- Every door from a CAR will permit immediate reentry from the outside at all times when the facility is being used. This must be accomplished without toggling down the panic hardware.
- Design door thresholds and hardware to facilitate the exiting of an evacuation crib with up to four children pushed and/or pulled by a single adult.

- Secondary exit doors: All exterior doors other than the main entrance, the kitchen exterior entrance, and any door that opens to a fenced area must trigger a notification when opened to the reception desk to alert staff of unauthorized entry or exit.
- Exits must have a maximum drop of .25 in. (6 mm) and be equipped with ramps with all-weather non-slip surface for emergency evacuation of wheeled evacuation cribs and wheelchairs. Turns and bends in the ramps must be wider than the minimum. Any handrails must meet requirements for guardrails and protective barriers as set forth in the *CPSC Public Playground Safety Handbook*. Size of allowable handrail openings limited to 3 in. (75 mm) (as established in CPSC guidelines for Toddlers).

Provide a smooth paved-surfaced evacuation route to a safe gathering area not less than 75 ft. (23 m) from the facility for all exits and CARs. This route must not cross any emergency vehicle access path, parking area or street, but the paved evacuation path must connect to a public way and must not dead end in grassed areas. The evacuation route must be a minimum of 60 in. (1524 mm) wide; turns and bends in the route must be wider to account for the turning radius of the evacuation cribs and wheelchairs. These routes and safe gathering area must comply with ABA requirements of an accessible route, and with the lighting requirements for exterior pedestrian walkways per UFC 3-530-01, “Design: Interior and Exterior Lighting and Controls”. Additionally, the evacuation route must provide landings at 75 horizontal foot (22.9 horizontal meter) intervals. Each egress gate must provide a minimum of 44 in. (1020 mm) clear width with panic hardware in the outdoor activity area fences. The safe gathering area needs to provide protection for children from adjacent hazards via fencing (such as storm drainage facilities) or other acceptable means as determined by the Regulatory Authority identified in Chapter 1.

3-4.2.2 Additional Exiting Requirements for Extreme Cold Weather Locations.

Extreme cold weather locations are those with more than 50 hours per year with a dry-bulb temperature below 5°F (–15° C) between the hours of 0900 and 1600. (Weather data for DoD is maintained by the Air Force Combat Climatology Center and may be accessed for all DoD locations at https://notus2.afccc.af.mil/SCISPublic/). The file can be searched by installation or city name. Temperature data is found in the Table, Dry-Bulb Temperature Hours for an Average Year and is presented first by month and annual summary. From the summary under the column 0900 to 1600, total the hours. For example, the numbers in parenthesis are the hours in that temperature range for the following bases: Bangor, ME (40); Elmendorf AFB, AK (151); Minot, ND (244); Offutt AFB, NE (41); and Andrews AFB, MD (0). Weather data is also available at http://www.afccc.af.mil/ using the “Other Domain” link to submit a service request for the weather data. If a location meets the criteria for an "extreme cold weather location," comply with the following:

- Provide a two-hour area separation wall dividing the facility child activity areas roughly in half on either side of the wall. Locate the core

administrative/support areas totally in one area or the other. Provide for horizontal exiting from one fire area to the other.

- Design corridor/room doors in the two-hour area separation wall to recess into the wall providing a smooth continuous wall surface. Install magnetic latches to hold door open, which release when the fire evacuation signal sounds. Install swinging doors that swing in opposite directions.
- Install magnetic latches to hold open other doors in the two-hour area separation wall that release when the fire evacuation signal sounds.
- Seal and fire stop all penetrations of the two-hour separation wall for conduit, piping, HVAC and electric service to maintain the fire rating of the wall.

3-4.2.3 Emergency Lighting.

Incorporate the emergency lighting into the normally provided lighting fixtures including the lighting in laundry rooms.

3-4.2.4 Fire Separation.

Provide a one-hour fire resistive fire barrier around the laundry room.

3-4.2.5 Fire Suppression Systems.

Provide complete automatic sprinkler systems in accordance with UFC 3-600-01 and NFPA 13. Comply with the following criteria:

- Provide wet pipe sprinkler system. Dry pipe sprinkler system may be used for those portions of the facility subject to freezing. Anti-freeze and pre-action systems are not permitted.
- Use quick response-type sprinkler heads in wet pipe sprinkler systems.
- Discharge inspectors' test connections to a safe, outside location onto a hard surface outside of areas where children play or congregate. Indicate location on drawings.
- Make fire department connection (FDC) accessible without entering or transiting a children's play area or crossing a discharge path. Provide the FDC on the street side of the building within 150 ft. (45m) of a fire hydrant outside of a fenced area and arranged so that the hose lines can readily and conveniently be attached without interference from any near-by object.
- Provide a wet chemical hood duct and cooking surface fire extinguishing system according to NFPA 96.

3-4.2.6 Fire Detection, Alarm System and Mass Notification System.

Provide systems in accordance with UFC 3-600-01 and comply with the following criteria:

- Locate the control panels in environmentally controlled locations in the facility.
- Use fully addressable Class B control panels with addressable detectors, supervisory sensors, and pull stations.
- Provide a pre-recorded voice notification of fire and other emergencies using a female voice. Provide an alerting tone consisting of a chime sound before each pre-recorded message. In facilities that are exempted from providing mass notification, provide fire alarm audible notification throughout the facility using an uncoded chime sound. Provide appliances to make the chime sound that are listed for "fire alarm service, private mode (45 dBA at 10 ft. (3.1m))". Provide this level in all interior areas of the building except where required to meet the louder output sound level required by NFPA 72 for mechanical rooms and other service areas subject to high levels of ambient noise.
- Provide smoke detection in all areas including closets over 20 $ft.^2$ (1.86 m^2) except the kitchen and spaces that are not climate controlled, such as the attic, walk-in coolers, and the mechanical equipment room.
- For those facilities using multiple, physically separated buildings/structures but one shared reception area, fire alarm and mass notification systems must be interconnected so that all facility occupants receive notification alarms and signals originating in any building/structure.

3-4.2.7 Carbon Monoxide Detection System.

Provide a protected premises carbon monoxide detection system in accordance with NFPA 720 for each building provided with fuel burning appliances. The carbon monoxide system must include the following required features:

- Automatic carbon monoxide alarm signal initiation.
- Notification of carbon monoxide alarms to building occupants using the audible and visual appliances of the mass notification system.
- Transmission of carbon monoxide alarms to the Base Fire Department as a supervisory signal in accordance with NFPA 72.
- Transmission of carbon monoxide detection system trouble and supervisory signals to the Base Fire Department in accordance with NFPA 72.
- Combination-type carbon monoxide detection systems that are integrated in operation with the building mass notification system and fire alarm system, and that meet the requirements of NFPA 72 for combination systems.

- Class B initiating device circuits, notification appliance circuits, and signaling line circuits.
- Install carbon monoxide detectors in accordance with the manufacturer's published instructions on the ceiling in the same room as all permanently installed fuel-burning appliances. Also provide at least one carbon monoxide detector centrally located within each area served by a separate air handler.

3-4.3 Electrical Design.

In addition to the criteria established in UFC 1-200-01 and the references therein, comply with the following CDC-specific requirements:

3-4.3.1 General Requirements.

Provide wall duplex receptacles at a maximum of 8 ft. (2.44 m) on center. Provide at least one duplex outlet on walls less than 9 ft. (2.74 m) long. All receptacles must be listed Tamper-Resistant (removable caps or plugs are not acceptable).

3-4.3.2 Lighting.

For the overall design approach, adapt the appropriate sections of UFC 3-530-01. To meet applicable energy codes and utilize daylight havesting, dimming may be necessary. However, lights cannot completely shut off during operating hours. Provide automatic controls to maintain minimum light levels throughout the facility and prevent lights from completely turning off during occupied hours. See Chapter 4, "Functional Data Sheets", for additional specific light level and control requirements.

Designers must coordinate with activity to verify that specifications as written are sufficient to ensure operational controls are appropriate for a CDC and lighting systems do not shut off during operating hours.

3-4.3.3 Optional Standby Power Connection.

Provide a standby generator hook-up and interior manual transfer switch to power the entire facility load. Ensure availability of a hard surface area adjacent to the building service entrance to accommodate the generator. Ensure that this surface is outside of the outdoor activity area and does not impact other child-occupied areas or pathways.

3-4.3.4 Intercom System.

Provide two way communication between child activity rooms to master station and other areas in the facility. The room devices must have two capabilities - communication must function hands-free as a one-touch control and allow for communication from anywhere in the room without using a headset or handset; also, handset functionality must be provided. "Hands-free" does not include a headset with a microphone. The master station in the reception area must include a handset and a hands-free function. The master station must have an "all call" capability. If intercom and telephone

capabilities are combined, coordinate programming with activity for operational controls of system (e.g., rooms in which calls outside building are prohibited).

3-4.3.5 Electronic Security Systems (ESS).

Design the ESS in accordance with UFC 4-021-02, *Electronic Security Systems*.

3-4.3.5.1 Intrusion Detection System (IDS)

The IDS components to be funded by construction funds and included in all projects include:

- A duress alarm (panic button) at the receptionist desk that reports to installation security dispatch.
- Point sensors on exit-only corridor doors that alarm at the front desk to indicate the potential that a child has exited the building.

Additional features for the IDS may be required by installation command and will be funded by the installation.

3-4.3.5.2 Access Control Systems

Provide card reader with keypads at entry to building.

3-4.3.5.3 Closed Circuit Television (CCTV)

Provide a complete and usable digital CCTV system, including all equipment, for child monitoring. See Chapter 4, “Functional Data Sheets” for monitor and camera locations.

3-5 HVAC.

3-5.1 General

Refer to UFC 1-200-01*s* and comply with stated and cross referenced requirements for HVAC. Also comply with UFC 3-401-01, *Mechanical Engineering* and 3-410-01, *Heating, Ventilating, and Air Conditioning Systems.* In addition, the following requirements are specific to CDC’s:

- All Child Development Centers (CDC’s) must be provided with mechanical heating and cooling as required to maintain space temperature and humidity levels listed below and in the tables in Chapter 4. All return air must be ducted to unit from each space. Plenum return systems will not be acceptable. Coordinate interior acoustic requirements for air transfer ducts with the Architect.
- Temperature for all regularly occupied areas to be adjustable between 68°F to 73°F (20°C to 22.8°C) in winter and 72°F to 77°F (22.2°C to 25°C) in summer.

- Relative Humidity will not exceed 50% RH in any space with mechanical cooling.

3-5.2 Kitchen.

Provide listed ventilation hoods over all cooking and warming appliances.

3-5.3 Laundry.

All dryer exhaust ducting must be metal. Use only solid metal ducting to transition through the fire barrier.

3-6 FURNISHINGS.

3-6.1 General.

Comply with following for furnishings in areas accessible to children:

- Furnishings must have rounded corners or edges with a .5-in. (12-mm) radius.
- Furnishings must not splinter or have toxic surfaces.
- Furnishings that are 36 in. (915 mm) or higher must be secured to prevent tipping.
- Furnishings less than 36 in. (915 mm) in height must be easily moved by staff to help define activity areas (e.g., storage units, display space units, bookcases, puppet stages) and circulation paths.
- Choose furnishings and equipment that meet all applicable codes and standards and are age appropriate.

3-6.2 Tables and Chairs.

Specify comfortable, cleanable upholstered adult seating in the infant/pretoddler CARs to provide a place where caregivers can nurture children. Child-scaled seating includes cleanable upholstered or exposed frame seating. To avoid suffocation, do not use beanbags, cushions and pillows for infants. Scale tables and chairs to the child. A minimum of one table per CAR must be height adjustable with appropriate knee clearance for children in wheel-chairs, 24 in. (600 mm) above the finished floor by 24 in. (600 mm) deep by 30 in. (750 mm) wide. Provide so top surface height is a maximum of 2 in. (50 mm) higher than knee clearance. See Appendix B, Designing for Children, for more information on anthropometric dimensions.

3-7 EXTERIOR SIGNAGE.

Identify the CDC as a "Child Development Center." Ensure that signage complies with Installation requirements. The installation or community name or graphical location of the facility may be used for public identification purposes (i.e. "____ Base Child

Development Center"). Do not use terms such as "Nursery," "Child Care Center," or "Preschool" to designate a CDC. Unique names must be approved by Program Management and Regulatory Authorities designated in Chapter 1 of this document. Sign placement and type are site-specific, but signs must be strategically located, adequately lit, and of sufficient size to permit proper viewing by individuals approaching the facility.

3-8 SITE DESIGN.

3-8.1 Grading and Drainage.

Ensure that all areas have positive drainage. This is especially critical in outdoor play areas. If possible, accommodate both the building and outdoor activity areas without extensive grading and potential damage to the existing drainage run-off patterns. Water must be drained away from all play areas to ensure the areas are useable as quickly as possible after rain. Drop inlets and catch basins are not allowed within outdoor activity areas.

3-8.1.1 Minimum Slopes.

Position drainage slopes away from the building at a minimum slope rate of 1:20, except in areas designated for the physically handicapped. Do not exceed a slope rate of 1:3 for banks for transition from one area to another. Use a minimum slope of 1:50 for grass areas.

3-8.1.2 Hydrologic Regime.

Rather than creating a large retention basin that could be a hazard, control storm water at the source by the use of micro-scale features that are distributed throughout the site. Locate retention or detention basins as far away as possible from the outdoor activity areas.

3-8.1.3 Downspouts.

Locate above-grade downspouts outside the outdoor activity areas and away from areas where children congregate. If this is not possible, connect downspouts to an underground drainage system. Design any elements of the downspouts or the drainage system located in the outdoor activity area to be free of sharp edges. Protect underground drainage systems from clogging. Provide a subsurface drainage system under all safety surfacing systems (including synthetic surfacing).

3-8.2 Walkways.

Connect the building to the public sidewalk system and to parking with pedestrian sidewalks. Comply with the following:

- The sidewalks must be a minimum of 5 ft. (1525 mm) wide.
- All access ways must utilize ramps or be on grade.

- Provide sidewalks immediately in front of or beside any designated parking areas to minimize the need for a child to walk behind a parked car to gain access to the building.
- Pedestrian approaches to the building must not pass through any outdoor activity areas.
- Where possible, provide views of the outdoor activity areas from the main walk from the parking lot to the building entrance, considering a child's height and perspective.

3-8.3 Parking/Vehicular Circulation.

Design the parking and vehicular circulation to meet UFC 3-201-01, *Civil Engineering.* Also comply with the additional criteria and exceptions in this section. For planning purposes, pavement area must allow for circulation, parking, and drives, plus space for the drop-off. Gravel surfacing is not permitted.

The layout of the parking lot and traffic circulation must consider the safety of the children when entering and departing the facility. Parking lots must be designed such that children are not required to walk behind parked vehicles as they walk from the parking lot to the building. Do not use parallel parking. If the parking lot design requires crosswalks, these must be painted and identified with signage in appropriate locations to ensure the safety of the patrons. All sidewalks must be ADA compliant.

For safety, separate vehicular and pedestrian circulation. Provide parking and vehicular access for six different functions:

3-8.3.1 Bus Drop-Off/Pick-Up.

Not all CDC programs use buses. If required, locate the bus drop-off/pick-up directly adjacent to the main building entrance. Provide safe points of facility access for children and adults that are separate from the main vehicular circulation. Bus drop-off/pick-up must be configured such that the right (door) side of the bus will always face the main facility entry.

3-8.3.2 Parent and Visitor Parking.

Parents are required to walk the child inside the facility for drop-off and to meet the child inside the facility for pick-up. This drives the need for a significant quantity of parent parking. Provide one space per 12 children accommodated by the facility. Support an increase in the parking allocation for patrons with the required site traffic impact study (see Chapter 2, “Site Selection”). Accommodate easy return to parking areas for circling. Provide a one-way traffic pattern with angled parking to improve traffic flow and limit back-up and turning maneuvers. Locate parent parking as close to the CDC entrance as possible while meeting required antiterrorism stand-off distances. Maximize the parking on the building-side of the drive to reduce the conflict between vehicles and children. Compact parking spaces (less than 9 ft. (2.7 m) wide) are not permitted in the parent and visitor lot. Strive to locate area drains and drainage inlets

away from paths where strollers will travel or parents and children will walk. Where signage is provided, use posts with no sharp edges.

3-8.3.3 Staff Parking.

Separate staff parking from parent/visitor parking. Locate staff parking near the building with a view to the entry. Provide parking spaces for the maximum number of staff on duty at one time. Staff parking can be configured for 90-degree parking.

3-8.3.4 Service Access.

Verify the size of required service vehicles and dumpster pad prior to planning and designing the service access areas. Plan service drive to allow ease of access to kitchen. Provide a back-up spur for dead-end and service drives which exceed 100 ft. (30.5 m) in length. Screen or separate the service area from public use or traffic areas with fences, depressions, berms, and landscaping. Ensure proper drainage if depressions are used. Provide physical barriers to separate outdoor child areas from all service areas. Service access must not cross outdoor activity areas.

Locate access near the serviced areas and consolidate service access when site and building layout allows. Provide a service vehicle apron. Four basic functions require service access:

- Occasional supply deliveries (furniture, laundry, books, toys).
- Regular food deliveries to the storage and kitchen area.
- Mechanical room related service (fuel deliveries, maintenance equipment).
- Regular garbage pick-up.

3-8.3.5 Emergency Vehicle Access.

Coordinate emergency vehicle access with the Installation fire protection. Personnel emergency egress routes/exit discharge paths must not cross any vehicle access roads.

3-8.3.6 Maintenance Vehicle Access.

Coordinate maintenance vehicle access with the Installation engineer's office.

3-8.4 Utilities.

Transformers, mechanical equipment, and other above-grade utilities must not be located within the outdoor activity area and must be inaccessible to children. This includes storm drainage inlets, utility clean outs, valve covers, and manhole covers. These items must be securable and accessible to only the installation’s engineering staff.

3-8.5 Radon.

Evaluate and mitigate Radon. See Appendix B for more information.

3-8.6 Perimeter Fencing.

There is no policy-based requirement for a perimeter fince. Coordinate the need for a perimeter fence with security personnel. If a perimeter fence is determined to be a project requirement, the fencing must be ornamental. Also provide perimeter fencing for CDCs located in “high traffic” areas. Comply with UFC 4-022-03*, Security Fences and Gates*, for perimeter fencing requirements. See Chapter 5 for requirements of fencing around Outdoor Activity Areas.

3-9 LANDSCAPING.

Landscaping is a critical component of a CDC and must be coordinated with the outdoor activity area design. Landscaping must reflect the local geographical environment, and selected plants must be easy to maintain and enhance the visual quality of the facility, including the entrance way, in all seasons. Use indigenous species to the greatest extent possible. Comply with UFC 3-201-02, *Landscape Architecture*, and the local Installation landscape standards.

Three critical components of CDC landscaping require attention beyond that of most other facility types: Child safety, child learning opportunities, and durability.

3-9.1 Child Safety.

Plants with thorns are not permitted. Poisonous or toxic plants are not permitted. Plants that produce fruits, nuts, or seeds that represent choking hazards, regardless of toxicity, are not permitted. Verify the selected and existing plant material for meeting these requirements—the submittal section of specifications require written verification by the nursery contractor that plants with thorns, poisonous plants, toxic plants, or fruit bearing plants are not planted in the outdoor activity area. A non-comprehensive list of common non-poisonous and poisonous plants is included in Appendix C of this document. For a comprehensive list of poisonous plants, refer to *Peterson Field Guides: A Field Guide to Venomous Animals & Poisonous Plants*.

Any fertilizers, herbicides and pesticides used in the outdoor activity area must be approved for use in child care environments by the Armed Forces Pest Management Board.

3-9.2 Child Learning Opportunities.

Provide a variety of plants with seasonal change, color, texture, fragrance, and interpretive value in the outdoor activity area to accommodate the programming requirements to provide learning opportunities for children. Gardens are permitted in outdoor activity areas for pre-school age children provided all plants are non-poisonous, and all fertilizers, herbicides and pesticides are approved for use in child care environments.

Preserve natural landscape features, including existing topography, trees and vegetation. Supplement the natural features as needed to provide opportunities for children to explore different aspects of nature. Ensure that natural features such as hills

and nature areas are accessible. Integrating plants into the entire play area is preferred over isolated nature areas. All areas of the outdoor activity area must be visibly accessible to adult supervisors.

While a maximum slope rate of 1:3 for site grading is allowed, a 1:2 slope is allowed for berms that incorporate hill slides in outdoor activity areas.

3-9.3 Durability.

Always use local, durable, native species to the greatest extent possible to help ensure survivability. Children's play will inflict additional wear and damage to plants, especially in playgrounds; provide plantings that are resilient and of adequate size to withstand daily play.

3-9.4 Irrigation.

When utilized, provide an irrigation system with sprinkler heads that do not present tripping or other safety hazards in the outdoor activity areas. Exposed or accessible elements of the sprinkler system must not have openings between .375 in. (9 mm) and 1 in. (25 mm) in size. Locate controls for the irrigation system in the mechanical room. Locate back-flow preventers, risers, and valves outside the outdoor activity area. An irrigation system for the landscaped areas will be determined on a case-by-case basis for the specific installation, project budget, and sustainable design principles. The only non-potable water allowed for irrigation systems in outdoor activity areas is rainwater.

This Page Intentionally Left Blank

CHAPTER 4 SPECIFIC DESIGN CRITERIA

4-1 INTRODUCTION.

This chapter identifies the specific design needs for each functional area as outlined in the space program. Tables 4-1 through 4-13 provide this data in a standard Functional Data Sheet format.

The interior construction specialties, equipment and furnishings criteria provided in these tables are broken down as follows:

4-1.1 Casework/Built-in Equipment.

This includes anything physically attached or plumbed to the building such as counters, cabinets, casework, toilet accessories, window treatments, laundry machines, and retractable overhead screens.

4-1.2 Furnishings, Fixtures, and Equipment (FF&E).

For the purposes of this FC, FF&E is broken down into Type 1 and Type 2. The FF&E types are distinguished as follows:

- Type 1. This includes contractor-furnished, contractor-installed loose items such as desks, tables, chairs, and bookshelves.
- Type 2. This includes all government-furnished, government-installed items, which are typically limited to office equipment such as computers, printers, copiers, and projectors (if mounted, projector mount would be built-in). Also, toys and accessories for the Child Activity Rooms are included in this FF&E Type.

4-2 ADMINISTRATIVE, STAFF SUPPORT, AND FACILITY SUPPORT.

Tables 4-1 through 4-9, and 4-13 are the functional data sheets for the administrative, staff support and facility support spaces.

Table 4-1. Entrance/Lobby/Corridors

Description/ Usage	The lobby serves as the primary entrance to the facility for parents, children and visitors, and it connects all the primary circulation pathways of the facility. Parents will escort children to the activity rooms. A waiting area is included.
Ceiling Ht.	10 ft. (3.05 m) minimum; 12 ft. (3.7 m) maximum.
Windows/Doors	Provide windows and doors per Chapter 3, Windows and Doors. Provide an entry vestibule at the main entrance. Exterior doors must accommodate adult- and child-height views from both sides. Sliding glass doors are only allowed as the interior door of the vestibule and must be automated. The exterior door of the vestibule must be an automated hinged door. If the sliding doors are used, plainly mark the doors at both adult and child levels to prevent someone walking through the door by accident.
Finishes	**Walls.** Lobby & Corridors. Provide a low-maintenance, durable finish with a wainscot. Consider high performance architectural latex coated (MPI no. 140) gypsum wallboard.

Table 4-1. Entrance/Lobby/Corridors

	Floor. Lobby. Provide a low-maintenance, durable, moisture and slip-resistant finish suitable for this high traffic area. Options include resilient flooring, sheet vinyl, stained concrete, stone, or terrazzo. Provide a recessed walk-off mat/area at the entrance door. Provide a base that matches the flooring or a resilient base. Corridors. Resilient flooring. **Service Exception:** USMC allows carpet. **Ceiling.** Lobby. Painted gypsum wallboard or acoustical ceiling panels (ACP). Corridors. ACP
Plumbing	Corridors: Provide an electric water cooler near the lobby and public toilets.
HVAC	Provide system per Chapter 3, "HVAC".
Fire Protection and Life Safety	Provide system per Chapter 3, "Fire Protection and Life Safety". Provide either a graphic or alphanumeric annunciator at the front desk or main entrance vestibule.
Power	Provide power per Chapter 3, "Electrical". Coordinate all powered equipment locations with the program personnel identified in Chapter 1, Regulatory Authorities, and place outlets accordingly to eliminate the need for extension cords. For safety of the children, the top of the electrical outlet boxes must be 54 in. (1370 mm) above finished floor. Outlets provided above countertops must be located no less than 18 in. (455 mm) from the edge of the countertop. .
Lighting	Provide system per Chapter 3, "Electrical".
Communication	**CCTV.** Provide outlets to cover the entrance and the interior. All monitors must be viewable from the entrance and lobby. **CATV/Internal Video.** Provide a CATV outlet. **Intercom.** None required. **Telephone.** Provide an outlet in the waiting area. **Data.** Provide an outlet in the waiting area.
Security System	Ensure visibility of the entrance from the reception/work area. Any additional security equipment must have a non-threatening appearance.
Acoustics	Design space to comply with Chapter 3, "Interior Acoustics".
Casework/ Built-in Equipment	Lobby. Provide a means to display facility information and children's artwork. Corridors. Provide a means to display children's artwork. Provide a parent-teacher board at the entry to each of the CARs. Provide CCTV cameras per the outlet count and monitors.
Type 1 FF&E	Waiting area includes durable, easy-to-clean, and moisture-resistant furniture; tables; magazine and brochure rack; wall art; and a wall clock.
Type 2 FF&E	
Special Req.	Include an area within or near the waiting area to store child safety seats and strollers. Provide a grated snow-trap for northern tier bases. Provide a means to visually reduce the length of the longer corridors, e.g. varied wall, ceiling and floor finishes, patterns, and design. If possible, allow children in the lobby/waiting area to see into some of the activity rooms.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net m^2 (ft^2)	

Table 4-2. Reception/Work Area

Description/ Usage	The reception desk is the focal point of information exchange within the building and is the check-in/out location for patrons. It is also the working surface for the receptionist/desk attendant. The work area includes shared office equipment and general work space.
Ceiling Ht.	9 ft. (2.74 m) minimum. 12 ft. (3.7m) maximum.
Windows/Doors	None required.
Finishes	**Walls.** Provide high performance architectural latex coated (MPI no. 140) gypsum wallboard. **Floor.** In front of counter: Provide a low-maintenance, durable, moisture and slip-resistant finish suitable for this high traffic area. Options include resilient flooring, sheet vinyl, linoleum sheet, vinyl plank flooring, stained concrete, stone, or terrazzo. Provide a base that matches the flooring or a resilient base. Behind counter and work area: Can match the lobby, or resilient flooring and carpet are also permitted for all Services. Provide resilient base. **Ceiling.** Match lobby ceiling. Consider using the ceiling to define and separate this area from the Lobby, i.e., a dropped gypsum board soffit over the reception desk and gypsum board false beams.
Plumbing	None required.
HVAC	Provide system per Chapter 3, “HVAC”. Locate HVAC shutdown switch here.
Fire Protection and Life Safety	Provide system per Chapter 3, “Fire Protection and Life Safety”. Provide LOC.
Power	Provide power per Chapter 3, “Electrical”. In addition, perform a power requirement survey as this area’s power requirements are extremely site- and locale-specific.
Lighting	Provide system per Chapter 3, “Lighting”. Provide emergency lighting to illuminate the desk area to a minimum of 1 ft. candle (10 lux).
Communication	**CCTV.** All monitors must be viewable from this area. Also see Special Requirements. **CATV/Internal Video.** None required. **Intercom.** Provide the master controls for the facility internal two-way system. **Telephone.** Provide outlets for the required number of phones and facsimile machines. **Data.** Provide outlets for the required equipment.
Security System	If a security system is provided, place the controls and a duress alarm accessible to the receptionist/desk attendant.
Acoustics	Design space to comply with Chapter 3, “Interior Acoustics”.
Casework/ Built-in Equipment	Provide a 24-in- (610-mm-) deep dual-height transaction counter that accommodates a minimum of one person in a wheelchair, a minimum of three standing adult patrons for small facilities and six standing adult patrons at large and extra large facilities. Ensure that a child can see the receptionist/desk attendant behind the counter, and vice versa. The counter must be dual height for standing transactions, seated office functions. The counter must be a durable solid surface material such as granite, concrete, or solid plastic—laminate is not permitted. Modesty panels and apron must also be of durable materials. Consider providing wall and base cabinets and an equipment counter. Provide CCTV monitors – verify size with Regulatory Authorities identified in Chapter 1.
Type 1 FF&E	Reception desk chairs and patron stools.
Type 2 FF&E	Point of sale equipment. Office equipment, including computers, printers, copiers, scanner, and facsimile machine.

Table 4-2. Reception/Work Area

Special Req.	The receptionist/desk attendant must have direct line-of-sight visual control over the main entrance and the CCTV monitors. Place the monitors so the seated attendant does not have to turn more than 30° to 45°from his or her normal working position to view the monitors. Coordinate the location of the monitors and the overall design of the area, including the lobby, with the monitor equipment selection to ensure appropriate viewing angles and distance. If the distance from the receptionist position to the monitor exceeds 6 ft (1830 mm), a separate monitor is required in close proximity to the receptionist.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net m^2 (ft^2)	

Table 4-3 Administrative Offices

Description/ Usage	The required offices will vary both by Service and Installation. Refer to Chapter 1, "Scope of Facility", and Chapter 2, "Space Program", for additional guidance. Locate offices as close to lobby/reception area as possible.
Ceiling Ht.	9 ft. (2.74 m) minimum.
Windows/Doors	Provide windows and doors per Chapter 3, "Windows and Doors and Interior Construction". If possible, locate offices on exterior wall and provide windows for natural light admission.
Finishes	**Walls.** Provide high performance architectural latex coated (MPI no. 140) gypsum wall board. **Floor.** Carpet with resilient base. **Ceiling.** ACP.
Plumbing	None required.
HVAC	Provide system per Chapter 3, "HVAC".
Fire Protection and Life Safety	Provide system per Chapter 3, "Fire Protection and Life Safety".
Power	Provide power per Chapter 3, "Electrical".
Lighting	Provide system per Chapter 3, "Electrical".
Communication	**CCTV.** Provide an outlet for a single CCTV monitor in the director's office. **CATV/Internal Video:** None required. **Intercom.** Provide a system remote in each enclosed space. **Telephone.** Provide one line per staff plus one additional line for fax and copier. **Data.** Provide one outlet per staff plus one outlet for each piece of equipment such as printers, copiers, and scanners.
Security System	None required.
Acoustics	Design space to comply with Chapter 3, "Interior Acoustics", and provide partition construction with a minimum STC rating of 45.
Casework/ Built-in Equipment	Provide coat hooks. Provide CCTV monitor in Director's Office only. Provide dry-erase boards in select offices and workstations.
Type 1 FF&E	Private Offices: desk, credenza, filing cabinet, desk chair, and two side chairs. Workstations: desk chair and side chair for open offices. Workstation systems furniture must provide adequate space for filing and overhead storage. The training and curriculum office requires one (1) lockable, four-drawer lateral file cabinet for each office/workstation.
Type 2 FF&E	Office equipment, including computers, printers, copiers, scanner, and facsimile machine.
Special Requirements	Provide direct line of sight from the director's office to the lobby/reception. If possible, provide direct line of sight from the FCC/CDH office to the lobby reception. The training and curriculum specialist office must be buffered visually and acoustically from the public areas and the CARs. The following offices require a 6 $ft.^2$ (0.56 m^2) lockable storage closet: Director, Administrator, and Resource and Referral.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net m^2 (ft^2)	

Table 4-4. Break/Staff Room

Description/ Usage	This space is used for staff breaks, meals and storage of belongings. It should be located adjacent to the staff/public toilet and the training and curriculum office, and it should be buffered visually and acoustically from the public areas and CARs.
Ceiling Ht.	9 ft. (2.74 m) minimum.
Windows/Doors	Provide windows and doors per Chapter 3, "Windows and Doors and Interior Construction".
Finishes	**Walls.** Provide high performance architectural latex coated (MPI no. 140) gypsum wall board. **Floor.** Carpet or durable resilient flooring with resilient base. Provide resilient flooring at sink area. **Ceiling.** ACP.
Plumbing	Provide a sink and a water line for connection to refrigerator ice maker.
HVAC	Provide system per Chapter 3, "HVAC".
Fire Protection and Life Safety	Provide system per Chapter 3, "Fire Protection and Life Safety".
Power	Provide system per Chapter 3, "Electrical".
Lighting	Provide system per Chapter 3, "Electrical".
Communication	**CCTV.** None required. **CATV/Internal Video.** Provide one outlet. **Intercom.** Provide a system remote. **Telephone.** Provide one line. **Data.** Provide a dedicated outlet for the time clock and at least one additional outlet.
Security System	None required.
Acoustics	Design space to comply with Chapter 3, "Interior Acoustics".
Casework/ Built-in Equipment	Provide solid-surface countertops with lockable wall and base cabinets. Provide 24-in- (610-mm-) deep Z-shaped lockers for staff. Provide bulletin board with tack surface.
Type 1 FF&E	Tables, chairs, microwave, refrigerator, coffee machine, television, wall clock, and time clock.
Type 2 FF&E	Telephone.
Special Requirements	If possible, locate break room on exterior wall and provide windows for natural light admission.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net m^2 (ft^2)	

Table 4-5. Training Room

Description/ Usage	The training room provides space for staff work, development of program materials, and utilization for staff training library and resources. Also includes two computer workstations for computer-based training. It should be located adjacent to the staff/public toilet and the training and curriculum office, and it should be buffered visually and acoustically from the public areas and CARs.
Ceiling Ht.	9 ft. (2.74 m) minimum.
Windows/Doors	Provide windows and doors per Chapter 3, "Windows and Doors and Interior Construction".
Finishes	**Walls.** Provide high performance architectural latex coated (MPI no. 140) gypsum wall board. **Floor.** Carpet with resilient base. **Ceiling.** ACP.
Plumbing	None required.
HVAC	Provide system per Chapter 3, "HVAC".
Fire Protection and Life Safety	Provide system per Chapter 3, "Fire Protection and Life Safety".
Power	Provide system per Chapter 3, "Electrical". For safety of the children, the top of the electrical outlet boxes must be 54 in. (1370 mm) above finished floor.
Lighting	Provide system per Chapter 3, "Electrical".
Communication	**CCTV.** None required. **CATV/Internal Video.** Provide one outlet. **Intercom.** Provide system remote. **Telephone.** Provide one line. **Data.** Provide outlets as required for equipment.
Security System	None required.
Acoustics	Design space to comply with Chapter 3, "Interior Acoustics", and provide partition construction with a minimum STC rating of 45.
Casework/ Built-in Equipment	Countertop with wall and base cabinets. Provide a storage closet for training materials and AV cart. Provide an electrically operated retractable screen, a built-in ceiling projector mount with network connection, bulletin board with tack surface, and dry-erase board.
Type 1 FF&E	Provide TV, VCR, and DVD player. Provide conference/work tables and chairs for 30 percent of staff in all facilities.
Type 2 FF&E	Computer projector, printers, and interactive dry-erase board.
Special Requirements	
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net m^2 (ft^2)	

Table 4-6. Central Storage

Description/ Usage	The separate central storage room provides space for shared program materials, audiovisual equipment, and other resource materials. It is located near staff/administrative areas.
Ceiling Ht.	9 ft. (2.74 m) minimum.
Windows/Doors	Provide doors per Chapter 3, "Doors".
Finishes	**Walls.** Provide high performance architectural latex coated (MPI no. 140) gypsum wall board. **Floor.** Resilient flooring with resilient base. **Ceiling.** ACP.
Plumbing	None required.
HVAC	Provide system per Chapter 3, "HVAC".
Fire Protection and Life Safety	Provide system per Chapter 3, "Fire Protection and Life Safety".
Power	Provide system per Chapter 3, "Electrical".
Lighting	Provide system per Chapter 3, "Electrical".
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **Intercom.** Provide system remote. **Telephone.** Provide one line. **Data.** Provide one outlet.
Security System	None required.
Acoustics	Design space to comply with Chapter 3, "Interior Acoustics".
Casework/ Built-in Equipment	Provide a combination of low open shelving, drawers, cabinets with doors, hooks that do not present a hazard, adult-height shelves, and wall-hung cabinets. Maintain an 18 in. (455 mm) clearance below the lowest point of the sprinkler heads.
Type 1 FF&E	None required.
Type 2 FF&E	Provide cart for multi-roll 48 in. (1220 mm) wide classroom paper. Provide baskets, boxes, chests, storage bags, buckets, crates and bins.
Special Requirements	Provide space for and access to multi-roll classroom paper cart.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net m^2 (ft^2)	

Table 4-7. Staff/Public Toilets/Janitor's Closet

Description/ Usage	ABA-compliant facilities located near the lobby and staff areas. In small CDCs, combine public and staff toilets. In medium, large and extra large facilities, provide separate public and staff toilets. Minimum requirements are as follows: Small CDCs - two unisex staff/public toilets. Medium CDCs - one unisex public and two unisex staff toilets. Large and Extra Large CDCs - one unisex public and three unisex staff toilets.
Ceiling Ht.	9 ft. (2.74 m) minimum.
Windows/Doors	Provide doors per Chapter 3, Doors. Any staff or public toilet that is not directly visible from the reception desk must require keyed entry or cipher lock.
Finishes	**Walls.** Epoxy painted, mold-resistant gypsum wall board with a ceramic tile wainscot. Consider full ceramic tile walls with integral patterns. Use a dark-colored epoxy grout. Janitor's closet: Epoxy painted, mold-resistant gypsum wall board **Floor.** Porcelain tile with integral patterns. Use a dark-colored epoxy grout. Janitor's closet: sealed concrete. **Ceiling.** Epoxy painted, water-resistant gypsum board. None needed for janitor's closet.
Plumbing	Provide floor-mounted water closets and wall-hung lavatories. Provide a floor drain with trap primer in each room.
HVAC	Provide system per Chapter 3, "HVAC".
Fire Protection and Life Safety	Provide system per Chapter 3, "Fire Protection and Life Safety".
Power	Provide system per Chapter 3, "Electrical". For safety of the children, the top of the electrical outlet boxes must be 54 in. (1370 mm) above finished floor.
Lighting	Provide system per Chapter 3, "Electrical". The lights in the janitor's closet must be controlled automatically to remain on during facility operating hours.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **Intercom.** None required. **Telephone.** None required. **Data.** None required.
Security System	None required.
Acoustics	Design space to comply with Chapter 3, "Interior Acoustics".
Casework/ Built-in Equipment	Solid-surface countertop with either underhung or integral sink. Mirror. Toilet accessories: toilet paper dispensers, paper towel dispenser with integral trash receptacle, robe hooks, grab bars, sanitary napkin disposal, seat cover dispensers, and soap dispensers. Fold-down diaper changing table/station.
Type 1 FF&E	Provide lockable cabinets for cleaning supplies and maintenance cart for Janitor's Closet.
Type 2 FF&E	None required.
Special Req.	Provide a Janitor's closet associated with or in proximity of these toilets. This closet includes a floor mop sink with hot and cold water and a hose connection, a floor drain, and storage for pails, mops, vacuums, and related cleaning supplies and equipment. Include an outward-swinging, lockable door with a vision panel per Chapter 3, "Interior Construction" that can be opened from the inside without a key.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net m^2 (ft^2)	

Table 4-8. Kitchen

Description/ Usage	CDC kitchens support food preparation, food and supply storage, delivery of snacks or meals to CARs, sanitation (washing of dishes, utensils, pots, pans, etc.), and storage of food service equipment, flatware, and dishes. Locate kitchen adjacent to an exterior wall and the service area. It requires a direct service entrance from the outside that does not cross any outdoor areas. Provide direct pathways from the kitchen to the CARs that do not pass through the lobby or other functional areas for food cart transport.
Ceiling Ht.	9 ft. (2.74 m) minimum.
Windows/Doors	Provide windows and doors per Chapter 3, "Windows and Doors and Interior Construction".
Finishes	**Walls.** Epoxy painted mold-resistant gypsum wall board. Food prep areas will have ceramic tile with dark-colored epoxy grout or stainless steel wall finish. The walls must be impact resistant up to 48 in. (1220 mm) from finished floor; consider using FRP panels. **Floor.** Quarry tile with epoxy grout or liquid applied flooring designed for commercial kitchens. **Ceiling.** High humidity-rated, ceramic-faced ACP.
Plumbing	Provide hand-washing sinks at each entrance; a two-compartment food preparation sink; a three-compartment, deep dishwashing sink with a gooseneck faucet. Provide a hot water booster to 180°F (82°C) to the dishwashing sink and to the heavy-duty, commercial-grade dishwasher. Provide a floor drain. **Service Exception:** Navy does not permit ice makers. CDC kitchens will typically use grease interceptors in lieu of central grease traps to service individual equipment. Locate them to be easily accessible for cleaning, be located outside of food preparation areas, and not project above the floor in open walkways or work areas. Exposed covers must be rust-proof and skid resistant. If central grease traps are provided, locate them outside the building in a service area inaccessible to children.
HVAC	Provide system per Chapter 3, "HVAC".
Fire Protection and Life Safety	Provide system per Chapter 3, "Fire Protection and Life Safety". Provide a fully recessed extinguisher cabinet with a Class K fire extinguisher.
Power	Provide system per Chapter 3, "Electrical". In addition, perform a power requirement survey as this area's power requirements are extremely site- and locale-specific. Provide a dedicated electrical circuit for the cold storage.
Lighting	Provide system per Chapter 3, "Electrical".
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **Intercom.** Provide a system remote. **Telephone.** Coordinate with activity if telephone is allowed. **Data.** Provide one outlet.
Security System	None required.
Acoustics	Design space to comply with Chapter 3, "Interior Acoustics".
Casework/ Built-in Equipment	Provide minimum 24-in- (610 mm-) deep stainless steel countertop and metal cabinets and wire shelves for food, utensil, equipment and supply storage. See Appendix D for sample equipment lists.

Type 1 FF&E	See Appendix D for sample equipment lists. Provide one stainless steel food cart for every CAR and space in the kitchen to store them. Provide a small office area with desk, chair, and file storage for food and supply orders. Provide fire extinguisher.
Type 2 FF&E	See Appendix D for sample equipment lists. Computer, printer, and phone for office area.
Special Requirements	Provide air curtains or air locks on the exterior doors. Provide lockable storage for dry food storage. Deep-fat fryers are not permittedSee Appendix E for sample layouts. Comply with *USDA Program Aid Food Service Equipment Guide for Child Care Institutions.* Include a food service specialist on the design team that is a member of the Foodservice Consultant Society.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net m^2 (ft^2)	

Table 4-9. Laundry.

Description/ Usage	The laundry room must be accessible only to adults. Locate it near the infant/pre-toddler CARs and an exterior wall. Room configuration and equipment must meet ABA requirements.
Ceiling Ht.	9 ft. (2.74 m) minimum.
Windows/Doors	Provide windows and doors per Chapter 3, Windows and Doors and Interior Construction.
Finishes	**Walls.** Epoxy painted CMU or water-resistant gypsum wallboard. Provide rub rails and metal/high-impact plastic corner guards. **Floor.** Sealed concrete, or seamless vinyl. **Ceiling.** Epoxy painted gypsum wallboard ceilings that comply with ASTM C1396/C1396M, Section 12, *Gypsum Ceiling Board.*
Plumbing	Provide connections to each of the washing machines and one single-compartment laundry tub, minimum size 22 in. D by 24 in. W by 13 in. (550 mm D by 600 mm W by 325 mm) depth of tub. Provide floor drains. Provide recessed plumbing cabinets for each utility connection to the machines.
HVAC	Provide system per Chapter 3. In addition, provide a minimum of six air changes per hour with all dryers running, a maximum of 50% relative humidity, and negative pressure. Each dryer must be vented directly and independently to the outside. Do not vent the dryer exhaust near a building entrance or into an outdoor play area. Provide ventilation in accordance with ANSI/ASHRAE 62.1 requirements for "Laundry Rooms, Central".
Fire Protection and Life Safety	Provide system per Chapter 3, "Fire Protection and Life Safety". Provide one-hour rated construction and 45-minute-rated door with self closer and rated vision panel—see Special Requirements. Provide a smoke detector.
Power	Provide system per Chapter 3, "Electrical". If washers and dryers are hard-wired (non-plug connected), provide wall-mounted safety disconnect switch within sight of the equipment it controls.
Lighting	Provide system per Chapter 3, "Electrical".
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **Intercom.** Provide system remote. **Telephone.** None required. **Data.** None required.
Security System	None required.
Acoustics	Design space to comply with Chapter 3, "Interior Acoustics", and provide partition construction with a minimum STC rating of 50.
Casework/ Built-in Equipment	Provide a built-in folding table and shelves for storage. Provide a spacer between the dryers and the wall to preclude the dryer vent from become compressed due to dryer movement.
Type 1 FF&E	Provide large, heavy-duty, front-loading residential washers and dryers: • Small. One washer and two dryers. • Medium. Two washers and three dryers. • Large and Extra Large. Two washers and three dryers. Covered containers for soiled laundry.
Type 2 FF&E	None required.

Special Req.	Achieve the one-hour rating with rated wall assemblies that extend to roof deck. Provide easy access to rear of dryers to allow easy maintenance and cleaning of vents (see HVAC). Coordinate door openings and dimensions with room layout and equipment sizes, e.g., laundry carts, washers, dryers. Provide acoustical measures to control the noise/vibration of the washers and dryers. The laundry room should not be visible from the lobby area.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net m^2 (ft^2)	

4-3 CHILD ACTIVITY AREAS.

Tables 4-10 through 4-10.4 provide the criteria for the CARs and their subspaces. Table 4-11 provides the criteria for the optional multipurpose room. Criteria for the outdoor activity areas are provided in Chapter 5.

The child interest centers described in Table 4-10.4 are the required subareas of the activity space within the CAR. They are defined primarily through operational considerations, such as furniture placement, but it will be helpful for the designer to understand the types of activities that will take place in these rooms. Not every CAR will include all these subspaces.

Table 4-10. Child Activity Rooms

Description/ Usage	Provides age-appropriate child activity areas and functional support spaces in a self-contained environment. These rooms are sized per Chapter 2, "Child Activity Rooms". Activities include developmental, play, eating, sleeping, and all other activities pertaining to a child's care. See special requirements for age-specific design considerations. See Tables 4-10.1 through 4-10.3 for subspaces of the CARs.
Ceiling Ht.	8 ft. (2.44 m) minimum; 9 ft. (2.74 m) maximum.
Windows/Doors	Provide windows and doors per Chapter 3, Windows and Doors and Interior Construction. **Provide** full-lite doors at all CARs. Provide interior windows from activity rooms to corridors at 42 in. (1070 mm) above finished floor, a minimum of 36 in. (915 mm) high, and a minimum of 15 $ft.^2$ (1.39 m^2) total window area (no horizontal members blocking view of either adults or children). Do not use folding or sliding doors. Provide finger guards on the hinge edge of both the interior and exterior sides of all activity room doors up to 48 in. (1220 mm) minimum above finished floor. Plastic accordion-style finger guards are not allowed. In cold climates, provide a vestibule at the exterior exit. One vestibule can serve two rooms. If a vestibule is provided, comply with Chapter 3, but use a non-latching type interior door with a hydraulic door closer and integral hold-open device and only install panic egress hardware on the exterior door. Exterior doors must be designed to open and allow easy maneuverability of the evacuation cribs onto the paved egress path.

Table 4-10. Child Activity Rooms

Finishes	**Walls.** Provide high performance architectural latexcoated (MPI no. 140) dual-layer gypsum board with outside layer of lower 4 feet of wall being impact resistant. Provide continuous vinyl bumper rail at the selected crib/equipment heights. Provide heavy vinyl bumpers on all corners. **Floor.** Seamless rubber, sheet vinyl or linoleum sheet with resilient base. See Tables 4-10.1 through 4-10.4 for flooring requirements for specific subspaces. **Ceiling.** ACP.
Plumbing	See Tables 4-10.1 through 4-10.3 for subspace plumbing requirements.
HVAC	Provide system per Chapter 3. In addition, maintain 35 to 50% humidity and maintain 68°F (20°C) minimum and 78°F (26°C) maximum. Use general ventilation rates per ANSI/ASHRAE 62.1, "Education Facilities, Daycare (through age 4)." See Tables 4-10.1 through 4-10.3 for ventilation rates of subareas. Provide DDC temperature sensor mounted in wall recess at 12 in. (305 mm) above finished floor for monitoring only. Provide uniform air velocities of no more than 30 ft. (9.14 m) per minute 12 in. (305 mm) from the floor in all child activity spaces, unless otherwise noted. For safety of the children, provide individual room control and locate thermostats 54 in. (1370 mm) above the floor. Incorporate night and weekend setback capability. Use room thermostats that adjust accordingly to maintain the appropriate temperature as measured by the DDC sensor. Locate or protect heating surfaces to ensure children cannot come in contact with surfaces above 110°F (43°C). Do not specify equipment that interrupts continuous and flat wall space at child levels that could accommodate perimeter activity areas. In climate zones 5 through 8 provide a supplemental, under-floor, hydronic radiant heating system in infant and pre-toddler CARs. Radiant floors must have in slab temperature sensors. Provide under floor slab R-10 insulation for climate zones 3 through 7 and R-15 insulation for climate zone 8.
Fire Protection and Life Safety	Provide system per Chapter 3, Fire Protection and Life Safety. Do not provide exit signs in the room. Provide a manual pull station at the exterior door.
Power	Provide system per Chapter 3, Electrical. Coordinate all powered equipment locations with the program personnel identified in Chapter 1, Regulatory Authorities, and place outlets accordingly to eliminate the need for extension cords. For safety of the children, the top of the electrical outlet boxes must be 54 in. (1370 mm) above finished floor. In infant and pretoddler CARs, coordinate the location of cribs with the personnel identified in Chapter 1, Regulatory Authorities, and do not locate outlets within reach of children in cribs. This may require deviations from the frequency and height of outlet criteria noted above and must be carefully coordinated with program personnel.
Lighting	Provide system per Chapter 3, Electrical. Provide lighting with automatic controls and multi-level switching. Maintain a minimum of 1 fc (10 lux) at all times to accommodate child observation requirements but do not exceed 5 fc (50 lux) for sleeping. Normal operating light levels are 20 fc (200 lux) general ambient and 30-40 fc (300-400 lux) task lighting at the counters. Provide emergency lighting to illuminate the entire room floor area to a minimum of 1 ft. candle (10 lux).
Communication	**CCTV.** Provide a minimum of two outlets and ensure full coverage. **CATV/Internal Video.** Provide one outlet. **Intercom.** Provide hands-free capability and system remote with a handset for private conversations. **Telephone.** None permitted. **Data.** Provide outlets as required for equipment.
Security System	None required.

Table 4-10. Child Activity Rooms

Acoustics	Design space to comply with Chapter 3, Interior Acoustics, and provide partition construction with a minimum STC rating of 50. The CAR's anticipated peak noise level is 70-80 dBA. The preferred sound level is 35-40 dBA, maintained for at least 80 percent of the time.
Casework/ Built-in Equipment	**Cubby Storage Area.** Provide pre-manufactured, compartmentalized, open-front cubbies with top shelf, anchored to the floor and/or wall. Provide an individual cubby for each child. Provide 36 in. (915 mm) of clear space directly in front of cubbies. • Infant/Pre-toddler. Provide 10 individual 12-in.-wide, 18-in.-high, and 15-in.-deep (305-mm x 455-mm x 380-mm) cubbie compartments. Cubby units must have solid raised base for floor applications. • Toddler/Preschooler. Provide 14 individual 12-in.-wide, 42-in.-high, and 15-in.-deep (305-mm x 1,220-mm x 380-mm) cubbie compartments. Provide two safety hooks in each cubbie. Provide a 10-in-high (255-mm) bench for child use. • Preschooler/Pre-K/K. Provide 24 individual 12-in.-wide, 42-in.-high, and 15-in.-deep (305-mm x 1,220-mm x 380-mm) cubbie compartments. Provide two safety hooks in each cubbie. Provide a 10-in-high (255-mm) bench for child use. **Other.** Provide magnetic locks to any storage cabinets within a child's reach that allow a child to open the door from the inside. • Infant/Pre-toddler. Provide a minimum of 60 in. (1525 mm) linear length of 1- to 1.2-in.- (25- to 30-mm-) diameter grab bars with rounded corners at 18 in. (455 mm) above finished floor level to aid infants to pull to standing position. Provide a shatter-resistant child safety glass mirror with safety edges. Locate the bottom edge at finished floor and the top at a minimum of 30 in. (760 mm) above finished floor. Laundry equipment is not permitted in the CARs. Provide a parent-teacher board at the entry to each of the CARs. Provide CCTV cameras, with a minimum of two, to ensure full coverage of all areas within room.
Type 1 FF&E	See Appendix D for more information on FF&E. **Infant/Pre-toddler.** Cribs used for sleeping and emergency evacuation. Cribs must be of durable construction, be narrow enough to pass through a door with a 32 in. (813 mm) clear opening, and have sturdy caster wheels approximately 4 in. (100 mm) in diameter. The evacuation crib must be able to support and transport a minimum of four 18-month-old children weighing a total of 120 lbs. (55 kg).
Type 2 FF&E	See Appendix D for more information on user-provided FF&E.
Special Requirements	**Room Design.** The ideal room width to length ratio is 3:2. Do not create blind spots in the room and ensure that caregivers have full visual access over all areas of the room without the use of mirrors to achieve full visual access. Color-coding can be used to differentiate spaces for each age group or activity room. **Interior construction.** Construct a partitioned, lockable general storage closet sized per Chapter 2, Child Activity Rooms, that can be opened from the inside without the key. The closet door must have a vision panel per Chapter 3, Interior Construction. Provide adjustable shelving in the closet; leave open floor space for stacked cot storage. Demountable and retractable partitions are not permitted in the CAR. **Infant/Pre-toddler.** Cribs must be directly observable by caregivers. Indicate location on plans of all major equipment using dotted lines to ensure proper fit and clearances. **Toddler/Preschooler.** Provide wider pathways to and within uninterrupted activity space to accommodate increased mobility. **Preschooler/Pre-K/K.** The uninterrupted activity space must be a large, open, flexible area that allows unrestricted movement.

Table 4-10. Child Activity Rooms

For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net m^2 (ft^2)	

Table 4-10.1. CAR Toilets

Description/ Usage	Provides age-appropriate toilet for children only. Where information is not provided in this table, use the criteria in the child activity room table.
Finishes	**Walls.** Provide high performance architectural latex coated (MPI no. 140) paint on mold-resistant gypsum wall board with an FRP wainscot. **Floor.** Seamless rubber sheet goods with the edges turned up the walls a minimum of 6 in. (150 mm) to form an integral coved base. **Ceiling.** ACP.
Plumbing	Sinks must have single-action, pre-mixing, automatic shut-off controls mounted within 14 in. (355 mm) of the leading edge of the lavatory. Provide a floor drain. **Infant/Pre-toddler.** Provide one child water closet with a rim height of 10 in (250 mm) and flush controls 20 to 30 in. (510 to 760 mm) above finished floor. Provide one child hand-washing sink, 18 - 20 in. deep, mounted at 22 in. (550 mm) above finished floor with 19 in. (480 mm) clearance for knee space. **Toddler/Preschooler.** Provide a minimum of two child water closets with a rim height of 11 in (280 mm) and flush controls 20 to 30 in. (510 to 760 mm) above finished floor. Provide two child hand-washing sinks, 18 - 20 in. deep mounted at 22 in. (560 mm) above finished floor with 19 in. (480 mm) clearance for knee space. **Preschooler/Pre-K/K.** Provide a minimum of two child water closets with a rim height of 12 in (280 mm) and flush controls 20 to 30 in. (510 to 760 mm) above finished floor. Provide two child hand-washing sinks, 18 - 20 in. deep mounted at 22 in. (560 mm) above finished floor with 19 in. (480 mm) clearance for knee space.
HVAC	Provide 200 cfm (94 L/s) exhaust over the general toilet area. Exhaust to operate continuously when lights are on in the CAR.
Casework and Built-in Equipment	Provide toilet-tissue dispenser at each water closet at 14 in (355 mm) above finished floor and within reach of a child on the water closet. Provide a hands-free paper towel dispenser without serrated edges at each lavatory. Provide a shatter-resistant mirror over the sink with the bottom edge no higher than 29 in (740 mm) above finished floor. Also provide an additional full-height shatter-resistant child safety glass mirror with safety edges and the bottom edge no higher than 18 in (455 mm) above finished floor. **Toddler/Preschooler.** Provide partitions between the water closets with the bottom of the partition at 9 in (230 mm) above finished floor and the top of the partition no higher than 36 in (915 mm). **Preschooler/Pre-K/K.** Provide partitions between the water closets with the bottom of the partition at 6 in (150 mm) above finished floor and the top of the partition no higher than 42 in (1065 mm). If a school-age care program is combined with a CDC, see Chapter 2, Facility Planning, for additional requirements.
Type 1 FF&E	None required.
Type 2 FF&E	None required.
Special Requirements	The water closets must not be visible from the door and corridor windows and must be screened from the rest of the room with partial height partitions constructed to 42” AFF, but no door. Design to accommodate easy supervision and the amount of congestion that can occur in the toilet, especially before meal times. **L**avatories must be located in the same space as the water closet, but open and visible to the rest of the room.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net m^2 (ft^2)	

Table 4-10.2. CAR Diaper Changing Area

Description/ Usage	Provides diapering station and diaper storage in every CAR. Caregivers must have a clear view of the room while standing at the changing table. Where information is not provided in this table, use the criteria in the child activity room table.
Finishes	**Walls.** Provide high performance architectural latexcoated (MPI no. 140) dual-layer gypsum board. Provide heavy vinyl bumpers on all corners. Provide an impervious wall finish on walls directly adjacent to the changing counter that will withstand continuous cleaning. If low walls are used, provide a solid surface cap at the required height of 42" AFF. **Floor.** Seamless sheet vinyl with an integral cove base. **Ceiling.** ACP.
Plumbing	Provide one deep, underhung sink with a swivel goose neck faucet, hands-free operation with a 30 second shut-off with use of foot, automatic, or wrist blade controls. Decision for faucet control type to be made by facility operator. Provide a dedicated shut-off valve.
HVAC	Provide a minimum of 150 cfm exhaust grille directly over the diaper changing area, served by a central exhaust system that operates continuously during facility operating hours.
Power	Do not provide any receptacles in this area.
Casework/ Built-in Equipment	Provide a 34-in.-high, 24-in.-deep (865 x 610 mm) solid-surface changing counter with integral storage underneath and integral, retractable steps that lock in place. Changing counter surface must be a minimum of 36 in. (915 mm) long for the infant/pre-toddler CAR and a minimum of 48 in. (1220 mm) long for the toddler and preschooler CARs. Provide a safety lip on either side of the changing surface area that extends 3 in. (75 mm) above the surface of the mat (mats are typically 1 in. (25 mm) thick). Lip must be constructed of same material as counter. This changing surface must be directly adjacent to the sink and allow for individual to reach sink when standing at the changing area. Provide hands-free paper towel (cone-type), soap, glove, and plastic bag dispensers within reach of the caregiver at the table. Provide 10 compartmentalized cabinets 9-in.-wide, 9-in.-high, and 12-in.-deep (230 x 230 x 305 mm) for storage of diapers and products. Ensure that cabinets do not inhibit the child from standing on the changing surface.
Type 1 FF&E	Two foot-operated, covered containers within reach of the caregiver standing at the changing table: one for soiled disposable diapers and one for laundry. The diaper container must be waterproof, washable, and have an airtight lid.
Type 2 FF&E	None required.
Special Requirements	Provide magnetic locks to any storage cabinets within a child's reach that allow a child to open from the inside.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net m^2 (ft^2)	

Table 4-10.3. CAR Adult Sink with Counter

Description/ Usage	Provides space to store and heat individual bottles and food in every CAR. This area must be physically separated from the Diaper Changing Area. Where information is not provided in this table, use the criteria in the child activity room table.
Finishes	**Walls.** Provide high performance architectural latexcoated (MPI no. 140) dual-layer gypsum board. Provide heavy vinyl bumpers on all corners. **Floor.** Seamless sheet vinyl with resilient base. **Ceiling.** ACP.
Plumbing	Provide one sink with a single-lever faucet and a dedicated shut-off valve.
Power	Provide a duplex outlet for the refrigerator. Provide a counter-height GFCI duplex receptacle at least 2 ft. (610 mm) from the edge of the sink for appliances.
Casework/ Built-in Equipment	Provide a 34-in.-high, 96-in.-long (865 x 2440 mm) solid-surface counter with base cabinets, the integral sink, and a 4-in. (100-mm) high, integral backsplash. The cabinets must have heavy-duty hinges, non-protruding handles/pulls/hardware, and easily-cleanable surfaces. Provide one lockable cabinet. If upper cabinets are provided, ensure the caregiver will have visual access of the room while standing at the food preparation area. Base cabinet doors and drawers must have recessed finger pulls. In infant and pre-toddler rooms, provide a 5 $ft.^3$ (.23 m^3) minimum, under-counter ADA-compliant refrigerator.
Type 1 FF&E	See Appendix D for FF&E.
Type 2 FF&E	None required.
Special Requirements	Physically separate this area from the diaper changing area to meet sanitation requirements. Do not locate this area under any sanitary or drain lines running through the ceiling. Provide magnetic locks to any storage cabinets within a child's reach that allow a child inside to open from the inside.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net m^2 (ft^2)	

Table 4-10.4. Child Interest Centers

Space	Description/Functions	Design Considerations
Blocks	Out-of-way area for children to build with and to store blocks and other props.	Typically located in a corner with soft-surface flooring.
Dramatic play	Area geared for creative and imaginative play activities.	Typically includes soft-surface flooring and wall mirrors.
Toys and games	Area for table-top and floor toy and game play.	Typically double functions as eating area with child-size tables and chairs and hard-surface flooring.
Art	Area for visual art activities	Typically double functions as eating area with child-size tables, chairs, and easels and hard-surface flooring. Provide means to display artwork and locate near a sink.
Library	Area for reading, writing, story telling, and storage of books and writing supplies.	Typically includes soft-surface flooring, comfortable seating, and bookshelves.
Discovery	Area for preschool children to participate in various investigation activities.	Hard-surface flooring with sensory tubs and nature collection storage.
Sand and water	Area for small-scale indoor sand and water play.	Hard-surface flooring with sand and water tubs. Locate near a sink.
Music and movement	Area for music and movement activities, including both recorded and child-generated music.	Typically includes soft-surface flooring and storage for music player, music, and instruments.
Cooking	Area for preschool children to participate in simple food preparation activities.	Hard-surface flooring with storage space for a mobile cooking cart. Locate near a sink.
Computers	Area for preschool children to access computers.	Typically includes soft-surface flooring with child-size desks and chairs.

Table 4-11. Multipurpose Room

Description/ Usage	This **optional** space accommodates children 24 months to 6 years of age for large group activities, wheel toy play, exercise, group games, or indoor play in extremely hot or cold climates. This room can also support other activities such as parenting classes and staff training. Service contacts provided in Chapter 1, Regulatory Authorities, must provide approval for inclusion of this space.
Ceiling Ht.	10 ft. (3.1 m) minimum and 12 ft. (3.7 m) maximum.
Windows/Doors	Provide windows and doors as in the CARs per Chapter 3, Windows and Doors and Interior Construction. Provide an interior window from the multipurpose room to the corridor at 42 in. (1070 mm) above finished floor, a minimum of 36 in. (915 mm) high, and a minimum of 10 $ft.^2$ (.93 m^2) total window area (no horizontal members blocking view of either adults or children). Do not use folding or sliding doors. Provide finger guards on the hinge edge of both the interior and exterior sides of all activity room doors up to 48 in. (1220 mm) minimum above finished floor. Plastic accordion-style finger guards are not allowed.
Finishes	**Walls.** Provide high performance architectural latexcoated (MPI no. 140) dual-layer gypsum board. Provide heavy vinyl bumpers on all corners. **Floor.** Seamless sheet vinyl with resilient base. **Ceiling.** ACP.
Plumbing	None required.
HVAC	Provide system per Chapter 3, HVAC. In addition, maintain 35 to 50% humidity, and maintain 68°F (20°C) minimum and 78°F (26°C) maximum. Exhaust rates must match child activity areas. Provide DDC temperature sensor mounted in wall recess at 12 in. (305 mm) above finished floor for monitoring only. Provide uniform air velocities of no more than 30 ft. (9.14 m) per minute 12 in. (305 mm) from the floor in all child activity spaces, unless otherwise noted. For safety of the children, provide individual room control and locate thermostats 54 in. (1370 mm) above the floor. Incorporate night and weekend setback capability. Use room thermostats that adjust accordingly to maintain the appropriate temperature as measured by the DDC sensor. Locate or protect heating surfaces to ensure children cannot come in contact with surfaces above 110°F (43°C). In climate zones 5 through 8 provide a supplemental, under-floor, hydronic radiant heating system in infant and pre-toddler CARs. Radiant floors must have in slab temperature sensors. Provide under floor slab R-10 insulation for climate zones 3 through 7 and R-15 insulation for climate zone 8.
Fire Protection and Life Safety	Provide system per Chapter 3, “Fire Protection and Life Safety”.
Power	Provide system per Chapter 3, “Electrical”. Coordinate all powered equipment locations with the program personnel identified in Chapter 1, Regulatory Authorities, and place outlets accordingly to eliminate the need for extension cords. For safety of the children, the top of the electrical outlet boxes must be 54 in. (1370 mm) above finished floor.
Lighting	Provide system per Chapter 3, Electrical. Provide emergency lighting to illuminate the entire room floor area to a minimum of 1 ft. candle (10 lux).

Table 4-11. Multipurpose Room

Communication	**CCTV.** Provide outlets required for full coverage **CATV/Internal Video.** Provide one outlet. **Intercom.** Provide system remote with a handset for private conversations. **Telephone.** None required. **Data.** Provide outlets as required for equipment.
Security System	None required.
Acoustics	Design space to comply with Chapter 3, “Interior Acoustics”, and provide partition construction with a minimum STC rating of 50.
Casework/ Built-in Equipment	Provide a lockable storage closet that can be opened from the inside without a key. Provide CCTV cameras, with a minimum of two, to ensure full coverage of all areas within room.
Type 1 FF&E	None required.
Type 2 FF&E	None required.
Special Requirements	Provide natural light from non-breakable skylights or a clerestory. Demountable and retractable partitions are not permitted in the multipurpose room.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net m^2 (ft^2)	

Table 4-12. Nursing Room

Description/ Usage	This space provides privacy for a mother to nurse her child. Locate near the infant and pre-toddler rooms.
Ceiling Ht.	8 ft. (3.1 m) minimum and 10 ft. (3.7 m) maximum.
Windows/Doors	Provide windows and doors per Chapter 3, "Windows and Doors and Interior Construction". Windows and doors require privacy while in use.
Finishes	**Walls**. Painted gypsum wall board. **Floor**. Seamless sheet vinyl with resilient base. **Ceiling**. ACP.
Plumbing	Provide integral sink as described in "Casework/Built-in Equipment".
HVAC	Provide system per Chapter 3, "HVAC".
Fire Protection and Life Safety	Provide system per Chapter 3, "Fire Protection and Life Safety".
Power	Provide system per Chapter 3, "Electrical". Provide a quad outlet over counter.
Lighting	Provide system per Chapter 3, "Electrical". Lights remain on during operating hours with dimming capability.
Communication	**CCTV**. None required. **CATV/Internal Video**. None required. **Intercom**. Provide system remote with a handset for private conversations. **Telephone**. None required. **Data**. None required
Security System	None required.
Acoustics	Design space to comply with Chapter 3, "Interior Acoustics".
Casework/ Built-in Equipment	Provide a diaper changing counter with integral storage underneath for the infants/pre-toddlers as described in Table 4-10.2, CAR Diaper Changing Area. Also provide a counter with base cabinets and an integral sink as described in Table 4-10.3, CAR Adult Sink with Counter.
Type 1 FF&E	None required.
Type 2 FF&E	None required.
Special Requirements	None required
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net m^2 (ft^2)	

Table 4-13 Nurses Office

Description/ Usage	This **Marine Corps**-only space provides a private room to isolate a sick child from the rest of the children until a parent can pick him or her up. Locate in the Administration area.
Ceiling Ht.	9 ft. (2.74 m) minimum.
Windows/Doors	Provide windows and doors per Chapter 3, "Windows and Doors and Interior Construction".
Finishes	**Walls.** Epoxy painted gypsum wall board. **Floor.** Sheet vinyl with integral base. **Ceiling.** ACP.
Plumbing	Provide sink.
HVAC	Provide system per Chapter 3, "HVAC". Use ventilation rates per ANSI/ASHRAE 62.1, "Education Facilities, Daycare Sickroom."
Fire Protection and Life Safety	Provide system per Chapter 3, "Fire Protection and Life Safety".
Power	Provide power per Chapter 3, "Electrical". For safety of the children, the top of the electrical outlet boxes shall be 54 in. (1370 mm) above finished floor.
Lighting	Provide system per Chapter 3, "Electrical". The lights shall be controlled automatically to remain on during facility operating hours.
Communication	**CCTV.** None required. **CATV/Internal Video:** None required. **Intercom.** Provide a system remote. **Telephone.** Provide one line. **Data.** Provide one data outlet.
Security System	None required.
Acoustics	Design space to comply with Chapter 3, "Interior Acoustics".
Casework/ Built-in Equipment	
Type 1 FF&E	Provide desk with lockable file drawers, 2 chairs, lockable file cabinet and lockable medicine cabinet.
Type 2 FF&E	
Special Requirements	Provide floor space for a cot.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net m^2 (ft^2)	

CHAPTER 5 OUTDOOR ACTIVITY AREAS

5-1 INTRODUCTION/PURPOSE.

The Outdoor Activity Area provides outdoor play activities for all age groups. It supports a program of activities and, as such, is an extension of the interior activity room space.

Design the play environment to allow a wide range of movement; stimulate the senses; offer novelty, variety and challenge; and be safe and comfortable. Ensure novelty by incorporating both simple and complex features. Incorporate textures such as sand, water, grass, flowers, trees, and smooth rocks (and other artifacts of nature) within the natural environment. Incorporate manufactured textures of wood, metal and plastic as well as elements that respond when acted upon within the play environment. Design the play environment to be open to many interpretations and uses in order for the child to exercise his or her power to manipulate it. Do not design the environment to impart preconceived notions of how to act or respond to the surroundings. With appropriate supervision, children will actively manipulate, transform, dismantle, and re-create the environment in order to learn about the makeup of the world.

5-2 PLANNING CRITERIA.

5-2.1 Size.

Provide a minimum of 130 $ft.^2$ (12.1 m^2) per child for 50% of each age group's capacity. Larger outdoor activity areas can be provided if approved by the regulatory authorities in Chapter 1.

5-2.2 Grade.

Provide a minimum slope of 1 percent for all paved areas and 2 percent of all grassed areas. The maximum slope is 5 percent throughout the entire outdoor activity area.

5-2.3 Layout.

Do not create blind spots or hidden areas within the playgrounds. Ensure design accommodates adult visual supervision of children at play, and avoid creating areas where unsupervised mischief or child abuse can occur. Ensure depth of outdoor areas allow for providing emergency exit pathways, play and shade structures.

5-2.3.1 Utilize Existing Features.

Preserve natural landscape features, including existing topography, trees, and vegetation, and supplement as needed to provide a varied natural environment. Ensure that natural features such as hills and nature areas are accessible to everyone and that plants and vegetation are non-toxic and don't have seeds or other elements that could be choked on. Trees that drop nuts or species subject to high deadfall limbs are not permitted. Integrate plants into the entire play area rather than provide isolated nature areas.

5-2.3.2 Utilities.

The only utilities permitted in the outdoor activity area are those actively supporting the outdoor activity area. Do not locate mechanical equipment, transformers, storm drains, and manholes in the outdoor activity area.

5-2.3.3 Drainage.

Provide proper drainage on the site and under the playground equipment to permit use of the outdoor activity area after inclement weather. See Chapter 3, “Site Design”, for additional grading and drainage criteria.

5-2.3.4 Adjacencies.

Design outdoor play areas to directly adjoin the CDC building. Locate age-specific play areas immediately adjacent to the age-appropriate CARs. Locate play areas in view of the CARs they serve.

5-2.3.5 Access and Exiting.

Provide a minimum of two access points: One from the CAR into the outdoor activity area, and one from the outdoor activity area to the outside site. Design the outside site access point to allow the retrieval of play equipment (i.e., balls). Additionally, provide an accessible pathway between the age specific outdoor activity areas that is surfaced in a maintenance free material. Design to accommodate the movement of maintenance equipment into the play area and allow an emergency exit. Pave the main entrance pathway from the outside site into the activity areas.

5-2.3.6 Climate Considerations.

Accommodate the prevailing weather patterns that can affect children's comfort. For example, if sited in an area with prevalent northerly winds, locate the play areas on the south side of the building. Provide natural wind breaks (trees) for extra protection from the elements.

5-3 GENERAL DESIGN CRITERIA.

Design the outdoor play area to support a program of activities and be conducive to creative play. To the degree that climate permits, design the outdoor activity area to accommodate many indoor activities—it is an extension of the interior activity room space. The play program encourages children to interact with the environment, each other, and the caregivers either in free play or through planned and structured activities. A certified playground safety inspector that has current certification from the National Playground Safety Institute that is not affiliated to an equipment manufacturer must design the outdoor activity area or review and approve the final design.

Integrate play areas, to the greatest extent possible, into the overall design of the center. Ideally, design the indoor and outdoor spaces simultaneously so that a proper link can be made to join the two spaces. The outdoor activity area is divided into age-

specific areas that correspond to the facility child activity rooms. General design criteria that apply to all ages and portions of the outdoor activity area are provided below.

5-3.1 Accessibility.

It is the policy of DoD to integrate children with special needs into the outdoor play environment with their appropriate group. To accomplish this, provide a diversity of play opportunities and equal opportunity for all children regardless of ability. Discuss accessibility needs with the CDC staff before starting the design, and note the following information.

5-3.1.1 Accessibility Pathways.

Provide an accessible pathway throughout the play area. Provide a safety-surfaced path for a wheelchair to approach, but not roll onto, manufactured play equipment. Do not provide access ramps that allow trike access onto equipment. The optimum solution is to provide an accessible surface up to the equipment and provide transfer platforms to help the child onto the equipment. Design play structures and play areas to be accessible. Provide specially designed decks and railings for transfer out of wheelchairs and onto equipment.

5-3.1.2 Access to Use Zone Surfacing.

Meet zone criteria for surfacing, but also design for wheelchairs to allow accessibility where possible. Use zone criteria take priority over equipment accessibility.

5-3.1.3 Sensory Rich Materials.

Provide a variety of materials to stimulate and entertain children, including those who are visually impaired, hearing impaired or who have other special needs.

5-3.1.4 Special Requirements.

For requirements to accommodate children who are severely handicapped in the child development program, consult with the contacts provided in Chapter 1, “Regulatory Authorities”.

5-3.2 Exterior Storage.

Provide enclosed, weather-tight, vandal-proof and lockable storage in each age-specific outdoor activity area. Storage size must be 100 $ft.^2$ (9.3 m^2) per infant/pre-toddler and toddler play area, and 150 $ft.^2$ (13.9 m^2) of storage space per pre-school play area. Comply with the following:

- Locate storage to be readily accessible to the age-specific activity area and so it does not create any blind spots in any portion of the Outdoor Activity Area.
- Connect the storage to the activity areas with ABA-accessible hard-surface pathways.

- Detached facilities require ventilation only.
- The floors must be concrete sloped to the door for drainage.
- Interior clear height must be a minimum of 7 ft. (2135 mm).
- Provide heavy-duty adjustable shelving, 2’ deep, able to support 100 pounds per linear foot.
- Provide doors 4 ft. to 6 ft. (1220 mm to 1830 mm) wide with a 5 SF vision panel. Doors must swing outward, include finger guards, and be equipped with vandal-proof hardware and keyed locks that can be opened from the inside without a key.
- Where possible, locate any storage unit not physically attached to the building with the storage unit door to be in-line with the playground fence and set the rest of the storage unit outside of the playground.

5-3.3 Fencing.

At a minimum, enclose the perimeter of the entire outdoor activity area with a 5 ft. (1520 mm) high fence. Add or position planting or landscape features to preclude an adult from reaching over the fence. Facility planners must submit site plans to the contacts identified in Chapter 1, “Regulatory Authorities”, to determine if a taller fence or solid wall is required. When the outdoor activity area is adjacent to hazards, busy roadways, or is in a high security risk neighborhood, enclose the perimeter of the entire outdoor activity area with an 8 ft. (2440 mm) high fence.

Enclose each age-specific area within the perimeter with a 3 ft. to 5 ft. (915 mm to 1520 mm) high fence or provide buffer areas between age-specific areas where appropriate Buffer areas can be created by using landscape elements to divide the children from one area to another. Provide passage gates between age-specific areas.

Comply with the following in the design of the fences.

- The fence design must be compatible with the architecture of the CDC and be more than simply utilitarian. Provide a combination of fencing materials to avoid an institutional effect. Black or dark green vinyl-coated chain link is the preferred fence material. Exposed galvanized wire is not permitted. Do not make fences out of wood.
- Use bollards, raised planters, or other devices to protect play areas located next to driveways or roads where cars could swerve into the play area.
- Fences must have smooth caps, be selvage knuckled, with no finials or sharp picket tops. The fencing components must not expose sharp points or edges that could cut or puncture children's skin. All fastening devices used for fence construction must be turned sideways or must not project perpendicular to the fence surface beyond .125 in. (3.2 mm). Finials or sharp picket tops are permitted only on the 8 ft. (2440 mm) high perimeter fences.

- The fence bottom must either be secured to a bottom rail or be buried a minimum of 3 in. (75 mm) below grade.
- Fencing gaps between vertical elements, such as at gates and at connecting points to the building, must be no more than 3.0 in. (75 mm).
- No openings in the fence must be between .375 in. (9 mm) and 1 in. (25mm) in size as pinch protection.
- Additional information on entrapment dimensions is provided in *CPSC Public Playground Safety Handbook*.
- Coordinate gate sizes to accommodate the evacuation cribs (See Chapter 4, “Child Activity Rooms”).
- Perimeter emergency egress gates must only be operable from the interior side with panic hardware, have adult-controlled securing devices to prevent child operation, and pinch/crush protection on the hinges. In addition, design the gate to preclude operation by an adult reaching over the fence from the exterior side as a child-abuse prevention measure.
- Provide at least one access gate that is 10 ft. to 12 ft. (3050 mm to 3650 mm) wide for emergency or service vehicles.
- Ensure that fences do not impede caregiver supervision of children.
- Design fences to discourage climbing. Do not use horizontal slats or horizontal rails. Design walls or structures used for barriers to discourage climbing. Design fences to be capable of withstanding code specific force applied horizontally.

5-3.4 Shade.

Shade is a requirement for the CDC to receive DoD certification. Provide each age-specific activity area with a structure or structures to provide shelter from the sun and inclement weather. At a minimum, provide whichever is greater: 10 percent shaded area per each age-specific area or a minimum of 15 $ft.^2$ (1.4 m^2) per child for the maximum number of children occupying the areas at any one time (see Chapter 5, “Planning Criteria”). At a minimum, 50 percent of each play area must be exposed to direct sunlight during the morning and afternoon use periods.

Shade structures include exterior screened rooms, park shelters, awnings, porches, gazebos, and umbrellas. Supplement structures with trees and other natural landscaping. All structures must provide a minimum shaded area of 6 ft. (1830 mm) in any direction. The degree and orientation of shade will depend on local climatic conditions. Transitional areas such as a patio, deck or platform that serve as a link between interior and exterior spaces are an effective means to provide shade. All shade structures must comply with the criteria provided in Chapter 5, “Equipment Requirements”. Shade structures must conform to architectural and design guidelines of the installation.

5-3.5 Equipment Requirements.

Playground equipment must be included in the MILCON construction to provide a complete and usable facility.

5-3.5.1 Industry Standards.

Playground equipment and shade structures must comply with the minimum standards put forth in the guidelines listed below. In some cases, this FC may include more stringent requirements than those listed. In those cases, follow the criteria identified in this FC. Use the most recent editions of the following publications:

- The Consumer Product Safety Commission (CPSC) *Public Playground Safety Handbook*. (Although the CPSC provides guidelines for unsupervised public play settings for children two years and older, the CDC playground must safely accommodate supervised children as young as 6 weeks of age.)
- ASTM F1292, *Standard Specification for Impact Attenuation of Surfacing Materials Within the Use Zone of Playground Equipment*.
- ASTM F1487, *Standard Consumer Safety Performance Specification for Playground Equipment for Public Use*.
- ASTM F1951, *Standard Specification for Determination of Accessibility of Surface Systems Under and Around Playground Equipment*.
- ASTM F2373, *Standard Consumer Safety Performance Specification for Public Use Play Equipment for Children 6 Months through 23 Months*.
- Accessibility. See additional information in Chapter 3, “Accessibility”.

5-3.5.2 Additional DoD Standards.

Show all use zones for play equipment on the site plan to ensure there is no conflict between play activities on the ground and swinging or jumping from the equipment. Do not overlap use zones. The minimum height above ground surface requiring a use zone is 20 in. (500 mm). As a minimum, design the infant crawl space, to include a 4 ft. (1.2 m) distance outside the infant crawl curb, as a use zone.

If young school-age children are using the playground, different use zone criteria apply.

5-3.5.2.1 Selection Criteria.

- **Range.** Provide a sufficient range of equipment to accommodate every type of play—exercise, dramatic, construction, organized games, social—engaged in by the age group served.
- **Novelty.** Select interesting play equipment with both simple and complex features. Group play equipment together to provide a sequence of play opportunities rather than providing single, large, fixed-in-place structures.

Provide for both solitary and social play. Select equipment that can be modified.

- **Flexibility.** Use composite units or super-structures that stimulate a wide range of motor functions. Provide equipment that can be used equally well by one child or by several children simultaneously. Do not select items designed to look like animal forms or other recognizable objects. Use dramatic play props that are adaptable to a range of make-believe roles or themes.
- **Challenge.** Provide equipment that provides clear, graduated stages of accomplishment, e.g., variable-height steps or climbing equipment with landings at different heights.
- **Scale.** Size equipment to match the age and development of child users.
- **Aesthetics.** Design children's playgrounds for aesthetics as well as function. Select equipment colors and styles that are appealing to children and compatible with the facility exterior. Integrate equipment with natural vegetation and landforms.

5-3.5.2.2 Installation Criteria.

The equipment purchasing agreement must include a requirement for the manufacturer to inspect the equipment after installation and confirm in writing that installation conforms to manufacturer's instructions and to CPSC and ASTM Guidelines. Also provide a contractual agreement for a skilled, certified, independent playground safety consultant that has current certification from the National Playground Safety Institute to inspect the entire playground after the installation is completed. Have experienced playground installers conduct or supervise installation.

5-3.5.2.3 Exclusions.

Do not use the following items in the outdoor activity areas, regardless of CPSC or ASTM approval:

- Animal swings, metal and otherwise.
- Wood equipment. Wood equipment is not permitted due to maintenance concerns, unless pre-manufactured and approved by the Service authorities.
- Metal slides. Metal slide surfaces are not allowed.
- Merry-go-rounds.
- Hard-seat swings.
- Trampolines.
- See-saws.
- Zip lines.

5-3.5.2.4 Exceptions and Modifications.

Observe the following exceptions and/or modifications to previous DoD policy or CPSC Handbook and ASTM requirements when selecting equipment for CDC outdoor activity areas:

- Spring toys are allowed if meeting CPSC Handbook and ASTM standards. However, this equipment is discouraged due its limited potential for creative play.
- Tunnels and tunnel slides require view panels. Specify only on preschool playgrounds.
- Use climbing structures that allow for free fall.
- Balance beam criteria vary by age group. Specify the CPSC Handbook standard for balance beams only on preschool playgrounds. For toddler playgrounds, the maximum height for a balance beam is 6 in. (150 mm).

5-3.6 Surfaces.

Use a variety of surface materials, with varying finishes, patterns, textures, and colors to stimulate interest and increase play opportunities. The outdoor activity area has four categories of surface areas with specific requirements: use zones, wheeled toy pathways, other hard surface areas, and general. Transitions between each category of surface areas must not exceed a 2 in. (50 mm) differential in elevation.

5-3.6.1 Use Zones.

Use zones are the areas under and around playground equipment and are defined by ASTM F1487. A required submittal is the commercial playground safety surface manufacturer's warranty and liability in the specifications and transfer to the Using Service. Include a written verification by the manufacturer that the playground safety surface meets the requirements of the CPSC Handbook and ASTM in the submittal section of the specifications.

The Services prefer poured-in-place resilient safety surfaces. Approval from the using Service is required for any other use zone surface material. Do not use the following surface materials:

- Engineered and natural wood fiber.
- Engineered loose rubber and ground tires.
- Any materials that are subject to compaction, ingestion, flammability, and wind dispersion.

5-3.6.2 Wheeled Toy Pathways.

Acceptable materials include concrete and stone and masonry pavers. The edge of pathways must be tapered for transitions and must not create trip hazards. Joints must be not wider than .5 in. (12 mm) because they may cause toys to tip. Adjacent grading

and/or sod installation must be within .75 in. (19 mm) of the pathway surface height and must allow for settlement to minimize replacement. Comply with the following when designing the wheeled toy pathways:

- **Modular paving.** Use non-grouted interlocking type pavers on sand placed over a continuous concrete setting bed. Install brick, stone or other non-interlocking type paving in grout over a continuous concrete setting bed. Do not install non-interlocking paving on sand in play areas, as the modular units may settle unevenly, resulting in a hazardous irregular surface. Where winter freezing is common and where poor soils occur, use a gravel base under concrete and reinforce to prevent cracking and deterioration. Integrally colored pavers are encouraged to create visual interest.
- **Concrete.** Add color additives or surface finishes to improve the appearance of concrete and reduce glare. Avoid smooth steel trowel finishes, which can become slippery when wet. Where winter freezing is common and where poor soils occur, use a gravel base under concrete and reinforce to prevent cracking and deterioration. Cast-in-place concrete over a well-compacted sub-grade is the most durable, maintenance-free paving material for hard surface areas.

5-3.6.3 Other Hard Surface Areas.

These areas include sidewalks, seating areas, patios, and areas for hard-surface games. Use a variety of surface configurations and materials for these areas. Specify compaction during construction. Sidewalks, seating areas, and patios must be concrete or stone and masonry pavers. Use brick and other types of modular paving for sidewalks to reduce the scale of these environments. The edge of sidewalks must be tapered for transitions and must not create trip hazards. Hard-surface game areas must be concrete.

5-3.6.4 General.

This encompasses any portion of the outdoor activity area not included in the other three defined areas. Use surfaces of grass or other natural landscaping. Use grass primarily in open, active play areas, passive play areas, and areas with low traffic levels. Do not use grass where wear and maintenance will become a problem. Locate grass in sunny areas where it will dry out quickly after rain. Artificial turf is not recommended for use as a playground surface; it can be abrasive and convey an unnatural impression. See Chapter 3, Landscaping, for more information on non-paved areas.

5-3.7 Plumbing.

Protect all outdoor water sources from freezing with an underground shut off valve.

5-3.7.1 Drinking Water.

Drinking water is typically provided via a portable cooler and single-use cups managed by the caregiver. However, if budget permits, provide a minimum of one outdoor

drinking fountain with mouth guard and angled jet in each activity area serving children older than 18 months. Provide outdoor fountains with frost-free operation and design to minimize clogging from sand or dirt. Use an appropriate height for the age group served, but do not exceed 24 in. (610 mm).

5-3.7.2 Hose Bibbs.

Provide a minimum of one hose bibb in each play area. Install hose bibbs in a recessed wall box to prevent impact injury. Provide hose bibbs with a frost-free water source and locate directly accessible to outside playgrounds.

5-3.7.3 Misters.

In hot, dry climates and if budget allows, provide misters. Connect misters to the potable water system and provide code-compliant back-flow prevention devices.

5-3.7.4 Irrigation System.

See Chapter 3, “Irrigation”, for system criteria.

5-3.8 Electrical.

Provide an outlet on the exterior of the building in each child outdoor play environment located at 54” above finished grade.

5-4 AGE-SPECIFIC AREA DESIGN CRITERIA.

5-4.1 Infant and Pre-toddler.

Separate but do not isolate this activity area from the other age groups. Provide a low fence, hill or other natural feature to separate crawling infants from more active toddlers, but allow easy transition between these areas. The separation must provide visual and audible connections but limit physical contact. Pre-toddlers can use either the infant area or the toddler area depending upon their level of development.

5-4.1.1 Storage.

Provide an individual 100 $ft.^2$ (9.3 m^2) of storage per room in accordance with Chapter 5, “General Design Criteria”.

5-4.1.2 Shade.

Shade is particularly important for infants and pre-toddlers. See Chapter 5, “General Design Criteria”, for additional information on shade.

5-4.1.3 Play Areas and Equipment.

Provide small steps, slopes, ground beams, climbing ramps, slight barriers and slides. If swings are provided, use belt-type baby seats with restraints.

5-4.1.4 Surfaces.

Access paths from the CDC must be concrete and double function as emergency egress paths. Modular paving must not be used in this activity area. Play area surfaces must consist of soft, resilient materials that protect crawling children and provide a comfortable surface on which to sit.

5-4.1.5 Exclusions.

Avoid excessive heights, abrupt surface level changes, and rough surfaces. The following items are not permitted in the infant/pre-toddler activity area:

- Treated wood
- Wood chips
- Pea gravel
- Pools of water

5-4.2 Toddlers.

This activity area must accommodate children playing alone, playing in pairs, and playing in small groups.

5-4.2.1 Storage.

Provide an individual 100 ft.^{2} (9.3 m^2) of storage per room in accordance with Chapter 5, General Design Criteria.

5-4.2.2 Play Areas and Equipment.

Provide the following play areas and equipment in this activity area:

- Wheeled toy path.
- Sand play area. Provide a sandbox with a retaining border that does not pose a tripping hazard, allows drainage, and will accommodate sand 18 in. to 24 in. (460 mm to 610 mm) deep. Locate the box so it is protected from the wind. Locate the box away from the entrance to the building and the drinking fountain to help alleviate concerns of tracking sand inside and clogging the fountain drain. Locate near storage. Provide raised troughs for wheelchair accessibility. If the sand area is less than 100 ft.^{2} (9.3 m^2), provide a cover. In cool, wet climates, locate sand areas in sunny locations and provide a sub-surface drain line system whenever possible to reduce dry out time. In hot, dry climates, provide shade over large sand areas to reduce heat and glare problems.
- Dramatic play area.
- Swings, space permitting. Provide 50 percent bucket-type swings and 50 percent single axis swings

- Multi-purpose area.
- Climbing equipment. Simple, versatile equipment is more appropriate for toddlers than scaled down versions of older children's play structures.
- Semi-enclosed spaces such as small play houses or climb-through tunnels. Climb-through tunnels must include vision panels.
- Small slides.

5-4.2.3 Exclusions.

Avoid excessive heights, abrupt surface level changes, and rough surfaces. The following items are not permitted in the toddler activity area:

- Treated wood
- Wood chips
- Pea gravel
- Pools of water

5-4.3 Preschoolers/Pre-K/Kindergarten.

The Preschool/Pre-K/Kindergarten activity area is larger than that required for infants and toddlers and requires more space for running and larger, more complex equipment.

5-4.3.1 Accessibility.

Preschoolers/Pre-K/K are self-mobile wheelchair users. Design this activity area to provide maximum accessibility.

5-4.3.2 Storage.

Provide an individual 150 $ft.^2$ (13.9 m^2) of storage per room in accordance with Chapter 5, General Design Criteria.

5-4.3.3 Play Areas and Equipment.

Provide the following play areas and equipment in this activity area:

- Wheeled toy path.
- Dramatic play area. Provide a larger, open-ended play superstructure offering many activities, but include elements such as playhouses, stages and props. Position these elements within the play area to allow the dramatic play to spill out and flow into other spaces. Place dramatic play materials and equipment in close proximity to each other and to wheeled vehicle paths.
- Construction area. Provide space for children to build freeform items and structures. Locate near storage for access to building materials, including blocks, wood boards, PVC pipe, paint, carpentry tools, ropes, and balls.

- Multi-purpose area.
- Swings. Locate swings along the perimeter of playground areas and provide adequate safety areas around swings to prevent conflicts with other activities. Use a flexible material for swing seats, such as the rubber belt-type, to avoid impact injuries. Hard seat swings are not allowed. Design swing top rails to not exceed 8 ft. (2.4 m) for children under four years old.
- Ball play area.
- Quiet activity space.
- Garden.
- Composite structure for climbing.
- Sand and water play. These areas should be adjacent to one another. Provide raised troughs for wheelchair accessibility to sand play area.
- Covered porch area. For use of musical devices, painting materials, chalkboards.

APPENDIX B BEST PRACTICES

B-1 INTRODUCTION.

The following material identifies background information and other current, good design practices for CDCs. The designer is expected to review and interpret this guidance and apply the information according to the needs of the project.

B-2 DESIGNING FOR CHILDREN.

B-2.1 Stages of Development.

Human development research indicates that there are universal, predictable sequences of growth and change that occur in children during the first years of life. Each stage is characterized by behavior that is different from that of the preceding stage. Each stage also integrates all behaviors possible at previous stages, consolidates them, and prepares for development toward the next stage. Knowledge about child development, i.e., behaviors, activities, and materials for a specific age group, and understanding about individual children's needs, must be applied to design the most appropriate learning environment.

B-2.1.1 Infants.

Infancy, from birth to about 12 months, is the period when rapid changes of a child can be noted in terms of intellectual as well as physical development. This period is characterized by the sequential acquisition of abilities such as locomotion and grasping. An infant's behavior is centered on the manipulation of objects and performance of activities for the simple sensation of them.

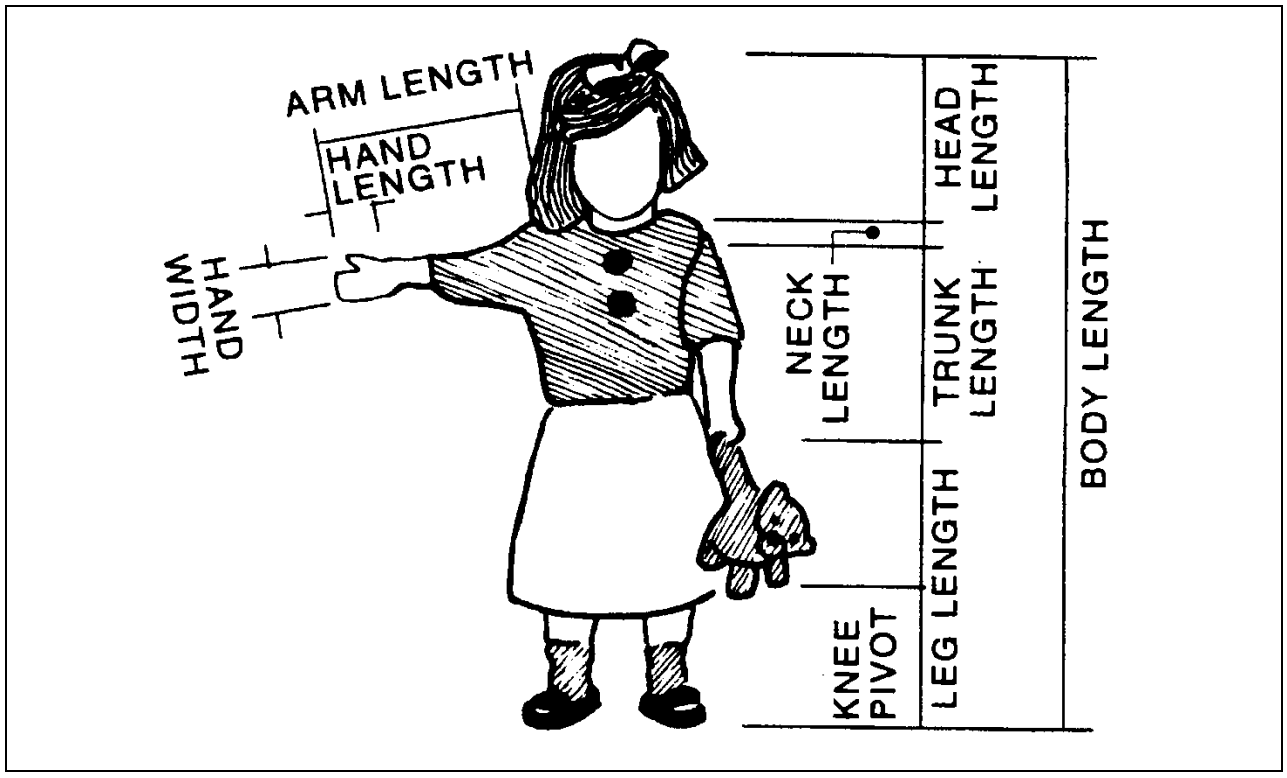
B-2.1.2 Toddlers.

The major developmental changes from infancy to toddler-hood are the increase in physical capabilities, the use of language, and the ability to internalize thoughts. During this period a child establishes walking and running, begins to explore and experiment with the environment, and increases social experiences such as talking and seeking the attention of others. Personalities are manifested, as well as likes and dislikes. Play for these children will progress into fantasy and parallel play where, although often in groups, toddlers play without much interaction with other children.

B-2.1.3 Preschool.

The preschool age child, between three and five years, has increased control of fine motor skills, a large vocabulary, and often engages in cooperative play. These children are better able to concentrate and remember.

B-2.2 Anthropometric Guidelines.



Average physical dimensions of children, according to their chronological age, are presented in Table B-1 and illustrated in Figure B-1. These figures do not apply to children with disabilities.

Table B-1. Anthropometrical Data

	Age In Years (The following dimensions represent averages)															
	Birth		0.5		1		2		3		4		5		6	
	mm	in.	mm	in.	mm	in.	mm	in.	mm	in.	mm	in.	mm	in.	mm	in.
Body Length	500	19.7	660	26	750	29.5	860	33.8	950	37.4	1040	41.9	1120	44.9	1170	46
Head Length	125	4.9	150	5.9	175	6.9	190	7.5	195	7.7	198	7.8	200	7.9	203	8
Head Width	97	3.8	119	4.7	132	5.2	140	5.5	142	5.6	145	5.7	145	5.7	145	5.7
Head Circum-ference	556	21.9	439	17.3	472	18.6	498	19.6	505	19.9	511	20.1	511	20.1	516	20.3
Trunk Length	211	8.3	295	11.6	320	12.6	345	13.6	363	14.3	381	15	389	15.3	399	15.7
Shoulder Width	150	5.9	178	7	203	8	224	8.8	236	9.3	246	9.7	254	10	262	10.3
Chest Circum-ference	330	13	437	17.2	475	18.7	508	20	521	20.5	528	20.8	538	21.2	554	21.8
Abdominal Circum-ference	N/A		411	16.2	445	17.5	462	18.2	470	18.5	516	20.3	518	20.4	521	20.5
Pelvic Width	81	3.2	117	4.6	130	5.1	145	5.7	157	6.2	175	6.9	185	7.3	196	7.7
Arm Length	193	7.6	254	10	305	12	371	14.6	417	16.4	424	16.7	503	19.8	533	21
Hand Length	N/A		N/A		97	3.1	107	4.2	119	4.7	124	4.9	127	5	130	5.1
Hand Width	36	1.4	41	1.6	43	1.7	48	1.9	51	2	51	2	56	2.2	58	2.3
Leg & Thigh Length	168	6.6	208	8.2	244	9.6	312	12.3	371	14.6	437	17.2	582	22.9	627	24.7
Sitting Height	N/A		447	17.6	488	19.2	538	21.2	572	22.5	597	23.5	622	24.5	635	25

1 Anita R. Olds, Ph.D., ARCHITECTURAL PROTOTYPE DOCUMENT, Commonwealth of Massachusetts, 1987; Diffrient, N., Tilley, A.R., and Bardagly, J.C., HUMANSCALE 1/2/3 MANUAL, Cambridge: MIT Press, 1974; Society of Automotive Engineers, Inc., ANTHROPOMETRY OF U.S. INFANTS & CHILDREN, Michigan: 1975

Figure B-1. Anthropometric Dimensions

B-2.3 Choking Hazards.

See current edition of "Caring for Children" book (from American Academy of Pediatrics) which indicates choking guidelines and physical dimensions of children, according to their chronological age.

B-3 GENERAL DESIGN GUIDANCE.

B-3.1 Space Attributes.

The design effort must allow for, and be sensitive to, the differences in space attributes for children and those for adults as well as the differences in space usage by the children in different age groups. Information about the characteristics and activities of the children is included to provide rationale for aspects of design. The requirements and recommendations set forth in this FC are aimed at establishing optimal design, though, when appropriate, specific maximum or minimum requirements are stated. The center design must meet the needs of children, caregivers, administrators, and parents by performing the following functions:

- Support the staff's care of children by creating safe and healthy environments that allow them to focus their efforts on the care and nurture of children. Provide features that encourage positive relationships between staff, children, and parents.

- Create an environment that comfortably accommodates the needs of well-qualified staff in order to attract and retain them.
- Facilitate family involvement in the center, particularly with the child's caregivers.
- Respond to local conditions, climate, and regional preferences in the design, while also considering the goals of the parents and sponsoring agency or agencies.
- Create a safe environment for both children and staff. Design the facility to ensure that children can not leave the facility without staff knowledge. Window and door criteria in Chapters 3 and 4 support this design objective.
- Create an appropriate, well thought-out and attractive child-oriented environment. The CDC should avoid a typical institutional atmosphere; it should be inviting and feel "home-like" for the child.
- Accommodate a child's scale, including how they will use the space, what they will see, and what kind of experience they will have, i.e., design through the eyes of a child.
- Provide an intriguing environment, but one devoid of overpowering colors, features and literal themes. Too much literalness can inhibit a child's creativity.
- Size the child activity rooms to accommodate the recommended group sizes and staff-to-child supervision ratios. Efficiently use space and provide strategically situated storage to accommodate effective supervision.
- Provide durable and cost effective materials and details. A CDC is used intensely; the design must be particularly sensitive to the life cycle cost of materials.
- Create a reasonably accommodating center for staff, parents and children in a cost effective manner.
- Provide for flexibility as the installations' demographic needs change.

B-3.2 Exterior Design.

Design CDCs to reflect a residential, non-institutional character. The physical environment supports the operational quality of a center and profoundly affects the behavior and development of children, as well as the efficient functioning and sense of well being in adult caregivers. The design must be sensitive to all environmental influences without compromising the functional program requirements. Accomplish this through sensitive architectural design that addresses the issues of environment, proportion, scale, forms, landscaping, and imagery that are important in this type of facility. Choose appropriate colors and materials that are complementary to installation plans. A pleasant functional environment influences the way caregivers react to the

children. Because this facility is focused on children, use a pallet intriguing and rich but not over-stimulating or “flashy.”

B-3.3 Interior Design.

Think of the center as a “home away from home” for the child. Design the interior spaces to dispel an institutional feeling, especially if it is treated in a home-like way. One example is circulation areas that allow stopping places for social interaction. Include elements such as neutral warm colors, low-level lighting, and soft residential-type furniture to create an inviting and reassuring reception for children. Provide offices with exterior windows to the extent possible. Use finishes that feel home-like. For instance, small-scale finish materials, such as bricks, are typically preferable to large pre-cast panels. The dimension of brick is more congruent with the size of a child and his or her home experience.

Use textures to help cue children in activity areas. Provide a variety of textures on surfaces within reach of children, especially for infants and toddlers. Soft textures relax children while harder finishes and surfaces make a space noisier and more chaotic. Utilize soft textures whenever possible to promote relaxed and quiet behavior. Hard textures are more appropriate for large motor activity areas. Using subtle, varied and natural textures is highly encouraged.

B-3.4 Signage.

Interior signage and graphics are an important part of making the facility inviting to children and adults. The use of color to code different age group modules is an excellent way to create interest, identify the module and help children with a visual orientation throughout the facility. Use colors, textures, and finish materials on the walls and/or floors to define circulation patterns. Use signs with words and symbols where appropriate.

B-3.5 Site Walkways.

Develop a successful transition from the parking lot to the building entry by providing interesting walks that pass through natural or landscaped areas, wherever possible, and which overlook engaging sights such as playgrounds. Consider a child's perspective in this development.

B-3.6 Vehicular Circulation.

Private vehicle drop-off areas are not permitted within the antiterrorism stand-off distances.

B-3.7 Landscaping.

B-3.7.1 Buffers.

Consider buffering play areas from traffic with earth berms at the site perimeter of 3 to 4 ft. (900 to 1200 mm) in height with a 3:1 slope. Also consider earth berms to screen

parking and service areas. Higher berms at the site perimeter could be used to provide acoustical protection from a noise source, but the height and slope will be determined by the site and noise source specifics. To maintain supervision and safety, higher berms are only permitted on one side of the site.

In windy climates, use trees as natural windbreaks. In hot, sunny climates, use trees to supplement the required shade structures (see Chapter 5, “Shade”, for more on shade requirements).

B-3.7.2 Building Entry.

Provide colorful flowering plantings that are visually interesting throughout the seasons to create a sense of welcome for the children at the main entry.

B-4 INDIVIDUAL ROOM DESIGN GUIDANCE.

B-4.1 Entrance/Lobby/Reception.

The character of the main entry should communicate security and professionalism to the parents. At the same time, it must be fun and engaging to children. Pay attention to the design, materials, finishes, interesting volumes and colorful details.

B-4.2 Child Activity Rooms.

A prime objective of a successful design is to create conditions that allow caregivers and children to interact both verbally and non-verbally in large and small groups. To do this successfully, activity room space should not appear crowded. Include low tables and chairs and the space for caregivers to communicate individually with children. Define functional areas by furniture arrangements that vary depending upon the age group.

In order to maximize the amount of uninterrupted activity space and space devoted to childcare functions, design the circulation between the entrance and exits to be as direct as possible. Adjacent to circulation, it is appropriate to position tables and work surfaces, which tend to involve more crowded functions while retaining corners and floor area for more protected and nurturing activities.

The following practices result in the most optimum child activity room design:

- **Maintain corners.** Preserve room corners for child activity areas. Do not locate the room entrances/exits near a corner.
- **Efficiency.** Plumbing elements include child hand washing, toilets, adult sink with counter, diaper changing, and other sinks. Group the fixed elements to share a plumbing wall or minimize piping runs.

B-4.2.1 Infants.

Infants engage in crawling, walking, floor play, table play, and wheel toy play. Provide a safe, soft, stimulating environment in which babies can crawl, explore, and interact with

their caregivers. The infant room needs to be warm and nurturing in character. Because each infant may have a unique schedule, a variety of activities can take place in the infant room at any given time, ranging from playing, diaper changing, eating, sleeping, cuddling, and nursing. This variety of activities requires that quiet areas be separate from more active areas.

B-4.2.2 Pre-toddlers.

The pre-toddler activity room will hum with activity as pre-toddlers quickly move through their space, involved in all the activities available to them. Design an environment that is stimulating, offering the child a safe, yet warm and nurturing place to spend the day. Scale furnishings and equipment for this age group to encourage growth toward independence. Consider that pre-toddlers may nap more often than once a day. Pre-toddlers will gather at child-scaled tables for snacks and lunchtime. They can feed themselves with some assistance from their caregivers. In the pre-toddler open activity area, offer a range of opportunities for exploring and challenges in developing large motor skills. Design the activity area for running and cruising (movement through the space to view and select from a variety of activities) without disrupting children in other activities.

B-4.2.3 Toddlers.

Toddlers are busy experiencing their environment and developing essential motor skills as they take part in active play. In the toddler open activity area, offer a range of opportunities for exploring and challenges in developing these motor skills. Provide features such as wide access to portable platforms and generous, clear pathways that avoid sharp corners. Locate manipulative toys and materials on low, open shelving where the toddler can see and easily reach them. Though generally scale the space to child size, the activity room design must also permit caregiver access to all spaces.

B-4.2.4 Preschool.

Children at this age are actively exploring their environment; exercising large muscle skills by running, jumping, galloping, riding wheeled toys and playing various ball games. Provide a large amount of architecturally unrestricted space that caregivers and children can divide into smaller interest areas. Their level of skills enables them to take part in more advanced activities, requiring a greater number of interest areas configured for small groups of children in each area. Other activities for this group are dramatic play, music, painting, puzzles, manipulative play, block play, pre-math, reading, and writing. Preschool age children are involved in various projects, including simple food preparation, problem solving, science, and gardening.

B-5 BUILDING SYSTEMS GUIDANCE.

B-5.1 Fire Protection and Life Safety.

The following are requirements that are contained in other guidance but are frequently overlooked or misinterpreted:

- Provide tactile signage at each exit door and on interior signage to meet accessibility and life safety requirements.
- Meet sprinkler design density, design area, hose stream allowance, duration of supply, and piping materials required by UFC 3-600-01. Note that some system designs permitted by NFPA 13 are not permitted by UFC 3-600-01.
- Within the fire detection and alarm system, ensure that the visual notification appliances meet the minimum candela required for the space in which they are located including increased candela ratings in sleeping areas..
- Provide visual notification devices that flash in synchronization when more than two strobes are within an occupant's field of view. This feature reduces the potential for adverse reactions by persons subject to photosensitive epilepsy.
- Provide fire alarm reporting and mass notification system external communication capability in accordance with NFPA 72, UFC 3-600-01 and UFC 4-021-01 and that is compatible with the Installation's existing systems. Consult with the Installation since these may be sole source items.
- Keep the top 18 in. (460 mm) from the ceiling clear for sprinkler and smoke detector operation. This is often overlooked in storage rooms with built-in shelving or racks.

B-5.2 Radon.

Check the EPA's Map of Radon Zones (by state), EPA 402-R-93-071 (available from http://www.epa.gov/), to determine the radon priority area. Also, check the results of the Navy radon survey by contacting the NAVFACENGCOM Facilities Engineering Command (FEC) or Integrated Product Team (IPT) Air Pollution Engineer. Provide passive sub-slab depressurization systems for projects located in Priority Areas No. 1 (predicted average radon level is greater than 4/pCi/L). Change the system to active, if needed, based on follow-up testing. Check the following EPA documents available from the EPA Radon Information Center, (703) 356-5346:

- *EPA's Model Standards and Techniques for Control of Radon in New Residential Buildings, EPA 402-R-94-009.*
- *Radon Prevention in the Design and Construction of Schools and Other Large Buildings, EPA/625/R-92-016,*
- *Radon Measurement in Schools, EPA/402/R-92-014.*

B-6 OUTDOOR ACTIVITY AREA.

B-6.1 Play Areas and Equipment.

Turn over the sand to a depth of 18 in. (460 mm) annually and replace every two years.

B-6.2 Safety Background.

The major cause of playground injury is falling onto hard surfaces. Falls, head entrapments, strangulations, and contact with protrusions/projections on heavy swing seats account for most fatalities. Locate moving elements in areas away from natural child movement between zones.

This Page Intentionally Left Blank

APPENDIX C POISONOUS AND NON-POISONOUS PLANTS

Many popular house and garden plants are considered poisonous and can produce symptoms ranging from minor to severe. Table C-1 provides a non-comprehensive list of common plants that are known to be poisonous. Table C-2 provides a list of plants for which no evidence currently exists of a poisonous quality. These lists are provided by the Maryland Poison Center. Within the United States, check with local extensions of the US Department of Agriculture for more information about the nature of common plantings in specific locations. These lists are not intended to serve as a guide for plants to use or not use but are merely provided for informational purposes. See Chapter 3 for more information on landscaping and plant selection.

Table C-1. Common Poisonous Plants

Amaryllis	Jonquil
Azalea	Lantana
Barberry	Lily-of-the valley
Black locust	Mayapple
Boxwood	Mistletoe
Caladium	Morning Glory
Castor bean	Mountain laurel
Chinaberry	Narcissus
Chinese evergreen	Nephthytis/Arrowhead
Chrysanthemum	Nightshade family
Crown of thorns	Oak (acorns)
Daffodil	Oleander
Dumbcane/Dieffenbachia	Peace Lily
English ivy	Peony
Euonymous	Philodendron family
Four o'clock	Poison ivy/oak/sumac
Foxglove	Pokeweed
Fruit pits or seeds	Pothos
Gladiola	Privet
Holly	Rhododendron
Hyacinth	Snowball bush/Hydrangea
Iris	Water hemlock
Jerusalem cherry	Wisteria
Jimsonweed	Yew

Table C-2. Common Non-Poisonous Plants

African violet	Marigold
Begonia	Mulberry (ripe berries only)
Christmas cactus	Norfolk pine tree
Coleus	Peperomia
Corn plant	(spring) Petunia
Crocus	Poinsettia*
Dandelion	Prayer plant
Dogwood	Pyracantha/Firethorn
Dracaena	Rose
Easter lily	Rubber tree plant
Ferns	Sansevieria/Snake plant
Ficus*	Scheffiera*
Forsythia	Spider plant
Fuchsia	Swedish Ivy
Geranium	Tulip*
Hibiscus	Wandering Jew
Honeysuckle	Wax plant
Impatiens	Wild strawberry/Snakeberry
Jade plant	Zebra plant
Lilac	

***** Sap may be irritating.

APPENDIX D SAMPLE FURNISHINGS, FIXTURES AND EQUIPMENT LISTS

D-1 FF&E SAMPLE LISTS.

The following list is suggested items, broken down by traditional contractor-provided FF&E and user-provided items.

Table D-1. Sample Furnishings and Equipment

Functional Area and Items	FF&E	User Provided
Administrative Areas		
Artwork	✓	
File cabinet (4 drawers or 5 drawers)	✓	
Office chair with arms, office desk, arm chair	✓	
Copy machine (floor model) and fax machine	✓	
Time clock, safe	✓	
Lounge table(s), chair	✓	
Coat rack, magazine rack(s)	✓

APPENDIX E SAMPLE KITCHEN EQUIPMENT

E-1 KITCHEN EQUIPMENT LISTS BY FACILITY SIZE.

The following are equipment lists for small, medium and large kitchens. The kitchen must be designed by a qualified kitchen designer – see Chapter 3 for qualifications.

The CDC kitchens are designed to support short term storage, warming and food preparation. Delivery of supplies arrives from exterior of the building and trash is removed to a dumpster along this route. Trained staff prepares and wash-up. One food delivery utility cart for each CAR is loaded with food and beverage and transported to each classroom where it remains. When meal service is complete, the cart is returned to the kitchen for wash-up and storage.

Where items in equipment lists are indicated as “Optional”, Designer of Record must consult with program authorities in Chapter 1 to confirm if item is required.

E-1.1 Small CDC.

1 Food delivery utility carts (NSF approved or equivalent standards), with three shelves of minimum shelf size 18-in. x 26-in. (455 mm x 660 mm) and overall maximum height of 34 in. (865 mm)
2 Stainless steel wall shelf over food delivery utility carts at 12 in. (305 mm) deep *
3 Trash receptacle of minimum 44 gallons (167 L) on mobile trash receptacle dolly
4 Fire protection system panel *
5 Stationary shelving units (NSF approved or equivalent standards) for dry storage
6 Reach-in freezer, single door, of 19 $ft.^3$ (.54 m^3) minimum capacity (in MILCON)
7 Hand sink, wall mounted with support brackets at each entrance *
8 Optional slicer (NSF approved or equivalent standards)
9 Food preparation stainless steel work table with turned-up rolled rim edges, 6-in. (150 mm) high back splash, drain boards, work sinks *
10 Stainless steel wall shelf over prep work sinks *
11 Stainless steel wall shelf over prep work surface *
12 Reach-in refrigerator, two door, of 46 $ft.^3$ (1.3 m^3) minimum capacity for snacks *
13 Optional mobile stainless steel mixer stand
14 Optional mixer, 12 qt. (11.4 L) (NSF approved or equivalent standards)
15 Cook's and snack preparation island stainless steel work table with counter work sink, under shelf, double sided over shelf *
16 Ceiling mounted pot rack *

17 Shelving unit (NSF approved or equivalent standards) for service dishes
18 Reach-in refrigerator, two door, of 46 $ft.^3$ (1.3 m^3) minimum capacity *
19 Stainless steel work table with cross bracing on back and sides *
20 Optional mobile food warmer with universal rack slides and maximum height of 34.25 in. (870 mm) (NSF approved or equivalent standards) *
21 Stainless steel shelf over cook's work table for spices, utensils and miscellaneous items *
22 Optional stainless steel wall shelf adjacent to the griddle for spices, utensils and miscellaneous items (may be part of restaurant range) *
23 Exhaust hood, low volume high velocity (remote make-up air, if necessary) *
24 Fire protection system, as required *
25 Restaurant range (48 in. (1220 mm) left to right) with convection oven base and cooking surface consisting of four burners and 24-in. (610-mm) wide griddle *
26 Shelving unit (NSF approved or equivalent standards) for clean pots and pans *
27 Pot and pan ware washing stainless steel table with turned-up rolled rim edges, 10 in. (255 mm) high back splash, three pot and pan washing sinks, drain boards, drain board mounted garbage disposal, vacuum breaker and open base with legs and cross bracing *
28 Optional stainless steel, wall-mounted pot rack and wall shelf *
29 Optional garbage disposal with back splash mounted pre-rinse *
30 Optional wall-mounted stainless steel dish rack shelf (42 in. (1065 mm) left to right minimum) *
31 Optional push-thru dishwasher (NSF approved or equivalent standards) *
32 Stainless steel shelving unit (NSF approved or equivalent standards) for clean dishes, pitchers, cups *
33 Office desk, single pedestal
34 Office chair
35 Wall shelf over desk *
36 Dry erase/cork board (near office desk)
* Built-in equipment

E-1.2 Medium CDC.

1 Food delivery utility carts (NSF approved or equivalent standards), with three shelves of minimum shelf size 18 in. x 26 in. (455 mm x 660 mm) and overall maximum height of 34 in. (865 mm)
2 Optional stainless steel wall shelf over food delivery utility carts (12 in. (305 mm) deep) *
3 Trash receptacle of minimum 44 gallons (167 l) on mobile trash receptacle dolly
4 Fire protection system panel *
5 Stationary shelving units (NSF approved or equivalent standards) for dry storage
6 Reach-in freezer, single door, of 19 $ft.^3$ (.54 m^3) minimum (in MILCON)
7 Hand sinks, wall mounted with support brackets at each entrance *
8 Optional slicer (NSF approved or equivalent standards)
9 Food preparation stainless steel work table with turned-up rolled rim edges, 6-in. (150-mm) high back splash, drain boards, work sinks *
10 Optional garbage disposal, control panel and back splash mounted pre-rinse *
11 Stainless steel wall shelf over prep work surface *
12 Stainless steel wall shelf over prep work surface *
13 Reach-in refrigerator, two door, of 46 $ft.^3$ (1.3 m^3) minimum for snacks *
14 Optional mobile stainless steel mixer stand
15 Optional mixer, 12 qt. (11.4 l) (NSF approved or equivalent standards)
16 Cook's and snack preparation island stainless steel work table with counter work sink, under shelf, double sided over shelf *
17 Ceiling mounted pot rack *
18 Shelving unit (NSF approved or equivalent standards) for service dishes
19 Dual temperature reach-in refrigerator/freezer with two full-length doors each of 19 $ft.^3$ (.54 m^3) minimum capacity *
20 Stainless steel work table with cross bracing on back and sides *
21 Optional mobile food warmer with universal rack slides and maximum height of 34.25 in. (870 mm) (NSF approved or equivalent standards) *
22 Stainless steel shelf over cook's work table for spices, utensils and miscellaneous items *
23 Optional stainless steel wall shelf adjacent to griddle for spices, utensils and miscellaneous items (may be part of restaurant range) *
24 Exhaust hood, low volume high velocity (remote make-up air, if necessary) *
25 Fire protection system, as required *
26 Optional griddle, (36 in. (915 mm) left to right) with convection oven base *
27 Six burner Range (36 in. (915 mm) left to right) with convection oven base *
28 Shelving unit (NSF approved or equivalent standards) for clean pots and pans
29 Pot and pan ware washing stainless steel table with turned-up rolled rim edges, 10-in. (255-mm) high back splash, three pot and pan washing sinks, drain boards, drain board mounted garbage disposal, vacuum breaker and open base with legs and cross bracing *
30 Optional stainless steel wall mounted pot rack and wall shelf *
31 Optional garbage disposal with back splash mounted pre-rinse *
32 Optional wall mounted stainless steel dish rack shelf (42 in. (1065 mm) left to right minimum) *
33 Optional push-thru dishwasher (NSF approved or equivalent standards) *
34 Stainless steel shelving unit (NSF approved or equivalent standards) for clean dishes, pitchers, cups *
35 Office desk, single pedestal
36 Office chair
37 Wall shelf over desk *
38 Vertical file, four drawer
39 Mobile shelving units (NSF approved or equivalent standards) for walk-in refrigerator

40 Walk-in refrigerator and medium temperature refrigeration system, capacity coordinated with installation and program managers *
41 Walk-in freezer, capacity coordinated with installation and program managers *
42 Dry erase/cork board (near office desk)

* Built-in equipment

E-1.3 Large and Extra Large CDC.

1 Food delivery utility carts (NSF approved or equivalent standards), with three shelves of minimum shelf size 18 in. x 26 in. (455 mm x 660 mm) and overall maximum height of 34 in. (865 mm)
2 Optional stainless steel wall shelf over food delivery utility carts at 12 in, (305 mm) deep *
3 Trash receptacle of 44 gallons (167 l)) minimum capacity on mobile trash receptacle dolly
4 Fire protection system panel *
5 Stationary shelving units (NSF approved or equivalent standards) for dry storage
6 Hand sinks, wall mounted with support brackets at each entrance *
7 Mobile, stainless steel slicer stand
8 Optional slicer (NSF approved or equivalent standards)
9 Food preparation stainless steel work table with turned-up rolled rim edges, 6-in. (150-mm) high back splash, drain boards, work sinks *
10 Optional garbage disposal, control panel and back splash mounted pre-rinse *
11 Stainless steel wall shelf over prep work sinks and drain boards *
12 Reach-in refrigerator, two door, of 46 $ft.^3$ (1.3 m^3) minimum capacity for snacks *
13 Mobile stainless, snack work table with utensil drawer, under shelf and locking casters
14 Optional mobile stainless steel mixer stand
15 Optional mixer, 20 quart (18.9 l) (NSF approved or equivalent standards)
16 Cook's island stainless steel work table with counter work sink, utensil drawer, under shelf, double sided over shelf *
17 Ceiling mounted pot rack *
18 Shelving unit (NSF approved or equivalent standards) for service dishes
19 Single section, dual temperature reach-in refrigerator/freezer with two full length doors each of 19 $ft.^3$ (.54 m^3) minimum capacity *
20 Stainless steel work table with cross bracing on back and sides *
21 Optional mobile food warmer with universal rack slides and maximum height of 34.25 in. (870 mm) (NSF approved or equivalent standards) *
22 Stainless steel shelf over cook's work table for spices, utensils and miscellaneous items *
23 Exhaust hood, low volume high velocity (remote make-up air, if necessary) *
24 Fire protection system, as required *
25 Double full size convection ovens with cook and hold feature and glass doors *
26 Optional tilting griddle/braising pan with 43 in. x 24 in. (1090 mm x 610 mm) typical cooking surface *
27 Optional stainless steel floor trough for tilting/braising pan *
28 Optional pot filler faucet. Mounted on wall or as an option with tilting griddle/braising pan *
29 Eight burner range (48 in. (1220 mm) left to right) with convection oven base *
30 Optional stainless steel wall shelf adjacent to the range for spices, utensils and miscellaneous items (may be a range option item) *
31 Shelving unit (NSF approved or equivalent standards) for clean pots and pans
32 Pot and pan ware washing stainless steel table with turned-up rolled rim edges, 10 in. (255 mm) high back splash, three pot and pan washing sinks, drain boards, drain board mounted garbage disposal, vacuum breaker and open base with legs and cross bracing *
33 Optional stainless steel wall mounted pot rack and wall shelf *
34 Optional garbage disposal with back splash mounted pre-rinse *
35 Soiled dish table with cone/drain board mounted garbage disposal and open base *
36 Wall-mounted stainless steel dish rack shelf (42 in. (1065 mm) left to right minimum) *
37 Dish washer with booster heater (NSF approved or equivalent standards) *
38 Clean dish table with open base *

39 Wall-mounted stainless steel dish rack shelf over clean dish table (42 in. (1065 mm) left to right minimum) *
40 Stainless steel shelving unit (NSF approved or equivalent standards) for clean dishes, pitchers, cups *
41 Office desk, double pedestal
42 Office chair
43 Wall shelf over desk *
44 Vertical file, four drawer
45 Combined walk-in refrigerator/freezer unit and medium and low temperature refrigeration systems *
46 Mobile shelving units (NSF approved or equivalent standards) for walk-in refrigerator/freezer
47 Dry erase/cork board (near office desk)

* Built-in equipment

APPENDIX F GLOSSARY

F-1 ACRONYMS AND ABBREVIATIONS.

ABA	Architectural Barriers Act
ACP	Acoustical Ceiling Panel

NAVFAC or NAVFACENGCOM. Naval Facilities Engineering Command.

NFA	Net Floor Area
NFPA	National Fire Protection Association
OPNAV	Chief of Naval Operations
PA	Public address
PVC	Polyvinyl Chloride
RH	Relative humidity
RFP	Request for Proposal
SF	Square Feet
SOFA	Status of Forces Agreement
STC	Sound Transmission Class
TR	Tamper Resistant (electrical outlet)
TV	Television
UAS	Uninterrupted Activity Space
UFC	Unified Facilities Criteria
USDA	United States Department of Agriculture
USMC	United States Marine Corps
VCR	Video Cassette Recorder
VCT	Vinyl Composition Tile
VOC	Volatile Organic Compounds

F-2 DEFINITION OF TERMS.

Capacity: Also Operational Capacity. The total number of children that may be cared for at any one time. See also Group and Ratio.

Child Activity Room: the architecturally defined areas in which care is provided for each group of children.

Caregiver: Individuals providing direct care services to children in CDCs. The term, as used in this document, does not denote level of education, training, or staff status. Caregivers include head teachers, assistant teachers, aides, and all others who interact with children on a routine basis for a major part of each day.

Caring for our Children: The National Health and Safety Performance Standards: Guidelines for Out-of-Home Child Care Programs.

Cubby: A relatively small storage component/shelving system, usually open to one side and can be built in or premanufactured.

Decibels:. A unit of measurement for the relative intensity of sound. From 0 (barely perceptible) to 130 (painfully loud), on average.

Gross Floor Area: The total area of all floors of a building including main building lobbies, elevator shafts, egress stairwells and exterior partitions measured to the exterior side of the exterior wall.

Group: The maximum number of children, as determined by age group, who are cared for in the same self-contained activity room. See also Capacity and Ratio.

Infant: A child 6 weeks through 12 months of age.

Mixed-age Group: A group of children in a child development program drawn from more than one age group.

Net Floor Area: The amount of occupiable space to accommodate a space requirement.

Outdoor Activity Area: the exterior, fenced space adjacent to the building that provides for supervised outdoor play activities for the child occupants of the building. It is not simply a place for “recess” but is designed to support a program of activities and be conducive to creative play. It serves as an extension of the interior activity room space.

Parents: For the purposes of this FC, “parent” is understood to include legal guardians responsible for a child.

Playground: Playground may refer to the age-appropriate areas within the outdoor activity area. The outdoor activity area is divided into at least three play areas: one for infants, one for toddlers, and one for Preschoolers/Pre-K/K. Pre-toddlers will use the

infant play area or the toddler play area, as appropriate. The term playground may also refer generically to the outdoor activity area or any of its components.

Preschool Child: A child who is 3 to 5 years old and who does not attend kindergarten or a higher grade.

Pre-toddler: A child between the ages of 12 through 24 months. This age group may also be classified as toddlers, but in this document the category has been broken down into pre-toddler (ages one to two) and toddler (ages two to three). (See Toddler.)

Primary Caregiver: Principal person identified to be responsible for an assigned group of children.

Ratio: The ratio of caregivers to children, i.e., the number of children one caregiver may be responsible for, varying by age of children. See also Group and Capacity.

School-age Child: A child who is six years of age or older or who attends kindergarten or higher.

Toddler: A child between the ages of 24 and 36 months. Children as young as 12 month old may also be classified as toddlers, but in this document the category has been broken down into pre-toddler (12 – 24 months) and toddler (24 – 36 months). (See Pre-toddler.)

Toilet: This refers to the room or space and includes both the water closet and the lavatory (sink and counter)

Uninterrupted Activity Space: space in a care area used exclusively for activity. It excludes all fixed equipment and furnishings (i.e. the diaper changing station, the food preparation station, the toileting areas, storage areas, etc.) and any dedicated circulation space.

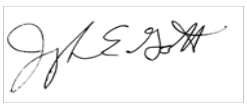
FOREWORD

The Unified Facilities Criteria (UFC) system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and applies to the Military Departments, the Defense Agencies, and the DoD Field Activities in accordance with USD(AT&L) Memorandum dated 29 May 2002. UFC will be used for all DoD projects and work for other customers where appropriate. All construction outside of the United States is also governed by Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA), and in some instances, Bilateral Infrastructure Agreements (BIA.) Therefore, the acquisition team must ensure compliance with the more stringent of the UFC, the SOFA, the HNFA, and the BIA, as applicable.

UFC are living documents and will be periodically reviewed, updated, and made available to users as part of the Services' responsibility for providing technical criteria for military construction. Headquarters, U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering Command (NAVFAC), and Air Force Center for Engineering and the Environment (AFCEE) are responsible for administration of the UFC system. Defense agencies should contact the preparing service for document interpretation and improvements. Technical content of UFC is the responsibility of the cognizant DoD working group. Recommended changes with supporting rationale should be sent to the respective service proponent office by the following electronic form: Criteria Change Request (CCR). The form is also accessible from the Internet sites listed below.



UFC are effective upon issuance and are distributed only in electronic media from the following source:

- Whole Building Design Guide web site http://dod.wbdg.org/.

Hard copies of UFC printed from electronic media should be checked against the current electronic version prior to use to ensure that they are current.

UNIFIED FACILITIES CRITERIA (UFC)
NEW DOCUMENT SUMMARY SHEET

Document: UFC 4-740-15
Superseding: None.

Description: This UFC provides design criteria for Army, Navy, and Marine Corps Continuous Child Care Facilities. NOTE: The Air Force does not currently have a program for these facilities.

Reasons for Document: This UFC was developed to provide design requirements to accomplish the following:

- Assist planners to understand the facility requirements to ensure accurate space programs and budgets.
- Provide architects, engineers, and construction surveillance personnel with the essential, minimum requirements for the design and construction of a Continuous Child Care Facility.
- Clarify the operational intent of the facility design.

Impact: The following will result from the publication of this UFC:

- This UFC will reduce the initial cost of design and reduce costs associated with redesign of facilities that do not meet minimum standards. The design should also streamline facility operations.
- This UFC defines the primary programs accommodated by the Continuous Child Care Facility.

Non-Unification Issues: There are four minor unification issues:

- Army health regulations require an upgraded floor finish and a floor drain in the kitchen. However, all Services seek to replicate the appearance of a residential kitchen while meeting the required codes and durability goals for a government-owned facility.
- The Army does not provide an alarm on the crib/infant room exterior door.
- The Army requires a 4-ft. (1220mm) tall outdoor activity area fence versus the Navy and USMS's 5-ft. (1525mm) tall fence. The Navy requires the fence bottom to be buried.
- The Navy excludes all swing types except tire swings.

TABLE OF CONTENTS

CHAPTER 1 INTRODUCTION

1-1 SCOPE OF DOCUMENT.

This UFC provides requirements for evaluating, planning, programming, and designing Continuous Child Care Facilities (CCCFs). The information in this UFC applies to the design of all new construction projects, to include additions, alterations, and renovation projects in the continental Unites States (CONUS) and outside the continental US (OCONUS). This UFC is not intended as a substitution for thorough review during design by individual Program Managers and Operations Staff in the appropriate Service.

1-2 SCOPE OF FACILITY.

CCCFs provide around-the-clock child care to support DoD families. These facilities combine the strengths of in-home-style care with those of center-based facility care. Architecturally, the CCCF shall have the look and feel of a residential home, but it shall comply with the applicable codes and requirements in this UFC. There are two types of facilities and the facility type must be confirmed prior to project initiation with the agencies noted in Chapter 1, Program Authorities:

- Option A represents a facility that typically supports parents on shift work for whom the normal child development center (CDC) operating hours are not adequate. These children tend to only occupy the facility for the duration of one work shift and are typically limited to 12 years of age or less.

- Option B represents a facility that typically supports families of wounded warriors, shift workers, and emergency or crisis care and may on occasion accommodate an older child. These facilities also accept children for potentially longer periods of time than Option A.

These variations necessitate some changes to the bathroom configuration and minor provisions required to adapt the staff den/office to also serve as an isolation area for sick children. To accommodate the generally higher percentage of infants in Option A, a second diaper changing station is provided. The functional program spaces are listed and described briefly in Table 1-1 and described in greater detail in Chapters 2 and 4.

TABLE 1-1. CCCF FUNCTIONAL PROGRAM AREAS

Functional Program Area	Description
Foyer	Primary facility entry and ID check-in
Living room	Gathering and quiet social activity area
Play room	Gathering and play area with a variety of structured activity subareas
Dining room	Family-style dining area for all children, also accommodating table-based activities such as crafts and homework
Kitchen	Full-service, residential-style kitchen
Staff desk area	Area with a small desk for ad hoc administrative functions, typically located as part of another space
Crib/infant room	Sleeping space and infant activity area
Bedrooms	Separate rooms for boys and girls
Option A toilets	These toilets support the Option A facility configuration. They consist of unisex facilities located in close proximity to the bedrooms but also accessible from the living/activity spaces.
Option B toilets	These toilets support the Option B facility configuration. They consist of gender-specific facilities located directly off each bedroom and two separate unisex facilities located off the hall/public area.
Staff toilet	Unisex accessible toilet
Laundry	Laundry room and janitor functions
Storage closet	General facility storage
Staff den/office	Staff office that also serves as an isolation area for the Option B facility configuration
Staff storage	Area with lockable storage for staff personal items, typically located as part of another space
Outdoor storage	Storage with direct access from the outside
Outdoor activity area	Fenced activity area for all children, provided for both Options A and B
Option B outdoor activity area	A second activity area supports the Option B facility configuration and accommodates the potentially older children in a patio setting

1-3 **USERS OF FACILITY**.

The following are the typical facility users:

- Children.
- Staff. Trained staff occupies the facility at all times in numbers that meet program requirements for staff-child ratios.
- Parents. Parents typically only occupy the facility at pick-up and drop-off times.

1-4 **PROGRAM AUTHORITIES**.

Prior to project development, confirm the acquisition methodology and coordinate the design team composition and facility requirements with the following contacts for the appropriate Service:

- Army. Family Morale, Welfare, and Recreation Command (FMWRC), Child, Youth, and School Services and the Center of Standardization, Huntsville, AL.

- Navy. CNIC (N91), Navy Family Readiness, (Program Manager), and CNIC (N944A), Fleet & Family Readiness, (Facilities Support).

- Marine Corps. HQ USMC, Personal and Family Readiness Division, Construction Branch (MRD); HQ USMC, Personal and Family Readiness Division, Children, Youth and Teen Programs (MRY-3); and HQ USMC, Installations and Logistics, Land Use and Military Construction (LFL)

CHAPTER 2 PLANNING AND LAYOUT

2-1 SIZE DETERMINANTS.

CCCF size is determined by the facility configuration option (A or B) and, in some cases, the number of children to be accommodated.

2-2 SPACE PROGRAM.

An interactive spreadsheet is available to help develop a space program for a CCCF. It is completed by selecting the appropriate Service branch, the appropriate optional facility configuration, the number of children to be accommodated, if applicable, and the type of construction. Based on these three or four selections, the spreadsheet generates a draft space program. This draft program shall be confirmed with the agencies identified in Chapter 1, Program Authorities, and customized as necessary for the specific project and project site.

This spreadsheet is available as a downloadable Microsoft© Excel© file from the Whole Building Design Guide Website: http://www.wbdg.org/zips/CCCFSpaceProgramTool.zip

2-3 LOCATION DETERMINANTS.

Determine the most appropriate and cost-effective location for a CCCF based on the following factors. The agencies identified in Chapter 1, Program Authorities, shall approve the final site location.

2-3.1 Site Size.

The minimum site area for a CCCF is 2 acres (.8 ha), but additional area may be necessary. The final site area shall be determined by local conditions, the final building and site layout, and the code and military requirements identified in Chapter 3.

2-3.2 Function.

Locate the facility to serve the function and the target user groups:

- Facilities serving shift work parents shall be located near CDCs, installation family housing, or community support areas that are en route to primary shift-work areas.
- Facilities serving in-patient medical facilities should be located near those facilities.

Regardless of function served, avoid the locations noted under Chapter 2, Safety, below.

2-3.3 Safety.

Avoid locations near busy streets and intersections. If this is not possible, provide mitigation measures, such as bollards, to increase safety at pedestrian areas and playgrounds. Do not locate CCCFs directly adjacent to the following hazards or nuisances:

- Fuel or other HAZMAT storage buildings
- Maintenance shops, including woodworking and painting areas
- Dry-cleaning facilities
- Correctional/detention facilities
- Security areas
- Any facility producing odors, smoke, dust or pollution
- Explosives
- Radiation
- Utility substations and high voltage overhead power lines

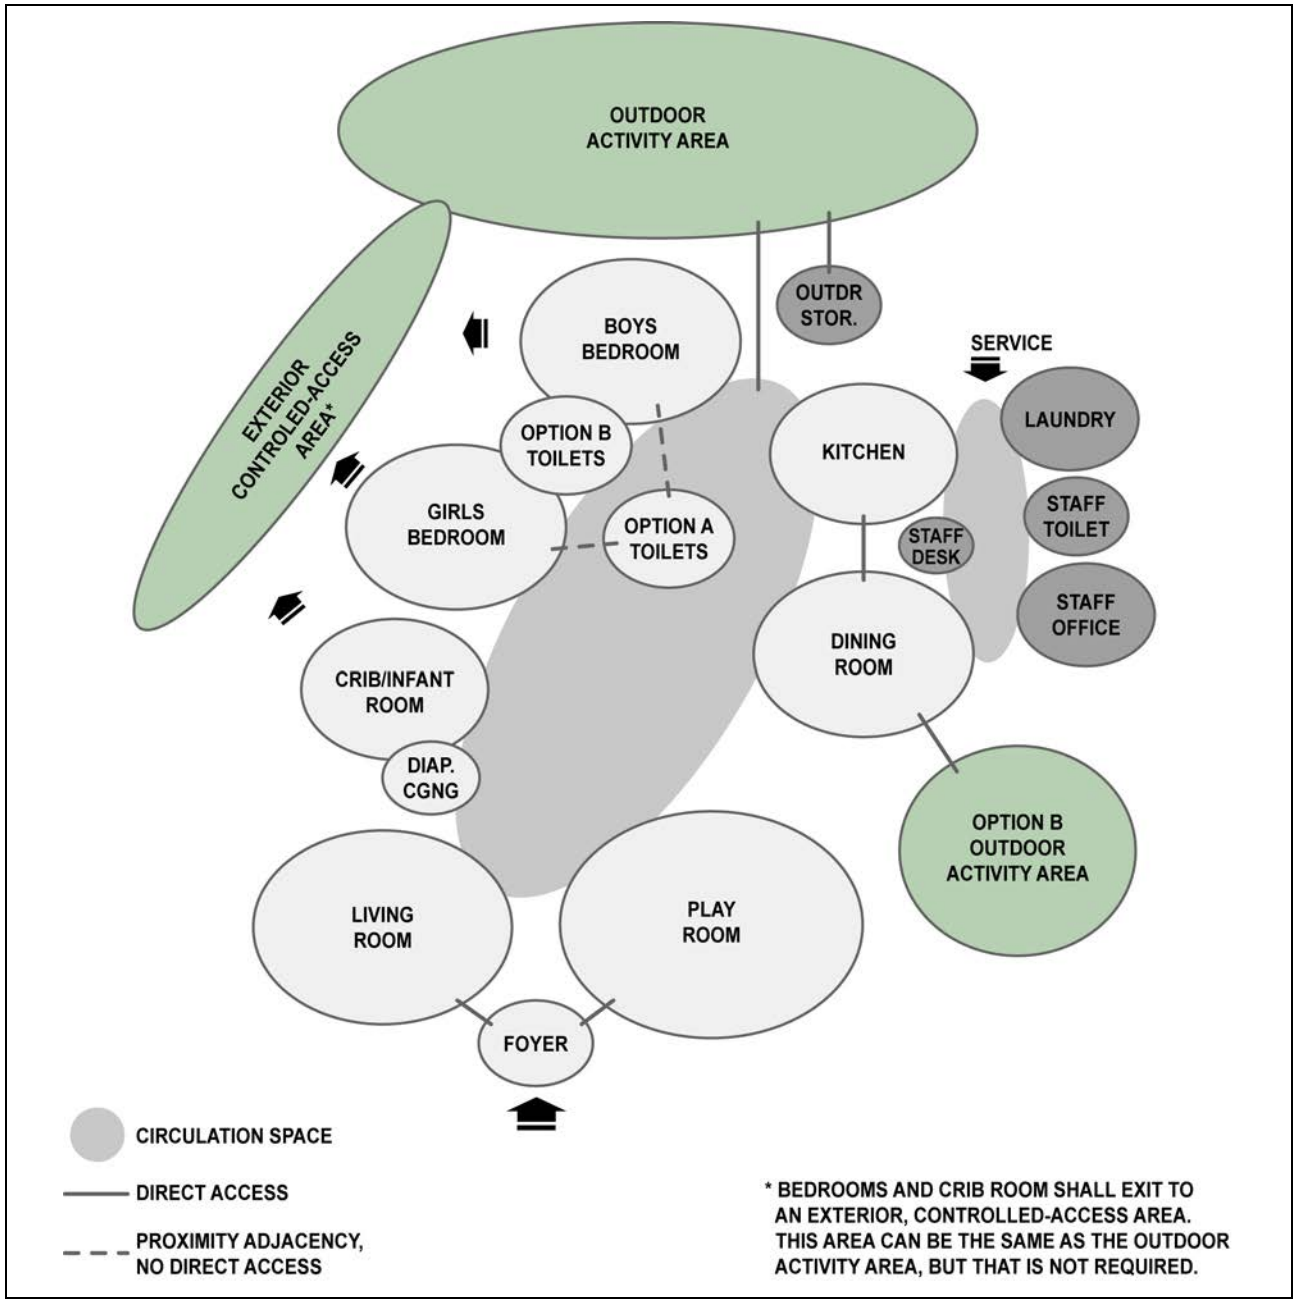
Avoid locating CCCFs adjacent or near the following facilities to the degree possible based on land availability and mission:

- Service stations/convenience stores
- Unaccompanied housing facilities
- Aircraft runways/helipads (except for emergency medical facilities)
- Railroads

2-3.4 Natural Environment.

Ensure the availability of natural light in the site selection and orientation of the building. Select a site with as many natural amenities as possible for a beneficial learning environment. These include the following: nontoxic plants and trees; non-dangerous animals; earth forms; rolling terrain; and natural protection from the sun, wind and rain. Develop a site plan that makes the most of the site's existing natural resources.

2-3.5 Combined Facilities.



CCCFs shall not be combined with other facilities without approval by the agencies identified in Chapter 1, Program Authorities. Because of specialized operational

requirements such as evacuation drills, CCCFs shall only be approved to be combined with CDCs and School Age Care Facilities. If combined, the CCCF shall be located as a separate wing and on the ground level. Comply with Chapter 3 for fire protection separation and exit requirements.

2-4 LAYOUT AND ADJACENCIES.

The appropriate layout and adjacencies of the CCCF are illustrated in Figure 2.1. This diagram does not convey a building shape. Explore opportunities to dual-use circulation space as additional activity area for children—to the degree possible, open areas should easily flow from one to the other in order to maximize gross motor activity areas for children. See the Functional Data Sheets in Chapter 4 for additional information on the space types and their relationships to each other.

FIGURE 2-1. CCCF BUBBLE DIAGRAM

CHAPTER 3 GENERAL DESIGN CRITERIA

3-1 GENERAL.

UFC 1-200-01, "General Building Requirements" provides applicability of model building codes and government-unique criteria for typical design disciplines and building systems, as well as for accessibility, antiterrorism, security, sustainability, and safety. Use this UFC in addition to UFC 1-200-01 and the UFCs and government criteria referenced therein.

3-2 ACCESSIBILITY.

The specifications in UFC 1-200-01 and its references contain alternate specifications based on children's dimensions and anthropometrics for ages 3 and older. This UFC contains alternate specifications for younger children for water closets and lavatories. Also note the following guidelines for the purpose of the CCCF design:

- Children below the age of 3 years are not considered to be self-mobile wheelchair users; they are assisted and transferred by caregivers.
- Children age 3 and older are considered to be self-mobile wheelchair users.

3-3 CHILD ABUSE PREVENTION.

The facilities design is to keep children safe within the center, to safeguard them from outside intruders, and to protect them from hazards to the fullest extent possible. Visibility of all areas, interior and exterior, is a key element in the prevention of child abuse. Plan for maximizing direct visual access through building organization and design, placement of windows, toilet room design, and playground design (e.g., by eliminating walls, where possible, or using half walls, CCTV, vision panels, and convex mirrors). See 3-8.2 CCTV for details.

3-3.1 Building Perimeter.

Treat the perimeter of the building and play yards as a controlled filter with only one primary means of public access and egress. Control all service and emergency points, with access limited to authorized individuals.

3-4 ARCHITECTURE.

3-4.1 Stories.

CCCFs shall be one-story buildings constructed at or near grade.

3-4.2 Exterior Design.

The design shall reflect a residential, non-institutional character. For example, small-scale finish materials, such as bricks, are preferable to large pre-cast panels. The dimension of brick is more congruent with the size of a child and his or her home experience. Minimize the use of irregular geometry in the overall building design that results in wall angle other than 90 degrees in the bedrooms and living/activity spaces.

3-4.2.1 **Entrance**.

The building and the outdoor activity areas shall each have only one primary means of public access. Control all other service and emergency egress points, with access limited to authorized individuals. Design the entry approach to be visible by inside staff. Incorporate a point of reference or landmark that serves as a welcome and a transition. Visually separate the primary entrance from other entrances and service areas.

3-4.2.2 **Roof.**

Roofs shall be steep sloped.

3-4.2.3 **Windows and Doors.**

Windows and doors shall replicate a residential style and scale. Provide window area in each child-occupied room to meet the LEED® credit for Daylight and Views and provide operable windows in climates where appropriate to take advantage of natural ventilation, reducing the amount of mechanical ventilation as allowable by code.

The operable portion of windows shall be a minimum of 36 in. (915mm) above finished floor, such as a single-hung, top-operable unit. Operable windows shall include screens. Locate all windows so that children have visual access to the outside with a maximum sill height of 24 in. (610mm) above finished floor. Casement and other projecting-type windows shall not project beyond wall thickness.

3-4.3 **Interior Design.**

Design the interior spaces to dispel an institutional feeling, and use residential-style layouts, scales, and finishes. Ensure collaboration between interior designer, architect, and the agencies identified in Chapter 1, Program Authorities.

3-4.3.1 **Interior Doors and Windows.**

3-4.3.1.1 **Interior Glass.**

All interior glass must be tempered safety glass at a minimum and mirrors must be constructed with break-resistant materials. Laminated interior safety glass is preferred if budget allows.

3-4.3.1.2 **Interior Doors.**

Interior doors shall be solid wood panel. Provide vision panels at adult and child viewing heights in all doors, including closets and storage rooms, except toilets. Vision panels shall be sized and placed so a person opening the door can see if children are sitting or standing in front of the door.

Install hinge finger-pinch protection devices wherever doors are accessible to children. All locking doors shall be operable from the inside without a key and with a single motion (emergency passage).

3-4.3.2 **Window Treatments.**

All window treatments shall be either cordless, have cords that are out of reach of children, or have continuous-loop cords that are permanently anchored to the wall. Vinyl mini-blinds are not permitted. Any textiles used in window treatments shall have passed the tests specified in NFPA 701.

3-4.3.3 **Counters, Casework, and Cabinets.**

Counters, casework, and cabinets shall be of high-quality and durable construction. Specify Architectural Woodwork Institute (AWI) Premium or Custom for finishes per *AWI Quality Standards Illustrated, current edition.* Doors, drawers, and casework faces shall be wood veneer at a minimum. Specify .75-in. (20-mm) minimum thickness for plywood, plywood backing, and solid wood panels.

Countertops shall be solid surface/solid composite plastics only. All counters throughout the facility shall have rounded safety corners with a 1-in. (25-mm) radius in plan view and a .5-in. (12-mm) radius for horizontal edges.

3-4.3.4 **Other Interior Construction.**

Provide blocking for all wall- or ceiling-mounted equipment and furnishings. Provide residential-style trim throughout the facility.

No facility display boards shall use tacks, small magnets, or other choking hazards.

3-4.3.5 **Finishes**.

3-4.3.5.1 **General**.

For finish criteria in specific areas, see the Functional Data Sheets in Chapter 4.

3-4.3.5.2 **Soft Floor Coverings**.

Floor coverings shall be impervious to bacteria, fungus growth, odor retention, and comply with fire and sanitation requirements. Use carpet tiles that do not have large patterned designs, for example, games or alphabets. Comply with the following for all carpet tiles and area rugs:

- Backings shall be anti-microbial of synthetic or inorganic material. Use carpet tiles with an attached cushion and a releasable adhesive system. Ensure adhesive or binding components of the carpet do not emit toxic fumes.

- Fibers shall be stain and soil resistant 100 percent solution-dyed nylon. Minimum yarn face weight shall be 28 oz (1.04 kg/m^2). Use heavy commercial wear classification carpet of level loop construction to minimize snagging.

- Ensure there are no tripping hazards at carpet/resilient transition. Area rugs shall be secured with a commercial-grade, two-sided carpet tape around the perimeter. Binding on rugs shall be heavy duty .375 in. to 1 in, (9.5 to 25mm) wide.

- Use carpets tested for Volatile Organic Compounds (VOCs) and that bear a Green Label from the Carpet and Rug Institute indicating that the carpet emissions are within the acceptable range.

- Use products containing less than 0.05 parts per million (ppm) of formaldehyde. Any product purchased with formaldehyde levels above 0.05 ppm must bear a label in accordance with 29 CFR 1910.1048.

3-4.3.5.3 **Resilient Floor Coverings**.

Resilient floor coverings shall be commercial-grade linoleum or vinyl sheet with heat-welded seams.

3-4.4 **Acoustics.**

3-4.4.1 **Exterior Acoustics.**

3-4.4.1.1 **Noise Levels.**

If noise levels at the CCCF exceed the following then comply with the acoustical criteria provided below:

- Outdoor activity area. Continuous: 70 dBA, Intermittent: 80 dBA

- Building exterior with sleeping and quiet areas placed next to exterior wall. Continuous: 60 dBA, Intermittent: 65 dBA

- Building exterior with sleeping and quiet areas protected and not located next to exterior walls. Continuous: 65 dBA, Intermittent:70 dBA

3-4.4.1.2 **Acoustical Criteria.**

If environmental noise levels exceed the maximums noted above, provide the following acoustical treatments:

- Use acoustically laminated glass with a Sound Transmission Coefficient (STC) rating of 35 to 45, having an air space of 2 in. to 4 in. (50 mm to 100mm) for all window and door glazing. (Conventional double-glazing and thermal glazing is not effective in this case.)

- Use high-quality commercial doors with a minimum STC rating of 30 for exterior doors.

3-4.4.2 Interior Acoustics.

Design the facility to provide a comfortable acoustical environment and provide comprehensive sound isolation and sound absorption measures for individual spaces as appropriate. Provide acoustical design to prevent sound from noisy spaces such as toilets, mechanical rooms, and play rooms from having negative impact on the bedrooms and infant/crib room. Comply with the following:

- Partitions can be single layer gypsum wallboard but shall have cavity insulation and be completely caulked at the top and bottom of the partition.

- Provide acoustical baffles in all ductwork that penetrates partitions.

- Do not place electrical outlet boxes back-to-back.

At a minimum, provide the required sound transmission coefficient (STC) ratings identified in Chapter 4, Functional Data Sheets, for individual spaces. Use the "Suggested Design Values" STC ratings in UFC 3-450-01, "Noise and Vibration Control" as the basis for the sound design of partition, door and window assemblies if required. Utilize gypsum board wall "improvements" to increase the STC of gypsum board "Stud Type" partitions to achieve the project sound requirements. Unless indicated in Chapter 4, STC ratings do not need to be field verified.

3-5 PLUMBING.

All sinks shall have hot and cold water supplies.

3-6 MECHANICAL.

Mechanical equipment shall not be located in an attic space.

3-7 FIRE PROTECTION AND LIFE SAFETY.

Because the DoD staff-to-child ratio is less than that prescribed by NFPA 101 Life Safety Code®, additional fire protection and life safety features are required. The additional features compensate for the reduced number of staff. Fire Protection requirements for CCCF are based on the most restrictive requirements of the NFPA

101®, New Day-Care Occupancies, and New Residential Board and Care Occupancies. CCCFs shall also meet the requirements of 32.3 Large Facilities.

3-7.1 Use and Occupancy Classification.

This facility shall be classified as Use Group I-2.

3-7.2 Exit Requirements.

Comply with the following and see the Chapter 4 Functional Data Sheets for additional door hardware and exiting requirements:

- Dead end corridors of any length are not permitted.
- All doors in the egress paths shall be a minimum of 36 in. (915mm) wide and shall provide a minimum clear width of 32 in. (815mm).
- No means of egress or means of escape shall pass through any other occupancy in the same building.
- No CCCF shall be located above another occupancy.
- A CCCF that is combined with another facility shall have a minimum of a two-hour fire resistance rating between the occupancies.
- Emergency evacuation plans shall be incorporated into the overall facility signage package and shall be permanently displayed in enclosed frames.

All doors and exit paths from the facility except from the mechanical room shall comply with the following:

- Doors shall have full-width push pad panic hardware that meets Accessibility requirements. The contact or pressing surface must extend the full width of the door. This is to prevent snagging on evacuation cribs.
- Exits shall have a maximum drop of .25 in. (6mm) and ramps shall be equipped with all-weather non-slip surface for emergency evacuation of wheeled evacuation cribs and wheelchairs. All ramps shall meet Americans with Disabilities Act (ADA) requirements.
- Provide a smooth paved-surfaced evacuation route to a safe gathering area not less than 75 ft. (23m) from the facility for all exits and sleeping rooms. This route shall not cross any emergency vehicle access path, parking area or street, but the paved evacuation path shall connect to a public way and shall not dead end in grassed areas. The evacuation route shall meet ADA requirements. These routes shall comply with the lighting requirements for exterior pedestrian walkways per UFC 3-530-01, “Design: Interior and Exterior Lighting and Controls”. Provide egress

gates with a minimum of 44 in. (1020mm) clear width in the outdoor activity area fences.

3-7.3 Emergency Lighting.

Provide emergency lighting to illuminate the staff desk area where the CCTV monitors are located (allowing staff to make emergency calls and carry out other duties necessary for the safety and security of the children) and in all areas required by NFPA 101®. Whenever possible, incorporate the emergency lighting into the normally provided lighting fixtures. Provide security lighting at all entries and exits.

3-7.4 Fire Separation.

Provide a one-hour fire resistive fire barrier around the following:

- Laundry room
- All storage rooms greater than 100 ft^2 (9.3m^2)
- All boiler or fuel-fired heater rooms

3-7.5 Fire Suppression Systems.

Provide automatic sprinkler systems in accordance with NFPA 13. Comply with the following criteria:

- Provide wet pipe sprinkler system. Dry pipe sprinkler system may be used for those portions of the facility subject to freezing. Anti-freeze and pre-action systems are not permitted.
- Use quick response-type sprinklers in wet pipe sprinkler systems.
- Discharge inspectors' test connections to a safe, outside location onto a hard surface outside of the outdoor activity area or congregation areas. Indicate location on drawings.
- Make fire department connection (FDC) accessible without entering or transiting a children's play area or crossing a discharge path. Provide the FDC on the street side of the building within 150 ft. (45m) of a fire hydrant outside of a fenced area and arranged so that the hose lines can readily and conveniently be attached without interference from any near-by object.
- Domestic stoves shall be provided with a residential fire suppression system in the domestic hood or the stoves shall be equipped with burners and controls that have their temperature limited to a maximum temperature of 662 degrees F (350 degrees C).

- The allowance of NFPA 101® to omit sprinklers from occupancy conversions cannot be used.

3-7.6 Fire Detection and Alarm System.

