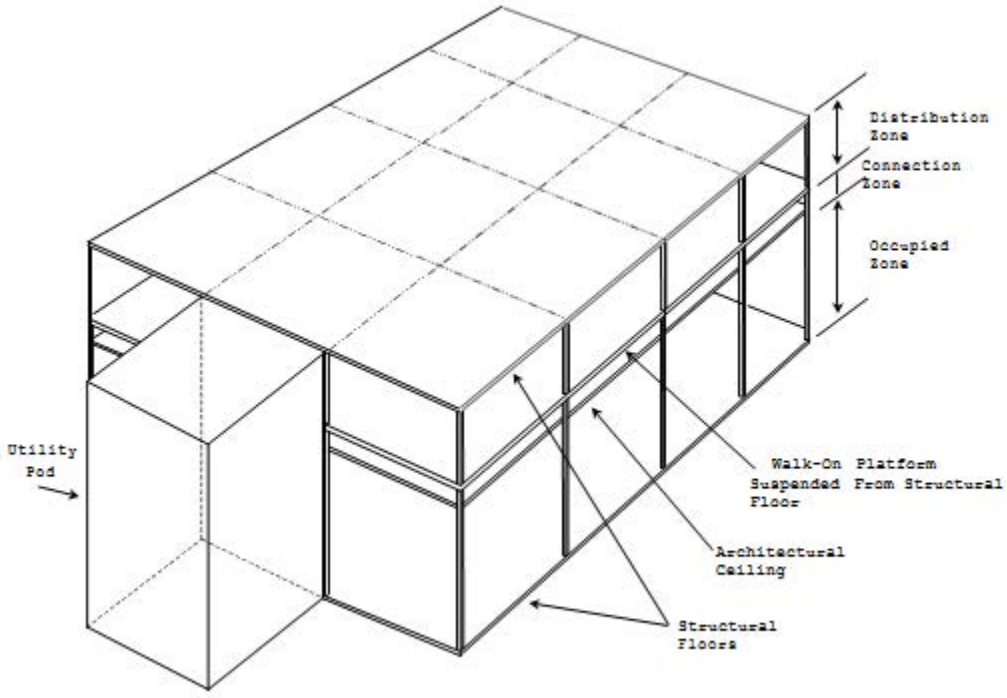
The fundamental approach to interstitial building design in DoD is the DoD Systems Module. The DoD Systems Module organizes building areas into discrete modules, normally defined by major medical department or occupancy boundary, and limited to the size of the relevant smoke compartment as permitted by NFPA 101. Each module is served by equipment, for example, mechanical, electrical, and piping, located in a dedicated utility pod, from which the services are distributed within the confines of the module boundaries via a dedicated distribution zone (interstitial space) and connection zone (above-ceiling space) to the occupied zone (functional space) associated with the respective module. (Refer to Figure E-1.) Having dedicated services for each module, the user has full knowledge of the areas affected by O&M services and by future system modifications. The DoD Systems Module concept also results in greater standardization of major MEP equipment (such as AHUs), reducing the storage of spare parts, and increasing the overall dependability of the systems.

E-2.2 Alternate Non-Modular Concept.



An alternative, non-modular approach, also with interstitial floors for utility distribution, may in some cases be utilized for some types of DoD facilities. In some instances, the DoD Systems Module design concept can be less economical than a non-modular approach, and is not ideally suited for all building types, for example, laboratories, in all locations. The non-modular designs typically differ from the DoD Systems Module in permitting equipment, such as AHUs, to serve different (multiple) functional areas, occupancies, or compartments. This can involve horizontal service distribution to differing parts of the building.

E-2.3 IBS Design Concept Approval.

For any IBS design, incorporate requirements in this appendix including those for construction of the interstitial floor (walk-on platform), utility penetrations, and the

organization of the distribution zone for accessibility and fire safety. Evaluate the decision as to whether an IBS building will follow the DoD Systems Module concept or an alternate non-modular design. Evaluation to occur following the 5 percent design submission and completed by the 20 percent submission. Include an economic comparison with alternatives considered with the 20 percent submission. Also include all costs associated with acquisition, operation, maintenance, and alteration for the designated service life of the proposed facility. Reference Appendix C for submission requirements. Approval of the IBS is documented on the DD Form 1391 as constructible building scope IAW Chapter 3.

Figure E-1 DoD IBS Systems Module (Typical)

E-3 IBS DESIGN.

E-3.1 DoD Systems Module Design.

The DoD Systems Module, a designated unit of space one story in height, is the basic building block of a DoD Systems Module facility, in other words the facility is composed of separately identifiable DoD Systems Modules each consisting of a utility pod, a distribution zone, a connection zone, and an occupied zone. Each DoD Systems Module is served by its own utility distribution systems. The relationship of the various zones is illustrated in Figures E-1 and E-2. Limit DoD Systems Modules to the size permitted by NFPA 101 for the smoke compartment associated with the relevant IBS system module, exclusive of the utility pod. Although there is a spatial discipline

associated with the DoD Systems Module, the overall organization and massing of a facility can be varied according to specific project requirements.

E-3.1.1 Utility Pod.

The utility pod contains AHUs and associated risers, fans, pumps, and other related equipment; electrical and heat exchange equipment; and associated risers serving the DoD Systems Module. Fresh air and exhaust openings are generally part of the utility pod enclosure. The utility pod is the space between two adjacent structural floors or between the highest structural floor and the roof. In multi-story buildings, stack utility pods from floor to floor so that plumbing and electrical risers can be efficiently and economically accommodated.

E-3.1.2 Distribution Zone.

The distribution zone is the space between the walk-on platform and the structural floor or roof above. The maximum height of the distribution zone measured from top of walk-on platform to underside of floor slab above is 9 ft (2.74 m). The distribution zone accommodates the horizontal distribution of main utility systems and provides convenient access to these systems by means of a walk-on platform. Central equipment for mechanical, electrical, plumbing, and communications systems, as well as motorized equipment, is not permitted in the distribution zone. Utility distribution systems enter and leave the utility pod through the distribution zone. Arrange the utilities (piping, ducts, VAV boxes, raceways, conduits, and cable trays) to minimize future modifications of the mains and to accommodate future modifications of branches and laterals. Except for gravity piping services, most systems in the distribution zone down-feed to the connection zone below. Finish the walk-on platform surface, or provide the capability of receiving finish materials, with sufficient bond strength and resistance to abrasion and impact to permit maintenance personnel to walk on the surface without affecting the structural integrity of the platform and without generating a dust problem. Seal all painted concrete surfaces.

E-3.1.3 Connection Zone.

The connection zone is the space between the walk-on platform and the architectural ceiling of the occupied zone below. The connection zone accommodates recessed lighting fixtures, sprinkler piping, and air diffusers and their supports, as well as the horizontal distribution of utilities to individual rooms or spaces. Provide access the connection zone from the occupied zone, usually through the architectural ceiling.

E-3.1.4 Occupied Zone.

The occupied zone is the space of functional activity. The occupied zone is defined by the structural floor and the architectural ceiling above.

E-3.2 Alternate (Non-DoD) IBS Design.

E-3.2.1 Use of Mechanical Rooms or Penthouse.

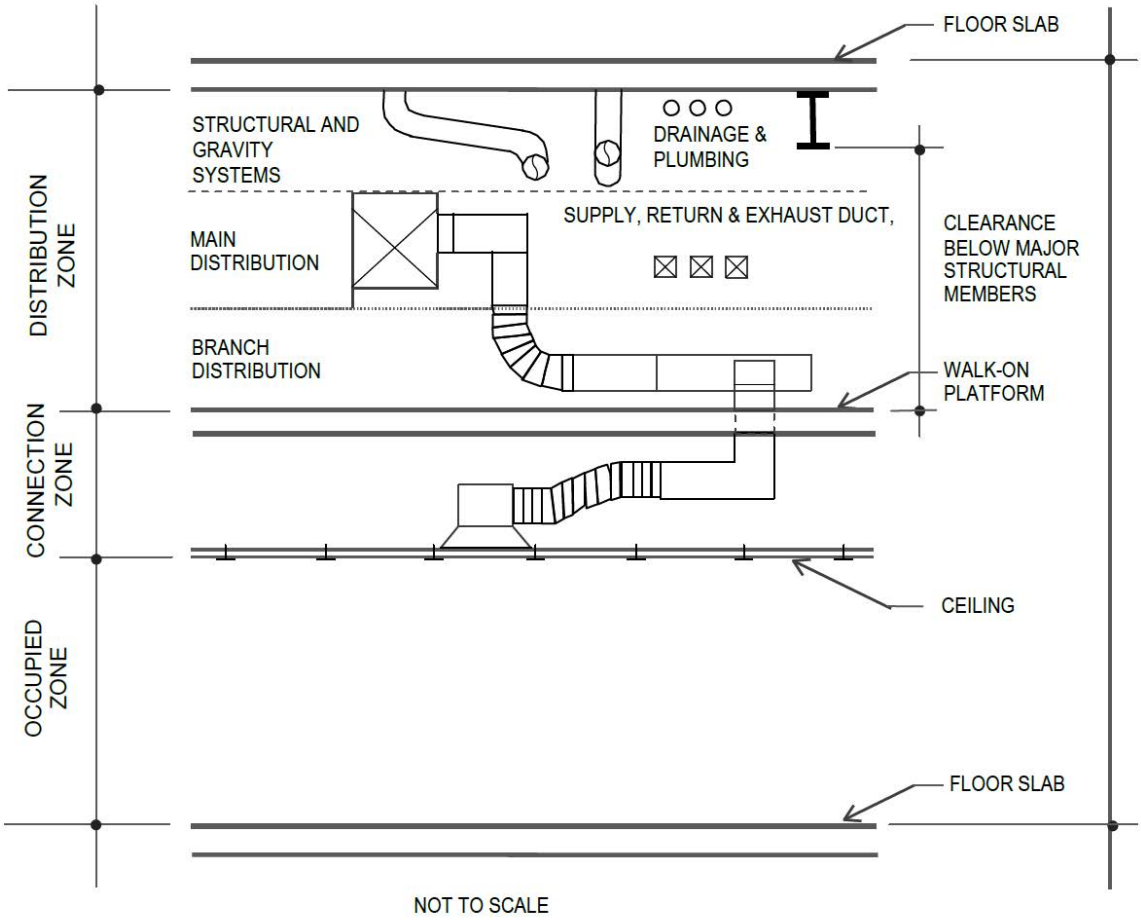
When utility pods are not provided, AHUs are typically located on the roof (in an enclosed, conditioned penthouse) or on another floor level in a mechanical equipment room. Remotely locating AHUs from the serviced area, compartment, occupancy, or smoke compartment boundary can require vertical distribution of ductwork passing through multiple floors. Also, to reach the intended serviced location, HVAC ductwork may be run horizontally through more than one smoke zone.

E-3.2.2 AHU Serving More Than One Area, Occupancy, or Smoke Zone.

Where air handling systems are designed to serve multiple areas, occupancies, or compartments, design the primary supply and return ductwork to enter each individual smoke zone boundary at a single point. Provide isolation smoke dampers to allow modifications in that smoke compartment to occur without impact on adjacent compartments. Provide smoke dampers, similar to a non-IBS facility, when crossing smoke compartment separation barriers.

E-3.2.3 Duct Smoke Dampers.

Provide smoke dampers in ducts in the distribution zone where a duct serves more than one smoke compartment. Where required, locate the smoke damper in the duct at the approximate location where the smoke barrier is located below in the occupied zone.



E-3.2.4 Boundary Partitions.

To manage systems distribution, partitions relative to the boundary of the predominant occupancy are required in the same locations of the distribution zone as located below in the occupied zone. This non-rated partition extends from the surface of the walk-on platform to the underside of the occupied zone above. This partition is required to maintain the separation of the support area relative to the boundaries of only the predominant occupancies, rather than every possible occupancy separation. In addition to utility management, another benefit is the added perimeter wall space for locating additional means of egress paths for the distribution zone.

E-3.3 General IBS Design Requirements.

Design requirements for the distribution zone, connection zone, and occupied zone are the same as defined and described for DoD Systems Module designs. Arrangement of IBS elements must be in accordance with Figure E-2.

Figure E-2 Interstitial Design Elements

E-3.3.1 Exceptions.

As early as possible in the design process, but no later than the 20 percent design submittal, identify any spaces or uses within a facility's proposed design that would either prevent, or otherwise negatively impact, the use of walk-on platforms. Spaces to consider include (but are not limited to) sloped floor areas; high-ceiling spaces, for example, auditoriums, high-pile storage, and atria; and MRI suites where equipment weight or unusual structural requirements may be applicable.

E-3.3.2 Number of Stories.

The walk-on platform constitutes the floor of the distribution zone. A walk-on platform does not constitute an independent story. Each occupied zone and the corresponding distribution zone are counted together as an independent floor (for the purpose of determining the number of stories).

E-3.3.3 Facility Expansion.

In DoD Systems Module buildings, place utility pods so not to encumber vertical or horizontal facility expansion.

E-3.3.4 Existing Facilities.

When an IBS facility is to be connected to an existing conventional facility, design concerns may arise. Existing floor-to-floor heights are typically less than the heights required for IBS construction. Therefore, alignment of new floors with existing floors is required. Continuity with existing facilities cannot be hastily assumed to preclude application of the IBS design concepts.

E-3.3.5 System and Equipment Capacity Increases.

Oversize utility systems to accommodate future changes. Design AHUs and ducts to have their capacities increased for future demand growth by a minimum of 15 percent. Design the distribution systems to accommodate a degree of capacity increase. During initial design, the Design and Construction Agent and the DoD Project Sponsor are to jointly determine the extent of system and equipment capacity increases required.

E-3.3.6 Distribution Zone Accessibility.

Provide means of egress paths on the walk-on platform throughout the distribution zone. All means of egress paths accommodate ease of access for maintenance and provide a defined means of egress. Provide available vertical space clearances within the distribution zone to permit the organization of the utility distribution systems for ease of accessibility. (Refer to Figure E-3.) It may not be practical to arrange the distribution zone for complete accessibility to every component. However, it is important to examine the various accessibility requirements to best locate means of egress paths to reach all main systems, feeders, connections, and maintainable equipment. Provide paths unobstructed by utility lines or other equipment. Provide sufficient clearance within the means of egress paths for a worker to stand, exclusive of major structural members. Additionally, clearly mark walking surfaces for means of egress paths which are to be clear from dust and debris. Access to the distribution zone is to be from adjacent stairs and, in multi-story facilities, from key-operated service elevators designed to stop at the walk-on platform levels. No access to the distribution zone will be permitted through access panels from the connection zone.

E-3.4 General IBS Mechanical and Plumbing Requirements.

E-3.4.1 Riser Locations.

In DoD Systems Module designs, risers and vertical circulation elements not located in the utility pods must be located at the boundaries of the DoD Systems Modules adjacent to permanent structural elements, stairs, or elevators.

Figure E-3 Interstitial Access-Egress (Typical)

E-3.4.2 Valves.

Locate control valves, except those required to be in the occupied zone such as medical gas control valves, in utility pods or equipment rooms to permit centralized control. Tag and identify shut-off and balancing valves located in the distribution zone and identify on a valve list that shows their distribution zone locations and the areas or equipment served in the occupied zone. Do not locate valves in the connection zone for any utility system unless specifically permitted by the DoD Project Sponsor.

E-3.4.3 Systems Expandability.

Select prime moving equipment, for example, pumps and fans, for operation at the midpoint of their operating characteristic curves. Size ducts and piping to permit future flow increases. Provide stubs, valves, and caps in plumbing risers and in horizontal branch terminations for future service extensions.

E-3.4.4 Air Handling System Selection.

Base system selection on functional needs, LCCA, energy efficiency, and ease of maintenance and repair. To enhance maintainability, it is normally desirable to "standardize" the size of AHUs when practical from a performance standpoint. For example, several AHUs of the same unit size and motor horsepower allow economy in the stocking of spare parts. Select "Off-the-shelf" packaged AHUs in lieu of custom manufactured units to ensure parts availability and ease of future modification.

E-3.4.5 Ventilation of Distribution Zone.

Under normal conditions, fresh air is not required in the distribution zone. However, if determined by the designers, ventilation may be required for moisture or temperature control in distribution zones exposed to roofs.

E-3.4.6 Gravity Systems in IBS Facilities.

Design the location and elevation of sloped gravity piping to maximize the access around the piping. Do not block designated access pathways.

E-3.5 General IBS Electrical and Communications Equipment.

E-3.5.1 Distribution Systems.

Base the distribution system routing (horizontal and vertical) and the quantity and location of unit substations on the size of the facility, LCCA, overall flexibility, and long-term system reliability. Compare the benefits of underground (or crawlspace) utility service distribution to the utility pods with service distribution through the distribution zones considering flexibility, reliability, system maintainability, and safety.

E-3.5.2 Electrical Room Locations.

In all IBS designs, stack electrical rooms to the extent feasible. In DoD Systems Module design facilities, locate electrical rooms in the utility pods and stack vertically from floor to floor. Provide provisions for easily running vertical cabling from floor to floor, for example separate/independent conduit risers with pull boxes at each distribution zone. (Refer to Chapter 11.) Size cabling and wiring for allowable voltage drop at full design load.

Evaluate the need for additional electrical rooms, located at opposite ends of the DoD Systems Modules from the utility pods, for maintenance of acceptable voltage drops, reasonable lengths of secondary cable runs, and numbers of devices per circuit. Locate additional rooms in the occupied zones adjacent to permanent structural elements, stairs, or elevators, and stack vertically from floor to floor.

E-3.5.3 Capacities for Flexibility.

Base capacities of major electrical components, such as main distribution panels and transformers, on the areas served, rather than specific use, to allow for flexibility.

E-3.5.4 Electrical Secondary Distribution.

Route branch circuiting through the distribution zone to allow for modification with minimal disruption of the occupied zone. Distribute electrical systems wiring through totally enclosed cable trays. Provide ground continuity throughout the cable tray system. Design cable trays with space dedicated in the distribution zone for future cable trays.

E-3.5.5 Communications Systems Distribution.

Use cable trays to distribute communications systems wiring. Provide ground continuity throughout the cable tray system.

E-3.5.6 Identification.

Provide coded identification of electrical raceway and junction boxes by voltage and function at 40 ft (12 m) intervals and on junction boxes. Provide circuit identification for electrical wiring and system identification for communications wiring.

E-3.5.7 Lighting.

Provide 50 lux of lighting throughout the distribution zone. Provide one hundred 50 lux over access-egress pathways and at distribution zone elevator lobbies using damage-resistant lighting fixtures. Additionally, provide egress lighting and exit signs over access-egress paths and at distribution zone exits as indicated in “Means of Egress Paths” of this appendix. Provide switches at each distribution zone entry and exit.

E-3.5.8 Power.

Provide specification-grade, heavy-duty, ground fault-protected electrical outlets in the distribution zone for use with portable tools and located to accommodate maximum 50-foot extension cords.

E-3.6 General IBS Fire Protection Design.

Design the fire protection and life safety features for facilities using IBS with the same codes and standards applicable to any non-interstitial facility. The IBS criteria noted here are based upon two special studies conducted by the National Institute of Standards and Technology (NIST)—one in May 1985 (NBSIR 85-3158) and the other in February 1995 (NISTIR 5560). The criteria herein have been coordinated with the requirements of the referenced codes and standards to accommodate the non-traditional characteristics of the interstitial building approach. Proposed designs that vary from the special studies will require a new fire test in accordance with NFPA 251.

Note that the use of engineering evaluation in lieu of fire tests is not permitted. Where variations between this standard and other applicable codes and standards occur, the fire safety design requirements for interstitial facilities indicated herein must govern; however, do not apply this document in such a manner as to exempt NFPA 101 or other applicable code requirements.

E-3.6.1 Occupancy.

The distribution zone is a “normally unoccupied building service equipment support area” (NUBSESA) as defined by NFPA 101. All IBS distribution zones and interstitial spaces are NUBSESA and compliance with NFPA 101 is required as modified in this appendix.

E-3.6.2 Smoke Compartmentation.

In all IBS building designs, provide smoke barrier separation for smoke compartmentation for occupied and connection zones. Smoke compartmentation is not required for the distribution zone in an interstitial floor.

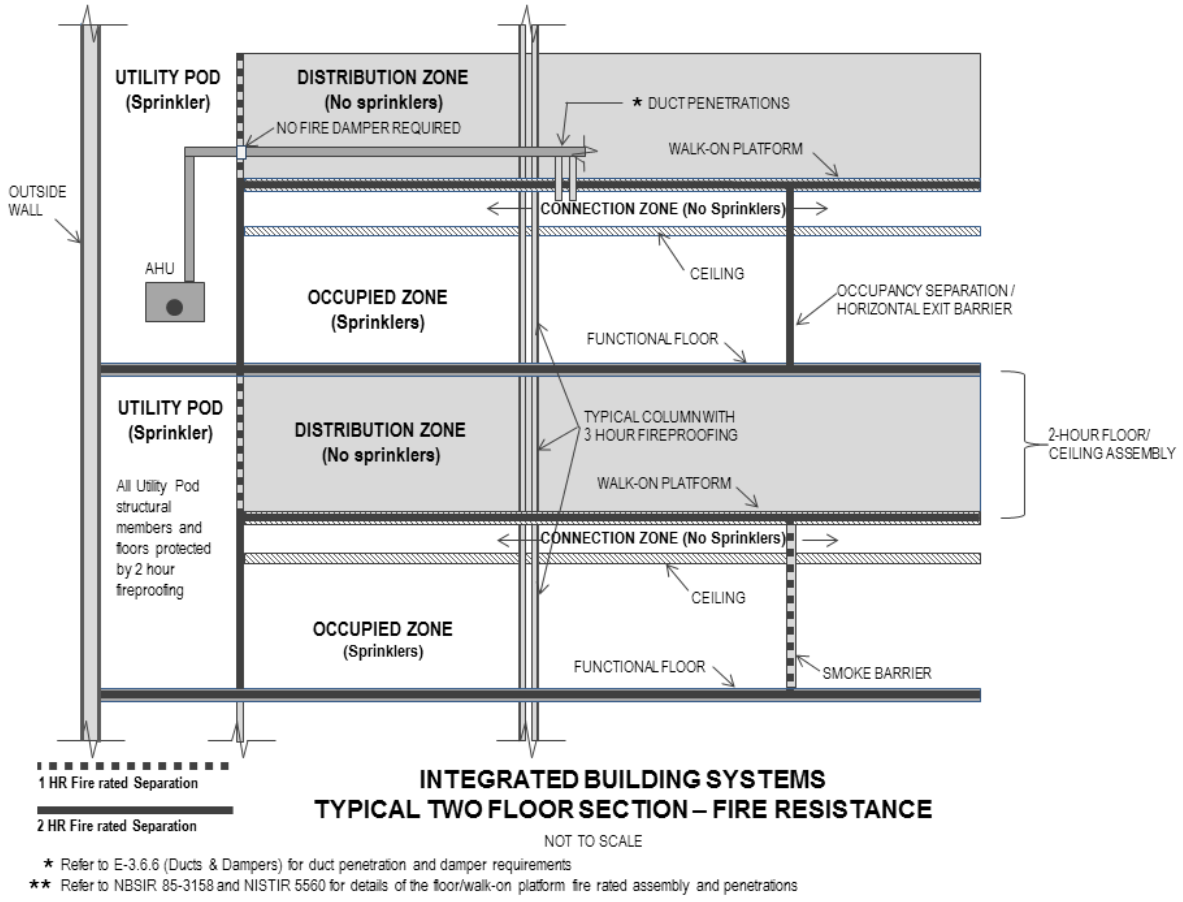
In DoD Systems Module designs, the integration of facility building modules with NFPA smoke compartmentation requirements is a basic fire protection/life safety principle of this non-traditional building concept. When applying NFPA 101, the modular configuration of the DoD Systems Module approach becomes a significant benefit because compartmentation is a natural byproduct.

E-3.6.3 Floor-to-Floor Fire Separation.

A two-hour fire separation is required between each functional floor level for IBS facilities. The functional floors are separated by a fire-resistive “floor/ceiling” assembly. The limits of each floor/ceiling assembly are defined by the bottom of the walk-on platform and the top of the structural floor above. In the DoD Systems Module concept, the fire resistance rating runs in a horizontal plane along the utility pod floor, then vertically along the wall separating the utility pod from the occupied zone and connection zone. The fire resistance rating then continues along the walk-on platform to the outside wall. The walk-on platform of the distribution zone must be designed in accordance with NBSIR 85-3158. Figure E-4 illustrates fire protection for the DoD Systems Module concept. The same figure is applicable to alternative non-modular designs, except the Utility Pods are not utilized.

E-3.6.3.1 Occupied Zone.

Provide smoke barriers requirement of NFPA 101 for the occupied zone.



Extend all barriers and partitions with fire-resistive ratings of two hours or less to the bottom of the walk-on platform.

E-3.6.3.2 Distribution Zone.

Dividing the distribution zone into smoke compartments with smoke barriers is not required.

In DoD Systems Module design facilities, horizontal exit, occupancy separation, or smoke barrier walls located in the occupied/connection zone need not be extended up into the distribution zone.

Figure E-4 DoD Systems Module Typical Two Floor Section – Fire Protection

E-3.6.3.3 DoD Systems Module Utility Pods.

Separate utility pods from the distribution zones by one-hour fire-rated construction and from the occupied and connection zones by two-hour fire-resistive construction. **\1\ /1/** Provide a two-hour fire resistive rating for the structural members in the utility pod.

Clearly identify the limits of the connection zone, occupied zone, and the distribution zone from the utility pod, particularly with respect to delineation of one- and two-hour fire-rated assemblies.

E-3.6.4 Structural Members Fire Protection.

Results of NBSIR 85-3158 determined that all structural steel within the interstitial space (distribution zone), except the columns, is adequately protected from the effects of fire for a minimum duration of two hours by the walk-on platform/interstitial space arrangement without any fireproofing directly applied to the structural steel within the tested interstitial space. Structural steel within the distribution zone (interstitial space) includes structural members supporting the walk-on platform. **\1\ /1/** Provide all columns with three-hour fire-resistive rating within all zones.

Provide a two-hour fire-resistive rating or protect in accordance with the fire resistance requirements of IBC for all primary structural members (supporting more than one floor) located within the distribution zone, such as girders and trusses. Do not fireproof secondary structural members (supporting only one floor) within the distribution zone. Lateral and seismic bracing within the distribution zone need not be fireproofed provided these members do not carry vertical loads (live or dead).

E-3.6.5 Openings.

To prevent fire and smoke migration into the distribution zone, protect openings through the walk-on platform as noted here: **\1**

E-3.6.5.1 Firestop.

/1/ Firestop all penetrations, for example, ducts, pipe, cables, and conduit, at the walk-on platform with approved material in accordance with NBSIR 85-3158 or with an approved through-penetration protection system. Incorporate all proposed designs with utility penetrations of the walk-on platform by one of the following methods of firestopping:

a. Approved firestopping material using materials from the NBSIR 85-3158.

b. A listed through penetration assembly for the proposed walk-on platform design.

c. A tested system that complies with ASTM E814 or ANSI/UL 1479 for the proposed walk-on platform. **\1**

E-3.6.6 Shafts.

/1/ Enclose shafts in properly rated construction and tightly seal the full perimeter of the penetration at the walk-on platform in accordance with NBSIR 85-3158 or with an approved through-penetration protection system.

E-3.6.7 Ducts and Dampers.

E-3.6.7.1 One-hour Rated Partitions.

Fire dampers are not required where ducts penetrate the one-hour fire-rated partition between the utility pod and the distribution zone.

E-3.6.7.2 Two-hour Rated Partitions.

Fire dampers are required where ducts penetrate two-hour fire-rated partitions between the utility pod and the occupied and connection zones.

E-3.6.7.3 Walk-on Platform Limitations on Unprotected Penetrations.

Do not exceed .98 percent for the total cumulative open space created by unprotected duct penetrations in the walk-on platform above any single smoke compartment or room in the occupied zone. NOTE: this includes annular space between duct and the inside edge of the walk on platform opening. This limit is provided as a design control feature to prevent over penetrating a given area of walk-on platform with un-dampered duct penetrations. The 0.98 percent value is based upon the percentage used in NBSIR 85-3158 and has been coordinated with TJC. Comply with the following paragraph for Individual duct penetrations.

E-3.6.7.4 Walk-on Platform Duct Openings.

Provide fire dampers for duct penetrations greater than 225 in^2 (0.14 m^2) in the walk-on platform. Fire dampers are not required in ducts for openings in the walk-on platform less than or equal to 225 square in^2 (0.14 m^2). This includes supply ducts from the distribution zone to the occupied zone, exhaust ducts, and return ducts from the occupied zone to the distribution zone. Flexible, round duct work (UL 181, Class I) is permitted in interstitial space for connections less than 5 ft (1.52 m) long, but not larger than 12 in. (305 mm) in diameter.

E-3.6.8 Automatic Sprinkler Protection.

Provide an approved automatic supervised sprinkler protection as defined by NFPA 101, throughout the occupied zone and, in DoD Systems Module facilities, in the utility pod. Sprinkler protection is not required throughout the distribution zone or connection zone unless otherwise required by UFC 3-600-01. However, sprinkler protection is required in rooms being used for electrical, communications, and elevator machine equipment, as well as over automatic box conveyor rails and tracks for electric track vehicle systems when located within the distribution zone.

E-3.6.9 Standpipe Protection.

Provide standpipe protection in accordance with UFC 3-600-01. In addition, provide hose outlets at each entrance to the distribution zone exit/access door.

E-3.6.10 Management of Smoke.

Evaluate each facility on an individual basis for the requirements for a smoke management system. Provide a means for purging the distribution zone of smoke and other products of combustion for post-fire operations.

E-3.6.11 Fire Alarm, Fire Detection, and Mass Notification.

Provide fire alarm, fire detection, and mass notification in accordance with Chapter 14. In addition, align system supervision and alarm zoning with the fire and smoke compartments associated with the IBS design. Identify the fire alarm and fire detection devices located in the distribution zone as a subset of the fire alarm evacuation system.

E-3.6.11.1 Manual Alarm Initiation.

Provide a manual pull station provided in the distribution zone at each exit/access door. Coordinate zoning for annunciation with the exit enclosure serving the occupied zone exit/access.

E-3.6.11.2 Occupant Notification.

Provide alarm notification appliances (speakers) utilizing voice evacuation for occupant notification throughout the distribution zone. Activate the alarm notification appliances within the corresponding distribution zone, upon any alarm initiating signal. Provide supplemental visual notification (signaling) in accordance with NFPA 72 along the means of egress paths.

E-3.6.11.3 Smoke Detection.

Provide smoke detection at each elevator access landing in the distribution zone. Connect the smoke detector(s) to the elevator controls and provide elevator response per NFPA 101.

E-3.6.12 Distribution Zone.

Storage is not permitted in the distribution zone.

E-3.6.12.1 Exit/Access.

Exiting from the distribution zone is provided by a side-hinged swinging door assembly located in each exit stairway enclosure. The exit/access door is the primary means of egress for distribution zone occupants and compliance with the exit and ease of operability requirements of NFPA 80 and 101 is required. Provide a door assembly with a minimum width of 36 in. (915 mm) and height of 80 in. (2030 mm). Provide a door which is lockable, self-closing, positive latching, and accessible only by key. Provide a sign on each access door stating: “Storage in This Area is Prohibited by Order of the Fire Marshall.” Provide a similar sign inside the distribution zone.

E-3.6.12.2 Means of Egress Paths.

Provide a designated means of egress path throughout the distribution zone space in accordance with NFPA 101. Any means of egress path connecting the exit/access doors are required at the perimeter of the distribution zone. Provide egress travel along means of egress paths not to exceed 100 ft (30 m) before two separate and distinct means of egress paths of travel to two remote exits are available. Additionally, provide means of egress paths within 25 ft (7.6 m) of any portion of the distribution zone where the only available access requires crossing over or under obstructions or distribution equipment. The minimum clear width for all paths is 36 in. (915 mm), except paths of existing distribution zones which maintain a minimum clear width of 28 in. (710 mm). Provide paths which are nominally level with thresholds and elevation changes in accordance with NFPA 101.

Delineate paths for the full 36 in. (915 mm) width on the surface of the walk-on platform from the most remote point to the exit/access door. Paint paths yellow with direction arrows or cross-hatching indicating direction to each exit/access door. Treat paths with a surface sealant prior to painting. **\1\ /1/** Illuminate exit signs and locate at each exit/access door. Provide an exit sign adjacent to the doorway within 36 in. (915 mm) of the walk-on platform. Locate exit signs along the pathways to provide clear direction toward exits. Provide exit signs in accordance with NFPA 101 for size and illumination requirements.

E-3.6.12.3 IBS Headroom Clearance.

Provide a designated means of egress path with a minimum headroom clearance of 80 in. (2032 mm) and maintained along the entire designated pathway, exclusive of interferences from major structural members. Headroom clearance may be reduced to 72 in. (1828 mm) for no more than 36 in. (915 mm) along any given path. The minimum spacing between each location with limited headroom clearances must be 36 in. (915 mm).

E-3.6.12.4 Exit Signage and Egress Lighting.

Provide exit signage and egress lighting on the life safety circuits and provide with standby or emergency power. Since the distribution zone space is normally unoccupied, separate keyed-alike key-operated light switches (for normal lighting, egress lighting, and exit sign lighting) located at each access doorway activates normal lighting, egress illumination, and exit sign illumination within the module in accordance with NFPA 70 switch requirements for control of emergency lighting circuits to minimize electrical usage and replacement of lamps in the distribution zone.

E-3.6.13 Variations.

In the event a variation from applicable IBS criteria herein is considered, provide documentation to justify the need and identify alternate solutions. Solutions may include equivalent concepts. Support all documentation with sound engineering

principles that are economically feasible and practical to apply. Address and obtain approval of all variations with the Design and Construction Agent prior to incorporation into the design. Interstitial floor construction characteristics, including the features, properties, and attachment methods of structural support members, walk-on deck materials and properties, and limitations and characterization of allowable deck penetrations, to be in accordance with the referenced NIST-tested assemblies. Where the proposed interstitial design does not replicate NIST tested assemblies, demonstrate structural and thermodynamic equivalency by full-scale testing in accordance with NFPA 251.

E-3.7 Documentation and Construction Considerations.

E-3.7.1 Construction Documentation.

Provide drawings for IBS facilities to include plans and sections delineating zones reserved for utility distribution, branches, and laterals. Drawing information must indicate location of all utility system walk-on platform penetrations and include installation details for each type of utility system penetration. Coordinate drawings with all disciplines. Provide interdisciplinary cross-sections at critical locations, for example, above ORs, equipment rooms, and corridors. Include requirements for coordination of all disciplines prior to construction in all pertinent specification sections.

E-3.7.2 Pre-Bid Conferences.

To ensure that construction contractors take the IBS DoD Systems Module design concepts into account when preparing bids, recommend presentations of these concepts for pre-bid conferences conducted by the Design and Construction Agent.

E-3.7.3 Pre-Construction Consideration.

For a DoD Systems Module construction project, construct a mock-up distribution zone at least 1000 feet^2 (93 m^2) in area at the project site, at the discretion of the Design and Construction Agent. Include a complete walk-on platform assembly with suspension members for the mock-up. Within the sample, include elements of the utility systems within the distribution zone. Complete construction of the mock-up in advance of facility construction to allow time for necessary testing and approval. Address and finalize various construction details within the mock-up, such as temporary protection of the walk-on platform during construction, proper support and sealing of ducts and fire dampers at walk-on platform penetrations, and permanent fire sealing of the walk-on platform to abutting walls and other permanent structural elements.

E-3.7.4 Coordination Drawings.

Provide coordination drawings prior to construction that show all utilities and penetrations. Include this information in the record drawings indicating the as-built conditions.

APPENDIX F FOOD SERVICE

F-1 GENERAL.

This appendix provides criteria and guidance for the design and development of food service systems in new and existing applicable facilities. The appendix includes lessons learned from using MilDep consultants and Post-Occupancy Evaluations for the purpose of minimizing errors on all future projects.

F-2 CONSULTING SERVICES.

The A/E of record shall provide the services of a qualified hospital food service consultant at project initiation, who provides design function, flow and equipment input throughout the design process. The consultant also provides input on equipment specifications and cost estimates of the equipment. A qualified food service consultant is one who has been in business solely as a food facilities design professional for a period of not less than five years and is a member of the Food Service Consultants Society International (FCSI) or equal. The consultant shall not be involved in the sale, installation, distribution, manufacture, or representation of food service equipment. Furthermore, the consultant should have experience with similar projects scope, size, and location for the specific project.

F-3 FOOD SERVICE DESIGN OBJECTIVES.

F-3.1 Environment.

Provide a functional, efficient, and aesthetically pleasing food and nutrition environment for patients, service members, staff, and guests, within staffing, budgetary guidelines, and space requirements. This includes a functional, efficient patient tray assembly area designed to provide room service style patient feeding.

F-3.2 Design Elements.

Design nutrition services (or patient and staff feeding) facilities that optimize the performance of existing personnel, the facility, and the equipment, while producing high-quality nutrition care services and products. The design shall incorporate evidence based design (EBD) elements, such as access to outdoor dining, access to natural views, a variety of spaces for social, dining, and collaborative engagement among patients, family, and staff, and providing positive distractions in all public spaces. Design patient tray assembly area to efficiently support room service style patient feeding, please refer to F-4.5. Give highest priority to colocation of all food service spaces and functions on one level. Requirements for food preparation spaces include proper temperature control, ventilation, and to the extent possible, minimizing the distance required to transport food products and finished food items from the point of preparation and cooking to the point of service.

Collocate and make accessible the pot and pan room and dishroom to the patient tray service and dining facility preparation areas.

F-3.3 Design Flexibility.

Design a food service system with the ability to adapt readily to changing missions, requirements, food preparation processes, labor conditions, and equipment technology.

This objective requires forethought from the DoD Project Sponsor, end user, and food service consultant. Recommended methods to build flexibility into the design include planning multiple sources of power with additional electrical capacity incorporating dual use equipment, and integrating information technology effectively. Design the dining area to maximize the projected seating capacity without sharing with non-food service departments, allow for flexibility to accommodate various sized groups as needed within the dining area, and provide a clear flow of traffic into and out of the dining area. Design the servery, dining area, cash registers and condiments bar as securable, discrete areas during non-operational hours.

F-3.4 Equipment.

Provide high-quality food service equipment that is manufactured in the United States (or as designated by regional requirements in OCONUS locations) and sized to accommodate the maximum capacity of the expected growth of the facility at the time of design. Provide dual functional equipment when possible, for example, a serving line capable of being self-serve or full service; a serving line with the capability to hold hot or cold food for service. Select and incorporate equipment into the design to create an efficient flow of materials and personnel. Custom-fabricated equipment is permitted in the servery, walk-in refrigeration and freezers, and space-restricted equipment; specified modular equipment must be easily disassembled and reassembled by the end user and must be off of the floor and or on wheels or coasters for ease of movement for cleaning and reconfiguration. Equipment must also be designed and built for ease of sanitation and food safety measures. Large equipment installed, custom fabricated or not, must be designed such that it can be removed and replaced at the end of its life cycle without having to execute major facility construction to widen doorways, open walls, or move other installed equipment during the removal/replacement process [or] all equipment included in the design must have the ability to be disassembled with minimal effort for removal through existing doorways, elevators, etc.

F-3.5 Energy Efficiency and Sustainability.

Consider energy efficiency and sustainability in the design. Incorporate sustainable design features and requirements including day-lighting, energy and water conservation measures, the use of nontoxic materials and finishes, and sustainable O&M practices. Incorporate space and equipment to maximize waste reduction, reuse, recycling, and composting in accordance with UFC 1-200-01 and local installation requirements. Prior to design, the contractor must verify that the community can support the recommended sustainability practices. Incorporate a blend of reusable dishware and other food service-related disposables.

F-3.6 Food Service Systems.

The basis of physical planning constitutes three food service system: ready prepared, cook/serve, and Grab and Go or a mix thereof. Most facilities have a mix of food systems utilizing a conventional flow of food. See the Functional Diagrams depicting flows for the various food service systems in the DoD Space Planning Criteria Chapter 510 Food Service.

F-4 DESIGN CRITERIA.

F-4.1 Design.

In food service design: (1) provide movement of food products to ensure effective monitoring and control of food temperatures through conventional flow while minimizing personnel cross-traffic, backtracking, and queuing conditions; (2) incorporate the Food and Drug Administration (FDA) Hazard Analysis and Critical Control Points (HACCP) system, and the Tri-Service Food Code (TSFC) to ensure food safety. The DoR and food service design consultant, at the 35 percent submittal, provide schematic plans; circulation paths from servery to seating, loading dock to storage, and kitchen to inpatient units; general material movement; principal dimensions; and dining seating counts in accordance with current DoD Space Planning Criteria Chapter 510 Food Service.

F-4.2 Configuration.

Use a rectangular general configuration of the food service operation to optimize use of space. Provide capacity to close off and secure the food storage areas, food service preparation, servery area, cash registers and cash control room from the public area after normal operational serving times. The food storage areas should have limited access to required personnel. Individual controlled access (card readers) is required on all walk-in refrigerators and freezers in addition to all storage rooms. Configuration provides an efficient flow of products from storage to preparation, to service in the servery and the patient tray assembly areas. The servery accommodates large numbers of customers in short periods of time and be configured to support prominent display of healthy/nutrient dense food and beverage options and less prominent display of less healthy/low nutrient density foods. Utilize a scatter, hollow square, or scramble servery design. Supply beverage stands with water sources and piggyback soda fountain conduit. Serving stations must require extensive planning based on input from the DoD Nutrition Committee, and the local end user, as well as coordination with the DOD Space Planning Criteria Chapter 510 Food Service, and Chapter 13.

F-4.3 Staging.

Collocate food service storage areas with the food service operation. Provide a dedicated food service dock that distinctly separates “dirty” and “clean” receiving. For the receiving area, provide adequate space and associated utility connections for a large, digital read out platform scale. The food service operations and receiving areas

must fully comply with HACCP principles and the TSFC. With respect to food safety, consider staging refrigerators and freezers near the loading dock to minimize elevation in food temperature. Provide a transportation and handling study during the planning stage that addresses the transportation of foods, food products, and food material throughout the medical facility to include recycling and holding, trash compaction, paths of travel, efficiencies in operations and locations, and waste management associated with food service. Refer to Chapter 17 for coordinated information related to transportation and waste management requirements. All supply areas where pallet jacks are used must have corridors that are a minimum width of 6 ft (1.83 m), and door design must accommodate pallet jacks. Food storage areas must be limited to authorized personnel for food security, safety, and accountability purposes. Designs must not have open access to all nutrition staff members.

F-4.4 Refrigerator and Freezer.

Connect all refrigerators and freezers to a single control panel with corresponding temperature readouts. Fit all refrigerators with a visual and audio alarm that annunciates in the Food Service Department and in the Facility Management Control Room and off duty personnel. Equip all refrigerator systems with temperature gauges located outside the entrance of the walk-in unit. Design must accommodate walk-in access to freezers directly via a walk-in refrigerator for optimal temperature control, and door design must accommodate pallet jacks. Locate compressors in close proximity to the refrigeration system, in a ventilated room with a floor drain and hose bibb. Refer to Chapter 10 for ventilation criteria. Label compressors with the refrigeration unit(s) they service. When using chilled water backup, include, a redundant pump to avoid refrigeration and freezer compressor damage and food product loss. All refrigeration and freezer units must be placed on an equipment EPS to provide department functionality during periods of crisis. Refer to Chapter 11 and Appendix B for emergency power requirements.

F-4.5 Patient Tray Assembly.

Patient Tray Assembly area must be designed to support Patient Room Service. Patient Room Service allows patients to call a dedicated call center that receives patient meal orders. Patients may order meals anytime between established hours (typically between 0600-1800). Meals are prepared and delivered on-demand within a specified time after the patient calls (typically 40 minutes). The Room Service call center must be adjacent to the Patient Tray Assembly area. The Patient Tray Assembly area must be separate from the dining room food preparation area and must be designed with a separate but collocated cold preparation area, hot cooking area to include hooded ventilation, tray assembly area and cart staging area. Appropriately scale the hot cooking area equipment to support the patient feeding workload, using relevant historical, current, and projected patient workload information to ensure sufficient capacity, such as a grill and stove top. Design all areas to include adequate adjoining work space collocated with equipment; for example: space to land hot pans, and adequate power, grates, drains, hood systems and exhaust systems. Additionally,

provide appropriate space and connectivity (IT and power) for printers that print patient meal tickets throughout the meal period.

A directly accessible route from tray assembly to service corridors or elevators to patient care areas is required. Provide dedicated elevators to food service in large medical centers. For cart routes, prevent dirty carts from crossing food preparation areas. Include flexible energy distribution systems in patient tray assembly area. Design warmers and refrigeration to ease bulk movement. Plan beverage islands and include a water source, ample electricity for expansion, under-floor installation of a 4 in. (100 mm) (minimum size) PVC conduit for “piggy-back” soda fountain conduit and juice machines, steam, and adequate drainage. If beverage dispensers have an ice machine affixed to the top, plan and provide a minimum ceiling height of 9 ft 0 in. (2.74 m) (reference Appendix B). Design a flexible tray line to decrease or increase the number of trays without changes in infrastructure requirements. Electrical outlet drops from the ceiling must be available to ensure versatility of tray line reconfiguration. Adequate space is required for cart staging, loading, storage, and cleaning, which includes consideration for life-safety requirements for egress and two way traffic, as well as increasing space requirements to avoid life-safety parameters around and near electrical boxes, control boxes, fire extinguishers, eye-washes, and other like items.

F-4.6 Dishwashing and Ware Washing.

Design dishwashing and ware washing (pot washing) to prevent crossing workflows between soiled and clean wares, and the food preparation and service areas. Locate dishwashing and pot washing adjacent to each other to share labor and equipment. Locate pot and Pan washing area in proximity to the main food preparation area. Sufficient dirty pot and pan landing space adjacent to a three compartment sink must be considered. Design dishwashing space to provide ample space as dirty dishes arrive on a conveyor system, followed by a disposal system, then a spray mechanism prior to dishes being loaded in the dishwasher. This space must accommodate patient tray carts to include the offloading of the cart, scraping of trays and allocation of various tray items into the appropriate containers for further cleaning. Plan out space to accommodate separate clean dish air drying and storage, dish racks, pots, plate warmers/low-raiders, inpatient tray racks, and tray delivery carts. Locate the tray drop-off and dishwashing areas as close to the dining area exit as possible to permit patron self-bussing. Design workflow to prevent garbage and dirty dishes from crossing into clean areas. Design must include or plan for installation of automated washing, disinfecting, and sanitizing chemical dispensing systems that are easily accessible to staff and have sufficient space for storage and cleaning.

F-4.6.1 Additional Requirements.

For manual ware-washing operations, water temperatures for sanitization must comply with the TSFC requirements. Allocate sufficient space to land large items that require cleaning and a garbage disposal/rinsing component. In accordance with the TSFC, manual washing must have sufficient space to accommodate air-drying of dish racks, pots, utensils, mobile plate warmers/low-raiders, inpatient tray racks, and tray delivery

carts (see DoD Space Planning Criteria Chapter 510 Food Service). Additionally, after manual cleaning and sanitizing, equipment and utensils must be air-dried or used after adequate draining as specified in 40 CFR 180.940. Design must include or plan for installation of automated washing, disinfecting, and sanitizing chemical dispensing systems that are easily accessible to staff and have sufficient space for storage and cleaning.

Install all mechanical ware washers and pot and pan washers with a steam reclaimer designed to remove hot, moisture-laden air as described in TSFC. For mechanical ware-washing equipment and sanitizing units, the wash solution temperature must comply with the TSFC requirements. Provide booster heaters as needed to meet TSFC temperature requirement. If low temperature ware-washers are used, they must be designed to dispense approved chemical sanitation agents in accordance with Federal, state, and local requirements. Include in the design floor drains in the ware washer center where equipment cleaning actually occurs. Special consideration must be given to the coordination of appropriate drain types, and their locations, and elevation such that the floor slopes toward the drain(s). Minimize the runs of piping from equipment to drains.

F-4.7 Communications.

Coordinate communications requirements with the DoD Project Sponsor and Chapter 12. Coordinate wiring, conduit, routing devices, and equipment with the DHA-FE and Food Service Consultants. Telephone and data lines are required in all offices, the Room Service call center, the tray assembly area, serving lines, storage, receiving, and food preparation areas. Provide connectivity to a wireless network or the internet throughout the kitchen to accommodate capabilities for patient tray ticket transfer and printing, temperature monitoring systems, inventory systems, and communications among staff. Prewiring is required for computerized communication at the cashier stations for electronic payment options and at serving stations for electronic menu boards. Design cashier stations to have a separate internet line to process credit card transactions that does not interface with the main server/system at the facility due to cyber security concerns. The dining area requires a base or post telephone capability for medical staff responses. Security systems (Service component coordination) intercom system, and TV in dining room require prewiring. The video surveillance system, at a minimum, must include cameras in the cash control room, at cash registers and in storage and supply areas, and per the requirements of the project specific CONOPS.

F-4.8 Waste Handling.

Dietary trash and waste handling requirements must be considered in conjunction with the total health facility waste handling requirements to minimize duplication of facilities. (Refer to Chapter 17.) Design dining, food preparation, servery, and processing areas to avoid transporting trash through food-handling or preparation areas for disposal. Provide waste pulping disposing systems to minimize the volume of solid waste products. Current disposal methods for the pulping residue must be accommodated in

the design as required per local contract agreement. Provide recycling areas and equipment in the Food Service Department for separating and recycling of cardboard, plastics, and other recyclable materials as required per local contract agreement. Handling of waste must be in compliance with local installation requirements. Further, separate spaces for storing clean (empty) and dirty (full) waste and recycling bins must be incorporated into nutrition services space and at external delivery pick up locations according to evidenced based / regulatory waste handling procedures that include prevention pest mitigation considerations and life-safety concerns. Also design a dedicated space to use for regularly cleaning waste and recycling bins (this may be interior or exterior near the waste disposal area).

F-4.9 Emergency Power.

Evaluate food service equipment for inclusion on the EPS to ensure impact to dining facility and patient tray food service operations is minimized by loss of power, giving special consideration to inclusion of walk-in refrigerators and freezer. The cash register electrical power system, at a minimum, must be on UPS; however, evaluation of the cash register system must be part of the overall evaluation of kitchen equipment and may be deemed appropriate for inclusion on the EPS by the DoD Project Sponsor. Refer to Chapter 11 and Appendix B for emergency power source requirements. Consideration must also be given to distributing electrical requirements between separate major junctions to create redundancies that maintain power to certain equipment while others may be down unexpectedly or for preventive maintenance requirements.

F-4.10 Steam.

Steam in direct contact with food must be "clean", containing no amines, oxygen scavengers, or other potentially harmful treatment chemicals. Where treated steam is available, it may be used for the indirect generation of clean steam for cooking. All equipment used in the generation and distribution of clean steam must be constructed of stainless steel in accordance with Chapter 10. Consideration must also be given to have multiple steam access and shut off points such that redundancies exist that maintain at least moderate steam flow to equipment when valves or steams systems go down unexpectedly or are taken out of operation for preventive maintenance requirements.

F-4.11 Shelving

Equip all storage areas (dry, non-food, refrigeration and frozen) with shelving systems that maximize space utilization and are appropriate to their specific applications. Use high density or track shelving where feasible to expand storage capabilities and maximize available storage areas. Shelving must be finished with galvanized steel, zinc-coated carbon steel, chrome-plated carbon steel, or extruded aluminum. To comply with Joint Commission, the bottom shelf must be solid. Louvered and open-wire shelving is recommended to encourage air movement. The Chemical Storage Room is

best located near the dishwashing and pot-washing area in accordance with applicable safety and environmental requirements.

F-4.12 Plumbing.

F-4.12.1 Hand washing.

All hand-washing sinks must be stainless steel and have “hands free” operation (wrist-, elbow-, or knee-operated). Install in accordance with the manufacturer’s instructions. Ensure compliance with the requirements of the TSFC for water temperature, valves, and water flow.

F-4.12.2 Floor Drains and Sinks.

Provide floor drains or floor sinks at all "wet" equipment (including ice machines) and as required for wet cleaning of floors. Coordinate location of floor drains and floor sinks with equipment to avoid conditions that prohibit removal of drain/floor sink covers (for example ensure drain/sink covers can be removed for cleaning). Drains must be properly leveled on the floors to ease cleaning.

F-4.12.3 Trough Drains.

Provide a floor trough at steam-jacketed kettles and tilt frying pans to facilitate cleaning of food service equipment. Construct fiberglass or heavy gauge stainless steel trough grates. Where pallet jacks are utilized, do not provide troughs in front of walk-in refrigerators and freezers. Grade floors throughout the storage (to include refrigerators and freezers), food preparation, food service, and sanitation areas to eliminate water accumulation.

F-4.12.4 Eyewash Stations.

Provide eyewash stations in janitor closets and all other areas where chemicals are utilized.

F-4.13 Compliance Standards.

Design food services to comply with TJC standards of care of patients, the NSF standards, the TFSC, and the HACCP Food service equipment must be manufactured or fabricated in accordance with industry standards governing safety such as the NSF, UL, the American Gas Association (AGA), the ASME, and the EPA ENERGY STAR program.

F-4.14 Exhaust Hoods.

Design all kitchen exhaust hoods to meet ASTM standard for open joints and solid welding, maximum noise thresholds (85 dBA time-weighted average is the maximum allowable exposure), and to be self-cleaning. Fire suppression system must be provided over all deep fat fryers, grills and charbroilers. Increased ventilation capability

must be considered where deep fat fryers and charbroilers are planned. Refer to Chapter 10.

F-4.15 Interior Finishes.

Interior finishes throughout food service must comply with Appendix B. Corner guards, wall guards, and steel kick plates for doors that continue up the wall partitions, toe-kicks, or cabinetry at least 4 in. (100 mm), forming a 3/8 in. (10 mm) minimum radius cove as an integral unit must be installed in applicable location per manufactures requirements. Cart wash areas and dish machine areas must be finished for wet environments to include non-slip floors. Acceptable flooring material is durable, light-colored, waterproof, grease-resistant, easily cleanable, and can withstand the load of heavy cart traffic. In areas where two contiguous Food Service functions have different flooring finishes in accordance with the Appendix B, provide the finish that is most appropriate throughout the contiguous areas/functions. Use grouting that is nonabsorbent and impregnated with epoxy, silicon, or polyurethane. Flooring must meet NSF/ANSI 52minimum standards. Acceptable wall material is durable, waterproof, grease-resistant, and easily cleanable, and can withstand high levels of moisture and the constant movement of carts that will bump and scrape against walls.

F-4.16 Data Processing Equipment and Security.

If the facility utilizes an information system or other interdepartmental system, the Food Service operation must be linked to this system (the Hospital Information Management Computer Room). Visual security monitoring systems with data recording and retrieval must be provided in the cash control room where cash counting occurs, the cashier stations, the loading dock, and the corridor utilized to move Food Service supplies into their designated storage areas. The cash control room, cash register stations, and the main foodservice supervisor office must be wired for a duress alarm. Reference paragraph 5-4.6 for further duress alarm requirements.

F-4.17 Grease Traps.

Locate grease traps outside the building. Grease traps must be accessible for cleaning in accordance with Federal, state, and local fire, safety, and environmental requirements.

F-4.18 Sealants.

Thoroughly seal all openings or penetrations of any horizontal or vertical finish surface so as not to provide access and/or hiding places for vermin or encourage the growth of bacteria. Sealant must be water- and detergent-resistant silicone.

F-4.19 Franchised/Leased Food Services.

Identification of the type of franchised or leased space for Food Services provided by entities other than DoD Food Service components must be identified during project planning and programming. To minimize unnecessary construction change orders,

careful coordination is necessary to identify room net square footages, equipment, engineering requirements, and wireless coverage for government networks to support these distinct functions. These requirements must be submitted to the Design and Construction Agent prior to the 20 percent design submittal.

F-5 SEISMIC CRITERIA.

The planning, selection, and installation of food service equipment must be carefully considered with regard to potential damage by earthquakes. Give special attention to the mounting of fixed equipment, to utility connections, and to the design features of selected equipment. The required seismic protection must depend on the seismic design level prescribed for individual projects. Indicate all bracing details for food service equipment on contract documents. Reference Chapter 7 for additional requirements.

F-6 FOOD SERVICE EQUIPMENT SPECIFICATIONS.

All contractor-provided food service equipment items identified on the contract drawing must be specific in detail. The latest technology must be specified. Commercial kitchen appliances must be either ENERGY STAR-qualified or Federal Energy Management Program (FEMP) recommended. All equipment must meet EPA standards where required, as well as NSF, UL, and AGA.

APPENDIX G PARKING REQUIREMENTS

G-1 GENERAL.

This appendix provides mandatory criteria for parking associated with applicable facilities.

G-2 PARKING AUTHORITY.

DHA-FE is the sole Approving Authority over DoD medical facility parking requirements. Inadequate parking can impede the MHS' ability to provide prompt and unhindered care to patients. It may also require ill patients to walk extended distances, and potentially increase infectious incidence on public transportation. Parking requirements within this document and shown in Table G-1 consider these issues and have been calculated and formulized by professional traffic engineers directly considering patient, staff, and visitor populations. Parking requirements at DoD Installations as stated in this document supersede all non-medical state, regional, and or local jurisdiction criteria or requirements.

G-2.1 Facilities and Location.

The parking area designer must size the required parking area based on calculation as described in this appendix. The designer must consider the minimum use of land, the economical and efficient use of existing and future utilities, ecological conditions, the impact on the environment, sustainability and conservation considerations, maintenance and operations requirements, and the potential need for future growth. Shared parking may be considered where feasible. Landscaping appropriate to the locality should be considered and utilized where applicable, affordable, and practical. Every reasonable and practical effort should be used to integrate existing trees or vegetation into the parking areas.

Parking structures or garages must be considered by the DoD Project Sponsor when the site is too small to accommodate the required parking, when the value of the land is excessive, the site is located in a harsh climate, the required amount of spaces creates extreme walking distances, or sustainability or ecological issues prevail. Parking structures must be included as a separate line item in the project Capital Investment Decision Model and later project DD Forms 1391. The DoD Project Sponsor must approve parking structures on a case-by-case basis.

G-3 PARKING CONSIDERATIONS.

G-3.1 General.

Integrate all design elements, including functional, architectural, civil engineering, electrical, emergency services access, security, and delivery services, and other features.

G-3.2 Off-Street Parking Design.

The DoR must follow the concepts from the most current Surface Deployment and Distribution Command Transportation Engineering Agency (SDDCTEA) Pamphlet 55-17, Section 17.2, Better Military Traffic Engineering, Off-Street Parking Facilities. Table G-1 (below) supersedes parking demand in MSDDCTEA Pamphlet 55-17, Section 17.2.1. Design parking areas for continuous traffic flow to the maximum extent possible.

G-3.3 Parking Garages.

The DoR must design each parking garage for continuous traffic flow and minimize dead-end parking spaces. The lack of continuous flow slows traffic flow and contributes to increasing vehicle accidents. Do not permit handicapped access path to traverse behind vehicles. Crossing vehicle travel aisles requires approval by Design and Construction Agent. Parking garage elevators must be included in the elevator traffic study (ETSA) and analysis in paragraph 16-2.2.

G-3.4 Parking Wayfinding.

Parking wayfinding must be included in the wayfinding plan in paragraph 6-13.

Table G-1 Required Parking Spaces for Medical Facilities

Calculating the Required Parking Spaces	
Number of Parking Spaces Required = $(0.75)(X_1) + (.40)(X_2) + (X_3) + (X_4)$	
Where:	X_1 = All personnel working in the facility on a full-time basis, plus an allowance for visitors and part-time staff. Include FTE's, contract maintenance, Red Cross volunteers, base exchange, clergy, interns, technical school trainees, Veterans Affairs and other DoD Project Sponsor liaison staff, Reserve, Guard, Professional Military Exchange (PME), and visitors. Visitors include: Installation Commander, TRICARE, RMO Security, Fire Department consultants, salespersons, and shift change overlap. (Use 10 percent if statistics are unavailable for additional visitors, shift overlap, and part-time staff.)
	X_2 = Use projected M2 (Military Medical business objects database) outpatient visits for the peak month (typically either August or September) and peak day of the week (typically a Monday). Include projected M2 pharmacy encounters: new scripts ("FCC" and "FCD") and refills except those scripts that are picked up at satellite pharmacies.
	X_3 = One space for each inpatient bed.
	X_4 = One space for each organizational Government vehicle, and facility contractor support vehicle that regularly uses the parking facilities. For those vehicles that are too large to use a standard parking space, provide an oversized space.
Notes:	
1. Additional parking spaces must be justified.	
2. "Reserved" spaces for Command, General Officers, Rewards, and Disabled are included in the above factors.	
3. Spaces for Disabled are included in the above total and must be allocated in accordance with Chapter 13 for both inpatient and outpatient requirements as applicable.	
4. Calculation adjustments may be made to the X_1 parking requirement for carpooling, public transportation (if reliable and available within reasonable walking distance) and for Quarters/Housing (if within reasonable walking distance). The adjustment must only be based on those staff that routinely avoids using the parking facilities.	
5. Parking lot segregation for staff, patients, and visitors must be addressed by the Project Sponsor during design.

H-2 DEFINITION OF TERMS.

For additional terminology, please reference the following:

DoD 6015.1-M, *Glossary of Healthcare Terminology*, January 1999, Assistant Secretary of Defense for Health Affairs, TRICARE Management Activity.

NFPA Glossary of Terms, 2021 National Fire Protection Association, www.nfpa.org

---

Air Handling Unit (AHU): An air conditioning unit consisting of fan(s), coil(s), filter(s), and other components designed and sized for supplying conditioned air to a given area or space(s).

Ambulatory: Able to walk; not confined to bed. **\1**

Ambulatory Care Center: An outpatient facility which provides a wide range of medical treatment. This facility category includes Ambulatory Care Clinics, Medical Clinics, and Dental Clinics. ***/1/***

Ambulatory Health Care Occupancies: Refer to NFPA 101 for occupancy definitions.

Ambulatory Surgery Center: An Ambulatory Care Clinic with two or more Operating Rooms.

Anesthesia: Partial or complete loss of sensation, with or without consciousness, as a result of drug, disease, or injury.

Anesthetic: Applies to any inhalation agent used to produce relative analgesia or general anesthesia.

Anesthetizing Location: Any area of the facility that has been designated to be used for the administration of any flammable or nonflammable inhalation anesthetic agents in the course of examination or treatment including the use of such agents for relative analgesia.

Antiseptic: The prevention of decay, putrefaction, or sepsis through use of an agent that must prevent or arrest the development of microorganisms.

Apparatus: Furniture, laboratory hoods, centrifuges, refrigerators, and commercial or man-made onsite equipment used in a laboratory.

Architect and Engineer (A/E) Firm: A business composed of professional architects and engineers.

Asbestos: A natural mined mineral that is a good thermal insulator, a good acoustical insulator, fire resistant, resistant to friction and wear, and a poor conductor of electricity. Known to cause lung cancer, mesothelioma, and other forms of cancer in the stomach and colon.

Aseptic Environment: An environment or area that is intended to be free from pathogenic microorganisms to prevent infection.

Automatic Box Conveyor (ABC): Also known as Electric Track Vehicle (ETV) or Powered Track Tote Box Conveyor System (PMTCS). A rail system utilizing self-contained buss bars to provide power to special carriers that contain and move small supply, demand, and other items between stations on the track network.

Automated Data Processing (ADP): Any equipment that is used in the automatic acquisition, storage, manipulation, management, movement, control, display, switching, interchange, transmission, or reception of data information.

Automatic Data Processing Equipment (ADPE): General purpose, commercially available automatic data processing equipment, and the systems created by them.

Autoclave: An apparatus for sterilizing utilizing steam under pressure.

Automated Guided Vehicle System (AGVS): Also known as Driverless Vehicle System (DVS). This system utilizes a battery-powered, electronically-controlled vehicle that follows a predetermined route (guide path or track that is buried in the floor or adhered to its surface) to move carts and material throughout the facility. The system utilizes the guide path network and special elevators to make the horizontal and vertical routings. Different degrees of automation and capabilities are available. The basic system components commonly found in a hospital application include: driverless vehicles, elevators, carts (modules), guide path and controls, cart wash(s), and battery charge equipment.

Average Interval, Elevator: The elapsed time in seconds between elevator departures from a terminal floor averaged over a specific time period. Average interval is a measure of the “quality” of elevator service. Average interval can be measured in existing buildings but must be calculated for new buildings. For practical purposes, it can also be viewed as the average roundtrip time of an elevator, divided by the number of elevators within the group in question. Average interval is not a direct measure of how long prospective passengers wait for service.

Average Maximum Ride Time (AMRT), Elevator: The amount of time a passenger is in an elevator from the point of origin to the destination is referred to as the “ride time.”

Average System Response Time, Elevator: The average time it takes for hall calls to be answered by an arriving elevator car. This is an estimated or simulated factor for new facilities but can be measured for existing facilities.

Average Waiting Time, Elevator: The average period that users wait for elevator service. This is an estimated or simulated factor. For example, if one person arrives at a lobby and initiates a hall call, and waits for 20 seconds for the car to arrive, while a second person arrives at the same time as the car, the average for these two persons being served is 10 seconds (20 seconds plus 0 seconds divided by 2). Tests indicate that average passenger waiting time (AWT) for service at a typical intermediate floor approximates 65–80 percent of the average interval during heavy two-way traffic periods.

Backflow Prevention: The use of a recognized device to prevent the backflow of water or other liquids, mixtures, or substances into the distributing pipes of the potable supply of water from any source such as a plumbing fixture or mechanical equipment.

Base Isolation: This is a seismic construction element to prevent ground motion from being transmitted from the building foundation into the superstructure.

Basic Life Safety (Seismic): A seismic damage risk classification category and an operational level category. Facilities in this category meet the minimum requirements and objectives of seismic building codes—to provide a collapse-resistant structure and thereby save lives. The life safety of the immediate building occupants is the sole objective of this category. Efforts to control damage due to earthquake in this category are minimum and limited primarily to the saving of human life. Reference Chapter 7.

Built-in Equipment: That equipment that is affixed to the facility and usually included in the construction contract.

Bulk Nitrous Oxide System: An assembly of equipment as described in the definition of bulk oxygen system that has a storage capacity of more than 3,200 pounds, approximately 28,000 cubic feet (normal temperature and pressure [NTP]) of nitrous oxide.

Bulk Oxygen System: An assembly of equipment such as oxygen storage containers, pressure regulators, pressure relief devices, vaporizers, manifolds, and interconnecting piping that has a storage capacity of more than 20,000 cubic feet of oxygen (normal temperature and pressure [NTP]) including unconnected reserves on-hand at the site. The bulk oxygen system terminates at the point where oxygen at service pressure first enters the supply line. The oxygen containers may be stationary or movable, and the oxygen may be stored as gas or liquid.

C-Arm: Term referring to a specific type of radiographic machine used for fluoroscopic examinations.

Cardio: Related to the heart.

Cart (also called a "Module"): A wheeled vehicle upon which material is placed to transport it throughout the facility. Many cart variations are available. The movement of carts can be accomplished by employees, or semi-automated or automated transportation systems as determined by careful analysis for each individual hospital.

Cart Lift: A small vertical lift that is dedicated to the movement of carts. Cart lifts are usually automated and provide automatic dispatch and loading and unloading of carts. "Cart lifts" that are manually dispatched and require manual loading and unloading of carts are generally called "cart dumbwaiters."

Cart Wash: The semi- or fully-automated machine that washes and rinses carts as required by the individual hospital's program. Units may provide automated or manual loading and unloading. Units may or may not provide a full drying capability. Selection of the correct unit(s) for an application should be made after a complete analysis of all requirements, to include financial (life-cycle cost [LCC]) and traffic. When the cart wash function is to be done manually, it is done by hose or steam gun in an equipment washroom or area.

Category Code (real property): A series of numerical codes used to classify and categorize real property. These code numbers are based on ten basic functional classes coded by the DoD. They are generally a five-digit code to plan, program, budget, design and construct, inventory and maintain its facilities. Some commands add digits to refine the functional description. A category code may consist of a collection of attributes that come together to form the specific category code.

Category Code (NFPA): The terms "Risk Category", "System Category" and "Space Category" are used throughout NFPA 99 and can be confusing as the definitions appear similar and all have a range of 1 to 4 with category 1 being the highest risk (or most stringent requirement) and category 4 being the lowest risk (or least stringent requirement). Space categories relate to the typical function in a given space and are defined by NFPA 99, and for the Military Health System, are provided with the room code in Appendix B. Risk categories are defined by NFPA 99 and are determined by a risk assessment IAW NFPA 99. System Categories are the resultant design criteria to be applied to a given system after considering the Risk Category and Space Category, but note that there is not always a direct correlation between these categories.

Central Material Service (CMS): The physical area and functional operation that is responsible for cleaning, sterilizing, preparing, packaging, storing, and distributing

sterile items within the facility. CMS is the primary support element for the Operating suites and Labor and Delivery Rooms.

Central Processing and Distribution (CPD): An all-inclusive term for that function in a hospital that encompasses those terms variously known as Central Supply, Central Nursing Supply, Central Sterile Supply, and Central Material Services. Generally refers to a materials handling methodology. Provides for the central management of all medical material required to support patient care activities. The heart of this concept is an automatic distribution system. CPD requires the standardization and centralization of the elements of storage and distribution.

Civilian Health and Medical Program for the Uniformed Services (CHAMPUS): An indemnity-like program called TRICARE standard that is available as on option under DoD's TRICARE program. There are deductibles and cost shares for care delivered by civilian healthcare providers to active duty family members, retirees and their family members, certain survivors of deceased members, and certain former spouses of members of the seven Uniformed Services of the United States.

Code of Federal Regulations (CFR): The CFR annual edition is the codification of the general and permanent rules published in the Federal Register by the departments and agencies of the Federal Government. It is divided into 50 titles that represent broad areas subject to Federal regulation. The 50 subject matter titles contain one or more individual volumes, which are updated once each calendar year, on a staggered basis. The annual update cycle is as follows: titles 1–16 are revised as of January 1, titles 17–27 are revised as of April 1, titles 28–41 are revised as of July 1, and titles 42–50 are revised as of October 1. Each title is divided into chapters, which usually bear the name of the issuing agency. Each chapter is further subdivided into parts that cover specific regulatory areas. Large parts may be subdivided into subparts. All parts are organized in sections, and most citations to the CFR refer to material at the section level.

Combined Elevators: Elevators intended for dual or multiple function such as combined passenger (visitors/public) and service (moving of materials or patients).

Commission of Fine Arts (CFA): A regulatory body in the U.S. National Capital Region (NCR) that helps determine applicability of all Federal Military Construction (MILCON)-funded facilities within the NCR. Reference National Capital Planning Commission [NCPC].

Compaction. A waste-handling methodology whereby the volume of waste materials is reduced for ease of disposal.

Concepts: The first phase of design that includes Block Plans (S1), Schematics (S2), Design Development (S3), and the final 35 percent submission (S4). The basis on

which a Programmed Amount (PA) can be set for the Budget Submission. Approximately 35 percent of the design effort, as opposed to the second phase of design that is called the “working drawings” phase of design.

Constructability: An analytical study that reviews the methodology, ease (or difficulty) with which a project can be administered, bid, built, enforced, understood, and phased that determines degrees of difficulty and construction time required to build a Medical Treatment Facility. Reference Chapter 3.

Construction Contract Solicitation: The point in the design-construction process when all review comments from the 100 percent design submittal have been incorporated, the CWE is within the PA, the DoD Project Sponsor has notified the Design and Construction Agent that funds are available, and the DoD Project Sponsor has notified the Design and Construction Agent to advertise the project for bids. It is generally the point in the process when the project ceases to be a design effort and becomes a “Construction Project.”

Construction Management Plan (CMP): Establishes processes and procedures for the execution of the construction contract.

Contract Documents (CDs): Design drawings and specifications that, as a unit, constitute the basis for receiving bids and awarding a contract for construction. Contract documents are the basis on which a building is constructed.

Cost-Benefit Analysis (CBA): The process of assessing all pertinent costs and benefits, usually performed in terms of an expected life-cycle of the system.

Court, Enclosed: A court bounded on all sides by the exterior walls of a building, or exterior walls and lot lines on which walls are permitted.

Criteria: Military Unified Facilities Criteria (UFCs), criteria manuals, guide specifications, definitive designs, DoD Project Sponsor guidance, standard designs, and other related guidance published to promote quality facilities’ engineering, design, construction, and maintenance.

Critical Facility: Critical Facility provides selective protection for critical healthcare mission staff and functions following catastrophic Chemical, Biological, Radiological, Nuclear, and High-Yield Explosive (CBRNE) attacks.

Critical Path: The linear path through a work schedule network determining the shortest time within which all work can be completed.

Current Working Estimate (CWE): The current cost of the project including construction cost, contingency, and supervision inspection and overhead (SIOH).

Required at certain levels of effort of design to compare against PA to determine whether the project is executable given projected funds availability.

Damage Risk Classification Categories (Seismic): Three seismic categories that attempt to relate the seriousness of the consequences of damage due to earthquake. The selection of a category may consider the density of human occupancy, the importance of the activity, or the value of the contents or structure itself. These categories are as follows: Basic Life Safety, High Risk Facility, and Essential Facility. Reference Chapter 7.

Dedicated Elevators or Lifts: A vertical transportation element that must be restricted in use to a singular predefined function. Elevators intended for patient transport from one patient care area to another patient care area, (for example ER trauma rooms, to the ORs, clean surgical material only or soiled materials only). Other functions may include the transport of surgical case carts or patient meal service. These are NOT normally shared or combined with other traffic.

Defense Health Agency - Facilities Enterprise (DHA-FE): The office of primary responsibility for all DoD MILCON funded facilities, https://home.facilities.health.mil/.

Dental Compressed Air (DCA): Compressed air system used for drying applications during dental procedures and as a power or drive source for lifts, locks, and pneumatic dental instruments and equipment. Not used for breathing or respiratory support of any kind. Reference Chapter 9.

Dental Surgical Vacuum (DSV): Dry vacuum system used to support patient care in dental treatment rooms and oral surgeries. Refer to Chapter 9.

Dental Low Vacuum for Oral Evacuation (OE): Low vacuum, high volume, wet pipe system to provide scavenging, collection, and disposal of liquids, solids, and aerosols from dental procedures. Refer to Chapter 9.

Departmental Gross Area: The functional space within a department plus intra-departmental circulation. Does not include “general” circulation.

Design and Construction Agent: The agency designated by the Secretary of Defense (SECDEF) responsible geographically (or by agreement) for the design or construction execution associated with the military construction program. Responsible for the project during design, construction, warranty period and financial closeout. Current Design and Construction Agents are:

a. The U.S. Army Corps of Engineers (USACE)

b. The Naval Facilities Engineering Systems Command (NAVFAC)

c. The Air Force Civil Engineer Center (AFCEC) in the United Kingdom

Design Authorization (DA): Notices from the DoD Project Sponsor to the Design and Construction Agents to proceed with A/E selection and award, design a project to varying levels of effort, advertise, and ultimately award a construction contract. Usually designates project, project fiscal year, project location, programmed amount (PA), scope of the project (size in square feet), which meetings the DoD Project Sponsor will attend, any deviations from the submittal requirements in this document, and whether or not the DoD Project Sponsor wishes to participate in the A/E selection process. Reference Chapter 3.

Designated Seismic Systems: The seismic force-resisting system in all structures and those architectural, electrical, and mechanical systems or their components in RC III and IV structures that require design in accordance with Chapter 13 of ASCE 7 and for which the component importance factor, Ip, is greater than 1.0. This designation applies to system that are required to be operational following the Design Earthquake for RC III and IV structures and follow the MCER for RC V structures. All system in RC V facilities designated as MC-1 must be considered part of the Designated Seismic Systems. Designated Seismic Systems will be identified in Chapter 7 of this UFC and will have an Importance Factor Ip = 1.5.

Disabled Person: An individual who has a physical or behavioral condition that, to a material degree, limits, contributes to limiting, or if not corrected will probably result in limiting the individual's performance or activities to the extent of constituting a substantial physical, behavioral, or vocational handicap.

DoD Project Sponsor: The primary DoD Project Sponsor for a particular project. For DoD MILCON, DHA-FE is most commonly the DoD Project Sponsor. Other agencies may be the DoD Project Sponsor for specific medical projects.

Drug Dispensing: The issuance of one or more doses of prescribed medication in containers that are correctly labeled to indicate the name of the patient, the contents of the container, and all other vital information needed to facilitate correct patient usage and drug administration.

Dumbwaiter: A small vertical lift that is dedicated to the movement of carts, tote boxes, and other similarly-sized items. Generally, this term implies manual loading and **unloading of the cargo.**

Economic Analysis (EA): A cost-benefit analysis done to identify the relative cost-effectiveness of delivering healthcare to a projected beneficiary population under different MTF sizing scenarios. P.L. 97-337 (15 October 1982), amended by Section

1087 of Title 10, U.S.C., requires an EA be done to determine the space to be programmed in MTFs for military retirees and their dependents.

Electrical Life Support Equipment: Electrically powered equipment whose continuous operation is necessary to maintain a patient's life.

Elevator Population: The building elevator population is the total number of riders/ vehicles that will require the use of automated vertical transport (elevators) during their stay in the building. Hence people that come, arrive, and depart from the main entrance level and that use the stairs would not be included in the elevator population. Traffic studies shall detail the calculations that arrive at the population used.

Etiologic Waste: Any viable microorganism or its toxins that causes or may cause human disease.

Evaluation: Implies an analysis to be performed by the designer (A/E) in the basic contract (as opposed to "studies" or "investigations," that are extra services to be performed to complete the contract intent and requirements).

Evidence-Based Design (EBD): The conscientious, explicit, and judicious use of current best evidence in making planning and design decisions that advance the needs of patients, staff, families, and organizations. Reference Chapter 6.

Facilities: Building(s), equipment, and supplies necessary for the implementation of services by personnel.

Facilities Sustainment: Facilities sustainment provides resources for maintenance and repair activities necessary to keep a typical inventory of facilities in good working order over the specific facility's expected service life.

Facility: A separate individual building, structure, utility system, or other item of real property improvement each item of which is subject to separate reporting and recording in accordance with DoD Instruction 4165.14, Real Property Inventory and Forecasting.

Federal Energy Management Program (FEMP): The U.S. Department of Energy (DOE) Federal Energy Management Program (FEMP) provides services, tools, and expertise to Federal agencies to help them achieve their legislated and executive-ordered energy, greenhouse gas, and water goals. These are delivered through project, technical, and program services.

Federal Information Processing (FIP): Any automatic data processing (ADP) equipment procured with Federal Government funds.

Fenestration: The arrangement of windows in a building, their size, placing, style, etc.

Fire Safety Evaluation System (FSES): In accordance with NFPA 101M.

Fixed: Fastened to walls, floors, or ceiling or to steam, gas, plumbing, electrical power, or sensor lines in a permanent manner.

Flammable Liquids Storage Cabinet: A cabinet for the storage of flammable and combustible liquids constructed in accordance with NFPA 30.

Floor Area, Gross: Gross floor area must be the total floor area within the building to include all rooms, mechanical rooms, hallways, stairs, closets, thickness of interior or exterior walls, columns, or other features. Where the term “area” is used, it must be understood to be gross area unless otherwise specified. Reference Chapter 3 and Figure 3-1 for expanded explanation.

Floor Area, Net: Net floor area must be the actual occupied area in a functional space, not including thickness of walls, chases, columns, or general circulation. Reference Chapter 3 and Figure 3-2 for expanded explanation.

Functional Program: A written narrative of the facility functional requirements. The requirements are expressed in both strategic objectives and facility area-specific operational perspectives.

Functional Requirements: Those requirements necessary to ensure a particular facility continually meets the objective of the function for which it was constructed.

Grade: The degree or inclination of slope at ground level.

Gravity Chutes: Usually used for the vertical return of trash and linen (separate chutes) to a holding and collection room at the base of each chute.

Green Board: Moisture resistant gypsum board.

Gurney: A gurney is a medical transport device designed with a variable height, adjustable headrest, leg-rest, contain accessories such as IV hook, oxygen tank holder, x-ray holder with wheeled metal frame to transport patients who require medical care, and are used by emergency medical services (EMS), hospitals and medical facilities. The minimum size is 36 inches wide x 92 inches in length.

Handling Capacity, Elevator: The “quantity” measure of elevator service is called handling capacity. Handling capacity is the number of persons and vehicles that can be transported by the elevator system in a given length of time. Average interval and handling capacity must be measured or calculated for the same designated time period to be meaningful.

Hazardous Area in Laboratories: The area inside fume hoods or enclosures where tests or procedures are being conducted.

Health: A condition in which all functions of the body and mind are “normal” and active.

Health Care Occupancies: Refer to NFPA 101 for occupancy definitions.

Hematology: The science of the blood.

High Efficiency Particulate Air (HEPA) Filter: Replaceable filters having a minimum collective efficiency of 99.97 percent for 0.3 micron particle. Reference Appendix B.

High Hazard Areas: Areas of structure, buildings, or parts thereof used for purposes that involve highly combustible, highly flammable, or explosive products or materials that are likely to burn with extreme rapidity, or that may produce poisonous fumes or gases, including highly toxic or noxious alkalis, acids, or other liquids or chemicals that involve flame, fume, explosive, poisonous, or irritant hazards; also uses that cause division of material into fine particles or dust subject to explosion or spontaneous combustion, and uses that constitute a high fire hazard because of the form, character, or volume of the material used.

High Risk Facilities (Seismic): A seismic damage risk classification category. Facilities in this category are recognized as warranting a higher level of damage risk than the average building but less than for an essential facility. Efforts to control damage due to earthquake in this category are intermediate. Reference Chapter 7.

Histology: Study of the microscopic structure of tissue. **\1**

Hospital: An inpatient facility which provides both inpatient and outpatient medical care. As a facility category this includes both Hospitals and Medical Centers.

/1/Hospital Bed: A bed for an adult or child patient. Bassinets for newborns in maternity units, beds in labor and delivery rooms, recovery rooms, and other beds used exclusively for emergency purposes are not included in this definition.

Illuminated, Externally: An illumination source contained outside the device that is to be illuminated.

Illuminated, Internally: An illumination source contained inside the device that is to be illuminated.

Incineration: In waste handling, the act of burning pathological and other designated waste/infectious waste in an incinerator in order to render the water material(s) harmless.

Inspection Certificate: An identification applied on a product by an approved agency containing the name of the manufacturer, the function and performance characteristics of the product, and the name and identification of an approved agency indicating that the product or material has been inspected and evaluated by an approved agency.

Interdepartmental Circulation: General circulation. Circulation that provides access to and from various departments; included elevators, stairs, and major corridors.

Interstitial Building System (IBS): System involving coordinated design of all elements to achieve a building of optimum functionality, appearance, maintainability, and adaptability. Reference Appendix E.

Interstitial Space: Unfinished and unoccupied space between floors used for horizontal utility distribution systems, of sufficient size to accommodate workmen, and that permit maintenance and alteration without interruption of activities on the normally occupied floors. Reference E for Interstitial Building Systems.

Intradepartmental Circulation: The area reserved for corridors and passages that are found immediately within the departmental area.

Japanese Facilities Improvement Program (JFIP): A government of Japan initiative, which started in 1979 to ease the financial burden of stationing U.S. Forces in Japan. The program reduces U.S. Government cost to improve the quality of life and military posture. Approximately 21 percent of the government of Japan host nation support provided to the U.S. Forces in Japan is allocated to JFIP.

Joint Schedule Number (JSN): The number used to identify equipment on architectural drawings and plans supporting Military Construction (MILCON) projects.

kvp: Unit used to describe the radiation quality of X-rays. X-rays generated by electrons accelerated in a potential difference of, for example, 100 kilovolts (kV), are termed 100 kvp (kV peak voltage) X-rays.

Laboratory Air (LA): Compressed air system for use in medical or dental laboratories. May be combined with a dental compressed air (DA) system. Reference Chapter 9.

Life-Cycle Cost (LCC): Reference UFC 1-200-02.

Life-Cycle Cost Analysis (LCCA): Reference UFC 1-200-02.

Local Area Network (LAN): A modular communication methodology whereby the facility is prewired during construction for current and future communications needs, such as telephone, Composite Healthcare (computer) Systems (CHCS), without having

to surface-mount additional wires or coax in the future and thereby reduce future communication installation costs.

Logistics Elevator: An elevator whose primary purpose is to transportation various supplies, such as dietary or medical/surgical supplies, devices, and equipment, as well as occasional construction materials.

Material Handling (MH): The function of moving, packaging, and storing of substances in any form. Material handling does not alter, change, enhance, or add value to a product in any way. It is a "cost" function only that should be minimized to the greatest extent possible (within given aseptic, physical, operational, and functional parameters).

Materials Handling Service Elevators: Elevators intended for use by staff for materials, supplies and equipment movement.

Materials Management (MM): Material management is a scientific technique, concerned with planning, organizing, and control of flow of materials, from their initial purchase to destination.

May: "May" is used to indicate provisions that are used at the option of the designer.

Mechanical Space: The area that houses the primary and intermediate components of the air conditioning, plumbing, communication, electrical, and ventilation systems. This area includes chases and shafts as well as mechanical and electrical equipment rooms.

Medical Compressed Air (MCA): Compressed air system used only for medical functions requiring breathable air to support respiration or for air-driven instruments that discharge into the pharynx. Reference Chapter 9.

Medical Military Construction (MILCON) Program: That portion of the President's budget devoted exclusively to the renovation, upgrade, and replacement of applicable facilities that cost more than $750,000. MILCON is not supposed to include Operations and Maintenance (O&M) or Repair and Maintenance (R&M) unless the area that could be done with O&M or R&M is affected by the larger MILCON project and must be accomplished to provide a complete and usable facility in accordance with NFPA and TJC requirements.

Medical Surgical Vacuum (MV) System: Dry vacuum system used only for medical functions involving patient care, therapy, and diagnostic functions. May be used for Dental Surgical Vacuum (DSV) requirements in dental treatment rooms and oral surgeries. Reference Chapter 9.

Medical Treatment Facility (MTF): A facility established for the purpose of furnishing medical and/or dental care to eligible individuals.

Migration, Elevator: When more than one elevator group is available in a building, a passenger's origin does not necessarily dictate which elevator group will be used. A certain percentage of the population will migrate to other areas of a building to use an elevator for reasons such as meeting a friend or dropping off something on the way to their destination. This percentage is usually estimated to be 5-10 percent of the population (or as otherwise appropriate for the facility being studied).

Military Construction (MILCON) Programming: The annual processing, review, and approval of MILCON project proposals by the Military Department Secretaries, the OSD, and the OMB for submission to Congress.

Military Department (MilDep): One of the departments within the Department of Defense created by the National Security Act of 1947, as amended. Specifically includes the Department of the Air Force, the Department of the Army, and the Department of the Navy.

Milliampere (mA): The unit of electrical current flow equal to 0.001 ampere.

Mixed Occupancies: Reference NFPA 101 for occupancy definitions.

Modernization: Alteration, repair, remodeling, replacement, and renovation of existing buildings (including initial equipment thereof) and replacement of obsolete, built-in equipment of existing buildings. Does not include replacement of a facility or a portion to a capacity greater than the capacity of the existing facility.

Modular: a. Having commensurable dimensions.
b. Capable of arrangement with exact fit in more than one sequence or direction.
c. Composed of or containing predetermined dimensional or functional units such as repetitive structural bays or service modules.

Must: Indicates a mandatory requirement, synonymous with "will."

National Capital Planning Commission (NCPC): A regulatory body in the U.S. National Capital Region (NCR) that helps determine applicability of all Federal MILCON-funded facilities within the U.S National Capital Region. (See definitions of Commission of Fine Arts and NCR.)

National Fire Codes: Codes, standards and recommended practices published by the National Fire Protection Association (NFPA).

National Stock Number (NSN): Medical equipment identification consisting of an applicable four-digit class code number plus the nine-digit national item identification number.

Noise Criteria-Level (NC-Level): Refers to a set of contours roughly corresponding to the ear's response to sound pressure level at various frequencies that define the background sound level existing within a space.

Nonflammable Anesthetizing Location: Any anesthetizing location designated for the exclusive use of nonflammable anesthetizing agents.

Nonflammable Medical Gas System: A system of piped oxygen, nitrous oxide, compressed air, or other nonflammable medical gases.

Non-Regulated Medical Waste (NRMW): Waste not classified as regulated medical waste (RMW), recyclable materials, or hazardous materials. Poses no special danger of infection or injury to personnel or the public.

Nurses' Stations: Areas intended to provide a center of nursing activity for a group of nurses serving bed patients where the patient calls are received, nurses are dispatched, nurses' notes written, inpatient charts prepared, and medications prepared for distribution to patients. Where such activities are carried on in more than one location within a nursing unit, all such separate areas are considered a part of the nurses' station.

Operational Level Category (Seismic): These categories define the post-earthquake performance requirements for various facilities with respect to operational mission, disaster preparedness, and medical post-earthquake needs.

Operationally Ready Mode: A critical facility that completed its functional checks and determined to be capable of transforming to a higher level of preparedness. Ready for the next higher Operational Mode.

Operations and Maintenance (O&M) Funds: Those funds other than MILCON used for the express purpose of upgrading and maintaining existing facilities and equipment, or for the purchase of government furnished equipment and furnishing (not built-in) to provide a complete and usable facility.

Passenger Elevator: An elevator configured to move visitors, staff, and other ambulatory passenger traffic between floors. This elevator is generally wide car configuration to facilitate the movement of passengers.

Patient Service Elevator: An elevator configured to move patients on beds, gurneys, and stretchers, as well as patient care-related equipment such as portable X-rays, inhalation equipment, empty gurneys, wheelchairs, etc. The elevation is generally narrow and deep to facilitate the loading and unloading of this traffic.

Permanent: For the purposes of Medical Military Construction (MILCON), any structure designed for a useful lifespan of 25 years or longer.

Planning and Design (P&D) Funds: Funds for costs associated with preparation of design plans and specifications (A/E and in-house design costs) and costs to develop Operation and Maintenance Support Information (OMSI) products for a specific project.

Plumbing Fixture: An installed receptacle, device, or appliance that is supplied with water or that receives liquid or liquid-borne wastes and discharges such wastes into drainage systems to which it may be directly or indirectly connected.

Pneumatic Tube System (PTS): A pneumatically-powered, small diameter (usually 4 or 6 inches) tube that moves special carriers that contain messages, small supplies, or other items that physically “fit” and can tolerate this method of transport. These systems can be point-to-point or multi-station in design.

Post-Occupancy Evaluation (POE): An evaluation of the design and construction of a facility performed after facility activation and usage to obtain lessons learned that can be applied to present and future designs and criteria.

Precious Metals Recovery Program: Promotes the economic recovery of precious metals from excess and surplus material, and the use of recovered precious metals as Government Furnished Material.

Pre-Engineered Building (PEB): For the purpose of these criteria, pre-engineered buildings are considered as those buildings in various configurations and sixes that are available from manufacturers as a standard item. This type of construction may be used for DoD medical and dental facilities where such use is indicated by life-cycle cost to be economical, where they will meet the performance and functional requirements of the project, and are architecturally compatible with the environment in which they will be erected. Because of the great variance in the quality and cost of such structures on the market, extreme care must be used in selection to ensure that the quality of the facility to be provided is commensurate with the project requirement and expected longevity of the mission to be served.

Process Air (PA): Compressed air system to support functions such as medical service columns or shop operations. Reference Chapter 9.

Program Amount (PA): The initial PA is the estimated cost of a facility based on the DoD Cost Guidance and DD Form 1391 preparation prior to any design effort that establishes a project’s viability in the budget cycle. Once Concept Design is completed, the PA may be adjusted (up or down) based on the developed and validated Current Working Estimate (CWE) from the Design and Construction Agents. This PA (new) may

be the amount sent to Congress and the basis of Final Contract Document Design phases through Construction Contract Solicitation.

Program Objective Memorandum (POM): Formal document to identify major initiatives, their resource consumption estimates, and their operational justification used to prioritize and allocate manpower and fiscal resources.

Rad/Fluoro: Radiographic/Fluoroscopic.

Radio Frequency Interference (RFI): Electromagnetic radiation that is emitted by electrical circuits carrying rapidly changing signals, as a by-product of their normal operation, and which causes unwanted signals (interference or noise) to be induced in other circuits.

Readiness, Military: The ability of forces, units, weapons systems, or equipment to perform as they were intended and to deploy and employ without unacceptable delays.

Regulated Medical Waste (RMW): Waste that poses danger of disease transmission and/or objectionable appearances to personnel and the public.

Request for Proposal (RFP): A procurement document released to commercial industries outlining a requirement for development or implementation of a system or design. Industry provides its formal response in the form of proposed solutions to the problem defined, its cost and development schedules, and other pertinent data upon which the Government selects a vendor(s) with whom to contract.

Research and Laboratory: A facility or building used directly in theoretical or applied research, development, testing, and evaluation activities for medical research. It can also be a function detached from a hospital that provides laboratory support to the hospital or other medical activities equipped to conduct scientific experiments, tests, investigations, and research. These facilities are used directly in basic or applied research in the sciences including medicine and engineering.

Respiratory Care Department/Service: An organizational unit of the hospital that is designed for the provision of ventilator support and associated services to patients.

Root Mean Squared (RMS): Also knows as Effective Value. The value of alternating current or voltage equal to 0.707 times its peak value.

Schematic Design: Room-by-room scaled drawings defining the size and arrangement of areas in a building or building configuration as a basis for design development.

Section 2807, Title 10, U.S.C: The appropriate committees of Congress must be notified of the intent to award a contract for A/E services and construction design for the proposed Military Construction (MILCON) project if the estimated cost of such services exceeds $1,000,000. This notification must include the scope of the proposed project and the estimated cost of such services and must be made not less than 14 days before the initial obligation of funds for such services.

Semi-Permanent: For the purposes of Medical Military Construction (MILCON), any structure designed to last between 5 and 25 years of useful life. An example is an overseas free-standing contingency facility off-base.

Separated Elevator: Elevators that are intentionally separated within a facility such as passenger, service (staff or patients and logistics (materials), etc. based solely on the function, operation or service provided.

Service Elevator: An elevator that is “narrow and deep” in configuration to move patients and vehicular-type traffic between floors.

Should: Indicates a recommendation or alternative that is highly advised but not absolutely required.

Simulation: The use of a computer program as a model of a real situation.

Single-Loaded Corridor: A corridor with a single entry and exit point.

Sound Transmission Class (STC): A single-number rating system that compares the sound transmission loss of a test specimen with a standard contour.

Special Use Elevator: Elevators intended for loading docks, mortuary, AGV or the transport of animals.

Standby Mode: A critical facility capable of quickly, and with minimum effort, transforming from its peacetime mode of operation to a higher level of preparedness. Ready for the next higher Operationally Ready Mode.

Statement of Work or Scope of Work (SOW): A formalized document describing the details of an effort to be accomplished through contracted resources.

State-of-the-Art: The level of development (as of a device, procedure, process, technique, or science) reached at any particular time usually as a result of modern methods.

Status of Forces Agreements (SOFA): Agreements between the U.S. Government and the government of a foreign nation (host nation) that allows U.S. Forces to engage in some activity (such as occupy, build, or otherwise have temporary rights) that

otherwise would not be possible. SOFA agreements usually stipulate governing rules, codes, and standards that must be followed in the course of construction on that nation's soil.

Stretcher: A stretcher is an apparatus used for moving patients who require emergency medical care. These are collapsible on a variable-height wheeled frame, have special wheels that makes transportation over pavement easier, integral lug to lock into the ambulance and straps to secure the patient during transport. The minimum size is 24 inches wide x 84 inches in length.

Structural Interior Design (SID): The portion of basic design services concerned with establishment of "motif," color, and finish selection usually very early in the Concept Design phase of all fixed, "structurally related" finishes (for example walls, floors, ceilings, columns, fixtures, casework, equipment, and exteriors) as opposed to Comprehensive Interior Design (CID) that is an option to design services and relates to such things as moveable, mobile, or portable equipment, fixtures, and furnishings. For unity of color selection and design, both the SID and the CID must be compatible, conform to the finish schedule, and coordinate early and throughout the design, procurement, construction, and installation processes. Reference Chapter 3 and Chapter 6.

Sustainable Design: Design, construction, operation, and reuse/removal of the built environment in an environmentally and energy-efficient manner.

Tactical (Operational) Mode: A critical facility, having completed its Operationally Ready functional checks, and activated its limited number of simple tasks during changeover, that is operating in an independent, sustained, continuous operation without resupply for a predetermined period of time. This is the highest level of preparedness or operation.

The Joint Commission (TJC): Private, not-for-profit organization composed of representatives of the American College of Surgeons, American College of Physicians, American Hospital Association, American Medical Association, and American Dental Association whose purpose is to establish standards for the operation of health facilities and services, conduct surveys, and determine accreditation status of medical treatment facilities.

Total Building Commissioning (TBCx): Commissioning is defined by the building industry as the process of verifying that all building systems perform interactively according to the design intent, and the systems meet the Owner's operational needs. Reference Chapter 19.

Total Gross Area: The total area including intra-departmental circulation, inter-departmental circulation, walls and structure, mechanical space, and total net area.

Universal X-Ray Room: The universal X-ray room must be capable of accepting all routine radiographic, fluoroscopic, and tomographic equipment up to 1200 milliamperes (mA), 150 kvp, regardless of manufacturer, during initial installation and subsequent replacement actions with little, if any, facility modification. The procedures must be performed unencumbered and without any restriction of system components, patient size, or any known procedure that any installed X-ray equipment can perform now or in the future. This definition does not apply to digital radiography, special procedure rooms, C-arms, or angiography rooms. Reference Appendix D.

Value Engineering (VE): Value engineering studies consist of analyses of certain high-cost areas of a design to determine if an alternate way exists to achieve the same or improved function at a lower life-cycle cost (LCC). The main objectives of VE studies are reduced LCC and improved quality of design. The application of value engineering must not result in a lowering of criteria, quality standards, or reduction of scope as established by the guidance in this document. Reference Chapter 3.

Vehicular Traffic, Elevator: Generally defined as that traffic that is pushed or rolled into elevators on wheels. Examples of vehicular traffic are beds and gurneys. Wheelchairs are considered vehicular traffic where they are pushed by an escort or attendant, and where the occupant is a patient. Where wheelchairs carry staff or visitors, they are generally counted in with the pedestrian population since they would utilize passenger elevators.

War Reserve Material (WRM): Material required to augment peacetime assets to completely support forces, missions, and activities reflected in DoD/Joint Chiefs of Staff war plans.

Whole Building Design Guide (WBDG): WBDG was created to assist the design community with integrating Government criteria, non-Government standards, vendor data, and expert knowledge into a 'whole building' perspective. This 'whole building' concept is an integrated design approach that employs a collaborative team process to achieve high-performance buildings.

Working Drawings: The second phase of the Design process that includes the final development of all contract documents to prepare for the bidding phase.

X-Ray Installations (Momentary Rating): A rating based on an operating interval that does not exceed 5 seconds.

Zone, Elevator: A group of floors in a building that is considered as a unit with respect to elevator service. It may consist of a physical entity – a group of upper floors above and below which are blind shafts – or it may be a product of the elevator group control system, changing with system needs.

Record of Changes (changes are indicated by **1**\ ... /**1**/)

Change No.	**Date**	**Location**
1	15 April 2021	2-3.2.3 to 2.3.2.13 reordered paragraphs; 4-2.4 to 4-2.6; new planning guidance on telework and workstation sharing. Edits to Table 4-3, 4-4, 4-5, and 4-26; new Table 4-24 Focus Room; A-2.1. Tables were reordered to group similar spaces. Editorial changes throughout.

This UFC supersedes UFC 4-610-01, dated 6 May 2008, with Changes 1-2 dated 21 May 2014.

FOREWORD

The Unified Facilities Criteria (UFC) system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and applies to the Military Departments, the Defense Agencies, and the DoD Field Activities in accordance with USD (AT&L) Memorandum dated 29 May 2002. UFC will be used for all DoD projects and work for other customers where appropriate. All construction outside of the United States is also governed by Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA), and in some instances, Bilateral Infrastructure Agreements (BIA). Therefore, the acquisition team must ensure compliance with the most stringent of the UFC, the SOFA, the HNFA, and the BIA, as applicable.

UFC are living documents and will be periodically reviewed, updated, and made available to users as part of the Services' responsibility for providing technical criteria for military construction. Headquarters, U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering Systems Command (NAVFAC), and Air Force Civil Engineer Center (AFCEC) are responsible for administration of the UFC system. Defense agencies must contact the preparing service for document interpretation and improvements. Technical content of UFC is the responsibility of the cognizant DoD working group. Recommended changes with supporting rationale may be sent to the respective DoD working group by submitting a Criteria Change Request (CCR) via the Internet site listed below.

UFC are effective upon issuance and are distributed only in electronic media from the following source:

- Whole Building Design Guide web site http://www.wbdg.org/ffc/dod.

Refer to UFC 1-200-01, *DoD Building Code*, for implementation of new issuances on projects.

UNIFIED FACILITIES CRITERIA (UFC)
REVISION SUMMARY SHEET

Document: UFC 4-610-01, *Administrative Facilities*

Superseding: UFC 4-610-01, *Administration Facilities,* dated 6 May 2008, with Changes 1-2, dated 21 May 2014

Description: This UFC provides planning and design criteria for Administrative Facilities. It outlines methods of space allocation and typical functional spaces to accommodate the executive and staff functions of an installation or particular organization.

Reasons for Document:

- To provide a unified approach to effectively planning, allocating space and designing, administrative facilities with updated methodologies and technologies, and incorporate the integrated design process.

Impact:

The following direct benefits will result from publication, revision and change of the UFC.

- More consistency in the design of administrative facilities with better work environments for higher productivity, efficiency and worker satisfaction.
- Lower initial cost due to better coordination and design efficiency.
- Lower Life cycle cost due to more refined definition of requirements.
- Easier, more efficient maintenance.
- Better safety and security.

Unification Issues:

- Each Service has specific planning, location and space programming requirements
- The Navy and Marine Corps have specific requirements for Austere Administrative Facilities. See Appendix B.

CHAPTER 1 INTRODUCTION

1-1 BACKGROUND.

An Administrative Facility is a building or portion of a building in which the administrative affairs of a military establishment are conducted. It accommodates the executive and staff functions of an installation or particular organization. The functions performed in an Administrative Facility may include logistics, personnel management, and in some cases, operational functions classified in other category codes.

1-2 PURPOSE AND SCOPE.

This UFC provides requirements for evaluating, planning, and designing basic Administrative Facilities for all new construction projects to include additions, alterations, and renovation projects in the continental United States (CONUS) and outside the continental US (OCONUS). Program and design these facilities to enhance the mission or organizational functions. In addition, design administrative spaces to be flexible, cost-effective, and create an atmosphere that increases morale, productivity, and collaboration.

1-3 APPLICABILITY.

This UFC applies to all military service elements, civilians, and contractors involved in the design and construction of Administrative Facilities, including the procurement of design-build services for the above-noted projects. For Army projects, in the event of a conflict between this UFC and an applicable Army standard design, the criteria in the Army standard design will takes precedence.

When administrative space represents a portion of a larger building, this UFC applies only if administrative functions are performed in that space and no other specific criteria addresses the function. Administrative office space provided within an operational facility, such as a warehouse or a recreational facility, is planned under the category code of the primary facility. For example, space in a general warehouse that is partitioned off and assigned to a clerk for administrative duties associated with that warehouse, is planned as warehouse space and is not governed by this UFC.

1-3.1 Users of this Document.

1-3.1.1 Planning/Programming Personnel.

Planning and programming personnel will use the UFC for pre-design planning or to assess the extent of improvements required in an existing facility in order to achieve the standard established herein.

1-3.1.2 Architects, Engineers, and Interior Designers.

Professional architects, engineers, and interior designers will provide design services under the direction of the individual design agencies and this UFC.

1-3.1.3 Service-specific Users and Distribution of Responsibilities.

When Service criteria varies from standard criteria, it is noted in the text as a “Service Exception” or a “Service-specific” criteria.

Since numerous and different program offices and functions may be housed in Administrative Facilities, refer to the appropriate overseeing program office for the specific users and distribution of responsibilities to be housed in the facility. For more general planning questions, refer to the following Service-specific governing documents:

- **Army**. AR 405-70
- **Navy and Marine Corps**. FC 2-000-05N
- **Air Force**. AFMAN 32-1084

1-4 GENERAL BUILDING REQUIREMENTS.

Comply with UFC 1-200-01, *DoD Building Code.* UFC 1-200-01 provides applicability of model building codes and government unique criteria for typical design disciplines and building systems, as well as for accessibility, antiterrorism, security, high performance and sustainability requirements, and safety. Use this UFC in addition to UFC 1-200-01 and the UFCs and government criteria referenced therein.

1-5 CYBERSECURITY.

All control systems (including systems separate from an energy management control system) must be planned, designed, acquired, executed, and maintained in accordance with UFC 4-010-06, and as required by individual Service Implementation Policy.

1-6 AUSTERE ADMINISTRATIVE FACILITIES (NAVY ONLY).

APPENDIX B contains requirements for Administrative Facilities that are specifically designated as “austere”. Austere construction is intended for facilities in locations determined by CNIC and approved by OPNAV to be eligible for austere construction. The austere standards are intended to be applied flexibly and in varying degrees to all facilities at locations designated as austere. Allow flexibility to ensure the criteria are appropriate for individual austere locations.

1-7 GLOSSARY.

APPENDIX C contains acronyms and abbreviations.

1-8 REFERENCES.

APPENDIX D contains a list of references used in this document. The publication date of the code or standard is not included in this document. Unless otherwise specified, the most recent edition of the referenced publication applies.

CHAPTER 2 PLANNING AND PROGRAMMING

2-1 SCOPE OF FACILITY.

This chapter establishes space planning and programming criteria and assignment guidelines for administrative facilities. These parameters assist in designing facilities to enhance the main mission or functions of an organization and increase morale, productivity, and collaboration. Additional design considerations include flexibility, initial cost, life cycle costs, and ease of maintenance.

2-2 LOCATION DETERMINANTS.

Determine facility location in accordance with the installation land use plan and/or Installation Development Plan and the following Service-specific planning documents.

- **Army**. UFC 2-100-01
- **Navy.** UFC 2-100-01
- **Air Force.** AFI 32-1015
- **Marine Corps.** MCO P11000.12C

2-3 ADMINISTRATIVE SPACE TYPES.

An Administrative Facility is planned to accommodate general administrative personnel space, support and special purpose spaces, circulation, and building core spaces. An Administrative Facility may contain more than one organization with different functional and space needs. Space requirements must be calculated for each organization and for shared spaces between the organizations.

The following space types are described functionally and may be organized or categorized differently than the Service specific planning guides. Plan and design in accordance with the following Service-specific planning criteria.

- **Army**. AR 405-70
- **Navy-Marine Corps.** FC 2-000-05N
- **Air Force.** AFMAN 32-1084

2-3.1 Administrative Personnel.

Administrative personnel require private offices, open office space, or flexible office space. Allocate space based on the personnel position and functional requirements. For example, if personnel are rarely in the office, or work remotely through a telework agreement three or more days a week, they may be located in a Flex Office or Open Office Flex Workstation. If they have a high level of interaction with others in the office, and require visual and acoustic privacy, they may be placed in a private office with conferencing space or in a private office adjacent to conferencing space. Semi-Private

Office spaces are useful for personnel whose positions do not warrant a Private Office, or may be used for a special team requiring separation from open office areas.

2-3.2 Administrative Support Spaces.

Administrative Support spaces include all office functions not included in personnel office space. Some of these spaces could be shared between multiple administrative organizations within a facility.

The design approach can consolidate some of these functions in a central area within an organization, spread them throughout the organization in a decentralized arrangement, or use some combination of these approaches. The relationship requirements of support to the administrative function must be carefully considered prior to determining the design approach. Space allocations for some of these functions are derived based on the number of staff within an organization.

2-3.2.1 Vestibule.

A building entrance vestibule both helps mitigate temperature differences between the indoor and outdoor environment and provides an area where people entering the building can wipe their feet on an appropriate surface.

2-3.2.2 Reception and Waiting Areas.

Reception and waiting areas are planned for organizations where outside visitors come to meet with personnel within the organization. The size and type of the organization and its function will determine the of reception and waiting areas requirements. The area may be staffed or just provide seating for visitors. To accommodate security concerns, the area may have intercom requirements for contact into the organization or locker requirements for cellphones or other electronic devices to be secured.

2-3.2.3 Mail Center.

This space accommodates processing and distribution of the facility’s incoming and outgoing mail and parcels. It may accommodate screening requirements. Ensure adequate storage and work area to include mail sorting stations, packaging material, postage machines, scales, storage for materials, and workspace. Mailrooms may be staffed and include workstation(s). The mailroom must be adjacent to and provide direct access to the shipping/receiving area. Consult with the appropriate Installation authority to determine how mail is delivered, inspected and sorted to determine the mailroom size, design and safety requirements

2-3.2.4 Shipping and Receiving.

This area accommodates loading and unloading of a wide variety of supplies and services necessary for the operation of the facility. Material may be stored on pallets in open areas or on pallet racks. Plan for workbenches, packaging equipment, charging stations, and pallet lifts or forklifts. It includes an exterior entrance located for easy access by delivery trucks and may include a loading dock. This entrance must not be

visible from the building's main entrance. In multistory structures, shipping/receiving must have direct access to a freight elevator. Ensure the width, depth, and height of the bays accommodate the trucks that can be reasonably anticipated for the specific location and the shipping and receiving functions within the facility.

2-3.2.5 Trash and Recycling Room.

This interior room provides a central collection point for trash and recyclable materials such as glass, plastic, aluminum, and paper. The main trash/recycling area is adjacent to the shipping/receiving area where recyclables from the floors can be consolidated and stored for pick-up. In multistory buildings, locate remote trash/recycling areas adjacent to break rooms, copy rooms, vending, and other similar areas. Locate containers such that they do not interfere with required egress widths.

2-3.2.6 Large Format Production Room.

This room provides space for large-format production equipment such as large, high capacity copiers and printers, plotters, and scanners. It includes work surfaces to handle the material and storage cabinets for associated paper, toner and other printing materials. Consider indoor air quality and HVAC requirements based on type and size of equipment.

Design the room to be conducive to computer-based design work and have space for document production and pallet-based paper storage. Incorporate double doors to accommodate movement of pallets of equipment and supplies. The room must be enclosed with partitions which extend from finished floor to the structure above. Provide acoustical treatment.

2-3.2.7 Break Rooms.

Breakrooms provide staff-only space for dining and breaks, minimal food preparation and often vending. Consider the size of the organization when planning space for refrigerators, microwaves, coffee makers, or other appliances. Ensure appropriate utilities for appliances. Some breakrooms are enclosed and require space for comfortable tables and chairs. These spaces can also be utilized as casual meeting space if necessary. Some break areas are unenclosed with fewer amenities, such as those in an open office or flex space, or within spaces designated for teleworkers who occasionally work from the office.

2-3.2.8 Nursing Mothers Room.

Nursing Mothers rooms must be in a safe area accessible to all, shielded from view, and in close proximity to the toilets in a facility. Consideration must be given to acoustics with respect to adjacent spaces. The size of the organization or facility will determine if multi-station lactation rooms are required. Reference GSA PBS-P100 and ECB 2019-4 for multi-station lactation room requirements.

2-3.2.9 Toilets.

Toilets and restrooms can be located within an organization's space with the locker room, shower room, and nursing mothers room. They can also be accessible only from within the organization's perimeter, as opposed to public restrooms being accessible as part of the building core.

2-3.2.10 Janitor's Closet.

A janitor's closet accommodates equipment and supplies, mop basin, mop rack, and shelving. This closet can be located within an organization's space with the toilets, locker room, shower room, and nursing mother's room. It can also be accessible only from within the organization's perimeter, as opposed to being publicly accessible as part of the building core.

2-3.2.11 Locker Room.

Locker rooms are provided for organizations with 24-hour/7-day operations, to support physical training requirements and security personnel. They provide storage space for personal items and change of clothes.

2-3.2.12 Shower Room.

A shower room is planned when a facility does not have access to a fitness facility or has 24-hour/7-day operations. The number of showers is determined by the number of personnel. Shower rooms are usually adjacent to locker rooms and toilets.

2-3.2.13 Fitness Room.

Small Fitness rooms can be planned for administrative facilities not located near Fitness Centers. These spaces must be in areas accessible to all and in close proximity to locker and shower facilities.

2-3.3 Assembly Spaces.

Assembly spaces include auditoriums, conference rooms, training rooms, team rooms, breakrooms, and open collaboration spaces.

2-3.3.1 Auditoriums.

Auditoriums accommodate 50 or more people for large presentations and include a tiered floor with fixed seating and a stage or raised platform. Accommodate built-in presentation equipment, a sound system, and specialized lighting. An auditorium must be enclosed with partitions that extend from the finished floor to the structure above. Include the services of specialized engineering disciplines to address issues of lighting, acoustics, audiovisual systems, and other technology requirements. Include these consultants as part of the design team when auditoriums are required in administrative office buildings.

2-3.3.2 Conference, Classrooms and Training Rooms.

Conference rooms, classrooms, and training rooms provide space for meetings, briefings and training. When planning these spaces, consider acoustic privacy, social distancing and visibility requirements, as well as audiovisual and technology requirements. These spaces may be grouped together as a centralized conference center and be isolated from quiet areas within the office space.

A classroom/training room may be planned for general training or dedicated for computer training. The classroom/training room accommodates a flexible arrangement of settings for many uses. The computer training room includes dedicated computer workstations in a more fixed arrangement. Plan for built-in projector and projector screen, or multiple monitors as indicated by the audio-visual requirements.

2-3.3.3 Team/Collaboration Areas.

Team rooms and open collaborative areas strategically placed in an office plan can be useful for casual, unscheduled impromptu meetings and collaboration. Meeting styles can range from the stand-up/touch down high-top tables and stools to low comfortable lounge seating. Include technology connectivity and acoustic design requirements in these spaces. Small team/collaboration areas can also be used for alternate work areas to support an occasional influx of teleworkers within the office environment.

2-3.4 Equipment and Storage Spaces.

2-3.4.1 General Filing and Storage Room.

This space can be open or closed space for an organization’s office supplies and equipment storage, day locker storage, conference room equipment (chairs and tables) and AV storage, lecterns, and other mobile presentation items. Group files, technical libraries, and similar materials are those not included in private offices or within workstations.

2-3.4.2 Archival Storage.

Archival storage is for retention of various types of records specific to an organization’s mission or functions performed. It may have letter or legal file cabinets, flat files, or high-density filing systems. This is a different type of space than a general filing and storage room or filing and storage incorporated into offices and workstations. Depending on the type of material and the timeframe it is to be stored, these spaces may require specialized climate control, fire protection, and ESS controls. Reference FC 4-760-10N for archival storage requirements.

2-3.4.3 Computer Room.

Plan computer rooms to accommodate an organization’s servers or LAN cabinets, and associated mechanical, electrical, and data design requirements. Coordinate the planning and design with the appropriate IT personnel.

2-3.4.4 Technical Equipment Room.

Plan this space to accommodate the organization's technical equipment requirements, including mechanical, electrical, and data. For example, it may accommodate equipment charging stations and check-in and check-out functions for government provided equipment. Plan space to be located near technology support personnel when applicable. Plan space for queuing and circulation for personnel and equipment when applicable.

2-3.5 Secure Spaces.

2-3.5.1 Controlled Entry/Quarterdeck.

A controlled entry area or quarterdeck may be required for secure facilities to allow for orderly check-in and check-out. The entry control area provides for one entry and one exit channel adjacent to one or more security watch stations. A security watch station is usually adjacent to house a security officer(s) and security system equipment.

2-3.5.2 Secure Storage.

A secure storage room provides lockable space to store sensitive or high value items. Size and furnish the room appropriately to accommodate the specific organizational requirements.

2-3.5.3 Secure Visitor Space.

A secure visitor space may be required for secure facilities where individuals must be separated from the organization awaiting an interview or an escort.

2-3.5.4 Sensitive Compartmented Information Facilities (SCIF).

A SCIF is an accredited area, room, group of rooms, buildings, or installation where sensitive compartmentalized information is stored, used, discussed, and/or electronically processed.

2-3.5.5 Vault Room.

A secure storage and workspace for classified materials may include storage and file cabinets, worktables, and workstations for staff. This space will likely have secure networks, hardware and construction requirements specific to the organization's function or mission; however, it may not be accredited.

Depending on the level of classification, refer to requirements for classified facilities requiring more stringent security requirements and specific design guidance such as Open Storage Secret (OSS), Sensitive Compartmented Information Facility (SCIF), Special Access Program Facilities (SAPF), and Top Secret/Sensitive Compartmented Information (TS/SCI).

2-4 SPACE PLANNING PROGRAM.

A space planning program can be calculated in general terms based on the number of occupants or based on a detailed accounting of each type of personnel space and support space. Space planning programs should take into account job-sharing programs, office/workstation sharing, and out-of-office remote working through telework agreements when approved by the Command. The stage in the process of planning and design determines the level of detail required for calculating the space program. Refer to the following for Service-specific criteria.

- **Air Force**, AFMAN 32-1084
- **Army**, AR 405-70
- **Navy and Marine Corps**, FC 2-000-05N

A space program can be developed through use of an interactive spreadsheet to serve as a baseline for the planning team. This spreadsheet is available as a downloadable Microsoft® Excel file from the Whole Building Design Guide (WBDG) website: https://www.wbdg.org/ffc/dod/unified-facilities-space-program-sustainability-spreadsheets.

2-4.1 Circulation.

Building design must allocate for primary circulation space in the building core and secondary circulation space as determined by the interior configuration of personnel and support /special spaces. Plan for secondary circulation in and around the private offices, open office space, flex space, and the administrative support and special spaces. A higher secondary circulation factor is required when there is more open office space and less private office or enclosed space. The General Services Administration (GSA) has conducted studies to determine the circulation required when utilizing open office design versus private office configurations. Refer to Appendix A for examples for planning circulation based on building layout and configuration.

This Page Intentionally Left Blank

CHAPTER 3 GENERAL DESIGN CRITERIA

3-1 BUILDING CONFIGURATION AND LAYOUT.

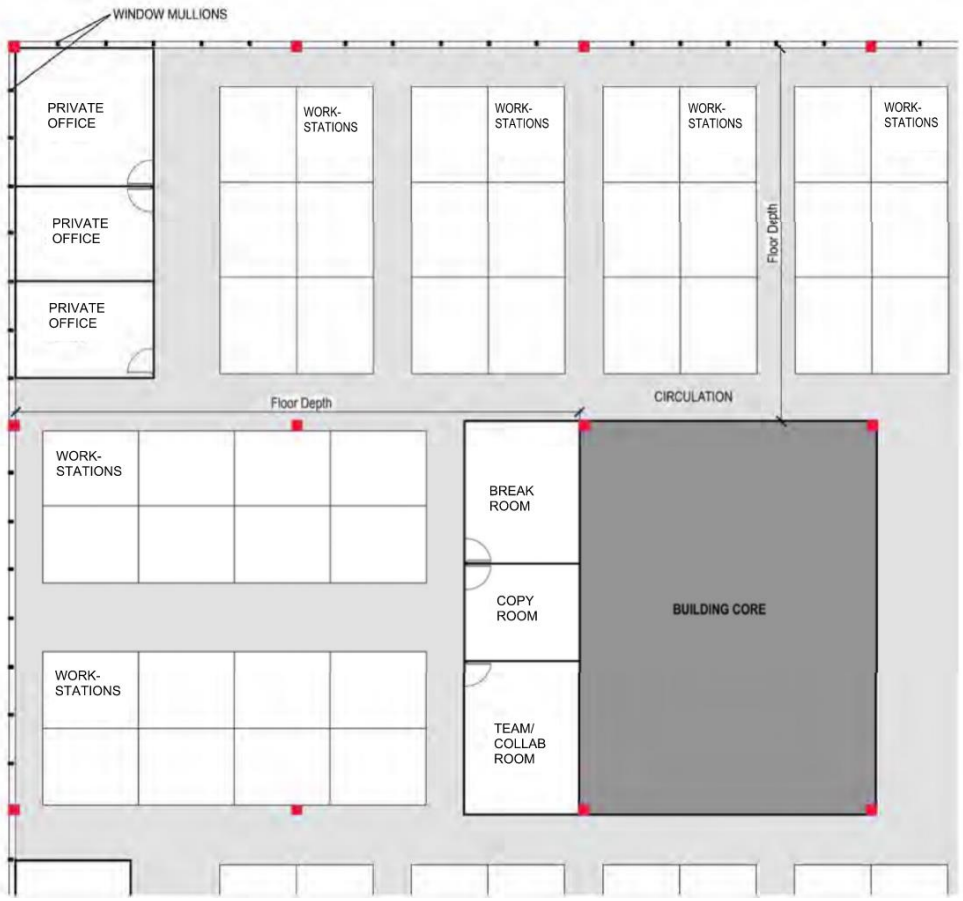
Building size, shape, and area-to-perimeter ratio have a direct impact on the cost and efficient space utilization of the facility, and these aspects must be considered during planning and design. A simple shape with an efficient structural layout and a high area-to-perimeter ratio yields the most economical and flexible facility.

Limit permanent interior partitions to those required for building core elements, private offices and special purpose spaces to allow flexibility in reconfiguration. Critical elements of an efficient layout include the design of the building core, the dimensions of floor depth and bay spacing, and the workstation design and layout.

3-1.1 Building Core.

The building core may include the following elements: vestibules; lobbies; passenger and freight elevators; primary corridors; stairs; toilets and restrooms; telephone, telecom, and electrical rooms; custodial closets; vending rooms; and mechanical rooms. Typically, these spaces are centralized and/or stacked in a building to provide greater efficiency in floor-plan layout, design, and utility distribution.

3-1.2 Floor Depth.



The floor depth is defined as the distance from inside face of the exterior wall to outside face of the building core. Floor depth affects the office and workstation sizing and configuration, and must be carefully coordinated with private office furniture and the open office furniture systems. In addition to its effect on workstation and office sizing, floor depth affects the admission of natural light. Too great a floor depth will preclude access to daylight by building occupants near the building core. Locate spaces not regularly occupied with personnel near the core of the building. Refer to Figure 3-1 for an illustration of the use and effects of working with a building’s floor depth.

3-1.3 Structural Bay Spacing.

The structural bay spacing plays a critical role in workspace layout efficiency as well as building primary circulation. The open area between structural columns is commonly referred to as a structural bay. The size and shape of the structural bays will directly affect the number of offices and workstations of a particular size that can be accommodated. Refer to Figure 3-1 for an illustration of the use and effects of working with a building’s structural bay spacing.

In this example, private offices are sized to align with the window mullions as well as having at least one dimension in common allowing for efficient construction and space utilization. The workstations are sized and aligned with the structural grid to accommodate the maximum number for this footprint. (structural columns are indicated as a red rectangle). This sample layout is an efficient use of space and adequate amount of secondary circulation.

Figure 3-1 Sample Building Layout

3-2 ARCHITECTURE AND INTERIOR DESIGN.

3-2.1 Exterior Design.

Exterior design must comply with the individual installation's architectural and design standards and the installation's development plans. This involves material and color selection for exterior walls, doors, and window elements, glazing, and roofing, as well as placement of mechanical units and landscaping.

3-2.2 Entrance.

Provide a main entrance with a clearly identifiable point of reference or landmark that serves as a welcome and a transition. Provide a canopy (or a recess) at required egress doors to ensure that doors can open completely without obstruction.

3-2.3 Windows and Natural Lighting.

Provide for the admission of natural light in the design of the window systems and in the design of the overall footprint and floor depth. Locate spaces not regularly occupied, such as Mail Centers and Large Format Production rooms, at the core of the building. Incorporate light-transmitting building elements to allow light to penetrate the space. Coordinate the selection of furniture systems that maximize the admission of natural light into the facility.

3-2.4 Raised Access Floor Systems.

A raised floor system is recommended, as it allows for easy access to utilities and flexibility in reconfiguration of the entire space. This system is particularly useful in spaces with high levels of data systems and power requirements. If such a system is used, mechanical air distribution may be incorporated into the floor cavity. Floor-supplied HVAC provides greater occupant comfort, which can lead to increased productivity.

3-2.5 Demountable and Operable Partitions.

Consider using demountable partitions and/or movable walls when reconfigurations are expected. Systems that are independent of the floor finish and ceiling grid will reduce configuration cost. If office or conference modules are repetitive, consistent sizes of panels allow for the maximum re-use of panels. These partitions and walls give facility managers flexibility to rearrange offices without the disruption or expense of construction. They have a higher initial cost than typical gypsum wallboard and steel stud partitions, but may be life-cycle-cost effective where reconfigurations are expected.

Dual-purpose features of some demountable and/or movable partitions include glazing for daylighting transfer, marker board and tack board surfaces, acoustical surfaces and slotted standards to receive systems furniture components. Multiple doors or telescoping sliding panels can open to adjacent spaces for alternate functions. Power and data can be managed easily with removable access panels.

3-2.6 Interior Signage.

Interior signage identifies spaces, organizations, and persons, as well as providing wayfinding and directories. Signage must comply with UFC 3-120-01 and Installation requirements. Sign placement and type are site-specific, but signs must be strategically located, adequately lit, and of sufficient size and contrast to permit proper viewing.

3-2.7 Interior Design and Finishes.

In addition to planning and designing for an organization’s space needs and functionality, provide interior construction elements such as casework, column enclosures, floor and wall accents, soffits, and ceiling features. Design interior finishes to support a professional image and incorporate the organization’s theme or mission. Coordinate interior finishes with the Functional Data Sheet Tables in Chapter 4. Provide

easily cleanable, maintainable, and durable finishes with material characteristics to support sustainability requirements and infectious disease control.

3-2.8 Acoustics.

Design facilities with acoustical treatments to provide a comfortable acoustical environment. Design acoustical control within the office environment to address sound isolation, transmission, and sound absorption appropriate for each type of space. Each of these characteristics are emphasized differently, depending on the use of the space, whether it is a private office or conference room, or a large open office setting. Consult with acoustical engineers and/or industry representatives to evaluate effective acoustical solutions for noise control. With space being a premium, workplaces are very densely populated and consequently require noise control.

3-2.8.1 Open Offices.

Use materials on ceilings, partitions, and floors that absorb sound and reduce noise reflection. These materials have a high Noise Reduction Coefficient (NRC) and are manufactured specifically for open office environments. Consider the acoustics when selecting a location for and designing the finishes adjacent to office equipment, such as copiers, printers, scanners, shredders, and facsimile machines.

The use of sound masking systems generates background noise to disguise speech. These are applied with noise generators strategically placed within the space. Consult with an acoustical engineer before designing an open office environment where a sound masking system will be used.

3-2.8.2 Multi-Purpose Spaces.

Design acoustical treatments in multipurpose spaces that have different acoustical needs depending on the configuration in use. For example, a conference room adjacent to a break room will need acoustic isolation from the break room. If the partition between the rooms is operable, and the rooms are opened to each other for a larger event, the acoustic treatment or design needs to accommodate the dual use.

3-2.9 Technology and Connectivity.

Technology and connectivity are some of the most frustrating and most important issues in the design and subsequent use of a facility. Identify telecommunications requirements early in the design process. Determine if an organization has special requirements, involve the appropriate IT personnel early on and engage them on lessons learned and challenges to overcome. Design building spaces and furniture selection to accommodate telecommunications distribution and access.

Plan assembly spaces of all types and sizes for power and data capabilities that can accommodate various uses such as presentations, instruction, or collaboration. Include technology and connectivity in collaboration spaces to increase multipurpose use and add productivity.

3-2.10 Ergonomics.

Provide an ergonomic work environment. Design features for an ergonomic environment include correct lighting for the space, comfortable noise levels, and adequate climate control and ventilation. Incorporate furniture design solutions with adjustable height worksurfaces with independently adjustable keyboard platforms and computer monitor mounting components. Ensure task seating includes a high level of adjustability to meet personnel requirements, including worker sizes and physical disabilities or characteristics.

Design facilities to reduce or eliminate work-related musculoskeletal (WMSD) injuries and risk factors or stressors due to processes, job tasks, and materials utilized in the workplace. Refer to the following for service-specific guidance:

- **Air Force**, *Air Force Interior Design Guide*, (update pending)
- **Army**, EP 385-1-96
- **Navy and Marine Corps**, OPNAVINST 5100.23G

3-3 TELECOMMUNICATIONS.

Coordinate the distribution of voice and data lines with the workstation and office layout and with installation communications personnel. Determine if accommodating a wireless network for data transfer is a requirement. All networks must meet the applicable Department of Defense and Service component information assurance certification and accreditation processes.

3-4 ELECTRONIC SECURITY SYSTEMS (ESS).

Determine electronic security systems requirements for providing ESS for access control, intrusion detection, and closed-circuit television (CCTV). If required, these systems protect personnel, equipment, and other assets. Provisions for alarm systems and access control features must be justified during the planning/programming process and included in project costs.

3-5 ALTERATIONS TO EXISTING FACILITIES.

Special attention must be given to selecting suitable existing facilities for adaptation to administrative functions. In retrofit projects, the column spacing, floor depth, and building configuration is already established. If the selected building or space has inefficient key elements such as floor depth and bay spacing, fewer workstations and office layouts can be accommodated than were planned for based solely on the gross area. In other words, inefficiency in building configuration and layout increases the circulation and net-to-gross multipliers so that fewer personnel can occupy the same gross building area when compared to efficiently designed facilities. The layout and capacity of existing electrical, communications, and other building distribution systems may also limit the feasibility and flexibility of the layout. Alteration and renovation projects must update existing facilities to meet the guidance and criteria in this UFC.

This Page Intentionally Left Blank

CHAPTER 4 SPECIFIC DESIGN CRITERIA

4-1 DESIGN AND SPACE PLANNING.

The following are design parameters to incorporate in determining space calculations and program requirements for administrative facilities.

4-1.1 Recognizing and Planning for Different Work Modes.

Workplace design has evolved from static spaces to dynamic, interconnected spaces comprised of a variety of work modes. The designer must acknowledge and identify the various work modes within an organization: Focused, Learning, Collaborative and Social. All of these are present whether private offices or open office spaces are planned.

4-1.1.1 Focused Work Mode.

Focused spaces are enclosed offices or open office workstations that provide visual or auditory privacy from other workstations. Personnel are usually doing heads-down work and require few distractions to be productive. These need to be located away from the busy circulation areas and meeting spaces.

4-1.1.2 Learning Work Mode.

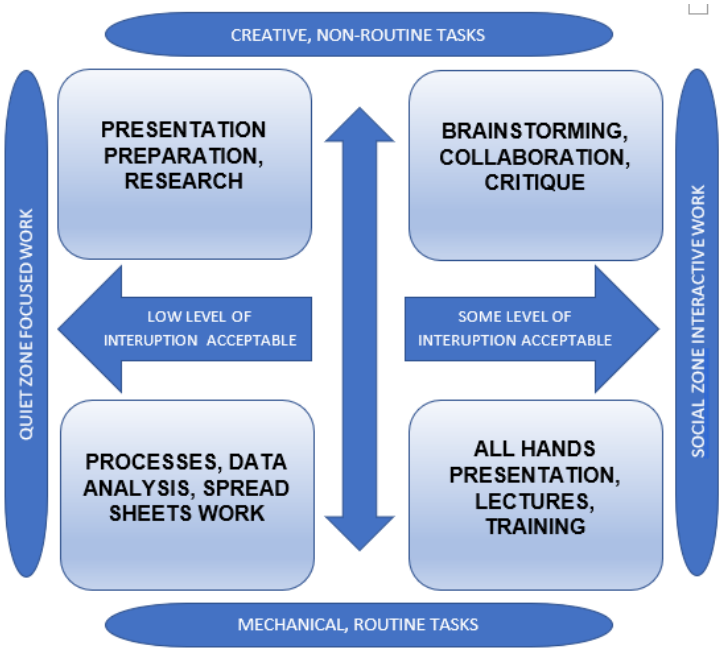
Learning spaces are conference rooms, training rooms or classrooms where a group of people gather for information sharing or instruction. These spaces must have limited distractions and are usually enclosed. Glazed walls are beneficial for daylighting, however not ideal for projection, video display and distractions.

4-1.1.3 Collaborative Work Mode.

Collaborative spaces, enclosed or not, are where a group of people can interact on the task. These gathering spaces can range from being as structured as a conference room, to a collaborative area of the offices that has low or no barriers between workstations, to as simple as an impromptu gathering around a central files counter or a lounge area for relaxing the body and mind. Consider a variety of collaborative spaces within a workplace for choices to support appropriate levels of visual and acoustic privacy and physical comfort. Consider providing communication, data, and electrical outlets for multiple users.

In some organizations, collaboration happens within the open office areas when workstations are designed for teams that regularly collaborate.

4-1.1.4 Social Work Mode.



Socialization happens in variety of settings whether in breakrooms, coffee nooks or collaboration spaces. A group of people may interact on a daily basis and may require a social configuration of workspaces to facilitate communication. Social workspaces would also accommodate transactional operations within an organization. Locate

appropriately designed spaces away from focused workspaces to reduce distraction and help with worker productivity.

4-1.2 Zoning Work Activities.

In space planning for administrative facilities, proper zoning of work activities can significantly influence the quality of noise control and increase worker productivity and satisfaction. Organizational adjacency requirements may or may not be consistent with the following Figure 4-1. The design must reach a balance of interaction, separation and acoustic control.

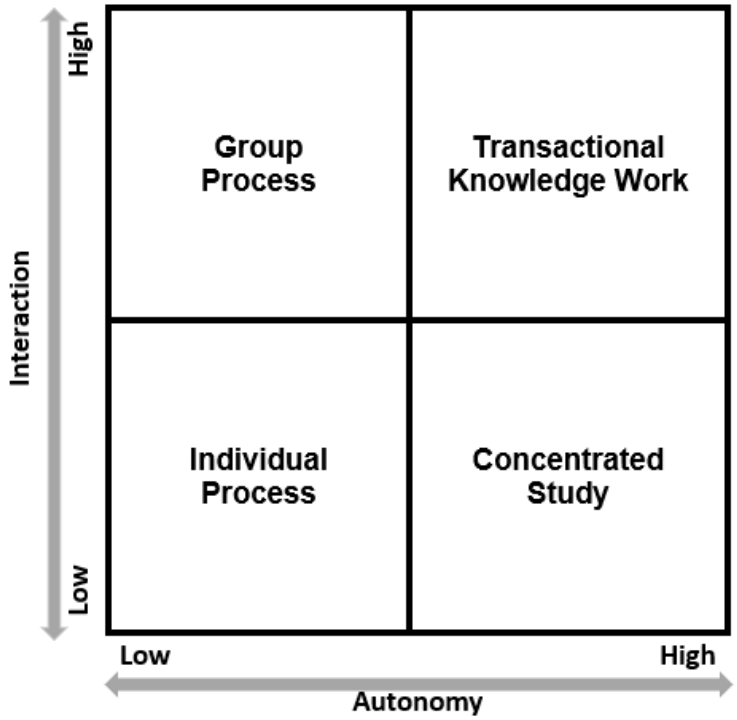


Figure 4-1 Zoning Work Activities

4-1.3 Choice of Workspace.

Plan a variety of spaces and flexible work areas where workers can move to for specific purposes or for the “change of scenery” effect. For example, Lounge spaces or alternate workstations are useful and can double as collaboration spaces. Choice of workspace also includes appropriate levels of autonomy and interaction required for work activities. Choice and flexibility can increase worker productivity and satisfaction when used properly. This also becomes part of the culture of the organization and must be managed.

Figure 4-2 Choice of Workspace

4-2 SPACE UTILIZATION AND MANAGEMENT.

4-2.1 Right-Sizing Spaces and Circulation.

Right-Sizing spaces, offices, workstations, conference and collaboration, is a method to utilizing space efficiently. For example, it is inefficient to provide a 200 square foot (18.6 square meter) private office when the only furniture required is a desk, credenza, and task and guest chairs. We are not a paperless society yet, however, filing and book storage requirements are typically less than they used to be. Space within an office or workstation previously required for paper storage has been replaced by technology requirements such as multiple computer displays. Design to the functional requirements of each worker or space and not to their position in the organization. Realistic circulation allowances also provide efficiencies in space utilization and productivity.

4-2.2 Flexibility and Modularity.

Design the interior of Administrative Facilities for flexibility of use. Maximize the use of an open floor plan and provide well-designed furniture systems that will allow adjustments to workspace to meet job functional requirements and ergonomic needs. Minimize the use of private offices and fixed partitions to the degree possible. This increases the number of personnel that can be accommodated within the space as well as allows more flexibility in reconfiguring the space. Also, minimize the number of different workstation and offices sizes. Use workstation and office sizes with a common

dimension to facilitate grouping stations and or offices of different sizes. This will ease the planning process and provide greater flexibility in the final design.

4-2.3 Multi-Purpose Uses.

Design spaces with compatible multi-functional features. Utilizing operable partitions in adjacent conference spaces and break rooms would provide rooms for small or large gatherings such as all staff meetings or events.

Conference spaces must have modular furniture reconfigurable for different types of purposes such as presentations, instruction or collaboration. Larger conference spaces and classrooms must have auxiliary storage nearby for storing folding or nesting tables and chairs, mobile screens and marker boards. **1**\

4-2.4 Teleworking, Office and Workstation Sharing.

Many organizations allow employees to work outside the office, or the position requires a certain amount of teleworking. Determine workstation or office requirements based on the amount of time these workers are physically in the office. Offices that participate in a robust teleworking program where employees routinely telework at least three scheduled days per week may consider reducing the number of individually assigned workstations and utilize shared workstations. Instead of providing one workstation for each individual, consider providing one workstation for every two regularly scheduled teleworkers. Consider technology and connectivity requirements in these spaces. Ensure that workstations or offices are designed with a high degree of adjustability to properly accommodate the different users. Consider the use of freestanding, electric, height-adjustable primary worksurfaces with or without modesty panels and attached privacy/sanitary screens to maintain the safety of nearby occupants. Secure, individually assigned lockers, file drawers, bins, mobile pedestals and other types of storage units may be required for storage of personal and work-related items used while in the office. Consider teleworking, office and workstation sharing as a space planning strategy when programming administrative facilities to minimize space requirements, construction costs and operating costs. To be effective in achieving measurable scope and cost savings, this planning strategy must be applied during the DD1391 project development process.

4-2.4.1 Situational Teleworking.

Situational telework is approved on a case-by-case basis, where the hours worked are NOT part of a previously approved, ongoing and routine telework schedule. Examples of situational telework include telework as a result of inclement weather, personal appointments, special work assignments, and is sometimes referred to as episodic, intermittent, unscheduled, or ad-hoc telework.

4-2.4.2 Routine Teleworking.

Routine telework is telework that occurs as part of an ongoing, regular schedule, occurring *up to two scheduled days per week*. The frequency of routine telework is determined by each individual Command.

4-2.4.3 Robust Teleworking.

Robust telework is a type of routine teleworking where workers regularly telework *at least three scheduled days per week*. The frequency of robust telework is determined by each individual Command. Where Commands authorize a robust teleworking program, flex workstations and office sharing may be implemented.

4-2.5 Office and Workstation Sharing.

A shared office or workstation, often referred to as a flex workstation, utilizes a "buddy system" for sharing an office or workstation between two or more persons if Command telework policy allows, and if individual work schedules can be aligned to accommodate. Shared office and workstation policy is determined by each individual Command.

4-2.6 Hoteling.

/**1**/Hoteling is an office management strategy that considers certain office resources, such as workspaces and equipment, to be shared assets, rather than assets 'owned' or dedicated to specific individuals within an organization. By sharing assets between personnel, an organization can optimize the efficiency of their offices; reduce their space requirements and operating costs by accommodating more people in the same space. Hoteling is typically characterized by reservation and check-in processes.**1**\ When planning office hoteling areas, consider the need for different Work Modes as described earlier in this chapter. /**1**/Consider hoteling as a space planning strategy when programming administrative facilities to minimize space requirements, construction costs and operating costs. To be effective in achieving measurable scope and cost savings, this planning strategy must be applied during the DD1391 project development process.

4-2.7 Command Suite.

The command suite is an office area that houses a Commanding Officer of an installation or activity or a Grade O7 or equivalent with command authority. It is typically an enclosed suite consisting of private offices, administrative support, special purpose spaces, and a secure entry point. The command suite typically includes the following spaces, but other spaces may be provided based on specific tenant needs (actual spaces to be provided and position titles vary by Service and mission):

- Commanding Officer's (CO) office,
- Deputy Commander/Executive Officer's office,
- Chief of Staff's office,
- Command Noncommissioned Officer's office,
- Visitor's office,
- Reception/waiting area,
- Aides' offices,
- Administrative support,
- Coffee Nook or Kitchenette and
- Conference room.

For details on the individual spaces, see the appropriate FDS Tables in Chapter 4. In general, finishes will be of a higher quality and tailored to meet the level of importance or rank of the suite's occupants.

4-3 FUNCTIONAL DATA SHEETS.

The Functional Data Sheets provide the minimum requirements for the respective rooms and spaces for the designer, planner, or RFP preparer. These minimum requirements apply in addition to the requirements of this criteria document and the referenced documents. This chapter identifies minimum and specific design requirements for the most common functional areas associated with Administrative Facilities. Not all of these spaces may be required in an administrative facility. Conversely, additional spaces with specialized functions may be required, depending on the organization's function and mission requirements.

4-3.1 Interior Construction/Built-in Equipment.

The Interior Construction/Built-in Equipment category includes anything physically attached or plumbed to the building such as counters, cabinets, casework, toilet accessories, window shades or blinds, and recessed projection screens.

4-3.2 Furnishings and Equipment.

The Furnishings and Equipment category includes loose or moveable items that have no permanent connection to the structure of a building, or utilities such as desks, chairs and tables, and cabinets.

4-3.3 Table Format and Usage.

The following tables provide this data in a standard Functional Data Sheet. Items enclosed in brackets [xx] are potential anticipated requirements. On design-build projects, the RFP preparer must either select from these bracketed items or include other specific requirements in the RFP. Where the requirements in a design-build RFP differ from this UFC, the RFP content takes precedence. "As required" designates there are no additional specific requirements other than the requirements in UFC 1-200-01 and the core UFCs.

Table 4-1 Private Office

Description/ Usage	Provide enclosed space for one person with visual and/or acoustic privacy based on assignment or functional requirements.
Ceiling Height	9 ft. (2.7 m) minimum.

Windows	Provide daylighting.
Doors	Door with minimum 35 STC rating or as required. Privacy lock or passage set.
Interior Construction / Built-in Equipment	Provide markerboard, changeable room signage acoustical treatment [demountable partitions].
Finishes	**Walls** Painted gypsum wallboard or demountable partitions extended from finished floor to suspended ceiling; for higher privacy requirements, extend partitions to structure. Minimum 40 STC.
	Floor Carpet tile with attached cushion, low maintenance, rated for heavy traffic.
	Base Rubber wall base [Wood base].
	Ceiling SAPC.
Plumbing	None required.
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	Provide two quad electrical receptacles on separate walls or as needed to support the required equipment.
Lighting	Provide general lighting.
Telecommunications	**Telephone** Provide one line with internal two-way communication.
	Data Provide a minimum of two lines/outlets or more to support the required equipment.
	CATV As required by organization function or mission.
Security	**IDS** None required.
	ACS None required.
	CCTV None required.
Acoustics	Provide a minimum 40-45 STC depending on occupant privacy requirements.
Furnishings and Equipment	Office desk/workstation, ergonomic task chair, filing and book storage, task lighting, [wardrobe], two guest chairs. Consider the use of freestanding, electric, height-adjustable primary worksurface with attached modesty panel.
Special Requirements	As required by organization function or mission. May be an executive private office as part of a command suite and require upgraded finishes.

Adjacencies / Location within Facility	As required by organization function or mission.
	For Use during project execution by appropriate Service
Occupancy	**Staff**
	Other
Min. net Ft^2 (m^2)	

Table 4-2 Semi-Private Office

Description/ Usage	Provide enclosed space for two or more persons with visual and/or acoustic privacy based on assignment or functional requirements
Ceiling Height	9 ft. (2.7 m) minimum.
Windows	Provide daylighting.
Doors	Door with minimum 35 STC rating or as required. Privacy lock or passage set. Lock if required.
Interior Construction / Built-in Equipment	Provide marker board, changeable room signage, demountable partitions.
Finishes	**Walls** Painted gypsum wallboard or demountable partitions, extended from finished floor to suspended ceiling. Minimum 40 STC.
	Floor Carpet tile with attached cushion; low maintenance, rated for heavy traffic.
	Base Rubber wall base.
	Ceiling SAPC.
Plumbing	None required.
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	Provide a quad electrical receptacle per person or as needed to support the required equipment.
Lighting	Provide general and task lighting.
Telecommunications	**Telephone** Provide one line with internal two-way communication per person.
	Data As required.
	CATV As required by organization function or mission.
Security	**IDS** None required.
	ACS None required.
	CCTV None required.
Acoustics	Provide a minimum of 40 STC.
Furnishings and Equipment	Office desks or workstations, ergonomic task chairs, filing and book storage, task lighting, [wardrobes], one guest chair per person or as required. [Collaboration table/space]. Consider the use of freestanding, electric, height-adjustable primary worksurface with attached modesty panel.
Special Requirements	As required by organization function or mission.
Adjacencies / Location within Facility	As required by organization function or mission. Command Suites require upgraded finishes and appurtenances.

	For Use during project execution by appropriate Service
Occupancy	Staff
	Other
Min. net Ft^2 (m^2)	

Table 4-3 Open Office – Full Time Staff

Description/ Usage	Open office space for full-time staff includes systems furniture workstation clusters, filing and storage, and informal meeting spaces. \1\ For Navy and Marine Corps projects, this space usage corresponds with Workstation Type 1 (WST1) in UFC 2-000-09N, Series 600, Table 61010-5.1 /1/
Ceiling Height	10 ft. (3.0 m) minimum.
Windows	Provide daylighting.
Doors	Provide doors at the perimeter walls of the open office space.
Interior Construction / Built-in Equipment	Interior wayfinding and workstation signage, marker boards, tack boards, bulletin display cases, casework, [acoustic treatment to aid in noise control] [demountable partitions].
Finishes	**Walls** Painted gypsum wallboard or demountable partitions of varying materials for various levels of visual and acoustical privacy.
	Floor Carpet tile with attached cushion for noise reduction; low maintenance, rated for severe traffic.
	Base Rubber wall base.
	Ceiling SAPC with high Articulation Class (AC) and Noise Reduction Coefficient (NRC) ratings.
Plumbing	None required.
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	Provide multiple circuits to the space to connect systems furniture workstations to building power. Exposed wiring is [and power poles are] not allowed. Plan power capacity for a minimum of four receptacles per person per workstation, or as required.
Lighting	Provide general lighting.
Telecommunications	**Telephone** Provide one line with internal two-way communication per person. Coordinate communication distribution through the systems furniture and as required.
	Data Provide one outlet per staff unless multiple systems are required. Provide additional outlets for each printer, copier, scanner, shredder, and other similar equipment. Coordinate data distribution through the systems furniture and as required.
	CATV None required.
Security	**IDS** None required.
	ACS None required.
	CCTV As required by organization function or mission.
Acoustics	Provide acoustical treatment in accordance with ASTM E1130-16 for open office spaces.

Furnishings and Equipment	Provide workstations sized for staff assignments and functionality; ergonomic task seating, guest seating, task lighting, lateral file cabinets, counter-height work/storage/meeting islands for files and supplies. Provide worksurfaces for printers, scanners, and other equipment as required to be used in the open office area. Consider the use of freestanding, electric, height-adjustable primary worksurface with attached modesty panel.
Special Requirements	Coordinate telecom and data distribution, equipment, and connection points requirements with workstation configurations and open office layouts.
Adjacencies / Location within Facility	As required by organization function or mission.
	For Use during project execution by appropriate Service
Occupancy	**Staff**
	Other
Min. net Ft^2 (m^2)	

Table 4-4 Private Flex Office

Description/ Usage	Private office space set aside for intermittent use by transient or teleworking staff or visiting dignitaries occasionally needing space in the office.**1**\ Offices may be shared by two or more persons depending on individual work schedules and demand./**1**/
Ceiling Height	9 ft. (2.7 m) minimum.
Windows	Provide daylighting.
Doors	Door with minimum 35 STC rating or as required. Privacy lock or passage set.
Interior Construction / Built-in Equipment	Provide markerboard, changeable room signage [demountable partitions].
Finishes	**Walls** Painted gypsum wallboard or demountable partitions, with varying materials for various visual and auditory privacy. Extend from finished floor to suspended ceiling. Minimum 40 STC.
	Floor Carpet tile with attached cushion, low maintenance, rated for heavy traffic.
	Base Rubber wall base.
	Ceiling SAPC.
Plumbing	None required.
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	Provide two quad electrical receptacles on separate walls or as needed to support the required equipment.
Lighting	Provide general and task lighting.
Telecommunications	**Telephone** Provide one line with internal two-way communication.
	Data Provide a minimum of two lines/outlets or more to support the required equipment.
	CATV None required.
Security	**IDS** None required.
	ACS None required.
	CCTV None required.
Acoustics	Provide a minimum of 40 STC.
Furnishings and Equipment	Office desk, ergonomic task chair, filing and book storage, task lighting, [wardrobe], two guest chairs, [small meeting table]. Consider the use of freestanding, electric, height-adjustable primary worksurface with attached modesty panel. **1**\ Provide individual, lockable storage units for daily storage of personal items. /**1**/
Special Requirements	As required by organization function or mission. If located in a Command Suite, provide upgraded finishes and appurtenances.

Adjacencies / Location within Facility	As required by organization function or mission.
	For Use during project execution by appropriate Service
Occupancy	**Staff**
	Other
Min. net Ft^2 (m^2)

Table 4-6 Vestibule

Description/ Usage	Airlock enclosure at the entrance to a building. Building security may be performed in this space.
Ceiling Height	9 ft. (2.7 m) minimum.
Windows	As required.
Doors	Exterior and interior double doors.
Interior Construction / Built-in Equipment	Recessed entrance mat, soil collection; interior signage, [wall protection].
Finishes	**Walls** Durable, easily maintained walls of [painted gypsum wallboard,] [split faced CMU], [clay masonry], [porcelain tile].
	Floor Durable, weather-resistant material, such as ceramic tile or vinyl tile, rated for severe traffic.
	Base: Resilient or tile to match floor material.
	Ceiling Durable, humidity-resistant material ,such as acoustic tile or painted gypsum wallboard.
Plumbing	None required.
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	Provide a minimum of one outlet, additional as required.
Lighting	Provide general lighting.
Telecommunications	**Telephone** As required if building security to be managed in this space.
	Data As required if building security to be managed in this space.
	CATV None required.
Security	**IDS** As required.
	ACS As required.
	CCTV As required.
Acoustics	As Required.
Furnishings and Equipment	None required.
Special Requirements	None required.
Adjacencies / Location within Facility	Where applicable, locate controlled entry, quarterdeck, watch, reception, waiting room, or secure visitor spaces near the entrance vestibule.
	For Use during project execution by appropriate Service
Occupancy	**Staff**

	Other
Min. net Ft^2 (m^2)	

Table 4-7 Reception and Waiting

Description/ Usage	Space or Room at organization entrance to receive visitors, usually staffed. Building security may be performed at reception via a check point. May include a seating area for visitors. May be an entry into a Command Suite.
Ceiling Height	9 ft. (2.7 m) minimum.
Windows	As required.
Doors	As required.
Interior Construction / Built-in Equipment	[Built-in reception desk], [organization directory], [command board,] [enclosed bulletin board,] interior signage [demountable partitions].
Finishes	**Walls** Painted Gypsum wallboard or demountable partitions, accent/feature wall.
	Floor Carpet [tile,] [, broadloom,] [porcelain tile,] or luxury/solid vinyl tile; low maintenance, rated for severe traffic.
	Base Rubber wall base {Wood base] or base to match/coordinate with flooring.
	Ceiling SAPC, [mid-quality], [high quality], [decorative] ceiling.
Plumbing	None required.
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	As required. Provide a minimum of one quad outlet at reception desk.
Lighting	Provide general, decorative and task lighting.
Telecommunications	**Telephone** Provide a minimum of one line with internal two-way communication.
	Data Provide an outlet at reception desk, [electronic directory] [flat screen monitor] or as required.
	CATV As required.
Security	**IDS** As required.
	ACS As required.
	CCTV As required.
Acoustics	As required.
Furnishings and Equipment	As required by organization function or mission. [Reception desk, ergonomic task seating, guest seating, display units for literature, memorabilia, artwork, lamps, flags].
Special Requirements	As required by organization function or mission. May require electronic storage lockers for cell phones. Command Suites require upgraded finishes and appurtenances.

Adjacencies / Location within Facility	Vestibule, entrance, main corridor, waiting.

Table 4-8 Mail Center

Description/ Usage	Room for processing and distribution of the facility's incoming and outgoing mail and parcels.
Ceiling Height	9 ft. (2.7 m) minimum.
Windows	None required.
Doors	As required.
Interior Construction / Built-in Equipment	Built-in solid surface counters and plastic laminate wall and base cabinets (if not freestanding mailroom products) for equipment and supplies, marker boards, interior signage, mailboxes.
Finishes	**Walls** Painted gypsum wallboard.
	Floor Luxury/solid vinyl tile or rubber tile; low maintenance, rated for severe traffic.
	Base Rubber wall base.
	Ceiling SAPC.
Plumbing	None required.
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	Provide general and dedicated outlets as needed for the required equipment.
Lighting	Provide general lighting.
Telecommunications	**Telephone** Provide one line with internal two-way communication.
	Data As required to support equipment and staff.
	CATV None required.
Security	**IDS** None required.
	ACS None required.
	CCTV None required.
Acoustics	Provide a minimum STC of 40.
Furnishings and Equipment	As required by Installation authority for mail delivery, sorting, packaging, and distribution. Provide counters and cabinets for equipment and work area and storage for supplies. [Provide workstation, ergonomic task chair, personal storage.]
Special Requirements	May accommodate screening requirements.
Adjacencies / Location within Facility	Direct access to Shipping and Receiving or as required by organization function and mission.
	For Use during project execution by appropriate Service
Occupancy	**Staff**

	Other
Min. net Ft^2 (m^2)	

Table 4-9 Shipping and Receiving

Description/ Usage	Accommodates loading and unloading of supplies and services necessary for the operation of the facility.
Ceiling Height	9 ft. (2.7 m) minimum.
Windows	None required.
Doors	Exterior entrance not visible from the front entrance.
Interior Construction / Built-in Equipment	Interior signage, [wire cages,] [pallet/heavy duty shelving].
Finishes	**Walls** Painted Gypsum wallboard, CMU or other highly durable, impact resistant wall construction [wall protection].
	Floor Sealed concrete [resinous epoxy flooring].
	Base Rubber wall base.
	Ceiling Exposed structure, [SAPC].
Plumbing	As required. [water fountain with bottle filler], [utility sink].
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	Provide general outlets and outlets as needed to support required equipment.
Lighting	Provide general lighting.
Telecommunications	**Telephone** Provide one line with internal two-way communication.
	Data As required to support equipment.
	CATV None required.
Security	**IDS** None required.
	ACS None required.
	CCTV None required.
Acoustics	As required.
Furnishings and Equipment	As required by Installation authority for delivery, staging and distribution. Provide shelving, forklifts, carts, and hand trucks as required. [Provide counters and cabinets.] [Provide workstation, ergonomic task chair, personal storage.]
Special Requirements	May accommodate screening requirements. May require loading dock, covered access, or sized to accommodate trucks inside.
Adjacencies / Location within Facility	Direct access to Mail Room and freight elevator in multi-story facilities or as required by organization function and mission.
	For Use during project execution by appropriate Service
Occupancy	**Staff**

	CCTV None required.
Acoustics	None required.
Furnishings and Equipment	Trash and recycling receptacles; sized and marked appropriately for central and/or remote location within the facility.
Special Requirements	Coordinate with agency for trash and recycling procedures.
Adjacencies / Location within Facility	Main trash/recycling area is adjacent to the shipping/receiving area where recyclables from the floors can be consolidated and stored for pick-up. In multistory buildings, locate remote trash/recycling areas adjacent to break rooms, copy rooms, vending, and other similar areas.
	For Use during project execution by appropriate Service
Occupancy	**Staff**
	Other

Min. net Ft^2 (m^2)	

Table 4-11 Large Format Production Room

Description/ Usage	Provides space for a large, production-quality copy machine and/or for staff to design and assemble reports, brochures, and informational pamphlets. It must be conducive to computer-based design work and have space for document production and pallet-based paper storage
Ceiling Height	9 ft. (2.7 m) minimum.
Windows	None required.
Doors	Door(s) with a minimum 35 STC rating.
Interior Construction / Built-in Equipment	Built-in solid surface counters and plastic laminate wall and base cabinets for equipment and storage, marker boards, tack boards, acoustic treatment, interior signage.
Finishes	**Walls** Painted gypsum wallboard, extend partitions from finished floor to structure above.
	Floor Luxury/solid vinyl tile or rubber tile; low maintenance, rated for severe traffic.
	Base Rubber wall base.
	Ceiling SAPC.
Plumbing	None required.
HVAC	As required to support staff and equipment.
Fire Protection and Life Safety	As required.
Power	As required to support staff and equipment.
Lighting	Provide general lighting.
Telecommunications	**Telephone** Provide one line with internal two-way communication or additional as required.
	Data Provide outlets to support staff and equipment required.
	CATV None required.
Security	**IDS** None required.
	ACS None required.
	CCTV None required.
Acoustics	Provide a minimum of STC 40.
Furnishings and Equipment	Work tables, workstations for staff, ergonomic task seating, cabinets and carts for material storage and handling, storage cabinets for supplies.
Special Requirements	May have additional HVAC and power requirements due to size and function of production equipment.
Adjacencies / Location within Facility	As required by organization function and mission.
	For Use during project execution by appropriate Service

Occupancy	Staff
	Other
Min. net Ft^2 (m^2)	

Table 4-12 Break Room

Description/ Usage	Staff-only space used for breaks and lunches to accommodate storage, vending, warming, and minimal preparation of food. Provide a comfortable space with tables and chairs.
Ceiling Height	9 ft. (2.7 m) minimum.
Windows	Provide exterior views.
Doors	Door(s) with minimum 35 STC rating or as required.
Interior Construction / Built-in Equipment	Built-in plastic laminate wall and base cabinets with solid surface countertops, marker boards, tack boards, interior signage.
Finishes	**Walls** Painted gypsum wallboard, [wall protection or wainscot]. Provide cleanable wall finish above counter, such as solid surface or ceramic tile.
	Floor Luxury/solid vinyl tile or porcelain tile; low maintenance, rated for severe traffic.
	Base Rubber or tile wall base to match/coordinate with flooring.
	Ceiling SAPC with a high CAC rating.
Plumbing	Provide for sink, hot and cold water, plumbed appliances.
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	Provide general outlets and as required for appliances and vending.
Lighting	Provide general lighting.
Telecommunications	**Telephone** Provide one line with internal two-way communication.
	Data As required.
	CATV As required.
Security	**IDS** None required.
	ACS None required.
	CCTV None required.
Acoustics	Provide a minimum STC 45.
Furnishings and Equipment	Coffee maker(s), microwave(s), undercounter or full-size refrigerator(s), café tables, chairs, trash/recycle bins.
Special Requirements	May double as a touch-down space with power/data connectivity or for informal meetings and collaboration. May include vending within break room. May require a full kitchen with stove for 24/7 operations. If located in a Command Suite, provide upgraded finishes and appurtenances.
Adjacencies / Location within Facility	As required for organization function and mission. Locate near vending and conference spaces.
	For Use during project execution by appropriate Service
Occupancy	**Staff**

	Other
Min. net Ft^2 (m^2)	

Table 4-13 Break Area

Description/ Usage	Staff-only space used for breaks and lunches to accommodate storage, warming and minimal preparation of food.
Ceiling Height	9 ft. (2.7 m) minimum.
Windows	None required.
Doors	None required.
Interior Construction / Built-in Equipment	Built-in plastic laminate wall and base cabinets with solid surface countertops, marker boards, tack boards, interior signage [demountable partitions].
Finishes	**Walls** Painted Gypsum wallboard or demountable partitions, [wall protection]. Provide a cleanable finish surface above counter such as solid surface or ceramic tile.
	Floor Luxury/solid vinyl tile or porcelain tile; low maintenance, rated for severe traffic.
	Base Rubber or tile wall base.
	Ceiling SAPC.
Plumbing	Provide for sink, hot and cold water, plumbed appliances.
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	As required for appliances.
Lighting	Provide general lighting.
Telecommunications	**Telephone** None required.
	Data None required.
	CATV None required.
Security	**IDS** None required.
	ACS None required.
	CCTV None required.
Acoustics	As required.
Furnishings and Equipment	Coffee maker(s), microwave(s), undercounter or full-size refrigerator(s), trash/recycling bins.
Special Requirements	If located in a Command Suite, provide upgraded finishes and appurtenances.
Adjacencies / Location within Facility	As required for organization function and mission. May be placed near large open office areas, near mail/copy rooms or near conference spaces.
	For Use during project execution by appropriate Service
Occupancy	**Staff**

Min. net Ft^2 (m^2)	

Table 4-14 Nursing Mothers Room

Description/ Usage	Nursing and lactation room, shielded from view and free from intrusion by others.
Ceiling Height	9 ft. (2.7 m) minimum.
Windows	None required.
Doors	Door with minimum 35 STC, privacy lock.
Interior Construction / Built-in Equipment	Provide solid surface counter and plastic laminate base cabinets for minimal storage, full-length mirror, coat hooks, tack board, interior signage with occupancy indicator.
Finishes	**Walls** Painted gypsum wallboard, minimum eggshell finish.
	Floor Hard or resilient flooring such as luxury/solid vinyl tile; low maintenance, rated for severe traffic, suitable for regular mopping and sanitizing.
	Base Rubber wall base.
	Ceiling SAPC.
Plumbing	Provide a small utility type sink with hot and cold water with high neck faucet.
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	Provide general outlets for breast pump and other items, GFCI at sink.
Lighting	Provide general and decorative, dimmable lighting.
Telecommunications	**Telephone** Provide one line with internal two-way communication convenient to chair and counter.
	Data Provide one line.
	CATV As required.
Security	**IDS** None required.
	ACS None required.
	CCTV None required.
Acoustics	Provide minimum STC 35.
Furnishings and Equipment	Comfortable chair with worksurface for lactation equipment, trash receptacle, refrigerator with freezer section for breast milk storage, [microwave for sterilization,] clock.
Special Requirements	Reference GSA PBS-P100 and ECB 2019-4 for multi-station lactation room requirements.
Adjacencies / Location within Facility	Toilets.
	For Use during project execution by appropriate Service
Occupancy	**Staff**

	Other
Min. net Ft^2 (m^2)	

Table 4-15 Toilet Room

Description/ Usage	Toilet rooms are sized per code and occupancy and may be single or multiple fixture toilets. Toilets may be located within an organization's perimeter, or public toilets accessible through the building core.
Ceiling Height	9 ft. (2.7 m) minimum.
Windows	None required.
Doors	Doors as required
Interior Construction / Built-in Equipment	Toilet compartment partitions and accessories, hand [and hair] dryers, built-in solid surface counters, interior signage.
Finishes	**Walls** Durable, low maintenance, water-resistant materials, such as porcelain tile.
	Floor Durable, low maintenance, water-resistant materials, such as porcelain tile, epoxy flooring.
	Base To match/coordinate with flooring.
	Ceiling Durable, humidity resistant material such as painted gypsum wallboard [or SAPC].
Plumbing	Sinks, toilets, urinals.
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	Provide general outlets and outlets to support required equipment such as hand dryers and hair dryers.
Lighting	Provide general and decorative lighting.
Telecommunications	**Telephone** None required.
	Data None required.
	CATV None required.
Security	**IDS** None required.
	ACS None required.
	CCTV None required.
Acoustics	As required.
Furnishings and Equipment	Waste receptacles (if not included in construction).
Special Requirements	
Adjacencies / Location within Facility	Collocate with showers, locker rooms and fitness rooms.
	For Use during project execution by appropriate Service
Occupancy	**Staff**

	Other
Min. net Ft^2 (m^2)	

Table 4-16 Janitor's Closet

Description/ Usage	A janitor's closet accommodates equipment and supplies for the maintenance of the toilets and building. Usually part of the building core, it may be located within an organization's perimeter.
Ceiling Height	9 ft. (2.7 m) minimum.
Windows	None required.
Doors	Doors as required.
Interior Construction / Built-in Equipment	Mop rack and shelving, interior signage.
Finishes	**Walls** Durable, low-maintenance, water-resistant materials, such as fiberglass reinforced wall panel, stainless steel, or porcelain tile.
	Floor Durable, low-maintenance, water-resistant materials, such as porcelain tile, epoxy flooring.
	Base To match/coordinate with flooring.
	Ceiling Durable, humidity-resistant material, such as painted gypsum wallboard [or SAPC].
Plumbing	Mop basin, [Utility sink].
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	Provide general outlets and outlets to support required equipment.
Lighting	Provide general lighting.
Telecommunications	**Telephone** None required.
	Data None required.
	CATV None required.
Security	**IDS** None required.
	ACS None required.
	CCTV None required.
Acoustics	As required.
Furnishings and Equipment	Waste receptacles (if not included in construction).
Special Requirements	May be incorporated inside toilets or locker rooms as required.
Adjacencies / Location within Facility	Collocate with toilets, locker rooms, shower rooms.
	For Use during project execution by appropriate Service
Occupancy	**Staff**

	Other
Min. net Ft^2 (m^2)	

Table 4-17 Locker Room

Description/ Usage	Space or room for staff to store and secure personal items in condensed open office areas, or for transient/teleworking staff periodically in the office. May be used in conjunction with shower rooms and fitness rooms.
Ceiling Height	9 ft. (2.7 m) minimum.
Windows	None required.
Doors	None required.
Interior Construction / Built-in Equipment	Built-in locker system, plastic laminate, phenolic, metal or composite finish, interior signage, demountable partitions.
Finishes	**Walls** Painted gypsum wallboard or demountable partitions.
	Floor Carpet tile with attached cushion, rubber or porcelain tile or luxury/solid vinyl tile; low maintenance, rated for severe traffic.
	Base Rubber or tile wall base.
	Ceiling Durable, humidity-resistant material ,such as painted gypsum wallboard [or SAPC].
Plumbing	None required.
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	As required.
Lighting	Provide general lighting.
Telecommunications	**Telephone** None required.
	Data None required.
	CATV None required.
Security	**IDS** None required.
	ACS None required.
	CCTV None required.
Acoustics	As required.
Furnishings and Equipment	Provide freestanding day locker system (if not included in construction).
Special Requirements	Consider providing power ports for charging devices.
Adjacencies / Location within Facility	Locate near open office space, break rooms, fitness rooms.
	For Use during project execution by appropriate Service
Occupancy	**Staff**

	Other
Min. net Ft^2 (m^2)	

Table 4-18 Shower Room

Description/ Usage	Single or Multi-user shower space, if fitness or wellness areas are not nearby.
Ceiling Height	9 ft. (2.7 m) minimum
Windows	None required.
Doors	Doors as required
Interior Construction / Built-in Equipment	Shower partitions and accessories, hand and hair dryers, built-in benches and solid surface counters, interior signage.
Finishes	**Walls** Durable, low maintenance, water-resistant materials, such as porcelain tile.
	Floor Durable, low maintenance, water-resistant materials, such as porcelain tile, epoxy flooring.
	Base To match/coordinate with flooring
	Ceiling Durable, humidity-resistant material ,such as painted gypsum wallboard or SAPC].
Plumbing	Showers, sinks, [toilets].
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	Provide general outlets and outlets to support required equipment, such as hand dryers and hair dryers.
Lighting	Provide general and decorative lighting.
Telecommunications	**Telephone** None required.
	Data None required.
	CATV None required.
Security	**IDS** None required.
	ACS None required.
	CCTV None required.
Acoustics	As required.
Furnishings and Equipment	Waste receptacles (if not included in construction), shower curtains, benches.
Special Requirements	May be incorporated inside toilets or locker rooms as required.
Adjacencies / Location within Facility	Collocate with toilets, locker rooms, fitness rooms.
	For Use during project execution by appropriate Service
Occupancy	**Staff**

	Other
Min. net Ft^2 (m^2)	

Table 4-19 Fitness Room

Description/ Usage	Optional area with several fitness machines for staff use, if fitness or wellness facilities are not nearby.
Ceiling Height	9 ft. (2.7 m) minimum.
Windows	Provide an interior window to the corridor at 42 in. (1.07 m) above finished floor, a minimum of 36 in. (0.91 m) high and a minimum of 10 sq. ft. (0.93 sq. m.) total window area.
Doors	Lockable entrance door with a vision panel.
Interior Construction / Built-in Equipment	Provide a minimum of one wall- or ceiling-TV mount. Provide an 8 ft. (2.4 m) high mirror covering one full wall. interior signage.
Finishes	**Walls** Painted gypsum board, double layer (impact side).
	Floor Durable, low maintenance, resilient seamless rubber sheet flooring.
	Base Rubber wall base.
	Ceiling Durable, humidity-resistant material, such as SAPC or painted gypsum wallboard.
Plumbing	Provide an electric water cooler with bottle filler.
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	Provide general outlets and properly sized and placed outlets to support required equipment. Provide outlet(s) for wall- or ceiling-mounted televisions.
Lighting	Provide general and decorative lighting.
Telecommunications	**Telephone** Provide one line with internal two-way communication.
	Data None required.
	CATV Provide outlets for wall- or ceiling-mounted TV(s). Coordinate with selected fitness equipment to accommodate equipment with built-in or attached TV(s).
Security	**IDS** None required.
	ACS None required.
	CCTV Provide outlets for full cameral coverage.
Acoustics	Provide partition construction with a minimum STC rating of 52.
Furnishings and Equipment	Waste and recycling receptacles (if not included in construction), benches.
Special Requirements	
Adjacencies / Location within Facility	Collocate with toilets, locker rooms, shower rooms.

	For Use during project execution by appropriate Service
Occupancy	Staff
	Other
Min. net Ft^2 (m^2)	

Table 4-20 Auditorium

Description/ Usage	Auditoriums accommodate 50 or more people for large presentations, ceremonies or distance learning.
Ceiling Height	Varies with size and function of auditorium space.
Windows	Not required.
Doors	Doors with minimum 50 STC rating or as required.
Interior Construction / Built-in Equipment	Tiered floor with fixed seating [and lecture hall tables] and a stage or raised platform, [projection screens,] acoustic treatment, interior signage.
Finishes	**Walls** Structural partitions that extend from finished floor to structure above, acoustically engineered to support the room function.
	Floor Carpet tile with attached cushion or luxury/solid vinyl tile; low maintenance, rated for severe traffic; wood or simulated wood flooring for stage or raised platform.
	Base Rubber or wood wall base.
	Ceiling Provide an acoustically engineered ceiling system.
Plumbing	None required.
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	Provide general and specialized power to support required equipment. May require floor receptacles to accommodate power requirements at seating [and fixed lecture hall tables].
Lighting	Provide general, decorative, and special lighting to support the functions of the room.
Telecommunications	**Telephone** Provide multiple lines with internal two-way communication as required. May require floor receptacles to accommodate telephone requirements at seating [and fixed lecture hall tables].
	Data Provide outlets to support the required equipment such as VTC, flat screen monitors, projector, and other similar equipment. May require floor receptacles to accommodate data requirements at seating [and fixed lecture hall tables].
	CATV As required.
Security	**IDS** None required.
	ACS None required.
	CCTV None required.
Acoustics	Provide STC 55 or greater.
Furnishings and Equipment	FF&E Package: Lecture hall tables and seating if not fixed and in construction.

	AV package: Flat screen monitors, projectors, screens, VTC systems, smart lectern, or as required.
Special Requirements	Provide an integrated, multi-disciplined design solution for effective acoustics, lighting, and audiovisual displays.
Adjacencies / Location within Facility	As required for organization function or mission.
	For Use during project execution by appropriate Service
Occupancy	**Staff**
	Other
Min. net Ft^2 (m^2)	

Table 4-21 Classroom/Training Room

Description/ Usage	Enclosed conference or training space for 30 - 50 people for flexible arrangements of conference and classroom settings. May be used for extended or daylong meetings, ceremonies, or distance learning.
Ceiling Height	10 ft. (3.0 m) minimum.
Windows	Not required.
Doors	Door(s) with minimum 35 STC rating or as required.
Interior Construction / Built-in Equipment	Provide marker boards, tack boards, projection [surfaces,] [screens,] Built-in casework for equipment or buffet; acoustic treatment, interior signage.
Finishes	**Walls** Painted gypsum wallboard. Provide partitions that extend from the finished floor to the structure above. Provide acoustical insulation in the partitions to achieve a minimum 50 STC rating.
	Floor Carpet tile with attached cushion; low maintenance, rated for severe traffic.
	Base Rubber wall base.
	Ceiling SAPC.
Plumbing	None required.
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	Provide general outlets and outlets to support the required equipment. May require floor receptacles to accommodate power requirements at the conference table.
Lighting	Provide multiple lighting solutions to include general lighting, accent lighting, and dimmable lighting.
Telecommunications	**Telephone** Provide one line with internal two-way communication, or as required. May require floor receptacles to accommodate telephone requirements at the conference table.
	Data Provide for computer, projection, flat monitor or lectern connectivity as required. May require floor-mounted receptacles to accommodate data requirements at the conference table.
	CATV As required by organization function or mission.
Security	**IDS** None required.
	ACS None required.
	CCTV None required.
Acoustics	Provide STC 45 or greater.
Furnishings and Equipment	FF&E Package: Modular conference tables to be configured for conference, seminar or classroom settings with power and data connectivity; seminar chairs or swivel conference seating, [upholstered, flexible backs, casters] mobile marker boards.

	AV package: Flat screen monitors, projectors, screens, VTC systems, smart lecterns or as required.
Special Requirements	Presentation or VTC functions; instructional or distance learning; power and data connectivity.
Adjacencies / Location within Facility	As required for organization function or mission.
	For Use during project execution by appropriate Service
Occupancy	**Staff**
	Other
Min. net Ft^2 (m^2)	

Table 4-22 Conference/Training Room

Description/ Usage	Enclosed space for 10 - 30 people for meetings, presentations, training, and occasional social or ceremonial functions.
Ceiling Height	10 ft. (3.0 m) minimum.
Windows	None required.
Doors	Door with minimum 35 STC rating or as required.
Interior Construction / Built-in Equipment	Provide acoustic wall treatment to achieve the required acoustical performance in addition to wall construction. Provide marker boards, [projection screen,] interior signage.
Finishes	**Walls** Painted gypsum wallboard. Provide partitions that extend from the finished floor to the structure above. Provide acoustical insulation in the partitions to achieve a minimum STC of 50.
	Floor Carpet tile with attached cushion; low maintenance, rated for severe traffic.
	Base Rubber wall base.
	Ceiling SAPC; provide a ceiling with a high Ceiling Attenuation Class (CAC) rating capable of reducing sound transmission.
Plumbing	None required.
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	Provide general outlets and outlets to support the required equipment. May require floor receptacles to accommodate power requirements at the conference table.
Lighting	Provide multiple lighting solutions to include general lighting, accent lighting and dimmable lighting.
Telecommunications	**Telephone** Provide one line with internal two-way communication, or as required. May require floor receptacles to accommodate telephone requirements at the conference table.
	Data Provide for computer, projection, flat monitor, or lectern connectivity as required. May require floor mounted receptacles to accommodate data requirements at the conference table.
	CATV As required by organization function or mission.
Security	**IDS** None required.
	ACS None required.
	CCTV None required.
Acoustics	Provide STC 45 or greater.
Furnishings and Equipment	FF&E package: Conference table, swivel conference chairs, side seating, credenza for AV equipment, podium, artwork, [logos].

	AV package: Flat monitor(s), projector, screen, smart lectern, VTC system or equipment as required by the organization function and mission.
Special Requirements	For VTC, provide appropriately placed outlets, room dimensions, and furniture selection. Accommodate a built-in projector and projection screen if required. If located in a Command Suite, provide upgraded finishes and appurtenances.
Adjacencies / Location within Facility	As required by the organization function and mission.
	For Use during project execution by appropriate Service
Occupancy	**Staff**
	Other
Min. net Ft^2 (m^2)	

Table 4-23 Team/Collaboration Room

Description/ Usage	Enclosed space for 6-10 staff for meetings and collaboration.
Ceiling Height	9 ft. (2.7 m) minimum.
Windows	Not required.
Doors	Door with minimum 35 STC rating or as required.
Interior Construction / Built-in Equipment	Provide marker boards, tack boards, interior signage, acoustic treatment, [demountable partitions,] [projection screen].
Finishes	**Walls** Painted gypsum wallboard or demountable partitions, Minimum 45 STC.
	Floor Carpet tile with attached cushion; low maintenance, rated for severe traffic.
	Base Rubber wall base.
	Ceiling SAPC; provide a ceiling with a high Ceiling Attenuation Class (CAC) rating capable of reducing sound transmission.
Plumbing	None required.
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	Provide general outlets and outlets to support the required equipment.
Lighting	Provide general and dimmable lighting.
Telecommunications	**Telephone** Provide one line with internal two-way communication.
	Data Provide connectivity in this space as determined by the organization function and mission.
	CATV As required by organization function or mission
Security	**IDS** None required.
	ACS None required.
	CCTV None required.
Acoustics	Provide a minimum of 45 STC.
Furnishings and Equipment	FF&E package: Conference table for 6 -10 people, swivel conference chairs; or individual or group lounge seating for relaxed collaboration. AV package: Flat screen monitors, projectors, screens, VTC systems, or as required.
Special Requirements	May be used for small scale VTC room. If located in a Command Suite, provide upgraded finishes and appurtenances.
Adjacencies / Location within Facility	As required by the organization function and mission.

	For Use during project execution by appropriate Service
Occupancy	Staff
	Other
Min. net Ft^2 (m^2)	

Table 4-24 Focus Room

Description/ Usage	Enclosed space for 1-2 staff for privacy and collaboration.
Ceiling Height	9 ft. (2.7 m) minimum.
Windows	Not required.
Doors	Door with minimum 35 STC rating or as required.
Interior Construction / Built-in Equipment	Provide marker boards, tack boards, interior signage, acoustic treatment, [demountable partitions,] [clear and/or frosted glass partition(s)].
Finishes	**Walls** Painted gypsum wallboard or demountable partitions, Minimum 45 STC.
	Floor Carpet tile with attached cushion; low maintenance, rated for severe traffic.
	Base Rubber wall base.
	Ceiling SAPC; provide a ceiling with a high Ceiling Attenuation Class (CAC) rating capable of reducing sound transmission.
Plumbing	None required.
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	Provide general outlets and outlets to support the required equipment.
Lighting	Provide general and dimmable lighting.
Telecommunications	**Telephone** Provide one line with internal two-way communication.
	Data Provide connectivity in this space as determined by the organization function and mission.
	CATV As required by organization function or mission
Security	**IDS** None required.
	ACS None required.
	CCTV None required.
Acoustics	Provide a minimum of 45 STC.
Furnishings and Equipment	FF&E package: height-adjustable worksurface or table, 2 task or conference chairs; or individual or lounge seating for relaxed collaboration; task lighting, as required. Consider prefabricated focus room units. AV package: Flat screen monitors, as required.
Special Requirements	

Adjacencies / Location within Facility	As required by the organization function and mission.

Occupancy	**Staff**
	Other
Min. net Ft^2 (m^2)	

Table 4-25 General Filing and Storage Room

Description/ Usage	Storage of files, supplies, and equipment. Provide a separate lockable room for storage of sensitive or high-value equipment.
Ceiling Height	9 ft. (2.7 m) minimum.
Windows	None required.
Doors	Doors with passage lock [access control].
Interior Construction / Built-in Equipment	Interior signage, [high density filing,] [plastic laminate clad wall and base cabinets with counters], [demountable partitions].
Finishes	**Walls** Painted gypsum wallboard or demountable partitions or as required depending on the agency and the level of security required.
	Floor Carpet tile with attached cushion, rubber tile or luxury/solid vinyl tile; low maintenance, rated for severe traffic.
	Base Rubber wall base.
	Ceiling SAPC [Exposed structure].
Plumbing	None required.
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	Provide general outlets.
Lighting	Provide general lighting.
Telecommunications	**Telephone** As required.
	Data As required.
	CATV As required.
Security	**IDS** As required.
	ACS As required.
	CCTV As required.
Acoustics	None required.
Furnishings and Equipment	Open utility shelving, file cabinets, or specialized storage systems as required by organization function and mission.
Special Requirements	Additional structural support for concentrated loads. ESS depending on security level.
Adjacencies / Location within Facility	As required by organization function and mission.
	For Use during project execution by appropriate Service
Occupancy	**Staff**
	Other

Min. net Ft^2 (m^2)	

Table 4-26 Technical Equipment Room

Description/ Usage	Room for specialized equipment specific to an organization's function and mission such as an IT laboratory/service shop, energy monitoring and control functions, or radio and equipment check out and charging.
Ceiling Height	9 ft. (2.7 m) minimum.
Windows	None required.
Doors	Doors with minimum STC 35. Lockable for high value equipment.
Interior Construction / Built-in Equipment	As required for organization function and mission.
Finishes	**Walls** Painted gypsum wallboard or demountable partitions
	Floor Carpet tile with attached cushion or luxury/solid vinyl tile; [rubber tile,] [static dissipative tile,] low maintenance, rated for severe traffic.
	Base Rubber wall base.
	Ceiling SAPC.
Plumbing	As required for organization function and mission.
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	Provide general outlets and outlets to support required equipment.
Lighting	As required.
Telecommunications	**Telephone** Provide one line with internal two-way communication.
	Data Provide general outlets and outlets to support required equipment.
	CATV Non required.
Security	**IDS** None required.
	ACS None required.
	CCTV None required.
Acoustics	Provide minimum STC 35.
Furnishings and Equipment	As required for organization function and mission.
Special Requirements	As required for organization function and mission.
Adjacencies / Location within Facility	As required for organization function and mission.
	For Use during project execution by appropriate Service
Occupancy	**Staff**

Min. net Ft^2 (m^2)	

Table 4-27 Controlled Entry/Quarterdeck

Description/ Usage	Secure space to control the access of personnel into a facility or area within the facility. May include display of flag or organizational memorabilia. May be staffed.
Ceiling Height	9 ft. (2.7 m) minimum.
Windows	As required.
Doors	Door(s) with integrated access control system in hardware.
Interior Construction / Built-in Equipment	Provide main facility signage and/or directory, chain of command board (if not in Lobby); [transaction window,] [entrance mat,] [casework,] [reception desk,] Interior signage, and as required by organization function or mission.
Finishes	**Walls** Painted gypsum wallboard [with architectural feature wall panel system using material such as acrylic, wood, metal or other upgraded durable panel material].
	Floor Provide low maintenance, durable flooring such as stone, terrazzo or porcelain tile. [provide carpet or luxury/solid vinyl tile with low maintenance, with severe wear rating.] Provide walk-off mat at entrance as an extension of the entrance vestibule.
	Base Resilient or tile to match/coordinate with floor material.
	Ceiling Durable, humidity resistant material such as acoustic tile or painted gypsum wallboard [metal,] [decorative,] [specialty ceiling].
Plumbing	None required.
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	Provide general electrical outlets and outlets to support required equipment. [Provide a minimum of a quad outlet at reception desk.]
Lighting	Provide general, decorative and task lighting.
Telecommunications	**Telephone** Provide one line with internal two-way communication.
	Data Provide an outlet at reception desk, [electronic] [directory] [flat screen monitor] or as required.
	CATV As required.
Security	**IDS** As required by organization function or mission.
	ACS As required by organization function or mission.
	CCTV As required by organization function or mission.
Acoustics	As required.
Furnishings and Equipment	As required by organization function or mission. [Ergonomic task seating; reception desk, workstation, guest seating, flags, artwork, display cases.]

