activity will ensure that engineering designs properly consider and provide for adequate environmental controls for the elimination of health hazards. Also use this review process for medical facility designs in excess of $1 million.

3-2.3 Naval Information Warfare Center (NIWC).

NIWC provides reviews and design input for projects where NIWC is providing and installing equipment as identified in the DD Form 1391. The drawings of cable and equipment layout are often provided by NIWC to the DOR, for incorporation into the design. Coordinate closely with Government Project Manager and their NIWC representative to receive timely input and to reduce impact to design and construction schedules and project costs.

Projects, even if prepared by NIWC, must bear the standard NAVFAC title blocks and drawing numbers. On drawings that require NIWC approval, NIWC signature can be applied in the NAVFAC Signature Block in the supplemental location and the NIWC drawing cross reference number can be provided on the border sheet. NIWC may also need to review where project impacts an adjacent facility, such as electro-magnetic radiation from police stations or hospitals affecting antennae, transmitters, and receivers.

3-2.4 Civil Works.

NAVFAC approves drawings and specifications prepared for civil works subcontracts. Assign NAVFAC drawing numbers to civil works contract drawings and approve and sign the drawings as "Satisfactory to" the prime contractor of the particular Navy industrial plant for whose use the facility is provided.

3-2.5 Historic Preservation Compliance.

Section 106 of the National Historic Preservation Act requires Federal agencies to take into account the effects of their undertakings on historic properties that are eligible for listing in the National Register of Historic Places (NRHP). Historic properties may include archaeological sites, individual buildings, historic districts, landscapes, structures, objects, and traditional cultural properties. In accordance with established procedures at each installation, an action proponent files a National Environmental Policy Act (NEPA) Compliance Checklist plus a copy of the Work Request or Project Description with the Installation Cultural Resource Manager (CRM). The CRM then reviews the Project Description and determines whether the project has the potential to affect historic properties or whether it is exempt from Section 106 compliance. The CRM will then either record that the undertaking is exempt or engage in consultation for Section 106 Compliance in accordance with 36 CFR 800.

3-2.6 Overseas Cultural Resources.

At Installations outside of the United States, coordinate with the applicable host nation regarding possible adverse effects to cultural resources.

3-2.7 NAVFAC Medical Facilities Design Office (MFDO).

Special coordination is required for coordination of medical facilities. Coordinate in accordance with UFC 4-510-01.

3-2.8 Sensitive Compartmented Information Facilities (SCIF) and Special Access Program Facilities (SAPF).

Special coordination is required for projects associated with a SCIF or SAPF. A designated Government Site Security Manager (SSM) is assigned to the project. The SSM is responsible for the project’s security requirements and will prepare a Construction Security Plan (CSP), Fixed Facility Checklist (FFC) and the TEMPEST addendum to the FFC (referred to as the TEMPEST Form A) for the project. The SSM will submit these documents to the Accrediting Official (AO) for approval. The DOR assigned to the project must assist the SSM in documenting the facility and site requirements necessary for the preparation of these documents. The AO-approved CSP, FFC and TEMPEST Countermeasure Review contains project requirements that must be incorporated into the project, in order for the facility to be accredited. Refer to UFC 4-010-05 for additional information.

3-3 COMMANDER, NAVFAC.

Authority and responsibility for formal approval of drawings and specifications and RFPs by, or for, the Commander, NAVFAC, is vested in the Facility Engineering Systems Command, Chief Engineer, Design Director (PDC4), and PMEB Design Director.

The level of approval and responsibility for DB drawings and documents, submitted by the Contractor and signed by the Government, are defined in the RFP contract.

This Page Intentionally Left Blank

CHAPTER 4 DELIVERABLE: FIELD INVESTIGATION

4-1 PURPOSE AND SCOPE.

The site approval process includes field investigation and verification. This early effort provides more defined project scope and cost and can rule out a site. Many of the functions identified under this heading are also essential during the DD Form 1391 validation process to assure the project has the appropriate funding based on the scope of work. This section is not applicable for post-award design services of DB contracts unless specifically addressed in the RFP.

4-2 RESPONSIBILITIES.

The Government installation planners are responsible for obtaining information required for project site approval prior to design. The DOR must obtain site and building data and investigate existing site conditions, utilities, and facilities to properly integrate the design of the project with existing conditions. Except as otherwise contracted, field investigations must include complete and accurate site investigation, topographic survey, and verification of location, ownership, and availability of utility and drainage systems. When available, research existing record drawings for information. Field verify record drawings information and other site features that may influence project design.

In a DB contract, the DOR is responsible to verify site information furnished in the Government issued RFP. In addition, the DOR must provide additional field investigations and verification of existing site conditions as may be required to support the development of the design and construction of the project.

4-3 COORDINATION.

Coordinate site work, including topographic and soil surveys, with representatives of the Public Works, Utilities and Energy team, Utility System Owners on privatized Installations, and other NAVFAC design personnel. Obtain technical review by Installation utilities engineers to ensure alignment and compatibility with existing and proposed utilities systems as part of the QA/QC review process. For utilities projects, ensure requirements are obtained from the Installation utilities engineers and that they are included in charrettes and reviews. During execution of field investigation work, the DOR is responsible for obtaining necessary permits, and complying with applicable laws, codes, and regulations, including OSHA regulations. The exact location of the geotechnical excavation, whether by drilling or digging, must be approved by the appropriate authorities, be it the local utility service or by a company hired by the geotechnical engineering firm to “scope” utilities. The DOR is responsible for damages to persons and property that occur as a result of their fault or negligence. The DOR must take proper safety precautions to protect the public, the property of the public and the Government from physical hazards and unsafe conditions. Upon completion of field investigation, return the property to its original condition except as released in writing by the client activity.

4-4 TOPOGRAPHIC SURVEY.

Provide a topographic survey of the project site in accordance with the National Society of Professional Surveyors (NSPS) *Model Standards for Topographic Surveys* with the following modifications:

- Project drawings by the Government must be in English or Metric as directed for each specific project.
- Ensure that adequate adjacent areas are included within the survey limits to clearly indicate and accommodate standoffs required by antiterrorism criteria, offsite drainage and offsite utility connections impacting the project.
- Provide a boundary survey and location of easements, standoffs, and security clear zones within the limits of the scope of work.
- Show horizontal control used during field survey. Indicate the reference coordinate plane and provide two permanent control points for reference. Include description of points (such as PK nail in cap). Provide a minimum of three reference distances to existing permanent structures (reference points) so that control can be re-established.
- Show elevations on paved or impervious surfaces (including rims of utility structures) to the nearest 0.01 feet (0.005 meters for metric designs). Show elevations on unpaved or pervious surfaces to the nearest 0.1 feet (0.05 meters for metric designs).
- Indicate the name of the surveying firm and date of survey.
- If match lines are used involving more than three sheets, provide a key map with current sheet highlighted. Remove extraneous lines and text from key map.
- Orient North toward the top (or left edge) of the plotted sheet. Coordinate north direction with other disciplines so that plans are oriented the same.
- Accurately locate (by means of structures visible from the surface and through research of Activity utility maps, record drawings, data from local utility companies) the following list of utilities (both above and below ground), structures and features. Provide notes indicating the sources, limitations, or assumptions of the data, and that the Contractor must field verify the location of utilities prior to construction. Include in the survey the following specific items and their related appurtenant above-ground features, but is not limited to:
    - Buildings: Describe building material and number of stories.
    - Pavements: Include type of material. In areas where pavement demolition is to occur, note each pavement thickness, including layer thicknesses and joint patterns for replacement. Pavement layer thicknesses may be obtained by reviewing record drawing information,

digging at the edge of the pavement, core drilling, and consulting with Activity personnel. Where proposed pavements are expected to abut existing pavements, provide pavement markings, joint pattern, and indicate joint types of the existing pavements.

- Surface Drainage Features: Indicate normal water level for permanent standing water.
- Utilities: Include rim elevations for utility structures; location and identification of lines as underground or aboveground; pipe sizes and materials. Identify water system as potable, non-potable, high pressure or saltwater as applicable. **\1** Ensure communication lines are identified. **/1/**
- Fences: Note height, type of fabric, barbed wire, direction of outrigger, top or bottom rails, tension wires, gate locations and types.
- Foundations: Indicate visible foundations of demolished buildings.
- Fuel Pipes and Storage Tanks: Include information such as fill ports, vent lines, and tank drains.
- Pump Stations: Include invert of influent pipe and elevation of force main. Locate above ground elements including controls.
- Railroads and Crane Rails: Include turnouts, rail sizes, compromise joint locations, and curve information, such as P.C., P.T., and P.I. as they may be applicable to the design requirements of the proposed project.
- Tidal Shoreline: Note water elevation, time of day, date, and tidal condition at time of survey. Indicate normal high/low water elevations referenced to the datum used.
- Trees/Woods: In wooded areas, locate outside drip line of wooded area, include general density and type of trees. Where selective clearing will be accomplished, locate individual trees and tree size over a 6-inch (152.4 mm) diameter.
- Wetland Areas: Wetland and marsh areas must be flagged and numbered by the Government prior to the survey. Locate flags and label in the same manner as marked in the field. If unanticipated wetlands are found during the survey, advise the Government’s Civil Reviewer to establish additional survey requirements.

4-5 GEOTECHNICAL INVESTIGATIONS AND REPORT.

4-5.1 Existing Information.

Each Facility Engineering Command maintains record files pertaining to the geotechnical aspects of previously constructed projects. Architecture and engineering firms preparing, planning, or designing documents are encouraged to use this resource to research existing conditions or past design approaches for facilities, structures, or pavements. Viewing or discussion of the files' contents is possible by contacting the Government. For DB contracts, relevant geotechnical or pavement information that is available will be furnished in the DB RFP for solicitation.

4-5.2 Foundation and Soils Investigation.

Perform foundation and soils investigations, including sampling, testing, and evaluation, with requirements and guidance set forth in the IBC, UFC 3-220-01, UFC 3-250-01, and UFC 3-260-02. In using the IBC, the terms "owner," "applicant," and "building official" are synonymous with the "Government." In addition, the following requirements apply:

4-5.2.1 General.

Investigations and evaluations (including soil borings, test pits, ground penetrating radar surveys, seismic refraction surveys, and electrical resistivity testing, laboratory testing) must be in accordance with ASTM standards to the fullest practical extent. The classification and investigation of the soil must be supervised by a registered professional engineer. Where ASTM methods are not applicable, procedures and apparatus used must be in accordance with generally accepted engineering practice.

4-5.2.2 Qualifications of the Testing Firm.

The qualifications of the geotechnical testing laboratory and personnel must meet ASTM D3740.

4-5.2.3 Use of Global Positioning System with Soil Investigation.

Global Positioning System (GPS) coordinates, with an accuracy of at least 3 feet (1 meter), must be taken at each soil boring, coring, or test pit location and stated on the boring/coring/test pit logs. The coordinates must reference WGS84 and be stated in degrees of latitude and longitude. Data Interchange for Geotechnical and Geoenvironmental Specialists (DIGGS) data files must be geo-located to the same standard.

4-5.2.4 Field Testing.

Field testing for geotechnical investigation typically consists of soil borings and standard penetration tests (SPT) or cone penetration tests (CPT). Conduct and provide the soil borings, SPT, and CPT in accordance with ASTM D1452, ASTM D1586, and ASTM D5778, respectively. For standard penetration testing, modify the ASTM D1586 procedure to make continuous standard penetration and sampling tests for the initial 12 feet (3.74 meters) of the boring. If the proposed building will have a basement level, the ASTM D1586 procedure must be modified to make continuous standard penetration and sampling tests for the initial 12 feet (3.74 meters) of the boring below the proposed basement floor elevation. During drilling, visually classify each soil type in accordance with ASTM D2488. If soft cohesive materials are discovered within 20 feet (6 meters) below the ground surface, or within the anticipated depth of loading influence, take undisturbed samples for laboratory testing. Undisturbed sampling and testing must be performed at the discretion of the Geotechnical Engineer responsible for performing the investigation. Perform other testing, such as percolation testing, seismic refraction surveys, and soil resistivity testing, in accordance with the contract, or by the Contractor's Geotechnical Engineer or DOR in a DB contract.

4-5.2.5 Use of Piezometers.

If drilling techniques are used that prevent the measurement of the water table levels, provide at least two piezometers per drilling site to measure the depth more accurately to the water table. Piezometers are required for storm water pond investigations. Piezometers are not required if the ground water levels can be accurately measured during drilling operations or there is good evidence that the water table is not within the depth of the borings or zone of influence for the foundation or structure.

4-5.2.6 Seismic Site Class Determination.

Base seismic site class on field testing for projects.

For DB projects, state in the RFP the seismic site class to be used for design. This can be determined by the cognizant NAVFAC Geotechnical engineer. NAVFAC is the ultimate authority on site class determination for design.

4-5.2.7 Laboratory.

The minimum laboratory testing must include grouping like samples, conducting a sieve analysis and Atterberg Limits tests, and performing natural moisture content determinations to effectively depict in-situ conditions. Update the field logs in accordance with ASTM D2487. Perform other testing, such as California Bearing Ratio, unconfined compressive strength, consolidation testing, triaxial testing, and potential volume change in suspected expansive clay areas, in accordance with the contract, or by the Contractor's Geotechnical Engineer or DOR in a DB contract.

4-5.3 Geotechnical Report.

Provide a geotechnical report on contracts unless waived by the Government's Contract Technical Representative or as stated otherwise in the contract. Describe in the report the regional geology, topography, and other physiographic information that may influence the geotechnical design. Describe and discuss the investigation program, exploration and testing techniques/procedures used to characterize the site. Depict in the report the soil stratigraphy, materials, and groundwater conditions at the site. Specifically address in the report the groundwater levels expected to be encountered in construction under normal conditions, and site-specific factors (such as tidal action, climate, seasonal flooding, or droughts) that may influence the groundwater levels. Include copies of pertinent U.S. Geological Survey Maps used. Geotechnical Reports must be signed by a registered Professional Engineer. Provide a digital copy of the report in Adobe Acrobat (PDF) format to the Design Manager and the government civil or geotechnical project engineer via DoD SAFE (https://safe.apps.mil/). Produce the

PDF copy of the report directly from the report's authoring software. Each heading, subheading and appendix in the PDF version of the report must be bookmarked. Format the document so that the bookmark panel opens when the report file is opened. Reports not meeting these requirements will not be accepted. Upload geotechnical data in a DIGGS compatible format.

4-5.4 Boring Logs.

Provide a scaled location plan, boring logs, ground water observations, laboratory data, and boring log legend and description notes on NAVFAC drawings as indicated in Chapter 12. Summarize the laboratory data in tables. No scanned boring logs will be accepted.

4-5.5 Foundation and Site Preparation.

Discuss the facility under design and make recommendations for the foundation type. Describe and specify the improvements that are required for shallow foundations, such as compaction, removal and replacement, surcharging, and wick drains. Describe the soil bearing capacity, anticipated settlements, seismic aspects, pile capacity, pile length, pile type and special instructions such as jetting, pre-drilling, and testing required. Discuss earthwork associated with foundation design and construction or site improvements, including settlement, liquefiable soils, expansive soils, slope instabilities or near surface groundwater. The discussion must address existing conditions, studies, or analysis performed, and recommendations for mitigation of the effects of these conditions. Address dewatering, and sheeting/shoring considerations, in design and construction, as applicable. If required by the DOR, state the pavement design parameters and the pavement design. If the pavement design is to be completed by others, provide design parameters determined from the subsurface investigation. If multiple structures are being designed, address structures on an individual basis. Discuss the site preparation and susceptibility to rain and construction equipment. Discuss soil conditions relating to potential concrete or piping corrosion and recommendations to mitigate effects thereof.

4-5.6 Airfield Pavement Evaluations.

Provide Airfield Pavement Evaluations in accordance with UFC 3-260-03.

4-6 FIRE PROTECTION INVESTIGATIONS AND SURVEY.

4-6.1 Utilities and Infrastructure.

4-6.1.1 Water Flow Testing.

4-6.1.1.1 Existing Water Supply.

Water flow testing of the existing water supply system(s) is required to determine the capability of the available water supply to support the expected fire flows and fire suppression system demands. Perform testing in accordance with NFPA 291. Provide a fire protection water flow test report in the Basis of Design. Comply with UFC 3-600-01. While historical flow data may be a valuable resource when performing an analysis of the existing water supply system, historical data must not be the sole source of data. A water flow testing must be performed by the Qualified Fire Protection Engineer (QFPE) during the field investigation.

4-6.1.1.2 Combined Sprinkler and Hose Stream Demand.

During water supply testing, flow sufficient water to meet or exceed the combined sprinkler and hose stream demand. If the Installation’s existing water distribution system or dedicated fire main includes existing fire booster pumps, conduct testing with pump controller(s) configuration configured based on activity policy for normal operating conditions. If there is a requirement for a redundant pump, disable one pump for the duration of the test. If, at the time of design, the booster pumps cannot be run and accurate flow testing cannot be conducted, include the following information in the contract documents:

- Show water distribution piping back to the booster pumps. Show the location of water supplies such as elevated water storage tanks.
- Identify make, model, rated characteristics of each booster pump and the number of booster pumps expected to be operating, based on the anticipated hydraulic demand. For stations with multiple pumps, confirm that one pump was designated “redundant” when there is a requirement for redundancy.
- Identify available water supply (flow test data) at the suction side of the booster pump(s).

4-6.1.2 Hydraulic Supply Analysis.

Evaluating the available water supply is critical for buildings with and without sprinkler protection. Documents cannot be released for advertisement with expectations of the contractor determining the available water supply. The capability of the water supply to support the required fire flow demand must be confirmed prior to advertisement. The QFPE, as defined in UFC 3-600-01, is responsible for obtaining water distribution maps, establishing flow testing procedures and coordinating flow testing with the base fire department and public works. If the station does not allow contractors to conduct the flow tests, the station personnel can perform the flow test under the direct supervision of the QFPE. The QFPE must not, under any circumstance, rely on data from flow tests which they did not personally supervise. The QFPE is responsible for conducting the actual flow testing for facilities that are not on federal property. The QFPE must graph the results for comparison with the anticipated hydraulic demand. This analysis is required for both sprinklered and non-sprinklered facilities.

4-6.1.3 Base-wide Fire Reporting and Mass Notification Systems.

Obtain information regarding the exterior fire alarm reporting system and the base mass notification systems.

4-6.2 Site and Building Surveys.

Design services must include surveys to obtain information about adjacent structures and property lines, existing building construction, and existing building systems and features.

4-6.2.1 Site Planning and Adjacent Structures.

When the proposed construction is within 60 feet (18.3-m) of existing adjacent structures, conduct a site survey to obtain information regarding the adjacent structures. Information about adjacent structures must include construction type, fire resistive rating of exterior walls, number of floors, area per floor, total building area, occupancy classification, and if the building is fully protected with an automatic fire sprinkler system.

4-6.2.2 Work in Existing Facilities.

Projects involving repairs, renovations, or modifications to existing facilities must include a survey, to establish the existing conditions regarding compliance with current life safety code and building code requirements, based on the intended use of the building facility. Survey must also include a description of the active fire protection systems (fire alarm and fire control/suppression). Determine the make, model, type, and year of the building fire alarm system. Projects modifying existing fire protection systems must include a thorough investigation of existing systems and site conditions to determine capabilities of the existing utilities to support the modifications/expansions of the effected fire protection systems. The existing systems being modified must also be thoroughly investigated to determine that compatible products, devices, and components are available.

4-6.2.3 Building Additions.

Building additions must include a building code and a life safety code survey to establish the existing conditions and, based on the intended use of the building, the level of compliance with the current editions of the IBC and Life Safety Code. Conduct an existing building survey to obtain construction type, fire resistive rating of exterior walls, number of floors, wall openings, area per floor, total building area, occupancy classification, types of fire protection systems and extent of protection. Building code assessment must establish the maximum allowable size (height and area) based on the existing building features and the proposed building expansion. Determine the make, model, type, and year of the building fire alarm system. Determine expansion capabilities of the existing fire alarm system, power supply and circuits to support the additional devices, appliances, and functions. Validate that new devices are available and compatible with the existing fire alarm system. Provide a Life Safety Code assessment of the existing building. Perform Building Code and Life Safety Code surveys must be in accordance with UFC 3-600-01.

4-7 ENVIRONMENTAL REQUIREMENTS.

Conduct surveys, information gathering, and analytical testing required by the contract. Provide in accordance with UFC 3-810-01N, which is a requirement, as invoked by this FC.

This Page Intentionally Left Blank

CHAPTER 5 DELIVERABLE: BASIS OF DESIGN

5-1 GENERAL REQUIREMENTS.

The Basis of Design is a narrative presentation of facts, sufficiently complete, to demonstrate that the project concept is fully understood, and that subsequent design details, and their ultimate presentation in the final drawings and specifications, will be based on sound architectural and engineering decisions. For DB RFP Development, the Basis of Design requirements are provided in PART 3 - Project Program and throughout the document.

Submit the Basis of Design required at each design stage in accordance with the contract, the Core UFC's, and the additional Discipline requirements herein. If another UFC adequately describes the requirement for a Discipline's deliverable, a paragraph for that Discipline is not provided below. For each Discipline in the Core UFC and contract, provide a discussion and description of the design and describe the functional requirements of the project and the expectations of how it will be used and operated, including, but not limited to: system goals, measurable performance criteria, cost considerations, applicable benchmarks, additional success criteria required by the project, and supporting UFCs, Codes, and Standards referenced.

5-2 FORMAT.

Format the Basis of Design as an 8 1/2 x 11-inch (216 x 279 mm) document, organized by Discipline. **\1** Bookmark Basis of Design as a PDF for the electronic submittals. Bookmark each discipline and chapter along with each appendix. **/1/** Provide a cover sheet identifying the document as the Basis of Design, and include the following:

- Submittal stage
- The project title
- The location
- A-E Contract or Construction Contract number (Post-Award DB Contracts only)
- Contract Task Order Number (if Indefinite Quantity contract)
- Contract Type (DB or DBB)
- The eProjects Work Order Number
- The Firm's name
- The Command, or the Contractor name; and
- The date

Only use the Maximo number, in lieu of the eProjects Work Order Number, if eProjects is not required for the project.

5-3 KEY PROJECT CONTACTS.

Identify the Key Project Contacts including Role, Organization, Name, Email, and Phone. Sample tables for inclusion in the Basis of Design are located in Appendix C.

5-4 BIM PROJECT EXECUTION PLAN (PXP).

For projects that require, or opt to utilize, BIM, provide a comprehensive Chapter in the Basis of Design that summarizes:

- Project Goals, BIM Objectives, and Unique BIM Requirements (3D Parametric Design Model, Record Model, DOR Edited Model, and Facility Data Matrix tab from eOMSI Facility Data Workbook)
- Organizational Roles and Staffing for each BIM use (Design Facility Data, Design Modeling, and Clash Detection are required by NAVFAC)
- Strategy for Quality Control of the model including Review Frequency and Software Utilized (Visual Review and Clash Detection are required)
- Technological Infrastructure Needs for each BIM use (Include Software and Version)
- Model Organization (Model Structure and Measurement System)
- BIM Project Deliverables by Design Phase (Include the format in which the information will be delivered)

Sample tables for use in the BIM Chapter are located in Appendix C.

5-5 SUSTAINABILITY.

Provide a comprehensive Sustainability Chapter in the Basis of Design that summarizes how the design will achieve the requirements of UFC 1-200-02 and Third-Party Certification (TPC) (where applicable). Address each discipline in the summary, elaborate on the various requirements, and where full compliance is not possible, include proper justification. Provide the following:

- Sustainability chapter
- The NAVFAC High Performance Sustainable Building (HPSB) Checklist for each applicable building in the project
- TPC Checklist (where applicable) for each applicable building in the project, and
- Justification for each missed or partially met requirement (where applicable)

No variations or substitutions to the Checklist(s) are allowed without Government approval.

5-5.1 Guiding Principles Validation.

The DOR is responsible to verify Guiding Principles Validation, in accordance with UFC 1-200-02 requirements, by including design requirements in the contract documents and verifying construction submittals when required by the contract.

5-5.2 Pre-award Commissioning Services.

When the project requires pre-award Commissioning services, incorporate comments, reports, (Owner Project Requirements (OPR) where required by third-party certification program), and other documentation related to commissioning effort, in accordance with UFC 1-200-02.

5-6 ANTITERRORISM (AT).

Provide an Antiterrorism (AT) section in the Basis of Design that summarizes how the design complies with the DoD minimum AT standards in UFC 4-010-01 and the applicable Geographic Combatant Commander’s AT Construction Standards. As a minimum, include the following in the summary:

- Facility description including occupancy (low occupancy or inhabited)
- Narratives of how each applicable standard is met
- Site plan dimensioning standoff distances
- Protective measures above the minimum
- Identify applicable Geographic Combatant Commander’s AT Construction Standards
- Level of Protection

Note: Do not identify explosive weights to avoid disclosure of CUI information.

5-7 GEOTECHNICAL.

Include in the Basis of Design (BOD) a paragraph briefly describing the geotechnical investigation program, the recommendations for the site preparation, and the recommendations for the building foundation and pavement design.

It is preferred that the geotechnical report be included in the BOD as an appendix. However, the schedule may preclude the completion of the field investigation prior to the submittal of the BOD. If this is the case, describe the assumed basis of design for the foundations and pavement, and submit the geotechnical report as soon as possible, and as acceptable to the Government.

5-8 CIVIL.

Identify the governing codes and criteria including federal and military handbooks being used for the design. References may be noted in the related sections listed below. Include reference titles and date of publications. Provide BOD with adequate narrative to describe design logic and assumptions. Show adherence to scope of work.

5-8.1 Existing Conditions.

Include the following:

a. Describe general site topography and vegetation type (grass, lightly wooded, brush). Describe existing site features.

b. Identify whether existing underground features, such as footings, foundations, or steam pits, exist, and describe.

c. Describe existing soil conditions.

d. Describe existing utilities, including size, type, and general location. Discuss impact that this, and future projects, will have on utility systems.

e. Identify predominant drainage features, including required downstream improvements. State whether field survey has been coordinated with delineation. Indicate the parties that have been notified of the presence of wetlands and are actively involved in this issue.

f. Identify and describe if endangered species inhabit area.

g. Identify and describe existing traffic patterns on and around site.

h. Provide horizontal and vertical datum and other pertinent survey information.

5-8.2 Demolition.

Discuss demolition relating to Civil issues only, typically 5 feet (1.5 m) outside of building line. Identify buildings slated to be demolished by building number. Generally, describe structure types (examples: 1-story frame, 2-story block); include building specifics under the Architectural BOD. Describe pavement to be demolished, including existing pavement section. Describe underground and overhead utility demolition, relocation, and abandonment. Describe other features to be removed (examples: play equipment or fencing).

5-8.3 Site Work.

Describe building and its function with respect to civil issues, such as vehicle ingress/egress and pedestrian movement. Address internal functions under Architectural BOD. Describe pedestrian access. Identify number of parking spaces; include stall and aisle widths. Describe handicap access in and around site, number, and size of handicap parking spaces. Identify physical security requirements, such as intrusion detection provisions, fencing type and height, and lighting requirements. Also identify antiterrorism standoff distance requirements for the specific site conditions. Identify vehicle type expected on project site; note non-standard vehicle sizes and weights. Identify design wheel loading. Define projected traffic volume. Define pavement types and sections. For airfield pavement, discuss design parameters, including pavement use, loadings, design life adopted in design, design methodology to be used, and availability of materials anticipated for construction, and possible impacts construction may have on airfield operations, such as haul routes and closures. For railroads and crane rail, state type of service for which rail track will be provided; anticipated volume and type of traffic; and the ruling grade and the maximum curvature. Describe proposed type, source and thickness of ballast, weight of rail and source, treatment, and dimensions of ties. For small arms ranges, list expected weapons and ammunition including the most powerful weapons/ammunition combination that the design is based on. Discuss critical features such as impact berms (including height and slope), side berms, firing lines, firing directions, target locations, bravo flag poles, road gates, fencing, access roads, supporting facilities, and other prominent feature. Do not include the Surface Danger Zone since this has nothing to do with the construction project.

5-8.4 Water Supply.

State design parameters such as domestic flow, fire flow, residual pressure, and recent flow test data. State anticipated demand. Coordinate with the QFPE to establish fire flow requirements. Describe water main and supply line sizes, capacities, and water velocities. Identify connection points. Identify connection methods. Identify whether existing infrastructure has capacity to support project. Identify requirements for backflow protection and freeze protection. Identify needs for metering. Identify need for booster pumps or pressure reducing valves. State the number of new fire hydrants. Provide number of wells and proposed pump rates.

5-8.5 Sanitary Sewer.

Describe waste stream and whether it is from domestic or industrial source. Include sources of hazardous substances. Identify design population, peak and average flows. State whether sewer will be gravity or force main. Identify pre-treatment requirements and solutions. State minimum pipe slopes and velocities. Identify special installation requirements. State new pipe sizes and capacities. Identify pump station type, wet/dry well, types of pumps, pump capacity and total dynamic head, horsepower, telemetry requirements and compatibility with existing on-base systems, backup power requirements, and assumed response time by Activity personnel. Consult Activity as to whether existing system is operating at or near capacity. Discuss adequacy of existing system to handle current and future flows.

5-8.6 Wastewater Treatment.

Identify completed treatability studies. Briefly describe recommended process noting deviations from the treatability study. Define impact of stream condensation and cooling water discharges on sewer piping and treatment plants and the estimated cost of distribution and treatment of this additional loading.

5-8.7 Storm Drainage System.

Identify factors such as receiving waters, classification (if applicable), storm frequency, and C factors. Discuss adequacy of existing storm system and its effects on downstream facilities and systems. Discuss whether existing system will require upgrades. Identify use of collection system versus sheet flow. Describe materials and pipe sizes. Describe how upstream flows that impact site will be handled.

5-8.8 Stormwater Management.

Identify Integrated Management Practices (IMP's) and approach to stormwater management. Discuss compliance with UFC 3-210-10, Navy LID Policy, Activity, State, and local requirements.

5-8.9 Erosion & Sediment Control.

Identify total disturbed area acreage. Discuss erodibility of soil, devices, or methods to be used to control erosion and sediment losses, and protection devices at outfalls. Discuss compliance with Activity, State, and local requirements.

5-8.10 Permits.

Identify the permits necessary for both construction and operation of facilities. Identify fees associated with each permit. Submit Permit Record of Design (PROD) form with BOD.

5-9 STRUCTURAL.

Provide a narrative report on how the design concept satisfies the customer's requirements, meets criteria, and is cost effective. Include statements on the following:

- List a summary of the criteria upon which the structural design is based. Including a statement of each load: dead, live, wind, snow, earthquake, and other significant load.
- List assumptions required for the structural design where the design criteria is undefined, unclear, conflicting, or unknown. State the basis of the assumption made.
- Describe the structural floor and roof systems. Include a discussion of both the gravity and lateral force resisting systems. Clearly describe the gravity and lateral load paths providing pertinent information such as, capacity, size, dimensions, materials, and design strengths. Define how

foundations and slabs on grade are used to distribute lateral forces between the structure and the ground.

- Provide a narrative summary of the foundation system, including method for determination of the bearing capacity, maximum allowable bearing capacity, and lateral force capacity of the foundation, as well as other soil parameters used in the design. Provide pertinent information, such as capacity, size, dimensions, and a list of materials with design strengths.
- When appropriate, provide a statement of special considerations that affect the design (such as “superflat floors” for high stack warehouses, special corrosion resistance requirements, fire-resistive requirements, or crane or monorails). Describe applicable special inspections, testing, and observations required in accordance with IBC Chapter 17, as modified by UFC 3-301-01, and IEBC, as modified by UFC 3-301-01. The generic schedule of special inspections is maintained on the WBDG as referenced in paragraph 17-11 Statement of Special Inspections.
- When using U.S. Geological Survey seismic information, provide a map showing the Latitude and Longitude of the project site.
- Provide a narrative summary of the Serviceability limits for the structure. Include the lateral drift limit for the primary lateral load resisting system for wind or seismic, roof framing deflection limit for DL + LL and LL only, floor framing deflection limit for DL + LL and LL only, and composite floor framing deflection limit for DL + LL and LL only.

5-10 FIRE PROTECTION.

Projects requiring the services of a QFPE must include a Fire Protection Basis of Design that includes the following information. Identify both the requirement and the actual design provided.

5-10.1 Project Summary.

Provide a brief summary of the project and scope of work. General information can be obtained from the DD Form 1391. Identify the purpose and use of the facility, including the following:

5-10.1.1 Specific Hazards.

Identify hazardous areas (such as chemicals, fuels, ordnance), processes, and special hazards or features requiring special fire protection considerations, such as Radio Frequency (R-F) Shielded Rooms, Secured Rooms, Computer Rooms, commercial kitchen appliances. Provide relevant information pertaining to the hazards and how they are protected.

5-10.1.2 Summary of Fire Protection Features.

Provide a brief summary of the active and passive features of fire protection. Provide a description and identify the location of new and existing fire extinguishing systems, detection systems, fire alarm systems, or fire pumps to be provided or existing systems to remain or be modified.

5-10.1.3 Summary of Existing Conditions.

Provide a brief summary of existing conditions impacting the project, such as existing detection/suppression systems or existing building construction features.

5-10.1.4 Summary of Design Enhancements.

Specifically identify items in excess of the contract, criteria, or code requirements.

5-10.1.5 Summary of Other Design Features.

Provide a brief summary of the other features of the design relevant to the fire protection of the project. Examples of “other features” include**\1\ /1/** structural engineering evaluation of existing floor systems supporting gaseous agent **\1\ /1/** concentrate storage tanks.

5-10.2 Building Code Analysis.

Include the following information: occupancy classification; height and area calculations (area per floor & total); type of construction; required building separation or exposure protection; rating of structural components; classification of interior finishes; location of fire-rated walls and partitions; description of construction; whether rated floor and roof assemblies are restrained or unrestrained; interior fire or smoke rated wall/partition requirements, fire rating of each floor, ceiling system, roofing system when applicable. Discuss if and how the proximity to, and classification of, adjacent structures factors into the analysis.

5-10.3 Life Safety Code Analysis.

Base the life safety code analysis on NFPA 101, Life Safety Code. Identify occupancy classification, number of exits, type of exits, exit travel distance, total exit width, total occupant load, common path of travel, and other applicable provisions of NFPA 101.

5-10.4 Water Supply Analysis.

Provide a summary of the data obtained from the water flow test (refer to Chapter 4) and provide a determination of the adequacy of the water supply (even for facilities without sprinkler protection), along with sketches of the water distribution system. If fire flow demands cannot be met, cite the deficiencies and recommend design alternatives/solutions to correct the problem of an insufficient water supply (such as fire pump(s), or water storage tank(s)).

5-10.5 Hydraulic Demand Analysis.

5-10.5.1 Analysis.

Using computer program generated hydraulic calculations, calculate the “anticipated” demand of a facility to validate the adequacy of the available water supply, or to establish the minimum water supply required. Refer to UFC 3-600-01 for hazard classifications and design criteria determination. Proposed piping layout must accompany the hydraulic sprinkler calculations included with the Fire Protection Calculations submittals.

5-10.5.2 Plot.

Plot the available water supply versus the hydraulic demand on the Q1.85 Hydraulic Graph Paper. Present hydraulic information in graphical format as discussed in the FM Global Property Loss Prevention Data Sheet 3-0.

5-10.5.3 Adequacy of Water Supply for Fire Protection.

5-10.5.3.1 Pre-award Design Services.

If the water supply analysis determines that the water supply cannot support the anticipated hydraulic fire flow or fire sprinkler demand, contact the DFPE, as defined in UFC 3-600-01 as soon as possible. Provide appropriate supporting calculations and propose design options or alternatives for consideration.

5-10.5.3.2 Post Award Design/Construction Services.

- Design assumptions must be based on the water supply data cited in the solicitation. This data must be used as the basis for fire flow and sprinkler design even if flow testing performed by the QFPE or Sprinkler Subcontractor reveals more favorable results.
- If flow testing performed by the QFPE or Sprinkler Contractor reveals flow/pressure less than that specified, immediately submit a “Request for Information (RFI) citing the concern. Provide supporting information and calculations to substantiate the claim and request clarification or direction.

5-10.6 Active Fire Protection Features.

Provide the following information as applicable:

5-10.6.1 Description of Fire Suppression System(s).

- The area(s) that will be protected, the hazard classification of these area(s) and the type of system protecting these area(s).
- For sprinkler systems, the design density, demand area and hose stream allowance to be specified for each different area.

- The method for connecting the suppression system to the fire alarm system, as well as the method of annunciating the systems, and a description of power disconnects or pre-alarms, that are required.

5-10.6.2 Sketches.

Where appropriate, provide sketches representing the water distribution system, sprinkler demand areas, and show hydraulic reference points for the hydraulic sprinkler calculations.

5-10.6.3 Description of Fire Alarm/Mass Notification System(s).

5-10.6.3.1 Description.

- Provide information for areas of the facility and what type of initiation devices and notification appliances will be provided.
- Identify areas that may have challenging features that will make it difficult to achieve intelligibility requirements.
- Provide information for connecting to the base-wide fire reporting system and the base-wide mass notification system.
- Provide drawings or sketches.

5-10.6.3.2 Existing Conditions.

Provide detailed information on existing fire detection and suppression systems for existing buildings (examples: type of systems; area of coverage; make and model of equipment; why system is or is not being replaced). For fire alarm systems, provide the following information (at a minimum): number of spare zones and spare spaces for modules, capacity of control panel(s), list of existing fire alarm zones, list of outputs, number of audio/visual circuits, and standby battery capacity. Indicate the working order of each system (condition or status).

5-10.7 Host Nation Requirements.

Refer to UFC 3-600-01.

5-11 CYBERSECURITY.

Provide cybersecurity design in accordance with the contract and UFC 4-010-06. As a minimum, include the following:

- Facility description generally describing facility’s mission.
- Confidentiality-Integrity-Availability (C-I-A) ratings for each FRCS.

- **\1** For work in existing buildings, identify and document existing FRCS infrastructure, to support project scoping and design of FRCS in project scope. **/1/**
- List of cybersecurity controls for each FRCS that can be satisfied within the design.
- Narrative of how each applicable cybersecurity control is met for each FRCS.

This Page Intentionally Left Blank

CHAPTER 6 DELIVERABLE: CALCULATIONS

6-1 GENERAL REQUIREMENTS.

Submit design calculations required at each design stage in accordance with the contract, the Core UFC's, and the additional Discipline requirements listed herein. If another UFC adequately describes the requirement for a Discipline's deliverable, a paragraph for that Discipline is not provided below.

Prepare calculations in metric units when metric design is required. Provide reference to the source (Navy and non-Navy criteria used) to produce the calculations.

6-2 COMPUTER GENERATED CALCULATIONS.

Provide the software program name, version and source used to produce each computer output or report.

6-3 FORMAT.

Format calculations as an 8 1/2 by 11 inch (216 by 279 mm) document. Provide a cover sheet with the title "Calculations;" the stage of the submittal; the project title and location; the A-E Contract or Construction Contract number; the eProjects Work Order Number; the Firm's name, Command, or Contractor's name; and the date. Organize calculations by Discipline, in the same order as the drawings, and in a manner appropriate for the number of sheets provided. Number each sheet. Provide an index, following the title sheet, with sub-indexes for disciplines having a very large number of sheets, and include Discipline name and page numbers. Only use the Maximo number, in lieu of the eProjects Work Order Number, if eProjects is not required for the project.

6-4 SUSTAINABILITY AND ENERGY.

Provide calculations in accordance with UFC 1-200-02 for life cycle cost analysis.

6-5 GEOTECHNICAL REQUIREMENTS.

The geotechnical calculations normally appear in the geotechnical report; however, they may be in a separate package if another consultant other than the geotechnical consultant prepares the calculations for foundations or pavement. The calculations must indicate the loadings, ultimate and allowable capacities, the safety factors, and the text or reference from which the calculations were based for the foundation and pavements. Graphs and formulae must be clearly indicated along with the derivation of curve slopes and data derived from the laboratory testing.

6-6 CIVIL.

Provide design calculations for erosion and sediment control, **\1** earthwork, **/1/** stormwater drainage system, stormwater management, pavement, and utility systems.

Calculations must be legible, orderly, and easily understood and checked by a registered practicing civil engineer.

6-6.1 Low Impact Development (LID).

Comply with UFC 3-210-10. The DOR is responsible for completing and submitting the Low Impact Development (LID) Verification Report (https://www.wbdg.org/FFC/NAVGRAPH/Navy_LID_Verification_Report.pdf) and the LID Data Card (https://www.wbdg.org/FFC/NAVFAC/NAVFAC_LID_Data_Card_v3.0.pdf). The DOR must complete the design portion of the LID Verification Report and attach it to UFGS 33 40 00. Annotate the LID Verification Report as a “G” submittal, requiring Government approval.

6-6.1.1 Submittals.

The DOR is responsible for submitting the LID Data Card to the Government during pre-final and final submittals, annotating changes involving LID, and coordinating changes with the LID Verification Report. The Government’s Civil Engineer reviews the LID data submitted by the DOR and Contractor LID Verification Report, and documents this information on the eProjects LID tab. When the Government's Civil Engineer is the DOR, design projects must be reviewed and approved by either the Civil Engineer’s supervisor or the Civil Technical Discipline Coordinator (TDC).

6-6.1.2 Navy LID Policy.

For Navy and Marine Corps projects, comply with Navy LID Policy (commonly referred to as the Penn Memo). The Navy LID policy sets a goal of no net increase in stormwater and sediment or nutrient loading from major renovation and construction projects. Major renovation projects are defined as having a stormwater component and exceeding $5 million. Major construction projects are defined as exceeding $750,000. Projects exceeding these dollar values must be documented on the LID Data Card and LID Verification Report as indicated in the paragraph 6-6.1 Low Impact Development. If LID is not implemented to the METF as defined in UFC 3-210-10, a waiver must be obtained from the Regional Engineer. The DOR is responsible for submitting the LID waiver request. The NAVFAC LID Waiver Form is located at: https://www.wbdg.org/FFC/NAVFAC/NAVFAC_LID_Waiver_Form_v4.doc. Coordinate the waiver and approval with the Government’s Civil TDC.

6-7 STRUCTURAL REQUIREMENTS.

Provide calculations to support items and details outlined on the drawings and specifications. Include calculations for the main framing systems and beams, columns, walls, foundations, bracing, diaphragms, equipment supports, and component inter-connections to provide a safe, stable efficient and cost-effective structural system, considering design loads and criteria. They must be legible, orderly, and easily understood and checked by a registered practicing structural engineer.

Also include the following:

- A cover sheet indicating the project title, location, construction contract number and names of the persons originating and checking the calculations.
- Table of contents.
- A brief statement describing the structural system, significant design parameters and restrictions that may affect the design.
- Applicable design criteria.
- Loads: Include loadings, forces, temperature changes, induced settlements, and other internal and external actions that may affect the design of the structure. The list must include the orientation and location, magnitude, and units of measure for each load.
- Restrictions: Include limiting factors such as horizontal and vertical deflections limits, height restrictions, installation or operating tolerances for equipment or building components and other limits to the structural system.
- Materials: Include materials used and their allowable stress limits, yield strengths, type, grade, class, or other applicable material properties.
- References: Include criteria, accepted standards, manuals, codes, texts, papers, or other references used in the analysis and design that are accepted in a public domain. Appropriately identify references; abbreviations such as AISC, ASTM, and ACI are acceptable. Document the origin of customer-specific criteria in the calculations.
- Sketches with sufficient detail and clarity to communicate design intent. Note assumptions and references to codes, standards, criteria drawings, and computer output.

6-7.1 Calculations and Test Reports for Antiterrorism.

When in project, provide calculations or test reports for the following systems demonstrating compliance with applicable Antiterrorism (AT) requirements:

- Blast resistant window systems
- Structural analysis of building elements where stand-off distances are less than the conventional stand-off distance
- Progressive collapse calculations

Note – Do not identify explosive weights as explosive weights to avoid disclosure of CUI information.

6-7.2 Design for Lateral Forces.

Design for lateral forces must include design calculations for wind, seismic, and other potential loadings. The construction drawings must depict the governing design elements base on both seismic and wind design requirements.

6-7.3 Computer Generated Calculations.

Provide input data, including loads, loading diagrams, node diagrams, and adequate documentation to illustrate the design. The schematic models used for input must show, as a minimum, nodes/joints, elements/members, materials/properties, and each loading, induced settlements/deflections, and a list of load combinations. Results must include an output listing for maximum/minimum stresses/forces and deflections for each element, and the restrictions for each loading case and combination. If required, submit narratives. In addition, provide the following:

- Submit graphical plots of structural models which must include, but not be limited to, main structural elements, boundary conditions, loading diagrams, and deflected shapes. Submit graphical plots with each deliverable at each submittal stage. Provide in both native, editable format and in PDF.
- If a modal analysis is performed, submit plots of mode shapes and a listing of the dominant natural frequencies.
- If blast or progressive collapse analysis is performed, submit comparison tables of computed rotations/residual strength ratios and response limits listed in UFC 3-340-01 and UFC 4-023-03.

If software not commonly commercially available, or widely accepted in the structural community, is used, submit validation documentation of the software (such as hand verification of the software solution of a significant, representative portion of the structure).

6-8 FIRE PROTECTION CALCULATIONS.

Provide calculations at the earliest possible stage in design, but no later than the Design Development Submittal and as further required by Chapter 15 of this FC.

6-8.1 Hydraulic Demand Analysis.

Calculate the fire flow demand for the facility. Provide calculations showing that the anticipated suppression systems and hose stream demands can be designed to the available water supply. For hydraulic calculations, deduct the hose stream requirement at the point of connection to the existing distribution systems or the closest fire hydrant; whichever is closer to the sprinkler riser and building.

6-8.1.1 New Sprinkler Systems.

Buildings requiring sprinkler systems must be hydraulically designed. Include a floor plan with the calculated piping layout.

6-8.1.2 Existing Sprinkler Systems.

Provide hydraulic calculations for additions to, or modifications of existing sprinkler systems to ensure the system demand can meet the hazard it is protecting. Establish if the existing system is hydraulically designed or a pipe schedule system. Contact the Installation Public Works Office or Installation Fire Department for information on an existing system.

6-8.1.2.1 Hydraulically Designed Systems.

Indicate the size and location of cross and feed main piping from the point of connection to the existing system back to the sprinkler riser. Indicate grid branch line piping for grid systems. Do not assume the available water supply will be that identified with the existing design. Obtain current information.

6-8.1.2.2 Pipe Schedule Systems.

When the project modifies an existing pipe schedule system, determine the hazard classification and whether the existing cross and feed mains, and the riser pipe sizes can support the new piping and sprinklers. Identify the size of the pipe at the point of connection. Identify existing piping requiring replacement. Small renovations to existing pipe schedule systems may be designed by the pipe schedule method as permitted by NFPA 13 and up approval of the DFPE.

6-8.2 Fire Pumps.

Provide the following calculations verifying pump selection:

- Calculations supporting selected rated capacity and pressure.
- Power calculations for motor driven pumps.
- Fuel supply calculations for engine driven pumps.
- Calculations for suction supply tanks when applicable.

6-8.3 Special Systems.

\1\ /1/

6-8.3.1 Gaseous Fire Extinguishing Systems.

- Provide calculations verifying agent quantity, number of required tanks and intended tank location.
- When systems are installed in existing facilities, ensure a structural analysis is provided for the intended tank location as required.

6-8.4 Fire Alarm/Detection and Reporting Systems.

6-8.4.1 Modifications to Existing Systems.

- Provide a power supply analysis. Submit calculations for power supply and standby battery capacity requirements of existing system and new devices. Ensure the power supply is capable of supporting the electrical load of the new devices.
- Provide a circuit analysis. Ensure the panel has the initiating and signaling expansion capabilities.

CHAPTER 7 DELIVERABLE: DRAWINGS

7-1 GENERAL REQUIREMENTS.

Provide drawings in accordance with the Core UFCs, the contract, Chapter 12, and the additional Discipline requirements herein, for every stage of design. If another UFC adequately describes the requirement for a Discipline's deliverable, a paragraph for that Discipline is not provided below.

7-2 BUILDING INFORMATION MANAGEMENT AND MODELING (BIM).

BIM is required on DB and AE-Designed DBB New Construction projects greater than $1M and Major Renovation Projects greater than or equal to 50% of the Plant Replacement Value (PRV) at Navy Installations, Joint Bases, Department of Defense (DoD) Agencies, or Field Activities where NAVFAC is the Maintenance Provider, or when required by the contract. BIM is not required on Navy in-house-designed DBB projects.

The deliverables of BIM are outlined in Chapter 12. Use the Facilities Data Workbook (FDW), that prescribes the BIM Level of Detail (LOD) required by system or subsystem, with UFGS 01 78 24.00 20.

Table 7-1 BIM and FDW Requirements.

BIM/EOMSI By Service				
DELIVERABLE	NAVY	MARINE CORPS	AIR FORCE	USACE/ ARMY
BIM – 3D Parametric Model	REQUIRED	NOT APPLICABLE	NOT APPLICABLE	NOT APPLICABLE
eOMSI Facility Data Workbook	REQUIRED	NOT APPLICABLE	NOT APPLICABLE	NOT APPLICABLE
UFGS 01 78 23 eOMSI Manuals	REQUIRED	OPTIONAL*	OPTIONAL*	OPTIONAL*

*When required by contract.

7-3 PRESENTATION.

Drawings must be consistent in presentation and format. If one discipline shows material selections directly on the details, other disciplines must conform to that format, and not use numbers to refer to a numerical legend elsewhere on the drawings.

7-4 DRAWING NUMBERS.

Request NAVFAC drawing numbers from the Government Design Manager. Provide them with the following information:

1. The amount of numbers required;
2. The eProjects Work Order Number, and
3. The project title. Request enough numbers that additional sheets can be added if necessary (usually 10% more).

Only use the Maximo number, in lieu of eProjects Work Order Number, if eProjects is not required for the project.

7-5 PROPER USE OF NOTES ON DRAWINGS.

- Be consistent with grammar used in notes on drawings. Wherever possible use imperative statements to describe work to be accomplished by Contractor.
- Do not use “Contractor must provide,” use “provide.” It is understood that the notes are directed to the construction Contractor. The Contractor is responsible for performing the work as shown and specified; therefore, there is no reason to use the phrase.
- Do not use “to be” for describing work that will be accomplished by the Contractor. “To be” implies that someone will accomplish the work other than the Contractor, such as the Government or another Contractor. Similarly, do not use “proposed,” as it can be interpreted to mean future work by others or work not in this contract. If work is to be accomplished by Government, for example, say “Government will remove storage building prior to start of construction.”
- Do not use the term "furnish" unless only delivery of material to the site is required. Similarly, do not use the term “install” unless the Government or others will furnish equipment or materials and Contractor will install. Use "provide" to mean "furnish and install."
- Do not use “new” for work in the contract. Work shown on the drawings is considered new, unless indicated otherwise. Inconsistent use of “new” throughout the drawings could mean that only some of the work is required.
- Do not use vague words and phrases or escape clauses such as "in this specification," "as may be required," "as necessary," "an approved type," "as approved/directed/determined by the Contracting Officer," "first class workmanship," "securely," "thoroughly," "suitable," "properly," "good working order," "neatly," "carefully," and "installed in a neat and workmanlike manner."

- Be careful with statements like “remove and replace,” which means to remove old item or material and replace that item or material when work is completed. This statement would be appropriate for work in a pump station where pumps were removed prior to the work and those same pumps replaced after the work is completed. On the contrary, if a portion of a concrete walk is cracked and requires replacement, say “remove and provide concrete walk.”
- Use the term "Contracting Officer" when referring to requirement for coordination between Contractor and Government agency; do not use terms such as "Officer in Charge of Construction," "Contracting Officer Representative," "Government Representative," “Navy,” “ROICC,” or “PWD”.
- Do not use the word "per", use "in accordance with" instead.
- Avoid the use of colloquial terms or jargon. For example, do not use "bulkhead" for wall, "deck" for floor, or "head" for toilet.
- Eliminate redundant wording such as "conforming to," "all," and "type." For example, when stating “paint doors”, **all** doors are implied.
- Do not use indefinite items such as "etc.," "any," and "and/or."
- Do not use long, compound, or hyphenated words such as "hereinbefore" and "hereinafter."
- Do not use words that have multiple meanings, requiring opinions, or judgmental decisions, such as “timely,” “nearly,” “good-condition,” “suitable,” “well-balanced,” “suitable for intended use,” “reasonable,” “approximately,” “reliable,” “proper,” “usable,” “appropriate,” “adequate,” or “qualified.”
- Do not use terms that are not biddable by the Contractor nor enforceable by the Government, such as “recondition,” “as directed,” “equal to,” “as required,” “similar to,” “as necessary,” “as close as possible,” “repair,” “match existing,” or “refurbish.”
- Some terms are only enforceable if quantities are shown on the drawings or included in the specifications, such as “as indicated,” “as shown,” “specified herein,” and “as noted.”
- Be careful when using the word, “typical,” especially if there are exceptions to the detail.
- Use “must” instead of “shall” to prescribe mandatory requirements, actions and procedures. “Shall” imposes an obligation to act, but may be confused with prediction of future action. “Must” imposes obligation and indicates a necessity to act.

- Do not use the word "should" in the specification text for mandatory requirements as "should" implies a recommendation. "Should" may be in the Notes to indicate desirable procedures that are advisory in nature.

7-6 CODE COMPLIANCE SUMMARY SHEET(S).

The Code Compliance Summary Sheet(s) must be prepared by the QFPE and must be included as “General Sheets” immediately following the title sheets. At a minimum, include the following information:

7-6.1 Building Code Site Plan.

Identify the following elements on the Building Code Site Plan:

- Line of encroachment identifying minimum separation distances from adjacent buildings and assumed property lines of the new construction and of the adjacent structures.
- Building perimeter used for frontage increases.
- Exit discharge paths.
- Fire Department vehicle access to building.
- Fire lane width, marking and locations, approach roads and turn radius and location.
- Intended fire department main entrance to building.
- Location of fire department connections.
- Fire hydrants, post indicator valve or valves and their connected water distribution mains serving building.
- Fire pump room.
- Water storage tanks.
- Hazardous material spill containment tanks.
- Backflow prevention assembly or assemblies serving water-based fire protection systems (if located outside of building).

7-6.2 Building Code Summary.

Identify each of the following elements in the Building Code Summary:

- Classification of occupancy.
- Allowed vs. provided type of construction.
- Basic allowable heights & areas vs. actual heights & areas.
- Allowable vs. provided height or area increases per floor and total.

- Calculations supporting height and area modifications/increases.
- Required vs. provided exterior exposure protection.
- Required vs. provided interior fire rated occupancy separations.
- Required vs. provided internal fire area separations.
- US Required vs Host Nation Required vs Provided (for OCONUS projects only).

7-6.3 Life Safety Code® Summary.

Identify the following elements in the Life Safety Code® Summary:

- Classification of occupancy of each room, area or compartment (on the drawings or in tabular form);
- Occupant load factor(s) and total calculated load;
- Required vs. provided number of exits;
- Required vs. provided capacity of means of egress;
- Required vs. provided arrangement of means of egress including remoteness of exits, horizontal exits, travel distance, common path of travel, dead-end corridor lengths. When suites are used, indicate type, location, area and arrangement;
- Required vs. provided accessible means of egress;
- Required vs. provided discharge from exits;
- Required vs. provided fire rated separation of exits and exit access;
- Required vs. provided fire rated separation of hazardous areas;
- Flame spread/smoke development ratings of interior finishes;
- Requirements (if any) for smoke control systems based on the specific occupancy chapter and building design considerations;
- Requirements for special locking arrangements such as delayed-egress locks or access-controlled egress doors. Specify the rooms/area.
- US Required vs Host Nation Required vs Provided (for OCONUS projects only).

7-6.4 Life Safety Plans.

The Life Safety Plans must be prepared by the QFPE and must be included as “General Sheets” immediately following the title sheets and code compliance summary sheets. Scale the floor plans so the entire footprint fits on a single sheet provided that information is clearly legible, and the scale is no smaller than 1/16-inch (1:200). At a minimum, include the following information:

- Location and rating of fire walls, fire barriers, fire partitions, smoke barriers and smoke partitions (both horizontal and vertical). Barriers requiring fire resistance rated supporting construction must be specifically identified for coordination with the structural design partition locations with fire rated partitions and horizontal exits identified.
- Building areas having different occupancy and hazard classifications.
- Room numbers, corresponding occupancy classification and calculated occupant load. Include occupant load of each room, area, or compartment (on the drawings or in tabular form). Similar occupancies can be grouped together for occupant load calculations.
- Capacity and number of occupants using each major means of egress component (such as stairs, stair doors, exterior doors, assembly exit doors.)
- Rooms or areas requiring special life safety or fire protection features.
- Location of hazardous materials storage, handling and use that exceed the maximum allowable quantities.
- Egress travel requirements (such as travel distances, common paths of travel, dead-end corridors).
- Structural fireproofing locations and associated ratings.
- When required, fire extinguisher cabinet and surface-mounted fire extinguisher locations.
- When required, fire extinguisher type/quantity table identifying the total number and type of extinguishers required.
- Location of primary fire alarm/mass notification control panel.

7-7 CIVIL DRAWINGS.

7-7.1 Cover Sheet, Drawing Index, Vicinity Map, Location Plan, Abbreviations, Legend, and Notes, or First Civil Sheet.

If project is not a Civil Engineering lead, assure that the following items are coordinated with the lead discipline responsible for creating cover sheet:

a. If General Development Maps (GDM) are used for the Vicinity and Location Maps, edit for the specific project being designed. Ensure street names, main gates, and the Public Works office of the base are identified. Ensure that text is legible at the plotted scale and remove extraneous lines.

b. The Vicinity Map must identify the Activity and have enough main highway names and street names to allow an out-of-town contractor to locate the work.

c. The Location Plan must allow the contractor to find the project on the base. This is generally a good place to show laydown areas, haul routes, construction traffic routing restrictions, and off-site benchmark locations. Provide street names to allow coordination between the Vicinity Map and the construction plans.

d. In general, it is desirable to show the Vicinity Map and the location Plan on the Cover Sheet along with the project title.

e. Coordinate with Contracting Officer and Activity for laydown area.

f. Edit standard details, abbreviations, legends, and general notes for the specific project being designed.

g. Provide a single Civil legend on one sheet (preferably sheet C-001).

h. Datum must be securely tied between project datum and local datum.

i. For projects near tidal waters, show datum sketch indicating project vertical datum and relationship to range of tide and other important datum.

7-7.2 Demolition Plan.

Include the following:

a. Clearly show what is to be demolished at an appropriate scale. Coordinate/edit the legend to match the demolition plans.

b. Indicate the beginning and ending points of utility removals and methods of plugging pipes (such as cap, brick & mortar). Show locations of valves to be used for isolating work.

c. Show limit of pavement removal and pavement thickness.

d. Describe the existing items in detail with supplemental descriptions if necessary. Indicate depth of pavements/bases to allow uniform contractor bids.

e. Provide a sequence of demolition if necessary. Include known requirement for continuous operation and limited shutdown requirements. These must be identified in the special scheduling paragraphs of the specification.

f. Do not show items that are being demolished with the current project on subsequent Civil plan sheets.

g. Show locations of erosion and sediment (E&S) control items and add E&S notes. Show erosion control details on drawings or refer to applicable details in the State Erosion and Sediment Control Handbook or manual. Verify that the erosion control legend is edited, clear and coordinated with the drawings.

h. Provide a Tree Protection Detail for existing trees, which are to be preserved during construction. Trees are not amenable to the same barrier fence application. Consult a Registered Landscape Architect or State Certified Arborist. As a minimum, show a 4 foot (1.2 m)- high safety-orange, plastic barrier fence with metal or 4 x 4 inch (101 x 101 mm) wood stakes at 8 foot (2.5 m) on center spacing, continuously located around the tree's drip-line, unless otherwise directed by a certified arborist. If trees are in a group or cluster, use only one fence to surround the entire cluster.

7-7.3 Site Plan.

Include the following:

a. Show aboveground features including features required by the BOD (examples: airfields, railroads, crane rail, small arms ranges) with adequate layout data and existing aboveground features, after demolition has occurred.

b. Label baselines to be used for project layout as 'construction baseline' as opposed to survey baseline.

c. Provide layout dimensions from the construction baseline, or another readily identified (and easily established) alignment in the field. Include horizontal control point locations and descriptions. Use of coordinates for layout purposes is discouraged, however their use may be considered on a case-by-case basis. Contact Government's Civil Reviewer for approval of coordinate layout prior to project submittal.

d. Show areas requiring pavement patching, repairs, and pavement. Provide pavement jointing plans for rigid pavements. Include separate pavement marking plans for airfield projects.

e. Eliminate extraneous items that may congest the drawing (such as contours, elevations) and detract from the layout information.

f. Show locations of additional E&S control items not already included on the Demolition Plan. Coordinate with E&S notes, details, and legend.

g. Indicate trees and plant material to remain.

h. Provide statement concerning location of soil borings and soil information.

7-7.4 Water and Sanitary Sewer Plan.

Include the following:

a. Indicate whether connections will be made by wet tap (tapping sleeve/valve) or by dry connection. Show nearest valve(s) for system isolation if the latter is the case. Indicate known scheduling issues in the special scheduling paragraphs of the specification.

b. Indicate surface materials (such as grass, bituminous, or concrete).

c. Provide numbers (or letters) for each sanitary structure and water fitting so that plans and profiles are easily coordinated. This labeling system must be clearly distinct from that used for the storm drainage system and preferably distinct from labels used by other utility systems (such as electrical).

d. Provide manhole rim and invert elevations, pipe slopes, pipe diameters and pipe materials. If profiles are provided, indicate slopes on the profile sheets and do not provide on the plan sheets.

e. For water treatment plants, provide details process and instrumentation diagram (P&ID).

f. Provide reference to drawings and specifications for cathodic protection of fire protection water storage tanks, piping, or water lines, including metallic components of non-metallic lines (for example, PIVs, fire hydrants, change of direction devices, and valves).

7-7.5 Water, Storm, and Sanitary Sewer Profiles.

a. Show profiles where needed for clarity and to avoid potential conflicts. Discuss profile requirements with Government's Civil Reviewer.

b. Indicate structure tops, pipe invert elevations, slopes, lengths, and diameters of gravity lines.

c. Coordinate structure numbers with plan sheets.

d. Reference the plan sheets where pipes/structures are shown.

e. Show and label existing and surface materials, such as concrete pads, curbs, and roads, traversed by the lines. Accurately show depth of existing pavements.

f. Show and label crossing utility lines, both existing and new.

g. If depths of existing utilities are unknown, indicate the horizontal location of the utility and indicate the vertical location with a line representing the anticipated range of elevations where the utility will be found in the field. Indicate the method of utility installation routing above or below conflicts (such as concrete encasement or pressure pipe).

7-7.6 Grading and Drainage Plan.

Include the following information:

a. Provide existing spot elevations and existing contours at intervals to clearly indicate existing drainage patterns.

b. Provide spot elevations and contours when appropriate to clearly indicate grading and drainage patterns. Spot elevations/contours must be easily distinguished (bolder font) from existing.

c. Indicate where grading ties to existing grading (limits) and verify that work will not block existing adjacent drainage.

d. Show benchmarks, temporary benchmarks (tbm's), other vertical control, and datum notes on this plan.

e. Show finish floor elevations on grading plans. Do not show finish floor elevations on the architectural or structural plans in order to avoid conflicts. Coordinate adjacent exterior grading with the architectural/structural plans to ensure positive drainage patterns away from the building.

f. Verify that the slopes indicated on the plans are suitable for the surface material involved (such as earth slopes, bituminous pavements, and concrete pavements. Consider if these slopes are maintainable for the service life of the facility.

g. Coordinate with the Landscaping Plans (L sheets) to prevent plantings from blocking site drainage.

h. Provide numbers (or letters) for each drainage structure so that plans and profiles are easily coordinated.

i. Provide erosion and sediment control details.

7-7.7 Site / Utility Details.

Incorporate details as follows:

a. If applicable, edit and update standard details provided by the Government's Civil Reviewer to apply to the particular conditions and requirements of the project.

b. Details of items shown in the construction standards of the Department of Transportation, or other agencies of the state in which the project will be constructed, or other appropriate local/commercial standards are required on the plans.

c. Pavement Sections.

7-8 LANDSCAPE ARCHITECTURAL DRAWINGS.

7-8.1 Landscape Demolition Plan.

Coordinate existing site improvements and existing trees or other plant materials to be demolished with Civil Engineer. If a Civil Engineer is not involved with the project, conform to the requirements listed in Civil Drawings section under Demolition Plan.

7-8.2 Landscape Site Plan.

Coordinate site improvements with Civil Engineer. For projects with detailed Landscape Architectural features provide a Landscape Site Plan. Include the following:

a. Show new aboveground features including features required by the BOD (examples: buildings, existing site features to remain, utilities and other infrastructure improvements, vehicular and pedestrian circulation, parking, hardscape, fire lanes, Indicate hardscape, plazas, courtyards, child play equipment, monuments, memorials, site furniture, fences, walls, trash enclosure, signage, landscape drainage, and other site structures, streetscapes, LID and other bio-retention features, and AT standoff distances) and unobstructed space with adequate layout data and existing aboveground features, after demolition has occurred. Provide enlargement plans to delineate appropriate detail in plan view.

b. Label baselines to be used for detailed Landscape Architectural features layout as ‘construction baseline’ as opposed to survey baseline.

c. Provide layout dimensions from the construction baseline, or another readily identified (and easily established) alignment in the field. Include horizontal control point locations and descriptions. Use of coordinates for layout purposes is discouraged, however their use may be considered on a case-by-case basis. Contact Government’s Landscape Architectural Reviewer for approval of coordinate layout prior to project submittal.

d. Eliminate extraneous items that may congest the drawing (such as contours, elevations) and detract from the layout information.

7-8.3 Landscape Construction Details.

Provide details, sections, and elevations for site improvements required for construction.

7-8.4 Landscape Planting Plan.

Show locations of facilities (such as buildings, parking areas, roads, sidewalks, plazas or patios, existing vegetation to remain, and other surface improvements) and new plantings (such as trees, shrubs, ground cover), LID features, and bio-retention treatments.

7-8.5 Plant Material Schedule and Details.

Include the following:

- Provide a schedule for plant material showing as a minimum: botanical name, common name, quantity of plants, tree trunk caliper, minimum height and spread at time of planting, root condition (for example, balled and burlapped, containerized, and boxed), and a keyed reference to a planting detail.
- Provide separate details for plant types (such as trees, shrubs, ground covers) and other elements (such as root barrier, headers or edging, mulching).

7-8.6 Landscape Irrigation Plan.

When a Landscape Irrigation Plan is required by the Statement of Work, show locations of facilities (such as buildings, parking areas, roads, sidewalks, plazas and patios, existing vegetation to remain, and other surface improvements). Show pressure pipe and lateral lines, sprinkler heads, drip tubing and emitters, valves, backflow preventers, water source connections, wells, rain sensors, automatic controllers, rainwater harvesting (and other sustainable design features), and similar items.

7-8.7 Irrigation Equipment Schedule and Details.

When a Landscape Irrigation Plan is required by the Statement of Work, include the following:

- Provide an Irrigation Equipment Schedule showing at a minimum: graphic symbol, description of the item, manufacturer, model number, irrigation nozzle type (for example, full, half, quarter, or bubbler), optimum nozzle pressure (PSI), nozzle radius, and nozzle flow (GPM).
- Provide separate details for irrigation equipment (such as sprinkler heads, automatic controller, backflow preventer, valves, and other accessories).
- Provide pressure loss calculations.
- Provide water budget watering schedule, and equipment manufacturer's specifications, operations, and other information.

7-9 GEOTECHNICAL DRAWINGS.

Include subsurface investigation results on the drawings for record-keeping purposes. As a minimum, the drawings must include each of the logs/records as they appear in the Geotechnical Report; a summary table of the laboratory testing results; legend and descriptive notes concerning the drilling, logs and testing; groundwater level observations/conclusions; and site preparation notes and details, such as undercutting and surcharging. Include accurate figures showing the testing locations in the geotechnical drawings, or preferably, show the testing locations in the existing conditions or civil drawings.

7-10 STRUCTURAL DRAWINGS AND NOTES.

Provide structural drawings that sufficiently detail the structural work. The drawings must contain a set of "Structural Notes" in accordance with UFC 1-200-01, and which provide critical reference information for future building modifications or evaluations. As a minimum, note Design Criteria, Design Standard References, General Construction requirements, and the following:

- Loads: Provide loading information and identify sources for listed loads.
- Foundation Conditions: Fully describe the foundation conditions and list the type of foundation system and method employed to determine allowable soil bearing values. Indicate the minimum allowable bearing capacity for shallow foundations, or the pile or pier capacity in both tension and compression for deep foundations. Indicate passive, active and at rest design pressures, the coefficient of friction and the sub-grade modulus. Indicate if a site-specific design spectrum is to be used in the design and give the site class in accordance with the seismic design criteria used.
- Materials: Clearly define the types, grades, and properties of materials for each structural element and system.
- Quality Assurance: Provide a summary of the quality assurance requirements.
- Ammunition and Explosive Facilities: Drawings that include a standard approved for Ammunition and Explosive storage facilities must include a note clearly identifying the source, name, and date of the standard design.
- Marine Structures: List mooring berthing and deck loads for marine structures, including ship classes (such as DDG 51, CG 47, CVN) with associated displacements.

7-11 FIRE PROTECTION.

Provide floor plans showing the following information. Scale the floor plan so the entire footprint fits on a single sheet provided that information is clearly legible, and the scale is no smaller than 1:200 or 1/16-inch. Where a building has multiple hazard classifications or areas protected with special fire suppression systems, differentiate each area by border or hatching.

Information pertaining to electronic control/release systems may be shown on the Fire Alarm/Mass Notification Systems drawings specified below.

7-11.1 Fire Sprinkler Systems.

Provide the following information:

- Locations of sprinkler riser room.
- Fire department connections.
- Post indicator valves.
- Isolation control valves.
- Sprinkler branch lines or feed main piping if a specific routing is required, such as single feed to computer room or elevator equipment room and hoistway.
- Location of control panels used for release of pre-action or deluge systems.
- Fire pump and associated equipment.

7-11.2 Gaseous Fire Extinguishing Systems.

Provide the following information:

- Outline of area/hazard to be protected.
- Location of storage cylinders and releasing panel.
- System initiating devices (such as manual releases, automatic detection devices).
- Notification appliances.
- Main/reserve transfer switches.
- Control devices such as dampers, shunt trip breakers for computer equipment shutdown, and air conditioning units to be shut down, and electromagnetic door hold-open devices.

\1\ /1/

7-11.3 Fire Suppression Detail Sheets.

Provide fire suppression detail sheets showing the following information:

7-11.3.1 Fire Sprinkler Systems.

- Enlarged plan view of sprinkler riser room showing sprinkler risers, control valves, backflow prevention device and service entrance (supply) manifold drawn to scale.
- Cross-sectional elevations of sprinkler and standpipe risers.
- Enlarged plan view of fire pumps and piping arrangement, jockey pump, and associated controllers and equipment drawn to scale.
- Cross-sectional elevations of fire pump supply and discharge piping arrangement.
- Releasing system riser diagram for pre-action or deluge sprinkler systems. Identify zones, circuit inputs and circuit outputs necessary for controls, including interconnection with building fire alarm control panel.

7-11.3.2 Gaseous Fire Extinguishing Systems.

- Releasing system riser diagram identifying zones, circuit inputs and circuit outputs necessary for controls, including interconnection with building fire alarm control panel.
- Elevation view of storage cylinders and manifold.
- Isometric detail drawing of agent distribution piping including storage cylinder manifold and discharge nozzles.
- Sequence of Operation Matrix. See NFPA 72 for sample.

\1\ /1/

7-11.4 Fire Alarm/Mass Notification System Plans.

Provide floor plans identifying location of field installed components and interconnected devices. Plans may identify fire suppression control/release system information identified above. At a minimum, identify the location of the following information:

- Control panel(s).
- Notification appliance circuit extender panels.
- Radio transmitter or master box.
- Line and low voltage surge arrestors.
- Initiating devices (including duct smoke detectors). In lieu of locating devices on the plans, and as authorized by the DFPE, provide the following information on the plans:
    - Ambient sound pressure levels and audible design sound pressure levels

- Area boarders or other means to identify differing distinguishable spaces (ADS)
- Area borders to indicate the type of detection system, initiating devices, notification appliances and releasing service
- Area borders for detection and notification zones
- Rooms and spaces that will have visible notification and those where visible notification will not be provided
- Rooms and spaces that will have initiating devices and the design performance requirements for those devices

- Supplemental equipment interfaced with the fire alarm system such as voice evacuation panels, electromagnetic door holders, delayed-egress or access-controlled doors, elevator system components.
- Supplemental fire suppression equipment control panels such as fire**\1\ /1/** pump controllers, Fire suppression control/release panels.

7-11.5 Fire Alarm/Mass Notification System Detail Sheets.

Detail sheets may identify fire suppression control/release system information identified above.

7-11.5.1 Riser Diagram.

Provide a riser diagram showing hierarchy, arrangement, and zoning of the system. Identify typical circuits, interconnections, and interlocks necessary for associated controls. Do not identify every field device individually, such as smoke and heat detectors. Identify required line and low voltage surge arrestors. Interface with security systems for required delayed-egress or access-controlled doors. Identify interface with fire suppression control/release panels.

7-11.5.2 Sequence of Operation Matrix.

See NFPA 72 for sample.

7-12 DRAWINGS PREPARED FOR OTHER GOVERNMENT ORGANIZATIONS.

Approval of drawings for projects of other Government organizations or approval of modifications or revisions of drawings prepared by such organizations is required as follows:

- Indicate approval by other Government departments or agencies by appropriate signature in the supplemental locations provided on the NAVFAC Title Block (in accordance with Chapter 12).

- When NAVFAC drawings are prepared for construction projects for other Government departments or agencies, submit fully developed concept designs to the appropriate departments or agencies for formal approval.
- For drawings prepared under the direction of NAVFAC, the other Government organization provides approval solely for functional and operational sufficiency.
- When definitive, standard, or project drawings of other Government departments or agencies are used by NAVFAC for design of projects for those departments or agencies, make modifications or revisions to such drawings only with the approval of the department or agency concerned, unless NAVFAC has been authorized otherwise.

This Page Intentionally Left Blank

CHAPTER 8 DELIVERABLE: SPECIFICATIONS

8-1 GENERAL REQUIREMENTS.

Provide specifications in accordance with UFC 1-200-01, the Core UFCs, UFC 1-300-02, and Chapter 12. Provide specifications that are as brief as possible, definitive, and free of ambiguities and omissions that may result in controversy and contractor claims for additional compensation.

8-2 GUIDE SPECIFICATIONS.

Specifications offer criteria for materials, equipment, and test methods. Guide specifications are documents that describe products and materials and the work necessary to incorporate them into a construction project. A guide specification facilitates the preparation of project specifications by standardizing products and processes, and their order of presentation. DoD uses the Unified Facilities Guide Specifications (UFGS) database, provided on the WBDG (https://www.wbdg.org), which is updated quarterly. Edit guide specifications to specific project requirements for incorporation into the contract documents. Guide specification and project specification sections describe the following in detail:

- Product or system to be provided,
- Salient design features or performance requirements of the product or system,
- Quality of that product or system and methods used to ensure the quality, including on-site and off-site testing,
- Method to be used to incorporate the product or system into the project, and
- Other features and functions necessary.

Guide specification section numbers, up to 10 digits, in CSI MasterFormat®, are grouped in pairs. Each of these groupings is referred to as a “level,” from one to five. Refer to CSI MasterFormat® (https://www.csiresources.org/standards/masterformat/masterformat-number) for further explanation.

8-2.1 Unified Facilities Guide Specifications (UFGS).

Use Unified Facilities Guide Specifications (UFGS) for projects, including DB. UFGS are available at the WBDG (https://www.wbdg.org/). Tailor and modify the UFGS to suit the work required by the specific project, including editing for metric or inch-pound. In addition, modify and edit to reflect the latest proven technology, materials, and methods, for the project.

There is only one current version of a guide specification at any time. The guide specification with the latest revision date and change number automatically cancels specifications of the same number with a previous date and change number.

8-2.2 Regional Guide Specifications.

Some Supported Commands have modified some of the UFGS for their region; these are referred to as Regional Guide Specifications. Use Regional Guide Specifications when sections are available by the Region and Activity for the project location, and in accordance with the contract. Regional specifications are located on the WBDG (https://www.wbdg.org/navy/nfgs) and where indicated in the contract.

Regional specifications are limited in number and scope to selected subjects particular to a location and contain a majority of local requirements. Regional specifications are used in the same way as the UFGS except that they are used only in the area of the specific facility engineering command jurisdiction. Regional specifications are numbered the same as the UFGS that has been used as a basis for the regional specification, with the exception of a regional designation at the fifth level for specifications in CSI MasterFormat®; for example, in UFGS Section number, 01 13 30.00 22, “22” indicates the region. Assigned regional designations can be found with the Regional specifications on the WBDG (https://www.wbdg.org/navy/nfgs).

8-2.3 Other Guide Specifications.

Other guide specifications are only allowed as a basis for information when not available in the UFGS. These developed specifications must be provided in UFGS format and modified to meet requirements of UFC 1-300-02.

8-2.4 UFGS Selection Order of Precedence.

Unless specified otherwise in the contract, the order of precedence for selecting which UFGS to start from, for CONUS jobs that require the use of the UFGS, is as follows:

1. Regional Guide Specifications (for the project location and where sections are published on WBDG).
2. UFGS, Navy only (UFGS with a “20” at the fifth level in CSI MasterFormat®).
3. UFGS (unified, no designator at the fifth level).
4. Other DoD UFGS (Army UFGS with .00 10 designation and modified for Navy job).

8-2.5 DB Performance Technical Specifications.

Develop Performance Technical Specification (PTS) sections in accordance with requirements of Chapter 11.

8-3 PROJECT PREPARATION POLICIES AND GUIDANCE.

Prepare specifications in Format and Styles required by UFC 1-300-02.

8-3.1 UFGS Version Date.

Download, use, and edit the most current UFGS database available from the WBDG (https://www.wbdg.org/dod/ufgs). Unless otherwise specified by the contract, the version that is current at the official start of the Pre-Final design phase for DBB must be used; or the version current at the last phase of RFP issuance for DB; and continue to be used, through Final design. Coordinate the version of the UFGS database used with the Government Design Manager and report this date to them.

8-3.2 Editing of Specifications for Project.

Modify and edit the guide specification to fit the project and to meet UFC requirements. Follow the Notes to the Designer to make selections in the UFGS. Use language and format in accordance with UFC 1-300-02. Delete portions of the guide specification not included in the project design and scope.

Use guide specifications only as source documents, and do not reference them in project specifications. Do not combine work covered by various UFGSs into one section unless the project is small and work is of a minor nature, and the Government Design Manager concurs.

8-3.2.1 Geotechnical and Civil Specifications.

Do not edit outside of the guide specification’s bracketed selections for Geotechnical and Civil UFGS sections in Divisions **\1** 31, 32, and 34 **/1/** without prior approval of the Government Design Manager.

8-3.3 Standard Plates, Sketches, and Details.

Provide plates, sketches, boring logs, and details on the drawings, and not in the specifications.

8-3.4 Unrestricted Bidding.

Provide only the actual minimum needs of the Government in the specifications and describe the salient characteristics of materials and installation so as to encourage maximum competition in bidding. Eliminate, insofar as possible, restrictive features that might limit acceptable offers to one supplier's product, or to the products of a relatively few suppliers, and in accordance with UFC 1-300-02. Do not list manufacturers unless

Contracting Officer approval is received in accordance with NFAS 6.304. Master UFGSs that list manufacturers must have a class justification on file.

8-3.5 Contract Parties.

Do not designate part of the work to be performed by a particular subcontractor (such as the plumbing contractor) in constructing the project, except for some specific instances. The Government recognizes only one Contractor (the prime or general contractor) and it is the Contractor's responsibility to divide up the work.

8-3.6 Facilities Electronic Operation and Maintenance Systems Information (eOMSI).

eOMSI (UFGS 01 78 24.00 20) is required on New Construction projects greater than or equal to $1 Million and Major Renovation Projects greater than or equal to 50 percent of the Plant Replacement Value (PRV), at Navy and Marine Corps Installations Joint Bases, Department of Defense (DoD) Agencies, or Field Activities, where NAVFAC is the maintenance provider of the facility. Also, use UFGS 01 78 24.00 20 for projects using BIM or when required by the contract. Use both UFGS 01 78 23 and UFGS 01 78 24.00 20.

The eOMSI Facility Data Workbook (FDW) is required for facilities operated and maintained by NAVFAC and Marine Corps. For BIM projects, use the FDW to prescribe the Level of Detail.

8-4 COORDINATION OF SPECIFICATIONS AND DRAWINGS.

FAR 52.236-21 states: "Where 'as shown’, 'as indicated’, 'as detailed’, or words of similar import are used, the reference is made to the drawings accompanying this contract unless stated otherwise."

8-4.1 DBB Contract Order of Precedence.

For DBB contracts, the Contract Order of Precedence is defined in FAR 52.236-21. In general, treat anything mentioned in the specifications but not shown on the drawings or shown on the drawings but not included in the specifications, as if shown or mentioned in both. In the case of discrepancies between the drawings and specifications, the specifications take precedence.

8-4.2 DB Contract Order of Precedence.

Refer to the RFP and the contract for Order of Precedence on DB contracts.

8-4.3 Coordination.

Coordinate the drawings and the specifications to ensure that items depicted in the drawings are covered by an appropriate specification section and that specification sections relate to items in the drawings.

8-5 USE OF UFGS AND SPECSINTACT.

Edit and provide UFGS sections in accordance with UFC 1-300-02, using SpecsIntact software and UFGS format. SpecsIntact is the word processing software used to edit the UFGS database. SpecsIntact software is available for download, free of charge, at the SpecsIntact website (https://specsintact.wbdg.org/).

8-6 SPECIFICATIONS PACKAGE ORGANIZING STRUCTURE.

8-6.1 Coversheet.

Include an overall cover sheet, for signature, with project specification package. Type in the name and title of the principal DOR, who must sign in the "Submitted By" location. The coversheet for electronic signature is available on the WBDG (https://www.wbdg.org/navy/project-information-form-specifications-cover-sheet/spec-coversheet).

Use the eProjects Work Order Number; only use the Maximo number on coversheet and other project documents if eProjects is not required for the project.

8-6.2 Contract Documents.

The DOR prepares and provides the following documents to the Government's Project Manager for the Contract Specialist. The Contract Specialist consolidates bidding and contract requirements, along with the drawings and specifications, into a single solicitation package.

8-6.2.1 Project Synopsis.

The scope in the project synopsis is taken from the Description of Work located in UFGS Section 01 11 00. This description of work must be concise, and summarize the location, facilities, and type of work involved. A sample synopsis is provided in Appendix A. Provide the scope of work for the Synopsis at Pre-Final and Final in accordance with contract requirements.

8-6.3 Format.

Provide specifications in UFGS format in accordance with UFC 1-300-02. Print job headers with the job title, exactly as it appears on the drawings, justified to the left, and with the eProjects Work Order Number justified to the right. For Prefinal submittals, follow the job title with "(Prefinal)."

8-6.4 General Requirements (Division 00 and 01) Specifications.

Edit the UFGS Division 00 and 01, General Requirements Divisions, to describe the general project requirements of the project. Provide additional requirements of a general nature, rather than of a technical nature, in General Requirements.

The UFGS sections in Table 8-1 are typically used in a DBB project. Use other Division 01 sections as required, depending on the scope of the project, or in accordance with the Contract. Provide UFGS Document 00 01 15 as part of the specifications package, or separately, in accordance with Contract requirements.

Table 8-1 Commonly Used DBB UFGS Division 00 and 01 Sections

UFGS Number	TITLE
00 01 15	LIST OF DRAWINGS (sometimes not provided in TOC)
01 11 00	SUMMARY OF WORK
01 14 00	WORK RESTRICTIONS
01 20 00	PRICE AND PAYMENT PROCEDURES
01 30 00	ADMINISTRATIVE REQUIREMENTS
01 32 17.00 20	COST-LOADED NETWORK ANALYSIS SCHEDULES (NAS)
01 33 00	SUBMITTAL PROCEDURES (attach Submittal Register)
01 33 29	SUSTAINABILITY REQUIREMENTS AND REPORTING
01 35 26	GOVERNMENTAL SAFETY REQUIREMENTS
01 42 00	SOURCES FOR REFERENCE PUBLICATIONS
01 45 00	QUALITY CONTROL
01 50 00	TEMPORARY CONSTRUCTION FACILITIES AND CONTROLS
01 57 19	TEMPORARY ENVIRONMENTAL CONTROLS
01 58 00	PROJECT IDENTIFICATION (attach Project Signboards)
01 78 00	CLOSEOUT SUBMITTALS
01 78 23	OPERATION AND MAINTENANCE DATA
01 78 24.00 20	FACILITY DATA WORKBOOK (FDW) (attach Facility Data Workbook)

8-6.5 DB RFP.

For Part 2, “General Requirements,” of the six part DB RFP, use the UFGS sections provided in Part Two of the NAVFAC DB Master on the WBDG (https://www.wbdg.org/navy/ndbm) as appropriate. Table 8-2 shows commonly used DB RFP Part Two UFGS sections.

Table 8-2 Commonly Used DB RFP PART Two UFGS Division 01 Sections

UFGS Number	TITLE
01 14 00	WORK RESTRICTIONS
01 20 00	PRICE AND PAYMENT PROCEDURES
01 30 00	ADMINISTRATIVE REQUIREMENTS
01 31 19.05 20	CONCEPT DESIGN WORKSHOP (CDW)
01 32 17.00 20	COST-LOADED NETWORK ANALYSIS SCHEDULES (NAS)
01 33 00.05 20	CONSTRUCTION SUBMITTAL PROCEDURES
01 33 10.05 20	DESIGN SUBMITTAL PROCEDURES
01 33 29	SUSTAINABILITY REQUIREMENTS AND REPORTING
01 35 13	SPECIAL PROJECT PROCEDURES
01 35 26	GOVERNMENTAL SAFETY REQUIREMENTS
01 45 00	QUALITY CONTROL
01 50 00	TEMPORARY CONSTRUCTION FACILITIES AND CONTROLS
01 57 19	TEMPORARY ENVIRONMENTAL CONTROLS
01 74 19	CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
01 78 23	OPERATION AND MAINTENANCE DATA
01 78 24.00 20	FACILITY DATA WORKBOOK (FDW)

8-6.6 Project Reports.

Many projects include special requirements due to the presence of environmentally sensitive materials, such as asbestos, lead containing paint, PCBs, or other hazardous materials. Typically, as part of the Design or RFP Development contract, investigations are conducted to determine the presence, levels, and limits of sensitive materials. The investigative firm then provides reports, from which the information is used to design the project or provided in the DB RFP. The Government provides this information to the Contractor as part of the contract documents.

8-6.6.1 DBB.

Provide and attach reports to the end of the appropriate UFGS specification section (example: provide the asbestos report at the end of UFGS 02 82 00 *Asbestos Remediation*).

8-6.6.2 DB.

For DB, provide project reports in Part 6 of the RFP.

8-6.7 Combining Multiple Projects into One Bid Package.

Occasionally, several projects that have been independently prepared, or need to be easily separated, will be combined into one solicitation package. One solution is to combine the packages into at least three Parts.

8-6.7.1 DBB Parts.

In Part A, provide one General Requirements (Division 01) specification for the entire package. This Division 01 must be edited and accurate for the combined projects. The header in Part A must list the titles of each project, justified to the left, and the corresponding eProjects Work Order Number for each project, justified to the right. Example is provided in Figure 8-1.

Part B consists of the technical specifications (Divisions 02-49) for the first project and Part C consists of the technical specifications for the second project. Add additional parts depending on the number of projects being combined. Provide a Divider, a Table of Contents, and the technical specification sections. The header in each part must contain only the title of that Project and the corresponding eProjects Work Order Number for that project. An example is provided in Figure 8-1.

Figure 8-1 Sample Table of Contents for Combined DBB Projects

GATE 5 SECURITY IMPROVEMENTS, NSA NORFOLK 222088
SECURITY IMPROVEMENTS, GATE 10, NAS OCEANA 235341

PROJECT TABLE OF CONTENTS

PART A: GENERAL REQUIREMENTS

DIVISION 34 – TRANSPORTATION

34 71 13.19 CRASH RATED ACTIVE VEHICLE BARRIERS AND CONTROLS

-- End of Part B --

PART C: SECURITY IMPROVEMENTS GATE 10, NAS OCEANA, VIRGINIA BEACH, VA (WON 235341)

DIVISION 02 - SITE WORK

02 41 00 [DEMOLITION][AND][DECONSTRUCTION]

DIVISION 31 – EARTHWORK

31 23 00.00 20 EXCAVATION AND FILL

DIVISION 08 - OPENINGS

08 11 13 STEEL DOORS AND FRAMES
08 71 00 DOOR HARDWARE

-- End of Part C –

8-6.7.2 DB Parts.

Part A consists of the General Requirements Division (Division 01), Part B consists of the RFP (Parts 3-6) for the first project, and Part C consists of the RFP for the second project. Add additional parts depending on the number of projects being combined. Provide a Divider, a Table of Contents, and the RFP sections (Parts 3-6). The header in each part must contain only the title of that Project and the corresponding eProjects Work Order Number for that project.

For RFPs in which Parts are shared, such as Part 2, Part 4, and Part 5, projects may be combined by simply using a Part 3 for each project, distinguished by the cover page and title, and inserted in Part 3; and a Part 6 for each project, distinguished by the title, and inserted in Part 6. In this case, parts A, B, and C dividers may not be required. Reflect the layout in the overall Table of Contents.

8-6.7.3 DB and DBB Hybrid.

For contracts where a DB RFP is combined with a DBB project, provide one project, complete, in Part A, and the other project, complete, in Part B; do not combine the General Requirements (Division 01) of these two different types of projects. An example is provided in Figure 8-2.

Figure 8-2 Sample Combined DB and DBB Project

PART A: GATE 5 SECURITY IMPROVEMENTS, NSA, NORFOLK, VA (WON 222088)

DIVISION 01 – GENERAL REQUIREMENTS

01 11 00	SUMMARY OF WORK
01 14 00	WORK RESTRICTIONS
01 20 00	PRICE AND PAYMENT PROCEDURES
01 30 00	ADMINISTRATIVE REQUIREMENTS
01 32 17.00 20	COST-LOADED NETWORK ANALYSIS SCHEDULES (NAS)
01 33 00	SUBMITTAL PROCEDURES
01 33 29	SUSTAINABILITY REQUIREMENTS AND REPORTING
01 35 26	GOVERNMENTAL SAFETY REQUIREMENTS
01 45 00	QUALITY CONTROL
01 50 00	TEMPORARY CONSTRUCTION FACILITIES AND CONTROLS
01 57 19	TEMPORARY ENVIRONMENTAL CONTROLS
01 57 19.01 20	SUPPLEMENTAL TEMPORARY ENVIRONMENTAL CONTROLS FOR GATE 5
01 57 19.02 20	SUPPLEMENTAL TEMPORARY ENVIRONMENTAL CONTROLS FOR GATE 10
01 58 00	PROJECT IDENTIFICATION
01 78 00	CLOSEOUT SUBMITTALS
01 78 23	OPERATION AND MAINTENANCE DATA

DIVISION 02 - SITE WORK

02 41 00	[DEMOLITION][AND][DECONSTRUCTION]

DIVISION 26 – ELECTRICAL

26 08 00	APPARATUS INSPECTION AND TESTING
26 32 15.00	ENGINE-GENERATOR SET STATIONARY 15-2500 KW, WITH AUXILIARIES

DIVISION 31 - EARTHWORK

31 00 00	EARTHWORK

DIVISION 34 – TRANSPORTATION

34 71 13.19	CRASH RATED ACTIVE VEHICLE BARRIERS AND CONTROLS

--End of Part A --

PART B: GATE 2 SECURITY IMPROVEMENTS, NSA NORFOLK, VA (WON 352025)

PART 1 – CONTRACT DOCUMENTS
(Included under separate attachment)
PART 2 – CONTRACT REQUIREMENTS
PART 3 – PROJECT PROGRAM
PART 4 – PERFORMANCE TECHNICAL SPECIFICATIONS (PTS)
PART 5 – PRESCRIPTIVE TECHNICAL SPECIFICATIONS
PART 6 – ATTACHMENTS

-- End of Part B --

8-6.7.4 Coversheet.

Provide one overall coversheet for signature. The coversheet must contain each of the eProjects Work Order Numbers. Contact the Government for which Work Order Number to use first as the primary. Also include project titles and if different Designers of Record prepared the RFP or specification, the information of each DOR firm or agency to be included. Be careful not to change the location of the electronic signature portlets when adding information to the coversheet.

8-6.7.5 List of Drawings.

Provide UFGS 00 01 15 listing drawings in the entire package. Group drawing lists by Project.

8-6.7.6 Table of Contents.

Provide a single, overall Table of Contents, listing each Part and the sections or documents in each Part. Note that SpecsIntact uses Courier New (10 pt) as the default font. Use this font to generate the Table of Contents and other documents in Word. A sample Table of Contents is provided in Figure 8-1 and Figure 8-2.

8-6.7.7 Submittal Registers.

Provide submittal registers for each Part at the end of UFGS 01 33 00 (for DBB) or UFGS 01 33 00.05 20 (for DB). Separate the submittal register for each part with a Divider; for example, bookmark “Part A: Submittal Register” (for Division 01 only), “Part B: Submittal Register,” and “Part C Submittal Register,” within the PDF package.

CHAPTER 9 DELIVERABLE: COST ESTIMATES

9-1 GENERAL REQUIREMENTS.

Provide cost estimates at each submittal in accordance with the applicable provisions of UFC 3-701-01, UFC 3-730-01, and UFC 3-740-05 unless specifically indicated otherwise in this chapter or in the contract documents. Cost estimates include budgetary estimates, current working estimates (CWE), independent government estimates (IGE), and independent cost estimates (ICE).

Provide cost and schedule risk analysis (CSRA), **\1\ /1/**value engineering study (VES) and independent cost estimate (ICE) when required by the scope of services. Provide construction schedules in support of the cost estimate.

9-2 COST ESTIMATE CLASS STANDARDS.

Cost estimate classifications based on the maturity of the project definition deliverables is provided in Appendix B, Table B-1.

Table 9-1 indicates the appropriate AACE RP 56R-08 cost estimate class with the commensurate project phase.

Table 9-1 Cost Estimate Classification by Project Phase

Project Phase	Estimate Class
Final Design; Pre-Final Design	2,1
Design Development (35% - 50%)	3,2
DB RFP - Final	3
DB RFP - Draft	4,3
Budgetary; Preliminary Design (MILCON **\1** Checklist– see Paragraph 13-5 **/1/**); Schematic Design; Studies	4,3
Planning; Installation Level DD1391; Rough order of magnitude (ROM), comparison or screening; square foot (square meter)	5

9-3 COST ESTIMATE DEVELOPMENT REQUIREMENTS.

Base the cost estimate on the defined process as described in UFC 3-740-05. Unless otherwise directed, prepare cost estimates using latest MII software (Micro Computer Aided Cost Estimating System). Update cost estimate to the latest Cost Book and regional equipment library.

When the level of design does not support a quantity takeoff, the PACES software (Parametric Cost Estimating System) may be used and is to be exported to MII. The export is to be transferred into the appropriate NAVFAC MII template and updated to requirements in this chapter.

NAVFAC MII templates are provided on the WBDG website: https://www.wbdg.org/navy/ceg. Unless otherwise directed, use the latest version of these templates at the initiation of the cost estimate.

9-3.1 Level of Detail.

The level of detail for each cost estimate must be commensurate with the project phase. The detailed cost items are to appear at the appropriate locations and levels in the work breakdown structure (WBS). See Table 9-2. Each of the folders in the NAVFAC template includes notes indicating the unit of measure (UOM) to be used for that folder in accordance with UNIFORMAT II. Update the quantity at the folder level and use the indicated UOM. Segregate MILCON costs from Non-MILCON costs. Develop the price schedule line items in the cost estimate by maintaining the WBS for each line item.

\1

9-3.2 Labor Costs

Obtain current local pricing for labor rates at the time the cost estimate is developed.

9-3.3 Local Pricing for Projects OCONUS

Host nation consultant to provide current local pricing for major cost items and labor rates. This information is to be included as part of the backup documentation.
/1/

Table 9-2 MII Template Project Items Crosswalk

Source	MII Folder Levels	MII Folder Level Title	Sample Level Description	UNIFORMAT II		Use
				Levels	Values	
Template	0	Project	*Project Name*	N/A	N/A	Mandatory
Template	1	Project Phase [1]	*Base Bid*	N/A	N/A	Mandatory
Template	2	Facility Type[2]	*Primary Facilities*	N/A	N/A	Mandatory
Template	3	Project Element[3]	*Primary Facility 1*[4,5]	N/A	N/A	Mandatory
Template	4	Major Group Element	*Shell*	1	B[6]	Mandatory
Template	5	Group Element (System)	*Superstructure*	2	B10[6]	Mandatory
Template	6	Individual Element (Subsystem)	*Floor Construction*	3	B1010[6]	Mandatory
Template	7	Sub-Element (Assembly)	*Floor Decks and Slabs*	4	B101003[6]	Mandatory
User	8	Sub-Assembly or Unit Price	*Floor Slabs*	N/A	N/A	Optional
User	9	Unit Price Line Items	*Detail Items*	N/A	N/A	Optional

Notes:
1. Project Phase is associated with large projects, such as Phase 1 of 4.
2. Facility Type values are either Primary, Supporting, or Other.
3. For Primary Facilities, include Cat Code as Source Tag.
4. For Primary Facilities Title use Cat Code Description
5. Include number of stories above and below grade in the Primary Facilities Title.
6. These UNFORMAT II values are used as MII Source Tags at the corresponding MII Folder Levels.

9-3.4 Escalation.

Use the NAVFAC Building Cost Index (BCI) for escalation, unless supporting market analysis dictates otherwise. Update the cost estimate at each submittal to reflect the current escalation. The NAVFAC BCI can be found on the WBDG website (https://www.wbdg.org/navy/ceg).

Include the escalation variance as a consideration in the sensitivity analysis and CSRA.

9-3.5 Job Office Overhead (JOOH).

Inform the duration of JOOH costs from the construction schedule. It is permitted to define the rate of JOOH as a percentage in earlier phases of design up to a Class 4 cost estimate. Itemized JOOH is required on Class 1, 2 and 3 cost estimates.

9-3.6 Markup Requirements.

The markups defined below are to be addressed in the cost estimate.

9-3.6.1 Direct Cost Markups.

- Productivity.
- Overtime.
- Sales Tax.
- Cost Data Escalation – Used to escalate direct material, labor and equipment costs from the cost data source date(s) to the date of the cost estimate.
- Design Contingency – Global application of this markup is allowed for an early design level, by pre-final submittal it is expected the markup be applied at a system level. The cost engineer owns this markup. Design contingency may also be addressed by including allowances.

9-3.6.2 Contractor Markups.

The following contractor markups are to be addressed for prime and subcontractors.

- JOOH
- Home Office Overhead (HOOH)
- Profit
- Bond and Insurances
- Excise Tax
- DB Fee
- Competition Premium - Used to account for markets with low competition. Do not use if a CSRA is included in the project as it is expected that the level of competition will be considered as a risk factor in the model.

9-3.6.3 Owner Markups.

These markups must be applied in the following order within MII.

- Market Escalation: used to escalate the project from the date of the cost estimate to the mid-point of construction.

- Risk Contingency: If a CSRA was developed as part of the scope of the project then the resulting contingency is to be applied as an owner markup.

9-3.6.4 Construction Contingency.

Construction contingency is not included as a part of the cost estimate. This cost is accounted for outside of the cost estimate.

9-3.6.5 Supervision Inspection and Overhead (SIOH).

SIOH is not included as a part of the cost estimate. This cost is accounted for outside of the cost estimate.

9-3.7 Development of Specific Task.

Clearly identify specific tasks with unique source tags.

9-3.5.1 Cost Overrides and Modified Cost Task.

Clearly document in the cost estimate overrides or modifications to component of the cost item that originates from published data.

9-3.5.2 User Items.

Clearly document user items in the cost estimate.

9-3.5.3 Assemblies.

Clearly document assemblies used in the cost estimate.

9-4 SENSITIVITY ANALYSIS.

\1 Perform a sensitivity analysis in accordance with UFC 3-740-05 for NAVFAC cost estimates. The results of the sensitivity analysis are used to inform the cost estimate, **/1/** CSRA and the ICE. For PEO II projects, utilize the value from the upper end of the uncertainty range in the base cost estimate and do not model the variation of the uncertainty item in the CSRA. Update the sensitivity analysis at each cost estimate submittal.

9-5 COST AND SCHEDULE RISK ANALYSIS (CSRA).

Perform the Cost and Schedule Risk Analysis (CSRA) in accordance with UFC 3-740-05 on projects greater than $20 million unless otherwise directed by NAVFAC Cost TDC. The Tri-Service CSRA template is located under Related Materials on the WBDG website for UFC 3-740-05. Develop CSRA models using the Crystal Ball add-in to MS Excel unless otherwise approved by the NAVFAC Cost TDC. Base the default risk contingency on an 85% Confidence Level unless otherwise directed or specifically required by governing policy or directive. Update the CSRA at each cost estimate submittal.

9-5.1 Budgeting CSRA.

The budgetary estimate is to consider each risk to inform the final Program Amount. Consider pre-award and post-award risk as well as uncertainty items in the CSRA.

9-5.2 Design CSRA.

During the design phase, consider risk to predict the price of the project in market. Each modeled risk must have identified risk reduction measures that are updated at each submittal. Consider each risk that the contractor will take into account during bidding. Keep track of post-award risks in the risk register but do not model them.

9-5.3 Construction CSRA.

If required during the construction phase of the project, the CSRA is leveraged to develop both the total contingency value and when those contingency dollars will be needed (FY). The model is to be updated on a continual basis as directed by the NAVFAC PM to better inform the contingency position. Include post-award risks focused on items that could occur during construction. Utilize to the greatest extent possible, the schedule of prices, cost loaded schedule, and the contract unit prices for informing and quantifying the risks.

9-5.4 Schedule Risk.

If a schedule risk is modeled, always model the associated cost from schedule impact regardless of magnitude. The quantified value accounts the JOOH monthly rate as well as the cost of escalation incurred by the additional duration. Calculate the monthly cost of escalation by determining the total dollar value of escalation in the base estimate divided by the construction duration.

9-6 VALUE ENGINEERING STUDIES (VES).

When required, provide a VES in accordance with Appendix B3.

9-7 INDEPENDENT COST ESTIMATE (ICE).

When required, an ICE is developed in addition to the DOR's cost estimate. The ICE is prepared by a qualified, third-party cost estimator independent of the project stakeholders. It is prepared in accordance with cost criteria and includes sensitivity analysis as well as a construction schedule to support comparative evaluations. The ICE must be developed with the same design documents and use the same WBS used to generate the DOR's cost estimate. To restrict potential bias, information from the DOR's cost estimate must be withheld from the ICE estimator to the maximum extent practical. The Government may provide supplemental information to the ICE estimator such as Charrette report, studies, and CSRA risk register. The ICE will be reviewed by the Government in the same manner as the DOR's estimate.

At the initiation of the ICE process (awarding an ICE contract), the Government cost engineer will schedule and hold a kickoff meeting for the ICE process to be attended by the DOR and the ICE estimator teams. During the development period, there will be bi-weekly meeting with the DOR and ICE estimator as scheduled by the Government cost engineer.

9-7.1 Reconciliation.

Reconciliation occurs at defined milestones and is a collaborative process between the Government, DOR, and ICE estimator. The Government cost engineer is responsible for leading the reconciliation process. This process will be repeated for each design submittal, except Final. The Government cost engineer will compare the ICE and DOR cost estimates in two steps. The first step of the analysis will focus on quantities and the cost estimates' sensitivity analyses. In this first step the Government cost engineer will summarize the results of the comparison in a report and forward it to the DOR and the ICE estimators for their review. The Government cost engineer will then schedule and facilitate a Quantity Reconciliation meeting to reconcile quantities and sensitivity analysis differences. The DOR and ICE cost estimates will be updated based on this meeting.

Using the DOR and ICE cost estimates updated from the first step, the Government cost engineer will compare the two estimates focusing on remaining differences in cost and schedule. In the second step of the analysis, the Government cost engineer will summarize the results in a comparison report. This report will be forwarded the DOR and the ICE estimators for their review. The Government estimator will then schedule and facilitate a Reconciliation Workshop to reconcile remaining cost and schedule differences.

9-7.2 Documentation.

The DOR retains the responsibility for the CWE developed for each design submittal. During the reconciliation workshop, the DOR will document discussions and inform their cost estimate at their discretion. The DOR's basis of estimate will be updated to document the key recommendations from the workshop as well as which recommendations were considered in the reconciled CWE. Recommendations that were not considered need to be documented with appropriate rationale for exclusion.

9-8 CONSTRUCTION SCHEDULE.

Provide a construction network analysis schedule (NAS) in support of the cost estimate and CSRA. **\1** Prepare construction schedules using Primavera P6 or Microsoft Project, unless otherwise approved by the NAVFAC Cost TDC. **/1/** Use the duration, crew hours, and labor hours from the cost estimate to inform the construction schedule. In turn, the cost estimate must include itemized job overhead costs informed by the construction schedule. This construction schedule is part of the cost estimate supporting documentation and will not be shared with the Contractor. Update the construction schedule at each cost estimate submittal.

9-8.1 Construction Schedule Class Standards.

Construction schedule classifications based on the maturity of the project definition. Unless otherwise directed by the NAVFAC cost engineer, the construction schedule is to be roughly equivalent to a Class 3 schedule as defined in AACE Recommended Practice 27R-03.

9-8.2 Construction Schedule Development Requirements.

The schedule must incorporate the following best practices from GAO-16-89G.

1. Capture activities defined in the schedule WBS at a sufficient level of detail to accomplish the project’s objectives.
2. Sequence activities in logic-driven predecessor-successor relationships, minimizing the use of lags and date constraints.
3. Establish durations for activities. These durations are to be informed by the cost estimate.
4. Verify that the schedule can be traced horizontally and vertically.
5. Identify and validate the critical path.
6. Identify a reasonable total float.
7. Incorporate the schedule information in the CSRA.

The schedule must also incorporate the following.

1. Environmental requirements (i.e., permits, fish windows, or SHPO.)
2. Impact of known installation activities upon the construction contractor’s operations.
3. Seasonal weather considerations including impact on the site soils.
4. Durations for submission and approval of administrative submittals.
5. Durations for material lead time and installation.
6. Interface of work trades within the project.
7. Productivity losses triggered by lack of lay-down/storage space.

The level of activity detail within the construction schedule is to be in accordance with Table 9-3.

Table 9-3 \1\ /1/Activity Detail by Schedule Class

Class	Activity with Duration Greater than
5	12 Weeks
4	10 Weeks
3	4 Weeks
2	2 Weeks
1	1 Week

9-8.3 Cost-Loaded Construction Schedule.

When directed, develop a cost-loaded construction schedule based on the values from the cost estimate. Assign cost respective to the construction activities. Activities assigned Government responsibility are to have zero cost. No contractor cost is to be assigned to an activity designated as a Government responsibility.

9-9 SUBMITTAL REQUIREMENTS.

Provide a cost estimate package in a separate submittal to the PM/DM only. In a single PDF combine the basis of estimate (BOE), MII cost estimate report, CSRA report, sensitivity analysis, VES, basis of schedule (BOS), **\1** construction schedule, and backup data for a complete report. **/1/**

9-9.1 BOE.

For each submittal, provide a narrative BOE. In addition to the requirements defined in the UFC 3-740-05, the BOE must include the following information:

- Provide a complete schedule of cost estimate submittals.
- Establish and maintain a table summarizing the cost development at each submittal in accordance with the WBS and using ASTM E1804 as guidance. The initial table entry is to be the budget or DD1391 estimated costs. Subsequent entries are to be added during the design development. Evaluate and describe the causes of variances exceeding 10% of UNIFORMAT II Level 1 and Level 2 cost elements, sub-totals, or

totals between the current cost estimate submittal and the previously submitted cost estimate.

- State the estimating methodology used to develop the cost estimate.
- Provide a narrative of the current construction market and expectation for changes through the planned construction period at the project location. This is to include availability of labor and materials and market drivers. Describe how the cost estimate accounts for the current construction market, including markups applied.
- Include the assumed minimum number of bidders.
- Include a summary of work self-performed by the prime contractor and work to be performed by subcontractors.
- Describe the development of the applied direct markups and include details backed up by industry data and/or calculations justifying percentages used for direct markups. Do not make broad statements such as “based on historical data.”
- Describe the development of the contractor markups and include details backed up by industry data and/or calculations justifying percentages used for contractor markups. Do not make broad statements such as “based on historical data.”
- Describe the development of the risk contingency markup.
- Describe the development of the market escalation markup.
- Describe the development design contingencies incorporated into the cost estimate and provide a defensible position.
- Describe the software tools and associated databases used in the development of the cost estimate.
- Describe the sources of cost data for material, labor and equipment.
- Describe the reasonableness of the proposed construction schedule to meet the contract award within the budget year or meeting the defined Initial Operational Capability (IOC) date.
- Describe the results from the sensitivity analysis identifying key cost drivers impacting the total construction cost by 5% or greater. The results of this analysis are to be captured in a table identifying the parameters or assumptions and the range of variation assumed for each key cost driver.

9-9.2 MII Cost Estimate Report and Native File.

Prepare and submit cost estimate reports using NAVFAC MII Standard Report Templates (https://www.wbdg.org/navy/ceg). Provide the native MII (.mlp) file.

9-9.3 Sensitivity Analysis.

Provide a report describing the process and documenting the results. The report is to include a graphical summary of the results to illustrate the relative impact of each factor identified in the analysis.

9-9.4 CSRA Report and Model.

\1 Provide **/1/** the native Excel macro-enabled CSRA model file and CSRA Report. The CSRA Report Template is available under Related Materials on the WBDG website for UFC 3-740-05.

9-9.5 VES Report.

If a VES is required, provide a copy of the latest version of the VES report.

9-9.6 Basis of Schedule.

Provide a schedule narrative to accompany the schedule. The scope of the schedule narrative will vary with project and contract complexity, but include at a minimum:

- Status of key milestone dates, including the project finish date.
- Explanations for key dates.
- Changes in network logic, including lags, date constraints.
- Relationship logic, and their effect on the schedule.
- Description of the critical paths, near-critical paths, and longest paths along with a comparison to the previous period’s paths.
- Description of significant scheduling software options that have changed between update periods, such as the criticality threshold for total float and progress override versus retained logic and whether or not resource assignments progress with duration.

9-9.7 Construction Schedule Native \1\ File and /1/ Report.

Provide the native construction schedule file (Primavera P6 or Microsoft Project, **\1** unless otherwise approved by the NAVFAC cost TDC) and a PDF schedule report. The report is to include fields for activity ID, activity name, the WBS of the activity parent folder, activity original duration, activity start, activity finish, predecessors, and successors. **/1/**

This Page Intentionally Left Blank

CHAPTER 10 DELIVERABLE: CONTRACTING REQUIREMENTS

10-1 GENERAL REQUIREMENTS.

The Contract Specialist incorporates line items from the information provided in the Project Information Form (PIF) and Price Schedule. Provide the PIF and Price Schedule in Microsoft Word or Adobe PDF format to the Government Project Manager who will provide it to the Contracting Specialist.

10-2 PROJECT INFORMATION FORM (PIF).

Prepare and provide a Project Information Form (PIF). The PIF communicates to the Contract Specialist which contract clauses to include in the solicitation. The Government Project Manager provides the PIF to the Contracting Specialist to prepare the contract clauses for the solicitation. A downloadable version of the PIF is available on the WBDG (https://www.wbdg.org/navy/project-information-form-specifications-cover-sheet/project-info-form).

10-3 SELECTION OF LINE ITEMS.

The Base Price line item must provide a complete and usable facility (primary facility, supporting facilities, and design for DB projects). Option items and additive items must be able to be logically separated from the project without rendering the facility unusable. Intention is for the Base Price, together with the line items, to provide the maximum, usable facility within the funds available. Do not use Additive and Option items in the same contract; use one or the other. Additive items are only allowed for sealed bids; do not use unless authorized by Contracting Officer.

Use multiple line items for cost breakdown of facilities and site, and unit prices as established in the price schedule template. Use multiple line items for multiple funding sources (such as when combining one or more projects into one contract package), and option or additive line items. Provide separate SUB-CLINs for (1) Each facility (as indicated by the Category Code), (2) The total project supporting facility (utility) cost (outside the 5 foot (1.5 m) line), and (3) Design Fee (if a DB project). The number of items and the estimated cost per item depends upon the nature of the project. Provide no more than four contract line items (base item, plus three), unless specifically approved by the Contracting Officer. Each estimated option or additive item should tend to approximate 2% to 10% of the estimated base item.

A downloadable version of the Price Schedule is available on the WBDG (https://www.wbdg.org/navy/project-information-form-specifications-cover-sheet/price-schedule).

10-4 OPTIONS AND ADDITIVES.

Options and Additives can change up to award of the contract. Do not indicate line items on the drawings, or reference anywhere in the specifications, unless approved by the Government, who may allow only if a description of the line item in the price schedule does not adequately describe the work.

Do not use the term “alternate” to represent line items. Do not use terms, such as “base item” to indicate items in the primary contract line item.

10-5 OPTION ITEMS.

Option items provide a means to separate the funding sources or to obtain and hold competitive prices for future award of items of work. Use option items when different funding sources are used (examples: Furniture, Fixture, and Equipment (FF&E), Electronic Security System (ESS) equipment, Audio Visual System (A/V) Equipment), or when funding is not available to cover certain portions of the work at the time of proposal opening, but there exists a high probability of attaining the funding in the near future. Typically, the price for the option item(s) is added to the base item price to determine the low offer. Options need not be listed in a particular order. They are executed individually at the Government’s discretion. A time limit is given in the contract documents for the Government’s right to execute each option. Use of options in construction contracts must be approved by the Contracting Officer prior to advertisement.

10-6 ADDITIVE ITEMS.

Since additive line items are only allowed in sealed bid, do not use these unless authorized by the Contracting Officer. If used, arrange additive items such that the most essential portion of the work is added first. Arrange succeeding items in decreasing importance. During evaluation of the offers, additive items are added to the base item in the order listed. As each additive item is added, a new bid price is computed and compared to the available funds. As additive items are determined to be within the funds available, they are added to the Offeror’s bid price. If they are not within the funds available, they are skipped. Each additive item must be independent of the others.

10-7 DEDUCTIVE ITEMS.

Do not use deductive items. The Base Price line item must contain the minimum requirements of the contract. Using deductive items implies that the project is designed above the minimum requirements. Use Options instead.

CHAPTER 11 DELIVERABLE: DB REQUEST FOR PROPOSAL (RFP)

11-1 GENERAL REQUIREMENTS.

Requirements for preparation of RFP are also provided in Chapter 12.

11-2 DB REQUEST FOR PROPOSAL INTRODUCTION.

NAVFAC Design-Build (DB) RFPs are developed by organizing project requirements into the NAVFAC DB Six Part Format to procure facilities for our Navy Customers and Users. Requirements included in the RFP are driven by the need to control the design and the construction of the facility. Because the Contractor is designing and constructing the facility, design issues are just as important as construction issues and must be given equal consideration. The RFP information may be gathered from many sources such as:

- DD Form 1391 Documentation
- Funding Documents
- Site conditions and Restraints
- User Requirements
- Local and Regional Requirements
- Applicable Standards and Codes
- Applicable NAVFAC and DoD Criteria and Clauses
- Performance and Prescriptive Product, Material, and System Requirements

RFPs are a combination of performance and prescriptive requirements, but give preference to performance requirements for DB. However, many times prescriptive requirements are necessary to define a minimum acceptable solution or expected level of quality. Therefore, mold the type of information included in the RFP to meet the anticipated level of quality and needs of the User. Create performance and prescriptive requirements that comply with the following characteristics of each.

- Performance requirements state the function, desired results, and durability to control the Contractor’s design and selection of products, materials, and systems.
- Prescriptive requirements define the products, materials, and system or their characteristics to control the facility function, performance, and quality.

11-3 DB REQUEST FOR PROPOSAL WEBSITE, FORMAT, AND DOCUMENTS.

Guidance on preparing the RFP for DB projects and DB Template documents are available on the NAVFAC DB Master website (https://www.wbdg.org/navy/ndbm). This site is intended to (1) familiarize those new to the NAVFAC DB process with the RFP format and typical RFP specification sections and (2) allow those preparing a DB RFP to download the current and archived electronic documents. The DB RFP website is organized using links to major components of the DB RFP, including:

- Overview and Training - NAVFAC RFP Format, UniFormat® Information Structures, and NAVFAC Technical Contacts responsible for document maintenance.
- Design Guidance.
- Standard Template – This is the foundation template that can be used on projects. The Standard Template is designed to cover most of the building types routinely designed and built by NAVFAC. Industrial and specialized facilities are examples of building types that require additional information to be added to the Standard Template to cover the design, materials, and equipment that are unique to these building types.
- Model RFP Templates - The Model RFP Templates use the Standard Template as its foundation. Each Model Template modifies the Standard Template to suit a particular building type. These Models are an advanced starting point toward creating an RFP, however they do require coordination with User and facility requirements to properly define the final RFP. The building type templates in the DB Master website are:
    - Armory
    - Child Development Centers
    - Dining Facility
    - Entry Control Facility
    - Fire Station
    - Fitness Center
    - Hangar
    - Magazine
    - Marine Corp BEQ
    - Market Style BEQ

- Small Project Template (SPT): The SPT is a scaled down version of the Standard Template to be used on projects of low-complexity and a limited number of construction trades. SPT projects utilize routine designs with limited plans and specifications and fit within monetary thresholds.

  o The table "Small Project Design-Guidance" is located with the SPT on the WBDG (https://www.wbdg.org/navy/ndbm/small-project-template) to provide guidance in the application of the SPT.

11-3.1 RFP Format.

The RFP must include the six RFP Parts indicated below unless they are not applicable to the project. The typical facility project will have information in every RFP Part, with the possible exception of RFP Part Five, "Prescriptive Specifications." Typically, Part One is not prepared by the RFP developer, but is provided by the NAVFAC Contracting office after RFP Parts Two through Six have been completed by the RFP developer. The RFP developer is required to provide certain information such as the Project Information Form (PIF) for the NAVFAC Contracting office to properly prepare the RFP Part One. Verify with the NAVFAC Facility Engineering Command, what provisions are necessary to allow for the RFP Part One to be integrated into the RFP.

The DB Templates utilize different types of information in different Parts of the RFP. Therefore, there are different information structures employed to organize the information in the different RFP Parts. The following list indicates the type of information and information structures are used in the RFP Parts:

- **Part One** includes the Proposal Form and Documents and specifies the contractual requirements.

  o This Part uses the Standard Procurement System documents that are organized using the CSI MasterFormat®.

- **Part Two** contains the General Requirements Specification Sections – some only available at the DB website.

  o This Part uses specification sections organized using CSI MasterFormat®.

- **Part Three** contains the Project Program for the project.

  o This Part predominately uses a paragraph format; Chapter Six of Part 3, the Engineering Systems Requirements uses UniFormat®.

- **Part Four** contains the Performance Technical Specifications.

  o This Part uses UniFormat®.

- **Part Five** contains Prescriptive Specifications required for the DB RFP.
  - o This Part uses CSI MasterFormat®.
- **Part Six** includes attachments to define existing conditions and design requirements (such as Boring Logs, reference drawings).
  - o This Part is a combination of various attachments that have no predominate format.

11-3.2 Recommend Change to DB Documents.

Submit a Contract Change Request (CCR) on the DB website to recommend a change to the DB documents.

11-4 DB REQUEST FOR PROPOSAL DOCUMENT PREPARATION.

The DB documents are updated and changed regularly. Because the DB documents change regularly, it is necessary to use the updated documents when creating an RFP. Download the most current versions available on the DB website. Each DB Template and Model RFP Templates has a DOWNLOAD feature. Download individual documents or documents organized into RFP Parts.

11-4.1 Combining Multiple RFPs into One Bid Package.

Refer to Chapter 8 for guidance, when multiple RFPs are combined into one solicitation package.

11-4.2 Project Information Form (PIF).

Provide and complete the PIF for Prefinal and Final submittals. Refer to Chapter 8 for further PIF requirements.

11-5 RFP ELECTRONIC DELIVERABLES.

Provide RFP electronically in accordance with Chapter 12. Organize the RFP into one or two PDF files, with order shown in the following Table of Contents. Bookmark each item below, and the additional items indicated.

1. RFP Coversheet
2. RFP PART 1 Divider (when directed by the Command)
3. Overall, RFP Table of Contents (Parts 2-6)
4. RFP PART 2 Divider

   \1\ /1/

   a. RFP Part 2 Specification Sections (bookmark first page of each section)

5. RFP PART 3 Divider
    a. RFP Part 3 Project Program Coversheet

    \1\ /1/

    b. RFP Part 3 Project Program
    c. Each Chapter of RFP Part 3 (bookmark first page)
    d. Each ESR in Chapter 6 (bookmark first page)
6. RFP PART 4 Divider

    \1\ /1/

    a. RFP Part 4 Performance Technical Specifications (bookmark first page of each PTS)
7. RFP PART 5 Divider (if prescriptive specifications are included in the RFP)

    \1\ /1/

    a. RFP Part 5 Specification Sections (bookmark first page of each section)
8. RFP PART 6 Divider

    \1\ /1/

    (1) Attachments (bookmark first page of each attachment)

11-6 DB DESIGN SUBMITTALS.

Provide design submittals electronically in accordance with Chapter 12. Include information and organize DB design submittals in accordance with this FC and UFGS 01 33 10.05 20.

11-7 DESIGN AND CONSTRUCTION SUBMITTAL REQUIREMENTS.

Because the DB projects require design and construction submittals, the submittals are more complex than DBB. The DB process utilizes the RFP and the UFCs to define design submittals and the RFP and the UFGS to define construction submittals.

11-7.1 Locations of DB Submittal Requirements.

Because the DB submittals are spread into different documents, the preparers of DB submittals are required to refer to multiple locations to obtain the complete submittal requirement. The design and construction requirements are found in the six major locations designated in the following table:

Table 11-1 Design and Construction Submittal Summary

DB DESIGN and CONSTRUCTION SUBMITTAL SUMMARY			
NO	DOCUMENT	LOCATION	SUBMITTAL REQUIREMENT
1	RFP Part Two UFGS Specs	NAVFAC DB RFP Website	
	A, Most RFP Part Two	RFP Part Two	Lists *Project Specific* Administrative Submittals for Government Approval
	B. UFGS 01 33 00.05 20 *Construction Submittal Procedures*	RFP Part Two	Lists *Project Specific* Government Reserved Construction Submittals for Approval or Surveillance
	C. UFGS 01 33 10.05 20 *Design Submittal Procedures*	RFP Part Two	Lists *Project Specific* Design Submittals
2.	Engineering System Requirements (ESR)	RFP Part Three	Lists *Project Specific* Design Requirements
3.	Performance Technical Specification (PTS)	RFP Part Four	Lists *PTS Specific* Critical Construction Submittals for DOR approval and Construction Submittal requirements
4.	Unified Facility Guide Specifications (UFGS)	Whole Building Design Guide Website	Edited UFGS specification required by RFP Part Two for Contractor's Design Submittal and Compliance to UFGS technical requirements
5.	FC 01-300-09N Navy and Marine Corps *Design Procedures*	Whole Building Design Guide Website	Lists *Discipline Specific* Design Submittals for NAVFAC to supplement Core UFCs
6.	Discipline Specific UFCs (Arch, Struct, Civil, Geotech, Mech, Elect, Fire Protection, Force Protection Anti-Terrorism)	Whole Building Design Guide Website, some temporarily on DB Website in Design Guidance web page	Lists *Discipline Specific* Design Requirements and Explanation of FC 01-300-09N listed design submittals

11-7.2 Government Approval and Surveillance of DB Submittals.

The RFP DB submittals are organized to allow the RFP editor the flexibility to evaluate the project needs, determine the availability of Government resources to review submittals, and modify the submittal approval requirements to suite the project. The following Government approvals are built into the RFP Part Two DB Templates but may need input from the RFP editor to tailor the submittal to the project:

a. RFP Part Two, UFGS 01 33 00.05 20, Submittals Reserved for Government Approval - RFP Part Two UFGS section submittals denoted with a "G" submittal action code.

b. RFP Part Two, UFGS 01 33 10.05 20, Government Approving Authority – Government approves each design submittal.

c. RFP Part Two, UFGS 01 33 10.05 20, Exception to Contractor Construction Actions – Identifies certain Government design submittals approvals that have to be accomplished before construction related to that design submittal can begin.

d. RFP Part Two, UFGS 01 33 10.05 20, Design Documents, and UFGS 01 33 00.05 20, Contractor Reviewing, Certifying, Approving Authority - Government identified construction submittals required to be incorporated in the design submittals. DOR approval of identified construction submittals precedes Government approval of associated design submittals.

e. RFP Part Two, UFGS 01 33 00.05 20, Submittals Reserved for Government Approval - Construction submittals reserved for Government approval. The approval of these identified construction submittals prevents the contractor from beginning construction on that portion of the work until Government approval is obtained.

11-7.2.1 Surveillance Submittals.

The Government requires the contractor's DOR to approve most of the construction submittals; however, the RFP identifies certain construction submittals for Government surveillance. Government surveillance does not prevent the contractor from proceeding with construction but allows the Government a chance to confirm the submittal approvals of the DOR. Surveillance of construction submittals are built into the DB Template at the following location:

RFP Part Two, UFGS 01 33 00.05 20, Submittals Reserved for Government Surveillance - Construction Submittals Reserved for Government surveillance.

11-7.2.2 Critical Path Submittals.

Contractor submittals in DB may be designated as Critical Path Submittals, as further described in UFGS 01 33 10.05 20 of the RFP. In this situation, the submittal may only contain the design of one or a few disciplines, for example, civil and structural. Follow the submittal requirements as applicable for the disciplines pertaining to that critical path submittal. Ensure that work is included and coordinated with the other disciplines that are affected by that critical path work; for example, electrical and mechanical site work is included and shown on the civil site work critical path submittal, and provisions are made for the utility service entrances through foundation and for major pieces of equipment for the foundation work critical path submittal.

This Page Intentionally Left Blank

CHAPTER 12 ELECTRONIC DESIGN DELIVERABLES (EDD) FORMAT

12-1 SUMMARY.

This Chapter sets the policy for NAVFAC compliance with DoD and Navy policy for paperless contracting systems. The DoD requires implementation of electronic bid solicitation at NAVFAC components for construction projects. These EDD requirements provide NAVFAC specific format guidance. Regardless of contracting method, projects must follow these EDD requirements. DB RFP submittals follow the requirements for the phase of design in the following paragraphs.

12-2 EDD.

The following electronic deliverables are required for projects:

- Contract Drawing source files
- Contract Drawings
- Input and output source files for structural calculations
- Specifications or RFP
- RFP source files
- Specification source files
- Calculations
- Cost Estimate
- Reports, Surveys and Studies
- Basis of Design
- eOMSI Facility Data Workbook (FDW)
- Project Execution Plan (PxP)*
- Design Model*
- Record Model*
- Record Drawings source files
- Record Drawings
- Shop Drawings/ transmittals
- Architectural Color Boards (photos) (where applicable)
- Submittal Register
- Other (such as Photos or Project background/ support files)
- Price Schedule (when required)
- High Performance and Sustainable Building Checklist (where applicable)
- TPC Checklist (where applicable)

* - Applies to BIM Projects Only

12-3 EDD FORMAT REQUIREMENTS.

12-3.1 Specifications.

Develop Project Specifications in accordance with the requirements of this FC and UFC 1-300-02, using SpecsIntact software. Organization of PDF for Specifications is described in Chapter 8. Organization of PDF for RFP is described in Chapter 11.

12-3.1.1 Specification Source Files.

From the SpecsIntact Job File, provide the following source files: “Pulldata” and “Submittal Register.” “Printdata” does not have to be provided.

12-3.1.2 DB RFP Part 2 Source Files.

Develop RFP and Part 2 specifications in accordance with Chapter 11 of this FC.

If a program other than SpecsIntact is allowed to be used, original source data must be provided as follows:

- The native authoring application file format.
- A PDF format print of the original authoring data. No scans, copied images, or third party reproductions of paper prints will be accepted.

12-3.2 Electronic Operation and Maintenance Support Information (eOMSI) Facility Data Workbook (FDW).

When required by the contract, provide the Excel workbook, which contains the Model & Facility Data Matrix tab (used to select Mastersystems, Systems, and Subsystems included in the design). Use the original eOMSI FDW source file, as referenced in Appendix E, for each project.

Complete the eOMSI FDW in accordance with the Instructions tab of the eOMSI FDW.

12-3.3 Drawings.

12-3.3.1 Drawing Definitions.

12-3.3.2 Drawing Source Files.

Produce source drawings using vector-based Computer Aided Design (CAD) software. Provide source drawing files in native format meeting the following requirements.

12-3.3.2.1 Contract Drawing Source Files.

Contract drawing source files are the native CAD files (such as plans, elevations, sections, details) created by the DOR for the project. The Contract Drawing Source Files are not the legal record of the project Design.

12-3.3.2.2 Contract Drawings.

The PDF files created from the Contract Drawing Source Files represent the scope of the projects. The Contract Drawings are the legal record of project Design which are awarded to the construction contractor (KTR) which includes amendments.

12-3.3.2.3 As-Built Drawings.

The hard copy prints of the Contract Drawings marked up by the KTR (in accordance with the project specifications) to represent approved changes to the Contract Drawings.

12-3.3.2.4 Record Drawing Source Files.

The Contract Drawing Source Files edited by the KTR or DOR (depending on contract requirements) to reflect the changes shown on the approved As-Built Drawings. Prepare Record Drawing Source Files as described in this Chapter, Record Drawing Preparation. Record Drawing Source Files are not a legal record of the Project.

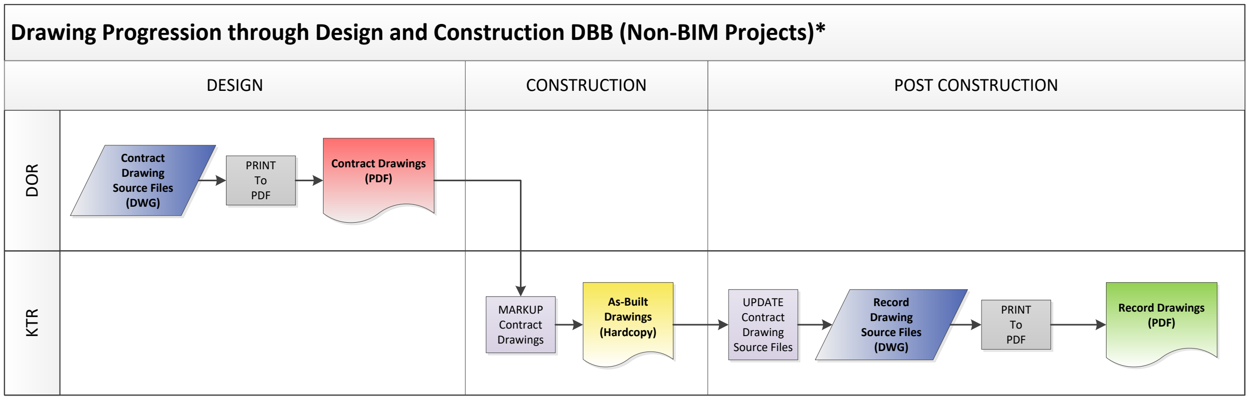
12-3.3.2.5 Record Drawings.