Comply with the following additional requirements:

- Locate the control panels in environmentally controlled locations in the facility.
- Use fully addressable control panels with addressable detectors, supervisory sensors, pull stations, notification appliances and other devices.
- Provide a mass notification system that is combined with the building fire alarm system.
- Do not use loud and jarring devices such as bells, horns, and klaxons as they can severely frighten young children causing them to hide or panic.
- Provide manual pull stations with protective covers inside the facility at each exterior door except for the mechanical room.
- Provide smoke detection in all areas, including closets over 20 ft^2 (1.86m^2), but excluding the kitchen and spaces that are not climate controlled, such as the attic and the mechanical equipment room.

3-7.7 Carbon Monoxide Detection.

Provide a protected premises carbon monoxide detection system in accordance with NFPA 720 for each building provided with fuel burning appliances. The carbon monoxide system shall include the following features:

- Automatic carbon monoxide alarm signal initiation.
- Notification of carbon monoxide alarms to building occupants using the audible and visual appliances of the mass notification system.
- Transmission of carbon monoxide alarms to the Base Fire Department as a supervisory signal in accordance with NFPA 72.
- Transmission of carbon monoxide detection system trouble and supervisory signals to the Base Fire Department in accordance with NFPA 72.
- Combination-type carbon monoxide detection systems that are integrated in operation with the building mass notification system and fire alarm

system and that meet the requirements of NFPA 72 for combination systems.

- Class B initiating device circuits, notification appliance circuits, and signaling line circuits.

- Install carbon monoxide detectors in accordance with the manufacturer's published instructions. Locate detectors on the ceiling in the same room as all permanently installed fuel-burning appliances. Also provide at least one carbon monoxide detector centrally located within each area served by a separate air handler.

3-7.8 **Conversions.**

A conversion from another occupancy to a CCCF shall comply with the requirements of this UFC and the NFPA occupancy chapters for New Board and Care and Day-Care. The requirements for Existing Board and Care and Existing Day-Care occupancies shall not be used.

3-8 **ELECTRICAL.**

All outlets accessible to children shall be listed tamper resistant and/or ground-fault circuit interrupted (GFCI) protected. Removable caps or plugs are not acceptable.

3-8.1 **Lighting.**

For the overall design approach, adapt the relevant Residential Housing and Childcare sections of UFC 3-530-01. However, maintain light levels at all times and the use of table and floor lamps should be minimized due to the potential for damage caused by active children. Security lighting shall be provided for all pedestrian walkways and building entrances and exits. See Chapter 4, Functional Data Sheets, for any specific light level and control requirements.

3-8.2 **CCTV**.

CCTV systems are considered an important supplement to direct visual access. Provide the infrastructure required to support the CCTV system with cameras located to ensure complete and unobstructed surveillance of child care areas. The agencies identified in Chapter 1, Program Authorities, will determine if funds will be provided, and the source of those funds, for the design and procurement of the equipment external to the outlet (cameras, monitors, operating consoles) in order to establish a complete and usable system. See Chapter 4, Functional Data Sheets for monitor and camera locations.

CCTV controls and recording equipment shall be located in a secure closet or cabinet. Recorded image capacity is required for 30 days of images. CCTV monitors include one desk monitor and one large monitor with accessible views for the parents and caregivers, coordinate monitors location with user. Provide conduit (minimum 19mm (.75)) and cabling in conduit for installation of system. CCTV may require outlets higher

in the ceilings, walls or both. Provide electrical service adjacent to the anticipated locations of cameras and monitors.

- Size Requirements. Provide .74SM to 1.11SM (8SF to12SF) for CCTV recording and viewing equipment. Recording equipment is optional.

- System Selection. Consider the size of the image, clarity of the image, color of the image, and distance to the image on the monitor during CCTV system selection. For example, if a split screen of nine images is color rather than black and white, the images may be discernible 1500 mm (5 ft.) away; but if the images are black and white, they may only be discernible from 900MM (3ft.) away. If the split screen has four color images, it may be visible 2100MM (7ft.) away, and so on. Design the monitoring station with the specific CCTV system in mind to ensure effective usability.

3-9 **FURNISHINGS.**

Comply with following for furnishings in areas accessible to children:

- Furnishings shall have rounded corners and edges with a minimum .5-in. (12-mm) radius in plan view and for horizontal edges.

- Furnishings shall not splinter or have toxic surfaces.

- Furnishings that are 36 in. (915mm) tall or higher shall be secured to prevent tipping.

- To avoid suffocation, do not use beanbags or overly pliable or yielding cushions and pillows that will allow an infant or small toddler to sink into the material.

- All furnishings shall meet standards for child safety and pinch/entrapment protection in CPSC 202, *The Safe Nursery.*

Additional furnishing and equipment criteria for specific spaces within a CCCF are provided in Chapter 4.

3-10 **SITE WORK**.

3-10.1 **Landscaping**.

To ensure child safety, plants with thorns and poisonous or toxic plants are not permitted. Plants that produce fruits, nuts, or seeds that represent choking hazards, regardless of toxicity, are not permitted. Verify the selected and existing plant material for meeting these requirements—the submittal section of the specifications require written verification by the nursery contractor that plants with thorns, poisonous plants, toxic plants, or fruit bearing plants are not planted in the outdoor activity area. Refer to

a comprehensive, commercially-available field guide for lists of poisonous plants. See Appendix C for non-comprehensive lists of common poisonous and non-poisonous plants.

3-10.2 **Site Circulation and Parking**.

Service access shall not cross the outdoor activity areas. Provide a minimum of 10 parking spaces for staff and parents.

3-10.3 **Site Plumbing.**

Provide a minimum of one hose bibb on each building elevation. Install hose bibbs in a recessed wall box to prevent impact injury. Provide freeze-proof hose bibbs at locations where temperatures can drop below freezing.

3-10.4 **Site Lighting and CCTV**.

The site lighting shall be designed to accommodate exterior CCTV camera monitoring for security and child abuse prevention. Provide exterior camera outlets to cover all building entries, the main approach and the outdoor activity area.

CHAPTER 4 SPECIFIC DESIGN CRITERIA

4-1 INTRODUCTION.

This chapter identifies the specific design needs for the individual spaces. Building design criteria are provided in a standard Functional Data Sheet (FDS) table format that generally follows the Uniformat II/Work Breakdown Structure. The Interior Construction/Built-in Equipment category includes anything physically attached or plumbed to the building such as counters, cabinets, casework, toilet accessories, window treatments, laundry machines, and retractable overhead screens. The Furnishings and Equipment category includes loose/moveable items.

Outdoor activity area design criteria are provided in textual format following the FDS tables.

4-2 **BUILDING DESIGN CRITERIA**.

TABLE 4-1. FOYER

Description/ Usage	The foyer is the primary facility entrance and ID check-in area. The design should feel open, inviting, and homelike. This area will open up into the living room and play rooms, and parents and children should be able see these areas from the entrance.
Ceiling Ht.	8 ft. (2.4m) minimum. Vary the foyer ceiling height to help define the space and distinguish it from the adjacent living and play rooms.
Windows/Doors	The entrance door shall have a side light and shall have a residential style appearance and an emergency passage manual lock.
Interior Construction/ Built-in Equipment	Provide some sense of separation between the foyer and the living and play rooms to help define the area while maintaining visible connections between the rooms. Consider partial walls and/or 42-in. (1065-mm) high half-height walls. Provide a display board per Chapter 3 near the entrance of the room for posting messages and facility information.
Finishes	**Walls.** Semi-gloss epoxy painted gypsum wallboard. **Floor.** Resilient sheet flooring system such as vinyl or linoleum with a simulated stone or wood-grain pattern. **Base.** Resilient with residential (or millwork) profile, solid color or wood-grain. **Ceiling.** Modular construction shall use 2 ft x 2 ft (610 x 610mm) acoustical ceiling panels (ACP). Non modular construction shall use painted gypsum wallboard.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and Chapter 3, Mechanical.
Fire Protection and Life Safety	Provide system per Chapter 3, General, and Chapter 3, Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General, and Chapter 3, Electrical.
Lighting	Provide system per Chapter 3, General, and Chapter 3, Electrical. Provide 20 fc (215 lux) average general ambient and security lighting at entrance and exit.
Communication	**Telephone.** Provide one jack at the check-in desk. **Data.** Provide one jack at the check-in desk. **CCTV.** Provide outlets for camera coverage of the exterior entrance and the foyer interior. Coordinate interior coverage with adjacent spaces to ensure complete coverage while minimizing the outlet/camera count. See 3-8.2 CCTV for details. **CATV.** None required. **Security.** Provide a duress alarm that alerts the Installation security office. Actuator shall be located at the maximum accessible-compliant height above finished floor and shall include a flip-up protective covering.
Acoustics	No special provisions required.
Furnishings and Equipment	Floor mat.
Special Requirements	Provide a doorbell at the exterior door. A check-in area is required and may be near the foyer/main entrance or a secondary entrance. At this check-in area, provide a check-in desk, check-in computer, and phone. If the staff desk area (Table 4-6) is combined with the check-in area, coordinate layout and design features.
	For use during project execution by the appropriate Service agency
Occupancy	Staff. Children.
Min. net ft^2 (m^2)	

TABLE 4-2. LIVING ROOM

Description/ Usage	The living room is a gathering and social activity area geared towards sedentary activities such as reading and television watching. The design should emulate a residential living room.
Ceiling Ht.	9 ft. (2.7m) minimum.
Windows/Doors	Provide windows per Chapter 3.
Interior Construction/ Built-in Equipment	None required.
Finishes	**Walls.** Semi-gloss epoxy painted gypsum wallboard. **Floor.** Resilient sheet flooring such as vinyl or linoleum with a simulated stone or wood-grain pattern, or carpet tiles per Chapter 3. **Base.** Resilient with residential (or millwork) profile, solid color or wood-grain. **Ceiling.** Modular construction shall use 2 ft x 2 ft (610 x 610mm) ACP. Non modular construction shall use painted gypsum wallboard.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and Chapter 3, Mechanical.
Fire Protection and Life Safety	Provide system per Chapter 3, General, and Chapter 3, Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General, and Chapter 3, Electrical.
Lighting	Provide system per Chapter 3, General, and Chapter 3, Electrical. Provide 20 fc (215 lux) general ambient and 40 fc (540 lux) at reading areas.
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** Provide outlets for camera coverage of the interior. Coordinate coverage with adjacent spaces to ensure complete coverage while minimizing the outlet/camera count. See 3-8.2 CCTV for details. **CATV.** Provide one outlet and coordinate location with the furniture plan. **Security.** None required.
Acoustics	No special provisions required.
Furnishings and Equipment	Comfortable seating such as adult and child-sized lounge chairs, loveseats and sofas; side tables; TV stand; bookshelves; TV; DVD player; and area rugs (if no carpet) per Chapter 3.
Special Requirements	
	For use during project execution by the appropriate Service agency
Occupancy	Staff. Children.
Min. net ft^2 (m^2)	

TABLE 4-3. PLAY ROOM

Description/ Usage	The play room is a gathering and social activity area geared towards energetic activities. It will include a variety of staff-structured play areas.
Ceiling Ht.	9 ft. (2.7m) minimum.
Windows/Doors	Provide windows per Chapter 3.
Interior Construction/ Built-in Equipment	Provide clip strips throughout the room for display of children's artwork directly below the chair rail.
Finishes	**Walls.** Semi-gloss epoxy painted gypsum wallboard. Provide a chair rail at 36 in. (915mm) above finished floor with a washable wainscot below. Provide impact-resistant wallboard up to 48 in. (1220mm). **Floor.** Resilient sheet flooring system such as vinyl or linoleum with a simulated stone or wood-grain pattern. **Base.** Resilient with residential (or millwork) profile, solid color or wood-grain. **Ceiling.** Modular construction shall use 2 ft x 2 ft (610 x 610mm) ACP. Non modular construction shall use painted gypsum wallboard.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and Chapter 3, Mechanical.
Fire Protection and Life Safety	Provide system per Chapter 3, General, and Chapter 3, Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General, and Chapter 3, Electrical.
Lighting	Provide system per Chapter 3, General, and Chapter 3, Electrical. Provide 30 fc (325 lux) general ambient.
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** Provide outlets for camera coverage of the interior. Coordinate coverage with adjacent spaces to ensure complete coverage while minimizing the outlet/camera count. See 3-8.2 CCTV for details. **CATV.** None required. **Security.** None required.
Acoustics	Provide wall- and/or ceiling-mounted acoustical attenuation features.
Furnishings and Equipment	Child height tables and chairs, area rugs, and a variety of play items and toy packages as required by program.
Special Requirements	
	For use during project execution by the appropriate Service agency
Occupancy	Staff. Children.
Min. net ft^2 (m^2)	

TABLE 4-4. DINING ROOM

Description/ Usage	The dining room emulates a large, family-style dining area for meals and other table-based activities such as homework and arts and crafts. It is open to the kitchen and may be open to the play room, but it should have some sense of separation from the play area and may be separated by circulation space.
Ceiling Ht.	9 ft. (2.7m) minimum.
Windows/Doors	Provide windows per Chapter 3.
Interior Construction/ Built-in Equipment	None required.
Finishes	**Walls.** Semi-gloss epoxy painted gypsum wallboard. **Floor.** Resilient sheet flooring system such as vinyl or linoleum with a simulated stone or wood-grain pattern. **Base.** Resilient with residential (or millwork) profile, solid color or wood-grain. **Ceiling.** Modular construction shall use 2 ft x 2 ft (610 x 610mm) ACP. Non modular construction shall use painted gypsum wallboard.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and Chapter 3, Mechanical.
Fire Protection and Life Safety	Provide system per Chapter 3, General, and Chapter 3, Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General, and Chapter 3, Electrical.
Lighting	Provide system per Chapter 3, General, and Chapter 3, Electrical. Provide 20 fc (215 lux) average general ambient.
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** Provide outlets for camera coverage of the interior. Coordinate coverage with adjacent spaces to ensure complete coverage while minimizing the outlet/camera count. Provide monitors that are viewable from both the dining area and the adjacent kitchen/food preparation area. See 3-8.2 CCTV for details. **CATV.** None required. **Security.** None required.
Acoustics	No special provisions required.
Furnishings and Equipment	Adult- and child-height dining tables and chairs. High chairs.
Special Requirements	If the staff desk area (Table 4-6) is located here, coordinate layout and design features.
	For use during project execution by the appropriate Service agency
Occupancy	Staff. Children.
Min. net ft^2 (m^2)	

TABLE 4-5. KITCHEN

Description/ Usage	The kitchen resembles a large, residential-style kitchen with ample preparation and food storage areas.
Ceiling Ht.	9 ft. (2.7m) minimum.
Windows/Doors	Provide windows per Chapter 3.
Interior Construction/ Built-in Equipment	Provide a minimum of 20 linear feet (6.1m) of counter space with upper and lower cabinets. Cabinets shall have heavy-duty hinges with non-protruding handles/hardware and integral child safety devices/latches. Counters shall have an integral backsplash and shall be solid surface. Provide an island and/or peninsular counter with base cabinets. Provide heavy-duty, "professional" grade, built-in residential appliances: oven and range top with an exhaust hood and fire suppression system (also see Chapter 3, Fire Suppression Systems) and a two-door reach-in refrigerator/freezer with minimum capacity of 19 ft^3 (.54 m^3) refrigerator and 19 ft^3 (.54 m^3) freezer with a built-in ice maker. Provide an under-counter, commercial-grade dishwasher (NSF International approved). In Option B facilities, provide an additional under-counter ice maker and two under-counter refrigerators for self-service drinks. These accommodate the older children that may occupy these facilities. Confirm approved equipment providers with the agencies noted in Chapter 1, Program Authorities.
Finishes	**Walls.** Semi-gloss epoxy painted gypsum wallboard. **Floor.** Resilient sheet flooring system such as vinyl or linoleum with a simulated stone or wood-grain pattern. For **Army,** provide a slip-resistant quarry tile floor. **Base.** Resilient with residential (or millwork) profile, solid color or wood-grain. For **Army,** provide a quarry tile base. **Ceiling.** Modular construction shall use 2 ft x 2 ft (610 x 610mm), vinyl-coated ACP. Non modular construction shall use painted gypsum wallboard.
Plumbing	Provide a two-compartment, under-mount stainless steel kitchen sink with a minimum .5 HP (.4 kW) garbage disposal and removable drain plug. Provide connections to the dishwasher, the refrigerator/freezer, and other equipment as necessary. Provide a single compartment, under-mounted hand-washing sink near the dining room. For **Army,** provide a floor drain.
HVAC	Provide a system per Chapter 3, General, and Chapter 3, Mechanical.
Fire Protection and Life Safety	Provide system per Chapter 3, General, and Chapter 3, Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General, and Chapter 3, Electrical.
Lighting	Provide system per Chapter 3, General, and Chapter 3, Electrical. Provide 20 fc (215 lux) general ambient and 50 fc (540 lux) at the counters.
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** Provide outlets for camera coverage of the interior. Coordinate coverage with adjacent spaces to ensure complete coverage while minimizing the outlet/camera count. See 3-8.2 CCTV for details. **CATV.** None required. **Security.** None required.
Acoustics	No special provisions required.
Furnishings and Equipment	Microwave, toaster, coffee maker, cookware, cooking and eating utensils, dinner and drinkware, and paper towel and soap dispensers.
Special Requirements	Ensure that staff standing at the food preparation areas can see the entire dining area and the CCTV monitors located therein. See 3-8.2 CCTV for details. Ensure access to a near-by storage closet/pantry.
	For use during project execution by the appropriate Service agency
Occupancy	Staff. Children.
Min. net ft^2 (m^2)	

TABLE 4-6. STAFF DESK AREA

Description/ Usage	The staff desk area is a small administrative area with a desk for ad hoc administrative functions, typically located as a sub area of another space. Effective locations include combining it with the check-in area, the dining room/kitchen area, or off of circulation space.
Ceiling Ht.	8 ft. (2.4m) minimum.
Windows/Doors	None required.
Interior Construction/ Built-in Equipment	None required.
Finishes	**Walls.** Semi-gloss epoxy painted gypsum wallboard. **Floor.** Coordinate with adjacent areas. **Base.** Resilient with residential (or millwork) profile, solid color or wood-grain. **Ceiling.** Modular construction shall use 2 ft x 2 ft (610 x 610mm) ACP. Non modular construction shall use painted gypsum wallboard.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and Chapter 3, Mechanical.
Fire Protection and Life Safety	Provide system per Chapter 3, General, and Chapter 3, Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General, and Chapter 3, Electrical.
Lighting	Provide system per Chapter 3, General, and Chapter 3, Electrical.
Communication	**Telephone.** Provide one jack. **Data.** Provide a minimum of one jack. Note in Navy and USMC facilities, this jack does not need to conform to NMCI requirements. **CCTV.** Coordinate with adjacent spaces to ensure outlets for camera coverage. See 3-8.2 CCTV for details. **CATV.** None required. **Security.** None required.
Acoustics	No special provisions required.
Furnishings and Equipment	Small desk, desk chair, computer, and phone.
Special Requirements	Confirm the location and configuration with the agencies identified in Chapter 1, Program Authorities. Coordinate the design features with the adjacent spaces.
	For use during project execution by the appropriate Service agency
Occupancy	Staff. Children.
Min. net ft^2 (m^2)	

TABLE 4-7. CRIB/INFANT ROOM

Description/ Usage	This room is a sleeping area for infants and pre-toddlers. It also accommodates diaper changing and bottle feeding.
Ceiling Ht.	9 ft. (2.7m) minimum.
Windows/Doors	Provide windows and interior door per Chapter 3. The exterior door shall meet the requirements for exit doors per Chapter 3. This exterior door shall have an automatic hold open device integral to the door or door closer. Flip down door stops are not permitted. Design door thresholds and hardware to facilitate the exiting of an evacuation crib with up to four children pushed and/or pulled by a single adult.
Interior Construction/ Built-in Equipment	Provide window treatments per Chapter 3. Floor length draperies or vertical blinds are not permitted in this space. Provide a 34-in.-high, 24-in.-deep (865 x 610mm), 42 in. (1065mm) long (minimum) solid-surface changing counter with integral storage underneath and integral, retractable steps that lock in place. Provide a safety device on all sides of the changing surface area that extends 3 in. (75mm) above the surface of the mat (mats are typically 1 in. (25mm) thick). This changing surface shall be integral with the sink counter. Ensure all edges are rounded and surfaces are smooth. Provide hands-free paper towel (cone-type), soap, glove, and plastic bag dispensers within reach of the caregiver at the table. Provide a minimum of eight (8) compartmentalized cabinets 9-in.-wide, 9-in.-high, and 12-in.-deep (230 x 230 x 305mm) for storage of diapers and products. These cabinets shall be within easy reach of a caregiver standing at the station with one hand on the child. Confirm the need for a separate small counter area with base and upper cabinets and an under-counter refrigerator with the agencies indentified in Chapter 1, Program Authorities. Also see Special Requirements below.
Finishes	**Walls.** Semi-gloss epoxy painted gypsum wallboard. **Floor.** Resilient floor such as vinyl or linoleum with a simulated stone or wood-grain pattern, or carpet tiles per Chapter 3. **Base.** Resilient with residential (or millwork) profile, solid color or wood-grain. **Ceiling.** Modular construction shall use 2 ft x 2 ft (610 x 610mm) ACP. Non modular construction shall use painted gypsum wallboard.
Plumbing	At the diaper changing station, provide one deep, integral or under-mount (under-mount shall be stainless steel) sink with a swivel goose neck faucet, and hands-free operation. If sensor-operated controls are used, provide a 30 second automatic shut-off. Provide a dedicated shut-off valve. If the counter/refrigerator area is included, provide a separate adult-height handwashing sink at that counter.
HVAC	Provide a system per Chapter 3, General, and Chapter 3, Mechanical. Provide individual thermostats, a switched exhaust fan at the diaper changing area, and maintain 35 to 50% humidity.
Fire Protection and Life Safety	Provide system per Chapter 3, General, and Chapter 3, Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General, and Chapter 3, Electrical.
Lighting	Provide system per Chapter 3, General, and Chapter 3, Electrical. Maintain a minimum of .5 fc (5 lux) at all times to accommodate child observation requirements but do not exceed 5 fc (52 lux) for sleeping. Normal operating light levels are 20 fc (215 lux) general ambient and 30-40 fc (320-430 lux) task lighting at the counters.

TABLE 4-7. CRIB/INFANT ROOM

Communication	**Telephone.** None required. **Data.** None required. **CCTV.** Provide outlets for camera coverage of the interior. See 3-8.2 CCTV for details. **CATV.** None required. **Security.** Provide a local alarm at the exterior door that sounds whenever the door is opened. **Army** does not alarm the crib/infant room exterior door.
Acoustics	Provide partition construction with a minimum STC rating of 52 per Chapter 3, Acoustics. Interior doors and windows/vision panels do not need to be STC-rated.
Furnishings and Equipment	Provide cribs for sleeping and emergency evacuation. A minimum of two cribs shall be evacuation cribs that shall be of durable construction, be a maximum of 29 in. (735mm) wide, and have sturdy caster wheels approximately 4 in. (100mm) in diameter. The evacuation crib shall be able to support and transport a minimum of five 18-month-old children weighing a total of 120 lbs. (55 kg). Provide two foot-operated, covered waterproof, washable trash containers, with self-closing airtight lids. Provide area rugs if no carpet.
Special Requirements	Provide childproof latches or magnetic locks to any storage cabinets within a child's reach. Option A facilities: Provide a hall/public area-accessible diaper changing station on the wall shared with the crib/infant room diaper changing station. This second diaper changing area shall mirror the one described above. Provide a window between the two stations that is the full width of the changing tables and allows views between the areas by staff standing at the stations. Provide all the related components in the hall/public area station, including the diaper storage compartments, exhaust fan and the covered trash container for soiled diapers.
	For use during project execution by the appropriate Service agency
Occupancy	Staff. Children.
Min. net ft^2 (m^2)	

TABLE 4-8. BEDROOMS

Description/ Usage	Separate bedrooms for boys and girls.
Ceiling Ht.	9 ft. (2.7m) minimum.
Windows/Doors	Provide windows and interior door per Chapter 3. The exterior door shall meet the requirements for exit doors per Chapter 3. This exterior door shall have an automatic hold open device integral to the door or door closer. Flip down door stops are not permitted.
Interior Construction/ Built-in Equipment	Provide window treatments per Chapter 3. Floor length draperies or vertical blinds are not permitted in this space. Option A facilities: Provide the following in each room and in a public area usually just outside the bedrooms: pre-manufactured, compartmentalized, open-front cubbies with a shelf and minimum of two coat hooks. These cubbies shall be anchored to the floor and/or wall. Ensure that clothing stored in each individual cubby can be separate from and will not come in contact with clothing stored in other cubbies. Provide 36 in. (915mm) of clear space directly in front of cubbies. These cubbies accommodate the child-storage function for the typical ages of the child occupants of Option A facilities and are contrasted with the FF&E noted below for Option B facilities. Also to accommodate the faster turnover rate, Option A facilities shall have a 32 ft^2 ($3m^2$) storage closet for cots and additional linens storage on shelving. Closet shall have twin-leaf doors with vision panels per Chapter 3.
Finishes	**Walls.** Semi-gloss epoxy painted gypsum wallboard. **Floor.** Resilient floor (with area rugs) such as vinyl or linoleum with a simulated stone or tile or wood-grain flooring pattern, or carpet tiles per Chapter 3. **Base.** Resilient with residential (or millwork) profile, solid color or wood-grain. **Ceiling.** Modular construction shall use 2 ft x 2 ft (610 x 610mm) ACP. Non modular construction shall use painted gypsum wallboard.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and Chapter 3, Mechanical.
Fire Protection and Life Safety	Provide system per Chapter 3, General, and Chapter 3, Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General, and Chapter 3, Electrical.
Lighting	Provide system per Chapter 3, General, and Chapter 3, Electrical. Maintain a minimum of .5 fc (5 lux) at all times to accommodate child observation requirements but do not exceed 5 fc (52 lux) for sleeping. Normal operating light levels are 20 fc (215 lux) general ambient and 30-40 fc (320-430 lux) task lighting at the side tables/beds.
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** Provide outlets for camera coverage of the interior. See 3-8.2 CCTV for details. **CATV.** None required. **Security.** Provide a local alarm at the exterior door that sounds whenever the door is opened.
Acoustics	Provide partition construction with a minimum STC rating of 52 per Chapter 3, Acoustics. Interior doors and windows/vision panels do not need to be STC-rated.
Furnishings and Equipment	Twin beds with under-bed drawer storage and side tables. Option B facilities: Provide lockable trunks with each bed to accommodate storage for older children and provide one armoire per every two beds. Secure the armoire to the wall to prevent tipping.
Special Requirements	
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Children.
Min. net ft^2 (m^2)	

TABLE 4-9. OPTION A TOILETS

Description/ Usage	These toilets support the Option A facility configuration and include two unisex toilets/bathrooms off of the public area/hallway near the bedrooms.
Ceiling Ht.	8 ft. (2.4m) minimum.
Windows/Doors	Provide lockable doors without vision panels. The doors shall be designed to allow opening from the outside during an emergency when locked.
Interior Construction/ Built-in Equipment	Provide a solid-surface countertop with a shatter-proof mirror over the lavatory. Provide toilet-tissue dispensers within reach of a child on the water closet. Provide a hands-free paper towel dispenser without serrated edges at the lavatory. Provide towel racks, shelving, and a screwed-in curved shower curtain rod at the tub.
Finishes	**Walls.** Semi-gloss epoxy paint with mold inhibitor on mold-resistant gypsum wallboard. **Floor.** Seamless sheet vinyl or linoleum with the edges turned up the walls a minimum of 6 in. (150mm) to form an integral coved base. **Base.** Integral. **Ceiling.** Modular construction shall use 2 ft x 2 ft (610 x 610mm) vinyl-coated ACP. Non modular construction shall use scrubable eggshell or semi-gloss paint with mold inhibitor on mold-resistant gypsum wallboard.
Plumbing	Comply with *Caring for Our Children, National Health and Safety Performance Standards: Guidelines for Out-of-Home Child Care* for water temperature control. In one of the two toilets, provide a child-height water closet with a seat height of 12 in. (305mm) and flush controls 20 to 30 in. (510 to 760mm) above finished floor and a child-height lavatory mounted at 22 in. (560mm) above finished floor with 19 in. (480mm) clearance for knee space. In the other toilet, provide standard accessible water closet and lavatory. All sinks shall have single-action, pre-mixing, automatic shut-off controls mounted within 14 in. (355mm) of the leading edge of the lavatory. In each room provide a one-piece, full-height, solid-acrylic combination bathtub and tub/shower surround with two recessed soap dishes, a non-slip surface, and fixed and handheld showerheads. Provide a floor drain in each room.
HVAC	Provide a system per Chapter 3, General, and Chapter 3, Mechanical. Provide humidistat-controlled exhaust system.
Fire Protection and Life Safety	Provide system per Chapter 3, General, and Chapter 3, Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General, and Chapter 3, Electrical.
Lighting	Provide system per Chapter 3, General, and Chapter 3, Electrical.
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** None required. **CATV.** None required. **Security.** None required.
Acoustics	Provide partition construction with a minimum STC rating of 45 per Chapter 3, Acoustics. Doors do not need to be STC-rated.
Furnishings and Equipment	
Special Requirements	
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Children.
Min. net ft^2 (m^2)	

TABLE 4-10. OPTION B TOILETS

Description/ Usage	These toilets support the Option B facility configuration and include gender-specific rooms directly off of each bedroom and two unisex toilets off of the public area/hallway. The typical configuration of the gender-specific facilities includes three areas (toilet room, bath/shower room and lavatories) and is described in Special Requirements below.
Ceiling Ht.	8 ft. (2.4m) minimum.
Windows/Doors	Provide lockable doors without vision panels to the gender-specific toilet and bath/shower rooms and to the two unisex toilets. The doors shall be designed to allow opening from the outside during an emergency when locked.
Interior Construction/ Built-in Equipment	Provide a solid-surface countertop at the gender-specific lavatory. Provide mirrors over each lavatory. Provide toilet-tissue dispensers within reach of a child on each water closet. Provide a paper towel dispenser without serrated edges at each lavatory. Provide towel racks, shelving, and a screwed-in curved shower curtain rod at the tubs.
Finishes	**Walls.** Impervious tile up to 48 in. (1220mm) above finished floor with epoxy paint with mold inhibitor on mold-resistant gypsum wallboard above. **Floor.** Impervious tile. **Base.** Match floor. **Ceiling.** Modular construction shall use 2 ft x 2 ft (610 x 610mm) vinyl-coated ACP. Non modular construction shall use epoxy paint with mold inhibitor on mold-resistant gypsum wallboard.
Plumbing	Comply with *Caring for Our Children, National Health and Safety Performance Standards: Guidelines for Out-of-Home Child Care* for water temperature control. **Gender-specific Toilet Rooms.** Provide both a child-height water closet with a seat height of 14 to 15 in. (355 to 380mm) and flush controls 20 to 30 in. (510 to 760mm) above finished floor and a child-height lavatory mounted at 31 in. (790mm) above finished floor with 24 in. (610mm) clearance for knee space. **Gender-specific Bath/shower Rooms.** Provide a one-piece, full-height, solid-acrylic combination bathtub and tub/shower surround with two recessed soap dishes, a non-slip surface, and fixed and handheld showerheads. **Gender-specific Lavatories.** Provide two integral or under-mount lavatories. **Unisex Toilets:** In one, provide a child-height water closet with a seat height of 10 in. (250mm) and flush controls 20 to 30 in. (510 to 760mm) above finished floor and a child-height lavatory mounted at 17 in. (430mm) above finished floor. In the other, provide a child-height water closet with a seat height of 14 to 15 in (355 to 380mm) and flush controls 20 to 30 in. (510 to 760mm) above finished floor and a child-height lavatory mounted at 31 in. (790mm) above finished floor with 24 in. (610mm) clearance for knee space. All sinks shall have single-action, pre-mixing, automatic shut-off controls mounted within 14 in. (355mm) of the leading edge of the lavatory. Provide a floor drain in each space.
HVAC	Provide a system per Chapter 3, General, and Chapter 3, Mechanical.
Fire Protection and Life Safety	Provide system per Chapter 3, General, and Chapter 3, Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General, and Chapter 3, Electrical.
Lighting	Provide system per Chapter 3, General, and Chapter 3, Electrical.
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** None required. **CATV.** None required. **Security.** None required.
Acoustics	Provide partition construction with a minimum STC rating of 45 per Chapter 3, Acoustics. Doors and windows do not need to be STC-rated.

TABLE 4-10. OPTION B TOILETS

Furnishings and Equipment	
Special Requirements	The gender-specific facilities are typically configured as follows: The main lavatory area is open to the bedroom with a separate private toilet/lavatory room off to one side and an accessible bath/shower room off to the other side.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Children.
Min. net ft^2 (m^2)	

TABLE 4-11. STAFF TOILET

Description/ Usage	This is a unisex, accessible facility.
Ceiling Ht.	8 ft. (2.4m) minimum.
Windows/Doors	Provide a lockable door without a vision panel. The door shall be designed to allow opening from the outside during an emergency when locked.
Interior Construction/ Built-in Equipment	Provide a solid-surface countertop with a full-width mirror over the lavatory. Provide toilet-tissue dispenser, paper towel dispenser, built-in trash receptacle, and soap dispenser.
Finishes	**Walls.** Epoxy semi-gloss paint with mold inhibitor on mold-resistant gypsum wallboard. As an option, also provide impervious tile up to 48 in (1220mm) above finished floor. **Floor.** Resilient sheet flooring system such as vinyl or linoleum, or impervious tile. **Base.** Resilient with residential (or millwork) profile, solid color or wood-grain, or impervious tile. **Ceiling.** Modular construction shall use 2 ft x 2 ft (610 x 610mm) vinyl-coated ACP. Non modular construction shall use epoxy paint with mold inhibitor on mold-resistant gypsum wallboard.
Plumbing	Provide accessible water closet and lavatory. Provide a floor drain.
HVAC	Provide a system per Chapter 3, General, and Chapter 3, Mechanical.
Fire Protection and Life Safety	Provide system per Chapter 3, General, and Chapter 3, Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General, and Chapter 3, Electrical.
Lighting	Provide system per Chapter 3, General, and Chapter 3, Electrical.
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** None required. **CATV.** None required. **Security.** None required.
Acoustics	Provide partition construction with a minimum STC rating of 45 per Chapter 3, Acoustics. Doors and windows do not need to be STC-rated.
Furnishings and Equipment	
Special Requirements	
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Children.
Min. net ft^2 (m^2)	

TABLE 4-12. LAUNDRY

Description/ Usage	The laundry room should be located near staff areas and an exterior wall. It includes the facility janitor functions.
Ceiling Ht.	8 ft. (2.4m) minimum.
Windows/Doors	Provide a lockable door with a vision panel per Chapter 3.
Interior Construction/ Built-in Equipment	Provide large, heavy-duty residential washer and dryer. Provide a built-in table for folding laundry and shelves for storage.
Finishes	**Walls.** Epoxy painted water-resistant gypsum wallboard. **Floor.** Sealed concrete, a resilient sheet flooring system such as vinyl linoleum, or impervious tile. **Base.** Rubber or match floor. **Ceiling.** Modular construction shall use 2 ft x 2 ft (610 x 610mm) vinyl-coated ACP. Non modular construction shall use epoxy-painted water-resistant painted gypsum wallboard.
Plumbing	Provide a laundry sink, connections to the washer, and a janitor's sink. Provide a floor drain. Provide recessed washing machine connector box for each utility connection to the machine.
HVAC	Provide a system per Chapter 3, General, and Chapter 3, Mechanical. Provide humidistat-controlled exhaust system to maintain a maximum of 50% relative humidity. Do not vent the dryer exhaust near a building entrance.
Fire Protection and Life Safety	Provide system per Chapter 3, General, and Chapter 3, Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General, and Chapter 3, Electrical.
Lighting	Provide system per Chapter 3, General, and Chapter 3, Electrical.
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** Provide outlets for camera coverage of the interior. See 3-8.2 CCTV for details. **CATV.** None required. **Security.** None required.
Acoustics	Provide partition and door construction with a minimum STC rating of 52 per Chapter 3, Acoustics.
Furnishings and Equipment	
Special Requirements	Confirm the need for HAZMAT storage provisions with the Installation Safety Officer.
	For use during project execution by the appropriate Service agency
Occupancy	Staff. Children.
Min. net ft^2 (m^2)	

TABLE 4-13. INTERIOR STORAGE

Description/ Usage	Interior storage includes dry food storage and general facility items. The food storage should be located near the kitchen and the general item storage may be one or more additional storage closets, depending on final building configuration.
Ceiling Ht.	8 ft. (2.4m) minimum.
Windows/Doors	Provide a lockable door with a vision panel per Chapter 3.
Interior Construction/ Built-in Equipment	Coordinate with agencies noted in Chapter 1, Program Authorities, to provide the preferred shelving/storage system to maximize storage in these spaces.
Finishes	**Walls.** Semi-gloss epoxy painted gypsum wallboard. **Floor.** Resilient sheet flooring system such as vinyl or linoleum. **Base.** Resilient with residential (or millwork) profile, solid color or wood-grain. **Ceiling.** Modular construction shall use 2 ft x 2 ft (610 x 610mm) ACP. Non modular construction shall use painted gypsum wallboard.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and Chapter 3, Mechanical.
Fire Protection and Life Safety	Provide system per Chapter 3, General, and Chapter 3, Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General, and Chapter 3, Electrical.
Lighting	Provide system per Chapter 3, General, and Chapter 3, Electrical. In all storage areas large enough for a child to enter, provide occupancy-sensor-controlled minimum light level of 5 fc (52 lux). The occupancy sensor shall be sensitive enough to detect a small seated child. This is a child abuse/child safety requirement.
Communication	**Telephone.** None required. **Data.** See Special Requirements. **CCTV.** See Special Requirements. See 3-8.2 CCTV for details. **CATV.** None required. **Security.** None required.
Acoustics	No special provisions required.
Furnishings and Equipment	
Special Requirements	CCTV recording equipment may be located in a storage closet; confirm data and other requirements if this option is exercised. See 3-8.2 CCTV for details. Paint a horizontal red stripe on all walls at 20 in. (510mm) below finished ceiling to indicate maximum height of storage.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Children.
Min. net ft^2 (m^2)	

TABLE 4-14. STAFF DEN/OFFICE

Description/ Usage	Private office for staff administrative functions. In Option B facilities, this room will also be used to isolate a sick child from the facility general population and for family counseling, as needed.
Ceiling Ht.	8 ft. (2.4m) minimum.
Windows/Doors	Provide a lockable door with a vision panel per Chapter 3.
Interior Construction/ Built-in Equipment	None required.
Finishes	**Walls.** Semi-gloss epoxy painted gypsum wallboard. **Floor.** Carpet tiles per Chapter 3. **Base.** Resilient with residential (or millwork) profile, solid color or wood-grain. **Ceiling.** Modular construction shall use 2 ft x 2 ft (610 x 610mm) ACP. Non modular construction shall use painted gypsum wallboard.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and Chapter 3, Mechanical. Option B facilities: Provide negative pressure.
Fire Protection and Life Safety	Provide system per Chapter 3, General, and Chapter 3, Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General, and Chapter 3, Electrical.
Lighting	Provide system per Chapter 3, General, and Chapter 3, Electrical.
Communication	**Telephone.** Provide one jack. **Data.** Provide a minimum of one jack plus additional jacks as necessary for equipment such as a printer. Note in Navy and USMC facilities, this is the only jack that will conform to NMCI requirements. **CCTV.** Provide a monitor. Option B facilities: Provide outlets for camera coverage to accommodate use as an isolation room. See 3-8.2 CCTV for details. **CATV.** None required. **Security.** Provide a duress alarm that alerts the Installation security office. Actuator shall be located at the maximum accessible-compliant height above finished floor and shall include a flip-up protective covering.
Acoustics	Provide partition construction with a minimum STC rating of 45 per Chapter 3, Acoustics. Doors and windows/vision panels do not need to be STC-rated.
Furnishings and Equipment	Desk, desk chair, side chair(s), credenza, lockable filing cabinet, computer, printer, and other office equipment as necessary. Option B facilities: Also provide lounge seating and a couch.
Special Requirements	
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Children.
Min. net ft^2 (m^2)	

TABLE 4-15. STAFF STORAGE

Description/ Usage	The staff storage area is a small area with lockable storage for small personal items, such as coats and bags. It is located within or combined with other facility areas. Effective locations/combinations include the small desk area and the laundry room.
Ceiling Ht.	8 ft. (2.4m) minimum.
Windows/Doors	None required.
Interior Construction/ Built-in Equipment	The storage area can be configured as a counter with lockable upper cabinets and an adjacent lockable coat closet or as half-size lockers. See Special Requirements.
Finishes	**Walls.** Semi-gloss epoxy painted gypsum wallboard. **Floor.** Coordinate with adjacent areas. **Base.** Resilient with residential (or millwork) profile, solid color or wood-grain. **Ceiling.** Modular construction shall use 2 ft x 2 ft (610 x 610mm) ACP. Non modular construction shall use painted gypsum wallboard.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and Chapter 3, Mechanical.
Fire Protection and Life Safety	Provide system per Chapter 3, General, and Chapter 3, Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General, and Chapter 3, Electrical.
Lighting	Provide system per Chapter 3, General, and Chapter 3, Electrical.
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** Coordinate with adjacent spaces to ensure outlets for camera coverage. See 3-8.2 CCTV for details. **CATV.** None required. **Security.** None required.
Acoustics	No special provisions required.
Furnishings and Equipment	None required.
Special Requirements	Confirm the location and configuration with the agencies identified in Chapter 1, Program Authorities. Coordinate the design features with the adjacent spaces.
	For use during project execution by the appropriate Service agency
Occupancy	Staff. Children.
Min. net ft^2 (m^2)	

TABLE 4-16. OUTDOOR STORAGE

Description/ Usage	Room with direct access from the outside for storage of outdoor play equipment. This room may be located within the building footprint or as a separate shed structure. Confirm location with the agencies noted in Chapter 1, Program Authorities. If the room is located within the building footprint, access from the interior is not required. If it is an exterior shed, it shall be an enclosed, weather-tight, vandal-proof storage shed that is architecturally compatible with the CCCF.
Ceiling Ht.	9 ft. (2.7m) minimum. 7 ft. (2.1m) minimum if a separate shed.
Windows/Doors	Provide a lockable door with a vision panel per Chapter 3, including both interior and exterior door criteria. Door shall be a minimum of 48 in. wide (1220mm).
Interior Construction/ Built-in Equipment	Storage shelves, racks and/or bins, as necessary.
Finishes	**Walls.** Semi-gloss epoxy painted gypsum wallboard or CMU. If exterior shed, use a prefabricated wood or plastic shed that meets the child safety standards identified in Chapter 4, Play Equipment. **Floor.** Sealed concrete sloped to the door for drainage. **Base.** None required. **Ceiling.** Unfinished.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and Chapter 3, Mechanical. Ventilate but do not air condition.
Fire Protection and Life Safety	Provide system per Chapter 3, General, and Chapter 3, Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General, and Chapter 3, Electrical.
Lighting	Provide system per Chapter 3, General, and Chapter 3, Electrical.
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** None required. See 3-8.2 CCTV for details. **CATV.** None required. **Security.** None required.
Acoustics	No special provisions required.
Furnishings and Equipment	
Special Requirements	No HAZMATS are stored in this space. Paint a horizontal red stripe on all walls at 20 in. (510mm) below finished ceiling to indicate maximum height of storage. Locate storage to be readily accessible to the outdoor play area. If it is a separate shed, its placement shall not create blind spots in the outdoor activity area. Provide hard-surface pathways connecting storage with the outdoor activity area.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Children.
Min. net ft^2 (m^2)	

4-3 **OUTDOOR ACTIVITY AREA DESIGN CRITERIA**.

4-3.1 **General**.

The CCCF outdoor activity area is similar to that for the CDC described in UFC 4-740-14, but on a much smaller scale. CCCFs will not provide separated (fenced) age-specific play areas and most will only have space for one or two pieces of equipment.

A certified playground safety inspector that is not affiliated to an equipment manufacturer shall design the playground or review and approve the final design. The outdoor activity area design and all features shall comply with the Consumer Product Safety Commission (CPSC) 325, *Public Playground Safety Handbook,* and with any other references in this UFC for specific design elements and features.

4-3.2 **Layout**.

If available area and site layout permit, provide separate areas for older and younger children. A separate area is required in Option B facilities where the age difference between children can be greater. The Option B area will typically be a covered patio.

4-3.3 **Fencing**.

Enclose the perimeter of the entire outdoor activity area with a fence. **Navy** and **USMC** fence shall be a minimum 5-ft. (1525mm) high fence. **Army** fence shall be 4-ft. (1220mm) high fence. Vinyl-coated chain link is the preferred fence material, and the final design shall comply with the following:

- Meet the Installation design standards to the degree possible while meeting these criteria.
- Exposed galvanized wire is not permitted.
- The top edge shall be selvage knuckled. The fencing components shall not expose sharp points or edges that could cut or puncture children's skin. All fastening devices used for fence construction shall be turned sideways or shall not project perpendicular to the fence surface beyond .125 in. (3.2mm). Fences shall have smooth caps and no finials or sharp picket tops.
- Space between vertical elements shall be no more than 3.5 in. (85mm).
- No openings in the fence shall be between .375 in. (9mm) and 1 in. (25mm) in size as pinch protection.
- Coordinate gate sizes to accommodate the evacuation cribs (See Chapter 4, Infant/crib Room).

- Perimeter egress gates shall only be operable from the interior side, have adult-controlled securing devices to prevent child operation, and pinch/crush protection on the hinges. In addition, design the gate to preclude operation by an adult reaching over the fence from the exterior side as a child-abuse prevention measure.

- Provide at least one access gate that is 8 ft. (2440 mm) wide for service vehicles.

- Ensure that fences do not impede caregiver supervision of children.

- For **Navy** projects, bury the fence bottom a minimum of 3 in. (75mm) below grade.

Additional information on entrapment dimensions is provided in CPSC 325.

4-3.4 **Play Equipment**.

4-3.4.1 **Industry Standards.**

Playground equipment and any shade structures shall comply with the minimum standards put forth in the guidelines listed below. In some cases, this UFC may include more stringent guidelines than those listed. In those cases, follow the criteria identified in this UFC. Use the most recent editions of the following publications:

- CPSC 325, *Public Playground Safety Handbook*.

- ASTM F1292, *Standard Specification for Impact Attenuation of Surface Materials within the Use Zone of Playground Equipment.*

- ASTM F1487, *Standard Consumer Safety Performance Specification for Playground Equipment for Public Use.*

- ASTM F1951, *Standard Specification for Determination of Accessibility of Surface Systems Under and Around Playground Equipment.*

- ASTM F2223, *Standard Guide for ASTM Standards on Playground Surfacing*.

- ASTM F2373, *Standard Consumer Safety Performance Specification for Public Use Play Equipment for Children 6 Months through 23 Months.*

4-3.4.2 **Additional DoD Standards.**

Show all use zones for play equipment on the site plan to ensure there is no conflict between play activities on the ground and swinging or jumping from the equipment. Do not overlap use zones.

4-3.4.2.1 **Selection Criteria.**

- **Novelty.** Select interesting play equipment with both simple and complex features. Select equipment that can be modified.

- **Flexibility.** Select a composite unit that stimulates a wide range of motor functions and that can be used equally well by one child or by several children simultaneously. Do not select themed items that are designed to look like specific objects.

- **Challenge.** Provide equipment that provides clear, graduated stages of accomplishment, e.g., variable-height steps or climbing equipment with landings at different heights.

- **Aesthetics.** Design children's playgrounds for appearance as well as function. Select equipment colors and styles that are appealing to children and compatible with the facility exterior. Integrate equipment with natural vegetation and landforms.

4-3.4.2.2 **Installation Criteria.**

The equipment purchasing agreement shall include a requirement for the manufacturer to inspect the equipment after installation and confirm in writing that installation conforms to manufacturer's instructions and to CPSC and ASTM Guidelines. Also provide a contractual agreement for a skilled, certified, independent playground safety consultant to inspect the entire playground after the installation is completed. Have experienced playground installers conduct or supervise installation.

4-3.4.2.3 **Exclusions.**

Do not use the following items in the outdoor activity areas, regardless of CPSC or ASTM approval:

- Animal-shaped, metal, or hard-seat swings. **Navy** excludes all swing types except tire swings.

- Wood equipment—wood equipment is not permitted due to maintenance concerns.

- Metal slide surfaces.

- Merry-go-rounds.

- Trampolines.

- See-saws.

- Zip lines.

4-3.4.2.4 Exceptions and Modifications.

The following is an exception to previous DoD policy: Tunnels and tunnel slides are allowed but require openings or view panels.

4-3.5 Surfaces.

CCCF outdoor activity areas typically have three categories of surface areas with specific requirements: use zones, wheeled toy pathways, and general. Comply with ASTM F2223, *Standard Guide for ASTM Standards on Playground Surfacing,* and the following criteria.

4-3.5.1 Use Zones.

Use zones are the areas under and around playground equipment and are defined by ASTM F1487. A required submittal is the commercial playground safety surface manufacturer's warranty and liability in the specifications and transfer to the Using Service. Include a written verification by the manufacturer that the playground safety surface meets the requirements of the CPSC 325 and ASTM in the submittal section of the specifications.

DoD prefers poured-in-place resilient safety surfaces. Approval from the using Service agencies identified in Chapter 1, Program Authorities, is required for any other use zone surface material.

4-3.5.2 Wheeled Toy Pathways.

If space and budget will accommodate wheeled toy pathways, the acceptable materials include concrete and stone and masonry pavers. The edge of pathways shall be tapered for transitions and shall not create trip hazards. Joints shall be not wider than .5 in. (12mm) because they may cause toys to tip. Adjacent grading and/or sod installation shall be within .75 in. (19mm) of the pathway surface height and shall allow for settlement to minimize replacement. Comply with the following when designing the wheeled toy pathways:

- Modular paving. Use non-grouted interlocking type pavers on sand placed over a continuous concrete setting bed. Install brick, stone or other non-interlocking type paving in grout over a continuous concrete setting bed. Do not install non-interlocking paving on sand in play areas, as the modular units may settle unevenly, resulting in a hazardous irregular surface. Where winter freezing is common and where poor soils occur, use a gravel base under concrete and reinforce to prevent cracking and deterioration. Integrally colored pavers are encouraged to create visual interest.

- Concrete. Add color additives or surface finishes to improve the appearance of concrete and reduce glare. Avoid smooth steel trowel finishes, which can become slippery when wet. Where winter freezing is

common and where poor soils occur, use a gravel base under concrete and reinforce to prevent cracking and deterioration. Cast-in-place concrete over a well-compacted sub-grade is the most durable, maintenance-free paving material for hard surface areas.

4-3.5.3 **General.**

This encompasses any portion of the outdoor activity area not included in the other two defined areas. Use grass or other natural landscaping surfaces. Use grass primarily in open, active play areas, passive play areas, and areas with low traffic levels. Do not use grass where wear and maintenance will become a problem. Locate grass in sunny areas where it will dry out quickly after rain. Artificial turf is not recommended for use as a playground surface; it can be abrasive, convey an unnatural impression, and can result in significantly higher surface temperatures than natural turf. Prior to approving artificial turf, confirm negative lead content from an independent lead-certified laboratory. See Chapter 3, Landscaping, for more information on non-paved areas.

APPENDIX C POISONOUS AND NON-POISONOUS PLANTS

Many popular house and garden plants are considered poisonous and can produce symptoms ranging from minor to severe. Table C-1 provides a non-comprehensive list of common plants that are known to be poisonous. Table C-2 provides a list of plants for which no evidence currently exists of a poisonous quality. These lists are provided by the Maryland Poison Center. Within the United States, check with local extensions of the US Department of Agriculture for more information about the nature of common plantings in specific locations. These lists are not intended to serve as a guide for plants to use or not use but are merely provided for informational purposes. See Chapter 3 for more information on landscaping and plant selection.

Refer to a comprehensive, commercial field guide for a complete list of poisonous plants.

TABLE C-1. COMMON POISONOUS PLANTS

Amaryllis	Jerusalem cherry
Azalea	Jimsonweed
Barberry	Jonquil
Black locust	Lily-of-the valley
Boxwood	Mistletoe
Caladium	Mountain laurel
Castor bean	Narcissus
Chinaberry	Nephthytis/Arrowhead
Chinese evergreen	Nightshade family
Chrysanthemum	Oak (acorns)
Crown of thorns	Peony
Daffodil	Philodendron family
Dumbcane/Dieffenbachia	Poison ivy/oak/sumac
English ivy	Pokeweed
Euonymous	Privet
Four o'clock	Rhododendron
Fruit pits or seeds	Snowball bush/Hydrangea
Gladiola	Water hemlock
Holly	Wisteria
Hyacinth	Yew
Iris	

TABLE C-2. COMMON NON-POISONOUS PLANTS

African violet	Marigold
Christmas cactus	Mulberry (ripe berries only)
Coleus	Norfolk pine tree
Corn plant	Peperomia
Crocus	(spring) Petunia
Dandelion	Poinsettia*
Dogwood	Prayer plant
Dracaena	Pyracantha/Firethorn
Easter lily	Rose
Ferns	Rubber tree plant
Ficus*	Sansevieria/Snake plant
Forsythia	Scheffiera*
Fuchsia	Spider plant
Geranium	Swedish Ivy
Hibiscus	Tulip*
Honeysuckle	Wandering Jew
Impatiens	Wax plant
Jade plant	Wild strawberry/Snakeberry
Lilac	Zebra plant

***** Sap may be irritating.

FOREWORD

The Unified Facilities Criteria (UFC) system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and applies to the Military Departments, the Defense Agencies, and the DoD Field Activities in accordance with USD (AT&L) Memorandum dated 29 May 2002. UFC will be used for all DoD projects and work for other customers where appropriate. All construction outside of the United States, its territories, and possessions is also governed by Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA), and in some instances, Bilateral Infrastructure Agreements (BIA). Therefore, the acquisition team must ensure compliance with the most stringent of the UFC, the SOFA, the HNFA, and the BIA, as applicable.

UFC are living documents and will be periodically reviewed, updated, and made available to users as part of the Military Department's responsibility for providing technical criteria for military construction. Headquarters, U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering Systems Command (NAVFAC), and Air Force Civil Engineer Center (AFCEC) are responsible for administration of the UFC system. Technical content of UFC is the responsibility of the cognizant DoD working group. Defense Agencies should contact the respective DoD Working Group for document interpretation and improvements. Recommended changes with supporting rationale may be sent to the respective DoD working group by submitting a Criteria Change Request (CCR) via the Internet site listed below.

UFC are effective upon issuance and are distributed only in electronic media from the following source:

- Whole Building Design Guide website https://www.wbdg.org/ffc/dod.

Refer to UFC 1-200-01, *DoD Building Code*, for implementation of new issuances on projects.

CHAPTER 1 INTRODUCTION

1-1 REISSUES AND CANCELS.

This UFC reissues and cancels UFC 4-740-20, *Libraries*, dated 1 May 2006.

1-2 PURPOSE AND SCOPE.

This UFC provides guidelines for evaluating, planning, programming, and designing libraries. Guidance is provided for developing library facilities appropriate for each installation to combine with operations and population requirements.

This information must be used by architects/engineers (A/E), designers, base civil engineers (BCE), library directors, command and headquarters' review personnel, and others involved in developing and approving library construction projects. It is intended to help all participants better understand contemporary library requirements, programs, and design criteria so they can effectively participate in the project development process.

For Navy libraries located within Historic Resource Facilities (HRF), refer to FC 4-760-10N, *Navy Museums and Historic Resource Facilities*, for additional requirements.

1-2.1 Libraries Mission Statement.

The mission statement for library facilities at DoD installations is to provide professional library programs and services to meet the military mission, educational, and leisure-time needs of the base community, including active-duty personnel (including all U.S. and foreign military), families, retirees, civilian employees, and other authorized users. The mission objectives for DoD libraries include the following three priorities, ranked by order of importance:

1. Mission support
2. Educational support
3. Quality of life support

1-2.1.1 Mission Support.

Installation mission support is the primary priority of each DoD library facility. The support functions provided are determined by the library director at each installation and may include the identification, organization, and procurement of technical reference services and publications for official use. Funding for DoD library facilities helps develop the services, programs, materials, and personnel needed to provide support for installation-specific mission requirements.

1-2.1.2 Educational Support.

Support for Professional Military Education (PME) and Voluntary Education Programs (VEP) for active-duty military personnel and authorized civilian contractors is the second priority for library facilities, programs, and services at installations around the world.

1-2.1.3 Quality-of-Life Support.

General library facilities, programs, and services help improve the quality of life for active-duty personnel, their families, retirees, and other authorized customers. The placement, siting, and possibly colocating of a library facility with other quality of life amenities can create destinations and a sense of community. The planned creation of destinations with many amenities or attractions for the installation community to come together is a quality-of-life force multiplier. This quality-of-life support is an important function of most facilities; however, installation mission support is always the first priority.

1-2.2 Types of Libraries.

The planned users, collections/content, and mission of the installation population determine the functional type of library. The facility and criteria used to develop a library should reflect the assigned type. The Air Force identifies base library types in AFMAN 32-1084, *Standard Facility Requirements*, CC 740675 Base Libraries 7416. Requirements and design criteria for academic, technical/scientific, medical, and specialty libraries are not included in this UFC.

- General libraries (“branch” or “public” type library)
- Academic libraries
- Medical libraries
- Technical/scientific libraries
- Specialty libraries (including legal)

1-2.2.1 General Libraries.

General libraries are centralized facilities that serve the whole installation and its entire population. These facilities offer information, materials, collections, and services similar to general public libraries found in most communities and schools. Design criteria for different types, configurations, and sizes of DoD general library facilities are the focus of this UFC.

1-2.2.2 Academic Libraries.

Academic libraries are an integral part of a formal school or college-level educational institution. These libraries are often used by students as a quiet place for studying and research and for collaborative work with other students.

1-2.2.3 Medical Libraries.

These libraries are located within medical facilities and feature specific medical collections.

1-2.2.4 Technical/Scientific Libraries.

Technical or scientific libraries provide detailed information and reference materials for personnel who work in research, development, testing and evaluation (RDT&E) programs or support other scientific and technical functions.

1-2.2.5 Specialty Libraries.

1-2.2.5.1 Legal Libraries.

Legal libraries are integral to the practice and college-level education of law. These libraries are often used by students and practitioners of law as a quiet place for studying and research and for collaborative work with others.

1-2.2.5.2 Site Libraries.

Site libraries contain a collection of print and non-print materials issued to a remote location at the request of the local installation or services commander to enhance library services. They may or may not have paid staff and set operating hours. Site libraries operate under the administration of the local site commander and are serviced from a general library or library service center.

1-2.2.5.3 Field Libraries.

Field libraries (Air Force-specific) house a collection of general reading materials issued from and directed by a general library or library service center to an Air Force, DoD, or State Department activity for which the Air Force has responsibility (see DoDI 1015.10, *Military Morale, Welfare, and Recreation (MWR) Programs*, Enclosure 10). Field libraries may or may not have set operating hours or paid staff and may operate on the honor system.

1-2.2.5.4 Forward and Expeditionary Libraries.

Materials and resources for contingency operations, including pre-departure needs, and support to remote sites, collections of paperback books, newspapers, periodicals, and audio/visual (A/V) materials may be issued to library-inaccessible locations serviced from a command/headquarters or general library.

1-2.3 Library Systems and Relationships.

Library design and construction projects may be the first library facility at an installation or one of a number of networked and cooperative facilities with different roles in achieving the library’s mission at DoD installations.

1-2.3.1 General Libraries.

General libraries serve the installation community in a manner comparable to public libraries that serve a civilian community. General libraries coordinate their services to support the mission and education of installation personnel, including those served by other types, such as technical or academic. Considerations for force-multiplying the

quality of life or creation of community space must be included in planning these general library facilities.

1-2.3.2 Accessory Libraries.

Accessory libraries feature academic, technical, scientific, or medical content and specialized programs to serve the unique educational program curriculum needed to support mission requirements at each installation, and often a specific building and mission. Often these libraries will be located inside another building. Coordinate with the host building to maximize the efficiency of space and facility resources. Spaces such as restrooms, elevators, stairs, and conference rooms could potentially be shared with the host building but this will be installation-specific.

1-2.3.3 Extension Libraries.

Extension libraries feature general and public interest content but consist of a reduced program to serve as mobile, temporary, or specific population or educational opportunity to support the quality of life or readiness of each installation. Extension libraries may or may not have a dedicated building, space, or may be a mobile site, such as a bookmobile.

1-2.4 Library Users.

Generally, library users include active-duty personnel, their families, retirees, and other authorized customers. Base/installation engineers, library directors, major command, or headquarters should provide the designers with anticipated population, demographics, common commitments and missions of users, and other desired usages of the library facilities. In designated locations, the library may be used by the surrounding community.

1-3 APPLICABILITY.

This UFC applies to all Service elements and contractors involved in the planning, design, and construction of general libraries worldwide. Other library types and renovation/additions will adopt portions of the guidance applicable to the scope and intent of their project.

1-4 GENERAL BUILDING REQUIREMENTS.

Comply with UFC 1-200-01, *DoD Building Code*. UFC 1-200-01 provides applicability of model building codes and government-unique criteria for typical design disciplines and building systems, as well as for accessibility, antiterrorism, security, high-performance and sustainability requirements, and safety. Use this UFC in addition to UFC 1-200-01 and government criteria referenced therein.

1-5 CYBERSECURITY.

All facility-related control systems (including systems separate from a utility monitoring and control system) must be planned, designed, acquired, executed, and maintained in

accordance with UFC 4-010-06, *Cybersecurity of Facility-Related Control Systems*, and as required by individual Service implementation Policy.

1-6 GLOSSARY.

Appendix B contains acronyms, abbreviations, and terms.

1-7 REFERENCES.

Appendix C contains a list of references used in this document. The publication date of the code or standard is not normally included in this document. Unless otherwise specified, the most recent edition of the referenced publication applies.

This Page Intentionally Left Blank

CHAPTER 2 PROGRAMMING AND PREDESIGN

2-1 GENERAL.

This chapter presents criteria specifically applicable to the design of each functional area and space of library facilities. Primary design considerations are presented for each functional area, indicating the anticipated use, performance, organization, character, and relationships between each area's component spaces. Example criteria are provided for space sizes, storage requirements, furnishings, equipment, and technical requirements for each component space within each functional area. The technical requirements and special criteria provided in this chapter address only items in addition to standard requirements by code, UFC references, and professional or construction service contracts. General considerations are presented in Chapter 3.

The guidelines in this chapter apply to all sizes and types of library facilities. Specific guidance for space allocation, in the three prototypical sizes of general libraries, is presented in Table 2-1. All guidance is provided based on the recommended space sizes and capacities for each overall facility size, supplemented by standard use and size factors, as appropriate. These recommendations may be modified in the design of an individual project to reflect local program requirements and capacity needs.

2-1.1 Program Definition.

The Requirements Document defines the program for design of an individual project, including functional requirements and design criteria. This includes the space programming and facility or project area/size. The programs found in this chapter are only guidance and example programs, plus descriptions of typical measures for the site design, building design, and building system concepts in Chapter 3. In addition, any unique local requirements concerning building programs, design criteria, and technical systems should be included in the Requirements Document.

Table 2-1 General Library Space Allocation

Functional Area/Space	#	Small	#	Med.	#	Large
Public Service Areas						
Display And Bulletin Boards	1	100	1	240	1	320
Circulation Area (w/Circulation Desk)	1	300	1	350	1	420
OPACS/ILS	1	90	1	120	1	240
Technology Hub	1	12	1	20	1	28
Reading Areas	15	600	22	880	15	1,800
General Collections	1	1,200	1	3,200	1	7,200
Reference Collections	1	200	1	400	1	700
Special Collections	1	75	1	200	2	320
Audio and Video Collections	1	50	1	75	1	100
Digital Media	1	50	1	75	1	100
Study/Huddle Rooms	6	240	12	480	18	720

Functional Area/Space	#	Small	#	Med.	#	Large
Teen Area (Reading)	1	180	1	600	1	900
Teen Area (Holdings/Collections)	1	60	1	160	1	400
Photocopier/Fax/Scan	1	80	1	160	1	240
Newspaper/Paperback Racks	1	40	1	80	1	120
Outdoor Reading Terrace		n/a		n/a		n/a
Information Services						
Customer Computer Lab	1	450	1	1,250	1	2,400
Printers/Stands/Projection Equipment	1	50	1	160	1	320
Storage	1	40	1	80	1	180
Community Technology	1	120	1	240	1	450
Meeting Space						
Group Meeting, Conference	1	200	1	200	2	400
Group Meeting, Classroom	1	1,000	1	1,200	1	2,000
Group Meeting, Small	2	180	4	340	5	500
Coffee/Café	1	160	1	500	1	1,000
Storage Closet	2	40	2	80	2	120
Children's Areas						
Children's General Collection	1	150	1	400	1	800
Children's Special Collection	1	20	1	80	1	120
A/V Collections	1	40	1	80	1	120
Children's Story Alcove & Activities	1	150	1	200	1	400
Storage	2	40	2	105	2	175
Administration Areas						
Office (1x, Director)	1	125	1	125	1	125
Office (2x, Assistant IT)	2	200	2	200	2	200
IT Workroom/Server Room	1	125	1	125	1	125
General/Open Office	3	160	6	300	8	400
Breakroom	1	125	1	125	1	150
Storage	1	36	1	112	1	200
Conference Room (May be combined with Staff Break Room)	1	160	1	200	1	240
Staff Restroom	1	50	1	50	1	100
Staff Lockers	1	24	1	64	1	80
Shower Facilities	1	16	1	16	1	32
Technical Service Areas						
Staff Conference/Meeting Room	1	120	1	160	2	280
Loading Dock	1	80	1	80	1	100
Workroom (staff)	1	200	1	400	1	600

Functional Area/Space	#	Small	#	Med.	#	Large
Storage for Material Processing	1	200	1	300	1	400
Storage for Supplies (Bulk, Technical)	1	40	1	60	1	80
Storage for Supplies (Technology And Programs)	1	20	1	30	1	40
Storage (DRMO) and Seasonal	1	20	1	30	1	50
Support Areas, Facility/Utility:						
Mechanical Room	1	500	1	800	1	1,000
Pump Room (Fire/Water)	1	64	1	80	1	100
Electrical Room	1	100	1	160	2	240
Lobby/Waiting Room	1	200	1	400	1	600
Vestibule	1	80	1	100	1	120
Janitor Closet	1	64	1	80	2	160
Public Toilet	2	500	3	600	5	720
Vending	1	18	1	36	2	48
Shower Facilities	2	32	2	32	5	72
Water Fountain (Bottle-Filling)	1	20	1	20	1	40
Elevator	0	-	0	128	0	320
TOTAL PROGRAM AREA	9,196		16,768		29,215	

2-2 SPACE ALLOWANCES CRITERIA.

The recommended set of functional areas and spaces for different sizes of general library facilities are shown in Table 2-1. This table provides example space size programs for representative facilities in each of three library program size categories. These are not definitive space programs but guides to approximate space sizes recommended for the given size facility. For facility sizes not included in this table, proportionally adjust the program figures shown for the specific facility's intended population and services. In developing the space program for an individual facility, consider the issues of overall building design and relationships described in this UFC.

Each base may determine that different or additional requirements are relevant to its local program. These considerations may affect the functional areas and spaces included in the program and their relative sizes.

2-2.1 Multiple Library Facilities

When the base population is separated by geographic or transportation barriers, planning should consider providing multiple facilities sized individually for the geographic populations. This is particularly important for equal accessibility to the library. Community destinations are a key issue for quality of life.

In these cases, each facility should be size-classified for the population to be served and the functions to be provided. Efficiencies may be gained by consolidating

management and administrative functions for a particular area or command with multiple libraries into a library services center.

2-3 CORE FUNCTIONAL AREAS.

General libraries have six specific core functional areas plus non-assignable support areas, with local variations in the scope of operation under each category. These functional area categories include the following:

- Public services areas
- Information services areas
- Meeting space areas
- Children's areas
- Administration areas
- Technical services areas
- Support areas (including mechanical rooms)

See paragraph 2-8 for additional information.

2-4 FACILITY REQUIREMENTS.

In developing the space program for an individual facility, consider the issues of overall building design and relationships discussed in Chapter 3 and Chapter 4. The space allocation sizes provided are not definitive space programs but guides to approximate space sizes recommended for the given size facility. Space requirements for library extension services (LES) facilities are based on local conditions and identified requirements of the community served.

In addition to the space program for each facility, consider the need or potential for consolidating the library into a shared facility with a BEC or learning center. It may be beneficial for some functional areas, like computer labs, to be shared with the BEC. Management, supervision, and maintenance responsibilities may also need to be evaluated along with the facility requirements.

2-5 CONSIDERATIONS FOR LIBRARY DESIGN.

2-5.1 Productivity.

Technological advances, demographic shifts, and continual demands for innovation have created pressures for environments to support the changing nature of work and workplaces. The various functions, programs, and customers in a library lead to designs to provide adaptability that enables spaces to change with work groups, activities, and projects.

The current understanding of learning spaces for mental focus and performance should be considered with other design objectives and within a total project context in order to

achieve quality study and collaboration spaces. Also, library quiet spaces are intended to include mental focus and productivity strategies that are often co-supportive with sustainable design principles, functional programming, and functionality. Endeavour to find a balance for the longevity and durability of the facility with all the issues considered. The WBDG Design Objectives website (https://www.wbdg.org/design-objectives/productive) provides five fundamental principles of productive building designs.

2-5.1.1 Promote Health and Well-Being.

Indoor environments strongly affect human health. An effective environment should be designed to support and enhance the health and well-being of its occupants. Sustainable design principles also help achieve this objective and the facility's quality of life mission.

2-5.1.2 Provide Comfortable Environments.

An environment designed and operated to provide the highest achievable levels of visual, acoustic, ergonomic, and thermal comforts for its occupants underpins worker effectiveness. Consider documenting predicted thermal comfort as described in ASHRAE 55, *Thermal Environmental Conditions for Human Occupancy*.

2-5.1.3 Design for the Changing Workplace.

Provide spaces with flexibility, social support, and technology to promote new ways of working, learning, and engaging in a number of activities.

2-5.1.4 Integrate Technological Tools.

Effectively integrate technological tools and distribution networks required in today's environments to enable occupants to perform activities or their duties, starting first and foremost with properly designed pathways and spaces.

2-5.1.5 Assure Reliable Systems and Spaces.

Reliability is one of the greatest concerns for building occupants since it directly affects their safety, health, and comfort. Occupants must be able to rely on sufficient functional space, building systems, equipment, and tools that function consistently and are properly maintained.

2-5.2 Energy and Resource Efficiency.

The mission of DoD and other federal agencies includes the protection and preservation of America's natural resources. Designs optimized for conservation of energy and other resources will contribute to achieving these missions and help to minimize environmental and air-quality pollution. Refer to UFC 1-200-02 for more information.

2-5.3 Resiliency, Operations, or Natural Disaster Response.

Building resiliency is the capacity of a building to continue to function and operate under extreme conditions, such as (but not limited to) extreme temperatures, sea level rise, natural disasters, etc. The base may provide a risk or vulnerability assessment applicable to the project site. As the built environment faces the impending effects of global climate change, building owners, designers, and builders can design facilities to optimize building resiliency. If desired by the installation or community, review UFC 4-023-10, *Safe Havens*, for measures or improvements.

2-5.4 Adaptability with Modular Furniture.

Building or space adaptability is the capacity to accommodate diverse uses of the occupancy or program. Modular furniture can be used to accommodate the events and function in the library's public service space or children's space. It may also be arranged for individuals for informal uses. It should be comfortable yet durable, with multiple configuration options. Provide an anchor or bracket to secure bookshelves.

2-5.5 Security.

The public entrance/exit is a prominent architectural component to facilitate customer wayfinding. Its design and detailing must follow UFC 4-022-01, *Security Engineering: Entry Control Facilities / Access Control Points*, and UFC 4-026-01, *Design to Resist Forced Entry*, where access control or denial is appropriate. Provide RFID scanners in the entry lobby to protect against theft. A separate "staff only" entrance may be provided that is not in a prominent location but near dedicated staff parking areas. Other exits must be for emergency use only and alarmed.

Staff at the circulation desk, or alternatively a staff work station, should have visual control over most of the reading areas for adults and children, the entry lobby, and entries to the activity areas, restrooms, and outdoor reading terrace. The circulation desk should not dominate the feeling of the library. Staff at the circulation desk or in the work room should be able to monitor equipment and activities in the computer, A/V, and technology areas. If utilized, outdoor reading terraces must be accessible only from inside. Provide curved-face surveillance mirrors or closed-circuit television (CCTV) for all hidden areas (e.g., behind stacks, around corners) for customer safety and theft prevention. The children's area needs to be visible from the circulation desk for increased security. The use of glass walls around the children's area may be used to increase visibility into the space.

2-5.5.1 After-Hours Access.

Areas such as the café, meeting rooms, restrooms, vending machines, and vestibule should have limited access for after-hours use, with CCTV monitoring and automatic door hardware with timed locking and remote unlocking. These spaces should be connected and visible to the rest of the library but located so they may be used after hours without giving access to the library.

2-5.6 Technology Center.

A technology center must include computers for public use along with printers/plotters. Tablets, laptops, headphones, and other equipment can be checked out at the desk. 3D printers may also be provided for use at each installation's discretion.

Checking out of equipment happens in a technology hub and should be located near a heavily circulated area. It should be easily located and monitored by library staff.

2-6 LOCATION AND DETERMINANTS.

2-6.1 Site Evaluation and Location.

Library facilities should be convenient and located near the center of base activities yet in quiet and uncongested areas. Consider locating them near the health and wellness center, family discovery center, dormitories, housing, and shopping areas where possible. Avoid noisy locations, such as those near arterials, airfields, and industrial facilities. Libraries may be included as parts of composite facilities with other community or mission-related functions or should be close to base educational facilities.

Consider the potential for sharing some functional areas with the BEC and family services utilizing consolidated structures, if possible. Centralized information resources provide one-stop shopping on any subject. However, library collections and technical services must function separately, with only support spaces or information services shared. These facilities should also be readily accessible from the main entrance to the base. Where possible, locate base libraries within walking distance of base operations, housing areas, shopping, and recreational facilities. Consider desirable natural site features, such as trees, vegetation, wetlands or existing water, potential water retention areas, and terrain. Existing natural site features may be incorporated into required site elements like antiterrorism/force protection (AT/FP) setback distances or vehicle barriers that may help to blend the facility into the natural setting of the site.

2-6.2 Site Size.

The minimum site area required for a free-standing library is two or three times the gross area of the building. More area may be needed if the site has any special features, such as irregular contours, existing specimen trees, or rock outcroppings to be preserved. Review UFC 3-201-02, *Landscape Architecture*, for guidance and criteria. Assure the selected site will accommodate an adequate number of parking spaces convenient to the library entrance and setback requirements provided in UFC 4-010-01. A preliminary site design must ensure the basic building and site criteria can be accommodated. Site size should provide for future expansion, if practical.

2-6.3 Site Organization.

Locate the building on the site to provide the most convenient access to take advantage of desirable views and natural site features. Examples may include providing protection from undesirable winds and glare; shading the building, especially glazed areas, from excessive sun in warm climates; and exposing the reading terrace to sun in cold

climates. Outdoor reading terraces are recommended in most climatic regions. Local base personnel should consider if such outdoor spaces would be used. Locate book and A/V collection boxes either in front of the library near the street or next to a vehicular drop-off loop with convenient sidewalk access for library staff.

2-6.4 Access and Visibility.

Provide easy access by automobile and base traffic. Choose a site with a prominent, visible location. The facility should be easily identifiable from approaching cars, base transportation, and pedestrian pathways. See the *Manual on Uniform Traffic Control Devices for Streets and Highways* (MUTCD) for the traffic control device requirements.

2-6.5 Site Utility Requirements.

Locate libraries for access to major utilities, including water, sewage, electricity, telephone, and gas lines. Provide water service, sanitary and storm systems, natural gas, steam service or fuel oil system (whichever is used), electricity, telephone, and fire alarm service to the building in accordance with UFC 1-200-01, UFC 3-201-01, *Civil Engineering*, UFC 3-210-10, *Low Impact Development*, and local service procedures. Include connections to the base computer network and communication systems.

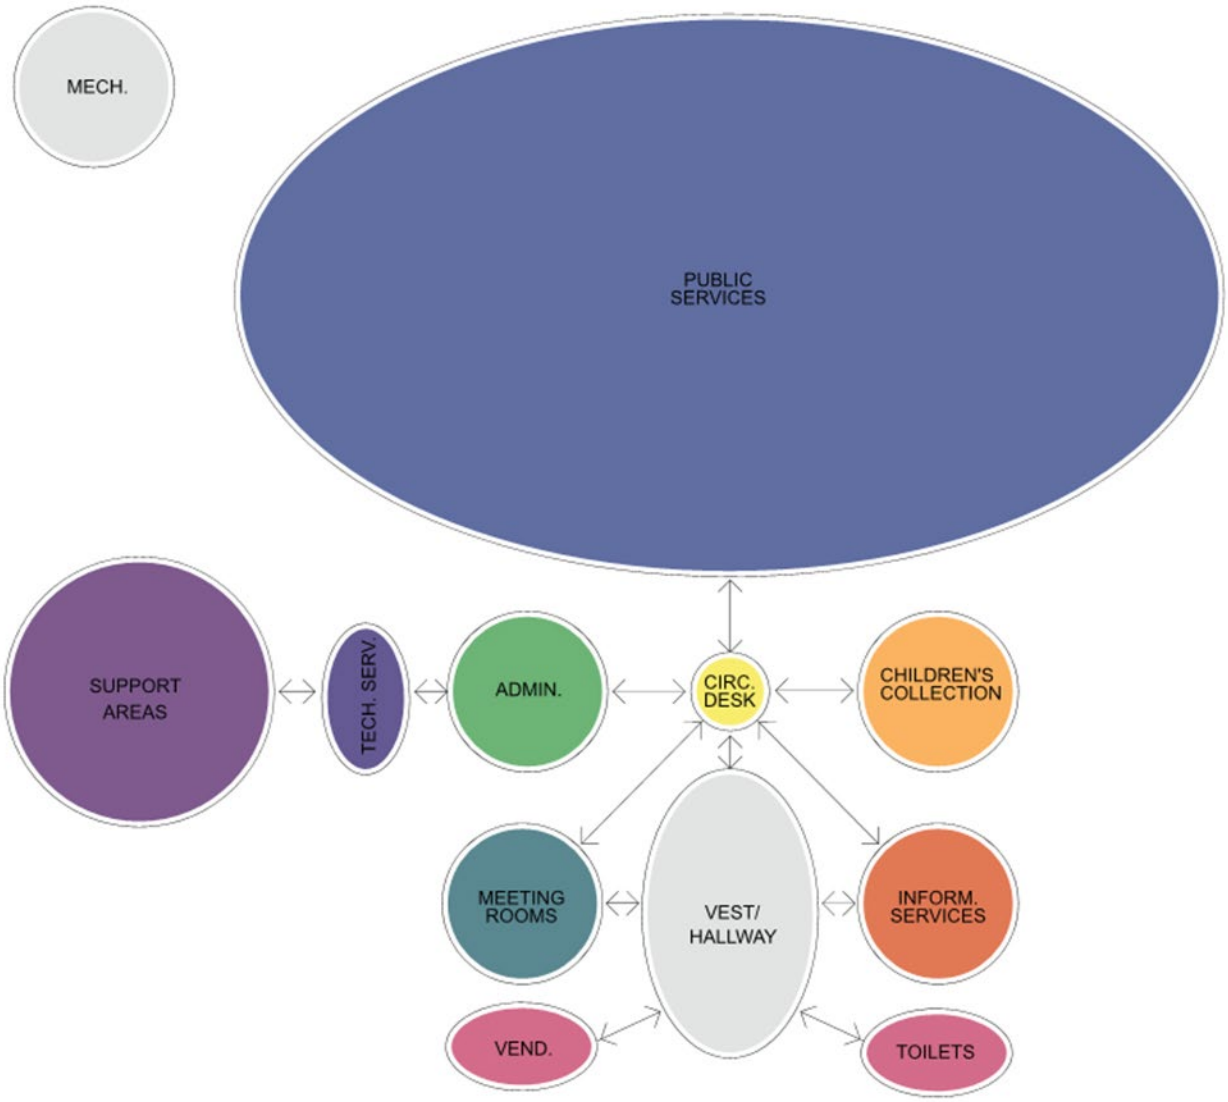
2-6.6 Building Layout and Adjacencies.

To reinforce the library facility's secondary mission—to contribute to the quality of life—additional considerations should be taken for the relationship of adjacent buildings, transportation routes, services, and activities. Managers, base personnel, and design teams should work to locate the library within the base community and built environment to create places or spaces that are destinations and facilitate the programs and services that improve the quality of life for active-duty personnel and their families, retirees, and other authorized customers. The planned creation of destinations with many amenities or attractions in a place for the base community to come together is a quality-of-life force multiplier. Quality of life support is a priority of most facilities; however, installation mission support is always the first priority.

2-6.6.1 Accessory Library Connections.

Smaller libraries may not be most beneficial as a stand-alone facility but better contribute to the quality of life or create destinations when connected to or included within a building hosting a complementary function.

2-7 BUILDING FUNCTIONAL AREA RELATIONSHIPS.



Internal adjacencies and functional relationships set up a facility for operational success. The entry lobby should have direct access to the meeting/conference rooms, restrooms, and other public support areas. A continually staffed location, such as the circulation desk, will have visual control of the public services, children's, and informational areas. The core building functional areas include:

- Public services areas

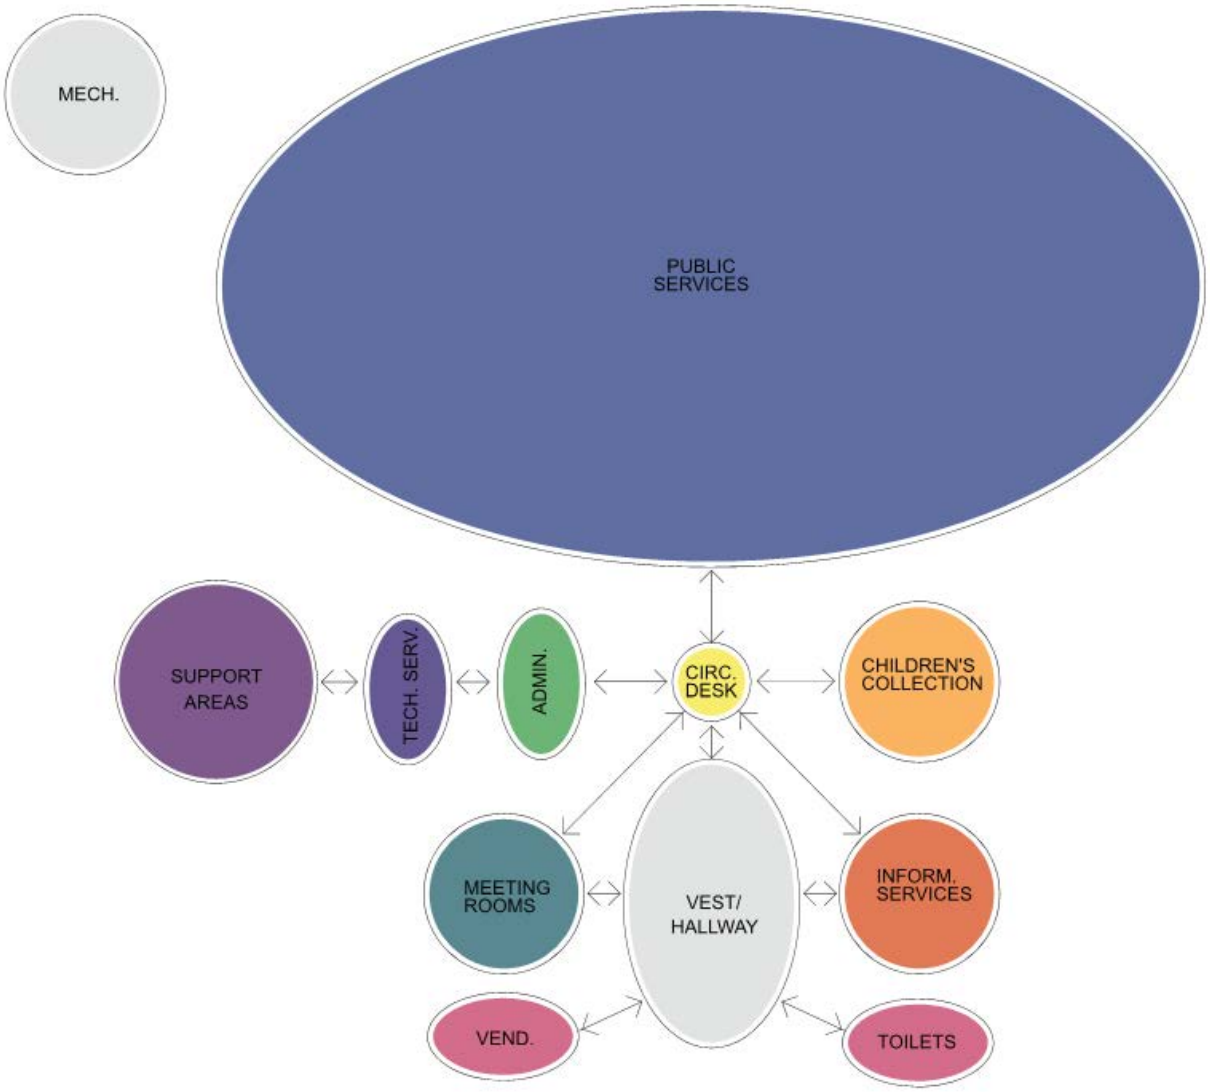
- Information services areas
- Meeting space areas
- Children’s areas
- Administration areas
- Technical services areas
- Support areas

The scope of operations may vary, depending upon specific installation and size requirements for each facility. Refer to the Functional Area Diagrams in Figure 2-1, Figure 2-2, and Figure 2-3 for an example of this functional relationship translated across facility size. Expeditionary libraries and some medium or small general libraries may be required to combine some core functional areas due to space limitations, existing infrastructure, or unique situations regarding the specific library.

Figure 2-1 Functional Area Diagram, Small

SMALL

Figure 2-2 Functional Area Diagram, Medium



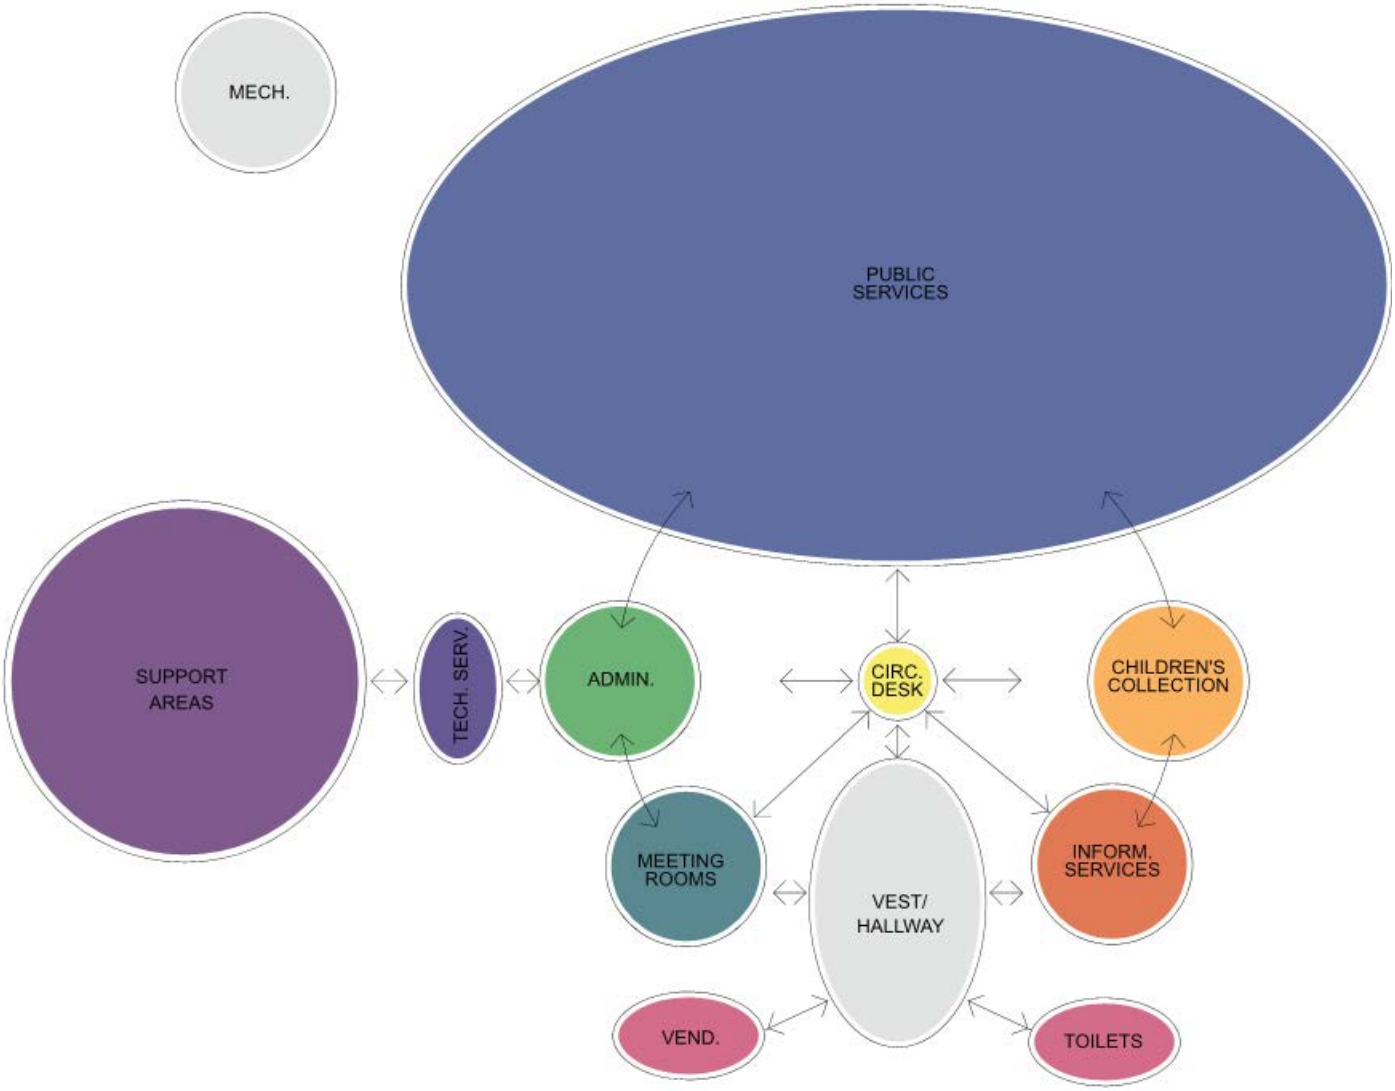


Figure 2-3 Functional Area Diagram, Large

2-8 PROGRAM AREAS.

2-8.1 Technical Services Area.

Activities conducted in the technical services areas include operational library functions such as acquisitions, cataloging, receiving, and processing collection items. These activities are usually colocated inside a large workroom along with storage areas, supplies, and equipment.

2-8.2 Administration Area.

Conference/meeting rooms may be used for meetings, seminars, lectures, story hours and other children's programs, A/V presentations, films, music, temporary exhibitions, receptions, adult study, and other similar functions. Not all events conducted in these rooms will be related to library activities.

2-8.3 Children's Area.

Requirements for children's areas will be specific to the installation's dependent population, if any. Typical areas include general and special collections, reading/story/activity areas, and a computer area. The majority of the area must be flexible and utilized for circulation between the collections, meetings, lectures, story hours, and other children's programs that may include A/V presentations, films, music, and temporary exhibitions. Use child-scaled furnishings and equipment with attractive materials, colors, and graphics. Furniture, decorations, toys, and displays may also be used to reinforce the themed environment of the children's areas. Provide visual access or control of the children's area from the circulation desk or similar workstation.

2-8.4 Information Services Area.

Computers available for customer use are the primary components of the information services areas. Areas for customer computers will be located in open areas inside public services or in an enclosed room or computer lab. Libraries that select an open area approach should colocate information services with the technology hub described in paragraph 2-8.5.3.

2-8.4.1 On-Line Public Access Catalog Computers.

Card catalogs have been replaced by Online Public Access Catalog (OPAC) computer terminals to look up information regarding available materials. These terminals are personal computers that require power and high-speed Internet connections to access data networks. Public access catalog database information is typically managed by outsourced providers to access this information. These terminals may also be used by library staff to access the Integrated Library System (ILS), which is a database of resources.

2-8.4.2 Reproduction, Fax, and Scanning Areas.

Provide electrical power for photocopiers and scanners per the manufacturer's specifications. Provide accommodations for a photocopier(s) with payment equipment, as required. Two printers, maintained at the circulation desk, must be networked to the computer stations to allow printouts to be sent from the computer stations and payment collected at the circulation desk. Photocopiers must have scanning capabilities or provide scanning stations within the information services area that include CD burners and other media storage devices as technology changes. Provide accommodations for a fax machine.

2-8.4.3 Community Technology Room.

Community technology rooms or “maker space” are dedicated for equipment or technology-based crafting, art, and educational projects by groups and individuals. Science, technology, engineering, math curriculum, and robotics clubs use these spaces for practical application of classroom skills. The installation’s specific funding options, volunteers, educational services, and support of mission requirements vary and must be verified for each library. When developing future plans and goals, educational populations must also be considered. Specialized technical solutions for ventilation, lighting, electrical receptacles, plumbing, fire protection, security, and information technology must be matched to each library’s community technology room and planned activities.

2-8.5 Public Services Area.

The component spaces for public services areas include reader stations, casual reading areas, study areas for individual and group use, general collections storage, reference materials, periodicals, casual browsing, and the circulation area, with support areas. Libraries are now used as meeting and collaboration spaces as often as research and quiet study. The public services spaces should meet the expectation for collaboration, creativity, and group learning as well as provide for traditional study and research by individuals.

2-8.5.1 Public Services Collections.

Design public services areas with the main reading space as the focal point. Areas for periodicals, reference collections, and A/V stations need not be in separate rooms but should be well defined. Use alcoves, shelves, furnishings, and architectural elements to define different spaces. Organize public services area functions to match typical library use sequences, starting at the entrance and proceeding to the circulation area, OPAC computer stations, book stacks, and reading areas. Locate functions that require frequent staff assistance, such as OPAC computer stations and A/V stations, close to the circulation desk. Organize shelving for easy collection searches and to accommodate changes in collection sizes and organization. Generally, shelves placed continuously along the edges of a space make searches more difficult than do groupings of parallel shelves. Use full-height shelving instead of partitions to distinguish between primary and secondary reading areas.

Most of the public services and children’s spaces should be visible from the circulation desk. This can be done by using low-profile furnishings. For instance, OPAC computer stations and shelving for special or reference collections and book stacks in other critical areas should be limited to a height of 3.5 feet (1000 mm); however, this does not apply to most general collection stack areas. Accommodate the needs and preferences of customers by providing reading areas that vary in size, degree of privacy, orientation to the outside, furnishing types, and arrangement. Provide at least one small area with residential qualities, like soft furniture, for a casual, relaxing atmosphere. The outdoors should be visible from the main reading areas and access from the public services area to an outdoor reading terrace (if utilized) should be provided. Coordinate the location of

convenience outlets with the locations of office and check-out equipment. Small group study areas may be placed near conference/meeting rooms and/or located around the public services areas. Provide accommodations for wireless Internet connectivity throughout the facility.

2-8.5.2 Circulation Area and Desk.

The main point of customer service interaction occurs at the circulation desk. When any distancing, safety, or security measures are desired, include them at the circulation desk. Locate the circulation area near the front entrance to facilitate surveillance of the entry lobby, computer area, children's areas, and main reading areas. Traditionally, the circulation desk is fixed but a mobile circulation desk can be utilized if desired. The circulation desk must be visible from the entry lobby and should have overviews of the public services and children's areas. Circulation desks should also have a view of restroom and conference/meeting room entrances. Locate the circulation area near reference, microform (if provided), and A/V spaces. Primary services include check-out/return functions, registering borrowers, processing overdue materials, reserving materials, and assisting customers. Locate drop slots away from queuing lines to facilitate quick returns and avoid bottlenecks. To prevent media damage, provide separate book and A/V drop slots with padding on the customer side of the desk. Locate self-check-out ILS equipment across from or near the circulation desk for supervision and assistance.

Aesthetically pleasing circulation desks should be provided to create favorable customer first impressions. Provide raised counter edges to hide computer equipment and connections, avoid clutter, and enclose storage shelves or cabinets behind the circulation desk. A minimum of 6 feet (1800 mm) clearance should be provided behind the circulation desk for staff activities. Consider including a consultation area or adjacent reading area with seating for customers and library staff adjacent to the reference desk. The reference desk may need to be combined with the circulation area or desk when staff or space is limited.

2-8.5.3 Technology Hub.

Locate A/V collections in a highly visible area, preferably near the circulation area, where staff members can easily provide assistance. A/V materials include digital movies, digital music audiobooks, tutorials, and instructional materials. Provide appropriate shelving, cabinets, and browser boxes for each media collection.

In addition, technology such as tablets, laptops, cameras, and headphones can be checked out here with the assistance of library staff. All technology should be securely stored and locked at all times, with the ability to charge while stored.

2-8.5.4 Circulation Spaces.

Circulation spaces should be free-flowing and integrated into the functional areas to prevent the perception that they are corridors. Provide durable, easily cleanable floor materials that do not make noise when book carts are used.

2-8.5.5 Displays and Bulletin Board Areas.

Provide areas for displays and bulletin boards for presenting information about current events, special programs, and other changeable information. Displays and bulletin boards should be located near high-traffic areas such as lobbies, entry corridors, and similar areas. Vacant wall space should be considered for these display requirements along with areas for freestanding easels or kiosks. Consider the need for display furniture, wall-mounted boards, and lockable cabinets. Provide display areas for print materials, three-dimensional objects, art, special promotions, community newspapers, areas for new book and A/V displays, and/or space for a central information kiosk, as needed.

2-8.5.6 Material Collections.

Material collections are composed of books, periodicals, maps, documents, computer software, and A/V resources. These collections are frequently available online as subscriptions.

2-8.5.6.1 General Collections.

Areas for general collections are composed of book stacks for fiction, non-fiction, and paperback books that occupy a large majority of the public services space. The size of the general collections and reading areas must be balanced between the required number of reader stations and the size of the general book collection (including growth). Military libraries vary considerably in the sizes of their general collections and their needs for reader stations. The balance of space allocation to stacks and readers must be determined individually for the facility in question. Consider the need for OPAC computer stations located within the general collection stacks for customer and staff convenience.

2-8.5.6.2 Special Collections.

Examples of special collections include rare books, personal papers, and unique materials. These collections are segregated from the general collection stacks. Requirements for special collections will vary at each installation. Provide a separate designated area for a paperback book swap display near primary circulation areas.

Examples of special collections include recommended reading lists, leased books, current events, local interest items, testing/educational materials, learning programs, and college course materials.

2-8.5.6.3 Reference Collections.

Many libraries provide reference material with online subscriptions or more condensed materials. When provided, reference collections will be installation-specific and may include lower-height book stacks, file cabinets for maps and pamphlets, and stands for dictionaries and atlases. Provide tables and chairs for viewing reference materials since they are not usually checked out.

2-8.5.6.4 Periodicals.

Libraries often provide periodical collections through online information catalogs and subscriptions that can be accessed with public computers (see paragraph 2-8.4.1). Where included, design periodical areas to include display shelving for magazines, newspaper racks, lounge chairs, accessory tables, and worktables. Provide a comfortable and inviting reading area, similar to upscale commercial bookstores, near the periodical collections. Utilize display shelves designed for magazines with storage areas behind for back issues.

2-8.5.6.5 Reading Area.

Reading areas are composed of major and minor reading spaces. The majority of the reader stations should be located in the main reading space of the public services area. Minor reading spaces, containing some portion of the total reader stations, may be scattered about in semi-remote locations for private reading or study. Small general, branch, field, and expeditionary libraries may not be sized to accommodate minor reading spaces. Provide data ports and flush electrical outlets for laptops and other equipment in the floor at each reading station. Coordinate spacing and location of electrical outlets with the furnishing's layout. Major reading areas should include moveable furniture to accommodate group events.

2-8.5.6.6 Collaboration Space.

A number of collaboration spaces should be spaced throughout and located within the reading spaces. Each collaboration space would reasonably seat three to five people at a worksurface. Partial-height walls or furniture may be used to define the space and give some privacy to the users. These are in addition to small study rooms (see paragraph 2-8.6.2). Consult with the installation on the specific number or desired elements.

2-8.5.6.7 Teen Areas.

Provide a dedicated space within the public services area for teenagers with material (general and special) collections, reading areas, small group study area with materials, selections and furnishings dedicated for teen audiences, and special interest teen items, like magazines. Partially enclosed spaces near periodicals, A/V stations, and other items frequently used by teenagers are good locations for teen areas. Do not locate the teen area within the children's areas. Teen areas should be designed with similar criteria and infrastructure to match adult program spaces. Provide computer stations with earphones and computer data ports for laptops, where possible.

2-8.6 Meeting Space Area.

The meeting spaces described below include conference/meeting rooms of various sizes, cafés, and other amenities that may be used for meetings, seminars, lectures, A/V presentations, films, music, temporary exhibitions, receptions, adult study, and other similar functions. Not all events conducted in these rooms will be related to library

activities. These meeting spaces should individually be considered for access outside of operational hours.

2-8.6.1 Conference Room.

Locate conference/meeting rooms off the entry lobby so its hours do not have to coincide with the library's hours. Designs should accommodate groups of different sizes (from a seating capacity of 30 for smaller facilities to 80 for larger ones) and a variety of furnishing arrangements. Consider a moveable partition in larger conference/meeting rooms so two simultaneous functions can occur, but only if requirements for maintenance, performance, and added value can be met. In this case, each room must have direct access to the entry lobby for separate access control and ensure each portion of the room has the required egress routes or emergency doors as required by codes. Design the room so it can be darkened for film presentations. Provide locally controlled dimmer switches for lights. Consider the need for telephone and video conferencing and provide the required infrastructure to provide these capabilities. For large conference rooms, consider the need for a small enclosed kitchenette with folding doors.

Locate the speaker's areas to reduce disturbances from people entering and exiting and from direct sunlight and glare. Do not place windows directly behind the speaker's position. Provide a coat closet near the door and lockable storage that is directly accessible from the conference/meeting rooms. Storage rooms should be large enough to accommodate storing tables and stacking chairs used in the activity rooms. For divisible rooms, this storage will be located in a common area that provides access from each room, such as off the entry lobby. Provide modular furniture and conference tables with Internet access, a speaker phone, and data and power accommodations. Provide a drop-down projection screen and wall-mounted whiteboards. Consider providing a smart board connected electronically to a networked printer. Provide millwork for conference materials, storage, displays, or refreshments. Provide a credenza for storage, A/V cart, and trash/recycling cans.

2-8.6.2 Small Group Study Area.

Small group study areas may consist of enclosed rooms and small tables with chairs located in open but secluded areas. Enclosed rooms that accommodate two to four people require approximately 150 square feet (14 square meters). Rooms that accommodate two people require approximately 75 square feet (7 square meters). Small group study areas require comfortable chairs and tables with two to four seats. Provide a whiteboard and trash cans in each enclosed small group study room. Provide ventilation in accordance with UFC 3-410-01, *Design: Heating, Ventilating, and Air Conditioning Systems*, lighting with controllable levels, and data ports and electrical outlets for computers and/or laptops. Provide some private, one-person study rooms with glass doors, where possible, for individual study and test preparation. All enclosed group study rooms should be acoustically sound to minimize disruptive and distracting noise.

2-8.6.3 Coffee Stands and Cafés.

Consider the need for a coffee stand/café within the non-secured area of the library lobby to serve coffee, espresso, other beverages, light snacks, and other items similar to those served in commercial bookstores and public libraries. Vendor services should be provided by outside sources and should not be considered part of the responsibilities of the library staff. Coffee cafés should be located near the main entrance area in a prominent location that will not disturb library operations. Locate coffee cafés in an area of the library such as a shared lobby that can be accessible to the public during hours when the rest of the library facility is closed and secured. Consider the need for an additional exterior entrance to the coffee café and locate appropriately.

2-8.6.4 Public Restrooms.

Provide male, female, and family accessible restrooms according to ABA requirements. The number of toilets and urinals required will vary according to the overall size of each facility. Locate restrooms off the entry lobby to allow access for users of the conference rooms and coffee café during times when the library is closed. In such cases, provide a night security closure at the access control point to secure the rest of the library.

2-8.6.5 Water Fountain.

Locate public water fountains near the restrooms. Include full-height and wheelchair-accessible water fountains according to ABA requirements.

2-8.6.6 Vending Machines.

Address the need for snack or drink machines and other vendor-supplied equipment located near the lobby or vestibule. Locate vending machines in an alcove or area with only a partial view from the entrance or lobby. Do not place vending machines at the entrance or in the lobby because it is unsightly. Provide an anchor or bracket to secure vending machines.

2-8.6.7 Outdoor Reading Terraces.

Where the climate permits, consider an outdoor reading terrace that may be used for adult casual reading or children’s story hours as an enriching addition to a library. The terrace should be entered from spaces visible from the circulation desk and should have no exits to the outside except for emergency egress. Local conditions, such as siting, building configuration, budget, and anticipated use, should be used to justify the appropriate size requirements.

2-8.7 Support Area.

Core areas that support the overall facility include the vestibule/airlock at the entrance, lobby, and circulation areas throughout the facility. Support areas like restrooms and water fountains may need to be located outside the access control point of the library for public access outside of operating service hours. Staff-only support areas include the loading dock, storage, and mechanical rooms.

2-8.7.1 Loading and Receiving Docks.

Provide a covered loading area and double-wide exterior doors. Asphalt or concrete access drives to the loading dock must be a minimum of 12 feet (3650 mm) wide for access by large trucks. Consider the requirements for commercial shipping and delivery companies and large furniture deliveries. Provide easy access to dumpsters or outside trash containers. Provide a doorbell or buzzer at the loading dock entrance door that can be heard in the administration and technical services areas. For Navy and Marine Corps facilities, provide a fall protection system in accordance with OPNAV M-5100.23, *Navy Safety and Occupational Health Manual*, where the elevation between the floor edge of the dock and adjacent surface is 4 ft (1.2 m) or greater.

2-8.7.2 Storage Areas.

Storage areas are vital to librarians for multiple reasons, including:

- Monthly in-processing and out-processing of lease materials
- Storage of supplies, which are usually bought in bulk at the end of the year
- New books, which are often bought in bulk at the end of the year
- Items going to Defense Logistics Agency (DLA) Disposition Services
- Seasonal displays and decorations
- Supplies, copier paper, and crafts for story time all require adequate storage

Provide storage closets, where possible, to maximize the use of available space. Provide lockable doors on all storage closets. Locate an open storage area near the loading dock for items being shipped or received. Verify storage requirements with the library director at each facility since special storage requirements may be required.

2-8.7.3 Janitor Closets.

Locate the janitor closets near the restrooms. Provide a floor-mounted mop sink, dry storage for supplies, shelves for maintenance supplies, and a sloped floor with a floor drain. Provide shelves and hooks for cleaning and maintenance equipment storage. All surfaces must have water-resistant finishes. Include enough room for a mobile cleaning cart.

2-8.7.4 Mechanical Rooms.

Utilize mechanical rooms, as required, for HVAC, plumbing, electrical, hot water, telephone, fire suppression, and other building systems equipment. Locate mechanical rooms so they have entry and service doors located on the outside of the building only to minimize noise and service disruptions. Provide sound proofing, where required. Utilize a sloped floor towards a floor drain for rooms with equipment involving water or that may leak.

2-9 SITE DESIGN ELEMENTS.

Site the library so the main entrance is clearly visible and the architecture provides intuitive wayfinding cues to guide visitors to the main entrance. Preserve and utilize natural site features, such as topography, trees, greenery, and rock outcroppings, to help define the site and accent the building. Use landscape elements to provide definition, screening, and focus for the site.

2-9.1.1 Outdoor Reading Area.

Depending on the climate, it may be shaded or exposed to the sun, or variable with the time of day. The enclosure should be a minimum of 6 feet (2 meters) high and visually permeable. Durable outdoor furnishings, furniture, and shading should be provided. Local conditions, such as siting, building configuration, budget, and anticipated use, should be used to justify the appropriate size requirements.

2-9.1.2 Book Drop-Off.

Book and A/V collection boxes should be located with customer convenience in mind and allow drivers to place materials in collection boxes from their cars when the library is closed. Building openings for collection boxes create AT/FP vulnerabilities and should not be incorporated in new construction. Existing building collection boxes should be replaced with remote boxes and these building penetrations should be permanently sealed. Remote collection boxes should be outside the minimum stand-off distances required by UFC 4-010-01, *DoD Minimum Antiterrorism Standards for Buildings.*

Locate remote book and A/V collection boxes where they offer the most convenient access for customers but do not cause traffic problems. Potential locations include at the front of the library near the street or next to a vehicular drop-off loop road. Remote collection boxes should be located on the driver’s side of the drop-off lane in an island. Provide an efficient pathway from the collection boxes to the staff entrance to minimize the effort required to return these materials to the work room area without utilizing the public entrance to the facility. A/V collection boxes should be padded to prevent potential damage to A/V media. Consider utilizing combination units that feature both types of collection boxes and the potential impact of severe weather, pick-up or “grab and go” equipment or improvements for convenience and safety of patrons, and a covered area to shelter the collection boxes drop-off point.

2-9.1.3 Transit Connections.

Access through base/installation or public transit infrastructure is a program goal and assumed by locating the library on service routes or providing such infrastructure. As an alternative, consider locating libraries at the installation visitor’s center, on- or off-installation high-traffic commercial/retail centers, or similar centers of activity. Provide covered waiting areas and seating that is publicly visible to encourage access to locations shown to have multimodal transportation choices.

This Page Intentionally Left Blank

CHAPTER 3 DESIGN

3-1 GENERAL.

This chapter provides general design and material guidance, including requirements for the site, plus building exterior and interior areas. The focus of this information is library-specific issues; general professional knowledge with which A/Es are familiar is not addressed. These guidelines address design considerations for site and building layout, architectural character, function, circulation, and facility systems. Information is provided regarding the preferred materials and finishes that deliver the required durability yet are still aesthetically pleasing. Functional diagrams and other guidance regarding potential layout configurations for different styles of building design are provided to illustrate how the functional area could potentially be organized.

Facility systems information is also provided regarding structural considerations, HVAC systems, plumbing, electrical, fire protection, life safety, communications, A/V requirements, alarm/security systems, and acoustical requirements. Non-government resources from the American Library Association (ALA) are not required but may help in design solutions or facilitate the preparation of specifications and contract documents (see Appendix C).

3-2 DISCIPLINE-SPECIFIC CONTENT.

3-2.1 Civil Engineering.

Connect libraries to utilities, including water, sewage, electricity, telephone, and gas lines. Provide water service, sanitary and storm systems, natural gas, steam service or fuel oil system (whichever is used), electricity, telephone, and fire alarm service to the building in accordance with requirements of UFC 1-200-01, UFC 3-201-01, UFC 3-210-10, and local service procedures. Include connections to the base computer network and communication systems.

3-2.1.1 Drainage.

Reference UFC 1-200-02 and UFC 3-201-01. The A/E should coordinate with local requirements, strategies, base master-drainage plan, and the site-specific geology/soils report.

3-2.1.2 Vehicle Circulation.

Where possible, locate parking areas to the sides of the building where they will not dominate the building entrance. Provide adequate light levels at night in all parking areas for security and safety and handicapped-accessible parking spaces. Consider the need for a dedicated staff parking area located near the staff-only entrance to the building. Spaces for motorcycles and bicycles should also be provided as required by the base population. Consider the location of bicycle racks near the main entrance in a secure location. Refer to UFC 3-201-01 for detailed information regarding vehicle circulation and parking requirements.

3-2.1.3 Site Design.

Site design and engineering must minimize cost and disturbance with consideration of the need to preserve and utilize natural site features, such as topography, hydrological features, trees, greenery, and rock outcroppings to help define the site and accent the building. Use landscape elements to provide definition and focus for the site, with screening from site liabilities if appropriate.

3-2.2 Landscape Architecture.

Refer to UFC 3-201-02 for additional information regarding landscape architecture.

3-2.2.1 Plantings.

Use indigenous plants that are appropriate for the climate and local base conditions. Landscape plantings can dramatically improve the first impression of a facility and help control erosion. In some instances, landscaping may also reduce maintenance requirements. Follow sustainable design principles for xeriscaping and low-water-usage plant design. Do not use poisonous or toxic plants.

3-2.2.2 AT/FP.

The existing landscape may also be used to create stand-off distances required for effective AT/FP measures and create buffer zones around the facility. Refer to UFC 4-010-01 for more information.

3-2.3 Architecture.

The architectural and interior design of the library must be integral and related. They both involve functional analysis and consideration of the appropriate aesthetic or stylistic character, building organization, circulation, supervision, and flexibility requirements, as well as finishes and furnishings. Present an open, inviting image while providing visibility of attractive activities from the approach and entrance. The library should have spaces that vary in character and scale to support different activities. Spaces should emulate the environments found at upscale commercial bookstores, with a range of lounge-like areas. The main activity areas should be grouped in a continuously visible sequence, with easy access between spaces. Single-level facilities are preferred. Refer to UFC 3-101-01, *Architecture*, for more information and follow base or installation guidance requirements.

Create an individual theme for the facility that may be host nation or base/installation related. Many thematic environments can best be presented in lobbies, primary circulation areas, and the main reading area for adults. Theming should apply continuously to the entire design of the facility, from overall architectural expression to specific interior development. The architectural character should reinforce the focus of the building on the main reading room and reader activity spaces. Service and support areas should be subordinate and, where appropriate, expressed as secondary volumes. The library should have a distinctive presence on the base. Materials and detailing should be of high quality, equal to those of the most significant buildings on the base.

The architectural style must comply with installation-specific requirements and be compatible with UFC 3-120-10, *Interior Design*.

3-2.3.1 Daylighting.

Controlled, indirect daylight should be admitted into reading areas through clerestories, skylights, or windows. Use of daylight will reduce the load on electric lights, reduce reader eye strain (eye strain is greatest with fluorescents), and permit visual connection to the outside. Review and implement the criteria in UFC 3-530-01, *Interior and Exterior Lighting Systems and Controls*, to the extent appropriate for libraries. However, care must be taken not to expose books to direct sunlight to avoid damage from ultraviolet (UV) rays. Consider sunlight-filtering devices applied to windows and solar shade screens to reduce UV exposure and reduce thermal heat gain. A passive solar design (described in UFC 1-200-02) applied to libraries requires specific efforts to manage glare, UV, and heat gain. Automatic shades or control devices (programmable), sufficient to block UV exposure are required. Refer to UFC 3-101-01.

3-2.4 Interior Design.

Choose furniture that is durable, comfortable, and attractive. Solid wood is a good choice and natural finishes can be used to accentuate the interior décor. Circulation and reference desks need durable counters and front panels, such as metal, granite, or solid surface composite materials. Consider modular furniture components designed specifically for libraries. Counter fronts are high maintenance and require highly durable materials because of wear and tear. People stand, lean, or press against the counter materials at all levels of height, including child heights. Current systems furniture options should be considered as a potential solution for library counters. If a systems furniture library counter is not included, it should at least be considered as a supplementary or complementary feature to provide adaptability for process and technology changes at the circulation area.

Consider graffiti-proof furniture and materials in bathrooms, small group study areas, and other secluded places not easily visible by staff members. Floor material colors and textures will be primary considerations for selecting coordinated furniture and equipment. Do not use compact or high-density shelving in areas accessible to the public. Use book stacks with heavy-duty construction and consider the use of 16-gauge metal stacks and shelves specifically designed for library use that can be secured to avoid being knocked over yet still be moved with books in place. This is very beneficial when rearranging stacks or replacing carpet because books do not need to be removed to relocate the stacks. Wooden book stacks are more attractive and quieter than metal stacks but may require moving books prior to relocation. If single-tier steel bracket shelving is used, follow ANSI/NISO Z39.73-1994 (R2012), *Single-Tier Steel Bracket Library Shelving*. Refer to UFC 3-120-10 for more information.

3-2.5 Geotechnical Engineering.

Refer to UFC 3-220-01, *Geotechnical Engineering*.

3-2.6 Structural Engineering.

Select an economical structural system based on facility size, projected load requirements, local availability of materials and labor, and wind, snow, seismic, geologic, and permafrost conditions. Provide consideration for addition or expansion of projected future needs to easily and economically accommodate future requirements; however, do not over-design the initial construction. Structural bay sizes should reflect space requirements, economy, and subsystem dimensions, such as masonry units and ceiling grids. Structural bay sizes should be compatible with standard shelving unit sizes and standard row-to-row dimensions. Keep to two stories or fewer where possible or the costs associated with designing-in progressive collapse criteria will need to be incorporated. Reference UFC 3-301-01, *Structural Engineering*, for general and location-specific soil, structural, and code requirements.

3-2.7 Fire Protection.

Fire protection and life safety designs must comply with the following sources for detailed guidelines and specifications:

- UFC 3-600-01, *Fire Protection Engineering for Facilities*
- UFC 3-601-02, *Fire Protection Systems Inspection, Testing, and Maintenance*
- Latest edition of the NFPA standards

Occupancy for libraries is classified as assembly by NFPA 101, *Life Safety Code.* Fire protection systems must conform to conventional United States standards and codes. All new and refurbished buildings must have automatic fire detection and/or fire suppression systems, which must be monitored to send signals to the base fire station and/or central control or monitoring facilities. All materials and equipment must be Underwriters Laboratory (UL) listed or Fire Marshal approved. The provision of fire protection systems and equipment must be reviewed for all new and refurbished buildings as part of a “fire risk analysis” and “fire strategy” study, executed during the design period. During the design period, careful consideration must be given to the selection of specific design codes, standards, base-specific criteria, and base fire officer requirements that affect the equipment specifications, design, and installation. Equipment selections should not be considered in isolation, but be reviewed in unison with the overall fire strategy for each building and installation.

3-2.8 Mechanical Engineering.

Provide HVAC systems in compliance with the current edition of the International Mechanical Code (IMC), UFC 3-410-01, and UFC 3-410-02, *Direct Digital Control for HVAC and Other Building Control Systems*. Comply with the recommendations of ASHRAE where applicable by UFC or referenced standards. Perform a lifecycle cost analysis of available energy sources. Due to the nature of the materials and stacks within the libraries, do not program night setbacks or unoccupied modes for the HVAC system unless reports and calculations accounting for humidity and thermal mass of library materials are accepted by base command/AHJ. Provide zone control for

maintaining different environmental conditions in each functional area. HVAC systems for activity areas, like conference and meeting rooms, should be designed to allow night-time operation while the rest of the facility is closed. Ductwork serving the children's areas and the activity areas must be designed to help acoustically separate those areas from the rest of the facility. Provide tamper-proof thermostats that may be internally controlled by the facility manager. Provide programmable controls and use security features so they are only accessible to authorized personnel. Design of new facilities must ensure that building energy consumption must not exceed DoD energy budget figures.

3-2.8.1 Library Materials Environment.

To help protect and preserve library materials, maintaining stable conditions is crucial. Per NISO TR01-1995, *Environmental Guidelines for the Storage of Paper Records*, fluctuations in temperature increase the degradation rate of paper relative to storage at one temperature. In accordance with NISO TR01-1995, the maximum recommended temperature for combined stack and customer spaces in libraries is a stable temperature no higher than 70 °F (21.1 °C) and a stable relative humidity between 30 percent and 50 percent. Institutions should choose a temperature and relative humidity within the recommended ranges that can be maintained 24 hours a day, 365 days a year. The climate-control system should never be turned off and settings should not be lowered at night, on weekends, or at other times when the library is closed. Additional costs incurred by keeping the system in constant operation will be far less than the cost of future conservation treatment to repair damage caused by poor climate.

Libraries with separate rooms for archives and/or special collections may have specific storage needs for various formats, including historic documents, photographs, film, maps, and rare books. Consult NARA Directive 1571, *Archival Storage Standards*, or the Society of American Archivists (SAA) (see Appendix C) for appropriate temperature and humidity standards.

3-2.8.2 Particular Space Engineering.

Certain rooms within the library, such as conference rooms, will be densely occupied at irregular or infrequent intervals as described in UFC 3-410-01. Consider the anticipated occupancy pattern when developing the HVAC equipment layout and sequence of operation to ensure that overall lifecycle cost is minimized. Evaluate opportunities, such as demand-controlled ventilation by occupancy sensors, for these room types.

Comply with AT/FP requirements in the design of HVAC systems. To ensure durability, consider climate conditions, high humidity, industrial atmosphere, saltwater exposure, or other adverse conditions when selecting exterior HVAC components. Design building HVAC systems to accommodate long-term flexibility, renovations, and additions.

3-2.9 Electrical Engineering.

Provide electrical service and distribution equipment, wiring receptacles and grounding, interior and exterior lighting and controls, emergency lighting, telephones, communication systems, fire alarms, and intrusion systems in accordance with UFC 3-520-01, *Interior Electrical Systems*, NFPA 70, *National Electric Code*, and the latest installation design requirements. See the International Trade Administration's Electric Current Worldwide website to determine voltages and cycles in overseas locations (https://legacy.trade.gov/mas/ian/ECW/index.html). Review and implement the criteria in UFC 3-530-01 to the extent appropriate for libraries.

Evaluate and include the following power needs to determine the required electrical service capacities: HVAC systems, technology hub, A/V equipment, computers or terminals, media, copiers, printers, theft detectors, other special equipment required by users, and considerations for expansion. Provide metering for electrical power. Secondary underground service raceways may be PVC Schedule 40. Service grounding system and all wiring methods must meet National Electric Code (NEC) requirements.

3-2.9.1 Receptacle Access.

General convenience receptacles and special power outlets must be specification grade. General spacing of convenience receptacles must be a maximum of 12 feet (3600 mm) on center and 5 feet (1500 mm) on center where carrels occur. Additional access to power and data through access flooring floor outlets or wall outlets should be considered and coordinated with the furnishing plan and activities/uses programmed for task lighting, equipment, computer/projector setup, and user convenience. Provide electrical outlets and public access Wi-Fi for laptops or personal devices in the study areas, reading areas, and coffee cafés. Consider the need for additional electrical outlets at circulation and reference desks, work rooms, offices for staff use, A/V areas, and in reading areas for customer use. The type and scope of computer systems that may be used can vary depending on local base decisions and technological developments.

Provide an intrusion detection alarm system and wall clocks in all functional areas.

3-2.10 Information Technology (Low-Voltage).

Reference UFC 3-580-01, *Telecommunications Interior Infrastructure Planning and Design*.

3-2.10.1 Public Internet and Exterior Resource Access.

Provide commercial Internet access for public and patron use at most computers and Wi-Fi throughout the facility.

3-2.11 Plumbing.

Provide domestic hot and cold water, sanitary and storm drainage, plus propane or natural gas systems (if required) in accordance with design requirements established in UFC 3-420-01, *Plumbing Systems*, and the International Building Code (IBC). Provide hot and cold water to all restrooms, sinks, janitor's closets, and coffee cafés. Provide a water bottle-filling station with the water fountain. Hot water temperature must not exceed 105 °F (40 °C) at the outlet. Provide floor drains in restrooms and janitor's closets. Provide shut-off valves at all fixtures. Provide frost-free hose bibs on all exterior walls if justified by local climatic conditions. Provide metering for gas service. Provide water metering for water conservation and maintenance measures.

This Page Intentionally Left Blank

CHAPTER 4 FUNCTIONAL DATA SHEETS

4-1 ADMINISTRATION.

Requirements for administration areas are the same for all types and sizes of libraries. Only the size requirements will vary depending upon the overall size requirements of the entire facility. If possible, design administration areas with visibility to the outdoors and/or interior of the library.

4-2 FUNCTIONAL DATA SHEETS.

Functional data sheets are intended to provide the minimum requirements for the respective rooms and spaces.

Table 4-1 Circulation Area

Description/Usage	The circulation area includes the circulation desk and is the main point of contact for information and assistance.
Occupancy Density	As reception/lobby of an office, 10 to 30 per 1000 ft^2 (93 m^2), including staff work stations, regularly occupied spaces.
Min. Ceiling Ht.	8 ft (2.4 m) minimum
Finishes	**Walls.** Provide a low-maintenance, durable finish. **Floors:** Durable flooring that absorbs sound and can be cleaned. **Ceiling:** Changes in ceiling type and heights should be utilized to guide people to the circulation desk. Consider acoustics and light reflectance in ceiling selection.
Plumbing	None required.
HVAC	Provide system per paragraph 3-2.8.
Fire Protection	Provide system per paragraph 3-2.7.
Power	Provide outlets per paragraph 3-2.9.
Lighting	Provide system per paragraph 3-2.9.
Communication	**CCTV.** Required. **CATV/Internal Video.** Required. **PA/Audio.** Provide phone or microphone connected to library PA system. Coordinate with installation needs, processes, and equipment. **Telephone.** Required, 2 minimum. **Data.** Required at each workstation to access the ILS database. Provide connections to outside computer networks. **Security.** Provide security camera monitors located out of the view of customers. Include space for lost and found items to be stored and provide lockable storage for staff personal items.
Acoustics	Meet library criteria in UFC 3-101-01 and provide an area of finishes with NRC of 0.70 or higher to equal or exceed the floor area of this room/area.
Casework/Built-in Equipment	Coordinate with installation needs, processes, and equipment. Circulation desk should be durable and abuse-resistant. Coordinate requirements for drawers, cabinets, browser boxes, and must be coordinated with end user's needs, processes, and equipment. Provide

	shelving and space for parking carts behind the desk to accommodate returned materials.
Furnishings Fixtures & Equipment (FF&E)	Equip the circulation desk. Coordinate with installation needs, processes, and equipment. Provide anti-fatigue mats behind the service counter areas where staff may stand for extended periods.
User-provided Equipment	Computers, workstation equipment, and ILS. Coordinate with installation.
Special Requirements	Visual connections and control of entrance, public spaces, and circulation.

Table 4-2 Reading Area

Description/Usage	Reading areas are composed of major and minor reading spaces. The majority of the reader stations should be located in the main reading space of the public services area.
Occupancy Density	As library, 10 per 1000 ft^2 (93 m^2) or as most dense use when multi-functional. Confirm with reading stations and open study seats, which may create higher density.
Min. Ceiling Ht.	8 ft (2.4 m) minimum
Finishes	**Walls:** Provide a low-maintenance, durable finish. **Floors:** Flooring should be sound-absorptive, durable, and easy to maintain despite rolling book carts. **Ceiling:** Provide acoustic absorption (NRC) and light reflectance (LRV) in support of room functions and lighting.
Plumbing	None required.
HVAC	Provide system per paragraph 3-2.8.
Fire Protection	Provide system per paragraph 3-2.7.
Power	Provide outlets per paragraph 3-2.9.
Lighting	Provide system per paragraph 3-2.9.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Coordinate with installation needs, processes, and equipment. **Telephone.** None required. **Data.** Coordinate with installation needs, processes, and equipment. **Security.** None required.
Acoustics	Meet library criteria in UFC 3-101-01 and provide an area of finishes with NRC of 0.70 or higher to equal or exceed the floor area of this room/area.
Casework/Built-in Equipment	Seating and tabletops optional for minor reading areas (or FF&E).
Furnishings Fixtures & Equipment (FF&E)	Seating, tables, and activity support furniture should be mobile and multi-function.
User-provided Equipment	TBD by the installation.
Special Requirements	Multi-use space and multi-function amenities.

Table 4-3 Children's Area

Description/Usage	The children's area includes general and special collections, reading/story/activity areas, and a computer area.
Occupancy Density	As library, 10 per 1000 ft^2 (93 m^2) or as most dense use when multi-functional. Confirm with reading stations and event/activity seats, which may create higher density.
Min. Ceiling Ht.	8 ft (2.4 m) minimum
Finishes	**Walls:** Provide a low-maintenance, durable finish in child-friendly colors. **Floors:** Flooring should be sound-absorptive, durable, and easy to maintain with activities and book carts. **Ceiling:** Provide acoustic absorption (NRC) and light reflectance (LRV) in support of room functions and lighting.
Plumbing	None required.
HVAC	Provide system per paragraph 3-2.8.
Fire Protection	Provide system per paragraph 3-2.7.
Power	Provide outlets per paragraph 3-2.9.
Lighting	Provide system per paragraph 3-2.9.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Coordinate with installation needs, processes, and equipment. **Telephone.** None required. **Data.** Coordinate with installation needs, processes, and equipment. **Security.** None required.
Acoustics	Meet library criteria in UFC 3-101-01 and provide an area of finishes with NRC of 0.70 or higher to equal or exceed the floor area of this room/area.
Casework/Built-in Equipment	Seating and tabletops optional for minor reading areas (or FF&E).
Furnishings Fixtures & Equipment (FF&E)	Seating, tables, and activity support furniture should be mobile and multi-function.
User-provided Equipment	TBD by the installation.
Special Requirements	Multi-use space and multi-function amenities.

Table 4-4 General and Reference Collections

Description/Usage	Areas for general collections are composed of book stacks for fiction, non-fiction, and paperback books that occupy a large majority of the public services space.
Occupancy Density	As library, 10 per 1000 ft^2 (93 m^2) or as most dense use when multi-functional. Confirm with each installation since this may create higher density.
Min. Ceiling Ht.	8 ft (2.4 m) minimum.
Finishes	**Walls:** Provide a low-maintenance, durable finish. **Floors:** Flooring should be sound-absorptive, durable, and easy to replace in sections. **Ceiling:** Provide acoustic absorption (NRC) and light reflectance (LRV) in support of room functions and lighting.
Plumbing	None required.
HVAC	Provide system per paragraph 3-2.8.
Fire Protection	Provide system per paragraph 3-2.7.
Power	Provide outlets per paragraph 3-2.9.
Lighting	Provide system per paragraph 3-2.9.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Coordinate with installation needs, processes, and equipment. **Telephone.** None required. **Data.** Coordinate with installation needs, processes, and equipment. **Security.** None required.
Acoustics	Meet library criteria in UFC 3-101-01 and provide an area of finishes with NRC of 0.70 or higher to equal or exceed the floor area of this room/area.
Casework/Built-in Equipment	Optional; confirm reference desk and workstations with installation.
Furnishings Fixtures & Equipment (FF&E)	Reference collections will be installation-specific and typically include lower-height book stacks, file cabinets for maps and pamphlets, and dictionary and atlas stands.
User-provided Equipment	TBD by the installation.
Special Requirements	N/A

Table 4-5 Reference Desk and Storage

Description/Usage	Areas for reference collections are composed of book stacks for reference books, computers for online catalog access, and special collections, such as microfilm.
Occupancy Density	As library, 10 per 1000 ft^2 (93 m^2). Confirm with each installation.
Min. Ceiling Ht.	8 ft (2.4 m) minimum.
Finishes	**Walls:** Provide a low-maintenance, durable finish. **Floors:** Provide durable, easy-to-clean flooring that can withstand heavy storage shelves. **Ceiling:** Provide acoustic absorption (NRC) and light reflectance (LRV) in support of room functions and lighting.
Plumbing	None required.
HVAC	Provide system per paragraph 3-2.8.
Fire Protection	Provide systems per paragraph 3-2.7.
Power	Provide outlets per paragraph 3-2.9.
Lighting	Provide system per paragraph 3-2.9.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Coordinate with installation needs, processes, and equipment. **Telephone.** None required. **Data.** Coordinate with installation needs, processes, and equipment. **Security.** None required.
Acoustics	Meet library criteria in UFC 3-101-01 and provide an area of finishes with NRC of 0.70 or higher to equal or exceed the floor area of this room/area.
Casework/Built-in Equipment	Optional; confirm reference desk and workstations with installation.
Furnishings Fixtures & Equipment (FF&E)	Reference collections will be installation-specific and typically include lower-height book stacks.
User-provided Equipment	TBD by the installation.
Special Requirements	Optional; confirm reference desk and workstations with installation.

Table 4-6 Study/Huddle Rooms

Description/Usage	Small group study areas may consist of enclosed rooms and small tables with chairs located in open, but secluded, areas.
Occupancy Density	As conference room, 50 per 1000 ft^2 (93 m^2). Confirm with study seats, which may create higher density.
Min. Ceiling Ht.	9 ft (2.7 m) minimum.
Finishes	**Walls:** Provide a low-maintenance, durable finish. **Floors:** Flooring should be sound absorptive, durable, and easy to replace in sections or maintain. **Ceiling:** Provide acoustic absorption (NRC) and light reflectance (LRV) in support of room functions and lighting.
Plumbing	None required.
HVAC	Provide system per paragraph 3-2.8.
Fire Protection	Provide system per paragraph 3-2.7.
Power	Provide outlets per paragraph 3-2.9.
Lighting	Provide systems per paragraph 3-2.9.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Coordinate with installation needs, processes, and equipment. **Telephone.** None required. **Data.** Coordinate with installation needs, processes, and equipment. **Security.** None required.
Acoustics	Meet conference room criteria in UFC 3-101-01 and provide an area of finishes with NRC of 0.70 or higher to equal or exceed the floor area of this room/area.
Casework/Built-in Equipment	Optional study booth or table.
Furnishings Fixtures & Equipment (FF&E)	Study chairs and accessories, study table if not built-in, white board and tray, and clock.
User-provided Equipment	TBD by the installation.
Special Requirements	N/A

Table 4-7 Teen Area

Description/Usage	Provide a dedicated space within the public services area for teen audiences and special interest collections for fiction, non-fiction, paperback books, and audio books.
Occupancy Density	As library to conference/meeting, 10 to 50 per 1000 ft^2 (93 m^2) or as most dense use when multi-functional. Confirm with reading stations and study/activity seats which may create higher density.
Min. Ceiling Ht.	9 ft (2.7 m) minimum.
Finishes	**Walls.** Provide a low-maintenance, durable finish. **Floors:** Flooring should be sound-absorptive, durable, and easy to replace in sections. **Ceiling:** Provide acoustic absorption (NRC) and light reflectance (LRV) in support of room functions and lighting.
Plumbing	None required.
HVAC	Provide system per paragraph 3-2.8.
Fire Protection	Provide system per paragraph 3-2.7.
Power	Provide outlets per paragraph 3-2.9.
Lighting	Provide system per paragraph 3-2.9.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** None required. **Telephone.** None required. **Data.** Coordinate with installation needs, processes, and equipment. **Security.** None required.
Acoustics	Meet library criteria in UFC 3-101-01 and provide an area of finishes with NRC of 0.70 or higher to equal or exceed the floor area of this room/area.
Casework/Built-in Equipment	Seating and tabletops optional for minor reading areas (or FF&E).
Furnishings Fixtures & Equipment (FF&E)	Seating, tables, and activity support furniture should be mobile and multi-function.
User-provided Equipment	TBD by the installation.
Special Requirements	Multi-use space and multi-function amenities.

Table 4-8 Community Technology Room

Description/Usage	Space dedicated for equipment or technology-based crafting, art, and individual project production. Often called “maker space.”
Occupancy Density	20 to 25 per 1000 ft^2 (93 m^2) as wood/metal shop or computer lab. Confirm with workstations and/or classroom seats, which may create higher density.
Min. Ceiling Ht.	9 ft (2.7 m) minimum.
Finishes	**Walls:** Provide a low-maintenance, durable finish. Coordinate with equipment in the room for appropriate finishes that can withstand the function of the room. **Floors:** Flooring should be durable, easy to clean, and abuse-resistant. **Ceiling:** Ceiling should be durable, cleanable, and give maintenance staff and equipment installers access to systems above. Provide acoustic absorption (NRC) and light reflectance (LRV) in support of room functions and lighting.
Plumbing	None required.
HVAC	Provide system per paragraph 3-2.8.
Fire Protection	Provide system per paragraph 3-2.7.
Power	Provide outlets per paragraph 3-2.9.
Lighting	Provide system per paragraph 3-2.9.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Coordinate with installation needs, processes, and equipment. **Telephone.** None required. **Data.** Coordinate with installation needs, processes, and equipment. **Security.** Coordinate with installation needs, processes, and equipment.
Acoustics	Meet library criteria in UFC 3-101-01 and provide an area of finishes with NRC of 0.70 or higher to equal or exceed the floor area of this room/area.
Casework/Built-in Equipment	Coordinate to support maker equipment and tools planned by installation.
Furnishings Fixtures & Equipment (FF&E)	Coordinate to support maker equipment and tools planned by installation.

User-provided Equipment	Coordinate with installation for maker equipment and tools. Task lighting.
Special Requirements	Confirm ventilation, plumbing, power and security with equipment and tools planned by installation.

This Page Intentionally Left Blank

APPENDIX A BEST PRACTICES

The Best Practices Appendix is considered to be guidance and not requirements. Its main purpose is to communicate proven facility solutions, systems, and lessons learned, but may not be the only solution to meet the requirement.

A-1 GENERAL.

The architectural design and construction industry has produced a number of strategies for coordination, lean project design, or integrated project delivery. The following paragraphs identify good design practices for libraries. The designer is expected to interpret this guidance and configure the design for the needs of the project.

A-1.1 Active Design.

Design for active occupants to encourage circulation or make the stairs a prominent feature in the building (if multi-story); encourage physical activity within the building.

A-1.2 Acoustic Control.

Acoustic modeling and testing are best practices but may not match the budget or schedule of library projects. Teams should consider the extent of acoustic control, design, testing, and mitigation to best serve the project.

A-1.3 Adaptability for Technology.

Modular flooring should be used where appropriate. Underfloor air distribution (UAD) and power access can be combined for advantage in layout flexibility and improved comfort, and is very effective for cable management. UAD systems not only allow fresh conditioned air to be delivered near the occupants, but also provides an opportunity for occupants to have control over this air flow. This is advantageous for multi-purpose and administration type spaces. However, stack shelves and collection spaces with additional structural requirements and that do not benefit from layout flexibility are not appropriate for UAD or power access floor. Refer to UFGS 09 69 13, *Rigid Grid Access Flooring*, for system criteria, requirements, and considerations. The same floor system and construction providing both air and cabling systems are similar, reducing the construction costs associated with conventional practices of separating overhead air and standard methods of cable management.

This UFC supersedes Air Force Pamphlet (AFP) 88-52 *Swimming Pools*, dated 1984.

FOREWORD

The Unified Facilities Criteria (UFC) system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and applies to the Military Departments, the Defense Agencies, and the DoD Field Activities in accordance with USD (AT&L) Memorandum dated 29 May 2002. UFC will be used for all DoD projects and work for other customers where appropriate. All construction outside of the United States is also governed by Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA), and in some instances, Bilateral Infrastructure Agreements (BIA). Therefore, the acquisition team must ensure compliance with the most stringent of the UFC, the SOFA, the HNFA, and the BIA, as applicable.

UFC are living documents and will be periodically reviewed, updated, and made available to users as part of the Services' responsibility for providing technical criteria for military construction. Headquarters, U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering Command (NAVFAC), and Air Force Civil Engineer Center (AFCEC) are responsible for administration of the UFC system. Defense agencies should contact the preparing service for document interpretation and improvements. Technical content of UFC is the responsibility of the cognizant DoD working group. Recommended changes with supporting rationale may be sent to the respective DoD working group by submitting a Criteria Change Request (CCR) via the Internet site listed below.

UFC are effective upon issuance and are distributed only in electronic media from the following source:

- Whole Building Design Guide web site http://www.wbdg.org/ffc/dod.

Refer to UFC 1-200-01, *DoD Building Code*, for implementation of new issuances on projects.

UNIFIED FACILITIES CRITERIA (UFC)
NEW DOCUMENT SUMMARY SHEET

Document: UFC 4-750-07, *Aquatic Facilities*

Superseding: Air Force Pamphlet (AFP) 88-52 *Swimming Pools*, dated 1984.

Description: This UFC 4-750-07 provides minimum requirements for natatoria, outdoor swimming pools, wading pools, spas, spray grounds, pool decks and all other functional building areas associated with recreational aquatic facilities.

Reasons for Document: This document provides minimum unified requirements and coordinating guidance for planning, designing, constructing and renovating recreation level aquatic facilities and will enhance DoD aquatic recreation facilities by:

- Providing application of existing aquatic model codes and industry standards to DoD facilities.
- Creating an interactive space program to quickly develop sizes of functional areas for each Service.
- Providing material criteria specific to aquatic facilities to increase facility longevity and decrease maintenance.

Impact: There are negligible cost impacts. However, the following benefits should be realized.

- Elimination of ambiguities that could lead to design and construction conflicts.
- Enhanced communication between disciplines involved in the design of aquatic facilities.
- The incorporation of existing model codes and industry standards improves the ease of updating and revising this reference document as technological advances occur in the industry.

Unification Issues:

- Army, Navy and Air Force have Service-specific documents related to design, construction and operation of natatoria and outdoor swimming pools. There are differences noted in this document that are attributed to specific functional spaces or systems. Service exceptions to the requirements of this UFC are written into the applicable section of the document.

CHAPTER 1 INTRODUCTION

1-1 BACKGROUND.

UFC 4-750-07 was originally drafted in 2006 by the Air Force to develop a new unified facility criterion for use in the design of aquatic facilities primarily used for recreation; however, the draft document was not finalized for implementation. Continued developments in the aquatic industry have resulted in advances in disinfection and recirculation technology, the introduction of unique programming and design elements, the passing of the Virginia Graeme Baker Act, development of the Model Aquatic Health Code, and development of the International Swimming Pool and Spa Code as part of the International Building Code. UFC 4-750-07 provides applicability of model building codes and government-unique criteria for aquatic facilities (including swimming pools, natatoria, non-medical spas, wading pools, spray grounds and pool decks), typical design disciplines and building systems, as well as for accessibility, antiterrorism, security, sustainability, and safety.

1-2 PURPOSE AND SCOPE.

Unified Facilities Criteria (UFC) 4-750-07 provides technical criteria and requirements for planning, designing, and constructing natatoria and outdoor aquatic facilities for recreational use. Alteration and renovation projects should update existing facilities to meet this criteria within budgetary constraints. This UFC is intended to promote innovative designs that are functional, economical, safe, aesthetically pleasing, and meet the expectations for modern aquatic facilities. Each design should satisfy the unique requirements of each Installation and at the same time be compatible with the local environment and specific site conditions.

Customized, individual solutions meeting the needs of each project is the primary objective of this UFC. Use this UFC in conjunction with Department of Defense (DoD) criteria, service-specific documents, aquatic industry publications, and regulatory agencies, as applicable. Obtain additional information on the unique program and design requirements of local projects from the Installation points of contact.

1-3 APPLICABILITY.

This UFC applies to all military services and contractors involved in planning, programming, design, and construction of aquatic facility projects, including additions, alterations, and renovation projects worldwide.

1-4 GENERAL BUILDING REQUIREMENTS.

Comply with UFC 1-200-01. UFC 1-200-01 provides applicability of model building codes and government unique criteria for typical design disciplines and building systems, as well as for accessibility, antiterrorism, security, high performance and sustainability requirements, and safety. Use this UFC in addition to UFC 1-200-01 and the UFCs and government criteria referenced therein.

1-5 CYBERSECURITY.

All control systems (including systems separate from an energy management control system) must be planned, designed, acquired, executed, and maintained in accordance with UFC 4-010-06, and as required by individual Service Implementation Policy.

1-6 GLOSSARY.

APPENDIX B contains acronyms, abbreviations, and terms used in this UFC.

1-7 REFERENCES.

APPENDIX C contains a list of references used in this document. The publication date of the code or standard is not included in this document. In general, the latest available issuance of the reference is used.

1-8 BEST PRACTICES.

APPENDIX A identifies background information and practices for accomplishing certain aquatic facility design and engineering services. The Designer of Record (DoR) is expected to review and interpret this guidance as it conforms to criteria and contract requirements, and apply the information according to the needs of the project. If a Best Practices document has guidelines or requirements that differ from any UFC or the Unified Facilities Guide Specifications (UFGS), the UFC and the UFGS must be given a higher order of precedence.

1-9 AQUATIC FACILITY CLASSIFICATIONS.

Two general types of aquatic facility classifications include outdoor pools and natatoria (indoor pools).

1-10 OPERATIONAL IMPLICATIONS.

Procedures for Installation level recreation programs, aquatic activities, operation, and maintenance of pools, including natatoria, are provided in the following documents:

- AFI 34-101
- AFI 32-1067
- AFMAN 48-114
- UFC 3-230-02
- MAHC
- TB Med 575
- TM 5-662
- Technical Criteria for US Army Physical Fitness Facilities

- NAVMED P5010-4

Consider operational and procedural issues during the design process. Include the facility user groups in determining operational, procedural, and program requirements, since project requirements vary, and successful incorporation is critical to the design of the project.

This Page Intentionally Left Blank

CHAPTER 2 PLANNING AND PROGRAMMING

2-1 PLANNING CONSIDERATIONS.

Chapter 2 provides requirements and information for planning and programming DoD aquatic facilities and the infrastructure to support them. Aquatic facility development planning and the programming of facility space are different for every project depending upon the unique factors regarding each Installation. Consider local requirements concerning building programs, design criteria, technical systems and the adequacy of existing facilities to meet current and future needs.

2-1.1 Operating Policies.

Selected programs and spaces for each facility may vary widely depending on the anticipated operating policies of each facility. Determine early in the planning process the preferred operating procedures for the types of programs and activities to be provided.

2-1.2 Programs and Activities.

Analyze the activities to be provided to determine facility requirements. Coordinate with Installation personnel to identify specific requirements for the programs and activities they plan to implement (e.g. open swimming, diving, water polo, wading, aquatic fitness/therapy, swimming/life-saving instruction, and Morale, Welfare, and Recreation (MWR) specialty programming). Consider building related requirements (e.g., access, security, and lighting) for pools where activities will be offered outside normal operating hours.

2-1.3 Competitive Swimming.

Consider the impact of specific institutional and host nation requirements if competitive swimming will be a part of the program requirements. Major sport swimming sanctioning organizations include:

- AAU – Amateur Athletic Union
- FINA –Federation Internationale de Natation
- NCAA – National Collegiate Athletic Association
- NFSH – National Federation of State High School Associations
- USA Swimming

2-1.4 Toilet/Shower/Clothing Storage.

Locate toilet and shower fixtures adjacent to changing areas. Position changing area entries to be accessible and visible from facility check-in point and to pool deck.

Provide half or full-height lockers located within the dressing room area or on the pool deck.

2-1.5 Supervision and Observation.

A strict system of observation and control is crucial in an aquatic facility. Organize the customer spaces to facilitate surveillance requirements to minimize staff numbers and customer movement. Surveillance of three activities is essential:

- Check-in and check-out system – ensures entry by approved users only.
- Storage of clothes – reduces opportunity for theft.
- Pool and pool deck activity – ensures proper safety for customers.

2-1.6 Check-In and Check-Out Procedures.

Design the entrance with clear line of sight and a means for controlling the entry to and exit from the facility. Considerations for entry control design include: type of identification required, method of verification, payment (if required), and supervision (e.g., if payment is required, provide sufficient counter space for payment processing and storage).

2-1.7 Scheduling.

Consider the preliminary program schedule in designing aquatic and support spaces. Identify programs that must occur simultaneously and the impacts this will have on pool design. For example, if competitive swimming and diving are required to occur concurrently at a specific Installation, consider “L” shaped pools, bulkheads, or separate pools.

2-1.8 First Aid.

Provide a location where first aid can be performed and associated equipment can be stored (e.g., first aid kit, personal protective equipment). Provide space for a cot and storage. Provide direct access from the pool deck to the first aid location.

2-1.9 Employee Training.

Provide a training room or multipurpose room for regular employee training. Visually isolate the training/multipurpose room from the pool area to limit distractions during training. Provide storage for training-specific items.

2-1.10 Food and Beverage Service.

Policies on food service may vary from no food permitted, vending machines, or a snack bar. Coordinate with Installation personnel to determine adjacencies and design considerations relating to location, trash removal, and types of food and beverage containers anticipated.

2-2 SPACE PROGRAM.

The space program for new aquatic facilities is developed using an interactive worksheets. It is completed by first entering the appropriate Service and then selecting the appropriate size basis for the facility. These selections generate the default space program. In some cases, there are options to modify the default numbers or to add optional spaces. This worksheet is available for download as a Microsoft© Excel© file from the Whole Building Design Guide (WBDG) Website under the DoD page, then Unified Facilities Criteria page and selecting this UFC title to view the attachment under the 'Related Materials' field. In developing the space program for an individual facility, consider the issues of overall facility design and the functional relationships described in this UFC.

Each Installation may also determine that different or additional requirements are relevant to its local program. These considerations can affect the functional areas and spaces included in the program and their relative sizes. Space allowances for aquatic facilities are based on standards developed for each DoD service component.

2-2.1 Facility Size.

Determine the overall facility size by analyzing the particular needs of each Installation, including the following factors:

- Size of the U.S. and host nation military population in the area served by the Installation.
- Number of youth and children served by the Installation. These are typically the most frequent users of aquatic facilities and associated activities.
- Number of dependent spouses, retirees, host nation personnel, contractors, and other authorized users to be served by the facility.
- Availability of other aquatic facilities on, or near, the Installation.
- Anticipated need for conducting competitive swimming events.
- Anticipated need for pool use in training activities, such as SCUBA and deep-water survival training.

2-3 FACILITY REQUIREMENTS.

Consider the parameters affecting overall facility design and the functional relationships discussed in paragraph DESIGN and paragraph FUNCTIONAL AREA TECHNICAL REQUIREMENTS when developing the space program for an individual facility. Facility requirements are based on local conditions and identified requirements of the community served.

2-3.1 Core Functional Areas.

Most aquatic facilities will need four core functional areas while allowing for local variation in the scope of operation under each category. Provide the following four core functional areas in the design of the aquatic venue:

- Water areas
- Pool deck
- Bathhouse (outdoor facilities) / Changing/Restroom (natatoria)
- Filtration, circulation, and chemical equipment

2-4 SITE SELECTION.

Locate aquatic facilities near the center of Installation activities and facilities such as the physical fitness center and the youth center, where possible. Aquatic facilities should be located with compatible functions as defined by the Installation Master Plan. Avoid locations near busy intersections, roadways or roads, airfields, and industrial facilities. Evaluate the potential impact of natural site features on the proposed facility design, in accordance with UFC 1-200-01, 2-100-01, and 3-201-02. Existing natural site features may be incorporated into required site elements like Antiterrorism/Force Protection (ATFP) standoff distances provided in UFC 4-010-01 or vehicle barriers that may help to blend the facility into the natural setting of the site. Select potential sites for aquatic facilities to minimize or eliminate problems in design, construction cost, and pool function.

2-4.1 Site Size.

Select a site large enough to accommodate all the components of the facility and anticipated future expansions. These components may include vehicle access, parking, pedestrian access, open areas that can be used for playing fields (e.g., throwing Frisbees, horseshoes, and similar recreational activities). Consider each site component as it relates to each specific project. In addition, size the site to allow for open or landscaped spaces around these components as required in UFC 3-201-02. For initial planning purposes, a site size can be considered satisfactory if the area of the site is at least the sum of the following:

- Exterior circulation and parking areas.
- Fire Lane with required fire truck turning radius.
- Stormwater management areas.
- The area of the swimming pool, surrounding pool deck, and internal circulation areas.
- The area of the spray ground, wading pool, or spa and surrounding deck.
- The gross area required for changing areas, storage areas, offices and support spaces, spectator areas and other building support areas.

- The gross area needed for water circulation, filtration, and chemical equipment facilities.
- Required easements, setbacks, and standoff distances.

More area may be needed if the site has any special features, such as irregular contours or perimeter, existing trees, or unusual landscape conditions. Accommodate the required number of parking spaces and AT/FP setback requirements in accordance with UFC 4-010-01. Provide for future expansion in site size determination, if practical.

2-4.2 Site Considerations.

Select sites for aquatic facilities in accordance with UFC 1-200-02 and the following criteria:

- Approach the site by sidewalk, without requiring pedestrians to cross heavily traveled streets or circulation areas within the parking lot.
- The necessary utilities, water, sanitary sewer, natural gas, and electricity are readily available.
- The topography is level enough for constructing the pool.
- The soil is stable and free of rock, which is costly to excavate.
- The site is not close to heavy industrial smoke or other unpleasant or harmful pollutants.
- The site is near other recreational activities, such as youth centers, clubs, and athletic facilities.
- Facility should be sited in accordance with compatibility guidelines as defined by the Installation Master Plan.
- Select a site that minimizes wind-blown debris and reduce wind damage to structures, furnishings, and equipment.

2-4.3 Site Access.

Provide easy access by pedestrians, automobiles, and Installation public transportation. Address accessibility issues for people with disabilities in accordance with the accessibility requirements identified in paragraph ACCESSIBILITY. A facility easily identifiable from approaching cars and pedestrian pathways is desirable. Provide a dedicated service drive near the filtration and chemical storage areas for maintenance vehicle access. Provide a service drive with convenient access to the pool deck areas, to be utilized by emergency responders for evacuation of injured customers without exiting through the bathhouse or locker rooms.

2-4.4 Site Utility Requirements.

Evaluate potential sites to determine the availability of utility services and conformation of easement and property lines. Locate aquatic facilities where access to major utilities is readily available (e.g., water, sewage, electricity, telecommunications (voice and

data), and natural gas). Provide storm or sanitary sewer systems capable of handling large-volume water discharge in accordance with local codes and pool filtration equipment selections. Provide water service, natural gas, steam service or fuel oil system (whichever is used), electricity, security, and fire alarm service to the building in accordance with UFC 1-200-01 and Installation requirements.

2-4.5 Topography and Sub-Soil Conditions.

Evaluate existing topography of potential sites to determine the impact of existing conditions on construction. Conduct geotechnical investigations to identify sub-soil conditions, the elevation of the water table, and the bearing capacity of the soil in accordance with requirements in UFC 1-200-01. Solicit recommendations regarding the locations of soil borings from the A/E. Evaluation of the geotechnical report should be a primary consideration of potential sites. Determine the most effective foundation system based on evaluation of the geotechnical data. Consider the impact of existing subsurface rock on the position of the pool, buildings, parking areas, and other structures so excavation can be minimized.

2-5 ACCESSIBILITY.

Design and construct new facilities, additions, and renovations of existing facilities in accordance with the Architectural Barriers Act (ABA) and UFC 3-101-01.

Provide one or more accessible entry into pools utilizing primary and secondary means established in the ABA requirements.

2-6 BUILDING CODES.

Provide all aquatic facilities in accordance with DoD criteria and Installation design guides. These criteria are based on national standards, private sector consensus standards, and model codes. Refer to UFC 1-200-01, *Design: General Building Requirements* for specific guidance. In the event of conflicts between codes and DoD criteria, use DoD requirements. For OCONUS situations where there is a conflict between mandatory code requirements, the most restrictive code takes precedence. Consider local codes where design choice impacts the exterior of the Installation.

2-7 AQUATIC INDUSTRY CODE COMPLIANCE.

For all new pool construction and renovations to existing pools, conform to the current version of the following documents:

- International Swimming Pool and Spa Code (ISPSC)
- Model Aquatic Health Code (MAHC)
- Federation Internationale de Natation (FINA) Standards; Facility Rules
- Local, State, Military Agency, Federal, and host nation codes, if applicable

In cases of conflict between the code documents, utilize the more stringent requirement.

2-8 ANTITERRORISM/FORCE PROTECTION.

Design the facility to comply with UFC 4-010-01 and UFC 4-020-01.

2-9 SUSTAINABLE DEVELOPMENT.

Design and construct new construction, additions, and renovations in accordance with UFC 1-200-02. Use an integrated approach to the planning and design of aquatic facilities in accordance with UFC 1-200-01.

2-9.1 General Sustainability Requirements.

Apply sustainable development concepts in the planning, design, construction, environmental management, operation, maintenance, and disposal of facilities and infrastructure projects that are consistent with budget and mission requirements. Comply with guidance for High Performance Sustainable Buildings compliance, tracking and policies in accordance with UFC 1-200-02.

2-9.2 Energy and Water Conservation.

Design new construction and renovation projects in accordance with UFC 1-200-02. The MAHC states that the IAQ proper removal of the chemical, biological, and physical contaminants, is the top priority, Treat the water filtration systems dedicated to the natatoria area as a process load

Provide pool covers in accordance with ISPSC and ASHRAE Standard 90.1. Include water conservation features such as manual and automatic stopping of aquatic features such as waterfalls and play features to reduce evaporative losses. Design spray grounds as recirculated systems or capture used, untreated water for irrigation or similar purposes requiring non-potable water. Employ other aquatic-specific sustainable practices on a project-specific basis where warranted by design and budget.