Special Requirements	May require a transaction counter or window or CCTV, speaker, phone for visibility or communication between visitor and personnel. May require adjacent bunkroom if a 24/7 facility.
Adjacencies / Location within Facility	Vestibule, main corridor, departmental entrance, reception, waiting.
	For Use during project execution by appropriate Service
Occupancy	**Staff**
	Other
Min. net Ft^2 (m^2)	

Table 4-28 Secure Visitor Space

Description/ Usage	Secure space for visitors to wait until received by personnel. Requirement for this space based on organization's function or mission.
Ceiling Height	9 ft. (2.7 m) minimum.
Windows	As required.
Doors	As required.
Interior Construction / Built-in Equipment	Interior signage.
Finishes	**Walls** Painted gypsum wallboard partitions.
	Floor Carpet tile with attached cushion or luxury/solid vinyl tile; low maintenance, rated for severe traffic.
	Base Rubber wall base.
	Ceiling SAPC.
Plumbing	None required.
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	Provide general outlets, or as required.
Lighting	Provide general lighting.
Telecommunications	**Telephone** Provide one line with internal two-way communication.
	Data Provide one outlet or as required.
	CATV
Security	**IDS** As required by organization function or mission.
	ACS As required by organization function or mission.
	CCTV As required by organization function or mission.
Acoustics	As required.
Furnishings and Equipment	Seating; occasional tables; lamps; artwork, display units for literature, bulletins, or memorabilia.
Special Requirements	As required by organization function or mission.
Adjacencies / Location within Facility	Vestibule, entrance, main corridor, reception.
	For Use during project execution by appropriate Service
Occupancy	**Staff**
	Other

Min. net Ft^2 (m^2)	

Table 4-29 SCIF

Description/ Usage	Sensitive Compartment Information Facility (SCIF); an accredited area, room, or group of rooms, where sensitive compartmentalized information is stored, used, discussed, or electronically processed
Ceiling Height	9 ft. (2.7 m) minimum.
Windows	None required.
Doors	Comply with UFC 4-010-05.
Interior Construction / Built-in Equipment	Acoustic treatment, interior signage, raised access flooring. Comply with UFC 4-010-05.
Finishes	**Walls** Painted gypsum wallboard.
	Floor Carpet tile with attached cushion; low maintenance, rated for heavy traffic.
	Base Rubber wall base.
	Ceiling SAPC.
Plumbing	None required.
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	As required.
Lighting	Provide general lighting.
Telecommunications	**Telephone** Provide one line with internal two-way communication, and as required for secure communication.
	Data As required.
	CATV As required.
Security	**IDS** As required by organization function or mission.
	ACS As required by organization function or mission.
	CCTV As required by organization function or mission.
Acoustics	Comply with UFC 4-010-05.
Furnishings and Equipment	As required by organization function or mission.
Special Requirements	Comply with UFC 4-010-05. If located in a Command Suite, provide upgraded finishes and appurtenances.
Adjacencies / Location within Facility	As required by organization function or mission.
	For Use during project execution by appropriate Service
Occupancy	**Staff**
	Other

Min. net Ft^2 (m^2)	

Table 4-30 Vault Room

Description/ Usage	A vault room is a secured area for handling classified material. Depending on the level of classification, refer to requirements for classified facilities requiring more stringent security requirements and specific design guidance such as Open Storage Secret (OSS), Sensitive Compartmented Information Facility (SCIF), Special Access Program Facilities (SAPF) and Top Secret/Sensitive Compartmented Information (TS/SCI).
Ceiling Height	9 ft. (2.7 m) minimum.
Windows	None required.
Doors	Doors with passage lock [access control].
Interior Construction / Built-in Equipment	Acoustic treatment, interior signage, raised access flooring.
Finishes	**Walls** Painted gypsum wallboard.
	Floor Carpet tile with attached cushion; low maintenance, rated for heavy traffic.
	Base Rubber wall base.
	Ceiling SAPC.
Plumbing	None required.
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	As required.
Lighting	Provide general lighting.
Telecommunications	**Telephone** Provide one line with internal two-way communication, and as required for secure communication.
	Data As required.
	CATV As required.
Security	**IDS** As required by organization function or mission.
	ACS As required by organization function or mission.
	CCTV As required by organization function or mission.
Acoustics	As required.
Furnishings and Equipment	As required by organization function or mission.
Special Requirements	If located in a Command Suite, provide upgraded finishes and appurtenances.
Adjacencies / Location within Facility	As required by organization function or mission.
	For Use during project execution by appropriate Service

Occupancy	Staff
	Other
Min. net Ft^2 (m^2)	

APPENDIX A BEST PRACTICES

A-1 BUILDING CONFIGURATION AND LAYOUT.

Critical elements of an efficient administrative building layout include the design of the building core, the dimensions of floor depth, structural bay spacing, and the office and workstation design and layout. A rectangular floor plan is generally preferred because it facilitates more efficient space planning. The simple shape with a high area-to-perimeter ratio yields the most economical facility.

A-1.1 Building Core.

To permit efficiency in floor plan design, the width of the building core is typically 20 to 40 ft. (6.1 to 12.2 m.). The length of the building core will vary depending on building requirements; 40 ft. (12.2 m.) is a suggested minimum.

A-1.2 Floor Depth.

The suggested floor depth for initial planning purposes is between 35 ft. (10.7 m.) and 40 ft. (12.2 m.). Floor depths of approximately 50-65 ft. (15.2 to 19.8 m.) can be configured at the ends of the building core to accommodate programmed space that is not dependent on natural light, such as computer or file storage rooms.

A-1.3 Structural Bays.

Consider the size and shape of the structural bays to allow for flexibility in workstation layout. Consider clear spans and columns beyond workstation footprint to improve the efficiency of interior space. This impacts the number and size of workstations that can be accommodated. For example, there may be the overall square footage of space to accommodate a certain number of workstations, but if the location of a structural column interferes with the location of a workstation, the actual number of workstations will be lower than the planning number. Because the bay dimension is repeated on each building floor, the results of poorly coordinated bay design is multiplied by the number of building floors with office layouts.

Typical bay spacing ranges from 20 to 30 ft. (6.1 to 9.1 m). However, this can vary depending upon the structural system employed, such as structural steel, reinforced concrete, precast concrete.

A-1.3.1 Circulation.

Circulation in Administrative Office planning is highly dependent on the mixture of enclosed and open spaces. As mentioned previously, facilities with more open office workstations and collaboration areas will require a higher circulation factor than a facility with more enclosed offices and conference rooms. The following excerpts from a GSA study “Circulation: Defining and Planning” illustrate this relationship.

Figure A-1 Circulation Case Study 0/100

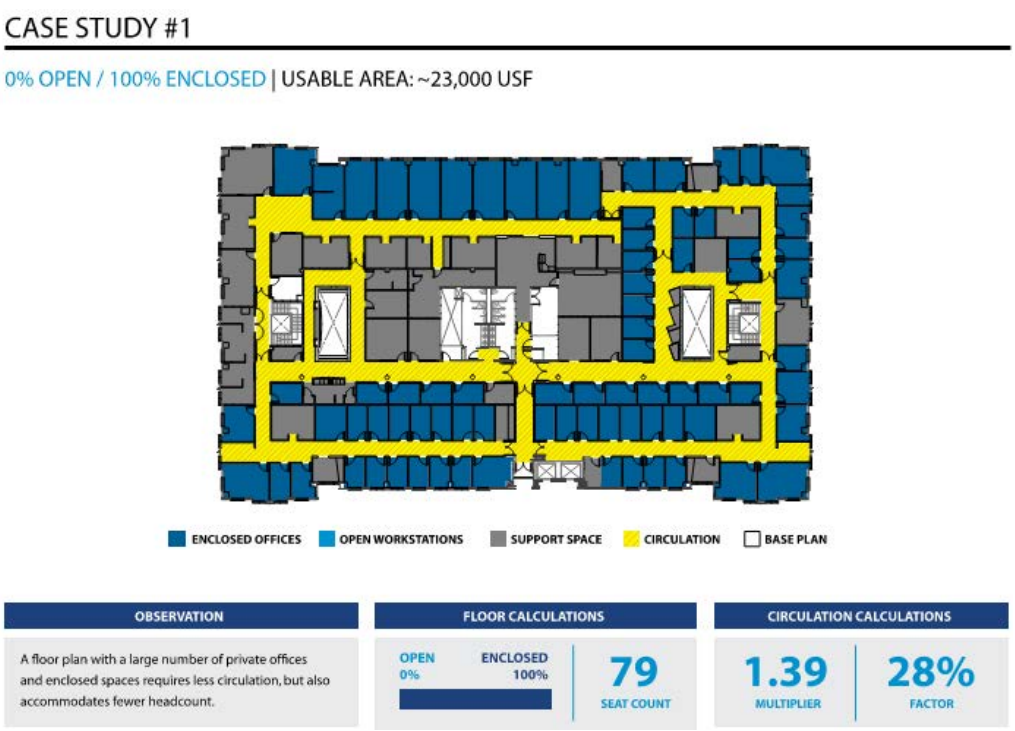

Figure A-2 Circulation Case Study 33/67

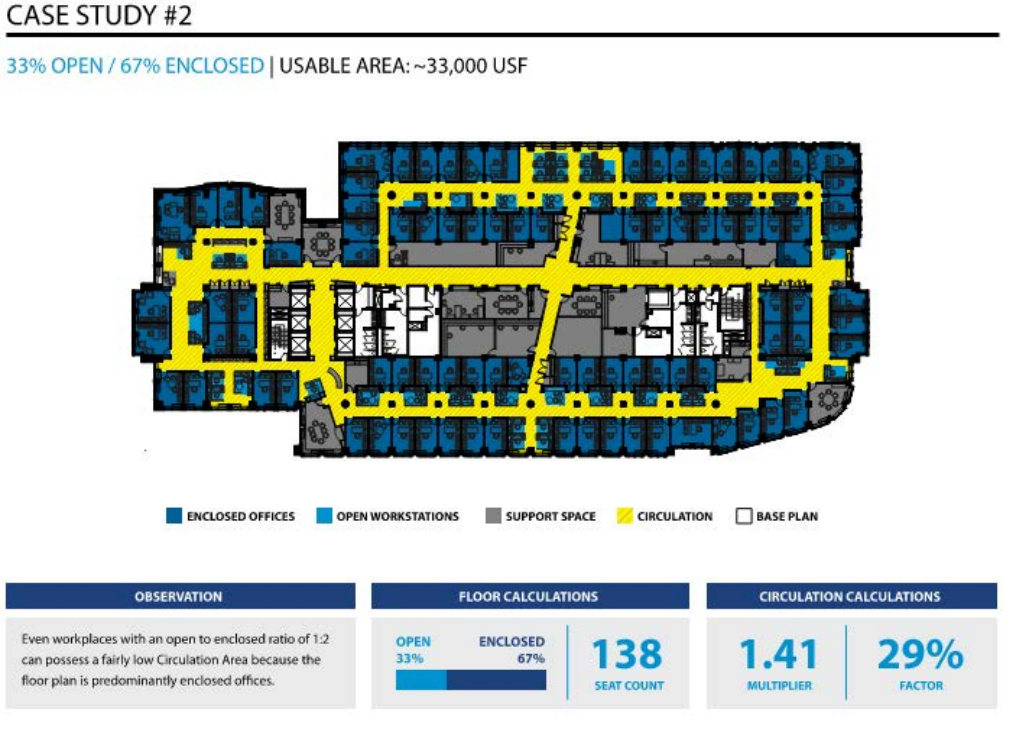

Figure A-3 Circulation Case Study 80/20

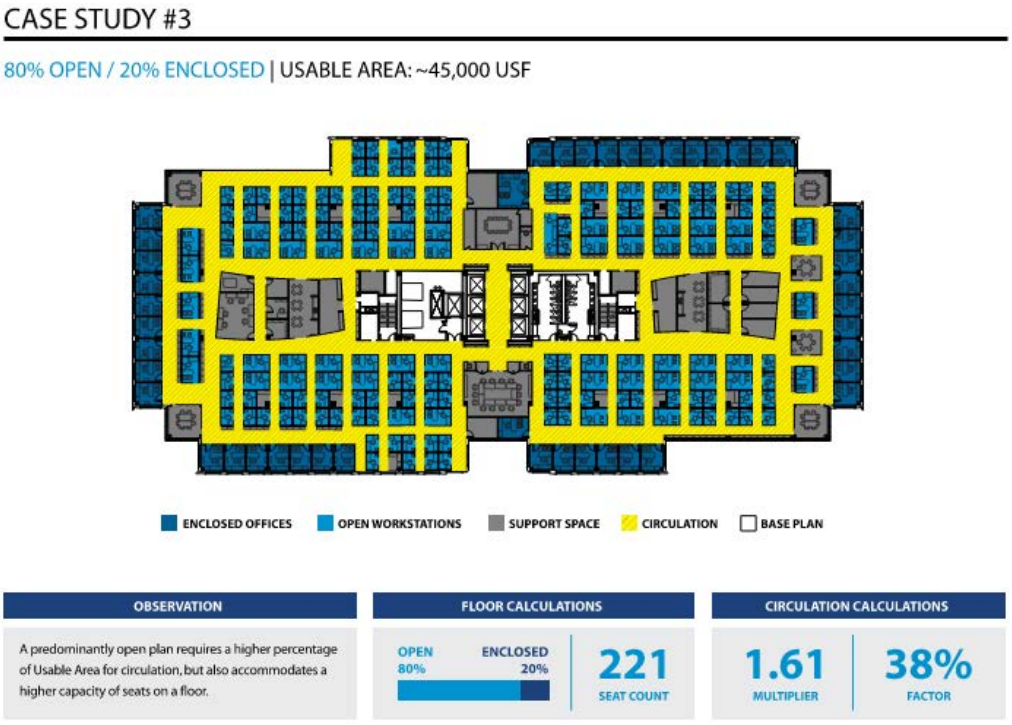

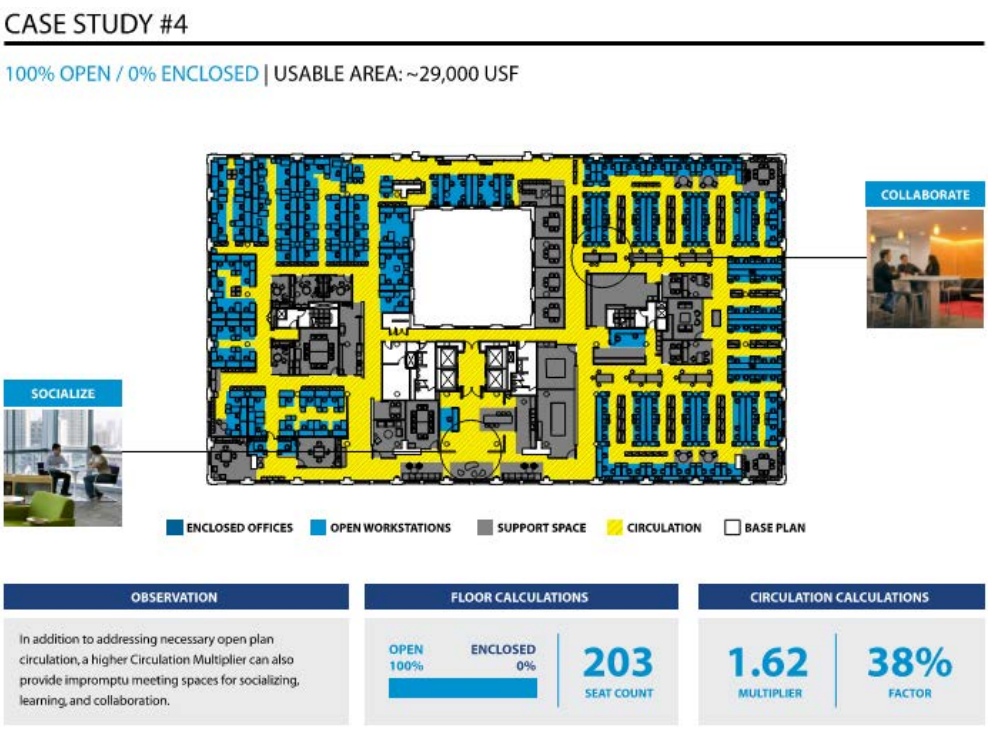

Figure A-4 Circulation Case Study 100/0

The basic building blocks of an administrative facility are the workstations and private offices. The sizes and features of these elements are critical to the efficiency of each worker, and the grouping or layout is critical to the efficiency of the organization. It is essential to understand the relationships between workstation/office design and the building design and systems.

A-2.1 Design for Flexibility.

Design the interior of Administrative Facilities for flexibility of use. Minimize the number of different workstation and offices sizes. This will ease the planning process and provide greater flexibility in the final design. Design the workstation for the task being performed and the size of the user, to the best extent possible. Make sure the furniture fits the user, supports them properly, and adjusts to their activities; use furniture systems that can be reconfigured easily for different users. **\1** Consider teleworking, shared workspaces, flex workstations, hoteling, and secure storage for daily personal items when selecting furniture. **/1/**

With furniture systems, it is possible to construct stations of any size or configuration—when necessary, consider larger workstations that accommodate meeting space. However, the open office environment can quickly become noisy and distracting if too many conversations occur. Meetings are best conducted in specifically designed meeting space.

A-2.2 Design for Modularity.

Design workstation sizes with a common dimension to facilitate grouping stations of different sizes. Two appropriate workstation sizes that can accommodate just about any office function are 8 ft. x 8 ft. (2.4 m x 2.4 m) and 8 ft. x 10 ft. (2.4 m x 3.0 m). Individual workstations should not be less than 6 ft. x 8 ft. (1.8 m x 2.4 m) and workstations in team work areas should not be less than 6 ft. x 6 ft. (1.8 x 1.8 m).

These same rules apply to private offices. Three appropriate office sizes are 10 ft. x 12 ft. (3.0 m x 3.7 m), 15 ft. x 12 ft. (4.6 m x 3.7 m), and sometimes 20 ft. x 12 ft. (6.1 m x 3.7 m.). If private offices are located against exterior window walls, coordinate the office sizes with the window mullion spacing so that office partitions occur at a mullion or solid wall component. Common mullion spacing is 5 ft. (1.5 m), which accounts for the common denominator of one dimension of the office sizes noted above.

A-2.3 Natural Daylight and Views.

Design the workstations and offices to maximize the admission of natural daylight and views. If private offices are on the exterior window walls, design interior partitions with glazing or sidelights or place the private offices against the building core. Ensure that the entire exterior wall is not blocked by private offices to maximize natural daylight admission and views into the building. Consider issues such as the even distribution of light, glare control, and heat gain and loss when designing space with good natural light qualities.

APPENDIX B AUSTERE ADMINISTRATIVE FACILITIES (NAVY ONLY)

B-1 PURPOSE.

The purpose of this appendix is to provide implementation requirements for the austere construction established by Commander, Navy Installations Command (CNIC). These requirements were developed to address construction of support facilities in CNIC designated operating environments.

B-2 DEFINITION AND SCOPE.

An austere facility is defined as a structure designed and constructed with minimal infrastructure, footprint area, and finishes, incorporating applicable building codes and facility criteria to assure adherence to all health, accessibility, and life safety standards and regulations required to fulfill the mission, including Anti-Terrorism Force Protection appropriate to each site. Austere facilities must be built with the least total ownership costs (TOC) possible, including purchase, maintenance, and use of consistently available alternative local goods.

B-3 APPLICABILITY.

Austere construction is intended for facilities in locations determined by CNIC and approved by OPNAV to be eligible for austere facilities construction. The austere standards are intended to be applied flexibly and in varying degrees to all facilities at locations designated as austere. This flexibility must be allowed to ensure the criteria are appropriate for individual austere locations.

Design these facilities with consideration of a timeframe appropriate to austere facilities, regionally appropriate acquisition of equipment, Base Operating Support (BOS) difficulties, and logistical difficulties.

B-4 MODIFICATIONS.

For austere design and construction use UFC 4-610-01, Administrative Facilities with the following (generally deductive) modifications of this appendix.

CHAPTER 2 PLANNING AND PROGRAMMING

2-3.1 Administrative Personnel.

Limit austere facilities to one Private Office with all other personnel in open office space. Delete these spaces unless mission-required:

- Semi-Private Office
- Private Flex Office
- Open Office – Flex Staff
- Command Suite

2-3.2 Administrative Support Spaces.

Delete these spaces unless mission-required:

- Reception and Waiting Area
- Locker, Shower, Fitness Rooms
- Nursing Mother's Room
- Shipping and Receiving (centralized location assumed)
- Trash and Recycling (centralized location assumed)

2-3.3 Assembly Spaces.

Limit austere facilities to one conference room unless mission required. Delete these spaces:

- Auditorium
- Large Conference Rooms
- Team/Collaboration Room
- Break Room/Areas

2-3-4 Equipment and Storage.

Delete these spaces unless mission-required:

- Large Format Production room
- Mail Center
- Technical Equipment Room

2-3.5 Secure Spaces.

Delete all spaces unless mission-required.

CHAPTER 3 GENERAL DESIGN CRITERIA

3-1 BUILDING CONFIGURATION AND LAYOUT.

Add the following:

For austere facilities, limit permanent interior partitions to those required for a single private office and a single conference room. Maximize the use of an open floor plan and provide well-designed furniture systems.

3-1.1 Building Core.

Use this paragraph with the following exception:

Elevators are prohibited in austere facilities.

3-2.2 Entrance.

Add the following:

Canopies will not be used in austere facilities unless needed for weather conditions.

3-2.4 Raised Access Floor Systems.

Raised access floor systems are prohibited in austere facilities unless mission-required.

3-2.5 Demountable and Operable Partitions.

Demountable and Operable Partitions are prohibited in austere facilities.

CHAPTER 4 SPECIFIC DESIGN CRITERIA

4-3 FUNCTIONAL DATA SHEETS.

Replace all FDSs with the following:

Table B-1 Austere Private Office (Replaces Table 4-1)

Description/ Usage	Provide enclosed space for one person with visual and/or acoustic privacy based on assignment or functional requirements.
Ceiling Height	9 ft. (2.7 m) minimum.
Windows	Provide daylighting.
Doors	Door with minimum 35 STC rating or as required. Privacy lock or passage set.
Interior Construction / Built-in Equipment	Provide markerboard, changeable room signage.
Finishes	**Walls** Painted gypsum wallboard extended from finished floor to suspended ceiling; for higher privacy requirements, extend partitions to structure. Minimum 40 STC.
	Floor Sealed concrete.
	Base Rubber wall base.
	Ceiling Exposed ceiling, painted or SAPC.
Plumbing	None required.
HVAC	As required.

Fire Protection and Life Safety	As required.
Power	Provide two quad electrical receptacles on separate walls or as needed to support the required equipment.
Lighting	Provide general lighting.
Telecommunications	**Telephone** Provide one line with internal two-way communication.
	Data Provide a minimum of two lines/outlets or more to support the required equipment.
	CATV As required by organization function or mission.
Security	**IDS** None required.
	ACS None required.
	CCTV None required.
Acoustics	Provide a minimum 40-45 STC depending on occupant privacy requirements.
Furnishings and Equipment	Limit private office to 10 ft. x 12 ft. (3.0 m x 3.7 m). Office desk/workstation, ergonomic task chair, filing and book storage, task lighting, [wardrobe], two guest chairs.
Special Requirements	As required by organization function or mission.
Adjacencies / Location within Facility	As required by organization function or mission.
	For Use during project execution by appropriate Service
Occupancy	**Staff**
	Other
Min. net Ft^2 (m^2)	

Table B-2 Austere Open Office (Replaces Table 4-3)

Description/ Usage	Open office space for full-time staff includes systems furniture, workstation clusters, filing and storage, and informal meeting spaces.
Ceiling Height	10 ft. (3.0 m) minimum.
Windows	Provide daylighting.
Doors	Provide doors at the perimeter walls of the open office space.
Interior Construction / Built-in Equipment	Interior wayfinding and workstation signage, marker boards, tack boards, casework.
Finishes	**Walls** Painted gypsum wallboard.
	Floor Sealed concrete.
	Base Rubber wall base.
	Ceiling Exposed ceiling, painted or SAPC.
Plumbing	None required.
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	Provide multiple circuits to the space to connect systems furniture workstations to building power. Exposed wiring is [and power poles are] not allowed. Plan power capacity for a minimum of four receptacles per person, per workstation or as required.
Lighting	Provide general lighting.
Telecommunications	**Telephone** Provide one line with internal two-way communication per person. Coordinate communication distribution through the systems furniture and as required.
	Data Provide one outlet per staff unless multiple systems are required. Provide additional outlets for each printer, copier, scanner, shredder, and other similar equipment. Coordinate data distribution through the systems furniture and as required.
	CATV None required.
Security	**IDS** None required.
	ACS None required.
	CCTV As required by organization function or mission.
Acoustics	None required.
Furnishings and Equipment	For Austere Facilities, limit workstations to 6 ft. x 8 ft. (1.8 m x 2.4 m) configured for staff assignments and functionality; ergonomic task seating, guest seating, task lighting, lateral file cabinets, counter height work/storage/meeting islands for files

	and supplies. Provide worksurfaces for printers, scanners and other equipment as required to be used in the open office area.
Special Requirements	Coordinate telecom and data distribution, equipment, and connection points requirements with workstation configurations and open office layouts.
Adjacencies / Location within Facility	As required by organization function or mission.
	For Use during project execution by appropriate Service
Occupancy	**Staff**
	Other
Min. net Ft^2 (m^2)	

Table B-3 Austere Toilet Rooms (Replaces Table 4-8)

Description/ Usage	Toilet rooms are sized per code and occupancy and may be single or multiple fixture toilets. Usually part of the building core, toilets may be located within an organization's perimeter.
Ceiling Height	9 ft. (2.7 m) minimum.
Windows	None required.
Doors	Doors as required
Interior Construction / Built-in Equipment	Toilet compartment partitions and accessories, hand [and hair] dryers, built-in solid surface counters, interior signage.
Finishes	**Walls** Durable, low maintenance, water resistant materials such as porcelain tile.
	Floor Durable, low maintenance, water resistant materials such as porcelain tile, epoxy flooring.
	Base To match/coordinate with flooring.
	Ceiling Durable, humidity-resistant material, such as painted gypsum wallboard [or SAPC].
Plumbing	Sinks, toilets, urinals.
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	Provide general outlets and outlets to support required equipment such as hand dryers and hair dryers.
Lighting	Provide general and decorative lighting.
Telecommunications	**Telephone** None required.
	Data None required.
	CATV None required.
Security	**IDS** None required.
	ACS None required.
	CCTV None required.
Acoustics	As required.
Furnishings and Equipment	Waste receptacles (if not included in construction).
Special Requirements	
Adjacencies / Location within Facility	Collocate with toilets, locker rooms, fitness rooms.
	For Use during project execution by appropriate Service
Occupancy	**Staff**

	Other
Min. net Ft^2 (m^2)	

Table B-4 Austere Janitor's Closet (Replaces Table 4-9)

Description/ Usage	A janitor's closet accommodates equipment and supplies for the maintenance of the toilets and building. Usually part of the building core, it may be located within an organization's perimeter.
Ceiling Height	9 ft. (2.7 m) minimum.
Windows	None required.
Doors	Doors as required
Interior Construction / Built-in Equipment	Mop rack and shelving, interior signage.
Finishes	**Walls** Durable, low maintenance, water-resistant materials such as fiberglass reinforced wall panel, stainless steel, or porcelain tile.
	Floor Durable, low maintenance, water-resistant materials such as porcelain tile, epoxy flooring.
	Base To match/coordinate with flooring.
	Ceiling Durable, humidity-resistant material such as painted gypsum wallboard [or SAPC].
Plumbing	Mop basin, [Utility sink].
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	Provide general outlets and outlets to support required equipment.
Lighting	Provide general lighting.
Telecommunications	**Telephone** None required.
	Data None required.
	CATV None required.
Security	**IDS** None required.
	ACS None required.
	CCTV None required.
Acoustics	As required.
Furnishings and Equipment	Waste receptacles (if not included in construction).
Special Requirements	May be incorporated inside toilets or locker rooms as required.
Adjacencies / Location within Facility	Collocate with toilets, locker rooms, shower rooms.
	For Use during project execution by appropriate Service
Occupancy	**Staff**

	Other
Min. net Ft^2 (m^2)	

Table B-5 Austere Classroom/Training Room (Replaces Table 4-17)

Description/ Usage	Enclosed conference or training space for 30-50 people for flexible arrangements of conference and classroom settings. May be used for extended or daylong meetings, ceremonies, or distance learning.
Ceiling Height	10 ft. (3.0 m) minimum.
Windows	Not required.
Doors	Door(s) with minimum 35 STC rating or as required.
Interior Construction / Built-in Equipment	Provide marker boards, tack boards, Projection [surfaces,] [screens,] Built-in casework for equipment or buffet; Interior signage.
Finishes	**Walls** Painted gypsum wallboard. Provide partitions that extend from the finished floor to the structure above. Provide acoustical insulation in the partitions to achieve a minimum 50 STC rating.
	Floor Sealed concrete.
	Base Rubber wall base.
	Ceiling Exposed ceiling, painted or SAPC.
Plumbing	None required.
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	Provide general outlets and outlets to support the required equipment. May require floor receptacles to accommodate power requirements at the conference table.
Lighting	Provide multiple lighting solutions to include general lighting, accent lighting, and dimmable lighting.
Telecommunications	**Telephone** Provide one line with internal two-way communication, or as required. May require floor receptacles to accommodate telephone requirements at the conference table.
	Data Provide for computer, projection, flat monitor, or lectern connectivity as required. May require floor-mounted receptacles to accommodate data requirements at the conference table.
	CATV As required by organization function or mission.
Security	**IDS** None required.
	ACS None required.
	CCTV None required.
Acoustics	Provide STC 45 or greater.
Furnishings and Equipment	FF&E Package: Modular conference tables to be configured for conference, seminar, or classroom settings, with power and data connectivity, seminar chairs or swivel conference seating [upholstered, flexible backs, casters], and mobile marker boards. AV package: Flat screen monitors, projectors, screens, VTC systems, smart lecterns, or as required.

Special Requirements	Presentation or VTC functions, instructional or distance learning, power and data connectivity.
Adjacencies / Location within Facility	As required for organization function or mission.
	For Use during project execution by appropriate Service
Occupancy	**Staff**
	Other
Min. net Ft^2 (m^2)	

Table B-6 Austere General Filing and Storage Room (Replaces Table 4-22)

Description/ Usage	Storage of files, supplies, and equipment. Provide a separate lockable room for storage of sensitive or high-value equipment or archives.
Ceiling Height	9 ft. (2.7 m) minimum.
Windows	None required.
Doors	Doors with passage lock [access control].
Interior Construction / Built-in Equipment	Interior signage, plastic laminate-clad wall and base cabinets with counters.
Finishes	**Walls** Painted gypsum wallboard as required, depending on the agency and the level of security required.
	Floor Sealed concrete.
	Base Rubber wall base.
	Ceiling Exposed ceiling, painted or SAPC.
Plumbing	None required.
HVAC	As required.
Fire Protection and Life Safety	As required.
Power	Provide general outlets.
Lighting	Provide general lighting.
Telecommunications	**Telephone** None required.
	Data None required.
	CATV None required.
Security	**IDS** None required.
	ACS None required.
	CCTV None required.
Acoustics	None required.
Furnishings and Equipment	Open utility shelving, file cabinets, or specialized storage systems as required by organization function and mission.
Special Requirements	Additional structural support for concentrated loads. Access control depending on security level.
Adjacencies / Location within Facility	As required by organization function and mission.
	For Use during project execution by appropriate Service
Occupancy	**Staff**
	Other

Min. net Ft^2 (m^2)

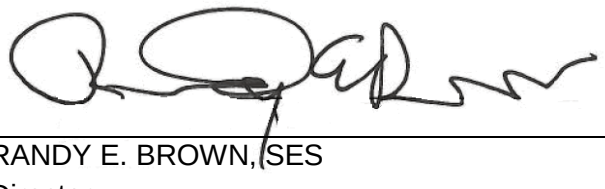
FOREWORD

Facilities Criteria (FC) provide functional requirements (i.e., defined by users and operational needs of a particular facility type) for specific DoD Component(s), and are intended for use with unified technical requirements published in DoD Unified Facilities Criteria (UFC). FC documents are applicable only to the DoD Component(s) indicated in the title, and do not represent unified DoD requirements. Differences in functional requirements between DoD Components may exist due to differences in policies and operational needs.

All construction outside of the United States is also governed by Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA), and in some instances, Bilateral Infrastructure Agreements (BIA). Therefore, the acquisition team must ensure compliance with the most stringent of the FC, the SOFA, the HNFA, and the BIA, as applicable.

Because FC documents are coordinated with unified DoD technical requirements, they form an element of the DoD UFC system applicable to specific facility types. The UFC system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and is applicable to the Military Departments, Defense Agencies, and the DoD Field Activities. The UFC System also includes technical requirements and functional requirements for specific facility types, both published as UFC documents and FC documents.



FCs are living documents and will be periodically reviewed, updated, and made available to users as part of the Services' responsibility for providing criteria for military construction. Headquarters, U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering Command (NAVFAC), and the Air Force Civil Engineer Center (AFCEC) are responsible for administration of the UFC system. Defense agencies should contact the preparing service for document interpretation and improvements. Technical content is the responsibility of the cognizant DoD working group. Send recommended changes with supporting rationale to the respective Service proponent office by the following electronic form: Criteria Change Request. The form is also accessible from the Internet site listed below.

FCs are effective upon issuance and are distributed only in electronic media from the following source:

- Whole Building Design Guide web site http://dod.wbdg.org/.

Refer to UFC 1-200-01, *General Building Requirements*, for implementation of new issuances on projects.

Air Force Civil Engineer Center

FACILITIES CRITERIA (FC)
NEW SUMMARY SHEET

Document: FC 4-610-04F, *Air Force Legal Facilities*

Superseding: *Air Force Base Legal Facilities Design Guide*

Description: This FC provides requirements for planning, programming, designing, and constructing legal facilities. The information in this FC applies to the design of all new construction projects, to include additions, alterations, and renovation projects in the continental United States (CONUS) and outside the continental United States (OCONUS). It also applies to the procurement of design/build services for the above-noted types of projects. Alteration and renovation projects should update existing facilities to meet the guidance and criteria within budgetary constraints.

Reasons for Document: This FC is the initial release to establish minimum requirements for a variety of different legal facility types. It provides the criteria for determining appropriately sized, flexible, cost-optimized, durable, quality-designed facilities on a life cycle basis to support the mission.

Impact: This FC will facilitate and standardize the design of legal facilities throughout the Air Force. It will provide more complete and consistent project requirements, expedite the programming and design of facilities, and reduce initial design cost.

Unification Issues: None.

CHAPTER 1 INTRODUCTION

1-1 GENERAL INFORMATION

This standard facility prototype design criteria was developed to assist Air Force planners to prepare and validate DD Form 1391 requirements and to assist architect and engineering (A-E) design professionals with approved project-specific design requirements. It is a source of basic programming and functional information for legal facilities. This standard is consistent with Air Force Corporate Facility Standards (AFCFS) and Unified Facilities Criteria (UFC). This standard, in conjunction with the AFCFS, is intended to define Air Force expectations for project programming and A-E design decisions.

The standard facility prototype design program defines consistent facility requirements across the Air Force enterprise to expedite delivery of a facility. This standard was designed in compliance with AFMAN 32-1084. The objective is to deliver appropriately sized, flexible, cost-optimized, durable, and quality-designed facilities on a life cycle basis to support the Air Force mission.

The mission of the Air Force Judge Advocate General's Corps (AFJAGC) is to deliver professional, candid, independent counsel and full-spectrum legal capabilities to the command and the warfighter. In so doing, the AFJAGC ensures the lawful accomplishment of the Air Force mission, the discipline of the force, the defense of Air Force resources, and the preservation of prerogatives for Air Force leaders. In addition, the AFJAGC represents accused Airmen, supports victims' rights, and assists Airmen and their families in resolving personal legal problems. Legal canons of ethics drive confidentiality for attorney-client discussions, which in turn necessitate private offices with higher than normal sound transmission ratings. Additionally, legal facilities should evince a professional image, reflective of the rule of law.

1-2 GENERAL BUILDING REQUIREMENTS

Comply with UFC 1-200-01. UFC 1-200-01 provides applicability of model building codes and government-unique criteria for typical design disciplines and building systems, as well as accessibility, anti-terrorism (AT), security, high-performance and sustainability requirements, and safety. Use this Facilities Criteria (FC), in addition to UFC 1-200-01 and the UFCs, and government criteria referenced therein.

Lighting systems must meet ASHRAE 90.1. Refer to UFC 1-200-02 for the publication year of ASHRAE. Note that the requirements of this UFC refer to ASHRAE 90.1-2010. When UFC 1-200-02 adopts a newer publication year for ASHRAE 90.1, it will have precedence over these FC requirements.

1-3 REFERENCES

Appendix A contains a list of related documents and references to be used in conjunction with this FC. The publication date of the code or standard is not included. In general, use the latest available issuance of the reference, unless otherwise noted.

1-4 INSTRUCTIONS

The standard facility prototypes in this FC were developed by determining personnel counts, allowable/authorized space/room sizes, adjacency diagrams between the functional spaces, and overall facility space requirements. It establishes Air Force criteria for the facility type. Use these criteria, in conjunction with other Air Force policies and regulations, such as Air Force departmental publications (e.g., AFIs, AFMANs) and UFCs, when programming and designing this facility type.

Supplement this FC with a thorough review by individual program managers and operations staff.

1-4.1 Standard Facility Prototype Tools

These standard facility prototypes consist of three parts to be used by programmers and A-Es:

- Facilities criteria for standard prototype (this FC document)
- Interactive programming sheet
- Facility Building Information Modeling (BIM) drawings

1-4.2 Facilities Criteria

The facilities criteria consist of three primary components:

- Space standards for common facilities
- Composite facility adjacency diagrams/composite floor plans
- Module components with associated room data sheets

1-4.2.1 Notional Sites

The notional site plan diagrams demonstrate key site development criteria. Site plan diagrams for a base legal facility and an Area Defense Counsel (ADC) office are included to demonstrate key site development criteria since they are legal facility types that might be stand-alone facilities. They are not site-specific solutions, but represent the land requirements to construct these facilities and include associated AT standoff distances and parking. Utilization of existing or shared parking is allowable and may reduce the total acreage required for the facilities. Adapt the requirements to the specific site and location, and comply with the applicable Installation Development Plan (IDP) and Area Development Plan (ADP) for facility siting.

1-4.2.2 Composite Office Adjacency Diagrams

The adjacency diagrams identify the proximity requirements between major standard spaces and ways to conceptually assemble them into functional composite areas. They are not intended to be definitive building designs.

1-4.2.3 Composite Notional Floor Plans

The composite floor plans are conceptual solutions that illustrate functional user and adjacency requirements. Plan variations may be rotated, flipped, or reversed to fit the actual site. A thorough compliance check of all other applicable criteria is required, even when using the conceptual solutions provided in this FC.

1-4.2.4 Flexibility/Adjustments

Utilization of the provided modules is highly recommended to maintain functional relationships, adjacencies, and allowed program areas. Modules contain fixed attributes that are essential to functional requirements. Modules may be rotated, flipped, or reversed to accommodate an overall composition or site issue. When the modules cannot be arranged to produce a constructible floor plan due to site constraints, their proportions may be adjusted to create a constructible plan. Manipulating the module shape must not result in an overall increase in square feet and/or reduce the functionality of any module or the required adjacencies in the composite plan.

Some modules are linked to space requirements that increase or decrease in size based on the unit's Unit Manning Document (UMD) staffing and typical equipment for that particular mission. In these cases, increase or decrease the size of the module or number of offices to match the revised scope calculation. This may sometimes require minor adjustments in other adjacent modules so they properly fit together to create a constructible facility floor plan. Spaces must comply with any critical dimensions on module plans. Manipulate as few modules as possible to create a constructible facility. The resulting composite plan must respect the established module's adjacencies and must not exceed the authorized project scope.

1-4.2.5 Room Data Sheets

Specific requirements for each room, space, or area are provided on room data sheets located in either the space standards or following in their respective group discussion. Information contained on the data sheets defines the functional and physical requirements for each of the spaces within the facility or office type.

1-4.3 Programming Sheets

This tool is provided in two formats. A PDF programming sheet is provided in each Judge Advocate (JA) unit section, primarily as a reference, and reflects the baseline standard facility program. An additional interactive programming sheet provides a tool for planners and programmers. It allows the input of authorized personnel positions and special purpose spaces. Updated inputs are automatically calculated and provide new

required square footage for each space and the overall facility/office size. A link is provided in Appendix B for access to the interactive tool.

1-4.4 Additions and Alterations

For additions and alterations to existing facilities, use the adjacencies sizing/scope and detailed requirements in the adjacency diagrams and room data sheets to the maximum extent possible. The functionality and adjacency of the standard spaces are still valid, but may require some manipulation to fit into existing spaces. This standard may be slightly modified to accommodate the existing structure. The A-E shall determine the most efficient means to balance the placement of modules within existing spaces or as a facility addition.

1-4.5 Sustainability

Meet the requirements of UFC 1-200-02 and achieve green building certification in accordance with the current Air Force Sustainable Design and Development (SDD) Implementing Guidance.

CHAPTER 2 GENERAL FACILITIES

2-1 GENERAL FACILITIES OVERVIEW

The majority of legal offices coexist in buildings with other occupants. However, if an office is a stand-alone facility, it is typically a one-story structure. The most common stand-alone facilities are base legal and Area Defense Counsel (ADC) offices.

AFCFS: Consult the AFCFS to determine exterior quality standards for this facility group. This standard facility prototype is considered a Group 1 hierarchy.

Facility Users/Occupants: These facilities are operated by active duty, civilian, National Guard, and Reserve military personnel. The number of occupants varies from office to office; thus, the design is based on the UMD for the specific unit, counting active duty military and civilian personnel.

Operational Aspects: Hours of operation for legal offices are driven by workload volume and often exceed standard operating hours. In the case of ADCs and SVCs, attorneys routinely meet with clients after normal hours to accommodate client schedules.

2-1.1 Professional Image

The most visible symbols of the rule of law in the Air Force are legal facilities. Trial courtrooms are the soul and public face of the military justice system and must promote respect for the tradition and purpose of the law and judicial process. To emphasize legal professionalism, courtroom designs must express solemnity, stability, integrity, and fairness. Legal facilities need to reflect the dignity of the profession and respect for the rule of law. Finish interiors so that legal job performance, mission accomplishment, and commander and client satisfaction are optimized. Use materials that invoke a sense of permanence and have consistency. Select colors that are subdued and complement the materials used. Use architectural elements that are proportional and arranged in hierarchy to denote order. Choose finishes that are durable and easy to maintain. The following key planning drivers are critical to the success of this FC.

2-1.2 Confidentiality

An Air Force attorney must maintain the confidentiality of all information relating to the representation of a client, in accordance with AFI 51-110, Atch 2, Rule 1.6; the American Bar Association Model Rules of Professional Conduct; and the rules of professional conduct in any state or territorial bar in which the attorney is licensed. These rules are mandatory, and violations can result in the loss of the attorney's professional license and/or designation to practice law in the Air Force. In addition, violations place the Air Force at risk of being sued or of losing the confidence of Congress and the public.

Confidentiality applies to any conversation with a client about the subject of the representation, any related interviews or discussions with others, and any associated

work by the attorney. Clients include personal clients, such as legal assistance clients (for base-level and other qualified legal assistance attorneys), defense clients (for defense counsel), sexual assault victims (for SVCs), and disability clients (for Office of Airman's Counsel attorneys), as well as government officials. Whenever an organization such as the Air Force is the client, confidentiality is required for authorized officials acting on behalf of the client. Conversations about legal matters with clients, prospective clients, and others must be kept completely confidential, unless the client gives informed consent for the release of information to other parties. The same protection applies to the attorney's work product (e.g., notes, observations, research, and written opinions). Materials must be kept confidential and properly safeguarded from unauthorized viewing, which affects the type of storage provided in the office.

In addition to the need to protect confidential information, Air Force attorneys are called upon, more than members of almost any other career field, to review and advise on information protected from release or disclosure by other laws, rules, or regulations. For instance, attorneys often handle matters governed by the Privacy Act, the Procurement Integrity Act, the Freedom of Information Act, the Health Insurance Portability and Accountability Act, or the Safety Privilege. They regularly advise commanders, first sergeants, and supervisors on military justice matters, misconduct by subordinates, and problems in the workplace. They commonly review and discuss investigative reports (prepared by the Air Force Office of Special Investigations [AFOSI], Security Forces, or other investigators), pre-decisional data, and other highly sensitive or classified material. In addition, they are involved in advising on the legality of proposed governmental actions, consulting on plans and ways ahead, and formulating litigation strategy or the defense of governmental actions or decisions. All of these activities require safeguarding discussions and protected material so they remain solely between those with the need to know. Even other attorneys in the same office frequently fall outside the bounds of those who should overhear or be privy to such exchanges, or view the information.

Air Force attorneys are regularly involved in the above activities. In addition, some Air Force paralegals routinely conduct client interviews, prepare witnesses, and counsel victims. As such, they require closed private office space with sufficient sound attenuation so in-person and telephone conversations remain confidential. This arrangement also provides a critical layer of protection for attorney work product. Furthermore, attorneys have the ethical responsibility to communicate frequently with clients (AFI 51-110, Atch 2, Rule 1.4). Not having a private office would place an unreasonable burden on an attorney to find a suitable location to conduct these recurrent communications. The same would apply to paralegals with routine confidential responsibilities.

Finally, the very nature of an Air Force legal office underscores the need for private offices for attorneys. Legal offices are a hub of activity wherever they are located. They are a bustling intersection of clients, defense counsel, accused, victims, commanders, first sergeants, senior officials, and others. In order to keep client business between the attorney and client, Air Force attorneys must have separate offices, properly insulated, to safeguard the work they do and comply with their ethical obligations. Failure to do so

jeopardizes client confidentiality, the attorneys' ability to practice law, and mission effectiveness.

The nature of the work performed determines the levels of privacy in designing an office. A low level of privacy would involve an open reception area or low-walled workstation. A medium level would apply to a workstation with higher walls so it is visually separated from a corridor or reception area. A high level of privacy would be a space, such as a private office or suite, that is acoustically treated so conversations or discussions are not distinguishable from the travel way or a neighboring office.

2-1.3 Room Interiors and Finishes

Select office furniture from Air Force Furniture Commodity Council mandatory sources. Interior finish standards are based on a limited range (see Figure 2-1) used to select the appropriate type of furnishings. Select commercial-grade furniture that is durable, low-maintenance, and utilizes colors compatible with other interior features. The following definitions describe each level of finish.

Level 1: Use durable, cost-effective finishes that are easy to clean and maintain, with resilient or tile flooring, painted gypsum board walls, plastic laminate-clad millwork, and storage units (e.g., shelving, file cabinets). This finish is considered typical for "back-of-house" areas.

Level 2: Use commercial-grade carpet on floors, with painted gypsum board walls; include some accent areas that provide a professional atmosphere. In open office environments, use panel-supported or desk-based systems furniture that provides flexibility. In private offices, provide freestanding, executive wood-finish desks and credenzas.

Level 3: Use a higher grade commercial carpet or other floor types of finish; limited use of wood paneling and wainscoting is allowed. Use freestanding executive wood furniture in private offices or higher-level leadership suites.

Figure 2-1 lists the typical JA spaces included in each of the finish categories and applies to the standard spaces discussed later in this FC. The exceptions to these standards are described under the individual JA group heading, if and when they occur. In those instances where support spaces, such as a copy area or storage room, are very small, match the finishes with the adjacent areas. Match hallways leading to individual spaces with the finish level of whichever space is considered most significant (e.g., the corridor to the courtroom will have a Level 3 finish).

Figure 2-1 Interior Finishes Summary

LEVEL 1	LEVEL 2	LEVEL 3
Work room	Private office	Courtroom
Mail room	Open office area	Judge's chamber
Storage area	Reception/waiting area	AFLOA command suite
Coffee bar	Huddle room	SJA office/leadership suite
Break room	AFJAGS student lounge	Legal office conference room
	AFJAGS classroom	AFJAGS auditorium
		AFJAGS executive conference room

2-2 SPACE STANDARDS ORGANIZATION

2-2.1 General

JA offices vary in scope and mission, but share commonalities in space types, whether in freestanding buildings or as tenants in larger buildings. The following rooms/spaces occur in each legal facility and are composed of common spaces classified as either an office space or as shared support space, each scalable to specific unit requirements. All legal offices are a combination of these common types of spaces and are discussed in detail in the following pages. Included in each section are room descriptions, floor plans, and room data sheets. Chapters 3 through 9 discuss specific office requirements for each general category of legal office, as well as the directorates, divisions, and field support centers (FSC) in the Air Force Legal Operations Agency (AFLOA). Only specific space types and requirements that are unique and not standard are discussed in detail in the individual sections. However, some space requirements may require local justification during the programming and planning stages of a new construction or remodeling project.

2-2.2 Common Spaces

2-2.2.1 Offices

Eight office types are common in Air Force legal offices, along with two types of systems furniture workstations:

- A1 - General Office: Private office, due to job requirements (e.g., visiting attorney or court reporter)
- A2 - General Attorney/Instructor Office: Private office with two guest chairs and sound attenuation
- A3 - Deputy Senior Attorney Office: Private office with side table, two guest chairs, and sound attenuation
- A4 - Senior Attorney Office: Private office with conference table (seating for six), two guest chairs, and sound attenuation
- A5 - Commander Office: Large private office, for the AFLOA Commander in the Jones Building, with seating for six and sound attenuation
- A6 - General Attorney Office (Jones Building): Private office with two guest chairs and sound attenuation
- A7 - Director Office (Jones Building): Private office with small conference table (seating for four), guest chairs, and sound attenuation
- P1 - Paralegal Workstation: Standard workstation
- P2 - Paralegal Office: Private office due to job requirements (e.g., performing client interviews or witness preparation, or serving as Law Office Superintendent)
- P3 - Senior Paralegal Office: Large private office, due to job requirements (i.e., serving as MAJCOM Functional Manager or Command Paralegal)
- P4 - Large Workstation: Specifically for the Jones Building

2-2.2.2 Shared Support

Spaces shared amongst several different private offices or workstations with similar functional adjacencies, which can be centrally located within each office group and/or combined with other individual group requirements listed in paragraphs 2-2.2.3 through 2-2.2.7.

2-2.2.3 Storage Spaces

Three storage types are common in legal offices:

- Open Storage Area: In shared, open office area
- Closed Secure Area: In secured, lockable file room
- Special Storage: As required (e.g., safe or sensitive compartmented information facility [SCIF])

2-2.2.4 Waiting/Reception Area

Access control point to regulate transit from the waiting area to other areas of the legal office. Access control can include buzzer entry systems or digital locking mechanisms. Seating numbers will vary based on office requirements.

2-2.2.5 Huddle/Conference Room

Room size varies based on group requirements; usually huddle (small), medium, large, and extra-large, with seating for 6 to 45 staff members; audio visual (A/V) and video teleconferencing (VTC) capabilities are frequently provided.

2-2.2.6 Work Room

Centralized work space, to include multifunctional copier/printer/fax machine, shredders, supply storage, and work area. Larger offices may utilize small satellite copier alcoves, in addition to a centralized work room.

2-2.2.7 Coffee Bar/Break Room

Kitchenette, ranging from no seating to seating for 8 to 16, with a sink, coffee maker, microwave, and full-size refrigerator.

Table 2-1 Summary of Common Spaces

Space	Size (SF)	Symbol
General office	100	A1
General attorney/instructor office	120	A2
Deputy senior attorney office	150	A3
Senior attorney office	216	A4
Commander office	300	A5
General attorney (Jones Building)	130	A6
Director (Jones Building)	200	A7
Paralegal workstation	64	P1
Paralegal office	100	P2
Senior paralegal office	120	P3
Large workstation (Jones Building)	100	P4
Huddle room (small)	168	C1
Conference room (medium)	304	C2
Conference room (large)	450	C3
Conference room (extra-large)	600	C4
Work space (small)	60	W1
Work room (medium)	120	W2
Work room (large)	200	W3
Coffee bar	60	B1
Break room (small)	120	B2
Break room (medium)	252	B3
Break room (large)	399	B4

2-2.3 Attorney Offices

Design attorney offices with standards and guidelines that are simplified, with space allocated according to functional requirements and flexibility. This principle recognizes that fewer barriers to change, less disruption when change occurs, and lower costs in money and time can be accomplished by standardizing office sizes.

Standard attorney offices are of six main types. A1 is a small office, 100 square feet in size, with an L-shaped desk and return, two chairs for clients, and a marker board. A2, the standard attorney office, is 120 square feet in size, with similar furnishings as A1. A3 is slightly larger, 150 square feet in size, with an L-shaped desk and return, bookshelves, two chairs for clients, and a marker board. A4 is the largest office, 216 square feet in size, with an executive desk, a credenza, bookshelves, a rectangular table with seating for six, two additional chairs for clients, a flat screen monitor, and a marker board. A6 (not pictured in Figure 2-2), 130 square feet in size, is the standard attorney office in the Jones Building, with similar furnishings as A1. A7, 200 square feet in size, is the standard director office in the Jones Building, with similar furnishings as A4, except for a smaller table with seating for four. In addition to the standard offices, A5, 300 square feet in size, is unique to the AFLOA Commander in the Jones Building, with an executive desk, a conference table with seating for four, a credenza, additional chairs, and an end table.

Office walls dividing offices from other spaces must meet a Sound Transmission Class (STC) minimum rating of 50. The door and window assemblies within these walls must meet an STC rating of 45. Higher STC ratings for door and window assemblies may be specified for specific projects or spaces. Field testing and on-site verification of the assembly of the final STC ratings are required for these applications. Exterior windows must meet AT requirements.

Figure 2-2 Standard Offices

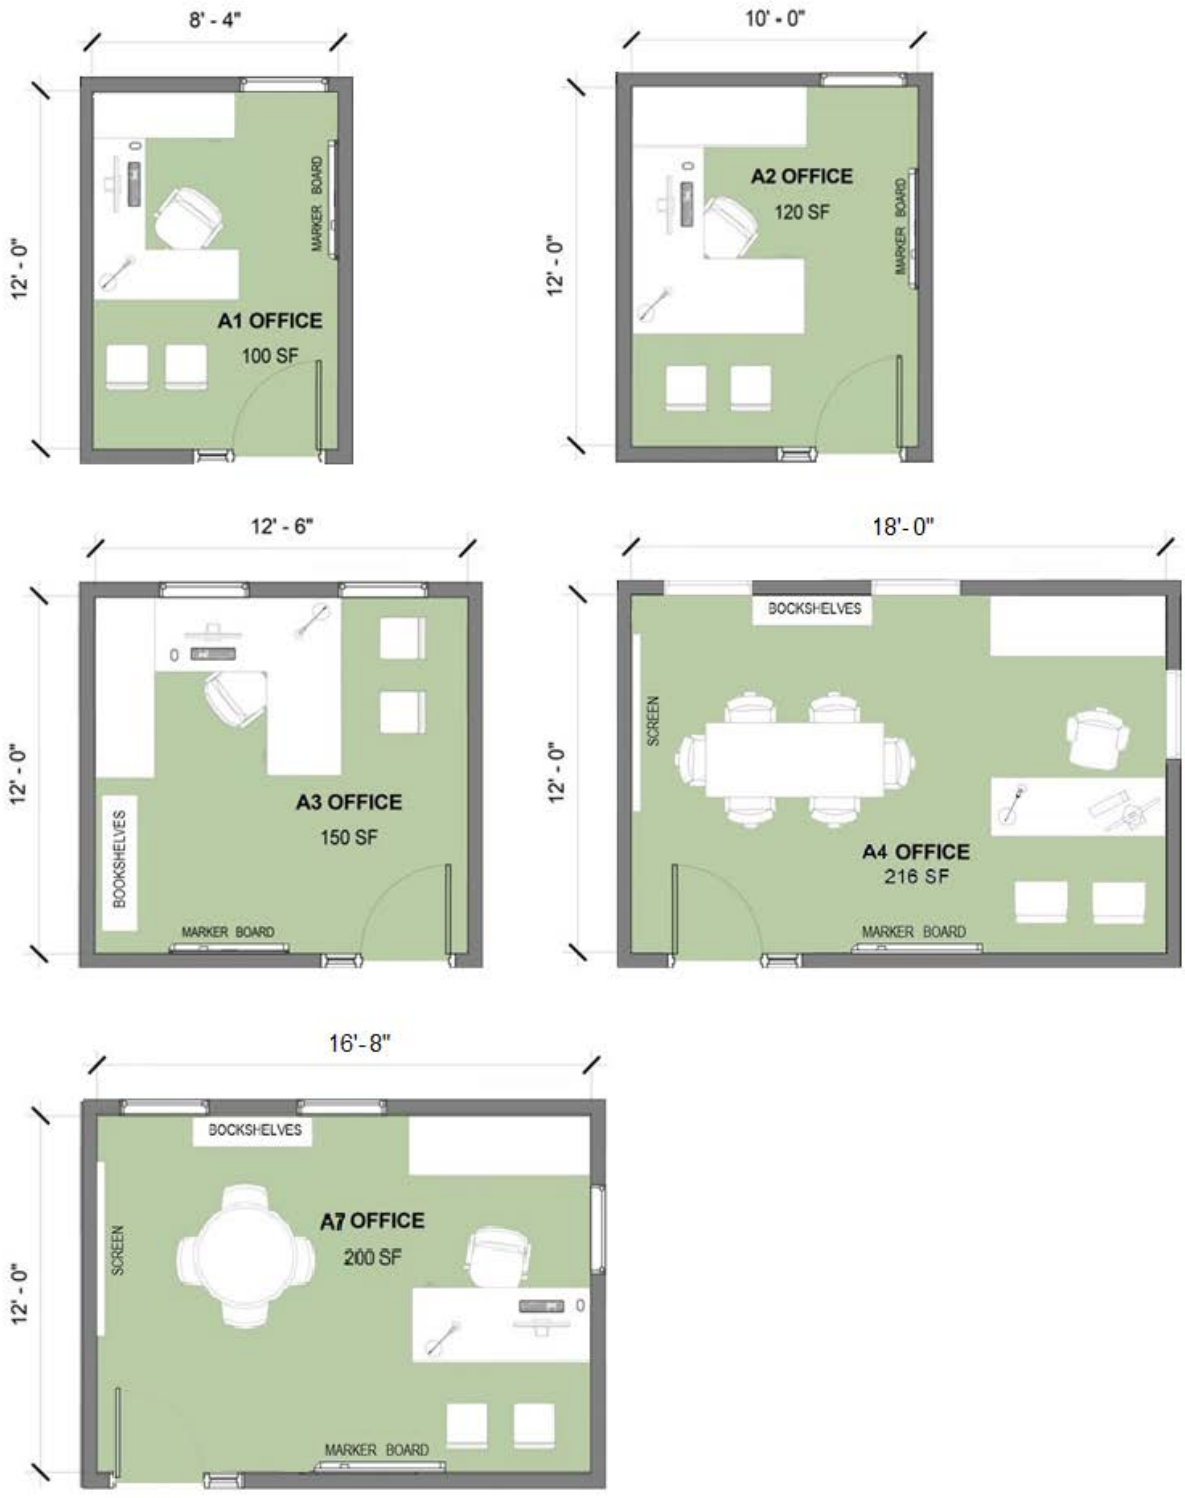

Figure 2-3 General Office Room Data Sheet

Description/Usage		A1 private office for a visiting attorney or a non-attorney with responsibilities necessitating a private office (e.g., a paralegal conducting witness interviews or a court reporter).
Ceiling Height		9'-0" minimum
Windows		Exterior insulated, AT compliant
Doors	**Type**	Hollow metal, 3' x 7'
	Security/ Hardware	Keyed lock set
	View Panels/ Kick-Plates	Side view panels
Finishes	**Walls**	Level 2
	Floor	Level 2
	Base	Level 2
	Ceiling	Level 2
Plumbing		N/A
HVAC		Per UFC 3-410-01
Fire Protection		Wet or dry pipe sprinkler system, per UFC 3-600-01
Power		Per UFC 3-520-01
Lighting		Per UFC 3-530-01
Communication	**Telephone**	One per desk
	Data	NIPR
	CCTV	N/A
	CATV	N/A
	Security	Duress alarm
Acoustics		Per UFC 3-450-01, for noise control. When the office is to be used routinely for legally confidential discussions, it requires additional acoustical privacy. In that case, floors, partitions, and ceilings meet or exceed the STC 50 requirement, and windows and doors meet the STC 45 requirement.
Furnishings Fixtures & Equipment (FF&E)		Provide one 6' wood-finish, L-shape systems furniture, with return and phone/data connections. Include one swivel chair, two straight visitor chairs, and marker board.
Special Requirements		When the office is to be routinely used for confidential discussions, extend partitions between the structural floor slabs and enhance the space with acoustical insulation to decrease sound transmission. STC requirements are for the entire assembly and not individual components (door, window, etc.).

Figure 2-4 Attorney Office Room Data Sheet

Description/Usage		A2, A3, and A6 (in the Jones Building) are private attorney offices. A2 can also be used as an instructor's office at the AFJAG School.
Ceiling Height		9'-0" minimum
Windows		Exterior insulated, AT compliant
Doors	**Type**	Wood, 3' x 7'
	Security/ Hardware	Keyed lock set
	View Panels/ Kick-Plates	Side view panels
Finishes	**Walls**	Level 2
	Floor	Level 2
	Base	Level 2
	Ceiling	Level 2
Plumbing		N/A
HVAC		Per UFC 3-410-01
Fire Protection		Wet or dry pipe sprinkler system, per UFC 3-600-01
Power		Per UFC 3-520-01
Lighting		Per UFC 3-530-01
Communication	**Telephone**	One per desk
	Data	NIPR, SIPR (as required)
	CCTV	N/A
	CATV	N/A
	Security	Duress alarm
Acoustics		Floors, partitions, and ceilings meet or exceed the STC 50 requirement. Windows and doors meet the STC 45 requirement.
Furnishings Fixtures & Equipment (FF&E)		Provide 6' wood-finish systems furniture with computer connections. Include 1 swivel chair, 2 straight visitor chairs, a whiteboard, and a bookshelf (for A3).
Special Requirements		Offices require additional acoustical privacy; extend partitions between the structural floor slabs and enhance the space with acoustical insulation to decrease sound transmission. STC requirements are for the entire assembly and not just individual components (door, window, etc.).

Figure 2-5 Senior Attorney Office Room Data Sheet

Description/Usage		A4 is a large private office for the senior attorney, styled for leadership functions, with upgraded finishes. A7 is a similar office for AFLOA directors in the Jones Building.
Ceiling Height		9'-0" minimum
Windows		Exterior insulated, AT compliant
Doors	**Type**	Wood, 3' x 7'
	Security/ Hardware	Keyed lock set
	View Panels/ Kick-Plates	Side view panels
Finishes	**Walls**	Level 3
	Floor	Level 3
	Base	Level 3
	Ceiling	Level 3
Plumbing		N/A
HVAC		Per UFC 3-410-01
Fire Protection		Wet or dry pipe sprinkler system, per UFC 3-600-01
Power		Per UFC 3-520-01
Lighting		Per UFC 3-530-01
Communication	**Telephone**	One per desk
	Data	NIPR, SIPR (as required)
	CCTV	Yes
	CATV	N/A
	Security	Duress alarm
Acoustics		Floors, partitions, and ceilings meet or exceed the STC 50 requirement. Windows and doors meet the STC 45 requirement.
Furnishings Fixtures & Equipment (FF&E)		For A4, provide a 6' free-standing wood executive desk, credenza, a leather swivel chair, 2 leather visitor chairs, and a 30" x 72" rectangular wood table with 6 leather swivel chairs. Include a bookshelf, marker board, flat screen monitor, and lateral file storage. A7 has the same furnishings, except for a circular table seating 4.
Special Requirements		Offices require additional acoustical privacy; extend partitions between the structural floor slabs and enhance the space with acoustical insulation to decrease sound transmission. STC requirements are for the entire assembly and not just individual components (door, window, etc.).

2-2.4 Paralegal Work Spaces

A paralegal is someone trained and certified in legal matters and procedures who assists attorneys in practicing law. Paralegal work spaces are divided into two types – workstations and offices – depending on the work assigned. P1 is a 64-square-foot workstation with an L-shaped desk and rear work surface. P4 is a 100-square-foot workstation, limited to the Jones Building, with additional space for seats or cabinets. Individual workstations are typically grouped together in an open office arrangement and have specialized visual and acoustical considerations. The height of the partitions depends on Air Force corporate standards. Integrate the workstation design with power, communications, and other building systems. P2 is a private office (same as the A1 office) required for certain responsibilities (e.g., performing client interviews, preparing witnesses, counseling victims, or serving as law office superintendent [LOS]). P3 is a private office for major command (MAJCOM) functional managers, with the same requirements as the A2 office.

Figure 2-6 Paralegal Work Spaces

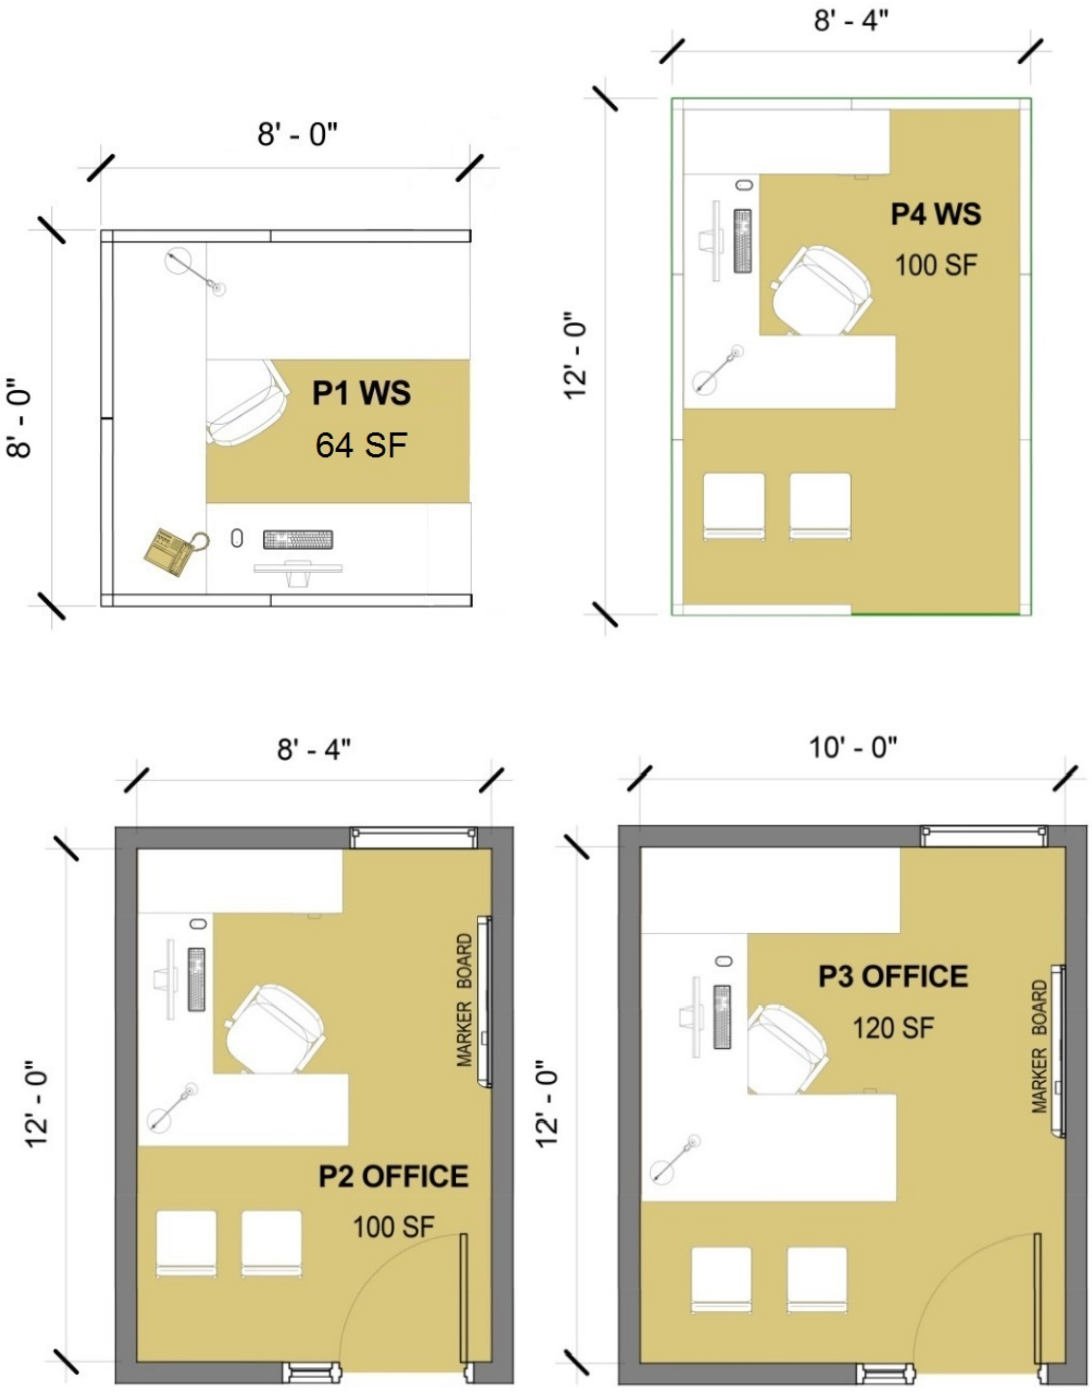

Figure 2-7 Paralegal Workstation Room Data Sheet

Description/Usage		An open office space designed to utilize furniture system components that delineate space and provide visual privacy.
Ceiling Height		9'-0" minimum
Windows		N/A
Doors	**Type**	N/A
	Security/ Hardware	N/A
	View Panels/ Kick-Plates	N/A
Finishes	**Walls**	Level 2
	Floor	Level 2
	Base	Level 2
	Ceiling	Level 2
Plumbing		N/A
HVAC		Per UFC 3-410-01
Fire Protection		Wet or dry pipe sprinkler system, per UFC 3-600-01
Power		Per UFC 3-520-01
Lighting		Per UFC 3-530-01
Communication	**Telephone**	One per desk
	Data	NIPR
	CCTV	N/A
	CATV	N/A
	Security	N/A
Acoustics		Per UFC 3-450-01, for noise control
Furnishings Fixtures & Equipment (FF&E)		For P1, provide modular systems furniture with computer connection capabilities, demountable partitions with fabric walls, and a swivel chair. Include work surfaces, storage, lighting, and electrical and communications distribution. Maximize storage in the furniture system design; include task lighting for each workstation. Integrate power, data, and communications with the furniture system panel.
Special Requirements		For P2 and P3, see room data sheets for General Office (Figure 2-3) and A2 Attorney Office (Figure 2-4), respectively.

2-2.5 Conference Rooms

Conference rooms are areas used for staff meetings, training, teleconferences, witness interviews, meetings with commanders and investigators, and other activities. Conference space requires flexibility, durable finishes to anticipate maximum use, and integrated utility lines, such as voice, data, and power, to accommodate a variety of multimedia presentations and VTCs, when required. Conference rooms are divided into four types. C1 is a small space (huddle room) with seating for six. C2 is the standard conference room, with seating for nine at the table. C3 is a larger room, with seating for 15 at the table. Both C2 and C3 can double as library space, if required. C4 is the largest room, with seating for 21 at the table. When not in use for large gatherings, C4 can be divided into two smaller meeting spaces. C2, C3, and C4 are large enough to accommodate VTC presentations, a lectern, and flags for an award ceremony, as well as bookshelves, file storage, or secondary seating along the walls.

Figure 2-8 Conference Rooms

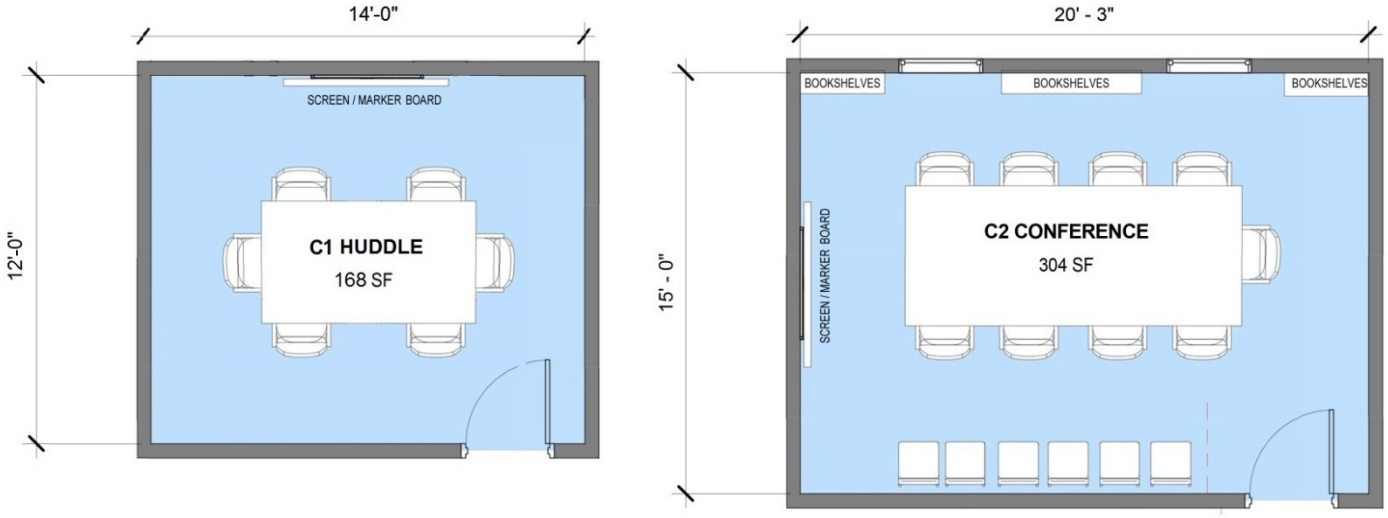

Figure 2-8 Conference Room (continued)

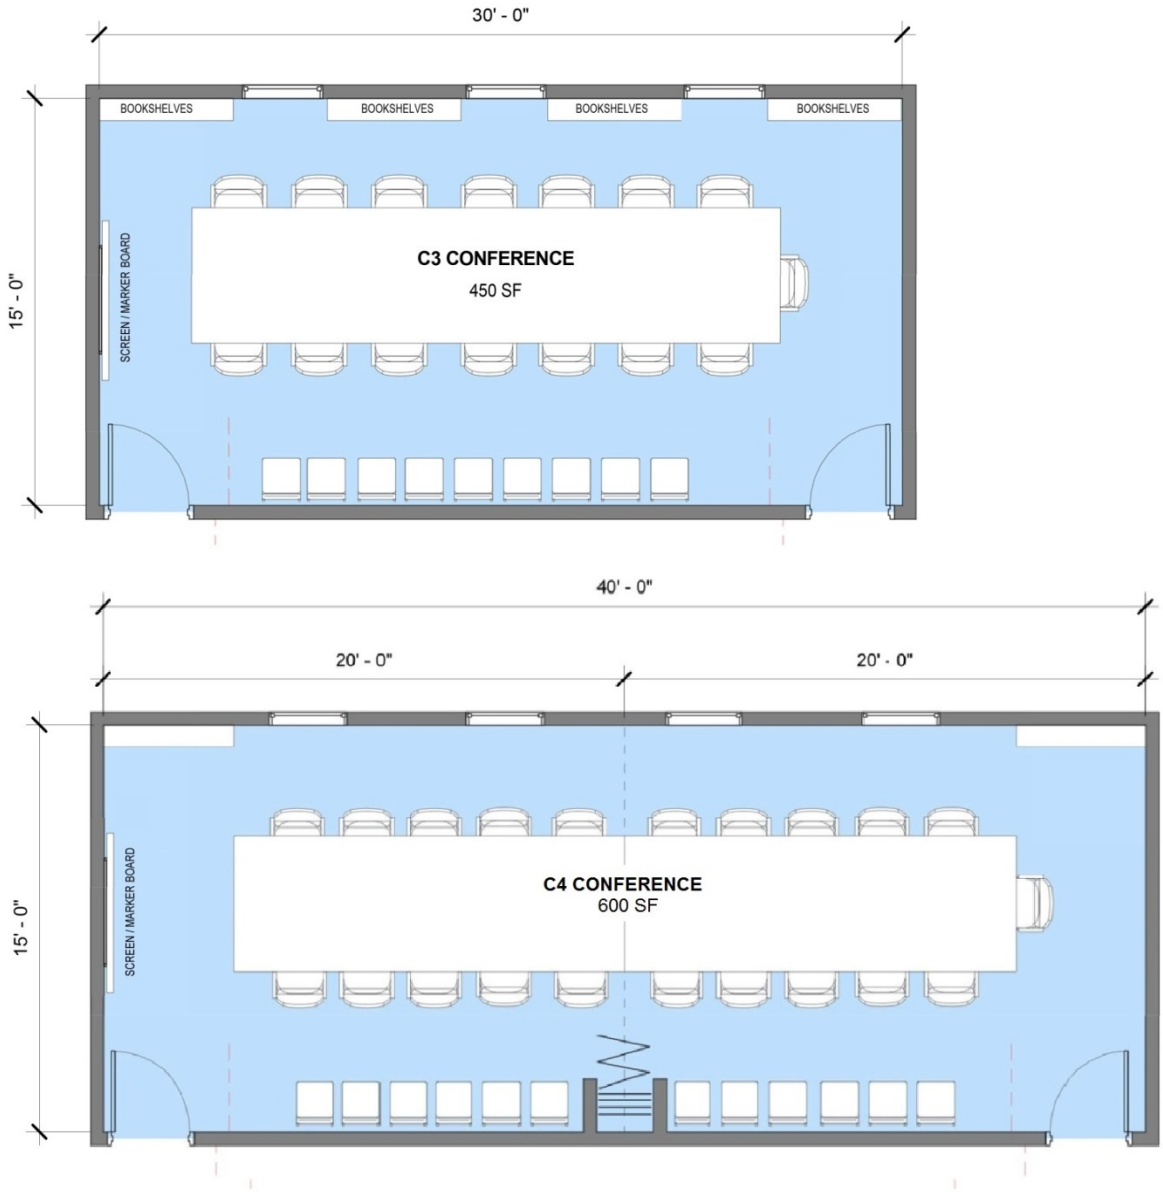

Figure 2-9 Conference Room Data Sheet

Description/Usage		Meeting space that serves both senior staff and office personnel for a variety of meetings. Size varies based on the office UMD.
Ceiling Height		9'-0" minimum
Windows		Exterior insulated, AT compliant
Doors	**Type**	Wood, 3' x 7'
	Security/ Hardware	Keyed lock set
	View Panels/ Kick-Plates	N/A
Finishes	**Walls**	Level 3
	Floor	Level 3
	Base	Level 3
	Ceiling	Level 3
Plumbing		N/A
HVAC		Per UFC 3-410-01
Fire Protection		Wet or dry pipe sprinkler system, per UFC 3-600-01
Power		Per UFC 3-520-01
Lighting		Per UFC 3-530-01
Communication	**Telephone**	One conference-ready phone
	Data	NIPR, SIPR (as required)
	CCTV	N/A
	CATV	N/A
	Security	N/A
Acoustics		Floors, partitions, and ceilings meet or exceed the STC 50 requirement. Windows and doors meet the STC 45 requirement.
Furnishings Fixtures & Equipment (FF&E)		For C1, include 30" x 72" rectangular table; for C2, include 5 'x 12' table; for C3, include 5' x 22' table; for C4 include two 5 'x 13' tables. For C2, C3, and C4, provide wall-mounted video monitor, VTC capable (when required), swivel chairs for number of seats at table, chairs for secondary seating along the walls. Include bookshelves and file storage if used for other purposes.
Special Requirements		Room STC requirements are for the entire assembly and the individual components (door, window, etc.). Enclose the conference room with partitions that extend from the finished floor to the structure above. Provide clearance around conference table, with extra seating along at least one wall.

2-2.6 Work Rooms

Work rooms can accommodate a variety of office systems, such as printer/copiers, facsimile machines, scanners, and shredders, as well as files, office supplies, safes, and actual work spaces. There are three primary types: a small, open work space and two larger, scalable spaces that can be enlarged to meet specific office requirements. W1 includes space for a copier, a supply cabinet, and two file cabinets. W2 is a standard-size work room, with space for one copier, supply storage, and a countertop work space. W3 is sized for larger offices and includes space for two copiers, supply material storage, two to four lateral file cabinets, and a work table area.

Figure 2-10 Work Rooms

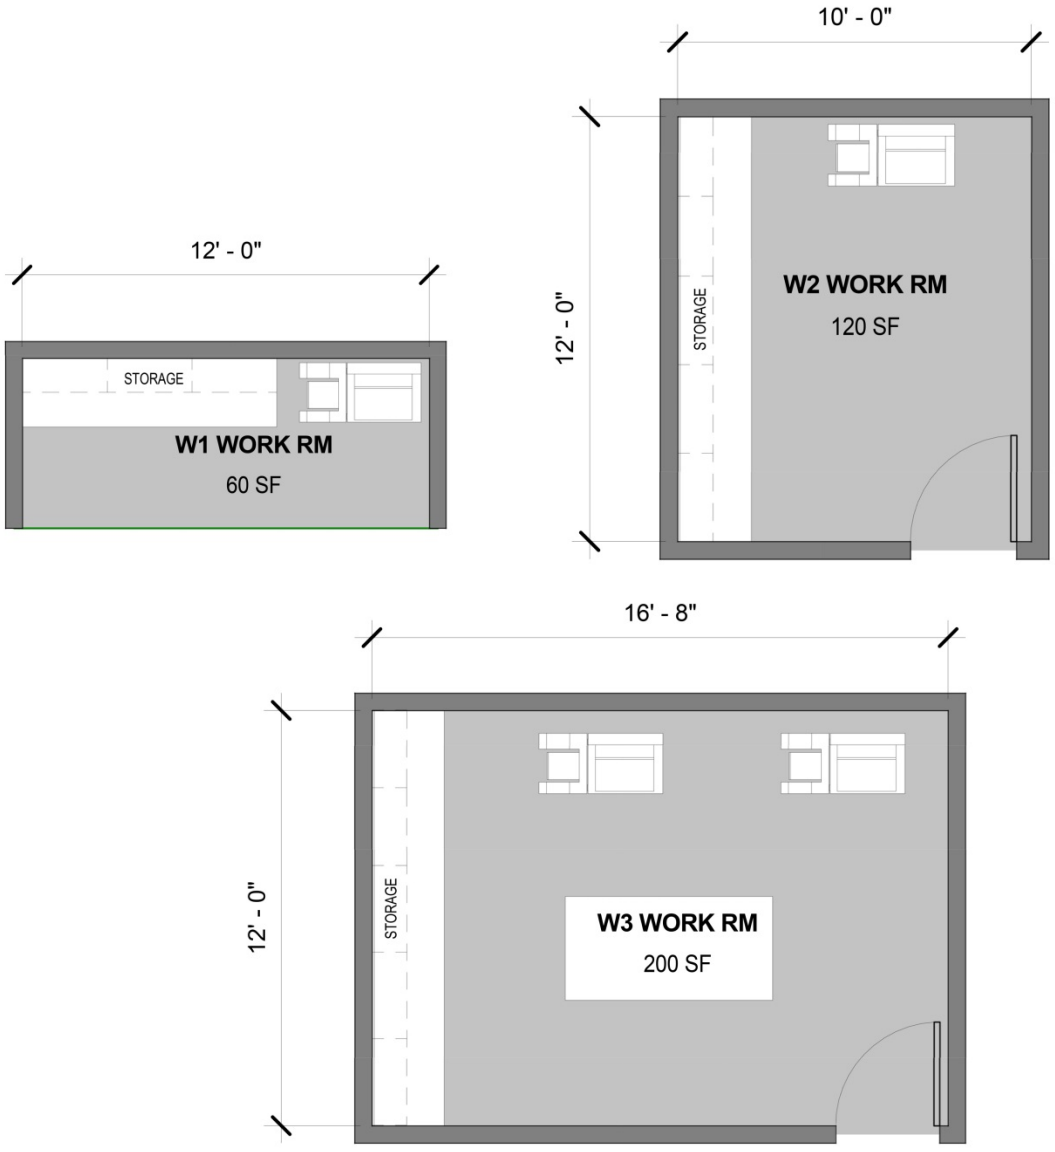

Figure 2-11 Work Room Data Sheet

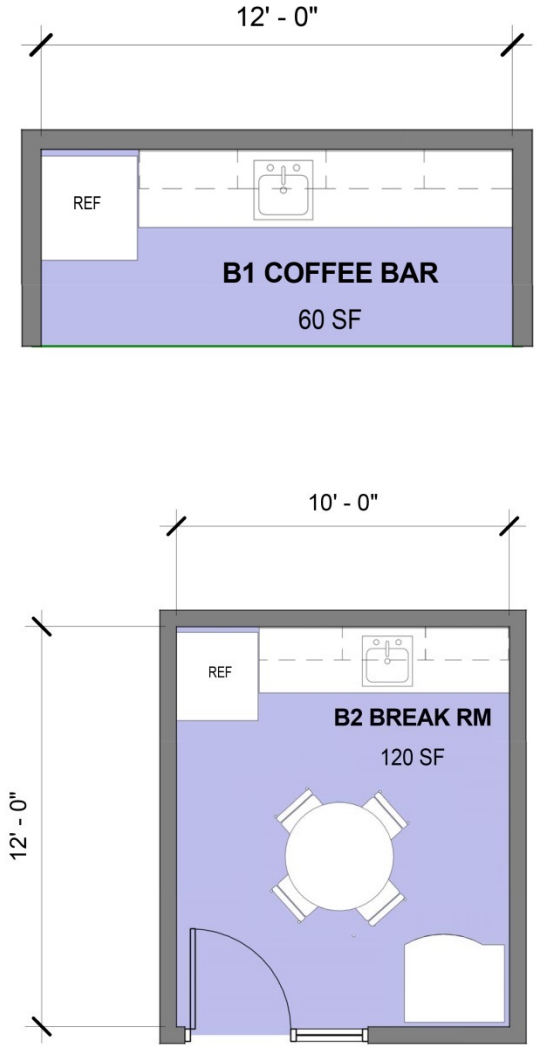
Description/Usage		Common space that is available for all personnel in the office. Room provides space for a large, production-quality print/copy machine, and for staff to assemble reports and records of trial, prepare for litigation, review evidence, assist in investigations, etc.
Ceiling Height		9'-0" minimum
Windows		N/A
Doors	**Type**	Hollow metal, 3' x 7'
	Security/ Hardware	Keyed lock set
	View Panels/ Kick-Plates	View panels, 5" x 20", for door to corridor
Finishes	**Walls**	Level 1
	Floor	Level 1
	Base	Level 1
	Ceiling	Level 1
Plumbing		N/A
HVAC		Per UFC 3-410-01
Fire Protection		Wet or dry pipe sprinkler system, per UFC 3-600-01
Power		Per UFC 3-520-01
Lighting		Per UFC 3-530-01
Communication	**Telephone**	One, wall-mounted
	Data	NIPR
	CCTV	N/A
	CATV	N/A
	Security	N/A
Acoustics		Per UFC 3-450-01, for noise control
Furnishings Fixtures & Equipment (FF&E)		For W1, W2, and W3, provide file cabinets, storage cabinets, and work countertop. W3 includes 3' x 6' work table and two multipurpose machines.
Special Requirements		Provide clearance around work table, when applicable.

2-2.7 Coffee Bar/Break Rooms

The activity levels in legal offices are often intense, requiring “eating in,” and the offices are frequently manned after normal work hours. Thus, it is beneficial for the staff to have access to a break area. Use one of four standard designs, depending on the size of the staff. In small offices, provide a stand-alone, walk-up coffee bar with a sink, microwave, and refrigerator. This can be combined with a copy room or work room. For medium-sized offices, provide a small break room with the same amenities as the coffee bar, along with table seating of 4 to 8 and a vending machine. For larger offices, provide a full break room with coffee bar amenities, along with space for two to four tables, seating 8 to 16, and two vending machines.

Figure 2-12 Coffee Bar/Break Rooms



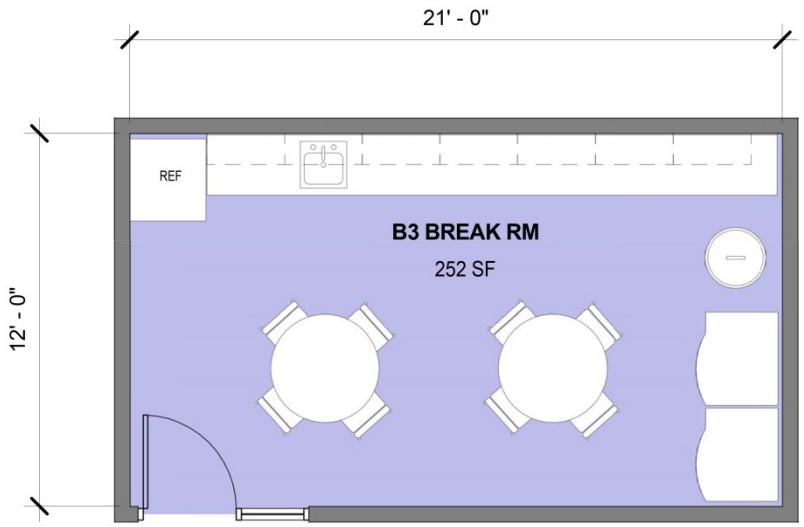


Figure 2-12 Coffee Bar/Break Rooms (continued)

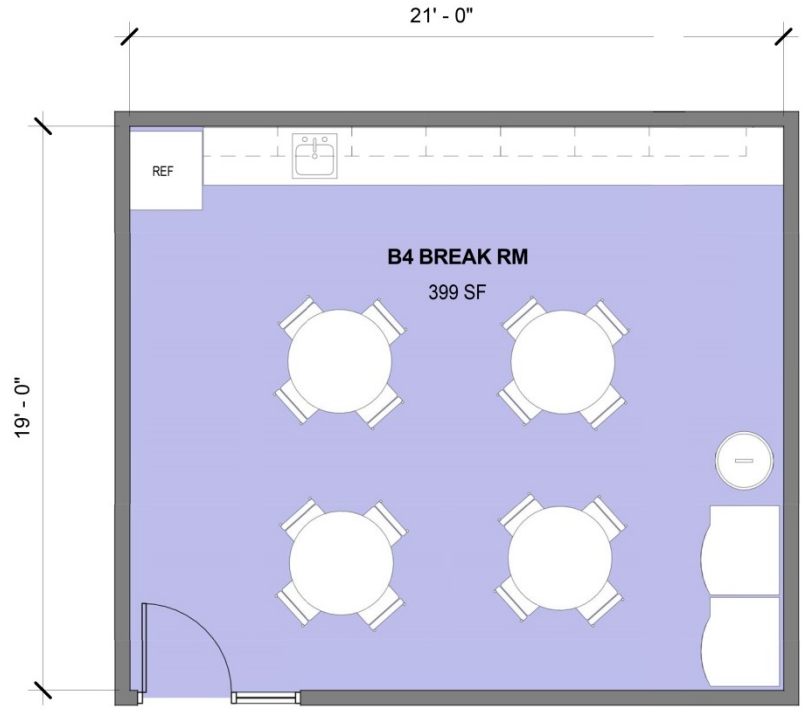

Figure 2-13 Coffee Bar Room Data Sheet

Description/Usage		A kitchenette open to the main work space, providing a small area for coffee-making, a microwave, a refrigerator, and a sink.
Ceiling Height		9'-0" minimum
Windows		N/A
Doors	**Type**	N/A
	Security/ Hardware	N/A
	View Panels/ Kick-Plates	N/A
Finishes	**Walls**	Level 1
	Floor	Level 1
	Base	Level 1
	Ceiling	Level 1
Plumbing		Sink with disposal, per UFC 3-420-01
HVAC		Per UFC 3-410-01
Fire Protection		Wet or dry pipe sprinkler system, per UFC 3-600-01
Power		Provide 120V dedicated circuits for coffee maker, microwave, and refrigerator. Include 120V convenience outlets, per UFC 3-520-01.
Lighting		Per UFC 3-530-01
Communication	**Telephone**	N/A
	Data	N/A
	CCTV	N/A
	CATV	N/A
	Security	N/A
Acoustics		Per UFC 3-450-01, for noise control
Furnishings Fixtures & Equipment (FF&E)		Refrigerator, microwave, sink, water heater (under sink), upper and lower cabinets, and solid-surface countertop.
Special Requirements		N/A

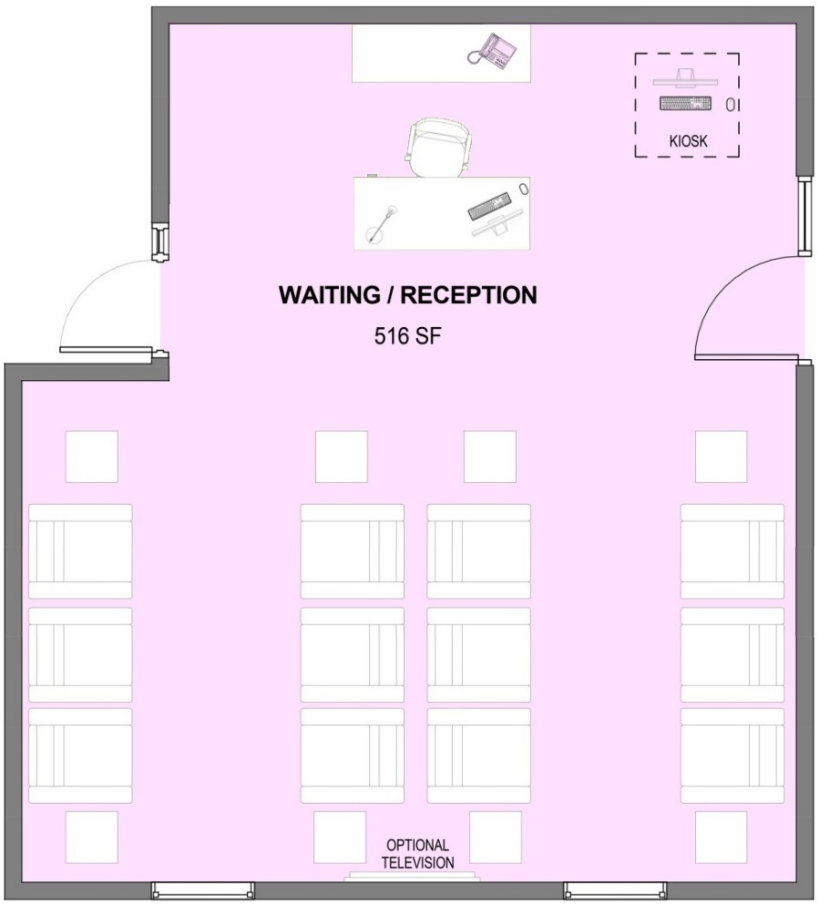
Figure 2-14 Break Room Data Sheet

Description/Usage		Break rooms are used as informal gathering spaces for staff during lunch and breaks. They include a kitchenette for storage, warming, and minimal food preparation.
Ceiling Height		9'-0" minimum
Windows		Exterior insulated, AT compliant
Doors	**Type**	Hollow metal, 3' x 7'
	Security/ Hardware	Keyed lock set
	View Panels/ Kick-Plates	View panels, 5" x 20"
Finishes	**Walls**	Level 1
	Floor	Level 1
	Base	Level 1
	Ceiling	Level 1
Plumbing		Sink with disposal, per UFC 3-420-01
HVAC		Per UFC 3-410-01
Fire Protection		Wet or dry pipe sprinkler system, per UFC 3-600-01
Power		120V dedicated circuits for coffee maker, microwave, and refrigerator; 120V convenience outlets, per UFC 3-520-01.
Lighting		Per UFC 3-530-01
Communication	**Telephone**	One, wall-mounted
	Data	NIPR
	CCTV	N/A
	CATV	One, wall-mounted (for B3 and B4)
	Security	N/A
Acoustics		Per UFC 3-450-01, for noise control
Furnishings Fixtures & Equipment (FF&E)		Provide refrigerator, microwave, dishwasher, sink, water heater (under sink), and solid-surface countertops for all break rooms. For B2 to B4, include vending machines and bulletin board. Include 1 to 4 round 36" plastic laminate tables, with 4 chairs per table for B3 and B4.
Special Requirements		Match break room finishes with surrounding area. Ensure appropriate utilities for all appliances.

2-2.8 Reception/Waiting Areas

The character and function of a reception/waiting area influences a client's or visitor's first impression of a legal office. Provide a space that balances aesthetics, security, and operational considerations. Separate client/visitor seating from, and control access to, the working portion of the office. Generally, provide for a receptionist in the waiting area. When required, depending on office operations, provide a CCTV or a secured partition/wall with a view window. If there is no receptionist, provide a door notification device.

Figure 2-15 Waiting/Reception Area



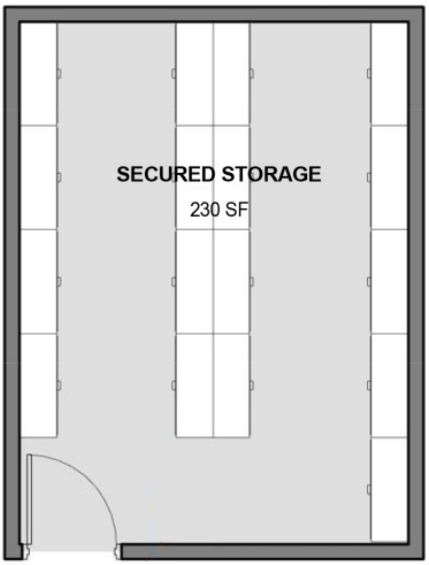


Figure 2-16 Waiting/Reception Area Room Data Sheet

Description/Usage		Waiting area and access control point where visitors are greeted by a receptionist prior to meeting with legal staff members. Seating area provided.
Ceiling Height		9'-0" minimum
Windows		Exterior insulated, AT compliant
Doors	**Type**	Wood, 3' x 7'
	Security/ Hardware	Keyed lock set; cypher lock (as required)
	View Panels/ Kick-Plates	View Panels, 5" x 20"
Finishes	**Walls**	Level 2
	Floor	Level 2
	Base	Level 2
	Ceiling	Level 2
Plumbing		N/A
HVAC		Per UFC 3-410-01
Fire Protection		Wet or dry pipe sprinkler system, per UFC 3-600-01
Power		Per UFC 3-520-01
Lighting		Per UFC 3-530-01
Communication	**Telephone**	One per desk
	Data	NIPR
	CCTV	N/A
	CATV	User justified
	Security	IDS, duress alarm (as required)
Acoustics		Per UFC 3-450-01, for noise control
Furnishings Fixtures & Equipment (FF&E)		Upholstered seating for visitors/clientele, depending on office requirements, with wood end tables. Include wood desk for receptionist when applicable. Provide space for a computer for check-ins and legal assistance support.
Special Requirements		Larger waiting areas include a TV.

2-2.9 Storage Areas

Storage areas are shared spaces containing files, materials, or equipment. Locate near the attorneys, paralegals, or administrative staff members that regularly use them. Storage areas may be enclosed with hard walls or in an open office area, depending on the type of materials stored and the need for security. Storage areas are utilitarian spaces that can be secured (lockable) or unsecured. Classified material storage must be in accordance with UFC 4-010-05.

Figure 2-17 Storage Rooms

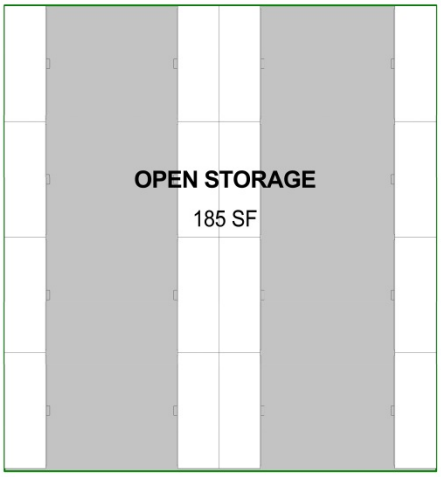

Figure 2-18 Secure Storage Area Room Data Sheet

Description/Usage		Space is used for storing files, supplies, and equipment. Provide a separate lockable room for storage of sensitive materials or high-value equipment.
Ceiling Height		9'-0" minimum
Windows		N/A
Doors	**Type**	Hollow metal, 3' x 7'
	Security/ Hardware	Keyed lock set; IDS

	Data	N/A
	CCTV	N/A
	CATV	N/A
	Security	IDS
Acoustics		Per UFC 3-450-01, for noise control
Furnishings Fixtures & Equipment (FF&E)		Provide systems furniture bookshelves or lateral filing cabinets.
Special Requirements		Classified material storage must be in accordance with UFC 4-010-05.

Figure 2-19 Open Storage Area Room Data Sheet

Description/Usage		General open office area set aside for lateral files or storage cabinets.
Ceiling Height		9'-0" minimum
Windows		N/A
Doors	**Type**	N/A
	Security/ Hardware	N/A
	View Panels/ Kick-Plates	N/A
Finishes	**Walls**	Level 1
	Floor	Level 1
	Base	Level 1
	Ceiling	Level 1
Plumbing		N/A
HVAC		Per UFC 3-410-01
Fire Protection		Wet or dry pipe sprinkler system, per UFC 3-600-01
Power		Per UFC 3-520-01
Lighting		Per UFC 3-530-01
Communication	**Tele.**	N/A
	Data	N/A
	CCTV	N/A
	CATV	N/A
	Security	N/A
Acoustics		Per UFC 3-450-01, for noise control
Furnishings Fixtures & Equipment (FF&E)		Provide bookshelves and/or lateral filing cabinets that match the office systems furniture design.
Special Requirements		N/A

CHAPTER 3 PENTAGON AND BASE LEGAL FACILITY

3-1 PENTAGON OFFICES

The Office of The Judge Advocate General, the Office of the Air Force General Counsel, and subordinate AF/JA and SAF/GC staffs are located primarily in the Pentagon. Because Pentagon facility design standards govern all Pentagon tenants, the requirements for those offices are not covered in this FC.

3-2 BASE LEGAL FACILITY/TRIAL COURTROOM

3-2.1 Function and Adjacency

Base legal facilities consist of the Office of the Staff Judge Advocate, supporting staff offices and work spaces, and a trial courtroom. The base legal office provides legal advice and counsel to base organizations and personnel in five major legal practice areas: military justice, civil law (i.e., administrative law, claims, contract law, environmental law, and labor law), operations law, international law (where applicable), and legal assistance. The overall size of a base legal office will vary, depending on unit mission and workload, but the size of individual offices and work spaces will follow the standard spaces previously described. The courtroom and its adjacent areas are essentially static and consist of three basic components: the courtroom itself, the arrangement of its internal components, and ancillary support spaces. Some support spaces, such as restrooms and a break room, can be shared with the base legal office to the extent they are collocated. Tax centers, where they exist, are command-level programs operated during tax season and are not accounted for in base legal facility requirements. Tax centers shall not be collocated in legal offices, absent additional space.

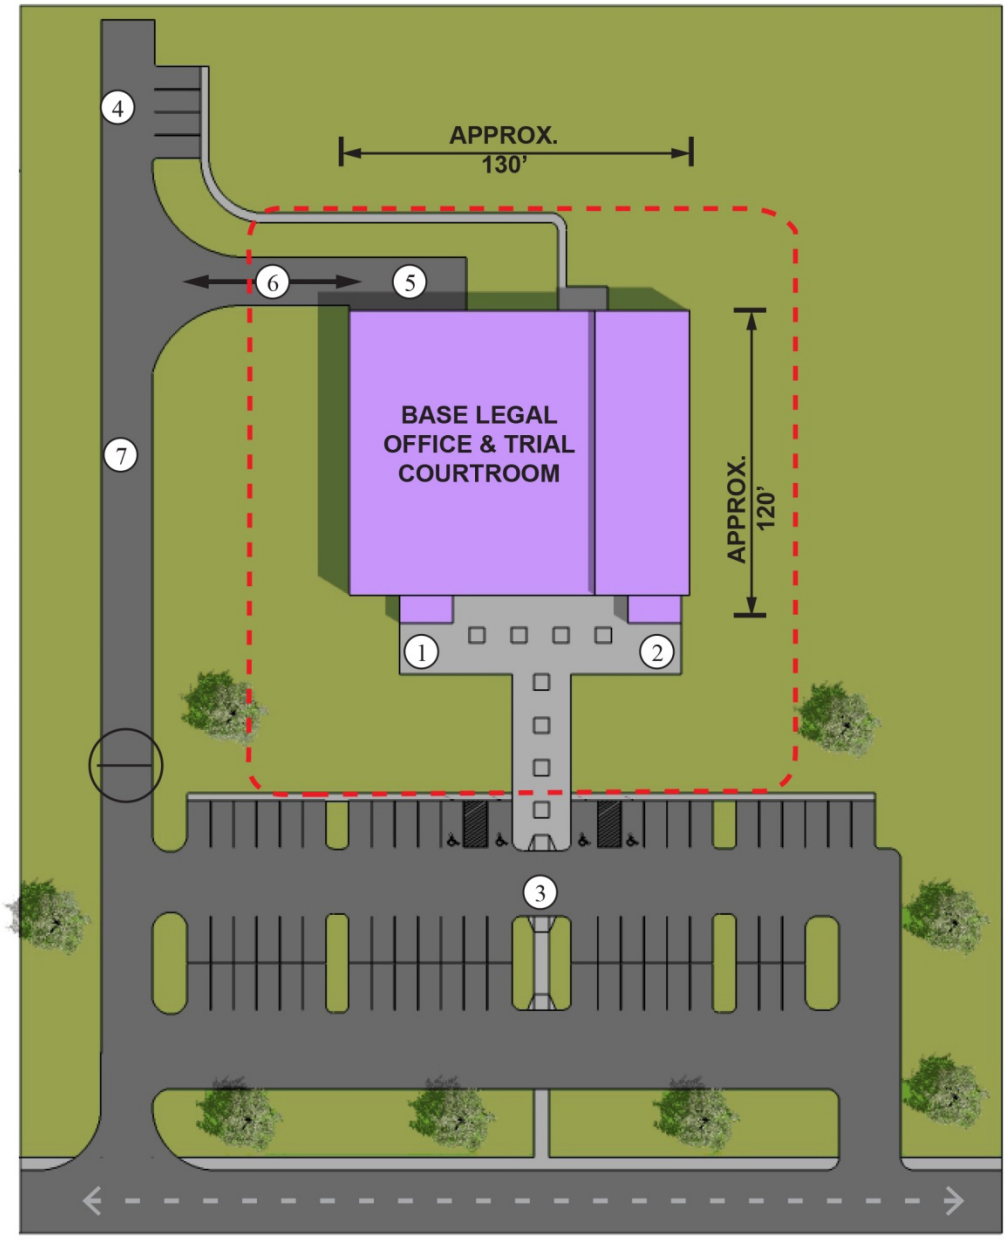
3-2.2 Base Legal Office Suite

Programming sheet: Figure 3-2

Special requirements: The office suite includes the SJA suite, attorney offices, LOS office, court reporter office, paralegal and administrative workstations, a conference room, a waiting/reception area, a work area, storage areas, and a break area. Additionally, nearby parking is required.

3-2.3 Trial Courtroom

Programming sheet: Figure 3-3



Special requirements: Include the judge’s bench, a court reporter station, a witness stand, a bailiff’s seat, the members’ box, trial and defense counsel tables, a gallery area, a judge’s chamber, private deliberation/conference room with coffee bar, trial and defense counsel preparation areas, witness/waiting rooms, a communications room, a judge’s restroom, a unisex restroom, and public restrooms.

3-2.4 Site Location

Base legal facilities are typically secondary tenants in buildings that serve another primary function (e.g., wing headquarters building). However, sometimes they are stand-alone facilities. Facility location is selected as part of the base master planning process, IDP, and ADP. Control public access to the office through a common reception area. Locate attorney offices so they are easily accessible from the reception area for legal assistance clients and other clients and visitors. In medium- and large-sized offices, personnel will be grouped in sections corresponding with the major legal practice areas (e.g., military justice, civil law, and international law). Locate the military justice section away from travel ways and in close proximity with the courtroom. Provide a direct connection to a front door for the public/visitors, with easy access, visibility, and well-lit, designated parking spaces for clients and those attending courtroom proceedings.

- Collocate base legal offices with or near the office of the installation commander.
- Avoid location near the ADC office, the SVC office, the Sexual Assault Response Coordinator (SARC) office, or the Inspector General (IG) office.

To the extent the information in this manual differs from that in Chapter 6 of AFMAN 32-1084, this information supersedes. Other applicable information not included in this manual can be found in AFMAN 32-1084, Chapter 6, Tables 6.3 and 6.4.

1. Attorney Offices: A4 - 1, for SJA; A3 - 1, for DSJA; A2 - for other attorneys, as authorized on UMD; A1 - for court reporter(s), as authorized on UMD, and visiting attorney space (1, for 3-9 authorized attorneys; 2, for 10 or more authorized attorneys).
2. Paralegal/Administrative Work Spaces: P2 - 1, for LOS; P1 - for other paralegals and administrative staff, as authorized on UMD.
3. Conference Rooms: C1 - 1-6 personnel; C2 - 7-15 personnel; C3 - 16-30 personnel; C4 - 31 or more personnel, as authorized on UMD. Seating at table and along one long wall. 150 sq. ft. added in C3 and C4 for speaker, per AFMAN 32-1084, Table 6.4.
4. Work Rooms: W1 - 1-4 personnel; W2 - 5-10 personnel; W3 - 11 or more personnel, as authorized on UMD.
5. Break Rooms: B1 - 1-10 personnel; B2 - 11-20 personnel; B3 - 21-30 personnel; B4 - 31 or more personnel, as authorized on UMD.
6. Total storage requirements: 30 linear ft. + (# authorized on UMD X 10) linear ft. Includes open area storage (outside individual offices and workstations) and closed/secure area storage (in separate, locked area). Distribution of open and closed storage depends on specific legal office requirements.
7. Special Storage: As required (e.g., safe or SCIF).
8. Waiting/Reception Area: # authorized attorneys X 1.5.
9. Parking spaces (basic requirement): # authorized personnel (staff) + # authorized attorneys + 2 (legal assistance) + 30 (courtroom participants - see Trial Courtroom Sheet).
10. Administrative areas include circulation factor of 10%, per AFMAN 32-1084.

Figure 3-3 Trial Courtroom Programming Sheet

1. Deliberation room includes space for coffee bar.
2. Storage closet for security and AV equipment.
3. Courtroom includes the judge's bench, court reporter station, witness stand, jury box (with seating for 12), well of the court (including 2 tables with seating for 3 each facing the bench), gallery (with seating for 25-30 spectators), and VTC capability. A private entrance for jury members connects circulation, courtroom, and deliberation spaces. A vestibule should be included for transition from the judge's chamber to the bench.
4. Restrooms included for judge, jury, counsel, and witnesses.
5. Administrative areas include circulation factor of 10%, per AFMAN 32-1084.

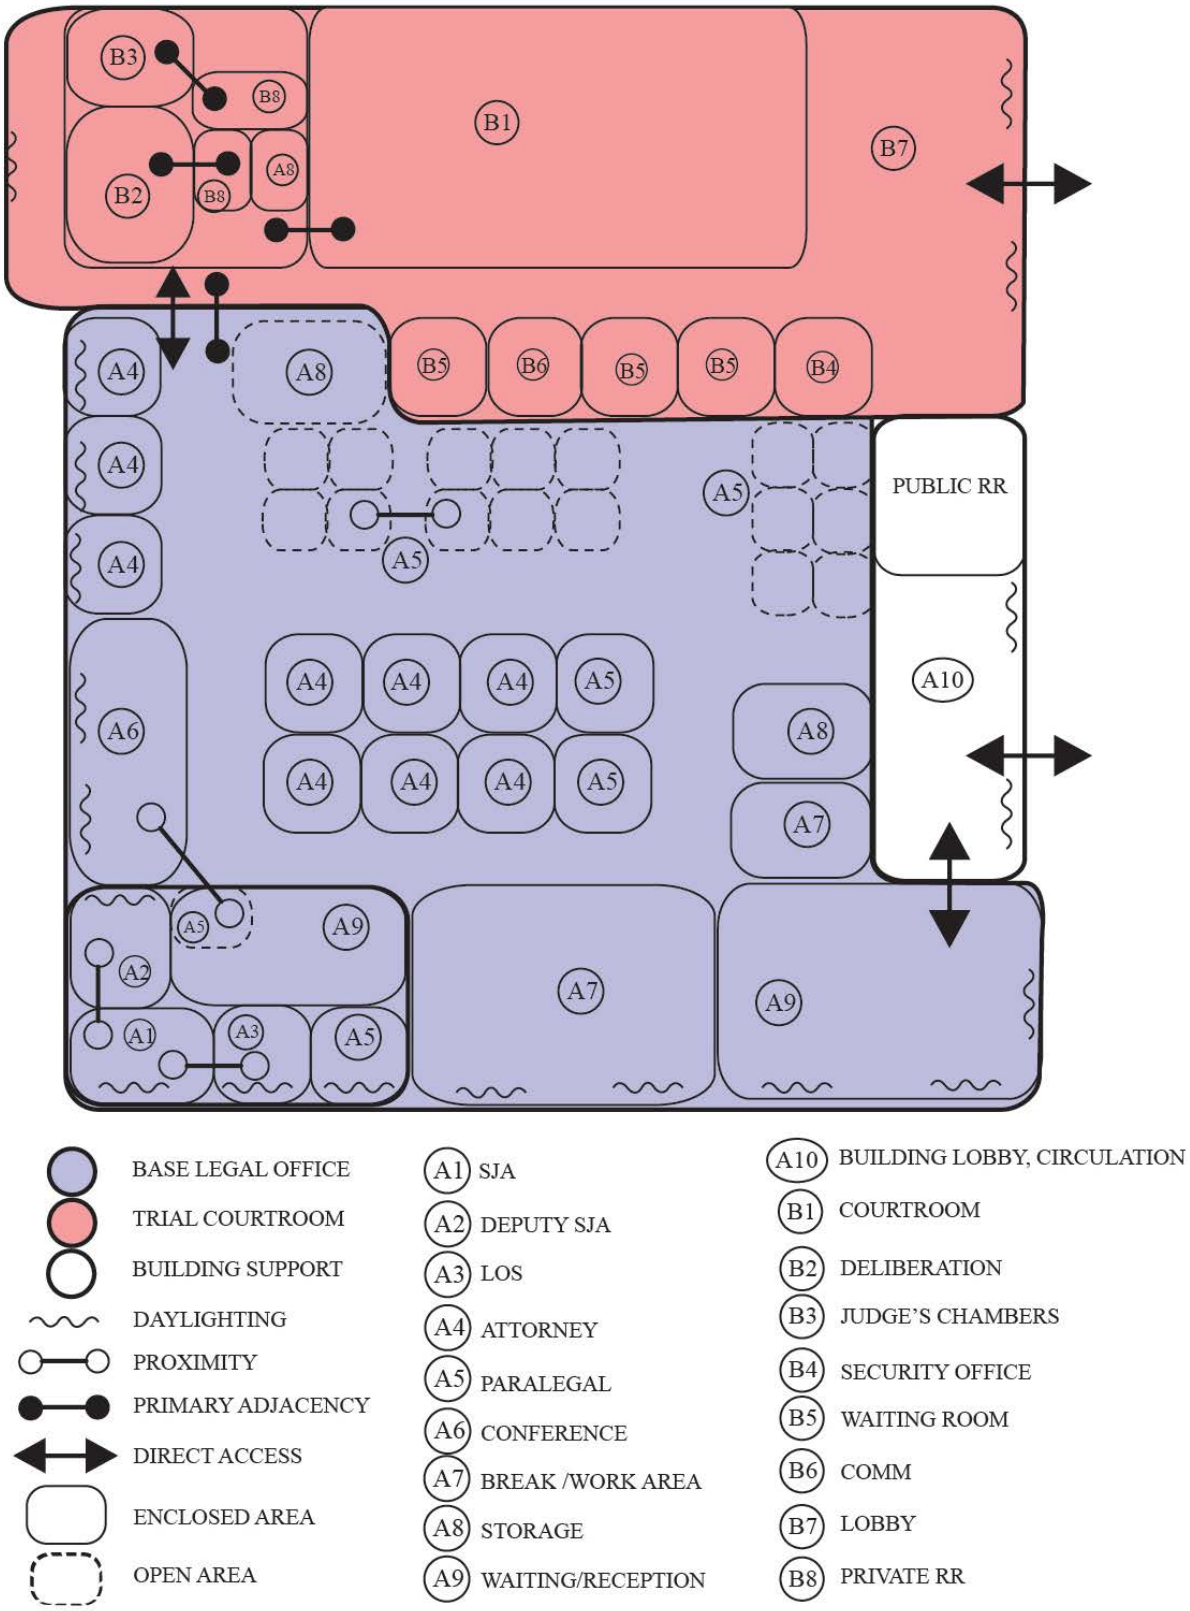

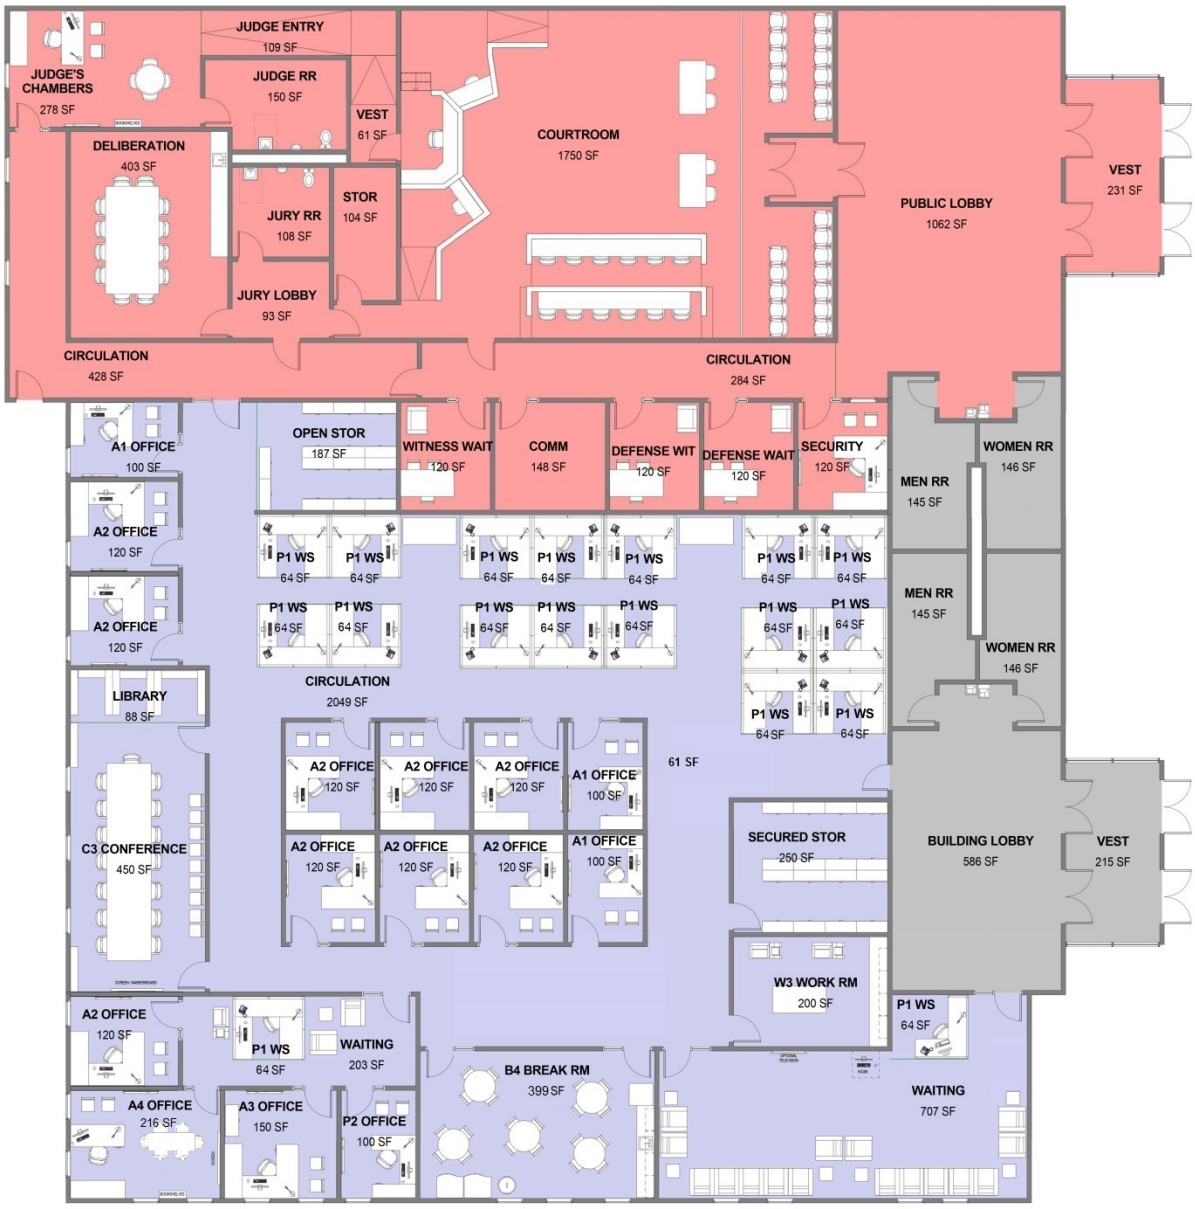

Figure 3-5 Base Legal Office and Trial Courtroom Notional Floor Plan

3-2.5 Base Legal Office Room Data Sheet

Figure 3-6 A3 and A4 Leadership Suite Room Data Sheet

Description/Usage		The leadership suite includes offices for the SJA, Deputy SJA, LOS, and a secretary (if assigned). The suite may also include a small waiting area for visitors.
Ceiling Height		9'-0" minimum
Windows		Exterior glazing, AT compliant
Doors	**Type**	Solid wood, 3' x 7'
	Security/ Hardware	Keyed lock set
	View Panels/ Kick-Plates	Side view panel
Finishes	**Walls**	A3 - Level 2; A4 - Level 3
	Floor	A3 - Level 2; A4 - Level 3
	Base	A3 - Level 2; A4 - Level 3
	Ceiling	A3 - Level 2; A4 - Level 3
Plumbing		N/A
HVAC		Per UFC 3-410-01
Fire Protection		Wet or dry pipe sprinkler system, per UFC 3-600-01
Power		Receptacles, per UFC 3-520-01
Lighting		Per UFC 3-530-01
Communication	**Telephone**	One per desk
	Data	NIPR, SIPR (as required)
	CCTV	N/A
	CATV	N/A
	Security	Duress alarm
Acoustics		Floors, partitions, and ceilings will meet or exceed the STC 50 requirement. Windows and door meet the STC 45 requirement.
Furnishings Fixtures & Equipment (FF&E), Casework		For A3, provide a L-shaped desk, credenza, one leather swivel chair, two leather visitor chairs, whiteboard, bookshelf, and lateral file storage. For A4, provide a 6' free-standing wood executive desk, credenza, one leather swivel chair, two leather visitor chairs, marker board, bookshelf, a 30" x 72" rectangular wood table with 6 leather swivel chairs, and a wall-mounted flat screen monitor.
Special Requirements		Offices require additional acoustical privacy; extend partitions between the structural floor slabs, and enhance the space with acoustical insulation to decrease sound transmission. STC requirements are for the entire assembly and not just individual components (door, window, etc.).

3-2.6 Trial Courtroom Room Data Sheets

Figure 3-7 Courtroom Room Data Sheet

Description/Usage		Courtrooms are used to conduct judicial and other proceedings. Spaces include a judge's bench, court reporter station, witness stand, jury members' box, gallery area, trial and defense counsel areas, bailiff seat, a judge's chambers, witness/waiting rooms, deliberation/conference room with coffee bar, communications room, unisex restroom, judge's restroom, and public restrooms. Gallery area sits 25–30 spectators.
Ceiling Height		12'-0" minimum
Windows		Clearstory or no windows
Doors	**Type**	Solid wood, 3' x 7'
	Security/ Hardware	Keyed lock set
	View Panels Kick-Plates	None
Finishes	**Walls**	Level 3
	Floor	Level 3
	Base	Level 3
	Ceiling	Level 3
Plumbing		N/A
HVAC		Per UFC 3-410-01
Fire Protection		Wet or dry pipe sprinkler system, per UFC 3-600-01
Power		Receptacles for all equipment at court reporter stand and counsel tables, per UFC 3-520-01
Lighting		Per UFC 3-530-01
Communication	**Telephone**	Include amplification, recording system, microphones for judge, witness, counsel, and members
	Data	NIPR for judge and court reporter; VTC and speaker telephone capability
	CCTV	N/A

	CCTV	N/A
	CATV	N/A
	Security	Duress alarm
Acoustics		Floors, partitions, and ceilings will meet or exceed the STC 50 requirement. Windows and doors meet the STC 45 requirement.
Furnishings Fixtures & Equipment (FF&E), Casework		Provide 6'-0" wood executive desk, credenza, leather executive swivel chair. Include four swivel leather chairs, two guest upholstered chairs, 4' round table, projection screen, and whiteboard.
Special Requirements		Provide direct access from courtroom for the judge to avoid passing other court participants or observers when entering or leaving the chamber. Include adjacent bathroom.

Figure 3-10 Witness/Waiting Room Data Sheet

Description/Usage		Quiet private rooms for both prosecution and defense witnesses, located with easy access to the courtroom. Interiors not visible to spectators.
Ceiling Height		9'-0" minimum
Windows		None
Doors	**Type**	Hollow metal, 3' x 7'
	Security/ Hardware	Keyed lock set
	View Panels/ Kick-Plates	None
Finishes	**Walls**	Level 2
	Floor	Level 2
	Base	Level 2
	Ceiling	Level 2
Plumbing		None
HVAC		Per UFC 3-410-01
Fire Protection		Wet or dry pipe sprinkler system, per UFC 3-600-01
Power		Receptacles per UFC 3-520-01
Lighting		Per UFC 3-530-01
Communication	**Telephone**	One, wall-mounted
	Data	NIPR
	CCTV	N/A
	CATV	N/A
	Security	Duress alarm
Acoustics		Floors, partitions, and ceilings will meet or exceed the STC 50 requirement. Windows and doors meet the STC 45 requirement.
Furnishings Fixtures & Equipment (FF&E), Casework		Provide table/desk and three swivel chairs.
Special Requirements		Standard applies to both prosecution and defense witness rooms.

Figure 3-11 Deliberation Room Data Sheet

Description/Usage		The deliberation room is a conference room that accommodates 12 to 14 jury members. It includes adjacent unisex restroom and a minimal coffee bar with sink.
Ceiling Height		9'-0" minimum
Windows		None
Doors	**Type**	Solid wood, 3' x 7'
	Security/ Hardware	Keyed lock set
	View Panels/ Kick-Plates	N/A
Finishes	**Walls**	Level 2
	Floor	Level 2
	Base	Level 2
	Ceiling	Level 2
Plumbing		Per UFC 3-420-01
HVAC		Per UFC 3-410-01

Power		Receptacles, per UFC 3-520-01
Lighting		Per UFC 3-530-01
Communication	**Telephone**	One, wall-mounted
	Data	NIPR
	CCTV	N/A
	CATV	N/A
	Security	N/A
Acoustics		Floors, partitions, and ceilings will meet or exceed the STC 50 requirement. Doors will meet the STC 45 requirement.
Furnishings Fixtures & Equipment (FF&E), Casework		Provide A/V equipment and cabinet, 12-person wood conference table, 12 swivel chairs with 2 extra chairs, and whiteboard.
Special Requirements		Direct access to courtroom near the jury members' box to ensure the jury has as little contact as possible with other participants in the proceedings.

This Page Intentionally Left Blank

CHAPTER 4 INTERMEDIATE HEADQUARTERS LEGAL OFFICES

4-1 INTERMEDIATE HEADQUARTERS LEGAL OFFICES (MAJCOM, NAF, CENTER, AND DRU)

4-1.1 Function and Adjacency

- Major command (MAJCOM) offices
- Numbered Air Force (NAF) offices
- Center offices (under Air Force Materiel Command [AFMC])
- Direct reporting unit (DRU) offices (see paragraph 4-2)

4-1.2 MAJCOM Offices

The ten MAJCOM legal offices function primarily as legal advisors to the senior MAJCOM staff. They also exercise professional oversight and supervision over the geographically separated base legal offices in their commands.

Programming sheet: Figure 4-1

4-1.3 NAF Offices

NAF legal offices are generally smaller and have an operational focus. The 19 NAF offices serve as legal advisors to the NAF staffs and concentrate primarily on military justice and operations law.

Programming sheet: Figure 4-2

4-1.4 Center Offices

The six Center legal offices in AFMC focus variously on military justice, procurement, technology transfer and development, and installation support management.

Programming sheet: Figure 4-2

Note: The Space and Missile Center at Los Angeles AFB, California, and the Air Force Warfare Center at Nellis AFB, Nevada, both provide installation-level legal support and use Figures 3-2 and 3-3.

4-1.5 Site Location

Intermediate headquarters (IHQ) legal offices will vary in size, depending on the organizations and missions they support. However, similar to base legal offices, the sizes of individual offices and support spaces will remain constant and reflect the previously established space standards in Chapter 2.

The preferred location is in a command headquarters building, with easy access to the commander.

The office does not need direct access to the main entrance.

Figure 4-1 MAJCOM Programming Sheet

(This programming sheet is notional, in that it reflects the space requirements for the MAJCOM legal office depicted in Figures 4-3 and 4-4. However, it can be used for all offices of the same type, using the formulas listed in the comments.)

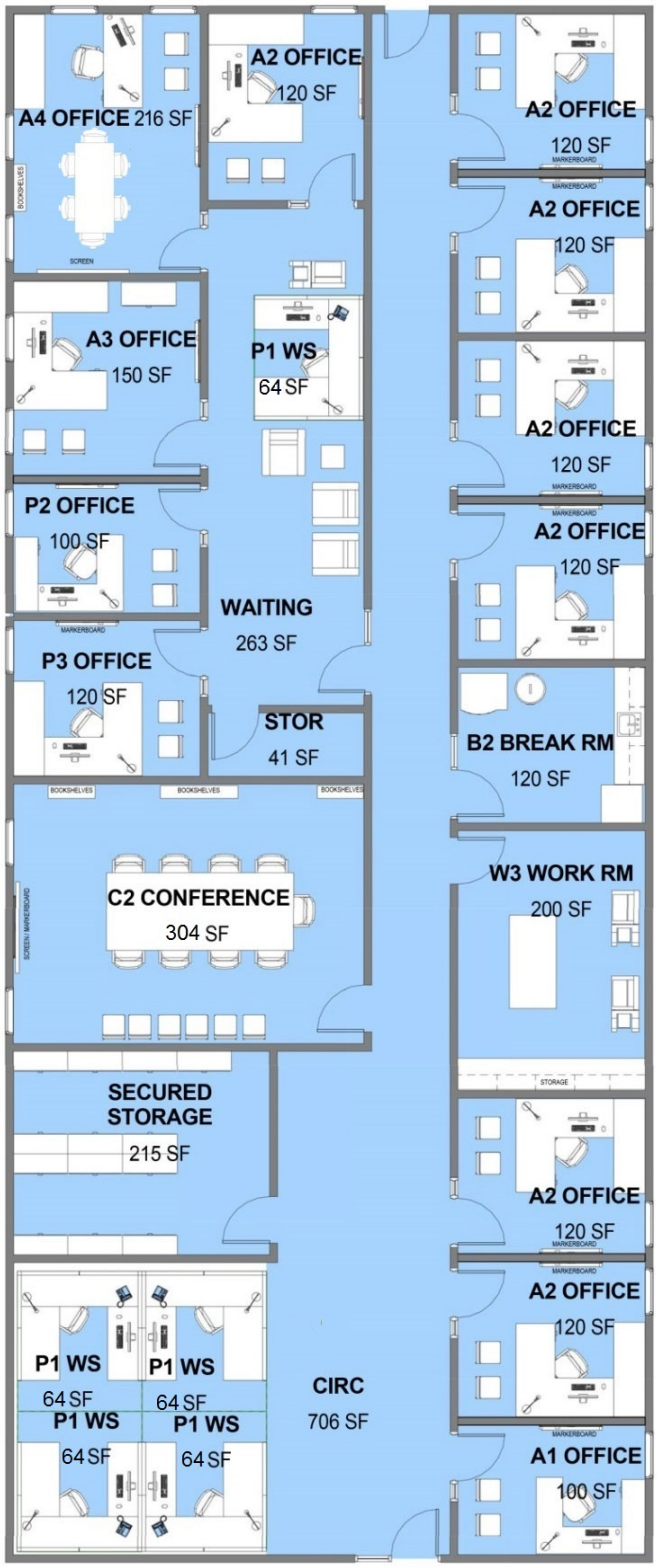

Figure 4-5 NAF/Center Legal Office Adjacency Diagram

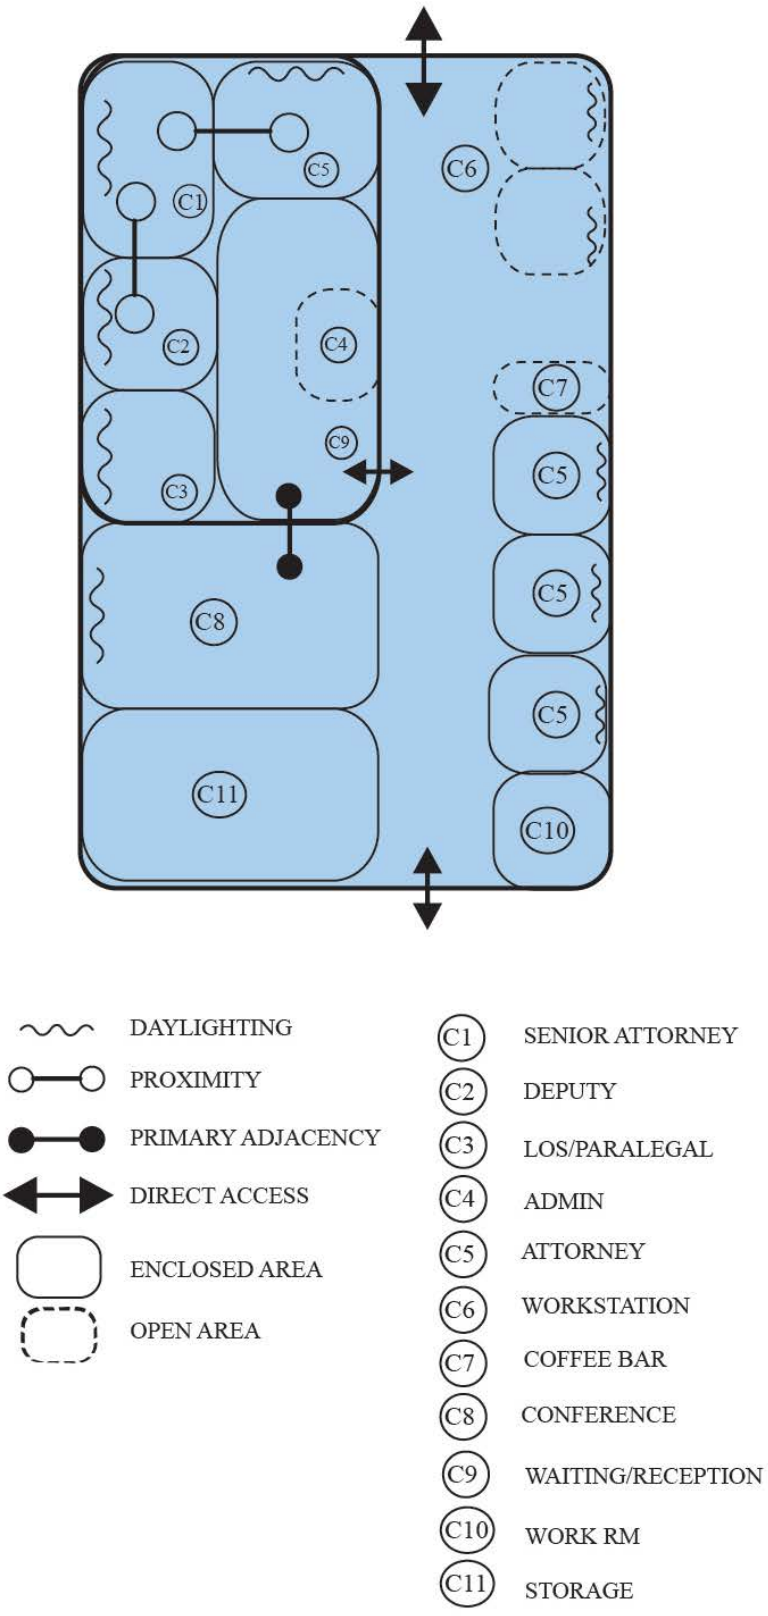

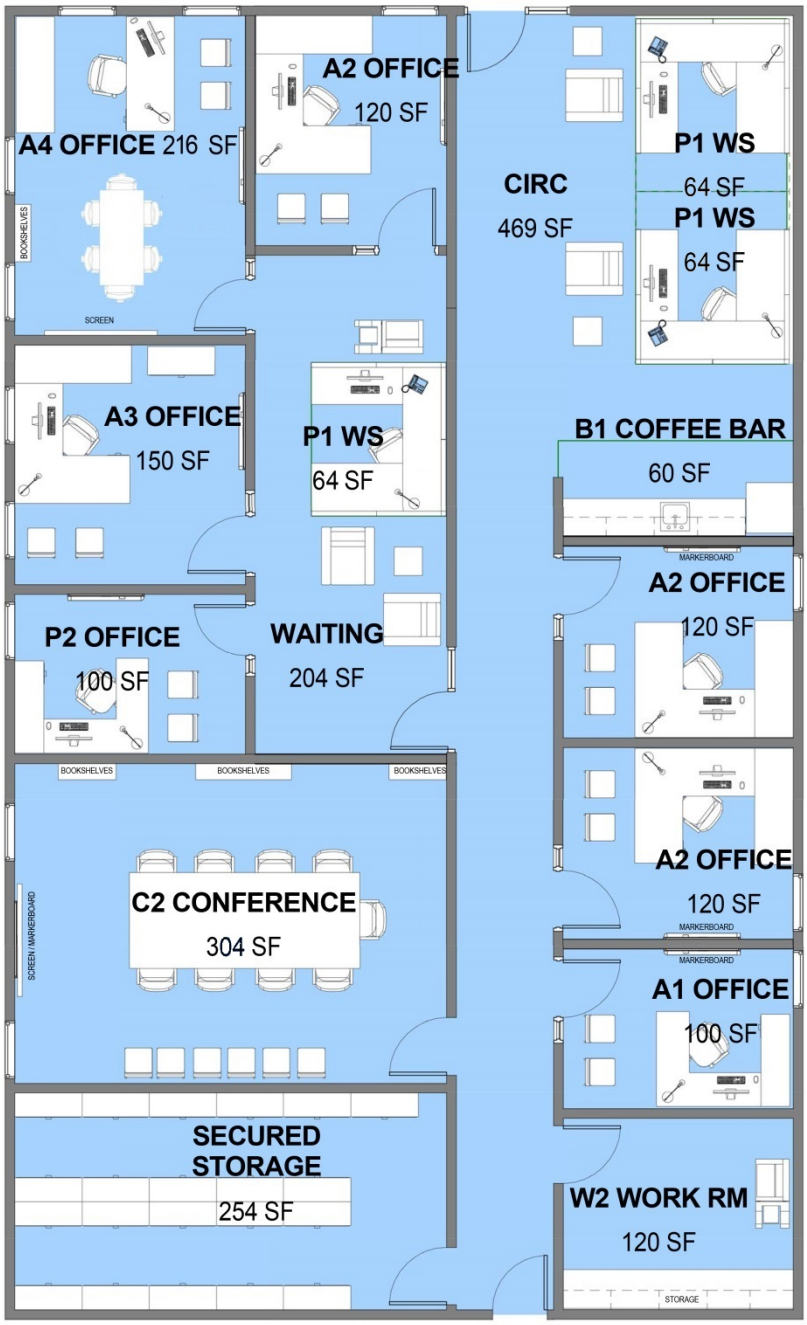

Figure 4-6 NAF/Center Legal Office Notional Floor Plan

4-2 DIRECT REPORTING UNIT (DRU) LEGAL OFFICES

4-2.1 Function and Adjacency

DRUs report directly to the Air Staff and have specialized missions. There are three DRU legal offices, each serving an activity with a markedly different mission:

- Air Force District Washington (AFDW)
- Air Force Academy (USAFA)
- Air Force Operational Test and Evaluation Center (AFOTEC)

4-2.2 Air Force District Washington (AFDW)

AFDW is the designated Air Force component lead for planning and implementing Air Force, joint contingency, and ceremonial activities in the National Capital Region (NCR). AFDW also provides military justice, personnel, and other support for Headquarters Air Force (HAF), AFDW units, and assigned Air Force elements worldwide. AFDW is primarily composed of the 11th Wing, the 79th Medical Wing, and the 844th Communication Group, all located at JB Andrews - Naval Air Facility Washington, Maryland, and the Air Force element at JB Anacostia-Bolling, Washington, D.C.

Programming sheet: Figure 4-1

Special requirement: The command paralegal manager, similar to a MAJCOM functional manager, is entitled to a P3 office.

4-2.3 Air Force Academy (USAFA)

USAFA is the military academy for Air Force officer candidates, located in Colorado Springs, Colorado. The Academy's stated mission is “to educate, train, and inspire men and women to become officers of character, motivated to lead the USAF in service to our nation.” The USAFA legal office advises the Academy leadership and staff and performs the functions of a base legal office. It also has a courtroom.

Programming sheets: Figures 3-2 and 3-3

Special requirements: None

4-2.4 Air Force Operations Test and Evaluation Center (AFOTEC)

AFOTEC, located at Kirtland AFB, New Mexico, is an independent agency responsible for testing new systems being developed for Air Force and multi-Service use under operationally realistic conditions. As a single attorney office, the legal office is embedded in the command suite and shares support spaces.

Programming sheet: None.

Special requirements:

- The attorney is entitled to an A4 office.

- All support spaces (e.g., conference room, storage area, safe, waiting area, visiting attorney office, work room, break room, restrooms, and parking) are shared with other building occupants.

CHAPTER 5 AIR FORCE LEGAL OPERATIONS AGENCY (AFLOA)

5-1 AFLOA LEGAL OFFICES - JONES BUILDING

5-1.1 Function and Adjacency

AFLOA is the field operating agency (FOA) of The Judge Advocate General (TJAG). It consists of six directorates:

- Air Force Judiciary (JAJ)
- Civil Law and Litigation Directorate (JAC)
- Commercial Law and Litigation Directorate (JAQ)
- Community Legal Services Directorate (CLS)
- Air Force Judge Advocate General's School (AFJAGS) (see Chapter 7)
- Legal Information Systems Directorate (JAS) (see Chapter 8)

In addition, the agency operates nine field support centers (FSC), including the Accident Investigation Board FSC, the Air Force Claims Service Center, the Commercial Litigation FSC, the Contract Law FSC, the Environmental Law FSC, the Labor Law FSC, the Medical Law FSC, the Medical Cost Reimbursement Program, and the Utility Law FSC.

5-1.2 Site Selection

AFLOA’s command suite, along with the leadership suites for JAJ, JAC, JAQ, and CLS, is located in the Jones Building on JB Andrews - Naval Air Facility Washington. The command suite will be in close proximity to other AFLOA directorate and division offices.

Programming sheet: Figure 5-1

Special requirements: The command suite includes the commander’s office, deputy commander’s office, command paralegal office, and open workstations for the executive officer, commander’s secretary, and other members of the command section. It also includes conference rooms, a library, a storage room, a work area, and a break area.

Other AFLOA offices in the Jones Building will vary in size, depending on the organization, its mission, and responsibilities. The directorate leadership suites will be in close proximity to their subordinate division offices. The space standards for AFLOA offices and support spaces in the Jones Building reflect those published in AFI 32-9010, Atch 2, and Chapter 2 of this FC.

1. Attorney Offices: A5 - 1, for Commander (applies only to AFLOA HQ); A7-1 - for Deputy Commander.
2. Paralegal/Administrative Work Spaces: P3 - 1, for Command Paralegal; P4 - for Executive Officer and administrative personnel, as authorized on UMD, and 7 extra P4 spaces.
3. Conference Rooms: C2; C3, with VTC capability.
4. Work Room: W1.
5. Break Room: B1.
6. Storage requirements: securable room, with 143 linear ft. of storage.
7. Waiting/Reception Area: 4 seats (20 sq. ft. per person)
8. Parking: As provided for Jones Building occupants.
9. Library/Conference Room: 2200 sq. ft. Includes VTC capability.
10. Administrative areas include circulation factor of 10%, per AFMAN 32-1084.

5-2 AIR FORCE JUDICIARY (JAJ)

5-2.1 Function and Adjacency

JAJ is responsible for administering and improving military justice across the Air Force, and advising TJAG, the Chief of Staff of the Air Force (CSAF), and the Secretary of the Air Force (SecAF) on a full range of military justice matters. The directorate assists convening authorities and SJAs in the field, provides defense services to Airmen, litigates complex cases, and provides government and defense appellate lawyers before the Air Force Court of Criminal Appeals (AFCCA), the Court of Appeals for the Armed Forces (CAAF), and the United States Supreme Court. JAJ is located in the Jones Building and has five divisions:

- Appellate Defense Division (JAJA)
- Trial Defense Division (JAJD)
- Government Trial and Appellate Counsel Division (JAJG)
- Military Justice Division (JAJM)
- Clemency, Corrections, and Officer Review Division (JAJR)

Figure 5-2 Standard AFLOA Programming Sheet (Jones Building)

(This programming sheet reflects the space requirements for AFLOA offices, other than the command suite, in the Jones Building. Items marked "TBD" will be determined according to the notes at the bottom of the programming sheet.)

To the extent the information in this manual differs from that in Chapter 6 of AFMAN 32-1084, this information supersedes. Other applicable information not included in this manual can be found in AFMAN 32-1084, Chapter 6, Tables 6.3 and 6.4.

1. Attorney Offices: A7 - for Directors; A3 - for Division Chiefs; A2 - for other attorneys, as authorized on UMD.
2. Paralegal/Administrative Work Spaces: P4 - paralegal/administrative personnel, as authorized on UMD.
3. Conference Room: As required and sized.
4. Work Room: As required.
5. Break Room: As required.
6. Total storage requirements: 30 linear ft. + (# authorized on UMD X 10) linear ft. Includes open area storage (outside individual offices and workstations) and closed/secure area storage (in separate, locked area). Distribution of open and closed storage depends on specific requirements.
7. Special Storage: As required (e.g., safe or SCIF).
8. Waiting/Reception Area: As required in leadership suites.
9. Parking: As provided for Jones Building occupants.
10. Administrative areas include circulation factor of 10%, per AFMAN 32-1084.

5-2.2 JAJ Leadership Suite

Programming sheet: Figure 5-2

Special requirements:

- Work area: W1

5-2.3 Appellate Defense Division (JAJA)

JAJA represents Airmen at all stages of the appellate process, which begins once a court-martial conviction is approved by the convening authority. Key responsibilities include representing accused Air Force members before the AFCCA, the CAAF, and the U.S. Supreme Court.

Programming sheet: Figure 5-2

Special requirements:

- Work area: W1
- Open storage: 462 linear feet for storing records of trial in the appellate process

5-2.4 Trial Defense Division (JAJD)

JAJD provides all trial defense services through its worldwide team of area defense counsel, defense paralegals, senior defense counsel, chief senior defense counsel, and defense paralegal managers. In addition to trial services, JAJD provides assistance to Airmen facing Article 15s and adverse administrative actions, including corrective paperwork and administrative discharge boards.

Programming sheet: Figure 5-2

Special requirements:

- Work area: W1

Area defense counsel offices, located on separate installations, are addressed in Chapter 6, paragraph 6-1.

5-2.5 Government Trial and Appellate Counsel Division (JAJG)

JAJG represents the Air Force in both the trial and post-trial stages of the court-martial process. Appellate counsel represent the Air Force in appellate reviews of court-martial before the AFCCA, the CAAF, and the U.S. Supreme Court. The division also provides advanced litigation support and trial advocacy training.

Programming sheet: Figure 5-2

Special requirements:

- Conference room: Includes table, with seating for eight
- Work area: W1
- Closed/secure storage: for storing records of trial in the appellate process
    - In JAJG: 288 square feet, with 350 linear feet of storage
    - In JAJR: 150 square feet, with 120 linear feet of storage
- Break area: B1

5-2.6 Military Justice Division (JAJM)

JAJM issues military justice opinions and policy for SecAF, CSAF, TJAG, and the Air Force. JAJM responds to inquiries on military justice matters by the White House, Congress, DoD, and the Air Staff. The division is the central collection point for records of court-martial and manages them as they move through the appellate process. JAJM acts as the lead agency for Freedom of Information Act (FOIA) requests related to records of trial.

Programming sheet: Figure 5-2

Special requirements:

- Conference room: Includes table, with seating for eight
- Work area: W1
- Closed/secure storage: 402 square feet, with 495 linear feet for storing records of trial in the appellate process prior to staging
- Special storage: 5-drawer safe for storing classified records of trial
- Break area: B1, combined with conference room

5-2.7 Clemency, Corrections, and Officer Review Division (JAJR)

JAJR is responsible for recommending SecAF action in all officer court-martial cases involving a sentence of dismissal and making clemency recommendations in enlisted court-martial cases. The JAJR attorney sits as a member of the Air Force Clemency and Parole Board and serves as counsel to the Air Force Security Forces community on all corrections matters.

Programming sheet: Figure 5-2

Special requirements:

- Work area: W1

5-3 CIVIL LAW AND LITIGATION DIRECTORATE (JAC)

5-3.1 Function and Adjacency

JAC specializes in legal practice areas dealing with Air Force claims and civil litigation (i.e., labor, personnel, information, environmental, utility, and tort litigation). JAC is located in the Jones Building and has three divisions:

- Claims and Tort Litigation Division (JACC)
- Environmental Law and Litigation Division (JACE)
- General Litigation Division (JACL)

5-3.2 JAC Leadership Suite

Programming sheet: Figure 5-2

Special requirements:

- Work area: W1
- Conference room: Includes table, with seating for 10
- Closed/secure storage: Shared with JACE, with 105 linear feet.

5-3.3 Claims and Tort Litigation Division (JACC)

JACC provides specialized tort guidance to, and receives critical investigative support from, Air Force headquarters-level and installation-level judge advocates. It adjudicates sensitive wrongful death, personal injury, and property damage claims arising from Air Force activities worldwide. It consists of four main branches:

- Aviation and Admiralty Law Branch
- Foreign Claims Branch
- General Torts Branch
- Medical Law Branch

In addition, there are four FSCs:

- Accident Investigation Board Field Support Center (AIBFSC)

- Air Force Claims Service Center (AFCSC)
- Medical Cost Reimbursement Program (MCRP)
- Medical Law Field Support Center (MLFSC)

JACC:

- Programming sheet: Figure 5-2
- Special requirements:
  - Conference room: Includes table, with seating for eight
  - Work area: W1
  - Closed/secure storage: 643 square feet, with 245 linear feet for storing claims investigation equipment
- Break area: B1

The AFSC, MCRP, and the MLFSC are located in the field and addressed in Chapter 6, paragraph 6-4.

5-3.4 Accident Investigation Board Field Support Center (AIBFSC)

The AIBFSC provides legal advisors to accident investigation boards (AIB) for mishaps involving aircraft, unmanned aerial systems, missiles, or spacecraft, and to ground accident investigation boards (GAIB) for duty-related ground accidents. The legal advisors advise AIB/GAIB members and help ensure board reports comply with applicable laws and regulations.

Programming sheet: Figure 5-2

Special requirements: None

5-3.5 Environmental Law and Litigation Division (JACE)

JACE provides expert legal support in all forms of environmental and utility litigation, regulation, and legislative matters. JACE advises Air Force clients on installation operation and management, natural infrastructure, environmental compliance, environmental restoration, utility rates, utility contracts, and renewable projects. JACE is responsible for the Environmental Law FSC, the Utility Law FSC, and three other field offices.

Programming sheet: Figure 5-2

Special requirements:

- Work area: W1
- Closed secure/storage area: 849 square feet (shared with JAC and JACL), with 225 linear feet of storage for litigation files
- Break area: B1

The Environmental Law FSC is located at JB San Antonio, Texas, and is addressed in Chapter 6, paragraph 6-4.3.

The Utility Law FSC is located at Tyndall AFB, Florida, and is addressed in Chapter 6, paragraph 6-4.6.

5-3.6 General Litigation Division (JACL)

JACL practices a broad range of civil and administrative litigation and has three branches: the Labor Law Field Support Center (LLFSC), the Military Personnel Litigation Branch, and the Information Litigation Branch. JACL represents the Air Force in federal, civil, and administrative litigation, and defends against lawsuits asserting violations of the Constitution, the Civil Rights Acts, federal labor law, civil service law, the Freedom of Information Act, the Privacy Act, and military personnel policies.

Programming sheet: Figure 5-2

Special requirements:

- Conference room: Includes table, with seating for eight
- Work area: W1
- Closed/secure storage: Shared with JACE, with 653 linear feet for storing litigation files
- Break area: B1

5-3.7 Labor Law Field Support Center (LLFSC)

The LLFSC focuses on matters such as discrimination complaints, dispute resolution, arbitration, labor agreement negotiations, and labor relations management of the Air Force civilian workforce.

Programming sheet: Figure 5-2

Special requirements: Same as paragraph 5-3.6

5-4 COMMERCIAL LAW AND LITIGATION DIRECTORATE (JAQ)

5-4.1 Function and Adjacency

JAQ's mission is to defend the Air Force in bid protests, contract and intellectual property disputes, and contract-related litigation worldwide, specializing in contract and commercial law. Additionally, JAQ handles all protests to the Government Accountability Office (GAO) and works with the Department of Justice (DOJ) on litigation arising from privatization actions. JAQ is located in the Jones Building and has two divisions, each of which serves as an FSC:

- Commercial Litigation FSC (CLFSC)
- Contract Law FSC (KLFSC)

5-4.2 JAQ Leadership Suite

Programming sheet: Figure 5-2

Special requirements:

- Work area: W1
- Closed/secure storage: Same as paragraph 5-4.3
- Break area: B1

5-4.3 JAQC Commercial Litigation Field Support Center (CLFSC)

JAQC litigates bid protests at GAO and provides Air Force acquisition attorneys to serve on multidisciplinary independent review teams (MIRT). The MIRTs function as special teams to identify potential grounds for bid protests prior to source selection in major acquisition programs and represent the Air Force before the Armed Services Board of Contract Appeals (ASBCA).

Programming sheet: Figure 5-2

Special requirements:

- Work area: W1
- Conference room: Includes table, with seating for 16
- Closed/secure storage: 643 square feet (shared with JAQ and JAQK), with 760 linear feet of storage for storing contract litigation files; requirement increasing due to closure of archives for staging
- SCIF: Required for bid protests, but not currently available

- Break area: B1

5-4.4 JAQK Contract Law Field Support Center (KLFSC)

JAQK is a full-spectrum provider of contract legal support Air Force-wide, including contingency contracting, at installation level and below. Additionally, it supports the Air Force legal outreach program, providing educational products and tools for all Air Force acquisition attorneys to enhance the quality and efficiency of acquisition legal support enterprise-wide.

Programming sheet: Figure 5-2

Special requirements:

- Work area: W2
- Conference room: Shared with JAQC
- Closed/secure storage: Same as paragraph 5-4.3
- Break area: B1

5-5 COMMUNITY LEGAL SERVICES DIRECTORATE (CLS)

5-5.1 Function and Adjacency

The CLS mission encompasses all areas of the Air Force legal practice where an Air Force attorney represents a personal client, excluding defense services, and an attorney-client relationship and privilege exist. CLS is located in the Jones Building and has three divisions:

- Office of Airmen’s Counsel (CLSA)
- Community Legal Services Division (CLSL)
- Special Victims’ Counsel Division (CLSV)

CLSA is located on JB San Antonio-Randolph and is addressed in Chapter 6, paragraph 6-3.

5-5.2 CLS Leadership Suite

Programming sheet: Figure 5-2

Special requirements:

- Conference room: Includes table, with seating for eight

- Work area: W1
- Break area: B2
- Waiting area: Seating for eight

5-5.3 Community Legal Issues Division (CLSL)

CLSL is responsible for establishing legal assistance policy impacting Airmen, their families, and retirees, and providing legal assistance training to field attorneys.

Programming sheet: Figure 5-2

Special requirements: Same as paragraph 5-5.2

5-5.4 Special Victims' Counsel (CLSV)

CLSV provides support through independent attorney representation of sexual assault victims, building and sustaining victim resiliency, empowering them by enforcing their rights, and increasing legal assistance.

Programming sheet: Figure 5-2.1

Special requirements: Same as paragraph 5-5.2

SVC offices, located on separate installations, are addressed in Chapter 6, paragraph 6-2.

5-6 AIR FORCE COURT OF CRIMINAL APPEALS (AF/JAH)

5-6.1 Function and Adjacency

AF/JAH is empowered to hear appeals of Air Force courts-martial and certain trial court rulings. As the only appellate court in the Air Force, it is located in the first floor of the Jones Building. It seats nine appellate judges and shares support spaces with the adjacent base trial courtroom.

5-6.2 Appellate Courtroom

Programming sheet: Figure 5-3

Special requirements: The courtroom includes a nine-judge integrated bench, clerk of court station, government and defense counsel areas, gallery area, waiting room, judge's robing room, deliberation/conference room with coffee bar, unisex restroom, and public restrooms.

5-6.3 JAH Office Suite

Programming sheet: Figure 5-3

Special requirements: The office suite includes the chief judge's office, other appellate judge offices, clerk of court office, law clerk and commissioner offices, paralegal workstations, a break area, and restrooms. Judges' offices have bulletproof doors as an additional security precaution.

5-6.4 Site Selection

The nine appellate judge offices are collocated with the appellate courtroom in the Jones Building.

Figure 5-3 JAH Programming Sheet

Acoustics		Floors, partitions, and ceilings will meet or exceed the STC 50 requirement. Door to meet the STC 45 requirement.
Furnishings Fixtures & Equipment (FF&E), Casework		Include nine-person wood conference table, nine swivel chairs, and whiteboard.
Special Requirements		Direct access to courtroom, to ensure judges have as little contact as possible with other participants in the proceedings.

5-7 TRIAL JUDICIARY (AF/JAT)

5-7.1 Function and Adjacency

AF/JAT manages the Air Force judicial circuits, ensuring judges are provided for courts-martial, administrative boards, judicial investigations, parole violation hearings, and special hearings related to draft environmental impact statements. AF/JAT is home to the Central Docketing Office, responsible for managing the docket for all events requiring an assigned trial judge.

Programming sheet: Figure 5-2

Special requirements:

- Work area: W1
- Break area: B1

The judicial circuits, located in the field, are addressed in Chapter 6, paragraph 6-6.

This Page Intentionally Left Blank

CHAPTER 6 AFLOA FIELD OFFICES AND FIELD SUPPORT CENTERS

6-1 JAJD AREA DEFENSE COUNSEL (ADC) OFFICES

6-1.1 Function and Adjacency

The ADC provides Airmen suspected of offenses or facing adverse administrative action with independent legal advice and representation. ADC personnel provide confidential advice, free from the influence of local chains of command. Operational and spatial separation of ADC offices facilitates attorney-client interaction.

Programming sheet: Figure 6-1

Special requirements:

- Due to client intake and interviewing responsibilities, the defense paralegal is entitled to a P2 office.
- For security, provide duress alarms in all offices, as well as a secondary exit.

6-1.2 Site Location

The ADC office can either be free-standing (preferable) or collocated in a multi-use building. If it is a stand-alone facility, locate the ADC in close proximity with dorms or dining facilities, allowing easy access for Airmen. It is imperative to separate the ADC office from the following facilities:

- Installation legal office
- Sexual Assault Response Coordinator (SARC)
- Special Victims' Counsel (SVC)
- Installation command offices
- Security Forces/AFOSI offices
- Family Advocacy office
- IG office

Figure 6-1 ADC Office Programming Sheet

(This programming sheet is notional, in that it reflects the space requirements for the ADC legal office depicted in Figures 6-2 through 6-4. However, it can be used for all offices of the same type, using the formulas listed in the comments.)

6-2 CLSV SPECIAL VICTIMS' COUNSEL (SVC) OFFICES

6-2.1 Function and Adjacency

SVCs represent victims of sexual assault during reporting, military investigations, and military proceedings, in both trial and post-trial matters. They advocate to protect victims' rights by removing barriers to victim participation in the military justice process and assisting victims in obtaining available services and resources. SVCs are located at bases throughout the Air Force, yet represent clients through an independent chain of command in AFLOA. Eligibility for representation and the scope of representation is a vital and expanding Air Force mission.

Programming sheet: Figure 6-5

Special requirements:

- Due to client intake and interviewing responsibilities, the Special Victims' Paralegal (SVP) is entitled to a P2 office.
- Larger waiting area, including a play area for children.

6-2.2 Site Location

The privacy and dignity of a sexual assault victim is paramount when considering SVC facilities. SVC offices may be stand-alone facilities (preferable) or secondary tenants in buildings that serve another primary function. The preferred location is one that provides discreet 24/7 entry and direct access to and from a parking lot. Provide a secondary exit for added security. Preferred adjacencies include:

- Installation chaplain's office
- Installation clinic/hospital
- SARC office
- Equal Opportunity office

It is imperative that SVC facilities be separate from the following:

- ADC office
- Installation legal office
- Security Forces office
- AFOSI office
- IG office

Figure 6-5 SVC Programming Sheet

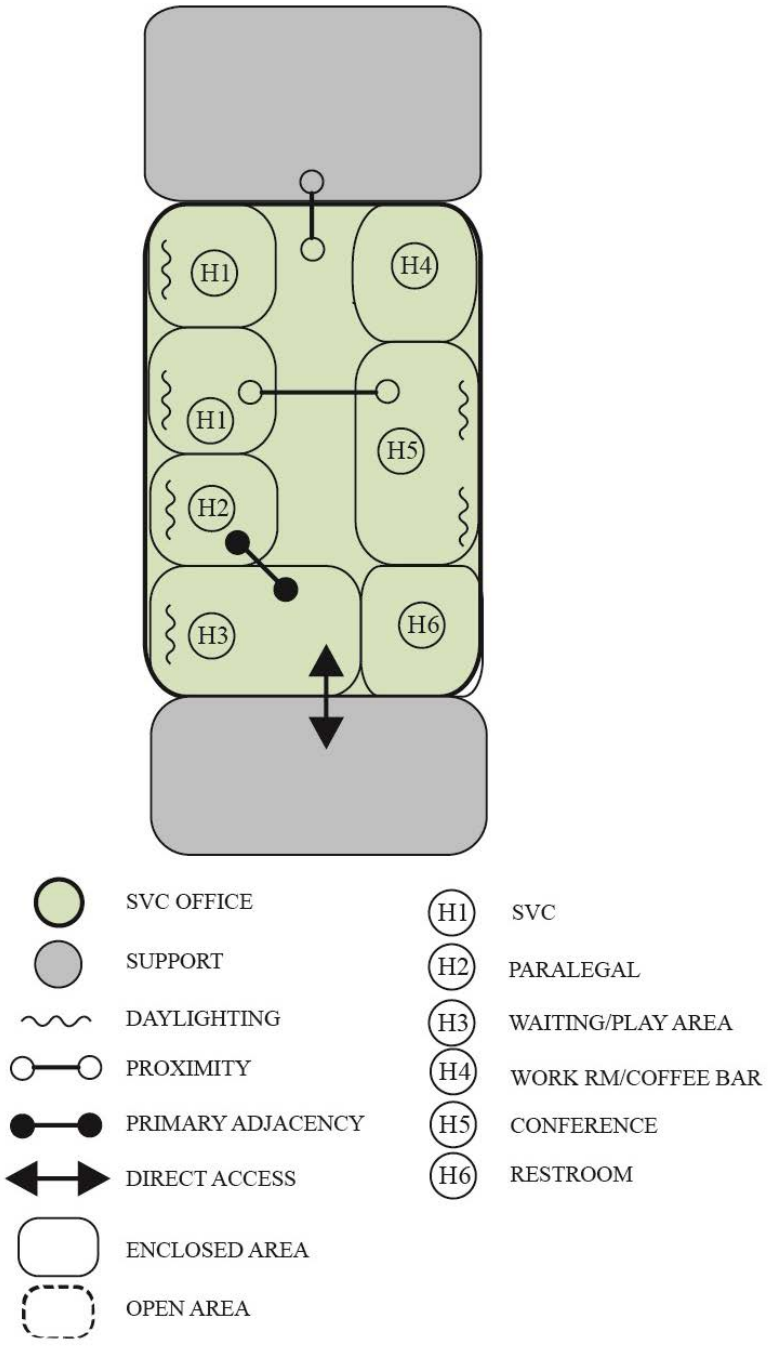
Figure 6-6 (Not Used)

Figure 6-7 SVC Adjacency Diagram



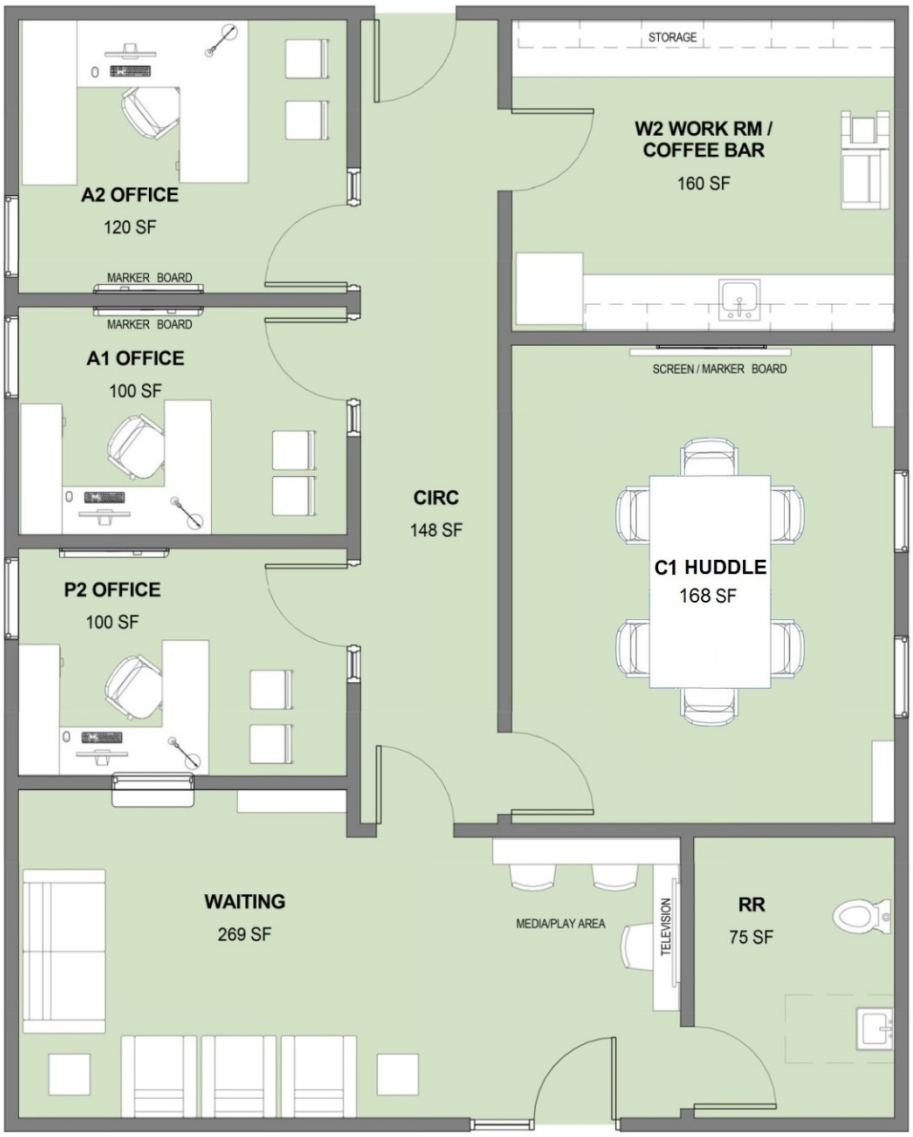


Figure 6-8 SVC Notional Floor Plan

6-3 CLSA OFFICE OF AIRMAN'S COUNSEL (OAC)

6-3.1 Function and Adjacency

The OAC represents Airmen involved in the Disability Evaluation System (DES). OAC attorneys and paralegals provide legal assistance to help Airmen reach their desired medical evaluation outcome. As the Airmen progress through the system, the OAC provides more specific advice, ultimately representing them if they choose to appear before the Formal Physical Evaluation Board (FPEB). The OAC also represents Airmen in appeals to the Secretary of the Air Force Personnel Council (SAFPC) and the Veterans Administration (VA). The OAC has unique privacy and security concerns because it routinely handles Health Insurance Portability and Accountability Act (HIPAA) and Privacy Act documents. Typically, four to five clients report to the FPEB each day, are in-briefed by OAC paralegals, and meet with assigned attorneys to prepare for FPEB hearings. Frequently, clients bring family members and/or medical escorts to assist them, as well as witnesses to testify on their behalf.

Programming sheet: Figure 6-9

Special requirements:

- Chief's office: A4
- Deputy chief's office: A3
- Handicap accessibility
- Waiting area with seating for 15, including space for three to four wheelchairs
- Records viewing room: Seating for 2 at each computer workstation
- Conference Room: C3
- Work room: W3
- Closed/secure storage area: Locked file cabinet, with 12 linear feet of storage for HIPAA and Privacy Act documents
- Break area: B2, B1
- IDS alarm at front and back doors
- Duress alarms in all offices and workstations

6-3.2 Site Selection

The OAC is a unique, specialized legal representation group, presently located at JBSA-Randolph. It could be situated in a stand-alone facility, but currently is a secondary tenant in another building. The preferred location for the office is one readily accessible on base, with direct access to and from a parking lot. Additionally, because many OAC clients have disabilities that make it difficult for them to ambulate, wheelchair and handicap accessibility is vital.

Figure 6-9 OAC Programming Sheet

(This programming sheet is notional, in that it reflects the space requirements for the OAC legal office depicted in Figures 6-10 and 6-11.)

6-4 FIELD SUPPORT CENTERS (FSC)

6-4.1 Function and Adjacency

In addition to AFLOA/JACC's offices in the Jones Building, it also staffs five satellite FSCs:

- Air Force Claims Service Center (AFCSC)
- Environmental Law Field Support Center (ELFSC)
- Medical Cost Reimbursement Program (MCRP)
- Medical Law Field Support Center (MLFSC)
- Utility Law Field Support Center (ULFSC)

6-4.2 Air Force Claims Service Center (AFCSC)

The AFCSC processes permanent change of station (PCS) claims by service members and other claims against the government.

Programming sheet: Figure 6-12

Special requirements:

- Server room: 200 square feet, secured and climate controlled, with four server racks
- Chief's office: A3
- Conference room: C3
- Work area: W1
- Closed/secure storage: 300 square feet, with 144 linear feet of storage for claims files and financial payment documents
- Break room: B2

6-4.3 Environmental Law Field Support Center (ELFSC)

The ELFSC provides a broad range of environmental law support to the MAJCOMs, and the Air Force Installation and Mission Support Center (AFIMSC) and its subordinate units.

Programming sheet: Figure 6-12

Special requirements:

- Chief's office: A4
- Deputy Chief's office: A3
- Conference room: C3
- Classified workstation/storage area: 260 square feet
- Open storage: 1,195 linear feet of high-density storage
- Work area: W1
- Break area: B1
- Waiting/reception area: Two seats, in leadership suite

6-4.4 Medical Cost Reimbursement Program (MCRP)

The MCRP pursues third-party liability claims to reimburse the Air Force for medical care provided to Air Force active-duty members, retirees, and dependents. It is dispersed in eight regional, CONUS-based offices.

Programming sheet: Figure 6-12

Special requirements for each regional office:

- Paralegals require P2 offices because of the confidential nature of frequent discussions regarding third-party liability claims.
- Conference room: C1 or C2, sized for total authorized on UMD
- Work area: W1
- Closed/secure storage: 240 to 400 linear feet of storage, depending on regional office requirement for retaining third-party liability claim records
- Break area: B1
- Client waiting/reception area: 2 seats

6-4.5 Medical Law Field Support Center (MLFSC)

The MLFSC embeds medical law consultants (MLC) and paralegals at regional medical treatment facilities (MTF) to provide medical-legal advice directly to the MTF/CC and staff, as well as other MTFs in the region. MLCs also provide reachback support to base

legal offices within their regions. The MLFSC is dispersed at nine regional CONUS offices and one OCONUS office.

Programming sheet: Figure 6-12

Special requirements: All support spaces (e.g., conference room, storage area, safe, waiting area, visiting attorney office, work room, break room, restrooms, and parking) are shared with other building occupants.

6-4.6 Utility Law Field Support Center (ULFSC)

As the largest consumer of energy in the federal government, the Air Force works with many of the nation's power utilities to purchase electrical power. The ULFSC represents the Air Force before state public service commissions in utility rate negotiations.

Programming sheet: Figure 6-12

Special requirements:

- Conference room: C1
- Work area: W1

To the extent the information in this manual differs from that in Chapter 6 of AFMAN 32-1084, this information supersedes. Other applicable information not included in this manual can be found in AFMAN 32-1084, Chapter 6, Tables 6.3 and 6.4.

1. Attorney Offices: A2 - for attorneys, as authorized on UMD.
2. Paralegal/Administrative Work Spaces: P2 - 1, for LOS; P1 - other paralegal/administrative personnel, as authorized on UMD.
3. Conference Room: As required.
4. Work Room: As required.
5. Break Room: As required.
6. Total storage requirements: 30 linear ft. + (# authorized on UMD X 10) linear ft. Includes open area storage (outside individual offices and workstations) and closed/secure area storage (in separate, locked area). Distribution of open and closed storage depends on specific legal office requirements.
7. Special Storage: As required (e.g., safe or SCIF).
8. Waiting/Reception Area: As required.
9. Parking (basic requirement): # authorized on UMD + avg. # clients.
10. Administrative areas include circulation factor of 10%, per AFMAN 32-1084.

6-5 OTHER AFLOA FIELD OFFICES

6-5.1 Function and Adjacency/Site Location

In addition to the AFLOA offices covered above, JAQK, JACE, the ELFSC, the LLFSC, and JAS have small satellite offices outside the National Capital Region (NCR) at various U.S. locations to forward station personnel to help execute the AFLOA mission. The standard programming sheet for these offices is Figure 6-12.

6-6 TRIAL JUDICIAL CIRCUITS

6-6.1 Function and Adjacency

The AFJAGC has five trial judicial circuits, three CONUS and two OCONUS. Each circuit office includes at least two military judges (AF/JAT), two senior trial counsel (AFLOA/JAJG), two senior defense counsel (AFLOA/JAJD), one defense paralegal manager (AFLOA/JAJD), a senior special victims' counsel (AFLOA/CLSV), and an enlisted court reporter (AFLOA/JAJ). CONUS-based circuits will have additional military judges, senior trial counsel, senior defense counsel, and enlisted court reporters. Collocating these senior military justice practitioners enhances their operational impact individually and collectively, both within their specialized military justice role, as well as across specializations. Offices should be configured with shared common space so that there is easy access between functional groups.

Programming sheet: Figure 6-13

Special requirements:

- Conference room: C1
- Work area: W1
- Break room: B1, for overseas circuits; B2, for CONUS circuits

6-6.2 Site Location

The trial judicial circuit offices will be typically secondary tenants in buildings that serve another primary function. The offices will be located at JB Langley-Eustis, JB San Antonio-Randolph, Travis AFB, Kadena AB, and Ramstein AB.

CHAPTER 7 AIR FORCE JUDGE ADVOCATE GENERAL'S SCHOOL (AFJAGS)

7-1 FUNCTION AND ADJACENCY

AFJAGS serves as the primary Air Force legal education and training site. The school is responsible for legal education courses for judge advocates, enlisted paralegals, and civilian attorneys. It has seven divisions:

- Military Justice Division
- Civil Law Division
- Operations and International Law Division
- Professional Outreach Division
- Paralegal Development Division
- Accreditation, Curriculum and Evaluations Division
- Administrative Division

It also publishes several major publications, including the *Air Force Law Review*, *The Reporter*, *Military Commander and the Law*, and *Air Force Operations and the Law*.

7-1.1 Site Location

The school is housed in the Dickinson Law Center, which is part of the larger Air University campus, located on Maxwell AFB, Alabama. The facility was built in 1993; there is no planned move in the near future.

7-1.2 Facility Components

AFJAGS is a two-story, 56,000-square-foot facility that includes a leadership suite, two auditoriums (with adjoining control rooms with VBrick systems), 15 seminar rooms, two courtrooms, a library, an executive conference room, an adjoining small conference room, an AFJAGC heritage room, a computer training room, a remote learning production room, a classified storage room, 52 faculty offices, administrative offices, instructor and student lounges, a distinguished visitor (DV) suite, an extended lobby, a mail/supply room, a server room, and restrooms. Under consideration is expansion of the heritage room and addition of a food service.

Within the school there are six main types of learning spaces: auditoriums, seminar rooms, conference rooms, computer lab, a library, and practice courtrooms. Additionally, there are student support spaces, including a large lounge area and restrooms on the first floor. The second floor contains instructor and administrative offices, a professional development suite, and building support spaces, including

restrooms. The general layout of the building is depicted in Figures 7-2 and 7-3. The programming sheet for the facility is Figure 7-1.

7-1.3 AFJAG Leadership Suite

Special requirements:

- VTC capability in Commandant's office
- Reception/waiting area: Alcove, with seating for three
- Unisex restroom

CHAPTER 8 LEGAL INFORMATION SERVICES DIRECTORATE (JAS)

8-1 FUNCTION AND ADJACENCY

JAS is the AFJAGC information technology (IT) directorate, managing JA IT systems and fulfilling a DoD executive agency for legal research. Its mission is to provide responsive and secure, legal-specific IT solutions for the AFJAGC and other DoD legal communities. JAS has six divisions:

- System Operations and Development Division
- Applications Development Division
- Legal Division
- Information Assurance Division
- Plans/Requirements/Testing and Training Division
- Resource/Personnel Division

8-1.1 Site Location

In 1993, JAS moved from Colorado to the second story of AFJAGS at Maxwell AFB, Alabama. In 2008, due to growth in the school faculty, JAS moved to an older building nearby on base. The data center that supports JAS is still located in the AFJAGS facility. Additionally, a small cadre of JAS programmers is located with the AFCSC at Wright-Patterson AFB, Ohio.

8-1.2 JAS Leadership Suite

Programming sheet: Figure 8-1

Special requirements: VTC capability in director’s office

8-1.3 Other JAS Offices

Programming sheet: Figure 8-1

Special requirements:

- Testing/training room
- Computer work space/storage
- Data center (in AFJAGS): Raised flooring

Figure 8-1 JAS Programming Sheet

(This programming sheet is notional, in that it reflects the space requirements for the JAS legal office depicted in Figures 8-2 and 8-3.)

To the extent the information in this manual differs from that in Chapter 6 of AFMAN 32-1084, this information supersedes. Other applicable information not included in this manual can be found in AFMAN 32-1084, Chapter 6, Tables 6.3 and 6.4.

1. Attorney Offices: A7 - 1, for Director; A3 - 1, for Deputy Director; A2- for other attorneys, as authorized on UMD; A1 - 1, for visiting attorney.
2. IT/Paralegal/Administrative Work Spaces: P2 - for LOS and non-attorney division chiefs, as authorized on UMD; P1 or P4 - for IT, paralegal, and administrative personnel, as authorized on UMD (P4s necessary due to extra IT equipment required in workstations).
3. Conference Room: 2 C1s, C4. 150 sq. ft. added for speaker, per AFMAN 32-1084, Table 6.4.
4. Work Rooms: W2 and W3.
5. Break Room: B3.
6. Total storage requirements: 30 linear ft. + (# authorized on UMD X 10) linear ft. Includes open area storage (outside individual offices and workstations) and closed/secure area storage (in separate, locked area). Distribution of open and closed storage depends on specific legal office requirements.
7. Special Storage: Safe.
8. Waiting/Reception Area: 2, in leadership suite (20 sq. ft. per person).
9. Parking spaces (basic requirement): # authorized personnel on UMD.
10. Administrative areas include circulation factor of 10%, per AFMAN 32-1084.

CHAPTER 9 OTHER FIELD OPERATING AGENCIES (FOA)

9-1 FUNCTION AND ADJACENCY/SITE LOCATION

FOAs are commands subordinate to Air Staff directors that perform specialized missions. The FOAs, other than AFLOA, with legal offices are:

- Air Force Inspection Agency (AFIA)
- Air Force Office of Special Investigations (AFOSI)
- Air Force Personnel Center (AFPC)
- Air Force Safety Center (AFSEC)
- National Air and Space Intelligence Center (NASIC)

9-1.1 Air Force Inspection Agency (AFIA)

AFIA provides independent inspection, evaluation, and analysis to advance the continuous improvement of mission effectiveness at all levels in the Air Force. Its mission set includes nuclear surety, healthcare, management inspections of organizations above wing level, unit effectiveness inspections of FOAs and DRUs, directed inspections of programs of significant interest to Air Force leadership, and oversight of all aspects of the Air Force Inspection System. AFIA/JA is located at Kirtland AFB, New Mexico.

Programming sheet: Figure 9-1

Special requirements: Support spaces (e.g., conference room, work room, break room, and restrooms) are shared with other building occupants.

9-1.2 Air Force Office of Special Investigations (AFOSI)

AFOSI is a federal law enforcement agency, with responsibility for conducting independent criminal investigations, counterintelligence activities, and specialized investigative and force protection support for the Air Force worldwide. AFOSI/JA is located at Marine Corps Base Quantico, Virginia.

Programming sheet: Figure 9-1

Special requirements:

- Legal office is sited in a SCIF
- Support spaces (e.g., conference room, work room, break room, and restrooms) are shared with other building occupants

- Visiting attorney office: A1

9-1.3 Air Force Personnel Center (AFPC)

AFPC executes personnel programs covering the entire life cycle of Air Force military and civilian personnel, from accession through retirement. AFPC/JA is located at JB San Antonio - Randolph, Texas.

Programming sheet: Figure 9-1

Special requirements:

- Conference room: C2
- Open storage/library: 525 square feet
- Work area: W1
- Break area: B1
- Reception/waiting area: 6 seats
- Visiting attorney office: A1

9-1.4 Air Force Safety Center (AFSEC)

AFSEC develops, implements, executes, and evaluates Air Force aviation, ground, weapons, space, and system mishap prevention, and nuclear surety programs and policy. AFSEC/JA is located at Kirtland AFB, New Mexico.

Programming sheet: Figure 9-1

Special requirements:

- AFSEC records library: Secure 1,800-square-foot storage room, with 1,054 linear feet of storage for privileged safety investigation reports for review and analysis
- Work area: W1
- Break area: B1
- Visiting attorney office: A1

9-1.5 National Air and Space Intelligence Center (NASIC)

NASIC analyzes intelligence on foreign air and space forces, weapons, and systems. NASIC assessments of aerospace performance characteristics, capabilities, and

vulnerabilities are used to shape national security and defense policies and support weapons treaty negotiations and verification. NASIC/JA is located at Wright-Patterson AFB, Ohio.

Programming sheet: Figure 9-1

Special requirements:

- Legal office is sited in a SCIF
- Support spaces (e.g., conference room, work room, break room, and restrooms) are shared with other building occupants
- Visiting attorney office: A1

To the extent the information in this manual differs from that in Chapter 6 of AFMAN 32-1084, this information supersedes. Other applicable information not included in this manual can be found in AFMAN 32-1084, Chapter 6, Tables 6.3 and 6.4.

1. Attorney Offices: A4 - 1, for SJA; A3 - 1, for DSJA, if authorized; A2 - for other attorneys, as authorized on UMD; A1 - for visiting attorney, as required.
2. Paralegal/Administrative Work Spaces: P2 - 1, for LOS, if authorized; P1 - other paralegals and administrative personnel, as authorized on UMD.
3. Conference Room: As required.
4. Work Room: W1.
5. Break Room: B1.
6. Total storage requirements: 30 linear ft. + (# authorized on UMD X 10) linear ft. Includes open area storage (outside individual offices and workstations) and closed/secure area storage (in separate, locked area). Distribution of open and closed storage depends on specific legal office requirements.
7. Special Storage: As required (e.g., safe or SCIF).
8. Waiting/Reception Area: As required.
9. Parking (basic requirement): # authorized on UMD + avg. # clients.
10. Administrative areas include circulation factor of 10%, per AFMAN 32-1084.

CHAPTER 10 ENGINEERING/TECHNICAL CRITERIA

10-1 ACOUSTICAL PERFORMANCE

10-1.1 Acoustical Design

For any given critical legal space, it is important that speech from the activity within not be audible in adjacent spaces, and vice-versa. Special attention should be paid at the earliest stages of planning to ensure that noise-producing spaces (e.g., building systems equipment rooms, restrooms, circulation space, public lobbies) are not located directly adjacent (vertically or horizontally) to noise-sensitive spaces.

Include an acoustic consultant during project development, whether new construction or remodeling, to determine the appropriate information needed for the design of attorney offices, courtrooms, and auditoriums, so that sound/vibration issues are properly addressed. Internal partitions must be of a construction determined to achieve an appropriate level of airborne sound isolation, as measured per ASTM E90-09. All facade elements (e.g., walls, glazing, roofs, flooring) must be designed to provide appropriate sound isolation.

The following list of STC ratings for privacy levels, discussed in the various room data sheets, are required in courtrooms, auditoriums, command and leadership suites, and rated attorney offices. The STC ratings fall into three categories. These categories are listed below, along with typical examples of interior partition construction that provides the appropriate acoustic isolation:

STC of 40-45: One layer of 12.7-millimeter (0.5-inch) gypsum wallboard on each side of the steel studs to the underside of the structure, with acoustic sealant at top and bottom. Include an acoustic break along the base of the walls.

STC of 50: One layer of 15.9-millimeter (0.625-inch) gypsum wallboard on each side of the steel studs, plus an additional layer on one side, to the underside of the structure, with acoustic sealant at top and bottom. (Install 69.8-millimeter [2.75-inch] glass fiber insulation in the wall cavity.)

STC of 55: One layer of 6.3-millimeter (0.25-inch) and 15.9-millimeter (0.625-inch) gypsum wallboard on each side of the steel studs to the underside of the structure, with acoustic sealant at top and bottom. (Install 69.8-millimeter [2.75-inch] glass fiber insulation in the wall cavity.)

10-1.2 HVAC Acoustic Performance

HVAC acoustic performance must be a major consideration regarding the selection of equipment for both courtrooms and legal offices. Systems serving the courtrooms, legal offices, and auxiliary spaces must be designed with sound attenuation to provide consistent and acceptable sound levels. This is particularly critical in any court facilities, auditoriums, and conference rooms that require extensive use of sound and A/V or VTC equipment for recording and presentations. Regulate noise during all modes of

operation and for all load conditions by providing an HVAC system with one or more of the following:

- Sound traps and acoustic lining in the duct work
- Low-velocity, low-static pressure fan systems
- Special low noise diffusers

If air is returned by the ceiling plenum, special attention must be given to the location of any partitions extending to the floor structure above and to the acoustical treatment of the required penetration of these partitions for return air.