The PDF files created from the Record Drawing Source Files that represent the final installed condition of the project. Prepare the project Record Drawings as described in this Chapter, Record Drawing Preparation. The Record Drawings are the legal record of the completed project.

12-3.3.3 Drawing Progression.

Naming conventions and procedures as drawing progresses through design, construction, and post-construction are indicated in Figures 12-1 and 12-2.

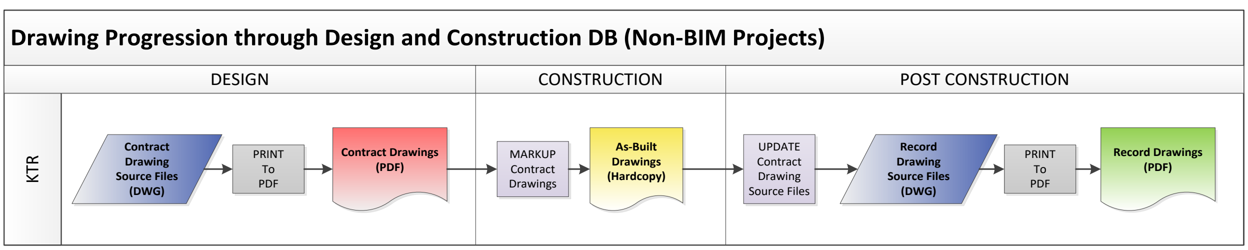
Figure 12-1 Drawing Progression Chart DBB



***This example reflects the KTR producing the record drawings.**

PRINT To PDF	**Print the source drawings to PDF files. The PDF becomes the legal record.**
MARKUP Contract Drawings	**KTR marks up the PDF Contract Drawings to reflect approved changes to the Contract.**
UPDATE Contract Drawing Source Files	**KTR updates the Contract Drawing Source Files to reflect the changes shown on the As-Built Drawings.**

Figure 12-2 Drawing Progression Chart DB



PRINT To PDF	**Print the source drawings to PDF files. The PDF becomes the legal record.**
MARKUP Contract Drawings	**KTR marks up the PDF Contract Drawings to reflect approved changes to the Contract.**
UPDATE Contract Drawing Source Files	**KTR updates the Contract Drawing Source Files to reflect the changes shown on the As-Built Drawings.**

12-3.3.4 CAD Standards.

CAD standards order of precedence are the requirements of this Chapter, then the latest versions of the DoD A/E/C CAD Standard and A/E/C Graphics Standard (A/E/C) then the National CAD Standard (NCS). In cases where the DoD A/E/C standards version changes after a project has commenced, the project PM must be consulted prior to adoption and integration of the newer standard into the drawing source files.

12-3.3.4.1 NAVFAC Standard Drawing Format.

Sheet drawings must use the NAVFAC standard title block (border sheet). Provide sheet drawings in ANSI D (22 x 34 inches) size format for projects using imperial units. Provide sheet drawings in ISO A1 (594 x 841 mm) for projects using metric units (ANSI D is assumed in other parts of this FC but modify and scale as appropriate if ISO A1 is used). See 12-3.7 NAVFAC Supported EDD Standard Components for border sheet templates and pen configuration table.

AutoCAD Source drawings must contain only one plotted sheet. Drawing source files which contain more than one sheet will be rejected with the following exceptions:

- Civil Sheet Files and other site plans (such as site utilities - electrical and telecommunications) in which the entirety of the project site cannot be legibly shown on a single sheet.
- Plan Sheet Files which the entirety of the project plan cannot be legibly shown on a single sheet at 1/8” = 1’– 0” (1 = 100) scale.

In both cases consult with the project PM prior to developing sheet files to ensure concurrence.

12-3.3.4.2 Plotting Guidelines.

AutoCAD pen weights and colors must be in accordance with the NAVFAC pen table. NAVFAC has developed a comprehensive pen table that utilizes the NCS 255-pen table as a basis but has added thinner lines and grayscale pens. Color numbers are assigned to “black” or “halftone” except where the pen table provides for color in other plotting applications. In the NAVFAC Revit templates, lineweights of model elements are scaled annotatively by default. Annotation lineweights have been adjusted to match the NAVFAC pen table for consistent plot results across disciplines. For BIM applications not using the Revit template or other BIM software, the plotted lineweights must match the NAVFAC pen table.

The NAVFAC Revit templates, the NAVFAC AutoCAD standard border, and the NAVFAC pen table references are provided on the WBDG (See paragraph 12-3.7 NAVFAC Supported EDD Standard Components). This pen table and corresponding line weights were established to be legible when printed at half-size (11 x 17 inches (279 x 431 mm)). Plotted files (hardcopy or PDF) must be monochrome unless color plots are specifically requested, for example, 3D representation (isometrics, perspectives, photographs).

12-3.3.4.3 Text Font and Size.

\1 Use standard and consistent text heights for a plotted full-size drawing throughout the project of 3/32 inch (2.4 mm) minimum, 1/8 inch (3 mm) preferred, for dimensions, notes, callouts, tables, schedules, and general typical text. Use 3/16 inch (5 mm) minimum for view title text, and 1 inch (25 mm) maximum for project titles on cover sheets. For existing features on plotted full-size civil drawings, a maximum oblique angle of 12 degrees is allowed. The text width factor must not be less than 0.8 for fonts in the body of the construction document. All fonts in the border, gutter, and cover sheets are 1.0 width factor, regardless of height. **/1/**

- Use the ARIAL.TTF font file for text less than or equal to 1/4 inch (6 mm).
- Use SWISS.TTF (Swis721 BT) font file for text larger than 1/4 inch (6 mm).

12-3.3.4.4 Translations.

Construction drawings are required to be prepared in dual language at a majority of overseas locations. For drawings developed in dual language, provide adequate space for the foreign language translation for objects such as notes, titles, and symbols. The final drawing must not appear cluttered or congested. Use italic font to distinguish the foreign language translation.

Location of translated text must be consistent across the drawing package, regardless of discipline. English on top, and the Host Nation language beneath, or on a following sheet when separate translation sheets are used. Refer below for acceptable locations:

- Translated text for Drawing Notes, Titles within the Drawing Area, and Symbols must be located directly beneath the English text.
- The following are acceptable locations for translated text pertaining to General Notes, Sheet Keynotes, or Schedules:
    - Beneath English text of each individual note or line item.
    - Grouped beneath the entire English General Notes, Sheet Keynotes, or Schedule table.
    - Where entire sheet consists of notes or schedules only, a separate translation sheet immediately following the English language sheet may be used. Use the proceeding sheet number and NAVFAC number for the separate translation sheet.

Consult with the project PM and DM prior to developing sheet files to ensure concurrence.

12-3.3.4.5 File Naming Conventions.

Use File Naming Convention for CAD Files as specified in the DoD A/E/C standard except as noted in Figures 12-3 and 12-4 below:

Figure 12-3 Model Files

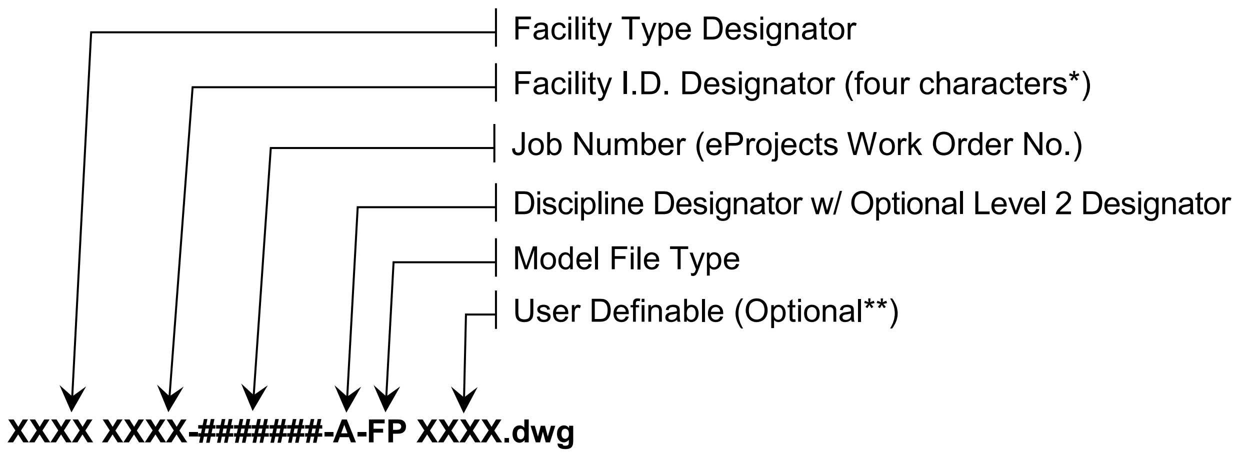


Figure 12-4 Sheet Files

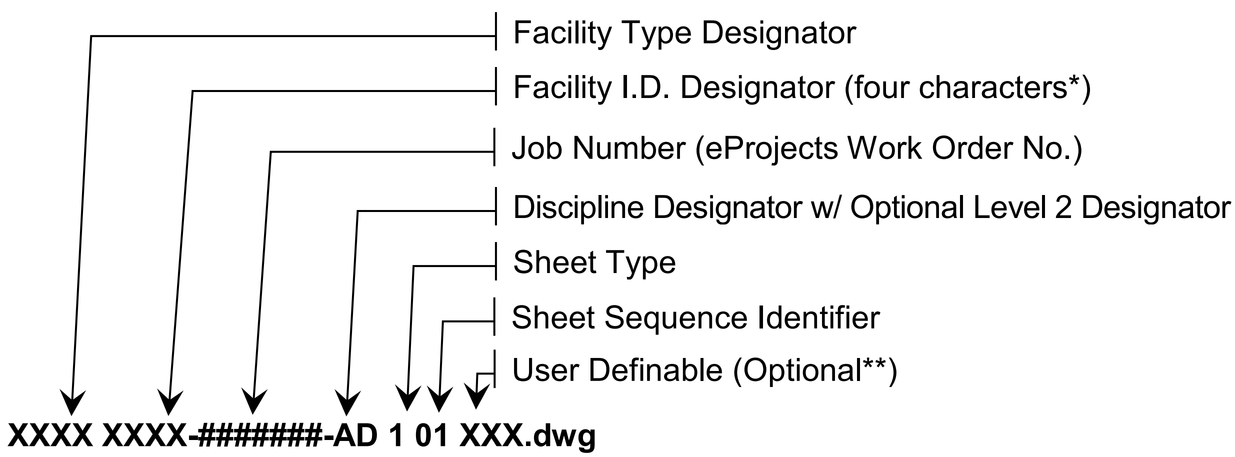


* If no building designation has been assigned, such as for new construction prior to completion, then utilize the project number (P-number) for the Facility Type and I.D. designators. If installation has an alternate building identification system, that designator may be utilized in lieu of the Facility Type and Facility I.D. Designator.

** When used, typically the first two characters of the User Definable suffix address the floor number. Use the last two characters to further specify quadrants, phases, or wings. For example: BLDG0001-eProjectWON-C-101-12.dwg; The User Definable suffix "-12" is used here on a Civil plan sheet where multiple tabs/layouts contain (12) adjacent sheets that are connected by match lines.

Model file types, sheet file types, and discipline designators are found in the DoD A/E/C CAD Standards. Obtain the Facility I.D. Designator and Job Number from the Contracting Officer.

12-3.3.4.6 Facility Type and I.D. Designators.

Use Facility Type and I.D. designators in Table 12-1.

Table 12-1 Facility Types and I.D. Designators

Facility Type

AFLD	=	AIRFIELD
BLDG	=	BUILDING
DRDG	=	DREDGE
DRYD	=	DRYDOCK
BRTH	=	BERTH
PIER	=	PIER
SLIP	=	WET SLIP
PRKG	=	PARKING LOT
ROAD	=	ROAD
RAIL	=	RAIL
FENC	=	FENCE
GATE	=	GATE
UTIL	=	UTILITY
CRAN	=	CRANE

.

For **Utility** projects the Facility I.D. Designator must be as follows:

SWTR	=	SALT WATER
FWTR	=	FRESH WATER
PWTR	=	POTABLE WATER
NGAS	=	NATURAL GAS
STEM	=	STEAM
SSWR	=	SANITARY SEWER
STRM	=	STORM DRAIN
CAIR	=	COMPRESSED AIR
POWR	=	POWER
COMM	=	COMMUNICATIONS
CATV	=	CABLE TV

For **Rail** projects the Facility I.D. Designator must be as follows:

CRAN	=	CRANE RAIL TRACK
TRAK	=	RAILROAD TRACK

12-3.3.5 Drawing Support Files.

Support files necessary for initializing, editing, and plotting drawing files must be a standard DWG or Microsoft Windows® component (or they must be an integral and standard component within the drawing file that require no third party custom utility or program to use). Support files include, but are not limited to, line types, hatch patterns, font styles, layer filters, display configurations and object styles. DWG files containing objects, styles, or definitions that require external files (such as SHX, LIN or LAY) to initialize, operate and display properly will be rejected.

12-3.3.6 Cost Estimates.

Submit the cost estimate as indicated in Chapter 9 with each submittal.**\1\ /1/**

Use the following file naming convention for MII files incorporating the Award Fiscal Year (AFY) and WON:

AFY_WON_P#_Short Description_Location_Submittal_Date

Use the following file naming convention for the cost estimate package:

AFY_WON_P#_Short Description_Location_Submittal_Date_CEP

12-3.4 Preliminary Design Documents.

Preliminary design includes previous phases of design except for the Final Design phase. Source drawings and their associated PDFs must maintain a “PRELIMINARY NOT FOR CONSTRUCTION” stamp across the signature areas of the title block, until the actual final design submittal. The NAVFAC AutoCAD border has this block on the default layer “G-ANNO-TTLB-PRLM”. That layer must be frozen at the time of creating the final deliverables. Except for the final submittal, indicate the submittal phase designation, such as “PREFINAL”, after the project title on the coversheet of the drawings, and in the header and on the coversheet of the specifications or the RFP. Combine drawings into a single PDF file to facilitate ease of use unless file size requires a multi-file submission.

12-3.5 Final Design Documents.

12-3.5.1 General.

Convert source drawings to PDF format directly from their authoring software. Drawing PDF file sizes must be a maximum of 50Mb with digital signatures or a maximum of 50 sheets. There is no limit on file size for specifications or RFPs.

12-3.5.2 Format of Final Design Drawings.

Combine drawings into a single PDF file to facilitate ease of use unless file size requires a multi-file submission.

Bookmark PDF files and create visual “thumbnails.” Create a bookmark for the beginning of each drawing discipline. Create a sub-bookmark for individual drawing sheets. Bookmark wording must be as descriptive as practical (such as S-101 Foundation Plan). When complete, the files must open to the “bookmarks” view as the default view with the drawing sheets visible in “fit to page” magnification. Before submission to NAVFAC, the professional must electronically sign and seal sheets and appropriate locations on the NAVFAC Title Block(s). (See paragraph 12-4 NAVFAC Signature Electronic Requirements.)

12-3.5.2.1 Multi-File Drawings.

If the PDF drawing set must be broken into several PDF sets due to the file size restrictions given in paragraph 12-3.5.1 General, every attempt should be made to package complete discipline sets (do not break-up discipline specific sheets).

12-3.5.3 Format of Final Design Specifications.

Convert specifications to PDF format directly from their authoring software.

12-3.5.3.1 Preparation of PDF for Final Design Specification.

1. Merge PDF files for each section into one PDF file.
2. Combine the PDF files of the Coversheet, Table of Contents, and other project specific files including the Submittal Register. Insert blank pages where needed so that sections, graphics, and reports begin on an odd number page. Blank pages must include the following statement: “This Page Intentionally Left Blank.” Create “thumbnail” images of each page. Refer to Chapter 8-6 for NAVFAC Coversheet location.
3. Bookmark the Coversheet, Table of Contents, each Division, Section, and inserted graphics, including the Submittal Register and Environmental Forms, following the respective UFGS section. Each Division bookmark must read “DIVISION XX - DIVISION TITLE”, each Section bookmark must read “XX XX.XX XX - SECTION TITLE” and is a sub-bookmark of its corresponding division. SpecsIntact allows printing of the PDF in this format automatically; however, the coversheet and graphics must be inserted at the appropriate location and Bookmark.
4. Set the Document Properties of the PDF such that it opens to the first page and to the “bookmarks” view as the default view with the specification or RFP pages visible in “fit page” magnification.
5. Before submission to NAVFAC at Final, the principal design professional(s) must electronically sign the documents in accordance with paragraph 12-4 NAVFAC Electronic Signature Requirements.

12-3.5.4 Format of PDF for Final DB RFP.

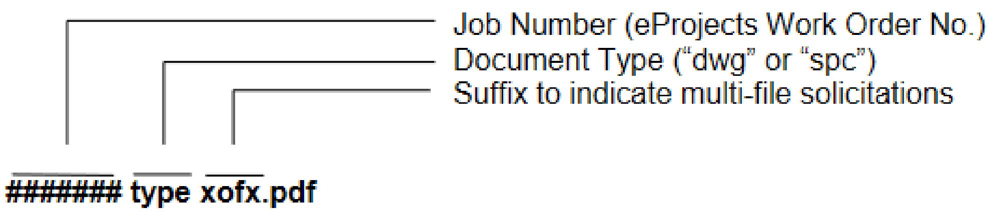
Provide PDF of RFP following the requirements for Specifications in paragraph 12-3.6.2 Source Documents, except add a bookmark for each Part. Insert attachments following the same convention.

If the RFP contains drawings, provide a separate PDF for the RFP and the drawings. Typically, reference drawings are provided in Part 6. This should be a separate file because of the sheet size (11 x 17 inches (279 mm x 432 mm) or 22 x 34 inches (558.6 mm x 863.6 mm)) and will facilitate printing of this file separately by the Contractor.

12-3.5.5 File Naming Convention for Final Design PDF Files.

File naming convention for the final design drawings and specifications is shown in Figure 12-5 below:

Figure 12-5 File Naming Convention for Final Design PDF Files



12-3.5.6 File Naming Convention for Amendments.

File naming convention for the Continuation Sheet is as follows:

Job Number (eProjects Work Order No.) Amend XXXX .pdf

For example, **55555Amend0001.pdf**.

File naming for attachments to the amendment follows guidance for naming specifications and drawings, with the exception that the amendment number must be included.

For example, **55555Amend0001dwg.pdf** or **55555Amend0001spc.pdf**

Combine attached drawing files into a single PDF file and attached specification files into a single PDF.

12-3.5.7 Password Protection of PDF Files.

Password protection to prevent changes to the PDF files is not allowed.

12-3.6 Record Documents.

12-3.6.1 Record Drawing Preparation.

Prepare Record Drawings in accordance with the drawing format guidelines of this Chapter and the following additional requirements. Make sheet changes **\1** directly in the authoring software format incorporating modifications and as-built conditions. In a BIM project, the authoring software DWG exports are from the BIM Record Model. **/1/** Use the CAD standards used for the Contract Drawings Source Files for as-built modifications and the following guidelines:

- AutoCAD: Make revisions on the original layer of the object being changed. Draw a "cloud" around the changed portion and place it on layer Z-ANNO-REVC. Place revision symbols, notes, and "Record Drawing Stamp", including those placed in each drawing's revision block, on the Z-ANNO-REVS layer.
- Revit: Make revisions to the Record Model elements. Using per sheet revision numbering, add the required Sequence Number(s) / Letter(s), Description(s), and Date(s) for the Amendment(s) / Mod(s). Draw revision cloud(s) around the changed portion(s) at the sheet level and assign the proper Revision sequence. Tag the cloud(s). The Revision Schedule on that sheet will populate MARK, DESCRIPTION, and DATE for Amendment(s) / Mod(s) clouded on that sheet. Make date entry in format MMM YYYY (ex. SEP 2023).
- Place a "Record Drawing Stamp" on each drawing sheet, as illustrated in Figure 12-6 below, for maximum visibility without conflicting with other pertinent data:

Figure 12-6 Record Drawing Stamp Example

RECORD DRAWING LETTER DATED – dd/mm/yy

Provide the following information on the revision block of Record Drawings:

- Sheets with No Changes → "**As-Built**"
  - Sheets with revisions to match final field conditions → "**As-Built Conditions Shown**"
  - Cover Sheet → "**RECORD DRAWINGS INCLUDE AS-BUILT CONDITIONS AND MAY NOT MATCH THE ORIGINAL CONTRACT DRAWING SHEETS.**"
- Type in the signatures, initials, dates, and SAT-TO information, in the title block area on the contract drawings, as text on the record drawings. The record drawings are not signed again by the DOR. The record drawings do not have to be sealed, and the seal from the DOR is not transferred.
- Provide extra sheets as required to accommodate sketches, amendments, and field changes. Obtain NAVFAC drawing numbers from the Design Activity for added sheets; these numbers will be out of sequence for inserted sheets. Typically, use the previous sheet designation followed by "A," "B," and so on for inserted sheets. Update the sheet index to reflect the final record drawing titles, sheet numbers, and NAVFAC numbers.

- Upon completion of the drawing modifications, save drawing files named as specified in this chapter.
- Produce a PDF file of each individual record drawing using a PDF page size that corresponds to the original document sheet size. Provide a PDF print resolution that results in clear detail of drawing features. Electronic signatures are not required.
- For DB Contractor provided drawings, the RFP reference or definitive drawings are not required for inclusion in the Record set of drawings.

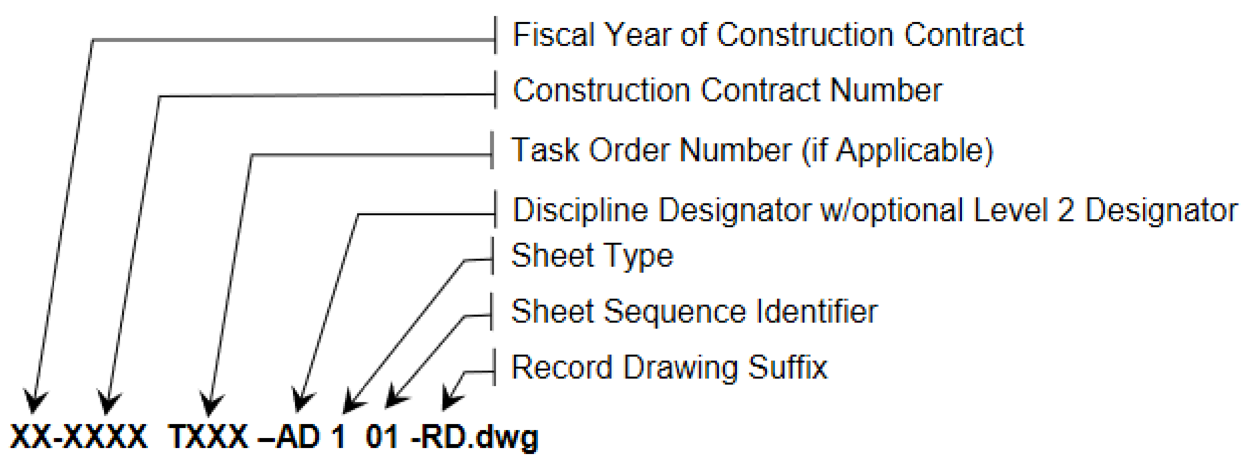
12-3.6.2 Source Documents.

In addition to the drawings, provide the specifications, design analysis, reports, surveys, calculations, and other contract documents utilized in creating the design package (drawings, specifications, and cost estimate) **\1** electronically on DODSAFE (https://safe.apps.mil/) or other approved secure site (coordinate with the Government Project Manager), **/1/** as specified in paragraph 12-6.3 Minimum Record Drawing Submittal Requirements. Provide the cost estimate and cost estimate backup (such as, quantity take-off or material or equipment quotes) on separate media.

12-3.6.3 Record Drawing Source File Naming.

The file naming convention for record drawing sources is shown in Figure 12-7:

Figure 12-7 Record CAD Files



12-3.7 NAVFAC Supported EDD Standard Components.

The WBDG contains the following NAVFAC standards for use on developing project deliverables: NAVFAC Standard CAD title blocks (border sheet templates) and pen configuration table at https://www.wbdg.org/navy/cad.

The standard CAD templates have incorporated the NAVFAC standards along with the DoD A/E/C CAD and National CAD Standards (NCS). The templates are available in

AutoCAD and Revit. These templates are available for use, but NAVFAC does not guarantee that they are without error and are not responsible for inaccuracies. NAVFAC is continually updating and improving the templates.

12-4 NAVFAC ELECTRONIC SIGNATURE REQUIREMENTS.

Federal legislation has established the legality and acceptability of electronic signatures (in accordance with Public Law 106-229). NAVFAC requires the use of electronic signatures for the certification of drawings and specifications. The following sections outline the requirements for electronic signatures on NAVFAC deliverables.

12-4.1 General Requirements.

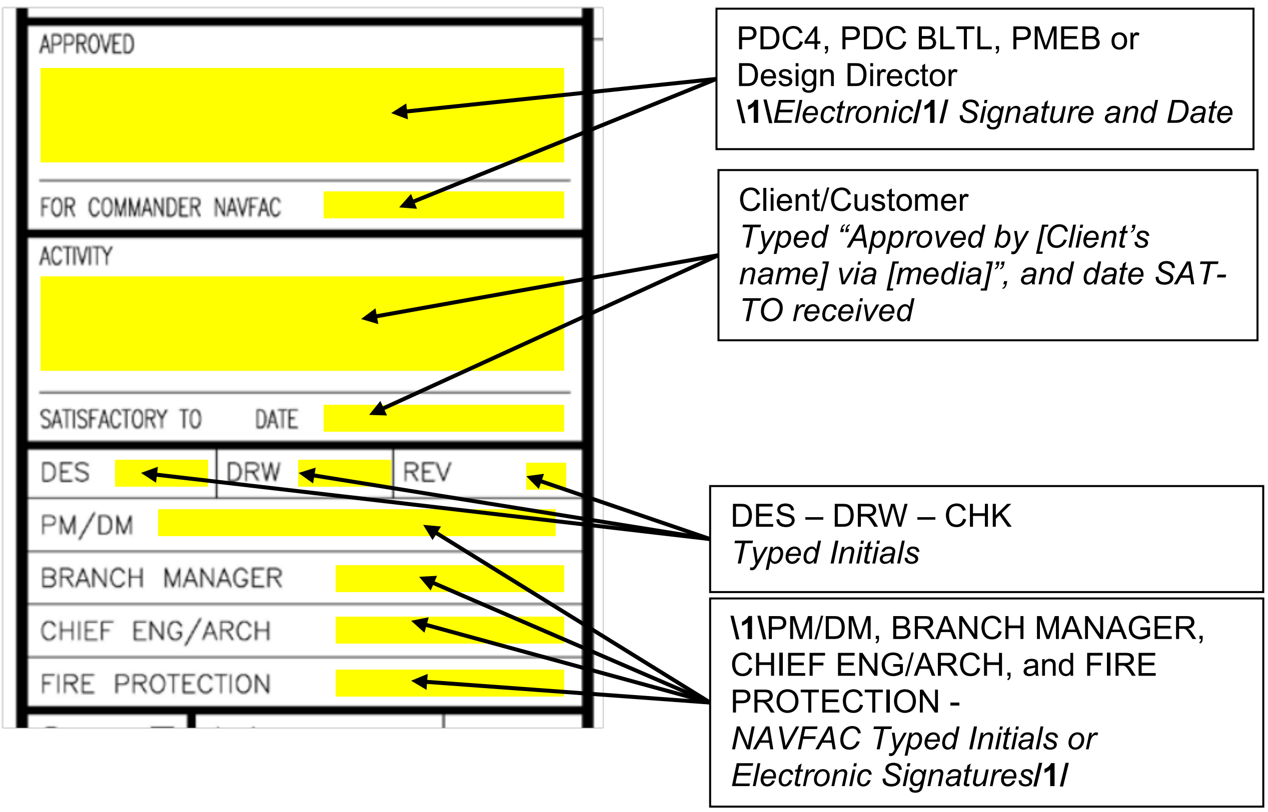
Prior to final NAVFAC signature, the following steps must be completed:

- Government Project Manager receives SATISFACTORY TO (SAT-TO) from the Client.
- Type “Approved By [Name of Client Representative] via [media (such as email or fax)]” in the ACTIVITY field, and the date the SAT TO was received, in the DATE field. SAT TO must appear on every drawing sheet in the CAD file.
- **\1\ /1/**
- Type in the initials of the “DES, DRW, and CHK” areas on the border to indicate the individual(s) who designed, drafted, and checked the sheet, respectively. These areas must display the responsible individual’s initials in the CAD file. The CHK initials CANNOT be the same as the DES and DRW initials.
- The “PM/DM, BRANCH MANAGER, CHIEF ENG/ARCH, and FIRE PROTECTION” fields are for use by NAVFAC **\1** and may be signed with Sign-it®, Bluebeam, **/1/** or initialed with CAD text. **\1** Signatures in these fields must be **/1/** a supervisor or has delegated signature authority under NAVFACINST **\1** 5216.1O. The CHIEF ENG/ARCH CAD text can be changed to reflect the signatory’s title; if this field is not used, the CHIEF ENG/ARCH CAD text in this field must be removed. **/1/** A signature block is shown in Figure 12-8.
- Provide an electronic seal in the title block labeled “SEAL” for each CAD sheet per the discipline responsible for the work contained on the sheet.
- **\1** The DOR must **/1/** electronically sign the PDF of the specification coversheet (RFP coversheet for DB RFP Preparer) and **\1\ /1/** the seal on each drawing PDF sheet, using Sign-it® **\1** or Bluebeam **/1/**. If the professional is required to submit “wet-signed” documents to be in compliance with their state regulations, then a separate “wet-signed” drawing and specification set may be submitted, meeting the requirements

of paragraph “Wet-Signed Documents”. A fully electronic solicitation, including electronic signatures is still required.

When the above steps are completed, NAVFAC will **\1** electronically **/1/** sign the “For Commander NAVFAC” in the title block on each Drawing sheet and on the coversheet of the Specifications. This is required on final designs including designs prepared under DB contracts.

Figure 12-8 NAVFAC Signatures



12-4.2 Specific Software Requirements.

Sign design documents using the Sign-it® **\1** or Bluebeam **/1/** software. Current version information, points of contact, and order forms for Sign-it® are located on the WBDG (https://www.wbdg.org/navy/cad).

12-4.3 Wet-Signed Documents.

If required, produce wet-signed documents from the final electronic PDF documents (prior to electronic signature application) submitted to NAVFAC.

12-5 BUILDING INFORMATION MANAGEMENT/MODELING (BIM) REQUIREMENTS.

For projects that require BIM, comply with requirements for Drawings and as follows.

12-5.1 BIM Definitions.

12-5.1.1 BIM Project Execution Plan (PxP).

The DOR is responsible for the PxP, which is a mandatory document that identifies in detail: key contacts, quality control, software used, model organization, and project deliverables when designing with a BIM application.

Download the PxP file found on the NAVFAC BIM Page of the WBDG (https://www.wbdg.org/navy/bim-eomsi).

12-5.1.2 3D Parametric Modeling Application.

A software application which uses select criteria, parameters, and variables to determine the characteristics (including length, width, height) of a Model Element and defines relationships between other model elements.

12-5.1.3 Model.

A digital representation of the physical and functional characteristics of a facility or a part thereof, comprised of Model Elements with Element Data.

12-5.1.4 Model Element.

A self-contained object within a Model with a unique identification, whose behavior and properties are defined by data fields (Element Data). Model Elements can represent a physical entity, such as a pump or a concrete wall, and range from the simple (a standalone pump) to the complex (a multi-component wall system).

12-5.1.5 Element Data.

The non-graphical information of a Model Element that defines the various characteristics of the object. Element Data can include properties such as parametric values that drive physical sizes (length, width, height), material definitions and characteristics (wood, metal), manufacturer data, industry standards (AISC steel properties), and project identification numbers. The required Element Data fields can be found in the Required Facility Asset Fields of the Model & Facility Data Matrix tab in the eOMSI FDW.

12-5.1.6 Design Model.

The Model created and delivered by the DOR which is developed to a specific Level of Detail (LOD) as defined in the Model & Facility Data Matrix tab of the eOMSI FDW.

12-5.1.7 Record Model.

The Design Model modified by the KTR or DOR (depending on contract requirements/delivery method) which incorporates the real-world conditions of the facility as constructed.

12-5.1.8 Facility Data Workbook.

The Facility Data Workbook (FDW) defines the BIM Levels of Detail (LOD) required for each system, during design. The FDW is initially populated during design and completed during construction with the actual components and systems provided. The FDW is provided as part of UFGS 01 78 24.00 20 and required in accordance with paragraph 7-2 Building Information Management and Modeling (BIM).

12-5.2 Minimum Modeling and Data Requirements.

12-5.2.1 General.

Use 3D Parametric Modeling Application(s) to develop the Design Model(s) based on the project scope.

12-5.2.2 Model & Facility Data Matrix.

DOR completes the Model & Facility Data Matrix tab of the eOMSI FDW (XLS) utilizing the Instructions tab found in the eOMSI FDW. Download the eOMSI FDW from the NAVFAC BIM Page of the WBDG (https://www.wbdg.org/navy/bim-eomsi).

12-5.2.3 Model Files.

Produce an independent Design Model for each discipline that can be linked to each other. Document the Model names and Model links in the PxP.

12-5.2.4 Element Data.

Use the Required Facility Asset Fields (Element Data) specified in the Model & Facility Data Matrix tab of the eOMSI FDW for modeled elements.

12-5.2.5 Room Space Data.

Include room space data defining net square footage and net volume to develop the room finish schedule including room names and numbers.

12-5.2.6 Schedules.

Produce Schedules (Finish, Room, Lighting, Plumbing, Equipment, Openings) from the Model Elements and Element Data within the Model.

12-5.3 Design Model.

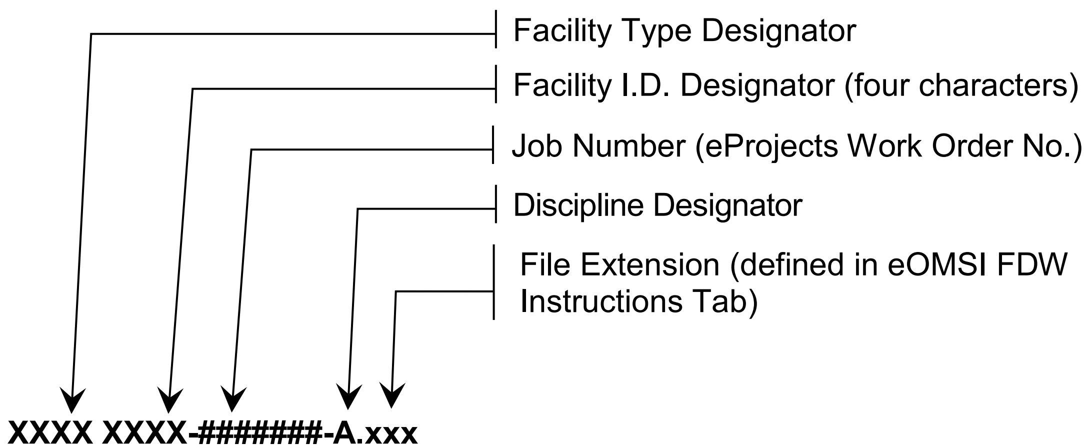
DOR develops the Design Model using a 3D Parametric Modeling Application to produce a complete set of Contract Drawings. Submittals must be compatible and editable using their native software as defined in the PxP.

12-5.3.1 Design Model Naming Convention.

Refer to Table 12-1 for the Facility Type and Facility I.D. Designators.

Use the naming convention found in Figure 12-9 for BIM Design Models files:

Figure 12-9 BIM Design Model Naming Convention



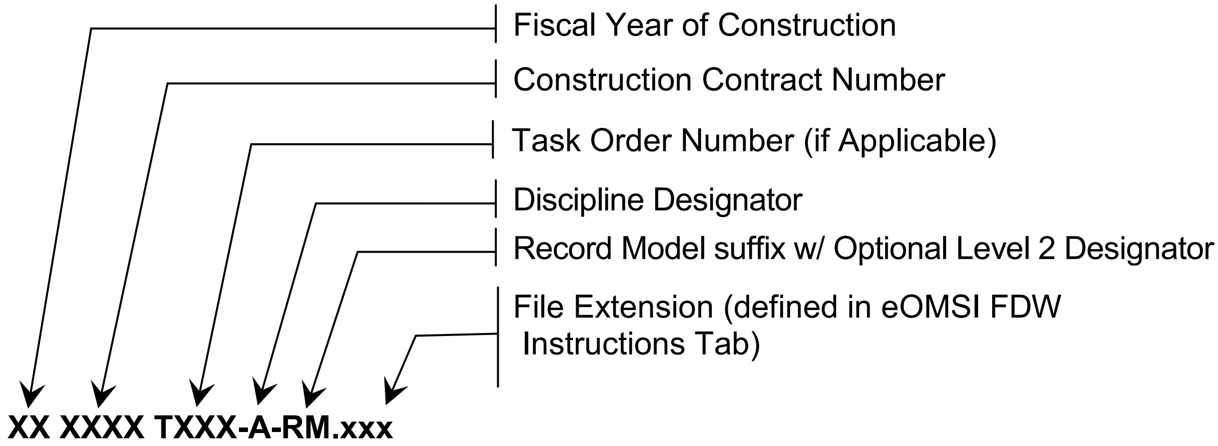
12-5.4 Record Model.

KTR develops the Record Model by modifying the DOR's Design Model as the facility is being constructed. Utilize the Record Model Grade specified in the Model & Facility Data Matrix tab in the eOMSI FDW.

12-5.4.1 Record Model Naming Convention.

The file naming convention for record models is shown in Figure 12-10 below:

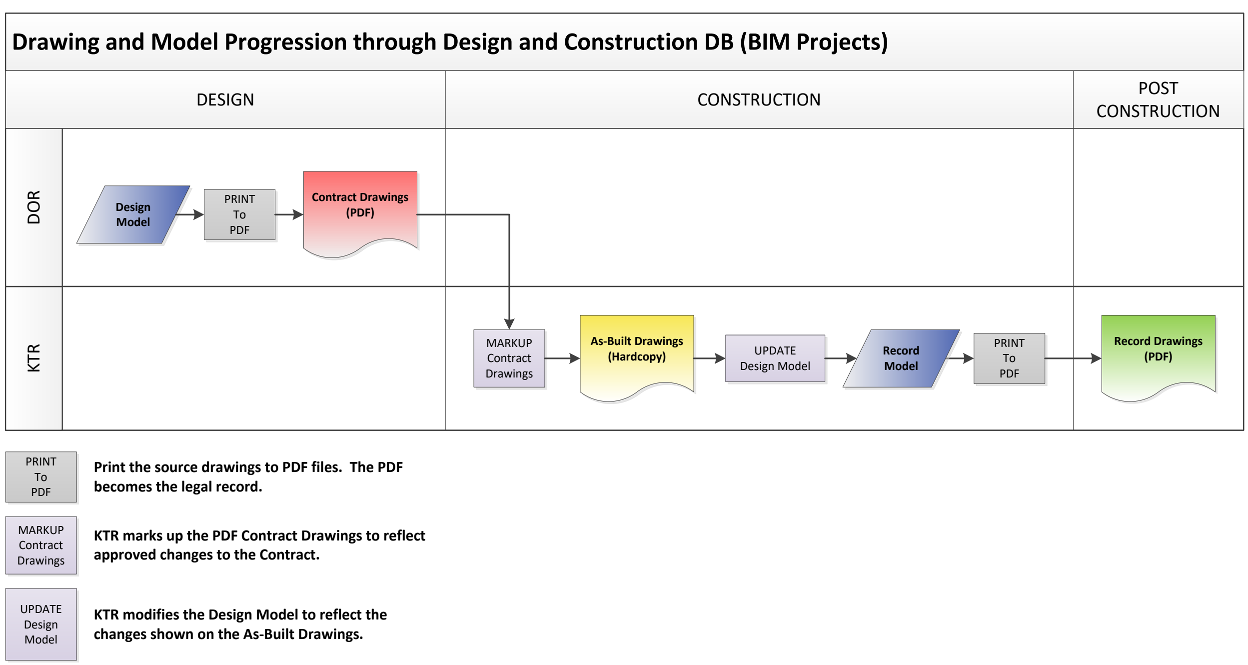
Figure 12-10 Record Model Naming Convention.



12-5.5 Drawing and Model Progression.

Model and Drawing naming conventions and procedures are indicated in Figure 12-11.

Figure 12-11 Drawing and Model Progression DBB



12-5.6 BIM Submittal Requirements.

12-5.6.1 Visual Review Report.

The DOR must produce a report (PDF) which compares the Mastersystems, Systems, and Subsystems list in the Design Model with the Mastersystems, Systems, and Subsystems list identified in the Model & Facility Data Matrix tab in the eOMSI FDW at each Design Phase. Identify discrepancies (omitted and unintended Model Elements) between the two lists, including an explanation for each. Address omitted and unintended Mastersystems, Systems, and Subsystems in the Design Model by Final Design. Provide a written explanation for omitted and unintended Model Elements that remain in the Design Model.

12-5.6.2 Clash Detection Report.

The DOR must conduct a clash detection of the Design Model at each design phase. Provide a report (PDF) at each phase showing existing clashes in the Model. The final Clash Detection report must reflect zero clashes.

12-5.6.3 Format of PxP in Preliminary Design.

Provide PDF file of PxP.

12-5.6.4 Format of Final Design Model.

Provide the final Design Model in native format and exported CAD files in DWG format.

12-5.6.5 Format of Final Record Model.

Provide the final Record Model in native format and exported CAD files in DWG format.

12-5.6.6 Facility Data Workbook (FDW).

Provide the Facility Data Workbook in Excel format.

12-6 EDD MEDIA AND ORGANIZATION.

12-6.1 General.

Provide Official submittals **\1** electronically on DODSAFE (https://safe.apps.mil/) or other approved secure site (coordinate with the Government Project Manager). **/1/** Submit CAD files in native Drawing (*.DWG) format in the NAVFAC supported version. Drawing files must be uncompressed and unzipped. Purge files of unused items (blocks, layers, line types, and nested items). Do not submit single drawing files with multiple layouts except as described in paragraph 12-3.3.4.1 NAVFAC Standard Drawing Format. Do not bind cross referenced parent and child drawings. If the submitted native DWG files are not the native file format for the authoring software, provide native design data in the original authored format in addition to the native DWG compliant format.

12-6.2 Minimum Final Submittal Requirements.

Provide the following as a minimum at final design submittal. NAVFAC Components may require additional submittals**\1\ /1/**.

\1\ /1/ #1 - Final Design or RFP for Government Signature\1\ /1/

Drawing PDF file(s) electronically signed by the Professional(s) in Responsible Charge

RFP or Specification PDF file electronically signed by the Professional in responsible charge in the "Submitted By:" Section

\1\ /1/ #2 - Source Files\1\ /1/

/CAD Native CAD Files for disciplines; include X-refs, images, or other external reference files.

/BIM (for BIM projects only) Native BIM models, PxP, Visual Review Report, and Clash Detection Report.

/eOMSI FDW

/Specifications folder - Specification source files

/PullData folder (*.sec files)

/RFP folder - Source files of RFP package, further divided by subfolders into Parts, except for specification section files or CAD files.

/Calculations folder (pdf and input/source files)

/Support folder

/Reports-Surveys - Studies folder

/Basis of Design folder

/Architectural Color Boards folder (photos)

/Other folder (such as Photos, Project background/support files)

\1\ /1/ #3 - Cost Data\1\ /1/

12-6.3 Minimum Record Drawing Submittal Requirements.

Submit **\1** record drawings **/1/**. Each must have the following folders and content.

/Record Drawings/

/CAD - Record CAD files and X-refs for disciplines must be stored in the same folder (directory).

/PDF

/Specs

/Calcs

/Cost

/Basis of Design

CHAPTER 13 PHASE: PRELIMINARY DESIGN: DON MILCON

13-1 GENERAL REQUIREMENTS.

Preliminary Design for the Department of the Navy, Military Construction (MCON) requires development of Preliminary Design Deliverables to ensure that projects submitted for Congressional and Presidential approval contain sufficient planning, accurate construction scope, adequate documentation, and a valid cost estimate for successful execution. For "Blue Navy" MCON projects, Preliminary Design begins upon substantial completion of advanced planning after the issuance of Budget Project Readiness Index (PRI) Authority (BPA). For "Green Navy" MCON, MCNR and Family Housing projects, Preliminary Design begins with issuance of Preliminary Design Authorization (PDA).

13-2 PRELIMINARY DESIGN.

Preliminary Design is authorized for development of Preliminary Design Deliverables including a budget-ready DD Form 1391 for submission into the Department of Navy's (DoN) Military Construction budget, through the facility programming process. The purpose of Preliminary Design is to validate planning requirements and develop Preliminary Design Deliverables and cost estimate for MCON projects. Upon issuance of authority to start Preliminary Design, Preliminary Design Deliverables and a cost estimate are prepared to ensure MCON projects submitted for Congressional and Presidential approval contain sufficient planning, accurate scope, a minimum set of design deliverables, and a construction cost estimate for successful contract award and execution.

Preliminary Design Deliverables as described in this chapter do not have the same level of detail as the Schematic Design Submittal described in Chapter 14. Although many of the same requirements are contained in both submittals, they are developed for different purposes.

13-3 PROJECT PLANNING DD FORM 1391 ASSESSMENT.

Conduct an assessment of the existing project planning documentation, including the DD Form 1391, developed during the advance planning phase. **\1** Refer to the Consistency Review Board (CRB) Guidelines and DD Form 1391. **/1/**

13-4 ROLES AND RESPONSIBILITIES.

DD Form 1391 documentation is the combined result of a team project development effort from planning through the end of preliminary design. DD Form 1391 content is divided into blocks. Some blocks cover Designer or Project Manager prepared information, while other blocks are dedicated to Planning data. Responsible entities for DD Form 1391 content are as follows:

- Block 9, Cost Estimates: Project Team

- Block 10, Description of Proposed Construction: Project Team
- Block 11, Requirement: Public Works (PW) Directorate Real Property Manager and Activity/Region
- Block 12, Supplemental Data: PW Directorate Real Property Manager
- Block 12, Budget Estimate Summary Sheet: Project Team
- Block 12, Estimated Design Data: Project Manager
- Block 12, Equipment from Other Appropriations: Project Manager, PW Directorate Real Property Manager and Government Activity/Region

13-5 PRELIMINARY DESIGN DOCUMENTATION.

The project documentation establishes the basic requirements needed to meet the mission of the Support Command.

13-5.1 Preliminary Design Element.

Elements of the project documentation for most facility projects include: a DD Form 1391 in **\1** Programming Administration and Execution (PAX) **/1/** format with detailed construction scope, collateral equipment list with cost, and preliminary budgetary cost information for primary facility and supporting facilities (for example, utilities, connections, and site work). Authority for Preliminary Design will only be issued once the advanced planning is substantially complete and the Project Planning DD Form 1391 sufficiently addresses the following elements:

- Site Identification & Approval
- Economic Analysis with updated costs
- Facility Planning Data
    - o Basic Facility Requirement (BFR)
    - o Facility Planning Document (FPD)
    - o Planning Study (for example, utility, traffic, asbestos, lead, radon)
- Equipment List and Cost
- Project Cost
- Environmental, Historic, Cultural Resources Impacts
- Project Requirements Schedule, and Engineering Studies (Utilities, Anti-Terrorism (AT), Physical Security, Geotechnical, Site, and Structural)

13-5.2 Preliminary Design File Naming Convention.

Use the file naming convention shown in Figure 13-1 for Preliminary Design files and Element Extensions provided in Table 13-1. **\1** This is required for uploading documents into PAX. **/1/**

\1\ /1/

Figure 13-1 Preliminary Design File Naming Convention

FYXX PXXX_MILCONChecklist_Submittal_Name

13-6 PRELIMINARY DESIGN CHARETTE.

Conduct a charrette with project stakeholders and multi-disciplines as applicable to develop Preliminary Design Deliverables. The multi-disciplinary design effort examines project functions, validates requirements, and analyzes alternate concepts.

13-6.1 Format.

The preliminary design charrette format consists of multiple work-sessions (usually 2-3 work-sessions), over a week-or-greater timeframe. Both the number of work-sessions and the time between work-sessions is dependent on project size and complexity, as well as the completeness of prior project planning efforts. Complete the site engineering investigation, described in paragraph 13-12 Cost Estimate, prior to or coincident with the preliminary design charrette.

Initial charrette work-sessions focus on validating project planning documents, analyzing project functions, and presenting notional concepts and alternatives for the site and facilities. The preliminary design charrette format is iterative; follow-on work-sessions feature presentation of revised project concepts and discussion leading to refinement of the product.

13-6.2 Participation.

Engage project stakeholders in the preliminary design charrette. As a minimum, include the following team members:

- Project Manager, Cost Engineer/Estimator and Project Technical Team, including the Design Manager, Architects and Engineers from disciplines needed to support the preliminary design.
- Customer Representatives, including but not limited to: End User, Project Sponsor, Subject Matter Experts.
- Base Facilities Representatives, including Planners, Utility Managers and Technical Staff, Installation Security Officer, Environmental Technical Staff, Construction Management Staff, Base Communications Officer (BCO), Cybersecurity Stakeholders (for example, NAVFAC Echelon IV CIO4 and CIO2).
- Privatized utility system owners.

13-7 IDENTIFICATION OF UNIQUE PROJECT REQUIREMENTS.

Identify and coordinate unique project requirements during the preliminary design charrette. Coordinate costing and development of unique requirements identified by the Project Technical Team, or other appropriate personnel, of issues not related to design. Unique requirements that are prone to be overlooked include:

- Construction restrictions due to airfield/waterfront operations

- Explosive Safety Site Approval
- Temporary facility requirements
- Laydown areas which may include offsite areas that increase project cost, such as batch plants for large pavement projects and stockpiling area for contaminated material
- Construction phasing requirements
- Locating property lines and other land restrictions, such as easements
- Security and Anti-terrorism requirements (Controlled Areas)
- Environmental issues, including hazardous material abatement, radon mitigation, permitting, and NEPA
- Cost of disposing hazardous materials
- Seismic, fire protection and sustainability triggers for renovation projects
- Host Nation Requirements (for overseas projects; for example, verify if energy or renewable requirements)
- On Installations with privatized utilities (such as gas, water, electric), coordination with the Privatized utility system owners for utility system connections and upgrades to the utility system. Utilities cannot be disturbed without the written consent of the privatized utility owner. Ensure utility system costs are included in the DD Form 1391.

13-8 DD FORM 1391.

Prepare updates to the project's DD Form 1391 documentation for submission in **\1** PAX **/1/**. Conform to the following, latest guidance provided by the Government MILCON Manager:

- Consistency Review Board (CRB) Guidelines & DD Form 1391 Development
- Budget Quality DD Form 1391 Editing and Style Guidelines
- POM Preliminary Design Guidance for applicable MILCON Program Budget Year

13-9 PRELIMINARY PROJECT NARRATIVE.

The project narrative, along with the drawings, documents the preliminary project design that facilitates the budget-ready project cost development. Preliminary design is driven by the requirements identified by Project Stakeholders, Government Project Planners, and applicable design criteria. The preliminary design is not constrained by a pre-determined budget.

Identify the following in the project narrative document:

13-9.1 Description of Proposed Construction.

Revise and enhance Block 10 statements in the prior DD Form 1391 that was prepared during planning. Prepare description of proposed construction in compliance with Block 10 requirements in "CRB Guidelines & DD Form 1391 Development" and "Budget Quality DD Form 1391 Editing and Style Guidelines." Use verbiage prepared for this portion of the Project Program for Block 10 of the budget-ready DD Form 1391.

13-9.2 Project Objectives.

Identify the Mission Statement and Facility Function. Describe issues that need to be considered in future project development, including, but not limited to: Project Specific Priorities, Workflow Processes, Appropriate Design, Special Design Challenges, Adaptability and Flexibility, and target dates for Initial and Full Operating Capability (IOC/FOC).

13-9.3 Site Analysis.

Define existing site conditions and site development requirements. Identify constraints that restrict development. Project cost can increase for sites that are developable but constrained – and require special considerations to build on the site. Describe situations where the site location is associated with other-agency or Command approval processes (for example, NOSSA, SHPO, NEPA, NAVAIR). Refer to Paragraph 13-13 Site Engineering Investigation.

13-9.4 Building Requirements.

Develop the facility preliminary design concept. Describe primary blocks, such as, interior spatial areas, workflow/processes, functional relationships, circulation patterns, equipment/storage requirements, and security issues. Schematically tabulate facility floor area requirements on a room-by-room basis. Verify that floor plan area requirements identified by the functional analysis match Facility Planning Documents (FPD), prepared by Government project planners.

13-9.5 Host Nation Requirements.

For OCONUS projects, identify host-nation requirements, such as energy or renewable requirements or others.

13-10 DISCIPLINE-SPECIFIC BASIS OF DESIGN.

Develop separate and condensed summaries for core disciplines (in reference to the Core UFCs defined in UFC 1-200-01) including: Geotechnical, Civil, Landscape Architecture, Architectural, Structural, Fire Protection, Mechanical, and Electrical.

Provide sufficient definition in the discipline-specific Basis of Design to support the development of a cost estimate for that discipline.

13-10.1 Building Systems.

For the building systems (such as architecture, structural, mechanical, electrical, fire protection), identify the discipline-specific design assumptions, as required to support a parametric estimate on the Primary Facility. Consult with interior design personnel for select projects, where unique interior design requirements cannot be captured by standard parametric estimating techniques for the facility-type. Ensure that risks associated with facility systems identified, typically on the Preliminary Hazard List (PHL) or Preliminary Hazard Analysis (PHA) if developed prior to the Preliminary Design, are mitigated, or have engineering controls to eliminate the risk.

13-10.2 Site.

For the site, including utility systems (for example, civil, electrical, telecommunication) identify the design assumptions for Supporting Facilities, as required to support quantities and unit costs. Consult with landscape architecture personnel for select projects, where a portion of total costs may be associated with landscape architectural requirements.

13-10.3 Cybersecurity Impact Level.

Indicate the Cybersecurity Impact Level for the control systems. Provide project-specific requirements.

13-10.4 Ratio of Renovation Cost to Replacement Cost.

For renovation projects, provide an analysis of the ratio of renovation cost to replacement cost (see UFC 3-701-01 for the definition of replacement cost). Clearly identify ratios that trigger additional facility upgrades (such as AT, Physical Security, seismic evaluation and retrofit, and sustainability). Re-address the costs in the Economic Analysis provided from the Project Planning development phase.

13-10.5 Narratives.

In addition to basis of design narratives for core disciplines, provide separate narratives for the following cross-disciplinary elements. Devote special attention to issues that may have significant impact such as:

- AT – Discuss AT with the customer and identify AT requirements that have significant cost impact including full compliance with UFC 4-010-01 and progressive collapse avoidance.
- Sustainability – Indicate the feasibility of meeting Guiding Principle requirements and other sustainability goals for the project in accordance with UFC 1-200-02. Include a draft NAVFAC High Performance Sustainable Building (HPSB) Checklist. Where TPC is an anticipated requirement, develop a draft TPC checklist. Discuss the scope for

commissioning, to include systems to be commissioned, development of required documents, and Commissioning Provider contracting method.

13-11 PRELIMINARY DRAWINGS.

Prepare preliminary design drawings or sketches, for the purpose of:

1. Clearly illustrating the basic project scope to stakeholders, and
2. Supporting development of the parametric cost estimate.

Preliminary design drawings or sketches need not feature the level-of-detail or format specified in Chapter 7; especially where highly complex drawings could detract from the primary intent. Include the following:

- Vicinity Map and Location Plan
- Demolition Plan: Show facilities to be demolished (if required)
- Site Plan(s):
    - Show the layout (size and possible shape) of the new facility in relation to major landmarks.
    - Show the possible location of access roads, parking, landscaping, pedestrian walkways, plazas and patios, landscape structures, roads, and sidewalks, as applicable.
    - Indicate approximate dimensions and orientation.
    - Clearly indicate site constraints such as explosive safety arcs, flood zones, wetlands, or other environmentally sensitive areas.
    - Where AT and Physical Security is applicable, clearly depict setback distances to vulnerabilities, including parking, roadways, and obstructions.
    - Provide a Building Code site plan showing the assumed property lines of adjacent structures.
- Utilities Plans:
    - Show utility lines and their points of connection in relation to existing adjacent structures, roads, and utilities.
    - Show off-site utility upgrade requirements needed to support the project.
    - Show civil, mechanical, electrical and telecommunication utilities to clearly convey the scope and quantities associated with various utility improvements.

o On large utility distribution projects, provide one-line diagrams of electrical and telecommunication utilities.

o Show mechanical building utilities coming into the building (for example, water, sanitary sewer, gas piping, and steam.

- Building Floor Plans:

  o Provide floor plans depicting functional utilization of spaces. Incorporate Collateral Equipment (CEQ) and Furniture, Fixtures and Equipment (FF&E) into the design development and indicate on building floor plan(s).

  o For renovation projects, provide separate drawings to identify existing conditions, demolition, and new construction elements.

  o Provide mechanical and plumbing floor plans to include utilities coming into the building (for example, water, sanitary sewer, gas piping, and steam), and major pieces of equipment with clearances (for example, water, heater/storage tank, HVAC equipment, and pumps).

- Building Elevations: Provide elevations that depict the building character and indicate materials.

13-12 COST ESTIMATE.

Cost estimate class requirements are a minimum Class 3 in accordance with AACE RP 56R-08. NAVFAC Headquarters may issue project specific guidance at Preliminary Design start. Cost estimate methodology and cost tools are addressed in Chapter 9.

Project definition deliverables are required to be commensurate with the required estimate class. Refer to Appendix B, Table B-1 for class-specific project definition deliverables requirements. Appendix B, Table B-2 is the minimum requirement for Preliminary Design.

13-13 SITE ENGINEERING INVESTIGATION.

Supplement known site information/studies and examine high risk cost elements by conducting on-site utility investigation and site engineering studies to include soil borings and analysis, topographic analysis, fire flow tests, and flood projections and mitigation studies.

Evaluate if site information obtained as part of the preliminary design effort is sufficient to proceed with the full-design of the proposed facility. If sufficient data is not available, provide a list of additional site investigation needed to proceed with design.

13-13.1 Utility Investigation.

Locate and identify the nearest points of connection for utilities. If the points of connection are outside the project boundaries, provide additional information that shows the locations.

- Verify Project Planning DD Form 1391 identified point of connection.
- Retrieve and review the Installation's utility plans and consult with Government utilities personnel; where utility systems are privatized, consult with privatized utility system owner.
- Validate adequate utility capacities at points of connection.
- For Government-owned utility systems, conduct waterflow testing in accordance with UFC 3-600-01; for privatized utility systems, request waterflow testing data from privatized utility system owner.
- For utilities projects: Retrieve and review the utility study that supports the scope and type of work to be performed.

13-13.2 Subsurface/Geotechnical Investigations.

Consult with a Geotechnical Engineer to determine if the site can be characterized and foundation systems conceptualized based on known geologic conditions. If known geologic data can be used, the Geotechnical Engineer must document in the Basis of Design that the conceptual design for pavement and foundation design is based upon available soils information.

If existing geological data is not sufficient, and for large projects with anticipated Special Foundation costs (for example, pile foundations, mat foundations, significant grading and over-excavation, ground improvement), conduct a full soils investigation at the preliminary design stage. Perform foundation and soils investigations, including sampling, testing, and evaluation, with requirements set forth in Chapter 4. If ground source heat pumps are being considered, determine the soil characteristics for the geothermal well field.

13-13.3 Topographic Survey.

Utilize existing topographic data to the maximum extent possible.

For projects where costs associated with grading and dredging are significant, conduct topographic surveys at the preliminary design stage. Conduct topographic surveys in accordance with Chapter 4. Topographic Surveys must indicate significant site elements, including, but not limited to, utility points of connection, natural resource boundaries, fish and wildlife habitats (including buffer zones), rookeries, wetlands, and other environmentally sensitive areas.

13-13.4 Existing Building Surveys.

For repair, renovation, or rehabilitation projects, perform engineering studies to assess extent of the work, and to provide budget-level costs. These studies include, but are not limited to, structural, electrical, mechanical, fire protection, AT, Physical Security, building envelope, accessibility, and roof systems and components.

When triggered, conduct Tier I or Tier II seismic evaluations in accordance with UFC 3-301-01 and identify mitigation costs. Defer Tier III investigations until subsequent design phases (Final Design Authority, FDA). For renovations of historic properties: Coordinate with the NAVFAC Environmental Cultural Resources Office to determine special construction elements and other project constraints. For fire protection requirements, refer to the paragraphs titled “Planning” and “Existing Facilities” in UFC 3-600-01.

13-13.5 Hazardous Materials Investigation.

Validate and address findings from Field Investigation Report conducted during planning prior to Preliminary Design and conducted in accordance with UFC 3-810-01N. Hazardous Materials, along with their associated costs, must be identified and addressed in the DD1391. MCON Design Appropriations may only be used for comprehensive investigations hazardous materials investigations that are directly in support of a project design solution. For example, investigations that directly support development of design drawings and specifications.

13-13.5.1 Survey and Research.

As a minimum, for budget-ready costs, conduct a visual survey of existing field conditions. Consult with Government Environmental personnel, and research records for existing hazardous materials documentation and known site contamination issues. Determine if the site is part of an installation restoration program/project. Base the preliminary design on conservative assumptions from the visual survey and records search.

13-13.5.2 Demolition, Renovation, Repair, or Contaminated Sites.

For projects that include significant demolition, renovation, or repair, or sites with significant known environmental contamination issues, verify the presence of hazardous materials such as, but not limited to, asbestos, RCRA 8 metals (arsenic, barium, cadmium, chromium, lead, mercury, selenium, and silver), PCB, and mercury. For specific requirements, comply with UFC 3-810-01N.

13-13.6 Building Code Assessment of Adjacent Structures.

When the proposed construction is within 60 feet (18.3-m) of existing adjacent structures, conduct a building code assessment of the adjacent structures. Information about adjacent structures must include construction type, fire resistive rating of exterior walls, wall openings, number of floors, area per floor, total building area, occupancy classification, and if the building is fully protected with an automatic fire sprinkler system. The purpose of obtaining this information is to assure the new building (or addition) does not encroach on minimum separation requirements or assumed property line based on the design assumptions and building code analysis of the existing building(s).

13-14 CALCULATIONS.

13-14.1 Plumbing.

Provide the following plumbing calculations:

- Domestic water size coming into the building (looking for a preliminary calculation on the water size. Needed to determine if the existing water main has the size/capacity for demand).
- Available Water pressure (If the water pressure is suspect, a water pressure calculation is needed to determine if domestic water pump is required).
- Water Heater Size/Storage (preliminary calculation on the water heater/storage tank size).
- Sanitary sewer size coming into the building (preliminary calculation on the sanitary sewer size to determine if the existing main has the size/capacity for demand).
- Sanitary Sewer piping elevation/slope (preliminary calculation to determine if a grinder pump is required).
- Building Utilities (such as Steam and Gas) (preliminary calculation on the utility size to determine if the existing main has the size/capacity for demand).
- Sustainability (such as solar hot water or rainwater harvesting).
- Preliminary calculations and LCCE as needed to support position.

13-14.2 Mechanical.

- Building Cooling Load (Block Cooling Load Calculation)
- Building Heating Load (Block Heating Load Calculation)
- ASHRAE 62 Calculation (preliminary Calculation needed for DOAS systems).

- Preliminary Equipment Sizes (with clearances to size mechanical rooms if required).
- Life Cycle Cost Analysis (LCCA) (Performed on the mechanical systems such that a single system is selected during Preliminary Design.)
- Commissioning/Acceptance (determine if required for cost estimate).

13-14.3 Fire Protection.

Provide water supply and fire flow calculations. Refer to UFC 3-600-01.

CHAPTER 14 PHASE: SCHEMATIC DESIGN SUBMITTALS (10-15%)

14-1 GENERAL REQUIREMENTS.

The Schematic Design Submittal is intended to convey the extent of the work in a preliminary conceptual manner. Deliverables are approximately 10% to 15% complete at this stage. Appendix B Preliminary Design requirements may not apply for non-Preliminary Design projects. In addition to the requirements of the Core UFCs and the contract, include the deliverables described herein, as a minimum.

14-2 DB SCHEMATIC DESIGN SUBMITTAL.

For DB, if defined by the RFP, the Schematic design may be the Contractor's technical response to the RFP, including layout, functional drawings, and design. When this is used, exceptions to the UFC requirements must be outlined in the RFP solicitation.

14-3 BASIS OF DESIGN.

The discipline-specific Basis of Design needs to provide sufficient definition to support the development of a Class 4 cost estimate for that discipline. Submit a preliminary version of the Basis of Design addressing items defined in the contract, the Core UFCs, Chapter 5, and as follows.

14-3.1 Geotechnical.

Include the Geotechnical Report, if available, as an appendix. It is encouraged to have this report at this submittal to obtain review comments at the earliest possible date.

14-3.2 Sustainability.

Provide completed HPSB Checklist(s) and TPC Checklist(s) (where applicable) for each applicable building in the project. Provide copy(ies) of TPC registration information (where applicable), and comprehensive Sustainability Chapter.

14-3.3 Cybersecurity.

Provide a single submittal indicating criteria and describing requirements for integrating cybersecurity into the design and construction of the FRCS. The basis of design must describe specific guidance for control systems with the assigned Confidentiality, Integrity and Availability (C-I-A) impact ratings and must list the security controls with recommendations and justifications for future tailoring of the security control set. **\1** For existing building work, include documentation of existing FRCS infrastructure and how new work is integrated. **/1/**

14-4 DRAWINGS.

Provide drawings required by the contract, the Core UFCs, and herein as applicable to the project:

14-4.1 Architectural.

- Floor Plans – Provide floor plans, new and demolition, indicating room names and basic dimensions.
- Building Elevations – Provide building elevations indicating exterior materials.
- Building Section – Indicate heights of critical building elements.

14-4.2 Civil.

- Schematic Site Plan - Indicate above and below grade utility lines, vehicular and pedestrian circulation paths, buildings, parking, paved areas, and existing site features to remain.
- AT Standoff Distances.

14-4.3 Landscape Architecture.

- Site Inventory and Analysis Plan.
- Schematic Landscape Site Plan - Indicate buildings, existing site features to remain, utility lines and improvements, vehicular and pedestrian circulation, hardscape, plazas and patios, walls, structures and other above ground features, streetscapes, planting concept, Low Impact Development (LID) and other bio-retention areas.
- AT standoff distances.
- Provide types and purpose of plant materials used on the plan (for example, tall broadleaf evergreen shade tree or medium-sized flowering accent tree).
- Provide type of irrigation, water source, and how it is controlled.
- Provide additional information unique to the project.

14-4.4 Electrical.

Provide the following in accordance with UFC 3-501-01. The drawings need not provide extensive details but must be complete enough to thoroughly express the Designer's intentions:

- Existing Site and Demolition Plan.
- Site Plan.

- Single Line Diagram.
- Preliminary floor plans with dedicated space clearly identified for electrical and telecommunications rooms.

14-4.5 Fire Protection.

Provide the following. The drawings need not provide extensive details but must be complete enough to thoroughly express the Designer's intentions:

- Code Compliance Summary Sheets.
- Life Safety Floor Plan. At a minimum, identify building areas having different occupancy and hazard classifications and identify egress travel requirements.
- Fire Suppression Plans. At a minimum, provide floor plans identify hazard classifications. Where a facility has multiple hazard classifications, differentiate each classification area by border or hatching. Identify areas to be protected with special fire suppression systems.

14-4.6 Geotechnical.

Boring log drawings are encouraged but not required.

14-5 BIM PXP.

Provide a completed PxP within 30 days after the Charrette, Functional Analysis Concept Developments (FACDs) or Design Kick-Off Meeting for government review and approval. Format in accordance with Chapter 12.

14-6 CALCULATIONS.

Provide calculations complete and in sufficient detail to support the items outlined in the preliminary Basis of Design, as indicated on the drawings, in accordance with the Core UFCs, Chapter 6, and as follow:

14-7 SUSTAINABILITY.

14-7.1 TPC Registration.

When TPC is required in accordance with UFC 1-200-02, register each applicable building in the project with TPC organization within 30 days of the design kickoff meetings.

14-7.1.1 Format.

Use the following format to register with TPC:

- Project Title First Line: U.S. Navy or U.S. Marine Corps, Building Name (if applicable)
- Project Title Second Line: P-(#); (DD Form 1391 Project Name)
- Project Address First Line: UIC (Installation Code)
- Category Code: RPUID (Real Property Unique Identifier) Number
- Project Owner Organization: U.S. Navy or U.S. Marine Corps
- Primary Contact, Owner: NAVFAC Project Manager
- Additional Contact, Bldg. Owner: Choose Either: Public Works Officer/Deputy Public Works Officer or a Designee

14-7.1.2 Management and Documentation.

Provide TPC management and documentation online (or offline, with secure facilities) throughout the design of the project. Maintain TPC Checklist and obtain TPC Design Review.

14-8 CHARETTES AND FUNCTIONAL ANALYSIS CONCEPT DEVELOPMENT (FACD) STUDIES.

Charrettes and FACDs may be used in DBB to develop the design of the project or in DB to develop the Project Program in the RFP. Both use value-engineering techniques to develop concept designs. The formal Value Engineering process is required for DBB MCON projects over $30 Million and is suggested for other high value multidisciplinary DBB projects. Provide charrette or FACD when required by the contract, and the formal Value Engineering process defined in the contract.

14-8.1 Description.

FACD studies and design charrettes are cooperative efforts by the design team, user and client representatives, installation planning staff, DD Form 1391 project team members, other appropriate Regional staff, facility engineering command personnel, and other interested parties. A charrette may last one to three days, while a FACD may last one to two weeks. They include on-site development of a Schematic design in response to functional, aesthetic, environmental, base planning, site, budgetary, and other requirements. Submittals include meeting minutes, schematic design, and documentation of the decision and information that led up to that decision, including a partnering agreement signed by the principal participants.

CHAPTER 15 PHASE: DESIGN DEVELOPMENT SUBMITTALS (35% - 50%)

15-1 GENERAL REQUIREMENTS.

The Design Development Submittal is intended to convey the complete extent of the work in a preliminary manner. The deliverables are typically about 35% to 50% complete at this stage. Update and include submittals from the previous submittal stage and provide additional detail to bring them to the required completion percentage. In addition to the requirements of the Core UFC's and the contract, include the following as a minimum:

15-2 BASIS OF DESIGN.

Update and submit a complete Basis of Design addressing items defined in Chapter 5 and the Core UFCs.

15-2.1 Sustainability.

Provide updated HPSB Checklist(s) and TPC Checklist(s) (where applicable) for each applicable building in the project. Provide updated Sustainability Chapter.

15-3 DRAWINGS.

Provide updated drawings from the previous submittal and additional drawings required by the contract, the Core UFCs, and herein as applicable to the project. Plan views, including enlargements, and excluding Site Plans, must include vertical and horizontal column lines within the range of the view.

15-3.1 Architectural.

- Legend and Abbreviations
- Floor Plans – Provide floor plans, new and demolition, indicating room names and dimensions
- Building Elevations – Provide building elevations indicating exterior materials
- Roof Plan – Provide a plan of roof areas, indicating direction of slope and method of drainage
- Building Section – Indicate heights
- Typical Wall Sections – Provide sufficient wall section(s) to indicate materials and different conditions
- Finish Schedule – Indicate proposed finishes

15-3.2 Interior Design.

Provide Structural Interior Design (SID) to include the following:

- Interior and Exterior Material and Finish samples in loose format
- FF&E Plan indicating built-in and movable items
- FF&E Summary List corresponding to the FF&E Plan with estimated item costs

15-3.3 Landscape Architecture.

- Overall Landscape Site Plan. Provide an overall landscape site plan with matchlines (if site plan is divided into multiple sheets) and specific sheet references, general notes, and options (if applicable).
- Landscape Site Plan. Provide enlargement plans as required to delineate appropriate detail.
- Landscape Construction Details.
- Landscape Planting Plan.
- Plant Material Schedule and Details.
- Landscape Irrigation Plan. When a Landscape Irrigation Plan is required by the Statement of Work, provide a sprinkler head layout, remote control valves, automatic controller, pressure pipe and lateral lines, backflow prevention device, and point of connection.
- Landscape Irrigation Equipment Schedule and Details. When a site irrigation plan is required by the Statement of Work, provide an irrigation equipment schedule.

Drawings indicated above can be combined. Contact Government's Landscape Architectural Reviewer for approval of combined drawings prior to project submittal. For example, on small projects a Landscape Site Plan and Landscape Planting Plan can be shown on the same sheet.

15-3.4 Geotechnical.

- Results of subsurface investigation, such as boring logs, test pit logs and laboratory test results, and special site preparation requirements.

15-3.5 Civil.

- Cover sheet, Drawing Index, Vicinity Map, Location Plan, Abbreviations, Legend and Notes.
- Existing Conditions / Demolition Plan.
- Site Plan.

- Water and Sanitary Sewer Plan.
- Grading and Drainage Plan.

Drawings indicated above can be combined. Contact Government's Civil Reviewer for approval of combined drawings prior to project submittal. For example, on small projects, a Site and Water and Sewer Plan can show the Site Plan and Water and Sanitary Sewer Plan on the same sheet or, the Site and Grading and Drainage Plan can show the Site Plan and Grading and Drainage Plan on the same sheet.

15-3.6 Structural.

- Foundation Plans. Include for structures, showing dimensions, arrangements, elevations, locations referred to a column line grid system, type of foundation and foundation obstructions. Include the layout of parts, including but not limited to, slabs, footings, piers, grade beams, and piles, showing foundation features of the design.
- Framing Plans. Include a framing plan for each structural level of the facility, showing dimensions, elevations, and column locations and numbering referenced to a column line grid system, and overall sizes of major members and components. Show the layout of system, including, but not limited to, beams, joists, and stringers.
- Structural Details. Show typical details of construction, indicating the connection and relationship between major components of the structural system.
- Structural Elevations. Show general sizes, location, and arrangement of significant features of the vertical framing system, such as columns, walls, and beams.
- Structural General Notes.

15-3.7 Mechanical.

- Plumbing Floor Plan. Show plumbing fixtures, floor drains and equipment locations.
- Site Plan. Show connections, such as to base steam distribution, location of propane and oil tanks, and layout of ground coupled heat pump well fields.
- HVAC Floor Plan. Show equipment locations, one or two-line duct layout and preliminary piping runs.
- Mechanical Room Plan. Show major equipment and maintenance access space. Provide section view(s) to clarify layout and supports.

15-3.8 Electrical.

- Existing Site and Demolition Plan.
- Site Plan.
- Single Line Diagram.
- Preliminary floor plans with dedicated space clearly identified for electrical and telecommunications rooms.
- Legend and Abbreviations.
- Lighting Plan(s).
- Power Plan(s).
- Lightning Protection Plan.
- Cathodic Protection Plan.
- Communications Plans.
- Special Systems Plans.
- Additional Plans/Risers.

15-3.9 Fire Protection.

- Code Compliance Summary Sheets (Updated from Schematic Design Submittal).
- Life Safety plan (Updated from Schematic Design Submittal). Identify locations of fire rated partitions and horizontal exits).
- Fire Suppression plans. (Updated from Schematic Design Submittal. Refer to Chapter 7-11, except that cross-sectional elevations/details of suppression system risers are not required at this submittal phase.)
- Fire Alarm and Mass Notification System Plans. (Updated from Schematic Design Submittal. Refer to Chapter 7-11.)
- Detail Sheets. (Updated from Schematic Design Submittal. Refer to Chapter 7-11.)

15-4 BIM DESIGN MODEL.

Provide Visual Review Report and Clash Detection Report.

15-5 OUTLINE SPECIFICATIONS.

Provide outline specifications, in the form of a list of specification sections the DOR intends to use in the job.

Use Unified Facilities Guide Specifications, as required in Chapter 8. Provide a listing of the UFGS used in the job by Section Number, Title, and Section Date. Follow the Order of Precedence for choosing UFGS master guide specifications in Chapter 8, unless required otherwise by the contract.

15-5.1 eOMSI Facility Data Workbook (FDW).

Provide Model & Facility Data Matrix tab of the Facility Data Workbook in sufficient detail to document the level of design completed in this phase. The FDW is an attachment to UFGS 01 78 24.00 20 in subsequent phases. The Facility Data Workbook is available for download at https://www.wbdg.org/navy/bim-eomsi.

15-6 CALCULATIONS.

Provide calculations complete, and in sufficient detail to substantiate the design level in this preliminary Basis of Design, as indicated on the drawings, in accordance with the Core UFCs, Chapter 6, and herein, and updated from the previous design phase.

15-6.1 Structural and Geotechnical.

Provide Structural and Geotechnical calculations in sufficient detail to support the items outlined in the Basis of Design and indicated on the drawings.

15-6.2 Civil.

Provide calculations in sufficient detail to indicate compliance with LID criteria, Navy LID Policy, and state or local stormwater regulations. Provide calculations for utility systems and pavements in sufficient detail to support items outlined in the Basis of Design and indicated in the drawings and specifications.

15-6.3 Architectural.

Provide acoustical calculations in accordance with UFC 3-101-01.

15-6.4 Mechanical.

Provide a bookmarked Adobe PDF **\1\ /1/** of input and output data, and summary sheets for Energy Analysis, Life Cycle Cost Analysis, Building Heating and Cooling Loads, and ASHRAE 90.1 Compliance Calculations in accordance with UFC 3-410-01.

15-6.4.1 Energy Analysis.

Provide an Adobe PDF copy of the computerized energy analysis that includes input and output data in their entirety.

15-6.4.2 Life Cycle Cost Analysis.

Submit the computerized LCC analysis utilizing the latest edition of the NIST Building Life-Cycle Cost Program.

15-6.4.3 Building Heating and Cooling Load.

Provide an Adobe PDF copy of the computerized load calculations with input and output data in their entirety.

15-6.4.4 ASHRAE 90.1 Compliance Calculations.

Submit calculations and compliance forms indicated in the Basis of Design.

15-6.4.5 Plumbing Calculations.

Provide Design Basis in accordance with UFC 3-420-01.

15-6.5 Electrical.

Provided calculations required by Core UFCs and also include:

- Load Analysis.
- Service size.
- Feeder size.
- Larger special circuit sizes.
- Lightning Risk Assessment.

15-6.6 Fire Protection.

Submit calculations supporting fire suppression and fire alarm/detection systems for the project. Calculations for systems, features, or elements other than fire suppression or detection will be required as applicable. Fire suppression system calculations must be prepared using commercially available computer software.

15-6.7 Environmental Report.

Provide reports in accordance with UFC 3-810-01N.

15-7 QUALITY CONTROL (QC) REVIEW AND DOCUMENTATION.

15-7.1 Review.

Provide a quality control review by a third party not involved in the design of the project. Evaluate both technical accuracy and discipline coordination. The QC review must include, but is not limited to, the following:

- Eliminate errors, omissions, interferences, and inconsistencies among design disciplines and among drawings, specifications, and cost estimates.
- Verify current criteria, lessons learned, and responses to approved review comments are incorporated.
- Ensure the constructability of the facility as detailed in the drawings, specifications, and technical documents.
- Ensure documents are biddable.

15-7.2 Documentation.

With the submittal, provide Design Quality Control (DQC) documentation that demonstrates that cross-checking of documents has taken place. Provide a single set of documents highlighted to validate that the review was performed, and that the corrections were made.

This Page Intentionally Left Blank

CHAPTER 16 PHASE: PRE-FINAL DESIGN SUBMITTALS (100%)

16-1 GENERAL.

The intent of the Pre-Final submittal is to provide a complete set of design deliverables. The following are the minimum requirements of a Pre-Final submittal:

16-2 BASIS OF DESIGN.

Submit Basis of Design for each of the core disciplines, including updated information and incorporating responses to previous government review comments.

16-2.1 Geotechnical.

The Geotechnical DOR must validate that findings and design recommendations from the latest edition of the Geotechnical Report are valid, and construction and site preparation recommendations have been correctly incorporated into the pertinent drawings and specifications. Provide a draft verification letter from the Geotechnical DOR, certifying that a review of the Pre-Final drawings and specifications, as they relate to the Geotechnical Report, has been conducted and that these drawings and specifications comply with the Geotechnical Report findings and recommendations.

The Geotechnical Report, if modified during the previous review, must be re-submitted as an appendix to the Basis of Design; otherwise, do not submit.

16-2.2 Sustainability.

Provide updated HPSB Checklist(s) and TPC Checklist(s) (where applicable) for each applicable building in the project. Provide updated Sustainability Chapter.

16-3 DRAWINGS.

Drawings must be 100% complete, minus final signatures, and incorporate responses to the previous review comments. The drawings must be complete to the extent that they may be released for bid or constructed as submitted. Provide a complete set of construction drawings organized by discipline as described in this document and the Core UFCs. Upon submittal of the Pre-Final package, request NAVFAC Drawing Numbers from the Government. For DB projects, follow the requirements of the RFP when shop drawings are used as design drawings.

Provide drawings updated from the previous submittal level, drawings specified in the Core UFCs, Chapter 7, and the following, as a minimum:

16-3.1 Civil.

Provide updated drawings from the previous submittal and the following:

- Water, Storm and Sanitary Sewer Profiles

- Site / Utility Details.

16-3.2 Landscape Architecture.

Provide updated drawings from the previous submittal to substantiate design level, and the following, in accordance with UFC 3-201-02:

- Landscape Irrigation Plan. When a site irrigation plan is required by the Statement of Work, update irrigation system with pipe sizing and remaining associated requirements for a complete and operational system.
- Landscape Irrigation Equipment Schedule and Details. When a site irrigation plan is required by the Statement of Work, update irrigation equipment schedule. Provide irrigation details.

16-3.3 Electrical.

Provide updated drawings from the previous submittal to substantiate design level, and the following in accordance with UFC 3-501-01:

- Existing Site and Demolition Plan.
- Site Plan.
- Single Line Diagram.
- Legend and Abbreviations.
- Lighting Plan(s).
- Power Plan(s).
- Lightning Protection Plan.
- Cathodic Protection Plan.
- Special Systems Plans.
- Additional Plans/Risers.
- Lighting: Interior and Exterior Foot-candles.
- Load Analysis.
- Service size.
- Feeder size.
- Larger special circuit sizes.
- Lightning Risk Assessment.
- Communications Riser Diagram.
- Intercommunication Riser Diagram.

- Other Riser Diagrams for Television, Security, and similar systems.
- Panel Schedules.
- Switchboards and Motor Control Center Schedules.
- Lighting Fixture Details.

16-4 BIM DESIGN MODEL.

Provide Visual Review Report and Clash Detection Report.

16-5 SPECIFICATIONS.

Provide edited, marked-up specification sections, using the SpecsIntact "Show Revisions" function when editing and printing, to show deletions from and additions to the UFGS master sections. Use the default settings in SpecsIntact that displays deletions lined out and additions underlined. Run verification reports when printing. Print project specification sections, using the SpecsIntact "Show Section Dates" function, to display the official date of release of the master guide specification and version of the specification used. This date appears immediately below the specification section title.

Design submittal must be complete at this stage and require only minor corrections if any. Organize specifications in accordance with Chapter 8. Provide a submittal register with the specifications.

16-5.1 Sustainability.

Attach completed HPSB Checklist(s) and TPC checklist(s) (where applicable) for each applicable building in the project to UFGS 01 33 29.

16-5.2 Environmental.

Provide environmental specifications in accordance with UFC 3-810-01N.

16-5.3 eOMSI Facility Data Workbook.

Provide the source file (Excel format) of the eOMSI FDW in a separate file folder. Provide the PDF of the completed Model & Facility Data Matrix tab of the eOMSI FDW attached to UFGS 01 78 24.00 20.

16-6 CONTRACT SOLICITATION.

Provide a PIF, which includes the Bid Schedule as specified in Chapter 10, and a complete scope for use in the project Synopsis.

16-7 INTERIOR DESIGN.

16-7.1 Structural Interior Design (SID).

Include the following:

- Interior and Exterior Material and Finish samples submitted in presentation board or binder format.
- Signage plans, details, and schedules.
- FF&E Plan indicating built-in and movable items.
- FF&E Summary List corresponding to the FF&E Plan with estimated item costs.

16-7.2 FF&E.

Provide Preliminary FF&E to include the following, and present to the Activity and NAVFAC personnel:

- Cover Title Page (project name, project #, submittal date, submittal title).
- FF&E list (Cost Summary).
- Furniture placement plans coded to the FF&E list and furnishings specifications.
- Specifications and procurement data sheets (such as furniture, furnishings), indicating final finish and fabric selections.
- Catalog cuts and finish samples for each specified item.
- 16 x 20 inch (406 x 508 mm) color boards of furniture/furnishings and finishes specified for Activity presentation to indicate overall design intent.
- Best Value Determination (BVD) Analysis including copy of the BVD Analysis cover letter, performance specifications, project specific typical, pricing spreadsheet and questionnaire.

16-8 CALCULATIONS.

Provide calculations, updated from previous submittal, to substantiate design level and to reflect resolution of previous government review comments, and in accordance with the Core UFCs and Chapter 6. Provide design analysis that is 100% complete. In addition, provide the following:

16-8.1 Mechanical.

Submit calculations to support the plumbing and mechanical systems and the major equipment comprising those systems. Submittals must include, but not be limited to, cooling loads, heating loads, air balance, and outside air calculations. Update the energy analysis, provided at the Design Development phase, with the equipment efficiencies scheduled on the drawings.

16-8.2 Electrical.

Provide updated and complete calculations required by Core UFCs and include photometric calculations for interior and exterior lighting.

16-9 STATEMENT OF SPECIAL INSPECTIONS.

Prepare special inspections specification UFGS 01 45 35 (DBB and DB). This specification contains the DOD process for implementing the special inspections, testing, and observations required in accordance with IBC Chapter 17 as modified by UFC 3-301-01 and the International Existing Building Code as modified by UFC 3-301-01. The generic Schedule of Special Inspections is maintained on the WBDG (https://www.wbdg.org/dod/ufgs/ufgs-forms-graphics-tables).

16-10 DRAFT DD FORM 1354.

Provide a Draft DD Form 1354 in accordance with UFC 1-300-08. A blank, editable form is available for download at https://www.esd.whs.mil/portals/54/documents/dd/forms/dd/dd1354.pdf.

Break out assets by construction categories, provided on the form, and by the Navy-specific "Category Codes for Military Real Property" found in FC 2-000-05N. Coordinate the identification of appropriate asset construction categories with the Government's Real Property Accounting Officer. Include quantities and units of measure; however, cost breakdown is not required.

16-11 FACILITY RECOGNITION PLAQUE.

Design for and specify a professionally designed and manufactured recognition plaque commemorating the opening of the facility and recognizing the leadership participants of the project. Coordinate the building recognition plaque location(s) with the TPC plaque location(s) (where applicable). Provide design details for wall blocking to support the weight of hanging the plaque(s). If multiple facilities are in the project, design a plaque for each major facility. Indicate requirements of plaque on drawings and specify in UFGS 10 14 00.20. Include the following information:

- Facility Name
- Identify recognition applied to the facility or person for which the facility has been dedicated
- Date of occupancy (month/year)
- Sustainability TPC achieved (if applicable)
- Using Activity Commander/ Commanding Officer

- Base Commander/ Commanding Officer
- NAVFAC Component Commander/ Facility Engineering Component Commanding Officer
- Prime Contractor
- Architect/ Engineer (DOR)

16-12 DB RFP DEVELOPMENT.

Provide edited, red-lined RFP, showing deletions from and additions to the DB template and UFGSs. Follow Specifications requirements in Chapter 8 for prescriptive specifications provided in Part 5 of the RFP.

RFP submittal must be complete at this stage and require only minor corrections if any. Organize Part 2 specifications in accordance with Chapter 11.

16-13 OVERSEAS TRANSLATIONS.

Provide translated documents in accordance with the contract.

16-14 QUALITY CONTROL (QC) REVIEW AND DOCUMENTATION.

16-14.1 Review.

Provide a quality control review by a third party not involved in the design of the project. Evaluate both technical accuracy and discipline coordination. The QC review must include, but is not limited to, the following:

- Eliminate errors, omissions, interferences, and inconsistencies among design disciplines and among drawings, specifications, and cost estimates.
- Verify current criteria, lessons learned, and responses to approved review comments are incorporated.
- Ensure the constructability of the facility as detailed in the drawings, specifications, and technical documents.
- Ensure documents are biddable.

16-14.2 Documentation.

With the submittal, provide Design Quality Control (DQC) documentation that demonstrates that cross-checking of documents has taken place. Provide a single set of documents highlighted to validate that the review was performed, and that the corrections were made.

CHAPTER 17 PHASE: FINAL DESIGN SUBMITTALS

17-1 GENERAL REQUIREMENTS.

The Final Submittal provides a complete and final set of contract documents ready for bid solicitation by the Government, or in the case of DB, ready for construction by the Contractor. Previous government review comments must have been addressed.

Unless specified otherwise by the Contract, provide final submittals in electronic format in accordance with Chapter 12. Update deliverables from the previous submittal stages, and in addition to requirements from the Core UFCs, provide the following, as a minimum, for the Final Submittal:

17-2 BASIS OF DESIGN.

Submit final Basis of Design for each of the core disciplines, including updated information and incorporating responses to previous government review comments.

17-2.1 Geotechnical.

The Geotechnical DOR must validate that findings and design recommendations from the latest edition of the Geotechnical Report are valid, and construction and site preparation recommendations have been correctly incorporated into the pertinent drawings and specifications. Provide a verification letter from the Geotechnical DOR, signed and sealed, certifying that a review of the Final drawings and specifications, as they relate to the Geotechnical Report, has been conducted and that these drawings and specifications comply with the Geotechnical Report findings and recommendations.

17-3 SUSTAINABILITY.

Provide updated HPSB Checklist(s) for each applicable building in the project. Provide updated Sustainability Chapter. Provide updated TPC Checklist(s) (where applicable) for each applicable building in the project as a separate PDF.

17-3.1 TPC Design Review.

For projects that require TPC certification, submit TPC requirements for Design Review to TPC organization, no later than 60 days after Final Design Submittal.

17-4 DRAWINGS.

Provide complete construction drawings updated from the previous submittal level and organized by discipline in accordance with the Core UFCs and herein. Ensure NAVFAC drawing numbers are entered into the appropriate location on the NAVFAC standard drawing border within the native software format.

17-4.1 Plotstamp Record.

Provide a Plotstamp Record for each contract drawing. This history begins with the final design submittal and continues with subsequent submissions and modifications of that drawing. Maintain this record and make it available at the jobsite for review. Locate the Plotstamp Record on the lower left corner of the sheet, outside the border, and at the staple edge with the text rotated 90 degrees. Include the following:

- File Name: (Include the file location)
- Layout Name (if applicable)
- Plotted: Date and Time
- User: First name and last name of the person who printed the drawing

17-4.1.1 DB Plotstamp Records.

In addition, provide an updated Plotstamp Record at the following developmental stages of the contract drawings:

a. DOR signed Final Critical Path Submittal or the Final Design Submittal.

b. Government approved Final Critical Path Submittal or the Final Design Submittal. This development stage may be combined with "c." below, if issued at the same time.

c. Incorporation of the Final Critical Path or Final Design drawings in the contract by modification.

d. Submissions to Government and modifications of the Final Critical Path or Final Design drawings incorporating variations in the contract.

17-4.2 DB Shop Drawings.

For DB projects, follow the requirements of the RFP when shop drawings are used as design drawings.

17-5 BIM DESIGN MODEL.

Provide Clash Detection Report, Visual Review Report, and Final Design BIM Model in accordance with Chapter 12 and PxP. There must be zero clashes.

17-6 SPECIFICATIONS.

Provide complete, final specifications with redlines executed. Organize and compile the package as detailed in Chapter 8.

17-6.1 eOMSI Facility Data Workbook.

Provide complete Model & Facility Data Matrix tab of the eOMSI FDW and attach to UFGS 01 78 24.00 20. In addition, provide the native Excel file of the FDW with the electronic files.

17-6.2 Sustainability.

Attach final HPSB Checklist(s) and TPC Checklist(s) (where applicable) for each applicable building in the project to UFGS 01 33 29.

17-6.3 Environmental.

Comply with UFC 3-810-01N for environmental specifications.

17-6.4 DB Design Submittal Specifications.

For DB projects, follow the requirements of the RFP when manufacturer's catalog data are used with the UFGS during design.

17-6.4.1 Fire Protection Specifications.

For Fire Protection systems, combine design and construction submittal information on the design documents. In addition to the UFGS specification, provide proprietary information, such as catalog cuts and manufacturers data that demonstrates compliance with the RFP. Fire protection systems include fire suppression systems, fire pumps, fire alarm and detection systems, fire-stopping, and spray-applied fireproofing.

17-6.5 Report Source File.

As part of the Final submittal of the specifications, provide the source files of Reports included in the specifications.

17-7 CONTRACTING DOCUMENTS.

Provide a final, completed PIF, including Bid Schedule. Provide final scope for Project Synopsis.

17-8 INTERIOR DESIGN.

17-8.1 Structural Interior Design (SID).

Update deliverables for Interior Design from Pre-Final. Include Interior and Exterior Material and Finish samples submitted in presentation board or binder format.

17-8.2 FF&E.

Provide the final FF&E submittal with final submittal package. Present to NAVFAC and to the Activity. Update FF&E deliverables from Pre-Final.

- Cover Title Page (project name, project #, submittal date, submittal title)
- Table of Contents and Manufacturer Contact List
- FF&E list (Cost Summary)
- Furniture placement plans coded to the FF&E list and furnishings specifications
- Specifications and procurement data sheets, such as for furniture and furnishings, indicating final finish and fabric selections.
- Catalog cuts and finish samples for each specified item.
- 16x20 inch (406 x 508 mm) color boards of furniture/furnishings and finishes specified for Activity presentation to indicate overall design intent
- BVD Sheets signed by the Offeror’s Interior Designer with required supporting information.

17-9 CALCULATIONS.

Revise design analysis and calculations as required to reflect resolution of previous government review comments and in accordance with this document and the core UFCs.

17-10 DRAFT FORM DD 1354.

Provide completed Draft Form DD 1354.

17-11 STATEMENT OF SPECIAL INSPECTIONS.

Prepare special inspections specification Section 01 45 35 (DBB and DB). This specification contains the DOD process for implementing the special inspections, testing, and observations required in accordance with IBC Chapter 17 as modified by UFC 3-301-01 and the International Existing Building Code as modified by UFC 3-301-01. The generic Schedule of Special Inspections is maintained on the WBDG (https://www.wbdg.org/dod/ufgs/ufgs-forms-graphics-tables).

17-12 RFP.

Provide complete, final RFP with redlines executed. Organize and compile the package as detailed in Chapter 11.

17-12.1 Report Source File.

As part of the Final submittal, provide source file of Reports included in the RFP, in either Word or SpecsIntact.

17-13 FIRE PROTECTION DESIGN COMPLIANCE DOCUMENT.

This design compliance document must be submitted with the final design submission as part of the design analysis and must bear the signature and professional seal of the QFPE. Refer to UFC 3-600-01.

17-14 QUALITY CONTROL (QC) REVIEW AND DOCUMENTATION.

17-14.1 Review.

Provide a quality control review by a third party not involved in the design of the project. Evaluate both technical accuracy and discipline coordination. The QC review must include, but is not limited to, the following:

- Eliminate errors, omissions, interferences, and inconsistencies among design disciplines and among drawings, specifications, and cost estimates.
- Verify current criteria, lessons learned, and responses to approved review comments are incorporated.
- Ensure the constructability of the facility as detailed in the drawings, specifications, and technical documents.
- Ensure documents are biddable.

17-14.2 Documentation.

With the submittal, provide Design Quality Control (DQC) documentation that demonstrates that cross-checking of documents has taken place. Provide a single set of documents highlighted to validate that the review was performed, and that the corrections were made. Provide a stamp on the cover page of the drawing set and specifications as shown in Figure 17-1.

Figure 17-1 Quality Review Block.

QUALITY CONTROL REVIEW	
Signature	Date

17-14.3 DB Quality Control.

For DB projects, this review must be a coordinated effort between the Contractor and their DOR. Additional Overseas Submittals Requirements.

17-14.4 Code Compliance Certification.

Design must comply with the applicable U.S. & Host Nation norms, regulations, and applicable U.S. Military criteria. Plans and Specifications must be certified by a Host Nation architect or engineer, registered on the country's professional rolls, for compliance with applicable codes and laws.

Provide this certification on the cover sheet of project drawings and specifications, in dual languages. If the specifications coversheet does not have sufficient space for this certification, provide directly behind the coversheet on a separate page, including the project information from the coversheet. The code compliance certification must be provided as indicated in Figure 17-2 below, and dated, signed, and stamped in accordance with the requirements set forth in Chapter 7 of this document.

Figure 17-2 Code Compliance Certification

HAVING PARTICIPATED IN THE DESIGN OF PROJECT No. (Identify project number, project title, location), AND HAVING THOROUGHLY REVIEWED THE COMPLETED PROJECT DOCUMENTS, I DECLARE THAT THE FACILITY DESIGN INCLUDED HEREIN COMPLIES WITH ALL APPLICABLE (Identify Host Country) CODES AND LAWS.

Date Signature (Professional Seal)

17-14.5 Host Nation Life Safety/Building Code Compliance Documentation.

Provide the following in accordance with UFC 3-600-01:

- Host Nation Life Safety and Building Code analysis.
- Comparisons of Host Nation requirements with NFPA Codes, UFC 1-200-01, and UFC 1-200-02
- Items of conflict and approved resolutions
- Additional costs, both engineering effort to prepare the design modification and estimated construction costs

17-14.6 Geotechnical Report Translation.

Translate the Geotechnical Report into English. Unless stated otherwise in the contract, the boring logs must be shown in two languages, English and the local language of country of bidding and construction.

This Page Intentionally Left Blank

CHAPTER 18 PHASE: POST-DESIGN OR POST-RFP DEVELOPMENT SUBMITTAL REQUIREMENTS

18-1 GENERAL REQUIREMENTS.

Submissions after final design or RFP development must integrate changes resulting from Contractor Pre-Proposal Inquiries (PPI) and Requests for Information (RFI) into Amendment and Contract Modification documents. Submissions may include additions or corrections to drawings, specifications, or RFP, and an explanation of changes. Changes to the Contract Documents before contract award are Amendments; changes after contract award are Contract Modifications.

18-2 PRE-PROPOSAL AND REQUESTS FOR INFORMATION.

Responses to PPIs and RFIs must be responded to as quickly as possible to prevent delay to construction contract award. It is expected that the DOR will provide response to a PPI or RFI no later than three working days after notification. Where the response to a PPI or RFI requires additional time, the DOR must notify the Government Project Manager/Design Manager or Contracting Officer of the expected date of response. The DOR must indicate if an Amendment or a Contract Modification is required in response to the PPI or RFI.

18-3 CHANGE NUMBERS OR LETTERS.

Prior to submission, the Contracting Officer for the procurement/contract assigns the Amendment number or Contract Modification letter and provides to the PM and DM. Numbers or letters are assigned in numerical order as required. Amendment numbers are prefixed by three ciphers, for example, the first Amendment is numbered "0001".

18-4 COST ESTIMATE CHANGES.

Accompany Amendment or Contract Modification with detailed cost estimates to indicate changes in construction cost of the project, or to substantiate a statement of no change in cost. Accompany Contract Modification with a detailed cost estimate that can be used in the negotiation of Contract Modification.

18-5 CHANGE FORMAT.

The Contracting Officer prepares the Standard Form SF 30, *Amendment of Solicitation/Modification of Contract,* coversheet for an Amendment. Block 14 of this form is the “Description of Amendment” with enough space for a brief description, thus, the first page of the changes text starts on page two called the Continuation Sheet with an explanation of the changes. Submit the Continuation Sheet to the Contracting Officer for processing.

Provide a Proposed Change Sheet for a Contract Modification with an explanation of the changes. Include the Modification letter, contract number, and task order number (if available), eProjects work order number, project title, and project location. Submit the Proposed Change Sheet to the Contracting Officer for processing.

Where drawings, RFP sections, or specifications are replaced or added, attach the document PDF file separately, and reference in the Continuation Sheet or Proposed Change Sheet in accordance with guidance below. When multiple drawing, RFP section, or specification files are replaced or added, combine the documents by type into a single file, and bookmark each document. Follow file size limitations in accordance with Chapter 12.

18-5.1 Continuation Sheet, Modification, and Language Format.

Use Figure 18-1 Sample Amendment/Modification for guidance on how to format the language for revisions and changes. List specification changes, additions, deletions, or replacement of complete specification sections only under the specifications PROJECT TABLE OF CONTENTS. For drawing changes, additions, deletions, or replacements of a complete drawing must be listed in specification 00 01 15 LIST OF DRAWINGS and on the DRAWING INDEX sheet.

When drawings are revised and replaced, use a cloud to highlight the change. For Amendments, place a triangle with a sequential number in it and place it next to the cloud or the item(s) changing for each sheet. For Modifications, use a triangle with a sequential letter. Provide the number or the letter on the sheet revision block and provide the same brief over-arching description on the revised sheets. Insert the date that the change was made; this distinguishes the revised drawing from the original drawing. Also, note that a sheet has been added or replaced in the DRAWING INDEX sheet. Do not change sheet numbers or sheet designations for revised drawings. Listing the Amendment or Contract Modification number is not appropriate.

Best Practices:

Minimize narrative only description of changes on Continuation Sheets. Recommend reissuing the sheet(s) or specification section(s).

Maximize practice of indicating changes by issuing replacement Drawings and Specification Sections. NOTE: Previous narrative only changes must be incorporated.

Apply above guidance as much as practicable, without significant slow-down in communications with bidders or impacts to pre-award execution.

Figure 18-1 Sample Amendment/Modification

[CONTINUATION SHEET] [MODIFICATION "modification letter"]

DRAWINGS:

On NAVFAC Drawing No. [NAVFAC DWG No.] (G-101)
ADD the following drawings to the DRAWING INDEX under the corresponding discipline and drawing number. These drawings accompany this [Amendment] [Modification]:

S-213 [NAVFAC DWG No.] BRACED BAY FRAMING ELEVATIONS - ADDED SHEET
M-504 [NAVFAC DWG No.] DETAILS – ADDED SHEET

REPLACE the following drawings to the DRAWING INDEX under the corresponding discipline and drawing number. These drawings accompany this [Amendment] [Modification]:

A-301 [NAVFAC DWG No.] ELEVATIONS – REPLACED SHEET
P-503 [NAVFAC DWG No.] DETAILS – REPLACED SHEET

On NAVFAC Drawing No. [NAVFAC DWG No.] (CS510)
A5/CS510 Detail: **DELETE** "9'-10"" vertical dimension and **REPLACE** with "10'-0"".

On NAVFAC Drawing No. [NAVFAC DWG No.] (S-101)
Foundation Plan Notes: Note 3, **DELETE** "THE BOTTOM OF THE FOOTING" and **REPLACE** with "THE TOP OF THE FOOTING".

On NAVFAC Drawing No. [NAVFAC DWG No.] (A-505)
B5/A-505 Breakroom Elevation, **DELETE** note "PNT4" and **REPLACE** with "PNT5".

SPECIFICATIONS:

PROJECT TABLE OF CONTENTS

ADD the following section(s) that accompany this [Amendment] [Modification]. Add date in the footer to distinguish the added section.*

01 45 35 Special Inspections, dated May 17, 2023
09 29 00 Gypsum Board, dated May 17, 2023

REPLACE the following section(s) with the attached section(s) that accompany this [Amendment] [Modification]. Add date in the footer to distinguish the replaced section.*

07 11 13 Bituminous Dampproofing, dated May 17, 2023
09 68 00 CARPETING, dated May 17, 2023

(*NOTE to specification editor: To change the date, for subsequent additions/replacements of the section, a date must be manually typed into the footer on the 'Print Processing > Header/Footer' tab in SpecsIntact. See the eLearning Module in Chapter 4: Process and Print/Publish, Header/Footer Tab.)

DOCUMENT 00 01 15 LIST OF DRAWINGS

1.2 Contract Drawings

ADD the following drawings. These drawings accompany this [Amendment] [Modification].

DRAWING NO.	REVISION NO.	NAVFAC DWG NO.	TITLE
S-213	1	[********]	BRACED BAY FRAMING ELEVATIONS
M-504	1	[********]	DETAILS

DELETE and **REPLACE** the following drawings as of [date]. These drawings accompany this [Amendment] [Modification].

DRAWING NO.	REVISION NO.	NAVFAC DWG NO.	TITLE
CU102	1	[********]	SITE UTILITY PLAN
LP102	1	[********]	LANDSCAPE PLANTING PLAN

SECTION 01 50 00 TEMPORARY CONSTRUCTION FACILITIES AND CONTROLS

1.4 Construction Site Plan

DELETE this paragraph and **REPLACE** with: “Prior to the start of work, submit a site plan showing the locations and dimensions of temporary facilities (including layouts and details, equipment and material storage area (onsite and offsite), and access and haul routes, avenues of ingress/egress to the fenced area and details of the fence installation.”

SECTION 03 30 00 CAST-IN-PLACE CONCRETE

1.3 Submittals, SD-02 Shop Drawings

ADD “Survey Plan; G”.

ADD subpart “1.6.3.5 Survey Meeting

Coordinate a meeting with surveyor, QC Manager, field superintendent, concrete subcontractor, and Contracting Officer to discuss a plan to survey the formwork and the embedded components prior to concrete placement. Discuss the schedule, coordination issues, timing, and efficiency issues.”

--End of [Amendment] [Modification]—

CHAPTER 19 PHASE: POST-CONSTRUCTION DOCUMENTS

19-1 PROJECT CLOSE-OUT.

The DOR may be required to execute specific project tasks during project close-out. These tasks may include preparing DD Form 1354, "Real Property Record," for Government signature, attending project close-out meetings, or performing other tasks. Refer to the design contract (if a DBB project) or the DB RFP for project close-out related tasks.

19-1.1 Interim Form DD 1354.

Update the Draft DD Form 1354 to include additional assets, improvements or alterations that occurred during construction. Identify costs. Submit completed form for approval to the Government. Attach to each DD Form 1354, updated HPSB Checklist(s) and TPC Checklist(s) for each applicable building in the project. For these DD Form 1354, ensure Block 14, “Sustainability Code” is marked with “1” for compliant.

19-1.2 Record Drawings.

Prepare record drawings in accordance with Chapter 12.

19-1.3 BIM Final Record Model.

Provide the final Record Model in accordance with Chapter 12.

19-1.4 Sustainability.

No later than 60 days after Beneficial Occupancy Date, provide updated HPSB Checklist(s) for each applicable building in the project to the Government Project Manager. Obtain TPC for each applicable building in the project when TPC organization requirements are complete. For projects with post-occupancy sustainability or energy requirements (such as commissioning), provide updated HPSB Checklist to the Government Project Manager. Ensure copies of the following are archived to the project’s electronic sustainability folder:

- Copy of the Final Commissioning Report, and copy of the Updated Final Commissioning Report, when applicable, for projects that use Government-hired Commissioning Provider.
- Copy of the Final report, validation, or certification for projects that apply Sustainable TPC.
- Contractor's completed submittal of the Sustainability eNotebook, and the Updated Sustainability eNotebook when applicable.

APPENDIX A SAMPLE DELIVERABLES

A-1 PRICE SCHEDULE FORM FOR DBB PROJECT

Price Schedule Form is located at: https://www.wbdg.org/navy/project-information-form-specifications-cover-sheet/spec-coversheet

Line Item	Description	Quantity	Unit	Unit Price	Sub-Total	Total Price
1	BASE PRICE: Total Price for the entire work for [Project P### – Insert description of the project scope here] in accordance with the [drawings and specifications][RFP], complete, but excluding work provided in another Priced line Item.	1	EA			$_____
1A	Subtotal of Base Price for the entire work for [Insert Primary Facilities Description] complete to the [1.5-meter] [5-foot] line outside of the building in accordance with the [drawings and specifications][RFP], but excluding work provided in another line item	1	EA		$_____	
1B	Subtotal of Base Price for the entire project sitework, outside the facility [1.5-meter][5-foot] line, for [Insert Site Work Description here], complete in accordance with the [drawings and specifications][RFP], but excluding work described in another line Item.	1	EA		$_____	
1C	Subtotal of Base Price for entire Design of the Project, complete, but excluding work provided in another line item.	1	EA		$_____	
1D	Unit Price for providing Foundation Piling complete in accordance with the [drawings and specifications][RFP], but excluding work provided in another line item.	[_____]	[LM] [LF]	$_____	$_____	

1E	Unit Price for providing Pile Load Test, complete in accordance with the [drawings and specifications][RFP], but excluding work provided in another line item.	[_____]	EA	$_____	$_____	
1F	Unit Price for mass rock excavation and disposal complete in accordance with the [drawings and specifications][RFP], but excluding work provided in another line item.	[_____]	[CM] [CY]	$_____	$_____	
1G	Unit Price for trench rock excavation and disposal complete in accordance with the [drawings and specifications][RFP], but excluding work provided in another line item.	[_____]	[CM] [CY]	$_____	$_____	
1H	Unit Price for removal and disposal of asbestos containing pipe insulation (by pipe diameter ranges [_____]) complete in accordance with the [drawings and specifications][RFP], but excluding work provided in another line item.	[_____]	[LM] [LF]	$_____	$_____	
1J	Unit Price for removal and disposal of asbestos containing floor tile complete in accordance with the [drawings and specifications][RFP], but excluding work provided in another line item.	[_____]	[SM] [SF]	$_____	$_____	
1K	Unit Price for removal and disposal of asbestos containing siding complete in accordance with the [drawings and specifications][RFP], but excluding work provided in another line item.	[_____]	[SM] [SF]	$_____	$_____	
1L	Unit Price for providing removal and disposal of oily water and sludge inside tanks [_____], complete in accordance with the [drawings and specifications][RFP], but excluding work provided in another line item.	[_____]	[L] [Gal]	$_____	$_____	

1M	Unit Price for removal and disposal of contaminate stockpiled soils complete in accordance with the [drawings and specifications][RFP], but excluding work provided in another line item.	[_____]	[CM] [CY]	$_____	$_____	
1N	Unit Price for provision and compaction of fill in place of removed contaminate soil, complete in accordance with the [drawings and specifications][RFP], but excluding work provided in another line item.	[_____]	[CM] [CY]	$_____	$_____	
2	Option Item No. 1: Price for providing all work in connection with [_____], complete in accordance with the [drawings and specifications][RFP], but excluding work provided in another Priced line item.	1	EA			$_____
3	Option Item No. 2: Price for providing Electronic Security System (ESS) equipment, testing, and associated training, but excluding work provided in another Priced line item. The ESS includes, but is not limited to, Intrusion Detection System (IDS), Access Control System (ACS), and Video Systems complete in accordance with the [drawings and specifications] [RFP]. Equipment includes items such as Premise Control Units (PCU), central processing units, field panels, sensors, card readers, keypads, cameras, switches, video recorders, workstations, and the communication cabling connecting these devices together. Include the price for supporting, permanent infrastructure under the Base Price. Interior supporting infrastructure includes items such	1	EA			$_____

	as conduit, junction boxes, electronic door strikes, door-hardware, mounting hardware, and power connections. Exterior supporting infrastructure includes items such as exterior duct banks, manholes, utility poles, utility connections, and power connections.					
4	Option Item No. 3: Price for providing Audio Visual System (A/V) Equipment, testing, and associated training in accordance with the [drawings and specifications] [RFP], but excluding work provided in another Priced line item.. Equipment includes, but is not limited to, items such as flat panel monitors, projectors, wall input boxes, touch screens, push button control panels, video teleconferencing codecs, microphones, speakers and the communication cabling connecting these devices together. Include the price for supporting, permanent infrastructure under the Base Price. Interior supporting infrastructure includes items such as conduit, junction boxes, mounting hardware, and power connections.	1	EA			$_____
5	Option Item No. 4: Price for providing work in connection with labor, material, equipment, transportation and supervision required for the Furniture, Fixtures, and Equipment (FF&E), complete in accordance with the [drawings and specifications][RFP], but excluding work provided in another Priced line item.	GOV Estimated Price: [$_____]	HAR Percent (NTE 5%) ___%		HAR Subtotal $_____	Total FF&E Estimated Price $_____

A-2 SAMPLE SYNOPSIS

Synopsis for P236 FITNESS CENTER, CLDJ

THIS NOTICE IS PROVIDED FOR INFORMATION PURPOSES ONLY. THIS PROCUREMENT WILL BE SOLICITED ON AN UNRESTRICTED BASIS. SOLICITATION DOCUMENTS WILL NOT BE AVAILABLE FOR DOWNLOADING UNTIL APPROXIMATELY 17 DECEMBER 2012.

This is a one step design/bid/build construction project that will construct a two-story fitness center at Camp Lemonnier, Djibouti (CLDJ), Africa. The building is a pre-engineered metal building on reinforced concrete slab and foundations with insulated metal wall and roof panels, translucent wall panels, hydraulic elevator, interior concrete partitions, metal stud and gypsum board partitions, interior finishes, fire alarm and sprinkler system, plumbing, mechanical, electrical and incidental related work. Scope requirements include site preparation necessary for the construction of the fitness center also requiring installation of 75 new Containerized Living Units (CLUs), relocation of 75 existing CLUs encumbering the site, and replacing the artificial turf on the existing athletic field. Once the 75 new CLUs are constructed then the occupants of G-Block CLUs can relocate thus allowing those CLUs to be moved, triple stacked, and retrofitted with fire alarm and sprinkler systems.

Other scope requirements include the demolition of the existing fitness center after the new facility is constructed.

The period of performance is approximately 18 months after notice to proceed.

This project will be awarded as a firm-fixed price contract. The Government reserves the right to enter into negotiations or limit the competitive range. The construction range is between $10,000,000 and $25,000,000.

This contract will require a Performance Bond pursuant to FAR 52.228-15, through an approved surety under the United States Treasury Department Circular 570. Based on the feasibility of a contractor to furnish a Performance Bond, offerors may provide a 10% Performance Guarantee, in accordance with NFAS 5252.228-9306, in lieu of a Performance Bond.

The Request for Proposals (RFP) will be available for viewing and downloading on or about 17 December 2012. The proposal due date will be on or about January 31, 2013, 2:00 p.m. Eastern Standard Time North America.

The solicitation will be formatted as an RFP in accordance with the requirements designated by Federal Acquisition Regulation (FAR) 15.203 for a negotiated procurement utilizing procedures of FAR 36.2. This method permits evaluation of proposals based on price competition, technical merit and other factors; permits impartial and comprehensive evaluation of offerors' proposals; permits discussions if necessary; and ensures selection of the source whose performance provides the best value to the Government.

APPENDIX B COST ESTIMATE CLASSIFICATION AND VALUE ENGINEERING STUDY REQUIREMENTS

B-1 INDUSTRY COST ESTIMATE CLASSIFICATION.

AACE International publishes Recommended Practice 56R-08, *Cost Estimate System – As Applied for the Building and General Construction Industries*. This recommended practice (RP) defines the relationship between the maturity of the construction project definition deliverables and the accuracy of the cost estimate based on those deliverables. The RP defines five classes of estimates based on the level of project definition maturity. These five levels overlap to account for factors of the project such as project complexity and quality of cost data.

AACE International RP 56R-08 applies to the majority of projects undertaken by NAVFAC. In the cases where a project is similar to projects from the process industry, AACE International RP 17R-97 would be acceptable as a guidance to estimate accuracy classification. It is similar in its definition of estimate maturity but does not include a table that is analogous to Table 3 from AACE RP 56R-08.

Table B-1 Cost Estimate Class Comparison from AACE RP 56-08.[2]

Degree of Completion Descriptors

General Project Data:

- **Not Required (NR):** May not be required for all estimates of the specified class, but specific project estimates may require at least preliminary development.
- **Preliminary (P):** Project definition has begun and progressed to at least an intermediate level of completion.
- **Defined (D):** Project definition is advanced, and reviews have been conducted. Development may be near completion with the exception of final approvals.

Technical Deliverables:

- **Not Required (NR):** Deliverable may not be required for all estimates of the specified class, but specific project estimates may require at least preliminary development.
- **Started (S):** Work on the deliverable has begun. Development is typically limited to sketches, rough outlines, or similar levels of early completion
- **Preliminary (P):** Work on the deliverable is advanced. Interim, cross-functional reviews have usually been conducted. Development may be near completion except for final reviews and approvals.
- **Complete (C):** The deliverable has been reviewed and approved as appropriate.

B-2 PRELIMINARY DESIGN COST ESTIMATE.

For Preliminary Design scope development, the project definition is based on the minimum project data and deliverables indicated in Table B-2.

Table B-2 Minimum Project Data and Deliverables.

Crosswalk between AACE International RP56R-08 and Preliminary Design	**Preliminary Design**	**Remarks**
Maturity level of project definition deliverables	Preliminary Design Deliverables	
General Project Data		
Construction Scope Description	Defined	DD1391 requirements govern this.
Project Location	Defined	DD1391 requirements govern this.
Total Building Area - SF or m2	Defined	DD1391 requirements govern this.
Functional Space Requirements -SF or m2	Defined	DD1391 requirements govern this.
No. of Building Stories	Defined	DD1391 requirements govern this.
Exterior Closure Description	Preliminary	Addressed in the Basis of Design.
Finishes Descriptions and Requirements	Preliminary	
Building Code or Standards Requirement	Defined	
Mechanical Systems and Total Capacity	Preliminary	
Electrical Capacity	Defined	
Communication Systems	Preliminary	
Fire Protection and Life Safety Requirements	Preliminary	
Security System	Started	
Antiterrorism	Defined	Provide separate narratives for the following cross-disciplinary elements. Devote special attention to issues that may have significant cost impact. AT – Identify the AT occupancy (low occupancy or inhabited), and protective measures above the minimum, and AT requirements that may have significant cost impact (for example, Geographic Combatant Commander’s AT Construction Standards).

Crosswalk between AACE International RP56R-08 and Preliminary Design	Preliminary Design	Remarks
Sustainability	Started	Sustainability – Indicate the feasibility of meeting Guiding Principle requirements and other sustainability goals for the project in accordance with UFC 1-200-02. Include a draft High Performance Sustainable Building (HPSB) Checklist. Where TPC is an anticipated requirement, develop a draft TPC checklist.
Soils and Hydrology Report	Started	Utilize existing topographic/hydrographic data to the maximum extent possible.
Integrated Project Plan	Preliminary	Other preliminary design deliverables that may not always be supported by the Project Technical Team.
Project Master Schedule	Preliminary	
Work Breakdown Structure	Preliminary	
Project Code of Accounts	None	
Contracting Strategy	Preliminary	Identify DBB or DB costs for considering the application of SIOH to the design effort relative to representing the information on the DD1391.
Escalation Strategy and Basis	Discussed	Include escalation calculations in the Basis of Estimate.
Design Deliverables [3]	RP 56R-08 uses: None [blank]; Started [S]; Preliminary [P]; Complete [C].	
Building Codes and Standards Drawing	None	Separate document not required
Fire Protection and Life Safety Requirements	P	Address requirements in the basis of design.
Site Plan	P	Preliminary design drawing or sketch - Site Plan(s): Show the layout (size and possible shape) of the new facility in relation to major landmarks. Show the possible location of access roads, parking, landscaping, pedestrian walkways, roads, and sidewalks, as applicable. Indicate approximate dimensions and orientation. Site Plans must clearly indicate site constraints such as explosive safety arcs, flood zones, wetlands or other environmentally sensitive areas. Where AT is applicable, clearly depict setback distances to vulnerabilities, including parking, roadways, and obstructions.

Crosswalk between AACE International RP56R-08 and Preliminary Design	Preliminary Design	Remarks
Existing Site Plan	P	Preliminary design drawing or sketch - Vicinity Map and Location Plan
Demolition Plan and Drawings	P	Preliminary design drawing or sketch - Demolition Plan: Show facilities to be demolished (if required)
Utility Plan and Drawings	P	Preliminary design drawing or sketch - Utilities Plans: Show utility lines and their points of connection in relation to existing adjacent structures, roads, and utilities. Show off-site utility upgrade requirements needed to support the project. Show civil, electrical and telecommunication utilities to clearly convey the scope and quantities associated with various utility improvements. On large utility distribution projects, provide one-line diagrams of electrical and telecommunication utilities.
Site Electrical Plan and Drawings	P	
Site Lighting Plan and Drawings	P	
Site Communication Plan and Drawings	P	
Erosion Control Plan and Drawings	S/P	Address requirements in the basis of design - Basis of design for site and utility related disciplines (for example, civil, electrical, telecommunication) must identify the design assumptions for Supporting Facilities, as required to support quantities and unit costs for Supporting Facilities. Consult with landscape architecture personnel for select projects, where a large proportion of total cost is likely to be associated with landscaping requirements.
Stormwater Plan and Drawings	S/P	
Landscaping Plan and Drawings	S/P	
Exterior Elevations	P	Preliminary design drawing or sketch - Building Elevations: Provide schematic elevations indicating the building exterior character.
Interior Elevations	No drawing, plan, diagram or schedule	Address requirements in the Basis of Design - Basis of design for building systems (for example, architecture, structural, mechanical, electrical, fire protection) must identify the discipline-specific design assumptions, as required to support a parametric estimate on the Primary Facility. Consult with interior design personnel for select projects, where unique interior design requirements cannot be captured by standard parametric estimating techniques for the facility-type.

B-3 VALUE ENGINEERING STUDY (VES) REQUIREMENTS.

Provide the service of a Value Engineering (VE)/Value Analysis (VA) team led by a Value Study Team Leader (VSTL) to conduct a Value Engineering Study (VES) to include a Value Engineering Workshop (VEW). The VEW may be combined with other meetings or workshops associated with the project. The VES must follow the methodology advocated by SAVE International and will be documented in a report. Each of the alternatives evaluated as part of the VES must be achievable with the project's construction award amount.

The following industry standards apply to the extent feasible in accordance with the level of design development:

- SAVE Value Methodology Guide, 2020
- ASTM E1699 *Standard Practice for Value Engineering (VE)/Value Analysis (VA) of Projects, Products, and Processes* (Latest Revision)
- ASTM E2013 *Standard Practice for Constructing FAST Diagrams and Performing Function Analysis During Value Analysis Study* (Latest Revision)

B-3.1 VE/VA Team Requirements.

Value Study Team Leader (VSTL): Provide a VSTL certified by SAVE International as a Certified Value Specialist, with experience in preparing Value Studies and conducting VES workshops for projects related to the construction of buildings and other engineered systems. The VSTL will be responsible for leading the VE/VA team, resolving issues to the maximum extent possible, documenting meetings, organizing the study materials for on-site use/approval, and providing the VES Report.

DOR PDT will provide the VE/VA Technical Team.

B-3.2 VES Kick Off Meeting.

Conduct the VES meeting via teleconference and review workshop preparations, scope, expectations, roles and responsibilities, schedules, and documentation requirements. This meeting will generally last one hour and must be attended by the VSTL and the Project Manager (PM) and Design Manager (DM) from the DOR.

B-3.3 Value Engineering Workshop (VEW).

The VEW must be attended by the VSTL as well as the key members of the DOR's PDT. This is to include the DOR's PM, DM, Architect, Structural Engineer, Mechanical Engineer, Electrical Engineer, Civil Engineer, Landscape Architect, Cost Engineer, Fire Protection Engineer, Interior Designer, CTS-D, Geotechnical Engineer, and Sustainability Coordinator. Other technical disciplines may be included if approved by the NAVFAC PM, DM, or Cost TDC. The VSTL will lead the VEW following the six-step job plan consistent with the SAVE International Value Standard, ASTM E1699 and

ASTM E2013. A comprehensive VEW will establish the six steps during the on-site workshop. An abbreviated VEW will accomplish the first three steps during the workshop and the remaining three steps after the workshop. The six phases of the Value Methodology Job Plan are:

1. Information Phase
2. Function Analysis Phase (including FAST Diagrams in accordance with ASTM E2013)
3. Creative Phase
4. Evaluation Phase
5. Development Phase
6. Presentation Phase

B-3.3.1 VEW Preparations.

Provide a meeting facility to accommodate the anticipated number of participants. The facility is to provide access to photocopying for handout material and access to the Internet for Email and research by participants.

Complete the following items prior to the start of the VEW:

a. As a minimum, review the available documentation gathered by the NAVFAC PDT. This includes but is not limited to:
   - Information included or cited in the project's scope of services (SAES or SIHS as appropriate)
   - Design Instructions from other agencies
   - Design authorization and programming documents
   - Studies, cost estimates, and other information

b. **\1** Plan and coordinate for a site visit prior to the workshop to allow the VSTL and the VE/VA Technical Team to become familiar with the project site. Coordinate this effort with the NAVFAC PM/DM. **/1/**

c. **\1** The VSTL is to prepare a sample presentation format for the use of the DOR's VE/VA Technical Team. Submit a copy of this for NAVFAC review and approval. **/1/**

d. Prepare a presentation handout **\1** for VEW participants. Submit this handout for NAVFAC review and approval. This handout is to include: **/1/**
   - A discussion of the overall VES methodology

- A discussion of the scope of work as currently developed
- A discussion of the current program amount allocated for the project
- A discussion of the current estimated construction cost estimate
- A capital cost model as indicated in ASTM E1699, 7.2.8 **\1\ /1/**.
- A discussion of the project documentation provided for this study, noting that copies are available during the workshop
- A discussion of the performance and acceptance requirements for evaluating alternatives in accordance with ASTM E1699, 7.2.5 **\1\ /1/**.

B-3.3.2 VEW Process.

a. The DOR's PDT members will explain how the current scope/design accomplishes the stakeholder objectives.

b. The workshop participants will generate a list of ideas for project improvement followed by an evaluation of those ideas. The evaluation will include input from key stakeholder decision makers before proceeding with development recommendations.

c. The VE/VA Technical Team will develop selected ideas into alternatives with enough documentation to allow decision makers to determine if the alternative should be implemented.

d. The VSTL, with input from NAVFAC, will evaluate each alternative in accordance with the pre-determined performance and acceptance requirements.

e. The VSTL will present the alternatives to the key stakeholder decision makers on the final day of the workshop.

B-4 VES DECISION/IMPLEMENTATION MEETING.

The VSTL must conduct a four hour Decision/Implementation Meeting via teleconference. This meeting is to assist key project stakeholders in the selection of which of the developed alternatives to implement. The VES Decision/Implementation Meeting must be attended by the DOR's PDT who will be working on this project. This is to include the DOR's PM, DM, Architect, Structural Engineer, Mechanical Engineer, Electrical Engineer, Civil Engineer, Landscape Architect, Cost Engineer, Fire Protection Engineer, Interior Designer, CTS-D, and Geotechnical Engineer. Other technical disciplines may be included if approved by the NAVFAC PM, DM, or Cost TDC.

B-5 VES REPORT.

Provide a report documenting the VES process and its application to this project by capturing the process and the alternatives considered or recommended. Provide a report reflecting the type of VEW performed, comprehensive or abbreviated.

Include the following in the report:

- Project Objectives
- Project Description
- Scope Analysis
- VES Procedure
- VES Alternatives and associated savings/improvements considered
- VES Alternatives and associated savings/improvements recommended
- Copy of the original Study Team Presentation Handout

B-5.1.1 Comprehensive Workshop VES Report.

a. Preliminary VES Report: Include a collection of the findings of six phases of the Value Methodology Job Plan at the conclusion of the workshop.

b. Draft Final VES Report: Incorporate revisions from previous submittal comments and include a list of final recommendations.

c. Final VES Report: Incorporate revisions from previous submittal comments and the implementation decisions captured during the Decision/Implementation Meeting.

B-5.1.2 Abbreviated Workshop VES Report.

a. Preliminary VES Report: Include a collection of draft/summaries of the findings at the conclusion of the workshop. As a minimum address the first (3) phases of the Value Methodology Job Plan covered during the workshop.

b. Interim VES Report: Include revisions of the Preliminary VES Report and include draft/summaries of the last (3) phases of the Value Methodology Job Plan.

c. Draft Final VES Report: Incorporate revisions from previous submittal comments and include a list of final recommendations

d. Final VES Report: Incorporate revisions from previous submittal comments and the implementation decisions captured during the Decision/Implementation Meeting.

APPENDIX C BIM (MODELING)

C-1 BIM - BASIS OF DESIGN SAMPLE TABLES.

Examples to assist with completion of the Basis of Design are provided in the following Tables. Modify the text to suit the needs of the organization filling out the template.

FACILITIES CRITERIA (FC)

FACILITY PLANNING FOR NAVY AND MARINE CORPS SHORE INSTALLATIONS

FOREWORD

This publication, *Facility Planning for Navy and Marine Corps Shore Installations* (FC 2-000-05N formerly known as UFC 2-000-05N and the P-80), provides facility planning criteria for use in computing quantitative facility requirements for Navy and Marine Corps installations. This document was reformatted from the October 1982 P-80 document on 31 January 2005 and in accordance with the standards for Unified Facilities Criteria (UFC). Since that time the facility planning criteria has been determined not unified among the various DoD services. Therefore, UFC 2-000-05N was changed to a Facilities Criteria (FC) document on 02 March 2023. The criteria are regularly updated to address emergent facility planning issues. The document includes planning criteria and data applicable to those categories of facilities to which a planning factor or data can be applied for computing facility requirements.

Planning criteria contained in this publication are used in the preparation of Basic Facility Requirements, evaluation of existing assets and the determination of specific facility requirements for shore facilities programs. These criteria apply equally to proposed and existing facilities. Their application to existing facilities provides a basis for planning against deficiencies or disposition of excess property as appropriate.

This Foreword and Chapter 1 include the authority and responsibilities of the Naval Facilities Engineering Command for the preparation and publication of planning criteria for use in calculating facility requirements at Navy and Marine Corps Installations and describe the use and applicability of the facility planning factors. The following sections contain a compilation of planning data and related space criteria developed by the Naval Facilities Engineering Command, furnished by systems commands, bureaus and offices of the Department of the Navy and issued by the Secretary of Defense. Planning criteria are established as a guide and normally will be considered as maximum for facilities listed.

The systems for updating this publication will minimize inconsistencies or contradictions with other applicable current directives. Users are invited to call to the attention of the Planning Criteria Managers any criteria requiring updating, clarification, or revisions due to error.

This publication and its appendices can be found at: https://www.wbdg.org/dod/ufc/fc-2-000-05n.

In all cases the material on the website is considered the most up to date. This publication is certified as an official publication of the Naval Facilities Engineering System Command.