2-10 ENVIRONMENTAL ISSUES.

Aquatic facilities have specific environmental considerations, such as backwashing of filters and the disposal of waste water. Dispose of all chemically treated water in accordance with State and local code requirements. Incorporate safe provisions for storing and handling of pool chemicals.

Require procurement of construction materials and building supplies that have a lesser or reduced effect on human health and the environment over their lifecycle, when compared with competing products or services that serve the same purpose, in accordance with UFC 1-200-02.

2-11 MODIFICATION OF FACILITIES AND EQUIPMENT.

The configuration of existing facilities may limit the ability to meet the requirements for aquatic facilities at the Installation. Provide modifications of facilities and equipment that conform to these requirements to the greatest extent possible.

2-11.1 Renovation and Repairs.

Leaking pools and piping systems may require significant renovation and repairs. Low capital investment options, such as vinyl liners, are acceptable. Gutter systems may be replaced with stainless steel gutter systems. New gutter systems may be designed to handle the surge capacity requirements and eliminate the need for adding a surge tank system or additional underground piping.

2-11.2 Restoration and Preservation.

Older DoD aquatic facility renovations may require restoration of pool and deck surfaces. Use cost comparisons to determine if restoration or replacement is the most cost-effective option.

2-11.3 Upgrades and Additions.

Improvements to existing aquatic facilities may include replacing wading pools with spray grounds or adding play amenities detailed in this UFC. Typical upgrades to existing facilities may also include new gutters, surge control systems, circulation/filtration systems, energy upgrades, ABA compliance, or APSP-16 compliance. Give priority to upgrades and additions that enhance the safety of the existing aquatic facility over upgrades to enhance recreational value.

CHAPTER 3 DESIGN

3-1 GENERAL.

Chapter 3 provides general design and material requirements, including detailed requirements for the site, infrastructure, water areas, pool deck, bathhouse, and other buildings or structures. These criteria address design requirements for site and building layout, architectural character, function, circulation, and facility systems. Information is provided regarding the preferred materials and finishes that deliver the required durability yet while remaining functional and aesthetically pleasing.

Facility system requirements for circulation, filtration, chemical storage, structural considerations, HVAC systems, plumbing, electrical, fire protection, life safety, telecommunications, alarm/security systems, and acoustical requirements are included in this chapter. Special considerations for operational requirements, Installation-specific programs, and the renovation of existing facilities are addressed in APPENDIX A.

3-1.1 Design Development.

Provide designs that comply with the general criteria and provide a compatible solution for the specific project requirements. Provide individual designs that enhance the surrounding built environment and natural character of the Installation. Other factors that determine the success for the design include:

- Value and Cost: Design facilities than can be constructed within the project budget and economically maintained.
- Operating Efficiency: Arrange individual spaces to meet specific needs of the user population and allow for maximum staff efficiency.
- Project Cost: Design to minimize construction and operating costs. Use a compact floor plan that minimizes floor area for personnel circulation, walls, and structure. Reduce structural, architectural, and mechanical costs through compact building volume and careful placement of mechanical and filter rooms to reduce the length of pipe runs.
- Simplified Construction: Use familiar building assemblies and terms that do not require a specially qualified labor force or special construction equipment for installation. Include durable, water-resistant materials that have a low life-cycle cost. Minimize the number of different materials used and select materials that are locally available. Consider the use of pre-engineered building systems where they are locally available and architecturally compatible with the Installation building standards. Use systems that can be supplied and maintained economically, especially for natatoria.
- Energy Management: Reduce operating costs for natatoria by applying the principles of passive solar design, optimizing the effective use of insulation based on a life-cycle study, and using fuels that can be provided

economically for the life of the facility.

- Environmental Influences: Design for the specific climate of each Installation. Where unheated pools and open-air bathhouses are planned, environmental considerations include the control of sunlight and wind by shading, tunneling, blocking, or other methods.

3-1.2 General Design Process.

Prepare designs through an iterative process of submittals, user reviews, and discussions to reconcile comments in accordance with A/E Statement of Work and service-specific design procedures (e.g., FC 1-300-09N).

3-2 SITE DESIGN.

Site the aquatic facility so the main entrance is clearly visible, and the architecture provides intuitive wayfinding cues to guide visitors to the main entrance. Preserve and utilize natural site features, such as topography, trees, greenery, and unusual landscape features to help define the site and accent the building. Use landscape elements to provide definition, screening, and focus for the site. Locate the pool, spray ground or wading pool, spa, bathhouse, and non-aquatic outdoor recreational areas to reflect local climate and micro-climate conditions. Provide protection from wind and glare for aquatic elements.

3-2.1 External Circulation.

Provide an external circulation system to include an access road, vehicle drop-off, parking lot for staff and customers, connections to on-site walkways, service drive with gate for easy access to the circulation/filtration equipment and chemical storage, and emergency responder vehicle access to the pool deck. Pave paths or walkways leading into the pool area with concrete, pavers, brick, stone, or other hard surface to eliminate tracking loose materials onto the pool deck. Provide a concrete apron for garbage dumpsters and recycling containers adjacent to the service drive.

3-2.2 Vehicle Circulation.

Provide a loop road or similar drop-off area in front of the aquatic facility that will accommodate buses and vans. Consider a one-way, double-lane width drop-off area to allow loading and unloading of buses and vans onto adjacent sidewalks, yet still allow privately owned vehicles (POV) to pass and drop-off or pick up customers. Locate bus stops and shelters conveniently near the aquatic facility with direct sidewalk access to the main entrance. Coordinate with the Installation to incorporate any additional requirements in accordance with Installation design guides.

Locate parking areas to the side of the entry building, where possible.

3-2.3 Building Access.

Provide clearly identified pedestrian access to the main entrance. Reinforce

connections to related Installation facilities with clear, direct pathways. Provide separate vehicular access for a main entrance drop-off area and for the service/emergency responder vehicle entrance.

3-2.4 Zoning.

Zone the pool deck, associated pools, spray grounds, sunbathing, recreation, and food service areas for maintenance and safety. Segregate children's play areas, spray grounds, and wading pools from the main pool by low fencing. If permanent spectator seating is provided, utilize low, transparent barriers to segregate the seating area from the pool area. Provide a separate entrance from an external pedestrian walkway system for spectators. Segregate food service areas with landscaping, low barriers, or fencing to provide controlled access between the pool and food service area. Place trash receptacles at the access point.

3-2.5 Landscaping.

Provide landscaping for the facility in accordance with UFC 3-201-02. Depending on project location, minimize the use of deciduous trees and plant varieties that shed materials around an outdoor pool to minimize deck and pool maintenance. Do not use bark mulch, small rocks, or similar ground covering materials near the pool deck or in areas where these materials may get washed into the pool or scattered about the pool deck area.

Coordinate with the Installation to incorporate any additional requirements in accordance with Installation design guides.

3-2.6 Site Signage.

Provide an exterior signage system in accordance with UFC 3-120-01. Coordinate exterior sign programs with the exterior design of the building and Installation requirements. Also, provide site signs that identify dedicated parking areas, service areas, accessible entrances, and other facilities for the disabled. Provide information regarding the facility's hours of operation and force protection condition (FPCON) on exterior signage located near the main entrance that is visible to customers from their vehicles.

3-2.7 Sunlight and Glare Control.

Outdoor aquatic facilities require special consideration to minimize excessive sunlight and control the effects of glare on patrons and staff. Provide accommodations for moveable lifeguard stations that can be easily relocated throughout the day to minimize the effect of glare on the water from sunlight or facility lighting. Provide shade for children's areas, patrons on the pool deck, lifeguard stations, food service areas, and for staff members at the check-in area and administrative areas. Provide portable shade accommodations at each lifeguard station.

For natatoria, orient the building and windows to reduce sunlight and glare throughout

the day.

3-2.8 Exterior Lighting.

Provide exterior lighting and controls for parking lots, building entrances and exits, pedestrian walkways, wheelchair ramps and plazas, vehicle roadways, streets and driveways in accordance with UFC 3-530-01. Design the exterior lighting system for the lighting zone in which the aquatic facility will be constructed. Provide a wall-mounted sign light to illuminate the building sign from above. Refer to paragraph POOL LIGHTING for detailed specifications for pool deck and underwater lighting.

3-3 WATER AREA DESIGN.

Water areas include swimming pools, diving pools, wading pools, spray grounds, non-medical spas and all spaces or equipment within these areas.

3-3.1 Pool Size and Capacity.

The maximum allowable pool size is determined by paragraph SPACE PROGRAM. The size of pools depends upon the unique program requirements at each Installation. The main pool may be a free-form general use pool, a lap swimming pool, or a combination of these two, depending on Installation-specific programming.

3-3.2 Shape, Slope, and Depth.

Design pool floor slopes and depths to the most stringent requirement in MAHC, ISPSC, ABA or in accordance with the event sanctioning body, unless paragraph FUNCTIONAL AREA REQUIREMENTS requires otherwise.

3-3.3 Lap Swimming Pool Size Standards.

These requirements cover pools for swimming laps, or competitive swimming events.

- Limit pools programmed for lap or competitive swimming to rectangular shape. Where diving is also a required program, diving may be incorporated into the deep end of the pool in a stretch or “L” configuration, when topographic conditions, site shape, natatorium enclosure challenges, or budget limit design options. The shape of training, recreation or wading pools is optional, with much more flexibility for unique shapes and configurations.
- Pool Lengths: 25 meters (82 feet, 1/4 inch) or 50 meters (164 feet, 1/2 inch). Provide an additional 0.03 meter (1-3/16 inches) of length to competitive pool nominal lengths to allow for electrical timing touch pads.
- Pool Widths: Six lanes – 18 meters (59 feet); eight lanes – 22.86 meters (75 feet). When pool width will be used for cross-course competitive swimming, provide an additional 0.03 meter (1-3/16 inches) to allow electrical timing touch pads.

- Lane Widths: Design all lanes equal width with lane lines in place. Provide additional space adjacent to the outside lanes, commonly referred as “buffer lanes”, to accommodate the overall width of the pool.
- Pool Depths: Pool depth requirements vary depending upon different levels of competition and the anticipated intended use or programs. Exceed depth requirements specified by sanctioning organizations at starting platform locations. Provide a depth of 3 feet, 6 inches to 4 feet, 0 inches (1.1 to 1.2 meters) at the shallow end of the pool for a minimum of 800 square feet (74.3 square meters). Coordinate with Installation point of contact for program specific requirements.

3-3.4 Diving.

For pools provided with spring boards or platform diving, provide the minimum dive envelope (length, width and depth) required by FINA*, unless the Installation-specific competitive diving sanctioning standards are more stringent.

*For Navy facilities: Provide the minimum pool length ahead of the plummet in accordance with NAVMED P-5010-4, Chapter 4.

3-3.5 Deep Water Activities.

For pools with drop-style slides or play features requiring deep water, provide the minimum pool dimensions required by the manufacturer of the play equipment.

3-3.6 Pool Construction.

Design and construct pools and spray pads of impervious and structurally sound material(s), which provide a smooth, yet slip-resistant, easily cleanable, watertight structure. The following construction types are approved for use:

- Reinforced concrete walls and gutter:
  - Cast-in-place concrete; or
  - Shotcrete (pneumatically-applied concrete).
- A combination of reinforced concrete walls with a metal gutter system.
- Metal (aluminum or stainless steel)

3-3.6.1 Metal Pools and Gutters.

Provide corrosion-resistant metal pools and gutters constructed of type 304 or 316 stainless steel. Provide aluminum pools with a system for minimizing corrosion (e.g., provide sacrificial anodes).

3-3.7 Pool Finishes.

For concrete construction, provide a ceramic tile pool interior or a combination of

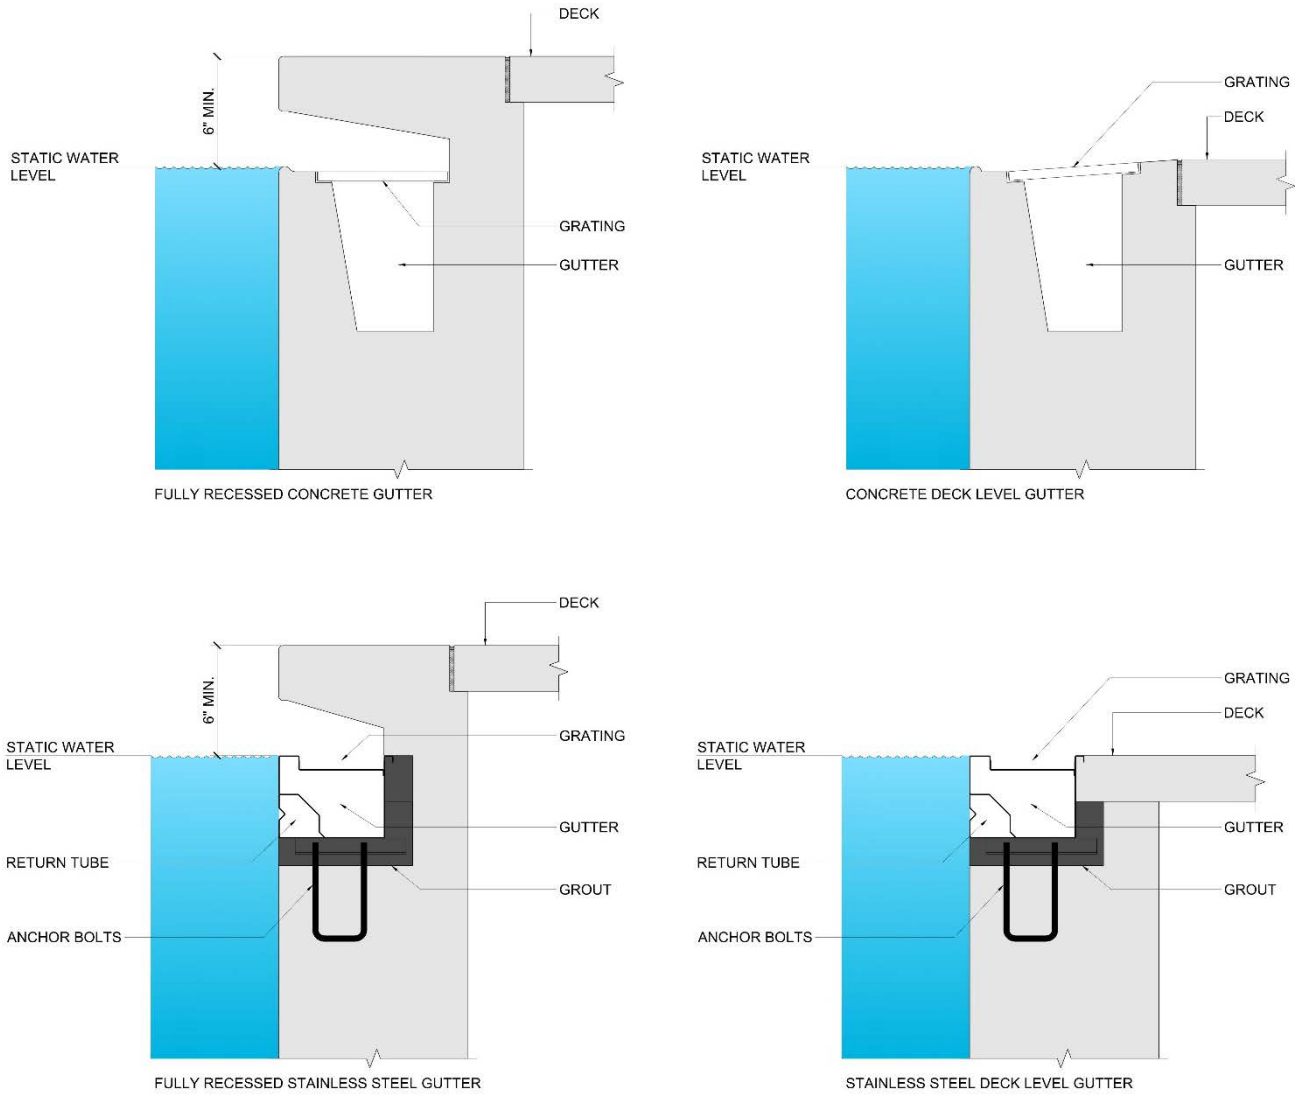
ceramic tile and quartz aggregate interior. Provide ceramic tile at the perimeter waterline, freeboard, racing course markings, end wall targets, slope line break, and at stair and bench nosing. Provide a painted finish for metal pools.

Provide a white or light blue pool finish color in accordance with the MAHC. Provide contrasting finish color for depth markers, racing course markings, end wall targets and stair and bench nosing. Provide a pool coping or gutter system that contrasts in color from the surrounding deck color or provide a contrasting perimeter tile band between the gutter/coping and deck finish. Provide slip-resistant finishes on all horizontal surfaces and on vertical surfaces in competition or lap swimming pools. Provide a hand hold on all portions of the pool deeper than 2 feet (0.61 meters).

3-3.8 Surface Skimming.

Provide all pools with a means of surface skimming in accordance with the ISPSC, MAHC and Service-specific requirements.*

*For Army facilities: Provide only fully or semi-recessed overflow systems sized to provide the required surge volume. Where skimmers are used, provide an equalization fitting in accordance with TB MED 575.



3-3.8.1 Overflow Systems.

Provide continuous perimeter overflow systems in accordance with the MAHC. Allowable overflow systems include fully recessed and deck level gutters as indicated in Figure 3-1: Overflow Systems. Cover overflow systems with a corrosion-resistant, structural grating. Fully recessed overflow systems may be provided without grating if the maximum opening does not exceed four inches (.01 meters). Design overflow systems to drain to the surge tank via gravity.

3-3.8.2 Skimmers.

Pools not required to have a complete perimeter overflow system may utilize manufactured skimmer systems in lieu of overflow systems.

Figure 3-1 Overflow Systems

3-3.9 Recirculation and Filter Systems.

Use air gap fittings to supply potable water into the pool, either directly or into the recirculation system. Provide air gap fittings between the swimming pool recirculation system and the sanitary or storm sewer system such that there is no direct physical connection. Provide complete, continuous recirculation of water through all parts of the swimming pool by appropriately sized, non-corrosive pipes. Use Schedule 40 polyvinyl chloride (PVC) or Schedule 80 PVC for most recirculation and activity pump piping requirements. For heater and heat exchanger piping, provide copper or chlorinated polyvinyl chloride (CPVC) pipe. Size the valves and draining system for the pool to prevent flooding (surcharging) of the sanitary or storm drainage system. Provide a centrifugal recirculation pump with capacity to achieve the minimum turnover rate of the pool, plus an additional allowance of 30 percent. Provide a pool turnover rate in accordance with the more stringent requirement between ISPSC and MAHC for all

venue and pool types.

3-3.9.1 Recirculation System Minimum Requirements.

Provide a recirculation system consisting of pumps, piping, filters, feeders, water-conditioning equipment, city water make-up, surge tank, and other accessories to filter and disinfect the swimming pool volume of water in the turnover time required in paragraph RECIRCULATION AND FILTER SYSTEMS. Recirculate water from the main drains and overflow system into the circulating pumps via the surge system under normal operating conditions. Size overflow gutter piping and main drain piping according to the requirements in the MAHC. Provide valves and regulating devices that allow for adjustment of the ratio of water through the main drains and overflow gutter.

3-3.9.2 Surge Tanks and Surge Control.

Equip recirculation systems with concrete, cast-in-place surge tanks, unless the maximum surge requirements of the pool are handled by surge contained in the gutter or freeboard. Provide the minimum surge capacity required by ISPSC and MAHC. Provide flow control valves to modulate water flow from the main drain and from the surge tank.

3-3.9.3 Motor Controls and Auxiliaries.

Provide magnetic starters for the control of the recirculation pump, including corrosion-resistant enclosures. Use NEMA 4X fiberglass-reinforced polyester (FRP) components for all electrical and control items subject to corrosion. Provide integral capacity motors that meet the requirements for Premium Efficiency Motors in accordance with EPAct05.

Provide variable frequency drives (VFDs) for all filter pump motors and for activity pump motors greater than 10 HP. For filter pump motors, interlock the flow meter with the VFD to maintain constant design flow regardless of system variables.

3-3.9.4 Pumps.

Provide centrifugal style pumps for all recirculation and activity pumps. Provide basket strainers immediately in front of all centrifugal pumps to protect the internal components of the pump. Provide an extra basket strainer for each pump system. Provide a pump pit adjacent to the surge tank or pool to provide a flooded suction condition*. If a pump pit cannot be included, provide self-priming pumps or other means for pump priming. Provide a flow control valve on the pump effluent pipe for manual control of flow and isolation for system testing and maintenance.

*For Army facilities: Provide flooded suction design for all pumps except fractional or small horsepower pumps for special uses.

3-3.9.5 Flow Meters.

Provide a flow meter in each main line serving a pool. Provide flow meters on a straight, uninterrupted section of pipe at least 10 pipe diameters downstream from the

last fitting and five diameters distance beyond. In addition, provide a mercury-type manometer flowmeter or magnetic flowmeter at the discharge of the recirculation pump to monitor primary flow and backwash.

3-3.9.6 Filters.

Acceptable types of pool filters are sand filters* and regenerative media filters. Provide a filtration rate for high rate sand filters that does not exceed 13 gallons per minute per square feet of filter bed (32 cubic meters per hour per square meter of filter bed). Provide a filtration rate for regenerative media filters of 1.3 gallons per minute per square feet of filter bed (3.2 cubic meters per hour per square meter of filter bed) or less. Provide pearlite media for regenerative media filters. Discharge backwash water and regenerative media drain water via an air gap fitting into the sanitary or storm sewer where allowed by code. Diatomaceous earth for filter media is not allowed.

*For Army facilities: Provide only regenerative media filters.

3-3.9.7 Drains and Inlets.

Provide main drain and outlet systems in accordance with ANSI/APSP/ICC 7 and ANSI/APSP-16. Provide at least one main drain in the deepest part of the swimming pool. For pools at least 30 feet (9.1 meters) wide, space multiple drains no more than 15 feet (4.5 meters) from a side wall, but no greater than 20 feet (6.1 meters) apart. Provide hydrostatic relief valves in each drain. Provide flat, not domed, drain grating in pools where the water depth at the main drains is less than five feet (1.5 meters). Provide drains flush with the pool floor.

Provide a minimum inlet quantity as required by ISPSC, spaced in accordance with MAHC. For wall inlets, use butterfly ball-and-globe-style inlet valves made partially or completely of PVC or other high-quality plastic for new pools and renovations. For stainless steel gutter pools, provide wall inlets integral to the pool gutter and floor inlets in accordance with MAHC. Provide an automatic fill system with manual bypass. Supply fresh water through an air gap at least 6 inches (150 millimeters) above the pool deck elevation. Locate fill spout and controls in a location that is inaccessible to users.

3-3.10 Heating and Water Temperature.

Provide a means for heating for all indoor pools and for outdoor pools where the climatic conditions warrant their use. Provide water heaters and heat exchangers specifically designed for use with swimming pool water and sized to bring the pool up to temperature within 24 hours (main pool) or 4 hours (spa pool or wading pool) or less, if required by the local Installation or pool program. Provide a heater or heat exchanger that can maintain the temperature range required for the anticipated programming of the pool. Where gas-fired pool water heaters are specified, provide direct vent/sealed combustion.

Provide an insulated pool cover in accordance with ISPSC, UFC 1-200-02, and paragraph SUSTAINABLE DEVELOPMENT.

3-3.11 Water Quality.

Coordinate design and method for pool disinfection with the Installation's agency responsible for water quality testing and certification. Use of chlorine gas is not allowed at new construction. Allowable sanitizers include sodium hypochlorite (liquid chlorine), calcium hypochlorite (solid chlorine), and on-site generation of chlorine from sodium chloride (salt). Pipe filtered water to chemical rooms for introduction of chemicals rather than running chemical lines through occupied spaces.

Provide automatic chemical controllers to analyze pool water and automatically feed chemicals. Provide supplemental disinfection/sanitization utilizing an ultraviolet (UV) light disinfection system or ozone generator in accordance with the MAHC and ISPSC*. Supply fresh make-up water to the pool automatically utilizing an automatic water level control system.

*For Army facilities: Provide supplemental disinfection on all indoor pool filtration systems.

3-3.12 Pool and Deck Lighting.

Lighting is required for swimming pools and pool deck areas. Provide lighting systems as described below and in accordance with UFC 3-530-01, MAHC, and ISPSC.

Provide artificial lighting for swimming pools that will be used at night, or which do not have natural lighting, so that all portions of the pool, including the bottom and drains, are readily seen without glare.

3-3.12.1 Overhead Lighting Criteria.

Provide overhead luminaires installed along the pool edge, not over the water, for ease of maintenance from the pool deck with the aid of portable ladders or scaffolding. Arrange overhead luminaires to provide uniform distribution of illumination. Where pool size or geometry requires overhead luminaires to be installed over the pool water surface, or where they cannot be maintained from the pool deck, they must be arranged so that they are readily accessible from permanently-installed catwalks.

For recreational pools, provide a minimum of 30 horizontal foot candles overhead illumination on the water surface when underwater lighting, in accordance with paragraph UNDERWATER LIGHTING CRITERIA, is used. Without underwater lighting, provide a minimum of 50 horizontal foot-candles on the water surface. Provide a minimum of 10 horizontal foot-candles overhead illumination on the pool deck surface.

3-3.12.2 Overhead Lighting Controls.

For indoor pools, where artificial lighting is used to meet the light level requirements, provide manual means to control the overhead luminaires. Separately control luminaires in daylighted areas through continuous dimming photocontrol to reduce light output when natural light is available. For outdoor pools, where natural lighting methods

are used to meet the light level requirements, provide automatic lighting controls based on light levels or time of day to turn lights on and off.

3-3.12.3 Emergency Lighting.

In the pool area, provide emergency illumination in accordance with ISPSC. In addition to the prescriptive requirements of ISPSC, provide emergency egress lighting that produces a minimum of 0.5 foot-candles along the path of egress in the pool area. Avoid placing emergency light fixtures over the pool water surface area or in areas where they cannot be maintained from the deck.

3-3.12.4 Underwater Lighting Criteria.

Provide underwater lighting systems to meet the performance requirements of the ISPSC and MAHC, and the installation requirements of NFPA 70. Use non-dimmable light-emitting diode (LED) luminaires for underwater lighting. Where LED luminaires are prohibited or not practical, use incandescent luminaires for underwater lighting. Provide underwater light fixtures in standard voltage (120 volts) or low voltage (12 volts). When low-voltage light fixtures are specified, locate the transformer in accordance with NFPA 70. Either wet niche or dry niche fixtures may be used.

Consider pool use, agitation of water, and overhead lighting design when designing the underwater lighting system. For competition swimming, provide lights on the side walls and, for competitive pools with cross-course swimming, centered under lane anchors on the start and turning ends of the pool. If lights are provided at the start and turning ends of a pool used for competitive events, provide a turn-off switch for racing.

3-3.12.5 Underwater Lighting Controls.

Provide manual lighting controls to turn underwater luminaires on and off. Dimming controls are not permitted.

3-4 POOL DECK DESIGN.

Provide impervious, slip-resistant deck area around each pool to serve as a circulation path and lounging area for pool users. For outdoor pools, shade areas of the pool deck to provide protection from the sun for customers and staff. Optional amenities, such as concession areas and spectator seating areas, may require additional deck space to accommodate the desired programs.

3-4.1 Deck Size and Capacity.

Provide deck area for outdoor pools at a ratio of two to three times the pool water area. Locate spray grounds for children on the pool deck and consider additional space to accommodate these areas. Provide deck space for natatoria at a ratio of 0.75 to 1.5 times the pool water area. Provide separation of deck spaces into walkways and other uses. Provide minimum walkway clearance in accordance with ISPSC.

Provide the following minimum clear pool deck widths:

- SIDES: 10 feet (3.05 meters) Indoor Pools, 12 feet (3.6 meters) Outdoor Pools
- SHALLOW END: 15 feet (4.6 meters) Indoor Pools, 20 feet (6.1 meters) Outdoor Pools
- DEEP END: 20 feet (6.1 meters) Indoor Pools, 20 feet (6.1 meters) Outdoor Pools

3-4.2 Slope and Drainage.

Slope the pool deck away from the pool so that water on the deck (either from pool overflow, splashing, rain or surface water run-off) is not allowed to flow into the pool. Provide a minimum deck slope of 0.25 inch (6 millimeters) per 1 foot (0.30 meter) and not more than 0.5 inch (12 millimeters) per 1 foot (0.304 meter). Provide deck drains such that all areas of the deck slope to a drain to eliminate ponding on the deck. For natatoria designs, locate deck drains between the pool and building wall and slope all areas to drain. Route piping from the deck drainage to the sanitary sewer (indoor pools) or storm sewer (outdoor pools) unless required otherwise by State and local codes where drainage leaves the Installation.

3-4.3 Materials and Surface Finishes.

Provide pool decks of a long-lasting, easily cleanable, UV-resistant and impervious material. Acceptable materials include concrete, ceramic tile, or equivalent materials. Provide all deck surfaces with slip-resistant finish. Where appropriate for outdoor pools, use cool decking materials that do not build up excessive heat when exposed to direct sunlight. Provide slip-resistant, permanent depth makers in the pool deck at the edge of the pool.

3-4.4 Spectator Seating.

Provide seating for spectators according to the program requirements and separated from walking paths.

3-5 BATHHOUSE AND NATATORIUM DESIGN.

Provide structures and finishes capable of resisting corrosion from moisture and chemical vapor. Provide interior and exterior walls of masonry construction with brick, block, composite material siding, metal panels, stucco, or similar materials that are architecturally compatible with the Installation-specific guidelines. Provide moisture- and mildew-resistant, easily cleaned surfaces. Dressing rooms, shower rooms, drying areas, and toilets are considered wet areas. Provide materials for stalls, walls and floors in wet areas that are impervious to water and able to be hosed down for cleaning. Provide slip-resistant wet area floors pitched to floor drains. Provide elevated concrete pads for lockers and other equipment to facilitate cleaning and reduce the corrosive effects of frequent exposure to water.

3-5.1 Natatoria Design.

Select building materials to economically span the pool and deck width with moisture-resistant materials such as concrete, galvanized steel, and laminated wood. Coat all exposed metal surfaces to resist the corrosive climate within the natatorium. Design exterior walls and openings for climate impact. Evaluate seasonal impact of indoor and outdoor humidity to properly locate vapor barriers. Conduct dewpoint analysis on exterior walls and roofs. Provide thermal breaks in window -and door-frame openings. Provide acoustic control of natatorium space through use of natatorium specific baffles or panels. Comply with dimensional requirements detailed in FINA for minimum ceiling heights in natatoria with diving. Provide minimum 16-feet (5 meters) clearance for facilities without diving. Locate windows in the natatorium to avoid glare on the water surface. Provide fixed sun screens on southern exposures. Tint deck level windows if provided along the sides of the pool.

For enclosure of existing outdoor pools, evaluate existing deck slope. Provide deck drains to completely remove deck water.

3-5.1.1 Vestibules and Airlocks.

Provide vestibules and airlocks in natatoria based upon the climatic issues at each Installation. When designing entry vestibules, provide double sets of entrance doors to create an airlock. Comply with accessibility requirements identified in paragraph ACCESSIBILITY. Provide walk-off mats inside the airlock and removable rugs in lobby areas. Consider built-in drains inside recessed walk-off mats in foyers to allow water to drain off, and heated mats in cold-weather climates. Provide ventilation or climate control to prevent moisture accumulation or condensation.

3-5.2 Building Organization and Circulation.

Organize bathhouse and natatorium spaces to take advantage of local climate conditions, such as prevailing winds and sunlight. Consider the desired flow of customer traffic from the entry control point to the pool deck and the need to provide convenient access to the shower areas to encourage customers to shower before entering the pool. Provide a pool office located with direct visual access to all pools.

For natatorium designs, separate wet and dry areas. Provide a dry circulation path from the entry to the control point and locker rooms. Provide a wet circulation path from the locker rooms, through the shower area, and onto the pool decks. Where spectator seating is provided, provide access to that seating on the dry circulation path. Provide an entry lobby with waiting/display, control desk, equipment storage and vending space. Provide a control desk in lobby for customer check-in. Provide a training/classroom accessible from both the dry and wet corridors.

3-5.3 Clothing Storage.

Provide lockers for storage of customer clothing and valuables. Determine appropriate locker size for local program and climate requirements. Locate lockers within changing rooms, on pool deck or a combination of both locations.

3-5.3.1 Locker Systems.

Provide non-corrosive, moisture-resistant, vented lockers, that are durable, easily cleaned, and do not accumulate water. The optimal arrangement of lockers is two tiers to permit the hanging of adult street clothes. Increase the number of lockers to meet the authorized capacity, but do not exceed the comfortable reach limits for an averaged sized person or reach limits required by the ABA for accessibility. The most efficient locker arrangement is a back-to-back layout with alcoves off of circulation aisles. Provide locker systems capable of use with user-provided locks.

Provide a 16 inch (410 millimeter) high bench in the middle of each aisle for the entire length of the aisle minus circulation clearance where an aisle meets a wall.* Locate benches a minimum of 2 feet, 8 inches (810 millimeters) clear of locker doors, in the open position, or as to comply with ABA accessibility requirements. When a row is more than 16 lockers long, provide a 3 foot (910 millimeter) long break every 15 feet (4.6 meters). Alternatively, provide 16 inch (400 millimeter) wide benches integral to the locker system. Lockers required to comply with ABA must have benches a minimum of 20 inches (500 millimeters) to maximum 24 inches (600 millimeters) in depth; 42 inches (1050 millimeters) minimum in length; seat height of 17-19 inches (425-475 millimeters) above floor. Provide a minimum 6 inches (150 millimeter) concrete base. Provide a recessed toe kick at the base.

*For Army facilities: Provide benches that are integral with the locker base.

3-5.4 Pool Equipment Storage.

An extensive amount of equipment is required for the operation and safety of the pool and other components of the facility. Carefully size and design storage areas to accommodate required equipment. Provide ventilation and a drain in the pool equipment storage room. Provide storage for lifesaving equipment in the pool area (e.g., hang life hook/pole and backboard on building wall) in a location that facilitates instant access to those items related to lifesaving procedures.

3-5.5 Surveillance and Security.

Orient bathhouse or natatoria and overall site to allow effective, continuous monitoring of the facility with a limited staff. Locate a prominent check-in/check-out counter near the main entrance with unobstructed views of all entrances and exits. Locate the pool office with complete and unobstructed surveillance of the entire deck and pool area. Lifeguard stations have specific surveillance requirements depending upon the configuration of the pool and other facilities. Refer to paragraph LIFEGUARD STATIONS for detailed information regarding location and quantity requirements.

Where direct visual contact of the lobby, entrances into locker rooms, and pool areas cannot be made from the check-in/check-out counter, or other designated control desk location, provide security cameras to facilitate surveillance of those areas from the designated control desk location*

*For Army facilities: Provide surveillance infrastructure, including conduit, cabling, raceways, wires, conductors, power, and junction boxes for a complete and operational system. Provide 2-inch empty conduit routed from security camera sources to control counter base cabinets and continue into ceiling cavity above counter for present and future video cabling. Conduit system to be concealed. Place a surveillance-system CCTV monitor connection in the staff office or check-in counter where it can be easily viewed by the facility director and staff. Provide a surveillance-system CCTV monitor connection in the director's office and ensure the system can record and back-up information. Provide waterproof surveillance-system equipment when located within the pool deck envelope or natatorium.

3-5.6 Architectural Character.

Bathhouse and building designs express the recreational role the aquatic facility plays in the life of the community and should project a feeling of informality. Although there is no single mandatory style, the design respect of the style, scale, and character of the surrounding area is desirable. Coordinate material selections, course lines, roof slopes, scale of windows, and other building elements to ensure the building style complies with the Installation-specific architectural compatibility guidelines and better buildings in the local area. Bathhouses that are removed from surrounding structures offer opportunity for a more unique architectural form, while remaining compatible with the overall styling and character of the Installation, as well as the geographic region. Locate unsightly elements, such as pool equipment and garbage dumpsters, at the back of the facility where they are not visible from roads and parking areas. Screen these items and similar elements, when needed, with landscaping, walls, fencing, and other architecturally compatible materials.

Provide architectural and interior design of aquatic facilities that is integral and related. Both involve functional analysis and consideration of the appropriate environmental character, building organization, circulation, supervision, and flexibility requirements, as well as finishes and furnishings. Present an open, inviting image while providing visibility of attractive activities from the approach and entrance. Admit only controlled, indirect daylight into dressing rooms and administrative areas through clerestories, skylights, or windows.

3-6 INTERIOR DESIGN.

Use NCIDQ-certified interior designers with experience in aquatic facility design to prepare the Comprehensive Interior Design. Provide interior surface materials, finishes and designs that are suitable for use in aquatic facilities and that enhance the overall architectural theme and aesthetic of the facility. Carefully select interior surfaces, details, finishes, fixtures, and fittings for resistance to wear, impact, and vandalism.

Select materials that are resistant to water and mildew due to the high humidity and corrosive environment associated with pools and showers. Base interior design selections on consideration of anticipated use, maintenance characteristics, life-cycle cost, fire protection, and other safety requirements. Coordinate with Installation personnel to incorporate local interior design requirements.

3-6.1 Interior Finishes.

Consider the safety and hygiene of customers in every aspect of the design development. Provide slip-resistant floor and deck surfaces in wet areas. Select wall surfaces to minimize abrasions in case of accidents or stumbles by customers and staff. Coordinate material, finish, color, texture, and furniture selections to complement the overall building design and image. Use colors, textures, and finish materials on the walls and floors to support circulation patterns. Select surface materials and furnishings that are moisture-and mildew-resistant and express a warm, intimate, and relaxed atmosphere. Use local materials to the greatest extent practicable to reinforce the user's sense of place or region.

3-6.2 Flooring.

Use slip-resistant ceramic tile, concrete, or other slip-resistant material for bathhouse or natatorium floors and in other administration areas. Select walking surface finishes with a minimum wet dynamic coefficient of friction (DCOF) as dictated by MAHC. Ensure that flooring materials, such as rubber, comply with applicable service and installation criteria. Slope floors to drains to prevent standing water. Provide coved tiles at wall to floor intersection in wet areas (e.g., dressing rooms, showers, toilet areas, etc.) to minimize dirt accumulations and for ease of cleaning.

3-6.3 Interior Walls.

For wet areas, construct walls with nonabrasive materials, like smooth block or brick. Dry area walls may be painted concrete masonry unit (CMU) block, painted masonry, moisture-resistant gypsum board, Portland cement plaster, or high-strength gypsum plaster. Construct dry area non-concrete or masonry cavity walls with galvanized metal studs raised upon a 6-inch concrete curb. A protective ceramic tile finish may be installed either full height or as a wainscot. Provide doors and frames that comply with SDI/Door A250.8, physical performance Level B, and be 316L stainless steel or fiberglass at wet area service. Door hardware must be 316L stainless steel.

3-6.4 Ceilings.

Provide a ceiling clear height of least 9 feet (2.75 meters).

3-6.4.1 Public Spaces.

For wet areas, provide moisture-resistant, sound absorbent, light reflective ceiling materials such as moisture-resistant gypsum board, plaster, galvanized metal, or other finishes impervious to moisture and mildew. For dry areas, provide moisture-resistant,

sound absorbent, light reflective ceiling materials such as moisture-resistant gypsum board, plaster, tegular acoustical tile, galvanized metal, or other finishes resistant to water and mildew.

3-6.4.2 Natatorium Ceilings.

Provide moisture-resistant materials such as galvanized metal, or other finishes impervious to moisture mildew. Suspended ceilings of any type are not allowed in the natatorium.

Provide a clear ceiling height over diving boards in accordance with FINA, unless the Installation-specific competitive dive standards are more stringent.

3-6.5 Furniture, Fixtures, and Equipment.

Provide furnishings and equipment with materials, finish selections, manufacturing methods and usage suitable for use in aquatic facilities for both indoor and outdoor furnishings, and that enhance the overall architectural theme and aesthetic of the facility. Choose interior furniture, fixtures, and equipment (FF&E) that is durable, comfortable, attractive, water and mildew-resistant. Consider modular components that match the office, staff break area, and training room. Provide highly durable surfaces for check-in and concession counter fronts, as they are subject to heavy use. Consider metal, solid-surface composite materials or stone for the front counter panels and counter tops. Provide corrosion-, moisture- and graffiti-resistant furniture and materials in dressing rooms.

3-6.6 Interior Signage.

Interior signage is important to support the functionality of the facility and for wayfinding. Provide interior signage system in accordance with UFC 3-120-01 and ABA requirements. Coordinate with Installation personnel to meet additional local design criteria requirements.

3-7 FACILITY SYSTEMS.

Facility systems include specific guidelines for core building systems, such as structural, mechanical, electrical, plumbing, lighting, fire protection, life safety, security, and acoustics. For natatoria, provide facility systems, components, and finishes and hardware that are moisture- and corrosion-resistant.

3-7.1 Structural.

Select an economical structural system based on facility size, projected load requirements, local availability of materials and labor, and wind, snow, seismic, geologic, and permafrost conditions. Select and design the structural system based on analysis of projected future needs to accommodate future expansion requirements easily and economically. However, do not over-design the initial construction. Structural bay sizes should reflect space requirements, economy, and subsystem

dimensions, such as masonry units and ceiling grids. Coat all exposed metal surfaces with appropriate coating to resist the corrosive environment within the natatorium. Provide structural bay sizes compatible with standard shelving and locker unit sizes and standard row-to-row dimensions.

Buildings should be limited to one or two stories to avoid the additional costs associated with AT/FP progressive collapse requirements.

3-7.2 Heating, Ventilation, and Air Conditioning (HVAC).

3-7.2.1 General.

Provide HVAC systems in accordance with UFC 3-410-01, UFC 3-410-02, UFC 4-010-01 and other applicable UFCs. Additional criteria specific to aquatic facility HVAC systems is included herein*

*For Army facilities: Provide designs in accordance with Technical Criteria for US Army Physical Fitness Facilities, Chapter V Natatorium and Technical Bulletin 575, Recreational Water Facilities.

**For Air Force facilities: Provide designs in accordance with AFMAN 48-114, Recreational Waters & Mission Training Pools.

3-7.2.1.1 Determine heating and cooling system design loads for sizing systems, appliances, and equipment in accordance with UFC 3-410-01. Include analysis of UFC 1-200-02, ASHRAE 189.1, ASHRAE 62.1 and ASHRAE 55 for thermal environmental conditions for human occupancy in the HVAC design.

3-7.2.1.2 Natatorium/indoor pool spaces must be on a separate ventilation system from the rest of the facility, including administrative space, showers, toilets and locker rooms. Provide HVAC systems for natatorium/indoor pool environments that comply with the recommended natatorium practices in the 2015 ASHRAE Handbook – HVAC Applications (Chapter 5 Places of Assembly – Natatoriums) for humidity control, room pressure control, ventilation requirements (outdoor and exhaust air) for indoor air quality (IAQ), air distribution, duct design, pool water chemistry and evaporation rates.

3-7.2.2 Outdoor Environmental Conditions.

Size equipment and all system components to maintain and control indoor design conditions at the outdoor conditions in accordance with UFC 3-410-01.

3-7.2.2.1 Natatorium/Indoor Pool Environments: These spaces are to be considered Spaces Conditioned for Specialized Technical Requirements in accordance with UFC 3-410-01. Due to the significant ventilation load requirements for these spaces, pay close attention to the 1.0 percent humidity ratio and corresponding Mean Coincident Dry Bulb (MCDB) condition.

3-7.2.3 General Indoor Environmental Conditions.

Size equipment and all system components to maintain the following indoor design conditions. Provide design conditions, including temperature, humidity, filtration, ventilation and air changes required.

3-7.2.4 Administrative/Office/Restroom/Locker Room Environments.

Maintain indoor heating and cooling design conditions for both occupied and unoccupied hours in accordance with UFC 3-410-01.

Bathhouses for outdoor pools are not heated or air-conditioned except for administrative areas. Because of the high humidity produced in the shower and dressing areas, as well as the potential odor associated with locker storage, provide the bathhouse with a ventilation system in accordance with the International Mechanical Code, ASHRAE 62.1 or a minimum of six air changes per hour, whichever is greater. Provide mechanical ventilation fans in dressing rooms, showers, and toilets to help reduce excessive humidity and odor.

3-7.2.5 Natatorium/Indoor Pool Environments.

3-7.2.5.1 Maintain indoor air temperature at the pool and wet deck 2 to 4 degrees Fahrenheit (1.1 to 2.2 degrees Celsius) above the water temperature at a relative humidity of 50-60%.

3-7.2.5.2 This paragraph applies to Army and Air Force facilities. Provide a separate direct outside air system (DOAS) for the pool deck that delivers the greater of 2.2 CFM per square foot (of pool surface area) or the recommended air changes per hour (ACH) per the current ASHRAE Handbook, HVAC Applications, “Places of Assembly.” This criterion will insure sufficient ventilation air to maintain healthy IAQ and control the build-up of toxic chloramines, such as dichloramine and trichloramine, that off-gas into the air due to water treatment. Add occupancy and other ventilation air requirements per ASHRAE Std 62.1 as necessary. See paragraph NATATORIUM/INDOOR POOL ROOM HVAC SYSTEMS for specific HVAC system design strategies/requirements for these spaces.

3-7.2.5.3 This paragraph applies to Navy and Marine Corps facilities. Provide sufficient supply air delivery rate and outdoor ventilation air to maintain healthy IAQ and control the build-up of toxic chloramines, such as dichloramine and trichloramine, that off-gas into the air due to water treatment. See paragraph NATATORIUM/INDOOR POOL ROOM HVAC SYSTEMS for specific HVAC system design strategies/requirements for these spaces.

3-7.2.5.4 Maintain a supply air delivery rate of 4-6 air changes per hour for recreational pools with no spectator areas, 6-8 air changes per hour for competition pools with spectators, and 4-6 air changes per hour for therapeutic pools. The supply air rate must be adjusted to meet space sensible loads while maintaining a comfortable supply air temperature for swimmers; 65 degrees Fahrenheit (18.3 degrees Celsius) is a

practical minimum supply air temperature.

3-7.2.5.5 This paragraph applies to Army and Air Force facilities. Provide minimum outside air for ventilation of 2.2 CFM per square foot (of pool surface area) at all times unless an increase in the ventilation rate is determined to be required by the recommendations of the current ASHRAE HVAC Applications Handbook (chapter on "Places of Assembly"). The minimum requirement at the breathing zone of the swimming pool and wet deck area (3 inches to 72 inches above the deck) is 0.48 cfm per square foot (2.4 l/s per square meter). The breathing zone is 3 inches to 72 inches (75 millimeters to 1830 millimeters) above the deck. Adjust this requirement based on the ASHRAE activity factor for the facility type in accordance with the procedure detailed in the ASHRAE Applications chapter on natatoriums. The minimum for spectator areas and deck areas not considered to be wet is 0.06 cfm per square foot (0.3 l/s per square meter) with an additional 7.5 cfm/person (3.8 l/s per person).

3-7.2.5.6 This paragraph applies to Navy and Marine Corps facilities. Provide minimum outdoor air for ventilation in accordance with ASHRAE 62.1, unless an increase in the ventilation rate is determined to be required by the recommendations of 2015 ASHRAE Applications Handbook, Chapter 5. The quantity of outdoor air must provide adequate dilution of contaminants generated by the pool water. The minimum requirement at the breathing zone of the swimming pool and wet deck area (3 inches to 72 inches above the deck) is 0.48 cfm per square foot (2.4 l/s per square meter). The breathing zone is 3 inches to 72 inches (75 millimeters to 1830 millimeters) above the deck. Adjust this requirement based on the ASHRAE activity factor for the facility type in accordance with the procedure detailed in the ASHRAE Applications chapter on natatoriums. The minimum for spectator areas and deck areas not considered to be wet is 0.06 cfm per square foot (0.3 l/s per square meter) with an additional 7.5 cfm/person (3.8 l/s per person).

3-7.2.5.7 Maintain pool and spa areas at a negative pressure of 0.05 to 0.15 inches of water (12.5 to 37.4 pascals) relative to adjacent spaces and the outdoors; implement active pressure control if feasible. Design system so exhaust air rate exceeds the supply air delivery rate such that the excess exhaust is 10% of the supply air volume; acceptable range for excess exhaust is 2% to 10%.

3-7.2.6 Administrative/Office HVAC Systems.

Heating, ventilating and air conditioning systems must be separate from those serving the natatorium/indoor pool environment. Fully duct all supply and return air distribution systems. Provide zoning to maintain different environmental conditions in each required functional area.

3-7.2.7 Natatorium/Indoor Pool Room HVAC Systems.

3-7.2.7.1 Deterioration of materials from condensation should be anticipated and minimized with mechanical design and construction material selection resistant to chemical corrosion from the pool atmosphere. Construct metal ductwork, diffusers, registers and grilles of aluminum. Fabric ductwork with grilles sewn in may be

acceptable for exposed ductwork in pool areas. Use of duct liner is prohibited. Steel hangers and supports must be painted with an epoxy-based paint or other durable finish suited to protect the metal from corrosion in a natatorium environment. Aluminum is the preferred material of construction for interior walls and floors of air handling sections of air conditioning units, including drain pans, dampers, fan wheels and heat exchangers; provide phenolic or baked epoxy coating for coils. Any steel components must have a phenolic or baked epoxy coating. Provide filters that are resistant to moisture degradation.

3-7.2.7.2 Do not locate equipment requiring maintenance above the pool or spa.

3-7.2.7.3 Direct supply air to building envelope surfaces, particularly glass, to prevent condensation. Direct supply air over the water surface toward low return/exhaust intakes to remove chloramines from the breathing zone of swimmers. Limit the air velocity over the water surface to 30 fpm (0.15 m/s) or less. Locate high and medium return intakes to capture warm, humid air for return to the ventilation system, minimize short-circuiting of supply air, and limit chloramine recirculation. Locate low exhaust intakes to optimize the capture of chloramines and limit their recirculation. Locate return and exhaust intakes at the warmest bodies of water and those with the most agitation, as these areas off-gas at higher rates than traditional pools; always provide exhaust intakes directly over spas.

3-7.2.7.4 For pools with spectator areas physically separate from pool area, the preference is to provide a dedicated air handling unit to provide supply air to the space at a temperature more comfortable for spectators and separate spectator ventilation requirements from pool area ventilation requirements for improved ventilation/energy efficiency. If a single unit is provided to serve both the spectator viewing and pool areas, then it must be sized to include the spectator ventilation load at full occupancy during swim meets and events.

3-7.2.7.5 Provide system with method of air-to-air energy recovery between exhaust and outdoor air streams. Justification must be provided to not include this energy recovery feature (economically unfeasible due to existing conditions, system size, etc.). Desiccants are broken down by chlorides and are not to be used.

3-7.2.7.6 HVAC system serving the pool area must include a purge mode to replace indoor air with outdoor air after chemical treatment process of “shocking” the pool as recommended by the Model Aquatic Health Code. Design the system to provide 100% outside air during this operation.

3-7.2.7.7 Consideration must be given to energy saving strategies such as, but not limited to, the following:

- Use of increased outdoor air ventilation for dehumidification and increased IAQ in conjunction with air-to-air energy recovery
- Use of waste heat from air conditioning and dehumidification to heat pool water

3-7.2.8 Chemical Storage Rooms.

Space must be kept at a negative pressure with dedicated exhaust air system meeting the requirements of the MAHC. Each chemical storage room must have an independent, dedicated exhaust system to prevent mixing of acid and chlorine vapors. Provide exhaust air intakes within 6-inches (150 millimeters) of the floor to capture chemical vapors heavier than air. Minimum flow rate to be the greater of 1.5 cfm per square foot (7.5 l/s per square meter) or 10 air changes per hour, unless the MSDS or manufacturer of the chemicals being stored requires a higher rate. Materials of construction must be resistant to corrosion. Construct ductwork, registers and grilles of aluminum or fiber-reinforced plastic (FRP). Provide exhaust fan(s) made of aluminum or FRP construction. Steel elements, such as hangers and supports, must be painted with an epoxy-based paint or other durable finish suited to protect the metal from corrosion in this environment.

3-7.2.9 Pump and Water Treatment Equipment Rooms.

Keep space at a negative pressure with dedicated exhaust air system meeting the requirements of the MAHC. Provide exhaust air intakes within 6-inches (150 millimeters) of the floor to capture chemical fumes heavier than air. Meet the minimum flow rate requirements of ASHRAE 62.1 or other applicable standards for chemicals and equipment being utilized, as well as heat gain from equipment. Ventilation system must be capable of accommodating venting of surge tanks, if applicable. Materials of construction must be resistant to corrosion. Construct ductwork, registers and grilles of aluminum or fiber-reinforced plastic (FRP). Provide exhaust fan(s) made of aluminum or FRP construction. Paint steel elements, such as hangers and supports, with an epoxy-based paint or other durable finish suited to protect the metal from corrosion in this environment.

3-7.2.10 Pool Equipment Storage Rooms.

Keep space at a negative pressure with dedicated exhaust air system providing a minimum flow rate of 1.0 cfm per square foot (5 l/s per square meter) or 10 air changes per hour, whichever is greater. Materials of construction must be resistant to corrosion due to chlorides. Construct ductwork, registers and grilles of aluminum or fiber-reinforced plastic (FRP). Provide exhaust fan(s) made of aluminum or FRP construction. Paint steel elements, such as hangers and supports, with an epoxy-based paint or other durable finish suited to protect the metal from corrosion in this environment.

3-7.2.11 HVAC Controls - General.

If facility is provided with a direct digital control (DDC) system, it must comply with UFC 3-410-02, Direct Digital Control for HVAC and Other Building Control Systems and UFC 4-010-06 Cybersecurity of Facility-Related Control Systems. If connecting to Installation BAS/UMCS system, UFC 3-470-01 Utility Monitoring and Control System (UMCS) Front End and Integration is applicable.

Do not locate thermostats and temperature sensors on exterior walls or adjacent to windows, doors, water or other features that would influence an inaccurate reading.

3-7.2.12 Administrative/Office HVAC Controls.

Provide night and weekend setback capability for the HVAC system and zone control for maintaining different environmental conditions in each required functional area. If facility is not provided with a DDC system, then provide 24-hour/7-day programmable thermostats. Utilize security features so that thermostats are only accessible to authorized personnel.

3-7.2.13 Natatorium/Indoor Pool Environments HVAC Controls.

3-7.2.13.1 HVAC system controls are to be integrated with swimming pool process control system, as applicable, for coordination of system operational functions such as supply air temperature set point vs pool water temperature, purge mode, etc.

3-7.2.13.2 Provide packaged pool room air conditioning and dehumidification equipment with microprocessor controls. If facility has a building Direct Digital Control (DDC) system, packaged equipment must have manufacturer-provided open protocol interface for communication with this DDC system.

3-7.2.13.3 Do not implement night temperature setback to reset the space temperature down; this increases pool water evaporation and possibility of condensation.

3-7.2.13.4 The strategy to shut off the ventilation air during unoccupied hours to save energy by reducing load on the dehumidification system may be implemented, however careful consideration must be made with regard to potential negative impact to air and water quality. For natatorium/pool environments with separate air handling units for the spectator area, the ventilation air to the spectator zone may be reduced to zero during unoccupied periods.

3-7.3 Plumbing.

3-7.3.1 General.

Provide toilet and bath facilities in accordance with ISPSC, MAHC and UFC 3-420-01. Provide automatic mixing valves on showers where hot water is over 105 degrees Fahrenheit (40 degrees Celsius). Provide shut-off valves at all plumbing fixtures. Provide floor drains in all dressing rooms, shower rooms, toilet areas, and custodial closets. Provide metering for gas service, if used. Supply hot and cold water to all restrooms, sinks, and custodial closets. Hot water temperature is not to exceed 105 degrees Fahrenheit (40 degrees Celsius) at the outlet. Provide frost-free hose bibs on exterior walls to enable hose access to the entire pool deck and locate interior hose bibs to enable hosing down of all wet areas within the bathhouse. Provide separate water service with meter for the pool. Provide a dedicated backflow preventer in the pool equipment room*

*For Army facilities: Provide designs in accordance with the requirements of Technical Criteria for US Army Physical Fitness Facilities, Chapter V Natatorium and Technical Bulletin 575, Recreational Water Facilities.

3-7.3.2 Surge Tanks.

Provide PVC vent pipe leading to the outdoors for surge tanks located below the pool deck, if applicable. Size vent for surge volume required by MAHC. Terminate vent at gooseneck with birdscreen.

3-7.4 Electrical.

Provide electrical service to the aquatic facility in accordance with UFC 3-550-01. Provide distribution equipment, wiring methods, receptacles, grounding, interior and exterior lighting, controls, and emergency lighting, in accordance with UFC 3-520-01 and the published Installation-specific design requirements. Provide voltages and frequencies for overseas locations in accordance with UFC 3-510-01. Coordinate with Installation personnel to determine the quantity of electrical outlets, and their placement, for specific equipment such as vacuums, public-address systems, timing devices, and score boards.

3-7.4.1 Wet and Corrosive Areas.

The chemical storage rooms and pool area are considered wet and corrosive. Design the electrical system within the chemical storage room using equipment and wiring methods that are drip-proof and corrosion-resistant.

Provide devices that are specification-grade, with stainless-steel cover plates within the pool area.

3-7.4.2 Service Entrance Equipment.

Provide service entrance equipment sized for the facility on the calculated load plus 15% empty (bussed) space and 15% spare capacity (ampacity), rounded up to the next standard service size. Provide metering for electrical power in accordance with the Installation's utility metering requirements.

3-7.4.3 Lightning Risk Assessment.

Conduct a lightning risk assessment and, if required, provide a lightning protection system in accordance with UFC 3-575-01.

3-7.5 Fire Protection and Life Safety.

Provide fire protection and life safety designs in accordance with the following standards and criteria:

- UFC 3-600-01
- Latest edition of the applicable National Fire Protection Association

(NFPA) Codes and Standards

3-7.6 Communications and Data.

Provide a minimum of one telephone and one data outlet with high-speed internet connection in the check-in and office area. Provide wireless local area network (LAN) connectivity for all office areas, and for pool areas for patrons. Because of the technical nature and rapidly changing communications and data requirements, refer to UFC 3-580-01 for detailed guidelines and specifications:

Provide junction boxes with rigid conduit within the ceilings and walls that includes the required infrastructure for telephone and data connections. Provide telecommunications outlets with stainless-steel cover plates within the pool area. Telephone and data outlets may be independent of each other or combined into a single junction box. If these connections can be combined into a single junction box, the cover plate to that junction box must allow for multiple connections. Coordinate with the Installation POC for Information Technology (IT) systems to determine if additional local requirements or preferences are applicable to the project.

3-7.7 Public Address System.

A centrally-controlled public address (PA) and two-way communication system is required for all pool facilities. Incorporate PA capability with the phone system to allow paging from all staff phones, where possible. All PA components located in the pool area must be suitable for installation in wet and corrosive environments.

Provide a PA system at the circulation desk if it cannot be incorporated in the phone system. Provide at least one PA speaker in each dressing room, office, check-in, public toilet, and lobby (at indoor pools). Provide one indoor speaker for every 800 sq. feet (74.3 sq. meters) of net floor area. Provide a minimum of two outdoor speakers for every 25-meter pool and at least three speakers for every 50-meter pool. Provide an interface between the PA system and the Installation Wide Area Mass Notification System (MNS).

3-7.8 Interior Lighting.

Provide interior lighting fixtures, design, materials, finishes, and placement that support the architectural and interior design function of each space and enhance the design aesthetic of the facility. Provide wet-area-rated light fixtures in wet areas like the natatorium, showers, dressing areas, and toilets. Provide light fixtures that minimize glare and shadowing.

Where artificial lighting is used to meet the light level requirements, provide manual means to control the luminaires. Separately control luminaires in daylighted areas through continuous dimming photocontrol to reduce light output when natural light is available.

3-7.9 Alarm Systems.

Provide an alarm system for intrusion detection to protect equipment and assets. Coordinate at the Installation level to provide alarm system equipment that is compatible with the systems used at each Installation. Provisions for an alarm system must be justified during the planning and programming process.

3-7.10 Cable Television (CATV) System.

For CATV service, provide the facilities and infrastructure to accommodate routing of the CATV service trunk-line entry from the nearest source on the Installation to the network headend in the facility telecommunications room (TR). Provide a distribution conduit pathway from the TR to one outlet in the office area. Coordinate with the Installation personnel to determine where additional CATV outlets are required.

3-7.11 Closed-Circuit Television (CCTV) System.

Coordinate with the Installation personnel to provide facilities and infrastructure for CCTV in the pool area for displaying messages, for instructional purposes, and for marketing announcements, for pool supervision, and for electronic surveillance. Provide distribution pathways to head-end equipment and connectivity to the LAN.

CHAPTER 4 FUNCTIONAL AREA TECHNICAL REQUIREMENTS

4-1 GENERAL.

Chapter 4 presents requirements specifically applicable to the design of each functional area and space of aquatic facilities. Specific criteria are provided concerning critical dimensions, storage requirements, furnishings, equipment, and technical requirements for each component space within each functional area. The technical requirements provided in this chapter address only items with special criteria for each individual space. General planning requirements are presented in paragraph DESIGN.

The requirements in this chapter apply to all sizes and types of aquatic facilities. Specific space allocation is provided in accordance with paragraph SPACE REQUIREMENTS.

4-2 SITE FUNCTIONAL AREA REQUIREMENTS.

Provides technical requirements for siting pools, structures, parking areas, pool deck, recirculation and filtration equipment, chemical storage, service drive, and non-water recreation areas.

4-2.1 Non-Water Recreational Areas.

Physically separate non-water recreation areas from the main pool with a low fence, wall, or barriers with a self-closing gate. Provide low barriers in accordance with the MAHC for barriers not serving as part of the aquatic facility enclosure.

Provide shaded areas and shelters for protection from the sun.

4-2.2 Outdoor Showers.

Provide a minimum of one outdoor rinse shower at the entrance to the pool deck. Locate drains to prevent water from outdoor showers from accumulating on the pool deck.

For natatorium, provide a minimum of two rinse showers in the pool enclosure, on the pool deck, near the entrance into the pool area.

4-2.3 Parking Areas.

Provide customer parking spaces in accordance with UFC 3-201-01 at peak capacity, plus one for each full-time staff member. Provide dedicated spaces for motorcycles and bicycle racks in accordance with LEED or sustainable design guidelines and Installation design requirements. Provide bicycle racks near the main entrance in a secure location. Provide artificial light levels at night in all parking areas in accordance with by UFC 3-530-01 for security and safety.

4-2.4 Fences, Gates, and Wind Screens.

Enclose the pool and surrounding deck area completely with a barrier. For pools where unauthorized access may be an issue, provide a minimum fence height of 8 feet (2.4 meters). Segregate areas within the deck (e.g., food service areas, spectator seating) with low barriers compliant with MAHC barriers not serving as part of the enclosure. Do not use chain-link fencing for internal segregation. Use fencing that is architecturally compatible with the fencing in nearby areas and is visually permeable, so Installation security personnel can easily monitor activities within the compound. Use fence materials that match or complement the exterior bathhouse and building materials. Use brick or masonry walls to screen equipment and provide protection from wind. Emergency access gates must be a minimum of 6 feet (1.83 meters) wide to accommodate emergency responder personnel and equipment. Provide MAHC-compliant gates in perimeter fencing for landscaping maintenance equipment.

4-2.5 Filtration, Recirculation, and Heating Systems.

Separate all pool mechanical equipment and chemical storage areas from public access. Pool mechanical systems may be located inside a building structure or outside within a fenced or enclosed exterior compound. Equipment includes pumps, pipes, filter tanks, water heaters, chlorine and disinfectant feeders, surge tanks, and control panels. Locate all equipment with convenient access for maintenance. Provide sufficient space for the placement, replacement, and servicing of each piece of equipment. Size doors or openings to permit future replacement of all equipment. Provide ventilation for motors and heaters.

4-2.6 Chemical Storage.

Provide chemical storage rooms or secured structures to house chlorine and other chemicals independent of the other pool mechanical equipment. Provide separate, independent rooms for oxidizing chemicals and pH adjustment chemicals. Locate the storage rooms within the mechanical equipment compound or adjacent to the pool equipment in a space that is not accessible to the public. Secure doors from break-ins and unauthorized access. Post warning signs in accordance with MAHC for chemical storage room doors and additional signs requiring protective clothing and equipment. Provide fire- and explosion-proof chemical storage rooms. Refer to paragraph HEATING, VENTILATION, AND AIR CONDITIONING (HVAC) for air change and exhaust requirements. Provide an OSHA-approved drench shower and eye wash station, gloves, protective goggles, and gas masks in the pool equipment and all chemical storage areas. Do not provide floor drains in the chemical storage rooms.

For renovations of existing facilities utilizing gas chlorine, provide a storage space meeting the requirements of MAHC and provide an audible and visual alarm to alert of chemical leak.

4-2.7 Service Drives and Emergency Vehicle Access.

Coordinate with the Installation to determine the sizes and weights of required

emergency and service vehicles before planning the service access areas. Design all service and emergency drives for the weight of the vehicles anticipated and consider the inclusion of the pool deck as part of the emergency access drive. Provide direct access to the pool deck for emergency vehicles and do not cross outdoor activity areas with service/emergency access.

Avoid dead-end service drives and service drives that exceed 100 feet (30 meters) in length. Provide a backup spur for dead-end and service drives that exceed 100 feet (30 meters) in length. Provide a service drive access to the recirculation/filtration equipment and chemical storage area for chemical delivery, maintenance and waste removal. Screen or separate the service area from public use or traffic areas with attractive fences, walls, depressions, berms, or landscaping. Provide proper drainage if depressions are used. Asphalt or concrete access drives to the loading dock must be a minimum of 12 feet (3.6 meters) wide for access by trucks and emergency vehicles. Provide access for maintenance of overhead lighting, if provided. Comply with AT/FP standards as provided in UFC 4-010-01, particularly for dumpster separation and access control. Provide easy access to dumpsters or outside trash containers located on paved areas or a concrete pad.

4-3 WATER AREA REQUIREMENTS.

Water areas include the main pool swimming and diving areas, wading pool, spray ground areas, and spa areas. Locate the staff office to enable constant visual monitoring of the water areas. Locate access to the pool from the bathhouse or dressing room areas near the shallow end, wading pool, or spray ground area.

4-3.1 Lap and Competitive Swimming Areas.

Provide a dedicated area for lap swimming. Follow sanctioning agency detail requirements for competitive swimming facilities. Consult AAU, NCAA, NFHS, USA SWIMMING or FINA regulations for detailed requirements and additional information since these requirements are subject to annual review and change. Default to FINA requirements when sanctioning entity is not known.

4-3.2 Lane and Area Dividers.

Provide racing lane dividers consisting of a set of continuous disk-type, wave quelling floats strung on a cable or cord running the full length of the lane. Provide permanent recessed anchors integral to the pool deck, wall or gutter for lane divider attachment. Provide lane dividers with a tensioning device so that they can be stretched tight and held in position. Provide one racing lane divider to separate each racing course lane and additional dividers to separate outside lanes from additional space adjacent to the pool wall. In the general-use pools, separate deep water (the diving area) from shallow water using a lane divider, bulkhead, or an area divider. Provide area dividers consisting of a rope with buoys spaced along the length. Provide recessed anchors centered between racing lanes, at the line separating diving from free swim areas, and to isolate specific program areas. Provide an area divider 1 foot (.30 meter) to the shallow side to mark the 5-foot (1.5-meter) depth point during recreational swim periods.

4-3.3 Racing Lanes and Target Markings.

Provide racing lane and target markings according to the appropriate event sanctioning entity that may be involved in competitive events (e.g., NCAA, FINA). Default to FINA requirements when sanctioning entity is not known. For a 25-meter course, provide a recall line 40 feet (12 meters) from the starting end. For a 50-meter course, provide a recall line 50 feet (15 meters) from the starting end. Hang the recall line from removable stanchions. Provide a cover for the stanchion anchors when not in use and design anchor to prevent standing water. If provided, specify touch pads to be a minimum of 6 feet, 6 inches (1.98 meters) wide by 2 feet (610 millimeters) tall. Install in a fixed position in the center of the lane and vertically positioned in accordance with the requirements of the event sanctioning body. Provide slip-resistant race lane and target markings.

4-3.4 Bulkheads.

Provide bulkheads for competition pools where the length of the pool is greater than the required course length for competition. Provide bulkhead locations such that the required course dimensions are met when the bulkhead is anchored into position.

Use moveable bulkheads with “flow thru” vertical surfaces where displaced water moves through the bulkhead for easier movability. Avoid bulkhead designs that have a “trampoline effect” or are required to maintain constant air pressure for structural integrity.

*For Army facilities, provide motorized bulkheads.

4-3.5 Diving and Deep-Water Areas.

Diving and deep-water areas are used for competitive diving, recreational diving, SCUBA training, survival training, rock wall climbing and other activities requiring deep water. Provide a diving envelope size and depth compliant with or exceeding FINA minimum requirements or in accordance with play feature manufacturer (e.g., climbing walls). Diving and deep-water areas may be accommodated in three possible ways:

- The preferred method is to locate diving areas adjacent to the deep end of a general-use pool in a typical “L”-shaped configuration.
- Incorporate the diving area into the deep end of a general-use pool. Utilize bulkheads to separate program spaces.
- Provide a separate pool exclusively for diving or deep-water training and programs.

For Army facilities, provide a recessed toe-ledge in the pool wall no less than 4 feet (1.22 meters) below the water surface on all sides of any pool where the water depth exceeds 5 feet (1.52 meters).

4-3.6 Diving Boards and Platforms.

Where desired by local Installation, provide diving boards that are manufactured from aluminum, fiberglass, or wood, coated with a slip-resistant surface. For springboards of 10 feet (3 meters) or more above the water surface or for competitive diving, provide springboards that comply with FINA or the sanctioning organization. For diving boards over 2 feet (610 millimeters) in height, provide 3 feet (910 millimeter) high double guard rails on each side of the board extending to the water's edge. Where desired by the local Installation, provide 1 meter (3.3 feet) and 3 meter (9.9 feet) platforms compliant with FINA requirements. Cover fulcrum mechanisms to prevent injury to fingers or toes.

To increase visibility of the water surface, provide a water surface agitator using water jets at deck level or air bubble inlets in the pool bottom.

4-3.6.1 Special Diving Requirements.

Where required by the local Installation, provide high-diving platforms of 7.5 meters (24.3 feet) and 10 meters (32.8 feet) high. Provide concrete construction compliant with FINA.

4-3.6.2 Water Slides.

Where desired by the local Installation, provide recreational water slides compliant with ASTM F2376 in the water areas. Provide water slides designed for feet-first sliding only. Provide the water depth and pool floor profile required by the slide manufacturer and MAHC at the termination of the slide. Water slides may terminate in an independent landing pool, on the pool deck in a fiberglass runout or in a general pool. For slides landing in a multi-use pool, provide barriers to isolate the slide landing area. Provide an egress point(s) within the landing area such that riders do not cross the path of another rider to exit the pool. Provide a landing pad and pool floor-mounted barriers for children's slides terminating in shallow water.

Provide a minimum clear height from the water slide starting tower to the lowest overhead obstruction of at least 8 feet (2.4 meters).

4-3.7 Play Structures and Aquatic Play Equipment.

Where desired by the local Installation, include play structures and other aquatic features compliant with ASTM F2461 as part of the spray ground areas or wading pool to create a water park environment. Where desired, provide play structures/sprays located inside the main pool zero-depth entry and other water areas. Consider climbing walls for deep-water pools. Provide water area, depths and feature construction for play structures and aquatic feature equipment in compliance with MAHC and the manufacturer's requirements.

4-3.8 Spray Grounds/Interactive Water Play.

Design spray grounds with all points of the spray area sloped to drain such that no

standing water is present. Provide spray ground equipment for the dependent population at each facility. Install ground sprays flush with the spray ground finish. For overhead spray equipment, provide protective coverings over flanges and anchor hardware, or anchor feature below grade to prevent toe-stub hazards. Spray grounds may be designed with either recirculated or potable water for features.

Physically separate spray ground areas from other pool areas with a low fence or barriers with a self-closing, self-latching, lockable gate. Provide low barriers in accordance with the MAHC for barriers not serving as part of the aquatic facility enclosure.

4-3.8.1 Recirculated Systems.

For recirculated systems, design the spray ground recirculation independent from any other pool or spray ground system. Provide a turnover rate compliant with MAHC and ISPSC. Provide supplemental disinfection system in accordance with MAHC.

4-3.8.2 Potable Water Systems.

Potable water supplies connected directly to play features are acceptable as an alternative to recirculated spray grounds. For potable water systems, discharge waste water (water that has been sprayed through a feature and has then contacted the spray ground finish) into the sewer as permitted by the Installation and according to local codes or collect water for reuse in grey water applications.

4-3.9 Wading Pools.

The depth of wading pools* may range from 0 to 18 inches (150 to 450 millimeters). Provide a pool floor slope between 1:15 and 1:20. Provide an independent water recirculation system for wading pools.

Locate wading pools at the shallow end of the main pool. Provide adult seating opportunities for at least one parent for each child at maximum capacity. Physically separate wading pools from the main pool with a low fence or barriers with a self-closing, self-latching, lockable gate. Provide low barriers in accordance with the MAHC for barriers not serving as part of the aquatic facility enclosure.

*For Navy facilities: Do not provide wading pools in new construction projects. Existing shallow wading pools may be maintained, as needed, for small children to play and swim.

4-3.10 Recreational Spa Pools.

These requirements apply to spas used for non-medical purposes. Provide a spa depth between three feet (0.9 meters) and four feet (1.2 meters). Provide underwater bench seating a maximum of 18 inches (0.45 meters) below the normal operating water level. Provide underwater pool steps to the spa pool floor. Utilize skimmers and wall inlets for recirculation. Provide flat main drains installed flush with the pool floor at the deepest

point of the spa pool floor. Spa pools may include water or air induced hydrotherapy jets.

4-3.11 Pool Access.

Pool access may be accomplished in several ways.

4-3.11.1 Accessible Ramps and Equipment.

Provide accessible entry and equipment in accordance with paragraph ACCESSIBILITY.

4-3.11.2 Zero-Depth Entry Area.

Design slip-resistant zero-depth entry areas with a slope between 1:15 and 1:20 for main pools and wading pools. Provide a perimeter overflow gutter with pre-fabricated grating at the normal operating water level to assist in debris removal and reduce maintenance.

If provided, group spray play features to maintain a path free of spraying water adjacent to the play area.

4-3.11.3 Ladders and Grab Rails.

Provide steps and ladders recessed into the pool wall. No ledges or projections are permitted under the water surface. Grab rails with recessed steps are preferred over projecting ladders. Locate grab rails and recessed steps at both ends of the long walls near the corners for 25-yard or 25-meter pools. For 50-meter or uniquely shaped pools, provide intermediate grab rails and recessed steps in accordance with the MAHC.. Where steps, step holes, or ladders are located within the pool, provide a grab rail on both sides extending over the edge of the deck.

Locate a ladder or recessed step with grab rails no more than 16 feet, 5 inches (5 meters) from a diving board or water slide. Position ladders or recessed steps so swimmers don't have to cross the landing areas of diving boards and water slides.

4-3.11.4 Pool Steps and Ramps.

Provide one set of shallow water steps or a sloped-entry compliant with ABA for access into the shallow end of the pool unless prohibitive. Design underwater steps recessed into the pool wall. Provide slip-resistant finish on ramps and stair treads, on the leading edge of stair treads and grab rails. Provide a contrasting color, permanent marking on the leading edge of each tread.

4-4 POOL DECK AREA REQUIREMENTS.

Provide the following deck equipment: lifeguard stands and stations, backboards, head immobilizer, rescue tubes, a drinking fountain, emergency telephone, lounge chairs, umbrellas and other sun screens, and night lighting. Other potential furniture, fixtures,

and equipment (FF&E) includes supplemental chairs, dining tables, occasional tables, basketball goals, volleyball nets and poles, pace clocks, floor stand portable signs, starting blocks, starting block safety covers, backstroke stanchions, lockers, storage carts, lane lines and area dividers, lane line reels, pool cover, and pool cover reels.

4-4.1 Lifeguard Stations.

Provide portable lifeguard stations for different activities and conditions. Provide a minimum of one elevated lifeguard station for pools with a surface area of over 2,000 square feet (186 square meters). Provide a minimum of two lifeguard stations for pools over 4,000 square feet (371 square meters), and one for every successive 2,500 square feet (232 square meters) or majority fraction thereof. Consider pool layout, shape, and elevated features in the determination of the required quantity of lifeguard chairs.

Require lifeguard stations capable of securing portable lifesaving equipment (e.g., ring buoys). Provide lifeguard stations capable of securing UV protection compliant with MAHC.

4-4.2 Life Safety Equipment.

Provide one rescue (reaching) pole fitted with a life hook or shepherd's crook and one ring buoy for each 2,000 square feet (186 square meters) of water area. Provide two wound throwing ropes of length equal to one-and-a-half times the pool width. Provide a minimum of one backboard with straps and head immobilizer for each pool. Locate required items in the immediate vicinity of the pool. Provide a rescue tube at each lifeguard station.

Provide a first aid kit, cot, blanket, pillow, and Automatic External Defibrillator (AED)*, in the first aid room.**

*For Navy projects: Provide (AED) in the pool enclosure with immediate access from the pool deck.

**For Army facilities: Refer to the MAHC for minimum life safety equipment requirements.

4-4.3 Depth Markings.

Locate deck depth markers on the pool deck beside the pool edge. For pools with a freeboard of 4 inches (10 cm) or greater, provide vertical wall depth markers at or above the water level. For pools with a freeboard less than 4 inches (10 cm), place wall depth markers as high on the wall as possible. For deck level pools, provide wall depth markers below the water level, as high as possible on the pool wall.

4-4.4 Starting Platforms.

When competitive swimming is a program requirement, provide starting platforms for each course lane in the pool. Mount starting platforms above the water level at the

dimension required by the sanctioning institution governing the competitive events. Mount the front edge flush with the vertical end wall of the course. Provide a minimum platform width of 20 inches (510 millimeters). Slope the platform's surface at not more than 10 degrees and provide a slip-resistant surface. Number starting platforms according to FINA. Provide anchors for starting platform installation. Provide winterizing covers for when platforms are stored.

4-4.5 Automatic Timing Devices.

Where required, equip timing devices to be initiated by the starting system. Provide automatic timing devices that display all recorded information and finish contact pads activated by a light hand touch. Where automatic timing devices are installed, provide in deck timing system connections, such that there are no exposed wires on the pool deck.

4-4.6 Chairs, Tables, and Umbrellas.

Provide a variety of chairs, tables, and umbrellas designed for outdoor use around the pool deck. Use reclining lounge-style chairs for sunbathing and general pool-side use. Provide some chairs and tables grouped together. For outdoor pools, provide movable umbrellas for shaded, informal seating areas. Use stackable chairs, where possible, to facilitate storage. Provide chair and umbrella fabrics that are moisture-resistant and designed for outdoor use. Do not use glass table tops.

Provide a line of demarcation in the pool deck to delineate between seating/lounging areas and walking areas. Use permanent, slip-resistant finish materials, contrasting in color to the pool deck surface.

4-4.7 Sun Screens.

For outdoor pools, provide large pool deck areas protected by overhead sun screens (shade structures), especially around the check-in and bathhouse areas. Provide shade structures that provide shading for a portion of the pool water areas, common grass areas, and at least half of the spray ground or wading pool areas. Provide shade accommodations at each lifeguard station that are adjustable and can be moved according to changing sun conditions.

4-4.8 Deck Equipment Storage.

Provide freestanding or built-in storage for instructional and recreational equipment, such as kickboards, floats, buoys, fins, masks, SCUBA equipment, noodles, pennants, swim trainers, scoreboard, chalkboard, electric clock, water polo goals, water basketball goals, volleyball equipment, pool cleaning equipment, lane markers, pool covering, thermometer, backstroke lines, personal flotation devices (PFD), aquatic exercise equipment, and other miscellaneous items. Consult with Installation-level personnel and the aquatic facility director regarding storage areas needed to meet program and operating policy requirements.

4-4.9 Locker Areas.

Locker storage for clothing may be located on the pool deck or within the dressing rooms.

4-4.10 Water Fountains.

Provide public water drinking fountains accessible from the pool deck in accordance with MAHC.

4-4.11 Deck Signage.

Provide signs regarding pool rules at the entrance to the pool deck and within the water areas. Include signs that provide emergency numbers near the office telephone, warnings outside the pool area, room names, entry prohibitions, and instructions necessary for diving or special equipment. Provide signs in accordance with UFC 3-201-02.

4-5 BATHHOUSES AND NATATORIUM AREA REQUIREMENTS.

Bathhouses normally contain the following core spaces: check-in area, male and female dressing rooms, showers, toilets, storage, offices, and administrative areas. These core spaces may be contained within the same building or separated into different structures, as desired. Food service, filter rooms, chemical storage, and mechanical equipment may also be contained within the bathhouse building; however, some of these components may not be required to be located within a building structure and may need to be located in separate areas of the site for safety and functionality. Typical bathhouse spatial relationships are shown in Figure A-3: Bathhouse Functional Area Relationships.

4-5.1 Entry Control Checkpoints.

This area serves to monitor the flow of people in and out of the facility. If valuables storage is handled in this area, provide 12 inch by 12 inch (127 millimeter x 127 millimeter) lockers. Additionally, this space also serves as a surveillance station for the pool and deck area. Locate check-in areas immediately adjacent to the entrances to both dressing areas. Visibility of and direct access to pool and deck areas is required.

4-5.1.1 Entry Control Checkpoint Area FF&E.

FF&E required for entry control areas include locker systems for valuables, desk or check-in counter, staff chairs, telephone with PA systems, cash register, and an exterior clock visible from the pool area. Provide storage for small equipment and lost/found items. Optional items include a bulletin board.

4-5.1.2 Natatorium Lobbies.

Incorporate a lobby area in designs for natatoria that serves as the primary entrance to the facility for all participants, visitors, and spectators. Direct access from the lobby is

required to spectator viewing areas and dressing rooms. Locate public toilets, staff office, and concession areas (if provided) adjacent to this space. Visual monitoring of the lobby is required from the staff office or the check-in area. Accommodate at least 50 percent of the visitors in the largest spectator seating areas. Include chairs, trash receptacles, and bulletin boards.

4-5.2 Dressing Rooms.

Provide separate facilities for men and women. Locate dressing areas to be easily accessible to the pool deck and check-in area. Design the locker room/changing room to prevent visibility from public areas. Locate showers, lavatories, toilets, and drying areas within or adjacent to each dressing room. Lockers may be located inside the dressing room or on the pool deck for increased visibility and security. Include floor slopes to drain for hosing and cleaning.

4-5.2.1 Family Dressing Rooms.

Provide separate family dressing room(s)* with showers, toilets, sinks and baby changing stations to serve the needs of single-parent families or special needs of the disabled or elderly. If accessible off the pool deck, these family dressing rooms may also serve as public toilets. Provide lockers outside of family dressing rooms in separate, non-lockable area.

*For Navy and Air Force facilities: Evaluate requirement for family dressing rooms on a project-specific basis. Family dressing rooms are required for Army facilities.

4-5.2.2 Dressing Room FF&E.

Provide a locker for each user based upon the overall pool capacity. Provide additional lockers dedicated for use by the staff. Other furnishings and equipment include benches, vanity mirrors, one full-length mirror, and ceiling fans. Optional equipment includes a clock, hair driers, and a bulletin board. Provide wooden or recycled plastic bench seating, mirrors, soap dispensers, and paper towel dispensers or blowers conveniently located near the lavatories. Provide sanitary napkin dispensers and disposal units inside the female dressing rooms. Provide at least one GFCI electrical outlet near the vanity sinks and vanity mirrors spaced every 30 inches (762 millimeters) on center. Provide baby changing accommodations in both male and female dressing rooms*. Provide a minimum of one swimsuit dryer (spinner)** in each dressing room wired on a dedicated GFCI branch circuit and plumbed to drain. Provide two to five dressing cubicles with seats or benches in each dressing room.

*For Army facilities: Provide baby changing stations in the family dressing rooms only.

**For Army facilities: Provide swimsuit dryer located in a tiled alcove out of the traffic path. Provide floor drain below dryer.

4-5.3 Showers.

Provide showers located inside or adjacent to each dressing room for customer personal hygiene use before and after swimming. Provide direct access from the showers to the dressing area. Provide separate facilities for men and women. The exact size requirements for showers depend upon the peak number of potential customers and the type of shower facilities desired. Provide fixtures in accordance with UFC 3-420-01.

Provide all private showers with attached drying area enclosures for new construction and major renovations. Provide a bench in each adjacent drying area. Do not allow direct views into the shower room areas. Provide commercial-grade built-in soap dispensers inside shower stalls and at lavatory sinks. Provide built-in towel racks and clothing hooks in drying areas. Use natural lighting whenever possible and waterproof lighting fixtures in all showers. Furnish shower stalls with showerheads mounted on a side wall to permit users to initiate shower without getting wet. Locate tempering controls beneath shower head. Provide all fittings and fixtures to feature cut-off valves and be of commercial quality. Provide for proper drainage of each stall by using floor drains or perimeter trench drains, or a combination of the two. Do not allow discarded water from bathers to pass into adjacent shower spaces.

4-5.4 Toilets and Urinals.

Provide both male and female toilet stalls in or near each respective dressing room area. Provide at least one low mounted urinal near the men's toilets for children. Provide direct access from the toilets to the dressing room areas. Locate toilets next to the showers and lavatory sinks for each sex. Refer to UFC 3-420-01 for the quantity of toilets and urinals required according to the overall size of each facility.

Provide flushometer-style commercial toilets that are durable and require less maintenance than tank-top residential models. Provide graffiti-resistant and corrosion-resistant toilet stall partitions that are attractive and complement the interior design of the dressing room area. Provide a separate exhaust system for the toilet areas in both the male and female dressing rooms.

4-5.4.1 Public Toilets.

Locate public toilets near the lobby in natatoria. Locate public toilets readily accessible to spectator viewing areas. Provide separate accessible restrooms according to ABA guidelines for both men and women. Include a lavatory, mirror, soap dispenser, paper towel dispenser or blower, baby changing station, and a separate exhaust fan for each restroom. The peak number of spectators and visitors anticipated will establish the quantity of public toilets. Provide fixtures in accordance with UFC 3-420-01.

4-5.5 Office and Administration Areas.

Locate office and administrative areas adjacent to the entry control checkpoint. Provide visual monitoring of and easy access to the water and deck areas from these spaces.

Provide furnishings that are durable, moisture- and mildew-resistant. Use non-woven, impermeable materials in lieu of fabrics for seating. Include floor drains and floor slopes to prevent standing water.

4-5.5.1 Administration Office.

Provide an office with a lockable door for use by the aquatic facility director and staff. Provide a separate small lounge area for pool staff and lifeguards. Provide a desk with compatible chair in the office area and at least two visitor's chairs along with a telephone, data and phone connections, file cabinets, shelving units, and a bulletin board.

4-5.5.2 Staff Lounge.

Locate central controls for the public address, security, lighting systems, and all environmental controls in the staff lounge or administrative office. Provide a work table with chairs, as needed to accommodate the staff, bulletin board, staff lockers, time clock, refrigerator, microwave, storage shelves, first aid kit, and cabinets in the staff lounge.

4-5.5.3 Training Rooms.

For small facilities, this room may be combined with the staff lounge. Design the room so it can be darkened for video presentations. Provide locally controlled dimmer switches for lights. Consider the need for telephone and video conferencing and provide the required infrastructure for these capabilities. Provide a lockable credenza or storage cabinets, a table, stacking chairs, television with media player, and a trash can. Provide modular furniture appropriate for wet conditions, a conference table, computer data connections with high-speed Internet access, a speaker phone, and electrical power accommodations. Provide furnishings that are durable, moisture- and mildew-resistant. Use non-woven, impermeable materials in lieu of fabrics for seating. Provide a whiteboard and a cork bulletin board for posting changeable information. For natatorium, provide access to the training room from both the wet and dry circulation path.

4-5.6 Safety & First Aid.

Provide a first aid room immediately off the pool deck with hand sink, cot, first aid kit, and telephone compliant with MAHC requirements. For small facilities, this room may be combined with staff lounge. Provide privacy screens or treatments on vision pathways. Furnish first aid equipment per MAHC.

4-5.7 Concession, Resale, and Vending Areas.

Provide public water fountains located near the administrative areas of the bathhouse or in a covered, shaded area of the pool deck. Consider the need for food and beverage service within the aquatic facility compound. Coordinate with the aquatic facility director regarding their policies for a resale and concession area that may offer a variety of food

and beverage options. Determine functional need for indoor concession service, locate concessions and concessions seating to serve this need. Outdoor pools may include a concession area that includes tables and seating as desired at each facility. Locate seating areas to have good visibility of the pool and deck and some shading. Refer to the current FDA Food Code and supplements when considering a concessions area to ensure inclusion of all required sanitary areas. If food like hamburgers and hotdogs will be cooked on-site, ensure that the concession kitchen meets the requirements outlined in NFPA 96, Standard for Ventilation Control and Fire Protection of Commercial Cooking Operations.

Provide concession and vending areas in the shade, adjacent to, or easily accessible from the pool deck and major sunbathing areas. For facilities with picnic areas, locate concessions near picnic area with easy access by vendors with pushcarts. Separate concession and vending areas from the pool area. Provide service access through an entrance separate from the customer entrance to the facility. Provide power outlets, water service with hose bibs, and drainage for cleaning the concession and vending areas. Consider the need to provide electrical, water, and parking space to accommodate a mobile concessions trailer that may be located near the pool deck and moved when not in use. Use materials and finishes that are water- and mildew-resistant and can be easily cleaned.

4-5.8 Mechanical Rooms.

Mechanical rooms are required for natatoria and the bathhouses for outdoor pools to accommodate HVAC equipment, plumbing, electrical, hot water, telephone, fire suppression, and other building systems equipment. To minimize noise and service disruptions, locate mechanical rooms so the entry and service doors are located on the outside of the building. Avoid locating the entrance to the mechanical rooms at the front of the facility; locate mechanical entrances to the side or rear (allowing for access by maintenance staff).

For indoor pools, provide sound attenuation at pool mechanical room walls common to natatoria and other public spaces. Slope floors to drains for rooms with equipment involving water or exposed piping. Separate all pedestrian and vehicular circulation associated with mechanical services and maintenance operations from circulation provided for participants and the public. Locate mechanical rooms to minimize the lengths of distribution services or “runs.” Treat service doors architecturally in a manner that will minimize their visibility or impact on the building design.

4-5.9 Electrical Room.

Provide a dedicated electrical equipment room for the installation of service-entrance equipment and other major electrical equipment that serves the facility.

4-5.10 Telecommunications Room.

Provide a dedicated telecommunications room (TR) to house the point-of-entrance of the telecommunications service, telecommunications equipment, cable terminations,

cross-connect cabling, data and telecommunications systems, and other low-voltage systems such as fire-alarm, CATV, CCTV, and electronic security and surveillance systems. Coordinate with Installation communications POC for size and other requirements for this space.

4-5.11 Equipment Storage.

Provide storage for life-saving, instructional, and competition swimming supplies and equipment. Also consider requirements to accommodate pool-cleaning equipment, supplies, and other items related to pool operations. Equipment storage space must open directly onto the pool deck and be readily accessible by staff members. Provide the storage room with a minimum width of 8 feet (2.44 meters) to allow storage of materials on either side of a small aisle. The minimum length is defined by program of stored equipment, and accommodating overnight storage of reach poles and other first aid equipment. Access the storage room through double doors with a minimum width of 6 feet (1.83 meters).

Verify storage requirements with aquatic facility personnel at each Installation, since special storage requirements may be required for instructional items (e.g., kickboards), lane lines, ropes, flags, starting platforms, and other competition equipment, as well as equipment for games or water shows. Pool maintenance equipment includes a pool vacuum, water-testing supplies, hose reels, sprinklers, scoop nets, and miscellaneous tools. Typical safety equipment includes shepherd's crook, ring buoys, reach poles, life lines, resuscitator, first aid equipment, backboard, and a stretcher. Provide lighting in accordance with UFC 3-530-01. Ventilate the equipment room per paragraph HEATING, VENTILATION AND AIR CONDITIONING (HVAC), slope floor to floor drains to help reduce moisture and mildew.

4-5.11.1 Natatorium Storage.

For natatoria, provide storage capacity that complements pool programming. For pools with competition equipment, provide storage capacity for lane lines, timing equipment and instructional aids.

4-5.11.2 Seasonal Storage.

For seasonal outdoor facilities, consider out-of-season storage requirements. Properly size access to dressing rooms and other open spaces to accommodate movable equipment and furnishings during the off-season.

4-5.12 Maintenance Storage.

Provide space to store equipment and supplies required for the maintenance of the facility. Maintenance storage spaces require floor drains if storing pool equipment. Provide lighting in accordance with UFC 3-530-01. Ventilate the maintenance storage room in accordance with paragraph HEATING, VENTILATION AND AIR CONDITIONING (HVAC).

For natatoria, provide storage capacity that compliments facility size and programming. Accommodations for pool vacuums, hoses, test kits, cleaning supplies and equipment are required. The final size requirements must be determined after coordination with Installation personnel on a project-specific basis. For outdoor facilities, additional equipment such as lawn mowers, trimmers and ladders, will dictate the size requirements. Include space for other maintenance items, like rakes, brooms, clippers and cleaning equipment.

4-5.13 Custodial Closets.

Provide a custodial closet for storing janitorial equipment and supplies, including other maintenance items with access to the dressing rooms, showers, and toilets. Include a floor-mounted mop sink, dry storage for supplies, shelves for maintenance supplies, and a sloped floor with a floor drain. Provide water-resistant finishes for all surfaces. Provide shelves and hooks for cleaning and maintenance equipment and supplies. Provide lighting in accordance with UFC 3-530-01. Ventilate the custodial closet in accordance with paragraph HEATING, VENTILATION AND AIR CONDITIONING (HVAC).

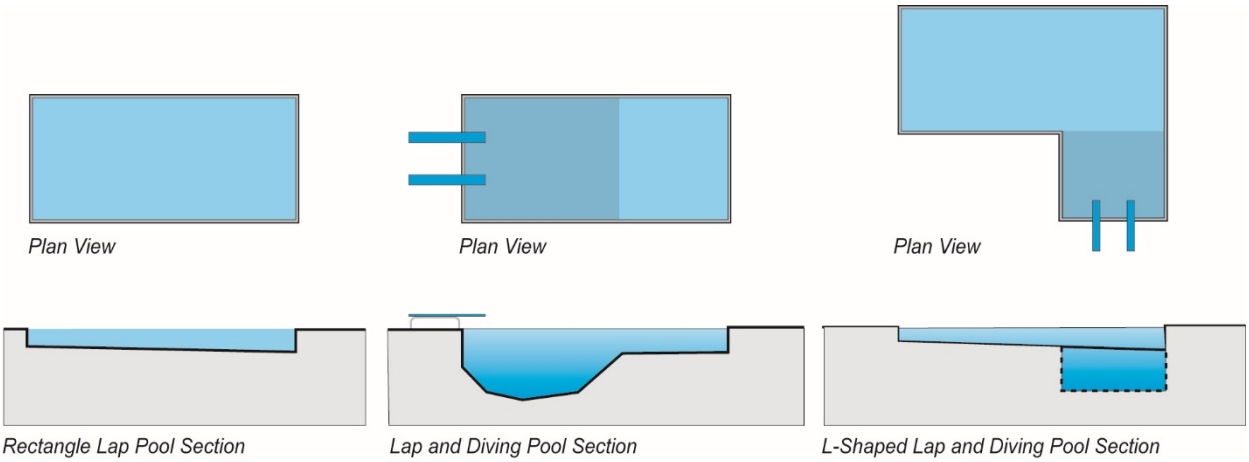
APPENDIX A BEST PRACTICES

A-1 PLANNING AND PROGRAMMING.

Each project requires a unique design tailored to the local character of the Installation, the site, and the needs of the user population. Consider the following items when planning aquatic facility projects.

- The type of competitive swimming events to be hosted at an aquatic facility has a major impact on the planning of the facility. Facility requirements and rules vary depending upon the different institutions that sanction competitive events. For example, lane bottom and target wall marking requirements are different for many of the governing institutions that sanction events.
- Consider small lockers for valuables only, such as phones, wallets and keys.
- Consider first aid procedures in the planning of aquatic facilities, including timely access to the pool deck for emergency responders and their equipment. Consider inclusion of a sink.
- Consider location of chemical storage and chemical storage venting. Prevailing winds, locations of patron walkways, patron access, and ease of chemical delivery should be considered in siting chemical storage areas.
- Consider the possibility of recycling excavated rock for alternative uses.
- Consider geothermal heat sources for heating pools where easily accessible, co-generation (the simultaneous generation of electric power and useful heat), and time-controlled activity pumps. Consider retractable roof structures over pool areas where climate is favorable to reduce HVAC energy consumption and to provide natural lighting.

A-2 DESIGN.



A-2.1 Landscaping.

Deciduous trees are acceptable in picnic or play areas, but do not allow their drip line to extend over the pool deck. Evergreens and shrubs can be beneficial as wind screens or visual barriers, and grass sunbathing areas inside the pool complex are always appreciated but must be designed to minimize “tracking” grass clippings onto the pool deck.

A-2.2 Lap Pool Layouts.

Traditionally rectangular, lap swimming centric pools have been utilized for the main pool, however the requirements are not intended to prevent new recreation centric pool designs of unique shapes and program capabilities. Traditional layouts for lap pools are shown in Figure A-1: Lap Pool Layouts:

Figure A-1 Lap Pool Layouts

The shape of the pool is affected by the placement of the diving area, if provided. Provide a simple rectangle pool shape for free swimming area, with a diving well placed on either side of the deep end to create an overall "L" shaped pool. If the depth of water in the swimming course is held to a maximum of 5 feet (1.5 meters), the "L"-shaped plan will offer the largest-capacity pool.

A-2.3 Zero-Depth Entry.

Use zero-depth entry pools to create a beach-like, gradual entrance to the water. These pool entrances are commonly used for play areas and access to the shallow end of a pool to help accommodate the needs of children, the elderly, and weak swimmers. If properly designed, zero-depth entry pools meet the requirements for accessible entry.

A-2.4 Pool Construction.

The three methods of construction addressed in Chapter 3 increase in durability (as well in cost) in the order provided. The normal lifespan of a concrete pool is eleven to twenty-five years. Considering budget and durability, a concrete pool with a metal gutter system is recommended for normal use. This type of pool is less expensive than a metal pool and outlasts a concrete or shotcrete pool because the metal gutter system is placed at the point of maximum wear. This type of construction provides not only an integral continuous overflow perimeter gutter system but can also provide a majority of the pool's supply return and surge plumbing requirements.

A-2.5 Pool Finishes.

Painted finishes require repainting every three to five years, depending on water quality and use. Many metal pools have been in place for over twenty-five years and show no sign of need for replacement. Consider a metal pool under the following circumstances:

- Where questionable soil conditions exist.

- In an area where extreme vandalism is prevalent.
- Where unusual structural and/or site conditions require a lightweight, prefabricated structure.

Maintaining proper water balance is essential for pool finish longevity. Metal gutter systems (usually stainless steel with plastic accessories) require no finish.

A-2.6 Gutter Systems.

Prefabricated, stainless steel surge gutter systems are preferred because they provide constant skimming of the surface water to help remove debris and can provide surge storage capacity for water displaced by swimmers. Scuppers that utilize a thin layer of water falling over a weir may be used to skim water from wading and training pools; however, they are not appropriate for the large surge requirements of main pools.

A-2.6.1 Drains and Inlets.

Fresh water fill can deliver water to the pool or surge tank via an air gap. To prevent injuries and to slightly disturb the water for better diver visibility in the diving area, provide spout with no sharp edges and locate under one of the diving boards. Where diving boards are not provided, or where inclusion on the deck would present a safety hazard, the fill spout may be located remote from the pool and flow via gravity to the surge tank or pool wall.

A-2.7 Heating and Water Temperature.

The use of a condensing boiler design is preferred for pool heater design. Consider solar heating for the hot water side of a heat exchanger if provided.

Consider automatically-deployed insulated pool covers to address the extensive labor and storage space required by traditional pool covers.

A-2.8 Secondary Sanitizers.

Secondary sanitizers may be used to reduce chlorine demand; however, coordinate with the Installation to comply with their minimum free available chlorine residual requirements.

A-2.9 Deck.

Consider using a resilient deck surface for spray grounds and around wading pools (if provided). Consider the existing slope and drainage of the pool deck during the design of an enclosure for an existing outdoor pool.

A-2.10 Seating.

For a small number of spectators at a family-type recreational pool, a raised platform or pavilion is sufficient. For competitive events, consider the need for portable seating for up to 600 people that can be rolled for convenient storage or moved for use at other

sport facilities on the Installation. For larger numbers, the following guidelines are suggested:

- Bench seating with 2 feet (610 millimeters) of length provided for each spectator.
- Provide 6 to 8 square feet (0.55 to 0.74 square meter) of space for each spectator.
- Provide access from a pedestrian path outside of the pool area for visitors attending events. Fence off spectator seating areas from the pool. Provide a see-through fence and lockable gate between the bleachers and the pool deck to separate spectators from competitors.
- Locate spectator seating parallel to the racing lanes in the pool.
- Construct permanent bench seating from concrete, wood, non-corrosive metal (aluminum), or recycled plastic. For temporary or movable bench seating provide metal bench seating specifically designed for sporting events.
- Provide spectator seating that is stepped in elevation to allow maximum visibility.
- Provide full or partial shading options in the spectator seating area.

A-2.11 Storage.

Locker storage located on the pool deck reduces problems associated with theft and vandalism because the lockers are more visible to customers and staff. Consider locating the administrative and entry control checkpoint in the center of the building with changing facilities on each side to provide separation between male and female facilities.

A-2.12 Electronic Surveillance.

For Air Force and Navy facilities, consider the need for an electronic surveillance system to facilitate surveillance of the entire facility.

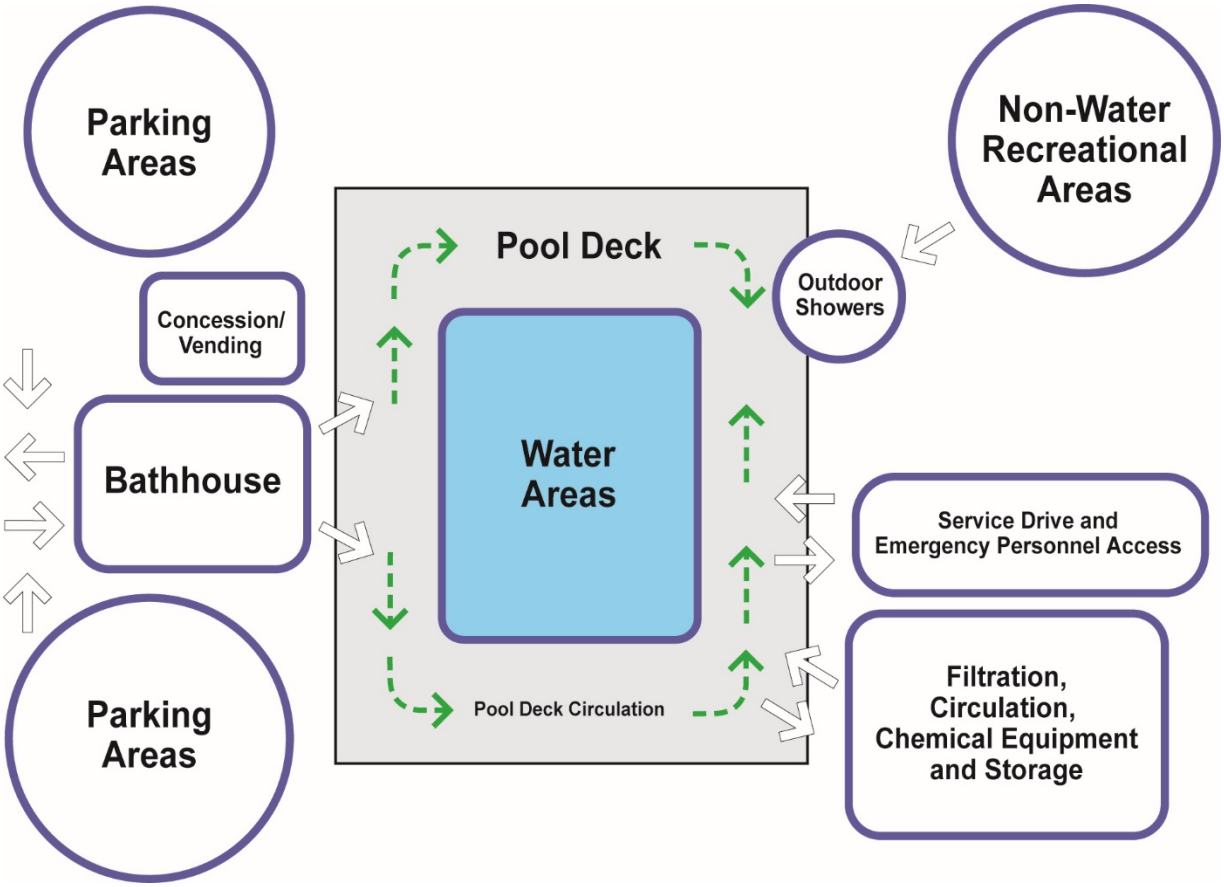
A-2.13 Underwater Lighting.

For recreational-only swimming pools, consider providing a programmable, color-changing LED lighting system for underwater lighting. The illumination requirements described in Chapter 3 must be maintained for color-changing systems.

A-2.14 Drowning Detection System.

To support the lifeguard, consider providing a computer-aided drowning-detection system for recreational swimming pools. Systems may include overhead cameras, underwater-binocular cameras in water deeper than 7 feet (2.13 meters), redundant servers with uninterruptible power supplies, supervision workstation, audio/visual alert

stations for indoor pools, and lifeguard pagers for outdoor pools.



A-2.15 Natatorium/Indoor Pool Room HVAC

Consider the use of high-volume, low-speed fans to prevent stratification and provide mixing at upper elevations for facilities with high ceilings (35 feet plus).

A-3 FUNCTIONAL AREA REQUIREMENTS.

Typical spatial relationships for aquatic facilities are shown in Figure A-2: Functional Area Relationships.

Figure A-2 Functional Area Relationships

A-3.2 Recreational Areas.

Depending on the design of the site and local conditions, outdoor recreation areas may be desired in grass areas surrounding the pool deck. Consider the need for non-water-related recreational areas located inside the pool compound, such as sand volleyball courts and grass areas for sunbathing, throwing Frisbees, horseshoes, picnics, and similar activities. Consider the need for picnic tables, outdoor grills, and similar site furnishings for birthday parties and other group functions that are compatible with the

Installation's facility standards.

Rinse showers allow swimmers to rinse off dirt, sand, and sweat before entering the pool, which reduces maintenance and chemical use.

A-3.3 Low Barriers.

The purpose of a low barrier is to prevent children from wandering into the pool area; it is not designed to prevent unauthorized access when the pool is closed. In some areas, consider the need for combination fencing that has brick or masonry bases with fencing material mounted on top; this type of fencing may help prevent grass clippings and other debris from entering the pool compound.

A-3.4 Miscellaneous Considerations.

- Consider locating filtration, recirculation and heating system equipment outside near the service drive, if possible—it is usually more cost-effective and easier to provide working space around each component.
- Consider the use of portable platforms that may be placed into the main pool to create shallow water environments that can be used for training or instructional courses, and can be removed, as needed, for other pool functions.
- Consider additional recessed rope anchors for equipment and recreational features (e.g., inflatables, recreational water polo goals, etc.) based on coordination with Installation personnel.
- Consider the need for a recall line suspended above the racing course at least 4 feet (1.22 meters) above the water surface or alternative recall methods as dictated by the sanctioning organization. Consider the need for automatic timing touch pads.
- Consider the need for movable fiberglass or stainless-steel bulkheads to divide the water surface area for multifunctional use. Movable bulkheads are very useful for competitive swimming events to provide variable short course lengths, as desired, and other recreational activities.
- Orient outdoor diving boards facing north or east (northern hemisphere) or south (southern hemisphere) where possible, to help eliminate visibility problems associated with sunlight and glare reflecting off the water. An elevator or man-lift is recommended for easy access to high dive platforms. Detailed requirements for competitive diving will depend upon the sanctioning agency sponsoring certain events. For springboards over 10 feet (3 meters) in height, consider a stair access in lieu of a ladder access for diver safety.
- Consider different types of slides for recreation pools, e.g., body slides, drop slides, children's slides. A wide variety of commercially

manufactured play structures and play features designed for use in aquatic environments is available from different specialty companies.

- Consider using rigid board or closed cell sprayed insulation in natatorium areas to prevent moisture build-up in the insulation that might occur using fiberglass insulation. Do not use fiberglass insulation.

A-3.5 Spray Grounds.

Spray grounds are referred to by the MAHC as Interactive Water Play Venues. Spray grounds are recommended instead of wading pools as they are generally safer because there is little to no standing water to create a drowning hazard for children. Spray grounds may include a wide variety of water play equipment designed specifically for children, offering a greater variety of recreational opportunities than traditional wading pools. Spray grounds may include ground sprays, overhead sprays, climbable play structures, slides and other apparatus specifically manufactured for interactive water play.

For potable water spray pads, consider collecting spray ground waste water for alternative purposes, such as irrigation or washing cars and aircraft, especially in areas where water conservation is critical.

A-3.6 Wading Pools.

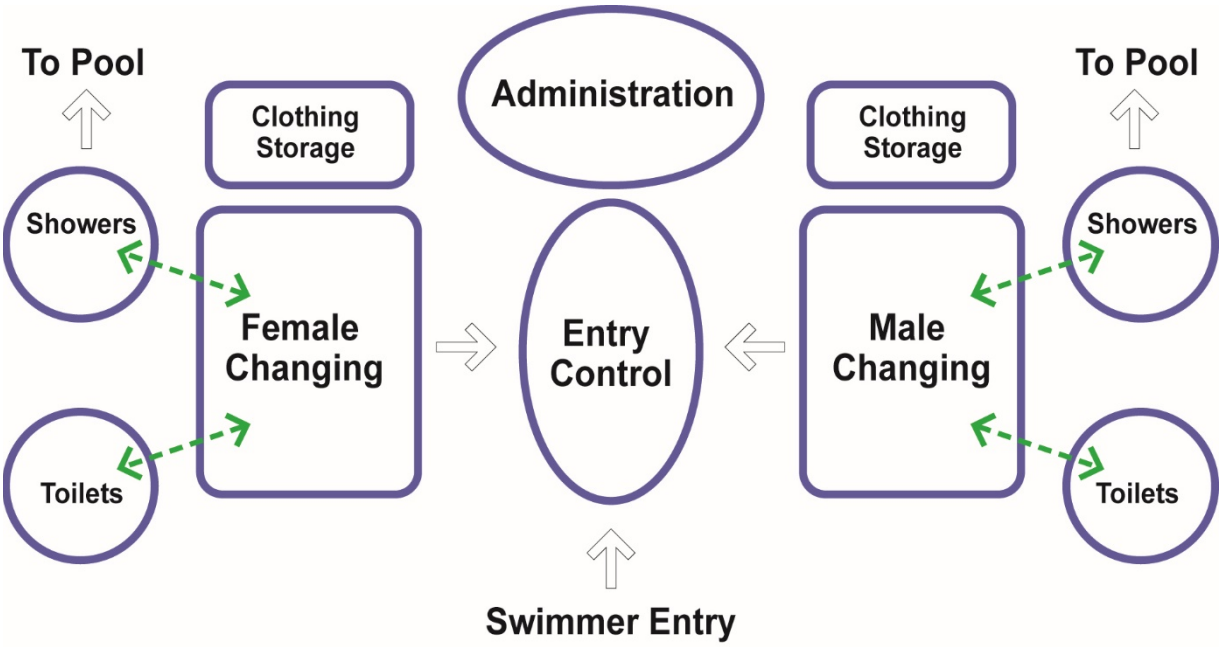
Typical wading pool construction uses scuppers instead of a continuous perimeter overflow system. Parental supervision of children in wading pools is mandatory for safety.

A-3.6.1 Pool Access.

Aquatic lifts may also serve a dual purpose by providing an effective method to get an injured swimmer on a backboard out of the pool.

Providing an egress within the specified minimum distance allows lifeguards to keep their focus at all times on the area around the board or slide by eliminating the need to track an exiting swimmer who has to leave the immediate area of the board or slide, making supervising the next diver or slider problematic.

A-3.7 Depth Markers.



In addition to the required pool wall depth markers, for deck level gutter designs, consider site and pool specific design conditions and place depth markers around the pool, above the water line, on buildings, fences, or walls to clarify the pool depths. Refer also to MAHC annex for rationale.

A-3.8 Bathhouse.

Consider the following items when designing the bathhouse. Refer to Figure A-3: Bathhouse Functional Area Relationships

- Consider placement, type and number of toilet and shower fixtures when designing toilet/shower/clothing storage spaces.
- Consider using recycled plastic toilet and urinal stall partitions because they are non-corrosive, cost-effective, durable, and environmentally friendly.
- For large facilities, consider the need for additional public toilets for visitors and spectators because of the limited access requirements to the dressing room areas.
- The staff lounge, training rooms, and food service areas may be located away from the entry control checkpoint. Locate with views of the water and deck areas, where possible. Consider the need for a washer and dryer in the staff lounge.
- Consider the need for a drop-down projection screen and wall-mounted white boards.
- A storage room length of 16 feet (4.88 meters) is recommended if safety equipment has not been selected prior to design.

Figure A-3 Bathhouse Functional Area Relationships

A-3.9 Showers

Consider the following items when designing showers:

- Consider the need for vandal-proof showerheads.

- Consider adding shower caddies or built-in shelves in each stall for storing soap and accessories.
- Glass and glazing must not allow visual access from adjacent buildings or outside areas into shower areas.

C-2 TERMS.

Aquatic facilities may have a variety of different components, depending upon the unique requirements for each facility. Below are some common definitions associated with major aquatic facility components:

- Swimming Pool: Any artificial basin of water constructed, installed, modified, or improved for the purpose of swimming, wading, diving, recreation, or instruction. It does not include pools designed to be used exclusively for military training or operations.
- Natatorium: An indoor or enclosed swimming pool.
- Spa: An artificial basin of water designed for recreational use and/or therapeutic use and is not drained, cleaned, and refilled for each individual user. Spas may include hydro jets, hot or cold water, air induction systems, or any combination thereof. It does not include pools used under the direct supervision of medical personnel.
- Wading Pool: A pool that is no more than 18 inches (0.45 meter) deep and intended to be used by young children.
- Slip-Resistant: A surface meeting the minimum coefficient of friction for slip-resistance in accordance with the MAHC.
- Spray Ground: An area, with no standing water, that includes water-spraying devices and other water related recreational equipment intended to be used by young children. May also be referred to in the industry as a splash pad, spray pad, or spray deck or wet deck.
- Pool Deck: The concrete or hard surface area surrounding the pool water areas.
- Bathhouse: A building that typically contains changing areas, restrooms,

and locker areas. Bathhouses may also contain administrative, entry control, food service, storage, mechanical, and other related functions or areas.

- Zero Depth Entry: A sloped means of access into the pool starting from the deck elevation and continuing into the body of water until the first point of slope change.
- Freeboard: Vertical distance between the normal operating water elevation and the deck elevation.
- Fiberglass Runout: The fiberglass portion of manufactured slide that is used to decelerate and stop the slider.
- Surge Tank: A tank used to hold water displaced by bathers in the pool.
- Skimmer: A manufactured device installed in a pool wall that is used to remove floating debris from the surface of the water.
- Weir: A barrier over which water flows.
- Flooded Suction: A term used to describe the installation of a pump where the suction pipe is below the normal operating water elevation of the tank or body of water connected to the pump suction.

FOREWORD

Facilities Criteria (FC) provide functional requirements (i.e., defined by users and operational needs of a particular facility type) for specific DoD Component(s), and are intended for use with unified technical requirements published in DoD Unified Facilities Criteria (UFC). FC are applicable only to the DoD Component(s) indicated in the title, and do not represent unified DoD requirements. Differences in functional requirements between DoD Components may exist due to differences in policies and operational needs.

All construction outside of the United States is also governed by Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA), and in some instances, Bilateral Infrastructure Agreements (BIA.) Therefore, the acquisition team must ensure compliance with the most stringent of the UFC (replace w/ FC), the SOFA, the HNFA, and the BIA, as applicable.

Because FC are coordinated with unified DoD technical requirements, they form an element of the DoD UFC system applicable to specific facility types. The UFC system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and applicable to the Military Departments, Defense Agencies, and the DoD Field Activities. The UFC System also includes technical requirements and functional requirements for specific facility types, both published as UFC documents and FC documents.

FC are living documents and will be periodically reviewed, updated, and made available to users as part of the Services' responsibility for providing criteria for military construction. Headquarters, U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering Command (NAVFAC), and the Air Force Civil Engineer Center (AFCEC) are responsible for administration of the UFC system. Defense agencies should contact the preparing service for document interpretation and improvements. Technical content is the responsibility of the cognizant DoD working group. Recommended changes with supporting rationale should be sent to the respective service proponent office by the following electronic form: Criteria Change Request. The form is also accessible from the Internet site listed below.

FC are effective upon issuance and are distributed only in electronic media from the following source:

- Whole Building Design Guide web site http://dod.wbdg.org/.

Refer to UFC 1-200-01, *General Building Requirements*, for implementation of new issuances on projects.

AUTHORIZED BY:

JOSEPH E. GOTT, P.E.
Chief Engineer
Naval Facilities Engineering Command

FACILITIES CRITERIA (FC)
NEW SUMMARY SHEET

Document: FC 4-760-10N, *Navy Museums and Historic Resource Facilities*

Superseding: None

Description: FC 4-760-10N, *Navy Museums and Historic Resource Facilities* represents an effort to establish uniform design and construction standards for Naval History and Heritage Command (NHHC) facilities including public museums, artifact storage and curatorial spaces, archives, secure archives, and administration. These standards will cover new construction, leased facilities and repair projects.

Reasons for Document:

- Many existing facilities are inadequate in size and condition, with insufficient heating, ventilating, and air conditioning systems. Many existing facilities are not conducive to the proper conservation, preservation, and storage of rare and historic archives, books, art and artifacts. Current storage conditions do not meet standards for collection management and risk permanent damage to artifacts.

Impact:

- Single, comprehensive, up-to-date criteria and standards will help to produce facilities that provide a safe, economical, and energy efficient environment for visitors, artifacts, historical documents, and art. These facilities will preserve and provide access to naval history and heritage for present and future generations.

CHAPTER 1 INTRODUCTION

1-1 PURPOSE AND SCOPE.

This FC provides requirements for evaluating, planning, programming, and designing two facility types:

- Navy Museum – Protects and displays precious naval artifacts, documents and art portraying the Navy's rich military history and offers visitors, including Navy personnel, their families, retirees, recruits and the general public, an important glimpse into their cultural heritage.
    - Plans, designs, and fabricates exhibits and displays.
- Historic Resource Facility (HRF) – There are several functional areas which are included in HRFs. Although HRF is listed as a facility type, its functional areas may be co-located within a single facility or built as separate structures. See Chapter 2 for additional planning information. HRFs serve the following functions:
    - As an archive depository that consists of operational and administrative records of SECNAV, fleet, major commands, and other organizations and individuals stored in paper, microform and electronic form.
    - As a library to hold collections of books, journals, maps, charts, records, and other valuable items deemed important to the Navy for the purpose of research, analysis, and writing about naval history and related topics as well as for the purpose of preserving important icons of the Navy's heritage.
    - Executes the responsibilities of the Director of NHHC/Curator of the Navy and ensures proper documentation, cataloging, accountability, and preservation of historical art, property, artifacts, and collections.
    - Develops and administers exhibit programs, including collecting, selecting, and researching exhibit materials.
    - Manages and oversees historical underwater archaeology, conservation projects, and activities that relate to the Curator of the Navy.

The information in this FC applies to the design of all new construction projects, to include additions, alterations, and renovation projects.

This FC is organized to provide the data and criteria needed at each stage of the project development process. It also applies to the procurement of design/build services for the above noted projects. Alteration and renovation projects should update existing

facilities to meet the guidance and criteria within budgetary constraints. Some Core UFCs provide guidance and requirements on renovation and alteration projects relative to thresholds and triggers. A list of the Core UFCs is included in UFC 1-200-01, *General Building Requirements*. This FC is not intended as a substitution during design for thorough review by individual program managers and operations staff.

1-2 APPLICABILITY.

This FC is intended as a source of basic architectural and engineering information for all individuals involved in the planning, design, construction or evaluation of museums and historic resource facilities. Architects and Engineers (A/Es) that provide design services will use this FC under the direction of NAVFAC. Installation and facility planning personnel will use this FC, in conjunction with other required planning documents, for programming new or replacement facilities, pre-design planning, or assessing the extent of improvements required in an existing museum or historic resource facility in order to achieve the standard established herein.

1-3 GENERAL BUILDING REQUIREMENTS.

Comply with UFC 1-200-01, *General Building Requirements*. UFC 1-200-01 provides applicability of model building codes and government unique criteria for typical design disciplines and building systems, as well as for accessibility, antiterrorism, security, high performance and sustainability requirements, and safety. Use this FC in addition to UFC 1-200-01, as well as the UFCs and other government criteria referenced therein.

1-4 STANDARDS.

Museum and Historical Resource Facility standards are critical to ensure the longevity of historical artifacts and to share U.S. naval history with the public. Museums and HRFs are not the Navy's typical operational facilities. These facilities require a unique set of standards to allow the Navy to meet its mission. The intent of this FC is to reference existing standards to the greatest extent possible, supplemented by new standards for these facilities which have unique requirements. Where conflicts occur between additional referenced documents, this FC will have precedence.

1-4.1 National Archives and Records Administration (NARA).

NARA standards are the guiding documents for the following functional areas which are included in this FC:

- Navy Museums – Archival Processing
- Navy Historic Resource Facilities – Archives, Library, and Histories, as well as for common functional space shared by these groups

NARA 1571 directive establishes structural, environmental control, fire safety, preservation, and security standards for archival storage conditions in NARA archival facilities. 36 CFR, Chapter XII, Subpart B, 1234.10-14, Facility Standards for Records Storage Facilities establishes civil, architectural, structural, environmental control, and fire safety standards for records storage in NARA storage facilities. 36 CFR 1234.20

explains what rules apply if there is a conflict between NARA standards and other regulatory standards that a facility must follow.

1-4.2 National Park Service Title 36 – Parks, Forests, and Public Property, Part 79 (36 CFR 79).

For purposes of this FC, 36 CFR 79, Curation of Federally-Owned and Administered Archaeological Collections, is federal law and therefore also applies to the artifacts and underwater archaeological collections under the jurisdiction of the NHHC.

The regulations in this part establish definitions, standards, procedures and guidelines to be followed by Federal agencies to preserve collections of prehistoric and historic material remains, and associated records, recovered under the authority of the Antiquities Act, the Reservoir Salvage Act, Section 110 of the National Historic Preservation Act or the Archaeological Resources Protection Act.

1-5 HISTORIC PRESERVATION COMPLIANCE.

1-5.1 Stewardship.

The Department of Defense remains a leader in the federal government in balancing new construction projects with the protection of historic properties. According to SECNAVINST 4000.35A, “The DON is a large scale owner of historic buildings, districts, archaeological sites, ships, aircraft and other cultural resources. Protection of the components of the nation’s heritage is an essential part of the defense mission, and the DON is committed to responsible cultural resources stewardship.” The Department of Defense abides by federal legislation on protecting cultural resources, and issues its own complementary policies for stewardship.

1-5.2 Compliance with Laws.

Museum and Historic Resource Facility projects related to existing facilities on or eligible for the National Register of Historic Places must comply with federal laws regarding cultural resources including the National Historic Preservation Act and the Archaeological Resources Protection Act. Navy personnel need to determine possible adverse effects upon an historic structure and/or archaeological resource during project development and consult accordingly. The Navy is required to identify, protect and nominate historic properties to the National Register of Historic Places. NAVFAC HQ develops policy statements and other forms of guidance, maintains and interprets data, and produces reference and promotional materials.

1-5.3 Compliance with DoD Standards.

Conversely, historic preservation compliance does not negate the requirement to implement DoD policy. Federal agencies are always the decision maker in the Section 106 process of the National Historic Preservation Act. Navy Cultural Resource managers work directly with naval installations, state historic preservation offices and other interested parties to implement the Section 106 process.

1-6 MUSEUM ACCREDITATION.

One of the goals set forth in OPNAVINST 5450.342 for the NHHC's outreach mission is to sustain a fully accredited "Smithsonian class" Navy museum network. Use of this FC will provide facilities that meet requirements of the American Alliance of Museums' *National Standards and Best Practices.* Note that museum accreditation by the American Alliance of Museums involves a wide range of issues beyond planning and facility-related requirements such as a Code of Ethics, fundraising, and other operational needs.

1-7 REFERENCES.

Appendix A contains a list of references used in this document. The publication date of the code or standard is not included in this document. In general, the latest available issuance of the reference should be used.

1-8 RESOURCES.

Appendix B contains additional resource materials for planners and designers of Museums and Historic Resource Facilities.

1-9 GLOSSARY.

Appendix C contains acronyms, abbreviations, and definitions.

CHAPTER 2 PLANNING AND LAYOUT

2-1 PLANNING CONSIDERATIONS.

The content of Chapter 2 provides guidelines and information needed for planning and programming Navy Museums and Historic Resource Facilities. Development planning and the programming of facility space and other requirements may be different for each project depending upon the unique factors regarding each facility. Review applicable programmatic requirements based on facility location, master plan development, landmark status, or site security requirements that may be part of larger site context requirements.

2-2 SPACE CRITERIA.

Museum and Historic Resource Facility space needs are site and mission specific and must be individually programmed based on a facility study. Actual size must be determined during the planning phase using UFC 2-000-05N (P-80), *Facility Planning Criteria for Navy and Marine Corps Shore Installations* and UFC 3-101-01, *Architecture*.

2-3 FACILITY REQUIREMENTS.

In developing the space program for an individual facility, consider the issues of overall building design and relationships discussed in Chapters 3, 4 and 5. The adjacency diagrams at the end of Chapter 2 do not indicate sizes of spaces. The diagrams should be used as guidance for space functional relationships including adjacencies and flow.

2-4 FACILITY TYPES.

- Museums.
- Historic Resource Facilities.

2-5 MUSEUMS.

Each museum should be planned and sized based on the mission of the facility, the type and size of the planned collections, and the projected audience. Most museums have non-government organizations (NGO) which should be included in the planning, design and operations of revenue-generating spaces. These spaces may include, but are not limited to: parking, museum store, theater, food service, and special events area(s). See Figure 2-5, Museum Adjacency Diagram, for additional guidance.

The goals of museum planning are:

- to provide space and facilities that are both aesthetically pleasing and effective in preserving and interpreting museum collections for museum visitors;

- to establish and/or maintain an institution which can perform these functions efficiently and sustainably.[1]

2-5.2 Site.

2-5.2.1 Location.

Visibility, access, and convenience are all contributing factors to the success of a museum. If possible, locate public museum facilities outside the secured perimeter of the base to enable unrestricted public access. If located on base, the museum should be readily accessible from the main entrance to the base. Locate museum facilities near existing transportation alternatives to provide various options for visitors. A museum's location along a prominent thoroughfare or in a key district of a community, such as a housing, shopping, or recreational area, increases its visibility to its audience. If the museum has multiple buildings, locate the museum and resource facilities near each other to reduce travel time between buildings and to minimize potential exposure of collections. Consider desirable natural site features such as terrain. Existing natural site features may be incorporated into required site elements like antiterrorism standoff distances or vehicle barriers that may help to blend the facility into the natural setting of the site. Though it may not be possible in certain areas, it is desirable to have the museum located above the 500 year flood pain or have critical artifacts protected to this level. See Chapter 3 for minimum design requirements.

2-5.2.2 Size.

It is desirable to have a minimum level terrain site area of approximately two or three times the gross area of the building. This size will allow for proper truck access to loading dock areas, parking and other site features such as attractive landscaping and monuments. More area may be needed if the site has any special features, such as natural ravines, existing specimen trees, or rock outcroppings to be preserved. The loading dock will serve as a space for material shipping and receiving, as well as a place for building waste removal. When sizing, consider shipments and large collection items that will enter the facility through the loading dock. A preliminary site design should be prepared to ensure the basic building and site criteria can be accommodated. Site size should provide for future expansion, if practical.

2-5.2.3 Access.

New construction, additions, and renovations of existing facilities must be designed and constructed to meet accessibility requirements of the Architectural Barriers Act Accessibility Standard (ABAAS) for DoD Facilities. All functional areas must be barrier-free and accessible to persons with disabilities. Site and building designs should enable persons with disabilities to act independently and enjoy the full range of programs provided. Level changes may be included but must be accommodated by ramps suitable for wheelchair users, both indoors and outdoors. Include access to all areas

[1] B. Lord, G. Dexter Lord, L. Martin, "Museum Planning" in *MANUAL OF MUSEUM PLANNING*, 3rd Edition, 2012

and facilities, including staff and work areas, restrooms, water fountains, and communication devices.

Consider service road access for loading dock/service entrance and emergency vehicles. Along with parking area(s) and service road, consider group tour bus drop off area(s) with the access planning. When possible, provide two (2), two-way access drives to separate service vehicles/truck access from privately owned vehicle parking area access. Provide bicycle racks in a secure location near the facility entrance.

2-5.3 Building Service Areas.

Provide an interior off-loading area separated from the remainder of the building by a second overhead coiling door to accommodate the staging and delivery of materials and collections. After the items have been processed, they will proceed either to the collections or the exhibit areas. Minimum size of the overhead coiling door is 8 ft. (2.4m) wide by 8 ft. (2.4m) high, but larger sized doors may be required based on the size and type of collection materials. To accommodate the movement of items, the loading dock must be connected to each of these other spaces by corridors which have the same minimum width as the overhead coiling door. All interior doors and openings along these access routes must accommodate a minimum height dimension equal to the height of the overhead coiling door. The general collections storage space is required to be adjacent to the loading dock. To minimize the possibility of contamination of exhibits and collections due to a common path with the trash, locate a trash room separated from, but accessible to the loading dock. If the loading dock is used to receive food, provide a separate path of travel for food items to the food service area, thereby isolating museum exhibits and collection storage areas.

2-5.4 Public/Private Areas.

Separation between public and non-public, more secure spaces should be a planning consideration for museum facilities. Public functions, including exhibition halls, theaters, food service, public toilets and museum store should be located near the main building lobby. Elevators should be visible from the main entrance.

2-5.4.1 Public Areas.

2-5.4.1.1 Lobby.

Plan for all visitors to enter the museum through one common entrance unless the size of the facility and expected visitor count require a separate bus/group entrance. Visitor areas should be continuously monitored by the facility's video surveillance system. Provide space for possible security desk and screening equipment. If possible, provide queuing space in front of security/inspection stations inside lobby.

2-5.4.1.2 Museum Store.

The museum store must be in close proximity to the main entrance and lobby. Provide adjacent office for museum store manager, storage area and packing area.

2-5.4.1.3 Toilets.

In addition to public toilets, provide family toilets in the same area. For facilities where high visitation by children is anticipated, consider child-size toilet fixtures and mounting heights in family toilet. Provide drinking fountains in this area.

Provide separate staff-only restrooms in non-public areas of the building.

2-5.4.1.4 Visitor Services.

Plan visitor services area to include coatroom, storage for loaner wheelchairs, strollers, or walkers, and possible first aid room. Consider providing locker storage for visitor accommodation. Include display and storage space for printed materials for visitors, easily accessible to front visitor reception counter. Locate visitor services adjacent to lobby and public toilets.

2-5.4.1.5 Food Service.

Any requirement for food service must be approved under a coordinated business financial management plan. Food service operations for each facility should be determined based on mission and projected visitor needs. Food service may range from vending machines/self-service café to full-service restaurant. Food service should be located adjacent to the lobby or special events area. Consider location of food service to allow for outdoor dining space as well as convenience to the education space. Food service must be separated from collections storage areas.

Locate separate catering kitchen and beverage vault adjacent to main food service facilities in order to isolate food preparation, storage, and service areas from the museum exhibits and collections. The catering kitchen should be zoned for possible after-hours use.

2-5.4.1.6 Theater.

Theater should be sized and designed based on the museum exhibits, mission and expected visitor count. The theater should accommodate large presentations and varied media viewing. It should incorporate fixed seating, a focal point stage or platform, projection room, and AV systems. Theater location should be adjacent to lobby, special events area and exhibits, with the option for after-hours use. Consideration must be given to NFPA 101, Life Safety Code®, compliance regarding lobby design relative to required egress width from the theater.

2-5.4.1.7 Special Events Area.

Consider providing a space adjacent to the lobby which can function as a gathering space for larger group events such as change-of-command and retirement ceremonies, youth and educational functions, receptions and parties. This space can also serve as an exhibition hall for museum displays which provide a “wow-factor” and an enticing introduction to the overall museum collections. This area should be zoned to allow for after-hours use.

2-5.4.1.8 Exhibit Space.

The exhibit areas should consist of minimal fixed items. Recommend involvement of an exhibit designer early in the design process. Planning considerations which must be decided early in the process include the following:

- Determine if there will be fixed walls and/or panels.
- Determine if there will be an exposed or finished ceiling design (e.g. black or white box, high or low bay).
- Determine if the exhibits will follow a linear progression or an open plan.

Exhibit space should have a minimum clear ceiling height of 12 ft (3.7m).

2-5.4.1.9 Education Space.

Provide classroom space to educate young adults and children in naval history through special programs and outreach activities. Provide large, flexible space with folding partitions to accommodate smaller groups. Larger museum facilities may include Science, Technology, Engineering and Mathematics (STEM) laboratories, possibly located throughout the museum near specific exhibit areas. Provide outdoor education space if possible. The education space should be zoned to allow for after-hours use.

2-5.4.2 Private Areas.

2-5.4.2.1 A/V Room(s).

Locate near exhibit space and theater. Multiple A/V Rooms may be required based on exhibit layout.

2-5.4.2.2 Exhibit Production/Maintenance Spaces.

The size and functions within exhibit production and maintenance spaces will vary depending on whether exhibits are produced off-site or in-house. In-house exhibit production may require planning for separate spaces for the following functions:

- Tool Room
- Sign and Framing Shop
- Lighting Shop
- Metal Shop
- Project Assembly Room
- Dust Collection Room

2-5.4.2.3 Collections Storage.

Collections storage should be located near exhibit space as well as the shipping/receiving area. If a freight elevator is required, it should be located in close

proximity to the collections storage area. The collections storage area must be located remotely from any break rooms, vending areas or food service operations.

2-5.4.2.4 General Storage.

Provide storage space for building maintenance supplies. Provide storage space for furnishings and equipment required for functions in the special events area and the catering kitchen.

2-5.4.2.5 Mechanical/Electrical.

Provide a buffer between mechanical and finished public space to prevent potential problems of noise, vibration and odors.

2-5.4.2.6 Office Space.

Design administrative space for long-term flexibility and possible future re-configurations. Open plans, with a high use of workstations rather than closed offices, have a greater degree of efficiency and flexibility, and provide easier distribution of heating, cooling and natural light to the work areas. Where private office space is required, consider the use of demountable partitions for flexibility. Provide administrative support space adjacent to offices including conference rooms, training rooms, copy/mail rooms, file rooms, and supply rooms. Provide staff break room with refrigerator, microwave and sink. Follow planning guidance and criteria per UFC 4-610-01, *Administrative Facilities*.

2-6 HISTORIC RESOURCE FACILITIES (HRF).

Historic Resource Facilities should be planned and sized based on the site and mission-specific functions of the facility. Functional areas that may be a part of this facility include Administrative Space, Archives, Library, Histories, Artifacts, Art, and Underwater Archaeology. See Figure 2-6, Historic Resource Facilities Adjacency Diagram, for additional guidance.

2-6.1 Administrative.

Provide administrative and support space (break rooms, copy rooms, conference space, supply storage rooms) for the Historic Resource Facility. Note that a planning goal is to share as many administrative and support spaces as possible depending upon which functional groups are combined in one building. For example, Archives office space may be combined with Histories and Library office space if these functions are within one facility. Likewise, if NHHC Command Administration shares space in the HRF, common administration and support spaces may be shared with one or more of the other functional areas. Follow planning guidance and criteria per UFC 4-610-01, *Administrative Facilities*.

2-6.2 Archives.

Navy Archives mission is to collect, preserve, arrange, describe, catalog and make available for use the official documents, personal papers, and oral histories relating to the US Navy and Navy personnel. See Figure 2-7, Archives, Library, and Histories Adjacency Diagram, for additional guidance.

2-6.2.1 Archives – Office Space.

Provide general administrative office space including reception area for Archives visitors. Locate adjacent to research area for unclassified documents. Locate adjacent to exterior walls to allow for windows and daylighting. Consider a separate staff entrance to reduce disruption to researchers in the reference and research areas.

2-6.2.2 Archives – Classified Receiving.

Provide secure, open and flexible space adjacent to Loading Dock, Archives – Decontamination Area, and Archives – Classified Processing.

2-6.2.3 Archives – Decontamination.

Provide a secure classified space for the inspection and decontamination of archives prior to entering the HRF. Note that unclassified materials may be handled in this classified space. Two separate decontamination spaces are not required for unclassified and classified decontamination. Locate adjacent to Archives - Classified Receiving and Archives - Classified Processing.

2-6.2.4 Archives – Declassification.

Provide a secure classified space to be used for mandatory declassification reviews of archival materials. Locate adjacent to Archives – Classified Research.

2-6.2.5 Archives – Classified Research.

Secure Archives includes space for classified document research. This secure space should be located near Archives – Office Space, Archives - Classified Archives Storage, Archives – Declassification.

2-6.2.6 Archives and Library – Unclassified Research.

Provide a shared public research space for unclassified Archives and Library documents. This space should be located adjacent to the Entry, Archives – Office Space, and Library – Reference and Circulation for more convenient public access.

2-6.2.7 Archives – Unclassified Archives Storage.

Archives include space for unclassified archives storage. This space should be located adjacent to the Archives - Classified Processing, Archives – Unclassified Cold Storage, and Archives – Classified Storage.

2-6.2.8 Archives – Classified Archive Storage.

Secure Archives includes space for top secret archival storage. This secure space should be located adjacent to Archives –Classified Processing, Archives – Classified Cold Storage, and Archives – Unclassified Storage. Classified Archive Storage should be located near Archives – Office Space, Archives – Classified Research, and Archives - Declassification.

2-6.2.9 Archives – Secure Space.

Secure Space is a compartmented area located within Classified Archives Storage. Include JWICS access. Refer to the section in Chapter 3 entitled, “Physical Security Requirements” for additional security requirements for this space.

2-6.2.10 Archives – Cold Storage.

Provide Archives – Cold Storage in a central, easy-to-access location due to heavy use of this functional area. Research and Reference areas should be adjacent, but separate. Provide both classified and unclassified Cold Storage for negatives, photos, microform, motion recordings and sound recordings.

2-6.3 Library.

Navy Department Library is the only functional group that allows visitors direct access to research materials. The library should be located at the front of the facility because it requires the most public interaction. The library must have controlled access via a single location which includes inventory control sensors. Follow library planning guidance and criteria per UFC 4-740-20, *Libraries*. See Figure 2-7, Archives, Library, and Histories Adjacency Diagram, for additional guidance.

2-6.3.1 Library – Reference/Circulation Area.

Provide reference/circulation area located adjacent to the main entry, book stacks, and Archives and Library - Unclassified Research Room. Rare books/special collections room and restricted research room should be located within clear visible sight from the reference/circulation area.

2-6.3.2 Library – Books Stacks.

Provide space for the book stacks located centrally in the space adjacent to the Reference/Circulation area and within easy access to the Archive and Library Unclassified Research Room.

2-6.3.3 Library – Rare Books/Special Collections Room.

Provide separate room for rare books and special collections with restricted access and alarm system. The rare books/special collections room should be located adjacent to the Restricted Research Room.

2-6.3.4 Library – Restricted Research Room.

Provide restricted access research room located adjacent to the rare books/special collections room. This room should have interior windows visible from the circulation desk for monitoring.

2-6.3.5 Library – Cataloging Area.

Provide cataloging area adjacent to or within the office space.

2-6.3.6 Library – Office Space.

Provide general administrative office space for library staff with exterior windows for daylighting and views if possible.

2-6.4 Histories.

Histories functional group researches and analyzes printed, artifact and oral sources as evidence for articles, reports, monographs and published books. Provide additional space in Historian Office area for numerous bookcases and storage cabinets. Provide separate room for Histories microform viewing and storage. Include separate spaces for conducting classified and unclassified oral histories. Include space for historian office within overall secure boundary. The Histories space is administrative and should be located adjacent to the Archives and Library functional areas. See Figure 2-7, Archives, Library, and Histories Adjacency Diagram, for additional guidance.

2-6.5 Artifacts.

The Artifacts functional grouping is guided by the need for appropriate storage facilities for a wide variety of historic artifacts and modern conservation capabilities including Macro and Micro Artifact Storage, as well as the Navy Art Collection.

2-6.6 Artifact Storage.

Artifact Storage includes general storage space for Macro and Micro Artifact collections as well as support spaces for Loan Artifact Processing, Shipping and Receiving, Technical Library, Record Storage, and Photo Room. Locate general and support spaces adjacent to both Macro Artifact Storage and Micro Artifact Storage. Provide for classified, sensitive, weapons and high-value storage.

2-6.6.1 Macro Artifact Storage.

Provide room for Macro Artifact bulk storage. In addition, provide an area for Macro Artifact Processing. See Figure 2-1 for example of Macro Artifact Storage.

Figure 2-1 Sample Macro Artifact Storage

Maryland Archaeological Conservation Laboratory, Jefferson Patterson Park & Museum

2-6.6.2 Micro Artifact Storage.

Provide room for Micro Artifact Storage to include area for Micro Artifact Processing. In addition, provide specialized areas for Conservation, Uniform/Textile Storage, Cold Storage, and Secure Weapons Storage. Specialized storage areas should be located adjacent to Micro Artifact Storage. See Figure 2-2 for example of Micro Artifact Storage. See Figure 2-3 for example of Artifact Processing Area. See Figure 2-8, Historic Resource Facilities – Artifact Storage Adjacency Diagram, for additional guidance.

Figure 2-2 Sample Micro Artifact Storage

Museum Support Center, Fort Belvoir, VA

Figure 2-3 Sample Artifact Processing Area

Museum Support Center, Fort Belvoir, VA

2-6.6.3 Navy Art Collection.

NHHC is the principal custodian of the Navy's art/painting heritage. The mission of the Navy Art Collection is to collect, document, preserve, and exhibit art that is significant to the history of the Navy for service personnel and for the public, as well as to promote the creation of art through the Navy Art Program.

The Art Collection space includes the following areas: Administrative space including studio for resident office, Processing, Art Gallery Art Storage, Framing Room, Accessioning, and Secure Storage. The collocation of the Navy Art Collection non-exhibit functions and the Artifacts conservation, distribution, and storage functions allows for a consolidated facility, appropriate storage methods, and improved distribution of Navy assets. Separate art galleries may be located at Navy museums.

2-6.6.4 Underwater Archaeology.

Underwater Archaeology (UA) is the center of expertise and recognized authority for the Department of the Navy in all matters related to science of underwater archaeology, identification, research, analysis, interpretation, preservation, conservation, inventory, and management of Navy's historic ship and aircraft wrecks and their associated contents.

The functions of UA are not easily grouped with other functions found in the HRF. UA is most closely associated with the Artifact Storage function and has been shown in Figure 2-6 to be adjacent to Artifact Storage. There are also functional relationships between UA, NHHC Command Administration, and the museum functional group. See Figure 2-9, Underwater Archaeology Adjacency Diagram for additional guidance.

2-6.6.4.1 UA - Administration.

Provide UA offices and support space to include a conference room, secure library, break room, map room, and copier room. Provide a demonstration lab space which is adjacent to the conservation laboratory space.

2-6.6.4.2 UA – Conservation Laboratory.

Locate adjacent to UA offices and demonstration lab space in a visible way to facilitate tours. Conservation laboratory should be large enough to accommodate increasing collection. Locate lab adjacent to loading dock. Provide overhead crane. Provide adjacent space for equipment storage, forklift storage, boat storage, chemical storage, cold storage, x-ray machine, and dive operation facility with storage for dive gear and remote-sensing equipment. Plan for adjacent outdoor tanks. See Figure 2-4 for example of UA Conservation Laboratory.

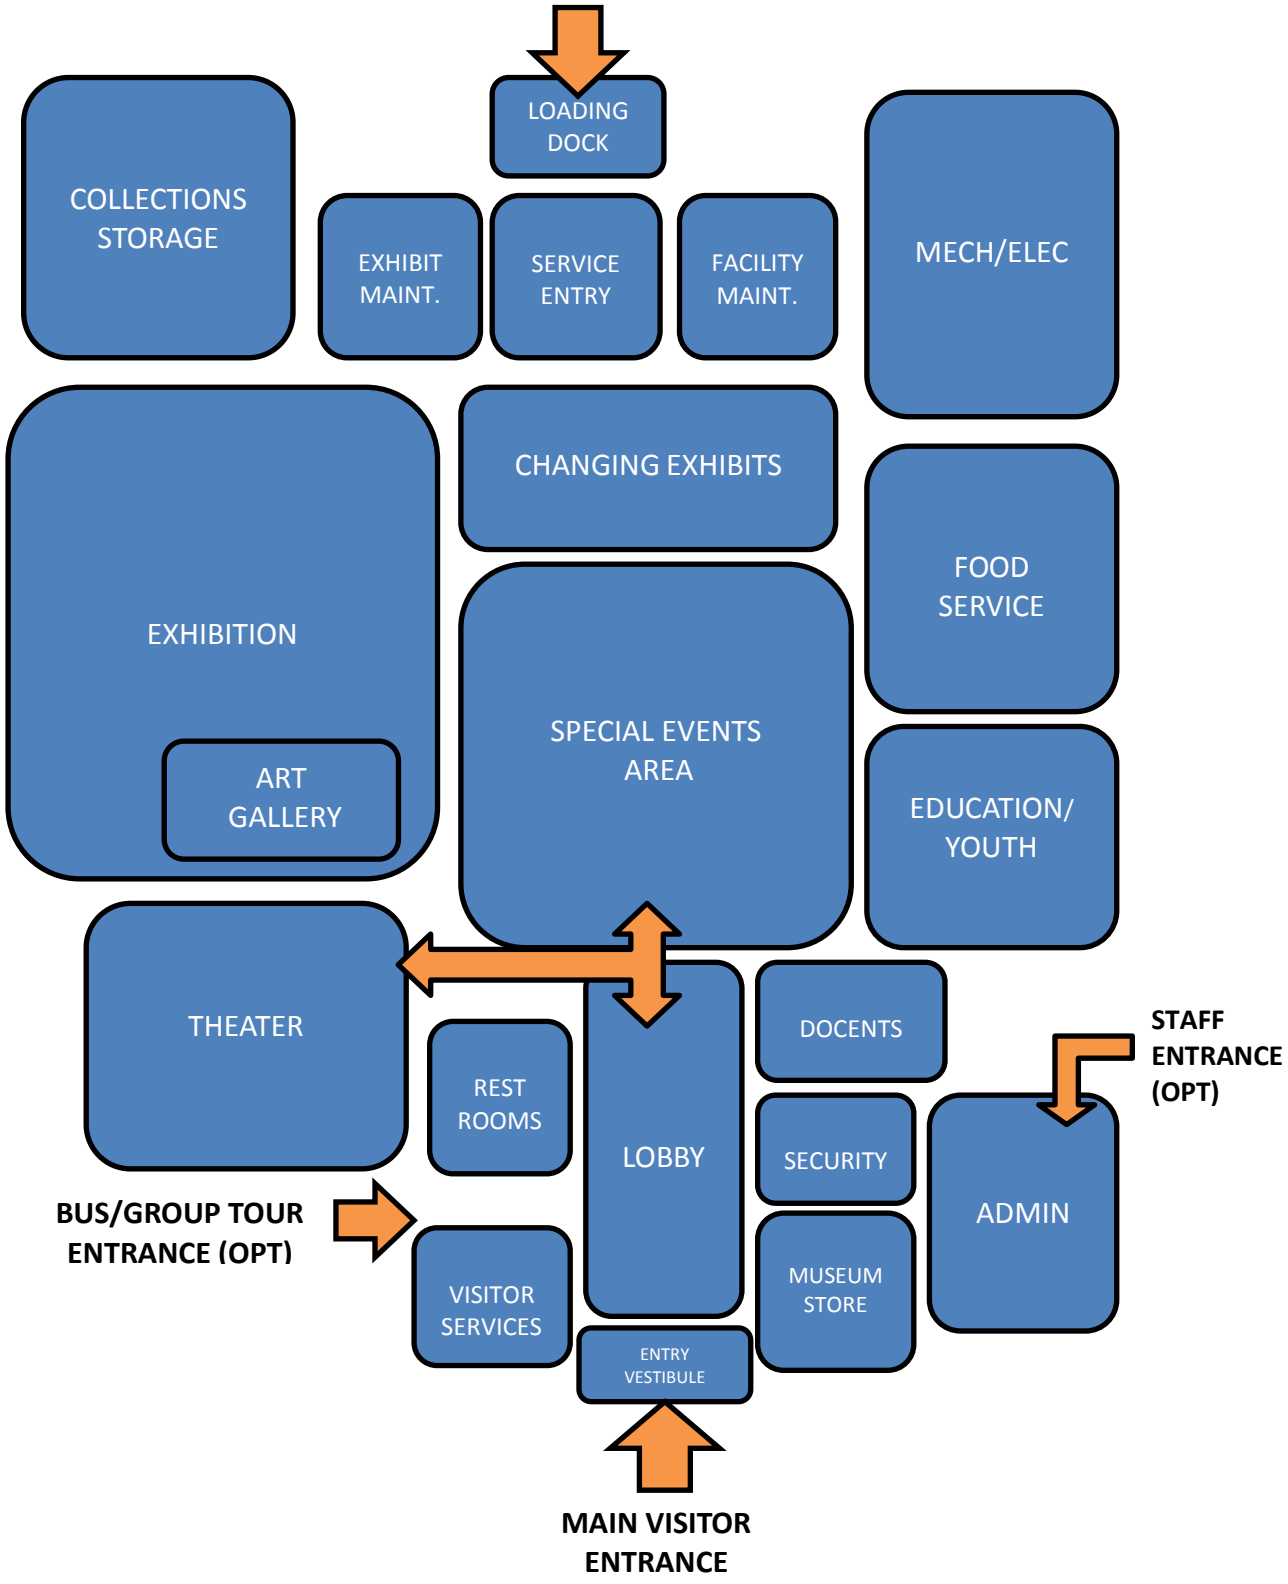
Figure 2-4 Sample UA Conservation Laboratory

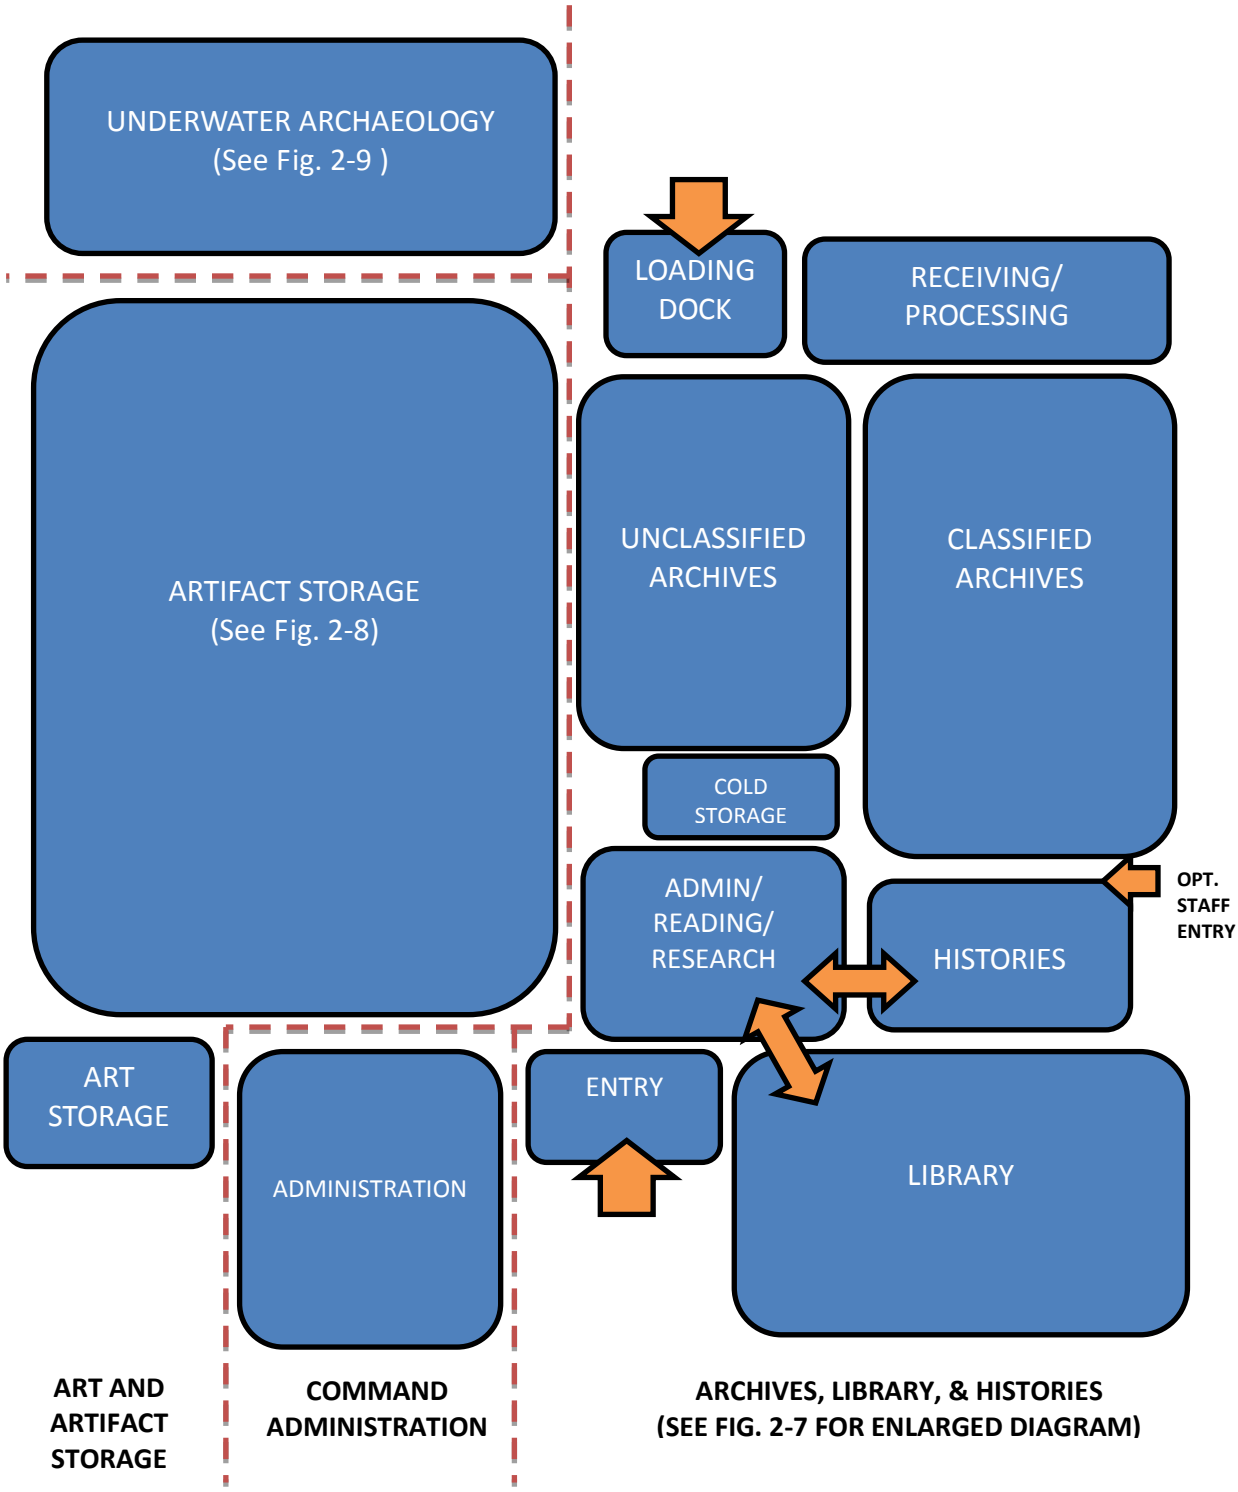
Maryland Archaeological Conservation Laboratory, Jefferson Patterson Park & Museum

2-6.6.4.3 UA – Collections Storage.