Locate all HVAC equipment, including air-handling units (AHU) and variable air volume (VAV) boxes, away from courtrooms, jury rooms, judge's chambers, and designated spaces. The minimum distance between AHUs and critical facilities must be 7.6 meters (25 feet). Provide the appropriate treatment of mechanical supply/return ducts to minimize sound and voice transfer from courtroom facilities, conference rooms, or legal offices to surrounding areas. Noise criteria (NC) define the limits that the octave band spectrum of the noise source must not exceed, and must range from 25 to 30 in facilities. For sound level maintenance, courtrooms or other designated spaces need to be served by constant volume air supply. Air ducts serving courtrooms, trial jury deliberation rooms, auditoriums, and critical conference rooms must be lined with 50 millimeters (2 inches) of acoustical absorption material for a length of at least 3700 millimeters (12 feet) from the diffuser or return air intake to minimize sound transmission.

Record of Changes (changes are indicated by **1**\ ... /**1**/)

Change No.	Date	Location
1	01-08-2024	Deleted “2015” reference for IECC in “Revision Summary Sheet” and updated IECC reference in Appendix A as requested by CP Panel dated 12-13-2023. Also updated WBDG web page link and incorporated CCR’s #6766, #7028, #8590, #10036, #10048, #11476, and a few grammar related changes.
2	02-14-2024	Revised paragraph 4-6.7.2 Window Fall Prevention; removed paragraph B4-8.6.1 along with image; and updated Reference Appendix.

This UFC supersedes UFC 4-711-01 dated 13 July 2006.

FOREWORD

The Unified Facilities Criteria (UFC) system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and applies to the Military Departments, the Defense Agencies, and the DoD Field Activities in accordance with USD (AT&L) Memorandum dated 29 May 2002. UFC will be used for all DoD projects and work for other customers where appropriate. All construction outside of the United States is also governed by Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA), and in some instances, Bilateral Infrastructure Agreements (BIA.) Therefore, the acquisition team must ensure compliance with the most stringent of the UFC, the SOFA, the HNFA, and the BIA, as applicable.

UFC are living documents and will be periodically reviewed, updated, and made available to users as part of the Services' responsibility for providing technical criteria for military construction. Headquarters, U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering Command (NAVFAC), and Air Force Civil Engineer Center (AFCEC) are responsible for administration of the UFC system. Defense agencies should contact the preparing service for document interpretation and improvements. Technical content of UFC is the responsibility of the cognizant DoD working group. Recommended changes with supporting rationale should be sent to the respective service proponent office by the following electronic form: Criteria Change Request. The form is also accessible from the Internet sites listed below.

UFC are effective upon issuance and are distributed only in electronic media from the following source:

- Whole Building Design Guide website **\1** https://www.wbdg.org **/1/.**

Refer to UFC 1-200-01, *DoD Building Code (General Building Requirements)*, for implementation of new issuances on projects.

UNIFIED FACILITIES CRITERIA (UFC)
REVISION SUMMARY SHEET

Document: UFC 4-711-01,

Superseding: 2006 version of UFC 4-711-01, *DESIGN: FAMILY HOUSING*

Description: This is a Joint-Service document that supersedes and updates the 2006 version of the same UFC.

Reasons for Document: The UFC 4-711-01, *FAMILY HOUSING* represents another step in the joint Services effort to bring uniformity to the planning, design and construction of military Family Housing. This revision updates the 2006 UFC in accordance with the following:

- Alignment with the latest model codes, standards, and practices governing quality residential construction.
- Update housing unit design to better reflect off-post market equivalents and privatized housing.
- Elimination of two bedroom units.
- Incorporation of minimum areas for critical dwelling unit spaces.
- Requirement for 2-car garages.
- Stringent window fall prevention requirements (exceeds the Code minimum)
- Minor revisions to the neighborhood features section to broaden the amenities.
- Removal of the requirement for EPA ENERGY STAR® Home Certification. Note that individual ***products*** are still required to be ENERGY STAR certified.
- Addition of Best Practices and Lessons Learned appendix.
- Incorporation of resiliency.

Impact: The following impacts will result from this update of UFC 4-711-01:

- Energy savings through compliance with Energy performance requirements of the **\1\ /1/** International Energy Conservation Code (IECC) – estimated to be 32% average savings over the 2006 UFC.
- Increased usability through increasing reliance on mature industry codes and standards.
- Safer and more resilient housing through incorporation of cost effective resiliency practices and increased window fall prevention measures.

Unification Issues

- Army requires LEED certification for housing projects, Navy and Air Force do not.

TABLE OF CONTENTS

CHAPTER 1 INTRODUCTION 1

1-1 BACKGROUND. 1
1-2 PURPOSE AND SCOPE. 1
1-2.1 Purpose. 1
1-2.2 Goal and Objectives. 1

CHAPTER 1 INTRODUCTION

1-1 BACKGROUND.

This UFC originated as a guidance document to ensure the construction of high quality housing to support Military families.

1-2 PURPOSE AND SCOPE.

1-2.1 Purpose.

This UFC provides guidance for the design, construction, and **\1** alterations **/1/** of Department of Defense (DoD) family housing facilities in the United States, its possessions, and foreign countries. It is intended, when used in combination with applicable building codes and standards which this UFC supplements, to define minimum standards consistent with high quality, energy efficient, sustainable family housing equivalent to off-post market offerings.

It is not within the scope of this UFC to specify the content of design deliverables and construction documentation for housing projects. Refer to the Design agency for the applicable specifications.

1-2.2 Goal and Objectives.

The Military Family Housing Goal Statement defines the ideal end-state for military communities and housing. It is not intended to be static, but responsive to the dynamics of military family housing needs. The Military Family Housing Goal is:

- To provide quality-housing neighborhoods and dwellings to contribute to a strong force of skilled people who provide the readiness of our Military Forces.

Military family housing objectives support the family housing goal. These objectives are:

- To bring the existing required housing inventory up to contemporary housing standards (i.e. life safety, convenience, quality, livability, maintainability) to the extent practicable through repair, **\1** alterations **/1/** and replacement.
- To reduce energy consumption per Executive Order (EO) 13834, which establishes a variety of annual energy reduction, renewable energy, water conservation, and waste management goals.

Military family housing facility programs should use a “whole house revitalization” and “whole neighborhood” approach for **\1** alterations **/1/**, replacement, and repair of existing family housing units and neighborhoods pursuant to elevating the overall quality of housing. Whole neighborhood/house revitalization should generally follow the following prioritization schedule:

- Restore housing units to structural soundness.
- Extend the useful life of facilities and infrastructure by at least 25 years.
- Achieve high energy performance and sustainability.
- Increase quality of life and convenience.
- Provide utility repair and replacement.
- Provide street repair and replacement.
- Provide, enhance, and repair streetscapes.
- Provide, enhance community amenities.

1-3 APPLICABILITY.

This UFC applies to all Service elements and contractors involved in the planning, design, or construction of family housing projects.

1-4 GENERAL BUILDING REQUIREMENTS.

1-4.1 General.

This UFC shall not be construed to preclude application of, and adherence to, other governing DoD and Service specific regulations and policies. Also, no apparent omission in this UFC shall be construed to imply waiver authority to deviate from the minimum requirements of applicable building Codes and standards.

1-4.2 Building Code Criteria.

The DoD adopts the International Code Council (ICC) ***International Building Code*® (IBC)** (per UFC 1-200-01 DoD Building Code) and ***International Residential Code* (IRC)** as the primary voluntary consensus standard for DoD Family Housing. Except as augmented or modified in this UFC, design, construct new, and improve Family Housing in accordance with the following:

- Detached one- and two-family dwellings and multiple attached single-family dwellings (townhouses) not more than three stories above grade plane in height with a separate means of egress and their accessory structures shall comply with all sections of the ***International Residential Code (IRC)*** and referenced codes and standards.
- All other housing types shall comply with UFC 1-200-01 *DoD Building Code (General Building Requirements*), which augments the ***International Building Code (IBC)***. This includes primarily multifamily (i.e. apartment style) housing.

1-4.2.1 Definitions.

The following terms used throughout this document shall be defined as follows:

Code(s) – IRC, IBC, ABA, or other applicable code in accordance with the context.

Improvement(s), Improvement work, Improvement construction – blanket terms to encompass either repair, renovation, alteration, or reconstruction as defined specifically by ***ICC***.

*IBC Building - Building types subject to the **IBC** in accordance with 1-4.2*

*IRC Building - Building types subject to the **IRC** in accordance with 1-4.2*

Multifamily [dwellings] – Housing type with three or more dwelling units sharing common entry, circulation elements, mechanical service, and other supporting elements. Note that this definition excludes *Townhouses* which are defined as multiple attached single family dwellings. Multifamily housing is classified in IBC as R-2 and may be stand-alone or as part of a mixed occupancy/use building.

1-4.3 Supplemental Criteria.

Current supplemental criteria listed below provide service-specific operations, maintenance, planning, programming, design and construction guidance; provision of this list does not limit the services from publishing additional direction related to Family Housing.

- ARMY: Army Regulation AR 420-1 - Army Facilities Management. In addition, at the earliest phase of programming Family Housing projects, planners must consult with the USACE Center of Standardization (COS), Norfolk District, to assist in a thorough and comprehensive review prior to finalizing scope and 3086 costs. The COS also provides other resources including additional Army required technical criteria, template DD Form 1391, and template Design/Build Statement of Work.
- AIR FORCE: Air Force Family Housing Guide for Planning, Programming, Design, and Construction.
- MARINE CORPS: MCO P11000.22 – Marine Corps Housing Management Manual.

1-4.4 \1\ Alterations /1/ Based on Criteria.

Current criteria shall be used to the extent that it corrects or remedies any health and safety, structural, and major livability deficiencies. Projects should not be created for the sole purpose of meeting this UFC.

1-4.5 Accessibility.

1-4.5.1 Architectural Barriers Act (ABA) Standards.

DoD has adopted the Architectural Barriers Act (ABA) Standards. These Accessibility Standards include building and site accessibility requirements for Military Family Housing new construction, alterations, and leases to be applied at all project locations

that are subject to US law and DoD criteria. Projects in other locations may still be subject to local accessibility standards.

Refer to the US Access Board and the October 31, 2008 DoD Memo *Access for People with Disabilities* for additional information such as waiver requirements, applicability to projects outside the United States and its possessions, and host funded projects. These standards supersede the ICC codes for accessibility. Additional housing specific interpretive guidance provided in the following subparagraphs.

1-4.5.1.1 New Construction.

ABA requires that new housing projects include a percentage of units with mobility features (5%, with an accessible route) and communication features (2%). For the purpose of determining number of accessible units required, a *military installation* is defined as the area of responsibility of the Housing Office. It is not the ABA intent to require that a new housing project provide more than the required percentage in order to satisfy a current deficit of accessible Installation housing stock.

1-4.5.1.2 ABA Unit Dispersion.

For the purposes of accessible unit *dispersion*, housing *type* as indicated in the ABA should be defined in accordance with the variability of the particular military installation housing stock. For example, housing type may be differentiated by bedroom number (i.e. 3, 4, or 5 bedrooms units), by unit configuration (i.e. single family or duplex), or by other meaningful differentiator. It is not the ABA intent that each housing *type* adhere strictly to the percentage thresholds of the ABA (i.e. 5% of duplexes, 5% of apartments, etc.); these percentages apply to overall housing stock. Generally, accessible units shall be single story ground level units, although accessible apartments units may also be feasible.

1-4.5.1.3 \1\ Alteration /1/ Scope.

The planner/designer shall be aware of ABA standard scope triggers regarding **\1** alterations ***/1/***; for example, the requirement that dwelling units which include substantial alteration of a kitchen or bath, in combination with alteration of one other room, must incorporate mobility features and/or communication features throughout the unit pursuant to the satisfaction of the installation's overall percentage requirement. Normal maintenance, reroofing, painting or wallpapering, or changes to mechanical and electrical systems are not alterations unless they affect the usability of the building or facility. As an example, replacement of kitchen cabinets in-kind is not an alteration, but reconfiguring kitchen and dining areas while installing new cabinets is an alteration.

1-4.5.1.4 Mixed Use Buildings.

IBC buildings, especially multi-use mid-rise and high-rise, have additional accessibility requirements such as accessibility to building shared amenities, functional areas, public

bathrooms and others outside the scope of the dwelling unit. Refer to the ABA accessibility standards.

1-4.6 Antiterrorism and Security.

Antiterrorism standards are generally applicable only to residential buildings exceeding 12 units. Refer to UFC 4-01-01 *DoD Minimum Antiterrorism Standards for Buildings* for requirements for this housing type.

Locations outside the United States, its territories and possessions, locations subject to elevated threat, and/or housing associated with High Risk Personnel may require additional AT or protection measures. Consult with the Installation Antiterrorism Officer (ATO) and Security Officer to confirm requirements.

1-4.6.1 Housing for High Risk Personnel (HRP) Housing associated with HRP may require additional AT and protection measures. Determining the level of protection and associated protection measures for a HRP is the responsibility of the Protection-Providing Organization (PPO). Refer to UFC 4-010-03, Security Engineering Physical Security Measures for High Risk Personnel.

1-4.7 Historic Construction Criteria.

The National Historic Preservation Act of 1966, and subsequent Executive Orders, require the Federal Government to take into account historic housing facilities listed on, or are eligible for listing on, the National Register of Historic Places. Responsibility for the majority of preservation duties falls to each installation. Maintenance, **\1** alterations **/1/**, or repair of historic quarters, must comply with applicable DoD Directives and Instructions (see References). Coordinate work planned for historically significant quarters with State Historic Preservation Office (SHPO), Installation Cultural Resources personnel, and with local historic preservation officials.

This Page Intentionally Left Blank

CHAPTER 2 RESIDENTIAL COMMUNITY PLANNING

2-1 GENERAL.

Planners and designers must ensure that lot and site designs conform to standards or requirements stated in installation and family housing master plans. The goal of neighborhood design for military family housing is to develop and sustain a residential environment that responds to the military family, and reinforces the connection between families and community. Design neighborhoods to accommodate the widest range of residents and modes of transport.

In designing or improving a neighborhood, an important planning element is to create a sense of community and understand the nature of the housing area—the relationship of each dwelling unit to a cluster of units, neighborhood, and community as a whole. Housing areas should be planned so that community members can identify "their own" place in the overall neighborhood, while at the same time fostering social interaction vital to the military family support structure. Plan the site so that housing units are clustered into mini- or sub-neighborhoods, or are organized around a central element, such as a cul-de-sac, recreation area, community center, or other common amenity with attention to consistent architectural proportion among units. Consider the accommodation of multiple users– residents, motorists, and pedestrians alike - in establishing a hierarchy of safe and convenient passage with appropriate scale, vistas, and overall experience.

Promote, protect, and enhance the unique environment, character, and natural site features as much as possible. Consider the local history of the particular site and how to retain, and interpret that history in the architecture of the site.[1]

2-1.1 Site Selection

Plan to ensure that construction avoids, to the maximum extent practicable, wetlands, coastal and shoreline zones, and natural habitats when making neighborhood improvements or executing construction projects. These projects must undergo environmental impact analyses in compliance with the 1969 *National Environmental Policy Act (NEPA)* as implemented by Council on Environmental Quality regulations found at 40 CFR 1500-1508. Objectives of site development are to:

- Plan and provide adequate infrastructure.
- Use residential building blocks to create neighborhood identity.
- Orient buildings and paved surfaces to optimize solar control and minimize heat-island effects.

[1] For additional guidance on creating great neighborhoods, refer to https://www.planning.org/greatplaces/neighborhoods/characteristics.htm

- Ensure adequate and consistent unit setbacks from the street to limit street parking and to maintain sidewalks clear of driveway-parked vehicle intrusions.
- Strengthen the neighborhood with efficient traffic patterns for motorists, cyclists (consider cycling lanes), joggers, and pedestrians.
- Provide or create access to a full range of private and shared recreational facilities and associated parking.
- Use sustainable landscape design to minimize impact on the environment and reduce water consumption.

2-1.1.1 Flood Hazard Areas.

Do not locate Housing units in a Special Flood Hazard Area (SFHA) as determined by FEMA Flood Insurance Rate Maps (FIRM).

2-1.1.2 Compatible Use Zones.

New housing must be located in compatible areas with respect to aircraft noise, as established in DoDINST 4165.57 (1977, updated 12 March 2015), *Air Installation Compatible Use Zone* (AICUZ). Military Family Housing sites should have a maximum Day-Night Average Level (DNL) rating of less than 65. These standards also apply to housing sites near heavily traveled highways or other noise generating facilities. New Military Family Housing will not be located within any runway Clear Zone or Accident Potential Zone (APZ I or APZ II).

Site preparation and site improvements, required exclusively for support of a housing project, should be included in the design and be included in total project cost. Site preparation work includes demolition of existing structures, correction of drainage problems and unsuitable subsurface conditions, clearing, grubbing, and rough grading as applicable. Site improvements include utility systems, roads, streets, curbs and gutters, walks, driveways, off-street parking, recreation areas, bike and jogging paths, lawns, landscaping, low impact development, and finish grading as required to support function and livability of housing. Site improvements may require incorporation of a future ACP, refer to UFC 4-010-01.

2-2 NEIGHBORHOOD AND DENSITY.

Densities for family housing projects, expressed in units per acre, are listed in Table 2-2a. Density ranges represent guidelines intended to assist the master planner and designer in generating a housing type mix that results in the desired neighborhood density. The program benchmark density should be the median value.

Table 2-2a. Site Densities

Density Factors – Number of Units per Acre		
Low [1]	**Medium [2]**	**High [3]**
4-6	7-10	11-15

1. Suburban, moderately developed, and rural areas.
2. Developed urban areas, not included under "High" location.
3. Dense metropolitan areas and most overseas locations where land is not available to meet at least medium density. Only in exceptional cases will high-rise building density of up to 40 units per acre or 100 units per building be programmed.

2-2.1 Housing Types.

Refer to the table below for permitted dwelling unit types.

Table 2-2b. Permitted Units by Building Type and Grade

Unit Type	Apartment	Townhouse	Duplex[1]	Detached
O6-O7+	NP	NP	NP	P
E9, W4/5, & O4-O5 - 3-4 BR	NP	NP	P	P
W1/3, O1-O3 - 3-5 BR	P	P	P	P
E7-E8 - 4-5 BR	P	P	P	P
E7-E8 - 3 BR	P	P	P	NP
E1-E6 - 4-5 BR	P	P	P	NP
E1-E6 - 3 BR	P	P	P	NP

P =Permitted. NP = Not permitted
Table excludes foreign mid-rise and high-rise construction. This table does not apply to Air Force, which do not rank differentiate housing; Individual Services may have requirements that vary from these recommendations.

Note 1. 'over-under' style Duplex is not permitted.

2-3 NEIGHBORHOOD RECREATION.

Outside of the immediate yard areas of each dwelling unit, provide each neighborhood housing cluster a minimum of 2 acres per 100 population, but no less than two acres, of open area to support safe and convenient neighborhood recreation. These areas shall encompass age-appropriate play lots, common open areas, landscaped areas, dog parks, picnic areas, sitting areas, walking, biking and jogging paths as indicated below. Recreation areas shall have a maximum service area of 1/4 mile distance from the housing units they serve. New recreational areas are required to comply with chapter 10 of the ABA Accessibility Standards. Playground design, and equipment and surfaces shall comply with CPSC Publication No. 325 –*Public Playground Safety Handbook.* Avoid bare metal surfaces in playground equipment.

Locate recreational site amenities with appropriate adjacency compatibility. For example, tot lots should be located carefully with regard to playing fields for safety reasons, yet should have wide viewsheds from other park locations for security reasons; consider separating bike traffic from slower pedestrian traffic; dog parks shall be fenced and separate from play areas; consider consolidating 'hardscape' play areas like tennis and basketball, with appropriate sound buffers. Installation should determine the need for any supporting facilities.

Provide site amenities and recreational facilities as specified in Table 2-3, based on number of family housing units in the neighborhood. These areas need not be co-located, but may be dispersed in accordance with the masterplan and good neighborhood design practice. Design all site amenities in accordance with national, local, or installation design standards and guidelines.

Table 2-3. Site Recreation

ITEM	QUANTITY OF AMENITIES	REMARKS
Outdoor Spaces		
Tot lot (2-5 year olds)	Min 1 per neighborhood	
Play lot (6-10 year olds)	Min 1 per neighborhood	
Fenced Dog Park	Min 1 per neighborhood	Accommodate waste disposal
Picnic area	Min 1 per neighborhood	Provide min 2 tables per area. Preference is for shaded locations.

Common open areas	Min 1 per neighborhood	Leisure area for Frisbee, community events, etc. consider co-location with natural landscaped area.
Skate Board Park (optional)		
Natural landscaped areas (optional)	1 per neighborhood	
Basketball courts (optional)	1 per neighborhood, or 1 per 100 housing units.	
Tennis courts (optional)	1 pair per neighborhood	
Open athletic fields (optional)	1 acre per 100-200 housing units	Installation preference: ballfields, soccer, etc.
Outdoor structures		
School bus stop enclosures	Min 1 per 100 housing units, more as required.	
Benches	Min 2 per tot lot, play lot, rec. court, and playfield.	Distribute throughout neighborhood, along walkways/trails
Bike paths	1 per neighborhood	May be combined, and connected to existing paths.
Jogging paths	1 per neighborhood	
Walkways	1 per neighborhood	

2-4 SUPPORT FACILITIES.

Concurrent with the planning of new or improvement housing projects, consider the need for support facilities such as housing management offices (aka Housing Service Center), housing maintenance facilities, and community service centers. These facilities are typically based on Installation population and/or housing development density. Consult the Installation masterplanner to determine requirements. When such support facilities are required, those facilities located in the project area should be

architecturally compatible with the housing unit design and installation architectural standards to provide a coherent neighborhood.

CHAPTER 3 SITE ENGINEERING

3-1 NEIGHBORHOOD VEHICULAR AND PEDESTRIAN CIRCULATION.

3-1.1 General.

Vehicular and pedestrian circulation systems should provide convenient and safe access and circulation within the housing area and neighborhood.

3-1.2 Roads and Streets.

Street systems should minimize through-traffic in housing areas. Roads and streets must be adequate to accommodate occupant traffic, service vehicles (including maintenance, trash removal, buses, moving vans, curbside parking, firefighting equipment), bicycles, and snow removal equipment where applicable. The development of improved vehicular circulation systems is one of the best ways to strengthen identity of neighborhoods. Although the street system should provide safe, convenient access to housing units to and from the neighborhood, it must not play a dominant role with respect to the overall housing area environment. Additionally, the street system must address the need for motorist visibility for the safety of pedestrians, particularly as children may be present and obstructed by parked vehicles.

Residential streets and collector streets shall accommodate bicycle travel lanes in accordance with AASHTO. Design street systems in accordance with the AASHTO *Roadside Design Guide*, and AASHTO *Guide for the Development of Bicycle Facilities*, or local requirements if more stringent. These and the following criteria may require modification at locations outside of the Unites States and its possessions and territories, especially for higher density urban environments.

3-1.3 Residential Street.

Residential streets should be designed with target speeds of no greater than 25 mph, and have a target minimum width in accordance with the accommodation of bidirectional traffic, curbside parking, and cyclists. A residential street carries low volumes of traffic and functions as access to each housing cluster. Consider ‘gateway features’ that inform drivers they are entering a residential neighborhood. Provide for flexibility in accommodating diverse modes of travel and those with individual mobility challenges. Useful guidance for successful streets and streetscapes can be found in Institute of Transportation Engineers (ITE) *Designing Avenues and Streets in Residential Areas.*

3-1.4 Collector Streets.

Collector streets handle traffic from a group of clusters and residential streets and shall be sized in accordance with applicable criteria. Do not locate housing units on collector streets or the arterial streets into which they discharge.

3-1.5 Curb, Gutter, and Sidewalk.

Curbs and gutters should generally be provided on all new streets. Sidewalks are required on at least one side of each street. A "greenbelt" space should separate sidewalk and curb for pedestrian safety. Depress standing curbs at driveways, intersection corners, cross walks, and wheelchair accessibility ramps.

3-1.6 Dwelling Unit Setbacks.

For each dwelling unit, provide front, rear, and side setbacks in accordance with the Installation Design guide or Area Development Plan. Setbacks may also be governed by fire separation requirement and/or the Emergency Services. If these, or similar local practice guidance is unavailable, provide sufficient setbacks to ensure adequate light infiltration, health and safety, and privacy through the following minimums which shall not be reduced[2]:

- 30 feet front yard setback (measured from back of curb)
- 10 foot side yard setback (building to 'lot line'); single family and duplex.
- 30 feet rear yard setback (building to lot line)

3-1.7 Driveways.

Driveways shall accommodate 2 car widths with a minimum of 18 ft. (5.5 m). The minimum length for driveways utilized for off-street parking shall be 24 ft. (7.3 m), measured from back edge of sidewalk to the garage door or as necessary to ensure that vehicles do not encroach over the sidewalk. Driveways shall have a minimum of 2% positive slope away from the housing unit.

3-1.8 Pedestrian Circulation.

Provide pedestrian-oriented circulation systems. Pave sidewalks and walks, and provide appropriate surfaces for jogging, exercise, and bikes. Walkways should provide pedestrian access to and from housing units, public sidewalks, and other common use areas. Walkways should be a minimum of 4 ft. (1.2 m) wide, and jogging paths should be a minimum of 6 ft. (1.8 m) wide, and may be combined with bicycle paths. Pedestrian circulation shall be separated from vehicular circulation as much as possible. Walks must conform to ABA Accessibility Standards.

3-1.9 Signage and Lighting.

Provide street signs and markings according to Federal Highway Administration (FHWA) *Manual on Uniform Traffic Control Devices* (MUTCD), and applicable individual Military Service Sign Standards. Guidance for minimum lighting of walkways, streets, and parking areas is available from the Illuminating Engineering Society of North

[2] Excerpted from *US Air Force Family Housing Guide, 2004.*

America (IESNA). Foreign locations must also adhere to Host Nation standards for street signs and markings.

3-2 PARKING.

3-2.1 Private Parking.

Each unit in CONUS new construction should have three off-street parking spaces to accommodate residents and guests. Projects outside the United States and its territories shall have a minimum of 2 spaces. Indented, 90-degree, and gang parking are not desirable except where necessary in high density urban housing. Each parking space provided in a garage, carport, or driveway counts as a parking space.

3-3 STORM WATER MANAGEMENT.

3-3.1 General.

Develop a storm water management system in accordance with UFC 3-210-10 *Low Impact Developmen*t. Incorporate the natural features as much as feasible into the neighborhood planning to protect natural resource systems and reduce infrastructure costs. Ensure child safety is integrated into the design and construction of storm water systems and structures.

3-3.2 Storm Water Runoff.

Areas should be designed for positive drainage away from housing units. Finish grade around perimeter of each housing unit should slope a minimum of 5% for 10 feet to carry surface water away from foundation walls. Where lot lines, walls, slopes, or other physical barriers make this infeasible, drains or swales should be provided to ensure drainage away from the structure.

3-3.3 Foundation Drains.

Drains should be provided in accordance with applicable codes and standards.

3-4 UTILITIES.

Provide utility services in accordance with applicable codes and standards.

3-4.1 Meters.

For new construction and renovations, provide advanced meters in accordance with DoDI 4170.11 metering policy[3] for referenced utilities. For large multi-family buildings, the configuration may be a master meter with sub-meters for each Unit, depending upon the established utility charge structure. Confirm with the local **\1** BO/AHJ **/1/** or

[3] As amended by DOD Utilities Meter Policy, 16 April 2013.

privatized utility for specific requirements and protocols related to Energy Management Control System (EMCS), meter installation and integration.

3-4.1.1 Meter Location.

New meters should not be located on the front of the dwelling units. Consider a corner or side location, outside of any fenced yard area if feasible.

3-4.2 Utility Distribution.

Utility distribution in new construction shall be underground. Direct bury of electrical feed is not permitted in new projects. Where feasible, and acceptable to local utility supplier or servicing agency, use common trenches for two or more utilities and applicable underground utility marking protocol. However, a minimum of 10 feet horizontal separation shall be maintained between water and sewer lines to prevent cross contamination.

3-4.3 Corrosion Control.

Protect all ferrous materials in underground utility systems from corrosion. Comply with applicable recommendations of UFC 3-570-01 *Cathodic Protection*, and National Association of Corrosion Engineers (NACE) *Standard Practice: Control of External Corrosion on Underground or Submerged Metallic Piping Systems*.

CHAPTER 4 FAMILY HOUSING SIZE AND FEATURE STANDARDS

4-1 FAMILY HOUSING SIZE STANDARDS.

Provide new housing units in accordance with Table 4-1 which establishes the family housing unit size limitations by rank and bedroom count. Note that 2 bedroom units are prohibited in new construction projects.

Programming Benchmarks (with allowable increases per footnotes below) represent the maximum unit size to be programmed in new housing projects, and shall not be exceeded. *Construction Minimum* represents the livability threshold for new and existing housing unit construction, and *Construction Maximum* represents the absolute ceiling. This range is provided to address constraints associated with improvement projects, and also to address square footage variations associated with Design/Build 'Best Value' acquisitions. Refer to the COS for 'planning factor' guidance associated with circulation and building support elements of multifamily (apartment) buildings.

Table 4-1. Unit Floor Area Gross Square Footage (GSF)

Rank and Number of Bedrooms	Programming Benchmark [1,2]		Construction Minimum	Construction Maximum
	(GSF)	GSM (m^2)	(GSF)	(GSF)
O7 and above - 4BR	**3330**	309	2600	4060
O6 - 4BR	**2520**	234	2110	2920
O4-O5 - 4BR	**2310**	215	1920	2700
O4-O5 - 3BR	**2020**	188	1740	2300
E9 & W4/5 - 4BR	**2310**	215	1920	2700
E9 & W4/5 - 3BR	**2020**	188	1740	2300
E7/8-W1/3-O3 - 5BR	**2510**	233	1920	3090
E7/8-W1/3-O3 - 4BR	**2150**	200	1800	2500
E7/8-W1/3-O3 - 3BR	**1860**	173	1670	2050
E1-E6 - 5BR	**2300**	214	1920	2670
E1-E6 - 4BR	**1950**	181	1670	2220
E1-E6 - 3BR	**1630**	151	1490	1760

1. Add up to 27.9 m^2 (300 ft^2) for harsh climates. Harsh climates are defined as having more than 7,500 Heating Degree-Days (HDD), annually, or 5,500 Cooling Degree-Days (CDD), annually, using a 65 deg F reference temperature.
2. Gross floor area may be increased by 10% for housing units for an officer holding a special command position, for the Sergeant major of the Army and special command sergeant major positions, for the commanding officer of a military installation, and for the senior non-commissioned officer of a military installation. Refer to AR 420-1 for approved special command and special command sergeant major positions.

4-1.1 Unit Floor Area Calculation.

Unit Gross Square Footage for all unit types[4] shall be defined as, and calculated in accordance with, the *Finished Area*[5] of the *American National Standard for Single-Family Residential Buildings, Square Footage-Method for Calculating*: ANSI Z765, with the following modifications:

- Only 6 in (15 cm) of exterior wall thickness shall be **included** in the dwelling unit GSF, measured outward from the inside finished face of the wall.
- Sunrooms, even if defined in ICC as *uninhabitable* and even though excluded in ANSI finished area, shall be **included** in the dwelling unit GSF.
- Shared common spaces outside of the dwelling unit in multifamily (apartment-style) buildings shall be **excluded** from the dwelling unit GSF.

4-2 UNIT DESIGN – INTERIOR SPACES.

4-2.1 General.

Several 'Best Practices' floor plan layouts are provided in Appendix B for information only and not intended as requirements. Generally, centrally locate and arrange circulation space to serve as many functional areas as possible without the need for extended hallways. Consider multiple furniture placement layouts in determining location of windows and doors, electrical outlets and switches, and HVAC supply and return outlets (or radiators located underneath windows as commonly used in foreign construction).

4-2.2 Main Entry.

Design main entries to provide a sense of identity for each individual unit. Visual impact from the street is extremely important. Avoid a common entry to several units. Each unit should have an appropriate number or letter designation. Provide each front entrance with a door chime and door knocker. Provide overhead weather protection and a slip-resistant finish for porch surfaces.

4-2.3 Entrance Foyer.

Provide each housing unit with a lighted foyer and nearby coat closet. Locate entrance adjacent to living room, but avoid undifferentiated main entrance into the middle of a living space. Provide access to other areas without passing directly through the living room, unless accommodating width for circulation is provided. Foyers should have a

[4] Strictly speaking, the ANSI standard is not intended for apartments. However, it can be applied to apartments with little to no modification.
[5] ANSI defines finished area as ". enclosed area in a house that is suitable for year-round use, embodying walls, floors, and ceilings that are similar to the rest of the house"

minimum dimension of 4 ft. (1.2 m) deep. For **\1** alterations **/1/** consider entrance foyer requirement whenever it is economically feasible.

4-2.4 Circulation.

Provide hallways, stairways, and stairwells as required. Particular attention should be given to these areas to minimize floor space lost to circulation. Proper placement of door openings can produce more usable floor space. Design circulation areas to permit movement of a queen size box spring. Minimum hallway width of 3 ft. 6 in (1.1 m) is recommended.

4-2.5 Dining Room.

The primary eating area may be a separate dining room, or combined dining and living room (Great room), or dining and kitchen in accordance with an open plan concept. Dining room shall accommodate a family table and chairs, and china cabinet or buffet and a minimum area[6] of 90, 110, 140 ft^2 (8.3, 10.2, 13.0 $m^{2)}$ for three bedroom, four and five bedroom, and O6+ units. The dining room should not have bathroom doors within direct sight, if possible. . Units for O7+ shall maintain a separate formal dining room.

4-2.6 Living Room.

Units shall be provided with a living room. Minimum dimension of living room should be 11 ft. 8 in (3.6 m) and a minimum area[7] of 150 ft^2 (13.9 m^2) Living room may be combined with Dining Room to create a single Great Room. Great Room (see exception above) shall be able to accommodate multiple furniture arrangements associated with spaces that are combined. The benefits of such arrangements are that the combined space can be used more efficiently.

4-2.7 Family Room.

Units should be provided with a family room in addition to a living room with a minimum area[7] of 90 ft^2 (8.3 m^2) Include at least one wall that has a minimum length of 10 ft. (3 m) to accommodate a sofa and end tables.

4-2.8 Kitchen Area.

Locate kitchen adjacent to dining room and family room, with direct access to each. Provide a visual separation between kitchen and formal living areas. Convenient access from kitchen to a covered parking area, and to interior utility and exterior service areas, is desirable. Kitchens shall be sized and designed in accordance with *National Kitchen and Bath Association (NKBA) Space Planning Guidelines* and accommodate a minimum of double bowl sink and disposer, under-counter mounted dishwasher, full height standard refrigerator, stovetop/oven, and countertop appliances. Provide kitchen storage capacity in accordance with NKBA *small* (three bedroom units)*, medium* (four

[6] Excludes circulation path.

and five bedroom units*),* and *large* (O6+ units). Kitchens will generally be a minimum of 100 ft^2 (9.3 m^2). Provide ducted range hood with exterior discharge. Ductless recirculating systems are not permitted.

4-2.9 Secondary Eating Area (Breakfast Area).

A secondary eating area may be provided in the form of an oversized kitchen, breakfast bar, or family room and dining area. This secondary eating area may be in direct sight of food preparation areas.

4-2.10 Laundry/Utility Room.

Provide a minimum 64 ft^2 (5.9 m^2) enclosed laundry/utility room to accommodate side-by-side washing machine and dryer, plus shelving and cabinets for storing laundry supplies, located out of sight of entry, entertainment, and eating areas. Locate the laundry/utility room within conditioned space, and not within a bedroom, bathroom, or kitchen. Utility areas can do double duty as secondary access to/from the garage, in which case the square footage should be increased to accommodate the coat hooks and 'landing' space. Exhaust from moisture-producing equipment (e.g. clothes dryers) must be vented to the exterior, with provisions to disallow bird nests and rodents. Vent-less (internally circulating) clothes dryers are prohibited.

4-2.11 Bathrooms.

Provide a minimum of 2 full bathrooms and 1 half-bath in all units with 3 to 4 bedrooms, and 3 full bathrooms and 1 half-bath in 5 bedroom units. Locate full bathrooms near bedrooms and out of sight of other areas of the house. In two-story units, the half-bath should be provided to serve the first floor with access to both guests and family activities without passage through an intervening room. The master bedroom shall have a private full bathroom, accessible only from the master bedroom, with the remaining full bathrooms to serve the remaining bedrooms. Provide exterior exhaust ventilation for all bathrooms containing shower or tub fixtures, and consider exhaust for half-baths as well. Design all bathrooms in accordance with the *National Kitchen and Bath Association (NKBA) Space Planning Guidelines.*

4-2.12 Bedrooms.

Family housing units must include a master bedroom, plus two or more additional bedrooms. Separate these sleeping areas from all other functional areas of the house, and conveniently located near bathrooms. Provide access to bathrooms from halls serving bedrooms, without passage through other rooms of the house. For new construction master bedrooms shall be a minimum of 150 ft^2 (13.9 m^2) to accommodate a king size bed, flanking nightstands, dressers and adequate circulation. One bedroom shall be a minimum of 120 ft^2 (11.1 m^2) to accommodate a full size bed, and the remaining bedrooms shall be a minimum of 100 ft^2 (9.3 m^2) to accommodate a full size bed. In new construction, units for the rank of O7+ should have a bedroom located on

ground floor adjacent to public areas with a private full bath. In new construction, bedrooms shall not be located adjacent to the mechanical room.

4-2.13 Interior Storage and Closets.

Provide storage areas in the form of clothes closets, linen closets, and bulk storage in the housing unit for seasonal and personal effects:

- Foyer/entry: coat closet minimum 2 ft 4in (0.7 m) deep, 4 ft (1.2 m) wide.
- Bedrooms: wardrobe closet minimum 2 ft (0.6 m) deep, 4 lineal ft. (1.2 m) per occupant.
- Master bedroom: at least 1 walk-in closet is preferred, of approximately 24 ft^2 (2.2 m^2) minimum area per occupant.
- Interior bulk storage: minimum 32 ft^2 (2.9 m^2).

4-3 UNIT DESIGN - OUTDOOR SPACES.

4-3.1 General.

Each family dwelling unit should have an adjoining private or semi-private outdoor space, partially or completely surrounded by privacy screening, unless such space is considered impracticable because of density or location.

4-3.2 Balconies.

Each living unit located entirely above ground floor should have a balcony with no dimension less than 6 ft. (1.8 m). Construct balconies using solid decks with an impervious surface, sloped to drain to the outer edge. Provide direct access from balcony to living room, dining room, or family room.

4-3.3 Patios and Decks.

Screen patios and decks from streets, common areas, and adjacent living units. Provide direct access from patios and decks to living room, dining room, or family room areas. For each living unit that opens to the exterior at ground level, provide a minimum patio area of 120 ft^2 (11.2 m^2) with a minimum dimension of 8 ft. (2.4 m). An acceptable alternative is a raised deck of the same size, constructed of weather-resistant materials.

4-3.4 Lawns.

Provide sufficient lawn space of durable native grass species for each dwelling unit for use by the Unit occupants. Consider the need for screening or fencing for privacy, pets, and for supervision of children.

4-4 UNIT DESIGN – SERVICE AND SUPPORT.

4-4.1 Garages and Carports.

For new construction, provide a two-car garage for each single family detached and duplex units, and for townhouse units when feasible. For **\1** alterations **/1/** projects, garages or carports should be provided as the site allows. Enclosed bulk storage may be included in the garage or carport. Garages should be attached to the housing unit they serve. If garages cannot be attached, locate them as close as possible to kitchen and the service area of the house. For ABA units, garages must be on an accessible route from within the unit. Design garages to compliment architectural features, materials, and roof slopes of the house. In addition, provide light switches and duplex convenience outlets in each garage. Garage floor surface must be a minimum of 4 in. (10.2 cm) lower than finished floor of the attached housing unit; slope floor to drain liquids away from walls. Design and construct any attached garages so as to prevent infiltration of air-borne contaminants into housing units.

4-4.2 Mechanical Space.

Provide indoor acoustically insulated mechanical space as needed, with exterior access for Base Operations and Maintenance personnel. Locate the space either at grade level or in the basement. Mechanical equipment shall not be located in confined spaces such as crawlspace and attics. Do not locate mechanical room adjacent to bedrooms. For space savings, consider co-locating mechanical/plumbing equipment with unit fire suppression sprinkler equipment if feasible to optimize clearance requirements, drains, cleanouts and other support elements. Fire suppression equipment shall be located within conditioned space.

4-4.3 Electrical and Communication Space.

Locate electrical load centers in accordance with Code and as close to the meter as possible, preferably close to heavy load centers such as kitchen, laundry, and mechanical spaces for efficiency and to minimize cable runs. Do not locate panels in storage or moist spaces.

4-4.4 Exterior Storage.

For each unit, provide exterior storage space wide enough to accommodate lawn mowers and typical lawn tools. For new construction, this space is best located attached to the garage (often abutting the back or side), with the service door opening to outdoor living and lawn areas, and a paved access path to/from the nearest door of the unit. Where attachment to the unit is not possible - for example in existing work - the space may be a freestanding structure located in the back yard. Provide a switch-controlled light at outside service door. Recommended exterior storage space is 40 ft^2 (3.7 m^2) for three bedroom units, and 50 ft^2 (4.6 m^2) for four and five bedroom units. Note that this space is not exempt from accessibility requirements for accessible dwelling units. In **\1** alterations **/1/** projects where site is limited, a consolidated exterior storage may co-

locate several units' storage, provided it is partitioned by unit, with separate securable access provided.

4-4.5 Trash Enclosure.

For IRC buildings, provide each living unit with a paved pad area large enough for a minimum of two standard 96-gallon roll-type containers, plus any recycling containers required by the installation. Locate pad near trash pickup to the side, but not the front of the house, and provide paved access for occupant access. If visible from the street, common area, or from other living units, provide semi-transparent trash enclosure screening using a combination of fencing and landscaping material (ex; hinged gate fence in front, fence to the side, landscaping in the back). Alternatively, garages may be designed to provide adequate space for containers.

For IBC buildings, trash containerization is typically centralized, with outside dumpsters. In these cases, a 3-side landscaped masonry screen wall with operable double gate access is appropriate. Do not use 'chain-link' fencing for container screening. Use aesthetically and architecturally appropriate picket/slat or similar style system of durable prefinished non-wood materials.

4-4.6 Exterior Stairs.

Design code compliant non-skid (i.e. broom finish or similar) stairs to permit safe occupant passage as well as conveyance of a queen-size bed box spring and any other unit furniture items. Exterior stairways serving multiple units should be sheltered from wind and precipitation. Stairs should have a minimum width of 3 ft. 6 in (1.1 m), or greater as required by code, and be of durable, non-wood construction. Provide factory finished aluminum or steel handrails, pickets, and guards as required. Open risers are not permitted.

4-4.7 Entrance Ramps.

Entrance Ramps for new ABA accessible units shall be of durable permanent materials. Wood-based exterior ramps are prohibited in new construction.

4-4.8 Lifts and Elevators.

Platform or stairway lifts will not ordinarily be needed for new accessible units, as these will normally be single story units. Refer to ABA standards if they are required. Refer to code and ABA standards when elevators are required in multifamily (apartment) units. For mid-rise and high-rise housing, 1 passenger elevator should be provided for every 70 to 100 dwelling units, plus a freight elevator. Stair lifts shall not be used in new dwelling units.

4-5 UNIT INTERIOR DESIGN, FINISHES AND FEATURES.

Interior design, and materials and finish selection for a housing project shall consider life safety, quality of life, economies of scale, local labor expertise and acquisition, and to the extent practicable should be a natural extension of the site/architectural context of the housing area development plan. Refer to applicable guidance in UFC 3-120-10 *Interior Design* for the preparation of interior design submittals. Design interior systems in accordance with Codes and standards, and as augmented in this section.

4-5.1 Sound Attenuation.

Attenuate sound transmission between units of multi-family buildings, and within the unit spaces to achieve suitable privacy and speech intelligibility for occupants to carry out day-to-day functions. Refer to Mechanical systems chapter for additional requirements related to acceptable background noise levels.

For **\1** alterations **/1/** projects, replace unrated assemblies with acoustically rated assemblies – wall, ceiling, doors as applicable – to the extent that the assembly replacement is within the scope or collateral to it (example; if drywall removal is required for plumbing reconfiguration, acoustically insulate the wall where it adjoins adjacent living spaces(s).

4-5.1.1 Interior Acoustics, Airborne Sound.

Design unit separation assemblies with an STC50 as required by code in order to achieve a field tested minimum STC 45 between units and between units and public spaces. Within units, design assemblies in accordance with the following STC ratings:

- **\1** STC45 – between bathroom/powder, mechanical room and non-bedroom habitable spaces of the unit. **/1/**

4-5.1.2 Exterior Sources.

Refer to the Noise control section of UFC 3-101-01 *Architecture* for required composite Outdoor Indoor Transmission Class (OITC) values for the building envelope.

4-5.2 Interior Finishes.

Select environmentally sustainable materials and finishes to achieve a balance between occupant convenience, satisfaction, appearance, durability, and life cycle cost. Refer to chapter 7 for environmental requirements for material selection. Paint shall be based on Master Painters Institute's (MPI's) standards and specifications. Finishes and coatings shall should have vapor permeance characteristics in accordance with the intended vapor and moisture management strategy.

In **\1** alterations **/1/** projects involving material replacements, use contemporary approximations rather than customization. For example, non-custom moldings may often be compounded to achieve the required profile, avoiding the high cost of custom

knifing setups. Consult with the Installation Cultural Resources personnel and/or local SHPO.

4-5.2.1 Flooring.

Provide finishes providing some slip resistance. Carefully consider the appropriate application for carpet. Generally, carpet should be limited to bedrooms, and shall not be installed in kitchens, baths, laundry areas, utility areas, storage rooms, entryways, patios, porches, and areas exposed to weather elements. Consider alternatives to carpet for living rooms. If considering carpet for living rooms, ensure it is appropriately durable and stain-resistant. Do not install hardwood flooring in kitchens, bathrooms, or utility/laundry rooms.

4-5.2.2 Walls.

Provide Gypsum board finished to level 4 or 5 as appropriate for all living and sleeping spaces. Provide tile wall surfaces and/or moisture resistant gypsum board with mold/mildew resistant paint in high moisture spaces. Avoid vinyl wallcoverings, as these tend to trap and conceal moisture within the walls.

4-5.2.3 Ceilings and Ceiling Height.

At a minimum, provide gypsum board finished ceilings for all interior spaces and all other spaces as required by code for fire separation/barrier purposes. Suspended acoustical tile ceiling systems – typically of mineral fiber or fiberglass – is prohibited in dwelling units. Comply with code as applicable for minimum ceiling heights of interior spaces. For garages, coordinate ceiling height with the garage door manufacturers required clearances, which are usually 12 to 16 inches of vertical clearance above the (typical 7 or 8 ft high) door opening of a torsional spring, motor operated system.

4-5.2.4 Woodwork and Trim.

Running trim shall be low-maintenance, easily cleanable standard round-over-type residential profiles, in compliance with Architectural Wood Institute (AWI) Woodwork standards. Avoid excessive architectural ornamentation except as authorized and required for historical authenticity.

4-5.3 Interior Doors, Frames and Hardware.

Within dwelling units, provide dimensionally stable, interior flush or paneled wood doors to accommodate occupant passage/egress, maneuvering (i.e. furniture), acoustical privacy, and passive ventilation as required. Comply with AWI custom grade performance specification for all wood doors. Ensure the doors, especially bedroom closet doors, provide for adequate flanking wall space for furniture items, light switches, and other anticipated décor items, as well as accommodate movement of large bedroom furniture including boxspring. Avoid Lauan doors except at closets and unit

storage rooms not subject to humid conditions. Avoid pocket doors generally. Bi-fold and sliding bypass doors shall have both top and bottom tracks

For **\1** alterations **/1/** projects that include door replacement, the priority shall be to meeting code egress width requirements, followed by material durability upgrades.

4-5.3.1 Door Dimensions.

Ensure that doors are sufficiently wide to allow passage of people and furniture;

- For apartment units accessed from an interior corridor, unit main entrance doors shall be a minimum of 36 inch x 78 inches side-swinging doors made of either solid core wood or – in areas outside the US and its territories - an equivalently durable alternative material.
- In all housing types, Bedroom doors shall be a minimum 32 inches wide.
- No door within the unit intended for passage shall provide for less than 30 inches clear opening width, or greater as required when located on an accessible route pursuant to ABA compliance.

4-5.3.2 Acoustics.

Door acoustic STC ratings should match that of the walls.

4-5.3.3 Hardware.

Provide BHMA compliant hardware in accordance with industry standards for the function; passage (ex; hallways), privacy (ex; bedrooms, bathrooms), and storage. Provide door stops to protect adjacent wall surfaces from door swing.

4-5.4 Window Treatments.

Provide glass door and window treatments for occupant privacy. Comply with ANSI/WCMA A100-1, except that new window treatments shall not be the corded type nor have a hazardous loop configuration.

4-5.5 Casework, Counters, and Cabinets.

All casework shall be in accordance with AWI Custom Grade, except that hardwood plywood shall be used in lieu of MDF in moist environments like bathrooms and kitchens. Cabinets and countertop underlayment must comply with ANSI A208.2 or ANSI/HPVA HP-1 standards for low formaldehyde emissions.

Simple built-ins – such as open shelving within an alcove, a ‘command’ station in the kitchen, etc. - may be a cost effective way to ‘capture’ otherwise underutilized interior space and elevate the quality of the unit’s interior. If provided, do so strategically, sparingly, and without excessive customization or hardware.

4-5.6 Furniture and Equipment.

If the procurement is included in the contract, designer shall specify ENERGY STAR certified fixtures and appliances[7] that are safe, easily maintainable, and have the least amount of operational complexity. Refer to ABA standards for required appliance features for accessible dwelling units. Provide utility connections for all appliances and accommodate in the space with due regard for operation and maintainability. Typical Government-Furnished Government Installed equipment includes a refrigerator, and stove/range. Typical Contractor-furnished contractor-Installed equipment includes a disposer and dishwasher. Typical tenant supplied items include washer, dryer, and microwave. For safety reasons, all equipment must be installed in a way that precludes tip-over. This may require additional securement.

4-6 UNIT GENERAL CONSTRUCTION.

4-6.1 General.

Comply with Code and all referenced standards and criteria except as augmented by this UFC.

4-6.2 Structural Criteria.

Comply with code as applicable to the Building type. For IBC buildings, comply with UFC 3-301-01 *Structural Engineering* which includes modifications, alterations, and additions to the IBC.

4-6.2.1 Limitations.

Log Structures are not permitted.

4-6.3 Resiliency.

Achieve resiliency to the extent that is Life cycle cost effective. Whereas building and life safety codes are designed for life safety, the intent of resiliency standards is to minimize residential property losses and occupant displacement resulting from severe storm events. Resiliency is achieved by adherence to construction standards of a nationally recognized resiliency standard such as the “FORTIFIED Home” program of the Insurance Institute for Business & Home Safety (IBHS), or to more stringent local resiliency standards. IBHS standards are designed for new and existing single family wood framed detached housing in CONUS and US OCONUS locations, but can be adapted to other housing types, locations and construction. These construction standards will meet and in some aspects exceed those of model building codes. Application of the IBHS standards is dependent on the specific project location. IBHS categorizes each US region and its territories as either Hurricane-prone or High Wind-prone, applying a set of storm-specific measures in an incremental tiered approach -

[7] https://www.energystar.gov/products/appliances

"Bronze", "silver", and "Gold"– commensurate with increasing resiliency. Note that non-compliance with a model national resiliency standard shall not be construed to be a Building or Life Safety Code violation, nor authorization in itself for an **\1** alterations **/1/** project.

4-6.3.1 Certification.

Designation and independent certification is not required unless otherwise required by SOFA or host-nation agreement. However, consider documentation attesting to adherence to the construction standards for quality assurance. Label all resiliency features on drawings and specifications.

4-6.3.2 Resiliency Standards.

Other recognized resiliency standards besides IBHS FORTIFIED Home may be applied, provided these effect equivalent overall resiliency performance. Resiliency standards should focus on the following construction areas:

- Enhanced Roof Cover, roof deck, and attic ventilation systems and installation (1st level; IBHS "Bronze")
- Additional detail consideration at gables (additional framing and bracing), chimney lateral bracing, ancillary attached structures, overhangs, openings and similar vulnerable locations (2nd level; IBHS "Silver")
- Continuous load path from foundation to roof (3rd level; IBHS "Gold") with (typically) metal straps and anchors, and based on documented engineering analysis.

4-6.4 Hurricane and Tornado Storm Shelters (aka "Safe Rooms").

Residential or Community Storm Shelters are authorized if required by Local Codes. These shall be programmed in the DD form 1391 with supporting justification. The installation of any safe room should be coordinated with the Base **\1** BO/AHJ **/1/** and local emergency management and law enforcement to ensure its use during extreme wind events is not a violation of Base, Local or State evacuation plans.

If a shelter is required in new construction, the preference in single-family, two-family (duplexes) and multiple single family attached (townhouse) units is to construct the storage Room, utility room, closet, or bathroom as the shelter, or else a prefabricated unit in the garage, adding little or no additional Unit square footage. A basement location may also be feasible in non-flood prone areas. In multi-family housing (apartments), a shared Community Shelter serving multiple dwelling units may be more appropriate. Note that Community Shelters – those designed for more than 16 occupants - have more stringent criteria including but not limited to ventilation, sanitation, and fire separation. Safe room location and construction features shall be identified on the drawings in accordance with ICC/NSSA. In the absence of more location-specific criteria, comply with the following in accordance with the type of shelter required. In case of conflict, apply the more stringent:

- FEMA P-320 *Taking Shelter from the Storm: Building a Safe Room for Your Home or Small Business*. This publication provides prescriptive safe room solutions (drawings and construction details) and planning guidance for shelters serving up to 16 persons.
- FEMA P-361 *Safe Rooms for Tornadoes and Hurricanes: Guidance for Community and Residential Safe Rooms.* This publication contains the technical design criteria, including location and sizing criteria, used to develop the prescriptive solutions of P-320 and applicable to shelters of various sizes.
- ICC/NSSA *Standard for the Design and Construction of Storm Shelters (ICC 500).* Applicable to both Residential and Community Storm Shelters.
- UFC 4-023-10 *Safe havens* (as applicable).

4-6.5 Foundations, Crawl Spaces, and Basements.

Comply with code except as modified herein. Refer to UFC 3-301-01 for snow loading and frost penetration depths at locations outside the United States. For IRC buildings in US Coastal areas, comply also with the guidance of FEMA P-550 *Recommended Residential Construction for Coastal Areas; Building on Strong and Safe Foundations,* except where more stringent local codes exist.

4-6.5.1 Wood Foundation Systems.

Wood foundation systems are not permitted.

4-6.5.2 Crawl Spaces.

Exposed grade in under-floor (crawl) spaces, even if a vented crawlspace, shall be covered with a continuous Class I vapor retarder installed in accordance with the IRC for unvented crawlspaces. Consider a crawlspace drainage system if warranted by local conditions and/or required by Code. All crawlspaces shall have a low-maintenance hinged access door on the exterior or basement wall to access the crawlspace.

4-6.5.3 Termite Prevention.

Provide termite protection for new housing and ancillary structures in areas subject to damage from termites as determined by IBC/IRC probability maps or by State, Base, and/or local authorities. When termite protection is required, and for all types of construction, it shall at a minimum consist of Soil treatment during construction in accordance with UFGS Specification *31 31 16.13 Chemical Treatment Control* with EPA and locally approved chemical termiticides.

4-6.5.3.1 Protection shall also consist of additional measures or methods recommended or required by State, Base, housing management, and/or local authorities.

4-6.5.4 Basements.

Full or partial Basements in new housing may be provided if life cycle cost effective considering energy efficiency, operations and maintenance, life safety/egress, ABA accessibility requirements, fire prevention, shelter requirements, site constraints, and whether it will contain *habitable* space. Appropriate adjustments in unit size should be made if a basement is constructed, due to the loss of square footage from the addition of a stairwell and an increase in square footage if the water heater and HVAC systems are relocated to the basement. Refer to paragraph 7-1.4.2 for Radon mitigation. Other considerations include:

4-6.5.4.1 Unit Basement access should be provided from within the dwelling unit.

4-6.5.4.2 At a minimum, Incorporation of a basement shall assume full (new construction) Code compliance consistent with *useable* space with provisions for the light and ventilation needs of *habitable space*. However, if intended to be habitable space, then it shall be designed and constructed accordingly.

4-6.6 Exterior Wall Construction.

Comply with applicable criteria and local practices.

4-6.6.1 Wall System Limitations.

Structural Insulated Panel (SIP) Construction is permitted provided it is life cycle cost effective considering operations and maintenance, available labor expertise, cladding and roofing considerations/limitations, configurability/flexibility, construction timeline as well as first cost. If SIPs are used, comply with the IBC/IRC and the Structural Insulated Panel Association recommendations and guidelines.

4-6.6.2 Thermal and Moisture Control.

Provide a comprehensive thermal and moisture control strategy. Of particular concern is the control of air transported moisture by infiltration which accounts for considerably more moisture migration than vapor diffusion.

4-6.6.2.1 Water Resistant Barriers (WRB).

Required in all wall systems. Approved materials are those meeting the requirements of the International Code Council Evaluation Service (ICC-ES)

4-6.6.2.2 Air Barrier Systems.

Use systems with 3rd party certifications, such as by the Air Barrier Association of America (ABAA) or equivalent. Air barrier construction is often the work of multiple trades, depending on the air barrier plane location and configuration. Therefore it is important that construction documents clearly identify and properly detail the air barrier.

Comply with additional guidance from Department of Energy's *Building Technologies Program; Air Leakage Guide*.

4-6.6.2.3 Vapor Retarders.

Determine the need for, and permeance characteristics of vapor retarders. Not all climates will require them. Codes and standards will generally require warm-in-winter side vapor retarders for cold (i.e. heating climates) and portions of mixed regions, with exceptions to the class I or II vapor retarder requirement (allowing class III instead) when the cladding is vented and the wall continuously sheathed with insulation which mitigates the potential for trapped moisture and condensation within the wall system. Outside of the mixed and cold regions, confirm through ASHRAE dew point analysis supplemented by local best practices whether conditions warrant a vapor retarder. Often, incorrect location of a vapor retarder causes more damage than its omission would otherwise cause.

4-6.6.2.4 Insulation.

In colder regions, consider distributing some of the insulation as insulated sheathing outboard of the wall framing, which help to not only reduce thermal bridging, but also in maintaining sheathing surface temperatures above the dew point temperature, thus eliminating air leakage based condensation. This is especially critical for cold formed metal framed assemblies. Refer to the guidelines of CRREL Cold Regions Research and Engineering Laboratory for practical application.

4-6.6.3 Cladding Systems.

Use sustainable, low maintenance, color-fast finish materials, such as brick, integrally-colored concrete masonry, integrally colored stucco, vinyl siding, fiber-cement siding, engineered wood siding, and drainable exterior insulation and finish systems. Avoid materials requiring field finishing. For all cladding types, and in the absence of other codes or standards, Include an air gap rain screen of 3/8" inch (or larger in wetter climates) at the sheathing/siding interface. Alternatively, provide either an approved integrated moisture management system or an analysis demonstrating sufficient moisture barrier properties as determined by IRC's modified ASTM E331 procedures.

Aluminum siding, and wood shakes and shingles are not permitted.

4-6.6.3.1 EIFS and Stucco.

Refer to UFC 3-101-01 for LCCA-based consideration of Exterior Insulation and Finish Systems (EIFS), and Exterior Residential Stucco systems. These exterior systems are applicable to low-rise residential construction only. Stucco systems shall comply with both the Stucco Manufacturer's Association (SMA) recommendations and the IBC. EIFS shall comply with the IBC/IRC as applicable to the unit type. Additional requirements are as follows:

4-6.6.3.1.1 All EIFS and Stucco systems, regardless of substrate, must incorporate a drainage plane.

4-6.6.3.1.2 Maintain the lowest finished edge at least 8 in (200mm) from finished grade to provide protection from mowers, string trimmers, etc. Increase this clearance where snow accumulation conditions warrant.

4-6.6.3.1.3 At all areas subject to abuse or abnormal stress, provide high impact or Ultra-high impact EIFS (as classified by ASTM E2468). At a minimum, these areas include walls adjoining sidewalks and lawns up to at least water table height, but may also include wall locations vulnerable to door swing impacts, vehicles/bikes, and ball play activities.

4-6.6.3.1.4 Use solid or sheathing backed Stucco systems only. Do not install Stucco directly onto plastic-based polyolefin water-resistive barriers (WRB) which are vulnerable to surfactants in the cement.

4-6.6.3.2 Wood Siding.

Wood siding is prohibited, due to its maintenance costs. Engineered wood siding is permitted and should comply with ANSI/APA performance criteria. Use only USGBC approved (or equivalent) no formaldehyde, treated, pre-finished siding bearing third party certification.

4-6.7 Exterior Windows and Doors.

Comply with code which prescribes independent testing, labelling, performance and construction requirements for exterior windows, doors, and fenestration and their installation.

4-6.7.1 Material Selection.

For all housing types, provide energy efficient manufactured windows and doors that are ENERGY STAR Certified (or FEMP-designated) for the particular project location, if Life Cycle Cost Effective. Refer also to UFC 1-200-02. Site-built windows and doors are not permitted. Provide low maintenance clad pre-finished insulated hinged exterior doors for all exterior doors. Choose materials and finishes consistent with the specific environmental context including salt exposure, ambient noise exposure, residential scale and aesthetic, and similar considerations. Clad doors, rather than un-faced wood doors, are generally preferred for durability in all environments. True divided lite windows should be avoided unless historical authenticity requires it. Skylights should generally be avoided.

4-6.7.2 Window Fall Prevention.

\2 Operable windows with an opening sill height less than 42 inches (106.7 cm) above finish floor and greater than 72 inches (182.9 cm) above the adjacent surface, and with

an opening large enough for a 4 in. (10.1 cm) sphere to pass through, must be provided with window fall prevention devices that comply with ASTM F 2090 or ASTM F 2006, as applicable. Note that as of October 2019, Title 10 USC 2857 limits the definition of acceptable window fall prevention devices to include only fall protection screens and guards. Window Opening control devices – which work by limiting the window opening to 4 inches (10.1 cm) or less - are not acceptable.

Regardless of improvement scope, Improvement projects shall provide window fall prevention devices for all operable windows, in accordance with the new construction requirement described above and any other applicable fire and life safety requirements. ***/2/***

4-6.7.3 Resiliency.

Comply with the “Silver” level of IBHS “Fortified Housing” impact resistance and opening protection requirements if life cycle cost effective. Note this may require impact rated glazed assemblies or opening protection systems. Where opening protection systems are selected, choose systems that do not require manual removal/retrieval and storage, which are less likely to be deployed in conditions that require them. Instead, select architecturally compatible hinged shutters or similar.

4-6.7.4 Door and Window Operation.

Provide thermally insulated, securable windows. Tilt-in windows are recommended to facilitate cleaning by occupants. Window screens shall be provided for operable windows in habitable rooms and spaces, and must be removable for window cleaning and (if applicable) emergency egress without the use of any special tools. Removable window guards or child safety locks may be provided in lieu of reinforced window screens. For IRC buildings, Doors shall generally be swing type. Automatic sliding doors may be permitted in IBC multifamily mid-and high-rise buildings.

4-6.7.5 Garage Door Operation.

Provide automatic garage door openers for each garage door, listed and labeled by UL 325.

4-6.7.6 Door and Window Hardware.

Exterior doors leading into the house shall have a BHMA/ANSI minimum grade 2 keyed entry lockset and deadbolt. These may be provided as a combination unit. Provide wide-angle door viewers unless a sidelight is provided that provides viewing opportunity. Keyless systems are not recommended due to safety concerns.

4-6.7.6 Other Considerations.

Protect the main entry door with a minimum 2 ft. (0.6 m) overhang, or covered porch, for weather protection and decreased operations and maintenance burden associated with flooring maintenance. For rear exterior doors, consider glass storm door with operable panel to facilitate backyard activity supervision for families. Provide interior and exterior lighting at each main entrance.

4-6.8 Roofing.

Provide roof systems with a service life of 25 years or greater. For low-slope roofing, and for IBC housing generally, comply with UFC 3-110-03 *Roofing,* which incorporates National Roofing Contractors Association (NRCA) and the IBC with modifications. For steep slope roofing systems, comply with the IRC at a minimum, and additionally with applicable NRCA recommendations. Roofing materials should comply with ENERGY STAR recommendations provided all other performance standards are satisfied. Design roof drainage systems in accordance with SMACNA.

4-6.8.1 Roof Slopes and Overhangs.

Roofs with slopes greater than 4/12 have improved maintainability and a more residential scale and are encouraged. Roofs should generally have eave overhangs of 12 inches or more, and gable overhangs of 6 inches or more. For steep slope asphalt shingle roofing systems, provide a minimum 4/12 roof slope for housing units, and a minimum 3/12 roof slope for unconditioned detached accessory structures.

4-6.8.2 Roof System Limitations

4-6.8.2.1 Wood shingles and shakes, and roll roofing are prohibited. Photovoltaic shingles may be used if Life cycle Cost Effective and approved by the **\1** BO/AHJ **/1/**. Avoid Fire retardant-treated plywood roof systems above unconditioned attics which prematurely degrade with exposure to high temperatures and humidity.

4-6.8.2.2 For steep slope roof systems over conditioned spaces in areas with mean January temperatures below 30F (corresponding approximately to ASHRAE climate zones 5+), provide ice barrier protection complying equivalent to ASTM D1970 (aka ice and water shield) at eaves and rakes. Install in accordance with NRCA recommendations except that membrane shall extend horizontally a minimum of 36 inches from the inside face of the exterior wall, or further if warranted by known ice conditions.

4-6.8.2.3 Where IRC or local practices permit self-adhering membranes to be used as underlayment for full shingle roof system coverage, include a bond break (equivalent to type I underlayment) between the membrane and shingles to prevent shingle bond.

4-6.8.3 Steep Slope Roof Drainage.

4-6.8.3.1 Pre-finished Roof edge gutters are generally required for edge draining roof systems and must discharge rainwater at least 5 feet from the home to reduce the chances of saturating the soil around the foundation. Gutters are not necessary in dry climates provided a sufficiently wide overhang and positive ground slope can maintain the occasional rainwater (or snowmelt) away from the structure. Gutters shall be sloped, with sections joined with rivets and sealant, welded, or soldered. Vinyl gutters and downspouts are not prohibited. Gutter profile should be selected for drainage performance while adhering to the residential scale and aesthetic; 'K' style and/or 'ogee' style gutters are preferred. Built-in gutters and half-round gutters are prohibited except when historical replication is required by the **\1** BO/AHJ ***/1/***.

4-6.8.3.2 Alternate drainage systems are permitted subject to **\1** BO/AHJ ***/1/*** approval and storm water management requirements. System should be one of those identified in the ENERGY STAR *airPLUS Construction Specifications* and have been proven an effective local practice based on similar systems on comparably built area housing. Note that *airPLUS* label is not required.

4-6.8.3.3 Non-potable water collection systems (rain-water harvesting) shall be constructed in accordance with Code and the EPA ENERGY STAR Construction criteria.

4-6.8.4 Roof Ventilation.

Provide vented attics unless dictated otherwise by local practices. In most heating climates a vented uninsulated (i.e. 'cold') attic with a sealed and insulated attic floor is common practice. However, if significant HVAC heat loss within the attic is anticipated through attic located duct distribution, exhaust fans, or other items, then an unvented, sealed attic is generally required. Whether attic is vented or not, the roof shall be vented with a 1-1/2" ventilation gap between roof sheathing and any insulation below, and include the Code required intake (i.e. eave or cornice vents) and exhaust (i.e. ridge vents) ventilation. Ridge vents typically allow more air to escape than 'mushroom' style vents.

4-6.8.4.1 For vented attics, provide balanced (intake/exhaust) passive ventilation for optimal performance. In colder regions, vented attics may require mechanical temperature-controlled fans to supplement passive ventilation. Determine the requirement based either on the analysis and calculations presented in Cold Regions Research Engineering Laboratory (CRREL) MP 5106, *Attic Ventilation Guidelines to Minimize Icings at Eaves*, or by another non-proprietary authoritative method. Guidelines for designing cathedral ceiling ventilation to prevent ice dam formation are also available from CRREL.

This Page Intentionally Left Blank

CHAPTER 5 BUILDING SYSTEMS

5-1 UTILITIES.

For new housing developments, determine energy source based upon a life-cycle cost analysis of feasible alternatives in accordance with UFC 1-200-02 *High Performance and Sustainable Building Requirements.*

5-2 HEATING, VENTILATING AND AIR CONDITIONING (HVAC).

5-2.1 General.

Design HVAC systems for occupant comfort and control in accordance with code, which references ACCA Manuals D, J, and S for load calculation methodology. Equipment should be ENERGY STAR certified. For all fuel fired systems, provide direct vent sealed combustion equipment. In revitalization projects, replace all HVAC ducts in or below the floor slab with an above floor system, to maintain interior air quality and reduce contamination potential.

5-2.1.1 Provide separate zones for first and second floor. Provide ENERGY STAR certified programmable (set-back) thermostats in new construction and major revitalizations. Provide return air registers, transfer grill, or undercut door to maintain pressure balance throughout the house.

5-2.1.2 **\1** To the extent possible, ductwork shall be placed within the conditioned portion of the thermal envelope. Avoid placing ducts in unconditioned attics without sufficient duct insulation and condensation mitigation strategy. Attic ductwork shall be insulated even if it is a conditioned attic, to mitigate the potential for condensation. Do not install ductwork under or within floor slabs. This change allows for renovation of existing buildings where the HVAC system is replaced as well as allowing the designer the flexibility to best locate the HVAC system and ducts without having to bring the entire attic enclosure into the envelope. ***/1/***

5-2.1.3 Comply with UFC 3-450-01 *Noise and Vibration Control*, and the ASHRAE *Handbook of Fundamentals*. Design shall achieve a Noise Criteria (NC) rating between NC-20 and NC-30.

5-2.2 Heating.

Portable room heaters, floor furnaces, and heat lamps are prohibited. Electric resistance heat is prohibited except for existing work subject to the restrictions specified in UFC 3-410-01

5-2.2.1 Do not locate heating and cooling equipment that requires maintenance in attics or crawlspaces.

5-2.2.2 Roof discharge of heating equipment exhaust is preferred.

5-2.3 Ventilation.

Comply with Code for Unit mechanical ventilation. The preference is for a balanced intake/exhaust system, with manual override, coupled with an Energy Recovery Ventilation (ERV) system to ensure against over/under pressurization. System may be designed for intermittent cycling in accordance with ASHRAE 62.2 to optimize energy usage.

5-2.3.1 Bathroom exhaust fan shall be maximum 1.5 sone, and an exhaust fan with maximum 5.0 sone shall be provided in each kitchen. Exhaust fans must discharge to the exterior; discharging into attic, crawl space, or internal recirculation is prohibited

5-2.4 Air Conditioning.

In new construction and **\1** alterations **/1/**, provide air conditioning in locations where during the six warmest months of the year dry bulb temperature is 26.7 degrees C (80 degrees F), or higher for over 650 hours; or wet bulb temperature is 19.4 degrees C (67 degrees F), or higher for over 800 hours in accordance with OMB Circular A-45. Window or through-wall units are prohibited. See chapter 7 for refrigerant limitations.

5-3 ELECTRICAL AND COMMUNICATIONS

5.3.1 Electrical Distribution.

Provide exterior distribution in accordance with the housing specific sections of UFC 3-550-01 *Exterior Electrical Power Distribution.* Provide visual screening for meters, and do not locate meters adjacent to unit front entrances.

5-3.2 Service Panel.

Where possible, provide 200 amp minimum electrical service to each new dwelling unit. Locate service panel in discrete location within the dwelling unit, accessible to occupants, but not in a living, sleeping, or storage room.

5-3.3 Lighting.

Comply with applicable residential sections of UFC 3-530-01 *Interior and Exterior Lighting Systems and controls.* However, comply with IES “The Lighting Handbook; Reference and Application” for unit interior and exterior lighting locations, coverage, color rendition, and illuminance levels using average age bracket (25-65yrs).

5-3.3.1 Exterior Lighting.

Ensure adequate exterior illuminance is provided to the periphery of the dwelling units for safety and security. Luminaire selection shall be compatible with the architectural residential character of the neighborhood. Avoid ‘industrial-looking’ luminaries in housing areas. Consider motion or timer type (i.e. ‘dusk to dawn’) automatic lighting and step-down functions to minimize light trespass and nuisance glare towards adjacent

units. Unit exterior lighting shall be controlled from inside the respective dwelling unit, at each exterior door and from within the garage. Generally avoid decorative landscape lighting.

For general exterior site safety lighting outside of the unit periphery, including consolidated parking areas and street lighting, comply with UFC 3-530-01. Where life cycle cost effective, utilize LED or other high efficiency lighting technologies.

5-3.3.2 Interior Lighting.

Provide wall-switched overhead light fixtures in all walkable spaces including kitchen, dining room, bedrooms, walk-in closets, bathrooms, halls, stairs, and utility/storage rooms. Provide lighting for all closets 24 inches in depth or greater. Consider wall switch operated, ENERGY STAR certified ceiling fans in living/dining area, family room, and bedrooms when desirable. Fans should be provided with separate fan and light control. Provide lighting for attics and storage spaces. Consider occupancy sensor technology where appropriate for the space and intended function.

5-3.4 Building Telecommunications Systems.

For all dwelling unit types, comply with applicable portions of UFC 3-580-01 *Telecommunications Infrastructure Planning and Design,* and all of TIA-570-C *Residential Telecommunication Infrastructure Standard* (including the annexes).

The Communications System and/or cable TV (CATV) provider serving the installation should be responsible for installing and maintaining the distribution system up to the demarcation point, and the construction contractor is generally responsible from the demarcation point into and throughout the dwelling unit(s). At the demarcation point, locate network interface device(s) at a discrete location of the unit that is accessible, preferably near the utility room, and the Distribution device centrally located within the unit and tenant accessible. Interior unit cabling shall be a minimum of a combination of Category 6 wiring, coaxial cable, and fiber optical cable (if available) in accordance with Grade 2 residential cabling capability. Conduit is generally not required, but should be considered at metal stud framing, between units of a multifamily structure, and other vulnerable locations. Additionally, consider a 1 in. (2.5 cm) diameter conduit from house connection location to attic, basement or crawl space to facilitate future telecommunication wiring.

5-3.4.1 Outlet Locations.

Within the unit, provide telephone outlets at a minimum in kitchen, living room, family room, dining room, and all bedrooms, with multiple modular jacks compatible with multiple furniture arrangements in each room. Provide, as a minimum, duplex cable TV/television outlets in living room, kitchen, family room, and all bedrooms. Ensure that all outlet locations are compatible with multiple furniture arrangements.

5-3.5 Security Systems.

Security systems are not generally required in most family housing. However, multifamily housing areas may warrant systems to address region specific vulnerabilities, especially in high-rise**,** high-population facilities and in OCONUS locations depending on the Facility Security Level (FSL). These shall be coordinated with the Installation Safety/Security office. For Government-owned housing, refer to UFC 4-020-01 *Security Engineering Facility Planning Manua*l. Refer also to *The Risk Management Process for Federal Facilities.*

Housing associated with 'High Risk' personnel may also augment certain security measures. Refer to UFC 4-010-03, *Security Engineering Physical Security Measures for High Risk Personnel.*

5-4 WATER SYSTEMS

5-4.1 General.

For IBC buildings, comply with UFC 3-420-01, *Plumbing Systems* and the IPC which it augments. For IRC buildings, comply with the IRC and the following;

5-4.2 Water Supply Cutoff.

The interior service shut-off valve for each housing unit shall be accessible to the occupants. Do not install in crawlspaces. Typical locations include utility room, under kitchen sink, or basement. Coordinate additional curb stop/shut-off valve location for each building in accordance with Base requirements.

5-4.3 Exterior Hose Bibs.

Provide hose bibs in easily accessible locations at both front and rear of each dwelling unit. Hose bibs subject to freezing shall be frost-proof type.

5-4.4 Domestic Hot Water.

A "heat trap" must be provided with all water heaters. Where fuel-fired domestic water heaters are provided, sealed combustion units are required. Roof discharge for the vent is preferred. Tankless water heaters are generally preferred due to maintenance concerns associated with water tanks.

5-5 SANITARY SEWER.

For IBC buildings, comply with UFC 3-420-01, *Plumbing Systems,* and the IPC which it augments. For IRC buildings, comply with the IRC. For all housing types, locate vent stacks to rear of housing units, and consolidate to limit the number of roof penetrations. Provide drains for air-conditioning condensation, humidifier overflow, and water heater and relief valves. Drains shall discharge to the exterior.

5-6 GAS.

Comply with NFPA 54 *National Fuel Gas Code* and NFPA 58 *Liquefied Petroleum Gas Code* as applicable.

This Page Intentionally Left Blank

CHAPTER 6 FIRE AND LIFE SAFETY

6-1 FIRE AND LIFE SAFETY.

6-1.1 General.

For IRC buildings, comply with the IRC except as modified in this UFC (e.g. refer to paragraph on window fall prevention). For IBC buildings, comply with UFC 3-600-01 *Fire Protection Engineering for Facilities.*

For existing work in housing types, comply with the UFC 3-600-01 compliance triggers, except where the IRC compliance triggers are more stringent.

For handicapped accessible units, refer to the Architectural Barriers Act Accessibility Standards (ABAAS) for alarm requirements.

6-1.2 Flame-Spread and Smoke-Developed Indices.

Comply with IRC or UFC 3-600-01 as applicable to the housing type.

6-1.3 Automatic Sprinklers.

All new family housing is required to have a complete automatic fire suppression system. For IRC housing, system shall be stand-alone or multipurpose, wet pipe system in accordance with NFPA 13D. Incorporate all applicable recommendations and guidelines of the *NFPA Automatic Sprinkler Systems for Residential Occupancies Handbook (latest edition)*.

Additional requirements for all residential sprinkler systems include:

6-1.3.1 Piping Protection.

Provide protection from living spaces for all non-metallic pipe even if the space does not require sprinkler protection and even if the pipe is listed for exposed locations.

6-1.3.2 Sprinkler Protection.

\1 In finished areas, **/1/** provide domed plate concealed, pendant concealed, or semi-recessed sprinklers to reduce the potential for unintended activation resulting from accidental misuse.

6-1.3.3 Relief Valve.

Consider a UL listed pressure relief valve if pressures are anticipated to exceed the pressure rating of any component.

6-1.3.4 Piping Distribution.

Maintain piping within the building thermal envelope. Antifreeze systems are prohibited due to ongoing ignition safety concerns.

6-1.3.5 Backflow Preventer.

Coordinate with the Base and/or privatized Utility for determination of the need for backflow prevention devices, which may not be required by IRC/NFPA 13D.

6-1.4 Fire-Resistant Separation.

Provide fire and smoke separations in compliance with IRC or UFC 3-600-01 as applicable. Avoid Fire retardant-treated plywood in unconditioned attic spaces at unit separation walls.

6-1.5 Smoke Alarms.

Provide interconnected hard-wired smoke alarms with battery backup, in accordance with IRC or UFC 3-600-01 as applicable. Smoke alarms and carbon monoxide alarms may be a combined system.

6-1.6 Carbon Monoxide (CO) Detection System (Interconnected System).

Provide CO detection in compliance with IRC or UFC 3-600-01 as applicable.

6-1.7 Overseas and Leased Housing Requirements.

Overseas family housing, whether constructed or leased, must comply with these life safety measures, and may also be required to adhere to base or host nation requirements.

CHAPTER 7 ENVIRONMENTAL

7-1 ENVIRONMENTAL.

7-1.1 General.

Construct in compliance with Federal, State, interstate, local and SOFA requirements as applicable to the project. DoD masterplanning guidance is provided in UFC 2-100-01 *Installation Master Planning.* For projects on Army Installations, refer also to AR 420-1 *Army Facilities Management,* and AR 200-1 *Environmental Protection and Enhancement.*

7-1.2 Environmental Planning.

Required Environmental planning due diligence is a function of the Installation Masterplanning process which must occur and result in an approved site prior to initiating an improvement or construction project.

7-1.3 Energy and Sustainability.

7-1.3.1 Federal Energy Reduction Mandates.

New Housing must be designed to exceed the baseline standards in the International Energy Conservation Code (IECC) for low-rise residential buildings (and ASHRAE Standard 90.1 for commercial and non-low-rise residential buildings) with energy consumption levels at least 30 percent below the baseline, where life-cycle cost-effective[8]. Refer to UFC 1-200-02 for guidance on conducting life cycle cost analysis.

7-1.3.1.1 Calculated Loads.

Refer to applicable Department of Energy (DOE) Guidance with regard to residential-specific loads to be considered in the energy reduction modelling calculation.

7-1.3.2 Sustainability.

Comply with UFC 1-200-02 to the extent applicable.

Army only: Army Housing projects shall be certified at LEED “Silver” level with at least 15 energy points (Energy and Atmosphere category) in accordance with current SDD policy dated January 2017. Improvement projects shall comply with the extent practicable and life cycle cost effective, but are not required to be LEED certified. Additional Army requirements include:

[8] (42 U.S.C. 6834(a)(3)(A))

7-1.3.2.1 For single family, duplex, and multiple single family housing (Townhouses) up to three stories, comply with *LEED BD+C: Homes and Multifamily Low-rise*, latest edition. For other housing, such as midrise and high-rise housing projects, and for housing that is combined with another building type, refer to UFC 1-200-02.

7-1.3.2.2 LEED Energy and Atmosphere prerequisites require housing to meet the ENERGY STAR for homes. However, ENERGY STAR for homes certification is not required.

7-1.3.2.3 Given the nature, breadth, and wide-ranging life-cycle operations and maintenance impacts of many LEED credits, credit determination shall be made in coordination with appropriate stakeholder review including operations and maintenance personnel, housing office, master-planning, and others as applicable to the credit.

7-1.4 Toxic Substances.

Refer to the Department of Defense Environmental Restoration Program and service specific environmental guidance documents[9] for the required assessments, surveys, sampling, mitigation, operational controls and other related procedures and due diligence associated with polychlorinated biphenyls (PCBs), radon, asbestos, lead based-paint, chlorofluorocarbons, and other substances regulated by EPA under the Toxic Substance Control Act (TSCA).

7-1.4.1 Polychlorinated Biphenyls (PCB).

Follow applicable guidance. Refer to UFGS specification section 02 84 22 *Removal and Disposal of Polychlorinated Biphenyls (PCB)* for technical implementation

7-1.4.2 Radon Hazard Mitigation.

Refer to UFC 3-101-01 and service specific guidance to determine whether active or passive systems are required. For new construction, comply with the most stringent of the IRC, GBCI pre-requisite credit requirements, and UFGS specification 31 21 13 *Radon Mitigation*, and EPA Indoor *airPLUS* Construction specifications for design and construction of the required radon control and construction measures. For **\1** alterations ***/1/*** projects of IRC buildings, comply with ASTM E2121 *Standard Practice for installing Radon Mitigation Systems in Existing Low-Rise Residential Buildings*.

7-1.4.2.1 The preparation of the building for future active pressurization system installation is required for zone 1. It is recommended for zones 2 and 3.

[9] For Army, see AR 200-1 *Environmental Protection and Enhancement.* For Navy, see OPNAV Instruction 5090.1D – *Environmental Readiness Program.* Technical Criteria include UFC *Architecture*, UFC 3-810-01N *Navy and Marine Corps Environmental Engineering for Facility Construction*

7-1.4.2.2 Note that vent pipe fans are not permitted to be located in conditioned or habitable space. Unvented attics may be considered conditioned space if within the thermal envelope. Confirm with the **\1** BO/AHJ **/1/**. In such cases, an exterior or other approved location shall be selected.

7-1.4.2.3 Do not install exterior vent pipes on the front of the house. Choose a discrete location such as the back corner, or other approved non-obtrusive location.

7-1.4.3 Asbestos.

Follow applicable guidance. Asbestos materials shall not be used in new construction, repair or maintenance at shore facilities and supporting construction, even when those materials are not specifically banned by EPA. Use asbestos-free substitute materials. Technical guidance may be found in UFGS specifications 02 82 13.00 10 *Asbestos Abatement* and 02 82 16.00 20 *Engineering Control of Asbestos Containing Materials*.

7-1.4.4 Lead.

Follow applicable guidance related to lead-based paint, lead-in-dust, lead-in-soil, and related lead hazards. Do not use materials with lead content in new construction. Specific handling and abatement guidance may be found in UFGS specification section 02 83 13 *Lead-Based Paint Removal and Disposal.* Do not use lead-containing piping, flux, solder, fittings or fixtures in water distribution components.

7-1.5 Chlorofluorocarbons (CFCs) & Hydrochlorofluorocarbons (HCFCs).

Do not use CFC- or HCFC-based refrigerants, or other EPA class I or II ozone-depleting materials in heating, ventilating, air conditioning and refrigeration systems which have been phased out or are slated for phase out. For **\1** alterations **/1/** projects, retrofitting of refrigerant systems or complete system replacement should be evaluated as part of a life cycle cost analysis. Do not mix refrigerant systems. Consult the EPA's Significant New Alternatives Policy (SNAP) Program for updated list of substitutes.

7-1.6 Volatile Organic Compounds (VOC).

For IBC buildings, Comply with UFC 1-200-02. For new IRC buildings - and to the extent practicable in **\1** alterations **/1/** projects - comply with the EPA's Indoor *airPLUS Construction Specifications* which establishes VOC limits for residential building components such as composite wood, paints and finishes, carpets, adhesives and sealants. The Indoor *airPLUS* label is not required.

APPENDIX B – BEST PRACTICES AND LESSONS LEARNED

The following content includes non-mandatory best practices and lessons acquired from completed and current Family Housing MILCON projects and is approved by the tri-services UFC working group for application to current and future design and construction projects. Content is organized in accordance with the format of this UFC. Users are encouraged to also check other non-MILCON sources for best practices and lessons learned.

Lessons Learned is knowledge or understanding gained by experience - either positive or negative. Best Practices are techniques that have been shown to produce optimal results. It is the responsibility of the design or construction agent to exercise professional judgement and expertise in the application to their project.

This Page Intentionally Left Blank

CHAPTER B1 INTRODUCTION

B1-1 ACCESSIBILITY.

Whereas ABA is based on adult anthropometrics, non-mandatory Universal Design (aka Barrier-free Design) focuses on making the features of the house safe and accessible for everyone regardless of age, physical ability, or stature. To the extent practicable, accommodate the broadest range of family member needs and abilities. Examples include:

- Using pulls instead of knobs on cabinets which are easier on hands of all ages.
- Position light switches to accommodate the widest variety of users.
- Consider varied-height cabinets and countertops to accommodate multi-cook families (i.e. a very tall parent and a child working together to prepare a meal.
- Adjustable-height showerheads.
- Offset shower and/or tub controls to facilitate access from outside the tub or shower.
- Avoid changes in floor height, including interior thresholds.
- Consider lever handles instead of knobs for doors.
- Enhanced slip resistance.

Many other strategies can be found at The Center for Universal Design at the Institute for Human Centered Design; https://www.humancentereddesign.org/

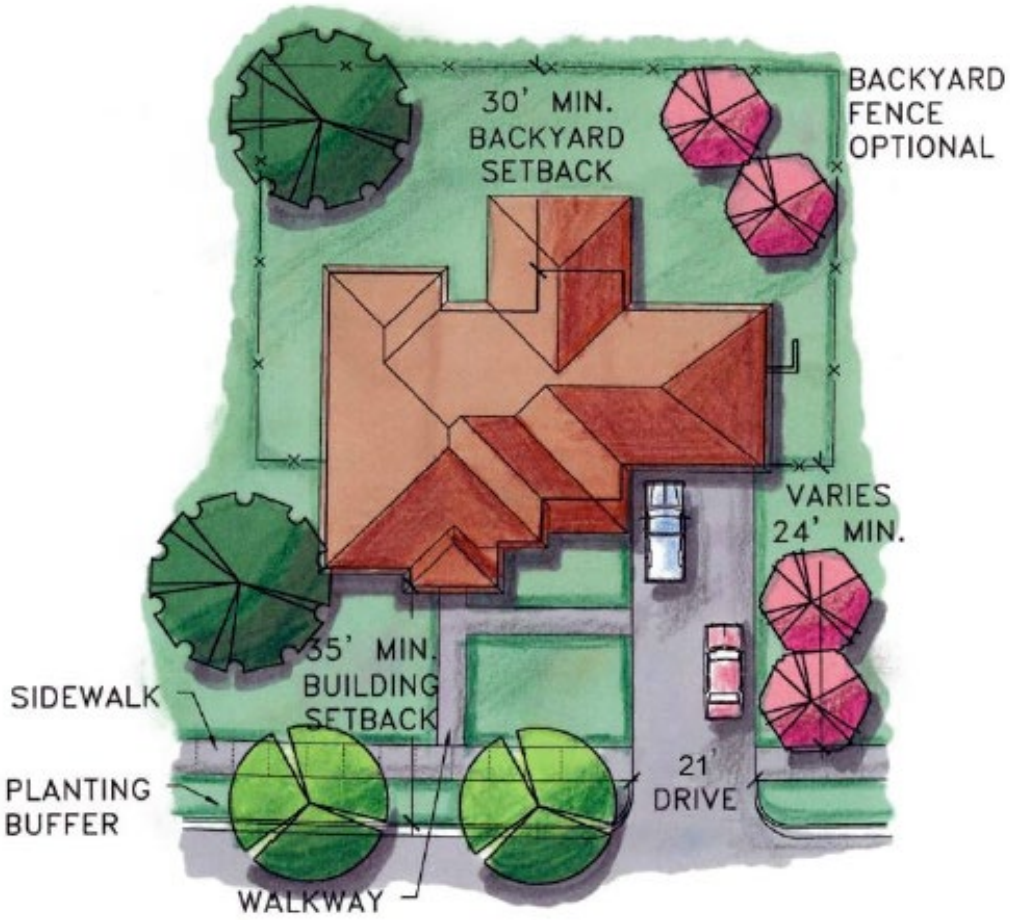
This Page Intentionally Left Blank

CHAPTER B2 RESIDENTIAL COMMUNITY PLANNING

B2-1 GENERAL – RESIDENTIAL NEIGHBORHOODS.

At Jefferson Terrace at Ft Lee, VA, (image below) dwelling units are part of a cohesive neighborhood community connected to the rest of the Post. Successful strategies employed here include:

- Residential streets differentiated by housing clusters providing dwelling unit variety.
- Street patterns that reinforce the sense of community and limit through traffic.
- Consistent setbacks and architecture, shared greenspaces.



B2-2 NEIGHBORHOOD AND DENSITY.

The concept single detached unit site layout (below) employs several successful strategies including;

:

- Generous back yards that accommodate children, pets (when fenced) and family activities. Note that some housing locations permit multiple pets, so consider increasing the backyard sizes.
- Judicious use of landscaping without being excessive. Tree plantings adjacent to sidewalks should be minimized.
- Appropriate setbacks provide a clear and comfortable ‘public-private’ space buffer.

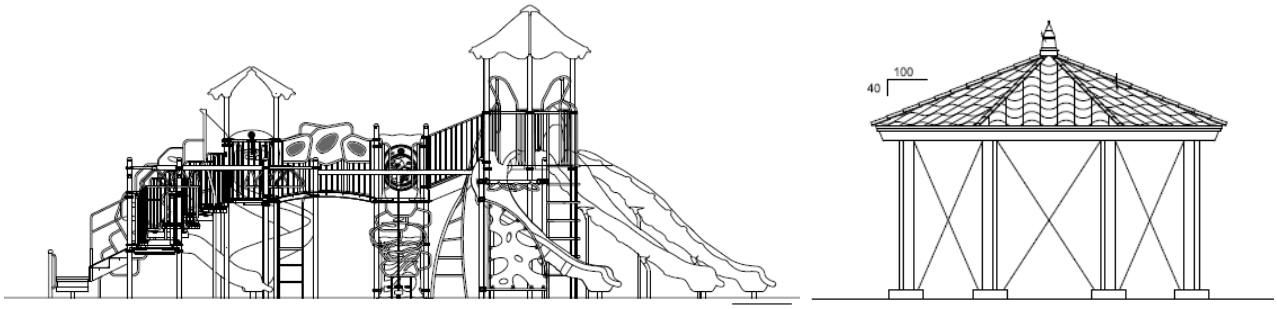
B2-2.1 Housing Types.

A mix of Housing unit types with varying densities within a neighborhood as clusters can be very successful, as demonstrated at gateway Village which includes a mix of duplexes, multi-family, and single detached units which provide a textured yet coherent neighborhood.

This housing project shown below incorporates additional site details that contribute to safe and aesthetically pleasing neighborhoods:

- Side yard located trash screening is discreetly located, and articulated similar to the house as an attractive element instead of an eyesore. (However, it is preferred to be set back a little further than shown here).
- Landscaping softens building corners and existing mature shade trees were retained to shade the patio and side yards, and reduce interior heat gain, making an attractive and yet functional site amenity.

Harrison Villa (below) is a neighborhood revitalization project consisting of duplex and single family detached units. Consistent architectural articulation sets these Ft Lee houses apart and contribute to a coherent community identity. Successful strategies include:



- Despite the inherently repetitive nature of a duplex, each unit of the duplex is slightly varied on the outside; altering the material palette slightly from unit to unit to differentiate while still realizing economies of scale of a large housing project.
- Headers, arched-tops fenestration openings provide visual interest and coherence to the neighborhood.
- Differentiating the main entrance with a small portico contributes to the sense of arrival.
- Roof slopes are consistently at 5/12 or greater, and the roof forms vary slightly across the elevation, providing human scale.
- Generous Roof overhangs provide visual benefit as well as cut down on heat gain.

B2-3 NEIGHBORHOOD RECREATION.

In this neighborhood recreational areas and playfields are well-integrated and within comfortable walking distance of the housing units they serve. Successful strategies employed here include:

- Dwelling unit backyards are integrated into the common site amenities yet retain unit privacy through landscaping, selective fencing. Viewsheds for monitoring children are maintained.
- Generous provision of shade trees and shade structures with consideration of playtime exposure addresses safety hazards of direct sun exposure and of skin contact with heated playground equipment.
- For playground equipment and playground areas in general, limit yellow colors which attract bees.
- Illuminated areas result in a decrease in incidents of vandalism. Consider illumination of areas and structures (such as bus and park shelters) that have been shown to be prone to vandalism.

This Page Intentionally Left Blank

CHAPTER B3 SITE ENGINEERING

B3-1 NEIGHBORHOOD VEHICULAR AND PEDESTRIAN CIRCULATION.

Harrison Villa (below) successfully and safely addresses the circulation hierarchy through the following strategies:

- Residential streets are nicely differentiated and separated from collector streets, and incorporate sweeps, bends, and cul-de-sacs Collector streets serve as the neighborhood buffer and do not have houses on them.
- Landscaped buffers along collector streets.
- Integrated “greenway” pedestrian circulation connects neighborhood recreation areas with housing units without dangerous street crossings.

With strategic location of wider sidewalks, neighborhoods like this one at Ft Benning accommodates joggers and younger cyclists as well as pedestrians, so that housing is connected to recreation. This path runs parallel with the streets but separated by a greenspace buffer.

CHAPTER B4 FAMILY HOUSING SIZE AND FEATURE STANDARDS

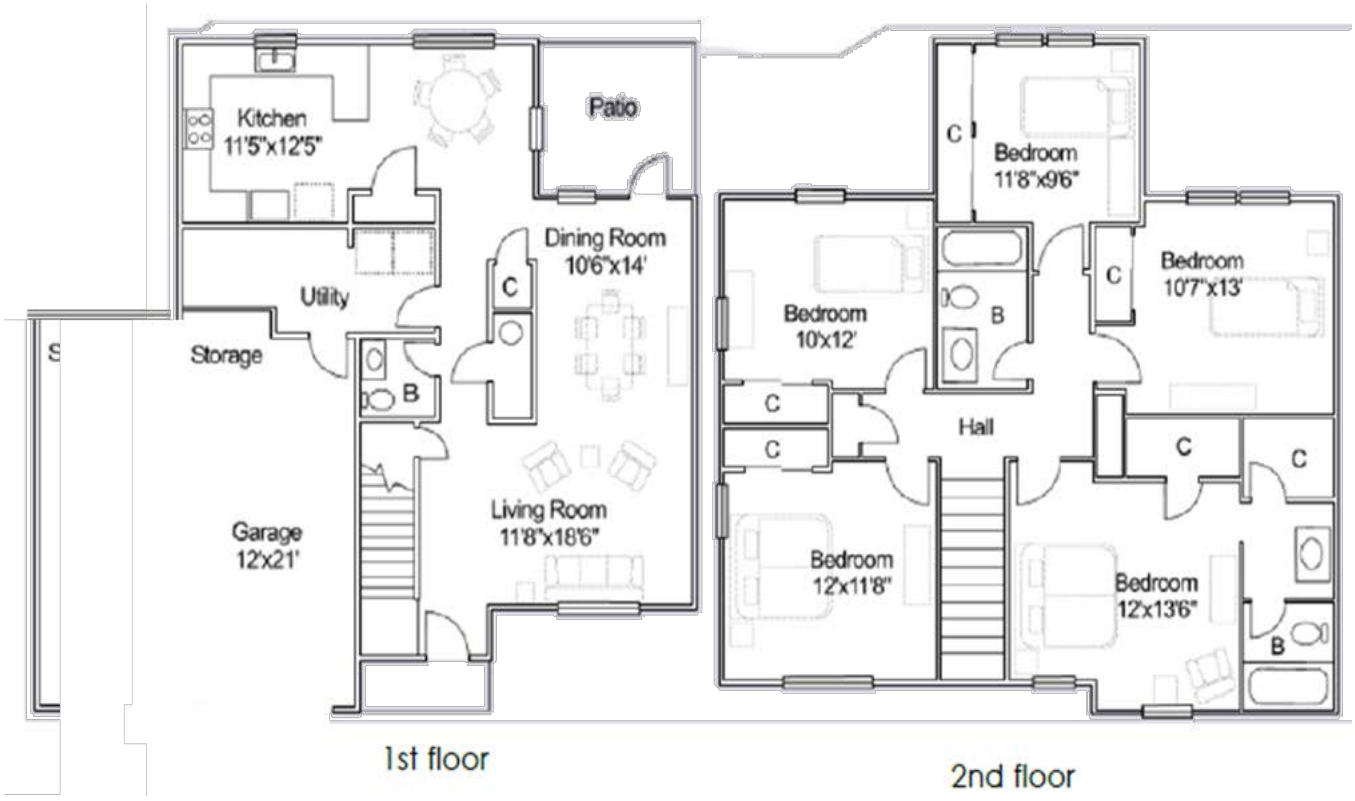
B4-1 UNIT DESIGN – INTERIOR SPACES.

This 1,650 ft2, 3 bedroom, 2.5 bath duplex unit at Ft Lee is characterized by efficient space organization while maintaining functional adjacencies. Successful plan strategies include:

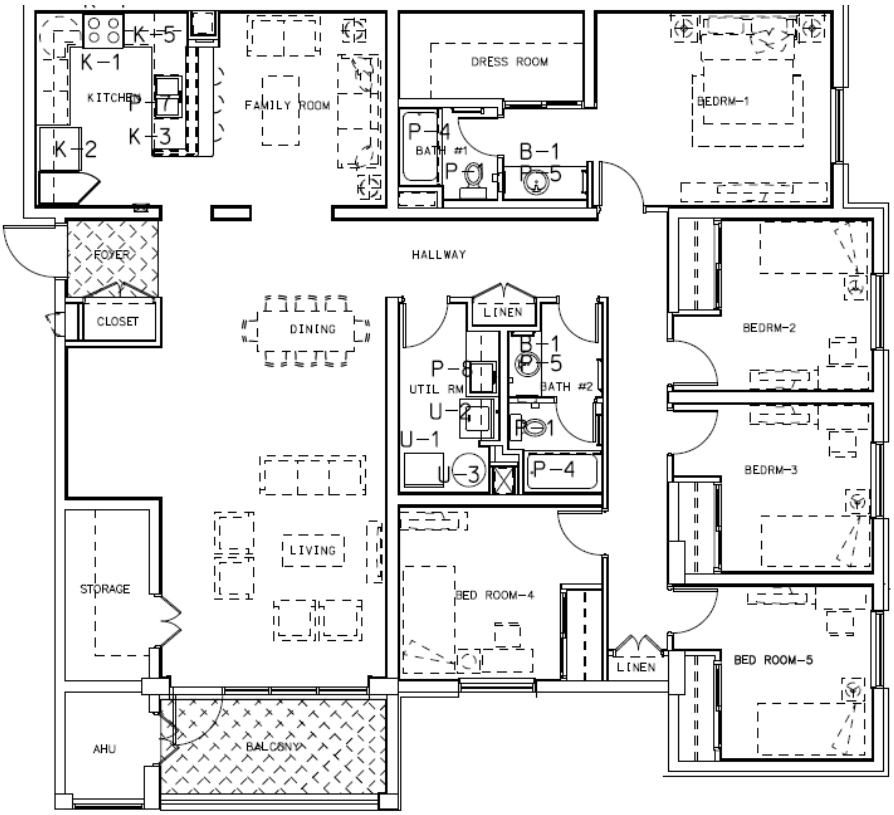
- Mirroring the units alongside the non-garage side vice the garage side means less visual prominence of the service portion of the house, lending a better streetscape and neighborhood experience.
- Despite the small unit sizes. Living spaces are combined into a great room towards the back of the unit adjacent to the patio, while retaining the formal living space in the front.
- Double doors lead to the back patio.
- The kitchen provides open plan concept that incorporates an island that doubles as informal eating (breakfast) area without adding much space.
- Despite limited ground floor space, a small foyer with closet provides just enough separation from the main living to contain items like coats, shoes, and sundry so they don't intrude on living spaces.
- Upstairs, ample landing space width is provided with efficient access to bathroom and sleeping spaces without having a 'corridor-like' feel.
- Double sinks in the master bathroom.

This 1,943 ft^2, 4 bedroom, 2.5 bath detached unit at Ft Benning includes the following successful strategies:

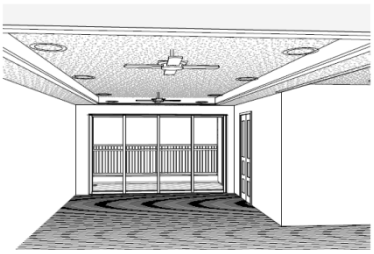
- Pleasant portico entrance is clearly differentiated, provides sense of arrival and does not enter directly into the living room.
- Space 'captured' over the garage in the form of a 'computer nook' (2nd floor) is a skillful way to gain usable space.
- Bedrooms are provided with generous size walk-in closets.
- Exterior storage integrated with the garage.
- Louder family activities are nicely segregated from a quieter more formal living room.



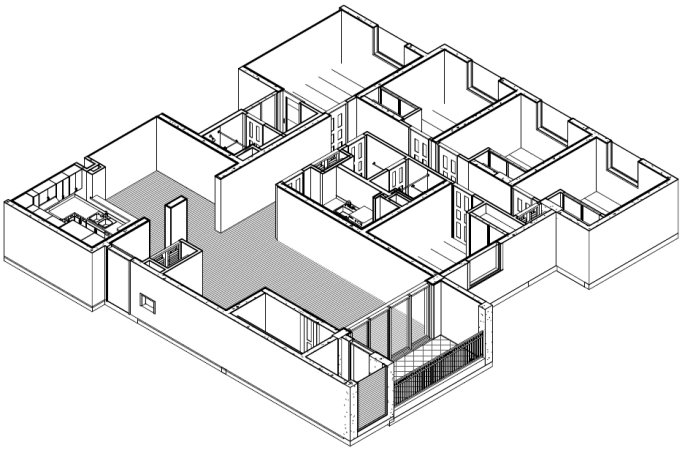
1st Floor



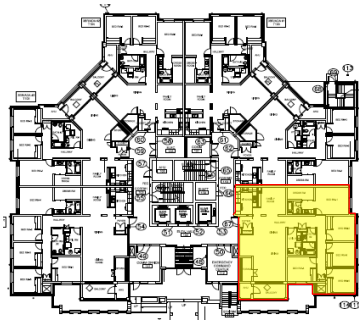
2nd Floor



This single detached unit floor plan manages to fit 5 bedrooms and 2.5 baths within a 1,630 ft^2 footprint and still retain full functionality. Several successful strategies include:



- Open plan kitchen with efficient work triangle.
- Patio is well-positioned to 'extend' living spaces outdoors, making the space feel less constrained than it would otherwise.
- Semi-combined living and dining room provides a balance of segregation and efficient integration.
- Efficient circulation throughout the unit provides for more usable space in living and sleeping areas.



These 2,491 ft^2 high-rise apartment units at Camp Walker provide 5 bedrooms and 2 full baths within the programming benchmark square footage.

B4-1.1 Bathrooms.

Consider interlocking bathroom exhaust fans to run on low power full time and to run on high whenever the lights are turned on.

Do not locate windows over bathtub enclosures when the bathroom faces the street.

B4-1.2 Bedrooms.

Avoid using recessed can type lights in bedrooms; these tend to focus light in occupants eyes when lying in bed reading, or watching TV.

B4-1.3 Interior Storage and Closets.

Consider closet shelving/storage systems to optimize storage capacity.

B4-2 LAWNS.

Consider Sod for front yards: The front yards are often a high traffic area and difficult to establish seed into the turf quality needed. The sod has a longer planting period and could be established easier. It is often cost effective because the front yards are usually fairly small and sod prevents having to have the contractor return to the site for reseeding. The improved curb appeal that results from sodding has been preferred by both tenants and DPW.

For seeded areas, many climate zones benefit from a seed mix; i.e. in southern climates a Bermuda sod turf quality grass that was over-seeded with rye rooted during the dormant season and worked well. In more northern climates you might consider a tall fescue/bluegrass blend.

B4-3 GARAGES AND CARPORTS.

When you have a double garage door and the garage is on the front of your home, the door becomes a major design element. Using 2 two single doors can lessen the impact of one large door, allowing a better balance between the doors and the rest of the house.

B4-4 MECHANICAL SPACE.

In multifamily mid and high rise, do not locate mechanical rooms near dwelling units. Residents often complain about noise and vibration emanating from circulation pumps, air handlers, and other equipment.

B4-5 TRASH ENCLOSURE.

Screen enclosure doors should get latches, hardware, closer, and diagonal bracing to restrain it from sagging which becomes a later maintenance burden.

B4-6 LIFTS AND ELEVATORS.

Do not use ceramic tile or other vulnerable floor finish material in elevators. These finishes are prone to breakage from furniture, dropped objects, spills, and similar events.

B4-7 SOUND ATTENUATION.

Consider increasing sound attenuation/deadening between dwelling unit floor/ceiling assemblies with additional acoustical batt insulation. Lack of Noise mitigation/control is a frequent issue in multifamily housing and a slight increase in the insulation thickness can be a very cost effective solution. Consider other sound dampening strategies such as additional felt membranes or underlayment often specified with floor finishes.

B4-8 INTERIOR FINISHES.

For apartment style housing, consider high quality finishes within the primary common areas of the building. Upgraded finishes here can cost-effectively elevate the quality of the facility. Finishes here should complement that of the dwelling units. Examples include:

- Wood panels on hallway walls.
- Higher ceiling heights.
- Ceramic tile accents in targeted areas.
- Judicious use of carpet (where not heavily trafficked).
- Upgraded hallway lighting fixtures.

B4-8.1 Flooring.

For hardwood flooring, specify dimensionally stable certified products and ensure installation specifications adequately address the tolerances required to accommodate seasonal movement. This is critical to ensure that gaps do not open excessively in dry conditions leaving unsightly gaps and associated maintenance burden, as has been the case in several past projects.

B4-8.2 Ceilings and Ceiling Height.

Consider higher ceiling heights; for example 9 ft. (2.7 m) ceilings on the first floor of the dwelling unit (8' on the second), especially for large open living areas.

Cathedral or vaulted ceilings are encouraged, where climatically appropriate, to improve the quality of unit living space.

B4-8.3 Interior Doors, Frames and Hardware.

Ensure the correct placement of door stops if using the floor mount type that it does not create a tripping hazard.

Doors that have different environmental conditions on opposing sides are more vulnerable to the associated humidity changes, as for example, a main dwelling unit entrance door located off of a primary public circulation corridor for which mechanical zones may differ from the unit. This condition has imposed shrink/swell changes in wood doors. Ensure that the door materials selected are appropriate for the environmental exposure.

B4-8.4 Air Barrier Systems.

Apply an air barrier at the perimeter of the window system that is integrated with the surrounding wall system. Air flow around the frames from the exterior or from cavities within the wall system that are vented to the exterior greatly reduces the performance benefit of thermal breaks.

B4-8.5 Insulation.

Provide additional insulation behind the exterior window casing to mitigate the thermal bridging effect, and provide thermal breaks in all perimeter flashing or trim that surround the window. Never extend clip or veneer supports across the thermal break. These conditions may warrant submittal requirements that call for more detail than is typically required of construction document.

B4-8.6 Exterior Windows and Doors.

Consider automatic sliding entrance doors in high density multifamily housing (i.e. high-rise) and areas subject to high winds.

\2\ /2/

This Page Intentionally Left Blank

CHAPTER B5 BUILDING SYSTEMS

B5-1 ELECTRICAL AND COMMUNICATIONS.

B5-1.1 Lighting.

B5-1.1.1 Exterior Lighting.

As the lighting in the image below demonstrate, site luminaires should be selected to not only ensure adequate security and visibility for pedestrians and tenants, but also for neighborhood architectural theme compatibility.

B5-1.1.2 Interior Lighting.

Carefully consider the appropriateness of occupancy sensors prior to designing them in the dwelling unit. These tend to have lower lamp life, and are generally not appropriate for bedrooms.

B5-1.2 Security Systems.

Consider security systems for addressing the inherent safety vulnerabilities of multi-family housing – i.e. elevators, common use basements, dumpster areas, hallways, and similar areas.

Change No.	**Date**	**Location**

This UFC supersedes AFSDG 4-724-01 Design: Visiting Quarters, June 21, 2005.

FOREWORD

The Unified Facilities Criteria (UFC) system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and applies to the Military Departments, the Defense Agencies, and the DoD Field Activities in accordance with USD (AT&L) Memorandum dated 29 May 2002. UFC will be used for all DoD projects and work for other customers where appropriate. All construction outside of the United States is also governed by Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA), and in some instances, Bilateral Infrastructure Agreements (BIA.) Therefore, the acquisition team must ensure compliance with the most stringent of the UFC, the SOFA, the HNFA, and the BIA, as applicable.

UFC are living documents and will be periodically reviewed, updated, and made available to users as part of the Services' responsibility for providing technical criteria for military construction. Headquarters, U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering Command (NAVFAC), and Air Force Center for Engineering and the Environment (AFCEE) are responsible for administration of the UFC system. Defense agencies should contact the preparing service for document interpretation and improvements. Technical content of UFC is the responsibility of the cognizant DoD working group. Recommended changes with supporting rationale should be sent to the respective service proponent office by the following electronic form: Criteria Change Request. The form is also accessible from the Internet sites listed below.

UFC are effective upon issuance and are distributed only in electronic media from the following source:

- Whole Building Design Guide web site http://dod.wbdg.org/.

Hard copies of UFC printed from electronic media should be checked against the current electronic version prior to use to ensure that they are current.

UNIFIED FACILITIES CRITERIA (UFC)
NEW DOCUMENT SUMMARY SHEET

Document: UFC 4-720-01
Superseding: AFSDG 4-724-01

Description: This UFC provides planning and design criteria for Lodging Facilities. This document was developed from AFSDG 4-724-01, dated 21 June 2005, Army Lodging Standard Design Criteria, and discussions with all the Service contacts noted in Chapter 1, Contacts.

Reasons for Document: This UFC was developed for the following reasons:

- Establish planning and design criteria for Navy Lodging Facilities (Navy Gateway Inns and Suites), which did not previously exist.

- Unify planning and design criteria among the Services. The Air Force had existing criteria in the form of AFSDG 4-724-01, dated 21 June 2005, and the Army has existing criteria in the form of Army Lodging Standard Design Criteria.

Impact: The following direct benefits, both positive and negative, will result from the publication of this UFC:

- The Navy now has design and planning criteria for their Navy Gateway Inns and Suites program. This will enhance the project development process and help ensure minimum standards are achieved.

- Unification of the Services' criteria reduces confusion among government and non-government project development personnel and reduces criteria maintenance costs.

Non-unification Issues: Lodging Facilities are substantially unified among Services and accommodate the same basic functions and overall facility design. However, differences exist between the Services that result from programmatic variations that are, in some cases, fundamental to the different Service missions:

- Room sizing, layout, finishes and design features vary somewhat among Services. These differences are essential for each Service to maintain their individual "brand" of visitor lodging facility, which is critical to a successful program. These differences are not detailed in this UFC and readers are directed to the Service agencies in Chapter 1, Contacts.

- Service-specific programming policies are referenced in Chapter 2. These references are essential given the lodging program variability among the Services.

Non-programmatic differences are minor and include the following:

- Army has additional hot water storage requirements to accommodate mission requirements as approved by the Army Facilities Standardization Committee.

- The Air Force requires some minor variations in mechanical criteria: guest room and toilet ventilation requirements, and temperature and humidity requirements for guest laundry and fitness spaces.

- The Army uses prefabricated kitchens in their suites and staff break area.

- The Army has additional grounds storage needs due to the fact that the lodging program maintains the lodging grounds. The Installation typically maintains the lodging grounds for the other Services.

- The Air Force provides a clothes washer and dryer in their suites.

- The Air Force provides a range in their OCONUS staff break area.

CHAPTER 1 INTRODUCTION

1-1 SCOPE.

This UFC provides guidelines for evaluating, planning, programming, and designing lodging facilities (LF) to accommodate both temporary duty (TDY) travel and permanent change of station (PCS) travel as described below. The information in this UFC applies to the design of all new construction projects, to include additions, alterations, and renovation projects in the continental United States (CONUS) and outside the continental US (OCONUS). Alteration and renovation projects should update existing facilities to meet the guidance and criteria contained in this UFC within budgetary constraints. This UFC is not intended as a substitution for thorough review during design by individual Program Managers and Operations Staff in the appropriate Service.

Lodging programs are managed as follows:

- Army. The lodging facilities described in this document accommodate all official travel, including both PCS and TDY lodging.

- Navy. The lodging facilities described in this document accommodate all TDY lodging. PCS lodging is addressed by the NEXCOM Office, Navy Lodge program.

- Air Force. The lodging facilities described in this document accommodate all TDY lodging. PCS lodging is addressed by the Temporary Lodging Facilities Design Guide

- Marine Corps. The lodging facilities described in this document accommodate all TDY lodging. PCS lodging is addressed by the USMC HQ, Personal and Family Readiness Division (MRK).

1-2 USERS OF THIS UFC.

This UFC is intended as a source of basic architectural and engineering information for all individuals involved in the planning, design, or evaluation of LFs. Specific users of the UFC include the following:

1-2.1 Architects and Engineers.

Architects and engineers (A/Es) that provide design services will use this UFC under the direction of the Service design agencies.

1-2.2 Planning Personnel.

Installation and facility planning personnel will use this UFC, in conjunction with other required programming documents, for programming new or replacement facilities, pre-design planning, or assessing the extent of improvements required in an existing LF in order to achieve the standard established herein.

1-2.3 Additional Users.

Additional users include the following:

- Headquarters Staff and Field Operating Agencies,
- Major Command Staff/Regions,
- Installation Commanders,
- Installation Facilities Management,
- Installation Technical Proponents, and
- LF managers and senior staff.

1-3 DOCUMENT ORGANIZATION.

The criteria are organized to parallel the design process:

- Chapter 2—Planning and Programming. This section provides criteria relevant to site planning, project scope, funding, and execution of LF projects.
- Chapter 3—General Design Criteria. This section provides overarching technical design criteria such as codes and standards, site design, overall building design, infrastructure, and building systems.
- Chapters 4 and 5—Design Criteria. These sections provide detailed requirements for each functional space as well as illustrative design information. This section is divided into chapters for guest rooms and all other spaces.
- Appendices—Appendix A provides all applicable references. Appendix B provides “best practices” that include valuable background information, lessons learned, and design guidance the designer is expected to incorporate according to the needs of the project. Appendix C provides space criteria.

1-4 CONTACTS.

Prior to project development, confirm the acquisition methodology and coordinate the design team composition and facility requirements with the following contacts, as appropriate:

- Army. Family and Morale, Welfare and Recreation Command (FMWRC): U.S. Army Installation Management Command, Attn: Family and MWR Command-Director, Hospitality Programs, 11711 North IH 35, Suite 110, San Antonio, TX 78233-5498.

- Navy. CNIC (N924), Fleet & Family Readiness, Washington, DC (Program Manager), and CNIC (N944), Fleet & Family Readiness, Millington, TN (Facilities Support).

- Air Force. Air Force Center for Engineering and the Environment (AFCEE) for the acquisition methodology and HQ Air Force Services Agency, Lodging Facilities Branch (HQ AFSVA/SVOLF) for design team composition and facility requirements.

- Marine Corps. USMC HQ, Installations and Logistics, I&L (LF).

1-5 SCOPE OF FACILITY.

LFs provide quality, consistent, and cost effective lodging services to official government travelers. The design and configuration of LFs employ most concepts of a mid-priced, limited service private sector hotel—i.e., a hotel that does not have full-service food and beverage capability. Department of Defense Instructions (DoDI) 1015.11 and 1015.12 provide policy and resourcing for all lodging facilities and define TDY and PCS lodging. The Joint Federal Travel Regulations define the types of travelers that will use these facilities.

Criteria in this UFC include options and requirements. Options shall be approved by the agencies identified in Chapter 1, Contacts. All criteria or features not identified as options shall be considered the minimum requirement for the facility and shall be funded and incorporated unless a waiver is obtained from the agencies identified in Chapter 1, Contacts.

1-5.1 Types of Facilities.

There are two types of LFs:

- Central. Central facilities accommodate the main check-in function, the majority of the guest services and administration, and the guest rooms and suites. There will always be at least one central facility on an Installation that includes visitor lodging.

- Satellite. Satellite facilities accommodate additional guest rooms, suites and limited services and support functions. They may be located remotely from the central facility to serve additional Installation areas or near the central facility as part of a visitor lodging complex.

1-5.2 Functional Program Areas.

Table 1-1 provides a listing of all the LF functional program areas, indicates if each area is included in each type of facility, and describes the function of the area.

TABLE 1-1. FUNCTIONAL PROGRAM AREAS

Functional Program Area	Central	Satellite	Description
Guest Services			
Covered entry	X		Covered vehicle drive for loading/drop-off at main entry
Entrance vestibule	X	X	Entry airlock
Central lobby	X		Central facility lounge seating and circulation space between reception and other central guest services
Satellite lobby		X	Satellite seating/waiting and circulation space adjacent to main entry
Reception	X		Reception desk for check-in/out and guest service
Concierge[1]	X		Optional concierge desk/area for guest service
Bell cart station	X	X	Area near the entrance vestibule for storage of bell carts.
Coffee bar[1]	X		Optional area for self-service coffee
Food service[1]	X	X	Optional small cafeteria-style food service for continental or limited menu self-service meals (includes service, dining, and prep/storage)
Service			Self-service serving line
Dining (seating)			Seating area
Prep/storage			Limited food prep/warming kitchen and food and dry goods storage
Retail food service[1]	X		Optional contract (retail) food service ranging from a small coffee kiosk to a full-service restaurant
Retail sales[1]	X		Optional area adjacent to reception for sale of small items such as sundries, candy, drinks, etc.
Luggage storage	X		Secure room adjacent to reception for storage of guest luggage
ATM[1]	X	X	Optional ATM kiosk
Registration machines[1]	X	X	Optional self-service registration kiosks.
Public toilets	X	X[1]	Public toilets
DSN Phones[1]	X		Optional area for DSN phones
Fitness room[1]	X	X	Optional, small, guest fitness room
Conference room[1]	X		Optional conference room
Business center[1]	X		Guest-use computers and office equipment
Study room[1]	X	X	Optional room(s) used by guests for small group study sessions, typically only at training installations
Guest laundry	X	X	Self-service guest laundry
Gear wash[1]	X	X	Optional area for personnel to wash equipment after field exercises
Guest bulk storage, Option 1[1]	X	X	Optional area for self-service guest storage of large, bulky items
Vending[1]	X	X	Optional self-service guest vending

Functional Program Area	Central	Satellite	Description
Ice	X	X	Self-service ice dispenser on each floor
Patio[1]	X	X	Optional outdoor space for picnic tables, seating, grills, etc.
Patio storage[1]	X	X	Only available with patio, provides storage for amenities, as needed based on climate
Guest corridors/ circulation	X	X	Access to guest rooms and remote services
Guest room[2]	X	X	Standard room with a combined living/sleeping area and private bath. See Table 4-1, 4-5.
Family/business suite (Suite)[2]	X	X	Suite with separate living and sleeping areas, a compact kitchen and private bath See Table4-3
Administration Services			
Lodging communications	X		IT/communications room including guest and staff Internet, television, and administrative file server.
Manager's office	X		Private office See Table5-29
Asst. manager[1]	X		Optional private office See Table 5-29
Front desk supervisor	X		Private office See Table5-29
Accounting office	X		A single office or up to 3-4 workstations depending upon operation size
Clerical	X		Workstations for clerical staff in an open office area See Table 5-31
Reservations[1]	X		Optional workstations for reservations staff in open office area See Table 5-31
Work space	X		Copier, printers, facsimile machines, work space, common files, and administrative storage See Table5-31
Cash room	X		Secure room where front desk agents reconcile shift cash functions and store cashier banks
Floor Support			
Janitor areas	X	X	Janitor closet on each floor or wing.
Housekeeping areas	X	X	Housekeeping support and supplies on each floor or wing
Utility rooms	X	X	Mechanical, electrical, communications, and sprinkler rooms located for efficient utility distribution
Back-of-House Support			
Training room[1]	X		Optional room for staff training
Training office[1]	X		Optional office and/or training material storage area
Central Janitor areas	X	X	Central janitor closet with additional supply storage See Table 5-38
Housekeeping manager	X	X	Private office
Housekeeping assistant[1]	X	X	Optional private office for large programs
Soiled linen storage	X	X	Separate storage from clean linens, adjacent to receiving or laundry

Functional Program Area	Central	Satellite	Description
Clean linen storage	X	X	Separate storage from soiled linens
Receiving	X	X	Service entrance/loading dock
Receiving/supply office[1]	X		Optional private office
Linen laundry[1]	X		Optional space with industrial-grade equipment, based on local service contract linen costs and availability
Supply/general storage areas	X	X	Storage and warehousing of facility supplies
Cleaning fluid storage	X	X	Separate storage for cleaning chemicals
Utility rooms	X	X	Central facility mechanical, electrical, communications, and sprinkler rooms
Guest bulk storage, Option 2[1]	X	X	Optional staff-access secure room for guest storage of large, bulky items
Break area	X	X	Staff break area with kitchenette and lockers
Staff toilets	X	X[1]	Staff facilities
Maintenance workshop	X		Includes limited storage and accommodates repair of small equipment and furnishings
Grounds equipment storage[1]	X		Optional space with direct exterior access for grounds and exterior building maintenance supplies and equipment
Service circulation	X	X	Separate stairs, corridors and elevators from guest circulation

[1] Optional space requiring approval of the agencies noted in Chapter 1, Contacts.
[2] The final number, mix and variations of room types will be determined in the planning stage. See Chapter 2 for more information.
[3] Specific design needs for each Functional Program Area may be described in Tables in Chapters 4 and Chapter 5.

CHAPTER 2 PLANNING AND PROGRAMMING

2-1 INTRODUCTION.

This chapter provides basic guidelines for planning and programming new lodging facilities and renovating existing facilities. The number of guest rooms, suites, guest support areas, and service areas at each site will vary depending on the mission, but standard plans and requirements will remain consistent. Renovations will follow this guidance as closely as possible, understanding that variances will be made on a case-by-case basis. The agencies noted in Chapter 1, Contacts, have programming and design latitude and decision making authority in the following areas: site selection and exterior architectural treatment.

2-2 SITE PLANNING.

Installation planning personnel will determine the appropriate site for a new LF or campus. The footprint and mass of a new LF is significantly greater than traditional dormitory-style facility configurations; therefore, appropriate and adequate site selection is critical. Coordinate site and building height requirements with fire department capabilities, DoDI 4165.57, and airfield restrictions (if applicable).

Determine the most appropriate and cost effective location for the LF/campus based on the following factors:

- Development potential, future expansion and adjoining land uses. Expansion of lodging facilities usually involves adding guest rooms. It is generally impractical to add onto an existing lodging facility. Therefore, if potential future expansion is identified during the programming stage, allow space in the site development plan for additional structures and size site utilities accordingly.

- Proximity to and capacity of recreational centers and community facilities such as fitness centers, dining facilities, postal service centers, Installation exchanges, commissaries, pedestrian circulation systems, bike paths, and mass transit routes. Balance the proximity to community services with the need for quiet and privacy.

- Proximity to a particular activity or site that the lodging facility serves, if applicable, also considering transportation resources and routes to those activities.

- Existing topography and landscape. Site selection should minimize the need for excessive grading.

- Available Installation infrastructure such as roads and drives, parking, landscape, utilities, and fire department access.

- Future demands placed on the capacity of supporting infrastructure and utilities.

- Facilities requiring demolition.
- Off-Installation communities and adjoining neighborhoods.

2-3 PROGRAMMING.

2-3.1 Programming Policy.

Information and guidance regarding work classifications, funds sources and approval levels for both appropriated fund (APF or MILCON) and non-appropriated fund (NAF) projects may be found in DoDI 1015.11, 1015.12, and 1015.15 and the following documents:

2-3.1.1 Army.

- AR 420-1
- AR 215-1

2-3.1.2 Navy and Marine Corps.

- OPNAVINST 11010.20H
- NAVFACINST 11010.45

2-3.1.3 Air Force.

- AFI 32-1021
- AFI 32-1022
- AFI 32-1023
- AFI 34-205
- AFI 34-246

2-3.2 Initial Project Scope.

The initial primary facility scope of a LF project shall be programmed using the standards and criteria contained this UFC and the following documents:

- Army Lodging Standard Design Criteria and Army Standards for Army Lodging
- UFC 2-000-05N (P-80)
- AFH 32-1084

The organizations provided in Chapter 1, Contacts, will provide the number and types of rooms based on usage data. Planning shall incorporate accessibility requirements in all common guest support areas. Allow space for guest support areas, back-of-house service areas, and site requirements. Replacement of existing support functions will be considered in the programming of a new facility.

2-3.3 Final Project Scope.

The final project scope will be based on the results of an independent assessment performed through the agencies identified in Chapter 1, Contacts. This assessment validates the site selection; determines the overall number of room types, support areas, guest services to be provided; and identifies any companion projects necessary to provide a complete and usable facility.

The facility space program will accommodate the following:

- Projected guest utilization based on official historical usage, non-availability certificates issued, and projected usage based on new or planned activities that will yield 80% average projected occupancy for the proposed facility/complex.
- ABA-accessible room count per Chapter 3, Accessibility
- Potential for retention and renovation of existing facilities
- Need for additions/alterations versus completely new construction projects
- Existing on-Installation community facilities and their potential for meeting current and future needs
- Additional requirements such as potential surge conditions, significant transient crew requirements, and historic long-term TDY and PCS commitments

2-3.4 Guest Room and Suite Sizing.

Comply with Table 2-1 for guest room and suite net area standards (net area as measured from interior finished wall to interior finished wall). Commands desiring a waiver from these absolute planning factors must submit a fully justified request, formatted as a normal congressional reprogramming action, and an economic analysis to the organizations provided in Chapter 1, Contacts.

TABLE 2-1. NET AREA STANDARDS FOR NEW CONSTRUCTION AND RENOVATION

Room Type	Minimum	Maximum
Guest Room	300 ft^2 (27.9 m^2)	325 ft^2 (30.2 m^2)
Suite	450 ft^2 (41.8 m^2)	606 ft^2 (56.3 m^2)

2-3.5 Support Space Sizing.

Support space sizing standards are provided in Appendix C of this UFC. Sample space programs are included to demonstrate how to calculate space requirements.

2-4 FUNDING/COST GUIDANCE.

Design these facilities with the objective of achieving the lowest life cycle cost over a 50-year period. The budget must support an appropriate and high-quality program and the performance requirements outlined in this UFC. The following information provides guidance on developing a budget that will support these goals.

2-4.1 Site Cost.

The project will fund outdoor passive and/or active use areas and/or site amenities as required to provide an attractive and usable facility that is competitive with comparable commercial facilities. These features must complement the architecture of the campus and include amenities such as walks, site lighting, landscaping, benches, trash receptacles, and fencing if used to screen equipment or dumpsters. Additional amenities such as barbecue grills and tables are permitted, but they are the funding responsibility of the Installation or the Activity/Major Command.

2-4.2 Other Design Cost Considerations.

2-4.2.1 Guest Room and Suite Sizing.

Guest rooms and suite usable space minimums in Table 2-1 cannot be changed due to budgetary constraints.

2-4.2.2 Signage.

The project budget shall include all interior and exterior facility directional signage, room and informational signage, and the freestanding exterior facility identification (monument) sign.

2-4.2.3 Furnishings Fixtures and Equipment.

Chapters 4 and 5 provide the breakdown of furnishings, fixtures and equipment (FF&E) for each space and indicate whether the items are contractor furnished/contractor installed (CFCI), i.e., included in the project construction contract, or government furnished/government installed (GFGI), i.e., not part of the construction contract. Some

items are also classified as government furnished/contractor installed (GFCI). Items included in the project construction contract may be funded by different sources depending on the Service and overall project funding approach, so confirm the interior design funding sources with the agencies identified in Chapter 1, Contacts, prior to finalizing the project budgets.

2-4.3 Additional Funding/Cost Guidance for NAF Projects.

If the LF project is a NAF project, additional special reporting and approval requirements must be followed. See DoDI 7700.18 for this guidance.

2-5 RENOVATION PLANNING.

Lodging renovations range from building and system upgrades to complete reconfiguration. The requirements and recommendations in this UFC apply to renovations. Some flexibility in complying with established guidance contained in this UFC is allowed for renovated facilities, but the facilities shall include the required spaces to the greatest extent feasible. Flexibility in design may be considered based on existing conditions and physical limitations such as construction type, location and character of load bearing walls and columns, and others.

CHAPTER 3 GENERAL DESIGN CRITERIA

3-1 GENERAL.

UFC 1-200-01 provides applicability of model building codes and government-unique criteria for typical design disciplines and building systems, as well as for accessibility, antiterrorism, security, sustainability, and safety. Use this UFC in conjunction with the criteria identified in 1-200-01.

3-2 ACCESSIBILITY.

Per DoD requirements, provide accessible rooms per Table F224.2 of the ABA Accessibility Standard for DoD facilities. Comply with DoD Memorandum, DoD Housing Inspection Standards for Medical Hold and Holdover Personnel for wounded warrior accessibility. This will require some ABA guest rooms to include direct access to an adjoining guest room.

3-3 STRUCTURE.

Coordinate column/wall spacing to limit awkward placement within larger public spaces.

3-4 ARCHITECTURE.

3-4.1 Attics.

Attic access is required, but restricted to LF personnel only. Storage capability in attic areas shall not be provided.

3-4.2 Exterior Design.

The building design shall comply with Command and Installation architectural standards and incorporate the local geographical and cultural environment. See Appendix B, Best Practices, for additional guidance.

3-4.2.1 Exterior Finishes.

Exterior finishes shall be durable and low-maintenance. Coordinate exterior colors and finishes with the interior design standards noted in Chapter 3, Interior Design, paragraph 3-4.3.

3-4.2.2 Windows/Natural Light.

Provide for the admission of natural light in the design of the facility window systems and in the design of the overall footprint and floor depth. Select furniture systems that maximize the admission of natural light into the facility. The goal should be to achieve the LEED® “Daylight & Views” points. In designing for natural light admission, coordinate with Chapter 3, Electrical Design, paragraph 3-5.4.

Comply with the following requirements:

- Use tight-fitting, insulated, commercial-grade windows that meet antiterrorism requirements per UFC 4-010-01. Light-duty residential grade windows are not acceptable.

- Analyze the cost and sustainability benefits of Energy Star labeled windows and low emissive (Low E) double pane glazing for increased thermal performance, ultraviolet retardation, and maximum light transmission. Qualifying products are listed on the Energy Star website. Provide these windows and glazing if the analysis supports.

- Size windows nominally between 10 and 15 percent of the floor area they serve.

- Maximize window size and area to increase the admission of natural light into guest rooms.

- Select windows that are compatible with the type of window coverings to be used to ease maintenance.

- Provide solid surface windowsills at all windows.

3-4.2.3 Exterior Doors.

Comply with the following requirements:

- All public area entrance doors shall meet force protection and accessibility construction standards minimum requirements per UFC 1-200-01, and will be a minimum of 36 in. (910mm) in width.

- Remote, non-guest exit doors shall be equipped with an alarm that sounds at the front desk when the doors are opened. This alarm shall be programmable to be operational at specific times of the day.

- Secondary guest entrances shall have electronic key card locks.

- Doors shall be fully weather-stripped; include a heavy-duty metal threshold to prevent drafts, dirt, water, and insect entry; and be thermally insulated.

- Exterior entrance service doors will be hollow metal with hollow metal frames.

- All doors require doorstops, and wall-mounted bumpers will be used where possible. Provide blocking in walls as required.

- See Interior Doors below for locking system requirements.

3-4.2.4 Roofing.

Unless the installation's architectural compatibility standards state otherwise, all lodging facilities shall have sloped standing-seam metal roofs. Cool roofs are required unless engineering analysis on its suitability negates its use in accordance with ACSIM Sustainable Design and Development Policy.

Provide protection against falling ice and snow for sloped roofs located over building entrances. Coordinate exterior locations of dryer vents and bath exhausts to minimize roof penetrations and reduce the visual impact on exterior elevations.

3-4.2.5 Building Signage.

Building signage shall provide clear directional and informational assistance. Mechanical, electrical and/or utility room doors must have identifying signage to match other building signage.

3-4.3 Interior Design.

Interior design and FF&E packages shall comply with the Service-specific branding concepts that provide the finish and color requirements for each space. The agencies noted in Chapter 1, Contacts, shall provide the latest branding concept standards. See Appendix B, Best Practices, for additional general guidance.

3-4.3.1 Interior Doors.

All interior door hardware throughout lodging facilities will be lever style. If possible, provide single hardware assembly for door closure and hold open operation.

If an electronic locking system is not already in use at other Installation lodging facilities, provide a complete system, including the reception desk. If an electronic locking system is in use at other Installation lodging facilities, match existing system. Assure that the statement of work for the locking system software selected for Installation will interface with the Property Management System. All doors will operate from this same locking system except doors accessing utility and service functions.

3-4.3.2 Interior Construction.

Provide blocking for all wall- or ceiling-mounted equipment and furnishings.

Built-in cabinets must be well constructed with sturdy hardware and meet the requirements of the Kitchen Cabinet Manufacturer's Association standards. Particleboard may not be used. All case goods and hardware will be coordinated with the Comprehensive Interior Design package for the project to ensure matching woods, stains, and finishes as best possible. In all cases, concealed hinges will be provided. Finishes must be able to withstand frequent cleaning and must coordinate with the other finish materials. Countertops shall be solid surface/solid composite plastics only. Where no water source is present, plastic laminate with hardwood or solid surface edging may be permitted with approval from the agencies identified in Chapter 1, Contacts.

3-4.3.3 Finishes.

Finishes should take into account the intended uses and be highly durable. They must meet the requirements listed in NFPA 101 and UFC 3-120-10.

Comply with the following requirements throughout the entire facility:

- In moist climates, do not cover the inside of exterior walls with impervious materials such as mirrors or vinyl wall coverings to help preclude mold development in the wall.

- Procure a high quality, easy to maintain, durable carpet that provides a long lasting appearance.

- For additional finish criteria in specific areas, see Chapters 4 and 5.

3-4.4 Acoustics.

Design the facility to provide a comfortable acoustical environment and provide comprehensive sound isolation and sound absorption measures for individual spaces as appropriate. Provide acoustical design to prevent sound from noisy spaces such as corridors, toilets, elevator machine rooms, and mechanical rooms from having negative impact on the adjacent spaces. Comply with the following:

- Isolate sound-generating mechanical equipment to minimize sound and vibrations from being transmitted through the building structure. Isolation methods include isolation hangers or other appropriate methods.

- Walls between living units, between living units and corridors, between living units and other spaces, and exterior walls of living units shall have a minimum sound transmission class (STC) of STC 54.

- Floor and ceiling assemblies shall be a minimum of STC 55 and have an impact isolation class (IIC) of at least 60.

- Telephone, cable television, convenience outlets, and mechanical ducts shall be staggered or otherwise designed to not compromise the acoustical integrity of wall, floor, or ceiling assemblies.

- Where fluorescent lamps are used, specify fluorescent lamp ballasts with a sound level rating ‘A’.

At a minimum, provide the required STC ratings identified above and the ratings in Chapter 5, Functional Data Sheets, for individual spaces. Use the “Suggested Design Values” STC ratings in UFC 3-450-01 as the basis for the sound design of partition, door and window assemblies. Utilize gypsum board wall “improvements” to increase the STC of gypsum board “Stud Type” partitions to achieve the project sound requirements. Unless noted otherwise extend the room partitions and seal to the

structure above for rooms that have a noise source such as, but not limited to, corridors, toilets, classrooms, training rooms, maintenance rooms, and mechanical rooms. Unless indicated in Chapters 4 and 5, STC ratings do not need to be field verified.

3-5 SERVICES.

3-5.1 Plumbing.

Comply with the following:

Provide for the installation of fixtures and associated amenities noted in Chapters 4 and 5, Specific Design Criteria.

Design plumbing systems to take advantage of stacking bathrooms and common wet walls for efficiency.

Exposed plumbing pipes are not permitted.

Copper piping shall be used for all supply lines. If PVC drainage pipe is used above public spaces, the area shall be insulated for sound control.

Provide shut-off valves at all fixtures.

Toilet and bath fixtures must match and be white in color.

All bathroom plumbing fixtures exposed (pipes, faucets, etc.) shall be first-line plated brass, manufactured by nationally known manufacturers.

All tubs and lavatories shall have pop-up-type waste stoppers. Rubber stoppers are not permitted.

Tub/shower valves shall be pressure balanced anti-scald type. Locate faucet, showerhead and controls on interior wall to allow for placement of plumbing access panel.

Provide filtered water lines for break area refrigerators with automatic icemakers.

Provide hose bibbs on exterior walls of each building at 100 ft. (30.5m) intervals and where indicated in Chapters 4 and 5; freeze proof as dictated by climatic conditions.

Central hot water domestic systems (gas if possible) will be specified for all projects to reduce costs and provide better service for guests. The minimum requirements are to allow for simultaneous use of 100% of the showers discharging (maintaining a pressure of 15psi at the showerhead). Minimum hot water storage will be sized to maintain flow under 100% shower discharge for a five-minute period (capacity will vary based on number of rooms). The heat exchangers within the calorifier will be capable of raising the contents from 50°F (10°C) to 149°F (65°C) in one hour. The temperature of the hot water as it leaves the hot water storage calorifier will be 140°F (60°C). Service Exception: The Army requires that a circulating pump or other approved in-line system

shall be installed to provide hot water to the guest room taps at 110°F (43°C), 75% diversity for 30 minutes (capacity will vary based on number of rooms).

3-5.2 Heating, Ventilating, and Air Conditioning (HVAC).

In order to minimize the possibility of mold or mildew, ensure the humid area criteria provisions in the core mechanical UFCs as defined in UFC 1-200-01 are followed when designing the HVAC system. Air Force HVAC systems shall be designed in accordance with ETL 04-3.

3-5.2.1 System Selection.

Selection of the HVAC system shall be based upon the lowest total life cycle costs: include initial costs, operating costs, energy costs, system maintenance and repair costs, and component replacement costs, if not expected to achieve the same life cycle of the systems under consideration.

Refer to Appendix B, Best Practices, for additional information and considerations in system selection. Comply with the following:

- If a geothermal heat pump system (GCHP) is being considered, the soil reports prepared during the design process shall include borings to the depth necessary to consider the use of a ground source heat pump. The cost of the drilling and installation of the pipe shall be considered in the economic analysis.

- In the selection of chilled water systems, the design of HVAC enclosures shall take into account the space needed for chillers to receive air to cool condenser coils and room for service. The enclosure design shall prevent large amounts of pollen and vegetation from clogging condenser coils, be appropriately located on the site, and be compatible with surrounding architecture and exterior design elements.

- Supply air and outside air (OSA) will be ducted to the sleeping rooms. Branch ducts will be equipped with balancing dampers. Do not place ductwork over the shower area, and ceiling space will not be used as return air plenums. Soffit areas in guest room and suite closets are good ductwork locations. Determine the amount of transfer/return air sound attenuation between the guest rooms and adjacent areas.

- For new construction, do not locate HVAC units in the ceiling.

- Coordinate the location of sensors and thermostats with location of furniture and artwork throughout the building.

3-5.2.2 Maintainability.

Maintainability of the system is critical to the continued quality of life of the occupants. Design access to the system to minimize disruption or inconvenience to LF guests and

maximize servicing efficiency. Air Force shall comply with ETL 01-1. In renovated facilities when HVAC units are located above the ceiling, ensure that filters, controls, drain pans, and condensate piping, control valves and coils are easily accessible for servicing and cleaning. Condensate piping must be equipped with traps and threaded clean-outs at the unit. Design drawings must detail these features including minimum clearances for maintenance and required force protection setback distances.

3-5.2.3 Ventilation.

Each guest room will be supplied continuously with conditioned outside air via a central ventilation system to meet the current ASHRAE Standard 62.1 (Service Exception: For Air Force facilities meet ASHRAE Standard 62.2-2010, table 4.1a) or as required for building pressurization, whichever is larger. Equip all branch ducts with accessible volume control dampers. The guest room or suite's HVAC unit's fan must run continuously. Operable windows are not permitted in guest rooms in view of the foregoing.

3-5.2.4 Bathroom Exhaust.

Bathrooms shall be equipped with a central exhaust system. Comply with the following:

- The exhaust system shall run continuously and be interlocked with the building supply air system. Ensure the system meets HVAC-Related Background Sound criteria for hotel rooms as listed in the latest ASHRAE Handbook – HVAC Applications. Service Exception: For Air Force facilities, guest bathroom exhaust shall meet ASHRAE Standard 62.2-2010, table 5.2 for continuous exhaust.

- Include a manual volume damper accessible from the space for proper balancing.

- Include a life cycle cost evaluation for utilizing heat recovery from the exhaust system to precondition ventilation air.

3-5.2.5 Guest Room HVAC Systems.

Individual HVAC systems shall not be used as the primary facility HVAC system to condition outside air. When guest rooms are equipped with individual HVAC systems, these systems will be ducted vertical fan units or heat pumps placed within designated mechanical closets or mechanical rooms equipped with lockable doors. If individual HVAC systems are used as a secondary system for the guest rooms in humid areas, they must be carefully designed to avoid mold and mildew.

3-5.2.6 Piping System.

Where centralized hot and chilled water are utilized, individual HVAC systems shall be connected to a centralized mechanical system by a four-pipe hot water and chilled water distribution system to provide positive space control.

Where GCHPs are used, evaluate the need for a backup heating system (such as an auxiliary boiler) and towers in the loop based on site location.

3-5.2.7 Perimeter Fin Tube Heating.

In OCONUS areas or as applicable per local code where perimeter fin tube heating is utilized, provide temperature control for each zone.

3-5.2.8 Laundry Areas.

Design straight-run venting of dryers to avoid lint clogs. Dryer venting must be exhausted away from windows and exterior balcony areas.

3-5.3 Fire Protection and Life Safety.

Fire Protection shall be in accordance UFC 3-600-01. Fire sprinkler heads shall be concealed in occupied and living spaces.

Provide carbon monoxide detection in accordance with NFPA 720 and as part of the installed addressable fire alarm and emergency notification system in all LFs that contain carbon-based fuel burning systems. Comply with the following:

- Provide a separate carbon monoxide alarm (voice message) via the fire alarm system.
- Locate carbon monoxide detectors in the immediate vicinity of the bedroom portion of the guest rooms and suites.
- Locate carbon monoxide detectors on the ceiling in the same room as all permanently installed fuel-burning appliances.
- Transmit a separate carbon monoxide alarm signal to the Installation's Receiving Station.
- Transmit a separate carbon monoxide trouble and supervisory signals to the Installation's Receiving Station.

3-5.4 Electrical Design.

Surface-mounted conduit or wire-mold shall not be used in any guest rooms, public spaces or administrative spaces. General outlets required should comply with UFC 3-520-01. Comply with the following LF-specific requirements:

3-5.4.1 Lighting.

See Chapters 4 and 5, Functional Data Sheets for light level and control requirements that are exceptions or in addition to standard requirements. For the guest rooms and suites, adapt the Residential Housing sections of UFC 3-530-01 as modified by Chapters 4 and 5 of this UFC.

3-5.4.2 CCTV.

Provide the infrastructure for a CCTV system. The agencies identified in Chapter 1, Contacts, will determine funding requirements for the additional components required to develop a complete system. See Chapters 4 and 5, Functional Data Sheets for monitor and camera locations.

3-5.4.3 Telecommunication Systems.

See Chapters 4 and 5, Functional Data Sheets, for jack locations. Where “house phones” are indicated, these shall connect to the front desk or dedicated administrative areas only. Allow for easy, future upgrades to data and communications cables and allow for fiber optic cables for communications. Provide cellular repeaters as needed throughout the facility to ensure adequate mobile phone service.

Provide Internet access through a business class wired and WiFi network system throughout all spaces indicated in Chapters 4 and 5. The system must comply with DoDI 8420.01. At a minimum the system shall include multiple SSID, VLAN tagging, SNMP for remote management and monitoring with Power Over Ethernet for flexible deployment and password protection. Army should comply with Technical Criteria for the Installation Information Infrastructure Architecture (I3A).

3-5.4.4 Television Systems.

See Chapters 4 and 5, Functional Data Sheets, for outlet locations.

3-5.4.5 Electronic Security Systems (ESS).

See Chapters 4 and 5, Functional Data Sheets, for locations.

3-6 SITE WORK.

Organize the site to be compatible with the site planning and style of adjacent existing structures. Locate the building to reflect local climatic conditions. For example, provide protection from prevailing winds and glare and orient operable windows to take advantage of summer breezes. Locate the building to take advantage of passive solar heating and daylighting.

3-6.1 Site Circulation and Parking.

Comply with UFC 3-210-02. Provide guest access to lodging facilities from secondary (collector) streets to minimize the congestion associated with main arterial streets.

Where possible, divide main entrances with landscaped traffic medians between entry and exit lanes. Because of the high volume of traffic using the entrances, the minimum width of non-divided entry roads will be 24 ft. (7.3m).

3-6.1.1 Emergency and Service Vehicles.

Design access drives and parking areas to accommodate service vehicles. Provide access to fire protection vehicles in accordance with UFC 3-600-01 and UFC 4-010-01. Obtain width, weight, and turning radii of fire fighting vehicles from the Installation fire department.

3-6.1.2 Parking.

Provide a minimum of .5 parking spaces per guest room. Parking spaces shall be 10 ft. wide (3.1m) minimum. In addition to standard guest parking, provide a minimum of three short-term check-in parking spaces at central facilities. For programs with more than 200 rooms, provide a check-in space at the central facility for 1.5% of all guest rooms. As an option, identify each check-in space with a sign. Additional visitor parking with the exception of accessible parking is not required, but may be an option based on local requirements.

Provide one staff parking space for each daytime lodging staff person. Staff parking shall be separated from guest parking. Based on site size and layout, consider providing an optional sign to indicate staff-only parking with close access to the staff entrance. Parking areas will be sized to local conditions.

3-6.1.3 Pedestrian Access.

All sidewalks and walkways shall be a minimum of 6 ft. (1.8m) wide. Design and grade sidewalks to provide barrier-free access to the first floor of all lodging facilities and to any associated outdoor use areas. In addition to accessibility requirements, provide ramps and curb cuts throughout to accommodate rolling luggage and other moving needs. Provide connections to other functional areas of the Installation with pedestrian circulation systems.

3-6.2 Site Development.

Well-designed site amenities enhance the visual experience of a LF campus and complete the lodging project. The landscape architect shall coordinate with the architect and interior designer to ensure smooth transitions are made from within the building to the outdoors and vice versa. Provide effective transitions by incorporating building materials, colors, and design details into the site design and amenities. Also coordinate paving materials, signage and site furnishings. See Appendix B, Best Practices, for additional guidance.

3-6.2.1 Fencing.

Any fencing used as a screening material shall be compatible with the lodging campus and surrounding architecture, comply with Installation standards, and will be

accomplished with project funds. Fencing around the perimeter of the site, if desired, will be the responsibility of the Installation or Activity/Major Command.

3-6.2.2 Site Furniture.

Select site furniture that is in harmony with the architectural style and complements the building. Place the site furniture to help organize the outdoor spaces and to maximize usability.

3-6.2.3 Exterior Signage.

Signage includes the freestanding exterior facility identification (monument) sign and required site signage, including parking and street signage. All signage will be in accordance with the Installation signage program. The monument sign and building identification signage shall include the Service-specific appropriate branding styles and logos.

3-6.3 Drainage and Landscaping.

Comply with UFC 3-201-02 and UFC 3-210-10. See Appendix B, Best Practices, for additional guidance on landscaping specific to LFs.

3-6.4 Storm Water Management/ Low Impact Development.

Comply with UFC 3-210-10. See Appendix B, Best Practices, for additional guidance specific to LFs.

CHAPTER 4 SPECIFIC DESIGN CRITERIA – GUEST ROOMS AND SUITES

4-1 INTRODUCTION.

This chapter identifies the specific design needs for the guest rooms and suites. Sizing guidance for these rooms is provided in Chapter 2, Programming.

Design criteria are provided in a standard Functional Data Sheet (FDS) table format that generally follows the Uniformat II/Work Breakdown Structure. The Interior Construction/Built-in Equipment category includes anything physically attached or plumbed to the building such as counters, cabinets, casework, toilet accessories, window treatments, laundry machines, and retractable overhead screens. Furnishings and equipment are provided in separate tables for rooms and suites. Unless noted otherwise, finishes and features included in the FDS tables represent the required minimums.

4-2 GUEST ROOMS.

4-2.1 Design Criteria.

Table 4-1 identifies the specific design needs for the guest room, including its variations.

TABLE 4-1. GUEST ROOMS

Description/ Usage	The guest room includes combined living/work and sleeping areas and a private bathroom and can include the following variations: • an extended-stay studio suite version that has basically the same layout but trades closet space for a small pre-fabricated kitchenette • a pet-friendly version that has different finishes
Ceiling Ht.	8 ft. (2.4 m) minimum.
Windows/Doors	Entry doors shall be self-closing, solid core wood a minimum of 36-in (915 mm) wide with a decorative face, automatic electronic lock, swing bar door guard, deadbolt, and 180-degree one-way viewer. Provide a second viewer at the appropriate height in ABA rooms. Provide inoperable windows on as much of the exterior wall as possible. Provide full-height sliding closet doors with a header track and a floor track mounted directly to the floor. Opening hardware shall be integral with the frame.
Interior Construction/ Casework	Provide a ceiling fan with integral low-profile light and combined light dimmer and speed control. Provide closet shelf and hanging rod. Extended-stay studio suites include a prefabricated kitchenette unit.
Finishes	See Chapter 3, Interior Design, for color and finish guidance. **Walls.** Finished gypsum board. Provide vinyl corner guards on all exposed corners to 48 in (1220 mm) above the base. **Floor.** Commercial grade (heavy wear classification) carpet and pad. For pet-friendly rooms, provide porcelain tile flooring, commercial wood-grain vinyl or linoleum sheet flooring and base throughout. **Base.** Stained or painted wood or carpet. **Ceiling.** Painted gypsum wallboard.

TABLE 4-1. GUEST ROOMS

Plumbing	See Table 4-5 for bathroom plumbing requirements. For extended-stay studio suites, provide hot and cold water to the kitchenette unit.
HVAC	Provide a system per Chapter 3, General, and HVAC. Room HVAC systems will be standardized with electronic sensors or key card readers regulating temperature controls. Individual climate control must be provided and located within each guest room. Limit individual thermostat controls to the range of 65 to 78 F (18 to 26 C) degrees.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General. Provide outlets for all equipment. Provide a quad outlet at the desk and at least one of the two nightstands to power guest's equipment such as computers and chargers. Provide a minimum of one outlet in an easily accessible location for use with an ironing board/iron. Provide individual circuits for each guest room.
Lighting	Provide system per Chapter 3, General, and Lighting. In addition, provide backlit wide rocker switches at room entrance and bathroom. Task lighting provided by table or wall fixtures at the bed, desk and lounge seating shall provide adequate directional lighting for reading, typically 30-40 fc (325-430 lux).
Communication	**Telephone.** Provide one jack (ganged with data in single box) at the nightstand, one jack (ganged with data in single box) at the desk, and one jack at the CATV outlet location. Label each jack "phone." **Data.** Provide one jack (ganged with telephone in single box) at the nightstand and one jack (ganged with telephone in single box) at the desk. Label each jack "data port." Provide Wi-Fi service throughout the room. **CCTV.** None required. **CATV.** Provide an outlet at the TV location. **Security.** Door electronic card key access reader.
Acoustics	Provide acoustical separation per Chapter 3, Acoustics.
Special Requirements	Locate downlights and sprinkler heads such that they are not within 12 in (305 mm) of the sweep of the ceiling fan blades. Provide transition strips where different floor finishes meet.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

4-2.2 Furnishings, Fixtures and Equipment.

Coordinate FF&E packages with the interior designer and follow the requirements noted in Chapter 3, Interior Design. To assist planners and designers, Table 4-2 provides the general types of FF&E by Service for each space and indicates whether the item is CFCI, GFGI, or GFCI (F/I).

TABLE 4-2. GUEST ROOM FF&E

Army		Navy		Air Force

N/A		Alarm clock	GFGI	Alarm clock	GFGI
N/A		Ice bucket	GFGI	Ice bucket	GFGI
N/A		Luggage rack	GFGI	Luggage rack	GFGI
N/A		Wastebasket	GFGI	Wastebaskets	GFGI

[1] For Navy facilities when mission essential requirements dictate, provide two double beds and two separate and lockable closets/lockers for ranks of E-6 and below.

4-3 SUITES.

4-3.1 Design Criteria.

Table 4-3 identifies the specific design needs for the suite.

TABLE 4-3. SUITE

Description/ Usage	The suite includes separate and distinct living/work and sleeping areas, a kitchenette, and a private bathroom.
Ceiling Ht.	8 ft. (2.4 m) minimum.
Windows/Doors	Entry doors shall be self-closing, solid core wood a minimum of 36-in (915 mm) wide with a decorative face, automatic electronic lock, swing bar door guard, deadbolt, and 180-degree one-way viewer. Provide a second viewer at appropriate height in ABA rooms. Provide inoperable windows on as much of the exterior wall as possible. Provide full-height sliding closet doors with a header track and a floor track mounted directly to the floor. Opening hardware shall be integral with the frame.
Interior Construction/ Casework	Provide a ceiling fan with integral low-profile light and combined light dimmer and speed control. Provide closet shelf and hanging rod. In PCS facilities, provide built-in shelving per the standard floor plan, which accommodates the additional storage requirements for longer stays. At the kitchenette, provide a solid-surface counter with base and upper cabinets. **Army** suites include a prefabricated kitchenette unit. **Air Force** suites include a ventless laundry washer/dryer combination.
Finishes	See Chapter 3, Interior Design, for color and finish guidance. **Walls.** Finished gypsum board. Provide vinyl corner guards on all exposed corners to 48 in (1220 mm) above the base. At the kitchenette, provide a solid-surface or ceramic tile backsplash. **Floor.** Commercial grade (heavy wear classification) carpet and pad. At the kitchenette, provide porcelain tile with a dark-colored epoxy grout and matching base. **Base.** Stained or painted wood or carpet. **Ceiling.** Painted gypsum wallboard.
Plumbing	Provide an under-mount stainless steel kitchen sink with a removable trap and drain plug. For **Army** suites, provide service to the prefabricated kitchenette unit. For **Air Force** suites, provide service to laundry washer/dryer combination. See Table 4-5 for bathroom plumbing requirements.
HVAC	Provide a system per Chapter 3, General, and HVAC. Room HVAC systems will be standardized with electronic sensors or key card readers regulating temperature controls. Individual climate control must be provided and located within both the bedroom and living areas. Limit individual thermostat controls to the range of 65 to 78 F (18 to 26 C) degrees.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General. Provide power to all equipment. Provide a quad outlet at the desk and at least one of the two nightstands to power guest's equipment such as computers and chargers. Provide a minimum of one outlet in an easily accessible location for use with an ironing board/iron. Provide individual circuits for each suite.

TABLE 4-3. SUITE

Lighting	Provide system per Chapter 3, General, and Lighting. In addition, provide backlit wide rocker switches at suite entrance, bedroom entrance, and bathroom. Task lighting provided by table or wall fixtures at the bed, desk and lounge seating shall provide adequate directional lighting for reading, typically 30-40 fc (325-430 lux).
Communication	**Telephone.** Living area—Provide one jack (ganged with data in single box) at the dining counter/table, one jack (ganged with data in single box) at the desk, and one jack at the CATV outlet location. Bedroom—Provide one jack (ganged with data in single box) at the nightstand and one jack (ganged with data in single box) at the dresser/TV area. Label each jack "phone." **Data.** Living area—Provide one jack (ganged with telephone in single box) at the dining counter/table and one jack (ganged with telephone in single box) at the desk. Bedroom—Provide one jack (ganged with telephone in single box) at the nightstand and one jack (ganged with telephone in single box) at the dresser/TV area. Label each jack "data port." Provide Wi-Fi service throughout the suite. **CCTV.** None required. **CATV.** Provide outlets at the two TV locations: One in the bedroom and one in the living area. **Security.** Door electronic card key access reader.
Acoustics	Provide acoustical separation per Chapter 3, Acoustics.
Special Requirements	Locate downlights and sprinkler heads such that they are not within 12 in (305 mm) of the sweep of the ceiling fan blades. Provide transition strips where different floor finishes meet. For **Air Force** ventless laundry washer/dryer combination, ensure adequate air circulation around the unit for heat dissipation and to accommodate maintenance. Ventless dryer does not need to be located on an exterior wall.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

4-3.2 Furnishings, Fixtures and Equipment.

Coordinate FF&E packages with the interior designer and follow the requirements noted in Chapter 3, Interior Design. To assist planners and designers, Table 4-4 provides the general types of FF&E by Service for each space and indicates whether the item is CFCI, GFGI, or GFCI (F/I).

4-4 GUEST BATHROOMS.

Guest bathrooms are similar in configuration and amenities regardless of location in a guest room or a suite. Suite bathrooms may be a little larger, but not significantly. Provide the requisite number of ABA-compliant bathrooms in all room configurations.

Table 4-5 identifies the specific design needs for the guest bathroom.

TABLE 4-5. GUEST BATHROOMS

Description/ Usage	Lavatory, water closet, shower/tub, and associated amenities.
Ceiling Ht.	8 ft. (2.4 m) minimum.
Windows/Doors	Lockable entry door, 36 in. (915mm) wide minimum. No windows required.
Interior Construction/ Casework	Provide a minimum 36-in wide (915mm) solid surface counter top with 4-in. (100 mm) back/side splashes, a 6-in. (150 mm) deep toiletry shelf, and integral soap holder. Provide a minimum of 9 in (230mm) of clear vanity space on both sides of the sink. In PCS facilities, provide a base cabinet with an integral tissue box holder, which accommodates additional storage needs. In other facilities, base cabinets and other under-counter storage are optional. Provide towel bars at the vanity and at the shower/tub, a door-mounted robe hook, toilet tissue dispenser, screw-in curved shower curtain rod, and a wall-mounted hair dryer at the vanity. Shower doors shall not be used. Provide a minimum 36-in-wide (915mm), mirror over the vanity. Provide a hair dryer mount. Coordinate with the agencies identified in Chapter 1, Contacts, to determine if a hard-wired hair dryer is to be provided or if it will be FF&E (see special requirements below).
Finishes	See Chapter 3, Interior Design, for color and finish guidance. **Walls.** Finished mold-resistant gypsum wallboard. Provide a mud-set, one-piece full-height, solid-surface tub/shower surround with 2 recessed soap dishes. **Floor.** Mud set, non-slip, commercial-grade porcelain tile with epoxy grout. **Base.** Porcelain tile. **Ceiling.** Scrubable eggshell or semi-gloss paint (with mold inhibitor) on mold-resistant gypsum wallboard.
Plumbing	Provide a minimum 18-in. (455 mm) integral lavatory; a floor-mounted, tank-type, elongated, water saver water closet with full seat and lid; and a full-size shower with an entry curb sloping to a floor drain. The shower head shall be height adjustable over a wide range. A tub is optional and if provided shall be a cast-iron 60-in. (1525 mm) bathtub with a non-slip surface.
HVAC	Provide a system per Chapter 3, General, and HVAC. In addition, provide a minimum of eight air changes per hour and negative pressure. **Service Exception:** For Air Force, provide a system per Chapter 3, General, and HVAC, and negative pressure.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General. Provide a dedicated circuit for the hair dryer and size for a 1600-watt unit. Coordinate with the agencies identified in Chapter 1, Contacts, to determine if hair dryer will be hard-wired or a plug-in type.

TABLE 4-5. GUEST BATHROOMS

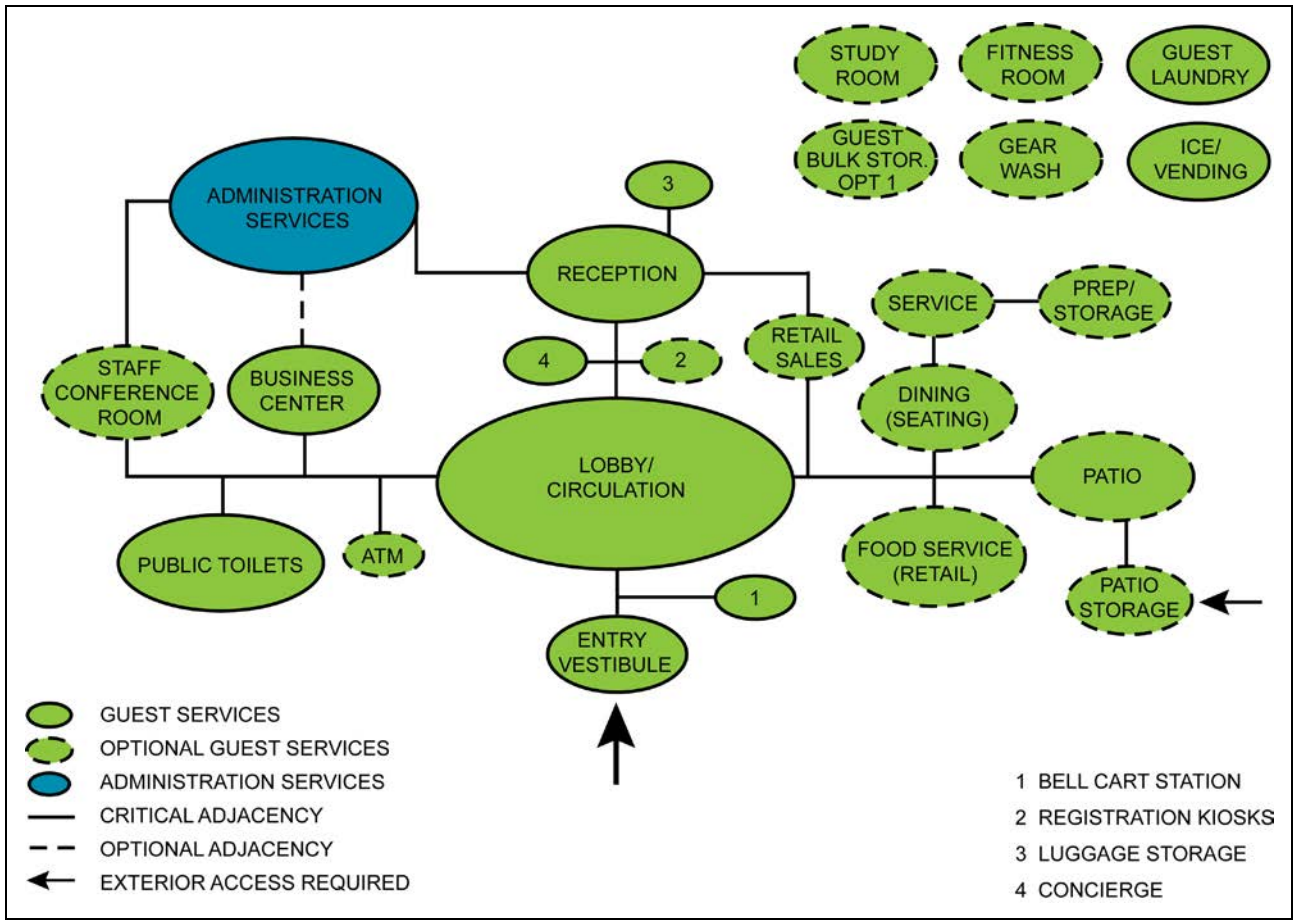
Lighting	Provide system per Chapter 3, General, and Lighting. Strategically locate light sources at the vanity to illuminate the occupant's face while eliminating harsh shadows on the face. Coordinating the vanity and other room surface reflectivity characteristics with the lighting design can assist this goal. Provide a recessed ceiling light fixture in the shower area.
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** None required. **CATV.** None required. **Security.** None required.
Acoustics	No special provisions required.
Special Requirements	Provide transition strips where different floor finishes meet. If wallcoverings are used, seal wallcovering edges at ceiling and base with a clear caulk. ABA-compliant bathrooms will include a roll-in shower with a full-width trench drain along the back wall. If the hair dryer is not hard-wired (per Interior Construction) provide a 1600-watt hair dryer as FF&E.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

CHAPTER 5 SPECIFIC DESIGN CRITERIA – SUPPORT AND ADMINISTRATION

5-1 INTRODUCTION.

This chapter identifies the layout, adjacencies and specific design needs for the public, administrative, and support spaces. These spaces are broken down into guest services, administrative services, floor support, and back-of-house support as indicated in Table 1-1.

Design criteria are provided in the standard FDS table format that generally follows the Uniformat II/Work Breakdown Structure. The Interior Construction/Built-in Equipment category includes anything physically attached or plumbed to the building such as counters, cabinets, casework, toilet accessories, window treatments, laundry machines, and retractable overhead screens. Furnishings and equipment are not included in the FDS but are provided in Table 5-52. Unless noted otherwise, finishes and features included in the FDS tables represent the required minimums.



5-2 GUEST SERVICES.

Guest services represent all the public guest spaces of the facility. Public spaces for guest services are critical to the quality level of the guest experience. Most of these spaces are either located in or around the central lobby area or are distributed among the guest rooms and suites.

5-2.1 Guest Services Layout.

Figure 5-1 indicates the acceptable relative adjacencies of the guest services spaces.

FIGURE 5-1. GUEST SERVICES ADJACENCY DIAGRAM

5-2.2 Guest Services Design Criteria.

Tables 5-1 through 5-25 provide the guest services specific design criteria in the FDS format. Table 5-52 provides the FF&E for these spaces.

TABLE 5-1. COVERED ENTRY

Description/ Usage	This is the primary entrance for guests and visitors.