CHAPTER 1

INTRODUCTION

Table of Contents

1-1 PURPOSE OF PUBLICATION

This Facility Criteria publication, FC 2-000-05N was formerly designated as FC 2-000-05N under the same title. It provides the space planning factors, criteria and techniques for use in developing Basic Facility Requirement (BFR) calculations and assessments. Establishing the BFR provides the space demand or support requirement for shore-based facilities, by category code, necessary to perform the peacetime missions of Navy shore activities. A BFR justification is the calculation of an installation, command, or region's facilities allowances based upon established planning criteria. The BFR calculation can be modified (with justification) to accommodate site-specific or unit-specific loading requirements, such as mission, personnel, functions and equipment.

BFRs encompass entire functional categories of use, such as administrative offices, general warehouses or public works shops, for both host and tenant commands. For each of the activity's functional categories, if the sum of all current assets assigned to that category code is greater than the calculated requirement in the BFR, there is a surplus of space; if it is less, there is a deficiency. BFRs should be updated periodically and must be updated when there is a change in loading or a change in mission.

The purpose of this publication is to present the specific criteria and algorithms used to prepare BFRs for different categories of functional uses.

1-2 BFR PROCESS

Information about the process of preparing BFRs can be found in the Naval Facilities Engineering Command (NAVFAC) Business Process Management System (BPMS), which provides a systematic method for the management of various business processes and common practices that produce and/or support production of NAVFAC products and services. The BPMS provides best business processes documentation and links to applicable, appropriate and up-to-date policies, guidance, forms and information.

The BPMS process guide for production of BFRs is located on the NAVFAC portal website at the following secure address:

https://flankspeed.sharepoint-mil.us/sites/NAVFAC-BPMS/SitePages/NAVFAC-BPMS-Overview.aspx

1-3 BFRs FOR USMC INSTALLATIONS

When preparing BFRs for United States Marine Corps (USMC) installations or for any USMC facilities on Navy installations, the facility planner will ensure that requirements are coordinated with the program requirements of *Marine Corps Installation Command (MCICOM) GF-Facilities at Headquarters Marine Corps.*

1-4 ORGANIZATION OF FC 2-000-05N

1-4.1 CATEGORY CODE NUMBERS

Chapter 2 of this FC 2-000-05N publication is organized by Category Code Numbers (CCNs), the sequence of which generally corresponds to functional areas and activities.

A complete database of the Department of the Navy CCNs, with supporting facility type and economic factor data fields is available on the *Internet Navy Facility Assets Data Store* (iNFADS), which is available through the secure NAVFAC SharePoint web portal.

Department of Defense (DoD) Instruction 4165.03 establishes the framework and guidance for categorizing Facility Analysis Categories (FACs) and the facility Category Code Numbers (CCNs). This framework provides for the orderly categorization of Real Property for the planning of facilities and real property inventory designations.

The system of Category Code Numbers is grouped using the following series:

- 100 Series – Operational and Training Facilities
- 200 Series – Maintenance and Production Facilities
- 300 Series – Research, Development, Acquisition, Test and Evaluation Facilities
- 400 Series – Supply Facilities
- 500 Series – Medical Facilities
- 600 Series – Administrative Facilities
- 700 Series – Housing and Community Facilities
- 800 Series – Utilities and Ground Improvements Facilities
- 900 Series – Real Estate Facilities

1-4.2 PAGE NUMBERING AND APPENDICES

The page numbering system in Chapter 2 of this publication corresponds to the first three digits of the category group.

The appendices to this document are:

Appendix A contains a current listing of Dept. of the Navy CCN's, reflecting data recently downloaded from the NAVFAC iNFADS database.
Appendix B is a list of applicable units of measurement and their abbreviations.
Appendix C is the NAVFAC P-80.1: Runway Capacity Handbook - Fixed Wing.
Appendix D is the NAVFAC P-80.2: Naval Mobile Construction Battalion Facilities.
Appendix E is the NAVFAC P-80.3: Airfield Safety Clearances.
Appendix F is the Austere Facilities Planning Criteria.

1-4.3 WEB ACCESS OF PUBLICATION AND COMMENTS

This publication and its appendices can be found at:
https://www.wbdg.org/ffc/dod/unified-facilities-criteria-ufc/fc-2-000-05n.

The criteria elements included in this publication are dynamic. As such, they are subject to continuous comment, review and update in response to changing requirements. Users of this criteria are encouraged to submit comments and recommendations regarding the content, application and/or format of the publication for consideration and review. Comments are submitted through the Criteria Change Request system on the WBDG website, at the following web address: https://cms.wbdg.org/ccrs/new?ufc=2-000-05N. Include your contact information, as well as sufficient explanation for evaluation of the recommended changes to the criteria.

1-5 REQUIREMENTS IN THE REGIONAL CONTEXT

1-5.1 REGIONAL PLANNING

Navy leadership is departing from the traditional paradigm, which managed shore infrastructure at the level of individual shore activities. Under Regionalization and the Installation Claimant Consolidation programs, the Navy is shifting toward managing and planning facilities in a larger, regional context (for example, a collection of military installations in geographic proximity to one another). This comprehensive regional approach to planning broadens the field of opportunities beyond those available on an individual activity to include the geographic and functional context of the region. Regional planning looks to reduce redundant facilities within a geographic region and seeks alternative means of satisfying requirements for infrastructure, such as leasing, outsourcing and privatization.

Therefore, a planner must take into account geographically proximate military installations and civilian communities when developing BFRs. While proximate installations may have significant operational differences, they may all provide similar support services. It is feasible that Navy personnel assigned to one activity, as well as retirees in the area, may choose to use support facilities at another installation, which would reduce or even eliminate facility requirements at the first activity. Additionally, many military installations are located near urban communities, which offer a number of resources to military and their dependents. The services provided by some support facilities in civilian communities, especially morale, welfare and recreation assets, are generally similar to on-base facilities. Planners must account for these community facilities in the BFR process by applying Geographic Adjustment Factors (GAFs), which are multipliers that represent the lower limit of on-base facility requirements. GAFs should not be used when planning at OCONUS installations because personnel usually prefer to use installation facilities, instead of facilities in the local community.

1-5.2 METHODS FOR CALCULATING REGIONAL REQUIREMENTS

There are two methods of calculating requirements for regional planning. For more individualized functions like laboratories, an applicable method is to calculate an individual requirement based on each tenant's loading and then sum the results to produce a final requirement. For common-use functions like golf courses and distribution centers, the preferred method is to add up all the loading to produce a single aggregate requirement and then subdivide the result, as appropriate. While a planner must exercise professional judgment in determining the best method to employ, this document offers specific guidance for the regional planning of supply/logistics facilities and community facilities.

1-5.2.1 REGIONAL PLANNING OF SUPPLY/LOGISTICS FACILITIES. Specific regional considerations are included in the introduction to the CCN 430 and 440 Series. With the goal of seeking economies of scale for regional planning, the planner should view the sum of all available assets in their aggregate, wherever practical. It is in this aggregate view of assets that a requirements summary in cubic feet should be translated into an optimal configuration in square feet. In other words, the planning exercise should answer the question: "What is the most efficient accommodation of the cubic foot requirement within the existing or planned square footage (facilities and systems)?"

1-5.2.2 REGIONAL PLANNING OF COMMUNITY FACILITIES. Various transportation studies were consulted to determine the distance that the average person is willing to walk and to drive to community facilities. These distances are considered the "service radius" of the facility. If a military installation is located in proximity to another military installation or civilian community that offers one of the following community facilities, use of this off-base facility should be taken into consideration. If the off-base facility is within the service radius (as detailed in the following table) from the installation, a similar facility may not be required on the installation. Refer to the introduction for the CCN 740 Series for detailed information about project validation assessments and other topics.

Table 1-1. Regional Travel Times (CCN 740, 750 and 760 Series)

Category(s)	Category Description(s)	Service Radius Walking Time (minutes)	Service Radius Driving Time (minutes)
740-01, -04, -23, -86	Exchange Retail Store; Food Service; Commissary; Warehouse	15	15

Category(s)	Category Description(s)	Service Radius Walking Time (minutes)	Service Radius Driving Time (minutes)
740-87, 750-60, 750-61	Marina Support Building, Marina and Recreational Piers	0	60

1-6 COMPONENTS OF BFR DEVELOPMENT

BFRs are developed using peacetime mission and loading; they should not include contingencies. BFRs are the product of a regional analysis of the following factors:

1. Projected missions, functions, and tasks,
2. Base loading, and
3. Criteria.

1-6.1 PROJECTED MISSION, FUNCTIONS, AND TASKS

Each activity has its own statement of missions, functions, and tasks. Missions are concise, unclassified general statements of what the activity is to accomplish. Functions are workload derived from the main elements of an activity's mission. Tasks are workload accomplished in connection with existing program policy directives or written tasking assignments. The BFR process assesses an activity's missions, functions and tasks in the context of base loading and requirements, and translates the output into infrastructure. A first step in translating the activity's missions into facility requirements is to assign the mission(s) to major functional areas and note the associated facility types, according to the CCN series.

1-6.2 BASE LOADING

1-6.2.1 DETERMINATION OF INCLUSION AREA. Base loading is the number of aircraft, ships, personnel and equipment assigned to perform the tasks and services. To determine loading for use in a regional BFR, the planner should increase the inclusion area to encompass the larger region while ensuring that personnel or equipment are not double-counted. Typically, there is no predefined geographic inclusion area; an inclusion area may fluctuate depending on the facility being planned or the type of study that the BFRs are supporting. The planner should use sound professional judgment to determine the inclusion area and must have the area validated by the stakeholders prior to completing the BFRs.

1-6.2.2 USE OF LOADING PROJECTIONS. BFRs should be prepared using five-year loading projections. Planning beyond the five-year timeframe should be based on approved CNO initiatives. Unapproved, out-year Program Objective Memorandum requests may only be used if no other data is available.

1-6.2.3 EFFECT OF FLEET RESPONSE PLAN. The Fleet Response Plan (FRP), which is a new deployment concept, has had important ramifications for ship, aircraft, and personnel loading numbers used in BFRs. FRP combines training and maintenance schedules, manning requirements, equipment and funding to make six carrier strike groups available to the national leadership within 30 days, with two more available within 90 days in times of war or significant crises. During war and times of crisis, deployments will be made to meet the mission and might be less than or more than six months long. Previously, certain loading categories only counted 67% of the deployable populations at a certain installation, under the assumption that 33% of the population would be deployed. Under FRP, BFRs assume 100% of the aircraft loading requirement and 73% of the ship requirement, plus associated personnel.

1-6.2.4 POTENTIAL LOADING DATA SOURCES. Commander Navy Installations Command (CNIC) and NAVFAC headquarters are developing a loading database that will be the definitive site for use in Navy BFRs. Until this site is developed, the potential sources listed below are meant to be starting points for data, acknowledging that websites and specific departments may become obsolete. It is the planner's responsibility to 1) gather data from accurate sources and 2) have the loading numbers validated by the stakeholders or client before completing the BFRs.

Table 1-2. Potential Aircraft Loading Sources

Categories	Potential Sources
Permanent duty stations of aviation units include the number and type of squadrons including the wing, and the number and type of aircraft assigned to the wing and squadrons.	Information about wings and squadrons assigned to each region is available from the TYCOM.
Transient Aircraft are supported at activities for military transport aircraft or transiting aircraft that are enroute to deployment areas. Installations assigned transient aircraft must include facility requirements for average daily on-board aircraft. Transient aircraft also include visiting aircraft at installations located within close proximity of training ranges (e.g., firing or Fleet Carrier Landing Practice airfields). Peak loadings for exercises or contingencies are not to be used for	Projections of aircraft for each wing/squadron are available in the Primary Assigned Aircraft allowance, which can be provided by the Operations Officers of the wing/squadron. Aircraft procurement data is available from Commander, Naval Air Forces (CNAF). Transient aircraft data must be accounted from the average daily loading of Air

Categories	Potential Sources
determination of allowances. Transient aircraft maintenance is generally supported at home ports and home bases.	Operations records.

Table 1-3. Potential Ship Loading Sources

Categories	Potential Sources
Current and projected homeport assignment of ships. This data requires the collection of ship type and numbers of ships within each ship type.	Naval Vessel Register http://www.nvr.navy.mil
Operational Tempo considers the number of ships in port versus the number of ships at sea (i.e., deployed/rotational units are to be counted at the receiving installation). Under the Fleet Response Plan (FRP), assume that 73% of surface and subsurface ships including personnel are at homeport at any given time. Assume that 27% of surface and subsurface ships including personnel are deployed. Pier-side maintenance scheduling encompasses dredging, fender repairs, mooring repairs, etc. This limits the amount of berthing space for ships. Transient/Other Ships include Military Sealift Command, MARAD, visiting ships, foreign ships, ship commissioning and decommissioning. Average on-board numerical data is required for determining requirements. Peak loadings for exercises or contingencies not to be used.	Fleet Commanders (e.g., LANTFLT, PACFLT) and TYCOMS (e.g., COMNAVSURFLANT, COMNAVSURPAC) Port Operations Officers at individual installations

Table 1-4. Potential Personnel Loading Sources

The majority of space allowances are based on military strength.

Categories	Potential Sources
Military Strength – all officer (O1-O10) and enlisted personnel (E1-E9) assigned to an activity for permanent duty. Military strength may also include "Permanent Change of Station" (PCS) students, who are assigned to a school on orders lasting more than 20 weeks and may be counted as permanent party personnel, especially for bachelor housing requirements. Reservists are considered the military strength population at Reserve Training Centers.	CNI Housing Intranet (MyHSG) site: https://www.emh.housing.navy.mil Maintained by Navy Housing Technical Support at 800-877-8503 or 703-273-5480 or eMH@aemcorp.com. Downloads from the Total Force Manpower Management System (TFMMS), managed by the Navy Personnel Command and found at http://www.npc.navy.mil.
Some CCN series, especially the 500 and 700 series modify the Military Strength calculation and allow the following Transients categories to be included. This will be specifically called out in the CCN series:	
Transients – average daily number of personnel on Temporary Duty (TDY), awaiting transfer for further assignment, or pending separation who are not permanently assigned to the activity. Transients may only be counted when sizing facilities that transients specifically use. Discharged medical personnel awaiting PCS assignment are not included. Transients also include groups (1) through (4) listed below:	
(1) Temporary Duty (TDY) Students – personnel assigned to a school on orders for less than twenty weeks. However, only the average number on board may be used and only for sizing facilities that students specifically use.	Chief of Naval Education and Training. BUMED (for TDY medical students).

Categories	Potential Sources
(2) Reservists – personnel assigned to reserve units. Reservists may be counted with the active duty military populations at active duty installations only for sizing facilities that are specifically affected by this group, such as the 740 and 750 series. Eighty percent of the average onboard count of Reservists on weekend or two-week duty may be counted when located at Commander, Naval Air Reserve commanded air stations; twenty percent	Average daily numbers are available from all Naval shore activities.
(3) Rotational personnel – are the average daily number of personnel deployed with squadrons or mobile units on a scheduled basis at locations other than their homeport. Deployed personnel are counted at the activity to which they are deployed.	
(4) Personnel assigned to ships undergoing overhaul.	Overhaul schedules for the next six years can be obtained from the Naval Sea Systems Command.
The following non-transient populations may be included in some BFR calculations, but must be specifically indicated as such in the CCN explanatory material. These potential populations include:	
Civilians – DoD Civilians and foreign nationals (at OCONUS installations) are counted in category codes where they are	Data about civilians is available from all Naval shore activities (typically the Human Resources Office).
Contractors – private-sector contractors employed by the DoD or employees of other services, agencies or nations working with the DoD.	The contract document or the Memorandum of Understanding usually details the amount and kinds of space required to accommodate these personnel.

Categories	Potential Sources
Retiree Population – number of retirees living within a thirty-minute drive of the installation. Retired personnel may be counted in facility requirements only if indicated in the respective allowance table and to the percentage authorized. Dependents of retired personnel are not counted.	If the installation cannot provide data, use most current FY Statistical Report provided by the DoD Office of the Actuary, http://actuary.defense.gov. In areas with many military installations, consult with the activities to determine the appropriate number of retirees apportioned to each installation.
Dependents – spouses and children of assigned military personnel. Dependents are counted in requirements if the individual CCN's allowance table indicates that they may be counted and only to the percentage authorized. While a reduction in military strength should be made to account for military personnel on deployment, no similar reduction should be made in calculating dependent population, as dependents remain at the homeport location. In BFRs that require calculating "installation population," dependents of military strength assigned to the installation are included.	through Defense Manpower Data Center (DMDC) Data Request System at https://www.dmdc.osd.mil/drs. * Data as of 18 February 2005 is included below in Table 1-5.

Table 1-6. Potential Equipment Assigned Loading Sources

Categories	Potential Sources
Materials requiring storage – quantity (usually expressed in volume) of an item that must be stored.	Host or Tenant Command maintains a "Table of Allowances"
Ordnance requiring storage – type and amount of munitions (by volume, Net Explosive Weight Compatability Group).	Installation ordnance load plans are available from Naval Operational Logistics Support Center (NOLSC), Mechanicsburg, PA. See CCN 421 series for details. Also check with Fleet Commanders Ordnance staff for fleet ordnance download requirements from ships.

1-6.2.5 NEED FOR DOCUMENTATION. BFRs must thoroughly document loading numbers by including citations of the sources used and explanations of the methodology employed. Loading numbers should be cited on each individual BFR justification worksheet and in a summary loading worksheet included at the beginning of a BFR package.

1-6.3 CRITERIA

1-6.3.1 CRITERIA COMPONENTS. The methodology set forth in this publication allows facilities to be appropriately sized and provides uniformity. Specifically, the criteria ensure that the existing and planned facilities are neither too small nor too large to accomplish standard mission objectives. The criteria also establish common planning standards within the Navy. Criteria information in this publication can be separated into several components, as follows:

Description of the facility – The description usually includes: the primary function of the facility; the relationship with operational components; installation types that require this facility; list and relationships of internal functional elements; and references to other publications that provide more detailed data.

Specific planning factors – This is quantitative facility data, which are usually presented in tables as formulas or in fixed gross allowances. Fixed allowances are used when a specific facility type is uniform throughout the Navy. It is important to note that fixed gross allowances do not include such facility components as loading docks and porches. If a planner expects that a facility may have these components, then the planner must adjust the BFR to accommodate them.

Approximate planning factors – For some facilities, development of specific planning factors is not feasible. However, the size of these facilities will usually fall within a limited range that has been identified by engineering surveys. Detailed justification of these requirements may be required.

1-6.3.2 GUIDELINES IN APPLYING CRITERIA. The criteria should be considered guidelines, not regimented formulas. In certain circumstances, a planner may need to modify criteria or even develop new requirements. Some CCNs do not require BFRs, such as the 800 and 900 CCN series, Family Housing, and other individual CCNs per NAVFAC P-72. Likewise, no activity is automatically entitled to a facility size allowance or the facility itself, just because the facility is included in this document. Every facility must be justified on the basis of need. Requirements should neither be based on the size of existing assets simply to justify their retention nor inflated to accommodate existing inefficient or oversized assets.

In fact, a smaller facility than the maximum gross allowance may be adequate to meet an activity’s needs. Although a BFR is initially based on facilities sizing guidelines and established planning criteria, the resulting maximum allowances should be reviewed within the context of existing conditions. If the existing space is sufficient and this amount is less than the derived allowance, then the BFR should be reduced. Likewise, when a facility is sized based on regional loading, it may be smaller than the aggregate of similar facilities whose separate sizes are based on individual activity population. This difference is acceptable because the sizing reflects economies of scale. However, it is incumbent upon the planner to be consistent in the methodology used for both BFR development and actual facility sizing and construction.

1-6.3.3 NET-TO-GROSS FACTORS. In addition to the specific criteria presented under each category code, the net-to-gross factors should also be considered in developing the final space allowance. In some countries, net-to-gross factors for facilities are larger than what this document indicates. This is due to Host Nation laws and norms that require additional space, such as larger and more numerous corridors, stairwells, mechanical rooms on exterior walls, safe rooms accessible via stairwells at each floor, separate mechanical and electrical rooms and wider egress doors. Many countries also have day lighting requirements that may justify the use of atriums or open courtyards and, therefore, restrict the building shape.

Planners must document and apply appropriate net-to-gross factors. This will ensure projects have sufficient building area and cost built into the program in order to prevent functional areas from being reduced during project design. Each project must be considered independently. Higher factors may be justified for increased circulation requirements in multi-story buildings or in buildings with several different functional spaces. Consideration also should be given to the type of facility (for example, warehouse requirements may require higher allowances, as per Table 440A & B), variation of occupant functions, local requirements and site limitations on building size and shape. Also, the number of occupants may dictate allowances; for example, uninhabited facilities like Military Working Dog kennels and armories may not necessitate higher allowances. If a planner decides to adjust the net-to-gross factors based on any of the above situations, appropriate justification must be included in the BFR documentation.

NOTE: All criteria or algorithms listed in this publication produce gross area, unless otherwise noted.

1-7 ADDITIONAL PLANNING GUIDANCE

Commander, Navy Installations has chartered an integrated product team (IPT) to review the two primary BFR types: a Planning BFR, which typically is an “80% solution” used when preparing large quantities of BFRs as part of Regional Overview, Functional, or Activity Plans; and the Project BFR, which is a 100% scope solution used to justify a MCON or Special Project. Once the results are evaluated in the Fall of 2005, the BFR IPT team will release more definitive guidance about the appropriate use of each type. Traditionally, the Navy Audit Service has used this FC 2-000-05N publication as the source document when auditing MCON projects. This publication’s criteria are also enforced to ensure that operational safety and security criteria are followed. Under the regional planning model, however, variations may be necessary and the following topics should be considered when calculating BFRs:

1-7.1 ADJUST FOR OPERATIONAL CONDITIONS

Many operational conditions, circumstances and influences can affect the use of Navy facilities. For example, the use of specific equipment or the conduct of certain operations may require that a facility be larger or smaller than anticipated. In addition, some rooms in the facilities may be unable to be occupied while such equipment is being used or operations are underway. These conditions must be taken into account when determining the requirements for a specific facility.

It is also difficult to develop specific planning factors for unique, one-of-a-kind facilities, such as Research, Development, Testing, and Evaluation facilities. Requirements for these facilities should be based on an engineering analysis of the operation and the specific uses within the facility. Planners may also look to examples in other services, government agencies and in the private sector, keeping in mind that specialized Navy security requirements may alter these facility requirements. Regardless of the example used or method employed, the planner is responsible for providing a detailed justification of the resulting requirement.

1-7.2 UNDERSTAND HOST / TENANT RELATIONSHIPS

The planner must determine if a host activity is responsible for providing common facilities to both personnel assigned to the host and the personnel attached to tenants that are supported by the host activity. The planner must recognize these support relationships and develop base loading figures accordingly. While CNIC is in the process of establishing the formal relationships, interim host/tenant relationship information is available in the Activity Module of iNFADS.

1-7.3 USE SOUND PROFESSIONAL JUDGMENT

The planner must be prepared to provide appropriate justification for any deviations from established criteria. Appropriate justification may include the number and organizational status of the personnel, support space requirements, space needed for each function within the facility, and an industrial engineering analysis of the operations. There are two techniques for preparing industrial engineering analyses: one technique is to indicate each piece of equipment and operational feature with their corresponding working and/or access space requirements in a scaled drawing; the other technique is to list the above components and their sizes in columnar format. The totals obtained from either method, plus an appropriate net-to-gross conversion factor, yield the requirement.

Complete BFR justifications should be in tabular format and should include the date of their preparation and citations of sources that were used. Do not consider “based on experience” to be sufficient justification for a BFR without further clarification or analysis. The example worksheet on the following page provides more information.

1-7.4 REFERENCE DOCUMENTS

This publication, FC 2-000-05N, should serve as the Navy Facility Planners' primary resource for determining facility space requirements. The following documents and resources are among the many sources of supplementary information that can provide supporting data and guidance to assist with establishing and justifying the necessary facility space requirements:

1) DOD Tri-Service Unified Facility Criteria (UFC) and DON Facility Criteria (FC) manuals, which provide technical discipline and facility specific guidance and criteria, and are located on the Whole Building Design Guide (WBDG) website: https://www.wbdg.org/ffc/dod/unified-facilities-criteria-ufc. Examples are:
    - UFC 1-200-02 *High Performance Buildings*
    - UFC 3-101-01 *Architecture*
    - FC 4-721-10N *Navy and Marine Corps Unaccompanied Housing*
2) DOD Unified Facilities Space Program Spreadsheets, located on the WBDG website: https://www.wbdg.org/ffc/dod/unified-facilities-space-program-sustainability-spreadsheets, which provide space allowance calculations (for a limited number of facility types) based on the criteria presented in this UFC and in the manuals noted in item 1 above.
3) NAVFAC P-970 Planning in the Noise Environment located on the NAVFAC informational documents web-portal page: https://portal.navfac.navy.mil/portal/page/portal/084BACA3D5146AC9E0440003BA8FC471
4) NAVSEA OP5, Vol.1 Ammunition and Explosive Ashore: Explosive Storage and Safety Distance
5) DD Form 805 Storage Space Management Report

Planners should also solicit input from functional area experts and local Activity representatives. Incorporating information from these and other sources will help ensure that there is a correlation between the program needs and the types and sizes of spaces to be provided.

1-7.5 EXAMPLE OF WORKSHEET

The following worksheet is included as an example of how to present the BFR justification calculations. While the exact formats are not mandatory, all worksheets should be dated and include the name of the person who prepared the information.

Figure 1-1. Example Basic Facilities Requirements Justification Worksheet

BASIC FACILITY REQUIREMENTS WORKSHEET

Activity -	NAB Little Creek	**UIC -**	N61414

CCN -	740-76	**DESCRIPTION -**	MWR Library

			Other

LOADING ANALYSIS / JUSTIFICATION OF REQUIREMENT

A. MISSION: The Naval Amphibious Base Little Creek Library is required to provide active duty personnel and their family members professional and educational enrichment materials to enhance the Navy quality of life and to provide leisure and recreational materials for their personal enjoyment.

B. PLANNING CRITERIA: Basic Facilities Requirements (BFR) for Category Code 740-76, MWR Library, was developed in accordance with NAVFAC P-80, Facility Planning Criteria for Navy and Marine Corps Shore Installation.

C. LOADING: Based on a FY02 Base Loading report: Officers (953); Enlisted (7,244); Military Strength total is 8,197.

D. ANALYSIS:

1. Table 740-76A — 1,670 m2 or 18,000 GSF

2. Staff — 2PN x 130 NSF = 260 NSF
   Limited Duty — 4 PN x 90 NSF = 360 NSF
   620 NSF

   620 NSF x 1.25 GSF/NSF = 775 GSF

   Total: 18,000 + 775 = **18,775 GSF or 1,742 m^2**

REQUIREMENT: 18,775 GSF or 1,742 m^2 — **Page 1 of 1**

Date Prepared: January 18, 2002
Prepared by: Jane Doe, Code HBJD, NAVFAC

CHAPTER 2 - FACILITY PLANNING CRITERIA FOR SERIES 100 THROUGH 900

100 Series – Operational and Training Facilities
200 Series – Maintenance and Production Facilities
300 Series – Research, Development, Acquisition, Test and Evaluation Facilities
400 Series – Supply Facilities
500 Series – Medical Facilities
600 Series – Administrative Facilities
700 Series – Housing and Community Facilities
800 Series – Utilities and Ground Improvements Facilities
900 Series – Real Estate Facilities

Version: 100.20242012

Date	CCN #	CCN Title	Description of Change
08 May 2018	143 65	Region / Installation Emergency Operations Center	Updated criteria to reflect new 131 Introductory criteria.
08 May 2018	143 80	Mission Operation Command And Control Facility	Updated criteria to reflect new 131 Introductory criteria.
08 May 2018	C5ISR	Command, Control, Communications, Computers, Combat Systems, Intelligence, Surveillance, And Reconnaissance (C5ISR) Facilities	A C5ISR BFR Calculator is available on the NAVFAC Portal to be used in tandem with the updated C5ISR Planning Criteria. Use the portal search function to search for "C5ISR BFR Calculator".
13 June 2018	125 20	Shed/Shelter For Pump Station And Ancillary Equipment	Remapped to FAC 1459 as per OSD/RPCP FY18.
13 June 2018	143 09	Expeditionary Ops Support Facility	Changed title from "Expeditionary Ops Support Module" to "Expeditionary Ops Support Facility" as per OSD/RPCP FY18.
13 June 2018	171 21	Decontamination Training Facility	CCN deleted. Not a standalone facility.
24 Oct 2018	143 80	Mission Operation Command And Control Facility	Minor change to language in section 14380-2.
11 June 2019	171 30	Physical Education Building	Minor editorial change to paragraph numbering
12 July 2019	143 12	Operational Storage Laydown	Updated table 14312-1 and 14312-2 and added verbiage
08 Aug 2019	116 55	Tactical Support Laydown Area	Changed Title from "Ordnance Handling Pad" to "Tactical Support Laydown Area"
08 Aug 2019	121 20	Aircraft Truck Fueling Facility	Remapped to FAC 1261.
08 Aug 2019	122 30	Small Craft Ready Fuel Storage	Remapped to FAC 1242.
08 Aug 2019	179 09	Ship Loading and Unloading Mockup	Remapped to FAC 1732. Changed UM to SF
08 Aug 2019	179 11	Air Transport Mockup	Remapped to FAC 8526. Changed UM to SY
08 Aug 2019	179 12	Elevated Training Tower/Platform	Changed Title from "Parachute Landing Fall Platform" to "Elevated Training Tower/Platform". Remapped to FAC 1734.

Date	CCN #	CCN Title	Description of Change
08 Aug 2019	179 13	Suspended Harness Mockup	CCN Deleted in FY19. Assets have been consolidated into CCN 179 12
08 Aug 2019	179 14	Mockup Jump Tower	CCN Deleted in FY19. Assets have been consolidated into CCN 179 12
08 Aug 2019	179 15	Underwater Fording Site	CCN Deleted in FY19.
08 Aug 2019	179 18	Airfield Demolition Range (ADR)	Changed Title from “Road/Airfield Construction Training Site” to “Airfield Demolition Range”
24 Sep 2019	111 30	Runway Overrun-Paved Surface	Revised Table 11130-1 for longitudinal centerline grade, Class A Runway to match recent update of UFC 3-260-01.
24 Sep 2019	141 82	Full Pressure Suit Facility	Revised text to indicate pressure suit maintenance is normally performed in the Aviation Life Support Systems Shop (Non-NAVAIR Depot), Category Code 211 75.
03 August 2020	116 41	Improved Fresnel Lens Optical Landing System (IFLOLS) Pad	CCN added.
03 August 2020	143 08	Expeditionary Ops Boat Maintenance Repair Facility	CCN added.
03 August 2020	143 13	Operational Vehicle/Equipment Canopy	CCN added.
03 August 2020	144 40	Scale House	CCN added.
03 August 2020	148 10	Ship Propulsion Support Facility	Retitled and changed description to remove the term “nuclear”.
03 August 2020	148 15	Ship Weapons Handling Facility	Retitled and changed description to remove the term “nuclear”.
03 August 2020	148 20	Ordnance Demolition Area	CCN deleted but see note under 148 20.
03 August 2020	148 25	Explosive Truck Holding Yard	Remapped to FAC 8526. UM changed to SY.
03 August 2020	148 35	Container Holding Yard	Remapped to FAC 8526. UM changed to SY.

Date	CCN #	CCN Title	Description of Change
03 August 2020	148 40	Container Transfer Facility (Ordnance)	Remapped to FAC 8526. UM changed to SY.
03 August 2020	148 45	Rail/Truck Receiving Station (Ordnance)	Remapped to FAC 8526. UM changed to SY.
03 August 2020	149 20	Aircraft Catapult	CCN deleted but see note under 149 20.
03 August 2020	149 62	Tactical Vehicle Wash Facility	CCN added.
03 August 2020	153 10	Cargo Staging Area	Remapped to FAC 8526.
03 August 2020	179 21	Armored Vehicle Launch Bridge, Raft, and Ford Area	CCN deleted.
03 August 2020	179 53	Enclosed Fire Fighter Trainer Facility	CCN added.
01 April 2021	151 Section 151-1	Pier Facilities	Delete reference to 165-10. Add reference to UFC 4-150-06, Military Harbors and Coastal Facilities
01 April 2021	151 Section 151-4	Pier Facilities	Add complete title, Military Harbor and Coastal Facilities for UFC 4-150-06.
20 Jan 2023	143-11	Operational Vehicle Garage	1. Expand the "Definition" information. 2. Include additional guidance for calculating the space requirements. 3. Add new tables with space requirements.
20 Jan 2023	143-12	Operational Vehicle Parking/Laydown Area	Change Net to Gross factors for Table 14312-1 and added 1B designation to Table 14312-2.
20 Jan 2023	143-22	Navy Explosive Ordnance Disposal Shore Detachment Facility	Redefine EOD Shore DET Facility.
20 Jan 2023	149-10	Protective Barricades	Redefine Protective Barricade/Revetment to support explosives safety requirements.
20 Jan 2023	148-20	Ordnance Demolition Area	CCN was deleted in Aug 2020 but is reinstated and will be remapped to FAC Code 1783 in FY23.
20 Jan 2023	173-40	Observation Tower/Bunker	CCN added to serve as a protective shelter facility at ranges for personnel protection.

Date	CCN #	CCN Title	Description of Change
2 Mar 2023	100 Series	UFC 2-000-05N	Change UFC 2-000-05N to FC 2-000-05N document due to the fact that this planning criteria is not unified among the other DoD services.
17 Mar 2023	141-20	Aircraft Fire and Rescue Station	Change URL to access Space Planning Spreadsheet. Change URL to access Design UFC 4-730-10 Fire Stations.
17 Mar 2023	151 Series, 151-5	Pier Facilities	Change URL to access Design UFC 4-150-06 Military Harbors and Coastal Facilities.
17 Mar 2023	171-15, Section 17115-3.2	Navy and Marine Corps Reserve Training	Change URL to access NOSC Space Planning Spreadsheet. Change URL to access Design Criteria FC 4-171-06N Navy Operational Support Center.
31 Mar 2023	123-30, Section 12330-7	Vehicle and Equipment Ready Fuel Storage	Replace reference CCN 126-50 with CCN 126-15 Petroleum Ready Fuel Storage Facility.
31 Mar 2023	156-10, Section 15610-1	Waterfront Transit Shed	Include reference to Section 440-2 General Supply Requirements in Category Code 440 Series.
11 Jul 2023	126-15	Petroleum Ready Fuel Storage Facility	Change the Unit of Measure (UM) from BL to GA.
30 Aug 2023	131-12 131-13 131-17 135-11 135-12 135-13 135-15 135-21	Communications Maintenance Vault Communications Maintenance Tunnel Communications Maintenance Channel Fiber Optic Communications Lines, Underground in Conduit Fiber Optic Communications Lines, Non-Conductive Riser Rated Fiber Optic Communications Lines, Outside Plant, Armored Optical Ground Wire Fiber Optic Communications Lines, Outside Plant, Marinized (Underwater/Wetland)	Category Code changes included with updated descriptions / definitions for all CCNs listed.

	11130-1	Description	Updated description
	11130-2	Criteria	Referenced UFC 3-260-01, deleted Table 11130-1
	112 10	Taxiway	Updated Design and Additional Design Criteria.
	11210-2.1	Basic	Inserted introduction regarding and new Figure 11210-1 Basic Airfield Layout
	11210-3	Criteria	Referenced UFC 3-260-01, deleted duplicative information.
	11210-4	Exits for Class B Fixed Wing Runways	Referenced UFC 3-260-01 and provided additional clarity.
	11210-6	Safety Clearances/Separations	Referenced UFC 3-260-01, deleted duplicative information.
	113 20	Aircraft Parking Apron	Updated Design and Additional Design Criteria.
	11320-1	Description	Updated description to provide for reference to UFC 3-260-01 and added Figure 11320-1 Aircraft Parking Aprons and Figure 11320-2 Apron and Taxiway Category Codes.
	11320-2	Criteria	Referenced UFC 3-260-01, deleted duplicative

Date	CCN #	CCN Title	Description of Change
			information.
	11320-4	Spacing of Aircraft	Referenced UFC 3-260-01, and deleted Table 11320-1, Table 11320-2, Table 11320-3, Table 11320-4, Figure 11320-1, Figure 11320-2, Figure 11320-3, Figure 11320-4, and Figure 11320-5.
	11320-4.1	Jet Blast Protection	Reference UFC 3-260-01, for deleted tables/figures.
	11320-4.2	Deviations from Efficient Configuration	Reference UFC 3-260-01, for deleted tables/figures.
	11320-5	Peripheral Taxilanes	Reference UFC 3-260-01, deleted 11320-5.1
	11320-6	Safety/Lateral Clearances	Reference UFC 3-260-01, P 80.3 deleted.
	11320-7	Distance from Apron Edge	Apron edge is defined, deleted contradictory information.
	11320-8	Maintenance Hangar Offset from Apron	Reference UFC 3-260-01 and deleted duplicate information.
	11320-9	Deviation from Criteria	Substituted parallel for through taxiway, referenced UFC 3-260-01 and deleted duplicate information.
	11320-10		Reference UFC 3-260-01 and deleted duplicate information.
	11320-11		Deleted
	11320-11 (new)	Access Taxilanes and Vehicle Roads	Defined Category Code for vehicle roads as part of apron requirements, deleted Table 11320-1, Table 11320-2, Table 11320-3, Table 11320-4, Figure 11320-1, Figure 11320-2, Figure 11320-3, Figure 11320-4, and Figure 11320-5.
	113 40	Aircraft Access Apron	Updated Design and Additional Design Criteria.
	11340-1	Aircraft Access Aprons	Referenced UFC 3-260-01 for peripheral taxilane wingtip requirements.
	116 10	Aircraft Wash Rack Pavement (M2/SY)	Updated Design and Additional Design Criteria.

Date	CCN #	CCN Title	Description of Change
	11610-1	Wash Racks	References UFC 3-260-01 and identified three standard types of wash racks for fixed wing aircraft.
	11610-1.1	Type A (for Fighter and Attack Aircraft and Helicopters)	Updated description of Type A, B and L wash rack use and deleted 11610-1.2. Term “wash rack” is 2 words.
	11610-1.3	Type B (for Patrol and Cargo Transport Aircraft	Updated description and equation of Type B wash rack use and deleted 11610-1.4, deleted Figure 11610-1.
	116 12	Aircraft Pavement Shoulder	Updated Design and Additional Design Criteria.
	11612-1	Description	Updated description and referenced UFC 3-260-01.
	116 15	Aircraft Rinse Facility	Updated Design and Additional Design Criteria.
	11615-1	Taxi-Through	Described rinse facility components, referenced YFC 3-260-01.
	11615-1.1	Type 1	Defines basic length and width.
	11615-1.2	Type 2	Defines basic length and width.
	11615-1.3	Type 3	Defines basic length and width.
	11615-1.4	Type 4	Defines basic length and width including V-22 aircraft.
	116 20	Aircraft Compass Calibration Pad	Updated Design and Additional Design Criteria.
	11620-1	Aircraft Compass Calibration Pad	Referenced UFC 3-260-01 and deleted duplicate information.
	11620-2	Pad Capabilities	Deleted duplicate information
	11620-3	Siting	Referenced UFC 3-260-01 and deleted duplicate information.
	11620-4	Minimum Distances	Referenced UFC 3-260-01 and deleted duplicate information.
	11620-5	Access Taxiways to Calibration Pad	Deleted duplicate information
	11620-6	Gross Area Required for Calibration	Referenced UFC 3-260-01 and deleted duplicate

Date	CCN #	CCN Title	Description of Change
		Pad	information.
	11620-7	Calibration Target	Moved from 11620-5
	116 35	Arming and De-Arming Pad	Updated Design and Additional Design Criteria.
	11635-1	Description	Referenced UFC 3-260-01.
	116 40	Precision Approach Radar	Updated Design and Additional Design Criteria.
	116 41	Improved Fresnel Lens Optical Landing System	Updated Title to more accurately represent 116 41.
	116 42	Blast protection Pavement	Updated Design and Additional Design Criteria.
	11642-1	Description	Added blast protection pavement not intended to fully support aircraft load, added language regarding aircraft exhaust and the use of high temperature concrete, added F-35B aircraft type.
	116 45	Line Vehicle Parking	Updated Design and Additional Design Criteria.
	11645-1	Vehicle Parking Spaces	Identified category codes for peripheral taxilane, reference to UFC 3-250-01.
	116 50	Towway	Updated Design and Additional Design Criteria.
	11650-3	Typical Towway Widths	Referenced UFC 3-260-01 and deleted duplicate information.
	116 55	Ordnance Handling Pad (M2/SY)	Updated Design and Additional Design Criteria.
	11655-1	Description	Referenced UFC 3-260-01 and the term Hazardous Cargo Pad.
	11655-1.1	Types of Pads	Referenced UFC 3-260-01, and specific figures.
	11855-1.2	Dimensions	Referenced UFC 3-260-01, and specific figures, deleted Figure 11655-1, and Figure 11655-2.
	116 56	Combat Aircraft Loading Area	Updated Design and Additional Design Criteria.
	11656-2	Compliance with Explosive Safety Criteria	Reference UFC 3-260-01, P 80.3 deleted.
	11656-4	Criteria	Referenced UFC 3-260-01 and deleted duplicate

Date	CCN #	CCN Title	Description of Change
			information.
	116 60	Fire and Rescue Vehicle Alert Pad (M2/SY)	Updated Design and Additional Design Criteria.
	11660-2	Size and Location	Reference UFC 3-260-01, P 80.3 deleted.
	116 65	Tactical Support Van Pad (M2/SY)	Updated Design and Additional Design Criteria.
	11665-1	Description	Referenced UFC 4-141-10, tactical van pads to be clear of all imaginary surfaces.
	121 10	Aircraft Direct Fueling Station	Updated Design and Additional Design Criteria.
	12110-2	Policy	Referenced UFC 3-260-01.
	12110-4	Siting Requirements	Reference UFC 3-260-01, P 80.3 deleted.
	12110-5	Access Taxiways and Vehicle Roads	Added category codes for access taxiways, and vehicle roads for fueling facility.
	12120-4	Siting	Reference UFC 3-260-01, P 80.3 deleted.
	12150-3	Siting	Referenced UFC 3-460-01.
	122 10	Marine Fueling Facility (GM)	Updated Design and Additional Design Criteria.

100 SERIES
OPERATIONAL AND TRAINING FACILITIES

Table of Contents

110 AIRFIELD PAVEMENTS

110-1 PAVEMENTS

This category group includes all pavements necessary for use by operational aircraft. Planning for pavements shall include all safety clearances and facilities required to provide a fully operational field, complete with accessories such as aircraft tie-downs and pavement marking. Airfield pavement lighting is considered separately under 133/134 series category codes. See UFC 3-260-01, Airfield and Helicopter Planning and Design, for criteria on obstruction clearances and clear zones related to airfields and heliports. Clearances and separations related to a specific pavement type (for example: the separation between parallel runways) is given under the applicable category code within the 110 code series.

[C] 110-1 PAVEMENTS

Information in FC 2-000-05N, Appendix E (NAVFAC P80.3 Airfield Safety Clearances, dated Jan 1982) has been integrated and superseded by UFC 3-260-01. Therefore, P80.3 is no longer applicable.

Facilities considered in this category group are:

111 Airfield Pavements - Runways (includes helipads)
112 Airfield Pavements - Taxiways
113 Airfield Pavements - Aprons
116 Airfield Pavements - Other

When creating or updating real property records for airfield pavement facilities, this will be done in accordance with P-78 Real Property Inventory (RPI) Procedures manual and the Department of Defense Guide for Segmenting Types of Linear Structures.

110-2 CLASS A AND B RUNWAY CRITERIA

The airfield criteria published herein differs from previous criteria in that it has been revised to conform to the standards published in the UFC 3-260-01 and the Air Installations Compatible Land Use Zone (AICUZ) program defined in OPNAVINST 11010.36D. The unified facilities criteria are defined in terms of class A and B runways and their supporting taxiways, aprons, etc. The A and B runways and the application of an A or B designation to a particular runway is explained in UFC 3-260-01. All Navy and USMC supporting pavements such as taxiways, aprons, etc., shall be considered class B unless their use is totally dedicated to supporting a runway which has been designated class A, and the application of class A standard has been approved by Headquarters NAVFACENGCOM and NAVAIRSYSCOM.

RUNWAY CLASSIFICATION. The classification is dependent on the type of aircraft which operate from the runway. Table 3-1 in UFC 3-260-01 provides the runway classifications for all Navy and Marine Corps aircraft as well as aircraft from other services or government agencies. These aircraft are listed by aircraft type. Each type includes all model variants.

Transient aircraft from other services or government agencies are special exceptions in the planning of Navy and Marine Corps air stations. Individual justification must be made for these cases where runway length must be extended to allow for the landing and takeoff of these aircraft.

Class A runways are primarily used by small light aircraft and the runway should not have the potential for development for use by heavier aircraft or have a foreseeable requirement for such use. Ordinarily, Class A runways are less than 8,000 feet (2,440 meters) long and less than 10 percent of the operations involve Class B type aircraft. Class B runways are primarily intended for high performance and large heavy aircraft. Basic training outlying fields used by T-6, T-34, T44, and T-54 aircraft have special criteria in UFC 3-260-01.

The classification of Navy and Marine Corps runways is determined as a part of the Air Installations Compatible Land Use Zone (AICUZ) program and is published in AICUZ study for a particular installation. NAVFACENGCOM and NAVAIRSYSCOM concurrence and CMC/CNO approval is required prior to classifying any runway Class A or B. This approval is obtained via approval of the AICUZ study.

111 AIRFIELD PAVEMENTS - RUNWAYS

Series 111 Category Codes include criteria for runways for fixed wing aircraft and runways or landing pads for rotary wing aircraft. Runways are prepared surfaces for the landing and takeoff of both fixed wing and rotary wing aircraft. Landing pads are prepared surfaces for the Vertical Takeoff and Landing (VTOL) of rotary wing aircraft (including V-22). The number of runways and/or landing pads is determined by the expected traffic density, airfield mission, operational procedures, and environmental factors. Runway orientation is determined from analysis of wind data, terrain, noise levels generated, and local development conditions.

111 10 RUNWAY/FIXED WING (M2/SY)
FAC: 1111
BFR Required: Y

Design Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design,
UFC 3-260-02, Pavement Design for Airfields
Additional Planning Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design

11110-1 DESCRIPTION. Runways are prepared surfaces for the landing and takeoff of aircraft. The number of runways required is determined by the expected traffic density, airfield mission, operational procedures and environmental factors. Runway orientation is determined from analysis of wind data, terrain, noise levels to be generated and local development planning.

11110-2 CRITERIA. The following standards apply to fixed-wing runways at all Navy and Marine Corps air installations, including outlying fields, unless specifically noted otherwise. Deviation from these standards must be approved by the Naval Air Systems Command.

11110-3 RUNWAY WIDTH. See UFC 3-260-01, Chapter 3 for criteria regarding runway width.

11110-4 LENGTH. Many factors influence the required runway length. The following paragraphs present a basic outline of the multitude of influencing factors and procedures for determining runway length. Planners must validate required runway length using the aircraft specific Facilities Requirement Document (FRD) and obtain concurrence/approval from NAVAIR.

The maximum planned length of a runway shall be long enough to accommodate selected critical aircraft in takeoff and landing operations under stipulated load and environmental conditions. The critical aircraft for a station is defined as one which:

a. Is or will be assigned to the installation or is to be supported by the installation in accordance with the mission assigned by the major claimant/CNO.

b. Requires the longest Takeoff Ground Run (TGR) or landing roll of those aircraft meeting the above stipulation.

11110-5 CRITICAL AIRCRAFT. The basic TGR or landing roll for the critical aircraft can be obtained from the pertinent Naval Air Training and Operating Procedures Standardization (NATOPS) Manual. Basic TGR is defined as the distance an aircraft requires to lift off at a given gross weight on a level runway surface at sea level (Barometric pressure 29.92 inches Hg.) with 59 degrees Fahrenheit ambient temperature and under conditions of zero wind. The TGR in most cases is the controlling characteristic.

Table 11110-1 provides minimum and maximum TGR and minimum and maximum landing roll for a group of selected Navy and Marine Corps aircraft. The minimum TGR (TGR min) is defined as the minimum takeoff distance an aircraft requires to lift off at minimum takeoff weight on a level runway surface at sea level (Barometric pressure 29.92 inches Hg.) with 59 degrees Fahrenheit ambient temperature and under conditions of zero wind. The maximum TGR (TGR max) is defined as the minimum takeoff distance an aircraft requires to lift-off at maximum takeoff weight (wartime weight) on a level runway surface at sea level (Barometric pressure 29.92 inches Hg.) with 59 degrees Fahrenheit ambient temperature and under conditions of zero wind. When local operating conditions are unavailable, use maximum TGR to compute runway length when TGR is the controlling characteristic.

Table 11110-1. Selected Navy and Marine Corps Aircraft Takeoff Ground Rolls (TGR) and Landing Distances

Aircraft Type	Min. Takeoff Ground Roll (TGR min) (1) (feet/meters)	Max. Takeoff Ground Roll (TGR max) (2) (feet/meters)	Min. Landing Distance (feet/meters) (3)	Max. Landing Distance (feet/meters) (4)

Note:
(1) Minimum takeoff distance at minimum takeoff weight.
(2) Minimum takeoff distance at maximum takeoff weight.
(3) Minimum landing ground roll required at minimum landing gross weight.
(4) Minimum landing ground roll required at maximum landing gross weight.
(5) (A/B/C/D) model Hornet with F404-GE-400 engine.
(6) (A/B/C/D) model Hornet with F404-GE-402 engine.
(7) (E/F) model Super Hornet with F414-GE-400 engine.
(8) Weight limited to 21.3 k-lb by tire speed.
(9) Vertical landing.

11110-6 BASIC LENGTH AND CORRECTION FACTORS. The planned runway length for an aircraft is the TGR or landing roll (whichever governs) of the critical aircraft, corrected for nonstandard conditions of altitude, temperature, and effective gradient, and with an appropriate safety factor applied. The result is rounded to the next 30.5 meters (100 feet). (Additional corrections are to be applied to crosswind runways and runways used by T-6, T-34, T-44, and T-54 aircraft for basic training). The safety factor allows for variation in pilot techniques, runway surface conditions, wind, minor mechanical difficulties, and psychological factors. Older versions of this document included elevation and mean high temperature data. Use elevation and historical weather data to determine applicable data and calculate appropriate correction factors. Correction and safety factors are applied as follows:

11110-6.1 Altitude. Increase runway length (TGR or landing roll) by 1.1 percent for each 30.5 meters (100 feet) the site is above sea level.

11110-6.2 Temperature. Increase above result by 0.66 percent for each degree F the anticipated mean high temperature is above 59 degrees F. The mean highest temperature is defined as the average of the highest temperature recorded each day during the month which has the highest average daily maximum temperature.

11110-6.3 Safety Factor. Multiply the above result by 1.6 for all runways except those at Air Training Command air installations where a safety factor of 2.0 shall be applied.

11110-6.4 Effective Gradient. Increase the above result by 10 percent for each 1 percent of effective gradient. Effective gradient is the maximum difference in elevation along the centerline of the runway divided by the runway length and expressed as a percent.

11110-6.5 Round off. Final runway length is the result of the foregoing calculations rounded off to the next higher 30.5 meters (100 feet).

11110-6.6 Basic Training Runways. At basic training runways used by T-6, T-34, T-44, and T-54 aircraft, 305 meters (1,000 feet) shall be added to the computed runway requirement. The additional runway length is required to practice precautionary emergency landings.

11110-6.7 Example. See the example computation at the end of Category Code 111 10.

11110-7 CROSSWIND RUNWAY. The foregoing discussion applies to the primary runway. When the primary runway provides less than 95 percent wind coverage (that is, when a 15 knot crosswind component occurs more than 5 percent of the time), it becomes necessary to consider a crosswind runway. Justification based on wind data and operational needs is required before planning action is taken. In those cases where a crosswind runway is authorized for planning, the length is computed as for the primary runway with the exception that the takeoff ground run (or landing roll) is reduced by 20 percent. This accounts for headwinds, 15 knots or more, which normally will be encountered on the crosswind runway. If operational conditions, wind data, or runway configuration are such as to indicate that a headwind other than 15 knots should be planned for, then the NATOPS Manual for the critical aircraft should be consulted, and the appropriate TGR computed.

11110-8 RUNWAY SEPARATIONS/CLEARANCES. See UFC 3-260-01 for guidelines for determining obstructions to air navigation and the definition of airfield imaginary surfaces. The following lateral separations are required between runways and other airfield pavements. Deviations from criteria require a waiver from NAVAIR unless specifically exempted from waiver per UFC 3-260-01.

11110-8.1 Parallel Runways. A minimum of 305 meters (1,000 feet) is required between centerlines of parallel runways. The separation shall be increased to 1,311 meters (4,300 feet) if simultaneous Instrument Flight Rule (IFR) operations are to be flown from the parallel runways.

11110-8.2 Parallel Taxiway. A minimum of 152.4 meters (500 feet) is required between the centerline of a runway and the centerline of a parallel taxiway. (Note: Aircraft using the parallel taxiway are under the direction of the air control tower and therefore are not considered an obstruction even though the taxiway lies within the runway primary surface).

11110-8.3 Parking Apron. The edge of a parking apron, including its peripheral taxilane, shall be sited outside the runway primary surface. Aircraft shall be parked such that they do not penetrate the 7:1 transitional surface.

11110-8.4 Objects. Objects shall be sited outside the runway primary surface and such that they do not penetrate the 7:1 transitional surface or other imaginary surfaces defined in UFC 3-260-01.

Figure 11110-1. Computation 1

The following is an illustrative example of the runway length computation:

GIVEN:	*Patrol Plane Air Station*	-	*P-3C is critical aircraft*
	Elevation of Site	-	*(91.5 meters) 300 feet above mean sea level*
	Mean Highest Temperature	-	*70 degrees (F)*
	Effective Runway Gradient	-	*0.8%*

Since TGR max is greater than LD max, use TGR max.

Altitude Correction (1) — *(91.5) 300 / (30.5) 100 x 1.1% = 3.3%*

1,219.5 (4,000) x 1.033 = 1,259.7 meters (4,132 feet)

Temperature Correction (1) — *(70-59) x 0.66% = 7.26%*

1,259.7 (4,132) x 1.0726 = 1,351.1 meters (4,432 feet)

Safety Factor Correction — *1,351.1 meters (4,432 feet) x 1.6 = 2,161.8 meters (7,091 feet)*

Effective Gradient — *0.8 x 10% = 8% increase*

2,161.8 meters (7,091 feet) x 1.08 = 2,334.7 meters (7,658 feet)

Figure 11110-2. Example Computation 2

The following is an illustrative example of the runway length computation:

<u>GIVEN</u>: *Air Station - F/A-18 "Hornet" w/ F404-GE-402 engine is critical aircraft*
- *(15.2 meters) 50 feet above*

Mean Highest Temperature	*-*	*80 degrees (F)*
Effective Runway Gradient	*-*	*0.5%*

-
Since LD max is greater than TGR max, use LD max.

Altitude Correction (1) *<u>(15.2)</u> <u>50</u> x 1.1% = 0.55%*
(30.5) 100

1,341 (4,400) x 1.0055 = 1,348.4 meters (4,424 feet)

Temperature Correction (1) *(80-59) x 0.66% = 13.86%*

1,348.4 (4,424) x 1.1386 = 1,535.3 meters (5,037 feet)

Safety Factor Correction 1,535.3 meters (5,037 feet) x 1.6 = 2,456.5 meters (8,059 feet)

Effective Gradient 0.5 x 10% = 5% increase

2,456.5 meters (8,059 feet) x 1.05 = 2,579.3 meters (8,462 feet)

Round off = 2,591.5 meters (8,500 feet).

111 12 RUNWAY/FIXED WING - UNSURFACED (M2/SY)
FAC: 1114
BFR Required: Y

Design Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design

11112-1 DESCRIPTION. Runways for rotary wing aircraft, which do not consist of a pavement or hardstand surface. More specific planning criteria is planned for development.

111 15 RUNWAY/ROTARY WING (M2/SY)
FAC: 1112
BFR Required: Y

Design Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design,
UFC 3-260-02, Pavement Design for Airfields
Additional Planning Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design

11115-1 DESCRIPTION. Runways/rotary wing are prepared surfaces for the landing and takeoff of helicopters. For planning purposes, helicopter landing/takeoff surfaces greater than 121.9 meters (400 feet) in length shall be considered a runway. Pavements equal to or less than 121.9 meters (400 feet) in length and-width (or diameter) shall be classified as Category Code 111 20, Helicopter Landing Pad. See UFC 3-260-01 for planning and design criteria for airfield safety clearances.

11115-2 CRITERIA. The basic rotary wing runway described below is designed to support normal takeoff and landing operations and may be increased in length when training exercises are to be conducted from the runway. Due to the multiple missions assigned to helicopters and the flexibility of their operating methods, standard size training pavements are difficult to define. However, a 305 meter (1,000 foot) long runway (no temperature and altitude correction is applied) is considered sufficient to conduct proficiency training and autorotation exercises for most Navy air installations.

11115-2.1 Width. See Chapter 4, UFC 3-260-01.

11115-2.2 Length. See Chapter 4, UFC 3-260-01.Temperature Correction. Increase the rotary wing runway length by 4.0 percent for each 10°F that the average daily maximum temperature for the hottest month is above 59°F.

11115-3 MULTIPLE TOUCHDOWN POINTS. Where multiple touchdowns points are provided on a single rotary wing runway, the touchdown points shall be spaced a minimum of 121.9 meters (400 feet) center to center.

11115-4 RUNWAY CONFIGURATIONS. Multiple rotary wing runway configurations that may be planned include parallel runways or arranging three runways as each side of a triangle. See UFC 3-260-01, Chapter 4, for distance between parallel taxiways.

11115-5 DISTANCE FROM CENTERLINE. For distance from the centerline of a Fixed Wing Runway to the centerline of a parallel Rotary Wing Runway under various conditions, see UFC 3-260-01, Chapter 4.

a. Simultaneous VFR operations for Class A Runway = 213.4 meters (700 feet)
b. Simultaneous VFR operations for Class B Runway = 305 meters (1,000 feet)
c. Instrument Flight Rules (IFR) using simultaneous operations (depart-depart or depart-approach) = 762.2 meters (2,500 feet)
d. IFR using simultaneous approaches = 1,311 meters (4,300 feet)

11115-6 IFR OPERATIONS. For rotary wing runways designed for IFR operations, the runway design must take into account the Ground Control Approach (GCA) system to be used and the number of instrumented touchdown points required. For example, two touchdown points located at opposite ends of a 305 meter (1,000 foot) runway could be served by a single GCA located on a turn table offset near the midpoint of the runway.

11115-7 AIRCRAFT SAFETY CLEARANCES. The location of objects adjacent to rotary wing runways is governed by the runway primary surface, transitional surface, and approach/departure surface. These surfaces differ for IFR and VFR operations and are defined in UFC 3-260-01. Also see UFC 3-260-01 for takeoff safety zone criteria for VFR rotary runways.

111 20 HELICOPTER LANDING PAD/HOVERPOINT (M2/SY)
FAC: 1112
BFR Required: Y

Design Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design
UFC 3-260-02, Pavement Design for Airfields
Additional Planning Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design

11120-1 DESCRIPTION. A helicopter landing pad (helipad) is a prepared area for the hovering, vertical takeoff and landing (VTOL) of helicopters and other VTOL aircraft. The pad is designed to accommodate only one helicopter/VTOL aircraft at a time. The pad may service a hospital, administrative activity, command headquarters or other installations which require helicopter cargo or passenger service. Helipads may be planned at fixed wing air installations, but only if air traffic density or safety requirements preclude the use of the fixed wing runways by helicopters.

Helipad locations marked on an apron without dedicated helipad lighting are considered part of the apron and fall within the boundary of Category Code 113 20 (Aircraft Parking Apron).

Helipad locations marked on a runway without dedicated helipad lighting are considered part of the runway and fall within the boundary of Category Code 111 10 (Runway/Fixed Wing) or Category Code 111 15 (Runway/Rotary Wing).

Helipad locations marked on a taxiway without dedicated helipad lighting are considered part of the taxiway and fall within the boundary of Category Code 112 10 (Taxiway).

See UFC 3-260-01, Chapter 4 for design criteria and definitions for Standard, Limited Use, and IFR Helipad.

11120-2 HOVERPOINT. A hoverpoint is a prepared and marked surface used as a reference or control point for air traffic control purposes by arriving or departing helicopters. A hoverpoint is generally located in non-traffic areas. See UFC 3-260-01, Chapter 4 for design criteria and definitions for Standard, Limited Use, and IFR Helipad.

11120-2.1 Types of Helipads.

a. Standard VFR Helipad. VFR standards are used when no permanent requirement exists or will exist in the future for an IFR helipad.
b. Limited Use Helipad. This is a VFR helipad used at sites where only occasional operations are conducted. These sites may be, but are not limited to, hospitals, headquarter areas, missile sites, and established airfields or heliports where the Limited Use Helipad may be used to preclude mixing helicopters and fixed-wing traffic. Limited Use Helipads may also be used to separate lighter helicopter (12,500 lbs. (5,670 kg) or less from medium and heavy helicopter traffic.
c. IFR Helipad. IFR standards are used when an instrument approach capability is essential to the mission and no other instrument landing facilities, either fixed wing or rotary wing, are located within an acceptable commuting distance to the site.

11120-3 HELIPAD LOCATION. Helipad location should be selected with regard to mission requirements, overall facility development, approach-departure surfaces, and local wind conditions. When a helipad is to be located near fixed and rotary wing runways, its location should be based on type of operations. Construction of helipads on buildings or on any type of elevated structure above ground shall be subject to review and approval by Naval Air Systems Command.

11120-4 STAND-BY PARKING. At individual helipad sites where it is necessary to have one or more helicopters on standby, an area adjacent to the helipad, but clear of the landing approach and transitional surfaces, should be designated for standby parking. This area is designated as a parking apron (see Category Code 113 20, Aircraft Parking Apron)

11120-5 SAME DIRECTION INGRESS/EGRESS. Helipads with same direction ingress/egress allow a helicopter pad to be in a confined area where approach-departures are made from only one direction. The approach may be either VFR or IFR. Same direction ingress/egress helipads must be individually justified and approved by NAVAIRSYSCOM. See UFC 3-260-01 for typical same direction ingress/egress helipad.

11120-6 CRITERIA. See UFC 3-260-01, Chapter 4, and Table 4-2 for standard helipad and hoverpoint criteria. The size of the helipad may be modified to accommodate specific training or mission requirements, for example, a shipboard-sized pad (approximately 15.2 meters by 15.2 meters (50 feet by 50 feet) for shipboard landing practice. Individual justification must be provided. Where more than one helicopter is to be at the pad location at one time, a connecting taxiway and parking apron is required. Helipads at VTOL training air stations (helipads servicing VTOL aircraft) should be 61.0 meters by 91.4 meters (200 feet by 300 feet) (5,575.4 square meters) (2,222 square yards).

11120-7 AIRFIELD SAFETY CLEARANCES. The location of objects adjacent to helipads and hoverpoints is governed by the primary surface, take off safety zone, transitional surface and approach departure surface. These surfaces differ for IFR and VFR operations and are defined in UFC 3-260-01.

111 25 FIXED WING AIRCRAFT (VTOL) LANDING PAD (M2/SY)
FAC: 1111
BFR Required: Y

Design Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design
UFC 3-260-02, Pavement Design for Airfields
Additional Planning Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design

11125-1 DESCRIPTION. This category code includes Vertical Landing (VL) Pads and shore-based Landing Helicopter Deck (LHD) facilities. This category code also includes connecting taxiways between VL or LHD facilities and adjacent runways, taxiways or aprons. In addition, shoulders and paved safety areas for the VL or LHD facility are included in this category code.
VTOL locations marked on a runway are considered part of the runway and fall within the boundary of Category Code 111 10 (Runway/Fixed Wing) or Category Code 111 15 (Runway/Rotary Wing).

VTOL locations marked on a taxiway are considered part of the taxiway and fall within the boundary of Category Code 112 10 (Taxiway).

VTOL locations marked on an apron are considered part of the apron and fall within the boundary of Category Code 113 20 (Aircraft Parking Apron).

See UFC 3-260-01, Chapter 8 for definitions, dimensions and design criteria.

111 30 RUNWAY OVERRUN – PAVED SURFACED (M2/SY)
FAC: 1113
BFR Required: Y

Design Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design
UFC 3-260-02, Pavement Design for Airfields
Additional Planning Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design

11130-1 DESCRIPTION. Runway overruns are areas extending at each end of a runway. The runway overrun areas are required to reduce serious damage to an aircraft in the event that the aircraft runs off of the runway end during takeoff or landing. These overrun areas are paved.

11130-2 CRITERIA. UFC 3-260-01, Chapter 3, provides the dimensional requirements for the overrun areas for Class A and Class B runways.

112 AIRFIELD PAVEMENTS – TAXIWAYS

112-1 DESCRIPTION. This basic category covers aircraft taxiway pavements and includes both normal and high-speed runway exits. Criteria for peripheral and interior taxi lanes of aircraft parking aprons are included in Category Code 113 20, Aircraft Parking Apron.

112 10 TAXIWAY (M2/SY)
FAC: 1121
BFR Required: Y

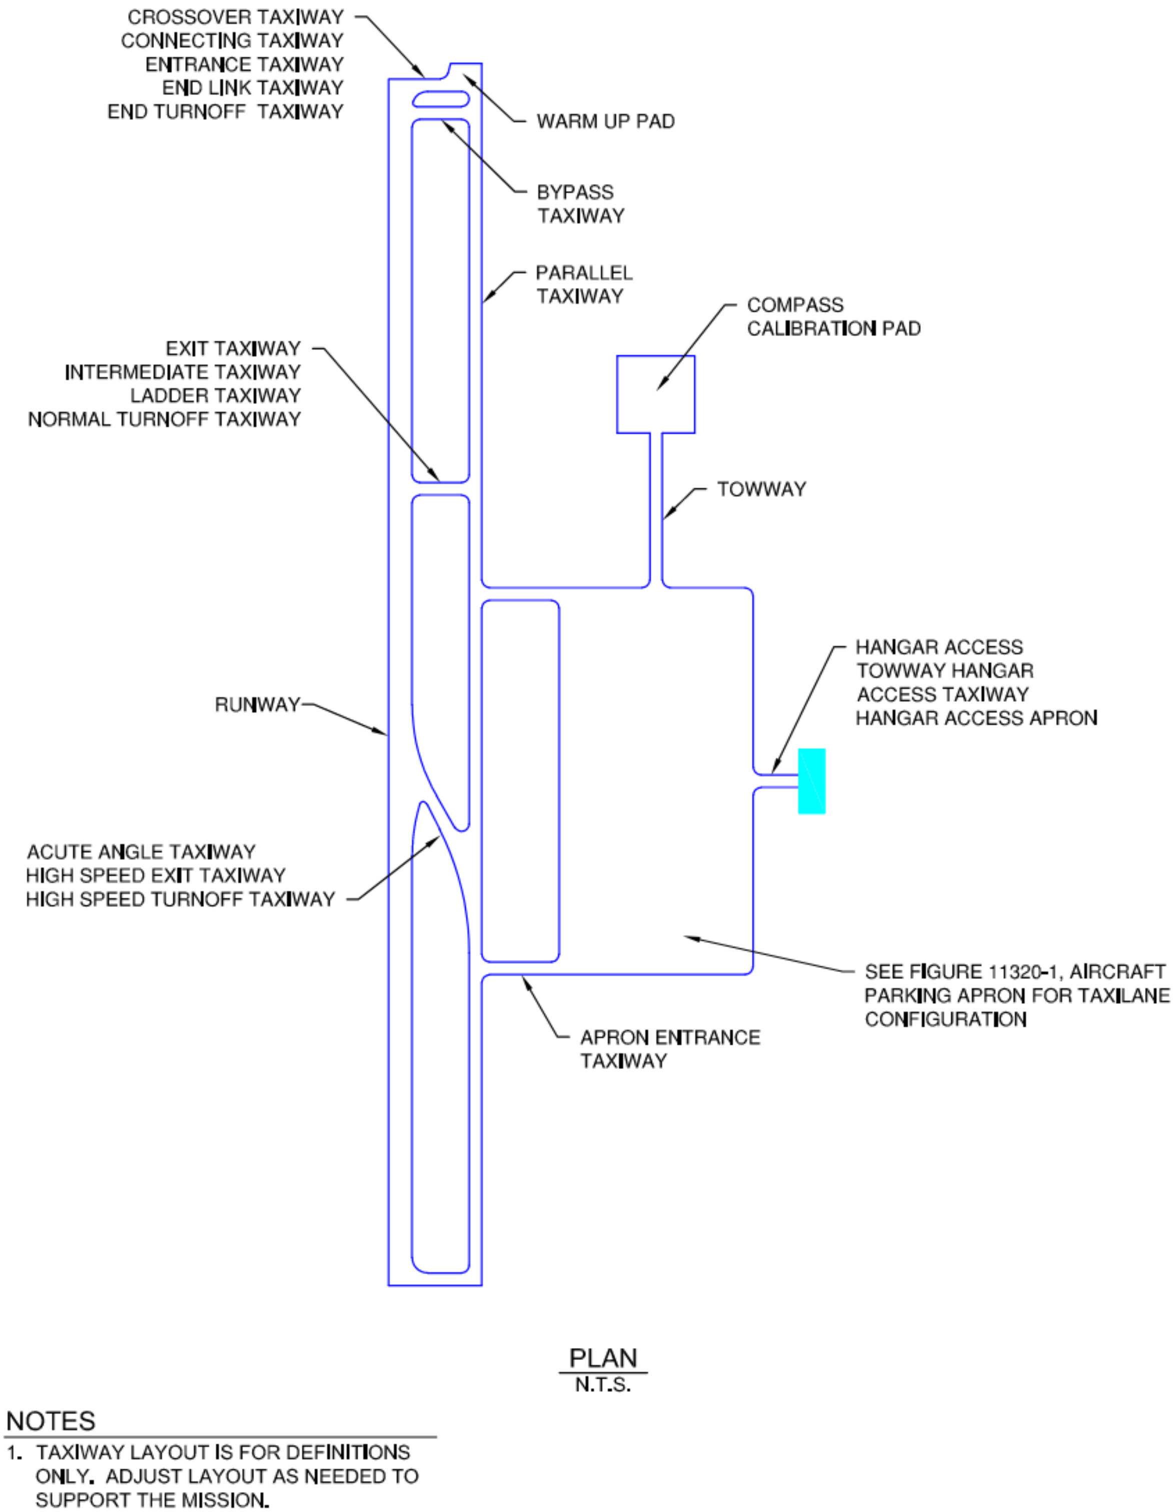
Design Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design
UFC 3-260-02, Pavement Design for Airfields
Additional Planning Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design

11210-1 DESCRIPTION. Taxiways are paved surfaces on which aircraft, both fixed and rotary wing, move under their own power to and from landing, service and parking areas. Criteria for surfaces for towing aircraft are included in Category Code 116 50, Towway.

11210-2 TAXIWAY TYPES.

11210-2.1 Basic. The basic airfield layout consists of a taxiway connecting the center of the runway with a parking apron. This system limits the number of aircraft operations at an airfield. Departing aircraft must taxi on the runway to reach the runway threshold. When aircraft are taxiing on the runway, no other aircraft is allowed to use the runway. If runway operations are minimal or capacity is low, the basic airfield layout with one taxiway may be an acceptable layout. See Figure 11210-1 for basic airfield layout. See Figure 11320-2 Apron and Taxiway Category Codes for typical boundaries of taxiway pavements.

Figure 11210-1 Basic Airfield Layout



11210-2 Parallel Taxiway. A taxiway parallel for the length of the runway, with connectors to the end of the runway and parking apron, is the most efficient taxiway system. Aircraft movement is not hindered by taxiing operations on the runway and the connectors permit rapid entrance and exit to traffic.

11210-2.3 High Speed Taxiway Turnoff. High speed taxiway turnoffs are located intermediate of the ends of the runways to increase the capacity of the runway. The high-speed taxiway turnoff enhances airport capacity by allowing aircraft to exit the runways at a faster speed than turnoff taxiways allow.

11210-2.4 Additional Types of Taxiways. Besides the types of taxiways above, there are other taxiways at an airfield. Taxiways are often Identified based on their function. Common airfield taxiways include, but are not limited to, crossover, connecting, bypass, acute angle, intermediate, and ladder.

11210-2.5 Peripheral and Interior Taxilanes. A taxi route through or around an apron is referred to as a taxilane. Taxilanes are generally an integral part of the aircraft parking apron and as such as included under Category Code 113 20, Aircraft Parking Apron.

11210-3 CRITERIA. The width of a taxiway depends upon the specific airfield configuration and layout of support facilities. Runway exits are part of the taxiway system and include end, normal intermediate and high-speed turn-offs. See UFC 3-260-01, Chapter 5 for taxiway dimensional criteria.

11210-4 EXITS FOR CLASS B FIXED WING RUNWAYS: End turn-offs are planned for each runway end and are 45.7 meters (150 feet) wide, except those from parallel runways to the parallel taxiway which are 61 meters (200 feet) wide. Normal intermediate turn-offs are required for all runways. They are normally 22.9 meters (75 feet) wide and are placed 610 meters (2,000 feet) from each end of the runway and in the remaining runway length at intervals of not more than 915 meters (3,000 feet) or less than 610 meters (2,000 feet). High-speed turn-offs are provided where traffic studies indicate the need for additional runway landing capacity. High-speed turn-offs are 30.5 meters (100 feet) wide at the throat tapering to 22.9 meters (75 feet) and are a minimum of 305 meters (1,000 feet) long. See UFC 3-260-01, Chapter 5.

11210-5 EXITS FOR CLASS A FIXED WING RUNWAYS AND ROTARY WING RUNWAYS: End turn-offs are planned for each runway end and intermediate taxiways shall be placed at intervals appropriate to runway length.

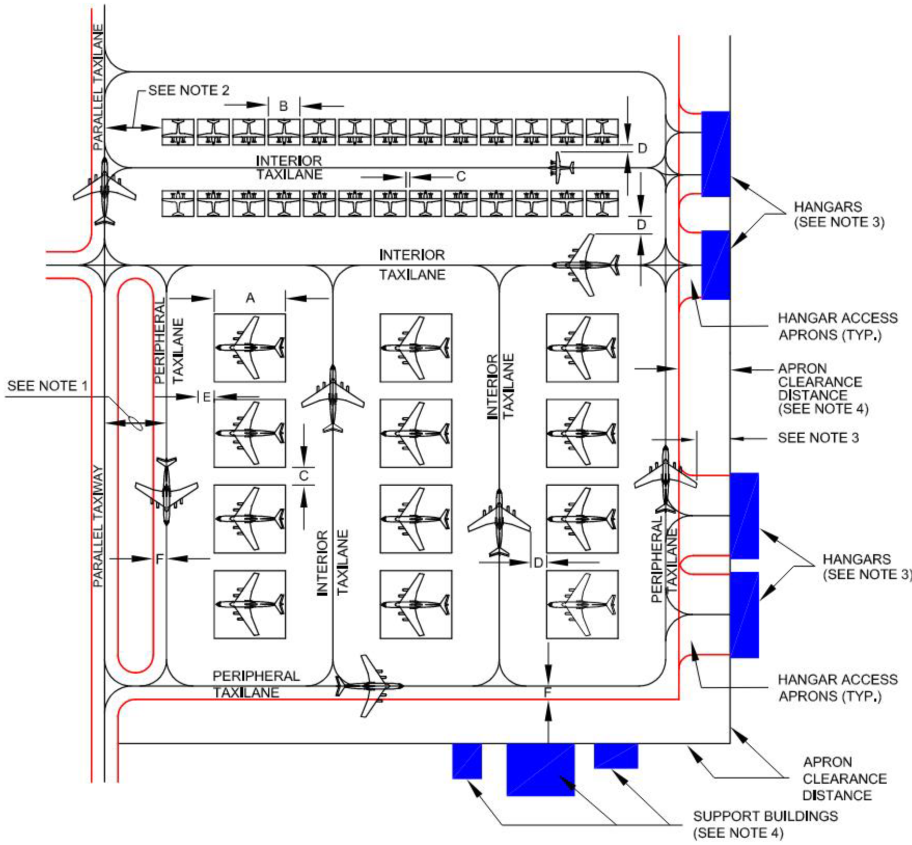
11210-6 SAFETY CLEARANCES/SEPARATIONS: Taxiways are located so as to provide adequate clearance between taxiing aircraft and aircraft in adjacent areas and obstacles. See UFC 3-260-01 for separation clearances.

113 AIRFIELD PAVEMENTS – APRONS – AIRCRAFT PARKING

113 20 AIRCRAFT PARKING APRON (M2/SY)
FAC: 1131
BFR Required: Y

Design Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design
UFC 3-260-02, Pavement Design for Airfields
Additional Planning Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design

11320-1 DESCRIPTION. Aircraft parking aprons are required for loading, unloading and servicing of aircraft in addition to providing parking space. There is no standard size or apron configuration. See Figure 11320-1 Basic Aircraft Parking Apron for typical parking apron configuration and limits included in this category code. See Figure 11320-2 Apron and Taxiway Category Codes for typical boundaries of apron, taxiway, and shoulder pavements. The size is based on the type and number of aircraft to be parked, the requirement for squadron integrity and 45 versus 90 degree parking. The area required includes parking space, wing-tip separation between aircraft, interior taxilanes, peripheral taxilanes, and connector taxilanes between aprons and adjacent taxiways. Aprons used for ordnance handling require special siting considerations, see Category Codes 116 55, Ordnance Handling Pad and 116 56, Combat Aircraft Loading Area. For design criteria, see UFC 3-260-01.

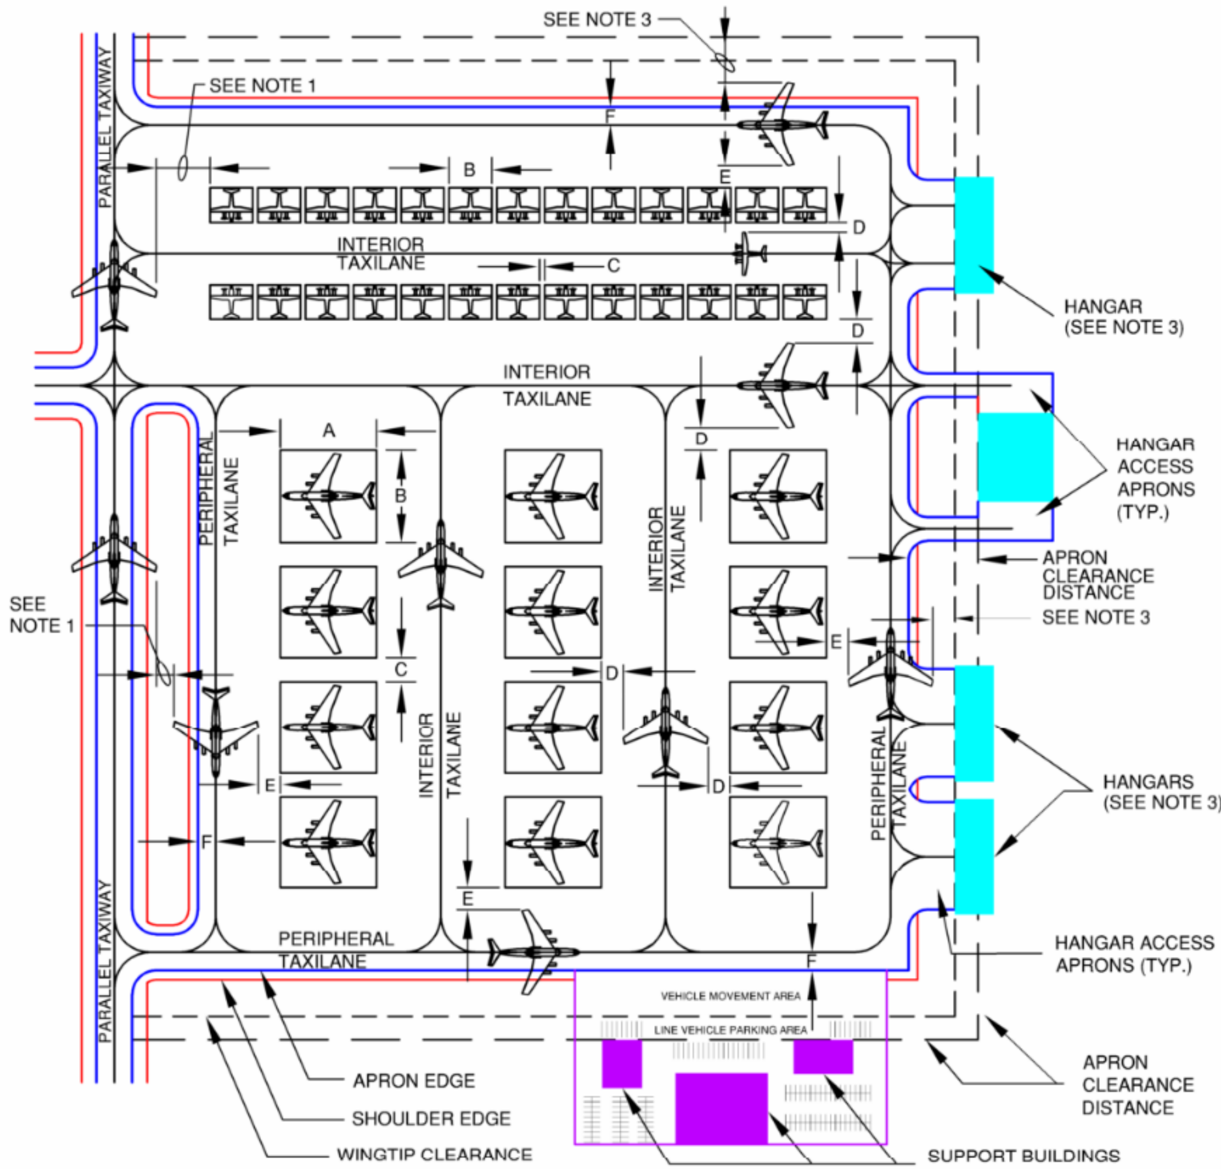


LEGEND

B - AIRCRAFT WIDTH
A - AIRCRAFT LENGTH
D - WINGTIP CLEARANCE FOR INTERIOR TAXILANE (MIN. TAXI CLEARANCE)
E - WINGTIP CLEARANCE FOR PERIPHERAL TAXILANES
C - WINGTIP CLEARANCE FOR PARKED AIRCRAFT
F - DISTANCE FROM PERIPHERALTAXILANE CENTERLINE TO APRON EDGE

NOTES:

1. TAXIWAY CLEARANCE DISTANCE AT FACILITIES WITH PARALLEL TAXIWAYS; SEE TABLE 5-1, ITEM 11.
2. SEE TABLE 6-1 N/MC FOR DIMENSIONAL DEFINITIONS.
3. INSURE MINIMUM WINGTIP CLEARANCE IS PROVIDED TO HANGARS OR OTHER PERMISSIBLE DEVIATIONS (SEE TABLE 6-1 N/MC ITEMS 6 AND 15).
4. MINIMUM 100 FEET BETWEEN APRON EDGE AND OTHER FIXED OBJECTS.



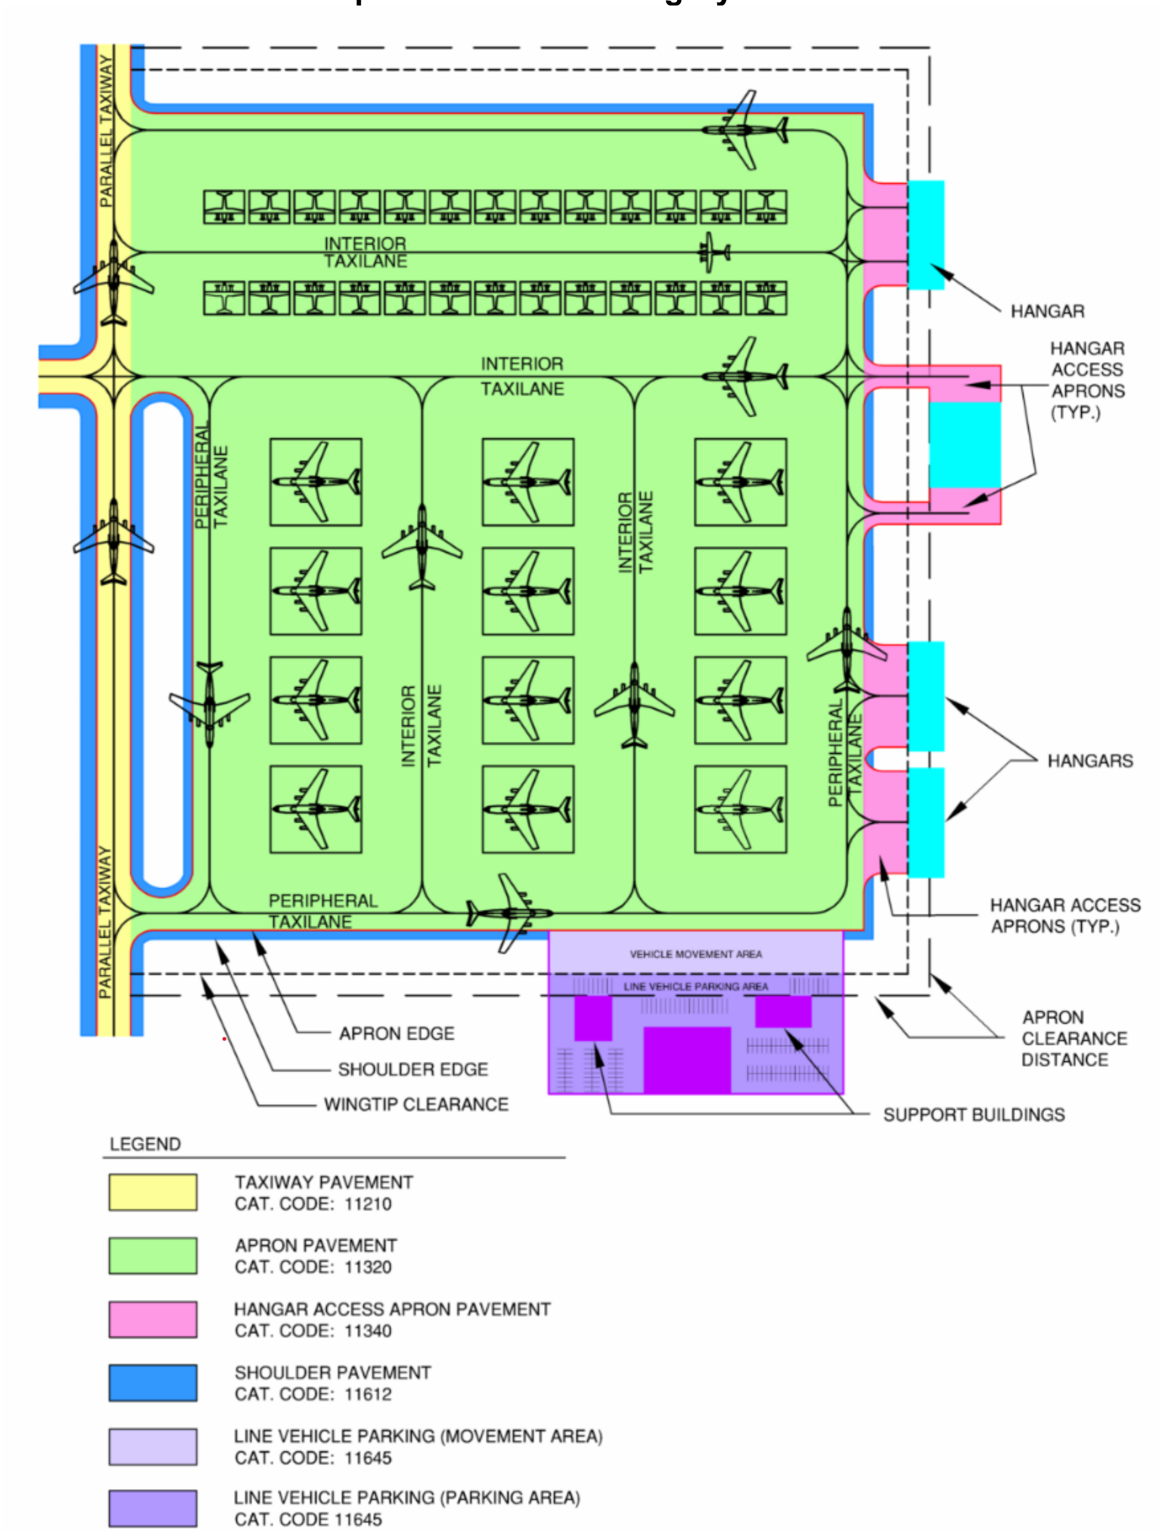
LEGEND

A - AIRCRAFT LENGTH
B - AIRCRAFT WIDTH
C - WINGTIP CLEARANCE FOR PARKED AIRCRAFT
D - WINGTIP CLEARANCE FOR INTERIOR TAXILANES
E - WINGTIP CLEARANCE FOR PERIPHERAL TAXILANES
F - DISTANCE FROM PERIPHERAL TAXILANE CENTERLINE TO APRON EDGE

NOTES:

1. TAXIWAY CLEARANCE DISTANCE AT FACILITIES WITH PARALLEL TAXIWAYS; SEE UFC 3-260-01, TABLE 5-1, ITEM 11.
2. SEE UFC 3-260-01, TABLE 6-1 N/MC FOR DIMENSIONAL DEFINITIONS.
3. ENSURE MINIMUM WINGTIP CLEARANCE IS PROVIDED TO HANGARS OR OTHER PERMISSIBLE DEVIATIONS (SEE UFC 3-260-01, TABLE 6-1 N/MC, ITEMS 6 AND 15).

Apron Pavement Category Codes



11320-2 CRITERIA. The determination of the apron requirements involves the following steps:

1. Determine the number of aircraft parking spaces required.
2. Layout the parking spaces using the dimensions in UFC 3-260-01, Chapter 6 for clearances between aircraft and interior taxilanes.
3. Provide peripheral taxilanes around the perimeter of the apron using the dimensions in UFC 3-260-01, Chapter 6.

11320-3 NUMBER OF PARKING SPACES. The number of parking spaces required is based on the average number of aircraft on board (including transients) reduced by a factor to reflect the number of aircraft expected to be in hangars for scheduled organizational maintenance. For planning purposes, assume that the following percentages of the average on-board aircraft assigned organizational maintenance at a station will be in the hangar for scheduled maintenance:

33% - Carrier and Rotary Wing aircraft
17% - Patrol, Special Mission, and Training aircraft
11% - Transport aircraft

11320-3.1 The above reductions apply except that the reduction to the number of apron parking spaces shall not exceed 50 percent of the hangar spaces available.

11320-3.2 Where organizational maintenance is provided by a commercial contractor, the average number of aircraft in hangars for scheduled maintenance shall be determined on an individual basis. Where an air installation is subject to peak loadings on a regular basis for training exercises or overlap of deployable squadrons, individual justification may be provided for additional spaces to support peak loadings.

11320-3.3 Example Computation: A station supports 6 fleet operational F/A-18 squadrons. Each squadron has 12 aircraft. Determine the number of parking apron spaces required.

a. F/A-18 aircraft are categorized as Carrier aircraft.

b. Total number of aircraft = 6 x 12 = 72

c. Reduction for aircraft assigned organizational maintenance (i.e. parked in aircraft maintenance hangar) (for Carrier aircraft) = 72 x 33% = 23.8 = 24 (rounded to next whole number). However, the reduction shall not exceed 50% of the aircraft maintenance hangar space available. Therefore, the total reduction for aircraft assigned organizational maintenance (i.e. parked in aircraft maintenance hangar) = 24 x 50% = 12

d. Number of aircraft requiring apron parking apron spaces = 72 – 12 = 60

11320-4 SPACING OF AIRCRAFT. See UFC 3-260-01, Chapter 6 for apron spacing and typical apron configurations for 90 and 45 Degree Parking Layouts.

11320-4.1 Jet Blast Protection. Parked aircraft must be separated to maintain proper wing-tip clearances, interior taxilane widths and protection from jet blast. Jet blast protection is achieved by providing the space necessary to dissipate the temperature and velocity of the jet blast to levels that will not injure or damage aircraft personnel and equipment. Typically, this level is approximately 100 degrees Fahrenheit (38 degrees Celsius) and 30.4 knots (35 mph). This level can be easily achieved by parking carrier based aircraft at 45 degrees with their engine blast aimed into the interior taxilane, providing safe and adequate jet blast dispersion (see UFC 3-260-01, Chapter 6).

11320-4.2 Deviations from Efficient Configuration. The most efficient apron size results from parking jet aircraft at either a 45-degree or 90-degree angle, and propeller aircraft and helicopters at a 90-degree angle to the interior taxilane. Use of the most efficient configuration is preferred. Factors impacting designs for aircraft parking configurations could include space availability, operational constraints, type and number of aircraft, taxiing or towing procedures, and clearances. The apron spacing dimensions may be modified when a Fixed Point Utility System (FPUS), starting air and electrical service, or Flightline Electrical Distribution System (FLEDS), electrical system is to be installed in the apron. The FPUS or FLEDS service points and the parking spaces are spaced to accommodate all Navy fighter and attack aircraft rather than designed for a particular aircraft. Coordinate with the FPUS and FLEDS manufacturer and users for specific apron layout criteria.

11320-5 PERIPHERAL TAXILANES. A peripheral taxilane is normally provided on all sides of an aircraft parking apron. The MC-4 Triton does not require peripheral taxilane. Movement of this aircraft in and out of hangar and inside an apron is achieved with a towing tractor. See UFC 3-260-01, Chapter 6 for peripheral taxilane dimensions and clearances.

11320-6 SAFETY/LATERAL CLEARANCES. See UFC 3-260-01 for the definition and application of airfield safety clearances. Parking aprons shall be sited outside the primary surface of the runway (or helipad). The edge of the apron may be adjacent to the outer edge of the primary surface; however, parked aircraft shall not penetrate the transitional surface.

11320-7 DISTANCE FROM APRON EDGE. Aircraft taxiing on the peripheral taxilane are not considered obstructions even though they do penetrate the transitional surface. The apron edge shall be a minimum of 45.7 meters (150 feet) from the centerline of any parallel taxiway of the runway system. The minimum distance any object, except maintenance hangars, shall be sited from the apron edge is 30.5 meters (100 feet).

11320-8 MAINTENANCE HANGAR OFFSET FROM APRON. Maintenance hangars opening to the apron shall be offset 15.2 meters (50 feet) from the apron edge. For criteria regarding access pavement to the hangar see Category Code 113-40, Aircraft Access Aprons

11320-9 DEVIATION FROM CRITERIA: The 45.7 meter (150 foot) separation between an aircraft parking apron and the centerline of a parallel taxiway must be maintained when the taxiway is expected to carry a substantial amount of through traffic, i.e., traffic other than that which starts or terminates at that particular apron. When the anticipated amount of through traffic is minimal and is so justified to NAVAIRSYSCOM, a parking apron may be located such that the parallel taxiway is incorporated within the apron peripheral taxilane. However, in this case, the parallel taxiway becomes a part of the apron and therefore must be located outside the runway primary surface. Any savings in pavement to be gained by combining the parallel taxiway shall be compared to any increases in pavement for runway turnoffs required due to moving the parallel taxiway outside the runway primary surface. This combination shall not be planned without prior approval of NAVAIRSYSCOM. Where minimum apron spacing requirements cannot be met, see UFC 3-260-01, Appendix B Section 1 for Navy and Marine Corps process to obtain NAVFAC UFC exemption to criteria and NAVAIR airfield safety waiver.

11320-10 Peripheral taxilanes are to be provided on all sides of fixed wing aircraft parking aprons. Although such an arrangement is desirable, it is not always necessary. When small numbers of aircraft (one or two rows) are to be parked or when operational requirements allow, the number and/or width of the peripheral taxilanes may be reduced on the advice of local air operations personnel, subject to NAVAIRSYSCOM approval. Peripheral taxilanes for helicopters shall not be reduced from the dimensions shown in UFC 3-260-01, Chapter 6.

11320-11 Tables 11320-1, 11320-2, 11320-3 and 11320-4 list aircraft by type and include all models, such as the S-3 aircraft type which includes S-3A, S-3B, ES-3A, US-3A, and YS-3A. However, in some instances there are size differences between models of the same aircraft, such as the F/A-18A and the F/A-18E. In these cases, the particular aircraft type is also further defined by the model to which the data applies.

113 40 AIRCRAFT ACCESS APRON (M2/SY)

FAC: 1131
BFR Required: Y

Design Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design
UFC 3-260-02, Pavement Design for Airfields
Additional Planning Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design

11340-1 AIRCRAFT ACCESS APRONS. Aircraft access aprons provide access to aircraft maintenance hangars from the aircraft parking apron and is normally programmed at the same time as the hangar (Category Code 211 05). The paved area required varies with the hangar dimensions and the hangars displacement from the aircraft parking apron. The access apron requires a minimum 15.2 meter (50 foot) depth and must be at least as long as the hangar door. See UFC 3-260-01, Chapter 6 for peripheral taxilane wingtip clearance requirements that may impact the aircraft access apron length. For pull through hangars with dual access aprons, both access aprons are part of this category code.

116 AIRCRAFT PAVEMENTS – OTHER

116-1 DESCRIPTION. Included in this basic category are airfield pavements, other than runways, taxiways, and aprons, such as wash racks, rinse facilities, compass calibration pads, arming/de-arming pads, Ground Controlled Approach (GCA) pads, blast protective pavement, line vehicle parking, towaways, ordnance handling pads, fire and rescue vehicle alert pads, and tactical support van pads.

116 10 AIRCRAFT WASH RACK PAVEMENT (M2/SY)
FAC: 1163
BFR Required: Y

Design Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design
UFC 3-260-02, Pavement Design for Airfields
Additional Planning Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design

11610-1 WASH RACKS. Aircraft washracks are provided at all air installations for cleaning of aircraft in conjunction with periodic maintenance. See Category Code 116 15 for aircraft freshwater rinse facility criteria. A minimum of one washrack is required at each Naval and Marine Corps aviation shore installation. The total number required at an installation depends on numbers and types of on-board aircraft. The number of aircraft that can be serviced by a single washrack is dependent on the frequency of required washes, prescribed in NAVAIR Manual NA01-1A-509, the average time to wash the aircraft, and the availability of the washrack. There are three standard shapes of washracks for fixed wing aircraft as indicated in UFC 3-260-01, Chapter 6: Type F, which accommodates fighters and other small aircraft; Type L, which accommodates heavy bombers and large cargo aircraft; and Type B, which is specifically for Navy/Marine Corps Patrol and Cargo Aircraft. UFC 3-260-01, Figure 6-40 should be used to assist in determining the Wash Rack Type.

11610-1.1 Type F (Fighter, Attack Aircraft, and Helicopters): Type F wash rack can service 80 VA/VF or similar size aircraft or 40 rotary wing aircraft, or a combination of both. The number of combined aircraft that can be serviced on a Type F pad can be determined from the following equation: The number of VA/VF (or similar size) aircraft plus two times the number of helicopters equals 80.

Example: 40 VA/VF plus 20 helicopters as 40 plus 2(20) does not exceed 80.

11610-1.3 Type B (Straight Wing Patrol and Cargo Transport Aircraft): Type B washrack can service 20 VP aircraft or 80 cargo transport aircraft, or a combination of both. The number of combined aircraft that can be serviced on a Type B pad can be determined from the following equation: four times the number of patrol aircraft (VP) plus the number of cargo aircraft equals 80.

EXAMPLE: 18 VP and 8 cargo as 4(18) plus 8 does not exceed 80.

11610-1.4 Type L (Swept Wing Patrol and Cargo Trasport Aircraft): Type L wash rack accommodates heavy bombers and large cargo aircraft.

11610-2 WASH RACK LOCATION. The normal location of the wash racks is adjacent to the hangar with access pavement provided as required. Utilities and an antipollution drainage system are provided.

11610-3 ACCOMPANYING UTILITIES. A utilities control building with a gross area of approximately 58.6 square meters (630 square feet) is planned with each wash rack. It houses detergent metering equipment, air compressor, detergent mixing tank, water heater, utility controls, sanitary facilities for personnel, if required, and storage space for cleaning equipment. A detergent storage tank is located outside of the utilities control center and may be below ground.

11610-4 SAFE ACCESS. An aircraft wash rack must include the capability to provide safe access to all aircraft surfaces with lifelines and/or platforms for personnel safety.

11610-5 RUNOFF. In addition, the wash rack pavement must be curbed and guttered to preclude uncontrolled runoff of wash and rinse water. The wash rack pavement must also include adequate runoff storage capacity to preclude overflow of wash and rinse water and average daily rainfall with daily emptying and disposal of effluent in the sump. For VF/VA and helicopter type aircraft this effluent storage capacity shall be not less than 18,900 L (5,000 GA) per day. For VP and transport type aircraft the effluent collection and storage capacity shall be not less than 15,100 L (4,000 GA) per day. For layout and design criteria for wash racks, see UFC 3-260-01.

116 12 AIRCRAFT PAVEMENT SHOULDER (M2/SY)
FAC: 1165
BFR Required: Y

Design Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design
UFC 3-260-02, Pavement Design for Airfields
Additional Planning Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design

11612-1 DESCRIPTION. Unprotected areas adjacent to runways, overruns, taxiways, and aprons are susceptible to erosion caused by jet blast. Shoulders also reduce the probability of serious damage to an aircraft to a minimum in the event that the aircraft runs off the pavement. Paved shoulders are required to be adjacent to all runways, taxiways, and aprons. See UFC 3-260-01 for shoulder dimensional criteria. See Figure 11320-2 Apron and Taxiway Category Codes for typical boundaries of shoulder pavements.

116 15 AIRCRAFT RINSE FACILITY (M2/SY)
FAC: 1167
BFR Required: Y

Design Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design
UFC 3-260-02, Pavement Design for Airfields
UFC 3-401-01 Mechanical Engineering
Additional Planning Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design

11615-1 TAXI-THROUGH. An aircraft rinse facility provides an unattended taxi-through, treadle operated, freshwater deluge system to rinse aircraft. The aircraft rinse facility is required at each Navy and Marine Corps air installation having aircraft subject to accelerated corrosion due to low-level over-water operations or a corrosive atmosphere at the installation. A facility of appropriate type is planned for each type of aircraft normally stationed at the airfield. A rinse facility includes several components, including pavement, water supply, pumps, sprayers, wastewater collection system, among other components. See UFC 3-260-01, Chapter 6 for an illustration of a typical aircraft rinse facility.

11615-1.1 **Type 1** is for rotary wing aircraft and has a gross area of 913.3 M2 (1,093 SY). The basic length and width for full-strength pavement is 75 feet x 130 feet. Shoulder pavements adjacent to the full-strength pavement must provide a minimum paved width of 100-ft for CH-53 aircraft.

11615-1.2 **Type 2** is for VP type aircraft and has a gross area of 1428.9 M2 (1,710 SY). The basic length and width for full-strength pavement is 75 feet x 205 feet.

11615-1.3 **Type 3** is for VF or VA type aircraft and has a gross area of 760.4 M2 (910 SY). The basic length and width for full-strength pavement is 75 feet x 110 feet.

11615-1.4 **Type 4** is for V-22 aircraft and has a gross area of 913.3 M2 (1,093 SY). The basic length and width for full-strength pavement is 75 feet X 130 feet. Shoulder pavements adjacent to the full-strength pavement must provide a minimum paved width of 100-ft for V-22 aircraft.

11615-2 ACCESS TAXIWAYS AND VEHICLE ROADS. Access taxiways (Category Code 112 10) and vehicle roads (Category Code 851 10) are programmed with the rinse facility as required. The facility should be located in proximity to the most frequently used taxiway and as near to the hangar area as possible. A water supply and drainage area are required.

116 20 AIRCRAFT COMPASS CALIBRATION PAD (M2/SY)
FAC: 1161
BFR Required: Y

Design Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design,
Additional Planning Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design

11620-1 AIRCRAFT COMPASS CALIBRATION PAD. An aircraft compass calibration pad is a paved area in a magnetically quiet zone where the compass in the aircraft is calibrated. See UFC 3-260-01, Chapter 6 and Appendix B, Section 10 for layout, siting, type of pad, and marking requirements.

11620-2 PAD CAPABLILITIES. A minimum of one pad is provided at each station, however, additional pads may be required based on local demand.

11620-3 SITING. See UFC 3-260-01, Chapter 6 for specific siting requirements relative to other airfield facilities and magnetic interference.

11620-4 MINIMUM DISTANCES. See UFC 3-260-01, Appendix B, Section 10 for specific minimum distances between compass calibration pads and sources of magnetic interference.

11620-5 ACCESS TAXIWAY TO CALIBRATION PAD. The access taxiway to the calibration pad is oriented to facilitate moving the aircraft onto the pad, headed toward magnetic north.

11620-6 GROSS AREA REQUIRED FOR CALIBRATION PAD. The gross area required for a compass calibration pad exclusive of access taxiway is provided in UFC 3-260-01, Chapter 6.

11620-7 CALIBRATION TARGET. Each pad requires a target placed at a known but arbitrary bearing at a distance of approximately 805 meters (one-half mile) from the pad and visible from both the aircraft and the compass calibration set.

116 35 ARMING AND DE-ARMING PAD (M2/SY)
FAC: 1131
BFR Required: Y

Design Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design
UFC 3-260-02, Pavement Design for Airfields
Additional Planning Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design; NAVSEA OP-5 – Volume I, latest revision, Ammunition Ashore Regulations for Handling, Storing, Production, Renovation and Shipping

11635-1 DESCRIPTION. This pad provides a paved area for activating or deactivating weapons systems on-board aircraft. It is utilized at all Navy and Marine Corps air installations where gunnery, rocketry, and/or missile firing are conducted. The average time for arming an aircraft is 20 minutes, and for de-arming an aircraft, 30 minutes. All aircraft on the pad may be either armed or de-armed simultaneously; however, arming and de-arming cannot occur simultaneously on the same pad. The number of pads at an installation depends upon the demand at that installation. The pads are sited at either end of the primary runway and, if additional pads are required, at either end of the crosswind runways. See UFC 3-260-01, Chapter 6 for siting considerations.

11635-1.1 Type A. The gross area of the Type A pad (exclusive of the access taxiway) is 2,138 square meters (30.5 meters by 70.1 meters) (2,556 square yards (100 feet by 230 feet). The Type A pad will accommodate simultaneously four helicopters (AH-1 type).

11635-1.2 Type B. The gross area of the Type B pad (exclusive of the access taxiway) is 5,434 square meters (45.7 meters by 118.9 meters) (6,500 square yards (150 feet by 390 feet). The Type B pad will accommodate simultaneously four fixed wing attack (VA) aircraft or four fixed wing fighter (VF) aircraft.

11635-1.3 Type C. The gross area of the Type C pad (exclusive of the access taxiway) is 6,526 square meters (79.3 meters by 82.3 meters) (7,800 square yards (260 feet by 270 feet). The Type C pad will accommodate simultaneously two fixed wing patrol (VP) aircraft.

11635-2 PARKING AT PAD. Aircraft utilizing the pad normally park parallel to the runway but in any case they park headed in the direction providing the maximum length of undeveloped space along the extended longitudinal centerline of the aircraft. In no case is arming or de-arming of propelled armament conducted when the aircraft is headed towards inhabited areas on or near the air installation.

116 40 PRECISION APPROACH RADAR (PAR) PAD (M2/SY)
FAC: 1164
BFR Required: N

Design Criteria: UFC 3-260-01, Airfield and Heliport Planning
UFC 3-260-02, Pavement Design for Airfields
Additional Planning Criteria: Mechanical Manuals for Specified Equipment

11640-1 PAR PAD. The Precision Approach Radar (PAR) pad is a paved hardstand provided to support the PAR equipment in operating position. The hardstand must be a minimum of 146 square meters (12.1 meters by 12.1 meters) (178 SY (40 feet by 40 feet)). Technical manuals provided by the equipment manufacturers should also be consulted in order to determine the most appropriately sized pad. The number of pads required depends on the number of PAR units at the air installation. At installations where PAR approaches are provided to more than one runway by a single

PAR unit, a turntable is provided to allow PAR service more than one runway. Technical manuals for the respective equipment describe acceptable locations for the pad.

116 41 IMPROVED FRESNEL LENS OPTICAL LANDING SYSTEM PAD (M2/SY)
FAC: 1164
BFR Required: N

11640-1 DESCRIPTION. A paved hardstand pad that provides support to the Improved Fresnel Lens Optical Landing System (IFLOLS) equipment in operating position.

116 42 BLAST PROTECTIVE PAVEMENT (M2/SY)
FAC: 1164
BFR Required: N

Design Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design,
UFC 3-260-02, Pavement Design for Airfields
UFC 3-270-01, O&M Manual: Asphalt and Concrete Maintenance and Repair
Additional Planning Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design

11642-1 DESCRIPTION. Blast protective pavement is provided adjacent to the runway threshold and end turnoff for all runways except those at basic training propeller aircraft fields. Blast protection pavement is not intended to fully support aircraft load. However, in cases where the training propeller aircraft is not an exclusive use to the airfield, blast protective pavement is a requirement. Permanently based aircraft and significant transient aircraft and services should be included in determining a requirement for pavement protection. If aircraft exhaust will be directed directly at pavement for extended periods of time, give consideration to using high temperature concrete to mitigate damage that may be caused by hot exhaust. Blast protective pavement may be required in other locations for aircraft, such as the F/A-18 with downward exhausted auxiliary power units, the AV-8B and F-35B with ducted exhaust, and the V-22 with both down turbine exhaust and propeller wash. The area of blast protective pavement required for a particular aircraft may be determined from exhaust plume data in Naval Air Training and Operating Procedures Standardization (NATOPS) or engine manufacturers specifications for developmental aircraft. For aircraft including F/A-18, F-35, and AV-8B the width of the blast protective pavement is 30.5 meters (100 feet) except for Master Jet Air Stations where the length shall be 37.5 meters (125 feet), or in support of F-35B Short Take-off operations where the length shall be 61 meters (200 feet).

116 45 LINE VEHICLE PARKING (M2/SY)
FAC: 1164
BFR Required: N

Design Criteria: Military Handbook 1021/1, Airfield Geometric Design; NAVAIR 00-80T-109
UFC 3-250-01, Pavement Design for Roads and Parking Areas

Additional Planning Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design

11645-1 VEHICLE PARKING SPACES. Line vehicle parking spaces contiguous to taxiway and parking aprons are allocated for ground support equipment assigned for flight line use. See Table 11645-1 for space requirements. Vehicle parking spaces must be located beyond the peripheral taxilane wingtip clearance and are not part of the aircraft parking apron (Category Code 113 20). Vehicle parking space pavement shall be designed to support using vehicles in accordance with UFC 3-250-01. See Figure 11320-2 Apron and Taxiway Category Codes for typical boundaries of line vehicle parking pavements.

Table 11645.1. Line Vehicle Parking

Equipment	Area (M2)	Area (SY)
Tow Tractor	16.7	20
Refueling Truck (1)	39.3	47
Refueling Trailer (1)	58.5	70
Mobile Electric Power Plant	10	12
Nitrogen/Oxygen Trailer	6.7	8
Air Conditioning Trailer	10	12
Utility Vehicle	16.7	20
Bomb Truck	16.7	20
Bomb Trailer	12	14
Industrial Flatbed Truck	7.5	9
Industrial Platform Truck	7.5	9

Note: (1) Parking for both truck and trailer refuelers should be sited away from the flightline to reduce and/or eliminate hazards. NAVAIR 00-80T-109 states that refuelers and fuel servicing equipment will be parked in designated areas which have a minimum lateral separation of 7.6 meters (25 feet), measured center to center of truck, between trucks. It also states that no refuelers and fuel servicing equipment will be parked closer than 30.5 meters (100 feet) to any inhabited building.

11645-2 PARKING FOR FIRE AND RESCUE VEHICLES. Parking for aircraft fire and rescue vehicles are provided separately. See Category Code 141 20, Aircraft Fire and Rescue Station and Category Code 116 60, Fire and Rescue Vehicle Alert Pad.

11645-3 OPTIMUM EFFICIENCY. Parking areas shall be selected to permit optimum efficiency in the use of equipment (for example, squadron vehicles will normally be assigned space close to the squadron maintenance hangar) and to conform to lateral safety clearances for existing and projected airfield pavements. Where weather requires and the clearances permit, shelter for line vehicles may be provided.

116 50 TOWWAY (M2/SY)
FAC: 1131
BFR Required: N

Design Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design
UFC 3-260-02, Pavement Design for Airfields
Additional Planning Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design

11650-1 DESCRIPTION. A towway is a paved roadway used for towing fixed or rotary wing aircraft from one area to another. It differs from a taxiway in that aircraft do not move on it under their own power. Towways may be authorized at air installations where it is necessary to tow aircraft from one operational area to another and in some instances, particularly at air installations with jet aircraft, to minimize noise conditions. Towway pavement is normally provided at industrial seaport air installations where carrier berthing facilities include those for unloading and loading of aircraft. Pavement marking, particularly centerline, should be provided, and lighting provided if operations are to be conducted at night.

11650-2 TOWWAYS ON EXISTING STREETS AND ROADS. In some cases, towways will be on existing streets and roads or abandoned runways and taxiways, which may be tailored for this use. Such modification will include reconstruction or strengthening of existing facilities to support the maximum aircraft loading that will be superimposed at each location, as well as provision for adequate horizontal and vertical clearances. Jet blast criteria and shoulder specification need not be considered.

11650-3 TYPICAL TOWWAY WIDTHS. Towways are planned for air installations based upon the installation mission and type aircraft to be moved. For towway widths see UFC 3-260-01, Chapter 5.

116 55 ORDNANCE HANDLING PAD (M2/SY)
FAC: 1131
BFR Required: Y

Design Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design
UFC 3-260-02, Pavement Design for Airfields
Additional Planning Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design NAVSEA OP-5 – Volume I, latest revision, Ammunition Ashore Regulations for Handling, Storing, Production, Renovation and Shipping

11655-1 DESCRIPTION. An ordnance handling pad is provided for air installations where there is a requirement for loading or off-loading explosives from cargo aircraft and where no apron is available for use without violating explosive safety distance criteria. The pads are designed for use by cargo aircraft and will generally vary in size depending on the type of ordnance being handled and the number and type of aircraft to be loaded/unloaded simultaneously. Note: Ordnance Handling Pad is referred to as a Hazardous Cargo Pad within UFC 3-260-01.

11655-1.1 Types of Pads:

a. Circular: At aviation facilities used by small cargo aircraft, the Ordnance Handling Pad is a circular pad as shown in UFC 3-20-01, Figure 6-34.

b. Semi-Circular: At aviation facilities used by large cargo aircraft and Aerial Ports of Embarkation (APOE) and Aerial Ports of Debarkation (APOD), the Ordnance Handling Pad is a semi-circular pad as shown in UFC 3-260-01, Figure 6-35. The semi-circular pad is adequate for aircraft up to and including the dimensions of a C-5 aircraft.

11655-1.2 Dimensions. The Ordnance Handling Pad geometric dimensions shown in UFC 3-260-01, Figure 6-34, and Figure 6-35 are minimum requirements. Ordnance Handling Pads may be larger than these if the design aircraft cannot maneuver on the pad.

11655-2 ORDANCE HANDLING PAD SITING. The ordnance handling pad shall be sited in accordance with standards published in NAVSEA OP-5 - Volume I, latest revision (Ammunition Ashore Regulations for Handling, Storing, Production, Renovation and Shipping). Also, the ordnance handling pad should be sited in accordance with all pertinent airfield safety criteria. Barricades shall be provided where required by explosives safety criteria or where installation will produce a net reduction in construction and land acquisition costs.

11655-3 JOINT USE CONSIDERATION. Consideration should be given to a joint use Combat Aircraft Loading Area (CALA), Category Code 116-56, for ordnance handling provided the CALA is sited in accordance with the guidelines stated above.

116 56 COMBAT AIRCRAFT LOADING AREA (CALA) (M2/SY)
FAC: 1131
BFR Required: Y

Design Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design
Additional Planning Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design; NAVSEA OP-5 – Volume I, latest revision, Ammunition Ashore Regulations for Handling, Storing, Production, Renovation and Shipping

11656-1 DESCRIPTION. The combat aircraft ordnance loading area is primarily an apron where explosives are loaded/off-loaded from combat aircraft departing and/or returning from weapons training flights. This area is required where there is not space available on the parking apron for loading mass detonating ordnance which will meet the explosive safety requirements specified in NAVSEA OP-5, Volume I, latest revision (Ammunition and Explosives Safety Ashore Regulations for Handling, Storing, Production, Renovation and Shipping). The weapons are not armed on this apron, see Category Code 116-35, Arming and De-arming Pad.

11656-2 COMPLIANCE WITH EXPOSIVE SAFETY CRITERIA. Due to the ordnance handling taking place on this apron, its location with respect to other facilities shall be determined using explosives safety criteria specified in NAVSEA OP-5, Volume I, latest revision. In addition, the airfield safety criteria specified in UFC 3-260-01.

11656-3 Airfield Safety Clearances apply and:

a. The apron must be outside of the runway primary surface
b. Parked aircraft shall not penetrate any transitional surface
c. No objects shall be sited within 30.5 meters (100 feet) of the edge of this apron

11656-4 CRITERIA. There is no standard size for a combat aircraft ordnance loading area. The area required is a function of the number of aircraft to be simultaneously loaded/unloaded and the class and net explosive weight of the ordnance to be carried by each aircraft. Aircraft on the apron shall be separated from each other by the above ground magazine (unbarricaded, K=11) distances specified in OP-5, Volume I, latest revision. The greater the net explosive weight on the aircraft, the greater the required separation. However, as a minimum, the aircraft spaces shall be separated by not less than the A, B, C, and D dimensions specified for parking aprons, Category Code 113 20. Peripheral taxilanes shall be provided as required to provide safe access to parking spaces. See UFC 3-260-01, Chapter 6 for peripheral taxilane requirements.

11656-5 SIZING FOR LOADING SCENERIOS. The apron most likely will have to be sized to accommodate several loading situations. For example, parking locations could be spaced such that twelve aircraft could each be loaded with 227 kgs (500 labs) net explosive weight or six aircraft, parked in alternate spaces, could each be loaded with 2,270 kgs (5,000 lbs) net explosive weight. The maximum net explosive weight to be on the apron at one time shall be used in determining the explosive quantity distance arcs for the apron. These arcs shall be measured from the edge of the apron pavement, including the peripheral taxi lanes. Justification shall be provided for the number of aircraft and the net explosive weight per aircraft chosen for sizing the apron. Strong consideration shall be given to providing a joint use apron for ordnance handling from cargo aircraft, Category Code 116-55, and the combat aircraft ordnance area if these operations can be scheduled on a non-concurrent basis. If supporting facilities such as an ordnance operations building, or fixed point utility system are required, they shall be individually justified.

116 60 FIRE AND RESCUE VEHICLE ALERT PAD (M2/SY)
FAC: 1164
BFR Required: N

Design Criteria: NAVAIR 00-80R-14, Aircraft Firefighting and Rescue NATOPS Manual

UFC 3-260-01, Airfield and Heliport Planning and Design
Additional Planning Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design

11660-1 DESCRIPTION. This facility provides parking area for Immediate Response Alert Vehicle. The purpose of the Immediate Response Alert is to:

1. Observe all landings and take-offs.
2. Respond immediately to any aircraft accident.
3. Provide timely rescue of personnel involved in emergencies.

11660-2 SIZE AND LOCATION. The pad should be large enough to park one 3,780 liter (1,000 gallon) aircraft rescue and fire fighting vehicle (P-19) and should be located no closer than 45.7 meters (150 feet) from the runway edge. The pad should not include a protective shelter or any other structure, which would violate airfield safety clearance criteria. See UFC 3-260-01 for guidance. The pad should be connected to the runway by a 4.9 meter (16 foot) wide access road to the runway. If there is no access from the crash house to the alert pad other than from the runway, the parking space should be widened as required to allow the truck sufficient space to turn around (see Table 11660-1).

Table 11660-1. 3,780 Liter (1,000 Gallon) Aircraft Rescue and Fire Fighting Vehicle Dimensions (P-19)

Weight	=	15,200 kg (3,600 lbs)
Width	=	2.4 meters (8 feet)
Length	=	8.3 meters (27.1 feet) (over bumpers)
Inside turning radius (“wall to wall”)	=	24.4 meters (80 feet)

11660-3 MULTIPLE ALERT PADS. Normally there will be one alert pad per air station. However, multiple alert pads will be required when more than one runway is in use and operations cannot be observed from a single vantage point. The optimum location is on either side of the runway and near the middle of the airfield but may vary depending upon the best observation of the runway. Consideration should be given to maximum utilization of existing abandoned pavements prior to construction of an alert pad.

11660-4 ELECTRICAL POWER JUSTIFICATION. Normally electrical power is not provided to the Alert Pad. However, when power is required to charge the truck batteries, requirements must be individually justified. For additional information see NAVAIR 00-80R-14 Aircraft Firefighting and Rescue NATOPS Manual.

116 65 TACTICAL SUPPORT VAN PAD (M2/SY)
FAC: 1164
BFR Required: Y

Planning Criteria: NAVAIRINST 13670.1B/MCO 13670.1

11665-1 DESCRIPTION. This facility consists of a concrete pad and support structure to accommodate groups of relocatable tactical shelters or “vans”. Numerous functions at Navy and Marine Corps installations are done in relocatable shelters. These shelters, while referred to by different nomenclatures depending on usage, are commonly called “vans”. They are generally aluminum structures built to commercial standards of 2.4 meters (8 feet) in width and height, and 6.1 meters (20 feet) in length. These vans can be carried by any military or commercial cargo carrier by air, ship, truck, or rail. Vans are designed to be grouped together with removable doors, access panels, and butting kits and can be configured for solo use or grouped in large complexes. Tactical support van pads are not to be used to support airfield operations support facilities per UFC 4-141-10.

Site tactical van pads to be clear of the primary surface, clear zone, and imaginary surfaces as well as clearances relative to runways, taxiways, and aprons.

11665-2 TYPES OF VANS:

16665-2.1 Interconnect Unit (INU). Placed in the center of groups and used to connect vans of the other types together. INUs have a door at each end and three access panels on the sides for the joining of up to five vans to each INU.

11665-2.2 Basic. Internally configured for a specific mission from administrative to maintenance. These vans can be joined only with another van at each end.

11665-2.3 Other (Right, Left, Middle). These types of vans are used in specific configurations to make up double and triple wide vans. These vans can only be joined to a complex at the end of another basic van.

11665-3 MAXIMUM VAN GROUP SIZE. By NAVAIR Instruction, van groups cannot be larger than six INUs connected end to end with a maximum of two vans extending from each side. In this configuration, up to 42 vans can be joined together.

11665-4 EXAMPLES OF VAN COMPLEXES: By combining groups of 42 vans into larger complexes with other temporary structures, an entire Marine Aviation Logistics Squadron (MALS) can set up and operate from an unimproved forward deployed site. By far the largest user of vans is the MALS. Referred to as Mobile Maintenance Facilities (MMF), these vans are deployed in large complexes with the Marine Air group (MAG) to support various missions. Navy activities also use MMFs, primarily for P-3 deployable sites where Intermediate level support does not exist. Other units that utilize vans for tactical shelters when deployed are Mobile Calibration Laboratories (MCC), Marine Wing Support Squadrons (MWSS), Marine Wing Control Squadrons (MWCS), Marine Air Support Squadrons (MASS), and Marine Air Control

Squadrons (MACS). When not forward deployed, these vans are used in various roles. Most MALS units utilize a large part of their vans to provide intermediate level maintenance support to home based squadrons, just as they would if they were deployed. Most other units use their vans for training.

11665-5 REQUIREMENT: All vans require a concrete pad and utility support when at home base. This allows the vans to be used, maintained, and always ready to deploy for their primary mission. This structure consists of two parts, the pad and a nearby support building.

11665-6 PAD SIZE REQUIREMENTS. Pads are built to accommodate the unit and van configuration of a specific mission. They are sized to hold the required quantity of vans established by the holding unit to accomplish the specific mission. The following guidance shall be used to size pads:

a. For groups of up to 42 vans, establish the quantity and layout with the unit. Provide a pad sized to fit the required layout with a 0.152 meter (2 foot border)

b. For groups of 42 vans, provide a 1,120 M2 (1,333 SY) pad.

c. For groups of more than 42 vans, divide the quantity by 42 and multiply number of areas by 1,120 M2 (1,333 SY) and add a 4.6 meter (15 foot) access lane between areas. Add 93 M2 (111 SY) for storage of bogie wheels and other towing gear for van movement.

11665-7 PAD UTILITY REQUIREMENTS. Pads require electrical power, phone and computer line connections, compressed air, and water for washing vans. It will also require an environmental drainage system for wash water runoff.

11665-8 SUPPORT BUILDING. The support building is required if the van pad is built away from other facilities or the existing nearby facilities cannot handle the personnel load that would be placed upon them by the extra personnel working in the vans. The pad size guidance provided above DOES NOT include the space required for the support building.

11665-9 SUPPORT BUILDING SPACE REQUIREMENTS. The support building is required to house personnel space such as restrooms and locker rooms, storage for van parts such as door and access panels that have been removed for complexing of vans, mechanical equipment rooms for power, phone and computer distribution, and air compressors. The following guidance shall be used to size support building:

a. Provide 4.6 M2 (50 SF) of covered storage for every two INUs or every four of the other types of vans.

b. Provide 1.8 M2 (19 SF) per person for restrooms, lockers, showers and dressing rooms.

Either use the actual manning of the van complex
OR assume 1.2 persons per van.

c. Provide 13.9 M2 (150 SF) for mechanical equipment area to support the vans.

11665-10 NET TO GROSS FACTOR. The support building figures listed above are net M2 (net SF). All figures should be multiplied by 1.25 (net to gross factor) to provide areas for aisles, fire protection, HVAC, and structure.

Tactical Support Van Pad Sizing - Computation Example 1

An MWCS unit has eight vans consisting of two INUs and six basic vans laid out as shown in Figure 11665-1 "Typical Small Complex Van Pad Layout".
These vans are occupied by 12 personnel.

Pad Size Calculation:

The layout of the vans is 12.3 meters (40.5 feet) by 14.9 meters (49 feet).
Adding a 0.6 meter (2 foot) border makes the pad 13.6 meters (44.5 feet) by 16.2 meters (53 feet) or 219 M2 (262 SY).
As this is a single group, the 4.6 meter (15 foot) access lane IS NOT required.

Pad Total = 219 M2 (262 SY)

Support Building Size Calculation:

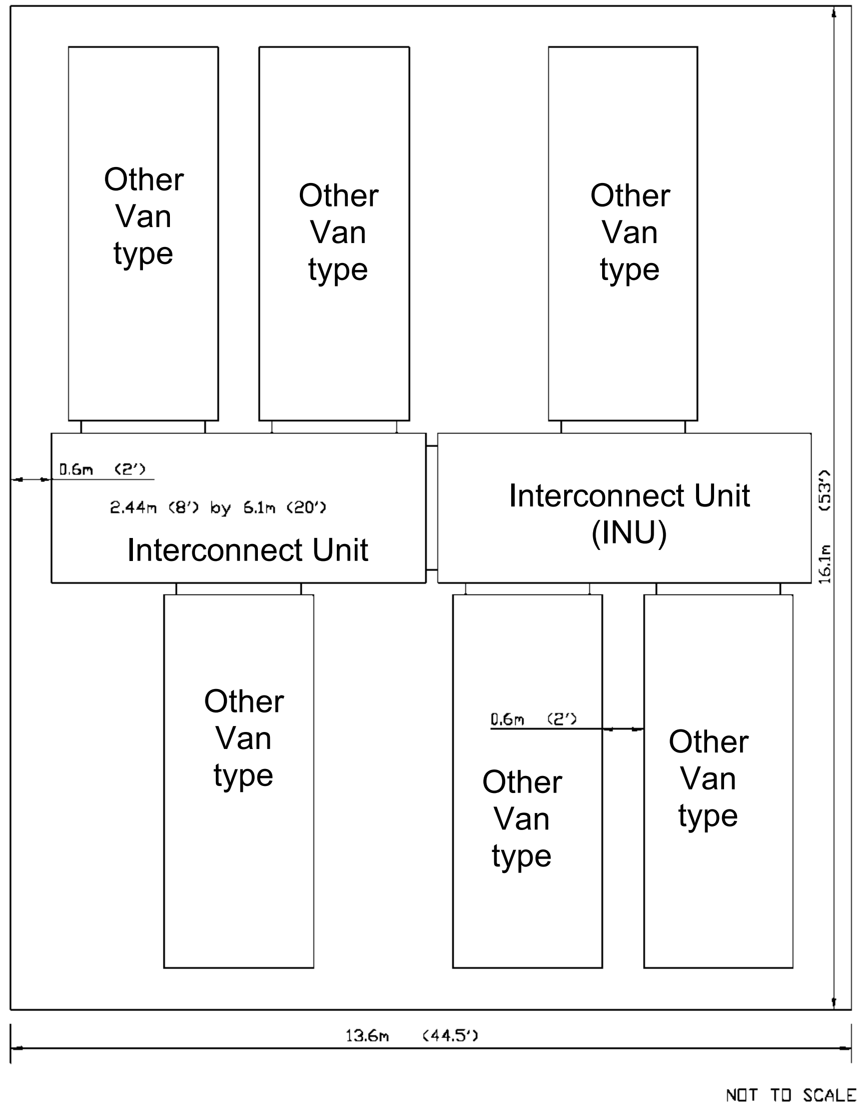
Number of INUs = 2
Number of others = 6
Number of personnel = 12

Covered Storage:
INUs: 2 / 2 = 1.0
Others: 6 / 4 = 1.5
1.0 x 4.6 M2 (50 SF) + 1.5 x 4.6 M2 (50 SF) = 11.5 M2 (125 SF)
Restrooms, Locker Rooms, Showers and Dressing Rooms:
12 x 1.8 M2 (19 SF) = 21.6 M2 (228 SF)
Mechanical Room:
13.9 M2 (150 SF)

Support Building Subtotal (Net)
11.5 M2 + 21.6 M2 + 13.9 M2 = 47.0 M2(net)
(125 SF + 228 SF + 150 SF = 503 SF(net))

Support Building Total (Gross)
47.0 M2 (net) x 1.25 = 58.8 M2 (gross)
(503 SF (net) x 1.25 = 629 SF (gross))

Figure 11665-1. Typical Small Complex Van Pad Layout



Tactical Support Van Pad Sizing - Computation Example 2

A MALS unit has 250 vans laid out as shown in Figure 11665-2. "Typical Large Complex Van Pad Layout".
The personnel loading is unknown.