Provide a large, open bay storage area with an adjacent space or space within the large storage area for smaller object storage.

Figure 2-5 Museum Adjacency Diagram





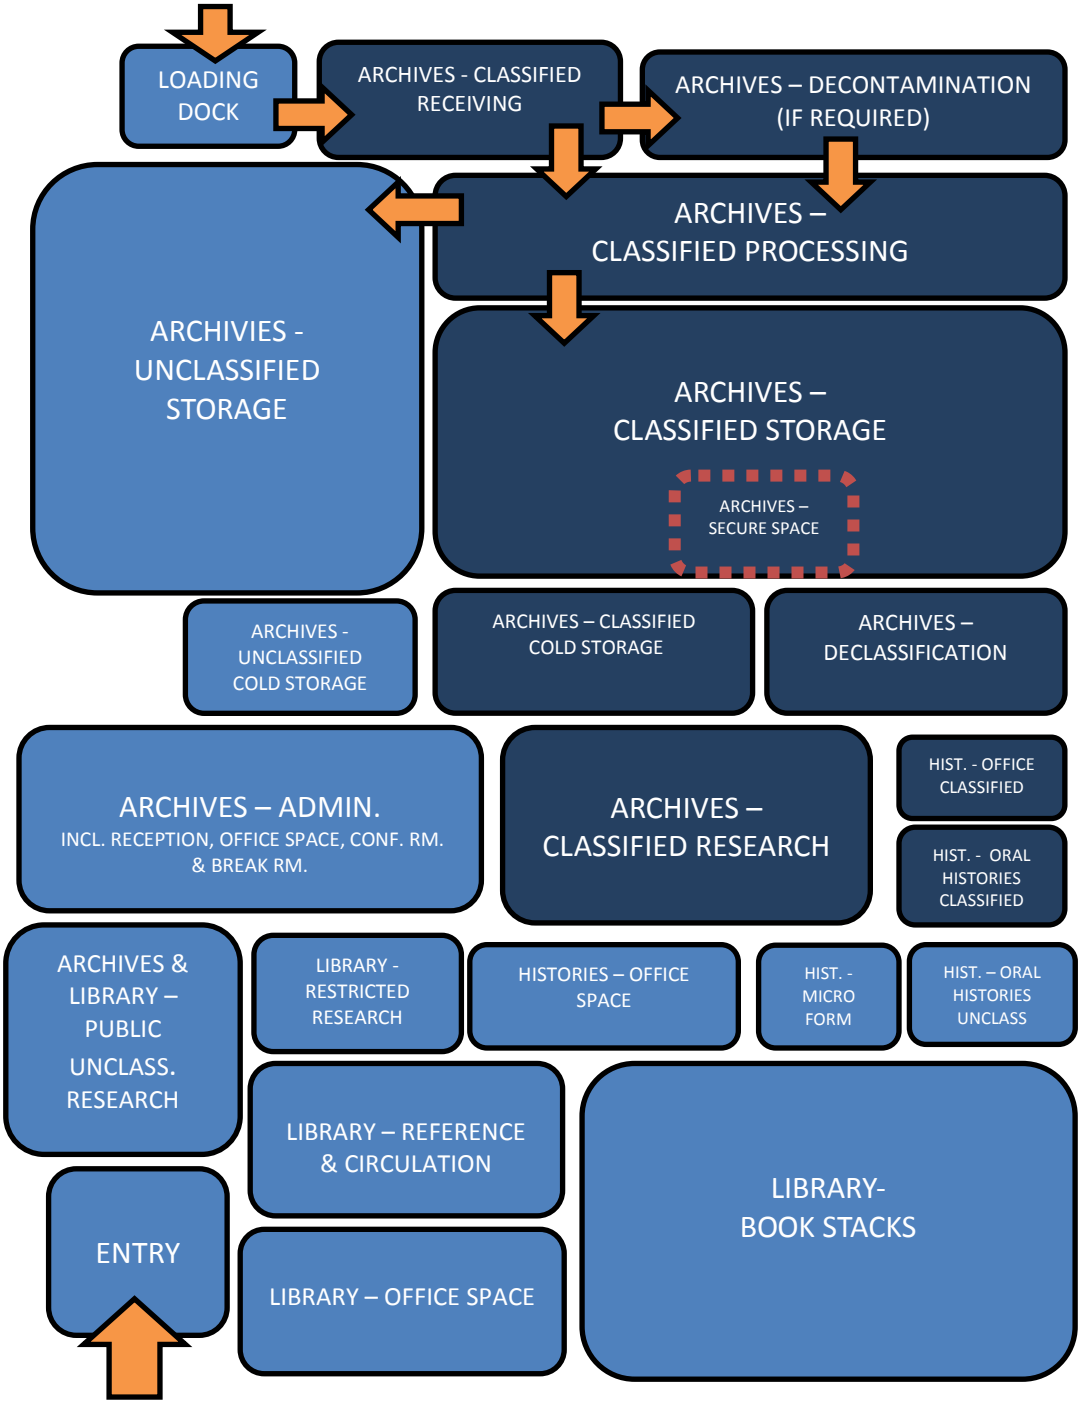


Figure 2-6 Historic Resource Facilities Adjacency Diagram

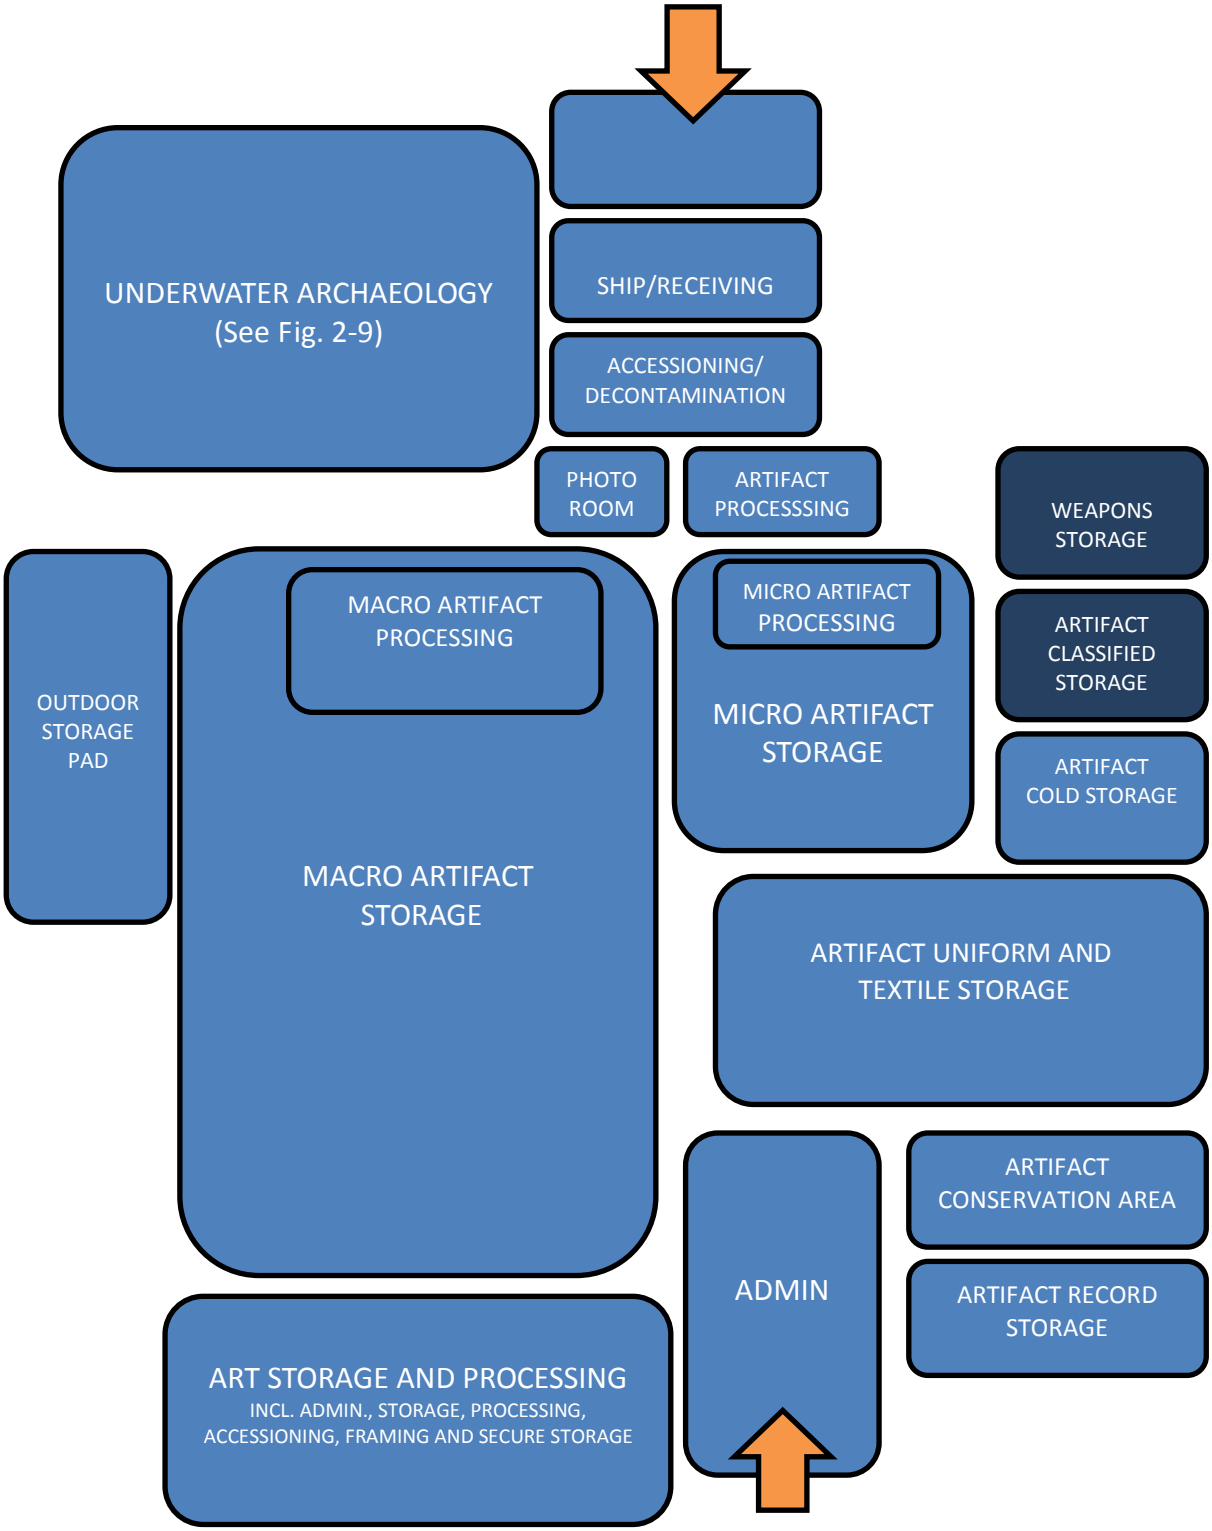
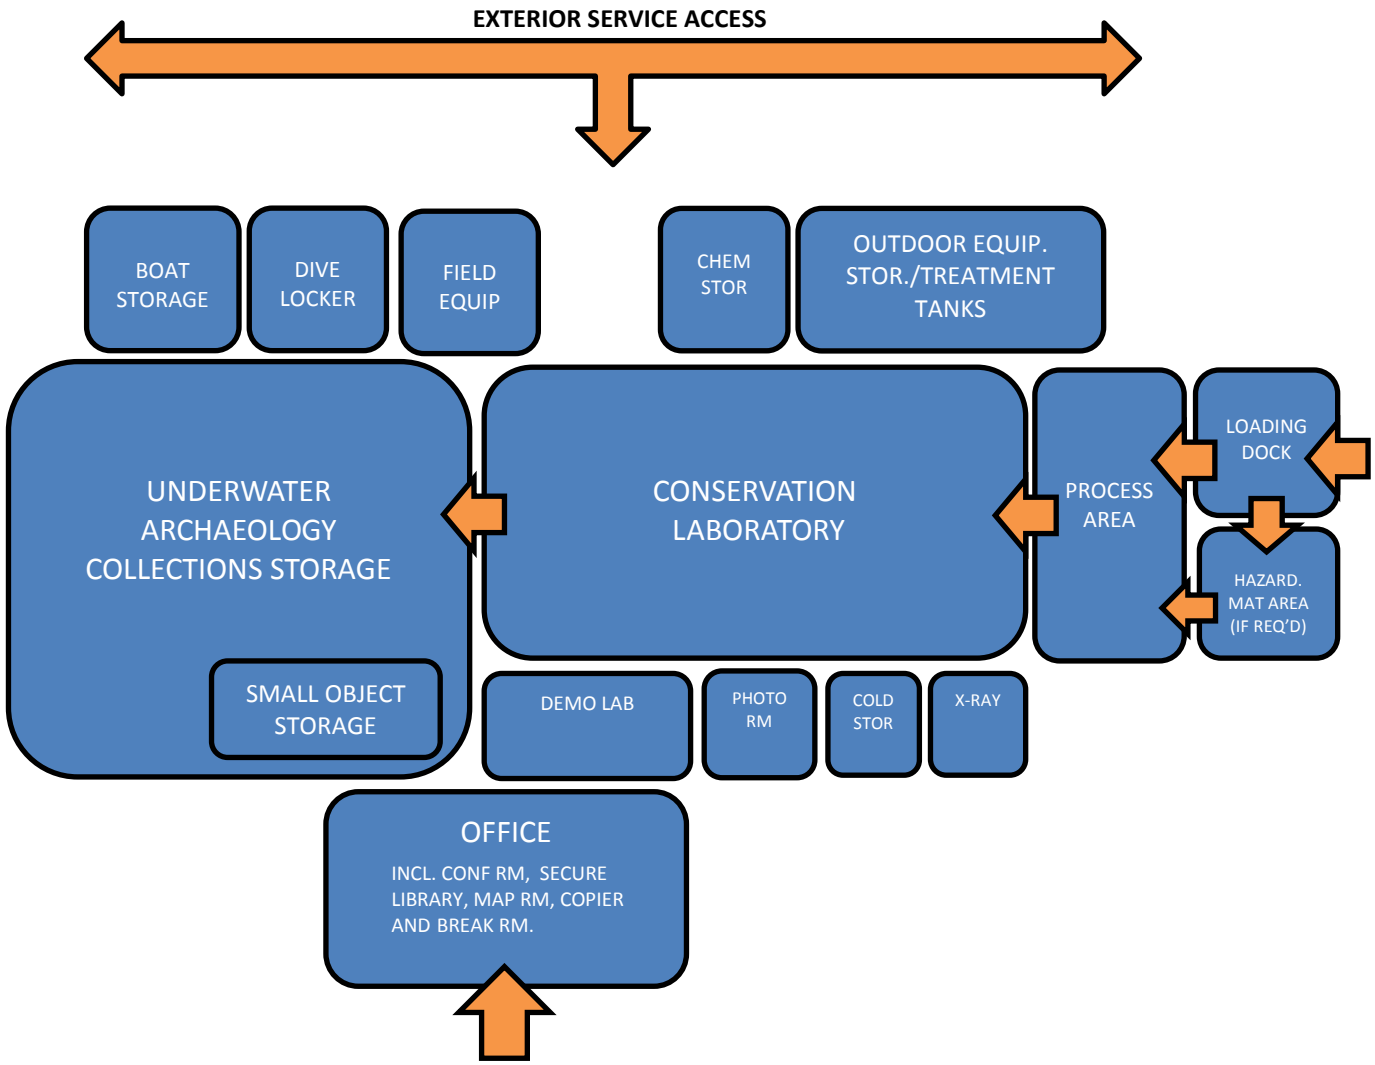


Note: Dashed lines indicate that these functional areas may be located in separate facilities.

Figure 2-7 Archives, Library, and Histories Adjacency Diagram



Note: Dark blue shading represents Top Secret/Open Storage functional areas and protected area perimeters. The dashed line represents a secure area boundary within a secure area. See Functional Data Sheets for more information.

Figure 2-8 Historic Resource Facilities – Artifact Storage Adjacency Diagram

Note: Dark blue shading represents special secure areas. See Functional Data Sheets for more information.

This Page Intentionally Left Blank

CHAPTER 3 GENERAL DESIGN REQUIREMENTS

3-1 GENERAL.

This chapter describes the general design criteria shared by Museums and Historic Resource Facilities.

3-2 CIVIL.

3-2.1 Site Design.

Site design must be in accordance with UFC 3-201-01, *Civil Engineering*. Also, in addition to the requirements of UFC 1-200-01, *General Building Requirements*, the building must be sited a minimum of five feet (1.52m) above and 100 feet (30.48m) from any 100 year flood plain areas, or be protected by an appropriate flood wall that conforms to local or regional building codes. As noted in Chapter 2, it is desirable to have both museums and HRFs located above the 500 year flood plain or have critical artifacts and records protected to this level. Provide adequate parking for both staff and visitors based on historic and projected parking requirements with the appropriate access drives. Consult local planning documents for facilities located outside the secured perimeter of the base to ensure compliance with applicable regulations.

3-2.2 Water Distribution Systems.

A dependable water supply free of interruption must be provided including a continuous site distribution loop connected to the water main and sized to support the facility with only one portion of the loop operational. Water supply and distribution systems must have the capacity to meet both fire hose and fire sprinkler requirements for 2 hours.

3-2.3 Building Access.

New construction, additions, and renovation of existing facilities must be designed and constructed to meet accessibility requirements of the Architectural Barriers Act Accessibility Standard (ABAAS) for DoD facilities. All functional areas must be barrier-free and accessible to persons with disabilities. Site and building designs should enable persons with disabilities to act independently and enjoy the full range of programs provided. Level changes may be included but must be accommodated by ramps suitable for wheelchair users, both indoors and outdoors. Include access to all areas and facilities, including staff and work areas, restrooms, water fountains, and communication devices.

3-2.4 Service Areas/Loading Docks.

Provide appropriate access drives and loading docks/service entrances in compliance with UFC 4-440-01, *Design: Warehouses and Storage Facilities.*

3-3 ARCHITECTURAL.

3-3.1 Exterior Design.

3-3.1.1 Landscaping.

All landscaping must adhere to guidelines found in UFC 3-201-02, *Landscape Architecture*, and local Installation Appearance Plans (IAP's). All design disciplines should coordinate planning and design efforts. Create design solutions that minimize adverse impacts on the natural environment. Landscaping should be compatible with existing surrounding landscapes. Use plant materials to screen undesirable views, land uses, utilities, and reduce visual impacts of parking lots. All landscaping must adhere to current AT standards.

Maximize low-maintenance landscapes. Use hardy, regionally native and drought-tolerant plant material to the greatest extent possible. Where irrigation systems are required, install water-efficient systems.

3-3.1.2 Site Amenities.

Site amenities include items such as benches, trash receptacles, planters, and flag poles. Use site amenities that are durable, well-constructed, and resistant to vandalism.

Provide bicycle racks in a secure location near the facility entrance.

3-3.1.3 Exterior Signage.

An exterior signage system must be developed in accordance with UFC 3-120-01, *Design: Sign Standards*. Coordinate exterior sign programs with the exterior design of the building and local base standards. Signs must also identify the building, parking areas, service areas, and facilities for the disabled.

3-3.1.4 Exterior Screening.

Loading docks, trash dumpsters, and both ground and rooftop mechanical equipment must be screened from views at areas such as main entrance, courtyards, gathering areas, streets and parking lots. Screens should be compatible with main building materials.

3-3.2 Future Expansion Capability.

Plan for building design that permits additions as collections and storage needs grow. Design the structural system for easy expansion and additions, without over-designing the initial construction.

3-3.3 Roofs.

Pitched roofs with exterior gutters and downspouts should be used whenever possible. Roof penetrations should be kept to a minimum to reduce potential leaks.

For storage occupancies, roof or ceiling slope above fire sprinkler systems must not exceed a pitch of 2 in 12 (a rise of 2 units in a run of 2 units, a roof slope of 16.7 percent). Coordinate with the project fire protection engineer.

3-3.4 Windows.

Windows should only be provided in administrative offices, break areas, vestibules, lobbies, classrooms and other public areas that do not house artifacts or archival materials. See Functional Data Sheets for specific locations where windows are permitted.

According to the IES HDBK, the potential damage that daylight can cause to sensitive materials is a concern in both museums and HRFs for the following reasons. Fading and bleaching is caused by the ultraviolet, visible, and infrared portions of the spectrum. Because daylit spaces generally have higher illuminance levels, it is logical that sensitive materials in daylit spaces are more likely to suffer fading and bleaching. In museums, light exposure is quantified in terms of lux-hours (with UV filters applied) and must be limited to protect preservation-worthy materials. This is why daylighting systems in museums often have sophisticated automated controls to maintain interior daylight values at or below specified target values. UV is a well-known cause of fading and is found at higher levels in daylight than in electric lighting (10 times higher than in incandescent lighting). The ratio of UV energy compared to visible energy is almost twice as high in diffuse skylight as it is in sunlight, however, sunlight is generally stronger and therefore provides more UV exposure when present. Coatings on glass can reduce the transmission of UV radiation by up to 75%. Additional absorptive films within laminated glass can further decrease UV transmission to a low as 1%. In instances such as renovations to existing facilities where windows are unavoidable use absorptive films on inside surface of laminated glass.

3-3.5 Acoustics.

Follow outside to inside noise control guidance and interior acoustic requirements per UFC 3-101-01, *Architecture.* Include the service of an acoustics consultant on the design team to properly address acoustics within the facilities.

Specific interior acoustic requirements are included in the Functional Data Sheets. These acoustic ratings (Noise Isolation Class or NIC) reference wall partition assemblies only.

3-3.6 Integrated Pest Management (IPM).

Apply a decision-making process that helps determine if, when, and where pest suppression is needed. Develop a strategy to keep pests from attacking collections. Use a variety of techniques to prevent and solve pest problems using pesticides only as a last resort. Consider knowledge of a pest's habits, ecology and the environment in which it thrives and survives. Using IPM provides a structure in which to make responsible decisions about treating pests. Use IPM to develop a site specific facility design to meet these goals:

- Protect the museum/resource facility and its collections from pests
- Reduce the amount of pesticides used in collections

3-3.7 Interior Design.

3-3.7.1 Interior Construction/Finishes.

Interior construction and finishes (floors, walls, and ceilings) must be durable, low maintenance and appropriate to the purpose of the facility. Select finish materials, adhesives and sealant systems that contain low to no VOCs to promote healthy indoor air quality. Per NARA 1571 and SI Facilities Design Guide, following is a list of materials that are not permitted in areas where records and artifacts are used, processed, exhibited and stored, including vaults, but may be used in other areas of the facility. These materials are prohibited due to properties that can rapidly degrade and negatively affect artifacts and archival materials:

- Asbestos
- Cellulose nitrate lacquers and adhesives
- Polyurethane products, including paints, varnishes and foams
- Acid-curing silicone sealants and adhesives
- Sulfur containing materials that could release sulfur dioxide (SO2) – include, but are not limited to, vulcanized rubber and cadmium sulfide pigments
- Pressure sensitive (tacky) adhesives that release VOCs
- Unstable chlorine-containing polymers (polyvinyl chloride or PVCs)
- Formaldehyde (urea, phenol) emitting compounds, such as might be found in plywood, particle board and plastic laminates
- Vinyls
- Oil-based paints and varnishes and modified alkyd paints

Flooring materials throughout both facility types must be level to facilitate smooth transport of exhibit materials, archival records and artifacts.

3-3.7.2 Interior Signage.

Develop a comprehensive interior signage package for each facility type that addresses permanent spaces. Refer to UFC 3-120-01, *Design: Sign Standards*, when developing interior signage packages.

3-3.7.3 Wall and Door Protection.

Provide wall protection and corner guards in service corridors where high cart and equipment traffic may be present. Provide door and door frame protection at heavily traveled doors within service corridors, loading dock/service elevator areas, and artifact, exhibit, and record storage areas.

3-3.7.4 Window Treatments.

Treatments should be provided at all exterior windows, to include storefronts or locations where control of daylight or privacy at night is required. Uniformity of window covering color and material should be maintained to the maximum extent possible throughout the facility.

3-3.7.5 Storage Systems.

Provide static or mobile specialty storage systems, as required, to properly house collections. Storage methods include, but are not limited to, flat files, warehouse pallet racks, file cabinets, electric lateral filing machines, specialty art storage racks, and various storage cabinets, some with filter vents for passive air purification. Consider using storage equipment that can be easily adapted for use as movable, high density storage systems.

Design and locations of high density mobile storage systems will require close coordination with structural, mechanical and fire protection engineers. Floor load limits within all storage areas must be established by a licensed structural engineer and will need to be calculated based on storage densities and the type of stored collection (paper-based and larger artifacts will be heavier). Fire suppression and mechanical distribution systems will impact cabinet/shelving heights and the overall design of the storage system. Lighting layouts will also need to be coordinated with these systems, typically running perpendicular to the storage system for optimal illumination of the aisles. When determining high density mobile shelving system requirements also consider:

- Shelving system must include mechanisms (such as bumpers or guards) to maintain a minimum 4 inch (102mm) to 6 inch (152mm) flue space between carriages to reduce the amount of potential fire damage.
- Manual operation of mobile shelving system is recommended due to lower maintenance requirements. However, the use of motorized system operation should be considered during design based on specific user requirements (for example, motorized operation may offer smoother and controlled carriage movement, thereby minimizing vibrations and jarring of fragile artifacts).
- Consider off-gassing of materials utilized in system components such as bumpers, gaskets, recessed tracks, and ball bearings.
- Cold storage areas (temperatures less than 50 degrees F (10 degrees C) should utilize open chrome-plated stainless steel wire racks which promote air circulation and prevent condensation on stored materials.
- Coordinate mobile shelving system design with the structural engineer with regard to floor slab loads, slab flatness, and insertion of recessed tracks. Consult NFPA 232, Standard for the Protection of Records, for additional guidance on construction of mobile shelving to withstand fire damage.

- Perforated shelving uprights and end panels will facilitate air flow circulation or flow of water in the event of fire.

3-4 MECHANICAL.

3-4.1 Heating, Ventilation, and Air Conditioning (HVAC) Design.

In addition to the criteria established in the section in Chapter 1 entitled, “General Building Requirements” and the stated and cross-referenced requirements for HVAC systems, comply with the following in the design of the mechanical system:

- UFC 3-410-04, Industrial Ventilation
- ASHRAE HVAC Applications Handbook Chapter, “Museums, Galleries, Archives, and Libraries”
- ASHRAE HVAC Applications Handbook Chapter, “Laboratories”
- ASHRAE Standard 62.1, “Ventilation for Acceptable Indoor Air Quality”
- NARA 1571, Archival Storage Standards

3-4.1.1 Humidification.

Do not use base steam.

3-4.1.2 Ductwork.

Coordinate duct layout with the end user and architect concerning heights of partitions, displays, shelves, and storage racks, to avoid the disruption of air distribution for spaces with ductwork intended for general air distribution. Provide maintenance access for personnel.

Where theft is a concern due to large duct access, coordinate with the user’s security specialists on duct sizes and maintenance access points.

3-4.1.3 Sound and Vibration Isolation.

Mechanical systems must not transmit or radiate noise or vibrations. Provide an acoustical analysis to demonstrate how noise levels will be addressed.

3-4.1.4 Critical Spaces.

Roof penetrations, roof-mounted equipment, and water piping are prohibited above critical spaces.

Design spaces deemed critical by the end user and in the Functional Data Sheets of this FC at their respective indoor temperature and relative humidity requirements and categorize them as process requirements. Conditions in these spaces must be maintained 24 hours/day 365 days/year. Include these spaces in zones conditioned for specialized technical requirements. Air-side economizers are prohibited in these spaces. Perimeter fin-tube radiation and other sensible- only heating or cooling elements that can create local humidity extremes near collections are prohibited.

Coordinate with the electrical engineer to provide emergency power to maintain indoor requirements in these spaces. The HVAC systems for these spaces must be capable of achieving a gradual shift between the cooling and heating conditions, and must maintain these conditions as stated by the end user and in the Functional Data Sheets included in this FC.

3-4.1.4.1 Renovations.

Coordinate with the architect on protecting the building envelope and structure against moisture migration and condensation. In critical spaces, provide drain pans under all existing roof penetrations and piping containing water or other fluids, except for fire protection piping. Provide piping from drain pans to outdoors and discharge at grade.

Coordinate with the end user on the possible levels of climate control that can be achieved with the existing building(s) and their requirements.

3-4.1.4.2 Redundancy.

If required by the Commanding Officer due to the value of items in these spaces, provide 100% redundancy.

If chilled water systems are selected, size the chillers for 75% (60% allowable with approval) of peak load for the entire facility. Alternate the use of the chillers via a user programmable schedule and equalize run time to lengthen the life span and improve efficiency. Include in controls that in the event of a failure, non-critical loads can be dropped. Variant Refrigerant Volume (VRV) systems and glycol systems are prohibited.

3-4.1.4.3 Filtration.

Filter the combined supply air, including return and outside air, with a combination of prefilter(s) with a Minimum Efficiency Reporting Value (MERV) of 7 and final filter(s) with a MERV of 15 when tested in accordance with ASHRAE 52.2, “Method of Testing General Ventilation Air-Cleaning Devices for Removal Efficiency by Particle Size”. Verify and coordinate with the user if a micro-environment is needed when critical spaces with collections require higher than MERV of 15 filtration. Provide minimal airflow and separate filtration at a HEPA level (99.97%).

Provide chemical filtration of outdoor air if there is a risk of ambient air pollution.

3-4.1.4.4 Contaminated Materials.

Contaminated materials must be stored in a separate space on a separate HVAC system.

3-4.1.4.5 Positive Air Pressure.

Provide positive air pressure as required in critical spaces where it is necessary to prevent particle pollution during entry and exit from these spaces.

Coordinate requirement for smoke control with the project fire protection engineer. Refer to the Section in Chapter 3 entitled, “Fire Protection”.

3-4.1.4.6 Warehouse-type Storage Spaces.

- Infiltration rate - Design for an infiltration rate of two air changes per hour. The rate is dependent upon the installation of dock door seals.
- Under floor heating system - Investigate the use of an under floor heating system when outside design temperature is below -10 degrees F (-23 degrees C). Under floor heating systems must be between the bottom 2 inches (51mm) to 3 inches (76mm) of the floor slab.
- Ceiling fans - Provide multi-speed ceiling fans with wall-mounted controls where required by the end user and in the Functional Data Sheets included in this FC.
- Space thermostat and humidistat - In existing buildings where it is determined that object receiving areas cannot be separated from sensitive storage areas by dual bays/door locks, a switch activated by opening the dock doors should override the space thermostat and humidistat to stop the HVAC equipment. Provide a minimum temperature thermostat field set at 34 degrees F (1 degree C) to override the heating deactivation switch during door-open periods of subfreezing ambient temperatures. After the doors are closed, the space thermostat and humidistat should resume control. Maximum HVAC system recovery time should be 60 minutes after the doors are closed.
- HVAC zones - Each module/bay must be on a separate HVAC zone. Coordinate with fire protection engineer for smoke management requirements.

3-4.1.4.7 Laboratories.

Coordinate with the end user on air filtration requirements at the diffusers for laboratories where dust control is critical.

3-4.1.4.8 Lobbies and Entrance Areas.

Provide and maintain positive air pressure in lobbies and entrance areas relative to the outside. Maintain lobbies at a negative pressure relative to the rest of the building. Air servicing the lobby must not circulate to other parts of the building. If feasible, the lobby should have a separate HVAC system.

3-4.1.4.9 Loading Docks.

If enclosed, provide and maintain positive air pressure in loading docks relative to the outside. Maintain loading docks at a negative pressure relative to the rest of the building. Air servicing the loading dock must not circulate to other parts of the building.

If the user requires an enclosed loading dock with HVAC, the loading dock must have a separate HVAC system.

3-4.1.5 Stairwells.

Provide heating and cooling in stairwells adjacent to critical spaces. Maintain stairwells not adjacent to critical spaces at mechanical room conditions. Special attention may be required for high humidity areas to prevent condensation in the stairwells.

3-4.1.6 Controls.

Specify direct digital control (DDC) system per UFGS 23 09 23.13 20, BACnet Direct Digital Control Systems for HVAC. Coordinate DDC specification to ensure proper interface to existing or planned base-wide DDC/EMCS system or UMCS/BAS, and remote network monitoring of temperature and relative humidity.

Due to the critical nature of these facilities, the end user, not the base EMCS office, must have direct control of the thermostats and humidistats. The end user must also have direct control of the cooling and heating utilities, not the base central plant. Coordinate locations of temperature and humidity data loggers, thermostats and humidistats, and DDC system temperature and humidity sensors with the end user in spaces that require them.

3-4.1.7 Exhaust Equipment.

Provide snorkel type localized exhaust systems with articulating arms that can be adjusted and manually set to desired positions of users where required in laboratories, conservation work spaces, restoration work spaces, and office spaces. Provide damper shutoff of snorkel type exhaust at the main trunk, not at the capturing hood. Verify during design if fume hoods and ventilated safety cabinets are also required by the end user.

3-5 PLUMBING.

In addition to the criteria established in the section in Chapter 1, entitled, “General Building Requirements”, and cross-referenced requirements therein, include the following requirements:

3-5.1 Emergency Shower / Eyewash Stations and Floor Drains.

Provide emergency shower/eyewash stations and floor drains where required by the end user and in the Functional Data Sheets included in this FC. Coordinate locations of emergency shower/ eyewash stations with electrical equipment.

3-5.2 Compressed Air.

Provide compressed air where required by the end user and in the Functional Data Sheets included in this FC.

3-5.3 Specialty Gases.

Provide specialty gases where required by the end user and in the Functional Data Sheets included in this FC.

3-5.4 Critical Spaces.

Roof penetrations and all plumbing piping are prohibited above critical spaces.

3-5.4.1 Renovations.

In critical spaces, provide drain pans under all existing roof penetrations and plumbing piping containing water or other fluids. Provide piping from drain pans to outdoors and discharge at grade.

3-6 FIRE PROTECTION.

3-6.1 Fire Protection Design Objective.

The fire protection design objective is to minimize damage to, and loss of, historic artifacts and archive material by incorporating active and passive fire protection features. Active features include automatic fire sprinkler systems, smoke detection systems, and smoke control systems. Passive features include fire and smoke resistive construction to create protected fire compartments for the artifacts and archives. Additionally, these compartments are limited in size to minimize the maximum foreseeable loss if a fire event were to occur. The requirements specified herein blend requirements from the various references listed below to minimize the loss of items having cultural, historic, or strategic significance. Special occupancy requirements are included in Chapter 4.

3-6.1.1 Applicable Design References and Criteria.

- UFC 3-600-01, Fire Protection Engineering for Facilities
- 36 CFR 1234, Facility Standards for Records Storage Facilities
- National Park Service *Museum Handbook, Part 1: Museum Collections,* Chapter 9: Museum Collections Security and Fire Protection
- NFPA 232, Standard for the Protection of Records
- NFPA 909, Code for the Protection of Cultural Resource Properties — Museums, Libraries, and Places of Worship

3-6.2 Fire Suppression Systems.

Facilities must be protected with wet pipe sprinkler systems to provide 100 percent coverage throughout the entire building. Areas subject to freezing or designated cold storage areas must be protected with dry pipe or preaction sprinkler systems as required by NFPA 13 and as appropriate for the protected area. Storage collection areas must be individually zoned with dedicated isolation valve and alarm flow switch. Refer to Chapter 4 for additional requirements.

3-6.2.1 Piping.

Sprinkler systems must be designed to minimize the risk of corrosion. Design must consider selection of piping material, pitching of piping, auxiliary drains, and other

methods as recognized by the applicable codes standards, and industry practices. Use of galvanized piping is prohibited. Use of non-ferrous piping materials must be approved by the cognizant NAVFAC fire protection engineer. Use of non-ferrous piping requires an analysis of dissimilar metal corrosion potential, along with mitigation measures if necessary. Where dry pipe or preaction systems are necessary, systems must be charged with nitrogen. For wet pipe system, nitrogen inerting may be considered as an acceptable method of minimizing internal corrosion of pipe. Consideration may be given to new technologies, such as nitrogen inerting of wet pipe sprinkler systems. When provided, nitrogen generation systems must comply with UFC 3-600-01.

3-6.3 Fire Alarm and Detection Systems.

All facilities must be protected with a voice evacuation fire alarm system. The system may serve as the MNS and public address functions as required or as necessary. Smoke detection is required throughout and may be provided with spot, optical beam, video, or early warning smoke detection as appropriate for the protected area. Additional specific design requirements are defined in Chapter 4 and the applicable Functional Data Sheets.

3-7 ELECTRICAL.

Provide site electrical utilities, interior distribution systems, and communications in accordance with UFC 3-501-01, *Electrical Engineering*, and the latest installation design requirements.

- Site Electrical Utilities include equipment, overhead power distribution, underground electrical systems, grounding, metering, and exterior site lighting.

- Interior distribution systems include distribution and service entrance equipment, surge protective devices (SPDs), wiring devices, raceways, conductors, interior lighting systems, lightning protection systems, and hazardous locations.

- Communications includes telecommunications systems, Cable Television System (CATV), and Closed Circuit Television (CCTV).

3-7.1 Lighting.

Provide lighting system designs in accordance with the above which includes UFC 3-530-01, *Design: Interior and Exterior Lighting and Controls*. Exceptions and additions are identified in this FC, and in the Functional Data Sheets.

For areas or rooms not specifically covered, comply with the requirements of the Illuminating Engineering Society of North America's (IESNA) *Lighting Handbook Reference and Application* (hereafter called the *Lighting Handbook*).

3-7.1.1 Exterior Lighting.

Provide vehicular traffic areas, parking facilities, pedestrian areas, and building lighting meeting the requirements for Lighting Zone 2 (LZ2).

3-7.1.1.1 Security Lighting.

Provide a Medium Level of Protection (MLOP) including the security lighting required by 36 CFR 1234.

3-7.1.2 Interior Lighting.

Conservation considerations are a primary concern when illuminating sensitive artifacts such as paintings, photographs, textiles, tapestries, furniture, rare books, scrolls, and other organic objects. Optical radiation may cause damage through photochemical action and radiant heating. Therefore, all light sources in areas displaying or storing sensitive objects must eliminate harmful ultraviolet (UV) and infrared (IR) wavelengths through ultraviolet filtering or choice of light source.

For the purposes of this FC, lighting for these areas, displaying, handling, or storing sensitive artifacts will be considered “Sensitive Lighting” (SL) and will be designated as requiring SL on the Functional Data Sheets.

3-7.1.2.1 Requirements for Sensitive Lighting (SL).

Provide SL systems with the following characteristics:

- Limiting UV light to less than 400 nm
- Limiting IR light greater than 700 nm
- Light sources with CRI’s greater than 85
- When Life Cycle is cost effective, provide Light Emitting Diode (LEDs). They are an excellent choice for this application since most LED light sources do not emit UV and IR[2].

3-7.1.2.2 Levels of Sensitive Lighting.

The levels are divided into three major categories based on the particular object being examined, stored, or on display. These categories are described in a variety of ways in the standards from organizations such as IESNA, Smithsonian, and Society of American Archivists (SSA). Table 3.1 identifies the sensitivity and recommended light levels for materials that will be displayed, handled, or stored in these facilities.

The levels and additional details identified in the FDSs are based on the interpretation of generalized room characteristics, and for archival and display spaces, the general visitors age and visibility limits. Coordinate the requirements herein with the user of the specific facility under design. Modifications may be made to the values, based on the

[2] GATEWAY report for the J. Paul Getty Museum, http://apps1.eere.energy.gov/buildings/publications/pdfs/ssl/getty_museum_gateway_final.pdf.

additional age and visibility requirements identified in the IESNA *Lighting Handbook* for the specific rooms applicable to the project.

Note: There are numerous specialized reference documents available for additional information, such as the “Archival and Special Collections Facilities: Guidelines for Archivists, Librarians, Architects and Engineers”. It provides extensive detailed information on lighting systems focusing on striking a balance between three essential goals of being “Economical, Safe, and Functional”. It also includes detailed descriptions, lighting system considerations, and recommended light levels for many of the areas / rooms covered by this FC. However, the latest Lighting Handbook, included in our order of precedence requirements, continues to expand and currently addresses many of these issues with updated information as well.

Table 3-1 Light Sensitivity Categories

Category	Example Materials	Maximum Recommended Light Level fc / (Lux)
Extremely Sensitive (Per IESNA - High Sensitivity)	Fragile textiles (e.g., silk) Wool Paper Dyed leather Feathers Natural-dyed materials Lacquer Composite objects utilizing any of the above materials	5 / (50)
Moderately Sensitive (unless qualified above) (Per IESNA - Low Sensitivity)	Bone, Ivory, Horn Textiles (Cotton, Linen) Cellulosic Materials (Wood, Tapa, Basketry, Reed, Grass) Leather, Parchment, Rawhide, Skin Fur Furniture Paintings	15 / (150)
Fairly Sensitive (unless qualified above) (Per IESNA – No Sensitivity)	Metal - unpainted Stone - unpainted Ceramic - unpainted Glass - unpainted	25 / (250) see Note 1

Note 1: Object Exposure may be unrestricted (up to 100 fc (1000 lux) max). Adjust fc / Lux accordingly. However, when in Museum setting, recommend limits be adhered to.

3-7.1.3 Areas Covered by CCTV.

When area covered by CCTV is unoccupied, provide ambient lighting with a minimum illumination level of 0.5 ft-candle (5 lux) average in the camera's field of view.

3-7.1.4 Additional Lighting Requirements.

In addition to the requirements covered by the core documents, provide the following:

- Emergency (battery backup) lighting in restrooms.
- Lighting systems in stack areas perpendicular to the stack arrangement.
- Special effects lighting in the theater, demonstration, ceremony and event areas, coordinated with the end user based on the planned museum and HRF functions and their missions.

3-7.2 Power.

In addition to the power requirements covered by the core documents, provide the following:

- Dedicated electrical panels in areas such as Underwater Archeology Conservation Laboratory where there are significant electrical loads that need to be controlled from within that area. These areas are indicated on the FDSs.
- Ceiling mounted power cord reels in areas with individual workstations such as the Artifact – Micro Artifact Processing Area and Art - Framing Room when indicated on the Functional Data Sheets. See Figure 2-3 Sample Artifact Processing Area.
- Arc-Fault Circuit Interrupters (AFCIs) on circuits serving stack areas.
- Recessed in floor power in special areas, such as for stages and podiums. Coordinate with the end user and provide the flexibility for the variety of potential functions / events.
- Appropriate power and controls for specialty systems as designated by the end user (such as for the HVAC necessary for the micro-environment storage systems often used in areas like the Underwater Small Object Storage Area.)

3-7.3 Emergency Power.

If required by Installation mission requirements due to the extreme fragility or historical significance of materials being stored, provide the service entrance with either an external temporary / portable emergency generator hook-up for the facility, or in rare instances, provide a permanent emergency power generator for the facility. Comply with paragraph entitled "Emergency Generators" in UFC 3-520-01, *Interior Electrical Systems*, and ensure the availability of a hard surface area adjacent to the building service entrance to accommodate the emergency power hookup when designating a temporary / portable generator.

Comply with UFC 3-540-01, *Engine Driven Generator Systems for Backup Power Applications*, when a permanent generator system is used. (Note: The final draft of this UFC is available on the Navy Design Build Master (NDBM) website.)

3-7.3.1 Emergency Power Coordination with End User.

Coordinate specific requirements with the end user on a case-by-case basis utilizing the information on the Functional Data Sheets. As a minimum, place the following loads on emergency power:

- Life safety loads, including elevators
- Emergency and Perimeter Lighting
- Sump pumps
- Head end communication systems
- Physical Electronic Security Systems (ESS), including IDS, ACS and CCTV
- Cold Storage

Validate the planned emergency operation process with the end user, including the following:

- Extent of Load: Is complete power needed for the designated area including air-conditioning/humidity control, or is power only needed for the critical component such as the walk in or portable freezer units for specimen isolation or film storage?
- When will it be needed – immediately, or only if the outage is extended beyond a certain number of hours?
- How long will it be needed – duration of outage or only until the critical articles are relocated?

3-7.3.2 Connection Point Signage.

When a portable generator connection point is provided, coordinate with end user to develop a written, manual load-shedding procedure for the facility. Document size of the generator required to support design conditions. Place signage at the connection point designating proper generator size.

3-7.4 Cable Television System (CATV).

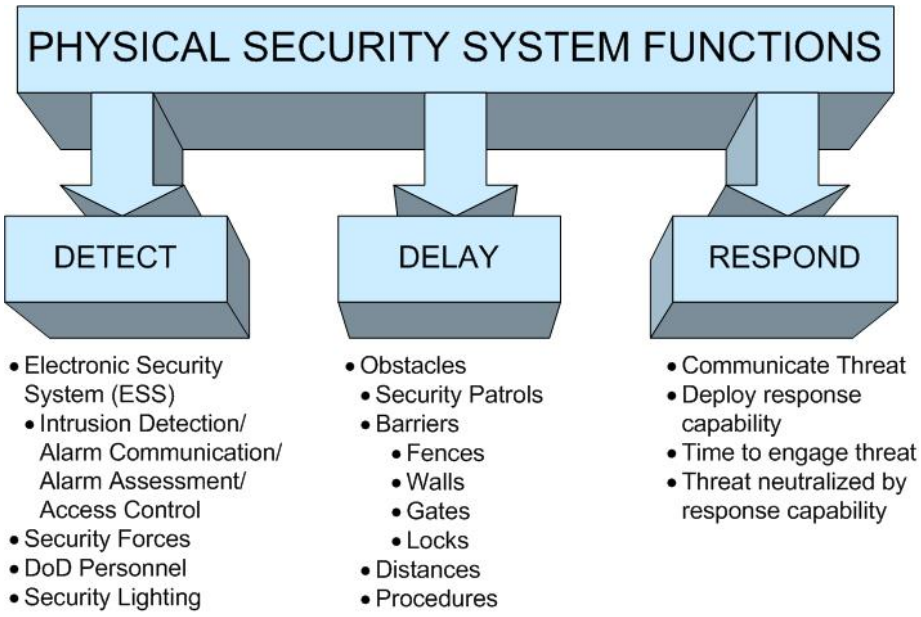
Provide the infrastructure for a CATV system for utilization by specific groups to access cable television programs. This normally consists of the conduit, wire and outlets from the outside point of connection to the local provider, via the telecommunications room, to the individual locations identified in the FDSs. Coordinate with the local provider's requirements.

3-7.5 Telecommunications.

Provide the telecommunications (data and telephone) system infrastructure. Provide the infrastructure for the Secret Internet Protocol Router Network (SIPRNET) system and JWICS system in areas identified. Coordinate requirements with the end user's Certifying Tempest Technical Authority (CTTA). Provide Protected Distribution Systems (PDS) when required, in accordance with UFC 3-580-10, *Navy and Marine Corps Intranet (NMCI) Standard Construction Practices*. See FDSs for the identified rooms and spaces.

- Coordinate the quantities and locations of outlets with the end user to support the specific equipment requirements in the individual areas.
- Coordinate with the end user and provide recessed in floor telecommunication outlets in areas where special events and functions may be held.

3-8 PHYSICAL SECURITY.



That part of security concerned with physical measures designed to safeguard personnel; to prevent or delay unauthorized access to equipment, installations, material, and documents; and to safeguard them against espionage, sabotage, damage, and theft.

3-8.1 Physical Security System.

A physical security system is comprised of people, equipment, and operational procedures that control access to critical facilities or assets. Electronic Security Systems (ESS) and security lighting are two of the elements that comprise the equipment component of a physical security system.

Design physical security systems to ensure protective measures work as an integrated system rather than separate elements. The system must detect threats, delay threats, and then respond to threats. This concept is referred to as detect, delay, and respond or detect, delay, and defend. To create an effective system, the time between detection and response by response capability must be less than the time it takes the threat to compromise the asset. Physical security systems accomplish this by detecting threats at the farthest possible distance from the asset and providing delays between the detection points and the asset giving the response capability time to neutralize the threat. Figure 3-1 diagrams some of the components of a physical security system.

Figure 3-1 Diagram Physical Security Functions

3-8.2 Physical Security Requirements.

Museums and Historic Resource Facilities contain assets that must be protected against damage or theft.

3-8.2.1 Defining Physical Security Requirements.

The requirement to protect assets such as classified materials or arms are defined in Director of National Intelligence (DNI), Secretary of the Navy (SECNAV), and Office of the Chief of Naval Operations (OPNAV) policies and Instructions. For assets not defined in policy, the requirements are determined by evaluating the value of the assets and the threats to those assets. Defining the requirements of a physical security system and its components involves an interdisciplinary team. The team should consider all interests relating to a project to determine how security fits into the total project design. The specific membership of the team will be based on local considerations, but in general, the following functions should be represented; facility user, antiterrorism officer, operations, security, logistics, architecture, engineering, life safety, and others as required. This team identifies the design criteria, which includes the assets to be protected, policy based requirements, threats to the identified assets (the Design Basis Threat), and the level of protection to be provided to protect the assets. For information on Security Engineering Planning and Design process, refer to UFC 4-020-01, *DoD Security Engineering Facilities Planning Manual,* and UFC 4-020-02, *DoD Security Engineering Facilities Design Manual.* In addition, the team must identify user constraints such as appearance, operational considerations, manpower requirements or limitations, energy conservation and sustainment costs when establishing the physical security system requirements.

When required, integrate physical measures into the site, building, room(s), or area(s) as applicable. Refer to the Specific Design Requirements and Functional Data Sheets (FDS) for specific area requirements.

3-8.2.1.1 Arms Storage.

Provide in accordance with OPNAV INSTRUCTION 5530.13C, *Department of the Navy Physical Security Instruction for Conventional Arms, Ammunition, and Explosives*.

3-8.2.1.2 Classified Materials Storage.

Provide in accordance with SECNAV M-5510.36, *Department of the Navy Information Security Program.*

3-8.2.1.3 Archives Secure Space.

Provide in accordance with Intelligence Community Standard (ICS) 705-1 *Physical and Technical Security Standards for Sensitive Compartmented Information Facilities* and design in accordance with UFC 4-010-05, *Sensitive Compartmented Information Facilities Planning, Design, and Construction*.

3-8.3 Vaults.

Vaults are required for arms storage. In addition, vaults may be required to store high value assets of historical significance. Vaults must be constructed to provide a minimum of 10 minutes' resistance to forced entry against an unlimited supply of hand and battery-operated tools.

3-8.3.1 Walls, Ceilings, and Floors.

Walls, ceilings, and floors must be constructed of 8-inch (20cm) reinforced concrete. Concrete must have a minimum strength of 2,500 psi (175 Kgf/sq cm). Reinforcing must be a minimum of 5/8-inch (16mm) diameter steel, 6 inches (15cm) on center each direction. Wall reinforcement must be tied into floors and ceilings. A modular vault meeting Federal Specification AA-V-2737 (with a GSA-approved Class 5 Armory Vault Door) may be used to meet this requirement.

3-8.3.2 Vault Doors.

Doors must be a GSA-approved Class 5 vault door that meets requirements of Federal Specification AA-D-600.

3-8.3.3 Locks.

Vault doors must be equipped with a combination lock meeting Federal Specification FF-L-2937.

3-8.4 Staff and Visitor Separation.

Staff only areas must be grouped to reduce access control requirements. The grouping of staff spaces must provide both vertical and horizontal access controls to enable adequate Public/Staff separation and Intrusion Detection System zoning. Egress paths from Public space must not pass through Staff only areas.

3-8.5 Protected Area Perimeter.

The protected area may be defined as the entire facility, an area, or areas within the facility. The protected area perimeters and the penetrations in those perimeters are the primary focus of physical security design. The perimeter of protected areas must be designed for forced entry, covert entry, and visual evidence penetration.

3-8.5.1 Perimeter Walls.

Walls must go from floor slab (true floor) to underside of floor or roof deck (true ceiling). Perimeter walls, floor and ceiling must be permanently and solidly constructed and attached to each other. Openings which penetrate a perimeter wall (including HVAC ducts) and are larger than 96 sq inches (240sq cm) with any dimension being greater than 10 inches (25.4cm), must be protected with permanently affixed bars or grills.

- Bars must be a minimum of ½ inch (13mm) diameter steel, welded vertically and horizontally 6 inches (150mm) on center. A deviation of ½ inch (13mm) in vertical and/or horizontal spacing is permissible.
- Grills must be of ¾ inch (20mm) #9 (10 gauge) case hardened expanded metal. When used, metal sound baffles or wave forms must be permanently installed and set no farther apart than 6 inches (150mm) in one dimension.

3-8.5.2 Perimeter Ceiling and Floors.

Ceilings and floors must meet the same requirements as walls with regard to forced entry, covert entry, and visual evidence penetration.

3-8.5.3 Primary Entrance.

Unless otherwise noted or approved, each protected area must have one primary entrance where visitor control is conducted. The primary entrance should incorporate a vestibule/lobby for reception desk, queuing, and future requirements such as magnetometer and bag screening equipment. Primary entrance must be:

- Equipped with an automated access control device.
- Equipped with a GSA-approved pedestrian door deadbolt meeting Federal Specification FF-L- 2890.

3-8.5.4 Perimeter Door.

Doors must be constructed of metal, metal clad or solid wood. At a minimum, wood doors must be 1-¾ inches (45mm) thick solid wood core (wood stave). At a minimum,

metal doors must have a 1-¾ inches (45mm) thick face steel equal to 18 gauge with a predrilled lock area or reinforced to 10 gauge. At least one perimeter door must be provided with an exterior key lock for emergency entrance purposes.

3-8.5.5 Emergency Exit Doors.

Emergency exit doors must meet perimeter door requirements and:

- Be alarmed 24/7 and equipped with a local annunciation.
- Have no exterior hardware.
- Have delayed-egress with NFPA 101 compliance.
- Be secured with deadlocking panic hardware.

Delayed egress hardware must be specified with the activation switch incorporated into the door panic hardware. Delayed egress hardware that integrates the activation switch within the magnetic locking mechanism is not permitted.

3-8.5.6 Internal Security Doors.

Internal security doors are used to secure internal spaces such as closed exhibit or between public events areas and other areas within the facility. When required, internal security doors must meet the requirements of the perimeter door or may be a roll up security gate. Security gate must be one of the following:

- Interlocking perforated or non-perforated Slats: Galvanized ASTM A653/A653M Grade C or ASTM A240/A240M Stainless steel 300 series 16 gauge slats.
- Grille: Solid 5/16 inch (8mm) ASTM A641/A641M galvanized carbon steel wire. Maximum horizontal spacing of 6 inches (15cm) and a maximum vertical spacing of 2 inches (5cm).
- Roll-up security doors which are electrically operated must be provided with key-operated switch. The key-operated switch may be internal or external of protected area.

3-8.5.6.1 Locks.

All locking arrangements must meet the International Building Code and NFPA 101, Life Safety Code requirements and the following:

- Locks must be capable of receiving full size cylinders.
- Card access controlled doors must be provided with key cylinders on the unprotected side to permit bypass of inoperative card readers for emergency purposes. Use of key bypass will cause a forced entry alarm.
- Doors with automatic door openers (during public hours) must have a lock-down mechanism (e.g.: door deadbolt locks) for use after area/building is closed.

- Roll-up doors at perimeters which are electrically operated must be provided with key-operated electrical switches internal to the protected area.
- Electric locks should be coordinated with the architect, door hardware, and electronic security designer to ensure appropriate lock specification.

3-8.5.6.2 Hinges.

Hinges must be reinforced to 7 gauge and may be full mortise, half mortise, full surface, or half surface.

Hinge pins on perimeter doors must be tamper resistant unless mounted on the protected side of the door. Tamper resistant hinges must have non-removable pins, security pins, set screws, welded, or equipped with a safety stud.

3-8.5.6.3 Door Closures.

All perimeter doors must be equipped with a heavy duty door closure, reinforced to 12 gauge, automatic non-hold door-closer installed internal to the protected area.

3-8.5.7 Windows.

Windows in protected areas less than 18 feet (5.5m) (measured from the bottom of the window) above the ground or from the nearest platform; such as lower roof, canopy or mechanical equipment, which affords access to the window must be non-operable, have positive latch, or deadbolt to secure the window in the closed position. Positive latch must preclude opening with ordinarily obtainable tools. Where window hinges are on the exterior of the building and the hinge pins are capable of being removed, the hinge pins must be either fixed in place with a set screw which is inaccessible when the window is closed or welded in place.

3-8.6 Electronic Security System (ESS).

ESS is the integrated electronic system that encompasses one or more of the following subsystems; access control system (ACS), intrusion detection system (IDS), and closed circuit television (CCTV) systems for assessment of alarm conditions. Refer to the Specific Design Requirements and Functional Data Sheets (FDS) for specific area requirements.

ESS must meet the policy based requirements for assets being protected and designed in accordance with UFC 4-021-02, *Security Engineering Electronic Security Systems*. For policy based requirement, refer to Physical Security Requirements in this chapter.

3-8.6.1 ESS Closet.

Provide ESS closets dedicated to ESS distribution equipment and workstations. ESS closets must be adjacent to telecommunications room and be stacked vertically in multi-floor facilities. The minimum size of an ESS closet must be 40 sq feet (3.7sq m) with a minimum ceiling height of 8 feet (2.4m).

3-8.6.2 Intrusion Detection System (IDS).

All Interior areas of a Museum and Historic Resource Facilities through which reasonable access could be gained to works of art, archives, and artifacts must be protected by IDS.

3-8.6.2.1 IDS Zones.

An IDS zone is a room or space within a building that can be armed and disarmed independently from all other zones. See Specific Design Requirements for IDS zoning. Regardless of IDS zoning, each sensor must annunciate as a discrete, identifiable alarm point.

3-8.6.2.2 Motion Detection Sensors.

Must be UL 639 Listed.

3-8.6.2.3 Point Sensors.

Must be UL 634 high security switches (HSS) level 1 or 2. HSS Level 2 is preferred. Balanced Magnetic Switches meet HSS Level 2. Level 2 rated switches include only Balanced Magnetic Switches that pass additional performance testing.

3-8.6.2.4 Local Annunciation.

The local alarm annunciation (sounder) must produce a minimum 92db local chime measured at 10 feet (3.0m) from the device. Provide local sounder at all card reader doors. Sounder should be mounted flush on a stainless steel single-gang box cover, on the protected side, above the door and below any ceiling or tiles and meet the following:

- Sounder must initiate with a Door prop-open alarms.
- Door held-open alarms may be incorporated with request-to-exit devices only if the device will provide the intermittent, chime alert that can be achieved by a stand-alone device.
- Local sounders must be programmed to automatically reset upon reset of door position (secured position).

3-8.6.2.5 IDS Local Processor or Intrusion Panel.

Provide an IDS local processor or intrusion panel within the protected area. System must be configured to only allow cleared personnel located within the protected area to initiate changes in access modes or alarm conditions.

3-8.6.2.6 Sensor Cabling.

Cabling between all sensors and the IDS local processor or intrusion panel must be dedicated to the system and contained within the protected area. If the wiring cannot be contained within the protected area, provide tamper protection in accordance with UFC 4-021-02, *Electronic Security Systems*.

3-8.6.2.7 External Transmission Line Security.

IDS transmission lines leaving the protected area to the central monitoring station, must have line supervision. If line supervision is unavailable, two independent means of alarm signal transmission is required.

3-8.6.2.8 Backup Power.

Provide 24 hours of uninterruptible backup power. This may be provided by internal batteries, uninterruptible power supply (UPS), generators, or any combination. Emergency backup power for IDS should not generate the requirement for a UPS or generator. If a generator or UPS is not available for backup, provide backup with internal batteries.

In the event of primary power failure, the IDS must:

- Automatically transfer to the emergency electrical power source without causing alarm activation.
- Initiate an audible or visual indicator at the IDS local processor or intrusion panel to provide an indication of the primary or backup electrical power source in use.
- Initiate an audible or visual indicator at the monitoring station indicating a failure in a power source or a change in power source.

3-8.6.3 Access Control System (ACS).

Provide ACS to ensure only authorized personnel are permitted ingress and egress into areas containing protected assets. The ACS should log and archive all transactions and alert authorities of unauthorized entry attempts. Equipment containing access-control software programs must be located in the protected area. Unless otherwise directed, the default ACS identifier credential should be the Common Access Card (CAC) [3].

3-8.6.4 Closed Circuit Television (CCTV).

Provide CCTV system for alarm assessment, routine, and event video archiving. CCTV system must be integrated to the IDS and ACS to access and archive events such as alarm conditions and unauthorized entry attempts.

3-8.6.4.1 CCTV Workstation.

Provide a minimum of one workstation for each CCTV system. Multiple workstations may be required for a large distributed system. Video management software must be compatible with all cameras, encoders, and recording devices.

[3] Per DoD 5200.08-R

This Page Intentionally Left Blank

CHAPTER 4 SPECIFIC DESIGN REQUIREMENTS

4-1 GENERAL.

This chapter describes specific design requirements that only apply to each type of facility including:

- Museums.
- Historic Resource Facilities (HRF).

4-2 MUSEUMS.

4-2.1 Civil.

4-2.1.1 Service Areas/Loading Docks.

Provide a covered loading dock and adequate access for trucks to enable easy transfer of artifacts and supplies. When space allows, provide a separate service access from privately owned vehicle parking access. The size of required service vehicles should be verified by the designer prior to planning the service access areas. A back-up spur should be provided for dead-end and service drives that exceed 100 feet (30 meters) in length. Access should be near the loading dock and receiving area. Provide a service vehicle apron and consolidate service access, when possible. Screen or separate the service area from public use or traffic areas with attractive fences, depressions, berms and landscaping. Ensure proper drainage if depressions are used. Do not cross outdoor activity areas with service access. Ensure compliance with AT/FP standards, particularly for dumpster separation and access control. Consult installation fire officials concerning emergency access.

If the museum has food service which involves food deliveries and waste removal, a separate loading dock should be provided from the collections shipping and receiving dock.

4-2.2 Architectural.

4-2.2.1 Exterior Design.

Museums are often thought of as important buildings due to their status as cultural landmarks. The exterior design may be either well integrated into the surrounding environment or more prominent if the decision is made to have the museum stand in contrast to its surroundings. If the museum is located on a base, the exterior design should comply with the Installation Appearance Plan (IAP).

4-2.2.1.1 Entrances.

Museum entrances should be clearly identifiable from parking areas with easy to follow directions to the main door. The building should have one primary means of public access unless a bus or group tour entrance is required to due facility size and expected visitor count. Provide drop-off areas to the primary entrance that are easily accessible

for people who are unable to walk from the parking lot. Consider covered waiting areas if people are expected to queue outside. Control all other service and emergency egress points with access limited to authorized individuals. Design the main entrance to be visible by inside staff. Incorporate a point of reference or landmark that serves as a welcome and transition location for visitors. Visually separate the primary entrance from other entrances and service areas.

Provide security doors or secure gates to exhibit areas and other non-public areas from public spaces that may be used after-hours. Locks must meet the requirements of the section in Chapter 3, entitled ”Locks”.

4-2.2.1.2 Exterior Materials/Architectural Character.

The museum should have a distinctive architectural character, whereby the architecture identifies the building as an impressive and inviting destination. Materials and detailing should be of high quality. The architectural character and the interior design of the museum should be integral and related. They both involve functional analysis and consideration of the appropriate environmental character, building organization, circulation, supervision, and flexibility requirements, as well as finishes and furnishings.

4-2.2.1.3 Exterior Signage.

Provide information regarding the museum’s hours of operation on exterior signage that is visible to customers from their cars and at the entrance to the building.

4-2.2.1.4 Outdoor Public Areas.

Where site allows, provide outdoor gathering space for viewing exterior sculpture, works of art, or historical artifacts. These areas should include, as a minimum, specialty paving, benches, plantings, lighting and signage. Provide as much seclusion from adverse impacts (e.g. utility appurtenances, poor views, noise) as possible in order to create outdoor areas that lend themselves to quiet reflection.

4-2.2.2 Future Expansion Capability.

Plan for building design that permits additions as collections and storage needs grow. Design the structural system for easy expansion and additions, without over-designing the initial construction.

4-2.2.3 Building Circulation.

The museum should be designed with clarity of circulation in mind. Public circulation should flow with self-evident ease and without the need for extensive signage. Public circulation should be directed, but should also allow for some self-paced flexibility and choice among museum visitors, especially among repeat visitors.

4-2.2.4 Supervision and Security.

Provide only one main public entrance/exit that is a prominent architectural component to facilitate visitor wayfinding and supervision. A separate staff only entrance may also

be provided that is not in a prominent location, but near dedicated staff parking areas. All other exits should be for emergency use only and alarmed. Staff at the information/ticket desk should have visual control over the lobby, public toilets, museum store, special events area, and entrances to exhibit spaces. Provide closed circuit television (CCTV) monitoring capability for staff working at the information/ticket desk if a separate security room is not provided.

4-2.2.5 Windows.

Consider a larger storefront system in the lobby or special events area which could be temporarily removed or partially removed in order to accommodate the installation or removal of an oversized collection object.

4-2.2.6 Integrated Pest Management.

Food and beverage service, catering kitchens, vending areas and break rooms must be separated from all museum display and storage areas. Organic garbage disposal must be kept separate from museum collections areas. Loading docks should be dedicated to museum collections only. Collections storage rooms must include doors with closers and door sweeps.

4-2.2.7 Interior Design.

4-2.2.7.1 Interior Construction/Finishes.

Interior construction and finishes (floors, walls, and ceilings) should support the cultural theme of the museum facility and convey a cohesive image throughout. Museum facilities receive a tremendous amount of visitor traffic as well as heavy equipment traffic to facilitate exhibit changes. Durability is important when specifying materials for interior construction. Finishes should also be low maintenance and promote limited use of cleaning supplies and resources.

Interior finishes should provide a neutral backdrop for artwork and exhibits. Consider the mission of the museum when selecting interior finishes. Interactive, dramatic spaces may utilize dark ceiling and wall finishes creating a “black box” effect. Museums that are more informational or exhibit-based may use lighter tones on walls and ceilings to give the space a lighter feel, thereby allowing the exhibits and displays to stand out. The finishes within entry areas, lobbies and main halls should provide visual interest through the introduction of color and texture.

For more information on finishes in specific areas, see the Functional Data Sheets.

- Floors
    - Floor finishes should be durable, easy to maintain and provide slip resistance for those visiting the facility. Floors in main traffic areas (lobby, special events area, main corridors) should receive high-quality hard surface flooring materials such as epoxy terrazzo, stone, or porcelain tile. Utilize large format tiles to minimize grout lines, thereby reducing maintenance. Consider the introduction of

non-distracting flooring patterns for visual interest. Provide modular, recessed aluminum framed entrance floor mat systems at all major entries to deter the transition of exterior debris into the facility.

- Galleries and exhibit areas could utilize a variety of floor finishes (carpet tile, vinyl flooring materials, stone) to delineate specific collections or displays. Address flooring transitions to eliminate tripping hazards and ensure smooth transport of exhibit materials and artifacts.

- Where carpet is introduced, use tile products with 100% solution-dyed nylon fiber, multi-level loop construction. All carpets, backings and adhesive systems must be certified by Carpet and Rug Institute (CRI) Green Label Plus to ensure low VOCs, promoting healthy indoor air quality. The carpet tile backing system should be non-vinyl.

- Solid wood and composite wood flooring is not recommended for use in museum spaces.

- Walls
  - Wall finishes in public areas should be durable and promote an upscale image for the backdrop of the facility. Exterior wall finishes, such as brick or stone, could transition into interior spaces for visual flow and introduction of varying material textures. Consider the use of high performance coatings (pro-industrial, precatalyzed, water-based epoxy) on walls in high traffic and service areas. Fabric-wrapped wall panels may be introduced for acoustical benefit, visual interest or display requirements.

- Miscellaneous
  - Toilet partitions should be floor-mounted overhead-braced and constructed of stainless steel, solid plastic (HDPE) or color-through phenolic for durability and graffiti resistance.

  - Built-in casework and cabinetry should consist of plastic laminate base and wall cabinets with solid polymer (solid surfacing) material countertops. Provide integral solid surface material sinks at restrooms. Stainless steel sinks should be provided at all other locations.

4-2.2.7.2 Raised Access Flooring.

Raised access flooring may be introduced in changing exhibition spaces where flexibility of power and data accessibility is required. Consider load requirements as well as

equipment used for exhibit maintenance when selecting raised access floor product. Seal concrete under raised flooring with a clear water-borne sealer.

4-2.2.7.3 Interior Signage.

Develop a comprehensive interior signage package for the facility that addresses permanent spaces and facilitates visitor wayfinding which is critical to a positive museum experience. Consider low lighting levels within exhibit spaces and the impact on viewing critical directional or informational signage content.

Consider the use of digital signage and interactive floor plans, specifically at the main entry/lobby. The interior signage package should complement interior finishes and exhibit signage with regard to materials, fonts, and style.

4-2.2.7.4 Demountable and Operable Folding Partitions.

Consider the use of demountable partition systems in exhibit gallery spaces as well as office/administration areas. These partitions will add flexibility to areas that are prone to frequent reconfiguration. System should be non-progressive, moveable and easily reconfigurable unitized panels from a single manufacturer (SI Facilities Design Standards).

Consider the use of operable folding partitions to create temporary separate areas, such as within education/training spaces.

4-2.2.7.5 Fixed Theater Seating.

Provide fixed seating in theater spaces. Frame and upholstery finishes should be durable and easily cleaned. Design must comply with NFPA 101. Refer to SI Facilities Design Guide, Section 126100, Fixed Auditorium Seating, for recommended performance specifications. Ensure adequate positions are provided for wheelchairs.

4-2.2.7.6 Furniture, Fixtures and Equipment (FF&E).

Throughout the museum facility, it is crucial to provide enough seating, offering rest areas for visitors. This can be accomplished through the introduction of built-in or freestanding benches scattered within the facility. Consider FF&E construction and finish materials during the selection process to ensure off-gassing is kept to a minimum in all spaces.

For more information on FF&E in specific areas, see the Functional Data Sheets.

4-2.3 Structural.

4-2.3.1 Special Loading Conditions.

Floor live loads must be in accordance with UFC 3-301-01, *Structural Engineering*. Since locations of corridors are subject to change over time, use a minimum uniform live load of 100 pounds per square foot (4.79 kilopascals) over the entire floor area. Identify

specific live loads based on the use of the space. Consider display size and weights along with potential equipment required to move or service the exhibits.

4-2.4 Mechanical.

4-2.4.1 Interior Design Conditions.

See Functional Data Sheets for additional requirements.

4-2.4.2 Temperature Control.

See Functional Data Sheets for additional requirements.

4-2.4.3 Humidity Control.

See Functional Data Sheets for additional requirements.

4-2.4.4 Heating, Ventilation, and Air Conditioning (HVAC) Design.

4-2.4.4.1 “Immersive” Experience Displays.

Coordinate with the end user on HVAC requirements needed in museum displays to create an “immersive” experience for the museum visitor (i.e., heating to simulate Vietnam, cooling to simulate Korea).

4-2.4.5 Acoustics and Noise.

See Functional Data Sheets for additional requirements.

4-2.5 Plumbing.

4-2.5.1 “Immersive” Experience Displays.

Coordinate with the end user on plumbing requirements needed in museum displays to create an “immersive” experience for the museum visitor (i.e., compressed air and hydraulics to simulate helicopter vibration).

4-2.6 Fire Protection.

4-2.6.1 Fire Protection Design.

Fire protection designs must incorporate the prescriptive-based options of NFPA 909. Performance-based options must not be considered without explicit approval of the NAVFAC Chief Fire Protection Engineer.

Designs must incorporate redundant fire protection concepts, employing active fire protection through automatic fire suppression and detection systems, passive fire barrier features, and limiting combustible fuel load in order to control and minimize potential injury to staff and losses to collections, mission, and infrastructure.

4-2.6.2 Applicable Guidance and Criteria.

- National Park Service *Museum Handbook, Part 1: Museum Collections,* Chapter 9: Museum Collections Security and Fire Protection
- NFPA 909, Code for the Protection of Cultural Resource Properties — Museums, Libraries, and Places of Worship
- Smithsonian Institution Office of Safety, Health, and Environmental Management's Fire Protection and Life Safety Design Manual

4-2.6.3 Fire Alarm and Detection Systems.

Fire alarm and smoke detection systems must be provided throughout. Smoke detection in public exhibit and gathering spaces may be provided with spot, optical beam or early warning smoke detection as appropriate for the protected area. Serviceability and accessibility of detectors must be considered when selecting detector type. Incorporate necessary interfaces such that activation of the building fire alarm system automatically overrides theater A/V systems and other immersive type experiences.

4-2.6.4 Sprinkler Systems.

Fire Sprinkler System design criteria must comply with NFPA 13 –Installation of Sprinkler Systems, but must be designed for no less than Ordinary Hazard Group 2 criteria.

4-2.6.5 Passive Fire Protection.

Fire barriers must have a minimum one-hour fire resistive construction and be constructed as smoke barriers. Higher fire ratings may be required depending on the materials, process or hazards present, or as dictated by an applicable code or standard. In addition to fire separation requirements covered by the core documents, provide fire resistive barriers to separate and protect the following areas:

- Process areas or other rooms where collections will be inventoried, processed, restored, and cleaned.
- NGO spaces, such as the museum store or restaurant.

4-2.6.6 Interior Finishes and Decorative Materials.

- Wall and ceiling materials, paneling, and acoustical tile must be Class A or B, unless otherwise noted, with a maximum flame spread rating of 75 or less, and maximum smoke developed of 450 as tested in accordance with ASTM E84.
- Wood used for platforms, enclosures, cases over 100 cubic feet (or with heat producing equipment) or for other purposes must be fire retardant pressure impregnated lumber and markings clearly visible attesting to its fire retardant characteristics.

- Fire retardant coatings of intumescent paint or other fire retardant chemicals must not be used in lieu of fire retardant pressure impregnated treatment.
- Textiles or other materials treated with a fire retardant must be re-treated as per the recommended frequency by the treatment manufacturer. The building manager must maintain a record of the date and type of treatment for as long as the material is in use.
- Artificial rocks, faux environments, and similar construction must be fabricated of noncombustible materials to the greatest extent possible. Gypsum, glass fiber, metal lath and other noncombustible materials must be used in lieu of foamed plastics and other combustibles.
- Cellular or foamed plastics and expanded plastics must not be used unless they comply with the fire test criteria and limits on quantities in the IBC and in NFPA 101.

4-2.7 Electrical.

4-2.7.1 Lighting.

Provide automatic controls to maintain minimum light levels throughout the facility and prevent the lights from completely turning off during occupied hours. Provide master control stations at main staff entrance and at information /ticket desk if a separate security room is not provided. See Functional Data Sheets for additional information.

4-2.7.2 Additional Lighting Requirements in Exhibit and Display Areas.

Provide SL for all of the various lighting systems used in the exhibit and display areas, addressing the following:

- Coordinate with the end user and exhibit designer to determine how much illuminance and how much exposure time is acceptable for the artifacts planned to be displayed in each area. Limit the maximum display illuminance based on sensitivity of the artifacts (See Table 3-1). The maximum is usually between 5 and 25 fc; (50 to 250 lux).
- Provide luminaire and light sources that provide a defused light pattern, appropriate warmth/coolness of light for the art, color rendering, and visual clarity.
- Provide sources that are suitable for illuminating color paintings and black-and-white prints.
- Limit the use of incandescent specialty lighting to prevent infrared (IR) damage. Use of incandescent lamps requires specific authorization from the end user.
- Provide adjustable lighting systems in rotating exhibit areas. Implement systems, such as Track lighting on a 10 ft. (3.0m) x 10 ft. (3.0m)

permanent grid, to accomplish the initial arrangement while building in flexibility to accommodate future display requirements.

- Comply with Accessibility Laws including provision of circulation pathway lighting into and out of exhibit areas with a minimum of 1 FC (10 lux).
- Incorporate specific pre-programmed controls to permit the light level to remain low or off until a visitor approaches.
- Fiber optics for displays are ideal and are usually integrated into the display cases. Coordinate with the end user, and incorporate the appropriate power and controls for these systems.
- Note: The exhibit systems are often provided via a separate contract, however, exhibit areas must still have a separate maintenance / ambient lighting system. Establish locations of controls and the planned control procedures so that both systems can be operated independently by the staff, at appropriate times.

4-2.7.3 Power.

All receptacles located in areas occupied by children, such as the Education Center, must be listed Tamper-Resistant (removable caps or plugs are not acceptable).

Coordinate with exhibit planners and provide dedicated sources of power to support the exhibit requirements. Ensure connection points, when concealed, are accessible to staff without disruption of planned exhibits. Provide modular underfloor or within floor power and communication systems in rotating exhibit areas, such as a 10 ft. (3.0m) x 10 ft. (3.0m) permanent underfloor grid, to accomplish the initial arrangement while building in flexibility to accommodate future display requirements.

4-2.7.4 CATV.

Coordinate with exhibit planners and provide infrastructure to support the educational interactive features planned for the exhibits.

See Functional Data Sheets for additional requirements.

4-2.7.5 Telecommunications.

Provide modular underfloor or within floor system in the rotating exhibit areas, such as a 10 ft. (3.0m) x 10 ft. (3.0m permanent underfloor grid, to accomplish the initial arrangement while building in flexibility to accommodate future display requirements. Provide recessed in floor telecommunication outlets in the Theatre, including at the stage and podium areas. Coordinate with the end user and provide the flexibility for the variety of potential functions / events.

See FDS for additional requirements.

4-2.7.6 Coordination.

The following items require interdiscipline coordination with the electrical design:

- Location of the cashier stations in museum stores that accommodate both data and telephone outlets.
- All power requirements for:
  - Lab equipment
  - Shop equipment
  - Food service equipment
  - Integration of food service equipment with fire suppression equipment

4-2.8 Electronic Security System (ESS).

See FDS for additional requirements.

4-2.8.1 ESS – Food Service and Museum Store.

When provided, ESS for the Food Service and Museum Store must be a standalone system. Coordinate requirements with service provider.

4-2.8.2 Intrusion Detection System (IDS).

- All Interior areas of a Museum through which reasonable access could be gained to works of art, artifacts, and archives must be protected by IDS.
- Provide point sensors on all windows, doors, and man-passable openings. Provide motion sensors within protected areas to protect all windows, doors, and man-passable openings and detect movement within the protected space.
- All emergency exit doors must be alarmed 24/7 and equipped with a local annunciation and delayed-egress is recommended with NFPA 101 compliance. Delayed egress hardware must be specified with the activation switch incorporated into the door panic hardware. Delayed egress hardware that integrates the activation switch within the magnetic locking mechanism is not permitted.

4-2.8.2.2 Exhibit Alarms.

Depending on value of the asset, some exhibit cabinets, wall mounted, or free standing exhibits may require IDS. When required, comply with the following:

- Exhibit cases must be protected with plunger or point sensor(s) on all doors/hatches and have vibration sensor(s) within the case. Sensors and wiring must be routed within the case, and protected from tampering.
- Wall mounted or free standing exhibits must be protected with plunger or point sensor and vibration sensor. In addition, wall mounted or free standing exhibits may utilize motion sensors with a curtain pattern to

create a detection zone around the asset. Protection patterns expand with distance from the detector. Therefore, careful detector placement is required to avoid inadvertent alarms. In most applications, floor mounted sensors are recommended. Movement within the detection zone should initiate a local sounder and alarm at the security office. In lieu of a toned alarm at the local sounder, consider a pre-recorded message such as "Please step back from the exhibit".

Provide a local sounder mounted at the exhibit to warn individuals who may have touched an exhibit case, wall mounted or free standing exhibits, or trespassed into an alarm zone. Provide a timer to silence the alarm after a preset time.

4-2.8.2.3 Local Annunciation.

A minimum of four local sounders should be placed in the corners of exhibit galleries. Additional sounders may be required in large galleries.

4-2.8.2.4 IDS Zones.

Staff only areas and public areas must be on separate IDS zones. In addition, the following areas will be on separate IDS Zones:

- Lobby, Special Events Area, Education Youth, and Theater
- Exhibition and Changing Exhibits
- Exhibit Alarms
- Collection Storage
- Exhibit Maintenance
- Facility Maintenance
- Loading Dock and Service Entrance

4-2.8.3 Access Control System (ACS).

At a minimum, provide card reader with keypad at the primary entrance, group tour entrance, primary staff entrance, loading dock entrance, ESS closet, the primary entrance of each protected area and IDS zone.

4-2.8.4 Closed Circuit Television (CCTV).

The following provides the minimum requirements.

4-2.8.4.1 Cameras.

Infrared (IR) illuminators are prohibited in areas that store or display IR sensitive objects or materials. Coordinate lighting design with camera locations; reference the Lighting in Areas Covered by CCTV section.

4-2.8.4.2 Cameras - Public Areas.

Provided camera coverage at the public entrances, lobby, emergency exits, loading dock, and in areas where the public has reasonable access to valuable assets. Provide a minimum of 75% camera coverage in the exhibit galley space with a combination of fixed and pan-tilt-zoom (PTZ) cameras. Cameras must provide coverage of:

- Alarmed cases and exhibits
- Museum windows
- Persons entering and exiting museum

4-2.8.4.3 Cameras - Non-Public Areas.

Provide camera coverage for the primary entrance to each protected area/IDS Zone, emergency exits, and within the protected area based on asset value.

4-2.8.4.4 CCTV Workstation.

Provide at locations indicated in FDS.

4-2.8.4.5 Video Recording.

System should have the capability to digitally record and store all cameras images for a minimum of seven days.

- On-demand and event activated recording must be 30 frames per second (fps)
- Routine recording should not be less than 10 fps
- Resolution should be no less than 720 X 480 pixels.

4-3 HISTORIC RESOURCE FACILITIES (HRF).

4-3.1 Civil.

4-3.1.1 Site Design.

All Historic Resource Facility site designs must be in accordance with Department of Defense (DoD) criteria. These criteria are based on national standards, private sector consensus standards, and model codes. Refer to UFC 4-440-01N, *Design: Warehouses and Covered Storage,* for additional design requirements.

4-3.1.2 Parking.

Provide parking for facilities staff and persons with disabilities within walking distance of the facility entrance. Parking areas should be separated from truck docks and other activity areas by some appropriate physical means. Provide access for the largest size truck expected to serve the facility along with materials handling apparatus and fire apparatus. Truck parking and turning space for the largest size truck expected must be provided.

4-3.1.3 Service Areas/Loading Docks.

Provide maneuvering space to facilitate loading and unloading operations at dock. Inside loading docks are preferable over outside docks. Outside docks should be protected by full width canopies to shield docks from precipitation. Protect building corners and dock areas from vehicle impact by using concrete filled bollards. Dock height will vary between 44 and 52 inches (1120 mm and 1320 mm) depending on the class of trucks served. Configure truck docks to conform to building, site, and traffic flow requirements. Provide dock levelers at all truck positions. Provide space to load and unload flatbed and low-boy trucks and to move material in and out of the facility using a hoist or similar material handling equipment. Specify dock leveler capacity to provide a minimum 20 year life.

4-3.2 Architectural.

4-3.2.1 Exterior Design.

If the historic resource facility is located on a base, the exterior design should comply with the Installation Appearance Plan (IAP).

4-3.2.2 Entrances.

Control all other service and emergency egress points, with access limited to authorized individuals. Design the main entrance to be visible by inside staff. Incorporate a point of reference or landmark that serves as a welcome and transition location for visitors. Visually separate the primary entrance from other entrances and service areas.

4-3.2.3 Roof and Rainwater Collection System.

Consider using the roof for the collection of rainwater for the Underwater Archaeology outdoor treatment tanks.

4-3.2.4 Future Expansion Capability.

Plan for building design that permits additions as collections and storage needs grow. Design the structural system for easy expansion and additions, without over-designing the initial construction.

4-3.2.5 Building Circulation.

The flow of an item or material into, through and out of the building must be considered during the design of a HRF. There should be direct, uninterrupted flow, without ramps, turns or steps, from the loading dock through shipping/receiving to packing/unpacking, holding, and final location.

4-3.2.6 Supervision and Security.

Provide only one main public entrance/exit that is a prominent architectural component to facilitate visitor wayfinding and supervision. A separate staff only entrance may also be provided that is not in a prominent location, but near dedicated staff parking areas.

All other exits should be for emergency use only and alarmed. Staff at the reception or security desk should have visual control over the entrance and access points to secured areas. Provide closed circuit television (CCTV) monitoring capability for staff working at the reception/security desk if a separate security room is not provided.

4-3.2.7 Integrated Pest Management.

Provide separate holding room for pest inspection and treatment of materials prior to entering the HRF.

Vending areas and break rooms must be separated from all collections and storage areas.

4-3.2.8 Interior Design.

4-3.2.8.1 Interior Construction/Finishes.

HRFs should incorporate the use of functional and practical interior construction and finishes. Interior construction materials and finishes should contain low to no Volatile Organic Compounds (VOCs). Off-gassing of VOCs could adversely affect historic artifacts and archival materials. Per NARA 1571, all interior finish materials used in areas where records are stored must be approved by NARA Preservation Programs (NWT). Ensure testing times are incorporated into project planning and construction schedules.

For more information on finishes in specific areas, see the Functional Data Sheets.

- Floors
    - Flat and smooth concrete floors must be utilized throughout storage and lab spaces. Ensure there are no changes in floor levels or materials in corridors or path of travel for collections. Coordinate with structural engineer. Use of carpet is not permitted in records storage areas, but may be used in other parts of the archival facility (such as administrative spaces and library areas).
    - Archival Storage - Per NARA 1571, within archive/record areas, use a low VOC acrylic membrane curing compound for concrete floors, after which an epoxy should be applied. Limit off-gassing of any epoxy and floor coating used to less than 0.1 part per million by restricting the use of toluene and xylene in the floor coating mix.
    - Artifact Storage - Per NPS Museum Handbook, within artifact storage and work areas, treat concrete floors with a sodium silicate sealing/curing agent which will harden and increase the density of the surface of the concrete. The floor should be easy to clean without the use of chemicals. Seal concrete floors with a water-borne sealer (deck gray or similar color so that dirt and wear will be evident) which does not off-gas during or after curing. Product

should be able to be reapplied once worn without the need to remove collections from the spaces.

- Ceilings
  - Do not install dropped ceilings in record storage areas since they obscure leaks, provide habitats for pests and acoustic tile material can generate dust and debris (National Park Service Museum Handbook, Part 1). Exposed ceiling structure (as well as all exposed ceiling pipes) must be painted with an acrylic water-reducible primer covered by two coats of latex paint (NARA 1571.12). Acoustical tile ceilings can be used in administrative spaces, corridors and other spaces where stacks are not present. Ceilings should be a light color.
- Walls
  - Per NARA 1571.12, use water-based latex paint for walls. Do not use oil-based or alkyd paints. All concrete block walls in storage areas must be primed and painted to prevent dust. Walls should receive a light color.
- Casework
  - Built-in casework and cabinetry should consist of plastic laminate base/wall cabinets with solid polymer (solid surfacing) material countertops. Countertops in lab spaces should be constructed of a material that is nonporous, heat- and scratch-resistant, such as stainless steel or epoxy resin. Provide integral solid surface material sinks at restrooms. Stainless steel sinks should be provided at all other locations.

4-3.2.8.2 Storage Systems.

- Archival Storage Systems
  - All archives/record storage shelving, racking and high density mobile shelving systems must meet National Archives and Records Administration (NARA) standards per 36 CFR 1234, Facility Standards for Records Storage Facilities. Per NARA 1571, all metal shelving surfaces within records storage areas must be factory-finished with a “powder-coating polymer that must be a polyester epoxy hybrid or best equivalent that passes NWT-conducted or independent lab tests for hardness, coating stability, bending, coating adhesion, and coating durability.” Paints must not exceed off-gassing limits specified in Appendix B of NARA 1571. Wood shelving is not permitted.
  - Shelving must be stabilized to prevent tipping. Seismic conditions must be considered during design. Air circulation around static

shelving in archival storage areas is critical. At perimeter shelving units, the use of perforated backs, coupled with placing units 6 inch (152mm) off walls, will facilitate air flow.

- Electronic media such as CDs, DVDs, and magnetic tapes may require specialized storage units with 4 inch (102mm) to 7 inch (178mm) high drawers, promoting vertical orientation of the media.

- Artifact Storage Systems
  - Micro artifact storage systems include cabinets, shelving units and racks depending on the type and size of the object or collection stored. Specialized storage cabinets can reduce artifact exposure to light, increase security with locking mechanisms, or create a micro-environment inside the cabinet to protect against dust, pollutants, and pests. Macro artifact storage requires the use of heavy-duty widespan shelving or warehouse pallet rack systems. Refer to UFC 4-440-01*, Design: Warehouses and Storage Facilities*, for additional information. Macro and micro storage units could also be designed as a high density mobile system. Incorporate aisles that allow for safe handling of artifacts as well as full operation of any drawers or doors. Macro artifact mobile systems would need to accommodate forklift-accessible crates.
  - The use of restraining bars or cords secured to edges of shelves is recommended to prevent objects from falling, especially for collections housed in mobile storage systems or in earthquake zones. Per the NPS Museum Handbook, consider raising static storage shelving and cabinets off the floor at least 4 inches (102mm), preferably 6 inches (152mm) on metal risers to protect against flooding, pests and to facilitate cleaning. Artifact storage units should be factory-finished to match the requirements for Archival Storage Systems as described above.

4-3.2.8.3 Furniture, Fixtures and Equipment (FF&E).

For information on FF&E in specific areas, see the Functional Data Sheets.

4-3.3 Mechanical.

4-3.3.1 Interior Design Conditions.

See Functional Data Sheets for additional requirements.

4-3.3.2 Temperature Control.

See Functional Data Sheets for additional requirements.

4-3.3.3 Humidity Control.

See Functional Data Sheets for additional requirements.

4-3.3.4 HVAC.

See Functional Data Sheets for additional requirements.

4-3.3.5 Acoustics and Noise.

See Functional Data Sheets for additional requirements.

4-3.4 Plumbing.

See Functional Data Sheets for additional requirements.

4-3.4.1 Underwater Archaeology Floor Drains.

For conservation areas, coordinate with the user on the extensive network of floor drains that include chemical traps and neutralizers, as well as the capacity to handle catastrophic failures of vats capable of holding hundreds of gallons of diluted solutions.

Provide piping from floor drains to separate chemical containment system that includes holding tank(s) sized to accommodate the site where the facility is located and the maintenance program for evacuating them on a periodic basis (i.e., monthly, biannually, as needed).

4-3.4.2 Access to Underwater Archaeology Holding Tank(s).

Provide personnel access to holding tank(s) for the disposal of chemicals.

4-3.4.3 Compressed Air System for Underwater Archaeology.

Centralize compressed air system for Underwater Archaeology. If feasible, provide air compressor and air dryer in the space for the remote sensing equipment and dive locker. If air compressor and air dryer are provided in the covered area used for the outdoor treatment tanks and equipment storage, provide outdoor rated system, mounted on a slab.

4-3.5 Fire Protection.

4-3.5.1 Fire Area Limitation.

The storage of collections and high-value items (including art, artifacts, rare books, archival materials, and objects of historic value) must be stored in fire compartments sized to minimize the maximum foreseeable loss of items stored in any one compartment from a single fire event.

- Artifacts Storage Areas: The maximum size of any single collection storage space must be 30,000 sf (2790 m2). Smaller spaces may be required, depending on the value of collection items stored.

- Archival Material and Record Storage Areas (excluding Hazardous materials, including records on cellulose nitrate film): For storage of items deemed “vital” as defined in NFPA 232, the maximum storage volume of vital archival materials or records must not exceed 25,000 cubic ft (708 m3) in a single compartment. Items not deemed “vital” are considered “important” as defined in NFPA 232. The maximum storage volume of important archival materials or records must not exceed 125,000 cubic ft (3540 m3) in a single compartment.

4-3.5.2 Fire Area Separation.

The storage of collections and high-value items (including art, artifacts, rare books, archival materials, and objects of historic value) must be protected by passive and active fire protection measures. These measures include the following unless determined otherwise by the NAVFAC fire protection engineer:

- Separate storage areas from other areas with minimum 3-hour fire-rated construction. Barriers must also be constructed as smoke barriers. Higher fire ratings may be required depending on the materials stored and hazard presented.
- Items of extreme value must be stored in fire-resistive vaults, containers, or safes.
- Archival material and records deemed “vital” as defined in NFPA 232 must be separated from other areas with minimum four-hour rated construction.
- Collection storage rooms must be dedicated for such purpose. Artifact processing, packing, unpacking, crate and packaging storage, research performed on artifacts, and conservation of artifacts must not be conducted in collection storage rooms. Separate spaces must be incorporated into the design for these purposes.
- Each collection’s storage area must have a separately zoned HVAC configured to go to full exhaust mode upon smoke detection operation in a corresponding HVAC zone. Coordinate design requirements and features with the project mechanical engineer.
- Artifacts process areas or other rooms where artifacts will be inventoried, processed, cleaned and restored must be separated from other areas by a minimum one-hour fire-rated construction. Barriers must also be constructed as smoke barriers. Higher fire ratings may be required depending on the materials in process and hazard present.

4-3.5.3 Fire Suppression.

- Wet-pipe fire sprinkler systems must be provided throughout unless ambient or design temperatures warrant consideration for freeze protection. Antifreeze systems are prohibited.

- The protection of artifact storage areas must be based on Class IV commodities, unless a more severe class of storage is anticipated. Use Early Suppression Fast Response (ESFR) protection methods.
- Storage areas utilizing high density mobile shelving systems must be protected with ESFR sprinklers. High density mobile storage of archival materials and records must comply with the provisions of NFPA 13 for "Mobile High Bay Records Storage". These requirements also apply to mobile storage units less than 12 ft (3.7m) high.
- Standpipe systems must be provided for storage areas utilizing compact mobile storage units. Fire department hose outlets must be spaced so that any point in the record storage area can be reached with a 50-foot (15.2m) hose stream from a 100-foot (30.4m) hose lay.
- Where books or records are stored in fixed open book shelves, the provisions of NFPA 909 and of NFPA 13 for "Library Stack Areas and Record Storage" apply. Performance-based options of NFPA 909 must not be considered without explicit approval of the NAVFAC Chief Fire Protection Engineer.
- Supplemental systems, such as clean agent fire extinguishing systems, may be considered based on hazard, risk, and value of the items stored. Clean agent fire extinguishing systems are not a substitute for required automatic sprinkler systems.

4-3.5.4 Fire Alarm and Detection.

Artifact and archive storage and processing areas must be protected with early warning smoke detection systems. Each storage area defined by fire rated partitions will be zoned separately. Alarm threshold activation will initiate HVAC smoke exhaust mode.

4-3.5.5 Special Occupancy Requirements.

Archival material and record storage areas must be designed and constructed in accordance with NFPA 232 for "vital" and "important" records defined except that fire area separation requirements for "important" records must be as required above.

The storage of records on cellulose nitrate film must be in accordance with NFPA 40, Standard for the Storage and Handling of Cellulose Nitrate Film.

The protection of laboratories using chemicals must be in accordance with NFPA 45, Standard on Fire Protection for Laboratories Using Chemicals.

4-3.6 Electrical.

4-3.6.1 Lighting.

See Functional Data Sheets for specific lighting requirements. Coordinate with the user, and provide lighting controls based on the specific area zoning requirements.

Include sequentially timed lighting activated as individuals progress through the zoned areas, where appropriate.

4-3.6.2 Power.

See Functional Data Sheets for specific additional power requirements.

4-3.6.3 CATV.

See Functional Data Sheets for additional requirements.

4-3.6.4 Telecommunications.

See Functional Data Sheets for additional requirements.

4-3.6.5 Coordination.

The following items require coordination with the electrical design:

All power requirements for:

- Lab equipment
- X-ray equipment
- Shop equipment

4-3.7 Electronic Security System (ESS).

See Functional Data Sheets for additional requirements.

4-3.7.1 Intrusion Detection System (IDS).

All Interior areas of a Historic Resource Facility through which reasonable access could be gained to works of art, artifacts, and archives must be protected by IDS.

- Provide point sensors on all windows, doors, and man-passable openings. Provide motion sensors within protected areas to protect all windows, doors, and man-passable openings and detect movement within the protected space.
- All emergency exit doors must be alarmed 24/7 and equipped with a local annunciation and delayed-egress is recommended with NFPA 101 compliance. Delayed egress hardware must be specified with the activation switch incorporated into the door panic hardware. Delayed egress hardware that integrates the activation switch within the magnetic locking mechanism will not be permitted.

4-3.7.1.2 IDS Zones.

Staff only areas and public areas must be on separate IDS zones. In addition, the following areas must be on separate IDS Zones:

- Underwater Archaeology
- Art Storage
- Artifact Storage
- Arms Storage
- Archives
- Top secret/Open Storage functional areas
- Archive Secure Space
- Loading Dock

4-3.7.2 Access Control System (ACS).

At a minimum, provide card reader with keypad at the primary entrance, staff entrance(s), loading dock entrance, ESS closet, and the primary entrance of each protected area and IDS zone.

4-3.7.3 Closed Circuit Television (CCTV).

The following provides the minimum requirement.

4-3.7.3.1 Cameras.

Cameras are prohibited in areas containing classified materials. IR cameras or IR illuminators are prohibited in areas that store or display IR sensitive objects or materials. Coordinate lighting design with camera locations; reference the Lighting in Areas Covered by CCTV section.

4-3.7.3.2 Cameras - Public Areas.

Provided camera coverage at the public/Staff entrances, emergency exits, loading dock, and in areas where the public has reasonable access to valuable assets.

4-3.7.3.3 Cameras - Non-Public Areas.

Provide camera coverage for the primary entrance to each protected area/IDS Zone, emergency exits, and within the protected area based on asset value.

4-3.7.3.4 CCTV Workstation.

Provide at locations indicated in FDS.

4-3.7.3.5 Video Recording.

System must have the capability to digitally record and store all cameras images for a minimum of seven days.

- On-demand and event activated recording must be 30 frames per second (fps)

- Routine recording should not be less than 7 fps
- Resolution should not be less than 720 X 480 pixels

C-2 DEFINITIONS

Accessioning. The formal act of accepting an object(s) into the category of materials that a museum or historic resources facility holds in the public trust which typically includes the creation of an immediate, brief, and permanent record utilizing a control number for an object or group of objects. An accession record typically includes the accession number, the date and nature of acquisition (i.e. gift, excavation, purchase, bequest), the source, a brief identification and description, condition, place of origin, value, and name of staff member recording the accession.

Archives. An archive is a repository of historically significant material. The Archives Branch of the Naval History and Heritage Command collects, preserves, arranges, describes, catalogs and makes available for use material consisting of paper-based, photographic, and electronic documentation.

Artifact. An object created by people that is indicative of or exemplifies a specific period of time, culture, or activity.

Cataloging. The process of listing something for inclusion in a catalog. In library and information science, the process encompasses the production of bibliographic descriptions of books as well as other types of discovery tools for documents. Today cataloging study and practice has broadened and merged with that of metadata ("data about data contents").

Cold Storage. A Critical Space storage room for film and audio recordings where cold temperatures must be maintained in order to protect and preserve the collections.

Collections. Objects, documents, books, serials, and other media that museums, libraries, archives, manuscript repositories, and historic resource facilities hold in trust for the public. Items are usually considered a part of a collection once they are accessioned or cataloged.

Conservation. A process by which objects are treated with the goal of keeping them in their original or current condition in perpetuity.

Critical Space. An area or space where the respective indoor temperature and relative humidity requirements must be maintained 24 hours/day, 365 days/year in order to protect and preserve naval artifacts, archives, and art.

Curator. A curator is the keeper or custodian of a museum or other collection. The Curator Branch of the Naval History and Heritage Command ensures the proper documentation, care, and preservation of the Navy's historical artifacts, and makes them available to the Navy and to the public in order to develop a better understanding of and fuller support for the Navy.

Electronic Security System (ESS). The integrated electronic system that encompasses interior and exterior Intrusion Detection Systems (IDS), Closed Circuit Television (CCTV) systems for assessment of alarm conditions, Access Control Systems (ACS), Data Transmission Media (DTM), and alarm reporting systems for monitoring, control, and display.

Historic Resource Facility. A type of storage facility that may include one or more of the following functional areas: administrative, archives, artifacts (including historical art, property, artifacts and collections), exhibit programs, library and underwater archaeology.

Histories. Histories is a functional group within the Naval History and Heritage Command, which conducts historical research and analysis, and produces historical knowledge products ranging from scholarly monographs and policy papers, to on-line chronologies and blog postings. The Histories Branch also promotes and supports outside research of naval history.

Immersive Experience. Museum display that simulates an actual environment or historical event and provides the viewer with a feeling of being there.

Integrated Pest Management. The coordination of information about pests and environmental conditions with available pest control methods to prevent unacceptable levels of pest damage while minimizing hazards to people, property, collections, and the environment. IPM programs apply a holistic approach to pest management decision making and consider all appropriate options, including but not limited to pesticides.

Intrusion Detection System (IDS). A system consisting of interior and exterior sensors, surveillance devices, and associated communication subsystems that collectively detect an intrusion of a specified site, facility, or perimeter and annunciate an alarm.

Library. An organized collection of information resources made accessible to a defined community for reference or borrowing. It provides physical or digital access to material, and may be a physical building or room, or a virtual space, or both. A library's collection can include books, periodicals, newspapers, manuscripts, films, maps, prints, documents, microform, CDs, cassettes, videotapes, DVDs, Blu-ray Discs, e-books, audiobooks, databases, and other formats. A library is organized for use and maintained by a public body, an institution, a corporation, or a private individual. Public

and institutional collections and services may be intended for use by people who are unable to purchase an extensive collection themselves, who need material no individual can reasonably be expected to have, or who require professional assistance with their research. In addition to providing materials, libraries also provide the services of librarians who are experts at finding and organizing information and at interpreting information needs. Libraries often provide quiet areas for studying, and they also often offer common areas to facilitate group study and collaboration. Libraries often provide public facilities for access to their electronic resources and the Internet. Modern libraries are increasingly being redefined as places to get unrestricted access to information in many formats and from many sources. They are extending services beyond the physical walls of a building, by providing material accessible by electronic means, and by providing the assistance of librarians in navigating and analyzing very large amounts of information with a variety of digital tools.

Macro Artifact. Artifact that is larger in size than a micro artifact and may need a specialty built crate that takes up more than a 4 ft (1.2m) by 4 ft (1.2m) pallet on the floor. Examples of macro artifacts include large ordnance and cannons, ship control panels, anchors, submarine sails, boats, and submersibles.

Micro Artifact. Artifact that can be placed within a cabinet or storage rack, can be packaged together for bulk storage, or takes up no more than one standard 4 ft (1.2m) by 4 ft (1.2m) pallet. Examples of micro artifacts include objects as small as a uniform button up to objects such as ship's bells or other equipment.

Micro-environment. A climate-controlled and secure space for the display or storage of artifacts within a sealed case or frame. Micro-environments are utilized in facilities where environmental control is not feasible for entire rooms.

Physical Security. That part of security concerned with physical measures designed to safeguard personnel; to prevent or delay unauthorized access to equipment, installations, material, and documents; and to safeguard them against espionage, sabotage, damage, and theft.

Preservation. A branch of library and information science concerned with maintaining or restoring access to artifacts, documents, and records through the study, diagnosis, treatment and prevention of decay and damage. It should be distinguished from conservation, which refers to the treatment and repair of individual items to slow decay or restore them to a usable state.

Processing. A systematic means of bringing an artifact, document, or record into the collection. Processing includes formally accessioning the artifacts, documents, or records, cataloguing, photographing/scanning, packing and/or housing them for storage, and creating a written and/or electronic record of this documentation.

Records. All books, papers, maps, photographs, machine readable materials, or other documentary materials, regardless of physical form or characteristics, made or received by an agency of the United States Government under Federal law or in connection with

the transaction of public business and preserved or appropriate for preservation by that agency or its legitimate successor as evidence of the organization, functions, policies, decisions, procedures, operations, or other activities of the Government or because of the information value of data in them. Materials made or acquired or preserved solely for reference or exhibition purposes, extra copies of documents preserved only for convenience of reference, and stock of publications and of processed documents are not included.

Security Lighting. Security lighting provides illumination during periods of darkness or in areas of low visibility to aid in the detection, assessment, and interdiction of aggressors by security forces. Security Lighting is sometimes referred to as protective lighting.

Sensitive Lighting (SL). Lighting with special characteristics required to be used in areas displaying, handling or storing artifacts or archival materials. See the electrical paragraphs within this FC for detailed information.

Storage Systems. A system of stationary or mobile storage shelving units, cabinets, racks or other storage solutions. High-density mobile systems include storage units, in varying sizes and configurations, on wheeled carriages which travel on recessed or low-profile tracks. High-density mobile systems offer increased storage capacity and can be either motorized or manually operated.

Underwater Archaeology. Underwater Archaeology is a branch under the Naval History and Heritage Command that is tasked to manage and oversee historical underwater archaeology, conservation projects, and activities that relate to the Curator of the Navy. Underwater Archaeology conducts compliance and permitting responsibilities related to cultural resources management and Sunken Military Craft Act compliance as defined in the appropriate directives.

Vault. A room specifically designed to provide resistance to forced and covert entry.

APPENDIX D MUSEUM FUNCTIONAL DATA SHEETS

This appendix further identifies specific design needs for individual spaces within Museums. Building design criteria are provided in a standard Functional Data Sheet (FDS) table format that generally follows the Uniformat II/Work Breakdown Structure (WBS). The Interior Construction/Built-In Equipment category includes anything physically attached or plumbed to the building such as counters, cabinets, casework, toilet accessories, window shades or blinds, and recessed projection screens. The Furnishings and Equipment category includes loose or moveable items such as desks, chairs, and shelving.

The Functional Data Sheets are presented as a guide for the designer, planner, or RFP preparer. It is intended that the information in them are the minimum requirements for the respective rooms and spaces. These minimum requirements apply in addition to all other requirements of this FC and other referenced documents. In the event of a mutually exclusive conflict or where both requirements cannot be satisfied, the Functional Data Sheets take precedence. However, if in the best judgment of the designer, a more restrictive requirement is appropriate, the more restrictive requirement may be applied after consulting with the user. Note that blank spaces found in the Functional Data Sheets indicate building components or systems should follow standard guidance per UFC 1-200-01, *General Building Requirements*.

Table D-1 Museum – Vestibule

Description / Usage	Vestibule. Main entrance to the museum.	
Ceiling Height	8 ft. (2.4m) minimum.	
Windows	Storefront system for daylighting and vision into lobby.	
Doors	Heavy duty storefront system to accommodate high visitor traffic.	
Interior Construction / Built-In Equipment	Provide recessed walk-off mat.	
Finishes	**Walls**	Upgraded wall finish system such as wood, stone, or continuation of exterior finishes.
	Floor	Hard surface (terrazzo, stone/porcelain tile, etc.).
	Base	Terrazzo, stone (coordinate with floor material).
	Ceiling	Painted plaster or GWB, or decorative ceiling treatment.
Plumbing		
HVAC	Provide per Chapter 3. Provide only heating in vestibule.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the addition of an average of 5 fc (50 lux) ambient and daylighting with dimmability controls.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	Provide per Chapter 3 & 4.
Acoustics		
Furnishings and Equipment		
Special Requirements		
Adjacencies/Location within Facility	Adjacent to Lobby/Main Entrance/Visitor Services.	
	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-2 Museum – Lobby/Main Entrance/Visitor Services

Description / Usage	Lobby/Main Entrance/Visitor Services. Provide dedicated group/tour entrance as required.	
Ceiling Height	Varies.	
Windows		
Doors		
Interior Construction / Built-In Equipment	Reception counter, building directory, bulletin boards, donor recognition display, monitor to display on-going visitor information.	
Finishes	**Walls**	Upgraded wall finish system such as wood, stone, or continuation of exterior finishes.
	Floor	Hard surface (terrazzo, stone/porcelain tile, etc.).
	Base	Terrazzo, stone (coordinate with floor material)
	Ceiling	ACT, exposed structure, acoustic clouds or other specialized ceiling treatments.
Plumbing	Provide per Chapter 3. Provide electric water cooler in proximity of public toilets.	
HVAC	Provide per Chapter 3. Critical area. Design lobby area to 72 deg F (22.2 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4. FA/MNS flush-mounted remote panel with microphone located at the reception counter.	
Power	Provide per Chapter 3. Coordinate with power requirements for additional special systems.	
Lighting	Provide per Chapter 3 with the additions of 5 fc (50 lux) ambient, day lighting penetrations, and dimmability w/photosensors.	
Communication	**Telephone**	Provide at reception counter.
	Data	Provide at reception counter. Coordinate requirements for ticket sales system.
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4. Locate ACS workstation at reception counter unless directed otherwise.
	CCTV	Provide per Chapter 3 & 4.

Acoustics		
Furnishings and Equipment	Benches, Automated External Defibrillator (AED)	
Special Requirements	Consider areas for visitor queuing, wheelchair storage, and visitor screening (x-ray). Include space for visitor coat and personal effects storage.	
Adjacencies/Location within Facility	Vestibule, Museum Store, Public Restrooms, Security, Special Events Area, Theater	
	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-3 Museum – Museum Store

Description / Usage	Museum Store. Consists of retail area and inventory storage area for museum merchandise. Include shipping/wrapping area and Point of Sale (POS) register area.	
Ceiling Height	10 ft. (3.0 m) minimum.	
Windows	Provide, if possible, for views and daylighting.	
Doors	Recommend storefront system for visibility.	
Interior Construction / Built-In Equipment	Sales counter to accommodate POS register. Modular display and storage systems.	
Finishes	**Walls**	Paint - egghell/satin finish.
	Floor	Carpet tile or resilient flooring material (linoleum, luxury vinyl tile/plank).
	Base	Resilient.
	Ceiling	ACT, exposed structure, acoustic clouds or other specialized ceiling treatments.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3 with the addition of power panels.	
Lighting	Provide per Chapter 3 with the additions of 40 fc (400 lux) ambient, day lighting penetration, dimmability w/ photosensors, and coordination with store display lighting as appropriate.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3 and with the addition of infrastructure for non-NMCI system and credit card processing.
	CATV	Provide per Chapter 3.
Security	**IDS**	
	ACS	
	CCTV	Stand alone system to be coordinated w/ NGO.
Acoustics		
Furnishings and Equipment	Stool at sales counter.	
Special Requirements	May require coordination with NGO. Refer to Museum Store Association (MSA) standards for additional information. Provide storefront wall at front of store for display visibility. Provide storefront door, gate or coiling grille to secure space after-hours, if open to lobby.	
Adjacencies/Location within Facility	Lobby/Main Entrance.	

	For use during project execution by the appropriate Service	
Occupancy	Staff	
	Other	
Min. net ft^2 (m^2)		

Table D-4 Museum – Museum Store Manager Office

Description / Usage	Museum Store Manager Office. Office can be located within or near Museum Store.	
Ceiling Height	8 ft. (2.4m) minimum	
Windows	Provide, if possible, for views and daylighting.	
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Carpet tile.
	Base	Resilient.
	Ceiling	ACT.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3 with the addition of infrastructure for possible Non-NMCI data system connection.
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Freestanding desking system, task lighting, ergonomic desk chair, side chairs, filing/storage, safe.	
Special Requirements	May require coordination with NGO.	
Adjacencies/Location within Facility	Museum Store. Main lobby.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-5 Museum – Security Office

Description / Usage	Security Office. Optional office for security personnel (in larger museum facilities only).	
Ceiling Height	8 ft. (2.4 m) minimum.	
Windows		
Doors		
Interior Construction / Built-In Equipment	Built-in console for monitoring equipment.	
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Carpet tile.
	Base	Resilient.
	Ceiling	ACT
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4. FA/MNS Remote Panel with microphone.	
Power	Provide per Chapter 3. Coordinate requirements for radio charging system.	
Lighting	Provide per Chapter 3 and dimmable lighting.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	Provide per Chapter 3.
Security	**IDS**	Provide IDS Workstation
	ACS	Provide card reader at entrance and ACS Workstation
	CCTV	Provide CCTV Workstation
Acoustics		
Furnishings and Equipment	Desk, ergonomic chair, storage (file cabinet or shelving), task lighting, guest side chair(s), lockable gun storage, as required.	
Special Requirements		
Adjacencies/Location within Facility	Lobby/Main Entrance, Special Events Area	
	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-6 Museum – Public Restrooms

Description / Usage	Public Restrooms/Family Restroom/Mothers' Room. Men's, Women's and Family toilet rooms.	
Ceiling Height	8 ft. (2.4m) minimum.	
Windows		
Doors		
Interior Construction / Built-In Equipment	Sink vanities, toilet partitions, mirrors, toilet accessories, diaper changing stations.	
Finishes	**Walls**	Ceramic or porcelain tile (full-height). Provide water-resistant GWB at wet walls.
	Floor	Porcelain tile.
	Base	Ceramic or porcelain tile.
	Ceiling	ACT and/or painted GWB (satin finish).
Plumbing	Provide per Chapter 3. Provide wall-mounted urinals, floor-mounted toilets, and lavatories. Provide a floor drain.	
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the addition of emergency lighting with battery backup .	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Provide comfortable lounge chair in Mother's Room.	
Special Requirements	Locate one restroom at each floor level. Coordinate with Facility Manager when determining soap and paper product dispensing preferences. Consider child-sized toilet, sink and dispensers and proper mounting heights at Family Restrooms.	
Adjacencies/Location within Facility	Lobby, Exhibit spaces, Education spaces.	
	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-7 Museum – Theater

Description / Usage	Theater. Accommodates large presentations, ceremonies and media viewing.	
Ceiling Height	12 ft. (3.7m) minimum.	
Windows	Not required.	
Doors		
Interior Construction / Built-In Equipment	Fixed seating, audiovisual systems (presentation, sound, lighting, etc.), recessed projection screen, projector mount(s), stage curtain.	
Finishes	**Walls**	Acoustic wall panels, paint (eggshell or satin finish) or other specialized wall treatments.
	Floor	Carpet tile, resilient flooring, stained/sealed concrete.
	Base	Wood or resilient.
	Ceiling	ACT, exposed structure, acoustic clouds or other specialized ceiling treatments.
Plumbing		
HVAC	Provide per Chapter 3. Use demand controlled ventilation or heat/enthalpy recovery when cost effective.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapters 3 and 4 with the addition of flush floor mounted outlets, coordinated with requirements of the planned events.	
Lighting	Provide per Chapters 3 and 4 with the additions of 30 fc (300 lux) ambient with dimmability, and the specialty lighting systems to accomodate the planned events.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapters 3 and 4 with the addition of the infrastructure for video teleconferencing system for presentations and training purposes, non-NMCI data system connection, and flush floor mounted outlets, coordinated with requirements of planned events.
	CATV	Provide per Chapter 3.
Security	**IDS**	
	ACS	
	CCTV	
Acoustics	NC 55 or greater.	
Furnishings and Equipment	Lecturn/podium	
Special Requirements	May require coordination with NGO. Consider use of tiered floor and stage or platform. Provide audio-visual systems to support museum mission. Provide accommodation for remote VTC and podcasts.	
Adjacencies/Location within Facility	Lobby, Special Events Area	

	For use during project execution by the appropriate Service	
Occupancy	Staff	
	Other	
Min. net ft^2 (m^2)		

Table D-8 Museum – Docent Education/Training Room

Description / Usage	Docent Education/Training Room. Work/lounge space for docents/volunteers.	
Ceiling Height	8 ft. (2.4m) minimum.	
Windows	Provide, if possible, for views and daylighting.	
Doors		
Interior Construction / Built-In Equipment	Built-in casework and lockable cabinets, if sink required. Personnel lockers.	
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Carpet (resilient flooring near sink area, if provided).
	Base	Resilient.
	Ceiling	ACT.
Plumbing	Provide per Chapter 3. Provide a stainless steel sink with hot and cold water supply and a cleanout. Provide a water connection for icemaker at refrigerator.	
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the addition of 15 fc (150 lux) ambient and 30 fc (300 lux) task, dimmability or mutilevel switching, and occupancy sensors.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	Consider provision of infrastructure for Video teleconferencing hookup for training purposes.
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Work table, chairs, small touch-down workstations, open library shelving, storage cabinets for materials, refrigerator, lounge chairs, occasional tables.	
Special Requirements		
Adjacencies/Location within Facility	Main lobby, Exhibit area, Education Director	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-9 Museum – Museum Director Office

Description / Usage	Museum Director Office. Private office for museum director.	
Ceiling Height	8 ft. (2.4m) minimum	
Windows	Provide, if possible, for views and daylighting.	
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell or satin.
	Floor	Carpet tile.
	Base	Resilient.
	Ceiling	ACT.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Freestanding desking system, task lighting, ergonomic desk chair, side chairs, filing/storage.	
Special Requirements		
Adjacencies/Location within Facility		
	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-10 Museum - Curatorial/Historian Office

Description / Usage	Curatorial/Historian Office	
Ceiling Height	8 ft. (2.4m) minimum	
Windows	Provide, if possible, for views and daylighting.	
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell or satin.
	Floor	Carpet tile.
	Base	Resilient.
	Ceiling	ACT.
Plumbing		
HVAC	Provide per Chapter 3. Verify if snorkel type localized exhaust systems with articulating arms that can be adjusted and manually set to desired positions of users are required.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Freestanding desking system, task lighting, ergonomic desk chair, side chairs, filing/storage.	
Special Requirements		
Adjacencies/Location within Facility	Collections Area	
	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-11 Museum - Computer/IT Office

Description / Usage	Computer/IT Office.	
Ceiling Height	8 ft. (2.4m) minimum	
Windows	Provide, if possible, for views and daylighting.	
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell or satin.
	Floor	Carpet tile.
	Base	Resilient.
	Ceiling	ACT.
Plumbing		
HVAC	Provide per Chapter 3 & 4.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Freestanding desking system, task lighting, ergonomic desk chair, side chairs, filing/storage.	
Special Requirements		
Adjacencies/Location within Facility	Administrative Area.	
	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-12 Museum – AV Supervisor Office

Description / Usage	AV Supervisor Office	
Ceiling Height	8 ft. (2.4m) minimum	
Windows	Provide, if possible, for views and daylighting.	
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell or satin.
	Floor	Carpet tile.
	Base	Resilient.
	Ceiling	ACT.
Plumbing		
HVAC	Provide per Chapter 3 & 4.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Freestanding desking system, task lighting, ergonomic desk chair, side chairs, filing/storage.	
Special Requirements		
Adjacencies/Location within Facility	Theater.	
	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-13 Museum – Administrative Support Spaces

Description / Usage	Administrative Support Spaces. Includes any administrative support spaces required to include copy, print, central files.	
Ceiling Height	8 ft. (2.4m) minimum	
Windows	Provide, if possible, for exterior views and daylighting.	
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell or satin finish.
	Floor	Carpet tile.
	Base	Resilient.
	Ceiling	ACT.
Plumbing		
HVAC	Provide per Chapter 3 & 4.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Freestanding systems furniture (open office), worktables, storage cabinets, file cabinets.	
Special Requirements		
Adjacencies/Location within Facility	Administrative offices.	
	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-14 Museum – Conference Room

Consider area for wheelchair storage.	Conference Room. Room to support staff meetings, presentations and training.	
Ceiling Height	9 ft. (2.7m) minimum.	
Windows	Provide, if possible, for exterior views and daylighting.	
Doors		
Interior Construction / Built-In Equipment	Recessed projection screen, projector mount. Visual display system - whiteboards, tackboards, etc.	
Finishes	**Walls**	Paint - eggshell or satin finish. Optional finish treatments (wood wainscott, acoustical wall panels, etc.).
	Floor	Carpet tile.
	Base	Resilient or wood.
	Ceiling	ACT. Could introduce GWB soffits for interest.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3 with the addition of the infrastructure for video teleconferencing system for presentations and training purposes.
	CATV	Provide per Chapter 3.
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Conference table, chairs (around table and stacking for additional capacity), lectern, storage credenza, mobile flipchart easel.	
Special Requirements	Consider VideoTeleconferencing (VTC).	
Adjacencies/Location within Facility	Administrative area, Museum Director Office.	
	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-15 Museum – Staff Break Room

Description / Usage	Staff Break Room	
Ceiling Height	8 ft. (2.4m) minimum.	
Windows	Provide, if possible, for views and daylighting.	
Doors		
Interior Construction / Built-In Equipment	Casework with base/wall cabinets; television wall-mount bracket.	
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Resilient (linoleum, luxury vinyl tile or plank).
	Base	Resilient.
	Ceiling	ACT.
Plumbing	Provide per Chapter 3. Provide a stainless steel sink with hot and cold water supply and a cleanout. Provide a water connection for icemaker at refrigerator.	
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	Provide per Chapter 3.
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Tables and chairs, countertop microwave, refrigerator, coffee machine, television, recycling containers.	
Special Requirements	Provide area for recycling containers and vending machines.	
Adjacencies/Location within Facility	Administrative areas.	
	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-16 Museum – Intern Staff Cluster

Description / Usage	Intern Staff Cluster. Space to support NHHC intern programs.	
Ceiling Height	8 ft. (2.4m) minimum	
Windows	Provide, if possible, for views and daylighting.	
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Carpet tile.
	Base	Resilient.
	Ceiling	ACT.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3 with the addition of infrastructure for possible Non-NMCI data system connection.
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Freestanding desking system or systems furniture (open office), task lighting, ergonomic desk chair, side chairs, filing/storage.	
Special Requirements		
Adjacencies/Location within Facility		
	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-17 Museum – Staff Restrooms

Description / Usage	Staff Restrooms. Toilet facilities for building staff.	
Ceiling Height	8 ft. (2.4m) minimum	
Windows		
Doors		
Interior Construction / Built-In Equipment	Sink vanities, toilet partitions (if required), lockers, mirrors, toilet accessories.	
Finishes	**Walls**	Ceramic or porcelain tile (full-height). Provide water-resistant GWB at wet walls.
	Floor	Porcelain tile.
	Base	Ceramic or porcelain tile.
	Ceiling	ACT and/or painted GWB (satin finish).
Plumbing	Provide per Chapter 3. Provide wall-mounted urinals, floor-mounted toilets, and lavatories. Provide a floor drain.	
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment		
Special Requirements	Coordinate with Facility Manager when determining soap and paper product dispensing preferences.	
Adjacencies/Location within Facility	Administrative areas (non-public areas)	
	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-18 Museum – Special Events Area

Description / Usage	Special Events Area. Large open space to accommodate ceremonies, training, and other special events. This space may be a part of the main lobby.	
Ceiling Height	Varies.	
Windows	Provide, if possible, for views and daylighting.	
Doors		
Interior Construction / Built-In Equipment	Benches, Special mission graphics	
Finishes	**Walls**	Upgraded wall finish system such as wood panels, stone, or continuation of exterior finishes.
	Floor	Hard surface (terrazzo, stone/porcelain tile, etc.). Coordinate with Main Entrance finishes.
	Base	Terrazzo, stone (coordinate with floor material).
	Ceiling	ACT, exposed structure, acoustic clouds or other specialized ceiling treatments.
Plumbing		
HVAC	Provide per Chapter 3. If part of the main lobby, this is a critical area which must be designed to 72 deg F (22.2 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the addition of 10 FC (100 lux) ambient, daylighting, and dimmability controls to accommodate specific activities.	
Communication	**Telephone**	Provide per Chapter 3 with the addition of flush floor mounted outlets, coordinated with requirements of special events .
	Data	Provide per Chapter 3 with the addition of flush floor mounted outlets, infrastructure for Non-NMCI service , and additional systems (e.g., sound, wireless) coordinated with requirements of special events.
	CATV	Provide per Chapter 3.
Security	**IDS**	Provide per Chapter 3 & 4
	ACS	Provide per Chapter 3 & 4
	CCTV	Provide per Chapter 3 & 4

Acoustics		
Furnishings and Equipment	Tables, chairs, and podium to provide flexible layout options.	
Special Requirements	May require coordination with NGO.	
Adjacencies/Location within Facility	Lobby, Food Service area	
	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-19 Museum – Special Events Storage

Description / Usage	Special Events Storage. Include room for storage of chairs, flags, tables, podiums, etc.	
Ceiling Height	10 ft. (3.0m) clear minimum.	
Windows		
Doors	Oversize - Pair 3 ft. - 6 inch (1.0m) wide x 8 ft. (2.4m) high.	
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Sealed concrete or continuation of adjacent floor finish.
	Base	Resilient.
	Ceiling	Exposed structure - painted.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Table and chair carts, if required.	
Special Requirements		
Adjacencies/Location within Facility	Special Events Area, Kitchen/Catering space.	
	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-20 Museum – Exhibit Area

Description / Usage	Exhibit Area(s). Includes permanent collection gallery, temporary exhibit gallery and art gallery spaces.	
Ceiling Height	Varies. 12 ft. (3.7m) minimum. Consider mix of high bay and low bay ceiling heights depending upon exhibit requirements.	
Windows	Provide only if exterior views are necessary for exhibit enhancement.	
Doors	Provide oversize doors and openings as required for exhibit installation and maintenance.	
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Painted gypsum wallboard, finish level 4, on 1/2 inch (1.3 cm) FRT plywood. Use 3/4 inch (1.9 cm) FRT plywood on 12 foot (3.7m) high walls.
	Floor	Floor finish materials will vary depending on exhibit layout and design.
	Base	Varies to coordinate with floor finish.
	Ceiling	ACT, exposed structure, acoustic clouds or other specialized ceiling treatments.
Plumbing	Provide per Chapter 3 and 4.	
HVAC	Provide per Chapter 3 and 4. Critical area. Design to 72 deg F (22.2 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4. Provide Very Early Warning Smoke Detection.	
Power	Provide per Chapters 3 and 4 with specialty power connections and grids, as appropriate.	
Lighting	Provide per Chapters 3 and 4. All lighting shall be SL, including 1 fc (10 lux) continuous ambient during occupancy, maintenance lighting system (coordinated to sensitivity of the exhibits), exhibit lighting systems with grids as appropriate, and occupancy sensors.	
Communication	**Telephone**	Provide per Chapters 3 and 4 with specialty communication connections and underfloor grids as appropriate
	Data	Provide per Chapters 3 and 4 with specialty communication connections and underfloor grids as appropriate
	CATV	

Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	Provide per Chapter 3 & 4.
Acoustics		
Furnishings and Equipment	Benches.	
Special Requirements	Art Gallery area - provide flexible art display system for changing exhibits.	
Adjacencies/Location within Facility	Lobby, Special Events Area	
	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-21 Museum – AudioVisual Room

Description / Usage	AudioVisual Room. Serves as the AV and lighting support areas for exhibits.	
Ceiling Height	9 ft. (2.7m) minimum.	
Windows		
Doors		
Interior Construction / Built-In Equipment	Projection systems, AV racks.	
Finishes	**Walls**	Paint - egghell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	ACT or exposed painted structure.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4. Provide very early warning smoke detection.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3. Coordinate with specialty systems needed for the special events.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3. Coordinate with specialty systems needed for the special events, including microphones, sound, and wireless systems.
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment		
Special Requirements		
Adjacencies/Location within Facility	Exhibits.	
	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-22 Museum – Education Space – Classrooms

Description / Usage	Education Space - Classroom(s). Utilized for a variety of activities - lectures, children's education, training.	
Ceiling Height	9 ft. (2.7m) minimum.	
Windows	Provide, if possible, for views and daylighting.	
Doors		
Interior Construction / Built-In Equipment	Consider operable folding partitions if required for flexibility. Recessed projection screen, projector mount. Visual display system - whiteboards, tackboards, etc. Built-in casework and lockable storage, if sink required. Consider use of Smartboards.	
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Resilient.
	Base	Resilient.
	Ceiling	ACT.
Plumbing	Provide per Chapter 3. If required, provide a stainless steel sink with hot and cold water supply and a cleanout.	
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3 and Chapter 4.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3. Consider provision of infrastructure for Video teleconferencing hookup for training purposes.
	CATV	Provide per Chapter 3.
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Tables and chairs, podium, flip chart/easel	
Special Requirements	Refer to STEM Center Spaces for possible related education spaces. Consider room-darkening shades for training presentations.	
Adjacencies/Location within Facility		

	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-23 Museum – Education Space – STEM Center

Description / Usage	Education Space - Science, Technology, Engineering & Mathematics (STEM) Center Spaces. Optional space in larger facilities. Include robotics lab, prep room and storage areas.	
Ceiling Height	9 ft. (2.7m) minimum.	
Windows	Provide, if possible, for views and daylighting.	
Doors		
Interior Construction / Built-In Equipment	Casework, as required, with base/wall cabinets for storage.	
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Resilient.
	Base	Resilient.
	Ceiling	ACT. Will vary depending on location(s).
Plumbing		
HVAC	Provide per Chapter 3. Includes critical areas. For critical areas, design to 72 deg F (22.2 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 and Chapter 4.	
Power	Provide per Chapter 3 and Chapter 4.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	Provide per Chapter 3. Consider provision of infrastructure for Video teleconferencing hookup for training purposes.
Security	**IDS**	
	ACS	
	CCTV	

Acoustics		
Furnishings and Equipment	Lab tables, stools, storage cabinets.	
Special Requirements	STEM space(s) could be scattered throughout the Exhibit areas or centrally located.	
Adjacencies/Location within Facility	Exhibit space, Education Director.	
	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-24 Museum – Education Space – Children's Area

Description / Usage	Education Space - Children's Area. Accommodates children's programs, crafts, etc.	
Ceiling Height	8 ft. (2.4m) minimum. May vary depending on location, if incorporated into Exhibit areas.	
Windows	If separate room, provide, if possible, for views and daylighting.	
Doors		
Interior Construction / Built-In Equipment	Built-in casework to accommodate sink and locked storage. Incorporate child-height casework and sink. Artwork display system.	
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Resilient.
	Base	Resilient.
	Ceiling	ACT. May vary with location.
Plumbing	Provide per Chapter 3. If required, provide a stainless steel sink with hot and cold water supply and a cleanout.	
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3 and Chapter 4.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	Provide per Chapter 3.
Security	**IDS**	
	ACS	
	CCTV	Provide per Chapter 3 & 4.
Acoustics		
Furnishings and Equipment	Tables and chairs (scaled for children). Storage cabinets.	
Special Requirements	Provide artwork posting/display area.	
Adjacencies/Location within Facility	Exhibit area, Education spaces, Education Director.	
	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-25 Museum – Restaurant/Café

Description / Usage	Restaurant/Café. Food service area for museum visitors and staff.	
Ceiling Height	10 ft. (3.0 m) minimum.	
Windows	Provide, if possible, for views and daylighting.	
Doors	Recommend storefront system for visibility.	
Interior Construction / Built-In Equipment	Food service equipment. Casework and storage as required for concessions operations. Sales counter to accommodate Point of Sale (POS) register.	
Finishes	**Walls**	Painted GWB, ceramic tile in wet areas.
	Floor	Porcelain or terrazzo tile.
	Base	Coordinate with floor finish.
	Ceiling	ACT, exposed structure, acoustic clouds or other specialized ceiling treatments.
Plumbing	Provide per Chapter 3. Provide a compartmented stainless steel countertop sink with hot and cold water supply and a cleanout. Provide floor drain. Provide a water connection for icemaker.	
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3 with the addition of power panels.	
Lighting	Provide per Chapter 3 with the addition of 20 fc (200 lux) task, day lighting penetrations, and dimmability w/ photosensors.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3 and with the addition of infrastructure for non-NMCI system and credit card processing.
	CATV	Provide per Chapter 3.
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Equipment as required for concessions operations, tables and chairs for seating, recycling containers, waste receptacles.	
Special Requirements	May require coordination with NGO. Provide recycling and trash collection area. Locate away from exhibit areas to prevent contamination. Requires access to a loading dock for deliveries.	
Adjacencies/Location within Facility	Lobby, Special Events Area, Kitchen/Catering Space.	

	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-26 Museum – Kitchen/Catering Space

Description / Usage	Kitchen, Catering Space. Area to support restaurant and/or catering (smaller museums) for special events food service.	
Ceiling Height	9 ft. (2.7m) minimum.	
Windows		
Doors		
Interior Construction / Built-In Equipment	Food service equipment. Casework, as required, with base/wall cabinets. Paper towel dispenser(s), soap dispenser(s). Dishwasher. Icemaker.	
Finishes	**Walls**	Epoxy paint - eggshell/satin finish.
	Floor	Quarry tile, resilient or epoxy flooring system.
	Base	Coordinate with floor finish.
	Ceiling	Painted GWB - epoxy (eggshell/satin finish).
Plumbing	Provide per Chapter 3. Provide a compartmented stainless steel countertop sink with hot and cold water supply and a cleanout. Provide floor drain. Provide a water connection for icemaker at refrigerator or separate icemaker.	
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3. Coordinate requirements for kitchen and catering equipment.	
Lighting	Provide per Chapter 3 with the addition of 15 fc (150 lux) ambient, 50 fc (500 lux) task, day lighting penetrations, and dimmiability	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	Provide per Chapter 3.
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Refrigerator, microwave, coffee machine, recycling containers, waste receptacles.	
Special Requirements	Critical to isolate this space from Exhibit space and any Collections areas. May require coordination with NGO.	
Adjacencies/Location within Facility	Special Events Area, Restaurant/Cafe.	

	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-27 Museum – Food Service Manager Office

Description / Usage	Food Service Manager Office.	
Ceiling Height	8 ft. (2.4m) minimum	
Windows	Provide, if possible, for views and daylighting.	
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Resilient.
	Base	Resilient.
	Ceiling	ACT.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3 with the addition of infrastructure for possible Non-NMCI data system connection.
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Freestanding desking system, task lighting, ergonomic desk chair, side chairs, filing/storage, safe.	
Special Requirements	May require coordination with NGO.	
Adjacencies/Location within Facility	Food service area(s), Loading dock.	
	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-28 Museum – Exhibit Production/Maintenance

Description / Usage	Exhibit Production/Maintenance. Space used to design, construct and maintain exhibits in-house.	
Ceiling Height	9 ft. (2.7m) clear minimum.	
Windows		
Doors	Oversize - Pair 3 ft. - 6 inch (1.0m) wide x 8 ft. (2.4m) high.	
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Impact resistant wall protection panels to 4 ft. (1.2m) a.f.f. Epoxy paint (eggshell/satin) finish above.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing		
HVAC	Provide per Ch. 3. Critical area. Design to 72 deg F (22.2 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3 with the addition of power panels and cable reels.	
Lighting	Provide per Chapter 3 with the additions of SL, 5-25 fc (50 to 250 lux) ambient, 50 fc (500 lux) task, and bi-level or multi-level switching.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	Provide per Chapter 3 & 4.
Acoustics		
Furnishings and Equip.	Work tables, stools.	
Special Requirements	If exhibits are produced/maintained in-house, this area may include Tool Area, Sign & Framing Area, Lighting Area, Metal Shop, Project Assembly area, Dust Collection area (see individual FDS for these areas).	
Adjacencies/Location within Facility	Loading dock, Exhibit area.	

	For use during project execution by the appropriate Service	
Occupancy	Staff	
	Other	
Min. net ft^2 (m^2)		

Table D-29 Museum – Exhibit Production Manager Office

Description / Usage	Exhibit Production Manager Office. Head of exhibit production shop.	
Ceiling Height	9 ft. (2.4m) minimum	
Windows	Provide, if possible, for views and daylighting.	
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Carpet tile.
	Base	Resilient.
	Ceiling	ACT.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Freestanding desking system, task lighting, ergonomic desk chair, side chairs, filing/storage.	
Special Requirements

	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-30 Museum – Metal Shop

Description / Usage	Metal Shop	
Ceiling Height	9 ft. (2.7m) clear minimum.	
Windows		
Doors	Oversize - Pair 3 ft. - 6 inch (1.0m) wide x 8 ft. (2.4m) high.	
Interior Construction /		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing	Provide per Chapter 3. Provide emergency eyewash station.	
HVAC	Provide per Chapter 3. Verify during design if work such as grinding, sanding, painting and other process operations that generate dust and particulates that can become airborne or accumulate with heavy metals such as lead, hexavalent chromium, cadmium, and other hazardous residue operations is required. If so, metal shop and associated spaces and areas must comply with COMFRC Instruction 7500, and FRC Southeast Instruction 5103.15B. Includes critical areas. For critical areas, design to 72 deg F (22.2 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3 with the addition of power panels and cable reels.	
Lighting	Provide per Chapter 3 with the additions of 50 fc (500 lux) task, day lighting penetrations, and bi-level or multi-level switching.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4
	ACS	Provide per Chapter 3 & 4
	CCTV	Provide per Chapter 3 & 4

Acoustics		
Furnishings and Equipment	Workbenches.

Table D-34 Museum – Sign and Framing Shop

Description / Usage	Sign and Framing Shop. Production of tile panels and framing for exhibits, gallery, etc.	
Ceiling Height	9 ft. (2.7m) clear minimum.	
Windows		
Doors	Oversize - Pair 3 ft. - 6 inch (1.0m) wide x 8 ft. (2.4m) high.	
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing	Provide per Chapter 3. Provide emergency eyewash station.	
HVAC	Provide per Chapter 3. Critical area. Design to 72 deg F (22.2 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions. Provide snorkel type localized exhaust systems with articulating arms that can be adjusted and manually set to desired positions of users where required.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3 with the addition of power panels and cable reels.	
Lighting	Provide per Chapter 3 with the additions of SL, 5-25 fc (50 to 250 lux) ambient, 50 fc (500 lux) task, and bi-level or multi-level switching.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4
	ACS	Provide per Chapter 3 & 4
	CCTV	Provide per Chapter 3 & 4
Acoustics		
Furnishings and Equipment	Work tables, storage cabinets, stools/chairs.	
Special Requirements	This space may be included within Exhibit Production/Maintenance.	
Adjacencies/Location within Facility		

	For use during project execution by the appropriate Service	
Occupancy	Staff	
	Other	
Min. net ft^2 (m^2)		

Table D-35 Museum – Project Assembly Shop

Description / Usage	Project Assembly Shop. Includes space for dust collector.	
Ceiling Height	9 ft. (2.7) clear minimum.	
Windows		
Doors	Oversize - Pair 3 ft. - 6 inch (1.0m) wide x 8 ft. (2.4m) high.	
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. Design to 72 deg F (22.2 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3 with the addition of power panels and cable reels.	
Lighting	Provide per Chapter 3 with the addtion of 50 fc (500 lux) task, day lighting penetrations, and bi-level or multi-level switching.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4
	ACS	Provide per Chapter 3 & 4
	CCTV	Provide per Chapter 3 & 4
Acoustics		
Furnishings and Equipment	Work tables, stools, storage cabinets.	
Special Requirements	This space may be included within Exhibit Production/Maintenance.	
Adjacencies/Location within Facility

Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-36 Museum – Exhibit Production Storage

Description / Usage	Exhibit Production Storage. Storage for equipment and materials used to produce exhibits.	
Ceiling Height	9 ft. (2.7m) clear minimum.	
Windows		
Doors	Oversize - Pair 3 ft. - 6 inch (1.0m) wide x 8 ft. (2.4m) high.	
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. Design to 72 deg F (22.2 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	Provide per Chapter 3 & 4.
Acoustics		
Furnishings and Equipment	Shelving and storage cabinets, as required.	
Special Requirements		
Adjacencies/Location within Facility		

	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-37 Museum – Collections Receiving

Description / Usage	Collections Receiving & Processing. For intake and processing of artifacts submitted to museum.	
Ceiling Height	9 ft. (2.7m) clear minimum.	
Windows		
Doors	Oversize - Pair 3 ft. - 6 inch (1.0m) wide x 8 ft. (2.4m) high.	
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing	Provide per Chapter 3. Provide a stainless steel sink with hot and cold water supply and a cleanout.	
HVAC	Provide per Chapter 3. Critical area. Design to 72 deg F (22.2 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3 with the addition of cable reels	
Lighting	Provide per Chapter 3 with the additions of SL, 5-25 fc (50 - 250 lux) ambient and 75 fc (750 lux) task, dimmability, and occupancy sensors.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4
	ACS	Provide per Chapter 3 & 4
	CCTV	Provide per Chapter 3 & 4
Acoustics		
Furnishings and Equipment	Flat work tables.	
Special Requirements		
Adjacencies/Location within Facility	Loading Dock.	

	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-38 Museum – Archival Collections Processing

Description / Usage	Archival Collections Processing. Optional space. For intake and processing of archives submitted directly to museum.	
Ceiling Height	9 ft. (2.7m) clear minimum.	
Windows		
Doors	Oversize - Pair 3 ft. - 6 inch (1.0m) wide x 8 ft. (2.4m) high.	
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. Design to 72 deg F (22.2 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4. Provide Very Early Warning Smoke Detection.	
Power	Provide per Chapter 3 with the addition of cable reels.	
Lighting	Provide per Chapter 3 with the addition of SL, 5 - 25 fc, (50 to 250 lux) ambient and 75 fc (750 lux) task, dimmability, SL, and occupancy sensors.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3 + SIPRNet. Coordinate with the Certified Tempest Technical Authority (CTTA).
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	No cameras allowed with space.
Acoustics		
Furnishings and Equipment	Flat work tables (standing height).	
Special Requirements	Possibly Top Secret (classified materials). Restricted access. Separate from Collections Processing. Locate for control/isolation.	
Adjacencies/Location within Facility		

	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-39 Museum – Holding and Staging Area

Description / Usage	Holding and Staging Area. Area to allow exhibit climatization.	
Ceiling Height	10 ft. (3.0m) clear minimum.	
Windows		
Doors	Oversize - Pair 3 ft. - 6 inch (1.0m) wide x 8 ft. (2.4m) high.	
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - painted.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. Design to 72 deg F (22.2 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3 with the addition of cable reels.	
Lighting	Provide per Chapter 3 with the additions of SL, 5-25 fc (50 to 250 lux) ambient, 50 fc (500 lux) task, and bi-level or multi-level switching.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	Provide per Chapter 3 & 4.
Acoustics		
Furnishings and Equipment	Work tables, stools.	
Special Requirements		
Adjacencies/Location within Facility	Loading dock, Processing area.	

	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-40 Museum – Curatorial Research Lab

Description / Usage	Curatorial Research Lab. Workspace where incoming objects are examined.	
Ceiling Height	9 ft. (2.7m) minimum	
Windows		
Doors	Oversize - Pair 3 ft. - 6 inch (1.0m) wide x 8 ft. (2.4m) high.	
Interior Construction / Built-In Equipment	Casework (stainless steel countertops) with base/wall cabinets.	
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Resilient or sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing	Provide per Chapter 3. Provide emergency shower/eyewash station. Provide one- or two-compartment stainless steel countertop sinks with hot and cold water supply and cleanouts. Provide emergency eyewash stations adjacent to sinks.	
HVAC	Provide per Chapter 3. Critical area. Design to 72 deg F (22.2 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions. Provide snorkel type localized exhaust systems with articulating arms that can be adjusted and manually set to desired positions of users where required. Verify if fume hoods and ventilated safety cabinets are also required by the end user.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3 with the addition of power panels and cable reels.	
Lighting	Provide per Chapter 3 with the additions of SL, 5-25 fc (50 to 250 lux) ambient and 75 fc (750 lux) task, dimmability, and occupancy sensors.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	Provide per Chapter 3 & 4.

Acoustics		
Furnishings and Equipment	Stainless steel work tables, stools.	
Special Requirements		
Adjacencies/Location within Facility	Archival Collections Processing.	
	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-41 Museum – Artifact Storage (Clean Room)

Description / Usage	Artifact Storage (Clean Room)	
Ceiling Height	9 ft. (2.7m) clear minimum	
Windows		
Doors	Oversize - Pair 3 ft. - 6 inch (1.0m) wide x 8 ft. (2.4m) high.	
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - painted.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. Design to 72 deg F (22.2 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions. Coordinate locations of temperature and humidity data loggers with end user.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4. Provide very early warning smoke detection.	
Power	Provide per Chapter 3 with the addition of cable reels.	
Lighting	Provide per Chapter 3 with addition of SL, 1 fc (10 lux) ambient and 75 fc (750 lux) task, dimmability, and occupancy sensors.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	Provide per Chapter 3 & 4.
Acoustics		
Furnishings and Equipment	Work tables and shelving, as required.	
Special Requirements		
Adjacencies/Location within Facility	Collections Storage.	

	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-42 Museum – Building Manager Office

Description / Usage	Building Manager Office. Facilities management space.	
Ceiling Height	8 ft. (2.4m) minimum.	
Windows	Provide, if possible, for views and daylighting.	
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Resilient.
	Base	Resilient.
	Ceiling	ACT.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Freestanding desking system, task lighting, ergonomic desk chair, side chairs, filing/storage.	
Special Requirements		
Adjacencies/Location within Facility	Loading dock.	
	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-43 Museum – Building Management Storage

Description / Usage	Building Management Storage. Used to store surplus building products/supplies such as light bulbs, cleaning and paper products.	
Ceiling Height	8 ft. (2.4m) clear minimum.	
Windows		
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Storage cabinets and shelving.	
Special Requirements		
Adjacencies/Location within Facility	Building Manager Office, Loading dock.	
	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-44 Museum – Janitorial Space

Description / Usage	Janitorial Space. Space for custodial supplies and equipment.	
Ceiling Height	8 ft. (2.4m) clear mininum.	
Windows		
Doors		
Interior Construction / Built-In Equipment	Include mop/broom rack, utility shelf.	
Finishes	**Walls**	Ceramic tile wainscot (4 ft. (1.2m) high) or fiber-reinforced or rigid vinyl panel wall protection wainscot (4 ft. (1.2m) high). Epoxy paint - semi-gloss finish above.
	Floor	Porcelain tile or sealed concrete.
	Base	Ceramic tile.
	Ceiling	Exposed structure - paint.
Plumbing	Provide per Chapter 3. Provide a mop sink and keyed hose bibb.	
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Storage cabinet (optional).	
Special Requirements		
Adjacencies/Location within Facility	Restrooms, Public areas.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-45 Museum – Break Room - Building Staff

Description / Usage	Break Room - Building Staff. Provide separate break room for each group that must accommodate three-personnel rotations to include: 1) Security/Guard Forces 2) Building Management Group.	
Ceiling Height	8 ft. (2.4m) minimum.	
Windows	Provide, if possible, for views and daylighting.	
Doors		
Interior Construction / Built-In Equipment	Casework with base/wall cabinets, television wall-mount bracket, lockers.	
Finishes	**Walls**	Paint - eggshell/satin finish. Full-height ceramic tile at shower/wet areas. Water resistant GWB at wet areas.
	Floor	Resilient (linoleum, luxury vinyl tile or plank). Porcelain tile at shower floor/base and wet area.
	Base	Resilient. Porcelain tile.
	Ceiling	ACT. Painted GWB.
Plumbing	Provide per Chapter 3. Provide a stainless steel sink with hot and cold water supply and a cleanout. Provide a water connection for icemaker at refrigerator. Provide a floor drain at shower(s).	
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Tables and chairs, countertop microwave, refrigerator, coffee machine, television, recycling containers.	
Special Requirements	Provide separate shower room for shift workers. Provide area for recycling containers and vending machines.	
Adjacencies/Location within Facility	Locate near personnel areas supported.	

	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-46 Museum – Elevators

Description / Usage	Elevators. Elevator meeting all IBC requirements at each floor.	
Ceiling Height	8 ft. (2.4m) minimum.	
Windows		
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Stainless steel or plastic laminate panels.
	Floor	Hard surface (stone/porcelain tile, etc.) or resilient. Continue adjacent space floor finish.
	Base	Stainless steel.
	Ceiling	Panels as offered by elevator manufacturer.
Plumbing	Provide per Chapter 3.	
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the addition of 5 fc (50 lux) ambient.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment

Acoustics		
Furnishings and Equipment		
Special Requirements	Locate per Life Safety requirements. Consider use of monumental stair in lobby or public gathering space - finishes to continue or complement lobby finishes.	
Adjacencies/Location within Facility	Lobby, Public Gathering.	
	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-53 Museum – Loading Dock(s)

Description / Usage	Loading Dock(s). Area for shipping/receiving as well as building waste removal.	
Ceiling Height	Varies.	
Windows		
Doors	Minimum 8 ft. (2.4m) wide x 8 ft. (2.4m) high coiling overhead door. Size may vary depending on objects entering the facility. Provide personnel door.	
Interior Construction / Built-In Equipment		
Finishes	**Walls**	High Performance Architectural Coating (HIPAC). Service corridors leading to loading dock to receive impact resistant wallcovering wainscot (4 ft. (1.2m) high) with HIPAC above wainscot.
	Floor	Sealed concrete.
	Base	None. Service corridors to receive resilient base.
	Ceiling	Exposed structure - paint.
Plumbing	Provide per Chapter 3. If restroom is required in this area by end user, verify if shower is also required.	
HVAC	Provide per Chapter 3. If loading dock is enclosed, provide a unit heater or infrared heater at the entrance of the loading dock, and a vehicle exhaust removal system for trucks.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the additions of 10 fc (100 lux) and photocell controlled exterior lights.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	Provide per Chapter 3 & 4.
Acoustics		
Furnishings and Equipment		
Special Requirements	Lifts may be stored in this space. Optional: flash freezer for decontamination.	
Adjacencies/Location within Facility	Service entry, Exhibit maintenance and collection storage/holding.	

	For use during project execution by the appropriate Service	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table D-54 Museum – Shipping and Receiving

Description / Usage	Shipping & Receiving. Secure staging area for crating and uncrating of exhibits and objects.	
Ceiling Height	10 ft. (3.0m) clear minimum.	
Windows		
Doors	8 ft. (2.4m) wide x 8 ft. (2.4m) high rolling coil door. Size may vary depending on objects entering the facility.	
Interior Construction / Built-In Equipment	Staff mailboxes.	
Finishes	**Walls**	Impact resistant wallcovering wainscot (4 ft. (1.2m) high), epoxy paint (eggshell/satin finish) above.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - painted.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. Design to 72 deg F (22.2 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3 with the addition of cable reels.	
Lighting	Provide per Chapter 3 with the additions of SL, 5-25 fc (50 to 250 lux) ambient, 50 fc (500 lux) task, and bi-level or multi-level switching.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	Provide per Chapter 3 & 4.
Acoustics		
Furnishings and Equipment	Packing tables, stools, storage cabinets.

APPENDIX E HRF FUNCTIONAL DATA SHEETS

This appendix further identifies specific design needs for individual spaces within Historic Resource Facilities. Building design criteria are provided in a standard Functional Data Sheet (FDS) table format that generally follows the Uniformat II/Work Breakdown Structure (WBS). The Interior Construction/Built-In Equipment category includes anything physically attached or plumbed to the building such as counters, cabinets, casework, toilet accessories, window shades or blinds, and recessed projection screens. The Furnishings and Equipment category includes loose or moveable items such as desks, chairs, and shelving.

The Functional Data Sheets are presented as a guide for the designer, planner, or RFP preparer. It is intended that the information in them are the minimum requirements for the respective rooms and spaces. These minimum requirements apply in addition to all other requirements of this FC and other referenced documents. In the event of a mutually exclusive conflict or where both requirements cannot be satisfied, the Functional Data Sheets take precedence. However, if in the best judgment of the designer, a more restrictive requirement is appropriate, the more restrictive requirement may be applied after consulting with the user. Note that blank spaces found in the Functional Data Sheets indicate building components or systems should follow standard guidance per UFC 1-200-01, *General Building Requirements*.

Table E-1 HRF – Archives and Library – Unclassified Research Room

Description / Usage	Archives & Library - Unclassified Research Room. General research space where the public can review unclassified archive and library collections.	
Ceiling Height	9 ft. (2.7m) minimum.	
Windows		
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint- eggshell/satin finish.
	Floor	Resilient.
	Base	Resilient.
	Ceiling	ACT.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. Design to 70 deg F (21.1 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 68 deg F (20 deg C) to 72 deg F (22.2 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the addition of SL, 5 fc (50 lux) ambient and 50 fc (500 lux) task, multi-level switching, and occupancy sensors.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	Provide per Chapter 3 & 4.
Acoustics		
Furnishings and Equipment	Work tables, chairs, task lighting, microform readers, shelving as required.	
Special Requirements	This space can be shared by Archives & Library. Note that some microform readers are floor mounted and require a significant footprint.	
Adjacencies/Location within Facility	Library - Restricted Research; Archives - Administrative Spaces.	

	For use during project execution by the appropriate Service agency	
Occupancy	Staff	
	Other	
Min. net ft^2 (m^2)		

Table E-2 HRF – Archives – Reception Area

Description / Usage	Archives - Reception Area	
Ceiling Height	8 ft. (2.4m) minimum.	
Windows	Provide, if possible, for views and daylighting.	
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Carpet tile.
	Base	Resilient.
	Ceiling	ACT.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the addition of an avg. of 50 fc (500 lux) ambient and daylighting with dimmable controls.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	Provide per Chapter 3.
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	Provide per Chapter 3 & 4.
Acoustics		
Furnishings and Equipment	Reception workstation, side chairs for waiting, file cabinets and storage as required. May include personal lockers for storage of visitor items.	
Special Requirements	Visitor personal effects must be collected/stored. Provide area for printers, as required. Provide window between Reception and Archives and Library - Unclassified Research Room.	
Adjacencies/Location within Facility	Archives - Offices, Archives - Research areas.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-3 HRF – Archives – Office Space

Description / Usage	Archives - Office Space. To include conference space, if required.	
Ceiling Height	8 ft. (2.4m) minimum.	
Windows	Provide, if possible, for views and daylighting.	
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Carpet tile.
	Base	Resilient.
	Ceiling	ACT.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Workstations, ergonomic task chairs, task lighting, side chairs, filing and storage.	
Special Requirements	Centrally locate within Archives area. Include space for required copier, printers, scanners and any common storage requirements. Provide private office space for supervisors to meet FOIA requirements.	
Adjacencies/Location within Facility	Archives - Storage areas, Archives - Reception Area, Archives - Research areas.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-4 HRF – Archives – Break Room

Description / Usage	Archives - Break Room	
Ceiling Height	8 ft. (2.4m) minimum.	
Windows	Provide, if possible, for views and daylighting.	
Doors		
Interior Construction / Built-In Equipment	Casework with base/wall cabinets.	
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Resilient.
	Base	Resilient.
	Ceiling	ACT.
Plumbing	Provide per Chapter 3. Provide a stainless steel sink with hot and cold water supply and a cleanout. Provide a water connection for icemaker at refrigerator.	
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with addition of daylighting and dimming controls.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Tables and chairs, countertop microwave, refrigerator, coffee machine, recycling containers.	
Special Requirements	Provide area for recycling containers.	
Adjacencies/Location within Facility	Archives Office spaces.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-5 HRF – Archives – Classified Research

Description / Usage	Archives - Classified Research. Top Secret research space where the classified documents can be viewed.	
Ceiling Height	9 ft. (2.7m) minimum.	
Windows		
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Resilient.
	Base	Resilient.
	Ceiling	ACT.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. Design to 72 deg F (22.2 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the additions of SL, 15 fc (150 lux) ambient, 30 fc (300 lux) task, and bi-level or multi-level switching.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3 with the addition of SIPRNET. Coordinate with the Certified Tempest Technical Authority (CTTA).
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	No cameras allowed within space.
Acoustics		
Furnishings and Equipment	Storage cabinets and shelving, as required. Work tables, chairs. Microform readers.	
Special Requirements	Top Secret space - locate within boundaries of Top Secret/Open Storage area. Provide SIPRnet. Provide in accordance with SECNAV M-5510.36, Department of the Navy Information Security Program.	
Adjacencies/Location within Facility	Near Archives - Admin. Space.	

	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-6 HRF – Archives – Declassification

Description / Usage	Archives - Declassification Room. Classified workspace for team review of documents to determine classification status.	
Ceiling Height	8 ft. (2.4m) minimum.	
Windows	Provide, if possible, for views and daylighting.	
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Resilient.
	Base	Resilient.
	Ceiling	ACT.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. Design to 72 deg F (22.2 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the additions of SL, 15 fc (150 lux) ambient, 50 fc (500 lux) task, and bi-level or multi-level switching.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	No cameras allowed within space.
Acoustics		
Furnishings and Equipment	Workstations, ergonomic task chairs, task lighting, microform readers.	
Special Requirements	Locate within boundaries of Top Secret/Open Storage area.	
Adjacencies/Location within Facility	Near Archives - Storage Areas.	