For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	NA

TABLE 5-2. ENTRANCE VESTIBULE

Description/ Usage	This is the primary entrance for guests and visitors.
Ceiling Ht.	9 ft. (2.7m) minimum.
Windows/Doors	Antiterrorism-compliant automated glass doors with infrared sensor operation.
Interior Construction/ Built-in Equipment	Provide a recessed or lay-down walk-off mat.
Finishes	**Walls.** Aluminum store front glazing system at front and back at a minimum. **Floor.** Stone or porcelain tile. **Base.** Match floor. **Ceiling.** Painted exposed structure or gypsum wall board.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** If inner doors will be locked during non-business hours, provide a house phone or intercom. **Data.** None required. **CCTV.** Provide outlets for full camera coverage of the vestibule and exterior entrance. **CATV.** None required. **Security.** If doors will be locked during non-business hours, provide an electronic card key access reader locking door.
Acoustics	No special provisions required.
Special Requirements	Provide an airlock as required by local climate. If the facility includes a reception desk, ensure desk is visible from the entrance and vice versa.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-3. CENTRAL LOBBY

Description/ Usage	The central lobby provides a comfortable seating/waiting area near or directly adjacent to the main entrance and open-feeling circulation between reception and guest services. Along with those spaces, this area serves as the interior architectural focal point of the facility and should feel warm and inviting.
Ceiling Ht.	10 ft. (3.1m) minimum over open areas. Vary the ceiling height to help define spaces and coordinate with other lobby and guest service areas.
Windows/Doors	Provide windows or glazed storefront on at least one wall of the entire lobby/guest services area.
Interior Construction/ Built-in Equipment	Provide built-in features such as planters, seating, a fireplace, and railings to enhance the design and define the areas. Provide vinyl corner guards. Provide wall or ceiling TV mount(s).
Finishes	See Chapter 3, Interior Design, for color and finish guidance. **Walls.** Also see Chapter 3, Interior Design, for wall material guidance. **Floor.** Stone or porcelain tile and inset commercial-grade carpet and pad. Tile shall have .125-in (3 mm) grout joints. **Base.** Stained wood or stone/tile to match floor. **Ceiling.** Painted exposed structure or gypsum wall board with dropped soffits to define areas.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General.
Lighting	Provide system per Chapter 3, General, and Lighting. 20 fc (215 lux) general ambient and 50 fc (540 lux) at the seating area. Coordinate the lighting and interior design. Use recessed compact fluorescent downlights for general lighting with cove, wall sconces, decorative pendant, chandelier, or other indirect lighting as accents.
Communication	**Telephone.** House phone. **Data.** Provide a minimum of one jack at the seating area and Wi-Fi service throughout the lobby. **CCTV.** Provide outlets for full camera coverage. **CATV.** As an option, provide one outlet for a wall- or ceiling-mounted TV. **Security.** None required.
Acoustics	Provide features to minimize reverberation time and control noise. Provide noise attenuation measures to mitigate acoustical problems resulting from mechanical systems, plumbing systems, and vibration transmitted through the facility structure.
Special Requirements	Develop a professional wayfinding plan that is coordinated with the interior design and provides directions to guest services, public amenities, and guest rooms by room number.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-4. SATELLITE LOBBY

Description/ Usage	The satellite lobby provides a seating/waiting area near or directly adjacent to the main entrance and an enhanced circulation space that gives a sense of welcome and entry to the minimum-service satellite facilities.
Ceiling Ht.	8 ft. (2.4m) minimum.
Windows/Doors	None required.
Interior Construction/ Built-in Equipment	Provide vinyl corner guards.
Finishes	See Chapter 3, Interior Design, for color and finish guidance. **Walls.** Also see Chapter 3, Interior Design, for wall material guidance. **Floor.** Porcelain tile or other resilient flooring. **Base.** Coordinate with floor finish. **Ceiling.** Painted exposed structure or gypsum wall board with dropped soffits to define areas.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General.
Lighting	Provide system per Chapter 3, General, and Lighting. 20 fc (215 lux) general ambient and 50 fc (540 lux) at the seating area. Coordinate the lighting and interior design.
Communication	**Telephone.** As an option, provide a house phone. **Data.** Provide a minimum of one jack at the seating area and Wi-Fi service throughout. **CCTV.** Provide outlets for full camera coverage. **CATV.** None required. **Security.** None required.
Acoustics	Provide features to minimize reverberation time and control noise. Provide noise attenuation measures to mitigate acoustical problems resulting from mechanical systems, plumbing systems, and vibration transmitted through the facility structure.
Special Requirements	Develop a professional wayfinding plan that is coordinated with the interior design and provides directions to guest services, public amenities, and guest rooms by room number.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-5. RECEPTION

Description/ Usage	Reception accommodates check-in/check-out, other guest services and the administrative functions of the front desk staff.
Ceiling Ht.	8 ft. (2.4m) minimum. Vary the ceiling height to help define spaces and coordinate with other lobby and guest service areas.
Windows/Doors	None required.
Interior Construction/ Built-in Equipment	The reception/front desk will be custom designed for each project, ABA-compliant, and coordinated with the interior design of the entire lobby area. The transaction top and credenza work surfaces shall be solid surface material and the under counter areas shall be enclosed with built-in cabinetry. Coordinate the design with all power, data, and telephone wiring systems and ensure adequate ventilation of computer equipment. See Chapter 3, Interior Design, for overall design, color and finish guidance.
Finishes	See Chapter 3, Interior Design, for color and finish guidance. **Walls.** Also see Chapter 3, Interior Design, for wall material guidance. **Floor.** Match lobby in front of counter and provide commercial grade carpet and pad behind the counter. **Base.** Coordinate with floor finish. **Ceiling.** Gypsum wall board with dropped soffits over the counter to define areas.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General.
Lighting	Provide system per Chapter 3, General, and Lighting. 30 fc (325 lux). Use recessed compact fluorescent down lights for soffit and general illumination behind counter.
Communication	**Telephone.** Provide two jacks per workstation. **Data.** Provide two jacks per workstation. **CCTV.** Provide outlets for camera coverage of front and back of counter. Provide for monitors viewable from behind the counter but not in front. **CATV.** None required. **Security.** Provide a duress alarm at each workstation with direct connection to the supporting police/security authority.
Acoustics	No special provisions required.
Special Requirements	Ensure easy access to a facsimile machine and a photocopier by the front desk staff. Door bell at receiving will sound here.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-6. CONCIERGE

Description/ Usage	Optional area for a staff member to meet with guests and provide assistance on transportation and local activities.
Ceiling Ht.	Coordinate with central lobby.
Windows/Doors	None required.
Interior Construction/ Built-in Equipment	None required.
Finishes	**Walls.** Coordinate with central lobby. **Floor.** Coordinate with central lobby. **Base.** Coordinate with central lobby. **Ceiling.** Coordinate with central lobby.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** Provide one jack. **Data.** Provide one jack. **CCTV.** None required. **CATV.** None required. **Security.** None required.
Acoustics	No special provisions required.
Special Requirements	The concierge desk should be clearly visible from the reception area and lobby.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-7. BELL CART STATION

Description/ Usage	Provides storage for bell carts when not in use.
Ceiling Ht.	Coordinate with central lobby.
Windows/Doors	None required.
Interior Construction/ Built-in Equipment	None required.
Finishes	**Walls.** Coordinate with central lobby. Provide impact resistant wall board up to 48 in (1220 mm) above finished floor and provide wall bumper guards. **Floor.** Coordinate with central lobby. **Base.** Coordinate with central lobby. **Ceiling.** Coordinate with central lobby.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** None required. **CATV.** None required. **Security.** None required.
Acoustics	No special provisions required.
Special Requirements	This area should be clearly visible from the exterior entrance and the reception area.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-8. COFFEE BAR

Description/ Usage	The optional coffee bar provides a small area for self-service coffee directly off the central lobby in facilities without other food service options.
Ceiling Ht.	Coordinate with central lobby.
Windows/Doors	None required.
Interior Construction/ Built-in Equipment	Solid-surface counter with lockable base cabinets. Coffee machine.
Finishes	**Walls.** Coordinate with central lobby. **Floor.** Hard surface flooring that is coordinated with central lobby. **Base.** Coordinate with central lobby. **Ceiling.** Coordinate with central lobby.
Plumbing	Provide a connection to a coffee machine.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General. Provide a minimum of one counter-height duplex outlet.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** None required. **CATV.** None required. **Security.** None required.
Acoustics	No special provisions required.
Special Requirements	
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-9. FOOD SERVICE – SERVICE

Description/ Usage	The optional food service area is a small, self-service area that is typically limited to breakfast. It is directly off of the lobby and may act as an extension of the entire lobby area. It is broken down into three sub-areas: Service where the food is served, dining where patrons sit to eat, and prep/storage where the food is prepared. This table describes the service area.
Ceiling Ht.	9 ft. (2.7m) minimum. Vary the ceiling height to help define spaces and coordinate with other lobby and guest service areas.
Windows/Doors	Swinging door with a vision panel and a deadbolt lock to the prep/storage area.
Interior Construction/ Built-in Equipment	Solid-surface service counters with lockable base cabinets. Coffee machine.
Finishes	See Chapter 3, Interior Design, for color and finish guidance. **Walls.** Finished gypsum wall board. Provide a solid-surface or resilient tile backsplash at the counter. **Floor.** Porcelain tile with .125-in (3 mm) grout joints. **Base.** Porcelain tile or stained wood. **Ceiling.** Coordinate with central lobby.
Plumbing	Provide water supply and drains for coffee machine and juice machine (if included). Provide a floor drain.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General. Ensure adequate counter-height outlets to power anticipated equipment such as coffee and juice machines, warming plates/lights, self-service microwave and toaster.
Lighting	Provide system per Chapter 3, General, and Lighting. 30 fc (325 lux) general ambient and 50 fc (540 lux) at the counters.
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** None required. **CATV.** None required. **Security.** None required.
Acoustics	No special provisions required.
Special Requirements	The service area should be clearly visible from the dining area, but provide a sense of separation between the two spaces. Staff servicing the area should have visual control over the entire service and dining areas.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-10. FOOD SERVICE – DINING

Description/ Usage	The optional food service area is a small, self-service area that is typically limited to breakfast. It is directly off of the lobby and may act as an extension of the entire lobby area. It is broken down into three sub-areas: Service where the food is served, dining where patrons sit to eat, and prep/storage where the food is prepared. This table describes the dining area.
Ceiling Ht.	9 ft. (2.7m) minimum. Vary the ceiling height to help define spaces and coordinate with other lobby and guest service areas.
Windows/Doors	Provide windows or glazed storefront on at least one wall.
Interior Construction/ Built-in Equipment	Provide a wall or ceiling TV mount. Coordinate seating with FF&E and provide a bar/counter seating area and/or table seating.
Finishes	See Chapter 3, Interior Design, for color and finish guidance. **Walls.** Finished gypsum wall board. **Floor.** Porcelain tile with .125-in (3 mm) grout joints or commercial carpet and pad. **Base.** Porcelain tile or stained wood. **Ceiling.** Coordinate with central lobby.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General.
Lighting	Provide system per Chapter 3, General, and Lighting. 30 fc (325 lux) general ambient.
Communication	**Telephone.** None required. **Data.** Provide Wi-Fi service throughout. **CCTV.** None required. **CATV.** Provide a minimum of one outlet for wall- or ceiling-mounted TV(s). **Security.** None required.
Acoustics	Provide features to minimize reverberation time and control noise. Provide noise attenuation measures to mitigate acoustical problems resulting from mechanical systems, plumbing systems, and vibration transmitted through the facility structure.
Special Requirements	The dining area should be clearly visible from the lobby areas and reception, but provide a sense of separation between the spaces.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-11. FOOD SERVICE – PREP/STORAGE

Description/ Usage	The optional food service area is a small, self-service area that is typically limited to breakfast. It is directly off of the lobby circulation and may act as an extension of the entire lobby area. It is broken down into three sub-areas: Service where the food is served, dining where patrons sit to eat, and prep/storage where the food is prepared. This table describes the prep/storage area. Food preparation is typically limited to thawing and staging with minimal to no scratch preparation.
Ceiling Ht.	8 ft. (2.4m) minimum.
Windows/Doors	Lockable swinging door with vision panel to the receiving area or service corridor.
Interior Construction/ Built-in Equipment	Provide minimum 24-in.- (610-mm-) deep stainless steel countertop, metal cabinets and wire shelves for food, utensil, equipment and supply storage. Commercial ice maker. Under-counter commercial-grade dishwasher, if scoped.
Finishes	**Walls.** Epoxy or semi-gloss or better latex painted mold-resistant gypsum wall board. Food prep areas will have ceramic tile with dark-colored epoxy grout or FRP panels. The walls shall be impact resistant up to 48 in. (1220 mm) from finished floor. **Floor.** Porcelain tile with epoxy grout. **Base.** Porcelain tile. **Ceiling.** High humidity-rated, ceramic-faced acoustical ceiling panels (ACP).
Plumbing	Food service scope will vary by location. Depending on final scope of food service, comply with the required codes and consider the following requirements: a hand-washing sink at each entrance; a two-compartment food preparation sink; commercial-grade dishwasher, a three-compartment, deep dishwashing sink with a gooseneck faucet and 180-F (82-C) hot water booster. The hot water booster shall also connect to the heavy-duty, commercial-grade dishwasher. Lodging prep areas will typically use grease interceptors in lieu of central grease traps to service individual equipment. Locate them to be easily accessible for cleaning, be located outside of food preparation areas, and not project above the floor in open walkways or work areas. At a minimum, provide one hand-washing sink, a separate two-compartment sink, a connection for an ice maker, and a floor drain.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General. Perform a power requirement survey as this area's power requirements are extremely site- and locale-specific. Provide a dedicated electrical circuit for the cold storage.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** Provide one jack. **Data.** Provide one jack. **CCTV.** None required. **CATV.** None required. **Security.** Electronic door lock to receiving/service corridor if available.
Acoustics	No special provisions required.
Special Requirements	
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-12. RETAIL FOOD SERVICE

Description/ Usage	Optional space (may be contract operation) that can range from a small coffee bar/kiosk to a full-service restaurant. Coordinate design, finishes and amenities with the service provider.
Ceiling Ht.	Coordinate with service provider.
Windows/Doors	Coordinate with service provider.
Interior Construction/ Built-in Equipment	Coordinate with service provider.
Finishes	**Walls.** Coordinate with service provider. **Floor.** Coordinate with service provider. **Base.** Coordinate with service provider. **Ceiling.** Coordinate with service provider.
Plumbing	Coordinate with service provider. Provide separate metering.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General. Provide separate metering.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** Coordinate with service provider. **Data.** Coordinate with service provider. **CCTV.** Coordinate with service provider. **CATV.** Coordinate with service provider. **Security.** Coordinate with service provider.
Acoustics	Coordinate with service provider.
Special Requirements	Coordinate with service provider.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-13. RETAIL SALES

Description/ Usage	Optional area directly adjacent to reception and providing display space for retail items such as pre-packaged food, beverages, sundries, and small gifts.
Ceiling Ht.	8 ft. (2.4m) minimum.
Windows/Doors	None required.
Interior Construction/ Built-in Equipment	Counter with lockable base cabinets and display shelving. Provide a service counter open to behind the reception counter where the point of sale (POS) will reside.
Finishes	See Chapter 3, Interior Design, for color and finish guidance. **Walls.** Finished gypsum wall board. **Floor.** Match lobby circulation. **Base.** Stained wood. **Ceiling.** Gypsum wall board or ACP.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General. Provide dedicated circuits to refrigerated/freezer display cases.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** None required **Data.** None required. **CCTV.** Provide outlets for full camera coverage. **CATV.** None required. **Security.** None required.
Acoustics	No special provisions required.
Special Requirements	Locate the POS equipment in the reception area.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-14. LUGGAGE STORAGE

Description/ Usage	Secure room for limited storage of guest luggage. While this room is included under guest services, it is not publicly accessible and is directly adjacent to the reception staff areas.
Ceiling Ht.	8 ft. (2.4 m) minimum.
Windows/Doors	Lockable entry door.
Interior Construction/ Built-in Equipment	Provide 24-in.-deep (610-mm) heavy-duty shelving on all walls. Provide 30 in. (760 mm) of vertical space between shelves.
Finishes	**Walls.** Painted impact-resistant gypsum wall board or CMU. **Floor.** Vinyl composition tile (VCT) or match lobby. **Base.** Rubber. **Ceiling.** ACP.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** None required. **CATV.** None required. **Security.** Door electronic card key access reader.
Acoustics	No special provisions required.
Special Requirements	
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-15. ATM

Description/ Usage	Optional area or alcove directly off of the lobby with space for an automated teller machine (ATM).
Ceiling Ht.	Coordinate with lobby.
Windows/Doors	None required.
Interior Construction/ Built-in Equipment	None required.
Finishes	**Walls.** Coordinate with lobby. **Floor.** Coordinate with lobby. **Base.** Coordinate with lobby. **Ceiling.** Coordinate with lobby.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** None required. **Data.** Provide one jack. **CCTV.** None required. **CATV.** None required. **Security.** None required.
Acoustics	No special provisions required.
Special Requirements	The ATM should be clearly visible from the reception area. Review requirement for CCTV coverage.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-16. REGISTRATION MACHINES

Description/ Usage	Optional area or alcove directly off of the lobby with space for one or more registration machine(s).
Ceiling Ht.	Coordinate with lobby.
Windows/Doors	None required.
Interior Construction/ Built-in Equipment	None required.
Finishes	**Walls.** Coordinate with lobby. **Floor.** Coordinate with lobby. **Base.** Coordinate with lobby. **Ceiling.** Coordinate with lobby.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** None required. **Data.** Provide one jack for each machine. **CCTV.** None required. **CATV.** None required. **Security.** None required.
Acoustics	No special provisions required.
Special Requirements	In central facilities, the registration machine(s) should be clearly visible from the reception area.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-17. PUBLIC TOILETS

Description/ Usage	Male and female public toilets directly off the central lobby with an optional electric water cooler. Satellite facilities shall only have a single unisex toilet.
Ceiling Ht.	9 ft. (2.74 m) minimum.
Windows/Doors	Entrance doors. Unisex toilet shall have a door lockable from the inside.
Interior Construction/ Built-in Equipment	Solid-surface countertop with either under-mount or integral sinks. Solid composite or phenolic core toilet and urinal partitions. Toilet accessories: toilet paper dispensers, automatic paper towel dispenser, built-in trash receptacle, robe hooks, grab bars, sanitary napkin disposal and purse shelf (female water closet stalls), automatic soap dispensers, and optional seat cover dispensers. Full-width mirror over vanity. Fold-down diaper changing table/station in both the male and female toilets.
Finishes	See Chapter 3, Interior Design, for color and finish guidance. **Walls.** Finished mold-resistant gypsum wallboard with a ceramic tile wainscot. Use a dark-colored grout. **Floor.** Porcelain tile. Use a dark-colored grout. **Base.** Porcelain tile. **Ceiling.** Finished mold-resistant gypsum wall board.
Plumbing	Provide automatic flush-valve wall-hung water closets and urinals, and 18-in (455 mm) minimum, automatic lavatories based on the applicable code. Provide a floor drain outside of the internal circulation paths. As an option, provide a keyed hose bibb. Provide an electric water cooler near the entrance to the toilets.
HVAC	Provide a system per Chapter 3, General, and HVAC. In addition, provide a minimum of eight air changes per hour and negative pressure. **Service Exception:** For Air Force, provide a system per Chapter 3, General, and HVAC; use the continuous exhaust requirements per ASHRAE 62.1, table 6-4; and provide negative pressure.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** None required. **CATV.** None required. **Security.** None required.
Acoustics	No special provisions required.
Special Requirements	
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-18. DSN PHONES

Description/ Usage	Optional area or alcove directly off of the lobby with space for one or more Defense Switched Network (DSN) phones.
Ceiling Ht.	Coordinate with lobby.
Windows/Doors	None required.
Interior Construction/ Built-in Equipment	None required.
Finishes	**Walls.** Coordinate with lobby. **Floor.** Coordinate with lobby. **Base.** Coordinate with lobby. **Ceiling.** Coordinate with lobby.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** Provide one compliant jack for each DSN phone. **Data.** None required. **CCTV.** None required. **CATV.** None required. **Security.** None required.
Acoustics	No special provisions required.
Special Requirements	
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-19. FITNESS ROOM

Description/ Usage	Optional area with several fitness machines for guest use.
Ceiling Ht.	9 ft. (2.7m) minimum.
Windows/Doors	Lockable entrance door with a vision panel.
Interior Construction/ Built-in Equipment	Provide a minimum of one wall or ceiling TV mount. Provide an 8-ft.- (2.4m) high mirror covering one full wall. Provide an interior window to the corridor at 42 in. (1070 mm) above finished floor, a minimum of 36 in. (915 mm) high, and a minimum of 10 $ft.^2$ (.93 m^2) total window area.
Finishes	**Walls.** Finished double-layer (impact side) gypsum board. **Floor.** Resilient seamless rubber sheet flooring. **Base.** Rubber. **Ceiling.** ACP.
Plumbing	Provide either an electric water cooler or a bottle water cooler (FF&E).
HVAC	Provide a system per Chapter 3, General, and HVAC. In addition, provide 68 F (20 C) minimum, 74 F (23 C) maximum, less than 50% relative humidity, 20 cfm/person outside air and use CO_2 sensors to control outside air. Provide multi-speed ceiling fans. **Service Exception:** For Air Force, provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General. Provide flush-floor outlets for commercial-grade equipment sized appropriately for equipment spacing. Provide outlet(s) for wall- or ceiling-mounted televisions.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** House phone. **Data.** None required. **CCTV.** Provide outlets for full camera coverage. **CATV.** Provide outlet(s) for wall or ceiling mounted TV(s). Coordinate with selected fitness equipment to accommodate equipment with built-in or attached TVs. **Security.** Door electronic card key access reader.
Acoustics	Provide partition construction with a minimum STC rating of 52 per Chapter 3, Acoustics.
Special Requirements	
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-20. CONFERENCE ROOM

Description/ Usage	Optional room used by guests or staff for meetings.
Ceiling Ht.	8 ft. (2.4m) minimum.
Windows/Doors	Lockable entrance door(s) with a vision panel.
Interior Construction/ Built-in Equipment	Provide an 8-ft. (2.4m) minimum length built-in counter with lockable base cabinets. Provide a retractable overhead screen, a ceiling projector mount, and a wall-mounted dry-erase board.
Finishes	See Chapter 3, Interior Design, for color and finish guidance. **Walls.** Finished gypsum wallboard. **Floor.** Commercial grade carpet and pad. **Base.** Rubber, carpet or wood. **Ceiling.** ACP.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General. Provide a ceiling outlet for a projector.
Lighting	Provide system per Chapter 3, General, and Lighting. Consider dimming capability.
Communication	**Telephone.** Provide a house phone and one jack on each of three walls and a minimum of one centrally-located floor jack. **Data.** Provide two jacks in a single box on each of three walls, a minimum of one centrally-located floor jack, and a ceiling jack for the projector. Provide Wi-Fi service. **CCTV.** Provide outlets for full camera coverage. **CATV.** Provide one outlet. **Security.** Door electronic card key access reader.
Acoustics	Provide partition and door construction with a minimum STC rating of 50 per Chapter 3, Acoustics.
Special Requirements	
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-21. BUSINESS CENTER

Description/ Usage	Optional area that includes computers and office equipment for guest use. This may be a small area or alcove off of the lobby with a single computer or a separate room with multiple computers/workstations.
Ceiling Ht.	8 ft. (2.4m) minimum.
Windows/Doors	Lockable entrance door, as required.
Interior Construction/ Built-in Equipment	Provide a 24-in. (610-mm) deep counter with cord cut-outs and grommets and knee space. Provide lockable cabinets and shelving. Note that CPUs will be stored in the lockable cabinets to preclude customer access.
Finishes	See Chapter 3, Interior Design, for color and finish guidance. **Walls.** Finished gypsum wallboard. **Floor.** Commercial grade carpet and pad. **Base.** Rubber or carpet. **Ceiling.** ACP.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** Provide a minimum of two jacks in a single box. **Data.** Provide a minimum of two jacks in a single box and coordinate with final equipment schedule. Provide Wi-Fi service **CCTV.** Provide outlets for full camera coverage. **CATV.** None required. **Security.** Door electronic card key access reader.
Acoustics	Provide partition and door construction with a minimum STC rating of 50 per Chapter 3, Acoustics.
Special Requirements	If this is an alcove off of lobby circulation, provide visual control from reception. If it is a separate room, consider providing a staff entrance from the administrative areas to facilitate supervision and technical support/assistance.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-22. STUDY ROOM

Description/ Usage	Optional room(s) used by guests for small group study sessions and meetings.
Ceiling Ht.	8 ft. (2.4m) minimum.
Windows/Doors	Lockable entrance door with a vision panel.
Interior Construction/ Built-in Equipment	Provide a wall-mounted marker board.
Finishes	See Chapter 3, Interior Design, for color and finish guidance. **Walls.** Finished gypsum wallboard. **Floor.** Commercial grade carpet and pad. **Base.** Rubber or carpet. **Ceiling.** ACP.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** Provide a house phone and one jack on each of three walls and a centrally-located floor jack. **Data.** Provide two jacks in a single box on each of three walls and a centrally-located floor jack. Provide Wi-Fi service. **CCTV.** Provide outlets for full camera coverage. **CATV.** Provide one outlet. **Security.** Door electronic card key access reader.
Acoustics	Provide partition and door construction with a minimum STC rating of 45 per Chapter 3, Acoustics.
Special Requirements	
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-23. GUEST LAUNDRY

Description/ Usage	Self-service laundry for guests. Depending on facility size and mission, this may be either a single centralized room or rooms per every floor. If centralized, the room shall not be located directly off the lobby circulation areas. Laundry on the guest room floors shall be located off the guest corridors and near the vertical circulation, if possible.
Ceiling Ht.	8 ft. (2.4 m) minimum.
Windows/Doors	Lockable entrance door with a large vision panel.
Interior Construction/ Built-in Equipment	Provide large, heavy-duty, residential washers and dryers. Provide removable covers to conceal the plumbing connections and a spacer between the dryers and the wall to preclude the dryer vent from become compressed due to dryer movement. Provide a wall TV mount and a tack board.
Finishes	**Walls.** Epoxy-painted, moisture-resistant gypsum board. **Floor.** Porcelain tile. **Base.** Porcelain tile. **Ceiling.** Moisture-resistant ACP.
Plumbing	Provide connections to the washers, one drain per washer with solid interceptors, and one additional floor drain. In PCS facilities provide a laundry sink with a solid interceptor and goose-neck faucet,
HVAC	Provide a system per Chapter 3, General, and HVAC. In addition, provide 20 C (68 F) minimum, 27 C (80 F) maximum. Provide straight-run vents to the outside for the dryers. Provide a minimum of six air changes per hour, 50 to 60% relative humidity, and negative pressure. **Service Exception:** For Air Force, provide a system per Chapter 3, General, and HVAC. Provide straight-run vents to the outside for the dryers. Provide ventilation in accordance with ASHRAE 62.1-2010, table 6-1, Hotels, Motels, Resorts, Dormitories-laundry rooms, central.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General. Provide concealed outlets for currency change machine and laundry vending, if provided as powered equipment (see Table 5-52).
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** As an option, provide a house phone. **Data.** None required. **CCTV.** Provide outlets for full camera coverage. **CATV.** As an option, provide an outlet for wall-mounted TV. **Security.** Door electronic card key access reader.
Acoustics	Provide partition and door construction with a minimum STC rating of 54 per Chapter 3, Acoustics. Partitions between the laundry room and a guest room or suite shall have a minimum STC rating of 60 per Chapter 3, Acoustics.
Special Requirements	Mount utility connections 36 in. (915 mm) above finished floor and ensure easy access for maintenance. Consider Wi-Fi for laptop use while waiting for laundry.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-24. GEAR WASH

Description/ Usage	Optional area used by guests coming in from field exercises to clean their personal equipment. This is typically only included at school/training Installations. Locate this room at a secondary, ground floor building entry.
Ceiling Ht.	9 ft. (2.7m) minimum.
Windows/Doors	Lockable entrance door with a vision panel.
Interior Construction/ Built-in Equipment	None required.
Finishes	**Walls.** Epoxy-painted, moisture-resistant gypsum board. **Floor.** Sealed concrete. **Base.** 4-in. (100 mm) ceramic tile. **Ceiling.** Moisture-resistant ACP.
Plumbing	Three deep, stainless steel wash sinks with flexible nozzles, one hose bibb, and floor drains with sediment traps located to ensure proper drainage.
HVAC	Provide a system per Chapter 3, General, and HVAC. Provide a minimum of 12 air changes per hour, 50 to 60% relative humidity, and negative pressure.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General.
Lighting	Provide system per Chapter 3, General, and Lighting. 30 fc (325 lux).
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** Provide outlets for full camera coverage. **CATV.** None required. **Security.** Door electronic card key access reader.
Acoustics	Provide partition and door construction with a minimum STC rating of 52 per Chapter 3, Acoustics.
Special Requirements	
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-25. GUEST BULK STORAGE, OPTION 1

Description/ Usage	Optional self-service areas used by PCS guests to store luggage and other bulky items.
Ceiling Ht.	9 ft. (2.7m) minimum.
Windows/Doors	Lockable entrance door.
Interior Construction/ Built-in Equipment	Built-in, heavy-gauge wire cages with closers that allow for use of individual padlocks. Each cage shall enclose 25 $ft.^2$ (2.3 m^2) and have 14 linear ft. (4.3 m) of durable wall-mounted shelving.
Finishes	**Walls.** Epoxy-painted, impact-resistant gypsum board. **Floor.** Sealed concrete. **Base.** Rubber. **Ceiling.** ACP or exposed structure.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General.
Lighting	Provide system per Chapter 3, General, and Lighting. 30 fc (325 lux).
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** None required. **CATV.** None required. **Security.** Door electronic card key access reader.
Acoustics	No special provisions required.
Special Requirements	Access passageways to cages shall be a minimum of 6 ft. (1.8 m) wide to facilitate movement of items. Distribute rooms among guest rooms on multiple floors and locate near suites, if possible. These may be adjacent to guest laundry with access from the laundry rooms.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-26. VENDING/ICE

Description/ Usage	Self-service drink, snack and ice vending area for guests. A minimum of one area per floor, located off the guest corridors and near the vertical circulation, if possible. First-floor vending area shall be recessed off a hallway and easily accessible from both the lobby and the first-floor guest rooms. These areas may be combined with the guest laundry—see Special Requirements.
Ceiling Ht.	8 ft. (2.4 m) minimum.
Windows/Doors	None required.
Interior Construction/ Built-in Equipment	Commercial ice dispenser sized at 300 lbs (136 kg) per 200 guests.
Finishes	See Chapter 3, Interior Design, for color and finish guidance. **Walls.** Finished gypsum wallboard. **Floor.** Porcelain tile. **Base.** Porcelain tile. **Ceiling.** ACP.
Plumbing	Provide a connection to the ice machine and a floor drain positioned under the ice machine and out of view.
HVAC	Provide a system per Chapter 3, General, and HVAC. Ensure adequate ventilation to support the equipment.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General. Confirm power/outlet requirements with machine manufacturer.
Lighting	Provide system per Chapter 3, General, and Lighting. 10 fc (110 lux).
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** Provide outlets for full camera coverage. **CATV.** None required. **Security.** None required.
Acoustics	Provide partition construction with a minimum STC rating of 52 per Chapter 3, Acoustics. Partitions between vending/ice and a guest room or suite shall have a minimum STC rating of 60 per Chapter 3, Acoustics.
Special Requirements	If combined with the guest laundry, provide the plumbing, power, and ventilation requirements to support the selected equipment. If only one area is provided per floor, locate centrally.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-27. PATIO

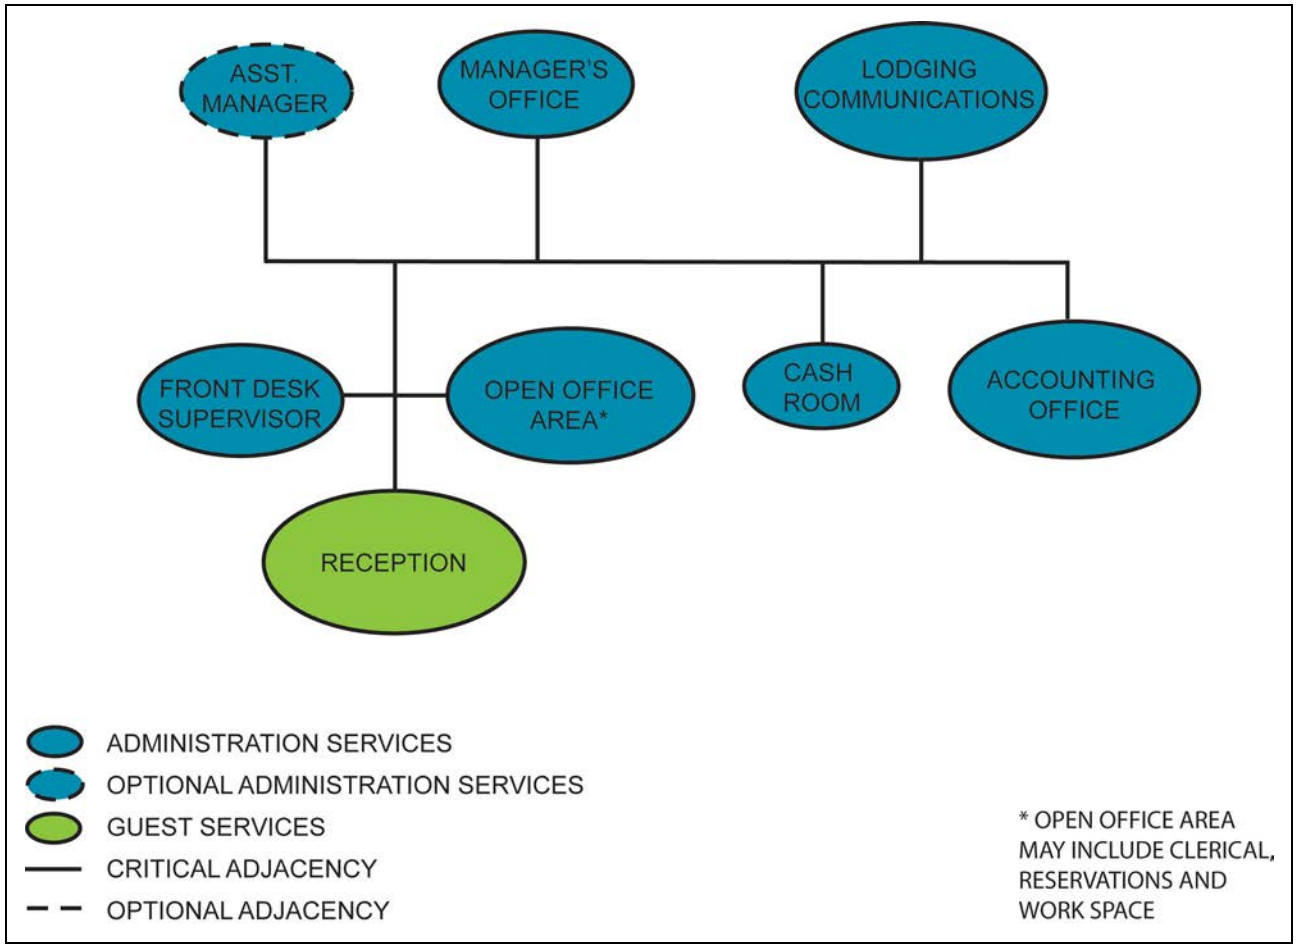
Description/ Usage	Optional exterior patio for guest use.
Ceiling Ht.	Not applicable.
Windows/Doors	Not applicable.
Interior Construction/ Built-in Equipment	Not applicable.
Finishes	**Walls.** Not applicable. **Floor.** Patterned/textured concrete, stone or brick pavers. **Base.** Not applicable. **Ceiling.** Not applicable.
Plumbing	Provide a hose bibb. Provide a gas connection to a grill if availability and budget permit.
HVAC	Not applicable.
Fire Protection and Life Safety	Not applicable for uncovered patios. Fire protection may be applicable if patio is covered.
Power	Provide exterior outlets per Chapter 3, General.
Lighting	Provide system per Chapter 3, General, and Lighting. Provide .5 fc (11 Lux) with energy efficient outdoor light fixtures.
Communication	**Telephone.** None required. **Data.** Provide Wi-Fi service. **CCTV.** Provide outlets for full camera coverage. **CATV.** None required. **Security.** None required.
Acoustics	Not applicable.
Special Requirements	
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-28. PATIO STORAGE

Description/ Usage	Only available with a patio, this room or shed accommodates storage of seasonal items, as needed based on climate.
Ceiling Ht.	9 ft. (2.7m) minimum.
Windows/Doors	Lockable entry door with a vision panel.
Interior Construction/ Built-in Equipment	None required.
Finishes	**Walls.** Painted concrete/CMU or gypsum wallboard. **Floor.** Sealed concrete. **Base.** None required. **Ceiling.** None required.
Plumbing	None required.
HVAC	None required.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** None required. **CATV.** None required. **Security.** None required.
Acoustics	No special provisions required.
Special Requirements	
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-29. GUEST CORRIDORS/CIRCULATION

Description/ Usage	The public horizontal and vertical circulation paths.
Ceiling Ht.	8 ft. 4 in. (2.5 m) minimum.
Windows/Doors	Maximize natural light in corridors. Windows can be located at corridor ends and/or at corners and intersections.
Interior Construction/ Built-in Equipment	None required.
Finishes	See Chapter 3, Interior Design, for color and finish guidance. **Walls.** Finished gypsum wallboard. Provide impact-resistant wall construction up to a minimum height of 48 in. (1220 mm) above finished floor. Provide a chair rail, surface-mounted corner guards, and a vinyl bumper rail to protect walls from housekeeping carts. **Floor.** Commercial grade carpet and pad. **Base.** Carpet, wood or tile. **Ceiling.** Painted gypsum wall board or ACP.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General. Consider added outlets for housekeeping.
Lighting	Provide system per Chapter 3, General, and Lighting. Provide an average of 10 fc (110 lux) through a combination of wall sconces and recessed compact fluorescent downlights.
Communication	**Telephone.** As an option, provide house phones at elevator lobbies. **Data.** None required. **CCTV.** None required. **CATV.** None required. **Security.** None required.
Acoustics	No special provisions required. See Special Requirements for elevator acoustical criteria.
Special Requirements	Corridors shall be a minimum width of 6 ft. (1.8 m). **Elevators.** Coordinate the elevator interior with the lobby area design and provide a durable, non-porous, solid-surface wall finish such as high-pressured laminate. Provide stainless steel cart rails and doors (interior and exterior). Minimum load capacity shall be 2,500 lbs (1135 kg), minimum opening shall be 42 in. (1070 mm), and minimum speed shall be 150 ft/min (45.7m/min). Consider faster, traction-type elevators for buildings above five floors. Partitions between the elevators and elevator equipment rooms and guest rooms or suites shall a minimum STC rating of 60 per Chapter 3, Acoustics.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	



5-3 ADMINISTRATIVE SERVICES.

Staff administrative spaces support the overall administration of the facility and/or Installation program. They are typically located adjacent to/behind reception. Design to minimize staff circulation through guest services areas.

5-3.1 Administrative Services Layout.

Figure 5-2 indicates the acceptable relative adjacencies of the guest services spaces.

FIGURE 5-2. ADMINISTRATIVE SERVICES ADJACENCY DIAGRAM

5-3.2 Administrative Services Design Criteria.

Tables 5-29 through 5-32 provide the guest services specific design criteria in the FDS format. Table 5-52 provides the FF&E for these spaces.

TABLE 5-30. LODGING COMMUNICATIONS

Description/ Usage	IT communications room includes guest and staff internet, television, and administration file server.
Ceiling Ht.	9 ft. (2.7m) minimum.
Windows/Doors	Lockable entry door.
Interior Construction/ Built-in Equipment	NA.
Finishes	**Walls.** Paint. **Floor.** Concrete. **Base.** None required. **Ceiling.** Painted exposed structure or gypsum wall board.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** None required. **CATV.** None required. **Security.** Locking passage door.
Acoustics	No special provisions required.
Special Requirements	NA.
For use during project execution by the appropriate Service agency	
Occupancy	Staff access only.
Min. net ft^2 (m^2)	No minimum required.

TABLE 5-31. PRIVATE ADMINISTRATIVE OFFICES

Description/ Usage	The number of private offices will vary by facility and Installation depending on the program and other, existing resources. Offices will vary in size as well. The following private offices may be included in a LF: manager, assistant manager, and front desk supervisor/superintendant.
Ceiling Ht.	8 ft. (2.4 m) minimum.
Windows/Doors	Lockable entry door. Provide exterior windows if possible.
Interior Construction/ Built-in Equipment	Provide a coat hook on the door and wall-mounted tack and/or marker boards. In the front desk supervisor office provide a one-way window with a view of the front desk and lobby areas.
Finishes	**Walls.** Finished gypsum wallboard. **Floor.** Commercial grade carpet and pad. **Base.** Rubber or carpet. **Ceiling.** ACP.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General. Provide a minimum of one duplex outlet per wall and one additional duplex outlet at the desk location.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** Provide two jacks in a single box adjacent to the desk duplex outlet. **Data.** Provide two jacks in a single box adjacent to the desk duplex outlet. **CCTV.** In the front desk supervisor office provide for a monitor. **CATV.** None required. **Security.** Door electronic card key access reader.
Acoustics	Provide partition and door construction with a minimum STC rating of 45 per Chapter 3, Acoustics.
Special Requirements	
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-32. ACCOUNTING OFFICE

Description/ Usage	Depending on the size of the facility and Installation program, this may be an office for one or two people or an open-office area for up to five accounting staff.
Ceiling Ht.	8 ft. (2.4 m) minimum.
Windows/Doors	Lockable entrance door. Provide exterior windows if possible.
Interior Construction/ Built-in Equipment	As an option, provide a wall-mounted tack and/or marker board.
Finishes	**Walls.** Finished gypsum wallboard. **Floor.** Commercial grade carpet and pad. **Base.** Rubber or carpet. **Ceiling.** ACP.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General. Provide three duplex outlets per workstation and additional outlets as needed for shared office equipment.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** Provide two jacks in a single box per workstation. Provide additional jacks as necessary for shared equipment. **Data.** Provide two jacks in a single box per workstation. Provide additional jacks as necessary for shared equipment. **CCTV.** None required. **CATV.** None required. **Security.** Door electronic card key access reader.
Acoustics	Provide partition and door construction with a minimum STC rating of 45 per Chapter 3, Acoustics.
Special Requirements	
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-33. OPEN OFFICE AREA

Description/ Usage	This is an open office work area that accommodates workstations for clerical and reservations staff, administrative storage, and general work space. It may accommodate shared equipment such as photocopiers, facsimile machines, and printers or those may be in a separate area (see Special Requirements below).
Ceiling Ht.	8 ft. (2.4 m) minimum.
Windows/Doors	Lockable entrance door. Provide exterior windows if possible.
Interior Construction/ Built-in Equipment	As an option, provide wall-mounted tack and/or marker boards as appropriate.
Finishes	**Walls.** Finished gypsum wallboard. **Floor.** Commercial grade carpet and pad. **Base.** Rubber or carpet. **Ceiling.** ACP.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and HVAC. Also see Special Requirements.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General. Provide three duplex outlets per workstation and additional outlets as needed for shared office equipment.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** Provide two jacks in a single box per workstation. Provide additional jacks as necessary for shared equipment. **Data.** Provide two jacks in a single box per workstation. Provide additional jacks as necessary for shared equipment. **CCTV.** None required. **CATV.** None required. **Security.** Door electronic card key access reader.
Acoustics	Provide partition and door construction with a minimum STC rating of 45 per Chapter 3, Acoustics.
Special Requirements	If possible, separate shared equipment such as printers and photocopiers into a dedicated space that will meet the requirements for indoor environmental quality LEED® credits. Regardless, this shared equipment shall be easily accessible by front desk and administrative staff. The front desk staff in particular must be able to access this equipment quickly to minimize time away from guests.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-34. CASH ROOM

Description/ Usage	This secure room is used by front desk staff to reconcile shift cash functions, including balancing cash drawer and making deposits.
Ceiling Ht.	8 ft. (2.4 m) minimum.
Windows/Doors	Lockable entry door.
Interior Construction/ Built-in Equipment	Provide a 24-in- (610mm) deep counter with upper cabinets. Provide a three-drawer (minimum) secure cash drawer rack that is permanently affixed to wall and has an individual lock on each drawer. Coordinate sizing of this rack with the front desk cash registers. Provide a drop cash safe with a tumbling drum.
Finishes	**Walls.** Finished gypsum wallboard. **Floor.** Commercial grade carpet and pad. **Base.** Rubber or carpet. **Ceiling.** ACP.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** Provide one jack located below counter. **Data.** Provide two jacks in a single box located below counter. **CCTV.** Provide outlets for full camera coverage. **CATV.** None required. **Security.** Electronic card key access reader. Provide a duress alarm that sounds at the Installation Security Office. The agencies identified in Chapter 1, Contacts, may waive this requirement.
Acoustics	No special provision required.
Special Requirements	Walls shall extend to bottom of deck above for security.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

5-4 FLOOR SUPPORT.

Floor support spaces are staff areas located on each floor of guest rooms and suites in support of those rooms. Tables 5-33 through 5-35 provide the floor support specific design criteria in the FDS format. Table 5-52 provides the FF&E for these spaces.

TABLE 5-35. JANITOR AREAS

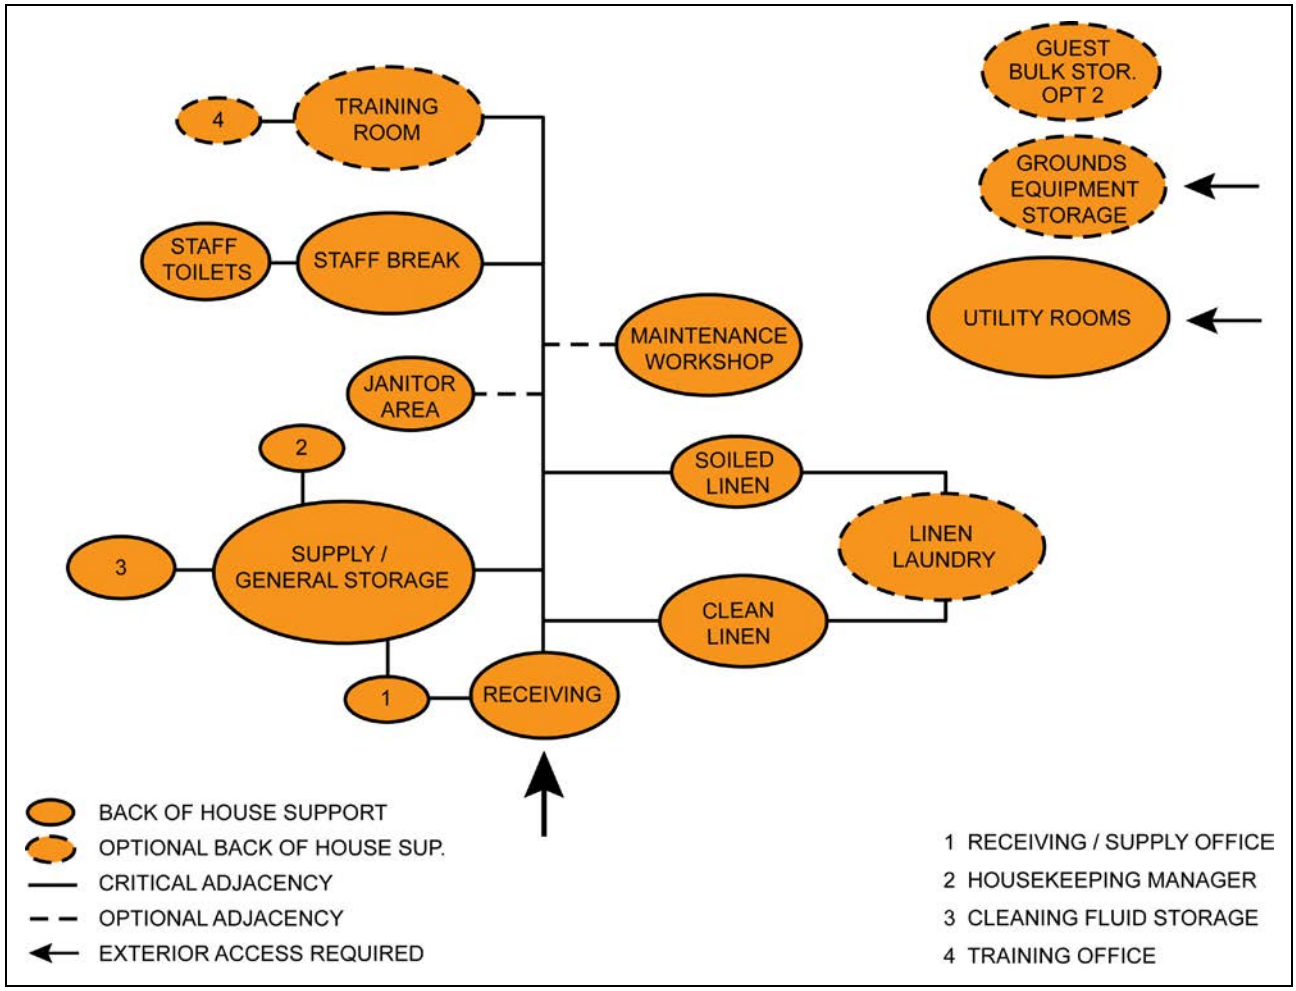
Description/ Usage	Janitor closets located in a central location on each floor. Some building configurations may require two closets on each floor. This space may be combined with the housekeeping closets on the guest room floors.
Ceiling Ht.	8 ft. (2.4 m) minimum.
Windows/Doors	Lockable entry door.
Interior Construction/ Built-in Equipment	Built-in shelving and wall brackets for mops and brooms.
Finishes	**Walls.** Epoxy painted, moisture-resistant gypsum wall board or CMU. **Floor.** Stained and sealed concrete or porcelain tile. **Base.** Rubber. **Ceiling.** None.
Plumbing	Provide a mop sink and a floor drain.
HVAC	Provide a system per Chapter 3, General, and HVAC. Provide negative pressure.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** None required. **CATV.** None required. **Security.** Door electronic card key access reader.
Acoustics	No special provisions required.
Special Requirements	
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-36. HOUSEKEEPING AREAS

Description/ Usage	Rooms located in a central location on each floor. Some building configurations may require two housekeeping areas on each floor. These rooms store the housekeeping carts, guest amenities, clean linens for the rooms served, and accommodate temporary storage of dirty linens. This space may be combined with the janitor closets on the guest room floors.
Ceiling Ht.	8 ft. (2.4 m) minimum.
Windows/Doors	Lockable entry door.
Interior Construction/ Built-in Equipment	Built-in shelving and wall brackets for mops and brooms.
Finishes	**Walls.** Epoxy painted, moisture-resistant gypsum wall board or CMU. **Floor.** Stained and sealed concrete or porcelain tile. **Base.** Rubber. **Ceiling.** None.
Plumbing	Provide an optional service connection to a dishwasher. If any water source is present, provide a floor drain.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** None required. **CATV.** None required. **Security.** Door electronic card key access reader.
Acoustics	No special provisions required.
Special Requirements	
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-37. UTILITY ROOMS

Description/ Usage	Mechanical, electrical, communications, and sprinkler rooms located on each floor as needed for efficient utility distribution. The majority of these rooms will be switch closets to accommodate data pulls, CATV pulls and boosters, and telephone pulls. Those rooms shall be no more than 280 ft. (85.4m) from any guest room.
Ceiling Ht.	8 ft. (2.4 m) minimum.
Windows/Doors	Lockable entry door. Size doors to allow future equipment removal.
Interior Construction/ Built-in Equipment	Built-in equipment racks.
Finishes	**Walls.** Epoxy painted, gypsum wall board or CMU. **Floor.** Stained and sealed concrete. **Base.** Rubber. **Ceiling.** None.
Plumbing	In mechanical equipment rooms only, provide one hose bibb and floor drain.
HVAC	Provide a system per Chapter 3, General, and HVAC. Switch closets require individual temperature and humidity control per equipment requirements. Do not duct return air from any adjacent space through the communication room.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** As required for system. **Data.** As required for system. **CCTV.** None required. **CATV.** As required for system. **Security.** See Special Requirements.
Acoustics	Provide partition and door construction with a minimum STC rating of 52 per Chapter 3, Acoustics. Mechanical rooms or rooms with noise-generating equipment that are located adjacent to guest rooms or suites shall have partition construction with a minimum STC rating of 60 per Chapter 3, Acoustics.
Special Requirements	The main, first floor electrical room and the mechanical rooms shall be accessible from both the exterior and the interior. Do not combine switch closets with the mechanical rooms and minimize the potential for water damage in the switch closets—do not locate valves, connections, cleanouts, drain traps or similar joints within or directly above the switch closets. Do not co-locate high-power electrical systems in the switch closets due to potential signal interference. Ensure that facility staff will have access (through the key card system) to the facility communications equipment.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	



5-5 BACK-OF-HOUSE SUPPORT.

Back-of-house support spaces are staff-only areas—typically limited to the first floor—that provide facility and staff support functions.

5-5.1 Back-of-house Support Layout.

Figure 5-3 indicates the acceptable relative adjacencies of the back-of-house support spaces.

FIGURE 5-3. BACK-OF-HOUSE SUPPORT ADJACENCY DIAGRAM

5-5.2 Back-of-house Support Design Criteria.

Tables 5-36 through 5-51 provide the back-of-house support specific design criteria in the FDS format. Table 5-52 provides the FF&E for these spaces.

TABLE 5-38. TRAINING ROOM

Description/ Usage	Optional dedicated room for staff training.
Ceiling Ht.	8 ft. (2.4 m) minimum.
Windows/Doors	Lockable entry door with a small vision panel.
Interior Construction/ Built-in Equipment	Provide a secure cabinet for AV equipment. Provide a retractable overhead screen, a ceiling projector mount, and a wall-mounted marker board.
Finishes	**Walls.** Finished gypsum wallboard. **Floor.** Commercial grade carpet and pad. **Base.** Wood or carpet. **Ceiling.** ACP.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General. Provide a ceiling outlet for a projector. Also provide floor outlets in a center core.
Lighting	Provide system per Chapter 3, General, and Lighting. Consider dimming capability.
Communication	**Telephone.** Provide one jack on each wall and floor jacks in a center core. **Data.** Provide two jacks in a single box on each wall, floor jacks in a center core, and a ceiling jack for the projector. **CCTV.** None required. **CATV.** Provide one outlet. **Security.** Door electronic card key access reader.
Acoustics	Provide partition and door construction with a minimum STC rating of 45 per Chapter 3, Acoustics.
Special Requirements	
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-39. TRAINING OFFICE/STORAGE

Description/ Usage	This optional space may be used for storage of staff training supplies or for both administration of the staff training program and storage of supplies.
Ceiling Ht.	8 ft. (2.4 m) minimum.
Windows/Doors	Lockable entry door.
Interior Construction/ Built-in Equipment	None required.
Finishes	**Walls.** Finished gypsum wallboard. **Floor.** Commercial grade carpet and pad. **Base.** Rubber or carpet. **Ceiling.** ACP.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General. Provide a minimum of one duplex outlet per wall and, if serving an administrative function, one additional duplex outlet at the desk location.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** If serving an administrative function, provide two jacks in a single box adjacent to the desk duplex outlet. **Data.** If serving an administrative function, provide two jacks in a single box adjacent to the desk duplex outlet. **CCTV.** None required. **CATV.** None required. **Security.** Door electronic card key access reader.
Acoustics	Provide partition and door construction with a minimum STC rating of 45 per Chapter 3, Acoustics.
Special Requirements	
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-40. JANITOR AREA

Description/ Usage	Central janitor closet(s) serving the first floor public and staff spaces and including additional supply storage.
Ceiling Ht.	8 ft. (2.4 m) minimum.
Windows/Doors	Lockable entry door.
Interior Construction/ Built-in Equipment	Built-in shelving and wall brackets for mops and brooms.
Finishes	**Walls.** Epoxy painted, moisture-resistant gypsum wall board or CMU. **Floor.** Sealed and stained concrete or porcelain tile. **Base.** Rubber. **Ceiling.** None.
Plumbing	Provide a mop sink and a floor drain.
HVAC	Provide a system per Chapter 3, General, and HVAC. Provide negative pressure.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** None required. **CATV.** None required. **Security.** Door electronic card key access reader.
Acoustics	No special provisions required.
Special Requirements	
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-41. HOUSEKEEPING OFFICE

Description/ Usage	This is a private office for the housekeeping manager and housekeeping assistant to conduct administrative and staff management functions.
Ceiling Ht.	8 ft. (2.4 m) minimum.
Windows/Doors	Lockable entry door.
Interior Construction/ Built-in Equipment	None required.
Finishes	**Walls.** Painted gypsum wall board. **Floor.** Carpet or VCT. **Base.** Rubber or carpet. **Ceiling.** ACP.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General. Provide a minimum of one duplex outlet per wall, one additional duplex outlet at the desk location, and one additional duplex outlet at the time clock location.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** Provide two jacks in a single box adjacent to the desk duplex outlet. **Data.** Provide two jacks in a single box adjacent to the desk duplex outlet. **CCTV.** None required. **CATV.** None required. **Security.** Door electronic card key access reader.
Acoustics	Provide partition and door construction with a minimum STC rating of 45 per Chapter 3, Acoustics.
Special Requirements	The timeclock is installed on the wall outside the office immediately adjacent to the entry door.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-42. SOILED/CLEAN LINEN STORAGE

Description/ Usage	Separate, distinct storage areas for soiled and clean linen storage. Both shall be adjacent to receiving and/or optional linen laundry.
Ceiling Ht.	8 ft. (2.4 m) minimum.
Windows/Doors	Lockable entry door with a small vision panel.
Interior Construction/ Built-in Equipment	24-in. (610 mm) deep, heavy-duty, built-in shelving.
Finishes	**Walls.** Epoxy painted gypsum wall board or CMU. **Floor.** Sealed concrete. **Base.** Rubber. **Ceiling.** ACP or none.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General.
Lighting	Provide system per Chapter 3, General, and Lighting. 15 fc (160 lux) average.
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** None required. **CATV.** None required. **Security.** Door electronic card key access reader.
Acoustics	No special provisions required.
Special Requirements	The soiled linen storage consists primarily of space for storage of laundry carts and open floor space for sorting. The clean linen storage consists primarily of storage shelving.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-43. RECEIVING

Description/ Usage	Central receiving area for deliveries with a loading dock.
Ceiling Ht.	8 ft. (2.4 m) minimum.
Windows/Doors	Provide an exterior pedestrian door with electronic lockset and a small vision panel. At a minimum, provide double doors from the dock to the interior. As an option, provide an electrically-operated, insulated overhead coiling door at the dock.
Interior Construction/ Built-in Equipment	Loading dock width shall be capable of accommodating a single city delivery truck at minimum, and depth shall be 60 in. (1525 mm) minimum. Provide stairs to the ground level, a manual dock leveling mechanism, and dock bumpers. Provide roof overhang protection of the dock.
Finishes	**Walls.** Epoxy painted impact-resistant gypsum wallboard or CMU. **Floor.** Sealed concrete. **Base.** Rubber. **Ceiling.** ACP or none.
Plumbing	Provide one hose bibb and a floor drain.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General. Provide one duplex outlet per wall.
Lighting	Provide system per Chapter 3, General, and Lighting. 30 fc (325 lux) from recessed fluorescent fixtures.
Communication	**Telephone.** Provide a house phone or exterior speaker at the entrance gate and/or dock exterior. As an option, provide one jack (ganged with data in single box) located adjacent to a duplex outlet at the interior of the loading dock. **Data.** As an option, provide one jack (ganged with phone in single box) located adjacent to a duplex outlet at the interior of the loading dock. **CCTV.** Provide outlets for camera coverage of the dock and access gate. **CATV.** None required. **Security.** Door electronic card key access reader.
Acoustics	No special provisions required.
Special Requirements	Provide a door bell adjacent to the house phone/speaker that sounds at the interior receiving area and reception. Coordinate loading dock size and height with anticipated delivery vehicles. This area may serve as the primary employee entrance.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-44. RECEIVING/SUPPLY OFFICE

Description/ Usage	Small optional private office adjacent to receiving and supply/general storage area for administration of maintenance staff, inventory and deliveries.
Ceiling Ht.	8 ft. (2.4 m) minimum.
Windows/Doors	Lockable half-lite entry door.
Interior Construction/ Built-in Equipment	None required.
Finishes	**Walls.** Painted gypsum wallboard. **Floor.** VCT. **Base.** Rubber. **Ceiling.** ACP.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General. Provide a minimum of one duplex outlet per wall with an additional duplex outlet at the desk location.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** Provide one jack (ganged with data in single box) at the desk location. **Data.** Provide one jack (ganged with phone in single box) at the desk location. **CCTV.** None required. **CATV.** None required. **Security.** Door electronic card key access reader.
Acoustics	No special provisions required.
Special Requirements	Door bell at receiving will sound here.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-45. LINEN LAUNDRY

Description/ Usage	This optional space accommodates the in-house laundry of all bed linens and towels.
Ceiling Ht.	8 ft. (2.4 m) minimum.
Windows/Doors	Lockable entry door with a small vision panel.
Interior Construction/ Built-in Equipment	Large, high capacity industrial extractors and dryers—coordinate dryer size/quantity to ensure appropriate turn-over. Extractors must be mounted on vibration-isolated concrete foundations. Provide a built-in table for folding laundry and storage shelves/lockers. In larger facilities/programs or when permanent-press-type linens with a crease-resistant finish are not available, evaluate the need for a pressing/folding machine. Provide optional high-speed commercial-grade ceiling fans.
Finishes	**Walls.** Epoxy painted CMU or mold-resistant gypsum wallboard. Provide rub rails, and metal/high-impact plastic corner guards. **Floor.** Sealed concrete. **Base.** Rubber. **Ceiling.** Moisture-resistant ACP.
Plumbing	Provide connections to the extractors, a stainless steel laundry sink with a solid interceptor and goose-neck faucet, an emergency eye wash station, one drain per washer with solid interceptors, and one additional floor drain.
HVAC	Provide a system per Chapter 3, General, and HVAC. Provide separate straight-run vents to the outside for the dryers. Provide a minimum of six air changes per hour, 50 to 60% relative humidity, and negative pressure.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General. Provide a wall-mounted safety disconnect switch for each extractor.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** Provide one jack. **Data.** None required. **CCTV.** None required. **CATV.** None required. **Security.** Door electronic card key access reader.
Acoustics	Provide partition and door construction with a minimum STC rating of 52 per Chapter 3, Acoustics.
Special Requirements	This room shall be located on the first floor of the facility. Allow 36 in. (915 mm) from each machine to the wall to accommodate venting, maintenance, and product delivery systems.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-46. SUPPLY/GENERAL STORAGE/CLEANING FLUID STORAGE

Description/ Usage	Provides warehousing and accessible storage for everything from spare furniture and TVs to consumable goods and operational supplies. Approximately 80% of the area is secured warehousing storage and the remaining 20% is accessible for daily restocking. The two areas may be combined in one large room or in two separate rooms (see Interior Construction). Provide a separate adjacent area for storage of cleaning fluids.
Ceiling Ht.	10 ft. (3.1 m) minimum. 12-16 ft. (3.7-4.9 m) typical.
Windows/Doors	Lockable entry door.
Interior Construction/ Built-in Equipment	Provide a minimum of 200 linear ft. (610m) of 30-in.- (760 mm) deep heavy duty shelving. Shelving shall be designed to support 300 lbs. (136 kg) over 7 ft. (2.1m). The lowest shelf shall be mounted 6 in. (150 mm) above finished floor. Provide a full-height, lockable cage to divide the warehousing section from the accessible storage or these may be two separate rooms.
Finishes	**Walls.** Epoxy painted CMU or impact-resistant gypsum wall board. **Floor.** Sealed concrete. **Base.** Rubber. **Ceiling.** None required.
Plumbing	Cleaning fluid storage shall include an emergency eye wash station and a floor drain.
HVAC	Provide a system per Chapter 3, General, and HVAC. Cleaning fluid storage shall include negative pressure.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** None required. **CATV.** None required. **Security.** Door electronic card key access reader.
Acoustics	No special provisions required.
Special Requirements	Ensure open floor area for packing/unpacking activities and that there is space to accommodate queen size mattresses and furniture storage. The separate area for storage of cleaning fluids shall meet LEED® requirements.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-47. GUEST BULK STORAGE, OPTION 2

Description/ Usage	This optional secure room accommodates storage of guest's larger, bulkier items, such as bicycles, steamer trunks, etc. It is typically only provided in facilities that accommodate long-term stays and only when budget permits. Locate it on the ground floor near a secondary public entrance.
Ceiling Ht.	9 ft. (2.7m) minimum.
Windows/Doors	Lockable entrance door.
Interior Construction/ Built-in Equipment	None required.
Finishes	**Walls.** Epoxy-painted CMU or impact-resistant gypsum board. **Floor.** Sealed concrete. **Base.** Rubber. **Ceiling.** ACP or exposed structure.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General.
Lighting	Provide system per Chapter 3, General, and Lighting. 30 fc (325 lux).
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** None required. **CATV.** None required. **Security.** Door electronic card key access reader.
Acoustics	No special provisions required.
Special Requirements	This is not a self-service space. Staff will accompany guests and provide access to the space.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-48. BREAK AREA

Description/ Usage	The primary function of this space is a staff lounge/break area with a kitchenette and lockers. In central facilities this area can also dual-function as a staff meeting/training area. It is directly adjacent to the staff toilets. In satellite facilities, it serves the staff break functions only.
Ceiling Ht.	8 ft. (2.4 m) minimum.
Windows/Doors	Provide windows or other means of natural light if possible. If an entry door is included, provide a vision panel.
Interior Construction/ Built-in Equipment	Half-height, double-stacked lockers per full staff count (not only on-duty). Provide solid-surface counter at kitchenette with upper and base cabinets and under-counter dishwasher. **Army** provides a prefabricated Kitchenette unit. **Air Force** provides a range with exhaust hood at OCONUS facilities. TV wall mount, tackboard, and lockable bulletin board. In central facilities when this area will function as a staff meeting/training area, provide a ceiling projector mount and a retractable overhead screen.
Finishes	**Walls.** Painted gypsum wall board with ceramic backsplash at the kitchenette. **Floor.** Provide a high-quality resilient or hard-surface flooring. **Base.** Coordinate with flooring. **Ceiling.** ACP.
Plumbing	Provide an under-mount stainless steel, kitchen sink with a gooseneck single lever faucet and a disposal. Provide connections to the refrigerator ice maker and the coffee machine. As an option, provide a dishwasher. For **Army,** provide service to the prefabricated kitchenette unit.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** Provide one jack (ganged with data in single box). **Data.** Provide one wall jack (ganged with phone in single box) and a ceiling jack adjacent to the projector mount, if provided. Provide Wi-Fi service throughout. **CCTV.** None required. **CATV.** Provide one outlet for wall-mounted TV. **Security.** Electronic card key access reader, if applicable.
Acoustics	No special provisions required.
Special Requirements	
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-49. STAFF TOILETS

Description/ Usage	Male and female staff toilets directly adjacent to the staff break area.
Ceiling Ht.	8 ft. (2.4 m) minimum.
Windows/Doors	Entrance doors.
Interior Construction/ Built-in Equipment	Solid-surface countertop with either underhung or integral sink. Solid composite or phenolic core toilet and urinal partitions. Toilet accessories: toilet paper dispensers, automatic paper towel dispenser, built-in trash receptacle, robe hooks, grab bars, sanitary napkin disposal and purse shelves (female water closet stalls), seat cover dispensers, and automatic soap dispensers. Full-width mirror over countertop.
Finishes	**Walls.** Finished mold-resistant gypsum wallboard with a ceramic tile wainscot. Use a dark-colored grout. **Floor.** Porcelain tile with integral patterns. Use a dark-colored grout. **Base.** Porcelain tile. **Ceiling.** Epoxy or semi-gloss or better enamel painted, mold-resistant gypsum wall board.
Plumbing	Provide automatic flush-valve wall-hung water closets and urinals, and automatic lavatories based on the applicable code. Provide a floor drain. Provide a keyed hose bibb.
HVAC	Provide a system per Chapter 3, General, and HVAC. In addition, provide a minimum of eight air changes per hour and negative pressure. **Service Exception:** For Air Force, provide a system per Chapter 3, General, and HVAC; use the continuous exhaust requirements per ASHRAE 62.1, table 6-4; and provide negative pressure.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General.
Lighting	Provide system per Chapter 3, General, and Lighting.
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** None required. **CATV.** None required. **Security.** None required.
Acoustics	No special provisions required.
Special Requirements	
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-50. MAINTENANCE WORKSHOP

Description/ Usage	A general work room for repair of equipment and furnishings.
Ceiling Ht.	10 ft. (3.1 m) minimum.
Windows/Doors	Double, lockable entrance doors.
Interior Construction/ Built-in Equipment	Built-in shelving and wall brackets for tools. Built in workbenches. Provide built-in tools/equipment as necessary based on the maintenance program.
Finishes	**Walls.** Epoxy painted CMU or impact-resistant gypsum wallboard. **Floor.** Sealed concrete. **Base.** Rubber. **Ceiling.** None required.
Plumbing	Plumbing requirements shall accommodate the specific maintenance program. Needs may include a handwashing sink, emergency eyewash station, a hose bibb, and floor drains to ensure drainage.
HVAC	Provide a system per Chapter 3, General, and HVAC. Coordinate ventilation requirements with the selected equipment.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General. Coordinate power requirements and outlet locations with equipment to ensure adequate circuits and correct outlet locations. Provide a minimum of two 240 volt outlets.
Lighting	Provide system per Chapter 3, General, and Lighting. 50 fc (540 lux) general lighting and 75 fc (810 lux) task lighting at the workstations.
Communication	**Telephone.** Provide one jack (ganged with data in a single box) on each wall. **Data.** Provide one jack (ganged with telephone in a single box) on each wall. **CCTV.** None required. **CATV.** None required. **Security.** Door electronic card key access reader.
Acoustics	Provide partition and door construction with a minimum STC rating of 52 per Chapter 3, Acoustics.
Special Requirements	Scope of maintenance activities can vary significantly based on program. Carefully coordinate power, HVAC, and equipment requirements.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-51. GROUNDS EQUIPMENT STORAGE

Description/ Usage	Optional small shed or closet in **Navy** and **Air Force** facilities with direct exterior access for storage of grounds and exterior building maintenance supplies and equipment.
Ceiling Ht.	9 ft. (2.7 m) minimum.
Windows/Doors	Lockable entrance door.
Interior Construction/ Built-in Equipment	Built-in shelving and wall brackets for tools.
Finishes	**Walls.** Semigloss enamel painted CMU. **Floor.** Sealed concrete. **Base.** None required. **Ceiling.** None required.
Plumbing	Provide an exterior hose bibb.
HVAC	Provide a system per Chapter 3, General, and HVAC. Coordinate any specific requirements with the equipment to be stored.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety. Coordinate any specific requirements with the equipment to be stored.
Power	Provide outlets per Chapter 3, General. Provide one duplex outlet per wall.
Lighting	Provide system per Chapter 3, General, and Lighting. 15 fc (160 lux)
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** None required. **CATV.** None required. **Security.** Door electronic card key access reader.
Acoustics	No special provisions required.
Special Requirements	If this is provided as a separate structure, the exterior architecture shall match the main lodging facility.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-52. GROUNDS EQUIPMENT STORAGE (ARMY)

Description/ Usage	**Army** space with direct exterior access for storage of grounds and exterior building maintenance supplies and equipment.
Ceiling Ht.	9 ft. (2.7 m) minimum.
Windows/Doors	Lockable personnel door and 8 ft. x 8 ft. (2.4m x 2.4m) manually-operated, insulated overhead door.
Interior Construction/ Built-in Equipment	Built-in shelving and wall brackets for tools.
Finishes	**Walls.** Semigloss enamel painted CMU. **Floor.** Sealed concrete. **Base.** None required. **Ceiling.** None required.
Plumbing	Provide a utility sink, an emergency eyewash station, and a floor drain. Provide an exterior hose bibb.
HVAC	Provide a system per Chapter 3, General, and HVAC. Coordinate any specific requirements with the equipment to be stored.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety. Coordinate any specific requirements with the equipment to be stored.
Power	Provide outlets per Chapter 3, General. Provide one duplex outlet per wall.
Lighting	Provide system per Chapter 3, General, and Lighting. 15 fc (160 lux)
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** None required. **CATV.** None required. **Security.** Door electronic card key access reader.
Acoustics	No special provisions required.
Special Requirements	If this is provided as a separate structure, the exterior architecture shall match the main lodging facility.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

TABLE 5-53. SERVICE CIRCULATION

Description/ Usage	Staff horizontal and vertical circulation paths between back-of-house support areas.
Ceiling Ht.	8 ft. (2.4 m) minimum.
Windows/Doors	Provide heavy-duty swinging doors between the service corridors and public spaces.
Interior Construction/ Built-in Equipment	None required.
Finishes	**Walls.** Epoxy painted CMU or impact-resistant gypsum wallboard. Provide bumper rails and corner guards. **Floor.** Stained and sealed concrete or VCT. **Base.** Rubber. **Ceiling.** ACP.
Plumbing	None required.
HVAC	Provide a system per Chapter 3, General, and HVAC.
Fire Protection and Life Safety	Provide systems per Chapter 3, General, and Fire Protection and Life Safety.
Power	Provide outlets per Chapter 3, General.
Lighting	Provide system per Chapter 3, General, and Lighting. 20 fc (215 lux) average.
Communication	**Telephone.** None required. **Data.** None required. **CCTV.** None required. **CATV.** None required. **Security.** None required.
Acoustics	No special provisions required.
Special Requirements	Corridors shall be a minimum width of 8 ft. (2.4 m). **Elevators.** Provide stainless steel cart rails and doors (interior and exterior) and provide wall hooks for grommeted wall padding. Size the elevators to accommodate a king size mattress, housekeeping service cart, and a stretcher for medical emergencies. Minimum load capacity shall be 3,000 lbs (136 kg). Provide a key operated lock-down/hold feature.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Guests.
Min. net ft^2 (m^2)	

5-6 FURNISHINGS, FIXTURES AND EQUIPMENT.

Coordinate FF&E packages with the interior designer and follow the requirements noted in Chapter 3, Interior Design. To assist planners and designers, Table 5-52 provides the general types of FF&E by Service for each space and indicates whether the item is CFCI, GFGI, or GFCI (F/I). Note that interior construction items such as toilet accessories, built-in shelving, cabinets, wall-mounts, and plumbed or attached equipment are included in the FDSs. Therefore, if a space has no FF&E, it is not included here.

APPENDIX B BEST PRACTICES

B-1 INTRODUCTION.

The following material identifies background information and other current, good design practices for LFs. The designer is expected to review and interpret this guidance and apply the information according to the needs of the project.

B-2 PROJECT PLANNING.

B-2.1 Site Analysis Costs.

Project programmers must consider costs for the following:

- Preliminary soils analyses essential to determine whether extensive site work and foundation costs are required. Also, organic soil analyses for exterior landscape plant materials may be required.

- Local environmental and climatic conditions such as heavy snow loads, wind loads, high humidity, and extreme temperatures result in additional costs due to structural, and to a lesser extent, insulation requirements.

- Projects located in areas prone to seismic activity.

- Projects located in designated historic districts may incur additional cost in order to ensure compliance with historic preservation requirements.

- The Installation will fund site development costs to include cut/fill and other work necessary to make the site usable. The Installation will provide all NAF projects with a clean site up to 6 in. (150 mm) below grade in accordance with DoDI 1015.15. The Installation is responsible for supporting costs. This considers all work outside the 5-ft. (1525 mm) building line and includes site preparation, roads, utilities, landscaping demolition, etc.

B-3 SITE DESIGN.

B-3.1 General Considerations.

B-3.1.1 Site Development.

The site plan is one of the more important elements of any project design and can greatly impact the overall success of the LF project. Involve the installation community planner, architect, landscape architect, and civil, mechanical, electrical, and communication engineers, and the organizations identified in Chapter 1, Contacts. Achieve spatial balance and scale through thoughtful placement and arrangement of structures, landscaping and landforms. Pay special attention to building orientation, mass and scale in developing the site plan.

B-3.1.2 Proximity to Common Use Areas.

Although the emphasis in LF campus planning is to create a residential neighborhood atmosphere, somewhat separated from surrounding base administrative and mission related functions, proximity and access to common public use facilities are desired. The design of vehicular paths, pedestrian paths and landscape can help define layers of boundary around the lodging facility campus to provide this separation, but can also enhance the flow into and out of the adjacent community areas, such as the dry cleaners, post office, dining establishments, theatre, fitness center, enlisted dining facility, and clubs.

B-3.1.3 Adjacencies to Public Areas.

Adjacent recreational spaces additionally enhance these layers of boundary and can buffer other non-desired areas or functions. Site planning and community planning will define an edge to the LF campus, while considering the importance of adjacent community and common public areas. Reference AFPAM 32-1010 for additional useful information and guidance on this subject.

B-3.1.4 Community Planning.

Develop a sense of order, arrival, orientation and community in planning the site. To the extent possible, lodging structures must not be overwhelming in apparent size. Site lodging facilities in relationship to one another to create outdoor spaces for use as passive or active recreation areas. Overall room requirements and available acreage will establish the number of stories of a new LF facility. Any configuration needs to ensure an efficient use of available real estate, but may require additional fire protection, structural, and life safety costs associated with buildings over three stories in height. Locate industrial areas and spaces such as loading docks, mechanical rooms, electrical rooms, trash dumpsters, HVAC equipment toward the rear of the facility or otherwise away from the guest view.

B-3.1.5 Building Placement.

Building placement and design should also take advantage of views that are scenic, pleasant, or interesting. Designers must be sensitive to the approaches to the facility and strive to create a clear sense of arrival for newcomers.

B-3.1.6 Climatic Considerations.

LF design and building orientation must take advantage of local climatic conditions. Where practical, use passive solar construction techniques to reduce energy consumption. Local climate conditions must be considered as well as other site organization issues such as the creation of outdoor space, building scale or orientation to other facilities, when determining the best project site.

B-3.1.7 Natural Features.

Site facilities should take advantage of the positive features of the site. Provide protection from undesirable winds and glare. Incorporate shading from excessive sun in warm climates. Solar gain and prevailing winds can enhance energy conservation and yield significant cost savings. Design roof overhangs to account for sun angles to provide solar shading. Achieve mutual shading by sensitively arranging adjacent structures. Avoid excessive east or west-facing glass and design for maximum cross-ventilation where feasible.

B-3.2 Site Circulation.

B-3.2.1 Vehicular Access.

Plan vehicular layout to eliminate, or at least minimize, the adverse impact of noise and headlights shining into guest room windows. Consider delivery truck access and required easements.

B-3.2.2 Emergency Service.

Reference Chapter 3, Fire Protection and Life Safety, for a minimum separation required between lodging facilities and the closest adjacent building. This separation is for fire protection purposes but may also be dictated by force protection requirements and local fire protection policies.

B-3.2.3 Service Vehicles.

Access drives and parking areas will be designed to accommodate service vehicles. Where interior court areas are proposed between adjoining lodging structures, consider designing the main pedestrian walks to accommodate such vehicles. When doing so, these walkways must be a minimum of 8 ft. (2.4m) wide and must be constructed using reinforced concrete to accommodate medium weight vehicles. Consider treating the walkways with a patterned concrete system to minimize the negative visual impact of the wider access route. Consider materials such as concrete grass road type pavers to provide access for infrequent service vehicles.

Consider installing removable bollards as needed to restrict unauthorized vehicle access. Where possible, separate service entrances associated with mechanical rooms or mechanical enclosures from guest parking areas.

B-3.2.4 Bus Route Access.

Where possible and appropriate, consider access to public transportation systems in project design. If the Installation provides bus service, designers will consider including shelters and walks to serve guest needs. Bus shelters must be compatible with the architectural style of existing buildings and guidelines established by the Installation.

B-3.2.5 Pedestrian Access.

Consider including links to jogging/biking trails as part of the site development process. In northern tier locations, consider the use of sidewalks above steam heat tunnels to keep walkways free of ice in the winter, or consider heated or covered walks in lieu of open corridors.

B-3.2.6 Bicycle Parking.

Provide bicycle parking facilities within the lodging campus area as determined by the Installation and in accord with UFC 4-010-01. Racks will comply with base architectural guidelines. Provide all bicycle parking on concrete surfaces adjacent to sidewalks or first floor building corridors. If these areas are covered and screened from view of the general public, they must be located outside the force protection setback. Consider covered bicycle parking enclosed on a minimum of three sides in northern tier or highly corrosive environments. Consider lockable bicycle lockers, which maximize security and minimize visual clutter.

B-3.3 Site Considerations.

B-3.3.1 Finished Floor Elevation.

Establishing the ground-level finished floor elevation of LF facilities is one of the more important aspects of site planning. The finished floor elevation affects grading, cut and fill, visual impact of the facility and interior-exterior transitions. In addition, the finished floor elevation has a significant impact on the landscape architect's ability to effectively introduce plant materials into the new environment.

Leveling the site without sensitivity to other demands results in barren sites that lack visual interest. The landscape architect, architect, and civil engineer must work closely together to achieve optimal design results.

B-3.3.2 Grading.

Grade the site to achieve an orderly transition from the point where guests enter the site by vehicle or on foot to the point where they are at the first floor entrance. Site grading must consider the impacts of the parking area, the lodging facility, bus-stop shelters, sidewalks, outdoor passive use areas, mechanical equipment, and trash dumpsters. Provide smooth transitions (no steps) at building entries. For renovation projects, make every effort to eliminate stairs to the facility. Where appropriate, use grading to control the negative visual impacts that these man-made facilities have on the visual environment. See the discussion of landforms below.

Lodging facilities tend to be linear and relatively narrow in configuration and therefore lend themselves to an orientation paralleling existing contours. Where on-site storm water retention is required, the location of retention areas must be carefully thought out in terms of function as well as visual impact. Use large water retention sites for outdoor recreation areas. Refer to UFC 3-210-10 for further storm water guidance.

B-3.3.3 Landforms.

Use landforms to soften the impact of parking on the landscape and to positively enhance force protection of the lodging facility campus. Use landforms such as mounds and swales in conjunction with landscape plant materials to soften or obscure the parking areas, provide spatial articulation, or enhance drainage structures or surface water retention areas. Use landforms to add interest and diversity to the project. In particular, landforms can perform an important function around outdoor activity areas by screening undesirable views.

B-3.3.4 Storm Drainage.

Depending on the geographic location and the availability of nearby subsurface storm drains, provide underground storm drainage for each lodging campus. All site water must either be intercepted in drop inlet structures or be designed to drop directly into a subsurface system. If subsurface storm drains are not available at the proposed site, include as part of the lodging facility project. As a minimum, divert surface water to an underground system to a point where it is discharged into above ground storm drains. Project funds will provide for appropriate surface water retention and erosion prevention, and will provide for drop inlets as necessary to intercept surface runoff and prevent walkways from being flooded.

B-3.3.5 Utility Corridors.

The site planner will develop underground utility corridors (easements) in coordination with the base community planner, electrical, mechanical, communication and civil engineers. Design corridors to accommodate future expansion. Place utility corridors no closer than one and one-half times the crown width of nearby mature trees or 35 ft. (10.7m), whichever is greater. Locate utility corridors to allow for future street-tree plantings. Consider using pipe tunnels and trenches.

B-3.4 Site Amenities.

B-3.4.1 Site Lighting.

Site lighting is an integral part of any lodging project. Provide lighting to ensure occupants have a means of safely moving between outdoor spaces. All signage and lighting must be in compliance with the Installation's standards. The selection of materials and locations must be a joint decision between the landscape architect and the electrical engineer. Energy-efficient lamps such as high-pressure sodium with color correction ensuring optimum visual acuity are recommended for energy-conscious site lighting. Consider life-cycle costs of lamp replacement, though, when specifying fixture and lamp types.

Provide adequate site lighting at any point where there is a change in grade requiring steps, near accessible parking areas, under stairwells, and near main entrances to buildings. A lighted sign may be appropriate for night visitors. Use the recommendations of the referenced documents in Chapter 3, Electrical Design, to establish illumination levels. Design exterior lighting such that zero direct-beam illumination leaves the building site. Consider motion detection and photosensitive

sensors to achieve energy efficient lighting design. Additionally, consider a solar collection system if the geographical location of the lodging facility can support the required solar levels required.

B-3.4.2 Outdoor Areas.

Include outdoor passive and/or active use areas in all lodging campus plans. These features will include project-funded amenities such as walks, site lighting, landscaping, pavilions, and fencing (only if used to screen equipment or dumpsters enclosures). Where appropriate, design pavilions to become an integral part of the site. The pavilions must complement the architectural style and materials of the lodging. Consider additional amenities such as barbecue grills, tables, and benches.

B-3.4.3 Sustainability.

Incorporate sustainable design concepts into the lodging facility campus. Consider recycling centers and containers and other refuse issues when developing site design and landscaping. Coordinate locations of recycling and refuse containers with site furnishings and landscape to complement the campus and building design. Emphasize ease of use and service access to these containers. Army should comply with the USACE Army LEED Implementation Guide.

B-3.5 Landscape Architecture.

B-3.5.1 Landscape Site Design.

Perform a site analysis that includes visual elements, hydrology, security, climatic conditions, topography, maintenance, existing vegetation, spatial and program analysis, soil quality, and circulation patterns. Consider these landscape design techniques and principles:

- Enframement. Use landscape elements to focus attention on important features by manipulating and placing tree masses and screening undesirable features.

- Visual Separation. Separate multiple buildings into framed units and arrange shrubs and small trees around a building to soften structural lines.

- Spatial Articulation. Use plant materials to create outdoor enclosed spaces, to separate spaces one from another, and to direct people through outdoor spaces by visually defining and reinforcing patterns of movement.

- Visual Screening or Enhancement. Use landscape elements to screen unattractive views of objects such as trash dumpster areas, pad mounted electrical transformers, parking areas, and mechanical utilities.

- Wind Control. Use landscape elements to control, slow, guide, deflect, or filter the prevailing winds.

- Sun Control. Use landscape elements around buildings, walkways, and parking areas to intercept direct and reflected radiation from buildings and parking.

B-3.5.2 Landscape Irrigation.

Landscape with indigenous materials and plants to minimize irrigation needs. Consider irrigation systems for arid and semi-arid climatic regions. Use bubbler or drip irrigation systems adjacent to building facades to minimize impact of over spray. Provide all irrigation systems with solid-state automatic multi-station controllers, state-of-the-art control valves, and backflow preventers in accordance with building codes. Provide separate metering for the irrigation system.

In cold climates, locate backflow preventers in the mechanical room. Where freezing is not a problem, locate backflow preventers within screened mechanical enclosures. Include adjusting turf spray coverage, duration of watering cycles, repairing leaks, and general maintenance to ensure proper functioning during the maintenance period for all irrigation systems. Water conservation is a high-priority factor in development of the irrigation design. Take advantage of non-potable water if possible.

B-4 BUILDING DESIGN.

Building design for LFs shall address needs for comfort while incorporating functional building systems. Comprehensive interior design is a critical component, ensuring appropriate finish, material, and furnishing selections. The goal is to provide a cohesive lodging campus reflecting a quality appearance, appropriately sited within the existing community, fulfilling functional and operational requirements, and addressing guest's needs.

B-4.1 Mass and Scale.

Large lodging facilities often have a greater mass than many buildings on an Installation. Modulate the form and facade of these buildings with setbacks, repetitive details, and less dominant colors to soften their physical appearance and blend them in terms of form, proportion, and perceived size. Combine size, shape, proportion, repetition, and placement of design features such as fenestrations, roofs, and columns, etc., to project the architectural character and mass of a building. When planning the project, consider the possibility of future renovations or additions to minimize extensive changes.

Lodging facilities must provide a commercial hospitality environment with an architectural scale that imparts a clear sense of relative comfort, ease, and satisfaction. Architectural scale is defined as the comparative relationship of a structure or space to the human form to possess a human scale. Use relative proportions, height, form and volume of the building or space and its formal relationship to other buildings or spaces to achieve this sense of scale.

B-4.2 Architectural Compatibility.

Despite its massive size, a lodging facility's architectural character must be in context with its surroundings. Architectural character is typically defined in the architectural compatibility standards available at most Installations.

B-4.3 Exterior Finish Materials.

Select reliable, conventional building systems for lodging facilities, and use building materials and finishes that are durable and easy to maintain. Select architectural systems based on their aesthetics, simplicity, economic characteristics, and compliance with Installation architectural guidelines. Consider the benefits and limitations of brick, split face concrete block, and custom pre-finished tilt-up wall construction; they have been used successfully as primary exterior wall finishes. If allowed within Installation standards, brick or split-face block are the preferred exterior finishes. Consider the recycled content requirements for affirmative procurement of products included in the Environmental Protection Agency list of guideline items such as insulation, cement and concrete, latex paint, patio blocks, and structural fiberboard.

B-5 INTERIOR DESIGN.

The interior design of LFs encompasses functional area requirements, relationships, and interior materials and finishes. Several basic lodging functions must be addressed during the design phase of any lodging project. Designers must fully understand the relationships between these interactive functions and take a holistic approach to creating a fully integrated facility:

- Residential. Guest rooms are residential. Activities include sleeping, resting and relaxation (television viewing, reading, etc), personal hygiene and grooming, personal cooking (microwave), and personal study.

- Guest Support. Guest support activities include reception, vending, laundry, retail sales, administration, guest business activities, secure luggage storage, small-scale food and beverage, and meeting/conference activities.

- Services. Service activities allow the facilities to operate efficiently and include back-of-house and guest support services. Back-of-house activities include utility services, maintenance, staff functions, housekeeping, bulk storage, linen storage, supply storage, delivery and refuse removal.

The interior design and architectural design of the facility must be in context with characteristics of the built environment of the local region. The interior design also has a direct impact on the quality of life for the guests.

B-5.1 Interior Design Services.

Interior design shall comply with the Service-specific branding concepts that provide the finish and color requirements for each space. The agencies noted in Chapter 1, Contacts, shall provide the latest branding concept standards. See UFC 3-120-10 for further information on interior package requirements.

A budget is established for all FF&E. FF&E is specified to be durable, functional and aesthetically pleasing with cost and maintenance factors high in consideration. Interior designers must be diligent in staying within the budgeted amount for the entire furnishings package. Interior designers should refrain from one-of-a-kind or custom-made furnishings and lighting. In some instances, custom-sized case goods are required due to architectural constraints affecting the room layout; no special approval is required in these cases.

B-5.2 Color and Materials Selection.

Select materials to be long-lasting and durable to ease maintenance. Finishes and color scheme should provide a warm, inviting facility for guests.

B-5.3 Interior Finishes.

When selecting interior finishes, consider the recycled content requirements for affirmative procurement of products included in Environmental Protection Agency list of guideline items. Federal agencies must purchase products made with recycled materials unless these products do not meet technical requirements, are more expensive than comparable virgin material products, are not available competitively from two or more sources, or are not available in a timely manner. The items in this list related to interior design include carpet and cushion, latex paint, floor tiles, and shower and restroom dividers. This list changes as the Environmental Protection Agency adds new items every other year. The complete list of guideline items and their recycled content requirements is found on the Environmental Protection Agency website. Additionally, designers are encouraged to work with product manufacturers for other available products.

B-5.3.1 Carpet.

Consider new products with additional wear-ability and maintenance abilities, and consider recycled/recyclable goods.

B-5.3.2 Walls.

The use of natural materials such as stone on the interior can provide a durable finish and provide warmth and texture to the space and will be considered as part of the entrance/lobby area design. If budget allows, consider the use of a textured acrylic finish in common areas and guest rooms, providing a durable coating, rich in texture and easy to maintain.

B-5.3.3 Ceilings.

Lay-in acoustical tile ceiling systems with exposed suspended grid systems will be specified for use in administrative areas, business centers, and conference areas only, as they convey a nonresidential quality and are easily damaged. Avoid heavily textured acoustical treatments, including a sprayed popcorn ceiling application, which is difficult to patch.

Coordinate ceiling treatment with lighting selections. Consider varying ceiling heights and combination task and ambient lighting packages, especially in corridors and large areas, such as lobbies and conference rooms, to create interest. Emphasize natural light as much as possible. Consider the use of painted wood crown molding throughout primary guest support areas and in suites.

B-5.4 Furniture Considerations.

Coordinate with the Comprehensive Interior Design package during the design process. All case goods and hardware will be coordinated with the Structural Interior Design package for the project to ensure matching woods, stains, and finishes as best possible. Selection of materials and finishes for the main lobby area will accommodate heavy use.

B-5.5 Signage, Artwork and Accessories.

B-5.5.1 Public Area Artwork.

Provide artwork for all public areas. Coordinate with the installation and the organizations identified in Chapter 1, Contacts. Graphics presentation and content must be well designed, coordinated with the architecture and interior design packages, and compatible with the local geographical culture. All artwork shall be hung with security hangers. Silk plants are authorized for common areas.

B-5.5.2 Accessiblity in Signage.

Interior signage will be in accordance with the installation sign standards, accessibility requirements defined in Chapter 3, Accessibility, and UFC 3-120-01. All interior signage will be funded as part of the LF project. Provide clearly visible unit room names and/or numbers for all guest support areas including main entrance signage and direction signage, service areas, and individual guest rooms and suites. Coordinate directional signage and individual guest room numbering schemes with the local lodging manager and base communications. Consider odd numbers on one side of the hallway and even numbers on the opposite side.

B-5.5.3 Fixture Color and Finish Requirements.

With the exception of emergency pull boxes, all speakers, electrical panel covers and access panel covers exposed to interior rooms, thermostat controls, fire extinguisher cabinets, hose boxes, electrical boxes, plumbing chase covers, etc. will have a factory finish to match the color of surrounding walls or ceiling as specified in the Structural Interior Design package. Standard factory finish colors may not be acceptable.

B-5.6 Equipment Considerations.

- Coordinate the use and location of recycling centers throughout the common areas to complement the interior design while supporting sustainability guidance.

- All appliance colors should be coordinated with the FF&E. The construction contractor or design/build contractor will submit cut/datasheets of proposed equivalents/substitutions appliances for review/approval.

- Purchase appliances meeting Energy Star program standards and specifications as included in this guide. Qualifying products are listed on the Energy Star website.

B-6 BUILDING SYSTEMS.

B-6.1 Energy Performance.

Sustainable energy efficient performance in lodging facilities cannot be achieved solely by individual building systems but must be supplemented by other design factors. Comply with UFC 3-400-01. Design factors such as mechanical systems and management controls selection, thermal insulation characteristics, building orientation, solar shading, landscape, electrical system design, occupancy sensor devices, and appliance selection will be considered.

There are many other factors designers must consider, but they will keep in mind the importance of life cycle cost analysis for lodging facilities. The military Services keep their facilities for a longer period of time than most buildings in the private sector. Therefore, considerable attention will be given to energy-efficient design in the initial planning process. Efficient energy management policies require consideration of whole building design that relies on renewable energy sources.

B-6.2 Structural.

B-6.2.1 Structural Selection.

Select an economical structural system based on force protection requirements, facility size, projected load requirements, subsoil conditions, local availability of materials and labor, feasibility of prefabrication, local construction practices, and resistance to fire, wind, snow, seismic, geologic, and permafrost conditions. Decisions concerning the structural system have substantial impact on construction costs. Coordinate column spacing and layout with the floor plan to ensure column placement within or in alignment with walls. Minimize columns awkwardly placed within guest rooms or living areas, and limit placement to larger public spaces.

B-6.2.2 Structural Best Value.

Analyze the proposed structural system to determine if it is the best value method to realize the architectural design intent. Larger projects such as a new LF campus design or fast track design-build projects will consider new alternative construction methods and materials. Based on the required expertise needed to apply new construction methods, these systems are not recommended for smaller lodging projects.

B-6.2.3 Life Cycle Considerations.

Roof systems and supporting structure will consider life cycle costs as well as long-term durability and ease of maintenance. Concrete tile roofing systems and metal roofing systems are recommended for typical lodging construction.

B-6.3 Mechanical System Selection.

Use of a central plant will be considered for LF campuses. A central plant with heating and cooling equipment reduces maintenance and capitalizes on the higher efficiency of larger capacity commercial equipment. Ground-mounted and through-the-wall AC systems may also be considered, as appropriate.

Consider the use of renewable energy technologies as part of the selection of the HVAC system or as a supplemental energy source. Reference UFC 3-400-01 for further guidance. The use of ground source heat pumps is encouraged if economically feasible. Benefits include energy conservation and reduced maintenance. Energy Management Control Systems (EMCS) are effective energy savings systems and highly encouraged.

B-6.4 Plumbing.

Mechanical engineers, architects and structural engineers must work together to carefully plan the size and location of plumbing chases with minimal impact on usable living space. Consider collocating plumbing chases with exhaust risers serving each guest room.

B-6.5 Electrical/Communications.

The electrical design of a LF project will be based on maximum guest room hotel occupancy. Provide surge protection on service entrances, distribution panels, and sensitive load circuits. Mass Notification system speakers will be 4 in. (100mm) diameter, recessed, and factory finished to match color of wall or ceiling as specified in the Structural Interior Design package.

The standards referenced in this UFC apply to the planning, design, and construction phase of new LF construction and renovation to existing facilities and systems. These standards will also serve as a checklist for reviewing drawings and specifications for electrical design of LF projects. Floor plans must show the location of all electrical equipment, items, devices, controls, and loads. Construction drawings must include one line for all electrical equipment (transformers, switching gear, panels, loads, etc) including schedules for all panels, circuits, and loads. Consideration to daily operation and maintenance will be emphasized. This list will not be considered complete or all-inclusive, but rather a starting place. Improved concepts and additions will be added as well as “lessons learned.” Cross-exchange of new, improved, more efficient data is encouraged to increase the electrical group knowledge and processes as well as to further minimize life-cycle costs for lodging facilities. Ensure that 110v, 60hz duplex outlets are provided in rooms in overseas locations, in addition to any differing local standard (i.e., such as the 220/230v, 50hz European standard).

B-6.5.1 Lighting.

Lodging facilities have historically suffered from poor lighting levels, thus designers must provide a much higher quality light source, light level and fixture selection to enhance new LF spaces and their use. The designer must be cognizant of lighting for both day and night situations and will emphasize the use of natural light in combination with lamps to provide a comfortable lighting level. Consider the use of a certified lighting consultant, and provide the highest quality illumination within budget and life cycle cost limitations.

Coordinate lighting selections with ceiling treatments and consider combinations of recessed lighting, light coves, indirect lighting and soffit lighting as alternatives. Coordinate ductwork and lighting locations to use soffit areas as possible. Provide blocking in walls throughout for all wall- mounted accessories including wall mounted lighting fixtures. Limit the types of lamps necessary to simplify inventory. LED lamps and compact fluorescent lighting are good alternatives over traditional lighting systems based on long term energy efficiencies, improved luminance, and long lamp life spans. Specify interior lighting that meets Energy Star program standards. Qualifying products are listed on the Energy Star website. Consider solar-powered exterior luminaries when they meet lighting requirements and are cost effective.

B-6.6 Corrosion Protection.

Conform with NACE International standards for corrosion control on all LF projects. This includes material selection—non-metal or no dissimilar metals, cathodic protection for all underground metal systems, protective coatings for above ground structures and underground metal, and industrial water treatment. Include corrosion protection for electrical components in humid/salt air environments. Consider nitrogen purge or refrigeration type dehumidification protection systems depending on size and capacity.

APPENDIX C SPACE CRITERIA

C-1 INTRODUCTION.

C-2 Space Criteria Chart provides the space criteria standards for all the support spaces. Space standards vary according to the number of guest rooms and suites, the number of floors, whether the facility is central or satellite, and optional programs and spaces. Some spaces must be custom programmed for each facility considering specific site and operational factors. The final space program shall be carefully coordinated with and approved by the agencies identified in Chapter 1, Contacts. To help illustrate the potential combinations of spaces and how they will generate a complete space program, three examples are included in C-2:

- Sample A describes an Army central facility that has 400 rooms and four floors in a 400-room program on a training Installation with 10% suites.

- Sample B describes a Navy central facility that has 200 rooms and four floors in a 200-room program with 5% suites.

- Sample C describes an Air Force central facility that has 350 rooms and four floors in a 350-room program with 5% suites.

C-2 SPACE CRITERIA CHART.

Functional Program Area		Base Area[1]		Space Standard (planning factor)	Notes/explanation	Sample A			Sample B			Sample C		
		ft.^{2}	m^2			Option/Quan	ft.^{2}	m^2	Option/Quan	ft.^{2}	m^2	Option/Quan	ft.^{2}	m^2
Guest Services	Covered Entry	550	51.1	Per Central Facility	Count 50% of actual roof area	Required	275	0.0	Required	275	25.5	Required	275	0.0
	Entrance Vestibule	100	9.3	Per Facility	Standard size	Required	100	9.3	Required	100	9.3	Required	100	9.3
	Central Lobby	4	0.4	Per Central Facility guest room (gst rm)	Includes lobby circulation and seating areas	Required	1600	148.6	Required	800	74.3	Required	1400	130.1
	Satellite Lobby	260	24.2	100sf + 1sf per Satellite gst rm	Reduced circulation and seating	N/A	N/A		N/A			N/A		
	Reception	150	13.9	150sf <100 Program gst rm + 75sf per ea addl 100 gst rms up to 375sf max	75sf per staff, minimum two staff. Count all program guest rooms	Required	375	34.8	Required	225	20.9	Required	338	31.4
	Concierge	45	4.2	Per optional Central Facility space	Concierge station in lobby	No			No			No		
	Bell Cart Station	20	1.9	20sf <100 Facility gst rm + 10sf per ea addl 50 gst rms	10sf per cart	Required	80	7.4	Required	40	3.7	Required	70	6.5
	Coffee Bar	25	2.3	Per optional Central Facility space	Optional self-service coffee	No			No			No		
	Food Service: Prep and Storage	150-240	13.9-22.3	Per optional Central Facility space	To be custom programmed with a minimum of 150sf to max of 240sf	Yes	150	13.9	No			No		
	Food Service: Service	90-120	8.4-11.1	Per optional Central Facility space	To be custom programmed with a minimum of 90sf to max of 120sf	Yes	100	9.3	No			No		
	Food Service: Dining	150	13.9	Optional space at 150sf <100 Central Facility gst rm + 115sf ea addl 50 gst rm up to 600sf max	All three Food Service spaces must be programmed together	Yes	600	55.7	No			No		
	Retail Food Service	TBD	TBD	Variable optional Central Facility space based on retail provider	Coordinate the space program with the retail food service vendor	No			No			Yes	650	60.4
	Retail Sales	TBD	TBD	Variable optional Central Facility space based on retail provider	Coordinate the space program with the retail vendor	No			No			Yes	80	7.4
	Luggage Storage	75	7.0	75sf <100 Program gst rm + .25sf per ea addl gst rm to 150sf max	Count all program guest rooms	Required	150	13.9	Required	100	9.3	Required	138	12.8
	ATM	10	0.9	Per optional Central Facility space	Optional one ATM machine	No			Yes	10	0.9	Yes	10	0.9
	Registration Machines	20	1.9	Per optional Facility space	Optional two to three kiosks in any facility	Yes	20	1.9	No			Yes	20	1.9
	Public Toilets	100	9.3	Minimum for Central Facility male/ female toilets + 25sf per addl fixture as determined by code	Use applicable code for specific facility to determine final fixture count	Required	400	37.2	Required	250	23.2	Required	400	37.2
	Unisex Toilet	50	4.6	Unisex toilet for satellite facility	Satellite facilities only	N/A			N/A			N/A		
	DSN Phones	10	0.9	Per optional Facility Space	Optional DSN phone for guest use	No			No			Yes	10	0.9
	Fitness Room	300	27.9	Optional space at 300sf <100 Central Facility gst rms +50sf per ea addl 200 gst rm. 600sf max	Calculated at 50sf per cardio machine	Yes	375	34.8	Yes	350	32.5	Yes	363	33.7
	Staff Conference Room	440	40.9	Per optional Central Facility space	Standardized room accommodates 20 people	Yes	440	40.9	Yes	440	40.9	Yes	440	40.9
	Business Center	75	7.0	Optional space at 75sf <100 Central Facility gst rms +25sf per ea addl 100 gst rm. 300sf max.	75sf for two workstations and circulation with 25sf for each addl workstation	No			Yes	100	9.3	Yes	138	12.8
	Study Room	250	23.2	Per optional Facility space. One room per 75 gst rms or one rm per floor, whichever is less.	Typically provide one per floor or fewer, depending on local demand	Yes	1000	92.9	No			No		

FIGURE C-1. SPACE CRITERIA

Functional Program Area		Base Area[1]		Space Standard (planning factor)	Notes/explanation	Sample A			Sample B			Sample C

FOREWORD

Facilities Criteria (FC) provide functional requirements (i.e., defined by users and operational needs of a particular facility type) for specific DoD Component(s), and are intended for use with unified technical requirements published in DoD Unified Facilities Criteria (UFC). FC are applicable only to the DoD Component(s) indicated in the title, and do not represent unified DoD requirements. Differences in functional requirements between DoD Components may exist due to differences in policies and operational needs.

All construction outside of the United States is also governed by Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA), and in some instances, Bilateral Infrastructure Agreements (BIA.) Therefore, the acquisition team must ensure compliance with the most stringent of the FC, the SOFA, the HNFA, and the BIA, as applicable.

Because FC documents are coordinated with unified DoD technical requirements, they form an element of the DoD UFC system applicable to specific facility types. The UFC system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and applicable to the Military Departments, Defense Agencies, and the DoD Field Activities. The UFC System also includes technical requirements and functional requirements for specific facility types, both published as UFC documents and FC documents.

FC are living documents and will be periodically reviewed, updated, and made available to users as part of the Services' responsibility for providing criteria for military construction. HQ U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering Command (NAVFAC), and the Air Force Civil Engineer Center (AFCEC) are responsible for administration of the UFC system. Defense agencies should contact the preparing service for document interpretation and improvements. Technical content is the responsibility of the cognizant DoD working group. Recommended changes with supporting rationale should be sent to the respective service proponent office by the following electronic form: Criteria Change Requirements. The form is also accessible from the Internet site listed below.

FC are effective upon issuance and are distributed only in electronic media from the following source: Whole Building Design Guide web site http://dod.wbdg.org/.

Refer to UFC 1-200-01, *General Building Requirements*, for implementation of new issuances on projects.

JOE SCIABICA, SES
Director
Air Force Civil Engineer Center

FACILITIES CRITERIA (FC)
NEW SUMMARY SHEET

Document: FC 4-721-02F, *Air Force Level I Confinement Facility*

Superseding: None

Description: This FC provides requirements for evaluating, planning, programming, and designing Level I confinement facilities, separate from the Security Forces Operations Center. The information in this FC applies to the design of all new construction projects, to include additions, alterations, and renovation projects in the continental United States (CONUS) and outside the continental United States (OCONUS). It also applies to the procurement of design-build services for the above-noted projects. Alteration and renovation projects should update existing facilities to meet the guidance and criteria within budgetary constraints.

Reasons for Document: This FC is the initial release to establish requirements for a Level 1 confinement facility. It defines the criteria for determining appropriately sized, flexible, cost-optimized, durable, quality-designed facilities on a life cycle basis to support the mission. The plans presented in this FC are concepts only and are primarily intended to communicate functional user and adjacency requirements. A thorough compliance check of all other applicable criteria is required.

Impact: This FC will facilitate and standardize the design of Level 1 confinement facilities throughout the Air Force. It will provide more complete and consistent project requirements and will expedite the programming and design of facilities and reduce initial design cost.

Unification Issues: None

CHAPTER 1 INTRODUCTION

1-1 GENERAL INFORMATION.

1-1.1 Purpose

This standard facility prototype design was developed to assist Air Force programmers in preparing and validating DD Form 1391 requirements and to assist architect-engineer (A-E) design professionals with approved project-specific design requirements. It is a source of basic programming and functional information for Level 1 confinement facilities. This standard is consistent with the Air Force Corporate Facilities Standards (AFCFS), Unified Facilities Criteria (UFC), and existing design guides. This standard, in conjunction with the AFCFS, defines Air Force expectations for project programming and A-E design decisions.

1-1.2 Objective

The standard facility prototype design program defines consistent facility requirements across the Air Force enterprise to expedite delivery of a facility. This FC was designed in compliance with AFMAN 32-1084. The objective is to deliver right-sized, flexible, cost-optimized, durable, quality-designed facilities on a life cycle basis to support the Air Force mission.

1-2 GENERAL BUILDING REQUIREMENTS.

Comply with UFC 1-200-01, which provides applicability of model building codes and government-unique criteria for typical design disciplines and building systems, as well as for accessibility, antiterrorism, security, high performance and sustainability requirements (comprehensive requirements are detailed in UFC 1-200-02), and safety. Use this FC in addition to UFC 1-200-01 and the UFCs and government criteria referenced therein.

1-3 REFERENCES.

Appendix A contains a list of related documents and references to use with this FC. In general, use the latest available issuance of the reference.

1-4 INSTRUCTIONS.

1-4.1 Method

This standard facility prototype was developed by determining personnel counts, allowable room sizes, adjacency diagrams between functional spaces, and overall facility space requirements. The standard facility prototype establishes Air Force criteria for the facility type. Use these criteria in conjunction with Air Force ETLs, departmental publications, and UFCs when programming and designing this facility type. Supplement this FC with thorough reviews by individual program managers and operations staff.

1-4.2 Standard Facility Prototype Tools.

This standard facility prototype consists of three parts to be used by programmers and A-Es:

- Facilities criteria standard prototype (this FC document)
- Interactive programming sheet
- Facility Building Information Modeling (BIM) drawings

1-4.3 Facilities/Design Criteria.

This FC consists of three primary components:

- Notional site
- Composite/standard floor plans and facility adjacency diagrams
- Modules with associated room data sheets

1-4.3.1 Notional Site.

The notional site plan diagram presents key site development criteria and is not a site-specific solution. The information represents the land requirements to construct this facility and includes associated antiterrorism (AT) standoff distances and parking. Utilization of existing or shared parking is allowable and may reduce the total acreage required for the facility. Adapt the requirements to the specific site and location and comply with the applicable Installation Development Plan (IDP) and Area Development Plan (ADP) for facility siting. Comply with UFC 3-600-01 regarding minimum separation from other structures.

1-4.3.2 Composite Floor Plans.

The composite floor plans are conceptual solutions that illustrate functional user and adjacency requirements. Plan variations may be rotated, flipped, or reversed to fit the actual site. A thorough compliance check of all other applicable criteria is required even when using the conceptual solutions provided in this FC.

1-4.3.3 Modules.

Spaces and rooms that are integrally related with a specific functional connection or operational flow are grouped into a module. Modules and the associated room data sheets identify specific criteria and additional detail for each functional area of the facility as outlined in the space program sheets in Appendix B. Information is provided in a standard presentation and data sheet format and the required space adjacencies and modules are illustrated in figures.

The resulting shape of the facility assembled from the facility prototype modules must provide construction efficiencies obtained from building proportions and overall configuration. The building footprint shall be organized and well composed. The building

design must comply with the installation facility standards (architectural compatibility plan) and the AFCFS. Modules shall not be deconstructed or altered except as indicated in paragraph 1-4.3.4.

1-4.3.4 Module Flexibility/Adjustments.

Utilization of the modules provided is highly recommended to maintain functional relationships, adjacencies, and allowed program areas. Modules contain fixed attributes that are essential to functional requirements. Modules may be rotated, flipped, and reversed to accommodate an overall composition or site issue. When the modules cannot be arranged to produce a constructible floor plan due to site constraints, their proportions may be adjusted to create a constructible plan. Manipulating the module shape must not result in an overall increase in square feet and/or reduce the functionality of any module or the required adjacencies in the composite plan.

Some modules are linked to space requirements that increase or decrease in size based on the personnel count and equipment for a particular mission. In these cases, increase or decrease the size of the module to match the revised scope calculation. This may sometimes require minor adjustments in other adjacent modules so they properly fit together to create a constructible facility floor plan. Spaces must comply with any critical dimensions indicated on module plans. Manipulate as few modules as possible to create a constructible facility. The resulting composite plan must respect the established module’s adjacencies and must not exceed the authorized project scope.

1-4.3.5 Room Data Sheets.

Specific requirements for each room, space, or area are provided on room data sheets that are located following their respective module. Information contained on the data sheets defines the functional and physical requirements for each space within the facility type.

1-4.4 Programming Spreadsheet(s).

This tool is provided in two formats in Appendix B. A PDF programming sheet is provided as a reference and reflects the baseline standard facility program. The interactive programming sheet provides a tool for planners and programmers. It allows the input of authorized personnel positions and special purpose spaces. Updated inputs are automatically calculated and provide new required square footage for each space and the overall facility size. A link is provided in Appendix B to provide access to the interactive tool.

1-4.5 Facility Drawings – BIM.

The facility drawings component of the facility prototype tools includes both a PDF version and a Revit version of the modules, rooms, and composite floor plan. The spaces, rooms and modules shown reflect the baseline (eight cells) standard facility program spreadsheet in Appendix B. The drawings in this FC are copies of the BIM drawings and comply with the program scope. The BIM drawings provide a starting

point for the digitization of building data and a starting point in the design and construction of a facility. BIM drawings are found at the link provided in Appendix B.

1-4.6 Additions and Alterations.

For additions and alterations to existing facilities, use the adjacencies, sizing/scope, and detailed requirements contained in the site diagrams, module drawings, and room data sheets to the maximum extent possible. The functionality and adjacency of the modules are still valid but may require some manipulation to accommodate the existing structure. Move non-structural walls to the greatest extent possible to open up space in existing facilities to make them more receptive to the placement of the modules. The planner and designer shall determine the most efficient means to balance the placement of modules within existing spaces or as a facility addition.

1-4.7 A-E Design Professionals.

The requirements set forth in this FC are the approved space programming and functional layouts in accordance with AFCFS. The Air Force Security Forces Center (AFSFC) must approve variations to functional and operational issues and deviations from core requirements.

CHAPTER 2 SITE & OVERALL ADJACENCY

2-1 GENERAL FACILITY OVERVIEW.

A Level 1 confinement facility is typically a one-story structure. The confinement cells can either be part of the Security Forces (SF) operations center or a stand-alone facility. It is operated by the Air Force and consists of confinement spaces, control room, administration area, entry/visitor spaces, and building support. The facility houses confinees 24/7 and is open to visitors only a few hours per week as administered by the base command and SF directives.

2-2 FACILITY USERS/OCCUPANTS.

Occupants of the facility primarily include pretrial and post-trial confinees (referred to as “confinees”) and the SF guard staff. It may house maximum-custody confinees for short periods while awaiting trial or post-trial transfers to another facility. Visitors of confinees have access to limited areas of the facility on a controlled basis.

2-3 SIZE DETERMINANTS.

Confinement facility size is generally driven by the intended military population. Some facilities serve multiple installations due to proximity benefits.

2-3.1 Level I Confinement Facility Size.

Level I confinement facility sizes vary from four-cell to twelve-cell facilities, in increments of four. For the purpose of this FC the following sizes were analyzed but the eight-cell facility has been selected as standard:

- Four-cell facility
- Eight-cell facility
- Twelve-cell facility

The space program for confinement facilities is developed based on the size of the assigned population and historical data from AFSFC. Facility size changes must be approved/authorized by AFSFC.

Critical to facility size is the required size of cells. They must comply with Adult Correctional Institutions (ACI) requirements as follows: total of 80 square feet of floor space per single occupancy cell, of which 25 square feet is unencumbered.

2-4 OPERATIONAL ASPECTS.

The facility will house both pre-trial and post-trial confinees. Door hinges and peens must be on the side opposite of confinee access to prevent barricading or peen removal.

2-5 NOTIONAL SITE.

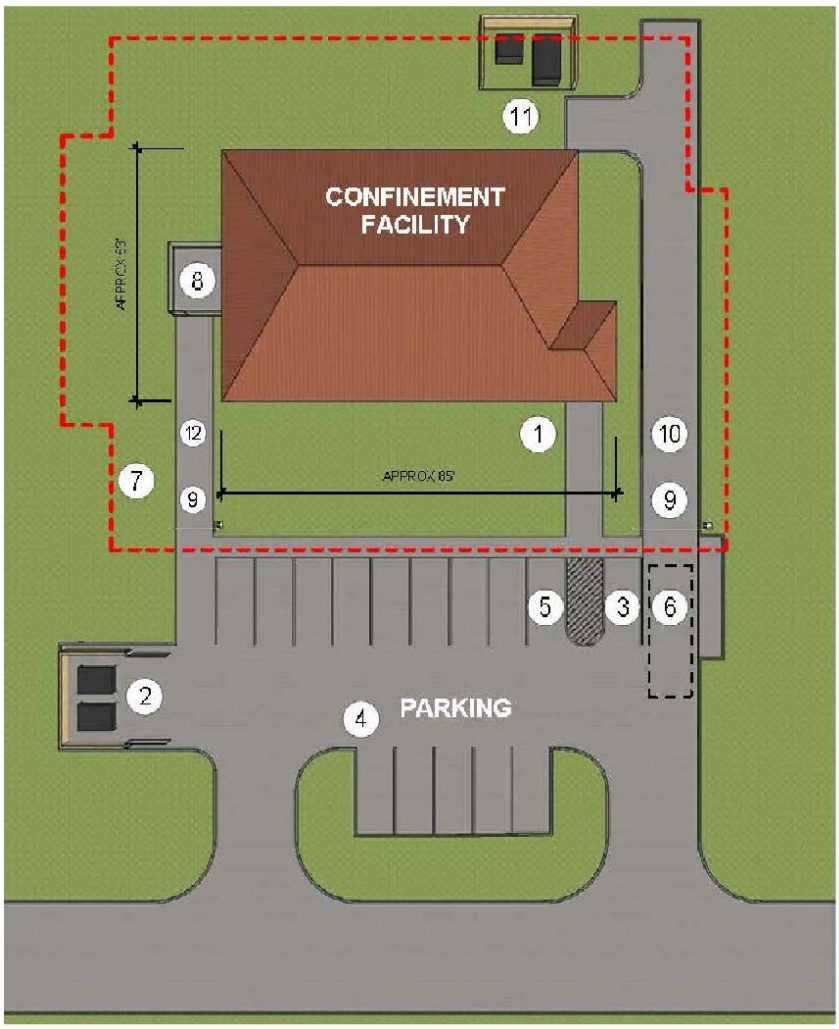
The site diagram (Figure 2-1) represents a notional layout to reflect site development requirements/criteria only—it is not an actual site design. Siting must comply with the IDP and ADP.

2-6 LOCATION DETERMINANTS (SITE SELECTION) OR SITE LOCATION AND ORIENTATION.

Several factors determine the most appropriate and cost-effective location for a confinement facility. Analyze the availability and capacity of required utilities and the mass/scale of the facility relative to adjacent structures and noise issues. Open space surrounding the facility is desirable. Locate away from schools, dormitories, housing, industrial, and retail areas. Comply with UFC 3-600-01 regarding minimum separation from other structures.

2-6.1 Access.

The confinement facility's ideal location is in the vicinity of the main SF squadron facility and with main road access. Locate the facility away from any active pedestrian or populated areas. Provide parking as close to the facility as possible while complying with AT requirements in UFC 4-010-01.



2-6.2 Parking and Access Drives.

Provide parking for both staff and visitors with access drives as indicated in the space program. Coordinate with local units if adjacent properties may share visitor parking. Comply with UFC 3-201-01. In general, provide two privately owned vehicle (POV) spaces for every three confinees.

2-6.3 Existing Facility Alteration.

Analyze the site of the existing facility and its limitations. Use permanent facilities for conversion to a confinement function. Assess existing buildings as to whether or not they can support the core and other functional areas and dimensional requirements of the program. The building must be able to accommodate durable cells and have adequate floor-to-ceiling heights.

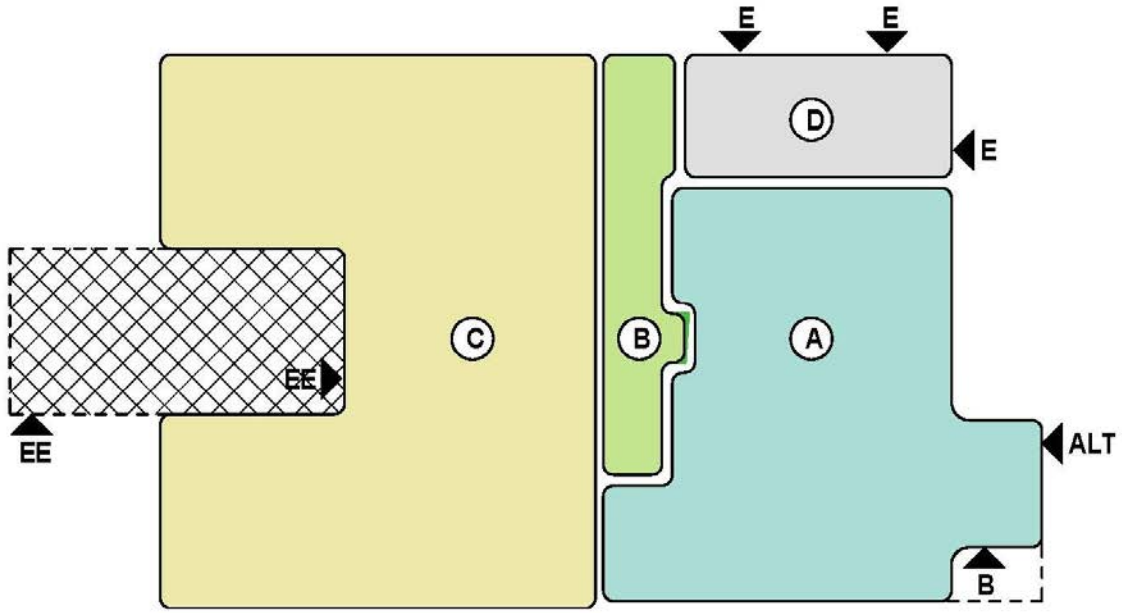
9.	ACCESS CONTROL GATE
10.	SERVICE DRIVE - MECHANICAL EQUIPMENT ACCESS
11.	SCREENED EQUIPMENT YARD
12.	WIDE SIDEWAIK FOR VEHICLE ACCESS TO EXERCISE YARD (DOUBLE-LEAF GATE AT FENCE)

2-7 COMPOSITE FACILITY ADJACENCY.



The space program for the Level 1 confinement facility is developed based upon the actual base population and the intended population of the base.

The space program developed through the base planning team generally represents the maximum space allowed. The final space program for a new confinement facility must be carefully determined by installation representatives and the appropriate service program office guided by the criteria in this FC. Additional information is found in Appendix B.

The required space adjacencies are illustrated in Figure 2-2. All program spaces are assigned a module designator. Functional spaces that must be located next to each other or share an important operational flow are grouped into one module with the intent that the module will remain intact during final design. The facility is composed of three primary functional areas: 1) secure area; 2) semi-secure area; and 3) controlled spaces/area (or administrative/visitor).

Composite plans represent conceptual solutions for Level 1 confinement project requirements. These composite facility plans convey an AFSFC-approved solution. The building shape may be adjusted in response to site requirements or unusual or specific installation issues if approved in accordance with the procedures in Chapter I. See Appendix B for conceptual facility floor plans. Three concept plans and the related BIM drawings are included in Appendix B.

Figure 3-3 Administrative Processing Data Sheet

Description/Usage		General administrative functions for two staff members. Place for redundant controls/systems from control room and override capability for electronics and video monitors.
Ceiling Height		9’-0” minimum
Windows		Exterior wired, tempered glass clerestory
Doors	**Type**	3’-0” x 7’-0” hollow metal, security-rated doors and frame
	Security/ Hardware	Access controlled; keyed lockset
	View Panels/ Kick-Plates	Kick plates
Finishes	**Walls**	Painted CMU or concrete with impact-resistant gypsum on furring
	Floor	Tile, epoxy, or sealed concrete
	Base	Tile, epoxy, or vinyl
	Ceiling	Concrete with acoustical ceiling tile (no drop ceiling)
Plumbing		Bar sink with hot and cold water
HVAC		Air conditioned and heated year round
Fire Protection		Automatic sprinkler system (see UFC 3-600-01)
Power		120V convenience outlets; quad receptacles adjacent to each workstation; dedicated outlet for printers; dedicated
Lighting		Per UFC 3-530-01
Communication	**Tele.**	One per workstation
	Data	NIPR
	CCTV	Monitoring of facility
	CATV	N/A
	Security	Door control master station
Acoustical		Minimum STC of 46
Furnishings, Equipment, and Casework		Lockable security drawer or safe; two systems workstations with chairs; two drawer type pass-through windows with integrated speaker capability; copier; under-counter refrigerator; microwave; built-in shelving for radio/flashlight charger station; coffee maker; SF counter with base and upper cabinets for clothing shakedown of confinees
Special Requirements		Lockable door to administrative storage; pass-through windows to sally port and public corridor; access control system for facility; 4’ x 4’ wall-mounted peg board for handcuffs and body cuffs

Figure 3-4 Administrative Storage Data Sheet

Description/Usage		Storage for confinees' dress uniforms and other personal belongings as well as administrative and building supplies (e.g., blankets, sheets, pillows, spare toiletries). Location for recording hardware for monitoring devices.
Ceiling Height		9'-0" minimum
Windows		N/A
Doors	**Type**	3'-0" x 7'-0" hollow metal
	Security/ Hardware	Keyed lockset
	View Panels/ Kick-Plates	Kick plates
Finishes	**Walls**	Painted CMU or concrete with gypsum board on furring
	Floor	Epoxy or sealed concrete
	Base	Epoxy or vinyl
	Ceiling	Concrete with acoustical ceiling tile (no drop ceiling)
Plumbing		N/A
HVAC		Ventilated
Fire Protection		Automatic sprinkler system (see UFC 3-600-01)
Power		120V convenience outlets
Lighting		Per UFC 3-530-01
Communication	**Tele.**	N/A
	Data	N/A
	CCTV	N/A
	CATV	N/A
	Security	N/A
Acoustical		N/A
Furnishings, Equipment, and Casework		2'-0" x 2'-0" single-tiered lockers (one per cell minimum); 24" x 36" x 72" open shelving for administration supplies (number of cells plus two)
Special Requirements		Controlled access direct from administrative processing

Figure 3-5 Public Corridor Data Sheet

Description/Usage		Provide main circulation in the administrative and visitor areas and space for processing confinees.
Ceiling Height		9’-0” minimum
Windows		N/A
Doors	**Type**	3’-0” x 7’-0” hollow metal, security-rated doors and frames; sliding detention
	Security/ Hardware	Controlled access
	View Panels/ Kick-Plates	Kick-plates; 6” x 30” security-rated view panels
Finishes	**Walls**	Painted CMU or concrete
	Floor	Tile, epoxy, or sealed concrete
	Base	Tile, epoxy, or vinyl
	Ceiling	Concrete with acoustical ceiling tile (no drop ceiling)
Plumbing		Electric water cooler
HVAC		Air conditioned and heated year round
Fire Protection		Automatic sprinkler system (see UFC 3-600-01)
Power		Convenience receptacle
Lighting		Per UFC 3-530-01
Communication	**Tele.**	Integrated with security camera
	Data	N/A
	CCTV	Dual monitored, recorded
	CATV	N/A
	Security	Video camera
Acoustical		N/A
Furnishings, Equipment, and Casework		Secure pass-through drawer window with integrated speaker capability
Special Requirements		N/A

Figure 3-6 Restroom Data Sheet

Description/Usage		Restroom facilities for staff and visitors.
Ceiling Height		9’-0”
Windows		N/A
Doors	**Type**	3’-0” x 7’-0” hollow metal
	Security/ Hardware	Keyed lockset; privacy lock
	View Panels/ Kick-Plates	Kick plates
Finishes	**Walls**	Painted CMU with gypsum board on furring and tile wainscot
	Floor	Tile, epoxy, or sealed concrete
	Base	Tile or vinyl
	Ceiling	Painted concrete with gypsum ceiling
Plumbing		Connections for water closet and counter-mounted lavatory; connection to electric water cooler in corridor; floor drain
HVAC		Ventilated
Fire Protection		Automatic sprinkler system (see UFC 3-600-01)
Power		GFI convenience duplex outlet
Lighting		Per UFC 3-530-01
Communication	**Tele.**	N/A
	Data	N/A
	CCTV	N/A
	CATV	N/A
	Security	N/A
Acoustical		N/A
Furnishings, Equipment, and Casework		Water closet, lavatory, mirror (non-glass), grab bars, toilet paper dispenser, toilet seat cover dispenser, soap dispenser, paper towel dispenser with waste receptacle
Special Requirements		Room and all accessories shall comply with ABA accessibility requirements

Figure 3-7 Sally Port Data Sheet

Description/Usage		Secure entry point for law enforcement officials to perform pat searches, confiscate property, and complete pre-booking paperwork. Serves as the controlled entry and exit point for all visitors and confinees.
Ceiling Height		9’-0” minimum
Windows		No exterior windows allowed
Doors	**Type**	3’-0” x 7’-0” hollow metal, security-rated doors and frames; interlocking
	Security/ Hardware	Controlled access
	View Panels/ Kick-Plates	Kick-plates; 6” x 30” security-rated view panels to public corridor and at exterior door
Finishes	**Walls**	Painted CMU or concrete
	Floor	Tile, epoxy, or sealed concrete
	Base	Tile, epoxy, or vinyl
	Ceiling	Concrete with acoustical ceiling tile (no drop ceiling)
Plumbing		N/A
HVAC		Air conditioned and heated year round
Fire Protection		Automatic sprinkler system (see UFC 3-600-01)
Power		Exterior convenience outlet near entry
Lighting		Per UFC 3-530-01
Communication	**Tele.**	Integrated with security camera
	Data	N/A
	CCTV	Dual monitored in administrative processing and control room, recorded
	CATV	N/A
	Security	Video camera (infrared capable) inside sally port and at exterior entrance; controlled from administrative processing
Acoustical		N/A
Furnishings, Equipment, and Casework		12” x 18” double-tiered lockers for visitor personal effects (one per cell minimum); pass-through drawer and window with speaker to administrative processing; one-way glass from administrative processing
Special Requirements		• Sally port must accommodate a stretcher • “Door call” button and intercom connected to control room and administrative processing • Exterior Knox Box mounted 90” above finish floor in inconspicuous location

Figure 3-8 Visitation/Training Room Data Sheet

Description/Usage		Room for confinees to visit with attorneys, family, and other visitors. Also serves as guard training and meeting room and worship center.
Ceiling Height		9'-0" minimum
Windows		Exterior wired, tempered glass clerestory window
Doors	**Type**	Hollow metal security-rated at waiting; sliding detention at semi-secure corridor
	Security/ Hardware	Keyed locksets
	View Panels/ Kick-Plates	Tempered wired security view panels; 6" x 30" one-way view panels for guard supervision; kick plate
Finishes	**Walls**	Painted CMU or concrete
	Floor	Tile, epoxy, or sealed concrete
	Base	Tile, epoxy, or vinyl
	Ceiling	Painted concrete with gypsum ceiling (no drop ceiling)
Plumbing		N/A
HVAC		Air conditioned and heated year round
Fire Protection		Automatic sprinkler system (see UFC 3-600-01)
Power		120V convenience outlets, tamper-proof
Lighting		Per UFC 3-530-01; surface-mounted security level (jail type)
Communication	**Tele.**	Phone, wall-mounted
	Audio	Intercom with call button to semi-secure corridor
	CCTV	N/A
	CATV	N/A
	Security	N/A
Acoustical		N/A
Furnishings, Equipment, and Casework		Built-in jail-type table and benches (two seats per cell); optional stand-alone computer and printer workstation
Special Requirements		Door to semi-secure corridor must have vision panel for guard supervision; direct access from waiting area for visitors and from semi-secure corridor for confinees; computer station must not have Internet access

Figure 3-9 Waiting Room Data Sheet

Description/Usage		Visitor waiting area prior to meeting with confinees in the visitation/training room. Outer door to corridor remains open during meetings.
Ceiling Height		9’-0”
Windows		Exterior wired, tempered glass clerestory
Doors	**Type**	3’-0” x 7’-0” hollow metal, security-rated doors and frames
	Security/ Hardware	Hold-open function on outer door
	View Panels/ Kick-Plates	Kick-plates
Finishes	**Walls**	Painted CMU or concrete with impact-resistant gypsum board on furring
	Floor	Tile, epoxy, or sealed concrete
	Base	Tile, epoxy, or vinyl
	Ceiling	Concrete with acoustical ceiling tile (no drop ceiling)
Plumbing		N/A
HVAC		Air conditioned and heated year round
Fire Protection		Automatic sprinkler system (see UFC 3-600-01)
Power		120V convenience outlets
Lighting		Per UFC 3-530-01
Communication	**Tele.**	One wall-mounted phone
	Data	N/A
	CCTV	Monitored
	CATV	N/A
	Security	Camera
Acoustical		Minimum STC rating of 46 at wall between waiting room and visitation/training room
Furnishings, Equipment, and Casework		Chairs (one per cell); side tables (one per four chairs)
Special Requirements		N/A

3-3 MODULE B: SEMI-SECURE AREAS.

Figure 3-10 Floor Plan and Axonometric

MODULE B – SEMI SECURE AREA ROOM SCHEDULE	
ROOM NAME	**AREA**
CONTROLLED CORRIDOR	**See Appendix-B Programming Worksheets**
JANITOR CLOSET	
LAUNDRY ALCOVE	

***NOTE: DAYLIGHTING TO BE DESIGNED PER UFC 1-200-02**

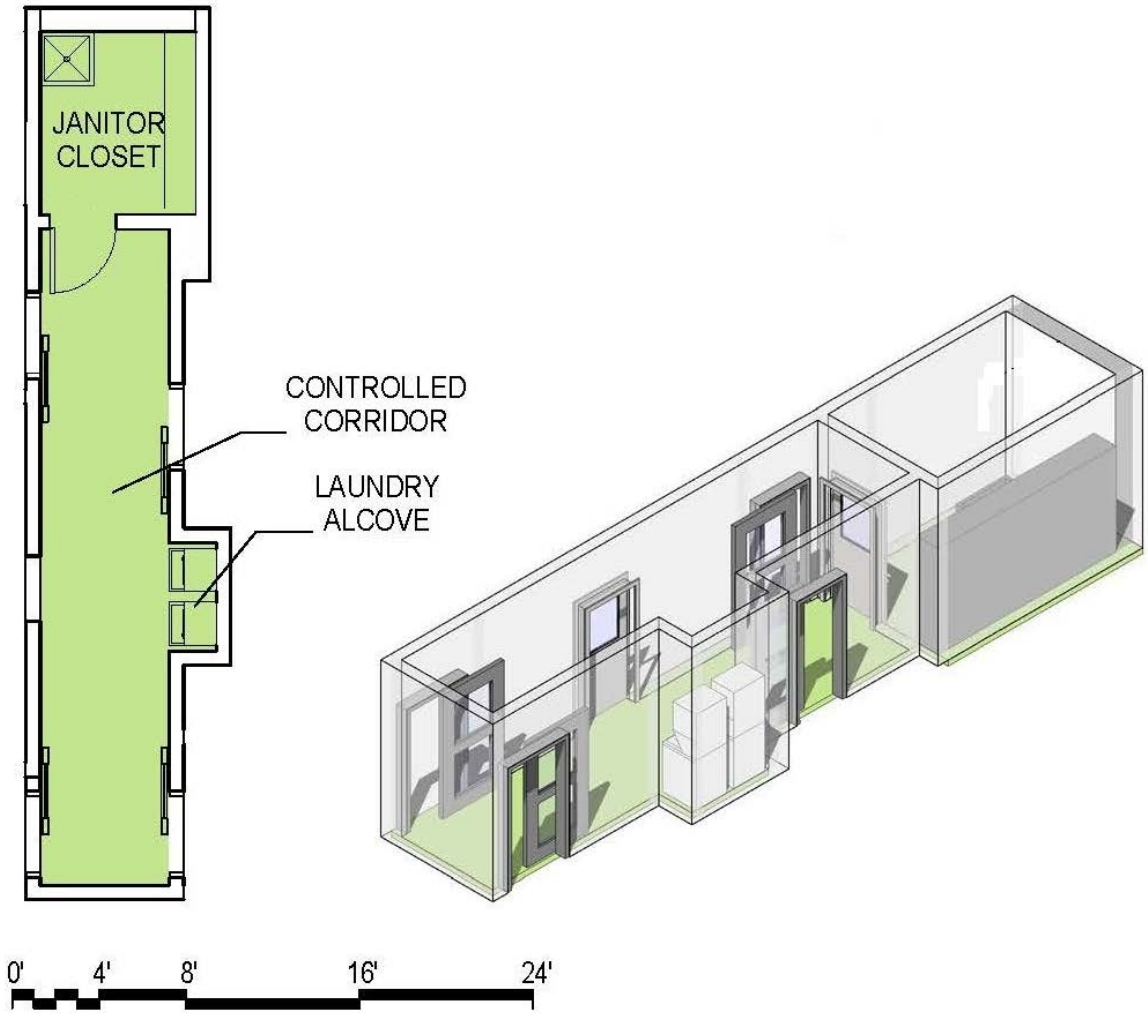

Figure 3-11 Controlled Corridor Data Sheet

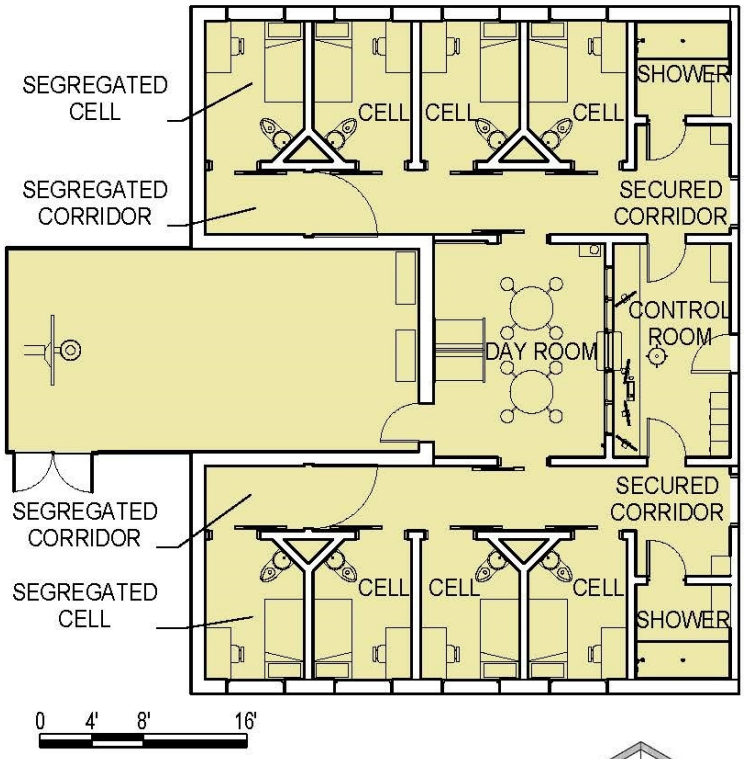
Description/Usage		Main circulation point between corridor, visitation, and secure corridor. Minimum width is 5’-0” clear.
Ceiling Height		9’-0”
Windows		N/A
Doors	**Type**	Sliding detention
	Security/ Hardware	Keyed locksets
	View Panels/ Kick-Plates	Tempered wired security view panels
Finishes	**Walls**	Painted CMU or concrete
	Floor	Epoxy
	Base	Integral epoxy cove
	Ceiling	Painted concrete
Plumbing		N/A
HVAC		Air conditioned and heated year round
Fire Protection		Tamper-resistant automatic sprinkler system (see UFC 3-600-01)
Power		120V convenience outlets; tamper-proof
Lighting		Per UFC 3-530-01; surface-mounted security level (jail type)
Communication	**Tele.**	N/A
	Audio	Intercom from visitation
	CCTV	Dual monitored at control room and administrative processing
	CATV	N/A
	Security	Camera
Acoustical		Minimum STC of 50
Furnishings, Equipment, and Casework		N/A
Special Requirements		N/A

Figure 3-12 Janitor Closet Data Sheet



Description/Usage		Miscellaneous building storage, cleaning and laundry supplies. Confinee has access under guard supervision.
Ceiling Height		9'-0" minimum
Windows		N/A
Doors	**Type**	Hollow metal, security rated
	Security/ Hardware	Keyed lockset; alarmed; concealed hinges
	View Panels/ Kick-Plates	Kick plates
Finishes	**Walls**	Painted CMU
	Floor	Epoxy
	Base	Integral epoxy cove
	Ceiling	Painted concrete
Plumbing		Hot and cold water connection for mop sink; floor drain
HVAC		Ventilated
Fire Protection		Tamper-resistant automatic sprinkler system (see UFC 3-600-01)
Power		One duplex outlet; tamper-proof
Lighting		Per UFC 3-530-01; surface-mounted security level (jail type)
Communication	**Tele.**	N/A
	Audio	N/A
	CCTV	N/A
	CATV	N/A
	Security	Monitored from control room and administrative processing, with motion detector in room and door alarmed
Acoustical		N/A
Furnishings, Equipment, and Casework		Mop sink; shelving with integral mop holder; shelving for supplies
Special Requirements		Door must swing out

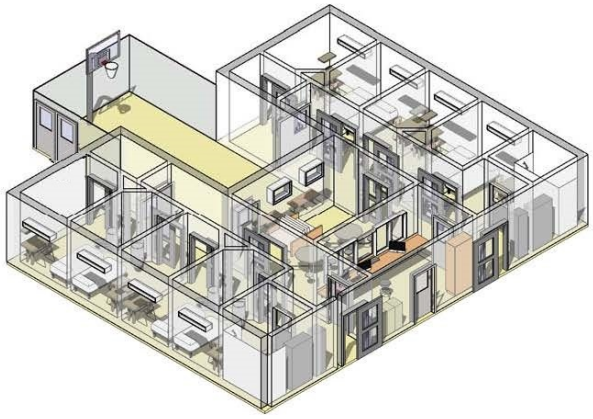


Figure 3-13 Laundry Alcove Data Sheet

Description/Usage		Laundry facilities for use by confinees under guard supervision.
Ceiling Height		9’-0” minimum
Windows		N/A
Doors	**Type**	N/A
	Security/ Hardware	N/A
	View Panels/ Kick-Plates	N/A
Finishes	**Walls**	Painted CMU or concrete
	Floor	Epoxy
	Base	Integral epoxy cove
	Ceiling	Painted concrete
Plumbing		Connection for washer
HVAC		Dryer exhaust; ventilated
Fire Protection		Tamper-resistant automatic sprinkler system (see UFC 3-600-01)
Power		Provide appropriate power for utilities; provide secure plug to prevent confinee access
Lighting		Per UFC 3-530-01; surface-mounted security level (jail type)
Communication	**Tele.**	N/A
	Audio	N/A
	CCTV	Dual monitored, recorded
	CATV	N/A
	Security	Camera (infrared-capable)
Acoustical		N/A
Furnishings, Equipment, and Casework		Washer and dryer; secure units to floor or walls and prevent confinee access to vent
Special Requirements		N/A

3-4 MODULE C: SECURE AREAS – 8 CELL.

Figure 3-14 Floor Plan and Axonometric

MODULE C – SECURE AREA	
ROOM NAME	**AREA**
CELL	**See Appendix-B Programming Worksheet**
CELL	
CELL	
CELL	
CELL	
CELL	
CONTROL ROOM	
DAY ROOM	
SECURED CORRIDOR	
SECURED CORRIDOR	
SEGREGATED CELL	
SEGREGATED CELL	
SEGREGATED CORRIDOR	
SEGREGATED CORRIDOR	
SHOWER	
SHOWER	

Figure 3-15 Cell Data Sheet

Description/Usage		Secure room for confinee.
Ceiling Height		8’-0” minimum
Windows		Exterior clerestory windows; minimum of 3 SF of glazing for natural light
Doors	**Type**	Sliding detention; hollow metal security-rated at segregated corridor, inset/flush to wall when open
	Security/ Hardware	Access controlled
	View Panels/ Kick-Plates	6” x 30” view panel
Finishes	**Walls**	Painted CMU or prefabricated steel (special color required for segregation cells)
	Floor	Epoxy
	Base	Integral epoxy cove
	Ceiling	Painted concrete or prefabricated steel
Plumbing		Connection for toilet and sink; provide pre-mixed cold and tepid water; Muffin Monster in sewer line
HVAC		Ventilation min. of 15 CFM of outside or recirculated filtered air per occupant for cells/rooms, officer stations, and dining areas; separate exhaust system for cells; reference ACA
Fire Protection		Tamper-resistant automatic sprinkler system (see UFC 3-600-01)
Power		Not allowed
Lighting		Per UFC 3-530-01; surface-mounted security level (jail type); controlled from administrative processing and control room
Communication	**Tele.**	N/A
	Audio	Call button to administrative processing and control room; alarm indicates which cell activated the switch
	CCTV	N/A
	CATV	N/A
	Security	Camera in segregated cells
Acoustical		Minimum STC of 50
Furnishings, Equipment, and Casework		Built-in jail-type bed; built-in jail-type table and chair; stainless-steel integrated toilet and sink; stainless-steel mirror; stainless-steel shelf 12” D x 24” L and 18” above desk: two break-away hooks per cell
Special Requirements		Provide built-in jail-type beds; fiberglass bed with integrated storage. Do not use metal beds. Toilet and vanity unit to be stainless-steel mirror above sink in segregated cells. Porcelain, jail-type toilet and vanity unit preferred in standard cells. No glass mirrors allowed in cells. Ensure surfaces are smooth everywhere. Reference ACA standards.

Figure 3-16 Control Room Data Sheet

Description/Usage		Direct supervision of day room and showers; serves as control center for security cameras and doors throughout facility. Unobstructed views required of day room and shower doors.
Ceiling Height		9’-0”
Windows		One-way security-rated window units to day room with drawer type pass-through window to day room
Doors	**Type**	3’-0” x 7’-0” hollow metal, security-rated
	Security/ Hardware	Keyed lockset; access/door control and annunciator panel
	View Panels/ Kick-Plates	6” x 24” vertical view panels with one-way security-rated glazing for all doors
Finishes	**Walls**	Painted CMU or concrete with impact-resistant gypsum on furring; need sound-abatement material to reduce echo effect
	Floor	Epoxy, tile, or sealed concrete
	Base	Integral epoxy cove; tile or vinyl
	Ceiling	Painted concrete with gypsum ceiling (no drop ceiling)
Plumbing		N/A
HVAC		Air conditioned and heated year round
Fire Protection		Automatic sprinkler system (see UFC 3-600-01)
Power		120V convenience outlets; dedicated 20 A quad receptacle adjacent to work area receptacle for fridge under counter
Lighting		Per UFC 3-530-01; surface-mounted security level (jail type); dimmable
Communication	**Tele.**	Connection to administrative processing
	Data	Connectivity
	CCTV	Security camera monitors
	CATV	N/A
	Security	Counter-mounted security camera monitors
Acoustical		Minimum STC rating of 50
Furnishings, Equipment, and Casework		Wall-mounted fire extinguisher; built-in counter 48” A.F.F; sound wire management features; wall-mounted lockable key box; 20” deep open cabinet with shelving for PPE and board games; 12” x 12” lockable cabinet for medical supplies; 12” x 48” double-tiered lockers for guards; under-counter refrigerator; elevated chair; computer station with 3 monitors; security camera monitors, access/door control annunciator panel
Special Requirements		• Break-away coat hook • PA to day room • Houses lighting controls for all cells

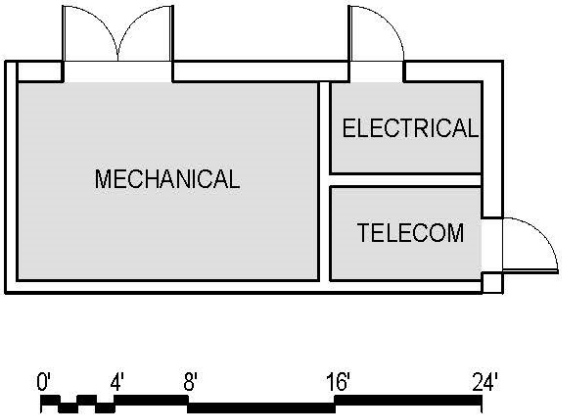
Figure 3-17 Day Room Data Sheet

Description/Usage		Recreational room for confinees.
Ceiling Height		9’-0” minimum
Windows		Exterior wired, tempered-glass clerestory window with minimum 12 SF of glazing
Doors	**Type**	Hollow metal, security-rated to exterior; sliding detention from secure corridor
	Security/ Hardware	Access/door control; electronic with manual release
	View Panels/ Kick-Plates	6” x 30” security-rated view panels in doors; unobstructed guard supervision of day room from control room via one-way security-rated window units; kick plates
Finishes	**Walls**	Painted CMU or concrete
	Floor	Epoxy or sealed concrete
	Base	Integral epoxy cove
	Ceiling	Painted concrete
Plumbing		Connection for electric water cooler
HVAC		Air conditioned and heated year round
Fire Protection		Tamper-resistant automatic sprinkler system (see UFC 3-600-01)
Power		General-purpose duplex outlets and power and cable connection to TV; all tamper-resistant
Lighting		Per UFC 3-530-01; surface-mounted security level (jail type)
Communication	**Tele.**	Wall-mounted jail-type phone
	Audio	PA from control room; call button into control room
	CCTV	Dual monitored, recorded
	CATV	Wall-mounted TV connection, flush with no protruding edges
	Security	Electric locks; cameras
Acoustical		N/A
Furnishings, Equipment, and Casework		Cardio exercise equipment (in cold climates; one treadmill in 4 cell, two treadmills in 8 or 12 cell); built-in jail-type table and attached chairs (one per cell); molded jail-type couch; wall-mounted TV with protective cage (provide space/recess, wiring/conduits and enclosure cover); wall-mounted jail-type phone; electrical water cooler
Special Requirements		N/A

Figure 3-18 Secure Corridor Data Sheet

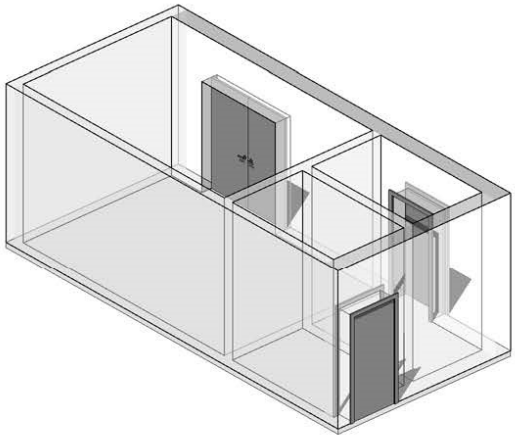
Description/Usage		Main circulation point between day room, cells, showers, and control room.
Ceiling Height		9’-0”
Windows		N/A
Doors	**Type**	Sliding detention to cells; hospital-type flush open door to near segregation cell for sight and sound control
	Security/ Hardware	Keyed locksets; kick plate on sight/sound door
	View Panels/ Kick-Plates	Tempered wired security view panels; no view panels in segregation sight and sound door
Finishes	**Walls**	Painted CMU or concrete
	Floor	Epoxy or sealed concrete
	Base	Integral epoxy cove
	Ceiling	Painted concrete
Plumbing		Access panels to plumbing chase areas from corridor; tamper-proof
HVAC		Air conditioned and heated year round
Fire Protection		Tamper-resistant automatic sprinkler system (see UFC 3-600-01)
Power		120V convenience outlets; tamper-proof
Lighting		Per UFC 3-530-01; surface-mounted security level (jail type)
Communication	**Tele.**	N/A
	Audio	N/A
	CCTV	Dual monitored, recorded
	CATV	N/A
	Security	Camera
Acoustical		Minimum STC of 50 at both walls and doors
Furnishings, Equipment, and Casework		12” x 12” x 12” single-tiered lockers in secure corridor (one per cell)
Special Requirements		Place/locate cells/cell doors to avoid direct views through view panels into day room

Figure 3-19 Shower Data Sheet



Description/Usage		Shower for confinee daily use. One male and one female per facility (in opposite secure corridors); up to a 12 cell facility. Controlled access to showers.
Ceiling Height		8’-0” minimum
Windows		N/A
Doors	**Type**	Coordinate type with AFSFC and size to meet changing regulations
	Security/ Hardware	Coordinate type with AFSFC and size to meet changing regulations
	View Panels/ Kick-Plates	Coordinate type with AFSFC and size to meet changing regulations
Finishes	**Walls**	Painted CMU; tile in shower
	Floor	Epoxy, slip-resistant floor finish
	Base	Integral epoxy cove
	Ceiling	Painted concrete
Plumbing		Provide water pre-mixed and tepid for shower use at 100–120 °F; floor drain in shower only
HVAC		Ventilated, exhaust
Fire Protection		Tamper-resistant automatic sprinkler system (see UFC 3-600-01)
Power		N/A
Lighting		Per UFC 3-530-01; surface-mounted security level (jail type), rated for wet location
Communication	**Tele.**	N/A
	Audio	Call button to control room and administrative processing
	CCTV	N/A
	CATV	N/A
	Security	Occupancy motion detector monitored from control room and administrative processing
Acoustical		N/A
Furnishings, Equipment, and Casework		Built-in bench; stainless steel mirror (no glass); two breakaway towel hooks (one for towel, other for clothes)
Special Requirements		Breakaway curtain rod, shower head, and clothes hooks

Figure 3-20 Outdoor Recreational/Exercise Yard Data Sheet



Description/Usage		Exterior secured area connected to the facility used as an exercise yard for confinees and as an emergency refugee area. Minimum size is 500 SF. Half of area is to be covered from the weather. Access directly from day room.
Ceiling Height		12'-0" minimum; nothing on the building can be lower than 12' within the covered yard area
Windows		N/A
Doors	**Type**	Gate for emergency exit; guard supervised/escorted for confinees; door from day room to recreational yard is to be opened electronically from guard room or by key for safety
	Security/ Hardware	N/A
	View Panels/ Kick-Plates	N/A
Finishes	**Walls**	Metal perforated wall minimum 12' high
	Floor	Asphalt or concrete
	Base	N/A
	Ceiling	Provide shaded covered area of at least half the total area
Plumbing		Not required
HVAC		Not required
Fire Protection		Tamper-resistant automatic sprinkler system (see UFC 3-600-01)
Power		Not required
Lighting		Per UFC 3-530-01; HID wall packs
Communication	**Tele.**	None required
	Audio	None required
	CCTV	None required
	CATV	None required
	Security	Security cameras monitored from control room
Acoustical		N/A
Furnishings, Equipment, and Casework		Optional basketball hoop; optional benches
Special Requirements		Place benches 3 to 5 feet away from walls or fences. Ensure basketball backboard is anchored and 6 to 8 feet away from walls or fences. No downspouts or vertical support allowed inside fence to prevent access to the roof. Provide locked double-leaf gate for emergency personnel or fire truck access.

3-5 MODULE D: BUILDING SUPPORT.

Figure 3-21 Floor Plan and Axonometric

MODULE D – SUPPORT AREA ROOM SCHEDULE	
ROOM NAME	**AREA**
ELECTRICAL	**See Appendix-B Programming Worksheets**
MECHANICAL	
TELECOM	

AREA OF MODULE TO BE SIZED PER CLIMATIC AND SYSTEMATIC REQUIREMENTS

Figure 3-22 Building Support Data Sheet

Description/Usage		Space for mechanical, electrical, and telecommunications systems. Three separate rooms with exterior access for civil engineering, mechanical, electrical and telecom. Possibly fire pump room where required.
Ceiling Height		9’-0” minimum
Windows		N/A
Doors	**Type**	Hollow metal 3’ x 7’ leafs
	Security/ Hardware	Keyed lock set
	View Panels/ Kick-Plates	Kick-plate
Finishes	**Walls**	Painted CMU or concrete
	Floor	Sealed concrete
	Base	Vinyl
	Ceiling	Open to structure for M&E; painted; painted gypsum board for telecom; needs a ceiling as it is conditioned
Plumbing		As needed for HVAC equipment and water heaters, etc.
HVAC		Ventilated; telecom room has dedicated HVAC unit
Fire Protection		Automatic sprinkler system
Power		Specific local UPS in comm room; outlets and service as needed for equipment; general maintenance receptacles for CE service. For telecom: two dedicated quad receptacles per rack; two dedicated duplex outlets on wall; convenience receptacles on each wall
Lighting		Per UFC 3-530-01; weather-rated/cold
Communication	**Tele.**	Main terminal
	Data	Main terminal
	CCTV	N/A
	CATV	N/A
	Security	N/A
Acoustical		Minimum STC rating of 50 at mechanical room walls
Furnishings, Equipment, and Casework		Mechanical, electrical, and telecommunication equipment
Special Requirements		Design each system per appropriate UFC. Room sizes may vary per climate and system design. Provide additional weather protection for telecom room door to prevent dust and water intrusion.

CHAPTER 4 TECHNICAL CRITERIA

4-1 GENERAL.

Comply with all applicable UFCs and government-unique criteria for typical design disciplines and building systems, as well as for accessibility, anti-terrorism, security, high-performance and sustainability requirements, security and safety. Use this FC in addition to UFC 1-200-01. This chapter provides specific criteria/requirements for the program and includes references to technical design criteria documents.

4-2 STRUCTURE.

4-2.1 Foundation.

The foundation design and type is site-specific and must be designed based on geotechnical recommendations provided by a licensed geotechnical engineer knowledgeable of the local conditions.

4-2.2 Superstructure.

Construction type must not be less than Type I-A as defined in the IBC. The preferred superstructure is CMU, fully grouted, with concrete roof. Other hardened structures may be considered based on local site requirements. Much of the roof area shall be hardened to control escape attempts.

4-3 EXTERIOR DESIGN.

In general, the building’s image, theme, and fixtures must be consistent with the programs offered and the architecture established on base. Reflect the local geographical and cultural environment in the design and comply with AFCFS and installation architectural standards. Provide a visually attractive, safe, and welcoming appearance. Consider grouping high bay spaces together. Do not allow the building massing to dominate or overwhelm surrounding structures.

4-3.1 Entrances/Exit.

Provide a covered entry. The main facility entrance to the sally port serves as a control and transition point.

4-3.2 Doors and Windows.

Natural light must be provided in cells and dayroom areas in sizes/areas indicated in the data sheets. Provide clerestory, wired, tempered-glass windows to allow natural light into the facility. Use hollow metal frames and doors for general-purpose doors. Provide electronic locking for all exterior doors and interior hallway doors. Units shall comply with AT requirements in UFC 4-010-01 and fire protection requirements in UFC 3-600-01.

4-3.3 Exterior Signage.

Provide an attractive, clearly visible sign at the front entrance to show the program visitor hours of operation. Comply with installation standards and UFC 3-120-01. Wording shall be as directed by local command; however, all signs shall include at least the following:

- No weapons or ammunition allowed
- No drugs or other illegal substances allowed

4-4 INTERIOR DESIGN.

Support the function and theme of confinement with finishes (walls, floor, and ceiling). Provide the same sense of safety, security, and professionalism that can be found in comparable commercial facilities.

4-4.1 Interior Construction.

Interior construction must be extremely durable. The use of hollow core wood doors is prohibited. All interior glass must be tempered safety glass. Mirrors must be standard stainless-steel jail-type mirrors; glass mirrors are not allowed. All hardware must be jail-type (i.e., resistant to confinee destruction). Gypsum board for walls shall be impact-resistant type.

Provide counters, casework, and cabinets of high-quality and extremely durable construction. Specify Premium or Custom grade for finishes per *Architectural Woodwork Standards*. All countertops shall be solid surface/solid composite plastics or composite stone or stainless steel. Items and fixtures in the cells and confinee showers and day room must be heavy-duty, non-breakable stainless-steel or fiberglass (jail type).

4-4.2 Finishes.

Finishes shall be highly durable and low maintenance. Acoustical ceiling tiles provide acoustical noise reduction for the administrative, waiting, and visitor areas. The interior design shall be coordinated with *US Air Force Interior Design Standards* and installation design standards. Use low-maintenance, easy-to-clean gloss, semi-gloss, or other coatings; stained concrete, sealed concrete. Minimize the variety of finishes to simplify maintenance and create continuity in this small facility. All interior finishes must comply with UFC 3-600-01.

Segregated cells must be painted pastel pink (for the calming effect; coordinate exact shade with AFSFC).

4-4.3 Window Treatments.

Include window treatments (shading systems) in the administrative and waiting areas not accessible to the confinees. Analyze solar conditions when selecting a window treatment. Dual fabric solar roller shade systems with manual roll chain operation are recommended.

4-4.4 Interior Signage.

Provide stencil-type graphics and interior signage to complement the architectural and finish materials. Provide interior signage as an integral part of the construction contract. Provide interior signage at each room in the public area; no removable signage is to be accessible to confinees. Coordinate with AFSFC and local command for exact wording.

4-5 SERVICES.

See paragraph 4-9 for sustainable design requirements.

4-5.1 Plumbing.

Comply with UFC 3-420-01. Use a Muffin Monster-type grinder pump between floor drains and sewer main for the plumbing system. Showers must receive water pre-mixed and made tepid at a temperature from 100 to 120 °F. Cell sinks must receive pre-mixed tepid water only. Cells shall not have floor drains. Provide heavy-duty, jail-type fixtures only. Provide toilet and vanity unit with pre-mixed cold and tepid water. Plumbing chases must have access for maintenance from the corridor. Segregated cells must have stainless-steel toilets/bubblers; other cells may use porcelain if cost-effective.

4-5.2 Heating, Ventilating, and Air Conditioning (HVAC).

Design the HVAC system to meet the requirements of UFC 3-410-01, UFC 3-410-02, and UFC 3-600-01. Comply with AT requirements in the HVAC system design (see paragraph 4-8). Supply and return air registers and ductwork shall be jail type, with security grills and tamperproof screws. Shower areas shall have localized exhaust fans to prevent accumulation of steam produced by a hot shower with a minimum ten air changes per hour. Provide a minimum of 15 cubic feet per minute (CFM) of outside air per occupant.

4-5.3 Fire Protection and Life Safety.

UFC 1-200-01 shall be utilized to determine the applicable design codes and standards required for the building construction and life safety features of the facility. UFC 3-600-01 provides the specific fire protection features required for the facility, including fire detection, alarm, and fire suppression systems.

Design and installation of a mass notification system shall be in accordance with UFC 4-021-01.

4-5.4 Electrical.

Provide electric service and distribution equipment, wiring receptacles and grounding, interior and exterior lighting and control, security lighting, exit and egress lighting, telephone, communication systems, fire alarm, other health and safety alarms, and intrusion systems in accordance with NFPA 70, UFC 3-520-01, and installation design requirements. Power distribution shall support all equipment, furniture, and systems for

this building. Provide a connection point for a temporary emergency generator to support all life safety and critical security equipment. Provide a self-contained uninterruptible power supply (UPS) for the cell door controls. The location of electrical receptacles shall be coordinated so they are adjacent to data receptacles in areas where data are provided. No outlets (or plumbing faucets) are allowed within the exercise yard area.

Electrical system and all wiring methods must meet current NFPA 70 requirements. All service equipment must be Underwriters Laboratories (UL) listed. No outlets and switches are to be provided in cells. Outlets accessible to confinees must be vandal-proof GFI type.

4-5.4.1 Lighting.

Comply with UFC 3-530-01 for lighting and control systems throughout the facility. Pay particular attention to issues such as glare, heat generation, and impact protection. The fixtures in areas accessible to the confinees shall be jail-type.

4-5.4.2 Communications and Data.

Telephone and data outlets may be independent of each other or combined into a single junction box. If the hard-wired connections can be combined into a single junction box then the cover plate to that junction box must allow for multiple connections. In some unique situations, the cable television (CATV)/internal video connection can also be combined into a single junction box with the appropriate cover plate. Identify the preference for individual or combined telephone/data/video outlets with the functional data sheets in Chapter 3. Coordinate with AFSFC to determine the actual scope of the security system and closed circuit television (CCTV) system. Specify the need for a public address (PA) system and a CCTV system for each individual space. Provide a PA master control in the control room and secondary control in the administrative processing office. Provide all CCTV security monitors in the control room with integral digital video recording (DVR). Fire alarm notification must comply with UFC 3-600-01.

4-5.4.3 Alarm System.

Provide an alarm system to acknowledge unauthorized opening/closing of interior doors and exit doors. Provide a motion detector in the janitor closet and showers to be monitored from the control room. Provide access control and alarms for all confinement areas (excludes IT, mechanical, and telecom rooms), interior doors (including module to module), both sally port doors, and cell doors. All interior doors will have key (mechanical) override capability in case of power loss. All interior doors except the storage room and restroom need electric unlocking to allow the guard to open (buzz in) the door. All doors are considered locked unless electronically or mechanically opened, except the storage room and restroom, which are mechanical only. Audible and panel light alarms shall annunciate if a door is opened without being previously cleared from the panel. Confinee showers and cells shall have a call button alarm terminating in the control room and administrative processing to request opening.

Provide a redundant door control system with master controls in both the control room and administrative processing. Primary control will be in the control room. Provide a switch in administrative processing to disable the control room in case of disturbance.

4-6 SITE DESIGN AND ORGANIZATION.

The site design and all exterior features must comply with the AT standards in UFC 4-020-01 (including standoff and access road requirements) and the local base planning documents. Also provide minimum separation from other structures in accordance with UFC 3-600-01.

4-6.1 Landscaping and Irrigation.

Refer to UFC 3-201-02, the *USAF Landscape Design Guide*, and installation standards. Comply with UFC 1-200-02, UFC 3-210-10, and UFC 4-020-01. Provide a water-efficient irrigation system. Ensure that there are no loose rocks or other objects that can be used as missile material.

4-6.2 Service Drive.

Verify the size of required service vehicles prior to planning the service access areas. Provide a back-up spur for dead-end and service drives that exceed 30 meters (100 feet) in length. Access shall be near the serviced areas: receiving area, garbage dumpster/storage (indoor or outdoor), and mechanical room. Provide a service vehicle apron and consolidate service access when possible. Screen or separate the service area from public use or traffic areas with attractive walls, fences, depressions, berms, and landscaping. Ensure proper drainage if depressions are used. Do not cross outdoor activity areas with service access. Ensure compliance with UFC 4-020-01, particularly for dumpster separation and access control.

4-6.3 General Site Lighting.

Ensure that parking areas and the facility have lighting for safety, evacuation, and security measures. Illuminate the entire perimeter fence of the recreation yard. Comply with UFC 3-530-01 and IESNA *Lighting Handbook*. CCTV cameras may be mounted on selected poles for complete coverage.

4-7 BARRIER-FREE DESIGN.

Refer to UFC 1-200-01 for barrier-free design requirements. Confinees and staff personnel will be considered “able-bodied.” Only areas accessible by visitors will be barrier-free and handicapped-accessible. The sally port, corridor, restroom, waiting area, and visitation area shall comply with the ABA Accessibility Standard for Department of Defense Facilities. Physically challenged confinees will be housed in local civilian facilities.

4-8 ANTITERRORISM.

Refer to UFC 4-020-01 for AT requirements.

4-9 SUSTAINABLE DESIGN.

Meet the requirements of UFC 1-200-02 and achieve green building certification in accordance with the current Air Force Sustainable Design and Development (SDD) Implementing Guidance.

FOREWORD

Facilities Criteria (FC) provide functional requirements (i.e., defined by users and operational needs of a particular facility type) for specific DoD Component(s), and are intended for use with unified technical requirements published in DoD Unified Facilities Criteria (UFC). FC are applicable only to the DoD Component(s) indicated in the title and do not represent unified DoD requirements. Differences in functional requirements between DoD Components may exist due to differences in policies and operational needs.

All construction outside of the United States is also governed by Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA), and in some instances, Bilateral Infrastructure Agreements (BIA). Therefore, the acquisition team must ensure compliance with the most stringent of the UFC, the SOFA, the HNFA, and the BIA, as applicable.

Because FC are coordinated with unified DoD technical requirements, they form an element of the DoD UFC system applicable to specific facility types. The UFC system is prescribed by MILSTD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and are applicable to the Military Departments, Defense Agencies, and DoD Field Activities. The UFC System also includes technical requirements and functional requirements for specific facility types, both published as UFC documents and FC documents.

FC are living documents and will be periodically reviewed, updated, and made available to users as part of the Services' responsibility for providing technical criteria for military construction. Headquarters, U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering Systems Command (NAVFAC), and Air Force Civil Engineer Center (AFCEC) are responsible for administration of the UFC system. Defense agencies should contact the preparing service for document interpretation and improvements. Technical content of UFC is the responsibility of the cognizant DoD working group. Recommended changes with supporting rationale should be sent to the respective service proponent by the following electronic form: Criteria Change Request. The form is also accessible from the Internet site listed below.

FC are effective upon issuance and are distributed only in electronic media from the following source:

- Whole Building Design Guide web site http://www.wbdg.org/ffc/dod.

Refer to UFC 1-200-01, *DoD Building Code*, for implementation of new issuances on projects.

CHAPTER 1 INTRODUCTION

1-1 BACKGROUND.

The Navy and the Marine Corps will use this document. It presents basic design criteria guidance for Unaccompanied Housing (UH) for the Navy and the Marine Corps and applies to both enlisted and officer quarters. It also considers local program operations and requirements, in accordance with the latest construction standards established by the Office of the Secretary of Defense (OSD). Unaccompanied Housing serves permanent party, trainees, and students, and includes open bay housing, barracks, and dormitories. This facilities criteria (FC) includes planning and design criteria for renovation and new construction of Navy and Marine Corps UH. Planners and designers must incorporate the requirements of this document as applicable to their appropriate type of UH. This document does not apply to privatized UH, commonly referred to as public private venture (PPV) assets by the Navy and the Marine Corps. This document does not include criteria for Navy Gateway Inns & Suites (NGIS), Transient, or Visitors Quarters.

1-1.1 Quality of Life.

Providing our unaccompanied military personnel with adequate, comfortable housing is a major goal for the Navy and Marine Corps, and a critical element in attracting and retaining high caliber personnel. Thus, the minimum standards set forth in this document maintain the focus of providing housing for a comfortable living environment.

1-2 APPLICABILITY AND MINIMUM STANDARDS.

This FC establishes minimum UH design standards that must be followed. It provides UH criteria and is applicable to both new military construction (MILCON) as well as sustainment, restoration and modernization (RM, SRM) projects. It is applicable to UH projects whether inside the continental United States, (CONUS) or outside the continental United States (OCONUS). Use this FC in conjunction with Department of Defense (DoD) and other Department of Navy (DoN) criteria related guidance. This FC recognizes that local climates, geography, communities, mission needs, and changing programs necessitate some special requirements for Navy and Marine Corps UH. These standards provide criteria for determining site evaluation and planning, landscape design, facilities design, and interior design.

1-3 GENERAL BUILDING REQUIREMENTS.

Comply with UFC 1-200-01 which provides applicability of model building codes and Government unique criteria for typical design disciplines and building systems, as well as for accessibility, antiterrorism, security, high performance and sustainability requirements, and safety. Use this FC in addition to UFC 1-200-01 and the UFCs and Government criteria referenced therein.

1-4 CYBERSECURITY.

Control systems (including systems separate from an energy management control system) must be planned, designed, acquired, executed, and maintained in accordance with UFC 4-010-06, and as required by individual Service Implementation Policy.

1-5 AUSTERE CONSTRUCTION.

Austere construction is intended for facilities in locations determined by Commander Navy Installations Command (CNIC) and approved by OPNAV to be eligible for austere facilities construction. The austere standards are intended to be applied flexibly and in varying degrees to all facilities at locations designated as austere. The flexibility should be allowed to ensure the criteria are appropriate for individual austere locations. Austere requirements are in APPENDIX C of this document and Planning requirements are in Appendix F of UFC 2-000-05N.

1-6 GLOSSARY.

Appendix D contains acronyms, abbreviations, and terms.

1-7 REFERENCES.

APPENDIX E contains a list of references used in this document. The publication date of the code or standard is not included in this document. Unless otherwise specified, the most recent edition of the referenced publication applies.

CHAPTER 2 PLANNING

2-1 PROJECT INITIATION AND PLANNING.

This FC provides information required for preparation of DD Form 1391, which initiates project development. This includes information about functions, space allowances, overall building size, site evaluation, and special factors to consider in developing overall scope and cost estimates. It provides data and criteria needed at each stage of NAVFAC planning, project engineering, and the design process. Additional documentation may be provided in accordance with Chief of Naval Operations (CNO) or Commandant of the Marine Corps (CMC) guidance.

2-1.1 Navy Requirements Determination.

Navy UH requirements are defined in annual Unaccompanied Housing Requirements Determination Report (R-19), within the enterprise Military Housing System (eMH). The R-19 identifies the "Permanent Party Program Requirements" (line 15) by comparing base loading (people) and projected inventory. "School Program Requirements" are identified in the R-19 on page two (line 33), by comparing student throughput demand and projected inventory.

2-1.1.1 Permanent Party (Navy).

E1-E3: Shared bedrooms, with a bathroom to be used by 2 persons maximum.

E4: Private bedroom, with a bathroom to be used by 2 persons maximum.

E4-E6 (at remote locations): Private bedroom, with a bathroom to be used by 2 persons maximum.

E7-E9, O1 and above (at remote locations): Private unit with living room, bedroom, kitchen, and bathroom.

2-1.1.2 Military Necessity/Mission Essential (Navy).

E1-E3: Shared bedrooms, with a bathroom to be used by 2 persons maximum.

E4-E6: Private bedroom, with a bathroom to be used by 2 persons maximum.

E7-E9, O1 and above: Private bedroom, private bathroom.

2-1.1.3 Students (Navy).

Training Necessity: Shared bedrooms, with a bathroom to be used by 2 persons maximum.

2-1.2 Marine Corps Requirements Determination.

Marine Corps UH requirements are defined in annual UH Requirements Worksheet generated by MCICOM GF to the Installations Permanent Party.

E1-E4: Shared bedroom, with a bathroom to be used by 2 persons maximum.

E5: Private bedroom, with a private bathroom.

2-1.2.1 Students (Marine Corps).

Recruit: use the Open Bay plan to house personnel engaged in duty that requires special housing in groups to accomplish their tasks. These include basic training, follow-on entry level training at the Schools of Infantry (East and West), Special Forces with special mission needs, or other special situations as approved.

Formal Training/Schools: marines undergoing Military Occupational Specialty (MOS) training at Marine Corps Formal schools will be billeted at the 2+0 standard, unless otherwise approved.

Officer Accession: Shared bedrooms, with a bathroom to be used by 2 persons maximum.

2-1.3 Site Selection.

Site selection is a key aspect of initial project development and requires thoughtful consideration. This is part of a comprehensive planning process. After site selection and approval, thorough site and field investigations are performed.

- For Navy projects, follow the Installation Development Plan in accordance with UFC 2-100-01.
- For Marine Corps projects, follow the site selection process in accordance with the Base Installation Master Plan.

2-1.4 Project Analysis and Engineering Phase.

After a project is initiated, it is analyzed and defined. During the project analysis stage, the project team meets to define the project to have a clear understanding of the project goals and objectives. The customer, CNIC/HQMC, design agent, and architect/engineer (A/E) team then develops the project documentation based on an analysis of unique customer needs, requirements, established criteria, and site and environmental constraints. Information gathered provides the basis for defining the preliminary design and supports the project engineering phase, parametric cost estimating (PCE), and programming process. Information required includes space planning, site design, selection of the appropriate plan, and building design, elements and concepts. Unique local requirements concerning building program and design criteria are included in the PCE.

- Antiterrorism requirements are established as part of the design program and are identified as a separate line item in the DD Form 1391 estimate.
- For Navy Modernization projects a Business Case Analysis (BCA) is required for OPNAV review and approval.

2-2 ASSIGNMENT STANDARDS.

Navy: Assignment standards for the Navy are described in Commander Navy Installations Command Unaccompanied Housing Operations Manual CNIC M-11103.2. Refer to DOD 4165.63-M for additional information.

Marine Corps: Assignment standards for Marine Corps personnel are described in Marine Corps Order (MCO) 11000.22. Refer to DOD 4165.63-M for additional information.

2-3 FACILITY FUNCTIONS.

Three basic functional activities must be addressed in Navy and Marine Corps UH: “Units” (Navy) and “Rooms” (Marine Corps); Building Common Areas; and Recreational and Community Areas.

2-3.1 Terminology: “Unit”, “Room”, “Plan”, “Open Bay”.

The basic UH living unit should be composed of bedroom, living area, personal storage closet, bathroom, sink/personal hygiene area, food preparation area, and telecommunications as applicable. Navy and Marine Corps terminology differs for the same entity.

- "Unit". Navy UH living spaces are referred to as "Units”. The ‘Unit’ will refer to any group of rooms sharing any common space, such that a ‘Navy 2+0 Unit’ is composed of only one room and bathroom, whereas a ‘Market Unit’ might include several bedrooms, bathrooms, kitchen and living/dining area.
- "Room" or "Plan". The Marine Corps uses the terms “Room” or “Plan” for their basic UH living spaces, resulting in the “Marine Corps 2+0 Room”, “SNCO/BOQ Room” and “Marine Corps Officer Plan”.

Both Navy and Marine Corps use the term "Open Bay".

2-3.2 Building Common Areas (Spaces).

Building Common Areas (Spaces) are spaces within the building that are not included within the Navy UH Unit or the Marines Corp UH Room or Plan. Examples of these spaces are: entrance, laundry facilities, bulk storage, utility space, circulation space, multipurpose space, vending areas, public toilets, supply storage rooms, and administration area. See Chapter 3 for general space requirements which apply to all plans, and Chapters 4 thru 6 for Common Areas which vary by plans.

- Allowances for Common Areas (Spaces) vary depending upon the plan used.
- Not all Common Areas (Spaces) are permitted or available for all plans.

2-3.3 Recreation and Community Areas (Spaces).

Recreation and Community Areas (spaces) are outdoor activity areas. See Chapter 3, paragraph 3-2.14 entitled “Outdoor Recreation” for a more detailed description.

2-4 ACCESSIBLE UNITS.

Comply with *Architectural Barriers Act* (most recent edition) for additional requirements at accessible units or rooms. To determine the quantity of accessible units or rooms required in a project, take into account the amount of rooms provided in other UH facilities which meet ABA standards and include the quantity of rooms in the current project to meet the total required. Provide accessible units or rooms on the ground floor. Accessibility requirements also apply to common spaces (such as administrative areas, lobby, multipurpose rooms and laundry rooms).

2-5 ADAPTABLE UNITS

Adaptable rooms allow flexibility to accommodate the temporary requirement to house Members who are temporarily unable to climb stairs or have only limited mobility. These type facilities are not intended to house wounded warriors who require long term medical care. Fully accessible rooms are not intended; rather to serve those who are temporarily unable to climb stairs. In new construction projects, provide a minimum of two easily “adaptable” rooms on the ground floor to allow assigned service members with minor injuries to remain with their Units. Functional spaces and minimum square footage requirements must be provided in adaptable rooms (such as 2 closets required in 2-person units).

“Adaptable unit” means dwelling units that include the features of adaptable design specified in 24 CFR 100.205(c) (2)-(3). These include:

- Doors designed to allow passage into and within premises are sufficiently wide to allow passage by handicapped persons in wheelchairs;
- An accessible route into and through the unit;
- Light switches, electrical outlets, thermostats, and other environmental controls in accessible locations;
- Reinforcements in bathroom walls to allow later installation of grab bars around the toilet, tub, shower, stall and shower seat; and
- Usable kitchens and bathrooms such that an individual in a wheelchair can maneuver about the space.

2-6 NAVY STANDARDS FOR CONSTRUCTION AND SUSTAINMENT, RESTORATION, AND MODERNIZATION.

Restoration and Modernization (RM) projects must be executed in accordance with the current version of OPNAVINST 11010.20. This document provides detailed guidance for the administration of facilities projects at Navy shore installations. The criteria standards for Construction, Sustainment, Restoration, and Modernization (SRM) for Navy UH are referred to as Permanent Party, Mission Essential, or Recruits/Trainees. The existing building shell should be considered and respected in re-design projects. Modernization projects which alter the configuration of the building require a Business Case Analysis (BCA) approved by Deputy Chief of Naval Operations (Facilities Readiness & Logistics).

2-6.1 Recruits.

Provide Open Bay UH plan for recruits.

2-6.2 Training Necessity.

New construction for Students in Officer Accessions (Officer Training Command) and Enlisted (E1-E4), "non-prior service" in Initial Skills training (such as "A" Schools, Accessions pipeline, and "C" Schools) must use the Naval Education and Training Command (NETC) 2+0 Dormitory Unit.

2-6.3 Mission Essential.

New construction for rotational Sailors outside their homeport must use the Navy 2+0 Unit or the Austere design (based upon location).

2-6.4 Permanent Party.

Construction for Permanent Party UH must use Market Units in accordance with CNIC M-11103.2. Students in training 20 weeks or longer with exception of Officer Accessions and Enlisted "A" School pipeline training will be housed as Permanent Party (Market Units). This requirement is not applicable to renovation projects. Note that the Navy no longer uses a 2+0 plan for new footprint Permanent Party construction.

2-7 MARINE CORPS STANDARDS FOR CONSTRUCTION AND SRM.

Restoration and Modernization (RM) projects must be executed in accordance with the current version of OPNAVINST 11010.20. The criteria standards for Construction, Sustainment, Restoration, and Modernization (SRM) for Marine Corps UH are referred to as Permanent Party, Transients, or Recruits/Trainees. The existing building shell should be considered and respected in re-design projects. Modernization projects which alter the structural configuration of the building require a Business Case Analysis (BCA) approved by the Marine Corps Office Facilities and Services Division (Code LF).

2-7.1 Permanent Party.

New Marine Corps construction for Permanent Party UH must use the Marine Corps 2+0 Room.

2-7.2 Recruits and Trainees.

Use the Open-Bay Plan for UH to house personnel engaged in duty that requires special housing in groups to accomplish their tasks. These include basic training, follow-on entry level training at the Schools of Infantry (East and West), Special Forces with special mission needs, or other special situations as approved by HQMC Facilities and Services Division (Code LF). Marines undergoing Military Occupational Specialty training at Marine Corps formal schools will be billeted at the 2+0 standard, unless otherwise approved by HQMC Facilities and Services Division (Code LF).

2-8 DESIGN LIMITATIONS.

Graphic illustrations in this document are the basic building blocks from which UH designs are developed. These illustrations are provided to promote uniformity in the design of projects. These designs may be altered, but the mandatory size limits require that any variations be small. Required Common Areas (Spaces) for each UH plan differ. Refer to the specific Unit or Plan within subsequent chapters for the detailed descriptions of required Common Areas (Spaces).

- While plan layouts may be altered to some degree, all of the detailed features and fixtures must be included as a mandatory minimum.
- The Net Living/Sleeping Areas must be met, and gross area maximums must not be exceeded. Net Living/Sleeping Area describes the actual usable space in each sleeping/living area. Refer to DOD 4165.63-M for additional descriptive information.
- Plan room dimensions are NOT fixed but must remain functional. Size bedrooms to accommodate two extra-long twin beds, two desks and chairs, and if closets are not provided, two chest of drawers and two wardrobes.

2-9 GROSS BUILDING AREA.

When calculating the Gross Building Area, measure from the outside face to the outside face of exterior walls.

2-9.1 Gross Building Area = Unit/Room + Common Area (Space).

The total gross building size of UH facilities is based on a gross square footage metric for each unit or room type used. This metric accounts for the rooms/plans in addition to the common area spaces. See Chapters 3 thru 6 for the Net square footage requirements of specific spaces for use during plan layouts. These planning-level metrics are included in Table 2-1 below.

Table 2-1 Planning Level Metrics per Unit/Plan

UNIT/PLAN	MAXIMUM ALLOWABLE GROSS BUILDING AREA, FT2 (M2)
Navy Market Unit	606 ft2 (56.3 m2) per bedroom, based on a two-bedroom Unit. This maximum is not applicable for one-bedroom Units.
Navy NETC 2+0 Dormitory Unit / Navy 2+0 Unit	595 ft2 (55.3 m2) per plan
Marine Corps 1+1E Room	817 ft2 (76 m2) per plan
Marine Corps 2+0 Room	595 ft2 (55.3 m2) per plan
Marine Corps Officer Plan	855 ft2 (79.4 m2) per plan
Open Bay Plans	140 ft2 (13 m2) per person housed

2-9.2 Building Area Calculation.

For information on performing a building area calculation refer to UFC 3-101-01. For detailed information on Facilities Planning criteria for Navy/Marine Corps shore installations, refer to UFC 2-000-05N.

In cases where covered balconies and covered exterior circulation walks serve as the primary circulation (i.e., serving exterior room entrances), they count towards building gross area at 100%.

2-9.3 High Rise Structures and Additional Gross Area.

Multi-level construction requires additional structural and mechanical support. Therefore, for buildings above 3 stories an additional area of 21.5 ft^2 (2 m^2) may be added to the allowable gross area per Navy Unit or Marine Corps Plan. This must be identified and justified as a separate item in the DD 1391 documentation.

2-9.4 Additional Gross Area Required by Climate or Local Conditions.

Climate and local conditions may require additional enclosed spaces which need to be accounted for in the planning of the gross area for UH facilities. Examples of conditions and features that may require additional enclosed space include:

- Fire pump room where local infrastructure is insufficient.
- Locating emergency generator in an enclosed space due to climate or protection reasons.
- Requirements for a water treatment building where local water quality is inadequate.

2-9.5 Exterior Covered Areas

For covered outdoor facilities with no exterior walls, program these by the space function where there are associated Category Codes. Refer to UFC 2-000-05N for programmed areas of these spaces. Examples include:

- Car wash facility
- Gear/equipment washing and drying canopies
- Outdoor pavilion or other covered functional area

2-9.6 GROSS “UNIT” OR “ROOM” AREA.

Gross Unit or Room Area is defined as the area within the walls comprising the perimeter of a (Navy) Unit or (Marine Corps) Room. Review paragraph 2-3.1 entitled “Terminology for "Unit", "Room", "Plan" and "Open Bay"”.

- Wall thickness and chase areas within the perimeter walls are included in the Gross Area.
- Gross Area is measured from the centerline of perimeter walls shared with interior corridors, common chases, or other rooms.
- Gross Area is measured to the outside face of exterior walls.
- Plan corner rooms with two exterior walls are to have the same interior dimensions as other rooms, even though technically the Gross Area for these corner spaces is slightly more than for other spaces.

2-10 FUNCTIONAL SPACES BY ROOM/UNIT TYPE

2-10.1 Navy Required and Optional Spaces

Chapters 3, 4 and 6 provide detailed information on the functional spaces required by the Navy based on Unit types. Table 2-2 presents a summary of space types and those that are required, indicated by an “X”, and those that are optional, indicated by an “O”. “N/A” indicates that a space is not applicable to that Unit type.

Table 2-2 Required and Optional Common Spaces: Navy Unit Types

NAVY UNITS				
AREA/SPACE	**MARKET UNIT**	**NAVY 2+0**	**NETC DORM**	**NAVY OPEN BAY**
Corridors	X	X	X	X
Stairways	X	X	X	X
Offices/Administration Area	X	X	O	O

** Optional at satellite facilities.

CHAPTER 3 GENERAL DESIGN CRITERIA - NAVY AND MARINE CORPS

3-1 SCOPE.

This Chapter is applicable to new construction, and renovation and modernization UH projects. Redesign and renovation project teams must apply sections relevant to the scope of work for their project.

3-2 SITE DESIGN.

Comply with the requirements of UFC 3-201-01. Analysis of existing site conditions (e.g., utilities and plant material, traffic patterns, land use, community facilities, and off-site workplaces), and antiterrorism is important for effective site design.

- Site Navy and Marine Corps UH to take advantage of the positive features of the site. Provide protection from undesirable winds and glare, shading from excessive sun in warm climates, and orientation of operable windows to take advantage of summer breezes.
- Pay special attention to building orientation, mass, and scale in developing the site plan. Develop a sense of order, arrival, orientation, and community in planning the site. Arrange the placement of structures in relationship to one another to create outdoor spaces for use as passive or active recreation areas. Achieve spatial balance and scale through thoughtful placement and arrangement of structures, landscaping, and landforms. Organize the site using functional zones and the appropriate relationship of functions. Intermittent functions such as trash collection, vending machine service, furniture moving, and mechanical repair should not interrupt residents' activities.
- Establishing the finished floor elevation of the project is one of the most important aspects of site planning. The Finished Floor Elevation affects grading, cut and fill, and visual impact of the facility, as well as interior and exterior transitions. In addition, the Finished Floor Elevation has a significant impact on the landscape architect's ability to effectively introduce site improvements into the new environment. When the approach is to "level the site" without sensitivity to other demands, the results lack visual interest. Closely combine efforts of the landscape architect, architect, and civil engineer to achieve the most optimum design results. For Civil Engineering, provide the facility's minimum finished floor elevation and the mechanical/electrical equipment pad elevations in accordance with the latest civil design guidance.

3-2.1 Walkways and Sidewalks.

Locate and size walkways to efficiently connect residents with site amenities, parking, station transportation, community facilities, jogging trails, and workplaces. Place walkways with emphasis on functional rather than formal needs. Grade walkways to

drain away from the building and ensure non-slip surfaces are provided. Consider security in all circulation designs.

- Construct walkways to building entrances to be 8 feet (2.5 meters) wide.
- Construct sidewalks used for troop formations to be as much as 28 feet (8.5 meters) wide.
- Construct typical pedestrian sidewalks 6 feet (2 meters) wide.

3-2.2 Vehicular Access.

Provide access to the housing site from secondary (collector) streets to reduce congestion associated with main arterial streets. Where possible, divide main entrances with landscaped traffic medians between entry and exit lanes. Because of high volume of traffic using the entrances, construct the width of non-divided entrances to be a minimum of 24.6 feet (7.5 meters). Carefully review security requirements when designing for vehicular access.

3-2.3 Parking.

Review the security study and incorporate its requirements into the design. Ensure existing and proposed parking is in compliance with Chapter 3, paragraph 3-5, entitled, Antiterrorism. Provide parking for residents, visitors, staff, and service personnel that is convenient, safe, and pleasant to use. Locate and shape parking areas to improve the residential environment. Use landforms such as earth berms, retention ponds, and tree islands to separate parking from other functional zones and to buffer the residential area from possible surrounding adverse environment.

Provide standard parking spaces for 70% of the resident capacity. Provide motorcycle parking for 5% of the resident capacity; provide dedicated space with concrete paving. Provide bicycle parking for 5% of the resident capacity; provide secure, weather protected, conveniently located facilities. Provide visitor parking for 2% of the resident capacity. Locate two standard parking spaces for guest check-in near the entrance. Provide parking for each staff member and locate staff parking at the outer areas of the parking area. Maintenance parking for service functions does not necessarily require dedicated space. Use the expected frequency of maintenance vehicles to determine whether dedicated parking is needed. Locate service access and parking to avoid disturbing residents.

3-2.4 Vehicular Service to Building.

Antiterrorism requirements take precedence over other requirements.

- Entrances. Where possible, separate service entrances associated with mechanical rooms or mechanical enclosures from parking areas.
- Design access streets and parking areas to accommodate service vehicles and fire protection equipment. Where interior court areas are being proposed between adjoining buildings, consider designing the main

pedestrian walks to accommodate service and fire protection vehicles. For example, construct the minimum width of such walkways a minimum of 8 feet (2.5 meters) wide and constructed using reinforced concrete to accommodate Government vehicle weight class 4 and 5.

- Consider treating the walkways with a patterned concrete system to minimize the negative impact of the wider access route. Use materials such as concrete grass road type pavers to provide access for infrequent service vehicles.

3-2.5 Bus Route Access.

Consider developing shelters and walks to serve personnel needs if the base provides bus service. Design bus shelters to be compatible with the architectural aesthetic of existing buildings, Installation Appearance Plan (IAP), and existing bus shelters on base. Program at least one bus stop shelter for each major housing complex. Coordinate with the base in selecting a new shelter that is programmed with new projects, where existing shelter design needs upgrading.

3-2.6 Utility Corridors.

Develop utility corridors in coordination with the planner, electrical, mechanical, and civil engineers. Size the corridors to accommodate future expansion. Locate utility corridors no closer to tree trunks than one and one-half times the crown width of mature trees or 33 feet (10 meters), whichever is the greater amount. Locate utility corridors to allow for future street tree plantings.

3-2.7 Fire Protection Access.

Site new structures a minimum of 39 feet (12 meters) laterally from the closest adjoining building. Provide fire department access, fire lanes, and fire apparatus turn-a-rounds in accordance with UFC 3-600-01.

3-2.8 Site Furniture.

Select site furniture that is in harmony with the architecture of the new and surrounding existing facilities, compliments the building, and makes the outdoor spaces more usable and organized. The landscape architect must coordinate the selections with the architect and interior designer to ensure smooth transitions are made in the procession from within the building to the outdoors and vice versa. Effective transitions are affected when building materials, colors used in the building exterior and interior areas, and design details from the building are incorporated into the paving materials and site furnishings. Durable site furnishings are to be used to support various site functions. Wherever possible, use recycled materials for site furnishings. Coordinate the use and locations of site furnishings, trash receptacles, seating, picnic shelters and grills, and lighting. Provide public areas suitable for various group sizes (4-20) with grills and at least partially covered seating. Site public areas to accommodate larger coordinated and smaller separated activities.

3-2.9 Mechanical Enclosures.

Screen mechanical equipment such as chillers, evaporating condensers, switchgear, and electrical transformers. Use architectural screening materials that complement the materials used to construct the new facility. Use landforms to screen objects in the landscape that do not require enclosures. Design screening low and in cognizance of the requirements of the Risk Analysis and Vulnerability Assessment and security requirements.

3-2.10 Trash Dumpsters.

Locate dumpsters in areas away from main entrances, while still as convenient as possible to residents and large trash handling trucks. Screen trash dumpster locations with any combination of hard wall materials, earth forms, and landscaping to reduce their impact. Where hard wall materials are used, use materials that complement the materials used in the project and adjacent facilities. Locate dumpsters and design screening in accordance with the requirements of the Risk Analysis and Vulnerability Assessment and security requirements.

Where large refuse containers or compactors are located within building footprints, locate trash chutes conveniently for use by all occupants. Provide trash rooms with a hose bib and floor drain for cleanup.

3-2.11 Planting and Vegetation.

Comply with the requirements of UFC 3-201-02. Proper planning and design, plant selection, and use of turf alternatives and mulch materials, zoning of plants in accordance with water requirements, soil improvements, efficient irrigation, and appropriate maintenance are the fundamentals of good landscape planting.

- Develop plantings to create an aesthetically pleasing landscape that conserves water and resources while minimizing maintenance requirements.
- Provide low shrubs and ground covers at the building foundation, bio-retention cells (if utilized), and for screening unsightly utility features.
- Provide trees throughout the site including at parking areas, along roadways, around the building as appropriate, and in turf areas.
- Provide new plantings which enhance the visual quality of the site during all seasons and incompliance with local installation standards.
- Provide a one-year maintenance contract on all plants, including sod or grass seeded areas.
- Provide plant materials that are drought tolerant, disease and pest resistant, and are native or naturalized.
- Plantings must meet Anti-terrorism (AT) Standards.

3-2.12 Landscape Maintenance Provisions.

The initial contract must provide landscape establishment and maintenance for installation of plant materials. Use a one-year duration of the establishment period in all cases. This must not be made optional. Include the following establishment requirements:

- Irrigation including adjusting sprinkler head radius, direction, and resetting to finish grade, replacing broken heads and other equipment, adjusting automatic irrigation controller timing;
- Mowing and edging, replacing mulch;
- Inspection, control of pests and weed control;
- Tightening, staking and guying materials, pruning, fertilization;
- Replacing damaged, dying, or dead plant materials;
- Maintaining watering saucers.

3-2.13 Irrigation.

Comply with the requirements of UFC 3-201-02. For Navy projects, permanent reclaimed water irrigation systems are required only for building perimeter planted areas, such as the 20-foot (6.096 meter) perimeter immediately around the building.

For Marine Corps projects, permanent irrigation systems are not required. Permanent reclaimed water irrigation systems may be approved where climactic conditions dictate.

3-2.14 Outdoor Recreation.

When providing sand volleyball courts and full basketball facilities or other appropriate amenities, light these facilities for evening use. Locate these recreational functions to reduce interference with other functions on and near the site. Shelter or screen both active and passive recreational facilities to temper wind and other climate elements. Provide horseshoe pits or other recreational activities, as well as tables, benches, appropriate lighting for safety and evening recreational activities, and appropriate plant materials.

3-3 RESTORATION AND MODERNIZATION REQUIREMENTS.

Projects for any existing facility housing unaccompanied personnel must incorporate a ‘whole building approach’ with the goal of eliminating all identified building deficiencies.

3-3.1 Navy RM.

Restoration and Modernization (RM) UH projects for the Navy will be executed to the maximum extent possible to include new construction requirements noting that a market style standard (assignment) for permanent party unaccompanied personnel may not be achieved within existing older facilities. RM projects must address all identified

deficiencies (Condition and Building Code), and functional Quality of Life (QOL) deficiencies.

3-3.2 Marine Corps RM.

Restoration and Modernization UH projects for the Marine Corps will be executed to the maximum extent possible to include new construction requirements noting that a 2+0 standard (assignment) may not be achieved within existing older facilities.

3-4 STRUCTURAL DESIGN.

Use UFC 1-200-01 for structural engineering and seismic design.

3-4.1 Structural Selection.

Coordinate column spacing and layout with the building's floor plan so that they occur within or in alignment with walls. Hold columns occurring within spaces to a minimum and limit them to larger public spaces. Analyze and select the proposed structural system that is the most economical method of realizing the architectural design intent.

Select an economical structural system based on: facility size; load requirements; geotechnical conditions and foundation design based on local experience; antiterrorism considerations, including progressive collapse for buildings of three stories or greater; local availability of materials and labor; local construction practices; experience of inspection personnel; resistance to fire; permafrost conditions; construction schedule.

3-5 ANTITERRORISM (AT).

The DOD objective is to eliminate personnel exposure to security threats in occupied UH and workspaces, limit property damage, and minimize the likelihood of mass casualties from terrorist attacks through cost effective security improvements. DOD policy and guidance for antiterrorism and the physical security of facilities is contained in core criteria as referenced in UFC 1-200-01. Use UFC 4-010-01 and Geographic Combatant Commander Antiterrorism construction standards for these antiterrorism requirements. These requirements are applicable for new construction, restoration, and modernization or redesign of existing facilities.

3-5.1 Vulnerability and Risk Assessment.

During the initial UH planning process, the Planning Team must conduct a vulnerability assessment to determine the appropriate Design Basis Threat (DBT) and associated level of protection. Use UFC 4-020-01.

3-5.1.1 UH Design in High Threat Environments.

When the vulnerability and risk assessment of a new project identifies a higher DBT, the following minimum design features are required:

- Kitchen/Bath. Kitchen and bath areas located to the threat side of the occupied space as a buffer to the more frequently occupied sleeping areas.
- Windows and Glass. Limit the use of doors and windows. Windows must be operable, and with lockable hardware.
- Protected Courtyard. A protected courtyard may or may not be a structurally enclosed space. A protected courtyard is a space where access by unauthorized persons or vehicles is limited by landscaping, structures or fencing.

3-6 ARCHITECTURE.

Refer to UFC 1-200-01 for direction to the appropriate core criteria for architectural details and finish concerning:

- Exterior Finishes, vapor retarders, thermal insulation, and air infiltration.
- Roof systems. Design and detail roof systems to resist maximum wind for the area.

3-6.1 Building Design.

Design buildings to make arrival and movement through them orderly and clearly understandable by users (visitors, residents, staff, and service personnel). Use circulation to organize and zone activities and to promote physical security.

- Provide a single public entrance to the building and to different functional areas within the building.
- Provide a weather protected entrance vestibule with two sets of doors. The first exterior door must not be secured. The second door set to provide secure access to the building.

3-6.2 Architectural Character and Scale.

Most military installations have published exterior architectural guidelines that contain criteria relative to achieving, maintaining, and emphasizing a positive exterior visual environment. Follow the design guidance contained in these documents. In the absence of such guidelines, design facilities to harmonize with the character of existing facilities considered historically or architecturally significant to the area.

Design the architectural character of the facility in context with its surroundings and relate not only to the immediate site and adjacent buildings, but also to the Installation itself.

3-6.3 Residential Character for Unaccompanied Housing.

Design housing to provide a residential environment through both exterior and interior elements. Design exterior building forms to reflect the residential character of the project. These residential images can be reinforced through the following:

- Provide gable or similar steep sloped roof shapes. Sloped metal roofs are mandatory on UH, with limited exceptions for Navy projects. The Navy will accept other roofing materials if necessary, to match existing buildings, with exception of asphalt shingles.
- Asphalt shingle roofs are prohibited.
- Bay windows may be used to change the exterior appearance from institutional to more residential. Additionally, architecturally integrated sunshades or other features are acceptable.

3-6.4 Model Unit “Mockups”.

Construction of a UH Model Unit or "Mockup" of a typical Unit/Plan or selected spaces within a typical Unit/Plan, created and finished for illustration purposes, have proven to be very effective in cost management and quality control. They are most successful when completed prior to the start of project construction. For new construction, mockups may be elemental or whole, built off-site and later dismantled or built on-site and converted for actual use. For RM projects, construct mockups in place on-site and convert to actual use to be most cost effective. For mockup reviews, include acoustical field testing in accordance ASTM E336.

- Mockups are required for Navy projects that contain more than 24 units. Provide a virtual typical unit model to test in-unit door swings and unit design functionality for projects containing less than 24 units.
- Mockups are encouraged for Marine Corps projects where space is available and time permitting, and if so, incorporated in the project RFP.

3-6.5 Acoustics.

Careful attention to acoustic design is required for UH to ensure a high degree of privacy for residents. Design to meet acoustic requirements structurally rather than through the use of applied finishes. Do not compromise the acoustical integrity of wall, floor, or ceiling assemblies with electrical outlets, or mechanical ducts. If required, field test assemblies in accordance with ASTM E336 and ASTM E492. Provide the following acoustic ratings:

- Walls between living units and between living units and corridors, and exterior walls of living units require a sound transmission class (STC) of minimum STC 55.
- Walls within the living units (room to room) require a minimum STC 50.
- Unit entry doors require a minimum STC 41.

Floor and ceiling assemblies require a minimum STC 55 and have an impact isolation class of at least (IIC) 60 for Navy. An impact Isolation rating (IIC) of STC 50 is the minimum design target for the Marine Corps, but an IIC 45 rating is acceptable if field tested.

3-6.6 Doors.

Specify doors, frames, and hardware to meet sound separation, fire separation, and security requirements unique to Navy and Marine Corps UH. Design all doors and frames in accordance with the findings of the Risk Analysis and Vulnerability Assessment provided for the project. Fully weather strip exterior doors and provide heavy duty metal thresholds that prevent drafts, dirt, water, and insect entry. Provide lobby and entry vestibules with glass commercial storefront doors with automatic openers at both sets of doors at major entrances. Provide other exterior doors as metal, thermally insulated, and secure.

- At Unit Entry for Navy facilities and at Room Entry for Marine Corps facilities, doors must be solid core wood (interior access) or thermally insulated metal doors (for exterior access) to provide sound isolation. Note that the acoustic rating of the door is not required to meet the adjacent wall acoustic rating. Provide a fire-rated, wide-angle security view port at 60-inch (1524 mm) height and an additional wide-angle security view port at 43-inch (1092 mm) height for accessible units.
- Doors within the units are required to be solid core wood doors. Connecting doors between bedrooms are not allowed.

3-6.7 Hardware and Locks.