Pad Size Calculation:

For van complexes consisting of more than 42 vans,
250 / 42 = 5.95, say 6 groups

Place a 4.6 meter (15 foot) access lane between each of the 6 groups gives a pad size of 81.7 meters (268 feet) by 95.1 meters (312 feet) or 7,770 M2 (9,291 SY)

add 93 M2 (111 SY) for storage

Pad Total = 7,770 M2 + 93 M2 = 7,863 M2
(9,291 SY + 111 SY = 9,402 SY)

Support Building Size Calculation:

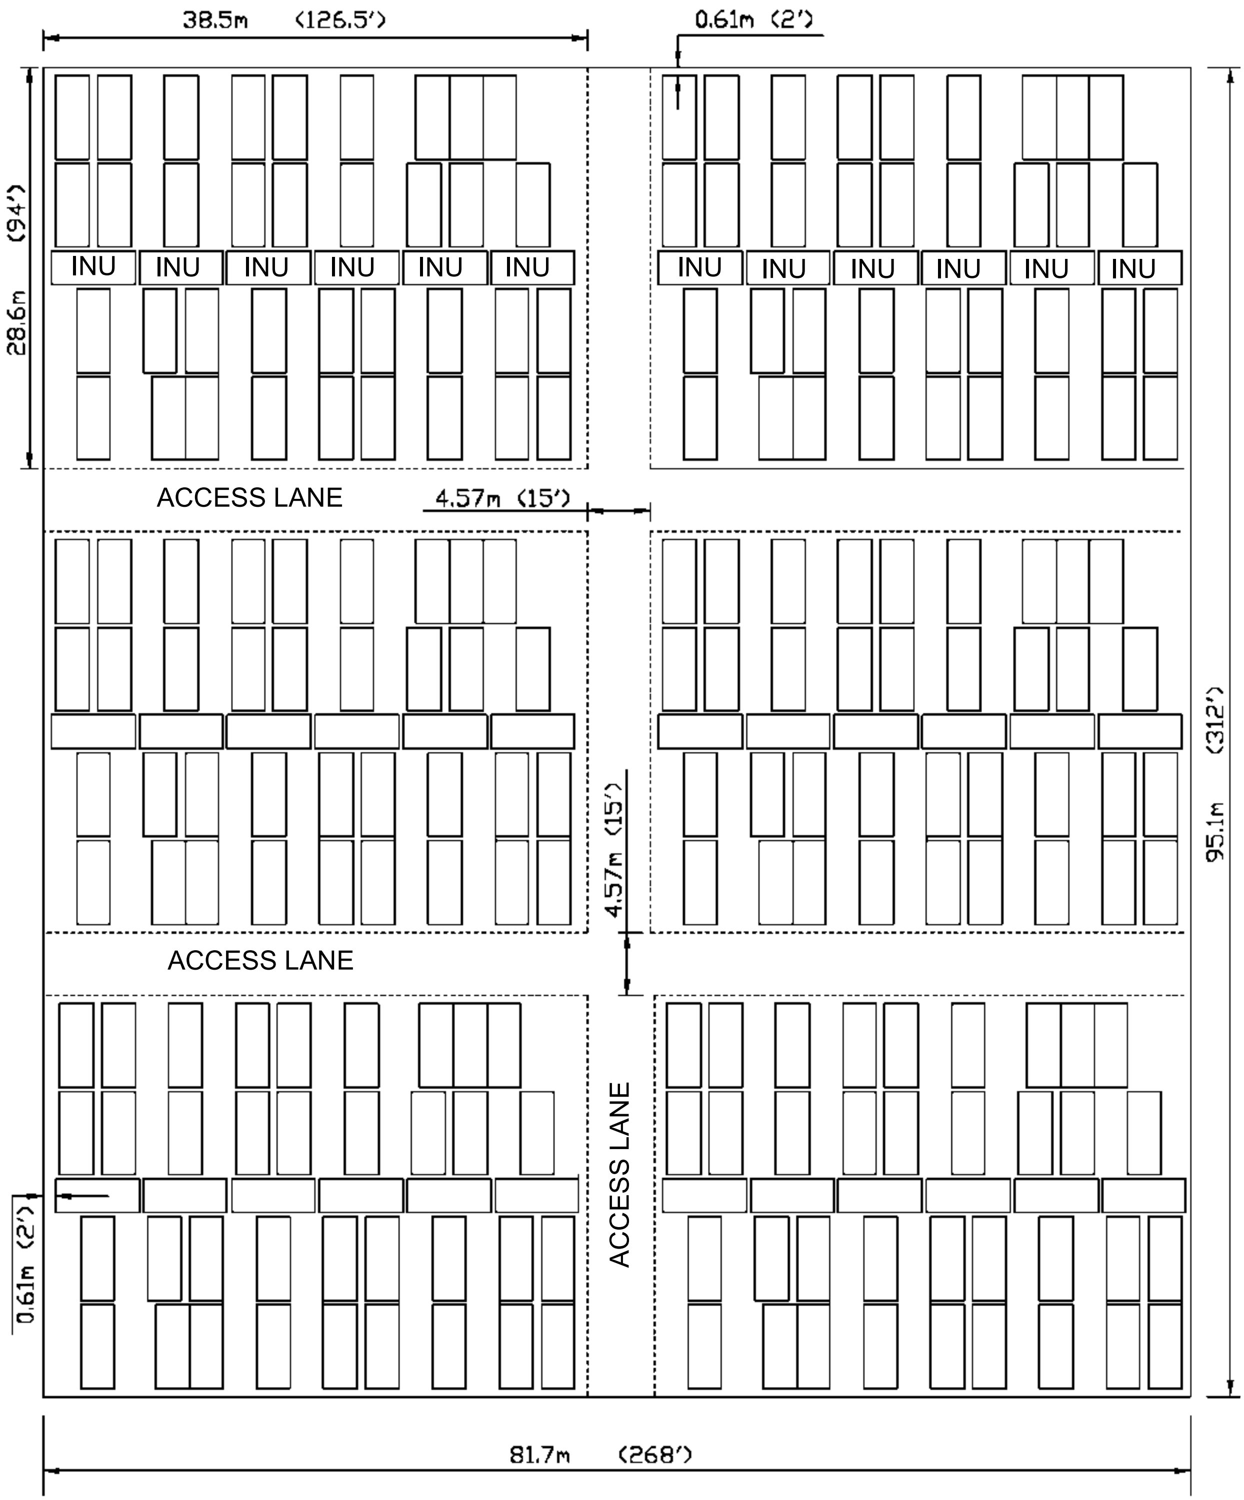
Number of INUs = 6 x 6 = 36
Number of others = 250
Number of personnel = unknown (assume 1.2 pn/van x 250 van = 300 pn)

Covered Storage:
INUs: 36 / 2 = 18
Other: (250 – 36) / 4 = 53.5
18 x 4.6 M2 (50 SF) + 53.5 x 4.6 M2 (50 SF) = 328.9 M2 (3,575 SF)
Restrooms, Locker Rooms, Showers and Dressing Rooms:
1.8 M2 (19 SF) x 300 = 540 M2 (5,700 SF)
Mechanical Room:
13.9 M2 (150 SF)

Support Building Subtotal (Net)
328.9 M2 + 540.0 M2 + 13.9 M2 = 882.8 M2(net)
(3,575 SF + 5,700 SF + 150 SF = 9,425 SF(net))

Support Building Total (Gross)
882.8 M2(net) x 1.25 = 1,103.5 M2(gross)
(9,425 SF(net) x 1.25 = 11,781 SF(gross))

Figure 11665-2. Typical Large Complex Van Pad Layout



NOT TO SCALE

121 AVIATION FUEL FACILITIES

121 10 AIRCRAFT DIRECT FUELING STATION (GM)
FAC: 1211
BFR Required: Y

Design Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design
UFC 3-260-02, Pavement Design for Airfields
UFC 3-401-01, Mechanical Engineering
UFC 3-460-01, Design: Petroleum Fuel Facilities
Additional Planning Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design

12110-1 DESCRIPTION. Aircraft direct fueling stations provided outlets where aircraft can be fueled from a closed-circuit fuel system as opposed to refueler trucks.

12110-2 POLICY. Refueler trucks are the preferred method to fuel aircraft. However, direct fueling stations may be considered for: (1) carrier aircraft, including helicopters, when the mission dictates a continuing need for rapid turnaround without shutting engines down, (2) cargo/transport aircraft with prescribed short ground times or (3) patrol aircraft which require an average refueling of 2500 gallons or more. Aircraft direct fueling stations shall be installed only when authorized by NAVFACENGCOM HQ and NAVAIRSYSCOM HQ. NAVFACENGCOM HQ (Code 04) and NAVAIRSYSCOM HQ (Code 4106) will provide technical assistance for the determination of the type and number of fueling station. See UFC 3-260-01, Chapter 6 for additional considerations.

12110-3 CRITERIA. Aircraft direct systems utilize multi-arm pantographs with closed circuit type nozzle assemblies. Cargo/transport aircraft may also be refueled from flush type direct fueling stations located in the apron in conjunction with hose/pantograph trailers or trucks. However, flush fueling stations should only be used where taxi patterns preclude the parking of aircraft in spaces which can be reached by apron edge fueling stations with fully extended (135 foot maximum reach) five arm pantographs.

The number of fueling outlets required must be determined by an engineering analysis. Where aircraft require quick turnaround, (i.e. transport aircraft with minimum ground time, tactical aircraft returning to the air without shutting down engines, or patrol aircraft on ready alert status), the number of fueling outlets required is a function of the number of aircraft that must be refueled within the specific time frame. UFC 3-460-01 "Design: Petroleum Fuel Facilities" provides guidance on the minimum number of outlets, fuel flow per outlet and total fuel flow required in the system. Systems are designed such that the flow in the system is less than the sum of the maximum outlet capacities. Three or four outlets each capable of delivering 600 gallons per minute (GPM) can be adequately served by a system with a capacity of 1200 GPM.

When determining the number of outlets required for simultaneous refueling of aircraft, the average rate at which the aircraft can receive fuel shall be used rather than the maximum GPM capacity of the outlet. For example, if the average fuel receiving rate for an aircraft is 250 GPM (the actual rate varies during filling), and the aircraft normally requires 2000 gallons of fuel, the fill-up time equals 2000/250 or 8 minutes. Allowing 7 minutes for other functions such as brake check, taxiing, hook-up, paperwork, etc., one aircraft can refuel every 15 minutes. In this case, each outlet could fuel 4 aircraft per hour. If the mission requirement is to turnaround 8 aircraft per hour, two outlets will be required. UFC 3-460-01 "Design: Petroleum Fuel Facilities" specifies a minimum of 2 outlets per fueling system.

12110-4 SITING REQUIREMENTS. The location of fueling stations at an activity depends on the aircraft mission and configuration of runways, taxiways, and aprons. The fueling stations may be located adjacent to through taxiways, parking aprons or dedicated fueling taxiways. See NAVFAC P-272, Drawing 1403986, for the layout of a fueling station with dedicated taxiways. Where direct fueling is used to hot fuel tactical aircraft, fueling stations shall be located to allow quick return to the runway. For cargo/transport aircraft, the fueling stations shall normally be located adjacent to where the aircraft are loaded/unloaded so that fueling may be done simultaneously with other logistic operations. Patrol aircraft may be fueled at their parking spaces or at some point enroute to the runway.

Direct fueling stations shall be sited outside of the runway or helipad primary surface and such that fueling equipment and the aircraft to be refueled do not penetrate the transitional surface as defined in UFC 3-260-01. Direct fueling stations shall not be sited beneath the approach-departure clearance surface. Fueling stations with dedicated access taxiways shall be located a minimum of 100 feet from the edge of a parking apron and 150 feet from the centerline of a through taxiway. The size and spacing of fueling lanes shall be in accordance with NAVFAC P-272, Definitive Drawing 1403986. Normally, when fueling stations are proposed adjacent to parking aprons or through taxiways, an airfield safety waiver from NAVAIRSYSCOM would be required prior to construction. However, in this case no formal waiver is required provided NAVFACENGCOM and NAVAIRSYSCOM have approved overall-planning for the project. Aircraft direct fueling stations shall not be sited within 200 feet of an inhabited building. Siting of fuel dispensing facilities must consider the effects of electromagnetic radiation; see UFC 3-460-01 "Design: Petroleum Fuel Facilities" for guidelines.

12110-5 ACCESS TAXIWAYS AND VEHICLE ROADS. Access taxiways (Category Code 112 10) and vehicle roads (Category Code 851 10) are programmed with the direct fueling facility as required.

121 20 AIRCRAFT TRUCK FUELING FACILITY (GM)
FAC: 1261
BFR Required: Y

12120-1 DESCRIPTION. An aircraft truck fueling facility is used to transfer fuel to aircraft refueling trucks. The fueling equipment is located on concrete islands which are designed to provide fuel from one side only. Where more than one island (one fueling outlet per island) is required, they shall be arranged parallel to each other with 15 feet between adjacent sides. The pavement between islands is sloped to a drain or catch basin which is connected to a containment area in case of a fuel spill. See NAVFAC P-272, Definitive Drawing 1403987 for a sketch of a typical refueler truck fill stand and UFC 3-460-01 "Design: Petroleum Fuel Facilities" for design criteria.

12120-2 POLICY. The use of refueler trucks is the preferred method to fuel aircraft. However, see Category Code 121 10 to determine when a direct fueling system may be considered. When direct fueling is provided, it is always in conjunction with truck fueling. An aircraft truck fueling facility supplied from a spur of the direct fueling system usually reduces non-productive truck time and is less costly than a separate truck fueling facility because the filter/separator and fuel monitor would be omitted. Also, depending upon the spurs' location in the system, a relaxation chamber may not be required. See NAVFAC definitive drawing 1403985 and UFC 3-460-01 –" Design: Petroleum Fuel Facilities". The determination of number of grades of fuel to be handled and the number of outlets required for each grade shall be made in conjunction with NAVFACENGCOM HQ (Code 04) and NAVAIRSYSCOM HQ (Code 4106).

12120-3 CRITERIA. The number of outlets required must be determined by an engineering analysis. The maximum capacity of each outlet is 600 gallons per minute (GPM). Factors to be considered in the engineering analysis include:

- **The number of grades of fuel to be provided.** Each grade requires a separate outlet.

- **The number of aircraft that must be refueled during peak periods of recovery and launch.**

- **The rate at which the fueling facility can fill refueler trucks.** Refueler trucks can accept up to 600 GPM, however, a figure of 450 GPM is more typical of rates achieved. Standard Navy refueler trucks can hold 5000 gallons of fuel. The capacity of refueler trucks in contract refueling operations vary and 8000 gallons is not uncommon.

- **The rate refueler trucks can fuel aircraft.** While refueler trucks can dispense fuel at approximately 250 GPM, only the larger and more modern jet aircraft can accept fuel at that rate and then only during the initial refueling phase. For planning purposes, the average aircraft fueling rates should be 200 GPM for large jet aircraft (Patrol/transport), 150 GPM for tactical jet aircraft and 100 GPM or less for rotary wing jets and all reciprocating engineer aircraft using aviation gasoline (AVGAS). Some larger aircraft can simultaneously take on fuel from two trucks in which case a combined average flow of 400 GPM can be used.

- **The distance the refueler trucks have to transit between the fueling stand and the aircraft.** The distance should be minimized to reduce transit times.

The analysis should consider that aircraft can be refueled overnight for morning departures. Peak demand for the truck fueling facility will normally occur at mid-morning or mid-afternoon when high rates of aircraft recovery are experienced.

12120-4 SITING. Aircraft Truck fueling facilities shall not be sited within the primary surface or under the approach/departure clearance surface of any runway or helipad. The facilities shall be sited so that no part of the fueling stand, equipment or refueler truck penetrates the imaginary surfaces specified in UFC 3-260-01 or the airfield safety clearances published in UFC 3-460-01 - Design: Petroleum Fuel Facilities (see criteria for runways, helipads, taxiways, and aprons). The fueling facility shall be at least 100 feet from any building, public road or above ground fuel storage tank. See UFC 3-460-01 – "Design: Petroleum Fuel Facilities" for additional siting restrictions with respect to electromagnetic radiation.

121 30 AIRCRAFT DEFUELING FACILITY (GM)
FAC: 1242
BFR Required: N

This Category Code shall be used for inventory of existing facilities only. Aircraft shall be defueled into tank trucks designated for that purpose.

121 50 AIRCRAFT READY FUELS STORAGE (BL)
FAC: 1241
BFR Required: Y

Note: Previously listed as Category Code 124 30 AIRCRAFT READY FUELS STORAGE

12150-1 DESCRIPTION. Aircraft ready fuel storage provides an operation and reserve supply of aviation gasoline and jet fuel. At air installations all aviation fuel storage shall be categorized as ready fuel storage as opposed to depot level storage; see 411 Category Code series. Aircraft ready fuel storage may be classified as local or remote. The remote are usually designated as the station's fuel farm and provide the majority of the storage capacity. Local storage refers to those storage tanks located close to a fuel dispensing facility. Local storage tanks (or day tanks) can be refilled overnight thereby permitting the use of a smaller diameter pipeline from the remote tanks to the local storage and dispensing area. Local storage such as day tanks should be used settlement prior to dispensing.

12150-2 CRITERIA. The fuel storage requirement must be determined by an engineering analysis. The Fleet Fuels Officer, Code N413F, within the US Fleet Forces Command in collaboration with Defense Logistics Agency's (DLA) Defense Energy Support Center (DESC) Code B (Bulk Fuels) will determine the fuel storage requirement. The requirement is a function of: the number and type of aircraft supported, aircraft fuel consumption rates, and the number of hours of flown. At CONUS installations, a ten-day supply is normally provided. At OCONUS installations, a thirty-day supply may be provided. The above days of supply requirements are guidelines and may be modified to reflect restricted or unpredictable fuel delivery schedules. When both local and remote storage are provided, the remote storage capacity requirement shall be reduced by 50% of the tank capacity provided by local storage. See Figure 12150-1 for a sample calculation.

Figure 12150-1. Example Requirement Calculation

Given: (1) CONUS 10 day requirement = 500,000 GA
(2) 50,000 GA of local storage is being provided

Remote Storage = 500,000 GA – {50% x (local storage)}
= 500,000 GA – {0.50 x (50,000 GA)}
= 500,000 GA – 25,000 GA
= 475,000 GA

Total (121 50) Requirement
= local + remote
= 50,000 GA + 475,000 GA
= 525,000 GA

12150-3 SITING. Fuels storage tanks must be separated from each other, buildings, property lines, roads, railroads lines, and power lines. The fuel farm layout, design and siting are available in the UFC 3-460-01 Design: Petroleum Fuel Facilities.

122 MARINE FUEL FACILITIES

122 10 MARINE FUELING FACILITY (GM)
FAC: 1221
BFR Required: Y

Design Criteria: UFC 3-460-01: Design: Petroleum Fuel Facilities

12210-1 DESCRIPTION. A marine fueling facility is designed for small vessels and capital ships and should be able to refuel the largest ship that can dock at the station’s waterfront. The facility may have the outlets located on a general purpose berthing pier, a combined cargo and fueling pier or on a separate fueling pier, depending on the station’s mission, logistics, and base location.

12210-2 ADDITIONAL REQUIREMENTS. In addition to the pier outlets, the facility has a piping approach trestle, a pumping station, security fencing, hose racks, access roads, fire protection and ready marine fuel storage tanks. Surge storage tanks, if required, are categorized under code 124-70 and bulk marine fuel storage tanks are categorized under code 411-10, Ship Fuel Storage. Fuel piers or wharves will vary greatly according to the services required. Some may be of the simple type having one ship berth and a minimum-size dock platform to the more elaborate pier head or finger-type having two or three ship berth all provided with the appropriate fuel bunkering connections.

12210-3 SEPARATION DISTANCES. There should be 1,800 feet between tankage and the nearest station structure or boundary fence. Consideration must be given to safe distances from other buildings and facilities.

122 20 SMALL CRAFT FUELING STATION (GM)
FAC: 1221
BFR Required: Y

Design Criteria: refer to UFC 4-150-01 “Piers and Wharves”

12220-1 DESCRIPTION. A small craft fueling station is used to refuel such small craft as crash boats and administrative boats. It shall include dispensing pedestal-type commercial pumps, piping, tanks, hoses, floodlights and grounding devices, electrical power, and fire protection.

12220-2 CAPACITY. There will be at least one separate pump for each grade of fuel used and each shall have a minimum backup storage of 5,000 gallons. The station will normally dispense a minimum of two grades of gasoline and diesel fuel and shall have sufficient capacity to service three boats simultaneously. This may be modified to conform to the type and number of small craft serviced.

12220-3 SITING. The small craft fueling station, except for the storage tanks, is a part of the Small Craft Berthing facility. The fuel storage tanks may be located in a remote area. The spacing of these tanks will be in accordance with criteria set forth in Category Code series 124.

122 30 SMALL CRAFT READY FUEL STORAGE (GA)
FAC: 1242
BFR Required: Y

Note: Previously listed as Category Code 124 40 SMALL CRAFT READY FUELS STORAGE

12230-1 DESCRIPTION. A marine ready fuel storage tank is the ready issue operation storage of a particular grade of fuel for small boats and yard craft. These boats will include small tugs, security boats, repair barges, etc. The boats may be operated by several different departments within or tenants operating at the installation including: Public Works, Base Security, Naval Coastal Warfare Command, Amphibious Group Two, Naval Special Forces Command, etc. Large ships will refuel at depot fueling piers or via fuel barges. For depot level fuel storage see Category Code 411. See Category Code 122 20 (Small Craft Fueling Station) for the fuel dispensing facility which includes commercial fuel pumps, piping from the tank to the pump, hoses, floodlights, and other equipment for dispensing the fuel.

12230-2 CRITERIA. The fuel storage requirement must be determined by an engineering analysis. The Fleet Fuels Officer, Code N413F, within the US Fleet Forces Command in collaboration with Defense Logistics Agency's (DLA) Defense Energy Support Center (DESC) Code B (Bulk Fuels) will determine the fuel storage requirement. The requirement is a function of: the number and type of boats supported, fuel consumption rates, and the number of hours of driven. At CONUS installations, a ten-day supply is normally provided. At OCONUS installations, a thirty-day supply may be provided. As minimum, the ready fuel storage will be one 5,000-gallon gasoline tank for each octane grade and one 5,000-gallon diesel fuel tank. The tanks will include the piping for fuel delivery to the tanks, pumps for pumping fuel into the tanks, tank security fencing, tank fire protection, and paving for fuel delivery, as required.

12230-3 SITING. Fuels storage tanks must be separate from each other, buildings, property lines, roads, railroads lines, and power lines. The fuel farm layout, design and siting are available in the Unified Facilities Criteria (UFC) 3-460-01 "Design: Petroleum Fuel Facilities".

123 LAND/GROUND VEHICLE FUELING/DISPENSING FACILITIES

123-1 This Category Code group is for facilities serving official government land vehicles and equipment only. If NEX operates the facility, see Category Code 740-30/31, Exchange Service and Auto Repair/Supplemental Gasoline Station. For Aviation Fueling and Dispensing, see Category Code Series 121. For Marine and Small Craft Fueling and Dispensing, see Category Code series 122. For bulk fuel storage such as tank farm installation, see Category Code series 411.

123 10 FILLING STATION (OL)
FAC: 1231
BFR Required: Y

12310-1 DESCRIPTION. A filling station is a fueling facility for official vehicles and equipment on Navy and Marine Corps installations. This Category Code applies to pump outlets including the covered islands that support the pump outlets, the concrete parking area, lighting and the access paving to the pumps/islands.

12310-2 ITEMS INCLUDED IN STATION. In the event the installation still has a filling station, the following items will be included:

- Three dispensing pumps (Outlet – OL) for each 250-gasoline engine vehicles in the official motor pool:

    1. One pump for gasoline that can dispense each of the three of standard octane grades gasoline (low, medium, high octane if required)
    2. One pump for diesel fuel
    3. One pump for other fuel if needed (i.e., leaded fuel if required, etc.)

- Allowance for associated safety and environmental equipment

12310-3 EXCLUSIONS. This Category Code excludes the fuel storage tanks and filling station building; see Category Code 123 30 for tank storage and Category Code 123 15 for shelter.

123 15 FILLING STATION BUILDING (SF)
FAC: 1444
BFR Required: Y

12315-1 DESCRIPTION. This code is used for reporting the administrative shelter associated with a filling station. If the filling station is operated by a private entity, then use the 740-30/31 Category Codes. Where credit card systems are used and operators are not needed, a shelter is not required. A shed may be provided to protect or house equipment.

12315-2 REQUIREMENT. This code should also include the following:

- Minimum size shelter is 6’x6’
- Control/monitoring room area
- Access road and 400 SF of pavement at each pump with appropriate curbing for spills and containment
- Area lighting and signage

123 16 OVERHEAD COVER, AIRFIELD (SF)
FAC: 1459
BFR Required: N

12316-1 DESCRIPTION. This category code was created for inventory purposes. It can be used for overhead covers located on the airfield (that are not classified as equipment).

123 17 OVERHEAD COVER, MISCELLANEOUS (SF)
FAC: 1459
BFR Required: N

12317-1 DESCRIPTION. This category code was created for inventory purposes. It can be used for overhead covers located at the main gates of installations, overhead covers atop gas pumps, and any other time that an overhead cover is used.

123 30 VEHICLE AND EQUIPMENT READY FUEL STORAGE (GA)
FAC: 1243
BFR Required: Y

Note: Previously listed as 124 50 VEHICLE READY FUEL STORAGE

12330-1 DESCRIPTION. This code is used for reporting the tank storage requirement associated with Category Code 123 10 and 740 30, including those tanks in remote locations that are considered Real Property.

NOTE: Tanks that are skid mounted and/or designed to be moved to various locations are considered equipment. Tanks that are provided by vendors are also considered equipment. This Category Code does not apply to equipment.

12330-2 NUMBER OF TANKS REQUIRED. One tank for each grade of fuel required (low, medium, and high-octane fuels; diesel fuel; and other fuels as required).

12330-3 STORAGE CAPACITY. The total amount of storage capacity in each station should be approximately twice the capacity of all fuel tanks of vehicles and equipment assigned to an activity.

12330-4 MINIMUM NUMBER OF GALLONS. Service station tanks should be a minimum of 5,000 gallons unless approved by Service Headquarters. For other tanks, such as heating fuel, small tanks may be used.

12330-5 ADDITIONAL REQUIREMENTS. In addition, there should be a 10-day total storage capacity for CONUS bases and a 30-day total capacity for overseas bases. This total storage should be based on high average such as winter months for heating oil. Location of base and access to fuel resources as well as current delivery schedules should be considered when developing this immediate backup fuel requirement. Don't forget to include emergency generators for buildings and utilities that may be needed in a hurricane or other base emergency. Some of these generators and equipment may have service contracts (i.e., utilities privatization, etc.) that should not be included in these calculations. A good resource for the rate of consumption information is the historical accounting and billing records. If records are not available, provide 32 gallons per vehicle for each type of fuel used at overseas bases. Equipment requirements will vary.

12330-6 ALTERNATE UNIT OF MEASURE. Barrels (BL) may be used as an alternative unit of measure.

12330-7 EXCLUSION. For fuel oil or heating fuel see Category Code 126 15 Petroleum Fuel Storage Facility.

123 40 ETHANOL READY FUEL STORAGE (GA)
FAC: 1243
BFR Required: Y

1**2340-1 DESCRIPTION.** This category is for alternative fuel facilities in support of ethanol operation of vehicles.

123 50 BIODIESEL READY FUEL STORAGE (GA)
FAC: 1243
BFR Required: Y

12350-1 DESCRIPTION. This category is for alternative fuel facilities in support of biodiesel operation of vehicles.

125 POL DISTRIBUTION / PIPELINE FACILITIES

125-1 This category is for pipelines and accessory equipment between tank farms and operating fuel storage facilities and intermediate points.

125 10 POL PIPELINE (MI)
FAC: 1251
BFR Required: N

12510-1 **DESCRIPTION.** Separate fuel lines should be used for each type of fuel stored at the activity. Underground pipelines are preferred and should be used wherever practical, therefore eliminating thermo-solar effects. In some instances, subaqueous pipelines will be required for crossing harbors or through marshy areas. Submarine pipelines have specific design requirements unique to sub refueling. This category will include in-line fuel filtering systems, censors, alarms, manifolds, area lighting for the pipeline, paving and piers. A surge tank is required for pipeline systems; see Category Code 125 30.

12510-2 **GENERAL PLANNING NOTES.** The capacity and size of the pipeline will have a direct impact on rate of flow as well as exposure to temperature changes. The design criteria are provided in the Unified Facilities Criteria Design: Petroleum Fuel Facilities (UFC 3-460-01 dated 16 Jan 2004). In distributing fuel oil, large pipelines are preferred. Whenever crossing private property be sure to include access roads and maintenance areas paralleling the pipeline. The maintenance area should not be less than 16 feet wide. Daily consumption, storage requirements, delivery schedules, length of delivery, and thermo-solar effects should all be considered when designing POL pipeline. Only the length of the POL is needed for this category requirement. Looped systems are preferred, so be sure to add this to total length of the pipeline. The loop will provide flexibility, reliability and contributes to product cleanliness as well as reduce the magnitude of hydraulic shock.

125 16 POL PIPELINE PUMP STATION - ANCILLARY EQUIPMENT (EA)
FAC: 1262
BFR Required: N

12516-1 **DESCRIPTION.** This Category Code includes pumping stations and ancillary equipment used to move the fuel through the pipes. This facility may also include controls, gauges, meter, lighting, fire protection, and ventilation. An alternative unit of measure may be cubic feet per minute (CM). Underground pump stations are preferred around runways.

125 20 SHED/SHELTER - PUMP STATION - ANCILLARY EQUIPMENT (SF)
FAC: 1459
BFR Required: N

12520-1 **DESCRIPTION.** This code is for the building or structure housing pumping stations and ancillary equipment.

12520-2 **REQUIREMENT.** Facility should be large enough to house or shelter equipment with ample space allow performance of maintenance to housed equipment. Typically, 2 - 4 feet of clearance is adequate. In lieu of net to gross factor, add in wall thickness if facility is enclosed.

125 21 POL PIPING - SINGLE SITE (LF)
FAC: 1252
BFR Required: N
125 30 SURGE STORAGE (GA)
FAC: 1244
BFR Required: N

Note: Previously listed as Category Code 124 70 SURGE STORAGE

12530-1 **DESCRIPTION.** A surge tank is used where there is a risk of hydraulic shock. Hydraulic shock can occur when the pump used to deliver fuel is greater than the pipeline capacity; unloading rate of the delivery tanker/barge exceeds the rate of the shore pumping system; or water, air or other blockage occurs in the pipeline. One surge tank is required each type of fuel. The size of the surge tank will be determined by the size of the tanker unloading at the facility and the capacity of shore booster pumps. UFC 3-460-01 suggests computer modeling to determine need and tank size.

126 OTHER LIQUID PETROLEUM PRODUCTS FACILITIES

126-1 Use this Category Code for liquid fuel or petroleum products facilities not specifically related to aviation, marine craft, or ground vehicle fuel requirements (see Category Codes series 121, 122, and 123, respectively). Use Category Code 821 60 or 821 61 for heating plant fuel storage. This Category Code includes fuel loading and unloading; drum storage, loading and maintenance; and miscellaneous fuel storage (i.e., heating fuel, kerosene, propane, fuel oil, etc.). See Category Code series 411 for depot level storage.

126 10 DRUM AND CAN LOADING FACILITY (SF)
FAC: 1261
BFR Required: Y

12610-1 **DESCRIPTION.** A drum and can loading facility is a fuel facility equipped to fill drums with fuel oil, diesel, kerosene, jet engine fuel, motor gasoline, aviation gasoline, and lubricating oils. The facility may also be provided with a drum reconditioning plant. Drum storage areas may also be needed. Drums with varying fuel may be stored in one storage area. Others may be separated; see Unified Facilities Criteria Design: Petroleum Fuel Facilities (UFC 3-460-01 dated 16 Jan 2004). There may be one storage area for empty drums and another storage area for filled drums. The drums have 55-gallon capacity. This facility should not be used for storage of contaminated fuel or waste oil ready for disposal; see hazardous waste facilities under Category Codes 831 41 and 831 42.

12610-2 **STORAGE.** Jet engine fuel and gasoline drums shall be stored outside in designated compounds. Special construction features will be required if an outside compound is not available. Drummed products with a flash point of 100 degrees Fahrenheit shall contain no more than 5,000 drums. Drummed products with a flash point above 100 °F may be stored in groups of 10,000 or less. When possible, racks and pallets should be used to reduce the footprint utilized to store drums.

12610-3 **WORK PLATFORMS.** The drum filling area shall include a work platform covered with an open shed. A separate platform shall be used for each type of fuel with individual pipelines for each of the various fuel types. The pipeline will run from the storage tank to a fuel manifold to the outlet (see Category Code 126 15 for storage tank). Each platform will have 2 outlets, spaced at 10-foot intervals. A mechanical drum conveyor system or equipment may be used to carry the drums, depending on the size of the operation.

12610-4 **SMALLER QUANTITIES.** For smaller operations where the fuel products are delivered in drums, only a small fuel/petroleum storage area may be required to hold a limited number of drums; in this case, use Category Code 441 30. For very small quantities, a hazardous material storage locker may be used.

126 15 PETROLEUM READY FUEL STORAGE FACILITY (GA)
FAC: 1244
BFR Required: Y

Note: Previously listed as Category Code 124 20 DRUM AND CAN READY FUEL STORAGE and Category Code 124 65 ACTIVITY HEATING FUEL STORAGE

12615-1 **DESCRIPTION.** This category shall be used for the storage of petroleum products used to fill drums as provided in Category Code 126 10, heating oil tanks (see Category Code 821-60 or 61 for heating plant fuel storage), lube oil tanks, grease, propane tanks, or fuel storage tanks for generators and other equipment. This Category Code should not be used for those items included in Category Code series 121,122, and 123.

12615-2 **REQUIREMENT.** The normal storage for CONUS would be a 10 day supply and for OCONUS a 30 day supply. Historical annual data may be used to determine average daily consumption, then multiply that times the number of days of supply needed to get the total storage requirement for each type of petroleum product stored. For storage tanks associated with one piece of equipment such as a building generator, sewage pump station or building heater, check equipment specifications and emergency requirements. Some facilities or activities may have specific hurricane or other emergency requirements that should be taken into consideration. If this activity has a drum loading facility, the size and number of drums should be added to the storage requirements for each type of fuel or petroleum product. Design should factor in fuel delivery schedules and availability. If emergency requirements dictate, additional storage may be required.

12615-3 **ALTERNATIVE UNIT OF MEASURE.** The alternative unit of measure is gallons, (GA).

126 30 TANK TRUCK TANK CAR LOADING FACILITY (OL)
FAC: 1261
BFR Required: Y

12630-1 **DESCRIPTION.** This Category Code applies to a tank truck loading facility (either a truck fill stand or stands) that dispense fuels other than aircraft fuels to delivery trucks. (For information on an aircraft truck fueling facility, see Category Code 121 20.) Each stand has one dual outlet, a meter, static line, platform, roadway, strainer and necessary valves, piping, pump, and electrical controls. For design criteria, see UFC 3-460-01.

12630-1.1 **Outlet Requirements**. A tank truck loading facility is required at those installations without contract refueling and automotive ready fuel storage facilities. There shall be at least one outlet for each grade of fuel, capable of dispensing fuel at the rate of 250 to 600 gallons per minute. The total number of outlets will vary with the station population, mission, and the number of fuels used. A tank truck loading island is 38 feet 9 inches long by 6 feet 0 inches wide.

12630-2 **PROVIDING FOR MULITPLE TYPES OF FUEL.** Facilities for issue of fuel by tank car shall be provided when specified by NAVFAC. The fuel normally issued will be jet engine fuel and gasoline, but diesel fuel oil and other fuel oils may be included. Separate pipe lines shall be provided from the storage tanks for each type of fuel.

12630-2.1 **Railroad Siding and Sludge Transfer Disposal.** The normal installation will provide for a railroad siding to each side of the loading island with a length to accommodate six cars on each side. A tank car issuing facility may also be used for disposal of sludge from storage tanks, and for this purpose special pipe lines to the facility shall be provided for sludge transfer.

12630-2.2 **Rate at Which Facilities Will Provide for Receipt of Fuel.** Tank cars are generally of 8,000- and 10,000-gallon capacity. However, there are some tank cars of 12,000-gallon capacity.

126 40 TANK TRUCK/TANK CAR UNLOADING FACILITY (OL)
FAC: 1261
BFR Required: Y

12640-1 **DESCRIPTION.** A tank car unloading facility unloads liquid products from tank cars. Each facility has static lines, strainer, access road, security fencing, lighting, necessary valves, piping, pump, electrical controls, and a shelter structure for use of accounting and/or control house. For design criteria, see UFC 3-460-01.

12640-2 **REQUIREMENT.** The number of cars to be accommodated at an unloading facility shall be determined by a survey. There will be one unloading connection for each car. The tank car unloading facility will provide 400- to 800-gallon fuel transfer rate between each tank car and storage.

12640-3 **QUANTITY OF TANK TRUCK UNLOADING FACILITIES.** Tank truck unloading facilities shall be determined by a survey. Facilities should be capable of handling the entire daily fuel requirements in 8 hours. Where unloading facilities by railroad tank cars are available, paved aprons should be provided adjacent to sidings so pumping facilities may serve both tank cars and tank trucks.

131 COMMAND, CONTROL, COMMUNICATIONS, COMPUTERS, COMBAT SYSTEMS, INTELLIGENCE, SURVEILLANCE, AND RECONNAISSANCE, (C5ISR) BUILDINGS

131-1 **DEFINITION.** This group of shore facilities supports the reception, processing, distribution, and/or transmission of classified and unclassified voice, data, and video communications in support of the Navy and Marine Corps organizations. Table 131-1 provides a matrix identifying which types of C5ISR functions are best represented for each category code.

Table 131-1. Category Code Functional Space Matrix

Function/Command	131 15	131 24	131 35	131 40	131 50	143 65	143 80
Base Communications Office	X						
Information Technology Office	X						
Data Center or Server Center	X						
Navy Information Operations Command (NIOC)	X						
Naval Computer and Telecommunications Station (NCTS) / Naval Computer and Telecommunications Master Area Station (NCTAMS)	X						
Satellite Communications (SATCOM)		X					
Receiver/Transceiver Function			X				
Unmanned Telecommunications Distribution				X			
Transmitter Function					X		
Region/Installation Operations Center						X	
Mission Operation Command and Control							X
High Density Computing Center	X						

131-2 **REQUIREMENT PROCESS.** Unless otherwise specified, the following requirements process should be utilized when planning C5ISR buildings. C5ISR buildings are unique in that they are specifically tailored to a Navy or Marine Corps activity. As a result, engineering evaluations, manning, and equipment configurations may also be required. This information should be used with the guidance provided below to determine the basic facility requirements.

131-3 **SECURITY.** Security issues and operational efficiencies may result in the co-location of office space, equipment space, associated maintenance space, and other associated support/storage space within respective commands.

131-4 **RESILIENCY.** The design of buildings and infrastructure to withstand, absorb, or avoid damage without suffering catastrophic failure is critical to C5ISR facilities. C5ISR facilities must be planned to provide the appropriate level of continuity of operations based on the individual mission of the tenant. There are three facets to the resiliency of C5ISR facilities: Tier Classification, Survivability, and Antiterrorism/Force Protection. All three of these facets must be addressed in basic facility calculations, facility design, and project cost estimating.

131-4.1 **Tier Classification.** The Tier Classification system, as defined by the Uptime Institute, is used to identify the appropriate redundancy requirements for power, cooling, maintenance, and capability to withstand a failure. Planning criteria should address any additional space requirements based on the Tier level required. The Tier Classification system is further described in the "Tiers Standard Topology" available at the Uptime Institute website: https://uptimeinstitute.com/resources/asset/tier-standard-topology

131-4.2 **Survivability.** Survivability is the ability of the overall building to withstand failure due to natural disaster such as earthquakes, hurricanes, tornados, flooding, and sea level rise - all of which are dictated by the climate in the geographic location of the existing or proposed facility.

131-4.3 **Antiterrorism/Force Protection (AT/FP).** The facility must be planned to meet antiterrorism and force protection requirements as identified in UFC 4-010-01, DoD Minimum Antiterrorism Standards for Buildings and UFC 4-010-02 DoD Minimum Antiterrorism Standoff Distances for Buildings.

131-5 **FUNCTIONAL AREAS.** C5ISR facilities may contain the following functional areas: General Administrative Space, Special Purpose Space, C5ISR Operations Space, Maintenance Space, Training Space, Equipment Space, and IT Logistics Support Space.

131-6 **PERSONNEL LOADING.** All C5ISR BFRs should be based on an official personnel loading source, projected loading year, and associated personnel loading. The official personnel loading analysis must be provided separately to support the requirement. The personnel loading document should include all assigned billets to include: military (including reservists), civilians, students, and contractors. Each billet should be assigned a space type of: private office, cubicle, shared, or special as defined below:

131-6.1 **Private Office.** Personnel that are entitled to an office include supervisory personnel or special billets that require privacy such as a legal officer or financial manager. See section 131-7.1 for calculation criteria.

131-6.2 **Cubicle**. Personnel that require a non-operations workspace but do not require a private office as stated in section 131-6.1 are assigned cubicles. See section 131-7.2 for calculation criteria.

131-6.3 **Shared**. Personnel assigned to watch sections are assigned to shared workstations, which are provided based on the watch stations required, not the total personnel assigned. Personnel that work in the maintenance spaces are also assigned to shared areas. The quantity of workstations required is calculated using the number of positions in the Watch Center and/or the number of workstations required to support the maintenance function. See Sections 131-9.1, “Watch Center” and 131-10 “Maintenance Space” for calculation criteria.

131-6.4 **Special**. Personnel that conduct analysis or operations functions that require space greater than that allotted by a cubicle are assigned the category of “Special”, see Section 131-9.2 “Analysis Operations” for calculation criteria. This space type is also used to classify specific billets such as the Special Security Officer, which is provided a specific space allotment under Section 131-8, “Special Purpose Space”.

131-7 **GENERAL ADMINISTRATIVE SPACE.** General Administrative Space types are justified to support administrative or similar functions. They include private and open office spaces.

131-7.1 **Private Office.** Private Offices are typically provided for supervisory and other personnel based upon specific job requirements. These offices typically have full-height walls, or partitions, from finished floor to finished ceiling.

Planning factor: Allocate 120 NSF/PN requiring Private Office space.
Justification: Private Offices are justified for supervisory personnel or for those positions whose job duties require privacy such as legal or financial officers.

131-7.2 **Open Offices**. Open Offices are programmed and designed to incorporate modular workstations, which are typically occupied by general administrative and/or functional support staff. Personnel assigned as requiring a cubicle per the personnel loading are assigned to Open Office space.

Planning factor: Allocate 64 NSF/PN requiring Open Office space.

131-8 **SPECIAL PURPOSE SPACE**. Special Purpose Spaces are additive and must be individually justified in support of specific missions or functions. For C5ISR missions, the following Special Purpose Spaces may be authorized with justification.

131-8.1 **Special Purpose Space – Basic.** Basic Special Purpose Spaces include allowances for Administrative Support, Auditorium, Break Room, Break Room Kitchen, Classified Material Storage (CMS) Vault, Conference/Training Rooms, Duty/Bunk Room, Mailroom, and Technical Publications Area.

131-8.1.1 **Administrative Support Space.** This space supports the administrative functions and includes the following:

- Conference room equipment storage (e.g. AV equipment, chairs, lecterns, tables)
- Day lockers
- Group file storage (excluding individual file storage provided within modular furniture)
- Lactation room(s)
- Office equipment and supply storage
- Reception area(s)

Planning factor: Allocate 8 NSF/PN requiring Administrative Support Space.

131-8.1.2 **Auditorium.** A large area performing the function of an auditorium may be required for commands with more than 250 personnel. The size of this area is dependent on the staffing and size of the organization.

Planning factor: Allocate 150 NSF plus 10 NSF per seat based on the largest department of the command.
Justification: An Auditorium may be justified under special circumstances. Justification should address some or all of the following factors as appropriate:

- Mission or functions performed
- Size of organization is greater than 250 personnel
- Other justification

131-8.1.3 **Break Room.** A Break Room w/o Kitchen is a staff-only space, used for breaks and lunches. It typically includes some or all of the following: coffee bar, microwave oven, MWR drink/snack space, refrigerator, water cooler.

Planning factor: Allocate 2 NSF/PN assigned.

131-8.1.4 **Break Room Kitchen.** A full kitchen may be provided, with justification, if a command has 24-hour operations or if the facility is located in a remote location with no food service options available on-site or near by. A Break Room Kitchen is a staff-only space. It may include some, or all, of the following: coffee bar, cupboards, microwave, refrigerator, stove, sink and meal preparation space.

Planning factor: Allocate an additional space for a kitchen equal to one third of the total Break Room requirement, up to a maximum of 150 NSF. This area is considered an additional requirement above and beyond the total Break Room requirement.
Justification: A Break Room Kitchen may be justified for operational functions. Justification should address some or all of the following factors as appropriate:

- Mission or functions performed
- Distance from food service facilities
- Other justification

131-8.1.5 **Classified Material Storage (CMS) Vault.** A CMS Vault is a secured area for handling classified material. For C5ISR functions, this type of facility is only provided when the primary facility is unclassified and intermittent access to classified materials and networks is required. Additionally, this space is not intended to be the primary workspace for any staff. It may include a worktable at 50 NSF and up to a maximum of 5 workstations at 64 NSF each. The number of workstations required must be provided by the organization for which the space requirements (BFR) are being prepared.

Note: If a portion of an organization operates at a higher classification than the rest of the facility, the space provided for them is calculated based on the overall requirements set forth in the 131 Introductory Criteria with an additional justification provided indicating the requirement for any additional physical separation, construction requirements, and security requirements.

Planning factor: Allocate 50 NSF (for a worktable) and up to a maximum of 5 workstations at 64 NSF, each based on specific requirements of the organization.
Justification: A CMS Vault room may be justified for various organizations or functions. Justification should address some or all of the following factors as appropriate:

- Mission or functions performed
- Number of workstations required
- Number of vaults required (if more than one)
- Other justification as necessary

131-8.1.6 **Conference/Training Rooms.** Conference/Training Rooms provide space for staff meetings, briefings, and training sessions. The total allocation may be adjusted in terms of number and size of conference rooms to meet organizational needs.

Planning factor: Allocate total NSF space requirement based on the Conference Room Table 61010-1.

131-8.1.7 **Duty/Bunk Room.** A Duty/Bunk Room is required when the mission requires 24 hours a day, 7 days a week operations.

Planning factor: Allocate 130 NSF for a Duty/Bunk Room.
Justification: A Duty/Bunk Room may be justified for any C5ISR function with an overnight watch that requires overnight accommodations for the duty officer and requires approval from the Installation Commanding Officer. Justification should address some or all of the following factors as appropriate:

- Mission or functions performed
- Watch schedule
- Other justification

131-8.1.8 **Mailroom.** A Mailroom accommodates processing and distribution of the facility's incoming and outgoing mail and parcels. It may accommodate screening requirements as necessary based on security requirements. Ensure adequate storage and work space. The mail room should be adjacent, and provide direct access, to the shipping/receiving area. A mail room must be individually justified for operational, site specific or other reasons such as large size of organization.

<u>Planning Factor</u>: Allocate 40 NSF for every 50 personnel assigned.
<u>Justification:</u> Address some or all of the following factors as appropriate:

- Mission or functions performed.
- Size of organization - Is organization large enough to warrant its own mail room rather than rely on the host installation's centralized postal facility?
- Location of organization - Does geographic separation of the organization from the host installation site warrant a standalone mailroom?
- Security - Do security requirements warrant a mail room?
- Mail room hours of operation (e.g., full-time or part-time)
- Other justification

131-8.1.9 **Technical Publications Area.** A Technical Publications Library provides ready access to technical manuals, handbooks, and other guidance.

Note that the need for technical/legal/other libraries has diminished as many resources are now readily available online; however, some functions still require access to printed publications.

As a space saving measure, consider combining technical libraries with small conference/training rooms, rather than providing a separate allocation. This area may be required to store reference publications and literary data. It is configured similar to a reference library and contains bookshelves, a reference area, and a working space for a minimum of two people. This requirement must be justified based on mission operational requirements.

<u>Planning Factor:</u> Allocate 300 NSF.
<u>Justification:</u> A Technical Publications Library may be justified for technical components or divisions of an organization. Justification should address some or all of the following factors as appropriate:

- Mission or functions performed
- Function(s) supported (e.g., architecture, engineering, legal, other)
- Number and size of technical libraries required
- Other justification

131-8.2 **Special Purpose Space – Fitness, Locker, and Shower**. Fitness Rooms, Locker Rooms, and Shower Rooms may be authorized as described below:

131-8.2.1 **Fitness Room.** A Fitness Room is a space specifically designated for exercise, fitness training, and physical wellness activities. Fitness Rooms are only allowed in accordance with CNICINST 1710.1, whereby an organization has more than a 15 minute commute by vehicle to the nearest Morale Welfare and Recreation (MWR) Fitness Center or if active duty personnel are required to be on station and unable to leave for 18 hours at any given time. A fitness room must also have approval from the Installation Commanding Officer. If approved, calculate the requirement separately under Category Code 740 45 Fitness Room.

131-8.2.2 **Locker Room.** A Locker Room provides individual secured storage space for a change in clothing and other personal belongings. Lockers are authorized in support of 24-hour, multiple shift operations. Lockers may also be authorized in support of military physical training requirements at remote locations, without access to fitness centers.

- When lockers are authorized in support of 24-hour, multiple shift operations, one locker, for every 10 PN based on the largest shift, should be provided.
- When lockers are authorized in support of physical training requirements for military personnel at remote locations without access to fitness centers, one locker for every 20 military personnel assigned should be provided.
- If the locker room is required due to overseas operations, where personnel are not allowed to travel to and from the installation in uniform, 1 locker per military staff is allowed with Installation policy provided as justification.

Use the guidance above to determine the number of lockers required.

Planning Factor: Allocate 8 NSF/Locker each.
Justification: A Locker Room may be justified to support physical training requirements for military personnel, and may be applicable to certain personnel that do not occupy a dedicated workspace, such as security personnel or workstation operators working in shifts. Justification should address some or all of the following factors as appropriate:

- Mission or functions performed
- Type of operations supported (normal, shift, emergency)
- Physical Training (PT) requirements at remote locations
- Overseas Installation uniform policy
- Type of locker space required (e.g., shared, dedicated, other)
- Types of personnel that require locker space (e.g., military, civilian, or contractor personnel)

- Types of personnel that require locker space (e.g., military, civilian, or contractor personnel). Military personnel may require locker space in support of mandatory physical fitness requirements. Military, civilian and/or contractor personnel may require locker space in support of shift or emergency operations. Other (e.g. security) personnel that do not occupy a dedicated work space, may require locker space.
- Other justification

131-8.2.3 **Shower Room.** A Shower Room provides one or more shower stalls and is typically collocated with a locker room and/or bathroom. Showers are authorized in support of critical 24-hour, multiple shift operations. Showers may also be authorized in support of military physical training requirements at remote locations without access to fitness centers.

- When showers are authorized in support of 24-hour, multiple shift operations, one shower for every 10 PN, based on the largest shift, should be provided.
- When showers are authorized in support of physical training requirements for military personnel at remote locations without access to fitness centers, one shower for every 20 military personnel assigned should be provided.

In both cases, a ratio of 80/20 (male/female), should be used for planning purposes (ratio may go up as manning structure dictates, but not lower than 80/20). Use the guidance above to determine the number of showers required.

<u>Planning Factor:</u> Allocate 20 NSF/shower.
<u>Justification:</u> A Shower Room may be justified for commands with 24-hour, multiple shifts or remote operation requirements. If the organization is located on a large installation with access to fitness centers, shower rooms are generally not authorized except when 24-hour operations are required. Justification should address some or all of the following factors as appropriate:

- Mission or functions performed
- Type of operations supported (normal, shift, emergency)
- Physical Training (PT) requirements at remote locations
- Total number of showers required based on guidance above
- Military personnel may require showers in support of mandatory physical fitness requirements.
- Military, civilian and/or contractor personnel may require showers in support of shift or emergency operations.
- Other justification

131-8.3 **Special Purpose Space, Security**. Security spaces for C5ISR facilities include the Entry Control Area and the Special Security Office Suite.

131-8.3.1 Entry **Control Area.** This multifunctional area provides an assembly or holding area for visitors awaiting escort, badge and pass issue and verification, and is considered the central point for ingress and egress. For unclassified facilities, this area should consist of up to two workstations, for a two-person watch, and up to 100 NSF waiting area for personnel.

For general planning purposes, facilities that have classified spaces will require larger Entry Control Area that supports two stations for a two-person watch, a waiting area that accommodates mantraps, one unisex restroom, and a waiting area. Additionally, this area should include an additional 20 NSF per every 50 personnel assigned to the organization to accommodate the transit of personnel though the Entry Control Area.

Planning Factors: For each area within the Entry Control area, allocate as follows:

- Security Entry Control Area. Allocate 1 entry control area at 100 NSF plus 20 NSF per every 50 personnel in the command.
- Secure Visitor Waiting Area. Allocate one secure waiting area at 120 NSF.
- Security Watch Station. Allocate 64 NSF per workstation (max of 2 workstations).
- Security Unisex Bathroom. Allocate one unisex bathroom at 60 NSF, allowed only if command population exceeds 500 PN in a single facility.
- Security, Other Space. Allocated as needed for other security requirements (e.g. Security Systems Monitoring). Provide appropriate Engineering Evaluation and justification.

Justification: Justification should address some, or all, of the following factors as appropriate:

- Mission or functions performed
- Security requirements
- Other justification

Note: Refer to requirements for classified facilities requiring more stringent security requirements and specific design guidance such as: Open Storage Secret (OSS), Sensitive Compartmented Information Facility (SCIF), Special Access Program (SAP) and Top Secret/Sensitive Compartmented Information (TS/SCI).

131-8.3.2 **Special Security Officer (SSO) Suite**. The SSO Suite may be required depending on the following TS/SCI classification level:

- If SCIF or SAP facilities are present
- If personnel within the command maintain clearance levels

The SSO Suite is a multifunctional area containing, but not limited to, a reception area, indoctrination area, photography area, vault, and the SSO office space. The required area varies based on the size of the command. Large commands require additional space to handle a larger volume of personnel that

need to be processed. A minimum allowance of 350 NSF is provided for all commands up to 100 personnel. Medium and large sized commands are provided additional area as shown in Table 131-2.
Note: The SSO Suite provides office area for the SSO but does not provide office space for any additional staff. SSO staff should be provided cubicle space as a part of the open office calculation, see Section 131-6. Alternatively, since the SSO office is included in this calculation, a private office should not be included in the private office calculation for the SSO.

Table 131-2. SSO Suite Allowances

SSO Suite Command Size	Total Max NSF
Small (< 100 PN)	350
Med (100-500 PN)	450
Large (>500 PN)	600

131-9 **C5ISR OPERATIONS SPACE**. C5ISR Operations Spaces are areas that directly support the C5ISR mission. These areas are often contained within a separate secure space from the rest of the facility and may require entry control space and dedicated briefing/planning spaces to support highly classified missions. Although not every C5ISR facility will contain all the areas listed, the criteria are provided as a guide. An Engineering Evaluation should be used to determine the total quantity and type of workstations required and if briefing and/or planning rooms are required. Depending on the nature of the mission, the workstations may be calculated based on the number of systems, networks, or personnel assigned. These spaces are often configured by a Watch Center or Analysis Operations Workspace. See Table 131-3 for further clarification and application of the spaces.

131-9.1 **Watch Center.** The Watch Center generally operates on a shift system where personnel oversee multiple systems using multiple shifts to provide coverage up to 24 hours a day. This space may contain the following areas: Watch Floor (containing Kiosk Workstations, Watch Stander Workstations, and Watch Workstations), Command Viewing Area, and Briefing Rooms.

All allowances for Watch Floor components include circulation area to support unclassified and classified printers, shredders, display walls, and line of site area requirements (Watch Commander Workstations to the Watch Stander Workstations).

131-9.1.1 **Kiosk Workstations**. Kiosk Workstations are provided for standalone systems. The number of Kiosk Workstations required is based on the purpose and necessity of the workstations. This station is also presumed to be unmanned, but available to all personnel on watch for use as needed.

<u>Planning Factors</u>: Allocate 40 NSF (including circulation area) for each Kiosk Workstation that supports up to 2 networks.

Justification: Kiosk Workstations may be justified when stand-alone or separately monitored systems require separate Kiosk Workstations.

131-9.1.2 **Watch Stander Workstations.** The number of Watch Stander Workstations is based on the number of systems being monitored and the number of watch standers per shift.

Planning Factors: Allocate 60 NSF (including circulation area) for each Watch Stander Workstation that supports up to 4 networks.
Justification: Watch Stander Workstations may be provided for operational missions with watch teams.

131-9.1.3 **Watch Commander Workstation.** In addition to Watch Stander Workstations, there are also Watch Commander Workstations required for each group identified within the Watch Center. The number of Watch Commander Workstations required is based on the structure of the watch team oversight and may include a Watch Commander, Deputy Watch Commander, and under instruction Watch Commander Workstations.

Planning Factors: Allocate 100 NSF (including circulation area) for each Watch Commander Workstations that supports up to 4 networks and 4 peripherals (secure telephones and secure video conferencing systems).
Justification: Watch Commander Workstations may be provided for operations missions with watch teams.

131-9.1.4 **Command Viewing Area.** A viewing area immediately adjacent to the Watch Floor Area may be provided for the Commanding Officer and Chief of Staff, if justified. This area may be separated from the Watch Floor by a glass wall, and may be elevated to provide complete visual oversight of the Watch Floor and its associated status boards.

Planning Factors: Allocate 300 NSF for a Command Viewing Area separate from Watch Commander Workstations. This area is separated and elevated from the Watch Floor but has a direct line of site to the Watch Floor and all displays. This space must be justified based on mission requirement.
Justification: Command Viewing Area is authorized for Emergency Operations Centers (CCN 143 65) and Mission Operation Command and Control Facility (CCN 143 80). It may be provided for other category codes with additional justification to include specific mission requirement.

131-9.1.5 **Watch Center Briefing Room.** A separate briefing area with Video Teleconference (VTC) capability is also be required for planning and briefing purposes to ensure uninterrupted operations on the Watch C. This space is separate from general-purpose conferencing capabilities due to mission requirements that may require long-term utilization of the Briefing Rooms, (e.g exercises and/or crisis action response).

Planning Factors: Allocate 500 NSF for a 25-person Watch Center Briefing Room in support of watch operations. All systems and displays monitored on the Watch Floor should also be available in this space.
Justification: Watch Center Briefing Room is authorized for Emergency Operations Centers (CCN 143 65) and Mission Operation Command and Control Facility (CCN 143 80). It may be provided for other category codes with additional justification to include specific mission requirement.

131-9.2 **Analysis Operations.** Analysis Operations generally require use of multiple network systems including both unclassified and classified networks. All personnel assigned to Analysis Operations functions require a dedicated workspace that provides both privacy for independent work and teaming areas. The workstation sizing includes the workstation area and appropriate circulation areas within the Analysis Operations space to accommodate shredders, safes and a printer for each network.

131-9.2.1 Analysis **Workstations (up to 4 networks).** This workstation provides adequate space to support operations personnel that utilize up to 4 different networked systems. This workstation can accommodate multiple classified systems that require separation from both unclassified systems and other classified systems.

Planning Factors: Allocate 90 NSF (including circulation area) for each workstation required. These workstations should support up to 4 networks of which 2 or more are classified networks and require a separation of 3 feet from each other and from unclassified networks.
Justification: Analysis Workstations (up to 4 networks) may be provided when the operations mission require staff to access more than 2 networks.

131-9.2.2 **Analysis Workstations (greater than 4 networks).** This workstation provides adequate space to support operations and personnel that utilize more than 4 different networked systems. This workstation can accommodate multiple classified systems that require separation from both unclassified systems and other classified systems.

Planning Factors: Allocate 130 NSF (including circulation area) for each workstation required. These workstations should support more than 4 networks, of which 2 or more are classified networks and require a separation of 3 feet from each other and from unclassified networks.
Justification: Analysis Workstations (greater than 4 networks) may be provided when operations missions require staff to access more than 4 networks.

131-9.2.3 **Analysis Teaming Room.** An Analysis Teaming Room provides a crisis response operations area to support operations that may last multiple days and is separate from conference room allocations due to the potential long-term operations and classified requirements that are supported.

Note: This is not a substitute for a department conference room, which is already provided by the command conference room calculation and requires mission specific justification.

Planning Factors: Allocate 150 NSF for a 10 PN Analysis Teaming Room.
Justification: Justification should address some, or all, of the following factors as appropriate:

- Mission or functions performed
- Organization size if more than one Analysis Teaming Room for 10 PN is required
- Other justification

Table 131-3. Analysis and Watch Center Space Types

Workstation Type	NSF	Notes
Watch Center – Kiosk	40	This workstation is composed of a single monitor and keyboard assembly. It is generally used as a hoteling station, which supports non-resident access to systems or provides access to a network not accessible to all staff members. In a Watch Center, this Kiosk is not manned but is provided for access to systems not available at every Watch Stander's Workstation.
Watch Center – Watch Stander Workstation	60	This workstation is composed of multiple monitors and accesses up to 4 different networks or systems.
Watch Center –Watch Commander Workstation	100	This workstation has access to all networks and systems monitored by the Watch Standers and has access to at least 4 peripherals - such as secure telephones and secure video conferencing systems.
Command Viewing Area	300	The Command Viewing Area is separate from Watch Floor. This space must be justified based on mission requirement.
Watch Center - Briefing Room	500	The Watch Center Briefing Room supports planning and briefing functions and ensures uninterrupted operations on the Watch Floor.
Analysis Workstation (up to 4 networks)	90	Each workstation supports up to 4 networks of which 2 or more are classified networks and require a separation of 3 feet from each other and from unclassified networks.
Analysis Workstation (greater than 4 networks)	130	Each workstation supports greater than 4 networks of which 2 or more are classified networks and require a separation of 3 feet from each other and from unclassified networks.
Analysis Teaming Room	150	This space is separate from Conference Room allocations due to the longer-term operations that are supported. This room may be configured to host crisis response operations that may last multiple days. This space must be justified based on mission requirement. *Note: This room is not a substitute for a department conference room which is already provided by the Conference Room calculation.*

131-10 **MAINTENANCE SPACE**. Maintenance Spaces that are internal to commands providing communications and electronic equipment maintenance may be provided utilizing an Engineering Evaluation, architectural layout, or the allowances provided in Table 131-4. These areas are considered integral to the mission of the command. Communications equipment maintenance areas that support multiple commands are considered external maintenance activities and should be classified as Category Code 217 10 (Electronics and Communication Maintenance Shop). Appropriate justification should also be provided.

131-10.1. **Maintenance Area Basic Components**. Table 131-4 provides the maximum allowance for basic components found within a Maintenance Space. Quantity and composition of these components vary with mission, logistics support systems, and levels of required security; and will be determined by an on-site Engineering Evaluation.

Table 131-4. Maintenance Area Basic Component Maximum Allowances

Component	Max Allowance NSF per Component
Work Desks	60
Small Work Tables	10
Computer Tables	30
Workbenches-Full Access	96
Workbenches-Limited Access	60
Storage Lockers	18
Small Storage Lockers	10
Large Storage Shelves	40
Large Storage Cabinet	30
Parts Lockers	12
File Cabinets	10
Test Equipment Storage Cabinets	50
Test Equipment Carts	15
Bookshelves	10
Equipment Shelves	40
Equipment Staging	TBD(1)
Other (provide Description & Justification)	TBD(2)

(1) The Equipment staging allowance is provided for C5ISR missions that fabricate or maintain large C5ISR systems and require storage and staging areas. These areas are primarily associated with NIOC Fleet Electronic Support functions, but may be justified by other missions. An Engineering Evaluation and detailed justification to include the average size and quantity of equipment maintained must be provided.
(2) An "Other" allowance is provided for C5ISR missions that have a unique maintenance or storage requirement. An Engineering Evaluation and detailed justification must be provided.

131-11 **TRAINING SPACE**. Due to the nature of C5ISR functions, specialized Training Spaces are required. These activities support ongoing training for command and fleet personnel on the latest C5ISR systems, networks, or threats. Formal course programs such as those provided through Naval Education and Training Command (NETC) learning sites should be classified as Category Code 171 10 (Academic Instruction Building) or Category Code 171 20 (Applied Instruction Building), and justified accordingly. General military training is not considered valid justification for training spaces and should not be included in the analysis to provide C5ISR Training Spaces.

131-11.1. **Training Stations**. A maximum of 20 Training Stations is provided in a training room. This training space should support the training of system upgrades, the fielding of new hardware and software, and security classifications of equipment. Training rooms that require more than 20 Training Stations require specific course justification. The exact quantity and size of training areas is determined by an Engineering Evaluation aligned to internal operations requirements. Table 131-5 provides applicable classroom types and appropriate space allocations per student station.

Table 131-5. Classroom Type and Student Station Allowances

Classroom Type	Max Student Stations	Training Station NSF
General (standard chairs and desks)	20	22
Work Desk (with CPU, keyboard, monitor)	20	40
Workbench (larger work space to support maintenance training functions)	20	60

131-12 **EQUIPMENT SPACE**. This area is provided for communications and electronic equipment mounted in racks in support of the function(s) being performed by the organization. An Engineering Evaluation is required to determine the total quantity of equipment racks required to support each network or system.

Note: Allowances identified in the following sections provide guidelines for planning purposes when exact values are not available. In accordance with UFC 3-580-01 2-4.4.3 to support equipment refresh and future growth, rack calculations should provide 25 percent spare capacity in each rack, and one spare rack for every four utilized racks. This will provide a growth multiplier of 1.67 which affords adequate rack space to set up new or updated equipment prior to the decommissioning of older systems and future system growth.

131-12.1. **Data Center**. Computer systems and associated components, such as telecommunications and storage systems are housed in the Data Center. This definition excludes facilities exclusively devoted to communications and network equipment (e.g., telephone exchanges and telecommunications rooms).

Data Centers act as a centralized repository, either physical or virtual, for the storage, management, processing, and dissemination of communications and information systems. Depending on the function of the command, these spaces could be the consolidated communications and information server support for the Navy or Marine Corps activities or may support high-density legacy computing systems that are integral to an individual command and cannot be consolidated into remote Data Centers.

131-12.2. **Communications Security Material Area**. This area supports the management and storage of Communications Security (COMSEC) material such as the Electronic Key Management System (EKMS). This area must be segregated and meet security requirements for the highest level of COMSEC material stored and consists of rack mounted equipment and workstations for personnel. An Engineering Evaluation is required to determine the total quantity of equipment racks and workstations to support a Communications Security Material Area.

131-12.3. **Commercial Services Equipment**. Also referred to as the Cable Plant Area, this area is a specialized equipment area that provides a demarcation point separating the incoming commercial communications sources from the Data Center area. This area is separated to provide controlled access without encroachment on the mission operations. It requires two-layer access, racks and cabinets with telephone lines and switches. This space is only provided when Commercial Services Equipment areas are provided directly to the facility. An average allowance of 25 percent of the Data Center size is to be used for planning purposes.

131-12.4. **Network Distribution Area.** This area consists of server racks that provide cabling and switching areas that connect operations spaces to the server area. These areas are most often required for operations that maintain additional networks above and beyond the DON Mission Networks, which include but are not limited to: Next Generation Enterprise Network (NGEN), OCONUS Navy Enterprise Network (ONE-Net), Marine Corps Enterprise Network (MCEN) and Global Network Transport (PSNet); and/or include a large watch or analysis operation area where internal distribution areas may be required to provide adequate network management and flexibility. A maximum of 15 percent of the size of the Data Center should be used for planning purposes.

Planning Factors**:** Although the quantity and size of Equipment Spaces will vary depending on which specific Category Code is being evaluated, the analysis will conform to the following guidance:

- An Engineering Evaluation of the equipment systems is to be used to determine the total quantity of racks required. These racks are to be positioned on a theoretical 2 ft x 4 ft grid.
- Racks should be set up in rows with an equal number of racks.
- A continuous row, with a maximum of 25 ft in length, is allowed before a safety passage must be included between columns or racks.
- The safety passage shall be a minimum of 5 ft wide and aligned to permit direct paths through the rows of racks.

- Racks should be aligned so the front and rear of the rows face each other to create cold aisles (front) and hot aisles (rear) to maximize cooling efficiency.

- When multiple rows of racks are required, a maximum of 6 ft is to be provided between the faces of parallel rows of racks; a maximum of 5 ft is to be provided between the backs of parallel racks; and a minimum of 5 ft is established between the end of a row and a wall. An engineering evaluation and appropriate justification is required for increased distances.

- When support devices such as electrical panels, transformers; heating, ventilation, and air conditioning (HVAC) equipment; and/or large conduit runs are surface mounted to the inside of the walls of an equipment and communications areas containing racks, the clearance requirements outlined above are to be increased by the depth of the respective support device. See Figure 131-2.

- For less than 120 total racks, the recommended server room requirements are listed in Table 131-6. For a server room with less than 10 racks, multiply the total number of racks by 45 net square feet (NSF) per rack.

Table 131-6. Equipment Room Requirement by Total Racks

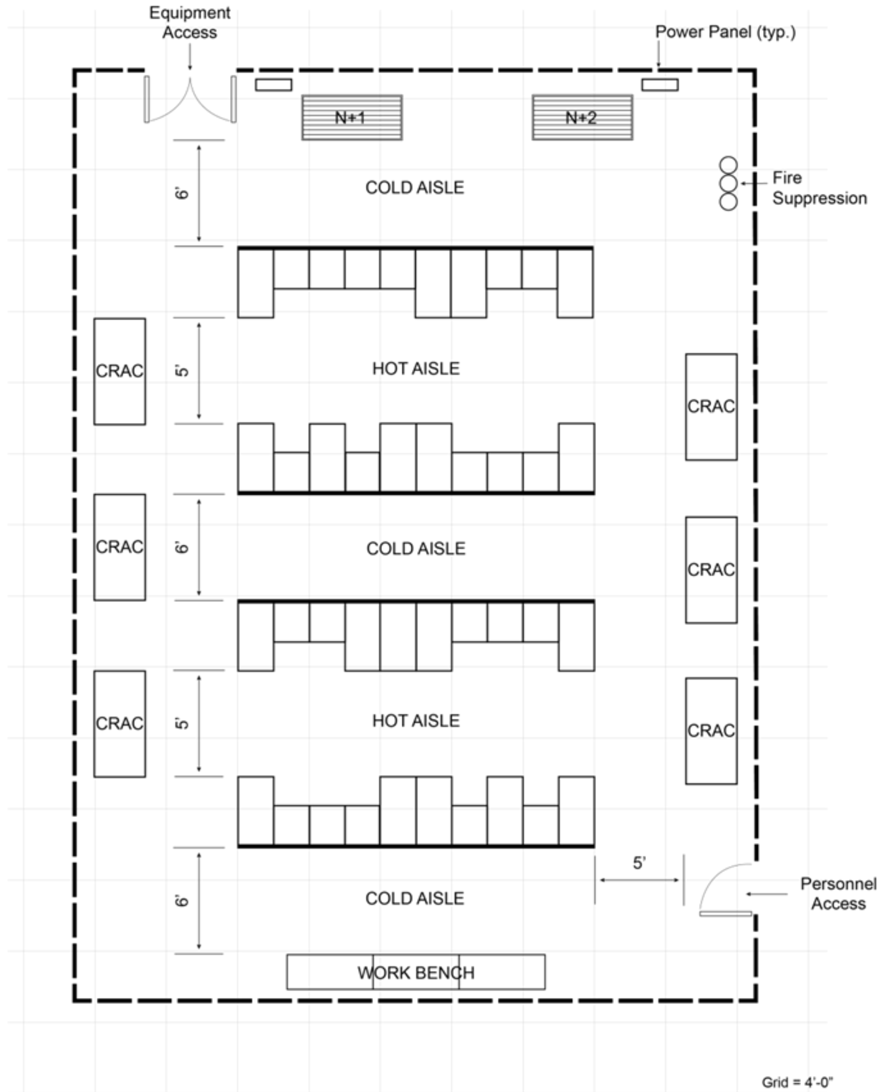
Total Racks	Total Equipment Rows	Total Columns of Equipment	Total Equipment Room (NSF)	NSF per rack
0-10	1	1	450	45
11-20	2	1	750	38
21-30	3	1	1020	34
31-40	4	1	1320	33
41-50	5	1	1590	32
51-60	6	1	1890	32
61-80	4	2	2420	30
81-100	5	2	2610	29
101-120	6	2	2915	29
>121	To be Determined by Engineering Analysis			28

- For Data Centers that have more than 120 racks, and in the absence of a specific layout, an overall maximum of 28 NSF per rack may be used which accommodates a maximum rack size of 24 inches wide by 48 inches deep.

- Depending on the type of cooling system and cable distribution system utilized in the Data Center, a false deck (also known as a raised floor) may be required. The depth of false deck shall be determined by the system design.

Figure 131-1. Typical Layout of Equipment Mounted in Racks

Note: Cooling redundancy within the Data Center is represented as N+1 and N+2; this represents



the total number of computer room air conditioner (CRAC) units required, plus one or two extra CRAC units for back up as required. The space requirement for the CRAC units is addressed within the Data Center Mechanical & Electrical Factor found in Section 131-9.

131-12.5. **C5ISR Equipment Room Factor.** To accommodate the significant electrical and mechanical requirements associated with facilities with large equipment rooms serving as a large Data Center or server space, this factor accounts for the additional spaces required to support the C5ISR equipment rooms that is above and beyond the requirement for the remainder of the facility. The type of mechanical systems used for cooling these types of rooms that support Data Centers and the level of redundancy required, as indicated by the Tier Level assigned to the Data Center, play key roles in the total footprint required. The Tier Level identified for a specific Data Center will dictate the redundancy requirements for each major system and is represented by N+1, N+2, 2N, etc. The general mechanical and electrical planning factor for Data Centers and server rooms with power densities of 5kW per rack or less, are provided in Table 131-7. Additionally, once the power requirement per Data Center rack exceeds 5 kW per rack, conventional computer room air condition (CRAC) unit based mechanical systems become ineffective to meet the demand of high-density servers. In cases where the power requirement exceeds 5kW per rack or the mission criticality of the facility requires a Tier IV facility, an Engineering Evaluation is required to determine the mechanical, electrical equipment, Uninterruptable Power Source (UPS) system, and emergency generator system requirements for the facility.

Table 131-7. C5ISR Equipment Factor

Tier Level	Data Center Factor
I	1.56
II	2.10
III	2.28

131-13 **IT LOGISTICS SUPPORT SPACE.** A dedicated shipping, receiving, laydown/IT staging, and storage areas may be provided to support the equipment and parts storage for a command. This area is in addition to any maintenance parts and consumables storage area requirements that may also exist.

Planning Factors**:** IT Logistics Support space may be provided using the following Planning Factors:

- This area should be capable of supporting a refresh rate of 18-24 months plus growth due to new systems. As a general rule, assume that the space can support at least 25 percent of the equipment room racks (volume) and 15 percent of CPUs and Monitors (volume) used within the command.

- The standard stacking height for this type of material is 6 feet. A factor of 0.327 NSF per cubic foot (CF) is applied to the volume of material to determine the required NSF for this functional area.

- To calculate the shipping, receiving, and laydown/IT staging area, multiply the total NSF of storage area by a factor of 2.

- Variance from the standard stacking height or larger storage operations should be classified as Category Code 143 77 (Operational Storage) or Category Code 217 77 (Electronics Spares and Miscellaneous Procured Items and Equipment) and justified accordingly.

131-14 **NET-TO-GROSS**. Unless otherwise noted, a net-to-gross conversion factor of 1.45 is used for all CCNs within the 131 Series. This factor applies to all spaces (including the Data Center) and is required to account for the additional electrical equipment, mechanical equipment, and architectural or structural elements required to directly support the electronic and communications systems and subsystems throughout the facility.

131-15 **ASSOCIATED INFRASTRUCTURE**. Additional power and HVAC system redundancy must be provided for Tier II and Tier III facilities. For Tier II facilities: N+1 generators, N+1 Uninterruptible Power Supply (UPS) system, and N+1 HVAC components must be provided for critical areas. For Tier III facilities: N+1 generators, 2N Uninterruptible Power Supply (UPS) systems, 2N HVAC, multiple distribution paths for critical power, multiple distribution paths for cooling, and elimination of single points of failure must be provide for critical areas. Fast action fire suppression systems that do not damage equipment are also required for critical areas in Tier III facilities.

131-16 **REQUIREMENTS SUMMARY**. The functional areas authorized by right (A), authorized with justification (J), or not authorized (N) for each the following Category Codes 131 15, 131 24, 131 35, 131 40, 131 50, 143 65, and 143 80 are shown in Table 131-8.

Table 131-8 Functional Areas Summary Matrix for Communications Buildings

Functional Area	Subspace	131 15	131 24	131 35	131 40	131 50	143 65	143 80
Administrative General Purpose	Private Office	A	A	A	J	A	J	A

	Specialized Equipment	J	J	A	A	A	N	J

Legend:
A – Approved without additional justification (based on the staffing and mission requirements)
J – Only approved with specific justification of mission requirements
N – Not approved for this category code
(1). This requirement should be captured under CCN 740 45. Fitness Rooms are only allowed in accordance with CNICINST 1710.1 where by the command is located more than a 15- minute commute by vehicle from the nearest Morale Welfare and Recreation (MWR) Fitness Center, or in cases where service members are required to be on station and unable to leave for 18 hours at any given time. The fitness room must also have approval from the Installation Commanding Officer.

131 10 CABLE HOUSE (SF)
FAC: 1311
BFR Required: Y

13110-1 **DEFINITION**. A Cable House is an unmanned facility that functions either as an external junction point for coaxial cables, or as mechanical space for support equipment associated with Extremely Low Frequency (ELF) and Very Low Frequency (VLF) antennas. As a junction point for coaxial cables, it permits significant changes of cable direction without exceeding the bending radius limit specified by the cable manufacturer and provides a physical access point for installation and maintenance of the cables that connect equipment areas and their respective antenna systems. The Cable House will be located within, or adjacent to, the antenna field containing ELF, VLF, Low Frequency (LF), and/or High Frequency (HF) antennas for shore to ship, and/or shore-to-shore communications.

13110-2 **FREQUENCIES.** For Very High Frequency (VHF) and/or Ultra High Frequency (UHF) systems in support of aircraft operations and tactical base support systems, a Cable House functions as a collection point that permits communication cables from multiple locations to be combined into a single path or trench that serves an single operational facility such as a Control Tower or Emergency Control Center.

13110-3 **ALLOWANCE.** Although no requirement calculations are associated with this category code, and requirements are based on an as needed basis, the maximum size of a Cable House should not exceed 27.87 GSM (300 NSF).

131 12 COMMUNICATIONS MAINTENANCE VAULT (EA)
FAC: 8927
BFR Required: N

13112-1 **DEFINITION.** A communications maintenance vault is a handhole, manhole, or confined space used for non-electrical splice and transport.

131 13 COMMUNICATIONS MAINTENANCE TUNNEL (LF)
FAC: 8931
BFR Required: N

13113-1 **DEFINITION.** This type of tunnel is an underground communications maintenance walkway accessible by personnel for communication line inspections, upgrades, and repairs below ground.

131 15 COMMUNICATIONS / INFORMATION / INTELLIGENCE BLDG. (SF)
FAC: 1311
BFR Required: Y

13115-1 **DEFINITION**. Communications, Information, or Intelligence Facilities are responsible for information processing, delivery of information services, and information/data storage. These facilities ultimately support the Joint Information Environment (JIE). The JIE/ identifies several different types of functional nodes: computing nodes (e.g. Data Centers), communication nodes (e.g. Network Gateways), and operations nodes (e.g. Enterprise Operation Centers). These nodes should be viewed as functional enclaves, not separate facilities; in fact, multiple nodes and node types may be present in a single physical facility. For further understanding of the different functional nodes refer to *DoD Information Enterprise Architecture, Data Center Reference Architecture Version 1.10 Final April 25, 2014 Table 1 and Table 2*.

13115-2 **FUNCTION TYPES.** Table 13115-1 provides a list of typical functions and sample commands that apply to this category code.

Table 13115-1. Function Types and Sample Organizations

Function Type	Sample Organizations
Data Center or Server Center (Only)	Any
Communications Center	Naval Computer and Telecommunications Station (NCTS), Naval Computer and Telecommunications Master Area Station (NCTAMS), etc.
Weather Center	Fleet Weather Centers (FWC), Joint Typhoon Warning Center (JTWC), etc.
Information and Intelligence Commands	NIOC, Navy Information Operations Division (NIOD), Navy Cyber Defense Operations Command (NCDOC), Navy Information Warfighting Development Center (NIWDC), Naval Network Warfare Command (NNWC), etc.

13115-2 **FUNCTION AREAS.** A Communications, Information, or Intelligence Facility may contain the functional areas shown in Table 13115-2. This facility will be supported by an Uninterruptible Power Supply (UPS) system and emergency generator system. Please refer to the guidelines provided in the introduction of 131-series Category Codes for C5ISR buildings to calculate the requirement for each functional area. Per section 131-14, the authorized **net-to-gross** factor is 1.45.

Table 13115-2. Communications, Information, or Intelligence Facility Functional Areas

Functional Area	Subspace	131 15
Administrative General Purpose	Private Office	A
	Open Office (Cubicle)	A
Special Purpose Space Basic	Admin Support	A
	Break Room	A
	Break Room Kitchen	J
	Classified Vault	J
	Conference Rooms/VTC	A
	Duty/Bunk Room	J
	Mail Room	J
	Technical Publications Area	J
Special Purpose Space Fitness/Locker/ Shower	Fitness Room[1]	J
	Locker Room	J
	Shower Room	J
Special Purpose Space Security	Quarterdeck/Entry Control	A
	Special Security Office	J
Operations Space	Watch Center	A
	Analysis Operations	A
Maintenance Space	Maintenance	J
Training Space	Training	J
IT Logistics Support Space	IT Logistics Support Space	A
Equipment Space	Data Center/Server	A
	Commercial Services Equipment	A
	Communications Security Material Area	A
	Network Distribution Area	A
	Specialized Equipment	J

Legend:
A – Approved without additional justification (based on the staffing and mission requirements)
J – Only approved with specific justification of mission requirements
(1). This requirement should be captured under CCN 740 45. Fitness Rooms are only allowed in accordance with CNICINST 1710.1 where by the command is located more than a 15- minute commute by vehicle from the nearest Morale Welfare and Recreation (MWR) Fitness Center, or in cases where service members are required to be on station and unable to leave for 18 hours at any given time. The fitness room must also have approval from the Installation Commanding Officer.

13115-4 **SPACE DISTRIBUTION.** A Communications, Information, or Intelligence Facility will generally consist of the functional space types shown in Table 13115-3: General Administrative and Special Purpose Space, C5ISR Operations (watch/analysis) Space, Maintenance Space, Training Space, Equipment Space (racked equipment area, often called a Data Center or server area), and IT Logistics Space. The percentages shown in Table 13115-3 provide a guide of the general size of these areas in relation to the overall facility. For instance, a stand-alone Data Center would likely be made up of 75 percent Equipment Space; 20 percent of General Administrative and Special Purpose Space, C5ISR Operations Space, Maintenance Space, and Training Space; and 5 percent IT Logistics Space.

Table 13115-3 Function Type and Space Type Distribution

Function Type	General Admin & Special Purpose	C5ISR Operations	Maintenance	Training	Equipment	IT Logistics
Data Center/Server Space (Only)	20%				75%	5%
Communications Center	25%	15%	5%	5%	45%	5%
Weather Center	34%	40%	n/a	1%	20%	5%
Information Analysis Center	30%	35%	n/a	5%	20%	5%

13115-4 **BUILDING BLOCKS.** Figure 13115-1 provides a diagram demonstrating a summary of the applicable spaces, appropriate allocation factors, and the special relationship for Communications, Information, and/or Intelligence Facilities.

- Determine CF of storage requirement NSF = 0.327 × CF

EQUIPMENT SPACE

Communications Security Material Area
- Determine # of Racks & Workstations. See Table 131-6
- 1.67 Factor for refresh/growth

Data Center
See Section 131-12.1
- Determine # of Racks
- Multiply 1.67 refresh / growth factor
- If total racks required less than 120 refer to Table 131-6 for total NSF
- If over 120 racks, use 28 NSF / Rack
- See Figure 131-1

Commercial Services Equipment / Cable Plant
- 25% × Data Center/Server NSF

Network Distribution
- 15% × Data Center/Server NSF

Apply Equipment Factor Based on Tier Level – Table 131-7

Apply NTG Factor of 1.45 – See Section 131-14

◆ Justification Required

131 17 COMMUNICATIONS MAINTENANCE CHANNEL (LF)
FAC: 8932
BFR Required: N

13117-1 **DEFINITION.** This type of facility is an underground communications maintenance channel accessible via ground level access panels to allow inspections, upgrades, and repairs to communication lines below ground.

131 20 COMMUNICATIONS RELAY FACILITY (SF)
FAC: 1311
BFR Required: Y

13120-1 **DEFINITION**. A Communications Relay Facility is an unmanned facility or enclosure associated with the operation of Microwave (MW) communications systems. It contains rack mounted communications receiving, amplification, and transmitting equipment, along with an Uninterruptible Power Source (UPS) system and an emergency generator system. A Communications Relay Facility can be a permanent facility, but unless location and atmospheric conditions dictate otherwise, it is normally Class III Property. It is located at the base of the antenna tower that contains the associated microwave dishes. The size of the facility or enclosure is dependent on the number of microwave links be served by the antenna tower and by the quantity of commercial equipment (cell phone) systems that DON has authorized. See Table 13120-1.

Table 13120-1 Allowances

Facility Size	Description	Allowance
Small Facility	Two Microwave Links with no commercial tenants	16 GSM (172 GSF)
Medium Facility	Three or more Microwave Links with no commercial tenants	20 GSM (215 GSF)
Large Facility	Three or more Microwave Links with multiple commercial tenants	22 GSM (237 GSF)

131 22 VHF/UHF COMMUNICATIONS FACILITY (SF)
FAC: 1311
BFR Required: Y

13122-1 **DEFINITION**. A VHF/UHF Communications Facility can either be contained within a permanent facility or within Class III Property. It contains a limited amount of rack mounted communications receiving, amplification, and transmitting equipment associated with Airfield Operations, Security and Fire Operations, or a tactical Communications system integral to unique special operations. A small Uninterruptible Power Source (UPS) system and an emergency generator system support a VHF/UHF Communications Facility.

13122-2 **Allowance.** Although no requirement calculations are associated with this Category Code, and requirements are based on an as needed basis, the maximum size of a VHF/UHF Communications Facility should not exceed 41.81 GSM (450 NSF).

131 24 SATELLITE COMMUNICATIONS FACILITY (SF)
FAC: 1312
BFR Required: Y

13124-1 **DEFINITION**. Satellite Communications Facility is often referred to as a 'gateway facility' supporting Worldwide, Regional, and Area of Responsibility (AOR) communications. It contains office and support requirements, equipment and operations areas, maintenance and training areas, and limited storage areas for ready-to-issue communications systems and subsystems required for the reception, processing, routing, and dissemination of incoming and outgoing communications traffic.

13124-2 **ANTENNAS.** The receiving/transmitting antennas systems associated with this facility are directional in nature. Antennas that are in excess of 3 meters in diameter are mounted, in most cases, on a dedicated tower or support structure that is integral to the antenna. In selected instances, the functional equipment associated with a Satellite Communications Facility may be located within a Communications, Information, Or Intelligence Facility (131 15), and thus this Category Code should be used only where 'stand-alone' facilities are being evaluated.

13124-2 **FUNCTIONAL AREAS.** A Satellite Communications Facility may contain the functional areas shown in Table 13124-1. This facility will be supported by an Uninterruptible Power Support (UPS) system and emergency generator system. Please refer to the guidelines provided in the introduction of 131-series Category Codes for C5ISR buildings to calculate the requirement for each functional area. Per section 131-14, the authorized **net-to-gross** factor is 1.45.

13124-3 **BUILDING BLOCKS.** Figure 13124-1 provides a diagram demonstrating a summary of the applicable spaces, appropriate allocation factors, and the special relationship for Satellite Communications Facilities.

Table 13124-1. Satellite Communications Facility Functional Areas

Functional Area	Subspace	131 24

	Commercial Services Equipment	A
	Communications Security Material Area	A
	Network Distribution Area	A
	Specialized Equipment	J

Legend:
A – Approved without additional justification (based on the staffing and mission requirements)
J – Only approved with specific justification of mission requirements
(1). This requirement should be captured under CCN 740 45. Fitness Rooms are only allowed in accordance with CNICINST 1710.1 where by the command is located more than a 15- minute commute by vehicle from the nearest Morale Welfare and Recreation (MWR) Fitness Center, or in cases where service members are required to be on station and unable to leave for 18 hours at any given time. The fitness room must also have approval from the Installation Commanding Officer.

Apply NTG Factor of 1.45 – See Section 131-14

◆J Justification Required

131 25 TELEMETRY BUILDING (SF)
FAC: 1311
BFR Required: Y

13125-1 **DEFINITION**. A Telemetry Building is an extremely specialized and unique facility specifically designed for the tracking of missiles and satellites. It can be a permanent facility or configured as a mobile asset within Class III property. As a permanent facility, it will contain equipment areas for transmitters, receivers, and recorders and personnel areas for operators and staff support elements. The size of equipment areas will be dependent upon the quantity of mission specific arrays of tracking antennas and communications interfaces. Personnel, support, maintenance, and logistics support requirements will be dependent on the infrastructure of the Shore Activity with which the Telemetry Building is collocated and will require an Engineering Analysis. If configured within Class III property, a maximum of three fifty-foot by twelve-foot vans are standard for the support of equipment, operations, and logistics spaces.

131 30 HELIX HOUSE (SF)
FAC: 1311
BFR Required: Y

13130-1 **DEFINITION**. A Helix House contains a Helical Coil and associated antenna tuning devices directly associated with, and integral to, the transmission of Low Frequency (LF), Very Low Frequency (VLF), and Extremely Low Frequency (ELF) communications.

13130-2 It is an unmanned facility, and is located within an antenna field associated with a Transmitter Building (Category Code 131 50). It is connected to a Transmitter Building by a cable trench, which contains power and signal cables. The Helix house is positioned adjacent to its respective antenna system.

13130-3 The size of a Helix House is totally dependent on the output power and operating frequency of the LF, VLF, or ELF transmitter located within the Transmitter Building. Although some AN/FRT-72 LF transmitters remain in the DON inventory, the AN/FRT-95 is the current generation of LF transmitters. An allowance of 342nsm (3,681nsf) is provided for a Helix House in support of the AN/FRT-95. VLF and ELF transmitters, which operate in the less than 30Kc range, are special manufacture units. Mission and location of the Transmitter Building, and coverage within a specific Area of Operation determine frequency and power. An allowance of 439nsm (4,725nsf) is normally provided for a Helix House in support of VLF and ELF transmitters.

131 35 RECEIVER BUILDING (SF)
FAC: 1311
BFR Required: Y

13135-1 **DEFINITION**. A Receiver Building supports a 24-hour a day, 7-day a week operations requirement for shore to shore and ship to shore administrative, tactical, and strategic High Frequency (HF) communications. This building may also be used to support transceivers, which are capable of both receiving and transmitting. *Note: if the transmitting only equipment is required, please refer to category code 131 50 Transmitter Building.*

The Receiver Building contains an equipment area with racked receivers and interface equipment, a maintenance area, and a storage area containing a small quantity of spare parts. A small personnel support space containing a toilet facility and break area is considered part of the facility. An Uninterruptible Power Source (UPS) system and an emergency generator system support a Receiver Building.

13135-2 **LOCATION.** The Receiver Building is physically located near the center of the receive antenna field, and it is connected to all antennas via direct buried coaxial cables. Location requirements for a Receiver Building and its associated antenna field with respect to possible areas of interference are provided in Table 13135-1 below.

Table 13135-1. Communications Distance Separations

From any High Frequency Antenna at a Receiver Site to:	
Navy Very Low Frequency (VLF) Transmitter Buildings	25 miles
Navy Low Frequency and High Frequency Transmitter Buildings	15 miles
Transmitting Facilities Not Under Navy Control	5 miles
Runways and Guide Paths Aeronautical Receivers	1,500 feet
General Communications Receivers	5 miles
Main Highways (hourly traffic count over 1,200 vehicles)	3,000 feet
Overhead High Tension Power Lines to include Receiver Station Feeders less than 100KV	1,000 feet
Overhead High Tension Power Lines to include Receiver Station Feeders over 100KV	2 miles
Residential Areas Not Under Navy Control	1 mile

From any High Frequency Antenna at a Receiver Site to:	
Light Industry	3 miles
Heavy Industry	5 miles
Primary Power Plants	5 miles

13135-3 **FUNCTIONAL AREAS.** A Receiver Building may contain the functional areas shown in Table 13135-2. In instances where the Receiver Building is located in an isolated location, and thus not readily supported by the staff of the associated Communications, Information, or Intelligence Facility (131 15), additional personnel support functions may be justified with appropriate documentation. These areas may include Conference Room, Break Room Kitchen, Locker Rooms, Shower Rooms, Duty/Bunk Rooms etc. This facility may also be supported by an Uninterruptible Power Support (UPS) system and emergency generator system. Please refer to the guidelines provided in the introduction of 131-series Category Codes for C5ISR buildings to calculate the requirement for each functional area. Per section 131-14, the authorized **net-to-gross** factor is 1.45.

See Table 13135-2 for additional spaces allowed with justification. In some instances, functions performed by a Receiver Building are an integral part of a Communications, Information, or Intelligence Facility (131-15), thus <u>this Category Code should be used only where 'stand-alone' facilities are being evaluated</u>.

Table 13135-2. Receiver Building Functional Areas

◆J Justification Required

131 40 TELECOMMUNICATIONS DISTRIBUTION FACILITY (SF)
FAC: 1311
BFR Required: Y

13140-1 **DEFINITION**. A Telecommunications Distribution Facility is a dedicated facility that supports the distribution of telecommunications systems across Navy Installations and Regions. This facility is often unmanned or has limited space for support staff. This type of facility contains the telecommunications switches and distribution frames. It may also contain the incoming demarcation point for commercial services or support the outside cable plant services for an installation or a special area. The facility is supported by Uninterruptible Power Source (UPS) systems and emergency generator systems, and may use a combination of hard wire, microwave, and satellite system to interface with the commercial providers. The receiving/transmitting antennas are normally commercial units and are directional in nature. The antennas are mounted on a dedicated tower or support structure immediately adjacent to the equipment they support. In many instances the telecommunications systems and their respective antennas are an integral part of a Communications, Information, or Intelligence Facility (Category Code 131 15). This Category Code (131 40) should only be used where ‘stand-alone’ facilities are being evaluated.

13140-2 **FUNCTIONAL AREAS.** A Telecommunications Distribution Facility may contain the functional areas shown in Table 13140-1. This facility may be supported by an Uninterruptible Power Supply (UPS) system and emergency generator system. Please refer to the guidelines provided in the introduction of 131-series Category Codes for C5ISR buildings to calculate the requirement for each functional area. Per section 131-14, the authorized **net-to-gross** factor is 1.45.

13140-3 **BUILDING BLOCKS.** Figure 13140-1 provides a diagram demonstrating a summary of the applicable spaces, appropriate allocation factors, and the special relationships for Telecommunications Distribution Facility.

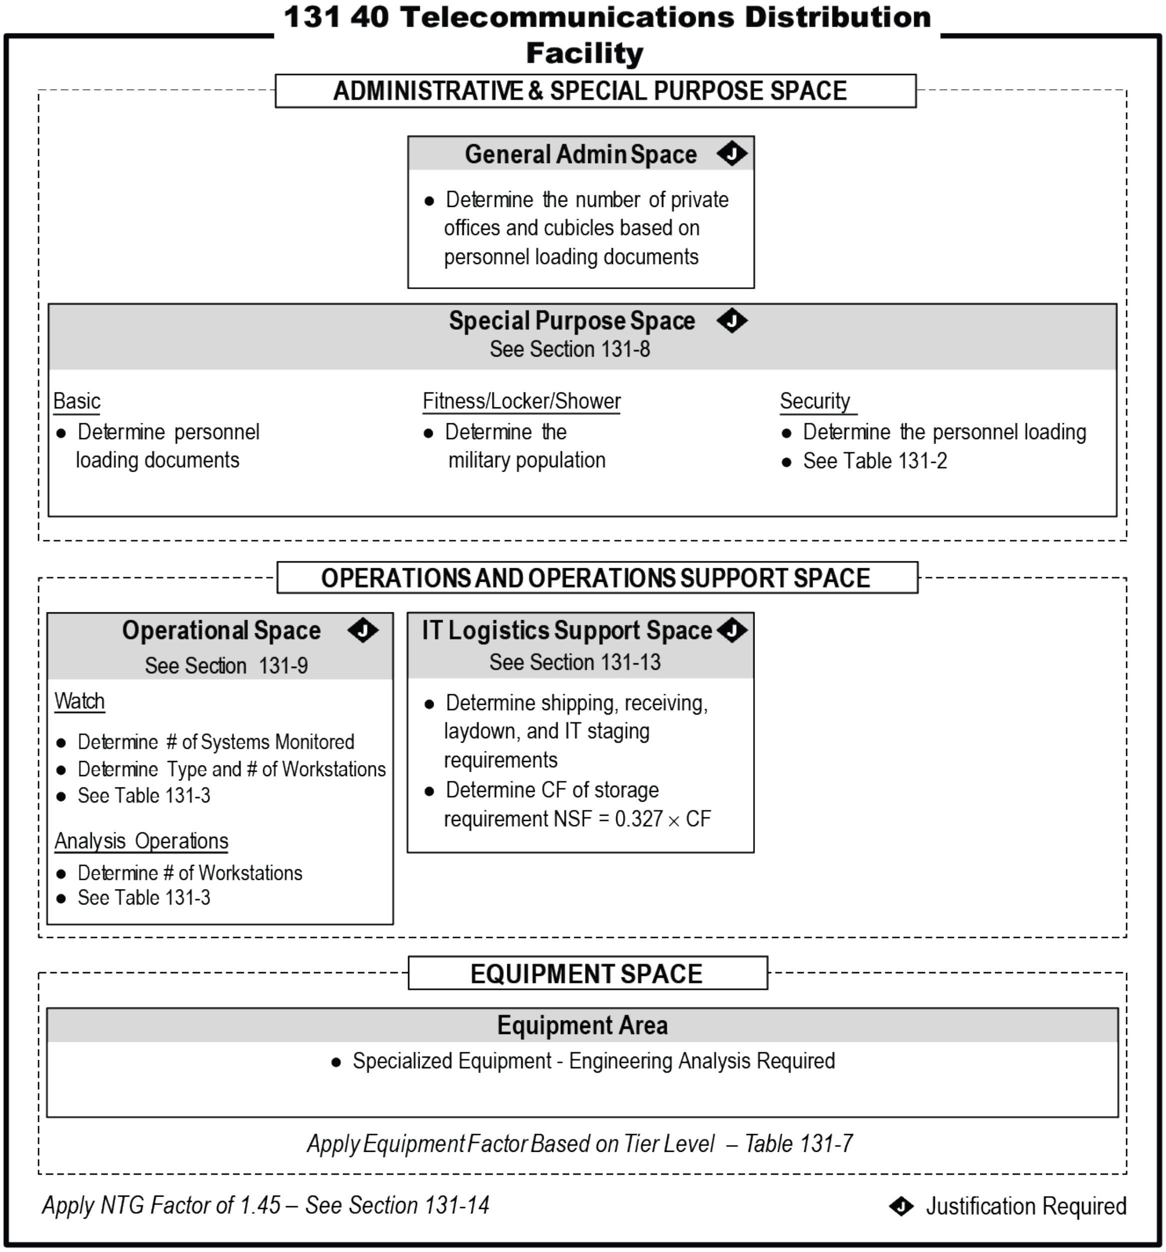
Legend:
A – Approved without additional justification (based on the staffing and mission requirements)
J – Only approved with specific justification of mission requirements

Figure 13140-1. Telecommunications Distribution Facility Building Blocks Diagram



131 42 AUTOMATIC COMMUNICATIONS SWITCHING CENTER (SF)
FAC: 1311
BFR Required: Y

13142-1 An Automatic-Communications Switching Center identifies a facility that contains the Telephone Switch and its immediate support infrastructure. Although it is possible that some isolated examples of this configuration may still exist, the current communications architecture for this equipment places it within a Telecommunications Distribution Facility (Category Code 131 40).

Use for Inventory Purposes only.

131 45 TERMINAL EQUIPMENT BUILDING (SF)
FAC: 1311
BFR Required: Y

13145-1 This facility originally, and currently to a minor extent, performs as a single-function building that is in direct support of High Frequency (HF) or Low Frequency (LF) communications. It provides an intermediate connection point that is required technically to support communications configuration or is required as the result of waveguide or cable loss.

13145-2 A Terminal Equipment Building is also the designation currently given to a new generation of facilities associated with satellite equipment and the selected equipment in support of the satellite antenna. It is commonly referred to as an equipment shelter and can be located within the pedestal base of the antenna or in a separate enclosure immediately adjacent to the base of the antenna. This new generation facility is Class III property in most instances. Although the antenna is classified as a structure, this Category Code is appropriate for 'stand-alone' configurations.

131 50 TRANSMITTER BUILDING (SF)
FAC: 1311
BFR Required: Y

13150-1 **DEFINITION**. A Transmitter Building supports a 24 hour a day, 7 day a week operations requirement for shore to shore, and shore to ship administrative, tactical, and strategic High Frequency (HF), Low Frequency (LF), and Very Low Frequency (VLF) communications. It contains an equipment area with stand-alone and racked transmitters, as well as their associated interface equipment, a maintenance area, and a storage area containing a small quantity of spare parts. A small personnel support space containing a toilet facility and break area is considered part of the facility. The Transmitter Building is physically located near the center of the transmit antenna field and is connected to all antennas via direct buried coaxial cables for HF applications, or by a dedicated power and signal trench for LF and VLF applications.

Due to the variable nature of transmitter equipment, an Engineering Evaluation is required to calculate the equipment and operations space requirements.

13150-2 **DISTANCE SEPARATIONS.** A specific Transmitter Building will support one of the following: HF only, HF and LF, VLF only, or ELF only operations. Location requirements for a Transmitter Building and its associated antenna field, with respect to possible areas of interference, are provided in Table 13150-1 below. An Uninterruptible Power Source (UPS) system and an emergency generator system support a Transmitter Building.

Table 13150-1. Communications Distance Separations

From the Nearest High Frequency, HF/LF/VLF/ELF Antenna Supporting a Transmitter Site to:	
Transmitting Facilities Not Under Navy Control	5 miles
Runways and Guide Paths Aeronautical Transmitters	1,500 feet
Main Highways (hourly traffic count over 1,200 vehicles)	1,000 feet
Overhead High Tension Power Lines to include transmitter station feeders	1,000 feet

13150-3 **FUNCTIONAL AREAS.** A Transmitter Building may contain the functional areas shown in Table 13150-2. This facility may be supported by an Uninterruptible Power Supply (UPS) system and emergency generator system. To calculate the area required to support the specialized equipment associated with each type of transmitter, an Engineering Evaluation is required. Specific requirements may be classified; therefore proper security clearance is required to obtain the information.

Please refer to the guidelines provided in the introduction of 131-series Category Codes for C5ISR buildings for additional information to calculate the requirement for other standard functional areas. Per section 131-14, the authorized **net-to-gross** factor is 1.45.

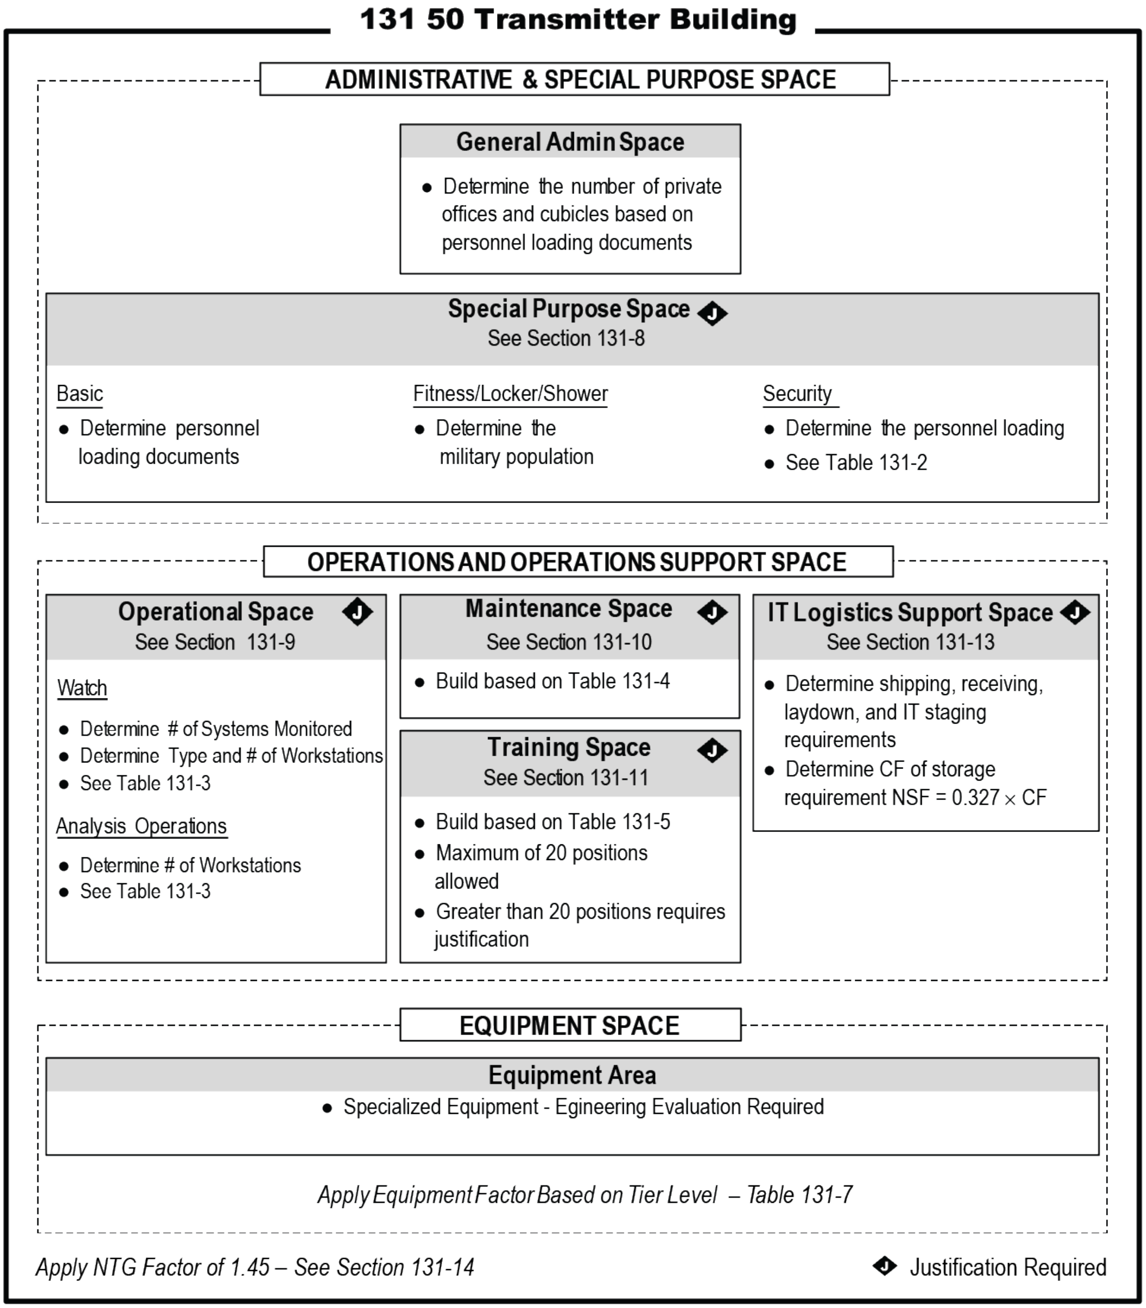
A – Approved without additional justification (based on the staffing and mission requirements)
J – Only approved with specific justification of mission requirements
(1). This requirement should be captured under CCN 740 45. Fitness Rooms are only allowed in accordance with CNICINST 1710.1 where by the command is located more than a 15- minute commute by vehicle from the nearest Morale Welfare and Recreation (MWR) Fitness Center, or in cases where service members are required to be on station and unable to leave for 18 hours at any given time. The fitness room must also have approval from the Installation Commanding Officer.

Figure 13150-1. Transmitter Building Building Blocks Diagram



131 55 CIRCULARLY DISPOSED ANTENNA ARRAY BUILDING (SF)
FAC: 1311
BFR Required: N

13155-1 **DEFINITION.** A Circularly Disposed Antenna Array (CDAA) Building is a High Frequency Direction Finding (HFDF) facility that contains the tuning and receiving equipment associated with the AN/FRD-10 antenna. Category Code 131 55 is specific to Naval Security Group Activity (NSGA) locations. It is a technical and operational requirement that the CDAA building be located within the center of the AN/FRD-10 array. The AN/FRD-10, commonly referred to as a Wullenweber antenna, requires specific siting criteria as outlined in NSGINST 2450.1. The CDAA building also contains staff and personnel support spaces, maintenance and training spaces, and storage spaces.

13155-2 The Department of Navy no longer maintains a HFDF mission. As a result, Circularly Disposed Antenna Array Buildings contained within inventory are in the process of being demolished, or are have been converted for use in other category codes. Category Code 131 55 is provided for information purposes only.

131 56 DIRECTION FINDER BUILDING (SF)
FAC: 1311
BFR Required: N

13156-1 **DEFINITION**. A Direction Finder Building is a High Frequency Direction Finding (HFDF) facility that contains the tuning and receiving equipment associated with the AN/FRD-13 antennas. It is associated with functions performed by various DON Communications, Intelligence, and Operational missions. Unlike the CDAA (131-55), the Direction Finder Building is not located within the center of the AN/FRD-13 array, and it contains very limited personnel support space, maintenance space, and storage space. The AN/FRD-13 requires specific siting criteria as outlined in NSGINST 2450.1.

13156-2 DON no longer maintains a HFDF mission. As a result, Direction Finder Buildings contained within inventory are in the process of being demolished, or are have been converted for use in other category codes. Category Code 131 56 is provided for information purposes only and should not be used.

131 60 MILITARY AFFILIATE RADIO STATION (MARS) (SF)
FAC: 1311
BFR Required: N

13160-1 This category code is for inventory purposes only until the function is either absorbed into Category Code 131 15 or is eliminated completely and facilities are reassigned to other functions.

131 65 COMMUNICATIONS ANALYSIS FACILITY (SF) [DELETE]
FAC: 1311
BFR Required: Y

13165-1 This category is deleted. All future requirements should be reassigned and revised to Category Code 13115 “Communications, Information, or Intelligence Analysis Facility.”

132 COMMUNICATIONS-OTHER THAN BUILDINGS

132-1 This facility group encompasses radio antennas, switching stations and public address systems. The antennas required are a function of the number and type of radio circuits to be incorporated in the communications system.

132 10 ANTENNA-COMMUNICATIONS (EA)
FAC: 1321
BFR Required: N

13210-1 Planning for communications antennas involves consideration of three basic aspects: siting, selection of types, and structures for support.

13210-2 Requirements for siting, arrangements, types of antennas, circuitry, and other aspects, are determined by the Space and Warfare Systems Command (SPAWAR) and the office having support responsibility. The antenna types and their heights are:

Uniform lattice (guyed)	to 1500 feet
Uniform lattice (self-supporting)	to 600 feet
Pole	to 220 feet

13210-3 Vertical radiators make use of the tower structure as the radiator. The SPAWAR Systems Command provides the electronic specifications for vertical radiator antennas. The Naval Facilities Engineering Command provides the structural design.

13210-4 The majority of antenna installations used at radio communications facilities are tower/pole and wire construction. These are:

- Antenna system supported between self-supporting or guyed towers, transmitting/receiving
- Vertical radiator, transmitting only
- Rhombic, transmitting/receiving

- Tilted folded doublet transmitting/receiving
- Vee, transmitting/receiving
- Horizontal LF, transmitting/receiving
- Vertical doublet transmitting/receiving
- Horizontal parasitic doublet, transmitting/receiving
- Horizontal two-wire doublet, transmitting only
- Horizontal three-wire doublet, transmitting only
- Various UHF and VHF antennas
- Rotatable log periodic, transmitting/receiving (tower supported)
- Horizontal log periodic, transmitting/receiving (tower supported)
- Vertical log periodic, transmitting/receiving (tower supported)
- Conical monopole, transmitting/receiving (tower supported)
- Discone, transmitting/receiving
- Inverted cone, transmitting/receiving
- Wire grid lens, receiving only
- Wullenweber, receiving only (Code 132 55)
- High take off angle, transmitting/receiving (tower supported)
- Hermes loop array, receiving only
- Umbrella top-loaded monopole, transmitting (tower supported)
- Inverted-L, transmitting (tower supported)
- T-antennas, transmitting (tower supported)
- Various VLF antennas, transmitting/receiving

132 50 PUBLIC ADDRESS SYSTEM - OUTDOOR (EA)
FAC: 1321
BFR Required: N

Design Criteria: UFC 4-021-01, Design and O&M: Mass Notification Systems

13250-1 Outdoor public address systems will be planned and installed to meet individual needs of a facility.

132 55 CIRCULARLY DISPOSED ANTENNA ARRAY (WULLENWEBER) (EA)
FAC: 1321
BFR Required: N

13255-1 This antenna array is generally planned in conjunction with a Circularly Disposed Antenna Array Building. See Category Code 131 55 for additional guidance.

13255-2 The Department of Navy no longer maintains a HFDF mission. As a result, Circularly Disposed Antenna Arrays contained within inventory are in the process of being demolished or have been converted for use in other category codes. Category Code 132 55 is provided for information purposes only and should not be used.

133 NAVIGATION AND TRAFFIC AIDS – BUILDINGS (NON-SHIP)

133-1 **DESCRIPTION.** Basic Category Code group 133 applies to those Air Traffic Control Facilities (ATCFs) that contain the equipment, devices, and personnel responsible for air traffic control and navigational aids. This group discusses complete air traffic control classes and systems, which are defined below. Other elements of air traffic control and navigation aids that are remotely located around the airfield can be found in the 133, 134 and 135 series of Category Codes.

133-1.1 **Air Traffic Control Facility (ATCF).** The ATCF includes personnel and equipment associated with the operation of the following:

- Control Tower
- Approach Control
- Terminal Radar
- En Route Radar
- Flight Planning
- Air Navigational Aids

The standard ATCF serves as the foundation for all other ATCF planning standards by establishing a common baseline for ACTF resource determinations. Addressed within the standard are the needs for ATCF classification, the concepts used for standard development, descriptions of the services provided by ATCFs and definitions of the resulting six ATCF classes.

133-1.2 **ATCF Classification Scheme.** The approach to standard development, by definition, is the process of arranging items into groups based on the systematic division of common traits. The underlying principle for establishing a classification scheme is that each resultant class must encompass common elements. Since Navy Air Traffic Control (ATC) is one of a large number of closely interrelated elements collectively supporting the naval aviation mission, the classification scheme must identify all elements that bear upon the performance of ATC and analyze each for commonality across the spectrum of ATCFs. The ATCF classification scheme, by segregating ATC services into groups, establishes six major classes as shown in Table 133-1.

Table 133-1 ATCF Classification Scheme

Class	Description
Class I	Flight Planning Facility
Class II	Control Tower Facility

Class	Description
Class III	Control Tower with Ground Control Approach (GCA) Facility (Class III ATCFs can be further identified by GCA pattern control authority, i.e., with or without)
Class IV	Approach Control Facility
Class V	Joint Control Facility
Class VI	Fleet Area Control and Surveillance Facility

133-1.3 **ATC Services.** ATC services include five distinct directives that are provided slightly or in combination at every ATCF:

133-1.3.1 **Flight Assistance Service.** The planning of a flight is the first element of an air operation. Safety of flight is dependent on thorough flight planning covering itinerary, times, and weather. Flight assistance services interface the flight crew with the air traffic control system and encompass work, space, personnel, equipment, and information related to:

- Planning a flight.
- Introducing the plan into the ATC system.

133-1.3.2**Airport Traffic Control Service.** Airport traffic control encompasses those services provided to aircraft operating within the airport traffic area or on the airport surface. They include:

- Issuing control instructions to provide sequencing to assure the orderly and expeditious movement of aircraft departing, landing, or approaching the airport or landing.
- Furnishing information to pilots concerning clearances to operate aircraft, weather and field conditions, and pertinent operating and procedural instructions.
- Relaying aircraft operation and control messages between pilots and other air traffic facilities.
- Notifying crash and rescue agencies during actual or potential accidents on or in the vicinity of the airport. These services are somewhat unique as they are the only services that are location sensitive; using today's technology, they also require an elevated structure and visual contact.

133-1.3.3**Low Approach and Landing Service.** This service permits aircraft to be recovered when weather ceilings and visibility are less than that prescribed for Instrument Approach Procedures (IAPs) predicated on the non-precision air navigational aids. The service encompasses:

- Issuing control instructions to provide separation to aircraft approaching for landing under marginal weather conditions.
- Providing control instructions and information to align aircraft in azimuth and altitude so an optimum touchdown point on the landing surface may be reached.

133-1.3.4**Terminal Area Control Service.** Terminal area control services provide separation and control of aircraft operating in the relatively dense air traffic environment surrounding major airports. Services are exclusive to those performed as part of airport traffic control and low approach and landing services. This service includes:

- Separation and control of departing and arriving aircraft operating under Instrument Flight Rules (IFR).
- Separation and control of transiting aircraft operating under IFR.
- Separation and control of aircraft operating under Visual Flight Rules (VFR) that desire the added margin of safety afforded by such control.

133-1.3.5 **Range Control (Air) Service.** Range control (air) services combine both ATC in the classic sense, i.e., separating aircraft from each other or obstructions, and the provisions of combat direction and/or range surveillance. Services are mission-oriented and encompass:

- Mission aircraft flight-following.
- Mission aircraft direction.
- National Airspace System Interface.

133-1.4 **ATCF Class Definitions**.

133-1.4.1**Class I**. Flight Planning Activity (also known as an Air Operations Building, Category Code 141 40). An ATCF organized, manned, and equipped to provide flight assistance services to aircrews including flight planning and flight safeguarding services. The air operations building is generally located on the edge of the airfield adjacent to the air traffic control tower and Military Terminal Radar Approach Control Facility (MTRACON), Category Code 133-72.

133-1.4.2**Class II.** Control Tower (Category Code 141 70). An ATCF organized, manned, and equipped to provide airport traffic control services including: air traffic sequencing to aircraft airborne within the airport traffic area; authority for aircraft to land or takeoff from runways, or heliports; and control of aircraft and vehicles on the surface within the movement area to ensure safe, orderly, and expeditious aircraft movement. Unless modified by letter of agreement, the air traffic control clearance authority vested in the tower is limited to that permitted operation in accordance with VFR; although IFR or special VFR air traffic control clearances, originated by other tower facilities having such authority, may be relayed by the tower. Flight assistance services may also be provided. The air traffic control tower facility is generally located on the edge of the airfield, situated to have an unobstructed line-of-sight to the aircraft approach areas, runways, taxiways, aircraft parking areas, and other operational areas over which aircraft movements are to be controlled. Provide tower location and height to result in lower cab eye level line of site intersecting airport traffic surfaces at a vertical angle of 35 minutes or greater.

133-1.4.3 **Class IIIA/IIIB**. Control Tower/Ground Control Approach (GCA) Facility (also referred to as a Radar Air Traffic Control Facility (RATCF), Category Code 133 71). An ATCF is organized, manned, and equipped to provide air traffic control and low approach and landing services, including: air traffic sequencing to aircraft airborne within the airport traffic area; authority for aircraft to land or takeoff from runways, or heliports; control of aircraft and vehicles on the surface within the movement area; and control instructions to aircraft during the intermediate and final approach segments (Class IIIA) to ensure safe, orderly, and expeditious aircraft movement. Unless modified by letter of agreement, the air traffic control clearance authority vested in the control tower is limited to that permitted for operation in accordance with VFR, although IFR and special VFR air traffic control clearances, originated by other facilities having such authority, may be relayed or issued. Likewise, GCA control authority may be extended beyond the intermediate fix when authorized by letter of agreement (Class IIIB). Flight assistance services may also be provided. This facility is generally located adjacent to the air traffic control tower.

133-1.4.4 **Class IV**. Approach Control Facility (also referred to as a Military Terminal Radar Approach Control Facility (MTRACON), Category Code 133-72). An ATCF organized, manned, and equipped to provide airport traffic control and terminal area services including separation and control to arriving, departing, and occasionally en route aircraft operating in accordance with IFR and, when appropriate, VFR within airspace assigned for the purpose by letter of agreement, to ensure safe, orderly, and expeditious aircraft movement. Service to the primary airport include air traffic sequencing to airborne aircraft within the traffic area; authority for aircraft to land or take off from runways or heliports; and control of aircraft and vehicles on the surface within the movement area. These facilities are authorized to originate IFR and special VFR air traffic control clearances for aircraft landing and departing airports within their assigned area of responsibility or transiting airspace under their control jurisdiction, including instrument approach and departure clearances. They may also provide low approach and landing and flight assistance services. This facility is generally located adjacent to the air traffic control tower and aircraft operations building where site requirements permit.

133-1.4.5 **Class V**. Joint Control Facility (JCF) (Category Code 133 74). A combined air ATCF and Range Operations Center (ROC), organized, manned, and equipped to provide Class II, IIIA/B, or IV services and range control services. ROC services may include aircraft control, separation, positioning, tracking, and target scoring. ROC operational jurisdiction is typically limited to special use airspace (restricted areas, Military Operations Areas (MOAs), or ATC Assigned Airspace (ATCAA)). The JCF is located adjacent to the air operations building when site criteria allows. An air traffic control tower may be sited with the JCF.

133-1.4.6 **Class VI**. Fleet Area Control and Surveillance (FACSFAC) (Category Code 133 73). A FACSFAC is an ATCF facility defined as an organization of personnel and equipment designated, equipped, and manned to manage offshore and inland operating areas, as required, dedicated for military use. The mission of a FACSFAC is to manage military use of Offshore Operating Areas (OPAREAS) through coordination, scheduling, and control, if applicable, of subsurface, surface, and airborne military platforms operating within and transiting to and from these areas. FACSFACs are established as an intermediate level facility between that of a Military Radar Unit (MRU) and an ATCF. Prior to being upgraded from a MRU level facility to an intermediate level ATCF, FACSFACs must comply with the following requirements:

- Possess flight check data depicting areas of radio/radar coverage.
- Possess radar/radio communication redundancy in areas routinely used for national airspace interface.
- Validate operator training programs by assuring compliance with FAA, OPNAV, and FACSFAC personnel qualification standards.
- Implement comptroller certification standards in compliance with FAA publications and the OPNAVINST 3721.1K.
- Possess auxiliary power to support the Fleet Area Control System (FACS) in the event of loss of commercial power.
- Obtain FACS interface certification with the FAA.

Each FACSFAC is tailored to meet the operational needs of a specific area in direct support of the fleet operational requirements. For purposes of identification, equipment and personnel control, each FACSFAC, at time of commissioning, is placed under the operational control of the supported command; administrative control is through the local commander; and technical support is received from Naval Electronic Systems Command (NAVELEX). Each FACSFAC is a stand-alone facility. Table 133-2 defines each of the six different types of ATCFs with their respective facility nomenclature in tabular form.

TABLE 133-2. ATCF CLASSES AND FACILITY NOMENCLATURE

Class ATC Facility	Air Operations Building	Control Tower	RATCF	MTRACON	JCF	FACSFAC
1	X					
2	X	X				
3	X	X	X			
4	X	X		X		
5	X	X			X	
6						X

133 15 RADAR WIND SOUNDING (RAWIN) BUILDING
FAC: 1331
BFR Required: Y

13315-1 **DEFINITION.** A RAWIN building (Radar Wind Sounding) is a specialized weather reporting facility. It houses tracking equipment used in conjunction with balloon-borne radiosonde transmitters.

13315-2 **GENERAL**. An engineering analysis is required to determine facility space allocations.

133 20 VERY HIGH FREQUENCY OMNI-DIRECTIONAL RANGE FACILITY (M2/SF)
FAC: 1331
BFR Required: Y

Design Criteria: UFC 4-141-10N, Aviation Operation and Support Facilities
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13320-1 **DEFINITION.** The Very High Frequency (VHF) Omni-Directional Range (VOR) building houses a VHF, fixed ground-based station which continuously transmits bearing, identification, and with proper equipment, distance information to properly equipped aircraft.

13320-2 **REQUIREMENTS.** A gross area of 28 M2 (300 SF) is provided for the electronic equipment, monitoring and test equipment, and mechanical equipment. A vehicle access road is required.

13320-3 **SITE PLANNING.** Any facility located within the Airfield Safety Clearance Zone as defined by NAVFAC P-80.3 requires a criteria waiver approved by COMNAVAIRSYSCOM (Code 09Y1). Any equipment that must be located in violation of the Safety Clearance Zone criteria shall be coordinated with the In Service Engineering Agent (ISEA). The ISEA must ensure that such equipment will be sited as far as possible away from the operating surface toward the outer limits of the NAVFAC P-80.3 criteria.

133 25 TACTICAL AIR NAVIGATION (TACAN) BUILDING (M2/SF)
FAC: 1331
BFR Required: Y

Design Criteria: UFC 4-141-10N, Aviation Operation and Support Facilities
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13325-1 **DEFINITION**. The Tactical Air Navigation (TACAN) Building houses UHF ground-based station which transmits bearing, identification, and distance information to properly equipped aircraft. The TACAN is primarily a military short-range 322 km (200 mile) navigational aid that is generally planned for each Navy and Marine Corps air station.

13325-2 **REQUIREMENTS**. A TACAN building is not required at those air stations which can be serviced by a TACAN or VORTAC of a nearby airfield, either military or civilian. A gross area of 28 M2 (300 SF) is provided for the electronic equipment, monitoring and test equipment, and mechanical equipment. A vehicle access road is required.

13325-3 **SITE PLANNING**. Any facility located within the Airfield Safety Clearance Zone as defined by NAVFAC P-80.3 requires a criteria waiver approved by COMNAVAIRSYSCOM (Code 09Y1). Any equipment that must be located in violation of the Safety Clearance Zone criteria shall be coordinated with the In Service Engineering Agent (ISEA). The ISEA must ensure that such equipment will be sited as far as possible away from the operating surface toward the outer limits of the NAVFAC P-80.3 criteria.

133 30 VERY HIGH FREQUENCY (VHF) OMNI-DIRECTIONAL RANGE/TACTICAL AIR NAVIGATION (VORTAC) BUILDING (M2/SF)
FAC: 1331
BFR Required: Y

Design Criteria: UFC 4-141-10N, Aviation Operation and Support Facilities
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13330-1 **DEFINITION.** The Very High Frequency (VHF) Omni-Directional Range/Tactical Air Navigation (VORTAC) Building houses VHF/UHF fixed ground-based station that continuously transmits bearing, identification, and distance information to properly equipped aircraft when distance measuring equipment (DME) is installed.

13330-2 **REQUIREMENTS**. A gross area of 28 M2 (300 SF) is provided for the electronic equipment, monitoring and test equipment, and mechanical equipment. A vehicle access road is required.

13330-3 **SITE PLANNING**. Any facility located within the Airfield Safety Clearance Zone as defined by NAVFAC P-80.3 requires a criteria waiver approved by COMNAVAIRSYSCOM (Code 09Y1). Any equipment that must be located in violation of the Safety Clearance Zone criteria shall be coordinated with the In Service Engineering Agent (ISEA). The ISEA must ensure that such equipment will be sited as far as possible away from the operating surface toward the outer limits of the NAVFAC P-80.3 criteria.

133 35 NON-DIRECTIONAL BEACON (NDB) FACILITY (M2/SF)
FAC: 1331
BFR Required: Y

Design Criteria: None Available.
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13335-1 **DEFINITION**. This Non-Directional Beacon (NDB) facility is an unattended facility which houses electric equipment (radio beacon) used to transmit a non-directional radio signal pattern to aircraft equipped with Automatic Radio Direction and Finding (ADF) equipment. The signal is used by the aircraft for homing and radio fix assistance. The radio beacon may be employed for voice or tone modulated transmission. The facility consists of an equipment building with adjoining or adjacent space with emergency standby power and an antenna mounted on an antenna support.

13335-2 **REQUIREMENTS.** The facility is required at all Navy and Marine Corps air stations unless other navigational aid facilities obviate the need. The NDN is located on or adjacent to the airport. Metal buildings, power lines, or metal fences should be kept a minimum of 30.5 meters (100 feet) from the NDB antenna. The building area is 11.2 M2 (120 gross SF) and requires an antenna support.

13335-3 **SITE PLANNING.** NDB may be located either on or off the station with specific siting satisfactory to NAVAIRSYSCOM and NAVELEXSYSCOM.

133 65 AIR NAVIGATION BUILDING (M2/SF)
FAC: 1331
BFR Required: Y

Design Criteria: None Available.

Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13365-1 **DEFINITION**. An Air Navigation Building is a specialized facility for providing a readily available source of operational and aeronautical intelligence information; storage and issue of aeronautical maps and charts; and secure storage of classified material up to TOP SECRET documents.

13365-2 **REQUIREMENTS.** There are two types of air navigation buildings:

13365-2.1 **Type A Building.** A Type A building requires a gross area of 417 M2 (4,487 SF) and is planned for flight support air stations having an area command mission.

13365-2.2 **Type B Building.** A Type B building requires a gross area of 1,010 M2 (10,863 SF) and is planned for those stations having logistics support for a major area command such as COMNAVAIRLANT or COMNAVAIRPAC.

13365-3 **SECURE STORAGE.** Secure storage areas are provided in conformance with OPNAVINST 5510.1 (latest revision).

133 71 RADAR AIR TRAFFIC CONTROL FACILITY (RATCF) (M2/SF)
FAC: 1331
BFR Required: Y

Design Criteria: UFC 4-141-10N, Aviation Operation and Support Facilities
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13371-1 **DEFINITION.** The Radar Air Traffic Control Facility (RATCF) provides housing for equipment and personnel to support Instrument Flight Rules (IFR) control of aircraft on approach to or departure from the terminal radar facility or airport. Other functions include Precision Approach Radar (PAR) for landing aircraft during inclement weather and limited visibility. It provides space for an IFR control room that contains radar display consoles and communications terminals, equipment rack storage for communications terminal equipment, a ready room for Air Traffic Control (ATC) watch standers, a training room, and office area for supervision and control.

13371-1.1 **Components.** The RATCF, a Class IIIA/IIIB activity, contains the Control Tower/Ground Controlled Approach (GCA) Facility. An Air Traffic Control Facility (ATCF) organized, manned, and equipped to provide air traffic control and low approach and landing services, including:

- Air traffic sequencing to aircraft airborne within the airport traffic area.
- Authority for aircraft to land or takeoff from runways or heliports.
- Control of aircraft and vehicles on the surface within the movement area.