	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-7 HRF - Archives - Classified Cold Storage

Description / Usage	Archives - Classified Cold Storage. Space for storage of classified archives to include negatives, photos, motion picture, micorforms and audio recording items.	
Ceiling Height	9 ft. (2.7m) minimum.	
Windows		
Doors		
Interior Construction / Built-In Equipment	High density mobile storage, as required.	
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Concrete with epoxy coating. Provide per Chapter 4.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. For storage of color photos, design to 34 deg F (1.1 deg C) dry bulb and 35% RH for indoor design cooling and indoor design heating conditions. Temperature and relative humidity operating ranges must be 32 deg F (0 deg C) to 36 deg F (2.2 deg C) and 32% RH to 38% RH for indoor cooling and heating conditions. For storage of color motion picture film, design to 38 deg F (3.3 deg C) and 30% RH for indoor design cooling and indoor design heating conditions. Temperature and relative humidity operating ranges must be 36 deg F (2.2 deg C) to 40 deg F (4.4 deg C) and 27% RH to 33% RH for indoor cooling and heating conditions. For storage of black and white motion picture film and audio recording items, design to 52 deg F (11.1 deg C) and 30% RH for indoor design cooling and indoor design heating conditions. Temperature and relative humidity operating ranges must be 50 deg F (10 deg C) to 54 deg F (12.2 deg C) and 27% RH to 33% RH for indoor cooling and heating conditions. If personnel will be working on color photos and color motion picture film, provide a holding area for these items to acclimate prior to personnel handling them. Design holding area for color photos to 55 deg F (12.8 deg C) and 35% RH for indoor design cooling and indoor design heating conditions. Temperature and relative humidity operating ranges must be 53 deg F (11.7 deg C) to 57 deg F (13.9 deg C) and 32% RH to 38% RH for indoor cooling and heating conditions. Design holding area for color motion picture film to 50 deg F (10 deg C) and 30% RH for indoor design cooling and indoor design heating conditions. Temperature and relative humidity operating ranges must be 48 deg F (8.9 deg C) to 52 deg F (11.1 deg C) and 27% RH to 33% RH for indoor cooling and heating conditions. For storage of black and white photos, negatives, and slides, design to 62 deg F (16.7 deg C) dry bulb and 35% RH for indoor design cooling and indoor design heating conditions. Temperature and relative humidity operating ranges must be 60 deg F (15.6 deg C) to 64 deg F (17.8 deg C) and 32% RH to 38% RH for indoor cooling and heating conditions. Verify and coordinate with user if microclimate/microenvironment is desired and/or recommended to satisfy these conditions.	

Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3. Coordinate requirements for Emergency Power.	
Lighting	Provide per Chapter 3 with the addition of SL, 5 fc (50 lux) ambient and 30 fc (300 lux) task, multi-level switching, and occupancy sensors.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	Provide per Chapter 3 & 4.
Acoustics		
Furnishings and Equipment	Storage cabinets/shelves - consider use of wire shelving to promote air circulation and inhibit condensation. Microform storage cabinets with 6 inch (152mm) drawers.	
Special Requirements	Restricted access.	
Adjacencies/Location within Facility	Archives - Classified Storage, Archives - Unclassified Cold Storage.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-8 HRF – Archives - Unclassified Cold Storage

Description / Usage	Archives - Unclassified Cold Storage. Space for storage of unclassified archives to include negatives, photos, motion picture, microforms and audio recording items.	
Ceiling Height	9 ft. (2.7m) clear minimum.	
Windows		
Doors		
Interior Construction / Built-In Equipment	High density mobile shelving, as required.	
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Concrete with epoxy coating. Provide per Chapter 4.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. For storage of color photos, design to 34 deg F (1.1 deg C) dry bulb and 35% RH for indoor design cooling and indoor design heating conditions. Temperature and relative humidity operating ranges must be 32 deg F (0 deg C) to 36 deg F (2.2 deg C) and 32% RH to 38% RH for indoor cooling and heating conditions. For storage of color motion picture film, design to 38 deg F (3.3 deg C) and 30% RH for indoor design cooling and indoor design heating conditions. Temperature and relative humidity operating ranges must be 36 deg F (2.2 deg C) to 40 deg F (4.4 deg C) and 27% RH to 33% RH for indoor cooling and heating conditions. For storage of black and white motion picture film and audio recording items, design to 52 deg F (11.1 deg C) and 30% RH for indoor design cooling and indoor design heating conditions. Temperature and relative humidity operating ranges must be 50 deg F (10 deg C) to 54 deg F (12.2 deg C) and 27% RH to 33% RH for indoor cooling and heating conditions. 	Floor	Concrete with epoxy coating. Provide per Chapter 4.
	Base	Resilient.
	Ceiling	Painted GWB - eggshell/satin finish.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. Design to 70 deg F (21.1 deg C) dry bulb and 45% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 68 deg F (20 deg C) to 72 deg F (22.2 deg C) and 40% RH to 50% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the additions of SL, 15 fc (150 lux) ambient, 50 fc (500 lux) task, and bi-level or multi-level switching.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapters 3 and 4 with the addition of SIPRNET and JWICS. Coordinate with the Certified Tempest Technical Authority (CTTA).
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	No cameras allowed within space.
Acoustics		
Furnishings and Equipment	Work tables, chairs, storage cabinets and shelving as required.	
Special Requirements	Refer to UFC 4-010-05, Sensitive Compartmented Information Facilities Planning, Design, and Construction, JWICS	
Adjacencies/Location within Facility	Locate within Top Secret/Open Storage area, Locate within Archives - Classified Storage.	

	For use during project execution by the appropriate Service agency	
Occupancy	Staff	
	Other	
Min. net ft^2 (m^2)		

Table E-12 HRF – Archives – Classified Processing

Description / Usage	Archives - Classified Processing. Space where archives are reviewed and classification status is determined for storage.	
Ceiling Height	10 ft. (3.0m) minimum.	
Windows		
Doors	Oversize - Pair 3 ft. - 6 inch (1.0m) wide x 8 ft. (2.4m) high.	
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Concrete with epoxy coating. Provide per Chapter 4.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. Design to 68 deg F (20 deg C) dry bulb and 45% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 40% RH to 50% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the additions of SL, 5 fc (50 lux) ambient, 50 fc (500 lux) task, and bi-level or multi-level switching.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	No cameras allowed within space.
Acoustics		
Furnishings and Equipment	Work tables, stools, shelving as required.	
Special Requirements	Locate within boundaries of Top Secret/Open Storage area. Strict supervision and restricted access.	
Adjacencies/Location within Facility	Archives - Classified Receiving; Archives - Decontamination; Archives - Storage Areas.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-13 HRF – Archives - Decontamination Room

Description / Usage	Archives - Decontamination Room. Classified space for isolation of incoming archival materials which may contain mold and/or pest infestation.	
Ceiling Height	10 ft. (3.0m) minimum.	
Windows		
Doors	Oversize - Pair 3 ft.- 6 inch (1.0m) wide x 8 ft. (2.4m) high.	
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Concrete with epoxy coating. Provide per Chapter 4.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3 with the addition of cable reels.	
Lighting	Provide per Chapter 3 with the additions of SL, 5 - 25 fc (50 to 250 lux) ambient, 50 fc (500 lux) task, bi-level or multi-level switching. and occupancy sensors.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	No cameras allowed within space.
Acoustics		
Furnishings and Equipment	Large work tables, stools, hazardous material containers, as required.	
Special Requirements	Locate within boundaries of Top Secret/Open Storage area. Strict supervision and restricted access.	
Adjacencies/Location within Facility	Archives - Classified Receiving; Archives - Classified Processing.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-14 HRF – Archives - Classified Receiving

Description / Usage	Archives - Classified Receiving. Top Secret/Open Storage. Receiving and processing area for classified materials.	
Ceiling Height	10 ft. (3.0m) minimum.	
Windows		
Doors	Oversize - Pair 3 ft.- 6 inch (1.0m) wide x 8 ft. (2.4m) high.	
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.

Table E-15 HRF – Library – Office Space

Description / Usage	Library - Office Space	
Ceiling Height	8 ft. (2.4m) minimum.	
Windows	Provide, if possible, for views and daylighting.	
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Carpet tile.
	Base	Resilient.
	Ceiling	ACT.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Desks/workstations, ergonomic task chairs, task lighting, file and storage cabinets, shelving.	
Special Requirements	Provide area for copier and printers. Cataloging offices require larger space to accommodate equipment (carts, tables).	
Adjacencies/Location within Facility	Library - Book Stacks, Library - Reference/Circulation, Library - Reading Rooms for supervision.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-16 HRF – Library – Reference/Circulation Desk

Description / Usage	Library - Reference/Circulation Desk. Main point of customer service interaction. Includes check-out area.	
Ceiling Height	10 ft. (3.0m) minimum.	
Windows	Provide, if possible, for views and daylighting.	
Doors		
Interior Construction / Built-In Equipment	Tackboards.	
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Carpet tile.
	Base	Resilient.
	Ceiling	ACT.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. Design to 68 deg F (20 deg C) dry bulb and 42% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 40% RH to 45% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the addition of 5 fc (50 lux) ambient, 50 fc (500 lux) task, daylighting with dimmability, and occupancy sensors.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	Provide per Chapter 3 & 4.
Acoustics		
Furnishings and Equipment	Circulation desk components, book carts/trucks, work tables, chairs, carrels, task lighting, dictionary stand, mobile storage system (as required). Provide lockers for researchers' personal items.	
Special Requirements	Reference UFC 4-740-20, Libraries, during space design. Circulation desk should have visual access into entire library space.	
Adjacencies/Location within Facility	Main Entry, Library - Book Stacks, Archives & Library - Unclassified Research Room.	

	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-17 HRF – Library – Catalog Area

Description / Usage	Library - Catalog Area. Accessible computer terminal areas with library material database processing and entry. Area can be located within Library office space.	
Ceiling Height	10 ft. (3.0m) minimum.	
Windows	Provide, if possible, for views and daylighting.	
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Carpet tile.
	Base	Resilient.
	Ceiling	ACT.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. Design to 68 deg F (20 deg C) dry bulb and 42% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 40% RH to 45% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the addition of 30 fc (300 lux) ambient, 50 fc (500 lux) task, daylighting with dimmability, and occupancy sensors.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	Provide per Chapter 3 & 4.
Acoustics		
Furnishings and Equipment	Carrels for computer terminals, work tables, seating, task lighting.	
Special Requirements	Refer to UFC 4-740-20, Libraries.	
Adjacencies/Location within Facility	Library - Reference/Circulation desk, Library - Book Stack Area.	

	For use during project execution by the appropriate Service agency	
Occupancy	Staff	
	Other	
Min. net ft^2 (m^2)		

Table E-18 HRF – Library – Book Stack Area

Description / Usage	Library - Book Stack Area.	
Ceiling Height	10 ft. (3.0m) clear minimum.	
Windows	No windows.	
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Carpet tile.
	Base	Resilient.
	Ceiling	ACT.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. Design to 70 deg F (21.1 deg C) dry bulb and 42% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 68 deg F (20 deg C) to 72 deg F (22.2 deg C) and 40% RH to 45% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3 with the addtion of mobile stacks AFCI protected.	
Lighting	Provide per Chapter 3 with the addition of 30 fc (300 lux) ambient and occupancy sensors. Coordinate lighting layout (perpendicular) with stacks.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Book stacks, reference tables, carrels.	
Special Requirements	Reference UFC 4-740-20, Libraries, during space design.	
Adjacencies/Location within Facility	Library - Reference/Circulation Desk, Library - Catalog Area.	

	For use during project execution by the appropriate Service agency	
Occupancy	Staff	
	Other	
Min. net ft^2 (m^2)		

Table E-19 HRF – Library – Special and Rare Collection

Description / Usage	Library - Special & Rare Collection. Storage of special collection books and manuscripts.	
Ceiling Height	10 ft. (3.0m) minimum.	
Windows	No windows.	
Doors		
Interior Construction / Built-In Equipment	High-density mobile shelving.	
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Carpet tile.
	Base	Resilient.
	Ceiling	ACT.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. Design to 62 deg F (16.7 deg C) dry bulb and 42% RH for indoor design cooling conditions, and 60 deg F (15.6 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 60 deg F (15.6 deg C) to 64 deg F (17.8 deg C) and 40% RH to 45% RH for indoor cooling conditions, and 58 deg F (14.4 deg C) to 62 deg F (16.7 deg C) and 37% RH to 45% RH for indoor heating conditions. Coordinate locations of temperature and humidity data loggers with end user.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the addition of SL, 5 fc (50 lux) ambient and 30 fc (300 lux) task, multi-level switching, and occupancy sensors.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	Provide per Chapter 3 & 4.
Acoustics		
Furnishings and Equipment	Reference work tables for processing, chairs, flat files, compact storage shelving (as required).	
Special Requirements	Restricted access. Provide storage for oversize book collection. Vault construction.	
Adjacencies/Location within Facility	Library - Restricted Research Room; Library - Reference/Circulation Desk.	

	For use during project execution by the appropriate Service agency	
Occupancy	Staff	
	Other	
Min. net ft^2 (m^2)		

Table E-20 HRF – Library – Restricted Research Room

Description / Usage	Library - Restricted Research Room. Space for visitors to reference special and rare collection materials.	
Ceiling Height	10 ft. (3.0m) minimum.	
Windows	No windows.	
Doors		
Interior Construction / Built-In Equipment	Provide interior windows for viewing/supervision of space from Reference/Circulation.	
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Carpet tile.
	Base	Resilient.
	Ceiling	ACT.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. Design to 70 deg F (21.1 deg C) dry bulb and 42% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 68 deg F (20 deg C) to 72 deg F (22.2 deg C) and 40% RH to 45% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the additions of SL, 5 - 25 fc (50 to 250 lux) ambient, 50 fc (500 lux) task, bi-level or multi-level switching. and occupancy sensors.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Display case, work tables, chairs, storage shelving.	
Special Requirements	Refer to UFC 4-740-20, Libraries. Restricted access with controlled entry/locks.	
Adjacencies/Location within Facility	Library - Reference/Circulation, Library - Special and Rare Collection.	

	For use during project execution by the appropriate Service agency

Min. net ft^2 (m^2)		

Table E-22 HRF – Histories – Conference Room

Description / Usage	Histories & Archives - Conference Room. This room may be shared by Histories and Archives groupings.	
Ceiling Height	9 ft. (2.7m) minimum.	
Windows	Provide, if possible, for views and daylighting.	
Doors		
Interior Construction / Built-In Equipment	Recessed projection screen, projector mount. Visual display system - whiteboards, tackboards.	
Finishes	**Walls**	Paint - eggshell/satin finish. Optional finish treatments (wood wainscott, acoustical wall panels, etc.).
	Floor	Carpet tile.
	Base	Resilient or wood.
	Ceiling	ACT. Could introduce GWB soffits for interest.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with addition of daylighting and dimming controls.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	Provide per Chapter 3.
Security	**IDS**	
	ACS	
	CCTV	
Acoustics	NIC 50	
Furnishings and Equipment	Conference table, chairs (around table and stacking for additional capacity), lecturn, storage credenza, mobile flipchart easel.	
Special Requirements		
Adjacencies/Location within Facility	Histories and Archives office areas.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-23 HRF – Histories – Microform Area

Description / Usage	Histories - Microform Area. Darkened space for storing and viewing microforms..	
Ceiling Height	8 ft. (2.4m) minimum.	
Windows		
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Carpet tile.
	Base	Resilient.
	Ceiling	ACT
Plumbing		
HVAC	Provide per Chapter 3. Critical area. Design to 72 deg F (22.2 deg C) dry bulb and 40% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) and 37% RH to 45% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the addition of SL, 7.5 fc (75 lux) ambient, 30 fc (300 lux) task, occupancy sensors and bi-level or multi-level switching or dimmable controls.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Worktables, chairs, microform storage cabinets, task lighting, microform readers.	
Special Requirements	Note that some microform readers are floor mounted and require a significant footprint.	
Adjacencies/Location within Facility	Histories- Office Space.	

	For use during project execution by the appropriate Service agency	
Occupancy	Staff	
	Other	
Min. net ft^2 (m^2)

Min. net ft^2 (m^2)		

Table E-27 HRF – Histories – Classified Office Space

Description / Usage	Histories - Classified Office Space. Classified space.	
Ceiling Height	8 ft. (2.4m) minimum.	
Windows	No windows due to security requirements.	
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Carpet tile.
	Base	Resilient.
	Ceiling	ACT.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the addition of SL, 5 - 25 fc, (50 to 250 lux) ambient and 75 fc (750 lux) task, dimmability, and occupancy sensors.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3 with the addition of SIPRNET. Coordinate with the Certified Tempest Technical Authority (CTTA).
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	No cameras allowed within space.
Acoustics		
Furnishings and Equipment	Desks/workstations, ergonomic task chairs, task lighting, file cabinets/shelving, bookshelves.	
Special Requirements	Restricted access - locate within boundaries of Top Secret/Open Storage area. Provide area for copier and printers.	
Adjacencies/Location within Facility	Histories - Office Space.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-28 HRF – Artifact – Office Space

Description / Usage	Artifact - Office Space. Include Curators, Materials Handlers, Materials Techs, Supervisory Curator. Can be combined with Artifact - Processing.	
Ceiling Height	8 ft. (2.4m) minimum.	
Windows	Provide, if possible, for views and daylighting.	
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Carpet tile, if not located within another space.
	Base	Resilient.
	Ceiling	ACT.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Workstations, ergonomic task chairs, task lighting, side chairs, filing and storage.	
Special Requirements	Provide area for associated printers and copier.	
Adjacencies/Location within Facility	Shipping/Receiving, Loading Dock, Artifact - Processing, Artifact - Storage.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-29 HRF – Artifact – Conference Room

Description / Usage	Artifact - Conference Room. Staff meetings, presentations, and training.	
Ceiling Height	9 ft. (2.7m) minimum.	
Windows	Provide, if possible, for exterior views and daylighting.	
Doors		
Interior Construction / Built-In Equipment	Recessed projection screen; projector mount. Visual display system - whiteboards, tackboards, etc.	
Finishes	**Walls**	Paint (eggshell or satin finish). Optional finish treatments (wood wainscott, acoustical wall panels, etc.) could be introduced.
	Floor	Carpet tile.
	Base	Resilient.
	Ceiling	ACT. Could introduce GWB soffits for interest.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3 with addition of infrastructure for Video teleconferencing hookup for training purposes.
	CATV	Provide per Chapter 3.
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Conference table, chairs (around table and stacking for additonal capacity), lecturn, storage credenza, mobile flipchart easel.	
Special Requirements	Consider VideoTeleconferencing (VTC)	
Adjacencies/Location within Facility	Artifact - Office Space.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-30 HRF – Artifact – Record Storage

Description / Usage	Artifact - Record Storage	
Ceiling Height	9 ft. (2.7m) clear minimum.	
Windows		
Doors	Pair - standard doors.	
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. Design to 72 deg F (22.2 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4
	ACS	Provide per Chapter 3 & 4
	CCTV	Provide per Chapter 3 & 4
Acoustics		
Furnishings and Equipment	File cabinets and storage cabinets, as required.	
Special Requirements		
Adjacencies/Location within Facility	Artifact - Processing, Artifact - Office Space, Artifact - Loan Artifact Processing.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-31 HRF – Artifact – Technical Library

Description / Usage	Artifact - Technical Library. Internal research area.	
Ceiling Height	9 ft. (2.7m) clear minimum.	
Windows		
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the addition of SL, 15 fc (150 lux) ambient and 50 fc (500 lux) task, multi-level switching. Coordinate lighting layout (perpendicular) with stacks.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4
	ACS	Provide per Chapter 3 & 4
	CCTV	No cameras allowed in space.
Acoustics		
Furnishings and Equipment	Shelving, work tables, chairs.	
Special Requirements	Scanner.	
Adjacencies/Location within Facility	Artifact - Office Space.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-32 HRF – Artifact – Conservation Area

Description / Usage	Artifact - Conservation Area. Include lab and storage space.	
Ceiling Height	12 ft. (3.7m) clear minimum.	
Windows		
Doors	Oversize - Pair 3 ft. - 6 inch (1.0m) wide x 10 ft. (3.0m) high.	
Interior Construction / Built-In Equipment	Casework (as required), stainless steel tops with base/wall cabinets.	
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing	Provide per Chapter 3. Provide emergency shower/eyewash station. Provide stainless steel industrial trough sink with hot and cold water supply and cleanouts. Provide washing machine hook-up.	
HVAC	Provide per Chapter 3. Critical area. Design to 72 deg F (22.2 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions. Provide snorkel type localized exhaust systems with articulating arms that can be adjusted and manually set to desired positions of users where required. Verify if fume hoods and ventilated safety cabinets are also required by the end user. Provide clothes dryer exhaust.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3 with the addition of cable reels, washer and dryer connections, and local power panels.	
Lighting	Provide per Chapter 3 with the addition of SL, 15 fc (150 lux) ambient and 75 fc (750 lux) task, dimmable controls, and occupancy sensors.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4
	ACS	Provide per Chapter 3 & 4
	CCTV	Provide per Chapter 3 & 4

Acoustics		
Furnishings and Equipment	Work tables (stainless steel), storage cabinets and shelving, as required. Washer and dryer.	
Special Requirements	Locate away from archive storage areas.	
Adjacencies/Location within Facility	Artifact - Storage Areas.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-33 HRF - Artifact – Uniform and Textile Storage

Description / Usage	Artifact - Uniform and Textile Storage.	
Ceiling Height	12 ft. (3.7m) clear minimum.	
Windows		
Doors	Oversize - Pair 3 ft. - 6 inch (1.0m) wide x 10 ft. (3.0m) high.	
Interior Construction / Built-In Equipment	High-density mobile shelving.	
Finishes	**Objects -**	Paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. Design to 72 deg F (22.2 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions. Coordinate locations of temperature and humidity data loggers with end user.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the addition of SL, 5 fc (50 lux) ambient and 30 fc (300 lux) task, multi-level switching, and occupancy sensors.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4
	ACS	Provide per Chapter 3 & 4
	CCTV	Provide per Chapter 3 & 4

Acoustics		
Furnishings and Equipment	Storage cabinets (with filter vents), flat files (flags), shelving as required.	
Special Requirements		
Adjacencies/Location within Facility	Artifact - Storage Areas; Artifact - Accessioning, Artifact - Decontamination.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-34 HRF – Artifact – Micro Artifact Storage

Description / Usage	Artifact - Micro Artifact Storage. Includes artifact processing area.	
Ceiling Height	12 ft. (3.7m) clear minimum.	
Windows		
Doors	Oversize - Pair 3 ft.- 6 inch (1.0m) wide x 10 ft. (3.0m) high.	
Interior Construction / Built-In Equipment	High-density mobile shelving, pallet racks.	
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. Design to 72 deg F (22.2 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the addition of SL, 15 fc (150 lux) ambient and 30 fc (300 lux) task, multi-level switching, and occupancy sensors.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	Provide per Chapter 3 & 4.
Acoustics		
Furnishings and Equipment	Storage cabinets and shelving, as required.	
Special Requirements		
Adjacencies/Location within Facility	Shipping/Receiving, Artifact - Accessioning, Artifact - Decontamination.	

	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-35 HRF – Artifact – Processing Area

Description / Usage	Artifact - Processing Area. Space for processing artifacts that can be located with Artifact storage areas.	
Ceiling Height	12 ft. (3.7m) clear minimum.	
Windows		
Doors	Oversize - Pair 3 ft. - 6 inch (1.0m) wide x 10 ft. (3.0m) high.	
Interior Construction / Built-In Equipment	Casework with base/wall cabinets.	
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - painted.
Plumbing	Provide per Chapter 3. Provide a stainless steel sink with hot and cold water supply and a cleanout.	
HVAC	Provide per Chapter 3. Critical area. Design to 70 deg F (21.1 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 68 deg F (20 deg C) to 72 deg F (22.2 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions. Provide fume hood.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3 with the addition of cable reels.	
Lighting	Provide per Chapter 3 with the addition of SL, 15 fc (150 lux) ambient, 75 fc (750 lux) task, dimmable controls, and occupancy sensors.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	Yes.
	ACS	Yes.
	CCTV	
Acoustics		
Furnishings and Equipment	Work tables (stainless steel), shelving and storage cabinets, as required.	
Special Requirements	Scanner, Provide flammable storage cabinets as required.	
Adjacencies/Location within Facility	Located within larger Artifact storage spaces (both Micro and Macro).	

	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-36 HRF – Artifact – Macro Artifact Storage

Description / Usage	Artifact - Macro Artifact Storage. Includes macro artifact processing area.	
Ceiling Height	20 ft. (6.1m) clear minimum.	
Windows		
Doors	Overhead coiling door - 12 ft (3.7m) x 12 ft. (3.7m).	
Interior Construction / Built-In Equipment	Pallet racks for large artifact storage.	
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing	Provide per Chapter 3. Provide stainless steel industrial trough sink with hot and cold water supply and cleanouts.	
HVAC	Provide per Chapter 3. Critical area. Design to 72 deg F (22.2 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions. Coordinate with user on location of exhaust system for hazardous materials (i.e.; radium).	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3 with the addition of cable reels.	
Lighting	Provide per Chapter 3 with the addition of SL, 15 fc (150 lux) ambient and 30 fc (300 lux) task, multi-level switching, and occupancy sensors.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	Provide per Chapter 3 & 4.
Acoustics		
Furnishings and Equipment	Storage cabinets and shelving, as required. Work tables, stools at Processing Area.	
Special Requirements		
Adjacencies/Location within Facility	Shipping/Receiving, Artifact - Accessioning, Artifact - Decontamination.	

	For use during project execution by the appropriate Service agency	
Occupancy	Staff	
	Other	
Min. net ft^2 (m^2)		

Table E-37 HRF – Artifact – Cold Storage

Description / Usage	Artifact - Cold Storage	
Ceiling Height	12 ft. (3.7m) clear minimum.	
Windows		
Doors	Oversize - Pair 3 ft. - 6 inch (1.0m) wide x 10 ft. (3.0m) high.	
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. Design to -25 deg F (-31.7 deg C) dry bulb for indoor design cooling and indoor design heating conditions. Temperature operating range must be -30 deg F (-34.4 deg C) to -20 deg F (-28.9 deg C) for indoor cooling and heating conditions. Verify and coordinate with user if microclimate/microenvironment is desired and/or recommended to satisfy these conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the addition of SL, 5 fc (50 lux) ambient and 30 fc (300 lux) task, multi-level switching, and occupancy sensors.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4
	ACS	Provide per Chapter 3 & 4
	CCTV	Provide per Chapter 3 & 4
Acoustics		
Furnishings and Equipment	Storage cabinets and rack shelving, as required.

	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. Design to 70 deg F (21.1 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 42% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 68 deg F (20 deg C) to 72 deg F (22.2 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 40% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3 with the addition of cable reels and local power panels.	
Lighting	Provide per Chapter 3 with the addition of SL, 15 fc (150 lux) ambient and 75 fc (750 lux) task, dimmable controls, and occupancy sensors.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4
	ACS	Provide per Chapter 3 & 4
	CCTV	Provide per Chapter 3 & 4
Acoustics		
Furnishings and Equipment	Work tables (stainless steel), stools, shelving and storage cabinets, as required.	
Special Requirements	Scanner.	
Adjacencies/Location within Facility	Artifact - Decontamination, Artifact - Accessioning, Artifact - Photo Room, Artifact - Storage Areas.	

	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-43 HRF – Artifact – Decontamination Room

Description / Usage	Artifact - Decontamination Room. Room for isolation of incoming artifacts which may contain hazardous materials (i.e.; radium) and/or pest infestation.	
Ceiling Height	20 ft. (6.1m) clear minimum.	
Windows		
Doors	Overhead coiling door - 12 ft. (3.7m) x 12 ft. (3.7m)	
Interior Construction / Built-In Equipment	Pallet racks, as required.	
Finishes	**Walls**	Paint - eggshell/stain finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3 with the addition of cable reels.	
Lighting	Provide per Chapter 3 with the additions of SL, 5 - 25 fc (50 to 250 lux) ambient, 50 fc (500 lux) task, bi-level or multi-level switching. and occupancy sensors.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Storage cabinets and shelving, as required. Large work tables, stools, hazaradous material containers, as required.	
Special Requirements		
Adjacencies/Location within Facility	Shipping/Receiving, Artifact - Storage Areas.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-44 HRF – Artifact – Accessioning Area

Description / Usage	Artifact - Accessioning Area. Holding area for incoming artifacts.	
Ceiling Height	15 ft. (4.6m) clear minimum.	
Windows		
Doors	Overhead coiling door - 12 ft (3.7m) x 12 ft (3.7m).	
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - painted.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. Design to 70 deg F (21.1 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 42% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 68 deg F (20 deg C) to 72 deg F (22.2 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 40% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3 with the addition of cable reels.	
Lighting	Provide per Chapter 3 with the additions of SL, 15 fc (150 lux) ambient, 30 fc (300 lux) task, and bi-level or multi-level switching.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	Provide per Chapter 3 & 4.
Acoustics		
Furnishings and Equipment	Large work tables, stools, filing, storage as required.	
Special Requirements		
Adjacencies/Location within Facility	Artifact - Storage Areas, Shipping/Receiving.	

	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-45 HRF – Artifact – Workshop

Description / Usage	Artifact - Workshop. General work area to include mount making. OPTION: May include provision for paint spray booth for conservation, if required by exhibit designers.	
Ceiling Height	12 ft. (3.7m) clear minimum.	
Windows		
Doors	Oversize - Pair 3 ft.- 6 inch (1.0m) wide x 10 ft. (3.0m) high.	
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing		
HVAC	Provide per Chapter 3. If paint spray booth is required, provide exhaust system for removal of fumes. Provide snorkel type localized exhaust systems with articulating arms that can be adjusted and manually set to desired positions of users where required for equipment below.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4. NFPA 30 as applicable.	
Power	Provide per Chapter 3 with the addition of cable reels and local power panels.	
Lighting	Provide per Chapter 3 with the addition of an avg. of 50 fc (500 lux) ambient, daylighting, and bi-level or multi-level switching.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	Provide per Chapter 3 & 4.
Acoustics		
Furnishings and Equipment	Miter saw, power and hand tools, workbench, stools.	
Special Requirements		
Adjacencies/Location within Facility	Artifact - Loan Processing, Shipping/Receiving.	

	For use during project execution by the appropriate Service agency	
Occupancy	Staff	
	Other	
Min. net ft^2 (m^2)		

Table E-46 HRF – Artifact – Shipping/Receiving Room

Description / Usage	Artifact - Shipping/Receiving.	
Ceiling Height	20 ft. (6.1m) clear minimum.	
Windows		
Doors	Overhead coiling door - 12 ft (3.7m) x 12 ft. (3.7m).	
Interior Construction / Built-In Equipment	Pallet racks, as required.	
Finishes	**Walls**	Epoxy paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. Design to 72 deg F (22.2 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the addition of an avg. 30 fc (300 lux) ambient.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	Provide per Chapter 3 & 4.
Acoustics		
Furnishings and Equipment	Work tables, stools. Shelving, as required.	
Special Requirements		
Adjacencies/Location within Facility	Artifact - Accessioning, Artifact - Storage Areas.	

	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-47 HRF – Artifact – Equipment Storage

Description / Usage	Artifact - Equipment Storage Area. Storage for forklift, pallet jacks, carts, etc.	
Ceiling Height	15 ft. (4.6m) clear minimum.	
Windows		
Doors	Overhead coiling door - 12 ft. (3.7m) x 12 ft. (3.7m).	
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Epoxy paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	Provide per Chapter 3 & 4.
Acoustics		
Furnishings and Equipment

Adjacencies/Location within Facility	Loading Dock.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-48 HRF – Artifact – Supply Storage

Description / Usage	Artifact - Supply Storage.	
Ceiling Height	12 ft. (3.7m) clear minimum.	
Windows		
Doors	Oversize - Pair 3 ft. - 6 inch (1.0m) wide x 10 ft. (3.0m) high.	
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - painted.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Shelving and storage cabinets, as required.	
Special Requirements		
Adjacencies/Location within Facility	Artifact - Processing Areas, Artifact - Storage Areas, Artifact - Accessioning.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-49 HRF – Artifact – Exterior Storage Pad

Description / Usage	Artifact - Exterior Storage Pad. Covered area for larger macro artifact storage.	
Ceiling Height	Exposed - 20 ft (6.1m) clear minimum.	
Windows		
Doors	Provide personnel doors to Shipping/Receiving and Macro Artifact Storage area.	
Interior Construction / Built-In Equipment		
Finishes	**Walls**	
	Floor	Reinforced concrete slab for heavy objects.
	Base	
	Ceiling	
Plumbing	Provide per Chapter 3 and 4. Provide hose bibbs and drains. Provide freeze proof hydrants in lieu of hose bibbs where climate demands. Connect drains to separate chemical containment system that includes holding tank(s) for Underwater Archaeology.	
HVAC		
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the addition of 0.6 fc (6 lux) and occupancy sensor with integrated photocell.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment		
Special Requirements	Provide truck access.	
Adjacencies/Location within Facility	Shipping/Receiving, Artifact - Macro Artifact Storage.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-50 HRF - Art – Office Space

Description / Usage	Art - Office Space. Open office area to accommodate Art staff and associated office functions. This space may be combined with Art - Processing Area. May include wall space for artwork display area associated with loan check-out.	
Ceiling Height	9 ft. (2.7m) minimum	
Windows	Provide, if possible, for views and daylighting.	
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Carpet tile.
	Base	Resilient.
	Ceiling	ACT.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the addition of SL, 5 - 25 fc, (50 to 250 lux) ambient and 50 fc (750 lux) task, daylighting, dimmability, and occupancy sensors.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Workstations, ergonomic task chairs, task lighting, side chairs, filing and storage.	
Special Requirements	Include space for required copier, printers, scanners and any common storage requirements.	
Adjacencies/Location within Facility	Art - Processing Area, Art - Storage, Near Shipping/Receiving.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-51 HRF – Art – Artist-in-Residence

Description / Usage	Art - Artist(s)-in-Residence. Space for Navy staff artist(s) to produce artwork.	
Ceiling Height	9 ft. (2.7m) minimum.	
Windows	Provide for views and daylighting necessary for art production.	
Doors		
Interior Construction / Built-In Equipment	Casework to include sink and base/wall cabinets for storage.	
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Resilient or sealed concrete.
	Base	Resilient.
	Ceiling	ACT.
Plumbing	Provide per Chapter 3. Provide a stainless steel sink with hot and cold water supply and a cleanout.	
HVAC	Provide per Chapter 3. Verify if exhaust system is required for removal of potential fumes created in this space from paints and solvents.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3 with the addition of cable reels.	
Lighting	Provide per Chapter 3 with the addition of SL, 5 - 25 fc, (50 to 250 lux) ambient and 50 fc (500 lux) task, daylighting, dimmability, and occupancy sensors.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Cabinets for art supply storage, work tables, stools, flammable locker, desk, ergonomic task chair, easel, task lighting.	
Special Requirements		
Adjacencies/Location within Facility	Art Gallery, Art - Office Space.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-52 HRF – Art – Break Area

Description / Usage	Art - Break Area. Space used for breaks and lunches. Includes kitchenette for storage, warming and minimal prep of food and area for seating/tables.	
Ceiling Height	9 ft. (2.7m) minimum.	
Windows	Provide, if possible, for exterior views and daylighting.	
Doors		
Interior Construction / Built-In Equipment	Casework to include sink and base/wall cabinets.	
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Resilient.
	Base	Resilient.
	Ceiling	ACT.
Plumbing	Provide per Chapter 3. Provide a stainless steel sink with hot and cold water supply and a cleanout. Provide a water connection for icemaker at refrigerator.	
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Refrigerator, countertop microwave, coffee maker, tables, chairs, recycling and trash containers.	
Special Requirements	Vending machines.	
Adjacencies/Location within Facility	Art - Office Space.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-53 HRF – Art – Framing Room

Description / Usage	Art - Framing Room. Space to fabricate and assemble frames.	
Ceiling Height	12 ft. (3.7m) clear minimum.	
Windows		
Doors	Oversize - Pair 3 ft.- 6 inch (1.0m) wide x 10 ft. (3.0m) high.	
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing	Provide per Chapter 3. Provide emergency eyewash station.	
HVAC	Provide per Chapter 3. Verify if exhaust system is required for removal of potential fumes created in this space from paints and solvents. Provide snorkel type localized exhaust systems with articulating arms that can be adjusted and manually set to desired positions of users where required for equipment below.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3 with the addition of cable reels and local power panels.	
Lighting	Provide per Chapter 3 with the addition of SL, 5 - 25 fc (50 to 250 lux) ambient, 50 fc (500 lux) task, and bi-level or multi-level switching.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4
	ACS	Provide per Chapter 3 & 4
	CCTV	Provide per Chapter 3 & 4
Acoustics		
Furnishings and Equipment	Tables, stools, workbench, storage for moldings and other framing supplies, mitre saw, dry mount press, frame chopper.	
Special Requirements		
Adjacencies/Location within Facility	Artist-in-Residence, Shipping.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-54 HRF – Art – Processing Area

Description / Usage	Art - Processing Area	
Ceiling Height	12 ft. (3.7m) clear minimum.	
Windows		
Doors	Oversize - Pair 3 ft.- 6 inch (1.0m) wide x 10 ft. (3.0m) high.	
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - painted.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. Design to 72 deg F (22.2 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3 with the addition of cable reels.	
Lighting	Provide per Chapter 3 with the additions of SL, 5 - 25 fc (50 to 250 lux) ambient, 50 fc (500 lux) task, bi-level or multi-level switching. and occupancy sensors.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4
	ACS	Provide per Chapter 3 & 4
	CCTV	Provide per Chapter 3 & 4
Acoustics		
Furnishings and Equipment	Large work tables, storage as required.	
Special Requirements	Provide space for digitizers and scanners, as required.	
Adjacencies/Location within Facility	Art - Storage, Art - Accessioning.	

	For use during project execution by the appropriate Service agency	
Occupancy	Staff	
	Other	
Min. net ft^2 (m^2)		

Table E-55 HRF – Art – Accessioning Area

Description / Usage	Art - Accessioning Area. Intake area for artwork.	
Ceiling Height	12 ft. (3.7m) clear minimum to accommodate larger art.	
Windows		
Doors	Oversize - Pair 3 ft.- 6 inch (1.0m) wide x 10 ft. (3.0m) high.	
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. Design to 72 deg F (22.2 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3 with the addition of cable reels.	
Lighting	Provide per Chapter 3 with the additions of SL, 5 - 25 fc (50 to 250 lux) ambient, 50 fc (500 lux) task, bi-level or multi-level switching. and occupancy sensors.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4
	ACS	Provide per Chapter 3 & 4
	CCTV	Provide per Chapter 3 & 4
Acoustics		
Furnishings and Equipment	Large work tables, filing, storage as required.	
Special Requirements		
Adjacencies/Location within Facility	Art - Processing, Loading Dock.	

	For use during project execution by the appropriate Service agency	
Occupancy	Staff	
	Other	
Min. net ft^2 (m^2)		

Table E-56 HRF – Art – Storage

Description / Usage	Art - Storage. Storage space for artwork. May include wall space for artwork display area associated with loan check-out.	
Ceiling Height	12 ft. (3.7m) clear minimum	
Windows		
Doors	Oversize - Pair 3 ft.- 6 inch (1.0m) wide x 10 ft. (3.0m) high.	
Interior Construction / Built-In Equipment	Art storage units, if mobile high density system.	
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. Design to 72 deg F (22.2 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions. Coordinate locations of temperature and humidity data loggers with end user.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the additions of SL, 5 - 25 fc (50 to 250 lux) ambient, 30 fc (300 lux) task, and bi-level or multi-level switching. Provide display area lighting per chapter 4 museum exhibit requirements.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4
	ACS	Provide per Chapter 3 & 4
	CCTV	Provide per Chapter 3 & 4
Acoustics		
Furnishings and Equip.	Art Storage Units, if freestanding. Flat files for unframed prints.	
Special Requirements	Mobile bin-type storage units or vertical hanging units. Provide varying bin sizes to accommodate varying artwork formats.	
Adjacencies/Location within Facility	Art - Processing, Loading Dock.	

	For use during project execution by the appropriate Service agency	
Occupancy	Staff	
	Other	
Min. net ft^2 (m^2)		

Table E-57 HRF – Art – Secure Storage

Description / Usage	Art - Secure Storage. Locked secure space for designated artwork.	
Ceiling Height	12 ft. (3.7m) clear minimum.	
Windows		
Doors	Oversize - Pair 3 ft.- 6 inch (1.0m) wide x 10 ft. (3.0m) high.	
Interior Construction / Built-In Equipment	Art storage units, if mobile high-density system.	
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. Design to 72 deg F (22.2 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the additions of SL, 5 - 25 fc (50 to 250 lux) ambient and bi-level switching.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4
	ACS	Provide per Chapter 3 & 4
	CCTV	Provide per Chapter 3 & 4
Acoustics		
Furnishings and Equipment	Art Storage Units, if freestanding. Flat files for unframed prints.	
Special Requirements	Mobile bin-type storage units or vertical hanging units. Provide varying bin sizes to accommodate varying artwork formats.	
Adjacencies/Location within Facility	Art - Storage.	

	For use during project execution by the appropriate Service agency	
Occupancy	Staff	
	Other	
Min. net ft^2 (m^2)		

Table E-58 HRF – Art – Crate Storage

Description / Usage	Art - Crate Storage. Area for storage and assembly of crating materials.	
Ceiling Height	12 ft. (3.7m) clear minimum.	
Windows		
Doors	Oversize - Pair 3 ft. - 6 inch (1.0m) wide x 10 ft. (3.0m) high.	
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	Provide per Chapter 3 & 4.
Acoustics		
Furnishings and Equipment		
Special Requirements	Approximate same size as Art - Storage.	
Adjacencies/Location within Facility	Shipping/Receiving, Loading Dock	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-59 HRF – UA – Office Space

Description / Usage	UA - Office Space. Open office area to accommodate UA staff and associated office functions. Includes reference area for document research.	
Ceiling Height	9 ft. (2.7m) minimum	
Windows	Provide, if possible, for views and daylighting.	
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - egghsell/satin finish.
	Floor	Carpet tile.
	Base	Resilient.
	Ceiling	ACT.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics	If adjacent to lab spaces, provide additional sound attenuation.	
Furnishings and Equipment	Workstations (intern and full-time staff), ergonomic task chairs, display cabinets for exhibits, files and storage cabinets as required. Research area - small work table/desk, locking document storage.	
Special Requirements	Provide space to accommodate required printers and copier. Incorporate research area.	
Adjacencies/Location within Facility	Entry, UA -Director Office, UA - Conference Room.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-60 HRF – UA – Director Office

Description / Usage	UA - Director Office.	
Ceiling Height	8 ft. (2.4m) clear minimum.	
Windows	Provide, if possible, for views and daylighting.	
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Carpet tile.
	Base	Resilient.
	Ceiling	ACT.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Freestanding desking system, task lighting, ergonomic desk chair, side chairs, filing/storage.	
Special Requirements		
Adjacencies/Location within Facility	UA - Office Space, Conference Room.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-61 HRF – UA – Conference Room

Description / Usage	UA - Conference Room.	
Ceiling Height	9 ft. (2.7m) minimum.	
Windows	Provide, if possible, for views and daylighting.	
Doors		
Interior Construction / Built-In Equipment	Recessed projection screen, projector mount. Visual display system - whiteboards, tackboards, etc. Map display rail.	
Finishes	**Walls**	Paint - eggshell/satin finish. Optional finish treatments (wood wainscott, acoustical wall panels, etc.).
	Floor	Carpet tile.
	Base	Resilient or wood.
	Ceiling	ACT. Could introduce GWB soffits for interest.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3 with addition of infrastructure for Video teleconferencing hookup for training purposes.
	CATV	Provide per Chapter 3.
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Conference table, chairs (around table and stacking for additional capacity), lectern, storage credenza, mobile flipchart easel.	
Special Requirements	Consider Video Teleconferencing (VTC).	
Adjacencies/Location within Facility	Entry, UA Office space, UA Director office.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-62 HRF – UA – Break Area

Description / Usage	UA - Break Area	
Ceiling Height	8 ft. (2.4m) minimum.	
Windows	Provide, if possible, for views and daylighting.	
Doors		
Interior Construction / Built-In Equipment	Casework to include sink and base/wall cabinets.	
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Resilient.
	Base	Resilient.
	Ceiling	ACT.
Plumbing	Provide per Chapter 3. Provide a stainless steel sink with hot and cold water supply and a cleanout. Provide a water connection for icemaker at refrigerator.	
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Refrigerator, countertop microwave, coffee maker, tables, chairs, recycling and trash containers.	
Special Requirements	Provide space for vending machines, if required.	
Adjacencies/Location within Facility	UA - Office Space.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-63 HRF – UA – Secure Library

Description / Usage	UA - Secure Library. Management of plan storage for sensitive, unclassified materials.	
Ceiling Height	8 ft. (2.4m) minimum.	
Windows		
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Carpet tile.
	Base	Resilient.
	Ceiling	ACT.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. Design to 72 deg F (22.2 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with addition of SL, 15 fc (150 lux) ambient.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	Provide per Chapter 3 & 4.
Acoustics		
Furnishings and Equipment		
Special Requirements	Restricted access.	
Adjacencies/Location within Facility	UA Office Space.	

	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-64 HRF – UA – Map/Drafting/Archives Room

Description / Usage	UA - Map/Drafting/Archives Room. Area to read, plot, prepare and store maps.	
Ceiling Height	9 ft. (2.7m) minimum.	
Windows		
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Carpet tile or Resilient.
	Base	Resilient.
	Ceiling	ACT.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. Design to 72 deg F (22.2 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the additions of SL, 5 - 25 fc (50 to 250 lux) ambient, 50 fc (500 lux) task, and bi-level or multi-level switching.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Workstation or tables, as required. Map table (standing height), flat files. Storage cabinets/shelving, as required.	
Special Requirements	Provide space to accommodate 3-D model production equipment, large plotter and scanner.	
Adjacencies/Location within Facility	UA - Office Space, UA - Director Office	

	For use during project execution by the appropriate Service agency	
Occupancy	Staff	
	Other	
Min. net ft^2 (m^2)		

Table E-65 HRF – UA – Collections Storage

Description / Usage	UA - Collections Storage.	
Ceiling Height	15 ft. (4.6m) clear minimum.	
Windows		
Doors	Overhead coiling door - 12 ft. (3.7m) x 12 ft. (3.7m).	
Interior Construction / Built-In Equipment	Overhead crane, pallet racks.	
Finishes	**Walls**	Epoxy paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing	Provide per Chapter 3 and 4. Provide emergency eyewash station(s). Provide floor drain that connects to separate chemical containment system that includes holding tank(s) for Underwater Archaeology.	
HVAC	Provide per Chapter 3. Critical area. Design to 70 deg F (21.1 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 42% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 68 deg F (20 deg C) to 72 deg F (22.2 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 40% RH to 45% RH for indoor heating conditions. Coordinate with user on location of exhaust system for hazardous materials (i.e.; radium).	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the additions of SL, 5 - 25 fc (50 to 250 lux) ambient, 30 fc (300 lux) task, and bi-level or multi-level switching.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4
	ACS	Provide per Chapter 3 & 4
	CCTV	Provide per Chapter 3 & 4
Acoustics		
Furnishings and Equip.	Forklift.	
Special Requirements	Overhead crane.	
Adjacencies/Location within Facility	UA - Conservation Lab, UA - Field Equipment, UA - Dive Locker.	

	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-66 HRF – UA – Small Object Storage

Description / Usage	UA - Small Object Storage.	
Ceiling Height	10 ft. (3.0m) clear minimum.	
Windows		
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing		
HVAC	Provide per Chapter 3. Critical area. Design to 70 deg F (21.1 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 42% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 68 deg F (20 deg C) to 72 deg F (22.2 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 40% RH to 45% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the additions of SL, 5 - 25 fc (50 to 250 lux) ambient.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	Provide per Chapter 3 & 4.
Acoustics		
Furnishings and Equipment	Shelving and storage cabinets, as required.	
Special Requirements		
Adjacencies/Location within Facility	Could be located within UA - Collections Storage.	

	For use during project execution by the appropriate Service agency	
Occupancy	Staff	
	Other	
Min. net ft^2 (m^2)		

Table E-67 HRF – UA – Boat Storage

Description / Usage	UA - Boat Storage. Area used to store trailered boats.	
Ceiling Height	15 ft. (4.6m) clear minimum.	
Windows		
Doors	Provide personnel door to space.	
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Epoxy paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	
	Ceiling	Exposed structure - paint.
Plumbing	Provide per Chapter 3. Provide hose bibbs. Provide freeze-proof hydrants in lieu of hose bibbs where climate demands. Consider rainwater collection system.	
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3 with the addition of local power panels.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment		
Special Requirements	Smaller boat storage to be enclosed. Larger boats - provide exterior sheltered area for boats up to 30 ft (9.1m) long (including trailer).	
Adjacencies/Location within Facility	Exterior access.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-68 HRF – UA – Dive Locker and Remote Sensing Equipment

Description / Usage	UA - Dive Locker and Remote Sensing Equipment. Space for dive suits to hang and dry, storage of compressed dive tanks and remote sensing equipment.	
Ceiling Height	10 ft. (3.0 m) clear minimum.	
Windows		
Doors	Oversize - Pair 3 ft.- 6 inch (1.0m) wide x 8 ft. (2.4m) high.	
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Epoxy paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing	Provide per Chapter 3 and 4. Provide compressed air system with air dryer. Coordinate locations of air drops with user. Verify if ceiling hung hose reels are required for compressed air system. Coordinate with user the location of the floor drain(s) for drying area of dive suits.	
HVAC	Provide per Chapter 3. Coordinate with user to provide required air circulation and 45% RH for indoor design cooling conditions, and 40% RH for indoor design heating conditions for drying area of dive suits. Relative humidity operating ranges must be 42% RH to 48% RH for indoor cooling conditions, and 37% RH to 43% RH for indoor heating conditions.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the additions of 20 fc (200 lux) ambient, damp or wet label as appropriate, and occupancy sensors.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Scuba tank racks, as required.	
Special Requirements	Dive tanks storage. Exterior access required.	
Adjacencies/Location within Facility	UA - Collections Storage.	

	For use during project execution by the appropriate Service agency	
Occupancy	Staff	
	Other	
Min. net ft^2 (m^2)		

Table E-69 HRF – UA – Field Equipment

Description / Usage	UA - Field Equipment. Storage area for equipment (generators, compressors, etc.).	
Ceiling Height	10 ft. (3.0m) clear minimum.	
Windows		
Doors	Oversize - Pair 3 ft.- 6 inch (1.0m) wide x 8 ft. (2.4m) high.	
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Epoxy paint - semi-gloss finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with vacancy sensor.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Storage cabinets.

Adjacencies/Location within Facility	UA - Dive Locker, UA - Conservation Lab, UA - Collection Storage.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-70 HRF – UA – Demonstration Laboratory

Description / Usage	UA - Demonstration Laboratory. Public viewing and demonstration space.	
Ceiling Height	10 ft. (3.0m) clear minimum.	
Windows		
Doors	Oversize - Pair 3 ft.- 6 inch (1.0m) wide x 8 ft. (2.4m) high.	
Interior Construction / Built-In Equipment	Casework (stainless steel tops) to include base/wall cabinets for storage. Provide viewing glass for spectators.	
Finishes	**Walls**	Epoxy paint - semi-gloss finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing	Provide per Chapter 3 and 4. Provide emergency shower/eyewash station. Provide stainless steel industrial trough sink(s) with hot and cold water supply and cleanout. Provide emergency eyewash station adjacent to sink. Provide floor drains where required by user that connect to separate chemical containment system that includes holding tank(s) for Underwater Archaeology. Provide compressed air system with air dryer. Coordinate locations of air drops with user. Verify if ceiling hung hose reels are required for compressed air system.	
HVAC	Provide per Chapter 3. Critical area. Design to 72 deg F (22.2 deg C) dry bulb for indoor design cooling and indoor design heating conditions. Design to 50% RH for conserved organic materials, and to 30% RH for conserved metals. Temperature operating range must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) for indoor cooling and heating conditions. Relative humidity operating range must be 47% RH to 53% RH for conserved organic materials, and 27% RH to 33% RH for conserved metals.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3 with the addition of power panels and cable reels.	
Lighting	Provide per Chapter 3 with the addition of SL, 25 fc (250 lux) ambient, 100 fc (1000 lux) task and bi-level or multi-level switching.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	
	ACS	
	CCTV	

Acoustics		
Furnishings and Equipment	Stainless steel work tables. Storage cabinets, as required.	
Special Requirements	Provide viewing glass between adjacent Conservation Lab and Administrative Space.	
Adjacencies/Location within Facility	UA - Conservation Lab, UA - Collection Storage, near entry.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-71 HRF – UA – Conservation Laboratory

Description / Usage	UA - Conservation Laboratory.	
Ceiling Height	10 ft. (3.0m) clear minimum.	
Windows		
Doors	Overhead coiling door - 12 ft. (3.7m) x 12 ft. (3.7m) from Processing area.	
Interior Construction / Built-In Equipment	Overhead crane. Casework (stainless steel tops) to include base/wall cabinets for storage. Provide viewing glass for spectators.	
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing	Provide per Chapter 3 and 4. Provide emergency shower/eyewash station. Provide stainless steel industrial trough sink(s) with hot and cold water supply and cleanouts. Provide emergency eyewash stations adjacent to sinks. Provide floor drains where required by user that connect to separate chemical containment system that includes holding tank(s) for Underwater Archaeology. Provide compressed air system with air dryer. Coordinate locations of air drops with user. Verify if ceiling hung hose reels are required for compressed air system.	
HVAC	Provide per Chapter 3. Critical area. Design to 72 deg F (22.2 deg C) dry bulb for indoor design cooling and indoor design heating conditions. Design to 50% RH for conserved organic materials, and to 30% RH for conserved metals. Temperature operating range must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) for indoor cooling and heating conditions. Relative humidity operating range must be 47% RH to 53% RH for conserved organic materials, and 27% RH to 33% RH for conserved metals. Provide fume hoods and/or ventilated safety cabinets as required by the end user.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3 with the additions of cable reels and local power panels.	
Lighting	Provide per Chapter 3 with the addition of SL, 25 fc (250 lux) ambient and 75 fc (750 lux) task, dimmable controls, and occupancy sensors.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	

Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	Provide per Chapter 3 & 4.
Acoustics		
Furnishings and Equipment	Stainless steel work tables (open shelf beneath), shelving and storage cabinets as required for tools/glassware, flammable storage cabinets, corrosive material storage cabinets, flat files, vacuum freeze dryer, large chest freezer, refrigerator, microscope (bench-mounted or freestanding), drying oven.	
Special Requirements	Provide deionized water supply. Overhead crane. Fume hood. Provide viewing glass between adjacent Demonstration Lab and Administrative Space.	
Adjacencies/Location within Facility	UA - X-Ray Room, UA - Cold Storage, UA - Collections Storage.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other

	Base	
	Ceiling	
Plumbing	Provide per Chapter 3 and 4. Provide drains and chemical spill containment for outdoor treatment tanks. Provide hose bibbs. Consider rainwater collection system (with associated hose bibbs). Provide freeze proof hydrants in lieu of hose bibbs where climate demands. Connect drains to separate chemical containment system that includes holding tank(s) for Underwater Archaeology. Provide compressed air system with air dryer. Coordinate locations of air drops with user.	
HVAC		
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the addition of an avg. of 0.6 fc (6 lux) and occupancy sensors with integrated photocell.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment		
Special Requirements	Chemical spill containment area required.	
Adjacencies/Location within Facility	UA - Conservation Lab.	

	For use during project execution by the appropriate Service agency	
Occupancy	Staff	
	Other	
Min. net ft^2 (m^2)		

Table E-77 HRF – UA – Object Receiving/Processing

Description / Usage	UA - Object Receiving/Processing. OPTION: May include provision for restroom/shower/changing area for decontamination of personnel and artifacts.	
Ceiling Height	15 ft. (4.6m) clear minimum.	
Windows		
Doors	Overhead coiling door - 12 ft. (3.7m) x 12 ft. (3.7m).	
Interior Construction / Built-In Equipment	Overhead crane.	
Finishes	**Walls**	Epoxy paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing	Provide per Chapter 3 and 4. Provide washing machine hook-up. Provide shower for personnel decontamination. Connect floor drain from shower to separate chemical containment system that includes holding tank(s) for Underwater Archaeology. Provide restroom in changing area.	
HVAC	Provide per Chapter 3. Critical area. Design to 72 deg F (22.2 deg C) dry bulb and 50% RH for indoor design cooling conditions, and 68 deg F (20 deg C) dry bulb and 40% RH for indoor design heating conditions. Temperature and relative humidity operating ranges must be 70 deg F (21.1 deg C) to 74 deg F (23.3 deg C) and 45% RH to 53% RH for indoor cooling conditions, and 66 deg F (18.9 deg C) to 70 deg F (21.1 deg C) and 37% RH to 45% RH for indoor heating conditions. Provide clothes dryer exhaust.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the additions of SL, 5 - 25 fc (50 to 250 lux) ambient, 50 fc (500 lux) task, and bi-level or multi-level switching.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	Provide per Chapter 3 & 4.
Acoustics		
Furnishings and Equip.	Work tables (stainless steel), stools. Forklift. Washer and dryer.	
Special Requirements	Provide shower area for personnel decontamination, if required.	
Adjacencies/Location within Facility	UA - Conservation Lab, Loading Dock	

	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-78 HRF – UA – Hazardous Material

Description / Usage	UA - Hazardous Material. Room for isolation of incoming artifacts which may contain hazardous materials (i.e.; radium).	
Ceiling Height	15 ft. (4.6m) clear minimum.	
Windows		
Doors	Overhead coiling door - 12 ft. (3.7m) x 12 ft. (3.7m)	
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Epoxy paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3 & 4.	
Power	Provide per Chapter 3 with the addition of cable reels.	
Lighting	Provide per Chapter 3 with the additions of SL, 5 - 25 fc (50 to 250 lux) ambient, 50 fc (500 lux) task, bi-level or multi-level switching. and occupancy sensors.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	Provide per Chapter 3.
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Storage cabinets and shelving, as required. Large work tables, stools, hazaradous material containers, as required.	
Special Requirements		
Adjacencies/Location within Facility	UA - Object Receiving/Processing, Loading Dock.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-79 HRF - Entries/Vestibule

Description / Usage	Entries/Vestibules. Provide optional employee entrances as required.	
Ceiling Height	8 ft. (2.4m) minimum.	
Windows	Consider storefront system for vision and daylighting into lobbies.	
Doors		
Interior Construction / Built-In Equipment	Provide recessed walk-off mat system. Bulletin boards.	
Finishes	**Walls**	Plaster or GWB - painted (exterior finishes could carry into vestibule).
	Floor	Hard surface (stone/porcelain tile).
	Base	Coordinate with floor finish and/or storefront system.
	Ceiling	Plaster or GWB - painted, decorative ceiling treatment.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3. Provide flush-mounted fire alarm/mass notification system remote annunciator and microphone station at main entrance vestibule.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the addition of an avg. of 0.6 fc (6 lux) and photocell controlled.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	Provide per Chapter 3 & 4.
Acoustics		
Furnishings and Equipment	Lockers (half-height), display cases.	
Special Requirements	Provide locker area for visitor item storage.	
Adjacencies/Location within Facility		
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-80 HRF – Public Restroom

Description / Usage	Public Restrooms. Men's and Women's toilet rooms.	
Ceiling Height	8 ft. (2.4m) minimum.	
Windows		
Doors		
Interior Construction / Built-In Equipment	Sink vanities, toilet partitions, mirrors, toilet accessories.	
Finishes	**Walls**	Ceramic or porcelain tile (full-height). Provide water-resistant GWB at wet walls.
	Floor	Porcelain tile.
	Base	Ceramic or porcelain tile.
	Ceiling	ACT and/or painted GWB (eggshell/satin finish).
Plumbing	Provide per Chapter 3. Provide wall-mounted urinals, floor-mounted toilets, and lavatories. Provide a floor drain.	
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the addition of emergency lighting with battery backup .	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment		
Special Requirements	Coordinate with Facility Manager when determining soap and paper product dispensing preferences.	
Adjacencies/Location within Facility	Entries	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-81 HRF – Staff Restrooms

Description / Usage	Staff Restrooms. Toilet facilities for faciility staff.	
Ceiling Height	8 ft. (2.4m) minimum.	
Windows		
Doors		
Interior Construction / Built-In Equipment	Sink vanities, toilet partitions (at multiple toilets), lockers, mirrors, toilet accessories.	
Finishes	**Walls**	Ceramic or porcelain tile (full-height). Provide water-resistant GWB at wet walls.
	Floor	Porcelain tile.
	Base	Ceramic or porcelain tile.
	Ceiling	ACT and/or painted GWB (eggshell/satin finish).
Plumbing	Provide per Chapter 3. Provide wall-mounted urinals, floor-mounted toilets, and lavatories. Provide a floor drain.	
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the addition of emergency lighting with battery backup .	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment		
Special Requirements	Coordinate with Facility Manager when determining soap and paper product dispensing preferences.	
Adjacencies/Location within Facility	Administrative areas (non-public areas).	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-82 HRF – Janitorial Space

Description / Usage	Janitorial Space. Space for custodial supplies and equipment.	
Ceiling Height	8 ft. (2.4m) clear minimum.	
Windows		
Doors		
Interior Construction / Built-In Equipment	Include mop/broom rack, utility shelf.	
Finishes	**Walls**	Ceramic tile wainscot (48 ft. high; 1.2m) or fiber-reinforced or rigid vinyl panel wall protection wainscot (4 ft. high; 1.2m). Epoxy paint - semi-gloss finish above.
	Floor	Porcelain tile or sealed concrete.
	Base	Porcelain or ceramic tile (coordinate with wall/floor).
	Ceiling	Exposed structure - paint.
Plumbing	Provide per Chapter 3. Provide a mop sink, floor drain, and keyed hose bibb.	
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Storage cabinet (optional).	
Special Requirements		
Adjacencies/Location within Facility	Restrooms, Public areas.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-83 HRF – Facilities Management Storage

Description / Usage	Facilities Management Storage. Space used to store surplus building products/supplies such as light bulbs, paints, cleaning and paper products.	
Ceiling Height	8 ft. (2.4m) clear minimum	
Windows		
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment	Storage cabinets, flammable cabinets, as required.	
Special Requirements		
Adjacencies/Location within Facility	Facility Manager office, Loading dock.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-84 HRF – Elevators

Description / Usage	Elevators. Elevator meeting all IBC requirements at each floor.	
Ceiling Height	8 ft. (2.4) minimum.	
Windows		
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Stainless steel or plastic laminate panels.
	Floor	Hard surface (stone/porcelain tile, etc.) or resilient. Continue adjacent space floor finish.
	Base	Stainless steel (cab finish).
	Ceiling	Panels as offered by elevator manufacturer.
Plumbing	Provide per Chapter 3.	
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the addition of an avg. of 5 fc (50 lux) ambient.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment		
Special Requirements		
Adjacencies/Location within Facility	Entries, public areas.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-85 HRF – Freight Elevator

Description / Usage	Freight Elevator. Elevator used to convey oversize displays, artifacts, equipment, etc.	
Ceiling Height		
Windows		
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Stainless steel panels (provide hooks for protective blanket installation).
	Floor	Resilient or sealed concrete.
	Base	Stainless steel.
	Ceiling	Panels as offered by elevator manufacturer.
Plumbing	Provide per Chapter 3.	
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the addition of an avg. of 5 fc (50 lux) ambient.	
Communication	**Telephone**	Provide per Chapter 3.
	Data	
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment		
Special Requirements		
Adjacencies/Location within Facility	Loading dock.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-86 HRF – Elevator Equipment Room

Description / Usage	Elevator Equipment Room(s). Room housing required elevator equipment.	
Ceiling Height	Exposed - 8 ft. (2.4) clear minimum.	
Windows		
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing	Provide per Chapter 3.	
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics		
Furnishings and Equipment		
Special Requirements		
Adjacencies/Location within Facility	Elevator, Freight Elevator.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-87 HRF – Stairwells

Description / Usage	Stairwells	
Ceiling Height	Varies.	
Windows		
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Sealed concrete with resilient stair system (treads, risers)
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power		
Lighting	Provide per Chapter 3.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	
	ACS	
	CCTV	
Acoustics

Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-89 HRF – Telecommunications/Server Room

Description / Usage	Telecommunications/Server Room. Room to house communications distribution. May include SIPR and JWICS.	
Ceiling Height	9 ft. (2.7m) clear minimum.	
Windows		
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the addition of 50 fc (500 lux) per telecommunications UFC, and bi-level or multi-level switching.	
Communication	**Telephone**	
	Data	Coordinate requirements for exrtra server racks for separate system for artifact area.
	CATV	
Security	**IDS**

Table E-93 HRF – Shipping/Receiving

Description / Usage	Shipping/Receiving. Receiving, unpacking and packing of all packages.	
Ceiling Height	10 ft. (3.0m) clear minimum.	
Windows		
Doors	Mininum 8 ft. (2.4m) wide x 8 ft. (2.4m) high rolling door.	
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Impact resistant wallcovering wainscot (4 ft. (1.2m) high), epoxy paint (eggshell/satin finish) above.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3 with the addition of an avg. of 30 fc (300 lux) ambient and bi-level or multilevel switching.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	Provide per Chapter 3 & 4.
Acoustics		
Furnishings and Equipment		
Special Requirements		
Adjacencies/Location within Facility	Loading dock.	
	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-94 HRF – Recycling Room

Description / Usage	Recycling Room. Easily accessible room dedicated to collection and storage of materials for recycling. Includes paper, corrugated cardboard, glass, plastics and metals.	
Ceiling Height	8 ft. (2.4m) clear minimum.	
Windows		
Doors		
Interior Construction / Built-In Equipment		
Finishes	**Walls**	Epoxy paint - eggshell/satin finish.
	Floor	Sealed concrete.
	Base	Resilient.
	Ceiling	Exposed structure - paint.
Plumbing		
HVAC	Provide per Chapter 3.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3.	
Lighting	Provide per Chapter 3.

	For use during project execution by the appropriate Service agency	
Occupancy	**Staff**	
	Other	
Min. net ft^2 (m^2)		

Table E-96 HRF – Loading Dock

Description / Usage	Loading Dock(s). Area for shipping/receiving as well as building waste removal.	
Ceiling Height	Varies.	
Windows		
Doors	Minimum 8 ft. (2.4m) wide x 8 ft. (2.4m) high coiling overhead door. Provide personnel door.	
Interior Construction / Built-In Equipment		
Finishes	**Walls**	High Performance Architectural Coating (HIPAC). Service corridors leading to loading dock to receive impact resistant wallcovering wainscot (4 ft. (1.2m) high).
	Floor	Sealed concrete.
	Base	
	Ceiling	Exposed structure - paint.
Plumbing	Provide per Chapter 3. Provide washing machine hook-up if required by end user. If restroom is required in this area by end user, verify if shower is also required.	
HVAC	Provide per Chapter 3. If loading dock is enclosed, provide a unit heater or infrared heater at the entrance of the loading dock, and a vehicle exhaust removal system for trucks.	
Fire Protection and Life Safety	Provide per Chapter 3.	
Power	Provide per Chapter 3. Provide washer and dryer connections.	
Lighting	Provide per Chapter 3 with the addition of an avg. of 10 fc (100 lux) and photocell controlled.	
Communication	**Telephone**	
	Data	
	CATV	
Security	**IDS**	Provide per Chapter 3 & 4.
	ACS	Provide per Chapter 3 & 4.
	CCTV	Provide per Chapter 3 & 4.
Acoustics

Record of Changes (changes are indicated by **1**\ ... /**1**/)

Change No.	Date	Location

This UFC supersedes UFC 4-826-10, Design: Refrigeration Systems for Cold Storage, dated 10 July 2002.

This Page Intentionally Left Blank

FOREWORD

The Unified Facilities Criteria (UFC) system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and applies to the Military Departments, the Defense Agencies, and the DoD Field Activities in accordance with USD (AT&L) Memorandum dated 29 May 2002. UFC will be used for all DoD projects and work for other customers where appropriate. All construction outside of the United States, its territories, and possessions is also governed by Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA), and in some instances, Bilateral Infrastructure Agreements (BIA). Therefore, the acquisition team must ensure compliance with the most stringent of the UFC, the SOFA, the HNFA, and the BIA, as applicable.

UFC are living documents and will be periodically reviewed, updated, and made available to users as part of the Military Department's responsibility for providing technical criteria for military construction. Headquarters, U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering Systems Command (NAVFAC), and Air Force Civil Engineer Center (AFCEC) are responsible for administration of the UFC system. Technical content of UFC is the responsibility of the cognizant DoD working group. Defense Agencies should contact the respective DoD Working Group for document interpretation and improvements. Recommended changes with supporting rationale may be sent to the respective DoD working group by submitting a Criteria Change Request (CCR) via the Internet site listed below.

UFC are effective upon issuance and are distributed only in electronic media from the following source:

- Whole Building Design Guide website https://www.wbdg.org/ffc/dod.

Refer to UFC 1-200-01, *DoD Building Code*, for implementation of new issuances on projects.

CHAPTER 1 INTRODUCTION

1-1 BACKGROUND.

The purpose of refrigerated systems for cold storage is to maintain or extend product life. Refrigeration systems for cold storage are applied to processing, manufacturing, and warehousing food, biomedical materials, ice manufacture, and other uses; but the largest application is for the refrigeration and freezing of foods. Refrigerated systems provide much lower temperatures than comfort air conditioning systems. The design, selection, and construction of a refrigeration system is different and can be more intensive than that for a comfort air conditioning system. For this reason, the refrigeration industry has evolved into a separate and distinct industry.

1-2 REISSUES AND CANCELS.

This UFC reissues and cancels UFC 4-826-10, *Design: Refrigeration Systems for Cold Storage* dated 10 July 2002.

1-3 PURPOSE AND SCOPE.

This UFC provides general criteria for the design of new refrigeration systems for cold storage. This document, and all references contained herein, provides guidance to the DoD. They may also be useful to commercial firms engaged in the design and construction of refrigeration systems for cold storage for DoD facilities.

Note that this document does not constitute a detailed technical design, maintenance or operations manual. Rather, its purpose is to identify and utilize the most appropriate Non-Governmental Standards (NGS) by specifying the refrigeration industry codes and standards that best apply, and to include the Tri-service's specific requirements.

1-4 APPLICABILITY.

This UFC applies to all Service elements and DoD contractors involved in the planning, design, and construction of DoD cold storage facilities.

1-5 GENERAL BUILDING REQUIREMENTS.

Comply with UFC 1-200-01, *DoD Building Code*. UFC 1-200-01 provides applicability of model building codes and government unique criteria for typical design disciplines and building systems, as well as for accessibility, antiterrorism, security, high performance and sustainability requirements, and safety. Use this UFC in addition to UFC 1-200-01 and the UFCs and government criteria referenced therein.

1-6 CYBERSECURITY.

All control systems (including systems separate from an energy management control system) must be planned, designed, acquired, executed, and maintained in accordance

with UFC 4-010-06, *Cybersecurity of Facility-Related Control Systems*, and as required by individual Service Implementation Policy.

1-7 PRIMARY VOLUNTARY CONSENSUS STANDARD REFERENCE.

This UFC adopts the latest edition of American Society of Heating, Refrigeration, and Air Conditioning Engineers (ASHRAE) Publications listed below as the primary voluntary consensus standard for the Tri-services refrigeration systems for cold storage.

- *ASHRAE Handbook – Refrigeration*

1-8 SECONDARY VOLUNTARY CONSENSUS STANDARD REFERENCES.

This UFC adopts the latest edition of the standards listed below as the secondary voluntary consensus standard for the Tri-services refrigeration systems for cold storage. ASHRAE Standards encompass halocarbon and ammonia refrigeration systems. International Institute of Ammonia Refrigeration (IIAR) refers to ammonia systems exclusively.

- ASHRAE Standard 15
- *ASHRAE Handbook – Applications*
- *ASHRAE Handbook – Fundamentals*
- *ASHRAE Handbook – HVAC Equipment and Systems*
- ANSI/IIAR Standard 2
- *IIAR Ammonia Refrigeration Piping Handbook*

1-9 CONFLICTS IN CRITERIA.

If any conflicts arise between the service's safety criteria and ASHRAE Standard 15, the most stringent requirement will prevail unless discussed and approved by the contracting officer. If a facility is located off of military owned sites, where local jurisdictional authority has control and code requirements that are more stringent than those herein, the local jurisdictional authority shall prevail.

1-10 SUSTAINABLE DESIGN.

It is the policy of the tri-services to incorporate sustainability concepts in the design of all facilities and infrastructure projects to the extent life-cycle cost effective, consistent with budget constraints and customer requirements. This policy applies to renovations and alteration projects as well as new construction; applies to projects regardless of funding source or amount; applies to projects for all customers; and applies to design associated with all procurement methods, including design/build. For further information, see https://www.wbdg.org/ffc/federal-facility-criteria.

1-11 GLOSSARY.

APPENDIX A contains acronyms, abbreviations, and terms.

1-12 REFERENCES.

APPENDIX B contains a list of references used in this document. The publication date of the code or standard is not included in this document. Unless otherwise specified, the most recent edition of the referenced publication applies.

This Page Intentionally Left Blank

CHAPTER 2 REFRIGERATION SYSTEM DESIGN REQUIREMENTS

2-1 GENERAL.

Design refrigerated systems for cold storage to provide safety, economy, and reliability. Refrigeration design is a specialized field. The design of cold storage refrigerated systems must be performed by an experienced refrigeration design engineer with at least 5 years' experience on at least two projects of similar complexity and scope. Refrigeration designs must be submitted using the "design-bid-build" or "design build" arrangement.

Proposed and utilized equipment manufacturers must have 5 years extensive experience in significantly supported refrigeration design.

2-2 SAFETY.

Safety is paramount. Safety is critical in the design, construction and operation of refrigeration systems for cold storage, especially with ammonia systems. Meet the ASHRAE Standard 15 refrigeration system's safety standards. ASHRAE Standard 15 specifies safe design, construction, installation, and operation of refrigeration systems by establishing safeguards for life, limb, heath and property and prescribing safety standards. This includes, but is not limited to, occupancy classification, restriction on refrigeration use, installation restrictions, design and construction of equipment and systems, operations, and testing.

2-2.1 Equipment Selection and Placement.

Consider equipment selection and its placement for safe accessible maintenance. A safety review of the engineered design and equipment layout is recommended with participation from the owner's site operations and maintenance (O&M) entities.

2-2.2 System Safety Plan and Hazard Analysis.

The designer is required to perform a system safety plan and hazard analysis. Personnel safety measures are required as part of the facility design. Hazards or controlled substances requiring consideration may include, but are not limited, to the following:

- Ozone depleting gases
- Greenhouse gases
- Ammonia
- Pressurized gases
- Flammable gases
- Hazardous gases
- Hot gases and equipment

- Electrical power

2-3 OPERATION AND MAINTENANCE.

Tri-service facilities do not perform the maintenance typical of commercial and industrial facilities. Participation of the site operations and maintenance entities in the design process is critical to a safely operated and maintained facility, plus helps to ensure a successful project. O&M entities will be interviewed up front in the "Charrette" stage of a refrigeration design project. Design charrettes are a key component in the initial stages of any project and must be required. The mechanical designers (specifically the lead mechanical engineer) involved in the refrigeration design and Safety and Environmental Protection personnel must participate in the design charrette.

2-4 ECONOMY.

Design systems to provide the lowest life-cycle cost with maximum energy efficiency and give special consideration to safety and low maintenance. As noted in Section 2-3, the maintaining of Tri-services facilities is not indicative of commercial and industrial facilities. Actual maintenance costs can be hidden and high. Therefore, a simple, high reliability design can be weighed greater than efficiency. Consider this in the life cycle analysis. Also, consider the impact of refrigerant phase-out and replacement costs, and Occupational Safety and Health Administration (OSHA) Regulations (refer to Section 2-6.3.2) to the life cycle analysis of the refrigeration system.

2-5 REFRIGERANT PHASE-OUT AND REPLACEMENT.

The phase-out schedule of refrigerants is briefly defined in the refrigerants chapter of the *ASHRAE Handbook – Fundamentals*. This information can also be found at the United States Environmental Protection Agency's web site https://www.epa.gov/ods-phaseout.

2-6 SYSTEM DESIGN AND SELECTION.

This section addresses the general requirements for the design and selection of a refrigerated system for cold storage. ASHRAE Standards and Handbook are the basis for refrigeration system design, selection, installation, testing, and operating. For ammonia systems, the standards of the International Institute of Ammonia Refrigerators (IIAR) will apply, and if more stringent than ASHRAE Standards, IIAR will prevail.

2-6.1 Facility Design.

Design new refrigerated facilities to meet the considerations for building design that are provided in the refrigerated facility design chapter of *ASHRAE Handbook – Refrigeration*. Cold storage facilities held below freezing can cause under floor ice formation, resulting in floor upheaval. Design sub-floor freeze protection for facilities that are held below freezing, such as air duct systems, electrical heating systems, or heated pipe grids. These systems are detailed in the above-mentioned chapter. Comply with all ASHRAE Standard 15 in its entirety, including but not limited to

equipment placement, ventilation design, door and passageway restrictions, refrigerant monitoring, flame devices, pressure relief and purge piping, refrigerant piping, signs, self-contained breathing apparatus (SCBA), and miscellaneous installation restrictions.

2-6.2 Refrigeration Load.

Determine the refrigeration loads by the calculations in the Refrigeration Load chapter of *ASHRAE Handbook – Refrigeration*.

2-6.3 Refrigeration System Selection.

The primary selection of a refrigeration system, such as halocarbon or ammonia refrigerant, direct expansion or liquid recirculation, must be determined by life cycle cost analysis. Should a system be selected for a design because of other issues, such as safety, reliability, maintainability, simplicity, the preference of the owner, and the recommendations of the design engineer, then the designer must clearly justify their selection in the project's design analysis, and include concurrence from the user and the funding agency.

Perform the design of the entire system, including loading areas, door swing clearances, noise considerations, clearances for maintenance, and pipe sizes and layout/slopes, based on guidance from ASHRAE. On the drawings, indicate that it will be the Contractor's responsibility to coordinate the pipe sizes and layout/slopes with the equipment and piping configurations to be provided. For small systems (systems with 1 or 2 compressors and 1 or 2 coolers; 1 compressor for each cooler), the designer may elect to show only the individual components and their relative layout or schematic with no pipe sizes or slopes. For these types of systems, it will be the Contractor's responsibility to submit shop drawings and calculations to completely define the entire system based on the equipment to be provided. Refer to the *ASHRAE Handbook – Refrigeration*, in the following chapters:

- Liquid Overfeed Systems
- System Practices of Halocarbon Refrigerants
- System Practices for Ammonia Refrigerant
- Secondary Coolants in Refrigeration Systems

2-6.3.1 Refrigerants.

The selection of a refrigerant impacts the project economics and safety. The selection, design, construction, and operation of a refrigeration system must meet ASHRAE Standard 15. Show the occupancy and restrictions on refrigerant quantity and usage on the drawings. Product, occupancy, or other criteria might require a "low-probability system" for the refrigeration system. Low-probability systems are designed so that if a leak occurred, the refrigerant cannot enter the occupied space. Most indirect systems are considered "low-probability systems". An indirect system has a secondary coolant, such as brine, which is cooled or heated by the refrigeration system.

A comprehensive list of refrigerants and refrigerant blends are listed in Table 1 and Table 2 respectively of ASHRAE Standard 34. R-404a is not recommended because it is a nonazeotropic mixture. A leak in a refrigeration system with a nonazeotropic mixture would change the composition resulting in a glide that would become unpredictable. A system leak could cause off performance that ultimately would require a complete refrigerant replacement. R-134a is not recommended for large capacity systems because the density is low and would require larger volume equipment. Ammonia is corrosive, hazardous, and can damage product when released in large quantities. But ammonia is considerably cheaper, much more efficient as a refrigerant, and has easier oil separation capabilities. Halocarbons have a lower toxicity limit than ammonia. All refrigerants can be injurious or even fatal in high enough concentrations and must be handled carefully. If ammonia is not ruled out as a refrigerant, the life cycle analysis will most likely suggest an ammonia system for large (typically above 5000 square feet (464.5 square meters)) cold storage refrigeration applications. Selecting a refrigerant for cold storage design is a function of the refrigeration design temperature and the equipment available. Lubrication oil management becomes critical at lower temperatures, especially when the oil is lighter than the refrigerant.

2-6.3.1.1 Ammonia.

Ammonia is a self-alarming substance that is distinguished by its pungent odor. Persons exposed to ammonia vapors well below the permanently damaging levels will not voluntarily stay in such areas. An ammonia-air mixture in an iron flask does not ignite below 1204 degrees F (651.1degrees C). The US Department of Transportation classifies ammonia as a nonflammable compressed gas for the purpose of transportation. Ammonia is rated a Group B-2L in ASHRAE Standard 34; that classifies ammonia as more toxic than most other refrigerants. Safety requirements are heightened for ammonia, thus the need for special care and attention to safety details in ammonia systems. Since ammonia is lighter than air, adequate ventilation is the best means of preventing accumulation. The challenge with ammonia is to control the magnitude of and promptly correct a leak, in order to avoid injury to people and damage to property and product. It is important that personnel understand the properties of ammonia and be thoroughly trained in its use, safety precautions and application.

2-6.3.1.2 Halocarbons.

Halocarbons are halogenated hydrocarbons that contain one or more of the halides: chlorine, bromine, fluorine, or iodine. Halocarbons are typically rated a Group A-1 in ASHRAE Standard 34; that is a lower toxicity and flammability than ammonia. Halocarbons are widely used because they are considered a safe approach to refrigeration. Economically, halocarbons are significantly more expensive and not as efficient as ammonia.

2-6.3.2 Commercially Designed Mechanical Refrigeration Systems.

The selection and design of a commercial mechanical refrigeration system should be economical, safe, reliable, and simple. A design must be indicative of the refrigeration

industry's trends, with emphasis on simplicity and low maintenance. There are essentially two refrigerant system designs utilized in the cold storage refrigeration market, such as, direct expansion and liquid recirculation. The dominant design is a field constructed ammonia liquid recirculation system utilizing screw compressors and evaporative condensers.

Large systems can have thousands of kilograms of refrigerant. If an ammonia refrigerant system exceeds 10,000 pounds (4536 kg) of ammonia, OSHA 29 CFR 1910 requires implementing a Process Safety Management program (PSM) and a Risk Management Plan (RMP). This would require staff and other operating requirements that can be very expensive to implement and maintain. There is an O&M savings incentive for ammonia refrigeration systems to contain less than 10,000 pounds (4536 kg) of ammonia. The owners of the larger refrigeration systems that have PSM programs try to mitigate safety incidences and their respective magnitude. There is a safety preference for refrigeration systems that contain the least amount of refrigerant to minimize the potential of a possible large release. For these reasons, direct expansion systems are sometimes preferred rather than the more economical recirculation systems.

2-6.3.2.1 Liquid Recirculation.

Liquid recirculation is the mechanical pumping, or gas pressure pumping arrangement, that forces liquid refrigerant into evaporators. More liquid is introduced into the evaporator than can be evaporated, usually by a factor of 3. This system requires additional pumping equipment, liquid-gas separation equipment, and significantly more refrigerant. The advantages of this system are realized during O&M. A liquid recirculation to direct expansion general comparison is as follows:

- Higher initial capital investment
- Contains a significantly larger amount of refrigerant (can be post prohibitive with halocarbons
- Lower operating costs
- Greater operating flexibility to control multiple temperate zones
- Easier maintenance
- Halocarbon recirculation requires large oil separation systems due to much lower separation velocity than ammonia

2-6.3.2.2 Direct Expansion.

Direct expansion is the introduction of refrigerant through an expansion device prior to the evaporator and only vapor leaves the evaporator. It is limited in low temperature applications. Ammonia direct expansion cannot perform much below 0 degrees F (minus 17.8 degrees C) so is not applicable with freezers. A direct expansion to liquid recirculation general comparison is as follows:

- Lower initial capital investment
- Contain significantly less refrigerant
- High operating costs
- Little operating flexibility
- Difficult to balance
- Compressor must be sized for the lowest temperature zone
- Limited low temperature applications with ammonia

Direct expansion with ammonia has two notable maintaining concerns, for example, ammonia is abrasive for a refrigerant, and lubricating oil is not as miscible in ammonia as it is with halocarbons, leading to difficulties in maintaining oil recirculation in ammonia systems.

2-6.3.2.3 Unitary System.

Unitary system is a packaged unit that is designed and built by a manufacturer; that includes retail display cases, walk-in storage coolers, household refrigerators and freezers, and commercial icemakers. Small refrigeration systems may have their design needs met with unitary systems. Unitary units are recommended for small applications due to the typical benefits over field-assembled units. These benefits are lower capital investment, higher reliability of factory assembled equipment, and comprehensive warranties. This equipment must be supported by a local distributor to provide support and parts.

2-6.4 Equipment Selection.

The refrigeration industry relies heavily on equipment manufacturers. Refrigeration equipment manufacturers provide expertise and information regarding equipment and design. Installing new technological advances in equipment is encouraged, but installing prototypes or new unproven technology is not recommended.

2-6.4.1 Materials of Construction.

Most common ferrous and copper base metals can be used with halocarbons. Not recommended are magnesium, zinc, and aluminum alloys containing more than 2% magnesium in contact with the refrigerant. Most common ferrous metals can be used with ammonia. Copper and alloys containing copper, brass, or alloys containing copper in contact with the ammonia refrigerant must not be used.

Contractors often install halocarbon refrigerant systems with the more stringent ammonia specifications for construction efficiencies. Ammonia components are typically more expensive but some halocarbon systems can be competitive with the ammonia specified components by utilizing experienced ammonia installation technicians

2-6.4.2 Compressors.

Compressors are typically of two types: reciprocating and rotary (screw or scroll). Scroll compressors are limited to lower capacity halocarbon systems. Rotary screw and scroll are increasingly popular due to lower maintenance costs. Screw compressors dominate the refrigeration market. This is mainly due to their high reliability, usually capable of operating over 50,000 hours between overhauls, and the selection of capacities of commercially available equipment. Commercially available motor driven capacities range from 25 horsepower (20 kilowatts) to over 1675 horsepower (1250 kilowatts). The recommended compressor for refrigeration service is a screw type compressor that comes as a package unit. The screw compressor package units consist of screw compressor, motor, coupling, oil separator, local logic controller, oil pump and filter. Refer to *ASHRAE Handbook – HVAC Systems and Equipment*.

2-6.4.3 Condensers.

Condensers are air or water-cooled. Halocarbon systems are usually air cooled, but water-cooled units are available. Ammonia systems are more often water-cooled. Properly sized water-cooled condensers result in greater efficiency and lower compressor energy consumption. This is offset by considerably higher maintenance costs, water consumption, and more complex systems than air- cooled. Water-cooled condensers are normally used for larger systems. Refer to *ASHRAE Handbook – HVAC Systems and Equipment*.

2-6.4.4 Cooling Towers.

Cooling towers used for condensing refrigerants are typically the closed circuit evaporative type. Refer to *ASHRAE Handbook – HVAC Systems and Equipment*.

2-6.4.5 Liquid Coolers.

Liquid coolers are heat exchangers that are normally used as liquid chilling systems for secondary coolants. Refer to *ASHRAE Handbook – HVAC Systems and Equipment*.

2-6.4.6 Evaporators.

Evaporators are most commonly fan-coil assemblies using propeller direct drive fans with ECM motors. Coil material must be compatible with the refrigerant used and the environment. Proper air distribution, location and quantity of evaporators depend on the load, size and layout of the refrigerated zone. Refer to *ASHRAE Handbook – Refrigeration*.

2-6.4.7 Piping Systems.

Refer to *ASHRAE Handbook – Refrigeration* and *IIAR Ammonia Refrigeration Piping Handbook*.

2-6.4.8 Piping Insulation.

Refer to *ASHRAE Handbook – Refrigeration* and *IIAR Ammonia Refrigeration Piping Handbook*.

2-6.5 Control Systems.

Design control systems, including control software applications, with safety interlocks, alarms, and shutdowns.

2-6.5.1 Programmable Logic Controller (PLC) Systems.

Provide programmable logic controller (PLC) based systems with ladder logic documentation. Alarms with automatic notification must be integrated. Automatic alarm notification must be first to the area supervisor onsite location. If no response, automatic alarm notification must notify the 24-hour watch. This can be accomplished via a dedicated telephone line.

2-6.5.2 Communication and Data Logging Permit Systems.

Control systems, having communication and data logging permit systems to operate at optimum conditions under transient load conditions. This must include staggered startup of multiple compressors and other refrigeration loads. Due to this, and stored product requirements, refrigerated control systems can become complicated. Recommend simple installations if at all possible. Basic control systems for an ammonia liquid recirculation system have approximately 100 input and output (I/O) signals. These include evaporator pressure regulation, backpressure regulation, capacity control, hot gas bypass, room temperature, and concrete slab temperature.

2-6.5.3 Energy Management Systems/Load Shedders.

Before application of energy management systems/load shedders to refrigeration systems, and related fans and pumps, the designer will ascertain that application will be neither conducive to equipment damage nor counterproductive. Safety trips, compressor slugging, freeze-ups, and loading of circuits may become more likely to occur.

2-6.6 Defrosting.

Spaces maintained at 35 degrees F (2 degrees C) will be defrosted with ambient air. Spaces maintained below 35 degrees F (2 degrees C) and environments that seasonal ambient temperatures are cold enough, will use either a hot-gas or electric-heat defrost system. For safety reasons, electric defrost must be avoided on ammonia systems. For a defrosting system, choose between a timer defrost controller or a demand defrost controller.

Timer defrosting is a time initiated and time terminated control method that has an adjustable defrost duration and number of cycles in a 24 hour period. The timer

defrosting is the most common method of defrosting control. Winter and summer conditions require different defrost duration and cycles. Demand defrost is a defrosting control method initiated by measuring the air pressure drop across the coils. Demand defrost is a more efficient defrost control method.

2-6.7 Seismic Zone Requirements.

The geographical location of a facility determines its seismic zone. The seismic zone locations have requirements for building design and restraint of equipment. Refrigeration facilities for cold storage must meet seismic design requirements. Refer to UFC 3-301-01 Structural Engineering at http://www.wbdg.org and the seismic and wind restraint design chapter of the *ASHRAE Handbook – Applications*.

2-6.8 Refrigerant Management.

The Air Force document, *Refrigerant Management Program*, may be of assistance during the preparation of a facility refrigerant conservation and replacement program. The handbook is available on https://www.wbdg.org/FFC/AF/AFMAN/afman32_7089.pdf.

BIA	Bilateral Infrastructure Agreement
CCR	Criteria Change Request
DoD	Department of Defense
ECM	electronically commutated
HQUSACE	Headquarters, U.S. Army Corps of Engineers
HNFA	Host Nation Funded Construction Agreements
HVAC	Heating, Ventilating, and Air Conditioning
IIAR	International Institute of Ammonia Refrigeration
I/O	input and output
NAVFAC	Naval Facilities Engineering Systems Command
NGS	Non-Governmental Standards
O&M	operations and maintenance
OSHA	Occupational Safety and Health Administration
PLC	programmable logic controller
PSM	Process Safety Management Program
RMP	Risk Management Plan
SCBA	self-contained breathing apparatus
SOFA	Status of Forces Agreements
UFC	Unified Facilities Criteria
U.S.	United States

A-2 DEFINITION OF TERMS.

Azeotropic: A precise refrigerant mixture or blend of substances that has properties differing from either of the two constituents.

Design-Bid-Build: Engineering firm furnishes a design, then the design is competitively bid for construction.

Design-Build: Contractor furnishes a designed and constructed facility, usually from a performance specification.

Direct Expansion System: A refrigerant system that has the refrigerant directly entering the air cooling coil.

Flooded Evaporator: A refrigerant system that has liquid refrigerant in the evaporator in amounts larger than can be evaporated and obtains higher efficiencies due to higher heat transfer of wetted surfaces.

Glide: The absolute value of the difference between the starting and ending temperatures of a phase change process by a refrigerant.

Halocarbon: Refrigerant that is a hydrocarbon derivative that contain one or more of the halogens bromine, chlorine, fluorine, or iodine; hydrogen may also be present.

Owner: Tri-service arm having the responsibility of operating and maintaining the subject facility.

FOREWORD

The Unified Facilities Criteria (UFC) system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and applies to the Military Departments, the Defense Agencies, and the DoD Field Activities in accordance with USD (AT&L) Memorandum dated 29 May 2002. UFC will be used for all DoD projects and work for other customers where appropriate. All construction outside of the United States, its territories, and possessions is also governed by Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA), and in some instances, Bilateral Infrastructure Agreements (BIA). Therefore, the acquisition team must ensure compliance with the most stringent of the UFC, the SOFA, the HNFA, and the BIA, as applicable.

UFC are living documents and will be periodically reviewed, updated, and made available to users as part of the Military Department's responsibility for providing technical criteria for military construction. Headquarters, U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering Systems Command (NAVFAC), and Air Force Civil Engineer Center (AFCEC) are responsible for administration of the UFC system. Technical content of UFC is the responsibility of the cognizant DoD working group. Defense Agencies should contact the respective DoD Working Group for document interpretation and improvements. Recommended changes with supporting rationale may be sent to the respective DoD working group by submitting a Criteria Change Request (CCR) via the Internet site listed below.

UFC are effective upon issuance and are distributed only in electronic media from the following source:

- Whole Building Design Guide web site http://www.wbdg.org/ffc/dod.

Refer to UFC 1-200-01, *DoD Building Code*, for implementation of new issuances on projects.

CHAPTER 1 INTRODUCTION

1-1 BACKGROUND.

This Unified Facilities Criteria (UFC), UFC 4-860-01, provides requirements for designing and rehabilitating railroad track, terminal and loading facilities. The requirements contained in this UFC apply to Army, Navy, and Air Force facilities unless specifically referenced to a single service. This UFC is not intended as a substitution for thorough review during design by individual Program Managers, Engineers and Operations Staff in the appropriate service.

The desired goal of this UFC is to maintain consistency in railroad tracks, terminals and loading facilities requirements across the Army, Navy and Air Force. This UFC is not intended as an operational manual.

1-2 REISSUES AND CANCELS.

This UFC reissues and cancels UFC 4-860-01FA, *Railroad Design and Rehabilitation*, dated 16 January 2004.

1-3 PURPOSE AND SCOPE.

This UFC provides technical requirements to design and rehabilitate railroad track, terminals, and loading facilities, along with information on construction. This UFC is for railroad lines operated at speeds and traffic volumes lower than common in the commercial industry. The technical requirements on terminal design are for small terminals handling military cargo: primarily tracked or wheeled vehicles and intermodal containers.

This UFC, supplemented with the specified references, provides information for general purposes. Most projects, however, include aspects that are site-specific or uncommon conditions. Designers are encouraged to obtain assistance when encountering unusual or unfamiliar situations.

1-4 APPLICABILITY.

These instructions are applicable to all DoD elements and their contractors involved with railroad design, construction, and rehabilitation.

1-4.1 Applying the Material in this Manual.

Designing a railroad often involves satisfying conflicting objectives. Throughout the process, the designer must prioritize project objectives and decide what objective to sacrifice to satisfy another. Properly balancing these compromises, tailored to each situation, produces an effective railroad design.

1-4.2 New Lines and Terminals.

To design new railroad lines and terminals, utilize Chapters 2 through 3 and 5 through 7 of this instruction. The design process summary is as follows:

a. Determine the traffic and load carrying requirements. Estimate the number of cars to be processed over the line and magnitude of the wheel loads the track must support.

b. Determine the terminal and support facilities requirements. From the type and magnitude of traffic, determine the number, size, location of loading and unloading facilities (terminals), sidings, wyes, and other support facilities and auxiliary tracks.

c. Establish route profile and alignment guidelines. Based on load carrying requirements, maximum desired speed, locomotive pulling capability, and other operating needs and conditions, select maximum effective grade, horizontal and vertical curvature, and other profile and alignment specifications.

d. Select the route. Through an iterative process, select the best route and profile between the terminals and the connecting commercial railroad, usually the nearest commercial railroad line. Include considerations of climate change on flood resiliency in accordance with the installation master plan and UFC 2-100-01 Installation Master Planning.

e. Design the track, roadway, and terminal and support facilities. From the traffic and wheel load estimates and the characteristics of the selected route, determine track, roadway, and drainage requirements.

1-4.3 Rehabilitation.

For rehabilitating existing lines and facilities, refer to Chapters 4 through 7, along with portions of Chapter 2.

1-5 USING THE AREMA MANUAL FOR RAILWAY ENGINEERING.

The American Railway Engineering and Maintenance-of-Way Association’s Manual for Railway Engineering (AREMA) is a standard industry reference and is cited throughout this technical manual. It contains a wide range of guidance with emphasis on commercial lines carrying substantial freight traffic. As a broad range of specifications is often given, proper use of the AREMA manual requires that the designer select the particular specifications most appropriate for a particular project.

The AREMA manual is written primarily for the commercial railroads that have their own company policies and procedures. The material assumes that many details are unnecessary, as a company’s own practices will govern. Therefore, military designers require details in addition to the material contained in the AREMA manual. In addition, requirements for operating on military railroads differ from those commonly found on commercial railroads. In these cases, the design guidance in this technical manual can vary from that found in the AREMA manual. For these reasons, when preparing

designs and specifications, avoid general statements, such as, “meeting AREMA specifications”. Such statements often leave the choice of materials or procedures wide open and lead to an undesirable or unsatisfactory product. When designing, clearly specify the work task and the acceptable construction materials.

1-6 OVERARCHING CRITERIA OR REGULATORY REQUIREMENTS.

Ensure designs meet all applicable state and local standards for new construction or rehabilitation. Design standards are typically obtained from the appropriate state departments of transportation or public utilities.

In addition, ensure that any new or rehabilitated track regularly utilized by a commercial railroad complies with that organization’s track requirements. Often commercial railroads require review and approval of the proposed design by their engineering department before operating over the proposed track.

1-7 SOURCES OF ASSISTANCE.

Designers are encouraged to seek assistance when questions arise on the best choice to suit a particular situation or for further interpretation of material in this manual or another reference. Obtain assistance through the Army Transportation Systems Center, Omaha, NE (CENWO-ED-TX) or Air Force AFCEC/COSC.

Installations that depend on a commercial railroad service for routine traffic or during a mobilization, contact the owning commercial organization and at a minimum coordinate the arrangement of the interchange yard and other track configurations to facilitate more convenient service.

1-8 GENERAL BUILDING REQUIREMENTS.

Comply with UFC 1-200-01, *DoD Building Code*. UFC 1-200-01 provides applicability of model building codes and government unique criteria for typical design disciplines and building systems, as well as for accessibility, antiterrorism, security, high performance and sustainability requirements, and safety. Use this UFC in addition to UFC 1-200-01 and the UFCs and government criteria referenced therein.

1-9 CYBERSECURITY.

All control systems (including systems separate from an energy management control system) must be planned, designed, acquired, executed, and maintained in accordance with UFC 4-010-06, and as required by individual Service Implementation Policy.

1-10 GLOSSARY.

APPENDIX D contains a list of acronyms, abbreviations, and definitions.

1-11 REFERENCES.

APPENDIX E contains a list of references used in this document. The publication date of the code or standard is not included in this document. Unless otherwise specified, the most recent edition of the referenced publication applies.

CHAPTER 2 DETERMINING TRAFFIC AND LOAD CARRYING REQUIREMENTS

2-1 INTRODUCTION.

The first step in designing a railroad is determining the type and volume of traffic. Traffic type and volume generally govern the size and arrangement of terminal facilities, the number of auxiliary tracks required, and track structure design. Ensure the traffic handling capability at an installation covers existing and foreseeable requirements to include:

- Mobilization outloading.
- Training exercises.
- Installation supply (routine traffic).

Once assembled, review and approve data on traffic volume and type before proceeding with the design process.

2-2 TRAFFIC TYPE.

Information gathered on traffic type includes:

a. Type of cargo processed.

b. Type and size of freight cars.

c. Manner of cargo loading and unloading.

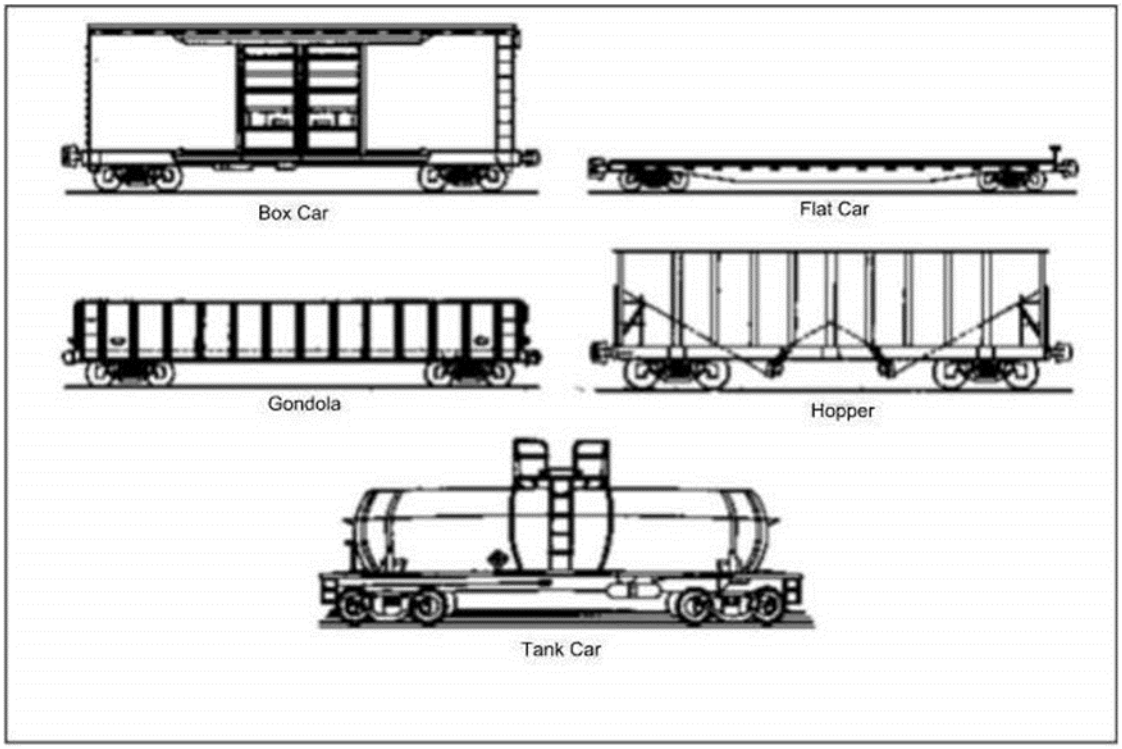
d. Height and width of cargo (for clearance requirements) carried on open cars (flatcars and gondolas).

e. Special requirements or restrictions for loading, unloading, or moving the cargo, especially hazardous cargo.

f. Determine the required type of loading facilities from this information. Chapter 7 covers planning and design for loading facilities. Table 2-1 lists the most common cargo types along with the freight cars and loading facilities to handle the cargo. Figure 2-1 shows common freight car types.

2-3 TRAFFIC VOLUME.

Estimate the amount of traffic using:



a. Maximum number of cars for each traffic type on the installation at any one time, including empty cars.

b. Longest train to accommodate into or out of the installation.

Table 2-1 Common Cargo Type and Loading Requirements

CARGO	CAR TYPE	LOADING/UNLOADING METHOD	FACILITY REQUIRED
Light wheel 0.25 – 2.5 T (0.23 – 2.27 MT)	Auto racks Bi/Tri-levels	Circus-type loading/unloading - staging area and bridge plates are required	Multi-level end ramp
Heavy wheel 5.0 T – HET (4.5 MT – HET)	Flatcar 40 – 140 T (36.3 – 127 MT)	Circus-type loading/unloading - staging area and bridge plates are required.	Permanent/portable end ramp
Light track (APC, Bradley)	Flatcar 40 – 140 T (36.3 – 127 MT)	Circus-type loading/unloading - staging area and bridge plates are required.	Permanent end ramp
Heavy track (Tank: M1, M60)	Flatcar 140 T (127 MT)	Circus-type loading/unloading - staging area and bridge plates are required.	Permanent end ramp
Engineer equipment (Wheel & track)	Flatcar 40 – 140 T (36.3 – 127 MT)	Special load items - crane access next to track may be required. Bridge plates are needed.	Permanent end ramp
40 ft (12.1 m) Container	COFC	Crane w/spreader bar or Rough Terrain Container Handler (RTCH) and yard tractor /trailer tandems.	Container loading facility
20 ft (6 m) Container	COFC	Crane w/spreader bar or RTCH and yard tractor /trailer tandems.	Container loading facility
Conex	Flatcar Gondola	Crane loading/unloading - crane access required next to track.	None
POL (bulk)	Tankcar	Pumping or dumping through a pipe network.	POL handling facility equipped with spill containment
POL (palletized)	Boxcar	Forklift into warehouse or dock, staging area next to dock may be required.	Side loading ramp equipped with spill containment
POL (containerized)	COFC	Crane w/spreader bar or RTCH and yard tractor /trailer tandems.	Container loading facility equipped with spill containment
Ammunition (palletized)	Boxcar	Forklift onto dock, staging area needed next to dock.	Side loading ramp that meets the quantity-distance requirements
Ammunition (containerized)	COFC	Crane w/spreader bar or RTCH and yard tractor /trailer tandems.	Container loading facility that meets quantity-distance requirements
Miscellaneous breakbulk	Boxcar	Forklift onto dock, staging area needed next to dock.	Side loading ramps

Figure 2-1 Common Freight Cars

c. Maximum number of cars of all types on the installation at any one time, including empty cars.

d. Maximum number of cars that each loading facility or terminal area must process in a single loading or unloading cycle.

2-4 WHEEL LOADS.

The magnitude of wheel loads greatly influences track structure design. While many types of cars and loadings may service an installation, for planning purposes, design for the wheel load of the heaviest type of loaded car that commonly travels a particular track. In many cases, engine wheel loads (Army-owned or commercial railroad) represent the heaviest single load on the track. However, the number of wheels of loaded cars typically far exceed the number of locomotive wheels over much of the track. Therefore, the magnitude of the car wheel load governs in most cases. Check both loading conditions before final design.

Obtain the design wheel load by taking the static wheel load for the heaviest commonly used car and add a factor to account for the dynamic effects of travel speed combined with track and wheel irregularities. Table 2-2 lists suggested design wheel loads for planning purposes. To use the table, select the car type in the first column that most closely matches the heaviest car in common use over the track. For terminal areas and around an installation, where speeds are usually limited to 10 mph (16 km/hr), select the design wheel load in the column labeled “<= 10 mph (16 km/hr).” For track connecting the installation with the commercial railroad where train speed exceeds 10 mph (16 km/hr), use the column labeled “10-25 mph (16-40.2 km/hr).” For track mostly used by

an engine during switching, or where mostly empty cars are stored, or otherwise see only occasional use, select from the column labeled “Light Use.”

2-5 LOCOMOTIVE TRACTIVE EFFORT.

2-5.1 Definition.

When designing a railroad route, it is necessary to know the pulling force a locomotive can exert. This pulling force is known as tractive effort. Tractive effort is maximum at starting and diminishes as speed increases.

2-5.2 Application.

Locomotive tractive effort, along with the route gradient and curvature, largely determines the maximum number of cars pulled over the route in a single train. Alternatively, locomotive tractive effort and minimum desired train size can determine the maximum acceptable grade and curvature on a route.

2-5.3 Tractive Effort Data.

Tractive effort data or graphs are often available for both military and commercial locomotives. When not readily obtainable, estimate the data from the locomotive weight and engine horsepower ratings. See Chapter 3, Paragraph 5.

2-6 TRAFFIC AND TERMINALS.

Once the traffic handling requirements are identified, as described in Chapter 2, Paragraphs 1 to 3, start the process of designing the terminal and support facilities. Determine the number and size (or length) of the required facilities and serving trackage from these traffic requirements. Chapter 7 covers planning and design for terminals.

2-7 SOURCES FOR TRAFFIC INFORMATION.

Obtain information about traffic types, car types, and volume, and mobilization requirements from the Installation Transportation Officer (ITO) and from the installation Transportation System Capability Study prepared by the Transportation Engineering Agency of the Military Traffic Management Command (MTTE-SEF).

Table 2-2 Common Car Types and Design Wheel Loads

Most Common Heavy Car	Design Wheel Load		
	10-25 mph (16-40.2 km/hr)	<= 10 mph (16 km/hr)	Light Use
Box, 40T	20,000 lb	17,600 lb	16,000 lb

CHAPTER 3 ESTABLISHING ROUTE PROFILE AND ALIGNMENT

3-1 INTRODUCTION.

Use the procedures in this Chapter (along with information on locomotive propulsion force, desired train capacity, propulsion resistances, and train operating requirements) to select the maximum grade and curvature and minimum transitions between grades and reverse curves.

Use these specifications as guidelines as construction costs vary depending on topography and other geological factors. Typically, the information and procedures described in this Chapter are used iteratively with those in Appendix A until a suitable solution is reached. Appendix B gives a sample problem illustrating the determination of a ruling grade. The specifications listed in this chapter are primarily for main running tracks. Chapter 7 gives additional profile and alignment specifications for terminal areas. Paragraphs 2 and 3 of Chapter 5 detail layout of horizontal and vertical curves.

3-2 GRADES AND GRADE RESISTANCE.

3-2.1 Definition.

Railroad grades are designated by the amount of elevation change in 100 ft (30.5 m) of length, expressed in percent. The additional force required to move a train, due to the presence of a grade, is known as grade resistance. Grade resistance equals 20 lb. per ton of train weight per percent grade. Thus, it takes twice the force to pull a train up a 2-percent grade as it does a 1-percent grade to overcome grade resistance. For this reason, the choice of maximum gradient greatly effects route operations.

3-2.2 Ruling Grade.

When a particular grade limits train size (tonnage) and speed over a route, that grade is known as the ruling grade. The ruling grade is not always the steepest grade, as a train’s momentum can carry it over a grade steeper, but shorter, than the ruling grade.

3-2.3 Grade Design Categories.

Table 3-1 lists grade design categories for main running tracks.

Table 3-1 Grade Design Categories for Main Running Tracks

Grade	Description
0.0 to 0.4 %	Light
0.4 to 1.0 %	Moderate
1.0 to 2.0 %	Steep
1.5 %	Suggested Limit for Ruling Grades
2.0 to 3.0 %	Very Steep: Approval required by the AHJ

3-3 ROUTE PROFILE AND TRANSITIONS BETWEEN GRADES.

3-3.1 Profile and Grade Length.

A route's profile is characterized by the steepness of grades and changes in grade along the route. Train operations are enhanced by avoiding frequent changes between ascending and descending grades (a rolling profile). Simplify route design and construction by avoiding frequent changes in grade steepness. Table 3-2 shows recommended minimum grade lengths.

Table 3-2 Recommended Minimum Grade Lengths

Maximum Speed	Between Different Ascending or Descending Grades	Between Ascending and Descending Grades
15 MPH (24.1 km/hr) or Less	500 Feet (152.4 m)	1000 Feet (304.8 m)
Above 15 MPH (24.1 km/hr)	1000 Feet (304.8 m)	1500 Feet (457.2 m)

3-3.2 Transitions between Grades.

Transitions between grades are made with vertical curves. These transitions are necessary for smooth train operation, but they increase the amount of surveying and staking required and are more difficult to construct than uniform grades.

Design guidance for grade transitions is given in Paragraph 2.2 of Chapter 5.

3-4 CURVATURE, CURVE RESISTANCE, AND EFFECTIVE GRADE.

3-4.1 Minimizing Curvature.

In general, sharper curves require more maintenance than gradual curves; they experience more rail side wear and gage widening. They also create more propulsion resistance. Minimizing curvature in a route provides long term benefits.

3-4.2 Curve Design Categories.

Table 3-3 shows curve design categories for main running tracks and terminal tracks.

Table 3-3 Curve Design Categories

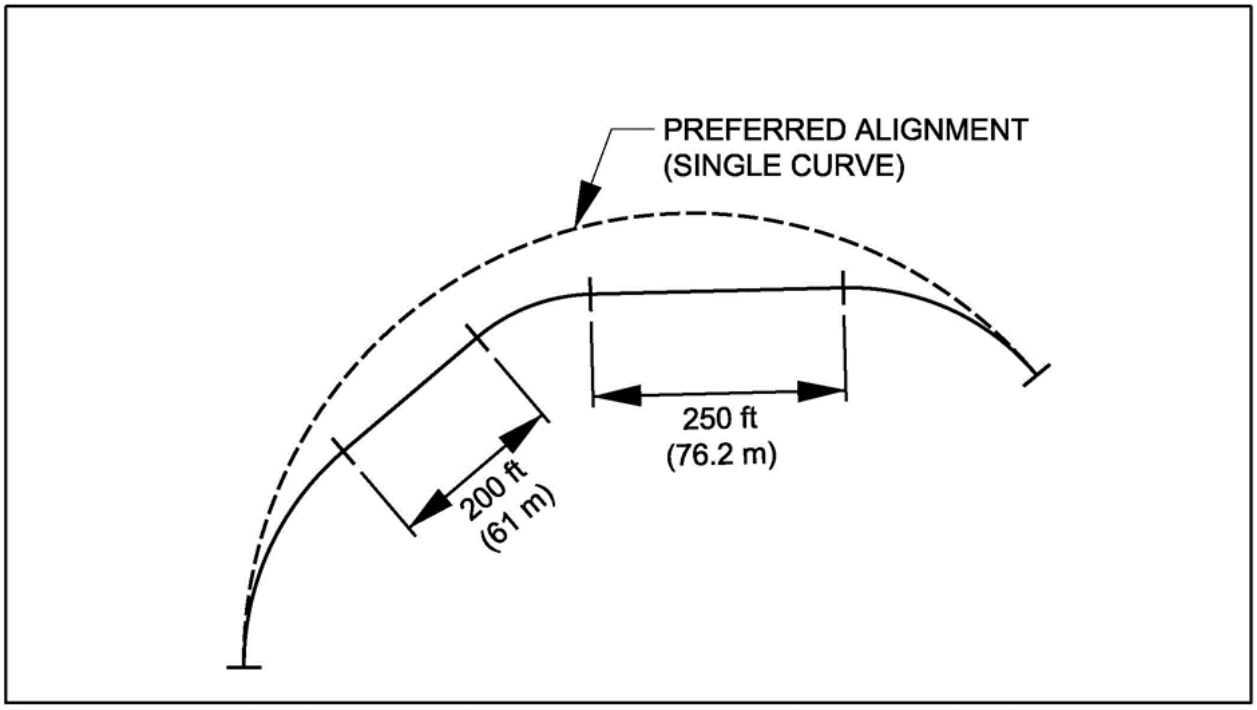
Main Running Tracks	
Degree of Curve	**Design Category**
0 - 3	Gradual
3 - 6	Moderate
4	Preferred limit, especially where speeds will exceed 15 MPH (24.1 km/hr)
6 - 8	Sharp
8	Maximum allowable where speeds may exceed 10 MPH (16 km/hr)
10	Maximum allowable where speeds will not exceed 10 MPH (16 km/hr)
Terminal Tracks	
Degree of Curve	**Design Category**
10	Preferred limit, especially for lead tracks and where number 9 or 10 turnouts are the smallest recommended turnout size per Chapter 6
12	Maximum allowable

See Chapter 5, Paragraph 3 for additional horizontal curve design information.

3-4.3 Combining Curves.

When designing a route, accomplish changes in direction uniformly. Avoid a series of curves connected by short tangents. Where the distance between adjacent curves of

the same direction is less than 300 ft (91.4 m), try to combine the two curves into one long curve of smaller degree (see Figure 3-1). Combining closely spaced curves usually provides advantages of less design work, easier construction, and reduced long-term track maintenance.



3-4.4 Curve Resistance.

Curvature adds to propulsion resistance at an average rate of 0.8 lb for each ton (.4 kg for each Metric ton) of train weight for each degree of curve. As a 1-percent grade adds resistance of 20 lb per ton (10 kg per Metric ton), a 1- degree curve is then equivalent in resistance to a 0.04-percent grade.

3-4.5 Curve Compensation.

When laying out a route, account for the additional resistance due to curvature. This procedure is known as curve compensation. Compensating a grade for curvature is almost always required for ruling grades and is recommended for grades in moderate and higher categories. Curve compensation is sometimes omitted where curves are very short or of gradual degree.

Figure 3-1 Combining Curves

When calculating curve compensation, reduce grades on curved track by the following:

Equation 3-1. Grade Reduction

$$G_r = 0.04 \times D$$

Where:
G_r = Amount of grade reduction (percent)
D = Degree of curvature (decimal degrees)

3-4.6 Actual and Effective Grade.

Table 3-4 illustrates curve compensation for a 1-percent grade. As shown, if a train travels around a long curve of 4 degrees on a 1-percent grade (uncompensated), the combined resistance is equal to a 1.16 percent grade. To maintain an effective grade (as experienced by the train) of 1-percent, the actual grade constructed through the 4-degree curve must be limited to 0.84-percent. Since the actual grade is reduced, compensating for curvature requires a longer track length to reach a given elevation.

Table 3-4 Curve Compensation for a 1 Percent Grade

Degree of Curve	Uncompensated Grade		Compensated Grade	
	Actual	Effective	Actual	Effective
1	1.00	1.04	0.96	1.00
2	1.00	1.08	0.92	1.00
3	1.00	1.12	0.88	1.00
4	1.00	1.16	0.84	1.00
5	1.00	1.20	0.80	1.00
6	1.00	1.24	0.76	1.00

3-5 LOCOMOTIVE TONNAGE RATING.

3-5.1 Definition.

The maximum train weight a locomotive can pull over a route is known as its tonnage rating. Tonnage ratings are affected by many factors, but locomotive tractive effort and ruling gradient are among the most important.

3-5.2 Application of the Procedures.

The procedures for estimating locomotive tractive effort and tonnage ratings presented below are simplified versions intended for route design purposes. Do not use these procedures to make-up and dispatch actual trains.

3-5.3 Tonnage Requirements, Locomotive Assignments, and their Effect on Route Design.

Design the route to allow trains of sufficient size to travel over the finished line. Determine the maximum train size from usable locomotive tractive effort and the gradients and curvature along the line. When designing, verify tonnage requirements with the appropriate transportation officers, as well as understand the general operating plan for routine traffic, training exercises, and mobilization.

On military railroads using government owned and operated engines, these engines might handle all routine traffic, but during training exercises or mobilization, a commercial engine can handle over-the-road operations, while the installation's engine takes care of switching and short moves. Alternatively, when installations have more than one engine, two engines can be used for maximum tonnage trains. Thus, in addition to tonnage requirements, also understand the local standard practice of locomotive use.

3-5.4 Determining Locomotive Tractive Effort.

3-5.4.1 Locomotive Capability.

Base tonnage ratings on curves when tractive effort curves are available for the locomotives. Otherwise, use expressions in Table 3-5 for tractive effort.

Table 3-5 Estimating Locomotive Tractive Effort

Speed Range	**Tractive Effort**
Starting to 10 MPH (16 km/hr)	TE = 30 x HP
Over 10 MPH (16 km/hr)	TE = 300 x HP / V
TE = Tractive Effort (in pounds) HP = Locomotive Rated Engine Horsepower V = Traveling Speed (MPH)	

3-5.4.2 Adhesion Limit.

Regardless of locomotive power, wheel rail adhesion limits the usable tractive effort. For design purposes, do not exceed W/4 usable locomotive tractive effort, where W is the weight of the locomotive in pounds.

3-5.5 Determining Tonnage Rating.

While tonnage ratings are commonly given in gross trailing tons (total weight of cars and loads), a convenient practice is to express tonnage ratings as the number of loaded cars a locomotive can pull, using an average or representative car and load for estimating purposes. Use Equation 3-2, along with Table 3-6 for selecting design car gross weight based on the nominal car carrying capacity. The constants 3 and 20 in Equation 3-2 indicate that an average car has a rolling resistance of 3 lb (1.4 kg) for each ton of its gross weight and that all equipment requires 20 lb (9.1 kg) to lift each ton of weight up each percent of grade. Any curvature on the maximum grade is assumed to be grade compensated, as described in Paragraph 4 of Chapter 3.

Equation 3-2. Design Gross Car Weights

$$N_{cars} = \frac{TE}{[3 + (20 \times \%G)]W_g}$$

Where:
N_{cars} = Number of cars locomotive can pull
TE = Usable locomotive tractive effort at desired speed (lb)
%G = Maximum ascending gradient long enough to contain the whole train (percent)
W_g = Gross weight of representative car (tons), from Table 3-6

Table 3-6 Design Gross Car Weights

Nominal Car Capacity Tons (MT)	70 (63.5)	80 (72.6)	90 (81.6)	100 (90.7)	120 (109)	140 (127)
Design Gross Weight Tons (MT)	105 (95.2)	115 (104)	125 (113)	135 (122)	160 (145)	190 (172)
Note: 140-ton (127 MT) cars (nominal capacity) are representative of those carrying 2 M1 Tanks.						

For field check, car capacity is normally stenciled on the side of each car in pounds. Capacity is labeled as CAPY on each car. For example, the marking on a 70-ton car would appear as: CAPY 140000.

3-6 TRIAL RULING GRADE.

Determine a trial percentage for the ruling grade for the first stages of route selection using Equation 3-3. The 0.15 constant in the equation indicates that the average rolling resistance for each car is equivalent to pulling the car up an additional 0.15-percent grade.

Equation 3-3. Trial Percentage for the Ruling Grade

$$G = \frac{TE}{20(W_{eng} + N_{cars} \times W_g)} - 0.15$$

Where:
G = Effective ruling gradient (percent), where the grade length is equal or greater than train length
TE = Usable locomotive tractive effort (pounds)
W_{eng} = Weight of Engine(s) (tons)
N_{cars} = Number of cars in train
W_g = Average gross weight of a car (tons)

As described in Paragraph 4 of Chapter 3, grade compensate all curvatures within the limits of the ruling grade. A ruling grade that is steeper, but shorter, than the calculated ruling grade can be used if the total train resistance of the cars on the grade and the cars off the grade does not exceed usable locomotive tractive force.

CHAPTER 4 REHABILITATION: TRACK, BRIDGES, AND TERMINALS

4-1 DEFINITION AND APPLICATION.

As used here, “rehabilitation” refers to work that falls between routine maintenance and new construction. It is often categorized as repair, minor construction, or a combination of the two. Rehabilitation involves restoring facilities to a “like new” condition and/or upgrading existing facilities to current design standards or installation requirements.

During the planning process, first establish current and future installation requirements. If subsequent investigations and analyses show that existing facilities can meet installation requirements through improving their condition and/or minor modifications, then rehabilitation is an appropriate option. Consider rehabilitation when:

- Routine track inspections reveal multiple defects that require speed restrictions or taking a track out of service.
- The track is not maintained or is out of service for an extended period.
- The track sustained multiple derailments.
- The condition of the track jeopardizes the facility’s mission.

4-2 INSTALLATION REQUIREMENTS AND FACILITY EVALUATION.

Review installation traffic and load carrying requirements, as described in Chapter 2. Then, crosscheck structural and operational requirements according to the criteria in Chapters 5, 6, and 7. Evaluations determines whether the track and facilities meet installation (mission) requirements, and if not, how they are deficient. Make these determinations through condition, structural, and operational evaluations.

4-3 CONDITION EVALUATION.

4-3.1 Level of Detail Required.

Condition evaluations occur in three stages or levels, depending on the size and scope of the project.

4-3.1.1 First Stage.

At the first stage, make a quick condition assessment based on recent inspection reports and inventory data and conduct a brief field survey. This assessment establishes the general rehabilitation requirements.

4-3.1.2 Second Stage.

The second stage is an evaluation for developing a rehabilitation plan. This information requires sufficient detail to determine the work needed at each location and to develop cost estimates for planning and budgeting purposes.

4-3.1.3 Third Stage.

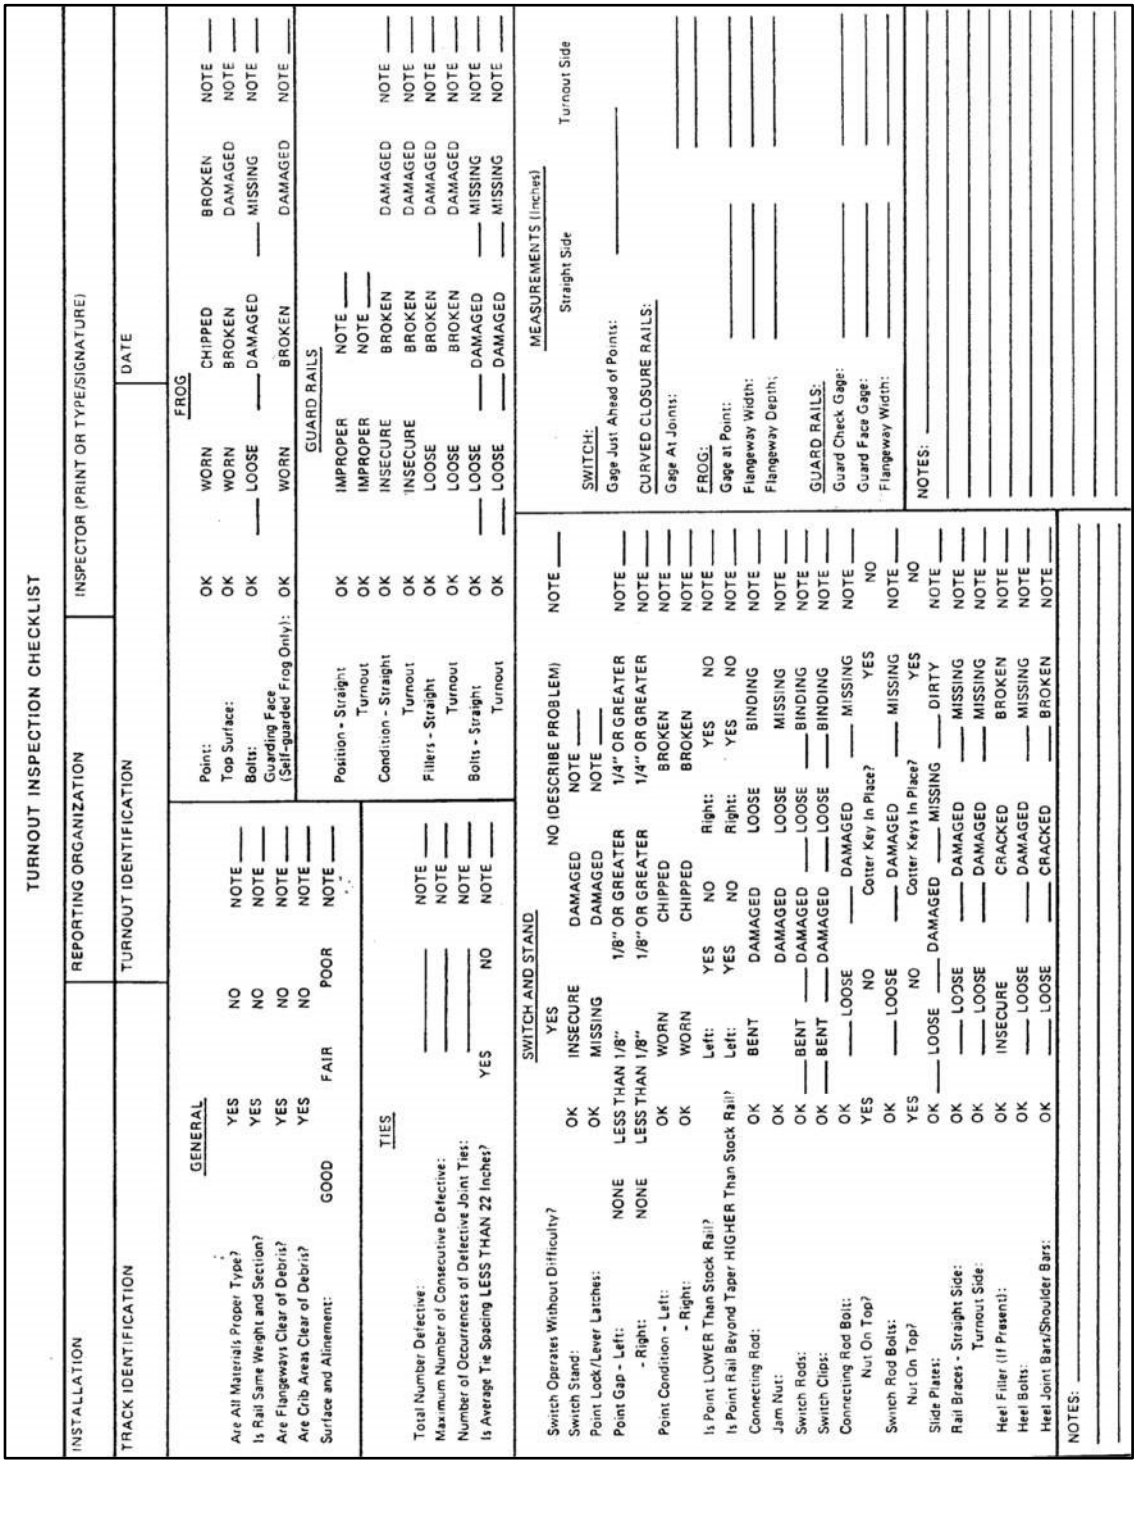
At the third level, determine the exact work requirements, quantities, and locations for final contract plans and specifications.

4-3.2 Track.

Evaluate track condition based on the criteria given in UFC 4-860-03 and other major rehabilitation requirements. In addition, estimate major deficiencies expected within the next 3 to 5 years if rehabilitation is not performed. If the installation has more than five miles of track, consider using automated hi-rail track geometry testing to measure track gage, the horizontal curvature of the track, cross-level, and warp. The hi-rail geometry testing can measure approximately 15 miles of track per day, which would take several days to measure using manual, hand-held equipment. The hi-rail equipment uses GPS to track the location of the inspection results. This produces reports and interactive computer maps of the results that aid in preparing rehabilitation plans. Perform tie inspections, joint inspections, and turnout inspections using manual methods when utilizing hi-rail track geometry testing. Record current track deficiencies on a field report form.

Before completing the rehabilitation plan, perform an internal rail inspection if one has not been performed within the last 5 years. Thoroughly inspect all turnouts in the track intended for rehabilitation, including operation of the points. Figure 4-1 shows an example of the type of turnout inspection information commonly collected. Use other available forms, designed for routine maintenance requirements, if convenient.

4-3.3 Bridges.



Include a condition assessment of bridges on any line to be rehabilitated. This assessment can come from the last annual inspection, if that inspection is less than 6 months old. Otherwise, conduct a new condition assessment.

If a triennial inspection is due within 6 months for any bridge on a line to be rehabilitated, conduct the triennial inspection and load rating per Chapter 4, Paragraph 4 as part of the rehabilitation plan. If the last annual inspection indicates any significant change in condition of a main bridge member since the previous load rating, thoroughly inspect and load rate at least the included span or spans of the bridge per Chapter 4, Paragraph 4 as part of the rehabilitation plan.

4-3.4 Terminal and Support Facilities.

Evaluate the condition of all terminal and support facilities. Report this evaluation separately from the track evaluation.

4-4 STRUCTURAL EVALUATION.

Perform a structural evaluation for all track, bridges, loading ramps, and other structures needed for railroad and terminal operations to determine current load carrying capacity. Use the computer program described in Chapter 5, Paragraph 6.1 for track structural evaluations.

4-4.1 Bridges.

The design capacity and present condition of the bridges along the route can determine the load-carrying capability of a railroad line. Have a practicing railroad bridge engineer examine and rate all bridges not thoroughly inspected and load rated within the previous three years. Conduct the rating in accordance with the AREMA manual for timber, concrete, and steel bridges.

Most military railroad bridges are of conventional timber design, built to an E60 rating. If these bridges are in very good condition, this capacity suffices for typical military traffic levels, including 140-ton (127 MT) heavy equipment flatcars. According to the AREMA rating guidelines, the in-service rating for bridges in very good condition can exceed their design rating. Additional material on bridge design ratings is found in Chapter 6, Paragraph 2.

4-5 OPERATIONAL EVALUATION.

Perform an operation evaluation on track and facilities to determine general suitability for mission requirements. Begin the evaluation with a check of track and facility capabilities along with basic geometric requirements, including:

- Number of loading and service tracks and usable car capacity of each.
- Car capacity of storage, yard, and auxiliary tracks.
- Clearances.
- Loading ramp height, width, and ramp slope.
- Size of parking and staging areas.
- Size of storage buildings in terminal areas.
- Track geometry.
- Maximum track curvature.
- Minimum turnout size.
- Protection and visibility at road crossings.

For terminals, evaluate the adequacy of lighting, service roads, and security features. For all track and facilities, check the adequacy of drainage. Include previous derailment sites and chronic problem areas in the evaluation.

4-6 THE REHABILITATION PLAN.

4-6.1 Purpose and Content.

The rehabilitation plan justifies the need for the recommended work. Document in the plan a thorough analysis of the existing facilities along with a clear presentation of mission requirements. The plan includes:

- Statement of installation (mission) requirements.
- Description of track and facilities and their current condition.
- Statement of deficiencies, based on condition, structural, and operational evaluations.
- A work plan of remedial actions to correct deficiencies, including an explanation of why the proposed actions were chosen over other alternatives.
- Cost estimates for each item in the work plan. Each of these items is discussed below. Appendix C contains an example track rehabilitation report; a similar format would also be used for bridges and terminal and support facilities. Appendix C presents realistic rehabilitation requirements and illustrates how track rehabilitation is commonly done. Use the plan as a guide in preparing track rehabilitation plans, particularly the sequential description of work.

4-6.2 Mission Requirements.

These are the current and expected future needs for regular traffic, training exercises, and mobilization, including amount and type of cargo, number and type of railroad cars to be handled, and terminal and support facilities requirements.

4-6.3 Description of Track, Bridges, and Facilities.

This includes a written description of facilities and their condition, along with track maps and photographs. If not previously done, assign a unique number or other designation to each track, bridge, and turnout. Mark each track with standard surveyor's stationing to help determine work and material quantities (from track lengths) and work locations, and to provide permanent reference location marks for future track inspections. In general, start track stationing with 0+00 at the point of the switch where the track branches from the main track, or for a main track, at the point where government ownership begins - at the connection with the serving commercial railroad.

4-6.4 Deficiencies List and Analysis.

Included in this section is a description of the major deficiencies found and an explanation of how these conditions interfere with, or prevent, the facilities from effectively supporting the required mission. As part of this explanation, compare the existing facilities to recommended design criteria. Include photographs to document deficiencies.

4-6.5 Work Plan.

The work plan lists recommended remedial actions for correcting deficiencies, along with the intended work limits. Within the work plan, clarify why these actions were chosen, and their advantages and benefits over other alternatives. For example, when a structural analysis indicates the need for a heavier rail section, eliminating the lighter rail often allows the installation to standardize with only one or two rail sections, thus requiring storing fewer sections for maintenance requirements and perhaps eliminating a section for which joint bars or additional pieces of rail are hard to find.

If the rehabilitation plan serves as the final plan and contract specifications, include all details of work in the work plan. Where appropriate, identify elimination of unneeded track, the possibility of re-using track materials elsewhere within the installation where traffic and structural requirements are lower, and the cost-effective sale, transfer (to another installation), or disposal of scrap and salvageable materials. For rehabilitation, re-gage the track if the existing gage is less than 56-1/4 in. (1.429 m) or greater than 57 in. (1.448 m).

4-6.6 Cost Estimates.

For plans for major rehabilitation, base cost estimates by pricing the major work items, with extra allowances for minor work at other locations and additional minor work within the major work locations or work categories. When the rehabilitation plan is done in one stage, the cost estimates must also serve for the contract plans and specifications. In this case, provide a more detailed cost estimate breakdown.

4-7 FINAL PLANS AND SPECIFICATIONS.

4-7.1 Detailed Work Plan.

Clearly define all work for the final contract plans and specifications. If not previously done, conduct a thorough inspection of all included facilities to assure correctness of work requirements, work locations, and work and material quantities.

4-7.2 Marking Parts for Replacement.

Individually mark all ties, rail, joint bars, bridge members, and other components intended for replacement and the limits for all work locations. When marking defective parts, especially ties, bridge members, switch points, and frogs, ensure those items in marginal condition (less than 3 to 5 years additional life) are included and marked for replacement.

4-7.3 Top-of-Rail Profiles.

When adding ballast to the track, and raising the track by 3 in. or more, take top-of-rail profiles (elevations along the top of the rail at 50 to 200-ft (15.2 to 61 m) intervals) to verify the final surface more easily. These profiles help in estimating ballast quantities. This is especially useful for poor existing track surfaces, as low areas require adjustment more than average to restore a smooth final surface.

Initial top-of-rail profiles are useful for track along loading docks to ensure proper car floor height at the dock. Take top-of-rail profiles wherever overhead clearances are tight.

4-7.4 Drainage Profiles and Cross Sections.

Before making final plans and estimates, take ditch profiles and cross sections to determine final ditch gradients and check earthwork quantities. Use these profiles to specify the exact work necessary and to guide the contractor's work in the field.

4-7.5 Handling Scrap and Salvage Materials.

Ensure rehabilitation contracts and specifications require neatly stacking and/or bundling scrap rail and other track materials in a designated storage area for later disposal. Also include, separating salvageable rail and other track material (OTM) by type and weight, stacking or containerizing, and storage in a designated area for reuse by the installation or shipment to another installation.

If the contractor retains scrap materials, the government receives a cost credit for that amount of scrap. This cost credit equals the fair scrap value less a small amount for handling and transporting the material.

4-8 CONSTRUCTION AND ON-SITE INSPECTION.

Quality on-site inspections, during all remedial work, are essential for successful track rehabilitation. While inspection is no substitute for competently performed track work, it assures that all work is performed according with contract specifications. On-site inspection during rehabilitation work can reveal deficiencies or errors that are difficult to detect during a completion inspection, or expensive to correct if discovered after completion. Such items include:

a. Was all excess vegetation removed before ballast was unloaded?

b. For completely rebuilt track in crossings, was the old ballast completely stripped? Was the subgrade properly graded? Was drainage fabric installed? Were all new ties installed?

c. Did the track actually receive a full 3-in. (76 mm) raise (or were the rough spots just smoothed out)?

d. Was every tie tamped? Did each tie get two insertions by the tamper? Did joint ties (on the joint side only) get a third insertion? Likewise, correcting the following items after the work is done is difficult:

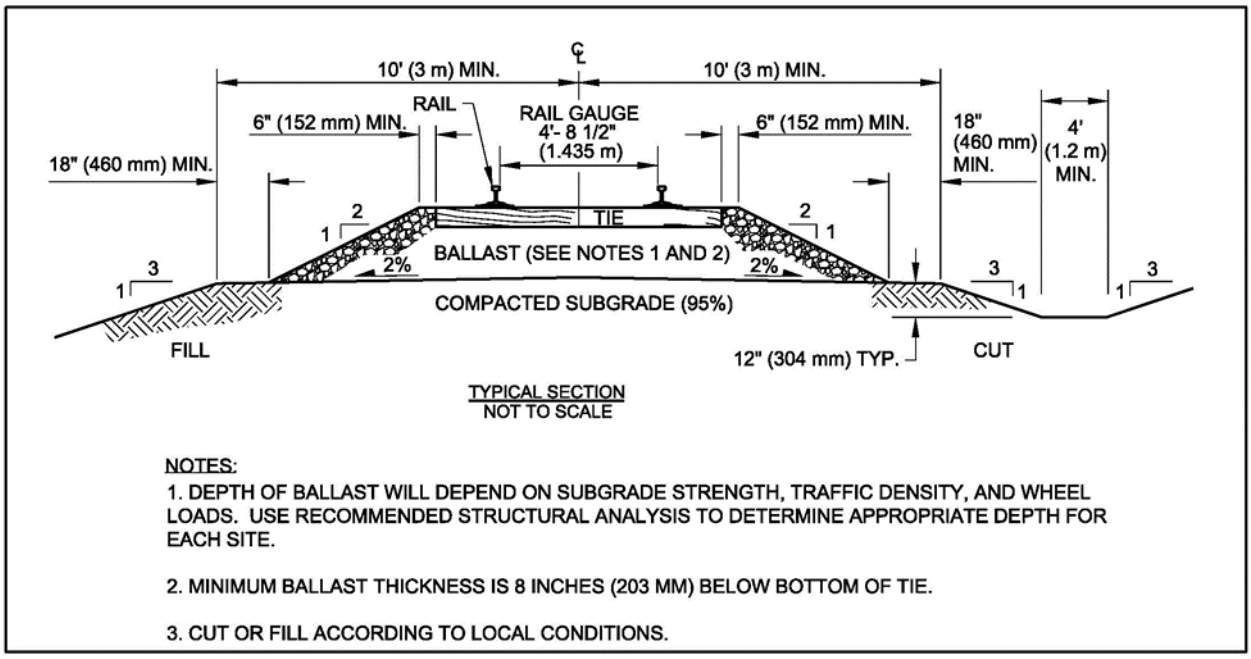
- Tie and ballast material not as specified in the contract.
- Old, fouled ballast in shoulders not fully plowed out before new ballast unloaded.
- Culvert improperly positioned, or site not graded properly before culvert was installed.

- Defective concrete or insufficient reinforcing in loading ramp.

Use the same people that prepared the design and specifications to inspect the work.

CHAPTER 5 TRACK AND ROADWAY DESIGN

5-1 ROADWAY.



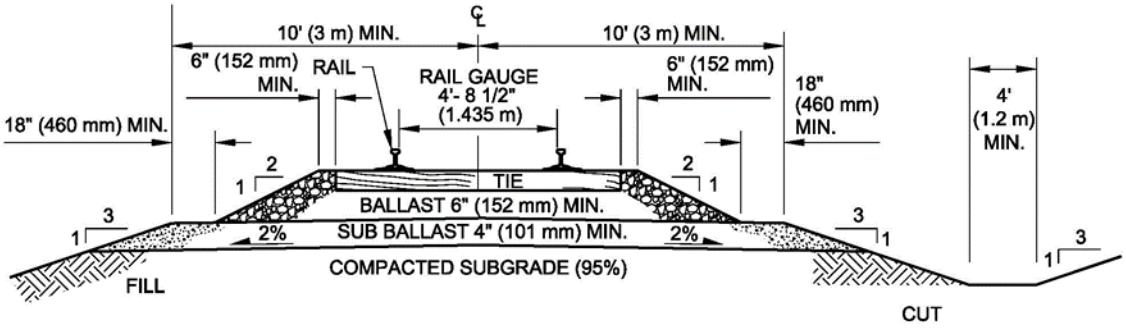
5-1.1 Definition.

The roadway is the strip of land containing the track, ditches, and other facilities needed for the operation of the railroad.

5-1.2 Roadway Width.

Roadway widths are wide enough to accommodate the track, side ditches, portions of embankment or cut slopes, parallel service roads, and other structures and facilities necessary for the operation of the railroad. The roadway must also allow sufficient clearances between the track and adjacent structures, as covered in Chapter 5, Paragraph 4. Figures 5-1 through 5-7 indicate the width required for the basic track structure. The roadway width must also meet the minimum requirements of the serving railroad, whichever is greater.

Figure 5-1 Typical Cross Section – Tangent Track



NOTES:

1. DEPTH OF BALLAST WILL DEPEND ON SUBGRADE STRENGTH, TRAFFIC DENSITY, AND WHEEL LOADS. USE RECOMMENDED STRUCTURAL ANALYSIS TO DETERMINE APPROPRIATE DEPTH FOR EACH SITE.

2. MINIMUM BALLAST THICKNESS IS 8 INCHES (203 MM) BELOW BOTTOM OF TIE.

3. CUT OR FILL ACCORDING TO LOCAL CONDITIONS.

Figure 5-2 Typical Cross Section with Sub-Ballast Layer – Tangent Track

2. MINIMUM BALLAST/SUB BALLAST THICKNESS IS 10 INCHES (254 MM) BELOW BOTTOM OF TIE.

3. THICKNESS OF BALLAST AND SUB BALLAST MAY BE VARIED TO OBTAIN BEST STRUCTURAL AND ECONOMIC DESIGN WHILE MEETING MINIMUM THICKNESS REQUIREMENTS.

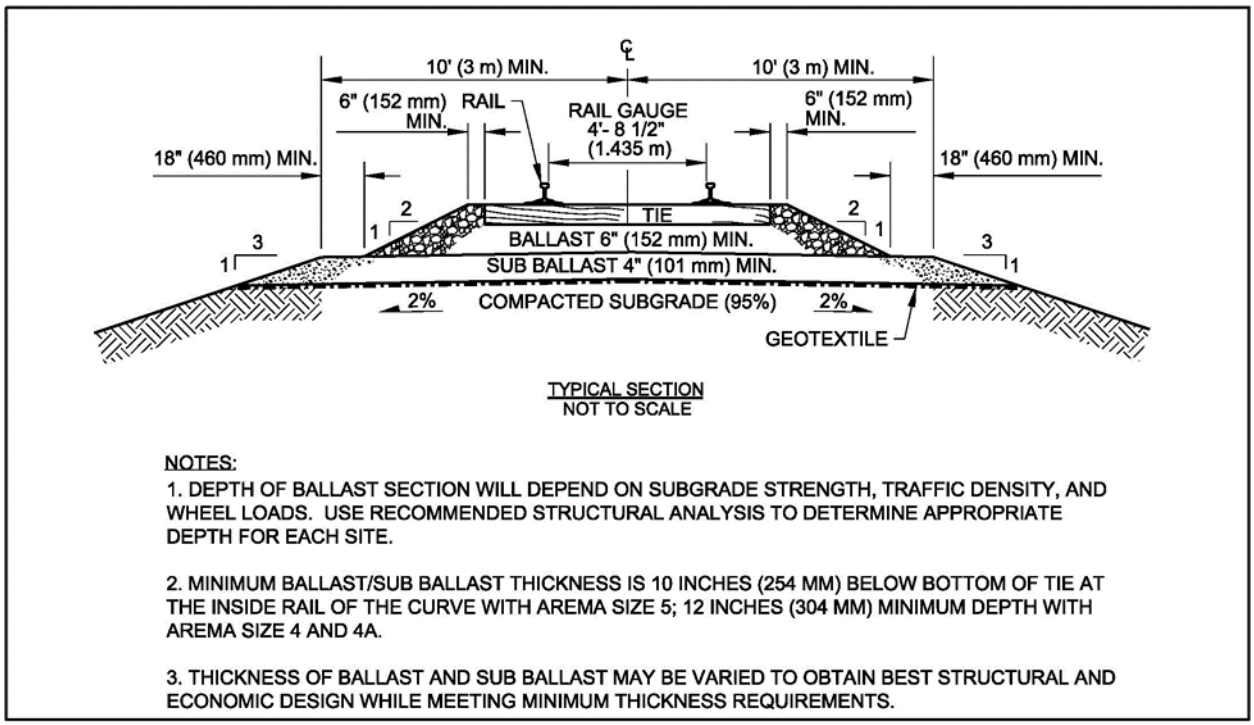
4. ON CURVES OF 6 DEGREEA OR GREATER, USE A BALLAST SHOULDER WIDTH OF 8 INCHES (203 MM).

5. CUT OR FILL ACCORDING TO LOCAL CONDITIONS.

Figure 5-5 Typical Cross Section – Track with Adjacent Service Road

NOTES:

1. DEPTH OF BALLAST SECTION WILL DEPEND ON SUBGRADE STRENGTH, TRAFFIC DENSITY, AND WHEEL LOADS. USE RECOMMENDED STRUCTURAL ANALYSIS TO DETERMINE APPROPRIATE DEPTH FOR EACH SITE.



2. MINIMUM BALLAST/SUB BALLAST THICKNESS IS 10 INCHES (254 MM) BELOW BOTTOM OF TIE.

3. TO BE USED ONLY WHERE A SERVICE ROAD IS REQUIRED. SERVICE ROAD TURN AROUND REQUIRED EVERY 2,000 FEET.

4. SUB BALLAST WILL BE A MINIMUM OF 4 INCHES (101 MM) DEEP.

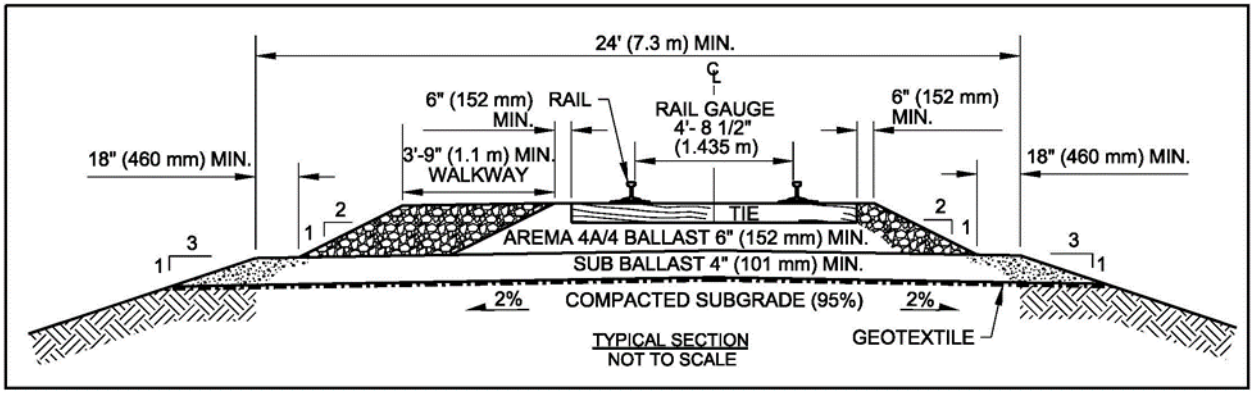
5. CUT OR FILL ACCORDING TO LOCAL CONDITIONS.

Figure 5-6 Typical Cross Section with Sub-Ballast Layer and Geotextile

NOTES:

1. DEPTH OF BALLAST SECTION WILL DEPEND ON SUBGRADE STRENGTH, TRAFFIC DENSITY, AND WHEEL LOADS. USE RECOMMENDED STRUCTURAL ANALYSIS TO DETERMINE APPROPRIATE DEPTH FOR EACH SITE.

2. MINIMUM BALLAST/SUB BALLAST THICKNESS IS 10 INCHES (254 MM) BELOW BOTTOM OF TIE AT THE INSIDE RAIL OF THE CURVE WITH AREMA SIZE 5; 12 INCHES (304 MM) MINIMUM DEPTH WITH AREMA SIZE 4 AND 4A.



3. THICKNESS OF BALLAST AND SUB BALLAST MAY BE VARIED TO OBTAIN BEST STRUCTURAL AND ECONOMIC DESIGN WHILE MEETING MINIMUM THICKNESS REQUIREMENTS.

5-1.3 Walkways.

Walkways are required around turnout switch stands and next to tracks where personnel regularly walk to inspect railroad cars or access railroad cars to load and/or secure equipment. Walkways require additional roadway width. Walkways are not required where a service road parallels the track.

To facilitate easier walking, construct walkways of smaller-sized ballast than is used for the main track section. AREMA Size 5 ballast is typically used for walkways. A typical cross session showing a track with a walkway is shown in Figure 5-7.

Figure 5-7 Typical Cross Section – Track with Adjacent Walkway

5-1.4 Snow Allowance.

In areas with heavy snowfall, allow for additional roadway width or ditch width to provide sufficient room for snow plowed from the track.

5-2 GRADES AND TRACK PROFILE.

5-2.1 Grades.

Chapter 3 gives gradient criteria for main running tracks. Chapter 7, Paragraph 3 gives gradient criteria for terminal areas.

5-2.2 Vertical Curves.

Vertical curves are required to transition between different grades. Transition rates are different for summits and sags. A summit refers to a convex curve where an ascending grade changes to a flatter grade, where a descending grade changes to a steeper grade, or where an ascending grade changes to a descending grade. Sags are concave curves that occur where an ascending grade changes to steeper grade, where a descending grade changes to flatter grade, or where a descending grade changes to an ascending grade. Note: Avoid locating turnouts in vertical curves. Table 5-1 shows recommended transition rates between grades. Determine the length of track required for these transitions from Equation 5-1. Vertical curves should have a minimum length of 100 ft.

Equation 5-1. Track Transitions

$$L = \frac{G_1 - G_2}{r} \times 100$$

Where:
L = Length of track required for vertical curve (ft)
G1 and G2 = Slope of the two adjacent grades (percent), where ascending grades have a positive value and descending grades have a negative value
r = Rate of change in grade in 100 ft (30.5 m)

Table 5-1 Recommended Transition Rates (r) between Grades

Main Running Track		
Summits	**Sags**	**Operating Application**
0.1	0.05	Average rate where speeds will exceed 15 MPH (24.1 km/hr) and right-of-way length is ample.
0.2	0.1	Average rate where speeds will not exceed 15 MPH (24.1 km/hr) or where transition length is limited.
0.3	0.15	Maximum rate where speeds will exceed 15 MPH (24.1 km/hr).
0.4	0.2	Maximum rate where speeds will not exceed 15 MPH (24.1 km/hr).
Terminal Tracks		
Summits	**Sags**	**Operating Application**
1.0	0.6	Preferred rate for terminal tracks
2	1.2	Maximum rate for terminal tracks

5-2.3 Track Profile.

Avoid a rolling profile (frequent changes in gradient) on main running tracks or terminal tracks in the roadbed or in the final track surface (top of rail elevation). Follow the criteria in Table 3-2 to maintain an acceptably smooth track profile.

5-3 HORIZONTAL CURVES.

5-3.1 Definition.

Railroads are laid out with circular curves using the chord definition. Curvature is measured in degrees, as indicated in Equation 5-2.

Equation 5-2. Curvature

$$D = 2arcsin\left(\frac{50}{R}\right) \text{ or } R = \frac{50}{sin\frac{D}{2}}$$

Where:
D = Degree of curve (decimal degrees)
R = Radius of curve (feet)

5-3.2 Design Criteria.

5-3.2.1 Design Categories.

Table 3-3 shows design categories for horizontal curves.

5-3.2.2 Track Rehabilitation Projects.

During the design of major track rehabilitation projects, to the maximum extent practical, adjust existing curvature to less than 10 degrees for main running tracks and 12 degrees in terminal areas.

5-3.3 Minimum Tangent Length between Reverse Curves.

When curves of different directions immediately follow in sequence (reverse curves), install a length of tangent track between the two curves. The preferred and minimum tangent lengths between reverse curves are:

- Preferred Tangent Length: 100 ft (30.5 m)
- Minimum Tangent Length: 60 ft (18.2 m)

5-3.4 Super Elevation.

For either new design or major rehabilitation, elevate the outer rail in curves above the inner rail by the amount shown in Table 5-2. Ensure designs do not call for a combination of speed and curvature that fall below the bottom-stepped ledger line in the table. Provide ½ inch (13 mm) of super-elevation on all curves in main running tracks wherever possible even when not required by Table 5-2. Do not provide super-elevation in terminal yard tracks.

Provide full super-elevation around the entire curve. For curves with 1-in. (25 mm) super-elevation, run out that elevation (transition back to level) in 40 ft (12.1 m) of tangent at the beginning and end of the curve. Where super-elevation is more than 1in. (25 mm), provide spirals at each end of the curve.

Table 5-2 Design Super-Elevation for Curved Track

Degree of Curvature	Design Operating Speed MPH (km/hr)						
	10 (16)	15 (21.4)	20 (32.2)	25 (40.2)	30 (48.3)	35 (56.3)	40 (64.4)
0.5	NO SUPER-ELEVATION REQUIRED						1.0
1.0					1.0	1.0	1.0
1.5				1.0	1.0	1.5	1.5
2.0			1.0	1.0	1.5	2.0	2.0
2.5			1.0	1.5	1.5	2.0	2.5
3.0		1.0	1.0	1.5	2.0	2.5	3.0
3.5		1.0	1.0	1.5	2.0	2.5	3.0
4.0	1.0	1.0	1.0	1.5	2.0	3.0	3.5
4.5	1.0	1.0	1.5	2.0	2.5	3.5	4.0
5.0	1.0	1.0	1.5	2.0	3.0	4.0	
5.5	1.0	1.0	1.5	2.0	3.0		
6.0	1.0	1.0	1.5	2.0	3.0		
6.5	1.0	1.5	2.0	2.5			
7.0	1.0	1.5	2.0	2.5			
7.5	1.0	1.5	2.0				
8.0	1.0	1.5	2.0				
8.5	1.0						
9.0	1.0						
9.5	1.0						
10.0	1.0						
10.5	1.0	DO NOT DESIGN FOR OPERATION IN THIS RANGE					
11.0	1.0						
11.5	1.0						
12.0	1.0						

Note: Table entries are super-elevation in inches.

5-3.5 Spirals.

When used, design spiral transition curves as shown in Chapter 5, Section 3.1 of the AREMA Manual. Increase super-elevation uniformly from zero at the beginning of the spiral (at the tangent) to the full elevation at the end of the spiral (where full curvature is reached).

Determine spiral length from Equation 5-3.