Provide hardware that conforms to Builders Hardware Manufacturers Association (BHMA) standards, ANSI/BHMA A156, (1000 series). Use Grade 1 for entry doors. Occupant entry doors BHMA 4000 series Grade 1 locksets and privacy latches. All locks must be industry standard and comply with UFC 1-200-01 and UFC 3-600-01. All electronic locks must have a mechanical key override. Installations must ensure procurement of new and replacement lock systems are based upon a single system to reduce operating costs. Provide doors with programmable electronic key systems except for bathrooms and closets. Provide stand-alone programmable new and replacement electronic lock systems, not connected to any information network. Procurement of networked electronic lock systems is prohibited. Use stand-alone key-encoding systems. Use of CAC cards as keys for new internal lock systems is prohibited. Use RFID key card locks with a battery compartment accessible from the exterior of the secured space.

3-6.7.1 Navy Locks.

New and replacement electronic lock systems must comply with the CNIC authorized system, an all-in-one system without a computer interface.

- Each occupant's key card must be able to open the entrance to their unit, bedroom, closet and secured common rooms (such as lounges and laundry) as appropriate. Provide dead bolts on unit entrance doors and privacy latches on bathroom doors.
- Provide Front Desk Unit (FDU).
- Exterior doors. Electronic locks are required at exterior doors. Building access must comply with CNIC and Installation standards.
- Use of mechanical key/tumbler locks is limited to service closets and administrative spaces.

3-6.7.2 Marine Corps Locks.

When determining lock configuration requirements, consider the different locking levels a manager, lock system programmer, facility employees such as housekeeping, and an occupant would need to open. Each occupant's key card must be able to open the entrance to their room and secured common rooms (such as lounges and laundry) as appropriate.

- Bathroom doors must have privacy latches and ensure that they cannot be locked from the outside.

3-6.8 Windows.

Fenestration must conform to the recommendations of DOD standards for buildings, and fire and life safety, including exiting. See UFC 3-101-01 for additional window design information. Place windows to prevent illicit entry accomplished by reaching adjacent entry door hardware. For exterior corridor configurations, where windows are likely to be kept covered for privacy, higher fenestration with a separate covering mechanism is recommended to allow light to enter the room while maintaining privacy at eye level. In general, size glazed openings to approximately 30% window to wall ratio to provide day light. Operable windows are encouraged within sleeping and living areas, subject to code compliance. Window sizing, placement, and shading should respond to the building's orientation and climate zone. Provide an energy efficient envelope which considers many aspects of opening design: allowing winter sun, shading summer sun, allowing day light into the majority of a given sleeping or living space, and quality of the glazing system. Specify commercial grade windows; low "E" glass is required. Install heavy duty insect screens on operable windows. For more information about optimum daylighting, see *Tips for Daylighting with Windows*.

3-6.9 Walls and Partitions.

Design walls and partitions to meet appearance and acoustic and durability requirements of Navy and Marine Corps UH. Seal edges of wall assemblies to adjacent construction to avoid flanking sound paths.

- For Navy projects, use light-frame construction for interior wall construction. When using gypsum board interior walls in high-use areas

(such as lobby, corridors and multi-purpose rooms), provide double layer gypsum board, high-impact gypsum board, plywood backing board as a base to gypsum board, or similar. When using CMU interior walls, provide a grout or resin based (not plaster) finish to CMU walls to fill the joints to be a uniformly smooth surface to be painted.

- Marine Corps exterior walls must be masonry construction and finish. Basic wall construction types consist of concrete masonry units (CMU), precast concrete, or cast-in-place concrete construction, where appropriate. The Marine Corps requires interior walls with hard finishes similar in durability to CMU. When using CMU interior walls, provide a grout or resin based (not plaster) finish to CMU walls to fill the joints to be a uniformly smooth surface to be painted.

3-6.10 Balcony.

For projects with exterior breezeway or balcony access to each room, consider the use of an upper window, and transom over the entry door. This allows for the entry of natural light into the occupants' rooms while retaining privacy from travelers along the breezeway or balcony.

3-6.11 Signage.

Prepare a signage design package that instructs the activity in maintenance of the signage system and provides equipment and materials necessary for this. Place emphasis on directional signage to allow visitors and occupants to immediately familiarize with room names and numbers.

3-6.11.1 Exterior Signs.

Design directional signs as an integral part of an overall building and site system, to be furnished and installed under the construction contract. Economy, aesthetics, durability, flexibility, ease of installation and maintenance are important considerations of signage design. Design the system to inhibit vandalism but with flexibility to enable the addition or deletion of information. Select a mechanical mounting mechanism for the signs to permit the reuse of signs as the facility changes.

- Specify an easily read typeface such as Helvetica Medium.
- Provide a signage plan, legend, and details. Indicate the design, location, and installation method in the plan, elevations, and specifications.
- Require the Contractor, in the project specifications, to make a comprehensive submittal of the proposed signage system and to provide information necessary for acquiring new or replacement signs.
- Provide building signs and other items on the building exterior that meet the IAP (Installation Appearance Plan).
- The exterior signage system must be respected both on and off the specific facility site. Signage must also be harmonious in the landscape.

Care must be taken to use signs only when necessary and to restrict the use of random sizing, placement, and colors.

- The interior designer will coordinate interior signage and identification with the exterior designs.

3-6.11.2 Project Signage.

Provide the following signs for each project or building:

- Entrance signs at roadway, walkway and building entry point as appropriate.
- Building Identification Sign.
- Building Directory.
- Directional Signs.
- Room Identification Signs. Coordinate room identification signs with the facility functions regarding occupant information.
- Regulatory Signs.
- Informational Signs. Include command board signage/display.
- Notices Board for residents' use (Permanent Party only).
- Bulletin Boards (for official use).

3-7 INTERIOR DESIGN.

Refer to the tables in this manual for specific interior finish schedules for Navy and the Marine Corps. Employ finishes that are easily cleaned and endure hard use and food spills. Select neutral colors for the more permanent surfaces within the facility (such as floor/wall tiles, solid surfacing material, masonry) to facilitate future finish/material changes with respect to Installation guidelines where available. See Table 3-1 for Navy and Table 3-2 for Marine Corps interior finish requirements.

Table 3-1 Interior Finishes Schedule: Navy

NAVY INTERIOR FINISH SCHEDULE			
AREA/SPACE	**FLOORS**	**WALLS**	**CEILING**
Administration/ Conference Rooms	Resilient (LVT or RT) or Poured Epoxy Terrazzo	Gypsum Board, impact resistant or smooth finished CMU, painted.	Gypsum board, painted or SAT
Elevators	Resilient (LVT or RT) or Porcelain Tile	Plastic laminate, stainless steel, or solid surface material wall panels	Factory finish with lighting
Lobby/Front Desk	Porcelain Tile, Resilient (LVT or RT) Poured Epoxy Terrazzo or integrally colored or honed concrete	Gypsum Board impact resistant or Accent material	Gypsum board, painted or SAT
Mechanical and Electrical Rooms	Sealed Concrete with Rubber cove base	Gypsum Board, impact resistant, Concrete or CMU	Exposed Structure, painted
Weather Vestibule	Entrance Mat, Porcelain Tile, integrally colored or honed concrete, or Epoxy Terrazzo	Exterior Building Finish, Porcelain Tile or Gypsum Board, impact resistant	Exterior Finish or Painted Gypsum Board
Lounge/Meeting/ Game Room	Resilient (LVT or RT) or Poured Epoxy Terrazzo	Gypsum Board, impact resistant or smooth finished CMU, painted.	Gypsum board, painted or SAT
Public Toilets	Porcelain Tile, Epoxy Flooring or Poured Epoxy Terrazzo	Gypsum board, and Porcelain Tile, floor to ceiling	Gypsum board, painted or SAT
Vending/Coffee Mess	Porcelain Tile, integrally colored or honed concrete, Epoxy Flooring or Poured Epoxy Terrazzo	Gypsum board, impact resistant, painted, extended solid surface backsplash at counter	Gypsum board, painted or SAT
Bulk Storage	Sealed Concrete	Gypsum Board, impact resistant, Concrete or CMU, painted	Exposed Structure, painted or SAT

NAVY INTERIOR FINISH SCHEDULE			
AREA/SPACE	**FLOORS**	**WALLS**	**CEILING**
Bike Rooms	Sealed Concrete	Gypsum Board, impact resistant, Concrete or CMU, painted	Exposed Structure, painted or SAT
Trash Rooms	Sealed Concrete	Gypsum Board, impact resistant, Concrete or CMU, painted	Exposed Structure, painted
Housekeeping/Linen	Sealed Concrete	Gypsum board, impact resistant, painted	Gypsum board, painted or SAT
Common Laundry	Porcelain Tile, Epoxy Flooring or Sealed Concrete	Gypsum Board, impact resistant, Concrete or CMU, painted	Gypsum board, painted or SAT
Public Corridors	Resilient (LVT or RT) or Epoxy Terrazzo or Porcelain Tile	CMU with grouted smooth finish, painted or Accent Finishes	Gypsum board, painted or SAT
UNITS			
Entry/Service Areas	Resilient (LVT or RT) or Porcelain Tile	Gypsum board, impact resistant, painted	Gypsum board, painted
Living/Dining Area	Resilient (LVT or RT), Porcelain Tile	Gypsum board, impact resistant, painted	Gypsum board, painted
Kitchen	Resilient (LVT) or Porcelain Tile	Gypsum board, impact resistant, painted	Gypsum board, painted
Bedrooms	Resilient (LVT or RT) plank or tile	Gypsum board, impact resistant, painted	Gypsum board, painted
Closets	Resilient (LVT or RT) plank or tile	Gypsum board, impact resistant, painted	Gypsum board, painted
Laundry	Resilient (LVT or RT), Epoxy Flooring or Porcelain Tile	CMU or Impact Resistant Gypsum board, painted	Gypsum board, painted
Bathrooms/Vanity	Porcelain Tile	Gypsum board with PT Tile full height, solid surface in showers, full height	Gypsum board, painted

MARINE CORPS INTERIOR FINISH SCHEDULE			
AREA/SPACE	**FLOORS**	**WALLS**	**CEILING**
Entry Vestibule	Entrance Mat, Porcelain Tile, integrally colored or honed concrete, or Epoxy Terrazzo	Exterior Building finish; Painted CMU or concrete. Optional grouted smooth finish. Painted CMU used with split faced block wainscot or equal.	Exterior Finish or Painted Gypsum Board
Duty Office	Resilient (LVT or RT) plank or tile	Painted CMU or concrete.	Gypsum board, painted
Duty Bunk Room	Resilient (LVT or RT) plank or tile	Painted CMU or concrete.	Gypsum board, painted
Public Toilet	Porcelain Tile, Epoxy Flooring or Poured Epoxy Terrazzo	Gypsum board, and Porcelain Tile, floor to ceiling	Gypsum board, painted
Vending	Porcelain Tile, integrally colored or honed concrete, Epoxy Flooring or Poured Epoxy Terrazzo	Painted CMU or concrete, optional grouted smooth finish. Painted CMU or concrete used with split faced block wainscot or equal.	Gypsum board, painted or SAT
Multi-Purpose Room	Porcelain Tile, integrally colored or honed concrete, Epoxy Flooring or Poured Epoxy Terrazzo	Painted CMU or concrete, optional grouted smooth finish. Painted CMU or concrete used with split faced block wainscot or equal.	Gypsum board, painted or SAT
Janitor Closet	Sealed Concrete	Painted CMU or concrete.	Exposed Structure, Paint

MARINE CORPS INTERIOR FINISH SCHEDULE			
AREA/SPACE	**FLOORS**	**WALLS**	**CEILING**
Laundry Room	Porcelain Tile, Epoxy Flooring or Sealed Concrete	Painted CMU or concrete.	Exposed Structure or Gypsum Board, Paint
Public Corridors	Resilient (LVT or RT) or Epoxy Terrazzo or Porcelain Tile	Painted CMU or concrete, optional grouted smooth finish. Painted CMU or concrete used with split faced block wainscot or equal.	Gypsum board, painted or SAT
Bedrooms	Epoxy Terrazzo; Resilient (LVT or RT) plank or tile.	Painted CMU or concrete.	Concrete, painted
Room Service Areas	Epoxy Terrazzo; Resilient (LVT or RT) plank or tile.	Painted CMU or concrete.	Gypsum board, painted
Room Toilets	Porcelain Tile	Gypsum board with PRT Tile full height, solid surface in showers, full height	Gypsum board, painted
Bedroom Closets	Epoxy Terrazzo; Resilient (LVT or RT) plank or tile.	Painted CMU or concrete.	Concrete, painted

3-7.1 Paint.

Paint interior surfaces, except factory pre-finished material, a minimum of one prime coat and two finish coats. Provide painted finishes with a minimum of high-performance architectural paint as defined by Master Paint Institute (MPI) on gypsum board and CMU. On steel and non-ferrous surfaces, provide a minimum of high-performance system as defined by MPI in a minimum of a semi-gloss finish. Back prime wood trim frames, and other wood.

3-7.2 Wall Finishes.

Provide wall finishes that are easy to clean, repair and refinish. Proprietary finishes are prohibited. Vinyl Wall Covering is prohibited in all UH facilities.

3-7.2.1 Gypsum Board.

Gypsum board must be a minimum of level 4 finish and a minimum of an eggshell finish; semi-gloss where required. Use epoxy paint for high use areas such as laundry rooms and stairwells.

3-7.2.2 Concrete Masonry Units.

Concrete Masonry Units (CMU) must have a minimum of an eggshell finish, semi-gloss is recommended in certain utilitarian spaces such as mechanical and electrical rooms. Coordinate where smooth finish CMU is to be used. Use epoxy paint for high use areas such as laundry rooms and stairwells.

3-7.2.3 Porcelain Tile.

Provide color body porcelain tile in UH facilities. In Toilets and vanity areas, provide full height color body porcelain tile with matching cove base or coved metal profile for floor to wall tile transitions. Include metal corner trims to protect outside corners from chipping. In public and recreational areas, porcelain tile may be used for a highly durable, cleanable wall finish and double as wall protection.

3-7.2.4 Showers.

Provide seamless solid surface materials (except at corners) from top of shower receptor to ceiling in showers. Tile with grout lines is not recommended for maintenance challenges.

3-7.2.5 Wall Protection.

Provide resilient corner guards consisting of integrally colored high impact resistant extruded vinyl, polyvinyl chloride, stainless steel, or injection molded thermal plastic. Install at outside corners of interior walls, partitions, and columns in all public spaces, high traffic, and high use spaces. Provide full height, minimum 8 ft. (2.44 m), corner guards at all locations where required. Additional wall protection, such as wainscots, bumper guards, and wall guards, may be required depending on the use of the space.

3-7.3 Ceilings.

Suspended acoustical tile may be used in corridors, entryways, and multi-purpose rooms. Suspended acoustical tile (SAT) is prohibited in bedrooms/bathrooms in UH projects. Provide painted gypsum board or concrete ceilings in these spaces with an off-white color. Blown-on or spray applied acoustic ceiling finish is not allowed in any space.

3-7.4 Flooring.

3-7.4.1 Resilient Flooring.

Use Luxury Vinyl Tile (LVT) flooring in units, rooms, corridors, and lounge/recreational spaces. Provide LVT in planks or large format sizes, with a minimum 20 mil wear layer and a minimum 20-year manufacturer’s commercial, non-pro-rated, written warranty. LVT flooring must be provided in medium tone colorations to minimize appearance of scratching and scuffing. Integral acoustical backing is required where noise transmission in existing facilities where the structure does not conform to acoustical

requirements. LVT must be used with a minimum 4 inch (102 mm) high rubber cove base.

Use Rubber Tile (RT) flooring in units, rooms, corridors, elevators, stair landings and lounge/recreational space. Provide a minimum of 0.125 inch (3.2 mm) thick tile with textured, easy to clean surface and through color patterned or multi-color visual. RT must be used with a minimum 4-inch (102 mm) high rubber cove base. For interior stairs, provide coordinating rubber tile for stair landings and rubber stair treads which allows compatible maintenance and cleaning methods. Grit and contrasting strips on stair treads are required to be integral to the tread construction. Applied grit and contrasting strips are not acceptable.

3-7.4.2 Carpet.

Carpet is prohibited throughout Navy and Marine Corps UH facilities.

3-7.4.3 Porcelain Tile.

For porcelain tile, use through-body color tile with a heavy commercial rating for floors. Provide appropriate slip resistance in all areas. Specify a mottled or shaded tile to hide discoloration from detergents and other substances. Provide epoxy grout in a medium to dark color. Provide matching coved wall base or metal cove trim for floor to wall tile transitions.

3-7.4.4 Resinous Epoxy Flooring.

Provide a 3/16-inch (4.8 mm) thick, decorative flake or quartz broadcast system. Epoxy flooring must be a troweled mortar system, utilizing epoxy and silica aggregate mortar, high build grout, seal coat and decorative vinyl chip or quartz aggregates. Install with minimum with minimum 4-inch (102 mm) high integral resinous epoxy cove base.

3-7.4.5 Poured Epoxy Terrazzo.

Poured epoxy terrazzo system must include (but not be limited to) moisture vapor primer system, isolation crack membrane, and divider strips; and include minimum 4-inch (102 mm) high by ½-inch (12.7 mm) thick precast epoxy terrazzo base. Thinner epoxy bases are not acceptable. Porcelain tile base is acceptable for terrazzo floor as it has a harder breaking strength and is more durable.

3-7.4.6 Integrally Colored or Honed/Polished Concrete.

Use honed, colored, polished, or sealed concrete as appropriate for the use of the space. Coordinate concrete finish products and specifications with the aesthetic, durability, and maintenance requirements of the space. Wall base must be rubber cove base or porcelain tile base.

3-7.4.7 Wall Base Molding.

Provide wall base molding for the flooring systems indicated above. Accent wall base molding may be provided in building and elevator lobbies.

3-7.5 Cabinets, Millwork, and Hardware.

Construct cabinets to American Woodworking Institute Custom grade with heavy-duty hardware.

- Provide acrylic solid surface or solid surface veneer kitchen countertops. Use of natural stone is prohibited. Coordinate type of sink and mounting with Plumbing.
- Provide acrylic solid surface, solid surface veneer or cultured marble bathroom vanity tops, with integral sink bowl. Coordinate type of sink and mounting with Plumbing.
- Provide cabinet boxes, bases and toe kick a minimum 3/4-inch (19 mm) hardwood plywood. Provide interior of cabinet boxes and drawer boxes with melamine for easy cleaning. Provide high pressure plastic laminate for exterior surfaces for impact resistance and easy cleaning. Cabinet backs and drawer bottoms should be minimum 1/4-inch (6.4 mm) hardwood plywood with melamine interior finish.
- Provide drawer boxes of 5/8-inch (15.8 mm) hardwood, with dovetail or box joints, mounted on full extension guides, rated for minimum 75 lbs (34 kg).
- Provide cabinet interior shelving of 3/4 inch (19 mm) hardwood plywood with melamine surface for ease of cleaning and with matching front edge banding. Hanging or mounting rails for wall cabinets must be a 3/4-inch (19 mm) hardwood.
- Cabinet doors and drawer fronts must be 3/4-inch (19 mm) hardwood plywood or medium density fiberboard, with high pressure plastic laminate on all surfaces and 1/8-inch (3 mm) PVC edging on all edges.
- Provide adjustable, cup type, hinges having a minimum 105-degree swing. Cabinets and countertop support must comply with CPA/ANSI A208.2 or ANSI/HPVA HP-1 standards for low formaldehyde emissions.
- Sustainable alternative materials should be considered where they provide comparable strength, quality, and durability, including formaldehyde free, or no added formaldehyde plywood and alternative backer boards.

3-7.6 Entrance Mats.

Provide entrance mats at main entries and at heavily used entrances which can be removed and cleaned as well as cleaned underneath them. Roll-up mats with the aluminum frame, vinyl hinges and foot cleaning treads are preferred. Provide a

minimum uniform floor load of 300 lb/sq ft (14.36 KPa) and a wheel load of 350 lb (160 kg) per wheel.

3-7.7 Toilet Partitions.

Provide toilet partitions of high-density solid plastic, stainless steel, or solid phenolic core with decorative laminate materials. Painted metal and plastic laminate clad MDF core toilet partitions are not allowed.

3-7.8 Toilet Accessories.

Provide toilet accessories as surface mounted or recessed, of non-corrodible metal or solid surface (showers). Provide heavy duty materials with concealed mounting methods. Provide toilet paper holder, soap dish, bathrobe hooks, and towel bars. Provide a shower curtain rod. Specify rod at proper height for conventional shower curtains (72 inches by 72 inches [1.8 m by 1.8 m], approximately).

3-7.9 Window Treatments.

Include window treatments (such as black out shades and sun shading systems) as an integral part of the construction contract. Dual solar roller shade systems with manual roll chain operation are recommended. Consider solar conditions when selecting window treatment light filtering opacity. Dual solar shade system provides visual privacy and natural light, with black out shades for sleeping. With black out shades, provide track on side of system for added durability and stability. Window treatments should overlap window openings to reduce light leakage, where possible. Note that soft window treatments, such as draperies, are considered collateral equipment and will be included in the FF&E package. Any window treatment must have flame resistance, blackout shade/lining, and be of commercial quality.

3-7.10 Furnishings, Fixtures and Equipment (FF&E).

3-7.10.1 Navy FF&E.

UH FF&E procurement packages must be designed by the same design agent as the facility and coordinated with UH Managers. Final approval of UH FF&E specifications will be determined by the design team to include guidance/input received from the respective Naval Facilities Command Interior Designers and the UH Manager. Use of turn-key approach to UH FF&E procurement within military construction UH projects is directed to the greatest extent possible and practical. This will ensure a coherent UH FF&E package which promotes an increased QOL for occupants and makes the best use of funding. This applies to UH furniture, furnishings, and equipment for new construction (collateral equipment) and existing UH (whole room concept and replacement items).

3-7.10.2 Marine Corps FF&E.

Marine Corps will prepare UH FF&E procurement packages through collaborative effort with Base Property, Purchasing and Contracting office, and installation Bachelor Housing Directors. Final approval of UH FF&E specifications will rest with the Installation BH Director. Procurement must conform to acceptable funding restraints. Incorporate to the extent possible guidance/input received from the respective Naval Facilities Command Interior Designers. Use of turn-key approach to FF&E procurement within military construction UH projects is directed to the greatest extent possible and practical. This will ensure a coherent UH FF&E package which promotes an increased QOL for occupants and makes the best use of funding. This applies to UH furniture, furnishings, and equipment for new construction (collateral equipment) and existing UH (whole room concept and replacement items).

3-7.11 Interior Signage, Artwork and Accessories.

Provide artwork for public areas, except storage rooms and maintenance areas. Coordinate graphics and interior signage to complement the architectural and finish materials. Provide attached or integral wall protection for recreational games such as dartboards and billiards. Provide bulletin boards in service areas and at the main entry. Provide interior signage, bulletin boards and wall protection devices as an integral part of the construction contract. Artwork is considered collateral equipment and will be included in the furnishings option. Provide interior signage at each room. Provide directional signage as required for way finding. Provide interior signage educating occupants on energy efficient and sustainable elements of the facility, particularly those elements with occupant control or influence. Educational signage should be permanent in nature but flexible for future additions/deletions of information. Utilize mechanical fasteners for interior signage.

3-8 LIFE SAFETY AND FIRE PROTECTION.

3-8.1 Sprinkler Systems.

All UH buildings are required to be sprinkled.

3-8.2 Fire Alarm Systems.

Install addressable building fire alarms systems and connect to the base reporting system.

3-8.3 Smoke Detectors.

Install smoke detectors for personnel housing facilities and power them from the building fire alarm system.

3-8.4 Carbon Monoxide (CO) Detectors.

Install approved carbon monoxide detectors in Navy and Marine Corps UH that contain carbon-based fuel burning systems. Use carbon monoxide detectors that are 24 Vdc

powered by the building fire alarm system. An alarm from the Carbon monoxide detector will cause the fire alarm system to activate a voice announcement stating the following," Carbon monoxide has been detected in the building. Please exit the building." The fire alarm system must send a separate signal via the base reporting system.

3-9 HEATING, VENTILATION, AND AIR CONDITIONING (HVAC).

Design and construct facilities to comply with UFC 3-401-01 and UFC 3-410-01. Apply smart building concepts using local loop technology. Avoid central controllers and monitors. Provide an HVAC system to give residents individual choice of heating and cooling year-round within each living area. Provide one thermostat per unit. All new buildings shall meet ASHRAE 62.1 or ASHRAE 62.2 ventilation requirements.

3-10 VENTILATION AND MOISTURE MITIGATION.

Design and construct new Navy facilities in accordance with ASHRAE 62.1 or ASHRAE 62.2, as applicable to facility size. Design and construct facilities to comply with UFC 3-401-01 and 3-410-01. Consideration should be given to all components of natural and mechanical ventilation to provide a system which is adequately sized and easily maintained to avoid excessive indoor moisture, mold growth, and poor indoor air quality.

Navy Renovation and Redesign projects must address building and unit ventilation and moisture management deficiencies, and endeavor to comply with ASHRAE 62.1 or 62.2. For new construction, redesign, and renovation projects, UFC 1-200-01 provides reference to the criteria governing moisture control.

3-11 SUSTAINABILITY.

Comply with the requirements of UFC 1-200-02.

3-12 COMMISSIONING.

Comply with the requirements of UFC 1-200-02.

3-13 PLUMBING.

Comply with the requirements of UFC 3-420-01. Avoid plumbing chases whenever possible by placing plumbing in wall cavities. Mechanical engineers, architects, and structural engineers must coordinate to plan and minimize the size and location of plumbing chases. Set fixture clearances for the intended occupants and use low-flow fixture requirements.

- Provide hot and cold water to public toilets, en-suite bathrooms, compact kitchens, janitor closets, and laundry rooms.
- Provide shutoff valves at all fixtures.
- Water Closets. Provide commercial quality, low consumption type water closets. It is recommended that areas with low water pressure use power-

flush type water closets. Use elongated, one-piece construction with a closed front seat and a lid. Provide matching water closets and bath fixtures in neutral color.

- Navy: Provide residential, tank-type water closets.
- Marine Corps: Provide flush-valve toilets, dual-flush manual type, and overhead rain fall type shower heads that meet low flow requirements set at a minimum of 75 inches (190.5 cm) above the shower base.
- Central Heads: For Navy recruits only, provide central heads in open-bay designs, including the following: Water closets 1 per 10 persons; Lavatories 1 per 10 persons; Individual Showers at 1 per 8 persons, or centralized showers with shower heads separated by partitions and tile floors sloped to drain.
- Provide hose bibs on exterior walls of each building at 100-foot (30 meter) intervals; in trash rooms and near rooftop mechanical units; frost-free as dictated by climatic conditions. Provide floor drains in all janitor closets, laundry rooms, public restrooms, and trash rooms.
- Provide a drinking fountain(s) with cooler for interior public areas. Include water bottle filling features.
- Domestic Hot Water System type is optional but must meet FEMP recommendations. Recommend building wide system.
- Natural Gas is prohibited in unit or room.
- Provide one Service Sink per floor.
- Use the following fixtures as standards: Washerless faucets at lavatories. Single lever faucets at tub/showers or shower stalls. Provide showerheads with maximum 2.2 gpm (8.3 lpm) flow rate. Locate showerheads a minimum of 75 inches (190.5 cm) above the floor.
- Showers are to have solid floor pans, with full height solid surface surround with separated shower stalls. New construction must provide a 12 ft2 (1.11 m2) shower space with a minimum dimension of 30 inches (76.2 cm). Renovation projects without redesign must provide a minimum 30-inch (76.2 cm) dimension and 9 ft2 (0.84 m2) in order to fit in existing space.
- Provide stainless steel kitchen sinks (double bowl), kitchenette (single bowl). All sinks to be provided with single lever faucets, sprayers are prohibited.

3-14 ELECTRICAL.

Provide site electrical utilities, interior distribution systems, communications and security, and site lighting according to core criteria referenced by UFC 1-200-01 and the latest installation design requirements. Provide site lighting to ensure occupants have a means of safely moving between outdoor spaces. Refer to the Installation Appearance

Plan in the selection of light poles and signs. Provide adequate site lighting where there is a change in grade requiring steps, near handicap and motorcycle parking areas, and near main entrances to buildings. Provide exterior lighting in parking areas, building entrances, and walkways.

Interior distribution systems include service entrance and distribution equipment, Televised Surveillance System (TVSS), dry type transformers, wiring devices, raceways, conductors, interior lighting systems, emergency power systems, lightning protection systems, hazardous locations, housing distribution, and systems furniture. Communications and security systems include telecommunications systems, television systems, electronic security systems (ESS), and intercommunication systems.

3-14.1 Ceiling Fans.

Ceiling fans are optional, except as noted below. Provide fans that are Energy Star compliant. Where included, provide ceiling fans in bedrooms and living areas within units. Also consider ceiling fans for multipurpose rooms and laundry facilities.

3-14.2 Power.

Provide electrical outlets appropriately adjacent to telecommunication outlets combined with television and telephone and computer data outlets. Provide duplex outlets in the compact kitchen or service areas. Provide a service panel located within the Unit or Room. Provide meter bases for all new and renovated buildings. Provide two USB charging outlets per occupant in each sleeping area.

3-14.3 Lighting.

Provide Energy Star certified lighting fixtures and lamps. LED lamps are preferred. Select fixtures to reflect a residential style, rather than institutional. Provide recessed hallway lighting (walls and ceilings). Suspended exit signs are prohibited. Surface mounted "pillow" or "cloud" light fixtures are prohibited for Navy. Recessed fixtures are preferred by Navy and allowed by Marine Corps.

3-14.3.1 Navy.

- Provide three-way switches at Unit/Room entrance and bedroom(s) doors. Also, provide motion sensor switches at closets, bathrooms and living rooms to control the light fixtures.
- Provide minimum 15 foot-candles lighting at the exterior of each unit or room entrance.
- Bedrooms: Provide overhead ambient lighting in bedrooms, separately switched and dimmed for each occupant side of the room. Ambient light level at desk height must provide a minimum of 30 foot-candles in each bedroom. The use of recessed and indirect fluorescent fixtures (T-8 730 lamps and electronic ballasts) is required by Navy.

- Bathrooms: Provide overhead ambient lighting and separate lighting at the lavatory mirror.
- Kitchens: Provide overhead ambient lighting, under cabinet lighting and lighting at sink.

3-14.3.2 Marine Corps.

- For direct entrance rooms, provide three-way switches at the entrance door and in the vanity area so that the living room and bedroom area lighting is controlled at either location. Also, provide motion sensor switches at bathroom doors to control the bathroom light fixture.
- Provide one exterior light fixture outside each room entrance door for exterior entry designs.
- Bedrooms: Provide overhead adjustable level ambient lighting in bedrooms; separately switched/dimmed for each occupant side of the room. Coordinate this with the furnishings plan. Marine Corps uses both indirect fluorescent fixtures (T-8 730 lamps and electronic ballasts) and dimmable LED lighting is allowed. Do not rely solely on table lamps for room lighting. Ambient light level at desk height must provide a minimum of 30 foot-candles in each bedroom. Indirect “cove” lighting is preferred.
- Bathrooms use fluorescent or LED lighting fixtures. Provide overhead lighting and valance lighting at the lavatory mirror. Use recessed valance or under counter (task) lighting in service area.
- Carefully consider the coordination of lighting with ceiling fans.
- Provide appropriate lighting and consider providing a recessed light at each entrance in addition to standard overhead corridor lighting.

3-14.4 Appliances.

Provide residential grade appliances, "Energy Star", CEE Tier 2 compliant.

3-14.4.1 Navy and Marine Corps.

- Washing machines: Minimum 3 c.f. (0.08 c.m.), top-loading where space accommodates. Size in-unit Laundry Area to accommodate a variety of available washing machines, including front loading, to ease future replacement. Where stackable washers and dryers are planned, specify that they can be separated and used and replaced separately.
- Dryers must be electric.
- Garbage disposal: 1/2 HP minimum, with SS impellers and sound insulation.
- Range: Free standing glass top electric 30-inch (76.2 cm) width.
- Cooktop: Minimum two burner electric cooktop.

- Exhaust Hood: Provide three speed vented exhaust fan, maximum 5.0 sones with dual light settings. Vent to exterior.

3-14.4.2 Navy.

- Appliances must be color white.
- Refrigerator: Kitchen 18-22 c.f. (0.5-0.62 c.m.); Kitchenette 16-19 c.f. (0.45-0.54 c.m.); Service Area 10-16 c.f. (0.28-0.45 c.m.)
- Microwave: Kitchen/Kitchenette 1500 watts; Service Area 1200 watts.
- Dishwashers are prohibited in new construction and renovation projects. Existing dishwashers may be replaced in renovation projects as applicable.
- Bathroom Exhaust Fan: Maximum 1.0 sones, minimum 50 cfm. Humidistat control preferred, with delay-off at switch.

3-14.4.3 Marine Corps.

- Dishwasher: Minimum 24-inch (60.96 cm) width.
- Refrigerator: Service Area 10.3 c.f. (0.29 c.m.); Kitchens (SNCO/BOQ), 18-22 c.f. (0.51-0.62 c.m.)
- Microwave: 1200 watts.
- Bathroom Exhaust Fan: Maximum 1.5 sones, minimum 50 cfm. Humidistat control preferred, with delay-off at switch.

3-14.5 Emergency Power.

Emergency power is not required in UH.

3-14.6 Telecommunication Service.

Provide in each Unit/Room a permanently installed conduit raceway system, supporting future needs of telecommunication systems. Provide a minimum of one outlet for each bedroom and one for each living room, located for flexibility and easy furniture access. Do not provide outlets in open bay berthing spaces. Navy UH and Marine Corps UH currently receive wireless internet service from service-wide contracted provider; coordinate to provide ample equipment space to meet the needs of this service.

3-14.7 Cable Television.

Navy requires no cable television service to each unit, but does permit vendor installation to each unit, through the Installation’s contract. Navy does require cable television service in each building, to be provided in common areas, such as lounges and lobbies.

Marine Corps requires cable television service in each building. Provide a permanently installed conduit raceway system for cable television system media. Refer to specific Plan for additional details.

3-14.8 Intrusion Detection/Monitoring systems (IDS).

Navy requires provision of conduit with pull strings and boxes for future installation of Intrusion Detection/Monitoring (IDS) systems that can cover building entrances/exits, entrance/elevator lobbies and hallways. With respect to "centrally monitored", the requirement is only something that is "central" to the building rather than central "base-wide". Provide IDS systems and Access Control systems with BMS switches (fixed) and card swipes (fixed) along with conduit, wiring and a "basic" monitoring panel, (fixed). Provide an appropriate location for a "stand-alone" card station.

3-14.9 Closed Circuit Television (CCTV) Systems.

Provide conduit systems with pull strings and outlet boxes to accommodate later installation of a monitoring system as part of all new construction. System to include all common areas such as hallways, lobbies, lounges, classrooms/special use rooms, common kitchens, game rooms, laundry rooms, vending areas, stairwells (interior and exterior), elevators, entrances and exits, building exterior and additional areas/facilities adjacent to the UH facility.

Navy: CCTV systems are Not allowed without prior authorization as per CNIC M 11103.2 (CNIC Note pending N00 sig).

3-15 GENERAL SPACE REQUIREMENTS FOR UH FACILITIES.

3-15.1 Laundry Facilities.

Laundry facility requirements vary. Refer to the detailed descriptions in Chapters 4 and 5.

3-15.2 Resident Bulk Storage.

Examples of items typically stored in bulk storage areas include luggage, original stereo system cartons, snow tires, bicycles, surfboards, ski equipment, and other sports gear. Resident bulk storage requirements vary by Unit or Room plan. Refer to the plan’s chapter for details.

3-15.3 Utility Area (Space).

Provide appropriate space for the mechanical and electrical systems and telecommunications. These rooms are calculated at between 6% and 10% of the Gross Building Area. This includes: Main Mechanical room at ground floor, Electrical control closet, Electrical room, Elevator Equipment room, Mechanical room on each floor, and main vertical duct space (floor to floor). A dedicated fire pump room is not included in these allowances.

3-15.4 Elevators.

Elevators are intended for the movement of furniture and people. Provide elevators sized to accommodate movement of both furniture and a medical stretcher for personnel. Provide elevators and rooms which support elevator operations meeting the requirements of UFC 3-490-06. Special consideration is to be given to protecting elevators from harmful weather conditions. Additional gross area may be added for high-rise construction. Refer to paragraph 2-9.3 entitled “High Rise Structures and Additional Gross Area.” for details. The following is guidance for new construction.

Additional elevators may be provided at the discretion of the Installation Commander. Conduct Client Surveys and Traffic Studies to determine the number of elevators. Provide the following for new construction at a minimum:

- Two elevators are required for buildings 2-5 stories;
- Three elevators are required for buildings 6-7 stories;
- Four elevators are required for buildings 8 stories or higher;
- Marine Corps Recruit Facilities require a minimum of one elevator.

3-15.5 Circulation.

Design interior corridors to emphasize each quarter’s entrance, and to de-emphasize length or “tunnel vision.” Size the corridor to provide a minimum clear width to accommodate two persons with suitcases, and a base minimum of 5 feet (1.52 meters). Ensure that exterior walkways have non-slip surfaces and drain away from the building.

3-15.6 Multi-Purpose Areas (Spaces).

Multi-purpose areas (spaces) are for individual recreation, group activities, training, and meetings. Multi-purpose space requirements vary by plan. Refer to the specific plans in Chapters 4 and 5 for details.

3-15.7 Game Rooms.

Requirements for Game Rooms vary by plan. Refer to the specific plans in Chapters 4 and 5 for details.

3-15.8 Vending Area (Space).

Discuss vending area, machine quantity and the desired type with the installation and the local Navy Exchange General Manager/Vending Manager or the Marine Corps Community Services Director as appropriate. Provide space adjacent or co-located to the Multi-Purpose Room.

3-15.9 Public Toilets.

Navy: provide public toilets adjacent to lobby and public areas. Provide commercial grade fixtures. For a 96-person project, provide a minimum of one water closet, one

urinal, and two sinks in the men's toilet and two water closets and two sinks in the women's toilet. Add one of each fixture for each increment of 100 persons; to a maximum of five of any fixture type. Provide floor and wall finishes as described in Tables 3-1 and 3-2. Use solid surfacing material for lavatory counters and solid plastic, continuous anchorage toilet partitions. Provide a floor drain placed out of the usual traffic pattern and close to the water closets. Provide appropriate dispensers for soap, towels, toilet tissue, and recessed waste receptacle. A single unisex toilet may be adequate for smaller capacity UH.

Marine Corps: requirements are described in Chapter 5.

3-15.10 Janitorial.

Requirements for Janitorial vary by Plan. Refer to the specific unit or plan for details.

3-15.11 Administrative Area (Space).

Requirements for Administrative areas (spaces) vary by Plan. Refer to the specific Plans in Chapters 4 and 5 for details.

3-15.12 Lobby, Vestibule, and Reception.

Lobby, Vestibule, and Reception vary by Plan. Refer to the specific plans in Chapters 4 and 5 for details.

3-15.13 General Maintenance Room

Locate on main entry level, size to be coordinated with the overall Base needs or Housing Complex needs. Where room will only serve the individual UH facility, size at 150 NSF (13.9 NSM) for <100 rooms plus 0.5 NSF (0.046 NSM) per each additional room (rooms are double occupancy).

3-15.14 Trash rooms

For facilities exceeding 3 stories, provide a trash chute to dumpster at main level. Provide fully walled room at each level for trash chute access, 64 ft^2 (min) to 100 ft^2 (max).

3-16 FALL PREVENTION AND PROTECTION.

Any location of the UH including accessing the roof structure or equipment that requires future maintenance work and exposing maintenance personnel to falls from heights above 4 feet, must incorporate prevention and control measures into the design. This is to protect personnel working at heights and exposed to fall hazards in accordance with OPNAVINST 5100.23H.

This Page Intentionally Left Blank

CHAPTER 4 NAVY UNITS

This Chapter describes the variety of units to be constructed, or Redesigned to, for Navy unaccompanied enlisted personnel. New construction must correspond to the current Construction Standard for the type of personnel to be housed. In accordance with DOD 4165.63-M and CNO direction, the construction standard for the Navy's core requirement (E1-E4) is a Market Unit. Restoration and Modernization (RM) project teams should take into account both the current DoD and Navy construction standards for the type of personnel, as well as the current layout of the facility, to determine best practices. RM project teams must utilize the Business Case Analysis process to determine whether renovation or replacement construction is more cost effective.

4-1 NEW CONSTRUCTION REQUIREMENTS.

- Construction of new Units for Permanent Party (E1-E6) must be the 2-bedroom double occupancy Market Unit, reference Figure A-1.
- Construction of new Units at remote locations where higher pay grades are housed in UH (E7-O10) must be the 1-bedroom Market Unit.
- Construction of new Units for Mission Essential must be the Navy 2+0 Unit, reference Figure B-4.
- Construction of new Units for Students (Training Necessity) must be the NETC 2+0 Dormitory Unit, reference Figure B-5.
- Construction of new Units for Recruits must be Open Bay Berthing (refer to Chapter 6).

4-1.1 Adaptable Units.

In new construction projects, provide a minimum of two easily "adaptable" rooms on the ground floor to allow assigned service members with minor injuries to remain with their Units or within proximity to their shipmates. To determine the quantity of units or rooms required in a project, take into account the number of rooms provided in other UH facilities and include the quantity of rooms in the current project to meet the total required. Adaptable rooms allow flexibility to accommodate the temporary requirement to house Members who are temporarily unable to climb stairs or have only limited mobility. These type facilities are not intended to house wounded warriors who require long term medical care. See Chapter 2 for additional information on "Adaptable Units".

4-2 MARKET UNIT PROJECTS.

Market Units have floor plans similar to comparable private sector housing, including entry areas, living room, kitchen, laundry, bedrooms, baths, and storage; see Figures A-1 and B-1, B-2. In new construction projects, Market Units must be 2-Bed/2-Bath. 1-Bed/1-Bath Market Units are authorized only at remote locations with a requirement to house personnel ranking E7-O10. Refer to Table 4-1 for space and area requirements. Dimensional requirements are not fixed but must remain functional and include all required features.

Table 4-1 Market Unit Square Footages

Market Unit Type	Minimum Areas (Net Square Feet (Net Square Meters))					Laundry (In-Unit / Common)	Minimum / Maximum Allowable Areas		Navy GSF per unit programmed amount (note 4)
	Bedroom (note 1)	Bedroom Closet (provide 2 per bedroom)	Shower /Toilet area (per bathroom)	Living / Dining Area (Note 2)	Kitchen		Construction Minimum GSF per Unit (note 3)	Construction Maximum GSF per Unit (note 3)	
2-Bed/2-Bath	144 (13.4)	12 (1.1)	40 (3.7)	N/A	55 (5.1)	IU	850 (79.1)	1290 (120.1)	1,212 (112.6)
1-Bed/1-Bath	144 (13.4)	12 (1.1)	40 (3.7)	N/A	55 (5.1)	IU	750 (69.8)	1050 (97.7)	1,028 (95.5)

Note 1: Bedroom area is Net Square Feet, specifically as defined by DOD 4165.63-M.

Note 2: No minimum living/dining area requirements.

Note 3: Construction Minimum and Maximum Gross Square Feet includes building circulation and common areas, as defined by DOD 4165.63-M.

Note 4: Navy requirements represent the Navy Programming standard inclusive of building circulation and common areas.

4-2.1 Market Unit Detail Requirements.

Refer to Chapter 3 for mechanical, plumbing, electrical, and telecommunication requirements.

4-2.1.1 Living/Dining Room.

Living/Dining Rooms can be a single shared space or two discrete spaces and must be sized to accommodate all occupants at one time. At a minimum, living rooms must accommodate a two-seat sofa, two lounge chairs, occasional tables, table lamps, in an arrangement for viewing a flat screen television. Provide a minimum of one hall/entry closet with shelf and coat rod. Dining areas must accommodate all occupants at one time.

4-2.1.2 Bedrooms.

Size bedrooms to accommodate two extra-long twin beds, two desks and two desk chairs. Provide wall mounted full height mirror, located to be able to be used by either occupant. Provide two closets per bedroom, equally sized. Closets must have a minimum of 4 lineal feet of hanging space and 4 lineal feet of 15” deep shelving space above. Lowest shelf must be no less than 30 inches AFF allowing for bulk storage below.

4-2.1.3 Laundry.

Units require in-unit laundry. Provide a full-size Energy Star CEE Tier 2 top-load washer and a full-size dryer in each Unit. Size laundry closet to accommodate a variety of top and front-loading washing machines, such that options will be available for replacement equipment in the future. Provide drip pan and drain in floor slab, tie this plumbing to restroom, kitchen, or other regularly used drain with trap. Include space in laundry closet for storage of one full size ironing board and iron, one shelf for product storage, and one hanging rod for clothes.

4-2.1.4 Kitchens.

Provide upper and lower cabinets, at least 3 lineal feet of uninterrupted countertop as food preparation area, two compartment sink, and full-sized residential grade appliances. For any galley or u-shaped layout, provide a minimum of 4 feet (1.22 m) between countertop edges. Overall, cabinet layout must provide a minimum of 75 c.f. (2.12 c.m.) of storage space behind a variety of doors and drawers. Appliances must include refrigerator/freezer, microwave, garbage disposal, range (or electric 4-burner cook top and oven), and range hood. Dishwashers are not authorized. Provide Energy Star Certified and CEE Tier 2 appliances. See additional appliance and ventilation requirements in Chapter 3.

4-2.1.5 Bathrooms.

Each bathroom is to be designed to provide two separate areas: a Shower/Toilet room and a Lavatory/Vanity area. In the case of remote locations authorized to construct 1-Bed/1-Bath units, provide a one room bathroom.

- Each Lavatory/Vanity Area will contain one sink, two medicine cabinets, and associated fixtures. Vanity must be a continuous counter surface at least 2 feet (0.61 m) deep and 4 feet (1.22 m) wide with a centrally located bowl. Base cabinetry must include a two-door storage area and minimum two drawers. Shield bedroom from spillover light from vanity.
- Each Shower/Toilet Room will contain a water closet and shower in a separate enclosed room, located adjacent to the Lavatory/Vanity Area. Locate toilet within a clear space at least 4 ft (1.22 m) in width; shower must be a minimum size of 12 ft^2 (1.1 m^2). See ventilation requirements in Chapter 3.

4-2.1.6 Doors and Locks.

Electric locks are required on Market Unit entrance doors, bedroom doors, and closet doors. Refer to Chapter 3.

4-2.2 Market Unit Building Common Areas.

Provide the following common areas. Mid/High-rise construction (over 3 stories) will have added common areas as identified.

4-2.2.1 Circulation.

Provide Corridors, Interior Stairways, and Elevators (optional/per local code requirements).

4-2.2.2 Building Utilities.

Provide Mechanical Rooms, Electrical Rooms, and Telecommunications Rooms sized to accommodate the building requirements. See UFC 3-580-01 for minimum telecom room size and system requirements.

4-2.2.3 Trash Chute (over 3 stories).

Provide a trash chute to dumpster at main level. Provide fully walled room at each level for trash chute access – see Chapter 3 for trash room sizing. At base of chute, provide dumpster room with lighting, ventilation, hose bib and floor drain. Trash compactors are optional. Provide only waterproof washable surfaces in trash and dumpster rooms.

4-2.2.4 Janitorial.

Janitorial includes vacuum cleaner storage and janitor’s sink and faucet, as well as storage for maintenance supplies per floor.

4-2.2.5 Vestibule and Lobby.

Provide vestibule with entrance mat of type and size to be effective for sustainability requirements. Provide lobby space in proportion with capacity of building and locate to facilitate way finding for residents and guests. At a minimum, provide a waiting/lounge area with one seat per eight Units in building. Design lobby and vestibule space to allow pedestrian traffic into building without passing through waiting/lounge area.

4-2.2.6 Reception/Front Desk.

Coordinate size with overall Base needs for check-in space; do not duplicate functions which are already accommodated in other UH buildings. If functional space is inadequate in an existing facility, consider including this space of an adequate size in new construction projects.

4-2.2.7 Offices/Administration Area.

Identify specific requirements to avoid future conversion/loss of assignable spaces. Do not duplicate functions which are already accommodated in other UH buildings. If functional space is inadequate in an existing facility, consider including this space of an adequate size in new construction projects.

4-2.2.8 Bulk Storage Room.

Storage room(s) may be provided for both UH Management and occupant storage. Storage room(s) must be climate controlled. Occupant storage lockers/areas, if provided, must be a minimum 50 c.f. (1.42 c.m.), securable by occupants.

4-2.2.9 Public Toilet.

Located at main entry level, provide a minimum of one male and one female restroom. Coordinate placement with multi-purpose rooms; and provide additional restrooms to accommodate occupancy of large multi-purpose rooms, including those located on other floors.

4-2.2.10 General Maintenance Room.

Locate on main entry level, size to be coordinated with the overall Base needs or Housing Complex needs. See Chapter 3 for sizing information.

4-2.2.11 Multi-purpose Room/Rooms.

Provide a combination of room types (including game room, lounge, and meeting room), at a minimum of 5 ft^2 (.47 m^2) per planned occupant to a maximum of 10 ft^2 (.93 m^2). Plan for space usage to change in the future and provide maximum flexibility. Isolate these areas acoustically and locate them close to public toilets when possible. Provide finishes that are easily cleaned and durable. Provide cabinets and counter space for minor food service and to accommodate a microwave oven. Provide locked storage for related supplies and equipment. Provide rooms with light and power for general use. Room lights must be controllable to accommodate multiple uses. Provide window coverings and hardware to allow for darkening of the room with blinds or shades.

4-2.2.12 Vending Area.

Coordinate vending area size with the Base needs or the Housing Complex needs. Do not duplicate functions which are already accommodated in other UH buildings. For large buildings, allow space for a minimum of four full-sized commercial vending machines with front facing circulation; three soft drink machines and one snack vending machine is typical. Allow a minimum recess of 40 inches (1 m) from the rear wall to the soffit. The minimum clearance from the finish floor to the soffit is 80 inches (2 m) for soft drink machines and 74 inches (1.9 m) for vending machines. Minimum space requirements for the vending areas are 180 inches (4.5 m) long x 84 inches (2.13 m) wide x 80 inches (2 m) high from finished space to finished space.

Locate vending areas on the ground floor with access from the parking areas. Locate vending space for security of users and for ease of service. Secure vending machines to prevent tipping. Provide appropriate sound isolation between vending and other spaces. Recess the machines into the wall or use materials to create a recessed appearance. Drop the soffits above the machines to the top of the machines but allow for proper cooling and heat dissipation. Coordinate paint or wall coverings with the interior designer's concept of the facility. Mirrored panels, cove lighting, and neon lights are optional, but desirable. Provide vending areas with appropriate outlets for appliances. Provide space for at least one waste receptacle and one recycling container. Provide an accented slip resistant floor surface and a dropped ceiling with open grid type panels or acoustic tiles to accent the vending area. Provide a retail commercial lighting level in this area.

4-2.2.13 Linen/Housekeeping Room.

Locate linen and housekeeping rooms, where provided, to maximize building functionality.

4-2.3 Market Unit Site Amenities.

Provide picnic and barbecue areas for 5% of the resident capacity; locate picnic tables and covers immediately adjacent to barbecue. Provide spaces appropriate for large and small groups. Provide other amenities as identified in the Recreational Services Assessment.

4-3 NAVY 2+0 UNIT.

This Unit type includes double occupancy living/sleeping area, two personal closets, and a separated toilet and shower compartment with a single bowl lavatory/vanity in the service area. Refer to Figure B-4. Access is from an interior corridor. <u>The construction of 2+0 Units is only authorized for Military Essential housing requirements.</u>

- Gross Building Area: Refer to paragraph 2-9.3 entitled "High Rise Structures and Additional Gross Area".
- Minimum Net Square Footage as defined by DOD 4165.63-M: 180 ft^2 (16.7 m^2).

4-3.1 2+0 Unit Detail Requirements.

4-3.1.1 Living/Sleeping Area.

Design room for double occupancy. Room dimensions are not fixed but must remain functional to accommodate two twin extra-long beds, two desk units, two desk chairs, and appropriate dresser drawer storage. For newly constructed facilities, the Sleeping Area must meet the Minimum Net Square Footage per DOD 4165.63-M as indicated above. For renovated and redesigned facilities, it may be appropriate to meet the Minimum Net Square Footage by combining both Sleeping Area and Service Area square footage.

4-3.1.2 Personal Closets.

Minimum 22 ft^2 (2 m^2) Net Area required. Provide one closet for each resident. Provide each closet with closet organizers with storage capability extending to the ceiling. Provide continuous ventilation in closets to resist mold and mildew growth. A light inside the closet with motion-activated control is preferable, but carefully placed lighting outside 2 ft (0.6 m) deep closets is acceptable.

4-3.1.3 Bathroom.

Provide a single lavatory and valance lighting in the service area with two medicine cabinets.

Provide a separate compartment with full-sized shower (12 ft^2 (1.1 m^2)) and water closet. Provide towel/toiletry hardware for two residents. Provide a full-length framed mirror mounted on Service area side of one door.

4-3.1.4 Service Area.

For Shared Units in a newly constructed facility, the Service Area is the corridor/service space within the unit that is not incorporated into the Net Square Footage. The service area provides access to the storage closets, bathroom, and a kitchenette. Kitchenette must include refrigerator, microwave, single bowl sink, and some counter and cabinet space. Kitchenette sink is separate from lavatory/vanity bowl.

In renovated and redesigned facilities, it is appropriate that Net Square Footage per DOD 4165.63-M may be achieved by combining both Sleeping Area and Service Area square footage.

4-3.1.5 Locks.

Electric locks are required on building entrance doors, Unit doors, and closet doors. See Chapter 3.

4-3.2 2+0 Unit Building Common Areas.

Provide common spaces as detailed for Market Unit Buildings, reference paragraph 4-2.2 entitled “Market Unit Building Common Areas”. Additionally, provide a common Laundry room(s), with a minimum one washer and two dryers for every 15 occupants.

4-4 THE NAVY (NETC) 2+0 DORMITORY UNIT.

This room plan includes double occupancy living/sleeping area, two personal closets, shared toilet with a separated shower compartment, and single bowl lavatory in the service area. Access is from an interior corridor.

- Gross Building Area: Refer to paragraph 2-9.3 entitled “High Rise Structures and Additional Gross Area”.
- Gross Room Area: 380 ft^2 (35.3 m^2) in the example plan.

- Net Living/Sleeping Area: 180 ft^2 (16.7 m^2) is the required MINIMUM size per bedroom.

4-4.1 Unit Details.

- Living/Sleeping Area. Bedrooms are intended for double occupancy. Bedroom dimensions are not fixed but must remain functional to accommodate two twin extra-long pop-top captains' beds with double storage compartments below, storage headboard; two computer/TV wall desk units with built-in under-cabinet lighting, two chairs, and at least one credenza with double sided drawers.
- Heads. Heads and fixtures are to be of residential design, quality, and finish. Provide a single lavatory and valance lighting in the service area, a separate compartment with full sized shower, and separate compartment with water closet with shelving. Provide towel/toiletry hardware for two residents. Provide a full-length framed mirror mounted on Service area side of one door.
- Personal Closets. 22 ft^2 (2 m^2) Net Area required. Provide at least one closet for each resident. Provide each closet with closet organizers with storage capability extending to the ceiling. Provide additional storage in service areas as appropriate. Provide closets full height, using the space above the normal door height for bulk storage. Provide continuous ventilation in closets to resist mold and mildew growth. Provide integral full-length hanging rods for coats and shelves. A light with motion-activated control is preferable, but carefully placed lighting outside 2 ft (0.6 m) deep closets is acceptable. Secure closets with standard hinged doors with non-removable pin hinges and locking hardware. Provide padlocking slide bolt hardware for personal closets. Bi-fold and sliding doors are not acceptable.
- Service Area. This term refers to the corridor/service space within the plan that is not incorporated into the Net Living/Sleeping Area. The service area in the plan provides access to the personal closets, head, a FAR Rated, Energy Star, 2-door refrigerator (10.3 cu. ft maximum) and microwave, and small counter space with the single bowl sink.
- Locks. Electric locks are required on building entrance doors, Unit doors, and closet doors. Use a magnetic key card system with hard key override.

4-4.2 Building Common Areas (Required).

The following spaces are REQUIRED common spaces. The net areas shown are approximations to assist the designer.

- Entry Vestibule. 50 ft^2 (4.5 m^2) Net Area. Provide automatic entry doors and weather vestibule. This area serves as the controlled single point of entry/exit quarterdeck as part of the Navy Military Training (NMT)

environment. Install an alarm system at other points of emergency egress, which would activate when door is opened.

- Duty Office. 125 ft^2 (12 m^2) Net Area. Include a duty office designed to provide the staff with a secure, efficient, and comfortable environment from which to manage the building. Provide area for one desk with computer.
- Duty Bunk. 80 ft^2 (7.5 m^2) Net Area. Provide lockable room for one bed and one wall locker. Locate adjacent to the Duty office.
- Unisex Restrooms. 45 ft^2 (4.5 m^2) Net Area. Provide one water closet, and one lavatory with associated hardware.
- Elevator. 85 ft^2 (8 m^2) Net Area each. (Elevator machine room area is excluded.) See Chapter 3 for added details.
- Vending. 85 ft^2 (8 m^2) Net Area. Provide space adjacent or co-located to the Multi-Purpose Room. Allow space for a minimum of four full-sized commercial vending machines with front facing circulation - three soft drink machines and one snack vending machine is typical. Discuss vending area, machine quantity and desired type with the activity and local UH Manager.
- Multi-Purpose Room. Calculate room size based on 6.25 ft^2 (0.58 m^2) minimum to 12.5 ft^2 (1.16 m^2) maximum area for each occupant. Includes spaces such as: Lounge, Meeting, Conference, Classroom(s), or other appropriate spaces. Isolate the area acoustically and locate them close to public toilets. Provide cabinets and counter space for minor food service and to accommodate a temporary microwave oven, waste receptacles, and other similar food warming equipment. Provide locked storage for related supplies and for equipment. Provide rooms with light and power for resident's general use and provide light dimmers. Provide window coverings and hardware to allow for darkening of the room with blinds or shades. With the military requirement of service members to access the internet to review military records and conduct personnel administration, multi-purpose rooms are required to be wired with infrastructure to support high speed internet access. Provide a minimum of two (2) eight-pin data ports wired with Category 5e wiring and clean power in each multi-purpose room.
- Laundry Room. Calculate room size based on 50 GSF (4.65 GSM) per 1 washer/2-dryer module. Provide 1 washer/2-dryer module for every 15 residents, as a minimum. Stacked units are acceptable. Locate laundry rooms (at the ground floor for NETC 2+0 Dormitory Unit only) for easy access and provide acoustic separation from other areas. Provide adjacency to a Multi-Purpose room as appropriate. Provide 12 linear feet (3.66 m) of folding table(s), clothes hanging area with hanging rods and 4 ft (1.25 m) of full height hanging for drip-dry clothing. Set aside a space of 36 inches x 72 inches (915 mm x 1829 mm) for soap, bleach, fabric softener and other laundry aid vending in each laundry facility.

- Janitor Closet(s). 90 ft^2 (8.5 m^2) Net Area. Provide a minimum 5 ft x 3 ft (1.5 m x 0.9 m) closet for permanent party facilities at each floor. At each floor level, provide a 5 ft x 5 ft (1.5 m x 1.5 m) closet for Transient facilities. In addition, for transient facilities, provide one secure space of about 250 ft^2 (23 m^2) net area for housekeeping equipment and supplies. Finish floor, base, and wall at the mop receptor to resist water. Slip resistant quarry tile or ceramic tiles are examples of acceptable finishes. Provide a motion-activated light. Provide a janitor's sink with drain, and basic storage for mops and one commercial grade floor polisher.
- Mechanical and Electrical Room(s). See Utility Area (Space) requirements in Chapter 3.
- Corridors. Travel distance from corridor door of any guest room to the nearest exit is limited by Code.
- Stair Towers. Estimate each exiting stair tower at 170 ft^2 (16 m^2) net area per floor. Enclose exterior stair towers or provide open-air per locale and building configuration.

4-4.3 Building Common Areas (Optional).

The following common spaces are OPTIONAL.

- Admin/Office Space. Provide other administrative office spaces as required within approved gross area constraints.
- Game Rooms. Acoustically isolate game rooms as appropriate. Include appropriate electrical outlets, and place close to public toilet(s). Design the rooms for installation of electronic video games. Locate within building design for appropriate monitoring by Marine Corps UH personnel. Provide rooms with substantial natural lighting.
- Resident Bulk Storage. Resident Bulk Storage as required.

4-4.4 In-Room Services.

See Chapter 3 for requirements for in-Room telephone, cable television and Local Area Network Systems (LAN).

4-5 OPEN BAY PLAN.

This construction standard is current for Recruits. See Chapter 6.

4-6 RESTORATION AND REDESIGN REQUIREMENTS FOR NAVY.

Refer to paragraph 3-3.1 entitled “Navy RM” for specifics concerning RM requirements for Navy projects.

4-6.1 Renovation.

Several previous Construction Standards are still considered adequate Unit design for housing Permanent Party unaccompanied enlisted personnel. As such, when facilities with adequate Unit Types are programmed for an RM project, the project team must endeavor to include features and benefits of current Construction Standards without Redesign, while providing best return on investment.

4-6.1.1 Adequate Previous Construction Standards/Unit Types.

Existing 1+1, 1+1E, and 2+0 Types, when minimum bedroom sizes are met see paragraph 4-6.3 entitled “Renovation and Redesign Criteria" below, are acceptable Unit plans. Project teams must apply the recommendations in the paragraph entitled “Renovation and Redesign Criteria" to the specific facility in question to determine best practices, ideal return on investment for the Navy, and how to best return adequate quarters for unaccompanied personnel. For example, considerations should include re-working single user bathrooms to the separate lavatory/vanity area and toilet-shower room when the project scope already includes bathroom work.

4-6.2 Redesign.

Several previous Construction Standards are inadequate for Permanent Party unaccompanied enlisted personnel. As such, when facilities with those Unit Types are programmed for an RM project, the project team must select the optimum solution for reconfiguring and most efficiently utilizing the existing footprint, providing best return on investment.

4-6.2.1 Previous Construction Standards/Unit Types.

Redesign existing Open Bay and Gang Head Unit Types, such as Motel or Tower, when planned to house Permanent Party Sailors. Existing Open Bay/Gang Head Unit Types must be redesigned when planned to house Students, subject to individual school requirements. Refer to the recommendations below for the specific facility to determine best practices, ideal return on investment for the Navy, and how to best return adequate quarters for unaccompanied personnel.

Permanent Party Barracks:

- Redesign Open Bay or Gang Head buildings to Navy Shared 2+0 Units
- 2+2 Units may be Redesigned to Market or 2+0 Units based upon the BCA.

Student Dormitories:

- Open Bay or Centralized Head buildings should be redesigned to NETC 2+0 Dormitory Units, requirements vary by school

4-6.3 Renovation and Redesign Criteria.

SRM Project Teams are responsible for evaluating optimum return on Navy investment for the specific facility in question, and providing a BCA as required above. For renovation or redesign projects, incorporate design features of current Unit Types whenever practicable. The following list is relevant for all Unit Types except as noted otherwise.

- In RM projects, provide, replace, or upgrade Fire Protection (Sprinkler & Fire Alarm) Systems to meet current requirements.
- Redesign projects must return the following minimum Bedroom area (NSF): Shared Unit = 180 ft^2 (16.7 m^2); Market Unit = 144 ft^2 (13.4 m^2) with no more than two Sailors per bath.
- In renovation projects, retain existing Bedroom size, except where built-in closets are being added. Renovated bedrooms must provide a minimum 90 NSF (8.36 NSM) per occupant.
- Bathroom Configuration. Where economically feasible and load bearing structure allows, provide separate lavatory/vanity and shower-toilet areas. Provide one medicine cabinet per potential occupant. Meet bathroom ventilation requirements in Chapter 3.
- Closet Sizing and Organization: Renovation projects should, and Redesign projects must, comply with current closet standards, Reference Chapter 3.
- HVAC: Projects must meet applicable energy conservation criteria as identified in UFC 1-200-02, including occupant HVAC controls in unit.
- Ventilation: Renovation projects should, and Redesign projects must, meet applicable criteria of ASHRAE 62.1 or 62.2.
- Laundry: Central laundry is not mandatory but is acceptable in existing buildings being renovated. Redesign projects should evaluate feasibility of relocating Laundry in the Unit. In-Unit, stacked full size washer/dryers are acceptable in Redesign projects. If central laundry will remain, provide one washer and two dryers per 15 Sailors.
- Kitchenette: For renovation and redesign projects returning 2+0 Units, provide a kitchenette meeting the following minimum requirements: Single bowl stainless steel sink; Base and wall cabinets; Microwave; Minimum 16 c.f. (0.45 c.m.) refrigerator. Where feasible, two-burner electric cook top if the building has no common kitchen.
- Building Common Areas: At Installations with surplus housing capacity, Renovation and Redesign project teams should evaluate the conversion of assignable building area to Common Areas, defined for new construction earlier in Chapter 4, to improve Sailors Quality of Life and ‘right size’ building capacity.

CHAPTER 5 MARINE CORPS ROOM PLANS

This chapter describes the variety of room plans to which Marine Corps unaccompanied enlisted personnel and single non-commissioned officers are assigned.

5-1 DESIGN PARAMETERS.

These plans are the basic building blocks from which Marine Corps UH designs are developed. The building layouts are provided to promote uniformity. All plan features must be included as a mandatory minimum.

- Building Gross Area must not be exceeded.
- Room Plan dimensions are NOT fixed but must remain functional. Size bedrooms to accommodate two extra-long twin beds. Room Plans are accessed from an interior corridor, or an exterior open breezeway.
- Adaptable Rooms**.** The Marine Corps will provide two easily adaptable rooms at the ground floor of new construction projects to allow Marines with minor injuries to remain with their group. Fully accessible rooms are NOT intended; rather to serve those who are temporarily unable to climb stairs. This billeting is not intended for wounded warriors who require long term medical care. This is not part of the accessibility requirements of the DoD Memorandum, Accessibility for People with Disabilities. Refer to paragraph 2-4 entitled “Accessible Units”.

5-2 MARINE CORPS 1+1E ROOM MODULE (OCONUS USE ONLY).

The 1+1E Room Plan Module has been approved as the standard for future UH built at Marine Corps Installations in Japan, instead of the 2+0 Module. Access is from an interior corridor, or conditioned or open breezeway.

- Gross Room Area: 600 ft^2 (56 m^2) (Example plans are notional).
- Net Living/Sleeping Area: 155 ft^2 (14.4 m^2) is the required MINIMUM size per bedroom.

5-3 MARINE CORPS 2+0 ROOM.

This room plan includes double occupancy living/sleeping area, two personal closets, shared toilet with a shower compartment, and sink service area. Access is from an interior corridor, conditioned or open breezeway.

- Gross Room Area: 387.5 ft^2 (36 m^2) (Example plans are notional).
- Net Living/Sleeping Area: 180 ft^2 (16.7 m^2) is the required MINIMUM size per bedroom.

5-3.1 Room Plan (Spaces) Detailed.

- Living/Sleeping Area. 180 ft^2 (16.7 m^2) Net Area required. Bedrooms are intended for double occupancy. Bedroom dimensions are not fixed but must remain functional to accommodate two twin extra-long pop-top captains beds with double storage compartments below, storage headboard; two computer/TV wall desk units with built-in under-cabinet lighting, two chairs, and at least one credenza with double sided drawers.
- Heads. Heads and fixtures are to be of residential design, quality, and finish. Provide a double vanity with double lavatory and valance lighting with double medicine cabinets, a full-sized shower, and water closet with shelving and towel/toiletry hardware for two residents. Provide a full-length framed mirror mounted on Service area side of the bathroom door.
- Personal Closets. 22 ft^2 (2 m^2) Net Area required. Provide at least one closet for each resident. Closets must be accessible to each living/sleeping area. Provide each closet with closet organizers with storage capability extending to the ceiling. Provide additional storage in service areas as appropriate. Provide closets full height, using the space above the normal door height for bulk storage. Provide continuous ventilation in closets to resist mold and mildew growth. Provide integral full-length hanging rods for coats and shelves. A light with motion-activated control is required. Carefully placed lighting outside 2 ft (0.6 m) deep closets is acceptable. Secure closets with standard hinged doors with non-removable pin hinges and locking hardware. Provide padlocking slide bolt hardware for personal closets. Bi-fold and sliding doors are not acceptable.
- Service Area. This term refers to the corridor/service space within the 2+0 Room Plan that is not incorporated into the Net Living/Sleeping Area. The service area in each Plan Room provides access to the personal closets, head, a FAR Rated, Energy Star, 2-door refrigerator (10.3 cu. ft) maximum, a microwave, and counter space with single bowl sink.
- Locks. Electric locks are required on building entrance doors and room doors. Use a magnetic key card system with hard key override. Provide each occupant one key that opens the room entry door, and one bedroom door. Installation Commanders may require electronic locks for closet doors as an option that provide each occupant with a second key for entry to his closet, without access to the other occupant's closet.

5-3.2 Required Common Building Spaces Detailed.

The following spaces are REQUIRED common spaces for the Marine Corps 2+0 Room configurations. The net areas shown are approximations to assist the designer.

- Entry Vestibule. 50 ft^2 (4.5 m^2) Net Area. Provide automatic entry doors per ABA and weather vestibule.

- Duty Office. 125 ft^2 (12 m^2) Net Area. Include a duty office designed to provide the staff with a secure, efficient, and comfortable environment from which to manage the building. Provide area for one desk with computer.
- Duty Bunk. 80 ft^2 (7.5 m^2) Net Area. Provide lockable room for one bed and one wall locker. Locate adjacent to the Duty office.
- Unisex Restrooms. 45 ft^2 (4.5 m^2) Net Area. Provide one water closet, and one lavatory with associated hardware.
- Elevator. 85 ft^2 (8 m^2) Net Area each. (Elevator machine room area is excluded.) See Chapter 3 for added details.
- Vending. 85 ft^2 (8 m^2) Net Area. Provide space adjacent or co-located to the Multi-Purpose Room. Discuss vending area, machine quantity and desired type with the activity and local Marine Corps Community Services Director. See Chapter 3 for details.
- Multi-Purpose Room. Calculate room size based on 6.25 ft^2 (0.58 m^2) minimum to 12.5 ft^2 (1.16 m^2) maximum Net Area for each occupant. Includes spaces such as: Lounge, Meeting, Conference, Classroom(s), or other appropriate spaces. Isolate the area acoustically and locate them close to public toilets. Provide cabinets and counter space for minor food service and to accommodate a temporary microwave oven, waste receptacles, and other similar food warming equipment. Provide locked storage for related supplies and for equipment. Provide rooms with light and power for resident's general use and provide light dimmers. Provide window coverings and hardware to allow for darkening of the room with blinds or shades. With the advent of Marine Online and the military requirement of Marines to access the internet to review military records and conduct personnel administration, multi-purpose rooms are required to be wired with infrastructure to support high speed internet access. Provide a minimum of two (2) eight-pin data ports and clean power in each multi-purpose room. Refer to UFC 3-580-01 for telecom room size and system requirements.
- Laundry Room. Calculate room size based on 50 GSF (4.65 GSM) per 1 washer/2-dryer module. Provide 1 washer/2-dryer module for every 12 residents, as a minimum. Stacked units are acceptable. Locate a single laundry rooms for easy access and provide acoustic separation from other areas. Provide adjacency to the Multi-Purpose room. Provide 12 linear feet (3.65 linear m) of folding table(s), clothes hanging area with hanging rods and 4 ft (1.25 m) of full height hanging for drip-dry clothing. Set aside a space of 36 inches x 72 inches (915 mm x 1829 mm) for soap, bleach, fabric softener and other laundry aid vending in each laundry facility.
- Janitor Closet(s). 90 ft^2 (8.5 m^2) Net Area. Provide a minimum 5 ft x 3 ft (1.5 m x 0.9 m) closet for permanent party facilities at each floor. Finish floor, base, and wall at the mop receptor to resist water. Slip resistant quarry tile or ceramic tiles are examples of acceptable finishes. Provide a

motion-activated light. Provide a janitor's sink with drain, and basic storage for mops and one commercial grade floor polisher.

- Mechanical and Electrical Room(s). See Utility Area (Space) requirements in Chapter 3.
- Corridors and Breezeways. Code limits travel distance from corridor door of any guest room to the nearest exit. Size building corridors to meet the minimum (or better) requirements of the International Building Code. Provide appropriate lighting and consider providing a recessed light at each entrance in addition to standard overhead corridor lighting. Size the corridor to meet NFPA 101 requirements with a minimum clear width to accommodate two persons with suitcases (60 inches (152.4 mm) clear).
- Stair Towers. Estimate each exiting stair tower at 170 ft^2 (16 m^2) net area per floor. Enclose exterior stair towers or provide open-air per locale and building configuration.
- Adaptable Rooms. Provide easily adaptable rooms per 5-1 Design Parameters.

5-3.3 Optional Common Building Spaces Detailed.

The following common spaces are OPTIONAL for the Marine Corps 2+0 configuration:

- Admin/Office Space. Provide other administrative office spaces as required within approved gross area constraints.
- Game Rooms. Acoustically isolate game rooms as appropriate. Include appropriate electrical outlets, and place close to public toilet(s). Design the rooms for installation of electronic video games. Locate within building design for appropriate monitoring by Marine Corps UH personnel. Provide rooms with substantial natural lighting.
- Resident Bulk Storage. Resident Bulk Storage as required.
- Centralized Kitchen.

5-3.4 In-Room Services.

See Chapter 3 for requirements for in-Room telephone, cable television and Local Area Network Systems (LAN).

5-3.5 Exterior Washdown Areas.

Size these areas based upon the number of occupants.

- Equipment Washdown Area. Locate equipment washdown areas at a covered cleaning shelter adjacent to a building entry point. The area must be concrete based, approximately 15 ft (4.6 m) width by 50 ft (15 m) length with supported standpipes consisting of six hose bibs with sturdy supports and anchored at the tabletop level 40 inch (1016 mm) maximum

height with separate cut-off valves suitable for simultaneous operation of all six (6). Provide a properly sized supply standpipe with a freeze-proof design and easily accessible shut-off valve(s). Slope the concrete tabletop area to a central drain with easy cleanout for mud and debris. Provide equipment suitable for outside service.

- Equipment Drying Areas**.** Provide a semi-enclosed roofed equipment drying area on concrete hardstand adjacent to the equipment washdown area. Each drying area may be totally enclosed on four sides and across the top for security per Command decision. The drying area must be divided into separate sections. If gates are used, each must have a lockable hasp. Slope the concrete hardstand adequately to prevent ponding water.
- Note that these structures will be counted as part of the allowable area limits for the project.

5-3.6 Windows.

Continuous overhead fenestration which provides cross ventilation is encouraged. See Chapter 3 for additional window requirements.

5-3.7 Interior Walls and Finishes.

Refer to paragraph 3-6.9 entitled “Walls and Partitions”, and Table 3-2 in this FC for specific interior finishes and schedules.

5-4 MARINE CORPS SNCO/OFFICERS ROOM.

This room plan is intended for unaccompanied Staff Noncommissioned Officers (E6-E9) (SNCO) and Officers on a dependent restricted unaccompanied orders, and support personnel on the Unit Deployment Program (UDP). Access is from an interior corridor, conditioned or open breezeway.

- Gross Room Area: 603 ft^2 (56 m^2).
- Bedroom Area: 151 ft^2 (14 m^2) is the required MINIMUM size per bedroom.

5-4.1 Room Plan (Spaces) Detailed.

- Bedroom. 151 ft^2 (14 m^2) Net Area required. Bedrooms are intended for single occupancy. Bedroom dimensions are not fixed, but must remain functional to accommodate one queen bed, one computer/TV wall desk unit with hutch, one chair, one nightstand, one lamp and at least one bureau or chest.
- Living Room. 130 ft^2 (12 m^2) Net Area required. Living rooms are intended for one occupant and two visitors use, sized for a sofa, chair, coffee table, end lamp, floor lamp and TV/credenza. Provide adjustable level lighting,

recess mounted in the ceiling. Provide a ceiling fan with no light attachment appropriately mounted to avoid the recessed fixtures.

- Laundry Area. Provide one washer and one dryer for every resident, as a minimum, vented to the exterior. Stacked units are acceptable. Provide a containment curb. A floor drain is optional. Provide room for storage of ironing board and shelving for laundry soap.
- Heads. Heads and fixtures are to be of residential design, quality, and finish. Provide a vanity with lavatory and valance lighting with a single medicine cabinet, a full-sized tub-shower, and water closet with shelving and towel/toiletry hardware for one resident.
- Walk-in Closet. 32 ft^2 (3 m^2) Minimum Net Area required. Provide at least one walk-in closet for each resident. Closet must be accessible to the sleeping area. Provide organizers with storage capability extending to the ceiling. Closet must be full height, using the space above the normal door height for bulk storage. Provide continuous ventilation in closets to resist mold and mildew growth. Provide integral full-length hanging rods for coats and shelves at the long side, with shelf above the hanging rod, and five fixed shelves located at the far end wall. Provide one wall void of shelving for storage of tall items. Lighting outside of closets is not acceptable. An interior light with motion-activated switch is required. Carefully placed lighting outside closets is not acceptable. Secure each closet with standard hinged doors with non-removable pin hinges and keyed locking hardware. Bi-fold and sliding doors are not acceptable. Closet doors must have full-length dressing mirrors.
- Kitchen. The kitchen area is adjacent and provides open access to the living area, and doorway access to the bath and bedroom. The kitchen area will contain a full-sized refrigerator (14 c.f. (0.40 c.m.) maximum), a four-burner range with oven below and microwave and ventilation fan collocated above, appropriate counter space with under cabinet lighting with single bowl sink. Provide a small pantry and closet with broom storage capabilities adjacent to the main Room entry door.
- Locks. Use a magnetic key card system with hard key override. Provide occupant one key that opens the room entry door and bedroom door.

5-4.2 Required Common Building Spaces Detailed.

The following spaces are REQUIRED common spaces for the Marine Corps SNCO and Officers configurations:

- Entry Vestibule. 50 ft^2 (1.5 m^2) Net Area. Provide automatic entry doors and weather vestibule.
- Unisex Restrooms. 15 ft^2 (1.5 m^2) Net Area. Provide one (1) water closet, and one (1) lavatory with associated hardware.

- Elevators. 85 ft^2 (8 m^2) Net Area. (Elevator machine room area is excluded.) Note that the number of elevators allowed is now calculated by the building height. See Chapter 3 for additional details.
- Janitor Closet(s). 90 ft^2 (8.5 m^2) Net Area. Provide a minimum 5 ft x 3 ft (1.5 m x 0.9 m) closet for permanent party facilities at each floor. Finish floor, base, and wall at the mop receptor to resist water. Slip resistant quarry tile or ceramic tiles are examples of acceptable finishes. Provide a motion-activated light. Provide a janitor's sink with drain, and basic storage for mops and one (1) commercial grade floor polisher.
- Mechanical and Electrical Room(s). These rooms are calculated at 6% of the Gross Building Area, (10% maximum). This includes: Main Mechanical room at ground floor, Electrical control closet, Fire Pump Room, Elevator Equipment room, Mechanical room on each floor, and main vertical duct space (floor to floor). Refer to UFC 3-580-01 for telecom room size and system requirements.
- Corridors and Breezeways. NFPA 101 limits travel distance from corridor door of any guest room to the nearest exit. Size building corridors to meet the minimum (or better) requirements of the International Building Code. Provide appropriate lighting and consider providing a recessed light at each entrance in addition to standard overhead corridor lighting. Size the corridor to meet NFPA 101 requirements with a minimum clear width to accommodate two persons with suitcases (minimum 66 inches (167.64 cm) clear).
- Stair Towers. Estimate each exiting stair tower at 170 ft^2 (16 m^2) net area per floor. Enclose exterior stair towers or provide open-air per locale and building configuration.

5-4.3 Optional Common Building Spaces Detailed.

The following common spaces are OPTIONAL for unaccompanied SNCO and Officers configurations.

- Admin/Office Space. Provide other administrative office spaces as required within approved gross area constraints.
- Vending. 85 ft^2 (8 m^2) Net Area. Provide space adjacent or co-located to the Multi-Purpose Room. Discuss vending area needs, machine quantity and desired type with the activity and local Marine Corps Community Services Director. Refer to Chapter 3 for details.
- Multi-Purpose Room. Calculate room size based on 6.25 ft^2 (0.58 m^2) minimum to 12.5 ft^2 (1.16 m^2) maximum area for each occupant. Includes areas such as: Billiards, Ping Pong, Foosball and Air Hockey and spaces such as a Game Room, Internet Café, Theater, or other appropriate areas or spaces. Isolate the area acoustically and locate them close to public toilets. Provide cabinets and counter space for minor food service and to accommodate a temporary microwave oven, waste receptacles, and other

similar food warming equipment. Provide locked storage for related supplies and for equipment. Provide rooms with light and power for resident's general use and provide light dimmers. Provide window coverings and hardware to allow for darkening of the room with blinds or shades. With the advent of Marine Online and the military requirement of Marines to access the internet to review military records and conduct personnel administration, multi-purpose rooms are required to be wired with infrastructure to support high speed internet access. Provide a minimum of two (2) eight-pin data ports wired with Category 5e wiring and clean power in each multi-purpose room.

- Game Rooms. Acoustically isolate game rooms as appropriate. Include appropriate electrical outlets, and place close to public toilet(s). Design the rooms for installation of electronic video games. Locate within building design for appropriate monitoring by Marine Corps UH personnel. Provide rooms with substantial natural lighting.
- Resident Bulk Storage. Resident Bulk Storage as required.
- Theater room is acceptable as an option.
- Audio/Visual Equipment Rooms are acceptable as an option.
- Balconies are an option.

5-5 ADDITIONAL REQUIRED BUILDING FEATURES.

The following common features must be provided.

5-5.1 Heating, Ventilation and Air Conditioning.

Design an HVAC system to provide residents with individual choice of heating and cooling year-round within each living area.

5-5.2 In-Room Services.

See Chapter 3 for requirements for in-Room telephone, cable television and Local Area Network (LAN) Systems.

5-5.3 Doors and View Ports.

Provide solid core doors or thermally insulated metal doors (in exterior applications) for sound isolation for the entry units. Provide a fire rated, wide angle security viewport at the 60-inch (1524 mm) height and an additional wide-angle security view port at 43-inch (1092 mm) height for accessible units.

5-5.4 Hardware and Locks.

Refer to Chapter 3 for hardware and lock information.

5-5.5 Windows.

Provide continuous overhead fenestration which allows cross ventilation in projects where open breezeway corridors are present. Single hung windows with window screens are required for interior corridor designs. Locate secure openings above the entry door and over windows in living room and bedroom. See Chapter 3 for additional window requirements.

This Page Intentionally Left Blank

CHAPTER 6 OPEN BAY

This Chapter describes Open Bay configurations used by the Navy and the Marine Corps. Marines Corps variations are specifically identified.

6-1 OPEN BAY PLAN.

An Open Bay barracks consists of an open-bay, central head facilities, common areas, circulation, and laundry facilities.

6-1.1 Gross Open Bay Sleeping Area.

Determine the total gross area of the open bay by the number of persons that will occupy the space. (# of persons x minimum net sleeping area per person). Typical sizes are 60 persons per bay.

6-1.2 Net Living/Sleeping Area.

Recruit net living area is 72 ft^2 (6.7 m^2) per person minimum.

6-1.3 Required Common Areas (Spaces).

The following spaces are required common spaces in Open-Bay designs.

- Navy Laundry facilities: Provide one washer and two dryers for every 12 residents as a minimum. Adjust this number as appropriate where some or all of the laundering is performed by contract. Locate laundry rooms preferably at each floor for easy access and provide acoustic separation from other areas; provide 10 linear feet (3 linear meters) of folding table with hanging rods above and 4 feet (1.25 meters) of full height hanging for drip-dry clothing.
- Marine Corps Laundry facilities: Provide one washer and two dryers for every 12 residents, at a minimum. Locate laundry rooms on the ground floor or in an adjacent separate building. Clothing and gear requirements vary by location. Provide folding tables with hanging rods appropriately designed for the mission of the occupants.
- Building Utility Room;
- Bulk storage. Provide bulk storage areas for gear and supplies for Navy. This is optional for the Marines Corps.
- Mechanical and Electrical Rooms. The spaces including main mechanical rooms, main electrical rooms, telecommunication room, and fire pump room must be provided within the limits of the maximum gross building area. This is limited to a maximum of 7% of the Gross building area. The elevator equipment room (not generally required for open bay UH), and the floor-to-floor duct spaces are not included in this limit.

- Design circulation, corridors, and hallways for appropriate passage with luggage and exiting. Provide additional recessed lighting at all entrances.
- Multi-Purpose Areas (Space) such as lounge or classroom. Isolate the areas acoustically and locate them close to public toilets. Provide rooms with light and power and provide light dimmers. Multi-purpose rooms are required to be wired with infrastructure to support high-speed internet access. Provide a minimum of two (2) eight-pin data ports wired with Category 5e wiring and clean power in each multi-purpose room. Provide window coverings and hardware to allow for darkening of the room with blinds or shades.
- Janitorial. Provide a 5-foot x 3-foot (1.5 meter x 0.9 meter) closet for each Bay to house vacuum cleaner storage and janitor's sink and faucet. Finish floor, base, and wall at the mop receptor to resist water. Slip resistant quarry tile or ceramic tiles are examples of acceptable finishes. Provide a motion-activated light.

6-1.4 Optional Common Areas (Spaces).

The following spaces are optional common spaces in Open-Bay designs.

- Automatic entry doors and weather vestibule. Weather vestibule may be required based on requirements in UFC 1-200-02.
- Administration Area (for Navy). Design administrative areas to provide the staff with a secure, efficient, and comfortable environment from which to manage the building.
- Navy Office Space. Provide other administrative office spaces to meet mission requirements within the gross building area limits.
- Lobby, Vestibule, Reception Desk. Locate the lobby and its vestibule for easy identification by arriving guests. Include a seating area for visitors and guests waiting for transportation. Locate the seating area for clear view of arriving automobiles and of the front desk. Choose and arrange lighting fixtures to organize and identify the space. Finish the lobby and entrance with attractive, durable, and easily cleaned materials. Provide the Reception Desk with enclosed space or counter/workspace. Locate the counter for visual control of the lobby and other central common spaces. Arrange the counter for check-in by several persons at once with computer, key control, and forms storage. Light counter surfaces for writing, mount duplex outlets above work surface, and provide computer and telephone cables and connections.
- Vending Area. Note that this is optional for recruit barracks.
- Public Toilets. Note that this is optional for recruit barracks.
- Marine Corps Drill Instructor Area. These spaces include a duty office designed for the Drill Instructor with head and bunkroom. Provide area to accommodate one desk with computer, with adjacency to a non-public

lavatory (included in the net area); a lockable room to accommodate one bed and one wall locker. Provide windows in the office area to observe conditions within the open-bay area, if located on each floor.

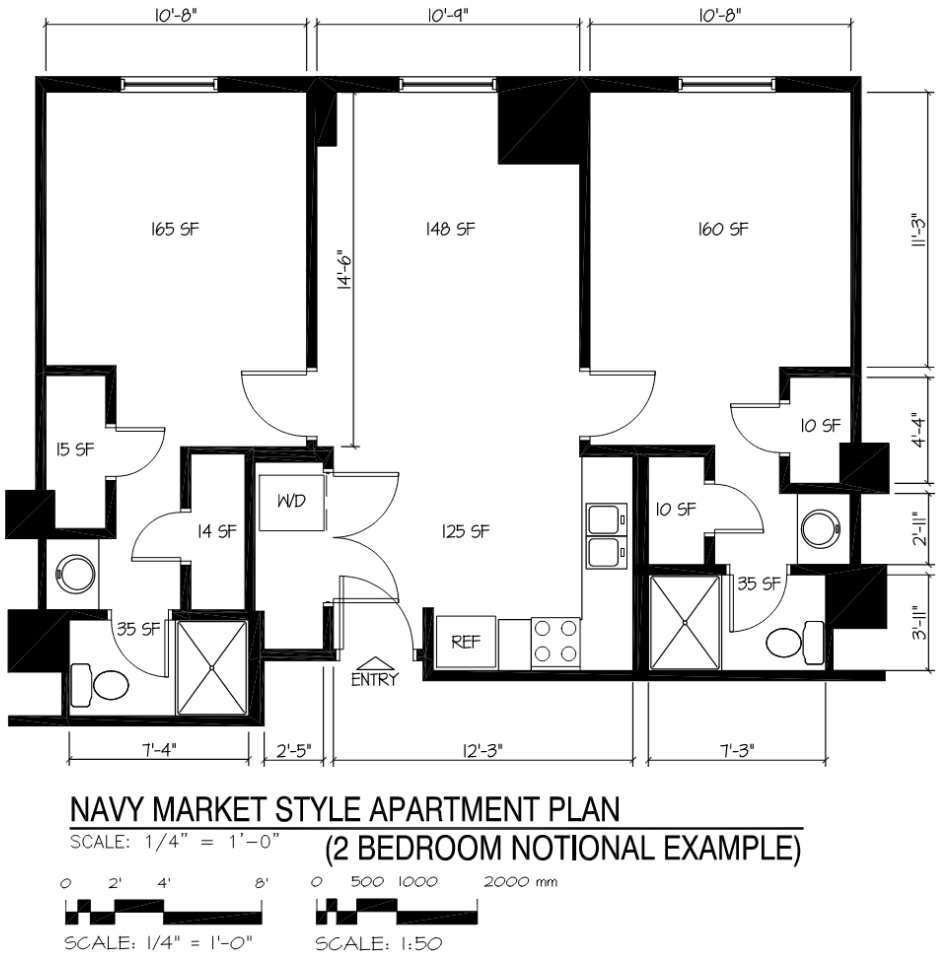
- Armories. Individual armories (if required) are part of the open bay area, or an adjacent space. This consists of a lockable (metal cage) cabinet permanently attached per force protection standards as referenced in UFC 1-200-01, and MCO 5530.14A.
- Marine Corps Multi-Purpose Areas. Isolate these areas acoustically and adjacent to a single public toilet. Provide these rooms with easily adjustable light (dimmers), power and internet capabilities according to mission use. Provide window coverings and hardware to allow for darkening of the room with blinds or shades. With the advent of Marine Online and the military requirement of Marines to access the internet to review military records and conduct personnel administration, multi-purpose rooms are required to be wired to support high speed internet access. Provide a minimum of two (2) eight-pin data ports wired with Category 5e wiring and clean power in each multi-purpose room.
- Exterior Wash down areas will be provided as follows: Navy will provide exterior water at a paved and well drained area with six grouped hose bibs securely posted at 40-inch (101.6 cm) height for individual wash down of field gear and shelters are optional. Marine Corps will provide exterior equipment wash down areas and shelters for them as described in paragraph 5-3.5 entitled, Exterior Washdown Areas.

This Page Intentionally Left Blank

APPENDIX A BEST PRACTICES

A-1 NAVY RESIDENT AND BUILDING MANAGER INPUT.

Best practices for new construction and renovation projects for Navy Permanent Party UH should consider recent resident feedback, documented in the form of Post Occupancy and Tenant Satisfaction Surveys. The most common desires among residents included:



- Outdoor BBQ areas, ideally with shade covers, and a variety of sizes to accommodate varying size groups. Provide site furnishings such as but not limited to picnic tables, benches, and trash receptacles.
- For bathrooms which will be shared by two people, consider how two Sailors will use the area at the same time. In addition to providing separate vanity area, provide space for closet access while roommate is using vanity.
- When possible, maintain 2-bedroom Market Units, and do not add additional bedrooms, as it complicates roommate interactions.
- Look at entry/exit travel paths for residents when setting building entries; with use of electronic locks and cameras, resident entries can be remote from main lobby on convenient travel paths from commonly used facilities on the Installation (such as the fitness center).
- Consider noise issues with locating equipment such as ice machines in Lounge or computer spaces.
- Consider noise issues when locating exterior mechanical or other equipment outside of entries, bedroom units, or recreational activities.
- Cleanliness and maintenance of buildings are a consistent top resident concern; strongly consider ease of maintenance in selection of finishes and equipment.
- Consider how to maintain operations when critical systems are being maintained; for example, providing a hookup for a generator-based A/C system during chiller maintenance.
- Door hardware: consider use of push plates and kick plates for appearance retention and minimize maintenance. Also consider use of a threshold shape that discourages the use of a tool or device under the entry door to gain access to the lever handle on the secured side.
- Consider using non-painted aluminum railings on exterior applications.
- Site: consider stamped concrete in lieu of pavers where pervious surface is not required.

Building Managers offered the following input during the Post Occupancy Survey process:

- Appliances:
  - Residential Grade, simple appliances are the best for obtaining replacement parts as well as ease of cleanability. For example, all-glass stovetops which require special cleaners are not usually properly maintained by UH residents.
  - Strongly consider maintainability in initial appliance selection, including ability to maneuver the unit in and out for replacement or maintenance, serial numbers and product codes on the front of units, and providing ample attic stock/replacement parts as part of initial construction contract.
- Finishes: strongly consider not only durability but colors which hide stains and dirt well for carpet, other flooring, grout, countertops, and other materials.

A-2 NAVY FLOOR PLAN EXAMPLE.

Figure A-1 Navy Market Style Example

The Market Style Apartments shown above offer a variety of solutions for accommodating all requirements.

A-3 MARINE CORPS BEST PRACTICES.

Marine Corps Best practices for new construction and renovation projects for Permanent Party barracks include:

- Design a cohesive and integrated campus style complex for convenience of residents, with better traffic flow, hierarchical outdoor spaces, varying from large active outdoor areas to smaller areas for passive use.
- Co-locate UHs and support facilities in order to provide more usable outdoor areas. Site buildings and structure to protect residents from strong winds and inclement weather, wherever possible; and use solar orientation to reduce summer heat gain and site to take advantage of seasonal cooling breezes.
- Provide identifiable entry and focal points, variation of building massing and colors, landscape with native plants (low maintenance and water conserving) and use of locally available site materials and elements.
- Outdoor BBQ areas, ideally with shade covers, and a variety of sizes to accommodate varying size groups. Include quality built-in BBQs and maximize outdoor seating/eating capacity with open green space areas.
- Provide home-like environment by maximizing living/sleeping area (within the maximum limits), provide beds with lockable storage compartments, maximize the use of natural daylight and ventilation.
- Utilize daylighting in multipurpose spaces and provide a visual connection to associated outdoor spaces (such as BBQ area and outdoor activity areas).
- For bathrooms, consider how two Marines will use the area at the same time. In addition to providing separate vanity area, provide space for closet access while roommate is using vanity, where possible.
- Finishes: strongly consider not only durability but colors which hide stains and dirt well for carpet, other flooring, grout, countertops, and other materials.
- Provide coordinated furnishings, fixtures, and equipment (FF&E) packages reflective of the buildings architectural style, local culture and theme. Involve interior designers in complete process (Concept Design Workshops (CDW), FF&E selection/design and turnkey process).
- Specify sustainable FF&E with an extended warranty for material and labor beyond the normal contract or manufacturer’s warranty period.
- Cleanliness and maintenance of buildings are a consistent top resident concern; strongly consider ease of maintenance in selection of finishes and equipment.

Create a team of professionals during the process from start to finish; these should include: NAVFAC, Contract Specialist, Project Manager, design manager, Interior

Designer, ROICC/Construction Manager, ROICC Contract Specialist, Client/End user, Bachelor Housing Director, Public works project manager, Installation Property Manager/CMSC Officer, and HQMC LF (where necessary).

Figure A-2 Best Practice, UH Campus Arrangement

In this illustration, the UH Facilities (3 each) are sited in the same complex with the new Dining Facility to form a very comfortable, easy to walk to various facilities in a coherent, sustainable complex with plenty of usable outdoor facilities for both very active sports to very low key passive recreational spaces.

UH CAMPUS ARRANGEMENT: Example of Preferred Building Arrangement, Adjacency, Massing, Site Improvements, Landscaping, and Vehicle and Pedestrian Circulation Paths.

Figure A-3 Best Practice, UH Campus Sun Shading and Walkways

Building design and site design: Example of using shading structures for outdoor gathering spaces, deep overhang to provide shade and shadow and minimize heat gain in Summer time, walkway connecting all elements of projects to each other, enhanced paving materials at important nodes in the circulation paths. Note site planning and building design to offer optimum views to all rooms in the UH.

APPENDIX C AUSTERE UNACCOMPANIED HOUSING

C-1 PURPOSE.

The purpose of this appendix is to provide implementation guidance for austere construction established by Commander, Navy Installations Command (CNIC). These requirements were developed to address construction of support facilities only in designated operating environments.

C-2 DEFINITION AND SCOPE.

An austere facility is defined as a structure designed and constructed with minimal infrastructure, footprint/area, and finishes while still incorporating applicable building codes and facility criteria to assure adherence to all health, accessibility, and life safety standards and regulations required to fulfill the mission, including anti-terrorism force protection regulations as appropriate to each site. Construct austere facilities with the lowest total ownership costs (TOC) possible, including purchase, maintenance, and use of consistently available local goods.

C-3 APPLICABILITY.

Austere construction is intended for facilities in locations determined by CNIC and approved by OPNAV to be eligible for austere facilities construction. The austere standards are intended to be applied flexibly and in varying degrees to all facilities at locations designated as austere. The flexibility should be allowed to ensure the criteria are appropriate for individual austere locations.

C-4 MODIFICATIONS FOR AUSTERE CONSTRUCTION.

For austere design and construction, use the facility criteria in the prior Chapters of this FC with the (generally deductive) modifications included in this Appendix, as follows.

(FC) CHAPTER 3 GENERAL DESIGN CRITERIA - NAVY AND MARINE CORPS.

3-2 SITE DESIGN.

Add the following to the FC paragraphs. Apply austere decision making to assess, modify and incorporate requirements such as pedestrian circulation, vehicle parking, and lighting plans appropriately to local conditions.

3-2.3 Parking.

Delete the FC paragraphs and use the following. Apply austere decision making to assess, modify and incorporate requirements such as pedestrian circulation, bus access, service vehicle parking, and lighting plans appropriately to local conditions and to limit parking as much as possible while still meeting the facility mission. Review the security study and incorporate its requirements into the design. Ensure existing and proposed parking is in compliance with antiterrorism requirements. In austere facilities parking for residents, visitors, staff, and service personnel should be extremely minimal

and only to the mission. Maintenance parking for service functions does not necessarily require dedicated space. Use the expected frequency of maintenance vehicles to determine whether dedicated parking is needed. Locate service access and parking to avoid disturbing residents.

3-6 ARCHITECTURE.

Add the following to the paragraphs. Austere construction requires cost effective and durable materials and finishes throughout. Refer to the Table 3-3 Austere Interior Finishes.

3-6.2 Architectural Character and Scale.

Delete this FC paragraph in its entirety. Scale should be a reflection of security and local military construction requirements.

3-6.3 Residential Character for Unaccompanied Housing.

Delete this FC paragraph in its entirety.

3-6.4 Model Unit "Mockups".

Delete the FC paragraph in its entirety. Mockups are not required in austere facilities construction.

3-6.7 Hardware and Locks.

Use the FC paragraphs with the following exceptions: Electric locks are optional in austere UH. Provide locks to ANSI/BHMA standards.

3-6.7.1 Bathroom locks.

Provide the following for bathroom locks: Provide hardware and latches for Common Centralized Shower, Toweling, Dressing, and adjacent Toilet only as privacy and personal security requires.

3-6.9 Walls and Partitions.

Delete the FC paragraphs and use the following for austere construction. The ability to repair, refinish and reconfigure are important in austere construction. Design walls and partitions to meet appearance, acoustics, and durability requirements of Navy UH. Seal edges of wall assemblies to adjacent construction to avoid flanking sound paths. Consider ease of repair and refinishing when choosing wall finishes. Proprietary finishes are prohibited. Provide corner guards on walls in public areas. Austere projects use of light-frame construction with gypsum board for interior wall construction is preferred. Concrete / masonry is optional; minimize load bearing walls where appropriate.

3-7 INTERIOR DESIGN.

Delete FC Table 3-1 and Table 3-2 and use the following Table 3-3 for Austere Facilities Finishes.

Table 3-3 for Austere Interior Finishes

AREA/SPACES	FLOORS	WALLS	CEILING
Entrance weather Vestibule	Concrete, hardened and sealed	Match exterior building finish at sides, 2 sets of double doors at entry	Moisture weather resistant gypsum board, painted
Resident Corridors/Distribution	Concrete, hardened and sealed	Gypsum Board, painted	Refer to 3-7.3 of this appendix
Resident multi-occupant rooms	Concrete, hardened and sealed	Gypsum Board, painted	Refer to 3-7.3 of this appendix
Centralized Toilets and Showers	Porcelain tile, slip-resistant	Ceramic Tile over Gypsum Board to full height; Painted Gypsum Board at plumbing/wet walls	Refer to 3-7.3 of this appendix
Janitorial Areas	Concrete, hardened and sealed	Gypsum Board, painted	Refer to 3-7.3 of this appendix
Housekeeping Areas	Concrete, hardened and sealed	Gypsum Board, painted	Refer to 3-7.3 of this appendix
Utility Rooms	Concrete, hardened and sealed	Gypsum Board, painted	Refer to 3-7.3 of this appendix
Laundry, linens (optional)	Concrete, hardened and sealed	Gypsum Board, painted	Refer to 3-7.3 of this appendix

Table 3-3 for Austere Interior Finishes			
AREA/SPACES	FLOORS	WALLS	CEILING
Laundry, resident use (optional)	Concrete, hardened and sealed	Ceramic Tile over Gypsum Board to full height; Painted Gypsum Board at plumbing/wet walls	Refer to 3-7.3 of this appendix
Laundry Storage, clean (optional)	Concrete, hardened and sealed	Gypsum Board, painted	Refer to 3-7.3 of this appendix
Laundry Storage, soiled (optional)	Concrete, hardened and sealed	Gypsum Board, painted	Refer to 3-7.3 of this appendix
Receiving (optional)	Concrete, hardened and sealed	Gypsum Board, painted	Refer to 3-7.3 of this appendix
Reception, (optional)	Concrete, hardened and sealed	Gypsum Board, painted	Refer to 3-7.3 of this appendix
Storage, cleaning fluid (optional)	Concrete, hardened and sealed	Gypsum Board, painted	Refer to 3-7.3 of this appendix
Storage, General supply (optional)	Concrete, hardened and sealed	Gypsum Board, painted	Refer to 3-7.3 of this appendix
Mechanical and Electrical Utility rooms	Concrete, hardened and sealed	Gypsum Board, painted	Refer to 3-7.3 of this appendix

3-7.1 Paint.

Delete the FC paragraphs and use the following. Interior (and Exterior) surfaces requiring paint must use a minimum of one prime coat and two finish coats.

3-7.3 Ceilings.

Delete the FC paragraph and use the following. Suspended acoustical ceilings and blown-on acoustical ceiling finishes are prohibited. Ceilings are to be exposed and painted, including all exposed plumbing mechanical and electrical conduit, unless it is more cost effective to provide a hard finished (gypsum board) painted ceiling.

3-7.4.7 Wall Base Molding.

Revise the paragraph as follows. For porcelain or ceramic tiled areas, use matching or cove base trim. For all other flooring, use coved rubber molding.

3-7.5 Cabinets, Millwork, and Hardware.

Delete the FC paragraph and substitute the following: Construct cabinets to American Woodworking Institute Custom grade with heavy-duty hardware. Centralized / Group bathrooms provide solid surface vanity tops with integral bowl lavatories. Toilet / Shower partitions (if applicable) shall be solid plastic (HDPE) or Color-through Phenolic.

3-7.8 Toilet Accessories.

Delete the FC paragraph and substitute the following: Provide toilet accessories as surface mounted or recessed, of non-corrodible metal or tile. Provide toilet paper holders, soap dishes, and bathrobe hooks. Provide shower curtain rods set at proper height for conventional shower curtains.

3-7.9 Window Treatments.

Delete the FC paragraph and substitute the following: Include window treatments (shading systems) as an integral part of the construction contract. Dual fabric solar roller shade systems with manual roll chain operation are recommended. Consider solar conditions when selecting a window treatment. Dual solar shade system provides visual privacy and natural light, with black out properties available as required. Sidetracks can add durability, stability and reduce light leakage.

3-7.10 Furnishings, Fixtures and Equipment, (FF&E).

Delete the FC paragraphs and substitute the following:

FF&E procurement packages must be designed by the same design agent as the facility to ensure complete coordination. Final approval of FF&E specifications will be determined by the design team to include guidance/input received from the respective NAVFAC Interior Designers. Use of turn-key approach to FF&E procurement within

MILCON projects is directed to the greatest extent possible and practical. This will ensure a coherent FF&E package and the most practical use of funding.

Specify furnishings as minimal as possible to meet the required mission of the facility. The major prerequisites for all products are durability, flexibility and sustainability. The standard finishes must be easily maintained and non-corrosive. Special attention must be given to the geographical location and extreme weather conditions of the facility to provide the most practical solutions to endure the situation. Consider surge capabilities as required by the specific location and facility requirements.

3-11 SUSTAINABILITY.

Delete the FC paragraph and substitute the following: Do not register or certify projects designated austere. The Chief Engineer of NAVFAC has waived Third Party Certification requirements for projects designated austere (OCONUS). However, requirements for the Guiding Principles for Federal Leadership in High Performance and Sustainable Buildings (HPSB) remain. Refer to UFC 1-200-02 for criteria associated with HPSB.

3-12 COMMISSIONING.

Delete the FC paragraph and substitute the following: Austere projects require fundamental commissioning or an equivalent process. At a minimum, commission the following systems: HVAC systems and controls, lighting controls, and if provided, day lighting controls, refrigeration systems and controls, renewable energy systems and domestic hot water systems. Refer to UFC 1-200-02.

3-13 PLUMBING.

Delete the FC paragraph and substitute the following: Avoid plumbing chases whenever possible by placing plumbing in wall cavities. Fixture clearances should be appropriately sized for the intended occupants and use low-flow Water Sense requirements where feasible.

- Centralized or common toilet areas are to be standard for austere housing. The International Plumbing Code (IPC) uses the term "Bathroom Group" for fixtures located together on the same floor. These bathroom groups should be centrally located at each floor within each building and designed with consideration to the local male/female resident privacy requirements. No tub-showers or bathtubs are allowed in austere construction. Provide all fixtures in accordance with the UFC 1-200-01 and IPC, for water closets and urinals, lavatories and service sinks, and individual curtained dressing/showers.
- Provide hot and cold water to laundry facilities if applicable.
- Provide easily accessible shutoff valves at all fixtures.
- Water Closets. Provide commercial quality water closets. It is recommended that areas with low water pressure use power-flush type

water closets. Use elongated, one-piece construction with a closed front seat and a lid. Provide matching water closets and bath fixtures in neutral color.

- Provide hose bibs on one exterior wall of each building and near rooftop mechanical units; frost-free as dictated by climatic conditions. Provide floor drains in all janitor closets, and laundry rooms, if applicable.
- Provide a single drinking fountain with cooler in accordance with the IPC.
- Provide a building- wide hot water system.
- Provide the following fixtures as standards: Provide single-lever and washer-less faucets at lavatories. Provide overhead rainfall type showerheads with maximum 2.2 gpm (8.3 lpm) flow rate, low-flow if applicable. Locate showerheads a minimum of 75 inches (190.5 cm) above the shower base.
- Showers are to have porcelain tile bases sloped to drains, with full height surrounds. For new construction, provide a 12 ft2 (1.11 m2) shower space with a minimum dimension of 30 inches (76.2 cm).

3-15 GENERAL SPACE REQUIREMENTS FOR UH FACILITIES.

3-15.1 Service Area.

Austere bedrooms do not have service areas. All bedrooms will use a common bath toileting area that is ideally centralized within the building and may be divided for male and female use with the inclusion of appropriate security measures.

3-15.12 Lobby, Vestibule, and Reception.

Delete the FC paragraph and substitute the following: Provide a weather vestibule with two sets of doors. Lobby and Reception areas are prohibited in austere.

Chapter 4 NAVY UNITS.

Delete the FC Chapter 4 NAVY UNITS except as follows:

4-4 The Unit.

Delete the FC paragraph and substitute the following: Each austere bedroom will be a simple open room sized 288 ft^2 (26.8 m^2) net for habitation by four persons; that is 72 ft^2 (6.7 m^2) net area per person in each room. They do not contain any service area or toilets within the rooms. UH occupants will use centralized toilet facilities.

4-4.1 Unit Details.

Delete the FC paragraph 4-4.1 The Market Unit, and substitute the following:

- Living/Sleeping Area. Bedrooms are intended for occupancy by four persons. Bedroom dimensions are not fixed but must remain functional to accommodate four twin extra-long beds; two desk units, two chairs, and four wall lockers.

- Personal closets are not included in Austere UH construction.

- Bathroom Groups (Common Centralized Shower /Toileting) - refer to Plumbing paragraph 3-13 to describe requirements for "Bathroom Groups". Common bathroom groups will consist of shower/dry toweling/dressing and adjacent toileting areas which are to be centrally located for division for male / female personnel occupancies at each floor.

- Centralized Laundry. The Austere requirement for laundry is optional. If provided, locate a single centralized laundry at the ground floor only if no other laundry facilities are within a reasonable co-location. Provide one washer and two dryers for every 20 residents, as a minimum. Stacked units are acceptable. Provide a single laundry room for easy access and provide acoustic separation from other areas. Provide 12 linear feet (3.6 m) of folding table(s), a clothes hanging area with hanging rods and 4 ft (1.25 m) of full height hanging for drip-dry clothing. Set aside a space of 24 inches x 48 inches (0.6 m x 1.2 m) for soap, bleach, fabric softener and other laundry aid vending.

Delete the FC Chapter 5 MARINE CORPS ROOM PLANS.

Delete the FC Chapter 6 OPEN BAY.

D-2 DEFINITION OF TERMS

2+0 Type Designs: Unaccompanied Housing suitable for assignment of two E1-E3 Sailors or one E4 Sailor. 2+0/2+0 Type Designs generally consist of a Unit providing a room of at least 180 net square feet and an in-room bath.

Formal Training/Schools: United States Marine Corps Training and Education Command (TECOM)-Sponsored Professional Military Education (PME) schools (such as the Sergeants course and Advanced Senior Non-Commissioned Officers (SNCO) Academy) or a formal MOS-producing school (similar to Navy A Schools). Formal Training/Schools do not include basic training which includes recruit basic training at Marine Corps Recruit Depots (MCRD), School of Infantry (SOI)/Marine Combat Training (MCT), or local training courses such as the Corporal's course, Vehicle Operator Training Course, and others).

Mission Essential: Housing for rotational/mobilized Sailors outside their homeport and crewmembers of uninhabitable ships/submarines outside their normal homeport.

Military Necessity: Housing supporting Individual's Accounts Personnel, individual augmentees, Sailors assigned to Transient Personnel Units while awaiting ship's movement or separation from the Navy, Sailors executing temporary duty for further assignment (TEMDUFURAS) orders, awaiting Medical boards, executing limited duty orders, or Sailors directed by the Command to temporarily reside in UH because of restricted duty, military protective orders, or cool down. Personnel are considered "must house" on the installation.

Motel/Tower Design: Unaccompanied Housing which generally consists of a ‘module’ including six bedrooms sized to house three Sailors each that share a central head, shower and laundry room and lounge.

Officer Accessions: Any of several programs that provide personnel to assume positions as commissioned officers.

Permanent Party: Active duty and Reserve Component military personnel who are assigned to or are attached to an installation in a PCS Status. Also includes trainees or students who are attending a training course for 20 weeks or longer.

Recruits: Personnel undergoing basic military training who have no continuous prior enlisted service (active or reserve).

Remote Locations: Installations without community housing support (such as NAVSUPPFAC Diego Garcia, NAVSTA Guantanamo Bay, the California Off-Shore Islands of Santa Cruz, San Clemente and San Nicolas, and others) or with only limited community housing support (such as AUTEC Andros Island and others).

Rotational/Mobilized Sailors: Sailors attached to units that are "Sea Duty for rotational purposes" (such as air squadrons, mobile training units and Seabees) on orders as a unit to duty outside their homeport, individuals on orders to a combat zone or crewmembers of uninhabitable ships/submarines outside their normal homeport.

Training Necessity: Training programs including officer accessions (such as OTC) and enlisted initial skills training (such as "A" schools and accessions pipeline schools) where student housing is part of the training mission and separate from other UH, and students are considered 'must house' on the installation.

FOREWORD

The Unified Facilities Criteria (UFC) system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and applies to the Military Departments, the Defense Agencies, and the DoD Field Activities in accordance with USD (AT&L) Memorandum dated 29 May 2002. UFC will be used for all DoD projects and work for other customers where appropriate. All construction outside of the United States, its territories, and possessions is also governed by Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA), and in some instances, Bilateral Infrastructure Agreements (BIA). Therefore, the acquisition team must ensure compliance with the most stringent of the UFC, the SOFA, the HNFA, and the BIA, as applicable.

UFC are living documents and will be periodically reviewed, updated, and made available to users as part of the Military Department's responsibility for providing technical criteria for military construction. Headquarters, U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering Systems Command (NAVFAC), and Air Force Civil Engineer Center (AFCEC) are responsible for administration of the UFC system. Technical content of UFC is the responsibility of the cognizant DoD working group. Defense Agencies should contact the respective DoD Working Group for document interpretation and improvements. Recommended changes with supporting rationale may be sent to the respective DoD working group by submitting a Criteria Change Request (CCR) via the Internet site listed below.

UFC are effective upon issuance and are distributed only in electronic media from the following source:

- Whole Building Design Guide website https://www.wbdg.org/ffc/dod.

Refer to UFC 1-200-01, *DoD Building Code*, for implementation of new issuances on projects.

CHAPTER 1 INTRODUCTION

1-1 BACKGROUND.

In July 2007, the most recent version of UFC 4-722-01 was published. Later, each Service developed its own Facilities Criteria (FC) or standards. The following list summarizes the various Services' responses:

- Air Force: FC 4-722-01F, *Air Force Dining Facilities*
- Army: *Army Standard for Permanent Party Enlisted Personnel Dining Facilities*
- Navy/Marine Corps: FC 4-722-01N, *Navy and Marine Corps Dining Facilities*
- Space Force: The Space Force has not developed any criteria or standards related to dining facilities. The Space Force follows Air Force criteria.

1-2 INCORPORATES AND CANCELS.

This UFC incorporates and cancels FC 4-722-01F, *Air Force Dining Facilities*, FC 4-722-01N, *Navy and Marine Corps Dining Facilities*, and *Army Standard for Permanent Party Enlisted Personnel Dining Facilities*.

1-3 PURPOSE AND SCOPE.

This UFC presents the design and construction criteria for all DoD enlisted dining facilities both outside and inside the continental United States. Its purpose is to provide general and specific design guidance. Special attention is focused on planning and budgeting, energy conservation, state-of-the-art food service equipment, and design for durability. Emphasis is placed on the design of functional and pleasant food service facilities that attract and retain Service personnel.

1-4 APPLICABILITY.

This UFC applies to all military Service elements and contractors involved in the planning, design, and construction of DoD dining facilities. Programmatic differences for a specific Service are indicated throughout this UFC. They may be optional or not required by other Services. Comply with the agency requirements that apply to the project.

1-5 GENERAL BUILDING REQUIREMENTS.

Comply with UFC 1-200-01, *DoD Building Code*. UFC 1-200-01 provides applicability of model building codes and unique government criteria for typical design disciplines and building systems, as well as for accessibility, antiterrorism, security, high performance and sustainability requirements, and safety. Use this UFC in addition to UFC 1-200-01 and the UFCs and government criteria referenced therein.

1-6 AUSTERE DINING FACILITIES.

Chapter 4 contains requirements for dining facilities designated as “austere.” Austere construction is intended for facilities in locations determined by Commander, Navy Installations Command (CNIC) and approved by the Office of the Chief of Naval Operations (OPNAV) to be eligible for austere construction. The austere standards are intended to be flexibly applied and in varying degrees to all facilities at locations designated as austere. Flexibility is allowed to ensure the criteria are appropriate for individual austere locations. The Air Force and Space Force reserve the right to apply requirements under Chapter 4 as applicable and approved by the Air Force/Space Force Services Center (AFSVC).

1-7 SERVICE RESPONSIBILITIES.

1-7.1 Air Force/Space Force.

There are three participants in the development of Air Force/Space Force facility design. First, the local installation civil engineer identifies the need for a new, modernized, or enlarged dining facility and initiates the project development process. Second, an Air Force/Space Force project manager is designated to manage design and construction. Third, the AFSVC sets the standards for all Air Force food service operations and determines the facilities and equipment required to perform the operations.

Direct questions regarding Air Force projects to AFCEC/CFTP and AFSVC/SVXF.

1-7.2 Army.

Army activities and designers using this UFC are advised that there are three participants in the development of facility design. First, there is the local command that identifies the need for a new, modernized, or enlarged dining facility and initiates the project development process. Second, there is the Army Corps of Engineers, Center of Standardization for Army dining facilities, which is responsible for standards and reviewing all Army facility designs. Third, the Army Center of Excellence, Subsistence sets the standard for all Army food service operations and determines the facilities and equipment required to perform the operations. The Army Center of Excellence, Subsistence is the agent of the Army Chief of Staff for Installation Management (ACSIM) Installation Management Agency (IMA).

Direct questions regarding Army projects to CEW-EV, HQ USACE.

1-7.3 Navy.

There are four participants in the development of Navy facility design. First, the local installation and facility manager identifies the need for a new, modernized, or enlarged dining facility and initiates the project development process. Second, the Naval Facilities Engineering Systems Command sets the standards for developing the criteria and establishing the facility space requirements. Third, the Naval Supply Systems Command sets the standard food service operations, in conjunction with the TYCOM, (i.e., CNIC). Fourth, the management of the design and construction of Navy facilities is

a joint effort of the Naval Facilities Engineering Systems Command and the cognizant Navy Region.

Direct design questions regarding Navy projects to the following contacts:

- Office of the Chief Engineer, Naval Facilities Engineering Systems Command, or to the Commander, Naval Facilities Engineering Systems Command Atlantic, or visit the NAVFAC website at https://www.navfac.navy.mil
- Commander, Navy Installations Command, Fleet and Family Readiness (N92), Galley Program Manager

1-7.4 Marine Corps.

Headquarters Marine Corps, Logistics Food Service (Code LFS-4) manages policies, sets standards, and directs all food service operations within the Marine Corps. The design project manager is responsible for approving design and construction. Each new dining facility will have a technical representative assigned by the activity Food Service Office to coordinate needs and requirements between Code LFS-4, the cognizant Naval Facilities Engineering Systems Command component, and other activities as needed.

Direct questions regarding Marine Corps projects to the Criteria Specialist for Dining Facilities, Naval Facilities Engineering Systems Command, Facilities Criteria Office. Marine Corps requests will be forwarded by NAVFAC to Headquarters, U.S. Marine Corps, Facilities and Services Division (Code LF).

1-8 COORDINATION.

Prior to project development, coordinate the design team composition and facility requirements with the Service contacts provided in paragraph 1-7.

1-8.1 Design Professionals.

Include a food service consultant in the design team of record. The food service consultant is qualified as a member of Foodservice Consultants Society International (FCSI) or equivalent. The consultant’s involvement will include, but not be limited to, developing specifications and schedules for all kitchen equipment, including utility connection sizes and capacities for all applicable items, location of floor sinks and floor drains, and kitchen hoods. Coordinate with the Installation Food Service Team.

1-9 SCOPE OF FACILITY.

Dining facility functional design is driven by the number of personnel to be served, meal schedule and duration, payment style, food delivery and eating methodologies, and any additional functions accommodated in the specific facility. These functions and how they drive the design of the facility are described in paragraph 2-2.

1-10 CYBERSECURITY.

All facility-related control systems (including systems separate from a utility monitoring and control system) must be planned, designed, acquired, executed, and maintained in accordance with UFC 4-010-06, *Cybersecurity of Facility-Related Control Systems*, and as required by individual Service implementation policies.

1-11 GLOSSARY.

Appendix B contains acronyms, abbreviations, and definitions.

1-12 REFERENCES.

Appendix C contains a list of references used in this document. The publication date of the code or standard is not included in this document. Unless otherwise specified, the most recent edition of the referenced publication applies.

CHAPTER 2 PLANNING AND LAYOUT

2-1 GENERAL.

Involve the installation's food service manager and food service officer (FSO) in the planning process to ensure new and renovated facilities meet the needs of the installation functional operators. This document includes space calculation tabulations for dining facilities serving up to 2,200 personnel. If facilities are required to feed more than 2,200 personnel, it is recommended to consider extending feeding hours or adding serving lines to accommodate additional personnel in lieu of constructing a substantially larger building.

2-2 FOOD SERVICE PLANNING DETERMINATIONS.

Planning the size and layout of dining facilities depends upon the following determinations.

2-2.1 Number of Personnel to be Served.

The number of personnel to be served drives the overall size of the facility. Refer to paragraph 2-3 for functional spaces, paragraph 2-4 for size of facilities, and paragraph 2-5 for space programs.

2-2.2 Meal Schedule and Duration.

The meal schedule and duration affect both the size and layout of the facility. The meal schedule may vary by Service, region, and installation. Determine meal schedule and duration as part of the planning process.

2-2.3 Payment.

The payment style affects the layout of the facility.

2-2.3.1 Cafeteria Style.

Patrons pay a set meal price upfront at a check-in station and choose from predetermined options.

2-2.3.2 À La Carte.

Patrons pick up individual menu items and pay only for the items selected at a check-out station at the serving area exit. Additionally, new innovations have established on-line ordering, "ghost kitchen," and meal pickup stations/areas within cafeteria-style operations. The Air Force/Space Force use food lockers for advance orders, as well as flight and ground meal pickup.

2-2.4 Food Delivery and Eating Methodologies.

Food delivery and eating methodologies affect the size and layout of the facility. Dining facilities may accommodate more than one of the following methodologies:

2-2.4.1 Serving Line or Station.

Patrons choose from predetermined options from serving lines or stations, such as hot bar line, salad bar, deli bar, pizza bar, taco bar. Food may be packaged for consumption in the facility or for takeout. Payment can be either cafeteria style or à la carte.

2-2.4.2 Short Order.

Patrons order items for custom preparation. Food may be packaged for consumption in the facility or for takeout. Payment can be either cafeteria style or à la carte.

2-2.4.3 Takeout/Meal Replacement.

Patrons choose from assorted prewrapped and prepackaged items that may range from hamburgers and pizza to full meals. Payment is typically à la carte.

2-2.5 Menu.

Determine menu options, nutritional guidelines, and the required variety prior to design and coordinate with the food delivery and eating methodologies. These will be used to determine the needed preparation, serving and storage area sizes, and equipment.

Menus, consumer information, menu boards containing prices and specials, and greeter boards are used within the serving line and dining area space to connect customers to what is offered on the menu. These information systems interact with back office and web-based platforms, typically automatically updated via operational day parts. As a general rule, the larger the space, the larger the menu display systems and independent menus at each station or serving area.

2-2.6 Staffing.

Determine staffing requirements prior to design and use to size the administrative areas, staff lockers, and toilets.

2-2.7 Bussing.

Patron self-bussing is required. Design the facilities to accommodate this mode of bussing, which affects the facility layout. Ideally, automating the patron side of a dining area allows for seamless dishware removal from the dining area into the dish room through automated belts, carousels, or similar systems. Patrons break down their dishware and recyclable items and then place them into automated systems to move dishware into the remote dish room. If used, bussing carts in dining areas should be appropriately sized and screened from the view of the dining area.

2-2.8 Other Facility Functions.

The dining facility may accommodate one or more of the following additional functions.

2-2.8.1 Field Feeding/Vat Chow.

The dining facility prepares group meals for field consumption. This function includes storing field preparation and serving equipment.

2-2.8.2 Flight Kitchens and Box/Bag Meals.

The dining facility prepares individual meals for field consumption. This function requires either storing individual meal packaging or storing commercially prepared individually packaged meals.

2-2.8.3 Satellite Kiosk Locations.

The Air Force/Space Force utilize a series of retail kiosks located adjacent to mission areas, allowing customers to briefly step away from the mission area. These kiosks rarely produce food items onsite, but finish, reheat, and utilize final-finish-in-front-of-the-customer technology. The bulk of all food and beverage items are produced in the primary business and industry cafeteria and then transferred in bulk to the remote kiosk locations. There is limited storage and access in these satellite operations due to their proximity to controlled mission areas.

2-2.8.4 Recreation Chow.

The dining facility prepares special event group meals for consumption outside the facility.

2-2.9 Mass Care Feeding Facility.

Dining facilities may be designated as mass care feeding facilities if mission, region, and installation requirements dictate. A mass care feeding facility is designed to remain operational after an emergency incident when other dining opportunities will not be available. This will significantly affect the project budget and requires classifying the building to meet a higher occupancy category per UFC 3-301-01, *Structural Engineering.* See paragraph 3-4 for more information. Also see paragraph 3-6.4 for emergency back-up power requirements. Coordinate with the installation antiterrorism (AT) plan or emergency management plan.

2-3 FUNCTIONAL SPACES.

The food service planning determinations along with site conditions and other basic building design, operation, and installation determinations establish the size, layout, and design of the facility functional spaces.

2-3.1 Entrance Lobby.

The entrance lobby is the main entrance to the facility and the size is determined by the number of personnel to be served. Provide a canopy or enclosure for patrons who arrive in advance of the opening of the facility or where the line of patrons is anticipated to extend outside the facility. In extreme-weather locations, this function can be accomplished in the form of a vestibule. Provide a bracket to accommodate hand sanitizer placement. Provide a shoe and boot brush cleaner outside the facility entrance.

2-3.2 Queue.

The queue is the space between the entrance lobby and serving area and is determined by the serving capacity, serving methodology, and payment style. Provide storage cubicles and/or coat/hat racks in this area to allow patrons to properly store personal gear. Provide hand sanitation areas/stations for patron use. For Air Force/Space Force, provide greeter information and digital menu display system informing patrons on what is available for à la carte service.

2-3.3 Serving Area.

The serving area accommodates ordering and delivery of food to patrons and is determined by the food delivery methodology and payment style. The design of the serving area impacts the serving capacity. Coordinate serving area design with the queue and dining area. For Air Force/Space Force, add within the dining area designated retail grab & go kiosk areas, ideally incorporated adjacent to dedicated point-of sale (POS) systems and may include retail self-checkout.

2-3.4 Cashier Station.

The cashier station accommodates patron payment. The configuration, location, and number of stations are determined by the number of personnel served, food delivery methodology, and payment style. Accommodate a variety of payment options such as cash, credit, debit cards, and Essential Station Messing (ESM) meal card customers. Provide electrical and data drops to allow for network connectivity, electronic menu board capabilities, and other POS accountability requirements.

Provide CAT6 cable runs between the main comms closet and back-office administrative area. This is required for POS, digital menu boards, and back-office computer systems interfacing with POS and credit card charge-processing systems. Include all in overall comms and data plan requirements.

See Figure A-9 for a schematic plan of the cashier station.

2-3.5 Dining Area.

The dining area accommodates patron eating and relaxation. It is determined by the number of personnel to be served and meal schedule and duration as expressed by

turnover/serving capacity and seating capacity. Coordinate the design with the food delivery methodology and bussing approach.

Air Force/Space Force dining areas contain Wi-Fi access. This is combined into the overall base communication plan for consumer education programs such as Go For Green (G4G), Healthy Food Initiatives, My Fitness Pal, and patron access to hosted online menus and online ordering.

2-3.5.1 Turnover/Serving Capacity.

Turnover is the number of times a dining area seat is occupied during a given period. Turnover drives the serving capacity, which is the number of patrons served within the set meal duration. The serving capacity is used to size the functional elements of the dining facility to ensure the required number of patrons can be served in the meal duration. Determine the serving capacity prior to design.

2-3.5.2 Seating Capacity.

Seating capacity is determined by considering the required serving capacity and the serving methodology. The seating capacity is used to size the dining area of the facility.

2-3.6 Public Toilets.

The public toilets are determined by the number of personnel to be served.

2-3.7 Dish/Pot Washing.

The dish- and pot-washing areas are determined by the number of personnel to be served, bussing considerations, food delivery methodology, and menu. Refer to Figures A-10 through A-13 for schematic dishwashing plans.

2-3.8 Kitchen and Preparation Areas.

The kitchen and all food preparation areas are determined by the number of personnel to be served, food delivery methodology, menu, bussing style, and storage capacity.

2-3.9 Storage.

Storage areas accommodate stocks of subsistence (consumables) and non-subsistence (e.g., tableware, cleaning supplies). The areas are determined by menu analysis, number of personnel to be served, and defined delivery cycles. Separate general storage from food storage areas.

2-3.10 Loading Dock.

The loading dock accommodates material transfer in and out of the facility. Coordinate loading docks with storage requirements. Separate pathways to/from the loading dock for food delivery and trash removal. For Navy and Marine Corps facilities, provide a fall protection system in accordance with OPNAV M-5100.23, *Navy Safety and*

Occupational Health Manual, where the elevation between the floor edge of the dock and adjacent surface is 4 ft (1.2 m) or greater.

2-3.11 Support Areas.

Support areas accommodate staff needs such as offices, training, cashier's office, other administrative tasks, toilets, lockers, and janitor closets. The areas are determined by the mission and staffing requirements. The cashier's office is used for counting money, contains the cashier's safe, and includes a lock on the exterior door.

2-3.12 Other Functions.

These spaces will be determined by the required specific facility functions as described in paragraph 2-2.

2-3.13 Building Services Areas.

These spaces accommodate building services such as mechanical, electrical, and communications.

2-3.14 Garbage Removal.

Determine garbage removal and recycling systems prior to design. Visually shield garbage removal/recycling systems from patron entrances and parking areas.

2-4 SIZE OF FACILITIES.

2-4.1 Air Force/Space Force.

The gross allowable area is defined by DAFMAN 32-1084, *Standard Facility Requirements*. Additionally, AFSVC/SVXF assists in determining requirements for unique Air Force/Space Force mission sets and standard à la carte designs.

2-4.2 Army.

See Table 2-1 for gross area of facilities.

Table 2-1 Permanent Party Enlisted Personnel Dining Facilities Army Standard

ITEM	MANDATORY CRITERIA	
Gross Area of Facilities	**GSF (Gross Square Feet) Deviation:** Facility constructed gross area shall not exceed 105% of space allocation set forth in this document to accommodate site, construction, or environmental factors.	
	Dining Facility: Includes dining, kitchen, storage, attached canopies and loading dock in GSF limits listed below.	
	Small (400–660 PN)	17,500 GSF
	With Field Feeding	17,750 GSF
	With Carry-Out	18,640 GSF
	With Field Feeding & Carry Out	18,890 GSF
	Medium (661–1056 PN)	18,900 GSF
	With Field Feeding	19,150 GSF
	With Carry-Out	20,040 GSF
	With Field Feeding & Carry Out	20,290 GSF
	Large (1057–1716 PN)	26,600 GSF
	With Field Feeding	26,970 GSF
	With Carry-Out	27,740 GSF
	With Field Feeding & Carry Out	28,100 GSF

2-4.3 Navy and Marine Corps.

Determine the number of personnel to be served by multiplying the projected maximum unaccompanied housing occupancy by the utilization factors in Table 2-2. Include the average on-board count of ships entitled to subsistence-in-kind while shipboard facilities are out of service in the projected occupancy. Do not include personnel on separate rations in the projected occupancy.

Table 2-2 Personnel to be Served by Mission

Mission	Utilization Factor
Training	
Basic and/or recruit training	95%
Service schools	85%
Permanent Party	
Remote locations*	90%
Naval stations	70%
Construction battalions	70%
Shipyards	70%
Weapon stations	70%
Personnel transfer and overseas processing centers	50%
Brig	100%

* Defined as a location with minimal available other feeding sources, on or off installation.

Note: Only include officers and civilians in the projected occupancy in overseas or remote locations where support is authorized.

The projected occupancy multiplied by the utilization factor equals the personnel served. The number of personnel served is used to establish the eight facility size classifications for dining facilities. See paragraph 2-2 for facility areas by size classification. Additional space planning criteria can be found in FC 2-000-05N, *Facility Planning Criteria for Navy and Marine Corps Shore Installations*, category code 722.

2-5 SPACE PROGRAMS.

2-5.1 Air Force/Space Force.

The Air Force provides design guidelines for its facilities. Refer to paragraph 2-4.1.

2-5.2 Army.

The Army provides design guidelines for its facilities. Refer to paragraph 2-4.2 and the *Army Standard for Permanent Party Enlisted Personnel Dining Facilities*.

2-5.3 Navy and Marine Corps.

Tables 2-4 and 2-5 identify functional areas in Navy and Marine Corps dining facilities and provide a target space allotment for each functional area. The space requirements are minimums to be provided for the range of personnel to be served. These targets have been provided to serve as a guide to the planner and designer considering the noted assumptions and are not restrictive. Actual gross allowable area for each project will be defined in DD Form 1391, *FY__ Military Construction Project Data*.

2-5.3.1 Space Program Assumptions.

The functional areas and associated space allotments identified in Tables 2-4 and 2-5 reflect the assumptions below. Adjust project areas and space allotments to align with the project-specific parameters.

- Preparation method is conventional cook-serve.
- Mission is basic or recruit training.
- Seating is based on 15 ft^2 (1.4 m^2) per seat.
- Lobby queuing and circulation space is minimized.
- One serving line is needed for every 200 seats, with a minimum of two lines.
- Multiple station/serving areas versus cafeteria lines are recommended for dining facilities serving more than 100 personnel.
- Serving stations will include ventless grills, turbo ovens, and other quick-cook ventless equipment for made-to-order items.
- Baking operations reflect primarily scratch baking methods with capability to bake-off pre-prepared dough or other items.
- Three meals per day are served seven days per week.
- Warm/chill storage stations will be provided for pre-order customer pick-up.
- Dishwashing space reflects a rack dish machine.
- Bussing method is self-bus to remote dish room.
- No provisions for catering are allocated other than field feeding/vat chow.
- Beverages are available at a free-standing self-serve counter.
- Staff toilets do not include showers.
- Staff changing rooms will have personal storage lockers for 100 percent of staff.

2-5.3.2 Storage.

2-5.3.2.1 Storage area requirements typically range from 10 to 25 percent of the facility net area (public, preparation, serving, and support areas) and include dry foods, refrigerated and frozen foods, consumables, and non-food goods. Factors that influence the storage requirements are the method of preparation and the inventory period.

- Scratch preparation has different fresh, dry, and refrigerated storage requirements from frozen convenience and pre-prepared preparation. Determine the mix of preparation methods to correctly size and design the storage areas.
- Inventory period is the time between deliveries. It will be influenced by the facility location (CONUS vs. OCONUS and rural/remote vs. urban areas), facility mission, and the vendor location and delivery contract terms. The longer the inventory period, the larger the storage requirements. On CONUS projects, provide storage space based on an inventory period of 7 to 10 days.
- Under normal CONUS conditions, the distribution of storage space type is 50 percent dry, 30 percent frozen, and 20 percent chill.

2-5.3.2.2 See Table 2-3 for a breakdown of these factors and how they impact the storage requirements.

Table 2-3 Estimated Storage Requirements

Inventory Period Factors	Food Preparation Factors	
	Frozen/Chill	Scratch
Often (urban)	10–15% of net area	15–20% of net area
Infrequent (rural/remote)	15–20% of net area	20–25% of net area

2-5.3.3 Net-to-Gross Multiplier.

The net-to-gross multiplier accounts for mechanical and other utility space, wall thicknesses, and other construction requirements. It typically ranges from 15 to 25 percent of all net areas for dining facilities and is influenced by the mechanical system, the number of floors, and the overall layout and design of the building. Carefully consider the net-to-gross multiplier in the planning and design process as extreme anomalies can occur. Some OCONUS projects have resulted in net-to-gross multipliers as high as 50 percent.

Table 2-4 Navy and Marine Corps Space Program (1–400 Personnel)

		Facility Size Classifications							
		1-80 Personnel Served		81-150 Personnel Served		151-250 Personnel Served		251-400 Personnel Served	
		62 Min. Seats		108 Min. Seats		116 Min. Seats		172 Min. Seats	
		1.3 Min. Turnover		1.4 Min. Turnover		2.2 Min. Turnover		2.3 Min. Turnover	
Functional Components		**ft^2**	**m^2**	**ft^2**	**m^2**	**ft^2**	**m^2**	**ft^2**	**m^2**
Public Areas	Dining Area and Circulation	935	86.9	1630	151.4	1875	174.2	3000	278.7
	Public Toilets	180	16.7	200	18.6	220	20.4	250	23.2
	Queue	130	12.1	250	23.2	325	30.2	500	46.5
	Sign-in Station	40	3.7	40	3.7	40	3.7	60	5.6
	Subtotal	**1285**	**119.4**	**2120**	**196.9**	**2460**	**228.5**	**3810**	**354.0**
Serving Areas	Regular Food Line	250	23.2	320	29.7	0.0	0.0	0.0	0.0
	Fast Food Line	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0
	Combination Food Line	0.0	0.0	0.0	0.0	420	39.0	620	57.6
	Beverage Line/Salad Bar	200	18.6	250	23.2	350	32.5	500	46.5
	Cashier Station	30	2.8	30	2.8	50	4.6	50	4.6

	Subtotal	**660**	**61.3**	**850**	**78.9**	**1140**	**105.8**	**1550**	**144.0**
Preparation Areas	Kitchen	650	60.4	800	74.3	600	55.7	845	78.5
	Vegetable Preparation	0.0	0.0	0.0	0.0	220	20.4	255	23.7
	Meat Preparation	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0
	Bakery	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0
	Utensil Wash	0.0	0.0	0.0	0.0	175	16.3	220	20.4
	Subtotal	**650**	**60.4**	**800**	**74.3**	**995**	**92.4**	**1320**	**122.6**
Support Areas	Offices	230	21.4	310	28.8	400	37.2	580	53.9
	Staff Toilets	260	24.2	260	24.2	260	24.2	260	24.2
	Staff Lockers	0.0	0.0	0.0	0.0	120	11.1	160	14.9
	Janitor's Closet	25	2.3	25	2.3	25	2.3	50	4.6
	Can Wash	40	3.7	40	3.7	40	3.7	40	3.7
	Loading Dock	200	18.6	200	18.6	200	18.6	230	21.4
	Subtotal	**755**	**70.2**	**835**	**77.6**	**1045**	**97.1**	**1320**	**122.7**
FACILITY SUBTOTAL		**3,350**	**311.3**	**4,605**	**427.7**	**5,640**	**523.8**	**8,000**	**743.3**
Storage ranges from 10 to 25% of Facility Subtotal									
Net-to-Gross ranges from 15 to 25% of Facility Subtotal									
Flight Kitchen*		**100**	**9.3**	**100**	**9.3**	**100**	**9.3**	**100**	**9.3**
FACILITY TOTAL		To be determined based on storage and net-to-gross		To be determined based on storage and net-to-gross		To be determined based on storage and net-to-gross		To be determined based on storage and net-to-gross	

* Not all locations will require a flight kitchen. A flight kitchen is a staging area where food products are assembled and packaged for delivery to aircraft. This applies to all stations that require pick-up/delivery options, not just air stations.

Table 2-5 Navy and Marine Corps Space Program (401–2200 Personnel)

Functional Components		Facility Size Classifications							
		401-650 Personnel Served		651-1000 Personnel Served		1001-1500 Personnel Served		1501-2200** Personnel Served	
		288 Min. Seats		345 Min. Seats		460 Min. Seats		575 Min. Seats	
		2.3 Min. Turnover		2.9 Min. Turnover		3.3 Min. Turnover		3.8 Min. Turnover	
		ft^2	m^2	ft^2	m^2	ft^2	m^2	ft^2	m^2
Public Areas	Dining Area and Circulation	4700	436.6	6320	587.1	7565	702.8	11000	1021.9

FACILITY TOTAL		To be determined based on storage and net-to-gross		To be determined based on storage and net-to-gross		To be determined based on storage and net-to-gross		To be determined based on storage and net-to-gross	

* Not all locations will require a flight kitchen. A flight kitchen is a staging area where food products are assembled and packaged for delivery to aircraft. This applies to all stations that require pick-up/delivery options, not just air stations.

****** If facility is serving more than 2,200 personnel, consider extended feeding hours or adding serving lines to accommodate additional personnel in lieu of constructing a substantially larger building.

2-6 BUILDING SITE.

This facility will be a focal point of the local community. It should be an open and inviting gathering place for Service personnel. Address the following factors in the site selection and design.

2-6.1 Location.

Locate the facility along the pedestrian paths to existing unaccompanied housing and centralized support services. Accommodate patron access through the relationships to existing vehicular and pedestrian circulation patterns, bike trails, and bus stops. If served by shuttle buses, provide a porte cochere. Provide adequate parking as close to the facility as possible within AT requirements.

2-6.2 Natural Light.

Select a site to maximize the admission of natural light while minimizing heat gain through the glazing.

2-6.3 Separate Service Functions.

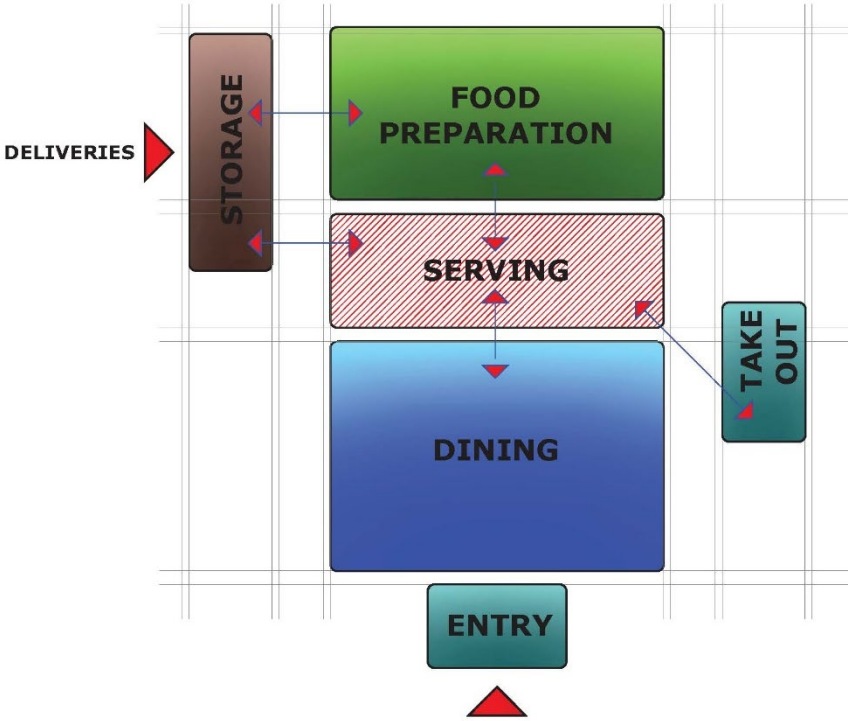
Separate service functions such as loading docks, maintenance yards, trash containers, on-grade mechanical equipment, and staff parking from the rest of the site by architectural screening, landscaping, or grading. Illuminate parking areas, pathways, and service areas. Do not impede visual access of pathways with landscaping shrubbery.

2-6.4 Patron Circulation.

Patrons arrive from many directions. Identify the various access points, both pedestrian and vehicular, and channel circulation to the entrance of the building. Encourage smooth circulation by landscaping and paving complementary to the building. Entry circulation begins as the patron enters the site and continues through the interior of the facility.

2-6.5 Outdoor Dining Area.

If climate and site permit, consider providing an outdoor area.



2-7 BUILDING LAYOUT

Foster efficient flow of people, materials, and work activities in the building layout. Visually and acoustically separate patron functions from food preparation and cleaning functions. Visible cooking stations are encouraged for individualized orders.

2-7.1 Flow Schematic.

Figure 2-1 schematically illustrates the building layout with major functional areas and displays the flow of people and material.

Figure 2-1 Dining Facility Flow Schematic

2-7.2 Functional Planning.

Carefully study the relationship among the various storage, preparation, cooking, serving, and cleaning functions to provide maximum flow and efficiency. Keep travel distances short and minimize crossover of circulation paths. Maintain open sight lines as much as possible and utilize mobile food service equipment for flexibility. Provide utility connections for mobile food service equipment. Plan for various serving styles.

2-7.3 Separate the Dining Area.

The dining area represents the conclusion of the patron process of arrival, queuing, identification, serving, and payment. To the extent possible, separate seated patrons from the congestion and movement of arriving and departing patrons. To avoid congestion within the dining facility, patron circulation space at the bussing area should be as large as possible.

2-8 BUILDING DESIGN.

Include the following design considerations in the planning and budgeting process. Emphasis is placed on the design of functional and pleasant food service facilities that help attract and retain patrons. Comply with command and installation architectural standards. The dining facility can represent a visual focal point on base, similar to a headquarters building, and its design can set the standard for the installation.

2-8.1 Design for Flexibility.

Planners and designers should recognize that future renovations, additions, and expansions of the facility are likely.

2-8.2 Aesthetics and Visual Image.

The dining experience represents a break in the patron's day. Its design should provide a visual respite as well. The designer should provide an aesthetic and visual image in keeping with the recreational functions of the facility.

2-8.2.1 Develop Architectural Character.

Create an appealing environment through interesting plan areas, spatial volumes, and other design elements. If outdoor dining is provided, consider the effect on both the facility layout and design character.

2-8.2.2 Signage.

Develop a comprehensive signage package (both exterior and interior) that addresses both way-finding and definition of all spaces within the facility. This may include signage that identifies serving stations. Signage should reflect and complement the environment through colors, images, and materials.

2-8.2.3 Menus.

Menus and their various versions are evolving into education/information instruments unlike anything envisioned a few years ago. As this evolution continues, the capacity to provide more locations and greater capabilities is a basic building block for the dining facility's target demographic.

2-8.3 Glazing.

The admission of natural light contributes significantly to the energy efficiency of the building and communicates a feeling of well-being and openness. Coordinate glazing design with the lighting design (see paragraph 3-6.4.3).

Direct sunlight on dining patrons can be uncomfortable and detracts from a positive dining experience. In addition to the site issues noted in paragraph 2-6.2, consider overhangs and other building features to preclude direct sunlight on the seating areas.

2-8.4 Design for a Quality Work Environment.

Ensure quality building systems, adequate employee facilities, easily accessible safety devices, and prevention of entry by vermin and insects.

2-8.5 Design for Durability and Maintainability.

The materials proven to be the most durable are shown in Table 3-1 and should be accommodated in the budget. The design should accommodate access for cleaning and maintenance in high-wear areas, including food preparation, dishwashing, and pot- and pan-washing areas.

CHAPTER 3 DESIGN CRITERIA, CODES, AND DESIGN STANDARDS

3-1 GENERAL.

Comply with UFC 1-200-01, which provides applicability of model building codes and government-unique criteria for typical design disciplines and building systems as well as for accessibility, antiterrorism, security, high performance and sustainability requirements, and safety. Use this UFC in addition to UFC 1-200-01 and the UFCs and government criteria referenced therein.

3-1.1 Authorized Building Program.

A DD1391 funding document is developed for all new construction projects, which establishes project requirements and authorized building size. The designer can use the functional diagrams contained herein to create the logical flow and individual space allocations for approved functions within the facility; however, the design may not exceed the square footage allowances of the DD1391 or add functional areas to the facility if the functions are not authorized in the validated DD1391.

3-1.2 Accessibility.

Comply with UFC 1-200-01 requirements for accessibility.

3-2 SUSTAINABILITY.

DoD requirements for sustainability apply to construction, redesign, renovation, and modernization projects. Refer to UFC 1-200-02, *High Performance and Sustainable Building Requirements*, for high performance and sustainable buildings (HPSB) criteria.

3-3 FOOD CODE.

Design facilities to meet the Food and Drug Administration's (FDA) *Food Code*.

3-4 STRUCTURE.

Comply with UFC 3-301-01 requirements for structural design. In addition, comply with the following:

- Provide clear spans as required for the dining area.
- If the facility has been designated as a mass care feeding facility (see paragraph 2-2.9), then the building is classified as Risk Category IV per UFC 3-301-01.

3-5 ARCHITECTURE AND INTERIOR DESIGN.

3-5.1 General.

Comply with UFC 3-101-01, *Architecture*, and UFC 3-120-10, *Interior Design*, requirements for architecture and interior design.

3-5.2 Coordination.

The following items require coordination with the architectural design:

- Requirements for floor drains, wall recesses, stub walls, and any pads or piers needed for food service equipment;
- All bumpers, guards, and protective devices;
- The use of special materials such as quarry tile, noncorrosive ceiling grid, skim coat plaster on concrete masonry unit (CMU) walls, metal acoustic ceilings, plaster ceilings, and smooth-face lay-in tile;
- Incorporate materials used in commercial restaurants for dining areas. Visible CMU walls are not permitted in the serving and dining areas;
- E.g, all roof, ceiling, floor, and wall penetrations for ducts, control lines, refrigerant tubing;
- Floor elevation and slope requirements to ensure proper water drainage in wet areas; and
- Between loading dock and kitchen, provide minimum 8-ft (2.4 m) -tall doors with adequate widths to accommodate equipment movement.

3-5.3 Materials and Finishes.

Approved finishes for functional areas are in Table 3-1. For deviation requests, see paragraph 1-7. Floors that are slip-resistant, drain well, and clean easily are of paramount importance. Provide floors that will endure cleaning by high-pressure spray equipment. Coordinate finishes with the interior designer.

Also comply with the following:

- Provide protective guards in all areas subject to cart traffic, i.e., walls, doors, and corners. Locate equipment to minimize cart damage.
- Provide door systems with acoustical properties between kitchen/dishwashing areas and dining areas. Where feasible, design doors for wheeled traffic without raised thresholds. Provide vision panels in doors to permit views of anyone entering and exiting.
- Ensure all joints and intersections of materials are sealed, free of pocketed or porous materials, and accessible for cleaning.

Table 3-1 Interior Finishes

Space	Finishes				
	Floor	Base	Walls	Protect	Ceiling
Entry/Vestibule	PT, RM	PT	Note 1		Note 3
Queue	PT or RF	PT or Rubber	Note 1		Note 3
Public Toilets	PT	PT	CT		MR GWB
Check-in	PT or RF	PT or Rubber	Note 1		Note 3
Dining Area	Carpet*, PT	Rubber or PT	Note 1	Note 2	Note 3
Serving, Patron Side	QT or PT	QT or PT	CT or GSU	Wall, Corners	MR Vinyl ACT
Serving, Server Side	QT, EF, or CUF	QT, EF, or CUF	CT or GSU	Wall, Corners	MR Vinyl ACT
Dishwashing	QT, EF, or CUF	QT, EF, or CUF	CT or GSU	Wall, Corners	MR Vinyl ACT
Food Preparation Area	QT, EF, or CUF	QT, EF, or CUF	CT or GSU	Wall, Corners	MR Vinyl ACT
Utensil Wash	QT, EF, or CUF	QT, EF, or CUF	CT or GSU	Wall, Corners	MR Vinyl ACT
Storage, Freezer	QT, EF, or CUF		MIP		MIP
Storage, Chilled	QT, EF, or CUF		MIP		MIP
Storage, Dry	SC or VCT	Rubber	GWC on CMU	Corners	ACT
Storage, Non-Food	SC	Rubber	GWC on CMU	Corners	ACT
Storage, Carb. Beverage	QT, CT, or CUF	QT, CT, or CUF	GWC on CMU		ACT
Offices	Carpet, PT or RF	Rubber or PT	Painted CMU		ACT
Staff Toilets	PT	PT	GWC on CMU		MR GWB
Staff Lockers	QT or PT	QT or PT	GWC on CMU		MR GWB
Janitor Closet	SC, PT or QT	Rubber, PT or QT	GWC on CMU	Corners	Exposed
Can Wash	Acid-Resistant EF or CUF	EF or CUF	Epoxy or CT	Wall, Corners	MR Vinyl ACT
Loading Dock	SC		Exterior		Exterior
Mechanical	SC		Painted CMU		Exposed

Note 1: Walls in public areas may be a variety of durable materials such as brick, split block, exposed concrete, plaster, or other materials as approved.

Note 2: Provide wall guard protection at locations subject to cart traffic.

Note 3: Ceilings in public areas may be a variety of suspended acoustic ceiling, sound reflectors, or barrier materials to add both acoustic and visual interest.

General Note: All grout to be epoxy. Consider use of darker grout to hide soiling.

Legend for Table 3-1:

ACT–acoustic ceiling tile

CMU–concrete masonry unit

CT–ceramic tile

CUF–cementitious urethane flooring

EF–epoxy flooring

GSU–glazed structural unit

GWB–gypsum wall board

GWC–glazed wall coating

MIP–metal insulated panel

MR–moisture resistant

PT–porcelain tile

QT–quarry tile

RF–resilient flooring

RM–recessed walk-off mat

SC–sealed concrete

VCT–vinyl composition tile

*If carpet is introduced, limit to dry areas and use patterned, restaurant-grade carpet tile.

3-6 MECHANICAL AND ELECTRICAL.

3-6.1 Plumbing Design.

Comply with UFC 3-420-01, *Plumbing Systems*, requirements for plumbing systems design.

3-6.1.1 Plumbing Systems.

Provide freeze-proof wall hydrants at exterior wash areas in addition to other locations around the building.

3-6.1.2 Waste Systems.

3-6.1.2.1 Locate grease traps near the loading dock but outside of vehicle pathways and ensure easy accessibility for cleaning. Provide exposed covers of rust-proof and skid-resistant construction.

3-6.1.2.2 If grease interceptors are used in lieu of central grease traps to service individual equipment, locate to provide easy accessibility for cleaning, outside of food preparation areas, and which do not project above the floor in open walkways or work areas. Provide exposed covers of rust-proof and skid-resistant construction.

3-6.1.2.3 The base environmental office or waste management program will determine the type of waste permitted from food grinders, waste pulping system, and floor drains.

3-6.1.2.4 Apply an air gap of two pipe diameters to all kitchen equipment drains not having other backflow protection. Navy projects also use cross-connection control and backflow prevention program implementation.

3-6.1.2.5 Coordinate floor sinks of adequate size and non-splash receptor design with drained equipment requirements. Prime floor drains are not used as indirect waste receptors or provided with deep seal traps.

3-6.1.2.6 Do not locate waste piping above kitchen and storage areas.

3-6.1.2.7 Provide chrome plating or chrome sleeve copper pipe and fittings for visually exposed equipment waste and drain lines.

3-6.1.2.8 Coordinate drain requirements for HVAC, cold storage refrigeration equipment, and the can wash.

3-6.1.2.9 Avoid usage of large trench drains. Maintain a maximum size of 8 ft x 8 ft (2.4 m x 2.4 m) drains to minimize food waste becoming trapped.

3-6.1.3 Water Supply Systems.

3-6.1.3.1 Coordinate specialized food service equipment needs for hard/soft water, delime, descale, and pressure such as ware-washing and water-chilled equipment.

3-6.1.3.2 Provide a filtration system on the building main water line. However, if building water is not filtered as part of a central system, provide a kitchen-based central water filter with filters for 0.5-micron particulates and taste. Split discharge for two circuits: The first circuit connects to soda, cold beverage machines, and water hydration stations and the second circuit includes a polyphosphate additive before connecting to coffee brewers, equipment with boilers, self-generating steam, combi ovens, and ice makers.

3-6.1.3.3 Provide high-temperature water supply in accordance with UFC 3-420-01 for the dishwasher, pot and pan wash, can wash, and field feeding area (if provided).

3-6.1.3.4 Provide a centrally controlled low-pressure washing system with remote wall-mounted workstations in the kitchen, can wash, dishwashing area, and receiving platform. Required accessories include water broom attachment, hose reel, spray nozzle, and freeze-proof valves for exterior use in cold locations.

3-6.1.3.5 Diversity factors for water heating are based on food service equipment usage. Dining facilities may require two or more different hot water temperatures zones. Provide public and employee handwashing sinks with either temperature-limiting devices or different incoming hot water temperature than for food equipment.

3-6.1.3.6 Hot water storage and recirculation. **Note:** Where limited flow fixtures are required, provide piping and recirculation system adjustments to ensure adequate hot water at the fixture.

3-6.1.3.7 Provide backflow protection on all water connections, including connections to beverage machines that may include internal backflow prevention, in accordance with UFC 3-420-01.

3-6.1.3.8 Provide UL- and NSF-approved/certified/listed sinks.

3-6.1.3.9 Provide one 8-inch (203 mm) empty conduit with pull string from the remote beverage room to each beverage station in the facility.

3-6.1.4 Coordination.

These items require coordination with the plumbing design.

3-6.1.4.1 The food service designer determines the locations and specifications for all food service equipment (fixed and relocatable). Coordinate food service equipment layout and specifications with the facility mechanical designer for coordination of facility plumbing design.

3-6.1.4.2 Coordinate locations of all water, waste, steam and steam condensate, refrigeration condensate, chilled water supply and return, floor drains, and gas lines with equipment requirements. Conceal these lines but ensure all lines are readily accessible for maintenance. Provide washable covers where the lines are exposed.

3-6.1.4.3 Coordinate unavoidable exposed vents for island or freestanding equipment with the architect for enclosure.

3-6.1.4.4 Coordinate the design and location of required grease traps with the mechanical, plumbing, architectural, and, possibly, structural designers.

3-6.1.4.5 If under-floor conduits are used for routing the beverage system, ensure they are sealed conduits with cleanouts and pull boxes every 100 ft (30.5 m), installed with pull lines, and sealed upon product line installation.

3-6.1.4.6 Provide floor drains and a hose bibb in the beverage storage area.

3-6.1.4.7 Provide plumbing and allocated hot water capacity to the automatic wash-down system with a battery back-up wash timer for exhaust hoods, if appropriate.

3-6.1.4.8 Coordinate any special requirements for plumbing connections to utility distribution systems.

3-6.1.4.9 For connections to gas-fired equipment, provide 300 series braided stainless steel flexible connections, brass, or stainless-steel fittings. Specify hose coverings to have NSF-approved coatings and fitted with required restraints.

3-6.1.4.10 Provide easy access to waste traps and collectors for cleaning.

3-6.2 Heating, Ventilation, and Air Conditioning (HVAC) Design.

Comply with UFC 3-400-02, *Design: Engineering Weather Data*, and UFC 3-410-01, *Heating, Ventilation, and Air-Conditioning Systems*, requirements for HVAC systems design.

Refer to NFPA 96, *Standard for Ventilation Control and Fire Protection of Commercial Cooking Operations*, ASHRAE 90.1, *Energy Standard for Buildings Except Low-Rise Residential Buildings*, and UL 710, *UL Standard for Safety Exhaust Hoods for Commercial Cooking Equipment*, for kitchen exhaust and ventilation.

Additional HVAC requirements unique to dining facilities include the following:

- Provide variable-speed kitchen hood fans in accordance with ASHRAE 90.1
- Design the HVAC system to allow for control of the following:
  - Large daily load swings
  - High space latent loads
  - High and variable ventilation requirements

3-6.2.1 Coordination.

The following items require coordination with the HVAC design.

3-6.2.1.1 Coordinate the location and size of all ventilated equipment, such as exhaust hoods, dishwashing equipment.

3-6.2.1.2 Coordinate the special requirements for ductwork connecting to equipment, such as drip pans and pitched or vented duct work.

3-6.2.1.3 Coordinate the ventilation of remote refrigeration condensers.

3-6.2.1.4 Air-condition the entire facility except for storage and service areas. Ventilate and heat storage and service areas as required by code.

3-6.2.1.5 Condition the kitchen, dish wash, and pot/pan washing not to exceed 85 °F (29 °C) and heat to maintain temperature no less than 68 °F (20 °C). Maintain a negative pressure in the kitchen, dish wash, pot/pan washing, service spaces, janitor closets, and restrooms. Maintain a positive pressure in the dining, point of sale, and interior queuing areas.

3-6.2.1.6 Incorporate testing, balancing, and commissioning into all dining projects to ensure proper airflow and fan operation upon construction completion. Execute testing and balancing with all kitchen equipment functioning.

3-6.2.1.7 Provide air curtain fans over all personnel entry/exit doors and receiving vestibule doors. Specify air curtain fans the full width of doors and mounted on the

interior side immediately above the door. Emergency “Exit Only” doors and mechanical/electrical rooms do not require air curtain fans.

3-6.2.1.8 Provide stainless steel all-welded construction kitchen hood systems, including lights, filters, grease troughs, and fire protection systems. Specify UL- and NSF-approved/certified/listed hoods, certified to meet International Mechanical Code-required velocities for the service application. If face discharge hoods are utilized, provide with tempered makeup air. Temper makeup air to 85 °F (29 °C) for cooling and 60 °F (16 °C) for heating.

3-6.2.1.9 Provide an independent on/off switch for the hood exhaust fans.

3-6.2.1.10 Ventless cooking equipment is encouraged.

3-6.2.1.11 “Spot cooling” with field-adjustable diffusers at predictable workstations at the kitchen and serving areas is encouraged.

3-6.2.2 Controls.

Specify direct digital control (DDC) system per UFGS 23 09 23.02, *BACnet Direct Digital Control for HVAC and Other Building Control Systems*, or UFGS 23 09 23.01, *Lonworks Direct Digital Control for HVAC and Other Building Control Systems*. Coordinate the DDC specification to ensure a proper interface to the existing or planned base-wide DDC/EMCS system.

Tie HVAC controls into the central location on base for controlling and monitoring systems.

3-6.3 Fire Protection.

Comply with UFC 3-600-01, *Fire Protection Engineering for Facilities*, requirements for fire protection systems.

Provide a kitchen hood fire-extinguishing system in accordance with NFPA 96.

3-6.4 Electrical Design.

Comply with UFC 3-520-01, *Interior Electrical Systems*, requirements for electrical systems.

3-6.4.1 Local Conditions.

Evaluate local conditions for their impact on facility design and backup power generation requirements.

3-6.4.2 Emergency Power.

When the facility is designated as a mass care feeding facility, provide a permanent, external, self-contained emergency generator that powers the entire facility load. Provide 72 hours of fuel storage.

When the facility is not designated as a mass care feeding facility, provide a service entrance with an external temporary emergency generator hook-up for the facility. At a minimum, loads to be supported by the emergency generator include 100 percent cold storage and facility lighting. If required by activity, support additional loads as determined on a case-by-case basis. Ensure availability of a hard surface area adjacent to the building service entrance to accommodate the generator. Provide signage at the external generator connection indicating the minimum load requirement for the portable generator (kVA, voltage, ampere).

3-6.4.3 Lighting.

Comply with UFC 3-530-01, *Interior and Exterior Lighting Systems and Controls*, requirements for lighting systems design and illuminance levels.

3-6.4.4 Closed Circuit Television (CCTV).

When a CCTV system for monitoring and recording of activities in the server and dining areas is required, provide the supporting infrastructure.

3-6.4.5 Special Systems.

Provide supporting infrastructure as required for the following:

- Local area network for computerized communications, such as food service and payment management system
- Energy monitoring and control system when mandated or economically justifiable
- Public address and intercom systems
- Security systems, alarm systems, and closed-circuit television (CCTV) systems
- Cable television (CATV) and audio-visual (AV) systems for dining areas

3-6.4.6 Lightning and Cathodic Protection.

Comply with UFC 3-570-01, *Cathodic Protection*, and UFC 3-575-01, *Lightning and Static Electricity Protection Systems*.

3-6.4.7 Coordination.

The following items require coordination with the electrical design.

3-6.4.7.1 Coordinate the location of all spot connections for equipment requiring an electrical connection.

3-6.4.7.2 Coordinate all projected power requirements for food service equipment (coordinated with the food service designer as early as possible). In addition to the power characteristics, determine the type of electrical connection required (plug-in, junction box) for each piece of equipment.

3-6.4.7.3 Coordinate special requirements for equipment, such as overload protection and control panels, located at the equipment being protected.

3-6.4.7.4 Coordinate integration of food service equipment with fire suppression system controls.

3-6.4.7.5 Coordinate integration of electrical requirements for the equipment utility distribution system.

3-6.4.7.6 Coordinate the location of conduit required for computer and electronic cash register stations.

3-6.4.7.7 Specify electrical service requirements for all equipment in accordance with UFGS 11 05 40, *Common Work Results for Foodservice Equipment*.

3-6.4.7.8 Coordinate potential future equipment upgrades.

3-6.4.7.9 Floor-mounted flush receptacles and conduit stub-ups are not permitted in the kitchen area or serving line. For safety reasons, provide ceiling cord reels in these areas.

3-6.4.7.10 Provide 15 percent spare electrical load capacity throughout the building electrical system. This includes, e.g, switchboards, feeders, panelboards, transformers, branch circuits.

3-6.4.7.11 Provide a building-wide, zoned paging/intercom system with announcement and music (plug-in) capabilities from the administrative office. This paging/intercom system can be integrated with the building’s mass notification system.

3-6.4.7.12 Provide transient voltage surge suppressors (TVSS) at service entrance panels and panels supporting electronic equipment.

3-6.4.7.13 Provide cathodic protection for all ferrous underground pressurized piping systems and any ferrous underground structures. If plastic piping systems are used, then cathodically protect all ferrous valves and fittings. Provide a sacrificial anode type cathodic protection system designed for a 25-year life.

3-6.5 COMMUNICATIONS AND COMPUTER SYSTEMS.

General guidance for the design of telephone systems is provided in UFC 3-580-01, *Telecommunications Interior Infrastructure Planning and Design*. Guidance pertinent to the design of dining facilities is as follows.

3-6.5.1 Telephones.

Provide telephones with a page intercom system in coordination with the local command.

3-6.5.2 Electronic Cash Registers and Computers.

In preparation for future computer systems, provide empty conduit from the array of register terminals to a location in the food service officer's office for linkage to a computer in use by the food service officer. This office will have a variety of computer-based systems such as file server and POS terminals, credit card charge processing, digital menu boards, nutritional, and social media information, and computer systems for employee time clocks. Consolidate local email and systems for advance ordering of subsistence items in this office area. Install a primary telephone for the facility in the office with extensions at all register locations for operators and anti-robbery protocols. Provide CAT6 cabling for each separate system as determined by the end user in the overall communications plan.

3-6.5.3 Cable TV (CATV), and Audio-Visual (AV) Systems.

When required, provide the infrastructure for CATV, AV, and Wi-Fi systems. The Service contacts in paragraph 1-7 will determine if design and construction funds will be provided for Wi-Fi, CATV and/or AV equipment. Provide a CATV and/or AV system with structural supports, mounting brackets, electric, and CATV/AV jacks in each TV location. Provide mounting brackets suitable for minimum 50-inch flat panel televisions. Provide normal base/installation Wi-Fi in the dining area and facility for alerts, weather, and installation information management.

3-7 EQUIPMENT.

Provide the type, quantity, and size of equipment necessary and with sufficient redundancy and/or multi-function features to develop meals based on the following requirements:

- The facility's menu;
- The facility's staffing plan;
- The facility's hours of operation, meal schedule, and duration;
- Normal maintenance requirements;
- The standards of quality required in:
    - UFGS 11 41 11, *Refrigerated and Frozen Food Storage Equipment*

- UFGS 11 42 00, *Food Preparation Equipment*
- UFGS 11 44 00, *Food Cooking Equipment*
- UFGS 11 46 00, *Food Dispensing Equipment*
- UFGS 11 47 00, *Ice Machines*
- UFGS 11 48 00, *Cleaning and Disposal Equipment*

- All other code requirements in this UFC.

3-7.1 Walk-In Refrigerator/Freezer.

To retain refrigerated air and reduce insect infestations, provide vinyl slatted curtains hanging inside the doors or provide a blower-type air curtain outside the doors of walk-in refrigerators and freezers.

Provide a heated viewport window in the door of walk-in refrigerators and freezers to permit views of anyone entering or exiting and provide a means of egress on the interior side of each door.

3-7.2 Cashier’s Safe.

Provide a three-tumbler safe containing individual combination-locked compartments for each cashier plus one cash collection agent.

3-8 SITE WORK.

Comply with UFC 3-201-01, *Civil Engineering*, requirements for site work.

3-8.1 Landscape.

Comply with UFC 3-201-02, *Landscape Architecture*, and local installation landscape standards. Ensure the landscape accentuates the building's main entrance. Provide landscaping at the outside dining area when one is provided, including but not limited to specialty paving (i.e., precast concrete pavers, brick pavers), shade trees, foundation planting, and screen planting, as required. Design all landscaping with an emphasis on low maintenance (reduced pruning, fertilization, pest control, leaf, flower, and fruit clean-up), drought tolerance, and native plant selection.

3-8.2 Parking, Access Drives, and Other Site Features.

Provide separate access drives for parking and loading dock access. Use turning radii for loading dock access roads appropriately sized for delivery trucks. For facilities serving up to 400 personnel, use minimum 6-ft (1.8 m) -wide sidewalks. For facilities serving more than 400 personnel, use minimum 8-ft (2.4 m) -wide sidewalks.

When a facility is designated as a mass care feeding facility, locate parking areas and other critical-use areas out of the 100-year floodplain to the extent practical.

CHAPTER 4 AUSTERE DINING FACILITIES

4-1 PURPOSE.

The purpose of this chapter is to provide requirements for austere construction established by CNIC. These requirements were developed to address construction of support facilities in CNIC-designated operating environments.

4-2 DEFINITION AND SCOPE.

An austere facility is defined as a structure designed and constructed with minimal infrastructure, footprint area, and finishes, incorporating applicable building codes and facility criteria to ensure adherence to all health, accessibility, and life safety standards and regulations required to fulfill the mission, including anti-terrorism force protection (AT/FP) appropriate to each site. Austere facilities should be built with the least total ownership costs (TOC) possible, including purchase, maintenance, and use of consistently available alternative local goods.

4-3 APPLICABILITY.

This chapter applies to Navy dining facilities designated as austere by CNIC. This chapter modifies requirements provided in this UFC. Austere construction is intended for facilities in locations determined by CNIC and approved by OPNAV to be eligible for austere facilities construction. The austere standards are intended to be applied flexibly and in varying degrees to all facilities at locations designated as austere. The flexibility should be allowed to ensure the criteria are appropriate for individual austere locations. The Air Force and Space Force reserve the right to apply these requirements as applicable and approved by AFSVC.

4-4 MODIFICATIONS.

The following are modifications to this UFC when designated austere.

CHAPTER 2 PLANNING AND LAYOUT

2-2.7 Bussing.

Delete the UFC paragraph and add the following:

Patron self-bussing will be the standard mode of bussing.

2-3.1 Entrance Lobby.

Add the following:

Canopies will not be used in austere facilities unless needed for weather conditions.

2-3.4 Cashier Station.

Delete this UFC paragraph and replace it with the following:

The cashier station/sign-in station accommodates patron payment. The configuration, location, and number of stations are determined by the number of personnel served, food delivery methodology, and payment style. Payment options (credit, Smart™ cards) will be determined prior to design. No cash payments allowed.

2-3.11 Support Areas.

Delete the UFC paragraph and add the following:

Support areas accommodate staff needs such as offices, training, other administrative tasks, toilets, lockers, and janitor closets. These areas are determined by the mission and staffing requirements. For austere facilities, provide a single administrative office that can accommodate up to three people.

2-4.3 Navy and Marine Corps.

Delete the UFC paragraph and replace it with the following:

Determine the number of personnel to be served by multiplying the projected maximum unaccompanied housing occupancy by the utilization factors in Table 2-2. Include the average on-board count of ships entitled to rations-in-kind while shipboard facilities are out of service in the projected occupancy. Do not include personnel on separate rations in the projected occupancy.

Table 2-2 Personnel to be Served by Mission

Mission	Utilization Factor
Austere Locations	90%

2-5.3 Navy and Marine Corps.

Delete the UFC paragraph and replace with the following:

Refer to FC 2-000-05N for space planning spreadsheets for austere dining facilities.

2-5.3.1 Space Program Assumptions.

Modify the UFC requirements as follows:

Seating should be based on 12 ft^2 (1.1 m^2) per seat.

Bake shops are not allowed.

Separate meat and vegetable preparation areas will not be provided.

2-5.3.2 Storage.

Add the following to the UFC paragraph:

Austere facilities are identified the same as OCONUS rural/remote facilities due to infrequent delivery periods.

2-8 BUILDING DESIGN.

Add the following to the UFC paragraph:

For austere facility locations, the dining facility should not represent a visual focal point on base, nor will its design set the standard for the installation.

2-8.1 Design for Flexibility.

Delete the UFC paragraph.

2-8.2 Aesthetics and Visual Image.

Delete the UFC paragraph.

CHAPTER 3 DESIGN CRITERIA, CODES, AND DESIGN STANDARDS

3-2 SUSTAINABILITY.

Delete the UFC paragraph and use the following:

The Chief Engineer of NAVFAC has waived Sustainable Third – Party Certification requirements for projects designated austere (CONUS and OCONUS). However, requirements for the *Guiding Principles for Federal Leadership in High Performance and Sustainable Buildings (HPSB)* remain. Refer to UFC 1-200-02 for criteria associated with HPSB.

3.5.3 Materials and Finishes.

Delete Table 3-1 and use the following:

Table 3-1 Austere Facilities Architectural Finishes

General Space	Recommended Finishes			
	Floor	Base	Walls	Ceiling
Vestibule	CONCS/WM	RB	P	EXP/P, Note 1
Queue	CONCS	RB	P	EXP/P, Note 1
Public Toilets	CONCS	RB	P	EXP/P, Note 1
Check-in	CONCS	RB	P	EXP/P, Note 1
Dining Area	CONCS	RB	P	EXP/P, Note 1
Serving, Patron Side	QT, EF, or CUF	QT, EF, or CUF	P	EXP/P, Note 1
Serving, Server Side	QT, EF, or CUF	QT, EF, or CUF	P	EXP/P, Note 1

General Space	Recommended Finishes			
	Floor	Base	Walls	Ceiling
Dishwashing	QT, EF, or CUF	QT, EF, or CUF	P	P
Food Preparation Area	QT, EF, or CUF	QT, EF, or CUF	P	P
Utensil Wash	QT, EF, or CUF	QT, EF, or CUF	P	P
Storage, Freezer	QT, EF, or CUF	QT, EF, or CUF	P	P
Storage, Chilled	QT, EF, or CUF	QT, EF, or CUF	P	P
Storage, Dry	CONCS	RB	P	P
Storage, Non-Food	CONCS	RB	P	P
Storage, Carbonated Beverage	QT, EF, or CUF	QT, EF, or CUF	P	P
Offices	CONCS	RB	P	EXP/P, Note 1
Staff Toilets	CONCS	RB	P	EXP/P, Note 1
Staff Lockers	CONCS	RB	P	EXP/P, Note 1
Janitor Closet	CONCS	RB	P	EXP/P, Note 1
Can Wash	CONCS		P	EXP/P, Note 1
Loading Dock	CONCS		P	EXP
Mechanical	CONCS		P	EXP

Note 1: Ceilings are to be exposed and painted, including all exposed plumbing, mechanical, fire stops, and electrical conduit unless it is more cost-effective to provide a hard finish, painted ceiling.

Note 2: Provide wall and corner guard protection at locations subject to cart traffic.

Legend for Table 3-1:

CONCS–concrete, hardened and sealed (option: integrally colored for accent)

EXP–exposed P–paint QT–quarry tile

RB–rubber base EF–epoxy flooring

WM–walk-off mat (surface) CUF–cementitious urethane flooring

3-7.1 Walk-In Refrigerator/Freezer.

Add the following:

Bulk storage for chilled/frozen/dry goods may be located exterior to the building in appropriate environments.

3-7.2 Cashier's Safe.

Delete UFC paragraph and replace with the following:

In austere environments, there will be no cash taken at the facility and no safe is required.

3-8.1 Landscape.

Delete UFC paragraph. No landscaping is required.

3-8.2 Parking, Access Drives, and Other Site Features.

Delete UFC paragraph and replace with the following:

Apply austere decision-making to assess, modify, and incorporate requirements such as pedestrian circulation, bus access, service vehicle parking, and lighting plans appropriate to local conditions and to limit parking as much as possible while still meeting the facility mission. Review the security study and incorporate its requirements into the design. Ensure existing and proposed parking complies with antiterrorism requirements. In austere facilities, parking for residents, visitors, staff, and service personnel should be extremely minimal and directed only to the mission. Maintenance parking for service functions does not necessarily require dedicated space. Use the expected frequency of maintenance vehicles to determine whether dedicated parking is needed. Locate service access and parking to avoid disturbing residents.

APPENDIX A BEST PRACTICES

A-2 Acoustics.

Delete UFC paragraph. No acoustic provisions are required.

A-7 FOOD SERVICE EQUIPMENT.

A-7.1 Sample Equipment Schedules.

Delete Table A-1 and use the following.

Table A-1 Conceptual Equipment List for Austere Facilities

• Air curtain	• Microwave oven
• Anti-splash floor troughs	• Mixer, 20 qt (19 L)
• Area floor drain	• Mobile attachment shelving
• Braising pan, 40 gal (150 L)	• Mobile chemical shelving
• Bread display	• Mobile hot food cabinet
• Bussing cart	• Mobile mixer table
• Can opener	• Mobile pot/pan shelving
• Can rack	• Mobile slicer table
• Carbonator	• Mobile tray rack
• Cashier counter	• Mobile utensil soak sink

Table A-1 Conceptual Equipment List for Austere Facilities

• Chemical storage shelving	• Mop rack
• Clean dish table	• Office printers
• Cold food wells	• Open-front refrigerated display cabinet
• Combination oven/steamer	• Plate dispenser
• Computers	• Platform truck
• Condensers for walk-ins	• Pot/pan utensil rack
• Condensers for ice makers	• Pre-rinse faucet
• Condiment counter	• Rack dolly
• Condensate exhaust canopy	• Receiving scales
• Conveyor bagel toaster	• Refrigerated equipment stand with cold rail
• Cook & hold cabinet	• Reach-in refrigerator
• Counter with freezer base	• Remote rack refrigeration system
• Counter with sink	• Scale
• Cup dispensers	• Scanners
• Declining balance card dispenser	• Serving counters
• Dish carriers	• Sink heater
• Dishwasher	• Slicer
• Dishwasher vents	• Soiled dish table
• Disposer with pre-rinse faucet	• Stainless steel wall panel
• Double-deck convection oven	• Storage cabinet
• Dry storage shelving	• Strip curtain
• Dunnage rack	• Tray accumulator, five-tier
• Electric can opener	• Tray cabinet
• Evaporators for walk-ins	• Tray carriers
• Exhaust hoods, Type 1	• Tray return opening frame
• Exhaust hoods, Type 2	• Twin soft serve dispenser
• Fire-suppression system	• Two-compartment sink
• Griddle	• Under-counter refrigerator
• Hand sink	• Utensil rack
• Heat lamps	• Utility cart
• Heated shelf	• Vertical cutter/mixer
• Hose bibb	• Walk-in cooler shelving
• Hose reel	• Walk-in dunnage rack
• Hot food wells	• Walk-in cook's cooler
• Ice bin	• Walk-in meat/dairy cooler
• Ice machine	• Walk-in freezer
• Ice/soda dispenser	• Walk-in produce cooler
• Janitor sink with can wash	• Wall shelf
• Kitchen lockers	• Water temperature booster 180 °F (82 °C)
• Knife rack	• Work table with sink

A-8.2 Staff Lockers.

Delete UFC paragraph and replace with the following:

Lockers are for storage of personal items only. Male and female lockers need not be separate and may be combined within an appropriate area. Locate lockers close to the staff toilets. Locker quantities are as indicated in Table A-2. All lockers should be half height except for facilities for 1,001 patrons and over, where three-tier lockers are used. The number of lockers scheduled for each space exceeds the projected number of

workers for each category to accommodate the likely shifting balance of male to female workers. Equip all lockers with sloped tops.

This Page Intentionally Left Blank

APPENDIX A BEST PRACTICES

The Best Practices Appendix is considered to be guidance and not requirements. Its main purpose is to communicate proven facility solutions, systems, and lessons learned, but may not be the only solution to meet the requirement.

A-1 INTRODUCTION.

The following material identifies good design practices for each functional area as outlined in the space program. The designer is expected to interpret this guidance and configure the functional areas according to the needs of the project.

A-2 ACOUSTICS.

All facilities should be designed or treated to provide a comfortable acoustical environment.

A-2.1 Finishes.

In key areas, use finishes that absorb sound, reduce noise reflection, and minimize the generation and impact of noise. These finish materials have a high noise reduction coefficient (NRC) rating.

A-2.1.1 Ceilings in the dining area should have a minimum 0.6 NRC rating. Ceilings in the kitchen should have a minimum 0.6 NRC rating, be washable, and be United States Department of Agriculture (USDA) -listed for this application.

A-2.1.2 Acoustic wall treatments in the dining area should be implemented above wainscot height, located away from high-traffic areas, and have a minimum 0.8 NRC rating. If located near high-traffic areas, incorporate an abuse-resistant finish.

A-2.1.3 Floor finishes in the dining area should be selected to minimize noise generation.

A-2.2 Partitions.

The partitions separating noisy areas (such as the kitchen, dishwashing, and pot and pan wash) from sound-sensitive areas (such as the dining area and offices) should have a partition assembly with a minimum 50 sound transmission coefficient (STC) laboratory rating.

Openings between the kitchen and the dining area should incorporate baffles or screens, where possible, to minimize a direct noise path between these spaces.

A-3 QUEUE.

Dining facilities that accommodate large training commands or functions will experience surge conditions and require a larger queue than comparable facilities that do not.

When the queue is adjacent to the dining area, use a screen to separate queued patrons from the dining area.

A-4 DINING AREA.

The dining area provides one of the principal facility functions. Issues of particular importance are as follows:

A-4.1 Space Division.

Dining areas should be capable of being subdivided by plan or partition to close off portions during off-peak serving periods.

A-4.2 Visual Separation.

Visually separate the eating area from all other facility functions.

A-4.3 Seating.

Provide a variety of table sizes and seating options. Use non-fixed and easily cleanable furnishings. See Figure A-2.

A-5 SERVERY.

Design the lines and stations for flexibility and good traffic flow. Beverage station locations should accommodate patron refills without disrupting the serving line flow. For Air Force/Space Force facilities, locate beverage and water refresh stations in the dining area, selling a refillable cup. This greatly increases flexibility and flow considerations and repurposes this space for retail grab & go merchandisers adjacent to easily accessible POS stations. This allows customers to access grab & go, get to POS stations, and then obtain beverages in the dining areas. Locate beverage and CO_2 tanks nearby. Secure CO_2 tanks with safety straps or in a cage designed for the application. Consider providing space at the loading dock area for refilling and bulk storage of CO_2 tanks. See Figures A-3 through A-8 and A-31 through A-34.

A-6 FOOD SERVICE AREAS.

Food service areas include receiving, storage, preparation, and cleaning areas.

A-6.1 Loading Dock.

Include a can wash area with high-temperature water supply and drain connected to the sanitary line. Confirm loading platform heights with the majority of trucks servicing the facility. Dock levelers may be provided to accommodate varying truck platform heights. Provide a non-skid dock surface and bumpers at the dock to prevent impact damage. In locations with extreme weather conditions, the loading dock may need to be enclosed. Provide a ramp to connect the loading dock with the vehicular area to facilitate the use of hand trucks/carts and provide cart stops at the edge of the dock to prevent rolloff. Provide a canopy that extends 48 in. (1220 mm) beyond the edge of the platform.

Confirm canopy heights with the majority of trucks servicing the facility and confirm door widths with common delivery item sizes. See Figure A-22.

A-6.2 Refrigerator/Freezer.

The floor under the box should be depressed and insulated so the finished height is level with the surrounding kitchen floor. Provide separate exterior exits from both the freezer and the refrigerator/chill box to the loading dock. The interior exit from the freezer to the food preparation area to be through a thaw box via a door that is lockable on the freezer side. The refrigerator/chill box to be divided by a wire mesh partition between the exterior exit to the loading dock and the interior exit to the food preparation area. This partition to have a door that is lockable on the loading dock side. See Figures A-1 and A-27. Provide safety handles.

A-6.3 Dry Food Storage.

Recommend exterior access from the dry food storage to exit directly to the loading dock and the interior access to exit directly to the food preparation area. The dry food storage to be divided by a wire mesh partition between the exterior exit and the interior exit. This partition to have a door that is lockable on the loading dock side. See Figures A-1 and A-21.

A-6.4 Nonfood Storage.

Separate cleaning product storage from food product storage.

A-6.5 Kitchen.

Provide individual or continuous floor grates with drains to facilitate cleaning and catch discharge from cooking equipment such as steam kettles and tilting frying pans. Provide sufficient separation between steam-generating cooking equipment and other open-type cooking equipment. See Figures A-16 through A-18.

A-6.6 Vegetable Preparation Area.

In some facilities, this area may be a separate, refrigerated room with its own dedicated walk-in refrigerator, sinks, slicers, choppers, mixers, worktables, and other equipment. See Figure A-19.

A-6.7 Bakery.

Some facilities may include a bakery. See Figure A-20.

A-6.8 Flight Kitchen.

Flight kitchens should have direct exterior access.

A-6.9 Field Feeding/Vat Chow.

Provide adequate power and amenities for food preparation. Provide direct access to the loading dock.

A-6.10 Takeout/Meal Replacement.

Provide adequate power and amenities for food preparation and packaging/storage. This area may have a separate entrance/exit and its own POS station.

A-6.11 Dishwashing Area.

The dishwashing area should be located as close to the dining area exit as possible to permit self-bussing by the patron. A tray conveyor bussing system or a cart bussing system may be incorporated into the design. See Figures A-10 through A-13.

A-6.12 Utensil/Pot and Pan Wash.

Ensure adequate moisture control and ventilation. See Figures A-14 and A-15.

A-6.13 Pulper/Extractor System.

Provide a pulper/extractor system adjacent to the dishwashing areas to reduce manpower and water consumption. Consider providing a piped connection to the trash areas to improve sanitation in the dish room and, depending on site layout, can eject directly into the trash dumpster, further reducing manpower.