- Control instructions to aircraft during the intermediate and final approach segments (Class IIIA) to ensure safe, orderly, and expeditious aircraft movement.

13371-1.2 **Control Authority.** Unless modified by letter of agreement, the air traffic control clearance authority vested in the control tower is limited to that permitted for operation in accordance with Visual Flight Rules (VFR), although IFR and special VFR air traffic control clearances, originated by other facilities having such authority, may be relayed or issued. Likewise, GCA control authority may be extended beyond the intermediate fix when authorized by letter of agreement (Class IIIB). Flight assistance services may also be provided. Consult Basic Category Code 133 information for additional ATCF class information.

13371-2 **REQUIREMENTS.** The facility space allowance is 402 M2 (4,320 SF) gross area which includes mechanical equipment room.

13371-3 **SITE PLANNING**. The facility should be sited adjacent to the air traffic control tower when site conditions permit.

133 72 MILITARY TERMINAL RADAR APPROACH CONTROL FACILITY (MTRACON) (FORMERLY RATCC CENTER) (M2/SF)
FAC: 1331
BFR Required: Y

Design Criteria: UFC 4-141-10N, Aviation Operation and Support Facilities
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13372-1 **DEFINITION**. A Military Terminal Radar Approach Control (MTRACON) Facility is used to control air traffic to provide safe, expeditious, and orderly movement of aircraft under all weather conditions. Justification for a MTRACON is established by the Chief of Naval Operations.

13372-1.1 **Components**. The MTRACON is a Class IV, Approach Control, Air Traffic Control Facility (ATCF). An ATCF is organized, manned, and equipped to provide airport traffic control and terminal area services including:

- Separation and control to arriving, departing, and occasionally en route aircraft operating in accordance with Instrument Flight Rules (IFR) and, when appropriate, Visual Flight Rules (VFR) within airspace assigned for the purpose by letter of agreement, to ensure safe, orderly, and expeditious aircraft movement.

- Air traffic sequencing to aircraft airborne within the airport traffic area.

- Authority for aircraft to land or takeoff from runways or heliports.
- Control of aircraft and vehicles on the surface within the movement area.
- Control instructions to aircraft during the intermediate and final approach segments (Class IIIA) to ensure safe, orderly, and expeditious aircraft movement.

These facilities are authorized to originate IFR and special VFR air traffic control clearances for aircraft landing or departing airports within their assigned area of responsibility or transiting airspace under their control jurisdiction, including instrument approach and departure clearances. They may also provide low approach and landing and flight assistance services. Consult Basic Category 133 information for additional ATCF class information.

13372-1.2 **Operation of a MTRACON.** NAVAIR 00-80T-114 promulgates policies affecting the establishment and operation of a MTRACON and its component radar systems. The area of jurisdiction for a MTRACON facility extends beyond the area of responsibility assigned to a Radar Air Traffic Control Facility (RATCF).

13372-2. The MTRACON radar facilities may consist of the Air Surveillance Radar (ASR) facility, Category Code 133 75, the Air Route Surveillance Radar (ARSR) facility, Category Code 133 76, and the Precision Approach Radar (PAR), Category Code 134 40, located on a turntable. Video information from each of these radars is transmitted to remote monitors in the MTRACON and control tower by underground cable or microwave relay.

13372-3 **SITE PLANNING.** Wherever practicable it is highly desirable that the MTRACON, the Control Tower, Attached/Free Standing, Category Code 141 70, and the Aircraft Operations Building, Category Code 141 40, be located together as an integral unit. If site conditions dictate the separation of the Air Operations Building and the Control Tower, the MTRACON should be collocated with the control tower, creating an integrated air traffic control facility.

13372-4 **REQUIREMENTS.** The MTRACON requires a gross area of 1,230 M2 (13,200 SF). The nerve center of the MTRACON is the control room which contains the radar monitors and communications modules. A radar and communications terminal equipment room houses the audio and video tape recorders as well as the automation central (or terminal) equipment. An office for the FAA liaison officer, training classroom, a ready room for radar controllers on work breaks, a Combined radar/ training chief office, leading chief office, MTRACON equipment maintenance and office space, an air traffic control officer’s office, and a proficiency trainer room are also provided. Space is also provided in the mechanical room for an emergency generator system and Uninterruptible Power Supply (UPS) system.

133 73 FLEET AREA CONTROL SURVEILLANCE FACILITY (M2/SF)
FAC: 1331
BFR Required: Y

Design Criteria: UFC 4-141-10N, Aviation Operation and Support Facilities
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13373-1 **DEFINITION.** The Fleet Area Control Surveillance Facility (FACSFAC) building houses the FACSFAC Tracking System (FACTS) and Navy Tactical Data System/Advanced Combat Direction System (NTDS/ACDS) equipment and personnel to provide a variety of services to air, surface and subsurface units. These services are provided to both military and civilian users and include radar surveillance and various forms of air traffic control in warning and other special airspace areas. Other services include:

- Surface operating area management.
- Ground controlled intercept.
- Operating area scheduling.
- Range control.

The FACSFAC normally operates continuously, 24 hours per day, and 7 days per week.

13373-1.1 **Components.** The FACSFAC is a Class VI Air Traffic Control Facility (ATCF) and is defined as an organization of personnel and equipment designated, equipped, and manned to manage offshore and inland operating areas, as required. The mission of a FACSFAC is to manage military use of Offshore Operating Areas (OPAREAS) through coordination, scheduling, and control, if applicable, of subsurface, surface, and airborne military platforms operating within and transiting to and from these areas. FACSFACs are established as an intermediate level facility between that of a Military Radar Unit (MRU) and an ATCF. Prior to being upgraded from a MRU level facility to an intermediate level ATCF, FACSFACs must comply with the following requirements:

- Possess flight check data depicting areas of radio/radar coverage.
- Possess radar/radio communication redundancy in areas routinely used for national airspace interface.
- Validate operator training programs by assuring compliance with FAA, OPNAV, and FACSFAC personnel qualification standards.
- Implement comptroller certification standards in compliance with FAA publications, the OPNAVINST 3721.1K, and the NAVAIR 00-80T-114.
- Possess auxiliary power to support the Fleet Area Control System (FACS) in the event of loss of commercial power.
- Obtain FACS interface certification with the FAA.

Consult Basic Category Code series 133 for additional ATCF information.

13373-1.2 **Operational Organization**. Each FACSFAC is tailored to meet the operational needs of a specific area in direct support of the fleet operational requirements. For purposes of identification, equipment and personnel control, each FACSFAC, at time of commissioning, is placed under the operational control of the supported command; administrative control is through the local commander; technical support is received from Naval Electronic Systems Command (NAVELEX).

13373-1.3 **Functions.** The FACSFAC functions include:

- Radar Air Traffic Control and Area Management.
- Communications Monitoring and Control.
- Command Administration.
- Equipment Maintenance.
- Training and Briefings
- Computer Systems Management and Engineering.

13373-2 **SITE PLANNING.** Facility normally stands alone and can be sited either on or off Station.

13373-3 **REQUIREMENTS.** The standard size of the FACSFAC building is 2,570 M2 (27,650 SF) gross area. The mechanical space should include sufficient room for as emergency generator system and an Uninterruptible Power Supply (UPS) system. The size of the facility should be adjusted in accordance with the specific mission and number of personnel assigned.

133 74 JOINT CONTROL FACILITY (M2/SF)
FAC: 1331
BFR Required: Y

Design Criteria: UFC 4-141-10N, Aviation Operation and Support Facilities
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13374-1 **DEFINITION.** The Joint Control Facility (JCF) is an air traffic control facility, a Radar Air Traffic Control Facility (RATCF), and a Range Operations Center (ROC) under one roof.

13374-1.1 **Components.** The JCF is a Class V Air Traffic Control Facility (ATCF). It is a combined air ATCF and ROC, organized, manned, and equipped to provide Class II, IIIA/B, or IV services and range control services. ROC services may include aircraft control, separation, positioning, tracking, and target scoring. ROC operational jurisdiction is typically limited to special use airspace (restricted areas, Military Operations Areas (MOAs), or ATC Assigned Airspace (ATCAA). The JCF is located adjacent to the air operations building when siting criteria allows. An air traffic control tower may be sited with the JCF. Consult Basic Category Code group 133 for additional ATCF class information.

13374-2 **REQUIREMENTS.** The specific functional areas to be provided include a main operations room where air traffic control radar display monitors and communications terminals are located; adjacent equipment spaces for communications devices, recorders and navigational aids; maintenance spaces for Ground Electronics Maintenance Division (GEMD) support personnel; and administrative spaces for command functions, training and personnel administration. The mechanical spaces should include sufficient space for an emergency generator system and Uninterruptible Power Supply (UPS) system. See Table 13374-1 for space allowances for the JCF facility.

Table 13374-1. Joint Control Facility Space Allowances

Type of Facility	Gross Area	
	M2	SF
Medium Density	3,156	33,970
High Density	3,670	39,500

13374-3 **SITE PLANNING.** The JCF should be located adjacent to the Air Operations Building when site conditions permit. The Air Traffic Control Tower, Category Code 141 70, should be sited with the JCF.

133 75 AIR SURVEILLANCE RADAR (ASR) FACILITY (M2/SF)
FAC: 1331
BFR Required: Y

Design Criteria: UFC 4-141-10N, Aviation Operation and Support Facilities
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13375-1 **DEFINITION.** The Air Surveillance Radar (ASR) facility is an unattended facility which serves as a major component of the Radar Air Traffic Control Facility (RATCF), Category Code 133 71; the Military Terminal Approach Control Facility (MTRACON), Category Code 133 72; and the Joint Control Facility (JCF), Category Code 133 74. It provides detection and identification for control of aircraft operating in a line-of-sight range and altitudes determined by system design. The system also provides azimuth and range data and is remotely controlled by the air traffic control personnel via underground cables or microwave link. It consists of a rotating radar antenna mounted on a supporting tower, a transportable building which houses the electronic equipment, and a standby power plant installed in a separate transportable shelter. The facility and its antenna are located under the direction of Naval Electronics Systems Command (NAVELEX) and defined in the Base Electronic Systems Engineering Plan (BESEP).

13375-2 **SITE PLANNING.** The ASR is the standard terminal air traffic control surveillance radar for the Navy, Air Force, and FAA. It is a separate facility, housing radar transmitting, receiving, and monitoring equipment and maintenance personnel to provide detection and identification of aircraft transiting the area or executing and instrument approach or departure. The building and its associated antenna tower are located in a remote area of the airfield and an access road and emergency generator are required. Information derived from the ASR is transmitted to the MTRACON, RATCF, or JCF by underground cable or microwave link, and the ASR is remotely controlled from the MTRACON, RATCF, or JCF.

13375-3 **REQUIREMENTS.** The ASR facility has a gross area of 130 M2 (1,400 SF) including mechanical equipment room.

133 76 AIR ROUTE SURVEILLANCE RADAR (ARSR) FACILITY (M2/SF)
FAC: 1331
BFR Required: Y

Design Criteria: UFC 4-141-10N, Aviation Operation and Support Facilities
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13376-1 **DEFINITION.** The Air Route Surveillance Radar (ARSR) facility houses the electronic long range radar system used to obtain the range and azimuth of an aircraft. When equipped with an Air Traffic Control Radar Beacon System (ATCRBS), the Air Route Surveillance Radar System (ARSR) obtains altitude and identification of the aircraft. The ARSR has a range greater than that of an ASR, and as such, is used primarily for Fleet Area Control and Surveillance Facility (FACSFAC), Category Code 133 73 or Joint Control Facility (JCF), Category Code 133 74 functions. This facility is similar to the Air Surveillance Radar (ASR) facility, Category Code 133 75; the difference being that an ARSR is used to monitor a larger piece of airspace than an ASR. An ASR only controls overflight, approach, and departure flight paths at a terminal facility.

13376-2 **SITE PLANNING.** The ARSR building should be located adjacent to the radar facility antenna tower.

13376-3 **REQUIREMENTS.** The facility provides space primarily for the radar equipment systems, a small work bench for maintenance of system equipment, storage areas for spare parts and restroom if required. The ARSR facility has an gross area of 174 M2 (1,876 SF), including mechanical equipment room.

133 80 WHEELS WATCH SHELTER (EA)
FAC: 1331
BFR Required: Y

Design Criteria: Not Available

Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13380-1 **DESCRIPTION.** A portable wheels watch booth is provided with the runway Wheels-Up/Wave-Off Lighting system, Category Code 136 45. The shelter is located approximately 302 meters (990 feet) short of the runway threshold near the wheels-up/wave-off lighting system. The facility may be either a trailer or truck. Due to its location and access road and pad may be required and the shelter is an obstruction to airfield safety criteria, therefore a waiver is required from Naval Air Systems Command (NAVAIRSYSCOM) prior to its installation. Normally this requirement will be satisfied by portable equipment, Class III Property. However, this code may be used for planning purposes.

134 NAVIGATION AND TRAFFIC AIDS - OTHER (NON - SHIP)

134-1 **DEFINITION.** Basic Category Code group 134 applies to structures which function as aircraft navigation/ traffic aids.

134 10 ANTENNA - NAVIGATION (EA)
FAC: 1341
BFR Required: N

Design Criteria: Not Available
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13410-1 **DESCRIPTION.** An antenna system for navigation aid will vary with the type and purpose of the navigational aid. This Category Code shall be used to indicate entire antenna systems.

13410-2 **REQUIREMENT.** No specific planning factors are applicable.

134 20 AIRPORT AND/OR HELIPORT BEACON (EA)
FAC: 1341
BFR Required: N

Design Criteria: FAA AC 150/5345-12C; NAVAIR 51-50AAA-12
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13420-1 **DEFINITION.** An airport and/or heliport beacon is an internationally recognized rotating or flashing illuminated beacon operated as a visual aid to air navigation to assist aircrews in locating and identifying airports and/or heliports. Basic criteria on usage of airport and/or heliport beacons may be found in Federal Aviation Administration Advisory Circular 150/5345-12 (L-801H), (L-802A), and (L-803A) Specifications for Airport and Heliport Beacons.

13420-2 **REQUIREMENTS**. Three functional types of airport and/or heliport beacons are: airport rotating, identification or code, and heliport beacons. Requirements for each type are as follows:

13420-2.1 **Airport Rotating Beacon.** This is required for each airfield; with exception that two adjacent airfields may have a common beacon. A lighted military airport is identified by a beacon showing alternate flashes of two white and one green light. An unlighted military airport is identified by white flashes only.

13420-2.2 **Identification or Code Beacon.** This is required when the airport beacon is more than 1,520 meters (5,000 feet) from the nearest point of the usable landing area or where two or more adjacent airfields use one common airport beacon. The identification or code beacon is non-rotating and flashes a signal, the code and color of which identify the field. Where a heliport is not part of an airfield and an operational requirement has been established, an identification beacon is required.

13420-2.3 **Heliport Beacon.** This is a rotating beacon that provides identification for a lighted heliport when it is not clearly associated with an airfield. The beacon should alternately flash white, green, and yellow. It is not to be installed within one mile of an existing airfield beacon or runway.

13420-2.4 **Hazard Beacon.** A hazard or obstruction beacon is a non-rotating beacon with a flashing red light used where special warning is required to identify a hazard to air navigation and is incorporated in Category Code 134 50, Obstruction Lighting, Aircraft.

134 40 GROUND CONTROL APPROACH SYSTEM (EA)
FAC: 1341
BFR Required: Y

Design Criteria: UFC 4-141-10N, Aviation Operation and Support Facilities
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13440-1 **DEFINITION.** A Ground Control Approach (GCA) System is a radar approach system operated from the ground by air traffic control personnel transmitting instructions to the pilot by radio. The approach may be conducted with surveillance radar (ASR), Category Code 133 75, only or with both surveillance and precision approach radar (PAR), Category Code 134 41.

13440-1.1 **Components**. A GCA system is part of a Class IIIA Air Traffic Control Facility (ATCF), see Basic Category 133. An ATCF is organized, manned, and equipped to provide air traffic control and low approach and landing services, including: air traffic sequencing to aircraft airborne within the airport traffic area; authority for aircraft to land or takeoff from runways, or heliports; control of aircraft and vehicles on the surface within the movement area; and control instructions to aircraft during the intermediate and final approach segments to ensure safe, orderly, and expeditious aircraft movement. Unless modified by letter of agreement, the air traffic control clearance authority vested in the control tower is limited to that permitted for operation in accordance with Visual Flight Rules (VFR), although Instrument Flight Rules (IFR) and special VFR air traffic control clearances, originated by other facilities having such authority, may be relayed or issued. Likewise, GCA control authority may be extended beyond the intermediate fix when authorized by letter of agreement (Class IIIB). Flight assistance services may also be provided. The GCA system is generic in terms of name; therefore, the two components should be identified separately by their respective Category Codes.

134 41 PRECISION APPROACH RADAR (PAR) (EA)
FAC: 1341
BFR Required: Y

Design Criteria: UFC 4-141-10N, Aviation Operation and Support Facilities
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13441-1 **DEFINITION.** The Precision Approach Radar (PAR) is an unattended self-contained radar system. The PAR detects azimuth, elevation, and range information of aircraft on final landing approach to PAR instrumented runways. The information is displayed in the Military Terminal Radar Approach Control (MTRACON) Facility. The controller uses the information to direct the aircraft along the glide path to the visual portion of an instrument approach. A PAR is a self-contained transportable unit mounted either on a turntable or on fixed base.

13441-2 **REQUIREMENTS**. A reinforced concrete platform is provided for fixed mounted PAR. Reinforced concrete foundations are provided to support the turntable mounted PAR frame.

134 42 PRECISION APPROACH LANDING SYSTEM (PALS) (EA)
FAC: 1341
BFR Required: Y

Design Criteria: UFC 4-141-10N, Aviation Operation and Support Facilities
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13442-1 **DEFINITION**. The Precision Approach Landing System (PALS) is an unattended, self-contained radar system. The PALS detects azimuth, elevation, and range information of aircraft on final approach to PALS instrumented runways. This information is displayed in the Military Terminal Radar Approach Control (MTRACON)

Facility. The controller uses the information to direct the aircraft along the glide path to the visual portion of an instrument approach.

13442-2 **REQUIREMENTS**. Reinforced concrete foundations are required for the PALS antenna tower.

134 43 INSTRUMENT LANDING SYSTEM (ILS) (EA)
FAC: 1341
BFR Required: Y

Design Criteria: UFC 4-141-10N, Aviation Operation and Support Facilities
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13443-1 **DEFINITION**. The Instrument Landing System (ILS) provides azimuth, distance, elevation, and glide path position to aircraft on a precision approach to the ILS instrumented runway. The ILS operates in the VHF and UHF radio bands.

13443-2 **REQUIREMENTS**. The ILS consists of two stations, a localizer and antenna station, and a glide slope equipment station. The localizer station requires a 5.49 meter by 6.1 meter (18 foot by 20 foot) concrete pad for the building housing the localizer equipment and a 3.66 meter by 5.49 meter (12 foot by 18 foot) concrete pad for the glide slope equipment building.

13443-3 **SITE PLANNING**. Both stations are located near the ends of the runway and require access roads and a pull-off area for maintenance personnel.

134 44 MICROWAVE LANDING SYSTEM (MLS) (EA)
FAC: 1341
BFR Required: Y

Design Criteria: UFC 4-141-10N, Aviation Operation and Support Facilities
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13444-1 **DEFINITION**. The Microwave Landing System (MLS) provides azimuth, distance, elevation, and glide path position to aircraft on a precision approach to the MLS instrumented runway. The MLS operates in a narrow band microwave frequency.

13444-2 **REQUIREMENTS**. The MLS consists of two stations, an azimuth station and an elevation station. Each station requires a concrete foundation pad for the respective types of equipment. The azimuth station requires a 1.52 meter by 6.1 meter (5 foot by 20 foot) pad and the elevation station requires a 1.21 meter by 1.83 meter (4 foot by 6 foot) pad for the instrumentation device.

13444-3 **SITE PLANNING**. Both stations are located near the ends of the runway and require access roads and a pull-off area for maintenance personnel.

s

134 45 SHORE BASED AUTOMATIC CARRIER LANDING SYSTEM (EA)
FAC: 1341
BFR Required: Y

Design Criteria: None Available
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13445-1 **DEFINITION**. The Shore-based Automatic Carrier Landing System (ACLS) is an unattended, self-contained radar system. The ACLS consists of precision tracking radar coupled to a computer data link to provide continuous information to the aircraft, monitoring capability to the pilot, and a backup approach system. Four modes of approach are available, depending on aircraft equipment. In Mode 1 approaches, data-link-transmitted ACLS signals are coupled to the autopilot after ACLS radar lock-on and control the aircraft until touchdown. Mode 1A approaches differ from Mode 1 approaches in that data-link ACLS signals are uncoupled at ½ mile (approximately 61 meters (200 feet) altitude) from touchdown. Mode 2 approaches the pilot-controlled using data-link needles information displayed in the aircraft allowing the pilot to fly the aircraft to the minimums in effect. A Mode 3 approach is a controller talk-down approach using no special equipment on the aircraft.

13445-2 **REQUIREMENTS**. Reinforced concrete foundations are required for the Shore-based ACLS antenna tower.

134 50 OBSTRUCTION LIGHTING AND MARKINGS (EA)
FAC: 1341
BFR Required: N

Design Criteria: NAVAIR 51-50AAA-2, Visual Landing Aids Design Standards, Land-based Installations
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13450-1 **DEFINITION OF OBSTRUCTION**. An airfield obstruction is an object that extends above the air safety clearance surfaces established for the airfield. Any object that violates the clearance zone will be removed, if practical; reduced in height to below the hazard level; or marked as an obstruction. Standards for determining obstructions to air navigation have been established by U.S. Code and are published in Federal Aviation Regulations, Part 77, which covers "Objects Affecting Navigable Airspace."

13450-2 **OBSTRUCTION LIGHTING**. Obstruction lighting provides visual identification of objects at night, or in some cases in day times, that are potentially hazardous to air navigation.

13450-2.1 **Definition**. Obstruction lighting is a system of lights that define the vertical and horizontal limits of a hazard to aircraft operations. Hazardous conditions exist when any obstruction encroaches on the standard airfield clearance surfaces or an unsafe condition, such as construction, on the airfield exists. Obstruction lighting includes flashing beacons and steady burning lights, both of which are aviation red in color.

13450-2.2 **Requirements**. The configuration, type, and number of lights depend upon the height and type of obstruction to be identified and on its surroundings. For objects less than 45.7 meters (150 feet) in height only steady burning lights mounted at the top are used. For objects more than 45.7 meters (150 feet) in height a combination of one or more beacons and one or more levels of steady burning lights are used. For each required lighting level not less than one beacon or two lights will be visible at any azimuth angle and at all approach angles. Some obstructions may require several lights or beacons at each light level. Consult NAVAIR 51-50AAA-2 for additional lighting types that may be used.

In some instances, obstructions require higher intensity lighting to provide identification and adequate clearance of the object in restricted visibility, especially during daylight hours. These objects are typically tall antenna towers, transmission lines, and tall stacks or chimneys. It is recommended to use flashing higher intensity obstruction lighting systems that may be more effective and more economical to install and maintain where permitted. These lighting systems include high intensity white obstruction lights; medium intensity obstruction lights; and dual red and higher intensity white lights. Consult NAVAIR 51-50AAA-2 for the necessary lighting type. It is necessary to provide lighting on all obstructions so that visibility of the lighting is assured from any normal angle of approach and from any direction.

13450-3 **OBSTRUCTION MARKINGS.** Obstruction markings provide visual identification of objects that are potentially hazardous to safe air navigation and to warn aircrews of their presence during daytime flight operations. The markings for different types of obstructions vary depending on the nature of the object and its location. The types of markings or markers used for obstructions include painted markings; markers; and vehicle markings.

13450-3.1 **Painted Markings**. Painted markings are the most common form of obstruction marking. Most obstructions are marked by painting the surface. Obstruction marking colors are aviation orange and aviation white. Other colors sometimes used include yellow, black, red, and aluminum. Painted surfaces will change color with time by fading, cracking, and/or peeling. Repainting is a must. The size and shape of the obstruction determines the type of painting pattern used. Painting patterns include solid patterns, alternate color bands, checkerboard patterns, and teardrop patterns. Consult NAVAIR 51-50AAA-2 for additional pattern information.

13450-3.2 **Markers**. Markers are used where it is impractical to mark an obstruction by painting. Markers may also be used in addition to painted markings if such markers may improve the conspicuity of the obstruction. These markers are displayed in conspicuous positions on or adjacent to the obstructions so as to retain the general definition of the obstruction. Markers should not increase the hazard that they mark. The two types of markers used include spherical markers and flag markers. Consult NAVAIR 51-50AAA-2 for marker usage.

13450-3.3 **Vehicle Markings**. Vehicle markings exist on vehicles used in the aircraft operational areas of the airfield and are marked according to NAVAIR 51-50AAA-2.

134 55 VISUAL APPROACH SLOPE INDICATOR (VASI) SYSTEM (EA)
FAC: 1341
BFR Required: N

Design Criteria: NAVAIR 51-50AAA-2, Visual Landing Aids Design Standards, Land-based Installations
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13455-1 **DEFINITION.** The Visual Approach Slope Indicator (VASI) System is an unattended system that provides visual glide slope guidance to pilots of aircraft during the final landing approach. The VASI is helpful during day and night operations and for Visual Flight Rules (VFR) and Instrument Flight Rules (IFR) operations. These requirements apply only for existing VASI installations. For complete replacement use Precision Approach Path Indicator (PAPI) System, Category Code 134 56.

13455-2 **CONFIGURATIONS**. The VASI system consists of several light units arranged in two and three bars near the edges of the runway in the touchdown zone. Each light unit projects a beam, fan-shaped in azimuth and split vertically with a white sector above and a red sector below. The light units are arranged in rows or bars on one or both sides of the runway. Each bar consists of two or three light units. If the bars are on both sides of the runway, the opposite bars shall be in the same line. The bar nearest the runway threshold is referred to as the downwind bar. The bar farthest from the threshold is the upwind bar. If the system has three bars, the bar between the others is the middle bar. A pilot making an approach and observing a two-bar VASI system will see one of the following configurations:

- On the established approach path angle, the downwind bar will be white and the upward bar will be red.

- Below the established approach path angle, both bars will be red.

- Above the established approach path angle, both bars will be white. In the transition sector where the light changes color, a narrow sector of the beam may appear to be pink. For a three-bar VASI system, which creates two approach path angles, the pilot uses the approach path angle established for his type of aircraft, and the third bar, although visible, is not part of the guidance system.

13455-3 **TYPES OF VASI SYSTEMS**. There are three types of VASI systems:

13455-3.1 **VASI-4 System.** This is a two-bar, four light unit system. There are two light units in each bar and are located only on one side, usually the left, of the runway. Some Navy airfields may have this system.

13455-3.2 **VASI-12 System**. This is a two-bar, twelve light unit system. There are three light units in each bar located on both sides of the runway. This is the system for joint use airfields with international civilian airline operations and some existing VASI installations at Navy airfields use this system.

13455-3.3 **VASI-16 System**. This is a three-bar, sixteen light unit system. There are three light units in each bar located on both sides of the runway for the downwind and middle bars and two lights on each side of the runway for the upwind bar. This system is used for airfields qualified for international civilian operations using large aircraft.

13455-4 **CRITERIA**. Conditions that may justify the requirement for a VASI installation are:

- The runway is used by aircraft with such characteristics that the approach angle must be maintained within close limits including speed and rate of descent.
- The runway is situation in an area where the pilots of some aircraft may have difficulty in judging the proper approach angle for any of the following reasons: 1) The approach is over water or featureless terrain that does not provide adequate visual cues; 2) Absence of sufficient extraneous lights in the approach area at night; or 3) Visual information is misleading, e.g., deceptive terrain or sloping runways may cause false impressions.
- Objects in the approach area that may be a serious hazard if an aircraft descends below the normal approach path.
- Conditions at the runway ends may present special hazards to aircraft undershooting or overrunning the runway.
- Terrain or meteorological conditions create severe or unusual turbulence along the approach path.

All light units are elevated lights and shall be installed on stable concrete pads or bases. Each leg support of the unit shall be mounted on a frangible coupling.

13455-5 **LOCATION OF VASI BARS.** The preferred locations are 184 meters (600 feet) from threshold to the downwind bar and at 213 meter (700 foot) intervals for the other one or two bars. The Runway Reference Point (RRP) is normally located midway between the downwind and upwind bars of two-bar VASIs or downwind and middle bar of three-bar VASIs installations. VASI bars may be placed at other than preferred locations, but the downwind bar shall not be less than 152 meters (500 feet) or more the 244 meters (800 feet) from runway threshold. The other bar or bars shall not be less than 152 meters (500 feet) or more than 274 meters (900 feet) from the adjacent bar.

13455-6 **LOCATION OF THE LIGHT UNITS**. The centerline of the innermost light unit of each bar shall be not less than 15.2 meters (50 feet) and not more than 18.3 meters (60 feet) from the runway edge and not less than 22.9 meters (75 feet) from the edge of any other runway, taxiway, or apron area. The innermost light units of all bars of the system shall be the same distance from the runway edge. The light units for each bar shall be equally spaced at 4.88 meters (16 feet) on center starting from the innermost light units. The elevation of the horizontal apertures of the light units shall be within 0.31 meters (12 inches) of the crown of the runway, except in areas with deep snow accumulations. There the light unit may be installed with the apertures not to exceed 1.22 meters (48 inches) above the ground surface. For installations with light units on both sides of the runway, the elevations of the lights on opposite sides shall not differ by more than 0.31 meters (12 inches). The apertures of the light units in a bar may have a tolerance of 0.03 meters (1 inch) horizontally and vertically from the line of the bar.

134 56 PRECISION APPROACH PATH INDICATOR (PAPI) SYSTEM (EA)
FAC: 1341
BFR Required: Y

Design Criteria: NAVAIR 51-50AAA-2, Visual Landing Aids Design Standards, Land-based Installations
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13456-1 **DEFINITION**. The Precision Approach Path Indicator (PAPI) System is an unattended system which provides visual glide slope guidance to pilots of aircraft during the final landing approach. The PAPI system provides this information during the day and night for Visual Flight Rules (VFR) and Instrument Flight Rules (IFR) operations as low as Category I conditions.

13456-2 **REQUIREMENTS**. The PAPI system consists of four light source units arranged in a wing bar near the edges of the runway in the touchdown area. Each light unit consists of two or more lamps and projects a beam of light, fan-shaped in azimuth and split vertically with a white sector above and a red sector below the transition zone. Each light unit is aimed at a slightly different elevation angle to present a different color pattern to a pilot on final approach depending on his/her position relative to the established approach slope. When observed from the ideal approach slope the two inboard light units are seen as red and the two outboard units as white. If more light units are red, the pilot is too low, and if more are white, he/she is too high. The lights also provide information on how much too high or too low the pilot is. The four light units are operated simultaneously whenever this runway approach is active.

13456-3 **CRITERIA.** Conditions that may justify the requirement for a VASI installation are:

- The runway is used by aircraft with such characteristics that the approach angle must be maintained within close limits including speed and rate of descent.

- The runway is situation in an area where the pilots of some aircraft may have difficulty in judging the proper approach angle for any of the following reasons: 1) The approach is over water or featureless terrain that does not provide adequate visual cues; 2) Absence of sufficient extraneous lights in the approach area at night; or 3) Visual information is misleading, e.g., deceptive terrain or sloping runways may cause false impressions.

- Objects in the approach area that may be a serious hazard if an aircraft descends below the normal approach path.

- Conditions at the runway ends may present special hazards to aircraft undershooting or overrunning the runway.

- Terrain or meteorological conditions create severe or unusual turbulence along the approach path.

- The runway length is short and there is serious danger of overrun if the touchdown is long.

All light units shall be installed on stable concrete bases and mounted on a frangible coupling.

13456-4 **LOCATION OF PAPI SYSTEM**. The wing bar shall be in a horizontal line at 90 +/-1 degrees to the runway centerline and should be on the left hand side of the runway as observed from the approach zone. To avoid intersecting runways or taxiways or other major installation problems, the PAPI may be located on the right side of the runway. The individual light units shall not be more than 0.08 meters (3 inches) longitudinally or in elevation from the line for the wing bar. The elevation of the line of the wing bar at the exit lenses or windows should be not more with 15.2 meters (50 feet) preferred. The other units shall be equally spaced at 9.2 +/- 0.6 meters (30 +/-2 feet). The preferred distance of the wing bar upwind from the runway threshold should be 305 +/- 30.5 meters (1,000 +/-100 feet). The actual location of this wing bar may be affected by the following conditions:

- The preferred distance of the wing bar shall be such as to have the visual approach slope coincide with the established glide path angle of the Precision Approach Radar (PAR), the Instrument Landing System (ILS), or other precision electronic approach aid.
- No light source unit shall be less than 22.9 meters (75 feet) from the edge of any other runway or any taxiway.

- The preferred distance of the wing bar shall ensure the minimum wheel clearance at threshold, usually 9.2 meters (30 feet), of the most critical aircraft normally using the runway or of obstacle clearance when the pilot is at or above the transition sector from red to white for the light source unit with lowest vertical aiming angle.

- The preferred distance of the wing bar shall be adjusted to compensate for the differences in elevation between the light exit windows and the runway threshold for sloping runways or for extra high installations to clear snow accumulations.

- The preferred distance of the wing bar shall provide adequate landing distance for stopping the most critical aircraft using this approach.

134 60 OPTICAL LANDING AIDS (EA)
FAC: 1341
BFR Required: N

Design Criteria: NAVAIR 51-50AAA-2, Visual Landing Aids Design Standards, Land-based Installations
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13460-1 **DEFINITION.** Optical Landing Aids (OLA) provides the pilot approaching for a landing with a visual signal to assist in intercepting and maintaining the correct approach glide slope. The OLA is a required visual aid for landings on aircraft carriers, but on shore-based airfields the OLA is primarily an aid for training or practice. The OLA may be used during day or night operations and in all weather conditions.

13460-2 **REQUIREMENTS**. The OLA systems are located near the touchdown point on the runway and consist of the following lighting components:

13460-2.1 **Source Lights**. The source lights are a yellow line of lights or images often referred to as the “meatball”. Some systems present a red signal when the aircraft is too low. The source lights may be formed by reflections in a special mirror or a vertical stack of lens cells or closely spaced lights.

13460-2.2 **Datum Lights**. The datum lights are a horizontal bar of green lights that provide a visual reference for determining the aircraft’s position in relation to the ideal approach glide path. The datum lights bar is in two groups of lights with a group on each side of the source lights. The visual signals presented to a pilot making an approach for landing are the same as his/her position relative to the glide slope path. If the source light appears to be above the datum lights he/she is too high, or if the source light appears to be below the datum lights he/she is too low and should adjust his/her approach path angle to obtain the correct on glide path signal with the source light in line with the datum lights.

13460-2.3 **Wave-off Lights**. The wave-off lights are flashing red lights along each side of the source lights. The wave-off lights are activated only to inform the pilot that he must execute a missed approach procedure.

13460-2.4 **Cut Lights**. Some optical landing systems have flashing green lights located above the source lights which are activated to instruct the pilot of propeller-driven aircraft to cut engine power.

13460-2.5 **Mounting Pad**. The height of the mounting pad shall be at ground level to preclude the creation of an obstruction when the OLA system is relocated from the site. During the calibration process the optimum height of the OLA system can be achieved by placing blocks under the equipment trailer cart and/or the addition of load leveling jacks to the cart.

13460-3 **TYPES OF OLA SYSTEMS**. There are four types of OLA Systems. The FLOLS, MOLS and IFLOLS are fixed signal systems that automatically indicate to the pilot his/her position in relation to the established glide path. The MOVLAS is a temporary replacement system for which the LSO controls the position of the source ("meatball") light. The specifications for each of these systems are listed below.

13460-3.1 **Fresnel Lens Optical Landing System (FLOLS).** The FLOLS consists of five yellow source light cell assemblies arranged vertically, 12 green datum lights, 10 red wave-off lights, and some models have 4 green cut lights. The stack of lens cells are all lighted but usually only one cell is visible to the pilot. The relation of this cell to the datum lights indicates the pilot's position relative to the proper glide slope. These lights are trailer-mounted for portability to move from one site to another.

13460-3.2 **Mirror Optical Landing System (MOLS).** The MOLS consists of a special mirror, 8 yellow source lights, 12 green datum lights, 10 red wave-off lights, and may have two green cut lights and double obstruction lights. The mirror reflects the image of the source lights to provide the "meatball". The position of the "meatball" in relation to the line of datum lights indicates the pilot's position relative to the proper glide slope.

13460-3.3 **Manually Operated Visual Landing Aid System (MOVLAS).** The MOVLAS is an emergency system to be used when the FLOLS or MOLS is inoperable. The MOVLAS source light is operated by the Landing Signal Officer (LSO) using a special controller. The source lights are 23 lights arranged in two closely spaced vertical rows. The six lowest lights are red and the other 17 are yellow. Three lights at adjacent heights are operated to form the source lights. As the controller handle is moved upward, the source lights are switched on progressively towards the top in clusters of three. This gives an approaching pilot the signal to increase his elevation as directed by the LSO. The LSO therefore guides the pilot by signaling to raise or lower his/her altitude to achieve the proper glide slope. The MOVLAS is provided with 10 green datum lights, 8 red wave-off lights, and 2 green cut lights.

13460-3.4 **Improved Fresnel Lens Optical Landing System (IFLOLS).** The land-based MK 14 MOD 0 IFLOLS is the replacement system for the FLOLS MK 8 MOD 0 and MK 8 MOD 1 land-based systems. The IFLOLS consists of 12 cells which provide greater sensitivity and resolution to the light in the cell seen by the pilot ("meatball") than the FLOLS. The position of the "meatball" relative to the datum lights indicates to the pilot where he/she is relative to proper glide slope. The IFLOFS system also has greater acquisition distance than the FLOLS. The land-based IFLOLS is also trailer-mounted for easy portability.

13460-4 **CRITERIA FOR JUSTIFYING OLA EQUIPMENT**. Each runway landing area with or programmed for a simulated carrier deck lighting installation shall be provided with a site installation and OLA equipment. Most OLA systems are portable and may be moved to different sites as the approach runway is changed. The use of OLA is intended for runway ends with simulated carrier deck lighting. Airfields without simulated carrier deck lights may have a need for proficiency that justifies the installation of OLA sites and equipment.

13460-5 **LOCATION OF OLA EQUIPMENT**. The OLA site shall be located on the left hand side of the runway as viewed by the approaching pilots. If the OLA is associated with a simulated carrier deck installation, the face of the lens cells or mirror shall be located 131.1 meters (430 feet) forward of the ramp athwartship lights. If the OLA is an independent installation for a three degree glide slope, the preferred location of the face of the lens cells or mirror is 228.7 +/- 3.05 meters (750 +/-10 feet) forward of the runway threshold but may be influenced by the following factors:

- The glide path angle for the primary electronic approach system.
- Special threshold crossing height requirements.
- Special ground point intercept for the runway or instrument approach system.
- Approach zone obstruction clearance requirements.
- Intersecting runways or taxiways.

The mounting pad shall be located so that the centerline of the lens cells is not less than 35.1 meters (115 feet) from the runway centerline and not less than 3.05 meters (10 feet) from the runway edge. To preclude the mounting pad from becoming an airfield obstruction when the OLA is relocated, the height of the pad should be no higher than 0.05 – 0.08 meters (2-3 inches) above terrain level (almost at ground level). The required height of the OLA should then be achieved by the use of concrete blocks on the pad and/or jacking screws attached to the OLA. The mounting pad shall be 3.4 meters x 5.2 meters (11 feet x 17 feet), level, and have a permanent survey marker for correct location and alignment of the centerline of the FLOLS cells. At 45.7 meters (150 feet) toward the runway threshold from the position for the face of the cells on a line parallel to the runway centerline, a survey monument for the siting mirror station for the FLOLS shall be installed. This monument or pad shall have a permanent survey marker for correct location of this equipment and should be at the same elevation as the mounting pad.

NOTE: Any new OLA pads installed at simulated carrier deck lighting installations or proficiency installations shall be made to accommodate an IFLOLS configuration. Pad size 3.4 meters x 5.2 meters (11 feet x 17 feet), perpendicular to the simulated carrier deck centerline, with an elevation at terrain level.

134 62 WIND DIRECTION INDICATOR (EA)
FAC: 1341
BFR Required: N

Design Criteria: NAVAIR 51-50AAA-2, Visual Landing Aids Design Standards, Land-based Installations
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13462-1 **DEFINITION**. A Wind Direction Indicator provides visual information of the surface wind direction and general indication of the wind speed to the aircrew. This wind information is most useful during takeoff, for orientation to make an approach, and in the final phase of approach prior to touchdown.

Wind cones/socks are the most common type of wind direction indicators; however, wind tees do still exist and remain in this Category Code for inventory purposes. The "wind tee" is a "T" shaped rotating structure used at Navy and Marine Corps air installations as a navigational aid. It is positioned on the ground where it will be visible from all directions of approach and centrally located for identification and orientation from the air. The "wind tee" is outlined with green lights which, when lit, give it the appearance of a single green "T" when viewed from above. When the lights are not lit, it appears as a single stroke yellow "T". A background of crushed stone, gravel, or similar material that will retard the growth of vegetation and provide sharp contrast to the "wind tee" colors is provided.

13462-2 **REQUIREMENTS**. The standard wind direction indicator used on Navy and Marine Corps airfields is the 3.66 meter (12 foot) wind cone and is often called a wind sock. This wind cone is a fabric, truncated cone 3.66 meters (12 feet) long. The throat, or entrance for air into the cone is 0.91 meters (3 feet) in diameter to fit over the framework 1.37 meters (54 inches) long to hold the cone open. The color of the cone is orange or white and provides good contrast with its background when viewed from an altitude of 305 meters (1,000 feet). The support for the wind vane and illumination and obstruction lights, if used, is pivoted for lowering the cone and lights for maintenance. If the airfield or runways have lighted facilities for flight operations at night, the cone must be illuminated.

A 2.44 meter (8 foot) wind cone can be used for smaller, secondary airfields, heliports, or if necessary to locate the wind indicator closer than the standard runway. These wind cones are proportionately smaller than the larger size, be in contrast to their surroundings, have the same maintenance issues, and must be illuminated at night for visibility.

13462-3 **SITE PLANNING**. The location of the 3.66 meter (12 foot) wind cone is near the runway threshold not less than 122 meters (400 feet) from the centerline, preferably between 152 meters (500 feet) and 457 meters (1,500 feet) down the runway from the threshold. One wind cone may serve the ends of two runways if the distance from either runway centerline is not more than 305 meters (1,000 feet).

The location of the 2.44 meter (8 foot) wind cone is not less than 45.7 meters (150 feet) from the runway edge where clearance space or wind disturbances are not suitable for the 3.66 meter (12 foot) wind cone. If the wind cone is less than 91.4 meters (300 feet) from the runway edge, the support shall be low-mass or light-weight type.

134 64 RUNWAY DISTANCE MARKERS (EA)
FAC: 1341
BFR Required: N

> **Design Criteria:** NAVAIR 51-50AAA-2, Visual Landing Aids Design Standards, Landbased Installations
> **Planning Criteria:** P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13464-1 **DEFINITION**. The purpose of Runway Distance Markers (RDMs) is to indicate to aircrews the distance remaining to the end of the runway during takeoff and landing. The RDM provide this information for day and night operations in all weather conditions. The RDM should be provided for all runways where fixed wing jet aircraft operations are conducted and are recommended for runways intended for operations of propeller type aircraft. If the runway is used for nighttime or low visibility Instrument Flight Rule (IFR) operations, the RDM must be internally illuminated. If the runway is only used for daytime operations, the RDM may have unlighted markers.

13464-2 **REQUIREMENTS**. The RDM consists of a row of vertical markers (signs) spaced along each side of the runway longitudinally. The faces of the markers are vertical. Each face of the marker indicates the distance in thousands of feet remaining to each end of the runway. The color scheme used is white numerals on a black background.

13464-3 **SITE PLANNING**. The rows of RDM are parallel to and equidistant from the runway centerline. A pair of markers on opposite sides of the runway is located at each 305 meter (1,000 foot) spacing. The lines connecting the pairs of markers are perpendicular to the runway centerline. The apex or edges of the markers nearest the runway in each row shall form a line not less than 15.2 meters (50 feet) and not more than 22.9 meters (75 feet) from the full strength runway edge. The 22.9 meter (75 foot) distance is preferred. The marker cannot be less than 15.2 meters (50 feet) from the edge of any intersecting runway or taxiway. Where the 305 meter (1,000 foot) positions do not provide clearance from an intersecting runway or taxiway, the position of the pair of markers may be moved a maximum of 30.5 meters (100 feet) to obtain the clearance.

For runways that are not exact multiples of 305 meters (1,000 feet), the extra distance is apportioned at the runway ends by the following equation:

$$E = (D - M)/2$$

E = the excess distance in feet to be added to the intervals at the runway ends.
D = the length of the runway in feet.
M = the distance in feet of the maximum number of 305 meter (1,000 foot) intervals.

Consult NAVAIR 51-50AAA-2 for additional information of marker siting and special site conditions. The markers are internally illuminated. Runway distance markers are planned for all Navy and Marine Corps installation.

134 66 VOR/TACAN CHECK SIGN (EA)
FAC: 1341
BFR Required: N

Design Criteria: NAVAIR 51-50AAA-2, Visual Landing Aids Design Standards, Land-based Installations
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13466-1 **DEFINITION**. A VOR/TACAN Check Sign provides information for the pilot when verifying the operation of the navigational aid in the aircraft before taking off. This check sign is a visual identification marker erected in the area adjacent to the aircraft holding point at the taxiway access to runway ends. The sign includes the type of navigational aid, identification code, radio channel, magnetic bearing, and the distance in nautical miles to the transmitting antenna from the checkpoint marking. It provides aircrew members with operational check information on the navigation equipment of the aircraft.

13466-2 **REQUIREMENTS**. The character height shall not be less than 0.18 meters (7 inches) or more than 0.20 meters (8 inches) high and the stroke width of not less than 0.03 meters (1 inch). The sign should have black characters on a yellow background and be similar in shape and color when lighted at night and unlighted during the daytime.

13466-3 **SITE PLANNING**. Check signs are planned for all runway ends at each air installation equipped with a tactical air navigation (TACAN), visual omni-directional range (VOR), or combined (VORTAC) installation.

134 70 RADAR TOWER (EA)
FAC: 1341
BFR Required: N

Design Criteria: None Available.
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13470-1 **REQUIREMENT.** Radar towers must be planned on an individual basis.

134 71 AVIATION METEOROLOGICAL FACILITY (EA)
FAC: 1341
BFR Required: Y

13471-1 **DEFINITION**. An AVI meteorological facility is a weather forecasting facility that supports air operations.

13471-2 **GENERAL.** . An engineering analysis is required to determine facility space allocations.

135 COMMUNICATION LINES

135 10 COMMUNICATION LINES OTHER THAN TELEPHONE (MI)
FAC: 1351
BFR Required: N

13510-1 Communication lines provide circuits between the various activities on or off the station. The communications net may include trunk line service cable, feeder lines, and direct circuits depending on the complexity of the system.

135 11 FIBER OPTIC COMMUNICATIONS LINES, UNDERGROUND IN CONDUIT (MI)
FAC: 1351
BFR Required: N

13511-1 **DEFINITION.** The communications lines are non-armored OM-2 Single mode Fiber Optic cables installed inside an underground duct.

135 12 FIBER OPTIC COMMUNICATIONS LINES, NON-CONDUCTIVE RISER RATED (EA)
FAC: 1351
BFR Required: N

13512-1 **DEFINITION.** The communications lines are non-armored OM-3 multimode Fiber Optic cables installed inside and underground duct.

135 13 FIBER OPTIC COMMUNICATIONS LINES, OUTSIDE PLANT, ARMORED (MI)
FAC: 1351
BFR Required: N

13513-1 **DEFINITION.** These communications lines are single mode, or multimode or mixed mode fiber rated for indoor and outdoor use for campus and/or building backbone installed in riser, conduit, and ducts or direct buried.

135 15 OPTICAL GROUND WIRE (MI)
FAC: 1351
BFR Required: N

13515-1 **DEFINITION.** Optical ground wire is for electrical power and optical communication between power substations in support of relay interconnects.

135 20 TELEPHONE LINES (MI)
FAC: 1351
BFR Required: N

13520-1 No specific criteria are available.

135 21 FIBER OPTIC COMMUNICATIONS LINES, OUTSIDE PLANT, MARINIZED (UNDERWATER / WETLAND) (MI)
FAC: 1351
BFR Required: N

13521-1 **DEFINITION.** The communication lines are underwater grade reinforced composite fiber cable used in aquatic conditions.

135 31 COPPER COMMUNICATIONS LINES, OUTSIDE PLANT, GEL FILLED (MI)
FAC: 1351
BFR Required: N

13531-1 **DEFINITION.** These types of communications lines are for indoor and outdoor use for campus and/or building backbone copper cable installed in riser, conduit, and ducts or direct buried.

135 32 COPPER COMMUNICATIONS LINES, OUTSIDE PLANT, AIR CORE (MI)
FAC: 1351
BFR Required: N

13532-1 **DEFINITION.** These types of communications lines are annealed reinforced composite copper cable used with air compressors to support continual drying.

135 33 COPPER COMMUNICATIONS LINES, OUTSIDE PLANT, MARINIZED (UNDERWATER / WETLAND) (MI)
FAC: 1351
BFR Required: N

13533-1 **DEFINITION.** These types of communications lines are underwater grade reinforced composite copper cable used in aquatic conditions.

135 34 COPPER COMMUNICATIONS LINES, OUTSIDE PLANT, ARMORED (MI)
FAC: 1351
BFR Required: N

13534-1 **DEFINITION.** These communications lines are bulk copper cable designed for direct burial condition installed directly in or above ground without conduit.

136 AIRFIELD PAVEMENT LIGHTING

136-1 **DEFINITION**. Airfield pavement lighting includes facilities for lighting all airfield pavements and approaches thereto. The purpose of this section is to provide the general requirements for airfield Visual Landing Aids for approaches, landings, takeoffs, taxiing, and surface maneuvering of aircraft on Navy and Marine Corps airfields. The visual landing aids include lighting and markings. The various lighting systems are planned with regard to other airfield related facilities so that integrated control is achieved, and the resultant overall lighting system is compatible with the operational mission of the air installation.

136-2 **CONDITIONS**. Based on missions assigned by CNO, lighting facilities are developed to meet Visual Flight Rules (VFR) or Instrument Flight Rules (IFR) conditions as defined in NAVAIR 51-50AAA-2 as follows:

136-2.1 **Visual Flight Rules (VFR).** These are rules which govern the procedures for conducting flights under visual conditions. The minimum conditions in which VFR operations are permitted is a minimum cloud ceiling height of 304.8 meters (1,000 feet) and ground visibility of 4.83 km (3 miles).

136-2.2 **Instrument Flight Rules (IFR).** These are rules governing procedures for conducting instrument flight. IFR flight operations are dependent upon pilots' use of instrument guidance. As a ceiling becomes lower or the visibility more restrictive, the more precise the electronic ad visual guidance must be as required for the following categories:

(1) Non-precision IFR: IFR operations that use non-precision electronic aids (TACAN, VORTAC, etc.) to provide directional guidance for straight-in approaches to a Minimum Decent Altitude (MDA) as low as 79.2 meters (260 feet) and 1.61 km (1 mile) visibility or 1,250 meters (5,000 feet) Runway Visual Range (RVR).

(2) Precision IFR, Category I: Requires precision electronic aids (ILS, PAR, or MLS) and visual aids for approach minimums of 60.9 meters (200 feet) Decision Height (DH) and 732 meters (2,400 feet) (some cases 488 meters (1,600 feet)) RVR.

(3) Precision IFR, Category II: Requires precision electronic aids (precision ILS or MLS) and visual aids for approach minimums of 30.5 meters (100 feet) DH and 366 meters (1,200 feet) RVR.

(4) Precision IFR, Category IIIA: Requires precision electronic aids (precision ILS or MLS) and visual aids for approach minimums of 0 meters (0 feet) DH and 213 meters (700 feet) RVR.

(5) Precision IFR, Category IIIB: Requires precision electronic aids (precision ILS or MLS) and visual aids for approach minimums of 0 meters (0 feet) DH and 45.7 meters (150 feet) RVR.

(6) Precision IFR, Category IIIC: Requires precision electronic aids (precision ILS or MLS) and visual aids for approach minimums of 0 meters (0 feet) DH and 0 meters (0 feet) RVR.

136-3 **REQUIREMENTS.** The types of approach visual aids required for an airfield depend on the kind of flight operations that will be performed. Flight operations are separated into VFR and IFR. Major airfields usually have both types of operations.

136-3.1 **Approach Visual Aids**. Approach visual aids associated with the different flight rules are indicated in Table 136-1.

Table 136-1. Approach Visual Aids Requirements

Visual Aids System		Authorized Operations						
		VFR	IFR Category					
			Non-Prec	I	II	IIIA	IIIB	IIIC
136-10	ALSF-1	NR	NR	R	NR	NR	NR	NR
136-10	ALSF-2	NR	NR	NR	R	R	R	R
136-10	MALSR	RS	RS	-	-	-	-	-
136-10	SALS	NR	RS	NR	NR	NR	NR	NR
136-30	Circling Guidance Lights	RS	RS	NR	NR	NR	NR	NR
136-60	REIL	C	C	-	NR	NR	NR	NR

C = Recommended
= Required. These visual aids are required for operating in the IFR Category, but other factors may negate approval for installation.
RS = Required under special conditions.
NR = Not required.

136-3.2 **Runway Approach Visual Aids.** The runway visual aids consist of markings and lighting installed near the runway. The runway lights include basic edge lights, low-intensity runway lights, and supplemental runway lights. The basic runway lights define the limits of the runway surface. These are edge lights, threshold lights, and runway end lights. Some runways may have displaced threshold lights and markings. The low-visibility runway lights are the centerline and touchdown zone lights. The supplemental runway lights may be runway exit lights, runway distance markers, and arresting gear markers. The configuration of the markings differs for the class of runway. The marking and types of lights may be different for runways on the same airfield. Runway visual aids associated with different flight rules are shown in Table 136-2.

Table 136-2. Runway Approach Visual Aids Requirements

Visual Aids System		Authorized Operations						
		VFR	IFR Category					
			Non-Prec	I	II	IIIA	IIIB	IIIC
	Runway Markings	R	R	R	R	R	R	IN
136-30	Runway Edge Lights (HIRL)	R	R	R	R	R	R	IN
136-30	Runway Edge Lights	R	R	R	R	R	R	IN
136-35	Runway Centerline Lights	NR	C	C	R	R	R	IN
136-55	Touchdown Zone Lights (TDZL)	NR	NR	OPT	R	R	R	IN
136-60	Displaced Threshold Lights and Markings	RS	RS	RS	RS	RS	RS	IN
136-60	Runway Threshold Lights and Markings	R	R	R	R	R	R	IN

C = Recommended
= Required. These visual aids are required for operating in the IFR Category, but other factors may negate approval for installation.
RS = Required under special conditions.
OPT = Option as recommended by Air Station Commander and approved by NAVAIRSYSCOM.
IN = Installation necessary.
NR = Not required.

136-3.3 **Taxiway Visual Aids**. The taxiway lights and markings identify the area as a taxiway, define its limits, and provide directional guidance for maneuvering aircraft. The signs provide information on routes to taxi destinations and identify areas along the taxi route. Taxiway markings are painted on the paved surfaces and include centerline, edge, holding position, and checkpoint markings. The taxiway lights include either edge lights, centerline lights, or a combination of both lights, and in some cases holding position lights. Taxiway guidance signs provide mandatory information that the pilot must recognize because of the existence of potential hazards. Also, general information is provided that assists the pilot in proceeding along the proper taxi route. Special signs may provide checkpoint information or routing information at complex intersections. The locations, types, and information on the signs vary for each taxiway. Taxiway visual aids associated with different flight rules are shown in Table 136-3.

Table 136-3.Taxiway Visual Aids Requirements

Visual Aids System	Authorized Operations						
	VFR	IFR Category					
		Non-Prec	I	II	IIIA	IIIB	IIIC
Taxiway Markings	R	R	R	R	R	R	R
Taxiway Edge Lights	R	R	R	R	C	C	C
Taxiway Centerline Lights, Intersections	NR	OPT	C	C	R	R	R
Taxiway Centerline Lights, Continuous	NR	NR	OPT	C	R	R	R
Taxiway Guidance Signs	RS	C	R	R	R	R	R
Special Signs (TACAN)	RS	RS	RS	RS	RS	RS	RS
Special Signs, Billboards	RS	RS	RS	RS	RS	RS	RS
Holding Position Signs	C	R	R	R	R	R	R
Holding Position Lights	RS	RS	RS	RS	RS	RS	RS
Taxiway Lights for Runways Used as Taxiways	RS	RS	RS	RS	RS	RS	RS

C =	Recommended
R =	Required.
RS =	Required under special conditions.
OPT =	Option as recommended by Air Station Commander and approved by NAVAIRSYSCOM.
NR =	Not required.

136-3.4 **Special Considerations**. The following airfield lighting requirements are determined by individual airfield needs as described under the referenced Category Code:

Approach Lighting	136 10
Apron and Parking Area Lighting and Markings	136 20
Runway Edge Lighting and Markings and Circling Guidance Lights	136 30
Runway Centerline Lighting and Markings	136 35
Simulated Carrier Deck Lighting and Markings	136 36
Wheels-Up/Wave-Off Lighting	136 45
Taxiway Lighting and Markings	136 50
Touchdown Zone Lighting and Markings	136 55
Threshold Lighting and Markings	136 60
Heliport Lighting and Marking Systems	136 65

Obstruction lighting, beacons, and other visual navigation and traffic aids are discussed under basic Category Code series 134. For airfield perimeter lighting, street lighting, and other general illumination, see Basic Category Code series 812, Electric Power – Transmission and Distribution Lines.

136 10 APPROACH LIGHTING (M/LF)
FAC: 1361
BFR Required: N

Design Criteria: NAVAIR 51-50AAA-2, Visual Landing Aids Design Standards, Land-based Installations
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13610-1 **DEFINITION.** Approach lighting enhances the aircrew's ability to acquire the runway environment visually when making an approach for landing during periods of reduced visibility. Visual cues for directional and roll guidance are provided to the aircrew for operations at night and in marginal weather conditions by day. The system includes both approach lights and sequenced flashers.

Approach lighting is provided for primary instrument approach runways. Planning of Category I, Category II, or Category III approach lighting systems is accomplished in accordance with mission requirements as listed in Basic Category 136. With sufficient justification approach lighting may also be authorized for other runways.

13610-2 **CONSIDERATIONS**. Factors to be considered in the justification of any approach lighting system include, but are not limited to:

- Existing and desired precision approach minimums.
- Number of actual instrument approaches.
- Climatology.
- Surface features, obstructions and feasibility of construction.

13610-3 **REQUIREMENTS**. Approach lights fall into three categories:

13610-3.1 **High Intensity Approach Lighting System (ALSF-1)**. The High Intensity Approach Lighting System, ALSF-1, is a system of light bars and barrettes in the approach zone immediately ahead of the runway threshold. The standard length of an ALSF-1 is 914 meters (3,000 feet) unless terrain or other local conditions prevent a full length installation. Then the length may be shortened to not less than 732 meters (2,400 feet). This shorter system can impact landing minimums. Approval from NAVAIRSYSCOM is required for systems shorter than 914 meters (3,000 feet). Systems that are between 427 meters (1,400 feet) and 701 meters (2,300 feet) are called Short Approach Lighting Systems (SALS). The ALSF-1 consists of centerline lighting barrettes, sequencing flashing lights, 305 meters (1,000 foot) crossbar, terminating bar, pre-threshold wing bars, and threshold lights (Category Code 136 60). The standard system extends from the threshold 914 meters (3,000 feet) into the approach area of the runway. A barrette is three or more lights closely spaced in a transverse line so that from a distance they appear as a single short illuminating bar. For the ALSF-1, the length of the barrette shall not exceed 4.57 meters (15 feet) and the center-to-center spacing of the lights shall not exceed 1.52 meter (5 feet).

13610-3.2 **High Intensity Approach Lighting System (ALSF-2).** The High Intensity Approach Lighting System, ALSF-2, is a system of light bars and barrettes in the approach zone immediately ahead of the runway threshold. This approach lighting system is intended for use where operation during Category II instrument flight conditions or lower weather minimums are required. The standard length of an ALSF-2 is 914 meters (3,000 feet) unless terrain or other local conditions prevent a full length installation. Then the length may be shortened to not less than 732 meters (2,400 feet). The plan for the ALSF-2 consists of centerline lighting barrettes, sequencing flashing lights, 305 meters (1,000 foot) crossbar, 152 meter (500 foot) crossbar, side row barrettes, and threshold lights (Category Code 136 60). A barrette is three or more lights closely spaced in a transverse line so that from a distance they appear as a short illuminating bar. For the ALSF-2, the length of the barrette shall not exceed 4.57 meters (15 feet) and the center-to-center spacing of the lights shall not exceed 1.52 meter (5 feet).

13610-3.3 **Medium Intensity Approach Lights (MALSR).** The MALSR is a medium intensity approach lighting system with runway alignment indicator lights. It is intended for installation at Naval airfields only in support of Visual Flight Rules (VFR) or non-precision instrument approaches where installation costs are a factor. The standard system consists of centerline lights, a 305 meters (1,000 foot) crossbar, and sequenced flashing lights. The centerline is coincident with the extended runway centerline. The overall system is 732 meters (2,400 feet) long, but may be shortened to as little as 427 meters (1,400 feet) where space or construction problems arise. Where systems are shortened to less than 610 meters (2,000 feet), flashers will be added to steady burning light stations to provide a minimum of three flashing lights.

136 20 APRON AND PARKING AREA LIGHTING AND MARKINGS (M/LF)
FAC: 1361
BFR Required: N

Design Criteria: NAVAIR 51-50AAA-2, Visual Landing Aids Design Standards, Land-based Installations
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13620-1 **DEFINITION**. Apron and parking area lighting enables the aircrew to guide their aircraft into position for loading, servicing, or parking and provides illumination to perform such functions as fueling, maintenance, loading, unloading, and security.

13620-2 **APRON MARKINGS**. Apron markings are the basic visual aid for taxiing in the apron area during daylight and to supplement the lights during night operations and for all meteorological conditions. The markings provide visual cues to aircrews for taxiing through a complex or congested area between the end of the taxiway and the final position for parking the aircraft. This area includes terminals, hangars, service areas, and taxiways. The apron markings include taxiway centerline and edge markings, shoulder or deceptive area markings for paved areas not intended for aircraft traffic, parking area markings, and special markings to identify destinations or to provide specific information.

13620-3 **APRON LIGHTING.** Lighting of apron and parking areas is accomplished by a combination of high and surface mounted floodlights and roadway luminaries. Apron and parking area lighting is provided at all air installations where night or all weather operations are conducted. The overall lighting scheme is developed after a study of the functions to be performed and the physical layout of pavements and structures of the particular airfield.

136 30 RUNWAY EDGE LIGHTING AND MARKINGS AND CIRCLING GUIDANCE LIGHTING (M/LF)
FAC: 1361
BFR Required: N

Design Criteria: NAVAIR 51-50AAA-2, Visual Landing Aids Design Standards, Land-based Installations
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13630-1 **DEFINITION**. This Category Code includes two groups of lights, Runway Edge Lights, which define the lateral limits of the pavement, and Circling Guidance Lights (CGLs), which enable an airborne aircrew to locate the runway while off to the side of the runway and establish the proper traffic pattern.

13630-2 **RUNWAY EDGE LIGHTING SYSTEM**. Runway edge lighting consists of three types of lights including: Low Intensity Runway Edge Lights (LIRL); Medium Intensity Runway Edge Lighting (MIRL); and High Intensity Runway Edge Lighting (HIRL). Runway edge lights are installed parallel to the runway centerline for the length of the runway. The intensity of edge lighting used depends upon dominant weather conditions over the airfield. Each type of runway edge lights defines the lateral limits of the usable runway surface for landings and takeoffs during nighttime operations and in reduced visibility. The runway edge lighting is a basic airfield lighting system. With its associated Threshold Lighting, Category Code 136 60, and runway end lighting, it can function without other lighting support. All runways intended for use at night or during Instrument Flight Rules (IFR) operations require edge lighting.

Edge lighting systems consists of two straight lines of lights with one line of lights located along each edge of the runway. The lights are equally spaced along the edge of the runway, bi-directional, and the emitted color shall be aviation white. For runways with displaced thresholds, edge lighting is installed at the edges of the displaced area if this area is used for rollouts and takeoffs. Edge lighting located in the displaced threshold area the color of the emitted light towards the approach zone shall be aviation red.

13630-2.1 **Edge Lights**. Runway edge lights are white lights equally spaced on each side of the runway with a maximum interval of 61 meters (200 feet). Runway edge lights are installed to provide visual guidance during takeoff and landing operations at night and under low visibility conditions. Requirements are expressed in terms of runway length; that is, runway lights programmed for a runway 3,200 meters (10,500 feet) long will be shown as 3,200 meters (10,500 feet) of runway lights. Consult NAVAIR 51-50AAA-2 for layout and spacing requirements.

13630-2.2 **Edge Markings**. Runway edge markings are continuous lines near each edge of the runway parallel to the runway centerline. The stripes are 0.914 meters (3 feet) wide. For runways 61 meters (200 feet) or less in width, the outer edge of these stripes shall be 0.61 meters (2 feet) from the nominal or designated edge of the runway. For runways more than 61 meters (200 feet) wide, the inner edges of the markings are 58 meters (190 feet) apart and symmetrical about the runway centerline. If the runway has a displaced threshold, the side stripes continue through the displaced section. Preferably, the edge markings extend to the runway ends but may terminate with the beginning of the threshold markings except where the threshold is displaced from the runway end. The color of the edge markings is retro-reflective white. Consult NAVAIR 51-50AAA-2 for layout and spacing requirements.

13630-3 **CIRCLING GUIDANCE LIGHTS**. Circling Guidance Lights (CGLs) are two straight lines of white lights with one line on each side of the runway with the beam emitted perpendicular to and away from the runway centerline. GCLs have a nominal 305 meter (l,000 foot) spacing and are placed outboard of the runway edge in line with the Runway Distance Markers, Category Code 134 64. They are used only for visual flight operations where conditions around the air installation, such as a metropolitan area or smog, confuse or obscure the runway when viewed from a circling aircraft. The need for circling guidance lights at a given air installation is determined by the particular airfield environment. Circling guidance lights requirements are also expressed in feet of runway length. Consult NAVAIR 51-50AAA-2 for layout and spacing requirements.

136 35 RUNWAY CENTERLINE LIGHTING AND MARKINGS (M/LF)
FAC: 1361
BFR Required: N

Design Criteria: NAVAIR 51-50AAA-2, Visual Landing Aids Design Standards, Land based Installations
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13635-1 **RUNWAY CENTERLINE LIGHTING**. Runway centerline lighting provides visual aid to assist the aircrew in keeping the aircraft centered on the runway during take-off and after landing at night or in condition of reduced visibility. It is a supplement to Runway Edge Lighting and Markings and Circling Guidance Lighting, Category Code 136 30. White in-pavement lights are placed along the runway centerline at either 7.62 meter (25 foot) spacing of “tailhook resistant” lights or 15.2 meter (50 foot) spacing of standard duty lights. Lights are white when viewed from the landing threshold until the last 914 meters (3,000 feet) of the runway. The white lights alternate with red for the next 610 meters (2,000 feet), and are all red the final 305 meters (1,000 feet) in order to distinguish the runway’s end.

13635-2 **REQUIREMENTS**. Runway centerline lighting is planned in accordance with mission requirements as listed in Basic Category Code series 136. Requirements are expressed in meters (feet) of runway length vice the length of the lighting circuit. Consult NAVAIR 51-50AAA-2 for layout and spacing requirements.

13635-3 **RUNWAY CENTERLINE MARKING**. Runway centerline markings are centered on the runway centerline. The markings are a broken line of 36.6 meters (120 foot) long stripes separated by blank spaces of 24.4 meters (80 feet) +/- 3.05 meters (10 feet). The first stripe from each end is 12.2 meters (40 feet) from the top of the designation number. The minimum width of stripes is 0.305 meters (1 foot) wide for basic runways and a minimum of 0.914 meters (3 feet) wide from other runways. The color of these markings is retro-reflective white.

136 36 SIMULATED CARRIER DECK LIGHTING (EA)
FAC: 1362
BFR Required: Y

Design Criteria: NAVAIR 51-50AAA-2, Visual Landing Aids Design Standards, Land-based Installations
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13636-1 **DEFINITION**. A simulated carrier deck is used to train pilots ashore for landing aircraft under simulated conditions of a carrier at sea. Simulated carrier deck lighting and markings permits training during the day, night, and adverse visibility conditions.

13636-1.1 **Lighting**. The carrier deck lighting consists of centerline lights, edge lights, and athwartship lights. The edge and athwartship lights form a 21.3 meter by 228 meter (70 foot by 748 foot) rectangle outlining the simulated carrier deck that is on the left side of the runway, as seen from the landing aircraft, and approximately 98 meters (320 feet) beyond the runway threshold. An Optical Landing Aid, Category Code 134-60, and Landing Signal Officer (LSO) station is also required. Consult NAVAIR 51-50AAA-2 for layout and spacing requirements.

13636-1.2 **Markings**. The simulated carrier deck markings supersede the standard runway markings, including the unpainted areas within the deck boundaries and are symmetrical about the designated deck centerline. The markings are painted on the runway surface. If the contrast of the markings against the runway is poor, the markings may be outlined with a lusterless black border. The markings shall consist of centerline markings, edge markings, and ramp athwartship markings. There is no athwartship line at the forward end of the deck. Consult NAVAIR 51-50AAA-2 for layout and spacing requirements.

13636-2 **REQUIREMENTS.** Simulated carrier deck lighting is required at all air installations designed by the Chief of Naval Operations (CNO) for Fleet Carrier Landing Practice (FCLP). Normally two sets are installed per runway, one at each end of the runway selected for FCLP.

136 45 WHEELS-UP/WAVE-OFF LIGHTING (M/LF)
FAC: 1362
BFR Required: N

Design Criteria: NAVAIR 51-50AAA-2, Visual Landing Aids Design Standards, Land-based Installations
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13645-1 **DEFINITION**. Wheels-Up and Wave-Off Lights are provided to allow either the Wheel Watch, the Landing Signal Officer (LSO), or Control Tower personnel to determine if a landing aircraft has its landing gear fully extended and/or to signal to an aircrew to abort or "wave-off" a landing attempt.

13645-2 **REQUIREMENTS**. Wheels-up lights are a bar of 20 white lights installed under the approach path that are aimed upward and toward the threshold. They are intended to illuminate the underside of landing aircraft to permit observers to determine that the landing gear is fully lowered. The system also includes a pad for siting a portable Wheels Watch Shelter, Category Code 133-80. The light bar is placed 264 meters (980 feet) +/- 1.54 meters (5 feet), from the threshold under the approach path and on the same side of the extended runway centerline as the Control Tower.

Wave-off lights are used to signal to the aircrew to abort or "wave off" a landing attempt. Six pairs of flashing red lights, three pairs on each side of the runway, spotted 3.05 meters (10 feet) outboard of the runway edge at 270 meters, 510 meters, and 750 meters (900 feet, 1,700 feet, and 2,500 feet) from the runway threshold that are activated by either the Wheels Watch or Control Tower personnel. The lights flash when activated.

136 50 TAXIWAY LIGHTING AND MARKINGS (M/LF)
FAC: 1361
BFR Required: N

Design Criteria: NAVAIR 51-50AAA-2, Visual Landing Aids Design Standards, Land-based Installations
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13650-1 **DEFINITION**. Taxiway lighting and markings define the lateral limits and direction of a Taxiway, Category Code 112-10, to guide aircraft movement between the runway operational area and the aircraft parking area during night operations or conditions of poor visibility.

13650-2 **TAXIWAY LIGHTING SYSTEM REQUIREMENTS**. Taxiway lighting requirements are expressed in meters/feet of lighted taxiway length, not in length of lighting circuit. The total length of taxiway lighting is dependent upon the length of the taxiway itself, its turn radii, and its number of intersections and holding positions. The amount of taxiway lighting is expressed in meters (linear feet). Included in this category are taxiway edge lights, taxiway centerline lights, hold lights and guidance signs.

13650-2.1 **Taxiway Edge Lights**. Taxiway edge lights are elevated or semi-flush blue lights located on each side of the taxiway at intervals delineated in NAVAIR 51-50AAA-2. This interval varies based on the length and turn radii of the taxiway. Therefore, the number of lights cannot be determined without first knowing the geometry of the taxiway and airfield. Consult NAVAIR 51-50AAA-2 for layout information. Taxiway edge lighting is planned for all air installations conducting all-weather or night operations.

13650-2.2 **Taxiway Centerline Lights**. Taxiway centerline lights are semi-flush green lights placed in the pavement on the centerline of the taxiway. They are used to add the directional guidance required at high speed taxiway exits. They are also used to supplement edge lights wherever more positive guidance of aircraft is necessary, such as at complex taxiway intersections or large ramp areas where pilot confusion might occur. Again, the number of taxiway lights cannot be determined without knowing the geometry of the airfield. Consult NAVAIR 51-50AAA-2 for layout and spacing requirements.

13650-2.3 **Hold Lights**. Hold lights are a group of three semi-flush lights centered about the taxiway centerline at the holding position marker. For wide taxiways, five lights may be used. If the taxiway has centerline lighting in the area where the holding position lights are to be installed, the holding position lights shall be the same type as the centerline lights except with yellow filters. For intersections without centerline lights, three yellow lights, located in the center of the taxiway, perpendicular to the aircraft's direction of travel, shall be aimed towards the holding position. Holding position yellow lights are used for night marking of the painted hold positions. Their position and location are based on operational requirements. Consult NAVAIR 51-50AAA-2 for layout information.

13650-2.4 **Guidance Signs**. Taxiway guidance signs are internally lighted signs used to supplement taxiway lighting systems. They are placed at intersections of runways, taxiways with runways, taxiways with aprons, taxiways with taxiways, at refueling stations, and generally where direction or location information is required. The number of signs is based on the particular airfield requirements and is kept to a minimum. Consult NAVAIR 51-50AAA-2 for sign height limitations and letter text size.

13650-3 **TAXIWAY MARKINGS REQUIREMENTS.** Taxiway markings consist of a system of markings identified by the functions which they serve. The elements of taxiway markings include: taxiway centerline markings (required); holding position markings (standard and Category II, required); runway entrance and exit markings (required); TACAN checkpoint markings (required, if established); edge markings (optional); shoulder markings (optional); hazardous area markings (optional); and closed taxiway markings (optional). The markings shall be painted of the specified color applied to the taxiway surface except temporary hazardous area markings may use flags or barrier markings. Also, temporary closed taxiway markings may be of materials such as tape of that color that can be easily removed.

Taxiway centerline markings are a contiguous retro-reflective yellow stripe not less than 0.152 meters (6 inches) wide located along the taxiway axis. If taxiway centerline lights are installed, the axis of the centerline stripe may be offset no more than 0.305 meters (1 foot) from the taxiway centerline to avoid painting over the lights. These marking provide identification of a taxiway and longitudinal guidance for steering the aircraft. The markings continue across the intersecting taxiways or curve into the intersecting taxiway to indicate turns that are frequently used in taxiing. On curves or curved sections the markings are smooth curves and the minimum distance from the edge of the taxiway is not less than one-half the width of the taxiway. Consult NAVAIR 51-50AAA-2 for layout information.

13650-4 **SPECIAL SITUATIONS**. The use of runways as taxiways should be avoided; however, where the existing airfield layout requires the use of the runway as a taxi path, separate taxiway fixtures and circuits, in addition to the runway lighting system, are used. Consult NAVAIR 51-50AAA-2 for lamp layout and spacing.

136 55 TOUCHDOWN ZONE LIGHTING AND MARKING (M/LF)
FAC: 1362
BFR Required: N

Design Criteria: NAVAIR 51-50AAA-2, Visual Landing Aids Design Standards, Land-based Installations
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13655-1 **LIGHTING REQUIREMENTS**. Touchdown zone lighting delineates the touchdown zone on the runway and provides directional and roll guidance for aircraft approaching the threshold. It provides visual cues for more accurately centering the aircraft on the runway, adjusting attitude for touchdown, and determining the touchdown position. The lighting consists of bars of white lights in the pavement on each side of the runway centerline. Thirty pairs of bars are spaced along the runway at 30.5 meters (100 foot) intervals for a total distance of 914 meters (3,000 feet). Touchdown zone lighting is planned in accordance with mission requirements as listed in Basic Category Code group 136. A set of lights is required only on the end of the runway with approach lighting.

13655-2 **MARKING REQUIREMENTS**. Touchdown zone markings consist of groups of three, two, and one rectangular bars symmetrically arranged impairs about the runway centerline. Each bar is 1.83 meters (6 feet) wide and 23.4 meters (75 feet) long. The bars within a group are spaced 1.52 meters (5 feet) apart. The second group of bars from the threshold shall be fixed distance markings as single bars 9.14 meters (30 feet) wide and 45.7 meters (150 feet) in length. For runways less than 45.7 meters (150 feet) wide, the width of the bars and spaces is reduced proportionately. The inner edges of the bars in a pair are 22 meters (72 feet) apart. The first pair of bars begins 152 meters (500 feet) down the runway from the beginning of the threshold markings (159 meters (520 feet) from the runway end).

On shorter runways, these pairs of bars that would extend to within 274 meters (900 feet) of the midpoint of the runway are eliminated. The color of touchdown zone markings is retro-reflective white. Consult NAVAIR 51-50AAA-2 for layout and spacing requirements.

136 60 THRESHOLD LIGHTING AND MARKINGS (EA)
FAC: 1362
BFR Required: N

Design Criteria: NAVAIR 51-50AAA-2, Visual Landing Aids Design Standards, Land-based Installations
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13660-1 **THRESHOLD LIGHTING**. Threshold lighting is a system of lights defining the ends of the usable runway surface. They include threshold lights, displaced threshold lights, Runway End Identification Lights (REIL) and runway end lights. The threshold lights are displaced from the extremity of the runway when a portion is unavailable for normal operations. REIL and runway end lights enable a pilot to positively identify the ends of the runway from a distance during night-non-precision approach operations.

13660-1.1 **Threshold Lights**. Threshold lights are installed to provide positive identification of the beginning of the operational runway surface for approaching aircraft at night or under Instrument Flight Rules (IFR) conditions. Threshold lighting consists of two groups of lights located symmetrically about and perpendicular to the runway centerline at each end of the runway, both inboard and outboard of the line of the runway edge lights. The lights show green toward the approach zone and, if at an extremity, red toward the runway. Threshold lights are planned for all lighted runways, but more lights are required where an approach lighting system is used as displayed in NAVAIR 51-50AAA-2.

13660-1.2 **Displaced Threshold Lights**. Displaced threshold lighting is used only if a portion of the end of the runway is unusable for landing but is available for rollout and takeoff. When this condition exists because of obstructions or other reasons, the lighting is modified to delineate the extent of runway which is available to aircraft approaching from either direction. This is accomplished by displacing and changing the threshold lights to indicate the new threshold location for landing aircraft and equipping the intervening runway edge lights with filters.

13660-1.3 **Runway End Identification Lights (REIL).** REIL consist of two synchronized flashing lights near the runway threshold to provide rapid and positive identification of the approach end of a runway. These lights have been adopted to replace the obsolete runway identification lights formerly employed as the standard.

13660-1.4 **Runway End Lights**. Runway end lights are installed to define the end of the operational runway for aircraft on landing rollout and takeoff. A minimum of ten red lights are arranged in two groups symmetrical about and perpendicular to the runway centerline pointing toward the runway side of the threshold at each end of the runway. Intervals between lights in each group are not to exceed 3.05 meters (10 feet). They are to be positioned not more than 1.52 meters (5 feet) beyond the length of usable pavement and the outboard most light in each group will be in the line of the runway edge lights. Where runway end lights and threshold lights are to be installed in the same location, bi-directional red/green lights may be used with the appropriate color lens. If located at the end of usable pavement in displaced threshold areas, they are bi-directional red.

13660-2 **THRESHOLD MARKING.** Threshold markings consist of ten stripes, five on each side, parallel and symmetrical about the runway centerline. The color of these markings is retro-reflective white. If the runway is less than 61 meters (200 feet) wide, the overall width of the threshold markings is 6.1 meters (20 feet) less than the runway width. The width of the stripes and spaces between the stripes is reduced proportionately. Consult NAVAIR 51-50AAA-2 for layout and spacing requirements.

136 65 HELIPORT LIGHTING AND MARKING (M/LF)
FAC: 1361
BFR Required: N

Design Criteria: NAVAIR 51-50AAA-2, Visual Landing Aids Design Standards, Land-based Installations
Planning Criteria: P-80.3, Airfield Safety Clearances (Facility Planning Factor Criteria for Navy and Marine Corps Shore Installations, Appendix E)

13665-1 **DEFINITION**. Heliport lighting is a system of lights arranged to clearly define the helicopter landing pad for operations at night and during periods of poor visibility. Heliport lighting includes all visual reference aspects of the approach and landing of rotary wing aircraft. This includes visual aids, markings, perimeter and approach lights, and runway and taxiway lights.

13665-2 **REQUIREMENTS**. The basic heliport lighting requirement is perimeter lighting and landing direction lights. Approach direction lights and depth perception lighting may also be required. Perimeter lighting and landing direction lights are planned for all helicopter pads designated for night or all-weather operations and when authorized as an operational requirement at a specific location. Landing direction lights are used to indicate a preferred landing direction and to give side orientation as wing bars. Approach direction lights are added if additional approach guidance is required. The need for depth perception lighting (pad inset lights and/or flood lights) is determined by heliport location, steepness of approach, and prevailing environmental conditions.

Heliport lighting and marking systems are comprised of numerous types of pavement markings and lighting systems. They include:

13665-2.1 **Helipad Identification Markings**. Included in this category are identification markings and perimeter markings. Helipad identification marking for a paved helipad shall be a capital letter “H”. The “H” marking shall be located in the center of the landing area, and oriented with the preferred approach direction. The dimensions shall vary with size of the landing and takeoff area. The color of the “H” is aviation white, and must be reflective if the pad is used at night. If the paved surface is a light color and improved contrast is needed, the identification marker shall be outlined with a lusterless black border. Perimeter markings define the safe landing area and are oriented with the sides of the parallel square to the letter “H”. The perimeter markings consist of the corners and edge bars. The corners form right angles and the edge bars are located midway between the corner markings. The outer edges of the markings are the designated limits of the landing and takeoff area. These markings are aviation white and if the helipad is used at night shall be reflective. Again, if contrast is needed, these markings will be outlined with a black border.

13665-2.2 **Helipad Perimeter Lights**. Helipad perimeter lights consist of a row of lights along or near the four sides of a helipad. Typically, these lights are elevated although semi-flush lights may be used in areas where helicopters with wheels may be taxiing on the surface between the helipad and parking or service areas. Both type of fixtures emit omni-directional yellow light.

13665-2.3 **Helipad Approach Lights**. Helipad approach lights consist of a row of landing direction lights perpendicular to the centerline of the perimeter lights, beginning approximately 7.62 meters (25 feet) from the midpoint of the perimeter light centerline. These lights are usually elevated although semi-flush lights may be use in areas where helicopters with wheels may be taxiing on the surface. These lights emit omni-directional beams. The helipad approach light system entails two types of lights. The first are Landing Directional Lights. These consist of a single row of six yellow lights outward from the helipad perimeter lights centered on the helipad in the established direction for the approach. The second type of light is the Approach Direction Lights. This system is comprised of two parallel rows of lights extending outward from the last landing direction light. Each row shall have five pairs of white lights.

13665-2.4 **Heliport Runway Lights**. Heliport runway lights are required for runways doing night operations. Yellow lights define the limits of the runway and are spaced at 4.57 meter (15 foot) intervals at the line of perimeter lights and extend outward in the direction of the preferred approach/takeoff path. These lights are an optional feature that is installed when it is necessary to provide directional guidance.

13665-2.5 **Heliport Taxiway Lights.** Heliport taxiways are defined while flush mounted green lights along the taxiway centerline. Blue omni-directional lights define taxiway route edges. The lights are spaced at 7.62 meter (25 foot) intervals on straight sections. On curves, this distance should remain the same; however, there must be at least four lights defining the turn.

137 SHIP NAVIGATION AND TRAFFIC AIDS-BUILDINGS

137-1 This code group applies to buildings for housing sea traffic control, navigation aids and navigation services.

137 10 METEOROLOGY AND OCEANOGRAPHY BUILDING (SF)
FAC: 1371
BFR Required: Y

13710-1 This category is deleted. All future requirements should be reassigned, revised, and calculated as a Category Code 13115 “Communications, Information, or Intelligence Analysis Facility”.

137 20 LIGHTHOUSE (M2/SF)
FAC: 1371
BFR Required: Y

13720-1 **DEFINITION.** A lighthouse is a structure that houses a navigation beacon that may emit light, sound, radio, radar, or a combination thereof. It may be onshore or offshore. Construction is done overseas when appropriate by the Naval Facilities Engineering Command.

13720-2 **REQUIREMENTS**. Criteria are supplied by the U.S. Coast Guard. See UFC 4-141-10N for details.

138 SHIP NAVIGATION AND TRAFFIC AIDS-OTHER THAN BUILDINGS

138-1 This code group applies to structures which function as sea traffic navigation/traffic aids.

138 10 BEACON - SHIP (EA)
FAC: 1381
BFR Required: N

13810-1 **DEFINITION**. The U.S. Coast Guard has specific jurisdiction over all aids to navigation (day beacons, buoys, foghorns, etc.,) in the continental United States and in all outlying territories and possessions. Day beacons are unlighted structures used to mark isolated dangers or channels, edges, or alignment. They are painted white, black, green, or red, either separately or in combination. Day beacons also have reflectors for night use. See Harbor and Coastal Facilities, UFC 4-150-06, for technical information, and International Rules of Road and Inland Waterways, U.S. Coast Guard, for regulations.

138 20 NAVIGATION AID TARGET (EA)
FAC: 1381
BFR Required: N

13820-1 **DEFINITION**. This Category Code is to be used for navigational aid targets which are a part of maritime navigational aids.

13820-2 **REQUIREMENTS**. These facilities are planned on an individual basis.

138 25 ANTENNA-NAVIGATION (EA)
FAC: 1381
BFR Required: N

13825-1 **DEFINITION.** This Category Code is to be used for antennas or antenna systems which are a part of maritime navigational aids.

13825-2 **REQUIREMENTS.** These facilities are planned on an individual basis.

140 LAND OPERATIONAL BUILDINGS

141 OPERATIONAL - BUILDINGS

141 11 AIR PASSENGER TERMINAL (SF)
FAC: 1412
BFR Required: Y

14111-1 **DEFINITION.** The air passenger terminal provides facilities for processing authorized passengers and their baggage and for processing incidental freight. Space is provided in the terminal for the following functional areas: administrative space, baggage claim room, check-in counter, minor freight storage, information counter, and waiting lounge with food concessions. (For air cargo terminal, see Category Code 141 12.) The space to be planned is based on an analysis of the passenger traffic anticipated. A terminal is planned for those air stations where passenger traffic is projected to exceed 30 passengers during a typical peak hour.

14111-2 Due to the irregular and often unpredictable passenger flow in military air terminals, the facility requirements must be justified in each individual case where a terminal is warranted. Supporting data must include historic passenger flow figures and mode in sufficient detail to permit validation of facility scope.

141 12 AIR CARGO TERMINAL (SF)
FAC: 1412
BFR Required: Y

14112-1 **DEFINITION.** An air cargo terminal is planned for air stations where cargo and freight handling exceeds 10,000 pounds per day. The air cargo terminal is separate from the air passenger terminal (Code 141 11) where only incidental freight is handled. Air cargo terminal functions include receipt of packages, control documentation, palletization, and holding for shipment, aircraft loading and unloading, package sorting, and loading on trucks.

14112-2 Space required for air cargo terminal operations is based on the weight of cargo to be handled as determined by station survey. Terminals are planned using the space allowances in Table 14112-1.

Table 14112-1 Space Allowances - Air Cargo Terminal

Average Daily Load (pounds) (1)	Air Cargo Terminal Type	Gross SF Area
10,000 - 20,000	Small, non-mechanical	7,720
20,000 - 40,000	Small, mechanical	32,500
40,000 - 100,000	Medium, mechanical	44,500
100,000 - 160,000	Large, mechanical	54,500

(1) Average Daily Load includes cargo originating, terminating, and being re-handled through the terminal.

14112-3 Air cargo terminal facilities must be adjacent to the transient aircraft apron area, but siting shall not violate aircraft pavement clearance criteria. Exterior pavement requirements include road access, access to aircraft apron, and non-organizational vehicle parking area (see Category Code 852 10).

141 20 AIRCRAFT FIRE AND RESCUE STATION (SF)
FAC: 1411
BFR Required: Y

Refer to Design Criteria, UFC 4-730-10 Fire Stations, for technical requirements at https://www.wbdg.org/dod/ufc/ufc-4-730-10.

The Space Planning Spreadsheet is at located at: https://www.wbdg.org/dod/unified-facilities-space-program-sustainability-spreadsheets.

14120-1 **DEFINITION.** This space criteria applies to Installation fire and rescue facilities which provide fire protection and emergency rescue services for pilots and aircraft.

14120-1.1 When feasible, the aircraft fire and rescue station is combined with the structural fire station (Category Code 730 10) to develop the total space allocation for one complete emergency facility, Category Code 141 25 “Combined Structural / Aircraft Fire / Rescue Station”.

14120-2 **REQUIREMENT.** The number of fire stations required on an Installation will be determined by the necessary response time for the type and function of facilities requiring fire protection. This analysis will be provided by Commander Navy Installations Command (CNIC) N30 or Marine Corps Installations Command (MCICOM) G3.

14120-3 **SCOPE.** Refer to CCN 730 10 for explanation of the scope, types, classes and function of the fire station facility.

14120-4.1 The total space allocation is based on the number of fire and rescue vehicles assigned to the aircraft fire and rescue function, at both the parent and outlying fields.

14120-2.2 Covered space, either building or shed, is provided for all assigned fire and rescue vehicles and equipment. Generally, the building element houses the active vehicles required to protect the parent Installation. The shed element houses: (1) the active foamer and crane, (2) the active vehicles to support the outlying fields, and (3) the spare vehicles for maintenance and reserve for both parent and outlying fields.

14120-4 **FUNCTIONAL AREAS.** Aircraft Fire and Rescue Stations consist of apparatus bays and support areas, equipment and gear storage areas (for fire extinguishers, self-contained breathing apparatus (SCBA), protective clothing, hoses, firefighting agents, etc.), dispatch office, administrative offices, training facilities, living quarters, recreation and dining facilities, and possibly an emergency operations center and/or apparatus and equipment maintenance areas (if required by Installation mission requirements).

14120-3 **SPACE ALLOWANCE.** The Total Gross Building area is determined using the space planning spreadsheet. This area will be the sum of the building and shed space allowance at both the parent and outlying field locations. The planner must account for all fire and rescue vehicles at the location and determine how many will be housed in the building and how many will be housed under sheds. The planner will reflect the following on the BFR: (1) the total shed area equals the number of vehicles housed in sheds times the area of the vehicle bays, and (2) the total building area is the Total Gross Building area minus the total shed area.

14120-3.1 Pavement is provided adjacent to the station for 25 percent of the vehicles and for one vehicle wash rack.

14120-3.2 The Fire and Rescue Vehicles Alert Pad is computed separately under Category Code 116 60.

Figure 141-20 Sample Computation - Aircraft Fire and Rescue Station

Assume an Air Station operates with outlying fields. The space planning spreadsheet has indicated that the Total Gross Building area is 11,700 GSF. The planner has determined that 40% of the fire and rescue vehicles will be housed in sheds, both at the parent and the outlying fields. The total shed requirement is 4,752 GSF, which is split into 2,160 GSF at the parent station and 2,592 GSF at the outlying fields. The building area will be 6,948 GSF. The total building and shed space sum up as follows:

	Building Area - GSF	Shed Area - GSF
Parent Station	6,948	2,160
Outlying Fields	0	2,592
Total	6,948	4,752
Total Gross Building Area	11,700 GSF	

The total space to show on the BFRL is 6,948 + 4,752 = 11,700 SF gross for the parent air station. No space to house the vehicles is required at any of the outlying fields.

141 25 COMBINED STRUCTURAL / AIRCRAFT FIRE / RESCUE STATION (SF)

FAC: 1411
BFR Required: Y

14125-1 **DEFINITION.** A combined structural/aircraft fire/rescue station is planned under certain conditions to serve the function of a structural fire station (Category Code 730 10) and an aircraft fire and rescue station (Category Code 141 20). The combined facility is planned for a location that satisfies the response time and distance requirements for both the structural fire and the aircraft fire and rescue stations.

14125-2 The station must provide adequate support of airfield activities and protection for all buildings and structures. The size of the building is planned to house the aircraft fire and rescue vehicles required plus the structural fire vehicles required. The computations are done as indicated in Category Codes 141 20, Aircraft Fire and Rescue Station, and 730 10, Fire Station. The sum of the areas required for the structural fire station and the aircraft fire and rescue station is the total building area for the combined station.

14125-3 Protection against structural fires may be provided in part or completely by community resources. The method for development of reciprocal agreements between Navy and a municipality for mutual fire protection may be found in NAVMATINST 11320.10.

141 30 AIRCRAFT LINE OPERATIONS BUILDING (SF)
FAC: 1412
BFR Required: Y

14130-1 **DEFINITION.** The aircraft line operations building is a structure used to centralize ground operations of the flight line. The building is utilized in keeping of squadron daily flight books, aircraft status boards, and bulletin boards and as support for line operations personnel by providing shelter, a water cooler, and a chemical toilet. The aircraft line operations building is a standard 12- by 20-foot portable building with a building area of 240 square feet gross.

14130-2 One line operations building may be planned for each hangar module when the distance between the squadron's parked aircraft and the hangar is greater than 1,000 feet.

NOTE: Criteria for this facility indicates that it is to be portable and therefore carried as collateral equipment, when acquired. Collateral equipment is not Class II real property and cannot be included in the real property inventory. However, this category code is being retained for real property inventory purposes since many of the existing facilities are not portable and accordingly must be reported in the RPI.

141 40 AIRCRAFT OPERATIONS BUILDING (SF)
FAC: 1412
BFR Required: Y

14140-1 **DEFINITION.** An aircraft operations building is planned for all Navy air stations, auxiliary air stations, and air facilities. The building houses the administration of flight operational activities with all supporting functions including flight control, communications, and weather services. The operations building adjoins the airfield control tower and the radar air traffic control center where siting requirements permit. See Table 14140-1 for space allowances.

Table 14140-1
Aircraft Operations Building

Installation	Gross Area Sq. Ft.
Air Station	12,637
Air Facility	9,760

141 41 MARINE AIR TRAFFIC CONTROL UNIT (MATCU) OPERATIONS BUILDING (SF)
FAC: 1412
BFR Required: Y

14141-1 **DEFINITION.** The MATCU performs a combined function similar to that accomplished in Category Codes 134 40, Ground Control Approach (GCA) System; 133 25, TACAN Building; and 133 75, Air Surveillance Radar (ASR) Building. Depending on the level of aircraft operations, the MATCU operations building may provide the sole GCA support at an air installation or may supplement and be in addition to permanent ASR, TACAN, and GCA facilities. A MATCU operations building should not be planned without prior coordination with and approval of the Commandant of the Marine Corps (LFF-1).

14141-2 When authorized, the MATCU operations building shall not exceed 9,130 gross square feet.

141 42 AIR INTELLIGENCE SUPPORT CENTER (SF)
FAC: 1444
BFR Required: Y

14142-1 **DEFINITION.** This facility, also known as a Joint Intelligence Center (JIC), is used to store and disseminate classified material for mission planning, pilot training and briefings in support of attack aircraft operations. The design and size of the center will be determined by the type and amount of equipment to be installed and the number of standard attack squadrons assigned to a station. Typical spaces include: administrative, library/chart storage, classroom, special security office, planning rooms, briefing rooms, photo intelligence interpretation room and storage. No specific planning criteria are currently available for this facility. Inquiries regarding space allocations should be forwarded to OPNAV N2.

141 60 VISUAL INFORMATION (VI) FACILITY (SF)
FAC: 1441
BFR Required: Y

14160-1 **DEFINITION.** This category code was previously referred to as a "Photographic Building". Navy visual information (VI) is a professional visual communication capability closely associated with Navy public affairs (PA). The role of Navy VI is to support the following activity missions and functions:

- VI documentation (VIDOC), which includes combat camera (COMCAM) documentation, operational documentation (OPDOC), technical documentation (TECDOC) and sub functions using graphic arts, motion media, still photographic, audio and other VI systems
- VI production in support of Navy operations, training, and other functions.
- Support of DoD records centers

- Ship/shore VI activities which include motion media production, still photographic production, graphic arts production, and other VI services needed at ship/base level

A VI Facility is a building or a space within a building that houses an authorized VI activity, which is a function within an organization whose principal responsibility is to provide VI products and/or services and must meet specific requirements as described in OPNAVINST 3104.1A, Chapter 0201. All VI Activities must first be approved by CNO Office of the Assistant for Visual Information N09C2 and assigned a Defense Activity number (DVIAN) prior to establishing a VI facility. Requests for establishing or modifying Navy VI activities must correspond with the guidance for activity establishment or modification prescribed in OPNAVINST 5400.44 (5440.169D); and, must meet CA requirements prescribed in OPNAVINST 4860.7D.

14160-2 **ALLOWANCE.** The size of a VI Facility will be determined by an engineering analysis of the space required to support the VI activity mission, functions, and systems. Basic Facility Requirements (BFR) creation/revision must be validated through the Commanding Officer and Public Affairs Officer of an installation.

141 65 FLEET RECONNAISSANCE PHOTOGRAPHIC LABORATORY (SF)
FAC: 1441
BFR Required: Y

14165-1 **DEFINITION.** These facilities are no longer programmed and are for inventory purposes only. All new Visual Information (VI) facilities should be captured under either CCN 14142 Air Intelligence Support Center or CCN 14160 Visual Information (VI) Facility.

141 70 CONTROL TOWER (SF)
FAC: 1413
BFR Required: Y

Planning Criteria: UFC 3-260-01, Airfield and Heliport Planning and Design
Design Criteria: UFC 4-133-01, Air Traffic Control and Air Operations Facilities

14170-1 **DEFINITION.** A control tower provides space for equipment and personnel to control aircraft traffic. It is an elevated structure having an unobstructed line-of sight to the airfield approach areas, runways, taxiways, aircraft parking areas, and all other operational areas over which aircraft movements must be controlled. This category code is used for the control tower in all cases even though the tower may be an independent structure or combined with a RATCC or an aircraft operations building. If at all possible, the control tower should be an integral unit with the RATCC (Category Code 133 71, thus providing a complete, integrated air traffic control facility. A control tower is planned for each installation where aircraft are based. It is not planned for outlying fields and auxiliary landing fields unless specifically authorized by competent authority. The minimum installation is the basic tower containing an entrance level, intermediate levels, and the control tower cab. The area of floor space for a control tower of standard design with six floors plus the control room is 2,956 square feet gross. Towers of increased height can be provided by adding incremental levels.

141 81 GROUND CONTROL APPROACH CREW FACILITY (SF)
FAC: 1412
BFR Required: Y

14181-1 **DEFINITION.** The ground control approach (GCA) crew facility provides a ready room for on duty personnel assigned to the GCA van. The facility consists of two (2) standard design skid-mounted shelters (each 12 feet by 20 feet). The crew facility is authorized whenever the mobile GCA unit is furnished.

NOTE: Criteria for this facility indicates that it is to be portable and therefore carried as collateral equipment, when acquired. Collateral equipment is not Class II real property and cannot be included in the real property inventory. However, this category code is being retained for real property inventory purposes since many of the existing facilities are not portable and accordingly must be reported in the RPI.

141V 82 FULL PRESSURE SUIT FACILITY (SF)
FAC: 1412
BFR Required: Y

14182-1 **DEFINITION.** Pressure suit maintenance is normally performed in the Aviation Life Support Systems Shop (Non-Navair Depot), Category Code 211 75. Special justification is required to provide a separate facility for this purpose.

141 87 LIQUID OXYGEN/NITROGEN FACILITY (SF)
FAC: 4122
BFR Required: Y

14187-1 **DEFINITION.** A liquid oxygen/nitrogen facility is required at each Navy and Marine Corps air station where 50 or more attack and fighter-type aircraft are assigned. Smaller numbers of aircraft are provided with these gases by bottled gas from commercial suppliers. The facility provides for storage, vaporization, and transfer of non-industrial oxygen and nitrogen and for test and repair of cryogenic equipment associated with aviator and aircraft support. Liquid and gaseous forms of both oxygen and nitrogen, as well as hot nitrogen gas for purging equipment, are handled. The facility includes liquid storage tanks, vaporizing units, transfer areas, cart and tank filling and storage areas, repair shops, and office space. Port land cement concrete driveways, loading ramps, and cart parking areas are required. A building with a gross area of 2,704 SF is adequate for all needs. The facility has a storage capacity of 4,000 gallons each of bulk liquid oxygen and nitrogen and 150 cylinders of each gas. The size of the transfer areas may be reduced if a station survey indicates a lesser requirement for cylinder storage.

14187-3 MARINE CORPS CRYOGENICS FACILITY. A Marine Corps cryogenics facility provides for operational support of a Marine Aircraft Group and accommodates in garrison the expeditionary liquid oxygen/nitrogen generating equipment assigned. A Marine Corps cryogenics facility does not supplant the liquid oxygen/nitrogen facility at a Marine Corps air station. Generally, two generators are assigned to each Group. The exceedingly high noise level of the turbine-powered expeditionary liquid oxygen/nitrogen generator necessitates locating the facility in a remote area. The facility consists of a generator area, a cylinder fill area, cylinder and cart storage shelter, and main building. The generator area has a concrete pad, an underground fuel tank, exterior lighting, electric power, water, and an outbuilding with a gross area of 246 square feet. Five hundred and ten square yards of concrete and 5,000 gallons of fuel storage are provided for a single generator. One thousand feet from the nearest generator is a shelter of 1,258 square feet gross area where gas cylinders are filled, and converters and liquid oxygen and liquid nitrogen carts and cylinders are stored.

14187-4 The main building of the Marine Corps cryogenics facility has a gross area of 3,570 square feet and is located no closer than 100 feet from the shelter. The main building contains offices, toilets, classroom, maintenance shop, and repair parts storage. Because of the training mission conducted at this facility, normally only one generator is in production at a time. Hence, the storage shelter and the main building usually may be shared by all Groups utilizing this facility. The size of either the storage shelter or the main building may be modified if a survey indicates a different requirement.

141 88 HARDENED AIRCRAFT SHELTER (SF)
FAC: 1465
BFR Required: Y

14188-1 No criteria is currently available for this Category Code.

142 OPERATIONAL – HELIUM PLANTS

142 10 HELIUM PROCESSING PLANT BUILDING (SF)
FAC: 1421
BFR Required: Y

14210-1 No criteria is currently available for this Category Code.

142 19 HELIUM STORAGE BUILDING (SF)
FAC: 1421
BFR Required: Y

14219-1 No criteria is currently available for this Category Code.

142 20 HELIUM STORAGE FACILITY (EA)
FAC: 1422
BFR Required: Y

14220-1 No criteria is currently available for this Category Code.

143 SHIP AND OTHER OPERATIONAL-BUILDINGS

143 08 EXPEDITIONARY OPS BOAT MAINTENANCE REPAIR FACILITY (SF)
FAC: 2133
BFR Required: Y

14308-1 **DEFINITION.** An Expeditionary Operations Boat Maintenance Facility provides spaces for expeditionary units to perform continuous maintenance on boats. The facility will provide maintenance bays, a tool room, parts room, oily water separator system, overhead crane, and administrative support space.

14308-2 **REQUIREMENT CALCULATIONS.** Criteria is currently being developed for this category code. In the interim, please contact NAVFAC Atlantic AM2 for space allowance information.

143 09 EXPEDITIONARY OPS SUPPORT FACILITY (SF)
FAC: 1444
BFR Required: Y

14309-1 **DEFINITION.** An Expeditionary Operations Support Module (EOSM) provides the organic components of an expeditionary command and guidelines for associated CCNs to be used to support them. The EOSM would define the following attributes: Expeditionary Administration, (at a 80% of standard space allowance), Medical (A Contingency Aid Station provides medical care at the local level for the Expeditionary commands), Sensitive Compartmented Information Facility (SCIF), Mission Planning Cell (may or may not be part of SCIF), Training Classrooms (not NETC associated training), Armory (at a reduced footprint from the CCN 143-45), and Locker and Shower spaces to support the physical training requirement of an Expeditionary Combat Command.

14309-2 **ALLOWANCE.** Space allowances are being developed. Questions regarding criteria can be directed to the NAVFAC Atlantic Expeditionary Operations criteria manager.

143 10 EMERGENCY VEHICLE GARAGE (SF)
FAC: 5307
BFR Required: Y

14310-1 **DEFINITION.** This is a building for official emergency and alert vehicles, such as an ambulance. It is justified in instances when immediate response required by special waterfront operational vehicle. The building protects these vehicles from extreme weather to improve operational availability. The building is not used for vehicle services nor housing personnel. This category code excludes shelters used for aircraft and community fire and rescue vehicles, see Category Codes 141 20, 141 25, and 730 10.

The size of the garage is determined by the vehicle area plus nominal clearances surrounding the vehicle.

A. Typically, three feet of clearance on each side is sufficient plus a gross to net factor of 1.05.
B. In cases where vehicle side doors or access panels' clearances are greater than three feet, larger clearances may be justified.
C. The distance between two vehicles should be the same as the side vehicle clearance.
D. The front-end clearance should be no more than one foot.
E. The rear clearance would vary the same as side clearances and depend on loading and accessibility. Three feet should be sufficient in most cases.
F. A carport type shelter may be provided where the air conditioning design temperature on a 10% basis exceeds 87°F dry bulb.
G. A garage may be provided where the heating design temperature on a 97.5% basis is less than 11°F dry bulb.

143 11 OPERATIONAL VEHICLE GARAGE (SF)
FAC: 1444
BFR Required: Y

14311-1 **DEFINITION.** An operational vehicle garage is used for the storage of vehicles which are not utilized on a daily basis, and which are exposed to adverse weather conditions that would have a detrimental effect upon them if stored out in the open. Accordingly, the type of vehicle stored, frequency of use and climatic conditions, will determine whether this type of facility is warranted.

14311-2 **INCLUSIONS/EXCLUSIONS.** This category code excludes 216 45 Line Vehicle Parking for airfield equipment, 214 40 Holding Shed for Public Works Transportation vehicles awaiting maintenance, 218 65 Equipment Holding Shed for Public Works Transportation construction vehicles and equipment, and 219 20 Pavement and Grounds Equipment Shed. This category code also excludes vehicles and equipment maintained and operated by the Public Works Transportation Department. This category code includes operational vehicles maintained by Naval

Special Warfare Groups, Naval Construction Battalions, and other groups that are responsible for the maintenance and upkeep of their company vehicles. Some of the vehicles that may require environmental protection include MK V boats and Ridged Hulled Inflatable Boats (RHIBs). These types of boats have rubber hulls that can deteriorate more quickly when exposed to sun and extreme temperatures creating a significant increase in maintenance expense of these vehicles. A Construction Battalion may have all sorts of heavy construction equipment like pavers and backhoes, etc.

14311-3 **REQUIREMENT CALCULATIONS.** To calculate the total gross are for this facility, first tally the quantity for each type of vehicle. Assign a "type code" per the Type Code and NSF Table 14311-1, based on the length of the item. Next, develop the Civil Engineering Support Equipment (CESE)/Service Craft & Boat Support System (SABAR) NSF requirements in accordance with Tables 14311-1 and 14311-2, to determine the total NSF required to store the command's equipment. Add 250 SF for a Mechanical Room for the fire suppressant system. Sum the total NSF and the 250 SF (mech. room) to determine the total NSF that is required. Based on the Net to Gross (NTG) Table 14311-3, multiply the total NSF times the correct NTG factor to determine the Gross Square Feet (GSF). For the final GSF, round up to nearest whole number. A ratio of between 1.5 and 3 (length to width) of the overall facility is desired, if possible. If an existing facility is converted to this use, an increase of fifteen percent may be added to the total area in order compensate for incompatible column spacing, wall, etc.

Table 14311-1: Type Code and NSF Table

Size	Gen Description	Type Code	NSF
0 - 5 FT	Non-mechanized CESE and SABAR (ex: Generators, Air Conditioner/Heating Units)	1A	108
5 - 10 FT	Non-mechanized CESE and SABAR (ex: Fuel Water SIXCON, Motors, Pumps, Generators, TRICONS)	A	168
10 - 15 FT	Vehicles and non-mechanized CESE and SABAR (ex: Trailers, Forklifts, Small Zodiac Boats)	1B	228
15 - 20 FT	Vehicles and non-mechanized CESE and SABAR (ex: Passenger Vehicles, HMMWV, Light Plant, Fork Lifts, Small Zodiac Boats)	B	288
20 - 30 FT	Large CESE and SABAR (ex: MTVR, Fuel Trucks, Boats < 30FT)	C	408
30 - 40 FT	Extra Large CESE and SABAR (ex: Boats > 30FT, MTVRs, Scrapers, Water Well, Semi-Trailers)	D	528
40 - 50 FT	Extra Large CESE and SABAR (ex: Boats > 40FT, Crane, Scrapers, Water Well, Semi-Trailers)	E	648
50 - 60 FT	Extra Large CESE and SABAR (ex: Boats > 50FT, Semi-Trailers, lowboy 55T)	F	768
60 - 70 FT	Extra Large CESE and SABAR (ex: Prime Mover and Boats > 60FT (11M w/ Prime Mover))	G	888

NSF: storage lanes are 12' wide (which includes side to side clearance for Inspection X length of component plus 2' front/back. The addition of the side to side and front/back is to provide space for minor Preventive Maintenance.

Example Table 14311-2:
CESE/SABAR NSF Calculation Table

Description	Type Code	Total Qty	NSF/Item	Total NSF
Assembly:10178-AIR CONDITIONER / HEATING UNIT (IECU)	1A	3	108	324
Assembly:04250; SHORT DESC: COMPRESSOR,RECIPROCATING	1A	5	108	540
Assembly: 52680; SHORT DESC: MK18 56KW GENERATOR	A	8	168	1344
Assembly:088002; SHORT DESC: TRLR 400G TANK POTABLE WATER	1B	3	228	684

		57		16,596

Table 14311-3:
Net to Gross Table

FROM	TO	NTG
0 SF	20,000 SF	1.35
20,000 SF	50,000 SF	1.2
50,000 SF	150,000 SF	1.15
150,000 SF	above	1.1

NTG: includes 2’ perimeter lane along all walls and a 20’ access lane.

Total SF 16,596 SF
Add 250 SF for Mechanical Room 250 SF
(Fire sprinkler system)

NTG: 1.35
Total: 22,742.10 GSF
Say: 22,743 GSF

143 12 OPERATIONAL VEHICLE LAYDOWN AREA (SY)
FAC: 8523
BFR Required: Y

14312-1 **GENERAL.** Many Navy and Marine Corps operational commands have missions that require the acquisition, operation, and maintenance of various types of vehicles and equipment. Examples of these include Civil Engineering Support Equipment (CESE) and Service craft and Boat Accounting Report (SABAR) equipment.

These items are typically acquired based on information shown in each command's Tables of Allowance and Equipment (TOA & E; Navy) or Table of Equipment (TE; Marine Corps) and are usually associated with an operational maintenance shop or motor pool. As a result, these commands have requirements for secure paved areas for storing these vehicles and equipment. These areas are typically different from standard parking areas in that they require more robust parking surfaces, and they are sized to accommodate vehicles and equipment that are infrequently used. This CCN is intended for long term storage of specialized vehicles and equipment only, and normal command staff parking should continue to be captured under CCN 85210 or similar.

14312-2 **DEFINITION.** An operational vehicle parking and/or laydown area consists of an asphalt or concrete paved area large enough to store and provide circulation for the vehicles and equipment for which the command is responsible. Vehicles can range from a typical passenger vehicle to a large prime mover such as an MTVR truck. The equipment requiring storage can range from towable generator sets or light packs to large flatbed trailers. It also includes operational small craft such as the in-shore fast boats and their trailers. These parking/laydown areas require perimeter fencing and in some case will require site lighting adequate enough to perform vehicle or small craft outfitting or minor repairs during nighttime hours. This category code should also be used to capture parking and maneuvering areas associated with CCN 15522 Small Craft Boat Ramp facilities (where the parking/laydown requirements are captured as a CCN14312 utilization on the associated boat ramp property record card).

14312-3 **ALLOWANCE.** Space allowances are based on engineering evaluations that summarize the size and quantity of each vehicle shown on the requesting command's TOA. The process for determining overall requirements is as follows:

1. Using the "General Description" column in Table 14312-1 (see below), planners must determine the type code for each vehicle/equipment type being used by the command. In cases where the general description is unclear or doesn't match that which is listed, use the actual item length and compare it to the "Size" column in the table to determine the type code.

Table 14312-1 Engineered Surface Laydown

Size	General Description	Type Code	GSY	GSF	*Net to Gross Factor
Small (<10FT)	Non-mechanized CESE and SABAR (ex: Fuel Water SIXCON, Motors, Pumps, Generators, TRICONS)	A	19	168	1.50
Medium (10FT-20FT)	Vehicles and non-mechanized CESE and SABAR (ex: Passenger Vehicles, HMMWV, Light Plant, Fork Lifts, Small Zodiac Boats)	B	32	288	1.75
Large (20FT-30FT)	Large CESE and SABAR (ex: MTVR, Fuel Trucks, Boats < 30FT)	C	46	408	1.75

Size	General Description	Type Code	GSY	GSF	*Net to Gross Factor
Extra Large (30FT-40FT)	Extra Large CESE and SABAR (ex: Boats > 30FT, Scrapers, Water Well, Semi Trailers)	D	59	528	2.00
Extra Large (40FT-50FT)	Extra Large CESE and SABAR (ex: Boats > 40FT, Scrapers, Water Well, Semi Trailers)	E	72	648	2.00
Extra Large (50FT-60FT)	Extra Large CESE and SABAR (ex: Boats > 50 FT, Semi Trailers, lowboy 55T)	F	86	768	2.25
Extra Large (60FT-70FT)	Extra Large CESE and SABAR (ex: 11M Rib with Prime Mover; 40PB with Prime Mover)	G	99	888	2.25

* Net to gross factor includes drive lanes/maneuvering areas, and circulation space around each item.

2. When requirement is for covered laydown engineered surface, use the Covered Laydown (Table 14312-2). The area is determined by: Component length (based on table's Type Code) x NUMBER OF CESE for each item.

Table 14312-2 Covered Laydown

Type Code	Length (FT)
1A	5
A	10
1B	15
B	20
C	30
D	40
E	50
F	60

3. Once the type codes are assigned for each item in the command’s TO&A/TE, multiply the area allowances per each type (A though G) by the quantity of each type needed. The sum of the total areas for each type code is then the total area requirement for the parking/laydown area for the command’s operational vehicles and equipment. This area includes circulation and maneuvering space.

NOTE: For parking/laydown areas associated with CCN 15522 Operational Boat Ramp facilities only: Determine the required area based on the average number of boat trailers, prime movers, and support vehicles/equipment to be parked on site during a typical training mission and use Table 14312-1 to determine a total gross area (same process as shown above). Add an additional 5% to this gross area to account for the prime mover/trailer combination maneuvering apron located adjacent to the boat ramp.

143 13 OPERATIONAL VEHICLE/EQUIPMENT CANOPY (SF)
FAC: 1459
BFR Required: Y

14313-1 **DEFINITION**. An operational vehicle/equipment canopy is used by the Navy and Marine Corps expeditionary units to protect vehicles and equipment from the weather. These canopies are usually associated with operational vehicle laydown areas or similar.

14313-2 **ALLOWANCE.** Sizing of these canopies is accomplished via an engineering analysis and is based upon the total area occupied by vehicles and/or equipment plus any related circulation between them. Note that canopies are measured by the drip line projected from the roof eaves down to ground level.

143 15 RANGE OPERATIONS CENTER (SF)
FAC: 1731
BFR Required: Y

14315-1 **DEFINITION**. A range operations center is the control point for testing torpedoes, calibrating ships' firing systems, and training pilots and testing aircraft on gunnery and bombing ranges. The center will vary with the equipment and control areas required. Standard planning factors for a center are not available. Its size must be planned to support the equipment and control areas to be housed.

143 17 SPACE SURVEILLANCE FACILITY (SF)
FAC: 1444
BFR Required: Y

14317-1 **DEFINITION.** Requirements are determined by Naval Network and Space Operations Command. Facilities typically support global space surveillance network which detects, tracks, identifies, and catalogs man-made objects in space and provides position information on these objects.

143 20 ORDNANCE OPERATIONS BUILDING (SF)
FAC: 1444
BFR Required: Y

14320-1 **DEFINITION**. An ordnance operations building is authorized where there is a need to control an ordnance operation. Ordnance operations are those involving ammunition storage, handling or disposal and organizational level maintenance. The facilities whose primary function is ordnance maintenance, intermediate level and above, are addressed in the 200 series Category Codes.

14320-1.1 **Installation Ordnance Operations Building**. At an ammunition storage or handling installation the authorized building space are 150 gross SF per person for administrative personnel and 50 gross SF per person for operating personnel (ammunition handlers, etc.). This provides space for an office (s), assembly and briefing room for ammunition handlers, locker room, and storage space for ammunition handling tools and equipment. Space requirements may increase as handling and support equipment changes dictate larger work and storage areas. Sufficient justification should support the increased space requirements. Air installations with bomb build-up requirements can plan for a weapons build-up facility. This facility serves as an ordnance assembly area for bombs, missiles and the like prior to going to the flight line for loading on aircraft. An overhead hoist, worktables and several roll up doors are minimal requirements to promote the buildup process. This facility can also serve to perform basic ordnance maintenance. Planning criteria is not available because of the potential multi-functions that may be served in this facility. Recommend a space analysis starting with a process flow and identifying functions to be performed.

14320-1.2 **Explosive Ordnance Disposal Facilities.** The EOD facilities have been moved to Category Codes 143 22, 143 23 and 143 24.

143 21 AMMUNITION SEGREGATION FACILITY (SF)
FAC: 1443
BFR Required: Y

14321-1 **DEFINITION.** A segregation facility is a building or series of buildings where fleet return explosive and inert material are screened and grouped by type and physical condition.

14321-1.1 Definition from NAVSEA OP-5 Vol. 1: Typically, these functions are located at Naval Weapons Station or Naval Magazine installations. For these larger installations, there may be multiple segregation facilities for bomb-type ammunition, general ammunition and propellant powder buildings. At smaller ammunition installations there would be just one segregation facility. For additional information see the NAVSEA OP-5 Manual.

14321-1.2 No planning criteria exist for the segregation function; recommend an engineering evaluation be completed. Functional examples might be: Shipping /receiving, inspection area, banding area and a technical documents area, etc. Some questions that might be asked of the facility user interviews: What is approx. ordnance throughput (amount/time period) average? Peak? What types of ordnance? Containerized precision guided munitions may require large amounts of space versus palletized ordnance. Will explosives be left in facility overnight? NAVSEA OP-5 safety criteria will dictate requirements.

143 22 NAVY EXPLOSIVE ORDNANCE DISPOSAL SHORE DETACHMENT FACILITY (SF)

FAC: 1444
BFR Required: Y

14322-1 **DEFINITION**. the nature and scale of the EOD operations involved, billets will be assigned for a "shore detachment" (1 officer, 1 – Leading Chief Petty Officer (LCPO), and 7 enlisted personnel). The facilities defined below are sized to support an EOD Shore Detachment (DET) and includes the following: Operational Space – built to "Open Secret", armory – built to meet **OPNAVINST 5530.13C, Physical Security Instruction for Conventional Arms, Ammunition, and Explosives, Armory**, latest revision. Lobby/Quarter Deck, Operational Space, Locker/Shower room, and drying cages (climate controlled) will be in environmentally controlled spaces. Open Bay spaces will include: 1) Workshop/Maintenance spaces, equipment storage, 2) exterior fresh water wash down area with deep sink, 3) drying area, and 4) four-bay High Bay Area Vehicle/ Boat Storage/miscellaneous emergency response equipment area. High Bay area must be provided with exhaust ventilation system and 16' x 16' roll-up doors. One bay, minimum, will be a "drive-through" to support the Multi-Mission Expeditionary Response Truck (MERT) and the trailer. To ensure correct line-up into the MERT bay, provide a straight approach lane, 58 feet x 16 feet, in front of and behind (for drive through lane) the facility for access.

Description	NSF	Climate Control	Net to Gross
Lobby/Quarter Deck			
Lobby and Sign In Area	165	Yes	1.35 to 1
Bunk Room	100	Yes	1.35 to 1
Male/Female Restroom for EOD Shore DET personnel	48	Yes	1.35 to 1
Provide a male/female restroom for lobby area	48	Yes	1.35 to 1
CONSTRUCT TO OPEN SECRET			
OPS (admin)	948	Yes	1.35 to 1
private offices - 2 ea: 200 SF, general office space – 7 ea: 448 SF Planning and Briefing Cell: 150 SF SIPER Room: 1 ea: 150 SF			
Male Restroom for EOD Shore DET personnel within the Open Secret Spaces	62	Yes	1.35 to 1
Female Restroom for EOD Shore DET personnel within the Open Secret Spaces	46	Yes	1.35 to 1
Shore DET PGI Cages			
9 ea @ 112 SF/cage	1,008	Yes	1.35 to 1

Description	NSF	Climate Control	Net to Gross
Shore DET Changing Room			
Male Bathroom/Shower/Locker Area	194.5	Yes	1.35 to 1
Female Bathroom/Shower/Locker Area	95	Yes	1.35 to 1
Drying Cages Area			
9 ea at 36 SF/cage (Drying Cages to be Climate & Humidity Controlled)	324	Yes	1.35 to 1
Armory			
(Armory must meet OPNAVINST 5530.13C, Physical Security Instruction for Conventional Arms, Ammunition, and Explosives, Armory requirements)			
General Armory Space for maintenance parts storage, safe, HazMat Locker, workbench, etc.	433	Yes	1.35 to 1
Weapons and Case Storage	180	Yes	1.35 to 1
Communications Gear Storage			
Shelving (4 In ft x 2 ft deep and 4 In ft x 4 feet deep) for communications gear storage	65	Yes	1.35 to 1
OPEN BAY AREA			
Operational Storage			
Shore DET Operational Storage Cage Space (Section 10 material), 10' x 10'. Size based on 8' max stack height	100	No	1.35 to 1
TOA stored on shelving units - Section 47: 32 sf plus 2.25 clearance factor(BDY ARMR EOD/LG)	72	No	1.35 to 1
Open floor space for items too heavy to store on shelving	538	No	1.35 to 1
TOA Storage (items not in Cage, on shelves, or on floor), Total Cubic Foot	975	No	1.0 to 1
Note: Net to Gross built into the GSF calculation for TOA storage			
Miscellaneous Work Areas			
Maintenance Work Benches, 2 ea	108	No	1.15 to 1
Wet Charging Stations, 2 ea - 2' x 6'	54	No	1.15 to 1
2 ea dip tanks located near exterior wall to be connected to Shore DET Air Compressor located near exterior wall under cover)			
Shore DET Open Area for Misc functions			

Description	NSF	Climate Control	Net to Gross
12 sf/EOD Tech	96	No	1.15 to 1
CESE/SABAR Storage			
Four Bays; Bays to be 68' deep X 16' wide with a 16' x 16' bay opening	4,352	No	1.15 to 1
Note: Provide at least One bay with drive through capability			
EXTERIOR SPACES/FUNCTIONS			
Exterior Rinsing Station			
Outside showers and wash sink is required. Provide 4 Showers, 1 stainless steel sink, 8' W x 4' deep and appropriate screening for outdoor gear washing.	108	No	1.10 to 1
Equipment Wash Tank, 2 ea, 6' L x 2' W	27	No	1.10 to 1
Temp exterior drying cage area (equipment/material staging/drying racks/shelving), 6 each, 3' x 4', cage spaces	162	No	1.10 to 1
Covered area outside of DET facility High Bay area for the DET's air compressor. Area to include cover from weather and piping, certifiable to Breathing Air standards and routed into the DET's Wet Charging station inside the High Bay space.	25	No	1.10 to 1

14322-2 In addition to the EOD shore detachment building proper, there are supporting facilities, which are located separately to meet safety requirements. This square footage is not part of this CCN and, therefore a separate BFR must be submitted for this requirement. The EOD Shore DET will require either a Golan or Ready Service Locker, both equipment, to house small quantiles of explosives. This equipment must be mounted on an Explosive Storage Site Pad, CCN 425-11, and the Explosive Storage Site Pad will be sited In Accordance With Naval Ordnance Safety and Security Activity (NOSSA) Instruction 8020.22 (latest revision). The Shore DET will need an Ordnance Demolition Area for destroying explosives and explosives-loaded devices, see CCN 148-20. Include an Observation Tower/Bunker for the protection of the EOD Shore DET personnel, CCN 173-40, to support the Ordnance Demolition Area. The Shore DET will need space for a generator to support Intrusion Detection System (IDS) requirements for AA&E/Classified Storage. Provide a Miscellaneous Open Storage Pad, CCN 852-40. Size the pad in accordance with the size of the backup generator plus a clearance area of 3 foot minimum on all sides of the generator to accommodate facility maintenance. The generator is equipment and therefore must be provided by the command. In situations where the Shore DET requires a boat ramp and pier space, add CCNs 143-12, 155-20 and 155-22.

14322-3 **EOD Shore Detachment Facility:**

EOD Shore DET Building	CCN 143-22: 12,032 GSF
Additional Requirements:	
Operational Vehicle Parking/ Laydown Area	CCN 143-12: 338 GSY
Explosive Storage Site Pad	CCN 425-11: Sized to requirement
Ordnance Demolition Area	CCN 148-20: Sized to requirement
Observation Tower/Bunker	CCN 173-40: Sized to requirement
Backup Generator	CCN 852-40: Sized to requirement
Boat Ramp	CCN 155-22: 1 ea
Small Craft Berthing	CCN 155-20: 89 FB, 2,250 SF
POV Parking	CCN 852-10: Sized for 9 personnel plus 2 visitor parking spaces

143 23 NAVY EXPLOSIVE ORDNANCE DISPOSAL MOBILE UNIT (EODMU) FACILITY (SF)
FAC: 1444
BFR Required: Y

14323-1 **DEFINITION.** EODMUs are responsible for manning, equipping and training of any number of deployable EOD detachments: Mobile Detachments, Area Search Detachments, Ordnance Clearance Detachments, Mobile Communications Detachments, Combat Service Support Detachments, Fly Away Recompression Chamber Detachments, Mine Counter Measures Detachments and Marine Mammal System Detachments. Facilities are required for administrative activities, equipment maintenance and storage, training and operations. Manning levels vary by MU, so square foot requirements for a given installation is based on the following criteria, all SF are net (NSF):

14323-1.1 **Net to gross markups by functions:**

- Administration through bath/showers functions below: 1.25
- Training Spaces: 1.33
- Supply/Storage: 2.38
- Remainder, operational spaces: 1.33

14323-1.2 **Administrative spaces**: 120 SF per administrative worker (includes CO, XO, CMC, MAA and all administrative department personnel).

14323-1.3 **Classified equipment and documents area**: 300 SF plus an additional 25 SF for each detachment assigned for the storage and maintenance of classified documents and equipment.

14323-1.4 **Quarterdeck:** Allow 150 SF for security screening area.

14323-1.5 **Bunkroom:** Allow 72 SF for each member of the watch. Separate male and female bunkrooms required.

14323-1.6 **Bathrooms/Showers**: Allow 15 SF/water closet, 20 SF/shower, 6 SF/urinal and 6 SF/lavatory with the number of fixtures appropriate for the maximum number of personnel using the facility at one time.

14323-1.7 **Multi-purpose Training/Conference Room**: Use Category Code 171-10, General academic. Loading is based upon an all-hands function, the mobile unit and all assigned detachments.

14323-1.8 **Academic Instruction Space**: Use Cat Code 171-10, General academic. Allow for instructor(s) space.

14323-1.9 **Supply/Storage**: Allow 2,100 SF for spare parts storage and 450 SF of administrative area for supply functions. The administration area should use the admin. net to gross markup above.

14323-1.10 **Magnetometer Room**: Allow 360 SF for testing of special purpose low magnetic signature tools.

14323-1.11 **Compressor Room**: Allow 300 SF for divers fixed high-pressure compressor and flasks.

14323-1.12 **Hydro Room:** Allow 300 SF for hydro test equipment.

14323-1.13 **MK 16 Locker**: Allow 800 SF for maintenance and preparation of MK 16 diving equipment. This needs to be an O_2 clean room.

14323-1.14 **Communal Staging Area**. Allow 1,000 SF for a communal outdoor staging area for assigned mobile detachments. Used prior to deployment for gear inspection and preventive maintenance.

14323-1.15 **Electronics Shop**. Allow 400 SF for maintenance of communications and navigation equipment.

14323-1.16 **Personnel Lockers**. Allow 12 SF for each diver and 6 SF for each additional support person assigned.

14323-1.17 **Medical Area**. Allow 150 SF for a doctor or independent duty corpsman (if both, 150 each), 200 SF for an examining room and 150 SF for a waiting area/medical records office.

14323-1.18 **Scuba Locker**: Allow 1350 SF for maintenance and preparation of scuba diving equipment.

14323-2 **Spaces**. The unique detachment missions may dictate additional spaces. The different type of EOD detachments and their space requirements that may be assigned to the Mobile Units are listed below. The typical manning levels are provided; should additional space be required; it must be individually justified.

14323-3 **Area Search Detachment (ASD):** Allow 450 SF for equipment storage and maintenance and 150 SF of administrative area for each ASD assigned. Manning: 1 Off/ 7 Enl.

14323-4 **Combat Service Support Detachment (CSSD):** Allow 1,200 SF for administrative, 6,000 SF warehouse for material and equipment storage and 3,968 SY controlled outside equipment lay down storage. Manning: 1 Off/ 16 Enl.

14323-5 **Fly Away Recompression Chamber Detachment (FARC):** Allow 1,204 SF for administrative, supply and equipment storage and 90 SY lay down compound for (1) FARC, (1) Generator set and (1) 8' x 8' x 10' Milvan. Manning: 1 Off/ 5 Enl.

14323-6 **Marine Mammal System Detachment (MMS):** Allow 1000 SF for each Mark shop assigned (e.g. Mk 5). Allow 432 SF for veterinarian. Allow 800 SF for food preparation. The Marine Mammal Systems Managers will determine space requirements for holding pens, staging areas and Marine Mammal Management Facilities. These spaces are regulated by Federal regulations and standards. Manning: 1 Off/ 15 Enl.