Equation 5-3. Spiral Length

$$L_s = 40 \times S$$

Where:
L_s = Length of spiral (feet)
S = Full super elevation (inches)

5-3.6 Increase in Gage on Very Sharp Curves.

Where curves of 12 degrees or more are unavoidable, finished track gage is as follows:

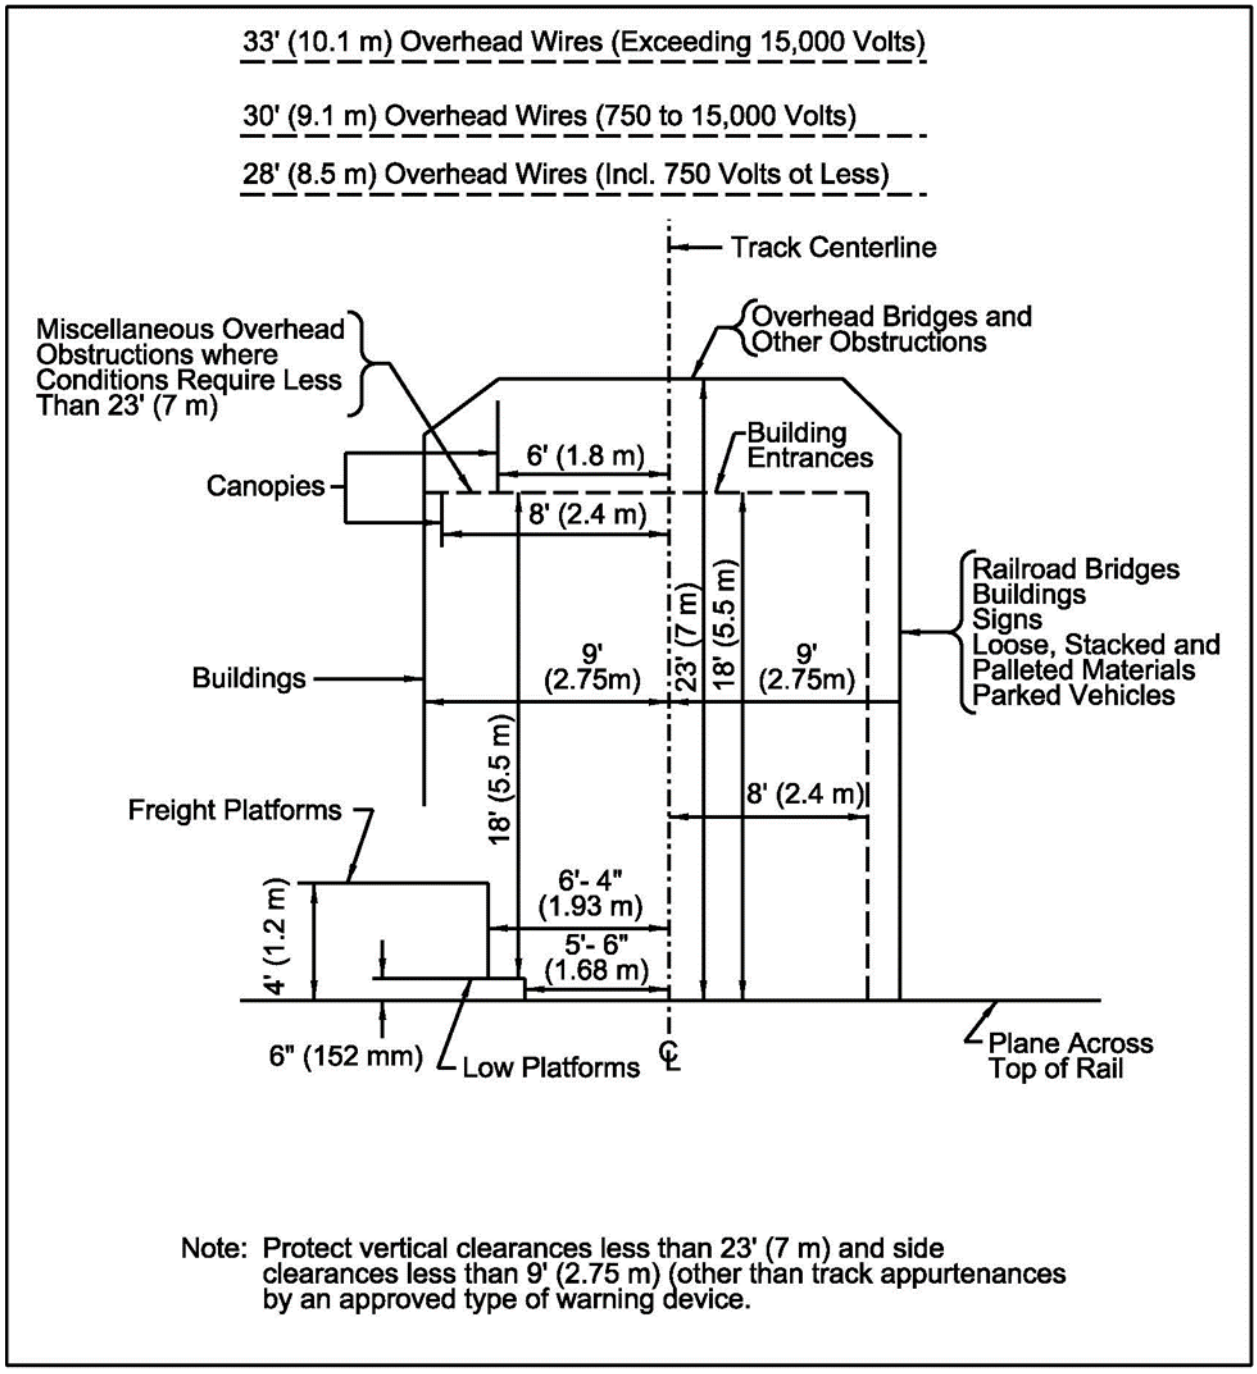
Table 5-3 Finished Track Gage

Curvature Range (degrees)	Track Gage in. (m)
12 to 16	56⅝ (1.438)
14 to 16	56¾

5-4 CLEARANCES.

5-4.1 Clearances to Check.

For either new construction or rehabilitation work, ensure the location and position of all tracks are checked for proper clearances before the final design is prepared and after construction is complete. Provide allowances for future track surfacing (adding ballast and raising track) and for small changes in alignment during maintenance.



5-4.2 Recommended Minimum.

Minimum clearances are shown in Figure 5-8 and Table 5-4. Vertical clearances are measured from the top of the rail, and horizontal clearances are measured from the center line of track.

5-4.3 State Requirements.

Each State has legal requirements for railroad clearances. These are summarized in a table in Chapter 28, Section 3.6 of the AREMA Manual. When State requirements exceed clearances shown in Figure 5-8 or Table 5-4, use the State requirement.

Figure 5-8 Clearance Diagram for Tangent Track

Note: Protect vertical clearances less than 23' (7 m) and side clearances less than 9' (2.75 m) (other than track appurtenances by an approved type of warning device.

Table 5-4 Overhead and Side Clearances for Tangent Track

Vertical Clearances (from top of rail)	Required Clearance
Overhead wires: (open supply, arc wires, service drops)	
0 to 750 volts	28 ft (8.5 m)
750 to 15,000 volts	30 ft (9.1 m)
15,000 to 138,000 volts	33 ft (10.1 m)
Other overhead wires	28 ft (8.5 m)
Building entrances (including engine-houses)	18 ft (5.5 m)
Overhead bridges	23 ft (7 m)
Other overhead obstructions	23 ft (7 m)
Side Clearances (from track center)	
Buildings	9 ft (2.75 m)
Buildings without platforms requiring delivery of materials	8 ft (2.44 m)
Platforms:	
Freight platforms up to 4' maximum height	6 ft – 4 in (1.93 m)
Low platforms (less than 6" high)	5 ft – 6 in (1.67 m)
Building entrances (other than engine-house)	8 ft (2.44 m)
Canopies over platforms (canopy height < = 18')	8 ft (2.44 m)
Fences, retaining walls, utility poles, and other obstructions	9 ft (2.75 m)
Bridges	9 ft (2.75 m)
Signs	9 ft (2.75 m)
All loose, palleted, and stacked materials	9 ft (2.75 m)
Parked vehicles	9 ft (2.75 m)

Notes: 1. In curves, side clearances will be increased 1½ in. (38 mm) per degree of curvature.

2. For voltages greater than 138,000 volts, see the latest National Electric Safety Code and assume a rail car height of 23 ft. (7 m) to determine required clearance.

5-4.4 Curved Track.

For each degree of curvature, increase side clearances 1-1/2 in. (38 mm) over that required in Figure 5-8 and Table 5-4. When an obstruction is located adjacent to tangent track, but the track begins to curve within 80 ft (24.4 m) of the obstruction, increase the side clearances by the amounts shown in Table 5-5.

Table 5-5 Clearance Increases Adjacent to Curved Track

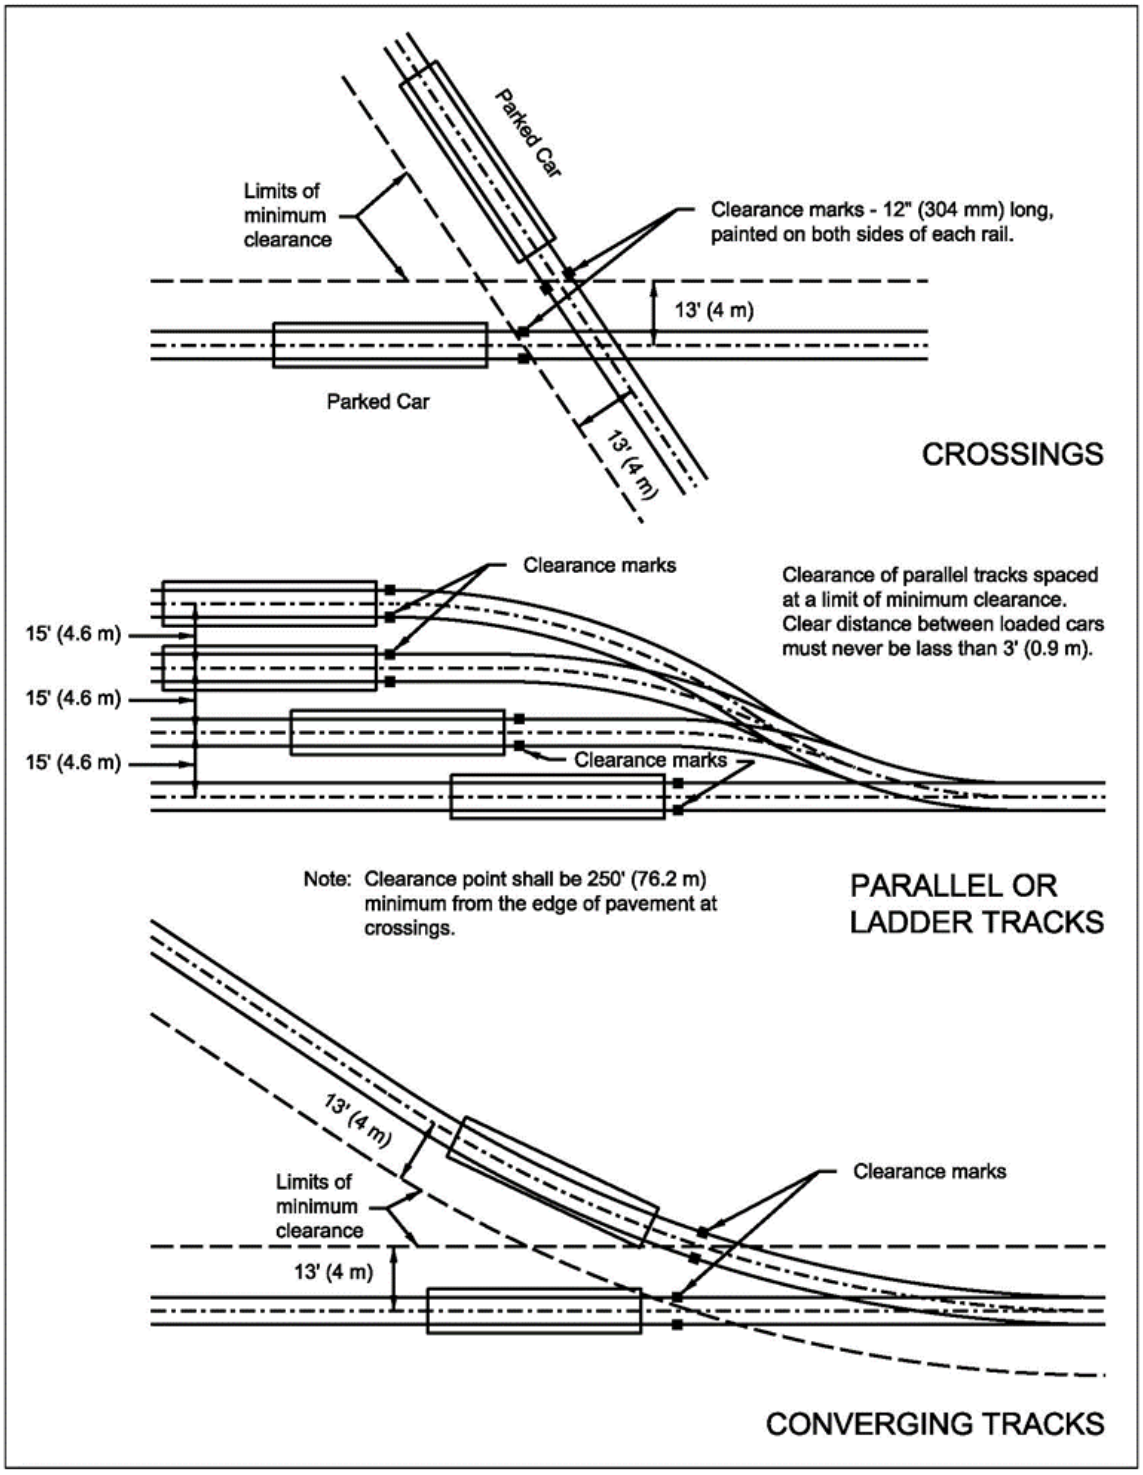
Distance from Obstruction to Curved Track ft (m)	Increase in Clearance per Degree of Curvature inch (mm)
0 -20 (0 -6)	1½ (38)
21 – 40 (6.4 – 12.1)	1⅛ (28.6)
41 – 60 (12.5 – 18.2)	¾ (19)
61 – 80 (18.6 – 24.4)	⅜ (9.5)

5-4.5 Minimum Track Centers.

The recommended minimum distance between the center lines of adjacent tracks is given in Table 5-6.

Table 5-6 Track Center Distances

Between	Minimum Distance Between Centerlines ft (m)
New Tracks	15 (4.6)
Existing Tracks	14 (4.3)



5-4.6 Clearance Points at Turnouts, Ladder Tracks, and Crossings.

Figure 5-9 illustrates how to determine the location of clearance points at turnouts, ladder tracks, and rail crossings. Ensure no rail car or piece of equipment remains standing on a track with any part of it extending past the clearance point (toward the track junction), the clearance point will determine the usable length of sidings, loading, yard, and storage tracks.

- Mark clearance points by a 12-in. (300 mm) yellow bar painted on both sides of the rail base.

- If derails are used, they must be set to derail equipment before it reaches the clearance point.

Figure 5-9 Location of Clearance Points

5-5 TRACK STRUCTURE.

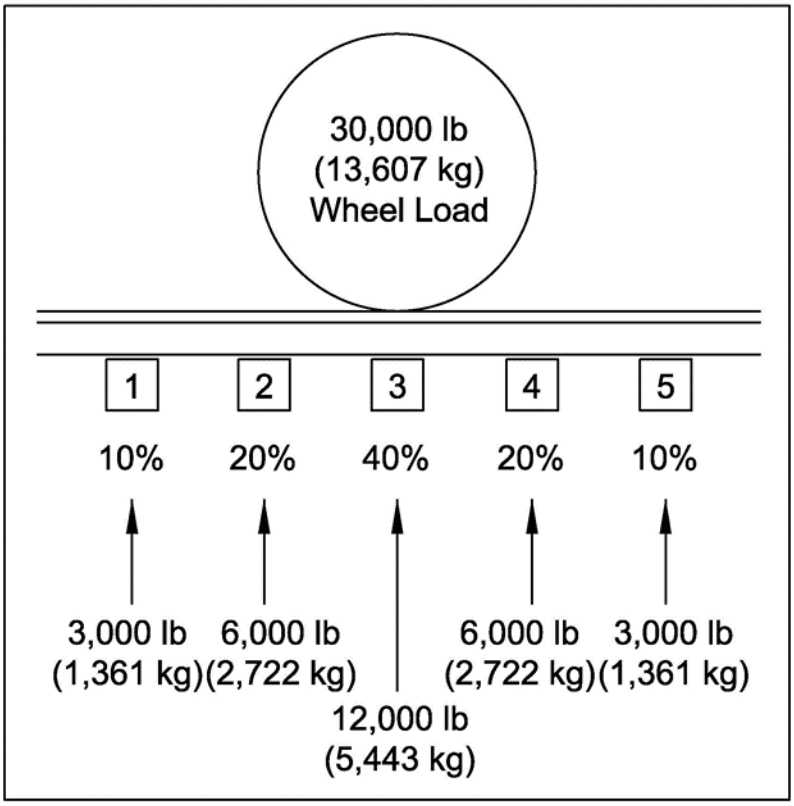
5-5.1 Design Objective.

Among its various functions, the track system distributes the large, concentrated wheel loads longitudinally, laterally, and vertically away from the wheel contact area on the rail surface. A well designed, constructed, and maintained track distributes loads in a relatively uniform fashion, with each component supporting its share of the load. The role of the designer is to select a track structure or changes to an existing track that ensures intended wheel loads are properly supported, without overstressing any of the four main track system components: rail, ties, ballast, and subgrade.

5-5.2 Load Distribution.

As Figure 5-10 shows, when a wheel is centered over a tie, the tie directly beneath the load will generally carry less than half of that wheel load, with the remainder supported by two ties on either side. Beneath the wheel, the pressures are distributed (reduced) approximately as shown in Figure 5-11. With a wheel-rail contact area of about ½ sq in., stresses are reduced from 60,000 psi (414 MPa) at the top of the rail to about 10 psi (.069 MPa) at the depth of the subgrade surface. While the actual load and pressure distributions vary with wheel load, track design, and track condition, the two figures illustrate a realistic case for good track.

Figure 5-10 Example Load Distribution along the Track



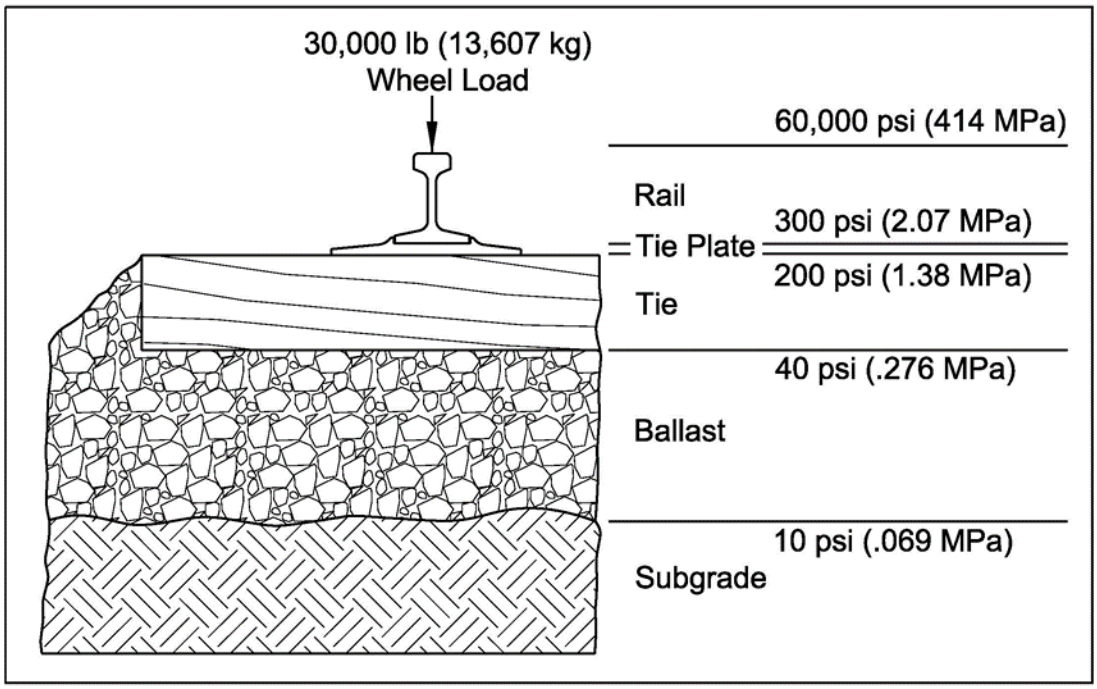


Figure 5-11 Example Vertical Pressure Reduction through the Track

5-5.3 Behavior under Load.

Although track construction is relatively simple, its behavior under load is not. An improvement (or increase in strength) in one track component can increase the load on another. It is not uncommon for an improvement (or increase in strength) of one track component to cause an increased load on another.

5-6 TRACK DESIGN METHODS.

5-6.1 Computer Program Available.

TRACK is the computer program for basic track structure design and is available at the PCASE Internet Site (https://transportation.erdc.dren.mil/pcase/software.aspx) or the Army Transportation Systems Center (CENWO-ED-TX).

5-6.2 Manual Design Procedure.

If computer programs are not accessible or if a computer is unavailable, use the design procedure in Paragraph 7 as an alternative. A disadvantage of this method, however, is that very little data exists to correlate the value of track modulus with the properties of individual rail support components: ties, ballast, and subgrade.

5-7 AREMA DESIGN PROCEDURE (1995-MODIFIED).

5-7.1 Applying the AREMA Method to Military Track.

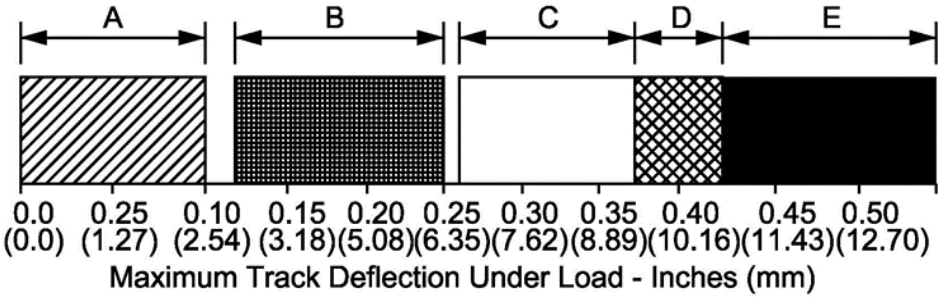
The AREMA method leaves several choices and judgments open to designers, to be set according to situation and policy. And like most AREMA criteria, the method is also oriented toward those commercial lines that carry medium to heavy traffic volumes (more than 10 million gross tons (9.07 million Metric tons) per year) and operate at medium or higher speeds (more than 40 mph (64.4 km/hr)). The guidance below assumes that most military track operates at relatively low traffic volumes (less than 5 million gross tons (4.54 million Metric tons) per year) and at relatively low speeds (less than 25 mph (40.2 km/hr)), and uses jointed, rather than continuously welded, rail.

For unusual cases where yearly traffic frequencies are expected to exceed 5 million gross tons (4.54 million Metric tons), designers can follow the method directly from Chapter 16 of the AREMA Manual.

5-7.2 Basis for Design.

The AREMA track design method is based on extensive field and laboratory testing conducted between 1914 and 1940. The committee supervising the tests and evaluations was led by Professor Arthur Talbot of the University of Illinois, whose name is often used when referring to the tests and findings. The Talbot Committee found that, when subject to a large number of load repetitions (“millions of groups of car wheels”), the greater the vertical rail deflection under those loads, the faster the track condition deteriorated. From the data and observations collected, AREMA employs a track design method based on limiting or controlling vertical rail deflection.

Figure 5-12 illustrates the general relationship between track deflection and track performance over long time periods. The design criteria in this section limits the deflection of main running tracks to 0.3 in. (7.6 mm) and of auxiliary, storage, spur, and light use tracks to 0.4 in. (10.2 mm). The AREMA track design method uses the beam-on-elastic-foundation model. In this model, the track has two components: the beam, which is the rail, and the elastic foundation, which represents everything below the rail combined. The basic expression in the model relates three main variables: the load on the rail, the stiffness of the track system, and the amount of vertical rail deflection, as shown in Equation 5-4.



Equation 5-4. Vertical Rail Deflection

$$Y = \frac{P}{(64\ EIu^3)^{.025}}$$

Where:
Y = vertical rail deflection at a point (inches)
P = applied wheel load (including contributions from adjacent wheels) (lb.)
EI = stiffness of the rail, where:
E = modulus of elasticity for steel (30 x 10^6 psi)

I = vertical moment of inertia of the rail section (inches^4)
u = stiffness of rail support, or track modulus (psi)
In this equation, EI represents the stiffness of the "beam" and u the stiffness of the "elastic foundation."

Figure 5-12 Maximum Track Deflection and Long-Term Track Performance

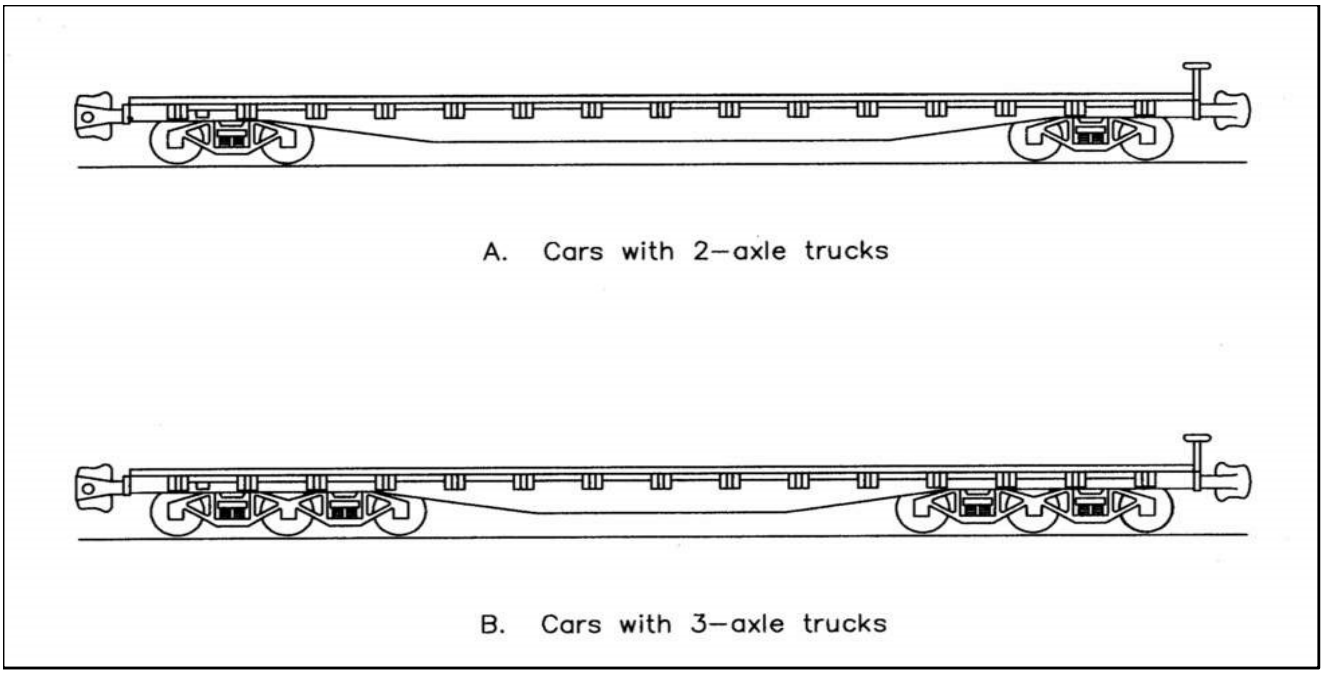
Range	Long Term Track Performance
A	Excessively stiff track.
B	Track of heavier construction which wil hold up well under large traffic volumes (> 15 GT (15.2 MT)).
C	Track suitable for lower thraffic volumes (< 15 GT (15.2 MT)).
D	Sidings and other auxiliary tracks on low traffic lines.
E	Track which will deteriorate quickly: only suitable for occasional movements with cars less than 100 tons (101.6 MT) capacity.

Note: Deflections do not include any play or looseness between track components.

5-7.3 Design Load and Wheel Spacing.

5-7.3.1 Design Load.

Select the design wheel load from Table 2-2, based on the most common, heaviest car expected to travel over the track.



5-7.3.2 Wheel Spacing.

Figure 5-13 shows the two most common wheel configurations. Most cars have two-axle trucks and the design wheel configuration is that in drawing (A), with an average 75-in. (1905 mm) wheel spacing. The 140- ton (127 MT) series flat cars, for carrying M-1 tanks and other heavy vehicles, and some 100-ton (90.7 MT) flat cars have 3- axle

trucks; their design wheel configuration is drawing (B), with 66-in. (1676 mm) wheel spacing.

Evaluate the track assuming that a wheel is centered over a tie, with an adjacent wheel on either side contributing to the loads, deflections, and stresses - as occurs when two cars are coupled together. Referring to Figure 5-13(A), the maximum tie, ballast, and subgrade loads occur under wheels one and four (counting from the left), while the maximum rail bending stress occur at wheels two and three. For the wheel configuration in Figure 5-13(B), the maximum tie, ballast, and subgrade loads occur under wheels two and five, while the maximum rail bending stress occur at wheels three and four. The effect of wheels farther than 100 in. (2540 mm) from the design wheel is negligible.

Figure 5-13 Design Wheel Configurations

5-7.4 Select Track Modulus (u).

The track modulus values listed in Table 5-7 are suggested starting points for design. In the table, track type “main” refers to main running tracks, while “auxiliary” includes sidings, wyes, loading, spur, storage, interchange, and light use tracks.

Table 5-7 Suggested Design Track Modulus Values

Track Type	Design Wheel Load Range – 1,000's of pounds (1,000's of kilograms)					
	20 – 25 (9.1 - 11.3)	25 - 30 (11.3 - 13.6)	30 – 35 (13.6 - 15.9)	35 – 40 (15.9 - 18.1)	40 - 45 (18.1 - 20.4)	45 – 50 (20.4 - 22.7)
Main	1500	1800	2000	2300	2600	2900
Auxiliary	1200	1300	1500	1700	2000	2200

5-7.5 Select Rail Size and Section.

Use Equation 5-5 to determine a minimum rail weight.

Equation 5-5. Minimum Rail Weight

$$W_o = 315 - \frac{21200}{\left(\frac{P}{1120}\right)(\alpha) + 67}$$

Where:
W_o = Weight of rail (lb./yd.)
P = Design wheel load (lb.)
α = Impact factor, where:
α = 1, where design operating speed is 25 mph or less.
α = 1.4, where design operating speed is more than 25 mph.

Select a rail section from Table 5-8 of equal or greater weight than calculated above.

Table 5-8 Rail Sections

Rail Section	Moment of Inertia, I (inches^4)	Section Modulus to Base, Z_b (inches^3)
115 RE	65.6	22.0
132 RE	88.2	27.3
133 RE	86.0	27.0
136 RE	95.4	28.2

5-7.6 Determine Moment and Loading Coefficients.

The moment and loading coefficients account for the effects of wheels adjacent to the design wheel. Adjacent wheels reduce rail moment and increase tie, ballast, and subgrade load. Calculate x_1 using Equation 5-6. (x_1 should normally range between 28 and 40).

Equation 5-6. Distance from Design Wheel Load to Point of Zero Bending

$$x_1 = 82\sqrt[4]{\frac{I}{u}}$$

Where:
x_1 = Distance from design wheel load to point of zero bending moment (inches)
I = Vertical moment of inertia of rail section (in.^{4})
u = Stiffness of rail support, or track modulus (psi)

Determine coefficients C_m and C_d as follows. For most design situations, and for cars with either 2-axle or 3-axle trucks, the rail moment coefficient (C_m) can be taken as 0.8. The load coefficient C_d can be taken from the following table. Intermediate values of Cd can be interpolated.

Table 5-9 Values for C_d

X_1 =		28	30	32	34	36	38	40
Design Wheel Spacing	66 in (1.67 m):	1.24	1.30	1.36	1.44	1.54	1.62	1.70
	75 in (1.91 m):	1.08	1.15	1.22	1.30	1.36	1.42	1.50

5-7.7 Check Rail Bending Stress.

Use Equation 5-7 to check that rail bending stress is less than 32,000.

Equation 5-7. Rail Bending Stress

$$f_0 = \frac{(0.318 P_d C_m X_1)}{Z_b}$$

Where:
f_o = Maximum flexural stress (psi)
P_d = Dynamic (design) wheel load (lb) from Table 2-2
C_m = Moment coefficient
X_1 = Distance from wheel load to point of zero bending moment (inches)
Z_b = Section modulus of rail base, from Table 5-8 (cu in.)

5-7.8 Ties and Tie Spacing.

Choose a trial tie spacing and calculate the maximum rail seat load using Equation 5-8:

Equation 5-8. Maximum Rail Seat Load

$$q_o = \frac{0.39 P_d C_d S}{X_1}$$

Where:
q_o = Maximum rail seat load (lb)
P_d = Dynamic (design) wheel load (lb) from table 2-2
C_d = Load coefficient for adjacent wheels
S = Tie spacing (inches). Typical spacings range from 19.5 in. (495 mm) to 22 in. (558 mm)
X_1 = Distance from wheel load to point of zero bending moment (inches)

Select tie size, either 6-in. x 8-in. x 8.5 ft (152 mm x 203 mm x 2.6 m), or 7-in. x 9-in. x 8.5 ft (178 mm x 229 mm x 2.6 m). Check tie bending stress using Equation 5-9 or 5-10. If f_t is greater than the maximum value of f_t in Table 5-, choose a larger tie size or decrease tie spacing.

Equation 5-9. Bending Stress for 6-in x 8-in (152 mm x 203 mm) Ties

$$f_t = \frac{q_o}{29}$$

Equation 5-10. Bending Stress for 7-in x 9-in (178 mm x 229 mm) Ties

$$f_t = \frac{q_o}{52}$$

Where:
f_t = Flexural stress on underside of tie below rail seat (psi)
q_o = Maximum rail seat load (lb.)

Table 5-10 Maximum Allow Values for f_t

Tie Material	**Maximum Allowable Value for f_t psi (MPa)**
Oak	1400 (9.65)
Mixed Hardwoods	1100 (7.58)
Longleaf Yellow Pine	1000 (6.89)
Douglas Fir	800 (5.52)

5-7.9 Ballast and Subgrade.

Determine ballast surface stress from Equation 5-11, with p_m = 65 psi (.448 MPa) as a suggested limit. If p_m exceeds 65 psi, choose a larger tie and/or decrease tie spacing.

Equation 5-11. Ballast Surface Stress

$$p_m = \frac{q_o}{A_b}$$

Where:
p_m = Ballast surface stress (psi). qo = Maximum rail seat load (lb.)
A_b = Effective bearing area of ½ tie on ballast under one rail (sq. in.)
For 6 x 8 (152 mm x 203 mm) ties, A_b = 270
For 7 x 9 (178 mm x 229 mm) ties, A_b = 312

Select design subgrade bearing capacity (pc) according to results of soil tests or other data. (In the absence of other guidance, the design bearing capacity for cohesive soils is the same as the unconfined compressive strength). Determine ballast depth from Equation 5-12:

Equation 5-12. Ballast Depth

$$h = \frac{\left(50\frac{p_m}{p_c}10\right)^{0.74}}{2.54}$$

Where:
h = Ballast depth in inches
p_m = Ballast surface stress (psi)
p_c = Design subgrade bearing capacity (psi)

5-8 SUBGRADE.

5-8.1 Subgrade Stability and Track Performance.

The subgrade is the prepared earth on which the railroad ballast section and track structure are built. If the subgrade does not have sufficient stability, it will be impossible to maintain proper track alignment, profile (surface), and cross level.

5-8.2 Soil Investigation.

Prior to initial design of the track structure, perform a geotechnical investigation along the proposed alignment to determine soil type, strength, bearing capacity, location of groundwater tables, natural water content, and compaction characteristics. Additional geotechnical borings, laboratory testing, and engineering analysis are required in areas where bridges or other special structures are to be constructed. Chapter 1, Section 1.1 of the AREMA Manual provides recommendations for geotechnical investigations. The

spacing and depth of borings will be project specific and developed with the assistance of a geotechnical engineer.

5-8.3 Design of Cuts and Fills and Subgrade Preparation.

Chapter 1, Section 1.2 of the AREMA Manual provides recommendations for design of cuts and fills and subgrade preparation. Table 1-1-10 of the AREMA Manual indicates soils types and their suitability as railroad subgrades.

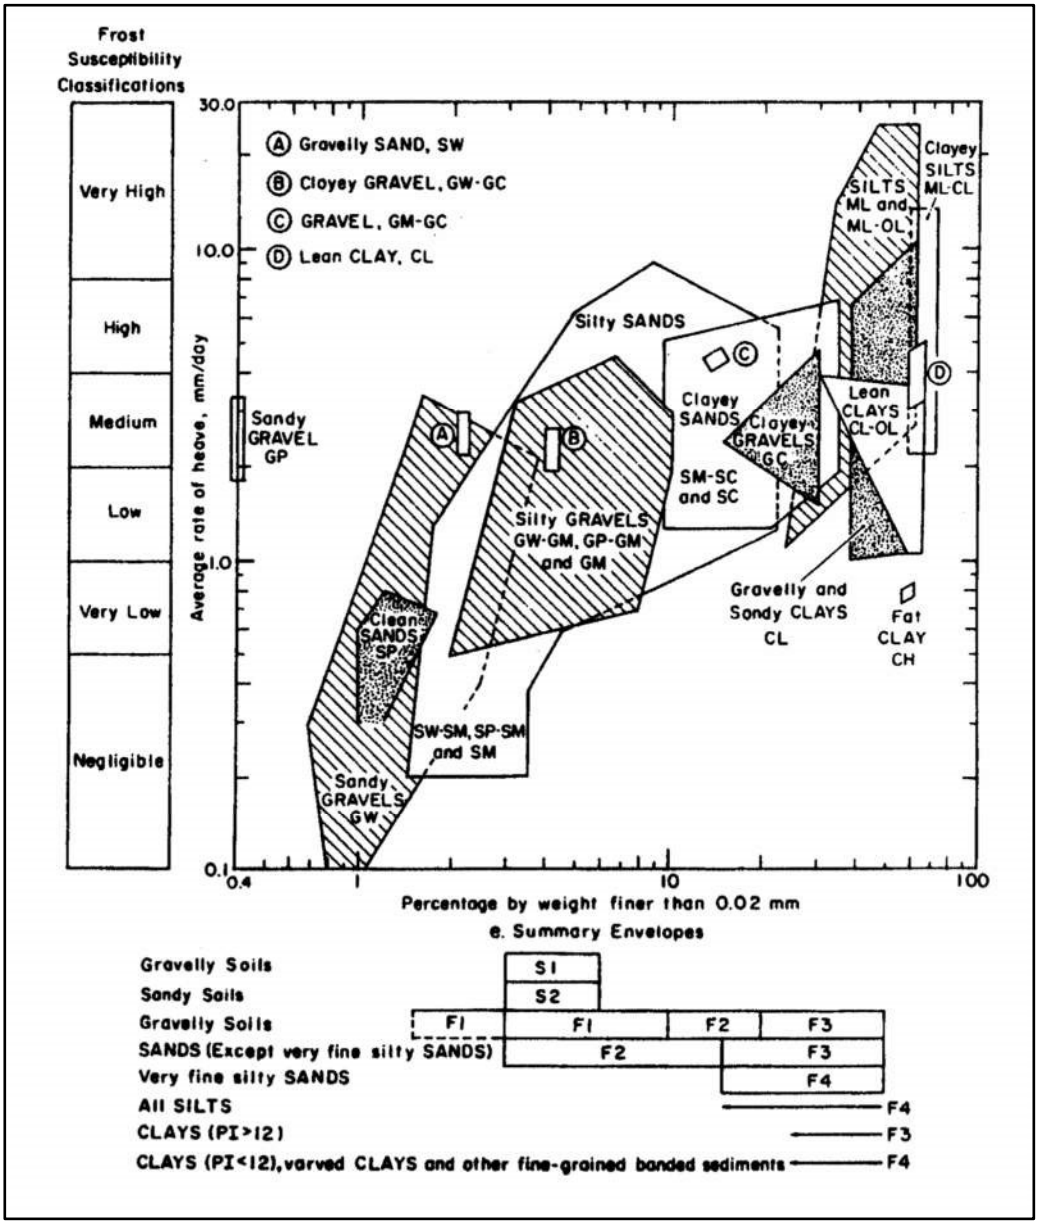
5-8.4 Track Structure Design Bearing Capacity - Cohesive Soils.

For cohesive soils, and for track expected to carry the usual military traffic level of less than 5 million gross tons per year, set design bearing capacity for the track structure at the soil's unconfined compressive strength at its natural water content. For unusual cases, where annual traffic volumes are projected at higher than 5 million gross tons (4.5 million Metric tons), use 80 percent of the unconfined compressive strength as the design bearing capacity.

5-8.5 Soil Stabilization.

Information on the use of soil stabilization and the design and construction of soil stabilized subgrades is presented in UFC 3-250-11. In frost areas, use soil stabilizers with caution and only after intensive laboratory testing, including a frost susceptibility test and a freeze-thaw durability test.

5-9 FROST DESIGN MODIFICATIONS.



5-9.1 Frost Heave Conditions.

Frost heaving is the rising of the soil due to the growth of ice lenses or ice segregation during freezing. There are three basic conditions that must be present for ice segregation to occur: a frost susceptible soil, a source of water, and freezing temperatures. A change in any of the three conditions impacts the amount of heave.

5-9.2 Identifying Frost Susceptible Soils.

For design purposes, the potential for ice segregation is often expressed as a function of grain (or particle) size. Most organic, non-uniform soils containing 3 percent or more by weight of particles smaller than 0.02 mm are considered frost susceptible. Consider gravel, well graded sands and silty sands, especially those approaching the theoretical maximum density curve, that contain 1.5 to 3 percent of particles smaller than 0.02 mm as possibly frost susceptible and subject to laboratory frost susceptibility tests. Expect considerable ice segregation in uniform sandy soils with greater than 10 percent smaller than 0.02 mm. Figure 5-14 illustrates a method for determining the frost susceptibility of soils.

Figure 5-14 General Method for Determining the Frost Susceptibility of Soils

5-9.3 Water Source.

Usually, the water source is an underlying groundwater table, a perched aquifer, or infiltration from the overlying layers.

5-9.4 Frost Depth.

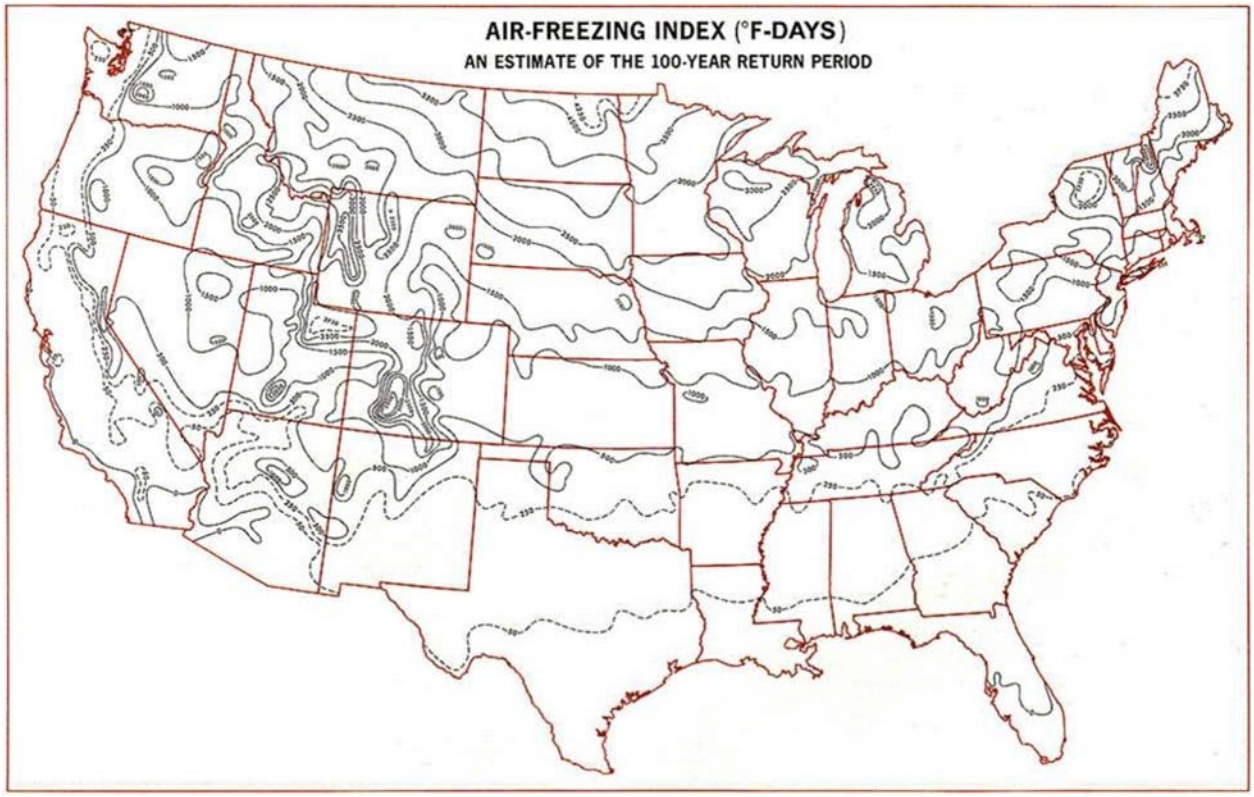
Future track maintenance costs are reduced if the design depth of frost below the top of the ballast is at least 60 percent of the expected local frost depth. Establish expected frost depth using local records, experience or building practices. If these are unavailable, use the frost depth provided in UFC 3-301-01.

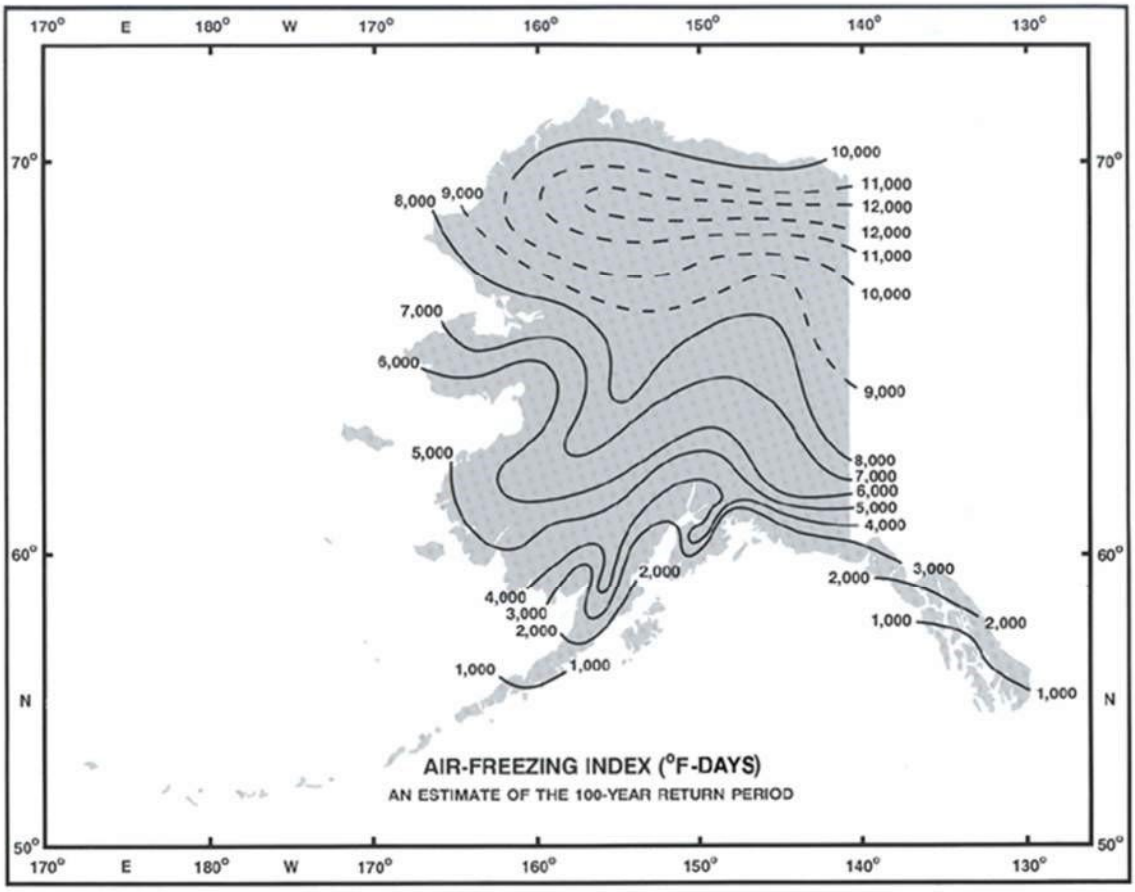
5-9.5 Alternate Frost Depth Procedure.

Use this procedure for fine grained soils of relatively uniform composition at different depths.

Determine the Air Freezing Index - the number of degree days (above and below 32 °F (0 degrees C)) between the highest and lowest points on the cumulative degree day curve for a freezing season. For the design air freezing index, use the 3 coldest years in the last 30 years of record, or use the average index and multiply it by 1.75. (If fewer than 30 years of data are available, use the air freezing index for the coldest year in the last 10-year period). If local records are unavailable, use the values directly from either Figure 5-15 or the PCASE WORLD INDEX program.

Figure 5-15 Design Air Freezing Indexes in CONUS





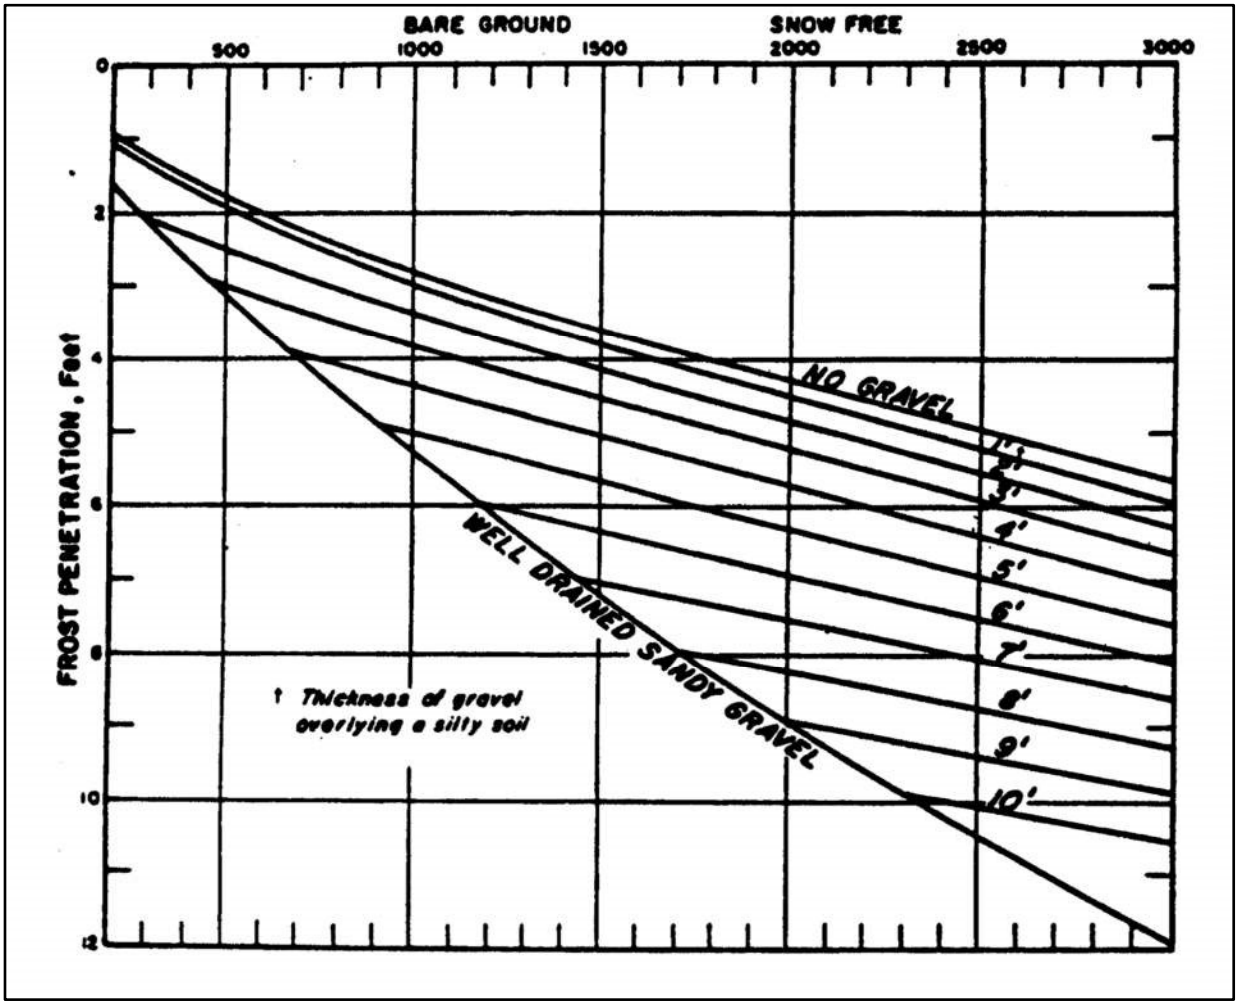


Figure 5-16 Design Air Freezing Indexes in Alaska

Determine the frost depth using Figure 5-17. The gravel thickness in this figure is the total depth of ballast and sub-ballast. Multiply the frost penetration value by 0.6. If the resulting number is smaller than the gravel thickness, then there is an adequate amount of ballast and sub-ballast in the cross section. If the resulting number is larger, additional ballast and/or sub-ballast should be added and the thickness recalculated.

Figure 5-17 Air Freezing Index/Surface Cover/Frost Penetration Relationship

5-9.6 Alternate Design Procedure.

An alternate method of designing for the effects of frost is to reduce the effective strength of the soil to compensate for the thaw-weakening period, similar to a reduced strength pavement design.

5-9.7 Methods for Reducing Frost Effects.

5-9.7.1 Additional Ballast/Sub-ballast.

If more than 40 percent of the total frost depth is in the frost susceptible subgrade, add non-frost susceptible material (clean ballast or sub-ballast) to the roadbed.

5-9.7.2 Geotextiles.

Geotextiles are sometimes used to prevent particle migration at the subgrade/sub-ballast interface during the spring thaw. Contamination of an otherwise clean ballast

and sub-ballast by subgrade soil can turn a non-frost susceptible material into a frost susceptible material. The application of geotextiles is covered in AREMA Chapter 1, Part 10.

5-9.8 Transition Zones.

A gradual transition is required between areas with significantly different frost heave behavior. The transition distributes differential heave over a distance and thus reduces its detrimental effects. Transitions between cuts and fills and at culvert crossings and bridge approaches are typically 75 to 100 ft. (22.9 m to 30.5m) long.

5-9.9 Construction Procedures.

Excavate the subgrade and scarify to a predetermined depth based on field conditions. Then windrow and blade to achieve adequate blending. This ensures a high degree of uniformity of soil conditions and eliminates any isolated pockets of soil with higher or lower frost susceptibility. Remove isolated pockets of either low or high frost susceptible material. In these cases, excavate the soil to the full frost depth and replaced with the surrounding soil. Remove stones (6-in. in diameter or larger) or large roots from any fill in the full depth of the frost penetration. This includes any stones encountered during subgrade preparation. Failure to remove these items results in track roughness as the stones and roots are gradually heaved upward. In rock excavations, provide positive drainage so that no pockets of water are left in the zone of freezing. The irregularity of the isolated pockets can cause non-uniform heaving. At the transition between cut and fill sections, use transition sections as previously discussed. Frequently, rock joints and fractures are full of frost susceptible soil. Clean out rock joints or fractures encountered in the subgrade to the full depth of frost penetration and replace these joints with non-frost susceptible material.

5-10 DRAINAGE.

5-10.1 Importance.

Although not a component of the track or roadbed, drainage (or lack of it) has a major impact on track strength and longevity. Without proper drainage, track will fail to perform as designed or intended.

5-10.2 Design Criteria.

Use UFC 3-201-01, Chapter 3 for design and construction of drainage structures, except as modified by the following paragraphs. If required by a commercial railroad, use more restrictive criteria in lieu of these requirements.

5-10.3 Side Ditches.

Most commonly, drainage is provided by open ditches running parallel to the track. In terminals and in other level areas, use inlets, sub-drainage, or other alternative drainage designs if required.

To prevent a significant loss of strength in the subgrade, ensure side ditches provide ample capacity and flow rate. Design ditch size based on the expected rainfall runoff and the contribution from other drainage that empties into the ditches. Design criteria for estimating runoff and determining ditch size is found in UFC 3-201-01.

5-10.3.1 Capacity and Flow Rate.

To provide adequate capacity, design side ditches to ensure the water surface elevation does not rise above the top of subgrade for the 50-year storm. To provide an adequate flow rate, the minimum gradient for side ditches is 0.30 percent.

5-10.3.2 Sub-drainage.

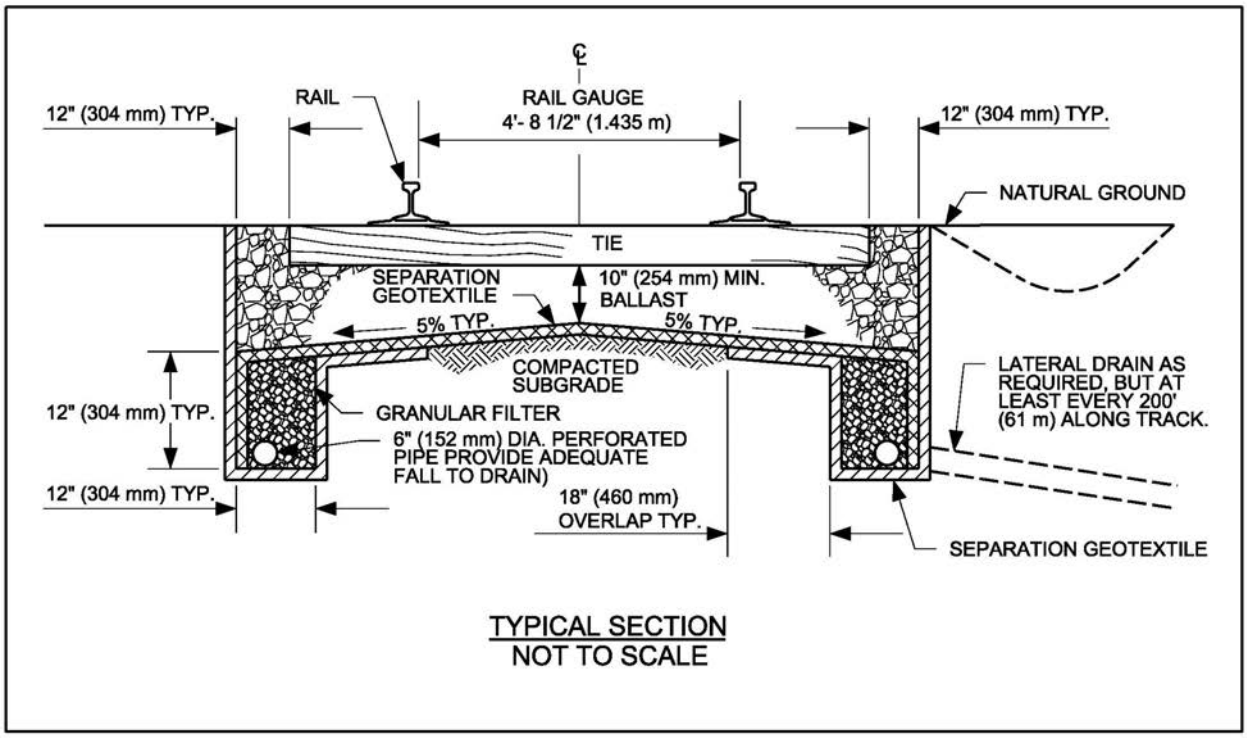
While not a desirable practice, there are some areas where the bottom of the ballast section cannot be installed or raised above the surrounding ground level, and standard side ditches cannot be dug (or would not provide sufficient flow). In these cases, install sub-drainage as shown in Figure 5-18.

5-10.4 Culverts.

Chapter 1, Part 4 and Chapter 8, Parts 10 and 16 of the AREMA Manual provide design criteria and specifications for railroad culverts. Ensure all culvert pipe conforms to current AREMA recommendations or specifications for culvert pipe under railroads. Size culverts to meet the following hydraulic criteria:

- The water surface elevation for the 25-year storm will not rise above the crown of the culvert.
- The water surface elevation for the 50-year storm will not rise above the top of the subgrade.
- If located in a FEMA-designated floodplain, size the culvert opening to meet FEMA's water surface elevation rise criteria if applicable.

Provide a minimum cover of 2.5 ft. (0.76 m) from the bottom of the tie to the top of the culvert. Less cover is authorized in low clearance situations. Perform a structural analysis to determine the appropriate culvert strength for each situation. Design culverts under track for Cooper E80 loading. Ensure culvert materials provide a life expectancy of 50 years.



5-10.5 Bridges.

Paragraph 6-2 provides structural design criteria for bridges. Size bridges over waterways to meet the following hydraulic criteria:

- The water surface elevation for the 25-year storm does not rise above the low chord of the bridge.
- The water surface elevation for the 50-year storm does not rise above the top of the adjacent subgrade.

- If located in a FEMA-designated floodplain, size the bridge opening to meet FEMA's water surface elevation rise criteria.

Figure 5-18 Required Sub-drainage where Open Side Ditches cannot be Installed

5-11 GEOTEXTILES.

5-11.1 Application under Track.

Geotextiles are sometimes used under the track to provide for filtration and/or separation of ballast and subgrade or ballast and sub-ballast, drainage functions, or reinforcement of the subgrade. Common locations for the installation of a geotextile under track are:

- Highway-railroad grade crossings.
- Locations with poor subgrade.
- When rebuilding track with a history of excessive loss of profile (surface) and frequent track maintenance requirements.
- Turnouts. See Figure 5-19.
- Bridge approaches. See Figure 5-20.
- Rail crossings.

Recent industry studies have shown that geotextiles have not always been effective under track. Thus, before deciding to install a geotextile, conduct a thorough analysis of the site to assure that a geotextile will accomplish its intended purpose.

5-11.2 Material and Installation Specifications.

Ensure geotextiles, and their installation, conform with the specifications in Chapter 1, Part 10 of the AREMA Manual. Install geotextile under track deep enough that it is not disturbed during tamping/surfacing of the track. It is recommended that geotextile and geogrid be installed underneath a layer of sub-ballast as shown in Figure 5-6 to protect it from damage during tamping/surfacing of the track.

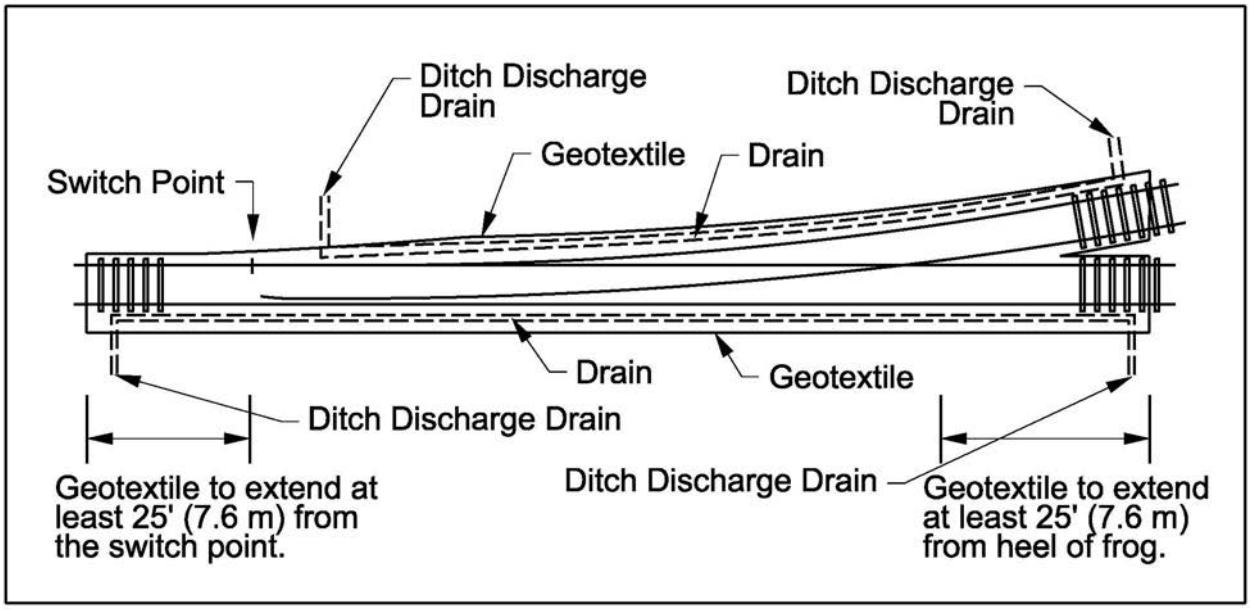
5-11.3 Design Criteria.

Use Chapter 1, Part 10 of the AREMA manual for the design of geotextile and geogrid applications. Geotextile manufacturers provide design guidance on the use of geogrids to support track construction equipment on low strength subgrades.

5-11.4 Drainage Applications.

Lighter weight geotextiles are often useful for drainage applications outside of the track structure, especially in sub-drainage.

Figure 5-19 Geotextile Installation under a Turnout



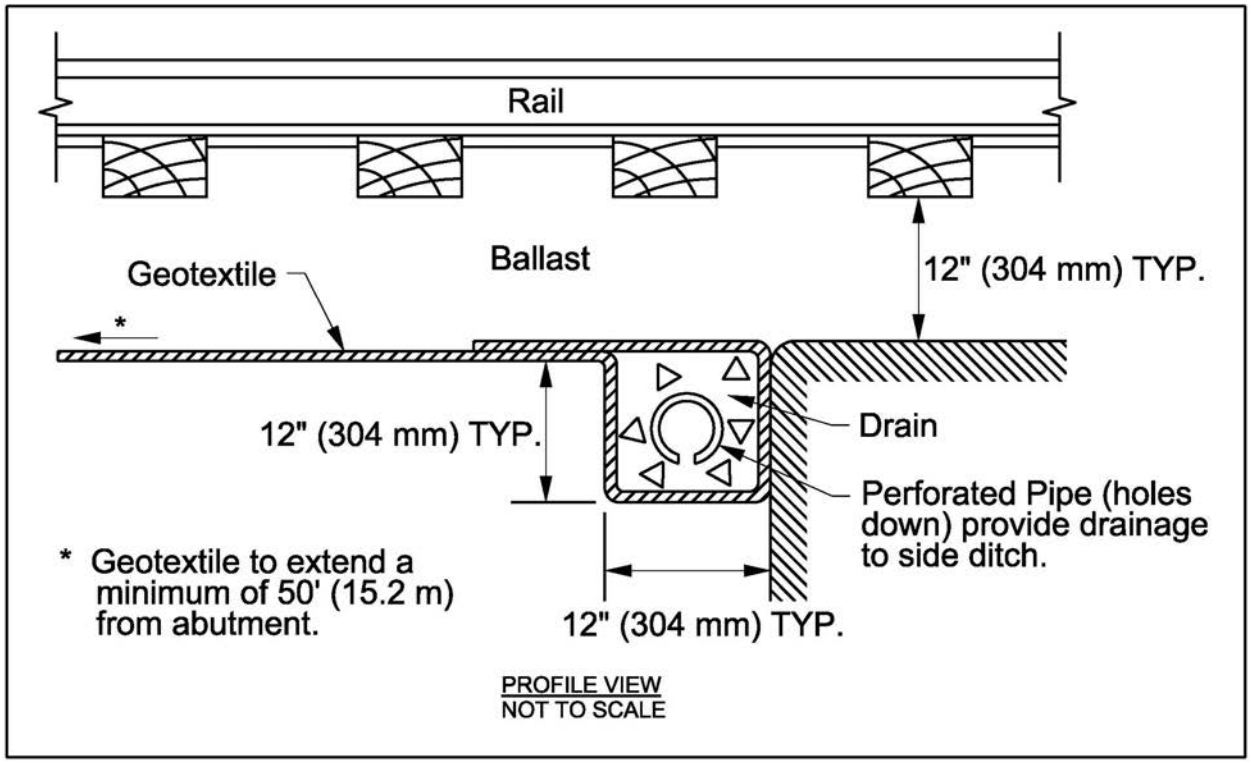


Figure 5-20 Geotextile Installation at a Bridge Abutment

5-12 BALLAST.

5-12.1 Purpose.

Ballast performs four primary functions:

- Distributes wheel loads at reduced pressure to the subgrade.
- Restrains the track laterally and longitudinally.
- Helps maintain track surface.
- Allows track structure to drain.

5-12.2 Material Type.

As ballast depends on high friction and interlock to be effective in restraining track and must also withstand large loads, ensure ballast consist of a hard angular crushed rock or crushed slag.

Common rock materials suitable for ballast are granites, traprocks, quartzites, dolomites, and hard limestones. As limestones degrade, they tend to produce fine particles that cement together, and are thus not the best ballast choice if other hard rock material is economically available. Crushed slag can also vary greatly in quality and suitability for good ballast.

5-12.3 Gradation.

Table 5-11 gives recommended AREMA ballast gradations. Use Size 4A or 4 between the top of the tie and the sub-ballast or subgrade. Use Size 5 ballast around turnouts to construct walkways to facilitate easier walking for switching operations. AREMA ballast Size 4 is identical to ASTM C33 Size 4. ASTM C33 Size 56 is close to AREMA Size 5.

Table 5-11 Recommended Ballast Gradations

Size No.	Nominal Size Square Opening in. (mm)	Amounts Finer Than Each Sieve (Square Opening) Percent by Weight							
		2½ in. (64 mm)	2 in. (50 mm)	1½ in. (37 mm)	1 in. (25 mm)	¾ in. (19 mm)	½ in. (13 mm)	⅜ in. (9.5 mm)	No. 4 (4.75 mm)
4A	2 to ¾ (50 to 19)	100	90-100	60-90	10-35	0-10		0-3	
4	1½ to ¾ (37 to 19)		100	90-100	20-55	0-15		0-5	
5	1 to ⅜ (25 to 9.5)			100	90-100	40-75	15-35	0-15	0-5

For smaller projects, where less than 200 tons (181 Metric tons) of ballast is needed, and where the nearest suppliers do not stock AREMA gradations, substitute the following ASTM gradations: Size 4 for AREMA 4, and Size 56 for AREMA 5.

5-12.4 Depth.

Determine the appropriate ballast depth (or the total of ballast and sub-ballast depth) by conducting a structural analysis using the computer program specified in Paragraph 6. The manual method described in Chapter 5, Paragraph 7 is acceptable, but not preferred.

For wood and engineered composite ties, the minimum depth of ballast from the bottom of the tie to the subgrade is 8 in. (203 mm). If sub-ballast is used, the minimum depth of ballast is 6 in. (152 mm). For steel ties, the minimum depth of ballast from the top of the tie is 10 in. (254 mm) regardless if sub-ballast is used. In most cases, main running tracks require more ballast.

5-12.5 Cross-Section.

Figures 5-1 through 5-6 show standard ballast shoulder widths and side slopes. In finished or resurfaced track, the top of ballast ranges between the top of the tie and 1 in. (25 mm) below. Six inches (152 mm) is the minimum width for shoulder ballast. Increase shoulder ballast width to 12-in. (300 mm) for track with continuously welded rail.

5-13 SUB-BALLAST.

5-13.1 Purpose.

Sub-ballast is a layer of material between the top ballast and subgrade with a gradation finer than the top ballast and coarser than the subgrade. Sub-ballast is often cheaper than top ballast and used to reduce total ballast cost or to provide a filter layer between the top ballast and a fine-grained subgrade. Figures 5-2, 5-4, 5-5, and 5-6 show a sub-ballast layer. It is recommended that sub-ballast be used for all new track construction and for rehabilitations replacing the track structure.

5-13.2 Application.

A sub-ballast layer is recommended for most new construction. In addition to providing a filter to keep subgrade particles from working up into and fouling the ballast, it provides a good mat to distribute loads from the ballast and prevents ballast particles from being pushed into the subgrade. A sub-ballast layer is required whenever:

a. The subgrade contains 85 percent or more (by weight) of silt and clay sized particles, or

b. The subgrade material has a liquid limit greater than 50 and a plasticity index greater than 20.

5-13.3 Material.

Sub-ballast should be a hard, angular, non-cementing material. Aggregate base courses specified by the local state department of transportation are typically good sub-ballast materials and can be considered for use.

5-13.4 Gradation.

Filter layers consist of sub-ballast particles ranging in size from the smallest ballast particles to the largest subgrade particles. Specifying ASTM D1241 Type I, Gradation B or the somewhat finer Gradation C provides an appropriate gradation. Also, aggregate base courses specified by the local state department of transportation typically have appropriate gradations. One of the following gradations must be met if a local aggregate base course material is used:

Table 5-12 Gradations

Sieve Size		1 in. (25 mm)	⅜ in. (9.5 mm)	No.4 (4.75 mm)	No. 40 (425 µm)	No. 200 (75 µm)
Percent Passing	**Gradation 1**	70-100	35-75	25-65	5-30	5-15
	Gradation 2	90-100	50-85	35-65	10-35	5-15

In addition, the materials must meet the following physical requirements:

- Coarse aggregate (that portion retained on the No. 4 (4.75 mm) sieve) composed entirely of crushed stone or crushed aggregate.
- The maximum percent of wear for the coarse aggregate fraction (that portion retained on the No. 4 (4.75 mm) sieve) is 50 percent when tested per ASTM C131.
- For the fraction passing the No. 40 (425 µm) sieve, the maximum liquid limit is 25 and the maximum plasticity index is 6.

5-13.5 Depth.

The sum of the sub-ballast depth and the ballast depth is often referred to as the total ballast depth. When sub-ballast is used, substitute sub-ballast material for a portion of the total ballast depth determined by structural analysis on a one-for-one basis.

A sub-ballast layer can comprise up to 40 percent of the total ballast depth on main running tracks and up to 50 percent on auxiliary and terminal tracks. When used, the minimum sub-ballast thickness will be 4 in. (101 mm) with a minimum ballast thickness of 6 in. (152 mm), resulting in a minimum total ballast depth of 10 in. (254 mm).

5-14 TIES AND TIE SPACING.

5-14.1 Wood Ties.

In most cases, wood is still the most cost-effective tie material. Required specifications for wood ties are found in Chapter 30, Part 3 of the AREMA Manual. The recommended species of wood for cross ties are:

Table 5-13 Recommended Wood Species for Cross Ties

Hardwoods	Softwoods
Ash	Douglas Fir
Beech	Pine
Hickory	Spruce
Red Oak	
White Oak	

Strictly defined, hardwood and softwood refer to a type of tree and not the hardness or density of the wood. However, the hardwoods listed above are denser and generally more durable than the listed softwoods and thus usually more desirable for ties. While softwoods are sometimes preferred on open deck bridges to help absorb impact, they are not recommended for use in turnouts or in curves over 8 degrees where the better spike-holding ability of the denser woods is needed.

5-14.1.1 Species.

Hardwood ties are often sold in species groups such as mixed hardwoods or oak. The mixed hardwoods can comprise, for example, 40 percent oak and 60 percent assorted hardwoods, including gum. Gum is not a preferred species but is commonly used. The oak group is usually a mix of red and white oak and typically costs more than the mixed hardwoods. The use of either mixed hardwood group or oak group ties is acceptable for military installations.

For track with annual traffic volumes of 5 million gross tons (4.5 Metric tons) or less, as is common at military installations, wood ties are more likely to fail from decay rather than mechanical wear or loss of spike-holding ability. Use information from the engineering department of the serving commercial railroad, regional tie suppliers, and local experience to select the most appropriate ties.

5-14.1.2 Cross-Section and Length.

The two common cross-sectional sizes for wood track ties are 7 in. (178 mm) thick by 9 in. (229 mm) wide or 6 in. (152 mm) thick by 8 in. (203 mm) wide. 7x9 (178x229) ties are recommended for areas with higher traffic volumes and wheel loads as well as in turnouts and in road crossings.

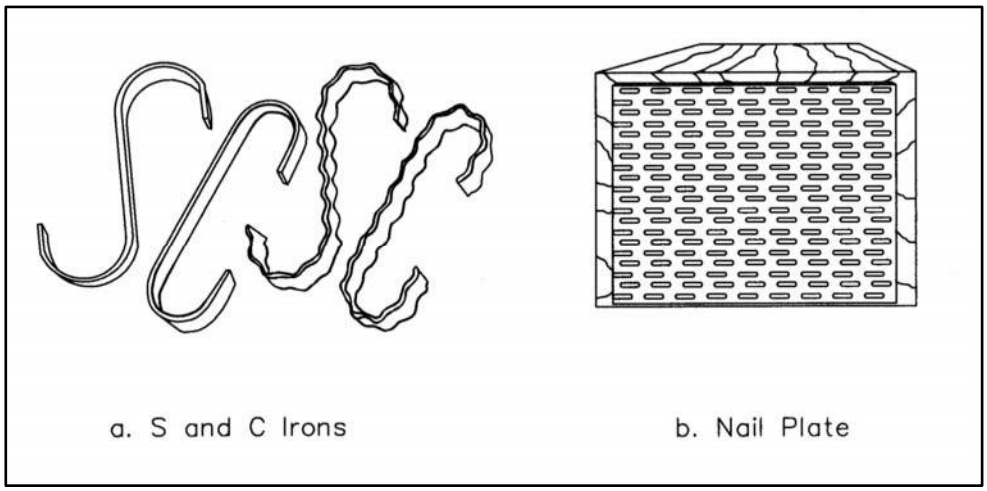
Track ties are commonly produced in 8.5 or 9 ft (2.6 or 2.75 m) lengths. Use minimum 8.5-ft (2.6 m) length ties, except for road crossing and turnouts. 10-ft. or 9-ft. (3 m or 3.75 m) long ties are typically used in road crossings. Ties for turnouts vary from 9 to 17 ft (2.75 to 5.2 m) long as indicated in Table 5-14.

Table 5-14 Switch Ties for Standard Turnouts

Frog #	Switch Point Length ft (m)	Lead Distance	Number of Ties of Each Length									Total Ties
			9 ft (2.74m)	10 ft (3.05m)	11 ft (3.35m)	12 ft (3.66m)	13 ft (3.96m)	14 ft (4.27m)	15 ft (4.57m)	16 ft (4.88m)	17 ft (5.18m)	
8	16½ (5.03)	68 ft (20.3 m)	7	13	6	6	4	5	7	6	3	57
9	16½ (5.03)	72 ft-3.5 in. (22 m)	7	13	7	7	6	5	8	6	4	63
10	16½ (5.03)	78 ft-9 in. (24 m)	7	15	8	7	6	6	7	8	4	68

Note: Each tie set includes 2 - 15 ft. (4.6 m) ties for head blocks, which hold the switch stand.

5-14.1.3 Treatment.



All wood ties will be pressure treated with preservative as specified in AWPA Standard U1, Commodity Specification C, to the requirements of Use category 4 (UC4). The preferred preservative for ties is a creosote solution (CR-S) as specified in AWPA Standard P2. For ties used west of the Mississippi River, a creosote-petroleum solution (CR-PS) as specified by AWPA Standard P3 is used.

In areas of high decay from fungi, insects or severe climactic or exposure conditions, a dual treatment with borate and creosote is recommended to significantly extend tie life. Dual treatment with borate (SBX) is specified in AWPA Standard P25. The average life expectancy of a properly treated wood tie in the CONUS is 25 to 35 years. The life expectancy in high-decay regions of the CONUS is as low as 12 years.

5-14.1.4 Anti-Splitting Devices.

To reduce the tendency of wood to split, anti-splitting devices are often applied to the ends of ties. Anti-splitting devices are recommended for turnout ties but can be specified for standard track ties. Of the two general types, as shown in Figure 5-21, the nail plates are more effective and thus preferred.

Figure 5-21 Anti-Splitting Devices for Tie Ends

5-14.1.5 Pre-Boring.

Once a common practice, the pre-boring of spike holes is no longer recommended.

5-14.1.6 Tie Spacing.

The center-to-center distance between adjacent ties ranges from 19.5 to 22 in. (495 to 558 mm), with a minimum allowable of 18 in. (460 mm) and a maximum of 24 in. (609 mm). For auxiliary and loading tracks, a 21 to 23-in. (533 to 584 mm) spacing is typical. Specify tie spacing after a structural analysis has been performed.

5-14.1.7 Pros and Cons.

The advantages of wood ties include:

- Typically, the most economical tie.
- Are widely available in the CONUS from many suppliers.
- Utilize typical hardware and equipment to attach the rail.
- Can be used in all track situations.
- Are good at surviving derailments.

The disadvantages of wood ties include:

- Short service life in high-decay environments.
- Typically require the use of rail anchors.
- Environmental issues associated with the disposal of defective ties.
- The track gage must be set manually by measuring prior to spiking the rail.

5-14.2 Engineered Composite Ties.

Engineered composite ties are composed of two or more materials in a matrix binder. The components can include recycled materials. Since the matrix often includes plastic, engineered composite ties are often referred to as plastic ties. Engineered composite ties are not widely used, but they have been used at DoD installations in high-decay areas of the CONUS. Due to their resistance to decay, they are well-suited to use in road crossings. They use the same hardware and equipment to attach the rail as is used with wood ties. To increase lateral and longitudinal track stability, engineered composite ties are typically manufactured with surface patterns to mechanically interlock with the ballast. Ensure engineered composite ties conform with the specifications in Chapter 30, Part 5 of the AREMA Manual.

5-14.2.1 Cross-Section and Length.

Engineered composite ties are typically 7 in. (178 mm) thick by 9 in. (229 mm) wide. The length of regular ties is typically 9 ft (2.75 m). Longer lengths are available for use under road crossings and as switch ties in turnouts. Since their dimensions are the same as typical wood ties, they are used to replace wood ties without other modifications to the track.

5-14.2.2 Pre-boring.

Engineered composite tie manufacturers typically recommend pre-boring of spike holes.

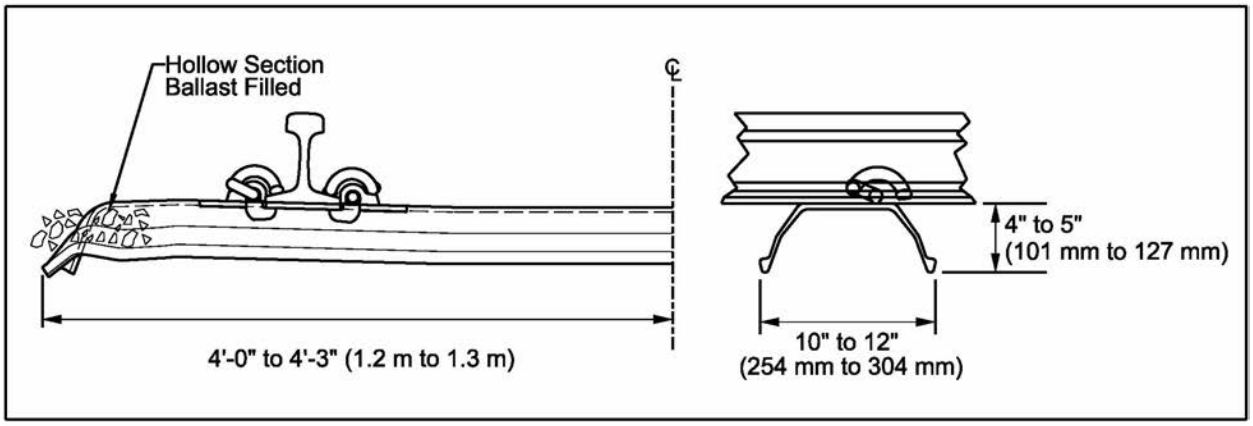
5-14.2.3 Tie Spacing.

The spacing for engineered composite ties is the same as for wood ties, usually ranging from 19.5 to 22 in. (495 to 558 mm), with a minimum allowable of 18 in. (460 mm) and maximum of 24 in (609 mm).

5-14.2.4 Pros and Cons.

The advantages of engineered composite ties include:

- Are resistant to decay.
- Have an estimated life span of 50 years.
- Are well-suited for use in road crossings.
- Can be intermixed with wood ties.
- Use the same hardware and equipment to attach the rail as wood ties.
- Can be used in all track situations.
- Defective ties may be recyclable.



The disadvantages of engineered composite ties include:

- Are more expensive than wood ties.
- There are a limited number of suppliers in the CONUS.
- Are not good at surviving derailments.
- Typically require the use of rail anchors.
- The track gage must be set manually by measuring prior to pre-boring and spiking the rail.

5-14.3 Steel Ties.

The use of steel ties in the CONUS is increasing, particularly in yards, low-speed tracks, and tunnels. Steel ties consist of a hollow shell with an inverted U-shaped cross section as shown in Figure 5-22. The hollow shell is packed with ballast to ensure the bearing area is at the top of the inside shell rather than at the bottom of the tie. This allows for reduced overall ballast thickness, which can make steel ties more economical than wood ties for new track construction in areas where ballast material cost is high. A minimum thickness of 10 in. (254 mm) of ballast, measured from the top of the tie, is required. Place a minimum 4 in. (101 mm) thickness of sub-ballast beneath the ballast. Inspection holes located in the steel tie's top surface allow for visual inspection that the hollow underside has been completely filled and proper ballast tamping has been achieved. Since the sides of the tie are embedded in the ballast, steel ties provide good longitudinal and lateral support of the track. Ensure steel ties conform with the specifications in Chapter 30, Part 6 of the AREMA Manual.

Figure 5-22 Steel Tie

5-14.3.1 Tamping.

Extra care is required when tamping steel ties. Since steel ties are not as tall as wooden ties, reduce the embedment depth of the tamper machine tools to match. Otherwise, proper compaction of the ballast under the steel ties will not be achieved. When steel ties are interspersed with wood ties, it is necessary to make two passes with the tamper: one pass with the tamper machine tools set at the proper depth for wood ties and a second pass to tamp the steel ties with the tamper machine tools set at the reduced insertion depth.

5-14.3.2 Fastening.

Steel ties utilize steel spring clips to attach the rail to the tie. This system tightly clamps the rail to the tie and eliminates the need for tie plates, spikes, and rail anchors. The ties are pre-punched for the fasteners, so track gage is set at the factory. In signalized track and near signalized road crossings, insulators are placed underneath the rail base and between the spring clips and the rail to prevent the steel tie from shunting the electric current between the rails.

The tension strength of the steel material and clamping action of the spring clips result in greater strength to hold gage than other ties. Because of this, steel ties are sometimes interspersed with wood ties (for example, every fifth tie is steel) in sharp curves and other areas where gage widening is a problem.

5-14.3.3 Road Crossings.

When steel ties are placed under a road crossing, the road crossing must be an asphalt crossing with rubber interface. If a different type of crossing is desired or required, use wood or engineered composite ties through the length of the crossing with a transition back to steel ties outside the limits of the crossing. A transition to a different type of tie must be used under roads that will carry tracked vehicles.

5-14.3.4 Turnouts.

Steel switch ties are available for use in turnouts. However, do not intersperse steel switch ties with other types of switch ties in a turnout. Do not use steel ties as the primary tie in track with speeds above 25 mph (40.2 km/hr) since the higher dynamic forces coupled with the stiffness of the steel can accelerate degradation of the ballast. However, it is acceptable to intersperse steel ties with wood ties (for example, every fifth tie is steel) in track with speeds greater than 25 mph (40.2 km/hr).

Steel ties are made of a special type of steel that acquires an initial coating of rust-like oxide that protects the steel from further corrosion. Steel ties are also very resistant to biological decay.

5-14.3.5 Cross Section and Length.

Steel ties are typically wider, but not as deep as wood ties. They can be shorter than wood ties. Typical dimensions of steel ties are shown in Figure 5-22. Longer lengths are available for use in turnouts. The length of switch ties in turnouts varies between manufacturers and will likely vary from the lengths shown in Table 5-14.

5-14.3.6 Tie Spacing.

The typical spacing for steel ties ranges from 20 to 24 in. (508 to 609 mm).

5-14.3.7 Pros and Cons.

The advantages of steel ties include:

- Requires less ballast since the required depth of ballast is measured from the top of the tie rather than the bottom of the tie.
- More economical than wood ties for new track construction in regions where ballast material cost is high.
- Cost effective in certain OCONUS situations with limited access to wood ties.
- Can be compactly stacked like plastic cups to minimize volume for shipping.
- Are resistant to decay.
- Have an estimated lifespan of 50 years or more.
- Can be intermixed with wood ties in existing track.
- Spring clip attachment system eliminates the need for tie plates and rail anchors.
- Spring clips do not loosen over time as occurs with spikes in wood ties.
- Track gage is set at the factory, reducing the chance of improper track gage during installation.

- Are superior to wood and engineered composite ties at holding gage.
- Are good at surviving derailments.
- Defective ties are recyclable.
- Are lightweight, which facilitates handling.

The disadvantages of steel ties include:

- Are more expensive than wood ties when replacing ties in existing track.
- Requires adjustment of the tamping machine tools for less depth compared to wood and engineered composite ties.
- Requires two passes of a tamping machine during surfacing operations when steel ties are interspersed with wood ties.
- Requires extra care during tamping operations to ensure the hollow underside has been completely filled with ballast.
- Should not be used for tracks with speeds greater than 25 mph (40.2 km/hr).
- There is a limited number of suppliers in the CONUS.

5-14.4 Concrete Ties.

Concrete ties are used by some commercial railroads, particularly on lines with the heaviest traffic volumes and in areas with numerous curves. Where used, concrete ties are in track with welded rail and solidly supported with deep ballast sections. Concrete ties are usually not economical on lighter traffic lines and are usually not suitable for use with jointed rail or in track of lighter construction. Also, concrete ties cannot be successfully mixed with wood ties. Thus, concrete ties are not economical and are not recommended for general use in CONUS military track. The use of concrete ties for certain OCONUS applications can be cost effective. These applications include areas where concrete ties are in widespread use and where timber is in short supply. Prior to selecting concrete ties for an installation, conduct an economic analysis.

Concrete ties are prestressed concrete. Wire reinforcement provides the prestressing force, keeping the concrete in compression to prevent cracking. The reinforcement also provides bending strength.

5-14.4.1 Fastening.

Concrete ties utilize steel spring clips to attach the rail to the tie, similar to steel ties. However, a specialized pad must be placed between the base of the rail and the tie. The pad cushions the load, preventing the development of rail and track surface defects. Steel shoulder inserts are cast into the tie to accept the spring clips. This results in the track gage being set at the factory. Insulators are placed between the steel shoulder inserts and the rail base and between the spring clips and the rail to isolate the tie electrically.

5-14.4.2 Road Crossing.

Concrete ties are available for road crossings and for use as switch ties in turnouts. However, the CONUS commercial railroads typically do not use concrete ties in road crossings or in turnouts. Instead, they transition to wood ties and use them throughout the limits of road crossings and turnouts.

5-14.4.3 Subgrade.

Subgrade cross slope must be constant under the length of a concrete tie. Do not locate a subgrade or sub-ballast crown below a concrete tie to avoid over-stressing the tie during ballast placement and tamping.

5-14.4.4 Cross Section and Length.

Concrete ties are typically 10 to 11in. (254 to 279 mm) wide at their base and taper to 7 to 8 in. (178 to 203 mm) wide at the top. The height is typically 8 to 8.5 in. (203 to 216 mm) at the ends of the ties and transitions to 6 to 6.5 in. (152 to 165 mm) between the rails. The typical length of a concrete tie in CONUS is 8 ft.-3in. (2.5 m). The dimensions of concrete ties in OCONUS locations can vary.

5-14.4.5 Tie Spacing.

The typical spacing for concrete ties is 24 in. (609 mm).

5-14.4.6 Pros and Cons.

The advantages of concrete ties include:

- Cost effective in certain OCONUS situations with limited access to wood ties.
- Resistant to decay.
- Have an estimated lifespan of 50 years.
- Spring clip fastening system eliminates the need for tie plates and rail anchors.
- Track gage is set at the factory, reducing the chance of improper track gage during installation.
- Are superior to wood and engineered composite ties at holding gage.

The disadvantages of concrete ties include:

- Are not economical and not recommended for general use in CONUS military track.
- Should not be used with jointed rail.
- Require a thicker ballast section.

- Cannot be intermixed with wood ties.
- Typically requires a transition to wood ties through the limits of road crossings and turnouts in CONUS situations.
- Are not good at surviving derailments.
- Concrete ties are approximately three times heavier than wood.

5-15 RAIL.

5-15.1 Section Designation.

Rail is rolled into different sizes (dimensions) and shapes commonly referred to as "weight" and "section." The weight of a rail is based on how much a rail weighs in pounds per yard of length. The section refers to the cross-sectional shape of the rail.

5-15.2 Selection Criteria.

Perform a structural analysis prior to selection of a rail section. Consider structural requirements, as well as cost and availability of rail sections before making a final selection.

5-15.3 Recommended New Rail Sections.

Weights and sections recommended for new rail purchases are: 115RE and 136RE, with 115RE being the preferred. These are the standard sections recommended by the AREMA.

Rail is purchased in 39- or 80-ft (11.9 or 24.4 m) lengths. Rail 80 ft. (24.4 m) long has the advantage of reducing the number of joints to half that for 39 ft. (11.9 m) rail. For small purchases where the rail is transported by truck, 39 ft. (11.9 m) lengths are more cost effective.

5-15.4 Relay (Secondhand) Rail.

Secondhand rail meeting the specifications in Table 5-15 either as is or after cropping off the ends, can be used for rehabilitation or new construction. Investigate the cost, condition, and availability of matching joint bars and tie plates before selecting relay rail.

Recommended relay rail sections are: 115RE, 132RE, 133RE, and 136RE. Select relay rail to limit the number of different rail weights and sections within the track network. Ensure the section and joint drilling pattern (bolt hole size and spacing) are consistent for a given weight. Due to the varying market for relay rail, recommend allowing the contractor an option to provide an acceptable rail section. Limit selection to sections that are sufficiently plentiful to supply future maintenance purchase requirements: rail, joint bars, frogs and other turnout parts.

5-15.5 Lightweight Rail.

Lightweight rail weighs less than 90 lb. per yd (44.6 kg/m). These weights are no longer manufactured and are only available as secondhand.

Do not use rail weights less than 90 lb. per yd (44.6 kg/m). A structural evaluation is necessary to determine the adequacy of these rail weights. Replace rail not adequate to support the desired wheel loads.

5-15.6 Continuous Welded Rail (CWR).

Continuous welded rail (CWR) is strings of standard rail welded together either in a rail plant or by field welding after installation. CWR is commonly used on commercial railroads and is beneficial in reducing maintenance costs due to rail joints. CWR is not recommended for general use on military track because it:

1. Requires a larger ballast section to provide sufficient track restraint
2. Needs more rail anchors to restrain longitudinal rail expansion
3. Is more subject to buckling in hotter weather and pull-aparts during colder weather
4. Has a higher initial installation cost

If conveniently available, short strings (less than 200 ft. (61 m)) are appropriate for wide road crossings or track in paved areas. CWR is applicable on certain lines that form a long connection to the serving commercial railroad. See Chapter 5, Section 3.1 of the AREMA Manual for additional CWR information.

5-15.7 Field Welds.

Weld rail running through road crossings and for 20 ft. (6 m) on either side of crossings to eliminate joints in these areas. Consider field welding for rail placed in confined loading areas, adjacent to warehouse loading docks, and in other areas where maintenance access to rail joints is difficult.

Accomplish rail welding with special thermite welding kits designed for this purpose and by people with the necessary training and experience in welding rail. Where many welds are performed, some specialized contractors have truck-mounted electric welding units designed for this purpose.

5-15.8 Salvaging Rail.

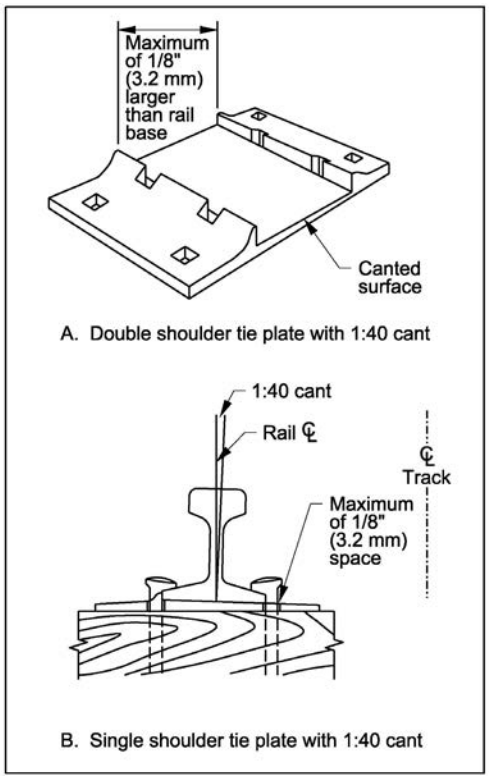
During track reconstruction, the existing rail and other track materials can often be salvaged for use at other locations on the installation, stockpiled for future construction projects, or sold on the open market as used material. Dispose of lightweight rail, defective rail, and other track materials not suitable for use in track reconstruction or for resale on the open market as scrap or reroll material.

Table 5-15 Dimension and Surface Specifications for Relay (Secondhand) Rail

Length	For Standard 39 ft (11.9 m) lengths: Not more than 10% of lot between 33 ft and 39 ft. (10.1 m to 11.9 m). No rail shorter than 33 ft. (10.1 m).
Vertical Wear	90 lb (44.6 kg) or Larger: Average top wear 5/16 in. (7.9 mm) or less with maximum at any one location of 11/32 in. (8.7 mm)
Side Wear	At least one side must meet the following: 90 lb (44.6 kg) or Larger - Maximum of 5/16 in. (7.9 mm)
Lip or Overflow	Maximum of 1/16 in. (0.8 mm), either as is or obtained by grinding off excess.
Engine Burns	Maximum of 1/2 in. (13 mm) diameter (or 1/4 in. (6.4 mm) wide by 1/2 in. (13 mm) long) and 1/32 in. (0.8 mm) deep. Maximum of four engine burns per rail. Engine burns on no more than 8% of the lot.
End Batter And Chipping	Maximum of 1/8 in. (3.2 mm) when measured 1/2 in. (13 mm) from the rail end with an 18 in. (460 mm) straightedge.
Running Surface Damage	Maximum size of 1/4 in. (6.4 mm) wide by 1/2 in. (13 mm) long and 1/32 in. (0.8 mm) deep. Maximum of four damaged spots in any one rail.
Defects Not Permitted	Bolt hole cracks or breaks, broken base, crushed head, detail or engine burn fractures, head-web or web-base separations, piping, horizontal or vertical split head or web, torch cuts or flame gouges, compound or transverse fissures, deep pitting from corrosion.
Condition and Appearance	Rail must be: free from obvious defects; clean in appearance; straight in line and surface and without kinks; and free from base defects such as plate wear and spike notches.
Internal Inspection	Rail to be ultrasonically inspected before or after installation. Defective sections to be rejected and replaced.
Note: See AREMA Manual Chapter 4, Part 4 for rail defect definitions and illustrations.	

5-16 OTHER TRACK MATERIAL.

5-16.1 Definition.



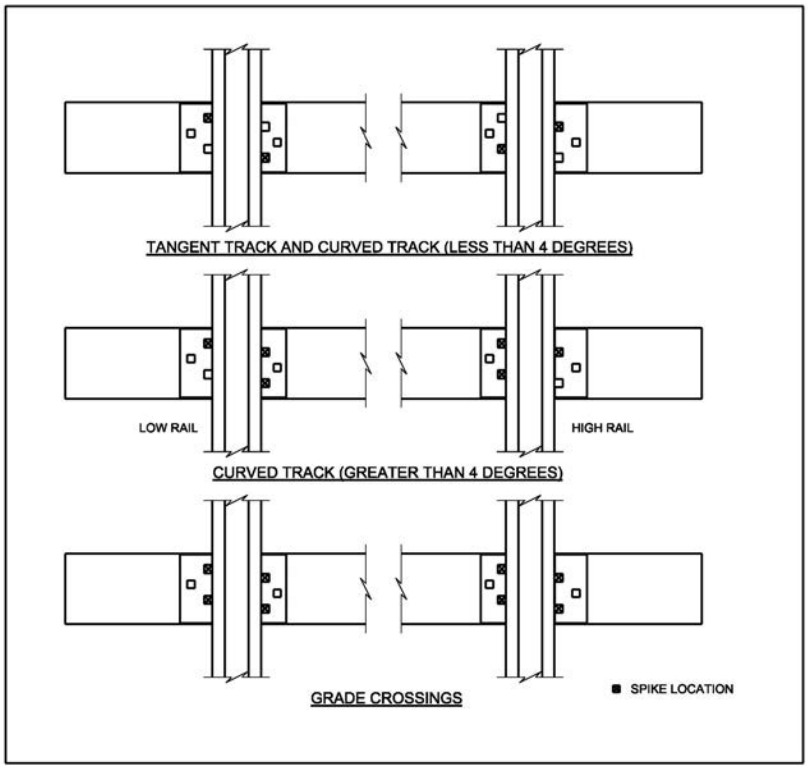
Tie plates, joint bars, bolts, spikes and other miscellaneous hardware used in track construction are commonly referred to as other track materials (OTM).

5-16.2 Tie Plates.

Tie plates vary in length and width. Most sizes are suitable, as long as the spike hole punching (or distance between the shoulders - for double shoulder plates) matches the width of the rail base. For double shoulder tie plates, the distance between the shoulders will be at most 1/8 in. larger than the rail base width. On single shoulder plates, the spike holes on the gage side (opposite the shoulder) must keep the inside face of the spike within 1/8 in. of the rail base when the opposite edge of the base is against the shoulder. See Figures 5-23 (a) and (b).

Use either single or double shoulder tie plates. Single shoulder tie plates are no longer manufactured. Only relay/secondhand single shoulder tie plates are available. Within a given length of track, it is allowable to use tie plates of different lengths and widths, and single shoulder plates can mix with double shoulder plates. However, do not mix plates with different cants: those with level rail seats and those with a 1:40 slope. Tie plates with a 1:40 cant are preferred. Secondhand plates that are not bent, have not lost much material due to corrosion, and otherwise meet the above requirements, are acceptable.

Figure 5-23 Tie Plates



5-16.3 Spikes.

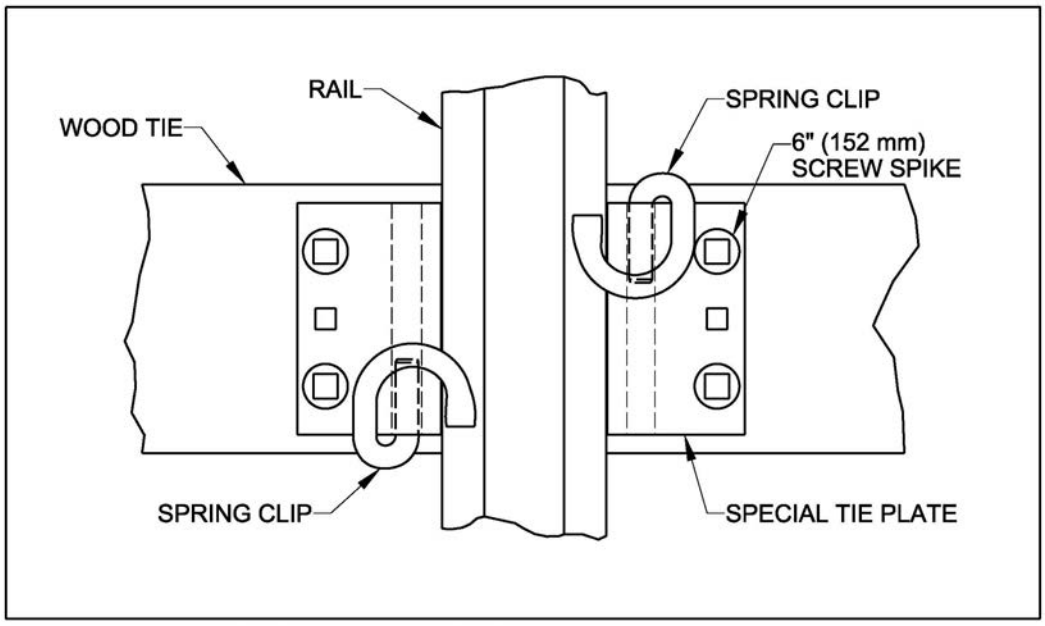
On tangent track and on curves up to 4 degrees, use one spike on the gage and field side of each rail, for a total of four spikes in each tie. On curves greater than 4 degrees, use one spike on the field side and two spikes on the gage side of each rail, for a total of six spikes in each tie. On track within road crossings, use two spikes on the gage

side and two on the field side of each rail, for a total of eight spikes in each tie. Diagrams of these spiking patterns are shown in Figure 5-24.

Figure 5-24 Typical Spiking Plans

5-16.4 Rail Spring Clips.

Rail spring clips are elastic forged steel fasteners that attach the rail base to steel or concrete ties to prevent horizontal and vertical movement of the rail. Rail spring clips can also be used with wood and engineered composite ties with special tie plates. Use rail spring clips with wood and engineered composite ties in situations where difficulty in holding gage is anticipated or encountered, such as curves sharper than 8 degrees. The spring clips come in different configurations. A common type of spring clip on a wood tie is shown in Figure 5-25. The spring clips tightly clamp the base of the rail to the tie and are typically applied and removed with a sledge hammer or special mechanized equipment. Spring clips eliminate the need for rail anchors.



5-16.5 Rail Joints and Joint Bars.

Use either four-hole (24-in. (608 mm)) or six-hole (36-in. (914 mm)) joint bars for rail joints. Standard joint bars are used to join rail of the same section. Compromise joint bars are used to join rail of different section. Ensure both standard and compromise joint bars are properly factory designed and constructed. In addition, ensure the bars are of the size, shape, and punching pattern to fit the rail being joined. Specifications for new joint bars are found in “Specifications for Quenched Carbon Steel Joint Bars

and Forged Compromise Joint Bars" in Chapter 4, Part 3 of the AREMA Manual and joint bar assemblies in Chapter 4, Part 3 of the AREMA manual. Compromise joints will be specified as indicated in AREMA Portfolio of Trackwork Plan 700B.

Use secondhand joint bars on secondhand rail if not bent, cracked, excessively corroded, or otherwise defective. Do not use secondhand joint bars on new rail. Use either field-applied type or prefabricated (glued) type joints for insulated joints required to isolate signal currents for road crossing warning devices. Special insulated tie plates are also required. It is recommended that rail joints be welded where located in paved areas or at any location where access to the joint is restricted.

Figure 5-25 Typical Rail Spring Clip

5-16.6 Track Bolts, Nuts, and Spring Washers.

Track bolts, nuts, and spring washers will conform to the specifications in Chapter 4, Part 3, of the AREMA Manual.

Common bolt diameters for different rail weights are found in Table 5-16.

Table 5-16 Common Joint Bolt Diameters

Bolt Diameter - in. (mm)	Rail Weights - lb/yd (kg/m)
1 (25)	90 to 130 (44.6 to 64.5)
1⅛ (25.4)	131 to 140 (65 to 69.4)

5-16.7 Rail Anchors.

For new construction, as a minimum, use rail anchors on main running tracks with spikes to restrain longitudinal rail movement in the quantity and arrangement diagrammed in Figure 5-26. Use additional anchors on track with grades steeper than 0.5 percent if required, and where maintenance problems indicate a need. Rail anchors are required in track with continuous welded rail. Rail anchors are not necessary in tracks that utilize rail spring clips. When anchors are used, apply four anchors to each tie that is anchored (box anchored), per tie as shown in Figure 5-26.

Use either spring or drive-on type anchors, shown in Figure 5-27. Drive-on anchors have the advantage of being easier to apply and remove manually, and do not require a special anchor wrench, as do spring anchors. Use caution, do not overdrive a drive-on anchor. Overdriving causes the anchor to lose its ability to tightly grip the rail base.

5-16.7.1 Bridges.

Do not use rail anchors across open deck bridges. Instead, box anchor every third tie for two rail lengths off each end of the bridge. Use a similar arrangement at rail crossings, as shown in Figure 5-28. Apply rail anchors at the normal designated pattern across ballast deck bridges.

Figure 5-26 Recommended Minimum Rail Anchor Application

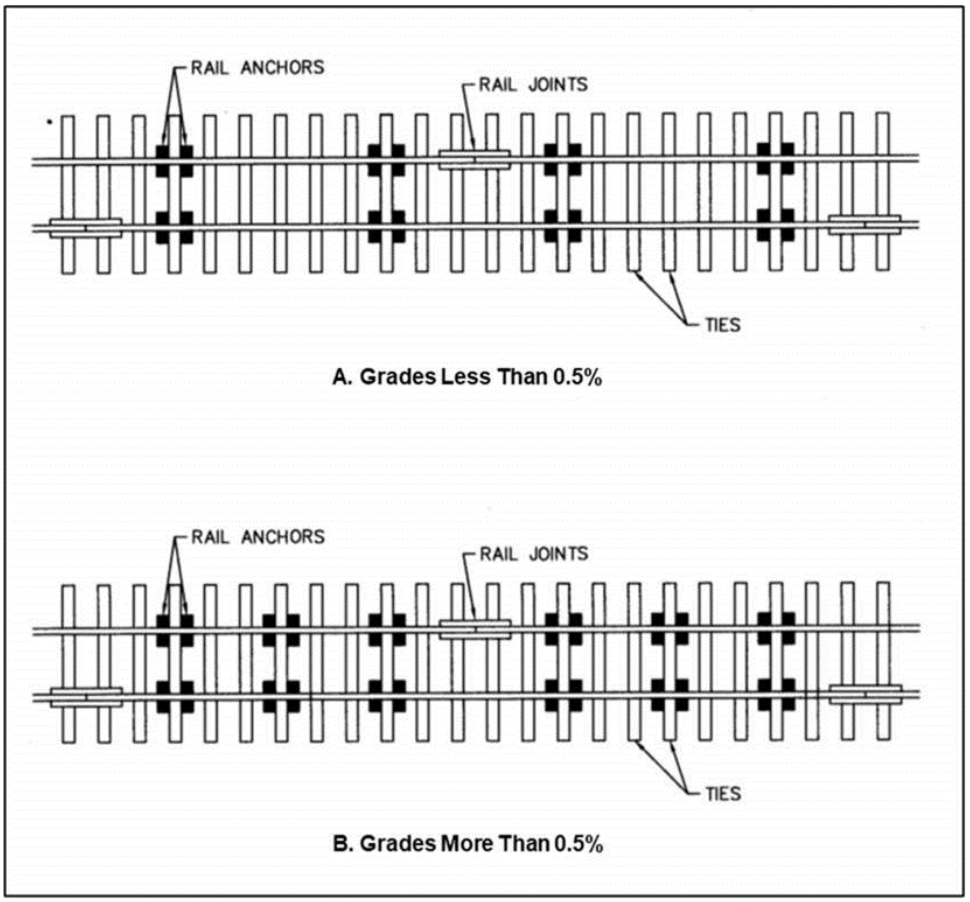


Figure 5-27 Rail Anchors

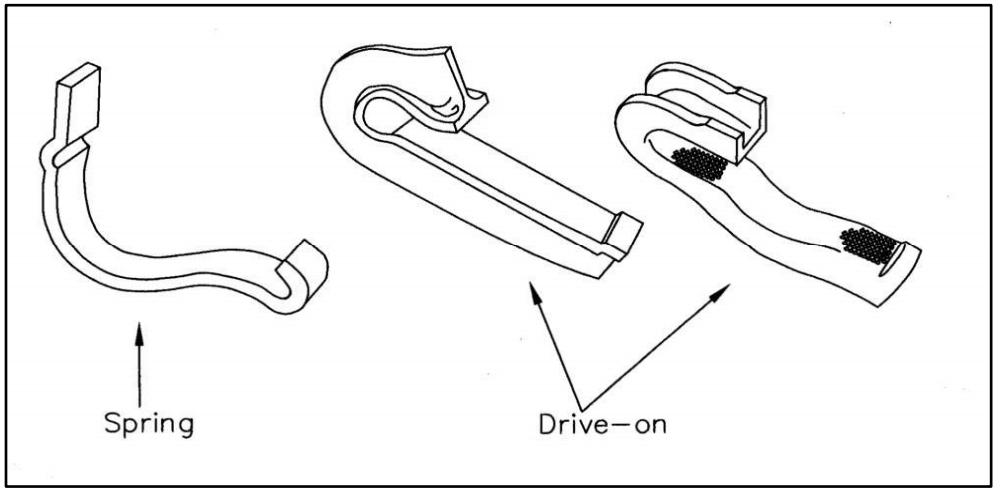

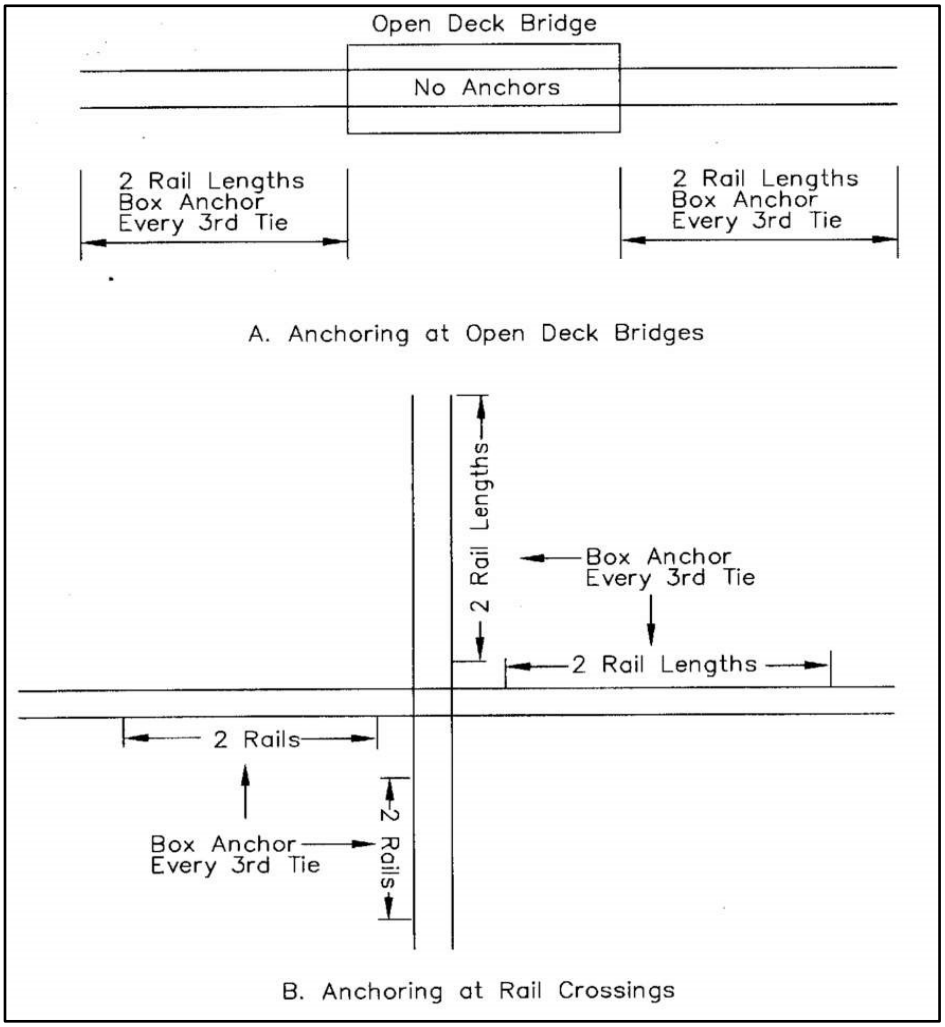

Figure 5-28 Rail Anchor Applications at Open Deck Bridges and Rail Crossings

5-16.8 Gage Rods.

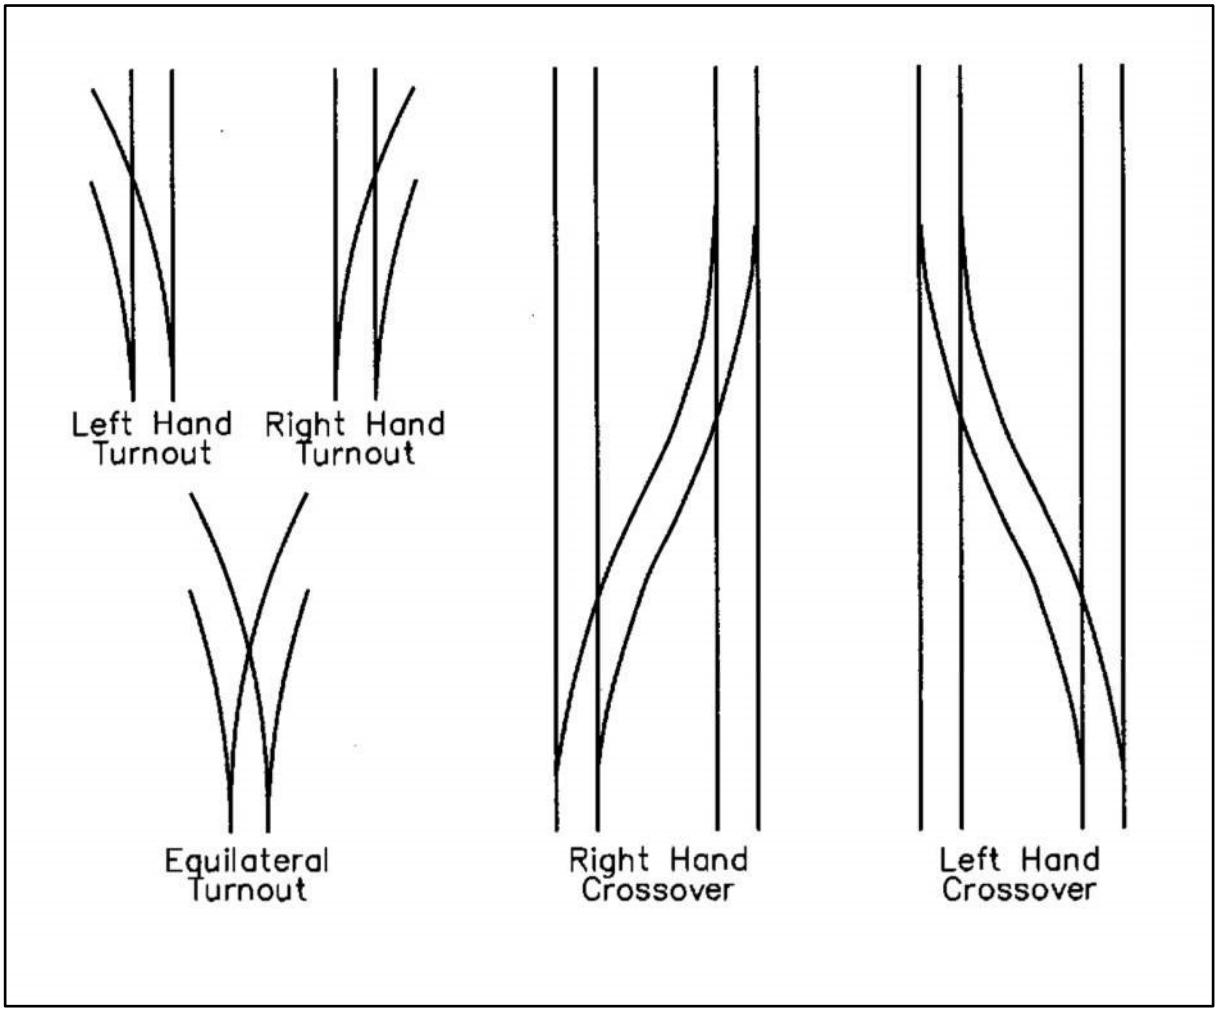
Gage rods are sometimes specified for maintenance purposes on curves over 8 degrees where difficulty in holding gage is encountered. Install two to four rods per rail length when used on sharp curves.

Do not use gage rods for new construction, only use them for maintenance of existing track. In new construction areas where difficulty in holding gage is anticipated, consider the use of wood ties with rail spring clips or steel ties rather than gage rods.

5-17 TURNOUTS AND CROSSOVERS.

Turnouts are designed to divert trains from one track to another. Two turnouts form a crossover when used together to allow the passage of trains between parallel tracks. The general arrangement of turnouts and crossovers is shown in Figure 5-29. The main parts of a turnout are shown in Figure 5-30. For additional switch detail see AREMA Portfolio of Trackwork Plans 190, 220, and 221.

Figure 5-29 General Arrangement of Turnouts and Crossovers



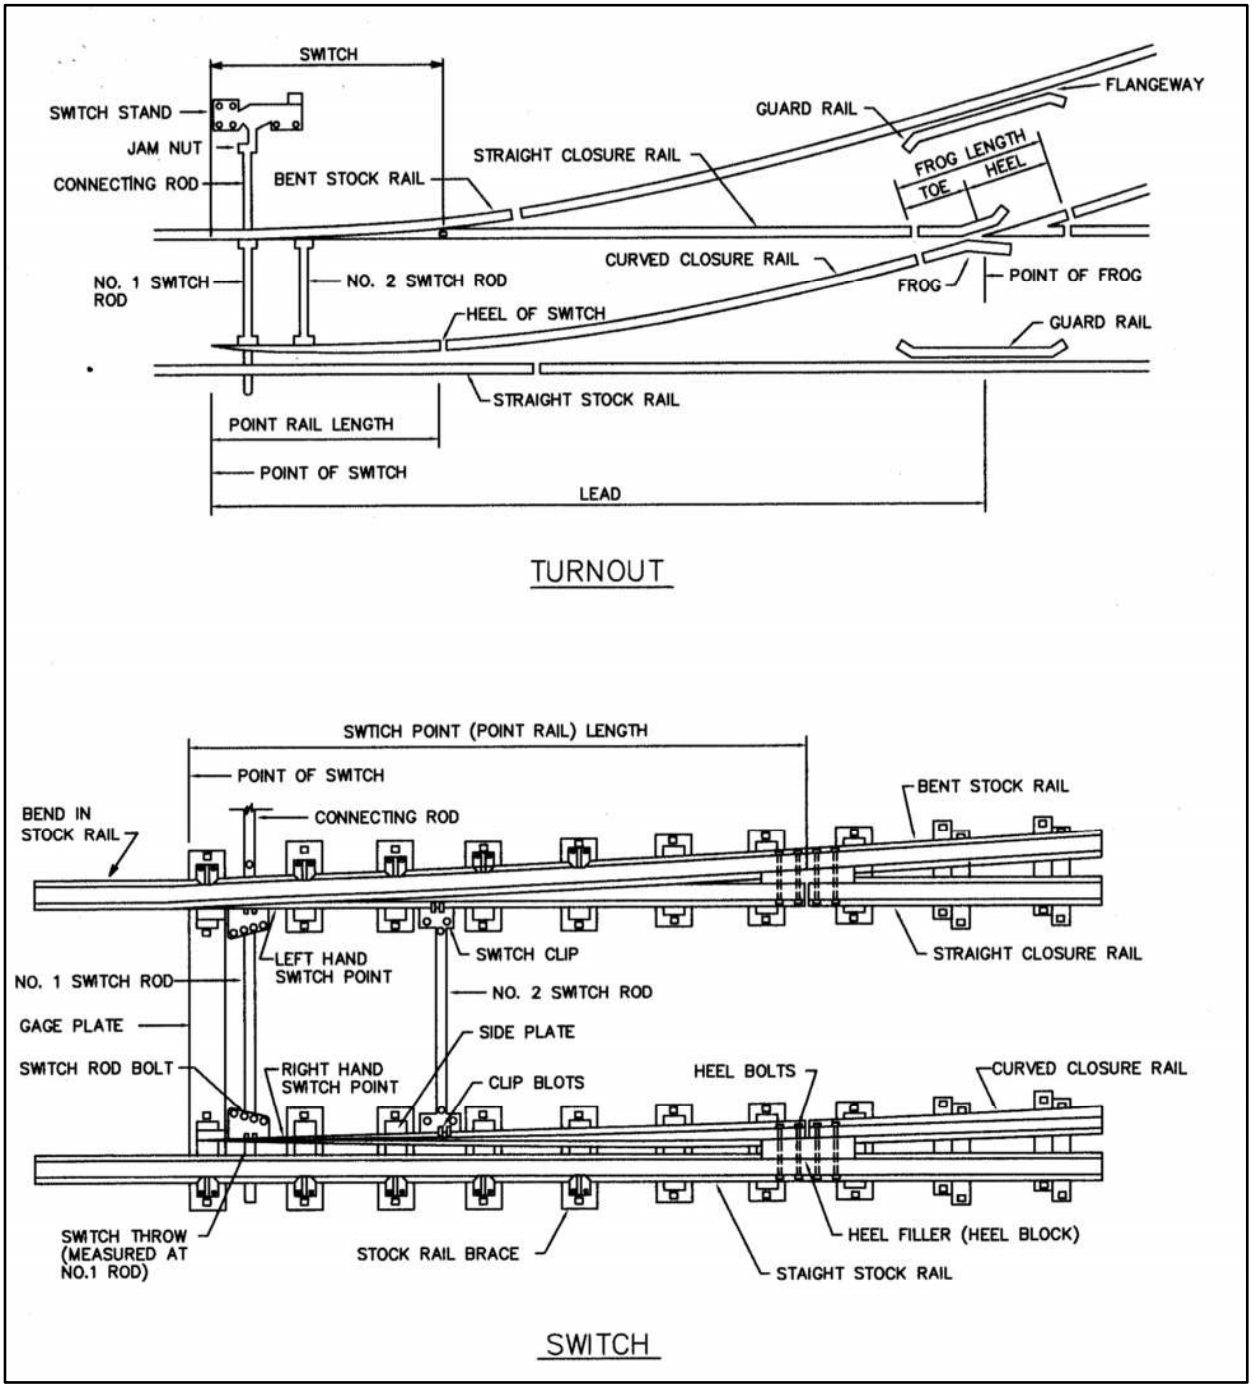


Figure 5-30 Parts of a Turnout

5-17.1 Size.

Turnout size is designated by the size of the frog used in the turnout, as illustrated in Figure 5-31. The size of the frog determines the angle at which the turnout track diverges from the tangent track. Frog size also influences the required degree of curvature within the turnout.

Select standard turnout sizes according to Table 5-17.

Figure 5-31 Determining Frog Number (Turnout Size)

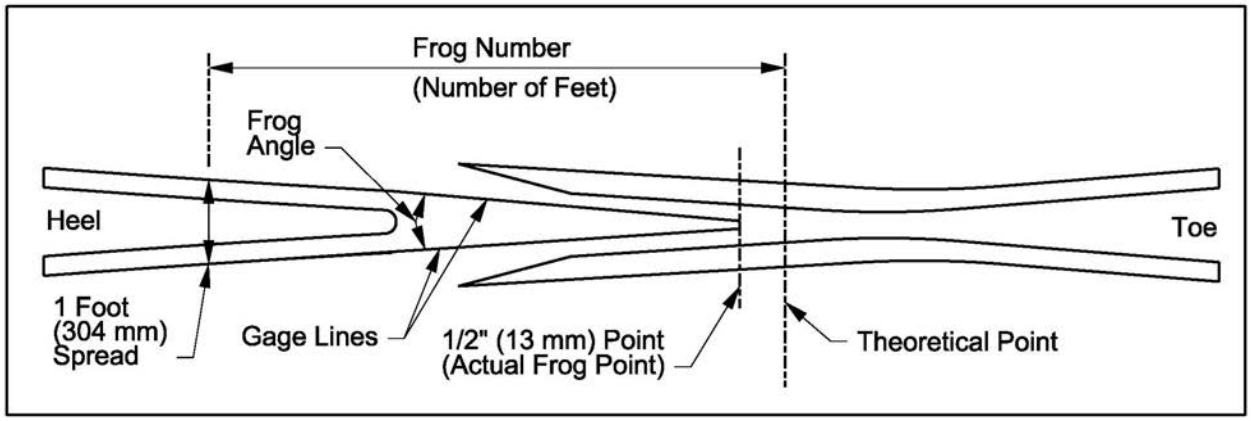

Table 5-17 Turnout Size Selection Criteria

Turnout Size	Turnout Curvature (Degrees)	Selection Criteria
10	7.4	Preferred where space permits, or where long cars (over 75 ft (22.9 m)) or 140-ton (127 MT) flatcars (with 3-axle trucks) are being handled. Use for crossovers.
9	9.3	Smallest size recommended for handling long cars (over 75 ft (22.9 m)) or 140-ton (127 MT) flatcars (with 3-axle trucks). In ladder tracks, saves space compared to a number 10.
8	11.8	Not recommended for handling long cars (over 75 ft (22.9 m)) or 140-ton (127 MT) flatcars (with 3-axle trucks). Smallest size normally permitted.

5-17.2 Design and Selection.

The main design decisions for turnouts are the direction the turnout will diverge, as shown in Figure 5-29, and the angle of the frog (or frog number), which determines how sharply the turnout diverges and also designates the size of the turnout. Recommended choices for different turnout components are covered below, as is layout design for use where nonstandard configurations are required.

Once a standard turnout has been selected from Table 5-17 or the geometry has been otherwise determined, the designer specifies the desired switch, frog, and guard rails if needed, from the appropriate AREMA Portfolio of Trackwork Plans; the turnout or crossover tie set from Table 5-14; and the amount of rail needed to complete the turnout (connect the switch and frog) from AREMA Portfolio of Trackwork Plan 910 or 911. The USACE Omaha District has standard plans available for the turnouts shown in Table 5-14 based on the AREMA Portfolio of Trackwork Plans. Guidance on the selection of these items and other turnout hardware is given below. Ensure all materials used within the limits of a turnout are factory designed and constructed, of the proper type and size, and not flame cut or otherwise altered in the field.

5-17.3 Switch Ties.

A turnout is fastened to a special set of ties called a switch tie set. Generally, switch ties increase in length from the switch point to just past the frog where the turnout ends. From that point, two standard tracks continue. An exception is at the switch point where the switch stand requires two long ties called head blocks to accommodate the stand and operating rods. Determine the make-up of switch tie sets using Table 5-14.

Use 7-in. x 9-in. (178 mm x 229 mm) hardwood ties for turnouts. Use oak switch ties in areas east of the Mississippi River and use oak or Douglas fir in areas west of the Mississippi River. Composite tie and steel tie sets are acceptable in turnouts. Switch tie material and treatment specifications are the same as for standard track ties and are covered in Chapter 5, Paragraph 14.

5-17.4 Switches and Switch Point.

The standard switch for use on military track is the 16 ft., 6-in. (5 m) switch with graduated risers, as shown in AREMA Portfolio of Trackwork Plan 112. The detailed specification for this switch is given in the notes in the upper right corner of the plan. In most cases, the specification will be for a 112A hand throw switch with adjustable braces. Use this specification for switches that are either within or not within a signal circuit (as near crossings with warning lights or gates). Use longer switches as needed when turnouts larger than No. 10 are used.

Specific criteria for switch point design in new turnouts are found in AREMA Portfolio of Trackwork Plan 221, Detail 5100. In locations where traffic conditions cause excessive wear on the tapered ends of the switch point, use manganese steel switch points per AREMA Portfolio of Trackwork Plan 220. The use of spring switches is not recommended on DoD track.

5-17.5 Switch Clips.

Use adjustable ductile iron rocker clips for switch clips as shown in AREMA Portfolio of Trackwork Plan 222, Detail 3117.

5-17.6 Rail Braces.

Use the adjustable type rail braces that support the outside of the stock rails as shown in AREMA Portfolio of Trackwork Plan 224. Leave rigid braces in existing turnouts if they provide adequate support per UFC 4-860-03.

5-17.7 Switch Stands and Lever Latches.

Ergonomic ground throw (low) switch stands are preferred, especially in terminal areas. However, there are situations when the height of the ergonomic stand will conflict with the clearance envelope of an adjacent track. In these situations, use a non-ergonomic stand. Many variations of ergonomic and non-ergonomic stands are available, and most are suitable. Ensure any stand selected has a provision for the throw lever to lock or latch solidly in place. For switches in more remote areas, a switch point lock and/or lever lock is desirable.

5-17.8 Frogs and Guard Rails.

Frogs are secured to ties with universal frog plates as shown in AREMA Portfolio of Trackwork Plan 242 or a set of hook plates. When not using self-guarded frogs, specify guard rails to match the frog size, as listed in Note 2A of AREMA Portfolio of Trackwork Plan 502. Guard rails of the type in AREMA Portfolio of Trackwork Plans 504 or 509 are acceptable.

Do not use spring rail frogs on DoD installations. Bolted rigid frogs that are in existing turnouts and are not defective can stay in place. When new frogs are required, use either solid manganese or rail bound manganese meeting the above specifications.

5-17.8.1 Solid Manganese Self-Guarded.

The solid manganese, self-guarded type frog, as shown in AREMA Portfolio of Trackwork Plans 641 and 691 (Section BB), is preferred for the slower speed operations most common at military installations. Self-guarded frogs simplify turnout construction by not requiring separate guard rails opposite each side of the frog.

5-17.8.2 Railbound Manganese.

Use railbound manganese (RBM) frogs, as shown in AREMA Portfolio of Trackwork Plans 622 - 625, on heavy traffic lines where the traffic is approximately equal on both sides of the frog. This type of frog is most desirable for long turnouts (Size No. 15 or above) since manganese steel is especially suited to the thin long points and requires comparatively little maintenance.

5-17.9 Stock Rails and Closure Rails.

When planning, specify enough rail to make up the straight and curved stock rails and closure rails, as indicated in AREMA Portfolio of Trackwork Plan 910 or 911. This amount will approximately equal twice the actual lead (Column 4) plus the closure distances (Columns 5 and 6). Ensure all rail within the limits of a new or secondhand

turnout is of the same weight and section and match the rails on the main and diverging tracks. Compromise joints are not permitted within the limits of a turnout. Where new switch points are specified with relay closure rail, check to assure that the top and gage side of the points and closure rails match at the heel joint.

When rebuilding turnouts, and new and relay rail are available on the project, it is recommended that new rail be used to reconstruct the turnouts; this will avoid the potential problem of rail contour mismatch at the switch heel joints.

5-17.10 Equilateral Turnouts.

In an equilateral turnout, the diverging angle (frog angle) is divided equally on both sides, thus the turnout has two curved stock rails and two curved closure rails that mirror each other. Likewise, the degree of curve along each closure rail is half that of a standard left or right-hand turnout.

5-17.11 Turnouts in Curves.

Do not place turnouts within the limits of horizontal curves without the approval of the AHJ. If a turnout is placed within the limits of a horizontal curve, preferably place the turnout with the curved side of the turnout in the main route's curve and the straight side of the turnout creating the new track to the outside of the curve. In this situation, the curvature of the turnout must match the curvature of the main route curve.

Avoid turnouts creating a new track to the inside of a main route curve. Curvature through a turnout on the inside of a curve equals the degree of curvature for the curve plus that for a standard turnout. Thus, a number 10 turnout off the inside of a 3 degree curve will have a curvature of 3 + 7.4 = 10.4 degrees. Ensure the total curvature does not exceed design limits.

5-18 TRACK CONNECTIONS AND LADDER TRACKS.

5-18.1 Diverging Routes.

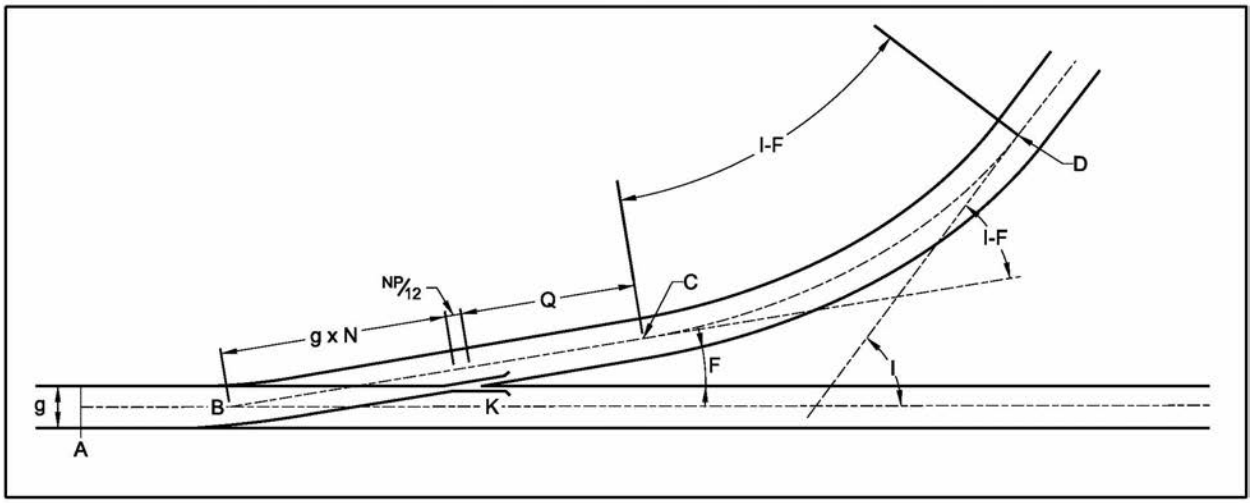

Figure 5-32 shows the layout for a typical diverging route connection. Note that the initial angle that the route diverges is the same as the frog angle for the turnout. If the diverging route needs to be at a different angle, the difference in angle is accomplished with a curve after the turnout and the required tangent distance. The distance from the intersection of track center lines to the location of the frog point is given by Equation 5-13. This distance is critical for determining the location of the turnout.

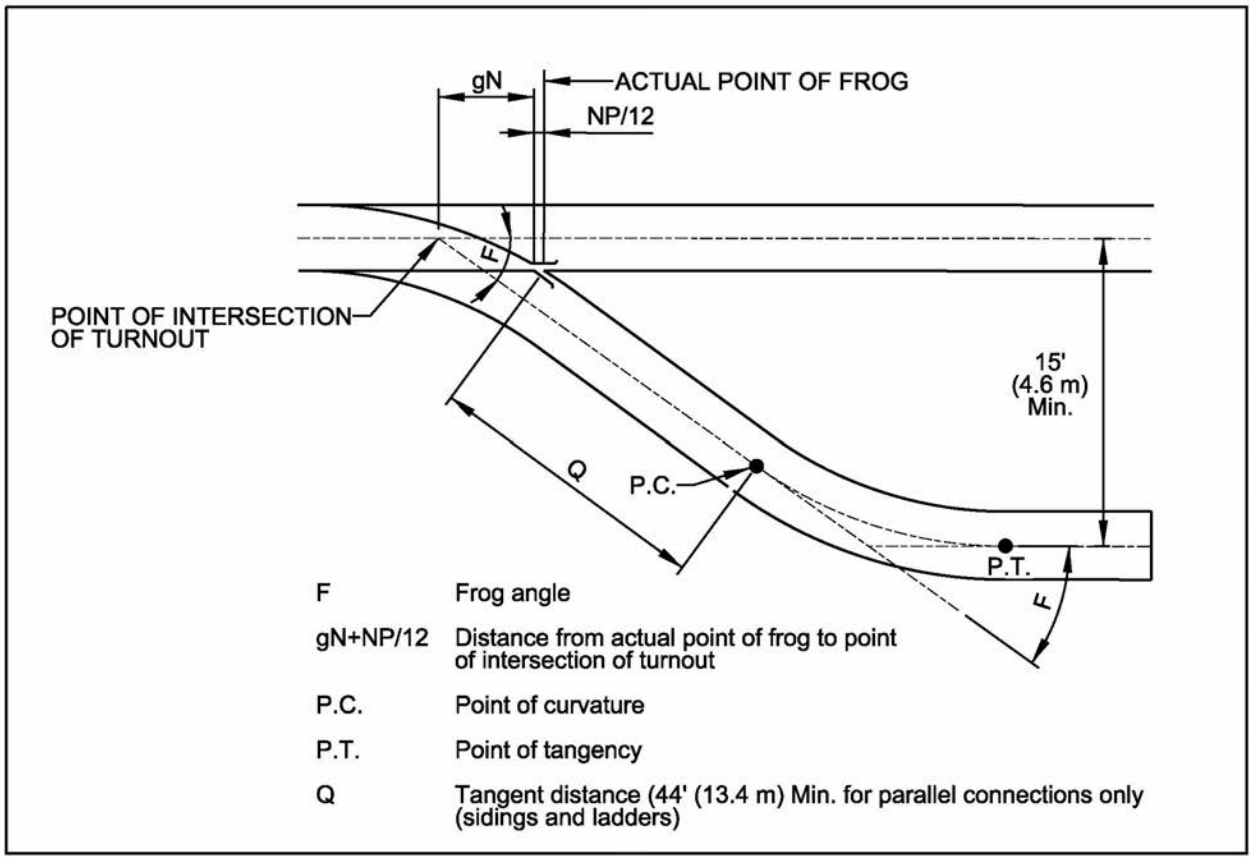
The layout of a parallel siding connection is a special case of a diverging route. See Figure 5-33. The parallel siding connection is used with sidings and yard ladders.

5-18.2 Crossovers.

Crossovers are a combination of two turnouts used to join two adjacent tracks, as shown in Figure 5-29.

Figure 5-32 Diverging Route Connection



Equation 5-13. Distance from Track Center Lines to Frog Point

$$BK = g(N) + \frac{NP}{12}$$

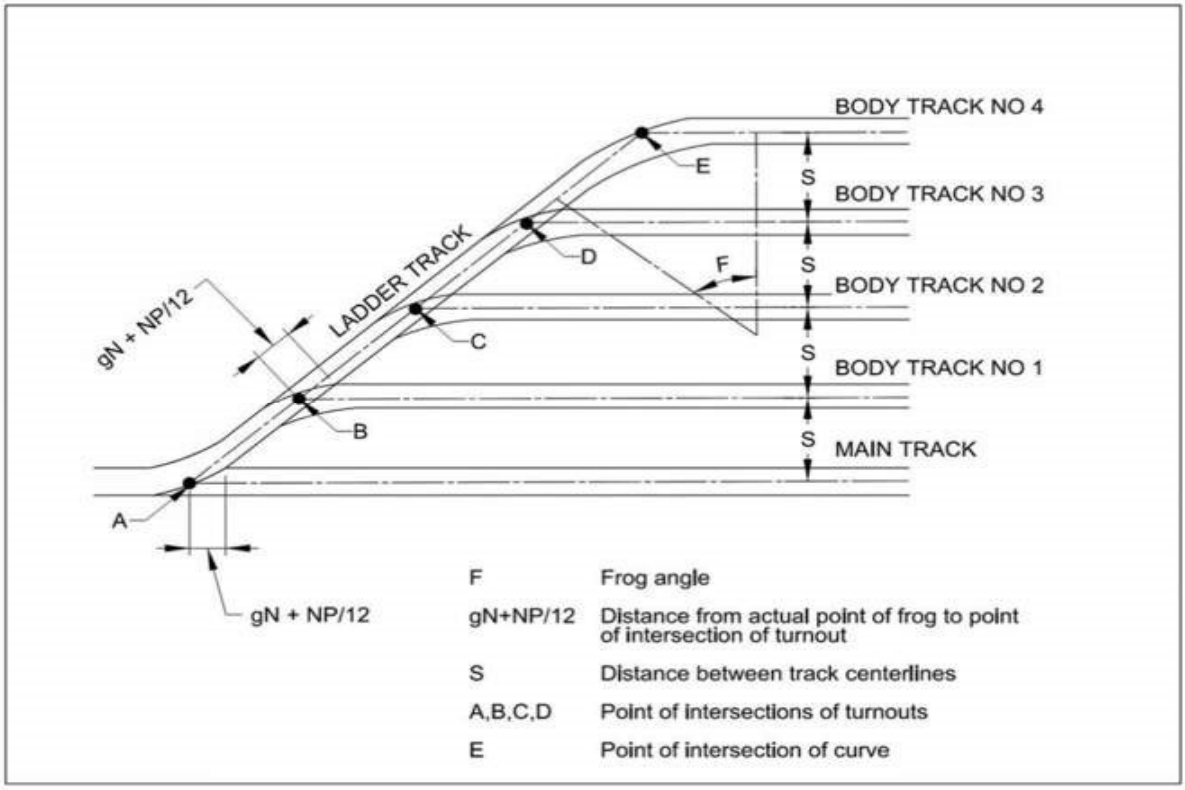
Where:
A = Point of Switch.
AK = Actual Lead.
B= Point of Intersection of Turnout.
BK = Distance from points B to K, as shown in Figure 5-32 (feet).
C= Point of Curvature.
D = Point of Tangency.
F = Frog Angle.
g = Track gage (feet).
I = Angle between mainline and diverging route.
K = Point of Frog.
N = Frog number.
P= Frog point width = ½ in. (13 mm)
Q= Tangent distance = 60 ft. (18.2 m) minimum for diverging routes.
= 44 ft. (13.4 m) minimum for parallel connections only (sidings & ladders).

Figure 5-33 Parallel Siding Connection

5-18.3 Ladder Tracks.

Figure 5-34 illustrates a typical ladder track, shown between points A and E. This arrangement is commonly used for parallel yard tracks or loading tracks. See Chapter 7 for layout of yard and terminal tracks.

5-19 RAIL CROSSINGS.



5-19.1 Recommended Types.

Bolted rail crossings, as described in item 1 on AREMA Portfolio of Trackwork Plan 700A, are recommended for use on military track. Tie layouts and plates for various angle crossings are given in AREMA Portfolio of Trackwork Plans 700F through 700J.

5-19.2 Anchoring Approaches.

Where rail anchors are used on the tracks approaching rail crossings, box anchor every third tie (four anchors per tie) for at least two rail lengths in all directions from the crossings.

Figure 5-34 Ladder Track Layout

5-19.3 Application.

As rail crossings are expensive and require more maintenance than standard track, do not design track layouts with crossing tracks unless this is clearly necessary.

5-20 MISCELLANEOUS TRACK APPLIANCES.

5-20.1 Derails.

5-20.1.1 Application and Type.

5-20.1.1.1 Switch Point Derails.

Derails are commonly used on spur tracks or sidings to prevent runaway rail cars or unauthorized entry of rail cars onto the main track. Derails are also used to protect standing equipment stored on a track. Three different types are the switch point derail, permanent hinged or sliding derail, and portable derail.

5-20.1.1.2 Permanent Hinged/Sliding Derails.

Use permanent hinged or sliding derails for permanent installations on military track. Hinged derails are typically more economical, require less maintenance, and are the

most popular. Sliding derails are easier to operate if they are properly maintained. Ensure permanent hinged and sliding derails include a sign or target to indicate when they are in the derailing position and are painted AREMA yellow.

Permanent hinged, sliding, or switch point derails must include locks to secure them in both the derailing and non-derailing position.

5-20.1.1.3 Portable Derails.

Use portable derails for temporary conditions, such as protecting a construction crew that is working on a track. Paint portable derails AREMA yellow (Federal Standard 595-B, color #13538, SCN 470.0004584.1) and include an elevated blue sign with the word "DERAIL" in white lettering to indicate when it is installed.

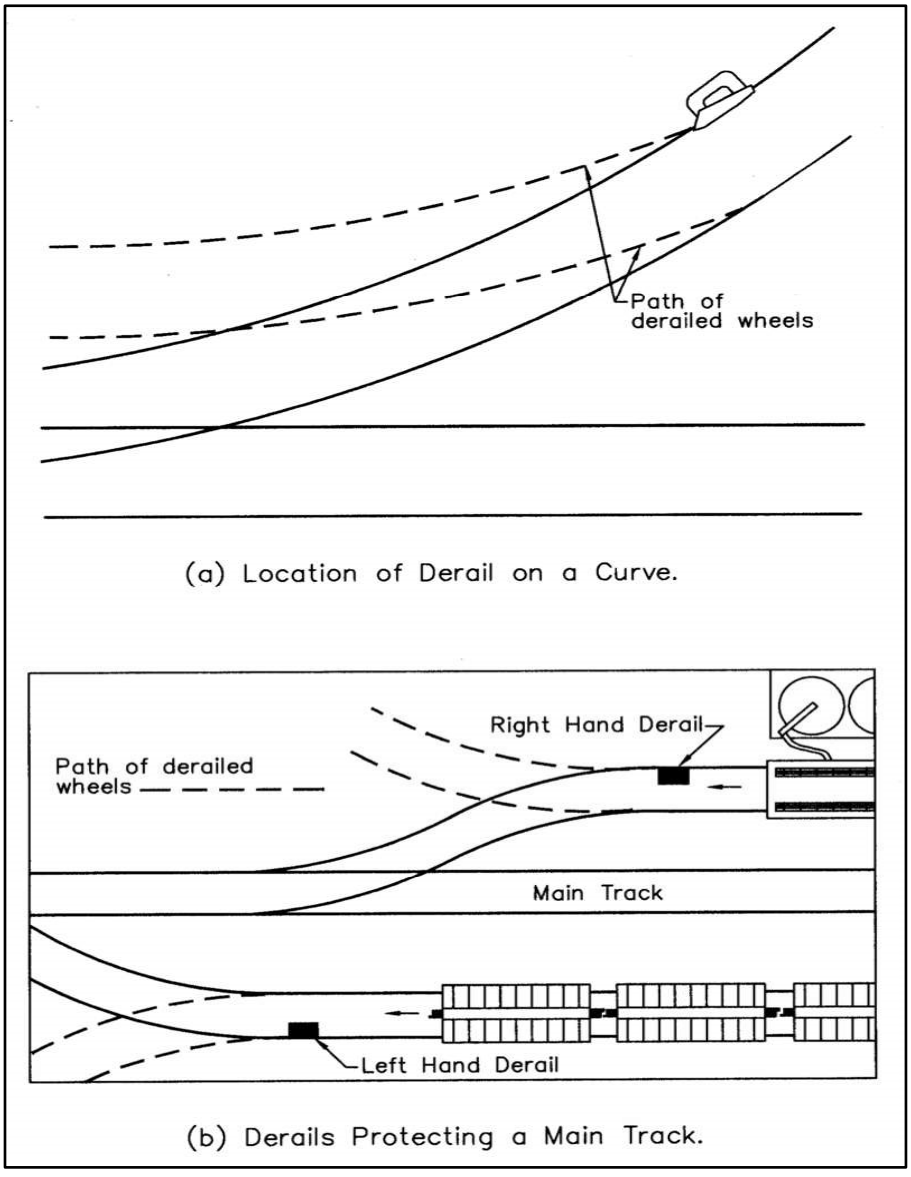
5-20.1.2 Location.

Locate derails so that after running over the derail, a car would stop before reaching the point requiring protection. To prevent the unauthorized entry of rail cars into a main track, place derails a minimum of 50 ft. (15.2 m) beyond the point where the centerline of the track has separated 13 ft. (4 m) from the main track. Additional distance can be required depending on track gradient or the requirements of the commercial railroad. To protect standing equipment stored on a track or a work area, install the derail a minimum of 150 ft. (45.7 m) from the equipment or work area. Figure 5-35 illustrates derail placement.

5-20.1.3 Size and Designation.

Specify derails for the size of rail on which they are to be installed. The number of the derail usually indicates the distance (in inches) from the top of the rail to the top of the tie (including tie plate thickness). Derails generally come in even 1-in. (25 mm) sizes and can be shimmed up to a height of 0.5 in. (13 mm) (or the ties on which the derail is attached can be added up to 0.5 in. (13 mm) deep) to accommodate height variations.

5-20.1.4 Direction.



Derails are designed as either left-hand or right-hand. The proper direction is determined by looking in the direction that the rolling stock to be derailed moves. Install a right-hand derail on the right-hand rail to derail the cars off the right side of the track. Install a left-hand derail on the left-hand rail to derail cars to the left.

5-20.2 Bonded and Grounded Track.

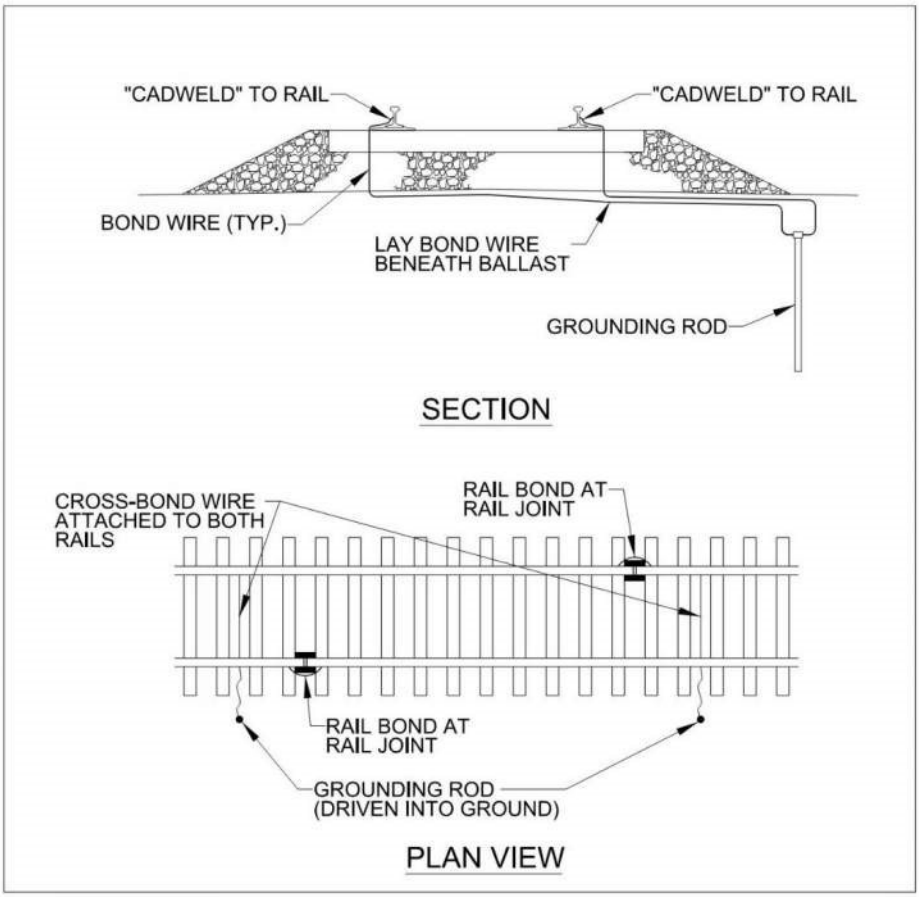
Wherever unloading cars carrying fuel, ammunition, or other flammable or explosive materials, or where track is located adjacent to electrical equipment, bond, ground, and insulate the rails and related track materials capable of conducting electrical current from the remaining track. This bonding and grounding help prevent the discharge of static electricity during the loading or unloading of these hazardous materials. General requirements for bonding and grounding are given below; additional details are found in Chapter 33, Part 7 of the AREMA Manual.

When a side track or section of running track is to be bonded and grounded, provide an insulated joint on each rail at the first rail joint beyond the turnout of the adjacent main track at either end of the main track. The rails at all other joints in the track beyond or between the insulated joints are bonded together with bond wires and both rails of the bonded track will be connected by grounding connectors to a single driven ground rod. Remove defective bonds by shear cutting old cables immediately adjacent to the weld or pin. Do not use flames or torches to remove defective or out-of-service bonds.

Figure 5-35 Location of Derails.

5-20.2.1 Grounding Rods.

Grounding rods are 0.75-in. (19 mm) diameter copper clad steel rods or 1-in. (25 mm) diameter zinc coated steel rods. The minimum length of ground rods is 8 ft. (2.44 m).



Drive ground rods vertically for their full length and ensure the top of the ground rod is located a minimum of 12 in. (304 mm) below the top of the subgrade at the toe of the ballast slope. The maximum allowable resistance of grounded rail or structures is 25 ohms. If testing indicates the resistance is greater than 25 ohms after all grounding and bonding connections are made, consult the design engineer to determine how to reduce the ground resistance below the minimum requirement.

5-20.2.2 Exothermic Rail Bond.

An exothermic type rail bond is recommended for the application of rail bonds on military track. Ensure bond cables are flexible bare copper stranded 1/0 AWG cables with preformed ends and conform to the applicable requirements.

Rail cross bonds are required to bond the two rails together and to connect the rails to the grounding rods. Install rail cross bonds using exothermic type bonds and 1/0 AWG flexible bare copper stranded cable. Apply the cross bond to the rail head or rail web and install the cable for the cross bonds a minimum of 12 in. (304 mm) below the bottom of the ties. Install cross-bonded ground rods at 100-ft (30.5 m) intervals along tracks designated for the loading and unloading of fuel, ammunition, and other volatile or hazardous materials. Figure 5-36 illustrates bonded and grounded track.