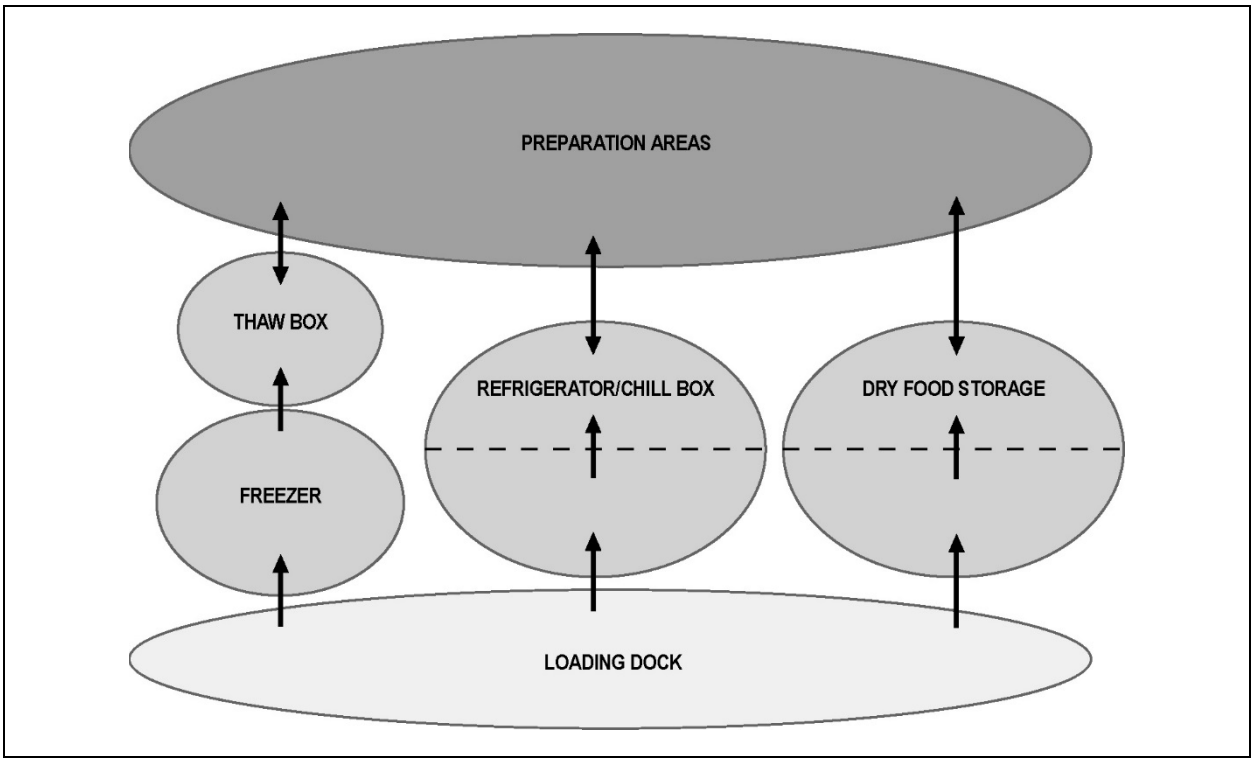
A-6.14 Cashier Station.

See Figure A-9 for Cashier Station.

A-6.15 Miscellaneous Kitchen Details.

A-6.15.1 Provide doors in kitchen and dishwashing areas meeting industry standard, single or double swing, typically of metal construction, with appropriate door protection, safety vision panels, and door hardware. See Figures A-23 through A-24 for details.

A-6.15.2 Provide wall and corner guards in all kitchen and dining areas to protect walls from damage from mobile cart and chair movement. Provide wall guard rails of materials harmonious with the overall interior design and at locations subject to mobile cart movement and chair impacts. See Figure A-25 for details.



A-6.15.3 Provide serving line tray slides at configurations determined by overall facility design. See Figure A-26 for details.

A-6.15.4 For recessed cold storage coolers and freezers, provide insulated slab construction coordinated with the cooler and/or freezer manufacturer. See Figure A-27 for typical detail.

A-6.15.5 Provide sump drains as needed by kitchen equipment and UFC 3-420-01. See Figures A-28 through A-29 for details.

A-6.15.6 Provide dishwasher duct vents as required by dishwashing equipment. See Figure A-30 for details.

Figure A-1 Storage Access Diagram

A-7 FOOD SERVICE EQUIPMENT.

Present all design work relating to kitchen equipment separately for review. This design work is to include all information required for fabrication and installation of all kitchen equipment.

A-7.1 Sample Equipment Schedules.

The following is a conceptual equipment list. This is a partial list. Consideration should be given for all ventless equipment. Provide any equipment not listed here that is required to provide a complete working system for the stated demand per paragraph 3-7.

Table A-1 Conceptual Equipment List

- Air curtain
- Air pot brewer
- Air pots
- Anti-splash floor troughs
- Area floor drain
- Audio-visual system
- Bagel display
- Bagel toaster
- Bain marie
- Bar code scanner
- Benches
- Blast chiller
- Braising pan, 40-gal (150 L)
- Bread display
- Bussing cart
- Cable television system
- Can opener
- Can rack
- Cappuccino dispenser
- Carbonator
- Cash register
- Cashier counter
- Cashier scales
- Charbroiler
- Chemical storage shelving
- Clean dish table
- Closed circuit television system
- Coffee brewer
- Coffee dispenser
- Cold food wells
- Combination oven/steamer
- Computers
- Condensers for walk-ins
- Condensers for ice makers
- Condiment counter
- Condensate exhaust canopy
- Cone dispenser
- Convection steamer, 10 pan
- Conveyor bagel toaster
- Cook & hold cabinet
- Counter with freezer base
- Counter with sink
- Cup dispensers
- Declining balance card dispenser
- Dish carriers
- Dishwasher
- Dishwasher vents
- Disposer with pre-rinse faucet
- Double-deck convection oven
- Dry storage shelving
- Knife rack
- Maximizer heat recovery
- Menu duplex printers
- Microwave oven
- Mixer, 20 qt (19 L)
- Mixer, 60 qt (57 L)
- Mixer, 80 qt (76 L)
- Mobile attachment shelving
- Mobile chemical shelving
- Mobile hot food cabinet
- Mobile hot food cabinet/proofer
- Mobile mixer table
- Mobile pot/pan shelving
- Mobile range
- Mobile slicer table
- Mobile tray rack
- Mobile utensil soak sink
- Mop rack
- Office printers
- Open-front refrigerated display cabinet
- Panini grill
- Pastry case
- Pizza oven
- Pizza make-up refrigerator
- Pizza preparation table
- Plate dispenser
- Platform truck
- Pot/pan utensil rack
- Pre-rinse faucet
- Pulper/extractor
- Rack dolly
- Receiving scales
- Recirculating disposer
- Recycling containers
- Refrigerated cold pan
- Refrigerated cream dispenser
- Refrigerated equipment stand
- Refrigerated equipment stand with cold rail
- Reach-in refrigerator
- Remote rack refrigeration system
- Roll-in refrigerator
- Safe
- Scale
- Scanners
- Serving counters
- Silver-sorting table
- Sink heater
- Slicer
- Snack cabinet
- Soiled dish table

Table A-1 Conceptual Equipment List

• Dunnage rack • Electric can opener • Electronic programmable station signage • Electronic sandwich pre-ordering station • Espresso machine • Evaporators for walk-ins • Exhaust hoods, Type 1 • Exhaust hoods, Type 2 • Fire-suppression system • Floor troughs • Food guards • Food processor • Food cutter • Frost top • Frozen novelty freezer • Fryer battery with filter • Griddle • Hand sink • Handicapped kitchen worktable • Heat lamps • Heated display cabinet • Heated shelf • Hose bibb • Hose reel • Hot chocolate dispenser • Hot food wells • Hot/cold pan • Ice bin • Ice maker for soda dispensers • Ice machine • Ice/soda dispenser • Iced tea dispenser • Ingredient bins • Insect control equipment • Janitor sink with can wash • Kitchen lockers	• Soup wells • Spent oil cooler • Stainless steel wall panel • Steam kettles • Storage cabinet • Strip curtain • Tabletop oven • Time clock • Toppings dispenser • Tray accumulator, five-tier • Tray cabinet • Tray carriers • Tray return opening frame • Turbo-wash, three-compartment sink • Twin soft serve dispenser • Twin 12-gal (45 L) kettles with stand • Two-compartment sink • Under-counter refrigerator • Uniform hot top range • Utensil rack • Utility cart • Vegetable dryer • Vertical cutter/mixer • Walk-in cooler shelving • Walk-in dunnage rack • Walk-in cook's cooler • Walk-in meat/dairy cooler • Walk-in freezer • Walk-in produce cooler • Wall shelf • Water filter • Water temperature booster 180 °F (82 °C) • Worktable • Worktable with sink

A-7.2 Vibration.

Mount vibration-producing equipment on vibration isolators. Provide vibration-resistant pipe mounting and joints for equipment requiring plumbing.

A-7.3 Utilities.

Coordinate utilities with equipment selection. In general, steam-powered equipment is less expensive and easier to maintain than gas-powered equipment. To the degree possible, equipment should be standardized across an installation or region to facilitate maintenance and maintenance training.

A-8 STAFF FACILITIES.

A-8.1 Staff Toilets.

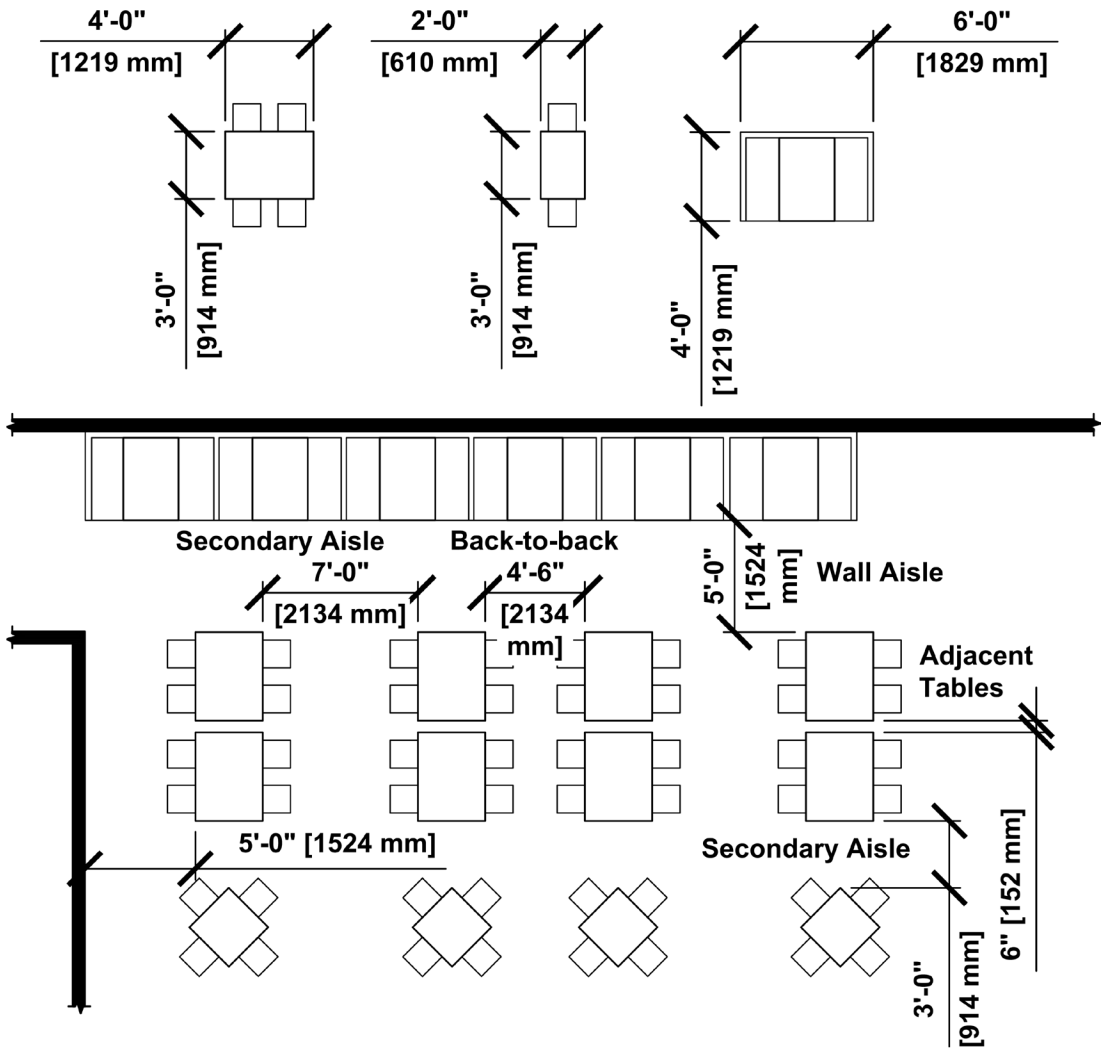
Government and contract personnel use staff toilets. Consult with the local command to determine staffing figures and shift population.

A-8.2 Staff Lockers.

Provide separate facilities for male and female personnel. Locate locker facilities adjacent to the toilets. Equip locker rooms with lockers, benches, and coat hooks to facilitate changing clothes. Locker quantities to be as indicated in Table A-2. All lockers should be half height except for facilities for 1,001 patrons and over, where three-tier lockers are used. The number of lockers scheduled for each space exceeds the projected number of workers for each category to accommodate the likely shifting balance of male to female workers. If equipment costs prohibit this number of lockers, provide space for the number of lockers in Table A-2. In this case, a portion of the lockers should be freestanding so they can be shifted from space to space as the staffing balance changes. All lockers to have sloped tops.

Table A-2 Staff Locker Count

No. of Staff	Military/Civilian		Contract	
	Male	Female	Male	Female
40 to 80	(Combined facilities, 10 male, 6 female)			
81 to 150	(Combined facilities, 16 male, 10 female)			
151 to 250	18	6	6	12
251 to 400	24	8	12	24
401 to 650	30	10	30	48
651 to 1000	48	12	44	70
1001 to 1500	64	16	64	96
1501 to 2200	96	24	88	132



A-9 PLUMBING DESIGN.

Do not use cast-iron piping for sanitary waste lines in dining facilities due to susceptibility to deterioration.

A-10 HVAC DESIGN.

Where possible, use remote condensers to reduce internal heating loads (i.e., ice machines, built-in refrigerators and freezers).

Figure A-2 Table Sizes and Clearances

Notes:

1. A variety of table sizes and configurations should be used to avoid a monotonous arrangement. However, the use of round or square tables is not as space efficient as rectangular tables. Consideration should be given to avoid or minimize seating arrangements which cause one patron to disturb another for access or egress.
2. Aisle widths shown are minimum and must be verified with NFPA 101, *Life Safety Code*, requirements. Sizes may need to be increased for very long aisles.
3. If partitions at tables are desired, partition height should be not greater than 4'-6" (1372 mm) to maintain openness of space.
4. Booth seating should not exceed 30% of total seating.
5. Distribution of table capacities: 20% 2-top; 60% 4-top; 20% 6± top.

Figure A-19 Schematic Plan of Typical Vegetable Preparation

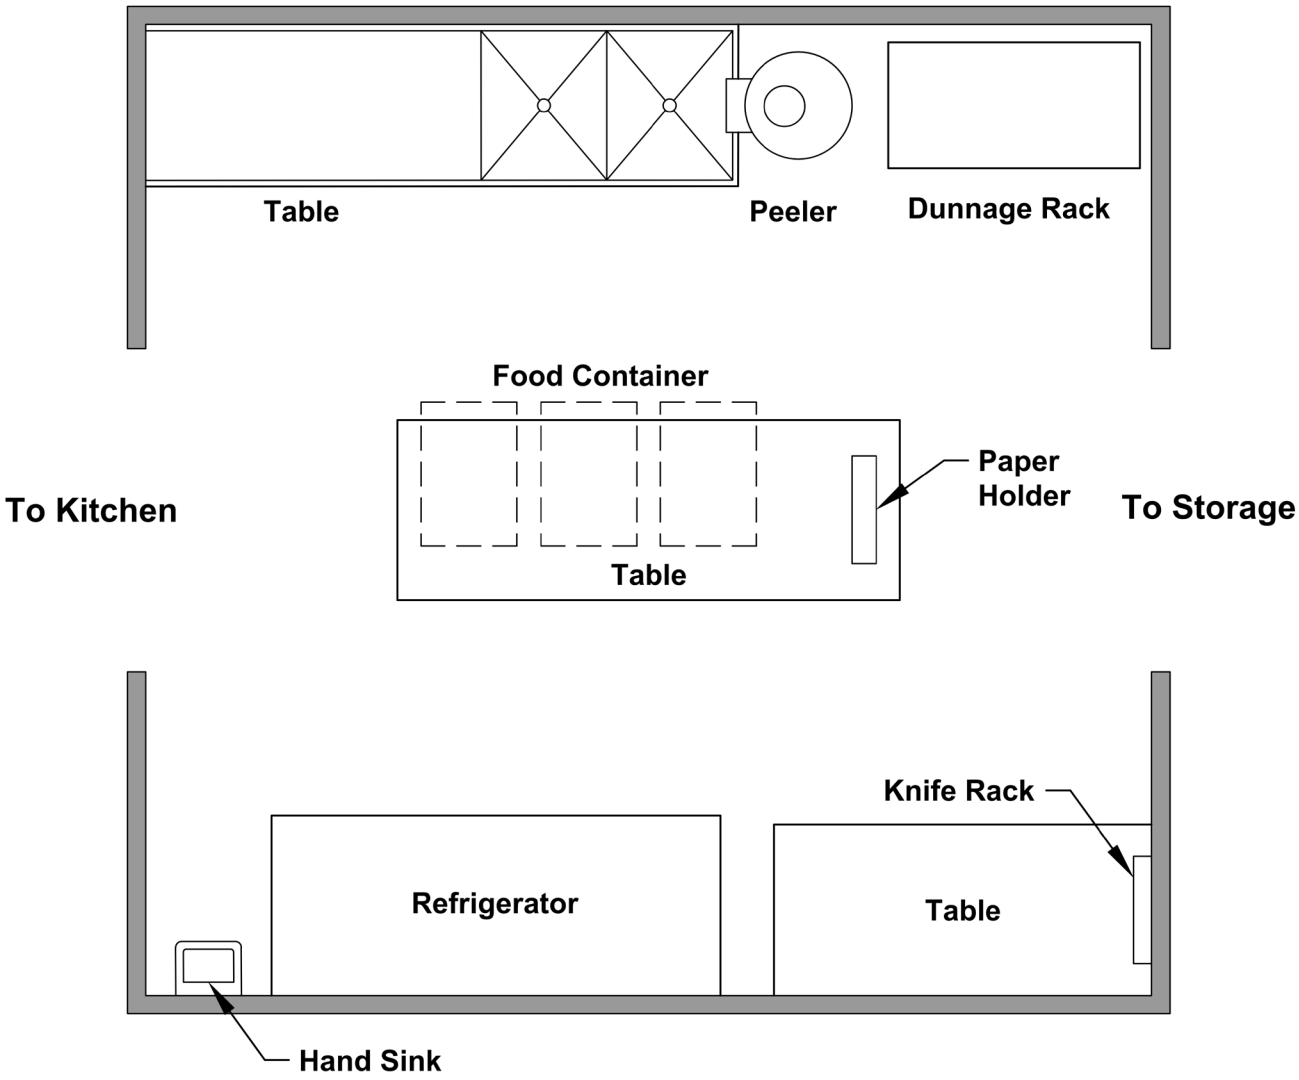

Figure A-20 Schematic Plan of Typical Bakery

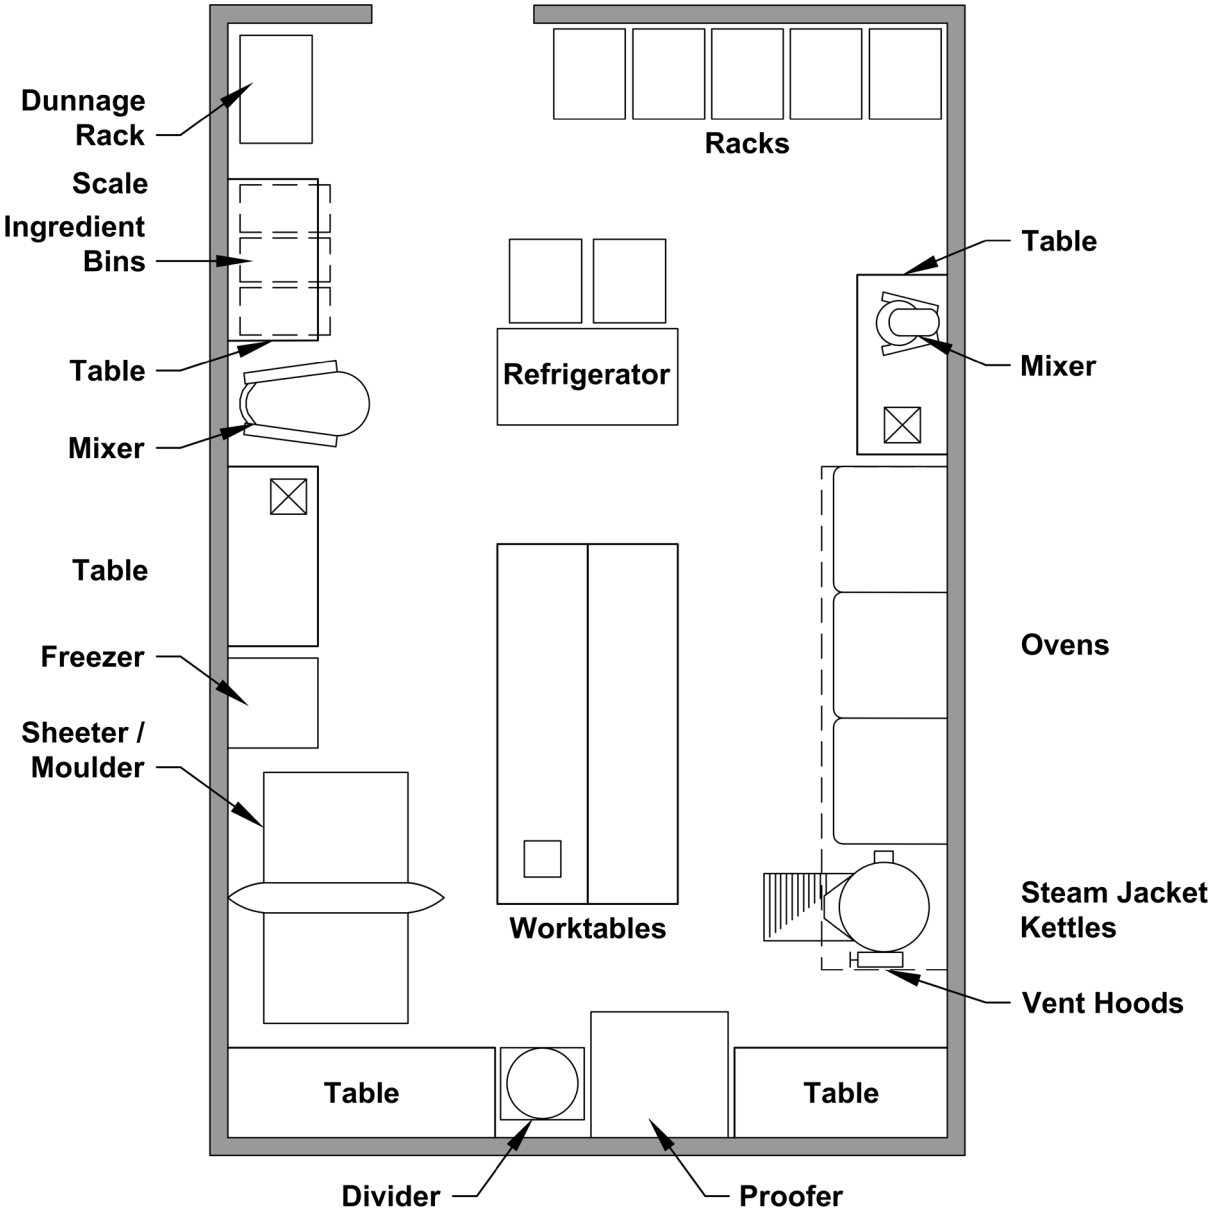

Figure A-21 Schematic Plan of Typical Storage Areas

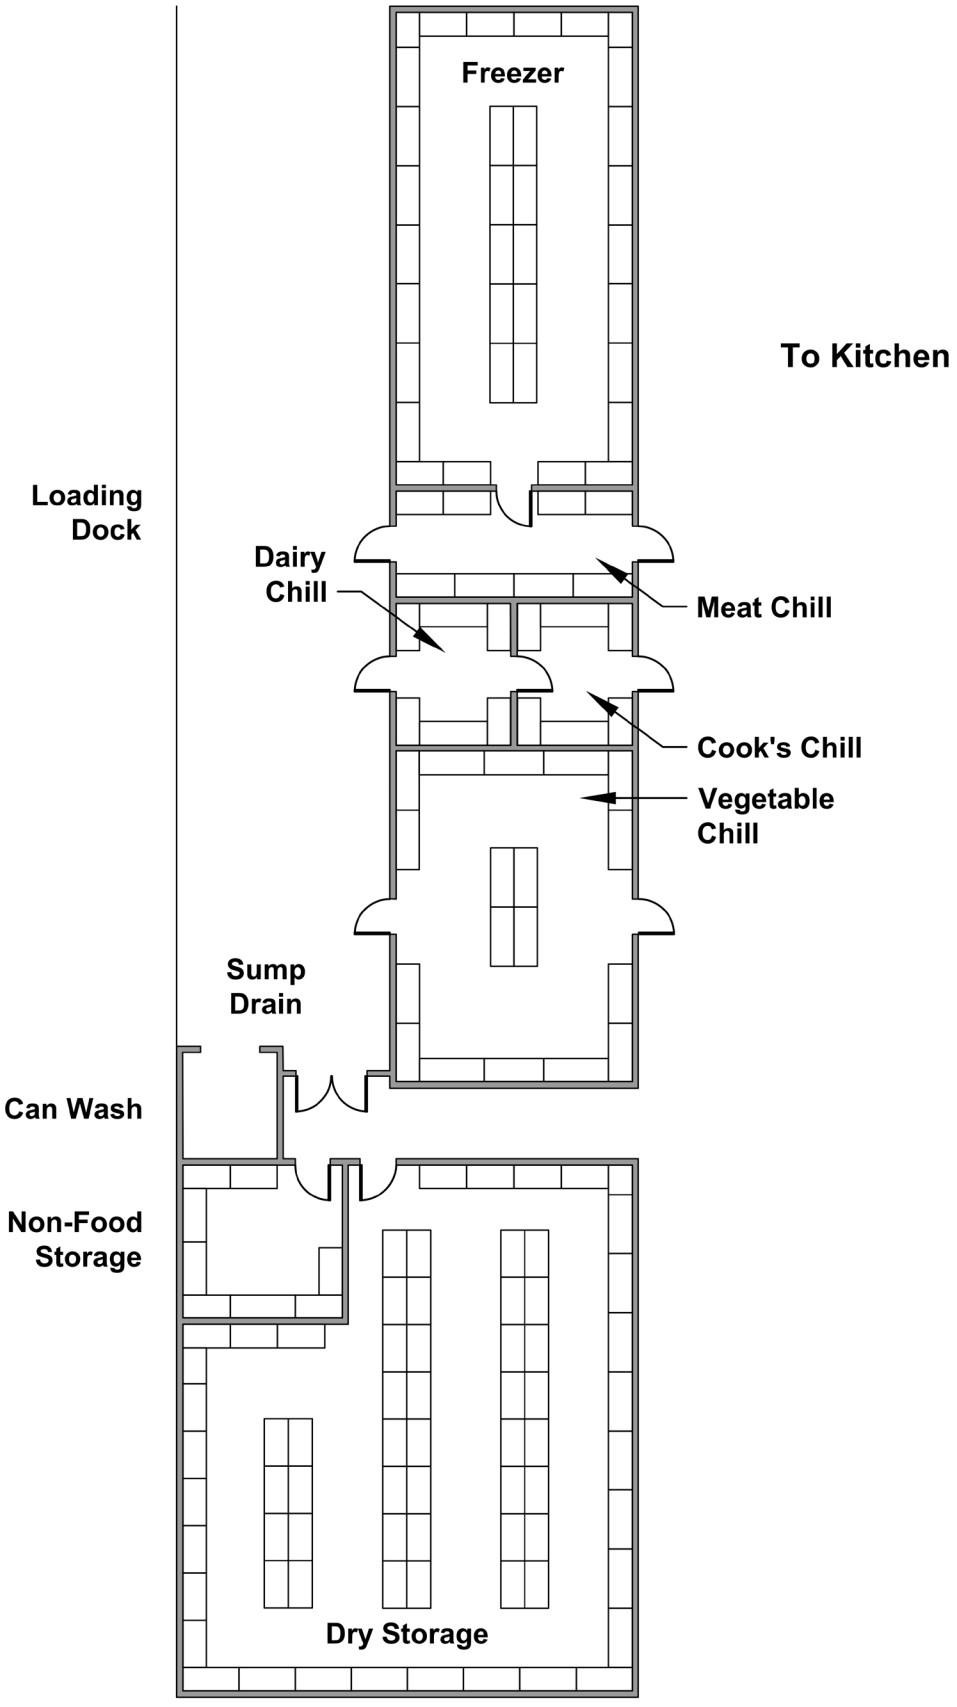

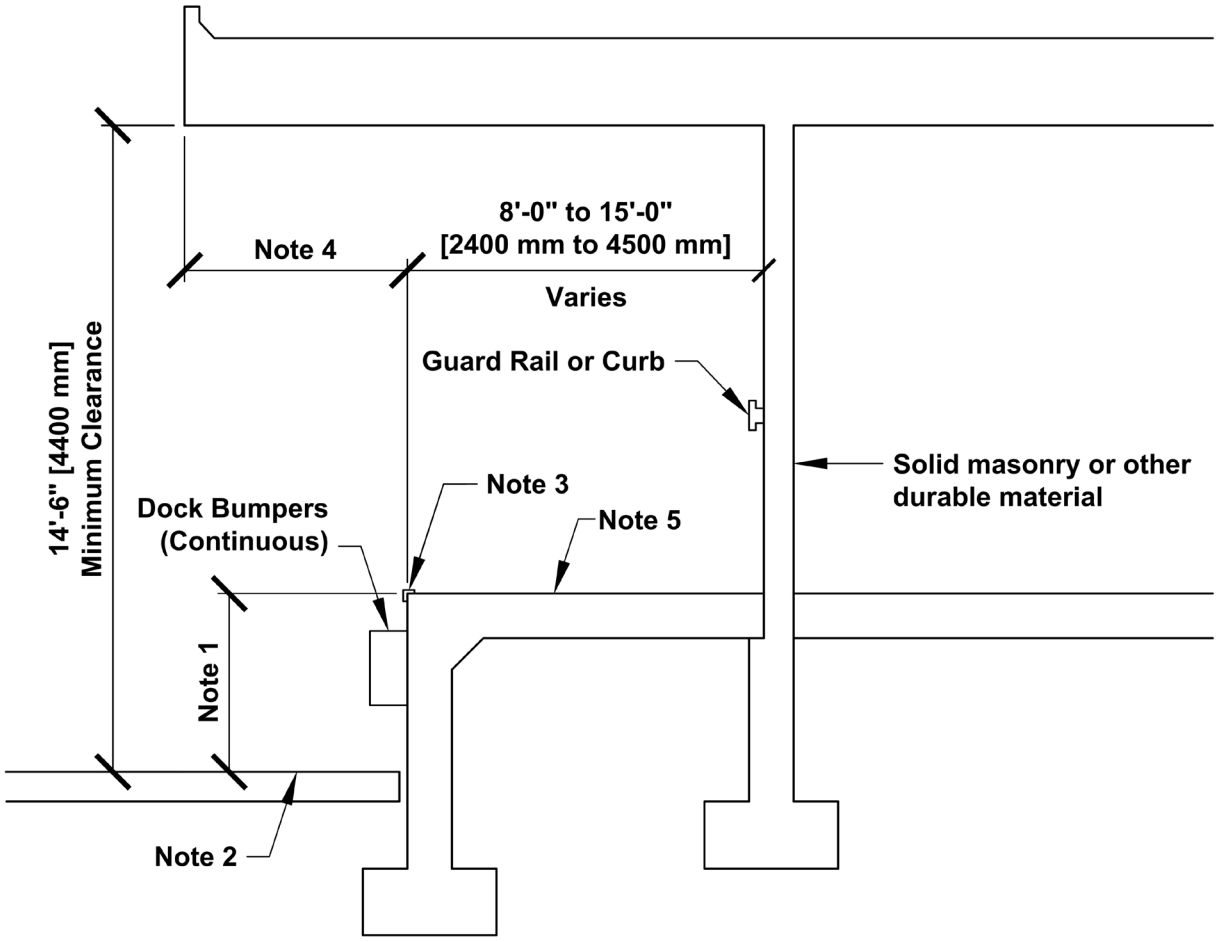

Figure A-22 Loading Dock Criteria

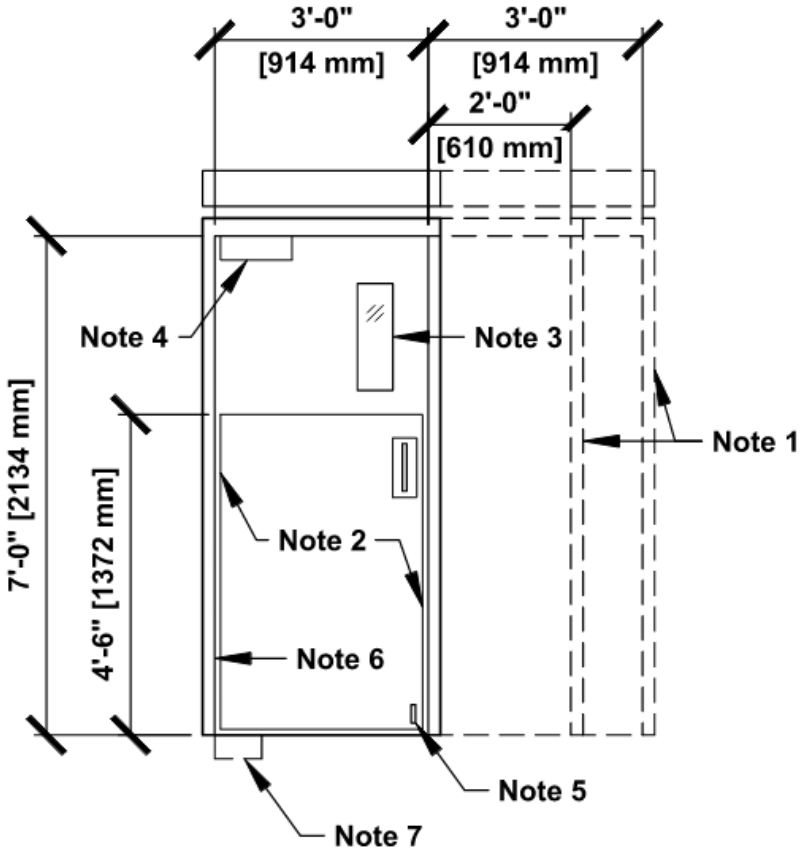
Note:

1. Coordinate height of loading dock with size of vehicles servicing facility. Standard height for larger facilities is 4'-0" [1200 mm].



2. Slope dock away from building 1/8" in 12" [305 mm]. Dock is to be broom finish concrete.

3. 2" [50 mm] metal lip to protect concrete edge of dock and to prevent carts from rolling off edge.

4. Overhang as required for weather protection. In cold weather areas requiring enclosed loading docks use insulated rolling doors and dock seals and omit overhang.

5. Provide concrete ramp from dock to vehicle area for hand cart access.

Figure A-23 Doors in Kitchen Area

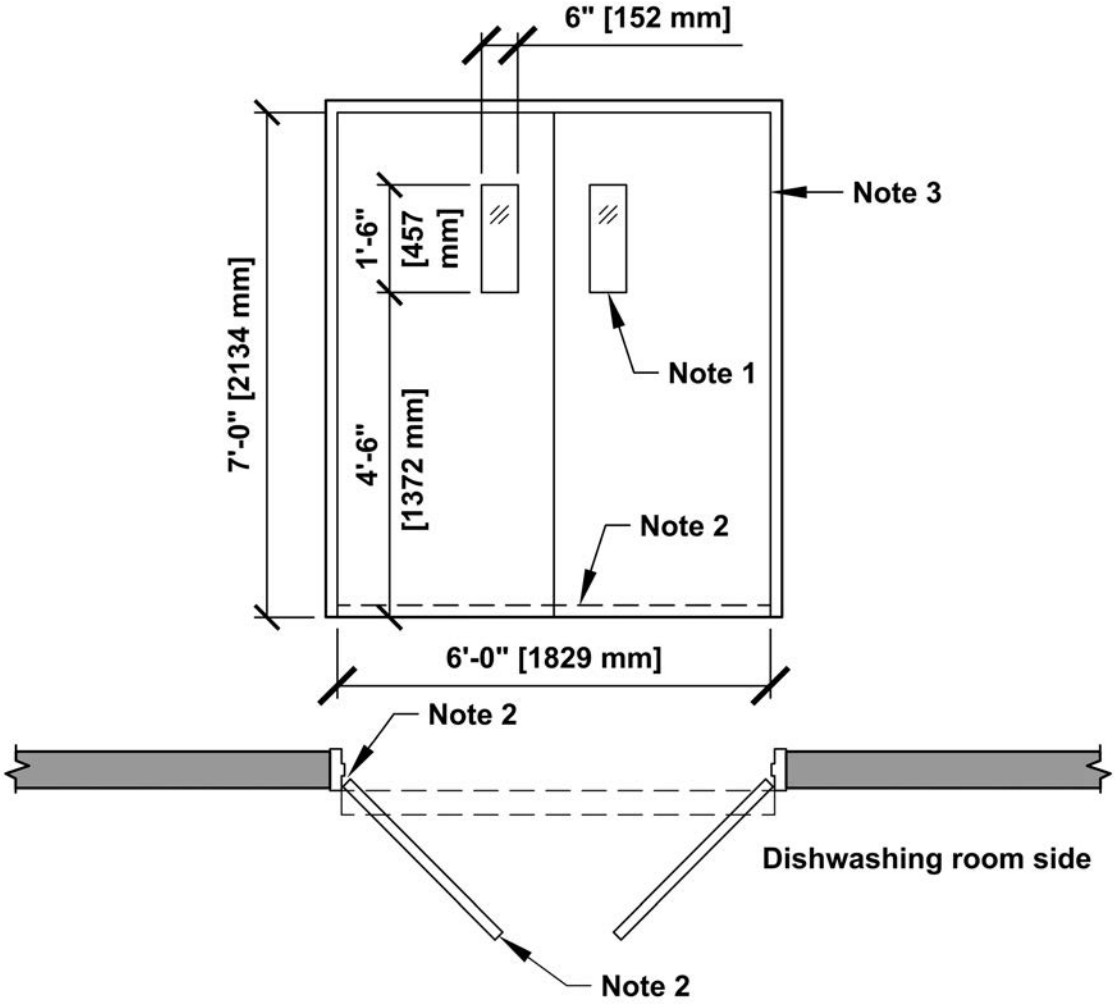
Notes:

1. **All doors in the kitchen area must be a minimum of 3'-0"x7'-0" [914 mm x 2134 mm]. Doors to storage and loading dock areas must be 6'-0" [1829 mm] wide double doors. If space limitations require the use of a 5'-0" [1524 mm] door, the inactive leaf should be 2'-0" [610 mm].**

2. **Provide 16 ga. stainless steel protection to all doors in areas having cart traffic.**

3. **Provide vision panel in all doors with two way traffic.**

4. **Provide heavy duty door closers with time delay closing feature at doors with heavy cart traffic.**



5. **Provide hold open device, either concealed indoor head or wall mounted. Floor mounted hold open devices are not approved.**

6. **Provide heavy duty ball bearing hinges at all single swing doors.**

7. **Provide heavy duty recessed pivot hinges at all double swing doors.**

8. **Provide plastic closure flaps at all exterior doors in cold storage spaces.**

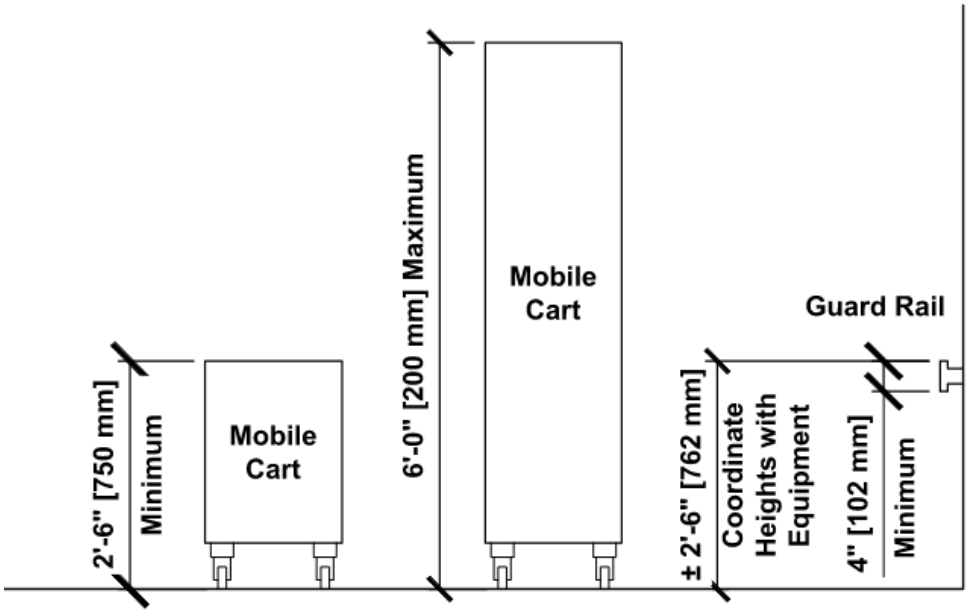


Figure A-24 Double Doors at Dishwashing Station

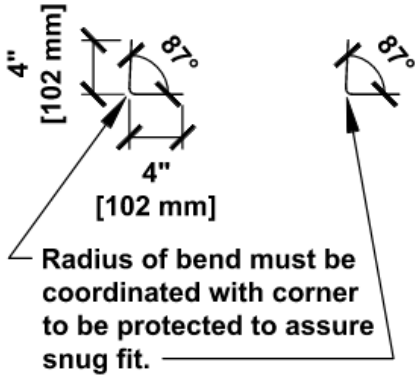
Notes:

1. Provide vision panels as indicated.
2. Provide sound seal hardware at all door edges.
3. Heavy duty ball bearing type hinges.

Figure A-25 Miscellaneous Guard Rail Locations and Corner Guards

Mount 14 ga. [1.90 mm] stainless steel corner guards flush with base. Attach with stainless steel fasteners and caulk with silicone sealant.



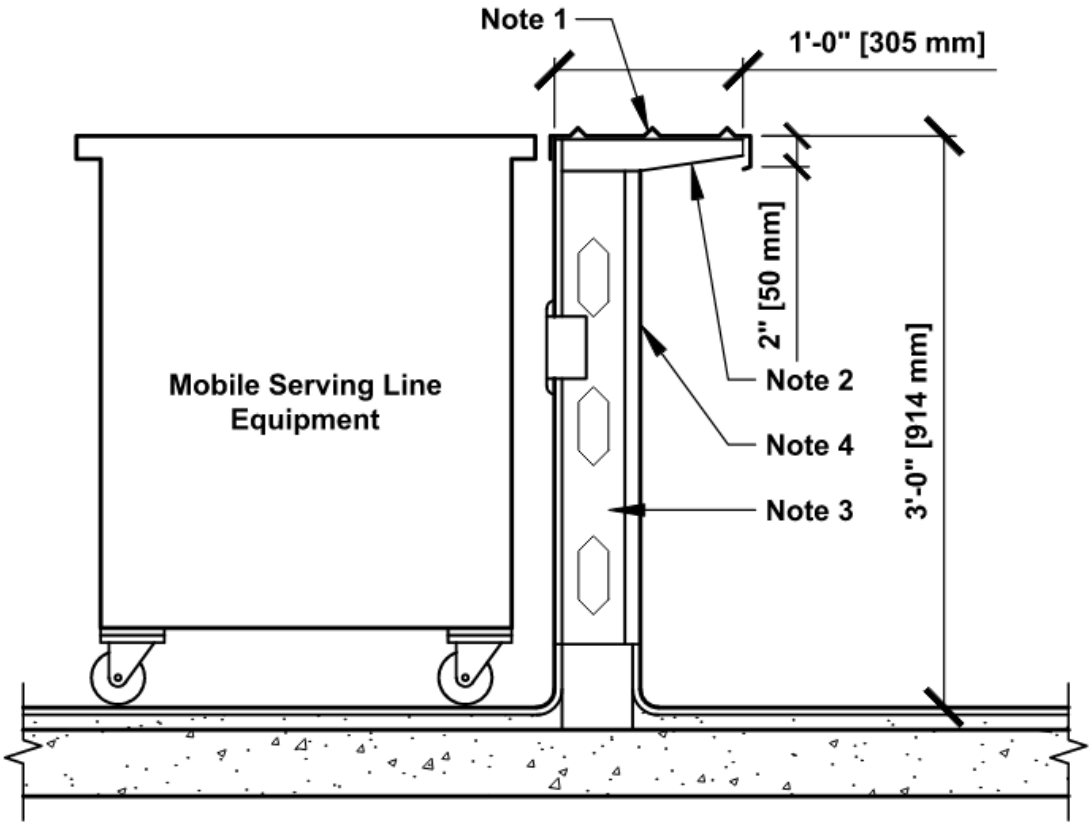


Figure A-26 Serving Line Tray Slide

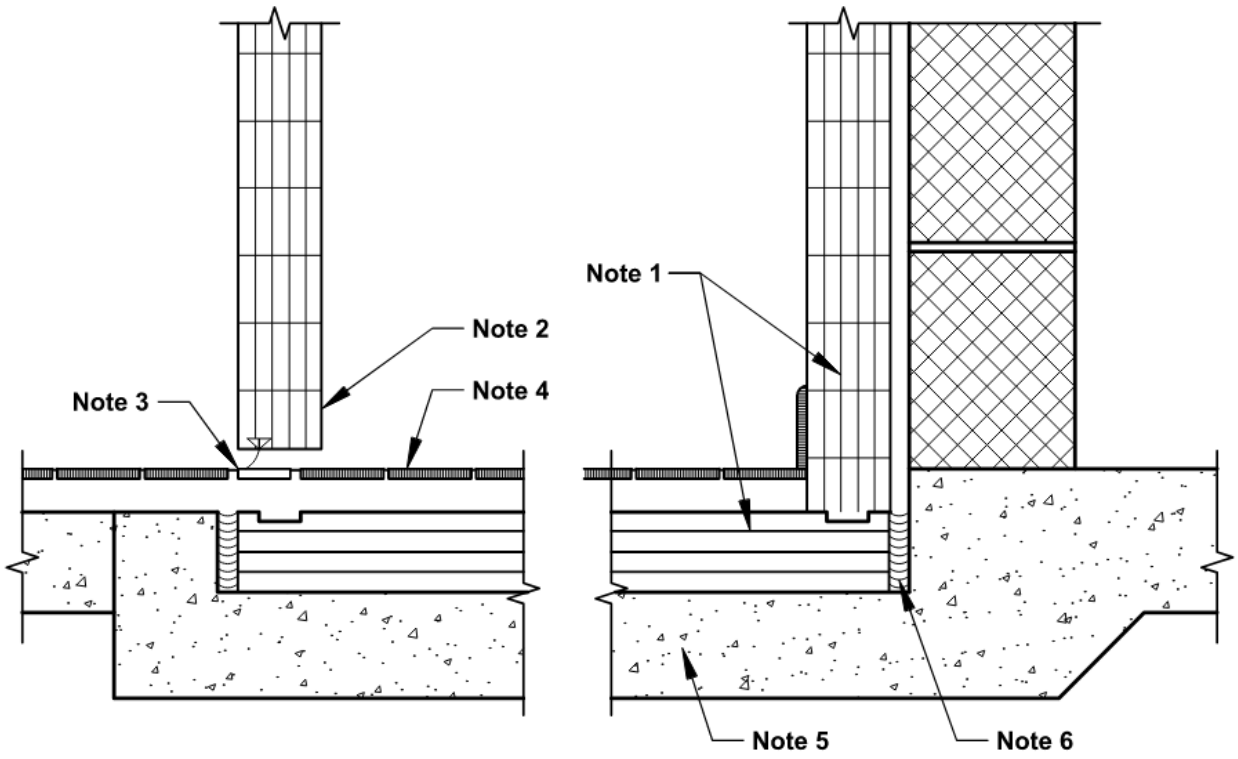
Notes:
For more information on trayslide details, contract Food Service System Office for current standard drawing.

1. **14 Ga. [1.9 mm] stainless steel trayslide secured to bracket with welded studs.**



2. **Stainless steel trayslide bracket welded to continuous stainless steel channel at 4'-0" [1200 mm] on center.**

3. **16 Ga. [1.50 mm] structural steel stud frame at 16" [400 mm] on center, anchor bolted to concrete curb. Frame must turn corner at ends and run 2'-6" [750 mm] to stabilize free standing ends. Openings in stud work must be used as raceway for electrical wiring and other utilities as required.**

4. **Face panels may be plastic laminate, ceramic tile or approved wall surfaces.**

5. **Manufactured trayslide systems providing similar features to the above may be submitted for approval.**

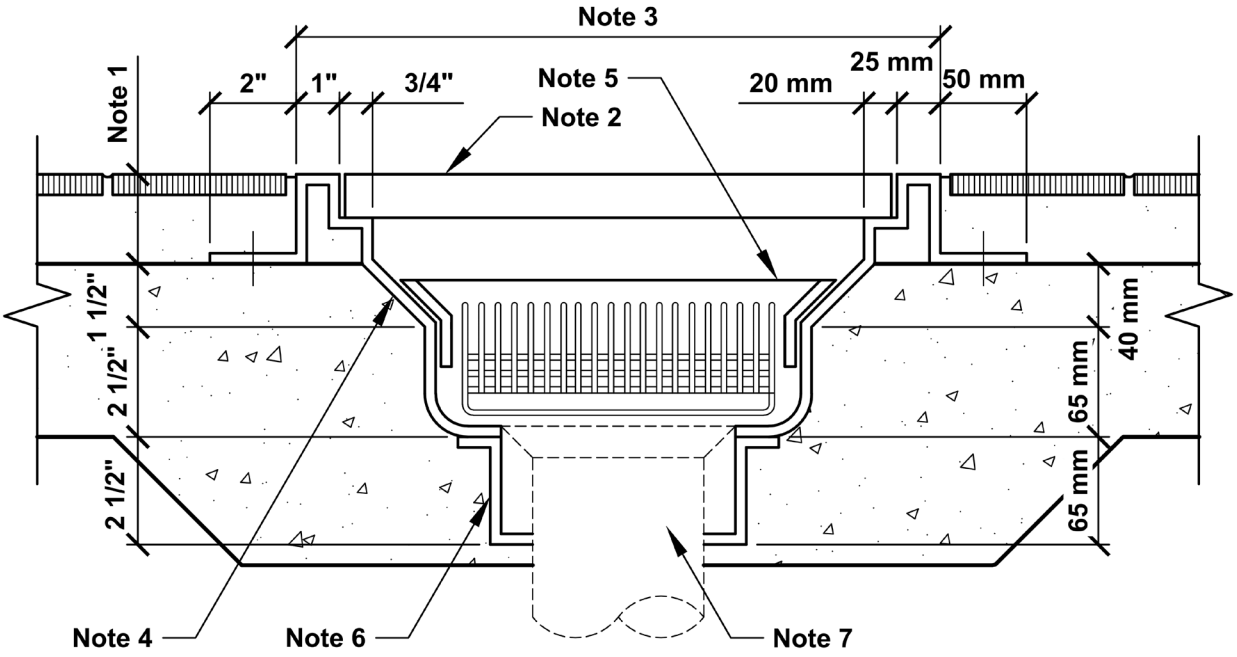


Figure A-27 Cold Storage Slab Insulation

Notes:

1. Metal covered insulated wall and floor panels.
2. Metal covered insulated walk-in door with adjustable floor wiper gasket.
3. Anti-sweat heater.
4. Quarry tile-in setting bed. Set tile dead level.
5. Recessed concrete slab on polyethylene vapor barrier. Depth of recess must be equal to thickness of insulated panel as specified and quarry tile and setting bed.
6. Provide sealant at edges of slab as indicated.
7. At freezer locations, if any portion of the slab is greater than 20'-0" [6000 mm] from the perimeter, the slab must be heated to prevent freezing.

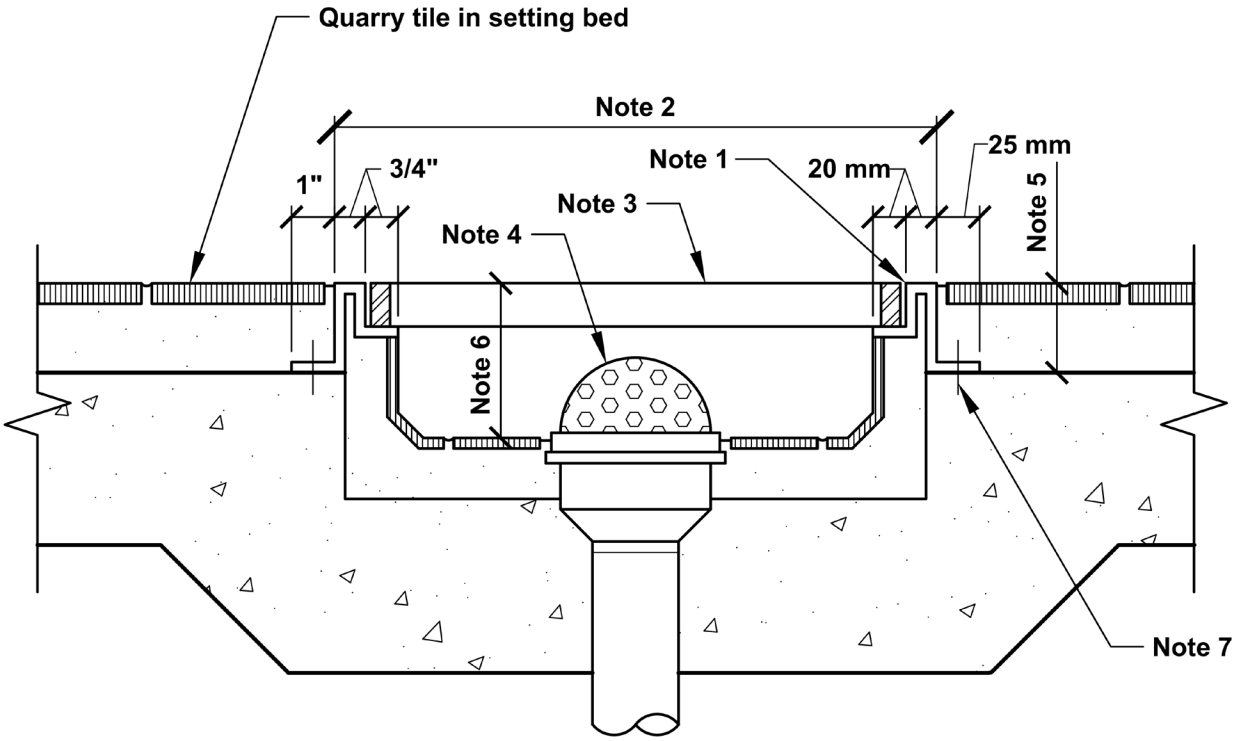
Figure A-28 Sump Drain – Pan Type

Notes:

1. **Coordinate depth of frame with depth of quarry tile setting bed.**

2. **Grating to be 1/4" x 1" [6 mm x25 mm] stainless steel bars fully welded at all connections. Allow 1/8" clearance on all sides.**

3. **Size of grating to be determined by designer.**



4. **14 Ga. [1.90 mm] stainless steel pan with all coved corners and fully welded seamless construction.**

5. **Removable mesh basket of #4 [5.75 mm] stainless steel wire mesh reinforced at top with 16 Ga. [1.50 mm] stainless steel perimeter frame.**

6. **12 Ga. [2.65 mm] stainless steel stuffing box.**

7. **4" [100 mm] waster plumbing with bell hub inside of stuffing box.**

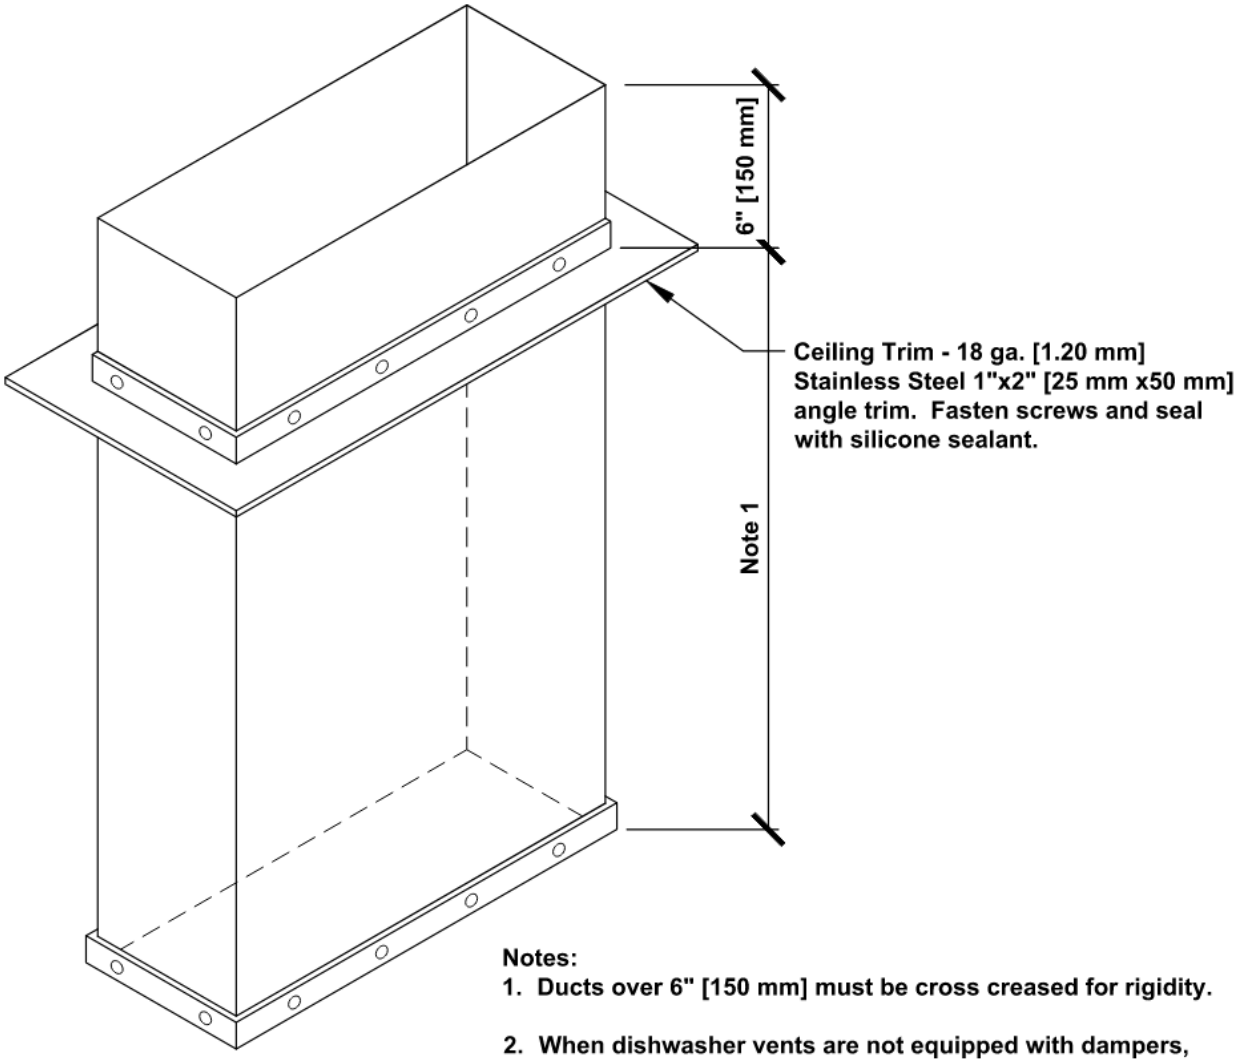


Figure A-29 Sump Drain – Tile Type

Notes:

1. **Grate frame is to be 12 Ga. [2.65 mm] stainless steel.**
2. **Width and configuration of trench drain is to be determined by designer.**
3. **Floor grate is to be pressure locked stainless steel grating as required to fit trench configuration. Maximum size of individual grate to be the lesser of 3'-0" [900 mm] or 30 lbs. (14 kg).**
4. **Adjustable beehive strainer.**
5. **Coordinate height of frame with specified depth of setting bed.**
6. **Finished depth of trench to be 4" [100 mm].**
7. **Fasten to slab with ram set concrete anchors.**
8. **Pitch trench at 1/8" per foot to drain.**

Figure A-30 Dishwasher Duct Vent

Notes:

1. **Ducts over 6" [150 mm] must be cross creased for rigidity.**
2. **When dishwasher vents are not equipped with dampers, duct must be provided with an 18 ga. [1.20 mm] stainless steel damper and locking quadrant located between the louvers and the dishwasher vent.**

FOREWORD

The Unified Facilities Criteria (UFC) system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and applies to the Military Departments, the Defense Agencies, and the DoD Field Activities in accordance with USD (AT&L) Memorandum dated 29 May 2002. UFC will be used for all DoD projects and work for other customers where appropriate. All construction outside of the United States, its territories, and possessions is also governed by Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA), and in some instances, Bilateral Infrastructure Agreements (BIA). Therefore, the acquisition team must ensure compliance with the most stringent of the UFC, the SOFA, the HNFA, and the BIA, as applicable.

UFC are living documents and will be periodically reviewed, updated, and made available to users as part of the Military Department's responsibility for providing technical criteria for military construction. Headquarters, U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering Systems Command (NAVFAC), and Air Force Civil Engineer Center (AFCEC) are responsible for administration of the UFC system. Technical content of UFC is the responsibility of the cognizant DoD working group. Defense Agencies should contact the respective DoD Working Group for document interpretation and improvements. Recommended changes with supporting rationale may be sent to the respective DoD working group by submitting a Criteria Change Request (CCR) via the Internet site listed below.

UFC are effective upon issuance and are distributed only in electronic media from the following source:

- Whole Building Design Guide website https://www.wbdg.org/ffc/dod.

Refer to UFC 1-200-01, *DoD Building Code*, for implementation of new issuances on projects.

CHAPTER 1 INTRODUCTION

1-1 BACKGROUND.

The Military Family Service Center (MFSC) is one part of the overall Family Readiness System (FRS), a network of agencies, programs, services, partnerships, and individuals which supports personal and family life readiness, mobilization and deployment readiness, and mobility and economic readiness.

In addition to installation MFSCs, the National Guard and Reserve Family Assistance Centers provide a variety of referral-based services to geographically dispersed families and retirees from all military components. As a gateway to these needed resources, the MFSC provides information, support, and services to help balance the demands of military life.

1-1.1 The Family Readiness System.

The mission of the FRS is to help Service members and their families manage the challenges of daily living experienced in the unique context of military service.

The FRS is defined and established by DoDI 1342.22, which also establishes policy, assigns responsibilities, and establishes procedures for the provision of military family readiness services. This includes requirements for financial education and counseling, relocation assistance, family readiness in the Reserve Components (RC), and Emergency Family Assistance (EFA). Oversight, monitoring, and implementing guidance of the FRS is provided by the Department of Defense (DoD) in cooperation and collaboration with the Secretary of each military department.

1-1.2 DoD Military Community and Family Policy Mission Statement, Touchstone Values.

Mission Statement: Empower and support our military community and family to thrive.

Touchstone Values: Mission Focused, collaborative, flexible, people-centric.

1-1.3 Formerly Family Services Centers.

In the previous edition of this UFC (7 April 2006), MFSC were known as Family Service Centers (FSC), and formerly within the Air Force as Airman and Family Readiness Centers (A&FRC). Any modification or work conducted at an MFSC/FSC must include updating the signage, labels, and directories to reflect the updated terminology.

1-2 REISSUES AND CANCELS

This UFC reissues and cancels UFC 4-730-01, *Family Service Centers*, dated 7 April 2006.

1-3 PURPOSE AND SCOPE.

This UFC provides requirements for evaluating, planning, and designing MFSCs. The information in this UFC applies to all new construction projects within these facilities, to include additions, alterations, and renovation projects. Alteration and renovation projects should update existing facilities to meet the guidance and criteria within budgetary constraints.

1-4 APPLICABILITY.

This UFC applies to all Service elements and contractors involved in the planning, design, and construction of MFSC worldwide.

1-5 GENERAL BUILDING REQUIREMENTS.

Comply with UFC 1-200-01, which provides applicability of model building codes and government-unique criteria for typical design disciplines and building systems, as well as for accessibility, antiterrorism, security, high performance and sustainability requirements, and safety. Use this UFC in addition to UFC 1-200-01 and the UFCs and government criteria referenced therein.

1-6 CYBER SECURITY.

All facility-related control systems (including systems separate from a utility monitoring and control system) must be planned, designed, acquired, executed, and maintained in accordance with UFC 4-010-06 and as required by individual Service implementation policy.

1-7 GLOSSARY.

Appendix B contains acronyms, abbreviations, and terms.

1-8 REFERENCES.

Appendix C contains a list of references used in this UFC. The publication date of a code or standard is not included; unless otherwise specified, the most recent edition applies.

CHAPTER 2 PROGRAMMING AND PREDESIGN

2-1 INTRODUCTION.

Criteria in this chapter apply specifically to the design of each functional area and space of MFSCs. Primary design considerations for each functional area include the anticipated use, performance, organization, character, and relationships between each area's component spaces. Specific criteria are not provided for space sizes, critical dimensions, storage requirements, furnishings, or specific equipment. This information must be informed by project goals, needs, and coordination amongst the project team. Technical requirements for each component space within each functional area are based on code, references, and industry practices. Descriptive requirements in this chapter address only items with special criteria or quality for a type of space/area. Chapter 3 contains general design considerations.

Guidance in this chapter applies to all sizes and types of family services facilities. Table 2-2 presents specific space allocation guidance for prototypical sizes. All guidance is based on recommended space sizes and capacities for each overall facility size, supplemented by standard use and size factors, as appropriate. These recommendations may be modified in the design of an individual project to reflect local program requirements and capacity needs.

2-2 SCOPE OF FACILITY.

MFSCs offer numerous programs to provide information and Military Family Service needed by qualified single and married DoD personnel and their family members to meet the unique demands of the military life style, as defined by DoDI 1342.22. These programs and services improve life skills by fostering competencies and coping skills, encouraging self-sufficiency, and offering short-term support and assistance when necessary. Specific programs vary among the Services, as each may provide some programs through facilities other than MFSCs. Table 2-1 lists the names of the various programs provided by each Service. While variation among the Services is significant, the programs provided and functions accommodated by the MFSC generally fall into one or more of four categories:

- Federally mandated program
- Additional programs
- Crisis action/response function
- Other administrative or support functions

2-2.2 Federally Mandated Programs.

Federally mandated programs that each Service must provide (but not necessarily in an MFSC) are defined by DoDI 1342.22 and similar in function among the Services. Table 2-1 lists the Services' various program names. The Army and Navy follow program names per DoDI 1342.22.

Table 2-1 Comparable MFSC Services Programs

Military Family Readiness, Services (per DoDI 1342.22)	Air Force (per AFI 36-3009)	Marine Corps (best matched to DoDI)	Program Category Name (outdated but may be found)
Relocation Assistance	Relocation Assistance Program (RAP)	Information, Referral and Relocation (IR&R programs)	Relocation Assistance
Non-Medical Individual and Family Counseling		Community Counseling Program (CCP)	
Personal and Family Life Education	Personal and Work Life	Family Life Education (Behavioral Programs and Marine Corps Family Team Building (MCFTB), Voluntary Education Substance Abuse program (SAP)	Family Advocacy Program
Personal Financial Management Services	Personal Financial Readiness (PFR) services	Personal Financial Management Program (PFMP)	Financial Management
Information and Referral	Information and referral*	(see IR&R)	Information and Referral
Deployment Assistance	Deployment	MCFTB	Deployment Support
Spouse Education and Career Opportunities (SECO)	Employment Assistance	Family Member Employment Program (FMEAP) credentialing services	Employment Support, or Employment Readiness
Exceptional family member support	Exceptional Family Member Program (EFMP)	EFMP	EFMP
Child Abuse Preven-tion and Response Services (governed by DoDI 6400.01)		*	
Domestic Violence Prevention and Response Services (governed by DoDI 6400.01)		Sexual Assault and Prevention Response Office (SAPRO)	
Morale, Welfare, and Recreation Services. (MWR) (governed by DoDI 1015.10)		Volunteer Management Single Marine Program (SMP)	Volunteer Programs

Military Family Readiness, Services (per DoDI 1342.22)	Air Force (per AFI 36-3009)	Marine Corps (best matched to DoDI)	Program Category Name (outdated but may be found)
EFA	Air Force Aid Society (AFAS)	Navy-Marine Corps Relief Society (NMCRS)*	Aide/Emergency Support
Transition Assistance	Transition Assistance Program (TAP)	Transition Readiness Program (TRP)	Transition Assistance
Family Readiness in Reserve Components			

*Optional program

2-2.3 Additional Programs.

Additional programs that are typically (but not necessarily) provided through an MFSC include the following as appropriate for the installation or population served. Programs are defined by DoDI 1342.22 and similar in function among the Services. Table 2-1 lists the Services' various program names.

- Employment support
- Family advocacy
- Exceptional family member support
- Volunteer programs
- Other support programs, including New Parent Support, Child Care, and Preventative Education Section (PES)
- AFAS
- Air Force Families Forever
- Air Force Warrior and Survivor Care
- Casualty Assistance
- Survivor Benefit Program

2-2.4 Crisis Action/Response Room.

The MFSC facility must be equipped with workstations and telecommunications and monitoring equipment to assist in an emergency with non-medical support, and should provide connections to medical emergency services. Provide space within the MFSC facility as a Crisis Action/Response Room in times of emergency. This space typically takes the form of communications specifications and configurations for a classroom or other large space within the MFSC. Refer to UFC 4-023-10.

2-2.5 Additional Program Areas.

Additional functional areas include the administrative spaces and building support, utility, and amenity functions. Services provided by other DoD entities that contribute to the overall MFSC mission -- such as New Parent Support Programs (NPSP), Child Development Programs, Youth Programs, Child Care, USMC's Children and Youth Programs (CYP), the Air Force Wounded Warrior (AFW2), or Casualty and Survivor Benefit Plan (SBP) -- may collocate.

2-3 LOCATION AND SIZE DETERMINANTS.

Several factors determine the most appropriate and cost-effective location for an MFSC. Requirements in this UFC define the program for design of an example project, including functional relationships, program requirements, and design criteria. This includes the space programming guidance found in this chapter, plus the site design, building design, and building systems concepts in Chapter 3. Any unique local requirements concerning building programs, design criteria, and technical systems should be identified and communicated among the designers, builders, base/Installation command, and occupants.

Each base may also determine that different or additional requirements are relevant to its local program. These considerations may affect the required functional areas and spaces and their relative sizes and consolidation of MFSC into shared facilities with libraries, Base Education Centers (BEC), places of commerce, or others mutually beneficial to Quality of Life and service functions. Co-locating MFSC may also affect required program spaces and sizes, such as public computers or administration meeting rooms.

2-3.1 Population Served.

The population served by the MFSC is determined by adding a multiplier to the active-duty population. The multiplier varies depending on the location of the proposed MFSC.

- CONUS: MFSC population equals active duty (AD) population times 1.6.
- OCONUS: MFSC population equals AD population times 2.4.
- **Service Exception:** For Navy Fleet Concentration Areas, MFSC population equals AD population times 2.4.

- **Service Exception:** For Air Force facilities, refer to AFI 38-101 to determine population served.

2-3.2 Facility Size Classifications.

Once the size of the MFSC population has been determined, classify the size of the facility according to Table 2-2. Within each size classification, other factors that affect the facility size include the variations among the Services and the optional program areas (see Table 2-1 for more information on optional spaces).

Service Exception: For Air Force facilities, refer to DAFMAN 32-1084 to determine facility size classifications.

Table 2-2 SIZE CLASSIFICATIONS

Size Classification	Population Served
Small	500-3,000
Medium	3,001-10,000
Large	10,001-40,000
Extra Large	40,001+

2-3.3 Optional Spaces.

Once the size classification has been determined, select the desired optional spaces (see Table 2-1). The base/Installation/station representatives must decide which optional spaces to provide.

2-3.4 Locate for Availability to Service Population.

When the total population is broken down into distinctive geographic locations, consider providing multiple facilities sized individually for the geographic populations. This is particularly important since access to the facility is a key issue for MFSCs. In these cases, each facility should be size-classified for the population to be served and the functions to be provided. Efficiencies may be gained by consolidating management and administrative functions. Consider including virtual/remote or tele-counselling spaces for improved access and diversifying functions connected to limited space.

For populations less than 500, accommodate the MFSC functions in other, non-dedicated facilities. Consider multiple facilities for very large or geographically dispersed populations.

2-3.5 Customer Access and Visibility.

Design the MFSC to be easily accessible by all potential facility customers. The importance of access by spouses, dependents, or non-active-duty personnel that may

be coming from off-Installation must not be overlooked. Consider locations such as near the Installation gate or other high activity or population centers such as the commissary, retail exchange, medical facilities, or “one-stop shopping” areas. Access through base/Installation or public transit infrastructure is a program goal and assumed by locating in such areas. As an alternative, consider locating the MFSC off-installation at sites like the installation visitor’s center or local high-traffic commercial/retail centers. If the MFSC is located off-base, consider the antiterrorism impacts in the design of the facility.

Also consider that while the primary MFSC facility may need to be located on base, additional remote, off-base facilities can be used to serve the non-active-duty customers. See Architectural Barriers Act (ABA) for additional accessibility requirements.

2-3.6 Site Size.

Ensure adequate site space for the following elements when selecting the MFSC site:

- Parking space for customers and staff,
- Space and access for the Lending Locker loading dock/exterior access,
- Service drive, and
- Antiterrorism Force Protection (AT/FP) setback criteria.

Assure the selected site will accommodate an adequate number of parking spaces convenient to the MFSC entrance and the AT/FP setback requirements provided in UFC 4-010-01. A preliminary site design should be prepared to ensure the basic building and site criteria can be accommodated.

2-3.7 Site Placement.

Locate the building on the site to provide the most convenient access and to take advantage of desirable views and natural site features. Examples may include providing protection from undesirable winds and glare and shading the building, especially glazed areas, from excessive sun in warm climates.

2-3.8 Access and Visibility.

Provide easy access by automobile and base traffic. Choose a site with a prominent, visible location. The facility should be easily identifiable from approaching cars, base transportation, and pedestrian pathways. See the Manual on Uniform Traffic Control Devices for Streets and Highways (MUTCD) for latest traffic control device requirements.

2-3.9 Site Utility Requirements.

MFSC must be located for access to major utilities, including water, sewage, electricity, telephone, and gas lines. Provide water service, sanitary and storm systems, natural gas, steam service or fuel oil system (whichever is used), electricity, telephone, and fire

alarm service to the building in accordance with requirements in UFC 1-200-01 and local service procedures. Include connections to the base computer network and communication systems.

2-3.10 Building Layout and Adjacencies.

Consider the relationship to adjacent buildings, transportation routes, services, and activities to reinforce the MFSC's secondary mission to contribute to the quality of life. Managers, base personnel, and design teams should work to locate the MFSC within the base community and built environment to create places or spaces that are destinations and facilitate the programs and services that improve the quality of life for active-duty personnel, their families, retirees, and other authorized customers. The planned creation of destinations with many amenities and attractions in a place for the base community to come together is a quality-of-life force multiplier. This quality-of-life support is an important function of most facilities; however, Installation mission support is always the first priority.

2-4 BUILDING FUNCTIONAL AREA RELATIONSHIPS.

Spatial relationships in the MFSC are best described in terms of the transition from public spaces to private spaces. In developing an individual facility space program, consider the overall building design and relationships discussed in Chapter 3 and Chapter 4. The space allocations provided in this UFC are approximate, and intended as guidance for the facility being discussed.

2-4.1 Public Spaces.

These are spaces that customers need ready access to and may be able to enter unattended. Locate public spaces near the main entrance. Public spaces Include:

- lobby/waiting area
- reception/information/referral area
- computer resource center
- toilets
- classrooms

2-4.2 Semipublic Spaces.

These are spaces that customers need access to but will usually enter accompanied by a staff member. They include:

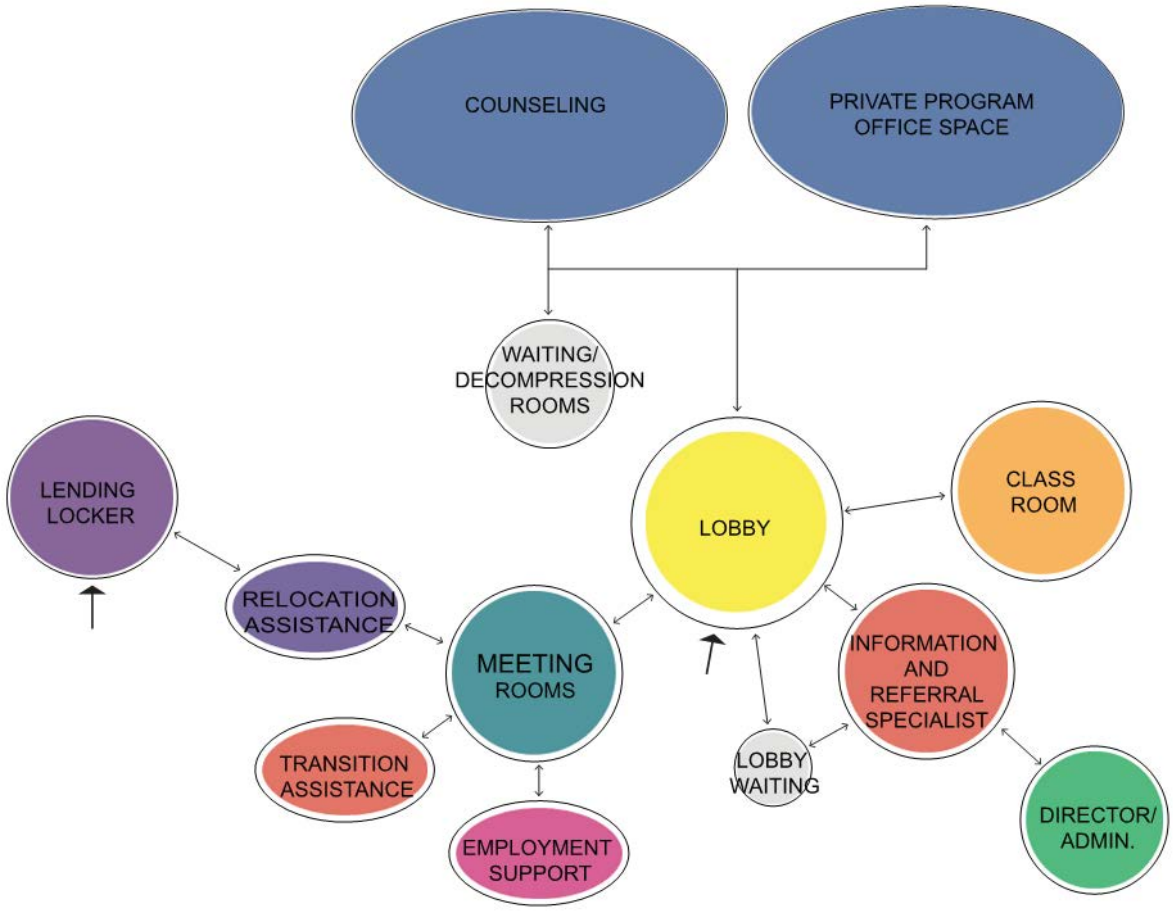
- relocation assistance (including Lending Locker)
- transition assistance
- employment support
- short term alternative child care

2-4.3 Private Spaces.

These are spaces that customers will not normally enter, or that customers will enter only with a staff member. They require a high degree of privacy (such as a counseling office). Private spaces include:

- program offices requiring privacy, such as those under Financial Management, EFMP, Casualty Assistance/SBP, Personal and Work Life, Deployment
- counseling offices
- decompression
- waiting room (optional for counseling or crisis)
- file storage, and copy/graphics room
- staff offices and work areas

Acoustic modeling and testing may be used to confirm acoustic privacy. Testing of defined assemblies may yield disparate results if not constructed to accurately match the approved assemblies. Mock-ups, early testing, or qualified construction crews may be considered where acoustic privacy is necessary. Consider acoustic control, design, testing and mitigation to best serve the project.



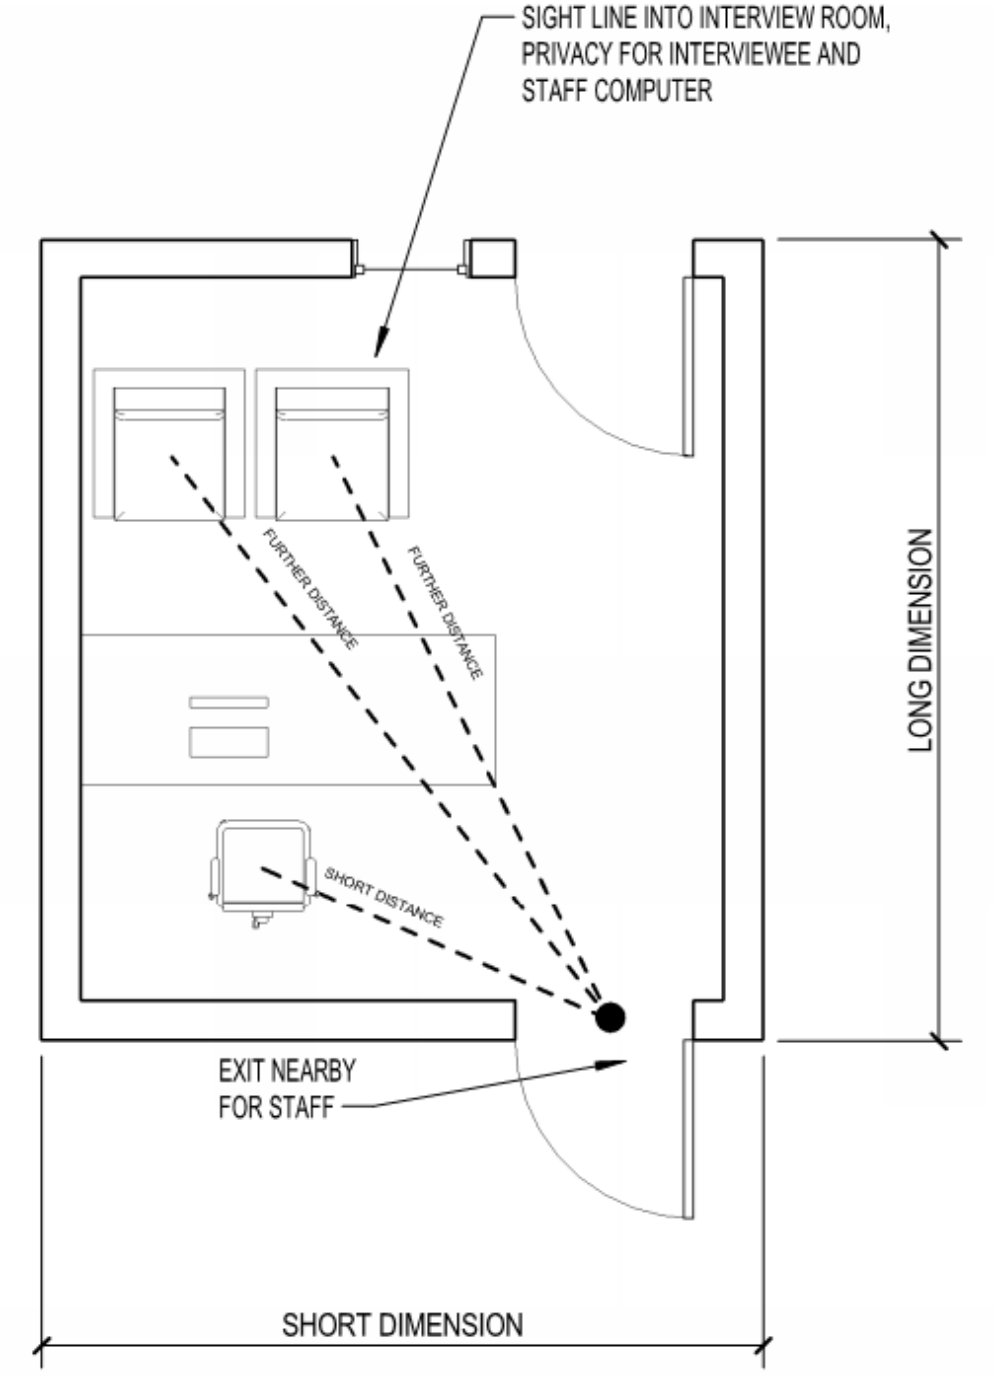
2-4.4 Functional Relationship Diagram.

Figure 2-1 illustrates acceptable relative adjacencies of the key functional spaces.

2-4.4.1 Illustrative Diagrams.

Figure 2-2 and Figure 2-3 illustrate a possible layout for an MFSC. These diagrams are not mandatory or even suggested layouts, but are provided to expand on Figure 2-1 and illustrate the relative sizes of the functional spaces along with the acceptable adjacencies. By including the relative sizes of the spaces, these diagrams convey a method to accommodate needed adjacencies. Of the two diagrams provided, one accommodates a traditional operational approach, and one accommodates an alternative operational approach. These two operational approaches vary in terms of space usage and operational flexibility. When planning an MFSC, consider these issues along with mission requirements.

Figure 2-1 Functional Relationship Diagram



2-4.4.2 Traditional Operational Layout.

Staff members meet with customers in dedicated offices.

Service Exception: The Army supports and maintains this traditional operational approach with private offices.

Figure 2-2 Dedicated Office with Safety Exit

2-4.4.3 Alternate Operational Layout.

In this approach, program staff members do not normally meet with customers in their own offices or workspaces, but use interview rooms shared by all programs. The net effect is that the administrative/office area grows to accommodate cubicles for program staff, but that growth is more than offset by the reduction in the number of dedicated program offices. In some cases, programs that do not use the alternate operational approach will also use interview rooms for other functions and have a similar building configuration.

Service Note: The alternate operational approach is optional for the Navy, Air Force, and Marine Corps. For Air Force, consider using the alternate operational approach for Air Force Reserve Unit MFSCs.

Figure 2-3 Alternative Operational Diagram

2-5 FACILITY SPACE PROGRAM.

Once the size classification has been determined and service programs selected, the facility space program is determined using Table 2-3. This table shows the basic functional spaces and the appropriate area for those spaces organized by size classification.

The space programs listed in Table 2-3 provide guidelines for the MFSC planning team. The final space requirements for elements such as toilets, mechanical spaces, and parking are governed by codes and must be determined by qualified designers. Additionally, the final space requirements for the MFSC programmed spaces will also need to be carefully determined by Installation representatives and the appropriate Service program office, guided by governing codes and criteria.

Service Exception: For Air Force facilities, refer to DAFMAN 32-1084 for MFSC space requirements. Some spaces not included in DAFMAN 32-1084 may be required for MFSCs. The minimum space requirements for those spaces are included in Table 2-3.

Table 2-3 Example MFSC Space Program

SPACE/ROOM	#	SMALL	#	MED.	#	LARGE	REMARKS
Admin/General Public Facing							
Display and bulletin boards	1	42	1	42	1	50

Elevator	0	--	0	--	1	128	
TOTAL PROGRAM AREA		6,515		10,125		17,032	

2-5.1 Public Facing Spaces.

2-5.1.1 Lobby.

The lobby is the entry point for staff and customers. It should be a warm and relaxing space that is simple and straightforward in design. The lobby should allow for easy circulation to and between the many public functions within the facility. Provide an airlock at the main entrance. Provide additional data and electrical outlets (beyond code minimum) for flexibility should the lobby be used for alternate activities.

Beyond standard ambient lighting, consider decorative lighting to provide a focal point. This will make the lobby, and in turn the whole facility, feel more welcoming and inviting. Also consider free-standing or built-in display cases and elements such as an integral/recessed walk-off grate and an umbrella rack. Note: If the recommended separate exterior entrance to the Lending Locker is not provided, consider providing a power-operated door from the lobby to the Lending Locker to ease moving equipment in and out.

2-5.1.2 Waiting Area.

Directly accessible from the lobby, the waiting area serves as a public waiting room for customers of the center. The space should be warm, comfortable, and secure. The seating arrangements should be intimate and allow for a sense of privacy. There should be distractions such as a wall- or ceiling-mounted TV, or magazines to allow each customer an opportunity to focus his or her attention away from other customers. Consider providing a space within the waiting area where children might sit and play quietly under parental supervision. This sub-space may be partitioned from the rest of the waiting area. As with the lobby, consider providing decorative task lighting such as table and/or floor lamps. Provide Architectural Barriers Act- (ABA-) accessible toilet facilities and water fountains conveniently located near the lobby and waiting area. Accommodate a wall-mounted clock. As with the lobby, provide additional data and electrical outlets for flexibility if/when the lobby is being used for alternate activities. Provide furniture such as upholstered armchairs, side tables, bookshelves, and magazine racks.

2-5.1.3 Short Term Alternative Child Care.

Space and staff for short-term child care provided within the facility or in a nearby facility, such as a fitness center, improves accessibility for military personnel and families with young children.

Coordinate such spaces with the Installation to the standards provided by the Installation Service or indicated by the Installation command, which include but are not limited to: UFC 4-740-06, FC 4-740-14N, and UFC 4-740-15.

2-5.1.4 Information and Referral (I&R).

I&R, also known as discovery research center, is located adjacent to, or within the lobby; it can serve as the welcome desk for the center. It should also function as the entry security point, but should not be intimidating or overwhelming. Staff should sit comfortably at the desk and perform office functions as well as interact with customers, assisting them with directions and information. The I&R desk should have direct visibility to the many public functions accessible from the lobby. There may be an office component to the I&R in larger facilities. Use durable materials for the countertop and front surface. Additional lockable wall and base cabinets for storage of equipment and supplies should be incorporated.

2-5.1.5 Classroom.

Much of the center's mission focuses on information and education. Classrooms are central to the mission and their importance to the facility should not be underestimated. Locate classrooms near the entrance and easily accessible from the lobby. They should be configured to allow flexibility in size and configuration and be designed with the infrastructure to allow for a wide variety of media presentations. When required, design one of the classrooms to easily transform into the crisis action/response room. If there is only one classroom in the facility, provide a sound-rated, operable partition. Even if the facility contains multiple classrooms, consider using movable partitions to increase programmatic and scheduling flexibility. Also consider providing built-in casework with a solid-surface countertop and small sink.

2-5.1.6 Teaching Kitchen.

This optional space accommodates instructional programs where military personnel and/or their families can learn cooking and serving techniques for family meals. Consider adjacency to the classrooms and the staff break room, as there may be opportunities to accommodate dual functions in this space.

Plan viewing angles for all workspaces to ensure that students can see the activities. Consider creating an island work area for ease of demonstration. This work area should include cook top, sink, and preparation area. Consider providing an adjustable mirror over the preparation area to allow students to view the activities. If the kitchen is located separately from the staff break room, consider accommodating an eat-in area with tables and chairs.

Service-specific Exception/Requirement: The Navy does not typically include teaching kitchens. The Air Force requires teaching kitchens at every installation.

2-5.1.7 Computer Resource Center.

Similar to the classrooms, the computer resource and information lab is central to the MFSC's mission and consolidates all the center's information for use in a more individualized and independent manner. Directly accessible from the lobby, this lab should be well-organized and allow for information displays, computer kiosks, research carrels, and general work space. The room should be friendly, comfortable, and inviting. Staff work spaces adjacent to the lab should also be inviting and open to encourage questions.

2-5.2 Professional Program/Service Counseling.

2-5.2.1 Interview Room.

Interview rooms provide a private space where program staff can meet with service members and family. Where the alternate operational approach is used, interview rooms replace a portion of private offices. In larger facilities, these rooms may also be provided to allow flexibility. This shared office space is used on an as-needed basis when program staff members who use open workstations need to meet privately with

customers. These rooms should be acoustically private, but visually accessible to other staff in case a situation arises in the room. After the session is over, staff will return to their workstation in the semipublic office space to continue working so that the individual interview room may be used by other staff.

2-5.2.2 Tele-counseling Room.

A room should be provided to accommodate tele-counseling. Acoustics should be a priority in this room to allow clinicians to communicate clearly to clients, and designed to prevent acoustic feedback during a session. Equipment should be provided such as a webcam, microphone, and appropriate lighting.

2-5.2.3 Semipublic Office Space (Open Offices).

These areas of the MFSC house the office space for relocation assistance, transition assistance, and employment support programs/services. They are distinguished as semipublic for two reasons: one, they are directly adjacent to public spaces such as the lobby or the computer resource and information lab; and two, the programs offered from these offices require a more casual and impromptu interaction with customers than in the private program office space. Design these offices to accommodate general staff office functions as well as customer interaction and personalized discussions. These office spaces may support the computer resource and information lab.

Furniture will include modular office furniture consisting of a desk or workstation, credenza with overhead storage, file cabinet, desk chair, and an additional two chairs. The furniture configuration allows the staff member to hold working consultations with customers and for both parties to use the desk as workspace. Provide a quad power/data/telephone outlet on at least three walls of the office, or at least one per staff member. Provide additional outlets as needed to operate additional equipment. Provide vision panel doors or sidelights.

2-5.2.4 Counseling Office Space.

Individual office spaces for staff can be used with clients so that they have a private but safe place to meet. Staff members who use this type of office space provide more intimate counseling functions, such as EFMP or clinical counseling. The alternative layout option will use few, if any, of these spaces. The traditional layout will have many. This office space will consist of acoustically private but visually accessible, individual offices. Design to comfortably seat at least three adults in a quiet, non-threatening setting. Provide LED dimmable lights in the office so that the lighting can be dimmed to calm a client, or increased for specific tasks.

2-5.2.5 Waiting/Decompression Room.

The waiting/decompression room must have two access points: one directly from the counseling offices, and one that leads to public space within the MFSC. This room provides space for distraught customers waiting to see a counselor or allows the customer to compose him or herself after an emotionally difficult session prior to

reencountering the public. It requires a high degree of acoustical privacy but should be visible to staff for safety.

2-5.3 Private/Secure Spaces (Staff Only).

2-5.3.1 Copy/Graphics and Office Supply Storage Room.

This optional space is typically included only in larger facilities. It provides room for staff to design and produce the numerous brochures and pamphlets generated for the MFSC programs. It should be located away from programmatic distractions, be conducive to computer-based design work, and have space for document production such as work tables and photocopiers. This room should also house office supplies.

Provide the following design elements:

- Casework for storage of supplies and equipment. Casework should consist of base and wall cabinets with a minimum 24-in (610-mm) deep countertop.
- Dedicated power and data outlets for computers, network printers, scanners, and copiers.
- Additional data outlets as needed to operate equipment such as a light table and poster/banner maker.

Consider providing a work/layout table for collating printed documents and laying out graphics. If a door is provided, include a vision panel or a sidelight.

Service-specific Requirement: The Army and Air Force require a copy/graphics room in every facility.

2-5.3.2 Staff Break Room.

This staff-only space is used for staff training, meetings, breaks, and lunches. If a Teaching Kitchen is provided, consider locating the staff breakroom immediately adjacent to the kitchen or designing the kitchen in such a way that it can be used as the staff breakroom when it is not used programmatically.

Provide the following design elements:

- Accommodate either a large table or multiple tables with chairs; and
- If located separately from the Teaching Kitchen, provide a residential-style refrigerator with icemaker, dishwasher, and microwave oven.

If a door is provided, include a vision panel or a sidelight.

2-5.3.3 Storage.

Generally, two types of storage are required. One area provides storage of brochures, program materials, and general office supplies. Another secure storage area is required

to support the computer lab and classrooms' audio/visual equipment and computers. The secure storage room must have a lockable door.

2-5.3.4 Lending Locker.

This subset of the relocation assistance program is a storage room for items such as pots, pans, and irons that may be loaned to recently relocated military personnel and their families. Design with adequate and varied shelving to accommodate the many different types of items in the locker's inventory. As many of the items may be bulky or heavy (such as a futon), provide direct access to an exterior loading area for easy customer loading and unloading. If a separate exterior entrance is not possible for a retrofit project, locate the Lending Locker adjacent to the lobby and with direct access to the front entrance.

Include the following design elements:

- Lockable interior and exterior doors,
- A commercial-grade dishwasher and a deep, utility-style sink with adjacent drying area for cleaning returned items.
- Heavy-duty metal storage shelving units and
- Temperature controlled.

Service Exception: Dishwasher and sink are optional for the Army.

2-6 ALTERATIONS TO EXISTING FACILITIES.

2-6.1 Design Considerations.

MFSCs are frequently placed in existing facilities; therefore, special consideration is required when selecting an appropriate existing facility to modify for MFSC functions. Consider only permanent facilities for conversion to an MFSC. Exceptions may be made for other buildings that are in excellent condition, subject to the location determinants in paragraph 2-3.

Consider adaptability to the intent of the building program. For instance, vehicular access for the Lending Locker, services as an emergency crisis response center, or access by non-active-duty personnel and family members may not be achievable in a conversion, alteration, or addition. Barrier-free design requirements and antiterrorism requirements must be provided for MFSC in existing facilities.

2-6.2 Regulatory Authorities.

- **Army:** Engineer Regulation (ER) 1110-345-100 and Army Regulation (AR) 608-1.
- **Navy and Marine Corps:** Authorities are contained in OPNAVINST 11010.20H and OPNAVINST 11010.45A. When planning alterations to an existing facility to convert it to an MFSC, for Navy, consult with Fleet and

Family Support, and for Marine Corps, consult with HQ USMC, Manpower and Reserve Affairs, Code MR.

- **Air Force:** AFCEC for architectural, landscape, interior design, and publication coordination; Facility Engineering Directorate (AFCEC/CF) for technical issues relating to fire, life safety, and certification. Reference the Airman and Family Readiness Operations Division (AFPC/DPFF) for functional requirements and policies.

2-7 SECURITY.

Provide only one public entrance/exit that is a prominent architectural component to facilitate customer wayfinding and monitored for security. A separate staff-only entrance may also be provided that is not in a prominent location, but near dedicated staff parking areas. Staff entrances are usually near the service delivery door or at the side of the building to provide convenient access to remote drop boxes. All other exits should be for emergency use only and alarmed, or for low-value material access such as the Lending Locker. Refer to UFC 4-022-01, UFC 4-026-01, UFC 4-023-10, and UFC 4-010-06 for more information.

2-8 COST.

Design MFSCs with the objective of achieving a low life cycle cost. To do so, the project's design program must adequately define the scope and performance requirements and match those needs against a budget. Conversely, the budget must adequately support an appropriate and high-quality program and the performance and technical requirements (such as sustainable design and antiterrorism criteria) identified in this UFC.

CHAPTER 3 DESIGN

3-1 INTRODUCTION.

This chapter provides general design and material guidance focusing specifically on MFSC issues. This guidance addresses design considerations for site and architectural character, function, circulation, and facility systems. Functional diagrams and other guidance regarding potential layout configurations for different styles of building design are provided to illustrate how the functional area could potentially be organized. Use UFC 1-200-01 for guidance on the use of model building codes for design and construction of DoD facilities. See paragraph 1-4 for direction to the appropriate governing codes for building services.

Refer to UFC 3-101-01 for more information regarding design quality and processes to modify the example program described in Chapter 2 to a population-specific MFSC. General guidance for the concepts and design phase is addressed as part of this chapter. Chapter 4 provides detailed design guidance for each functional area not contained in other UFCs. Preliminary and working drawings should exhibit the specific space criteria, technical issues, and functional area requirements.

3-2 SITE WORK.

For MFSC, Civil Engineering must provide connections to utilities, including water, sewage, electricity, telephone, and gas lines. Provide water service, sanitary and storm systems, natural gas, steam service or fuel oil system (whichever is used locally), electricity, telephone, and fire alarm service to the facility in accordance with UFC 1-200-01. Include connections to the base computer network and communication systems.

Facilitate alternate access via base or public transportation infrastructure to the MFSC by all potential facility customers (spouses, dependents, or non-active-duty personnel that may not have privately-owned vehicles). Site work, site improvements, and coordination with adjacent/context site improvements may be used to provide alternate access. Customers coming from off-Installation must also be supported.

3-2.1 Landscaping.

Landscaping should be appropriate to the professional nature of the facility and reflect the local geographical environment. Plants selected should be easy to maintain and enhance the visual quality of the facility in all seasons. Indigenous species are preferred. Comply with UFC 3-201-02 and the local installation landscape standards.

Service Exception: For Air Force, also refer to base's Installation Facility Standards.

3-2.2 Parking and Access Drives.

Provide adequate parking for both staff and patrons with appropriate access drives. The facility should be easily identifiable from approaching cars, base transportation, and pedestrian pathways. Consider locating bicycle racks near the facility entrance in a

secure location. Comply with UFC 3-210-01. Consider providing site walls, evergreen vegetation hedgerows, or screening features at the perimeter, road, or public way for privacy and anonymity for personnel approaching the facility. Patrons may wish to avoid stigma and shame from approaching programs/services for help. Alternative measures, such as co-locating the facility with other routinely-visited or popular destinations provides patrons with justification for visiting the area.

Service-specific Requirements: The Army and Air Force must work with the program manager and applicable codes and regulations to determine the appropriate number of parking spaces; and provide handicapped accessible parking spaces per requirements of the ABA. Consider the need for a dedicated staff parking area that is located near the staff-only entrance to the building. Spaces for electric vehicle charging, motorcycles, and bicycles should also be provided as required by the base population. If the installation provides bus or shuttle van service, create a path for convenient access for military and family members without personal vehicles.

3-2.3 General Site Lighting.

Ensure that parking areas and the facility have adequate lighting for safety, evacuation, and security measures. Comply with UFC 3-530-01. Consider hours and seasons of use for application of site lighting on pedestrian and bicycle paths.

3-3 ANTITERRORISM REQUIREMENTS.

Design the facility to comply with UFC 4-010-01.

3-4 STRUCTURE.

Comply with UFC 3-301-01. Limit the number of floors to two stories or fewer in height, where possible, or costs associated with progressive collapse criteria will need to be incorporated in the design.

3-5 ARCHITECTURE AND EXTERIOR DESIGN.

The exterior design of an installation's building should be of a character, quality, and detailing that reflects the surrounding community and extends or reinforces the "community fabric." The program and interface with surrounding improvements must create destinations or places that improve the installation Quality of Life (QoL). According to the DoDI 1342.22, the MFSC must be visually conspicuous and conveniently accessible to service members and their families, and furnished in a way that welcomes Service members, their families, and other clients.

Create an individual theme for the facility that may be host nation or installation-related. Refer to UFC 3-101-01 standards and current guidance. Many thematic environments can best be presented in lobbies, primary circulation areas, and shared spaces. Theming should apply continuously to the entire design of the facility, from overall architectural expression to specific interior development. The architectural and interior design of the MFSC must be integral and related. They both involve functional analysis and consideration of the appropriate environmental character, building organization,

circulation, supervision, and flexibility requirements, as well as finishes and furnishings. Provide controlled, indirect daylight into work and learning areas through clerestories, skylights, or windows.

3-5.1 Entrance.

The main entrance should incorporate a clearly identifiable point of reference or landmark that serves as a welcome and a transition. A transition such as a covered entry is very desirable at the main entry. In cold climates, provide a canopy (or a recess) at required egress doors to ensure that doors can open completely without obstruction from snow and ice.

3-5.2 Exterior Finishes.

The color, texture, and design should be consistent with the building material available to the area and therefore be appropriate for the building type and comply with any applicable installation design standards, as well as UFC 3-101-01. The design intent and character of the MFSC should provide the appearance and environmental setting of a professional business office. The MFSC should always present an expression of informality, comfort, and clear organization. The design should invite relaxed conversation, suggest discretion, and above all, promote confidence in the professional services offered. Coordinate the exterior finishes with the Service-specific design standards.

3-5.3 Exterior Signage.

Equip the main entrance with an attractive, clearly-visible sign that provides the program hours of operation. Ensure that signage complies with UFC 3-120-01 and installation requirements. Sign placement and type are site-specific, but signs must be strategically located, adequately lit, and of sufficient size to permit proper viewing by individuals approaching the facility.

3-6 INTERIOR DESIGN.

Construction and finishes (walls, floor, and ceiling) should support the image and theme of the facility and be consistent with the programs offered. The interior design should offer interest, refuge/comfort, and professionalism. Design the interiors of the facility following the process and requirements UFC 3-120-10 along with any individual installation standards. Provide professional interior design services in the same manner as standard A/E services. Coordination and planning between the architect and interior designer is critical.

3-6.1 Interior Construction.

Provide counters, casework, and cabinets of high quality and durable construction. Specify AWI Premium or Custom for finishes per AWI *Architectural Woodwork Quality Standards Illustrated*. Provide casework, cabinet doors, and drawer faces as veneer panel core. Doors, drawers, and casework faces should be plastic laminate at a minimum. Where no water source is present, countertops should, as a minimum, be

plastic laminate with hardwood or solid surface edging. Where a water source is present, provide countertops of solid surface/solid composite plastics only. Specify 0.75-in (19-mm) minimum thickness for plywood, plywood backing, and solid wood panels.

All interior glass must be tempered safety glass, and mirrors must be made of break-resistant materials. There may be extreme cases that require behavioral health self-harm resistant or ligature resistant areas or restrooms. Consult with installation and MFSC staff during design for confirmation. Provide window treatments to control light levels and glare within all offices and classrooms (occupied spaces). Take specific efforts to manage glare, UV, and heat gain. Manual or automatic shades or control devices (programmable) are sufficient to block UV exposure. Refer to UFC 3-101-01, Section C-1.

3-6.2 Finishes.

Finishes should be suitable for the intended use and be appropriately durable. They must meet the requirements listed in NFPA 101.

Do not cover the inside of exterior walls with impervious materials such as mirrors or vinyl wall coverings. This will help prevent mold development in the wall, as moisture can originate within a building and no waterproofing is perfectly designed or installed.

Service Exceptions: Also ensure interior (and exterior) design complies with the following Service-specific standards:

- **Army:** DG 1110-3-122, and Installation Design Guide Standards.
- **Air Force**: Air Force Corporate Facility Standards (AFCFS) and applicable Installation Facility Standards (IFS).

3-6.3 Furnishings, Fixtures, and Equipment (FF&E).

Choose furniture that is durable, comfortable, and attractive. Local wood is a good choice and natural finishes can accentuate the interior décor. Consider modular furniture components designed specifically for office and conference rooms. Counter fronts are high maintenance and require highly durable materials due to wear and tear. System furniture’s storage and power capabilities, as well as stackability, provide an incredible range of flexibility and options to serve the many needs of an office and education and counseling center.

Consider graffiti-proof furniture and materials in bathrooms, small group areas, and other secluded places not easily visible by staff members. Consider floor material colors and textures when selecting and coordinating furniture and equipment.

3-7 BUILDING SERVICES.

3-7.1 Fire Protection.

Design fire protection and life safety to comply with UFC 3-600-01.

3-7.2 Heating, Ventilation, and Air Conditioning (HVAC).

Design the HVAC system to meet the requirements of the most current edition of the International Mechanical Code (IMC), UFC 3-410-01, and UFC 3-410-02. Comply with antiterrorism requirements in the design of the HVAC system. Consider climate conditions, high humidity, industrial atmosphere, saltwater exposure, or other adverse conditions to ensure durability when selecting exterior HVAC components.

3-7.3 Electrical.

Provide electric service and distribution equipment, wiring receptacles and grounding, interior and exterior lighting and control, emergency lighting, telephone and communication systems, and intrusion systems in accordance with NFPA 70; UFC 3-520-01; UFC 3-501-01; and the latest installation design requirements. See the latest edition of International Trade Association (ITA) index web site **"**Electric Current Worldwide" to determine voltages and cycles in overseas locations. Service grounding system and all wiring methods must meet current NFPA 70 requirements. All service equipment must be Underwriters Laboratories (UL) listed. Alternately, published proof from an approved independent testing laboratory may be provided.

Provide lighting and control systems throughout the facility in accordance with UFC 3-530-01.

3-7.3.1 Communications and Data.

Telephone and data outlets may be independent of each other or combined into a single junction box. If these connections can be combined into a single junction box, the cover plate to that junction box must allow for multiple connections. In some unique situations, the cable television (CATV)/internal video connection can be combined into a single junction box with an appropriate cover plate.

Confirm the preference for individual or combined telephone/data/video outlets with the following Service-specific contacts:

- **Army and Air Force:** Installation Manager.
- **Navy Marine Corps:** Marine Headquarters Program Managers.

3-7.3.2 Security Alarm System.

Consider providing an alarm system for intrusion detection to protect equipment and assets. Provisions for an alarm system must be justified during the planning/programming process.

Service Exception: The Navy does not fund security alarm systems. If desired, the individual Navy installation must provide the funding for an alarm system.

3-7.3.3 Duress Alarm System.

If clinical counseling services are provided, an internal, silent duress alarm system may be required. This system usually includes activation buttons at the I&R area and in the counseling offices. When pressed, the button activates an alarm at the I&R and management areas. This allows the counselor or staff member to signal for help if necessary.

3-7.4 Plumbing.

Design domestic hot and cold water, sanitary and storm drainage, propane, fuel oil, or natural gas systems to meet the requirements of local Installation standards and UFC 3-420-01.

3-8 SUSTAINABLE DESIGN.

Follow the guidance in UFC 1-200-02.

3-8.1 Whole Building Design Guide.

The Whole Building Design Guide (https://www.wbdg.org/) further explains the environmental issues related to building materials and provides technical guidance on green building material selection.

CHAPTER 4 FUNCTIONAL DATA SHEETS

4-1 TYPICAL FUNCTIONAL DATA.

The functional data sheets provided in this chapter are limited to specialized or unique requirements. Typical spaces such as offices, building support/utility, and circulation areas are excluded from this chapter for brevity. Requirements for such spaces are assumed to be understood or outlined in other UFC, code, or standard documents.

4-2 FUNCTIONAL DATA SHEETS.

The following room data sheets provide the minimum requirements for the respective rooms and spaces specific to MFSCs.

Figure 4-1 Exceptional Family Member Program Common Area

Description/Usage	Multi-purpose space for families and Exceptional Family Member program participants to wait, socialize, and engage in leisure or educational activities
Minimum Ceiling Height	9′-0" (274 cm)
Finishes	**Walls:** Provide a low-maintenance, durable finish in materials, patterns, and colors for the needs of exceptional family members expected by the Installation. **Floors:** Flooring should be sound absorptive, durable, and easy to maintain with activities and often relocated furniture. **Ceiling:** Provide acoustic absorption (NRC) and light reflectance (LRV) in support of room functions and lighting.
Plumbing	None required.
HVAC	Provide system per paragraph 3-7.2.
Fire Protection	Provide system per paragraph 3-7.1.
Power	Provide outlets per paragraph 3-7.3.
Lighting	Provide system per paragraph 3-7.3.
Communication	**CCTV:** None required. **CATV/Internal Video:** None required. **PA/Audio:** Coordinate with installation needs, processes, and equipment. **Telephone:** None required. **Data:** Required. **Security:** Coordinate with installation needs, processes, and equipment.
Acoustics	Provide an area of finishes with NRC of 0.70 or higher to equal or exceed the floor area of this room/area.
Casework/Built-in Equipment	Seating and tabletops optional for child and/or adult reading or activities.
Furnishings Fixtures and Equipment (FF&E)	Seating, tables, and activity support furniture should be mobile and multi-function.
User-provided Equipment	Determined by users
Special Requirements	Multi-use space and multi-function amenities

Figure 4-2 Counseling Offices

Description/Usage	Private office w/counseling seating
Minimum Ceiling Height	8′-0" (244 cm)
Finishes	**Walls:** Provide a low-maintenance, durable finish on full height partitions. **Floors:** Flooring should be sound absorptive, durable, and easy to replace in sections or maintain. **Ceiling:** Provide acoustic absorption (NRC) and light reflectance (LRV) in support of room functions and lighting.
Plumbing	None required.
HVAC	Provide system per paragraph 3-7.2.
Fire Protection	Provide system per paragraph 3-7.1.
Power	Provide outlets per paragraph 3-7.3.
Lighting	Provide system per paragraph 3-7.3.
Communication	**CCTV:** None required. **CATV/Internal Video:** None required. **PA/Audio:** Coordinate with installation needs, processes, and equipment. **Telephone:** None required. **Data:** Required. **Security:** Coordinate with installation needs, processes, and equipment.
Acoustics	Meet Clinic/Health Unit criteria from UFC 3-101-01 and provide an area of finishes with NRC of 0.70 or higher to equal or exceed the floor area of this room/area.
Casework/Built-in Equipment	None
Furnishings Fixtures and Equipment (FF&E)	Workstation furniture and equipment with additional work surface or countertop, two side chairs and end table for interviewees
User-provided Equipment	Determined by users
Special Requirements	See plans provided

Figure 4-3 Group Treatment Room

Description/Usage	Conference room for staff led group counseling and education
Minimum Ceiling Height	9′-0" (274 cm)
Finishes	**Walls:** Provide a low-maintenance, durable finish. **Floors:** Flooring should be sound absorptive, durable, and easy to replace in sections or maintain. **Ceiling:** Provide acoustic absorption (NRC) and light reflectance (LRV) in support of room functions and lighting.
Plumbing	None required.
HVAC	Provide system per paragraph 3-7.2.
Fire Protection	Provide system per paragraph 3-7.1.
Power	Provide outlets per paragraph 3-7.3.
Lighting	Provide system per paragraph 3-7.3.
Communication	**CCTV:** None required. **CATV/Internal Video:** None required. **PA/Audio:** Coordinate with Installation needs, processes, and equipment. **Telephone:** None required. **Data:** Required. **Security:** Coordinate with Installation needs, processes, and equipment.
Acoustics	Meet Conference Room criteria from UFC 3-101-01 and provide an area of finishes with NRC of 0.70 or higher to equal or exceed the floor area of this room/area. Provide walls with a sound transmission coefficient (STC) rating of 50 to 55, and acoustic door with seals.
Casework/Built-in Equipment	None
Furnishings Fixtures and Equipment (FF&E)	Adjustable office chairs and accessories, with conference table white board and tray, clock
User-provided Equipment	Determined by users
Special Requirements	Acoustic privacy

Figure 4-4 Waiting/Decompression

Description/Usage	Dedicated for stressed or over-stimulated persons to be isolated and undisturbed for a limited time
Minimum Ceiling Height	8′-0" (244 cm)
Finishes	**Walls:** Provide abuse resistance, durable finish in calming color-patterns. See special requirements below. **Floors:** Flooring should be durable, easy to clean, and abuse resistant. **Ceiling:** Ceiling should be durable and cleanable. Do not locate equipment, valves or other items above the room which may require access. Do not provide ceiling access panels.
Plumbing	None required.
HVAC	Provide system per paragraph 3-7.2.
Fire Protection	Provide system per paragraph 3-7.1.
Power	Provide outlets per paragraph 3-7.3.
Lighting	Provide system per paragraph 3-7.3. Dimmable by occupant.
Communication	**CCTV:** None required. **CATV/Internal Video:** None required. **PA/Audio:** Coordinate with installation needs, processes, and equipment. **Telephone:** None required. **Data:** Required. **Security:** Coordinate with installation needs, processes, and equipment.
Acoustics	Meet Clinic/Health Unit criteria from UFC 3-101-01 and provide an area of finishes with NRC of 0.70 or higher to equal or exceed the floor area of this room/area.
Casework/Built-in Equipment	None
Furnishings Fixtures and Equipment (FF&E)	Comfortable armchair or lounge chair and a side table may be included.
User-provided Equipment	None
Special Requirements	Confirm with installation if impact/abuse resistant wall assembly or padding on walls is appropriate. Consider ligature-resistant door hardware and detailing.

Figure 4-5 Interview/Meeting Room

Description/Usage	Private office for interviewing personnel seeking counseling or training. Discussions could contain private health or financial information.
Minimum Ceiling Height	8′-0" (244 cm)
Finishes	**Walls:** Provide a low-maintenance, durable finish on full-height partitions extending to the underside of structure with sound insulation. **Floors:** Flooring should be sound absorptive, durable, and easy to replace in sections. **Ceiling:** Provide acoustic absorption (NRC) and light reflectance (LRV) in support of room functions and lighting.
Plumbing	None required.
HVAC	Provide system per paragraph 3-7.2.
Fire Protection	Provide system per paragraph 3-7.1.
Power	Provide outlets per paragraph 3-7.3.
Lighting	Provide system per paragraph 3-7.3.
Communication	**CCTV:** None required. **CATV/Internal Video:** None required. **PA/Audio:** Coordinate with installation needs, processes, and equipment. **Telephone:** None required. **Data:** Required. **Security:** Coordinate with installation needs, processes, and equipment.
Acoustics	Meet Clinic/Health Unit criteria from UFC 3-101-01 and provide an area of finishes with NRC of 0.70 or higher to equal or exceed the floor area of this room/area.
Casework/Built-in Equipment	None
Furnishings Fixtures and Equipment (FF&E)	Workstation and interviewee chair. Consider space for interviewee table, side table, and personal effects.
User-provided Equipment	Coordinate with installation.
Special Requirements	Staff/interviewee safety with view door light or side-lite and exit path.

Figure 4-6 Teaching Kitchen

Description/Usage	**A multi-use space that includes teaching and demonstration kitchen with one set of residential kitchen appliances (minimum) with space for class/audience. Other uses as break room, life-skills educational classroom, and general instruction classroom.**
Minimum Ceiling Height	9’-0" (274 cm)
Finishes	**Walls:** Provide abuse resistance, durable finish and cleanable. **Floors:** Flooring should be durable, easy to clean, and abuse resistant. **Ceiling:** Ceiling should be durable and cleanable.
Plumbing	Provide system per paragraph 3-7.4. Provide a floor drain and turn-down vent pipe at island sink. Provide 140 °F (60 °C) hot water for any sinks utilized for dish washing.
HVAC	Provide system per paragraph 3-7.2. Return air from this space must not recirculate to other spaces. Coordinate with installation needs, processes, and equipment regarding the need for an exhaust hood.
Fire Protection	Provide system per paragraph 3-7.1.
Power	Provide outlets per paragraph 3-7.3.
Lighting	Provide system per paragraph 3-7.3.
Communication	**CCTV:** None required. **CATV/Internal Vide:** None required. **PA/Audio:** Coordinate with installation needs, processes, and equipment. **Telephone:** None required. **Data:** Required. **Security:** Coordinate with installation needs, processes, and equipment.
Acoustics	Meet classroom criteria from UFC 3-101-01 and provide an area of finishes with NRC of 0.70 or higher to equal or exceed the floor area of this room/area.
Casework/Built-in Equipment	Provide residential appliances in demonstration countertop island (minimum one set) and storage casework.
Furnishings Fixtures & Equipment (FF&E)	Equip for educational instruction and cooking-lab use.
User-provided Equipment	Coordinate with installation.
Special Requirements	None

This Page Intentionally Left Blank

APPENDIX A BEST PRACTICES

A-1 INTRODUCTION.

The architectural design and construction industry has produced strategies for coordination, lean project design, or integrated project delivery. This appendix identifies good design practices for MFSC. The designer is expected to interpret this guidance and configure the design for the needs of the project.

The Best Practices Appendix is considered to be guidance and not requirements. Its main purpose is to communicate proven facility solutions, systems, and lessons learned, but may not be the only solution to meet the requirement.

A-1.1 Productivity.

The WBDG Design Objective (https://www.wbdg.org/design-objectives/productive) provides five fundamental principles of productive building designs. Refer to WBDG online resources for additional information.

A-1.1.1 Promote Health and Well-Being.

Indoor environments strongly affect human health. An effective environment should be designed to support and enhance the health and well-being of its occupants. Sustainable design principles also help achieve this objective.

Fresh air, good lighting, and natural lighting has been proven to improve human performance and health; ventilation systems or operable windows must be considered as a best practice. Operable windows do pose climate control and security challenges, but provide occupants with the control of and responsibility for their immediate environment. While this may be viewed as a maintenance risk, it may enhance the facility's value with occupants, eliciting greater care and respect.

A-1.1.2 Provide Comfortable Environments.

Provide the highest achievable levels of visual, acoustic, ergonomic, and thermal comforts for occupants within the program limitations.

A-1.1.3 Design for the Changing Workplace.

Design spaces to be flexible, cost-effective, and promote an atmosphere that increases morale, productivity, and collaboration.

A-1.1.4 Technological Tools.

Effective use of technological tools for modeling, planning, and design enables higher performance operations, efficiency, or occupants to perform activities or their duties with greater success.

A-1.1.5 Energy and Sustainability.

The mission of the DoD and other Federal agencies includes the protection and preservation of America's natural resources. Designs optimized for conservation of energy and other resources are required by DoD Guides and Manuals, including but not limited to UFC 1-200-02. The Federal government and DoD provide numerous references and design guidelines for their selected methods. Consider further improvements to performance through practices and procedures early in design and integrated design decision making.

Facility programing, client, and installation coordination can also benefit from early communication and integrated design practices. The design team may consider appropriately combining these with their own best practice standards, such as ASHRAE 90.1 (or IECC in the current edition, which includes various approaches), and the AIA's *An Architect's Guide to Integrating Energy Modeling in the Design Process*. Consideration may be given to ASHRAE 209 as an optional standard to define common language and consistent energy modeling procedures. This lexicon may assist project teams to deliver a proper building energy simulation and analysis. Note that not all energy modeling procedures are recommended for all projects. Minor projects should follow a limited selection, perhaps three to five of the procedures, each at a different project milestone or phase to deliver a high-performance building.

A-1.1.6 Adaptability with Modular Furniture and Fit-outs.

Building adaptability is the capacity of a building to be used for multiple uses and in multiple ways over the life of the building. For example, designing a building with a modular and integrated approach to infrastructure delivery and interior systems (furniture, ceiling systems, and access floors) allows the building to support multiple uses and multiple futures (https://www.wbdg.org/design-objectives/sustainable).

Modular furniture can be digitally planned, manufactured to a custom fit, and re-configured to accommodate different programs and service populations of an MFSC.

APPENDIX B GLOSSARY

B-1 ACRONYMS AND ABBREVIATIONS.

°C	degree(s) Celsius
°F	degree(s) Fahrenheit
A&FRC	Airman and Family Readiness Centers
ABA	Architectural Barriers Act

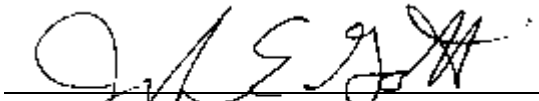
This UFC supersedes UFC 4-730-10, *Fire Stations*, dated 15 June 2006, and FC 4-730-10N, *Navy and Marine Corps Fire Stations*, dated 1 December 2013.

FOREWORD

The Unified Facilities Criteria (UFC) system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and applies to the Military Departments, the Defense Agencies, and the DoD Field Activities in accordance with USD (AT&L) Memorandum dated 29 May 2002. UFC will be used for all DoD projects and work for other customers where appropriate. All construction outside of the United States is also governed by Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA) and, in some instances, Bilateral Infrastructure Agreements (BIA). Therefore, the acquisition team must ensure compliance with the most stringent of the UFC, the SOFA, the HNFA, and the BIA, as applicable.

UFC are living documents and will be periodically reviewed, updated, and made available to users as part of the Services' responsibility for providing technical criteria for military construction. Headquarters, U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering Command (NAVFAC), and the Air Force Civil Engineer Center (AFCEC) are responsible for administration of the UFC system. Defense agencies must contact the preparing Service for document interpretation and improvements. Technical content of UFC is the responsibility of the cognizant DoD working group. Recommended changes with supporting rationale must be sent to the respective service proponent office by the following electronic form: Criteria Change Request. The form is also accessible from the Internet site listed below.

UFC are effective upon issuance and are distributed only in electronic media from the following source:



- Whole Building Design Guide web site http://dod.wbdg.org/.

Refer to UFC 1-200-01, *DoD Building Code (General Building Requirements)*, for implementation of new issuances on projects.

UNIFIED FACILITIES CRITERIA (UFC)
NEW DOCUMENT SUMMARY SHEET

Document: UFC 4-730-10, *Fire Stations*

Superseding: UFC 4-730-10, *Fire Stations*, dated 15 June 2006, and FC 4-730-10N, *Navy and Marine Corps Fire Stations*, dated 1 December 2013.

Description: This UFC provides criteria for planning and design of fire stations. This UFC includes guidance for Air Force, Army, Marine Corps, and Navy fire stations.

Reasons for Document: This is a new joint-Service document. This new document represents another step in the joint-Services' effort to bring uniformity to the planning, design, and construction of military facilities. This UFC was developed to provide design requirements to accomplish the following:

- Assist planners in understanding facility requirements to ensure accurate space program budgets.
- Provide architects, engineers, and construction surveillance personnel with essential, minimum requirements for the design and construction of fire stations.
- Clarify the operational intent of the facility design.

Impact: The following will result from the publication of this UFC:

- This UFC creates a single source for common DOD fire station criteria and an accurate reference to individual Service-specific documents.
- This UFC facilitates updates and revisions and promotes agreement and uniformity of design and construction among the Services.

Unification Issues: The following is non-unified content**:**

- The Marine Corps separates their program into two organizations, one for structural and one for aircraft rescue firefighting (ARFF).
- The Navy and Marine Corps mandate direct vent apparatus exhaust systems when required by intended apparatus operations.
- For Army only, the function associated with personal protective equipment (PPE) gear storage as described in Table 4-2 is permitted to occur within and open to the apparatus bay.
- For Army only, the functional program space for the decontamination room detailed in Table 4-11 has the option to be programmed as "fire extinguisher inspection, maintenance and storage (non-flight line)."

CHAPTER 1 INTRODUCTION

1-1 PURPOSE AND SCOPE.

This UFC provides requirements for evaluating, planning, programming, and designing fire stations. The information in this UFC applies to the design of all new construction projects, including additions, alterations, and renovation projects in the continental Unites States (CONUS) and outside the continental United States (OCONUS). This UFC is not intended as a substitution for thorough review during design by individual program managers and operations staff in the appropriate Service.

Fire stations support military firefighters' mission to provide fire protection to installation flightlines and facilities and fire prevention education and training. This UFC does not apply to deployment, contingency, or field operating facilities. When the fire station function is part of a consolidated operations facility (fire/police/safety), the criteria in this UFC is applicable only to fire station functions and must be applied carefully in order to integrate with other facility functions. Identify common support/administrative spaces that can be shared to improve efficiency.

1-1.1 Types of Stations.

Functionally, there are three types of fire stations:

- Structural stations provide fire protection to facilities
- Aircraft rescue firefighting (ARFF) stations provide fire protection to flightlines and aircraft
- Combination structural/ARFF stations

To support the firefighters' mission, it is crucial that the design of all fire stations accommodate the equipment, numerous unique functional requirements, and safety of the firefighting personnel. Generally, the differences between structural and ARFF stations are limited to the apparatus bay size criteria (see paragraph 2-3.1 for more on these differences) and the facility location determinants (see paragraph 2-1).

The Marine Corps program includes two separate organizations: one for structural and one for ARFF. Unlike the other Services, the Marine Corps rarely combines the stations and requires separate offices for fire chiefs and other personnel on their installations.

1-1.2 Classes of Stations.

Irrespective of type, there are two classes of fire stations:

- Headquarters (or main) stations generally house the fire chief and most of the general administrative functions.

- Satellite stations are located throughout the installation to provide response time coverage.

The differences between headquarters and satellite stations relate only to the additional administrative functions housed in the headquarters station. Both headquarters and satellite stations may be structural, ARFF, or combination stations.

1-1.3 Users of Stations.

Not all of these personnel will be located in every fire station but generally all of the following individuals will be present in at least one fire station per installation:

- Fire chief
- Deputy fire chief
- Assistant chief/shift supervisor
- Firefighters
- Inspectors
- Training officers
- Fire prevention officers
- Hazardous materials (HAZMAT)/health and safety officer
- Logistics officer
- Administrative assistant
- Reserve firefighters

1-2 APPLICABILITY.

This UFC applies to all Service elements and contractors involved in the planning, design, and construction of fire stations worldwide.

1-3 USERS OF THIS UFC.

This UFC is intended as a source of basic architectural and engineering information for all individuals involved in the planning, design, and construction of fire stations.

Specific users of the UFC include the following:

1-3.1 Architects and Engineers.

Architects and engineers (A/E) who will provide design services under the direction of the individual Service design agencies.

1-3.2 Planning Personnel.

Planning personnel will use this UFC for programming new or replacement facilities, pre-design planning, or assessing the extent of improvements required in an existing fire station to achieve the standard established herein.

1-3.3 Additional Users.

Additional users may include entities for operational or other purposes. The respective users must refer to this UFC from their own policy documents as appropriate and may include:

- Headquarters staff and field operating agencies
- Major command (MAJCOM) staff/regions
- Base, installation, and garrison commanders
- Installation facilities management
- Installation technical proponents

1-4 GENERAL BUILDING REQUIREMENTS.

Comply with UFC 1-200-01, *DoD Building Code*. UFC 1-200-01 provides applicability of model building codes and government-unique criteria for typical design disciplines and building systems, as well as accessibility, antiterrorism, security, high-performance and sustainability requirements, and safety. Use this UFC in addition to UFC 1-200-01 and the UFCs and government criteria referenced therein. Air National Guard facility requirements are defined in ANGH 32-1084, *Facility Space Standards*. For projects that fall under the area of responsibility of the U.S. Army Centers of Standardization (COS) program, the requirements of the COS for fire stations in Huntsville, Alabama, supersede any conflicting requirements herein. Designers must contact and coordinate with the COS accordingly.

1-5 BEST PRACTICES.

Appendix A is considered to be guidance and not requirements. Its main purpose is to communicate proven facility solutions, systems, and lessons learned, but may not be the only solution to meet the requirement.

1-6 REFERENCES.

Appendix D contains a list of references used in this document. The publication date of the code or standard is not included in this document. Unless otherwise specified, the most recent edition of the reference publication applies.

1-7 GLOSSARY.

Appendix C contains acronyms and abbreviations.

CHAPTER 2 PLANNING AND LAYOUT

2-1 LOCATION DETERMINANTS.

Several factors determine the most appropriate and cost-effective location for a fire station.

2-1.1 Access/Response Time.

The most critical determinant for the location of a fire station is response time. Refer to DODI 6055.06, *DoD Fire and Emergency Services Program*, or DOD component policy to determine required response times. In addition to response time, accommodate access to the station by delivery vehicles, staff, and visitors.

Direct access and response time may conflict with tightening antiterrorism (AT) criteria. Provide a facility site that is prominent and easily visible from the target areas (structures or flightlines).

2-1.2 Size.

Provide site space to accommodate firefighting vehicle turning radii, personnel parking, visitor parking, storage requirements, and reserve vehicles (if applicable). Provide site space to accommodate a dumpster pad and enclosure in accordance with the installation appearance plan (IAP).

2-1.3 Elevation.

Due to the critical response capabilities required by fire and emergency response units, select a site such that parking areas and driveways are located at least 3 ft (0.9 m) above the base flood elevation (BFE).

2-2 SIZE DETERMINANTS.

Several factors determine the size of the facility, as described below.

2-2.1 General.

Generally, the size of the station depends on the class of station, the number of companies housed, the number and types of vehicles housed, and any additional spaces required. The class of station will partially drive the number of spaces required. However, depending on what is currently available on the installation, some spaces normally reserved for headquarters stations may be provided in satellite stations. The installation representatives, in conjunction with the program manager, must decide which spaces must be provided.

Gross Square Feet (GSF) Deviation: The facility constructed gross area must not exceed 100 percent of the space allocation set forth in this UFC to accommodate site,

construction, or environmental factors. The number of apparatus bays and dorm rooms are used to determine the overall size of the fire station facility.

2-2.2 Needs Validation Assessment.

Conduct a needs validation assessment to determine the class and required capacity of personnel and vehicles of the new or renovated station.

2-2.3 Types of Spaces.

For a complete list of spaces, see Table 2-1. Fire station functional spaces fall into three main categories:

2-2.3.1 Maintenance and Apparatus.

This includes the apparatus room/bays that house the firefighting vehicles and supporting maintenance spaces. The maintenance spaces include both vehicle maintenance equipment maintenance/storage for fire extinguishers, self-contained breathing apparatus (SCBA), protective clothing, hoses, and firefighting agents.

2-2.3.2 Administration and Training.

This includes the appropriate offices, training spaces, dispatch areas, and administrative areas.

2-2.3.3 Residential and Living.

This includes on-duty firefighters' bedrooms, toilets/showers, kitchen/dining, recreation, and "living room" areas.

2-2.3.4 Other Spaces.

Other spaces that don't readily fit into the three categories include the following:

- Vending space shared by both staff and firefighters.
- Air Force Reserve Command/Air National Guard annex may provide a separate space for administration, equipment storage/maintenance, training, and testing.
- Host nation employee dayroom as mandated by Master Labor Contracts (MLC) or Status of Forces Agreements (SOFA).
- Transition zones (yellow) to allow movement of personnel between the facility's hot (red) and cold (green) zones. Hot zones are spaces in the facility exposed to carcinogens and green zones are living/working spaces intended for extended occupancy.

Table 2-1 Fire Station Program Spaces

Space	Notes
Maintenance and Apparatus	
Apparatus room/bays	Made up of bays; either single- or double-length bays. Sized according to truck modules: See para. 2-3.1.1.
Personal protective equipment (PPE) gear storage	One per station.
Hose storage	One per station.
SCBA compressor room	At least one per department. May be required in multiple stations due to extent of geographic separation as dictated by installation mission requirements.
SCBA maintenance	One per department.
Protective clothing laundry	One per station.
Equipment wash/disinfection	One per station.
Work room/equipment maintenance	One per station.
Vehicle maintenance equipment storage	One per station. Tools and minor parts.
EMT storage (basic first aid supplies)	One per station.
Medical storage cabinet/locker (drugs and needles)	One per station. Lockable. This may be combined with or a sub-space of the EMT storage room.
HAZMAT/CBRNE equipment storage	HAZMAT: One per station. CBRNE (chemical, biological, radiological, nuclear, explosive): As dictated by installation mission requirements. Not all stations require these spaces and store these materials off-site.
Agent storage	At least one per department. May be required in multiple stations due to extent of geographic separation as dictated by installation mission requirements.
Spare PPE gear storage	At least one per department.
Decontamination room	One per station. For Army only, this room can be programmed as "fire extinguisher inspection, maintenance and storage (non-flight line)."
Flightline fire extinguisher maintenance and storage	One per department.
Vehicle maintenance bay	Addition to apparatus room/bays, as dictated by installation mission requirements.
Vehicle maintenance office	As dictated by installation mission requirements if vehicle maintenance bay is provided.
Reserve and active duty mobility/deployment gear storage	As dictated by installation mission requirements.
Administration and Training	
Station officer office	One per station.

Watch desk	One per station only if no dispatch in station and then made part of station officer office. (Receives calls from dispatch.)
Fire chief office	One per department.
Chief's conference room	One per department. May be a part of fire chief's office.
Deputy chief office	The requirement for a deputy chief is driven by the size of the department.
Administrative assistant	Provided only in conjunction with chief and deputy chief.
Lobby area	Generally provided only in conjunction with chief and deputy chief.
Assistant chief/shift supervisor	One per station. Additional staffing as dictated by installation mission requirements.
Assistant chief of fire prevention	One per department as dictated by installation mission requirements.
Inspector(s) office(s)	Several workstations per department may be located in several stations.
EMS office	Space for EMS to complete confidential paperwork as dictated by installation mission requirements.
HAZMAT/health and safety office	One per department.
Logistics office	As dictated by installation mission requirements.
Department training room	At least one per department (in HQ station). May be provided in other stations as dictated by installation mission requirements.
Training officer office	One per department.
Testing/individual study area	One per station. Separate room.
General administration storage	One per station.
Fire-only dispatch	One per department; provided only if no requirement for consolidated or joint dispatch. Dispatch receives emergency calls from the public.
Consolidated or joint dispatch	Provided in lieu of fire-only dispatch. Combines fire, security, and medical dispatch functions.
Dispatch supervisor	Provided in conjunction with dispatch centers staffed by 3 or more on-duty dispatchers.
Dispatch bathroom	Dedicated facilities. Provide off the dispatch floor for immediate access by personnel.
Dispatch kitchenette	Dedicated facilities. Provide off the dispatch floor for immediate access by personnel.
Telecommunications room	One per station. Provide presence/size of dispatch and/or watch room as dictated by installation mission requirements.
Dispatch equipment room	One per station. Provide presence/size of dispatch and/or watch room as dictated by installation mission requirements.
Generator space	One per station. May need to be located inside as a security concern.
Residential and Living	

Day room	One per station. Includes kitchen, dining, and lounge areas.
Training room	The station training area may be incorporated as part of the dining portion of the day room as dictated by installation mission requirements.
Dorm rooms	Per station. Quantity depends on number of crews.
Bathrooms/shower/changing	Male and female facilities per station. Individual unisex showering/changing rooms can be provided as dictated by installation mission requirements.
Fitness room	One per station.
Laundry room	One per station.
Recreation room	Addition to day room for noisier activities such as games as dictated by installation mission requirements.
Covered outdoor patio	One per station is counted toward overall building square footage included in the validated DD1391.
Unisex public toilet	For headquarters stations only. Toilet facilities accessible from dayroom or main lobby for use by guests/visitors. For Army only: Required in all facilities.
Other Spaces	
Vending	For use by firefighters and staff.
Reserve firefighter gear	Air Force only. As dictated by installation mission requirements.
Reserve offices	Air Force only. Offices (two) for fire chief and assistant chief and training officer as dictated by installation mission requirements.
Host nation dayroom	Provide as mandated by Master Labor Contracts (MLC) or Status of Force Agreements (SOFA).
Transition zones (yellow)	Allow movement of personnel between the facility's hot (red) and cold (green) zones. Hot zones are spaces in the facility exposed to carcinogens and green zones are living/working spaces intended for extended occupancy.

2-3 SPACE PROGRAM.

The space program for fire stations is developed through the use of an interactive worksheet. It is completed by first entering the appropriate Service branch and then selecting the following: type of station, class of station, number of companies to be housed/dorm room count, number and class of vehicles to be housed, and additional required spaces. The selections vary depending on the Service branch selected. As selections are made, the program areas are calculated and summed for both the building and the site. The worksheet must be filled out in collaboration with the appropriate fire department representative(s).

This interactive worksheet is available as a downloadable Microsoft® Excel file from the Whole Building Design Guide Web site: http://www.wbdg.org/references/pa_dod_sps.php.

2-3.1 Critical Space Drivers.

To understand how the numbers in the interactive worksheet are calculated, several critical space drivers must be understood.

2-3.1.1 Apparatus Bays.

The apparatus bays are sized based on the class of truck to be housed. See Table 2-2 for a list of common truck types. These types have been classified as follows to standardize the size criteria:

- **Large.** These typically include structural aerial (ladder) trucks or large tanker trucks with lengths greater than 38 ft (11.58 m). The standardized footprint (floor space occupied by the truck, not considering the space around it) is 10 ft by 50 ft (3.05 m by 15.24 m).
- **Medium.** This class covers a wide range of vehicles, from structural pumper trucks and smaller tanker trucks to rescue and HAZMAT trucks. Medium trucks have lengths between 30 and 38 ft (9.14 and 11.58 m). The standardized footprint is 10 ft by 38 ft (3.05 m by 11.58 m).
- **Large ARFF (Wide).** All ARFF trucks are distinguished by their generally greater width and may include heavy rescue or very large tankers. Large ARFF trucks have lengths greater than 38 ft (11.58 m). The standardized footprint is 12 ft by 50 ft (3.66 m by 15.24 m).
- **Medium ARFF (Wide).** Medium ARFF trucks are also distinguished by their generally greater width. They can vary in length from about 23 ft (7.01 m) up to 38 ft (11.58 m) but the standardized footprint is 12 ft by 38 ft (3.66 m by 11.58 m).
- **Small.** These typically include ambulances, small rescue or HAZMAT trucks, small brush units, and command vehicles. Small trucks have lengths less than 30 ft (9.14 m). A separate vehicle bay size class is not designated for these trucks. Depending on the actual size of the small class truck, it may be housed in its own bay or in a bay with another truck. For example, two 20-ft (6.10-m) -long vehicles may be housed in a large bay (either ARFF or not). The interactive worksheet makes a recommendation for the area of additional apparatus bays, as appropriate, for the quantity of small vehicles indicated. However, this area must be carefully reviewed by the planning team to ensure it provides the correct space, accounting for the actual length of the small vehicles anticipated and the space that may be available in other bays.

In addition to the truck footprint, the space program takes into account the space around the parked truck. This space varies, depending on whether the truck is parked next to a wall or another truck. See Figures B-1 through B-4 for illustrations of these variations. The space program uses the middle-sized bay for each truck class to calculate an "average" size bay for the given vehicle. Also see Table 4-1 for more information on the apparatus bays.

Table 2-2 Common Types of Vehicles and Their Size Classes

Type of Vehicle	Size Class of Vehicle (See Para. 2-3.1.1)
Structural	
Pumpers	Medium
Telesquirts	Medium
Aerial/ladders	Large
Tankers	Medium or large
ARFF	
Large water tankers	ARFF medium
ARFF foam (vary from 1500 gal [5700 L] up to 6500 gal (24,600 L)	ARFF medium or ARFF large
Ambulance	
Ambulances	Small
Rescue	
Small/light rescue	Small
Medium rescue	Medium
Heavy rescue	ARFF medium
HAZMAT	
HAZMAT support/small	Small
HAZMAT squad	Medium
HAZMAT squad	Large
Brush	
Small brush	Small
Large brush	Medium
Equipment Trailers	
Various equipment trailers pulled by command or other vehicles	Small

2-3.1.2 Dorm Room Counts.

The interactive worksheet uses two methods to calculate the number of dorm rooms needed (dorm room count). First, the user enters the number of structural companies and the number of ARFF companies, as appropriate. (If it is a structural station, ARFF

companies are not permitted and vice versa.) Based on the branch of Service selected, the worksheet will calculate the number of dorm rooms from the number of companies. Second, the user adds or subtracts dorm rooms to accommodate ambulance companies, rescue companies, or cross-staffing of companies. The initial number of rooms plus or minus the modified number of rooms is the final dorm room count.

Dorm room counts must be coordinated with the fire chief. See Table 2-3 for sample on-duty staffing by vehicle type. Cross-staffed (x-staffed) vehicles are staffed on an as-needed basis by personnel assigned to another vehicle or vehicles. X-staffed vehicles have no dedicated staff of their own. The sample vehicle staffing numbers shown in Table 2-3 do not represent staffing authorizations.

Table 2-3 Sample Staffing by Vehicle Type

Type of Vehicle	Army	Navy	Air Force	Marine Corps
Structural				
Pumpers	4	4	4	4
Telesquirts	4 or x-staffed	4 or 6	4	4
Aerial/ladders	4 or x-staffed	4 or 6	4	4
Tankers	x-staffed	1 or x-staffed	n/a	1 or x-staffed
ARFF				
Large water tankers	x-staffed	1 or x-staffed	1	1 or x-staffed
ARFF foam	3	3	3	4
Ambulance				
Ambulances	2 or x-staffed	2	n/a	2
Rescue				
Small/light rescue	x-staffed	3 or x-staffed	3	3 or x-staffed
Medium rescue	x-staffed	3 or x-staffed	3	3 or x-staffed
Heavy rescue	x-staffed	3 or x-staffed	3	3 or x-staffed
HAZMAT				
HAZMAT support/small	x-staffed	x-staffed	x-staffed	x-staffed
HAZMAT squad	x-staffed	x-staffed	x-staffed	x-staffed
Brush				
Small brush	x-staffed	x-staffed	x-staffed	x-staffed
Large brush	x-staffed	x-staffed	x-staffed	x-staffed

2-3.2 Total Area.

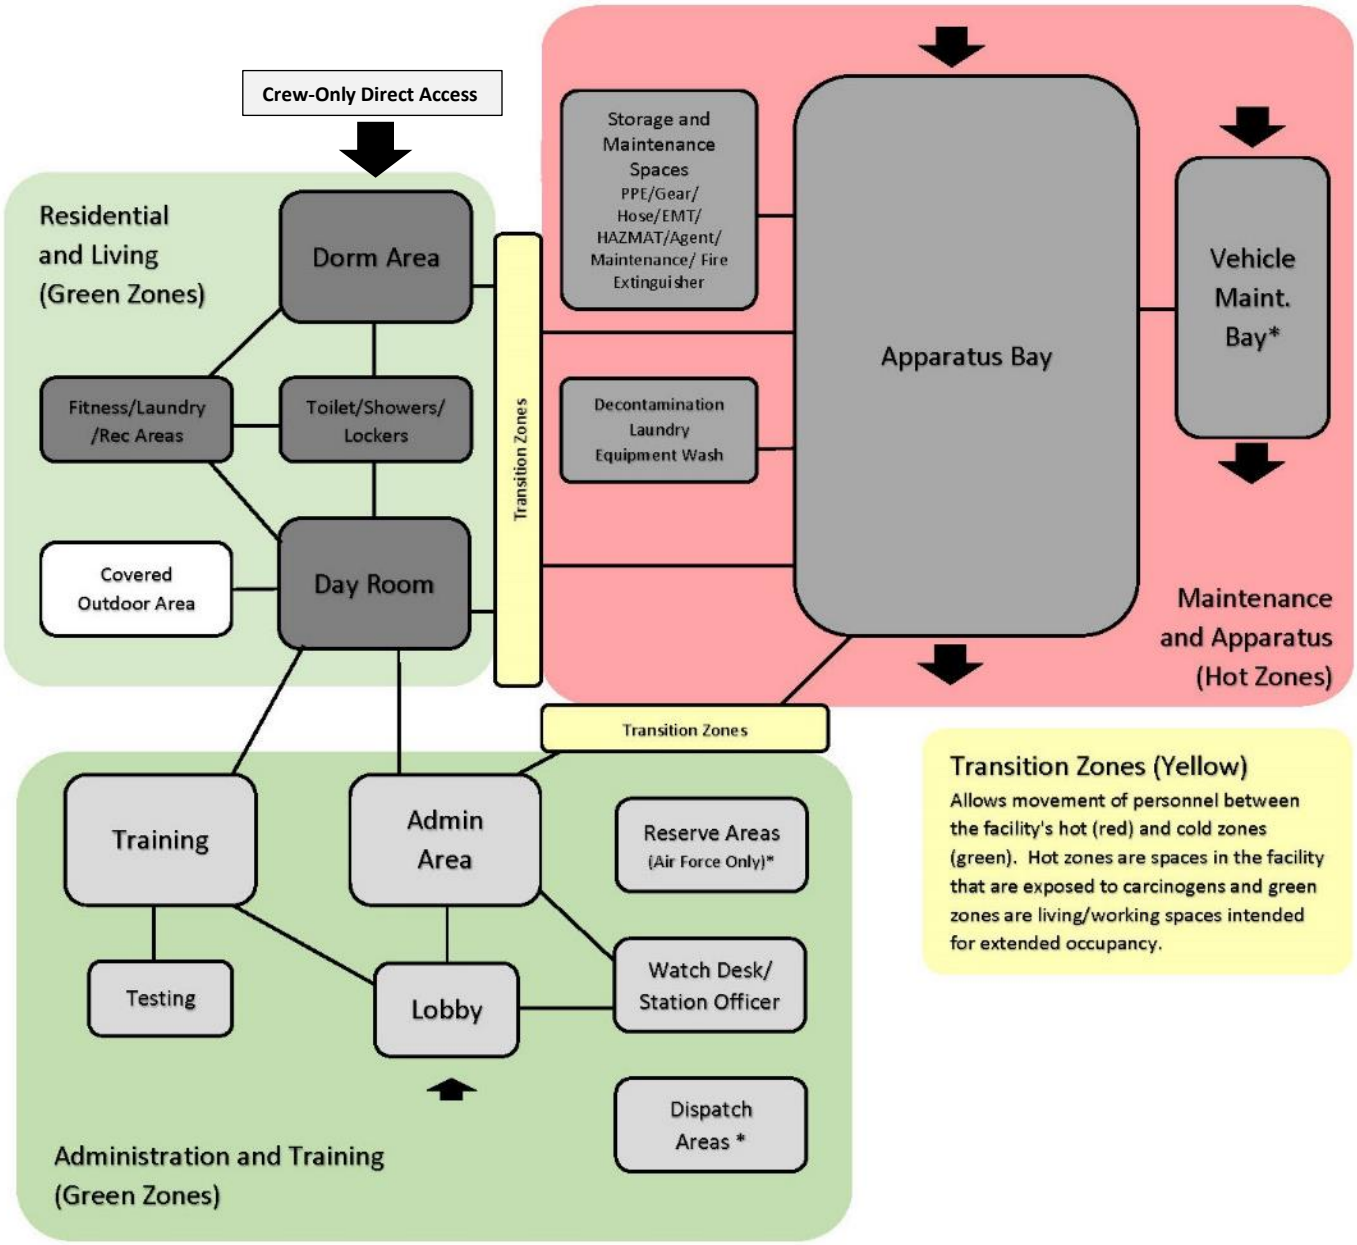
The space program developed through the use of the interactive worksheet serves as a guideline for the fire station planning team and generally represents the maximum space allowed. The final space program for a new fire station will need to be carefully determined by installation representatives and the appropriate Service program office, guided by the criteria in this UFC. The space assessment and its related basic facility requirement (BFR) calculation serves as the basis for the validated DD1391, which defines the total authorized space allowances for each project.

2-4 LIFE-CYCLE COST PRIORITIZATION.

Prioritize a lower total life-cycle cost over initial capital investment. Design these facilities with the objective of achieving the lowest life-cycle cost over a 40-year period. To do so, the project's design program must define the scope and performance requirements to develop and validate a long-term operational budget. The budget must be within reasonable funding expectations while supporting an appropriate and high-quality program and meeting the performance requirements identified in this UFC.

2-5 LAYOUT AND ADJACENCIES.

As with location determinants, the key internal adjacencies are driven by response time. The location of the residential and living areas must accommodate quick and clear access to the apparatus room/bays for response in the event of an alarm. The apparatus bays require the ability to drive through with overhead doors on either end of each bay. The appropriate layout and adjacencies are illustrated through a bubble diagram.



In HQ/main stations, coordinate the relationship between the administrative areas and the living areas with the users and program manager. There may be a desire to separate these areas to provide a sense of functional identity for each. One-story fire stations are preferred. However, if necessary, some required adjacencies may be accommodated vertically. If a two-story solution is proposed, the dispatch and administrative areas may be placed on the first floor to best account for Architectural Barriers Act (ABA) compliance requirements. The sequence for transitioning from a hot zone to a cold zone must allow space for personnel to take five steps along a walk-off surface over a minimum 6-ft (1.8-m) -long path after removing gear and washing off any visible contaminants.

2-5.1 Functional Relationship Bubble Diagram.

The bubble diagram in Figure 2-1 indicates the acceptable relative adjacencies of the functional spaces. Some of these key adjacencies may be accommodated through a hallway rather than a direct entrance/exit from one space to another. This is particularly true with the apparatus room/bays and the day room since many facility spaces need an adjacency with these two spaces. Note that the apparatus bay support area indicated in the diagram includes the following spaces, some of which may not be included in every station, depending upon installation mission requirements:

- SCBA maintenance
- SCBA compressor room
- Work room/equipment maintenance
- Equipment wash/disinfection
- Protective clothing laundry
- EMT storage
- HAZMAT/CBRNE equipment storage
- Spare PPE gear storage
- Decontamination room
- Flightline fire extinguisher maintenance

Figure 2-1 Basic Facility Functional Relationship Diagram

* If required by Installation mission requirements.

2-5.2 Space Assessment.

See the functional data sheets in Chapter 4 for additional information on the space types and their relationships to each other.

2-6 ALTERATIONS TO EXISTING FACILITIES.

2-6.1 Regulatory Authorities.

Refer to the following appropriate authorities for each Service:

- Army. The standard may be modified to accommodate the existing structure. However, all proposed modifications to the standard must be sent to the Army Corps of Engineers, Engineering & Support Center, HSV (CEHNC), for review and HQDA (CFSC; CYS) for approval prior to the initiation of concept design.
- Navy. Funding thresholds and authorities are in the most current version of OPNAVINST 11010.20, Navy Facilities Projects. The site approval request (SAR) process is in CNICINST 11010.3, Site Approval Request Process, and NAVFACINST 11010.45A, Site Approval Request Process. Prior to altering an existing fire station or converting an existing facility to a fire station, contact the local Asset Management Business Line of the Public Works Department (PWD) or Regional Facilities Engineering Command (FEC) for approval of changes to real property via site approval, certification of the work and property classification, assistance with project development, and the identification of signing authorities and fund source. This certification or assistance also applies to any alterations, conversion, construction, repair, or equipment installation effort for minor/specific work orders, special projects, or MILCON projects. Contact the Capital Improvements Business Line (CIBL) for assistance with the latest design and building codes.
- Air Force. Consult AFCEC for all architectural and functional requirements; technical issues relating to fire, life safety, certification; and publication coordination. Consult HQ USAF/A4C for functional policies.
- Marine Corps. Consult with Marine Corps Installations Command (GF) Facilities and (G3) Fire and Emergency Services.

2-6.2 Other Considerations.

It is unlikely that a non-fire station facility would ever be converted to a fire station. However, should this need arise, evaluate the site and structure of the existing facility and its limitations with regard to the required functions of a fire station.

Consideration must be given to the adaptability of the existing facility to the intent of the fire station program. For instance, can the building accommodate the apparatus room/bays? Does it have site space for the vehicle turning radii? Does it meet the

higher structural requirements for an essential facility (Risk Category IV) and an inhabited building or billeting? If not, can it be economically upgraded? Whether planning a conversion, alteration, addition, or new construction, all the criteria in this UFC must be met by the resulting facility.

2-6.3 Sustainable Design.

The location of a facility can have a significant impact on achieving sustainable design rating points. (See paragraph 3-9 for more information on sustainable design and sustainable rating systems.) Evaluate issues such as brownfield redevelopment, potential building orientation, access to public transportation, and reuse of existing paving and hardscape when selecting a site.

2-7 ACCESSIBILITY.

In accordance with UFC 1-200-01, follow the Architectural Barriers Act (ABA) Accessibility Standards for DOD facilities.

2-8 SUSTAINABLE DESIGN.

Design fire stations per the requirements of UFC 1-200-02, *High Performance and Sustainable Building Requirements*.

2-9 HAZARDOUS MATERIALS.

2-9.1 Background Information.

DOD operates facilities that routinely utilize, or have utilized in the past, hazardous materials and chemicals that contain lead, cadmium, chromium, and other heavy metals. Operations and activities that can create an unsafe condition with regards to worker protection include (but are not limited to) manual demolition, scraping, grinding, heat-gun applications, power tooling with dust collection, application of corrosion-control materials, spray paint with lead/chromium (VI)/cadmium-based paints, burning, power tooling without dust collection, rivet busting, cleanup activities with dry abrasives, movement/removal of enclosures, abrasive blasting, welding, cutting, and burning on steel structures. When these operations occur, there are hazards associated with the generation of dust, debris, and fumes. The hazards and the controls required are dependent on the materials used.

2-9.2 Facility Design Requirements.

For facilities that will operate, or will continue to operate, utilizing hazardous materials and/or chemicals, comply with the Occupational Safety and Health Act (OSHA), American Conference of Governmental Industrial Hygienists (ACGIH) *Guide to Occupational Exposure Values* and *TLVs and BEIs*, DODI 6055.01, *DoD Safety and Occupational Health Program*, and DODI 6055.06. The requirements found in the OSHA regulations and DODIs may affect facility design requirements, which may

include (but are not limited to), separate toilets and washing/bathing areas for workers exposed to the hazard, change rooms, decontamination areas, break rooms, clothes-washing facilities, areas for controlled disposal of contaminated waste and work clothes, both local and general high-efficiency particulate air (HEPA) ventilation systems and filters, eyewash stations, and deluge showers. Facility areas utilizing these hazardous materials and/or chemicals must be designated as regulated areas whenever exposure can be expected to be in excess of the permissible exposure limit(s) (PEL) and must be demarcated from the rest of the workplace in a manner that establishes and alerts building occupants of the boundaries of the regulated area. Design facilities in a manner to allow OSHA-required air sampling and monitoring for the specific hazardous material in use. Design facilities to control these hazards below the standards set in the stated regulations.

Additionally, DODI 6055.01, Appendix 4, lists additional requirements for facilities that involve operations generating airborne dust, mist, debris, or aerosols containing lead, chromium (VI), or cadmium. These requirements include (but are not limited to) containment processes and methods to monitor effectiveness of housekeeping procedures, decontamination procedures, and engineering controls tailored to each facility.

2-10 WEATHER RESILIENCY.

Current guidance for critical public safety facilities recommends facilities in identified weather threat areas include features to ensure emergency responders can survive through the trans-event period and immediately deliver emergency response services in the post-event period. Refer to FEMA's *Operational Lessons Learned in Disaster Response* for specific guidance.

CHAPTER 3 GENERAL DESIGN CRITERIA

3-1 GENERAL.

References within this UFC to applicable criteria and codes are intended to assist the designer in compiling the required documents. These references are not intended to identify all that may apply. It is the responsibility of the designer of record to identify and comply with all required statutes.

Use UFC 1-200-01 for applicability of model building codes and referenced government criteria. UFC 1-200-01 identifies, through references, key unified facility criteria and requirements, including accessibility, antiterrorism, security, sustainability, safety, acoustics, discipline-specific, and building systems. See paragraph 3-6 for appropriate governing codes for building services.

3-1.1 Authorized Building Program.

A DD1391 funding document is developed for all new construction projects that establishes the project requirements and authorized building size. The designer can use the functional diagram in Figure 2-1 to create the logical flow and individual space allocations for approved functions within the facility; however, the design may not exceed the square footage allowances of the DD1391 or add functions in the facility if the functions are not authorized in the validated DD1391.

3-2 STRUCTURE.

Classify the entire facility as Risk Category IV in accordance with UFC 3-301-01, *Structural Engineering*. Calculate wind loadings for the apparatus bay as a "partially enclosed building."

If the facility includes 11 or more beds, classify it as billeting in accordance with UFC 4-010-01, *DoD Minimum Antiterrorism Standards for Buildings*. Ensure that anticipated utilization of the apparatus bay allows for its classification as low occupancy, design the vehicle doors for conventional loads, and provide structural isolation from any inhabited portions of the building in accordance with UFC 4-010-01.

3-2.1 Substructure.

Design the floor slab in the apparatus bay for appropriate wheel loads based on the heaviest type and size of vehicle anticipated to be parked therein.

3-2.2 Superstructure.

Where the length of the apparatus bay is sized to accommodate one vehicle parked in each stall, provide clear spans with no intermediate columns. With the approval of the fire chief, where the length of the apparatus bay is sized to accommodate two or more vehicles parked end-to-end in each stall, a single row of interior columns perpendicular to the stalls is permitted, provided these columns do not obstruct the vehicle lanes.

3-2.3 Fall Protection.

Provide an active fall protection system, approved by the fire chief and designed by a licensed professional engineer in accordance with 29 CFR 1926.502, *Fall protection systems criteria and practices*, and ANSI/ASSE Z359, *Fall Protection Code*, in each stall of the apparatus bay where work or maintenance on top of a parked vehicle is anticipated. Design the structure for the associated anchorage locations and loadings.

3-3 ARCHITECTURE.

Refer to UFC 3-101-01, *Architecture*, and comply with stated and cross-referenced requirements for architecture, with the following additions and exceptions for this facility type.

3-3.1 Stories.

Single-story structures are preferred for fire stations. Site constraints may drive the need for multi-story structures. If a multi-story structure is required, ensure the appropriate adjacencies are maintained so the required response times may be achieved. See paragraph 2-4 for more information on the required adjacencies.

3-3.2 Exterior.

Design the exterior to comply with current command and installation planning and design guidance. Also design for the local geographical and cultural environment. The fire station must present a cohesive architectural image. Create an attractive, functional theme that applies to the entire facility design, from the overall exterior architectural statement to the specific interior design elements. Reinforce continuity of space by space planning, building form, elevation, materials, and details.

3-3.2.1 Entrances.

Clearly identify the main fire station entrance to discourage visitors from entering the facility through an open apparatus bay door. In cold climates, provide a canopy (or a recess) at required egress doors to ensure doors can completely open without obstruction from snow and ice.

Provide separate entrances to the dorm area and the day room.

3-3.2.2 Exterior Finishes.

Provide durable and low-maintenance exterior finishes. Coordinate the exterior finishes with the Service-specific design standards noted in paragraph 3-4.2.

3-3.2.3 Apparatus Bay Fire-Rated Construction

Separate the lodging/rooming and administrative portions of the building from the apparatus bay and maintenance areas with a 1-hour fire barrier. Design this fire barrier to also prevent the passage of exhaust emissions.

3-3.2.4 Building Signage.

Building signage must provide clear directional and informational assistance. Mechanical, electrical, and/or utility room doors must have identifying signage to match other building signage. Design signage to comply with command and installation appearance plans (IAP).

3-4 INTERIOR DESIGN.

Construction and finishes (walls, floor, and ceiling) must support the cohesive image and theme of the facility as noted in paragraph 3-3.2. The living areas of the facility, such as the day room and the dorm rooms, must reflect a residential, non-institutional character.

Durability is extremely important when specifying materials for interior construction and finishes. Fire stations are occupied 24 hours a day, seven days a week, and heavy equipment is regularly handled throughout the facility. These conditions will lead to greater interior damage being incurred compared to many other facility types.

Provide a clear boundary between contaminated spaces (such as apparatus bay, protective clothing laundry, decontamination spaces, hose storage, and similar spaces where equipment and clothing are exposed on the emergency scene) and uncontaminated spaces (such as offices, classrooms, dayroom, dining, sleeping rooms). Personnel travel through/across the boundary is allowed, though provision at the boundary to permit at least hand-washing should be provided.

3-4.1 Interior Construction.

Provide blocking for all wall- or ceiling-mounted equipment and furnishings. Counters, casework, and cabinets must be of high-quality, durable construction. Specify Architectural Woodwork Institute (AWI) Premium or Custom for finishes per *AWI Standards*. Countertops must be solid surface/solid composite plastics. Specify 0.75-in. (20-mm) minimum thickness for plywood, plywood backing, and solid wood panels. Particleboard may not be used.

Finishes must be able to withstand frequent cleaning and must coordinate with the other finish materials. All interior glass must be tempered safety glass and mirrors must be constructed with break-resistant materials.

3-4.2 Finishes.

Finishes must take into account the intended uses and be highly durable. They must meet the requirements listed in NFPA 101, *Life Safety Code*, and UFC 3-120-10, *Interior Design*. Coordinate the interior (and exterior) design with Service-specific

standards or agencies. Comply with the following requirements throughout the entire facility:

- In moist climates, do not cover the inside of exterior walls with impervious materials such as mirrors or vinyl wall coverings. This is due to concern over mold development in the walls.
- Procure a high-quality, easy-to-maintain, durable carpet that provides a long-lasting appearance.
- For more information on finishes in specific areas, see the functional data sheets in Chapter 4.

3-4.3 Interior Signage.

Develop a comprehensive signage package that addresses both way-finding and definition of all spaces within the facility. Signage must reflect and complement the interior environment through colors, images, and materials used. Signage must be in accordance with UFC 3-120-01, *Design: Sign Standards*, and with command and installation appearance plans (IAP).

3-4.4 Window Treatments.

All windows and other glazed openings to the exterior of the building must be provided with horizontal blinds or solar shading systems as part of the construction project.

3-5 ACOUSTICS.

3-5.1 Sound Transmission Coefficient Ratings

The functional data sheets in Chapter 4 provide minimum sound transmission coefficient (STC) ratings for the appropriate spaces. Typical STC ratings range from 35 to 55 STC, depending on the space and its intended use. The design team must achieve the minimum required STC values by treating wall surfaces, wall openings, and the structure with sound-attenuating materials.

3-5.2 Outdoor Indoor Transmission Class

Refer to UFC 3-101-01 and comply with stated and cross-referenced requirements for building envelope requirements. UFC 3-101-01 provides minimum building façade sound isolation ratings utilizing the composite Outdoor Indoor Transmission Class (OITC) values necessary for determining the acoustic building envelope requirements. Typical OITC ratings range from OITC 25 to OITC 50, dependent upon interior background noise levels set as noise criteria (NC) ratings. Unless otherwise stated, design the building envelope and interior spaces to achieve the more stringent acoustic criteria where applicable.

3-5.3 Air Installations Compatible Use Zones

Per DODI 4165.57, *Air Installations Compatible Use Zones (AICUZ)*, when a fire station is located near the flightline, comply with the AICUZ noise reductions for the facility location. If an AICUZ map is not available for the location, an acoustical engineer must conduct an acoustical analysis to determine the exact type and extent of the additional acoustical treatments needed to address aircraft noise.

3-6 SERVICES.

3-6.1 Plumbing.

Design all building systems—such as domestic hot and cold water, sanitary and storm drainage, propane, fuel oil, or natural gas systems—to meet the requirements of local installation standards, criteria in UFC 1-200-01, and cross-referenced requirements therein.

Provide combination water fountain and water bottle-filling station wherever electric water coolers are required. Provide double check-valve backflow preventers on all water lines serving beverage machines, coffee brewers, and ice makers.

3-6.2 Heating, Ventilating, and Air Conditioning (HVAC).

Refer to UFC 1-200-01 and comply with stated and cross-referenced requirements for HVAC systems. Unless otherwise stated, design spaces to comply with comfort cooling and heating requirements of UFC 3-410-01, *Heating, Ventilating, and Air Conditioning Systems*.

HVAC systems will maintain a negative pressure relationship between yellow/red zones and green zones at all times. Yellow zones are the transition zones between red zones (exposed to carcinogens) and green zones (living/working spaces).

3-6.3 Fire Protection and Life Safety.

Refer to UFC 1-200-01 and comply with stated and cross-referenced requirements for fire protection, life safety, and mass notification systems.

3-6.3.1 Fire Protection System Requirements.

Protect the entire fire station throughout with an automatic fire suppression and voice evacuation fire alarm system regardless of building size and type of construction. Comply with the facility safety section of NFPA 1500, *Standard on Fire Department Occupational Safety, Health, and Wellness Program*, except as modified in this UFC.

3-6.3.1.1 Carbon Monoxide Detection.

Provide carbon monoxide (CO) detection as required per UFC 3-600-01, *Fire Protection Engineering for Facilities*. Monitor, power, and provide notification for the CO detection from the fire alarm system, also as required per UFC 3-600-01.

3-6.3.1.2 Area Smoke Detection.

Provide smoke detection in sleeping rooms and sleeping room access hallways. Do not provide smoke detection in the apparatus bay or other areas where exhaust fumes may be present. Enable the general building evacuation signal upon activation of any smoke detector.

3-6.3.2 Retractable Partitions.

Where one or more retractable partitions are provided, fire suppression and fire alarm devices will be provided to protect the space in accordance with UFC 3-600-01 with the partitions in the open or closed position.

Means of egress inclusive of the number of exit access doors and door swing must be in accordance with NFPA 101 requirements with the partitions in the open or closed position.

3-6.4 Electrical.

Refer to UFC 1-200-01 and comply with stated and cross-referenced requirements for electrical systems. Also comply with the following fire station-specific requirements.

3-6.4.1 Lighting.

See Chapter 4 for light level and control requirements that are exceptions to or in addition to the requirements referenced above. Refer to UFC 3-530-01, *Interior and Exterior Lighting Systems and Controls*, for lighting levels not specified in Chapter 4 or in the requirements referenced above.

3-6.4.2 Emergency Power.

Provide 100 percent emergency generator back-up power for all stations. For satellite stations, provide emergency back-up power, at a minimum, for the following spaces/systems:

- Apparatus bay lighting and doors
- Watch desk/dispatch and all associated equipment
- IT room systems related to the dispatch and communication functions
- HVAC related to IT room support

- Lighting

Refer to the functional data sheets in Chapter 4 for uninterruptible power supply (UPS) requirements for applicable spaces. Provide on-site fuel storage for emergency generator back-up power for a 72-hour period. If fuel contracts are secured, the requirement for on-site fuel storage can be reduced to a 24-hour period.

3-6.4.3 Telecommunication Systems.

See Chapter 4 for outlet locations.

3-6.4.4 Television Systems.

See Chapter 4 for outlet locations.

3-6.4.5 Electronic Security Systems (ESS).

Design the ESS in accordance with UFC 4-021-02, *Electronic Security Systems*. See Chapter 4 for locations and additional criteria.

3-6.4.6 Access Control Systems.

Provide card readers with keypads at entries to building.

3-6.4.7 Closed-circuit Television (CCTV).

Provide the infrastructure for a CCTV system to meet operational requirements.

CCTV cameras will be located to monitor the apparatus bays, vehicle maintenance bay, and the main entrance to the facility. CCTV monitors will be located at either the watch desk or dispatch, if provided. See Chapter 4 for additional information.

3-6.4.8 Intercommunication Systems.

See Chapter 4 for locations and additional criteria.

3-6.4.9 Firefighter Alert System.

Firefighter alert systems must be provided in accordance with NFPA 403, *Standard for Aircraft Rescue and Fire-Fighting Services at Airports*, and NFPA 1221, *Standard for the Installation, Maintenance, and Use of Emergency Services Communications Systems*, for emergency response facilities (ERF). See general requirements below and Chapter 4 for additional information.

General Requirements:

- The system must provide audible announcements from defined message format to follow initial audible alert.

- Consult with component's dispatch leadership for specific technology used by computer aided dispatch (CAD)/records management system (RMS) for information transfer. This may include Web services.
- The system must provide fire station and EMS alerting with ramped heart saver tones no greater than 5 seconds from initiation.
- The system must provide fire station and EMS alerting with amplitude lighting no greater than 5 seconds from initiation.
- Fire station and EMS alerting will be provided with audible announcement to pubic address (PA) system no greater than 5 seconds from initiation.
- Fire station and EMS alerting will be provided with audible announcement to radios no greater than 5 seconds from initiation.
- Fire station and EMS alerting will be provided with a digital resource display board.
- The system must provide audible announcements from defined message format to follow initial audible alert.
- The system must provide a digital light status bar.
- The system must provide rip-and-run printers for incident and route information where required by the fire chief.
- The system must allow for zoning of audible and visual alert notification.
- Provide simultaneous light and audible control inside and outside to alert on-duty staff of emergencies.
- Provide simultaneous light and audible control for the following spaces when the firefighter alert system is activated: dorm room dedicated alert lights, corridor lights from dorm rooms to the apparatus bay, and the apparatus bay lights.

3-6.4.10 Lightning Protection System.

Install lightning protection systems for new facilities and existing facilities modifications in accordance with NFPA 780, *Standard for the Installation of Lightning Protection Systems*.

3-7 SITE WORK.

In addition to the criteria established in UFC 1-200-01 and the cross-references included therein, comply with the following additions or exceptions for this facility type.

Organize the site to be compatible with the site planning and style of adjacent existing structures. Locate the building to reflect local climatic conditions. For example, provide protection from prevailing winds and glare and orient operable windows to take advantage of summer breezes. Locate the building to take advantage of passive solar heating and day lighting.

3-7.1 Landscaping.

Select plants that are easy to maintain and enhance the visual quality of the facility in all seasons. Indigenous species are preferred. Accentuate main entrances to the facility with plant materials and specialty paving (precast concrete or brick pavers). Assess the growth characteristics of selected plant material when evaluating line-of-sight requirements to either flightline pavements or facilities. Comply with UFC 3-201-02, *Landscape Architecture*, and local installation landscape standards. For the Air Force, also refer to the applicable major command and installation standards.

Plan for sustainable design issues when designing the landscape. Select plants that require little to no additional water beyond normal rainfall. Avoid plants that require an irrigation system or evaluate a gray water or storm water irrigation system. Due to the proximity to the flightline for ARFF facilities, select trees and shrubs that produce little or no debris. Avoid using plants that produce fruits or nuts that may attract unwanted animals and birds to the airfield environs.

3-7.2 Firefighting Vehicle Access Drives.

Ensure that dimensions and layouts of access roadways and service entrances accommodate specific vehicle types anticipated for fire station operations. Provide apparatus ramps constructed of portland cement concrete pavement designed to support the anticipated vehicle weight.

Design the facility and site to permit drive-through apparatus bays unless restricted by the site and/or flightline. If the vehicle access drives are sloped, either for drainage or due to the site profile, ensure the slope angle is low enough to be easily navigated by the firefighting apparatus and the driver can maintain good visibility of the area around his or her vehicle. Provide signage and/or striping explicitly prohibiting unauthorized vehicles on the access drives and apparatus ramps. Do not install gates or other access control measures that would impede emergency response.

3-7.3 Parking and Other Access Drives.

Provide parking based on the total positions assigned, including eight- and 24-hour shift positions and reservists (if appropriate). Provide visitor parking separate from staff parking, with visitor parking spaces totaling approximately 25 percent of those required for staff. If possible, do not allow access drives to staff and public parking to cross the vehicle access drive out of the apparatus bay. Provide signage and/or striping to correlate with any parking or access drive restrictions or authorizations. Locate parking areas so they do not dominate the main entrance and public image of the facility. Provide a service drive adjacent to the mechanical room. Comply with UFC 3-201-01, *Civil Engineering*, and UFC 4-010-01.

3-7.4 General Site Lighting.

Refer to UFC 1-200-01 and comply with stated and cross-referenced requirements for electrical systems. If the facility is near a flightline, provide site lighting that will not interfere or be a distraction to aircraft movement at night. Comply with UFC 3-530-01. **\1\ /1/**

3-8 SUSTAINABLE DESIGN.

Requirements for sustainability apply to construction, redesign, renovation, and modernization projects. Comply with UFC 1-200-02.

CHAPTER 4 SPECIFIC DESIGN CRITERIA

4-1 INTRODUCTION.

This chapter identifies the specific design needs for each functional area as outlined in the space program. Tables 4-1 through 4-33 provide these data in a standard functional data sheet format.

The interior construction specialties, equipment, and furnishings criteria provided in these tables are broken down as follows:

- Casework/Built-in Equipment. This includes anything physically attached or plumbed to the building, such as counters, cabinets, casework, toilet accessories, window treatments, laundry machines, and marker boards.
- Furnishings, Fixtures, and Equipment (FF&E). This includes contractor-furnished, contractor-installed loose items such as desks, tables, chairs, and bookshelves.
- User-Provided Equipment. This includes all government-furnished, government-installed items, which are typically limited to office equipment such as computers, printers, and copiers. Flat panel display; if mounted, flat panel display mount is a built-in equipment item.

Table 4-1 Apparatus Bay

Description/ Usage	The apparatus bays house the fire protection vehicles. Drive-through bays are preferable. All bays must accommodate the latest and largest structural and ARFF vehicles. Each bay of the apparatus room/bays must include the required support utilities (drops) for vehicles such as exhaust, compressed air, hot and cold water, lighting, and power. Back to back bay arrangement is not permitted.
Min. Ceiling Ht.	14 ft (4.26 m) minimum. Note: 14 ft (4.26 m) clearance is required with bay doors in open and closed positions.
Finishes	**Walls**. Concrete masonry units (CMU). Provide epoxy paints on all wall surfaces. **Floor**. Provide either a sealed concrete surface or a 1-part or 2-part water-based epoxy concrete floor paint, in a slip-resistant, semi-gloss, light color finish. Final color selection to be coordinated with user and installation. Apply a concrete etcher to thoroughly clean concrete surface and a bonding primer for proper adhesion prior to applying epoxy finish. Slope floor to trench drains. **Ceiling**. Ceiling not required; however, provide finishes for exposed structure. Coordinate mechanical, electrical, and plumbing components. None of the ceiling components can be located below minimum ceiling height.
Plumbing	Provide minimum 3-in. (75-mm) -diameter water service with 2.5-in. (62-mm) -diameter National Standard Threads ball-valve outlet to each vehicle. Provide a combination eye/face wash and drench shower. Provide foot-operated mop sink with mop hanging rack. Provide one standard hot and cold water hose bibb with mounted hose reel (100 ft [30.5 m] capacity) for every two truck bays. Provide floor trench drains parallel to the centerline of each vehicle. All apparatus room/bays drains must connect to an **1**\oil water separator or where the Installation has pretreatment or treatment methods in place in accordance with their permitted allowances, an approved sanitary sewer system. Coordinate with Installation EV staff for information on existing pretreatment or treatment methods and permitted allowances. /**1**/ If an exterior wash area is provided, size the separator for the total volume and connect the exterior drain to this separator. Provide compressed air with self-retracting reels at each vehicle bay. Provide SCBA air connection.
HVAC	Design heating for 68 °F (20 °C) dry bulb. Local installations may decide to forgo heating in areas without risk of freezing. Provide gas-fired radiant heating if natural gas or propane is available. Local base or post authorities may choose different heating systems on a case-by-case basis. Provide ventilation to cool bay to within 10 °F (6 °C) of design outdoor temperature. The Services will not air condition the apparatus bay unless through exceptions. If approved, systems used for conditioning will be determined on a case-by-case basis. Consider climatic conditions, energy costs, and sustainability impacts for exceptions and system selections. For Army projects, refer to TI-800-1 for appropriate exceptions. For Navy projects: Local base authorities within the Naval Forces Central Command region may choose to air-condition the apparatus bay; air-conditioning of the apparatus bay is not permitted for any other regions. Maintain apparatus bay air quality within the strictest established regulatory guidelines for volatile organics, nitrogen oxide, sulfur dioxide, carbon monoxide, particulates, diesel exhaust particulates established by: • NIOSH (National Institute for Occupational Safety and Health) REL (recommended exposure limit/10-hour time-weighted average), *NIOSH Pocket Guide to Chemical Hazards*

	• OSHA (Occupational Safety and Health Administration) PELS (permissible exposure limit/8-hour time-weighted average), *Annotated Permissible Exposure Limits (PELS) Tables* • ACGIH threshold limit value (average over 8-hour work shift)/short-term exposure limit (over 15-minute period), *Guide to Occupational Exposure Values* and *TLVs and BEIs* • NFPA 1500 Per the International Mechanical Code (IMC), the apparatus bay will be classified as an "enclosed parking garage." The apparatus bay ventilation system will operate continuously and comply with all other applicable requirements of IMC-2015 Sections 403, 404, 502.13, and 502.14 or current IMC equivalent. Minimum ventilation rate will be the greater of the requirements of IMC-2015 Section 404.2 or current IMC equivalent and ASHRAE 62.1, “Transportation Waiting". Exhaust and ventilation systems will be designed and operate to keep apparatus bay negatively pressurized with respect to adjacent occupiable spaces at all times. Provide carbon monoxide and nitrogen dioxide detectors. Such detectors will be listed in accordance with UL 2075 and installed in accordance with their listing and the manufacturer's instructions. Provide air contaminant detector systems with audible and visual alarms given at required levels and be easily identifiable by all occupants within the apparatus bay. Force HVAC systems to operate when contaminants are sensed and continue to operate until safe conditions are present in the apparatus bay. Provide an air-cleaning system for elimination of fire apparatus vehicle exhaust in compliance with NFPA 1500, the IMC, and ASHRAE 62.1. The apparatus bay air-cleaning system will be designed to remove, treat or eliminate particulates, VOCs, and gaseous exhaust contaminants from the apparatus bay. Air-cleaning system will automatically operate on vehicle operation and operate until apparatus bay air has been fully treated. For Navy and Marine Corps projects: If engines are operated inside the apparatus bay other than to move apparatus into and out of the bay then also provide a direct vent system that connects directly to the fire apparatus exhaust and evacuates vehicle exhaust directly to the outdoors. The direct vent system can be either an automatic-type Fire Apparatus Vehicle Exhaust Removal System (FAVERS) or a manually operated hose-type exhaust system operating whenever equipment is running in the bay. A make-up air system will supply heated air to the apparatus bay. Make-up air system will be designed and controlled to provide make-up air for all sources of exhaust installed within the apparatus bay. Make-up air should be distributed to minimize drafts and be introduced above apparatus level since diesel exhaust is heavier than air. In this way, the make-up air flow downward will assist in pushing the exhaust fumes out the apparatus bay doors when open. Provide a floor radiant heating element at each bay door to prevent the door from freezing to the pavement at the local installation's discretion.
Fire Protection	Provide system per paragraph 3-6.3.
Power	Provide outlets per paragraph 3-6.4. Locate all outlets at 36 in. (900 mm) above finished floor (AFF). Provide one self-retracting electric drop cord for each parking area. Provide backup power sized to provide full unobstructed operation capability of the apparatus bays. Provide power to each retractable bay door.

Lighting	Provide lighting system per paragraph 3-6.4. Provide doors with a signaling system to indicate fully raised doors. A red/green indicator must be located on the driver's side. Coordinate indicator mounting height at viewable distance from driver position in planned truck for each bay.
Communication	**CCTV**. Provide interior and exterior outlets located to provide coverage of the apparatus bay and facility's main entrance. **CATV/Internal Video**. None required. **PA/Audio**. Provide speakers and horns with visual element. **Telephone**. Provide one line with internal two-way communication. **Data**. Provide data drops as required by equipment. **Security**. None required. **Firefighter Alert System**: Fire station and EMS alerting will be provided with audible announcement (to fire station PA systems and radios), ramped heart saving tones, and amplitude lighting with a digital resource display board no greater than 5 seconds from initiation.
Casework/Built-in Equipment	None required.
Furnishings Fixtures & Equipment (FF&E)	Ice machine (with fresh water dispenser). Locate in direct adjacency to apparatus bay. Install in a clean area that allows adequate space for safe handling of ice and does not present a risk for ice contamination. Provide storage cabinet for cleaning supplies near mop sink.
User-provided Equipment	CCTV cameras.
Special Requirements	Provide 14 ft by 14 ft (4.3 m by 4.3 m) apparatus bay doors, with electric eye, and/or fixtures and automatic reverse device. For ARFF bays, provide 18 ft by 18 ft (5.5 m by 5.5 m) apparatus bay doors as recommended by NFPA 403. Even if ARFF vehicles are only intended to be housed on one side of a double bay, provide the 18 ft by 18 ft (5.5 m by 5.5 m) doors on both sides to permit drive through and allow flexibility of use. Provide manual means to open doors in case of power failure. If solid door panels are used, provide insulated doors. Provide doors with radio-operated closing devices that can be activated from the vehicle. Ensure both the internal floor slope and the approach drive slope allow the fire protection vehicles to transition into and out of the apparatus bay without bottoming-out or impeding driver sightlines. Provide fall protection system per paragraph 3-2.

Table 4-2 PPE Gear Storage

Description/ Usage	The personal protective equipment (PPE) area provides storage for firefighters' protective gear. A well-ventilated locker is assigned to each member of the firefighting crew. Provide floor area in front of each locker as required for easy access during emergencies. Provide as ventilated space separate from apparatus bay. For Army only: PPE lockers are permitted to be located within and open to the apparatus bay.
Min. Ceiling Ht.	8 ft (2.4 m) minimum.
Finishes	**Walls.** CMU. Provide a low-maintenance, durable finish such as industrial latex or epoxy paints on all wall surfaces. **Floor.** Provide a slip-resistant, sealed concrete surface sloped to the drain. **Ceiling.** Provide durable ACP or GWB ceiling with industrial latex or epoxy paint.
Plumbing	Provide a floor drain. If part of apparatus bay, ensure hose bibb is available within 20 feet (6.1 m).
HVAC	Provide a system per paragraph 3-6.2. Provide exhaust to maintain space negatively pressurized relative to occupiable spaces. Exhaust system must be separate from occupiable space exhaust. For Army projects only, if PPE gear storage is incorporated into the apparatus bay, size general space ventilation system to account for gaseous emissions from storage gear.
Fire Protection	Provide system per paragraph 3-6.3.
Power	Provide outlets per paragraph 3-6.4.
Lighting	Provide system per paragraph 3-6.4.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Provide speakers and horns with visual element. **Telephone.** None required. **Data.** None required. **Security.** None required.
Acoustics	No special provisions required.
Casework/Built-in Equipment	Provide open 24 in. by 24 in. by 6 ft (600 mm by 600 mm by 1800 mm) high wire mesh metal locker that includes shelves and clothes hook. Lockers located along side walls.
Furnishings Fixtures & Equipment (FF&E)	Option to provide moveable gear lockers in lieu of fixed units. Provide work bench surface for personnel to conduct self-inspection of gear, take gear out of service for washing and return/place new PPE in service.
User-provided Equipment	None required.
Special Requirements	Locker layout must permit free air circulation around and throughout clothing. Layout must account for storage of additional spare equipment items. Provide extended-height door kick plates (min. 36 in. [914 mm]). Provide vision panel in door to assist in prevention of collision as personnel are frequently simultaneously moving in both directions through this doorway.