14323-7 **Mine Counter Measures Detachment (MCM):** Allow 1700 SF for equipment storage and maintenance and 150 SF for administrative area for each MCM detachment assigned. Manning 1 Off / 7 Enl.

14323-8 **Mobile Communications Detachments (MCD):** Allow 1,850 SF for equipment storage and maintenance and 150 SF of administrative area for each MCD assigned. Manning: 1 Off/ 7 Enl.

14323-9 **Mobile Detachments (MOB):** Allow 800 SF for equipment storage and maintenance and 150 SF for administrative area each mobile detachment assigned. Manning: 1 Off/ 7 Enl.

14323-10 **Ordnance Clearance Detachments (OCD):** Allow 480 SF for equipment storage and maintenance. Allow 150 SF of administrative area for each OCD's assigned to the mobile unit. Manning: 1 Off/ 7 Enl.

14323-11 **Additional Functions.** Additional functions associated with EOD units/detachments are mission driven and must be individually justified. The following Category Codes are some applicable selections:

- Parachute Survival Equipment Shop: use Category Code 211 75.
- Small Craft Fuel Station: use Category Code 122 20.
- Small Craft Fuel Storage Area: use Category Code 122 30.
- Emergency Vehicle Garage: use Category Code 143 10.
- Operational Vehicle Garage: use Category Code 143 11.
- Operational Storage: use Category Code 143 77.
- Armory: use Category Code 143 45.
- Hazardous Material/Flammable Storage: use Category Code 143 78.
- Ordnance Demolition Area: use Category 148 20.
- Small Craft Berthing: use Category Code 155 20.
- Landing Craft (boat) Ramp: allow one EA under Category Code 159 66.
- Light Demolition Range: use Category 178 30.
- Boat Shop: use Category Code 213 58.
- Vehicle Holding Shed: use Category Code 214 40.
- Vehicle Shop: use Category Code 214 20.
- Ready Magazine: use Category Code 421 35.
- Open Storage Area: use Category Code 451 10.
- Parking Area: use Category Code 852 10.

143 24 MARINE CORPS EXPLOSIVE ORDNANCE DISPOSAL FACILITY (SF)
FAC: 1444
BFR Required: Y

14324-1 **DEFINITION.** These facilities provide support for Marine Corps EOD shore teams and platoons permanently assigned to Marine Corps installations. The manning structure for EOD teams and platoons has increased and is reflected below in category codes 143 24 and 143 26.

14324-2 This facility provides support for EOD operations on Marine Corps Bases, Marine Corps Air Stations, and Marine Corps Air Wing Support Squadrons. The facility defined below is scaled to match the EOD Team (1 Officer, 8 Enlisted) and include administrative spaces, classified publication vault, quick response ready lockers, workshop/maintenance space, classroom, equipment storage, locker room, and ordnance training aids library space. The facility will be equipped with an Intrusion Detection System (IDS). In addition, the facility will house all the emergency response vehicles, trailers (including total containment vessels), and other emergency response equipment.

14324-3 In addition to the EOD team facility proper, there are supporting facilities, which are located separately to meet safety requirements. The hazardous/flammable storage building, category code 143 78, stores petroleum products, petroleum operated equipment, corrosives, and paints. Typically, these building are 12’x17’, but larger sizes may be justified depending on the team’s operational mission. This building should be located as close the EOD building as safety standards permit. The other facilities are the ready service magazines and are described under category code 421 35 as “Ready Magazines”. Refer to category code 421 series to understand the unique storage requirements of ordnance. These are sited in accordance with safety criteria published in NAVSEA OP 5, Volume 1, “Ammunition and Explosives Ashore” (abbrev. Title).

14324-4 When multiple EOD teams are assigned to the same installation and when collocating teams is viable, the gross square below should be multiplied by the number of teams assigned. Overall square footage may be reduced for common use spaces.

Table 14324-1
Overall Square Footage Requirements
For EOD Teams

EOD Building	7000 GSF
EOD Haz/Flam Building	204 GSF or sized to requirement
EOD Ready Service Magazine	Sized to requirement

14324-5 Submitted basic facility requirement (BFR)s shall include the EOD Table of Organization for the installation supported and facility component breakdowns of the overall requirement (i.e. admin, vehicle/trailer housing, storage, publication vault, locker area, etc.

143 25 SEAL TEAM BUILDING (SF)
FAC: 1444
BFR Required: Y

Note: This Category Code contains assets that were previously classified under 143 28.

14325-1 **DEFINITION.** The requirements for these facilities are developed by an industrial analysis for the specific facility. See category code 610 10 for administrative space guidelines and category code 159 64 for Waterfront Operations Building guidelines.

143 26 MARINE CORPS EXPLOSIVE ORDNANCE DISPOSAL PLATOON FACILITY (SF)
FAC: 1444
BFR Required: Y

14326-1 This facility is responsible for manning, equipping, and training for EOD operations in support of Fleet Marine Forces. The facility defined below is scaled to match the EOD Platoon (9 Officers, 97 Enlisted). Facilities are required for administration, equipment maintenance and storage, training and operations. All SF criteria are Net Square Feet (NSF), net to gross conversion = 1.33.

14326-2 **Administrative space:** Allow 1520 SF for administrative functions this includes Platoon commander, assistant platoon commander, SNCOIC, and all administrative department personnel.

14326-3 **Classified publications vault:** Allow 811 SF for storage of classified material and administrative space. This space requires IDS.

14326-4 **Combat Service Support Team Room:** Allow for 1200 SF administration area and 1000 SF for material, equipment, and maintenance area for each EOD team. Team manning level: 1 Officer, 8 enlisted.

14326-5 **Bathrooms/showers:** Allow 15 SF/water closet, 20 SF/shower, 6 SF/urinal and 6 SF/lavatory with the number of fixtures appropriate for the maximum number of personnel using the facility at one time. Allow 200 SF for female bathroom/Shower area.

14326-6 **Multi-purpose/Conference room:** Use category 171 10, General academic. Loading is based upon an all-hands function, or a maximum of 100 students.

14326-7 **Communal staging area:** Allow 1000 SF for a communal outdoor staging area for assigned detachments. Used prior to deployment for gear inspections and preventative maintenance. This should be at a minimum a paved surface.

14326-8 **Personnel Lockers:** Allow 18 SF for the maximum number of personnel using the facility at one time. This is sized to accommodate all the necessary combat equipment every platoon member is assigned.

14326-9 **Training aids library:** Allow 2000 SF. This area is used to store/display inert training aids.

14326-10 **Break area:** Allow 811 SF.

14326-11 **Material and equipment work area:** Allow 2000 SF for table of equipment storage and maintenance.

14326-12 Submitted basic facility requirements (BFR)s shall include the EOD Table of Organization for the installation supported and facility component breakdowns of the overall requirement (i.e. admin, vehicle/trailer housing, storage, publication vault, locker area, etc.

14326-13 Additional functions associated with EOD teams/platoons are mission driven and must be individually justified. The following category codes are some applicable selections:

- Small Craft Fuel Station: use Category Code 122 20.
- Small Craft Fuel Storage Area: use Category Code 122 30.
- Emergency Vehicle Garage: use Category Code 143 10.
- Operational Vehicle Garage: use Category Code 143 11.
- Armory: use Category Code 143 45.
- Operational Storage: use Category Code 143 77.
- Hazardous Material/Flammable Storage: use Category Code 143 78.
- Ordnance Demolition Area: use Category 148 20.
- Small Craft Berthing: use Category Code 155 20.
- Landing Craft (boat) Ramp: allow one EA under Category Code 159 66.
- Light Demolition Range: use Category 178 30.
- Parachute Survival Equipment Shop: use Category Code 211 75.
- Boat Shop: use Category Code 213 58.
- Vehicle Shop: use Category Code 214 20.
- Vehicle Holding Shed: use Category Code 214 40.
- Ready Magazine: use Category Code 421 35.
- Open Storage Area: use Category Code 451 10.
- Parking Area: use Category Code 852 10.

143 35 REGISTERED PUBLICATIONS ISSUING OFFICE (SF)
FAC: 1444
BFR Required: Y

14335-1 **DEFINITION.** A Registered Publications Issuing Office (RPIO) has a primary mission of supporting communications operations of the Fleet, Naval Aviation, U.S. Marine Corps, and the U.S. Coast Guard. RPIO's receive, store, issue, account for, and-officiate during the destruction of highly classified cryptological publications, equipment, and devices circulating in the Registered Publications System (RPS). An RPIO has three major space areas: Storage, Receive/ Issue, and Administration. The storage area of the RPIO must be constructed to meet the criteria of a Class A vault as defined in KAG-1D. The size of an RPIO can generally be related to the number of RPS items handled yearly. RPS items are such things as publications, magnetic tapes, films, crypto equipment, spare parts, cards, and other key material. See Table 14335-1 for planning factors.

Table 14335-1. Space Allowances
Registered Publications Issuing Office

RPS Items Handled Per Year (Thousands)	Gross Area (SF) Admin, Receive/Issue, Vault
100 - 500	7,500
501 - 750	12,500

RPS Items Handled Per Year (Thousands)	Gross Area (SF) Admin, Receive/Issue, Vault
751 - 1,250	14,000
1,251 - 2,500	16,000

143 40 COMPUTER PROGRAMMING OPERATIONS CENTER (SF)
FAC: 6104
BFR Required: Y

14340-1 This category is deleted. All future requirements should be reassigned and revised to Category Code 13115 "Communications, Information, or Intelligence Analysis Facility".

143 41 AMPHIBIOUS OPERATIONS BUILDING (SF)
FAC: 1431
BFR Required: Y

14341-1 The requirements for these facilities are developed by an industrial analysis for the specific facility. See category code 610 10 for administrative space guidelines and category code 159 64 for Waterfront Operations Building guidelines.

143 45 ARMORY (SF)
FAC: 4427
BFR Required: Y

14345-1 **DEFINITION.** A Navy installation armory provides space for storage and routing maintenance of small arms and emergency gear. The materials stored will provide for emergencies and for training of selected personnel in the handling of station emergencies, civil disorders, and area disasters. See Table14345-1 for space allowance.

Table 14345-1. Armory

Installation Military Strength	Building Gross Area
up to 2,000	576
2,001 - 4,000	880
4,001 - 7,500	1,200
7,501 - 10,000	1,508

Over 10,000	Add 0.1 sq ft per person

14345-2 The space above provides for an armory and small arms shop supporting only the weapons and personnel assigned to that installation. See Category Code 215 10 for Small Arms Shop in support of multiple installations.

14345-3 An additional method is to build the space requirements by weapon and ammunition count. The weapons/equipment within the armory is typically stored within cabinets, gun racks, shelving, boxes, or wall boards. In most cases, this method of storage allows some stacking of the weapons/equipment which can reduce floor space requirements. Requirements are listed on the Marine Force Armory website. Go to the “input” worksheets for: terms, definitions, weapon storage dimensions and basic algorithms for different types of weapons and equipment. Use this information to calculate space requirements.

14345-4 Armory design specifications can be found in MIL-HDBK-1013/1A and additional policy and guidance in OPNAVINST 5530.13 Series, Fleet Marine Force Armory (SF).

14345-5 An armory for Fleet Marine Force air and ground units provides a humidity controlled, air conditioned and secure space for storing and maintaining weapons assigned to personnel. Consolidation of unit armories should be emphasized provided such action is compatible with mission requirements, responsiveness and accessibility.

14345-6 The SF allocation for the Marine Force armory can be determined by locating the P-80 on the NAVFAC portal. The criteria algorithm is an EXCEL spreadsheet with the instructions provided in the first worksheet. Once the spreadsheet is opened go to the “instructions” worksheet.

14345-7 If you intend on using the spreadsheet to calculate facility requirements, it is suggested you perform a “save as” function to operate the spreadsheet from your computer vice via the Internet.

Click here to go to the spreadsheet.

143 46 MARINE BARRACKS - GENERAL PURPOSE BUILDING (SF)
FAC: 1446
BFR Required: Y

14346-1 **DEFINITION.** The criteria contained herein are applicable to CNO commanded Marine Barracks. The purpose of the Marine Barracks is to provide such security as approved by the Chief of Naval Operations, in coordination with the Commandant of the Marine Corps, and to perform such additional functions as directed by CMC.

14346-2 The criteria for Marine Barracks cover general-purpose functions only (for example, administration/operational, general instruction, armory and supply). Requirements for specific functions such as shop space, specialized storage, etc., should be developed from criteria of the Category Code for the specific function. This criterion does not include BEQ or community support facility requirements. Planning factor criteria for BEQ and community support facilities necessary to support the Marine Barracks personnel are contained in the Category Codes series 700. However, under normal conditions, the host activity would be expected to provide all community type support.

14346-3 The following shall be utilized for broad planning purposes when there is an absence of a detailed analysis of functional requirements. Provisions for parking (Category Code 852 10) and small arms pyrotechnic magazine (Category Code 421 48) should utilize the appropriate Category Code.

Table 14346-1 Marine Barracks

Military Strength	Gross SF/MN
1-50	75
51-100	65
101-150	55
151-200	45
201 -	For every man over 200, add 30 gross square feet per man

143 47 ALERT FORCE BUILDING (SF)
FAC: 1446
BFR Required: Y

14347-1 **DEFINITION**. An Alert Force Building is programmed in conjunction with an Air/Underwater Weapons Shop, Category Code 216 55, when required to meet the Alert Force response times established for the shop. The Alert Force Building provides barracks facilities, including limited messing facilities necessary to accommodate the guard of the day for an AUW Shop. It also contains a duty office, provision for weapons storage and an alarm repeater panel. Space requirements should be generated by an engineering space analysis.

143 55 TRANSIT SHED (SF)
FAC: 1444
BFR Required: Y

14355-1 **DEFINITION.** A transit shed is planned to support the rapid and orderly transfer of truck and rail freight in shipment from one carrier to another with minimum storage. For a waterfront transit shed, see Category Code 156 10. The transit shed is of the minimum design that will protect the freight from the weather and provide any security necessary. It may be a roofed shed with open sides or completely enclosed space built to the minimum specifications to provide the required protection. Plan at the rate of 1500 SF per 64 measurement tons (MT) of throughput per day for a peak (assumes 4 FT high stacking, 12 FT aisles for equipment maneuvering)

143 60 EXPLOSIVES, SHIPPING/TRANSFER DEPOT (SF)
FAC: 1431
BFR Required: Y

14360-1 **DEFINITION**. An explosives transfer depot is a facility used to transfer break-bulk ammunition and explosives between automotive vehicles and railcars for further shipment, or for delivery to a storage magazine, loading building, waterfront or airfield. The transfer depot may be in close proximity to a loading platform, a flight line, or a truck or rail center. This facility is typically required only at installations which expend or transship the ordnance materials in large quantities, e.g. NAVWPNSTAs and NAVMAGs. No planning factors are available; however, consider using industry metrics like peak daily throughput in sf/ton per unit of time. This code is not to be used for containerized ordnance; for ordnance moved in ISO (International Standards Organization) containers, use Category Code 148 40, Container Transfer Facility (Ordnance) should be used.

143 65 REGION/INSTALLATION OPERATIONS CENTER (SF)
FAC: 1431
BFR Required: Y

14365-1 **DEFINITION.** A Region/Installation Operations Facility is a shore mission specific Command, Control, and Coordination (C3) area in direct support of the operations mission of a Region/Installation Navy or Marine Corps Activity. This facility can also be designated as a Regional Operations Center (ROC), Emergency Control Center (ECC), or Emergency Action Center (EAC).

14365-2 **FUNCTIONAL AREAS.** This facility may contain the following functional areas:

- Equipment areas for both classified and unclassified server spaces to support tactical and operational communications systems and networks
- Operations areas to include a Watch Center and a Command Viewing Area
- Operations Analysis Workstations and Special Access Programs (SAP) area

Additional space may be provided to support Special Purpose Spaces such as: Break Room, Conference Room, and a Duty/Bunk Room, as well as Private and Open Office areas to support the small day-to-day operating staff. Additionally, adequate facilities are required to accommodate all operations staff that man the facility during emergency operations. Additionally, due to the nature of the mission of these facilities, an Uninterruptible Power Supply (UPS) system and emergency generator system may be required. See Table 14365-1 for authorized functional areas. An Engineering Evaluation will be used to determine the quantity and type of functional areas required. Please refer to the guidelines provided in the introduction of 131-series Category Codes for C5ISR buildings to calculate the requirement for each functional area. Per section 131-14, the authorized **net-to-gross** factor is 1.45.

14365-3 **BUILDING BLOCKS.** Figure 14365-1 provides a diagram demonstrating a summary of the applicable spaces, appropriate allocation factors, and the special relationship for Region/Installation Emergency Operations Facilities.

Table 14365-1. Region/Installation Operations Facility Functional Areas

Functional Area	Sub-space	143 65
Administrative General Purpose	Private Office	J
	Open Office (Cubicle)	A
Special Purpose Space Basic	Admin Support	A
	Break Room	A
	Classified Vault	J
	Conference Rooms/VTC	A
	Duty/Bunk Room	J
	Technical Publications Area	J
Special Purpose Space Fitness/Locker/ Shower	Locker Room	J
	Shower Room	J
Special Purpose Space Security	Quarterdeck/Entry Control	J
	Special Security Office	J
Operations Space	Watch Center	A

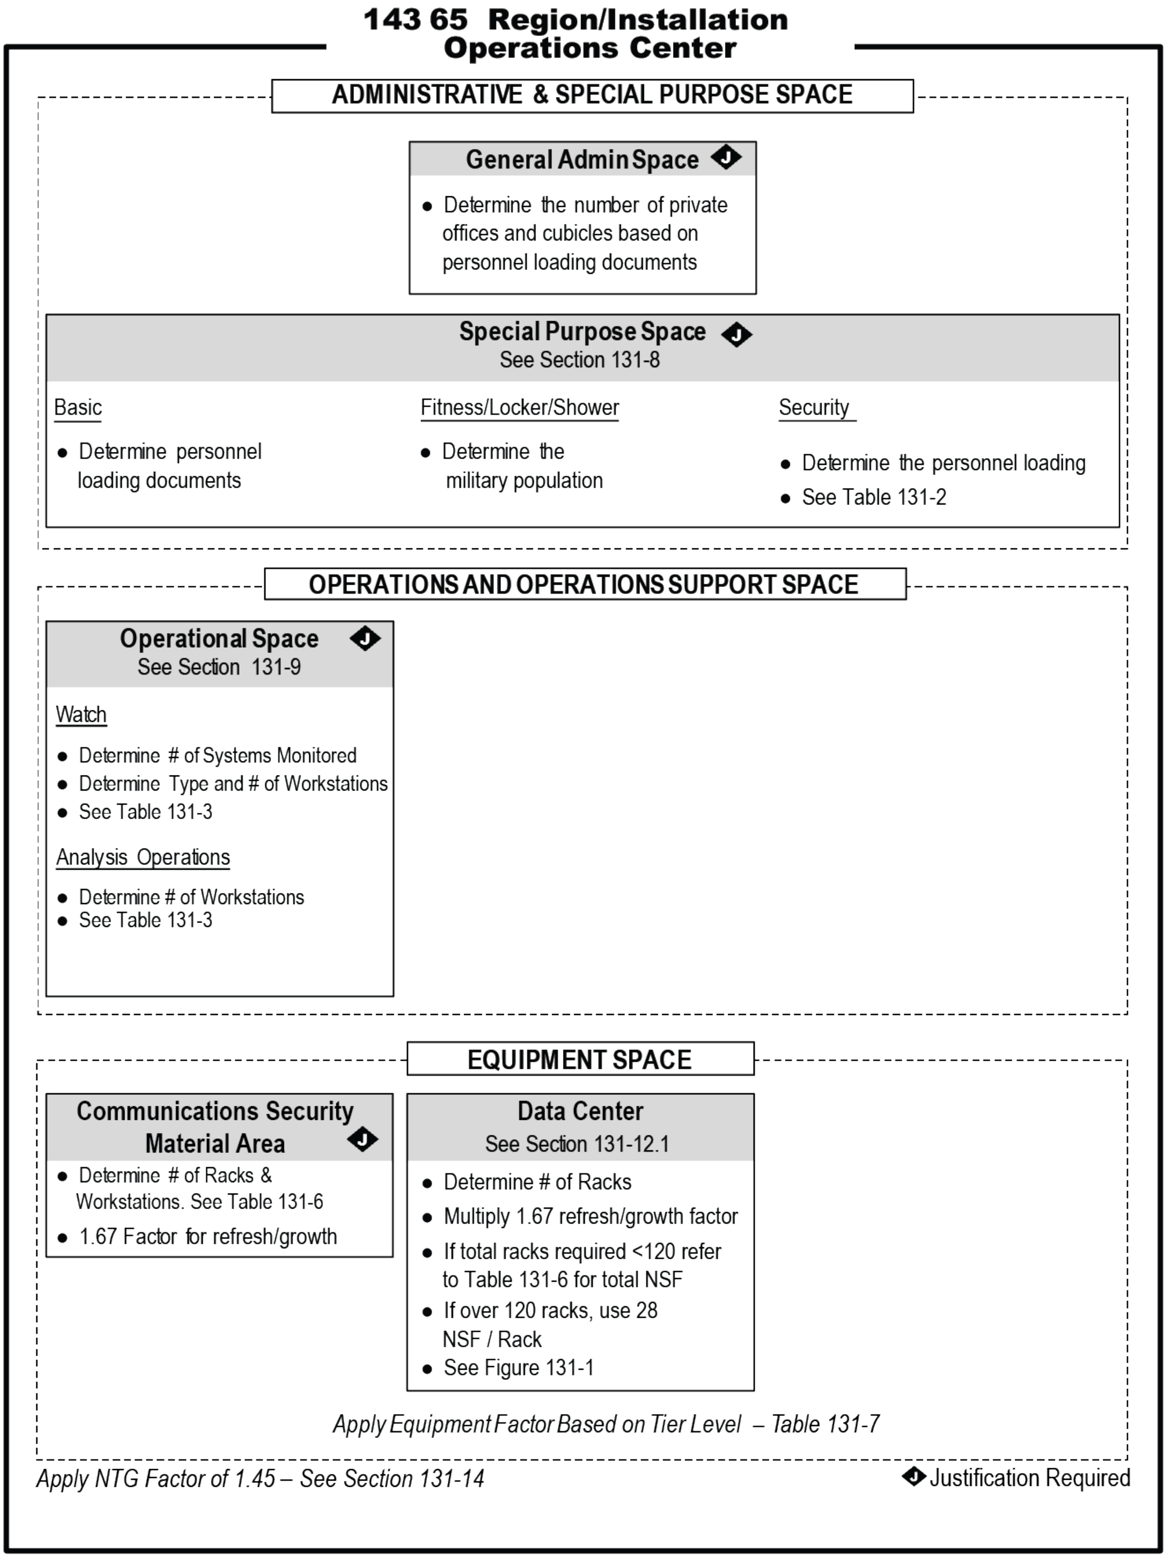
Equipment Space	Data Center/Server	A
	Communications Security Material Area	J

Legend:
A – Approved without additional justification (based on the staffing and mission requirements)
J – Only approved with specific justification of mission requirements

Figure 14365 -1. Region/Installation Operations Facility Building Blocks Diagram



143 70 RADIATION INSTRUMENT CALIBRATION FACILITY (SF)
FAC: 1442
BFR Required: Y

14370-1 **MONITORING DEVICES.** A health physics calibration building contains facilities required for calibration of health physics survey instruments and area monitoring devices. These devices are used to protect personnel against ionizing radiation from x-rays and atomic particles. The size of the building will depend upon the type and number of instruments being calibrated. Requirements typically include the following:

14370-2 **ADMINISTRATIVE OFFICES.** Refer to Category Code 610 10 guidance to determine the space requirements based on the number of offices needed.

14370-3 **CALIBRATION LAB.** Space consists of electrical and non-electrical workbenches, tool cabinets, and library of technical manuals, safety equipment, and storage of equipment waiting for calibration, storage for repair parts, and file storage for record keeping. The number of workbenches and cabinets must be determined based on the number of instruments being calibrated and number of personnel assigned to this function.

Table 14370-1. Calibration Lab

Items	NSF
Workbench (each)	125
Tool cabinet (each)	15
Library for manuals	50
Safety equipment	20
Equipment waiting calibration	80
Replacement parts	200
File storage cabinet (each)	7

14370-4 **Range.** Space consists of area to safely test the survey and monitoring equipment. The requirements will be determined by an engineering evaluation. The number of instruments, frequency of testing, and specific instrument testing requirements will dictate the space required for the range.

143 75 POL OPERATIONS/SAMPLING/TESTING BUILDING (SF)
FAC: 1442
BFR Required: Y

14375-1 **DEFINITION.** The POL operation building provides space required for quality control and administration of fuel activity. Space is provided in the building for an administrative office, control/gauge monitoring center, and fuels testing laboratory. Physical operation and control of the fuel system will be accomplished elsewhere (such as the pump house). Each person not working in the lab should be assigned desk space not to exceed 162.5 NSF. This net area allows for wall thickness, corridors and other general circulation, mechanical rooms, and rest rooms. Supervisor may be provided with private offices. The lab area and control monitoring center requirements will be based on engineering field analysis of the spaces. For the lab and control center only, a gross to net multiplier of 1.45 may be used. This multiplier will account for wall thickness, corridors, and circulation around equipment, mechanical rooms, and rest rooms.

143 77 OPERATIONAL STORAGE (SF)
FAC: 1443
BFR Required: Y

14377-1 **DEFINITION.** Operational Storage supports multiple Departments/Divisions within a command. It is under the control of the Logistics and Supply Department. This Category Code is used to identify areas used for bulk storage areas of major end items, and operational material. Storage of material under the control of the Communications Department should be classified within Category Code 217 77.

14377-2 Storage facilities for equipment related to operational facilities will be provided only where it can be individually justified. There are no criteria for this type of facility. General information on normal stacking heights, SF per measurement ton requirements, and other parameters are provided in Category Code 440 series.

143 78 OPERATIONAL HAZARDOUS/FLAMMABLE STORAGE (SF)
FAC: 1443
BFR Required: Y

14378-1 **DEFINITION.** This category will be used to provide a facility for the storage of materials used in daily operations that require special environmental separation. These materials such as paint, acetone, oil, etc. are considered to be hazardous and/or flammable. Personnel or storekeeper that may be assigned to this facility should be provided with a separate office space not to exceed 162.5 NSF. An engineering field analysis will be required to determine the warehouse space based on quantity of materials stored. Racks or shelves will be used to reduce footprint. Some materials may not be mix or must be divided by berms or firewalls and this separation space should be added to calculations. These facilities may require some environmental controls and ventilation. If quantity is palletized allow for forklifts in aisle ways or access through overhead doors. Reference the 440 series for assistance on converting CF to NSF.

14378-2 Facility should be close to or an extension of other warehouse space, therefore other personnel support spaces (i.e., restrooms, break area, lockers, etc.) are not required. Operational commands store small quantities of materials and small facilities under 1000 NSF are typical. For hazardous waste, see category codes 831 41/42.

143 80 MISSION OPERATION COMMAND AND CONTROL FACILITY (SF)
FAC: 1404
BFR Required: Y

14380-1 **DEFINITION**. A Mission Operation Command and Control Facility is a specialized facility that is only required in select locations to support the operations of Force Commanders and Fleet Commanders (e.g. US Fleet Forces Commander, Pacific Fleet) and selected others as established by DoD. A Mission Operation Command and Control Facility may also contain facility requirements for Type Commands (e.g. AIRLANT, SUBPAC), Operational Support Commands (e.g. CTF and CTG) and a Maritime Operations Center (MOC).

14380-2 **SPECIALIZED REQUIREMENTS**. A Mission Operation Command and Control Facility contains the total requirements for office space, special purpose space, operations spaces, maintenance spaces, training spaces, equipment space, and limited IT logistics support space. The technical and operational mission of this facility may require that it contain: Secure Compartmented Information Facility (SCIF) areas, an Uninterruptible Power System (UPS), emergency generator system and in select cases, TEMPEST countermeasures may be required such as Radio Frequency (RF) shielding, Protected Distribution Systems (PDS), and signal/power line isolation and filters. Although a Communications, Information, Intelligence Facility (Category Code 131 15) and/or a Satellite Communications Facility (Category Code 131 24) may be collocated on station with a Mission Operation Command and Control Facility, the Mission Operation Command and Control Facility may contain dedicated communication architecture and operational systems that require it to have its own connectivity via direct satellite systems.

14380-3 **FUNCTIONAL AREAS.** This facility may contain the functional areas outlined in Table 14380-1. In instances where Type Commands (e.g. AIRLANT, SUBPAC) and Operational Support Commands (e.g. CTF or CTG) are collocated with the operating force within the Mission Operation Command and Control Facility, a separate analysis shall be calculated for each respective command to determine their specific requirements. An Engineering Evaluation will be used to determine the quantity and type of functional areas required. Please refer to the guidelines provided in the introduction of 131-series Category Codes for C5ISR buildings to calculate the requirement for each functional area. Per section 131-14, the authorized **net-to-gross** factor is 1.45.

14380-4 **BUILDING BLOCKS.** Figure 14380-1 provides a diagram demonstrating a summary of the applicable spaces, appropriate allocation factors, and the special relationship for Mission Operation Command and Control Facilities.

Table 14380-1. Mission Operation Command and Control Facility Functional Areas

Functional Area	Subspace	143 80
Administrative General Purpose	Private Office	A
	Open Office (Cubicle)	A
Special Purpose Space Basic	Admin Support	A
	Break Room	A
	Break Room Kitchen	J
	Classified Vault	J
	Conference Rooms/VTC	A
	Duty/Bunk Room	J
	Mail Room	J
	Technical Publications Area	J
Special Purpose Space Fitness/Locker/ Shower	Fitness Room[1]	J
	Locker Room	J
	Shower Room	J
Special Purpose Space Security	Quarterdeck/Entry Control	A
	Special Security Office	J
Operations Space	Watch Center	A
	Analysis Operations	A
Maintenance Space	Maintenance	J
Training Space	Training	J
IT Logistics Support Space	IT Logistics Support Space	A
Equipment Space	Data Center/Server	A
	Commercial Services Equipment	J
	Communications Security Material Area	J
	Network Distribution Area	J
	Specialized Equipment	J

Legend:
A – Approved without additional justification (based on the staffing and mission requirements)
J – Only approved with specific justification of mission requirements
(1). This requirement should be captured under CCN 740 45. Fitness Rooms are only allowed in accordance with CNICINST 1710.1 where by the command is located more than a 15- minute commute by vehicle from the nearest Morale Welfare and Recreation (MWR) Fitness Center, or in cases where service members are required to be on station and unable to leave for 18 hours at any given time. The fitness room must also have approval from the Installation Commanding Officer.

Figure 14380-1. Mission Operation Command and Control Facility Building Blocks Diagram

143 80 Mission Operation Command & Control Facility

ADMINISTRATIVE & SPECIAL PURPOSE SPACE

General Admin Space

- Determine the number of private offices and cubicles based on personnel loading documents

Special Purpose Space ◆J
See Section 131-8

Basic
- Determine personnel loading documents

Fitness/Locker/Shower
- Determine the military population

Security
- Determine the personnel loading
- See Table 131-2

OPERATIONS AND OPERATIONS SUPPORT SPACE

Operational Space
See Section 131-9

Watch
- Determine # of Systems Monitored
- Determine Type and # of Workstations
- See Table 131-3

Analysis Operations
- Determine # of Workstations
- See Table 131-3

Maintenance Space ◆J
See Section 131-10
- Build based on Table 131-4

Training Space ◆J
See Section 131-11
- Build based on Table 131-5
- Maximum of 20 positions allowed
- Greater than 20 positions requires justification

IT Logistics Support Space
See Section 131-13
- Determine shipping, receiving, laydown, and IT staging requirements
- Determine CF of storage requirement NSF = 0.327 × CF

EQUIPMENT SPACE

Communications Security Material Area ◆J
- Determine # of Racks & Workstations. See Table 131-6
- 1.67 Factor for refresh/growth

Data Center
See Section 131-12.1
- Determine # of Racks
- Multiply 1.67 refresh / growth factor
- If total racks required <120 refer to Table 131-6 for total NSF
- If over 120 racks, use 28 NSF / Rack
- See Figure 131-1

Commercial Services Equipment / Cable Plant ◆J
- 25% × Data Center/Server NSF

Network Distribution ◆J
- 15% × Data Center/Server NSF

Apply Equipment Factor Based on Tier Level – Table 131-7

Apply NTG Factor of 1.45 – See Section 131-14

◆J Justification Required

143 85 JOINT RESERVE INTELLIGENCE CENTER (JRIC) (SF)
FAC: 1444
BFR Required: Y

14385-1 **DEFINITION**. Joint Reserve Intelligence Center (JRIC). A JRIC is a joint intelligence production and training activity that uses information networks to link reservist intelligence personnel, active duty units and contractors with the combatant commands, Services, and/or combat support agencies. A JRIC is located within a Service-owned and managed sensitive compartmented information (SCI) facility and may also include surrounding collateral and unclassified areas involved in the performance and direct management of intelligence production work that uses Joint Reserve Intelligence Program infrastructure and connectivity. The JRICs located around the country are equipped to effectively serve as satellite elements to combatant command Joint Intelligence Operations Centers (JIOCs), however they are shared facilities that serve multiple customers and missions.

14385-2 A JRIC contains the total requirements for office space, intelligence production space, support space, equipment and communications spaces, maintenance and training spaces, and limited storage space. The technical and operational mission of a JRIC will require that it contain, Secure Compartmented Information Facility (SCIF) areas, an Uninterruptible Power System (UPS), emergency generator system(s), and in selected cases, Radio Frequency Interference (RFI) shielding, Electromagnetic Interference (EMI) shielding, and Telecommunications Electronics Material Protected from Emanating Spurious Transmissions (TEMPEST) protection. It may contain dedicated communications architecture and operational systems that require it to have its own connectivity via direct satellite systems. The JRIC uses DIA / DoDIIS / DS-OGT for infrastructure and connectivity in “state of the art” Data Centers located within the SCIF.

14385-3 A JRIC may contain the functional areas outlined below.

14385-3.1 **Office Area**. Areas are provided for, but not limited to, the Site Manager (Officer in Charge), Administrative Staff, JRIC Operations Officer and JRIC Site Systems Administrator. Additional office space may be required to support the (Reserve Intelligence Area) Commander, Deputy, Chief of Staff, Command Support Staff (N-00), Special Staff (N-01/02), DCOS Manpower and Personnel (N-1), DCOS Intelligence and immediate Support Staff (N-2), DCOS Operations and immediate Support Staff (N-3), DCOS Logistics/Supply/Material and immediate Support Staff (N-4), DCOS Plans and Policy and immediate Support Staff (N-5), DCOS & Combat Systems and immediate Support Staff (N-6), DCOS Tactics and immediate Support Staff (N-7), DCOS Requirements, Readiness, and Assessment and immediate Support Staff (N-8).

14385-3.2 **Support Area**. The following support areas are normally required.

• **Reception Area**. A reception area, normally shared by the Commander, Deputy Commander, and Chief of Staff is required. This area should be capable of accommodating a minimum of eight (8) personnel. This is essentially a screening area for un-cleared personnel. This includes receptionist and visitors.

• **Commanders Conference Room**. A Conference Room normally shared by the Commander, Deputy Commander, and Chief of Staff capable of supporting a minimum of eight (8) personnel may be required.

• **Conference/Classroom Room.** Requirement is predicated on Base Loading/Stationing plan of supported units/activities.

• **Command VTC/Conference Room**. A large area performing the function of an Auditorium/Conference Room may be required. The size of this area is dependent on the stationing/base loading plan, staffing and size of the JRIC.

• **Break/Lounge/Galley Area**. As a result of the operational hours maintained within this facility, a small break/lounge/galley (kitchenette) area is required.

• **Quarterdeck Area**. This multifunctional area provides an assembly or holding area for visitors awaiting escort, badge and pass issue and verification, and is considered the central point for ingress/egress. The quarterdeck will normally contain a maximum of two workstations requiring approximately 200 nsf.

• **Technical Publications Area**. This area may be required to store reference publications and literary data. It is configured similarly to a reference library in that it contains bookshelves, a reference area, and a working space for a minimum of two people requiring approximately 190 nsf.

14385-3.3 **Operational Area**. Not every JRIC will contain all of the areas listed, and there may be slight differences in terminology of the areas referenced below as a result of geographic specialization required at each respective location. In addition, although intended as a guide, the specific size of the areas provided below may vary as a result of the stationing/base loading plan and mission of the respective JRIC. An Engineering Evaluation will be used to determine the quantity and type of space required. Guidance provided within the Category Code series applied will be used * (see notes below).

• **Intelligence Operations Center**. This operational area is typically configured as a two to three room suite. The first area supports Operational Intelligence Production/Evaluation. This area will be configured based on mission essential tasks/functional requirements, be comprised of a certain number of A, B and C type workstations and include a conference area/collaborative multi-disciplinary workspace with a table capable of seating eight (8). The second area supports Strike/Targeting production. This area will be configured based on mission essential tasks/functional requirements, be comprised of a certain number of A, B and C type workstations and include a conference area/ collaborative multi-disciplinary workspace with a table capable of seating eight (8). The third area supports Special Warfare intelligence production. This area will be configured based on mission essential tasks/functional requirements, be comprised of a certain number of A, B and C type workstations and include a conference area/ collaborative multi-disciplinary workspace with a table capable of seating eight (8). Within the center there may be areas designated as Special Access Programs (SAP) areas (see below), which may contain a conference area with a table capable of seating eight (8), one type A workstation, video displays and wall maps, and support equipment (scanners, printers, copiers, et cetera).

A workstation = Connectivity to three (3) systems
(JWICS/SIPRNet/DNI-U)

B workstation = Connectivity to two (2) systems
(JWICS/ SIPRNet/DNI-U)

C workstation = Connectivity to one (1) system
(JWICS/ SIPRNet/DNI-U)
• **Imagery Exploitation/Production Area**. The Imagery Production Area may contain up to three (3) separate areas as follows:

a. **Imagery Analysis Area**. This area may be divided into separate rooms each of which supports up to twenty (20) personnel and contains imagery technician workstations, plotters and printers. The governing reference for design of these spaces is the National Geospatial-Intelligence Agency (NGA) Exploitation Facility Design Guidelines, version 2.1 dated 21 December 2006.

b. **Production Area.** This area contains one type A workstation, large format plotter, layout tables, light tables and imagery processor equipment.

c. **Administrative, Reference and Storage Area**. This area contains one type A workstation, bookshelves & map flats for imagery materials & supplies and administrative support equipment.

d. **Collaborative multi-disciplinary work space.** This area will include a conference area with a table capable of seating eight (8) and may be co-located with the imagery production area.

The minimum imagery exploitation space allocation for any JRIC will be a four (4) workstation room.

14385-3.4 **Operational Support Area**

JRIC Support Suite. The JRIC Support Suite may contain up to four (4) areas as outlined below.

- **Data Center**. This area typically contains one Type C workstation and a single row of six to ten racks of servers. An Uninterruptible Power Source (UPS) system and emergency generator system supporting this equipment is required for continuous operations capability. This area is also supported with a remote environmental monitoring system and a gas fire suppression system.

- **JRIC Operations Officer Area**. This area typically contains one unique conference table configuration capable of seating up to eight (8) personnel, a Type A workstation, and large wall mounted video display and maps.

- **JRIC Site System Administrator (JSSA) Area**. This area typically contains one Type A workstation and administrative support equipment (scanners, printers, copiers et cetera).

- **Secure Storage**. This area will contain secure storage containers as approved by the supporting Special security office (SSO).

DIA/DoDIIS-DS/OGT Support Area. An area is required for DIA/DODIIS-DS/OGT servers associated with the JWICS, SIPRNet and DNI-U. This area functions as the technical control and monitoring point for DIA/DODIIS-DS/OGT connectivity. This area may be co-located with the Data Center.

Minimum connectivity requirements: Each JRIC will receive connectivity based on unit/activity/agency mission requirements. The minimum JRIC standard is:

System	Circuit Size	Quantity
JWICS	OC-3 line	1
SIPRNet	DS-3 line	1
DNI-U	DS-3 line	1

In addition each line will have a “back-up” or redundant circuit which will be sized in order to meet minimum mission requirements.

Special Security Officer (SSO) Suite. The SSO Suite associated with a JRIC Facility is a multifunctional area containing, but not limited to, a Reception Area, Indoctrination Area, Photography Area, and Vault requiring approximately 280 nsf. Office space for the SSO and associated support staff are located within the SSO Suite, but special requirements for them should also be contained within the Office Area above. The SSO Suite is considered a secure area and must meet Sensitive Compartmented Information Facility (SCIF) criteria.

Secure VTC/Briefing Area. This area will normally be configured for a minimum of fourteen (14) personnel. It will contain video monitors, cameras, conference room seating, a computer workstation, Smart/white boards, briefing boards for large charts and video displays. A rear screen projection room may also be required in this area.

Mission Critical Communications Equipment Area. The Mission Critical Communications Equipment Area is unmanned. It may contain IEMATS consoles and processors, SATCOM terminals, UHF voice consoles and equipment, an EMATS fiber optic interface, WWMCCS, JWICS, and other applicable information data base terminals. An Uninterruptible Power Source (UPS) system supporting this equipment is required to sustain continuous operations. Secure telecommunications is a standard requirement (e.g., Standard Telephone Units (STU) analog systems and/or Standard Telephone Equipment (STE) digital systems), to be located as mission dictates.

Mission (Operations) Cells. In addition to the Operations and Operational Support Areas addressed above, selected JRIC's may require specialized Mission Cells. These cells may include but are not limited to unique mission requirements or mission requirements incompatible with the supported units, activities or agencies (e.g., Force Cryptology Area, Fleet Support/Collection Management Area, Crisis Management Cell Area, et cetera). Each respective cell is arranged in a specific configuration, which will include a mix of rack mounted, and PC based systems. An Engineering Evaluation is to be used to determine the total number of cells required, quantity of racks and workstations associated with each respective cell.

Agency Support Area. The Agency Support Area is based on staffing. Agency personnel may be addressed under Office Area and will only be contained within the Equipment and Operational Area if required by unique security issues.

Special Access Programs (SAP), Compartmented Area (CA). In accordance with Intelligence Community Policy Memorandum, Number 2006-700-7, dated 12 JUL 2006, Subject: Intelligence Community Modifications to DCID 6/9 Physical Security Standards for Sensitive Compartmented Information Facilities (SCIF's). A CA is a room, or set of rooms, located within a SCIF designed to enforce need-to-know. A CA is required when different compartment programs are sharing the same SCIF and not all SCIF personnel are cross-briefed. CA areas are mission specific and require an Engineering Evaluation.

14385-3.5 **Maintenance and Training Area**. Although not every JRIC Facility will contain all the areas listed, they are provided below as a guide. In instances where the respective allowances for the systems do not reflect configurations at the site, an Engineering Evaluation will be used to determine the quantity and type of spaces required and guidance provided within the Category Code series will be applied.

System/Task Training Areas. Individual JRIC's may require dedicated 'modified academic' training areas. Training covers instruction and hands-on applications with operational equipment to provide Activity/Agency personnel, as well as Fleet personnel, with operator skills on existing and recently deployed systems. As CNO/CNI/DIA directives and operational requirements determine these classes, no formal yearly class schedule is established. Historical data shall be obtained on class sizes and the planning factor outlined in Category Code series 171 of UFC/NAVFAC P-80 of 45 nsf/pn applied.

Command Training Area. This academic training area is required to satisfy general training requirements for all of the RIA and JRIC units/activity/agency personnel. Training requirements cover general topics, which include but are not limited to, Quality of Life, Career Enhancement, Administrative, Educational Services, and Command Initiative Programs.

System/Task Maintenance Areas. Individual units and/or agencies may require dedicated systems/tasks maintenance areas. These maintenance areas may be configured with equipment racks and PC based workstations. An Engineering Evaluation and/or historical data shall be used to determine the quantity and configuration required for mission support, and guidance provided within the Category Code series section applied.

Flexible Secure Working Area (FlexSWA). To accommodate a broad range of system/ task training and command training requirements, where there is limited space availability for the JRIC, or greater space flexibility is required, it is possible to design and develop a Flexible Secure Working Area that is built to SCIF standards (DCID 6/9 requirements), but is configured to accommodate multiple functions and all levels of work, from unclassified up to TS/SCI, as required.

14385-3.6 **Storage Area**. A dedicated storage area may be provided for each unit/activity within the JRIC Facility. Allowance is based on Tables of Allowances/Modified Table of Organization and Equipment or equivalent.

Common Support Space Requirements. Note: Restrooms are required in both the SCIF and unclassified spaces. The restrooms in the unclassified spaces should have showers to support the full-time staff.

General. A JRIC is a remote joint service intelligence production and training activity that uses information networks to link reservists, active duty units and contractors with the Combatant Commands, Services, and/or Combat Support Agencies (C/S/A). A JRIC is located within a DoD-owned and managed Sensitive Compartmented Information Facility (SCIF) and surrounding collateral/unclassified areas involved in the performance and direct management of intelligence production work that uses JRIP (Joint Reserve Intelligence Program) infrastructure and connectivity. JRIC's provide interoperable intelligence support systems on which reserve elements simultaneously fulfill their intelligence support missions/production requirements and train on their Mission Essential Tasks. Reference: DoD Directive 3305.7, "Joint Reserve Intelligence Program (JRIP). For specific design information, please contact NAVFAC Atlantic Asset Management division.

144 40 SCALE HOUSE (SF)
FAC: 1444
BFR Required: N

14440-1 **DEFINITION.** A building that provides a protective enclosure for the operator of a vehicle/railcar weighing station. Sizing will be on a case-by-case basis and no criteria is available.

148 SHIP AND OTHER OPERATIONAL FACILITIES OTHER THAN BUILDINGS

148-1 **GENERAL.** This category group contains facilities and structures which support tactical or organizational ship and other land operations in which do not fall readily into another category. For facilities supporting aircraft operations, use category group 149.

148 10 SHIP PROPULSION SUPPORT FACILITY (EA)
FAC: 1481
BFR Required: Y

14810-1 **DEFINITION.** Planning and programming for this facility requires concurrence and planning guidance by NAVSEA Code 08.

148 15 SHIP WEAPONS HANDLING FACILITY (EA)
FAC: 1491
BFR Required: Y

14815-1 **DEFINITION.** No planning factors are available. Each facility requires individual justification and space requirements; please contact Director, Strategic Systems Program (SSP) Office.

148 17 SPACE SURVEILLANCE ANTENNA (EA)
FAC: 1456
BFR Required: N

14817-1 **DEFINITION.** Requirements are determined by Naval Network and Space Operations Command. Facilities typically support global space surveillance network which detects, tracks, identifies, and catalogs man-made objects in space and provides position information on these objects.

148 20 ORDNANCE DEMOLITION AREA (EA)
FAC: 1783
BFR Required: Y

14820-1 **DEFINITION.** An ordnance demolition (treatment) area is a location specifically designated and reserved for destroying explosives and explosives-loaded devices. The function typically means burning or detonating explosives in a bermed open burn/open detonation (OB/OD) area. Coordinate justification for this area with the EOD units or other users. Planning and scoping this facility should consider governing environmental federal and state regulations, user requirements and explosive safety criteria. This area must meet the requirements of NAVSEA OP-5 Vol.1 and OPNAVINST 3770.2 (series) for FAA clearance requirements. All ordnance demolition (treatment) areas located in the United States and U.S. territories are required to have a Resource Conservation and Recovery Act (RCRA) permit. The shelter/bunker for the demolition area will be captured under CCN 173-40 Observation Tower/Bunker. Use Category Code 178 30 for a demolition training range.

148 25 EXPLOSIVE TRUCK HOLDING YARD (SY)
FAC: 8526
BFR Required: Y

14825-1 **DEFINITION.** This yard is where trucks containing ammunition and/or explosives are held for interim periods of time prior to storage or shipment. Safe havens and wharf yards near piers and wharves should be categorized under this function. Each facility requires individual justification. Depending on land constraints and explosive safety criteria these facilities may or may not be barricaded. For containerized ordnance, use Category Code 148 35, Container Holding Yard.

148 30 EXPLOSIVES RAILROAD CAR HOLDING YARD (EA)
FAC: 1493
BFR Required: Y

14830-1 **DEFINITION.** This is a temporary holding area for railcars containing ordnance prior to storage or shipment. Each facility requires individual justification. Depending on land constraints and explosive safety criteria these facilities may or may not be barricaded. For containerized ordnance use Category Code 148 35, Container Holding Yard.

148 35 CONTAINER HOLDING YARD (SY)
FAC: 8526
BFR Required: Y

14835-1 **DEFINITION**. This is an open area that provides a temporary holding or staging area for containers loaded with explosive ordnance. Wharf yards near piers and wharves are also described by this function. Containers with explosive ordnance class/ Division 1.1 and 1.2 may or may not be in a bermed/barricaded area. Loaded containers can be stacked two high or singly on chassis or flatbed trailers. No planning criteria are provided because of the multiple container handling equipment possibilities and container configurations. A simple layout sketch of the proposed container holding

area, allowing for safe maneuvering of the container handling equipment, will generate the required space requirements.

14835-2 Minimum holding capacity of all holding yards should approximate one shipload of containers or the equivalent of 24 hours of sustained out-loading for the particular terminal operation.

148 40 CONTAINER TRANSFER FACILITY (ORDNANCE) (SY)
FAC: 8526
BFR Required: Y

14840-1 **DEFINITION.** A container transfer facility is used to transfer containers between rail flatcars and truck flatbeds or chassis, on a paved hardstand area, by means of a bridge crane or container handling equipment. Scale equipment should be expected to a part of this function. The area may be barricaded or unbarricaded. The size of the facility should be capable of handling a sustained maximum out-loading for the number of container throughput served in a 24-hour period. Determine the standard transfer rates given the type of container handling equipment. The mix of arrivals and departures of containers on rail or truck requiring transfer determines the how much material handling equipment is necessary to sustain the maximum out-loading. The area of paved hardstand and parking is dictated by the rate of container arrivals and departures. The control and service building of 204 SF provides office space, toilet facilities, etc. for employees. See Figure 14840-1 for a notional transfer facility using a bridge crane.

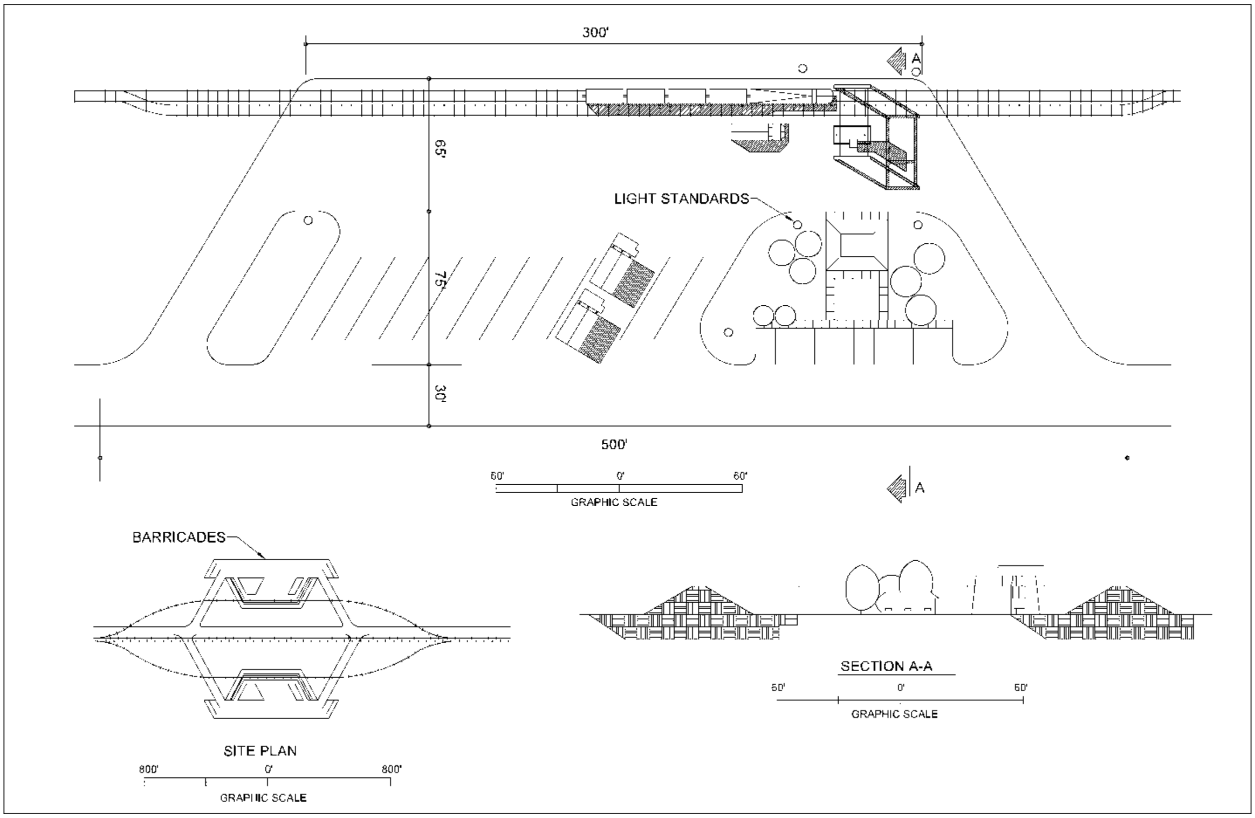


Figure 14840-1 Container Transfer Facility (Ordnance)

148 45 RAIL/TRUCK RECEIVING STATION (ORDNANCE) (SY)
FAC: 8526
BFR Required: Y

14845-1 **DEFINITION.** A rail/truck receiving station weighs and inspects all incoming shipments of break-bulk and containerized ordnance arriving by rail or truck and also a percentage of the outgoing shipments. Also, this station can be used as a short term storage facility limited to overnight and weekend periods and as an interchange storage facility limited to overnight and weekend periods and as an interchange yard between common carrier and station. The capacity of the receiving, inspecting, and weighing facility is based on expected maximum truck and rail arrivals and departures during a sustained out-loading. Figure 14845-1 provides a notional layout for a high volume ordnance receiving and inspection station. This notional facility can process 20 rail cars per hour and 20 trucks per hour and provide for a 40-truck parking area and 100 rail car siding. It contains two rail inspection pits and two truck inspection pits, scales, lighting, and 2,432 SF of administrative space.

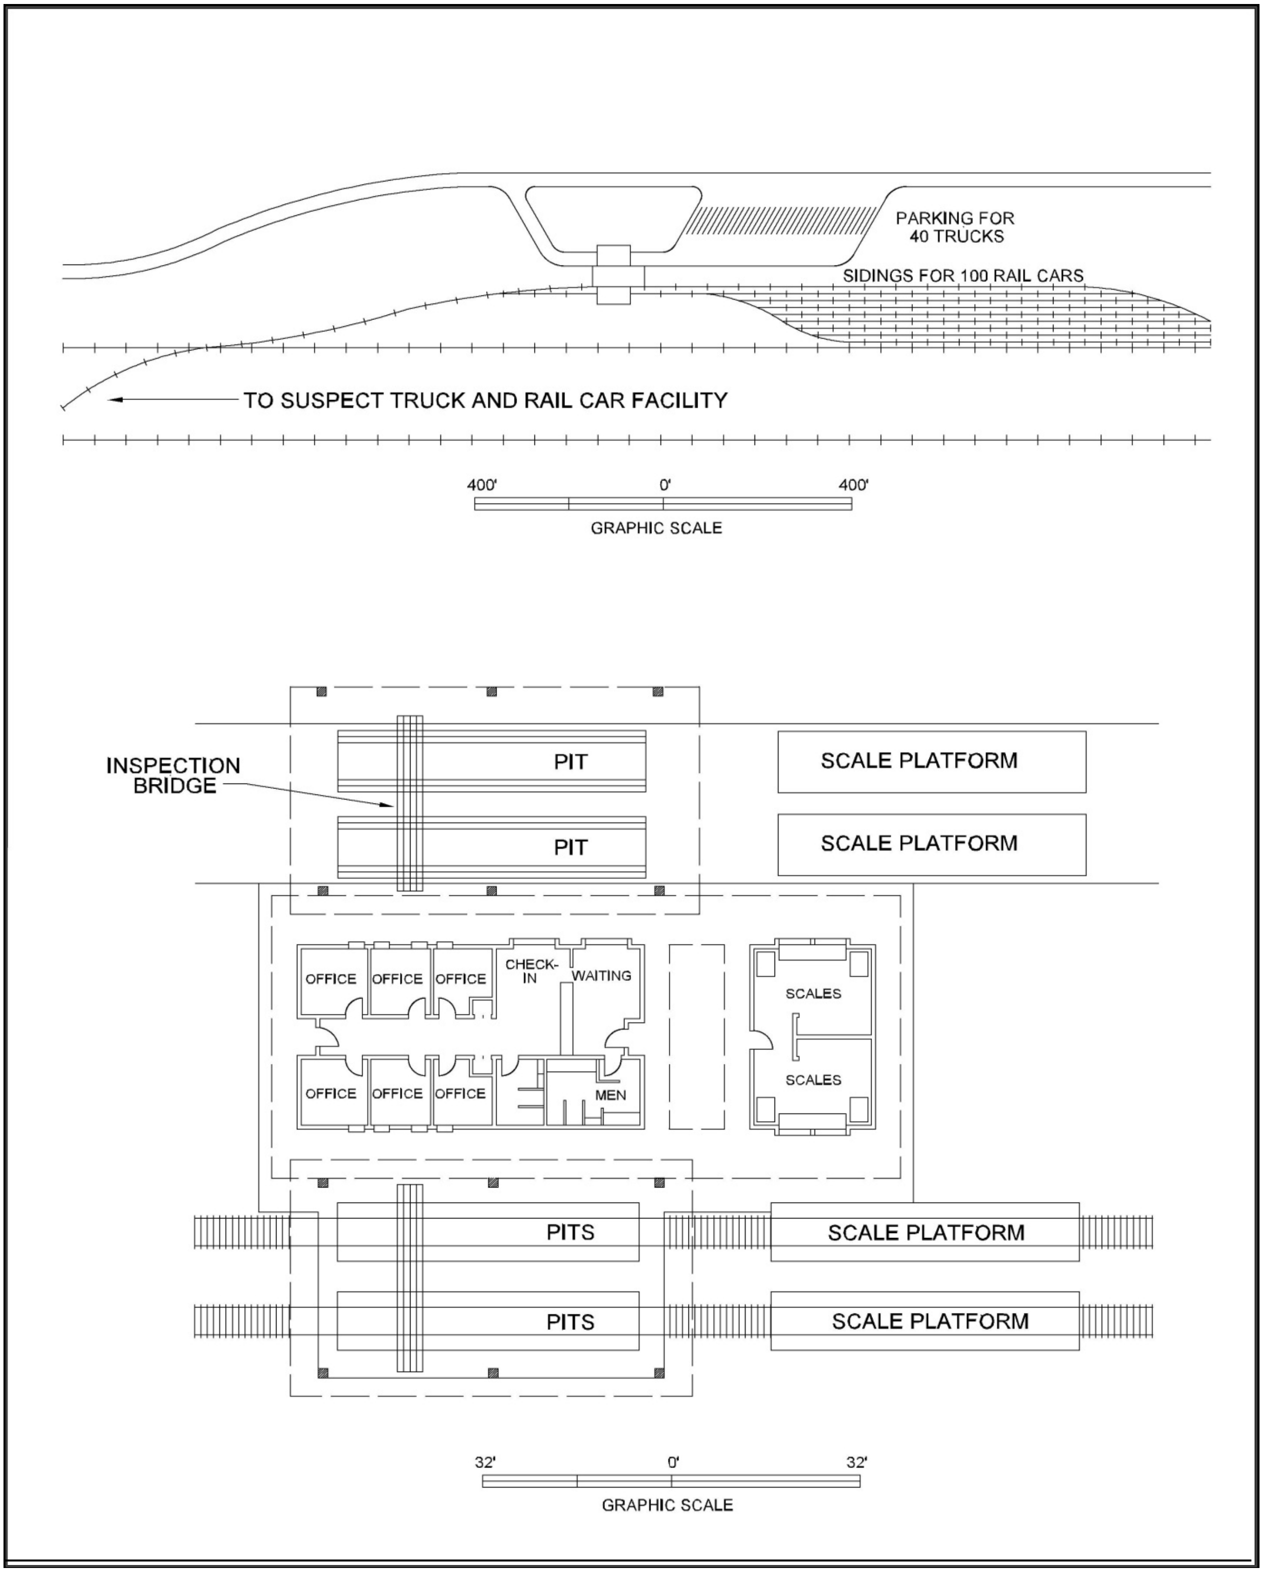

Figure 14845-1 Rail / Truck Receiving Station (Ordnance)

149 OPERATIONAL FACILITIES- OTHER THAN BUILDINGS

149-1 **GENERAL.** This category group contains facilities such as towers and structures which support tactical or organizational aircraft related operations, and which do not fall readily into another category. It includes protective construction.

149 10 AIRCRAFT REVETMENT (EA)
FAC: 1495
BFR Required: N

Design Criteria: None Available

14910-1 **DEFINITION.** Protective Barricades (also known as revetments) are constructed at locations where explosive safety dictates the need, such as in magazine areas, combat aircraft loading areas, etc. They can be either steel structures or man-made earthen berms.

Aircraft revetments are constructed only for emergencies or in combat zones for the protection of aircraft against fire, blast, or enemy action. Aircraft revetments will be sized according to the aircraft that it is to protect. Specific criteria for this requirement will be determined by field conditions and will be planned only on specific instructions of the Fleet or Area Commander. For planning purposes, the unit of measure is each (ea); that is, the number of protected aircraft sites.

Explosive barricades for suspect truck or rail cars are captured under CCN 860 20, Explosive Barricade for Suspect Trucks and Railroad Cars.

14910-1 **DEFINITION.** Aircraft revetments are constructed only for emergencies or in combat zones for the protection of aircraft against fire, blast, or enemy action. Aircraft revetments will be sized according to the aircraft that it is to protect. Specific criteria for this requirement will be determined by field conditions and will be planned only on specific instructions of the Fleet or Area Commander. For planning purposes, the unit of measure is each (ea.); that is, the number of protected aircraft sites.

149 15 FIXED POINT UTILITIES SYSTEM (EA)
FAC: 1467
BFR Required: Y

Design Criteria: UFC 4-121-10N, Aircraft Fixed Point Utility Systems
Planning Criteria: P-80.3, Aviation Operation and Support Facilities; UFC 3-260-01, Airfield and Heliport Planning and Design

14915-1 **DEFINITION.** Fixed Point Utilities Systems (FPUS) supply utilities to aircraft parking apron service points and aircraft maintenance hangar service point. The

FPUS can provide compressed air, preconditioned air for hangared aircraft, and/or electrical power. The system can consist of an enclosed pump house and storage tanks, an in-ground distribution system and service points in aircraft parking aprons or aircraft maintenance hangars. There are typically four types of systems:

1. Air Start System. Provides compressed air at the parking apron. Aircraft cooling is provided by mobile ground carts. Electrical power is provided by separate, dedicated service panels.
2. Environmental Control System. Provides compressed air for engine starting and environmentally controlled compressed air for aircraft cooling from a central source. Electrical power is provided by separate, dedicated service panels.
3. Flight Line Electrical Distribution System (FLEDS). Provides electrical power to aircraft parked on the aircraft parking apron.
4. Point of Use Frequency Converter System (Super Flight Line Electrical Distribution System (SFLEDS)). Provides conditioned (filtered and compensated) electrical power to aircraft parked on the aircraft parking apron.

Layout of FPUS shall be subject to the correlated siting of maintenance hangars, parking apron and taxiways. Aircraft parking and FPUS layout is prescribed under Aircraft Parking Apron, Category Code 113 20 and UFC 3-260-01, Airfield and Heliport Planning and Design.

149 20 AIRCRAFT CATAPULT (EA) (DELETED)

This CCN has been deleted because it is non-RP (the catapult system is equipment). However, the support building(s), which can be above or below ground, are now captured under CCN 319 10 MISCELLANEOUS EQUIPMENT AND ITEMS LABORATORY.

149 30 AIRCRAFT ARRESTING GEAR (EA)
FAC: 1461
BFR Required: N

> **Design Criteria:** AFI 32-1043, Managing, Operating, and Maintaining Aircraft Arresting Systems, FAA AC 150/5220-22B, Engineered Materials Arresting Systems (EMAS) for Aircraft Overruns
> **Planning Criteria:** UFC 3-260-01, Airfield and Heliport Planning and Design

14930-1 **DEFINITION.** Aircraft arresting gear is designed to bring an aircraft to a stop in case of an aborted takeoff or an emergency landing.

Aircraft arresting systems consist of engaging devices and energy absorbers. Engaging devices are net barriers, disc supported pendants (hook cables), and cable support systems that allow the pendant to be raised to the battery position or retracted below the runway surface. Energy absorbing devices are ships anchor chains, rotary friction brakes, such as BAK-9 and BAK-12, or rotary hydraulic systems such as the BAK-13 and E-28. The systems designated "Barrier, Arresting Kit" (BAK) are numbered in the sequence of procurement of the system design. There is no connection between the Air Force designations of these systems and their function. Other designations such as E-5, E-28 and M-21 are U.S. Navy designations. The U.S. Air Force systems in use today are MA-1A; E-5; BAK-9; BAK-12; BAK-13; BAK-14; 61QSII (BAK-15); E-28; and Textile Brake. Other types of systems include the Mobile Aircraft Arresting System (MAAS) and Soft-Ground Type Aircraft Arresting System/Engineered Material Arresting System (EMAS).

14930-1.1 **E-5.** This unidirectional emergency arresting system is a U.S. Navy design and designation. Much like the MA-1A, this system uses several shots of ships' anchor chain as the energy absorber, but these systems are never connected with a barrier (net). These systems can have from 1 to 4 disc-supported hook cables, with designations of E-5 and E-5 Mod 1 through E-5 Mod 3.

14930-1.2 **E-28.** The E-28 aircraft arresting system is a rotary hydraulic arresting gear that will accommodate a maximum aircraft weight of 35,400 kg (78,000 lbs.) and a maximum aircraft engaging speed of 293 km/hr. (160 knots). Aircraft engaging the E-28 arresting gear are stopped within a runout distance of approximately 305 meters (1,000 feet). Engagement can be made from either runway direction and at points up to 12.1 meters (40 feet) on either side of the runway centerline. The high performance (Model E-28) type of arresting gear is planned for both primary and secondary (crosswind) runways. Normally, two sets of arresting gear are required for each operative runway: one at each end between 274 meters (900 feet) and 457 meters (1,500 feet) inboard from the runway threshold. Midpoint arresting gear may be included on the station BFR when justified by runway or operational conditions and when approved through appropriate channels.

14930-1.3 **M-21.** The M-21 aircraft arresting system is a lightweight high-capacity arresting system for the recovery of aircraft. The arresting engines utilize the vortex principle of energy absorbing in a hydrodynamic braking system.

14930-1.4 **MA-1A.** The MA-1A emergency arresting system consists of a net barrier and cable system designed to engage the main landing gear of an aircraft. Because it is a unidirectional system, it must always be installed in the overrun area. Most MA-1A systems employ ships' anchor chains as the energy absorber. These systems require a runout area of at least 259 meters (850 feet) plus the length of the aircraft. The chains lie on either side of the runway overrun, beginning at the barrier location and running in the direction of aircraft travel; however, some MA-1A systems use a BAK-9 instead of a ships' anchor chain as the energy absorber. These systems require a runout area of at least 290 meters (950 feet) plus the length of the aircraft. *The MA-1A is not currently in production as a system.*

14930-1.5 **BAK-9.** The BAK-9 is an obsolete bi-directional emergency arresting system. It consisted of 1 energy absorber that employed 2 rotary friction brakes and purchase-tape reels mounted on a common shaft. The reels were mechanically connected at the midpoint by a third brake that acted as a clutch. This allowed each reel to turn at different speeds during off-center engagements and helped steer the aircraft toward the center of the runway. The energy absorber for these systems was installed below grade on 1 side of the runway and the purchase tape was routed to the opposite side of the runway through deflector sheaves and duct. The other purchase tape was routed to a turnaround sheave located in a pit sited to allow both purchase tapes to be of equal length. *The BAK-9 is not currently in production as a system and should not be considered as a suitable system for a new requirement.*

14930-1.6 **BAK-12.** The BAK-12 is the standard U.S. Air Force operational aircraft arresting system. This bi-directional system employs 2 energy absorbers. Each absorber consists of 2 multi-disc rotary friction brakes mounted on either side of the purchase-tape reel on a common shaft. The energy absorbers are located on opposite sides of the runway, connected to a 32 millimeter (1.25 inch) disc-supported pendant by the purchase tape. Ideally, the energy absorbers should be in a below-grade pit with a minimum split distance of 15.24 meters (50 feet). (Split distance is a measurement taken between the lead-on sheave of the fairlead beam or deck sheave, and the energy absorber.) Split distances of up to 91 meters (300 feet) are acceptable for all BAK-12 installations. You may also install BAK-12 systems above ground in one of two configurations, the selection depending upon site conditions and operational requirements. These are the expeditionary installation for periods of up to 1 year, and the semi-permanent installation, well-suited for long term use and typically selected when site conditions will allow a pit-type installation.

Originally, BAK-12 energy absorbers were fitted with a 60-inch purchase-tape storage reel. This design allowed the maximum energy expected to be imparted during an aircraft engagement to dissipate within a runout of 290 meters (950 feet) plus the length of the aircraft. Designers have since improved the BAK-12 to meet increased demands of heavier and faster aircraft. They retrofitted the energy absorbers with larger 66-inch or 72-inch tape storage reels to accommodate increased runout, thus increasing the total energy capacity of the system. Although some BAK-12 systems have 60-inch tape storage reels, new and upgraded BAK-12 systems have 66-inch reels. These systems require 366 meters (1,200 feet) plus the length of the aircraft for maximum runout. The 72-inch reel systems are special-purpose systems configured for 610 meters (2,000 feet) of runout.

The standard BAK-12 is configured for cross-runway separations of up to 61 meters (200 feet) (distance between fairlead beams or deck sheaves). For installations with cross-runway spans exceeding 61 meters (200 feet), replace the BAK-12 control valve cam to accommodate full runout of the system.

Dual BAK-12 systems are special-purpose installations configured to accommodate high-energy engagements of aircraft ranging from 27,200 to 63,500 kilograms (60,000 to 140,000 pounds). These configurations consist of 4 BAK-12 energy absorbers arranged in pairs on either side of the runway. The energy absorbers may be standard BAK-12s or be equipped with 72-inch diameter tape storage reels to accommodate 610 meters (2,000 feet) of runout. You need special tape connectors and edge sheaves for these installations.

14930-1.7 **BAK-13.** The BAK-13 is a bi-directional aircraft arresting system. It employs 2 velocity-sensitive energy absorbers installed on opposite sides of the runway, interconnected by nylon purchase tapes and a 32 millimeter (1.25 inch) disc-supported pendant. The energy absorbers are made from a steel weldment base that incorporates a tape-storage reel mounted on a vertical shaft and a vaned rotor assembly enclosed within a vaned stator assembly (also called a tub) that contains a water and glycol mixture. A rewind engine, transmission assembly, and an operator control panel are also included along with necessary hydraulic system components.

The energy imparted during an aircraft arrestment converts heat through the turbulence developed by rotation of the vaned rotor within the vaned stator. An external cooling reservoir permits rapid cycle of this system.

The site requirements are essentially the same as for the BAK-12; however, the low-profile units maybe located as close as 46 meters (150 feet) from the runway edge if installed in a semi-permanent configuration. These systems require 290 meters (950 feet) plus the length of the aircraft for maximum runout. *The BAK-13 is not currently in production as a system. I should not be considered as a suitable system for a new requirement due to the potentially high hook load generated during engagement.*

14930-1.8 **BAK-14 and Type H Hook cable Support Systems.** The BAK-14 hook cable system is a bi-directional hook cable (pendant) support system used in conjunction with the BAK-12, BAK-13, or a comparable arresting system to engage and safely stop a hook-equipped aircraft. It provides the means to support the pendant at least 2 inches above the runway surface while giving ATC the means to lower the pendant below the surface of the runway to prevent damage to low-undercarriage aircraft, the pendant, and the pavement below the pendant during trampling. These systems can accommodate 46, 60, and 90 meters (150, 200, and 300 foot)-wide runways, but you order the system to suit the specific application. The control side BAK-12 pit or protective shelter and foundation must be expanded to house the compressed air and control systems needed to operate this supplemental system.

The Type H hook cable support system is a bi-directional hook cable support system that can be used in conjunction with any type of energy-absorbing device. It provides a means to raise a cable at least 2 inches above a runway surface or lower it below the runway surface in less than 1.5 seconds. It can be supplied to accommodate runway widths of 46, 60, and 90 meters (150, 200, and 300 feet). A radio remote control system provides ATC the means to operate the system and to monitor its operational status. It mainly consists of Retraction Modules (from 14 to 18 depending on runway width) installed into pre-cast concrete blocks across the runway, and connected together by metallic rods, to form a rigid loop. This loop is actuated by an electro-hydraulic motor that is located in a concrete pit on one side of the runway.

14930-1.9 **BAK-15.** The BAK-15 aircraft arresting barrier consists of a pair of electro-hydraulically powered steel masts that provide support and remote-controlled movement for a unidirectional nylon net barrier. The masts are installed on opposite sides of the runway overrun on concrete foundations. The ATC tower contains a remote control panel, which can be hard-wired but the most common is radio controlled.

The barrier must be augmented with an energy-absorbing device such as a ship's anchor chain, BAK-12, or Textile Brake. During an aircraft engagement, shear links in the net suspension straps separate by the force of the aircraft engaging the net. The net then envelops the aircraft and seats on the leading edge of the wings, transferring forward momentum of the aircraft to the energy-absorbing device.

You can complement the system with a standard disc-supported pendant to accommodate tail hook engagements through interconnect configuration hardware similar to that used for the MA-1A Modified. The hook cable interconnect kit is designated as the 62 NI (net interconnect).

14930-1.10 **Textile Brake.** This modular arresting system is primarily intended as an emergency backup system for standard operational systems. It is comprised of multiple modules arranged in equal numbers on both sides of the overrun that contain specially woven textile tearing straps to absorb the kinetic energy generated during an engagement. One end of each module is anchored to the ground and the other end is connected to a tensioned cable positioned across the runway. The system is available in a 2-stage unidirectional configuration (MB 60.9.9.C) or as a single stage bi-directional system (MB 100.10.C).

The advantages of the 2-stage system (MB 60.9.9.C) over the bi-directional system (MB 100.10.C) are higher system capacity and lower costs for reconfiguration after low energy engagements. The modules in a stage (breaking lines) are expended upon aircraft engagement and must be replaced; however, a life cycle analysis indicates system costs are approximately 50 percent of the life cycle cost for a BAK-12 installed in the overrun area of a runway due to the low number of engagements that occur there. These systems are designed for tail-hook equipped fighter aircraft, but can also be complemented with a net barrier such as the BAK-15 or a net/cable interconnect system. They may also be configured for expeditionary or temporary installations.

If the bi-directional version of the Textile Brake arresting system is installed on the operational runway surface due to a non-standard length overrun, the Arresting Gear Marker (AGM) signs should be blanked when viewed from the approach. This is because the system is a low energy capacity system (compared with BAK-12 or BAK-13) and is no intended for approach end engagements.

14930-1.11 **Mobile Aircraft Arresting System (MAAS).** The MAAS is essentially a BAK-12 aircraft arresting system mobilized through installation on a specially developed trailer. It is configured for a maximum aircraft runout of 302 meters (990 feet). This system was initially developed and tested to accommodate recovery of fighter aircraft returning to a battle-damaged airfield. Such cases require rapid deployment and installation and may require that only the minimum essential anchoring hardware be installed to accommodate the above scenario. When installed for this purpose, the MAAS is installed using a 19-stake anchoring scheme. This configuration is limited to unidirectional engagement capability with a maximum aircraft weight and speed of 18,144 kilograms (40,000 pounds) at 150 knots.

The MAAS can be upgraded to accommodate bi-directional engagements with the full capacity of a standard BAK-12 aircraft arresting system. This is accomplished by increasing the total number of cruciform stakes used to anchor the system from 19 to 31, extending the runout to 366 meters (1,200 feet), and synchronizing the system for higher brake pressure. The system may also be installed in a set-back configuration to accommodate wide body aircraft operations through use of a fairlead beam.

14930-1.12 **Soft-Ground Type Aircraft Arresting System.** The Engineered Material Arresting System (EMAS) is an FAA-approved soft-ground system normally used for civil airports to mitigate short safety areas (less than 305 meters (1,000 feet) long) at runway ends. The system is constructed of cellular foam concrete of specific strengths and thickness to decelerate an aircraft that overruns the runway through rolling resistance. The design for each system is aircraft specific, based upon the type of aircraft that will use the runway. It is intended for use where it is impractical to obtain the standard 305 meter (1,000 foot) safety area and other alternatives are not feasible. For purposes of design, the soft ground arrestor system can be considered fixed by function and frangible since it is designed to fail at a specific load; therefore, a soft ground system is not considered an obstruction to navigation. Soft ground systems are located beyond the end of the runway, centered on the extended runway centerline. They will usually begin at some distance from the end of the runway to avoid damage due to jet blast or short landings. This distance will vary depending on the available area and the specific system design.

149 45 MISSILE LAUNCH FACILITY (EA)
FAC: 3901
BFR Required: N

14945-1 **DEFINITION.** This Category Code is provided for inventory purposes of missile and drone launch pads. See NAVSEA OP-5 for Explosive Safety Siting criteria of energetic liquids associated with launch pads.

149 50 BLAST DEFLECTOR FENCE (EA)
FAC: 1464
BFR Required: N

Design Criteria: None Available

14950-1 **DEFINITION.** Blast deflector fences are structures that direct the exhaust from jet engines upward. They are used in congested areas and parking and maintenance areas to protect personnel, equipment, structures, aircraft, and other vehicles from the blast effect of jet engine exhaust. Blast fences are also used to prevent erosion of paved and unpaved areas and to provide protection from flying debris. Their siting and length must be based on the study of individual station requirements. Blast deflector fences may be purchased or constructed in sections to permit moving them from one position to another as protection requirements change. Careful selection of location is necessary to prevent creating an obstacle to taxiing aircraft.

149 62 TACTICAL VEHICLE WASH FACILITY (SF)
FAC: 1496
BFR Required: Y

14962-1 **DEFINITION.** A wash structure is located to support maneuver/training areas and provide prewash mud removal and washing of military vehicles. Structure typically provides water-soaking capability for tactical tracked and wheeled vehicles, high and low pressure cleaning capability, water cannons, wash water containment and drains, sediment basins, and sludge removal. Prep and prewash areas, wash stations, water treatment, water supply, basins and controls/equipment are included as components of the facility. The facility that houses the controls/equipment is captured under CCN 89009 Miscellaneous Utility Building.

14962-2 **REQUIREMENTS**. Sizing requires an engineering analysis on a case-by-case basis. No criteria is available for this category code.

149 85 EXPEDITIONARY AIR CONTROL SITE – MACS AND MASS (EA)
FAC: 1467
BFR Required: Y

Design Criteria: UFC 4-141-10N, Aviation Operation and Support Facilities

14985-1 **DEFINITION.** These are Marine Corps facilities required to accommodate, in-garrison, the equipment used for expeditionary aircraft command and control. These facilities are assigned to specialized Marine Corps squadrons, and the expeditionary equipment used in conjunction with these facilities is normally squadron property. The Marine Air Control Squadron (MACS) and the Marine Air Support Squadron (MASS) are squadrons within the Marine Air Control Group (MACG) and Marine Aircraft Wing (MAW) that are directly responsible for air defense and air control. Each MACS contains two Air Traffic Control (ATC) Detachments and one Air Defense Detachment. The ATC Detachments were formerly the Marine Air Traffic Control Unit (MATCU). Both the MACS and MASS are squadrons in the MAW and are directly responsible for air defense and air control.

149 86 OPERATIONS SUPPORT SHED (EA)
FAC: 1499
BFR Required: Y

14986-1 No criteria currently exist for this category code.

151 PIER FACILITIES

151-1 DEFINITION. A pier is a structure that extends out from shore into navigable water and is designed for the homeport or temporary berthing of vessels. Services available at pier side include, but are not limited to, ship repair, fueling, training and other essential services, such as potable water, electric power, compressed air, waste disposal and communications facilities. A pier is oriented either perpendicular to or at an angle with the shore and normally accommodates berthing on both sides for its entire length although there are instances where only one side is used because of site conditions or because there is no need for additional berthing space. Code 151 includes all piers regardless of function served, protective dolphins at pier heads, fendering systems, and mooring fixtures, original dredging performed specifically for the purpose of providing the pier facility, all trackage on the pier, and all supporting utilities and services.

Piers provide a transfer point for cargoes and/or passengers between water carriers and land transport. Separate facilities should be maintained where service involves large volumes of both cargo and passengers. Joint service use of piers should be considered when at all possible.

In countries outside the United States, a pier is often referred to as a jetty, or a mole when of solid fill construction, and a wharf is referred to as a quay or a jetty. In the United States, the term jetty refers to a solid fill structure, located on an open seacoast at the mouth of a river or tidal inlet, designed to prevent shoaling of a channel by littoral materials and to direct and confine stream or tidal flow.

For data on channel and turning basin dredging, see UFC 4-150-06, Military Harborts and Coastal Facilities. For utilities and services landward of the inboard end of the pier, see UFC 4-150-02, Dockside Utilities for Ship Service. For crane and railroad trackage on shore, see Civil Engineering and Utilities, MIL-HDBK-1005/6. For transit sheds on piers, see category code 156 10; and for fixed crane structures, see category code 213 40.

Piers are classified according to their primary function and are described under their respective category codes.

151-2 BERTHING. Piers are used to provide either multipurpose berths or special purpose berths. Piers providing multipurpose berthing are used to service several classes of vessels so that ships will have the option of utilizing any one of several berthing facilities at a port. Berth selection depends upon the need to match available space, utilities and support services with the requirements of an incoming ship. It is not economically feasible to develop a single facility to accommodate and service all classes of vessels. Special berths are provided when berthing arrangements and/or locations are required for fueling vessels, berthing vessels carrying explosives, and for repairing vessels.

151-3 FEATURES. The following list gives appurtenances and facilities generally provided at or near piers. The facilities to be provided depend on functional requirements, which often determine the classification of the pier. The location of support facilities will be dependent upon the existence of weapons handling Explosive Safety Quantity Distance (ESQD) Arcs.

Located on the pier:

1. Berths having sufficient depths and widths to allow for efficient servicing of ship and safe vessel approach and departure.

2. Sufficient mooring devices (bollards, bitts, cleats) to safely secure vessel.

3. Hotel and ship service facilities.

4. Fender systems, oil containment booms and floating/fixed AT/FP barriers

5. Camels or struts.

6. Brows and stands for ship access to the pier

7. Access facilities for railroad cars, trucks and emergency vehicles.

8. Cranes and trackage.

9. Privately Owned Vehicle (POV) parking

Provided by the host activity in the general area of the pier:

1. Cargo handling equipment.

2. Firefighting equipment.

3. Covered and open storage space for cargoes; fenced where required, for control of pilferage.

4. Office space.

5. Sanitary facilities.

6. Ship support and repair facilities.

7. Medical facilities.

151-4 LOCATION AND ALIGNMENT. The location and alignment of piers in a harbor should consider factors such as ease of entering and leaving berth, required quayage, harbor line restrictions, adjacent navigational channels, foundation conditions and isolation requirements. For further information and criteria, see Military Harbors and Coastal Facilities, UFC 4-150-06.

151-5 PIER DIMENSIONS AND CLEARANCES. The dimensions of a pier are based primarily on the lengths of the vessels, present or contemplated, that it is to accommodate. The length of the pier is dependent upon the type of ship, and the width is dependent upon the type of service to be provided. Pier measurements and allowances for single-length and multiple-length berths are based upon either accommodating known vessels or known types of vessels, where types but not specific ships are known. The dimensions for both types are determined as follows:

1. **Pier Length.**

   a. Single-Length Berth shall equal the overall length of the largest vessel to be accommodated, plus an allowance of 50 feet at each end of the vessel. For aircraft carriers, the allowance at each end of the vessel is 100 feet. See Figure 151-10 for berthing diagram. Reference the following ship characteristics data in UFC 4-152-01 Piers and Wharves as follows:

   Table 2-1 Ship Characteristics for Selected Ships (Fully Loaded)
   Table 2-2 Ship Characteristics for Selected Ships (Lightly Loaded)

   b. Multiple-Length Berths shall equal the total overall length of the largest vessels simultaneously accommodated, plus allowances of 100 feet between vessels, 50 feet between the shore and the inshore ship and 50 feet beyond outermost moored vessels. See Figure 151-10 for berthing diagram.

2. **Pier and Wharf Width.** The width of a pier or wharf is determined on the basis of functional requirements, space availability and site conditions such as water depths, subsurface conditions and clearances. The widths of piers and wharves, as discussed hereinafter, refer to the dimensions determined for specific function classifications. These dimensions should not be less than the widths determined by geotechnical and structural considerations. Factors to be considered in the determination of pier and wharf widths are as follows:

    - <u>Berths Provided on Outboard Face of Pier</u>. Because pier widths are determined on the basis of the requirements of the main berths, the outboard face, or the end of a pier may be used only for vessels whose overall length does not exceed the width of pier and where bow and stern clearances conform to established criteria. The proximity to shipping lanes and high-energy wave environments may prohibit the use of this portion of the pier.

    - <u>Berths Provided Alongside Pier or Wharf.</u> Total structure width depends upon the size of the transit shed, if any, type of crane service provided, number of railroad tracks, firefighting equipment and truck lanes furnished and requirements for work space and open storage areas. At wharf facilities, open storage areas are often contiguous to the apron and shed, but at pier facilities open storage areas are generally located off the pier and thus do not affect the determination of total pier width. Table 15111-1, indicating minimum pier widths, is furnished as a guide.

    - <u>Berths for Carriers</u>. Camels specifically designed to breast off aircraft carriers should be provided at designated carrier berths. Alternatively, the provision of additional pier width may be considered to provide clearances for overhangs of flight decks and elevators.

    - <u>Services Requiring Additional Width</u>. Adequate width should be provided to accommodate railroad tracks, truck lanes, crane ways, emergency response equipment and fuel handling equipment when furnished.

3. **Slip width.**
    - <u>General Considerations</u>. The clear distance between piers, or slip width, should be adequate to permit the safe docking and undocking of the maximum size vessels that are to be accommodated in the slip. The size of slip should also permit the safe maneuvering and working of tugboats, barges, lighters and floating cranes. At multiple berth piers, where vessels are docked either one per berth, two abreast per berth, sufficient clearance should be available to permit the docking and undocking of vessels at the inshore berth without interfering with

vessels at the offshore berth. Because the size of a slip is affected by docking and undocking maneuvers, consideration should be given to the advice of local pilots who are familiar with the ships to be handled and with prevailing environmental conditions such as winds, waves, swells and currents. The slip width should be reviewed with specific functional requirements of the individual installation before a final determination is made.

- Minimum Width of Slip for Active Berthing. Minimum widths should be as shown on Figure 151-10. Widths are defined as a factor times the beam of the largest vessel to be accommodated. The minimum width should not be less than 300 feet. The recommended criteria are applicable only if vessels are turned outside the slip area.

Reference the following ship characteristics data in UFC 4-152-01 Piers and Wharves for the beam of typical vessel types as follows:

Table 2-1 Ship Characteristics for Selected Ships (Fully Loaded)
Table 2-2 Ship Characteristics for Selected Ships (Lightly Loaded)
At submarine slips, width requirements should be increased by at least four vessels beam and more, as required, to account for camels and separators, to provide for ships' vulnerability if their safety is involved, to provide for special maneuvering requirements of other ships during berthing or passing and to provide for special environmental conditions such as currents, waves and winds.

- The requirements discussed above apply where vessels are berthed on both sides of a slip. Where vessels are berthed on only one side of a slip, the width may be reduced.

- Referring to Figure 151-10, when more than 2 abreast berthing is employed, the width of slip should be increased by one ship beam for each additional ship added in order to maintain adequate clearances between moored ships during berthing and un-berthing maneuvers. Thus, for 2 abreast berthing on both sides of a slip, the slip width for single berth piers would be equal to 8 times ship beam and the slip width for multiple berth piers would be equal to 9 times ship beam.

- Minimum Width of Slip for Active Berthing. At slips containing inactive berths where vessels are stored for long periods of time on inactive status, in nests of two, three or more, clear distances between moored vessels and slip width may be reduced by one or two vessels beam to reflect the reduction in the frequency of berthing maneuvers and the decrease in activities of small boats and floating equipment.

4. **Water Depth in Slips.**

Minimum Depth of Water. In a sheltered harbor and where the harbor bottom consists of soft material, water depth in a slip, measured from Mean Lower Low Water (MLLW) should be equal to the maximum loaded draft of the vessels to be accommodated plus a minimum clearance of 4 feet which includes an allowance of 1 foot for vessel trim in loading, 2 feet for under keel clearance and an allowance of 1 foot for tidal variations. For the loaded draft of typical vessel types, refer to UFC 4-152-01 Piers and Wharves as follows:

Table 2-1 Ship Characteristics for Selected Ships (Fully Loaded)
Table 2-2 Ship Characteristics for Selected Ships (Lightly Loaded)

Additional information is available in UFC 4-150-06 Military Harbors and Coastal Facilities at https://www.wbdg.org/dod/ufc/ufc-4-150-06. Specified water depths should be maintained as close to the fender line of the structure as is practicable considering the accessibility of dredging equipment used during maintenance dredging operations.

a. Other Considerations. Minimum keel clearance of 4 feet should be increased if any of the following conditions prevail:

- Harbor bottom consists of a hard material such as rock.
- Excessive silting (one foot per year or more) occurs.
- Slip area is exposed to waves, swells and winds.
- Extreme low water (one foot or more) occurs.
- Investigation indicates probable fouling of condensers.

Aircraft carriers have had situations where they suck up bottom sediments and marine organisms through their intakes, clog up condenser coils and cause undue wear on machinery. In model tests it has been determined that one part of the solution to these situations is to increase the depth below the keel. Therefore, the water depth at carrier berths and anchorages shall be 50 ft. from MLLW datum for new construction. Water depth at existing facilities shall be increased to 50 ft. where feasible. Depths for AOE's may be increased for similar reasons. However, special studies at specific locations are required.

For Vessel Characteristics, refer to UFC 4-152-01 Piers and Wharves as follows:

Table 2-1 Ship Characteristics for Selected Ships (Fully Loaded)
Table 2-2 Ship Characteristics for Selected Ships (Lightly Loaded)

These tables provide a comprehensive listing of pertinent data for vessels in the naval fleet. The following is a list of footnotes which applies to the tables:

- Ordinarily, extreme breadth is the maximum width of vessel. For submarines, the value given is the maximum diameter or width of the hull structure and is not necessarily the maximum width which may occur at the horizontal stabilizer planes and is so noted. Canted aircraft carrier flight decks may not be dimensionally symmetrical about the longitudinal centerline of the vessel, marking the extreme breadth value for aircraft carriers unsuitable for determining berthing camel width at piers and wharves with gantry crane service.

- Maximum navigational draft is the minimum depth of water required to prevent grounding of a vessel due to appendages projecting below the vessel's base line or keel. Such appendages may be sonar domes, propellers, rudders, hydrofoils, vertical submarine control planes, etc. Many vessels also possess a decided trim to the bow or stern in fully loaded condition or in the case of submarines, a trim to the stern in surfaced condition.

- Water depth at carrier berths and anchorages is 50 ft. from MLLW datum for new construction. Water depth at existing facilities will be increased to 50 ft. where feasible. Depths for AOE's may also be increased if justified.

Table 15111-1
Typical Pier and Wharf Widths

Function Classification	Vessel Type	Minimum Pier Width (feet)	Minimum Wharf Apron Width (feet)	Railroad Tracks (standard gage)	Rail-Mounted Cranes
1. Ammunition	Ammunition	100	100	-	-
2. Berthing	Aircraft Carrier	100	-	-	-
3. Berthing	Cruiser	80	-	-	-
	Destroyer	80	-	-	-
	Frigate	80	-	-	-
	Submarine	60	-	-	-
	Auxiliary	80	-	-	-
4. Fitting-out	Destroyer	100	-	2 tracks; 1 each side	2-30 ft. Gage; 1 each side
5. Repair	Cruiser	125	-	4 tracks; 2 each side	2-30 ft. Gage; 1 each side
	Auxiliary	125	-	4 tracks; 2 each side	2-30 ft. Gage; 1 each side
6. Fueling	Auxiliary	50	-	-	-
7. Supply (General Cargo)	Auxiliary	125 plus shed width	60	2 tracks	-
8. Supply (Container Cargo)	Auxiliary	80	80	Up to 3 tracks	1 50 ft. Gage

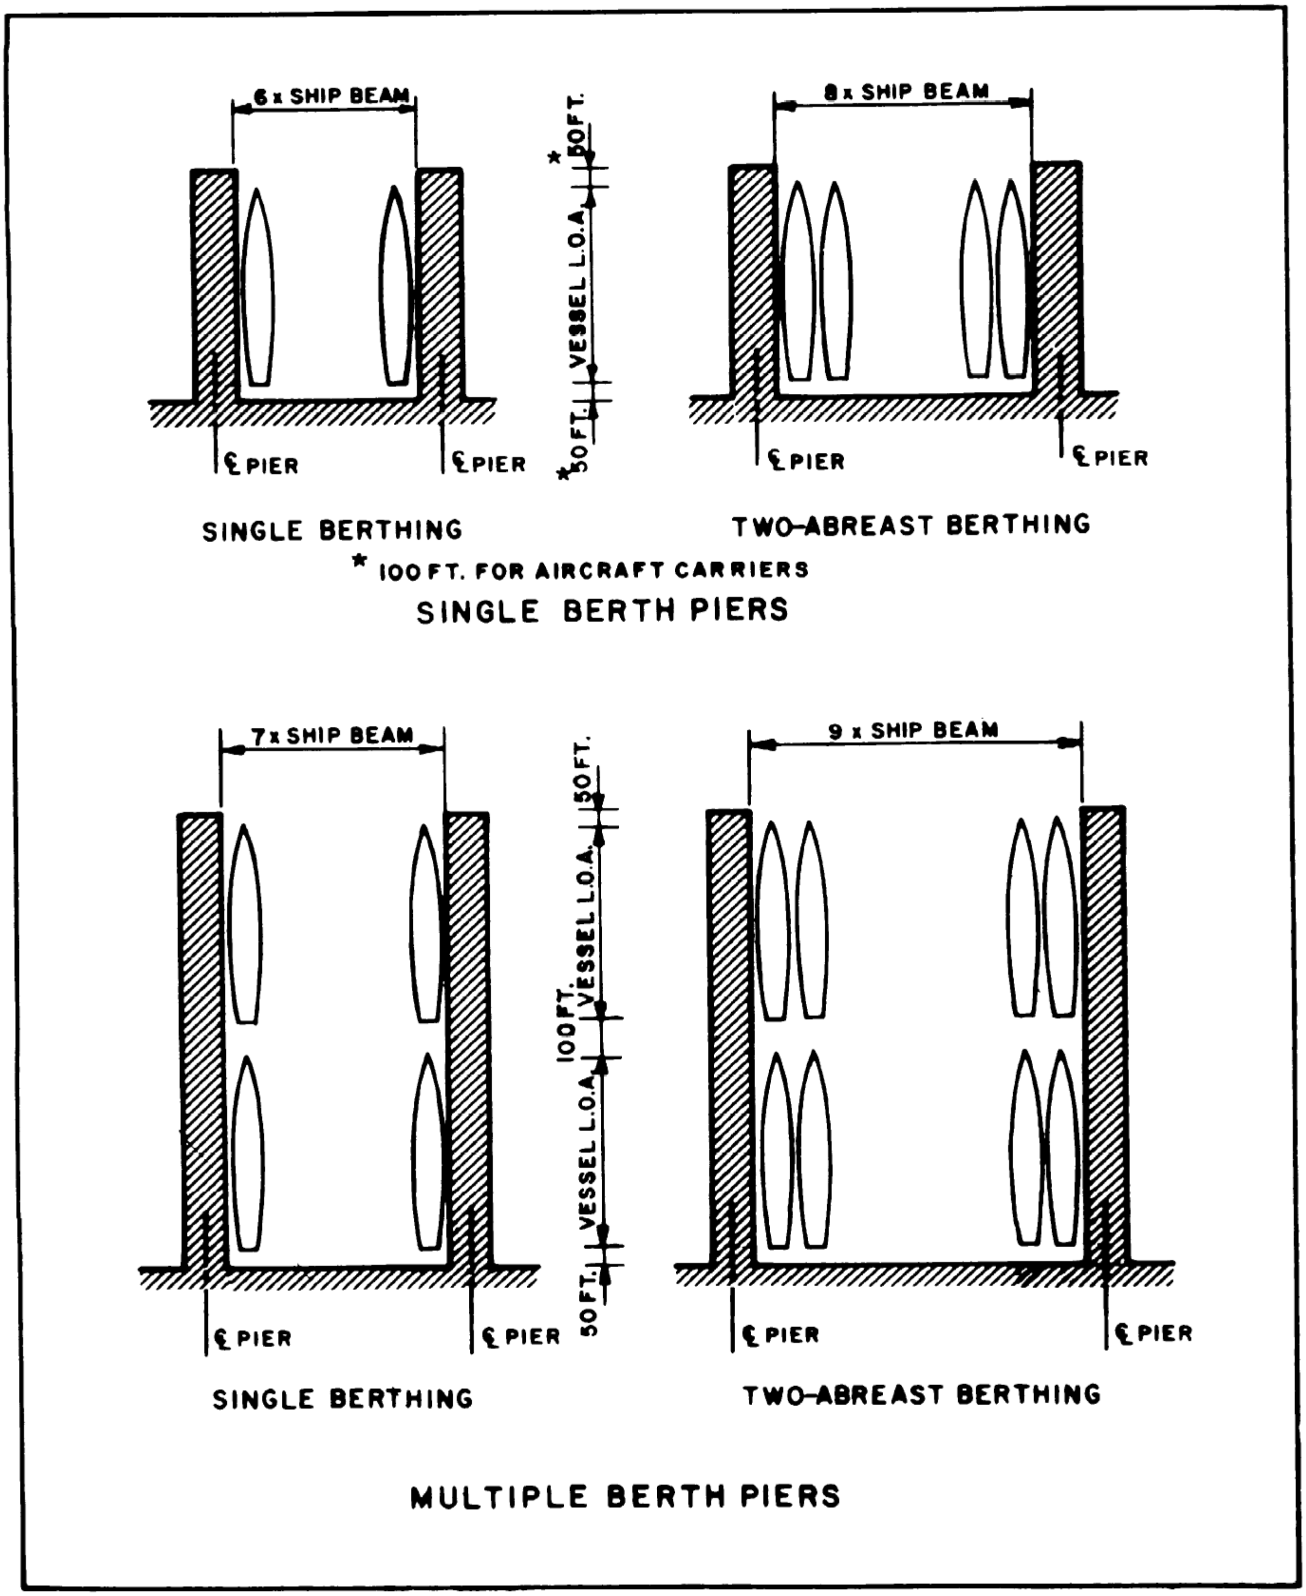

FIGURE 151-10
Slip Widths

151 10 AMMUNITION PIER (FB)
FAC: 1511
BFR Required: Y

15110-1 DEFINITION. Ammunition piers are designed for use in the receipt of ammunition for storage and for the offloading of ammunition onto barges and ships. In some cases outgoing ammunition is first loaded from the ammunition pier onto barges for transfer to ships moored offshore or in a roadstead. The services and facilities provided for ammunition piers include lighting, telephone and fire alarm systems, and salt water for firefighting. Railroad tracks are normally provided unless the established method of handling ammunition is by truck. Freshwater is provided if a supply is readily available. For dimensional and other pertinent information, see Code 151. For quantity-distant standards for pier and wharf facilities handling explosives and ammunition, see NAVSEA OP-5, Volume 1. This pier is for break bulk load/off-load of ammunition. For containerized load/off-load of ammunition, use Category Code 151 70, Ordnance Container Handling Pier.

151 20 GENERAL PURPOSE BERTHING PIER (FB)
FAC: 1511
BFR Required: Y

Design criteria: see Piers and Wharves, UFC 4-150-01

15120-1 DEFINITION. General Purpose Berthing Piers are used primarily for mooring home ported and transient ships that do not require piers equipped with shipyard facilities. Berthing piers are classified as active or inactive. The active berthing piers are used when ships are berthed for a relatively short time; the inactive classes are used when ships are to be tied up for long periods in a decommissioned status.

When berthing for carriers is to be provided on one side only or on both sides of a berthing pier the width of the structure shall be adequate to provide clearance for the overhang of the flight decks and sponsors. Alternatively, camels or other separators may be provided to fend off carriers.

All piers regardless of their function, will include such appurtenances as protective dolphins, fender systems, and dredging in connection with the facility. Supporting utilities, crane/railroad trackage, fixed cranes, and transit sheds on piers will carry their appropriate category codes. For other pertinent information, see Code 151 (general notes).

151 40 FUELING PIER (FB)
FAC: 1511
BFR Required: Y

Design criteria: see Piers and Wharves, UFC 4-150-01

15140-1 DEFINITION. Facilities for berthing ships while discharging fuel to storage or receiving fuel from storage are provided at fueling piers. Such piers will provide salt water for firefighting, telephone and fire alarm facilities and may provide freshwater, steam in cold climates, electric power. In addition, a fuel main and special protective hose racks and small derricks for handling fuel hoses are necessary. They shall also be equipped with pipelines for each type of fuel to be stored at the site, including bilge and ballast lines. Stripper pumps for emptying lines are also necessary. A fueling pier may be justified for those stations where bulk quantities of liquid fuel can be economically handled by water transportation. These piers vary according to the service required, the local exposure to wind and water, and the geologic formation of the site.

For dimensional and other pertinent information, see Code 151.

151 50 REPAIR PIER (FB)
FAC: 1511
BFR Required: Y

Design criteria: see Piers and Wharves, UFC 4-150-01

15150-1 DEFINITION. Repair piers are constructed and equipped to permit overhaul of those portions of a vessel above the waterline. These structures will normally be equipped with a gantry crane and standard-gage railroad tracks and have facilities to provide salt and freshwater, steam, compressed air, telephone and fire alarm service, and electric power for ship service, lighting and welding. In some cases industrial gases may be provided.

For dimensional and other pertinent information see Code 151.

151 60 SUPPLY PIER (FB)
FAC: 1511
BFR Required: Y

Design criteria: see Piers and Wharves, UFC 4-150-01; Supply Facilities, UFC 4-442-01N and MIL-HDBK 1032/2.

15160-1 DEFINITION. Supply piers accommodate berthing for the transfer of materials between ship and shore. A large building or transit shed normally occupies the central portion of a supply pier. The pier width will be in direct ratio to the width of the shed or sheds, placed longitudinally down the center of the pier. For example, the shed for a ship needing 600 feet of berthing space is 150 feet wide. Transit sheds are normally placed side by side parallel with the long axis of the pier when both sides of a pier are used for shipments. The pier width should then be from 380 to 420 feet because the pier deck or apron should be from 40 to 60 feet wide to accommodate railroad track, dock truck trains and allow proper cargo handling. Space restrictions at some seacoast installations will undoubtedly dictate the construction of piers of lesser width. In such cases, transit sheds must be designed with these restrictions. Planning for supply piers at installations will usually be restricted to industrial seaport locations having a primary stock point mission. For dimensional and other pertinent information relative to supply piers other than that in the preceding paragraph, see Code 151.

151 70 ORDNANCE CONTAINER HANDLING PIER (FB)
FAC: 1511
BFR Required: Y

15170-1 DEFINITION. An ordnance container handling pier is used primarily for the offloading and receiving of explosive ordnance in containers from non-self-sustaining container ships. This does not preclude use of the pier by conventional break-bulk or self-sustaining container ships. The pier should be sited in accordance with NAVSEA OP-5, Volume I. The services and facilities provided on the pier are lighting, telephones, fire alarms, and salt water for firefighting. Railroad tracks are provided where the normal method of drilling containers to the pier is by Trailer on Flat Car or Container on Flat Car (TOFC/COFC). Rails are flush with pier deck surface for ease of operations when moving containers by trucks on the pier.

For dimensional and other pertinent data, see Category Code 151Series (general notes) and UFC 4-150-01 Piers and Wharves.

151 71 DEGAUSSING PIER (FB)
FAC: 1511
BFR Required: Y

15171-1 DEFINITION. Sizing for this Category Code is based on the type of vessels to be serviced and is driven by the NAVSEA specified equipment. Special studies are required on a case by case basis.

151 80 DEPERMING PIER (FB)
FAC: 1511
BFR Required: Y

15180-1 DEFINITION. Sizing for this Category Code is based on the type of vessels to be serviced and is driven by the NAVSEA specified equipment. Special studies are required on a case by case basis.

151 90 ACCESS TRESTLE TO PIERS AND WHARVES (SF)
FAC: 1513
BFR Required: Y

No criterion currently exists for this category code.

152 WHARVES

152-1 GENERAL. A wharf is an open type marginal structure for the berthing of vessels; it is usually connected to the shore at more than one point. In most cases it will accommodate berthing along the outer face only, although a portion of the inner face may provide berthing space at a shallower draft. A wharf does not necessarily have continuous access to the shore. In general, the planning criteria that apply to piers are also applicable to wharves. Either may serve the same practicable purpose, however, since their physical design and layout will be much different, their capacities for berthing and cargo handling will vary. Piers are generally preferable structures; however, certain locations will dictate the use of a wharf rather than a pier because of the marginal fairway and topography involved.

For general planning information pertinent to wharves listed under Category Code 152 10 through Code 152 80, see the same pier designation listed under Category Code 151 10 through 151 80. The corresponding category codes for wharves are as follows:

152 10 AMMUNITION WHARF (FB)
152 20 GENERAL PURPOSE/BERTHING WHARF (FB)
152 30 FITTING OUT WHARF (FB)
152 40 FUELING WHARF (FB)
152 50 REPAIR WHARF (FB)
152 60 SUPPLY WHARF (FB)
152 70 ORDNANCE CONTAINER HANDLING WHARF (FB)
152 71 DEGAUSSING WHARF (FB)
152 80 DEPERMING WHARF (FB)

153 CARGO HANDLING OR STAGING AREAS

153 10 CARGO STAGING AREA (SY)
FAC: 8526
BFR Required: Y

15310-1 DESCRIPTION. A cargo staging area is an open hardstand for temporary storage of cargo awaiting further transshipment. For Open Storage, approximately 30,000 square feet of open storage area is required for each 431 short tons, or 385 long tons, or 1,000 measurement tons of cargo on hand per month based on a conversion factor of 2.32 measurement tons per short ton. For conversion factors for different commodities see page TBD. Average stacking height should be six feet. The square footage requirement should be established at 10% more than the space needed at peak times unless there is a wide discrepancy between the average amount of cargo on hand per month and the largest amount of cargo on hand at any one month during the last year. The square footage requirement should be established at 15% more than the average space needed in peak times if the discrepancy is recurring in nature. Average amount of receipts compared to issues per month as well as average hold time of cargo per month may be useful in developing data to support the facility requirement.

154 SEAWALLS, BULKHEADS, QUAYWALLS

154-1 **GENERAL.** Seawalls, bulkheads, and quay walls are shore protective structures not intended primarily for berthing vessels. Bulkheads and quay walls have the principal advantage of affording accessibility for their entire length along the foreshore. In addition, a much greater working area normally is available at each berth for storage, laydown, and repair operations than at berths alongside piers and wharves. The ratio of berthing space to a given length of waterfront, however, is much less for bulkheads and quay walls. The relative cost per berth is much greater for quay walls, especially for those in deep water or at sites with poor foundation conditions. Maneuverability into a berth at a long quay wall occupied by ships in adjoining berths is more difficult than entry into a single-length pier berth. In spite of these drawbacks, a quay wall may prove to be the only choice at a site located along a river or other relatively narrow channels if the natural terrain is high along the shore, making dredging of a recessed basin for piers very expensive, or if there is insufficient width of waterway for safe navigation into finger piers projecting out at an angle from the natural shoreline.

154 10 SHALLOW WATER BULKHEAD AND QUAYWALL WITHOUT A RELIEVING PLATFORM (LF)

FAC: 1541
BFR Required: N

15410-1 **DESCRIPTION.** This type of bulkhead or quay wall is a structure to retain earth along a shoreline in shallow water. The depth of water is typically limited to a 25 feet and the structure has no relieving platform. This structure does not provide ship berthing (151 Piers and 152 Wharves should be used for any ship berthing requirement). Typically, these structures are found between piers or wharves and are often used for Small Craft Berthing. It should be noted that this is a functional definition independent of the design type. Using today's technology bulkheads and quay walls have many useful design alternatives and the most economical construction should dictate the design based on local conditions.

15410-2 The linear footage and type of bulkhead required at any one installation would be determined by site location, the availability of real estate, topography, currents and wave action.

154 20 DEEP WATER BULKHEAD AND QUAYWALL WITH A RELIEVING PLATFORM (LF)
FAC: 1512
BFR Required: Y

15420-1 **DESCRIPTION.** This type of bulkhead or quay wall is a structure to retain earth along a shoreline in deep water. Typically, with a water depth exceeding 25 feet and includes a relieving platform to support heavy logistics operations. This structure does not provide ship berthing (151 Piers and 152 Wharves should be used for any ship berthing requirement). Typically, these structures are found between piers or wharves and are often used for Small Craft Berthing. Using today's technology bulkheads and quaywalls have many useful design alternatives and the most economical construction should dictate the design based on local conditions.

15420-2 The linear footage and type of bulkhead required at any one installation would be determined by site location, the availability of real estate, topography, currents and wave action.

154 30 SEAWALLS AND RIP RAP (LF)
FAC: 1541
BFR Required: N

15430-1 **DESCRIPTION.** These are structures built along and parallel to a shoreline (river or coast line) protecting and stabilizing the shore against erosion resulting from wave and current action. This is a functional definition, and various types of construction can be used to support this function. The most economical and efficient structure for a particular location can be determined only after a thorough study of local hydrographic and meteorological conditions, the amount and type of protection desired, and the characteristics of the property to be protected. This type of structure is often used in conjunction with a Category Code 871 35 Retaining Wall.

155 SMALL CRAFT BERTHING

This basic category group provides facilities supporting small craft operations. Included in this category are, but not limited to, yard craft, tug boats, security and service craft.

155 10 FLEET LANDING (FB)
FAC: 1551
BFR Required: Y

15510-1 **DESCRIPTION.** A fleet landing is a fixed or floating pier designed for the loading and/or unloading of a ship's personnel onto or from a personnel boat or ferry.

This facility must be in quiet water, carefully sheltered against disturbances. Water depth must be adequate for the type of ferry or service craft used. Requirements are developed based on the site specific conditions including tide range, available real estate and the types of crafts that will be using the facility. Category Code 155 20 can be used for general guidelines.

155 11 FLEET LANDING BUILDING (SF)
FAC: 1552
BFR Required: Y

15511-1 **DESCRIPTION.** A fleet landing building is a structure used to accommodate ship's personnel being loaded or unloaded from a personnel boat or ferry. The size and type of structure is dependent upon the average number of personnel being transferred at any one time and the type of climate in which the structure is located. In the absence of specific criteria, the quantitative requirements for the facility should be determined on an individual basis based on the experience and knowledge of the activity involved and the appropriate Systems Commands. Category Codes 155 21 and 159 64 can be used for general guidelines.

155 20 SMALL CRAFT BERTHING (FB)
FAC: 1551
BFR Required: Y

15520-1 **DESCRIPTION.** Berthing plans at waterfront facilities will provide space for all small craft authorized by CNO/CMC. Access and maintenance mooring arrangements should include facilities for harbor and pilot launches, survey boats, work boats, special service craft, rescue boats, and other small craft. If necessary, breakwaters will be provided for shelter against wind and wave action. Small boat piers and boathouses may be planned if several craft of medium and large size are to be accommodated. For medium and larger craft, water depth must be a minimum of 6 feet and preferably 8 feet at mean lower low water (MLLW). The pier may be designed to handle vehicles and provide turning space at the ell end of the pier. Water and electricity are required, as well as boat-fueling dispensers appropriately located on the pier. The utility services (800 series) and fueling for small craft (Category Code 122 30) are provided as secondary code items.

15520-2 **REQUIREMENT.** The requirement for Small Craft Berthing can be calculated using the following algorithm:

The following information should be obtained from Port Ops: CNO and other Small Craft loading, small craft dimensions, and the end-to-end spacing per type of small craft. If the end-to-end spacing varies between small craft types, then use the average spacing.

With the aforementioned information, the feet of berthing (FB) or meters of berthing (MB) necessary can be calculated using:

> [Number of each type of craft x length (or width depending on orientation of the crafts)] + [end-to-end spacing required x total number of crafts]

In addition to the FB/MB necessary there are secondary factors to consider:

- Draft - Medium and large craft = minimum of 6 ft (1.83 m), preferably 8 ft (2.44 m) at mean lower low water (MLLW)
- Breakwater required (yes/no)?
    - If yes, then determine the required length (see Category Code 16410)
- Boathouse required (yes/no)?
    - If yes, then see Category Code 155 21
- Vehicle access required (yes/no)?
    - If yes, add FB/MB depending on the vehicle type
- Vehicle turning space required (yes/no)?
    - If yes, add FB/MB depending on the vehicle type

155 21 SMALL CRAFT BOATHOUSE (SF)
FAC: 1552
BFR Required: Y

15521-1 **DESCRIPTION.** A boathouse is necessary where an alert crew is required, where a boat facility is remote from the supporting activity, or where boat repair facilities are essential. Boat crew quarters or a boathouse may be programmed for those locations that justify an alert crew for the aviation rescue boats, where the boat facility is remotely located from the supporting facility, and where boat repair facilities (either Code 213 56 or 213 58 as appropriate) are required. The boathouse is programmed on the following basis:

Alert crew quarters	85 square feet per person
Office and shop space	85 square feet per person
	170 square feet per person (Includes toilet and custodial space)

A boat shelter is often included as part of this facility and is sized by a study of the vessels required to meet the specific mission.

The following facilities should be provided for: repair shops and working platforms, crew bunkhouse, toilets, mechanical equipment room, a small office, boat machine and carpenter shops, marine railway hoist or crane, covered storage, paint shop, battery shop, fuel storage tanks with pumping apparatus, water, electricity, and sail loft, if necessary. At mean lower low water (MLLW), the depths in a boathouse shall not be less than 5 to 6 feet. The ceiling clearances will conform to the requirements of the various craft accommodated, but they should not be less than 16 feet. Working platforms should be about 3 feet above mean higher high (MHHW) water. A boathouse roof should provide cover over walkways and berths for emergency craft.

155 22 SMALL CRAFT BOAT RAMP FACILITY (EA)
FAC: 1591
BFR Required: Y

15522-1 **GENERAL.** Both the Navy and Marine Corps have in-shore boat teams that patrol inland waterways in support of various missions such as providing military escorts; securing inland waterways; carrying out “presence patrols”, and performing peacekeeping missions. These “brown water” functions require the use of fast boats that can be launched in shallow water and are capable of negotiating inland waterways. These capabilities require shore facilities such as boat ramps and piers or bulk heads that allow for launch and retrieval of these boats from towable trailers. This category code should be used for both home-ported and forward deployed operational or security forces requiring small boat launch ramps for the purposes of conducting in-shore training maneuvers or security patrols.

15522-2 **DEFINITION.** Small Craft Boat Ramp Facilities will provide a finished boat ramp that allows for launching operational boats from trailers and will be sloped to allow for proper approach, launch, and retrieval of the tow vehicle and boat/ trailer combination. This facility also includes an associated launch pier (per lane), parking (secure, if needed), and any bulkhead or shoreline erosion control measures (i.e., riprap or quarry rock) deemed necessary. Where mission requirements dictate, the launch pier should be based on criteria under Small Craft Berthing, CCN 15520 and captured in iNFADS as a sub category on the ramp Property Record Card (PRC).

The parking areas and approach apron are constructed of concrete or asphalt and are required for all Small Craft Boat Ramp facilities. These areas should be sized according to the criteria for Operational Vehicle Parking, CCN 14312 and shown as a separate utilization on the Boat Ramp property record card. All areas of the ramp, associated parking, and maneuvering areas must include adequate site lighting to allow for night time operations. In some cases, these areas might also be required to be secured via fencing and access gates. The boat ramp final design is based on many factors but for initial planning purposes, these guidelines and Figure 15522-1 dictate the parameters for a single lane small craft boat ramp facility. Note: this CCN provides requirements for a single lane ramp and uses a unit of measure of “EA”. Where ramps are required to be more than one lane, increase the quantity on the property record card based on the number of lanes needed. For example, a four lane boat ramp facility will have a quantity of “4” on the associated property record card.

15522-3 **PLANNING CRITERIA.** Small Craft Boat Ramp Facilities should be coordinated for use with the various training and operational schedules of different tenant commands at an installation. Tenant commands requiring boat ramp facilities should work together to determine how many lanes are necessary based on the op-tempo of their training cycles. The information included here should be used as a guide for planning operational boat ramps and their support spaces, but further detailed information can be found in the UFC 4-152-07 Design: Small Craft Berthing Facilities.

15522-4 **BOAT RAMP/LAUNCH PIER REQUIREMENTS (refer to Figure 15522-1)**

General guidelines:

1. Ramps will be planned at 20’ wide (clear width) and be constructed of reinforced concrete. The concrete surface will be grooved to provide both traction and proper drainage. Ramp slope will typically be set at 8 degrees (approximately 14%) wherever possible. Overall ramp length will be predicated on the local site grade elevation with respect to the Mean Lower Low Water (MLLW) mark.
2. The launch pier can be either fixed or floating but must maintain a clear minimum width of 6’. Pier length from the MLLW will be 50’ minimum.

Section (A) Approach:

1. Ramp approach transition from the shoreline to the ramp must be gradual to accommodate long prime-mover and trailer combinations. If the adjacent site terrain is relatively flat and does not have a natural slope towards the ramp, the approach apron must be vertically curved approximately 20’ from the parking/circulation area elevation to the boat ramp (see Fig. 15522-1). This area is accounted for in the parking allowances determined under the associated Operational Vehicle Parking/Laydown Area CCN 14312.
2. Any pedestrian ramps along the pier length will have a max slope (up or down) of 4 degrees (approximately 7%) to transition between various tide levels.

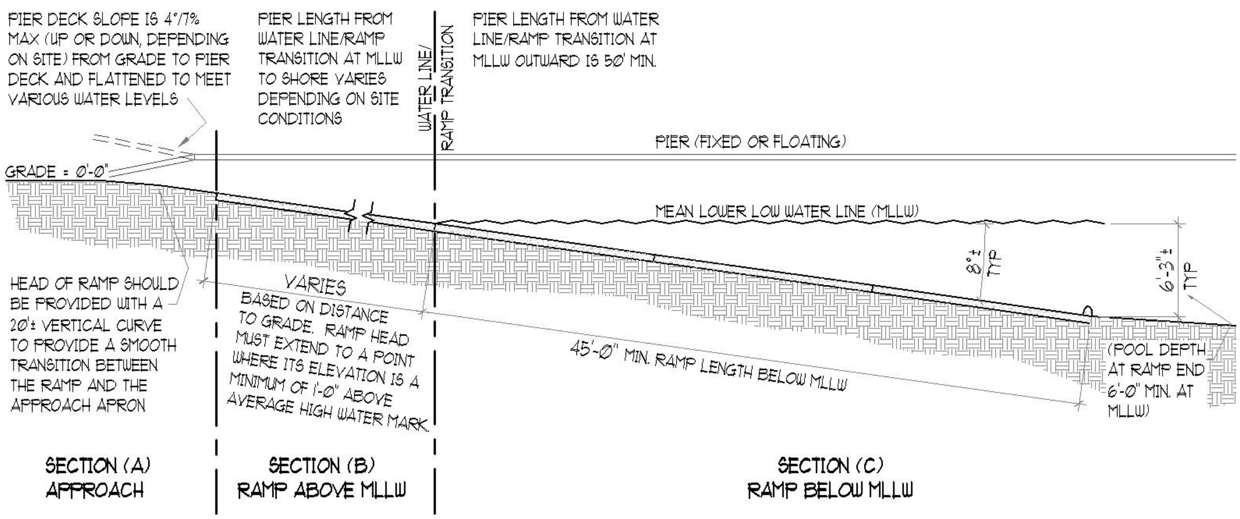
Section (B) Ramp Above MLLW:

1. Ramp length from the water line/ramp transition at MLLW is based on the shore elevation above the MLLW (see Figure 15522-1.) This distance must be determined in the field.
2. Pier length from the water line/ramp transition at MLLW is also based on the shore elevation above the MLLW. Note that the pier deck can be sloped up to 4 degrees (up or down) at any point along its length to shorten the required distance between the pier and shoreline. This determination will be made in the field.

Section (C) Ramp Below MLLW:

1. Ramp length below the MLLW is approximately 45'. At the designated 8 degree slope, this provides for a 6' deep pool at the foot of the ramp. The pool must be a minimum of 6' below the MLLW in all cases.
2. The pier length is not to exceed 75' in length from the water line/ramp transition at MLLW out into the water (see Figure 15522-1.)

Figure 15522-1



15522-5 **ASSOCIATED WATERWAY AND SMALL CRAFT BERTHING.** The basin (adjacent waterway) should be dredged to provide a minimum of 4' depth at MLLW. Bottom width at the ramp should be greater than the combined width of the launch ramp and boarding pier(s). Where required, small craft berthing should be planned and located in such a manner that it does not interfere with the actual launch procedures at the ramp or boat traffic within the basin. Any small craft berthing associated with this boat ramp facility should be captured under CCN 15520 Small Craft Berthing as a separate utilization on the boat ramp property record card.

15522-6 **PARKING AND CIRCULATION.** Small Craft Boat Ramp Facilities will require parking for prime mover and trailer combinations as well as any associated operational vehicles such as Humvees, pickup trucks, and passenger vans. Space allowances for parking, circulation, and apron areas at the boat ramp should be based on the criteria for CCN 14312 Operational Vehicle Parking/Laydown Area and captured in iNFADS under that category code. Note that this area under 14312 does not negate the need for parking allowances for the same vehicles at their permanent locations, usually operational facilities elsewhere at an installation.

156 CARGO HANDLING FACILITIES – BUILDINGS

156 10 WATERFRONT TRANSIT SHED (SF)
FAC: 1443
BFR Required: Y

15610-1 **DESCRIPTION.** A waterfront transit shed is a building or shed for storage of cargo awaiting further transshipment and requiring protection. For Covered Storage, approximately 8,000 square feet of covered storage area is required for each 560 short tons, or 500 long tons, or 1000 measurement tons of cargo based on a conversion factor of 2.32 measurement tons per short ton. For conversion factors for determining storage requirements, see Section 440-2 General Supply Requirements in Category Code 440 Series. Average stacking height should be twelve feet.

The actual space assigned to an activity must be developed taking cognizance of many factors such as planned organization and mission changes, packaging and labeling requirements, commodity mix, local fire control procedures, MHE aisle space, etc. Therefore, the best approach to use for planning purposes is to develop a general square footage figure and then adjust that figure based on other quantitative/qualitative information available. It is recommended that the following criteria be used to develop a general square footage requirement:

a. Average amount of cargo on hand per month.
b. Average amount of receipts compared to issues per month.
c. Largest amount of cargo on hand at any one month during the last year.
d. Average hold time of cargo per month.

Basically, there are three situations that are taken into consideration for calculating the space requirements for the storage of cargo awaiting further transshipment and requiring protection. These situations are as follows:

Situation (1) A relatively uniform amount of cargo is stored each month throughout the year. Since there is relatively little discrepancy between the data obtained from a and c; the square footage requirements should be established at 10% more than the space needed at peak times.

Situation (2) A relatively uniform amount of cargo is stored each month throughout the year with the exception that there is a large discrepancy that results from a one-time situation as indicated from the data in c. The square footage requirement is established as 10% more than the average actual space used per month.

Situation (3) A relatively uniform amount of cargo is stored each month throughout the year with the exception that there is a discrepancy, which is recurring in nature and is predictable. The square footage requirement is established at 15% more than the average space needed during the peak times brought about by the discrepancies.

Data developed from b and d may be useful in explaining/factoring the developed requirements.

The same criteria should be used in determining space requirements for label cargo. It should be noted, however, that since quantities of label cargo on hand are usually small, modifications to existing facilities (firewalls, secure area, etc.) should be considered prior to initiating construction of new facilities.

156 20 CONTAINER OPERATIONS BUILDING (SY)
FAC: 1443
BFR Required: Y

15620-1 **DESCRIPTION.** A container operations building is essential for safe direction and control of container operations to promote efficient and continuous flow to, within, and from the handling area. It is located to provide visual sighting of and two-way communication with handling operating facilities, such as shiploading, rail track and truck corridors serving and penetrating the handling area. The building contains muster areas, locker space, toilets, lunch room facilities, and an administrative area for container operations. A 50-foot tower contains two rooms at 30-foot and 40-foot levels for visual observation of ship, rail, and truck corridors and operational facilities.

A total gross area of approximately 6,000 square feet will house 15 employees in the administration area, 100 employees in the locker room, and 125 employees in the lunch room. The tower will accommodate 12 employees in approximately 700 gross square feet. The usual remoteness of this facility may necessitate the provision of parking spaces for all employees.

159 OTHER WATERFRONT OPERATIONAL FACILITIES

This basic category group provides for facilities which cannot be coded in basic groups 151 through 156.

159 10 AIRCRAFT DOCKING FACILITY (EA)
FAC: 1591

BFR Required: N

15910-1 This category code is for inventory purposes only. It is intended for waterfront facilities that were originally created to support seaplanes such as PBY Catalinas and similar from the WWII era and later. It is not associated with any airfield criteria and new facilities will not be planned under this CCN.

159 20 DEGAUSSING BUILDING (SF)
FAC: 1431
BFR Required: Y

15920-1 **DESCRIPTION.** Degaussing is the science dealing with the methods and techniques of reducing a ship's magnetic field so that the possibility of detection by magnetic mines and other magnetic influence detection devices is minimized. It consists of two functionally interdependent installations: An underwater Degaussing Range installation (Category Code 159 21) and this facility, which serves as an instrument station. The degaussing facility records a ship's magnetic field as it passes over the Degaussing Range and notifies the ship as to what adjustments must be made to the degaussing coils on board the ship (with the exception of submarines which have none) in order to reduce the ship's magnetic field to a safe operational level. If the vessel's magnetic field cannot be sufficiently reduced because of excessive permanent magnetization, the ship is scheduled to report for deperming (the process of reduction of permanent magnetism). See Category Code 159 30 for criteria relating to a deperming facility.

The sizing of this facility is determined by a study for the specific location and is directed by the equipment specified by NAVSEA.

159 21 DEGAUSSING RANGE (EA)
FAC: 1591
BFR Required: N

15921-1 **DESCRIPTION.** A degaussing range is an area set aside in a channel or harbor that contains submerged instruments, connected to the computer in the degaussing building (Category Code 159 20), which registers a ship's magnetic signature as it passes through the range. The test equipment in the degaussing building indicates whether the internal degaussing system on board the ship is calibrated properly. If shipboard equipment is not within tolerance new calibration settings will be provided to the ship to neutralize the fields to within an acceptable tolerances. Shipboard equipment that is not operating properly will also be identified and if necessary the ship may be scheduled for deperming.

Range Location. The range site for the degaussing facility should be carefully selected because the type of range to be installed and the method of installation depend mainly on the depth of water. The water depth will vary in accordance with the size of vessel to be ranged. The shallow range is located in 15 to 30 feet mean water depth and is used to range minesweepers and other vessels of comparable size. The medium range, which is generally 45 to 60 feet below the surface, is used for surface combatants, auxillary and amphibious warfare ships. The deep range, used for heavy carriers and the like, is located in 75 to 100 feet of water. The variation in water depth should not be greater than 10 feet for a particular range (shallow, medium, and deep). The range location should be based on the following considerations:

(1) Depth of water.
(2) Types of sea bottom.
(3) Tides and currents.
(4) Position of range relative to range house.
(5) Navigational hazards.
(6) Heading of range (generally on a north-south magnetic heading).

The selection of a range site must be approved by local naval port authorities. Continental sites and installations must be approved by the U.S. Army Corps of Engineers. See Category Codes 159 20 Degaussing Building and 159 30 Deperming Building for additional information.

159 30 DEPERMING BUILDING (SF)
FAC: 1431
BFR Required: Y

15930-1 **DESCRIPTION.** A Deperming Building is a facility that contains electrical instruments used to regulate and monitor the deperming operation. Deperming, the second phase of degaussing, is the process by which a ship's permanent longitudinal and athwartship magnetism is removed and its permanent vertical magnetism stabilized at a low level. The deperming facility consists of a Deperming Building, which serves as an instrumentation building, a Deperming Wharf, Category Code 151 80, and, if required, a generator house. The Deperming Building floor area is determined by the amount of equipment and the number of personnel determined by NAVSEA. Pier size must accommodate any size ship that requires deperming. Plans must include electrical facilities capable of meeting the power requirements determined by NAVSEA.

159 50 FERRY SLIP (EA)
FAC: 1591
BFR Required: N

15950-1 **DESCRIPTION.** A ferry slip provides the anchorage for ferries while loading or unloading. It consists of water areas directly in front of transfer bridges and is usually bordered by fender racks. The offshore waters must provide maneuvering area for the largest ferry to be accommodated. Depth of water depends on the ferries accommodated. For design criteria, see Waterfront Operational Facilities, MIL-HDBK-1025/1.

159 64 WATERFRONT OPERATIONS BUILDING (SF)
FAC: 1431
BFR Required: Y

15964-1 **DESCRIPTION.** A Waterfront Operations Building provides administrative space for the functions associated with the management of a naval port, and support for all ship berthing and small craft maintenance including related electronics systems. It may provide space for functions such as a duty crew bunk room, crew's lounge, boatswain’s locker, berthing for small boats if an integral part of the building, space for storage of boat gear and paint, oil spill equipment and a battery charging room.

This facility, which is under the cognizance of the officer in charge of port operations, is also staffed by personnel such as the dispatcher, dock master and harbormaster. Several functions performed are coordinating logistic support and harbor services, coordinating all movement of ships within the port as well as those entering and leaving, assigning ship berthing spaces, and providing pilots, operating tugs, service craft and small boats. The space for the office proper is based on the number of administrative people assigned. (See Category Code 610 10 for space allowances). Duty crew space shall be 85 net sf per person as detailed in Category Code 155 21. Space for the maintenance and boatswain’s functions are determined by an industrial analysis for the specific functions at each location. The industrial analysis shall include factors including the size of the port serviced, the size of the ships utilizing the port-and the frequency of movement of ships within the port and entrance channel(s).

In conjunction with the office space, a control tower with an unobstructed view of the entrance channel and berthing area may be provided. The tower space requirements should not exceed 600 gross square feet.

159 66 LANDING CRAFT RAMP (EA)
FAC: 1591
BFR Required: Y

15966-1 No criteria currently exists for this category code.