Figure 5-36 Bonded and Grounded Track

5-20.2.3 Overhead Power Lines.

Where overhead power lines in excess of 600 volts cross over the track, make the rails electrically continuous and grounded for a distance of 150 ft. (45.7 m) on each side of the power lines.

5-20.3 Track Scales.

When required, track scales will be designed and installed in accordance with the Scale Handbook, which appears as an appendix in the AREMA Manual.

The design and construction of track scales is best performed by a commercial firm that specializes in design, fabrication, and construction of railroad track scales.

5-20.4 Bumping Posts and Wheel Stops.

Use bumping posts, wheel stops, or earth mounds at the end of all stub tracks to prevent cars from rolling off the end of the track.

Where it is not critical that railroad cars be absolutely stopped at track ends to protect personnel, facilities, or parked vehicles and equipment, and where no other hazards are present, 4 ft. (1.2m) high earth mounds should be used at the end of the tracks rather than coupler-height bumping posts, wheel stops, or other obstructions. Earth mounds are economical, stop cars with minimal damage to the cars or the earth mound, are easy to repair, and are recommended by commercial railroads. An example application for earth mounds is at the ends of storage tracks. However, earth mounds must not be used with end ramps, which require the use of coupler-height bumping posts.

5-20.5 Security Fencing.

The character of the land use of property adjacent to the railroad and security requirements will govern the need for fencing along the right-of-way lines. Consult the installation Physical Security Officer to ensure that security fencing requirements are incorporated in the design. UFC 4-022-03 provides guidance on security fencing and gates. All gates are equipped with locking hardware.

5-20.5.1 Terminal Fencing.

Security fencing can be required to surround facilities within a terminal, or even a complete terminal area. These fences are typically standard chain-link construction, such as 6-ft (1.8 m) FE5 per USACE STD 872-90-02 Omaha District. When required, the following standard provides a more secure fence: FE6 USACE STD 872-90-03 or FE7 USACE STD 872-90-04 Omaha District .

5-20.5.2 Track Gates.

When designing a track gate, ensure the following:

- The gate prevents unauthorized entry by both pedestrians and vehicles.

- The gate opens a minimum width of 18-ft (5.5 m) or wider to meet the clearances in Paragraph 5-4 to allow cars to pass through.
- Culverts draining the track through a fence or gate have security bars in them.
- It is recommended that a drainage ditch security barrier be constructed using concrete. This will provide both a headwall for the culvert and a foundation to mount rollers for the sliding gate.

5-20.6 Snow Fences.

Chapter 1, Part 6 of the AREMA Manual provides guidance on the application and construction of snow fences and other measures to minimize snow drifting on the track.

5-20.7 Cattle Guards.

In areas where livestock or other large animals could enter the railroad right-of-way at road crossings, install cattle guards.

5-20.8 Utility Pipe Crossings.

Encase utility pipelines that carry liquids under pressure under or over railroad tracks within a protective steel casing pipe. Encase utility pipelines that carry gases under railroad tracks within a protective steel casing pipe or protect them using other means. Chapter 1, Part 5 of the AREMA Manual provides requirements for pressurized liquid and gas pipelines that cross railroad tracks.

This Page Intentionally Left Blank

CHAPTER 6 ROAD CROSSINGS AND BRIDGES

6-1 ROAD CROSSINGS.

6-1.1 Establishing Crossing Requirements.

Verify the need for a new crossing and its appropriate location with the installation master plan. As road crossings increase maintenance costs and safety risk, limit their quantity to a minimum.

Conduct a study to assess traffic and site conditions for a newly planned crossing or one intended for upgrading or rehabilitation. These findings help establish crossing and protection design requirements. This study should include:

- Amount and character of vehicle and train traffic.
- Train and vehicle operating speeds.
- Crossing angle and horizontal and vertical approaches of road and track.
- Available sight distances, from all directions, for vehicles approaching the track and from trains approaching the crossing.
- Previous accident or incident history.

6-1.2 Design Steps.

The main steps in designing a road crossing are:

- Determining the geometric layout.
- Selecting the crossing surface and flangeway design.
- Designing the drainage.
- Designing the track section.
- Determining the appropriate crossing protection.

6-1.3 Geometric Layout.

The ideal crossing geometry is a 90-degree intersection of the track and road (for best sight angles) with slight ascending grades on the road approaches. Drainage should be away from the track to reduce the flow of surface water toward the crossing.

Avoid locating crossings near road intersections. Avoid locating crossings within either a road or railroad curve. These sites typically result in poor sight distances and in conflicting super-elevations that often lead to long-term maintenance problems and poor performance of the crossing. Where the road and railroad cannot cross at right angles, the angle should be kept to 60 degrees or greater whenever practical. For angles less than 60 degrees additional warning or crossing protection should be considered.

6-1.4 Crossing Surfaces and Flangeways.

6-1.4.1 Standard Crossing Types.

Table 6-1 lists 5 standard crossing types. Figures 6-1, -2, -3, -4, and -6 show cross sections and design details for the 5 standard crossing types. These designs are described below along with recommendations for their application and their limitations. It should be noted that, even for the most expensive crossing surfaces, the cost of rebuilding the track, especially when new rail is installed, and the road approaches is usually more than the purchase and installation cost of the crossing surface itself. Thus, especially where road traffic volume is significant, where significant numbers of heavy trucks pass over the crossing, or where vehicle speeds exceed 25 mph (40.2 km/hr), the main cost variable will probably be the expected durability of the crossing.

Table 6-1 is a starting point for matching a crossing surface with traffic requirements. The descriptions of the crossing surfaces below will help focus on the most appropriate choices.

Table 6-1 Recommended Crossing Surfaces

Crossing Type	Vehicular Traffic Use Summary
Gravel Crossing with Timber Flangeway Header.	Very low or intermittent non-public traffic volume. For use within rail yards for maintenance access.
Timber Crossing.	Low traffic volume, low truck volume.
Asphalt Crossing with Rubber Interface.	Low to medium traffic volume. For use with steel ties. Not to be used for tracked vehicle crossing.
Prefabricated Concrete Panel Crossing.	High traffic volume, high truck volume, vehicle speeds exceed 25 mph (40.2 km/hr).
Sectional Monolithic Concrete (No Ties).	Crossing designed for heavy loading. For use by tracked vehicle.

6-1.4.2 Constructed Surfaces.

Gravel and asphalt crossings are constructed crossings. With this classification, the road or street extends across the track to form a crossing. Separate flangeway headers or rubber interfaces are recommended, but the crossing is generally made from available road and track materials and fabricated on-site. This arrangement provides site-specific versatility to fit a crossing in-place at the time of construction. These crossings are readily adaptable to any track curvature, superelevation, or gradient.

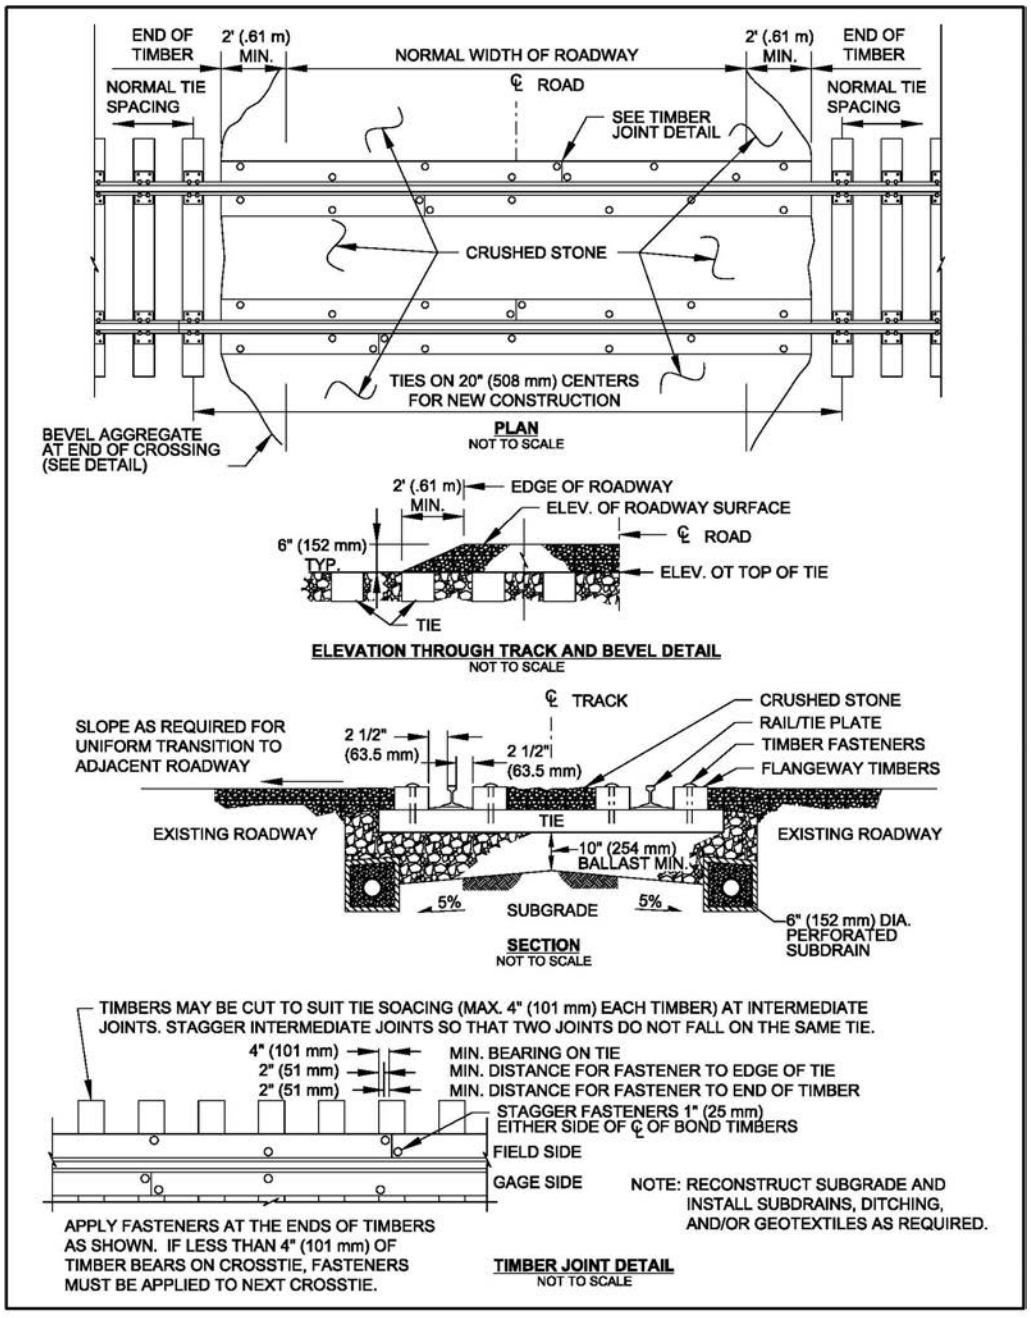
These crossings are not readily removed and replaced for track or road maintenance. Construct these crossings at least 2-ft (.61 m) on each side beyond the typical pavement width for the road. Taper the crossing material at each end of the crossing forming a beveled end ramp down to the track surfacing. Note that track constructed with steel ties requires a constructed crossing surface.

6-1.4.3 Prefabricated Surfaces.

Timber, prefabricated concrete panel, and sectional monolithic concrete crossings are categorized as prefabricated. These crossings are generally ordered from a manufacturer and are assembled at the site from surface panels using special panel attachment or track fastening hardware. Prefabricated crossings often require longer ties than standard. They are ordered specifically for the size of rail, tie plates, and anchors (if used) at the crossing. This ensures the panel height will match the rail height and that sufficient clear space is available under the panels for the tie plates and rail fastenings. Also, order prefabricated crossings to match any track curvature and for crossing angles that vary significantly from 90 degrees. It is suggested that prefabricated crossings be ordered to extend at least 2-ft (.61 m) on each side beyond the widest part of the road through the crossing, allowing for crossing angle as needed. Taper the crossing at each end of the crossing forming a beveled end ramp down to the track surfacing. A fabricated metal end ramp or deflector plate fastened to the ties and crossing panel can be used in-place of a beveled crossing surface.

Prefabricated crossings are typically installed more quickly than constructed crossings and are usable as soon as installation is complete. When considering prefabricated crossings, it is suggested that drawings and instructions be obtained from a sampling of manufacturers to help determine an exact list of materials and hardware required, as well as available options and track construction and preparation requirements.

6-1.4.4 Selecting a Road Crossing Surface.



Consider the following in selecting an appropriate road crossing surface:

- Vehicle traffic – volume, type, and speed.
- Road classification – local road, collector, arterial, or highway.
- Use by industrial traffic, special vehicles, tracked vehicles.
- Railroad traffic – volume, type, and speed.
- Accident history for existing crossings where the crossing surface contributed to the accident.
- Cost – initial construction cost, replacement cost, and maintenance cost.
- Expected service life.

6-1.4.5 Gravel Crossing with Timber Flangeway Header.

These crossings are appropriate in locations with very low traffic volumes and where a crossing is infrequently used by large trucks or tracked vehicles.

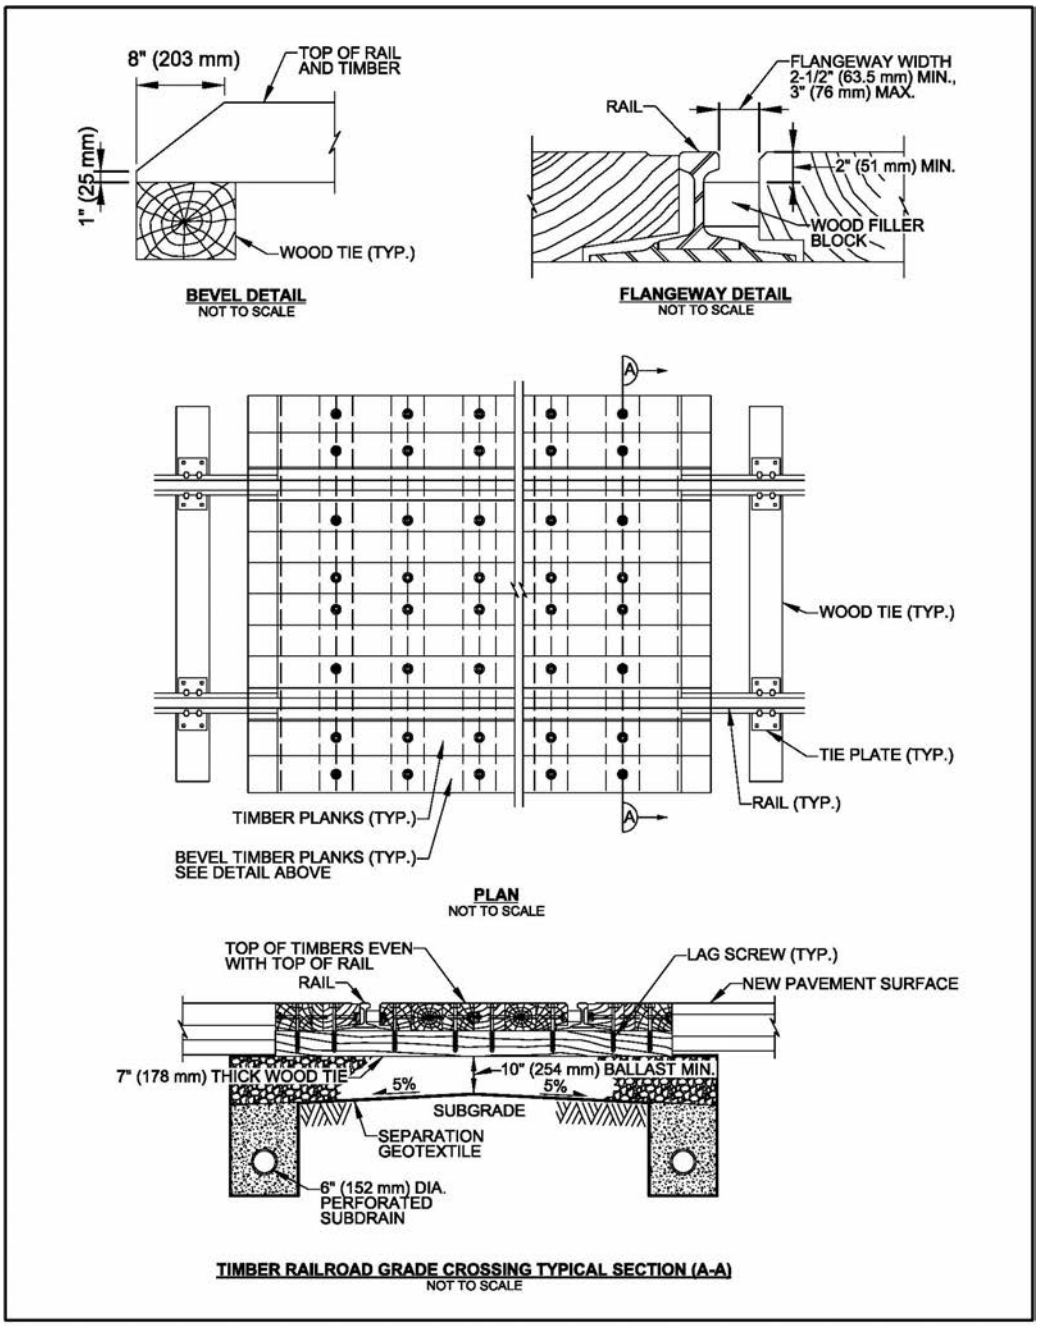


Figure 6-1 Typical Gravel Crossing with Timber Flangeway Header

6-1.4.6 Timber Crossing.

These crossings generally have a medium life span of about 10 to 15 years. They are often chosen due to long familiarity and experience with their design. If removed for track or road maintenance, however, the warping stresses that commonly build up in wood long exposed to weathering elements can make replacement difficult and produce a rougher riding surface. Timber is subject to wear that gradually exposes fastenings to vehicle tires. Timber is also subject to damage by plow blades during snow removal.

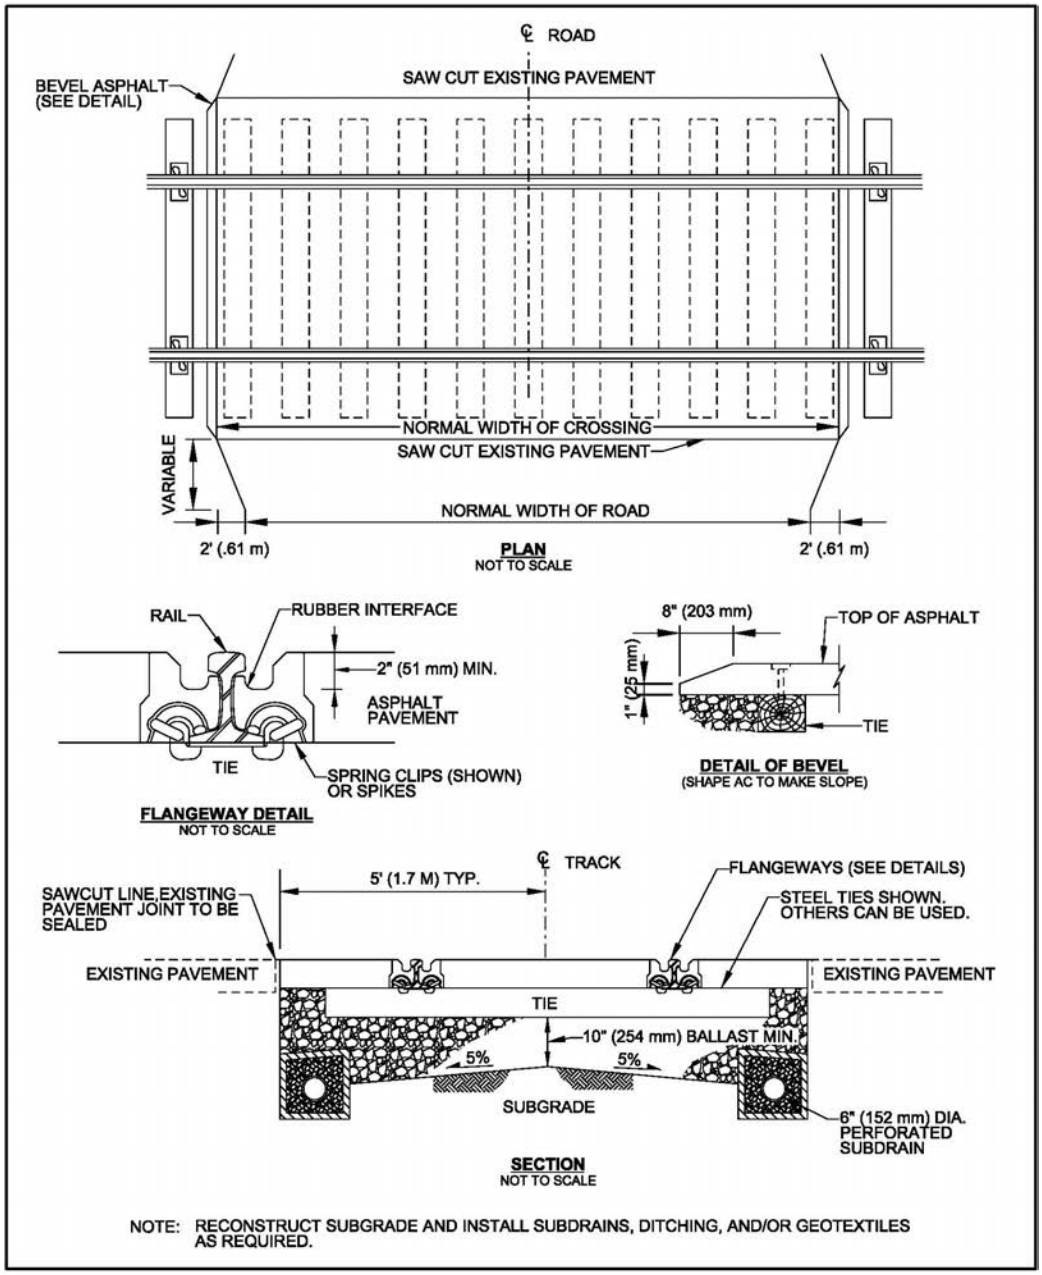

Figure 6-2 Typical Timber Crossing

6-1.4.7 Asphalt Crossing with Rubber Interface.

These are expediently and inexpensively constructed. The presence of a rubber interface providing a flangeway and separating the asphalt from the rail, typically results in reduced flangeway maintenance and less pavement breakage near the flangeway. Expected life averages 8 to 10 years under moderate traffic and where freeze-thaw cycles are common.

Figure 6-3 Typical Asphalt Crossing with Rubber Interface

6-1.4.8 Prefabricated Concrete Panel Crossing.

6-1.4.8.1 General Characteristics.

These are now being produced by a number of manufacturers and are being widely adopted due to their relative strength and expected durability, ease of installation and removal for track maintenance, and moderate cost. These crossings are not subject to decay as are standard timber crossings and are much less subject to damage from plow blades during snow removal operations, compared to timber or gravel crossings. In addition, they are the most suitable to accommodate traffic from tracked vehicles. When either track or adjacent road maintenance is required, these crossings can be removed relatively easily, in part or whole, and replaced without damage to the crossing material or track, and without loss of original evenness of surface. Like other crossings, though, these require solid support to prevent panel breakage or loss of crossing surface evenness. Due to the stiffness of the panels, these crossings are not recommended for locations where there is a pronounced vertical curve in the track.

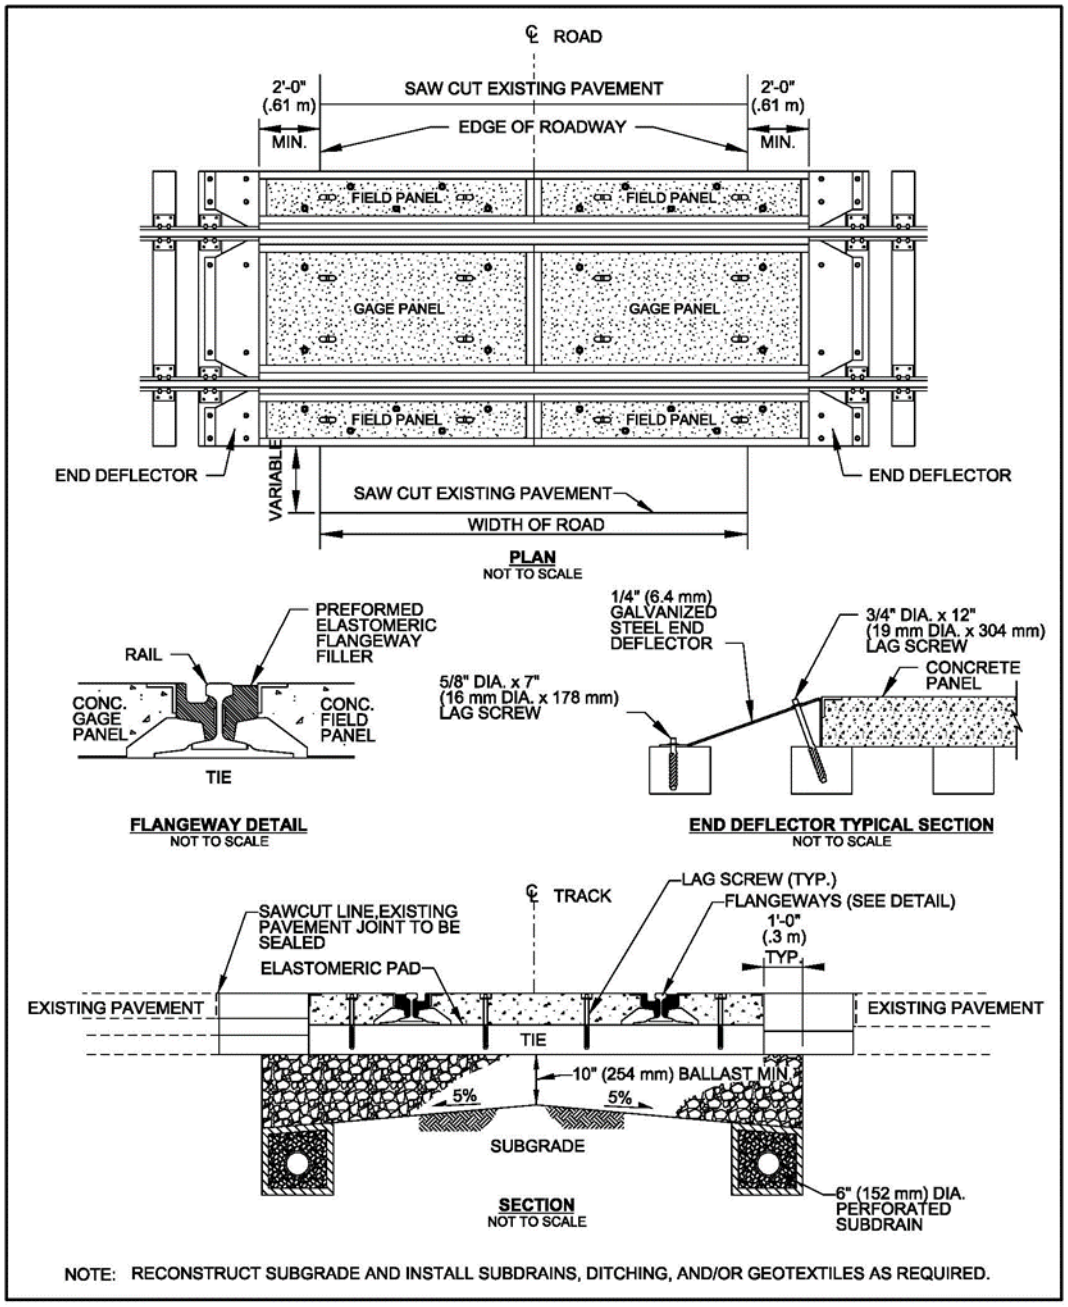
6-1.4.8.2 Specifications.

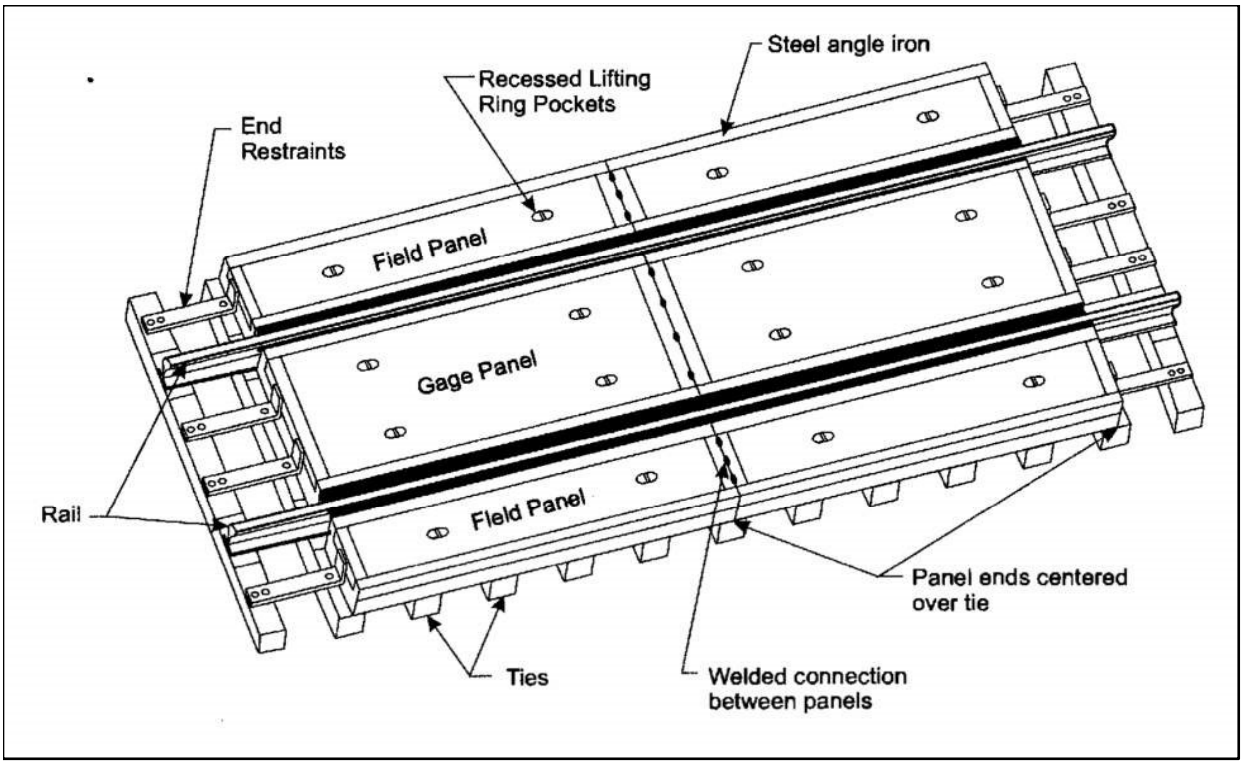
Design of these crossings varies with manufacturer. It is suggested that a type be chosen with a minimum concrete strength of 5,000 psi (34.5 MPa), with guaranteed panel thickness variation within +/- 1/8 in. (3.2 mm), with a waterproof and chemical resistant seal on panels, and with the option of epoxy coated rebar. A warranty of crossing performance should also be obtained.

6-1.4.8.3 Installation Options.

In a standard or lagged installation, the panels are “lagged” (attached) to wood ties with lag bolts, with no fastening between adjacent panels - similar to the way a conventional timber crossing is installed. With a lagless installation, the field panels and gage panels are fastened lengthwise to form three monolithic panels for the length of the crossing, with no fastening into the ties. Different methods are used for panel-to-panel fastening. Use end angles or other end restraint devices to secure the crossing longitudinally. Vertical and lateral movement is prevented by the weight of the fastened panels combined with confinement between the adjacent roadway and the rail for field panels, and confinement between the rails for gage panels. With a lagless installation, use flangeway fillers to keep gage panels secured away from the running rails. For most military applications, lagless installation is suggested. Figure 6-5 shows a lagless concrete panel crossing in which adjacent panels are fastened by a series of short welds.

Figure 6-4 Typical Prefabricated Concrete Panel Crossing





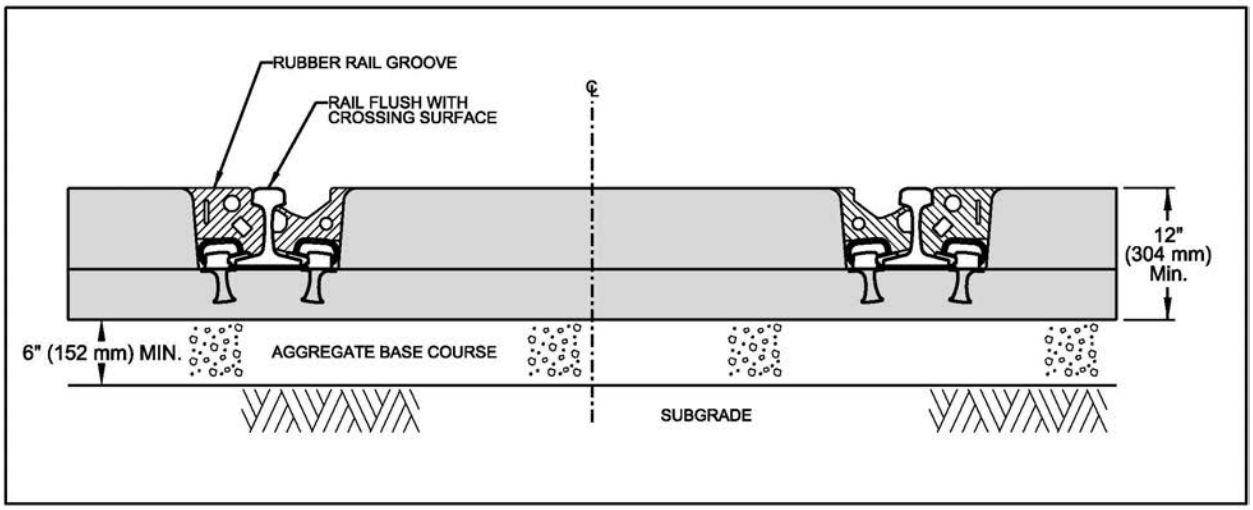


Figure 6-5 Lagless Concrete Panel Crossing

6-1.4.9 Sectional Monolithic Precast Concrete (No Ties).

These crossings essentially form a concrete roadbed and crossing surface all in one complete unit. The rails rest on rubber pads in precast concrete sections that form a solid bed. The concrete bed rests on a layer of crushed rock over a prepared subgrade. These crossings are well suited for rail service through an active container handling area or for tracks running through a concrete paved area. They are suitable for frequent heavy truck traffic and where other crossing types have not withstood the traffic and loadings. With these crossings, the rail is accessible by unbolting and removing the upper gage panels; however, since the bed is solid, the track cannot be surfaced (tamped or raised) by conventional methods. Conduct surface correction or a track raise by either completely removing the crossing sections and altering the subgrade, or for small corrections, by pressure injection of grout beneath the sections. A subgrade and base material with adequate strength and drainage are essential for good long-term performance of these crossings. These are the most expensive of the 5 crossing types – generally about twice the cost of a prefabricated concrete panel crossing.

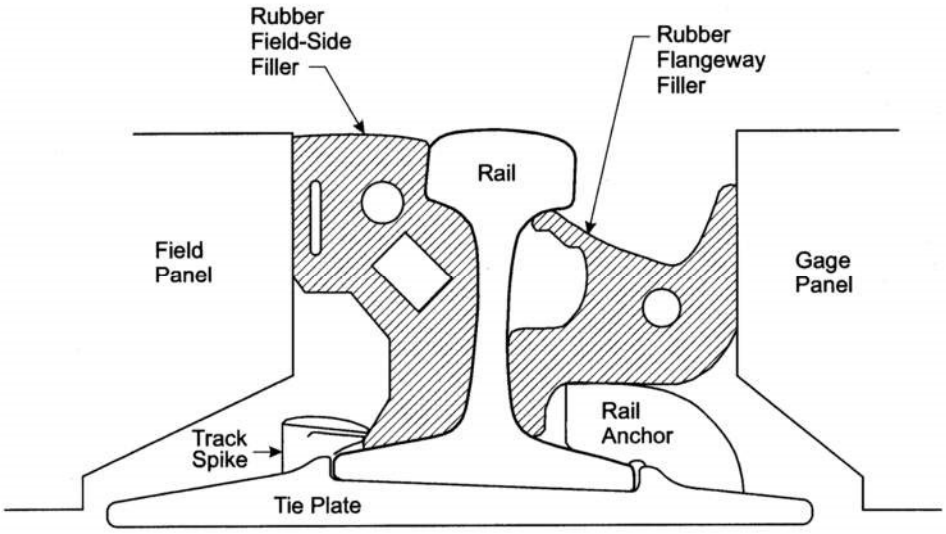
Figure 6-6 Typical Sectional Monolithic Precast Concrete (No Ties)

6-1.4.10 Flangeways.

6-1.4.10.1 General.

These are often the most maintenance-intensive parts of a crossing. In all crossings, provide a clear flangeway space to allow unimpeded passage of the flange on railroad wheels.

6-1.4.10.2 Open or Closed Flangeways.



Depending on the location, opinions vary on whether the benefits of filling a flangeway exceed its costs and disadvantages. Open flangeways allow water to enter the crossing and track below, and that is highly undesirable; however, if the drainage is good, the water quickly runs off and causes little harm. Over time, dirt and debris entering an open flangeway impedes drainage. Filled flangeways are often subject to rapid build-up of dirt and debris or snow and ice. If left uncleaned, these foreign materials are typically packed in by the passage of wheel flanges and can build up to the point of blocking the flangeway and causing a derailment. Ice in a flangeway has a high probability of causing a derailment.

In summary, an open flangeway readily allows water to enter the track structure, and a filled flangeway must typically be cleaned more frequently. In areas with low annual rainfall, or where track and road gradients naturally direct water away from the crossing, an open flangeway design is preferred. In most other cases, a filled flangeway provides long term benefits by reducing the amount of water entering the track through the flangeway. A closed flangeway may also be desirable in an indoors/interior track or anywhere you would want to reduce a tripping hazard.

6-1.4.10.3 Filler Material.

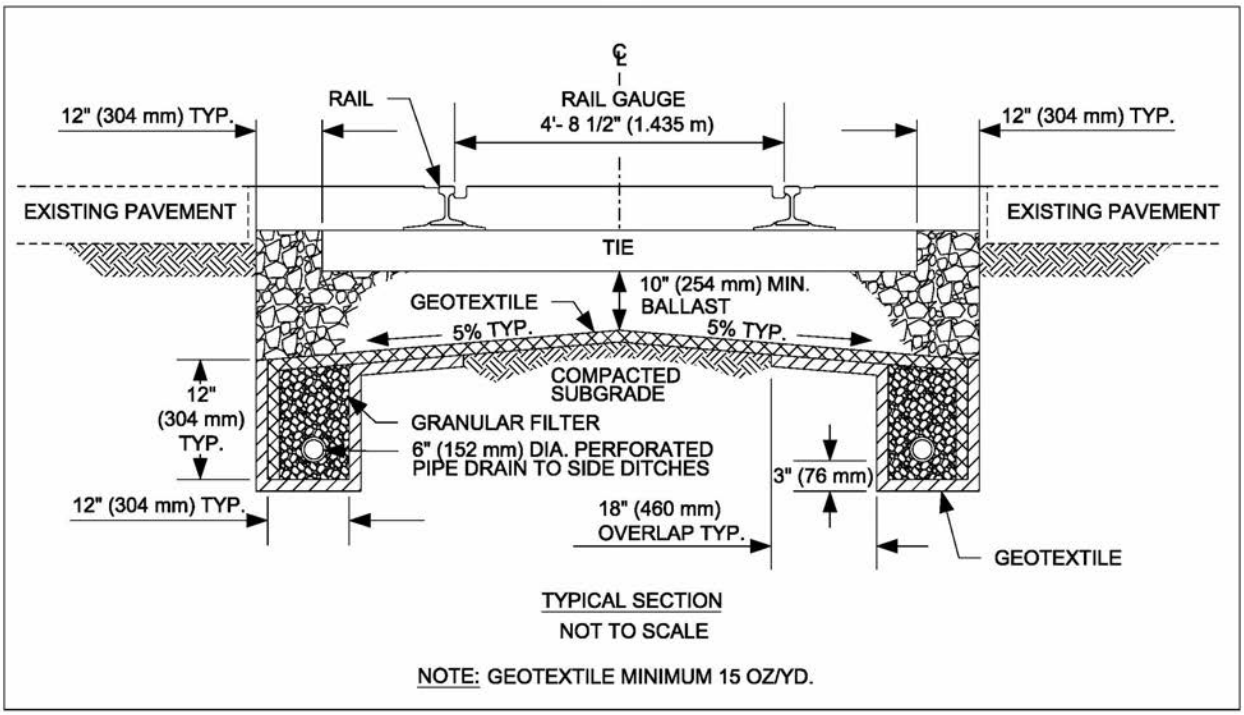
The least desirable filler is asphalt. While inexpensive, it tends to crack in a short time, losing its ability to seal against water entry, and ultimately requiring time-consuming removal and replacement. Preformed or pourable rubber products are available for some crossings. Concrete panel crossings are often supplied with rubber flangeway fillers, sometimes pre-attached to the panels. Rubber fillers can have a high initial cost, but they offer a reasonably good seal against water entry, are generally long lasting, and have a flexibility that reduces the tendency of a debris-packed flangeway to cause a derailment. Rubber flangeway fillers are especially useful where: (1) crossing geometry and low relative elevation naturally direct rainwater to the crossing flangeways, (2) where crossing drainage is naturally difficult, or (3) where crossing heave from freeze-thaw cycles is a common problem from rainwater or snowmelt entering unsealed flangeways. Rubber fillers are also an alternative where asphalt filler has not held up well in the past. Figure 6-7 shows rubber flangeway fillers installed in a concrete panel crossing.

Figure 6-7 Rubber Flangeway Fillers

6-1.5 Drainage.

Ensure all prefabricated concrete crossings have a subdrainage system similar to that shown in Figures 6-8 and 6-9. Subdrainage systems are recommended for asphalt and timber crossings. Geotextile surrounding the pipe filter is optional but recommended in fine-particle soils where filter clogging is likely.

Figure 6-8 Typical Geotextile/Subdrain installation for Vehicle Road Crossings



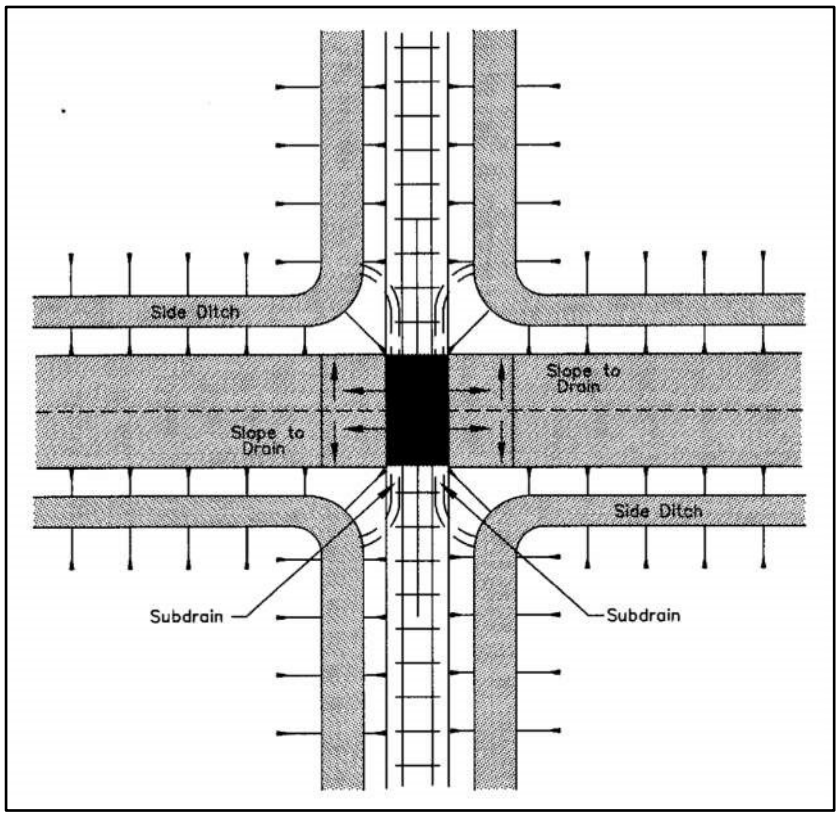


Figure 6-9 Typical Drainage at Road Crossings

6-1.6 Track Design.

Crossings do not act alone – their performance depends on adequate support from the ballast and subgrade. Unless recently constructed or repaired, rebuild the track, ballast section, and drainage system on a well-prepared subgrade before installing the crossing. Ensure the drainage system effectively transmits water outside the crossing limits.

6-1.6.1 Ties.

When crossings are built or rebuilt, replace all the ties in the crossing itself and for at least 20-ft (6 m) beyond each end of the crossing. Use 7-in x 9-in (178 mm x 229 mm) hardwood or polymer composite ties with minimum length of 9-ft. (2.75 m). Use longer tie lengths if required by the crossing manufacturer. To increase the life of the crossing, consider the use of composite ties that are 7-in x 9-in (178 mm x 229 mm) rather than wood ties. When prefabricated road crossings are installed, ensure tie length and spacing comply with the installation requirements provided by the crossing manufacturer.

If the track approaching the crossing is anchored, it is required that each tie in the crossing be box anchored and that the normal anchoring pattern be maintained throughout the remainder of the crossing area (20-ft (6 m) beyond each end).

6-1.6.2 Rail.

In crossings on main running tracks, rail of 115 lb per yd (57 kg/m) or greater is required.

As bolted rail joints in road crossings are often a maintenance problem, it is required that all joints through the crossing and for 20-ft (6 m) from either end of the crossing be welded. As an alternative, use 80-ft (24.4 m) rails to eliminate joints in the crossing area.

6-1.6.3 Geometry.

Ensure the track geometry (gage, surface and alignment) are correctly in position before covering the track with a conventional crossing surface. Failure to do so will result in a costly repair. Ensure the ballast in and around all the ties is well compacted to prevent settlement and movement of the crossing.

6-1.6.4 Flangeways.

Crossing flangeways are a minimum width of 2.5-in. (63.5 mm) with a maximum width of 3-in. (76 mm) and be at least 2-in. (51 mm) deep.

6-1.7 Road Approaches.

To reduce the amount of runoff water directed toward the crossing, road approaches are best sloped away from the crossing.

To achieve smooth riding characteristics, road approach slopes should be designed per AASHTO Policy on Geometric Design of Highways and Streets, 2018, Part 9.12.2, Figure 9-66 or subsequent latest edition. This criterion prevents low-clearance vehicles from being caught on the tracks. However, the difference in elevation between the railroad and the adjacent roadway can require steeper approaches. In these situations, verify ascending road approaches are not so steep that low-clearance truck trailers contact them. On descending road approaches, ensure gradients do not excessively lengthen stopping distances for vehicles approaching the crossing – including an allowance for wet or icy pavement. Use appropriate vertical curves to transition from the roadway grade to a level plane at the elevation of the rails. Tracks that are superelevated or a roadway approach section that is not level require a site-specific analysis.

6-1.8 Crossing Protection: Signs and Signals.

6-1.8.1 Specifications and Minimum Requirements.

Specifications for the basic design and appearance of passive crossing warning devices, such as signs and pavement markings, is given in Part 8 of the Manual of Uniform Traffic Control Devices (MUTCD). All road crossings are required to have the passive warning devices shown in the MUTCD, at a minimum. The need for additional signs or active warning devices, such as flashing lights and gates, includes consideration of the following:

- Crossing visibility or sight distance.
- Volume and speed of vehicular traffic.
- Volume and speed of railroad traffic.
- Volume of pedestrian traffic.
- Crossing geometry.
- Accident and incident history.

Further guidance on providing crossing warnings and protection can be found in the FHWA Railroad-Highway Grade Crossing Handbook.

6-1.8.2 Visibility.

Minimum clear visibility or sight distance criteria is provided for crossings without active warning devices in the AASHTO Policy on Geometric Design of Highways and Street, 2018, Part 9.12.4 or subsequent latest edition. Crossings that do not meet this clear visibility criteria require additional protection.

6-1.8.3 Traffic Character and Volume.

Consider additional protection at crossings that experience two or more train movements per day and the product of train movements and average daily vehicle traffic exceeds 3,000. This traffic threshold drops to 1,000 for crossings that are

considered visually obstructed, as defined above. In addition, consider active warning devices for crossings that experience several daily train movements, have heavy truck traffic, high usage by school buses, or frequent hazardous material traffic, and where clear visibility criteria are not met.

6-1.8.4 Crossing Geometry.

Consider additional protection for crossings with a road to track angle of less than 45 degrees, or where the road approaches the track at a steep grade.

6-1.8.5 Accident and Incident History.

Consider adding flashing lights to crossings with a history of at least one serious accident, some close-call incidents, and/or where incidents of motorists not obeying existing warnings are common. If flashing lights are already present, consider adding gates.

6-1.9 Whistle Posts.

6-1.9.1 General.

Whistle posts are signs located adjacent to the track to indicate to the train crew that a road crossing is ahead. They mark the point at which the standard train horn signal for crossing approach must begin. Whistle posts commonly show just a large letter “W” on their face, but various designs are used. The installation’s operating rules can designate the sign requirements.

6-1.9.2 Location.

Whistle posts are usually located on the right side of the track (when viewed facing the crossing) at a distance that allows sufficient time to warn motorists that an engine, train, or track machine is approaching the crossing. Consult the State Department of Transportation and the installation for requirements on whistle post location. The appropriate location will depend on factors that include the speed of railroad traffic, speed of vehicle traffic, and the visibility at the crossing. A commonly used guideline is that the crossing warning signal must begin sounding at least 20 seconds before an engine, car, or track machine reaches the nearest end of the crossing.

6-2 BRIDGES.

6-2.1 Deck Types.

Classify railroad bridges by deck type: open deck or ballast deck. In a typical open deck bridge, every second or fourth tie is bolted directly to the structure; thus in effect, the track becomes part of the bridge. In a ballast deck bridge, a standard track and ballast section are supported on a solid floor. The ballast deck has the advantage of allowing the track across the bridge to be lined and surfaced in the same fashion as standard track.

6-2.2 Design Procedures.

When a bridge is required, the bridge structure is designed by a practicing railroad bridge engineer in accordance with the AREMA Manual: Chapter 7 for timber structures, Chapter 8 for concrete structures, or Chapter 15 for steel structures. Part 9 of AREMA Chapter 15 provides background and commentary on railroad bridge design practices.

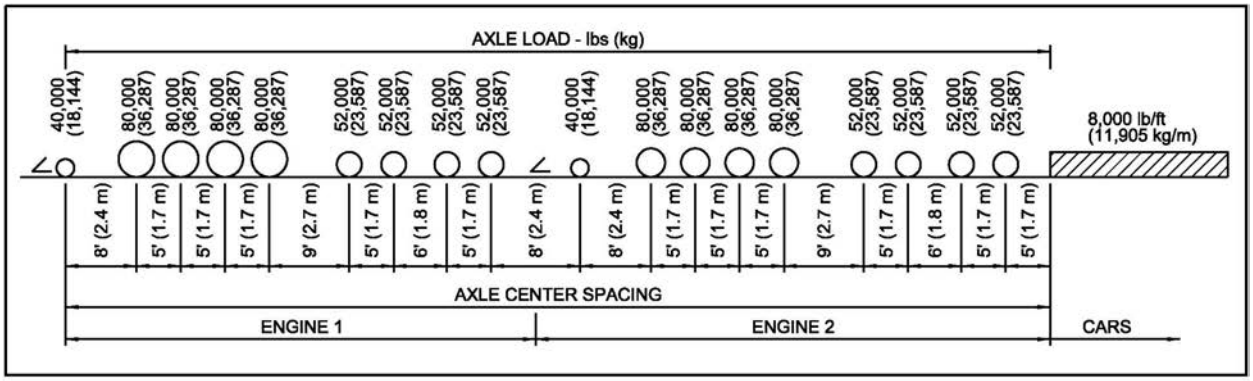
6-2.3 Basis for Design.

The design of railroad bridges is based on two main factors: the magnitude of loads applied to the bridge and the expected level of traffic (or number of stress cycles) over the design life of the bridge. One stress (or load) cycle is defined by one application and release of loading on a bridge member.

6-2.4 Live Load.

Use Cooper E-80 live load as shown in Figure 6-10 for the design of railroad bridges. If the bridge will be a steel structure, consider the Alternate Live Load shown in Figure 6-11. Use the live load that produces the greater stress for the design. Consider both Cooper E-80 and the Alternative Live Load for the design of each element in a steel structure. Use only Cooper E-80 live load for the design of timber and concrete bridges.

Figure 6-10 Cooper E-80 Live Load Configuration for Bridges



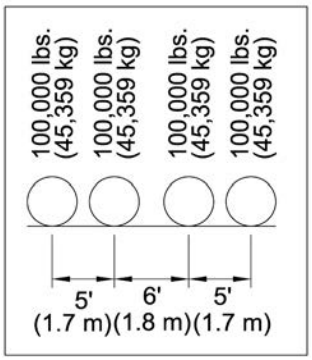


Figure 6-11 Alternative Live Load for Steel Structures

6-2.5 Walkways.

When bridges are located in areas where switching movements are made and at other locations where it is either useful or necessary for people to walk alongside a train (or cut of cars), provide walkways on at least one side of a bridge. Where people require access to both sides of the track when a bridge is occupied, provide walkways on both sides. Workers are never allowed or expected to cross the track by going under cars, crossing over couplers, or climbing over cars.

6-2.6 Tie Pads.

On open deck bridges, installation of rubber tie pads between the tie and tie plate is recommended.

6-2.7 Bridges Spanning over Railroads.

Design bridges spanning over railroads to have adequate horizontal and vertical clearance from the railroad tracks. Locate piers so they provide more than 25 ft. (7.6 m) of horizontal clearance from the centerline of existing tracks and possible future tracks. If less than 25 ft. (7.6 m) of horizontal clearance is provided, install crash wall pier protection.

Design crash wall pier protection per AREMA Chapter 8, Article 2.1.5.1. Crash walls for piers 12 to 25 ft. (3.6 to 7.6 m) clear from the centerline of track require a minimum height of 6 ft. above the top of rail. Crash walls for piers less than 12 ft. (3.6 m) clear of the centerline of track require a minimum height of 12 ft. (3.6 m) above the top of rail. If crash walls are used, the minimum required horizontal clearance for piers is as specified in Chapter 5, Paragraph 4. The minimum vertical clearance for bridges spanning over railroads is also specified in Chapter 5, Paragraph 4. Survey the profile of existing tracks for 1000 ft. (304.8 m) each side of a proposed overhead bridge. If the profile indicates a sag at the proposed bridge location, increase the vertical clearance sufficiently to permit raising of the track to remove the sag.

This Page Intentionally Left Blank

CHAPTER 7 TERMINALS

7-1 INTRODUCTION.

This chapter addresses the design of railroad terminal and support facilities that are primarily intended to support unit mobilization. Obtain design and planning information for terminals at supply depots or ammunition plants from the Construction Branch of the Army Material Command.

Terminals contain track and facilities for:

- Loading and unloading: tracked and wheeled vehicles, containers, equipment, ammunition, fuel, and general supplies.
- Holding: empty cars waiting to be loaded or loaded cars waiting to be unloaded, or cars that require repair or adjustment of the load or tiedowns.
- Switching: maneuvering cars around the terminal, re-ordering or turning a line of cars, or allowing an engine to get on either side of a cut of cars.
- Interchange: holding loaded or empty cars waiting to be picked up by the connecting commercial railroad, or cars delivered to the installation by the commercial railroad.
- Storage: for cars infrequently used or moved.
- Fueling and housing engines.

7-2 SITING AND GENERAL LAYOUT.

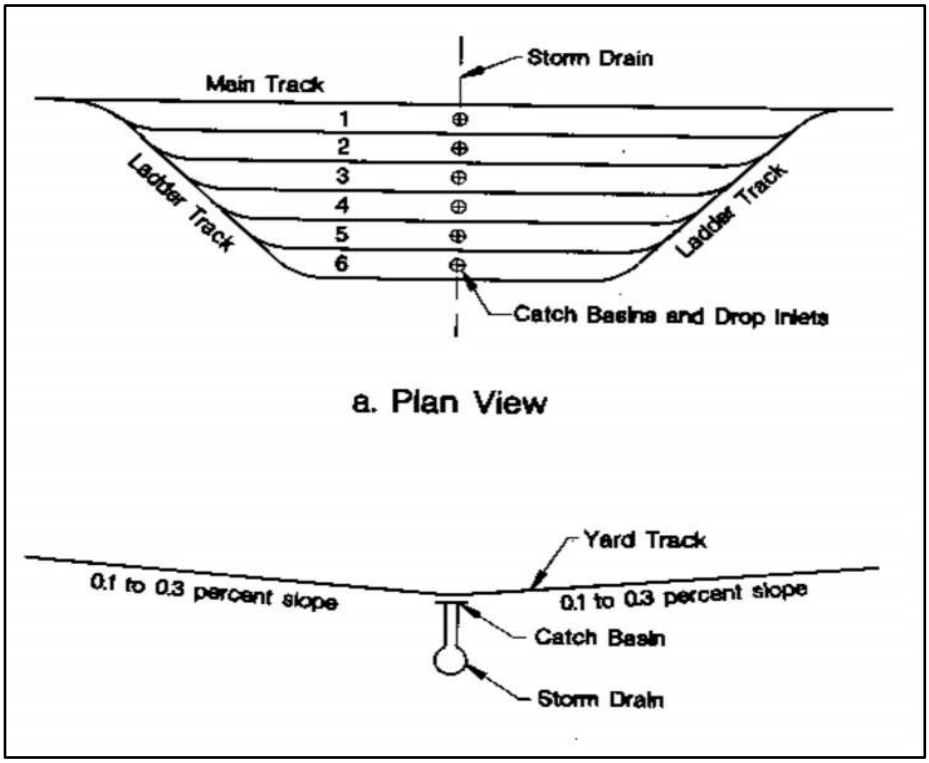
In the siting and layout of terminals, consider space requirements, logistics, security, safety, the presence and use of existing facilities, character of the terrain and natural drainage, as well as mission requirements. When locating a terminal area, select a site that has the correct size, shape, and orientation so that it provides convenient access for both vehicles and railroad service.

Where space is limited, consider two or more separate terminals to provide sufficient capacity. This option can generate better traffic flow and less congestion than at a single site but can complicate command and control of loading operations and security arrangements.

7-3 TRACK DESIGN.

7-3.1 Design Wheel Loads.

For through running tracks in terminal areas, use Table 2-2, “10 MPH (16 km/hr) or Less.” For tracks where cars are simply placed and removed (as distinguished from those where general running or back and forth switching movements frequently occur) such as warehouse sidings and spur tracks (dead end tracks), including loading and storage tracks, use Table 2-2, “Light Use.” For run-around tracks, passing sidings, yard tracks, wyes, balloon tracks, or other tracks where switching movements commonly occur, use Table 2-2, “10 MPH (16 km/hr) or Less.”



7-3.2 Gradients.

Do not allow gradients on running tracks through a terminal to exceed 1.0 percent. On auxiliary tracks where cars are temporarily left standing during switching, gradients cannot exceed 0.3 percent. Gradients on tracks where cars will be left standing for 1 or more days, such as loading, yard, and storage tracks, preferably do not exceed 0.2 percent, with a maximum allowable of 0.3 percent. It is desirable to have these tracks slope away from the main track or connecting track. Thus, if hand brakes do not properly hold on cars, they would not roll toward the main track.

7-3.2.1 Double-End Yards.

Double-end yards are best graded as shown Figure 7-1, with tracks sloping toward the center, where storm drainage is provided. This grading arrangement prevents cars from accidentally rolling toward either ladder track and will also facilitate drainage by collecting runoff at the center of the yard.

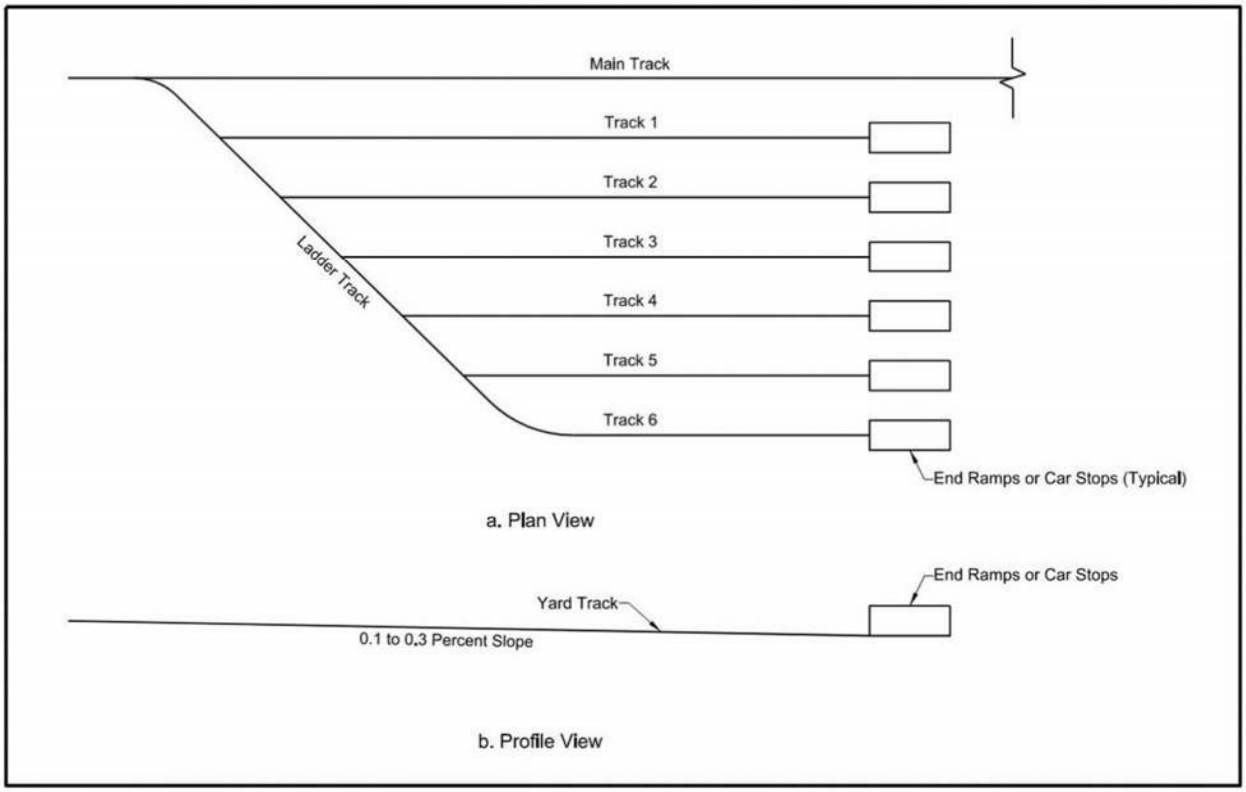


Figure 7-1 Typical Double-End Small Yard with Storm Drainage

7-3.2.2 Single-End Yards.

Grade single-end (also known as dead-end) yards as shown in Figure 7-2, with tracks sloping toward the end ramps or car stops.

Figure 7-2 Typical Single-End (Dead End) Small Yard

7-3.3 Vertical Curves.

Design guidance for vertical curves in terminals is provided in Table 5-1.

Do not locate turnouts in vertical curves. Turnouts in vertical curves result in problems with point fit and operation.

7-3.4 Horizontal Curves.

Design guidance for horizontal curves in terminals is provided in Table 3-3.

7-3.5 Track Layout.

Design guidance for the layout of turnouts, curves, ladder tracks, and track connections is covered in Chapter 5.

7-4 CLEARANCES AND USABLE TRACK LENGTH.

As terminal track is typically closely spaced near loading docks, buildings, access roads, parking and staging areas, parallel tracks, etc., awareness of clearance requirements is especially important. Clearance requirements are covered in Paragraph 5-4.

The maximum usable track length for positioning cars extends from the end of track (for spur tracks) to the clearance point, or (for sidings) between two clearance points, as indicated in Figure 5-9.

7-5 VEHICLE TERMINALS.

7-5.1 Purpose and Facility Requirements.

A vehicle loading terminal is generally designed for transferring tracked or wheeled vehicles on or off flatcars or, in the case of smaller wheeled vehicles, bi-level auto racks. A vehicle terminal will contain the following:

- Loading tracks to position the flatcars.
- Staging area to hold the vehicles.
- End ramps or multilevel ramps for transferring the vehicles to and from the railroad cars.
- Railyard operations building.
- Storage building for tie-down, blocking, and bracing material.
- Lighting for terminals and staging areas with operations after dark.

7-5.2 Track Spacing.

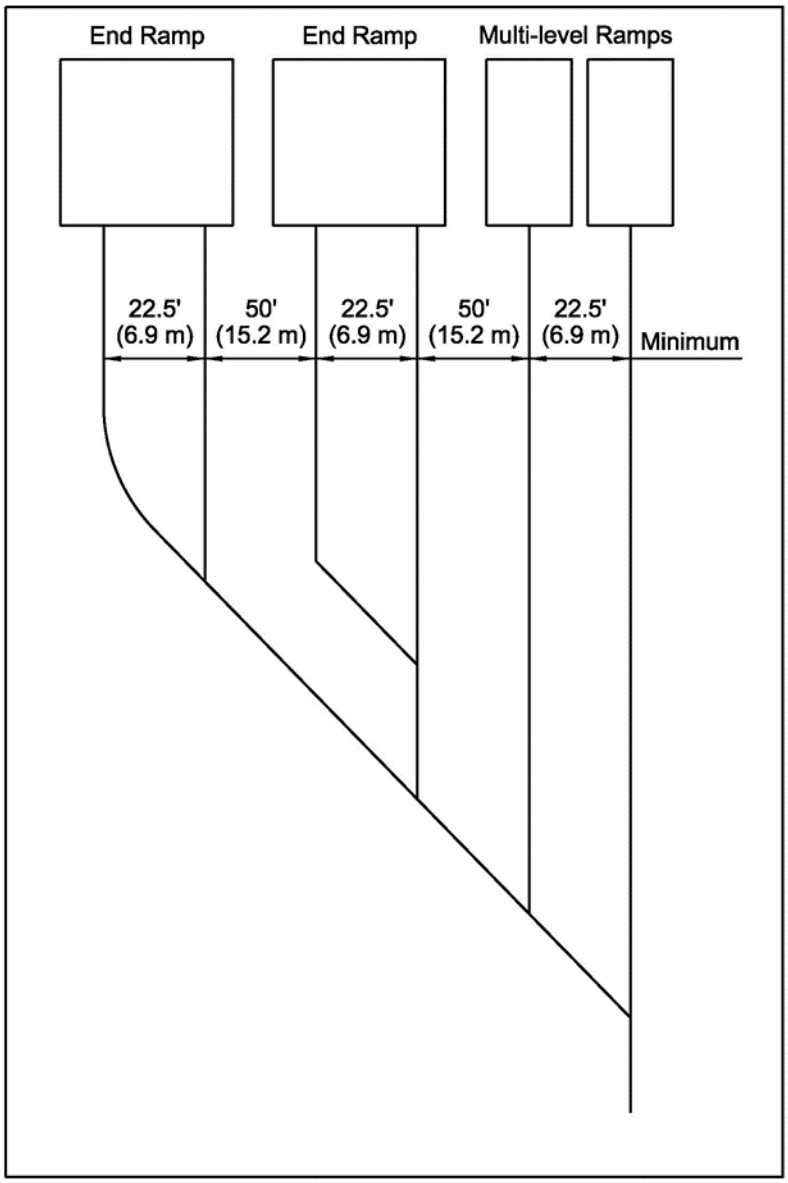
When the loading tracks in a vehicle terminal are laid out parallel to each other (as is often the case), the tracks are typically paired as shown in Figure 7-3. The minimum track spacing between tracks in a pair is 22.5-ft. (6.9 m). The minimum track spacing between track pairs is 50-ft. (15.2 m). 22.5-ft. (6.9 m) is the minimum track spacing for small utility terrain service vehicles to drive between the tracks. Bridge plate storage racks can be located in the 50-ft. (15.2 m) space between track pairs.

7-5.3 Track Length and Number of Tracks.

For vehicle loading, strings of between 10 and 20 cars are most effectively handled at a time: the lower limit of 10 to minimize switching requirements and the upper limit of 20 to limit the length needed to drive vehicles down the string of rail cars for efficient loading. As a result, each loading track has a tangent length extending from 10 to 20 car lengths from the loading ramp, as shown in Figure 7-4. For multi-level ramps, only handle a maximum string of 6 rail cars at a time.

The number of tracks required can be determined from the traffic and mission information covered in Chapter 2, the space available in the terminal area, and the criteria for track length above.

Figure 7-3 Vehicle Terminal



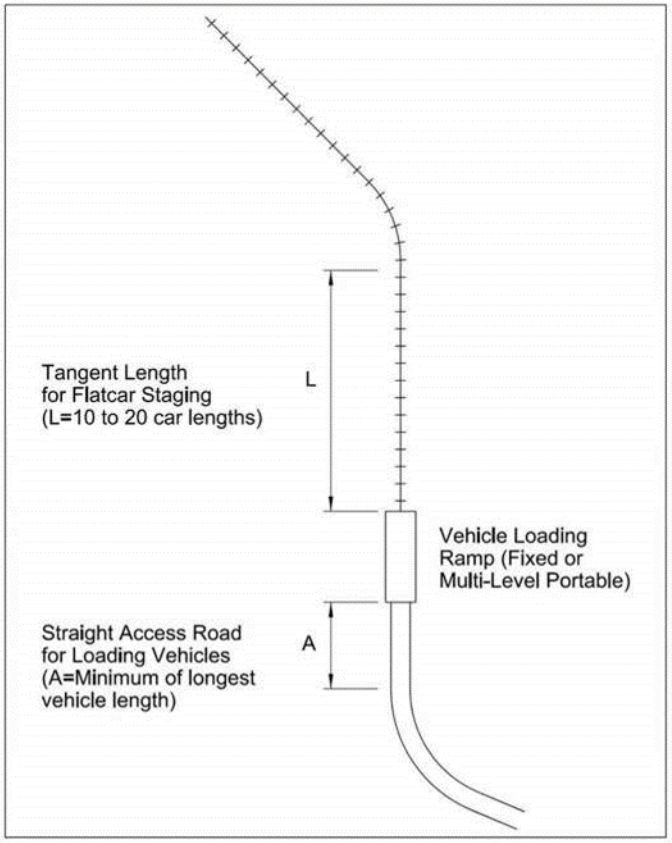


Figure 7-4 Track and Approach Road Lengths for Vehicle Loading

7-5.4 Staging Area.

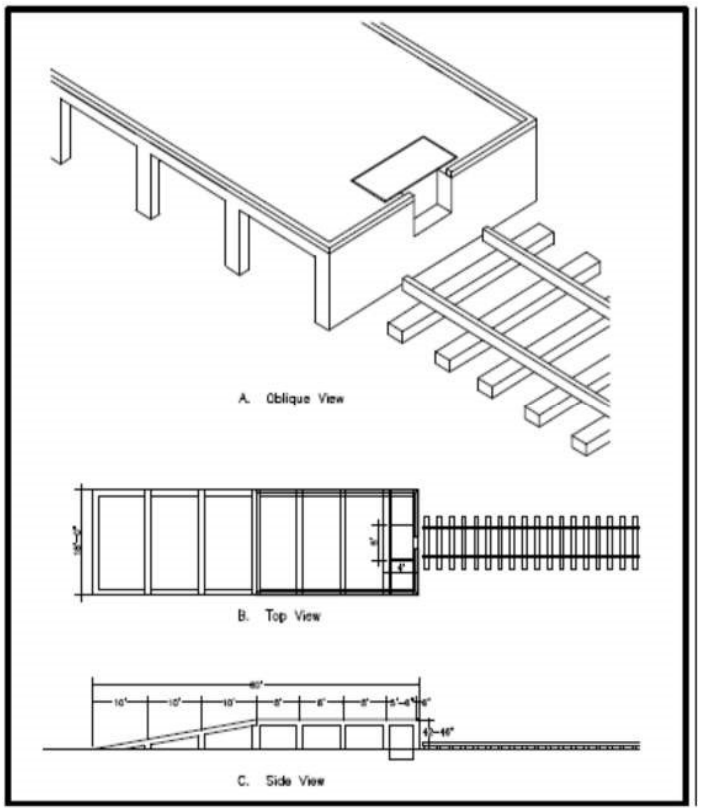
The size and location of a vehicle staging area depends on terrain characteristics and availability of space. Locate the staging area as close to the loading area as possible to facilitate better command and control. Ensure the staging area is large enough to stage one full loading cycle of vehicular cargo, thus a loading terminal with a capacity of 50 flatcars would require a staging area with a capacity of 50 carloads of vehicles.

The staging area requires an access road or approach leading up to the loading ramp, which is straight and in line with the ramp for at least the full length of the longest vehicle to be loaded. If practical, the in-line approach is twice the length of the longest vehicle to ensure that a vehicle can always be positioned ready to load as the first vehicle is driven up the ramp. It is also preferable that this road is not directly adjacent to any track to avoid a dust cloud from the approaching vehicles reducing the view of loading operations.

For operation after dark, staging areas need to be lighted with “parking lot” type lighting. Fencing is required if the cargo is security sensitive. (See Chapter 5, Paragraph 20.5).

7-5.5 End Ramps for Tracked and Larger Wheeled Vehicles.

Rapid loading of larger vehicles onto flatcars is best accomplished with permanent end ramps constructed at the end of the loading tracks. While end ramps can be constructed with concrete, wood, steel or retained earth, they must support the largest and heaviest vehicles mobilized: typically a main battle tank. A general reinforced concrete ramp design is shown in Figure 7-5. Obtain more detailed guidance from the Army Transportation Systems Center (CENWO-ED-TX, or at website: https://transportation.erdc.dren.mil/tsmcx/). A well-designed end ramp will:



a. Allow an M-1 Abrams tank to be driven onto a flatcar having the lowest platform height used in commercial railroad service. Note: It is safer and easier to drive a vehicle from a lower ramp level to a higher flatcar level than vice-versa.

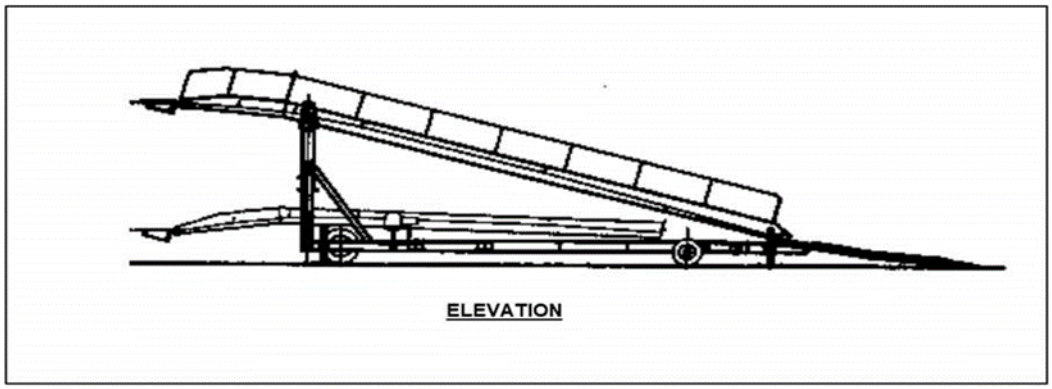
b. Provide ample width to enable guides to walk on both sides of an M-1 tank.

c. Provide sufficient level platform length to allow a tank to be in a completely horizontal position prior to proceeding onto the railcar.

d. Have the proper transition between the incline and the level platform so that a tank will not “high center” itself while negotiating the ramp.

Figure 7-5 Concrete End Ramp

To make vehicle loading easy, it is desirable to have the end of the rail car close to the ramp platform. It is also necessary to protect both the rail car and the ramp from impact damage when rail cars are being positioned at the ramp. As rail car designs vary (draft gear length, amount of end overhang, position of uncoupling lever, etc.), this protection cannot be reliably provided by fastening wheel stops to the track. The design in Figure 7-5 incorporates a cut-out at the front of the ramp at the height of the car coupler. Behind the cut-out is a concrete block separated from the remaining ramp structure with cushioning (expansion joint) material. This concrete bumper block reduces the likelihood of impact damage to the ramp. Other shock absorbing designs and devices can be used as well, including commercial railcar buffers. Select the method best suited for the particular application. While the concrete bumper block could easily be incorporated into new construction, it might prove impractical during rehabilitation if the existing ramp platform will not be extensively modified.



7-5.5.1 Spanners.

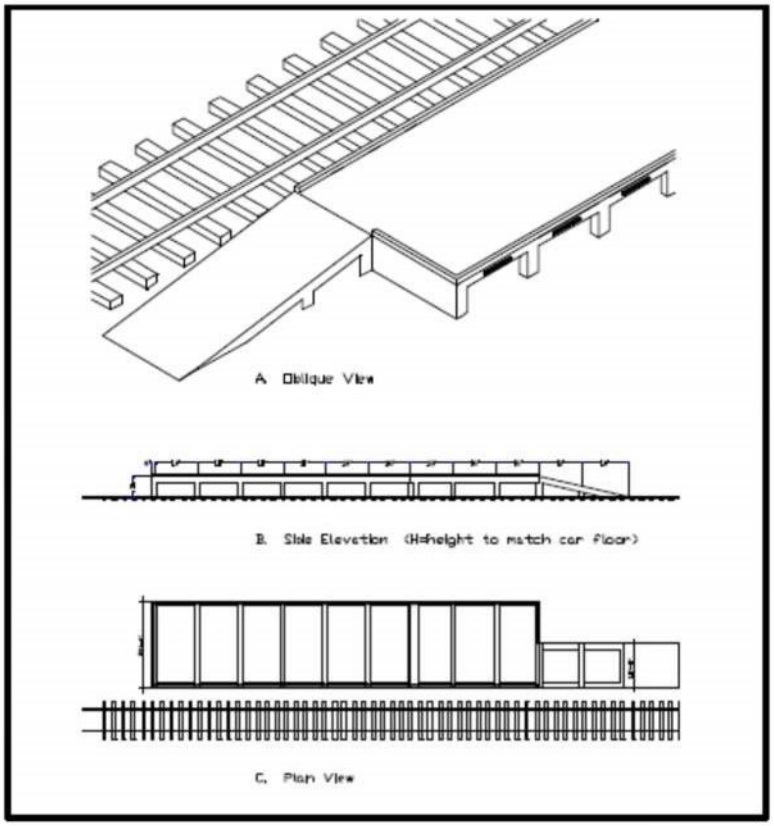
To permit wheeled vehicles to cross the gap between the ramp and the flatcar, spanner boards are necessary; tracked vehicles do not require spanner boards. Thus, if fixed spanners are used, ensure they are detachable so that they will not interfere with the loading and unloading of tracked vehicles.

7-5.6 Multilevel Ramps for Smaller Wheeled Vehicles.

If an installation has a requirement to mobilize large quantities of small-wheeled vehicles, it is recommended that multilevel ramps be used to load bi-level railcars. These ramps are portable pieces of equipment that can either be purchased and maintained by the installation or leased from a commercial railroad when needed. Like end ramps, multilevel ramps are positioned at the end of a track spur. A typical multilevel ramp is shown in Figure 7-6.

Figure 7-6 Portable Multilevel Ramp05

It is important that the ground underneath a multilevel ramp be level and capable of bearing the weight of the ramp plus the heaviest vehicle being loaded. A Portland cement concrete pad is recommended to ensure good ramp stability.



7-6 BREAK BULK (SMALL CARGO) TERMINALS.

Permanent side ramps, parallel to the track, are recommended for loading break bulk cargo into boxcars. For staging cargo, large open areas are needed surrounding the ramps. Thus, where several parallel tracks run through a terminal, construct the ramps along the outermost tracks. Figure 7-7 shows a diagram of a reinforced concrete side-loading ramp.

Side ramps are required to meet the following design criteria:

- Capable of supporting the weight of a fully loaded 4,000-lb (1815 kg) forklift.
- Allow sufficient area for a forklift to maneuver.
- A height convenient for a forklift to drive into a boxcar on the adjacent track as well as into a truck docked at the ramp.
- Incline angle small enough for a forklift to easily negotiate it.

Figure 7-7 Side Loading Ramp

7-7 CONTAINER TERMINALS.

A container loading area includes at least one track spur with sufficient space on one or both sides of the track for a container handler to operate. The required size of a

container terminal is related primarily to the largest volume of cargo required to be handled in the shortest time period. General plans and additional design guidance for container terminals can be found in Chapter 14, Part 4 of the AREMA manual.

Use the following design criteria for a container terminal:

- Include at least one straight spur track long enough to hold a minimum of five flatcars.
- Have one entrance and one exit to the yard area located to establish a one-way circular traffic flow.
- Have sufficient open area for a Rough Terrain Container Handler (RTCH) to efficiently operate.
- Have a surface that will support the weight of a RTCH carrying a loaded 40-ft container.
- For night operations, have “Parking Lot” type lighting positioned so that the light poles will not interfere with the operation of the RTCH or truck-trailers operating inside the yard.
- If a secured area is required, have a perimeter fence with a gate across each track entry and exit (see Chapter 5, Paragraph 20.5).

7-8 AMMUNITION TERMINALS.

Design ammunition terminals to meet the required shipping volume at the installation. Set up the terminal as either a break bulk terminal (Chapter 7, Paragraph 6) or a container terminal (Chapter 7, Paragraph 7). In addition to the usual terminal requirements, incorporate the following Explosives Safety standards into the design:

- Refer to service specific Explosives Safety guidance to determine the minimum Explosive Safety Quantity Distances (ESQD).
- Generally, yards will be laid out on a unit car-group basis with each car-group separated by the applicable above-ground magazine distance.
- If the yard is formed by two parallel ladder tracks connected by diagonal spurs, the parallel tracks and the diagonal spurs will be separated by the applicable above-ground magazine distance for the unit group quantities of high explosive.
- If the yard is a tree arrangement, consisting of a center ladder track with diagonal dead-end spurs projecting from each side at alternate intervals, separate the spurs by the applicable above-ground distance for the net quantity of high explosives in the cars on the spurs.
- Separate railroad yards from other facilities by the applicable Quantity-Distance standards.

The following recommendations also apply to ammunition loading areas:

- If loaded ammunition cars will stay in a terminal area for sufficient time, fence the areas completely, with gates across all tracks entering the area, and have locking pedestrian and vehicular gates. See Chapter 5, Paragraph 20.5.
- Lighted with “parking lot” type lighting.
- If guard towers are required, position them to allow observation of the entire ammunition loading area.

7-9 PETROLEUM, OIL AND LUBRICANT (POL) TERMINALS.

The design of POL handling and storage areas is regulated by Federal, State, and local environmental protection agencies as well as State and local fire marshals. Contact these agencies when designing POL facilities and incorporate appropriate design standards.

POL handling and storage areas are required to be completely fenced, with gates across all tracks entering the area and have locking pedestrian and vehicular gates (see Chapter 5, Paragraph 20.5). Light these areas with “parking lot” type lighting.

7-10 CAR INTERCHANGE.

7-10.1 Purpose.

The interchange area or yard consists of one or more tracks used for the transfer of cars between the installation’s railroad and the connecting commercial railroad. These tracks are usually located at or near the junction of the two railroads.

7-10.2 Arrangement.

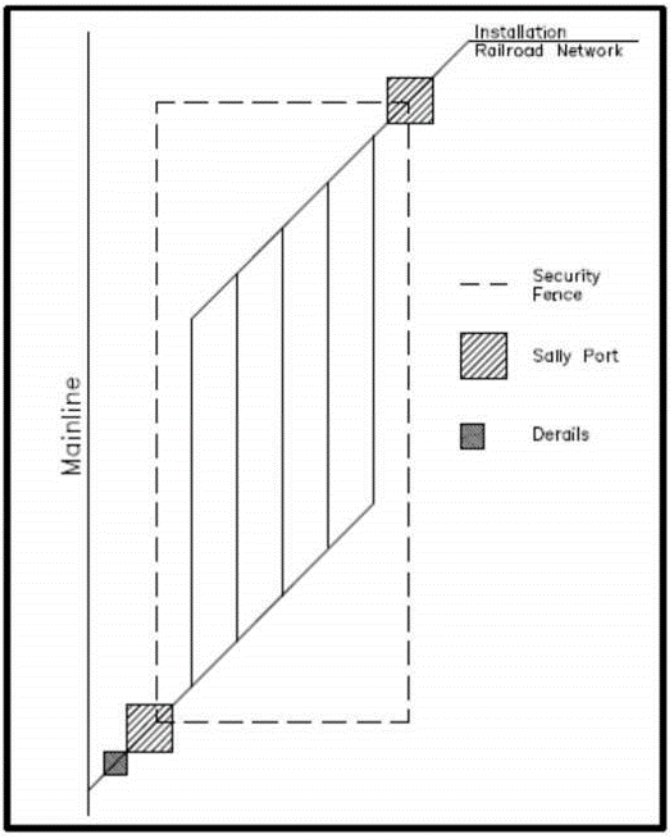


Figure 7-8 shows an example car interchange yard. In this arrangement, one or both of the outer two tracks would normally be designated as a running track and left clear of cars. The other tracks would be of sufficient combined length to handle the largest expected number of cars to come in or go out at any one time.

7-10.3 Running Track.

An open running track through the interchange yard will allow the installation’s or commercial railroad’s engine access to either end of each interchange track, and otherwise leaves an unblocked connection between the two railroads. The running track can also be used temporarily for switching. This makes it easier to rearrange the cars, if needed, or to pull out selected cars from any track.

At installations with frequent grade crossings or where at least one heavily traveled road crosses the tracks at grade, especially if the crossing angle is less than 45 degrees, access to either end of a cut of cars is usually required. This will permit the engine to always be at the front of a train, pulling the cars rather than pushing, in either direction of travel, providing much better visibility and safety at road crossings.

Figure 7-8 Interchange Yard

7-10.4 Set Out Track.

Consider including an additional track (or perhaps a short spur) at an interchange yard for special over-size loads, for cars needing repair, or for other special movements that need separate handling.

7-10.5 Derails.

In addition to being good practice, the connecting railroad will usually require that a derail be placed on the track leading to its line, along with a sufficient safe length of track between the derail and the junction. The derail is intended to prevent cars from accidentally rolling onto or blocking the connecting railroad's track. In some instances, derails are desirable at the installation end of the interchange tracks.

While derails themselves are not a design issue, their location is. Without a sufficient length of track between a derail and the clearance point of the track being protected, a derail will be nearly useless. During design, allow for this safe track length as an addition to the length of track required for car holding and switching space. The safe track length needed past a derail will vary with the grade of the yard tracks and the configuration of the junction area. Consult the connecting commercial railroad's engineering department for guidance on placing a derail to protect their track.

7-10.6 Security.

If the interchange yard is outside the main installation area or otherwise not located within constant view, it is recommended that the area be completely enclosed with a security fence, including lockable gates across the tracks (see Chapter 5, Paragraph 20.5). Consider lighting and guard towers if security-sensitive cargo is regularly handled.

7-11 YARD, STORAGE, AND OTHER AUXILIARY TRACKS.

7-11.1 Purpose.

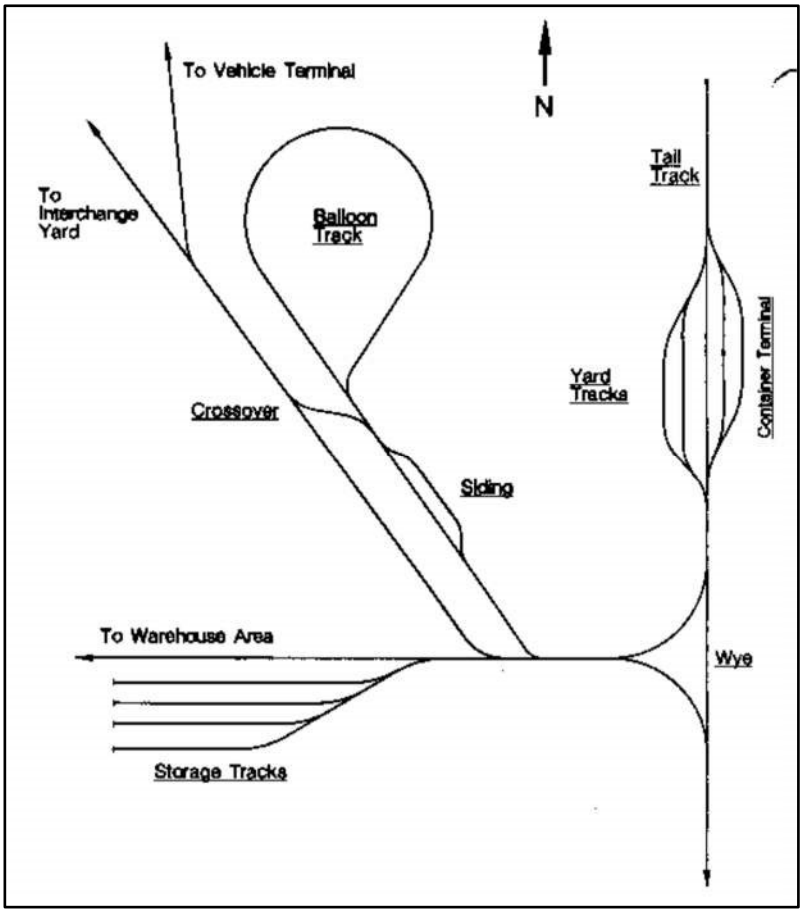
Yard and storage tracks are intended for, respectively, the short and long-term holding of cars. Yard capacity is needed at least equal to the maximum number of cars that the installation is expected to handle at one time. Ensure the storage capacity, at a minimum, accommodates the number of cars to be kept at the installation over a longer term. Loading tracks are not considered available for storage unless cars are pre-positioned on them for loading.

Auxiliary tracks include sidings, wyes, balloon tracks, crossovers, tail tracks, and other tracks used for switching and maneuvering cars, allowing engines and cars to clear the main track for other movements (as in a second engine switching or delivering cars), or to allow an engine to get around the other side of a string of cars.

7-11.2 Yard Tracks.

Especially where the interchange with the commercial railroad is several miles from the loading sites, or where loading sites are within a separate secure area, a yard can be required. A yard is typically several parallel tracks, as in Figure 7-1, serving as a holding area for cars waiting to be loaded or delivered to the interchange area.

An example is an installation with a mobilization plan calling for 60 loaded cars to be picked up each day and 60 empties to be delivered by the commercial railroad, and with loading sites 12 miles (19.3 km) from the interchange point that can accommodate 30 cars at one time. This installation will likely need a yard that will hold at least the second 30 cars waiting to be loaded, and subsequently, the first 30 after they are loaded — to make room for the second 30 at the loading sites.



7-11.3 Storage Tracks.

Storage tracks or a storage yard can appear as shown in Figure 7-1 but are often designed as spur (dead end) tracks off a single ladder, as indicated in Figure 7-2 and the lower left corner of Figure 7-9. It is usually not essential to have access to either end of cars in storage, thus saving the cost and maintenance of turnouts at one end of storage tracks.

7-11.4 Auxiliary Tracks.

Figure 7-9 shows common auxiliary tracks. Their application is explained below.

Figure 7-9 Auxiliary Tracks

7-11.4.1 Sidings.

Sidings temporarily hold extra cars or part of a string of cars while the remainder are switched or allow an engine to bypass a string of cars.

7-11.4.2 Crossovers.

Crossovers can be used as a shortcut between routes or to allow an engine to get around a string of cars. In Figure 7-9, the crossover, for example, allows trains from the interchange yard access to the siding without having to go south to the warehouse track and then back north again, thus the crossover allows the siding to be conveniently used from either track. In addition, when handling a string of cars longer than the capacity of the siding, the cars can remain south of the crossover on either track, with the engine then using the crossover to get to the other track and then around to the opposite end of the cars.

7-11.4.3 Wye or Balloon Track.

At least one wye or balloon track is almost always needed at military installations. These tracks allow engines and cars to be turned around. This capability is required for most effective use of vehicle terminals. If cars are delivered to the installation such that the vehicles on them would be facing away (backward) from the loading ramps, the cars need to be turned so the vehicles can be driven in a forward direction off the cars. Of the two types of turning tracks, wyes are most common, as they require far less space than balloon tracks. Balloon tracks are typically used if space allows them to conveniently encircle other facilities, thus not requiring a large land area just for the balloon track. Balloon tracks have the advantages over wyes of requiring only one turnout and a single movement to accomplish the turn. Wyes require a backward movement to complete a turn, as well as throwing more switches. Wyes are often created by installing the third leg where a junction already exists (or is required). In Figure 7-9, for example, the wye also allows convenient access to the warehouse track from either north or south directions.

7-11.4.4 Yard or Siding.

When a yard or siding is located near the end of a route, a tail track is often added to allow switching from the far end of the yard or siding. A tail track is most useful if it is at least three car lengths longer than the siding or the longest track in the yard. Figure 7-9 shows a tail track north of the container terminal.

7-12 MISCELLANEOUS BUILDINGS.

7-12.1 Purpose.

Evaluate if buildings are needed for storage, shelter, and for other purposes in each terminal area. At vehicle terminals, a railyard operations building is needed for blocking and bracing storage.

7-12.2 Railyard Operations Building.

Consider the following when designing a railyard operations building:

- Locate as close to the loading area as possible without interfering with the flow of vehicles between the staging areas and the loading ramps.
- Sufficient space to accommodate the billeting of a rail loading crew.
- A communication system for enhanced command and control.

7-12.3 Blocking and Bracing Storage Facility.

Consider the following when designing a blocking and bracing storage facility:

- Locate as close to the loading tracks as possible. Determine if co-location with the railyard operations building is desirable.

- Sufficient size to accommodate blocking and bracing material required for one cycle of rail loading, that is, enough material for the maximum car capacity of the terminal.

APPENDIX A BEST PRACTICES

A-1 ROUTE SELECTION.

A-1.1 Introduction.

This chapter describes the process of selecting the route for the track connecting the terminal facilities with the commercial railroad serving the installation.

The location process begins by roughly defining potential routes or areas through which a railroad might practically run. Additional and more detailed information is then collected, and the route alternatives are gradually reduced until the final route is chosen. Before this process begins, complete the initial location and orientation of terminal facilities as described in Chapter 7.

The ideal route is usually the one that:

- Is shortest in length.
- Has the lowest grades.
- Has the least curvature.
- Costs the least to build.
- Most conveniently serves the installation and all terminal areas, as well as connecting railroads.
- Causes the least interference with other activities and modes of transportation.
- Is environmentally compatible with adjacent land use.
- Provides reliability for use in all weather conditions.

Since the above-listed objectives often conflict, the engineer’s job is to determine the appropriate compromises that will produce the best route under the circumstances – the one that best meets all objectives.

If initial line locations prove unsatisfactory in some important aspect, look for a different terminal location or re-orient a terminal so that the line serves it from a different direction.

Throughout the route selection process, it is essential to have good maps, including contour maps, of the area for the potential railroad line. These are often available from online sources.

A-1.2 Establishing Control Points and Potential Corridors.

Control points serve to limit location alternatives. They represent places through which the railroad must pass or would ideally pass. The most obvious control points are end points: the terminals and the connections with the commercial railroad. Establish intermediate control points, which can include facilities or geographic features that must

be avoided, such as firing ranges, poorly drained areas, or environmentally sensitive areas. Place control points that also offer significant construction and operating advantages, such as narrow or shallow river crossings and areas with naturally good drainage. After control points are marked on contour or aerial maps, sketch approximate boundaries of potential route corridors. Identify more control points, and other information needed to define a specific route, during the next stage (reconnaissance).

A-1.3 Reconnaissance.

The reconnaissance is a quick examination of a wide strip of land between control points – the strip representing rough boundaries of a potential line location. If appropriate, examine several potential routes or alternatives for portions of a route.

The purpose of a reconnaissance is to identify routes that might allow the easiest construction effort consistent with the purpose and requirements of the railroad.

Contour maps, available geographic information system (GIS) information from county, state, and installation sources, aerial photographs from online sources, and previous survey information are good sources to use during the reconnaissance. A small set of maps and diagrams, with control points and potential routes identified, is convenient for field use. The information gathered during the reconnaissance can then be transferred to larger maps and computer files back in the office.

Perform reconnaissance by any means appropriate for the terrain and distances to be covered: review of online maps and photography, walking, driving, or from the air. Generally, take note of terrain features and anything that might affect route location and construction. Look especially for:

- Landmarks for referencing the location.
- Additional control points.
- Areas of potentially easy or difficult construction.
- Roads and utility lines to be crossed.
- Waterways or ravines to be crossed. Estimate length and height of bridges.
- Drainage paths.
- Soil conditions and geological features.
- Vegetation type and density.
- Potential for future additions to the railroad, as per the installation master plan.
- Wetlands and other environmentally sensitive areas.
- Snowfall and exposure to drifting snow.

Observe snow conditions along the proposed routes for at least one winter to identify locations where drifts form. Winter aerial photographs are potentially helpful for this

purpose. Avoid sites downwind of frozen lakes unless there is adequate room between the shore and the roadway to install snow fences.

After the reconnaissance has been completed, prepare maps showing all control points and potential alternative routes. Then, make general comparisons between the routes with respect to length, grades, curvature, relative amount of earthwork and drainage work required, bridge work, special construction requirements, and potential operating advantages and disadvantages.

If sufficient information is available at this point, recommend the best route; otherwise, prioritize the routes. Also note any special requirements for the initial survey.

A-1.4 Initial Survey.

The objective of the initial survey is to obtain sufficient information to allow preparation of initial earthwork and construction estimates and to establish a location for the track and drainage paths on maps back at the office. When the route choice is clear from the reconnaissance, the initial and final surveys are often combined.

The initial survey is done by approximating the routes as a series of tangents, taking elevations and cross section data at selected intervals, perhaps every 100 to 250 ft. (30.5 to 76.2 m) along the route. Generally, where terrain is fairly uniform, the longer survey intervals can be used. Take elevations and cross section data at points representing a rapid change in terrain or at other points of special interest that aid construction estimating. Incorporate all useful landmarks into the survey. Stakes need to be driven in sufficient number to clearly show the survey centerline - about every 200 to 400 ft. (61 to 121.9 m).

For cross sections (nearby elevations at right angles to the route), simply take elevations at points that will show the shape of the adjacent terrain - local peaks, low points, and other points of special interest. The width of the required cross section will be dictated by the character of the terrain, right-of-way ownership, and distance needed to show local drainage and topographical features. It is not necessary for cross sections to be of equal distance on each side of the route centerline or of equal width at each station along the route.

Where terrain is open and easily accessible, cross section data is often taken from 300 to 500 ft (91.4 to 152.4 m) on each side of the route centerline. In areas where the route location is fairly well defined, cross sections are much narrower; sometimes only a 50-ft (15.2 m) wide strip is needed. The situation governs the choice of width.

When approaching points where a change in direction will occur, it will often prove useful to take an extra wide cross section on the inside of the angle, as a curve must eventually connect the two tangents through this area.

During the initial survey, be sure to take sufficient information to establish drainage paths on both sides of the track. Also note paths that drain runoff into the right-of-way as well as outlets where water can exit the right-of-way to nearby streams, drop inlets, or other runoff channels.

A-1.5 Trial Location.

Trial location is the process of determining potentially practical routes (trial routes) through a particular area. The objective of trial location is to produce the best combination of tangents, curves, and grades for the routes surveyed. This is done by combining survey information with design and economic guidelines, operating requirements, and engineering judgment. During this process, many factors must be weighed and prioritized, and conflicting objectives must be balanced.

After the first trial routes are located, construction estimates are made. Then, the location of the track or drainage path is usually modified in an attempt to reduce construction cost, while still maintaining satisfactory operating characteristics, or to improve operating characteristics while keeping construction costs at a reasonable level. Adjustments are made to each route until the most satisfactory set of compromises has been produced.

For track through an installation or in a terminal area, this process can usually be simplified and done with fewer iterations. Likewise, the construction estimates might be done only once.

Trial location begins by lightly sketching the boundaries of the initial survey on a contour map. The first trial route drawn through this strip is often done by minimizing grades, or in flatter territory, by minimizing the number of curves needed. As with the initial survey, the route begins as a series of connected tangents, with curves chosen and drawn in later.

After the route is sketched, a profile is drawn. The elevations of the railroad come from the elevations of end and intermediate points and the different grades chosen between these points. The elevations of existing ground level are obtained by approximating the point where the route would pass through each cross section taken in the initial survey. When an initial survey is not done, the ground elevations are taken from the points where the route crosses map contours.

With the trial routes drawn, earthwork and construction estimates are made using standard procedures. At this stage, estimate embankment and cut widths and slope angles using the typical roadway cross sections in Chapter 5, Paragraph 1. If one route does not yet appear clearly superior, generate an additional iteration of modifications and analysis to produce the final location.

A-1.6 Final Location.

To finalize the route selection, modify the trial routes, if necessary, to even cut and fill amounts in adjacent areas or to reduce the total earthwork and grading required.

Where grades or curvature exceed the most desirable limits, the routes should be modified, if feasible, to reduce these. Also review the criteria listed in Paragraph A-1.1, for each trial route.

APPENDIX B RULING GRADE – EXAMPLE PROBLEM

This example of determining a trial ruling grade for a new railroad line follows the material presented in Chapter 3, Paragraphs 4, 5, and 6.

A railroad line is to be built from the terminal serving the new training area at Fort Example to the nearest commercial railroad, about 15 miles away. The most critical traffic, and heaviest loads, will be M-1 tanks on flatcars. Each car is 70 feet long and has a maximum loaded weight of 187 tons riding on 6 axles. The installation has one 1,500 HP, 100-ton locomotive.

To handle movements during larger training exercises and mobilization, the installation wants to use an engine from the connecting railroad which will be capable of hauling 25 loaded flats over the line at 15 MPH minimum speed. The connecting railroad expects to have a 3,000 HP, 170 ton (340,000 pound) locomotive available when needed. Tractive effort curves are not available for either locomotive. For simplicity, let locomotive length equal car length.

The designer must now determine the maximum effective gradient and grade length on the new line to accommodate these train movements. The first step is to determine how much traction force is available using Chapter 3, Paragraph 5.4. Available traction force will be the lesser of locomotive tractive effort or traction at the wheel-rail adhesion limit, for the commercial locomotive:

1. Locomotive Tractive Effort at 15 MPH = 300 x 3,000 / 15 = 60,000 lbs.
   Wheel-Rail Traction Limit = 340,000 / 4 = 85,000 lbs.
2. Locomotive traction capability governs usable tractive effort.
3. Ruling Grade from Equation 3-3:

   TE =60,000 lbs

   W_{eng} = 170 tons

   W_{car} = 187 tons

   N_{car} = 25

   G = 60,000 / 20(170 + 25 x 187) - 0.15

   = 0.47%

   Grade length = 26 (engine and cars) x 70 = 1820 Feet (or longer)

Thus, grades of 1820 feet or longer would have to be limited to an effective gradient of 0.47%. After a brief review of contour maps of the proposed route, the designer believes the route requires grades much steeper than 0.47% to keep construction costs at an acceptable level.

One way to accommodate the desire to move single trains of 25 loaded flats at a minimum speed of 15 MPH and allow for a steeper ruling grade is to use the installation's engine and commercial engine together. Dropping the travel speed up the ruling grade to 10 mph further increases the tractive effort available. To offset the loss in speed up the ruling grade, other portions of the route might be constructed to accommodate higher speeds perhaps – 25 to 30 mph. A check of this possibility shows the following:

For the commercial locomotive:

1. Traction at the Adhesion Limit = 340,000 / 4 = 85,000 lbs.
2. Locomotive Tractive Effort at 10 MPH = 300 x 3,000 / 10 = 90,000 lbs.
    a. Wheel-rail adhesion governs usable tractive effort.

For the installation's locomotive:

1. Traction at the Adhesion Limit = 200,000 / 4 = 50,000 lbs.
2. Locomotive Tractive Effort at 10 MPH = 300 x 1,500 / 10 = 45,000 lbs.
    a. Engine power governs usable tractive effort.
3. Ruling Grade (from Equation 3-3):

    TE =85,000 + 45,000 = 130,000 lbs.

    W_{eng} = 170 + 100 = 270 tons

    W_{car} = 187 tons

    N_{car} = 25

    G = 130,000 / 20(270 + 25 x 187) - 0.15

    = 1.16%

4. 2 engines and 25 cars = 27 total

    Grade length = 27 x 70 = 1890 Feet (or longer)

Thus, if this revised arrangement is acceptable, grades of 1890 feet or longer could have an effective gradient as high as 1.16%. Table B-1 shows the curve compensation for curves on this grade.

Table B-1 Curve Compensation for a 1.16% Grade

Degree of Curve	Uncompensated Grade		Compensated Grade	
	Actual	Effective	Actual	Effective
1	1.16	1.20	1.12	1.16
2	1.16	1.24	1.08	1.16
3	1.16	1.28	1.04	1.16
4	1.16	1.32	1.00	1.16
5	1.16	1.36	0.96	1.16
6	1.16	1.40	0.92	1.16

From the table, if a 5 degree curve was located within the ruling grade, the constructed (actual) gradient through that curve must be limited to 0.96% to keep the effective gradient within 1.16%.

APPENDIX C SAMPLE TRACK REHABILITATION REPORT

This sample report illustrates the type of information and level of detail suggested for an analysis of a military railroad network in preparation for rehabilitation work. The material that explains how the work is normally conducted is included for the benefit of the reader and would not be necessary in an actual rehabilitation plan.

Included in this example report are:

1. A description of track and roadway condition.
2. A problem/defect analysis.
3. A sequential work plan to correct the defects.
4. Cost estimates for each item of the work plan.

The material in Appendix C covers the structural evaluation that is normally required in a rehabilitation plan. Follow the guidance in Chapter 4, Paragraph 5 for the operational evaluation, which is not detailed here. Please note, do not use costs shown in the sample report as they are out-of-date.

RAILROAD TRACK REHABILITATION REPORT FOR FORT EXAMPLE

SUMMARY

Examination of the railroad network at Fort Example showed the following major deficiencies:

1. Inadequate lateral and longitudinal track stability.
2. Deteriorated track through road crossings.
3. Turnout defects.
4. Washouts under track.
5. Defective and/or skewed ties in certain areas.
6. Loose or missing track fastenings.
7. Thick vegetation growing in some portions of track.

The work plan was divided into 2 phases, with a total project cost of approximately $970,000.

Phase 1, to be accomplished first, covers the rehabilitation of the primary route and sidings extending from the connection with the commercial railroad to the end of the East Line. This work is estimated to cost approximately $550,000.

Phase 2 covers rehabilitation of most of the remainder of the track network: the south half of the Main Line, the West Line, and the North Line. This work is estimated to cost approximately $420,000.

The remedial work described in this report would restore the railroad network to a fully functional level, in a cost-effective manner. Remedial work has been specified only for those sections of track where the work is most needed. Tracks with no current use are not included in the plan.

The work plan has been designed so that when completed, the railroad network would require only normal routine maintenance to keep it fully functional for the foreseeable future.

C-1 INTRODUCTION.

C-1.1 Background.

This rehabilitation plan was prompted by reports that portions of the Fort Example railroad network were in a general deteriorated condition and that results of the structural evaluation program indicated structural deficiencies in several stretches of track. These conditions were confirmed by the team performing the track assessment contained in this report.

C-1.2 Objectives.

The objectives of this report are to:

1. Document the track and roadway deficiencies found during the recent field inspection, both by type and extent.
2. Propose corrective measures.
3. Provide cost estimates for budget planning.

The corrective work included in the plan is intended to restore the railroad network in a cost-effective manner. Thus, not all sections of track in the network are included in the plan, and each type of remedial work is specified only for those sections most in need. Further, corrective work is specified only to the extent that will restore the long-term function of the track. Tie replacement estimates are based on improving tie condition to the point where installation trackage can function well for 5 years before the next tie replacement program is needed.

C-1.3 Approach.

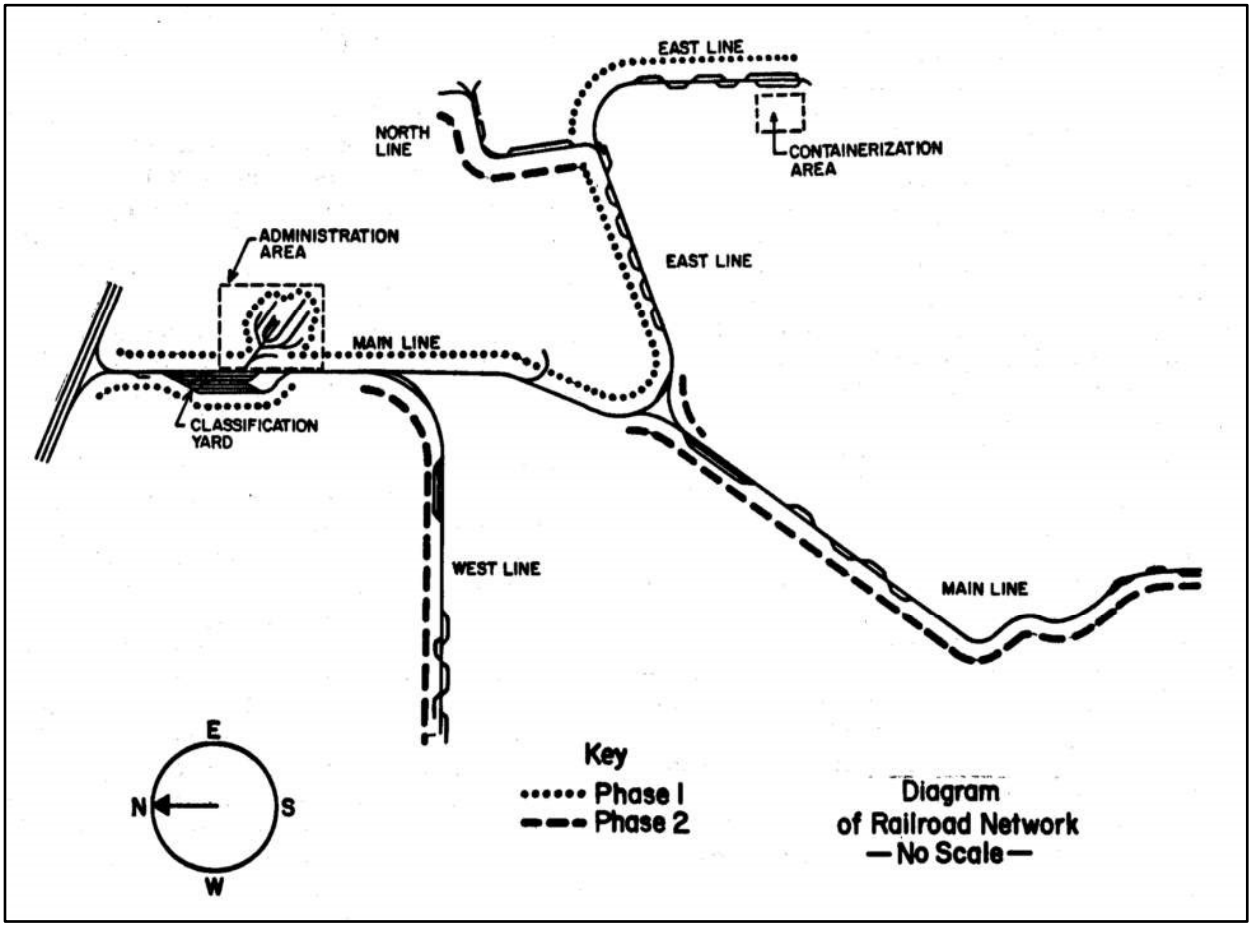
A three-person team visited the installation to examine the railroad network. During this visit, all track (except the short piece leading to the old coal/gravel chute) was examined by walking inspection, and all primary routes were traveled with the installation's 120-ton locomotive. In addition, those who were familiar with the track were interviewed about deficiencies they had observed and about track work performed in recent years.

C-1.4 Scope.

This report is intended to assist in the preparation of contract specifications for remedial track work. Neither the field investigation nor this report is intended to cover every detail required for proper restoration of the railroad network, nor is this report intended to be a substitute for a complete statement of work and specifications. There are, in fact, several items noted that will require additional examination and decisions before a complete and final remedial work plan can be established.

Accompanying this report are both general and detailed track maps and photographs, with notes, showing portions of the railroad network and representative defects.

C-2 OPERATIONAL EVALUATION.



Operational evaluations are covered according to the guidance in Chapter 4, Paragraph 5.

C-3 DESCRIPTION OF NETWORK AND TRACK CONDITION.

C-3.1 Introduction.

The railroad network connects with the [_____] Railway about 10 miles east of (City), (State). Of the 19.95 miles of track, 9.62 miles are primary routes, 3.43 miles are in the classification yard, and 6.90 miles are loading and storage sidings and auxiliary tracks. A track diagram is shown in Figure C-1, with a key to track designations in Table C-1.

Figure C-1 Track Diagram for Fort Example

Incoming cars are generally brought to the classification yard by the commercial railroad. There, one of the two installation locomotives will pick up the cars and deliver them to the appropriate area for loading or unloading. These cars are then brought back to the yard for pick up by the commercial railroad.

Table C-1 Key to Track Names and Station Locations

Letter Prefix	Track Type or Area
M	Main Line
E	East Line
W	West Line
N	North Line
A	Administration Area
P	Sidings serving loading ramps
S	Sidings serving buildings A through L
X	Miscellaneous spurs or sidings
Y	Wye tracks
2-14	Tracks in the Classification Yard

Below is a description of the railroad network, by component, reflecting conditions found during the investigation.

C-3.2 Rail.

C-3.2.1 Description.

80 percent of the rail is 90 lb (weight per yard of length) and manufactured between 1909 and 1924. The remaining 20 percent is 85 lb. The 85 lb. rail is primarily in Tracks 4 through 14 of the classification yard, the end of the North Line, and on Track A5 in the Administration Area, leading to the engine house. All rail was manufactured before the control cooling process was in use. The control cooling process, now standard practice, greatly reduces the formation of internal defects.

C-3.2.2 General Condition.

The rail is generally in good condition, neither excessively nor unevenly worn. Very few pieces show serious end batter or surface bending. Likewise, obvious external defects, serious corrosion (except, perhaps in crossings - where the whole rail is not visible), and breaks are rare. Testing for internal rail defects was not done.

C-3.3 Plates/Fastening.

C-3.3.1 Plates.

Almost all track has single shoulder tie plates. These are in adequate condition, with relatively few missing or defective.

C-3.3.2 Joints.

Joint bars are in good condition, with few excessively worn, cracked, or broken. However, many bolts are missing, loose, or not fully tightened. Of those that are not fully tightened, many appear to be rusted solid with the nut.

C-3.3.3 Spikes.

Spikes are in good condition; however some are not fully driven or have worked their way up in the last few years. Also, spikes have been frequently driven through angle bar base slots, which is no longer considered to be good practice.

C-3.4 Ties.

C-3.4.1 Description.

Most older ties are 6 x 8-in. in cross section. Most of the ties installed during the tie replacement 8 years ago are 7 x 8-in.

C-3.4.2 General Condition.

Tie condition is generally fair to good. Areas that did not receive ties during the last tie replacement program are generally in the worst condition. On the Main Line, approximately between stations 200+00 and 250+00, there are many skewed, bunched, or otherwise improperly spaced ties.

C-3.5 Ballast.

C-3.5.1 Description.

Most track in the primary routes has ballast composed of a low density, finely crushed volcanic material or slag, or cinders mixed with earth. Some stretches of track appear to have no real ballast section, leaving the track essentially sitting directly on the subgrade.

During recent track work, some new ballast was applied. This ballast is crushed rock of about AREMA 3 or 4 gradation and appears to be good, hard material. However, in most cases, this ballast is only a surface treatment, helping to fill in cribs (the spaces between the ties) and fill out the shoulders (at the ends of the ties).

C-3.5.2 General Condition.

The cinder/volcanic/earth material seems to drain adequately, but apparently provides insufficient lateral or longitudinal stability to the track. See Track Geometry section below. Additionally, this material is not sufficiently dense and stable to resist washout from heavy rains. See Drainage/Subgrade section below.

C-3.6 Drainage/Subgrade.

C-3.6.1 Description.

While the rainfall in this area of the country is not high, much of the rain comes in short, heavy periods, resulting in flash floods and washouts. Culverts at the installation are generally large, as big as 72 in., and often of double pipe arrangement, not only to accommodate sudden heavy flows, but also the debris that is swept along by the water.

The track is built on a sandy subgrade and is generally elevated above surrounding ground level. There are, however, clay layers near the surface in some locations. The large, flat areas containing tracks in the classification yard and in the Administration Area do not have a subdrainage system.

C-3.6.2 General Condition.

Drainage is generally good, both from the track and through culverts. However, there are a few problem areas. After a heavy rain, water commonly stands in the Administration Area and in some loading sidings for quite some time. Also, due to the large amount of debris present in the storm runoff, some culverts are partially or fully blocked.

Heavy rains have also caused several small washouts on the Main Line, especially along a roughly 800-ft stretch between stations 162+00 and 170+00 and at the south end of the line. In some places, shallow clay seams block vertical drainage, but water can usually escape adequately in lateral directions. And despite the numerous loose joint bars, the number of low joints is quite small, indicating good vertical ballast and subgrade support.

C-3.7 Vegetation.

C-3.7.1 Description.

Thick brush and low vegetation grow close to the track in many stretches of track, especially in loading sidings and near the ends of the primary routes.

C-3.7.2 General Condition.

Some vegetation is very tough, and where dense growth occurs, it scrapes the sides of trains. Because of this growth, it is difficult for a person to walk next to the track in several loading sidings and at the end of the Main Line.

C-3.8 Turnouts.

C-3.8.1 Description.

Turnouts are either 85 or 90 lb, matching the rail in the adjacent track. All but a few are Number 8 (in size) and have bolted frogs and either 11-ft or 16 ft, 6-in. switch points.

C-3.8.2 General Condition.

Overall, turnout condition, line, and surface are adequate. However, many switches are difficult to operate and badly need cleaning, lubrication, and adjustment. At many switches, the heel bolts are loose and the nuts and bolts often appear solidly rusted together, which would prevent re-tightening. Some switch points are also badly chipped or broken, and other miscellaneous parts need replacement. About half the turnouts had most or all of their ties replaced during the last tie replacement program. A few turnouts that did not get new ties do need some new ones.

C-3.9 Road Crossings.

C-3.9.1 Description.

Most crossings are all asphalt, with a few gravel/dirt type. There are two rubber crossings through the Main Highway near the connection with the commercial railroad.

C-3.9.2 General Condition.

About 25 percent of the asphalt crossings are in fair to poor condition. Likewise, the track in those crossings appears to be in fair to poor condition, typically showing loose joints and wide gage. Through a few crossings, only the slow and careful operation by the installation train crews has prevented derailments from occurring.

C-3.10 Track Geometry.

C-3.10.1 Description.

Track geometry describes the relative position of the two rails and track in the vertical and horizontal planes. The three primary measurements are:

- Alignment - a measure of lateral track deviations.
- Surface/Cross level - measures of vertical track deviations.
- Gage - the spacing between the two rails. Standard Gage is 56-1/2 in.

C-3.10.2 General Condition.

C-3.10.2.1 Alignment.

Track alignment is generally fair, with some poor sections.

C-3.10.2.2 Surface/Cross Level.

Track surface is generally adequate, although poor in places on the east half of the East Line, west half of the West Line, and spots on the Main Line. Track surface is also poor in some loading sidings. A few curves have excessive superelevation.

C-3.10.2.3 Gage.

Track gage is generally good, with the exception of some of the road crossings, where wide gage is common, and spots where skewed ties have caused tight gage.

C-3.11 Bridges.

C-3.11.1 Description.

There are three all timber bridges:

Table C-1 Timber Bridges

Line	Location	Length	Deck Type
Main	19+13	64 ft	Open
West	9+02	85 ft	Ballast
	40+00	122 ft	Open

C-3.11.2 General Condition.

These bridges were thoroughly inspected about 2 years previously and found to be in good condition. During this visit, the bridges were given a brief inspection, and no obvious defects were apparent.

C-4 STRUCTURAL ANALYSIS.

Explain any computer program or structural evaluations here.

C-5 ANALYSIS OF MAJOR DEFICIENCIES.

Below is a description of the major track deficiencies, along with contributing factors, where appropriate. In addition, these deficiencies refer to the remedial actions, as described in Paragraph C-6, designed to correct them.

C-5.1 Inadequate Lateral and Longitudinal Track Stability.

The track at the installation has at best, a surface layer of crushed rock ballast. Most stretches have a low density mix of fine crushed volcanic material and earth filling in the spaces between and around the ties. This material does not provide adequate lateral or longitudinal track support. And as a result, track alignment is generally fair or poor, and many ties have shifted position and become skewed (not perpendicular to the rails).

To both restore and keep proper track line and surface and maintain proper tie position, a sufficient amount of good quality ballast material must be added to the track. In addition, anchors must be correctly re-applied and added where needed. Remedial Actions 2, 6, 8, 9, 12, and 13 (as listed in Table C-2) are designed to establish adequate lateral and longitudinal track stability.

C-5.2 Deteriorated Track Through Road Crossings.

About 25 percent of the asphalt crossings are in poor condition, and likewise, so is the track in them; ties have deteriorated, track support is mushy, and joints have loosened - in some cases allowing track gage to widen to an unsafe distance. Remedial Action 5 includes complete crossing/track rebuild, as required.

C-5.3 Turnout Defects.

The portion of the track covered by this rehabilitation plan includes 48 turnouts. Many of these are difficult to operate, out of adjustment, and have loose or defective parts. Remedial Action 9, Restore Turnouts, includes allowances for general turnout rehabilitation.

C-5.4 Washouts under the Track.

Heavy rain runoff occasionally washes out ballast and subgrade beneath the track in three areas along the Main Line. Nine small washes have occurred in the last 3 years in the Main Line between Sta. 162+80 and 169+70. One small washout occurred near Sta. 253+40, and a deeper washout just past that point. This is one area in which further study will be required to determine the most cost effective way to either eliminate the probability of future washouts, or at least minimize possible track damage. Remedial Action 2 includes a general plan for correcting drainage problems at these washout areas.

C-5.5 Skewed Ties.

Some areas of the Main Line (mostly between stations 200+00 and 250+00) have skewed (crooked), bunched, and misspaced ties. This situation is caused by the following:

- Low density ballast that cannot resist tie movement.
- Cribs (space between the ties) not fully filled with ballast, further reducing resistance to tie movement.
- Anchors not replaced after tie installation or applied to only one rail (one side of the tie).
- Track on grades. Portions of the track are on grades steep enough to encourage longitudinal rail movement, and thus also, tie movement.
- Spikes driven in the slots in angle bar type joint bars. This is no longer considered good practice. As joints are usually staggered, rarely does a tie ever have a joint on both rails. Driving spikes into the joint bar base slots will then have the same effect as anchoring only one side of a tie.
- Ties with incorrect spiking pattern, present in some of the older ties. While this incorrect pattern does not actually cause tie skewing, it does encourage it.

- Some ties appeared to have been installed crooked.

Remedial Action 7 provides for repositioning skewed and misspaced ties, and Remedial Action 10 will help prevent future tie movement.

C-5.6 Loose or Missing Track Fastenings.

Numerous rail joints have loose or missing bolts, and at least 12 joints noted during the inspection have both bolts in one rail missing. Remedial Action 8 calls for tightening all joints and replacing defective bolts and joint bars.

C-5.7 Vegetation In or Near the Track.

Scattered locations along primary routes and loading sidings have thick brush growing close to the track, and in some cases, in the ballast section. This vegetation must be removed before any track work can be performed. In addition, sufficient herbicide needs to be applied soon after completion of track work to prevent future brush growth. Remedial Actions 1 and 13 cover the removal and future prevention of brush growth.

C-6 RECOMMENDATIONS AND COST ESTIMATES FOR REMEDIAL WORK.

C-6.1 General.

This section presents a general plan for correcting the majority of track deficiencies. The plan is organized as a list of 14 remedial actions, numbered in general work sequence order. The cost estimates for each remedial action are broken down between Phase 1, to be done this year, and Phase 2, to be done next year. Table C-2 shows a cost estimate summary.

Table C-2 Cost Estimate Summary

REMEDIAL ACTION				
No.	**Description**	**PHASE 1**	**PHASE 2**	**TOTAL**
1.	Remove Vegetation	$ 1,200	$2,400	$3,600
2.	Restore Drainage	15,000	35,000	50,000
3.	Rail Defect Inspection	5,000	---	5,000
4.	Replace Defective Rail	13,600	13,600	27,200
5.	Rebuild Crossings	29,950	33,470	63,420
6.	Tie Replacement	140,000	100,000	240,000
7.	Respace Ties	3,250	8,125	11,375
8.	Tighten Bolts/Spikes	18,700	18,700	37,400
9.	Restore Turnouts	19,800	12,150	31,950
10.	Rail Anchors	33,580	25,200	58,780
11.	Unload Ballast	147,640	86,060	233,700
12.	Surface Track	55,200	32,175	87,375
13.	Herbicide Application	3,200	2,600	5,800
14.	On-Site Inspection	12,000	12,000	24,000
	Subtotal	$498,100	$381,500	$879,600
	10% Contingency	49,810	38,150	87,960
	TOTAL	$547,910	$419,650	$967,560

NOTES:

PHASE 1 covers the primary route from connection with the commercial railroad to the end of the East Line, Admin. Area, and Tracks 2-5 of the Classification Yard.

PHASE 2 covers the remainder of the Main Line (East Jct. to End), West Line, and North Line.

Phase 1 and Phase 2 include the following trackage:

a. Phase 1: Main Line from connection with the commercial railroad (Sta. 0+00) to East Junction (Sta. 119+81).
    - Track Y1 and Classification Yard tracks 2 – 5.
    - Administration Area tracks A1 – A8.
    - East Line and sidings from Origin (Sta. 0+00) to End (Sta. 120+56).

b. Phase 2: Main Line and sidings from East Junction (Sta. 119+81) to End (Sta. 263+97), and track Y2.

- West Line and sidings from Origin (Sta. 0+00) to End (Sta. 75+06).
- North Line and sidings from Origin (Sta. 0+00) to End (Sta. 47+96).

The work plan and estimates are for restoration of the majority of the railroad network. However, not all remedial actions are intended to be carried out on all trackage. Within the description of each remedial action, the intended work limits are listed, where appropriate.

Generally not included in the work plan are Classification Yard tracks 6-14 (the far west tracks), tracks X1 through X5, Administration Area track A9 (to the old coal/gravel chute), and track P5 (at the end of the West Line). These tracks, while required for mobilization, are not in regular use.

C-6.2 Remedial Actions.

A cost estimate summary of the remedial actions is shown in Table C-2.

C-6.2.1 Remove Vegetation.

The first step to ensure that the track is fully accessible for other track work and that large amounts of vegetation will not be buried in the track during ballast unloading is vegetation removal. Use a plow and brooms of a ballast regulator, supplemented by laborers with brush cutters to remove vegetation.

Phase	Mileage	$ Estimate
1	1.2	1,200
2	2.4	2,400
Total	3.6 mi	$3,600

Note: Unit Cost = $1,000/Mile

C-6.2.2 Restore Drainage.

It is essential that proper drainage be provided and maintained to prevent roadbed deterioration and track washouts. While drainage of the track network is mostly satisfactory, some general maintenance is needed, with a few areas that require serious attention. This section provides a rough allowance for the following drainage work:

- Excavator, dump trucks, backhoe, and laborers reshaping ditches and cleaning culverts.

- Grading in the Administration Area to keep water from standing within the roadbed.
- Installation of culverts and related earthwork in washout areas on the Main Line.

Due to the nature of the drainage in the Administration Area and in the washout areas, it is not practical to implement a solution that will entirely correct the problems. A plan that greatly improves the situation is recommended.

Especially after heavy rains (such as were experienced last summer), water stands in the track in the Administration Area. Apparently, a drainage system was never installed here, and providing one now is quite expensive.

It is recommended that consideration be given to at least providing some grading so that water will tend to flow away from the track into adjacent lowered areas. While this solution will not eliminate the standing water in this area, it could at least prevent it from standing in the track, where it would do the most damage.

In selected areas along the Main Line, especially between Sta. 162+80 and 169+70, ballast and subgrade have been washed out from beneath the track on several occasions. These areas are located in the natural drainage path of heavy rain runoff. While preventing all runoff from reaching the track is not be affordable, it is recommended that remedial work be considered that will at least prevent the water that does reach the track from causing any roadbed damage. Such work might include:

- Install a culvert, perhaps double pipe, beneath the track, at the center of the washout area. Grade adjacent area to channel water through the culvert. Place large rock near the culvert approach to prevent erosion.
- Construct an interceptor berm, or other obstacle, in the drainage path to break the force of a heavy runoff.
- Increase the ballast shoulder in the washout areas to 12 in. This provides additional resistance against damage by water that does reach the track.

Accomplish any drainage work that directly disturbs the track before track work begins.

Phase	$ Estimate
1	15,000
2	35,000
Total	$50,000

C-6.2.3 Internal Rail Defect Inspection.

Since no record of internal rail defect inspection exists, and all rail was manufactured before the use of controlled cooling (1933), an inspection for the presence of internal rail defects should be made over the entire railroad network.

Phase	Mileage	$ Estimate
1	17	5,000
2	---	---
Total	17 mi	$5,000

Note: Rail defect testing is priced per day plus travel costs, rather than by mileage. Phase 1 includes inspection of all track in the rehabilitation plan. In addition to cost effectiveness, inspection of all rail as soon as practical will permit an accurate determination of the quantity of rail that requires replacement.

C-6.2.4 Replace Defective Rail.

This estimate is an allowance for replacing the defective rails that may be found during an internal defect inspection.

Phase	Number of Rails	$ Estimate
1	34	13,600
2	34	13,600
Total	68	$27,200

Note: Unit Cost = $400/rail. Estimate based on 33-ft sections of 90 lb. rail, and allowance of four defective rails/mile.

C-6.2.5 Rebuild Road Crossings.

In road crossings that require replacement, the track often needs to be completely rebuilt. In addition, conventional rail joints are often replaced with welded joints to eliminate the need for future joint maintenance (which usually requires tearing out at least part of the crossing surface). Welding joints in a crossing is especially recommended in areas with heavy truck traffic and in crossings in main running tracks.

The rebuilding of crossings can start any time before the ballast and surfacing operations. These estimates cover crossing replacements, as listed in Table C-3. Three types are specified: complete track rebuild with timber/asphalt surface, timber/asphalt surface replacement, and timber/gravel surface replacement.

Table C-3 Road Crossing Repair/Rebuilding

Phase	Centerline Line	Crossing Location	Rebuild Length (ft)	Type
1	Main	24+53	24	CA
		77+55	42	CA
		113+65	87	CA
	East	10+94	33	A
		46+46	31	A
		65+81	30	CA
2	Main	173+20	25	A
		193+31	22	A
		204+20	15	G
		258+09	30	A
	West	4+45	18	G
		37+56	21	A
		45+49	19	A
	North	5+75	85	CA
		35+63	30	A
		44+95	67	CA

SUMMARY Phase	Rebuild Type	Number of Xings	Footage	Number of Welds
1	CA	4	183	7
A		2	64	4
2	CA	2	152	8
A		6	126	11
G		2	33	2

Rebuild Type Key

CA – Timber/Asphalt crossing surface with complete track rebuild.

A – Timber/Asphalt crossing surface replacement.

G – Timber/Gravel crossing surface replacement.

The timber portion of the crossing surface refers to timber head boards installed along the gage side (or both sides) of the of the rail. Timber head boards help keep the flangeways clear, reduce intrusion of road material into the track, and lessen the lateral rail impact from vehicle traffic.

Phase	$ Estimate
1	29,950
2	33,470
Total	$63,420

Note: The following are the unit costs used for crossing work:
Timber/Asphalt crossing with complete track rebuild, $125/foot.
Timber/Asphalt crossing surface replacement, $50/foot.
Timber/Gravel crossing surface replacement, $25/foot.
Joint welds, $350 each.

C-6.2.6 Tie Replacement.

This estimate provides for ties primarily in the areas that were not covered in the previous tie replacement program. Generally, the limits are the same as specified for ballast and surfacing. The number of ties estimated is intended to allow the installation track to maintain sufficient tie condition for 5 more years before another tie program is required. (Although during the next 5 years, some spot tie replacement will probably be needed).

Included in the estimate for each phase is an allowance for 400 ties in the loading tracks (and the containerization terminal on the East Line to be done in Phase 1) and for 100 ties that drop during surfacing and are in too poor a condition to be re-spiked.

Exact tie counts should be made when preparing the final plans.

Phase	Number of Rails	$ Estimate
1	3500	140,000
2	2500	100,000
Total	6000	$240,000

Note: Unit Cost = $40/tie.

The tie spacing at the installation averages 20 in., which equals 3,168 ties/mi.

C-6.2.7 Respace Ties.

During this remedial action, properly reposition all skewed and misspaced ties. This work also includes raising ties that dropped during the track raise and replacing occasional defective ties that cannot be re-spiked.

This estimate covers labor and machine costs for tie respacing.

Phase	Mileage	$ Estimate
1	2.5	3,250
2	6.25	8,125
Total	8.75 mi	$11,375

Note: Unit Cost = $1300/mi.

For Phase 2, tie respacing not required on Main Line from Sta. 154+00 to Sta. 200+00. This work is also only needed over approximately half of the North Line.

C-6.2.8 Tighten and Replace Track Bolts/Drive High Spikes.

Due to numerous loose rail joints, use a bolt tightening machine to tighten all track bolts. During this operation, replace all defective bolts and joint bars. Along with bolt tightening, drive down all high spikes and replace all defective spikes. This will minimize the number of ties that drop down when the track is raised during surfacing.

However, it is not recommended to either pull any spikes driven in the slots of angle bar type joint bars, or pull or add any spikes in ties with an incorrect spiking pattern. The combination of tie straightening/respacing, additional ballast, and application of rail anchors included in this rehabilitation plan will prevent future tie movement due to incorrect spiking. Further, there would be significant potential for long term tie damage due to pulling spikes (even if old holes are plugged).

Both operations (for bolts and spikes) should be performed prior to any ballast unloading or surfacing.

Phase	Mileage	$ Estimate
1	8.5	18,700
2	8.5	18,700
Total	17.0 mi	$37,400

Note: Unit Cost estimate of $2,200/Mile based on:

1. Bolt tightening, $1,500/mi.
2. Allowance for extra bolts, $2.50 each, 120 per mi, or $300/mi.
3. Allowance for extra spikes and miscellaneous work, spikes @ $1.00 each, total allowance @ $400/mi.

C-6.2.9 Restore Turnouts.

Table C-4 provides a detailed listing of turnouts included in Phases 1 and 2, along with a rough approximation of switch tie requirements and switch point replacements. (Determine exact requirements for inclusion in contract work statement).

Phase	Number of Turnouts	$ Estimate
1	10	19,800
2	12	12,150
Total	22	$31,950

Notes:

1. Unit Cost varies with work required. Estimates based on:

   a. $1050/turnout for surfacing, miscellaneous parts, and cleaning and adjustment.

   b. $50/switch tie, installed.

2. Estimate allows for 74 switch ties in Phase 1 and 126 in Phase 2. (See Table C-4).

3. Estimate allows for seven switch points to be replaced in Phase 1 and 6 in Phase 2. Cost per point (installed) is estimated to be about $800 for a 16 ft, 6-in. point.

Table C-4 Turnout Rehabilitation

Phase	Line	I.D. Number	Location	Direction	Switch Tie Requirement	(1) Point Replacement
1	MAIN	M03	24+67	RIGHT	8	L R
		M04	39+88	LEFT	--	R
		M05	40+21	LEFT	--	L R
		M07	44+84	LEFT	12	--
	EAST	E03	3+64	LEFT	10	--
		E04	14+49	LEFT	8	--
		E08	36+15	RIGHT	20	--
		E10	42+77	LEFT	8	--
		E12	49+60	RIGHT	8	--
		E17	117+95	LEFT	--	L R
					74	7
2	MAIN	M13	134+51	RIGHT	15	--
		M15	155+02	LEFT	5	--
		M16	162+11	LEFT	5	--
		M17	170+55	RIGHT	9	L R
	WEST	W09	69+23	RIGHT	8	L
		W11	70+89	LEFT	8	--
		W12	71+54	RIGHT	8	R
	NORTH	NO1	8+78	RIGHT	12	--
		NO4	23+03	LEFT	22	L
		NO5	25+80	RIGHT	11	L
		NO6 (1)	32+47	LEFT	9	--
		NO7 (2)	32+87	RIGHT	14	--
Notes:					126	6

L = Left Point, R = Right Point

1. One switch rod missing
2. Cracked frog

C-6.2.10 Apply Rail Anchors.

After new ties have been installed and skewed and misspaced ties properly repositioned, apply rail anchors.

This estimate calls for every fifth tie to be box anchored (have four anchors applied), with anchoring of primary routes only (no sidings). See Notes 2 and 3 below for intended anchoring limits.

Phase	Mileage	$ Estimate
1	4.77	33,580
2	3.58	25,200
Total	8.35 mi	$58,780

Notes:

1. Unit Cost estimate of $7,040/Mile, based on:
   a. Purchase cost of $2.00/anchor.
   b. Installation cost of $1.25/anchor.
   c. 2,560 anchors/mi.
   d. Assumption that 25 percent of required anchors can be salvaged from existing material.
2. For Phase 1, anchors are to be applied along the Main Line from Railroad connection (Sta. 0+00) to East Junction (Sta. 119+81); East Line from Origin (Sta. 0+00) to End (Sta. 120+56); and along Y1.
3. For Phase 2, anchors are to be applied along the Main Line from East Junction (Sta. 119+81) through Sta. 194+00; West Line from Origin (Sta. 0+00) through Sta. 70+89; and North Line from Origin (Sta. 0+00) through Sta. 43+63.
4. Recommended anchoring near the two open deck bridges (M 19+13 and W 40+00) is: no anchors on the bridge; box anchor every third tie for two rail lengths (about 66 ft) off either end of the bridge.

C-6.2.11 Unload Ballast.

Once the track is clear of excess vegetation, all bolts in place and tight, high spikes driven, and track in crossings rebuilt, the track is ready for new ballast to be applied. Ballast and surfacing locations are shown in Table C-5.

This estimate is for sufficient ballast to give the track a 3-in. raise, fill in shoulders and cribs, and pull up any track sags. It includes the costs of purchasing the ballast material, delivery to the work site, and distribution along the track.

Table C-5 Ballast and Surfacing Locations

Location	Footage
PHASE 1	
Main	
3+87 (S. end Rt. 40 Xing) to 19+13 (N. end bridge)	1,526
24+65 (S. end new Xing) to 45+50 (N. end scale track)	2,085
47+51 (S. end scale track) to 119+81 (East Junction)	7,230
	10,841
East	
0+00 (East Junction) to 120+56 (End)	12,056
Sidings (except X3, X4)	6,586
	18,642
Yard	
Tracks 2-5	5,823
Admin	
Track A1 - up to 5+61 (Building 9)	561
Track A5 - up to 14+40 (to engine house)	1,440
Track A6 - up to 9+52 (End)	952
Track A8 - up to 6+00 (to scrap bin)	600
	3,553
Total Phase 1 Footage (7.36 mi.)	38,859
PHASE 2	
Main	
119+81 (East Junction) to 194+01	7,420
257+79 to 263+97 (End)	618
	8,038
West	
0+00 to 75+06 (End)	7,506
North	
0+00 to 48+73	4,873
Tracks SA-SE	2,237
	7,110
Total Phase 2 Footage (4.29 mi.) 22,654	

The mileages indicated correspond to the surfacing footages, as shown in Table C-5.

Phase	Quantity (tons)	Mileage	$ Estimate
1	10,100	7.36	147,600
2	5,900	4.29	86,060
Total	16,000	11.65 mi	$233,700

Notes:

1. Unit Cost estimate of $20,060/mile based on:

   a. Ballast quantity of 0.2 cu yd per track ft (1,056 cu yd/mi.) @ $10.00/cu yd. delivered to site, or

   b. Unloading operation @ $9,500/mile.

2. Locations for ballast unloading are the same as for surfacing (Remedial Action 12).
3. 1 cubic yard of ballast weighs approximately 1.3 tons. 4) Ballast needed for rebuilding track in crossings is included in the estimate for rebuilding road crossings.
4. Estimate includes AREMA standard 15 percent allowance for ballast waste and loss.

C-6.2.12 Surface Track/Reshape Ballast Section.

The main surfacing and tamping operation includes:

- Lifting the track 3 in.
- Restoring proper track line and surface.
- Reshaping the ballast section.

The limits for this work are as shown in Table C-5.

During the final design process, check the sidings serving the loading docks and magazine standards to ensure that there is proper horizontal and vertical clearance between the track and the loading platform. Make any required corrections during track surfacing.

Phase	Mileage	$ Estimate
1	7.36	55,200
2	4.29	32,175
Total	11.65 mi	$87,375

Notes:

1. The Unit Cost estimate for surfacing is $10,560/Mile. Included in the cost is the following work:
   a. Raising the track 3 in.
   b. Plowing new ballast back into the track to fill in up to the tops of the ties.
   c. Reshaping the ballast section.
   d. Sweeping the track.

For Phase 1, estimate assumes no track raise through the track scale, and also assumes that track will be raised to level of existing crossings in the sidings along the East Line (Buildings A - F).

For Phase 2, provide a 12-in. shoulder in the track washout areas along the Main Line.

C-6.2.13 Herbicide Application.

Once the track work is complete, treat all track to prevent the growth of weeds in the ballast section.

While vegetation spraying at least once per year is recommended, this estimate is for one initial heavy application over a 16-ft wide path (8 ft from the center line of track on both sides).

Phase	Mileage	$ Estimate
1	10.7	3,200
2	8.5	2,600
Total	19.2 mi	$5,800

Note: Contract herbicide application is priced per day. As a rough estimate, a unit cost of $300/mi was used.

Phase 1 to include all Classification Yard tracks.

C-6.2.14 Quality Control Inspection.

Although listed last, quality control inspection is an essential element for a successful track rehabilitation. It is an effective means of assuring that all work reflects good workmanship and is performed according to the contract specifications.

Phase	$ Estimate
1	29,950
2	33,470
Total	$63,420

Note: Inspection cost estimate based on $35/Hour basic labor and overhead charge, or $280/Day, and $100/Day subsistence expenses. Total = $380/Day.

Allowance for travel to and from site of one round trip/week = $500.

Total Inspection Cost/Week = $2,400.

Phase 1 and 2 estimated to require 5 weeks each of on-site inspection.

C-7 CONCLUSIONS AND RECOMMENDATIONS.

Proper track restoration will involve remedial work that requires special attention. It is essential that this work be done by skilled workers, with knowledgeable and attentive supervision.

As indicated in the report, there are still some areas that need further examination before detailed contract specifications can be made, particularly in the improvement of drainage in areas where track washouts have occurred. Include these additional determinations as part of the final design process.

If the design work is to be contracted to an outside organization, it is recommended that a single design/inspection package be considered. Having the track work designed and inspected by the same organization has great potential for improved quality control and accountability throughout the project.

To further clarify the work plan and contract specifications, mark the work requirements (by type and location) in the field, whenever practical. This might include: marking with paint those switch ties that need replacement, setting flags or stakes to indicate the limits where extra shoulder ballast is required, painting a code at each road crossing to indicate which type of reconstruction is to be done, and noting any other indicators that help guide the field work.

Change No.	**Date**	**Location**

_____

This UFC supersedes the TM 5-628/AFR 91-44 dated 1 April 1991, Navy draft MO 103.9 dated 2001, and UFC 4-860-03FA Railroad Track Standards dated 16 January 2004.

FOREWORD

The Unified Facilities Criteria (UFC) system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and applies to the Military Departments, the Defense Agencies, and the DoD Field Activities in accordance with USD(AT&L) Memorandum dated 29 May 2002. UFC will be used for all DoD projects and work for other customers where appropriate. All construction outside of the United States is also governed by Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA), and in some instances, Bilateral Infrastructure Agreements (BIA). Therefore, the acquisition team must ensure compliance with the more stringent of the UFC, the SOFA, the HNFA, and the BIA, as applicable.

UFC are living documents and will be periodically reviewed, updated, and made available to users as part of the Services' responsibility for providing technical criteria for military construction. Headquarters, U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering Command (NAVFAC), and Air Force Civil Engineer Support Agency (AFCESA) are responsible for administration of the UFC system. Defense agencies should contact the preparing service for document interpretation and improvements. Technical content of UFC is the responsibility of the cognizant DoD working group. Recommended changes with supporting rationale should be sent to the respective service proponent office by the following electronic form: Criteria Change Request (CCR). The form is also accessible from the Internet sites listed below.

UFC are effective upon issuance and are distributed only in electronic media from the following source:

- Whole Building Design Guide web site http://dod.wbdg.org/.

Hard copies of UFC printed from electronic media should be checked against the current electronic version prior to use to ensure that they are current.

UNIFIED FACILITIES CRITERIA (UFC)
REVISION SUMMARY SHEET

Description of Changes: UFC 4-860-03 unifies the Army/Air Force Handbook of Railroad Track Standards with the Navy's Railroad Trackage Field Assessment Manual the into one Department of Defense UFC manual.

Reasons for Changes:

- Consolidation of DOD railroad track standards into one single document.

- Consolidation of both railroad track maintenance standards and safety standards into a singular technical manual.

Impact: Inspection frequencies remain unchanged and the quality of track required remains nearly the same. These factors reflect a negligible cost impact as a result of the required track maintenance activities. However, the following benefits should be realized:

- Improvement in installation personnel's ability to determine the level of effort required for each track inspection.

- DOD Inspections that will be more consistent with the Federal Railway Administration (FRA) safety standards used for commercial trackage.
- Proper and expanded use of new technology and materials, such as new types of ties that have gained industry acceptance.

- Improvement of railroad track inspections and overall railroad management due to the much greater use of table formats for clarity and understanding.

- Improved inspections since the UFC now differentiates between railroad maintenance requirements and the very minimal FRA safety standards.

CHAPTER 1

INTENT AND APPLICATION

1-1. INTRODUCTION.

a. The Department of Defense's (DOD) railroad system is a critical asset for both peacetime and mobilization missions.

b. The standards in this UFC are presented to protect investments in track maintenance and rehabilitation and to ensure that DOD's railroad track is maintained at the level needed to support mission requirements. The standards in this UFC provide maintenance standards for each possible type of deficiency addressed in the Federal Railroad Administration (FRA) *Track Safety Standards*. DOD policy is to maintain its railroad track at a standard that exceeds FRA Class 2 safety standards and adhere to additional DOD speed restrictions as stated in this UFC. The following standards specifically identify separate thresholds for safety standards and maintenance standards. If a standard is not specifically listed as a safety standard, it shall be used as a maintenance standard. For Navy installations, NAVFAC Instruction (NAVFACINST) 11230.1, *Inspection, Certification, and Audit of Crane and Railroad Trackage*, shall also be used based on category of track and amount of use.

c. Simply meeting the minimum standard required in this UFC is not necessarily the best, most cost-effective, long-term maintenance policy. The frequent occurrence of substandard or restricted conditions indicates the need for a comprehensive track evaluation to determine if major repair or rehabilitation is warranted.

1-2. DEFINITIONS.

The following standards are discussed in this UFC:

a. ***Safety Standards.*** Based on the degree of hazard, these standards provide minimum safe operating limits for specific defects. FRA and DOD safety standards are addressed in Appendix F for comparison with maintenance standards. When established safety limits are exceeded, speed restrictions or “No Operation” shall be applied and enforced.

b. ***Maintenance Standards.*** These standards provide limits for specific defects and should be used to determine when maintenance is desirable and should be accomplished. This allows for maintenance or repair before the condition exceeding safety standards develops. Each installation shall develop a maintenance policy for additional defects not addressed in this UFC.

1-3. REFERENCES.

Appendix A contains a list of references used in this UFC.

1-4. INTENT.

a. These standards define the minimum required maintenance condition levels for railroad track. These standards shall be used for inspection and routine maintenance of railroad track by in-house or contract personnel.

b. These standards are not intended for, and shall not be used as specifications for, new construction or major track rehabilitation. The guidance given for Navy projects in UFC 4-860-02N, *Design: Trackage*, and for Army and Air Force projects in UFC 4-860-01FA, *Design: Railroad Design and Rehabilitation*, with Unified Facilities Guide Specification (UFGS) 05650, *Railroad Track and Accessories*, and/or host nation industry/government

standards will continue to apply to new construction and the complete reconstruction of segments of existing facilities.

c. Should the commercial carrier serving the installation require a more restrictive FRA standard or criteria not included in these standards, the installation track shall be maintained to meet the carrier's requirements.

d. The judgment of the designated track inspector and the criteria presented in this UFC must supplement each other in the application of these standards.

1-5. TRACK CATEGORIES. All railroad track shall be maintained in accordance with one of the following categories:

Category	Types of Track and Use	Minimum FRA Class of Track Safety Standard
A	All active mainline track, or other active track with speed greater than 10 mph	2
B	Active passing track, sidings, yard tracks, holding track, classification yard or storage track	2
C	Inactive track; no current mobilization requirements	0

1-6. APPLICATION.

a. ***Requirements versus Recommendations.*** In this UFC, the words “shall” and “is required” indicate requirements of the standards that must be met as prescribed by NAVFACINST 11230.1 for the Navy or AR 420-72 for the Army. Recommendations are indicated by the words “may,” “should,” and “it is recommended that….” These recommendations represent good maintenance practice. **DOD policy is to maintain the railroad track at full compliance with these maintenance standards and to restrict operations on any track below the safety standards.**

b. ***Condition Levels*.** These standards establish four levels of track condition. These condition levels indicate relative seriousness of defects, allow comparison of different types of defects, and provide a means for prioritizing repair work. The three track condition levels are as follows:

(1) *Full Compliance:* Track that meets all the requirements of the standards. Track at this level has, at most, only minor defects and should be fully capable of handling all train operations within the operating rules of the installation. Routine maintenance is required to maintain this condition level, and repair work will generally be only minor.

(2) *Restricted Operation:* Track has defects serious enough to make it unsuitable for operations greater than 10 mph, essentially “normal yard speed.” Based on the inspector’s judgment, track which has defects serious enough to make it unsuitable for operations at 10 mph may be reduced to 5 mph. Essentially, a train may be allowed to “crawl” over the track. This level is intended as a warning zone to indicate that the track is approaching a condition that will require removal from service.

(3) *No Operation:* Track has defects serious enough to require removal from service. At this level, the operation of trains over the track is generally considered hazardous. Operations shall not be allowed except as noted in paragraph 1-6.c.(5).

c. ***Operating Restrictions.***

(1) These standards establish minimum required condition levels and also identify track conditions requiring restriction or suspension of train operations. It is intended that a track inspector apply the required restriction or suspension immediately upon discovery of the substandard condition, and that the track be repaired to meet the appropriate condition level as soon as practical. A track restriction shall require the operational speed to be less than posted speed, but not more than 10 mph.

(2) *Notification of Track Restriction.*

(a) Army Track. The certified track inspector shall notify both the train operating personnel first and the director of public works (DPW) immediately upon the discovery of any condition that would warrant any restriction below normal operating practices. The DPW shall notify the installation transportation officer (ITO) verbally and in writing of any condition requiring train operations to be restricted or suspended.

(b) Air Force Track. The track inspector shall notify both the train operating personnel and the base civil engineer (BCE) immediately upon the discovery of any condition that would warrant any restriction below normal operating practices. The BCE shall notify the base traffic management officer (TMO) verbally and in writing of any condition requiring train operations to be restricted or suspended.

(c) Navy Track. The track inspector shall notify both the train operating personnel and the trackage certifying official immediately upon the discovery of any condition that would warrant a restriction beyond normal operating practices or a suspension in operations. Documentation and notification of restricted or non-certification of track shall be performed by the certifying official in accordance with NAVFACINST 11230.1.

(3) *Operations over Restricted Track.* For locations where operating restrictions have been imposed, the speed of the train or other on-track vehicles shall be reduced to the required level before the first wheel reaches the defective area and not increased until the last wheel has passed the defective area.

(4) *Removal of Track Restriction.* A track restriction may be removed after all defects resulting in the restriction have been repaired.

(a) Army Track. The certified track inspector shall notify the DPW upon completion of the repairs. The DPW shall notify the ITO in writing that the restrictions have been lifted.

(b) Air Force Track. The restriction shall not be considered removed until the TMO receives written notification of removal from the BCE.

(c) Navy Track. The trackage certifying official shall recertify the trackage repaired to the level allowed by repairs made. Certification and notification will be in accordance with NAVFACINST 11230.1.

(5) *Track Removed From Service.* Any portion of track where conditions fall below the minimum operable track condition (track condition is at the “No Operation” level) shall be closed to operations until repairs are completed. However, such track may be used under written permit from the track management authority and in the presence of a track inspector. During operations over the closed portion of track, the track inspector shall have visual contact with the train operator at all times and be prepared to signal the train crew to stop. For Navy track, movement of hazardous materials over track removed from service will be in accordance with NAVFACINST 11230.1.

d. Judgment of the track inspector shall govern. A track inspector shall have the authority to impose operating restrictions beyond the minimum required in these standards when conditions warrant.

e. Defective conditions or combinations of conditions may be found which are not directly addressed in these standards. In such cases, a track inspector shall exercise judgment in applying an appropriate operating restriction.

CHAPTER 2

INSPECTION OF TRACK AND RECORD KEEPING

2-1. TRACK INSPECTORS' QUALIFICATIONS. Track inspectors are responsible for conducting safety inspections (paragraph 2-3.c) and detailed track inspections (paragraph 2-3.).

a. ***Army.*** For Army track, the individual who completes the required track inspections shall be a certified track inspector as specified in AR 420-72.

b. ***Air Force.*** For Air Force track, the individual who completes the required track inspections shall be qualified to perform such inspections as designated by the BCE.

c. ***Navy.*** The individual who completes the required track inspections shall meet the requirements of NAVFACINST 11230.1 and be designated by the activity's certifying official.

2-2. RESPONSIBILITY OF THE TRACK INSPECTORS.

a. The designated track inspector is responsible for:

(1) Assuring that inspections are performed in accordance with this chapter and for Navy installations the additional requirements of NAVFACINST 11230.1.

(2) Examining the track to determine whether the track condition complies with the safety requirements and the maintenance standard requirements addressed in this UFC.

(3) Reporting any deficiencies from the full compliance condition level.

2-3. CATEGORIES OF INSPECTIONS.

a. ***Continuous Operator Inspection.*** Safety checks shall be conducted daily or before use. In addition, on-the-job observations shall be going on at all times when equipment is working. Railroad operations personnel shall be encouraged to observe and report track problems, deficiencies, obstructions and the "feel" of the track. Items to be aware of are broken rails and other rail defects, faulty switch point closure, indication of wide gage, poor alignment or surface (profile), loose crossing planks, wheel flanges hitting frog points and joint bars, working spikes and loose joints, rail pull-a-parts, evidence of imminent track buckling, blocked drainage, scour at bridges, and the threat of slides. All these things can contribute to train derailments and should be brought to the attention of the responsible person for correction.

b. ***Preventive Maintenance Inspection.*** Preventive maintenance is a continuous working inspection, examination of component parts, lubrication, adjustment, and minor repair. If not affecting the full compliance level, maintenance defects shall be corrected during the next maintenance cycle.

(1) *Navy Installations Only.* Further discussion of requirements and instructions on performing preventive maintenance are provided in NAVFACINST 11230.1.

c. ***Safety Inspection***. Safety inspection is that inspection of track performed in accordance with paragraphs 213.233, 213.235 and 213.239 of the FRA Track Safety Standards (see Appendix E) and this UFC. The purpose of this inspection is to identify defects that require restricted operations or no operations on the track being inspected.

(1) *Schedule.* As a minimum, track shall be inspected at the following interval:

Track Category	Traffic Frequency	Minimum Required Inspection Frequency
A	Mainline Track – Off-station Navy only*	Weekly
A & B	Two or more movements per week	Monthly
A & B	Greater than one movement per month but less than two movements per week	Quarterly
A & B	One movement or less per month	Semi-annual
C	No movements or inactive	Annual detailed inspection only (See Chapter 15)

***For Navy installation only**: Off-station track is defined as that track belonging to the Navy that extends outside the main station through residential and/or commercial public areas.

(2) *Inspection Method.* Track inspections shall be made on foot or in an on-track vehicle at a speed which is conducive to effective track inspection, but in no case to exceed 5 mph. Turnouts, rail crossings, and bridges shall be inspected on foot.