Table 4-3 Hose Storage

Description/ Usage	This area provides for storage of hoses. Hoses are rolled and stored on fixed or mobile storage racks.
Min. Ceiling Ht.	8 ft (2.4 m) minimum.
Finishes	**Walls**. CMU. Provide a low-maintenance, durable finish such as industrial latex or epoxy paints on all wall surfaces. **Floor**. Provide a slip-resistant, sealed concrete surface sloped to floor drain. **Ceiling**. None required.
Plumbing	Provide a floor drain. Ensure a hose bibb is available within 20 feet (6.1 m).
HVAC	Provide a system per paragraph 3-6.2. Ensure space is well ventilated.
Fire Protection	Provide system per paragraph 3-6.3.
Power	Provide outlets per paragraph 3-6., and dedicated outlets required to support drying equipment (if provided).
Lighting	Provide system per paragraph 3-6.4.
Communication	**CCTV**. None required. **CATV/Internal Video**. None required. **PA/Audio**. Provide a speaker. **Telephone**. None required. **Data**. None required. **Security**. None required.
Casework/Built-in Equipment	Fixed racks for roll-up hose storage.
Furnishings Fixtures & Equipment (FF&E)	Optional to provide movable racks for roll-up hose storage.
User-provided Equipment	Hoses and hose drying oven when required due to climatic conditions.
Special Requirements	None required.

Table 4-4 SCBA Maintenance/Compressor Room

Description/ Usage	The self-contained breathing apparatus (SCBA) maintenance room is used for the maintenance and minor repair of SCBA equipment. It includes a work bench, task lighting, and shelving for storage of parts and equipment. The room also contains a mask pressure testing machine. Separate but directly adjacent is the dedicated SCBA compressor room, which houses the main compressor unit used to charge the SCBA tank with filtered air. Ensure direct access between these rooms. This space must include sound attenuation. A compressed air supply line is provided from this room to the SCBA maintenance room and the apparatus bay.
Min. Ceiling Ht.	8 ft (2.4 m) minimum.
Finishes	**Walls**. CMU. Provide a low-maintenance, durable finish such as industrial latex or epoxy paints on all wall surfaces. **Floor**. Provide a slip-resistant, sealed concrete surface. **Ceiling**. None required.
Plumbing	Provide SCBA compressor and bottle filling stations. Provide compressed air lines to apparatus bay and SCBA maintenance room. Provide a floor drain for condensate. SCBA compressor air intake air must be separated from potential sources of contamination for SCBA compressor to provide Grade-E air as defined by ANSI/CGA G-7.1. Adequate maintenance and access clearance will be provided around SCBA compressor. Provide utility sink in SCBA maintenance room.
HVAC	Provide a system per paragraph 3-6.2. Provide positive pressure ventilation to prevent contamination.
Fire Protection	Provide system per paragraph 3-6.3.
Power	Provide outlets per paragraph 3-6.4.
Lighting	Provide system per paragraph 3-6.4. In the SCBA maintenance room, provide task lighting at the work/service bench at 50 fc (500 lux).
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. **Telephone.** Provide one line with internal two-way communication. **Data.** Provide data drops as required by equipment. **Security.** None required.
Casework/Built-in Equipment	Provide stationary containment fill station for safety of the occupant during fill operation.
Furnishings Fixtures & Equipment (FF&E)	Provide industrial grade 24 in. (610 mm) deep minimum work bench and storage shelving. Provide spare parts bin. Provide workstation as applicable with installation requirements.
User-provided Equipment	Provide mask pressure testing machine and scales.
Special Requirements	Layout must account for storage of additional spare equipment items.

Table 4-5 Protective Clothing Laundry

Description/ Usage	Protective clothing laundry room is utilized to wash and disinfect firefighters' protective clothing/gear. The room must accommodate large commercial-grade washers and dryers and a drip-dry rack. Locate room with direct access to the exterior, equipment maintenance/wash/ disinfection room, PPE gear storage, and apparatus bay.
Min. Ceiling Ht.	8 ft (2.4 m) minimum.
Finishes	**Walls**. CMU. Provide a low-maintenance, durable finish such as epoxy paints on all wall surfaces. **Floor**. Provide a slip-resistant, sealed concrete surface sloped to floor drain. **Ceiling**. Provide durable, moisture-resistant ACP or GWB ceiling.
Plumbing	Provide hot and cold water supply and an open-end drain to each washer. Provide hot and cold water supply and drain for laundry/utility sink. Provide a floor drain.**1**\ /**1**/ . Refer to NFPA 1581 for more information.
HVAC	Provide a system per paragraph 3-6.2. Exhaust per UFC 3-410-01 and negatively pressurize room. Provide direct vents to the outside for each dryer.
Fire Protection	Provide system per paragraph 3-6.3. Regardless of size, enclose the laundry room with a 1-hour fire barrier.
Power	Provide outlets per paragraph 3-6.4.
Lighting	Provide system per paragraph 3-6.4.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. **Telephone.** None required. **Data.** None required. **Security.** None required
Acoustics	No special provisions required.
Casework/Built-in Equipment	Large, high-capacity, industrial extractors and dryers (soft mount and programmable controls) that comply with NFPA 1851 and NFPA 1581. (NFPA 1581 requires commercial models of washers and dryers to be front-loading to prevent agitator damage to clothing). Provide one additional dryer per extractors. Extractors must be mounted on concrete foundations. Provide a stainless-steel laundry-folding table. Provide stainless-steel laundry/utility sink. Provide wall-mounted hanging racks.
Furnishings Fixtures & Equipment (FF&E)	Provide workstation and workbench per installation requirements.
User-provided Equipment	None required.
Special Requirements	None required.

Table 4-6 Equipment Maintenance/Wash/Disinfection

Description/ Usage	The maintenance area is used for the minor repair and maintenance of firefighters' equipment. Provide a work bench with lighting and storage. The wash/disinfection area is located adjacent to the maintenance area. It includes a wash-off area where incoming equipment can be washed, desalinated, and dried. When fire trucks return from a fire or other event, equipment is brought into this area for cleaning and disinfection. The equipment is taken from the truck directly to the wash and disinfection area prior to the truck's entry into the apparatus bay. Provide direct access to exterior.
Min. Ceiling Ht.	8 ft (2.4 m) minimum.
Finishes	**Walls**. CMU. Provide a low-maintenance, durable finish such as industrial latex or epoxy paints on all wall surfaces. **Floor**. Provide a slip-resistant, sealed concrete surface. **Ceiling**. Provide durable moisture-resistant ACP or GWB ceiling.
Plumbing	In the wash/disinfection area, provide floor mop sink with hose and spray nozzle. Provide a three-compartment stainless-steel sink and a drip dryer rack.**1**\ Connect all drains to an approved sanitary sewer or septic system. Coordinate with Installation EV staff to determine if the local pretreatment program requires the use of an oil water separator. /**1**/ Provide compressed air supply to both wash and maintenance rooms. Provide floor drain in maintenance area.
HVAC	Provide a system per paragraph 3-6.2. Provide exhaust to negatively pressurize both rooms.
Fire Protection	Provide system per paragraph 3-6.3.
Power	Provide outlets per paragraph 3-6.4.
Lighting	Provide system per paragraph 3-6.4. Provide 50 fc (500 lux) task lighting at work/service bench.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. **Telephone.** Provide one line with internal two-way communication. **Data.** None required. **Security.** None required.
Acoustics	No special provisions required.
Casework/Built-in Equipment	Provide 3-compartment stainless-steel laundry/utility sink and 8 ft by 4 ft (2.4 m by 1.2 m) stainless-steel work table for wash/disinfection space.
Furnishings Fixtures & Equipment (FF&E)	Provide industrial grade 24 in. (610 mm) deep minimum work bench with storage shelving and spare parts bins. Provide hanging racks and open shelf storage units.
User-provided Equipment	None required.
Special Requirements	None required.

Table 4-7 EMT Storage and Medical Storage Cabinet

Description/ Usage	The EMT storage area is for storage of basic first aid supplies. It must be directly adjacent to the apparatus bay. The space must be fully conditioned. The medical storage cabinet is often a cabinet or subspace within the EMT storage area and is for storage of drugs, needles, and other restricted medical supplies. Access to EMT storage is restricted and controlled to prevent theft and abuse of controlled substances.
Min. Ceiling Ht.	8 ft (2.4 m) minimum.
Finishes	**Walls**. Provide CMU or GWB wall with a low-maintenance, durable finish such as industrial latex paint. **Floor**. Provide low-maintenance resilient sheet or tile flooring material with rubber base. **Ceiling**. Provide ACP ceiling.
Plumbing	None required.
HVAC	Provide a system per paragraph 3-6.2.
Fire Protection	Provide system per paragraph 3-6.3.
Power	Provide outlets per paragraph 3-6.4.
Lighting	Provide system per paragraph 3-6.4.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** None required. **Telephone.** None required. **Data.** None required. **Security.** Provide electric cipher lock with remote push-button release and manual key override if narcotics/controlled substances are to be stored in this location.
Acoustics	No special provisions required.
Casework/Built-in Equipment	Provide wall (or free-standing FF&E) shelving units.
Furnishings Fixtures & Equipment (FF&E)	Provide a lockable cabinet for EMT storage to store drugs and other restricted supplies. Provide lockable medical refrigerator.
User-provided Equipment	None required.
Special Requirements	Provide a keyed lock set at the access point to the space.

Table 4-8 HAZMAT/CBRNE Equipment Storage

Description/ Usage	HAZMAT/CBRNE equipment storage is a dedicated storage room housing only equipment classified for use with hazardous materials. Provide floor and open shelf storage areas.
Min. Ceiling Ht.	8 ft (2.4 m) minimum.
Finishes	**Walls**. CMU. Provide a low-maintenance, durable finish such as industrial latex paint. **Floor**. Provide a sealed concrete surface. A non-skid, low-maintenance traffic coating may also be acceptable. **Ceiling**. None required.
Plumbing	Provide compressed air with self-retracting hose reels at the work bench.
HVAC	Provide a system per paragraph 3-6.2. Provide exhaust to negatively pressurize room.
Fire Protection	Provide system per paragraph 3-6.3.
Power	Provide outlets per paragraph 3-6.4.
Lighting	Provide system per paragraph 3-6.4.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. **Telephone.** None required. **Data.** None required. **Security.** None required.
Acoustics	No special provisions required.
Casework/Built-in Equipment	Provide heavy-duty hanging racks for HAZMAT suits.
Furnishings Fixtures & Equipment (FF&E)	Provide industrial and large-item storage shelving units.
User-provided Equipment	None required.
Special Requirements	None required.

Table 4-9 Agent Storage

Description/ Usage	Agent storage can be integral to the fire station building or detached. It must be located with access to the drive leading into the apparatus bay or access within the apparatus bay for ease of loading and unloading of firefighting agents.
Min. Ceiling Ht.	8 ft (2.4 m) minimum.
Finishes	**Walls**. CMU or metal stud construction. If metal stud construction, provide plywood sheathing for protection. Provide paint finish to plywood. **Floor**. Provide a sealed concrete surface. **Ceiling**. None required.
Plumbing	None required.
HVAC	Heating and cooling only as needed by the stored agent's MSDS temperature requirements. Maintain a minimum temperature of 50 °F (10 °C) or per stored agent's MSDS temperature requirements, whichever is higher.
Fire Protection	Provide system per paragraph 3-6.3.
Power	Provide outlets per paragraph 3-6.4.
Lighting	Provide system per paragraph 3-6.4.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** None required. **Telephone.** None required. **Data.** None required. **Security.** None required.
Acoustics	No special provisions required.
Casework/Built-in Equipment	None required.
Furnishings Fixtures & Equipment (FF&E)	None required.
User-provided Equipment	None required.
Special Requirements	Provide double or overhead-type exterior doors. Provide insulated doors in locations where required by climatic conditions. Layout must account for storage of additional spare equipment items.

Table 4-10 Spare PPE Gear Storage

Description/ Usage	This space serves to store extra PPE gear for all assigned firefighters and reservists currently not on duty. The space includes gear lockers with an open shelving storage system.
Min. Ceiling Ht.	8 ft (2.4 m) minimum.
Finishes	**Walls**. CMU. Provide a low-maintenance, durable finish such as industrial latex or epoxy paints on all wall surfaces. **Floor**. Provide a sealed concrete surface. A non-skid, low-maintenance traffic coating may also be acceptable. **Ceiling**. None required.
Plumbing	None required.
HVAC	Provide a system per paragraph 3-6.2. Provide exhaust to maintain space negatively pressurized relative to occupiable spaces. Exhaust system must be separate from occupiable space exhaust.
Fire Protection	Provide system per paragraph 3-6.3.
Power	Provide outlets per paragraph 3-6.4.
Lighting	Provide system per paragraph 3-6.4.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. **Telephone.** None required. **Data.** None required. **Security.** None required.
Acoustics	No special provisions required.
Casework/Built-in Equipment	Provide lockable 24 in. by 24 in. by 72 in. (600 mm by 600 mm by 1800 mm) high wire mesh metal lockers that include shelves and clothes hooks.
Furnishings Fixtures & Equipment (FF&E)	Option to provide portable gear lockers in lieu of fixed units.
User-provided Equipment	None required.
Special Requirements	Locker layout must permit free air circulation around and throughout clothing.

Table 4-11 Decontamination Room

Description/ Usage	The decontamination room provides showers and lockers for firefighters to decontaminate themselves prior to entering the living portion of the fire station. Space must be accessible/combined with the transition zones within the apparatus bay. For Army only: As required by the installation's mission, it is optional to utilize this space as "non-flightline fire extinguisher inspection, maintenance and storage." The non-flightline fire extinguisher maintenance and storage includes an indoor storage/maintenance room and possibly an outdoor storage area. The indoor storage/maintenance room accommodates a work bench with lighting to perform maintenance and service of extinguishers, safety cage, scale, recharge kit, and parts storage bins. Provide open shelving for storage of extinguishers. The outdoor storage area is covered and enclosed with a secured screen. This may be combined with the flightline fire extinguisher maintenance and storage area and made as one space with no dividing walls.
Min. Ceiling Ht.	8 ft (2.4 m) minimum.
Finishes	**Walls**. CMU. Provide a low-maintenance, durable finish such as industrial latex or epoxy paints on all wall surfaces. **Floor**. Provide a slip-resistant, sealed concrete surface. **Ceiling**. None required.
Plumbing	Provide a hose bibb and floor drain. Provide emergency eye wash station. Provide utility sink. Provide shower. Connect all drains to **1**\ an approved sanitary sewer or septic system. Coordinate with Installation EV staff to determine if the local pretreatment program requires the use of an oil water separator. /**1**/ For Army fire extinguisher maintenance only: Provide compressed air with self-retracting hose reels at the work bench.
HVAC	Provide a system per paragraph 3-6.2. Exhaust space per UFC 3-410-01 and to maintain negative pressure relationship to occupiable areas. Exhaust system must be separate from occupiable space exhaust.
Fire Protection	Provide system per paragraph 3-6.3.
Power	Provide outlets per paragraph 3-6.4.
Lighting	Provide system per paragraph 3-6.4. For Army fire extinguisher maintenance only: Provide 50 fc (500 lux) task lighting at work/service bench.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. **Telephone.** Provide one line with internal two-way communication. **Data.** For Army fire extinguisher maintenance only: Provide quad outlet at work bench and in locations where required to accommodate equipment. **Security.** None required.
Acoustics	No special provisions required.
Casework/Built-in Equipment	Provide bench and lockers.
Furnishings Fixtures & Equipment (FF&E)	For Army fire extinguisher maintenance only: Provide industrial-grade 24 in. (610 mm) minimum work bench, storage shelving, spare parts bin, and flammable storage locker.

User-provided Equipment	Floor scale for Army only.
Special Requirements	For Army fire extinguisher maintenance only: Provide double leaf doors to exterior. Locate access to fire extinguisher maintenance and storage away from apparatus bay exterior circulation.

Table 4-12 Fire Extinguisher (Flightline) Maintenance and Storage

Description/ Usage	The fire extinguisher maintenance and storage includes two parts: outdoor storage and indoor storage/maintenance room. The indoor storage/maintenance room accommodates a work bench with lighting to perform maintenance and service of extinguishers, safety cage, scale, recharge kit, and parts storage bins. The outdoor storage area is covered, enclosed with a secured screen, and accommodates tank recovery, spare tanks, and spare gaseous agent re-servicing tanks. This may be combined with the non-flightline fire extinguisher maintenance and storage area and made into one space with no dividing walls. For Army only: This space can be substituted for additional PPE gear storage as required by the installation.
Min. Ceiling Ht.	8 ft (2.4 m) minimum.
Finishes	**Walls**. CMU. Provide a low-maintenance, durable finish such as industrial latex or epoxy paints on all wall surfaces. **Floor**. Provide a slip-resistant, sealed concrete surface. **Ceiling**. None required.
Plumbing	Provide a hose bibb and floor drain. Provide an emergency eye wash station in maintenance room. Provide utility sink. Provide compressed air with self-retracting hose reels at the work bench.
HVAC	Provide a system per paragraph 3-6.2. Exhaust space per UFC 3-410-01 and to maintain negative pressure relationship to occupiable areas.
Fire Protection	Provide system per paragraph 3-6.3.
Power	Provide outlets per paragraph 3-6.4.
Lighting	Provide system per paragraph 3-6.4. Provide 50 fc (500 lux) task lighting at work/service bench.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. **Telephone.** Provide one line with internal two-way communication. **Data.** Provide quad outlet at work bench and in locations where required to accommodate equipment. **Security.** None required.
Acoustics	No special provisions required.
Casework/Built-in Equipment	Provide cylinder for extinguishing agent recovery (if halon is used, accommodate a 1500 lb [680 kg] cylinder). Place the agent recovery tanks outside the exterior wall of this room and connect via utility lines to a discharge point inside the room. If this approach is taken, provide a remote gauge in the room that displays the tank's fill status.
Furnishings Fixtures & Equipment (FF&E)	Provide industrial grade 24 in. (610 mm) minimum work bench, storage shelving, spare parts bin, and flammable storage locker.
User-provided Equipment	Agent and nitrogen tanks, dry chemical extinguisher recharge kit and floor scale.

Special Requirements	Provide double leaf or overhead-type doors to exterior. Locate access to fire extinguisher maintenance and storage away from apparatus bay exterior circulation.

Table 4-13 Vehicle Maintenance Bay

Description/ Usage	This space is mainly used to service and repair firefighting vehicles, if required by installation mission requirements. At times, this bay may be used as an additional apparatus bay as well. The bay is sized to accommodate the largest vehicle and the equipment required to service it. Similar to the apparatus bay, the vehicle maintenance bay must be a drive-through.
Min. Ceiling Ht.	14 ft (4.26 m) minimum.
Finishes	**Walls.** CMU. Provide epoxy paints on all wall surfaces. **Floor**. Provide either a sealed concrete or 1-part or 2-part water-based epoxy concrete floor paint, in a slip-resistant, semi-gloss, light color finish. Final color selection to be coordinated with user and installation. Apply a concrete etcher to thoroughly clean concrete surface and a bonding primer for proper adhesion prior to applying epoxy finish. Slope floor to trench drains. **Ceiling**. Ceiling not required; however, provide finishes on exposed structure. Coordinate mechanical, electrical, and plumbing components. None of the ceiling components can be located below minimum ceiling height.
Plumbing	Provide minimum 3-in (75-mm) diameter water service with 2.5 in. (62-mm) diameter National Standard Threads ball valved outlet to each vehicle. Provide a combination eye/face wash and drench shower. Provide standard one hot and cold water hose bibb for every two truck bays. Provide floor trench drains parallel to the centerline of each vehicle. Connect trench drain to an **1**\ oil water separator or where the Installation has pretreatment or treatment methods in place in accordance with their permitted allowances, an approved sanitary sewer system. Coordinate with Installation EV staff for information on existing pretreatment or treatment methods and permitted allowances./**1**/ Provide compressed air with self-retracting hose reels at each vehicle bay.
HVAC	Design heating for 68 °F (20 °C) dry bulb. Local installations may decide to forgo heating in areas without risk of freezing. Provide gas-fired radiant heating if natural gas or propane is available. Local base or post authorities may choose different heating systems on a case-by-case basis. Provide ventilation to cool the vehicle maintenance bay to within 10 °F (6 °C) of design outdoor temperature. The Services will not air-condition the vehicle maintenance bay unless through exceptions. If approved, systems used for conditioning will be determined on a case-by-case basis. Consider climatic conditions, energy costs, and sustainability impacts for exceptions and system selections. For Army projects, refer to TI-800-1 for appropriate exceptions. For Navy projects: local base authorities within the Naval Forces Central Command region may choose to air-condition the vehicle maintenance bay; air-conditioning of the maintenance bay is not permitted for any other regions. Maintain vehicle maintenance bay air quality within the strictest established regulatory guidelines for volatile organics, nitrogen oxide, sulfur dioxide, carbon monoxide, particulates, diesel exhaust particulates established by: • NIOSH REL (10-hour time-weighted average), *NIOSH Pocket Guide to Chemical Hazards* • OSHA PELS (8-hour time-weighted average), *Annotated Permissible Exposure Limits (PELS) Tables*

	• ACGIH threshold limit value (average over 8-hour work shift)/short-term exposure limit (over 15-minute period), *Guide to Occupational Exposure Values* and *TLVs and BEIs* • Latest NFPA 1500 Per the IMC, the bay will be classified as an "enclosed parking garage." The bay ventilation system will operate continuously and comply with all other applicable requirements of IMC-2015 Sections 403, 404, 502.13, and 502.14 or current IMC equivalent. Exhaust and ventilation systems will be designed and operated to keep vehicle maintenance bay negatively pressurized with respect to adjacent occupiable spaces at all times. Provide an air-cleaning system for elimination of fire apparatus vehicle exhaust in compliance with NFPA 1500, the IMC, and ASHRAE 62.1. The bay air-cleaning system will be designed to remove, treat, or eliminate particulates, VOCs and gaseous exhaust contaminants from the bay. Air-cleaning system will automatically operate on vehicle operation and operate until vehicle maintenance bay air has been fully treated. For Navy and Marine Corps projects: If engines are operated inside the vehicle maintenance bay other than to move apparatus into and out of the bay, then provide a direct vent system that connects directly to the fire apparatus exhaust and evacuates vehicle exhaust directly to the outdoors. The direct vent system can be either an automatic-type FAVERS or a manually operated hose-type exhaust system operating whenever equipment is running in the bay. A make-up air system will supply heated air to the bay. Make-up air system will be designed and controlled to provide make-up air for all sources of exhaust installed within the bay. Make-up air should be distributed to minimize drafts and be introduced above apparatus level since diesel exhaust is heavier than air. In this way, the make-up air flow downward will assist in pushing the exhaust fumes out the bay doors when open. Provide a floor radiant heating element at each bay door to prevent the door from freezing to the pavement at the local installation's discretion.
Fire Protection	Provide system per paragraph 3-6.3.
Power	Provide outlets per paragraph 3-6.4. Locate all outlets at 36 in. (900 mm) AFF. Provide self-retracting electric drop cords between vehicles. Provide backup power sized to provide full unobstructed operational capability of the apparatus bays and vehicle maintenance bay. Provide power to each retractable door.
Lighting	Provide system per paragraph 3-6.4. Provide doors with signaling system indicating fully raised doors. A red/green indicator must be located on the driver's side at 72 in. (1800 mm) AFF.
Communication	**CCTV**. Provide interior and exterior outlets and cameras located to provide coverage. **CATV/Internal Video**. None required. **PA/Audio**. Provide speakers and horns with visual element. **Telephone**. Provide one line with internal two-way communication. **Data**. Provide data drops as required by equipment. **Security**. None required.
Acoustics	No special provisions required.

Casework/Built-in Equipment	None required.
Furnishings Fixtures & Equipment (FF&E)	Provide tool storage bins and industrial work benches.
User-provided Equipment	CCTV cameras.
Special Requirements	Provide hydraulic lifts and/or overhead lift/crane per installation requirements. Provide or accommodate ladder access to ceiling equipment such as lights, HVAC, and apparatus vehicle exhaust system equipment. Vehicle doors must match the size, operator, and controls to those of the apparatus bays.

Table 4-14 Vehicle Maintenance Equipment Storage

Description/ Usage	Vehicle maintenance equipment storage is tied to the vehicle maintenance bay and is used to store spare parts and tools required for vehicle maintenance and service. It is only provided if required by installation mission requirements. It must accommodate shelving storage and floor area for storage of large items such as tires and wheels. This space must be adjacent to the vehicle maintenance office and vehicle maintenance bay.
Min. Ceiling Ht.	14 ft (4.26 m) minimum.
Finishes	**Walls**. CMU. Provide epoxy paints on all wall surfaces. **Floor**. Provide a sealed concrete surface. A non-skid, low-maintenance traffic coating may also be acceptable. **Ceiling**. Ceiling not required; however, provide finishes on exposed structure. Coordinate mechanical, electrical, and plumbing components. None of the ceiling components can be located below minimum ceiling height.
Plumbing	None required.
HVAC	Provide a system per paragraph 3-6.2.
Fire Protection	Provide system per paragraph 3-6.3.
Power	Provide outlets per paragraph 3-6.4.
Lighting	Provide system per paragraph 3-6.4.
Communication	**CCTV**. None required. **CATV/Internal Video**. None required. **PA/Audio**. Provide a speaker. **Telephone**. Provide one line with internal two-way communication. **Data**. None required. **Security**. None required.
Acoustics	No special provisions required.
Casework/Built-in Equipment	None required.
Furnishings Fixtures & Equipment (FF&E)	Provide industrial or large-item storage shelving units.
User-provided Equipment	None required.
Special Requirements	None required.

Table 4-15 Deployment Gear Storage

Description/ Usage	This storage space is utilized for storage of firefighting gear required for military deployment, if required by installation mission requirements. This gear may be used by reservists and/or active duty military personnel. It includes ventilated lockers.
Min. Ceiling Ht.	8 ft (2.4 m) minimum.
Finishes	**Walls**. CMU. Provide epoxy paints on all wall surfaces. **Floor**. Provide a sealed concrete surface. **Ceiling**. None required.
Plumbing	None required.
HVAC	Provide a system per paragraph 3-6.2.
Fire Protection	Provide system per paragraph 3-6.3.
Power	Provide outlets per paragraph 3-6.4.
Lighting	Provide system per paragraph 3-6.4.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. **Telephone.** None required. **Data.** None required. **Security.** None required.
Acoustics	No special provisions required.
Casework/Built-in Equipment	Provide lockable 24 in. by 24 in. by 72 in. (600 mm by 600 mm by 1800 mm) high wire mesh metal lockers that include shelves and clothes hooks.
Furnishings Fixtures & Equipment (FF&E)	None required.
User-provided Equipment	None required.
Special Requirements	Locker layout must permit free air circulation around and throughout clothing. Layout must account for storage of additional spare equipment items.

Table 4-16 Station Officer's Office/Watch Desk

Description/ Usage	The station officer's office provides space for the station officer and/or company officers to perform their administrative functions. For satellite stations the station officer's office may serve to control public access to the station. If a watch desk function is required (i.e., dispatch not located in the station), it is typically included in the station officer's office. The watch desk receives emergency calls from dispatch and contains the security monitors for the station. It is usually occupied 24 hours a day/7 days a week.
Min. Ceiling Ht.	8 ft (2.4 m) minimum.
Finishes	**Walls**. Provide a low-maintenance, durable finish such as eggshell latex paint. **Floor**. Provide low-maintenance resilient sheet or tile flooring material with rubber base or durable commercial carpeting with rubber base. **Ceiling**. Provide ACP ceiling system.
Plumbing	None required.
HVAC	Provide a system per paragraph 3-6.2. Provide independent thermostat.
Fire Protection	Provide system per paragraph 3-6.3. If sleeping accommodations are provided in this room, provide required systems for sleeping rooms per Chapter 3 and fire-rated construction as required for residential occupancies per NFPA 101.
Power	Provide outlets per paragraph 3-6.4, and as needed to support the extensive equipment required. Provide two additional quad outlets at the control center console. Provide a switch controlling operation of apparatus bay doors. Provide HVAC shutdown switch adjacent to LOC devices. If LOC devices are located elsewhere, coordinate HVAC shutdown switch location with this alternate location.
Lighting	Provide system per paragraph 3-6.4.
Communication	**CCTV.** For stations without a dispatch, monitors for the facility cameras will be located here. Provide outlets required to support required equipment. **CATV/Internal Video.** Provide outlets required to support required equipment. **PA/Audio.** Provide simultaneous light and audible control for the entire fire station. **Telephone.** Provide regular and secure multi-telephone line required to support switch board operation, telephone, and fax. **Data.** Provide regular and secure data outlets to support required equipment. **Security.** Provide pin pad/cipher electric lock with remote push-button release and manual key override. **Firefighter Alert System:** Provide light and audible control for the following elements when the firefighter alert system is activated: dorm room lights (the dedicated alert light), corridor lights from dorm rooms to apparatus bay, and the apparatus bay lights.
Acoustics	Provide partition and door construction with a minimum STC rating of 45 per paragraph 3-5.
Casework/Built-in Equipment	Provide tinted windows with blinds.
Furnishings Fixtures & Equipment (FF&E)	Provide control center console. Provide modular component workstations to accommodate computers, monitor screens, two-way radios, and audio equipment. Provide wall-mounted installation grid coordinate map. Provide map racks. Provide safes for classified technical manuals. Provide book cases and ergonomically designed seating.

User-provided equipment	If the facility does not include a dispatch, CCTV monitors, recording equipment and controls will be located here. Recording system to record all emergency radio and telephone conversations. Computers, computer monitors, radios and audio equipment.
Special Requirements	Provide vision panel to the apparatus bay. Provide a 36 in. (920 mm) free access area around the entire control console. Provide space for Emergency Information Systems computer.

Table 4-17 Fire Chief's and Deputy Fire Chief's Offices

Description/ Usage	The fire chief's and deputy fire chief's offices are two separate offices that will not exist in every station. When they are both located in a station, they are adjacent to each other and to an administrative assistant and a chief's conference room. Each office includes a typical office space and workstation. An adjacent private bedroom and private toilet are shared by both offices and must be directly accessible by both offices.
Min. Ceiling Ht.	8 ft (2.4 m) minimum.
Finishes	**Walls**. Provide a low-maintenance, durable finish such as eggshell latex paint. In toilet, provide moisture-resistant gypsum wall board with porcelain tile wainscot and semi-gloss industrial latex-based paint. **Floor**. Provide durable commercial carpeting with rubber base in office and sleeping areas. Provide porcelain tile and porcelain tile base in toilet. **Ceiling**. Provide ACP or gypsum board ceiling. Provide moisture-resistant gypsum board ceiling in the toilet. Provide eggshell latex paint in office and sleeping areas and semi-gloss industrial paint in the toilet.
Plumbing	Provide water closet, shower, floor drain, and lavatory.
HVAC	Provide a system per paragraph 3-6.2. Exhaust private toilet as required by UFC 3-410-01. Provide independent thermostat for fire chief's and deputy fire chief's offices.
Fire Protection	Provide system per paragraph 3-6.3. If sleeping accommodations will be provided in this room, provide required systems for sleeping rooms per Chapter 3 and fire-rated construction as required for residential occupancies per NFPA 101.
Power	Provide outlets per paragraph 3-6.4.
Lighting	Provide system per paragraph 3-6.4. Provide task lighting at individual desks. Provide a dedicated alert luminaire that is controllable from the watch desk/dispatch and tied into the firefighting alert system with a red-tinted bulb or lens.
Communication	**CCTV.** None required. **CATV/Internal Video.** Provide one outlet in the office area and one outlet in the bedroom area. **PA/Audio.** Provide a speaker. **Telephone.** Provide one line with internal two-way communication. **Data.** Provide data outlets to support required equipment. **Security.** None required. **Firefighter Alert System**: Provide system per paragraph 3-6.4. Fire station and EMS alerting will be provided with audible announcement to radios no greater than 5 seconds from initiation. The system must use web services submission method to the fire and emergency services (F&ES) RMS via a secure, encrypted website.
Acoustics	Provide partition and door construction with a minimum STC rating of 52 per paragraph 3-5.
Casework/Built-in Equipment	Provide window blinds. In the private bedrooms, provide black-out roller shades. Provide robe hooks and/or coat hooks.

Furnishings Fixtures & Equipment (FF&E)	Provide office desk, office chair, file cabinet, bookshelf, task lighting, and additional side chair. In the private bedroom, provide twin bed, night stand, table lamp, and a wardrobe.
User-provided Equipment	Computers and associated equipment.
Special Requirements	In large facilities where an assistant fire chief exists, the private toilet must be shared with the deputy fire chief and the fire chief must be provided with his or her own private toilet. There also may be a requirement for a chief's conference room. If required, this would be directly adjacent to or expand out of the chief's office. It provides space for a small conference table for 8 to 10 people.

Table 4-18 Offices

Description/ Usage	General administrative office spaces in the station include the following: assistant chief/shift supervisor office (for Army only: Assistant chief's office will include a private bunk room and toilet/shower room), inspectors' office(s), training officer office, vehicle maintenance office, EMS office, dispatch supervisor (if provided), administrative assistant, reservist office (if provided), assistant chief of fire prevention (if provided), HAZMAT/health & safety officer (if provided), and logistics officer (if provided). General administration storage space. Assistant chief for fire prevention's office: This typical office space at 120 net ft^2 (11.1 m^2) must contain a workstation located adjacent to and accessible from the inspector's office area or accessible from the corridor in the administrative office area. The offices are generally grouped together in the administrative component of the fire station. The administrative assistant is generally only provided if the chief and deputy chief are resident in the station, in which case this area also doubles as the general reception area for the facility and is located directly off the lobby (see Table 4-19).
Min. Ceiling Ht.	8 ft (2.4 m) minimum.
Finishes	**Walls**. Provide a low-maintenance, durable finish such as eggshell latex paint. **Floor**. Provide low-maintenance resilient sheet or tile flooring material with rubber base or durable commercial carpeting with rubber base. **Ceiling**. Provide ACP ceiling.
Plumbing	None required.
HVAC	Provide a system per paragraph 3-6.2.
Fire Protection	Provide system per paragraph 3-6.3.
Power	Provide outlets per paragraph 3-6.4.
Lighting	Provide system per paragraph 3-6.4.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. **Telephone.** Provide one line with internal two-way communication. **Data.** Provide data outlets to support required equipment. **Security.** None required.
Acoustics	Provide partition and door construction with a minimum STC rating of 39 per paragraph 3-5.
Casework/Built-in Equipment	None required.
Furnishings Fixtures & Equipment (FF&E)	Provide office desk, office chair, file cabinet, bookshelf, task lighting, and an additional side chair. For a more executive-level office, provide a credenza and two additional side chairs. For the fire prevention office, provide plans review/drafting table and plans storage cabinet/rack.
User-provided Equipment	Computers and associated equipment.
Special Requirements	The vehicle maintenance office will be located near the vehicle maintenance bay and storage. It will likely have CMU walls and more durable finishes than typical offices.

Table 4-19 Lobby

Description/ Usage	The lobby is generally only provided if the department chief and deputy chief are resident in the station. It serves as the entrance to the facility and gathering/waiting space for the visiting public. The lobby must be adjacent to the administrative component of the facility. It must be recognizable from the outside and be a well-lit, inviting space. For Army only: All facilities will require a lobby.
Min. Ceiling Ht.	8 ft (2.4 m) minimum.
Finishes	**Walls**. Provide a low-maintenance, durable finish such as industrial eggshell latex paint. **Floor**. Provide porcelain tile with porcelain tile base. Provide recessed walk-off mat. **Ceiling**. Provide acoustical and decorative ACP or gypsum board ceiling such as egg-shell latex paint for gypsum board ceiling.
Plumbing	Provide an electric water cooler.
HVAC	Provide a system per paragraph 3-6.2.
Fire Protection	Provide system per paragraph 3-6.3.
Power	Provide outlets per paragraph 3-6.4. Provide outlets for display cases.
Lighting	Provide system per paragraph 3-6.4. Provide decorative luminaires and task lighting.
Communication	**CCTV.** Provide at least one outlet. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. **Telephone.** Provide one line for local and toll-free calls. **Data.** None required. **Security.** None required.
Acoustics	No special provisions required.
Casework/Built-in Equipment	Provide tack boards and a glass-enclosed bulletin board or recessed display cases.
Furnishings Fixtures & Equipment (FF&E)	Provide upholstered seating, side tables, and magazine rack.
User-provided Equipment	CCTV camera.
Special Requirements	Provide airlock at main entrance when necessary. Provide overhead weather protection at fire station entrance as applicable by climate zone.

Table 4-20 Department Training Room

Description/ Usage	Department training room is a classroom space used for the continuing education and training of fire station staff and occasionally the public. At least one per department (in HQ station). May be provided in other stations as dictated by installation mission requirements. Space must be sized to fit on-duty population or Reserve component, whichever is larger. Provide seating and desks. Provide audiovisual capabilities with phone and Internet connections for each training station. A storage closet is located adjacent to the training room and used for storage of audiovisual equipment, media, additional equipment, and furnishings.
Min. Ceiling Ht.	8 ft (2.4 m) minimum.
Finishes	**Walls**. Provide a low-maintenance, durable finish such as eggshell latex paint. **Floor**. Provide low-maintenance resilient sheet or tile flooring material with rubber base, or durable commercial carpeting with rubber base. **Ceiling**. Provide ACP ceiling.
Plumbing	None required.
HVAC	Provide a system per paragraph 3-6.2. Provide independent thermostat.
Fire Protection	Provide system per paragraph 3-6.3.
Power	Provide outlets per paragraph 3-6.4. Provide direct power to each work table.
Lighting	Provide system per paragraph 3-6.4.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. **Telephone.** Provide one line with internal two-way communication. **Data.** Provide data outlets to every workstation. **Security.** None required.
Acoustics	Provide partition and door construction with a minimum STC rating of 55 per paragraph 3-5.
Casework/Built-in Equipment	Provide flat panel display mount. Provide bulletin board with tack surface and dry-erase board. Provide shelving and rack storage in training room closet.
Furnishings Fixtures & Equipment (FF&E)	Provide training tables and chairs or tablet armchairs. If a separate testing area is not provided, provide computer/study/testing carrels. Flat panel display. Provide podium or lectern.
User-provided Equipment	Computers, printer, and DVD.
Special Requirements	Provide black-out shades if windows are provided.

Table 4-21 Testing/Individual Study Area

Description/ Usage	This area consists of individual computer/study carrels for study and testing of firefighters. Each of these stations must be private to eliminate potential for cheating during testing and to facilitate quiet study.
Min. Ceiling Ht.	8 ft (2.4 m) minimum.
Finishes	**Walls**. Provide a low-maintenance, durable finish such as eggshell latex paint. **Floor**. Provide low-maintenance resilient sheet or tile flooring material with rubber base or durable commercial carpeting with rubber base. **Ceiling**. Provide ACP ceiling.
Plumbing	None required.
HVAC	Provide a system per paragraph 3-6.2.
Fire Protection	Provide system per paragraph 3-6.3.
Power	Provide outlets per paragraph 3-6.4. Provide direct power to each computer/study carrel and printer.
Lighting	Provide system per paragraph 3-6.4.
Communication	**CCTV.** Provide video camera with monitor located in training officer office. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker **Telephone.** None required. **Data.** Provide data outlets to all workstations and equipment. **Security.** None required.
Acoustics	Provide partition and door construction with a minimum STC rating of 55 per paragraph 3-5.
Casework/Built-in Equipment	None required.
Furnishings Fixtures & Equipment (FF&E)	Provide computer/study carrels, office chairs, and task lights. Provide lockable storage for personal technology devices.
User-provided Equipment	Computers and printer.
Special Requirements	None required.

Table 4-22 Dispatch

Description/ Usage	The dispatch room functions to receive and dispatch emergency-related calls. The space can be programmed for either a fire-only dispatch operation or a consolidated dispatch operation. Fire-only dispatch rooms are solely responsible for receiving and dispatching fire-related emergency calls. A consolidated dispatch room handles fire, security, and medical response service calls. Not every station includes a dispatch. The dispatch room includes workstations sized to accommodate the necessary equipment for each individual dispatcher. Coordinate with installation to determine if consolidated dispatch is to be operated by cross-trained staff vs independent staff assigned per service call type. In larger dispatch rooms (three or more dispatchers), a separate, adjacent room for the dispatch supervisor is required. The finishes and mechanical/electrical requirements for this room are the same as for offices (see Table 4-18). Provide low-profile access flooring as required by installation mission requirements. Dispatch rooms also include a dedicated toilet and kitchenette directly adjacent to and accessible from the dispatch floor for staff use. For Air Force only: When E-911 is programmed, provide additional space for Emergency Information Systems computer, Next-Gen 911, and DOD Public Safety Answering Point (PSAP) Pilot Program initiative.
Min. Ceiling Ht.	8 ft (2.4 m) minimum.
Finishes	**Walls**. Provide a low-maintenance, durable finish such as industrial eggshell latex paint. **Floor**. Provide low-profile access flooring with a low-maintenance resilient sheet or tile flooring material with rubber base or durable commercial carpeting with rubber base. **Ceiling**. Provide ACP ceiling.
Plumbing	Provide an ADA-accessible toilet with a lavatory. Provide a kitchenette with a kitchen sink and disposal.
HVAC	Provide a system per paragraph 3-6.2. Provide primary HVAC from independent dedicated HVAC system. The back-up HVAC system for the dispatch must be the main building HVAC system. Power primary and backup HVAC systems with generator backup power. Exhaust the toilet as required by UFC 3-410-01.
Fire Protection	Provide system per paragraph 3-6.3.
Power	Provide outlets per paragraph 3-6.4 and as needed to support all equipment, including charging equipment for handhelds. Provide a switch controlling open-only operation of apparatus bay doors. Provide HVAC shutdown switch. The generator must provide back-up power for all dispatch room systems. In addition, provide uninterruptible power supply (UPS) for the dispatch equipment.

Lighting	Provide 50 fc (500 lux) task lighting at control desk. Firefighter alert system: Provide light and audible control for the following elements when the firefighter alert system is activated: dorm room lights (the dedicated alert light), corridor lights from dorm rooms to apparatus bay, and the apparatus bay lights.
Communication	**CCTV**. Monitors for the facility cameras will be located here. Provide outlets required to support equipment. **CATV/Internal Video**. Provide outlets required to support equipment. **PA/Audio**. Provide a speaker and a microphone. **Telephone**. Provide regular and secure multi-telephone line required to support switchboard operation, telephone, and fax. **Data**. Provide regular and secure data outlets to support required equipment. **Security**. Provide pin pad/cipher electric lock with remote push-button release and manual key override. Provide remote door-locking capability within the room. **Firefighter Alert System**: The system must provide audible announcements from defined message format to follow initial audible alert.
Acoustics	Provide partition and door construction with a minimum STC rating of 49 per paragraph 3-5.
Casework/Built-in Equipment	At kitchenette, provide wall and base cabinets with 24-in (610-mm) deep solid surface counter. Provide wall personnel lockers and coat hooks per installation requirements.
Furnishings Fixtures & Equipment (FF&E)	Provide control center console. Provide modular component workstations to accommodate computers, monitor screens, two-way radios and audio equipment. Provide map racks. Provide book cases, and ergonomically designed seating. Provide refrigerator, coffee maker, and microwave. Provide a secure drawer or safe for storage of classified documents and classified technical manuals. Security must meet SECRET criteria.
User-provided Equipment	Computers, monitor screens, two-way radios, and audio equipment. Recording system to record all emergency radio and telephone conversations. Wall-mounted installation grid coordinate map.
Special Requirements	Comply with the requirements for "Communication Centers" in NFPA 1221 as well as the requirements in UFC 4-021-02, Chapter 7. Note that some equipment requires free access area around the entire control console. Design this space appropriate to the equipment being provided. Note any special requirements for the E-911 system, if appropriate. If required for selected equipment, provide a conduit to the roof for a roof-mounted antenna. Provide an adjacent dedicated IT room. Provide low-profile access flooring as required by installation mission requirements. Provide vision panel to the apparatus bay. Provide space for Emergency Information Systems computer. Provide tinted windows with blinds. Operators must be able to see exterior conditions. Also provide visible access to the flightline, if applicable.

Table 4-23 Telecommunications Room

Description/ Usage	This room is the termination point for all data and communication utilities in the facility. This room also houses the equipment racks for the facility's computer networks, telephone, and communication feeds.
Min. Ceiling Ht.	8 ft (2.4 m) minimum.
Finishes	**Walls**. Provide a low-maintenance, durable finish such as eggshell latex paint. Provide 0.75-in. (19 mm) fire-rated plywood on all walls as required. **Floor**. Provide sealed concrete or static dissipative tile flooring with rubber base. **Ceiling**. Provide ACP ceiling.
Plumbing	None required.
HVAC	Provide a system per paragraph 3-6.2. Provide dedicated HVAC system.
Fire Protection	Provide system per paragraph 3-6.3. Provide smoke detection.
Power	Provide outlets per paragraph 3-6.4 and as needed to support the extensive equipment required. The generator must provide back-up power for all dispatch and alarm systems. In addition, provide UPS for these systems and the computer file server.
Lighting	Provide system per paragraph 3-6.4.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** None required. **Telephone.** Provide telephone line as required to support equipment. **Data.** Provide data lines as required to support equipment. **Security.** None required.
Acoustics	No special provisions required.
Casework/Built-in Equipment	Provide racks to accommodate equipment.
Furnishings Fixtures & Equipment (FF&E)	None required.
User-provided Equipment	None required.
Special Requirements	Provide a cipher lock at the door. Locate telecommunications room in a central location of the station.

Table 4-24 Day/Training Room (Including Kitchen)

Description/ Usage	The day room is configured and furnished like a very large residential kitchen/dining room/living room. It must be flexible to accommodate a number of different activities. The dining area must accommodate dining, informal meetings, and group training for the number of on-duty companies. Provide controllable natural light and seating to accommodate all company members, both in the dining setting and comfortable seating for television watching, reading, and relaxation in the living room area. Directly adjacent to the dining area is a kitchen sized to provide preparation space for the entire overnight population of the station. In HQ/main stations this may include additional 8-hour/10-hour management/admin/prevention personnel. The kitchen must resemble a residential kitchen as much as possible. Provide separate dry and cold food storage for two shifts. Provide additional cold and dry food storage for a swing shift and/or other facility occupants. If day room is provided, refer to the contractual agreement and points of contact for size, space, and operational criteria.
Min. Ceiling Ht.	8 ft (2.4 m) minimum.
Finishes	**Walls**. Provide a low-maintenance, durable finish such as industrial eggshell latex paint. **Floor**. Provide low-maintenance resilient sheet or tile flooring material with rubber base, or durable commercial carpeting with rubber base. In kitchen, provide porcelain tile. **Ceiling**. Provide ACP or GWB with eggshell latex paint.
Plumbing	Provide hot and cold water supply in kitchen. Provide cold water connections for the coffee and ice makers. Provide hot water connections for dishwashers. Provide two-basin deep kitchen sink with garbage disposal and sink sprayer. Provide drain connection for the dishwashers. Provide a floor drain. Natural gas service must have an accessible shut-off switch.
HVAC	Provide a system per paragraph 3-6.2. Provide exhaust hood over kitchen stoves appropriate to the grade of equipment provided.
Fire Protection	Provide system per paragraph 3-6.3. Protect hood and duct systems for cooking equipment per UFC 3-600-01.
Power	Provide outlets per paragraph 3-6.4 to accommodate all kitchen equipment.
Lighting	Provide system per paragraph 3-6.4. Provide 50 fc (500 lux) task lighting at the day/training area. Provide residential-style luminaires with dimming control switches.
Communication	**CCTV**. None required. **CATV/Internal Video**. Provide at least one outlet in the living room area. **PA/Audio**. Provide a speaker. **Telephone**. Provide one line with internal two-way communication. **Data**. Provide at least one outlet in the dining/training area. Provide outlets in the living room area. **Security**. None required. **Firefighter Alert System**: Fire station and EMS alerting will be provided with audible announcement (to fire station PA systems and radios), ramped heart

	saving tones, and amplitude lighting with a digital resource display board no greater than 5 seconds from initiation.
Acoustics	Provide partition and door construction with a minimum STC rating of 45 per paragraph 3-5.
Casework/Built-in Equipment	Kitchen area: Provide large-capacity dishwashers, stove/range, exhaust hood, and free-standing ice-maker. Provide light commercial-grade equipment. Provide base and wall cabinets with deep, solid-surface work counter. Provide a minimum of two separate dry storage closets or pantries (one for each of two shifts). Provide additional pantry/closet for HQ/main stations with admin/management/prevention personnel. Dining/training area: Provide bulletin board with tack surface. Provide flat panel display mount and wall-mounted dry-erase board.
Furnishings Fixtures & Equipment (FF&E)	Kitchen area: Provide a minimum of two separate refrigerators with freezers (one for each of two shifts), microwave oven, commercial-grade coffee maker, and toaster oven. Provide light commercial-grade equipment. Provide additional refrigerator unit for HQ/main station with admin/management/prevention personnel. Dining/training area: Provide dining table with chairs. Living room area: Provide recliner armchairs, side tables, and entertainment center.
User-provided Equipment	Flat panel display, DVD player.
Special Requirements	None required.

Table 4-25 Dorm Rooms

Description/ Usage	Dorm rooms are the private quarters of the firefighters and are used for studying, relaxing, entertainment, and sleeping during 24-hour shifts. The room is shared between two firefighters of different crews/shifts so that the room is never occupied simultaneously. Individual wardrobes are provided for each firefighter. A bed, nightstand, and desk are shared. A two-bed arrangement, giving each firefighter an individual bed and nightstand, has become a desirable option in recent years. Wall-beds, also known as Murphy beds, are also becoming a common alternative. These combine the personality of an individual bed with added space savings. The room must be a comfortable, inviting space that promotes relaxation. Acoustical privacy between rooms and acoustical protection from outside-to-inside sound transmission is important. Provide direct access to a private corridor and means of natural light in every room (design for AT issues, especially in OCONUS locations, with regard to natural light provisions).
Min. Ceiling Ht.	8 ft (2.4 m) minimum.
Finishes	**Walls**. Provide a low-maintenance, durable finish such as eggshell latex paint. **Floor**. Provide durable commercial carpeting with rubber base. **Ceiling**. Provide painted gypsum ceiling with eggshell latex paint.
Plumbing	None required.
HVAC	Provide a system per paragraph 3-6.2. Provide independent thermostat for each room.
Fire Protection	Provide system per paragraph 3-6.3.
Power	Provide outlets per paragraph 3-6.4.
Lighting	Provide system per paragraph 3-6.4.
Communication	**CCTV.** None required. **CATV/Internal Video.** Provide one outlet. **PA/Audio.** Provide a dedicated alert speaker with a soft-start audio output controllable from the watch desk/dispatch and tied into the firefighting alert system. **Telephone.** Provide one line with internal two-way communication. **Data.** Provide one outlet. **Security.** None required. **Firefighter Alert System**: The system must provide a digital light status bar. Provide a dedicated alert luminaire that is controllable from the watch desk/dispatch and tied into the firefighting alert system with a red-tinted bulb or lens.
Acoustics	Provide partition and door construction with a minimum STC rating of 55 per paragraph 3-5.
Casework/Built-in Equipment	Provide black-out roller shades. Provide adjustable-arm flat panel display mounts. Provide robe and/or coat hooks.
Furnishings Fixtures & Equipment (FF&E)	Provide extra-long twin bed, night table, two wardrobes, desk and desk chair, desk light, and alarm clock. As an alternative to a shared bed, provide two beds or two retractable wall beds (retractable beds are built-in casework).
User-provided Equipment	Flat panel display.
Special Requirements	Provide operable windows.

Table 4-26 Bathrooms/Showers/Changing

Description/ Usage	The bathroom/shower/changing room includes private water closets, lavatory, and shower stalls with private changing area for the personal use of the firefighters. Also provide lockers for temporary storage of personal items within this room. These lockers are not for storage of PPE gear.
Min. Ceiling Ht.	8 ft (2.4 m) minimum.
Finishes	**Walls**. Provide a low-maintenance, durable finish such as industrial semi-gloss latex or epoxy paint. Provide full-height porcelain tile with cementitious backerboard. **Floor**. Provide slip-resistant porcelain tile. **Ceiling**. Provide painted moisture-resistant gypsum board ceiling.
Plumbing	Provide shower stalls, lavatories, and water closets. See Special Requirements below for male/female distribution. Provide a floor drain.
HVAC	Provide a system per paragraph 3-6.2. Exhaust per UFC 3-410-01.
Fire Protection	Provide system per paragraph 3-6.3. Provide corrosion-resistant sprinklers and escutcheons such as stainless-steel or Teflon-coated throughout room.
Power	Provide outlets per paragraph 3-6.4.
Lighting	Provide system per paragraph 3-6.4.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. **Telephone.** None required. **Data.** None required. **Security.** None required.
Acoustics	No special provisions required.
Casework/Built-in Equipment	Provide 24-in. (610 mm) -deep minimum solid-surface materials for countertops. Provide solid plastic (HDPE) or color-through phenolic shower and toilet partitions. Provide a mirror over the vanity. Provide 24-in- (610-mm) -deep lockers. Provide a mix of full- and half-sized Z-shaped lockers with integral benches (usually part of the locker system) at least 16 in. (406 mm) wide. Provide solid plastic (HDPE) or color-through phenolic lockers.
Furnishings Fixtures & Equipment (FF&E)	None required.
User-provided Equipment	None required.

Special Requirements	Divide facilities as follows for smaller stations: • One-company station: Provide 1 water closet, 1 shower, and 1 lavatory for females, and provide 2 water closets, 2 showers, and 2 lavatories for males unless required otherwise by UFC 1-200-01 and UFC 3-420-01. • Two-company station: Provide 1 water closet, 1 shower, and 1 lavatory for females, and provide 4 water closets, 4 showers, and 3 lavatories for males unless required otherwise by UFC 1-200-01 and UFC 3-420-01. For larger stations, consult with user, UFC 1-200-01, and UFC 3-420-01 for final fixture count but plan for concentrated usage of the toilets after a call and the disparity between male and female fixture counts. Note: Use of individual unisex shower/changing rooms as dictated by installation mission requirements is acceptable. Provide a janitor's closet associated with or in proximity to this room. This closet includes a floor mop sink with hot and cold water and a hose connection, a floor drain, and storage for pails, mops, vacuums, and related cleaning supplies and equipment. Provide a lockable door with a vision panel that can be opened from the inside without a key. Provide lockable cabinets for cleaning supplies. Exhaust per UFC 3-410-01. Provide extended-height door kick panel (minimum 24 in. [610 mm]).

Table 4-27 Fitness Room

Description/ Usage	The fitness room promotes health and physical fitness of fire department personnel. The fitness room must accommodate the latest in fitness machines as well as more traditional equipment. The room must be sized to provide open floor workout space and free circulation between equipment while in use. The room must be arranged to accommodate all on-duty personnel. Fitness training is often conducted by the entire crew at one time.
Min. Ceiling Ht.	10 ft (3 m) minimum.
Finishes	**Walls**. Provide a low-maintenance, durable finish such as industrial eggshell latex paint. **Floor**. Provide 0.079 in. (2 mm) virgin rubber top surface with a 0.30 in. (7.5 mm) recycled rubber base. Use tile only for easy replacement. Tile must be manufactured in a mold and never cut from rolls so placing weights on the seams during installation is not necessary. Impact and athletic flooring system cannot be accommodated by interlocking flooring tiles or movable furnishings such as mats. **Ceiling**. Provide acoustical ACP or gypsum board ceiling with a finish such as industrial eggshell latex paint for gypsum board ceiling.
Plumbing	Provide electric water cooler.
HVAC	Provide a system per paragraph 3-6.2.
Fire Protection	Provide system per paragraph 3-6.3. Where a sauna is present, provide high-temperature-rated corrosion-resistant sprinklers and escutcheons such as stainless-steel or Teflon-coated throughout sauna area. Fire alarm notification appliances are not required within the sauna. Provide an audible and visual fire alarm notification appliance on the wall directly opposite the entry door into the sauna, with a minimum sound power of 95 dB at 10 ft (3 m) and 110 cd. At a minimum, provide a 100 in^2 (0.6 m^2) vision panel within the entry door into the sauna.
Power	Provide outlets per paragraph 3-6.4. Provide wall or floor outlets to accommodate fitness machines. Ceiling fans may be provided.
Lighting	Provide system per paragraph 3-6.4.
Communication	**CCTV.** Provide for camera for view of room from the watch desk/stations officer's office. **CATV/Internal Video.** Provide at least one outlet for a wall-mounted unit. **PA/Audio.** Provide a speaker. **Telephone.** Provide one line with internal two-way communication. **Data.** None required. **Security.** None required.
Acoustics	Provide partition and door construction with a minimum STC rating of 52 per paragraph 3-5.
Casework/Built-in Equipment	Provide full-wall-height mirrors on at least one wall. Flat panel display mount. Provide cabinet with counter top with an associated electrical outlet.
Furnishings Fixtures & Equipment (FF&E)	Provide fitness machines, treadmill, stationary bicycle, elliptical machine, weights, and mats.
User-provided equipment	Flat panel display.

Special Requirements	Provide exterior access or locate in close proximity to exterior access. Provide for natural light to the extent feasible (with shade/privacy screen).

Table 4-28 Laundry Room

Description/ Usage	The laundry room contains washers, dryers, and a folding table for use by the firefighters. This laundry room is only used for personal clothing of the firefighters and occasionally for laundry from the common areas of the fire station, not for firefighting gear.
Min. Ceiling Ht.	8 ft (2.4 m) minimum.
Finishes	**Walls**. Provide a low-maintenance, durable finish such as industrial semi-gloss latex paint. **Floor**. Provide a resilient sheet or tile flooring material with rubber base. **Ceiling**. Provide durable, moisture-resistant ACP or GWB ceiling. Provide semi-gloss latex paint for gypsum board ceiling.
Plumbing	Provide hot and cold water supply and an open end drain to each washer. Provide a floor drain. Provide a deep laundry sink.
HVAC	Provide a system per paragraph 3-6.2. Provide dryer venting per UFC 3-410-01.
Fire Protection	Provide system per paragraph 3-6.3. Regardless of size, enclose the laundry room with a 1-hour fire barrier. Exception: Where the building is fully sprinklered in accordance with UFC 3-600-01, a smoke partition and associated opening protection may be provided in lieu of the 1-hour fire barrier.
Power	Provide outlets per paragraph 3-6.4. Provide an additional outlet at the folding table.
Lighting	Provide system per paragraph 3-6.4.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. **Telephone.** None required. **Data.** None required. **Security.** None required.
Acoustics	No special provisions required.
Casework/Built-in Equipment	Provide a built-in laundry-folding table and wall-mounted drying rack.
Furnishings Fixtures & Equipment (FF&E)	Provide large, heavy-duty, residential washers and dryers: • Less than 3 companies. One washer and two dryers. • 4 companies. Two washers and four dryers. • More than 4 companies. Three washers and six dryers. • Always provide two dryers to every one washer.
User-provided Equipment	None required.
Special Requirements	This laundry room is to be utilized only for washing staff's personal linens and clothing.

Table 4-29 Recreation Room

Description/ Usage	If required by the installation mission, this room provides space for the firefighters to engage in noisier recreational activities, such as table games (e.g., pool or table tennis) or video games and is in addition to the day room. Provide acoustical separation from the day room and dorm rooms. For Army only: This space can be substituted for additional day/training room as required by the installation.
Min. Ceiling Ht.	8 ft (2.4 m) minimum.
Finishes	**Walls**. Provide a low-maintenance, durable finish such as industrial eggshell latex paint. **Floor**. Provide low-maintenance resilient sheet or tile flooring material with rubber base, or durable commercial carpeting with rubber base. **Ceiling**. Provide acoustical ACP or gypsum board ceiling such as industrial eggshell latex paint for gypsum board ceiling.
Plumbing	None required.
HVAC	Provide a system per paragraph 3-6.2. Provide independent thermostat.
Fire Protection	Provide system per paragraph 3-6.3.
Power	Provide outlets per paragraph 3-6.4. Provide power required to accommodate any game equipment.
Lighting	Provide system per paragraph 3-6.4. Provide residential-style luminaires with dimming control switches.
Communication	**CCTV.** None required. **CATV/Internal Video.** Provide at least one outlet. Coordinate height of outlet for a wall-mounted flat panel display. **PA/Audio.** Provide a speaker. **Telephone.** Provide one line with internal two-way communication. **Data.** None required. **Security.** None required.
Acoustics	Provide partition and door construction with a minimum STC rating of 55 per paragraph 3-5.
Casework/Built-in Equipment	Flat panel display mount.
Furnishings Fixtures & Equipment (FF&E)	Provide pool table/table-tennis table, lounge chairs, side tables, bar stools, book cases, and storage cabinets.
User-provided Equipment	Flat panel display.
Special Requirements	None required.

Table 4-30 Vending

Description/ Usage	The vending area accommodates two or more vending machines for snacks and drinks. The vending area must be conveniently located for the use of firefighters and fire station staff. Do not place vending machines in the day room or lobby. Recommended locations include the recreation room (if provided) or an alcove off a main hallway.
Min. Ceiling Ht.	8 ft (2.4 m) minimum.
Finishes	**Walls**. Provide a low-maintenance, durable finish such as eggshell latex paint. **Floor**. Provide low-maintenance resilient sheet or tile flooring material with rubber base. **Ceiling**. Provide ACP or painted gypsum ceiling.
Plumbing	None required.
HVAC	Provide a system per paragraph 3-6.2.
Fire Protection	Provide system per paragraph 3-6.3.
Power	Provide outlets per paragraph 3-6.4. Provide outlets and power required by vending machines.
Lighting	Provide system per paragraph 3-6.4.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** None required. **Telephone.** None required. **Data.** None required. **Security.** None required.
Acoustics	No special provisions required.
Casework/Built-in Equipment	None required.
Furnishings Fixtures & Equipment (FF&E)	None required.
User-provided Equipment	Vending machines.
Special Requirements	None required.

Table 4-31 Outdoor Patio/BBQ

Description/ Usage	This is an outdoor patio space. The patio counts toward overall building square footage. Its character must resemble a residential patio or deck. Firefighters will relax, play games, and barbeque in this space during their 24-hour shift when weather permits. Patio must be adjacent to or in close proximity to the apparatus bay for easy access in the event of a call and be directly accessible from the kitchen/dining area.
Min. Ceiling Ht.	Provide shade structures.
Finishes	**Walls**. None required. **Floor**. Concrete, brick, or stone paver accents. **Ceiling**. None required.
Plumbing	Provide hose bibb. If natural gas is available, provide gas connection for an external grill at the local installation's discretion. Locate gas connection 10 ft (3 m) away from structure and not adjacent to any combustible materials. Natural gas service must have accessible shut-off.
HVAC	None required.
Fire Protection	Provide system per paragraph 3-6.3. Refer to NFPA 13 for fire-suppression requirements under attached canopies or awnings, where provided. Refer to UFC 4-021-01 for mass notification system requirements.
Power	Provide exterior outlets per paragraph 3-6.4.
Lighting	Provide system per paragraph 3-6.4. Provide 5 fc (50 lux) at the grill.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. **Telephone.** None required. **Data.** None required. **Security.** None required.
Acoustics	No special provisions required.
Casework/Built-in Equipment	Provide exterior-grade counter-top/food preparation workstation collocated with grill as required per installation.
Furnishings Fixtures & Equipment (FF&E)	Provide garden furniture: tables, chairs, lounge chairs, garden umbrella, and exterior surface walk-off mat at entrance to day room.
User-provided Equipment	Grill.
Special Requirements	None required.

Table 4-32 Unisex Toilet "Public Use"

Description/ Usage	For headquarters stations only. Toilet facilities accessible from dayroom or main Lobby for use by guests/visitors. For Army only: All facilities will require a unisex toilet "public use".
Min. Ceiling Ht.	8 ft (2.4 m) minimum.
Finishes	**Walls**. Provide porcelain tile on cementitious backer board for wet walls. Provide a low-maintenance, durable finish such as eggshell latex paint. **Floor**. Provide slip-resistant porcelain tile with tile base. **Ceiling**. Moisture-resistant gypsum board.
Plumbing	Provide lavatory, water-closet, and floor drain.
HVAC	Provide a system per paragraph 3-6.2. Exhaust per UFC 3-410-01.
Fire Protection	Provide system per paragraph 3-6.3. Provide corrosion resistant sprinklers and escutcheons.
Power	Provide outlets per paragraph 3-6.4.
Lighting	Provide system per paragraph 3-6.4.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. **Telephone.** None required. **Data.** None required. **Security.** None required.
Acoustics	No special provisions required.
Casework/Built-in Equipment	Provide sink set into counter/cabinet. Provide coat hooks. Provide wall-mounted/fold-down baby changing station.
Furnishings Fixtures & Equipment (FF&E)	None required.
User-provided Equipment	None required.
Special Requirements	None required.

Table 4-33 Transition Zone

Description/ Usage	This space allows movement of personnel between the facility's hot (red) and cold zones (green). Hot zones are spaces in the facility exposed to carcinogens and green zones are living/working spaces intended for extended occupancy. Also, locate the following areas between hot and green zones: equipment maintenance/wash/disinfection, protective clothing laundry, PPE gear storage, spare PPE gear storage, and deployment gear storage. The sequence for transitioning from a hot zone to a cold zone must allow space for personnel to take 5 steps along a walk-off surface over a minimum 6-ft (1.8 m) -long path after removal of gear and washing off any visible contaminants. Transition zones must be in close proximity to hand wash sink/eyewash, PPE storage/laundry, and boot scrub station.
Min. Ceiling Ht.	8 ft (2.4 m) minimum.
Finishes	**Walls**. CMU. Provide a low-maintenance, durable finish such as industrial latex or epoxy paints on all wall surfaces. **Floor**. Provide a sealed concrete surface and walk-off mat with scraper surface finish. A non-skid, low-maintenance traffic coating may also be acceptable. **Ceiling**. Provide ACP or painted gypsum board ceiling.
Plumbing	Provide a hand-washing sink.
HVAC	Provide a system per paragraph 3-6.2. Exhaust space to maintain negative pressure relationship to occupiable/"green" zones.
Fire Protection	Provide system per paragraph 3-6.3.
Power	Provide outlets per paragraph 3-6.4.
Lighting	Provide system per paragraph 3-6.4.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. **Telephone.** None required. **Data.** None required. **Security.** None required.
Acoustics	No special provisions required.
Casework/Built-in Equipment	Provide accessories, paper towel dispenser/waste receptacle, soap dispenser, hand sanitizer, and mirror.
Furnishings Fixtures & Equipment (FF&E)	Boot scrub station.
User-provided Equipment	None required.
Special Requirements	Provide recessed walk-off mat. Signage: "No fire gear beyond this point."

APPENDIX A BEST PRACTICES

The Best Practices Appendix is considered to be guidance and not requirements. Its main purpose is to communicate proven facility solutions, systems, and lessons learned, but may not be the only solution to meet the requirement.

A-1 STRUCTURE.

Single-story structures are preferred for fire stations. Where feasible, design the structural system to accommodate potential future expansion, such as additional stalls for the apparatus bay.

A-1.1 Substructure.

Coordinate the design assumptions for the floor slab in the apparatus bay with those for exterior pavements; for example, use wheel loads that correspond to the default fire truck configurations in the Pavement-Transportation Computer Assisted Structural Engineering (PCASE) software program.

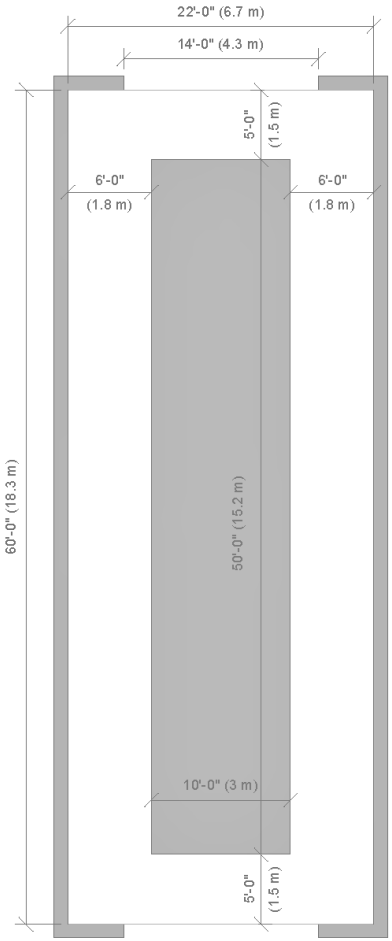
A-1.2 Superstructure.

Coordinate clearance and support requirements for the large overhead doors in the apparatus bay. Where feasible, use pre-engineered systems and components for building framing. For example, a pre-engineered metal building system may be an economical solution at the apparatus bay.

A-1.3 Fall Protection.

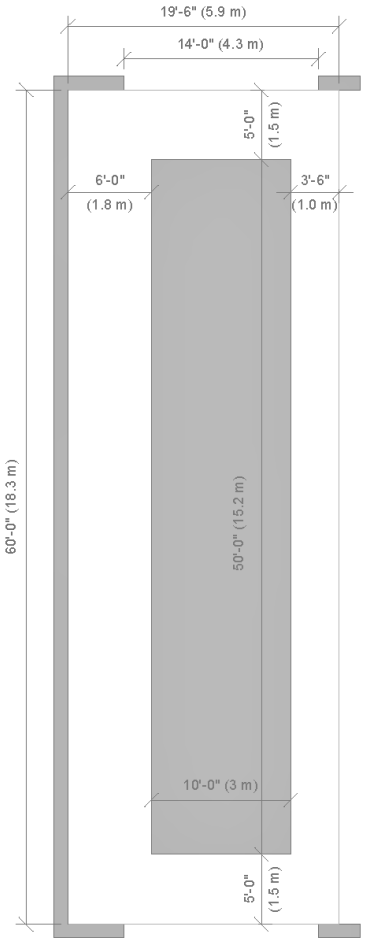
Coordinate the anchorage locations and loadings with the fall protection system specifications and the minimum design requirements of 29 CFR 1926.502.

This Page Intentionally Left Blank



APPENDIX B FIGURES

B-1 APPARATUS BAYS.



The key driver behind the size and configuration of the apparatus bays are the truck sizes and the required area around the vehicle footprint. Paragraph 2-3.1.1 gives the standard truck sizes and their relative footprints. The diagrams in Figures B-1 through B-4 illustrate the required space around each vehicle size class.

Each diagram has three possible configurations: a truck parked between two walls, a truck parked between a wall and another truck, and a truck parked between two other trucks. This is due to the different set-off distances for a wall versus another vehicle.

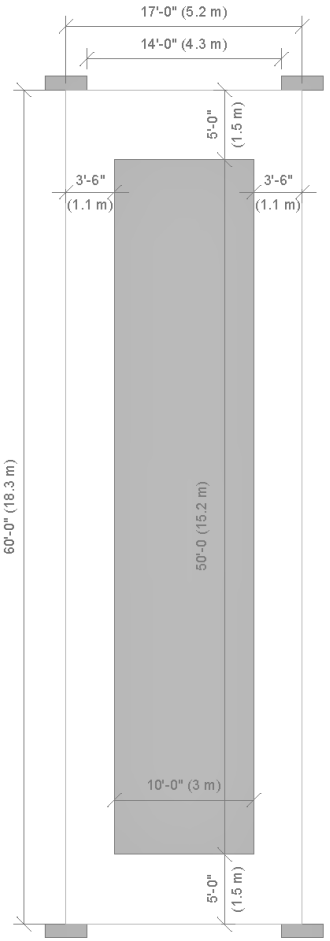


Figure B-1 Large Vehicle Class

LARGE TRUCK
SINGLE BAY

Record of Changes (changes are indicated by **1**\ ... /**1**/)

Change No.	Date	Location
1	30 May 2019	Updated Service-specific criteria in para. 2-3; updated references in paras. 3-5.1.2 and 3-6.4.1; updated functional data sheet link in para. 4-3; updated requirements and references in Tables 2-1, 4-20, 4-22, 4-25, 4-29, 4-30, 5-1, 5-2, 5-8, 5-9, 6-1, 6-14, and 6-17; added new Table 5-10 for building support/vertical circulation; updated App. B; designated former App. A as App. D, App. B as App. A, and App. D as Chap. 6; and updated references in App. D

This UFC supersedes FC 4-740-02F, *Air Force Fitness Centers*, dated 26 September 2006, and FC 4-740-02N, *Navy and Marine Corps Fitness Centers*, dated 1 April 2014.

FOREWORD

The Unified Facilities Criteria (UFC) system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and applies to the Military Departments, the Defense Agencies, and DOD field activities in accordance with USD (AT&L) Memorandum dated 29 May 2002. UFC will be used for all DOD projects and work for other customers, where appropriate. All construction outside of the United States is also governed by Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA) and, in some instances, Bilateral Infrastructure Agreements (BIA). Therefore, the acquisition team must ensure compliance with the most stringent of the UFC, the SOFA, the HNFA, and the BIA, as applicable.

UFC are living documents and will be periodically reviewed, updated, and made available to users as part of the Services' responsibility for providing technical criteria for military construction. Headquarters, U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering Command (NAVFAC), and Air Force Civil Engineer Center (AFCEC) are responsible for administration of the UFC system. Defense agencies must contact the preparing Service for document interpretation and improvements. Technical content of UFC is the responsibility of the cognizant DoD working group. Recommended changes with supporting rationale must be sent to the respective Service proponent office by the following electronic form: Criteria Change Request. The form is also accessible from the Internet sites listed below.

UFC are effective upon issuance and are distributed only in electronic media from the following source:

- Whole Building Design Guide web site http://dod.wbdg.org/.

Refer to UFC 1-200-01, *DoD Building Code (General Building Requirements)*, for implementation of new issuances on projects.

UNIFIED FACILITIES CRITERIA (UFC)
NEW DOCUMENT SUMMARY SHEET

Document: UFC 4-740-02, *Fitness Centers*

Superseding: FC 4-740-02F, *Air Force Fitness Centers*, dated 26 September 2006, and FC 4-740-02N, *Navy and Marine Corps Fitness Centers*, dated 1 April 2014.

Description: This UFC provides criteria for planning and design of fitness centers for the combined DOD United States Armed Forces.

Reasons for Document: This is a new Joint Service document. This document represents another step in the Joint Services' effort to bring uniformity to the planning, design, and construction of military facilities. The UFC was developed to provide design requirements to accomplish the following:

- Assist planners in understanding facility requirements to ensure accurate space program budgets
- Provide architects, engineers, and construction surveillance personnel with essential, minimum requirements for the design and construction of fitness centers
- Clarify the operational intent of the facility design

Impact: The following will result from the publication of this UFC:

- This UFC creates a single source for common DOD fitness center criteria and an accurate reference to individual Service-specific documents
- This UFC facilitates updates and revisions and promotes agreement and uniformity of design and construction between the Services

Unification Issues: The following is non-unified content:

- For Navy and Marine Corps only, exceptions in supporting specific functional program areas occur as noted in Table 2-1, "Functional Program Areas" and the functional data sheets in Chapter 4.
- The Army has different ceiling fan requirements.
- Chapter 6, "Austere Fitness Centers," applies only to the Navy.

Note: The use of the name or mark of any specific manufacturer, commercial product, commodity, or service in this publication does not imply endorsement by DOD.

This Page Intentionally Left Blank

CHAPTER 1 INTRODUCTION

1-1 PURPOSE AND SCOPE.

This UFC provides requirements for evaluating, planning, programming, and designing fitness centers. This UFC is not intended as a substitute for thorough review by individual program managers and operations staff in the appropriate Service.

1-2 APPLICABILITY.

The information in this UFC applies to the design of all new construction projects, including additions, alterations, and renovation projects within the United States and its territories and possessions and outside of the United States and its territories and possessions. It also applies to the procurement of design-build services for these projects.

1-3 USERS OF FACILITY.

The facility users are as follows:

- Active-duty military, retired military personnel, and their family members; and
- DOD civilians and others, as authorized.

1-4 GENERAL BUILDING REQUIREMENTS.

Comply with UFC 1-200-01, *DOD Building Code (General Building Requirements)*. UFC 1-200-01 provides applicability of model building codes and government-unique criteria for typical design disciplines and building systems, as well as accessibility, antiterrorism, security, high-performance and sustainability requirements, and safety. Use this UFC in addition to UFC 1-200-01 and the UFCs and government criteria referenced therein.

1-5 REFERENCES.

Appendix D contains a list of references used in this document. The publication date of the code or standard is not included in this document. In general, the latest available issuance of the reference is used.

1-6 GLOSSARY.

Appendix C contains acronyms and abbreviations.

1-7 AUSTERE FITNESS CENTERS (FOR NAVY ONLY).

Chapter 6 of this UFC contains requirements for fitness centers that are specifically designated as "austere." Austere construction is intended for facilities in locations determined by Commander, Navy Installations Command (CNIC), and approved by the Office of the Chief of Naval Operations (OPNAV) to be eligible for austere construction. The austere standards are intended to be applied flexibly and in varying degrees to all facilities at locations designated as austere. Flexibility is allowed to ensure the criteria are appropriate for individual austere locations.

This Page Intentionally Left Blank

CHAPTER 2 PLANNING AND LAYOUT

2-1 LOCATION DETERMINANTS.

Determine the most appropriate and cost-effective location for a fitness center based on the following factors. Ensure the availability and capacity of required utilities and the compatibility of the mass/scale of the facility relative to adjacent structures.

2-1.1 Access.

Locate the fitness center to be visible and easily accessible to other facilities utilized by the target audience, such as barracks/dormitories, MWR/NEX/MCCS/Services facilities, and dining facilities. To accommodate patron access, evaluate the relationships to existing vehicular and pedestrian circulation patterns, bike trails, and bus stops. Provide adequate parking as close to the facility as possible within antiterrorism (AT) requirements.

2-1.2 Cost.

Design these facilities with the objective of achieving the lowest lifecycle cost over a 40-year period. The project's design program must adequately define the scope and performance requirements and match those needs against a budget. Conversely, the budget must adequately support an appropriate and high-quality program following performance requirements outlined in this UFC.

2-1.3 Expansion.

Evaluate possible future additions when selecting the site to ensure cost-effective expansion possibilities. Future projects may include additional fitness center spaces, adjacent aquatics/swimming pool, adjacent outdoor sports fields and courts, and new/emerging program requirements.

2-2 FACILITY SIZE.

The space program must be developed in coordination with the installation’s mission requirements. The fitness center’s size will be driven by the program and the installation's population.

2-3 SPACE PROGRAM.

\1 The final space program for a new fitness center will need to be carefully determined by installation representatives, using the criteria in this UFC. The space assessment and its related basic facility requirement (BFR) calculation serves as the basis for the validated DD Form 1391, which defines the total authorized space allowances for each project.

For the Navy and Marine Corps, the space program is developed through the use of an interactive spreadsheet and serves as a baseline for the fitness center planning team. This spreadsheet is available as a downloadable Microsoft® Excel file from the Whole

Building Design Guide (WBDG) website: http://www.wbdg.org/references/pa_dod_sps.php. (See Appendix B for a sample space program spreadsheet for a Navy facility.)

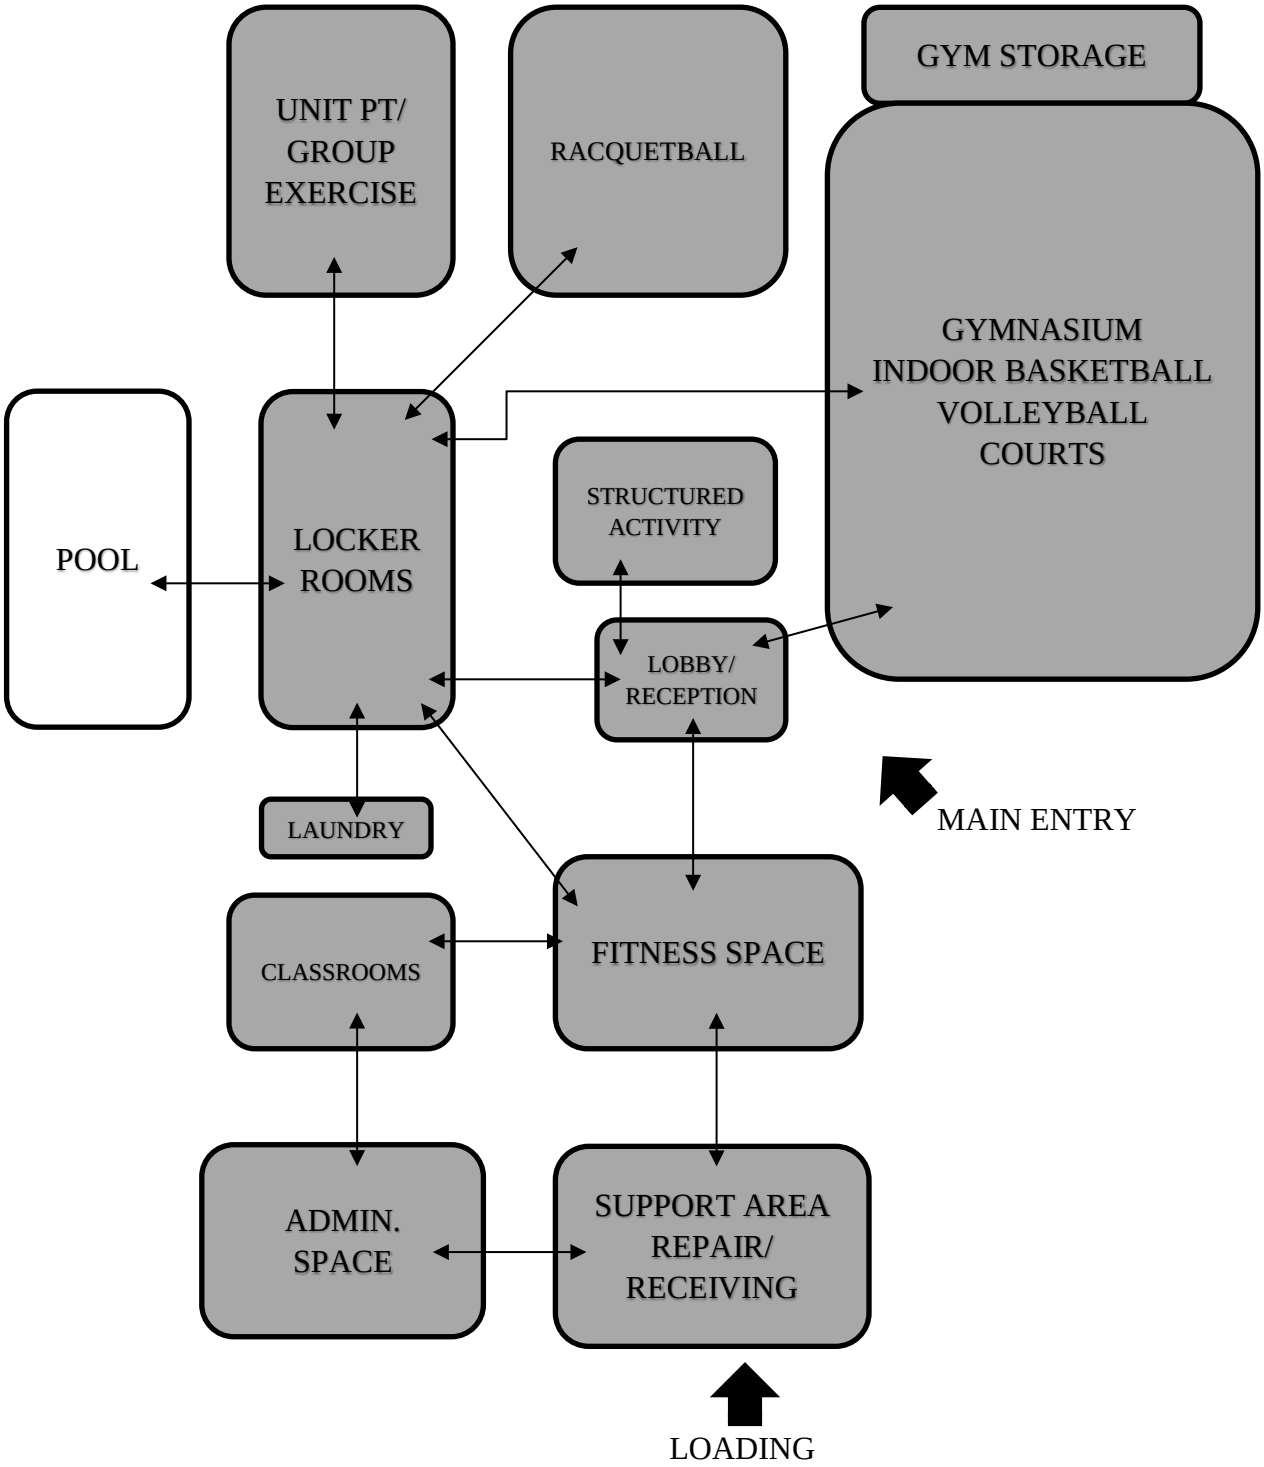
For the Air Force, the space program is developed through the use of an interactive spreadsheet and serves as a baseline for the fitness center planning team. This spreadsheet is available as a downloadable Microsoft® Excel file from the WBDG website: http://www.wbdg.org/references/pa_dod_sps.php.

For the Army, the space program is developed through consultation with the Physical Fitness Facility Center of Standardization to determine space requirements on the MILCON Requirements, Standardization, and Integration (MRSI) website: https://mrsi.erdc.dren.mil/cos/hnc/pff/. **/1/**

2-3.1 Space Tabulation.

The tabulation of areas for the majority of spaces within a fitness center follows UFC 3-101-01, *Architecture*, paragraph 2-2, "Building Area Calculations." Functional balconies within fitness centers used for fitness must be programmed as full scope in the area calculation. For indoor elevated jogging tracks, the Navy, Marine Corps, and Air Force programs these at full square footage.

Space requirements for the optional multipurpose field and supporting facilities are in Chapter 5.



2-4 LAYOUT AND ADJACENCIES.

The appropriate adjacencies are illustrated in Figure 2-1. These diagrams do not convey a building shape. Actual building shape will vary with available site, topography, vehicular access, site restrictions, utility access, and final installation program requirements. Required adjacencies may be accommodated vertically. This figure illustrates a facility with the gymnasium near the front entrance. This configuration allows the gymnasium to be used for events while the rest of the facility is closed off. However, also evaluate the massing of the facility when determining the location of the gymnasium.

2-4.1 Basic Facility.

The diagram in Figure 2-1 indicates acceptable relative adjacencies of the major functional spaces for a basic facility.

Figure 2-1 Basic Facility Functional Relationship Diagram

2-5 SPACE ASSESSMENT.

See Chapter 4 for additional information on the space types and their relationships to each other.

2-6 SCOPE OF FACILITY.

The fitness center comprises the fitness program spaces, the administrative area, and building support. Within the fitness programs there are core functional program areas and optional functional program areas. All functional program areas are described in Table 2-1 and paragraph 2-7. All of these spaces are described in greater detail in Chapters 2 and 4. Additionally, due to the numerous possible variations of fitness center programs, an interactive space programming tool has been developed to help users calculate a baseline space program for a new fitness center. This tool is described in paragraph 2-3.

A fitness center may be combined with a natatorium or outdoor athletic fields; however, the natatorium and fields have different category codes and may be programmed separately or as part of a fitness center complex. Chapter 5 includes requirements for multipurpose fields and softball fields. Requirements for natatoriums and other types of athletic fields are not included in this UFC.

2-7 PROGRAM AREAS.

2-7.1 Fitness Program, Administrative Areas, and Building Support.

Table 2-1 lists the core and optional areas for the fitness program, administrative areas, and building support. These are the traditional functions of a fitness center. They provide facilities and support services to meet the general fitness, skill development, training, and sports needs of all authorized users. This table identifies functional areas; when programming a facility, evaluate other areas such as circulation/corridors, exterior wall cavities, and mechanical/electrical/communication rooms to determine gross areas of the building. See UFC 3-101-01 for methods to calculate gross building area. Service-specific spaces are identified with an asterisk (*).

2-8 ANTITERRORISM/FORCE PROTECTION.

Refer to UFC 4-020-01, *DOD Security Engineering Facilities Planning Manual*, and UFC 4-010-01, *DOD Minimum Antiterrorism Standards for Buildings*, to develop requirements.

Table 2-1 Functional Program Areas

Functional Program Area	Description/ Requirements
Lobby/Reception	
Entry lobby and waiting/display	Entry space in front of control counter and/or vestibule. Combined with a waiting area with seating and display space. Space includes a public telephone.
Control counter/equipment issue/storage	Sign-in and small gear issue. Provides visual control via line of sight (LOS) to, at minimum, the entry, free weights, and locker room entrance. Visual control over other key areas must be accommodated via LOS or CCTV. Provides area to hold gear for issue (e.g., towels, balls, and racquets).
Retail/vending/food and beverage sales	Food and beverage sales may be combined with gear issue (refrigerator); may be self-serve (vending). Option for a retail area for clothes, sports equipment. Option for an expanded, separate juice counter in lobby space. May be contract space.
Public restrooms	Restrooms used primarily by visitors, spectators, and persons not using the locker and shower rooms. Sizing is tied to gym capacity.
Janitor's closet	Space used by custodial staff, with mop sink and storage space.
Administrative	
Director's office	Private office.
Program managers' offices	Private office. Installation to determine quantity of offices and workstations within each office.
Administrative support	Workstations.
Classroom/training room	Space used for conducting training and large meetings. Classroom sized for 25 persons (750 ft^2 [69.68 m^2]) for small facilities, 50 persons (1500 ft^2 [139.35 m^2]) for medium and large, and 75 persons (2250 ft^2 [209.03 m^2]) for extra-large and jumbo facilities.
Copy/work/break room	Copier, layout space, storage, small staff break area.
Gymnasium	
Basketball/volleyball court(s)	NCAA-size court(s).
Spectator seating	Minimum of 200 seats; more as required and with additional courts.
Storage/support	Storage area with access to both the gym and to the outside if adjacent intramural fields are present.
Unit PT/Group Exercise	
Group exercise room	One large subdividable room with partitions (for classes and/or unit/command fitness training).

Storage/support	Storage area with access to unit PT/group exercise room.
Fitness Spaces	
Stretching/warm-up/cool-down	Usually one open space; may use floor finishes to separate subspaces; may use alcoves; may use balconies/mezzanines.
Free/plate-loaded weights	
Selectorized (machine) weights	
Cardiovascular (cardio) equipment	
Fitness program manager's office	Private office adjacent to fitness assessment room and fitness spaces. May include fitness testing equipment.
Fitness assessment room	Private office with desk, computer, and chairs for staff to meet with customer adjacent to fitness spaces. Includes fitness testing equipment.
Indoor track	Optional. Determine permissibility by center size and climate.
Structured Activities	
Structured activity space	Can be used as needed, e.g., for rock climbing wall, indoor cycling, volleyball, martial arts/boxing, other structured activity, or rolled into other functional areas, as needed.
Racquetball courts	Designed and specified to meet USA Racquetball Association (USRA) *Standard Specifications for Racquetball Court Construction*.
Spectator area/officiating	Optional.
Functional fitness	Space that supports Service-developed programs. Functional fitness implies performing exercise in an optimal way, to achieve certain goals that allow improved performance of regular activities outside the gym. Typical equipment in the functional fitness area includes A-frames used for various exercises with bands, individual weight stations, and various kettlebells and other equipment.
Auxiliary gymnasium	Optional. This space is used for sports competitions such as basketball, volleyball, wrestling, and indoor soccer. The auxiliary gymnasium can also support instructional functions, informal, intramural, group exercise/fitness functions, and community events. Preferably, the auxiliary gymnasium will be adjacent to the main gymnasium and, if not adjacent, must be nearby.
High Intensity Tactical Training (HITT) Center*	Marine Corps-only space. This is typically one large, open-space room that is non-partitionable and used for implementation of the HITT program. Activities/classes such as aerobics, martial arts, and yoga must not be used in this space.

Indoor Cycling	Classroom to accommodate indoor cycling classes, which includes an instructor on a bike and participants on bikes. These bikes are different from stationary bikes utilized in the cardio area. This space may be included as part of the programmed space allotted for structured activities.
Locker Rooms	Separate male/female facilities. Each locker room is divided into the three indicated sub-areas.
Men's Locker Room	Programmed per installation population.
Locker/dressing area	Programmed per installation population.
Toilet area	Programmed per installation population.
Shower/drying area	Programmed per installation population.
Women's Locker Room	Programmed per installation population.
Locker/dressing area	Programmed per installation population.
Toilet area	Programmed per installation population.
Shower/drying area	Programmed per installation population.
\1\ Steam room	Optional. This space is not supported by the Navy. **/1/**
Sauna	Optional. When used, provide separate male/female facilities.
Convertible locker space	Optional. This is locker/changing space that can be used for additional male or female space to accommodate tournaments and/or changing demographics. It is a separate room between the male and female locker rooms, with double-locked doors into each.
Support Areas	
Laundry	For towels and uniforms.
Receiving and equipment repair/storage	Receiving, storage, and repair. Area to hold (if necessary), assemble, and repair equipment and store overflow from the equipment issue (e.g., seasonal items).
Additional programmatic storage	Optional storage for additional optional program equipment. May be combined with receiving/equipment repair.
Other Program Areas	
Massage room	Optional room for massage.
\1\ Hot tub	Optional. This space is not supported by the Navy. **/1/**

Unisex changing room/unisex locker room	Single-person locker room with shower, lavatory, and toilet; family member accompanies child. Adjacent to locker area and provides direct access to the pool.
Parent/child area	**\1** Optional **/1/** age-appropriate spaces based on Service guidance. Navy option: Provides a separate room for parents to watch their children while exercising. Includes adult fitness equipment on one side and a separate child play area on the other. The two sides are divided by a 30-in. (750-mm) -high clear wall with a central entry/exit point. Marine Corps option: Provides an unstaffed child care room with play area for the children and a seating/lounge area for the adults. Adult supervision is required in this area. Does not include fitness equipment.
Mother's room	Private space for nursing mothers. One per facility.
Related Program/Facility Areas	
Pool	Note that pools and natatoriums are a different category code. If a pool/natatorium is desired, it will affect the adjacencies and traffic flow within the building. See Figure 2-1 for these adjacencies.
Physical therapy/rehabilitation training	Optional. Note that these functions are a different category code. This space is only supported in special circumstances.
Multipurpose field	See Chapter 5 for details. Fields may be programmed with or separate from a fitness center on a case-by-case basis; also refer to UFC 4-750-02N.
Outdoor track	See Chapter 5 for details. Tracks may be programmed with or separate from a fitness center on a case-by-case basis; also refer to UFC 4-750-02N for other criteria.
Softball field	See Chapter 5 for details. Fields may be programmed with or separate from a fitness center on a case-by-case basis.

CHAPTER 3 GENERAL DESIGN CRITERIA

3-1 GENERAL.

This chapter provides general criteria only and consists mainly of references to the technical design criteria documents and general considerations. Chapter 4 provides the specific design requirements for each fitness center space.

3-1.1 Authorized Building Program.

A DD Form 1391 funding document is developed for all new construction projects, which establishes the project requirements and authorized building size. The designer must use the functional space program descriptions and functional diagrams in this UFC; however, the design may not exceed the square footage allowances or add functions not authorized by the validated DD Form 1391.

3-1.2 Accessibility.

Comply with stated and cross-referenced requirements for accessibility. Facilities programmed for wheelchair competition activities shall be designed to provide access for a 40-inch (1016-mm) -wide wheelchair at the main entrance, gymnasium, and restrooms.

3-2 STRUCTURE.

3-2.1 Substructure.

For the gymnasium, provide a level concrete slab on grade over properly graded crushed stone subbase, with a minimum 10-mil (0.25-mm) polyethylene sheet vapor barrier located directly between the slab and the subbase. For rooms with floor padding, provide a recessed slab to compensate for the mat thickness or a transition area outside of the mat area.

3-2.2 Superstructure.

Provide clear spans for the activity area and gymnasium. Where specialized elements such as basketball backstops, divider curtains and drapes, lighting and sound equipment, decorative banners, acoustical treatments, score boards, or running tracks will be suspended above the floor, design the roof structure for the appropriate support locations and loadings.

3-3 ARCHITECTURE.

Comply with stated and cross-referenced requirements for architecture. Fitness areas are to be as open as possible, with maximum utilization of natural light and views. Larger spaces will be provided to allow flexibility in addressing future fitness trends. Also comply with the following fitness center-specific requirements.

3-4 EXTERIOR DESIGN.

The building's image, theme, and fixtures must be consistent with the programs offered. The building design must reflect the local geographical and cultural environment and comply with the appropriate Service and installation architectural standards. The building and site must provide a visually attractive, safe, and welcoming appearance. Group high bay spaces together. The high bay areas must not dominate or overwhelm surrounding structures.

3-4.1 Entrances/Exits.

3-4.1.1 Main Entry.

Design the facility to require access at one main entry point sized in accordance with egress requirements of NFPA 101, *Life Safety Code*. To determine the occupant load of the gymnasium, use "Assembly Use - Without Fixed Seating" from NFPA 101. If the main entrance is not sized to accommodate the occupant load of a special event (e.g., change of command, award ceremonies), a separate gymnasium special event entrance with a paved path to the parking area is required.

3-4.1.2 Covered Entry and Alarm.

The main facility entrance to the lobby serves as a welcome and transition point. Provide a covered entry. In cold climates, provide a canopy (or a recess) at required egress doors to ensure doors can open completely without obstruction from snow and ice. All other exterior doors must have a local, key-controlled alarm that sounds at the door and the control desk when the door is opened. Indicate this alarm with signage on the door.

3-4.1.3 Equipment Deliveries.

If applicable, provide a separate entrance for equipment deliveries. See paragraph 3-8 for more information on site work.

3-4.2 Doors and Windows.

Provide doors and windows to allow natural light into and views in and out of the facility. Mitigate glare and direct sunlight in activity spaces such as the gymnasium and fitness spaces.

3-4.3 Exterior Finishes.

The exterior color, texture, and design must be consistent with the programs offered, building type, and the local environment in accordance with installation design standards. The design must communicate a sense of activity and energy while complying with installation design guides/standards.

3-4.4 Exterior Signage.

Equip the main entrance with an attractive, clearly visible sign that provides the program hours of operation. Ensure that signage complies with installation requirements. Sign placement and type are site-specific. The facility must include both a building-mounted sign and site monument sign (roadway-visible) that must be strategically located, adequately lit, and sized to permit proper viewing by individuals approaching the facility.

3-4.5 Exterior Walls and Mold.

Follow UFC 3-101-01 during design to help prevent the development of mold in exterior walls.

3-5 INTERIOR DESIGN.

Construction and finishes (walls, floors, and ceilings) must support the image and theme of the facility and be consistent with the programs offered and any installation interior standards. The interior design must offer the same interest, excitement, and professionalism found in comparable commercial facilities. As with the exterior, design the fitness center interior to reflect a high energy, non-institutional character that communicates a sense of activity.

Provide premium high-end finishes that are durable, hygienic, long-lasting, easily maintainable, and consistent with the programs offered and theme of the facility. The following key public spaces offer the greatest opportunity to establish a creative and interesting interior design approach:

- Entry lobby and waiting/display
- Control counter
- Unit physical training (PT)/group exercise
- Fitness spaces
- Structured activities
- Locker rooms and public toilets

3-5.1 Interior Construction.

3-5.1.1 Glass and Mirrors.

Interior construction must be extremely durable. Hollow-core wood doors are not allowed. All interior glass must be tempered safety glass and mirrors must be made of break-resistant materials.

3-5.1.2 Counters, Casework, and Cabinets.

Counters, casework, and cabinets must be of high-quality and durable construction. Specify Architectural Woodwork Institute (AWI) premium or custom for construction and finishes per **\1** *North American Architectural Woodwork Standards* (NAAWS). ***/1/***

Casework and cabinet doors and drawer faces must be provided as veneer panel core. Doors, drawers, and casework faces must be plastic laminate at a minimum. Countertops must be solid surface/solid composite plastics only. Specify 0.75 inch (20 mm) minimum thickness for plywood, plywood backing, and solid wood panels. Particleboard must not be used.

3-5.1.3 Functions

Identify the functions requiring counters/casework in each space within the fitness center and design these to accommodate these functions. Consult with the facility manager and program managers for specific program requirements.

3-5.2 Finishes.

Finishes must take into account the intended uses, be appropriately durable, and be low maintenance. Finishes must have good acoustical noise-reducing characteristics. They must meet the requirements listed in NFPA 101.

Vinyl composition tile (VCT) is not allowed. For information on finishes in specific areas, see Chapter 4. Also, coordinate the interior design with UFC 3-120-10, *Interior Design*, and installation design standards.

3-5.3 Building Signage.

Develop a comprehensive signage package (both interior and exterior) that addresses way-finding and definition of all spaces within the facility. Signage must reflect and complement the environment through the colors, images, and materials used. Building signage must provide clear directional and informational assistance to all functional areas. Mechanical, electrical, and/or utility room doors must have identifying signage to match other building signage. Provide signage in accordance with UFC 3-120-01, *Design: Sign Standards*.

3-5.4 Acoustics.

In general, since much of the facility comprises high-activity, high-noise functions, the design must seek to separate or acoustically protect the smaller, quieter functions rather than the noisier functions. For the purposes of this UFC, the following spaces are considered to be "noisy":

- Mechanical and laundry rooms
- Selectorized weight area(s)
- Free/plate-loaded weight area(s)
- Cardiovascular equipment area(s)
- Gymnasium
- Unit PT/group exercise room
- Racquetball courts and some other structured activity spaces

At a minimum, provide the required sound transmission coefficient (STC) ratings identified in Chapter 4 for individual spaces. Where not indicated in Chapter 4 for a particular room, use the interior acoustic requirements for typical spaces noise isolation class (NIC) ratings in UFC 3-101-01.

3-5.5 Window Treatments.

All windows and other glazed openings to the exterior of the building must be provided with horizontal blinds or solar shading systems as built-in equipment.

3-6 SERVICES.

3-6.1 Plumbing.

Design all building systems, such as domestic hot and cold water, sanitary and storm drainage, propane, fuel oil, or natural gas systems to meet the requirements of local installation standards and established criteria.

In multi-story facilities, locate toilets on each floor appropriately sized for participant load. Maintain a minimum of 60 percent of fixture counts in main locker rooms. Locate floor drains outside the normal travel paths. In toilet areas, locate floor drains under the partitions, where possible. Provide the number of electric water coolers (EWC) as required by UFC 3-420-01, *Plumbing Systems*, for peak occupancy loads, located as specified in Chapter 4 of this UFC. If all of the Chapter 4 requirements cannot be met by the number of EWCs required by UFC 3-420-01, additional units will be required. A location up to 100 feet (30.5 m) away from the entrance is considered acceptable when the requirement states “near.” EWCs throughout the facility must be combination water fountain and bottle-filling units. Never locate EWCs above wood flooring. EWCs must be provided on all levels.

3-6.2 Heating, Ventilating, and Air Conditioning (HVAC).

Comply with stated and cross-referenced requirements for HVAC and UFC 3-410-02, *Direct Digital Control for HVAC and Other Building Control Systems*. Unless otherwise stated, design spaces to comply with comfort cooling and heating requirements of UFC 3-410-01, *Heating, Ventilating, and Air Conditioning Systems*. Do not locate moisture-containing or -producing HVAC equipment above areas with wood floors, either on the roof or within the overhead space, due to the risk of a leak causing water damage.

If Chapter 4 requirements include providing ceiling fans, provide high-volume low-speed (HVLS) fans with appropriate clearances. Provide multi-speed fans with wall-mounted controls. The number of fans and fan sizes must be selected to provide consistent air movement over the entire space. For all spaces with ceiling fans, the minimum ceiling height listed is the minimum height of the fan; the actual ceiling shall be at the required clearance height above the fan. **For Army projects:** In two-story spaces, provide HVLS fans. In a one-story space, provide one fan with a diameter of not less than 48 inches per maximum of 400 square feet (37 m^2). In a one-story space, the distance from the floor to the fan must be no less than the suggested minimum ceiling height. Use demand-controlled ventilation and/or energy recovery as required and restricted by UFC

1-200-02, *High-Performance and Sustainable Building Requirements*, and UFC 3-410-01 or when lifecycle cost-effective.

3-6.3 Fire Protection and Life Safety.

Comply with stated and cross-referenced requirements for fire protection, life safety, and mass notification systems.

3-6.3.1 Operable Partitions.

Where one or more operable partitions are provided, fire suppression and fire alarm devices must be provided to protect the space in accordance with UFC 3-600-01, *Fire Protection Engineering for Facilities*, with the partitions in the open or closed position.

Means of egress inclusive of the number of exit access doors and door swing must be in accordance with NFPA 101 requirements, with the partitions in the open or closed position.

3-6.3.2 Protection from Mechanical Damage.

Protect fire suppression, fire alarm, and life safety devices from mechanical damage where devices are located in areas subject to damage from sports equipment or related activities. Provide protective guards over exposed devices such as sprinklers, fire alarm notifications, exit signs, and manual pull stations or provide devices designed to handle impact damage. Minimize projections into activity spaces by providing flush-mounted devices. Manual pull stations with break-glass mechanisms are prohibited.

3-6.4 Electrical.

Refer to UFC 1-200-01 and comply with stated and cross-referenced requirements for electrical systems. Also comply with the following fitness center-specific requirements.

3-6.4.1 Lighting.

See Chapter 4 for light level and control requirements that are exceptions or additions to the requirements referenced above. Refer to **\1** UFC 3-530-01, *Interior and Exterior Lighting Systems and Controls*, ***/1/*** for lighting levels not specified in Chapter 4 or in the requirements referenced above.

3-6.4.2 Standby Power Connection.

Provide the facility service entrance with the capability to temporarily connect a portable generator via an external connection point. Provide a hard surface area adjacent to the building service entrance sized to accommodate the largest portable generator (with integral fuel tank) dimension and weight available based on the generator size determined during the design. Provide accessible ground rod, bonded to the building grounding system, for connection to a portable generator.

Comply with NFPA 70, *National Electrical Code*, Article 702, “Optional Standby Systems.” Connect all emergency loads to a separate emergency panel served from the

main service panel by a manual transfer switch. Document the generator size required to support design conditions. Place signage at the connection point designating proper generator size. Loads to be supported by the emergency generator include the following, as a minimum:

- Facility lighting (interior and exterior)
- Electric water heaters
- Gymnasium power
- Gymnasium HVAC system when a separate system is primarily serving the gymnasium
- Toilet and shower exhaust within locker rooms
- Public toilet exhaust

3-6.4.3 Telecommunication Systems.

See Chapter 4 for outlet locations.

3-6.4.4 Cable Television (CATV).

See Chapter 4 for outlet locations.

3-6.4.5 Electronic Security Systems (ESS).

Design the ESS in accordance with UFC 4-021-02, *Electronic Security Systems*. See Chapter 4 for locations and additional criteria. For all facilities identified to operate in the unmanned state, provide Common Access Card (CAC) -enabled entrances and provide duress alarm buttons accessible to patrons.

3-6.4.6 Closed-Circuit Television (CCTV).

Design the CCTV system in accordance with UFC 4-021-02. See Chapter 4 for locations and additional requirements.

For all facilities identified to operate in the unmanned state, provide CCTV cameras in public fitness center spaces and at access points with a connection to a local CCTV recording system.

3-6.4.7 Intercommunication and Public Address (PA) Systems.

See Chapter 4 for locations and additional criteria.

3-6.4.8 Receptacles.

See Chapter 4 for locations and additional criteria.

3-6.4.9 Emergency Medical Alert.

Provide a means of notification of a medical emergency event by using a latching dedicated blue mushroom-type switch connected directly to the transmitter device/panel used to send fire alarm signals to a fire alarm/security supervising station. Activation of the medical emergency mushroom switch will activate a separate signal via the transmitter to the fire station/security supervising station.

3-6.4.10 Lightning Protection System.

Install lightning protection systems for new facilities and existing facilities modifications in accordance with NFPA 780, *Standard for the Installation of Lightning Protection Systems*.

3-7 FURNISHINGS AND EQUIPMENT.

Furnishings, fixtures, and equipment (FF&E) items are listed for specific spaces in Chapter 4. Fitness equipment includes all government-furnished, government-installed fitness equipment, including cardiovascular, strength training, and functional training items. These items are funded using the same source as FF&E but will be procured, installed, and coordinated by non-appropriated funds (NAF) via the fitness program management office.

3-8 SITE DESIGN AND ORGANIZATION.

Where possible, use outdoor spaces as transition spaces and for extended fitness uses, such as areas for runners and bicyclists and covered concrete pads for functional fitness equipment/apparatus. Provide a site design that feels safe for all authorized users. If located nearby, provide access paths to related functions such as outdoor running tracks, sports fields, open park space, or other outdoor activity areas.

3-8.1 Landscaping.

Refer to UFC 3-201-02, *Landscape Architecture*, and comply with stated and cross-referenced requirements for landscaping. Also comply with local installation landscape standards. Avoid plantings that require an irrigation system.

3-8.2 Parking and Access Drives.

Provide adequate parking for both staff and patrons with appropriate access drives.

Connect at least one of each site arrival point to an accessible building entrance using an accessible route. Provide bicycle racks near the facility entrance in a secure location. The total number of parking spaces to be constructed for a fitness center is based on a parking analysis of site conditions that considers factors such as available parking in the vicinity, access to public or government-furnished transportation, and location with respect to troop housing.

3-8.3 Service Drive.

Verify the size of required service vehicles prior to planning and designing the service access areas. Provide a back-up spur for dead-end and service drives that exceed 100 feet (30 m) in length. Provide access to the serviced areas: receiving and equipment repair area, recycling/garbage dumpster/storage (indoor or outdoor), mechanical room, and service entry, if one is designated. Provide a service vehicle apron and consolidate service access, when possible. Screen or separate the service area from public use or traffic areas with attractive walls, fences, depressions, berms, and landscaping. Comply with UFC 4-010-01. Ensure proper drainage if depressions are used. Do not cross outdoor activity areas with service access.

3-8.4 General Site Lighting.

Refer to UFC 1-200-01 and comply with stated and cross-referenced requirements for electrical systems. If the facility is near a flightline, site lighting cannot interfere with or be a distraction to aircraft movement at night.

3-9 SUSTAINABLE DESIGN.

Comply with UFC 1-200-02.

This Page Intentionally Left Blank

CHAPTER 4 SPECIFIC DESIGN CRITERIA

4-1 INTRODUCTION.

4-1.1 Design.

This chapter identifies the specific design needs for each functional area outlined in the space program. Tables 4-1 through 4-32 provide this data in a standard functional data sheet format.

4-1.2 Service-Specific Programmatic Differences.

Service-specific programmatic differences are indicated on the functional data sheets. Comply with agency requirements that apply to the project.

4-2 INTERIOR CONSTRUCTION SPECIALTIES.

The interior construction specialties, equipment, and furnishings criteria provided in these tables are broken down as follows:

4-2.1 Casework/Built-In Equipment.

This includes anything physically attached or plumbed to the building, such as counters, cabinets, casework, toilet accessories, fixed window treatments, and laundry machines.

4-2.2 Furnishings, Fixtures and Equipment (FF&E).

This includes contractor-furnished, contractor-installed loose items such as desks, tables, chairs, and bookshelves.

4-2.3 User-Provided Equipment.

This includes all government-furnished, government-installed items, which are typically limited to office equipment such as computers, printers, copiers, and flat panel displays (if mounted, the flat panel display mount will be built-in).

4-2.4 Fitness Equipment.

This includes all government-furnished, government-installed fitness equipment, including cardiovascular, strength training, and functional training items. These items are funded using the same source as FF&E but will be procured and installation-coordinated by NAF by the fitness program management office.

4-3 FUNCTIONAL DATA SHEETS.

These data sheets are available as a Microsoft® Word file for use during project execution. The file is downloadable from the Whole Building Design Guide (WBDG) website as an attachment to this UFC: **\1** http://www.wbdg.org/ffc/dod/unified-facilities-criteria-ufc/ufc-4-740-02 **/1/**

Table 4-1 Entry/Lobby and Waiting/Display

Description/ Usage	The lobby serves as the primary entrance to the facility for patrons, visitors, and spectators. The lobby must be open and friendly in design and serve to introduce the rest of the facility. Immediately adjacent to the lobby is the waiting/display area which provides an area for customers to relax and for the facility to display trophies and special activities and programs.
Min. Ceiling Ht.	10 ft (3.05 m) minimum.
Finishes	**Walls.** Provide a low-maintenance, durable finish with a wainscot. Provide painted gypsum wallboard or accent wall materials and color for visual interest. **Floor**. Provide a low-maintenance, durable, moisture- and slip-resistant finish suitable for this high-traffic area. Provide stained concrete, stone, terrazzo, or porcelain tile. Provide a walk-off mat/area at the entrance door that works integrally and flush with the adjacent finishes. Provide a base that matches the flooring or a vinyl or rubber base. **Ceiling**. Provide an identifying entry feature by creating custom ceiling using a combination of ceiling systems and/or a ceiling exposed to structure above.
Plumbing	Provide electric water cooler(s) near public toilets.
HVAC	Provide system per Chapter 3, "HVAC."
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, "Electrical."
Lighting	Provide system per Chapter 3, "Electrical." Provide decorative and task lighting. Provide accent lighting at signage/wayfinding devices.
Communication	**CCTV.** Provide at least one outlet or as needed to cover the entrance and lobby. **CATV/Internal Video.** Provide a CATV outlet. **PA/Audio.** Provide a speaker. **Telephone.** Provide one line. **Data.** Provide an outlet in the waiting/display area. **Security.** None required.
Casework/ Built-in Equipment	Provide display cases in this space.
Furnishings, Fixtures & Equip. (FF&E)	Waiting/display area must include durable, easy-to-clean, and moisture-resistant furniture; tables; magazine and brochure rack; tack surfaces; wall art; trophy case (if not built-in); and a wall clock. Provide a means to display installation and staff information. Provide a cell phone charging podium. Provide a self-use blood-pressure monitor.
User-provided Equipment	Computers and CCTV equipment.
Special Req.	Provide an airlock at the main entrance. Provide a grated snow-trap for Northern Tier bases.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 4-2 Control Counter/Equipment Issue/Storage

Description/ Usage	The control counter is often referred to as the front desk or reception desk. It's the focal point of information exchange within the building and is the check-in location for patrons; the check-in method may be located at the facility entrance or in the lobby to ensure all patrons check-in at entry. Do not use check-in/counting methods that restrict rapid access/egress to/from the facility, such as a turnstile. Equipment such as towels, balls, and racquetball rackets will be issued from the control desk. It must provide for direct supervision of the facility and greeting, informing, and directing patrons to their particular activity area. Additionally, the control desk serves as the focal point for safety and emergency situations. In smaller facilities, vending functions can be provided as an over-the-counter service at the control counter. Also see Table 4-3.
Min. Ceiling Ht.	9 ft (2.74 m) minimum.
Finishes	**Walls**. Painted gypsum wallboard. Provide accent wall materials and color for visual interest. **Floor**. **In front of counter:** Provide a low-maintenance, durable, moisture- and slip-resistant finish suitable for this high-traffic area. Provide stained concrete, stone, terrazzo, or porcelain tile. Provide a base that matches the flooring or a vinyl or rubber base. **Behind counter**: Provide stained concrete, stone or porcelain tile, or carpet. Provide vinyl or rubber base. **Ceiling**. Acoustic ceiling panels (ACP). Use the ceiling to define and separate this area from the lobby, e.g., a dropped gypsum board soffit over the control desk and gypsum board false beams.
Plumbing	None required.
HVAC	Provide system per Chapter 3, "HVAC."
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide power for all equipment per Chapter 3, "Electrical."
Lighting	Provide system per Chapter 3, "Electrical." Provide 30 fc (300 lx) of general ambient lighting. Provide fixed 50 fc (500 lx) task lighting at the control counter; decorative fixtures are preferred. In addition, provide accent lighting for emphasis around the counter area.
Communication	**CCTV.** All monitors must be viewable from this area. **CATV/Internal Video.** None required. **PA/Audio.** Provide PA and audio system controls at the control counter for room-by-room and "all call" communication. Provide intercom capability as directed by installation. Provide a speaker. **Telephone.** Provide one line per two points of sale (POS). Provide at least two additional general-purpose phone lines. In facilities that include a multipurpose field, provide a means for communication between the field kiosk and the control desk. **Data.** Data outlets must be provided for every piece of equipment identified as requiring data plus a 25% spare capacity for flexibility. Pieces of equipment include, but are not limited to, POS, computers, copier/printer/fax, and ID check system. **Security.** Provide a duress alarm with controls next to the POS units.

Casework/Built-in Equipment	Provide a 24-in. (610-mm) -deep counter with built-in cabinets. Provide file drawers and storage drawers with a minimum of two lockable drawers for each POS. The counter must be dual height for standing transactions, seated office functions, and ADA customer service. Note that ADA-height counter must have knee-hole space on both sides of the counter. The counter must be a durable solid surface material such as granite, concrete, or solid plastic; laminate is not permitted. Modesty panels and apron must be of durable materials. Provide a towel return drop opening in the counter top with space for a laundry cart below. The staff access to the counter must permit access to the free weight area for emergency response. Provide supports such as steel angle braces for counters with knee-hole space. Provide wall and base cabinets and an equipment counter. Storage must accommodate towels, small athletic equipment such as balls and rackets, and juice bar/vending supplies (if provided at the control counter). Provide flat panel display mount.
Furnishings, Fixtures & Equip. (FF&E)	Chairs and stools. Provide an automatic external defibrillator (AED).
User-provided Equipment	CCTV monitors, printers, scanner or swipe-card check-in device, and PA controls. POS units, desktop computer for administrative functions, and flat panel display.
Special Req.	Attendants at the control desk must have direct LOS visual control over the following: main entrance, free weight area, gymnasium entrance, locker room entrance, and climbing wall (if provided). Attendants must also have visual control (via LOS or CCTV) over the unit PT/group exercise rooms, the selectorized equipment, the cardio equipment, and structured activity areas. Air Force permits visual control of the locker room entrance via CCTV. For times when counter is not staffed: Provide a gate between the desk and surrounding area. Provide a coiling door or grille at the counter to serve as a security screen.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 4-3 Retail/Vending/Food and Beverage Sales

Description/ Usage	The retail/vending functions may be accommodated at the control counter. A juice bar or expanded retail functions will be provided in a separate area. Vending can also be provided at a self-service standalone space with vending machines. The vending area, if a standalone space, must be identifiable, visually screened but not totally enclosed, and visually accessible from the control desk. Space is considered optional for Navy.
Min. Ceiling Ht.	9 ft (2.74 m) minimum or matched with the lobby.
Finishes	**Walls**. Ceramic wall tile or other hard surfaces approved for food and beverage areas to a minimum of 4 ft (1.22 m) above finished floor (AFF). Utilize a durable and scrubbable eggshell or satin finish, whichever has higher gloss, for painted surfaces. **Floor.** Provide hard-surface flooring matching lobby or corridor such as seamless vinyl, hard tile or other durable material. Use of VCT is not allowed in this area. **Ceiling.** ACP or painted gypsum board.
Plumbing	Two-compartment stainless steel countertop sink with hot and cold water supply and a clean-out. Provide floor drain. If an icemaker is desired, provide a water connection.
HVAC	Provide system per Chapter 3, "HVAC."
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, "Electrical."
Lighting	Provide system per Chapter 3, "Electrical." Provide 40 fc (400 lx) of general ambient lighting. Provide 50 fc (500 lx) on food displays and at food preparation areas. Provide accent fixtures and lighting to provide special ambience.
Communication	**CCTV.** Provide quantity to allow adequate coverage. **CATV/Internal Video.** Provide an outlet at food and beverage area, if applicable. **PA/Audio.** Provide a speaker and intercom connection. **Telephone.** Provide one line per two POS. Provide at least one additional general-purpose phone line. **Data.** Provide one outlet per POS. Provide additional outlets, as needed, for associated hardware. **Security.** Provide duress alarm control next to the POS units.
Casework/ Built-in Equipment	Countertop with base and wall cabinets at the front opening. Behind the service corridor, provide base and wall cabinets. Sink-area countertop must be solid-surface. Drink rail. Dishwasher. Provide a lighted menu board (unless concessionaire operated). Option for under-cabinet microwave.
Furnishings, Fixtures & Equip. (FF&E)	Food and beverage/expanded retail: refrigerator, freezer, and other small appliances as required. In lieu of under-cabinet microwave, option for counter microwave. Provide ice maker and refrigerated display cases. Bistro-style tables and chairs.

User-provided Equipment	Provide CCTV cameras per the outlet count. Vending machines. POS unit(s).
Special Req.	Provide a means to secure the food and beverage sales/retail area. Provide a built-in safe per local policy.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 4-4 Laundry

Description/ Usage	The laundry accommodates cleaning and drying of towels and uniforms. Some installations contract out towel laundry; however, there is still a requirement to provide laundry for uniforms. Locate laundry adjacent to the control counter. It is preferred that the location be on an outside wall for ease of pick-up service.
Min. Ceiling Ht.	9 ft (2.74 m) minimum.
Finishes	**Walls.** Utilize a durable and scrubbable eggshell or satin finish, whichever has higher gloss, for painted CMU or mold-resistant gypsum wallboard. Provide durable finishes, rub rails, and metal/high-impact plastic corner guards. **Floor.** Sealed concrete, porcelain tile, or seamless vinyl. **Ceiling.** None, vinyl-faced ACP, or epoxy painted mold-resistant gypsum wallboard.
Plumbing	Provide hot and cold water and drain connections in recessed washer outlet box to each of the washing machines and one laundry sink. Provide floor drains. Provide connections and floor drain to an ice machine, if provided. Coordinate ice machine floor drain location with equipment.
HVAC	Provide system per Chapter 3, "HVAC." Temperature operating range: 68 °F (20 °C) to 76 °F (24 °C). Provide ventilation in accordance with ANSI/ASHRAE 62.1 requirements for "Laundry Rooms, Central." Provide separate vents for each dryer and vent dryers per UFC 3-410-01.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety." Regardless of size, enclose laundry rooms with a 1-hour fire barrier.
Power	Provide outlets per Chapter 3, "Electrical." Provide a dedicated circuit for each washer (or washer extractor) and for each dryer (or dryer tumbler). If hard-wired (non-plug-connected), provide wall-mounted safety disconnect switch within sight of the equipment it controls.
Lighting	Provide system per Chapter 3, "Electrical."
Communication	**CCTV**. None required. **CATV/Internal Video**. None required. **PA/Audio**. Provide one speaker. **Telephone**. None required. **Data**. None required. **Security.** Provide lockable doors.
Acoustics	Provide partition construction with a minimum STC rating of 52 per Chapter 3, “Acoustics.”
Casework/ Built-in Equipment	Provide a built-in folding table and shelves for clean towel storage.
Furnishings, Fixtures & Equip. (FF&E)	Provide storage shelves (freestanding) for laundry supplies. Laundry carts, and commercial grade washers/dryers.
User-provided equipment	None required.

Special Req.	Provide easy access to rear of dryers (or tumblers) to allow maintenance and cleaning of vents (see HVAC). Provide space for storage of laundry carts. Coordinate door openings and dimensions with room layout and equipment sizes, e.g., laundry carts, washers/extractors, dryers/tumblers, and ice machines. Provide acoustical measures to control the noise/vibration of the washers/extractors and dryers/tumblers. The laundry room must not be visible from the lobby area.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 4-5 Public Toilets/Janitor's Closet

Description/ Usage	These toilet rooms are used primarily by visitors, spectators, and persons not using the locker and shower rooms. They must be adjacent to the lobby and gymnasium. Provide unisex or separate male, female, and gender-neutral restrooms depending on the total number of patrons to be accommodated.
Min. Ceiling Ht.	9 ft (2.74 m) minimum.
Finishes	**Walls**. Epoxy or semi-gloss enamel painted mold-resistant gypsum wallboard with a ceramic tile wainscot. Prefer full-height ceramic tile walls with integral patterns, especially on wet walls. Use a dark-colored epoxy grout. **Floor**. Non-slip porcelain tile with dark-colored epoxy grout. Slope tile to drain. **Ceiling**. Semi-gloss enamel or epoxy painted mold-resistant gypsum wall board.
Plumbing	Provide wall-hung water closets, wall-hung urinals and lavatories based on the applicable UFC 3-420-01 requirements for the calculated occupancy of the gymnasium. Provide a floor drain.
HVAC	Provide system per Chapter 3, "HVAC." Temperature operating range: 70 °F (21 °C) to 78 °F (26 °C). Exhaust per UFC 3-410-01.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, "Electrical."
Lighting	Provide system per Chapter 3, "Electrical."
Communication	**CCTV**. None required. **CATV/Internal Video**. None required. **PA/Audio**. Provide a speaker. **Telephone**. None required. **Data**. None required. **Security**. Provide lockable doors.
Casework/ Built-in Equipment	Solid-surface countertop with either underhung or integral sink. Solid composite toilet and urinal partitions. Toilet accessories: Toilet paper dispensers, paper towel dispenser with integral trash receptacle, robe hooks, grab bars, sanitary napkin disposal (female water closet stalls), seat cover dispensers, and soap dispensers. Mirror. Provide electric hand dryers. Fold-down diaper-changing table/station in male, female, and gender-neutral toilets.
Furnishings, Fixtures & Equip. (FF&E)	Lockable cabinets for cleaning supplies at janitor's closet.
User-provided Equipment	None required.
Special Req.	Provide a janitor's closet associated with or in proximity of these toilets. This closet includes a floor mop sink with hot and cold water and a hose connection, a floor drain, and storage for pails, mops, vacuums, and related cleaning supplies and equipment. Include a lockable door (which can be opened from the inside). Exhaust per UFC 3-410-01.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 4-6 Parent/Child Area

Description/ Usage	The parent/child area is optional. This option provides parents/guardians a venue in which to exercise while maintaining direct visual control over their child. Part of the room has exercise equipment for the parent to use while the other part is designated for the children. The two areas must be divided by a 30-in. (760-mm) high, 0.5-in. (13-mm) thick, clear, shatterproof Plexiglas partition to ensure the parent can see the child at all times. Include a centrally located entry/exit in the partition**.**
Min. Ceiling Ht.	9 ft (2.74 m) minimum.
Finishes	**Walls**. Semi-gloss painted gypsum wallboard. **Floor**. Homogeneous resilient sheet flooring with scuff-resistant properties and maintenance consisting of damp mop, no wax, buff only, and resilient base. Exercise area must include permanently adhered resilient athletic flooring consisting of dual durometer layers of natural and synthetic rubbers, calendared and vulcanized together. The top layer is a non-porous, slip-resistant, textured surface; the bottom layer is a cushioned performance layer. Total thickness to be 3/8 in. (9 to 10 mm). Athletic flooring system cannot be accommodated by interlocking flooring tiles or movable furnishings such as mats. **Ceiling.** ACP.
Plumbing	None required.
HVAC	Provide system per Chapter 3, "HVAC." Temperature operating range: 68 °F (20 °C) to 74 °F (23 °C). Provide ventilation in accordance with ANSI/ASHRAE 62.1 requirements for "Health club/weight rooms."
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, "Electrical," in the child area. For safety of the children, the top of the electrical outlet boxes must be 54 in. (1350 mm) AFF. Provide flush-floor outlets for commercial-grade fitness equipment and outlets for wall- or ceiling-mounted flat panel display in the fitness area.
Lighting	Provide system per Chapter 3, "Electrical."
Communication	**CCTV.** Provide outlets to ensure adequate coverage. **CATV/Internal Video.** Provide an outlet in the fitness area. **PA/Audio.** Provide a speaker. Provide an emergency call/alarm that sounds at the control counter until reset by the respondent. **Telephone.** Provide an outlet. **Data.** Provide an outlet. **Security.** Provide lockable doors.
Casework/ Built-in Equip.	Child area to include storage cabinet for children's games and toys. Flat panel display universal wall mount.
Furnishings, Fixtures & Equip. (FF&E)	**Child area**: Provide child-sized tables, chairs, and games. Provide exercise mat. **Fitness area**: Provide fitness equipment.
User-provided Equipment	Flat panel display.

Special Req.	Mar-resistant Plexiglas partition of shatterproof, 30-in. (750-mm) high, 0.5-in. (13-mm) thick, and clear to ensure the parent can see the child at all times. Include a centrally located entry/exit in the partition. Provide vision panel in the door and side lites.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customer. Adults. Children.
Min. net ft^2 (m^2)	

Table 4-7 Receiving and Equipment Repair/Storage

Description/ Usage	Provides an area to store, assemble, and repair fitness equipment. It will also be used to store overflow from the control counter/equipment issue storage, such as large or seasonal items. This area is adjacent to the fitness areas. There is an option for additional storage for optional programmatic items (such as a boxing ring). If required, this space will usually be part of/adjacent to the receiving and equipment repair area.
Min. Ceiling Ht.	10 ft (3.05 m) minimum.
Finishes	**Walls.** Durable materials such as CMU with heavy-duty epoxy paint. **Floor.** Sealed concrete. **Ceiling.** None. Paint the exposed structure.
Plumbing	Provide a utility sink with hot and cold water connections and a floor drain.
HVAC	Provide system per Chapter 3, "HVAC."
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, "Electrical." Provide additional outlets at the work bench.
Lighting	Provide system per Chapter 3, "Electrical." Provide 30 fc (300 lx) of general ambient lighting. Provide 50 fc (500 lx) task lighting at the work bench.
Communication	**CCTV**. Provide one outlet. **CATV/Internal Video**. None required. **PA/Audio**. Provide a speaker. **Telephone**. Provide one line with internal two-way communication. **Data**. Provide one outlet. **Security**. Provide lockable doors, a door alarm, and exterior door bell.
Casework/ Built-in Equipment	None required.
Furnishings, Fixtures & Equip. (FF&E)	Provide adequate shelving, bins, and open-end cubicles for storage of athletic equipment for both in- and out-of-season supplies. Provide workbenches and lockable tool and parts storage cabinet.
User-provided Equipment	None required.
Special Requirements	Provide a pair of locking exterior double doors, 4 ft (1.22 m) wide by 9.5 ft (2.9 m) tall each, with flush sills, to facilitate movement of equipment. Provide an interior pair of locking double doors, 4 ft (1.22 m) wide by 9.5 ft (2.9 m) each, to facilitate movement of equipment. Do not combine this space with mechanical or electrical rooms.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 4-8 Administrative Offices

Description/ Usage	The administrative offices consist of a mix of private and open office space. The quantity and type of offices are facility-specific. Generally speaking, the following office spaces are provided: director's office, program managers' office(s), and support staff workstations. The offices must be free from frequent distraction, have a professional appearance, and provide a sense of workplace.
Min. Ceiling Ht.	9 ft (2.74 m) minimum.
Finishes	**Walls.** Utilize a durable and scrubbable eggshell or satin finish, whichever has higher gloss, for painted gypsum wall board or wall covering. **Floor**. Carpet tile with resilient base. **Ceiling**. ACP.
Plumbing	None required.
HVAC	Provide system per Chapter 3, "HVAC." Temperature operating range: 68 °F (20 °C) to 76 °F (24 °C).
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, "Electrical." Ensure an adequate number of circuits to power all equipment.
Lighting	Provide system per Chapter 3, "Electrical."
Communication	**CCTV.** Provide monitoring capability in the director's office when directed by the installation. **CATV/Internal Video:** One outlet required for director's office. **PA/Audio:** Provide a speaker. Provide controls in the director's office with room-by-room and "all call" communication. Provide intercom capability as directed by installation. **Telephone.** Provide one line per staff plus one additional line for fax and copier. **Data.** Provide one outlet per staff plus one outlet for each printer, copier, and scanner. **Security.** Provide lockable area for fitness access DVRs.
Acoustics	Provide partition construction with a minimum STC rating of 45 per Chapter 3, "Acoustics." If possible, do not locate these offices near noisy spaces as defined in Chapter 3, "Acoustics."
Casework/Built-in Equipment	Provide dry-erase boards in select offices.
Furnishings Fixtures & Equipment (FF&E)	Private offices—provide furniture for 120 ft^2 (11 m^2) or 100 ft^2 (9.3 m^2) office: desk, credenza, filing cabinet, desk chair, and two side chairs. Workstations—provide furniture for 64 ft^2 (6 m^2) workstation: desk chair and side chair for open offices. Workstation layout must provide adequate space for filing and overhead storage.
User-provided Equipment	Computers and other office equipment. Provide safe (for cash funds).
Special Requirements	For the director's office, provide an interior window with blinds to accommodate visual supervision over the fitness area and the control counter, where possible. Where possible, locate offices on exterior wall and provide windows for natural light admission. Provide shades or blinds at exterior windows for light control. Provide side lites next to the office doors for supervision and security.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 4-9 Classrooms/Training Rooms

Description/ Usage	This space is used for conducting training and large meetings. This space must be accessible from administrative areas and public circulation spaces. Classroom sized for 25 persons at 750 ft^2 (69.7 m^2) for small facilities, 50 persons at 1,500 ft^2 (139.4 m^2) for medium and large, and 75 persons at 2,250 ft^2 (209.0 m^2) for extra-large and jumbo facilities.
Min. Ceiling Ht.	9 ft (2.74 m) minimum.
Finishes	**Walls.** Utilize a durable and scrubbable eggshell or satin finish, whichever has higher gloss, for painted gypsum wallboard or wall covering. **Floor.** Carpet tile is preferred. Other acceptable materials include stone, terrazzo, porcelain tile, stained concrete, or other hard tile. VCT is not allowed. **Ceiling**. ACP.
Plumbing	None required.
HVAC	Provide system per Chapter 3, "HVAC."
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, "Electrical," and additional outlets necessary to operate portable and dedicated equipment.
Lighting	Provide per Chapter 3, "Electrical," and include multiple light levels with controls for viewing multimedia presentations.
Communication	**CCTV.** Provide outlets as required for coverage. **CATV/Internal Video.** Provide one outlet. **PA/Audio.** Provide a speaker. **Telephone.** Provide one line. **Data.** Provide a minimum of two outlets. Provide additional outlets for training purposes. **Security.** Provide lockable doors.
Acoustics	Provide partition construction with a minimum STC rating of 49 per Chapter 3, "Acoustics." If possible, do not locate this room near noisy spaces as defined in Chapter 3, "Acoustics."
Casework/ Built-in Equipment	Provide a universal flat panel display mount. Provide solid-surface countertop. Provide lockable wall and base cabinets. Bulletin board with tack surface and dry-erase board.
Furnishings Fixtures & Equipment (FF&E)	Provide tables and chairs. Provide A/V cart, podium/lectern.
User-provided Equipment	CCTV equipment, flat panel display, printer, and DVD player.
Special Requirements	Provide a lockable storage closet with built-in shelves for training materials and floor space for AV cart. Provide a vision panel, minimum 5 ft^2 (0.46 m^2), in the door. For medium-size facilities and larger, provide an acoustical operable partition with minimum STC of 45. The operable partition is to recess into an alcove when in open position. Provide two separate entrances.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 4-10 Copy/Work/Break Room

Description/ Usage	This space is used as a staff workroom for copying, meetings, breaks, and lunches. Provide isolated alcove or separate space for copy/workroom.
Min. Ceiling Ht.	9 ft (2.74 m) minimum.
Finishes	**Walls.** Utilize a durable and scrubbable eggshell or satin finish, whichever has higher gloss, for painted gypsum wall board or wall covering. **Floor.** Provide hard-surface flooring matching corridor, such as seamless vinyl, hard tile, or other durable material. **Ceiling.** ACP.
Plumbing	Provide a two-compartment stainless-steel countertop sink with hot and cold water. Provide a cold-water connection for refrigerator ice maker.
HVAC	Provide system per Chapter 3, "HVAC." Temperature operating range: 68 °F (20 °C) to 76 °F (24 °C).
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, "Electrical." Provide one additional outlet at counter height for convenience. Provide additional outlets necessary to operate dedicated equipment.
Lighting	Provide system per Chapter 3, "Electrical."
Communication	**CCTV.** None required. **CATV/Internal Video.** Provide one outlet. **PA/Audio.** Provide a speaker. **Telephone.** Provide one line. **Data.** Provide outlets as required for equipment. **Security.** Provide lockable doors.
Acoustics	No special provisions required.
Casework/ Built-in Equipment	Provide two separate solid-surface countertops: one for food/break functions and one for administrative functions. Provide lockable wall and base cabinets. Bulletin board with tack surface and dry-erase board.
Furnishings Fixtures & Equipment (FF&E)	Provide table, chairs, microwave, coffee machine, and refrigerator.
User-provided Equipment	Copier/fax/printer and laminating machine.
Special Requirements	Locate copy/work/break room on exterior wall and provide windows for natural light admission. Provide a vision panel in the door.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 4-11 Men's and Women's Lockers/Dressing

Description/ Usage	Separate men's and women's locker/dressing rooms will be used by those participating in fitness/sports activities for changing, dressing, and securing personal effects. It is open and directly adjacent to the toilet/shower facilities. As such, moisture and humidity must be addressed in the locker/dressing rooms.
Min. Ceiling Ht.	10 ft (3.05 m) minimum except where furred down at soffits.
Finishes	**Walls.** Epoxy or semi-gloss enamel painted CMU or mold-resistant gypsum wallboard. **Floor.** Non-slip porcelain tile with dark-colored epoxy grout. Slope tile to drain. **Ceiling.** High-humidity-rated, vinyl-faced ACP with a corrosion-resistant supporting grid or mold-resistant gypsum wallboard with a veneer plaster (level 5) finish and semi-gloss paint.
Plumbing	Provide and locate floor drains as required to ensure proper drainage and no standing water on the floor (this is particularly important in facilities with a pool). Provide an electric water cooler.
HVAC	Provide system per Chapter 3, "HVAC." Temperature operating range: 70 °F (21 °C) to 78 °F (26 °C). Provide supply air from the dry side of this space (opposite the adjacent toilet/shower wet side) and exhaust from the wet area. Exhaust per UFC 3-410-01. Limit relative humidity to under 50% through the use of humidistats. Provide multi-speed ceiling fans with wall-mounted controls (not required to be HVLS fans).
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety." Where shower spaces are open to the locker room area, provide corrosion-resistant sprinkler and escutcheons such as stainless steel throughout the locker room.
Power	Provide outlets per Chapter 3, "Electrical." Provide counter-height outlets at the vanity area. Provide power to the hair dryers identified in the built-in equipment. Provide outlets where flat panel displays are required; provide at height of flat panel display.
Lighting	Provide system per Chapter 3, "Electrical." Lighting fixtures must have translucent, damp location, non-breakable, protective covers. Minimize shadowing at face of lockers.
Communication	**CCTV**. None required. **CATV/Internal Video**. Provide CATV outlets for wall or ceiling mounts. **PA/Audio**. Provide PA speakers as needed for full coverage. Provide speakers for the separate audio system. Provide an emergency call/alarm. **Telephone**. None required. **Data**. None required. **Security**. None required.
Acoustics	No special provisions required.

Casework/ Built-in Equipment	Provide solid plastic (HDPE) lockers and benches. Lockers must be a minimum of 15-in. wide by 24-in. deep (375 mm by 600 mm) with integral minimum 16-in. (400-mm) -wide benches (usually part of the locker system). Five percent of lockers must be accessible. Accessible benches are required to be adjacent to accessible lockers. Benches must have a minimum of 20 in. (500 mm) to maximum 24 in. (600 mm) in depth; 42 in. (1050 mm) minimum in length; seat height of 17 to 19 in. (425 to 475 mm) above the floor. Typically provide a mix of full- and half-sized Z-shaped lockers; provide 2 half-height lockers and 1 full-height locker in every 2 spaces. The location's climate determines the ratio of half- to full-sized lockers: Colder climates will require a higher percentage (or 100%) of full-sized lockers to accommodate bulkier cold weather gear. Provide shelves and hooks for coats and hats inside lockers. Steel lockers are not permitted. Mount lockers at a level above the floor to ensure operating hardware is easily reachable. Provide padlock or touch combination hardware. Provide a vanity area with a counter and mirror. Provide wall-mounted hair dryers adjacent to this area. Provide one hair dryer for every three shower heads for men and one hair dryer for every two shower heads for women. Provide a full-height wall mirror.
Furnishings, Fixtures & Equip. (FF&E)	Provide a scale and a wall clock.
User-provided Equipment	Provide blood pressure monitor and flat panel display.
Special Requirements	Provide dropped gypsum board soffits over lockers or utilize sloped-top lockers to preclude the tops of the lockers being used for storage. Design the space to block direct views from the public areas in. Consider providing natural light via frosted skylights or translucent wall building materials.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 4-12 Men's and Women's Showers

Description/ Usage	These separate male and female areas are directly adjacent to (and may be open to) the corresponding gender's locker/dressing and toilet areas and include private shower and adjacent drying stalls. If the facility includes a pool, the pool entry/exit must be adjacent to this area. Other adjacent functions may include sauna and/or steam room. Shower compartment construction options include constructed separation walls, field-assembled pre-manufactured shower partitions and pre-manufactured solid surface shower compartments. Shower counts are programmed per installation.
Min. Ceiling Ht.	9 ft (2.74 m) minimum
Finishes	**Walls.** Full height ceramic tile with dark-colored epoxy grout on cementitious backer units. **Floor.** Non-slip porcelain tile with dark-colored epoxy grout. Slope tile to drain. **Ceiling.** Mold-resistant gypsum wallboard with a veneer plaster (level 5) finish and epoxy paint.
Plumbing	Provide minimum 42-in. (1068-mm) -wide private shower/drying stalls for men and women. Provide a minimum of one floor drain at each shower stall and additional drains as needed to ensure proper drainage.
HVAC	Provide system per Chapter 3, "HVAC." Temperature operating range: 70 °F (21 °C) to 78 °F (26 °C). Provide supply air from the dry side (adjacent locker/dressing area) and exhaust from the wet (toilet/shower) area. Exhaust per UFC 3-410-01. If constructed separation walls are used from floor to ceiling, locate exhaust outlets in each space.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety." Provide corrosion-resistant sprinklers and escutcheons such as stainless steel throughout the shower area.
Power	Provide outlets per Chapter 3, "Electrical."
Lighting	Provide system per Chapter 3, "Electrical." Provide recessed fixtures with sealed lenses, rated for wet applications.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. Provide an emergency call/alarm. **Telephone.** None required. **Data.** None required. **Security.** None required.
Casework/ Built-in Equipment	Solid plastic (HDPE) shower partitions secured at floor, wall, and ceiling or provide permanent walls between showers; see **Finishes** for wall finish. Provide fixed solid plastic benches at drying areas at least 16 in. (400 mm) wide. Provide hooks or towel pins on wall in drying area. Provide swim mats or tiles that are textured, anti-slip, self-draining, and raise the walking surface above standing water. If the facility includes a pool, provide a swimsuit spin-dry unit.
Furnishings, Fixtures & Equip. (FF&E)	None required.
User-provided Equipment	None required.
Special Requirements	Design the space to block direct views from the public areas into the shower room areas. Provide natural light via frosted skylights or translucent wall building materials.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 4-13 Men's and Women's Toilets

Description/ Usage	Separate men's and women's toilet facilities are open and directly adjacent to the corresponding gender's locker/dressing and shower areas.
Min. Ceiling Ht.	9 ft (2.74 m) minimum
Finishes	**Walls.** Full-height ceramic tile with dark-colored epoxy grout on cementitious backer units at wet walls and ceramic tile wainscots at fixture areas. Epoxy or semi-gloss painted, mold-resistant gypsum wallboard elsewhere. **Floor.** Non-slip porcelain tile with dark-colored epoxy grout. Slope tile to drain. **Ceiling.** Vinyl-faced ACP or mold-resistant gypsum wallboard with a veneer plaster (level 5) finish and semi-gloss paint.
Plumbing	Provide wall-hung water closets, wall-hung urinals and lavatories based on the applicable UFC 3-420-01 requirements for the calculated occupancy of the facility. Provide floor drains to fully drain area.
HVAC	Provide system per Chapter 3, "HVAC." Temperature operating range: 70 °F (21 °C) to 78 °F (26 °C). Provide supply air from the dry side of this space (adjacent locker/dressing area) and exhaust from the wet area (toilet/shower). Exhaust per UFC 3-410-01. Limit relative humidity to under 50% through the use of humidistats.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety." Where shower spaces are open to the toilet area, provide corrosion-resistant sprinklers and escutcheons such as stainless steel throughout the toilet room.
Power	Provide outlets per Chapter 3, "Electrical," Provide GFCI outlets at lavatory at counter height.
Lighting	Provide system per Chapter 3, "Electrical." Lighting fixtures must have translucent, damp location, non-breakable protective covers with shatterproof lens. Provide lighting directly over lavatories and grooming counters and minimize reflection glare in the mirrors in the overall lighting design.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. Provide an emergency call/alarm. **Telephone.** None required. **Data.** None required. **Security.** None required.
Acoustics	No special provisions required.
Casework/ Built-in Equipment	Solid-surface countertop supported at both ends and with the front edge supported by galvanized angle reinforcing. Use holes in lavatory countertop for waste disposal; coordinate location of paper towel dispenser. The sink may be either undermount or integral with the counter. Solid plastic (HDPE) toilet and urinal partitions secured at floor and ceiling. **Toilet accessories**: Toilet paper dispensers, paper towel dispenser, trash receptacle, robe and towel hooks, grab bars, feminine hygiene receptacles in women's water closets, seat cover dispensers, and soap dispensers at lavatories. Provide wall-mounted shelves and full-width mirror at the lavatories. Provide a full-length mirror. Provide electric hand dryers.

Furnishings, Fixtures & Equip. (FF&E)	None required.
User-provided Equipment	None required.
Special Requirements	Design entrances to prevent direct views into this area. Provide natural light via frosted skylights or translucent wall building materials.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 4-14 Unisex Changing Room/Unisex Locker Room

Description/ Usage	This space provides separate, individual rooms equipped with changing area, shower, toilet, sink, diaper changing table, and lockers intended as a single-use facility for adults with or without small children. Locate near the pool (if provided) or near the parent/child area. Allow for unisex locker units to be used independently from unisex changing rooms.
Min. Ceiling Ht.	9 ft (2.74 m) minimum.
Finishes	**Walls.** See Tables 4-11, 4-12, and 4-13 for the appropriate finishes. **Floor**. See Tables 4-11, 4-12, and 4-13 for the appropriate finishes. **Ceiling**. See Tables 4-11, 4-12, and 4-13 for the appropriate finishes.
Plumbing	Provide shower, wall-hung water closet, and lavatory. Provide a minimum of one floor drain in shower, one general floor drain, and additional drains as needed to ensure proper drainage.
HVAC	Provide system per Chapter 3, "HVAC." Temperature operating range: 70 °F (21 °C) to 78 °F (26 °C). Exhaust per UFC 3-410-01. Limit relative humidity to 50% through use of humidistats.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety." Where shower spaces are open to the locker room area, provide corrosion-resistant sprinklers and escutcheons such as stainless steel throughout the locker room.
Power	Provide outlets per Chapter 3, "Electrical." Provide counter-height GFCI outlets at the lavatory.
Lighting	Provide system per Chapter 3, "Electrical." Lighting fixtures must have translucent, damp location, non-breakable protective covers. Minimize shadowing at face of lockers. Provide lighting directly over lavatory to minimize reflections and glare in the mirrors. In the shower, provide recessed fixtures with sealed lenses, rated for wet applications.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. Provide an emergency call/alarm. **Telephone.** None required. **Data.** None required. **Security.** Provide lockable doors.
Casework/ Built-in Equipment	See Tables 4-11, 4-12, and 4-13 for the appropriate casework.
Furnishings, Fixtures & Equip. (FF&E)	See Tables 4-11, 4-12, and 4-13 for the appropriate FF&E.
User-provided Equipment	None required.
Special Requirements	See Tables 4-11, 4-12, and 4-13 for the appropriate special requirements.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 4-15 Steam Room

Description/ Usage	**Note:** This space is not supported by the Navy. The optional steam room must have an adjacent cool-down space and direct access to the shower spaces and the locker spaces. It provides a warm, extremely humid (close to 100%) environment for therapy and relaxation. Provide separate male and female rooms as part of or adjacent to male and female toilet and shower facilities.
Min. Ceiling Ht.	9 ft (2.74 m) minimum.
Finishes	**Walls.** Full-height ceramic tile with dark-colored epoxy grout. **Floor**. Non-slip ceramic. **Ceiling**. Tile: pitched for drainage down the walls.
Plumbing	Provide a cold-water shower with a rope pull-chain. Provide floor drains. Provide access to a keyed hose bibb with hot and cold water.
HVAC	Temperature operating range: 100 °F (38 °C) to 110 °F (43 °C). Humidity 100% relative. Provide secured controls.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety." Provide high-temperature-rated corrosion-resistant sprinklers and escutcheons such as stainless steel throughout the steam room. Fire alarm notification appliances are not required within the steam room. Provide an audible and visual fire alarm notification appliance on the wall directly opposite the entry door into the steam room, with a minimum sound power of 95 dB at 10 ft (3 m) and 110 cd. At a minimum, provide a 100 $in.^2$ (.06 m^2) vision panel within the entry door into the steam room.
Power	None required.
Lighting	35 fc (375 lx). General ambient lighting. Lighting fixtures must have translucent, moisture-resistant, non-breakable protective covers.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker in the adjacent cool-down area. Provide an emergency call/alarm in the steam room that sounds at the control counter. **Telephone.** None required. **Data.** None required. **Security.** None required.
Casework/ Built-in Equipment	Provide ceramic tile benches in a single- or double-tiered arrangement.
Furnishings, Fixtures & Equip. (FF&E)	Provide wall-mounted clock visible from steam room.
User-provided Equipment	None required.
Special Requirements	An adjacent cool-down space can serve the steam room, sauna (if provided), and hot tub (if provided). It must have a bench with wall-mounted clothing/towel hooks. Provide a full-glass door with a door seal adequate to retain the steam within the room. Provide steam generator in an adjacent closet.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 4-16 Sauna

Description/ Usage	**Note:** This space is not supported by the Navy. The optional sauna must have an adjacent cool-down space and direct access to the shower and locker spaces. It provides a very hot, dry environment for therapy and relaxation. Provide separate male and female rooms as part of or adjacent to male and female toilet and shower facilities. Providing a prefabricated, packaged unit is acceptable.
Min. Ceiling Ht.	8 ft (2.44 m) minimum.
Finishes	**Walls.** CMU with either redwood or cedar panels. **Floor**. Sealed concrete with removable redwood tile "mats." **Ceiling**. Redwood or cedar panels.
Plumbing	Provide a floor drain.
HVAC	Provide a separate dry heat system with individual temperature controls and a timer to achieve 170 °F to 180 °F (77 °C to 82 °C) with 5% relative humidity. Provide secure controls. Provide passive ventilation to achieve four air changes/hour.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety." Provide high-temperature-rated corrosion resistant sprinklers and escutcheons such as stainless steel throughout the sauna. Fire alarm notification appliances are not required within the sauna. Provide an audible and visual fire alarm notification appliance on the wall directly opposite the entry door into the sauna, with a minimum sound power of 95 dB at 10 ft (3 m) and 110 cd. At a minimum, provide a 100 in.^{2} (0.6 m^2) vision panel within the entry door into the sauna.
Power	Provide a dedicated circuit for the heat source.
Lighting	Provide 10 fc (100 lx) of general ambient lighting. Lighting fixtures must be rated for wet applications, with ambient temperature rating of at least 180 °F (82 °C).
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. Provide an emergency call/alarm mounted within 36 in. (900 mm) of finished floor that sounds at the control counter until reset by the respondent. **Telephone.** None required. **Data.** None required. **Security.** None required.
Casework/ Built-in Equipment	Provide solid board cedar or redwood benches. One bench must meet ABA requirements. Provide a wall-mounted room temperature and humidity gauge. Provide hooks.
Furnishings, Fixtures & Equip. (FF&E)	Provide a water tub and ladle for wet sauna. Provide a wall-mounted clock in this area that is visible from the sauna room.
User-provided Equipment	None required.
Special Requirements	Provide an insulated door with a vision panel and seals to maintain temperature. Minimize exposed metal hardware. Ensure no exposed metal fasteners on the benches. Use plastic or wood interior door handle. An adjacent cool-down space can serve the sauna, steam room (if provided), and hot tub (if provided). It must have a bench with wall-mounted clothing/towel hooks.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 4-17 Massage Room

Description/ Usage	The optional massage room provides a private space for massage service. It is preferred to be adjacent to the locker/shower facilities.
Min. Ceiling Ht.	9 ft (2.74 m) minimum.
Finishes	**Walls.** Utilize a durable and scrubbable eggshell or satin finish, whichever has higher gloss, for painted gypsum wall board. **Floor.** Non-slip porcelain tile with dark-colored epoxy grout or resilient flooring with resilient base or porcelain tile. **Ceiling.** ACP.
Plumbing	Provide a hand-wash sink with hot and cold water connections. Provide floor drain.
HVAC	Provide system per Chapter 3, "HVAC." Temperature operating range: 72 °F (22 °C) to 78 °F (26 °C). Provide independent thermostat.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, "Electrical."
Lighting	Provide system per Chapter 3, "Electrical." Provide 50 fc (500 lx) with indirect light fixtures and provide continuous dimming capability.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. Provide an emergency call/alarm that sounds at the control counter until reset by the respondent. **Telephone.** Provide one line. **Data.** None required. **Security.** Provide lockable doors.
Acoustics	Provide partition construction with a minimum STC rating of 45 per Chapter 3, "Acoustics." If possible, do not locate this room near noisy spaces as defined in Chapter 3, "Acoustics."
Casework/ Built-in Equipment	Provide clothes hooks.
Furnishings, Fixtures & Equip. (FF&E)	Provide a securable storage cabinet for supplies such as sheets, towels, and massage oil. Unless operated by a concessionaire, provide the following: height-adjustable massage table with adjustable head rest; adjustable-height wheeled stool for the therapist; massage chair in addition to or in lieu of the massage table; small table for making and verifying appointments.
User-provided Equipment	None required.
Special Requirements	None required.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 4-18 Hot Tub

Description/ Usage	**Note:** This space is not supported by the Navy. The optional hot tub must have direct access to the shower and locker spaces and be adjacent to the steam room, if provided. It provides a hot pool of water with powered jets of water for therapy and relaxation. May provide separate male and female rooms as part of or adjacent to male and female toilet and shower facilities or provide a single room for use by both men and women.
Min. Ceiling Ht.	10 ft (3.05 m) minimum.
Finishes	**Walls**. Water-resistant surface. **Floor**. Slip-resistant ceramic tile, no larger than 1 by 1 in. (25 by 25 mm) tiles with dark epoxy grout. **Ceiling**. Water-resistant surface.
Plumbing	Provide a floor drain.
HVAC	Provide system per Chapter 3, "HVAC." Temperature operating range: 72 °F (22 °C) to 78 °F (26 °C). Provide minimum six air changes per hour.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety." Provide corrosion-resistant sprinklers and escutcheons such as stainless steel throughout the hot tub area.
Power	Provide waterproof outlets. Provide dedicated power for the water pump with a timer-operated pump switch with patron access.
Lighting	Provide waterproof fixtures.
Communication	**CCTV.** Provide outlets as required for coverage if the facility is shared by men and women. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. Provide an emergency call/alarm that sounds at the control counter. **Telephone.** None required. **Data.** None required. **Security.** Provide lockable area for when fitness access is in use.
Casework/ Built-in Equipment	Provide clothes hooks, seating bench, and handrail for entrance/exit of pool.
User-provided Equipment	CCTV equipment.
Furnishings, Fixtures & Equip. (FF&E)	Provide freestanding shelving unit for towels and a wall clock. Provide a chemical storage cabinet.
Special Requirements	Provide a whirlpool tub with a dedicated water supply, water filter, hot water heater, and water pump. Provide an emergency shut-off control for the whirlpool. Provide an adjacent dry-off/dressing area. Provide corrosion-resistant materials for hardware, AC ducts, AC registers, and door frames.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 4-19 Convertible Locker Space

Description/ Usage	**Note:** This space is not supported by the Navy. This optional space for large or extra-large facilities provides locker/dressing space that can be converted to male or female space, as needed, to accommodate tournaments and/or changing demographics. It is a separate room between the male and female locker rooms with double-locked doors into each. The criteria generally follow that in Table 4-11 for the locker/dressing area. This is not additional locker space and will need to be deducted from the overall calculated locker space for the facility.
Min. Ceiling Ht.	10 ft (3.05 m) minimum except where furred down.
Finishes	**Walls.** Epoxy or semi-gloss enamel painted CMU or mold-resistant gypsum wallboard. **Floor.** Non-slip porcelain tile with dark-colored epoxy grout. Slope tile to drain. **Ceiling.** High humidity-rated, vinyl-faced ACP with a corrosion-resistant supporting grid or mold-resistant gypsum wallboard with a veneer plaster (level 5) finish and semi-gloss paint.
Plumbing	Provide floor drains. Provide an electric water cooler.
HVAC	Provide system per Chapter 3, "HVAC." Temperature operating range: 70 °F (21 °C) to 78 °F (26 °C). Exhaust per UFC 3-410-01. Control exhaust to unoccupied exhaust rate of 0.06 cfm/ft^2 (0.0183 m^3/min./m^2) when space is unoccupied. Limit relative humidity to under 50% through the use of humidistats. May provide ceiling fans with wall-mounted controls.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, "Electrical." Provide counter-height outlets at the vanity area.
Lighting	Provide system per Chapter 3, "Electrical." Lighting fixtures must have translucent, damp location, non-breakable protective covers. Minimize shadowing at face of lockers.
Communication	**CCTV.** None required. **CATV/Internal Video.** Provide an outlet. **PA/Audio.** Provide a speaker. Provide an emergency call/alarm. **Telephone.** Provide one line. **Data.** None required. **Security.** Provide lockable doors.
Casework/ Built-in Equipment	Provide solid plastic (HDPE) lockers and benches. Lockers must be a minimum of 15 in. wide by 24 in. (375 mm by 600 mm) deep with integral minimum 16-in. (400-mm) -wide benches (usually part of the locker system). These lockers are daily use only (not rented). Typically provide a mix of full- and half-sized Z-shaped lockers. The location's climate will determine the ratio of half- to full-sized lockers: colder climates will require a higher percentage (or 100%) of full-sized lockers to accommodate bulkier cold weather gear. Steel lockers are not permitted. Mount lockers at a level above the floor to ensure operating hardware is easily reachable. Provide a vanity area with a counter and mirror. Provide wall-mounted hair dryers adjacent to this area. Provide one hair dryer for every two shower heads. Provide shelves and hooks for coats and hats. Provide a full-height wall mirror.

Furnishings, Fixtures & Equip. (FF&E)	None required.
User-provided Equipment	None required.
Special Requirements	The doors in to the male and female locker/dressing area must be keyed from both sides. Provide dropped gypsum board soffits over lockers or utilize sloped top lockers to preclude the tops of the lockers being used for storage.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 4-20 Gymnasium/Basketball/Volleyball Courts

Description/ Usage	This space is used for team activities and sports competitions such as basketball and volleyball. Multiple court gymnasiums with divider curtains can accommodate simultaneous activities. The gymnasium can also support instructional functions, informal, intramural, and extramural sports as well as community events. Court size must meet NCAA standards. **\1** See Appendix D of this UFC for a link to the NCAA basketball court diagram. **/1/**
Min. Ceiling Ht.	28 ft (8.53 m) clear height below structure and lights.
Finishes	**Walls.** Provide durable wall system up to 12 ft (3.66 m) in height, such as CMU with heavy-duty epoxy. Above 12 ft (3.66 m), use semi-gloss enamel and acoustic panels. **Floor.** Maple athletic flooring, 25/32 in. (19.8 mm) thick. Synthetic multipurpose, resilient, athletic flooring may be allowed when requested by the installation. Flooring must meet DIN standards for the specified function per *ACSM's Health/Fitness Facility Standards and Guidelines*; however, where primary space use is basketball, minimum ball rebound must be 93%. **Ceiling.** Exposed, painted structure. Provide acoustical banners, baffles, panels, or similar treatment**.**
Plumbing	No plumbing fixtures in the gymnasium. Ensure access to nearby electric water coolers.
HVAC	Provide system per Chapter 3, "HVAC." Temperature operating range: 68 °F (20 °C) to 74 °F (23 °C). Provide ventilation in accordance with ANSI/ASHRAE 62.1 requirements for "Gym, sports arena (play area)." Provide durable air grill covers and do not place air grills in line with basketball nets. Locate ductwork to avoid trapping balls.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety," inclusive of protection from mechanical damage. Provide protection for sprinklers, exit signs, manual pull stations, and other exposed components; minimize equipment that protrudes into activity space or safety zones near activity spaces. Install component equipment (except manual pull stations) minimum 8 ft (2.44 m) AFF for safety considerations. Provide manual pull stations with protective covers. Provide upright sprinklers with head guards.
Power	Provide outlets per Chapter 3, "Electrical." Provide power for the scoreboard, shot clocks, and a high, wall-mounted clock. Provide power requirements for other functions such as retractable backboards, divider curtain, and stage sound and lighting. Provide recessed floor outlets to power portable equipment used to officiate games. Locate power outlets along sidelines at center court.
Lighting	Provide system per Chapter 3, "Electrical." Provide lighting levels for basketball in accordance with IESNA Class III adjustable up to Class II. If the program dictates televised events, provide appropriate IESNA lighting class of play levels for that specific sport. Provide keyed light switches. Provide fixtures with wire cages or appropriate shatterproof luminaires. Do not locate fixtures directly above basketball backboards. **\1** Do not install high-pressure sodium lighting. **/1/**
Communication	**CCTV**. Provide at least one outlet in each divided space. **CATV/Internal Video**. None required unless specified by installation. **PA/Audio**. Provide speakers with proper spacing. **Telephone**. Provide one line with internal two-way communication. **Data**. Provide data outlets in recessed floor boxes routed to scoreboard, centered under the anticipated scoring table location but outside the court boundaries. **Security**. Provide lockable area for when fitness access is in use.

Acoustics	For single court modules, reverberation time must equal 1.0 second. For two-court or larger modules, reverberation time must equal 1.8 to 2.0 seconds. Provide additional acoustical control with sound baffles, banners, and acoustical materials. Provide noise attenuation measures to mitigate acoustical problems resulting from vibration transmitted through the facility structure.
Casework/ Built-in Equipment	• Provide retractable basketball nets/backboards at two per half court or six per full court. Tournament courts only require 2 goals. Breakaway rims must be installed on all goals. • Provide volleyball built-in flush floor insert sleeves in each court. Provide floor inserts for gymnastics standards. • Motor-operated, vertical-acting (roll-up), divider curtain with manual override. Ensure the motor is easily accessible for maintenance. • Provide an electronic scoreboard that is visible to officials, players, and spectators. Provide control for scoreboard and divider curtain on side of room opposite of bleachers. • Bleachers. Use manually-operated, telescoping bleachers to maximize the flexibility of the space and allow sideline space for gymnasium events. Provide for accessible seating. **\1** Minimum of 200 seats; more as required and with additional courts. **/1/** • Provide game lines on flooring for full- and half-court basketball and volleyball. • Provide 6-ft (1.83 m) -high attached safety padding with bottom edge on top of floor base on all walls that can be impacted by a player. • Provide one pair of 30-second timing clocks for the main court.
Furnishings, Fixtures & Equip. (FF&E)	Provide volleyball stanchions, net, standard protective pads, net antenna, and elevated judge's stands. Provide wrestling mat, exercise mat, protective floor coverings with portable rolling stand, seating, scoring table, and chairs. **\1** Provide an AED. **/1/**
User-provided Equipment	CCTV cameras per the outlet count.
Special Requirements	• Court size must meet NCAA standards. See Appendix D of this UFC for a link to an NCAA basketball court diagram. • Interior entrance doors into the gym must have vision panels, minimum 5 ft^2 (0.46 m^2) each and ensure visual access from the control counter to the gym entrance. Where line of sight is not possible, CCTV monitoring of gym entrance must be provided. • Provide minimum 10 ft (3.05 m) of unobstructed floor space as a safety zone between the outer edge of the playing area and any feature or obstruction. Provide minimum 12 ft (3.7 m) side to side and 18 ft (5.5 m) end to end of unobstructed floor space as a safety zone between the outer edge of the playing area and any adjacent court playing area. • Design for moisture control and prevention of condensation on floor surface. • Provide exterior double doors with removable latch post for equipment access. • Provide natural light. Skylights are not permitted above wood floors. Mitigate glare on the play and spectator areas. Any glass panels must be a minimum of 18 ft (5.49 m) AFF and 0.5-in. (13-mm) -thick, tempered, laminated safety glass. • Do not locate windows, doors, or other obstructions within 7 ft (2.13 m) of all backboard centerlines. • Ensure no glazing or lighting can create glare or distraction on the play areas and cross-court play. Do not use window treatments to mitigate glare.

For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers. Participants. Spectators.

Table 4-21 Gymnasium Equipment Storage/Support

Description/ Usage	This room accommodates the storage of equipment and supplies, e.g., roll-away basketball goals, volleyball standards, gymnasium floor protective covering, and telescopic platform for maintenance/repair, needed for program support. Coordinate with overhead storage.
Min. Ceiling Ht.	10 ft (3.05 m) minimum.
Finishes	**Walls.** Utilize a durable and scrubbable eggshell or satin finish, whichever has higher gloss, for painted CMU or painted gypsum wall board. **Floor.** Sealed concrete. **Ceiling.** None required.
Plumbing	None required.
HVAC	Provide system per Chapter 3, "HVAC." Temperature operating range: 65 ºF (18 ºC) to 85 °F (29 °C).
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, "Electrical."
Lighting	Provide system per Chapter 3, "Electrical." Provide fixtures with wire cages or appropriate shatterproof luminaire.
Communication	**CCTV**. None required. **CATV/Internal Video**. None required. **PA/Audio**. None required. **Telephone**. None required. **Data**. None required. **Security**. Provide lockable doors.
Casework/ Built-in Equipment	None required.
Furnishings, Fixtures & Equip. (FF&E)	Shelving and storage cabinets.
User-provided Equipment	None required.
Special Requirements	Area must be accessible from both interior and exterior though lockable double doors with kick-plates. Provide "Dutch" doors at interior for equipment issue. Provide a vision panel in the door. Provide ramp at exterior door to facilitate equipment issue/delivery, if necessary. The area must be at least 8 ft (2.44 m) wide. In addition to the gym storage room, a separate storage area accessible from the exterior may be provided for exterior sports and athletic equipment, e.g., bleachers and soccer goals.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 4-22 Rock Climbing

Description/ Usage	A rock-climbing wall is an optional addition, usually to the fitness equipment area or combined with other structured activities. The main uses of climbing walls are threefold: offering instructional programs for new climbers, fitness training or recreation for intermediate through advanced climbers, and climbing competitions. Locate the wall within the facility so that it is a highly visible feature or centerpiece and also serves an advertising function. Ensure direct visual control from the control counter. For renovation projects, if rock climbing area is not visible from the control counter, this space must be included in a lockable room.
Min. Ceiling Ht.	For renovations, accommodate a 20-ft (6.1-m) -minimum-height climbing wall and the specific requirements of the equipment selected. For new projects, accommodate a 25-ft (7.6-m) -minimum-height climbing wall.
Finishes	**Walls.** CMU. Basic wall features can include arêtes, dihedrals, overhanging routes, flakes, chimneys, buttresses, and roof. Design for not only the width and height of climbing walls but also the available depth to create interesting features. **Floor**. The flooring beneath the climbing wall must be seamless rubber surfacing. • Description: Cushioned seamless floor system comprised of a cushioned impact course and colored cap surface, composed of peroxide-cured EPDM and recycled select rubber bonded by a specially formulated polyurethane binder. Completed system must comply with applicable Consumer Product Safety Commission (CPSC) criteria for playground surfacing **\1** contained in *Public Playground Safety Handbook* **/1/** and the following: o Tested for shock attenuation under ASTM F1292 and Head Injury Criterion (HIC). o Tested for slip resistance under ASTM E303. o Tested for fire resistance under ASTM E84. o Complies with ABA for wheelchair access. • Thickness: Poured-in-place; final thickness of 3.75 in. (93.8 mm). • Color: As selected by architect from manufacturer's full range of standard colors. • Primer: As recommended by the manufacturer. • Line Marker: Two-component polyurethane as recommended by the manufacturer for demarcation of specific areas or other lines or lanes. • Thinner: As recommended by the manufacturer. • Acceptable Manufacturers and Products: o No Fault Industries **\1** Safety Surface **/1/** o Vitricon Vitriturf o Approved substitute • Installation: o Areas of installation: climbing wall landing surface. o Proceed only when ambient and surface temperatures are within range recommended by the manufacturer and substrate condition has been approved by the installer. **Ceiling.** None required.
Plumbing	None required.
HVAC	Provide system per Chapter 3, "HVAC." Temperature operating range: 68 °F (20 °C) to 74 °F (23 °C). Provide ventilation in accordance with ANSI/ASHRAE 62.1 requirements for "Gym, sports arena (play area)."

Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, "Electrical."
Lighting	Provide system per Chapter 3, "Electrical." Provide 50 fc (500 lx) with uniform vertical illuminance on climbing surfaces. Coordinate the location of lights with the design of the climbing wall. Lighting must not impair the wall user, e.g., down-lighting fixtures must not be installed directly above the climbing wall.
Communication	**CCTV**. If direct LOS is not possible from the control desk, provide an outlet (also see **Special Requirements**). **CATV/Internal Video**. None required. **PA/Audio**. Provide a speaker. **Telephone**. If direct LOS is not possible from the control desk, provide an emergency call/alarm that sounds at the control counter. **Data**. None required. **Security**. Provide lockable area for when fitness access is in use.
Casework/ Built-in Equip.	Manufactured climbing walls are acceptable. Select the provider based both on service and product features. Accommodate any specific power requirements. Provide a wall-mounted bulletin board in a visible, adjacent area on which appropriate information and materials are posted, e.g., safety and injury guidelines, climbing tips, target heart zone information, and instructions for measuring heart rate.
Furnishings, Fixtures & Equip. (FF&E)	None required.
User-provided Equipment	CCTV cameras per the outlet count.
Special Requirements	Climbing wall, whether custom designed or manufactured, must exhibit a natural rock appearance. Component manufactured holds that mount to the climbing wall surface must be adjustable to accommodate climbing competitions. This feature will also allow for climbing route variations and various types of holds. Provide a separate teaching station. If direct LOS from the control counter is not possible, provide a means to secure the climbing wall during periods of non-use. Safety: If a manufactured climbing wall is used, comply with the manufacturer's guidelines and safety requirements. Also refer to the following industry groups for more information on safety requirements: Climbing Wall Association; Association for Challenge Course Technology. Ensure all anchors and other safety devices are installed for safe use.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 4-23 Racquetball Courts

Description/ Usage	Racquetball courts generally consist of one or more enclosed courts within a larger space that allows circulation, waiting, and spectator viewing. Courts are sized and specified specifically for the game of racquetball (see **Special Requirements**).
Min. Ceiling Ht.	20 ft (6.1 m) exactly.
Finishes	**Walls.** Pre-manufactured racquetball court side and front walls must be 0.5-in (13-mm) -thick, balanced, high-density dry panel systems with minimum 50-pound density weight panels over 0.5-in. (13-mm) sound cushion layer. Unless building layout precludes the option, provide a shatterproof, tempered glass back wall/door for viewing and officiating. Minimum calculated wall reflectance must be 0.65. See **Acoustics** section of this table for additional wall information. **Floor**. Maple athletic flooring. Flooring must meet DIN standards for the specified function per *ACSM's Health/Fitness Facility Standards and Guidelines*. **Ceiling**. Pre-manufactured racquetball court ceiling, 0.5-in. (13-mm) -thick, high-density resin core panels.
Plumbing	Must be near an electric water cooler.
HVAC	Provide system per Chapter 3, "HVAC." Temperature operating range: 66 °F (19 °C) to 72 °F (22 °C). Provide ventilation in accordance with ANSI/ASHRAE 62.1 requirements for "Gym, sports arena (play area)." Install ducts above ceiling or within wall surfaces. Install heavy-duty dent-resistant supply and return grilles flush and located in the rear one-third of the ceiling and/or the upper one-third of the back wall.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety," inclusive of protection from mechanical damage. Provide flush-mounted institutional style sprinklers throughout the racquetball court. Do not locate sprinklers closer than 6 ft (1.83 m) to the front wall of the court. Provide flush-mounted fire alarm and life safety equipment where these devices are required to be installed within the racquetball court.
Power	None required in courts. Provide convenience outlets per Chapter 3, "Electrical," in the waiting/viewing area.
Lighting	Provide system per Chapter 3, "Electrical." Match requirements for indoor tennis courts per UFC 3-530-01. Provide lighting levels for racquetball in accordance with IESNA Class III adjustable up to Class II. Use translucent, impact-resistant, non-breakable, flush-mounted protective covers specifically designed for racquetball courts. For courts with glass walls, the lighting level must be the same on both sides of the glass wall. This reduces glare and allows players to follow the ball as it plays off the glass wall.
Communication	**CCTV.** Provide at least one outlet in the waiting/viewing area to look into the court. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker in each court (upper end of back wall preferred) and in the waiting/viewing area. **Telephone.** None required. **Data.** None required. **Security.** Provide lockable area for when fitness access is in use.
Acoustics	Racquetball separation wall assembly must provide STC 60 rating. To achieve this STC rating and control impact noise, separating wall can either include independent steel frames separated by a 1-in. (25-mm) clear space or can incorporate CMU block wall with steel frames directly attached.

Casework/ Built-in Equipment	Provide mounting sockets and netting for wallyball games on 50% of the courts or per local demand. Provide recessed storage boxes in one sidewall of each court.
Furnishings, Fixtures & Equip. (FF&E)	If a waiting/viewing area is included, provide seating for spectators.
User-provided Equipment	CCTV cameras per the outlet count.
Special Requirements	Court striping and dimensions must comply with USRA rules. Wall, floor, and ceiling materials and construction must comply with USRA *Standard Specifications for Racquetball Court Construction*. Because of the special air-conditioning requirements for racquetball courts, design exterior exposed racquetball court walls to eliminate wet walls and mildew in accordance with Chapter 3, “Exterior Walls and Mold."
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers. Participants. Spectators.
Min. net ft^2 (m^2)	

Table 4-24 Unit PT/Group Exercise Room

Description/ Usage	This is typically one large room that is partitionable and can be used for large unit physical training or for multiple smaller classes that require only minimal equipment. Activities/classes include aerobics, martial arts, and yoga.
Min. Ceiling Ht.	10 ft (3.05 m) minimum clear to lowest overhead feature. Provide a 12-ft (3.66-m) minimum clear height ceiling for facilities with large martial arts programs.
Finishes	**Walls.** Utilize a durable and scrubbable eggshell or satin finish, whichever has higher gloss, for painted CMU. Painted, double-layer high-impact gypsum board on studs is also acceptable. **Floor**. Maple athletic flooring. Synthetic multipurpose, resilient, athletic flooring may be allowed when requested by the installation. Flooring must meet DIN standards for the specified function per *ACSM's Health/Fitness Facility Standards and Guidelines*. **Ceiling.** Exposed structure with acoustical spray paint or ACP. If ACP, provide non-sag tiles.
Plumbing	Must be near electric water coolers.
HVAC	Provide system per Chapter 3, "HVAC." Temperature operating range: 66 °F (19 °C) to 72 °F (22 °C). Provide ventilation in accordance with ANSI/ASHRAE 62.1 requirements for "Health club/aerobics room." Provide at least one ceiling fan per partitionable area.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, "Electrical." Provide power at flat panel display mounting locations and for sound system.
Lighting	Provide system per Chapter 3, "Electrical." Provide 30 fc (300 lx) minimum at the floor. To address safety concerns, coordinate lighting design with equipment layout and ensure that equipment users, particularly those using horizontal benches, are not exposed to glare of direct/down lighting. Provide protection for all fixtures when appropriate for specific activity. Provide multi-level switching.
Communication	**CCTV**. Provide at least one outlet in each divided space. **CATV/Internal Video**. Provide outlets for monitors coordinated with their location. **PA/Audio**. Provide speakers with proper spacing. **Telephone**. Provide one line with internal two-way communication. **Data**. Provide data outlets in the walls or in recessed floor boxes. **Security**. Provide lockable doors.
Acoustics	Reverberation time must equal 1.0 second. Provide noise attenuation measures to mitigate acoustical problems resulting from mechanical systems, plumbing systems, and vibration transmitted through the facilities structure. Provide partition construction with a minimum STC rating of 50 per Chapter 3, "Acoustics."

Casework/ Built-in Equipment	Provide one acoustical operable partition with minimum STC rating of 45. Partition must be recessed into an alcove. Provide impact-resistant/shatterproof mirrors 6 ft (1.83 m) tall on at least two walls at a minimum of 18 in. (450 mm) above the floor. If required, provide infrastructure and speakers for sound system for each divided space. Provide wall- or ceiling-mounted flat panel display mount in each divided space. Provide personal effects storage, such as cubbies, for customers in the room.
Furnishings, Fixtures & Equip. (FF&E)	Provide other fitness equipment as needed: indoor cycling equipment, stair steps, exercise balls, and small dumbbells. Provide an AED. Optional stage/platform.
User-provided Equipment	CCTV cameras per the outlet count. Flat panel display and sound system with mp3 and auxiliary input capability.
Special Requirements	Provide vision panel in the door, minimum 5 ft^2 (0.46 m^2), and consider side lites. Design the rooms to be rectangular to allow for flexibility in use. Provide a method of fastening padding on walls for use during combative sports. Provide acoustical separation from the rest of the facility. Provide natural light where appropriate based on activities in the space. Provide glare and heat-gain protection if exterior glazing is provided. Provide some visual connection to the rest of the facility. Consider providing interior windows to other exercise modules/circulation areas. If windows are provided, provide blinds. Accommodate queuing of customers in the area immediately outside the entrance. Provide secure storage room with direct adjacency to store items such as mats, stair steps, wall padding, and other fitness equipment. Storage rooms must either have double doors without astragal or designed as flow-through storage rooms.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 4-25 Fitness Area

Description/ Usage	This area is typically the focal point of the facility. The area is divided into four sections: stretching/warm-up/cool-down, free/plate-loaded weights, selectorized (machine) equipment, and cardiovascular equipment. The stretching/warm-up/cool-down area is open space within the larger room. It can also serve as transition areas between the other sections. The cardiovascular equipment area can be located in one or multiple areas throughout the facility. The criteria in this table will apply regardless of equipment location. Fitness area is adjacent to the equipment repair/receiving area. The free/plate-loaded weights area includes dumbbells, plate racks and plate-loaded equipment, and benches. The selectorized (machine) equipment consists of pin-selected weight equipment. The cardiovascular equipment consists of items such as treadmills, stationary bikes, and stair climbers.
Min. Ceiling Ht.	12 ft (3.66 m) minimum. 14 ft (4.27 m) is preferred.
Finishes	**Walls.** Utilize a durable and scrubbable eggshell or satin finish, whichever has higher gloss, for painted CMU. Provide high-impact wall guards up to 18 in. (450 mm) AFF in the free weight area. **Floor.** Use permanently adhered resilient athletic flooring consisting of dual durometer layers of natural and synthetic rubbers, calendared and vulcanized together. The top layer is a non-porous, slip-resistant, textured surface; the bottom layer is a cushioned performance layer. In the stretching/warm-up/cool-down spaces, use 1/4 in. (6 mm) thickness; in cardio, selectorized machine weights, and free weight areas use 3/8 in. (9 to 10 mm) thickness. Do not use interlocking flooring tiles or movable furnishings such as mats. Consider providing a low-profile raised floor in the selectorized and cardiovascular equipment areas to provide flexibility for routing power and data cables for fitness equipment. **Ceiling.** Exposed, painted structure. Consider providing ACP or other acoustical banners and treatments.
Plumbing	Provide a minimum of two electric water coolers.
HVAC	Provide system per Chapter 3, "HVAC." Temperature operating range: 68 °F (20 °C) to 74 °F (23 °C). Provide ventilation in accordance with ANSI/ASHRAE 62.1 requirements for "Health club/weight rooms." Provide ceiling fans.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, "Electrical." **Free weight area**: Provide outlets for wall- or ceiling-mounted flat panel displays. **Selectorized equipment area**: If a fitness tracking system will be provided, coordinate equipment outlets with the specific equipment selected. Provide flush-floor outlets for commercial-grade equipment in a grid pattern sized appropriately for equipment spacing and to accommodate fitness tracking systems. Provide outlets for wall- or ceiling-mounted flat panel displays. **Cardiovascular equipment area**: Coordinate equipment outlets with the specific equipment selected. Provide flush-floor outlets for commercial-grade equipment in a grid pattern sized appropriately for equipment spacing and to accommodate fitness tracking systems. Provide dedicated circuits for all treadmills. Coordinate flat panel display outlet locations with CATV outlet locations and the equipment selected: If cardiovascular equipment incorporates monitors, ensure outlets are located appropriately and provide outlets for wall- or ceiling-mounted flat panel displays as necessary to ensure adequate viewing angles for all equipment.

Lighting	Provide system per Chapter 3, "Electrical." Provide 30 fc (300 lx) uniform lighting. To address safety concerns, coordinate lighting design with equipment layout and ensure that equipment users, particularly those using horizontal benches, are not exposed to glare of direct/down lighting.
Communication	**CCTV**. Provide outlets as needed for coverage. **CATV/Internal Video**. Provide outlets for wall- or ceiling-mounted flat panel displays throughout the fitness area. Mount at proper viewing height for cardiovascular exercise machines in that area, height as selected by fitness area designer. The quantity and location of the CATV outlets must be determined by the sports fitness center designer and the Installation fitness program manager and must be coordinated with the equipment layout. The goal must be to enhance the experience and enjoyment of working out in the fitness areas and to have a number of CATV monitors available for comfortable viewing by all users of the fitness area. Consider **\1** options for wireless transmission of audio broadcast from **/1/** video monitors. **PA/Audio**. Provide PA speakers as needed. Provide a separate audio system with speakers as needed for full coverage. Consider separate volume control and separate channels for individual activity areas. **Telephone**. None required. **Data**. Provide data outlets in recessed floor boxes in the cardiovascular and selectorized equipment areas and entertainment systems. Data to equipment for fitness tracking is optional. **Security**. None required.
Acoustics	Reverberation time must equal 1.0 to 1.3 seconds. Provide noise attenuation measures to mitigate acoustical problems resulting from mechanical systems, plumbing systems, and vibration transmitted through the facilities structure.
Casework/ Built-in Equipment	Provide 6-ft (1.83-m) -tall mirrors on at least two walls at a minimum of 18 in. (450 mm) above the floor. One of the two walls must be in the free weight area. Provide 1.5-ft by 1.5-ft by 15-in. (0.46-m by 0.46-m by 0.38-m) -deep open cubbies – quantity to be 50% of number of pieces of fitness equipment. Provide wall-mounted bulletin boards.
Furnishings, Fixtures & Equip. (FF&E)	Fitness equipment must be commercial grade. Provide a free-standing heavy punching bag and a speed bag if a boxing program is included. Exercise mats, wall clocks, and trash containers. Provide self-serve equipment cleaning supply stations throughout that include disinfectant spray bottles and disposable or reusable towels. Provide an AED.
User-provided Equipment	CCTV cameras per the outlet count. Flat panel display.

Special Requirements	If this space is provided on the second floor, ensure the elevator is specified to accommodate the fitness equipment. The foundation/floor in this space must be designed to accommodate all live and dead loads associated with the equipment. Provide storage either within the room or with a direct adjacency to store items such as mats, spare equipment, punching bags, and other sports equipment. Provide natural light through the use of windows and/or overhead skylights. Mitigate glare. Provide attractive, color-coordinated décor that projects a friendly environment. Avoid bland treatments such as a black floor and tan walls. Color selection must coordinate with equipment selected for the space. Consider providing a help desk within this space in larger facilities. If provided, locate it within the space in areas not well served by the control counter. If provided, the raised floor provides flexibility for routing power and data cables for fitness equipment. Typically, this will be a low-profile access floor. If doors are provided, include vision panels, minimum 5 ft^2 (0.46 m^2) each, and consider side lites.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 4-26 Fitness Assessment Room

Description/ Usage	This room provides a space for staff to meet with customers and evaluate the customer's fitness level. It is inside or directly adjacent to the fitness spaces and the program manager's office and must include typical office furnishings and fitness testing equipment.
Min. Ceiling Ht.	9 ft (2.74 m) minimum.
Finishes	**Walls.** Utilize a durable and scrubbable eggshell or satin finish, whichever has higher gloss, for painted gypsum wall board. **Floor.** Carpet tile with resilient base. **Ceiling.** ACP.
Plumbing	None required.
HVAC	Provide system per Chapter 3, "HVAC." Temperature operating range: 68 °F (20 °C) to 74 °F (23 °C). Provide independent thermostat.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, "Electrical." Provide a minimum of one quad outlet on at least three walls. Gang outlets with data and telephone. Provide additional dedicated outlets to accommodate the fitness equipment.
Lighting	Provide system per Chapter 3, "Electrical." Provide 50 fc (500 lx) of general ambient lighting.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. **Telephone.** Provide one line. **Data.** Provide at least one outlet at the desk area and one outlet at the fitness equipment area. Provide a computer system with internet connectivity at each data outlet location. **Security.** None required.
Casework/ Built-in Equipment	None required.
Furnishings, Fixtures & Equip. (FF&E)	Office furniture: desk, credenza, filing cabinet, desk chair, and two side chairs. Partitions and dividers. Fitness testing equipment that testing can be completed on, such as a treadmill or cycle with built-in monitoring sensors/devices. Scale and height rod.
User-provided Equipment	Computers, printer, and other office equipment as needed.
Special Requirements	Provide a key locked door. Provide side lites with blinds next to the door for supervision and security. If this space is provided on the second floor, ensure the elevator is specified to accommodate the fitness equipment.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 4-27 Indoor Track

Description/ Usage	The indoor track provides space for running, jogging, and walking. It is usually co-located with the gymnasium (see Table 4-20), either surrounding the court safety zone or suspended above the gym area or other high-bay space. The track is required but it can be either indoor or outdoor.
Min. Ceiling Ht.	10 ft (3.05 m) minimum. If suspended in a high-bay area, the underside of the track structure must be 14 ft (4.27 m) minimum AFF.
Finishes	**Walls.** CMU with semi-gloss enamel paint. **Floor**. Resilient, cushioned running surface, such as rubber or urethane. **Ceiling**. Exposed, painted structure.
Plumbing	Provide an electric water cooler in the entrance lobby to the track.
HVAC	The HVAC criteria must match the criteria for the space in which the track is located.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, "Electrical." Provide power to a wall-mounted clock and electric water cooler. If cardio fitness equipment is provided, coordinate power requirements.
Lighting	The lighting criteria must match the criteria for the space in which the track is located. When located within the gymnasium surrounding the court safety zone, provide lighting levels and controls matching the court it surrounds. When suspended above the gymnasium, provide lighting control with horizontal illuminance: 30 fc (300 lx), CV = 0.30 or less (Emax/Emin= 4:1 or less).
Communication	**CCTV.** Provide outlets for adequate coverage. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. **Telephone.** Provide a telephone line or other emergency call system within or adjacent to the running track area. **Data.** None required. **Security.** Provide lockable area for when fitness access is in use.
Casework/ Built-in Equipment	Provide signage to indicate running directions (directions alternate day-to-day). Provide personal effects storage, such as cubbies, for customer use. Bulletin board and digital clock.
Furnishings, Fixtures & Equip. (FF&E)	Provide freestanding storage units for towels and personal items. (This can also be incorporated into casework.) Consider providing cardio fitness equipment, such as treadmills or stair climbers, in unused corners.
User-provided Equipment	CCTV cameras per the outlet count.