159 70 DREDGE CONTROL/PUMPING FACILITY (GM)
FAC: 1591
BFR Required: N

15970-1 **GENERAL.** The requirement for this facility is sized based on an engineering analysis for the conditions of the specific location.

160 HARBOR AND COASTAL FACILITIES

160-1 This category group includes all special facilities which may be required for protecting the harbor or coast against military action. This category also includes special facilities for mooring vessels and marine improvements for protecting the harbor land area or coastline from current or wave action and from flood conditions.

161 HARBOR PROTECTION FACILITIES

161-1 This basic category provides facilities for protecting the harbor against military action.

161 20 FIXED NET ANCHORAGE (EA)
FAC: 1611
BFR Required: N

16120-1 **DESCRIPTION.** This Category Code includes such functions as pile clusters and platforms used to support Anti-Terrorism/Force Protection (AT/FP) floating barriers. If a traditional submerged harbor net is used, this type of feature would also be required.
Typically, a Fixed Net Anchorage will require a means to connect and disconnect the floating barrier to allow for ships and other vessels to pass between the piers and wharves and the navigational channel. Barrier handling is typically done by service craft under the control of the Port Operations Department.

161 30 WINCH HOUSE (EA)
FAC: 1611
BFR Required: N

16130-1 **DESCRIPTION**. A winch house is a structure used in control of harbor nets, floating barriers and oil booms.

162 COASTAL PROTECTION FACILITIES

162-1 This basic category provides facilities for protecting the coast against military action.

162 10 GUN EMPLACEMENTS (EA)
FAC: 1499
BFR Required: N

16210-1 **DESCRIPTION**. Space in strategic sites is provided on base for the installation of gun emplacements, including anti-aircraft guns, for use in harbor defense.

163 MOORINGS

163-1 This basic category provides fixed structures for mooring vessels.

163 10 MOORING DOLPHIN (EA)
FAC: 1631
BFR Required: N

16310-1 **DESCRIPTION**. Mooring dolphins consist of clusters of timber, steel and concrete piles in planned patterns and spacing or can be closed structures such as sheet pile, steel or concrete caissons. Mooring dolphins are independent structures that are often placed at the outboard ends of piers or wharves to provide a mooring point that permits tying mooring lines at favorable angles without having to extend the entire pier or wharf structure. Mooring dolphins may have steel or concrete platforms used as pile cap structures and for mounting of mooring fittings. The timber piles are bound and secured by wire rope, shearing blocks, and bolts. Mooring dolphins are often connected to the main berthing pier or wharf by catwalks. Turning dolphins are used to deflect ships and assist in their alignment as the ships approach and enter a slip. Naval installations with harbor or waterfront facility requirements for mooring of small craft and ships, up to carriers, may plan for mooring dolphins to insure the safety and protection of the vessels. The number, size, and type of dolphins are dependent upon the type of vessels involved, the complexity of the approach to the slip and the requirements for mooring the vessel under prevalent environmental loads.

16310-2 **DESIGN CRITERIA**. For typical dolphin arrangements and design requirements, see Piers and Wharves, UFC 4-152-01. For other technical design information, see Military Harbors and Coastal Facilities, UFC 4-150-06.
+
163 20 MOORING PLATFORM (EA)
FAC: 1631
BFR Required: N

16320-1 **DESCRIPTION**. A mooring platform is an isolated structure consisting of a timber, steel or concrete deck supported on piling or can be a steel pile, sheet pile or concrete type caisson. Two or more platforms are provided in line for berthing of one or more vessels alongside. Mooring platforms provide facilities beyond those points where wharves or piers cease to function effectively as service or loading areas. Mooring platforms may include catwalks between each platform structure and the wharf. Mooring platforms are also referred to as breasting dolphins and allow a full length berth for large ships without the need for a full length wharf or pier. A berthing camel may be used between fender piles and the moored vessel.

16320-2 **DESIGN CRITERIA**. The mooring platform is shown in general plan and detail in Piers and Wharves, UFC 4-152-01.

163 30 STAKE PILE MOORING (EA)
FAC: 1631
BFR Required: N

16330-1 **DESCRIPTION**. A stake pile mooring consists of a stake pile driven below the surface of the firm bottom of the ocean floor. A chain attached to the stake is used to moor the vessel. The advantages of using stake piles instead of anchors for moorings are that they are fixed anchorage points. The disadvantages are that the mooring lines do not equalize the pulls in a spread mooring; the stake pile, because it is fixed, does not absorb shock energy as well as an anchor; and finally, approval from the authority in charge of channel dredging is necessary before driving stake piles into a bottom. When dredging is required in an area where stake piles are located, there is some hazard of damaging dredge cutters. The holding capacity, size, and other design details of stake piles can only be accurately determined by an analysis of bottom soil borings and field investigations at the site.

16330-2 **BUOY, CHAIN AND ANCHOR TYPE MOORINGS**. Moorings used to tie off bow and stern lines for ships can also be buoy, chain and anchor type of designs. These systems are equipment (personal property); they are not real property facilities and should not be categorized as stake pile moorings.

164 MARINE IMPROVEMENTS

164-1 This basic category provides structures for protecting the harbor, land area, or coastline from current or wave action and from flood conditions.

164 10 BREAKWATER (LF)
FAC: 1641
BFR Required: N

16410-1 **DESCRIPTION.** A breakwater is a freestanding barrier designed to break up and disperse heavy seas and to shield the waters of a harbor from wave action. Breakwaters are planned where primary protection is necessary to create or shelter a harbor or a basin for vessels from wave action. The type and quantity of breakwater is determined by local design considerations.

16410-2 **DESIGN CRITERIA**. Types of breakwater structures are shown in Piers and Wharves, UFC 4-152-01. For technical design information, see Military Harbors and Coastal Facilities, UFC 4-150-06.

164 20 GROINS AND JETTIES (LF)
FAC: 1641
BFR Required: N

16420-1 **DESCRIPTION**. Groins and jetties are structures built to intercept and deflect currents to control littoral drift and deposit of sand and silt.

16420-1.1 **Definition of Groins.** Groins are generally classified according to the principal construction materials used; that is, steel sheet piling, timber, stone, or concrete. A series of groins extending at right angles or parallel to the shoreline will protect the beaches from erosion. A groin serves to intercept currents that cause littoral drift of sand along a beach and under favorable conditions causes the deposition of sand, so as to reduce shore erosion.

16420-1.2 **Definition of Jetties**. Jetties are planned at harbor entrances and channels to control unstable conditions of silting and deposit of sand caused by river flow or tidal or wave action. A properly located jetty system will encourage scouring and maintain channel depth with a minimum of maintenance dredging. Jetties are similar in design to breakwaters, but are smaller.

16420-2 **DESIGN CRITERIA**. The types and lengths of groins and jetties will vary with local design considerations. Types and applications of groins and jetties are shown in Piers and Wharves, UFC 4-152-01 and design details are shown in Military Harbors and Coastal Facilities, UFC 4-150-06.

164 30 LEVEES (LF)
FAC: 8714
BFR Required: N

16430-1 **DESCRIPTION**. Levees are earthen embankments designed to protect property from water damage during the flood stage of rivers and/or other high water. The size and length of a levee will vary with local design considerations. Levees may be justified at air installations and at other naval installation where usable property must be protected from water damage.

169 OTHER HARBOR AND COASTAL FACILITIES

169-1 This basic category provides for harbor and entrance control points and signal towers.

169 10 HARBOR ENTRANCE CONTROL FACILITY (EA)
FAC: 1611
BFR Required: N

16910-1 **NET DEPOT**. Permanent installations from military control of a harbor entrance are not planned for peacetime, except that a large, paved area may be planned, where appropriate, as a site for layout and assembly of harbor nets and allied equipment. The layout area should be near the waterfront and accessible to mobile cranes for net and equipment handling. The area is known as the net depot and is used for net maintenance and for training in net handling.

16910-2 **FLOATING BARRIERS**. Current AT/FP measures utilize a variety of floating barriers that are considered equipment installations. Specific requirements are determined for each location based on geography, wave action and the types of assets to be protected. See Category Code series 161 and 163 for information related to the installation of floating barriers. The Naval Facilities Engineering Services Center (NFESC) has conducted a number of floating barrier studies and can serve as a valuable planning resource.

170 TRAINING FACILITIES

170-1 This category group covers facilities designated for the service career and reserve training of Navy and Marine Corps personnel. There are two basic categories under this code:

171 TRAINING BUILDINGS and
179 TRAINING FACILITIES OTHER THAN BUILDINGS

171/179-1 There are several specialized facility types such as auditoriums, drill halls, and others. Training facilities for general advancement of Navy/Marine Corps personnel, i.e., educational studies, which are conducted on an individual's own initiative and time, are planned under Category Code 740 88 (Educational Services Office).

171 TRAINING BUILDINGS

171-1 **General.** Facilities in this basic category are identified according to the nature of instruction provided. The major building types are:

171-1.1 **Academic Instruction Building** (Category Code 171 10). This facility provides accommodations for classroom lecture instruction, using chairs with fixed table arms, tables, desks or other similar working surfaces.

171-1.2 **Reserve Training Building** (Category Code 171 15). This facility is utilized for training Navy and Marine Corps Reserves.

171-1.3 **Applied Instruction Building** (Category Code 171 20). This facility is used to accommodate training through the use of equipment and tools such as drafting tables, workbenches, machinery, equipment or functional systems.

171-1.4 **Operational Trainer Space** (Category Code 171 35). This space is required to accommodate highly specialized real-life simulation training that needs specifically designed space within a building or a separate building. The size and configuration of these specialized spaces differ considerably from a typical applied instruction classroom.

171-2 **Space Type**. Training Buildings generally consist of three different types of spaces, classrooms, support and circulation, and service areas. The following is a description of the spaces and their components. See Table 171-1 for space allowances.

171-2.1 **Classroom Spaces**

171-2.1.1 **General Academic Space**. These classrooms devoted to lecture space are academic instruction classrooms defined under Category Code 171 10. Use Table 17110-1 for space allowances.

171-2.1.2 **Modified Academic Space**. This space consists of a lecture/laboratory combination classroom and is used for both lectures and practical exercises involving hands-on disassembly and assembly of small training aids applicable to the subject matter. A class that requires standard office desks is included in this category. Area includes workspace, circulation, teaching station and book storage. These classrooms are identified under Category Code 171 10.

171-2.1.3 **Workbench Lecture Space.** This space is for an instructional laboratory, the size of which may be only determined on an individual basis. The facility planners have to take into consideration the student/equipment/ instructor ratio which determines the numbers of instructional or test equipment per student station and consequently the space requirements, For example, electronics-related training requires approximately 6 linear feet of workbench resulting in approximately 50 to 55 net SF classroom space per student station, including circulation. Individual justification must accompany EWR submittals.

171-2.1.4 **Space for Hands-on Mockups**. This space is for a classroom in which instruction is given to individual or groups of students on stationary training devices representing all or part of an operating system. The size of this type classroom is generally determined not by the number of students, but by the physical size of the equipment. Figure

17120-1 under Category Code 171 20 provides a formula, which may be used to determine the required net floor space. A single line layout drawing indicating major dimensions should accompany BFR submittals.

171-2.1.5 **Learning Centers**. The learning center is a classroom utilized by students for individual study where training is conducted on a self-paced basis. It is space equipped with study carrels either designed for reading only or equipped with audio-visual training media. Since the self-paced training system has an unstructured time frame (i.e., students may use the facility whenever they have time available), the number of study carrels must be determined individually, the BFR submittal must show these calculations which should be based on the overall number of students requiring such facilities and the estimated number of students which are anticipated to use a learning center at a given time.

171-2.1.6 **Modified Academic Classroom**. This room is equipped with desks or other working surfaces in lieu of standard chairs with fixed tablet arms. Space requirements are 45 net SF per student station, including circulation. Larger areas require justification. These spaces are identified under Category Code 171 10.

171-2.2 **Support Spaces**

171-2.2.1 **Instructor's Work Space**. Facilities should be provided for each instructor to perform his administrative and preparatory duties.

171-2.2.2 **Instructor's Lounge**. The fixed allowance shown in Table 171 A assumes that no more than 10 instructors will be present at one time' Reduce this area proportionally if smaller use is anticipated. An increase in space above the amount indicated requires specific justification.

171-2.2.3 **Student Break Area**. This space should accommodate the average number of students scheduled to have a class recess at any given time. It can be provided at one location or dispersed in several locations throughout the school building.

171-2.2.4 **Library**. Due to the relative complexity of library operations, required space is broken down as follows:

- **Reading Area**. To estimate the number of persons utilizing this facility, use 20% of the average on board student load.

- **Stack Area**. Allowance given in Table 171-1 is based on 100 volumes per 3 linear feet section, 7.5 feet high, or 15 volumes per net square feet of floor area.

- **Media Storage**. Allowance given in Table 171-1 is based on storage of 424 DVDs or 260 VHS tapes in a section of shelving 3 feet long by 6 feet high in a space 3 feet wide. The width of this floor space provides for the cabinet depth plus half the width of an access aisle.

- **Staff Area**. Includes files, administration, reproduction space and material preparation area.

171-2.2.5 **Administrative Space**. This is space required for functions related to overall administration of the training facility in question and the allowances are governed by the number of administrative personnel. Planning procedures and net space allowances are the same as for Category Code 610 10 (Administrative Office), planning method 2 (detailed planning factors). The broad planning factor of 162.5 gross SF per occupant, under Category Code 610 10, may not be used because it would duplicate some of the support space allowances already provided for under this Category Code series 171.

171-2.2.6 **Training Aid Storage**. The space allowance is shown on Table 171-1.

171-2.2.7 **Other Support Spaces** not listed above must be identified separately and specific justification should accompany BFR submittals.

171-2.3 **Service Areas and Circulation.** These areas represents all spaces not in direct support of the training function, including walls, rest rooms, mechanical equipment, halls and corridors.

171-3 PLANNING PROCEDURES

Choose one of the following three methods to compute classroom net square feet space requirements.

171-3.1 **Average On Board.** This method is straightforward in the calculation of classroom space requirements. The formula requires a minimum amount of information as follows:

171-3.1.1 **Number of Students**. Total number of students per year for each course.

171-3.1.2 **Number of Days**. Total number of days (duration) to complete the course.

171-3.1.3 **Square Feet**. The proper choice of square feet per student from Table 171-1 based on the type of classroom instruction.

171-3.2 **Classroom Scheduling Method** The method that is preferred sometimes because it's easier to picture classrooms with a set number of students and a drawn schedule. The schedule shows an overall view of the student loading per month and gaps in classroom scheduling. The following minimum information is needed:

171-3.2.1 **Number of Students.** The number of students planned for each classroom.

171-3.2.2 **Course Time**. The duration of each course and the number of times taught throughout the year.

171-3.2.3 **Classroom Uses**. A decision on whether or not the classroom can be used for other courses.

171-3.3 **Student Time Distribution Method.** This method uses a more involved accounting system to estimate time expenditures for different types of course instruction. The method shows a detail study and breakdown of planned time distribution in labs, lectures and special applications classes. More information is required than in the other two methods.

In addition to computing classroom space requirements, develop the requirements for Support Spaces separately. Convert final totals to gross square feet.

SPECIAL NOTES FOR PLANNING PROCEDURES

1. Any construction project, regardless of funding source, submitted for authorization must be accompanied by detailed supporting documentation (broad planning factors cannot be used in lieu of detailed analysis).

2. Planning for training buildings shall be based on maximum utilization of available classrooms. To this end, the number and sizes of classrooms shall be determined on the basis of a detailed study encompassing curricula, group sizes, schedules, security and proximity requirements, and/or any other pertinent aspects. It is recognized that a number of subjects, especially in the applied instruction field, require extensive training aids or special classroom configurations. Every attempt must be made, however, to minimize the number of such single subject or "dedicated" classrooms, especially in those cases where their use would be relatively infrequent. Cross-scheduling of classroom use must be considered on an installation-wide basis, crossing organizational boundaries if necessary.

3. As a general rule, most training buildings will consist of a mixture of different types of instructional space (normally a combination of academic and applied instruction). For buildings of this type, the specific applicable criteria must be utilized to plan the facility in question even though a resulting project may carry only a single Category Code (171 10 or 171 20). For example, an applied instruction building (Category

Code 171 20) contains academic classrooms utilized to teach basic or familiarization aspects of an applied instruction curriculum. In such case, academic classrooms are sized using code 171 10 criteria, although on planning documentation, this space will eventually be combined with the figures for the applied instruction (Category Code 171 20) portions of the facility.

171-4 COMPUTATION METHODS FOR COMPUTING CLASSROOM SPACE

171-4.1 Average On Board

171-4.1.1 Use Figure 171-1 and list the courses of instruction conducted by the Activity. List the requirements in separate categories (e.g. general academic, lab-lecture, etc.).

171-4.1.2 Show the Course Data Processing Code (CDPC), course title, and other requested information. The columns of information are defined at the bottom of the table. Information is available in the Master Course Reference File (MCRF) of the Navy Integrated Training Resources and Administrative System (NITRAS) and other sources.

171-4.1.3 Use the AOB formula to calculate the number of students per class.

171-4.1.4 Based on the type of instruction, select the proper square feet per student from Table 171-1.

171-4.1.5 Calculate the Required NSF for each course.

171-4.1.6 Add the Required NSF column to obtain the total requirements.

171-4.2 Classroom Scheduling Method

171-4.2.1 Use Figure 171-2 and list each course.

171-4.2.2 Assume the courses meet all day. If a course meets during the AM hours in a room and a different course can meet in the same room during PM hours, assume one room requirement.

171-4.2.3 Draw a line through the number of weeks the course is held each time during the year.

171-4.2.4 Show the week the course begins and ends each time. Show the number of students planned for each course above the course duration line.

171-4.2.5 After the class scheduling is drawn, use Figure 171-3 to organize the requirements. List each course, type of class space, number of students for each classroom and the square feet used to calculate requirements obtained from Table 171-1.

171-4.2.6 Determine whether or not the classroom requirement should be dedicated strictly for the course or if other courses can be scheduled in the same room.

171-4.2.7 Use one of the following formulas to calculate space requirements and show the calculation in Figure 171-3 Column E or F.

171-4.2.8 Total Classroom requirement is the sum of Columns E and F. Separate the totals into classifications (e.g., total general academic, lab-class, etc., space).

Dedicated Classroom - This classroom has permanently installed demonstrations, mock-ups, laboratory equipment, or special teaching aids. The room is usually not conveniently set-up for teaching other courses.

Dedicated Classroom Requirement NSF	=	No. Pupils per Course in Classroom	X	Table 171-1 Type Class

Partial Classroom Requirement - This condition applies to courses that can meet in general classroom areas or courses that meet less than 60% of a 250-day school year.

Partial Classroom Requirement NSF	=	No. Pupils per Course in Classroom	X	Table 171-1 Type Class Sq. Ft.	X	Total Course Days per Year

School Year = 250 class days per year.

171-4.3 **Student Time Distribution Method**

171-4.3.1 Use Figure 171-4 to enter information.

171-4.3.2 Organize the list of planned courses according to the anticipated number of students in each classroom.

171-4.3.3 Group the courses in descending class sizes (e.g. classes with 40, 30, 20, students etc.) in Columns A and B.

171-4.3.4 Show the course duration in number of weeks. Use fractional weeks as necessary.

171-4.3.5 In Columns E, G, I, and K show the estimated percentage of time spent in each type of class (e.g., 50% lecture, 50% lab).

171-4.3.6 In Columns F, H, J, and L, show the equivalent weeks per year for the types of instruction (e.g., Col F = (C) x (D) x (E)

171-4.3.7 Total the weeks in Columns F, H, J, and L.

171-4.3.8 Organize the data according to types of instruction and class sizes as shown in the example Figure 171-4.

171-4.3.9 Calculate the classroom sizes from the square feet allowances per student shown in Table 171-1. For example, to calculate a general academic classroom for 8 students, use 22 sq ft from Table 171-1, which refers user to Table 17110-1.

171-4.3.10 Therefore, 8 x 22 = 176 sq ft. Use the same calculation method for labs and the other types of classroom spaces.

171-4.3.11 The totals in the Classroom Computation Schedule show the number of classrooms and net square feet.

Figure 171-1. Classroom Space Requirement Computation

Course CDP	Course Short Title	Duration in Days (DD)	Annual Frequency (AF)	Pupils Per CL (S)	Annual Input (AI)	Student AOB *	NSF Per Student (NSF)	Requirement Ne Area **

Total Student AOB and Total Requirement in Net SQ. FT.								

*	**Student Average on Board (AOB)**	=	Duration (DD)	X	Annual Input (AI)	/	250 (Classroom Days Per Year)
**	**Required NSF Area**	=	AOB	X	NSF	X	1.5

Round all Fractions to the next highest whole number
School year = 250 class days

NSF = Select proper square feet per student from Table 171-1 according to type of installation
CDP = Course Data Processing Code
DD = Duration of course in actual classroom days
AF = Number of times course is taught per year
AI = Number of students trained annually AI = (AF) x (S)
1.5 = A utilization factor required to compensate for the inability to completely schedule classes and fully use classroom capacity.

Figure 171-2. Classroom Scheduling Method Type of Training Space: Various

10 PN	20	/	50	=	0.4	0				
Total					0.8	1 Each				3240 NSF

- Workbench type space (Use Individual Justification)
- Hands-on-Mock-ups (Use Formula in Figure 17120-1)

* Allows for Holiday stand downs and scheduling flexibility

** Actual classroom required must equal or exceed computed classroom requirement. Number of required classroom must take into account the excess time available in larger size rooms, i.e., smaller classes can use available excess time in larger rooms.

*** Size data follows Table 171-1

Table 171-1. Space Allowances for Instruction Facilities

Type of Space	Maximum Allowances
1. CLASSROOM SPACE	
a. General Academic	Use Table 17110-1 allowances
b. Modified Academic Space	30 net SF per student station
c. Lecture-Lab Space	45 net SF per student station
d. Modified Academic with office desks	45 net SF per student station
c. Workbench Type Space	Individual justification required
d. Hands-On Mockup Space	Use formula given in Fig. 17120-1
e. Learning Centers	40 net SF fixed allowance
2. SUPPORT SPACE	
a. Instructor's Work Space	60 net SF per instructor
b. Instructor's Lounge	450 net SF fixed allowance
c. Student Break Area	6 net per student
d. Library	
(1) Reading Area	25 net SF per person
(2) Stack Area	6.6 net SF per 100 volumes
(3) Media Storage	9 net SF per 424 DVDs or 260 VHS tapes
(4) Media Viewing Room	100 net SF fixed allowance
(5) Staff Area	10% of sum of reading stack, film storage and viewing areas
e. Administrative Space	Use category code 610 10 detailed criteria
f. Training Aid Storage	1.5 net SF per student station
g. Other Support Spaces	Individual justification required
3. CIRCULATION AND SERVICE AREAS	
(Net to Gross Conversion)	Multiply NSF by 1.33

Note: Student station is defined as a classroom seat or shop workbench area designated to accommodate one student.

171 10 ACADEMIC INSTRUCTION BUILDING (SF)
FAC: 1711
BFR Required: Y

17110-1 A facility dedicated entirely to academic instruction will seldom be planned. In most cases, instruction of this type will be part of another training function, such as at a Service School or conducted in some other type of applied instruction building. The criteria for this type facility are based on net classroom square feet per student seat.

For planning purposes, academic classrooms can be divided into two general categories:

17110-1.1 **General Academic Classroom** - is one which supports approved training programs and provides accommodations for classroom lecture instruction, using standard chairs with fixed tablet arms or a similar seating configuration providing the student a writing surface and book depository. An instructor station is provided, with space for the use of portable training aids. The individual general academic classroom sizes in net square feet (i.e., within the interior walls of the room), as dictated by the required number of seats, shall not exceed the figures given in Table 17110-1.

17110-1.2 **Modified Academic Classroom** - is one which is equipped with desks or other working surfaces in lieu of standard chairs with fixed tablet arms.

17110-2 **Planning Steps**

17110-2.1 The number and size of individual classrooms must be determined in accordance with the general guidelines given under the topic Planning Procedures in the preceding general section for Basic Category 171.

17110-2.1.1 **Gross Square Feet - Broad Planning**

The space allowances for general and modified academic classrooms represent net classroom space only. The requirements for supporting spaces must be calculated separately in order to obtain gross SF building area. This may be done by either one of the two alternate methods:

- In the absence of detailed data during early stages of planning, the gross SF building area (including all necessary support space) shall be computed as follows:
    - In cases where the training building is composed entirely of general academic classrooms, use the broad planning factor of 45 gross SF per student station for the entire building.

- In cases where some or all of the classrooms are of the modified academic classroom type, by using the broad planning factor of 75 gross SF per student station for the entire building.

- In cases where, within an academic training facility, a number of classrooms must be modified to accommodate working surfaces different than standard chairs, the net area for such modified academic classrooms may be increased. For instance, modified academic classrooms (with standard office desks) will require approximately 45 net SF per student station, including circulation. Larger increases will require specific justification.

  - Maximum consideration must be given to provide a variety of classroom sizes in order to optimize space utilization.

Table 17110-1
Space Criteria for General Academic Classrooms

No. of Seats	Sq. Ft. per Seat
20	22
30	21
40	20
50	19.5
60	19
70	18.5
80	18
81 to 90	17
91 to 100	16
101 to 120	15.5
121 to 140	15
141 to 160	14.5
161 to 180	14
over 180	14

171 15 NAVY AND MARINE CORPS RESERVE TRAINING (SF)
FAC: 1714
BFR Required: Y
NOSC Space Program spreadsheet, located at: https://www.wbdg.org/dod/unified-facilities-space-program-sustainability-spreadsheets

Design Criteria: FC 4-171-06N "Navy Operational Support Center" https://www.wbdg.org/dod/ufc/fc-4-171-06n

17115-1 **DEFINITION.** Navy and Marine Corps Reserve Centers provide training, organizational and administrative support to Reserve units and their supporting functions. This category code refers to the Reserve Training center only. Criteria for other facilities which support the Reserve unit personnel (e.g., Bachelor Housing, Dining, Aircraft Maintenance Hangars, etc.) are not included in this section and follow the same criteria as active duty counterparts. Refer to Appendix A of this UFC for a function / category code cross-reference.

17115-2 **LOCATION:** In many instances, the Reserve Center may be located outside of the perimeter of a formal DoD Installation. In these cases, it is important to refer to UFC 4-010-01 "DoD Minimum Antiterrorism Standards for Buildings" for guidance relative to the necessary Force Protection elements to consider while planning new Reserve unit facilities and renovation of existing facilities.

17115-3 **NAVY OPERATIONAL SUPPORT CENTER (NOSC)**: A facility for use by Naval Reserve Units for training and organizational requirements.

17115-3.1 **Capacity.** The space allowances for a Naval Operational Support Center shall be determined on the basis of the **maximum weekend drill population**, not total drill population numbers. Other important factors determining capacity include the number of Full Time Staff (FTS) and the total number of Reserve Units utilizing the drill site.

17115-3.2 **Joint Space Allowance.** When two or more Services are combined into a single joint reserve facility, 50% of the smallest individual Service requirements for medical, janitorial, and male and female toilet areas shall be added to the largest individual Service's requirement for each respective area.

17115-3.2 **Space Criteria.** The gross square footage allowance for Administrative, Medical, Unit Area and Drill Hall spaces in the NOSC are obtained from the NOSC Space Program spreadsheet which can be found at https://www.wbdg.org/ffc/dod/unified-facilities-space-program-sustainability-spreadsheets.

Optional additive spaces for specific Unit requirements are provided in Tables 17115-1 through 17115-6, which should be added to the net results provided by the space program spreadsheet (if applicable) and increased by the 35% NTG factor for circulation, etc. (For Marine Corps Reserve Centers, refer to paragraph 17115-5. The space program spreadsheet does not apply to the Marine Corps Reserve Centers).

17115-4 **NOSC OPTIONAL ADDITIVE SPACES:** In specific cases, Reserve units are authorized additional space for applied training, simulators, or maintenance when authorized equipment is present at reserve centers. The following tables are provided as examples of additional requirements.

Table 17115-1 Additive Space Criteria for Cargo Handling Battalion (NRCHB)

Cargo Handling Battalion (NRCHB):		
Administrative/Training Facility	**@ Reserve Readiness Sites (RSS)**	**@ NOSC**

Organizational Vehicle Parking	680 SY	680 SY
Staging Area (paved)	1 ac	1 ac
Lay down Area (paved)	556 SY	556 SY
Training Site (see note 2)	5 ac	5 ac

NOTES

1 The ship mock-up and simulated pier are authorized only when there are no Maritime Administration (MARAD) ship or other ships available for training.

2 Five (5) acres of constructible land are required only if a MARAD ship is not available and the mock-up trainer is constructed. Actual requirements will be developed as a result of Master Planning and site layout.

TOTAL (net)	2800 SF	1725 SF

17115-5 **MARINE CORPS RESERVE CENTER**: Space allowances for these facilities will accommodate the range of personnel listed as column headings shown in Table 17115-7 (e.g. 50 to 150 persons, etc.). Square footages for each range are based upon the design capacity listed at the top of the column. To determine the facility requirement, choose the range in Table 17115-7 that corresponds to the units projected personnel loading (found in the USMC Table of Organization). Units with loading outside of the range of Table 17115-7 require special justification, and the user should consult the Naval Facilities Engineering Command or Headquarters, USMC for planning assistance.

Tables 17115-7, 17115-8, and 17115-9 are to be used only as a guide. Changes to individual functions are acceptable given adequate justification. Tables 17115-7, 17115-8, and 17115-9 Special Requirements, are not intended for all centers and require approval from Headquarters, USMC and Commander, Marine Forces. For further assistance, see other category codes, Architectural Design Standards or contact Naval Facilities Engineering Command or Headquarters, USMC.

Table 17115-7 Space Criteria For Marine Corps Reserve Centers
Training and Administrative Building
(All Numbers are Net Square Feet Unless Noted)

C) SPECIAL REQUIREMENTS

Special requirements are not included in all Reserve Centers. Each function is justified by a unit's particular mission. These functions are to be part of the Reserve Center interior floor plan (should have 25% added for walls and circulation accordingly). Each function must be approved by Headquarters, USMC and Commander, Marine Forces Reserve. (See Table 17115-7(a) for space derivation data)

Functional Area				All drill strengths
Food Service Galley				400
Photo Unit (Dark Room)				100
Mobilization Station				500
Food Service Storage				700
Classified Material Storage				200
Communications/Electronics Shop				700
Medical Logistics Storage				5,000
Embark Storage				800
Dental Officer Office				180
Medical Officer Office				180
Subtotal Part C. Special Requirements Space				

Total of Parts A, B, & C	
Net to Gross Factor for Walls, Circulation, & Common Areas (25%)	
Total GSF Requirement for Reserve Center	

Table 17115-7(a) Derivation of Space Allowances for Table 17115-7

A. JOINT USE SPACE	
Assembly Hall (Navy)/Drill Hall (Marine)	Minimum space is based upon full size basketball court. Space should accommodate 100% of the drill population for all hands events: equipment staging area, unit formations and physical fitness.
Classrooms	Size based upon 50% of drill population being in class at any given time, to include space for computers and audio/visual equipment (use 20 SF per student).
Medical Examination	Fixed size.
Conference Room	Size based upon 10% of drill population (use 15 SF per person)
Janitorial Space	Fixed size consistent with architectural standards.
Heads/Showers, Male	Size based upon OSHA standards of 1 toilet for each 10 personnel (with the appropriate mixture of toilets/urinals) and 1 shower head for each personnel (up to a maximum of 35 shower heads)
Heads/Showers, Female	Size based on minimum of 5% of drill population is female (1 toilet for each 10 personnel).
Lounge	Fixed size.
Day Locker Room (Marine)	Size based on 50% of drill population requirement for 1 day locker with lockers double stacked (each locker and bench is 5.3 SF).

B. EXCLUSIVE USE SPACE	
Administrative Offices	Variable size based on 18-12% of the drill strength (use 90 SF per person)
Conference Room	Size based upon 100% of active duty T/O (use 15 SF per person)
Recruiting	Fixed size.
Training Aid Storage	Fixed size.
LAN Control Center	Fixed size.
ISMT Training Room	Minimum size per training unit is 1,050 SF with a minimum ceiling height of 10 feet (each additional trainer requires another 1,050 SF).
Armory/Security Vault	Minimum size is 800 SF (for additional guidance use Cat Code 143-45). Size may increase based on units T/E.
Communication Maintenance Shop	Minimum size is 700 SF (for additional guidance use Cat Code 217)
Lockers	Size based on 100% of drill population requirement for 1 double-size locker per person.
Exercise/Fitness Center	Fixed size based on 15% of drill population working out at any one time (38.5 SF per person reference MIL-HDBK 1037/8).
Supply Storage	Minimum size listed with a minimum ceiling height of 20 feet (for additional guidance use Cat Code 441-10)

Table 17115-7(a) Derivation of Space Allowances for Table 17115-7 (Cont'd)

C. SPECIAL REQUIREMENTS	
Food Service Galley	Fixed size (400 SF)
Photo Unit (Dark Room)	Fixed size (100 SF)
Mobilization Station	Fixed size (500 SF)
Food Service Storage	Fixed size (700 SF)
Classified Material Storage	Fixed size (200 SF)
Communications/Electronics Shop	Fixed size (700 SF)
Medical Logistics Storage	Fixed size (5,000 SF). Should have a roll-up door for vehicle access
Embark Storage Shed	Fixed size (800 SF). Structure will have a vehicle access with roll-up door.
Dental Officer Office	Fixed size (180 SF). Only for dental battalions.
Medical Officer Office	Fixed size (180 SF). Only for medical battalions.

G	2	560	3	640	1	800	0	1,456	942	780	5,562

Notes - Table 17115-8

1) Total square footages are interior, functional space requirements. For total useable square footages, add mezzanine storage requirements. Mezzanine storage is to be constructed with ladder/stair access and removable safety rails over offices, tool rooms and heads.
2) Total gross square footages include 25% for walls and circulation.
3) The Lube/Preventative Maintenance Bay should be a separate bay, ideally with an air compressor lift vice a hydraulic lift. This bay should not be an exposed pit due to environmental concerns.
4) The Automotive Vehicle Maintenance Facility (Cat-Code 214-20) shall be 480 gross square feet, or 16' by 40' as directed by the P-80.

Table 17115-8(a) Derivation of Space Allowances for Table 17115-8 (cont'd)

TYPE A: Facility will not normally be incorporated into Marine Reserve Centers because their limited size does not allow for flexibility. Function breakdown is as follows:

SPACE	SIZE (SF)
Maintenance Bays	560
Flammable Storage	64

Table 17115-9 Space Criteria for Marine Corps Reserve Centers
Special Requirement Space Allowance

SPECIAL REQUIREMENTS –
Special requirements are not included in all reserve centers, and are justified by a unit's particular mission.

PART I (GROSS SQUARE FEET)

Each function must be approved by Headquarters, USMC and Commander, Marine Forces Reserve. Although these functions are located with the reserve center, for costing & scoping purposes they are not included in the 171-15 Category Code. Use appropriate Category Code unit cost. *See "Derivation of Special Requirement Space Allowances for Table 17115-9" for space requirement derivation data.*

Function	Cat. Code		Calculation	Scope	UOM
Indoor Pistol Range	171-50			900	SF
Rappelling Tower	179-50			400	SF
Tank, Combat Training Pool	179-55			4,200	SF
Parachute and Survival Equipment Shop	211-75			3,670	SF
Optics Shop	213-50			500	SF
Carpenter Shop	213-56			800	SF
Boat Shop	213-58			2,400	SF
Scuba Locker	213-68			250	SF
Field Maintenance Shop (Comm/Elect)	217-30			3,700	SF
Instrument Calibration Shop	218-45			3,600	SF
Boat Storage Shed	441-35			1,700	SF
Vehicle Holding Shed	214-40	___ # of tactical vehicles	___ # of bays (one per 30 vehicles) x 800 SF/bay =	_____	SF
Light Gun Shed	215-20		___ # of bays x 788 SF/bay =	_____	SF
Organic Equipment Storage Shed	441-12			Variable	SF

Table 17115-9 Space Criteria for Marine Corps Reserve Centers (continued)
Special Requirement Space Allowance

SPECIAL REQUIREMENTS – Special requirements are not included in all reserve centers, and are justified by a unit's particular mission.				
PART II (GROSS SQUARE YARDS)				
Each function must be approved by Headquarters, USMC and Commander, Marine Forces Reserve. Although these functions are located with the reserve center, for costing & scoping purposes they are not included in the 171-15 Category Code. Use appropriate Category Code unit cost. *See "Derivation of Special Requirement Space Allowances for Table 17115-9" for space requirement derivation data.*				
Function	**Cat. Code**	**Calculation**	**Scope**	**UOM**
Antennae Array	132-55		4,400	SY
Bulk Fuel Equipment Storage Shed	441-35		35	SY
Loading Ramp	851-15		35	SY
Vehicle Wash Platform	214-55	___ # of wash points x 90 SY/wash point =	_____	SY
Tactical Vehicle Parking (Wheeled)	852-35	___ # of wheeled vehicles x 50 SY/vehicle =	_____	SY
Tactical Vehicle Parking (Tracked)	852-35	___ # of tracked vehicles x 75 SY/vehicle =	_____	SY
Private Owned Vehicle Parking	852-10	___ # of personnel x 35 SY/vehicle (provide a min. of 80%) =	_____	SY
Quadcon Storage Pad	852-35	___ # of QUADCONS x 23 SY/QUADCON =	_____	SY
HAZMAT Storage Pad	852-35	___ # of HAZMAT sheds x 23 SY/HAZMAT shed =	_____	SY
MALS Van Pad	852-35	___ # of MALS vans x 34 SY/MALS van =	_____	SY
Generator Storage Shed	441-35	___ # of generators x 5 SY/generator =	_____	SY
Security Fencing	872-10		Variable	LF
Security fencing should be located, at a minimum, around the perimeter of the VMF, Tactical Vehicle Parking, Quad-Con Storage Lot, and Antennae Array, where applicable.				
Land	911-		10	AC

Table 17115-9(a) Derivation of Special Requirement Space Allowances for Table 17115-9

PART I		
Special requirements are not included in all reserve centers, and are justified by a unit's particular mission. Each function must be approved by Headquarters, USMC and Commander, Marine Forces Reserve.		
Function	**Cat. Code**	
Indoor Pistol Range	171-50	Fixed size (900 SF). For MP units only.
Rappelling Tower	179-50	Fixed size (400 SF)
Tank, Combat Training Pool	179-55	Fixed size (4,200 SF)
Parachute and Survival Equipment Shop	211-75	Fixed size (3,670 SF)
Optics Shop	213-50	Fixed size (500 SF). For units with special optical weapon system storage/maintenance requirements.
Carpenter Shop	213-56	Fixed size (800 SF)
Boat Shop	213-58	Fixed size (2,400 SF)
Scuba Locker	213-68	Fixed size (250 SF)
Vehicle Holding Shed	214-40	Variable size (1 bay at 800 gross SF for each 30 vehicles).
Light Gun Shed	215-20	Variable size (788 SF per bay). Multiply by number of bays required.
Field Maintenance Shop (Communications/Electronics)	217-30	Fixed size (3,700 SF). A separate structure with 200 SF of office space, 1,000 SF work area with tech benches, a head and vehicle access with roll-up door.
Instrument Calibration Shop	218-45	Fixed size (3,600 SF)
Organic Equipment Storage Facility	441-12	Based on 80% of unit's unique organic training allowance
Boat Storage Shed	441-35	Fixed size (1,700 SF)

Table 17115-9(a) Derivation of Special Requirement Space Allowances for Table 17115-9 (cont'd)

PART II		
Special requirements are not included in all reserve centers, and are justified by a unit's particular mission. Each function must be approved by Headquarters, USMC and Commander, Marine Forces Reserve.		
Function	**Cat. Code**	
Antennae Array	132-55	Fixed size (4,400 SY)
Vehicle Wash Platform	214-55	Variable size (800 SF per vehicle). Multiply by number vehicles washrack designed to accommodate.
Bulk Fuel Equipment Storage Shed	143-77	Fixed size (35 SY)
Quad Con Storage Lot	852-35	Variable size (23 SY per container)
HAZMAT Storage Pad	852-35	Variable size (23 SY per HAZMAT storage shed)
MALS Van Pad	852-35	Variable size (34 SY per van)
Generator Storage Shed	441-35	Variable size (5 SY per generator)
Loading Ramp	851-15	Fixed size (35 SY)
Tactical Vehicle Parking (Wheeled)	852-35	Variable size (50 SY per wheeled vehicle)
Tactical Vehicle Parking (Tracked)	852-35	Variable size (75 SY per tracked vehicle)
Private Owned Vehicle Parking	852-10	Variable size (35 SY per POV). Provide a minimum of parking for 80% of the drill strength
Security Fencing	872-10	Variable size around perimeter. Fencing required around VMF/tactical parking, Quad Con storage lot and antennae array, where applicable.
Land	911-	Minimum size (10 acres of useable land)

171 17 TV CENTER FOR INSTRUCTIONAL MATTER (SF)
FAC: 1441
BFR Required: Y

17117-1 **DEFINITION.** This facility may be provided only when specifically authorized by Naval Education and Training Command (NETC). Requirements will be determined for each individual case, with NETC guidance.

171 20 APPLIED INSTRUCTION BUILDING (SF)
FAC: 1712
BFR Required: Y

17120-1 **DEFINITION.** This facility provides for training personnel through the applied use of technical equipment and tools. Some of the characteristic features of applied instruction classrooms are:

- The use of drafting tables
- The use of workbenches to train personnel in trade/specialized skills such as electronics, machine tool operation, welding and similar.
- The use of operational training machinery such as automotive or other engines, refrigeration equipment, etc.
- The requirement for complete functional systems such as weapons delivery systems, fire control systems, etc.
- For planning purposes, applied instruction facilities can be divided into two general categories:
    a. **General Applied Instruction Facilities** (for example, Service School Shops and Laboratories).
    b. **Specialized Applied Instruction Facilities** (for example, Multiengine Patrol Plane Training Building).

17120-2 **PLANNING METHODOLOGY.** Facilities for each category must be planned separately because planning methodologies are different for each group. General applied instruction facilities have flexible space allowances and must be planned to individually suit the type of instruction to be accommodated. Specialized applied instruction facilities have fixed space allowances. In the following text, each category is discussed separately.

17120-3 **BROAD PLANNING FACTORS**

17120-3.1 **General Applied Instruction Facilities**. The gross SF building area (for BFR purposes) may be computed by <u>either one of the two alternate methods</u>:

- In the absence of detailed data or when close approximation to precise requirements is not considered necessary, the gross building area should be computed based on 150 gross square feet per student station.

- If specific personnel data is available follow the planning procedure and table given under Basic Category 171 and 171-20.

Figure 17120-1 provides a method to calculate floor area requirements for hands-on mockup training devices.

Figure 17120-1
Planning Formula for Determining Floor Requirements for Hands-on Mockup Space

FORMULA: A = B (CD + E)

DEFINITIONS

A = Area of classroom in net SF

B = Number of items of practice equipment required. This figure is obtained by dividing C into the average number of students in each class session.

C = Number of students assigned to each item of practice equipment.

D = Net SF of floor area required for one student working on an item of practice equipment.

E = Net SF of floor area occupied by one item of practice equipment. Includes clearances and aisles. Human engineering factors, including safety, must be considered. In cases where student working areas (item D) partially overlap equipment clearance areas, insure that the space requirements are not duplicated.

17120-3.2 **SPECIALIZED APPLIED INSTRUCTION FACILITIES.** This category includes facilities designed for training in specialized functions requiring a dedicated building. Space allowances are either fixed or given in gross SF per student and in every case includes all necessary support spaces, such as administration, lounges, training aid storage, library space, reproduction areas, learning centers, toilets, showers, locker rooms, corridors, and janitorial space. For some of the facilities listed below which require a specific building configuration, definitive designs have been prepared. Those cases are annotated in the text.

- **Flight Training and Briefing Building**. This building provides space for student pilots in support of direct flight training. Included in the allowance is space for lecture rooms and classrooms, instructor pilot offices, ready rooms, flight planning rooms, briefing rooms, and other support space.

The facility provides the necessary space for interaction of student and instructor in briefing and debriefing of actual training flight, singly or in groups. This space is over and above the space requirements for extensive classroom, instrument trainer or flight simulator training, which are covered in other category codes or in other sub listings under this category code. Also, this space is in addition to the normal squadron administrative space covered under category code 211 07. The planning factor for Flight Training and Briefing Building is 125 gross SF Per student, based on the average on-board student load.

- **Naval Air Maintenance Training Building**. Naval Air Maintenance Training Buildings provide the necessary classrooms and other space in support of one or more Maintenance Trainer Sets (MTS's). MTS's, consisting of instructional items as displays, actual systems/subsystems/equipment/parts/materials, cut-aways, mock-ups, audio/visual aids, provide maintenance personnel and pilots with technical training on aeronautical systems and associated equipment, organizational and intermediate maintenance, operation and special techniques as applied to aircraft subsystems, missiles and specific equipment and other training as the Chief of Naval Operations may direct.

17120-3.3 The planning factor for the Naval Air Maintenance Training Building is 160 gross SF per student. The number of students for planning purposes shall be the average on-board student loading.

17120-3.4 Highly sophisticated new weapon systems may require more space than-would be computed on the basis of 160 square feet per student. The facility or site study prepared for each new weapon system provides the necessary information for making such determination. When the maintenance training space requirement is found to exceed 160 square feet per student, the requirements shall be fully documented, to include data relative to size of trainers, students per trainer, support space requirements and other pertinent matters to enable evaluation of the actually required gross area.

- **Fleet Readiness Aviation Maintenance Personnel (FRAMP) and Aircrew Learning Center.** This facility provides classrooms, briefing rooms and environmentally protected FRAMP practical training work areas to support initial and recurrent training for fleet aircrew (pilots, Naval Flight Officers, and when applicable, enlisted crew members) and aircraft maintenance personnel. Gross area requirements vary with model of aircraft and student loading and must be determined for each individual case. Although FRAMP and aircrew training facilities can be separate, integrated facilities permit efficient utilization of classrooms, study carrels, media reproduction and support areas and administrative spaces. Simulator facilities (code 171 35) may be attached to this building.

- **All Weather Training Building**. The all-weather training building provides the necessary space to house the special devices used by pilots, crewmen, and ground controllers to maintain their operating proficiency for adverse weather conditions. The planning factor for this facility is one (1) standard all-weather training building for an all-weather training station supporting two or more all-weather squadrons. The standard all-weather training building has an area of 7702 gross SF. The building contains six classrooms of about 600 square feet each to house special devices, a map-making room, support spaces and space for routine maintenance and equipment testing.

- **Multi-engine Patrol Plane (VP) Training Building**. This facility houses special devices and gear used by patrol pilots and crewmen to maintain proficiency in submarine search and detection, aircraft and missile detection, and the employment of counter-measures against enemy radar. The planning factor is one (1) standard multi-engine patrol plane training building for a patrol plan e station with a mission for continuous support of two or more patrol squadrons. The facility has an area of 26,120 gross SF and contains 23 classrooms (18 feet by 22 feet average size), support spaces, and a lecture-demonstration hall.

- **Aviation Physiological Training Building**. This building provides classroom and support space for implementation of the aviation physiology training syllabus. The syllabus pertains to aeromedical aspects of night vision, acceleration and deceleration forces, explosive decompression, oxygen equipment, pressure suits, survival, protective and safety equipment. The planning factor is one (1) aviation physiological training building for each station that will support four carrier air groups or the equivalent of one HATWING OF VAH jet aircraft. The building is planned with the concurrence of NAVMEDCOM. The size of the building is 15,000 gross SF.

- **Delivery Retaining Detachment Building**. This facility provides refresher training for teams that handle and maintain special weapons and for pilots and crews assigned special weapons missions. The planning factor is one (1) delivery retraining detachment building for each air station supporting operational units with a special weapons capability. The building has an area of 1,590 gross SF.
- **Naval Construction Battalion Unit (CBU) Facility**. This facility provides a construction unit contingency augmentation capability to the Naval Construction Forces and assures unit and individual skill training essential to required readiness posture. Space requirements may be satisfied by a single or multiple building configuration. Facilities of this type will be planned only at locations designated by higher authority. Space allowances for CBU’s are given in Table 17120-1

- **Band Practice Facility**. Table 17120-2 provides a summary list of the recommended areas for each of the spaces for both small and large bands. Local differences in operational patterns and function programs may require some modifications to the space program. These differences may, for example, include; larger or smaller size for individual spaces; different relationship patterns between spaces; or elimination or addition of specific spaces.

- **Combat Training Pool/Tank, Enclosed.** This facility provides an enclosed pool/tank for instruction in swimming and survival under combat conditions. It includes the pool and supporting spaces, such as locker room, instructional deck, mechanical room, etc., however the actual composition of individual facilities may vary according to their particular training requirements. Unique pool/tank design considerations may be required for specialized training facilities such as aviators' survival training tanks and EOD/underwater demolition training. For general planning criteria, See Category Code 179 55.

Table 17120-1
Space Criteria for Naval Construction Battalion Units

Functional space	Notes	Gross Sq Ft	Gross Sq M
Administration		1,460	136
Engineering Lab		570	53
Locker/Showers	(3)	1,000	93
Classroom/Workbench		1,060	98
Classroom/Academic		580	54
Equipment Maintenance Shops	(1)	4,400	409
Vertical Shops (BU/SW/CE/UT)	(2)	4,000	372
Central Tool Room (CTR)	(2)	2,940	273
Project Material Storage (MLO)	(2)	2,540	236
Greens Issue/782 Issue	(2)	810	75
TOTAL GROSS AREA		19,360	1,799

Notes:

(1) Based on three equipment repair bays.
(2) Definition for the abbreviations used in this criterion are as follows:

BU = Builder
SW = Steelworker
CE = Construction Electrician
UT = Utilities man
CTR = Central Tool Room
MLO = Construction Project Material Storage (operated by the Materials Liaison Officer)
Greens/782 Issue = Organizational Clothing/Gear Issue

(3) Total Gross Area includes both men and women.

171 21 DECONTAMINATION TRAINING FACILITY (DELETED)
FAC: 1712
BFR Required: Y

17121-1 This category code is deleted. Decontamination training areas are integral to the operational facilities they occupy and as such, are not a standalone facility.

171 25 GENERAL PURPOSE AUDITORIUM (SF)
FAC: 7431
BFR Required: Y

17125-1 **DEFINITION.** An auditorium may be authorized when required as an adjunct to training or other functions (except administration). The primary purpose of the auditorium is an assembly area for instruction and training. General purpose auditoriums will not be planned at an installation where a motion picture theater is authorized except where justified by special circumstances. Seating capacity of an auditorium is to be determined in each specific case and justification provided. The size of an auditorium shall be calculated based on 12 square feet per seat gross floor area or 9 square feet per seat net floor area (in cases where auditorium is a part of a multiple use building sharing common circulation and service spaces).

171 30 PHYSICAL EDUCATION FACILITY (SF)
FAC: 1715
BFR Required: Y

17130-1 **DEFINITION.** A building that houses physical education training facilities at the United States Naval Academy (USNA) at Annapolis, Maryland. These facilities are used for the fitness development program of instruction at the USNA. This CCN is for use only by the USNA.

17130-2 **GENERAL.** An engineering analysis is required to determine facility space allocations.

171 35 OPERATIONAL TRAINER FACILITY (SF)
FAC: 1721
BFR Required: Y

17135-1 **DEFINITION.** This category is assigned to training space which meets one or more of the following criteria:

17135-1.1 It houses large operational trainers, usually duplicating part or all of surface or air weapons system.

17135-1.2 It is specifically designed and sized for a trainer; has characteristics such as high ceiling height, large room dimensions, and removable exterior wall panels to facilitate servicing; it may also include special design features to satisfy stability requirements of visual systems, unique environmental control requirements (HVAC & filtering), loads associated with motion base(s), and abnormal power requirements.

17135-1.3 Actual space requirement is dictated by the size of the trainer rather than student loading.

Examples of the type of trainers which should be categorized under this code area:

a. Weapons System Trainer/Flight Simulator.
b. Part-Task Trainer (air).
c. Cockpit Procedure Trainer.
d. Instrument Trainer.
f. Full scale models of ships boiler rooms.
g. Full scale mock-up of a Trident tube.
h. Full scale mock-up of a Tomahawk Launcher.
i. Large scale models of water basins for practice of berthing procedures.
e. Mock-ups of ships and submarines and their associated armament.

17135-2 Space which houses small trainers, such as radios, etc., is not categorized under this code, even though the trainers are operational. Use Category Code 171 20.

As space for operational trainers may occur as either a separate facility or as a wing or room of an applied instruction building, the following method of assigning the appropriate category code shall be used.

17135-3 In the case of a building to be used solely for the housing of a trainer and its required support space, the entire building shall be categorized as Category Code 171 35. The support space includes corridors, storage, briefing rooms, offices, mechanical room, and the like.

17135-4 If an operational trainer is included as part of a larger instruction building, the room housing the trainer shall be categorized as Category Code 171 35. This Category Code also includes support spaces for the trainer, including storage, briefing room equipment, and repair room. If any of the support spaces are used jointly for the operation of the trainer and the instruction given in the rest of the building, the support space shall be given the category assigned to the building, usually Category Code 171 20.

17135-5 Planning factors are given for a limited number of operational trainer facilities. Others will be added as they are developed. Where planning factors are not available, space requirements must be fully justified by and Engineering Evaluation. Room sizes, size of trainers, and support space should be listed, and the justification should be accompanied by drawings.

17135-6 Flight Simulator Space. This facility houses the Flight Simulator/Weapon System Trainer (WST) and associated Part Task Trainers (PTT). It is planned for stations supporting naval aircraft and is sized depending on aircraft type and average number of squadrons on-board. The total number of organizational units permanently assigned plus the average number of organizational units of rotational and special aircraft on-board shall be used for planning. Table 171-35A provides information on the gross areas required. The 6,000-square-foot area for example, will contain the following basic components:

- Trainer Room. An air-conditioned room of 50 by 50 feet minimum size, to house the necessary equipment of one (1) Weapon System Trainer (WST).

- Briefing Room. A classroom to house a maximum class of 20 pilots at 20 square feet per man.

- Administration. Office space for the officer-in-charge and two assistants.

- Maintenance Shop. A 20- by 15-foot space for the periodic maintenance of the test equipment.

- Mechanical and Electrical Equipment Room. Space of about 15 by 20 feet for the heating, air conditioning, and electrical distribution panels.

- Part Task Trainer Rooms. A minimum of two rooms of 20 by 20 feet for the housing of two Part Task Trainers (PTT).

- The other sizes will have similar requirements.

Table 17135-1
Flight Simulator Trainer Space Requirements

Type of Squadron	Number of Squadrons	Number of Trainers	Gross Area (Sq Ft)
VA/VF/HS/HM	2 - 8	1-WST, 2-PTT	6,000
	9 - 15	2-WST, 2-PTT	7,500
VA/VP	1 - 4 (VS)	1-WST, 2-PTT	9,000
	1 - 2 (VP)		
VS/VP	5 - 8 (VS)	2-WST, 4-PTT	12,000
	3 - 5 (VP)		

17135-7 **Instrument Trainer Space**. This facility houses instrument trainers and cockpit procedure trainers. The size of this facility is based upon the number and type of aircraft squadrons or attack carrier air wings (CVW). Table 17135-2 provides information on the gross area requirements. Included is space for: administrative office, briefing room, technical order library, storage room, equipment maintenance shop, mechanical equipment room, and trainer room. In using Table 17135-2, the total number of permanently assigned organizational units on-board shall be counted.

Table 17135-2
Basic Instrument Trainer Space Requirements

Type of Unit	Number of Units	Gross Area (Sq Ft)
VP, VS, or AEW squadron	1 squadron	5,000
	2 squadrons	8,000
CVW of VF/VA/HS/HM	1 or 2 wings	5,000
	3 or 4 wings	8,000

171 36 RADAR SIMULATOR FACILITY (SF)
FAC: 1724
BFR Required: Y

17136-1 AUTHORIZATION. This facility may be provided only when specifically authorized by Naval Education and Training Command (NETC). Requirements will be determined for each individual case, with NETC guidance.

171 40 DRILL HALL (SF)
FAC: 1714
BFR Required: Y

17140-1 **JUSTIFICATION.** Need for this facility must be determined on an individual basis and requires specific justification; this code is generally intended for inventory purposes.

171 45 MOCK-UP AND TRAINING AID PREPARATION CENTER (SF)
FAC: 1732
BFR Required: Y

17145-1 **AUTHORIZATION.** This facility may be provided only when specifically authorized by Naval Education and Training Command (NETC). Requirements will be determined for each individual case, with NETC guidance.

171 50 SMALL ARMS RANGE - INDOORS (SF)
FAC: 1718
BFR Required: Y

17150-1 **DEFINITION.** An indoor small arms range provides training space for the use of pistols and small caliber (22) rifles. Ranges will be used by all services on a joint basis when feasible, and they must be of sufficient size and capacity to provide continual training and retraining for all military personnel that require weapons training/qualification.

17150-2 The capacity of existing ranges or new requirements can be determined by:

1. Identifying the number of personnel to be trained.
2. Establish the number and size of training sessions.
3. Determine the number of hours per session and schedule training over an annual basis.
4. Calculate the required number of firing points based upon efficient arrangement of the size and schedules of the training groups.

17150-3 Indoor ranges are generally planned at locations where prevailing weather conditions seriously interfere with the scheduling of training. Otherwise, plan for outdoor ranges (Category Code 179 40).

For indoor range design criteria, refer to UFC 4-160-01.

171 60 RECRUIT PROCESSING BUILDING (SF)
FAC: 6100
BFR Required: Y

17160-1 **DEFINITION.** A recruit processing building is a facility for receiving, examining, and outfitting recruits. The processing building must provide space for the complete orientation, examination, and processing (medical, dental, supply, administrative) of all newly inducted and recruited personnel. The size of the facility will be determined by an engineering survey.

171 77 TRAINING MATERIAL STORAGE (READY ISSUE / SHOP STORES / MISC) (SF)
FAC: 1732
BFR Required: Y

17177-1 **DEFINITION.** Storage facilities for miscellaneous goods or equipment related to training facility support will be provided only where it can be individually justified. There are no criteria for this type of facility. General information on storage parameters is provided in Category Code series 440.

172 30 GAS CHAMBER (SF)
FAC: 1723
BFR Required: Y

17230-1 **DEFINITION.** A gas chamber is a building used for training personnel in the use of protective masks and the effects of chemical warfare.

173 10 RANGE OPERATIONS BUILDING (SF)
FAC: 1731
BFR Required: Y

17310-1 **DEFINITION.** Range Operations Buildings are designed for direct support to range operations. Such buildings can support a variety of operations for a firing range, such as: range operations, administrative support, target storage and issue, equipment storage and maintenance, and ammunition breakdown and distribution (not storage). This category includes buildings associated with range operations such as range operations centers, operations/storage buildings, and ammo breakdown buildings (not ammunition storage). This Category Code is for buildings only; report structures used for these purposes as Category Code 173 30, Covered Training Area.

173 11 RANGE SUPPORT BUILDING (SF)
FAC: 1731
BFR Required: Y

17311-1 **DEFINITION.** A Range Support Building would be a building which houses support functions conducted at the range complex but not covered elsewhere. This includes range billets, classroom space at a range, buildings to conduct after action reviews, and all other range support activities with the exception of activities described in Range Operations Building (Category Code 173 10), Weapons Range Observation Tower (Category Code 179 35), and Public Toilet (Category Code 730 75). This Category Code is for buildings only; structures used for this purpose should be reported as Category Code 17330, Covered Training Area.

173 20 TRAINING AIDS CENTER (SF)
FAC: 1732
BFR Required: Y

17320-1 **DEFINITION.** A Training Aids Center is a building that is used to fabricate, maintain, store, and issue training devices and materials including Multiple Integrated Laser Equipment System (MILES) and visual information (VI) aids; it also provides the administrative space for the training support division (TSD) management staff.

173 30 COVERED TRAINING AREA (SF)
FAC: 1733
BFR Required: Y

17330-1 **DEFINITION.** Covered Training Areas are structures which provide a covered area to support and conduct training or for feeding of personnel on a training facility while providing protection for equipment and personnel from the elements. Typically, the sides of the structure are open with a solid roof. This category also includes structures that support range operations. These facilities are usually located in ranges, training areas, bivouac, or maneuver areas. Square footage is measured as the area under the room or cover. Also this Category Code is used to report covered physical training areas and covered martial arts training areas.

173-40 OBSERVATION TOWER/BUNKER (SF)
FAC: 1783
BFR Required: Y

17412-1 **DEFINITION.** An Observation Tower/Bunker is a protective shelter used at Navy/Marine Corps EOD ranges for the protection of EOD technicians and observers. Location of the Tower/Bunker must be IAW NAVSEA OP-5. An Engineering Evaluation must be conducted to determine the correct size of the facility.

174 10 MANEUVER/TRAINING AREA, LIGHT FORCES (AC)
FAC: 1741
BFR Required: N

17410-1 **DEFINITION.** This category includes all space for ground and air combat forces to practice movements and tactics. Different types of units may support one another (combined arms), or a unit may operate independently. The “light” designation refers to areas where maneuver is restricted to only small units or units having only wheeled vehicles. “Light” maneuver/training areas are not typically used by “heavy” or mechanized forces, other than in assembly areas where movement is restricted to roads or trails. Included in this category are bivouac sites, base camps, and other miscellaneous training areas. Account for each area, typically managed and scheduled by a range name or code through the installation training or range control manager with a separate facility number and individual real property record. When maneuver/training areas can be used for multiple purposes, priority of assignment is Maneuver/Training Area, Amphibious; Maneuver/Training Area, Heavy; Maneuver/Training Area, Light.

174 11 MANEUVER/TRAINING AREA, AMPHIBIOUS FORCES (AC)
FAC: 1741
BFR Required: N

17411-1 **DEFINITION.** This category includes all space for ground and air combat forces to practice movements and tactics during amphibious (ship-to-shore) operations. Different types of units may work in support of one another (combined arms), or the units may operate independently. Tasks can include both combat and logistics (especially logistics over the shore (LOTS)). This category also includes areas with bivouac sites, base camps, and other miscellaneous training areas. Account for each area, typically managed and scheduled by a range name or code through the installation training or range control manager, with a separate facility number and individual real property record. When maneuver/training areas can be used for multiple purposes, priority of assignment is Maneuver/Training Area, Amphibious; Maneuver/Training Area, Heavy; Maneuver/Training Area, Light.

174 12 LAND NAVIGATION COURSE (AC)
FAC: 1741
BFR Required: N

17412-1 **DEFINITION.** A Land Navigation Course is an area located within the training complex which is principally scheduled and used for map reading, terrain association, or navigational training.

174 13 FIELD TRAINING AREA (AC)
FAC: 1741
BFR Required: N

17413-1 **DEFINITION.** A Field Training Area is a specific area that is intended for the training of personnel or animals in a field environment that cannot be categorized by the other Category Codes in the 174 basic series. Training conducted in such an area may include medical, K-9, or communications equipment. Maneuver land shall not be included in this category; separately classify maneuver in other Category Codes within the 173 basic series.

174 20 MANEUVER/TRAINING AREA, HEAVY FORCES (AC)
FAC: 1742
BFR Required: N

17420-1 **DEFINITION.** This category includes all space for ground and air combat forces to practice movements and tactics. Different types of units may support one another (combined arms), or may operate independently. The “heavy” designation refers to areas where maneuver is unrestricted and can consist of all types of vehicles and equipment, including tracked vehicles. “Heavy” maneuver/training areas can be used by “light” forces. This category includes bivouac sites, base camps, and other miscellaneous training areas. This area is typically managed and scheduled by a range name or code through the installation training or range control manager and is accounted for with a separate facility number and individual real property record. When maneuver/training areas can be used for multiple purposes, priority of assignment is Maneuver/Training Area, Amphibious; Maneuver/Training Area, Heavy; Maneuver/Training Area, Light.

174 30 IMPACT AREA DUDDED (AC)
FAC: 1743
BFR Required: N

17430-1 **DEFINITION.** An area having designated boundaries within which all ordnance will detonate, or impact shall be categorized as Impact Area Dudded. This area includes all impact areas that do not contain automated targets or targets classified as real property. Vehicle bodies are sometimes placed in the area to act as targets for artillery direct and indirect fire. The primary function of the impact area is to contain weapons effects as much as possible using earthen berms or natural terrain features. Assume the impact areas contain unexploded ordnance and may not be used for maneuver. This area is typically managed and scheduled by a range name or code through the installation training or range control manager and is accounted for with a separate facility number and individual real property record.

174 31 IMPACT AREA NON-DUDDED (AC)
FAC: 1743
BFR Required: N

17431-1 **DEFINITION.** An area having designated boundaries within which ordnance that does not produce duds will impact is an Impact Area Non-Dudded. This area is composed mostly of the safety fans for small arms ranges. This area includes all impact areas that do not contain automated targets or targets classified as real property. The primary function of the impact area is to contain weapons effects as much as possible using earthen berms or natural terrain features. A separate facility number and individual real property record shall be issued to account for each area that should be managed and scheduled by a range name or code through the installation training or range control manager. Although these impact areas may be used for maneuver, when the weapons ranges are not in use, they will remain categorized as impact areas.

174 40 PERSONNEL/EQUIPMENT DROP ZONE (AC)
FAC: 1744
BFR Required: N

17440-1 **DEFINITION.** A large, flat, cleared area for personnel and equipment to land following a parachute jump shall be categorized as a Personnel/Equipment Drop Zone.

175 01 AUTOMATIC RIFLE RANGE (AC)
FAC: 1750
BFR Required: Y

17501-1 **DEFINITION.** The Automatic Rifle Range is designed for training target engagement techniques with rifles and squad automatic weapon (SAW). This range is used to train personnel on the skills necessary to employ automatic and semi-automatic firing techniques. Within this range targets are not fully automated, and the scenarios are not computer driven or scored. This Category Code will not be used for ranges where the principal use is defined in other Category Codes within the 175 series.

175 02 NON-STANDARD SMALL ARMS RANGE (AC)
FAC: 1750
BFR Required: Y

17502-1 **DEFINITION.** The Non-Standard Small Arms Range is designed for training requirements that are not associated with current published doctrine but fall within a commander’s training requirements. This range includes all small arms ranges that do not fit into other categories. Targets in this range are not fully automated and/or the scenarios are not computer driven or scored. This Category Code number includes dedicated dry fire areas.

175 10 BASIC 10M-25M FIRING RANGE (ZERO) (AC)
FAC: 1751
BFR Required: Y

17510-1 **DEFINITION.** A Basic Zero Firing Range is designed for training shot-grouping and zeroing exercises with rifles and machine guns. This range is used to train individual personnel on the skills necessary to align the sights and practice basic marksmanship techniques against stationary targets. This range requires no automation.

175 20 AUTOMATED FIELD FIRE (AFF) RANGE (AC)
FAC: 1752
BFR Required: Y

17520-1 **DEFINITION.** An Automate Field Fire Range is designed for training target engagement techniques with rifles. This range is used to train and familiarize personnel on the skills necessary to identify, engage, and hit stationary infantry targets. All targets are fully automated and in the event specific target scenario is computer driven and scored from the range operations center.

175 30 RECORD FIRE RANGE, NON-AUTOMATED (AC)
FAC: 1753
BFR Required: Y

17530-1 **DEFINITION.** A Record Fire Range is designed for training and day/night qualification requirements with rifles. This range is used to train and test personnel on the skills necessary to identify, engage, and hit stationary infantry targets. Targets are not fully automated and/or the scenarios are not computer driven or scored. This Category Code with not be used for Known-Distance (KD) Ranges, which are accounted for under Category Codes 175 50 and 175 70.

175 31 AUTOMATED RECORD FIRE (ARF) RANGE (AC)
FAC: 1753
BFR Required: Y

17531-1 **DEFINITION.** An Automated Record Fire Range is designed for training and day/night qualification requirements with rifles. This range is used to train and test personnel on the skills necessary to identify, engage, and hit stationary infantry targets. All targets are fully automated, and the event specific target scenario is computer driven and scored from the range operations center. This category code number will not be used for Known-Distance (KD) Ranges, which are accounted for under Category Codes 175 50 and 175 70.

175 32 MODIFIED RECORD FIRE RANGE (AC)
FAC: 1753
BFR Required: Y

17532-1 **DEFINITION.** A Modified Record Fire Range is designed for training and day/night qualification with rifles. This range combines the capabilities of 1752X, Automated Field Fire (AFF) Range; and 1753, Automated Record Fire (ARF) Range to reduce land and maintenance requirements. All targets are fully automated, and the event specific target scenario is computer driven and scored from the range operations center. This Category Code Number will not be used for Known-Distance (KD) Ranges, which are accounted for under Category Codes 175 50 and 175 70.

175 50 RIFLE KNOWN DISTANCE (KD) RANGE (AC)
FAC: 1755
BFR Required: Y

17550-1 **DEFINITION.** A Rifle Known Distance Range is designed for training rifle marksmanship and target engagement techniques. This range is used to train personnel on the skills necessary to identify, engage, and hit stationary targets in a static array from a known distance.

175 60 SNIPER FIELD FIRE RANGE (AC)
FAC: 1756
BFR Required: Y

17560-1 **DEFINITION.** A Sniper Field Fire Range is designed to meet training and qualification requirements with the sniper rifle. This range is used to train and test snipers on the skills necessary to detect, identify, engage, and hit stationary and moving infantry targets in a tactical array in accordance with applicable field manuals. In this range targets are not fully automated and/or the scenarios are not computer driven or scored.

175 61 AUTOMATED SNIPER FIELD FIRE RANGE (AC)
FAC: 1756
BFR Required: Y

17561-1 **DEFINITION.** An Automated Sniper Field Fire Range is designed to meet the training and qualification requirements with the sniper rifle. This range is used to train and test snipers on the skills necessary to detect, identify, engage, and hit stationary and moving infantry targets in a tactical array in accordance with applicable field manuals. All targets are fully automated, and the event specific target scenario is computer driven and scored from the range operations center.

175 70 PISTOL KNOWN DISTANCE (KD) RANGE (AC)
FAC: 1757
BFR Required: Y

17570-1 **DEFINITION.** A Pistol Known Distance (KD) Range is designed for training pistol and revolver marksmanship and target engagement techniques. This range is used to train personnel on the skills necessary to identify, engage, and hit stationary targets in a static array from a known distance.

175 71 COMBAT PISTOL/MP FIREARMS QUALIFICATION COURSE (AC)
FAC: 1757
BFR Required: Y

17571-1 **DEFINITION.** A Combat Pistol/MP Firearms Qualification Course is a range designed to meet training and qualification requirements with combat pistols and revolvers. This range is used to train and test personnel on the skills necessary to identify, engage, and hit stationary infantry targets. In this range targets are not fully automated and/or the scenarios are not computer driven or scored.

175 72 AUTOMATED COMBAT PISTOL / MP FIREARMS QUALIFICATION COURSE (AC)
FAC: 1757
BFR Required: Y

17572-1 **DEFINITION.** An Automated Combat Pistol/MP Firearms Qualification Course is a range designed to meet training and qualification requirements with combat pistols and revolvers. This range is used to train and test personnel on the skills necessary to identify, engage, and hit stationary infantry targets. All CPQC targets are fully automated, and the event specific target scenario is computer driven and scored from the range operations center.

175 73 SUBMACHINE GUN RANGE (AC)
FAC: 1757
BFR Required: Y

17573-1 **DEFINITION.** A Submachine Gun Range is designed for training target engagement techniques with the submachine gun. This range is used to train personnel on the skills necessary to identify, engage, and hit stationary infantry targets. Targets are not fully automated and/or the scenarios are not computer driven or scored within this range.

175 80 MACHINE GUN TRANSITION RANGE (AC)
FAC: 1758
BFR Required: Y

17580-1 **DEFINITION.** A Machine Gun Transition Range is designed to meet the training requirements with machine guns. This range is used to train personnel on the skills necessary to identify, engage, and hit stationary infantry targets at known distances. Targets within this range are not fully automated and/or the scenarios are not computer driven or scored. Ranges that fulfill purpose of both Machine Gun Transition Range (Category Code 175 80) and Machine Gun Field Fire Range (Category Code 175 81) will be carried as Machine Gun Field Fire Range (Category Code 175 81).

175 81 MACHINE GUN FIELD FIRE RANGE (AC)
FAC: 1758
BFR Required: Y

17581-1 **DEFINITION.** A Machine Gun Field Fire Range is designed to train target engagement techniques with squad assault weapons and machine guns. This range is used to train personnel on the skills necessary to identify, engage, and hit stationary infantry, vehicle, and bunker type targets. Distance to targets is not predetermined. Within this range targets are not fully automated and/or the scenarios are not computer driven or scored. Ranges that fulfill purpose of both Machine Gun Transition Range (Category Code 175 80) and Machine Gun Field Fire Range (Category Code 175 81) will be carried as Machine Gun Field Fire Range (Category Code 175 81).

175 82 AUTOMATED MULTIPURPOSE MACHINE GUN (MPMG) RANGE (AC)
FAC: 1758
BFR Required: Y

17582-1 **DEFINITION.** An Automated Multipurpose Machine Gun (MPMG) Range is designed for zeroing, training, and qualification requirements with squad assault weapons (SAW) and machine guns. This range is used to train personnel on the skills necessary to identify, engage, and hit stationary infantry targets. All targets within this range are fully automated and the event specific target scenario is computer driven and scored from the range operations center.

176 10 GRENADE LAUNCHER RANGE (AC)
FAC: 1761
BFR Required: Y

17610-1 **DEFINITION.** A Grenade Launcher Range is designed to meet training and qualification requirements of the 40mm M203 Grenade Launcher. This range is used to train and test personnel on the skills necessary to engage and defeat stationary target emplacements with the 40mm Grenade Launcher. No automation is required for this facility. Count FP as each collection of points or lanes that allow completion of all training objectives.

176 20 40MM (GRENADE) MACHINE GUN QUALIFICATION RANGE (AC)
FAC: 1762
BFR Required: Y

17620-1 **DEFINITION.** A 40MM Machine Gun Qualification Range is designed to conduct training qualification firing with the grenade machine gun (e.g., MK-19). This range is used to train personnel with the weapon either ground or vehicle mounted. Targets in this range may be either non-automated or fully automated and the event specific target scenario is computer driven and scored from the range operations center. A lane is defined as the area for one gunner/weapon system to complete the training objectives.

176 30 LIGHT ANTIARMOR WEAPONS RANGE SUBCALIBER (AC)
FAC: 1763
BFR Required: Y

17630-1 **DEFINITION.** A Light Anti-armor weapons range is designed for training target engagement techniques with light anti-armor weapons (e.g., LAW/AT-4). This range is used to train personnel on the skills necessary to employ the weapon and hit stationary and moving targets using a sub-caliber training device. Targets are not fully automated and/or the scenarios are not computer driven or scored. Ranges used for both live and sub caliber firing will be carried under the Light Anti-armor Weapons Range Live (Category Code 176 31).

176 31 LIGHT ANTIARMOR WEAPONS RANGE LIVE (AC)
FAC: 1763
BFR Required: Y

17631-1 **DEFINITION.** A Light Anti-armor Weapons Range Live is designed for training target engagement techniques with light anti-armor weapons (e.g., LAW/ AT-4). This range is used to train personnel on the skills necessary to employ the weapon and hit stationary and moving targets using live rockets or a sub-caliber training device. Targets are not fully automated and/or the scenarios are not computer driven or scored. Ranges used for both live and sub-caliber firing will be carried under this Category Code.

176 40 ANTIARMOR TRACKING AND LIVE-FIRE RANGE (AC)
FAC: 1764
BFR Required: Y

17640-1 **DEFINITION.** An Anti-armor Tracking and Live-Fire Range is a complex designed to meet training and qualification requirements with medium and heavy anti-armor weapons systems (e.g., Javelin, TOW, SMAW). This complex is used to train and test soldiers on the skills necessary to employ the weapon, identify, track, engage, and defeat stationary and moving armor targets presented individually or as part of a tactical array. In this complex targets are not fully automated and/or the scenarios are not computer driven or scored. One lane is designed to accommodate up to 10 gunners/weapons.

176 41 AUTOMATED ANTIARMOR TRACKING AND LIVE-FIRE RANGE (AC)
FAC: 1764
BFR Required: Y

17641-1 **DEFINITION.** An Automated Anti-armor Tracking and Live-Fire Range is a complex designed to meet training and qualification requirements with medium and heavy anti-armor weapons systems (e.g., Javelin, TOW, SMAW). This complex is used to train and test personnel on the skills necessary to employ the weapon, identify, track, engage, and defeat stationary and moving armor targets presented individually or as part of a tactical array. All targets within this range are fully automated, computer driven, and scored from the range operations center. One lane is designed to accommodate up to 10 gunners/weapons.

176 50 FIELD ARTILLERY DIRECT FIRE RANGE (AC)
FAC: 1765
BFR Required: Y

17650-1 **DEFINITION.** A Field Artillery Direct Fire Range is designed to meet training requirements of field artillery crews. This range is used to train field artillery crews on the skills nec4essary to employ direct fire gunnery techniques with indirect fire equipment against stationary targets in a tactical array using live direct fire artillery. No automation is required for this facility. EA is defined as the range area to support up to one battery of artillery.

176 60 TANK/FIGHTING VEHICLE STATIONARY GUNNERY RANGE (AC)
FAC: 1766
BFR Required: Y

17660-1 **DEFINITION.** A Tank/Fighting Vehicle Stationary Gunnery Range is designed for conducting weapons system bore sighting, screening, zeroing and/or harmonization. Armor, infantry and/or aviation crew use this range. Within this range targets may be fully automated and/or scored from the range operations center. EA is defined as the range area to support up to 15 guns.

176 70 MORTAR RANGE (AC)
FAC: 1767
BFR Required: N

17670-1 **DEFINITION.** A Mortar Range is designed to meet the training requirements of mortar crewmen. This range is used to train mortar crews on the skills necessary to apply fire mission data, engage, and hit stationary targets in a tactical array using live fire mortars. No automation is required for this facility. EA is defined as the range area to support up to the mortar section.

176 71 FIELD ARTILLERY INDIRECT FIRE RANGE (AC)
FAC: 1767
BFR Required: N

17671-1 **DEFINITION.** A Field Artillery Indirect Fire Range is designed to meet the training and qualification requirements of field artillery units. This range is used to train field artillery crews on the skills necessary to apply fire mission data, engage, and hit stationary targets in a tactical array with indirect fire. No automation is required for this facility. EA is defined as the range area to support up to one battery of artillery.

176 80 MORTAR SCALED RANGE (AC)
FAC: 1768
BFR Required: Y

17680-1 **DEFINITION.** A Mortar Scaled Range is designed to meet the training requirements of mortar crewmen. This range is used to train mortar crews on the skills necessary to apply fire mission data, engage, and hit stationary targets in a tactical array using sub-caliber training devices. No automation is required for this facility. EA is defined as the range area to support up to three mortars.

176 81 FIELD ARTILLERY SCALED RANGE (AC)
FAC: 1768
BFR Required: Y

17681-1 **DEFINITION.** A Field Artillery Scaled Range is designed to meet training requirements of field artillery crews. This range is used to train field artillery crews on the skills necessary to apply fire mission data, engage, and hit stationary targets in a tactical array using sub-caliber training devices. No automation is required for this facility. EA is defined as the range area to support up to three artillery pieces.

176 90 SCALED GUNNERY RANGE (1:30 AND 1:60) (AC)
FAC: 1769
BFR Required: Y

17690-1 **DEFINITION.** A Scaled Gunnery Range (1:30 and 1:60) is designed to meet training requirements of armor crews. This range is used to train armor crews on the skills necessary to detect, identify, engage, and hit stationary and moving scaled targets in a tactical array using sub-caliber training devices. No automation is required for this facility. No standard facilities are associated with this range. EA is defined as a range designed to handle 4 vehicles.

176 91 SCALED GUNNERY RANGE (1:5 AND 1:10)
FAC: 1769
BFR Required: Y

17691-1 **DEFINITION.** A Scaled Gunnery Range (1:50 and 1:10) is designed to meet training requirements of armor and infantry crews. This range is used to train armor and infantry crews on the skills necessary to detect, identify, engage, and hit stationary and moving scaled targets in a tactical array using sub-caliber training devices and/or simulations. All targets are fully automated, computer driven, and scored from the range operations center. EA is defined as a range designed to handle 4 vehicles.

177 10 MULTIPURPOSE TRAINING RANGE (AC)
FAC: 1771
BFR Required: Y

17710-1 **DEFINITION.** A Multipurpose Training Range is designed to meet the training and qualification requirements for the crews, teams and sections of combat units. This range is used to train and test armor, infantry, and aviation crews and sections on the skills necessary to detect, identify, engage, and defeat stationary and moving armor and infantry targets in a tactical array. Targets are not fully automated and/or the scenarios are not computer driven or scored. LN is defined as a range to support training for 2 vehicles.

177 11 AUTOMATED MULTIPURPOSE TRAINING RANGE (AC)
FAC: 1771
BFR Required: Y

17711-1 **DEFINITION.** An Automated Multipurpose Training Range is specifically designed to satisfy the training and qualification requirements for the crews, teams and sections of combat units. This range supports dismounted infantry squad tactical live-fire operations either independently of, or simultaneously with supporting vehicles. This range is used to train and test armor, infantry, and aviation teams, crews and sections on the skills necessary to detect, identify, engage, and defeat stationary and moving armor and infantry targets in a tactical array. All targets are fully automated, and the event specific targets scenario is computer driven and scored from the range operations center. LN is defined as a range to support training for 2 vehicles.

177 20 TANK/FIGHTING VEHICLE PLATOON BATTLE RUN (AC)
FAC: 1772
BFR Required: Y

17720-1 **DEFINITION.** A Tank/Fighting Vehicle Platoon Battle Run is designed to meet the training and qualification requirements for platoons of armor and infantry units. This range is used to train and test armor and infantry platoons and sections on the skills necessary to detect, identify, engage, and defeat stationary and moving armor and infantry targets in a tactical array. Targets are not fully automated and/or the scenarios are not computer driven or scored. EA is defined as a range area to support training of platoon-sized units up to six vehicles.

177 21 TANK / FIGHTING VEHICLE MULTIPURPOSE RANGE COMPLEX, LIGHT, AUTOMATED (AC)
FAC: 1772
BFR Required: Y

17721-1 **DEFINITION.** A Tank/Fighting Vehicle Multipurpose Range Complex, Light, Automated, is a complex designed to meet the training and qualification requirements for platoons of light and mechanized infantry, armor, and aviation units. This complex is used to train and test infantry, armor, and aviation platoons, sections, teams and crews on the skills necessary to detect, identify, engage, and defeat stationary and moving armor and infantry targets in a tactical array. All targets are fully automated, and the event specific target scenario is computer driven and scored from the range operations center. EA is defined as a range area to support training of platoon-sized units up to six vehicles.

177 22 TANK / FIGHTING VEHICLE MULTIPURPOSE RANGE COMPLEX, HEAVY, AUTOMATED (AC)
FAC: 1772
BFR Required: Y

17722-1 **DEFINITION.** A Tank/Fighting Vehicle Multipurpose Range Complex, Heavy, Automated, is a complex specifically designed to satisfy the training and qualification requirements for the crews and platoons of armor, infantry and aviation units. This complex supports dismounted infantry squad tactical live-fire operations either independently of, or simultaneously with supporting vehicles. This range is used to train and test armor, infantry, and aviation platoons, sections, teams and crews on the skills necessary to detect, identify, engage, and defeat stationary and moving armor and infantry targets in a tactical array. All targets are fully automated, and the event specific targets scenario is computer driven and scored from the range operations center. When range can be used for both heavy and light purposes, it will be classified under this Category Code. EA is defined as a range area to support training of platoon-sized units up to six vehicles.

177 30 FIRE AND MOVEMENT RANGE (AC)
FAC: 1773
BFR Required: Y

17730-1 **DEFINITION.** A Fire and Movement Range is designed for training individual and buddy/team fire and movement techniques. The team negotiates maneuver utilizing cover and concealment techniques. Targets are not fully automated and/or the scenarios are not computer driven or scored. LN is defined as the path or trails to support training for two persons.

177 40 SQUAD DEFENSE RANGE (AC)
FAC: 1774
BFR Required: Y

17740-1 **DEFINITION.** A Squad Defense Range is designed for training individuals and squads on defensive engagement techniques and mutually supporting fires. This range is used to train personnel on the skills necessary to designate sectors of fire, identify, and provide suppressive fire on stationary infantry targets. All targets are fully automated, and the event specific target scenario is computer driven and scored from the range operations center. EA is defined as a range area to support training for a squad-sized unit.

177 50 INFANTRY SQUAD BATTLE COURSE (AC)
FAC: 1775
BFR Required: Y

17750-1 **DEFINITION.** An Infantry Squad Battle Course is designed for the training and qualification requirements of teams and squads on individual and collective tactics, techniques, and procedures and employment in tactical situations. This complex is used to train and test teams and squads on the skills necessary to conduct tactical movement techniques, detect, identify, engage, and defeat stationary and moving armor and infantry targets in a tactical array. Targets are not fully automated and/or the scenarios are not computer driven or scored. EA is defined as a range area to support training of squad and platoon sized units.

177 51 AUTOMATED INFANTRY SQUAD BATTLE COURSE (AC)
FAC: 1775
BFR Required: Y

17751-1 **DEFINITION.** An Automated Infantry Squad Battle Course is designed for the training and qualification requirements of teams and squads on individual and collective tactics, techniques and procedures and employment in tactical situations. This complex is used to train and test teams and squads on the skills necessary to conduct tactical movement techniques, detect, identify, engage, and defeat stationary and moving armor and infantry targets in a tactical array. All targets are fully automated, and the event specific target scenario is computer driven and scored from the range operations center. EA is defined as a range area to support training of squad and platoon sized units.

177 52 INFANTRY PLATOON BATTLE COURSE (AC)
FAC: 1775
BFR Required: Y

17752-1 **DEFINITION.** An Infantry Platoon Battle Course is designed for the training and qualification requirements of infantry platoons, either mounted or dismounted, on movement techniques and operations. This complex is used to train and test platoons on the skills necessary to conduct tactical movement techniques, detect, identify, engage, and defeat stationary and moving armor and infantry targets in a tactical array. Targets are not fully automated and/or the scenarios are not computer driven or scored. EA is defined as a range area to support training of squad and platoon sized units.

177 53 AUTOMATED INFANTRY PLATOON BATTLE COURSE (AC)
FAC: 1775
BFR Required: Y

17753-1 **DEFINITION.** An Automated Infantry Platoon Battle Course is designed for the training and qualification requirements of infantry platoons, either mounted or dismounted, on movement techniques and operations. This complex is used to train and test platoons on the skills necessary to conduct tactical movement techniques, detect, identify, engage, and defeat stationary and moving armor and infantry targets in a tactical array. All targets are fully automated, and the event specific target scenario is computer driven and scored from the range operations center. EA is defined as a range area to support training of squad and platoon sized units.

177 60 MOUT ASSAULT COURSE (MAC) (AC)
FAC: 1776
BFR Required: Y

17760-1 **DEFINITION.** A MOUT Assault Course is a facility for low-level collective training using live fire or MILES. This facility is used for training specific tasks before training on unit proficiency MOUT sites or Combat in Cities facility, carried under Category Code 179 61. Targets are not fully automated and/or the scenarios are not computer driven or scored. EA is defined as a range area to support training of platoon-sized units.

178 10 LIVE HAND GRENADE RANGE (AC)
FAC: 1781
BFR Required: Y

17810-1 **DEFINITION.** A Live Hand Grenade Range is designed to satisfy the training requirement of throwing live fragmentation grenades. This range familiarizes soldiers with the effects of live fragmentation grenades. No automation is required for this facility. Count each throwing location as one FP.

178 20 ENGINEER QUALIFICATION RANGE, NON-STANDARDIZED (AC)
FAC: 1782
BFR Required: Y

17820-1 **DEFINITION.** An Engineer Qualification Range, Non-standardized, is designed to meet the training and qualification requirements for engineer and combat engineer crews. This range is used to train and test engineer crews on the skills necessary to zero and/or boresight weapons systems, identify, classify, and reduce obstacles. Targets are not fully automated and/or the scenarios are not computer driven or scored. Count each firing position on the stationary firing line as one FP. If a stationary firing line does not exist, then count each obstacle clearing station as one FP.

178 21 ENGINEER QUALIFICATION RANGE, AUTOMATED / STANDARDIZED (AC)
FAC: 1782
BFR Required: Y

17821-1 **DEFINITION.** An Engineer Qualification Range, Automated/Standardized, is designed for the training and qualification requirements of engineer and combat engineer crews. This range is used to train and test engineer Crews on the skills necessary to zero and / or boresight weapons systems, identify, classify, and reduce obstacles. All targets are fully automated, and the event specific target scenario is computer driven and scored from the range operations center. Count each firing position on the stationary firing line as one FP. If a stationary firing line does not exist, then count each obstacle clearing station as one FP.

178 30 LIGHT DEMOLITION RANGE (AC)
FAC: 1783
BFR Required: Y

17830-1 **DEFINITION.** A Light Demolition Range is designed for the training and qualification of employing explosives and demolition charges. This range is used to train personnel on the proper techniques of wire, minefield and concrete obstacle breaching, timber and steel cutting, road cratering, and explosive demolition. No automation is required for this facility. Count each prepared station as one FP. Planning and scoping this function should consider user requirements and explosive safety criteria.

179 TRAINING FACILITIES OTHER THAN BUILDINGS

179-1 This basic category includes requirements for weapons ranges, training courses and mockups, training pools/tanks, and parade and drill fields, but it does not include expendable targets.

179 01 BAYONET ASSAULT COURSE (AC)
FAC: 1790
BFR Required: Y

17901-1 **DEFINITION.** A Bayonet Assault Course is designed for training assault techniques with a rifle and bayonet. These techniques are applied through a series of obstacles. This facility requires no automation. Report the number of FP as the number of prepared paths or set of targets in a standard path to be used in training.

179 02 TARGET DETECTION (TD) RANGE, NON-FIRING
FAC: 1790
BFR Required: Y

17902-1 **DEFINITION.** A Target Detection Range, Non-Firing, is a non-firing range to teach soldiers how to detect personnel on the battlefield under varying degrees of concealment and visibility. No automation is required for this range.

179 03 HAND TO HAND COMBAT PIT
FAC: 1790
BFR Required: Y

17903-1 **DEFINITION.** A Hand to Hand Combat Pit is a structure containing a circle of sand or sawdust for training in hand-to-hand fighting.

179 04 PRISONER OF WAR TRAINING AREA
FAC: 1790
BFR Required: Y

17904-1 **DEFINITION.** A Prisoner of War Training Area is typically and area fenced in with barbed wire and with guard towers used for the training of personnel in the handling of prisoners-of-war. The facility may also be used for the training of personnel in a simulated POW environment.

179 05 MINE WARFARE AREA (AC)
FAC: 1790
BFR Required: Y

17905-1 **DEFINITION.** A Mine Warfare Area is a cleared area for training in the placement, arming, disarming, and detection of vehicle and anti-personnel mines using non-explosive training material.

179 06 WHEELED VEHICLE DRIVERS COURSE (AC)
FAC: 1790
BFR Required: Y

17906-1 **DEFINITION.** A Wheeled Vehicle Drivers Course is for teaching basic driving skills, and for practice in four-wheel drive situations, parking, and backing up.

179 07 TRACKED VEHICLE DRIVERS COURSE (AC)
FAC: 1790
BFR Required: Y

17907-1 **DEFINITION.** A Tracked Vehicle Drivers Course is an area to teach the basic driving skills of steering and gear shifting on a level course. The facility may also contain a hilly course for developing advanced tracked vehicle driving skills such as turning on slopes and negotiating steep grades.

179 08 AMPHIBIOUS VEHICLE TRAINING AREA (AC)
FAC: 1790
BFR Required: Y

17908-1 **DEFINITION.** An Amphibious Vehicle Training Area contains sand or is close to a beach for training military personnel on unique driving, technical and tactical tasks associated with amphibious operations.

179 09 SHIP LOADING AND UNLOADING MOCKUP (SF)
FAC: 1732
BFR Required: Y

17909-1 **DEFINITION.** A mockup of a ship used for training personnel in ship loading and off-loading. Training area can also include negotiating cargo nets used during amphibious operations and operations at dockside.

179 10 AIRCRAFT GUNNERY, BOMBING, AND ROCKET RANGES (EA)
FAC: 1793
BFR Required: N

17910-1 **DEFINITION.** Aircraft Gunnery, Bombing and Rocket Ranges (Aircraft Weapons Ranges) provide air crews with operating areas for the development of proficiency in gunnery, bombing, rocketry, missile delivery, strafing, and mine laying. Ranges should generally be within 100 miles of the supporting air installation. The following criteria are not absolute as far as requirements are concerned; however, any plans to deviate from these criteria shall be referred to the Naval Air Systems Command.

17910-1.1 **Air-to-Air Weapons Ranges**. The Air-to-Air Weapons Ranges are Gunnery and Missile Ranges and should, if possible, be over water. The minimum surface impact areas and coincident restricted airspaces, whose minimum altitude is based on the characteristics of the using aircraft, are as follows:

- Gunnery Range - 23 nautical miles by 50 nautical miles.

- Rocket and Missile Ranges - 50 nautical miles square.

17910-1.2 **Air-to-Ground Ranges**. The Air-to-Ground Ranges are for training in strafing, high-altitude level bombing, loft bombing, close air support, aerial mining, and missile delivery. Communications are required between ground stations and between target controller and aircraft at these ranges. See Table 179-10 for specific surface impact areas, minimum restricted airspace, and other data applicable to air-to-ground ranges.

The following information for Air-to-Ground Weapons Ranges is provided in addition to that contained in Table 17910-1.

- Strafing Range. A strafing range is for air-to-ground gunnery proficiency training in low-altitude strafing firing 20-millimeter and possibly 30-millimeter ammunition. Targets may be panels or may simulate aircraft, gun emplacements, truck convoys, etc., and may be automatic recording targets.

- High-Altitude Level-Bombing Range. The high altitude level bombing range provides training in high-speed, high-altitude, level-attitude bomb releases. The center of the target is visible from 10 nautical miles at 50,000 feet. Offset bombing exercises are also conducted.

- Multipurpose Target Range. The multipurpose range is used for training in conventional dive bombing, high-altitude dive bombing, glide bombing, strafing, and rocketry (excluding controlled air-to-ground missiles). Inert training weapons with small charges are used to facilitate spotting.

- Loft Bombing Range. The loft bombing range is a highly instrumented land range for practice bombing with simulated nuclear weapons. A minimum altitude approach is used; bomb release maneuvers practiced include loft, toss, and over-the-shoulder techniques providing training in rapid recovery and escape from atomic-weapon effects, detection, and retaliatory ground fire.

The restricted airspace includes a 5-nautical-mile radius from the target center extending upward from the surface to 24,000 feet above the target and multiple-approach corridors extending 25 miles from target center. A 6-nautical-mile corridor width is required when alternate left or right escape maneuvers are performed. Clearance above the corridors is 3,000 feet for the first 10 nautical miles of the approach, 5,000 feet for the next 8 nautical miles, and 9,000 feet for the remaining 2 nautical miles to the airspace cylinder around the target center. The initial point of aim is at 50,000 feet from the target center which must be visible from an aircraft at 100 feet altitude. Instrumentation along the primary approach to the target provides instantaneous speed measurements, photo coverage, and profile and escape information.

- Close Air Support and Combat Training Area. The close air support and combat training area is planned for training with live ordnance, shapes, napalm, and air-to-ground missiles.

- Aerial Mining Range. The aerial mining range is planned for training in low-altitude and high-altitude mining. The restricted airspace is generally parallel to an adjacent irregular coastline with readily identifiable landmarks.

- Guided Missile Range. The air-to-ground guided missile target range is used for training in controlled air-to-ground missiles.

17910-2 The restricted airspace is 24,000 feet in height and consists of a rectangular- shaped primary line of approach 4 nautical miles wide by 5 nautical miles long starting at a point 15 nautical miles from the center of the impact area. The total length of the range is 20 nautical miles.

Table 17910-1

Basic Requirement for Air-to-Ground Ranges

Range	Minimum surface impact area (nautical miles)	Minimum restricted airspace (nautical miles)	Maximum restricted airspace (feet)	Control and spotting towers Note (2)	Target illumination for night operations
A. Strafing	1 x ½	Radius 5	10,000	1 Control	Yes
B. High altitude level bombing	Radius 3	Radius 5	Unlimited	1 Control Note (3)	Yes
C. Multipurpose target	Radius 1-1/2	Radius 5	Note (1)	Note (4)	Yes
D. Loft bombing	Radius 1-1/2	Radius 5 Length 30 Note (8)	24,000 Note (8)	Note (5)	Yes
E. Close air support and combat training area	16 x 20	Radius 25	Note (1)	Note (6)	Yes
F. Aerial mining	3 x 8	3 x 8	Note (1)	Note (4)	No
G. Guided missile	8 x 8	Radius 5 Length 20 Note (8)	24,000	Note (6) and (7)	Yes

Notes:

(1) The restricted airspace extends vertically to the maximum altitude required by the using aircraft.
(2) See Operational Tower, Category Code 179 35.
(3) Two spotting towers also are required to provide accurate three-dimensional rake information where remote spotting devices are not used.
(4) One control and tow spotting towers are required to provide accurate three-dimensional rake information.
(5) One control and three spotting towers are required.
(6) One control tower and two spotting towers at each designated target site are required.
(7) Towers are required only at ranges where self-guiding missiles are fired.
(8) See detailed airspace description in text.

179 11 AIR TRANSPORT MOCKUP (SY)
FAC: 8526
BFR Required: Y

17911-1 **DEFINITION.** An Air Transport Mockup is a ramp, and a platform structure used to simulate varying types of fixed- and rotary-wing aircraft. Structure allows loading, securing, and unloading of vehicles, equipment, and/or personnel.

179 12 ELEVATED TRAINING TOWER/PLATFORM
FAC: 1734
BFR Required: Y

17912-1 **DEFINITION.** A Elevated Training Tower/Platform is a structure consisting of platforms built above a sandy landing area to train future paratroopers to make proper aircraft exiting and landing techniques. It can consist of a canopy area and platform, a mockup of an aircraft door to train future paratroopers the proper exiting techniques from an aircraft as well as for parachute landing falls that simulates the deceleration experienced during a parachute opening.

179 13 SUSPENDED HARNESS MOCKUP

CCN deleted in FY19. Assets have been consolidated into CCN 179 12.

179 14 MOCKUP JUMP TOWER

CCN deleted in FY19. Assets have been consolidated into CCN 179 12.

179 15 UNDERWATER FORDING SITE

CCN deleted in FY19.

179 16 COMBAT TRAIL (AC)
FAC: 1790
BFR Required: Y

17916-1 **DEFINITION.** A Combat Trail is a training site used for various types of proficiency and sustainment training by rotation through different stations in a round-robin scenario. Types of training can include nuclear, Biological, and Chemical (NBC) and common task training. This site is separate from other training areas and sites.

179 17 RAPPELLING TRAINING AREA (EA)
FAC: 1790
BFR Required: Y

17917-1 **DEFINITION.** A Rappelling Training Area is an area that includes at least one structure used to practice rappelling (rope descent). The training area may also include modified towers for training in helicopter rappels.

179 18 AIRFIELD DEMOLITION RANGE (ADR) (SY)
FAC: 1164
BFR Required: Y

17918-1 **DEFINITION.** An area for training in the placement, clearing, compaction, repair, and grading of fill and construction of drainage structures for airfields. Steel mats or other non-bituminous mats may be utilized. If the airfield is actually used by aircraft, it should be inventoried as an unpaved airfield facility using appropriate 100 s*eries Category Codes.

179 19 TIMBER BRIDGE AREA
FAC: 1790
BFR Required: Y

17919-1 **DEFINITION.** A Timber Bridge Area is a cleared area beside a ditch or ravine for engineer units to practice building timber bridges.

179 20 PANEL BRIDGE AREA
FAC: 1790
BFR Required: Y

17920-1 **DEFINITION.** A Panel Bridge Area is a cleared area beside a creek or ravine for engineer units to practice building panel bridges.

179 22 FLOATING BRIDGE SITE
FAC: 1790
BFR Required: Y

17922-1 **DEFINITION.** A Floating Bridge Site is a cleared riverbank area for engineer units to practice fording water obstacles and erection and retrieval of floating bridging equipment.

*

179 24 WATER SUPPLY TRAINING AREA (EA)
FAC: 1790
BFR Required: Y

17924-1 **DEFINITION.** A Water Supply Training Area is partially improved land for performing water purification and storage operations. It should be located on a flowing stream with firm banks and all-weather access roads.

179 25 AIRFIELD SITE SELECTION TRAINING AREA (AC)
FAC: 1790
BFR Required: Y

17925-1 **DEFINITION.** An Airfield Site Selection Training Area is cleared land used to train soldiers in the fundamentals of selecting and securing a site suitable for takeoffs and parking of rotary-wing aircraft.

179 26 AERIAL GUNNERY RANGE (AC)
FAC: 1792
BFR Required: Y

17926-1 **DEFINITION.** An Aerial Gunnery Range is designed to support the training and qualification requirements of helicopter gunnery. This range is used to train and test helicopter crews on the skills necessary to detect, identify, engage, and hit stationary armor and infantry targets in a tactical array. This range does not require automation but does require surveillance of the target area.

179 30 SURFACE PROJECTILE RANGE (EA)
FAC: 1767
BFR Required: N

17930-1 **DEFINITION.** This code is for ranges supporting surface-launched projectiles as opposed to ranges for air-launched projectiles which are coded as Category Code 179 10. Criteria are not presently available for surface projectile range requirements.

179 31 MEDIUM HEAVY EQUIPMENT TRAINING AREA (AC)
FAC: 1790
BFR Required: Y

17931-1 **DEFINITION.** A Medium Heavy Equipment Training Area is an unimproved area for training in placement, compaction, and grading of fill, and training in construction of drainage structures.

179 32 DECONTAMINATION TRAINING SITE (AC)
FAC: 1790
BFR Required: Y

17932-1 **DEFINITION.** A Decontamination Training Site is an area consisting of a pit filled with rock with an attached rock-filled sump to a drain bed. This structure is used primarily for vehicle decontamination training.

179 33 POL TRAINING AREA (AC)
FAC: 1790
BFR Required: Y

17933-1 **DEFINITION.** A POL Training Area is a materials handling area for training personnel in the proper handling of petroleum, oils, and lubricants. Also used for assembly and training in various POL storage and distribution systems.

179 35 WEAPONS RANGE OPERATIONS TOWER (EA)
FAC: 1734
BFR Required: N

17935-1 **DEFINITION.** Range operations towers are used at gunnery, bombing, and rocket ranges to provide an unobstructed view of target areas for purposes of control and spotting impacts. For the tower requirements associated with the various ranges, see Category Code 179 10 (Table 179-10). The two types of weapons range operations tower are:

> 17935-1.1 The control range operations tower (control tower) has a gross area of 1,428 square feet and provides for the radio control of all range activities, including the scoring of training missions both visually and electronically.
>
> 17935-1.2 The spotting range operations tower (spotting tower) has a gross area of 100 square feet and is a secondary observation point to provide for visual scoring.

179 36 CLOSE AIR SUPPORT RANGE (AC)
FAC: 1793
BFR Required: N

17936-1 **DEFINITION.** A Close Air Support Range is designed to support the training and qualification requirements of close air support aircraft. This range is used to train and test aircraft crews on the skills necessary to provide air support to ground forces under varying conditions. This range does not require automation but does require surveillance of the target area.

179 37 AERIAL BOMBING RANGE (AC)
FAC: 1793
BFR Required: N

17937-1 **DEFINITION.** An Aerial Bombing Range is designed to support the training and qualification requirements for fixed-wing aircraft dropping their ordnance. This range is used to train and test aircraft crews on the skills necessary to detect and suppress enemy targets in a tactical array. This range does not require automation but does require surveillance of the target area.

179 40 SMALL ARMS RANGE - OUTDOOR (EA)
FAC: 1750
BFR Required: Y

17940-1 **DEFINITION.** A small arms range provides an area for training in the use of pistols, small caliber rifles, and small caliber machine guns. Ranges must be available all year to provide continual training and retraining for personnel who must be proficient in the use of small arms. If feasible, a small-arms range should provide training facilities for all military services within the area.

17940-2 The capacity of existing ranges or new requirements can be determined by:

17940-2.1 Identifying the number of personnel to be trained.

17940-2.2 Establishing the number and size of training sessions.

17940-2.3 Determining the number of hours per session and scheduling training over an annual basis.

17940-2.4 Calculating the required number of firing points based upon efficient arrangement of the size and schedules of the training groups.

17940-3 In developing requirements, the base number of training days less holidays and weekends is 242 days. However, ranges require maintenance and periods of recovery for flora and fauna and are often unusable during periods of severe weather or peculiar local limitations. The basic number of training days can be further reduced to 180 days based on local conditions.

17940-4 For certain types of small arms and where prevailing weather conditions seriously interfere with scheduling of training, an indoor range (Code 171 50) may be planned.

179 41 AIR DEFENSE MISSILE FIRING RANGE (AC)
FAC: 1794
BFR Required: Y

17941-1 **DEFINITION.** An Air Defense Missile Firing Range is designed to meet training and qualification requirements of air defense (LAAD/Stinger) units. This range is used to train and test crews on the skills necessary to employ ground to air anti-aircraft missiles against ballistic aerial target systems (BATS).

179 45 TRAINING MOCK-UPS (EA)
FAC: 1790
BFR Required: Y

17945-1 **DEFINITION.** This code includes mockup structures representing all or parts of ships, aircraft, tanks, or buildings for training personnel in skills such as disaster control, firefighting, and equipment handling.

179 50 TRAINING COURSE (AC)
FAC: 1790
BFR Required: N

17950-1 **DEFINITION.** This code includes areas designated for personnel training in various skills under actual operational conditions. Table 17950-1 outlines the facilities of this group and approximate requirements.

Table 17950-1
Training Course Criteria

Type of Course	Approximate Size	Preferred Terrain	Typical Improvements
Obstacle	2 acres	Flat	Obstacles, drainage
Combat techniques, guerrilla warfare, counterinsurgency	100 acres	Rough, heavy vegetation	Provisional mess hall and toilets where justified
Weapons ranges	See Code 179-10		
Disaster control, firefighting, etc.	2 acres	Flat	Training mockups
Field engineering surveying practice	2 acres	Rolling	None
Building construction practice	2 acres	Flat	1,200 square yards of paved area
Construction equipment operations	20 acres	Rolling, no vegetation	None
Vehicle safety, driver testing	6 acres	Flat	Pave area, course markets
Swimming, survival	See Code 179-55		

179 51 UNENCLOSED FIRE FIGHTER TRAINER (SF)
FAC: 1795
BFR Required: Y

17951-1 **DEFINITION.** A Fire Fighting and Rescue Training Area is an open area or structure consisting of a mockup of a multistory building, aircraft, or vehicle for training in fire containment, ladder use, escape, and rescue from buildings.

179 53 ENCLOSED FIRE FIGHTER TRAINER FACILITY (SF)
FAC: 1726
BFR Required: Y

17953-1 **DEFINITION.** This is an enclosed facility that houses interior and exterior mockups of areas within a surface ship, submarine, or multistory building for live firefighting and rescue training.

179 54 DAMAGE CONTROL (WET) TRAINER (SF)
FAC: 1724
BFR Required: Y

17954-1 **DEFINITION.** This category code is used to capture facilities used in the training of shipboard flooding countermeasures. Facilities include below-deck shipboard mockups with water deluge systems, observation decks, training classrooms, administrative spaces, and water deluge pumps, piping, and drainage systems.

179 55 COMBAT TRAINING POOL/TANK (EA)
FAC: 1725
BFR Required: Y

17955-1 **DEFINITION.** A combat training pool/tank is planned for instructions in swimming and survival under combat conditions. The swimming pool/tank may be provided only as required for training purposes, normally on the following basis: for each increment of 5,000 men to be trained, one swimming pool; pool area not to exceed 13,000 square feet. If survival training is required at installations having less than 5,000 assigned strength, one swimming pool of appropriate size may be provided, but not to exceed 13,000 square feet in pool area. Outdoor pools may be provided where feasible.

179 60 PARADE AND DRILL FIELD (AC)
FAC: 1745
BFR Required: N

17960-1 **DEFINITION.** This facility provides space for formation drills, parade and review functions, and honor ceremonies. Such a field may be planned for stations having independent command functions. The size of the field is computed on the basis of 1 acre per 125 men, total planned military strength. Surface will be turf where feasible and will be stabilized where climate and other conditions dictate. A reviewing stand may be planned with a capacity based on 5 percent of the total officer strength.

179 61 COMBAT IN CITIES FACILITY (AC)
FAC: 1790
BFR Required: Y

17961-1 **DEFINITION.** A Combat in Cities Facility is a non-standard training facility that typically includes the buildings, roads, and sidewalks normally found in an urban environment, and which is used to train and sustain unit proficiency in an urban environment. This facility is used to train urban-type operations when a standard CACTF is not available. No automation is required for this facility.

179 62 MOUT COLLECTIVE TRAINING FACILITY (SMALL) (AC)
FAC: 1790
BFR Required: Y

17962-1 **DEFINITION.** A MOUT Collective Training Facility (small) is designed to meet the training requirements of an infantry company-sized unit in an urban environment. This structure contains 24 buildings or less and is used to train unit collective tasks associated with urban terrain. Targets are not fully automated and/or the scenarios are not computer driven or scored.

179 63 MOUT COLLECTIVE TRAINING FACILITY (LARGE) (AC)
FAC: 1796
BFR Required: Y

17963-1 **DEFINITION.** A MOUT Collective Training Facility (large) is designed to meet the training requirements of an infantry battalion-sized unit in an urban environment. This structure contains more than 24 buildings and is used to train unit collective tasks associated with urban terrain. Targets are not fully automated and/or the scenarios are not computer driven or scored.

179 70 RADAR BOMB SCORING FACILITY (EA)
FAC: 1790
BFR Required: N

17970-1 **DEFINITION.** A Radar Bomb Scoring Facility (RBS) is used to measure, electronically, aircraft simulated-bombing results and to produce graphic flight path tracking data and other pertinent aircraft target scoring information. An RBS facility is available as a self-contained trailer-mounted facility. The mobile RBS equipment includes an operations trailer, acquisition radar, tracking radar, maintenance and spare parts trailer, and power trailer. A permanent power supply at the range eliminates the power trailer requirement. Criteria are not presently available for a fixed RBS System which would utilize permanent structures. RBS facilities are provided for selected aircraft ranges as determined by CNIC.

179 71 ELECTRONIC WARFARE TRAINING RANGE (EA)
FAC: 1790
BFR Required: N

17971-1 Criteria for the Electronic Warfare Training Range are not currently available.

179 72 UNDERWATER TRACKING TRAINING RANGE (EA)
FAC: 1790
BFR Required: Y

17972-1 **DEFINITION.** The underwater tracking range is used primarily to support surface and subsurface weapon system accuracy trials and development, test, and evaluation projects. No planning factors are currently available for this facility. Planning factors, standards, and guides for computing requirements for facilities under this category are excluded from this publication because of the special provisions and variances in the application of criteria for planning underwater tracking ranges. In the absence of specific criteria, the quantitative requirements for the range facilities should be determined on an individual basis based on the experience and knowledge of the activity involved and the appropriate Systems Commands.

179 81 INFILTRATION COURSE (AC)
FAC: 1798
BFR Required: Y

17981-1 **DEFINITION.** An Infiltration Course is designed for training individual infiltration and combat movement techniques and then executing them while subject to live fire. No automation is required for this facility. Count each path or trail for a single Marine as one FP.

179 91 CONFIDENCE COURSE (AC)
FAC: 1799
BFR Required: Y

17991-1 **DEFINITION.** A Confidence Course is designed for developing individual soldier confidence and strength through a series of obstacles. No automation is required for this facility. Count each complete course as one EA.

179 92 OBSTACLE COURSE (AC)
FAC: 1799
BFR Required: Y

17992-1 **DEFINITION.** An Obstacle Course is a facility containing numerous obstacles designed for developing and measuring individual soldier speed, agility, and coordination utilizing various obstacles in an effort to reach the objective. No automation is required for this facility.

Version: 200.20250516

FACILITIES CRITERIA (FC)
FACILITY PLANNING FOR NAVY AND MARINE CORPS SHORE INSTALLATIONS

Series 200: Maintenance and Production Facilities

Record of Changes:

Date	CCN #	CCN Title	Description of change
Nov 2016	21154	Aircraft Armament Systems Shop	Title of this CCN is changed from "Aviation Armament Shop" to "Aircraft Armament Systems Shop". Criteria was also revised.
Dec 2016	21374	Landing Craft Rinse Rack	CCN deleted
Dec 2016	22940	Sawmill	CCN deleted
Dec 2016	22960	Baling Facility	CCN deleted
Dec 2016	21107	Maintenance Hangar - 02 Space (Administrative)	FAC code changed from 1444 to 6100
Jan 2017	21940	Sewage Hose Storage Facility	Reporting requirements corrected to “N”. CCN is inventory only.
Jan 2017	21820	Construction / Weight Handling Equipment Shop	Incorrect diagram reference deleted.
Feb 2017	21920	Pavement And Ground Equipment Shed	Change reporting requirements to “N” as per verbiage in CCN 21910
Feb 2017	21925	Public Works Shops Expendable/Work-In-Process Store	Change reporting requirements to “N” as per verbiage in CCN 21910
May 2018	21181	Engine Test Cell (Non-NAVAIR Depot)	Updated criteria
May 2018	21105	Maintenance Hangar – O/H Space (High Bay)	Updated criteria
May 2018	21106	MAINTENANCE HANGAR – 01 SPACE (Shops And Maintenance Space)	Updated criteria

Date	CCN #	CCN Title	Description of change
May 2018	21107	Maintenance Hangar – 02 Space (Administrative)	Updated criteria
Aug 2019	21101	Aircraft Engine Test Cell Building	Title of this CCN is changed from "Aircraft Acoustical Enclosure" to "Aircraft Engine Test Cell Building".
Sep 2019	21107	Maintenance Hangar – 02 Space (Administrative)	Replaced reference to “UFC 4-211-01N” with “UFC 4-211-01, as updated”
Sept 2019	21105	Maintenance Hangar – O/H Space (High Bay)	Corrected formula for OH required hangar width. Added references to Type IV hangar as a new standard type. Added details to clarify notes for Tables 21105-1a and 21105-1b regarding clearances in the OH space. Added a reference to UFC 4-211-01 for further details. Added clarification for computation of hangar width in Section 21105/06/07-2.1. Also added in this section was a clarification that if an additional designated space is required for PMI, one more space with spread configuration will be provided per Type/Model/Series per installation.
Mar 2020	21105 21105	Maintenance Hangar – O/H Space (High Bay), Table 21105-2 Maintenance Hangar – O/H Space (High Bay), Table 21105-1a	Interim update - Update hangar ratio for P-8A squadrons with a new ratio of ¼ to reflect actual maintenance frequencies. Expanded the width for Type I standard module for the US Marine Corps from 262.5 ft to 270.0 ft to provide the capabilities to conduct periodic maintenance interval work for both F-35B and F-35C Variants. Marine Corps squadrons operate both variants.
July 2020	21211	Missile Module Maintenance and Loading Facility	Added new CCN
July 2020	21331	Shore Depot Level Repair Shop	Added new CCN
July 2020	21332	Shipyard Demilitarization and Recycling Facility	Added new CCN
July 2020	21365	Ship Propulsion Maintenance Facility	Title change from “Nuclear Repair Shop” to remove the word “nuclear”, as per OSD. Also, revised description.

Date	CCN #	CCN Title	Description of change
Feb 2021	21105	Maintenance Hanger – OH Space	Updated hangar ratios in Table 21105-2 for training squadrons under CNATRA to reflect accurate maintenance frequencies. The updated ratios are 0.28 for T-44A and T-44C Variants, and 0.39 for T-6A and T-6B Variants.
June 2021	21105	Maintenance Hangar – OH Space	Add Table 21105-1b, OH Space Standard, F-35C Model. Add Table 21105-1c, OH Space Standard, F-35B Model. Add Figure 1 – OH Space Diagram of F-35C Add Figure 2 – OH Space Diagram of F-35B.
June 2021	21105 21106 21107	Maintenance Hangar – OH Space Shops and Maintenance Administration – 01 Space Operations, Training, and Administration – 02 Space	Information added for Type IV Maintenance Hangar Add Section 21105/06/07-2.4, Type IV Unmanned Aircraft System Requirements. Add Table 21105-2a, OH Space Navy Standard, MQ-4C Triton Model. Add Figure 3 – OH Space Diagram of MQ-4C Triton. Add 21105-7, 01 Space Calculations for MQ-4C Triton. Add 21105-8, 02 Space Calculations for MQ-4C Triton.
October 2021	211 64	Ground Support Equipment Holding Shed (NavAir Depot)	Changed FAC Code to 2185
October 2021	214 40	Vehicle Holding Shed	Changed FAC Code to 2185
October 2021	218 61	Ground Support Equipment Holding Shed	Changed FAC Code to 2185
October 2021	218 65	Equipment Holding Shed (for Code 218-20)	Changed FAC Code to 2185
31 July 2022	218 52	Battery Recharging Shed	Add new category code.
22 Sep 2022	21105 21106 21107	Maintenance Hangar – OH Space Shops and Maintenance Administration – 01 Space Operations, Training, and Administration – 02 Space	On page 200 Series - 31, delete the words “crew and equipment” and replace with the words “shop and maintenance.” On page 200 Series - 31, delete the word “administrative” and add the words “operations; training; and administration.”
30 Sep 2022	21105 21106 21107	Maintenance Hangar – OH Space Shops and Maintenance Administration – 01 Space Operations, Training, and	Change width of wings spread for the C-40A aircraft to 35.8 (meters) and 117-5 (ft.-in.) in Table 21105-3 (Aircraft Widths and Hangar Space Requirements).

Date	CCN #	CCN Title	Description of change
		Administration – 02 Space	
2 Mar 2023	200 Series	UFC 2-000-05N	Change UFC 2-000-05N to FC 2-000-05N document due to the fact that this planning criteria is not unified among the other DoD services.
9 Jun 2023	200 Series 211-05/06/07	FC 2-000-05N Section 21105/06/07-2.1 Category Code 211-05 – OH Space, page 42	Include the correct SI unit of area as m^2 throughout the criteria where applicable. Under heading “FOR P-8A AIRCRAFT,” add reference to table 21105-3 with that of table 21105-2.
28 Jun 2023	211-05	Maintenance Hangar – OH Space	Under the heading “Calculating OH Space,” update the following: Update nomenclature for aircraft spacing requirements. Revise Table 21105-4 (Required Hangar Width Formulas. Note: Updates are required to be commensurate with the Type I Maintenance Hangar Study.
26 Jul 2023	211-05	Maintenance Hangar – OH Space	For Type III Maintenance Hangar data in Table 21105-1d, change m^2 heading to sq.ft. heading to reflect the correct unit of measure units.
21 Aug 2023	211-05	Maintenance Hangar – OH Space	Add notes at the end of Table 21105-4, Required Hangar Width Formulas, which explain procedures for rounding numbers when calculating the number of aircraft in a hangar. Change “Sample Maintenance Hangar Calculation to align with the Type I Maintenance Hangar formula in Table 21105-4.
25 April 2025	213 10	Dry Dock	Identify Code 900F as the organization responsible for the Dry Dock Certification Program.
16 May 2025	213 10	Pre-Engineered Maintenance Hangar	Delete reference to MIL-HDBK 1028/1C and add reference to UFC 4-211-01 Aircraft Maintenance Hangars.
16 May 2025	211-75	Aviation Life Support Systems Shop	Delete reference to MIL-HDBK 1028/1C and add reference to UFC 4-211-01 Aircraft Maintenance Hangars.
16 May 2025	211-09	Aircraft Boresight Range	Delete reference to MIL-HDBK 1028/1C.
16 May 2025	211-15	Line Maintenance Shelter	Delete reference to MIL-HDBK 1028/1C.

Date	CCN #	CCN Title	Description of change
16 May 2025	211-08	Airframes Shop (Non-NAVAIR Depot)	Delete reference to MIL-HDBK 1028/1C and add reference to UFC 4-211-01 Aircraft Maintenance Hangars.
16 May 2025	211-45	Avionics Shop (Non-NAVAIR Depot)	Delete reference to MIL-HDBK 1028/1C and add reference to UFC 4-211-01 Aircraft Maintenance Hangars.

200 SERIES
MAINTENANCE AND PRODUCTION FACILITIES

Table of Contents

211 MAINTENANCE - AIRCRAFT, SPARES

211-1 GENERAL

Facilities for the maintenance and repair of Navy and Marine Corps aircraft and related spares, including airframes, aircraft engines, aircraft weapons systems, avionics systems, and other related aircraft equipment are planned in accordance with maintenance functions and levels as authorized by the Chief of Naval Operations (CNO). Maintenance classifications are defined in OPNAVINST 4790.2 (series) and are the basis for the Naval Aircraft Maintenance Program (NAMP). These classifications of aircraft maintenance activities of the Naval Establishment are divided into three levels: depot ("D" level) maintenance, intermediate ("I" level) maintenance, and organizational ("O" level) maintenance.

Depot or "D" level maintenance is performed at Naval Aviation industrial establishments to ensure continued flying integrity of airframes and flight systems during subsequent operational service periods. It is performed on material requiring major overhaul or rebuilding of parts, assemblies, subassemblies, and end items. It includes manufacturing parts, making modifications, testing, inspecting, sampling, and reclamations. Depot maintenance supports lower levels of maintenance by providing engineering assistance and performing maintenance that is beyond the capability of the lower level activities. Each requirement for depot maintenance facilities must be planned and justified individually.

"I" level maintenance is the responsibility of, and performed by, designated maintenance activities in support of organizational level activities. The intermediate level maintenance mission is to enhance and sustain the combat readiness and mission capability of supported activities by providing quality and timely support at the nearest location with the lowest practical resource expenditure. Intermediate level maintenance consists of on and off equipment material support and is usually performed at a central facility located either directly on or just off the flight line. Some specific functions of intermediate or "I" level maintenance are shown in Table 21100-1.

Intermediate Maintenance Activities (IMAs) are usually established to support an entire air station or Marine Air Group (MAG). In specific circumstances, IMA shops may be established for support of a specific unit as a department of what would normally be considered an organizational level unit. An example of this would be the establishment of an avionics shop to repair just the special mission equipment installed in reconnaissance aircraft, where only a single squadron at an air station has these aircraft. That shop would be inside the squadron hangar, under the direct control of the squadron Aircraft Maintenance Officer.

Table 21100-1
Intermediate Level Maintenance Functions

Title	Work Center Code	Category Code Number	Function
Aircraft Intermediate Maintenance Activity Management	000	211 16	Supervisory, production control, material and financial management, quality control, training, administration.
Engine Maintenance Shop	400	211 21	Repair of aircraft engines and components, including removal and replacement of compressor sections, combustion sections, turbine sections, engine accessories, propellers and rotor components, auxiliary power units, auxiliary fuel cells, and in-flight refueling stores.
Airframes Shop	500	211 08	Repair and manufacture of aircraft structural and hydraulic components including structural panels, tire and wheel assemblies, brakes, hydraulic pumps, actuators, and line, painting, machining and welding, and non-destructive inspection (NDI).
Avionics Shop	600	211 45	Repair of aircraft avionics and electrical systems including communication, navigation and identification systems, electrical and instrument systems, generators and batteries, fire control systems, radar and electronic counter measures systems, anti-submarine warfare systems, precision measuring equipment and calibration, reconnaissance and photo systems, and module repair and wire harness manufacture.
Armament Shop	700	211 54 211 55	Repair and storage of weapons racks, launchers, guns, tow reels, and, for the Marine Corps, weapons support equipment.
Parachute and Survival Equipment Shop	800	211 75	Repair, maintenance, and periodic inspection of parachutes, life rafts and flotation systems, aviators survival equipment, oxygen regulators and generating systems, ejection seats, and oxygen and nitrogen generating and storage.
Ground Support Equipment Shop	900	218 60 218 61	Repair, maintenance, and storage of aircraft ground support equipment including tow tractors, check stands, aircraft starting units, electrical power carts, hydraulic power carts and servicing units, oxygen and nitrogen servicing carts, and mobile maintenance facilities (vans).

Organizational, or “O” level maintenance, and intermediate, or “I” level maintenance is performed at the individual sites where aircraft are stationed. Both maintenance levels are segregated into nine divisions, three organizational and six intermediate. These divisions are coded as 100, 200, and 300 for the organizational level maintenance and 400 through 900 for the intermediate level maintenance.

Organizational or “O” level maintenance is normally performed by an operating unit on a day-to-day basis in support of their own operations. The organizational level maintenance mission is to maintain assigned aircraft and aeronautical equipment in a full mission capable status while continually improving the local maintenance process. While organizational level maintenance may be done by intermediate or depot level organizations, it is usually accomplished by maintenance personnel assigned to aircraft squadrons either in aircraft maintenance hangars or on the parking apron immediately outside of the hangar. Some specific functions of the organizational or “O” level maintenance are shown in Table 21100-2.

Table 21100-2
Organizational Level Maintenance Functions

Title	Work Center Code	Category Code Number	Function
Aircraft Division	100	211-06	On aircraft repair and removal and replacement of engines, structural and hydraulic components, aircrew personal and protective equipment, egress and environmental systems, and periodic maintenance.
Avionics/Armament Division	200	211-06	On aircraft repair and removal and replacement of avionics, electrical, instrument, and fire control systems.
Line Division	300	211-06	Plane captains, flight line troubleshooters, support equipment operators, and flight crew.

These are the basic definitions for each level of maintenance. However, when temporarily required by operational or combat necessity, any appropriate operational authorities may authorize or require the performance of any maintenance task that, in their judgment, is within the capability of the personnel, materials, and facilities available.

Any of the three levels of maintenance may be performed by a contracted maintenance organization. The requirements for facilities then are a function of the contract. Additional facilities will not be built to support contract maintenance.

When it is desirable to keep aircraft under local control, space may be required to perform aircraft in-service repair (ISR), integrated maintenance (IMC/IMP), modifications (MOD) and other program work that may concurrently involve depot, intermediate, and organizational level work on aircraft by squadron, IMA, Naval Air Depot (NAVAIR Depot), and/or contractor personnel. When the existing organizational level spaces cannot accommodate the additional workload generated by ISR, IMC/P, and/or MOD a separate facility will be required.

Those facilities generally categorized as Organizational “O” Level Maintenance facilities are as follows:

211 03	Corrosion Control Hangar
211 04	Pre-Engineered Hangar
211 05	Maintenance Hangar – OH Space
211 06	Maintenance Hangar – 01 Space
211 07	Maintenance Hangar – 02 Space

Those facilities generally categorized as Intermediate “I” Level Maintenance facilities are as follows (also noted as Non-NAVAIR Depot):

211 01	Aircraft Acoustical Enclosure (Non-NAVAIR Depot)
211 08	Airframes Shop (Non-NAVAIR Depot)
211 09	Aircraft Boresight Range (Non-NAVAIR Depot)
211 16	Aircraft Intermediate Maintenance Management (Non-NAVAIR Depot)
211 21	Engine Maintenance Shop (Non-NAVAIR Depot)
211 45	Avionics Shop (Non-NAVAIR Depot)
211 54	Aviation Armament Shop (Non-NAVAIR Depot)
211 55	Aviation Armament Equipment Holding Shed (Non-NAVAIR Depot)
211 75	Parachute/Survival Equipment Shop (Non-NAVAIR Depot)
211 81	Engine Test Cell (Non-NAVAIR Depot)
211 82	Aircraft Weapons Alignment Shelter (Non-NAVAIR Depot)
211 88	Power Check Pad with Sound Suppression (Non-NAVAIR Depot)
211 89	Power Check Pad without Sound Suppression (Non-NAVAIR Depot)

Those facilities generally categorized as Depot “D” Level Maintenance facilities are as follows (also noted as NAVAIR Depot):

211 10	Aircraft Overhaul and Repair Shop (NAVAIR Depot)
211 11	Corrosion Control – Cleaning Shop (NAVAIR Depot)
211 12	Paint and Finishing Hangar (NAVAIR Depot)
211 13	Aircraft Non-Destructive Testing Shop (NAVAIR Depot)
211 14	Aircraft Rework Shop (NAVAIR Depot)
211 20	Aircraft Engine Overhaul Shop (NAVAIR Depot)
211 22	Engine Preparation and Storage Shop (NAVAIR Depot)

211 23	Engine Examination and Evaluation Shop (NAVAIR Depot)
211 24	Dedicated Aircraft Engine Overhaul – General Process (NAVAIR Depot)
211 25	Jet Engine Overhaul Shop (NAVAIR Depot)
211 26	Reciprocating Engine Overhaul Shop (NAVAIR Depot)
211 27	Turbine Engine Overhaul Shop (NAVAIR Depot)
211 30	Aircraft and Engine Accessories Overhaul Shop (NAVAIR Depot)
211 31	Dedicated Aircraft and Engine Accessories Overhaul – General Process (NAVAIR Depot)
211 32	Metal Components Shop (NAVAIR Depot)
211 33	Non-Metals Components Shop (NAVAIR Depot)
211 34	Dynamic Components Shop (NAVAIR Depot)
211 35	Hydraulic Components Shop (NAVAIR Depot)
211 36	Electrical Component Shop (NAVAIR Depot)
211 37	Turbine Accessories Shop (NAVAIR Depot)
211 38	Pneumatic Oxygen Shop (NAVAIR Depot)
211 39	Optical and Photographic Components Shop (NAVAIR Depot)
211 40	Electronics, Communication and Armament System Shop (NAVAIR Depot)
211 41	Dedicated Electronics, Communication and Armament – General Process (NAVAIR Depot)
211 42	Electronic System Components Shop (NAVAIR Depot)
211 43	Inertial Quality Instrument Overhaul Shop (NAVAIR Depot)
211 44	Non-Inertial Quality Instrument Overhaul Shop (NAVAIR Depot)
211 50	Aircraft Armament/Missile Rework Shop (NAVAIR Depot)
211 51	Dedicated Aircraft Armament/Missile Rework – General Process (NAVAIR Depot)
211 52	Aircraft Weapon Overhaul and Test Shop (NAVAIR Depot)
211 53	Air Launched Missile Rework Shop (NAVAIR Depot)
211 60	Support Equipment Rework Shop (NAVAIR Depot)
211 61	Dedicated Support Equipment Rework – General Purpose Shop (NAVAIR Depot)
211 62	Support Equipment Calibration Shop (NAVAIR Depot)
211 63	Ground Support Equipment Rework Shop (NAVAIR Depot)
211 64	Ground Support Equipment Holding Shed (NAVAIR Depot)
211 65	Airborne Weapons Support Equipment Shop (NAVAIR Depot)
211 70	Manufacturing and Repair Shop (NAVAIR Depot)
211 71	Dedicated Manufacturing and Repair – General Purpose Shop (NAVAIR Depot)
211 72	Metal Fabrication/Manufacturing Shop (NAVAIR Depot)
211 73	Metal Treatment Shop (NAVAIR Depot)
211 74	Non-Metal Fabrication/Manufacturing Shop (NAVAIR Depot)
211 76	Miscellaneous Parts/Components Repair Shop (NAVAIR Depot)
211 80	Test and Calibration Shop (NAVAIR Depot)
211 83	Engine Test Cell (NAVAIR Depot)

211 84	Helicopter Blade Test Facility (NAVAIR Depot)
211 85	Radome Test Facility (NAVAIR Depot)
211 86	Radar/Antenna Test Facility (NAVAIR Depot)
211 87	Aircraft Weapons Alignment/Boresight Facility (NAVAIR Depot)
211 90	Other Support Facilities (NAVAIR Depot)
211 91	Uncovered Ramp (NAVAIR Depot)
211 92	Covered Ground Check/Flight Test Facility (NAVAIR Depot)
211 93	Engineering Laboratory (NAVAIR Depot)
211 94	Aircraft Power Check Facilities (NAVAIR Depot)
211 95	Material and Equipment Staging/Storage Facility (NAVAIR Depot)
211 96	Maintenance, Aircraft Spares Storage (Ready Issue/Shop Storage Miscellaneous)
211 97	Plant Services for Aircraft Overhaul (NAVAIR Depot)
211 98	Aircraft Acoustical Enclosure (NAVAIR Depot)
211 99	Hazardous Materials Storehouse (NAVAIR Depot)

211-2 NAVAIR DEPOT FACILITIES

Consistent with DoD Instruction 4151.15, "Depot Maintenance Support Programming Policies," dated November 22, 1976, NAVAIR Depot facilities can be further segregated into Production Shop Categories consistent with the material the shops are established and designed to process and produce as follows:

211-2.1. **Airframe.** These are covered areas associated with processing the airframe under those programs commonly identified as Standard Depot Level Maintenance (SDLM), Programmed Depot Maintenance (PDM), On-Condition Maintenance (OCM), crash damage repair and/or overhaul, modernization, modification, etc. The work functions include cleaning, stripping, disassembly, airframe repair, reassembly, systems check, refinishing, painting, and fueling/defueling using covered facilities. Typical facilities associated with the Airframe Production Shop and their associated Navy Category Codes are:

211 10	Aircraft Overhaul and Repair Shop (Small Aircraft)
211 10	Aircraft Overhaul and Repair Shop (Large Aircraft)
211 11	Corrosion Control Shop
211 12	Paint and Finishing Hangar
211 13	Airframes Nondestructive Inspection Shop
211 14	Airframe Dedicated Machine Shop
211 14	Airframe Dedicated Welding Shop
211 14	Airframe Dedicated Plating Shop
211 14	Airframe Examination and Evaluation, Pre-Shop Analysis and Examination and Inspection Shop
211 14	Maintenance Dock
211 14	Quick Engine Change Shop
211 14	Fuel Systems Maintenance Facility

211-2.2 **Engine.** These are covered areas associated with processing jet, turbojet, and reciprocating type aviation engines in terms of overhaul, low time repair, complete repair, and major inspection. The work functions include uncanning, disassembly, cleaning, material examination, parts reconditioning, subassembly, final assembly and preservation.