(3) *Inspection Records.* The inspector shall complete and sign the Track Inspection Record on the day the inspection is made. Inspection records must specify the track inspected, date of inspection, location and nature of any deviation from the requirements, proposed corrective action, and the remedial action taken. Inspection reports which document deficiencies resulting in a track falling below its designated condition level shall be kept on file until all deficiencies have been corrected. As a minimum, inspection records shall be retained for at least one year after the inspection covered by the report. An example record is provided in Figure B-1. A reproducible master of the Track Inspection Record is provided in NAVFACINST 11230.1 or in Appendix B as used in the RAILER software.

d. *Detailed Track Inspection.* A detailed inspection shall be made to support sustainment, restoration and maintenance (SRM). Detailed inspections are conducted annually. Detailed inspections will be supported by engineering evaluations when there is any doubt of physical condition. The Track Inspection Record discussed in paragraph 2-3.c.(3) should be used to document detailed inspections. The purpose of the detailed inspection is to identify all track defects including those exceeding maintenance standards provided in this UFC. Results of this inspection will not only be used to establish urgent repairs, but by using the inspection reports and relating them to the activity's basic trackage requirements, its in-house capabilities, priorities, available funding, and other factors, the annual and long-range trackage maintenance and repair programs are developed and programmed.

e. *Electric/Electromechanical Grade Crossing Signals.* The inspection and testing of electric/ electromechanical signals at road–railroad grade crossings shall be performed at the frequency specified in paragraph 10-6.b and documented in accordance with paragraph 10-6.c.

f. ***Internal Rail Defect Inspection.*** Internal rail defect inspection shall be performed on class A and B railroad tracks at five-year intervals as specified in paragraph 7-2.b.

g. ***Special Safety Inspections.***

(1) *Infrequently Used Track.* Track that has not been used for a period of six months or more shall be inspected prior to the first movement over the track.

(2) *Mass Rail Movement.* For track that has not been inspected within the last two months, a track inspection is recommended before any mass rail movement (15 cars or more).

(3) *Unusual Occurrences.* Track inspections shall be conducted following unusual occurrences such as derailment, accident, flood, fire, earthquake, severe storm, or other occurrence that could have an adverse effect on the track structure. These inspections shall be conducted before the first movement over the track following the unusual occurrence.

2-4. INSPECTION OF PARTIALLY VISIBLE TRACK.

a. At locations where vegetation, dirt, debris, or other undesirable materials cover the ties and/or rail preventing effective track inspection, the undesirable material shall be removed and a thorough track inspection performed. Train operation shall not exceed 10 mph until the undesirable materials are removed and a thorough track safety inspection is performed.

b. At locations where ballast or other material is installed to meet operational requirements, sufficient material shall be removed to spot-check trackage.

c. ***Paved Areas.***

(1) In road crossings and other paved areas where complete inspection of the track is not possible, the track inspector must be alert for external signs of track deterioration. External signs indicating track deterioration are:

(a) Changes in gage and/or crosslevel.

(b) Settlement of the rails (changes in track profile).

(c) Excessive vertical or lateral movement of the rails as a train passes.

(d) Deterioration (cracking or breaking up) of the pavement in the vicinity of the track.

(2) Based on indication of defects with consideration taken for age and usage, activities shall establish a program to spot-check trackage encased in pavement.

(3) *Operating Restrictions for Track in Pavement.* When external signs of track deterioration develop, particular attention should be given to the track geometry measurements through the paved area. Track geometry measurements—combined with visual indications of lateral and vertical movement and the requirements for road crossing flangeways—shall be used to assign operating restrictions for the track through the paved area.

2-5. TRACK MAPS AND TRACK SCHEMATICS.

Track maps are essential in identifying and locating the components of the track network. Installations shall maintain a complete, accurate, and up-to-date set of track maps for use by maintenance and engineering personnel.

a. ***Track Charts.*** As described in the documents below, track charts may be used to supplement track maps.

(1) Army/Air Force: TM 5-627/AFM 91-33, *Maintenance of Trackage*.

(2) Navy: MO-103, *Maintenance of Trackage*, and NAVFACINST 11230.1.

b*. Criteria:*

(1) *Scale.* Track maps should be drawn to a legible scale. The scale should be shown on each page of the map.

(2) *Title.* Track maps should contain a standard title block.

(3) *Legend.* Track maps should contain a legend identifying all symbols used on the track map.

c. *Track Data.* Data presented on track maps should include:

(1) All track, active and inactive.

(2) Track name or identification for each track.

(3) Track category for each track.

(4) Buildings, loading docks, bridges, trestles, culverts, and other structures on or adjacent to the railroad roadway.

(5) Highway and road crossings.

(6) Connections to serving railroads.

(7) Limits of track ownership and maintenance responsibilities.

(8) Installation property lines and railroad right-of-way lines.

(9) Rail weight and section.

(10) Turnout identification number and weight and section.

(11) Degree of curvature for all curves.

(12) Grades and profile information.

(13) Track stationing or mileposts.

d. *Track Schematics.* Non-scaled, condensed track plans describing layout of tracks and turnouts. They are useful in track inspection reporting and record keeping.

CHAPTER 3

ROADWAY

3-1. ROADWAY.

a. ***Inspection.*** The roadway shall be inspected for the following defects:

(1) Ballast/subgrade pumping.

(2) Erosion of embankments and cut slopes.

(3) Embankment sliding or slippage.

(4) Potential slope stability problems.

(5) Settlement at approaches to bridges and road crossings.

(6) Washouts under and adjacent to the track.

If any of these defects are present, remedial action is required within a time frame necessary to prevent damage to the track structure.

b. ***Hazardous Conditions.*** Any condition presenting a hazard to the safe movement of trains shall be corrected before the first movement over that location.

3-2. DRAINAGE.

a. ***General.***

(1) A well-drained roadbed is essential to good track maintenance.

(2) Any attempts to divert water onto the roadway or to obstruct ditches or drainage structures shall be reported immediately to the trackage certifying official.

(3) Drains, ditches, and other open drainage structures shall be protected to prevent hazard to personnel.

b. ***Size and Design.*** Ditches and other drainage structures (culverts, drains, and drop inlets) shall be of sufficient size and construction to handle the expected flow of water.

c. ***Obstructions.*** Ditches and drainage structures shall be maintained to allow the free passage of water. At locations where flow is obstructed or otherwise inadequate, remedial action is required. During construction operations adjacent to the track structure, all ditches and other drainage structures shall be kept unobstructed.

d. ***Inspection.***

(1) Inspection and cleaning of drainage structures and channels shall be performed at least annually, preferably in the fall in anticipation of spring runoffs.

(2) Inspections of ditches and other drainage structures during and after heavy rains are recommended to assure that these structures are adequate to carry the runoff.

(3) Drainage ditches and structures shall be inspected for the presence of:

(a) Brush.

(b) Drift.

(c) Excessive ice and snow.

(d) Other obstructions that may interfere with the flow of water.

If any of these are present, immediate remedial action is required to prevent damage to the roadway and track structure.

(4) Particular attention shall be given to drainage conditions at turnouts, rail crossings, road crossings, bridge ends, and all locations where conditions may restrict adequate drainage.

(5) For obstructed or partially collapsed drainage structures, a safety standard shall be implemented to restrict speeds.

3-3. VEGETATION.

a. Vegetation shall be controlled so that it does not:

(1) Grow within the ballast section or obstruct ballast drainage.

(2) Interfere with adequate visibility (sight distance) at grade crossings.

(3) Obstruct visibility of location markers, switch position indicators, signs, or signals.

(4) Obstruct drainage.

(5) Interfere with the safe operation of trains.

(6) Prevent proper track inspection.

(7) Present a fire hazard to timber structures.

(8) Interfere with personnel walking within 8 feet of the track centerline.

(9) Brush the sides of engine or rolling stock.

b. ***Vegetation Interference.*** At locations where vegetation interferes with the effective inspection of the track or train operations, train operations shall be restricted until the vegetation is removed and a thorough track inspection is performed.

c. ***Vegetation Control.*** Undesirable vegetation growing within the roadway shall be removed by chemical or manual means. Chemical vegetation control shall be accomplished as prescribed in the following manuals:

(1) Army: AR 200-5, *Pest Management Program*, and TM 5-630, *Natural Resources Land Management*.

(2) Air Force: AFI 32-1053, *Pest Management Program*.

(3) Navy: OPNAVINST 6250.4, *Pest Management Program*.

d. ***Desirable Vegetation.*** Vegetation such as crown vetch may be planted and grown on the slopes of cuts and fills and in other locations within the roadway to prevent erosion. The growth of desirable vegetation should be controlled to meet the requirements of paragraph 3-3.a.

CHAPTER 4

BALLAST

4-1. GENERAL. Ballast is a select material placed on the subgrade to:

a. Provide adequate drainage of the track.

b. Restrain the track laterally, longitudinally, and vertically under the dynamic loads imposed by trains and the thermal stresses induced in the rails by changing temperature.

c. Distribute the load of the track and trains to prevent overstressing the subgrade.

4-2. SELECTION CRITERIA.

a. Considerations for selecting materials to be used as ballast include:

(1) Size and gradation.
(2) Shape (angularity).
(3) Weight.
(4) Strength.
(5) Durability.
(6) Cleanliness (no dirt or fines).
(7) Economics.

b. New ballast materials used in the maintenance of track shall meet the requirements specified in the AREMA *Manual For Railway Engineering*, Chapter 1, Part 2.

4-3. MAINTENANCE.

a. The ballast section should be clean, free-draining, and free of vegetation, soil (mud), and other foreign materials.

b. During major maintenance or track rehabilitation, dirty or fouled crushed stone or slag ballast meeting the requirements of paragraph 4-2.b may be cleaned/screened or reconditioned and reused.

c. Ballast materials shall provide a full crib and uniform shoulders, but shall not be allowed to cover or be at a level above the top of the ties. At turnouts, ballast shall not interfere with moveable parts of switches and sufficient clearance shall be maintained around switch rods and connecting rods. See paragraph 8-3.g, “Pocketing Switches.”

CHAPTER 5

TIES

5-1. GENERAL. The functions of a tie are to:

a. Maintain gage.

b. Maintain surface (profile).

c. Maintain alignment.

d. Distribute the load from the rail to the ballast and subgrade.

The inability of a tie to adequately perform any of the above functions constitutes a defective tie.

5-2. WOOD TIES.

a. *Tie Selection, Treatment and Inspection.*

(1) *Tie Selection.* New ties selected for the maintenance of track shall be adequately seasoned and treated and meet the requirements specified in the AREMA *Manual For Railway Engineering*, Chapter 30, Part 1, for 6-inch grade and the preferred 7-inch grade ties. The preferred species for ties are the following hardwoods: red oak, white oak, beech, ash, and hickory ties. Gum ties can also be used if local experience reflects satisfactory service. Where softwoods are used, the southern pine and Douglas fir species are preferred. Southern pine is not recommended for main line track or areas with high humidity. Beech and ash ties can also be used if local experience reflects satisfactory experience.

(2) Treatment. Ties shall be pressure-treated in accordance with the most current version of the American Wood Preserver's Association (AWPA) Standard C6. See UFGS 05650 for tie treatment recommendations.

(3) *Inspection.* It is recommended that all timber ties be inspected by an independent, qualified, professional inspector. Inspections should take place at producing plants where the ties can be inspected in the white (before treatment) and after treatment. Accepted ties are to be branded (stamped) by the inspector responsible for the acceptance.

(4) *Switch Ties & Turnout Ties.* It is recommended that switch ties be mixed oak hardwood.

b. *Installation.* Ties shall be installed perpendicular to the rails and properly tamped and spiked. Ties shall be installed with the top of the tie (or the tie plate) in full contact with the base of the rail and the bottom of the tie near the rail seat in full contact with the ballast.

c. *Identification of Defective Wood Ties.* A wood tie is defective if it is:

(1) Broken through.

(2) Split or otherwise impaired to the extent that it will not hold spikes or other rail fasteners.

(3) So deteriorated that the tie plate can move laterally more than 0.5 inch relative to the crosstie.

(4) Cut by the tie plate more than 2 inches.

(5) Cut by wheel flanges, dragging equipment, fire, etc., to a depth of more than 2 inches within 12 inches of the base of the rail, frog, or load-bearing area.

(6) Rotted, hollow, or generally deteriorated to a point where a substantial amount of the material is decayed or missing.

(7) Ties that are “end-broken.” End-broken ties often can be broken beneath the base plate and the defect is not noticeable except for a small rise in the end of the tie, from a plane of the center portion.
These defects are shown in Figure 5-1.

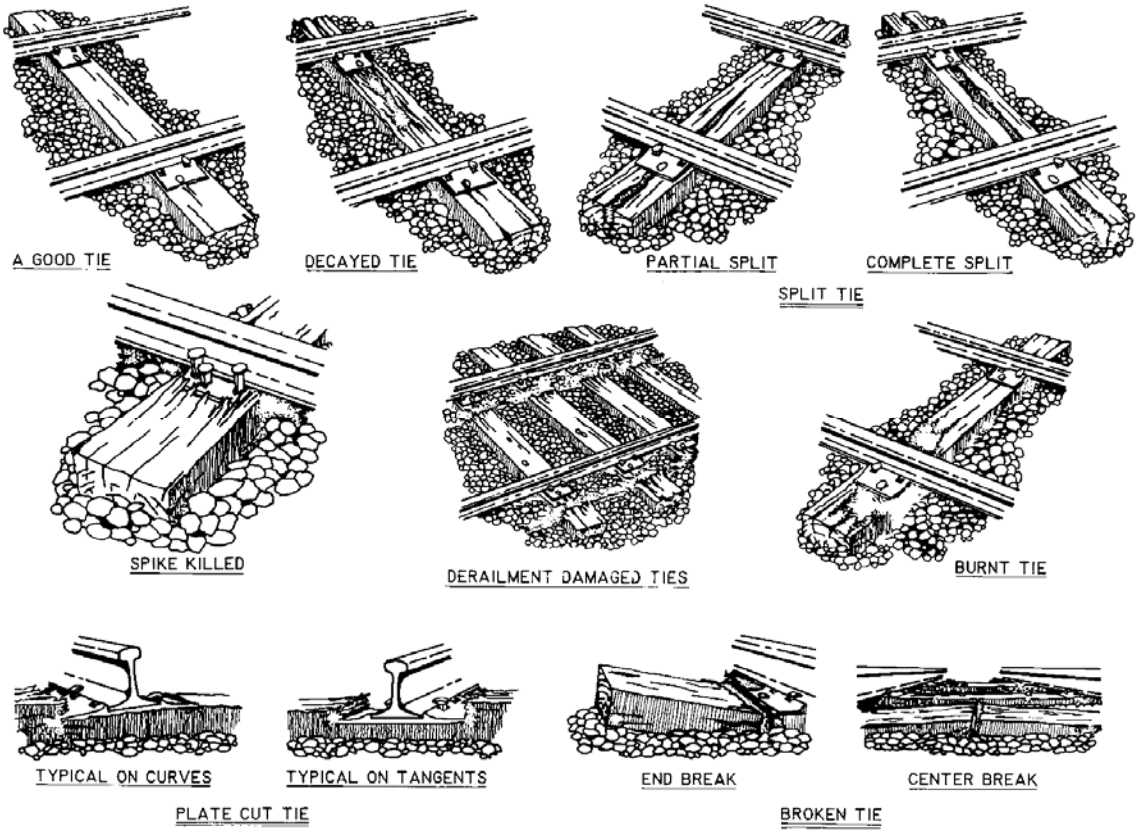

Figure 5-1. Examples of Good and Defective Ties

5-3. CONCRETE TIES.

a. ***Tie Selection.*** New concrete ties selected for the maintenance of track shall meet the requirements specified in AREMA *Manual for Railway Engineering*, Chapter 30, Part 4. Mixing wood and concrete ties in the same track section is not recommended. Concrete ties are very susceptible to impact, leading to premature failure when used in jointed track and require a more substantial ballast section.

b. ***Switch Ties.*** At this time, few concrete switch ties are being manufactured due to weight and difficulty in handling; hardwood switch ties are recommended.

c. ***Installation.*** Ties shall be installed perpendicular to the rails and properly tamped and fastened. Ties shall be installed with the top of the tie in full contact with the base of the rail and the bottom of the tie near the rail seat in full contact with the ballast.

d. ***Identification of Defective Concrete Ties.*** A concrete tie is defective if:

(1) Tie is broken across under one or both rail seats.

(2) Tie is broken across in the center and showing signs of further deterioration, loss of tension in pre-stressing wires, exposure of wires, crumbling, etc.

(3) Tie is broken longitudinally, resulting in loss of ability to hold one or both cast-shoulders in place.

(4) Both cast-shoulders in one rail are loose. (One loose shoulder per rail is not sufficient cause for removal unless it is causing some distress to adjacent ties.)

(5) Tie is damaged by derailment or dragging equipment which, in the opinion of the track inspector, should be replaced. It should be noted that quite serious damage can be done to the tie ends without seriously affecting the performance of the tie.

5-4. PLASTIC TIES

a. ***Tie Selection.*** Various plastic ties have been tested and proven to provide adequate support and low maintenance. Plastic ties shall have textured sides to provide stability. See UFGS 05650 for material requirements. Plastic ties can be cost-effective in areas of high decay. The weight of plastic is similar to wood and mixing wood and plastic ties in the same track section is permissible.

b. ***Installation.*** Ties shall be installed perpendicular to the rails and properly tamped and fastened. Ties shall be installed with the top of the tie in full contact with the base of the rail and the bottom of the tie near the rail seat in full contact with the ballast. Plastic ties can be installed with either cut or screw spikes, with screw spikes recommended.

c. ***Identification of Defective Plastic Ties.*** Plastic ties shall be treated as wood ties for determining defective ties. See paragraph 5-2.c.

5-5. STEEL TIES AND COMPOSITE TIES.

a. Advances in steel tie technology have proven successful and practical and should be considered as a possible alternative in replacing wood ties.

b. One type of composite tie is a hardwood tie treated with borates to prevent decay and rot from fungus, insects, and termites, then encapsulated in a tough plastic covering. Another composite tie is one which includes high-density polyethylene, rubber, and fiberglass with certain proprietary inert filler materials. Yet another composite tie is produced with fiberglass blown foam and molded into various tie sizes and lengths.

5-6. GENERAL.

a. ***Improper Tie Support (Down or Hanging Ties).*** Ties that do not support both rails are considered defective. If these ties are not materially defective, they shall be ballasted, tamped up, and respiked/refastened to fully support the rails.

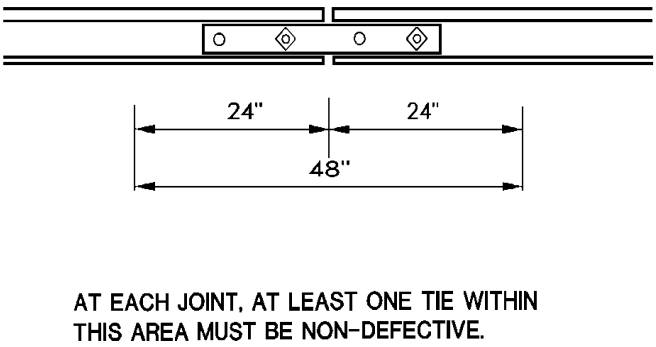

Figure 5-2. Required Tie Support at Joints (Safety Standard)

b. ***Missing Fasteners***. Ties that are installed, but not spiked with a sufficient number of spikes in accordance with paragraph 6-3.c., are considered defective. If these ties are not materially defective, necessary spikes shall be added.

c. ***Tie Requirements***.

(1) Track shall have a minimum number of non-defective ties per 39-foot rail length in combination with a maximum number of consecutive defective ties as specified below:

	Minimum Number of Non-Defective Ties per 39 Feet	
	Tangent & Curves Less Than 2°	**Curves Equal to or Greater Than 2°**
Maintenance		
Category A	12	13
Category B	10	11
Safety		
Restricted	8	10
No Operation	7	9

	Number of Consecutive Defective Ties	
	Tangent and Curves Less Than 2°	**Curves Equal to or Greater Than 2°**
Maintenance	3	2
Safety		
Restricted	4	3
No Operation	5	4

(2) *Joint Ties.* All joints shall be supported by the number of non-defective ties specified below. The centerline of these joint ties shall be within 24 inches of the rail ends as shown in Figure 5-2. Safety standard: Any track without a non-defective tie within 24 inches of the rail ends shall be "No Operations."

	Minimum Number of Non-Defective Ties per Joint
Maintenance	
Category A	2
Category B	1
Safety	
No Operation	0

d. ***Tie Spacing***. The center-to-center distance between adjacent ties usually ranges from 19 to 22 inches. The recommended tie spacing for new track is given below:

Track Category	Tie Spacing (Inches)	Number of Ties per 39-ft Rail
A	19.5	24
B	21	22

Army Criteria: For all track with an average tie spacing greater than 22 inches (less than 22 ties per 39-foot rail), the desired spacing should be established during the next maintenance or rehabilitation cycle.

Navy & Air Force Criteria: The maintenance standards shall require a maximum average center-to-center tie spacing of 24 inches within the distance of a rail length. For track having average tie spacing greater than 24 inches, the desired spacing should be established during the next major maintenance or rehabilitation cycle.

e. ***Missing Ties***. The maintenance standard requires all missing ties to be replaced. The safety standards consider a missing tie a defective tie and any location where the center-to-center tie spacing measured along either rail exceeds 48 inches to be "Restricted Operations," unless at a joint, which will be "No Operations."

f. ***Skewed Ties***. A skewed tie is a tie that is not perpendicular to the rails by more than the tie width. Slightly skewed or individual skewed ties are not serious. A section of track with skewed ties indicates a problem area (possible tight gage) that should be investigated (see Chapter 12, "Track Geometry"). Maintenance standards require that where localized areas have three or more ties skewed greater than 8 inches, the cause of the skewing shall be corrected and the ties straightened.

CHAPTER 6

OTHER TRACK MATERIALS (OTM), TIE PLATES, ANCHORS, RAIL FASTENINGS, ETC.

6-1. GENERAL MAINTENANCE STANDARD

a. All OTM shall be the proper size and type (sections) as specified in Chapters 4 and 5 of the AREMA *Manual For Railway Engineering* and the following:

(1) *Army*: UFC 4-860-01FA and TM 5-627.

(2) *Air Force*: UFC 4-860-01FA and AFM 91-33.

(3) *Navy*: UFC 4-860-02N, Appendix A, Section 5, and MO-103.

b. OTM shall not be flame cut or otherwise altered.

c. OTM that are of improper type, broken, or otherwise defective shall be replaced with the proper size (weight) and type (sections) material.

6-2. TIE PLATES.

a. ***Use.*** Tie plates distribute the applied loads from the rail to the tie as well as assist in keeping the rail in position. Their use is especially important on curves where they provide additional lateral restraint.

b. ***Type.*** Tie plates may be of either the single shoulder type (Figure 6-1) or the double shoulder type (Figure 6-2). Plates may be canted or flat. Canted plates are preferred, particularly in curves; however, canted and flat plates cannot be mixed together.

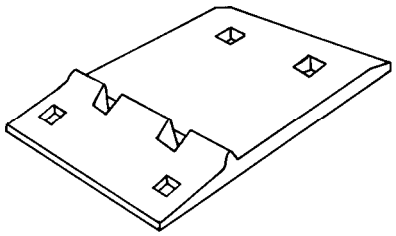

Figure 6-1. Single Shoulder Tie Plate

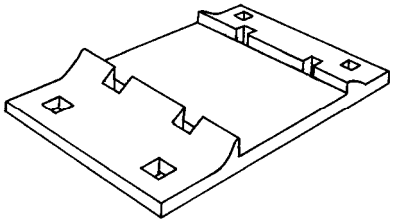

Figure 6-2. Double Shoulder Tie Plate

c. ***Installation.*** For track without tie plates, plates shall be installed on replacement ties during tie renewals or installed during rail replacement.

d. ***Shifted Plates***. Where the shoulder of a tie plate has become lodged beneath the base of the rail, the spikes shall be pulled, the spike holes plugged, the tie plate properly reset, and the rail respiked.

6-3. SPIKES.

a. The rail shall have a sufficient number of fasteners (spikes) to effectively maintain gage and provide sufficient rail restraint. Spikes provide primarily lateral support for the rail.

b. Spikes shall be:

(1) Of proper size for the tie plates used.

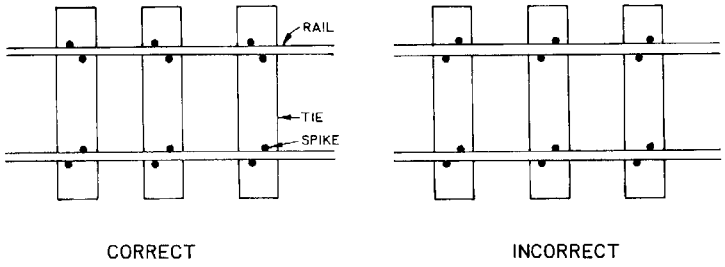
(2) Driven vertically and square with the rail.

(3) Either of the cut or screw type.

(4) Driven with approximately 0.125 inch of space remaining between the head of the spike and the base of the rail.

c. ***Spiking Pattern.***

(1) On tangent track and curves of 4 degrees or less, spikes shall be installed as shown in Figure 6-3.



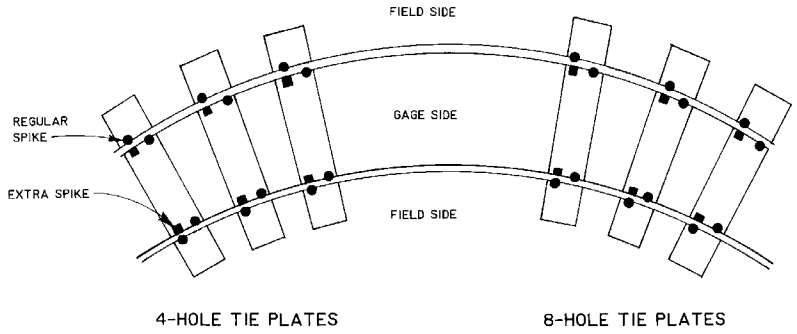


Figure 6-3. Spiking Pattern for Tangents and Curves of 4 Degrees or Less

(2) On curves greater than 4 degrees but less than 36 degrees and on the curved side of turnouts, the use of an additional spike per tie plate as shown in Figure 6-4 is recommended. However, it is acceptable to have the third spike on the field side of the rail. A maximum 12-degree curve is recommended for typical railroad applications.

Note: Extra spike can be on the field side and is preferred by the Army.

Figure 6-4. Spiking Pattern for Curves Greater than 4 Degrees but Less than 36 Degrees

(3) On curves of 36 degrees and greater the use of two additional spikes per tie plate as shown in Figure 6-5 is recommended.

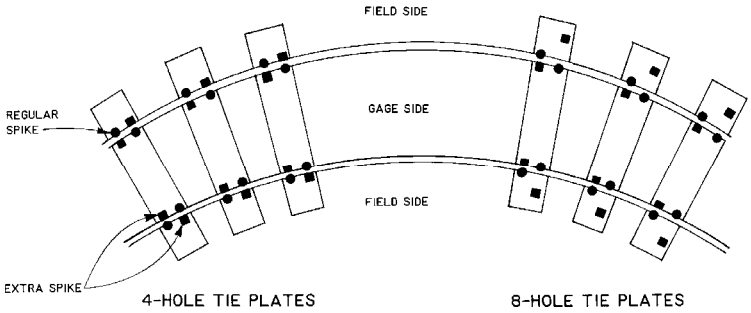

Figure 6-5. Spiking Pattern for Curves 36 Degrees and Greater

(4) Spikes shall not be installed through the slots in skirted-type slotted joint bars (angle bars) as shown in Figure 6-6. Correct spiking is shown in Figure 6-7.

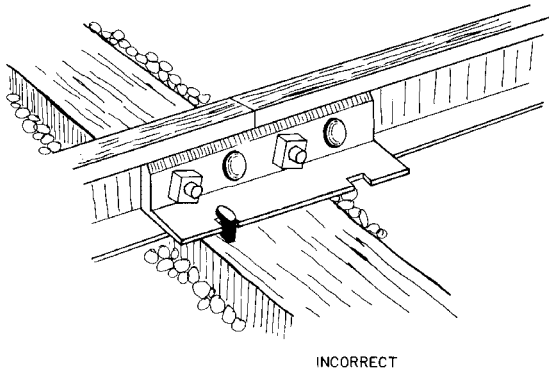

Figure 6-6. Incorrect Spiking of Angle Bars

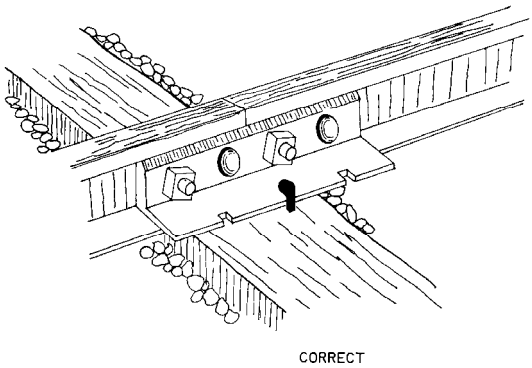

Figure 6-7. Correct Spiking of Angle Bars

(5) Correction of incorrect spiking patterns. An incorrect spiking pattern by itself is not a cause for removing and redriving spikes. However, an incorrect spiking pattern shall be corrected when other maintenance requires the spikes to be removed. Old spike holes shall be plugged to prevent accelerated tie deterioration.

d. ***Missing and Loose Spikes.*** Maintenance standards require missing spikes to be replaced. Old spike holes shall be plugged with a treated tie plug before replacing the

spikes. Loose spikes shall be removed, the holes plugged, and the spikes redriven. Gage shall be checked at these locations. Safety standards permit the track to be restricted at the track inspector's discretion.

e. ***Spikes Beneath Rail Base.*** Maintenance standards require where the head of a spike has become lodged beneath the base of a rail, the spike shall be removed immediately, the hole in the tie plugged, and the spike properly redriven. A spike lodged beneath the rail base is an undesirable condition that can lead to a broken rail base.

f. ***Other Hold-Down Devices.*** Maintenance standards require any defective hold-down device to be replaced. Safety standards permit the track to be restricted at the track inspector's discretion.

6-4. JOINTS.

a. ***Joint Bars.*** Rails shall be joined with proper factory-designed and -constructed joint bars. Joint bars shall not be altered with a flame in any manner, including the bolt holes. Maintenance standards require joint bars not meeting these requirements to be replaced. Safety standards require the track to be restricted until repairs are completed.

b. ***Compromise Joints.*** Rails of different weight and/or section shall be joined with proper factory-designed and -forged compromise bars, taper rails, or offset thermite welds. Safety standards require track to be restricted until all non-factory items are replaced.

c. ***Cracked or Broken Joint Bars.*** Maintenance standards require cracked or broken joint bars to be replaced. Safety standards require:

(1) Track to be "No Operation" when one or both joint bars are cracked or broken between the center bolt holes.

(2) Operations shall not be permitted over any location where both joint bars are broken, or where worn or loose joint bars allow vertical movement of either rail with respect to the other.

d. ***Bolts.*** Maintenance standards require each joint to be bolted with at least two bolts in each rail tightened to approximately 400 foot-pounds of torque which develops between 25,000 and 30,000 pounds of tension in the bolts.

(1) All bolts shall be of proper size and tightly in place. Proper bolt installation is shown in Figure 6-8.

(2) Bolts shall be installed with AREMA spring washers. Nuts shall be installed against the spring washer as shown in Figure 6-8. At least one full bolt thread shall extend past the outside of the nut.

(3) Bolts shall be installed so the nuts will run alternately on the inside and outside of the rail as shown in Figure 6-9.

(4) Whenever bolts and joint bars are removed, the rail in the joint area and the contact surfaces of the joint bar shall be cleaned (wire brushed) and lubrication applied to the joint bar and the bolt threads. New joint bars and bolts shall be lubricated before installation.

(5) Safety standards require a restriction if all bolts are loose or if there is only one bolt through a rail. No operations are permitted over locations where all bolts in one rail are missing or ineffective.

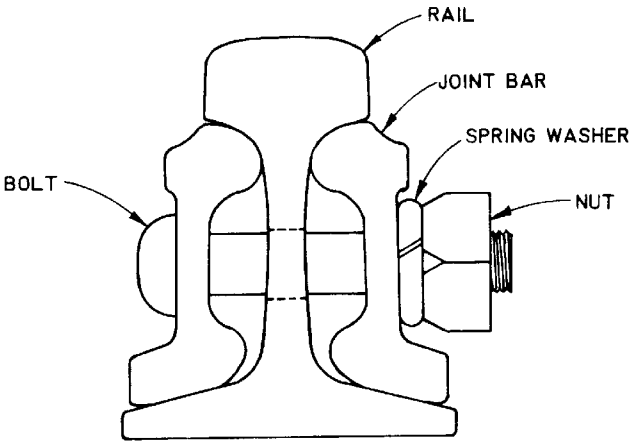

Figure 6-8. Proper Bolt Installation

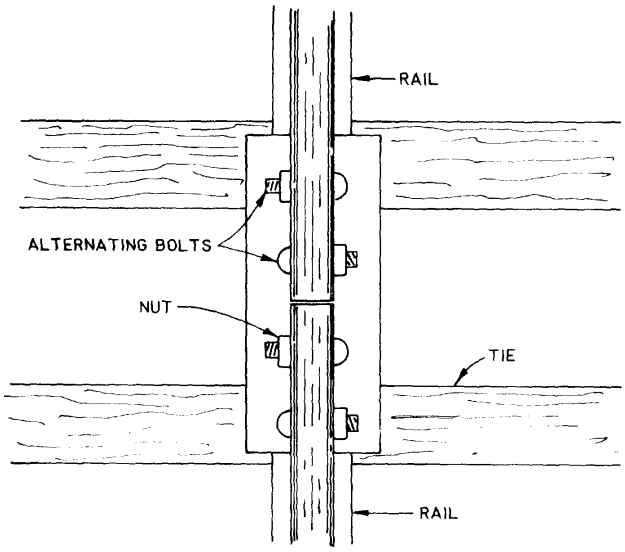

Figure 6-9. Alternating Bolt Pattern

e. ***Loose and Missing Bolts.***

(1) Maintenance standards require loose bolts to be tightened (approximately 400 foot-pounds) during the next maintenance activity. Bolts that cannot be tightened shall be replaced.

(2) Maintenance standards require that missing bolts be replaced.

f. ***Rail End Mismatch.*** Rail end mismatch on the tread portion or the gage side shall not exceed the following:

Rail End Mismatch (Inch*)*

	Tread	Gage Side
Maintenance	GT 0.125	GT 0.125
Safety		
Restriction	N/A	GT 0.1875
No Operation	GT 0.25	GT 0.25

g. ***Joint Gap.*** Standard rail gaps in properly drilled new rails and punched joint bars produce a rail gap of 0.125 to 0.25 inch. As the bolts, bars and rails wear, a gap of 0.5 to 0.625 inch may develop in some rail joints with track usage. Greater gaps indicate a potential problem. Rail joint gap shall not exceed the following:

	Joint Gap (Inch)
Maintenance	GT 0.75
Safety	
Restriction	GT 1.25
No Operation	GT 2

h. ***Joints in Restricted Areas***. It is recommended that the joint be thermite-welded whenever a joint is installed within 20 feet of a road crossing, the outer perimeter of any structure, or any location that restricts access to the joint.

i. ***Shims***. All shims shall be removed from joints. See UFGS 05650 for proper joint gap determination when replacing rails. Failure to compensate for the temperature could result in buckled track or pull-apart.

6-5. RAIL ANCHORS (MAINTENANCE STANDARD).

a. Rail anchors are designed to fit tight on the base of the rail. It is, therefore, extremely important to know the weight and section of the rail when ordering the anchors. Rail anchors help prevent the longitudinal movement of rails commonly known as “running” or “creeping.” Rail anchors should be used at locations where the track is subject to serious longitudinal movement from thermal stresses (rail expansion) or traffic conditions.

b. ***Rules for Anchor Application.*** General rules on the use of rail anchors are:

(1) Anchors shall be applied to the gage side of the rail base against the same tie face on opposite rails.

(2) Anchors shall grip the base of the rail firmly and have full bearing against the face of the tie.

(3) When the bearing of the rail anchor against the tie has been disturbed by removal of the tie, the anchor shall be removed and reapplied to the new tie.

(4) Anchors shall not be moved by driving them along the rail.

(5) Skewed ties shall be straightened before applying rail anchors.

c. Rail anchors not meeting requirements of 6-5.a and 6-5.b should be removed and reapplied.

d. ***Anchor Locations.***

(1) Where used, a minimum of eight anchors (four in each direction [boxed]) per 39-foot rail (or 16 anchors per 80-foot rail) is recommended as shown in Figure 6-10. Steep grades increase the importance of anchors and may justify more than the minimum number shown in Figure 6-10. If additional anchors are required, it is recommended to box-anchor approximately every third tie.

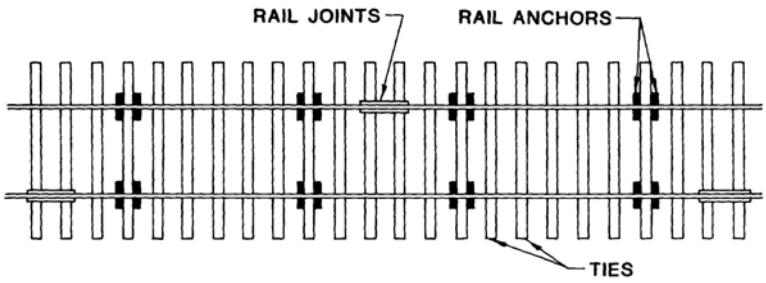

Figure 6-10. Recommended Minimum Anchoring Pattern for 39-foot Rails.

(2) *At Open Deck Bridges.* Where anchors are used on track approaching open deck bridges, every third tie should be box-anchored (four anchors per tie) for at least two rail lengths off each end of the bridge. No anchors shall be applied on the bridge itself.

(3) *At Rail Crossings.* Where anchors are used on track approaching rail crossings, every third tie should be box anchored (four anchors per tie) for at least two rail lengths in all directions from the crossing.

(4) *Turnouts*. Anchoring in turnouts is optional and can be used to correct geometry problems. Where used, every other tie (that can be anchored) should be anchored.

6-6. GAGE RODS.

a. ***Use.*** Gage rods are not required but are sometimes needed to help maintain proper track gage. However, they are **not** a substitute for good track maintenance and good tie conditions. Gage rods are sometimes used at the following locations:

(1) On sharp curves where there is difficulty holding the gage.

(2) In turnouts just ahead of the switch points and on the curved closure rail.

b. ***Spacing***. Where gage rods are used in sharp curves, two to four rods should be installed next to the joint on the outside rail and at evenly spaced intervals along the rail length.

c. ***Application.*** Gage rods should be installed at right angles to the rail with the jaws firmly gripping the base of the rail.

d. ***Maintenance.***

(1) Gage rods shall be kept tight while maintaining the proper track gage; ensure gage is not affected by over-tightening of gage rods.

(2) Bent or broken gage rods shall be replaced where track conditions warrant their continued use.

(3) Gage rods shall not be tightened if spikes are holding the rail from moving. It may be necessary to pull the spikes, plug the tie, tighten the rods to gage, then respike.

CHAPTER 7

RAIL

7-1. DEFECTIVE RAIL AND REMEDIAL ACTIONS.

a. Standards for rail defects are presented in Table 7-1. Remedial actions for rail defects are presented in Table 7-2. Where rail defects have been identified but remedial action has not been completed, the operating restrictions presented in Table 7-1 shall apply. Appendix C provides a glossary of common rail terms and brief descriptions of the common rail defects that may be observed in track.

b. ***Multiple Defects.*** Any individual rail having two or more of the transverse fissure or fracture type defects listed in Table 7-1, whether they are the same or different, shall be removed and replaced in lieu of other remedial actions.

c. ***Worn Rails.*** On rail suspected of being worn more than the allowances provided for in Table 7-1, wear measurements shall be taken at the center and at each end of the rail not more than 1 foot from the end of the joint bar. Rail wear measurements shall consist of a vertical head wear measurement and a horizontal side wear measurement as shown in Figure 7-1. Appendix D presents a table of details and properties for various rail sections and may be used to assist in identifying rail weight and sections for estimating the amount of rail wear.

Table 7-1. Rail Defect Standards

	Maintenance Standard		*Safety Standard*	
	Maximum Defect Category for Track Category		*Restricted (10mph) Operation*	*Close to Traffic*
Defect Type	*A*	*B*		
Bolt hole crack	RI	0.75”	GT 1.5”	BO
Bolt Hole – torch cut (3)	RI	RI	RI	*
Broken base	RI	RI	*	GT 6”
Corrosion (rail base)	0.25”	0.25”	*	*
Complete break	RI	RI	RI	RI
Crushed (flattened) head	RI	RI	GT 0.375”	BO
End Batter	0.25”	0.25”	GT 0.375”	GT 0.5”
Defective weld (1)	20%	20%	GT 20%	GT 40%
Fissure-compound (1)	RI	RI	GT 20%	GT 40%
Fissure-Transverse (1)	RI	RI	GT 20%	GT 40%
Fissure-detail (1)	RI	RI	GT 20%	GT 40%
Fracture-engine burn (1)	RI	RI	GT 20%	GT 40%
Head/web separation	RI	2”	GT 4”	BO (2)
Piped rail	RI	2”	GT 4”	BO (2)
Horizontal split head	RI	2”	GT 4”	BO (2)
Vertical split head	RI	2”	GT 4”	BO (2)
Split web	RI	2”	GT 4”	BO (2)
Flow on gage face	0.1875”	1/4”	GT 0.3125”	*
Running surface damage	0.25”	1/4”	GT 0.375”	GT 0.5”
Short rail	13’	13’	*	*
Torch cut rail	RI	RI	*	*
Wear - up to 90 lb rail				
Horizontal side wear	0.375”	0.375”	GT 0.5”	*

Table 7-1. Rail Defect Standards

Vertical head wear	0.375”	0.375”	GT 0.375”	*
Wear - 100 lb to 119 lb rail				
Horizontal side wear	0.5”	0.5”	GT 0.625”	*
Vertical head	0.375”	0.375”	GT 0.375”	*
Wear - rail above 119 lb				
Horizontal side wear	0.625”	0.625”	GT 0.75”	*
Vertical head wear	0.5”	0.5”	GT 0.5”	*

Notes:

1. Defect testing normally reports these defects as small (S), medium (M), or large (L). General relationship to size is:
   Small: 10–20% of head area.
   Medium: 21–40% of head area.
   Large: 41+% of head area.
Need to request inspector performing ultrasonic rail inspection to provide estimated percent of rail head affected by defect.

2. Rails having longitudinal defects accumulating to 3 feet or more in any 10 feet of rail shall be closed to traffic.

3. Include bolt holes anywhere in the rail.

4. Abbreviations:
   RI = Repair Immediately
   BO = Break Out in railhead
   GT = Greater Than
   LT = Less Than
   N/A = Not Applicable

* The activity shall evaluate the severity of each such defect and shall classify the degree of hazard based on engineering judgment and experience.

Table 7-2. Remedial Action for Rail Defect

Defect Type	Remedial Actions		
	Replace Entire Defective Rail	Crop Defect [2, 3]	Apply Joint Bars (Fully Bolted)
Bolt hole crack	Allowed	Allowed	---
Broken base	Allowed	Allowed	Not Allowed
Corrosion (rail base)	REQUIRED	Not Allowed	Not Allowed
Complete break - clean and square	Preferred	---	Allowed [3]
Complete break - rough or angled	Preferred	Allowed	Not Allowed [4]
Crushed head	Preferred	Allowed	Not Allowed [4]
Defective weld	---	Allowed	Preferred
End Batter	Allowed	Allowed	---
Fissure-compound [5]	Preferred	Allowed	Allowed [3]
Fissure-transverse [5]	Preferred	Allowed	Allowed [3]
Fracture-engine burn [5]	Preferred	Allowed	Allowed
Head/web separation	REQUIRED	Not Allowed	Not Allowed
Piped rail	REQUIRED	Not Allowed	Not Allowed
Running surface damage	Allowed	Allowed	Not Allowed
Short rail	REQUIRED	---	---
Horizontal split head	REQUIRED	Not Allowed	Not Allowed
Vertical split head	REQUIRED	Not Allowed	Not Allowed
Split web	REQUIRED	Not Allowed	Not Allowed
Torch cut rail ends	Allowed	Allowed	Not Allowed
			Not Allowed
Torch cut bolt hole	Allowed	Allowed	
Wear	REQUIRED [6]	---	---
Flow on gage face	Preferred	Allowed	---

Notes:

1. If two or more of these defects are found in any individual rail, that rail shall be replaced.

2. Rails may be cropped by cutting the rail with a rail saw or other appropriate cutting tool at least 6

Table 7-2. Remedial Action for Rail Defect

inches either side of the defect. 3. Not allowed if results in a rail length of less than 13 feet (see "Short Rail" below). 4. May be allowed as an emergency measure until defect is removed, provided train operations are speed-restricted. 5. If broken through or cracked out, rules for rough or angled complete break apply. 6. Rail with wear on only one side may be transposed if the horizontal wear does not exceed 0.375 inch. 7. Short lengths of flow may be ground off.

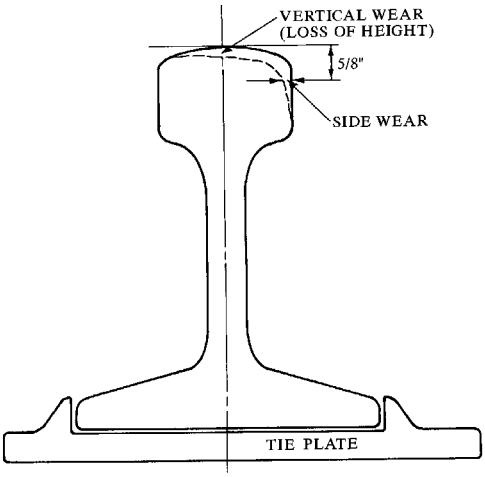

Figure 7-1. Rail Wear Measurement

d. ***Base Corrosion.*** Rail shall be removed from track if the base is corroded such that more than 0.25 inch play is allowed in the rail as shown in Figure 7-2.

e. ***End Batter.*** Rail end batter is measured 0.5 inch from the rail end with an 18-inch straightedge laid only on the rail being measured as shown in Figure 7-3. Table 7-2 presents remedial actions for end batter.

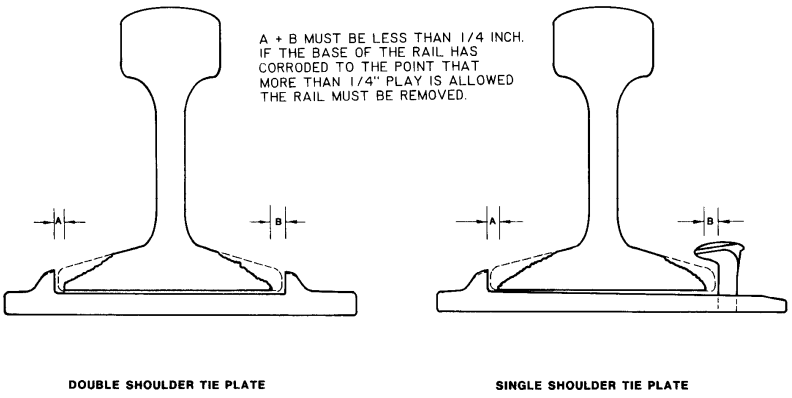

Figure 7-2. Rail Base Corrosion Measurement

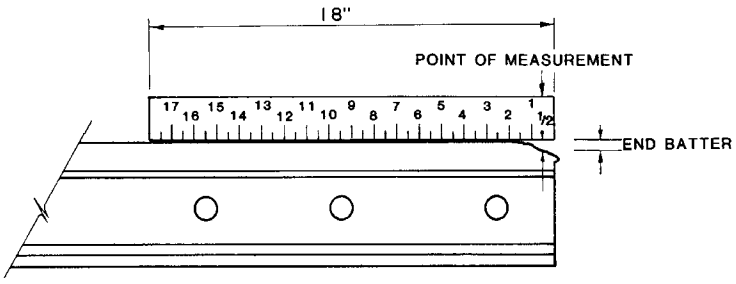

Figure 7-3. End Batter Measurement

f. ***Running Surface Damage.*** Rail running surface damage (e.g., deep engine burns, dents, equipment gouges) is measured at the midpoint of an 18-inch straightedge laid on the railhead over the defect.

7-2. RAIL MAINTENANCE.

a. ***Rail.*** New rail used in the maintenance of track shall meet the requirements specified in the AREMA *Manual For Railway Engineering*, Chapter 4.

b. ***Internal Defect Inspection.*** A "continuous search" internal rail defect inspection shall be performed on all active track. This internal rail defect inspection should be conducted using ultrasonic inspection techniques at a maximum of five-year intervals.

c. ***Torch Cut.*** Rail shall not be flame cut in any manner. This includes cropping the rail end, burning bolt holes, and trimming mismatched ends. Rail shall be cut using a mechanical or abrasive rail saw or other appropriate cutting tool.

d. ***Short Rail.*** Rail less than 13 feet in length shall not be installed in track.

7-3. LIGHTWEIGHT RAIL. Lightweight rail is defined as rail weighing less than 90 pounds/yard. Research has shown that lightweight rail may not be suitable for use in track subjected to heavy wheel loads.

a. Rail weights of 70 pounds/yard or less should be replaced if that rail will experience carloads of more than 50 tons (25,000-pound axle loads.)

b. Rail weighing 75 to 85 pounds/yard may be adequate depending upon tie and ballast support conditions. A structural evaluation and stress analysis is necessary to determine the adequacy of these rail weights. Rail not adequate to support the desired wheel loads should be replaced.

c. The replacement of any lightweight rail in Categories A and B track should be considered when planning major repair and/or rehabilitation projects.

CHAPTER 8

TURNOUTS

8-1. GENERAL. Turnouts are designed to divert trains from one track to another. Good turnout maintenance is essential for the safe and efficient operation of trains. Major components of a turnout are the switch, frog, and guardrails. Figure 8-1 shows a typical split switch turnout with the various parts identified. Tongue and mate switches used in paved areas are also commonly found in Navy trackage.

8-2. GENERAL REQUIREMENTS.

a. ***Materials***. All materials used within the limits of a turnout shall:

(1) Be factory-designed and -constructed.

(2) Be the proper weight and section.

(3) Be properly installed.

(4) Not be flame-cut or otherwise altered.

b. ***Rail.*** All rail used within the limits of a turnout shall be of the same weight and section. Compromise joints are not permitted within the limits of a turnout and shall be removed in the next maintenance cycle.

c. ***Ties.*** The standards in Chapter 5 of this UFC shall apply to ties within the limits of a turnout. Interlaced cross ties are not permitted and shall be removed in the next maintenance cycle.

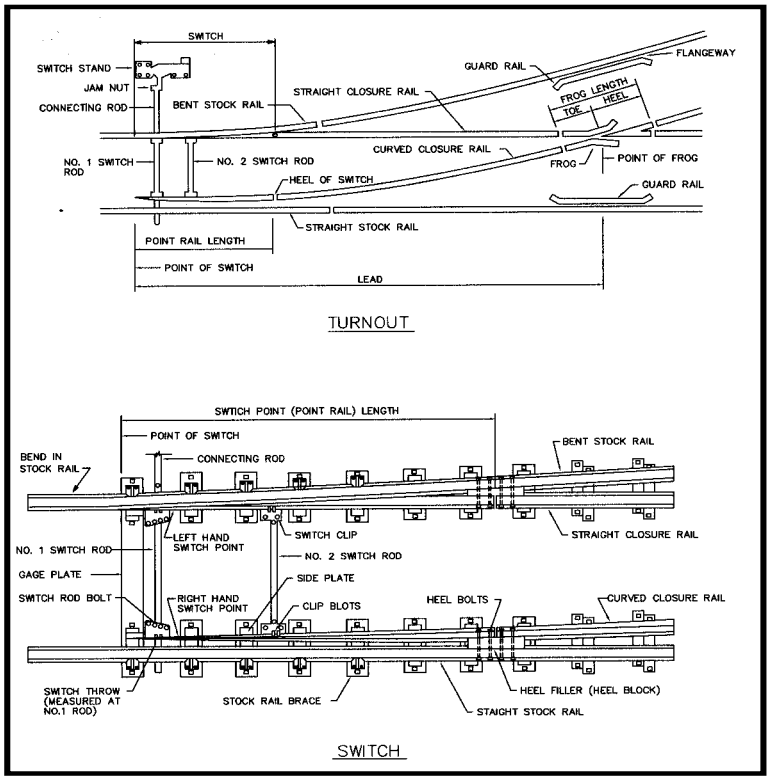

Figure 8-1. Parts of a Turnout

d. ***Track Geometry.*** The track inspector shall rate turnout track geometry as "Full Compliance," "Maintenance Required," "Restricted" or "No Operation" to conform to the standards in Chapter 12 and this chapter.

e. ***Reversing Tangent.*** It is recommended that the tangent between the frog and any reverse curve past the frog be no less than 50 feet in length as shown in Figure 8-2.

f. ***Switch Stand Placement.***

(1) The switch stand shall be installed so that when the switch is lined for the normal (main) route, the connecting rod keeps the points closed with a pulling (rather than a pushing) force. In most cases this will mean installing the stand on the diverging side of the turnout as shown in Figure 8-2.

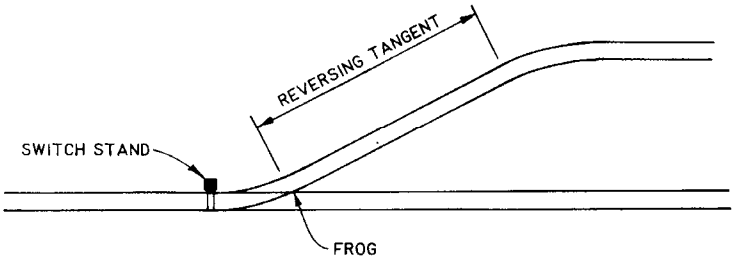

Figure 8-2. Reversing Tangent Length and Switch Stand Placement

(2) When a ground-throw stand is used, the handle shall point toward the frog when the switch is lined for the normal (main) route.

g. ***Cleaning, Lubrication, and Adjustment***. As scheduled, but at least annually, switches and switch stands shall be cleaned, lubricated, and adjusted. For Navy installations see NAVFACINST 11230.1 for additional guidance.

h. ***Plates.*** The proper type and size of tie plates shall be used. Double shoulder plates are preferred.

8-3. SWITCHES AND SWITCH STANDS.

a. Switches shall be inspected for the following defects:

(1) Switch difficult to operate.

(2) Gap between the switch point and the stock rail. Check with points in both positions. (See paragraph 8-3.b.)

(3) Worn or chipped switch points. (See paragraph 8-3.c.)

(4) Point of switch higher than stock rail. (See paragraph 8-3.c.)

(5) Point rail beyond taper lower than stock rail. (See paragraph 8-3.c.)

(6) Damaged or missing switch stand lever latches or switch point lock. (See paragraph 8-3.d)

(7) Loose, damaged, or improperly installed switch stand. (See paragraph 8-3.f and 8-3.g.)

(8) Loose, damaged, or missing jam nut at the end of the connecting rod. (See paragraph 8-3.h.)

(9) Bent, damaged, loose, binding, or improperly installed connecting rod, switch rods, or switch clips. (See paragraph 8-3.h.)

(10) Loose, damaged, or missing switch clip, switch rod, or connecting rod bolts. (See paragraph 8-3.h.)

(11) Loose, damaged, or missing heel bolts; cracked or improper heel joint bars or heel filler. (See paragraph 8-3.i.)

(12) Loose, damaged, or missing rail braces. (See paragraph 8-3.j.)

(13) Loose, damaged, or missing slide plates; dirt and debris buildup on slide plates.

(14) Missing cotter keys on switch rod and switch clip bolts. (See paragraph 8-3.i.)

(15) Debris in flangeways. (See paragraph 8-3.l.)

(16) Debris obstructing switch rods and connecting rod. (See paragraph 8-3.h.)

(17) Loose, damaged or missing point rail stops.

b. ***Switch Point Gap.*** Maintenance standards require an adjustment if the switch can be thrown and locked in either direction with a 0.25-inch spacer between the switch point and the stock rail or if the gap is greater than zero. Safety standards require restricted track at over 0.25-inch up to 0.375-inch gap and no operations if gap is over 0.375 inch.

c. ***Switch Points.***

(1) If the switch point is chipped, broken, or worn more than 0.5 inch down and 6 inches back from the point, maintenance standards require the switch point to be restored or replaced. (See Figure 8-3.)

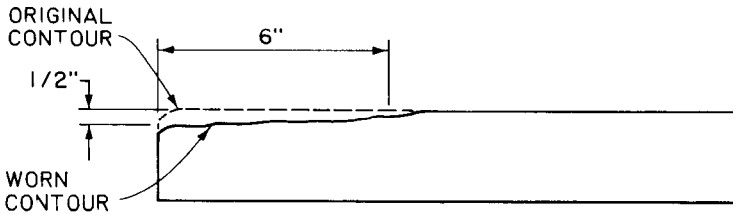

Figure 8-3. Switch Point Contour

(2) If switch point is worn or damaged beyond these limits or the top surface of the switch point is higher than the stock rail, safety standards require operation through the turnout to be restricted.

(3) If the point rail beyond the taper is lower than the top of the stock rail, no operations shall be permitted. Metal flow shall be removed by grinding to ensure proper closure. Figure 8-4 shows the proper elevation of the switch point and point rail with respect to the stock rail.

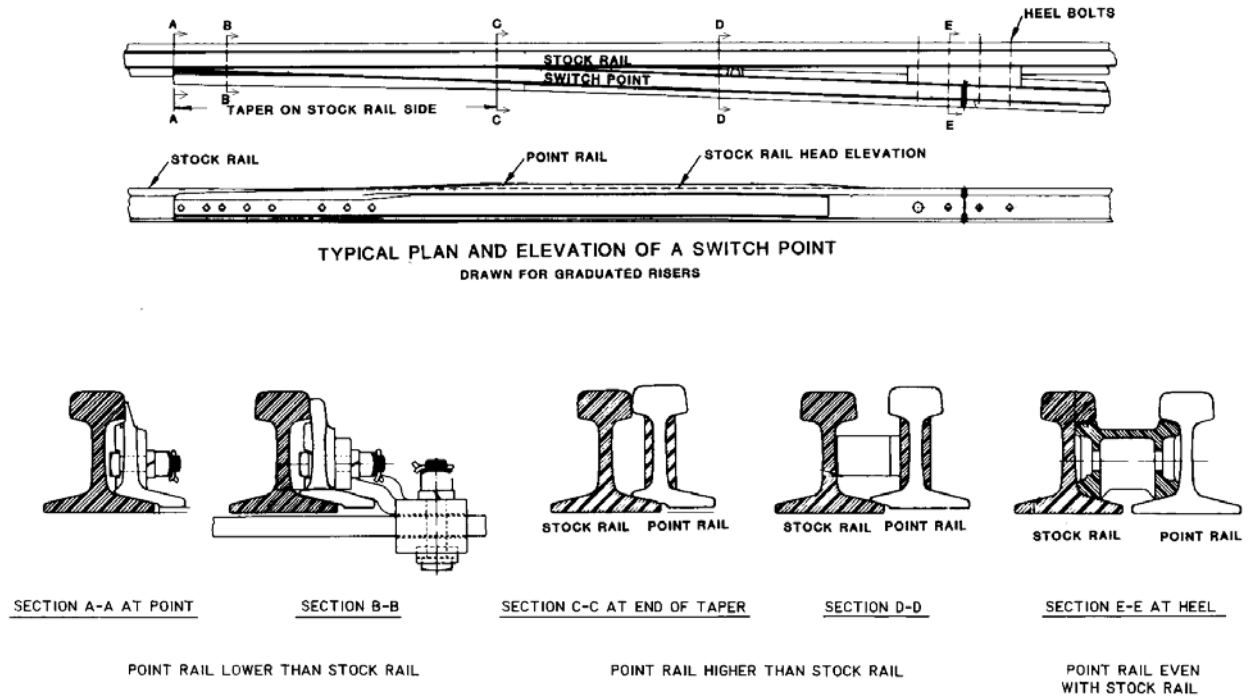

Figure 8-4. Switch Point Plan and Elevation.

d. ***Switch Stand Lever Latches and Point Locks.*** Safety standards require turnouts with latches that are missing, damaged, insecure, or otherwise inoperative, to be "No Operation."

e. ***Switch Stand.*** Maintenance standards require the switch stands to be fully secured to the head block ties to prevent any unintentional movement of the switch points. Where operations through the switch result in visible lateral movement of the switch stand or opening of the switch points (point gap), safety standards require "No Operation."

f. ***Connecting Rod, Switch Rods, and Switch Clips.***

(1) Maintenance standards require that these parts shall be installed and maintained to allow unobstructed motion when the switch is thrown. Rods and clips shall not contact adjacent ties. Damaged parts shall be replaced and improperly installed parts shall be adjusted. Washers or similar spacers shall not be permitted between the switch clip and the switch point. The jam nut at the adjustable end of the connecting rod shall be kept tight against the clevis.

(2) Safety standard is "No Operation" if the connecting rod, switch rod, or switch clip is insecurely fastened or is damaged. Where washers or similar spacers do not have full contact surface areas between the clip and switch point, operations through the turnout shall be restricted. Spacers, if needed, shall be constructed of steel plate with the dimension of the back of the switch clip and thickness, as required.

g. ***Pocketing Switches***. Ballast shall not be allowed at a level that will interfere with the smooth operation of the switch.

(1) The ballast level in cribs beneath the connecting rod, switch point rails, and switch rods should be at least 2 inches below any steel. In regions where the snow and ice accumulate or frost heave is a problem, at least 4 inches of clearance should be provided. This should be checked and performed in the fall.

(2) For switches where this clearance is not provided, the cribs shall be pocketed to provide adequate clearance.

h. ***Connecting Rod Bolts, Switch Rod Bolts, and Clip Bolts.*** Maintenance standards require that connecting rod and switch rod bolts shall be installed with the nut on top and cotter keys in place. Clip bolts shall have cotter keys. If bolts are not tight, safety standards require restricted operation.

i. ***Switch Heel (Bolts, Fillers, and Joint Bars).***

(1) *Maintenance Standards.* The heel of the switch shall be secure and the supporting switch ties solidly tamped. Where there are no existing heel blocks (filler), hook plates shall be used to secure the heel of the switch. The inside joint bar (nearest the track center) should be a bent bar per AREMA design. Remember, this assembly is a hinge allowing the switch rail to pivot in the joint assembly.

(2) Safety standards require restricted operation if any heel bolts are loose or missing, or the heel is otherwise not fully secure.

j. ***Rail Braces.***

(1) *Maintenance Standards.* Rail braces are essential to provide proper lateral support to the stock rails. Rail braces shall be fully secured to the tie and tight against the outside of the stock rail on both sides of the turnout. Rail braces should be installed in accordance with the appropriate plans for a given length point rail found in the AREMA *Portfolio of Track Plans*. It is recommended that non-adjustable rail braces be installed on each switch tie from the point of switch to within two ties of the switch heel. Adjustable rail braces should be installed per the AREMA *Portfolio of Track Plans*.

(2) Safety standards require restricted operation through the turnout if there are less than four rail braces properly secured to the tie and tight against the outside of each stock rail while switch is thrown.

k. ***Point Rail Stops***. Safety standards require track with bent or missing point stops to be "Restricted Operations."

l. ***Debris in Flangeways.*** Flangeways shall be kept clear of debris. Any obstructions, including ice and packed snow, shall be removed.

8-4. FROGS.

a. ***Frog Point.***

(1) Maintenance standards require frogs to be restored if the point is chipped, broken, or worn more than 0.5 inch below the original top surface and 6 inches back from the original point location. (See Figure 8-5)

(2) Safety standards require the track to be restricted for frog points with wear greater than 0.625 inch.

b. ***Frog Tread Surface.***

(1) Maintenance standards require a frog to be restored when the tread surface is worn more than 0.3125 inch below its original contour. Frogs that cannot be rebuilt and restored to a "like new" condition shall be replaced.

(2) Safety standards require the track to be restricted if the frog tread surface is worn greater than 0.375 inch below its original contour. (See Figure 8-5)

(3) If welding repairs are made on the frog, the tread portion of the frog will be restored before restoring the point.

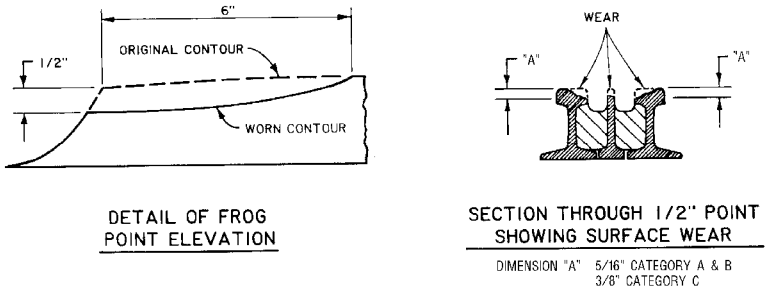

Figure 8-5. Frog Point and Tread Contours

c. ***Guarding Face of Self-Guarded Frogs.***

(1) *Maintenance Standards.* The raised guarding face on a self-guarded frog shall not be worn more than 0.3125 inch. (See Figure 8-6)

(2) Safety standards require the track to be "No Operation" if the raised guarding face on a self-guarded frog is more than 0.375 inch.

d. ***Repairing Self-Guarded Frogs.*** If repairs are made to a self-guarded frog without removing it from service, the raised guarding face and tread portion must be restored before rebuilding the point.

e. ***Frog Bolts***. All frog bolts shall be in place and tight.

f. ***Frog Flangeway Width.*** Standard frog flangeway width is 1.875 inches. Standards for frog flangeway width are presented in Table 8-1. (See Figure 8-7)

g. ***Flangeway Depth.*** Standard frog flangeway depth is 1.875 inches. Standards for frog flangeway depth are presented in Table 8-1. (See Figure 8-7)

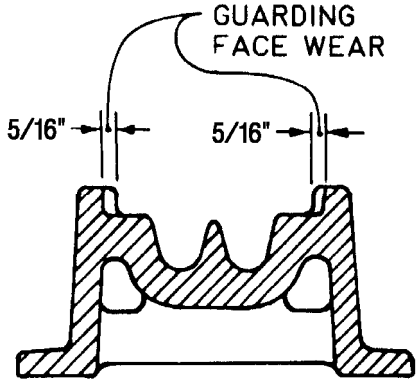

Figure 8-6. Allowable Wear on Guarding Face of Self-Guarded Frog

8-5. GUARD RAILS.

a. Guard rails shall be in place, properly positioned, and fully secured with guard rail plates placed with the shoulder against the guard rail. All guardrail bolts shall be in place and tight.

b. Guard rails shall be installed so the straight guarding face (the portion of the guard rail parallel with the running rail) extends in advance of the frog point a distance at least equal to the values given in Table 8-2.

c. ***Guard Check Gage.*** Standard guard check gage is 54.625 inches. Standards for guard check gage are presented in Table 8-1. (See Figure 8-7) After the measurements are taken and appear satisfactory, if visual observations indicate that the frog point is being hit by the wheel flanges, a careful inspection must be made to determine the cause of the problem. Something may be loose. Remember, these are static measurements that are being taken.

d. ***Guard Face Gage***. Standard guard face gage is 52.75 inches. Standards for guard face gage are presented in Table 8-1. (See Figure 8-7)

e. ***Guardrail Flangeway Width.***

(1) Standard guardrail flangeway width is 1.875 inches. Standards for guardrail flangeway width are presented in Table 8-1. (See Figure 8-7)

(2) Excessive wear on a guardrail is often indicated by a wide guardrail flangeway measurement or by tight guard check gage. Typically, guardrail flangeway widths of 2.125 inches or greater indicate that maintenance or replacement of the guardrail may be needed.

8-6. GAGE MEASUREMENT.

See Chapter 12 for gage measurements.

Table 8-1. Measurements and Operating Restrictions for Frogs and Guard Rails

	Measurement			
	Maintenance Standards		Safety Standard Operating Restrictions	
Parameter	*(New or Fully Restored)*	*Minimum*	*Restriction*	*No Operations*
Frog Flangeways				
Width	1-7/8 in. (1.875 in.)	1-5/8 in (1.625 in.)	LT 1-5/8 in. (1.625 in.)	LT 1-1/2 in. (1.50 in.)
Depth	GE 1-7/8 in. (1.875 in.)	LT 1-5/8 in. (1.625 in.)	LT 1-1/2 in. (1.50 in.)	LT 1-3/8 in. (1.375 in.)
Guard Check Gage	54-5/8 in. (54.625 in.)	LT 54-3/8 in. (54.375 in.)	LT 54-1/4 in. (54.25 in.)	LT 54-1/8 in. (54.125 in.)
Guard Face Gage	52-3/4 in. (52.75 in.)	GT 53 in. (53.00 in.)	GT 53-1/8 in. (53.125 in.)	GT 53-1/4 in. (53.25 in.)
Guard Rail Flangeway:				
Width	1-7/8 in. (1.875 in.)	1-5/8 in. (1.625 in.)	LT 1-5/8 in. (1.625 in.)	LT 1-1/2 in. (1.50 in.)

Note: GE = greater than or equal to, LT = less than, GT = greater than

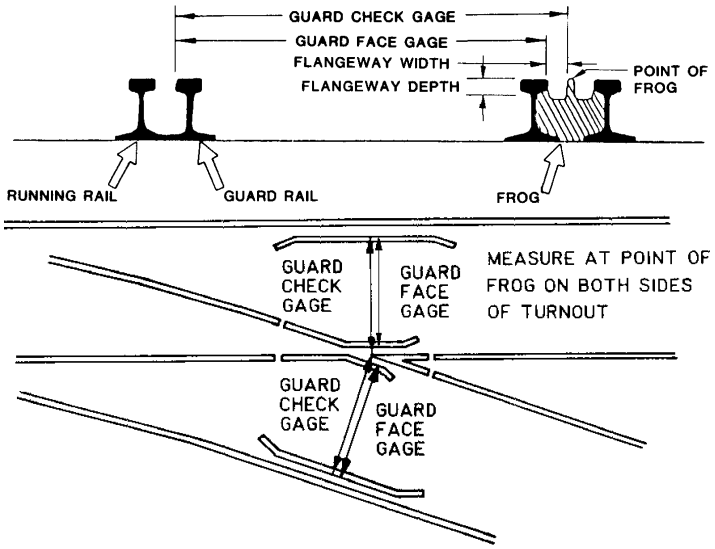

Figure 8-7. Measurement of Flangeway Width, Flangeway Depth, Guard Check Gage, and Guard Face Gage

Table 8-2. Minimum Length of Straight Guarding Face in Advance of Frog Point

Frog Number	Length (Inches)
4, 5, 6, 7, 8, 9, 10	14
11, 12, 14	18
15, 16	26
18, 20	30

CHAPTER 9

RAIL CROSSINGS

9-1. GENERAL. Rail crossings are designed to carry one track across another at grade. Drainage is vital in protecting the subgrade from increased impacts.

9-2. MAINTENANCE REQUIREMENTS.

a. *Size.* Rail crossings shall be the proper weight and section for the rails being joined.

b. *Flangeway Width and Depth*. Standards for rail crossing flangeways are identical to the frog flangeway standards given in Table 8-1 and shall be used.

c. *Debris in Flangeways.* Flangeways shall be kept clear of debris. Any obstructions, including ice and packed snow, shall be removed.

d. *Bolts.* All crossing bolts shall be in place and tight. Loose bolts shall be tightened and bolts that cannot be tightened shall be replaced. Missing bolts shall be replaced.

e. *Special Components.* All broken or damaged components shall be replaced or repaired.

9-3. ANCHORS. Where rail anchors are used on track approaching rail crossings, every third tie should be box-anchored (four anchors per tie) for at least two rail lengths in all directions from the crossing.

CHAPTER 10

ROAD CROSSINGS

10-1. DRAINAGE.

a. Adequate drainage is essential for satisfactory long-term performance of the track and roadway crossing.

b. Water shall not be allowed to pond on or near the track at a road crossing.

c. Catch-basins, gutters, ditches, sub-drains, and culverts should be properly installed and kept free of debris.

10-2. FLANGEWAYS.

a. ***Flangeway Width.*** Maintenance standards require the flangeway width in a road crossing to be no less than 2.5 inches nor greater than 3 inches. Safety standards require "Restricted Operation" for formed flangeway widths less than 1.75 inches.

b. ***Flangeway Depth.*** Maintenance standards require the flangeway depth in a road crossing to be no less than 2 inches. Safety standards require "Restricted Operation" for flangeway depth less than 1.5 inches.

c. ***Debris.*** Flangeways shall be kept clear of debris. Any obstructions, including ice and packed snow, shall be removed immediately.

10-3. TRACK.

a. ***Ties, Tie Plates, and Spikes.*** When crossings are rebuilt, all ties within the crossing limits and for at least 20 feet beyond each end of the crossing shall be replaced, fully tie plated, and spiked with eight rail-holding spikes on each tie (see Figure 10-1). For crossings, the use of hardwood ties is recommended.

b. ***Joints***. Bolted rail joints are not desirable in road crossings. When crossings are rebuilt, it is highly recommended that all joints within the crossing and up to 20 feet outside the crossing be welded.

c. ***Rail Anchors.*** Where the track on either side of the crossing is anchored, it is recommended that the anchoring pattern be continued through the crossing, provided that the crossing panels can accommodate anchors.

10-4. CROSSING SURFACES AND MATERIALS.

a. It is essential that the crossing surface be maintained to provide a smooth crossing for vehicles and to prevent vehicle tires from striking the rails. The crossing surface shall be maintained at an elevation level with the top of the rails. Additionally, there shall be a smooth transition between the crossing surface and the adjoining pavement.

b. During routine track inspections the inspector should take note of the general condition of the crossing materials and report any damage or condition requiring repair or replacement. Any condition observed in a road crossing which would cause a hazard to motor vehicles using the crossing should be corrected immediately.

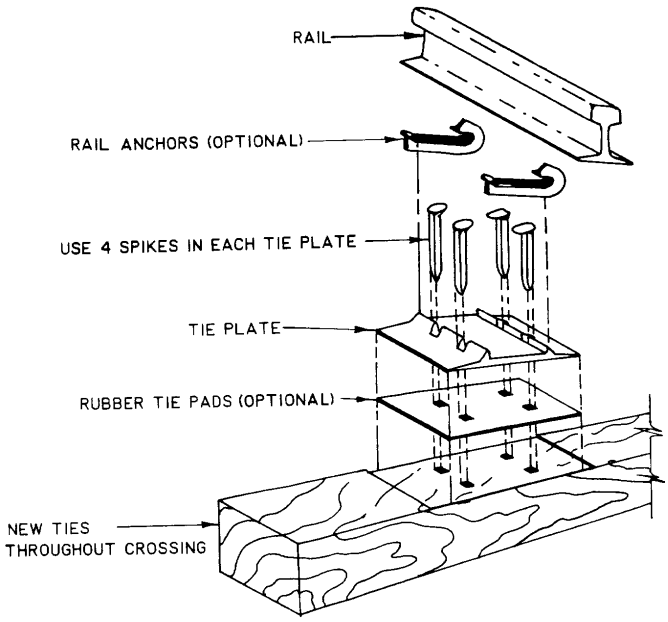

Figure 10-1. Track Construction for Road Crossing

10-5. GRADE CROSSING PROTECTION—SIGNS AND SIGNALS. During routine track inspections, the inspector should observe the condition of all whistle posts, highway warning signs and crossbucks, and signals. Signs and signals should be easily legible and clearly visible to the highway user. Signs and signals shall conform to the requirements of the Federal Highway Administration (FHA) *Manual on Uniform Traffic Control Devices* (MUTCD), Part 8, "Traffic Controls for Highway–Rail Grade Crossings." Additional guidance may be obtained from the FHA *Railroad–Highway Grade Crossing Handbook*.

10-6. ELECTRIC/ELECTROMECHANICAL GRADE CROSSING SIGNALS. Inspection and maintenance of electric and/or electromechanical signals should conform to manufacturer's recommendations, state/local requirements, and the FRA Part 234 "Grade Crossing Signal System Safety." Paragraph 10-6.a and b summarizes the minimum requirements of the FRA standards. The inspections and tests described are performed to determine if the warning system and its component parts are maintained in a condition to perform their intended function. Any electromagnetic device, relay or other electromagnetic device that fails to meet the requirements of the tests shall be removed from service until corrected. All reference to "system" in the remainder of this section shall refer to the grade crossing signal system. The inspector shall meet the qualifications of FRA Part 212.231. Signals shall be inspected once each month.

a. *Maintenance Standards.*

(1) *Location of Plans.* Plans required for proper maintenance and testing shall be kept at each system location (equipment cabinet). Plans shall be legible and correct.

(2) All control circuits shall operate on a fail-safe principle.

(3) Operating characteristics of electromagnetic, electronic, or electrical apparatus shall be maintained in accordance with the limits within which the system is designed to operate.

(4) When any essential component fails to perform its intended function, the cause shall be determined and the faulty component adjusted, repaired, or replaced

immediately. Until repair is completed, comply with appropriate action to flag vehicular traffic in accordance with activity/installation regulations or, for the Navy, paragraph 3.3.f of NAVFAC P-301, *Navy Railway Operating Handbook*.

(5) During testing or performing work on signals or track structure, which affects the integrity of the warning system, alternative methods must be provided to maintain safety for the highway user. Immediately after repairs, adjustments, or replacements have been completed, an appropriate test of the affected equipment must be made to verify that the system is operating as intended.

(6) Highway-rail grade crossing warning system apparatus shall be secured against unauthorized entry (i.e., locked equipment cabinet).

(7) Each circuit that affects the proper functioning of a grade crossing warning system shall be kept free of any ground or combination of grounds that will permit a current flow of 75 percent of more of the release value of any relay or electromagnetic device in the circuit.

(8) A standby source of power shall be provided with sufficient capacity to operate a warning system for a reasonable length of time during a period of primary power interruption. The designated capacity shall be specified on the plans (Paragraph 10-6.a.(1)). Batteries shall be checked as follows:

(a) Keep battery terminals, vent caps and cell casings clean. Keep terminals lightly coated with no-oxide grease.

(b) Keep electrolyte at the correct level in each cell.

(c) Check the charging rate and adjust as necessary.

(d) Measure and record the voltage of each cell.

(9) Flashing light units shall*:*

(a) Be properly positioned and aligned and shall be visible to a highway user approaching the crossing.

(b) Be maintained to prevent dust and moisture from entering the interior of the unit. Roundels and reflectors shall be clean and in good condition.

(c) Flash alternately. The number of flashes per minute for each light unit shall be 35 minimum and 65 maximum.

(10) Each gate arm light shall be maintained in such condition as to be properly visible to approaching highway users. Gates shall be cleaned and lubricated as necessary. Lights and light wire shall be secured to the gate arm.

(11) The voltage at each lamp shall be maintained at no less than 85 percent of the prescribed rating for the lamp.

(12) Each gate arm, when in the downward position, shall extend across each lane of approaching highway traffic and shall be clearly viewable by approaching highway users. Each gate arm shall start its downward motion not less than three seconds after flashing lights begin to operate and shall be in a horizontal position at least five seconds before the train arrives at the crossing.

(13) System must activate at least 20 seconds prior to rail traffic occupying a grade crossing.

(14) Train detection apparatus shall be maintained to detect a train or railcar in any part of a train detection circuit. If the presence of sand, rust, dirt, grease, or other foreign matter is known to prevent effective shunting, flagging of the crossing shall be accomplished.

(15) Each train detection circuit shall detect the application of a shunt of 0.06-ohm resistance when the shunt is connected across the rails of any part of the circuit.

(16) Each set of fouling wires in a train detection circuit shall consist of two discrete conductors, each maintained in such condition to ensure proper operation of detection apparatus when the circuit is shunted.

(17) Each non-insulated rail joint located within the limits of a train detection circuit shall be bonded by means other than joint bars and the bonds shall be maintained in such condition to ensure electrical conductivity.

(18) Each insulated rail joint shall be maintained to prevent current flowing between rails separated by the insulation in an amount sufficient to cause failure of the detection circuit.

(19) A switch, when equipped with a switch circuit controller connected to the point and interconnected with warning system circuitry, shall be maintained so that the warning system can only be cut out when the switch point is within 0.5 inch of full reverse position.

(20) Each wire shall be tagged or otherwise marked so that it can be identified at each terminal. Tags and other marks shall be made of insulating material and so arranged that tags and wires do not interfere with moving parts of the apparatus.

(21) Insulated wire shall be protected from mechanical injury. The insulation shall not be punctured for test purposes. A splice in underground wire shall have insulation resistance at least equal to that of the wire spliced.

(22) Wire on a pole line shall be securely attached to an insulator that is properly fastened to a cross arm or bracket supported by a pole or other support. Wire shall not interfere with other wires on the pole line. An open-wire transmission line operating at 750 volts or more shall be placed not less than 4 feet above the nearest cross arm carrying active warning system circuits.

(23) Each sign mounted on a signal system post shall be in good condition and be visible to the highway user.

b. ***Inspections and Tests.*** Inspection and tests of electric/electromechanical signals shall be performed to determine if the warning system and its component parts are maintained in a condition to perform their intended function. Any electronic device, relay, or other electromagnetic device that fails to meet the requirements of tests required by this UFC shall be removed from service and shall not be restored to service until its operating characteristics are in accordance with the limits within which such device or relay is designed to operate. Additional tests, adjustments, cleaning and lubrication in accordance with the equipment manufacturer shall be accomplished. Proper precautions must be taken to protect highway traffic and safe operation of trains before any changes or tests are initiated on a highway-grade crossing warning system.

(1) *Monthly Inspection and/or Tests.*

(a) Ground Tests: A test of grounds on each energy bus furnishing power to circuits that affect the safety of the warning system operation. (See paragraph 10-6.a.(7))

(b) Standby Power: Standby power shall be tested. (See paragraph 10-6.a.(8))

(c) Flashing Light Units: Each flashing light unit shall be inspected for proper visibility, dirt and damage to roundels and reflectors. Lenses shall be cleaned and bulbs replaced, as necessary. (See paragraph 10-6.a.(9)(b))

(d) Gate Arms and Gate Mechanism: Each gate arm and mechanism shall be inspected and observed for proper operation. (See paragraph 10-6.a.(10) and (12))

(e) Warning System Operation: Each crossing warning system, including warning bells or other stationary audible warning devices, shall be tested to determine that it functions as intended. (See paragraph 10-6.a.(15))

(f) Highway traffic signal pre-emption interconnection shall be tested.

(2) *Quarterly Inspections and/or Tests.*

(a) Cut-out circuits shall be tested at least every three months to determine that the circuit functions as intended. A cutout circuit is any circuit or device that overrides the operation of the automatic warning system. This includes both switch cutout switches and devices that enable personnel to manually override the system operation.

(b) Insulated rail joints, bond wires, and track connections shall be inspected. (See paragraph 10-6.a.(17) and (18))

(3) *Annual Inspection and/or Tests.*

(a) Flashing Light Units and Lamp Voltage:

1. Each flashing light unit shall be inspected for proper alignment and frequency of flashes in accordance with installation specifications. (See paragraph 10-6.a.(9)(a) and (c))

2. Lamp voltage shall be tested. (See paragraph 10-6.a.(11))

(b) Gate mechanism hold-clear devices shall be tested for proper operation.

(c) Each crossing warning system shall be tested for the prescribed warning time. (See paragraph 10.6.a.(13))

(d) Timing Relays and Timing Devices: Each timing relay and timing device shall be tested. The timing shall be maintained at not less than 90 percent nor more than 110 percent of the 41 predetermined time intervals. The predetermined time intervals shall be shown on the plans or marked on the timing relay or timing device.

(4) The following shall be tested at the frequency indicated:

(a) Relays affecting the proper functioning of a crossing warning system:

1. Alternating current centrifugal relays shall be tested every 12 months.

2. Alternating current vane-type relays, direct current polar-type relays and relays with soft iron magnetic structure shall be tested every two years.

3. Other type relays shall be tested at least every four years.

(b) Insulation resistance tests, wires in trunking and cables:

1. Insulation resistance tests shall be made on wires or cables every 10 years.

2. Insulation resistance tests shall be made between all conductors and ground, between conductors in each multiple conductor cable and between conductors in trunking. Insulation resistance tests shall be performed when wires, cables and insulation are dry.

3. When insulation resistance of wire or cable is found to be less than 500,000 ohms, prompt action shall be taken to repair or replace the defective wire or cable. Until replacement is completed, insulation resistance testing shall be made annually. A circuit with a conductor having an insulation resistance of less than 200,000 ohms shall not be used.

c. ***Results of Inspections and Tests.*** Results of inspections and tests made in accordance with paragraph 10-6.b shall be recorded. A sample form is provided in Appendix B, Figure B-3. The inspector shall sign each record. Each record shall be retained for two years or until the next reported inspection, whichever is longer. Each record shall indicate activity name, crossing inventory name, place and date, equipment tested, results of tests, repairs, replacements, adjustment made, and condition in which the apparatus was left.

CHAPTER 11

BRIDGES

11-1. GENERAL.

a. For inspection purposes, track standards are applied to the bridge ties and all the components resting on them. Bridge standards are applied to those components supporting the bridge ties and below.

b. All track bridges shall be equipped with inner guardrails. Guardrails may be an appropriate safety measure for tracks located under bridge overpasses.

c. Rail anchors shall not be installed on track over open deck bridges. Any anchors found on track over an open deck bridge shall be removed immediately.

11-2. BRIDGE INSPECTION AND LOAD RATINGS.

a. Railroad bridges shall be inspected using the procedures and checkpoints described in NAVFAC MO-322, *Inspection of Shore Facilities*, for the Navy; TM 5-600/AFJPAM 32-1088, *Bridge Inspection, Maintenance and Repair*, for the Air Force and Army; and AR 420-72 for the Army. For the Air Force, the BCE is responsible for determining the inspection requirements. The minimum frequency for inspecting railroad bridges is every two years.

b. Structure analysis based on current loading or larger anticipated loadings shall be maintained on file in accordance with NAVFACINST 11230.1 for Navy activities and AR 420-72 for Army garrisons.

11-3. DANGEROUS CONDITIONS. Inspectors shall note any condition of a bridge that might adversely affect train operations. Such conditions shall be reported immediately to the proper authorities. Train operations over the structure shall not be permitted until a damage or in-depth inspection is completed and has documented that the bridge is sufficient for normal operations.

CHAPTER 12

TRACK GEOMETRY

12-1. GENERAL.

a. One rail shall be designated as the line rail. This rail establishes the alignment of the track. Either rail may be used as the line rail on tangent track so long as the same rail is used for the entire length of the tangent. The outside rail in a curve is always the line rail.

b. In curves, the inside rail is designated as the grade rail. The grade rail is the reference from which superelevation is applied to the outside rail of the curve.

c. During routine track inspections, track geometry measurements shall be taken as a minimum at the following locations:

(1) Wherever there are visual indications of track geometry deviations.

(2) Wherever track geometry deviations were previously detected, unless the deviation has been corrected.

(3) Other locations as specified in this chapter.

12-2. GAGE.

a. ***Definition.*** Gage is the distance between the two rail heads, measured at right angles to the rails in a plane 0.625 inch below the top surface of the rail head as shown in Figure 12-1. Gage measurements shall include any evidence of lateral movement under load, such as any space between the field side rail base and tie plate shoulder.

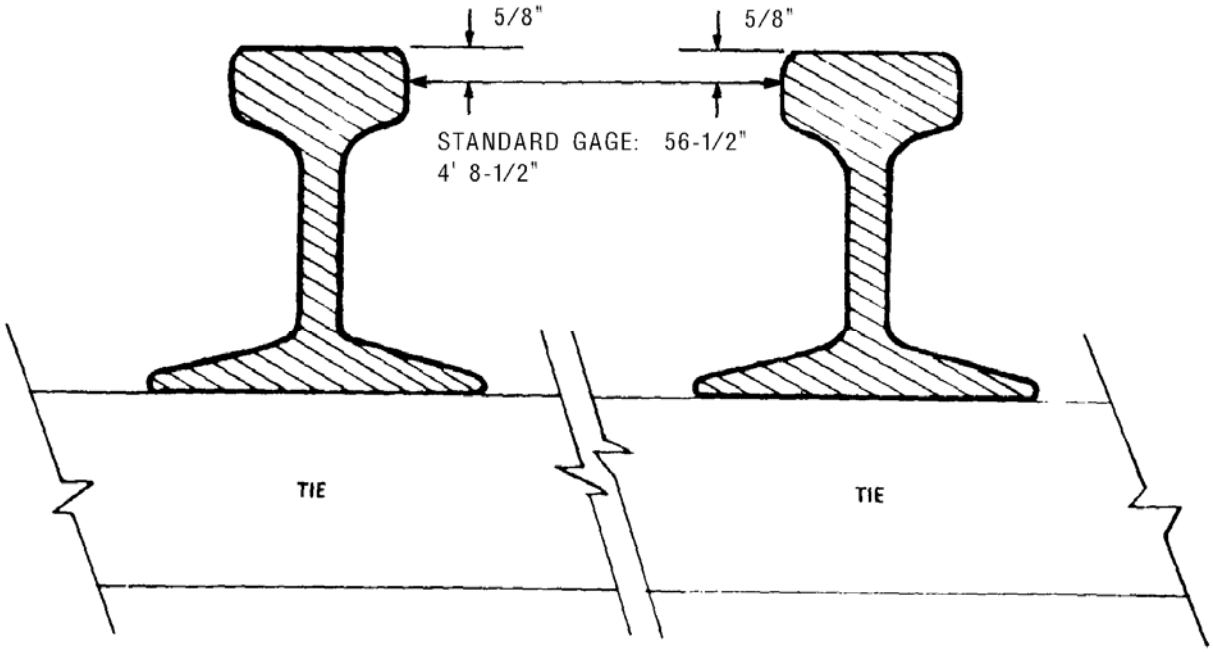

Figure 12-1. Gage Measurement

b. ***Measurement Locations.*** During routine track inspections, gage shall be measured at the following locations:

(1) In turnouts, just ahead of switch points (ahead of the bend in the stockrail) and at the joints in curved closure rails. (See Figure 12-2)

(2) Two measurements at the heel of the switch for the straight rail and the turnout side.

(3) At the point of frog on both sides of turnouts and rail crossings. (See Figure 12-2)

(4) Wherever there is a dark streak running along the field side of the top surface of the railhead.

(5) Wherever wear marks on a tie indicate lateral tie plate movement.

(6) Where a significant gap exists between the rail base and outside shoulder of the tie plate.

(7) At locations where ties are badly skewed.

(8) In road crossings.

(9) Near the beginning and ending of curves.

(10) In curves greater than 6 degrees, gage shall be measured in at least three well-spaced locations within the curve. Outside rail joints should also be observed for gage widening.

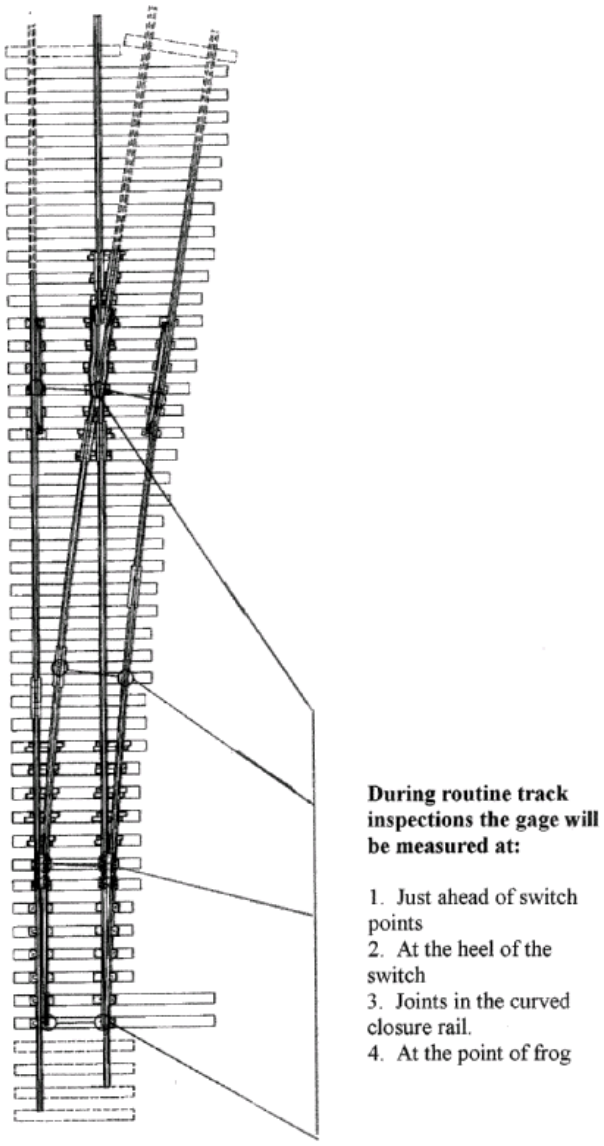

Figure 12-2. Required Gage Measurement Locations Within Turnouts

c. *Standard Gage.* Standard gage is 56.5 inches. Track will be gaged to this standard except in curves with high degrees of curvature (see Table 12-1) or other unusual conditions where the engineer in charge does not recommend standard gage.

Table 12-1a. Recommended Gage for Curved Track (Navy & Air Force)

Degree of Curvature	Recommended Gage (Inches)
Up to 12 degrees	56.5
Over 12 degrees up to 14 degrees	56.625
Over 14 degrees up to 16 degrees	56.75

Over 16 degrees up to 18 degrees	56.875
Over 18 degrees,	57

Table 12-1b. Recommended Gage for Curved Track (Army)

Degree of Curvature	Recommended Gage (Inches)
Up to 22 degrees	56.5
Over 22 degrees up to 26 degrees	56.625
Over 26 degrees up to 30 degrees	56.75
Over 30	56.875

d. Standards for gage are as follows:

Safety Standards Allowable Gage (Inch)				**Maintenance Allowable Gage (Inch)**	
Restriction		*No Operations*		*Min*	*Max*
Min	*Max*	*Min*	*Max*		
56	GT 57.5	LT 56	GT 57.75	56.125	57.5

12-3. CROSSLEVEL.

a. ***Definition.*** Crosslevel is the difference in elevation between the top surfaces of the two rails measured at right angles to the track, as shown in Figure 12-3. Crosslevel measurements shall include any evidence of vertical movement under load.

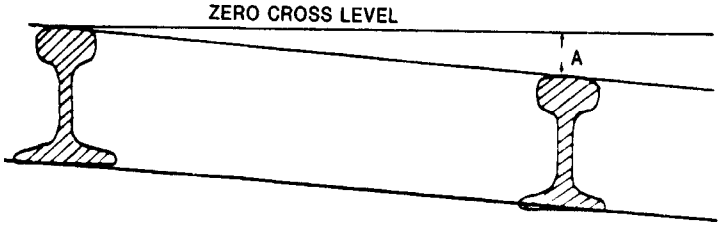

Figure 12-3. Crosslevel Measurement

b. ***Designated Crosslevel.*** On tangent track, the designated crosslevel is zero. On curved track, the designated crosslevel is equal to the designated superelevation.

c. Standards for the allowable deviation from designated elevation for crosslevel are as follows:

Track Category	Safety Standard (Inches)		Maintenance Standard (Inches)
	Restriction	*No Operation*	
A	GT 2	GT 3	GT 1.25
B	GT 2	GT 3	GT 1.5

12-4. SUPERELEVATION.

a. ***Definition.*** Superelevation is the intended increase in elevation of the outer rail above the inner rail in a curve.

b. ***Reverse Superelevation.*** Safety standards require a restriction if the outside rail of a curve is lower than the inside rail by more than 0.5 inch. Maintenance standards require the outside rail of a curve to be at the same elevation or above the inside rail.

c. ***Maximum Superelevation.*** The outside rail of a curve may not be more than 4 inches higher than the inside rail.

d. ***Uniform Superelevation.*** If a curve is superelevated, the superelevation shall be uniform throughout the curve.

e. ***Superelevation Runoff.*** Superelevation runoff shall be at a uniform rate and shall extend at least the full length of the spiral. If no spiral is present, the superelevation runoff shall be accomplished on the tangent track. Safety standards require a restriction if the superelevation runoff exceeds –1.75 inches in any 31 feet of rail. Maintenance standards recommend a target of 1 inch of runoff in 31 feet.

f. ***Recommended Superelevation.*** The recommended superelevation for a given maximum operating speed for curved track can be determined from Table 12-2. Table 12-2 reflects the recommended 0.5 inch of unbalance. Safety standards require a restriction if the curve superelevation exceeds 3 inches of unbalance. Three (3) inches of unbalance would be equal to 2.5 inches less than the recommended values of superelevation in Table 12-2. Maintenance shall be performed during the next maintenance cycle when the superelevation exceeds 1.5 inches of unbalance. One and one-half (1.5) inches of unbalance would be equal to 1 inch less than the recommended values of superelevation in Table 12-2. If reverse superelevation exists see paragraph 12-4.b.

Table 12-2. Recommended Superelevation for Curved Track

Degree of Curvature	*Maximum Operating Speed (mph)*							
	10	*15*	*20*	*25*	*30*	*35*	*40*	*45*
0.50	0.50	0.50	0.50	0.50	0.50	0.50	0.50	0.50
1.00	0.50	0.50	0.50	0.50	0.50	0.50	0.75	1.00
1.50	0.50	0.50	0.50	0.50	0.50	0.75	1.25	1.75
2.00	0.50	0.50	0.50	0.50	0.75	1.25	1.75	2.25
2.50	0.50	0.50	0.50	0.50	1.00	1.75	2.25	3.00
3.00	0.50	0.50	0.50	0.75	1.50	2.00	2.75	3.75
3.50	0.50	0.50	0.50	1.00	1.75	2.50	3.50	
4.00	0.50	0.50	0.50	1.25	2.00	3.00	4.00	

Degree of Curvature	*Maximum Operating Speed (mph)*							
	10	*15*	*20*	*25*	*30*	*35*	*40*	*45*
4.50	0.50	0.50	0.75	1.50	2.25	3.25		
5.00	0.50	0.50	1.00	1.75	2.75	3.75		
5.50	0.50	0.50	1.00	2.00	3.00			
6.00	0.50	0.50	1.25	2.25	3.25			
6.50	0.50	0.50	1.25	2.25	3.50			
7.00	0.50	0.75	1.50	2.50	4.00			
7.50	0.50	0.75	1.50	2.75				
8.00	0.50	1.00	1.75	3.00				
8.50	0.50	1.00	2.00	3.25				
9.00	0.50	1.00	2.00	3.50				
9.50	0.50	1.00	2.25	3.75				
10.00	0.50	1.00	2.25	4.00				
10.50	0.50	1.25	2.50	4.00				
11.00	0.50	1.25	2.50					
11.50	0.50	1.25	2.75					
12.00	0.50	1.50	2.75					
13.00	0.50	1.50	3.25					
14.00	0.50	1.75	3.50	TRAINS SHALL NOT BE OPERATED ON CURVES AT SPEEDS WHICH REQUIRE MORE THAN 4 IN. SUPERELEVATION				
15.00	0.75	1.75	3.75					
16.00	0.75	2.00	4.00					
17.00	0.75	2.25						
18.00	1.00	2.25						
19.00	1.00	2.50						
20.00	1.00	2.75						

Notes for Table 12-2:

1. At least 0.5 inch of superelevation is recommended on all curves as indicated to prevent reverse superelevation. On curves that historically do not retain the minimum 0.5 inch of superelevation, the next maintenance cycle should surface the curve with 1 inch of superelevation.
2. Safety standards should use the 3-inch unbalanced formula in accordance with the FRA *Track Safety Standards*.
3. Superelevation calculated using 0.5-inch unbalanced formula, i.e.:

$$E = (0.0007DV^2)-0.5$$

where: E = Superelevation, inches, D = Degree of Curvature V = Speed, mph. All values have been rounded to 0.25-inch increments.

Examples:

To determine superelevation:

-Enter table at maximum operating speed.
-Go down to maximum degree of curvature.
-Read Superelevation.

Known:

-Maximum operating speed: 25 mph.
-Degree of curvature: 8°

Required superelevation is 3.00 inches.

4. Cross-level (paragraph 12-3) shall determine the need for maintenance (related to superelevation) on curves.

12-5. WARP.

a. ***Definition.*** Warp is the difference in crosslevel between any two points less than or equal to 62 feet apart. Warp is determined as follows:

(1) Use the line rail as the reference rail.

(2) Measure the crosslevel at any two points less than 62 feet apart, normally at joints in the rail. If the reference rail is lower than the opposite rail, the sign of the measurement is negative (-). If the reference rail is higher than the opposite rail, the sign of the measurement is positive (+).

(3) *Determining Warp*. If both signs are the same, drop the signs and subtract the smaller measurement from the larger measurement. If the signs are different, drop the signs and add the measurements. Figure 12-4 presents an example of the warp calculation.

b. ***Designated Warp.*** The designated warp on both tangent and curved track is zero.

c. ***Maintenance and Safety Standards.*** Standards for the maximum allowable deviation due to warp are as follows:

Safety Standards (Inches)		Maintenance Standards (Inches)
Restriction	*No Operation*	
GT 2.25	GT 3.0	GT 1.75

d. All measurements taken at joints within the 62-foot distance must be calculated for warp. Assuming 39-foot rails, in addition to calculating warp at AB & AC, warp shall also be checked at AD as shown on Figure 12-4.

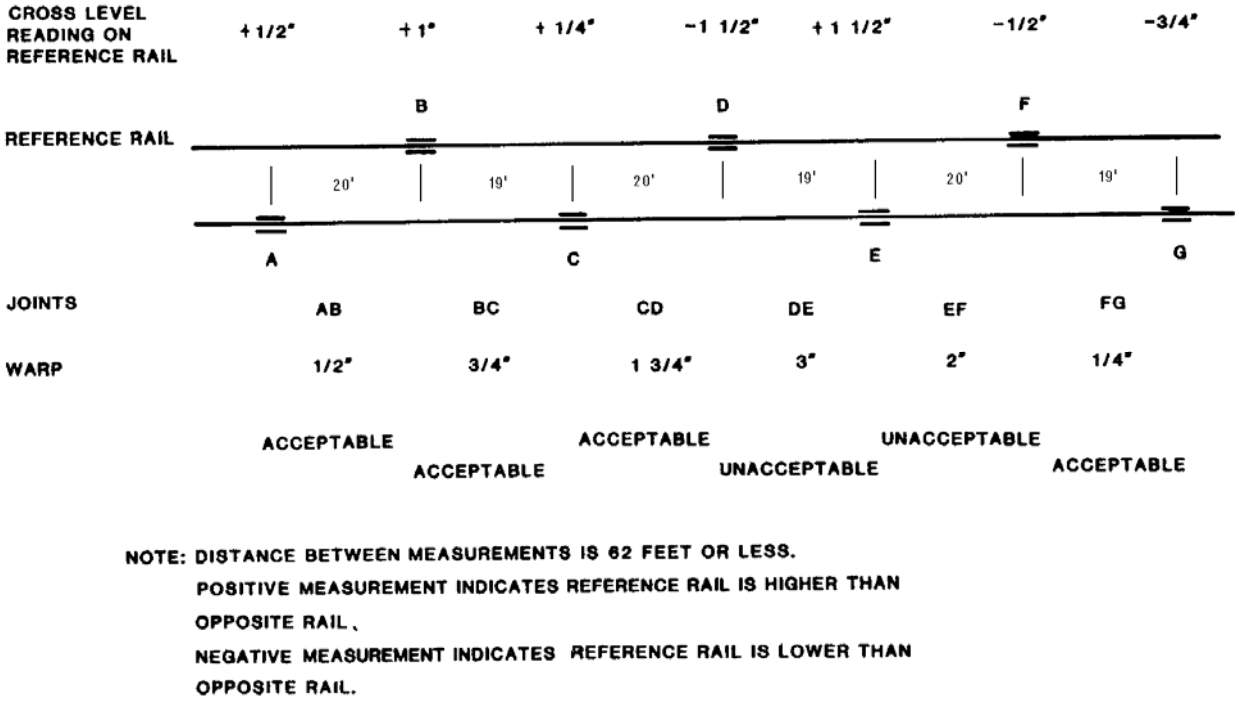

Figure 12-4. Determination of Warp

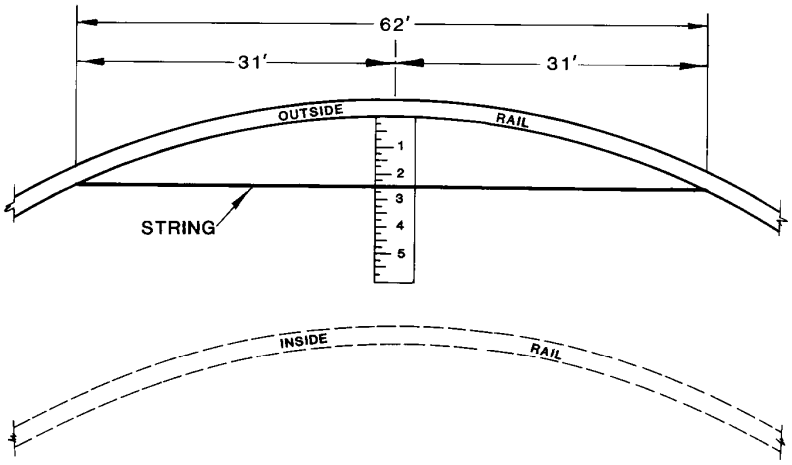
12-6. ALIGNMENT.

a. ***Definition.*** Alignment is the relative position of the rails in a horizontal plane.



b. ***Measurement.*** Alignment is measured at the midpoint of a 62-foot string line stretched along the gage side of the line rail at a distance of 0.625 inch below the top of the railhead. The alignment measurement is the distance in inches from the midpoint of the string line to the gage side of the line rail. It is measured at right angles to the string line.

c. ***Designated Alignment.*** For tangent track the designated alignment is zero. For curved track the designated alignment is the degree of curvature. In spirals the change in curvature will be at a uniform rate.

d. ***Curvature Measurement.*** On curves, 1-inch distance from the 62-foot string line to the line rail equals approximately 1 degree of curvature, as shown in Figure 12-5. If the degree of curvature is not known, it can be determined as follows:

(1) Beginning at a point near the center of the curve, mark at least two stations spaced 31 feet apart in both directions along the line rail.

(2) Measure the alignment at each station, including the beginning point, and average the measurements. This average measurement is the approximate degree of curvature.

MEASUREMENTS OF ALIGNMENT USING A 62 FOOT STRINGLINE:

1. STRETCH STRING WITH ENDS AGAINST GAGE SIDE OF LINE RAIL 5/8″ BELOW THE SURFACE OF THE RAIL.
2. MEASURE AT THE MID- POINT (31′) FROM STRING TO GAGE SIDE OF RAIL 5/8″ DOWN
3. ONE INCH EQUALS APPROXIMATELY ONE DEGREE OF CURVATURE.

EXAMPLE ILLUSTRATES A MEASUREMENT OF ABOUT 2-1/2″, OR APPROXIMATELY 2 DEGREES 30 MINUTES OF CURVATURE FOR THE ONE ISOLATED SPOT WHERE THE MEASUREMENT WAS TAKEN.

Figure 12-5. Measurement of Curve Alignment

e. ***Safety and Maintenance Standards.*** Standards for the maximum allowable deviations from designated alignment are as follows:

Track Category	Safety Standard (Inch)		Maintenance Standard (Inch)
	Restriction	*No Operation*	
A & B	GT 3	GT 5	GT 2

12-7. PROFILE.

a. ***Definition.*** Profile is the relative elevation of the two rails along the track. Profile deviation is the deviation from uniform profile on either rail at the midpoint of a 62-foot chord.

b. ***Safety and Maintenance Standards.*** When the maintenance standards are exceeded, maintenance shall be performed in the next cycle. Standards for the allowable deviations from uniform profile are as follows:

Track Category	Safety Standards (Inch)		Maintenance Standards (Inch)
	Restriction	*No Operation*	
A & B	GT 2.75	GT 3	GT 2.25

CHAPTER 13

CLEARANCES

13-1. MEASUREMENT. Vertical clearance shall be measured vertically from the top surface of the rail. Side clearance shall be measured horizontally from the centerline of the track.

13-2. CLEARANCE REQUIREMENTS, TANGENT TRACK. Clearances for tangent track shall not be less than those listed in Table 13-1 and shown in Figure 13-1.

13-3. CLEARANCE REQUIREMENTS, CURVED TRACK.

a. For each degree of curvature, side clearances shall be increased 1.5 inches over that required in Table 13-1 and Figure 13-1.

b. When an obstruction is located adjacent to tangent track but the track is curved within 80 feet of the obstruction, the side clearances shall be increased by the following amounts:

Distance from Obstruction to Curved Track (Feet)	Increase per Degree of Curvature (Inches)
0–20	1.5
21–40	1.125
41–60	0.75
61–80	0.375

13-4. TRACK CENTERS. The minimum spacing between the centerlines of adjacent tracks shall be maintained as given below and state department of transportation (DOT) clearance requirements shall also be checked as a minimum:

Type of Tracks	Minimum Center-to-Center Distance
Yard, loading, and storage tracks	13 feet (recommend 14 feet)
Yard track parallel to main or running track	15 feet
Passing track	15 feet

13-5. CHANGES TO CLEARANCES. Whenever changes in alignment or elevation are made, clearances shall be checked for compliance with the criteria given in this chapter. This is especially important in the vicinity of buildings, bridges, overhead structures, platforms, and tunnels. All four vertical clearance points (see Figure 13-1) under bridges/structures shall be measured. The least dimension shall govern for clearance.

Table 13-1. Clearance Requirements for Tangent Tracks

Obstruction	Required Clearance
Vertical Clearances	
Overhead wires: open supply, arc wires, service drops	
0 to 750 volts	27 feet
750 to 15,000	28 feet
Exceeding 15,000 volts	30 feet
Other overhead wires	27 feet
Building entrances (including engine-houses)	18 feet
Overhead	22 feet
Other overhead obstructions	22 feet
Side Clearances	
Buildings	8 feet 6 inches
Buildings without platforms (delivery required)	8 feet
Platforms	
Freight platforms up to 4 feet maximum height	6 feet 2 inches
Refrigerator car platforms up to 3 feet 3 inch	6 feet 2 inches
Refrigerator car platforms 3 feet 3 inch to 4 feet high	8 feet
Low platforms (less than 8 inches high)	5 feet
Engine-house entrances	6 feet-6 inches
Building entrances (other than engine-houses)	8 feet
Canopies over platforms (canopy height 16 feet or less)	8 feet
Fences, retaining walls, utility poles, and other obstructions	8 feet 6 inches
Bridges	8 feet
Signs	8 feet
All loose, palliated, and stacked materials	8 feet
Parked vehicles	8 feet

Note: In curves, side clearances shall be increased 1.5 inches for each degree of curvature.

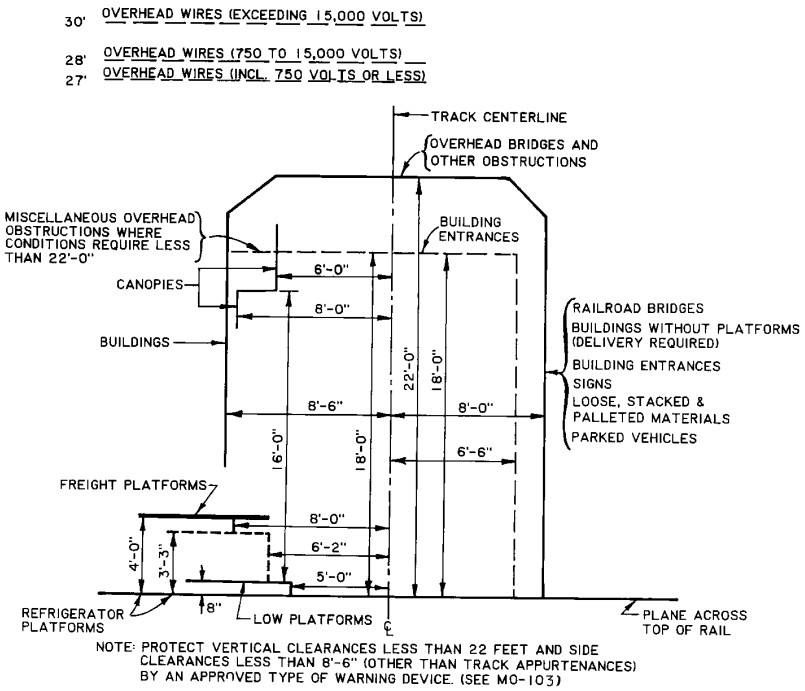


Figure 13-1. Minimum Clearances for Tangent Track

CHAPTER 14

MISCELLANEOUS TRACK APPLIANCES

14-1. TRACK SCALES. The inspection, maintenance, and calibration of railroad track scales are covered in the Association of American Railroads *Scale Handbook*, published annually as a part of the AREMA *Manual for Railway Engineering*. Track scales should be inspected and calibrated periodically in accordance with the recommendations given in the *Scale Handbook*.

14-2. BONDED AND GROUNDED TRACK.

a. Certain tracks used for the loading/unloading of fuels and ordnance are required to be bonded and grounded. Grounding requirements are given in UFC 4-860-01FA for Army and Air Force installations, and NAVSEA OP 5, *Ammunition and Explosives Ashore Safety Regulations for Handling, Storing, Production, Renovation and Shipping*, for the Navy. During maintenance of bonded and grounded track, care shall be taken to maintain the integrity of the rail bonds, ground rods, and connections.

b. During routine track inspections, the general condition of the bonds, ground wires, and connections shall be observed. Loose or missing bonds or connections shall be repaired immediately. The occurrence of excessive corrosion in the terminal areas of the bond wires and ground wires indicates a need for cleaning, repair, or replacement. Bonds and grounds shall be replaced if there is a large difference in electrical potential between the rails.

14-3. DERAILS.

a. Derails shall be maintained in good operating condition.

b. Derails shall be maintained free of lost motion that would allow it to be operated without removing the lock.

c. Derails shall be kept clean and painted in order to be readily visible to operating personnel.

d. Derails, normally supplied in 1-inch increments allowing no more than 0.5 inch of shimming, shall be properly installed for the rail to which it is applied.

14-4. OTHER TRACK APPLIANCES. Other track appliances, like bumper stops and cushion heads, wheel stops, etc., shall be in good working order for their intended use. Wheel stops are not designed for, nor shall they be used as, bumper stops. They are only designed to keep cars from rolling off the end of a track or past a point.

CHAPTER 15

MAINTENANCE ACTIVITIES FOR CATEGORY C TRACK

15-1. GENERAL. The minimum level of maintenance for inactive (Category C) track will be consistent with the anticipated future mission of the activity and the particular track involved. This chapter summarizes the general requirements.

15-2. MAINTENANCE REQUIREMENTS.

a. Maintenance of rail, ties, and ballast shall be discontinued.

b. Drainage shall be maintained in accordance with paragraph 3-2.

c. Damaging vegetation in the ballast, roadbed, and ditches shall be controlled in accordance with paragraph 3-3.

d. Bridges and other track structures shall be maintained in structurally sound condition with respect to their expected loading.

e. Clearances addressed in Chapter 13 shall be maintained to ensure that permanent facilities are not constructed within the railroad right-of-way.

f. If there is a mobilization requirement, switches shall be kept properly adjusted and fully operational.

15-3. INACTIVATION AND DISPOSAL. In accordance with NAVFAC P-73, *Real Estate Procedures Manual*, for Navy activities; AR 420-72 and AR 405-90, *Disposal of Real Estate*, for Army; and AFI 32-9004, *Disposal of Real Estate*, for Air Force installations, action will be taken to dispose of track having no foreseeable need.

TRACK INSPECTION RECORD AND TURNOUT INSPECTION CHECKLIST

B-1. To aid in the inspection of track, the Track Inspection Record, Turnout Inspection Checklist, and Highway Grade Crossing Warning System Inspection/Test Report provided in Figures B-1, B-2, and B-3 are available for use. These forms can also be found in NAVFACINST 11230.1. Figures B-4 through B-10 show the inspection worksheets for use with the RAILER Engineered Management System (EMS). These forms are intended for recording inspection findings in the RAILER software database after returning to the office. Alternatively, an electronic track inspection program, RAILER Remote Entry Database (RED), can be used to collect and record data on a tablet PC for electronic upload to the RAILER software. The RAILER database keeps an electronic record of the inspection defects and automatically reports the current standard condition level for each. Policies can also be created to match each defect up to its corrective work action. Note that, in general, each RAILER inspection form requires information about the inspector name, inspection date, track and segment. In addition, inspection information includes the type of defect, location, length, density, quantity, and other component-specific information. Some forms are formatted as checklists to provide the inspector a list of everything that needs to be verified during an inspection—the Turnout Inspection Worksheet (Figure B-7) is one example of this. Information on RAILER EMS is available at the following website:
http://www.tac.uiuc.edu/software/railer/railer.html

Appendix E provides a summary of the maintenance standards and safety standards.

B-2. TRACK INSPECTION RECORD.

a. ***Intent and Application.*** The Track Inspection Record is intended for use as a record of scheduled maintenance, safety, and special track inspections. This form will be used for each operational and special track inspection to record the type and location of deviations from the standards, degree of hazard, proposed corrective action and time frame for completion, and the actions taken to correct the deviation. For scheduled maintenance inspections, the inspector shall record the location and description of deficiencies. Completed records shall be provided to the appropriate office for action.

b. The form includes identifying information such as installation name, reporting organization, inspector's name (both printed and signed), and the inspection date. The remainder of the form is available for listing deviations observed during the track inspection. In this section one line is normally used to record each deviation, although two or more lines may be required if additional comments are needed. Figure B-1 presents an example of a Track Inspection Record. A description of each of the columns on this form is given below:

Degree of Hazard: The hazard of each defect shall be provided in accordance with NAVFACINST 11230.1 for Navy installations. Army and Air Force Installations shall use local guidance policy. Abbreviations for degree of hazard are provided on the bottom of the Track Inspection Record.

Catastrophic - CAT
Critical - CRIT
Marginal - M

Location Milepost or Station Number: Location of the deviation as referenced to the installations system of track stationing. May be recorded as stations or as Milepost + Feet.

Examples: Stations: 0+00, 6+39, 102+06
Mileposts: 0+0000, 0+639, 1+4926

Deficiency Description: Brief description of the deficiency of deviation observed in the track.

Examples: -Wide gage 57.875 inches
-Small amount of vegetation growing on track

Proposed Corrective Action and Time Frame: What needs to be done to correct the deviation and when. This should include the application of operating restrictions where required.

Examples: -Limit speed to 10 mph, regage, and respike as soon as possible
-Spray for vegetation control within 1 month

Follow-up Actions: Action taken and date completed: what was done to correct the problem and the date repairs were completed.

Examples: 10 mph restriction applied 10/2/00; Repaired 10/15/00;
Herbicide application 6/2/01

B-3. TURNOUT INSPECTION CHECKLIST.

a. *Intent and Application.* The Turnout Inspection Checklist is intended for use in the inspection of turnouts.

b. *Use.* The Turnout Inspection Checklist includes identifying information such as activity name, inspector's name, track identification (track name or number for identifying track), turnout identification (turnout number), and inspection date.

c. Additional sections are provided for the major components of the turnout such as ties, switch and stand, frog, and guard rails and for additional required data such as measurements and general items.

d. To assist in the use of this form and to promote consistent reporting, standard responses are supplied for many of the items. The applicable response should be circled for each item. If the printed response does not cover the situation or if an additional comment is required, a number can be placed in the blank after "Note ___" and the comments written in the "Notes" space provided at the bottom of the form. Blank spaces have been provided where items require a numerical response or a measurement. For multiple items such as rail braces, blanks have been provided before the responses so that a number may be indicated. For example, if two rail braces were loose, one is broken, and one is missing, the response would be:

OK 2 Loose 1 Damaged 1 Missing Note____

e. Some turnouts may be equipped with self-guarded frogs that do not require the presence of guard rails. In cases where there is a self-guarded frog and no guard rails, the entire section of the form titled "Guard Rails" should be crossed out and the words "Self-Guarded" written in the upper-right corner of the section. This will indicate that there are no guard rails in the turnout. If the frog is self-guarded and there are guard rails, the guard rails shall be inspected and the appropriate sections of the form completed.

f. The requirements for turnouts are found in Chapter 8. Figure B-2 presents an example of a completed Turnout Inspection Checklist.

B-4. HIGHWAY GRADE CROSSING WARNING SYSTEM INSPECTION/TEST REPORT (See Figure B-3)

a. *Intent and Application*. The Highway Grade Crossing Warning System Inspection/Test Report is intended for use in the inspection of electric/ electromechanical grade crossing signals as discussed in paragraph 10-6.

b. *Use.* The Highway Grade Crossing Warning System Inspection/Test Report includes identifying information such as activity name, inspector's name, crossing location (track name and highway designation), DOT/AAR Crossing Inventory Number (if applicable), and inspection date.

c. A checklist is provided, divided into Parts A, B, and C. Part A is the monthly requirements, Part B is the quarterly requirements and Part C is the annual requirements. When performing a monthly inspection, Part A is completed. When performing a quarterly inspection, Parts A and B are completed. When performing an annual inspection, Parts A, B and C are completed. Additional space is provided to indicate repairs, replacements, adjustments made and condition in which the apparatus was left. Areas are available for recording standby power battery voltages.

APPENDIX C

FIELD IDENTIFICATION OF RAIL DEFECTS

C-1. RAIL DEFECTS MAY BE OBSERVED IN TRACK. Table 7-1 presents a listing of rail defects and appropriate maintenance and safety standards. This appendix presents definitions relating to rail and brief descriptions of the common rail defects observed in track. Figure C-1 presents common rail nomenclature, and Figure C-2 shows the relative positions of planes through the rail.

All figures presented in Appendix C are copyrighted by Sperry Rail Services and used by permission.

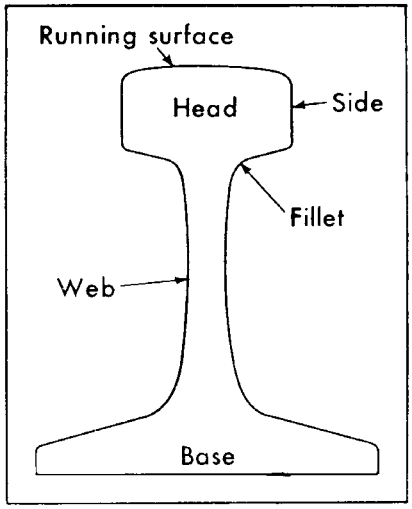

Figure C-1. Rail Nomenclature

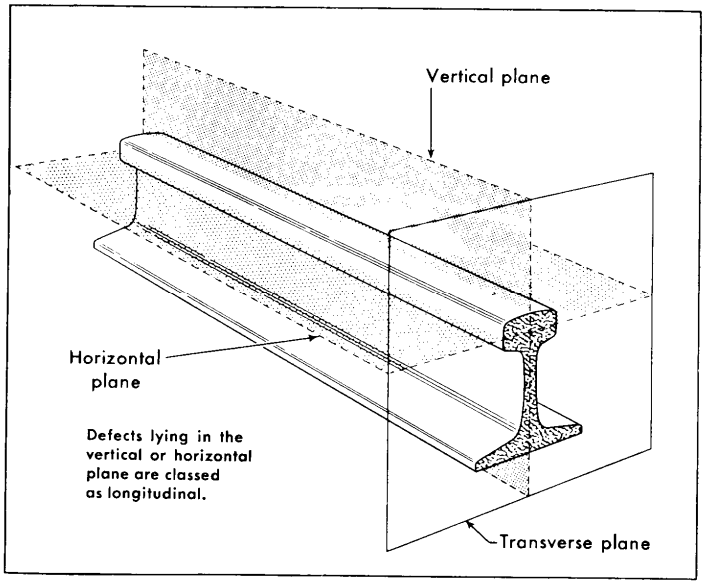

Figure C-2. Relative Positions of Planes Through a Rail

C-2. DEFINITION OF TERMS. The following are common terms related to rail and rail defects. For Navy installations, NAVFAC MO-103 presents additional terms and information.

a. *Bleeding*. Reddish-brown streak on a rail indicating internal rusting.

b. *Field Side*. The side of the rail away from the wheel flange.

c. *Gage Side*. The side of the rail closest to the wheel flange.

d. *Head Checks*. Transverse surface cracks on the gage corner of rails resulting from cold-working the surface metal; sometimes referred to as gage checks.

e. *Percent Size*. The percentage of rail head cross-sectional area weakened by a rail defect. Used only with transverse defects.

f. *Relaid Rail*. Rail that is worn but still usable, taken from track and reused in another location. Sometimes referred to as relayer rail.

g. *Shatter Crack*. Initiation of a transverse fissure resulting from entrapped hydrogen gas present in a steel rail that was cooled too rapidly. Control-cooling the rails and vacuum-degassing the molten steel have practically eliminated the hydrogen problem.

h. *Transposed Rail*. Rail that is moved from one side of the track to the other side without turning the rail so that the gage and field sides are interchanged.

i. *Tread*. The path of wheel in contact with the running surface of the rail.

j. *Turned Rail*. Rail with some wear that has been removed, turned, and replaced in track so the gage and field sides are interchanged.

C-3. FIELD IDENTIFICATION OF RAIL DEFECTS. These descriptions are presented in alphabetical order to assist in identifying defective rails in track. Refer to NAVFAC MO-103 for additional information.

a. *Bolt Hole Crack*.

(1) *Description.* A progressive fracture originating at a bolt hole.

(2) *Appearance in Track.* Bolt hole cracks are not visible until a bolt or a joint bar has been removed unless the defect has progressed beyond the bar. They may be recognized by a hairline crack extending from the bolt hole (Figure C-3).

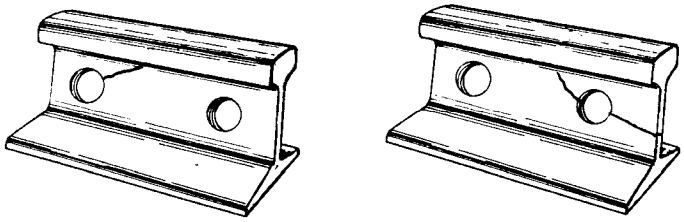

Figure C-3. General Appearance of Bolt Hole Cracks

b. *Broken Base*.

(1) *Description.* Any break in the base of the rail.

(2) *Appearance in Track*. Generally appears as a half-moon crack break in the rail base. Figure C-4 illustrates three different appearances of broken bases.

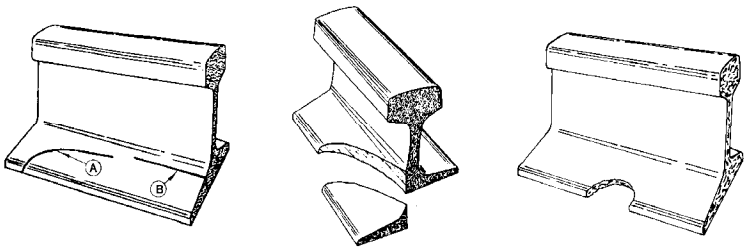

Figure C-4. General Appearance of Broken Base

c. *Complete Break (Broken Rail)*.

(1) *Description.* A complete transverse separation of the head, web, and base of the rail in which there is no sign of a fissure and in which none of the other defects described herein are found.

(2) *Appearance in Track.* May appear as a hairline crack running completely around the rail, usually accompanied by bleeding or a separation of the rail at the break with one or both of the broken ends battered down (Figure C-5).

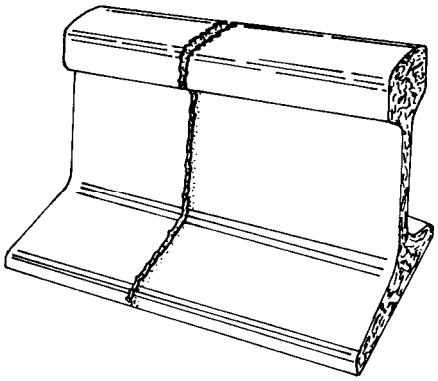

Figure C-5. General Appearance of Broken Rail

d. *Compound Fissure*. See "Transverse Defects," paragraph C-3.z.

e. *Corrosion*.

(1) *Description.* The decaying or corroding of the metal in the web or base of the rail.

(2) *Appearance in Track*. Pits or cavities in the upper base or the web of the rail. In advanced stages, a significant loss of material is evident.

f. *Corrugation*.

(1) *Description.* A repeated wavelike pattern on the running surface of the rail. Corrugations develop over a long period of time. A number of factors contribute to the development of corrugations with the actual cause dependent on the track and operating conditions.

(2) *Appearance in Track.* Small, hard, bright, short-pitch ridges along the running surface of the rail, varying anywhere from 2 to 18 inches apart and usually less than 0.0625 inch deep. Although the individual waves (ridges) are usually only a short distance apart, the corrugations may extend over a considerable distance (Figure C-6).

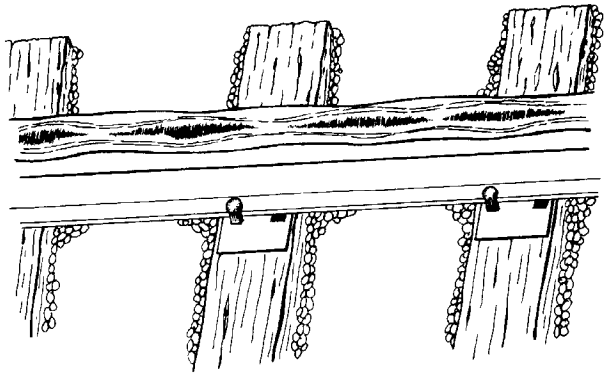

Figure C-6. General Appearance of Corrugation

g. ***Crushed (Flattened) Head*.**

(1) *Description.* The flattening of several inches of the rail head is generally caused by a soft spot in the steel. A crushed head is usually accompanied by a crushing down of the metal but with no signs of cracking in the fillet under the head. The origin of a crushed head is usually a soft spot in the steel of the head, which gives way under heavy wheel loads.

(2) *Appearance in Track.* Generally appears as:

(a) Flattening and widening of the head for several inches with the entire head sagging.

(b) Small cracks in a depression on the running surface.

(c) In advanced stages, a bleeding crack may be present at the fillet under the head (Figure C-7).

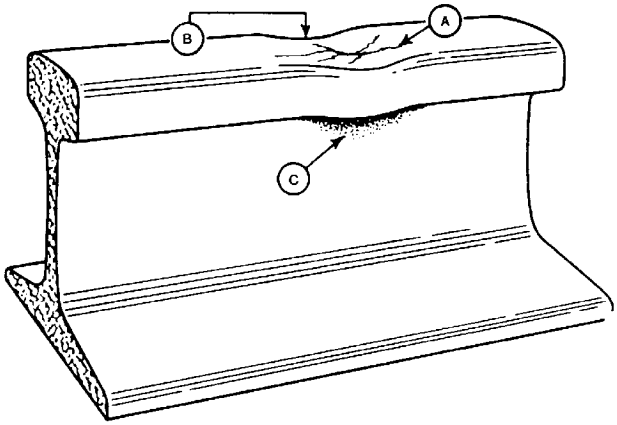

Figure C-7. General Appearance of Crushed Head

h. ***Defective Weld*.**

(1) *Description.* A progressive transverse separation within an area where two rails have been joined by welding or a rupture at a weld due to incomplete penetration of weld metal between the rail ends, lack of fusion, entrainment of slag and sand, or shrinkage cracking or fatigue cracking.

(2) *Appearance in Track.* No outward sign is visible until the separation reaches the rail surface. A defective weld may then be recognized by a vertical bleeding crack at the welded portion of the rail joint where the separation has reached the surface.

i. ***Detail Fracture*****.** See "Transverse Defects," paragraph C-3.z.

j. ***End Batter*****.**

(1) *Description.* Damage caused by wheels striking the rail ends.

(2) *Appearance in Track.* Appears as damage to or a depression in the top surface of the rail head at the ends of the rail (Figure C-8).

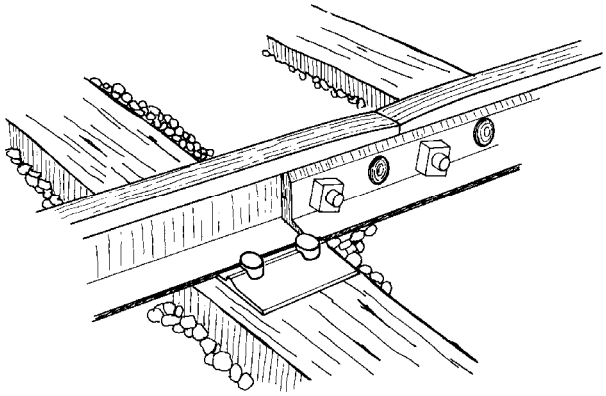

Figure C-8. Rail End Batter

k. ***Engine Burns (Burned Rail)*****.**

(1) *Description.* Rail that has been scarred on the running surface by the friction of a slipping locomotive.

(2) *Appearance in Track.* Round or oval rough spots or holes on the tread of the running surface. Engine burns may be deep (Figure C-9).

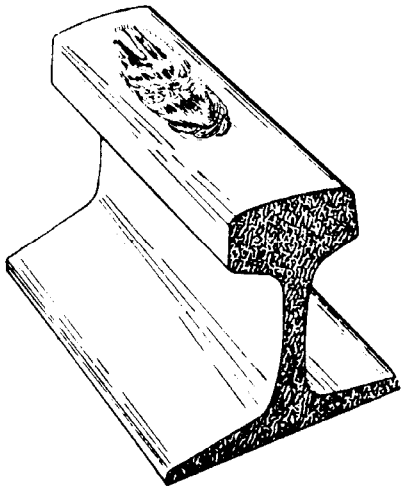

Figure C-9. Typical Appearance of Engine Burn

l. ***Engine Burn Fracture*****.**

(1) *Description.* A progressive fracture in the rail head starting from a point where engine wheels have slipped and burned the rail.

(2) *Appearance in Track.* No sign of transverse separation is visible until the defect reaches the rail surface (cracks out.) An engine burn fracture may then be recognized by one or more of the following characteristics:

(a) A hairline crack on the side of the head in the immediate vicinity of an engine burn and at right angles to the running surface. The crack may be visible on either the field or gage side of the head. An engine burn may lead to an engine burn fracture.

(b) Transverse thermal cracks extending from the burn to the gage corner and down the side of the head for at least 0.125 inch.

(c) A cracked-out horizontal separation on the field side of the rail head under the burned area often accompanied by one or more thermal cracks extending transversely to the gage corner (Figure C-10.)

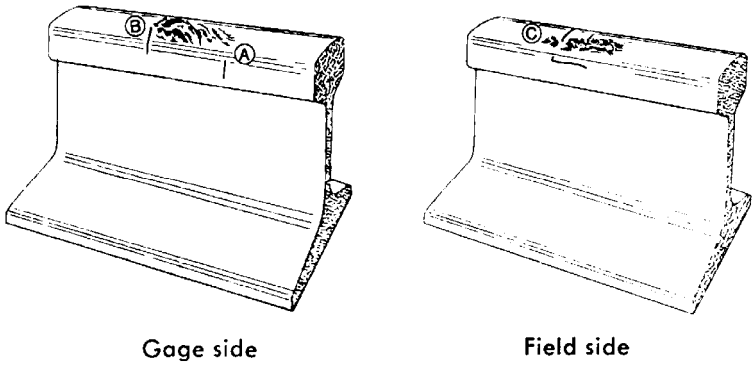

Figure C-10. General Appearance of Engine Burn Fracture

m. *Flaking*.

(1) *Description.* A progressive horizontal separation on the running surface near the gage corner, often accompanied by scaling or chipping. Flaking should not be confused with shelling as flaking occurs only on the running surface near the gage corner and is not as deep as shelling.

(2) *Appearance in Track.* Can be recognized by one or more of the following characteristics:

(a) Shallow depressions with irregular edges occurring on the running surface near the gage corner. Generally, flaking will occur within 0.25 inch of the corner of the rail.

(b) Horizontal hairline cracks along the running surface near the gage corner of the rail head, resembling small slivers (Figure C-11.)

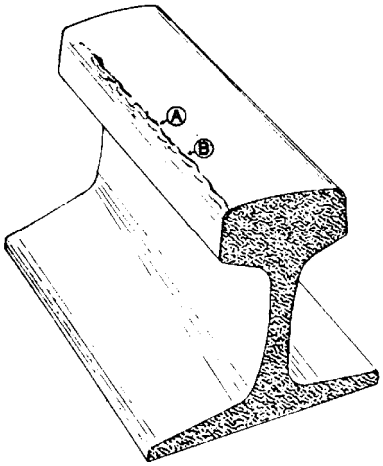

Figure C-11. General Appearance of Flaking

n. *Flowed Rail*.

(1) *Description.* A rolling out of the tread metal beyond the field or gage corner with no breaking down of the underside of the head.

(2) *Appearance in Track.*

(a) Surface metal on the head flowed toward the field side giving a creased appearance on the running surface near the field corner.

(b) A protruding lip extending along the length of the rail.

(c) In the advanced stage, flow becomes blade-like, jagged, or nonuniform and may hang down or separate from the rail head (Figure C-12.)

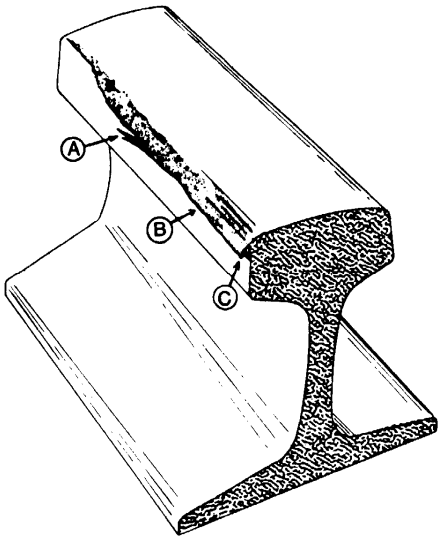

Figure C-12. General Appearance of Flow

o. *Head/Web Separation*.

(1) *Description.* A progressive fracture separating the head and web of the rail at the head fillet area.

(2) *Appearance in Track.* Can be recognized by one or more of the following characteristics:

(a) In earlier stages, wavy lines appearing along the fillet under the head.

(b) As the condition develops, a small crack will appear along the fillet on either side, progressing longitudinally with slight irregular turns upward and downward.

(c) In advanced stages, bleeding cracks will extend downward from the longitudinal separation through the web and may extend through the base (Figure C-13).

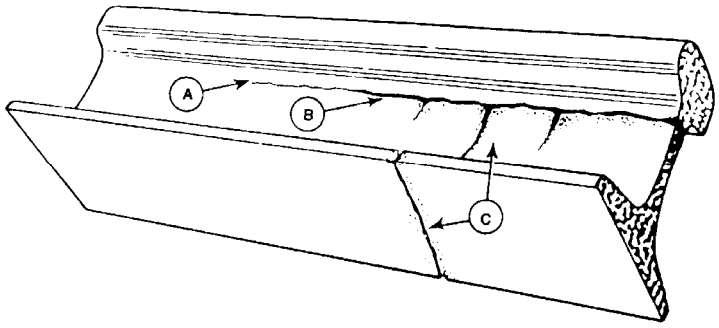

Figure C-13. General Appearance of Head/Web Separation

p. ***Horizontal Split Head*.**

(1) *Description.* A progressive longitudinal fracture in the rail head parallel to the running surface, usually 0.25 inch or more below the running surface.

(2) *Appearance in Track.*

(a) Before cracking out, a moderate size horizontal split head will appear as a flat spot on the running surface, often accompanied by a slight widening or dropping of the rail head. The flat spot will be visible as a dark spot on the bright running surface.

(b) After cracking out, the horizontal split head will appear as a hairline crack in either side or both sides of the rail head, usually 0.25 inch or more below the top of the rail head (Figure C-14).

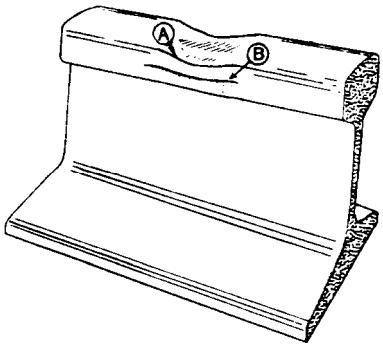

Figure C-14. General Appearance of Horizontal Split Head

q. ***Mill Defects*.**

(1) *Description.* Deformations, cavities, seams, or foreign material found in the head, web, or base of the rail.

(2) *Appearance in Track.* Any deformation in the rail, broken-out area, or inclusion (Figure C-15).

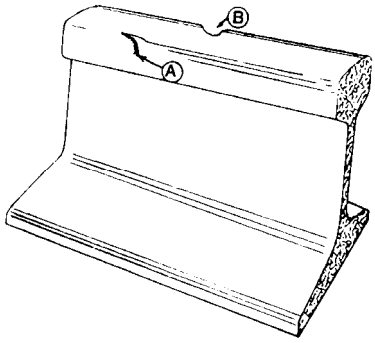

Figure C-15. General Appearance of Mill Defects

r. ***Piped Rail*.**

(1) *Description.* A progressive longitudinal fracture in the web of the rail with a vertical separation or seam, forming a cavity in the advanced stages of development.

(2) *Appearance in Track.*

(a) A bulging of the web on either or both sides. Shallow cracks due to distortion may be found in the bulging surface.

(b) A slight sinking of the rail head may exist above the pipe (Figures C-16 and C-17).

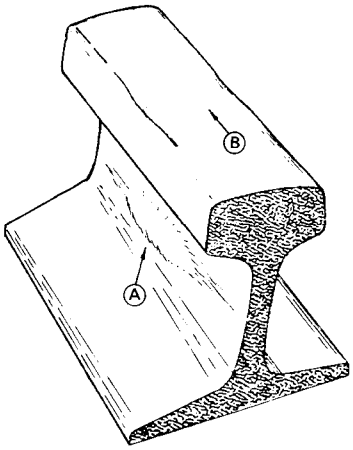

Figure C-16. General Appearance of Piped Rail

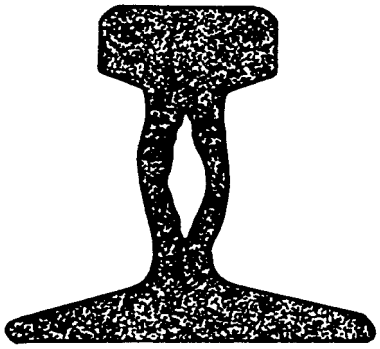

Figure C-17. Cross-sectional View of Piped Rail

s. ***Rail Wear.***

(1) *Description.* The loss of material from the running surface and side of the rail head due to the passage of wheels over the rail.

(2) *Appearance in Track.* Rail wear appears as a rounding of the running surface of the rail head, particularly on the gage side (Figure C-18).

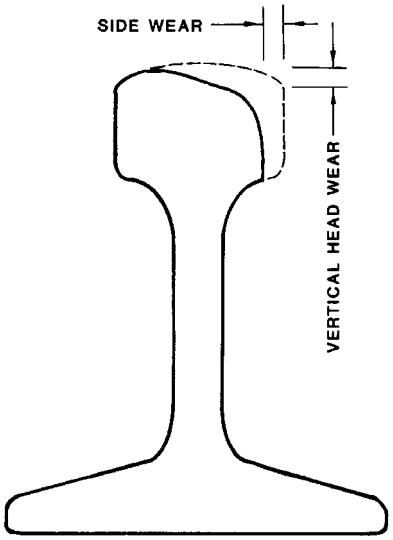

Figure C-18. General Appearance of Vertical Head and Side Wear

t. *Shelling*.

(1) *Description.* A progressive horizontal separation, which may crack out at any level on the gage side but generally at the gage corner. It extends longitudinally not as a true horizontal or vertical crack, but at an angle related to the amount of rail wear.

(2) *Appearance in Track.* Appears as one or more of the following:

(a) Dark spots irregularly spaced on the gage side of the running surface.

(b) Longitudinal separation at one or several levels in the upper gage corner with discoloration from bleeding.

(c) If the rail has been turned, the shelly spots will appear on the field side with an irregular overhanging lip of metal similar to flowed rail (Figure C-19).

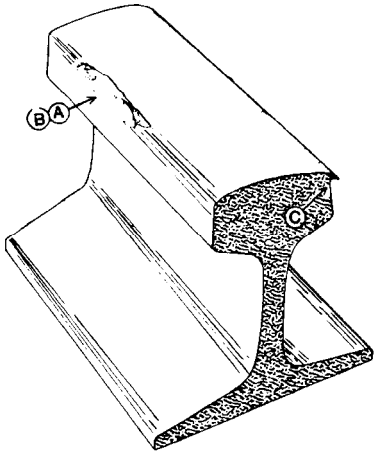

Figure C-19. General Appearance of Shelling

u. *Slivers*.

(1) *Description.* A sliver is the separation of a thin, tapered mass of metal from the surface of the head, web, or base of a rail.

(2) *Appearance in Track.* Thin slivers on the surface of the rail head and parallel to the rail length similar to wood slivers (Figure C-20).

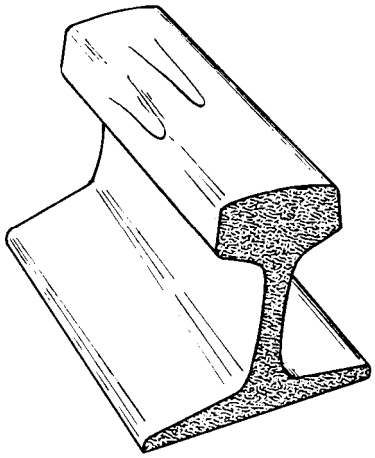

Figure C-20. General Appearance of Slivers

v. *Split Web*.

(1) *Description.* A progressive fracture through the web in a longitudinal and/or transverse direction.

(2) *Appearance in Track.* Horizontal and/or vertical bleeding cracks in the web (Figure C-21).

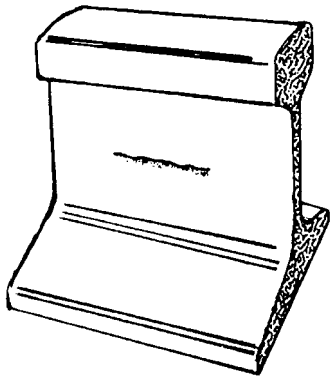

Figure C-21. General Appearance of Split Web

w. *Surface Bent Rail*.

(1) *Description.* The permanent downward bending of the rail ends due to long-term passage of traffic over track with loose or poorly supported joints. Surface bent rail cannot be corrected without replacing the rail.

(2) *Appearance in Track.* A downward bending of the rail head near the rail ends giving the appearance of low joints. When track with surface bent rail is surfaced

(raised and tamped), the rail ends soon return to a lower elevation. In the more serious cases the vertical curve in the rail head is still visible after surfacing.

x. *Surface Damage*.

(1) *Description.* Any damage to the surfaces of the rail, both the running surface and the external surfaces, caused by deep engine burns (running surface) or by striking the rail. Surface damage may lead to detail fractures or engine burn fractures.

(2) *Appearance in Track.* Deep engine burns, dents, nicks, cuts, or other abnormalities on the surface of the rail.

y. *Torch Cut Rail.*

(1) *Description.* Any rail that is cut or otherwise modified (including bolt holes) using an acetylene torch or other open flame.

(2) *Appearance in Track.* Irregular or rough rail ends and/or bolt holes (Figure C-22).

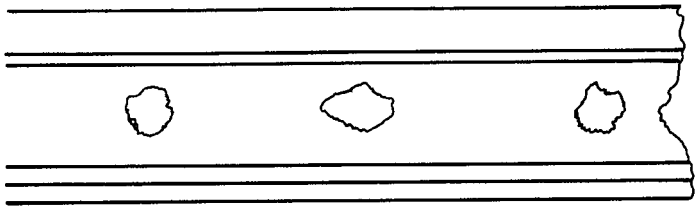

Figure C-22. General Appearance of Torch-Cut Rail

z. *Transverse Defects*. Compound fissure, transverse fissure, and detail fracture.

(1) *Description.* Any progressive fracture occurring in the rail head having a transverse separation, however slight. The exact type of transverse defect cannot be determined until after the rail is broken for examination.

(2) *Appearance in Track.* Not visible until the defect reaches an outer surface. A transverse defect may be recognized by one or more of the following characteristics:

(a) A hairline crack on the side of the head at right angles to the running surface, at the fillet under the head, and occasionally on the running surface.

(b) Bleeding (rust streaking) at the crack.

(c) A hairline crack at the gage corner of the rail head. On turned rail, this condition may occur at the field corner. Numerous small gage cracks or head checks are often present but should not cause suspicion unless a single crack extends much farther down the side and/or across the running surface.

(d) A horizontal hairline crack in the side of the rail head turning upward or downward at one or both ends, usually accompanied by bleeding. Under such conditions a flat spot will generally be present on the running surface.

(e) A hairline crack extending downward at right angles from a horizontal crack caused by shelling of the upper gage corner of the rail head (Figure C-23).

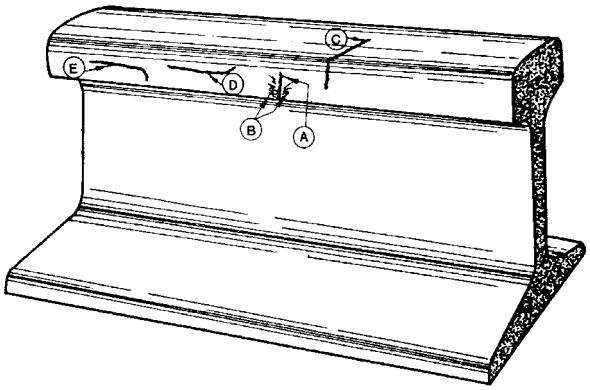

Figure C-23. General Appearance of Transverse Defects

aa. ***Vertical Split Head*****.**

(1) *Description.* A progressive longitudinal fracture in the head of the rail perpendicular to the running surface and is visible to a track inspector.

(2) *Appearance in Track.* Can be recognized by one or more of the following:

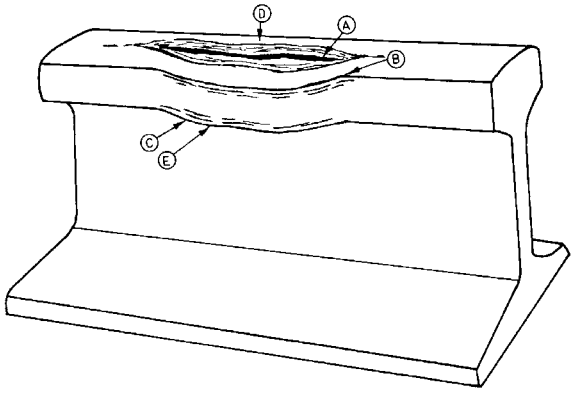
(a) A dark streak on the running surface.

(b) Widening of the head for the length of the split. The cracked side of the head may show signs of sagging.

(c) Sagging of the head causing a rust streak to appear on the fillet under the head.

(d) A hairline crack near the middle of the rail head.

(e) In advanced stages, a bleeding crack is apparent on the rail surface and in the fillet under the head (Figure C-24).



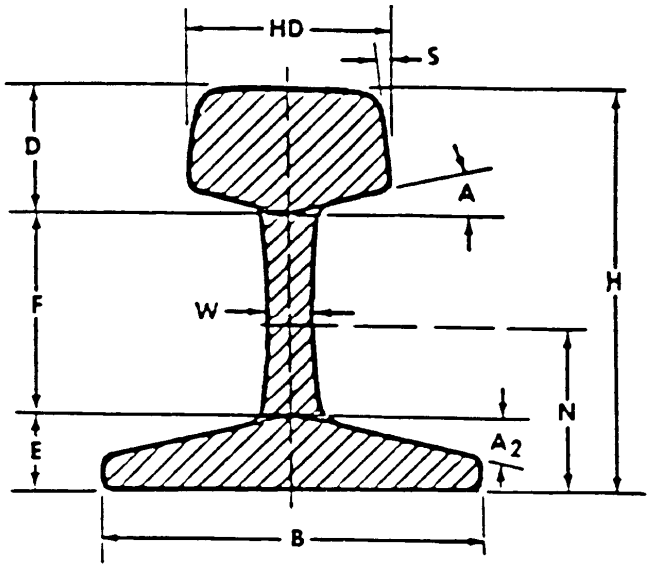


Figure C-24. General Appearance of Vertical Split Head

APPENDIX D

DETAILS OF RAIL SECTIONS

D-1. Table D-1 of this appendix presents a listing of dimensions and properties for various rail sections. This table can be used with Figure D-1 to assist in identifying rail sections and estimating amounts of rail wear.

(See Table D-1 for key)

FAR PART 213

[Code of Federal Regulations]
[Title 49, Volume 4]
[Revised as of October 1, 2003]
From the U.S. Government Printing Office via GPO Access
[CITE: 49CFR213.233]

TITLE 49--TRANSPORTATION

CHAPTER II--FEDERAL RAILROAD ADMINISTRATION, DEPARTMENT OF TRANSPORTATION

PART 213--TRACK SAFETY STANDARDS--Table of Contents

Subpart F--Inspection

Sec. 213.233 Track inspections.

(a) All track shall be inspected in accordance with the schedule prescribed in paragraph (c) of this section by a person designated under Sec. 213.7.
(b) Each inspection shall be made on foot or by riding over the track in a vehicle at a speed that allows the person making the
inspection to visually inspect the track structure for compliance with this part. However, mechanical, electrical, and other track inspection devices may be used to supplement visual inspection. If a vehicle is used for visual inspection, the speed of the vehicle may not be more than 5 miles per hour when passing over track crossings and turnouts, otherwise, the inspection vehicle speed shall be at the sole discretion of the inspector, based on track conditions and inspection requirements. When riding over the track in a vehicle, the inspection will be subject to the following conditions—
(1) One inspector in a vehicle may inspect up to two tracks at one time provided that the inspector's visibility remains unobstructed by any cause and that the second track is not centered more than 30 feet from the track upon which the inspector is riding;
(2) Two inspectors in one vehicle may inspect up to four tracks at a time provided that the inspectors' visibility remains unobstructed by any cause and that each track being inspected is centered within 39 feet from the track upon which the inspectors are riding;
(3) Each main track is actually traversed by the vehicle or inspected on foot at least once every two weeks, and each siding is actually traversed by the vehicle or inspected on foot at least once every month. On high density commuter railroad lines where track time does not permit an on track vehicle inspection, and where track centers are 15 foot or less, the requirements of this paragraph (b)(3) will not apply; and
(4) Track inspection records shall indicate which track(s) are traversed by the vehicle or inspected on foot as outlined in paragraph (b)(3) of this section.
(c) Each track inspection shall be made in accordance with the following schedule--

Class of track	Type of track	Required frequency
Excepted track and Class 1,2,and 3 track	Main track and sidings	Weekly with at least 3 calendar days, interval between inspections, or before use, if the track is used less than once a week, or twice weekly with at least 1 calendar day interval between inspections, if the track carries passenger trains or more than 10 million gross tons of traffic during the preceding calendar year.
Excepted track and Class 1, 2, and 3 track	Other than main track and sidings	Monthly with at least 20 calendar days interval between inspections.
Class 4 and 5 track		Twice weekly with at least 1 calendar day interval between inspections.

(d) If the person making the inspection finds a deviation from the requirements of this part, the inspector shall immediately initiate remedial action.

Note to Sec. 213.233: Except as provided in paragraph (b) of this section, no part of this section will in any way be construed to limit the inspector's discretion as it involves inspection speed and sight distance.

TITLE 49--TRANSPORTATION

CHAPTER II--FEDERAL RAILROAD ADMINISTRATION, DEPARTMENT OF TRANSPORTATION

PART 213--TRACK SAFETY STANDARDS--Table of Contents

Subpart F--Inspection

Sec. 213.235 Inspection of switches, track crossings, and lift rail assemblies or other transition devices on moveable bridges.

(a) Except as provided in paragraph (c) of this section, each switch, turnout, track crossing, and moveable bridge lift rail assembly or other transition device shall be inspected on foot at least monthly.

(b) Each switch in Classes 3 through 5 track that is held in position only by the operating mechanism and one connecting rod shall be operated to all of its positions during one inspection in every 3 month
period.

(c) In the case of track that is used less than once a month, each switch, turnout, track crossing, and moveable bridge lift rail assembly or other transition device shall be inspected on foot before it is used.

Sec. 213.239 Special inspections.

In the event of fire, flood, severe storm, or other occurrence which might have damaged track structure, a special inspection shall be made of the track involved as soon as possible after the occurrence and, if possible, before the operation of any train over that track.