Typical facilities associated with the Engine Production Shop and their associated Navy Category Codes are:

211 22	Engine Preparation and Storage Shop
211 23	Engine Nondestructive Testing Shop
211 23	Engine Examination and Evaluation, Pre-Shop Analysis and Examination and Inspection Shop
211 24	Dedicated Engine Cleaning Shop
211 24	Dedicated Engine Paint Shop
211 24	Dedicated Engine Plating Shop
211 24	Dedicated Engine Welding Shop
211 24	Engine Modification and Repair Shop
211 25	Jet Engine Overhaul Shop
211 26	Reciprocating Engine Overhaul Shop
211 27	Turbine Engine Overhaul Shop

211-2.3 **Accessories and Components.** These are covered areas associated with processing airframe and engine accessories. Typical facilities associated with the Accessories and Components Production Shop and their associated Navy Category Codes are:

211 30	Aircraft and Engine Accessories Overhaul Shop
211 31	Dedicated Cleaning Shop
211 31	Dedicated Paint Shop
211 31	Dedicated Machine Shop
211 31	Dedicated Plating Shop
211 31	Dedicated Welding Shop
211 31	Examination and Evaluation, Pre-Shop Analysis, Examination and Inspection Shop
211 31	Hazardous Test Shop
211 31	Reclamation Shop
211 32	Tank and Radiator Repair Shop
211 32	Sheet Metal Shop
211 32	Metal Surface Shop
211 32	Seat Repair Shop
211 32	Metal Bonding Shop
211 32	Container Reclamation Shop
211 33	Life Raft Repair Shop
211 33	Rubber Repair Shop

211 33	Parachute Repair Shop
211 33	Fabric and Upholstery Shop
211 33	Tire Repair Shop
211 33	Plastic and Fiberglass Shop
211 33	Composite Rework Shop
211 34	Propeller and Propeller Control Overhaul Shop
211 34	Rotor Head Overhaul Shop
211 34	Rotor Blade Overhaul Shop
211 34	Transmission/Gearbox Overhaul Shop
211 34	Dynamic Drive System Overhaul Shop
211 35	Hydraulic Components Overhaul Shop
211 35	Bearings Shop
211 35	Aircraft Landing Gear Shop
211 36	Alternator Drive Overhaul Shop
211 36	Electrical Accessories Overhaul and Test Shop
211 36	Battery Shop
211 36	Constant Speed Drive Shop
211 36	Electro-Mechanical Components Shop
211 37	Turbine Accessories Overhaul Shop
211 37	Turbine Accessories Test Shop
211 37	General Purpose Units Shop
211 37	General Purpose Units Test Shop
211 37	Ram/Air Turbine Accessories Overhaul Shop
211 37	Ram/Air Turbine Accessories Test Shop
211 38	Pneumatic Components Overhaul Shop
211 38	Cryogenics Shop
211 38	Oxygen Equipment Shop
211 39	Photographic Equipment Repair Shop
211 39	Optical Component Shop

211-2.4 **Electronic, Communications and Armament Systems.** These are covered areas associated with processing airborne communication and navigation equipment, instruments, airborne data computers, fire control and bombing system equipment, gyroscopes, inertial guidance systems, and other avionics equipment. Typical facilities associated with the Electronic, Communications and Armament Systems Production Shop and their associated Navy Category Codes are:

211 41	Dedicated Cleaning Shop
211 41	Dedicated Paint Shop
211 41	Dedicated Machine Shop
211 41	Dedicated Welding Shop
211 41	Dedicated Plating Shop
211 41	Dedicated Bearings Shop
211 41	Instrument Overhaul Shop

211 42	Armament and Avionics Shop
211 42	Airborne Systems Software Shop
211 42	Navigational Aids Repair Shop
211 42	Avionics Testing Shop
211 43	Inertial Quality Gyroscope Overhaul Shop
211 43	Inertial Guidance System Overhaul and Calibration Shop
211 44	Electronic Instrument Overhaul Shop
211 44	Mechanical Instrument Overhaul Shop
211 44	Non-inertial Gyroscope Overhaul Shop
211 44	Magnetic Instrument Overhaul and Test Shop

211-2.5 **Armament.** These are covered areas associated with processing weapons including guns, missiles, bomb racks, weapon pylons, etc., used by the aircraft in carrying out its assigned mission. Typical facilities associated with the Armament Production Shop and their associated Navy Category Codes are:

211 51	Dedicated Cleaning Shop
211 51	Dedicated Paint Shop
211 51	Dedicated Machine Shop
211 51	Dedicated Welding Shop
211 51	Dedicated Plating Shop
211 52	Aircraft Weapon Overhaul and Test Shop
211 52	Ordnance Equipment Shop
211 52	Weapon Accessories Repair Shop
211 53	Missile Shop

211-2.6 **Support Equipment.** These are covered areas associated with processing aviation general and special support equipment and aerospace ground support equipment. Typical facilities associated with the Support Equipment Production Shop and their associated Navy Category Codes are:

211 61	Dedicated Cleaning Shop
211 61	Dedicated Paint Shop
211 61	Dedicated Machine Shop
211 61	Dedicated Plating Shop
211 61	Dedicated Welding Shop
211 62	Aeronautical Electronic Support Equipment Shop
211 62	Electronic Test Systems Repair Shop
211 62	Precision Measurement Equipment Shop
211 63	GSE Maintenance Shop
211 63	Training Devices Shop
211 63	Hydrostatics Shop
211 64	Ground Support Equipment Holding Shed
211 65	Airborne Weapons Support Equipment Shop

211-2.7 **Manufacture and Repair.** These are covered areas which are not an integral part of other categories previously described, and which contribute to aircraft repair operations by such work functions as parts cleaning and painting, plating and metal processing shop. Typical facilities associated with the Manufacture and Repair Production Shop and their associated Navy Category Codes are:

211 71	Welding Shop
211 71	Foundry Shop
211 71	Peening and Blasting Shop
211 71	Non-destructive Inspection Shop
211 71	Parts Cleaning Shop
211 71	Parts Painting Shop
211 72	Machine Shop
211 72	Grinding Shop
211 72	NC Machine Shop
211 72	Metal Parts Fabrication Shop
211 73	Metal Processing Shop
211 73	Plating Shop
211 73	Heat Treating Shop
211 74	Plastic Fabrication Shop
211 74	Pattern Shop
211 74	Decal Shop
211 74	Woodworking Shop
211 74	Rubber Fabrication Shop
211 76	Tubing Shop
211 76	Cable Shop
211 76	Cordage Shop
211 76	Electrical Cable/Harness Shop

211-2.8 **Test and Calibration.** These are covered areas which are dedicated to test, trim, or calibrate engines, electronics, communications or armament systems. Typical facilities associated with the Test and Calibration Production Shop and their associated Navy Category Codes are:

211 83	Jet Engine Test Cell (10,000 – 16,000 lbs. max. thrust)
211 83	Jet Engine Test Cell (Over 16,000 lbs. max. thrust)
211 83	Jet Engine Test Stand
211 83	Turbo Prop Test Cell
211 83	Reciprocating Engine Test Cell (3,000 HP or less)
211 83	Reciprocating Engine Test Cell (Over 3,000 HP)
211 83	Reciprocating Engine Test Stand
211 83	Turbo Shaft Test Cell
211 83	Turbo Fan Test Cell
211 83	Pneumatic Gas/Air Turbine Test Cell

211 84	Helicopter Blade Test Facility
211 85	Radome Test Facility
211 86	Radar/Antenna Test Facility
211 87	Aircraft Bore Sight Range

211-2.9 **Other.** These are areas used to perform productive work that are not included in the eight Categories listed above. This includes ramp, apron, and aircraft storage sites. Typical facilities associated with the Other Production Shop and their associated Navy Category Codes are:

211 91	Aircraft Rework Apron
211 91	Reclamation Apron
211 91	Armament and Disarmament Pad
211 91	Predock/Postdock Apron
211 91	Aircraft Corrosion Control Facility (Uncovered)
211 91	Ground Check/Flight Test Support (Uncovered)
211 92	Ground Check/Flight Test Support (Covered)
211 93	Material Handlers/Parts Expediters
211 93	Material Control Laboratory
211 93	Standards Laboratory
211 93	Automatic Test Equipment and Numerical Controlled Machine
211 94	Power Check Pad (Without Sound Suppression)
211 94	Power Check Pad (With Sound Suppression)
211 94	Propeller Aircraft Power Check Pad
211 94	Helicopter Aircraft Power Check Pad
211 94	VSTOL Aircraft Power Check Pad
211 95	Packaging and Preservation
211 98	Aircraft Power Check Facility (Covered with Sound Suppression)

211-3 ADDITIONAL MAINTENANCE FACILITIES

Additional air-related maintenance facilities are tabulated under the following category codes:

116 10	Airfield Washrack Pavement
116 15	Aircraft Rinse Facility
116 65	Tactical Van Support Pad
212 30	Missile Assembly and Test Building
214 30	Refueling Vehicle Shop
216 55	Air/Underwater Weapons Shop
218 50	Battery Shop
218 60	Aircraft Ground Support Equipment Shop
218 61	Ground Support Equipment Holding Shed

211-4 AIRCRAFT LOADING

The primary planning factors in determining the size of maintenance facilities are the number of aircraft and spare components that the facility is required to support. Due to the size and complexity of modern test and support equipment, a repair station can be significantly larger than the number of personnel needed to operate it. The following planning factors have taken this into account and are developed accordingly.

When planning aircraft maintenance facilities for a given installation, the number of aircraft and squadrons to be counted is determined by projecting peak scheduled occupancy of all aircraft for which the station will have an aircraft maintenance support mission. Peak scheduled occupancy is defined as the maximum number of aircraft that are scheduled for simultaneous assignment at the installation for the planned construction year.

In May 2003, the Navy developed a new inter-deployment readiness profile, the “Fleet Readiness Concept” (FRC) with the goal of improving the Navy’s speed of response to world events. The FRC developed into the Fleet Response Plan (FRP). FRP was fully implemented in mid-2004 and will modify current ship and squadron operating cycles by adjusting maintenance intervals, along with training and manpower processes, to increase unit availability for surge operations – that is, building the long-term institutional capability to support rapid, massive build-up in deployed Naval forces.

FRP will alter Aircraft Carrier Battle Group/Aircraft Carrier Strike Group deployment cycles such that all aircraft squadrons could be at their respective homebases at the same time. Therefore, the concept of “hot-racking” single-sited air wing airframes is no longer valid. When planning aircraft maintenance hangars, 100% of the squadrons must be allotted space.

In some instances, an installation may be assigned the intermediate maintenance responsibility for aircraft not permanently assigned to the installation. In this case, these aircraft should be added to the base loading for the planning of intermediate maintenance shops.

211-5 AIRCRAFT MAINTENANCE DEPARTMENT OFFICES

The shops comprising the Intermediate Maintenance Facility may be established separately or grouped together in a consolidated complex. Space requirements for each individual shop having a specific category code include the administrative and training space for that shop. In addition, administrative and training spaces are required for the Navy’s Aircraft Intermediate Maintenance Department (AIMD) or the Marine Corps Intermediate Maintenance (IM) offices, preferably in a centrally located administrative building within the maintenance complex. When shops are not consolidated into a complex, consideration shall be given to enlarging the administrative space in one of the intermediate shops to provide space for the AIMD offices. Space allocations shall be made in accordance with Category Code 211-16, Aircraft Intermediate Maintenance Activity Management.

211-6 MARINE CORPS CRITERIA

Marine Corps aircraft facilities are planned for utilizing the basic criteria for comparable Naval facilities.

211 01 AIRCRAFT ENGINE TEST CELL BUILDING (NON-NAVAIR DEPOT) (m^2 / SF)

FAC: 2114
BFR Required: Y

Design Criteria: UFC 4-212-01, Navy Standard Jet Engine Test Cells

21101-1 **GENERAL.** During the aircraft maintenance and testing process, aircraft engines are run-up while aboard the aircraft (in-frame testing) and when removed from the aircraft (out-of-frame testing). In both cases, high noise levels are generated in surrounding areas unless sound abatement is provided. The aircraft acoustical enclosure, sometimes referred to as a hush house, is a total enclosure for fixed wing aircraft designed to abate noise during in-frame run-up of jet engines. The facility consists of a hangar-like aircraft enclosure, an absorptive augmenter for inducing cooling air and absorbing noise, a 45-degree blast deflector, an observation room with lavatory, and a mechanical equipment room. The observation and mechanical rooms are located adjacent to, not within, the aircraft enclosure.

21101-2 **POLICY.** This Category Code shall be used for acoustical enclosures, which support organizational and intermediate level aircraft maintenance. Enclosures at Naval Air Depots (NAVAIR Depots) supporting depot maintenance shall be Category Code 211 98, Aircraft Acoustical Enclosure (NAVAIR Depot).

For out-of-frame testing see Category Code 211 81, Engine Test Cell (Non-NAVAIR Depot); Category Codes 211 88, Power Check Pad (with Sound Suppression); or 211 89, Power Check Pad (without Sound Suppression).

21101-3 **CRITERIA.** The design of the acoustical enclosure is governed by the size of aircraft and the number and location of the engines.

The acoustical enclosure provides a better working environment than open pads by providing protection from inclement weather and cross winds which adversely affect testing of engines, while at the same time significantly reducing exterior noise levels. NAVFAC P-970, Planning in the Noise Environment, specifies acceptable noise levels for various land uses. Noise levels generated during engine run ups, if not abated, would restrict land use, require that sound insulation be installed in nearby buildings, or require the run up pad be located at a considerable distance from inhabited buildings. The latter results in increased fuel consumption and lost time while transiting the aircraft to and from the run up area. In addition, noise generated during run ups can result in complaints from civilian communities resulting in local pressure to restrict operations. As indicated by P-970, the total noise environment must be evaluated and the hush house considered as one possible solution to reducing noise levels. Most air installations have had detailed noise studies done as part of the Air Installation Compatibility Use Zone (AICUZ) program. AICUZ studies address solutions to noise problems and may serve as a basis for justifying the requirements for an acoustical enclosure.

If an acoustical enclosure is justified by a detailed analysis of noise problems and potential solutions, then one (1) acoustical enclosure shall be provided for up to 140 aircraft and two (2) for up to 360 aircraft.

Three standard designs are available to support the aircraft mix set forth in Table 21101-1.

Table 21101-1
Aircraft Acoustical Enclosure

Enclosure Type	Chamber Size	Augmenter Length	Aircraft Types
I	25.6 m x 21.9 m (84 ft x 72 ft)	28.9 m (95 ft)	S-3, F-14, F/A-18, A-4, A-6, A-7, T-2
II	24.4 m x 21.9 m (80 ft x 72 ft)	27.4 m (90 ft)	F-14, F/A-18, A-4, A-7, T-2 For A-6 flare Augmenter Bellmouth to 6.24 meters (20.5 feet)
III	20.7 m x 19.5 m (68 ft x 64 ft)	20.4 m (67 ft)	F/A-18, A-4, A-6, A-7, T-2

211 03 CORROSION CONTROL HANGAR (m^2 / SF)
FAC: 2113
BFR Required: Y

Design Criteria: UFC 4-211-02, Aircraft Corrosion Control and Paint Facilities

21103-1 **GENERAL.** The corrosion control hangar provides space for washing, rinsing, paint stripping, corrosion removal, protective coating and painting of aircraft at intermediate and organizational maintenance levels. The hangar along with Aircraft Washback Pavements (Category Code 116 10) and Aircraft Rinse Facilities (Category Code 116 15) support the corrosion control program as described in NAVAIR Technical Manual NAVAIR 01-1A-509. Depot level maintenance facilities for stripping and complete repainting of aircraft shall be coded as Paint and Finishing Hangar (NAVAIR Depot) (Category Code 211 12).

The corrosion control hangar may be required at Navy and Marine Corps activities to support the OPNAV Corrosion Control Program and to meet the environmental restrictions of the local and state governments. This facility is to be available for repair of damaged paint systems only and not for complete de-paint/repaint of an entire aircraft. That function is restricted to depot level activities. Functions performed in the corrosion control facility include deicing, limited detergent washing and rinsing, paint stripping, corrosion removal, protective coating application and painting, and finish curing and drying. The requirement for a corrosion control hangar should be endorsed by the cognizant Type Commander and NAVAIRSYSCOM prior to approval for planning purposes.

Corrosion Control facilities should consist of at least two (2) bays, one for “dirty” work such as sanding, stripping, and blasting, and one for “clean” work such as priming and painting. One “dirty” bay can support up to 135 aircraft and one “clean” bay can support up to 45 aircraft. There are two (2) corrosion control hangar facility sizes (see Table 21103-1). The small facility will support fixed wing carrier-type and rotary wing aircraft. The large facility will support patrol and transport aircraft.

Consideration must be given to industrial safety and environmental contaminants. The facility will require a laminar flow exhaust system with filtered air intake and outflow. It will require compressed air, both tool air to operate sanders, buffers, and paint guns, and breathing air for personnel. Additional support space in the facility would be required for mixing paint, hazardous material and non-hazardous material storage, gear and tool storage, non-destructive inspection, office, and for locker rooms and toilet facilities.

Table 21103-1
Aircraft Corrosion Control Hangar

Facility Type	Hangar Bay (each bay)	Support Space (each facility)	Aircraft Types
Small	27.4 m x 25.5 m (90 ft x 83.5 ft) 699 m^2 (7,515 SF)	64.7 m x 6.9 m (212.3 ft x 22.7 ft) 446 m^2 (4,819 SF)	Fixed wing, Carrier-type and Rotary Wing (F/A-18, F-14, H-60, H-53, etc.)
Large	36.6 m x 46.2 m (120 ft x 151.5 ft) 1,691 m^2 (18,180 SF)	36.6 m x 11.7 m (120 ft x 38.3 ft) 428 m^2 (4,596 SF)	Patrol and Transport (P-3, C-130, etc.)

Table 21103-2
Aircraft Corrosion Control Hangar
Hangar Requirements

Aircraft Quantity	Hangar Bay "Clean"	Hangar Bay "Dirty"	Support Space
Up to 45	1	1	1
46 – 90	2	1	1
91 – 135	3	1	1
136 – 180	4	2	1
181 – 225	5	2	1
226 – 270	6	2	1

211 04 PRE-ENGINEERED MAINTENANCE HANGAR (m^2 / SF)
FAC: 2111
BFR Required: Y

Design Criteria: UFC 4-211-01, Aircraft Maintenance Hangars

21104-1 **GENERAL.** The pre-engineered maintenance hangar provides an austere facility for organizational level maintenance of Navy and Marine Corps aircraft. It is intended for use primarily at overseas locations, particularly those where tenure may be limited. When provided, the pre-engineered hangars are programmed in lieu of, not in addition to, the larger standard Type I and/or II hangars (Category Codes 211 05/06/07).

The pre-engineered maintenance hangar is intended for the support of a detachment size unit of from three to five aircraft. Each hangar consists of hangar bay (OH) space and limited crew/equipment (01) and administrative (02) space. Movable partitions are provided within the crew/equipment and administrative space to facilitate configuring these areas in accordance with the requirements of the occupant.

There are three (3) types of pre-engineered maintenance hangars (See Table 21104-1). The specific type of hangar depends on the size of aircraft to be maintained. The Type "A" pre-engineered maintenance hangar is designed primarily for fixed wing, carrier-type aircraft and helicopters. It should be noted that a Type "A" hangar may also be utilized for smaller transport aircraft with a wingspan less than 25.5 meters (85 feet). The Type "B" pre-engineered maintenance hangar is designed primarily for shore-based patrol aircraft and transport aircraft with wingspans up to 30.5 meters (100 feet). The Type "C" pre-engineered maintenance hangar is designed primarily for (K)C-130 aircraft but may also be configured to accommodate other large transport aircraft with wingspans up to 40.2 meters (132 feet).

Table 21104-1

Pre-Engineered Maintenance Hangar

Hangar Type	Width and Depth	Gross Area	Aircraft Types
A	32.0 m x 24.4 m (90 ft x 83.5 ft)	818 m^2 (8,800 SF)	Fixed wing, Carrier-type and Rotary Wing. *Note: May also be utilized by smaller transport aircraft with wingspan less than 25.5 meters (85 feet.)*
B	36.6 m x 36.6 m (120 ft x 120 ft)	1,366 m^2 (14,700 SF)	Shore-based Patrol and Transport aircraft with wingspans up to 30.5 meters (100 feet).
C	45.7 m x 42.7 m (150 ft x 140 feet)	1,995 m^2 (21,466 SF)	Primarily (K)C-130 aircraft. *Note: May also be configured to accommodate other large transport aircraft with wingspans up to 40.2 meters (132 feet.)*

Note: (1) Gross Area includes Hangar Door pockets.

211 05 MAINTENANCE HANGAR – O/H SPACE (HIGH BAY) (m^2 / SF)
FAC: 2111
BFR Required: Y

211 06 MAINTENANCE HANGAR – 01 SPACE (SHOPS AND MAINTENANCE ADMINISTARTION) (m^2 / SF)
FAC: 2112
BFR Required: Y

211 07 MAINTENANCE HANGAR – 02 SPACE (OPERATIONS, TRAINING, AND ADMINISTRATION) (m^2 / SF)
FAC: 6100
BFR Required: Y

Design Criteria: UFC 4-211-01, as updated, Aircraft Maintenance Hangars, Type I, Type II, Type III, and Type IV

21105/06/07-1 **GENERAL.** Maintenance hangars are required to provide weather-protected shelter for the servicing and repair of Navy and Marine Corps aircraft at an organizational level and emergency shelter for operable aircraft. Maintenance hangar configured for a Marine Air Logistics Squadron (MALS) may provide for the servicing and repair of aircraft at the intermediate level as well as at the organizational level. See Category 211 Appendix – Marine Corps Aircraft Maintenance Facilities, in which additional special guidance is provided. The supplement is located at the end of the 211 series criteria. There are four basic types of standard modular hangars: Type I, Type II, Type III, and Type IV. These hangars each contain a high bay (OH) space, shop and maintenance (01) space, and operations, training, and administration (02) space. Each of these spaces is assigned a separate category code.

It is extremely difficult to establish specific criteria to meet the requirements of the multi-sized squadrons existing within the various commands of the Navy and Marine Corps. Sizes range from a four aircraft AEW squadron with a complement of about one hundred seventy-five persons to a fifty or more aircraft training squadron with a complement of up to one thousand five hundred persons (including students). Accordingly, the criteria stated herein and further defined in the Unified Facility Criteria (UFC 4-211-01, as updated) “Aircraft Maintenance Hangars” depicts the Type I, Type II, Type III, and Type IV Maintenance Hangar modules developed primarily to maintain squadron facility integrity for standard size fleet squadrons. In this context, “standard size” is defined as a combination of the following factors:

1. A squadron with ten to eighteen carrier aircraft and one hundred fifty to four hundred personnel assigned.
2. A squadron with four to six carrier aircraft and one hundred twenty-five to two hundred personnel assigned.

3. A squadron with six to twelve land based patrol or large transport aircraft and one hundred fifty to four hundred personnel assigned.

In general, the size of the OH space is based on a percentage of the number of Primary Assigned Aircraft (PAA) in a squadron and the technical requirements for ensuring adequate clearances around the aircraft. Planning factors, such as number of personnel in a squadron or number of workspaces required, are used to define the 01 space and the 02 space.

All other squadrons and/or units operating aircraft are considered non-standard. Guidance for applying these criteria to both standard and non-standard size units is contained in subparagraphs 1 and 2 below.

UFC 4-211-01, as updated, contains conceptual floor plans and notional drawings for Type I, Type II, and Type III hangars.

Type I: Primarily designed for carrier aircraft, but adaptable to meet requirements for rotary wing and various types of smaller aircraft. The 01 and 02 spaces in this type of hangar are configured for a typical strike fighter squadron, two carrier airborne early warning squadrons, two carrier electronic attack squadrons, or a helicopter antisubmarine warfare squadron.

Type II: Primarily supports U.S. Marine Corps aviation. Hangar is designed to accommodate CH-53 helicopters, V-22 Ospreys, and C-130 Hercules aircraft. This type of hangar may also accommodate Navy variants of the C-130, V-22, and H-53 aircraft.

Type III: Principally designed for land based patrol (P-8A) and large transport (C-40A) aircraft.

Type IV: Intended for the largest Unmanned Aircraft System (UAS), which is currently the MQ-4C Triton.

Tables 21105-1a and 21105-1b show the standard hangar's dimensional statistics for planning purposes. See also UFC 4-211-01 Table 2-1 for all Minimum Aircraft Maintenance Bay Clearances and Table 7-1 for other standard Hangar Type dimensions and requirements.

Type III useable depth computed upon the requirement for a 20-foot (6.10 meter) clearance from aircraft to nearest fixed obstruction along rear wall of the hangar and a 15-foot (4.57 meter) clearance between aircraft and inside face of front door.

(2) Type II useable width computed upon the requirement for a 10-foot (3.05 meter) work clearance from aircraft to nearest fixed obstruction along side wall. Type III useable width computed upon the requirement for a 20-foot (6.10 meter) work clearance from aircraft to nearest fixed obstruction along the side wall.

(3) 5% net-to-gross mark-up factor applied to account for wall thickness and other structural loss. Additional net-to-gross mark-up may be required for hangars utilizing enclosed door pockets.

(4) Excludes an allowance of up to 1,536 sq. ft. (143 m^2.) for mechanical equipment space to house Aqueous Fire Foam Film (AFFF) fire suppression systems.

Due to the different attributes of the functions performed in the three space types, separate net-to-gross (NTG) ratios are provided for each space type in a Type I maintenance hangar:

- Hangar Bay (OH Space) – 1.12
- Shops and Maintenance (01 Space) – 1.38
- Operations, Training, and Administration (02 Space) – 1.31

21105/06/07-2 **Guidelines for Applying Maintenance Hangar Criteria**.
In the application of the criteria for the planning of Maintenance Hangars, the following guidelines are established:

21105/06/07-2.1 **Category Code 211-05 – OH Space.**

(1) One Type I standard hangar module OH space will be planned for each standard size squadron with twelve to eighteen carrier aircraft.

(2) One half a Type I standard hangar module OH space will be planned for each standard size squadron with four to six carrier aircraft.

(3) One Type II standard hangar module OH space will be planned for each standard size squadron with ten to sixteen large helicopter or tilt-rotor aircraft.

(4) One Type III standard hangar module OH space will be planned for each standard size squadron with four to eight land based patrol or large transport aircraft.

(5) The aircraft assigned to all other squadrons or units located on an air station or air facility, including pool or station aircraft, will be combined into a total loading, and the number of hangar modules required for these aircraft will be determined as follows:

Hangar space requirements for both scheduled and unscheduled maintenance vary by aircraft due to maintenance complexity and mission requirements. Carrier and rotary wing aircraft require more maintenance than patrol, special mission, and training aircraft, which require more maintenance than transport aircraft. Carrier and rotary wing aircraft normally require removing skin panels to gain access to Weapons Replaceable Assemblies (WRA). On patrol, special mission, and training aircraft a larger percentage of WRAs are readily accessible from the interior of the aircraft and, therefore, more maintenance is performed on the flight line (parking apron). In general, transport aircraft are less complex and require less hangar space. Consequently, hangar space requirements should be planned as follows (See Table 21105-2 for details):

(a) OP-Carrier, OP-Rotary, OP-Tilt-Rotor, TRG-Rotary, TRG-Carrier, TRG-Tilt-Rotor, RES-Rotary, RES-Carrier type squadrons: One (1) hangar space for every three (3) aircraft assigned.

(b) OP-Patrol, OP-Special Mission, TRG-Patrol, TRG-New Pilot, TRG-Special Mission, OTH(N)–SAR, OTH(N)-Station, OTH(N)-NTPS, OTH(N)-NSAWC, OTH(MC)-Station, RES-Patrol, RES-Station, RES-Special Mission type squadron: One (1) hangar space for every six (6) aircraft assigned.

(c) RES -Transport type squadron: One (1) hangar space for every nine (9) aircraft assigned.

(d) OP-UAS (BAMS Only) and TRG-UAS (BAMS Only) type squadrons: One (1) hangar space for every two (2) aircraft assigned.

(e) ETD type squadron: Due to the unique and critical nature of the mission, one (1) hangar space per aircraft assigned

(f) RDT&E type squadron: Hangaring requirements vary based on aircraft testing configuration. See Category Code 311-05, 311-06, and 311-07.

OP = Operational
TRG = Training
OTH(N) = Other, Navy
NSAWC = Naval Strike and Air Warfare Center
OTH(MC) = Other, Marine Corps
RES = Reserve
RDT&E = Research, Development, Testing and Evaluation
SAR = Search and Rescue
NTPS = Navy Test Pilot School
ETD = Executive Transport

FOR FIXED WING AIRCRAFT:

Except for Type I hangar (see Table 21105-1a) or special cases, hangar requirements are computed with a distance of 1.52 meters (5 feet) between aircraft and with the aircraft wings folded.

FOR ROTARY WING AIRCRAFT:

Except for Type I hangar (see Table 21105-1a) or special cases, hangar requirements are computed with a distance of 1.52 meters (5 feet) between aircraft and with seventy-five (75) percent of the aircraft with rotors folded. Twenty-five (25) percent of the aircraft are maintained with the rotors in the spread mode.

FOR SPECIAL CASES:

Some aircraft require greater separation distances between parked aircraft to accommodate maintenance equipment as well as proper ingress/egress aisles. These aircraft include the MV-22 and P-8A (MMA).

FOR MV-22 AIRCRAFT:

Hangar requirements are computed with a distance of 3.05 meters (10 feet) between aircraft and with seventy-five (75) percent of the aircraft with wings/rotors spread. Twenty-five (25) percent of the aircraft are maintained with the wing/rotors in the folded mode.

FOR P-8A AIRCRAFT:

Hangar requirements are computed with a distance of 5.18 meters (17 feet) between aircraft.

Tables 21105-2 and 21105-3 provide aircraft widths, hangar space requirements ratios, and type hangar for each aircraft.

Hangar OH space represents the hangar high bay space. While the OH space is intended primarily to provide squadron-level maintenance (organizational or O-level), it is expected that a hangar bay could include an additional space designated for Planned Maintenance Interval (PMI). Naval Aviation Maintenance Program (NAMP) defines PMI as period of time for execution of an Integrated Maintenance Concept/Program (IMC/P) or Phased Depot Maintenance. While PMI can include O-level, intermediate-level (I-level), and depot-level (D-level) actions, the PMI space in a hangar bay is necessary to provide D-level maintenance at an air installation as O-level maintenance is already accounted for elsewhere in the hangar bay and I-level maintenance is generally performed off-aircraft and does not require a hangar spot. Depot-level maintenance is defined as maintenance performed on material requiring major overhaul or rebuilding of parts, assemblies, subassemblies, and end items. This type of maintenance includes manufacturing parts, making modifications, testing, inspecting, sampling, and reclamation. PMI D-level actions may include major structural repair involving removal and replacement of frames, bulkheads, and frames, along with full H-60 strip and paint.

PMI hangars need to be planned for each Type/Model/Series (TMS) by Commander, Fleet Readiness Center (COMFRC). A designated PMI space within an operational-level hangar bay is only required if PMI D-level maintenance actions under the IMC/P cannot be satisfied by COMFRC with other D-level maintenance space available elsewhere. Input from Commander Naval Air Atlantic/Pacific is necessary for an accurate assessment of the PMI space requirement.

To support this evolution in maintenance functions, the required hangar modules will be calculated using the following methodology:

- First, the product of the PAA and the hangar ratio (hangar ratios are shown in Table 21105-2) will be rounded up to the next integer for any values ending with a fraction of 0.3 or above for the Navy. For the USMC, rounding will follow conventional method (i.e., numbers with a fraction of 0.5 or more will be rounded up to the next integer). The figure will be rounded down for numbers with a fraction less than 0.5.

- Second, the calculated hangar modules will be normalized up to the next 0.5 module to determine the required hangar modules.

This methodology is expected to provide additional hangar spaces for PMI at Navy/USMC installations. For Navy hangars, if an additional designated space is required for PMI, one more space with spread configuration will be provided per Type/Model/Series per installation. This additional requirement must be verified with Commander, Naval Air Force Command (CNAF).

Sensitive Compartmented Information Facility (SCIF)/Special Access Program – Facility (SAP-F): SCIF/SAP-F requirements are design features in DOD ICD 705 incorporated in various functional spaces to allow for the dissemination of sensitive information. Spaces in the 01 and 02 functional areas may require SCIF design features. The mission of the squadron determines whether or not certain spaces in the 01 and 02 functional areas require SCIF design features. SCIF design features typically include shielding of walls, floors, ceilings, and doors; and secure systems such as security, telephone, network, electrical, and room acoustics.

Note

1. Based on scheduled maintenance loading of 48% and unscheduled maintenance loading of 52% P-8A VP squadrons experienced over the 4-year period ending 2019, the effective hangar ratio is determined to be to ¼, or 0.25. This ratio applies as an interim update (Source: PMA-290 criteria inquiry dated 21 February 2020).
2. Based on updated maintenance records submitted by Commander, Naval Training Command (CNATRA) with a criteria update request of December 2020.

Table 21105-3 Notes:
(1) Propeller disc span, which exceeds folded wing dimension.
(2) Minimum aircraft width with rotors in line with or folded in line with aircraft fuselage.
(3) MV-22 aircraft has multiple stow positions: Flight Ready Position = 25.816 meters (84'7"), Fold Horizontal Position = 16.154 meters (53'0"), Fold Vertical Position = 16.495 meters (54'1"), and Full Stow Position = 5.613 meters (18'5"). Use Flight Ready Position for Wings Spread width and Full Stow Position for Wings Folded width.
(4) Height with rotodome in raised position.
(5) Height with wings folded. Maximum height during wing folding procedure is 6.57 meters (21'6.8"). Aircraft height with wing extended is 4.95 meters (16'3"). Group the total aircraft non-standard loading by type, model, and series and apply the following formulas to each group. Combine the results of each calculation into Type I and Type II module requirements to obtain the required hangar widths to perform both scheduled and unscheduled maintenance in each type of hangar.
(6) Height for spread configuration. If aircraft in folded configuration then height reduced to 5.51 meters (18'1").

Calculating OH Space

Given the standard size of the OH space described previously, when planning OH space, planners shall follow the process below for determining the number of standard hangar modules required, and the gross square feet required.

1. *Gather data input*

Important data is necessary to select and apply correct formula to determine the number of hangar modules required. Data inputs include the following:

- Squadron service type (i.e., Navy or Marine Corps)
- Number of Primary Aircraft Authorized (PAA) for squadron
- Airframe assigned
- Width of aircraft with wings spread (for fixed-wing aircraft)
- Width of aircraft with wings folded (for fixed-wing aircraft)
- Rotor diameter when rotors are spread (for Tilt-Rotor aircraft, Rotor Spread is Flight Ready Position)
- Width of aircraft when rotors are folded or minimum aircraft width with rotors in line or folded in line with aircraft fuselage (for Tilt-Rotor aircraft Rotor Fold is Full Stow Position)

2. *Calculate the required hangar width (RHW) using formulas in Table 21105-4 as follows:*

Using the formulas in Table 21105-04 that includes the following variables:

N = Number of Primary Assigned Aircraft (PAA)

WS = Width of aircraft with wings spread (See Table 21105-3)

WF = Width of aircraft with wings folded (See Table 21105-3)

W = Width of aircraft for aircraft with wings that do not fold

D = Clearance between wingtips and walls or other wingtips, that is 7.5 feet

RS = Rotor diameter when rotors are spread (for Tilt-Rotor aircraft, RS is Flight Ready Position)

RF = Width of aircraft with rotors folded or minimum aircraft width with rotors in line or folded in line with aircraft fuselage (for Tilt-Rotor aircraft RF is Full Stow Position)

Table 21105-4
Required Hangar Width Formulas

Aircraft Type	Required Hangar Width Formula
Carrier Aircraft[1,2,3]	(1 x WS) + (N/3 x WF) + [(N/3 + 1) x D] + WS (for IMP)
Rotary Wing Aircraft[1,2,3]	0.25 x N/3 x RS + 0.75 x N/3 x RF + [(N/3 + 1) x D] + RS (for IMP)
Patrol, Special Mission, and Training Aircraft[2]	N/6 x W + [(N/6 + 1) x D] + W (for IMP)
Transport Aircraft[2]	N/9 x W + [(N/9 + 1) x D] + W (for IMP)
Tilt-Rotor Aircraft[1,2,3]	0.75 x N/3 x RS + 0.25 x N/3 x RF + [(N/3 +1) x D] + RS (for IMP)
Executive Transport Aircraft[2]	N/1 x W + [(N/1 + 1) x D]

[1]If an additional PMI bay is required, add space for WS and D.

[2]When performing calculations for determining the number of aircraft to a hangar, the Navy will incorporate the rounding down of a number when that number is less than 0.3 and rounding up when the number is equal to 0.3 or greater.

[3]For determining the number of aircraft in a hangar for the Marine Corps, use the conventional rounding method, and round up to the nearest whole number when the number is 0.5 or higher.

3. *Determine the number of standard modules required*

Divide the RHW by 212 feet for Navy and 262.5 feet for Marine Corps for partial modules. To determine the number of standard modules required, normalize partial modules as follows:

(a) Less than one module, one module is required.

(b) More than one module but equal one and one half modules, one and a half modules are required

(c) More than one and one half module but less than two modules, two modules are required

(d) Additional modules are determined on the same basis.

4. Calculate the gross square footage (GSF) required

Multiply the net square feet of the standard one-module hangar for either the Navy or Marine Corps by the number of standard modules required then by the1.12 net-to-gross ratio for the GSF required.

Sample Calculation

1. *Gather data inputs*

   Squadron Service: Navy
   Number of PAA: 14 aircraft
   Aircraft Variance: F-35C aircraft
   F-35C wings spread = 43 feet
   F-35C wings folded = 31 feet
   Hangar Ratio: PAA x hangar ratio

2. *Calculate the required hangar width (RHW)*

   N = 14 aircraft

   Hangar Ratio = 14/3
   = 4.66
   = 5 (Round up from 4.66)

RWH = (1 x WS) + (N/3 x WF) + [(N/3 + 1) x D] + WS
= (1 x 43’) + (5 x 31’) + [(5 + 1) x 7.5’] + 43’
= 43’ + 155’ + 45’ + 43’
= 286’

3. *Determine the number of standard modules required*

   Partial modules = RHW / Standard Module Width
   = 286’/212’
   = 1.34
   = 2 (Round up from 1.34)

   Number of standard modules required = 2.0

4. *Calculate the GSF required*

   GSF = 2 x 212’ x 95’ x 1.12
   = 45,114 SF

21105/06/07-2.2. **Category Code 211 06 – 01 Space.**

(1) One Type I standard hangar module 01 space will be planned for each standard size squadron with ten to eighteen carrier aircraft.

(2) One half Type I standard hangar module 01 space will be planned for each standard size squadron with four to six carrier aircraft.

(a) Provide a minimum of 520.5 m^2 (5,600 SF) per squadron when two squadrons share the same Type I standard hangar module.

(3) One Type II standard hangar module 01 space will be planned for each standard size MV-22 squadron with ten to sixteen aircraft

(4) One Type III standard hangar module 01 space will be planned for each standard size squadron with six to twelve land based patrol aircraft.

(5) As with the aircraft, the personnel of all the other (non-standard) squadrons or units that operate aircraft, except Fleet Readiness Squadrons (FRS) and other training squadrons, will be combined. The authorized 01 space will be computed at the rate of 3 m^2 (32.5 SF) per person for this combined total complement. Movable partitions within the 01 space will facilitate prorating of area for non-standard size squadrons and units.

(6) Squadrons operating with detachments, such as the HSL squadrons, are authorized an additional 19 m^2 (200 SF) of 01 space per detachment based on the average number of detachments on board.

(7) Squadrons with a cargo/passenger transport mission are authorized additional 01 space for the storage of aircraft equipment as follows:

Helicopters and carrier aircraft – 2 m^2 (25 SF) per aircraft.

Multi-engine land based aircraft – 5 m^2 (50 SF) per aircraft.

(8) Since line operations and line maintenance functions must be performed as close as possible to the apron parked aircraft of a squadron, an additional 27.9 m^2 (300 SF) is authorized per squadron. Note, if line operations and line maintenance is currently provided in separate structures, use Category Code 141 30 Aircraft Line Operations Building

and Category Code 211 15 Line Maintenance Shelter for inventory purposes only.

(9) The authorized 01 space for FRS and other training squadrons will be computed at the rate of 3 m^2 (32.5 SF) per permanent billet, less the training department. An additional 12 m^2 (125 SF) per student based on the average on board student load is authorized under Applied Instruction Building (Category Code 171 20) (Flight Training and Briefing Building). The training department billets are deleted from the squadron's complement for requirements calculations as space for these billets is included in the student allowance of 12 m^2 (125 SF). In many squadrons, it may be desirable to locate all, or a portion of the student space allowance in a separate facility or to combine it with the Operational Trainer Facility (Category Code 171 35) (Flight Simulator).

(10) The width of the 01 spaces shall not exceed the width of the computed number of OH modules; however, should the computed 01 space requirement exceed the 01 space available in the computed number of OH modules by twenty percent, authorization for deviations from standard hangar dimensions (see paragraph 1. Design Considerations) may be requested from Commander, Naval Air Systems Command (AIR-8.0Y1).

Maintenance shops compose the majority of the 01 space. Planning factors for 01 space for F-35 aircraft are shown on Tables 21105-4 and 21105-5. Space within the maintenance shops is allocated by the work center planning factor (presented in square feet per work center) and the number of people in each work center. The number of work centers planned per maintenance shop is determined by multiplying the PAA by the hangar ratio (from Table 21105-2). The planning factor for each work center usually accommodates 2-4 maintenance personnel and includes space (based on function) for a computer monitor, worktables/benches, short- term material/tool storage, and internal circulation. For example, the airframes maintenance shop has a recommended planning factor of 350 square feet (SF) per work center. If 10 aircraft are assigned to an F-35C squadron with a 1/3 hangar ratio, three work centers are required to accommodate 6-12 people; therefore, the net area for work centers in the airframe shop is 1,050 SF. In order to account for the variability in shop work schedules and personnel working between the shop and the OH space, use conventional rounding based on the 1/3 hangar ratio for maintenance shop work centers.

Table 21105-5
01 Space Calculations for F-35C and F-35B

CATEGORY	Unit	Unit Metric	Unit Factor	Each		Planning Metrics		Space Req't (SF)	
				F-35C	F-35B			F-35C	F-35B
SHOPS

GROSS 01 SPACE (Net-to-Gross Factor 1.38)								**19,658**	**27,800**

Notes: [1]A single Work Center equates to approximately 2-4 people and planning metric includes space (based on function) for computer desks, work tables/benches, storage, and circulation. [2] Includes flight equipment lockers and applicable work centers. [3] For maintenance administration area calculations, planners can use the 61010 guidance, which provides a maximum allowance of 162.5 GSF per person. [4] Includes Airframes officer, Avionics officer Powerplant officer, and Line officer. [5]Percentages for planning metrics need adjustment for male-female populations.

21105/06/07-2.3. **Category Code 211-07 – 02 Space.**

(1) One Type I standard hangar module 02 space will be planned for each standard size squadron with twelve to eighteen carrier aircraft.

(2) One half Type I standard hangar module 02 space will be planned for each standard size squadron with four to six carrier aircraft.

(3) One Type II standard hangar module 02 space will be planned for each standard size MV-22 squadron with ten to sixteen aircraft

(4) One Type II standard hangar module 02 space will be planned for each standard size squadron with six to twelve land based patrol aircraft.
(5) As with the aircraft, the personnel of all the other (non-standard) squadrons or units that operate aircraft, except FRS and other training squadrons, will be combined. The authorized 02 space will be computed at the rate of 3 m^2 (32.5 SF) per person for this combined total complement. Movable partitions within the 02 space will facilitate prorating of area for non-standard size squadrons and units.

(6) Squadrons operating with detachments such as the HSL squadrons are authorized an additional 19 m^2 (200 SF) of 02 space per detachment based on the average number of detachments on board.

(7) An additional 8 m^2 (80 SF) per squadron of 02 space is authorized for computer equipment room.

(8) The authorized 02 space for FRS and other training squadrons will be computed at the rate of 3 m^2 (32.5 SF) per permanent billet, less than the training department billets.

(9) The width of the 02 spaces shall not exceed the width of the computed number of OH modules; however, should the computed 02 space requirement exceed the 02 space available in the computed number of OH modules by twenty percent, authorization for deviations from standard hangar dimensions (see paragraph 1. Design Considerations) may be requested from Commander, Naval Air Systems Command (AIR-8.0Y1).

1. Design Considerations

In planning the authorized 01 and 02 spaces, the standard hangar modules shown in UFC 4-211-01, as updated, should be used whenever possible; however, due to the large diversity in the size of squadrons and other units, it is realized that deviations from the standard dimensions of 11.2 meters (36.8 feet) by 71.6 meters (235 feet) for Type I or 15.24 meters (50 feet) by 73.15 meters (240 feet) for Type II may be necessary.

2. Example

a. Background. A station supports 6 fleet operational F/A-18 squadrons. Each squadron has 12 aircraft and an average of 225 officers and enlisted. On average, one third of these squadrons are on extended deployment. In addition, the station supports an F/A-18A FRS operating 32 aircraft with an allowance of 600 officers and enlisted of which thirty-five are assigned to the training department. The squadron convenes 12 classes per year with 13 replacement pilots per class for a 24-week syllabus. Determine the number and type of maintenance hangars required to support these squadrons.

(1) The 6 fleet operational squadrons fit the criteria for standard size carrier type squadrons (12 to 18 carrier aircraft and 150 to 400 personnel); therefore, they each require one Type I hangar module. However, since one third of the squadrons normally are deployed, the station needs only 4 Type I modules to support the 6 squadrons.

(2) The FRS does not fit the criteria for any standard size squadron; therefore, its hangar requirements are determined using the criteria for non-standard squadrons.

Step 1. Determine RHW of O/H space. The F/A-18 is a carrier aircraft and requires one hangar space for every three aircraft. Total requirement is computed using the formula:

RHW = (N/3) x (W) + ((N/3) - 1) x (D) + 2 x SC

RHW = (32/3) x (8.38) + ((32/3) – 1) x (1.52) + 2 x (7.5)
RHW = (32/3) x (27.5) + ((32/3) –1) x (5) + 2 x (2.3)
RHW = 108.65 meters or two Type I modules (128.90 meters)
RHW = 356.47 feet or two Type I modules (424 feet)

Step 2. Determine required 01 space.

Personnel Allowance	600
Less Training Department Personnel	35
Total:	565

Space required for squadron personnel = (565) x (3) = 1,695 m^2 (18,363 SF)

Space required for line maintenance = 27.9 m^2 (300 SF)

Space for Mechanical/Electrical (AFFF) = 143 m^2 (1,536 SF)

Total 01 Space = 1,865.9 m^2 (20,199 SF)

Step 3. Determine required space 02.

Personnel Allowance	600
Less Training Department Personnel	35
	565

Space required for squadron personnel = (565) x (3) = 1,695 m^2 (18, 363 SF)

Space for Computer Equipment = 8 m^2 (80 SF)

Total 02 Space = 1,703 m^2 (18,443 SF)

Step 4. Determine required student support space.

Average student load =

$$\frac{(24 \text{ days}) \times (5 \text{ days/week}) \times (13 \text{ students}) \times (12 \text{ classes})}{(250 \text{ classroom days})} = 75$$

Total Training Area =75 Students x 12 m^2 = 900 m^2 (9,375 SF)

Note: Training Area can be located in the aircraft hangar, in a separate facility, or combined with the Operational Trainer Facility (Category Code 171 35) (Flight Simulator).

(10) Every unit requires dedicated administration and support spaces accessible by all personnel in the unit at the unclassified level. These spaces are generally allocated by square feet per person and are very similar to general administrative spaces found in other areas of a military installation. The administration and support areas are driven by the number of people in the squadron. The administration functions and support areas typically found in 02 space for a JSF squadron are listed in Table 21105-6. Depending on the PAA, more administration and support functions can be assigned to a squadron, in which case documentation must be provided for the additional space.

21105/06/07-2.4. **Type IV Unmanned Aircraft System Requirements.** The requirements of Unmanned Aircraft System (UAS) aircraft are unique and complex encompassing sensitive platform and functional space features. The current UAS aircraft is the MQ-4C Triton. The home basing plan for the Triton is four aircraft to a hangar.

OH Space

The Triton aircraft has a wingspan of 131 feet. The aircraft body, excluding the wings is five feet wide. The length of the aircraft is five feet. The length of the aircraft is 48 feet. All UAS aircraft must be kept in a hangar due to the sensitive components of the aircraft. The position of the aircraft is in two rows of two in the hangar bay. Two aircraft will be side by side and face the hangar door, and the other two aircraft will be in a position at the rear of the two rows of aircraft that face the hangar door.

Clearance Standards

The wingtip clearance between the aircraft is 30 feet. The clearance from the sides of the aircraft to the innermost protrusion from the hangar wall is 15 feet. The distance from the nose of the aircraft to the innermost protrusion of the hangar door is also 15 feet. The distance from the nose of the aircraft of the second row of aircraft to the tail of the first row of aircraft is 15 feet. The distance from the tail of the second aircraft to the innermost protrusion from the rear wall (usually power converters) is 15 feet.

01 and 02 Space

The planning factors for the 01 and 02 space requirements for a Triton hangar are shown in Table 7 and Table 8. The 01 and 02 space figures may differ due to the variation of rotational maintenance detachments for each installation location. The installation must contact CNAL/CNAP N2/N6 to obtain the most detailed information on the maintenance concept and personnel figures for a particular installation.

211 08 AIRFRAMES SHOP (NON-NAVAIR DEPOT) (m^2 / SF)
FAC: 2112
BFR Required: Y

Design Criteria: UFC 4-211-01, Aircraft Maintenance Hangars

21108-1 **GENERAL.** An Airframes Division at the intermediate maintenance level is required at Navy and Marine Corps Air installations for the testing, maintenance and repair of airframes components. This section provides a method for determining the space requirements for this division.

The primary function of the airframes shop is to repair aircraft structural and hydraulic. It contains a Structures Branch, a Hydraulics/Pneumatics Branch, a Non-Destructive Inspection (NDI) Branch; and, if authorized by NAVAIRSYSCOM, an Electro-Plating/Anodizing Branch. The shop structure is shown in Table 21108-1. In addition to the specific shop structure shown, support space for material storage, administration, training, male and female locker and restrooms, and a mechanical equipment room.

In addition to the specific shop structure shown in Table 21108-1, other areas required within the Airframes Shop include support and training spaces. Typical support spaces would include personnel support (heads, locker rooms, cleaning gear storage, lounge, etc.), parts storage (parts awaiting maintenance (AWM), material awaiting parts (AWP), test equipment, tools not in use, storage for stock of sheet metal, tubing, hose, composite materials, consumable items, Pre-Expended Bin items, Hazardous Material, Hazardous Waste, and associated items), and specialized mechanical equipment spaces (HVAC, specialized environment control for paint shop to control temperature and humidity, specialized environment control for hydraulics shop for establishment of clean room environment, compressed air to most power tools, paint guns, and breathing apparatus). Typical training spaces may include a classroom.

Table 21108-1
Airframes Shop Structure

Branch Code	Shop Code	Function	Definition
500		**Airframes Division**	**Division supervision**
510		**Structures Division**	**Structures branch supervision**
	51A	Structures Shop	Repair and manufacture of structural components
	51B	Paint Shop	Paint and corrosion control
	51C	Welding Shop	Welding
	51D	Machine Shop	Machining of tools and manufacturing of parts
	51E	Tire/Wheel Shop	Tire replacement and wheel repair
	51F	Composites Shop	Repair of composite structural components
520		**Hydraulics/Pneumatics Branch**	**Hydraulics/Pneumatics branch supervision**
	52A	Hydraulics Shop	Repair and manufacture of hydraulics components
	52B	Brake Shop	Repair of brakes and components
	52C	Strut Shop	Repair of struts
530		**Non-Destructive Inspection (NDI) Branch**	**NDI branch supervision**
	53A	Radiography Shop	X-Ray inspection
	53B	Electrical/Chemical Shop	Electrical/Chemical inspection
540		**Electroplating/Anodizing Branch** ***(if authorized)***	**Electroplating/Anodizing of components**

To determine the square-meter (square-footage) requirements for a given installation, the number of aircraft of all types receiving maintenance support at that installation is totaled. This number is derived by determining the number of aircraft of all types assigned to the installation and subtracting out the number of aircraft normally deployed on ships or detached to another location. The sum is used to enter Column 1 of Table 21108-2, and the required basic area for the Airframes Shop is read in Columns 2 and 3. Table 21108-3 is then entered in order to determine if additional space is required. This area is added to the basic area from Table 21108-2 to provide the required Gross Area for the Airframes Shop. See the following example for a sample computation.

Table 21108-2
Basic Space Allowance for Airframes Shops

Column 1 Total Aircraft	Column 2 Basic Area (Square Meters)	Column 3 Basic Area (Square Feet)
Up to 75	1,283	13,800
76-100	1,422	15,300

Column 1 Total Aircraft	Column 2 Basic Area (Square Meters)	Column 3 Basic Area (Square Feet)
Column 1 Total Aircraft	Column 2 Basic Area (Square Meters)	Column 3 Basic Area (Square Feet)
101-125	1,571	16,900
126-150	1,710	18,400
151-175	1,850	19,900
176-200	1,989	21,400
201-225	2,119	22,800
226-250	2,259	24,300
251+	2,398	25,800

Note: An area of 1,283 m^2 (13,800 SF) is the smallest practical space for an Airframes Division with full capabilities. Some small IMAs may not be tasked to provide all airframes functions. Their space requirements shall be individually justified.

Table 21108-3
Special Space Allowance for Airframes Shops

Column 1 Special Requirement	Column 2 Additional Space (Square Meters)	Column 3 Additional Space (Square Feet)
F-14 Support (HCT-12 Equipment)	114	1,225
S-3 Support (Beryllium Brakes Maintenance)	51	550
E-2 Support (Vapor Cycle Maintenance)	57	610
Composite Shop (Note 1)	151	1,630
Electro-Plating/Anodizing Shop (Note 2)	63	680

Note 1: Required in support of AV-8, F/A-18, and SH-60 aircraft.
Note 2: Required only when authorized by COMNAVAIRSYSCOM IAW OPNAVINST 4790.2.

1. Example Computation

Number of Aircraft	Type
44	S-3
96	A-7
80	F/A-18
220	

In accordance with Table 211-08B, a total of 220 aircraft requires a basic area of 2,119 m^2 (22,800 SF). From Table 211-08C it is determined the S-3 support requires an additional 51 m^2 (550 SF) and the Composite Shop required for F/A-18 support adds an additional 151 m^2 (1,630 SF). This gives a gross area as follows:

Basic Area	-	2,119 m^2	22,800 SF
S-3 Support	-	51 m^2	550 SF
Composite Shop	-	151 m^2	1,630 SF
Gross Area	-	2,321 m^2	24,980 SF

211 09 AIRCRAFT BORESIGHT RANGE (NON- NAVAIR DEPOT) (EA)
FAC: 1791
BFR Required: Y

21109-1 **GENERAL.** One aircraft boresight range is required at Navy and Marine Corps air installations that service aircraft equipped with fixed guns or gun pods. One boresight range has the capacity to boresight and fire-in 40 such aircraft each month on a single shift basis. A requirement for more than one boresight range at any station must be individually justified. There are two (2) types of ranges:

1.) Type “A” Semi-Enclosed. The Type “A” range shall be located in proximity to taxiways, but special care must be taken to ensure that no visual obstruction occurs between the control tower and runways and taxiways. Due to noise generation and safety considerations, this facility shall be separated from inhabited structures and the station boundary by a minimum distance of 366 meters (1,200 feet).

2.) Type “B” Open. In addition to the location criteria listed above for a Type “A” range, the Type “B” range requires a danger zone area, 1,555 meters (1,700 yards) wide and 6,401 meters (7,000 yards) long.

Both the Type “A” and Type “B” boresight ranges shall have a length of 50.8 meters (2,000 inches) from the firing point of the aircraft to the target at the firing-in-butt.

Generally, a Type “A” range is used unless there is existing land or restricted water area available for the 6,401 meters (7,000 yard), 60-degree sector danger zone required by a Type “B” range. Prevailing winds shall be considered for orientation and noise abatement; however, where practicable, the boresight range should be oriented north and south to avoid firing toward the sun during early or late hours.

A taxiway, Category Code 112 10 is required for access to this facility. An aircraft parking apron with tie-downs, Category Code 113 20 is required to park and secure the aircraft during gun alignment.

In addition, a standard 12- by 20-foot line shelter is planned with this facility for crew shelter and storage of jacks and tiedown gear. See Category Code 211 15, Line Maintenance Shelter, for criteria.

211 10 AIRCRAFT OVERHAUL AND REPAIR SHOP (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21110-1 **GENERAL.** An Aircraft Overhaul and Repair Shop is required for the Airframe Production Shop of the Naval Air Depot (NAVAIR Depot). There are generally two types of aircraft overhaul and repair shops. One supports aircraft overhaul and repair of trainer aircraft, fighter aircraft, and helicopters and one supports aircraft overhaul and repair of cargo, transport, and patrol aircraft.

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine requirement.

211 11 CORROSION CONTROL – CLEANING SHOP (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21111-1 **GENERAL.** A Corrosion Control – Cleaning Shop is required to provide space for aircraft corrosion control and decontamination facilities designed for cleaning, paint stripping, etc., of the complete aircraft for the Airframe Production Shop of the Naval Air Depot (NAVAIR Depot).

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 12 PAINT AND FINISHING HANGAR (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21112-1 **GENERAL.** A Paint and Finishing Hangar is required for the Airframe Production Shop of the Naval Air Depot (NAVAIR Depot). This facility provides space to repaint an entire aircraft.

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 13 AIRCRAFT NON-DESTRUCTIVE TESTING SHOP (NAVAIR DEPOT) (m^2 / SF)

FAC: 2116
BFR Required: Y

21113-1 **GENERAL.** An Aircraft Non-Destructive Testing Shop is required to provide space for the non-destructive inspection of airframes for the Airframe Production Shop of the Naval Air Depot (NAVAIR Depot).

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine requirement.

211 14 AIRCRAFT REWORK SHOP (NAVAIR DEPOT) (m^2 / SF)

FAC: 2116
BFR Required: Y

21114-1 **GENERAL.** An Aircraft Rework Shop is required for the Airframe Production Shop of the Naval Air Depot (NAVAIR Depot). Included within this Category Code are:

a. Airframe Dedicated Machine Shop
b. Airframe Dedicated Welding Shop
c. Airframe Dedicated Plating Shop
d. Airframe Examination and Evaluation, Pre-Shop Analysis and Examination and Inspection Shop
e. Maintenance Dock
f. Quick Engine Change Shop – Facility used for quick engine change and engine build-up including de-seal and re-seal operations.
g. Fuel Systems Maintenance Facility

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 15 LINE MAINTENANCE SHELTER (m^2 / SF)

FAC: 2112
BFR Required: Y

21115-1 **GENERAL.** Line maintenance shelters are required in support of aircraft located on aircraft parking aprons and at aircraft boresight ranges (Category Code 211 09). For aircraft located on the aircraft parking apron, they provide shelter for squadron line personnel awaiting aircraft that are ready for launch, returning from flight, or being serviced. For aircraft located at the aircraft boresight range, they provide crew shelter and storage for aircraft jacks and tiedown gear. For newer hangars, this requirement is included in the Aircraft Maintenance Hangar – 01 Space, Category Code 211 06 and as such included in the hangar. However, if space constraints exist in older hangars, or the aircraft parking apron is not in the immediate vicinity of the squadron hangar a line maintenance shelter will be provided. One (1) line maintenance shelter may be planned for each aircraft maintenance hangar module and one (1) for each aircraft boresight range.

The aircraft line maintenance shelter is 6.1 meters (20 feet) by 3.7 meters (12 feet) and is usually a portable facility that is planned as collateral equipment for the basic facility. Collateral equipment is not categorized as Class II real property and thus cannot be included in the real property inventory (RPI). However, this Category Code is being retained for real property inventory purposes since many of the existing facilities are not portable and accordingly must be reported in the Navy Facility Asset Data Base (NFADB).

For inventory purposes, the following guidance is provided:

a.) Line maintenance shelters directly associated with squadron line personnel awaiting aircraft that are readying for launch, returning from flight, or being serviced use Category Code 211 06, Aircraft Maintenance Hangar – 01 Space.

b.) Line maintenance shelters used at aircraft boresight ranges to provide crew shelter and storage for aircraft jacks and tiedown gear use this Category Code.

211 16 AIRCRAFT INTERMEDIATE MAINTENANCE ACTIVITY MANAGEMENT (NON-NAVAIR DEPOT) (m^2 / SF)

FAC: 2116
BFR Required: Y

21116-1 **GENERAL.** Management space provides for the control, monitoring, and administration of the Intermediate Maintenance Activity (IMA). The Aircraft Maintenance Officer and staff are responsible for the administration and supervision of the maintenance effort for the IMA. These responsibilities include production control, material control, financial accounting, training, personnel, administration, quality control, technical publications library, data analysis, and tool control for common and special tools and test equipment. The Naval Aeronautical Engineering Services Unit staff and personnel perform In-Service Engineering Agent (ISEA) functions for aircraft and are often co-located in the same spaces. These functions and the specific requirements of each branch are defined by OPNAVINST 4790.2E (series) and are highlighted in Table 21116-1.

Table 21116-1
IMA Management

Branch Code	Shop Code	Function	Definition
010		Aircraft Maintenance Officer (AMO)	IMA Supervisory
01A		Assistant Aircraft Maintenance Officer (AAMO)	IMA Supervisory and Training
01S		AMO Secretary/Reception	Administration
011		Maintenance/Material Control Officer (MMCO)	Production/Material Control Supervisory
020		Production Control	Control of maintenance effort
030		Maintenance Administration	Administration, training, and personnel management of IMA
040		Quality Assurance	Quality Control
	04A	Technical Publication Library	Receipt, issue and storage of master copies of all publications used in the IMA
	04B	Ground Safety	IMA safety office
	04C	Data Analysis	Data gathering, analysis, and reporting. Also includes space for NALCOMIS master computers.
	04D	Quality Management/Verification	Quality Assurance Representatives office and files
050		Material Control	Receipt, issue, ordering, and technical support for all parts required by IMA
	05A	Material Screening	Receipt of all incoming parts to IMA, screening for reparability, issue to shop for repair, receipt from shop, and issue to Supply Dept.
	05B	Material Procurement/Accounting	Ordering and technical support for parts requested by shops. Financial accounting of all IMA accounts
	05C	Individual Material Requirements Readiness List (IMRL) Manager	Management of IMRL which includes all special tools, test equipment, support equipment, and associated items
	05D	Tool Control Center	Management of common hand tools
070		NAESU	Contractor and government technical instructors

Personnel requirements to meet these functions are not noticeably affected by aircraft loading. One size space will be provided for all IMAs. Provide 917 gross m^2 (9,875 GSF) for IMA management functions.

211 17 REGIONAL AIRCRAFT SERVICE FACILITY (m^2 / SF)
FAC: 2116
BFR Required: Y

21117-1 **DEFINITION.** During day-to-day aircraft operations, space often may be required to perform aircraft in-service repair (ISR), integrated maintenance (IMC/IMP), modifications (MOD) and other program work that may concurrently involve depot, intermediate, and organizational level work on aircraft by squadron, IMA, Naval Air Depot (NAVAIR Depot), and/or contractor personnel. When the existing organizational level spaces cannot accommodate the additional workload generated by ISR, IMC/P, and/or MOD and it is desirable to keep aircraft under local control, a separate facility will be required.

The Regional Aircraft Service Facility provides space to perform aircraft in-service repair (ISR), integrated maintenance (IMC/IMP), modifications (MOD) and other program work that may concurrently involve depot, intermediate, and organizational level work on aircraft by squadron, IMA, Naval Air Depot (NAVAIR Depot), and/or contractor personnel. Facility is comprised of High-Bay Maintenance Bays, Shop Area, and Administrative Support Space. Shop and Administrative Support areas will be limited to minimal required supporting current and projected programs.

Criteria for this Category Code are currently under development.

211 20 AIRCRAFT ENGINE OVERHAUL SHOP (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21120-1 **GENERAL.** An Engine Overhaul Shop is required to provide space associated with processing jet, turbojet, and reciprocating type aviation engines in terms of overhaul, low time repair, complete repair, and major inspection. The work functions performed within this space include un-canning, disassembly, cleaning, material examination, parts reconditioning, subassembly, final assembly and preservation.

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 21 ENGINE MAINTENANCE SHOP (NON-NAVAIR DEPOT) (m^2 / SF)
FAC: 2112
BFR Required: Y

21121-1 **GENERAL.** An Engine Maintenance Shop provides space for all work centers within the Power Plants Division of an Intermediate Level Maintenance Activity (IMA). The CNO and the CMC assign aircraft maintenance tasks and responsibilities to activities of Naval operating/Training Forces and Fleet/non-Fleet Marine Forces. The NAVAIRSYSCOM, through the NAVAIRNOTE 4700, assigns maintenance tasks and responsibilities for Gas Turbine Engines. Individual IMAs will only be allocated the space required to perform maintenance on the engines, equipment or components authorized for repair at that activity by higher authority, (i.e., NAVAIR/Type Commanders). The authorized work centers may be obtained by the use of Individual Component Repair List (ICRL) for the given IMA.

The Power Plants or Aircraft Engine Maintenance Shop is required to maintain the aircraft engine and associated components. The primary function is to repair aircraft engines, engine components, propellers, rotors, auxiliary power units (APUs), and auxiliary fuel and refueling stores. It contains a Jet Engine Branch, Reciprocating Engine Branch, Propeller Branch, Rotor Dynamics Branch, Test Cell Branch, Auxiliary Fuel Stores Branch, and Navy Oil Analysis Program Laboratory. The shop structure is shown in Table 21121-1.

Table 21121-1
Aircraft Engine Maintenance Shop Structure

Branch Code	Shop Code	Function	Definition
400		**Power Plants Division**	**Division supervision**
410		**Jet Engine Division**	**Jet Engine Branch supervision**
	51A	Structures Shop	Repair and manufacture of structural components
	51B	Paint Shop	Paint and corrosion control
	51C	Welding Shop	Welding
	51D	Machine Shop	Machining of tools and manufacturing of parts
	51E	Tire/Wheel Shop	Tire replacement and wheel repair
	51F	Composites Shop	Repair of composite structural components
420		**Reciprocating Engine Branch**	**Repair of reciprocating engines**
	52A	Hydraulics Shop	Repair and manufacture of hydraulics components
	52B	Brake Shop	Repair of brakes and components
	52C	Strut Shop	Repair of struts
430		**Propeller Branch**	**Repair of aircraft propellers**
	53A	Radiography Shop	X-Ray inspection
	53B	Electrical/Chemical Shop	Electrical/Chemical inspection

Branch Code	Shop Code	Function	Definition
440		**Rotor Dynamics Branch**	**Repair of helicopter rotor and associated components**
450		**Test Cell Branch**	**Supervisory, scheduling, and maintenance for Test Cell operation**
460		**Auxiliary Fuel Stores Branch**	
470		**Navy Oil Analysis Program Laboratory**	
480		**Welding Shop**	

Table 21121-1 lists the space requirements for the main engine work area (high bay) for first and second degree engine maintenance for supported number of a given type of aircraft. The following data items were taken into consideration to arrive at the listed space requirements:

1. Size of engine
2. Number of engines per aircraft
3. Number, type and size of required maintenance stands
4. Work benches
5. Work center administrative and storage area
6. Fire lane/aisle space
7. Mean flight hours between failures (MFHBF) of engines requiring removal to an IMA.
8. Average turnaround time (TAT) of engine in IMA
9. Flight hours between inspections (FHBI)
10. Elapsed inspection time (EIT)
11. Quick engine change assembly (QECA) elapsed build up time (EBT)
12. Aircraft monthly utilization

Table 21121-2 lists the percentage factor of the sum total from Table 21121-1 to determine the additional space required for division administration, utilities and other support functions such as supply support, welding and cleaning shops. These spaces are normally provided in shop wing and/or mezzanine areas.

Table 21121-3 lists the space requirements of additional work centers required for applicable components within the Power Plants Division, if authorized by higher authority to be supported at a given IMA. These spaces may be housed in the high bay area or in a separate building/location.

Note: Though more than one type of the aircraft supported may have the same basic component, only one work center will be required.

Example: F-18 and AV-8 both have an Auxiliary Power Plant (APU); however, only one APU work center will be required.

Table 21121-4 list the space requirements in the main engine work area (high bay) for situations where an AIMD is assigned repair responsibilities for a predetermined number of given type engines not related to those generated by the aircraft directly supported.

To establish space requirements for the Power Plant Division, add the space required for the given numbers of each type aircraft supported from Table 21121-1 and space computed from Table 21121-4. Add to this the additional percentage of space authorized from Table 21121-2 and the additional authorized space from Table 21121-3.

Note: At most installations there are aircraft assigned in support roles, i.e. helicopters or utility type aircraft. These are not computed in the space requirements as they are normally supported by other designated IMAs or depot level activities.

Example Computation – Power Plants Division Shop Space Allowance using an aircraft mix of 44 A-6, 84 F-18, 62 P-3, 23 H-46 and 40 TF-30 engines.

From Table 21121-1

	No. A/C	Type A/C	Area (m^2)	Area (SF)
	44	A-6	648	6,975
	84	F-18	1,057	11,375
	62	P-3	630	6,775
	23	H-46	109	1,175
Subtotal			2,444 m^2	26,300 SF

From Table 21121-4

No. Eng.	Factor (m^2)	Factor (SF)	Area (m^2)	Area (SF)
40	7	76	280	3,040

Total 21121-1 and 21121-4

2,724 m^2
29,340 SF

From Table 21121-2

2,724 m^2. x 44% = 1,199 m^2
29,340 SF x 44% = 12,910 SF

Total space requirements from Tables 21121-1 and 21121-4 allow up to 2,724 m^2 (29,340 SF) for the high bay area. Table 21135-2 allows up to 1,199 m^2 (12,910 SF) which is 44% of the high bay area for shop wing/mezzanine space.

Table 21121-1		2,724	m^2
and 21121-4		29,340	SF
Table 21135-2	(44% of 2,724 m^2)	1,199	m^2
	(44% of 29,340 SF)	12,910	SF
Subtotal = 3,923			m^2
42,210			SF

3,923 m^2 (42,210 SF) constitutes the primary Power Plants Division. If authorized by higher authority, additional applicable work center space requirements from Table 21121-3 shall be added.

From Table 21121-3

	A-6	F-18	P-3	H-46				
Propeller			X		272	m^2	2,925	SF
APU		X	X	X	167	m^2	1,800	SF
Rotor Dynamics				X	314	m^2	3,375	SF
Aux. Fuel Stores	X	X			314	m^2	3,375	SF
					1,067	m^2	11,475	SF

Note: Only one work center of each type is required.

T-700	4	44
TF-34	5	52
T-76	4	43
PT-6	4	40
T-53	3	30

Type Engine	Factor (m^2)	Factor (SF)
TF-41	10	112
TF-30	7	76
T-400	4	48
T-64	9	92
T-56	6	65
F-402	12	130
J-85	5	51
J-60	5	54
T-63	2	21

To calculate the required work space, multiply the factor by the number of engines projected to be processed in a 12 month period, add this to the existing work area from Table 211-21A and apply Table 211-21B.

If a new Work Center is established, the minimum area should be 2,000 Sq.ft.

Pavement is provided for outside storage of engines in sealed containers calculated at 25 percent of the gross building area.

211 22 ENGINE PREPARATION AND STORAGE SHOP (NAVAIR DEPOT) (m^2 / SF)

FAC: 2116
BFR Required: Y

21122-1 **GENERAL.** An Engine Preparation and Storage Shop is required provide space used in preparing engines for test, storage or shipment for the Engine Production Shop of the Naval Air Depot (NAVAIR Depot).

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine requirement.

211 23 ENGINE EXAMINATION AND EVALUATION SHOP (NAVAIR DEPOT) (m^2 / SF)

FAC: 2116
BFR Required: Y

21123-1 **GENERAL.** An Engine Examination and Evaluation Shop is required for the Engine Production Shop of the Naval Air Depot (NAVAIR Depot). Included within this Category Code are:

a. Engine Non-Destructive Testing Shop
b. Engine Examination and Evaluation, Pre-Shop Analysis, Examination and Inspection Shop

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine requirement.

211 24 DEDICATED AIRCRAFT ENGINE OVERHAUL – GENERAL PROCESS (NAVAIR DEPOT) (m^2 / SF)

FAC: 2116
BFR Required: Y

21124-1 **GENERAL.** A Dedicated Aircraft Engine Overhaul – General Process Shop is required for the Engine Production Shop of the Naval Air Depot (NAVAIR Depot). Included within this Category Code are:

a. Engine Dedicated Cleaning Shop
b. Engine Dedicated Paint Shop
c. Engine Dedicated Machine Shop
d. Engine Dedicated Plating Shop
e. Engine Dedicated Welding Shop
f. Engine Modification and Repair Shop

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine requirement.

211 25 JET ENGINE OVERHAUL SHOP (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21125-1 **REQUIREMENT.** A Jet Engine Overhaul Shop is required for the Engine Production Shop of the Naval Air Depot (NAVAIR Depot).

211 26 RECIPROCATING ENGINE OVERHAUL SHOP (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21126-1 **REQUIREMENT.** A Reciprocating Engine Overhaul Shop is required for the Engine Production Shop of the Naval Air Depot (NAVAIR Depot).

211 27 TURBINE ENGINE OVERHAUL SHOP (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21127-1 **REQUIREMENT.** A Turbine Engine Overhaul Shop is required for the Engine Production Shop of the Naval Air Depot (NAVAIR Depot).

211 30 AIRCRAFT AND ENGINE ACCESSORIES OVERHAUL SHOP (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21130-1 **REQUIREMENT.** An Aircraft and Engine Accessories Overhaul Shop is required to provide space for the overhaul and testing of miscellaneous accessories such as control assemblies, engine fuel system components, and accessories gear drive for the Accessories and Components Production Shop of the Naval Air Depot (NAVAIR Depot).

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 31 DEDICATED AIRCRAFT AND ENGINE ACCESSORIES OVERHAUL – GENERAL PROCESS (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21131-1 **GENERAL.** A Dedicated Aircraft and Engine Accessories Overhaul – General Process Shop is required for the Accessories and Components Production Shop of the Naval Air Depot (NAVAIR Depot). Included within this Category Code are:

a. Accessories and Components Dedicated Cleaning Shop
b. Accessories and Components Dedicated Paint Shop
c. Accessories and Components Dedicated Machine Shop
d. Accessories and Components Dedicated Plating Shop
e. Accessories and Components Dedicated Welding Shop
f. Examination and Evaluation, Pre-Shop Analysis, examination and Inspection Shop
g. Hazardous Test Shop – This facility is used to test a portion of the accessory items overhauled. Because of the volatile fluid with which they are tested or the hazardous conditions of testing, the test area must be rigidly controlled. Items such as fuel pumps, fuel controls, etc. are worked in this area.
h. Reclamation Shop – Facility for removal of useable parts from defective end item components.

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 32 METAL COMPONENTS SHOP (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21132-1 **GENERAL.** A Metal Components Shop is required for the Accessories and Components Production Shop of the Naval Air Depot (NAVAIR Depot). Included within this Category Code are:

a. Tank and Radiator Repair Shop – Facility to repair all types of radiators, inter-coolers and metal tanks.
b. Sheet Metal Shop – Facility for repair of surface sheet metal parts.
c. Metal Surface Shop – Facility for repair of wings, doors, stabilizers, tail booms, control surfaces, etc.
d. Seat Repair Shop.
e. Metal Bonding Shop.
f. Container Reclamation Shop – Facility for repair of engine, transmission, rotor blade and other type metal containers.

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 33 NON-METAL COMPONENTS SHOP (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21133-1 **GENERAL.** A Non-Metal Components Shop is required for the Accessories and Components Production Shop of the Naval Air Depot (NAVAIR Depot). Included within this Category Code are:

a. Life Raft Repair Shop – Facility to repair inflatable life vests, dinghies, etc..
b. Rubber Repair Shop – Facility for the repair of rubber equipment such as aircraft fuel cells and molded rubber products.
c. Parachute Repair Shop – Facility for repair of parachutes, aerial pickup gear, etc.
d. Fabric and Upholstery Shop.
e. Tire Repair Shop.
f. Plastic and Fiberglass Shop – Facility for the repair of fiberglass and reinforced plastic items such as radomes, wingtips, ducts, covers, canopies, hatches and windows.
g. Composite Rework Shop.

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine requirement.

211 34 DYNAMIC COMPONENTS SHOP (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21134-1 **GENERAL.** A Dynamic Components Shop is required for the Accessories and Components Production Shop of the Naval Air Depot (NADEP). Included within this Category Code are:

a. Propeller and Propeller Control Overhaul Shop
b. Rotor Head Overhaul Shop
c. Rotor Blade Overhaul Shop
d. Transmission/Gearbox Overhaul Shop
e. Dynamic Drive System Overhaul Shop – Facility used for the repair of drive shafts, pitch links, swash plates, etc..

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine requirement.

211 35 HYDRAULIC COMPONENTS SHOP (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21135-1 **GENERAL.** A Hydraulic Components Shop is required for the Accessories and Components Production Shop of the Naval Air Depot (NAVAIR Depot). Included within this Category Code are:

A. Hydraulic Components Overhaul Shop
B. Bearings Shop - Specialized shop in which bearings are cleaned, disassembled, inspected, reassembled and tested.
C. Aircraft Landing Gear Shop - Facility used for the repair and overhaul of aircraft landing gear components such as wheels, brakes, and struts.

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 36 ELECTRICAL COMPONENTS SHOP (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21136-1 **GENERAL.** An Electrical Components Shop is required for the Accessories and Components Production Shop of the Naval Air Depot (NAVAIR Depot). Included within this Category Code are:

a. Alternator Drive Overhaul Shop
b. Electrical Accessories Overhaul and Test Shop – Facility used in the overhaul and test of electrical components including electrical systems, starters, control equipment and converters, etc..
c. Battery Shop – Facility for the repair and test of aircraft batteries.
d. Constant Speed Drive Shop
e. Electro-Mechanical Components Shop – Facility used to repair Electro-Mechanical actuators, cargo and rescue hoists, etc.

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 37 TURBINE ACCESSORIES SHOP (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21137-1 **GENERAL.** A Turbine Accessories Shop is required for the Accessories and Components Production Shop of the Naval Air Depot (NAVAIR Depot). Included within this Category Code are:

a. Turbine Accessories Overhaul Shop – Facility for overhaul of air compressor type equipment, such as air turbine starters, air conditioning packs, and air driven motors.
b. Turbine Accessories Test Shop
c. General Purpose Units Shop – Facility for the overhaul and repair of gas/air turbine engines and auxiliary power units, installed on the aircraft other than its' primary propulsion unit.
d. General Purpose Units Tests Shop
e. Ram/Air Turbine Accessories Overhaul Shop – Facility used for the overhaul of air driven accessories such as ram air turbines and scoops.
f. Ram/Air Turbine Accessories Test Shop

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 38 PNEUMATIC OXYGEN SHOP (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21138-1 **GENERAL.** A Pneumatic Oxygen Shop is required for the Accessories and Components Production Shop of the Naval Air Depot (NAVAIR Depot). Included within this Category Code are:

a. Pneumatic Components Overhaul Shop
b. Cryogenics Shop
c. Oxygen Equipment Shop – Facility used for repair of oxygen regulators, converters, etc.

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 39 OPTICAL AND PHOTOGRAPHIC COMPONENTS SHOP (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21138-1 GENERAL. An Optical and Photographic Components Shop is required for the Accessories and Components Production Shop of the Naval Air Depot (NAVAIR Depot). Included within this Category Code are:

a. Photographic Equipment Repair Shop – Facility for the repair of aircraft cameras and other photographic items.
b. Optical Component Repair Shop

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 40 ELECTRONICS, COMMUNICATION, AND ARMAMENT SYSTEM SHOP (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21140-1 **GENERAL.** An Electronics, Communication, and Armament System Shop is required to provide space associated with processing airborne communication and navigation equipment, instruments, airborne data computers, fire control and bombing system equipment, gyroscopes, inertial guidance systems, and other avionics equipment.

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 41 DEDICATED ELECTRONICS, COMMUNICATION, AND ARMAMENT – GENERAL PROCESS SHOP (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21141-1 **GENERAL.** A Dedicated Electronics, Communication, and Armament – General Process Shop is required for the Electronic, Communication, and Armament Systems Production Shop of the Naval Air Depot (NAVAIR Depot). Included within this Category Code are:

a. Electronics, Communication, and Armament Systems Dedicated Cleaning Shop
b. Electronics, Communication, and Armament Systems Dedicated Paint Shop
c. Electronics, Communication, and Armament Systems Dedicated Machine Shop
d. Electronics, Communication, and Armament Systems Dedicated Welding Shop
e. Electronics, Communication, and Armament Systems Dedicated Plating Shop
f. Electronics, Communication, and Armament Systems Dedicated Plating Shop
g. Electronics, Communication, and Armament Systems Dedicated Bearings Shop
h. Instrument Overhaul Shop

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine requirement.

211 42 ELECTRONIC SYSTEM COMPONENTS SHOP (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21142-1 **GENERAL.** An Electronic System Components Shop is required for the Electronic, Communication, and Armament Systems Production Shop of the Naval Air Depot (NAVAIR Depot). Included within this Category Code are:

a. Armament and Avionics Shop – Facility for the repair of navigational missile and bombing radar, electronic countermeasure equipment, flight facilities and communication equipment, electronic instruments, and fire control systems.
b. Airborne Systems Software Shop – Facility for the preparation, repair or modification of software packages for aircraft automated systems.
c. Navigational Aids Repair Shop – Facility for the repair of airborne navigational instruments such as celestial tracking system, sextants, driftmeters, etc..
d. Avionics Testing Shop

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine requirement.

211 43 INERTIAL QUALITY INSTRUMENT OVERHAUL SHOP (NAVAIR DEPOT) (m^2 / SF)

FAC: 2116
BFR Required: Y

21143-1 **GENERAL.** An Inertial Quality Instrument Overhaul Shop is required for the Electronic, Communication, and Armament Systems Production Shop of the Naval Air Depot (NAVAIR Depot). Included within this Category Code are:

a. Inertial Quality Gyroscope Overhaul Shop – Environmental controlled space for the overhaul of inertial quality gyroscopes. Inertial quality gyroscopes are those having a radome drift rate of 0.25 degrees per hour or less. All other gyroscopes are considered non-inertial quality for facility categorization purposes.
b. Inertial Guidance System Overhaul and Calibration Shop

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 44 NON-INERTIAL QUALITY INSTRUMENT OVERHAUL SHOP (NAVAIR DEPOT) (m^2 / SF)

FAC: 2116
BFR Required: Y

21144-1 **GENERAL.** A Non-Inertial Quality Instrument Overhaul Shop is required for the Electronic, Communication, and Armament Systems Production Shop of the Naval Air Depot (NAVAIR Depot). Included within this Category Code are:

a. Electronic Instrument Overhaul Shop – Facility used to support communications electronic instruments such as systems and display panels, oscilloscopes, etc..
b. Mechanical Instrument Overhaul Shop – Facility for the overhaul of items such as bank indicators and air speed indicators.
c. Non-inertial Gyroscope Overhaul Shop – Facility used to overhaul non-inertial gyroscope devices such as N-1 compass gyroscopes, bomb navigational system gyroscopes, etc.
d. Magnetic Instrument Overhaul and Test Shop

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 45 AVIONICS SHOP (NON-NAVAIR DEPOT) (m^2 / SF)
FAC: 2112
BFR Required: Y

21145-1 **GENERAL.** An Avionics Division at the intermediate maintenance level is required at Navy and Marine Corps Air installations for the testing, maintenance and repair of avionics systems. This section provides a method for determining the space requirements for this division. For additional guidance applicable to Marine Corps installations, see the 211 Supplement – Marine Corps Aircraft Maintenance Facilities. The Avionics Division is made up of standard size work centers, variable size work centers and support spaces.

a. Standard size work centers are those that do not vary with type/model of aircraft and size is determined by function and/or support equipment, i.e.: 60A Corrosion Control, 61D Crypto Repair, 62D Battery.

b. Variable size work centers are those that vary in size due to the quantity of support equipment required based on the number of aircraft supported, i.e.: 610 Comm./Nav., 62A Electrical, 64A Radar, 65A SACE, and 65P VAST.

c. Support spaces consist of those areas not directly involved in actual repair of aircraft components, i.e.: administrative, material control, production control, mechanical equipment room, passageways, locker rooms/heads, and the Precision Measuring Equipment (PME) work centers.

Refer to UFC 4-211-01 information on Avionics Shops.

The determination of gross square-footage requirements for a given air installation is accomplished through the use of Table 21145-1, Individual Aircraft Basic Allowance, and Table 21145-2, Multiple Aircraft Percentage Factors. This latter Table provides adjustments based on reduced requirements of support equipment due to commonality of aircraft components and to prevent duplicate allocations of standard size work centers and support spaces which are included in each individual aircraft basic space allowance.

Initially Table 21145-1 is entered using the number of assigned aircraft of each type/model. This provides the basic allowance for each type, and except as modified by Table 21145-3, is the total gross area for the support of a single type/model aircraft.

For installations supporting two or more type/model aircraft, the individual aircraft basic allowances from Table 21145-1 for each type/model are listed in descending order. Table 21145-2 is then entered with the first aircraft (largest basic space allowance) as the prime and the second aircraft as the secondary. The corresponding percentage factor is the percentage of the second aircraft's basic space allowance that will be added to the total space allowance of the first aircraft in computing the total space requirements. The percentage factor for the third (and succeeding) aircraft are determined by entering Table 21145-2 with each aircraft in the secondary column and selecting the smallest percentage factor when considered with all the other type/model aircraft with larger basic space allowances as the prime. These factors are applied to each aircraft's basic space allowance and the results added to compute the total space allowance for the installation.

Tables 21145-1 and 21145-2 are designed for Avionics Divisions of medium to large size Intermediate Maintenance Activities that normally require separate space for the full range of work centers. In smaller activities several functions are usually combined, reducing overall space requirements. Table 21145-3 provides an adjustment factor that is to be applied when the gross space allowance determined from Tables 21145-1 and 21145-2 is less than 40,000 square feet.

Table 21145-3
Adjustment Factor for Small Avionics Divisions

Gross Space (m^2)	Gross Space (m^2 / SF)	Factor
929 – 1,208	10,000 – 12,999	.50
1,209 – 1,487	13,000 – 15,999	.55
1,488 – 1,765	16,000 – 18,999	.60
1,766 – 2,044	19,000 – 21,999	.65
2,045 – 2,323	22,000 – 24,999	.70
2,324 – 2,602	25,000 – 27,999	.75
2,603 – 2,881	28,000 – 30,999	.80
2,882 – 3,160	31,000 – 33,999	.85
3,161 – 3,439	34,000 – 36,999	.90
3,440 – 3,717	37,000 – 39,999	.95
3,718 and up	40,000 and up	1.00

Example 1 - One type/model aircraft assigned.

There are 100 assigned aircraft of the type/model indicated in Column (1) below. Column (2) contains the basic space requirement from Table 21145-1.

Step 1.

Obtain basic space requirement for the type/model aircraft by entering Table 21145-1 with the quantity of aircraft to be supported.

Column (1)	Column (2)
100 F-14	3,727 m^2 (40,100 SF)

Since there is only one type/model assigned and the space requirement is over 3,718 m^2 (40,000 SF), no further computations are required.

Gross space allowance for Avionics Division – 3,727 m^2 (40,100 SF)

Example 2 - One type/model aircraft assigned.

There are 8 assigned aircraft of the type/model indicated in Column (1) below. Column (2) contains the basic space requirement from Table 21145-1. Column (3) contains the adjustment factor for a small avionics division from Table 21145-3. Column (4) contains the adjusted space requirement.

Step 1.

Obtain basic requirement for the type/model aircraft by entering Table 21145-1 with the quantity of aircraft supported.

Column (1)	Column (2)
8 E-2	22,200 SF

Step 2.

Since the space requirement in Column (2) is less than 40,000 SF obtain the adjustment factor for small avionics divisions from Table 21145-3.

Column (1)	Column (2)		Column (3)		Column (4)
8 E-2	2,064 m^2	x	.70	=	1,445 m^2
	22,200 SF	x	.70	=	15,540 SF

Gross space allowance for Avionics Division – 1,445 m^2 (15,540 SF)

Example 3 - Two Type/Model aircraft assigned

There are 144 assigned aircraft of the type/model and number indicated in Column (1) below. Column (2) contains the basic space requirements from Table 21145-1. Column (3) contains the percentage factor for the secondary aircraft (smallest basic space allowance). Column (4) contains the total space requirement.

Step 1.

Obtain basic space requirements for both type/model aircraft by entering Table 21145-1 with quantity of aircraft to be supported.

Column (1)	Column (2)
100 F-14	3,727 m^2 (40,100 SF)
44 F-4	1,534 m^2 (16,500 SF)

Step 2.

Obtain percentage factor for secondary aircraft by crossing from that aircraft in secondary column to the column under the prime aircraft (F-4 to F-14 = 35%) of Table 21145-2.

Column (1)	Column (2)	Column (3)
100 F-14	3,727 m^2 (40,100 SF)	
44 F-4	1,534 m^2 (16,500 SF)	31%

Step 3.

Enter 100% of prime aircraft basic space requirement (Column (2)) in Column (4). Calculate percentage (Column (3)) of secondary aircraft space requirement (Column (2)) and enter in Column (4). Add requirements of Column (4) for total avionics division requirement.

Column (1)	Column (2)		Column (3)		Column (4)
100 F-14	3,727 m^2	x	1.00	=	3,727 m2
	40,100 SF	x	1.00	=	40,100 SF
	1,534 m^2	x	0.31	=	476 m^2
44 F-44	16,500 SF	x	0.31	=	5,115 SF
					4,203 m^2
					45,215 SF

Gross space allowance for Avionics Division – 4,203 m^2 (45,215 SF)

Example 4 - Three or more Type/Model aircraft assigned

There are 196 assigned aircraft of the type/model and number indicated in Column (1) below. Column (2) contains the basic space requirements from Table 21145-1 in descending order of size. Column (3) contains the lowest percentage factor from Table 21145-2 for each secondary type aircraft when considered against those with larger basic space requirements as prime. Column (4) contains the total space requirement.

Step 1.

Obtain basic space requirements for both type/model aircraft by entering Table 21145-1 with quantity of aircraft to be supported.

Column (1)	Column (2)
100 F-14	3,727 m^2 (40,100 SF)
28 E-2	2,240 m^2 (24,100 SF)
44 F-4	1,534 m^2 (16,500 SF)
24 TA-4	995 m^2 (10,700 SF)

Step 2.

Select lowest percentage factor for secondary type aircraft for Column (3) by crossing from that aircraft in secondary column and considering each aircraft assigned with a larger basic space requirement as a prime aircraft.

a.The E-2 has only the F-14 with a larger basic space requirement therefore 20% will be used in Column (3).

b.The F-4 has both the E-2 (35%) and the F-14 (31%) with larger basic requirements. The F-14 has the lowest percentage factor (31%) so this will be entered in Column (3).

c.The TA-4 has all the other types with larger basic space requirements. The E-2 (11%) has a lower percentage factor than the F-14 (13%), but a higher percentage factor than the F-4 (10%); therefore, 10% shall be entered in Column (3).

Step 3.

Enter 100% of prime aircraft basic space requirement in Column (4). Calculate percentage (Column (3)) of secondary aircraft space requirement (Column (2)) and enter in Column (4). Add requirements of Column (4) for total avionics division requirement.

Column (1)	Column (2)		Column (3)		Column (4)
100 F-14	3,727 m^2	x	1.00	=	3,727 m^2
	40,100 SF	x	1.00	=	40,100 SF
28 E-2	2,240 m^2	x	0.20	=	448 m^2
	24,100 SF	x	0.20	=	4,820 SF
44 F-44	1,534 m^2	x	0.31	=	476 m^2
	16,500 SF	x	0.31	=	5,115 SF
24 TA-4	995 m^2 x	0.10		=	100 m^2
	10,700 SF	x	0.10		1,070 SF
					4,751 m^2
					51,105 SF

Gross space allowance for Avionics Division – 4,751 m^2 (51,105 SF)

211 50 AIRCRAFT ARMAMENT/MISSILE REWORK SHOP (NAVAIR DEPOT) (m^2 / SF)

FAC: 2116
BFR Required: Y

21150-1 **GENERAL.** An Aircraft Armament/Missile Rework Shop is required to provide space associated with processing weapons including guns, missiles, bomb racks, weapon pylons, etc., used by aircraft in carrying out its assigned mission.

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 51 DEDICATED AIRCRAFT ARMAMENT/MISSILE REWORK SHOP – GENERAL PURPOSE (NAVAIR DEPOT) (m^2 / SF)

FAC: 2116
BFR Required: Y

21151-1 **GENERAL.** A Dedicated Aircraft Armament/Missile Rework – General Purpose Shop is required for the Armament Production Shop of the Naval Air Depot (NAVAIR Depot). Included within this Category Code are:

a. Armament Dedicated Cleaning Shop
b. Armament Dedicated Paint Shop
c. Armament Dedicated Machine Shop
d. Armament Dedicated Welding Shop
e. Armament Dedicated Plating Shop
f. Aircraft Weapon Overhaul and Test Shop
g. Ordnance Equipment Shop
h. Weapon Accessories Repair Shop – Facility for the repair of bomb racks, weapon pylons, etc.

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 52 AIRCRAFT WEAPON OVERHAUL AND TEST SHOP (NAVAIR DEPOT) (m^2 / SF)

FAC: 2116
BFR Required: Y

21152-1 **GENERAL.** An Aircraft Weapon Overhaul and Test Shop is required for the Armament Production Shop of the Naval Air Depot (NAVAIR Depot). Included within this Category Code are:

a. Aircraft Weapon Overhaul and Test Shop
b. Ordnance Equipment Shop
c. Weapon Accessories Repair Shop – Facility for the repair of bomb racks, weapon pylons, etc.

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 53 AIR LAUNCHED MISSILE REWORK SHOP (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21153-1 **GENERAL.** An Air Launched Missile rework Shop is required to provide space for the repair of air launched missiles for the Armament Production Shop of the Naval Air Depot (NAVAIR Depot).

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 54 AIRCRAFT ARMAMENT SYSTEM SHOP (NON-NAVAIR DEPOT) (m^2 / SF)

Refer to the following publications for AAS storage facility preservation criteria:
CNAFINST 8380.2 and NAVAIR 15-01-500

FAC: 2112
BFR Required: Y

21154-1 **GENERAL.** Prior to commencing any I-Level facilities projects, coordination and planning must be conducted with the Command for which the facility is intended. Consideration must be made for other required duties of the occupying section. The Aircraft Armament Systems (AAS) shop and shops related to AAS sub-systems may be called different names. Within a Navy Command these shops fall under the Ordnance Division in the Maintenance Department. At a Marine Aviation Logistics Squadron (MALS), the AAS shop is under the Ordnance Department and not under the cognizance of the Maintenance Department. MALS Ordnance has the additional responsibilities of operating a Munitions shop, an Ammunition Stock Recording Section (ASRS), a Tool Room, a Production Control (PC) section, and an administrative section.

An Aircraft Armament Systems (AAS) shop is required at Navy and Marine Corps Intermediate Level (I-Level) maintenance activities to support combat aircraft. AAS encompasses five distinct subsystems; Aircraft Armament Equipment (AAE), Aircraft Gun Systems (AGS), Aircraft Crew Served Weapons (ACSW), ACSW mounts, and Laser Aiming Devices (LAD). Although missiles and rockets are handled at the missile maintenance shop or rocket assembly and loading areas, maintenance of AAS launchers is conducted in the AAS shop.

Aircraft that require support from this shop can be classified in three general groups, the attack/fighter group which require extensive support, the Anti-submarine Warfare (ASW), and Transport groups which require much less support. Table 21154-1 below lists the aircraft in each group. The Navy/Marine Corps aircraft that do not appear in either group generally do not require support from an AAS shop.

Table 21154-1
Aircraft Classification

Attack/Fighter	ASW	Transport
F-35	SH-60	KC-130HH
F/A-18	P-3	CH-53
AV-8	S-3	MV-22
AH-1/UH-1	P-8	
E/A-6		

The determination of gross square footage requirements for a given air installation is accomplished through the use of Table 21154-2 Space Allowance for Basic Aircraft Armament System Division, Table 21154-3 Space Allowance for AAS Pool, and Table 21154-4 Space Allowance for the Armament Weapons Support Equipment (AWSE) Work Center (for those activities having this responsibility). (Type Commander 8380 series instructions determine which activities have Aircraft Armament System Equipment Pool responsibilities).

Initially Table 21154-2 is entered in Column (1) using the total number of assigned attack and fighter aircraft. The gross area is read in Column (2). For those activities without any attack or fighter aircraft but having other type aircraft that require Armament Division support, such as P-3, S-3, etc., enter Column (1) with total number of these aircraft. The required gross area is read in Column (3).

Table 21154-2
Space Allowance for
Basic Aircraft Armament System Division

Column (1) No. Aircraft	Column (2) Attack/Fighter (m^2)	Column (2) Attack/Fighter (SF)	Column (3)* ASW (m^2)	Column (3)* ASW (SF)
Up to 50	325	3,500	251	2,700
51-75	409	4,400	288	3,100
76-100	465	5,000	325	3,500
101-125	502	5,400		
126-175	567	6,100		
176-225	623	6,700		
226 +	651	7,000		

*Do not use when activity also supports attack and/or fighter aircraft, use allowance from Column (2) only.

The above space allowances include space for degreasing, storage of guns, administration, production control, training, supply and tool room, male and female personnel facilities and a mechanical equipment room. If an I-level facility utilizes and stores Aircraft Crew Served Weapons (ACSW), the area which these systems are stowed must meet the Unified Facilities Criteria for Armories, Refer to UFC 4-215-1 (i.e. physical security and humidity controlled).

Example Computation 1 – Aircraft Armament Systems Shop

Assigned aircraft:	80	F-35
	56	F/A-18A
	42	S-3A
Total	178	

Since base loading includes attack and fighter aircraft, only those numbers are used to enter Table 21154-2. Therefore, Column (1) is entered with 136 aircraft. A required area of 567 m^2 (6,100 SF) is read from Column (2).

Example Computation 2 – Aircraft Armament Systems Shop

Assigned aircraft:	42	P-3C
	22	CH-53
Total	64	

This base loading does not include either attack or fighter aircraft, consequently the total number of aircraft is used to enter Table 21154-2. Entering Column (1) with 64 aircraft, a required area of 288 m^2 (3,100 SF) is read from Column (3).

Activities that have the assigned responsibilities of maintaining an Aircraft Armament System Equipment Pool, the basic shop requirement from Table 21154-2 will be increased by the requirement from Table 21154-3.

Table 21154-3
Space Allowance for
Aircraft Armament System Equipment Pool

Column (1) Aircraft	Column (2) Area Per Aircraft (m^2)	Column (2) Area Per Aircraft (SF)
E/A-6	3	32
F-35	6.1	66
F/A-18	5.9	64
AH-1/UH-1	5	54
MV-22	1.11	12
CH-53	7.1	76
SH-60	0.5	5
P-3	1.1	12
S-3	0.9	10
P-8	0.5	5
AV-8B	3.5	38
KC-130HH	1.11	12

The above allowance provides space for Pool storage and the issuing and receiving functions only. Administrative and other support functions are provided in the basic allowance from Table 21154-2.

Example Computation 3 – Aircraft Armament System Equipment Pool

Assigned aircraft are identical to Example Computation 1 above, however pool support is also provided for 30 SH-60B at another station.

Type A/C (Column (1))	Area Per A/C (m^2) (Column (2))	Area Per A/C (SF) (Column (2))	Number A/C	m^2	SF
F-35	6.1	66	80	488	5,253
F/A-18A	5.9	64	56	330	3,552
S-3A	0.9	10	42	38	409
SH-60B	0.5	5	30	15	161
Total space requirement				871	9,375

This requirement is added to the basic requirement from Table 21154-2, 567 m^2 (6,100 SF), to give a total requirement of 1,438 m^2 (15,475 SF) for the Aircraft Armament System Shop.

Marine Corps activities have the additional responsibility of conducting maintenance on AWSE. Space for this added function is provided by Table 21154-4. It is based on the activities' allowance for weapons trailers.

Table 21154-4
Space Allowance for
Armament Weapons Support Equipment Work Center

Column (1) Type Trailer	Column (2) Area Per Trailer (m^2)	Column (2) Area Per Trailer (SF)
AM32K-10	2.3	25
MHU-151/M	1.4	15

The above allowance provides space for the AWSE work center only. Administration and other support functions are provided in the basic allowance from Table 21154-2.

Example Computation 4 – Aircraft Armament Systems Shop

A Marine Corps activity has a base loading as shown below, with the armament equipment pool responsibility for the same number and type aircraft.

Base loading: 20 AV-8 Aircraft

24 AH-1Z Aircraft
16 CH-53E Aircraft
15 F-35 Aircraft
25 AM32K-10 Trailers
28 MHU-151/M Trailers

a.) Basic shop requirement

Attack Aircraft:	20	AV-8
	24	AH-1
	15	F-35
Total	59	

Enter Table 21154-2, Column (1) with 59 aircraft. A required area of 409 m^2 (4,400 SF) is read from Column (2).

b.) Aircraft Armament System Equipment Pool

Type A/C (Column (1))	Area Per A/C (m^2) (Column (2))	Area Per A/C (SF) (Column (2))	Number A/C	m^2	SF
AV-8	3.5	38	20	70	753
AH-1Z	5	54	24	120	1,292
CH-53E	7.1	76	16	114	1,227
F-35	6.1	66	15	92	990
Total space requirement				396	4,262

c.) Armament Weapons Support Equipment Work Center

Type Trailer	Area per Trailer (m^2)	Area per Trailer (SF)	No. Trailer	m^2	SF
AM32K-10	2.3	25	25	58	624
MHU-151/M	1.4	15	28	39	420
Total space requirement				97	1,044

Total gross square feet for Aircraft Armament System Shop

	m^2.	SF
a.) Basic Shop Requirement	409	4,400
b.) Equipment Pool Requirement	396	4,262
c.) Support Equipment W/C Requirement	97	1,044
Total	902	9,706

211 55 AVIATION ARMAMENT SUPPORT EQUIPMENT HOLDING SHED (NON-NAVAIR DEPOT) (m^2 / SF)

Refer to the following publications for AAS storage facility preservation criteria:
CNAFINST 8380.2 and NAVAIR 15-01-500

FAC: 4412
BFR Required: N

21155-1 **GENERAL.** For Marine Corps activities, an aviation armament support equipment holding shed is planned in conjunction with the Category Code 211 54, Aircraft Armament System Shop. The shed provides cover for weapons trailers, bomb cradles, and other armament support equipment and is an integral part of Marine Aviation Logistics Squadrons' Ordnance Department.

The holding shed requirement is based on a unit space for each weapons trailer in accordance with Table 21155-1. The gross square feet requirement is sized by multiplying the unit space for each type trailer by the activity's allowance.

Table 21155-1
Space Allowance for Armament Weapons Support Equipment Holding Shed

Type Trailer	Area per Trailer (m2)	Area per Trailer (SF)
A/M32K-10	12.4	133
MHU-151/M	6.7	72
U-21	12.4	133

Example Computation 1 – Holding Shed

A Marine Aviation Logistics Squadron (MALS) has an allowance of thirty AM32K-10 trailers and twenty-five of the smaller MHU-151/M trailers, and one U-21 maintenance trailer.

Type Trailer	Area per Trailer (m^2)	Area per Trailer (SF)	No. Trailer	m^2	SF
A/M32K-10	12.4	133	30	372	3,990
MHU-151/M	6.7	72	25	168	1,800
U-21	12.4	133	1	12.4	133
			Total	552.4	5,923

211 60 SUPPORT EQUIPMENT REWORK SHOP (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21160-1 **GENERAL.** A Support Equipment Rework Shop is required to provide space associated with processing aviation general and special support equipment and aerospace ground support equipment.

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 61 DEDICATED SUPPORT EQUIPMENT REWORK GENERAL PURPOSE SHOP (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21161-1 **GENERAL.** A Dedicated Support Equipment Rework General Purpose Shop is required for the Support Equipment Production Shop of the Naval Air Depot (NAVAIR Depot). Included within this Category Code are:

a. Support Equipment Dedicated Cleaning Shop
b. Support Equipment Dedicated Paint Shop
c. Support Equipment Dedicated Machine Shop
d. Support Equipment Dedicated Plating Shop
e. Support Equipment Dedicated Welding Shop

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 62 SUPPORT EQUIPMENT CALIBRATION SHOP (NAVAIR DEPOT) (m2. / SF)
FAC: 2116
BFR Required: Y

21162-1 **GENERAL.** A Support Equipment Calibration Shop is required for the Support Equipment Production Shop of the Naval Air Depot (NAVAIR Depot). Included within this Category Code are:

a. Aeronautical Electronic Support Equipment Shop – Includes mobile maintenance facility construction, outfitting and repair.
b. Electronic Test Systems Repair Shop – Facility for the repair of VAST, ATE, etc.

c. Precision Measurement Equipment Shop – Facility used to repair, calibrate and certify precision measurement and test equipment.

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 63 GROUND SUPPORT EQUIPMENT REWORK SHOP (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21163-1 **GENERAL.** A Ground Support Equipment Rework Shop is required for the Support Equipment Production Shop of the Naval Air Depot (NAVAIR Depot). Included within this Category Code are:

a. GSE Maintenance Shop – Facility used for the servicing and maintaining of ground support equipment such as work stands, firefighting equipment, portable air conditioners, air compressors, generators, etc..
b. Training Devices Shop – Facility used to repair and modify training aids such as mock-ups, cut away models, etc.
c. Hydrostatics Shop – Facility used to periodically inspect and overhaul of hydrostatic equipment.

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 64 GROUND SUPPORT EQUIPMENT HOLDING SHED (NAVAIR DEPOT) (m^2 / SF)
FAC: 2185
BFR Required: Y

21164-1 **GENERAL.** A Ground Support Equipment Holding Shed is required for the Support Equipment Production Shop of the Naval Air Depot (NAVAIR Depot).

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 65 AIRBORNE WEAPONS SUPPORT EQUIPMENT SHOP (NAVAIR DEPOT) (EA)

FAC: 2112
BFR Required: Y

21165-1 **GENERAL.** An Airborne Weapons Support Equipment Shop is required for the Support Equipment Production Shop of the Naval Air Depot (NAVAIR Depot).

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 70 MANUFACTURING AND REPAIR SHOP (NAVAIR DEPOT) (m^2 / SF)

FAC: 2116
BFR Required: Y

21170-1 **GENERAL.** A Manufacturing and Repair Shop is required to provide space for aircraft repair operations by such work functions as parts cleaning and painting, plating and metal processing shop.

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 71 DEDICATED MANUFACTURING AND REPAIR – GENERAL PURPOSE SHOP (NAVAIR DEPOT) (m^2 / SF)

FAC: 2116
BFR Required: Y

21171-1 **GENERAL.** A Dedicated Manufacturing and Repair - General Purpose Shop is required for the Manufacture and Repair Production Shop of the Naval Air Depot (NAVAIR Depot). Included within this Category Code are:

a. Welding Shop
b. Foundry Shop
c. Peening and Blasting Shop
d. Non-destructive Inspection – Magnetic particle, Dye Penetrant, etc..
e. Parts Cleaning Shop
f. Parts Painting Shop

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 72 METAL FABRICATION/MANUFACTURING SHOP (NAVAIR DEPOT) (m^2 / SF)

FAC: 2116
BFR Required: Y

21172-1 **GENERAL.** A Metal Fabrication/Manufacturing Shop is required for the Manufacture and Repair Production Shop of the Naval Air Depot (NAVAIR Depot). Included within this Category Code are:

a. Machine Shop
b. Grinding Shop – Facility is used primarily for close tolerance grinding of metal parts that have been built up by metalizing or electroplating processes.
c. NC Machine Shop – Facility primarily using numerically controlled machines; separate from common machine shop.
d. Metal Parts Fabrication Shop

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 73 METAL TREATMENT SHOP (NAVAIR DEPOT) (m^2 / SF)

FAC: 2116
BFR Required: Y

21173-1 **GENERAL.** A Metal Treatment Shop is required for the Manufacture and Repair Production Shop of the Naval Air Depot (NAVAIR Depot). Included within this Category Code are:

a. Metal Processing Shop – Facility for metal treating processes such as nickel braze, ceramic coating, plasma, etc.
b. Plating Shop
c. Heat Treating Shop – Facility for heat treating metals such as tempering, annealing, quenching, stress relieving, etc.

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 74 NON-METAL FABRICATION/MANUFACTURING SHOP (NAVAIR DEPOT) (EA)

FAC: 2116
BFR Required: Y

21174-1 **GENERAL.** A Non-Metal Fabrication/Manufacturing Shop is required for the Manufacture and Repair Production Shop of the Naval Air Depot (NAVAIR Depot). Included within this Category Code are:

a. Plastic Fabrication Shop – Facility for the manufacture of plastic items such as tubing, caps, covers, panels, foam container liners, templates, fixtures and tooling.
b. Pattern Shop
c. Decal (Graphic Arts) Shop
d. Woodworking Shop
e. Rubber Fabrication Shop – Facility for fabrication of rubber equipment such as aircraft fuel cells and molded rubber products.

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 75 AVIATION LIFE SUPPORT SYSTEMS SHOP (NON-NAVAIR DEPOT) (m^2 / SF)

FAC: 2184
BFR Required: Y

Design Criteria: UFC 4-211-01, Aircraft Maintenance Hangars

21175-1 **GENERAL.** An Aviation Life Support Systems Shop is required at Navy and Marine Corps air installations for inspecting, repairing, and repacking of parachutes, flotation devices, oxygen and other life support equipment. See basic Category 211 Supplement, Maintenance, Aircraft spares for Marine Corps Aircraft Maintenance Facilities, for which special guidance is provided.

21175-2 **APPLYING CRITERIA**. To determine the gross square footage requirements for a given air installation, the number of each type assigned aircraft, Column (1), is multiplied by the corresponding sizing factor in Column (2) of Table 21175-1. The sum of the products for each type of aircraft becomes the "basic sizing factor" which determines the number of packing tables required. This is used to enter Table 21175-2 to obtain the basic area allowance. Add to this the square footage of the largest sized Aviators Safety Equipment (Flotation) Shop from Column (3) and the largest sized Oxygen Regulator and Equipment Shop from Column (4) of Table 21175-1 to obtain the "gross square foot" requirement.

The basic area allowance from Table 21175-2 includes the following support spaces:

Male and Female lavatories and lockers
Training/Conference room
Administrative office
Sewing/Fabrication room
Production Control
Storage area
Washer and Dryer room
Mechanical room

In the one (1) packing table shop no separate areas are planned for the training/conference, sewing/fabrication rooms nor the administrative office. Space is planned within the production control area for the administrative functions, while the other functions are planned for within the packing table area.

Planning factors do not include space for a parachute hanging tower, a Liquid Oxygen (LOX) Farm nor for an Ejection Seat Shop. If an intermediate maintenance activity plans to operate/maintain a LOX Farm and/or an Ejection Seat Shop or has a special requirement for a hanging tower, such as support of a SEAL team, space allocation must be justified separately.

Table 21175-1
Sizing Factors for
Aviation Life Support Systems Shop

Column (1) Type A/C	Column (2) Parachute Shop Factor	Column (3) Flotation Shop	Column (4) Oxygen Shop
A-4	0.0016	M	L
TA-4	0.0032	M	L
A-6	0.0032	M	L
EA-6	0.0064	M	L
A-7	0.0016	M	L

H-1	0.0001	S	S
H-2	0.0001	S	S

Column (1) Type A/C	Column (2) Parachute Shop Factor	Column (3) Flotation Shop	Column (4) Oxygen Shop
H-3	0.0001	L	S
H-46	0.0001	L	S
H-53	0.0001	L	S
H-60	0.0001	L	S
P-3	0.0368	L	S
S-3	0.0064	M	L
T-2	0.0032	M	S
AV-8	0.0016	M	L
TAV-8	0.0032	M	L
OV-10	0.0032	M	S
Values of Column (3) S = 300 Sq.Ft. M = 500 Sq.Ft. L = 900 Sq.Ft.		**Value of Column (4) S = 300 Sq.Ft. L = 500 Sq.Ft.**	

Table 21175-2
Basic Allowance for
Aviation Life Support Systems Shop

Factor Total	Basic Allowance
0 to 1	3,000 Sq.Ft.
More than 1 to 2	5,000 Sq.Ft.
More than 2	6,000 Sq.Ft.

Example Computation 1

A/C	No.	Column (2)	Factor Product	Column (3)	Column (4)
F-14	120	0.0032	0.3840	M	L
TA-4	18	0.0032	0.0576	M	L
A-4	6	0.0016	0.0096	M	L
E-2	30	0.0080	0.2400	M	L
			0.6912	M	L

From Table 211-75B	0.6912 =	3,000 sq.ft..
From Table 211-75A	Column (3) “M” =	500 sq.ft.
From Table 211-75A	Column (4) “L” =	500 sq.ft..
		4,000 sq.ft.

Example Computation 2

A/C	No.	Column (2)	Factor Product	Column (3)	Column (4)
P-3	60	0.0368	2.2080	L	S
H-2	10	0.0001	0.0010	S	S
H-3	40	0.0001	0.0040	L	S
			2.2130	L	S

From Table 211-75B	2.2130 =	6,000	sq.ft.
From Table 211-75A	Column (3) "L" =	900	sq.ft.
From Table 211-75A	Column (4) "S" =	300	sq.ft.
		7,200	sq.ft.

Example Computation 3

A/C	No.	Column (2)	Factor Product	Column (3)	Column (4)
A-7	115	0.0016	0.1840	M	L
S-3	40	0.0064	0.2560	M	L
F/A-18	24	0.0016	0.0384	M	L
TF/A-18	6	0.0032	0.0192	M	L
H-3	4	0.0001	0.0004	L	S
			0.4980	L	L

From Table 21175-2	0.4980 =	3,000	sq.ft.
From Table 21175-1	Column (3) "L" =	900	sq.ft.
From Table 21175-1	Column (4) "L" =	500	sq.ft.
		4,400	sq.ft.

211 76 MISCELLANEOUS PARTS/COMPONENTS REPAIR SHOP (NAVAIR DEPOT) (m^2 / SF)

FAC: 2116
BFR Required: Y

21176-1 **GENERAL.** A Miscellaneous Parts/Components Repair Shop is required for the Manufacture and Repair Production Shop of the Naval Air Depot (NAVAIR Depot). Included within this Category Code are:

a. Tubing Shop
b. Cable Shop
c. Cordage (Flight Controls) Shop
d. Electrical Cable/Harness Shop

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine requirement.

211 80 TEST AND CALIBRATION SHOP (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21180-1 **GENERAL.** A Test and Calibration Shop is required to provide space dedicated to test, trim, or calibrate engines, electronics, communications or armament systems. This is the main Category Code used for the Test and Calibration Production Shop of the Naval Air Depot (NADEP).

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 81 ENGINE TEST CELL (NON-NAVAIR DEPOT) (m^2 / SF)
FAC: 2118
BFR Required: Y

Design Criteria: UFC 4-212-01, Navy Standard Jet Engine Test Cells

21181-1 **GENERAL.** An engine test cell provides an acoustic attenuated and fully instrumented enclosure in which uninstalled turbojet and turbofan engines are tested at installations where intermediate level maintenance engine repair work is performed. The enclosure provides a better working environment than open pads by providing protection from inclement weather and cross winds which adversely affect testing of engines, while at the same time significantly reducing exterior noise levels. NAVFAC P-970, Planning in the Noise Environment, specifies acceptable noise levels for various land uses. See Category Code 211 01, Aircraft Acoustical Enclosure (Non-NAVAIR Depot), for P-970 requirements.
Current Navy aircraft inventory includes two types of jet engines: turbo fan/turbo jet engines and turbo shaft jet engines, which power aircraft with rotors or propellers. The test cells for these two types of engines would differ in size due to the differences in power requirements, volume of exhaust, and noise levels.

This facility shall support out of frame testing for the Intermediate-level Engine Maintenance Shop (Non-NAVAIR Depot), Category Code 211 21.
The facility includes spaces for engine mounts, fueling system, and observation and control. Engine test stands and Power Check Pads, without Sound Suppression (Non-NAVAIR Depot), Category Code 211 89 or with Sound Suppression (Non-NAVAIR Depot), Category Code 211 88, are normally authorized for all stations or activities requiring jet engine test facilities.

If possible, the Test Cell should be sited close to the Engine Maintenance Shop. It will require a paved access road for towing engines from the shop. Consideration should be given to enclosing existing open Power Check Pads.

The number of test cells required is based on the total monthly engine runs required and availability of a test cell for testing. The total monthly engine runs would be determined by the program management activity involved for each engine. The required monthly production could be estimated from total flight hours, number squadrons, and number of engine runs for each engine. The availability of a cell available for testing runs on a monthly basis can be determined with input from Fleet Readiness Center and NAVAIR Aircraft Engine Test System (AETS) Fleet Support Team (FST) based on operational data. It is estimated that 60% to 80% of the time a test cell is in operation is available for engine testing due to maintenance requirements, scheduled or unscheduled. For a newer test cell, percentage availability is closer to 80% whereas an older test cell is expected to be available closer to 60% of the time.

Besides availability, several other factors impact production rate including the time required for each engine run, number of shifts available for a test cell, and number of days a test cell is in operation on a monthly basis.

The following example illustrates the methodology for defining the requirement for test cells at Naval Air Oceana Test Cell involving two engines for F/A 18A-F aircraft.

Table 21181-1
Out-Of-Frame Engine Test Facility Requirements
Global Engine Repair
Naval Air Station Oceana

Item Description	Unit	Value	Note/Computation
Total Monthly Engine Runs Required			
Required production per month (projected up to the next 5-yrs)	F404 Engine	17	Data obtained from PMA
	F414 Engine	18	Data obtained from PMA
Total monthly production requirement	Engine Tests/Mo	35	Summary of monthly productions for all engines
Number of engine runs per engine test	Engine Runs/ Engine Test	2	Requirement set by PMA
Total monthly engine runs required	Engine Runs/Mo	70	Total monthly production requirement X Number of engine runs per engine test
Monthly Engine Runs Per Cell			

Item Description	Unit	Value	Note/Computation
Time required for one engine run	Hrs.	8	Data obtained from test cell operation
Shifts per available day		2	Average based on annual operation
Operating hours per shift	Hrs.	8	Data obtained from test cell operation
Operating hours per day	Hrs.	16	Shifts per available day X Operating hours per shift
Number of days test cell is available per month	Days/Cell/Mo	20	Average based on annual operation
Operating hours per cell per month	Hrs./Cell/Mo	160	Operating hours per day X Number of days test cell is available per month
Availability of test cell for engine testing	Percentage	60%	Average based on annual operation, determined with input from FRC/AETS FST
Available hours for engine testing per cell per month	Hrs./Cell/Mo	96	Operations hours per cell per month X Availability of test cell for engine testing
Monthly engine runs per test cell	Engine Runs/ Cell/Mo	24	Available hours for engine testing per month / Time required for one engine run
Number of Test Cells Required			
Number of test cells required	Cells	2.92	Total monthly engine runs required / Monthly engine runs per test cell
Number of test cells required, rounded up	Cells	**3**	

211 82 AIRCRAFT WEAPONS ALIGNMENT SHELTER (NON-NAVAIR DEPOT) (m^2 / SF)

FAC: 2116
BFR Required: Y

21182-1 **GENERAL.** A minimum of one aircraft weapons alignment shelter is required at Navy and Marine Corps air installations having fighter or attack aircraft which require alignment of on-aircraft weapons systems. In addition to weapons systems alignment, which is the process of mechanically and electrically aligning aircraft weapons electronic systems to a common aircraft axis, this facility provides space for on-aircraft electronic maintenance of the weapons systems. For the mechanical alignment of guns attached to aircraft, see Aircraft Boresight Range (Non-NAVAIR Depot), Category Code 211 09. If vehicle and aircraft access pavement is required, see Category Code 851 10, Roads, and 113 40, Aircraft Access Apron.

To determine the square footage requirements for a given air installation, the number of assigned aircraft of the types that require weapons calibration is first determined. This number is used to enter column 1 of Table 21182-1. Columns 2 and 3 of Table 21182-1 show the number of bays and gross area of structure required respectively.

Table 21182-1
Space Allowances for Aircraft Weapons Alignment Shelter

Column 1	Column 2	Column 3
No. A/C	**No. Bays**	**Gross Area m^2 (SF)**
Up to 20	1	488 (5,246)
21 to 41	2	969 (10,423)
42-63	3	1,441 (15,503)
64-87	4	1,913 (20,583)
88-114	5	2,385 (25,663)
115-145	6	2,858 (30,743)
146-181	7	3,330 (35,822)
182-223	8	3,802 (40,902)
224-272	9	4,274 (45,983)
over 272	10	4,746 (51,063)

211 83 ENGINE TEST CELL (NAVAIR DEPOT) (m^2 / SF)
FAC: 2118
BFR Required: Y

21183-1 **GENERAL.** An Engine Test Cell is required for the Test and Calibration Production Shop of the Naval Air Depot (NAVAIR Depot). Included within this Category Code are:

a. Jet Engine Test Cell (10,000 – 16,000 lbs. maximum thrust)
b. Jet Engine Test Cell (Over 16,000 lbs. maximum thrust)
c. Jet Engine Test Stand – Facility for testing jet aircraft engines which has no acoustical noise abatement and is not part of an enclosed facility.
d. Turbo Prop Test Cell
e. Reciprocating Engine Test Cell (3,000 HP or less)
f. Reciprocating Engine Test Cell (Over 3,000 HP)
g. Reciprocating Engine Test Stand - Facility for testing reciprocating aircraft engines which has no acoustical noise abatement and is not part of an enclosed facility.
h. Turbo Shaft Test Cell
i. Turbo Fan Test Cell
j. Pneumatic Gas/Air Turbine Test Cell

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 84 HELICOPTER BLADE TEST FACILITY (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21184-1 **GENERAL.** A Helicopter Blade Test Facility is required for the Test and Calibration Production Shop of the Naval Air Depot (NAVAIR Depot).

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 85 RADOME TEST FACILITY (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21185-1 **GENERAL.** A Radome Test Facility is required for the Test and Calibration Production Shop of the Naval Air Depot (NAVAIR Depot).

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 86 RADAR/ANTENNA TEST FACILITY (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21186-1 **GENERAL.** A Radar/Antenna Test Facility is required for the Test and Calibration Production Shop of the Naval Air Depot (NAVAIR Depot).
There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 87 AIRCRAFT WEAPONS ALIGNMENT/BORESIGHT FACILITY (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21187-1 **GENERAL.** An Aircraft Weapons Alignment/Boresight Facility is required for the Test and Calibration Production Shop of the Naval Air Depot (NAVAIR Depot).

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 88 POWER CHECK PAD WITH SOUND SUPPRESSION (NON-NAVAIR DEPOT) (m^2 / SF)
FAC: 2118
BFR Required: Y

21188-1 **GENERAL.** Power check pads provided with fixed or portable sound suppressors which meet desired noise criteria are categorized here. Planning is the same as in Category Code 211-89. NAVFAC P-970 provides an analytical method for evaluating location of the power check pad with respect to inhabited areas. It shows how to calculate the expected noise levels and estimate the probable response to the noise. This noise survey is essential for substantiating the requirement for a power check pad with sound suppression.

211 89 POWER CHECK PAD WITHOUT SOUND SUPPRESSION (NON-NAVAIR DEPOT) (m^2 / SF)
FAC: 2118
BFR Required: Y

21189-1 **GENERAL.** Navy and Marine Corps air installations where aircraft are permanently assigned, and aircraft maintenance is performed require power check facilities. The power check pad is used to test and adjust engines mounted in the aircraft, in-frame testing. Employing portable engine test stands, the power check pad is used for uninstalled engine testing. A power check pad includes Portland cement concrete airfield pavement with securing fittings, and, where required, protection walls and blast deflectors. NAVFAC P-970, Planning in the Noise Environment, specifies acceptable noise levels for various land uses. See Category Code 211 01, Aircraft Acoustical Enclosure (Non-NAVAIR Depot), for P-970 requirements.

Power check pads without sound suppression shall only be planned when a noise survey, as laid out in P-970, has shown that the location will not result in the need for sound suppression.

One power check pad for in-frame testing shall be planned to support up to 140 aircraft and two will support up to 360 aircraft. Out-of-frame testing facilities should be planned in conjunction with Category Code 211 81, Engine Test Cell (Non-NAVAIR Depot). The power check pad should be at least 610 meters (2,000 feet) from any other activity, and preferably at greater distances from administrative, training, housing, and other inhabited buildings in order to reduce the sound suppression requirement. When used for uninstalled engine testing, the power check pad includes provision for portable fueling and instrumentation equipment and must be located for ready accessibility from the Engine Maintenance Shops, Category Code 211 21. At existing airfields, maximum use shall be made of surplus airfield pavement that can be modified to satisfy the power check pad requirement.

211 90 OTHER SUPPORT FACILITIES (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21190-1 **GENERAL.** Other Support Facilities are those areas used to perform productive NAVAIR Depot work that have not been previously identified. This includes ramp, apron, and aircraft storage sites.

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 91 UNCOVERED RAMP (NAVAIR DEPOT) (m^2 / SF)
FAC: 2118
BFR Required: Y

21191-1 **GENERAL.** Uncovered Ramp is required to perform NAVAIR Depot-specific maintenance and production functions. Included within this Category Code are:

a. Aircraft Rework Apron – Uncovered areas specifically assigned for NAVAIR Depot maintenance.
b. Reclamation Apron – Uncovered areas assigned to depot maintenance used for performing aircraft reclamation work.
c. Armament and Disarmament Pad
d. Pre-dock /Post-dock Apron
e. Aircraft Corrosion Control Facility (Uncovered)
f. Ground Check/Flight Test Support (Uncovered)

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 92 COVERED GROUND CHECK/FLIGHT TEST FACILITY (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21192-1 **GENERAL.** A Covered Ground Check/Flight Test Facility is required for the Naval Air Depot (NAVAIR Depot).

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 93 ENGINEERED LAB (NAVAIR DEPOT) (m / SF)
FAC: 2116
BFR Required: Y

21193-1 **GENERAL.** An Engineering Lab is required to provide space to support NAVAIR Depot-specific maintenance and production functions. Included within this Category Code are:

a. Material Handlers/Parts Expediters
b. Material Control Laboratory
c. Standards Laboratory
d. Programmer’s – Automatic Test Equipment and Numerical Controlled Machine

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 94 AIRCRAFT POWER CHECK FACILITIES (NAVAIR DEPOT) (m^2 / SF)
FAC: 2118
BFR Required: Y

21194-1 **GENERAL.** Aircraft Power Check Facilities are required to perform NAVAIR Depot-specific maintenance and production functions. Included within this Category Code are:

a. Power Check Pad (No Sound Suppression)
b. Power Check Pad (With Sound Suppression)
c. Propeller Aircraft Power Check Pad
d. Helicopter Aircraft Power Check Pad
e. VSTOL Aircraft Power Check Pad

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 95 MATERIAL AND EQUIPMENT STAGING/STORAGE FACILITY (NAVAIR DEPOT) (m^2 / SF)
FAC: 2116
BFR Required: Y

21195-1 **GENERAL.** A Material and Equipment Staging/Storage Facility for Naval Air Depot (NAVAIR Depot) is required to provide space for Packaging and Preservation of material.

There are no specific criteria developed for this Category Code. An engineering study must be performed to determine the requirement.

211 96 MAINTENANCE – AIRCRAFT/SPARES STORAGE (m^2 / SF)
FAC: 2116
BFR Required: Y