Special Requirements	The metric unit equivalent for the track distance must be an accurate soft conversion because runners will time themselves based on number of laps; the reference point must be consistent. Track length is based on the inside radius. Lanes are preferred to be 45 in. (1067 mm) wide. The turns must have a minimum inside radius of 20 ft (6.1 m). Consider using banked curves. The height of banked curves on an indoor track must be 1 in. per 1 ft (25 mm per 300 mm) of track width. When using banked curves, ensure compliance with ABA requirements. Provide "lobby" areas at the entrances to a suspended track so that the doors do not open onto the track area and to provide space for stretching and warm-up. Provide an exercise mat in this area. Provide vision panels in the doors, minimum 5 ft^2 (0.46 m^2) each. Ideally, the entry lobbies are to be located near the center of a straightaway. Provide for exterior views if possible or, at a minimum, natural light admission. Mitigate glare and prevent direct sunlight on the track or the gymnasium (if suspended above). Track length and number of lanes varies as follows: **Navy.** Minimum track distance/size is 1/14 mile (115 m) and two lanes, which will fit over the smallest gymnasium option. In larger facilities, the preferred distance/size is 1/11 mile (146.3 m) in length and three lanes. In extra-large and jumbo size facilities, the Navy will include a 1/8-mile (201.2-m) four-lane track. **Marine Corps.** Minimum track distance/size for new facilities is 1/8 mile (201.2 m) and four lanes. The minimum track distance/size for add/alter facilities is 1/11 mile (146.3 m) in length and three lanes. Typically, the most space- and cost-effective location for the indoor track is suspended above the gymnasium. Service-specific size and length criteria for the track is given above but consider the following when sizing the indoor track: • Ensure the suspended track does not interfere with gymnasium play below. The track must not encroach into the clear zones of the gym. Ensure that required adjacencies are not affected by the placement of the track. • The facility can be designed to allow the track to extend beyond the gymnasium area and into other high-bay spaces, such as the fitness area. This can make for an interesting architectural feature but will have significant cost implications.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 4-28 Functional Fitness

Description/ Usage	Functional training is exercise performed to better enable the participant to move through normal life activities. Functional fitness implies performing exercise in an optimal way, to achieve certain goals that allow improved performance of regular activities outside the gym. This may mean more fluid, precise movements, accomplishing necessary activities with the least possible wear and destruction, and remaining pain-free in the performance of mundane tasks. Better function could have applications in pulling weeds, loading the dishwasher, waxing the car, or carrying groceries home from the store. Typical equipment in the functional fitness area includes A-frames used for various exercises with bands, individual weight stations, and various kettle bells and other equipment.
Ceiling Ht.	14 ft (4.27 m) minimum.
Finishes	**Walls**. CMU with heavy-duty epoxy or painted, double-layer (impact side) gypsum board, and provision of high-impact wall guards up to 18 in. (450 mm) AFF where weights are used. **Floor**. Use 3/8-in. (9- to 10-mm) -thick permanently adhered resilient athletic flooring consisting of dual durometer layers of natural and synthetic rubbers, calendared and vulcanized together. The top layer is a non-porous, slip-resistant, textured surface; the bottom layer is a cushioned performance layer. Provide a section of turf in coordination with installation requirements. **Ceiling**. Open structure is preferred; however, adequate acoustics must be maintained.
Plumbing	Provide a minimum of one electric water cooler.
HVAC	Provide system per Chapter 3, "HVAC." Temperature operating range: 68 °F (20 °C) to 74 °F (23 °C). Provide ventilation in accordance with ANSI/ASHRAE 62.1 requirements for "Health club/weight rooms." Provide ceiling fans.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety," inclusive of protection from mechanical damage. Provide protection for sprinklers, exit signs, manual pull stations, and other exposed components; minimize equipment that protrudes into activity spaces. Install component equipment (except manual pull stations) minimum 8 ft (2.44 m) AFF for safety considerations. Provide manual pull stations with protective covers. Provide upright sprinklers with head guards in areas without suspended ceilings.
Power	Provide outlets per Chapter 3, "Electrical." Convenience outlets required.
Lighting	Provide system per Chapter 3, "Electrical." Lighting must be switched to allow for different levels of lighting. Provide fixtures with wire cages. **Light level:** 30 fc (300 lx) at the floor, minimum.
Communication	**Sound system**: Flush recessed speakers, 25-watt minimum output rating, capable of reproducing the entire audible range for human speech. Link speakers and provide audio interface in accessible area for sound equipment.
Acoustics	Walls must be acoustically treated to minimize the transmission of sounds from impact to other spaces.
Casework/ Built-in Equipment	None required.

Furnishings, Fixtures & Equip. (FF&E)

Description	Notes	Quantity
Double power station (3")/storage/stainless	Includes rack, bench, platform	1
Glute/ham bench (split pad)/lineal		1
Step-up box with plywood; no logo		1
Olympic lifting bar 20kg, 1-1/8 in. shaft 1800# test zinc		2
45# bumper plate		8
35# bumper plate		4
25# bumper plate		4
10# bumper plate		4
Olympic plates - grip rubber	4-10, 4-5, 4-2.5	70
Adjustable dumbbells	15-60/5# (10 Pair Total)	1
Triple-tier dumbbell rack (15 pr.)	Bottom two levels for DBs, top level for kettlebells.	1
Band attachments		1
Vertical medicine ball rack		1
Kettlebells 5-60/5, 70 to 100 lb/10	15/20/25/30/35/40	165
Olympic curl bar (26 lb.) 5 ft black		1
Olympic spring lock collars		3
Medicine ball	4/6/8/10/12/15/18/20/25/30 elite medicine balls	1
TRX straps		2
Stretch equipment: cage (e.g., True Stretch, 37 deg. angle calf stretch blocks with heel anti-slip ledge and a PT table for pre/post conditioning		
Pre-movement prep, cooldown, injury prevention, supports functional movement: stretch cage and calf stretch blocks attached semi-permanent to floor, PT table		
Power sled (plate loaded); includes harness + belt		1
	Double ladder	1
	Battling rope 50 ft	1
	Weight lifting bands	1

User-provided Equipment	None required.
Special Requirements	• A storage room must be provided. • Must be on first floor of facility due to dropping weights. • Provide vision panels in the doors, minimum 5 ft^2 (0.46 m^2), and consider side lites.

For use during project execution by the appropriate Service agency

Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 4-29 Auxiliary Gymnasium

Description/ Usage	**Note:** This space is not supported by the Navy. This space is used for sports competitions such as basketball, volleyball, wrestling, and indoor soccer. The auxiliary gymnasium can also support instructional functions, informal, intramural, group exercise/fitness functions, and community events. Preferably the auxiliary gymnasium will be adjacent to the main gymnasium. If not adjacent, must be nearby.
Ceiling Ht.	Minimum 25 ft (7.62 m) clear height to lowest overhead element.
Finishes	**Walls.** Provide durable wall system up to 12 ft (3.66 m) height, such as CMU with heavy-duty epoxy. Above 12 ft (3.66 m), use semi-gloss enamel and consider acoustic panels. **Floor**. Maple athletic flooring, 25/32 in. (19.8 mm) thick, must be installed in gymnasiums 6,500 ft^2 (603.9 m^2) or larger. Synthetic multipurpose, resilient, athletic flooring may be allowed when requested by the Installation. Flooring must meet DIN standards for the specified function per *ACSM's Health/Fitness Facility Standards and Guidelines*. **Ceiling**. Exposed, painted structure. Provide acoustical banners, **\1** baffles, panels, or similar treatment. ***/1/***
Plumbing	None required. Ensure access to nearby electric water coolers.
HVAC	Provide system per Chapter 3, "HVAC." Temperature operating range: 68 °F (20 °C) to 74 °F (23 °C). Provide ventilation in accordance with ANSI/ASHRAE 62.1 requirements for "Gym, sports arena (play area)." Provide durable air grill covers and do not place air grills in line with basketball nets. Locate ductwork to avoid trapping balls.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety," inclusive of protection from mechanical damage. Provide protection for sprinklers, exit signs, manual pull stations, and other exposed components; minimize equipment that protrudes into activity space or safety zones near activity spaces. Install component equipment (except manual pull stations) minimum 8 ft (2.44 m) AFF for safety considerations. Provide manual pull stations with protective covers. Provide upright sprinklers with head guards.
Power	Provide outlets per Chapter 3, "Electrical." Provide power for the scoreboard, shot clocks, and a high, wall-mounted clock. Consider power requirements for additional lighting for special events.
Lighting	Provide system per Chapter 3, "Electrical." Provide lighting levels for basketball in accordance with IESNA Class III adjustable up to Class II. If the program dictates televised events, provide appropriate IESNA lighting class of play levels for that specific sport. Provide perimeter compact fluorescents multi-level switched for non-sport activities. Provide keyed light switches. Provide fixtures with wire cages or appropriate shatterproof luminaires. Do not locate fixtures directly above basketball backboards. Do not install high-pressure sodium lighting.
Communication	**CCTV**. Provide at least one outlet on each wall. **CATV/Internal Video**. None required. **PA/Audio**. None required. **Telephone**. None required. **Data**. None required. **Security**. None required.

Acoustics	Reverberation time must equal 1.0 second. Provide noise attenuation measures to mitigate acoustical problems resulting from mechanical systems, plumbing systems, and vibrations transmitted through the facility's structure.
Casework/ Built-in Equipment	• Provide six retractable basketball nets/backboards. Breakaway rims must be installed on all goals. • Provide volleyball built-in flush floor insert sleeves in each court. • Provide an electronic scoreboard. • Provide game lines on flooring for full- and half-court basketball and volleyball. • Provide 6-ft (1.83-m) -high attached safety padding with bottom edge on top of floor base on all walls that can be impacted by a player.
Furnishings, Fixtures & Equip. (FF&E)	Provide volleyball stanchions, net, standard protective pads, and net antenna. Provide wrestling mat, exercise mat, and protective floor coverings. Provide an AED.
User-provided Equipment	CCTV cameras per the outlet count.
Special Requirements	• Interior entrance doors into the auxiliary gymnasium must have vision panels, minimum 5 ft^2 (0.46 m^2) each. • Provide a minimum 10-ft (3.05-m) unobstructed floor space safety zone between the outer edge of the playing area and any feature or obstruction. • Consider moisture control and prevention of condensation on floor surface. Consider under-floor ventilation requirements, under-slab vapor barrier, estimated dew point occurrence, local water table, and local soil conditions. • Provide exterior double doors with removable latch post for equipment access. • Do not locate windows, doors, or other obstructions within 7 ft (2.14 m) of all backboard centerlines. • Ensure no glazing or lighting can create glare or distraction on the play areas.
For use during project execution by the appropriate Service agency	
Occupancy	Staff Customers
Min. net ft^2 (m^2)	

Table 4-30 High Intensity Tactical Training (HITT) Center

Description/ Usage	**Note: \1** This space is for Marine Corps only. **/1/** This is typically one large, open space room that is non-partitionable and is used for implementation of the HITT program. Activities/classes such as aerobics, martial arts, and yoga must not be used in this space.
Ceiling Ht.	20 ft (6.1 m) minimum.
Finishes	**Walls**. CMU with heavy-duty epoxy or painted, double-layer (impact side) gypsum board. **Floor**. Use 3/8 in. (9 to 10 mm) thick permanently adhered resilient athletic flooring consisting of dual durometer layers of natural and synthetic rubbers, calendared and vulcanized together. The top layer is a non-porous, slip-resistant, textured surface; the bottom layer is a cushioned performance layer. Synthetic artificial turf and track are to be installed in centers 2000 ft^2 (185.8 m^2) or larger. HITT logo is to be included on flooring where Olympic lift platform stations will be located. Provide high-impact wall guards up to 18 in. (450 mm) AFF. Impact and athletic flooring system cannot be accommodated by interlocking flooring tiles or movable furnishings such as mats. **Ceiling**. Exposed structure with acoustical spray paint or ACP. If ACP, provide non-sag tiles.
Plumbing	Provide a minimum of one electric water cooler.
HVAC	Provide system per Chapter 3, "HVAC". Temperature operating range: 68 °F (20 °C) to 74 °F (23 °C). Provide ventilation in accordance with ANSI/ASHRAE 62.1 requirements for "Health club/weight rooms." Provide ceiling fans.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety," inclusive of protection from mechanical damage. Provide protection for sprinklers, exit signs, manual pull stations, and other exposed components; minimize equipment that protrudes into activity spaces. Install component equipment (except manual pull stations) minimum 8 ft (2.44 m) AFF for safety considerations. Provide manual pull stations with protective covers. Provide upright sprinklers with head guards in areas without ceilings.
Power	Provide outlets per Chapter 3, "Electrical."
Lighting	Provide system per Chapter 3, "Electrical." Provide 30 fc (300 lx) minimum at the floor. To address safety concerns, coordinate lighting design with equipment layout and ensure that equipment users, particularly those using horizontal benches, are not exposed to glare of direct/down lighting. Provide protection for all fixtures and dimming capability.
Communication	**CCTV**. Provide at least one outlet on each wall. **CATV/Internal Video**. Provide at least one outlet for wall-mounted monitor(s). **PA/Audio**. None required. **Telephone**. Provide one line with internal two-way communication. **Data**. Provide at least one outlet. **\1** HDMI **/1/** cable outlet below dedicated flat panel display. **Security**. None required.
Acoustics	Reverberation time must equal 1.0 second. Provide noise-attenuation measures to mitigate acoustical problems resulting from mechanical systems, plumbing systems, and vibrations transmitted through the facilities structure. Provide partition and door construction with a minimum STC rating of 50 per Chapter 3, "Acoustics."

Casework/ Built-in Equipment	• Provide adjustable pull-up bars on at least one wall. Number of bars is determined by center size. • Provide a built-in protective box for the telephone. • Provide 9-ft (2.74-m) -high mirrors on at least two non-adjacent walls at a minimum of 18 in. (450 mm) above the floor. • Provide wall flat panel display mount in each divided space. • Provide personal effects storage, such as cubbies, for customers in the room. • Provide attached wall padding for both ends of rubberized track surface.
Furnishings, Fixtures & Equip. (FF&E)	• Fitness equipment must be commercial grade. Equipment counts will vary by size based on square footage. • Address accessibility issues in equipment selection. • Provide other combat fitness equipment as needed: power racks (Olympic lift platforms with wood base and squat rack type), plyometric equipment, speed and agility equipment, functional training equipment, kettlebells, medicine balls. • Office equipment: desk and chair. • Provide an AED.
User-provided Equipment	CCTV cameras per the outlet count. One dedicated flat panel display for video analysis usage. Flat panel display must have **\1** HDMI **/1/** port to connect to moveable hardware platform.
Special Requirements	• Design the rooms to allow for flexibility in use. Provide a method of fastening padding on walls for use during sprint/speed training. Provide acoustical separation from the rest of the facility. • Provide protection of all sprinklers, fire alarm strobe/speaker, thermostats, and other similar features. • Provide natural light where appropriate. Provide glare and heat-gain protection if exterior glazing is provided. • Provide some visual connection to the rest of the facility. Consider providing interior windows to other exercise modules/circulation areas. If windows are provided, provide blinds. • Accommodate queuing of customers in the area immediately outside the entrance. • Provide secure storage either within the room or with a direct adjacency to store items such as speed/agility equipment, cones, ladders, and other fitness equipment. • Provide attractive, color-coordinated HITT logo on one main wall. Walls must be colored white. • Color selection for equipment must match HITT logo color. • Provide vision panels in the doors, minimum 5 ft^2 (0.46 m^2) each, and consider side lites. • Provide space for fitness testing; 25- to 40-yd dash, 5-10-5 cone drill, and kneeling medicine ball throw.
For use during project execution by the appropriate Service agency	
Occupancy	Staff Customers
Min. net ft^2 (m^2)	

Table 4-31 Indoor Cycling

Description/ Usage	Classroom to accommodate indoor cycling classes, which includes an instructor on a bike and participants on bikes. These bikes are different from the stationary bikes utilized in the cardio area. This space may be included as part of the programmed space allotted for structured activities.
Ceiling Ht.	10 ft (3.0 m) minimum to lowest element.
Finishes	**Walls.** Painted walls. Coordinate with users to find out any special images such as murals as well as preferred color (light vs. dark). **Floor**. Rubber or wood floor typical. Provide flooring that is appropriate and industry standard for indoor cycling classrooms. Strongly recommend use of platforms for the classroom to provide better view of the instructor. **Ceiling**. Exposed, painted structure. Consider providing ACP or other acoustical banners and treatments.
Plumbing	Provide an electric water cooler.
HVAC	Provide system per Chapter 3, "HVAC." Temperature operating range: 68 °F (20 °C) to 74 °F (23 °C). Provide ventilation in accordance with ANSI/ASHRAE 62.1 requirements for "Health club/weight rooms." For Army projects, provide ceiling fans.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, "Electrical."
Lighting	Provide system per Chapter 3, "Electrical." Match requirements of indoor basketball court, per UFC 3-530-01. Lighting must be switched to allow for different levels of lighting. Natural light via windows may be provided but direct sunlight and glare must be avoided. Windows providing internal views to other spaces is desirable. **Lighting control**: Use of occupancy sensors to activate lighting by motion detection is recommended. In addition, grouping lights so a portion of the lights may be turned off, especially if natural daylighting is provided, is required. Independent slide or toggle controls may also be used to control fixtures by groups. Grouping must be coordinated with user.
Communication	**CCTV/CATV/Internal Video**. Provide for up to 3 large flat panel displays on the front wall. The control for these must also be in the center of the front wall near the instructor. **PA/Audio**. Provide speakers for main PA system so announcements from the desk can be heard in this space. Provide ceiling-mounted speakers for high-quality music reproduction. If a lay-in ceiling is provided the speakers must be recessed. Speakers must have a 100-watt minimum output rating and must be capable of reproducing CD-quality sound. Provide wiring, cabling, and other built-in support for a user-provided sound system plugged into the speaker system in the room. Provide the connection for the instructor near the center of the front wall. The instructor will position their stereo equipment close to their bike so they can adjust the music while working out. **Telephone**. None required. **Data**. None required. **Security**. None required.

Acoustics	The indoor cycling classroom must be designed to acoustically separate this space from other spaces. In addition, this space must be designed for proper acoustics for aerobic and other exercise classes. Aerobic activity will require partitions to be sound rated to 53 STC minimum. Where glass walls are used to enhance interior views, front these walls to interior circulation and not into other activity spaces. One exception is the gymnasium.
Casework/ Built-in Equipment	**Architectural Casework**: Provide storage cubicles (cubbies) along one wall of the module for incidental storage during activities. Provide minimum of one cubby for 75% of the total number of participants at room's maximum occupant load (based on 50 ft^2 [4.6 m^2]) per person). Cubby design is generally an open-face cube in modular "banks" aligned on one wall to counter-top height or vertically with the tallest cubicle 5 ft (1.52 m) AFF. Cubbies must be minimum 14 in. by 14 in. (350 mm by 350 mm), 18 in. by 18 in. preferred (450 mm by 450 mm) face opening by minimum 15 in. (375 mm) deep. Construct cubbies of ½-in. (12.5-mm) minimum particle board shell with 1/2 in. (12.5 mm) plywood horizontal shelves. Entire construction veneered with .048 horizontal grade, high-pressure plastic laminate. As an alternative, if solid wood or hardwood veneer-core plywood is used throughout, the surfaces may be finished and sealed with a polyurethane (or equal) coating. Cubbies may also be made from a plastic or solid phenolic type material for added durability. The coating must be cleanable and able to withstand moisture without degrading. Edge trim of cubby frames must be solid hardwood (bonded) or 3 mil PVC edging routed into panel edge. Use of plastic laminate edges is not allowed. If counter-height, provide solid-surface countertop with eased edge front and minimum 1-in. (25-mm) -tall lip where the counter abuts the wall.
Furnishings, Fixtures & Equip. (FF&E)	None required.
User-provided Equipment	Flat panel displays.
Special Requirements	• Design the rooms to allow for flexibility in use. • Provide acoustical separation from the rest of the facility. • Provide secure storage room with a direct adjacency to store fitness equipment. • Per installation request, special lighting or themes may be required. • Provide vision panels in the doors, minimum 5 ft^2 (0.46 m^2) each, and consider side lites. Provide a means to darken the vision panels.
For use during project execution by the appropriate Service agency	
Occupancy	Staff Customers
Min. net ft^2 (m^2)	

Table 4-32 Mother's Room

Description/ Usage	This space is used by nursing mothers.
Min. Ceiling Ht.	9 ft (2.74 m) minimum.
Finishes	**Walls.** Utilize a durable and scrubbable eggshell or satin finish, whichever has higher gloss, for painted gypsum wall board. **Floor.** Provide hard-surface flooring matching corridor such as seamless vinyl, hard tile, or other durable material. **Ceiling.** ACP.
Plumbing	Provide countertop-mounted sink with hot and cold water. Provide a cold-water connection for refrigerator ice maker.
HVAC	Provide system per Chapter 3, "HVAC." Temperature operating range: 68 °F (20 °C) to 76 °F (24 °C).
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, "Electrical." Provide one additional outlet at counter height for convenience. Provide additional outlets necessary to operate dedicated equipment.
Lighting	Provide system per Chapter 3, "Electrical."
Communication	**CCTV.** None required. **CATV/Internal Video.** Provide one outlet. **PA/Audio.** Provide a speaker. **Telephone.** Provide one line. **Data.** Provide outlets as required for equipment. **Security.** Provide lockable doors.
Acoustics	No special provisions required.
Casework/ Built-in Equipment	Provide extended solid-surface countertop for bottle prep/clean functions and to house mini-fridge below.
Furnishings Fixtures & Equipment (FF&E)	Guest chair on casters if table/work surface is provided or a lounge chair with tablet arm; small undercounter refrigerator and microwave.
User-provided Equipment	None required.
Special Requirements	None required.
For use during project execution by the appropriate Service agency	
Occupancy	Staff Customers
Min. net ft^2 (m^2)	

CHAPTER 5 ACTIVITY FIELDS

5-1 INTRODUCTION AND PLANNING ISSUES.

This chapter provides criteria for activity fields, including a multipurpose activity field with an encircling running track, softball fields, spectator seating, and support buildings. These features may be included as standalone or as components of a fitness center complex. When programming these fields and support features, different category codes apply and funding sources may be different from the fitness center.

The activity fields must be planned in conjunction with a comprehensive audit of other existing or planned activity fields on the installation to maximize consolidation and shared efficiencies.

5-1.1 Related Activity Areas.

The following are outdoor activity areas that will benefit from being planned in conjunction with, and located in proximity to, the activity fields:

- Tennis courts
- Outdoor basketball courts
- Other sports fields, as needed

5-2 PROGRAM AREAS.

Table 5-1 lists the program areas of the activity fields, breaking them down by support building areas and site areas.

Table 5-1 Multipurpose Field

Functional Program Area	Description/Service Exceptions
Support Building	
Concessions	Accommodates the preparation and sales of food and drink.
Covered public space	Covered, paved exterior area directly adjacent to the concessions service window.
Male toilets	A standard configuration for toilets. This can be expanded if the program and budget allow.
Female toilets	A standard configuration for toilets. This can be expanded if the program and budget allow.
Maintenance bay	Accommodates the storage of a field maintenance vehicle, maintenance supplies, and master lighting controls.
Announcer's booth/press box	Second-story space to accommodate up to three observers and the scoreboard controls.
Dry goods storage	Accommodates storage of non-food items such as paper goods.

Sports activity storage	Accommodates storage of sports activity items such as cones and flags.
Building support/vertical circulation	Accommodates building HVAC, janitor's closet, and non-ABA access to the press box.
Fields and Site Spaces	
Multipurpose field and track	Fixed-size field encircled by a 1312-ft (400-meter) running track per Table 5-8.
Softball field	Fixed-size softball field per Table 5-9.
Bleacher pads	Standard-size concrete pads and portable, aluminum bleachers.
Lighting zone	Area outside the field and bleacher footprint with high mast lights to illuminate the track and field to standardized levels.
Scoreboard zone	Area outside the field with an electronic scoreboard.
Paved parking	Usually shared with the fitness center, other fields, or other facilities.
Unpaved parking	Overflow parking area for sport tournaments or other large group activities.
Site circulation	A mix of hard-surface pathways and grassed areas to connect the various areas of the multipurpose field complex.

5-3 SPACE PROGRAM.

The multipurpose field has a standardized space program as illustrated in Figure 5-1. It is not developed with the fitness center's interactive spreadsheets.

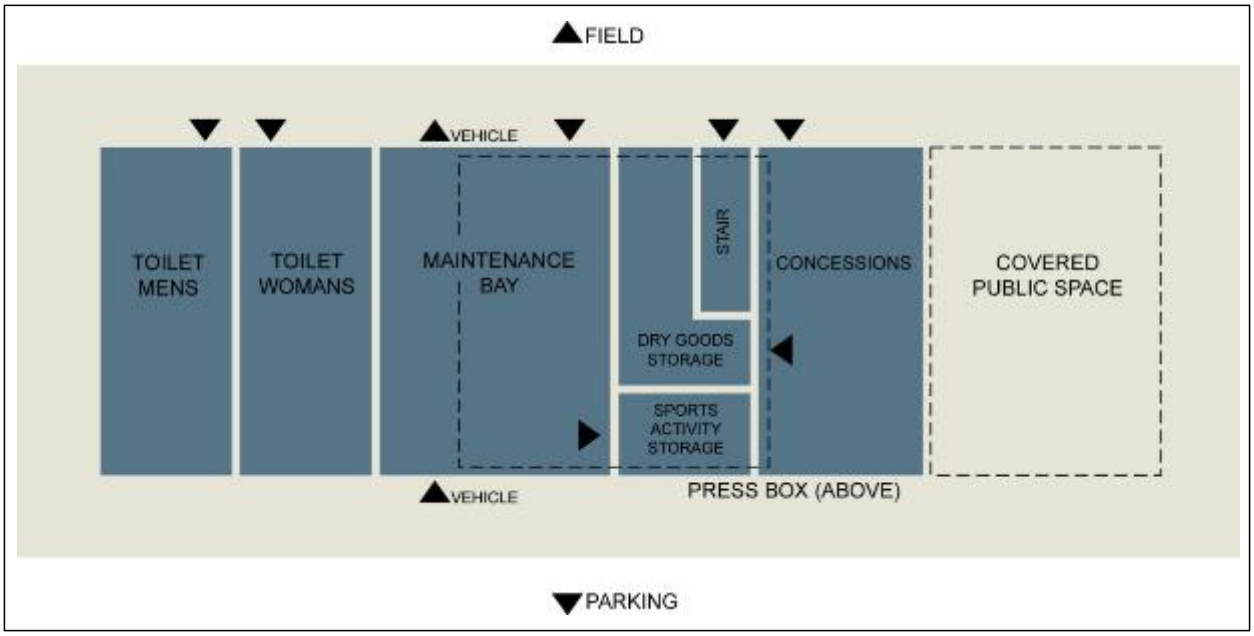
Figure 5-1 Activity Field Space Program

Functional Program Area		Standard ft^2	Standard m^2	Quantity	Total Area ft^2	Total Area m^2
Support Building	Concessions*	200	18.6	1	200	18.6
	Covered public space*	280	26.0	1	280	26.0
	Male toilets*	160	14.9	1	160	14.9
	Female toilets*	160	14.9	1	160	14.9
	Maintenance bay	280	26.0	1	280	26.0
	Press box	350	32.5	1	350	32.5
	Dry goods storage	80	7.4	1	80	7.4
	Sports activity storage	40	3.7	1	40	3.7
	Building support/vertical circulation	30	2.8	1	30	2.8
Subtotal - Net Spaces					**1,580**	**146.8**
Net-to-Gross Factor (incl. construction)				**15%**	**237**	**22.0**
Total Building					**1,817**	**168.8**
Site	Multipurpose field and track	141,570	13,151.9	1	141,570	13,151.9
	Softball field	82,915	7,702.8	1	82,915	7,702.8
	Bleacher pads*	6,750	627.1	2	13,500	1,254.2
	Parking*	450	41.8	38	17,100	1,588.6
	Site circulation*	57,181	5,312.1	1	57,181	5,312.1
Total Site					**312,266**	**29,009.5**
Total Project Area					**314,083**	**29,178.3**

* If the multipurpose and softball field are part of a larger complex of related activity fields, sizes of these areas may be increased if mission, site, and budget allow. Areas without an (*) must not be changed regardless of adjacent functions.

5-4 LOCATION DETERMINANTS.

The location of the activity fields must be coordinated with the fitness center location as described in paragraph 2-1 and the planning issues noted in paragraph 5-1. Ensure adequate site space per Figure 5-1.



5-5 LAYOUT AND ADJACENCIES.

The appropriate layout and adjacencies for the multipurpose field and associated buildings are illustrated in Figures 5-2 and 5-3. These diagrams do not convey a building or site shape and do not include the softball field(s). If softball fields are being included with the fitness center and multipurpose field, they must be located to take advantage of common features such as parking, circulation paths, and support buildings.

5-5.1 Support Building.

The diagram in Figure 5-2 indicates acceptable relative adjacencies of the support building.

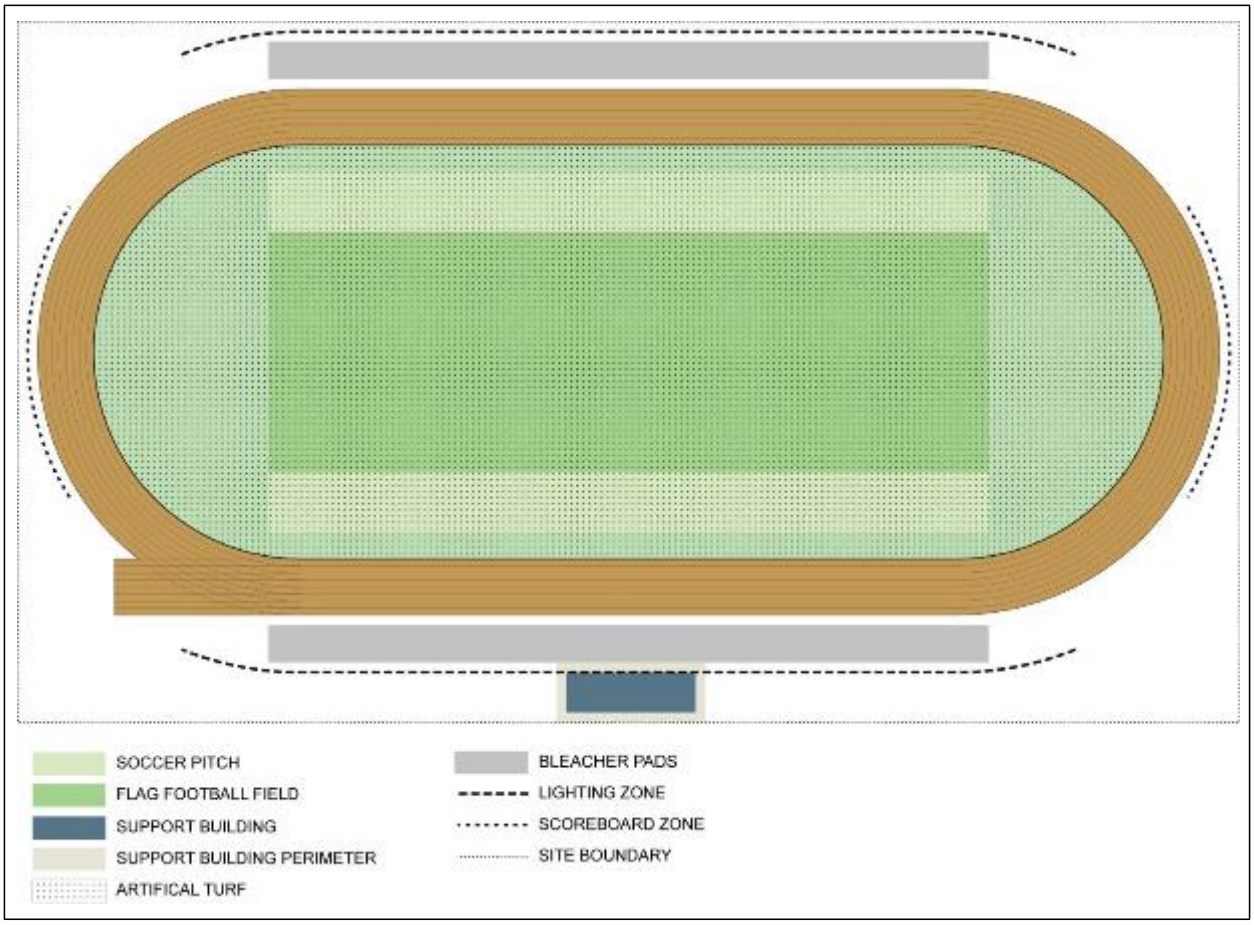


Figure 5-2 Support Building Functional Relationship Diagram

5-5.2 Multipurpose Field and Site.

The diagram in Figure 5-3 indicates acceptable relative adjacencies of the multipurpose field and site spaces.

Figure 5-3 Multipurpose Field and Site Functional Relationship Diagram

5-5.3 Space Assessment.

See Chapter 4 for additional information on space types and their relationships to each other.

5-6 GENERAL DESIGN CRITERIA.

The design of the multipurpose and softball fields must comply with the design guidance in Chapter 3. Additional requirements or exceptions specific to the activity fields are provided here.

5-6.1 Accessibility.

Per *ABA Accessibility Standards* (ABAAS), Section 407.4, the second-story press box space is not required to be accessible as it is not open to the general public, houses less than five persons, and is less than 500 square feet (46.5 m^2). Accessible routes are continuous, unobstructed paths connecting all accessible elements and spaces. The accessible route must comply with ABAAS provisions for location, width minimum of 36 inches (900 mm), passing space, head room, surface, slope (maximum of 1:12 or 8.33 percent), changes in level, doors, egress, and areas of rescue assistance.

5-6.2 Exterior Lighting.

Provide lighting and control systems per paragraph 3-6.4.1 and the additional criteria identified in paragraph 5-8, which notes field lighting levels and control requirements.

5-7 SITE DESIGN.

The site design, parking, other hard-surface areas, and landscaping of the activity fields must comply with the design guidance identified in Chapter 3. Additional requirements for specific areas of the multipurpose and softball fields are provided in paragraph 5-8.

5-8 SPECIFIC DESIGN CRITERIA.

The specific design needs for each functional area of the activity fields are provided in Tables 5-2 through 5-9 in a standard functional data sheet format.

Table 5-2 Concessions

Description/ Usage	Space for preparation and sale of food and drinks.
Ceiling Ht.	10 ft (3.05 m) minimum
Finishes	**Walls.** CMU with heavy-duty epoxy paint. **Floor**. Sealed concrete or seamless vinyl. **Ceiling**. Painted exposed structure.
Plumbing	Two-compartment stainless-steel sink with hot and cold water supply and a clean-out. Provide a separate hand-washing sink. Floor drain. Provide water connections to the ice machine and soda fountain. Provide wall hydrant on exterior wall.
HVAC	Provide system per Chapter 3, "HVAC." Temperature operating range: 68 °F (20 °C) to ventilated 10 °F (6 °C) above the 1.0% dry bulb temperature. No mechanical cooling.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, "Electrical." Provide dedicated outlets for the refrigerators, ice machine, and fountain soda machine. Provide countertop-height outlets for POS units, microwave, and other food/warming equipment as required.
Lighting	Provide system per Chapter 3, "Electrical." Provide 40 fc (400 lx) of general ambient lighting. Provide task lighting of 50 fc (500 lx) at the food preparation and service areas. Provide an occupancy sensor on the light controls.
Communication	**CCTV**. None required. **CATV/Internal Video**. None required. **PA/Audio**. None required. **Telephone**. Provide one line per POS. Provide at least one additional general-purpose phone line. **Data**. Provide one outlet per POS. Provide additional outlets, as needed, for associated hardware. **Security**. Consider providing duress alarm control next to the POS units.
Acoustics	No special provisions required.
Casework/ Built-in Equipment	Provide 24-in. (600-mm) -deep solid surface work-surface counter for food preparation. Provide two solid surface service counters with service windows opening to the public covered space and the side facing the field. Provide coiling doors at the service windows.
Furnishings, Fixtures & Equip. (FF&E)	Provide a menu board, an under-counter, reach-in refrigerator, a freezer, and an ice maker.
User-provided Equipment	A glass-front, front-loading refrigerated display case; soda fountain machine with under-counter boxed syrup; microwave; and other food preparation/warming equipment as required by the specific menu. Trash receptacles.
Special Requirements	Provide a minimum 36-in (900-mm) -wide access door to the dry goods storage room.
For use during project execution by the appropriate Service agency	
Occupancy	Staff Customers
Min. net ft^2 (m^2)	

Table 5-3 Covered Public Space.

Description/ Usage	Covered, paved exterior area directly adjacent the concessions service window.
Ceiling Ht.	10 ft (3.05 m) minimum.
Finishes	**Walls.** None. **Floor**. Sealed concrete or brick or stone pavers if budget allows. **Ceiling**. Painted exposed structure.
Plumbing	Provide a keyed exterior wall-hydrant; frost-free as dictated by climatic conditions.
HVAC	None.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	None required.
Lighting	Provide system per Chapter 3, "Electrical." Provide 5 fc (50 lx) of general ambient lighting.
Communication	**CCTV**. None required. **CATV/Internal Video**. None required. **PA/Audio**. None required. **Telephone**. Provide emergency telephone. **Data**. None required. **Security**. None required.
Acoustics	No special provisions required.
Casework/ Built-in Equipment	None required.
Furnishings, Fixtures & Equip. (FF&E)	Provide trash and recycling receptacles. Provide an AED in an exterior-mounted tamper-resistant case with a breakable seal for access.
User-Provided Equipment	None required.
Special Requirements	None required.
For use during project execution by the appropriate Service agency	
Occupancy	Staff Customers
Min. net ft^2 (m^2)	

Table 5-4 Men's and Women's Toilets

Description/ Usage	Separate ABA-compliant men's and women's toilet facilities that exit directly to the exterior.
Ceiling Ht.	10 ft (3.05 m) minimum.
Finishes	**Walls**. Semi-gloss enamel painted, mold-resistant gypsum wallboard with a ceramic tile wainscot. Prefer full-height ceramic tile walls with integral patterns, especially on wet walls. Use a dark-colored epoxy grout. **Floor**. Slip-resistant epoxy no-seam floor with integrated epoxy base to 6 in. (150 mm) AFF. **Ceiling**. Mold-resistant gypsum wallboard with a veneer plaster (level 5) finish and epoxy paint.
Plumbing	**Male:** Two flush-valve floor-mounted urinals, two flush-valve wall-mounted water closets, and two lavatories. Provide wash-out stall urinals, recess-mounted so that top of lip is level with adjacent finished floor. **Female:** Three flush-valve wall-mounted water closets and two lavatories. Provide floor drains for proper drainage located under the water closet partitions. Provide keyed hose bibbs with hot and cold water.
HVAC	Provide system per Chapter 3, "HVAC." Temperature operating range: 55 °F (13 °C) to ventilated 10 °F (6 °C) above the 1.0% dry bulb temperature. No mechanical cooling. Exhaust per UFC 3-410-01.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, "Electrical."
Lighting	Provide system per Chapter 3, "Electrical." Lighting fixtures must have translucent, damp location, non-breakable protective covers with shatterproof lenses.
Communication	**CCTV**. None required. **CATV/Internal Video**. None required. **PA/Audio**. None required. **Telephone**. None required. **Data**. None required. **Security**. None required.
Acoustics	No special provisions required.
Casework/ Built-in Equipment	Provide solid-surface lavatory countertops supported at both ends, with the front edge supported by galvanized angle reinforcing. Consider use of holes in lavatory countertop for waste disposal; coordinate location of paper towel dispenser. The sink must be integral with the counter. As an option, consider stainless-steel wash trough-style lavatories. Provide stainless-steel, solid plastic (HDPE) toilet and urinal partitions secured at floor and ceiling. Toilet accessories must be stainless steel and include: toilet paper dispensers, paper towel dispenser, trash receptacle, robe and towel hooks, grab bars, feminine hygiene receptacles in women's water closets, seat cover dispensers, and soap dispensers at lavatories. Provide full-width mirror at the lavatories.
Furnishings, Fixtures & Equip. (FF&E)	None required.
User-provided Equipment	None required.
Special Requirements	Exterior doors must have a keyed lockset that is lockable from the exterior only.
For use during project execution by the appropriate Service agency	
Occupancy	Staff Customers
Min. net ft² (m²)	

Table 5-5 Maintenance Bay

Description/ Usage	Space for field maintenance equipment, including truck, field groomer, and main access for field lighting.
Ceiling Ht.	10 ft (3.05 m) minimum.
Finishes	**Walls.** CMU with heavy-duty epoxy paint. **Floor**. Sealed concrete. **Ceiling**. Painted exposed structure.
Plumbing	Provide floor drain with a filter-cartridge-style oil/water separator. Provide exterior wall hydrant.
HVAC	Provide system per Chapter 3, "HVAC." Temperature operating range: 55 °F (13 °C) to ventilated 10 °F (6 °C) above the 1.0% dry bulb temperature. No mechanical cooling.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, "Electrical."
Lighting	Provide system per Chapter 3, "Electrical."
Communication	**CCTV**. None required. **CATV/Internal Video**. None required. **PA/Audio**. None required. **Telephone**. None required. **Data**. None required. **Security.** None required.
Acoustics	No special provisions required.
Casework/ Built-in Equipment	Provide lockable cabinets for cleaning supplies. Provide two overhead doors on opposite sides of the bay to allow drive-through with the maintenance vehicle. Provide one separate personnel door to the side of one of the overhead doors. All doors must be lockable.
Furnishings, Fixtures & Equip. (FF&E)	Provide workbenches and lockable tool and parts storage cabinet.
User-provided Equipment	Synthetic turf groomer.
Special Requirements	Place the master control panel for the field lights and irrigation system in this space. Provide a paved approach outside the overhead doors, where equipment can be hosed-off prior to entering the bay.
For use during project execution by the appropriate Service agency	
Occupancy	Staff Customers
Min. net ft^2 (m^2)	

Table 5-6 Announcer's Booth/Press Box

Description/ Usage	Second-story space to accommodate observers and scoreboard controls.
Ceiling Ht.	10 ft (3.05 m) minimum.
Finishes	**Walls.** CMU with heavy-duty epoxy paint. **Floor**. Sealed concrete. **Ceiling**. Painted exposed structure.
Plumbing	None required.
HVAC	Ventilate to not greater than 10 °F (6 °C) above the 1.0% dry bulb temperature. No heating or mechanical cooling provided.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, "Electrical." Provide dedicated power to the wireless scoreboard controls.
Lighting	Provide system per Chapter 3, "Electrical." Provide an occupancy sensor on the light controls.
Communication	**CCTV**. None required. **CATV/Internal Video**. None required. **PA/Audio**. Where required in project scope, provide PA system with speakers to project sound to spectator's area(s). **Telephone**. Provide one line. **Data**. Wireless scoreboard controller. **Security**. None required.
Acoustics	No special provisions required.
Casework/ Built-in Equipment	Provide a seated-height solid surface countertop at field-side window.
Furnishings, Fixtures & Equip. (FF&E)	Three chairs. Provide the control panel for the wireless scoreboard. Wireless scoreboard controls to include a game timer/clock, home and visitor scores, and quarter and half indicators.
User-provided Equipment	None required.
Special Requirements	Provide lockable, horizontal sliding windows facing the multipurpose field for the full width of the wall. The window sill must be at the seated-height countertop and the glazed area must extend to 78 in. (1950 mm) AFF. If the support building serves multiple activity fields, provide a counter and windows on each side that faces a field.
For use during project execution by the appropriate Service agency	
Occupancy	Staff Customers
Min. net ft^2 (m^2)	

Table 5-7 Dry Goods and Sports Activity Storage

Description/ Usage	Accommodates separate storage spaces for dry food service supplies such as paper goods (not for food storage) and sports activity items such as cones and flags.
Ceiling Ht.	10 ft (3.05 m) minimum.
Finishes	**Walls**. CMU with heavy-duty epoxy paint. **Floor**. Slip-resistant sealed concrete. **Ceiling**. Painted exposed structure.
Plumbing	None required.
HVAC	Ventilate to not greater than 10 °F (6 °C) above the 1.0% dry bulb temperature. No heating or mechanical cooling provided.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, "Electrical."
Lighting	Provide system per Chapter 3, "Electrical."
Communication	**CCTV**. None required. **CATV/Internal Video**. None required. **PA/Audio**. None required. **Telephone**. None required. **Data**. None required. **Security**. None required.
Acoustics	No special provisions required.
Casework/Built-in	None required.
Furnishings, Fixtures & Equip. (FF&E)	Provide storage shelving as required.
User-provided Equipment	None required.
Special Requirements	The walls for both storage rooms must extend to underside of structural ceiling. The dry goods storage must only be accessible from the concessions area via a lockable door. The sports activity storage must only be accessible from the exterior via a lockable door.
For use during project execution by the appropriate Service agency	
Occupancy	Staff Customers
Min. net ft^2 (m^2)	

Table 5-8 Multi-Purpose Field and Track

Description/ Usage	This table describes the multipurpose field and track and associated features including the bleacher pads, lighting zone, **\1** scoreboard zone, and site circulation. **/1/**
Dimensions	**Track**. A 1312-ft (400-meter) elliptical track: six lanes for medium-sized facilities and smaller, eight lanes for large-sized facilities and larger, and a 328.1-ft (100-meter) dash straightaway. For Air Force only, provide lane markings at 1.24 mile (2.0 km) distance for alternate walk test. See **Special Requirements** below for additional criteria. **Multipurpose field**. Fixed-size field of 360 ft by 160 ft (109.7 m by 48.8 m) playing area, with an additional 10 ft (3.0 m) of unobstructed space on each side. The synthetic turf multipurpose field must be striped for soccer per **\1** *NCAA Soccer Rules* **/1/** and for flag football per United States Flag Football Association (USFFA) *National Rules*. It is preferred that striping be integrated in the factory with the synthetic turf. The field must have white stripes for flag football and yellow stripes for soccer. In general, **\1** NCAA **/1/** and USFFA standards must be followed. See **Special Requirements** below for additional criteria. **Bleacher pads**. Pads are sized to accommodate 5-row tilt-up bleachers with a 5-ft (1.53-m) space around perimeter. The length can be continuous or with 5-ft (1.53-m) gap between each set of bleachers.

Surface Materials	**Track**. Provide a first-class, full-pour polyurethane synthetic surface, including all necessary sub-structure and drainage to obtain long-life durability, pursuant to the guidelines of **\1** *NCAA Cross Country/Track and Field Rules*. ***/1/*** The minimum thickness of the track surface must be ½ in. (13 mm) and the surface color will be determined by the installation. Provide a flush, paved transition strip a minimum width of 18 in. (450 mm) between the outside edge of the track and the surrounding area. This transition strip must not present a tripping hazard. The surfacing system minimum performance standards must reflect ASTM requirements for the materials specified. Running lanes will be marked on the track and markings will be placed for the 1.5-mile (2.41 km) events through use of a standard starting line and finish location arrow. The synthetic track system must be designed and constructed with a minimum five (5) year warranty covering the synthetic track surface against defects, workmanship, and normal use. Provide service start and stop signage for fitness testing. **Multipurpose field**. Provide either a natural grass turf or a synthetic artificial turf surface. As a minimum, the synthetic turf field must be an infill turf product utilizing a UV-stable, extruded-spine monofilament polyethylene fiber system. The finished playing surface must appear as mowed grass with no irregularities and must afford excellent traction for athletic shoes of all types. The finished surface must resist abrasion and cutting from normal use. The infill materials must be a mixture of graded, dust-free, rounded silica sand and crumb rubber. Seams (glued and/or sewn) must be as recommended by the synthetic turf manufacturer. The field must include an adequate drainage layer, including geotextile, panel drains, and stone base below the playing surface designed to prevent the field from excessive ponding of water. Grade field subgrades to provide a minimum of 0.7% slope from crown to sidelines. Drainage mats are not permitted. The synthetic playing field must be designed and constructed with a minimum eight- (8) -year warranty covering the synthetic playing surface against defects, workmanship and normal use, and increased G-max rating. The G-max value of the field must be from 100 to 125 at the completion of the installation and must not exceed a value of 175 during the 8-year warranty period; the increase in G-max value must not increase more than 5% in any single year. This surface must cover the entire area within the inside perimeter of the track. **Bleacher pads**. Reinforced concrete. Pad surface must be flush with surrounding areas. **Site circulation**. Provide concrete pathways with grass in non-paved areas. If budget and design language allow, provide brick or porous concrete pavers in lieu of concrete.
Plumbing and Drainage	**Multipurpose field**. Provide drainage per the selected manufacturer's specifications; do not use plastic cells for drainage. Subbase system must consist of a stone aggregate base on the subgrade to serve as a base for the synthetic turf and remove water from the synthetic turf surface. Subbase system must also include a concrete edge curb and attachment system and a sub-drainage system to convey storm and/or groundwater away from playing field areas. Sub-drainage system must consist of perforated HDPE drainage piping in gravel-filled trenches sloped to provide positive drainage. Provide an appropriate liner, as specified by the manufacturer, over the prepared subgrade and interiors of the sub-drain trenches prior to installation of subbase materials, piping, and trench backfill to prevent groundwater from entering the sub-drainage system. Provide water supply with quick hose disconnects at 4 locations around the perimeter of the field. If facilities include a natural grass turf surface, the field wet-down system is not required. Provide a sprinkler system or other means of watering the turf. **Site circulation**. Provide drinking fountains adjacent to an approach path for the track and multipurpose field. These drinking fountains may also be located on the support building exterior wall.

Power	Provide power to the lights, wireless scoreboard, and lighting control/communications kiosk.
Lighting	Provide system per Chapter 3, "Lighting." IESNA Class III lighting levels for recreation mode and Class II for competition mode.
Fencing	Provide a 4-ft (1.2-m) -tall vinyl-coated chain-link fence around outermost lane of track. The fencing must be 9 gauge (prior to vinyl coating) galvanized steel with vinyl-coated PVC coating, double-knuckle top and bottom with top and bottom rail. Color of vinyl coating specified by installation. Posts are to be 3-in. (75-mm) -diameter galvanized steel with vinyl coating and foundations are to be concrete with a minimum depth of 4 ft (1.2 m) or to the frost line, whichever is greater.
Furnishings, Fixtures & Equip. (FF&E)	**Multipurpose field**. Soccer goals and cones. Provide natural grass turf or synthetic artificial turf grooming and maintenance equipment. **Bleacher pads**. Five-row, tilt-up, portable aluminum bleachers. Provide trash and recycling receptacles. **Scoreboard zone**. Provide an electronic wireless scoreboard that includes game timer/clock, home and visitor scores, and quarter and half indicators. Scoreboard must be sized to ensure visibility from the opposite end of the field. Provide protector (i.e., fencing/net) for scoreboard.
Special Requirements	**Track**. Track design and exact dimensions must be per **\1** *NCAA Cross Country/Track and Field Rules* **/1/** guidelines for running tracks. Track will include lane markings; markings will be placed for 1.5-mile (2.41-km) events. The inner lane must have a width of 48 in. (1200 mm) and all other lanes must have a width of 42 in. (1050 mm). Inner and outer edges of track to have concrete containment curb per track manufacturer's design and requirements. **Multipurpose field**. Fixed-size playing area per **Dimensions** section above. Provide white striping for flag football per USFFA *National Rules*, “Diagram of Eight Man Field.” Provide yellow striping for soccer per **\1** *NCAA Soccer Rules*. **/1/** Provide an installation logo at the center of the field. **Site circulation**. Provide a lighting control/communications kiosk adjacent to an approach path to the track and multipurpose field. The kiosk must include controls for the recreation mode light level on a one-hour maximum timer, a phone or intercom communication link to the fitness center control desk, and a phone or intercom communication link to the installation emergency dispatch.
For use during project execution by the appropriate Service agency	
Occupancy	Staff Customers
Min. net ft^2 (m^2)	

Table 5-9 Softball Field

Description/ Usage	This table describes the requirements for the softball field and related features, including dugouts, bleacher pads, lighting, scoreboard, and site circulation.
Dimensions	**Softball Field.** The dimensions are as follows: bases are 70 ft (21.3 m) apart, pitching mound must be 50 ft (15.2 m) from home, and the outfield fence must be 300 ft (91.4 m) from home. The backstop must be 25 ft (7.6 m) from home plate. The side fence must be 25 ft (7.6 m) from the foul line. The synthetic turf softball field must be striped for softball per the **\1** *GSL – USSSA Slow-Pitch Rule Book & By-Laws* **/1/** to include the foul lines, batters' boxes, coach's boxes, and on-deck circles. It is preferred that striping be integrated in the factory with the synthetic turf. Provide breakaway bases (double first base) attached to rubber grommets anchored in the ground that release on impact. The new synthetic turf softball field must utilize an "infill" system consisting of synthetic turf fibers and an infill of sand and crumb rubber. See **Special Requirements** below for additional criteria. **Bleacher pads.** Pads are sized to accommodate 5-row tilt-up bleachers with a 5-ft (1.53-m) space around perimeter. Separate pads and bleachers are to be provided on the home and visitor sides behind backstop.
Surface Materials	**Softball field.** Provide either a natural grass turf or a synthetic artificial turf surface. As a minimum, the synthetic turf field must be an infill turf product utilizing a UV-stable, extruded-spine monofilament polyethylene fiber system. The finished playing surface must appear as mowed grass with no irregularities and must afford excellent traction for athletic shoes of all types. The finished surface must resist abrasion and cutting from normal use. The infill materials must be a mixture of graded, dust-free, rounded silica sand and crumb rubber with a ratio of sand to rubber to be per manufacturer's recommendation but must be a minimum 25% sand to rubber by volume. **\1** Seams (glued and/or sewn) must be as recommended by the synthetic turf manufacturer. To the maximum extent possible, field striping, markings, and inlays must be factory installed. **/1/** The field must include an adequate drainage layer, including geotextile, panel drains, and stone base below the playing surface, designed to prevent the field from excessive ponding of water. Grade field subgrades to provide a minimum of 0.7% slope for drainage. Drainage mats are not permitted. The synthetic playing field must be designed and constructed with a minimum eight (8) year warranty covering the synthetic playing surface against defects, workmanship, and normal use, and increased G-max rating. The G-max value of the field must be from 100 to 125 at the completion of the installation and must not exceed a value of 175 during the 8-year warranty period; the increase in G-max value must not increase more than 5% in any single year. Provide a cast-in-place concrete perimeter edge curb constructed as recommended by the synthetic turf manufacturer. **Bleacher pads.** Reinforced concrete. Pad surface must be flush with surrounding areas. **Site circulation.** Provide concrete pathways with grass in non-paved areas. If budget and design language allow, provide brick or porous concrete pavers in lieu of concrete.

Plumbing and Drainage	**Softball field**. Provide drainage per the selected manufacturer's specifications; do not use plastic cells for drainage. Subbase system must consist of a stone aggregate base on the subgrade to serve as a base for the synthetic turf and remove water from the synthetic turf surface. Subbase system must also include a concrete edge curb and attachment system and a sub-drainage system to convey storm and/or groundwater away from playing field areas. Sub-drainage system must consist of perforated HDPE drainage piping in gravel-filled trenches sloped to provide positive drainage. Provide an appropriate liner, as specified by the manufacturer, over the prepared subgrade and interiors of the sub-drain trenches prior to installation of subbase materials, piping, and trench backfill to prevent groundwater from entering the sub-drainage system. Provide a minimum of 4 quick-couplers (2 on each side of the field) for turf maintenance and washing down the field. Quick-couplers must be located around the field so that a 100-ft (30-m) hose can reach all parts of the field. Locate couplers adjacent to the synthetic turf. If facilities include a natural grass turf surface, the field wet-down system is not required. Provide a sprinkler system or other means of watering the turf. **Site circulation**. Provide drinking fountains adjacent to an approach path for the track and multipurpose field. These drinking fountains may also be located on the support building exterior wall.
Power	Provide system per Chapter 3, "Electrical." Include power for lights, wireless scoreboard, and lighting control/communications kiosk.
Lighting	Provide system per Chapter 3, "Lighting." Match requirements of football fields per UFC 3-530-01.
Fencing	**Backstop Fencing**. Provide a 16-ft (4.9-m) -tall vinyl-coated chain-link softball backstop with 6-ft (1.8-m) top overhang panel sloped at 45 degrees 25 ft (7.6 m) from home plate. The backstop must be 16 ft (4.9 m) wide on the home field side, 16 ft (4.9 m) wide behind home plate, and 16 ft (4.9 m) wide on the visitor side. The fencing must be 9 gauge (prior to vinyl coating) galvanized steel, vinyl coated, and be double-knuckled at the top and bottom. Color of vinyl coating specified by installation. Provide an 8-in. (200-mm) -wide concrete maintenance curb 4 in. (100 mm) above adjacent grade at the base of / below the fence. **Side Fencing**. Provide a 6-ft (1.8-m) -tall vinyl-coated chain-link fence between the backstop and outfield fence with one 4-ft (1.2-m) man gate adjacent to the farthest end of the dugout from home plate and one double 5-ft (1.5-m) (10-ft [3-m] opening) equipment gate halfway between the first to second base line and the outfield fence. Fencing must be 9 gauge (prior to vinyl coating) galvanized steel, vinyl coated, double-knuckle top and bottom with top and bottom rail. Color of vinyl coating specified by installation. Provide an 8 in. (200 mm) wide concrete maintenance curb 4 in. (100 mm) above adjacent grade at the base of /below the fence. **Outfield Fence**. Provide a 6 ft (1.8 m) tall vinyl coated chain link fence around the outfield. Fencing must be 9 gauge (prior to vinyl coating) galvanized steel with vinyl coating, double knuckle top and bottom with top and bottom rail with 4-1/2 in. (112 mm) corrugated plastic tubing over top rail/fence. Color of vinyl coating specified by Installation. Provide an 8-in. (200-mm) -wide concrete maintenance curb 4 in. (100 mm) above adjacent grade at the base of / below the fence. **Foul Pole**. Provide a 20-ft (6.1-m) -tall foul pole with 1.5 ft (0.5 m) by 12 ft (3.7 m) visible galvanized steel mesh wing with optic yellow vinyl coating at the intersection of each foul line and outfield fence.

Furnishings, Fixtures & Equip. (FF&E)	**Softball field**. Bases. Provide natural grass turf or synthetic artificial turf grooming and maintenance equipment. **Bleacher pads**. 5-row, tilt-up, portable aluminum bleachers. Provide trash and recycling receptacles. **Scoreboard zone**. Provide an electronic wireless scoreboard that includes game timer/clock, home and visitor scores, and ball/strike/out indicators. Scoreboard must be sized to ensure visibility from the backstop. Provide protector (i.e., fencing/net) for scoreboard.
User-provided Equipment	None required.
Special Requirements	**Softball field**. Fixed-size playing area per **Dimensions** above. **Site circulation**. Provide a lighting control/communications kiosk adjacent to the side fencing. The kiosk must include lighting system controls on a one-hour maximum timer, a phone or intercom communication link to the fitness center control desk, and a phone or intercom communication link to the installation emergency dispatch. **Dugouts (Optional)**. Provide dugouts for the visitor and home teams. Each dugout to be 8 ft (2.4 m) deep by 20 ft (6.1 m) wide with a minimum 4-in. (100-mm) -thick broom-finished concrete slab floor; surrounded by a 6-ft (1.8-m) -tall vinyl-coated chain-link fence beginning 25 ft (7.6 m) along the base line from home plate. The fencing must have a 4-ft (1.2-m) -wide opening at the end farthest from home plate. Fencing to be 9 gauge (prior to vinyl coating) galvanized steel, vinyl coated, double-knuckle top and bottom with top and bottom rail. The concrete slab floor must extend 4 in. (100 mm) beyond the face of the chain link fencing and be 4 in. (100 mm) above adjacent grade. Provide a single-slope standing seam metal roof with 8 ft (2.4 m) clear to underside of structure inside of the dugout. The roof must start behind/outside of the fence to the field and extend a minimum of 1 ft (0.3 m) beyond the side and back fencing of the dugout. Color of vinyl coating and metal roof as specified by installation.
For use during project execution by the appropriate Service agency	
Occupancy	Staff Customers
Min. net ft^2 (m^2)	

Table 5-10 \1\ Building Support/Vertical Circulation

Description/ Usage	This space is to accommodate building HVAC, janitor's closet, and non-ABA access to the press box.
Min. Ceiling Ht.	N/A
Finishes	**Walls.** CMU with heavy-duty epoxy paint. **Floor.** Sealed concrete or seamless vinyl. **Ceiling.** Painted exposed structure.
Plumbing	Provide a floor drain. Provide a mop sink with hot and cold water and a hose connection.
HVAC	Heating and ventilation only.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	As required for mechanical equipment.
Lighting	Provide system per Chapter 3, "Electrical." Provide an occupancy sensor on the light controls.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** None required. **Telephone.** None required. **Data.** None required. **Security.** None required.
Acoustics	No special provisions required.
Casework/ Built-in Equipment	Provide shelving in janitor's closet.
Furnishings, Fixtures & Equip. (FF&E)	Mechanical HVAC equipment, as required. If required by installation, provide lockable cabinets for cleaning supplies in janitor's closet.
User-provided Equipment	None required.
Special Req.	None.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.

CHAPTER 6 AUSTERE FITNESS CENTERS (NAVY ONLY)

CHAPTER 1 GENERAL

6-1 PURPOSE.

The purpose of this chapter is to provide implementation requirements for austere construction as established by CNIC. These requirements were developed to address construction of support facilities in CNIC-designated operating environments.

6-2 DEFINITION AND SCOPE.

An austere facility is defined as a structure designed and constructed with minimal infrastructure, footprint area, and finishes, incorporating applicable building codes and facility criteria to assure adherence to all health, accessibility, and life safety standards and regulations required to fulfill the mission, including antiterrorism force protection (AT/FP) appropriate to each site.

- Austere construction is intended for support facilities, such as unaccompanied housing (UH), administration, galleys, and fitness facilities.
- Build austere facilities with the least total ownership costs (TOC) possible, including purchase, maintenance, and use of consistently available alternative local goods.

6-3 APPLICABILITY.

This chapter applies to Navy fitness center facilities designated as austere by CNIC. This chapter modifies requirements provided in other chapters of this UFC.

6-4 MODIFICATIONS.

The following are modifications to this UFC. When designated austere, delete the coordinating paragraph in this UFC and replace with the following Chapter 6 paragraph:

CHAPTER 2 PLANNING AND LAYOUT

2-1 LOCATION DETERMINANTS.

2-1.1 Access.

Locate the fitness center to be visible and easily accessible to a diverse representation of users. Consider sites located along pedestrian paths to the existing or proposed barracks/dormitories, existing or proposed MWR/NEX facilities, and/or the dining facility. To accommodate patron access, consider the relationships to existing or proposed vehicular and pedestrian circulation patterns, bike trails, and bus stops.

2-1.2 Cost.

Design these facilities with consideration of a timeframe appropriate to austere facilities, regionally appropriate acquisition of equipment, base operating support (BOS) access difficulties, and logistical difficulties.

2-3 SPACE PROGRAM.

Refer to UFC 2-000-05N, *Facility Planning Criteria for Navy/Marine Corps Shore Installations*, for space planning spreadsheets for austere fitness facilities.

2-5 SPACE ASSESSMENT.

See the austere functional data sheets in Chapter 6 for additional information on the space types and their relationships to each other.

2-7 PROGRAM AREAS.

2-7.1 Fitness Program, Administrative Areas, and Building Support.

Table 6-1 lists the core and optional areas for the fitness program, administrative areas, and building support. This table identifies functional areas. Program the facility, including areas such as circulation/corridors, exterior wall cavities, and mechanical/electrical/communication rooms to determine the gross area of the building. See UFC 3-101-01 for methods to calculate gross building area.

Table 6-1 \1\ Austere Functional Program Areas

Functional Program Area	Description/ Requirements
Lobby/Reception	
Entry lobby and waiting/display	Entry space in front of control counter and/or vestibule. Combined with a waiting area with seating and display space.
Control counter/equipment issue storage	Sign-in and small gear issue. Provides visual control via LOS to, at minimum, the entry, free weights, and locker room entrance. Visual control over other key areas must be accommodated via LOS or CCTV. Provides area to hold gear for issue (e.g., towels, balls, and racquets).
Public restrooms	Restrooms used primarily by visitors, spectators, and persons not using the locker and shower rooms. Sizing is tied to gym capacity.
Janitor's closet	Space used by custodial staff, with mop sink and storage space.
Administrative	
Director's office	Private office.
Program managers' offices	Workstations.

Administrative/Support Staff	Workstations.
Classroom	Space used for conducting training and large meetings. Classroom sized for 25 persons (750 ft^2 [69.68 m^2) for small facilities, 50 persons (1,500 ft^2 [139.35 m^2]) for medium and large, and 75 persons (2,250 ft^2 [209.03 m^2]) for extra-large and jumbo facilities.
Copy/work/break room	Copier, layout space, storage, small staff break area.
Gymnasium	
Basketball/volleyball court(s)	NCAA-size court(s).
Spectator seating	Minimum of 200 seats, more as required and with additional courts.
Storage/support	Storage area with access to both the gym and to the outside if adjacent intramural fields are present.
Unit PT/Group Exercise	
Group exercise room	One large subdividable room with partitions (for classes and/or unit/command fitness training).
Storage/support	Storage area with access to unit PT/group exercise room.
Fitness Spaces	
Stretching/warm-up/cool-down	Usually one open space; may use floor finishes to separate subspaces; may use alcoves; may use balconies/mezzanines.
Free/plate-loaded weights	
Selectorized (machine) weights	
Cardiovascular (cardio) equipment	
Fitness program manager's office	Private office adjacent to fitness assessment room and fitness spaces. May include fitness testing equipment.
Structured Activities	
Locker rooms	Separate male/female facilities. Each locker room is divided into the three sub areas indicated.
Men's locker room	Programmed per installation population.
Locker/dressing area	Programmed per installation population.
Toilet area	Programmed per installation population.
Shower/drying area	Programmed per installation population.
Women's locker room	Programmed per installation population.
Locker/dressing area	Programmed per installation population.

Toilet area	Programmed per installation population.
Shower/drying area	Programmed per installation population.
Support Areas	
Laundry	For towels and uniforms.

/1/

CHAPTER 3 GENERAL DESIGN CRITERIA

3-3 ARCHITECTURE.

Refer to UFC 3-101-01 for direction as to the appropriate core criteria for architectural details and finish concerning:

- Exterior finishes, vapor retarders, thermal insulation, and air infiltration.
- Design and detail roof systems to resist maximum wind for the area.
- Austere construction requires durable materials and finishes throughout.

In addition to UFC 3-101-01, the following requirements in paragraphs 3-4.3, 3-5.1, and 3-5.2 are specific to austere fitness centers.

3-4.3 Exterior Finishes.

Exterior surfaces requiring paint must use a minimum of one prime coat and two finish coats.

3-5.1 Interior Construction.

Ability to repair, refinish, and reconfigure are important in austere construction. For austere projects, the use of light-frame construction for interior wall construction is preferred. Concrete/masonry is optional; minimize load-bearing walls where appropriate.

Construct cabinets to American Woodworking Institute (AWI) custom grade with heavy-duty hardware.

3-5.2 Finishes.

Refer to Table 6-2 for austere interior finishes. For additional information on finishes in specific areas, see the functional data sheets in Chapter 6.

Ceilings are to be exposed and painted, including all exposed plumbing, mechanical fire stops, and electrical conduit, unless it is more cost-effective to provide a finished ceiling.

Table 6-2 Austere Interior Finishes

General Space	Recommended Finishes			
	Floor	Base	Walls	Ceiling
Entry/vestibule	CONCS/WM	RB	P	P
Control counter/equipment issue storage	CONCS	RB	P	P
Public toilets	CONCS or PT	RB	P or CT	P
Janitor's closet	CONCS	RB	P	P
Administrative office	CONCS	RB	P	P
Classroom/conference room	CONCS	RB	P	P
Copy/work room	CONCS	RB	P	P
Basketball/volleyball courts	RSF	RB	P	P
Group exercise room	RSF	RB	P	P
Fitness spaces	RSF	RB	P	P
Locker rooms	PT	CT	P	P
Toilets	PT	CT	P/CT wet walls	P
Showers	PT	CT	CT full height	P
Laundry	CONCS	RB or CT	P or CT	P
Stairwells	CONCS	RB	P	P

Key:

CONCS – Sealed concrete
CT – Ceramic tile
P – Paint
PT – Porcelain tile
RB – Rubber base
RSF – Resilient sports flooring
WM - Walk-off mat (surface)

3-6 SERVICES.

3-6.1 Plumbing.

Avoid plumbing chases whenever possible by placing plumbing in wall cavities. Fixture clearances must be appropriately sized for the intended occupants and use low-flow WaterSense requirements where feasible.

- Provide hot and cold water to laundry facilities.
- Provide easily accessible shutoff valves at all fixtures.
- Water closets must be commercial-quality. Use low-consumption type only if appropriate for the austere location. It is recommended that areas with low water pressure use power-flush-type water closets. Use elongated, one-piece construction with a closed front seat and a lid. Provide fixtures in a neutral color.

- Provide flush-valve toilets, dual-flush manual type.
- Provide hose bibbs on one exterior wall of each building and near air-cooled mechanical equipment; frost-free as dictated by climatic conditions. Provide floor drains in all janitor's closets and laundry rooms, if applicable.
- Use the following flow fixtures as standards: washerless faucets at lavatories with single-lever faucets. Provide overhead rainfall type showerheads with maximum 2.2 gallons per minute (0.14 liter per second [l/sec]) flow rate. Locate showerheads a minimum of 75 inches (1875 mm) above the shower base.

3-7 FURNISHINGS AND EQUIPMENT.

Furnishings, fixtures, and equipment (FF&E) procurement packages must be designed by the same design agent as the facility to ensure complete coordination. Final approval of FF&E specifications will be determined by the design team, including guidance/input received from the respective NAVFAC interior designers. A turn-key approach to FF&E procurement within military construction projects is directed to the greatest extent possible and practical. This will ensure a coherent FF&E package and the most practical use of funding.

Specified furnishings must be as minimal as possible to meet the required mission of the facility. Durability, flexibility, and sustainability must be the major prerequisites for all products provided. Special attention must be given to the geographic location and extreme weather conditions of the facility to provide the most practical solutions to endure the situation. Surge capabilities must be considered as required by the specific location and facility requirements.

3-8 SITE DESIGN AND ORGANIZATION.

Apply austere decision-making processes to assess, modify, and incorporate location, antiterrorism circulation, and lighting plans appropriate to local conditions.

3-8.2 Parking and Access Drives.

Apply austere decision-making to assess, modify, and incorporate requirements such as pedestrian circulation, bus access, service vehicle parking, and lighting plans appropriately to local conditions and to limit parking as much as possible while still meeting the facility mission. Review the security study and incorporate its requirements into the design. Ensure existing and proposed parking is in compliance with antiterrorism requirements. In austere facilities, parking for residents, visitors, staff, and service personnel must be extremely minimal and only as critical to the mission. Maintenance parking for service functions does not necessarily require dedicated space. Use the expected frequency of maintenance vehicles to determine whether dedicated parking is needed. Locate service access and parking to avoid disturbing residents.

3-8.3 Service Drive.

Limit (or eliminate) use of screen walls.

3-9 SUSTAINABLE DESIGN.

Comply with UFC 1-200-02. For projects designated austere (CONUS and OCONUS), the Chief Engineer of NAVFAC has waived third-party certification requirements.

CHAPTER 4 SPECIFIC DESIGN CRITERIA

4-1 INTRODUCTION.

This chapter identifies the specific design needs for each functional area outlined in the space program.

The interior construction specialties, equipment, and furnishings criteria provided in these tables are broken down as follows:

- Casework/Built-in Equipment. This includes anything physically attached or plumbed to the building, such as counters, cabinets, casework, toilet accessories, fixed window treatments, and laundry machines.
- Furnishings, Fixtures, and Equipment (FF&E). This includes contractor-furnished, contractor-installed loose items such as desks, tables, chairs, and bookshelves.
- User-provided Equipment. This includes all government-furnished, government-installed items, which are typically limited to office equipment such as computers, printers, copiers, and flat panel displays (if mounted, flat panel display mount would be built-in).

4-3 FUNCTIONAL DATA SHEETS.

When designated austere, delete the coordinating table in this UFC and replace with the following Chapter 6 table:

Table 6-3 (Replace Table 4-1) Austere Entry

Description/ Usage	The entry serves as the primary entrance to the facility for patrons.
Ceiling Ht.	10 ft (3.05 m) minimum.
Finishes	**Walls.** Utilize a durable and scrubbable eggshell or satin finish, whichever has higher gloss, for painted surfaces. **Floor**. Sealed concrete, moisture and slip-resistant. Provide a surface walk-off mat/area at the entrance door. Provide rubber base. **Ceiling**. Exposed painted structure.
Plumbing	Provide electric water cooler(s) in proximity of public toilets/locker rooms.
HVAC	Provide system per Chapter 3, “HVAC.”
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, "Electrical."
Lighting	Provide system per Chapter 3, "Electrical."
Communication	**CCTV**. Provide at least one outlet or as needed to cover the entrance. **CATV/Internal Video**. Consider a CATV outlet. **PA/Audio**. Provide a speaker. **Telephone**. Provide one line. **Data**. Provide an outlet. **Security.** None required.
Acoustics	No provisions required.
Casework/ Built-in Equipment	None.
Furnishings, Fixtures & Equip. (FF&E)	Furniture must be durable, easy to clean, and moisture-resistant, if provided. Provide a means to display installation and staff information.
User-provided Equipment	Provide CCTV cameras per the outlet count.
Special Req.	Provide an airlock at the main entrance. Exterior doors must have continuous or heavy-duty hinges. Provide a grated snow-trap for Northern Tier bases. Signage.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 6-4 (Replace Table 4-2) Austere Control Counter/Equipment Issue/Storage

Description/ Usage	The control counter is often referred to as the front desk or reception desk. It is the focal point of information exchange within the building and is the check-in location for patrons. Patrons must not be able to access other facility spaces without passing the control desk and checking in. Do not use check-in/counting methods that restrict rapid access/egress to/from the facility, such as a turnstile. Equipment such as towels and balls will be issued from the control desk. It must provide for direct supervision of the facility and greeting, informing, and directing patrons to their particular activity area. Additionally, the control desk serves as the focal point for safety and emergency situations. Staff access to the counter must permit access to the free weight and treadmill areas for emergency response.
Ceiling Ht.	9 ft (2.74 m) minimum.
Finishes	**Walls.** Utilize a durable and scrubbable eggshell or satin finish, whichever has higher gloss, for painted surfaces. **Floor**. Sealed concrete, moisture and slip-resistant finish. Provide rubber base. **Ceiling**. Exposed painted structure.
Plumbing	None required.
HVAC	Provide system per Chapter 3, "HVAC." Provide an emergency HVAC shut-off control in accordance with UFC 4-010-01.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide power for all equipment per Chapter 3, "Electrical." Perform a power requirement survey as power requirements are extremely site- and locale-specific.
Lighting	Provide system per Chapter 3, "Electrical." Provide 30 fc (300 lx) of general ambient lighting. Provide fixed 50 fc (500 lx) task lighting at the control counter.
Communication	**CCTV**. All monitors must be viewable from this area. **CATV/Internal Video**. None required. **PA/Audio**. Provide PA and audio system controls at the control counter for room-by-room and "all call" communication. Provide intercom capability as directed by installation. Provide a speaker. **Telephone**. Provide at least two general-purpose phone lines. **Data**. Data outlets must be provided for every piece of equipment identified as requiring data, plus a 25% spare capacity for flexibility. Pieces of equipment include, but are not limited to, computers, copier/printer/fax, and ID check system. **Security**. None.
Acoustics	No provisions required.
Casework/ Built-in Equipment	Provide a 24-in (600-mm) -deep counter with built-in base cabinets. Provide file drawers and storage drawers with a minimum of two lockable drawers for each POS. The counter must be dual height for standing transactions, seated office functions, and ABA customer service. Note that ABA-height counter must have knee-hole space on both sides of the counter. The counter must be a durable solid surface material such as concrete or solid surfacing material; laminate is not permitted. Provide a towel return drop opening in the counter top with space for a laundry cart below, if required by operations. Modesty panels and apron must be of durable materials. Provide supports such as steel angle braces for counters with knee-hole space. Provide wall cabinets. Storage must accommodate towels and small athletic equipment such as balls. Provide PA controls.

Furnishings, Fixtures & Equip. (FF&E)	Chairs and stools. Provide an AED.
User-provided Equipment	Desktop computer for administrative functions, CCTV monitors, and printers.
Special Req.	Attendants at the control desk must have direct LOS visual control over the following, at minimum: entry, free weight area, treadmill section of the cardiovascular area, and locker room entrance. Visual control over other key areas must be accommodated via LOS and/or CCTV and are identified in the individual functional data sheets.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 6-5 (Replace Table 4-4) Austere Laundry

Description/ Usage	The laundry accommodates cleaning and drying of towels and uniforms. Some installations contract out towel laundry; however, there is still a requirement to provide laundry for uniforms. Locate adjacent to the control counter. It is preferred that the location be on an outside wall.
Ceiling Ht.	9 ft (2.74 m) minimum.
Finishes	**Walls.** Utilize a durable and scrubbable eggshell or satin finish, whichever has higher gloss, for painted CMU or mold-resistant gypsum wallboard. Provide durable finishes, rub rails, and metal/high-impact plastic corner guards. **Floor**. Sealed concrete with rubber base. **Ceiling**. None or epoxy painted mold-resistant gypsum wallboard.
Plumbing	Provide hot and cold water and drain connections in recessed washer outlet box to each of the washing machines and one laundry sink. Provide floor drains. Provide connections and floor drain to an ice machine, if provided.
HVAC	Provide system per Chapter 3, “HVAC.” Temperature operating range: 68 °F (20 °C) to 76 °F (24 °C). Provide ventilation in accordance with ANSI/ASHRAE 62.1 requirements for "Laundry Rooms, Central." Provide separate vents for each dryer and vent dryers per UFC 3-410-01.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety." Regardless of size, enclose laundry rooms with a 1-hour fire barrier.
Power	Provide outlets per Chapter 3, "Electrical". Provide a dedicated circuit for each washer (or washer extractor) and for each dryer (or dryer tumbler). If hard-wired (non-plug connected), provide wall-mounted safety disconnect switch within sight of the equipment it controls.
Lighting	Provide system per Chapter 3, "Electrical."
Communication	**CCTV**. None required. **CATV/Internal Video**. None required. **PA/Audio**. Provide one speaker. **Telephone**. None required. **Data**. None required. **Security**. None required.
Acoustics	No provisions required.
Casework/ Built-in Equipment	Large, high-capacity commercial washers and dryers.
Furnishings, Fixtures & Equip. (FF&E)	Provide storage shelves for laundry supplies. Laundry carts.
User-provided Equipment	None.
Special Req.	Provide easy access to rear of dryers (or tumblers) to allow maintenance and cleaning of vents (see **HVAC**). Provide space for storage of laundry carts. Coordinate door openings and dimensions with room layout and equipment sizes, e.g., laundry carts, washers/extractors, dryers/tumblers, and ice machines.
For use during project execution by the appropriate Service agency	
Occupancy	Staff.
Min. net ft^2 (m^2)	

Table 6-6 (Replace Table 4-5) Austere Public Toilets

Description/ Usage	These toilet rooms are used primarily by patrons and staff if no locker and shower rooms are provided. They must be adjacent to the lobby and gymnasium. Provide unisex or separate male and female restrooms.
Min. Ceiling Ht.	9 ft (2.74 m) minimum.
Finishes	**Walls.** Semi-gloss enamel painted, mold-resistant gypsum or ceramic tile wainscot. **Floor**. Sealed concrete or non-slip porcelain tile with dark-colored epoxy grout. Slope tile to drain. **Ceiling**. Exposed painted structure.
Plumbing	Provide wall-hung water closets, wall-hung urinals, and lavatories based on UFC 3-420-01 for the calculated occupancy of the gymnasium. Provide a floor drain.
HVAC	Provide system per Chapter 3, “HVAC.” Exhaust per UFC 3-410-01.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, "Electrical."
Lighting	Provide system per Chapter 3, "Electrical."
Communication	**CCTV**. None required. **CATV/Internal Video**. None required. **PA/Audio**. Provide a speaker. **Telephone**. None required. **Data**. None required. **Security**. None required.
Acoustics	No special provisions required.
Casework/ Built-in Equipment	Solid-surface countertop with either undermount or integral sink. For single-occupancy toilets, wall-hung lavatories without countertop are allowed. Solid plastic (HDPE) toilet and urinal partitions. Toilet accessories: Toilet paper dispensers, paper towel dispenser, trash receptacle, robe hooks, grab bars, sanitary napkin disposal (female water closet stalls), seat cover dispensers, and soap dispensers. Mirror.
Furnishings, Fixtures & Equip. (FF&E)	None.
User-provided Equipment	None.
Special Req.	None.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 6-7 (Replace Table 4-5) Austere Janitor's Closet

Description/ Usage	This space is for use of custodial staff and includes mop sink and storage space for cleaning equipment and supplies.
Min. Ceiling Ht.	9 ft (2.74 m) minimum.
Finishes	**Walls.** Semi-gloss enamel painted, mold-resistant gypsum wallboard. **Floor**. Sealed concrete. **Ceiling**. Not required but where provided must be moisture-resistant and cleanable.
Plumbing	Provide a floor drain. Provide a mop sink with hot and cold water and a hose connection.
HVAC	Provide system per Chapter 3, “HVAC.” Exhaust per UFC 3-410-01.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, "Electrical."
Lighting	Provide system per Chapter 3, "Electrical."
Communication	**CCTV**. None required. **CATV/Internal Video**. None required. **PA/Audio**. None required. **Telephone**. None required. **Data**. None required. **Security**. None required.
Acoustics	No special provisions required.
Casework/ Built-in Equipment	Provide shelving.
Furnishings, Fixtures & Equip. (FF&E)	If required by installation, provide lockable cabinets for cleaning supplies.
User-provided Equipment	None required.
Special Req.	Locate in proximity of other areas with plumbing. This closet includes storage for pails, mops, vacuums, and related cleaning supplies and equipment. Include a lockable door (which can be opened from the inside). Provide space for lockable cabinets for cleaning supplies, as required by installation.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 6-8 (Replace Table 4-8) Austere Administrative Office

Description/ Usage	The administrative office provides space for the director, program manager(s) and/or support staff. This space may also be used for conference and copy room functions for staff.
Ceiling Ht.	9 ft (2.74 m) minimum.
Finishes	**Walls.** Utilize a durable and scrubbable eggshell or satin finish, whichever has higher gloss, for painted gypsum wall board. **Floor**. Sealed concrete with rubber base. **Ceiling**. Exposed painted structure.
Plumbing	None required.
HVAC	Provide system per Chapter 3, “HVAC.”
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, "Electrical."
Lighting	Provide system per Chapter 3, "Electrical."
Communication	**CCTV.** Provide monitoring capability when directed by the installation. **CATV/Internal Video:** One outlet required for office. **PA/Audio:** Provide a speaker. Provide controls in the office with room-by-room and "all call" communication. Provide intercom capability as directed by installation. **Telephone.** Provide one line per staff plus one additional line for fax and copier. **Data.** Provide one outlet per staff plus one outlet for each printer, copier, and scanner. **Security.** None required.
Acoustics	No provisions required.
Casework/ Built-in Equipment	None.
Furnishings Fixtures & Equipment (FF&E)	Workstations—provide furniture for 64 ft^2 (6 m^2) workstation: desk chair and side chair for open offices. Provide task lighting and adequate space for filing and overhead storage.
User-provided Equipment	Computers and other office equipment.
Special Requirements	Provide an interior window with blinds to accommodate visual supervision over the fitness area and the control counter, where possible. Provide a vision panel, minimum 5 ft^2 (0.46 m^2), in the door.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 6-9 (Replace Table 4-9) Austere Classrooms

Description/ Usage	This optional space is used for conducting meetings and training. This function may be incorporated into the administrative office area. When provided as a separate space, program for 25 persons at 750 ft^2 (69.7 m^2)
Ceiling Ht.	9 ft (2.74 m) minimum.
Finishes	**Walls.** Utilize a durable and scrubbable eggshell or satin finish, whichever has higher gloss, for painted gypsum wallboard. **Floor**. Sealed concrete with rubber base. **Ceiling**. Exposed painted structure.
Plumbing	None required.
HVAC	Provide system per Chapter 3, “HVAC.”
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, "Electrical."
Lighting	Provide system per Chapter 3, "Electrical."
Communication	**CCTV.** Provide outlets as required for coverage. **CATV/Internal Video.** Provide one outlet. **PA/Audio.** Provide a speaker. **Telephone.** Provide one line. **Data.** Provide a minimum of one outlet. **Security.** None required.
Acoustics	No provisions required.
Casework/ Built-in Equipment	None.
Furnishings Fixtures & Equipment (FF&E)	Provide tables, chairs, and an AV cart, as required.
User-provided Equipment	Provide CCTV cameras per the outlet count.
Special Requirements	Provide a vision panel, minimum 5 ft^2 (0.46 m^2), in the door if space is provided.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 6-10 (Replace Table 4-10) Austere Copy/Work/Break Room

Description/ Usage	This optional space is used as a staff workroom for copying, meetings, breaks, and lunches and may be incorporated into the administrative office area.
Ceiling Ht.	9 ft (2.74 m) minimum.
Finishes	**Walls.** Utilize a durable and scrubbable eggshell or satin finish, whichever has higher gloss, for painted gypsum wall board. **Floor**. Sealed concrete with rubber base. **Ceiling**. Exposed painted structure.
Plumbing	Provide a two-compartment stainless steel sink with hot and cold water. Provide a cold-water connection for refrigerator ice maker.
HVAC	Provide system per Chapter 3, “HVAC.”
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, "Electrical." Provide one additional outlet at counter height for convenience if casework is provided.
Lighting	Provide system per Chapter 3, "Electrical."
Communication	**CCTV.** None required. **CATV/Internal Video.** Provide one outlet. **PA/Audio.** Provide a speaker. **Telephone.** Provide one line. **Data.** Provide outlets as required for equipment. **Security.** None required.
Acoustics	No provisions required.
Casework/ Built-in Equipment	Solid-surface countertops if casework is provided.
Furnishings Fixtures & Equipment (FF&E)	Table, chairs, microwave, coffee machine, and refrigerator, as required.
User-provided Equipment	Copier, fax machine, printers, and other office equipment, as required.
Special Requirements	Provide a vision panel, minimum 5 ft^2 (0.46 m^2), in the door if space is provided
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 6-11 (Replace Table 4-11) Austere Men's and Women's Lockers/Dressing

Description/ Usage	Separate men's and women's locker/dressing rooms will be used by those participating in fitness/sports activities for changing, dressing, and securing personal effects. It is open and directly adjacent to the toilet/shower facilities. As such, moisture and humidity must be addressed in the locker/dressing rooms. Distribution of lockers for each gender are determined on a case-by-case basis.
Ceiling Ht.	10 ft (3.05 m) minimum.
Finishes	**Walls.** Epoxy or semi-gloss enamel painted CMU or mold-resistant gypsum wallboard. **Floor**. Non-slip porcelain tile with dark-colored epoxy grout. Slope tile to drain. **Ceiling**. Exposed painted structure.
Plumbing	Provide and locate floor drains as required to ensure proper drainage and no standing water on the floor. Provide an electric water cooler.
HVAC	Provide system per Chapter 3, “HVAC.” Temperature operating range: 70 °F (21 °C) to 78 °F (26 °C). Provide supply air from the dry side of this space (opposite the adjacent toilet/shower wet side) and exhaust from the wet area. Exhaust per UFC 3-410-01. Provide ceiling fans with wall-mounted controls (do not have to be HVLS fans).
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety." Where shower spaces are open to the locker room area, provide corrosion-resistant sprinklers and escutcheons such as stainless steel throughout the locker room.
Power	Provide outlets per Chapter 3, "Electrical." Provide counter-height outlets at the vanity area.
Lighting	Provide system per Chapter 3, "Electrical." Lighting fixtures must have translucent, damp location, unbreakable protective covers. Minimize shadowing at face of lockers.
Communication	**CCTV**. None required. **CATV/Internal Video**. Provide CATV outlets for wall or ceiling mounts. **PA/Audio**. Provide PA speakers as needed for full coverage. Provide speakers for the separate audio system. Provide an emergency call/alarm. **Telephone**. None required. **Data**. None required. **Security.** None required.
Acoustics	No special provisions required.
Casework/ Built-in Equipment	Provide solid plastic (HDPE) lockers and benches. Lockers must be a minimum of 15 in. wide by 24 in. deep (375 mm by 450 mm). Typically provide a mix of full-and half-sized Z-shaped lockers. The location's climate will determine the ratio of half- to full-sized lockers: colder climates will require a higher percentage (or 100%) of full-sized lockers to accommodate bulkier cold weather gear. Steel lockers are not permitted. Provide minimum 16-in. (400-mm) -wide integral (usually part of the locker system) benches. Mount lockers at a level above the floor to ensure operating hardware is easily reachable. Provide a full-height wall mirror.
Furnishings, Fixtures & Equip. (FF&E)	Provide a scale and a wall clock. Provide a flat panel display.

User-provided Equipment	Provide blood pressure monitor.
Special Req.	Provide sloped-top lockers to preclude the tops of the lockers being used for storage.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 6-12 (Replace Table 4-12) Austere Men's and Women's Showers

Description/ Usage	These separate male and female areas are directly adjacent to (and may be open to) the corresponding gender's locker/dressing and toilet areas and include private shower stalls. If the facility includes a pool, the pool entry/exit must be adjacent to this area. Shower compartment construction options include constructed separation walls, field-assembled pre-manufactured shower partitions and pre-manufactured solid surface shower compartments.
Ceiling Ht.	9 ft (2.74 m) minimum.
Finishes	**Walls.** Full-height ceramic tile with dark-colored epoxy grout on cementitious backer units. **Floor**. Non-slip porcelain tile with dark-colored epoxy grout. Slope tile to drain. **Ceiling**. Exposed painted structure.
Plumbing	Provide minimum 36-in (900-mm) -wide private shower stalls for men and women. Provide a minimum of one floor drain at each shower stall and additional drains as needed to ensure proper drainage.
HVAC	Provide system per Chapter 3, “HVAC.” Temperature operating range: 70 °F (21 °C) to 78 °F (26 °C). Provide supply air from the dry side (adjacent locker/dressing area) and exhaust from the wet area (toilet/shower). Exhaust per UFC 3-410-01. If constructed, separation walls are used from floor to ceiling; locate exhaust outlets in each space.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety." Provide corrosion-resistant sprinklers and escutcheons such as stainless steel throughout the shower room.
Power	Provide outlets per Chapter 3, "Electrical."
Lighting	Provide system per Chapter 3, "Electrical."
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. Provide an emergency call/alarm. **Telephone.** None required. **Data.** None required. **Security.** None required.
Acoustics	No special provisions required.
Casework/ Built-in Equipment	Solid plastic (HDPE) shower partitions secured at floor and ceiling or permanent walls between showers; see **Finishes** for wall finish. If the facility includes a pool, provide swim mats or tiles that are textured, anti-slip, self-draining, and raise the walking surface above standing water.
Furnishings, Fixtures & Equip. (FF&E)	None required.
User-provided Equipment	None required.
Special Req.	Design the space to block direct views from the public areas into the shower room areas.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 6-13 (Replace Table 4-13) Austere Men's and Women's Toilets

Description/ Usage	Separate men's and women's toilet facilities are open and directly adjacent to the corresponding gender's locker/dressing and shower areas.
Ceiling Ht.	9 ft (2.74 m) minimum.
Finishes	**Walls.** Ceramic tile wainscot with dark-colored epoxy grout on cementitious backer units at wet walls/fixture areas. Epoxy or semi-gloss painted, mold-resistant gypsum wallboard elsewhere. **Floor**. Non-slip porcelain tile with dark-colored epoxy grout. Slope tile to drain. **Ceiling**. Exposed painted structure.
Plumbing	Provide wall-hung water closets, wall-hung urinals, and lavatories based on UFC 3-420-01 for the calculated occupancy of the facility. Provide floor drains to fully drain area.
HVAC	Provide system per Chapter 3, “HVAC.” Temperature operating range: 70 °F (21 °C) to 78 °F (26 °C). Provide supply air from the dry side of this space (adjacent locker/dressing area) and exhaust from the wet area (toilet/shower). Exhaust per UFC 3-410-01.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety." Where shower spaces are open to the toilet room, provide corrosion-resistant sprinklers and escutcheons such as stainless steel throughout the toilet room.
Power	Provide outlets per Chapter 3, "Electrical."
Lighting	Provide system per Chapter 3, "Electrical." Lighting fixtures must have translucent, damp location, unbreakable protective covers with shatterproof lens.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. Provide an emergency call/alarm. **Telephone.** None required. **Data.** None required. **Security.** None required.
Acoustics	No special provisions required.
Casework/ Built-in Equipment	Solid-surface countertop supported at both ends and with the front edge supported by galvanized angle reinforcing. The sink may be either undermount or integral with the counter. Solid plastic (HDPE) toilet and urinal partitions secured at floor and ceiling. Toilet accessories: toilet paper dispensers, paper towel dispenser, trash receptacle, robe and towel hooks, grab bars, feminine hygiene receptacles in women's water closets, seat cover dispensers, and soap dispensers at lavatories. Provide wall-mounted shelves and full-width mirror at the lavatories. Provide a full-length mirror.
Furnishings Fixtures & Equip (FF&E)	None required.
User-provided Equipment	None required.

Special Req.	Design entrances to prevent direct views into this area.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 6-14 (Replace Table 4-20) Austere Gymnasium/Basketball/Volleyball Courts

Description/ Usage	Optional space as approved by CNIC. Provide a covered outdoor basketball/volleyball court. Court size must meet NCAA standards. **\1** See Appendix D of this UFC for a link to the NCAA basketball court diagram. **/1/**
Ceiling Ht.	28 ft (8.53 m) clear height to lowest overhead element.
Finishes	**Walls**. Provide durable wall system up to 12 ft (3.66 m) in height, such as CMU or concrete with heavy-duty epoxy. Above 12 ft (3.66 m), use semi-gloss enamel. **Floor**. Synthetic multipurpose, resilient athletic flooring. Flooring must meet DIN standards for the specified function per *ACSM's Health/Fitness Facility Standards and Guidelines*; however, where primary space use is basketball, minimum ball rebound must be 93%. **Ceiling**. Exposed, painted structure.
Plumbing	No plumbing fixtures in the gymnasium. Ensure access to nearby electric water coolers.
HVAC	Provide system per Chapter 3, “HVAC.” Temperature operating range: 68 °F (20 °C) to 74 °F (23 °C). Provide ventilation in accordance with ANSI/ASHRAE 62.1 requirements for "Gym, sports arena (play area)." Provide durable air grill covers and do not place air grills in line with basketball nets. Locate ductwork to avoid trapping balls.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety," inclusive of mechanical damage. Provide protection for sprinklers, exit signs, manual pull stations, and other exposed components; minimize equipment that protrudes into activity space or safety zones near activity spaces. Install component equipment (except manual pull stations) minimum 8 ft (2.4 m) AFF for safety considerations. Provide manual pull stations with protective covers. Provide upright sprinklers with head guards.
Power	Provide outlets per Chapter 3, "Electrical." Provide power for the scoreboard; shot clocks; and a high, wall-mounted clock. Provide power requirements for other functions such as retractable backboards and divider curtain. Locate power outlets along sidelines at center court.
Lighting	Provide system per Chapter 3, "Electrical." Provide lighting levels for basketball in accordance with IESNA Class III adjustable up to Class II. Provide keyed light switches. Provide fixtures with wire cages or appropriate shatterproof luminaires. Do not locate fixtures directly above basketball backboards.
Communication	**CCTV**. Provide at least one outlet in each divided space. **CATV/Internal Video**. None required, unless specified by installation. **PA/Audio**. Provide speakers with proper spacing. **Telephone**. Provide one line with internal two-way communication. **Data**. Provide data outlets in recessed floor boxes routed to scoreboard, centered under the anticipated scoring table location but outside the court boundaries. **Security.** None required.
Acoustics	No provisions required.

Casework/ Built-in Equipment	• Provide retractable basketball nets/backboards at two per half court or six per full court. Tournament courts only require 2 goals. Breakaway rims must be installed on all goals. • Provide volleyball built-in flush floor insert sleeves in each court. • Motor-operated, vertical-acting (roll-up) divider curtain with manual override. Ensure the motor is easily accessible for maintenance. • Provide an electronic scoreboard that is visible to officials, players, and spectators. • Provide game lines on flooring for full- and half-court basketball and volleyball. • Provide 6-ft (1.83-m) -high attached safety padding with bottom edge on top of floor base on all walls that can be impacted by a player. • Provide one pair of 30-second timing clocks for the main court.
Furnishings, Fixtures & Equip. (FF&E)	Provide volleyball stanchions, net, standard protective pads, net antenna, as required. Provide wrestling mat, exercise mat, protective floor coverings with portable rolling stand, seating, scoring table, and chairs as required by installation.
User-provided Equipment	CCTV cameras per the outlet count.
Special Req.	• Interior entrance doors into the gym must have vision panels, minimum 5 ft^2 (0.46 m^2) each, and ensure visual access from the control counter to the gym entrance. Where line of sight is not possible, CCTV monitoring of gym entrance must be provided. • Provide minimum 10 ft (3.05 m) of unobstructed floor space as a safety zone between the outer edge of the playing area and any feature or obstruction. Provide minimum 12 ft (3.7 m) side to side and 18 ft (5.5 m) end to end of unobstructed floor space as a safety zone between the outer edge of the playing area and any adjacent court playing area. • Design for moisture control and prevention of condensation on floor surface. Design for under-floor ventilation requirements, under-slab vapor barrier, estimated dew point occurrence, local water table, and local soil conditions. • Provide exterior double doors with removable latch post for equipment access. • Mitigate glare on the play and spectator areas. Any glass panels must be a minimum of 18 ft (5.49 m) AFF and 0.5-in. (13-mm) -thick tempered, laminated safety glass. • Do not locate windows, doors, or other obstructions within 7 ft (2.14 m) of all backboard centerlines. • Ensure no glazing or lighting can create glare or distraction on the play areas and cross-court play. Do not use window treatments to mitigate glare.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers. Participants. Spectators.
Min. net ft^2 (m^2)	

Table 6-15 (Replace Table 4-21) Austere Gymnasium Storage/Support

Description/ Usage	Optional space as approved by CNIC.
Ceiling Ht.	10 ft (3.05 m) minimum.
Finishes	**Walls.** Utilize a durable and scrubbable eggshell or satin finish, whichever has higher gloss, for painted CMU or painted gypsum wall board. **Floor**. Sealed concrete with rubber base. **Ceiling**. None required.
Plumbing	None required.
HVAC	Provide system per Chapter 3, “HVAC.” Temperature operating range: 65 °F (18 °C) to 85 °F (29 °C).
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, "Electrical."
Lighting	Provide system per Chapter 3, "Electrical." Provide fixtures with wire cages or appropriate shatterproof luminaires.
Communication	**CCTV**. None required. **CATV/Internal Video**. None required. **PA/Audio**. None required. **Telephone**. None required. **Data**. None required. **Security**. None required.
Acoustics	No special provisions required.
Casework/ Built-in Equipment	None.
Furnishings, Fixtures & Equip. (FF&E)	Shelving and storage cabinets as required.
User-provided Equipment	None.
Special Req.	None.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 6-16 (Replace Table 4-24) Austere Unit PT/Group Exercise Room

Description/ Usage	This is typically one large room that is partitionable and can be used for large unit physical training or for multiple smaller classes that require only minimal equipment. Activities/classes include aerobics, martial arts, and yoga.
Ceiling Ht.	10 ft (3.05 m) minimum clear to lowest overhead feature.
Finishes	**Walls**. Utilize a durable and scrubbable eggshell or satin finish, whichever has higher gloss, for painted CMU. Painted, double-layer high-impact gypsum board on studs is also acceptable. **Floor**. Synthetic multipurpose, resilient athletic flooring. Flooring must meet DIN standards for the specified function per *ACSM's Health/Fitness Facility Standards and Guidelines*. **Ceiling**. Exposed painted structure.
Plumbing	None required. Provide access to electric water coolers.
HVAC	Provide system per Chapter 3, “HVAC.” Temperature operating range: 68 °F (20 °C) to 74 °F (23 °C). Provide ventilation in accordance with ANSI/ASHRAE 62.1 requirements for "Health club/aerobics room."
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, "Electrical." Provide power at flat panel display mounting locations and for sound system.
Lighting	Provide system per Chapter 3, "Electrical." Provide 30 fc (300 lx) minimum at the floor. To address safety concerns, coordinate lighting design with equipment layout and ensure that equipment users, particularly those using horizontal benches, are not exposed to glare of direct/down lighting. Provide protection for all fixtures when appropriate for specific activity.
Communication	**CCTV**. Provide at least one outlet in each divided space. **CATV/Internal Video**. Provide outlets for monitors coordinated with their location. **PA/Audio**. Provide speakers with proper spacing. **Telephone**. Provide one line with internal two-way communication. **Data**. Provide data outlets in the walls or in recessed floor boxes. **Security**. None required.
Acoustics	No provisions required.
Casework/ Built-in Equipment	Provide one acoustical operable partition. Partition must be recessed into an alcove. Provide 6-ft (1.83-m) -tall mirrors on at least two walls at a minimum of 18 in. (450 mm) above the floor. If required, provide infrastructure and speakers for sound system for each divided space. Provide wall- or ceiling-mounted flat panel display mount in each divided space as required. Provide personal effects storage, such as cubbies, for customers in the room.
Furnishings, Fixtures & Equip. (FF&E)	Provide other fitness equipment as needed: indoor cycling equipment, stair steps, exercise balls, and small dumbbells. If required, provide sound system with mp3 and auxiliary input capability. Provide an AED.
User-provided Equipment	CCTV cameras per the outlet count. Provide flat panel displays.

Special Req.	Provide vision panel in the door, minimum 5 ft^2 (0.46 m^2). Design the rooms to be rectangular to allow for flexibility in use. Provide storage room with a direct adjacency to store items such as mats, stair steps, wall padding, and other fitness equipment as required.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

Table 6-17 (Replace Table 4-25) Austere Fitness Area

Description/ Usage	This area is typically the focal point of the facility. The area is divided into four sections: Stretching/warm-up/cool-down, free/plate-loaded weights, selectorized (machine) equipment, and cardiovascular equipment. The stretching/warm-up/cool-down area is open space within the larger room. It can also serve as transition areas between the other sections. The cardiovascular equipment area can be located in one or multiple areas throughout the facility. The free/plate-loaded weights area includes dumbbells, plate racks and plate-loaded equipment, and benches. The selectorized (machine) equipment consists of pin-selected weight equipment. The cardiovascular equipment consists of items such as treadmills, stationary bikes, and stair climbers.
Ceiling Ht.	12 ft (3.66 m) minimum to the lowest element. 14 ft (4.27 m) is preferred.
Finishes	**Walls**. Utilize a durable and scrubbable eggshell or satin finish, whichever has higher gloss, for painted CMU. Provide high-impact wall guards up to 18 in. (450 mm) above finished floor in the free weight area. **Floor**. Use permanently adhered resilient athletic flooring consisting of dual durometer layers of natural and synthetic rubbers, calendared and vulcanized together. The top layer is a non-porous, slip-resistant, textured surface; the bottom layer is a cushioned performance layer. In the stretching/warm-up/cool-down spaces, use ¼ in. (6 mm) thickness; in cardio, selectorized machine weights, and free weight areas, use 3/8 in. (9 to 10 mm) thickness. Impact and athletic flooring system cannot be accommodated by interlocking flooring tiles or movable furnishings such as mats. **Ceiling**. Exposed, painted structure.
Plumbing	Provide a minimum of two electric water coolers.
HVAC	Provide system per Chapter 3, “HVAC.” Temperature operating range: 68 °F (20 °C) to 74 °F (23 °C). Provide ventilation in accordance with ANSI/ASHRAE 62.1 requirements for "Health club/weight rooms." Provide ceiling fans.
Fire Protection	Provide system per Chapter 3, "Fire Protection and Life Safety."
Power	Provide outlets per Chapter 3, Electrical." **Free weight area:** Provide outlets for wall- or ceiling-mounted flat panel displays. **Selectorized equipment area:** If a fitness tracking system will be provided, coordinate equipment outlets with the specific equipment selected. Provide flush-floor outlets for commercial-grade equipment in a grid pattern sized appropriately for equipment spacing and to accommodate fitness tracking systems. Provide outlets for wall- or ceiling-mounted flat panel displays. **Cardiovascular equipment area:** Coordinate equipment outlets with the specific equipment selected. Provide flush-floor outlets for commercial-grade equipment in a grid pattern sized appropriately for equipment spacing and to accommodate fitness tracking systems. Provide dedicated circuits for all treadmills. Coordinate flat panel display outlet locations with CATV outlet locations and the equipment selected. If cardiovascular equipment incorporates monitors, ensure outlets are located appropriately and provide outlets for wall- or ceiling-mounted flat panel displays as necessary to ensure adequate viewing angles for all equipment.

Lighting	Provide system per Chapter 3, "Electrical." Provide 30 fc (300 lx) uniform lighting. To address safety concerns, coordinate lighting design with equipment layout and ensure that equipment users, particularly those using horizontal benches, are not exposed to glare of direct/down lighting.
Communication	**CCTV**. Provide outlets as needed for coverage. **CATV/Internal Video**. Provide outlets for wall- or ceiling-mounted flat panel displays throughout the fitness area. Mount at proper viewing height for cardiovascular exercise machines in that area; height as selected by fitness area designer. The quantity and location of the CATV outlets must be determined by the sports fitness center designer and the installation fitness program manager and must be coordinated with the equipment layout. **\1** Consider options for wireless transmission of audio broadcast from video monitors. **/1/** **PA/Audio**. Provide PA speakers as needed. Provide a separate audio system with speakers as needed for full coverage. Provide separate volume control and separate channels for individual activity areas. **Telephone**. None required. **Data**. Provide data outlets in recessed floor boxes in the cardiovascular and selectorized equipment areas and entertainment systems. Data to equipment for fitness tracking is optional. **Security**. None required.
Acoustics	No provisions required.
Casework/ Built-in Equipment	Provide 6-ft (1.83-m) -tall mirrors on at least two walls at a minimum of 18 in. (450 mm) above the floor. One of the two walls must be in the free weight area.
Furnishings, Fixtures & Equip. (FF&E)	**\1** Fitness equipment must be commercial grade. Exercise mats, wall clocks, and trash containers. **/1/** Provide self-serve equipment cleaning supply stations throughout that include disinfectant spray bottles and disposable or reusable towels. Provide an AED.
User-provided Equipment	CCTV cameras per the outlet count.
Special Req.	If this space is provided on the second floor, ensure the access is sized to accommodate the fitness equipment. The foundation/floor in this space must be designed to accommodate all live and dead loads associated with the equipment. Provide storage either within the room or with a direct adjacency to store items such as mats, spare equipment, punching bags, and other sports equipment. If doors are provided, include vision panels, minimum 5 ft^2 (0.46 m^2) each.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Customers.
Min. net ft^2 (m^2)	

APPENDIX A BEST PRACTICES

A-1 STRUCTURE.

A-1.1 Substructure.

For the concrete slab on grade at the gymnasium, consider moisture control and prevention of condensation on the floor surface. Utilize relative humidity (RH) testing as recommended by the Maple Flooring Manufacturers Association (MFMA). Consider under-floor ventilation requirements, under-slab vapor barrier, estimated dew point occurrence, local water table, and local soil conditions. Where continuous water is anticipated beneath floors due to local conditions, a subsurface drainage system is recommended.

A-1.2 Superstructure.

Where feasible, use pre-engineered systems and components for building framing. For example, a pre-engineered metal building system may be an economical solution at the gymnasium. Coordinate HVAC ductwork and lighting arrangements with the structural layout.

A-2 PLUMBING.

For facilities with sensor-operated flush valves and/or faucets, take into consideration the effects on facility operation created by a power outage. Facilities expected to operate without power shall have appurtenances to ensure bathroom functionality during these conditions.

A-2.1 Shower Count

Provide one shower per 15 anticipated fitness facility users per hour for each male and female.

A-3 INTERIORS.

A-3.1 Signage.

Educational/inspirational/motivational signage/wall graphics should be considered in coordination with the installation’s health promotion objectives.

APPENDIX B \1\ SAMPLE INTERACTIVE SPREADSHEET.

Figure B-1 illustrates a sample interactive spreadsheet completed for a hypothetical Navy fitness center.

Figure B-1 Sample Interactive Worksheet for a Navy Fitness Center

Sample Navy Fitness Facility Project

Select Service Branch: Navy

Select size of facility:
Navy size options are to the right. Check box next to appropriate size. Refer to UFC Section 2.1 for population criteria.

Check box next to appropriate facility size.

Extra Small	☐	For populations of <500
Small	☐	For populations of 501-3,000
Medium	☐	For populations of 3,001-7,000
Large	☐	For populations of 7,001-14,000
Extra Large	☐	For populations of 14,001-30,000
Jumbo		For populations over 30,000, enter 1 here: 1

Based on data entered above, facility size basis is: Jumbo — For populations of >30,000

Confirm facility size basis is correct (yes or no): Yes

Many of the spaces below are determined by the size and/or population criteria confirmed above. Where appropriate or necessary, modify each space or select the appropriate options to determine the total net facility size.

Fitness Spaces			Default quantities	m^2	$ft.^2$
Lobby/Reception					
Entry Lobby			6 Vestibule/Lobby Module(s) (for 2-3 ppl).	55.74	600
Control Counter			4 Counter Module(s).	46.45	500
Equipment issue storage			4 Storage Module(s).	65.03	700
Vending			1 Vending Machine(s).	1.86	20
Waiting/Display			5 Seating/Display Module(s) (for 4 ppl).	41.81	450
Spectator peak-time circulation	For this option, select yes or no:	Yes	3 Circulation Module(s).	83.61	900
Public restrooms/phones	For this option, select size of restroom:	2 male/ 3 female	2 male/ 3 female Public Restroom(s).	20.90	225

Fitness Facilities Space Program Worksheet — Page 1 of 5 — Use with UFC 4-740-06, Fitness Facilities

Sample Navy Fitness Facility Project

		Default quantities	m^2	$ft.^2$
Gymnasium				
Basketball/volleyball Court		3 Two-court/200-seat Module(s).	4892.86	52,668
Additional Spectator seating	To change default, enter new quantity:	0 Additional 200-seat Module(s). 600 total seats.		
Basic storage/support		5 Storage Module(s).	325.15	3,500
Additional court storage				
Unit PT/Group Exercise				
Partitionable Room(s)		75 people at 4.6 m2 (50 ft.2)/person.	348.38	3,750
Storage/support		10% of partitionable room area.	34.84	375
Fitness Spaces				
Stretching		12 people at 4.6 m2 (50 ft.2)/person.	55.74	600
Cardiovascular Equipment		150 items at 4.6 m2 (50 ft.2)/item.	696.75	7,500
Selectorized (machine) weights		54 items at 4.6 m2 (50 ft.2)/item.	250.83	2,700
Free/Plate-loaded weights		45 stations at 6.0 m2 (65 ft.2)/stations.	271.73	2,925
Finess Program Manager's Office				
Fitness Assessment Room		1 Office(s).	11.61	125
Structured Activities				
Structured Activity Space		3 Flexible space Module(s).	222.96	2,400
Racquetball Courts		8 Racquetball Court(s).	594.56	6,400
Spectator/officiating				
Structured activity storage		10% of Structured Activity Space.	22.30	240
Locker Rooms				
Space criteria for men's and women's locker, shower, and toilet areas are provided at the end of the spreadsheet because they are determined by selections made throughout.				
Sauna, cool-down area	To change default, select new:	Large M/F (2) Saunas/cool-down area.	26.76	288
Steam Room, cool-down area	To change default, select new:	Large M/F (2) Steam Rooms/cool-down area.	30.66	330
Hot Tub	To change default, select new: Medium	Medium Unisex Hot Tub.	11.71	126

Sample Navy Fitness Facility Project

Fitness Spaces (continued)			Default quantities	m^2	$ft.^2$
Support Areas					
Laundry			5/10 machine combo Laundry Room.	44.59	480
Equipment repair and receiving			Repair/receiving Room.	141.44	1,523
Storage			Storage Room.	63.75	686
Additional Programmatic Storage	For this option, enter required sf:	200	200 sf Additional Storage.	18.58	200
Core HAWC Spaces					
Lobby/Reception					
Director's Office					
Program Managers' Offices					
Support Staff Workstations					
Classrooms/Training rooms					
Resource Room/Computer Lab					
Storage/support					
Ergometry and Fitness Testing *					
Wellness Assessment *					
Administrative Spaces (required or optional)					
Director's Office			1 Office.	11.15	120
Program Managers' Offices			1 Office(s).	9.29	100
Support Staff Workstations			5 Workstation(s).	29.73	320
Copy/file/work/break Room			3 Workroom Module(s).	22.30	240
Classroom/Training Room			5 15-person Classroom/Training Module(s).	195.09	2,100
Classroom/Training Storage			5 Storage Module(s).	27.87	300

Sample Navy Fitness Facility Project

Optional or Service-specific Program Spaces			Default quantities	m^2	$ft.^2$
Indoor Track					
Indoor Track	To change default, select new:		1/8th-mile, 4-lane Indoor Track	989.11	10,647
To change the default selection (described to the right), choose the size of track desired. The description to the right will then change to reflect the new choice. To return to the default, delete the selection above.					
Indoor track lobby	To change default, enter new quantity:		2 Indoor track lobby(ies).	26.76	288
Additional Group Exercise Room					
Massage Room	For this option, select yes or no:	Yes	1 Massage Room(s).	11.15	120
Physical Therapy Training	For this option, select yes or no:	No			
Expanded Retail 1	For this option, select yes or no:	No			
Expanded Juice Bar 1	For this option, select yes or no:	Yes	1 Expanded Juice Bar Module(s).	13.94	150
Expanded Juice Bar Seating	For this option, enter required modules:	2	2 Two-table seating Module(s).	27.87	300
Family Changing Room	Does this facility include a pool (yes/no)?	Yes	5 Family Changing Room(s).	51.10	550
Male DV Locker Room *					
Female DV Locker Room *					
Child Play Area/Parent Child Area *			1 Parent/child Module(s).	74.32	800
HAWC Demonstration Kitchen					
HAWC Relaxation Room *					

Locker Rooms					
The following Locker Room spaces are based on total building occupancy, which is driven by the selctions made on this spreadsheet.					
Navy allocates the locker area at a 60% Male and 40% Female split.			To change this default split, select new:		
Men's Locker Room				384.14	4,135
Locker/changing area	To change default, select new:		508 Lockers in 335 slots.		
Navy designates 2 spaces (slots) for every 3 lockers (66%). This is 1 full-sized & 2 half-sized lockers for every 3 required. To change this default, select new configuration. ALSO: See Women's Locker/changing area.					
Shower/drying area			23 Showers.		
Toilet area			17 Water closets/lavatory modules.		

Sample Navy Fitness Facility Project					
Woman's Locker Room				278.61	2,999
Locker/changing area	To change default, select new:		338 Lockers in 223 slots.		
Shower/drying area			15 Showers.		
Toilet area			17 Water closets/lavatory modules.		
Building Totals					
			Subtotal - Total Net Building Area	10,533.0	113,380
	Is this facility more than one story (yes/no)?	Yes	Net-to-gross Factor @ 0.28	2,949.2	31,746
			TOTAL GROSS BUILDING	13,482.2	145,126
Site Spaces			Default quantities	m^2	$ft.^2$
Staff Parking			15 Paking Spaces.	627.08	6,750
Loading dock			1 Loading Dock.	8.36	90
Service Drive/trash			1 Service Drive Module.	69.68	750
Customer Parking			500 Parking Spaces.	20902.50	225,000
Bicycle Rack Area			2 10-bike Rack(s).	29.73	320
Patio					
			TOTAL GROSS SITE SUPPORT	21,637.4	232,910
			TOTAL GROSS FACILITY (BUILDING + SITE SUPPORT)	35,119.6	378,036

Change No.	Date	Location
1	21 March 2022	3-2, 3-5.3.2.1 changed Navy to preference for 1 story structure, same as Air Force.

FOREWORD

The Unified Facilities Criteria (UFC) system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and applies to the Military Departments, the Defense Agencies, and the DoD Field Activities in accordance with USD(AT&L) Memorandum dated 29 May 2002. UFC will be used for all DoD projects and work for other customers where appropriate. All construction outside of the United States is also governed by Status of forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA), and in some instances, Bilateral Infrastructure Agreements (BIA.) Therefore, the acquisition team must ensure compliance with the more stringent of the UFC, the SOFA, the HNFA, and the BIA, as applicable.

UFC are living documents and will be periodically reviewed, updated, and made available to users as part of the Services' responsibility for providing technical criteria for military construction. Headquarters, U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering Command (NAVFAC), and Air Force Civil Engineer Support Agency (AFCESA) are responsible for administration of the UFC system. Defense agencies should contact the preparing service for document interpretation and improvements. Technical content of UFC is the responsibility of the cognizant DoD working group. Recommended changes with supporting rationale should be sent to the respective service proponent office by the following electronic form: Criteria Change Request (CCR). The form is also accessible from the Internet sites listed below.

UFC are effective upon issuance and are distributed only in electronic media from the following source:

- Whole Building Design Guide web site http://dod.wbdg.org/.

Hard copies of UFC printed from electronic media should be checked against the current electronic version prior to use to ensure that they are current.

UNIFIED FACILITIES CRITERIA (UFC)
NEW DOCUMENT SUMMARY

Document: UFC 4-740-06, *Youth Centers*
Superseding: There is no superseding data; this is a new, unified criteria document.

Description: UFC 4-740-06 provides guidelines for evaluating, planning, programming, and designing Youth Centers. The information in this UFC applies to the design of all new construction projects, to include additions, alterations, and renovation projects in the continental Unites States and overseas. It also applies to the procurement of design/build services for the above-noted projects. Alteration and renovation projects should update existing facilities to meet the guidance and criteria within budgetary constraints.

Need: The Youth Center is a social and recreational center primarily for use by children ages 6 to 18 in support of a Youth Program, as defined by DoD Instruction 6060.4 *Youth Programs (YPS)*. The Youth Center supports opportunities for youth to develop their physical, social, emotional, and cognitive abilities and to experience achievement, leadership, enjoyment, friendship, and recognition**.** Youth Program activities are generally offered free of charge or at a reasonable cost to parents to encourage participation and make them affordable to families.

CHAPTER 1 INTRODUCTION

1-1 SCOPE OF DOCUMENT.

This UFC provides guidelines for evaluating, planning, programming, and designing Youth Centers. The information in this UFC applies to the design of all new construction projects, to include additions, alterations, and renovation projects in the continental Unites States and overseas. It also applies to the procurement of design/build services for the above-noted projects. Alteration and renovation projects should update existing facilities to meet the guidance and criteria within budgetary constraints. This UFC is not intended as a substitution during design for thorough review by individual Program Managers and Operations Staff in the appropriate Service.

1-2 USERS OF THIS DOCUMENT.

This UFC is intended to be a source of basic architectural and engineering information for all individuals involved in the planning, design, or evaluation of Youth Centers. Note: where one Service's criteria vary from the other Services' criteria, it is noted in the text Specific users of the UFC include the following:

1-2.1 Architects and Engineers.

Architects and Engineers (A/Es) who will provide design services under the direction of the individual design agencies, including the Army Corps of Engineers (COE), Army Community and Family Support Center (CFSC), Naval Facilities Engineering Command (NAVFAC), and Navy Personnel Command (NPC).

1-2.2 Planning Personnel.

Planning personnel will use this UFC for programming new or replacement facilities, pre-design planning, or assessing the extent of improvements required in an existing Youth Center in order to achieve the standard established herein.

1-2.3 Additional Users.

Additional users include the following:

a. Headquarters Staff and Field Operating Agencies

b. Major Command Staff/Regions

c. Installation Commanders

d. Installation Facilities Management

e. Installation Technical Proponents

f. Program Directors

g. Facility/Program Operations Staff

1-3 SCOPE OF FACILITY.

The Youth Center is a social and recreational center primarily for use by children ages 6 to 18 in support of a Youth Program, as defined by DoD Instruction 6060.4, *Youth Programs (YPS)*. The Youth Center supports opportunities for youth to develop their physical, social, emotional, and cognitive abilities and to experience achievement, leadership, enjoyment, friendship, and recognition. Youth Program activities are generally offered free of charge or at a reasonable cost to parents to encourage participation and make them affordable to families.

The Youth Center facility may comprise up to three functional program areas. Not all of the three program areas are required, but if a certain program area is provided, it must include certain elements to meet individual program requirements. Beyond the required spaces, each program area may have additional spaces required or allowed by the individual Services.

The three functional program areas and their respective required elements are described in paragraphs 1-4 through 1-6. The other facility spaces are described in paragraph 1-7. All of these spaces are described in greater detail in Chapters 2 and 4. Additionally, due to the numerous possible variations of Youth Center programs, a special space program tool has been developed to help users navigate the intra- and inter-Service permutations. This tool is described in paragraph 2-2; it may be helpful to review this material in conjunction with these program descriptions.

1-4 SAC PROGRAM AREA.

Included in the Youth Center facility, but generally separate from the youth program functions, is a School-Age Care (SAC) program. This area supports the SAC program and includes the SAC Activity Rooms, the SAC Toilets, and support and outdoor areas.

Note: the **Navy** does not provide the dedicated SAC toilet—SAC youth share the toilets in the Youth Program Area. See Table 3-1 for more on this Service Exception.

The SAC program provides before- and after-school accountable childcare for a fee. This may include having the school bus pick-up and drop-off the children both before and after school. If children are dropped off by bus after school, the Youth Center keeps them until parents can pick them up from the center. The SAC program varies by Service:

a. The **Army** SAC program is generally for children ages 6 to 10. The Army generally accommodates its SAC program in separate facilities. See Child Development Center Standard Designs, for School-age Children 6-10 Years of Age, approved December 2004.

b. The **Navy** program is generally for children ages 6 to 12. The Navy does not separate the SAC functions from the youth program functions.

c. The **Air Force** program is for children ages 6 to 12.

d. The **Marine Corps** SAC program is generally for children ages 6 to 12.

1-5 YOUTH PROGRAM AREA.

This program area includes the following spaces:

1-5.1 Commons.

This area is the heart of the program area, around which all other program spaces generally revolve. It should accommodate social units of 12 to 15 youth gathering in pockets, while allowing these groups to interact with and feel part of the larger space. Subsets of the Commons include the Game Area, Snack Bar Eating Area, television (TV) viewing, and general gathering and conversation areas. All these spaces are generally in one open and inviting space, but the subset spaces may be defined by variations in ceiling heights or finishes.

1-5.2 Activity Rooms.

There are two categories of Activity Rooms that are the same size, but have different design characteristics. Each Service may specify General Activity Rooms, Special Activity Rooms, or both, depending on the size of the facility and its program needs.

The General Activity Room may be configured for gatherings, club meetings, arts and crafts (with the addition of a sink), or for other general uses. For these types of activities, this room accommodates up to 30 youth with the appropriate staff supervision.

The Special Activity Room is designed for active functions such as dance or martial arts. As such, it may have a higher ceiling, different flooring, and features such as dance bars and mirrors. For these types of activities, the room accommodates 10 to 15 youth with the appropriate staff supervision. This room is not intended for team sport activities, however. Those activities are accommodated in the multipurpose room.

1-5.3 Homework/Computer.

The Homework and Computer functions are required as part of the Youth Program, but the Services vary as to how they accommodate these functions:

a. The **Army** generally provides separate Homework and Computer rooms, sized identically. For small programs/facilities, this function may be combined into one space;

b. The **Navy and Marine Corps** provide a separate Computer Room and typically accommodate homework activities in one of the Activity Rooms; and

c. The **Air Force** accommodates both functions in one Homework/Computer Room.

1-5.4 **Outdoor Activity Area**.

There is a need for outdoor activity space as part of the Youth Program. This may be accommodated though the SAC Outdoor Activity Area or an additional outdoor space may be programmed as part of the Youth Program.

1-6 **TEEN PROGRAM AREA**.

This area provides older teens their own space to socialize and have access to more independent activities in a home-like environment. Activities may include things like table games, video games, computers, and television watching. Teens should be given more latitude and independence than the younger youth. This area includes the Teen Room/Lounge and an outdoor Teen Patio.

1-7 **ADDITIONAL FUNCTIONAL AREAS AND OPTIONAL SPACES**.

These spaces do not necessarily fall into any of the dedicated program areas.

1-7.1 **Administrative Area**.

The administrative area includes the facility lobby, the check-in area, the communications room, and staff offices and work areas.

1-7.2 **Other and Optional Spaces**.

Other spaces include various toilets (the Services accommodate toilets differently—see Table 3-1) and the multipurpose room. The multipurpose room accommodates large motor activities and team sports. There are different size options for the multipurpose room that vary by Service.

Optional spaces vary by Service and may include separate spaces not directly related to a program, such as a kitchen, or spaces that are optional within a program space such as a dedicated music/multimedia room (part of the Youth Program). The **Navy** normally does not permit kitchens in their Youth Centers.

1-8 **USERS OF FACILITY**.

The primary facility users are as follows:

a. Youth participants,

b. SAC program participants,

c. Teen participants,

d. Facility staff,

e. Volunteers,

f. Other program partners, and

g. Parents.

1-9 **RELATED DOCUMENTS**.

DoD Instruction 6060.4 provides the program requirements for Youth Centers and DoD Instruction 6060.3 provides the program requirements for SAC. Also review DoD School-age Program Inspection Checklist and the *NSACA Standards for Quality School-Age Care.*

Refer also to the following Service-specific related documents:

a. For **Army** projects, this UFC will serve as the framework for the revision of the *Youth Center Definitive Standard Design;*

b. For **Navy** projects, use this UFC in conjunction with the Navy Youth and School-age Care (SAC) Standards and Metrics;

c. For **Air Force** projects, use this UFC in conjunction with the *USAF Services Design Guide for Youth/School Age Center;* and

d. For **Marine Corps** projects, this UFC serves as the primary criteria document for Youth Centers.

CHAPTER 2 PLANNING AND LAYOUT

2-1 SIZE DETERMINANTS.

Several factors determine the size of the facility.

2-1.1 Needs Validation Assessment.

Conduct a Needs Validation Assessment (NVA) or Project Validation Assessment (PVA) to determine the need for each of the three program areas (see paragraphs 1-4 through 1-6), the optional spaces, and the size of the populations to be served by each program. The three program areas may be sized differently within a single facility. In some cases, one or more program areas may not be needed if the population served is too small or if that population is served by other, existing facilities. When reviewing existing facilities, consider both facilities on the installation and facilities within the community, such as the Boys & Girls Clubs of America, 4-H, and other community centers.

Note: Each Service may have different requirements with regard to the programs provided as part of this facility. While the NVA or PVA and the criteria in this UFC provide guidelines for the size of a Youth Center, the final space program will need to be carefully determined by installation representatives and the appropriate Service program office.

2-1.2 SAC Program Size.

Once the need and population size for the SAC program area has been determined, the SAC area is sized based on the number of SAC activity rooms needed. Each room serves two ratio groups or a total of 30 children. An **Air Force** SAC room serves two ratio groups or a total of 24 children. A ratio group represents the ratio of children to adult caregivers, or 15 children to one adult caregiver. The **Air Force** ratio group is 12 children to one adult caregiver.

The maximum number of SAC rooms permitted per facility is eight. If the needs assessment determines that more than eight rooms are required, provide multiple facilities.

Included in the SAC program are dedicated SAC toilets, and a storage closet for each SAC room. The **Navy** does not provide a dedicated SAC toilet—SAC children share the toilets in the Youth Program area.

2-1.3 Youth Program Size Classifications.

Once the need for the Youth program area has been determined, the size is classified by the number of youth to be accommodated in the *primary* program spaces. (Additional youth may be accommodated in optional spaces, like the Multipurpose Room.) Therefore, each size category provides for appropriate space in the Commons and support areas and provides the appropriate number of activity rooms.

Tables 2-1.1 and 2-1.2 illustrate these size classifications with the appropriate Service exceptions. The **Army** provides a combined Computer/Homework Room for their small youth program. For larger programs, they provide separate Computer Rooms and Homework Rooms. Due to the fact that the **Army** provides this additional program space for their larger programs, the number of youth that can be accommodated is greater than the other Services. These differences are reflected in Table 2-1.2.

In general for all Services, as noted above, the number of youth to be accommodated in the size classifications only account for the dedicated Youth program spaces. When programming the Youth program area, consider that additional youth may be accommodated in other areas such as the Multipurpose Room.

TABLE 2-1.1 NAVY, AIR FORCE, AND MARINE CORPS YOUTH PROGRAM SIZE CLASSIFICATIONS

Size Classification (No. of Youth)	Activity Rooms (General or Special)	Homework/ Computer Rooms*
Up to 60 Youth	1	1
61 to 90 Youth	2	1
91 to 135 Youth	3	2
136 to 155 Youth	4	2

*__Navy and Marine Corps__ provide a separate Computer Room and typically accommodate the homework function in the Activity Rooms. The **Air Force** combines the Homework function with the Computer Room.

TABLE 2-1.2 ARMY YOUTH PROGRAM SIZE CLASSIFICATIONS

Size Classification (No. of Youth)	Activity Rooms (Gen. or Spec.)	Computer Rooms	Homework Rooms
Up to 60 Youth	1	1 combined room	
61 to 105 Youth	2	1	1
106 to 150 Youth	3	1	1
151 to 170 Youth	4	1	1

2-1.4 **Teen Program Size Classifications**.

Once the need for the Teen program area has been determined, classify the size as follows:

a. Up to 15 teens,

b. 16 to 30 teens,

c. 31 to 45 teens, and

d. 45 to 60 teens.

2-1.5 **Optional Spaces**.

Once the program areas have been sized, determine which optional spaces to include. Optional spaces are identified in paragraph 2-1.5.3. Optional spaces vary by Service. The Base representatives, in conjunction with the program manager, must decide which optional activity spaces to provide. Note the following when selecting optional activities:

If an existing facility is being renovated to accommodate the Youth Center function, the amount of space available will likely determine what options may be provided. See paragraph 2-5 for more information on alterations to existing facilities.

Consider what can be provided within both the operational and construction budgets.

Optional spaces include the following:

a. Multipurpose Room;

b. Kitchen. **Navy** normally does not permit kitchens;

c. Music Room(s);

d. Additional Parent Waiting (in addition to the waiting area in the lobby). **Navy** does not permit additional parent waiting;

e. Laundry Room. **Navy** normally does not permit laundry rooms;

f. Youth Program Outdoor Activity Area; and

g. Outdoor Open Area (large play area).

2-1.6 **Administrative Area**.

Size the administrative area respective of all the program areas provided. For example, if a facility is to have only one or two SAC activity rooms and small youth and teen programs, a small administrative area will probably be sufficient. However, if a facility is to have only one or two SAC activity rooms, a small teen program, but a large youth program, a medium or large administrative area will probably be required. Carefully consider the entire program when sizing the administrative area.

2-1.7 **Administrative Spaces**.

Administrative office space, both private offices and workstations, should be thoroughly justified to and approved by the program manager. In general, the administrative area includes the following:

a. Lobby,

b. Check-in,

c. Staff Offices,

d. Staff Workstations,

e. Break/Staff Training Room,

f. Copy/file Room,

g. Storage,

h. Communications Room,

i. Staff/Visitor's Toilets/Janitor's closet (see Paragraph 3-5.1 for more information on toilets), and

j. Administrative Site Support (including staff and patron parking, drop-off/bus drive, and service drive).

2-1.8 **Office Limits**.

The overall number of private offices is limited to five and the number of workstations is limited to eight. These limits are regardless of the size of the Administrative Area. However, programmers should consider the overall size of the Administrative Area when selecting the number of private offices and workstations. For example, a small General Administrative Area will not typically require five private offices.

The **Navy** places additional limits on private office quantities. A small General Administrative Area is permitted one office. A medium General Administrative Area is permitted one office or two with additional justification. A large General Administrative Area is permitted two offices. An extra large General Administrative Area is permitted two offices or three with additional justification.

2-1.9 **Other Size Considerations**.

If the projected installation requirements exceed the largest size allowances for a program area, provide multiple Youth Centers. Further, when the total program populations are broken down into distinctive geographic locations, consider providing multiple facilities sized individually for the geographic populations.

2-2 **SPACE PROGRAM**.

The space program for Youth Centers is developed through the use of an interactive spreadsheet. It is completed by first entering the appropriate Service branch; then selecting the appropriate sizes for the three Program areas, the additional program spaces and options, the administrative area, and the site areas. The selections will vary depending on the Service branch selected. This is a result of the appropriate Service exceptions. As selections are made, the program areas are calculated and summed for both the building and the site.

This spreadsheet is available as a downloadable, zipped Microsoft© Excel© file from the Whole Building Design Guide DoD page (http://dod.wbdg.org) web site.

2-2.1 **Spreadsheets**.

Samples of the interactive spreadsheet with the Service branch selected as “Army” and “Navy” are illustrated in Figures 2-1 and 2-2, respectively. Figure 2-1 is a blank Army form and Figure 2-2 shows a completed Navy sample. These two Services were chosen to illustrate some of the differences in the options available on the form depending on the Service selected in the first line.

2-2.2 **Appendix B**.

The data upon which the interactive spreadsheet is based is illustrated in Appendix B. Do not use Appendix B to develop the space program—use only the interactive spreadsheet.

2-2.3 **Planning and Coordination**.

The space program developed through the use of the interactive spreadsheet serves as a guideline for the Youth Center planning team and generally represents the maximum space allowed. The final space program for a new Youth Center will need to be carefully determined by installation representatives and the appropriate Service program office guided by the criteria in this UFC.

FIGURE 2-1. SAMPLE BLANK INTERACTIVE SPREADSHEET FOR AN ARMY YOUTH CENTER

Select Service Branch:	Army		Gross m^2	Gross $ft.^2$
School Age Care (SAC): Enter no. of SAC Rooms *The Army generally accommodates SAC in other facilities. When provided, the SAC program includes no. of SAC rooms selected plus space for storage and toilets.		SAC Building		
Youth Program: Select Size of Youth Program *The Army Youth program adds an additional, dedicated homework room, except for small programs where it is combined with the comoputer room.		Youth Building		
Teen Program: Select Size of Teen Program		Teen Building

Administrative: Tied to building selection	(entered above)	Admin. Site Support	1915.60	20,620
		TOTAL GROSS SITE SUPPORT	**2457.21**	**26,450**
		TOTAL GROSS FACILITY (BUILDING + SITE SUPPORT)	**3,936**	**42,370**

2-3 **LOCATION DETERMINANTS**.

Several factors determine the most appropriate and cost-effective location for a Youth Center.

2-3.1 **Access**.

The Youth Center should be easily accessible by buses (dropping off), privately-owned vehicles (either dropping off/picking up or parking), and by youth patrons via foot or bicycle. Weigh these considerations against the effect on traffic during peak pick-up/drop-off times. For example, a location near or adjacent to a school or child development center may be convenient for patrons, but it may cause traffic congestion at peak times. To accommodate parent/patron access, provide adequate parking as close as possible, taking into account antiterrorism (AT) requirements (see paragraph 3.8).

2-3.2 **Safety**.

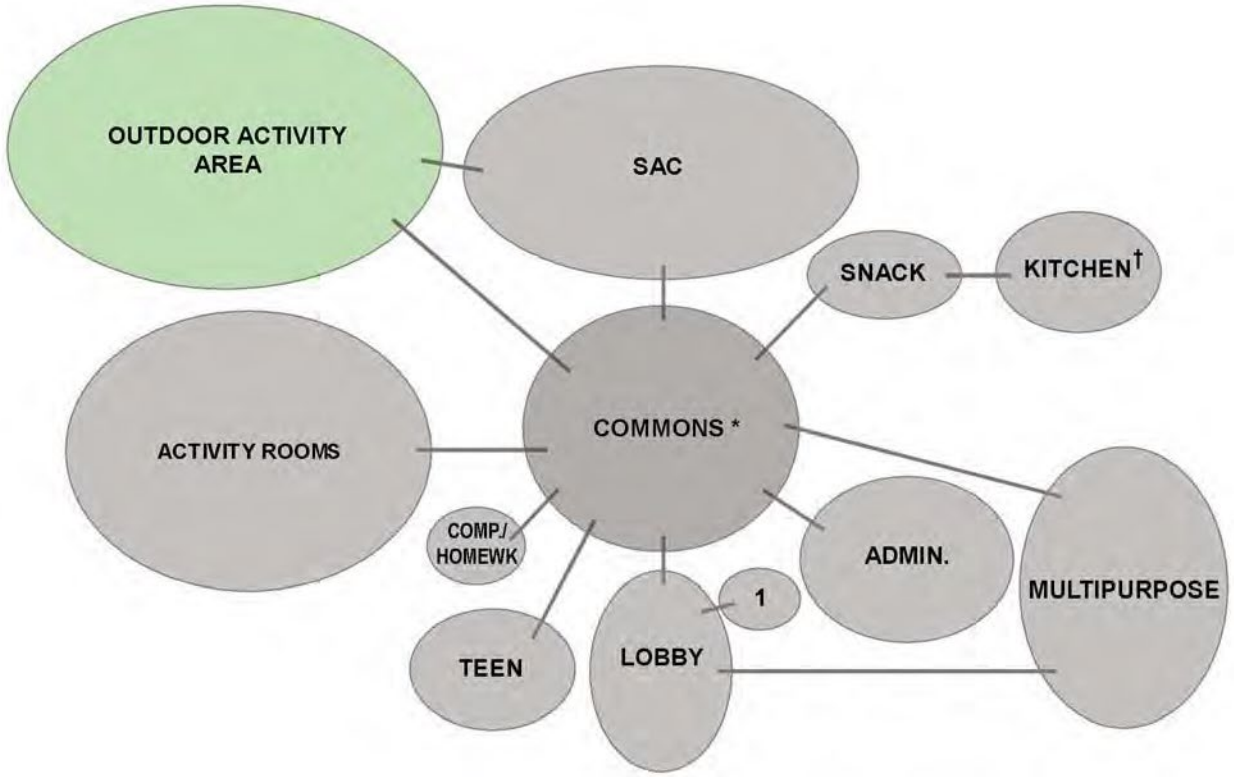
Consider the above-noted pedestrian and bicycle traffic by the youth patrons. Minimize the degree to which pedestrian and bike paths cross vehicular paths in the approach to the Youth Center site. If pedestrian and bike paths cross or run adjacent to busy streets and intersections, provide mitigation measures, such as bollards, to increase safety. Also consider the location of bus access for drop-off and pick-up.

2-3.3 **Cost**.

Design these facilities with the objective of achieving the lowest life cycle cost. To do so, the project's design program must adequately define the scope and performance requirements and match those needs against a budget. Conversely, the budget must adequately support an appropriate and high-quality program and the performance requirements outlined and identified in this UFC.

2-3.4 **Related Facilities**.

Consider locating near other facilities such as youth sports fields, open park space, etc.



2-4 **LAYOUT AND ADJACENCIES**.

The appropriate layout and adjacencies are illustrated through a bubble diagram and adjacency matrices.

2-4.1 **Functional Relationship Bubble Diagram**.

The bubble diagram in Figure 2-3 indicates acceptable relative adjacencies of the functional spaces.

FIGURE 2-3. FUNCTIONAL RELATIONSHIP BUBBLE DIAGRAM

1 = Check-in
* Commons includes the Game Area and the Eating Area.
† Kitchen is optional for all Services except Navy for which it is normally not permitted.

2-4.2 **Adjacency Matrices.**

Figures 2-4 and 2-5 further illustrate the acceptable relative adjacencies of functional spaces and should be used in conjunction with Figure 2-3. Figure 2-4 provides the adjacencies for **Army**, **Air Force** and **Marine Corps** facilities. Figure 2-5 provides the adjacencies for **Navy** facilities.

FIGURE 2-4. ADJACENCY MATRIX

Functional Spaces	Lobby/Building Entrance	Check-in	Administrative Offices	Break/Staff Training Room	Copy/File Room	Staff Lockers	SAC Activity Rooms	SAC Toilets †	SAC Outdoor Activity Area	Commons	Game Area	Snack Bar/Vending †	Eating Area	Kitchen * †	Homework/Computer Room †	General Activity Room(s)	Special Activity Room(s)	Music/Multimedia Room *	Parent Waiting Area *	Youth/Teen Toilet †	Teen Room/Lounge	Teen Patio *	Multipurpose Room †	Multipurpose Room Storage/Gear Issue	Laundry * †	Staff/Public Toilets †	Youth Outdoor Activity Area *	Outdoor Open Area *	Pick-up and Drop-off (Bus)	Service Drive/Trash	Staff Parking	Patron Parking

2-4.3 **Space Assessment**.

See the Functional Data Sheets in Chapter 4 for additional information on the space types and their relationships to each other.

2-5 **ALTERATIONS TO EXISTING FACILITIES**.

2-5.1 **Regulatory Authorities**.

Refer to the following for the appropriate authorities for each Service:

a. **Army**. The standard may be modified to accommodate the existing structure. However, all proposed modifications to the standard must be sent to the Army Corps of Engineers, Engineering & Support Center, HSV (CEHNC) for review and HQDA (CFSC‑CYS) for approval prior to the initiation of concept design.

b. **Navy and Marine Corps**. Authorities are contained in OPNAVINST 11010.20 and NAVFACINST 11010.45. Prior to planning alterations to an existing facility to convert it to a Youth Center, the activity should consult the following: Navy: NPC (Pers 656D/659) and Marine Corps: MCCS HQ (MRY/MRD).

c. **Air Force**. HQ AFCEE for architectural and publication coordination; HQ Air Force Civil Engineering Support Agency (AFCESA) for technical issues relating to fire, life safety, and certification; HQ AFSVA for functional requirements; and HQ USAF/ILV for functional policies.

2-5.2 **Other Considerations**.

Consider the site of the existing facility and its limitations with regard to the Youth Center's needs. Only consider permanent facilities for conversion to a Youth Center. Exceptions may be made for other buildings that are in excellent condition, subject to the location determinants in paragraph 2-3.

Consider adaptability to the intent of the building program. For instance, can the building accommodate a multipurpose room? Does it have site space for the outdoor activity area and the teen patio? Whether planning a conversion, alteration, addition, or new construction, antiterrorism requirements must be taken into account (see paragraph 3.8). Also consider barrier-free design requirements as noted in paragraph 3-7.

CHAPTER 3 GENERAL DESIGN CRITERIA

3-1 GENERAL.

Use UFC 1-200-01 for guidance on the use of model building codes for design and construction of Department of Defense facilities. See paragraph 3-5 for the appropriate governing codes for building services.

3-2 STRUCTURE.

1\ The Youth Centers for the **Army** must be a single-story structure. The **Air Force and Navy** may allow two-story Youth Centers, but prefer a single-story structure. /**1**/

3-2.1 Foundation.

The foundation is site specific and must be designed upon known geotechnical considerations, by an engineer knowledgeable of the local conditions.

3-2.2 Superstructure.

Provide clear spans as required for the activity areas and multipurpose room. Use pre-engineered components for superstructure framing, where feasible.

3-2.3 Materials.

Consider climate conditions, high humidity, industrial atmosphere, saltwater exposure, or other adverse conditions when selecting the following:

a. The type of cement and admixtures used in concrete,

b. The concrete cover on reinforcing steel in concrete membrane,

c. The coatings on structural members,

d. Expansion joints,

e. The level of corrosion protection, and

f. The structural systems.

3-3 EXTERIOR DESIGN.

In general, keep the building’s image, theme, and fixtures consistent with the programs offered. Design the Youth Center to reflect a residential, non-institutional character. The building design should comply with the Service command and installation architectural standards and design guides. Also consider the local geographical and cultural environment. The building and site should provide a visually attractive and welcoming appearance with ample parking, and signs giving directions to the site.

3-3.1 **Entrances**.

The main facility entrance to the lobby should serve as a welcome and transition point—elements such as a covered entry are very desirable. Such a feature might be combined with a covered walkway that connects the building to short-term parking to protect arriving youth and parents from inclement weather. If a covered walkway feature is provided, it should be structurally independent from the main Youth Center structure. In cold climates, provide a canopy (or a recess) at required egress doors to ensure that doors can completely open without obstruction from snow and ice.

Consider providing separate entrances to the multipurpose room and the teen room. Alternatively, consider providing a paved path from the parking area to a multipurpose room exit. The **Navy** requires a separate, exterior entrance to the Teen Room/Lounge that is independent from the main lobby but visible from the check-in.

3-3.2 **Doors and Windows**.

Residential size and type of doors and windows should be provided. Casement and other projecting types of windows must be recessed or located so as to be free from dangerous protrusions. Ensure windows and doors comply with antiterrorism criteria as noted in paragraph 3-8.

3-3.3 **Exterior Finishes**.

Keep the exterior color, texture, and design consistent with the programs offered, the local environment and appropriate for the building type. Design the Youth Center to reflect a residential-style, non-institutional character—the design should communicate a sense of fun while complying with installation architectural standards. The physical environment supports the operational quality of a center and profoundly affects the behavior and development of youth, as well as the efficient functioning and sense of well being in adult staff. Also coordinate the exterior finishes with the Service-specific design standards noted below in paragraph 3-4.2 for interior finishes.

Consider climate conditions, high humidity, industrial atmosphere, salt-water exposure, or other adverse conditions when selecting exterior finishes, including the roof system, to ensure durability.

3-3.4 **Exterior Signage**.

Equip the main entrance with an attractive, clearly located sign that provides the program hours of operation. Ensure that signage complies with Installation requirements. (**Air Force** use UFC 3-120-01.) Sign placement and type are site-specific, but signs must be strategically located, adequately lit, and of sufficient size to permit proper viewing by individuals approaching the facility.

3-4 **INTERIOR DESIGN**.

Use construction and finishes (walls, floor, and ceiling) that support the image and theme of the facility and that are consistent with the programs offered. Use finishes that are extremely durable with good acoustical, noise reducing characteristics. The interior design should offer the same interest, excitement, and professionalism that can be found in comparable commercial hospitality facilities. As with the exterior, design the Youth Center to reflect a high energy, non-institutional character that communicates a sense of fun. Consider techniques to display and celebrate the youth's artwork. For **Navy** facilities consider bright and vibrant colors and wall murals in common areas.

3-4.1 **Interior Construction**.

Use high-quality, durably constructed counters, casework, and cabinets. Specify Architectural Woodwork Institute (AWI) Premium or Custom for finishes per *AWI Quality Standards Illustrated*. Provide casework and cabinet doors and drawer faces of veneer panel core. Provide doors, drawers, and casework faces as plastic laminate at a minimum. Where no water source is present, use countertops of plastic laminate as a minimum with hardwood or solid surface edging. Where a water source is present, use countertops of solid surface/solid composite plastics only. Specify 20-mm (.75-in.) minimum thickness for plywood, plywood backing, and solid wood panels.

Confirm the amount (linear mm/ft.) of counter/casework for each space within the Youth Center with the following Service-specific contacts:

a. The Installation Manager for **Army** and **Air Force** projects and

b. HQ Program Managers for **Navy** and **Marine Corps** projects.

All Interior glass must be tempered safety glass and mirrors must be break-resistant materials.

3-4.2 **Finishes**.

Finishes should take into account the intended uses and be appropriately durable. They must meet the requirements listed in NFPA 101, *Life Safety Code.* Also coordinate the interior design with the following Service-specific standards or agencies:

a. **Army**. DG 1110-3-122, *Interior Design Guide and Installation Design Guide Standards*;

b. **Navy**. PERS-656;

c. **Air Force**. *Air Force Interior Design Guide*, Major Command and installation design standards, and Engineering Technical Letter (ETL) 00-06, *Air Force Carpet Standard*; and

d. **Marine Corps**. MCCS HQ MRY/MRD.

3-4.2.1 In moist climates, do not cover the inside of exterior walls with impervious materials such as mirrors or vinyl wall coverings. This is due to a concern over mold developing in the wall.

3-4.2.2 For the teen room/lounge, consider guiding a teen focus group in selection of an interior color scheme. For more information on finishes in specific areas, see the Functional Data Sheets in Chapter 4. The **Navy** requires the involvement of a teen focus group in the selection of interior color schemes for the Teen Room/Lounge.

3-5 **SERVICES**.

Also see paragraph 3-9 for information on sustainable design and energy consumption.

3-5.1 **Plumbing**.

Design domestic hot and cold water, sanitary and storm drainage, propane, fuel oil, or natural gas systems to meet the requirements of UFC 3-420-01.

Navy requirements differ from the other Services on toilet requirements. See Table 3-1 for this Service exception.

TABLE 3-1. TOILET REQUIREMENTS BY SERVICE

<table>
<tr><th>Service</th><th>SAC</th><th>Youth</th><th>Teens</th><th>Staff</th><th>Visitors</th></tr>
<tr><td>Army, Air Force, and Marine Corps</td><td>Separate male/female (child-use only).</td><td colspan="2">Separate male/female (child-use only) shared by Youth & Teens.</td><td colspan="2">Separate male/female shared by staff and visitors.</td></tr>
<tr><td>Navy</td><td colspan="2">Separate male/female (child-use only) shared by SAC & Youth.</td><td colspan="4">Multiple unisex toilets shared by Teens, Staff, and Visitors.</td></tr>
</table>

3-5.2 **Heating, Ventilating, and Air Conditioning (HVAC)**.

Design the HVAC system to comply with the requirements of the most current edition of the International Mechanical Code (IMC). Use UFC 3-410-02N as supplemental guidance. Comply with antiterrorism requirements in the design of the HVAC system (see paragraph 3-8).

Consider climate conditions, high humidity, industrial atmosphere, salt-water exposure, or other adverse conditions when selecting exterior HVAC components to ensure durability.

3-5.3 **Fire Protection and Life Safety**.

Design fire protection and life safety to comply with UFC 3-600-01*;* the National Fire Protection Association (NFPA) Standards; and the requirements listed below. Complete compliance with the NFPA 101 is required by Public Law (USC Title 10, Section 1794) and may not be waived except by the Secretary of each military Service.

In case of conflict between this UFC and the latest edition of NFPA 101, contact the appropriate Service representative below for resolution:

a. **Army**. USACE District Fire Protection Engineer

b. **Navy**. NAVFAC FEC/EFD/EFA Fire Protection Engineer

c. **Air Force**. HQ AFCESA/CES

d. Marine Corps. HQ Fire Protection Engineer

3-5.3.1 **Occupancy Classification.**

The entire facility, except for the multipurpose room, will be classified as an educational occupancy as defined in NFPA 101. The multipurpose room, if provided, will be classified as an assembly occupancy as defined in NFPA 101.

3-5.3.2 **Exiting Requirements**.

Use the NFPA 101-listed occupant load factors for the purpose of designing the means of egress as follows:

a. Use the factor for “Educational Use, Classrooms” for the entire facility except the multipurpose room and

b. Use the factor for “Assembly Use, Concentrated use, without fixed seating” for the multipurpose room.

3-5.3.2.1 Rooms normally occupied by second-grade children and older may be located no more than one floor above the ground floor. Note: Only the **Air Force \1** and **Navy /1/** allow a Youth Center of more than one floor.

3-5.3.2.2 Provide at least two separate, accessible exits on every story. Any interior stair serving as an exit will be enclosed by fire resistant construction as required by NFPA 101 and allow discharge from the stairway directly to the outside.

3-5.3.2.3 Provide corridors of at least 1830 mm (72 in.) clear width.

3-5.3.2.4 Egress corridors may not be used as a portion of a supply, return, or exhaust air system serving adjoining areas.

3-5.3.2.5 Provide sufficient doors between the multipurpose room and the building core areas to accommodate the egress of at least one-half of the maximum multipurpose room occupant load into the building core areas. Size the main

entrance/lobby and other exits directly connected to the main entrance/lobby to accommodate the exit of the multipurpose occupants along with the occupants of the building core areas.

3-5.3.2.6 Equip all exit doors from the facility to the outside with panic hardware.

3-5.3.2.7 Where cold weather vestibules are provided at activity room exits and exits other than the primary entrance, use a non-latching-type door held closed by a hydraulic door closer for inside door. Install panic egress hardware only on the exterior door.

3-5.3.2.8 Provide either of the following methods to protect the means of egress:

a. Provide a direct exit to the outside from every room normally occupied by children, or

b. Design corridor walls to form smoke partitions. Use magnetic hold-open devices for all fire doors and kitchen doors.

3-5.3.2.9 Provide a smooth, accessible, and unobstructed evacuation route to a safe gathering area not less than 23 m (75 ft.) from the facility for all activity rooms. The route must not cross any emergency vehicle access path, parking area, or street. The evacuation route must be at least 1020 mm (44 in.) wide, and turns and bends in the route should be wider to account for use of wheelchairs. Provide gates with not less than 1020 mm (44 in.) clear width as necessary in the play area fence. Provide sufficient outdoor lighting for the egress path to meet NFPA 101 minimum illumination requirements.

3-5.3.3 **Exit Marking.**

Provide exit signs in accordance with UFC 3-530-01 and UFC 3-600-01. Install exit signs in child occupied rooms when exterior exit doors are provided.

3-5.3.4 **Additional Exiting Requirements for Extreme Cold Weather Locations.**

If the facility location meets the weather criteria outlined below, provide for horizontal exiting within the facility according to NFPA 101 and the criteria in this section.

Extreme cold weather locations are those with more than 50 hours per year with a dry-bulb temperature below –15 degrees C (5 degrees F) between the hours of 0900 and 1600. (See UFC 3-400-02 for information on obtaining this data.)

3-5.3.4.1 Provide a two-hour area separation wall dividing the facility areas roughly in half on either side of the wall. When a gymnasium is provided, provide the separation wall between the gymnasium and the core areas.

3-5.3.4.2 Design corridor doors in the two-hour area separation wall to recess into

the wall providing a smooth continuous wall surface. Install magnetic latches to hold door open, which release when the fire evacuation signal sounds. Install swinging doors that swing in opposite directions.

3-5.3.4.3 Install magnetic latches to hold open other doors in the two-hour area separation wall that release when the fire evacuation signal sounds.

3-5.3.4.4 Seal and fire stop all penetrations of the two-hour separation wall for conduit, piping, HVAC and electric service to maintain the fire rating of the wall.

3-5.3.5 **Emergency Lighting.**

Provide emergency lighting in all areas required by NFPA 101 and at the front desk area for desk attendant to make emergency calls and carry out other duties necessary for the safety and security of the children. Whenever possible, incorporate the emergency lighting into the normally provided lighting fixtures.

3-5.3.6 **Flammability Codes and Standards.**

Use textiles and upholstered components complying with the applicable interior finish requirements stated in NFPA 101 and other applicable local, state, or federal standards. In addition, comply with the following:

a. Use carpets tested for Volatile Organic Compounds (VOCs) and that bear a green label from the Carpet and Rug Institute indicating that the carpet emissions are within the acceptable range and

b. Use products containing less than 0.05 parts per million (ppm) of formaldehyde. Any product purchased with formaldehyde levels above 0.05 ppm must bear a label in accordance with 29 CFR 1910.1048.

3-5.3.7 **Fire Hydrants.**

Provide at least one fire hydrant within 45 m (150 ft.) of the building's fire department connection.

3-5.3.8 **Fire Separation.**

3-5.3.8.1 Provide one-hour fire-rated construction to separate the multipurpose room from the building core areas.

3-5.3.8.2 Provide a one-hour fire-resistive barrier around the laundry room, if provided, and at least a 45-minute fire-rated door.

3-5.3.8.3 Other fire separations are not required in a typical one-story Youth Center fully protected with an automatic sprinkler system. Additionally, smoke barriers are not required if direct exits are provided from each room normally occupied by children (see paragraph 3-5.3.2).

3-5.3.9 **Fire Extinguisher Cabinets.**

If fire extinguishers are required by the local installation, provide recessed fire extinguisher cabinets. Recessed cabinets located in fire-rated walls must be listed or approved fire-rated cabinets that can be installed in fire rated walls without having to "build-out" the wall.

3-5.3.10 **Fire Suppression Systems.**

Provide complete automatic sprinkler systems meeting the requirements of UFC 3-600-01. Wet pipe sprinkler systems are the preferred system type because of the high reliability and low maintenance requirements. Take care to avoid freezing sprinkler pipes located in attic spaces. Sprinkler systems subject to freezing may be dry pipe sprinkler systems. Note the following additional criteria:

a. Design the sprinkler system water flow indication to activate the building fire evacuation system;

b. Discharge inspectors' test connections to a safe, outside location onto a hard surface outside of areas where children play or congregate. Indicate discharge location on drawings;

c. Use quick response type sprinkler heads; and

d. Ensure that the fire department connection is accessible without entering or transiting an outdoor play area or crossing a discharge path.

e. Pipe penetrations of the exterior wall must be no greater than 610 mm (24 in.) above finished grade.

If the optional kitchen is included, provide a wet chemical or water spray hood duct and cooking surface fire extinguishing system according to NFPA 96.

3-5.3.11 **Fire and Alarm System.**

3-5.3.11.1 Provide an automatic fire evacuation alarm system according to NFPA 72 and complying with the installation's requirements. Note the following requirements:

3-5.3.11.2 Locate the fire alarm control panel in an environmentally controlled location in the facility.

At a minimum, meet the following criteria for circuits in the systems:

a. Initiating circuits – Class B, Style C

b. Notification circuits – Class A, Style Z

c. Signaling Circuits – Class B, Style 3.5

3-5.3.11.3 Fully addressable control panels with addressable supervisory sensors,

pull stations, notification devices, and other devices are recommended.

3-5.3.11.4 Provide audio and visual notification devices/strobes in accordance with NFPA 72 and UFC 4-021-01.

Note: **Army** and **Navy** require the following additional criteria: Provide a voice evacuation system that is capable of accepting input from a remote location. This system must be UL listed for fire alarm use. The voice evacuation system will satisfy the requirements of the Mass Notification System. Provide a single type of visual notification device that will serve as the fire alarm visual alarm notification and as the Mass Notification System visual alarm notification that complies with NFPA 72 and is labeled “Alert.” The spacing and location of the visual notification devices must meet the requirements of NFPA 72.

3-5.3.11.5 The signal type/tone will be the same throughout the building, and will be heard on the playgrounds. Sufficient alarm notification devices will be provided so that the signal is not excessively loud in any location (15 dB above ambient is the target level).

3-5.3.11.6 Provide manual pull stations inside the facility at each exterior exit door.

3-5.3.11.7 Building smoke detection is not required and should not be provided except for the one smoke detector that is required by NFPA 72 to be located over the fire alarm control panel. Heat detectors are not required in any area because the facility is fully sprinkled. Smoke detectors must be installed in HVAC ducts as required by NFPA 90A.

3-5.3.11.8 Provide either a graphic or alphanumeric annunciator at the front desk or vestibule.

3-5.3.11.9 Provide and install a fire alarm transmitter compatible with the installation fire alarm receiving equipment to transmit fire alarm and system supervisory signals to the installation fire alarm reporting center. Consult with the Installation Fire Chief or fire system maintenance activity. This may be a sole source item.

3-5.4 **Electrical**.

Provide electric service and distribution equipment, wiring receptacles and grounding, interior and exterior lighting and control, emergency lighting, telephone, communication systems, fire alarm, and intrusion systems in accordance with NFPA 70*;* UFC 3-520-01*;* and the latest installation design requirements. See the latest edition of *Electric Current Abroad* to determine voltages and cycles in overseas locations. Service grounding system and all wiring methods must meet the current NFPA 70 requirements. All service equipment must be Underwriters Laboratories (UL) listed. Alternately, published proof from an approved independent testing laboratory may be provided.

3-5.4.1 **Lighting.**

Vary lighting levels and types throughout the Youth Center. Provide a combination of

task and ambient light to create interest. Consider that most public spaces in the Youth Center should exhibit a more residential or hospitality-oriented character than an office or educational facility. For more information on the specific spaces, refer to the Functional Data Sheets in Chapter 4 and UFC 3-530-01.

3-5.4.2 Communications and Data.

Provide a junction box with rigid conduit to the ceiling for telephone and data connections. Telephone and data outlets may be independent of each other or combined into a single junction box. If these connections can be combined into a single junction box then the cover plate to that junction box must allow for multiple connections. In some unique situations, the cable television (CATV)/internal video connection can also be combined into a single junction box with the appropriate cover plate.

Confirm the preference for individual or combined telephone/data/video outlets with the following Service-specific contacts:

a. The Installation Manager for **Army** and **Air Force** projects and

b. HQ Program Managers for **Navy** and **Marine Corps** projects.

The **Navy** requires that each space supplied with a data connection have two hard-wired connections: a primary and an alternate. The alternate serves as a back-up and is generally not activated. Facilities that will contain Navy and Marine Corps Intranet computers must comply with UFC 3-580-10.

3-5.4.3 Alarm System.

Consider providing an alarm system for intrusion detection to protect equipment and assets. Provisions for an alarm system must be justified during the planning/programming process. For **Navy**, the individual Navy Installation desiring an alarm system may fund the system as collateral equipment.

3-5.4.4 Closed Circuit Television (CCTV).

CCTV is designed to deter and reduce the risk of child abuse and protect staff from any unwarranted allegations of child abuse. Service requirements vary on CCTV systems—note the following criteria:

3-5.4.4.1 **Army.** The video surveillance system for Army programs is to be digital, which allows for speed (quicker access to images), reduced space requirements (few tapes to store), and higher quality images. Locate the central monitor in the administrative/reception area. Design the system to provide documentation of the following areas:

a. All activity spaces,

b. Hallways to include exit doors,

c. Kitchen to include delivery entrance and storage room,

d. Reception area (front desk/lobby area/main entrance), and

e. Outdoor Activity Areas to include the outdoor storage area that children can access.

This equipment, external to the outlets, is considered personal property. All video monitoring security systems will be coordinated with U.S. Army Community and Family Support Center, Child and Youth Services Directorate for the latest specifications for Video Monitoring Equipment. All patrons must be notified of the camera surveillance.

3-5.4.4.2 **Navy.** Provide conduit (minimum 19 mm (.75 in.)) and cabling in each activity space with the central monitors located at the check-in desk and a remote monitor located in the Youth Center Director's office. The conduit will accommodate government-furnished/government-installed, locally-funded video equipment. This may require outlets higher in the ceilings, walls, or both. Provide electrical service adjacent to anticipated location of cameras and monitors.

3-5.4.4.3 **Air Force.** Provide the entire CCTV system including cameras, monitors, conduit, cabling, power, and junction boxes required for a complete and operational system. Place monitors at the main check-in desk where they can be easily viewed by staff and in the Youth Center Director's office.

3-5.4.4.4 **Marine Corps.** Provide the entire CCTV system including cameras, monitors, conduit, cabling, power, and junction boxes required for a complete and operational system. Place monitors at the main check-in desk where they can be easily viewed by staff and in the Youth Center Director's office.

3-6 **SITE WORK**.

3-6.1 **Landscaping**.

Design landscaping s to reflect the programs offered and the local geographical environment. Choose plants that are easy to maintain and enhance the visual quality of the facility in all seasons. Indigenous species are preferred. Refer to the local installation landscape standards. For **Air Force**, also refer to the *USAF Landscape Guide* and any Major Command standards.

Do not use poisonous or toxic plants or rocks. Table 3-2 provides a non-comprehensive list of common plants that are known to be poisonous. Table 3-3 provides a list of plants for which no evidence currently exists of a poisonous quality. These lists are provided by the Maryland Poison Center. Within the United States, check with local extensions of the U.S. Department of Agriculture for more information about the nature of common plantings in specific locations. These lists are not intended to serve as a guide for plants to use or not use but are merely provided for informational purposes. Refer to a comprehensive, commercially-available field guide for complete lists of poisonous plants.

TABLE 3-2. COMMON POISONOUS PLANTS

Amaryllis	Jerusalem cherry
Azalea	Jimsonweed
Barberry	Jonquil
Black locust	Lily-of-the valley
Boxwood	Mistletoe
Caladium	Mountain laurel
Castor bean	Narcissus
Chinaberry	Nephthytis/Arrowhead
Chinese evergreen	Nightshade family
Chrysanthemum	Oak (acorns)
Crown of thorns	Peony
Daffodil	Philodendron family
Dumbcane/Dieffenbachia	Poison ivy/oak/sumac
English ivy	Pokeweed
Euonymous	Privet
Four o'clock	Rhododendron
Fruit pits or seeds	Snowball bush/Hydrangea
Gladiola	Water hemlock
Holly	Wisteria
Hyacinth	Yew
Iris	

TABLE 3-3. COMMON NON-POISONOUS PLANTS

African violet	Marigold
Christmas cactus	Mulberry (ripe berries only)
Coleus	Norfolk pine tree
Corn plant	Peperomia
Crocus	(spring) Petunia
Dandelion	Poinsettia*
Dogwood	Prayer plant
Dracaena	Pyracantha/Firethorn
Easter lily	Rose
Ferns	Rubber tree plant
Ficus*	Sansevieria/Snake plant
Forsythia	Scheffiera*
Fuchsia	Spider plant
Geranium	Swedish Ivy
Hibiscus	Tulip*
Honeysuckle	Wandering Jew
Impatiens	Wax plant
Jade plant	Wild strawberry/Snakeberry
Lilac	Zebra plant

***** Sap may be irritating.

3-6.2 **Drop-off Area/Bus Stop**.

Comply with antiterrorism standards noted in paragraph 3-8 below. Consider providing a sign at the entry to the bus drop-off lane that reads, “Bus Drop-Off Lane Only. All Other Vehicles Prohibited.”

3-6.3 **Parking and Access Drives**.

Provide adequate parking for both staff and patrons with the appropriate access drives. Consider location of bicycle racks near the facility entrance in a secure location.

3-6.4 **Service Drive**.

Verify the size of required service vehicles prior to planning the service access areas. Provide a back-up spur for dead-end and service drives that exceed 30 m (100 ft.) in length. Access should be near the serviced areas, i.e., kitchen (if provided), garbage dumpster/storage (indoor or outdoor), mechanical room, and service entry, if one is designated. Provide a service vehicle apron and consolidate service access when possible. Screen or separate the service area from public use or traffic areas with attractive fences, depressions, berms, and landscaping. Ensure proper drainage if depressions are used. Do not cross outdoor activity areas with service access. Ensure compliance with antiterrorism standards noted in paragraph 3-8, particularly for dumpster separation and access control.

3-6.5 **General Site Lighting**.

Ensure that parking areas and the facility have adequate lighting for safety, evacuation, and security measures. See UFC 3-530-01.

3-6.6 **SAC Outdoor Activity Area**.

The SAC Outdoor Activity Area should comply with the *Handbook for Public Playground Safety* guidelines for developmentally-appropriate play spaces and groupings. It should also comply with ASTM F1487. See Table 4-4.2 for more information on this space.

3-6.7 **Youth Outdoor Activity Area**.

If both SAC and Youth programs are accommodated in a facility, the youth program may share the SAC Outdoor Activity Area, in which case there are no additional criteria. If SAC is not provided or if an additional, separate Youth Outdoor Activity Area is programmed, it should at a minimum meet the *Park, Recreation, Open Space and Greenway Guidelines*. Also consider providing features such as an exterior basketball court.

3-6.8 **Teen Patio**.

See Table 4-10.2 for more information on this space.

3-6.9 **Optional Outdoor Open Area**.

This optional area is intended for large area outdoor activities, such as team sports. Consider designing features to accommodate a regulation soccer field or a little-league baseball field. At a minimum, this space should also meet the *Park, Recreation, Open Space and Greenway Guidelines*.

3-7 BARRIER FREE DESIGN REQUIREMENTS.

Design Youth Centers to be barrier-free and accessible in compliance with the Architectural Barriers Act (Public Law 90-480) of 1968, http://www.access-board.gov/ufas/ufas-html/ufas.htm - ABA. Provide barrier free design requirements in accordance with the Uniform Federal Accessibility Standards (UFAS), published as Federal Standard (FED-STD)-795, http://www.access-board.gov/ufas/ufas-html/ufas.htm, and 28 CFR Part 36, the Americans with Disabilities Act Accessibility Guidelines for Buildings and Facilities (ADAAG), http://www.access-board.gov/adaag/html/adaag.htm.

3-8 ANTITERRORISM.

For antiterrorism requirements, refer to UFC 4-010-01 and UFC 4-020-01, *DoD Security Engineering Facilities Planning Manual*.

3-9 SUSTAINABLE DESIGN.

Use an integrated approach to the planning and design of Youth Centers that minimizes energy consumption and optimizes life cycle cost renewable energy possibilities. Use a practical combination of site selection and siting, energy conserving building envelope technologies, energy efficient lighting, occupant sensing controls, variable frequency drives for motors and exhaust fans, and high efficiency HVAC systems to achieve this goal. Incorporate renewable energy principles such as day-lighting, passive and active solar heating, natural ventilation, and photo-voltaics where they are life cycle cost effective.

3-9.1 Service Specific.

See the following Service-specific requirements:

3-9.1.1 **Army.** Design Youth Center projects with consideration for sustainable ratings in eight facility categories: Sustainable Sites, Water Efficiency, Energy and Atmosphere, Materials and Resources, Indoor Environmental Quality, Facility Delivery Process, Current Mission, and Future Missions. The minimum rating for the Army's Sustainability Project Rating Tool (SPiRiT) must be in accordance with the current rating. Most projects can reach the sustainability rating without increasing costs, while improving installation sustainability and balancing available resources with customer requirements. Understanding and applying the principles of Sustainable Design and Development and using the SPiRiT rating process improves day-to-day decisions and project quality.

3-9.1.2 **Navy and Marine Corps.** Use the United States Green Building Council (USGBC) LEED™ Green Building Rating System to measure the sustainability of the completed project. It can also be used during planning and design as a source of green building strategies. LEED™ addresses sustainable sites, water efficiency, energy and atmosphere, materials and resources, and indoor environmental quality. The minimum LEED™ rating of "Certified" should be met within budgetary constraints. Actual certification is encouraged, but not required.

Follow the guidance in UFC 3-400-01.

3-9.1.3 **Air Force.** It is Air Force policy to apply sustainable development concepts in the planning, design, construction, environmental management, operation, maintenance, and disposal of facilities and infrastructure projects, consistent with budget and mission requirements.

Each Major Command should incorporate sustainable development using LEED™ criteria. The *Air Force Sustainable Facilities Guide* will provide tools and suggested guidelines for selecting candidate projects. The goal is to have all MILCON/NAF projects in the FY09 program capable of achieving LEED™ certification. Submission to the USGBC for actual LEED™ certification is at MAJCOM discretion. This policy does not apply to Host Nation or NATO funded projects.

Sustainable development concepts will benefit the Air Force by creating high-performance buildings with long-term value. They are to be integrated into the development process and balanced with all other design criteria to achieve best value for the Air Force. The economic analysis process need not change, but the elements to consider will now include sustainable technologies and their potential for long-term savings. Complete Air Force policies may be found in the *Air Force Sustainable Facilities Guide* found at http://www.afcee.brooks.af.mil/dc/dcd/arch/rfg/index.html.

3-9.2 **Other Sustainable Design Criteria**.

The following general references provide more information:

3-9.2.1 When specifying products that are included in EPA's list of affirmative procurement guideline items, designers must include the requirement for these products to meet or exceed the recycled material content standards established by EPA. The list of products and their corresponding recycled content requirements are found at www.epa.gov/cpg/products. Listed products likely to be used in Youth Centers include building insulation, carpet and cushion, cement and concrete, latex paint, floor tiles, patio blocks, restroom dividers, and structural fiberboard.

3-9.2.2 The "Whole Building Design Guide" www.wbdg.org further explains the environmental issues related to building materials and provides technical guidance on green building material selection.

3-9.3 **DoD Energy Budget**.

Design of new facilities must ensure that building energy consumption does not exceed the DoD energy budget figures.

CHAPTER 4 SPECIFIC DESIGN CRITERIA

4-1 INTRODUCTION.

This chapter identifies the specific design needs for each functional area as outlined in the space program. Tables 4-1 through 4-11 provide this data in a standard Functional Data Sheet format.

These Data Sheets are available as a Microsoft© Word© file for use during project execution. The file is available with the Space Program spreadsheets, downloadable from the Whole Building Design Guide DoD page (http://dod.wbdg.org/) web site.

TABLE 4-1. LOBBY

Description/ Usage	The Lobby serves as the entrance to the facility. This entrance should be recognizable from the outside and be close to the school bus drop-off, base bus stop, and patron parking. The lobby should be open and friendly and serve to introduce the rest of the facility. It should have a comfortable area for waiting. The Check-in (see Table 4-2) is an integral part of the lobby.
Min. Ceiling Ht.	2.74 m (9 ft.) minimum.
Finishes	**Walls.** Provide a low-maintenance, durable finish. Prefer a wainscot. Consider painted gypsum wallboard or the use of vinyl wall covering where budget and practical considerations allow. **Floor.** Provide a low-maintenance, durable, moisture and slip-resistant finish suitable for this high traffic area. Consider seamless vinyl, stained concrete, or stone or quarry tile. Provide a walk-off mat/area at the entrance door. **Ceiling.** Provide a decorative ceiling. Consider exposed, painted structure.
Plumbing	None required. Consider providing a drinking fountain.
HVAC	20 C (68 F) minimum, 26 C (78 F) maximum.
Fire Protection	Provide system per paragraph 3-5.3.
Power	Provide outlets per code. Consider outlets for display cases.
Lighting	430 lux (40 fc). General ambient lighting. Consider decorative and task lighting.
Communication	**CCTV.** Provide at least one outlet. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. **Telephone.** Consider providing one line for local or toll-free calls. **Data.** None required. **Security.** None required.
Casework	Consider providing display cases in this space and along corridors for display of projects.
Furnishings Fixtures & Equip. (FF&E)	Floor mat at entrance; soft padded furniture for seating/waiting area; tables; magazine rack, and tack surfaces. Consider providing a pay phone. For **Army**, consider providing a ceiling or wall-mounted TV and security monitors.
Special Req.	Airlock at main entrance. Signage.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Patrons/Youth.
Min. net m^2 (ft^2)	

TABLE 4-2. CHECK-IN

Description/ Usage	The Check-in area is the primary area to monitor and control access into and out of the building. Youth will be checked in here, and all visitors must register at this point. It must have visible control over all primary entrances/exits and the Commons and access points to other spaces. Game supplies may be stored at the check-in desk. The audio and CCTV controls will also be located here. 
Min. Ceiling Ht.	2.74 m (9 ft.) minimum.
Finishes	**Walls.** Painted gypsum wallboard. Consider vinyl wall coverings. **Floor.** VCT with vinyl or rubber base. Consider carpet or cushioning properties behind the counter. **Ceiling.** ACP. Consider using the ceiling to define and separate this area from the Lobby.
Plumbing	None required.
HVAC	20 C (68 F) minimum, 26 C (78 F) maximum
Fire Protection	Provide system per paragraph 3-5.3.
Power	Provide power for all equipment. Perform a power requirement survey, as this area's power requirements are extremely site and locale specific.
Lighting	540 lux (40 fc). General ambient lighting. Provide task lighting; consider decorative fixtures.
Communication	**CCTV.** All lobby monitors must be viewable from this area. **CATV/Internal Video.** None required. **PA/Audio.** PA controls. Provide a speaker. **Telephone.** Provide one line per two points of sale (POS). Provide at least two additional general-purpose phone lines. **Data.** Provide one outlet per POS. Provide additional outlets, as needed, for associated hardware. **Security.** None required.
Casework	Provide a 610 mm (24 in.) deep counter with built-in cabinets. Provide file drawers and storage drawers with a minimum of two lockable drawers for each POS. The counter should be dual height for standing transactions, seated office functions, and ADA customer service. Note that ADA-height counter should have knee-hole space on both sides of the counter. Consider a durable material for the counter such as solid surface—laminate edges are not permitted. Consider supports such as steel angle braces for counters with knee-hole space. Modesty panels and apron must be of durable materials. Consider providing wall and base cabinets and equipment counter.
Furnishings Fixtures & Equip. (FF&E)	Point-of-Sale units, desktop computer for administrative functions. CCTV monitors. Printers. Chairs and stools. Scanner or swipe-card check-in device.
Special Requirements	Consider providing a gate between desk and surrounding area. Consider providing a coiling door or grille at the counter to serve as a security screen.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Patrons/Youth.
Min. net m^2 (ft^2)	

TABLE 4-3.1 ADMINISTRATIVE OFFICES

Description/ Usage	The Administrative Offices consist of a mix of closed and open office space. The quantity and selection of closed offices is facility specific. The remaining staff sits in open offices or workstations arranged in an open office plan with systems furniture. All offices are used for planning, developing, organizing, supervising, implementing, promoting, and evaluating facility operations. The offices should be free from frequent distraction, have a professional appearance, and provide a sense of work place.
Min. Ceiling Ht.	2.44 m (8 ft.) minimum.
Finishes	**Walls.** Painted gypsum wallboard or vinyl wall covering. **Floor.** Carpet with vinyl or rubber base **Ceiling.** ACP
Plumbing	None required.
HVAC	20 C (68 F) minimum, 26 C (78 F) maximum
Fire Protection	Provide system per paragraph 3-5.3.
Power	Ensure an adequate number of circuits to power all equipment. Provide a minimum of one quad outlet in closed offices on at least three walls. Gang outlets with data and telephone. Workstations should provide at least one quad outlet per staff. Provide additional outlets as necessary to operate shared equipment such as printers, fax, etc.
Lighting	540 lux (50 fc). General ambient fixtures.
Communication	**CCTV.** Provide one outlet for remote monitor in Director's office and one for the School-age Coordinator. **CATV/Internal Video:** None required. **PA/Audio:** Provide a speaker. **Telephone.** Provide one line per staff plus one additional line for fax and copier. **Data.** Provide one outlet per staff plus one outlet for each printer, copier, scanner, etc. **Security.** None required.
Casework	None required.
Furnishings Fixtures & Equipment (FF&E)	Private Offices—provide furniture for 11 m^2 (120 $ft.^2$) office: desk, credenza, filing cabinet, desk chair and two side chairs. Workstations—provide furniture for 4.5 m^2 (48 $ft.^2$) workstation: desk chair and side chair for open offices. Workstation systems furniture must provide adequate space for filing and overhead storage.
Special Requirements	Provide vision panels in office doors.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Patrons/Youth.
Min. net m^2 (ft^2)	

TABLE 4-3.2 BREAK/ STAFF TRAINING ROOM

Description/ Usage	Used for staff training, meetings, breaks, and lunches. Consider that staff lockers may be in this area (see Table 4-3.4).
Min. Ceiling Ht.	2.44 m (8 ft.) minimum.
Finishes	**Walls.** Painted gypsum wallboard or vinyl wall covering. **Floor.** VCT with vinyl or rubber base. **Ceiling.** ACP
Plumbing	Provide a sink. Consider water connection for refrigerator icemaker.
HVAC	20 C (68 F) minimum, 26 C (78 F) maximum
Fire Protection	Provide system per paragraph 3-5.3.
Power	Provide outlets per code. Provide one additional outlet at counter height for convenience. Provide additional outlets necessary to operate dedicated equipment such as the coffee machine, refrigerator, time clocks, microwave, and various training equipment.
Lighting	540 lux (50 fc). Consider dimmable lights.
Communication	**CCTV.** None required. **CATV/Internal Video.** Consider providing one outlet. **PA/Audio.** Provide a speaker. **Telephone.** Provide one line. **Data.** Provide a minimum of one outlet. Consider providing additional outlets for training purposes. **Security.** Provide a vision panel in the door.
Casework	Solid-surface countertop; see paragraph 3-4.1 for length criteria. Provide lockable wall and base cabinets. Provide storage for training materials and AV cart.
Furnishings Fixtures & Equipment (FF&E)	Table and chairs, microwave, coffee machine, and refrigerator. Bulletin board with tack surface. Dry-erase board. AV cart with TV, VCR, and DVD for training purposes. Projector and screen. Computers.
Special Requirements	Provide a vision panel in the door.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Patrons/Youth.
Min. net m^2 (ft^2)	

TABLE 4-3.3 COPY/FILE AREA

Description/ Usage	This area could be either enclosed and centralized or open and decentralized within the Administrative area. It houses copy machines, printers other than those dedicated to specific individuals, filing cabinets, and storage for general office supplies. In addition, provide sufficient space to act as a workroom for staff to allow for collating documents, presentations, and work projects.
Min. Ceiling Ht.	2.44 m (8 ft.) minimum.
Finishes	**Walls.** Painted gypsum wallboard or vinyl wall covering. **Floor.** VCT with vinyl or rubber base. **Ceiling.** ACP
Plumbing	None required.
HVAC	20 C (68 F) minimum, 26 C (78 F) maximum
Fire Protection	Provide system per paragraph 3-5.3.
Power	Provide outlets per code and dedicated outlets for copiers and printers.
Lighting	540 lux (50 fc)
Communication	**CCTV.** Consider providing one outlet. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. **Telephone.** Provide at least one line for telephone and one additional line, if appropriate, for a facsimile machine. **Data.** As necessary for network printers. **Security.** Lockable area for filing or lockable filing cabinets.
Casework	610-mm (24-in.) deep countertop. Lockable base and wall cabinets and storage shelves.
Furnishings Fixtures & Equipment (FF&E)	Photocopy machine and other office equipment, as appropriate. Work table for collating documents and other work.
Special Requirements	If this is a dedicated room with a door, provide a vision panel.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Patrons/Youth.
Min. net m^2 (ft^2)	

TABLE 4-3.4. OPTIONAL STAFF LOCKER AREA

Description/ Usage	This optional area is used by all staff for the storage of personal articles only. It is not intended as a rest room or shower facility. It is usually part of or adjacent to the Break/Staff Training room (see Table 4-3.2).
Min. Ceiling Ht.	2.44 m (8 ft.) minimum.
Finishes	**Walls.** Painted gypsum wallboard or vinyl wall covering. **Floor.** VCT with vinyl or rubber base. **Ceiling.** ACP.
Plumbing	None required.
HVAC	20 C (68 F) minimum, 26 C (78 F) maximum.
Fire Protection	Provide system per paragraph 3-5.3.
Power	Provide outlets per code.
Lighting	540 lux (50 fc).
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. **Telephone.** None required. **Data.** None required. **Security.** None required.
Casework	None required.
Furnishings Fixtures & Equipment (FF&E)	Half-sized lockers with key/combination locks. **Navy** requires padlock lockers
Special Requirements	If this is a dedicated room with a door, provide a vision panel in the door.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Patrons/Youth.
Min. net m^2 (ft^2)	

TABLE 4-3.5 STAFF/VISITORS TOILETS/ JANITOR'S CLOSET

Description/ Usage	See Table 3-1 for Service-specific toilet requirements. These are separate male and female toilets for use by adult staff and visitors. **Navy** provides multiple unisex toilets that are shared by Teens, staff, and visitors—see Table 4-9.
Min. Ceiling Ht.	2.44 m (8 ft.) minimum.
Finishes	**Walls.** Epoxy or enamel painted, moisture-resistant gypsum wall board with a ceramic tile wainscot. Consider full ceramic tile walls. **Floor.** Ceramic tile. **Ceiling.** Painted, moisture-resistant gypsum board. None needed for janitor's closet.
Plumbing	Provide wall-hung water closets, wall-hung urinals, and lavatories based on the applicable code for the calculated occupancy. Provide a floor drain.
HVAC	20 C (68 F) minimum, 26 C (78 F) maximum. Ventilate to the exterior per code.
Fire Protection	Provide system per paragraph 3-5.3.
Power	Provide outlets per code.
Lighting	540 lux (50 fc).
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** None required. **Telephone.** None required. **Data.** None required. **Security.** Provide lockable doors. Provide a vision panel in the door.
Casework	Solid-surface countertop with either underhung or integral sink. Solid composite toilet and urinal partitions. Not necessary for **Navy** unisex toilets.
Furnishings Fixtures & Equipment (FF&E)	Toilet accessories: toilet paper dispensers, paper towel dispenser with integral trash receptacle, robe hooks, grab bars, and soap dispensers. Mirror.
Special Requirements	Provide a Janitor's closet associated with or in proximity of these toilets. This closet includes a mop sink with hot and cold water, a floor drain, and storage for pails, mops, vacuums, and related cleaning supplies and equipment. Include a lockable door, (which can be opened from the inside) with a vision panel. Provide lockable cabinets for cleaning supplies. Provide exhaust ventilation directly to the outside.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Patrons/Youth.
Min. net m^2 (ft^2)	

TABLE 4-3.6. OPTIONAL LAUNDRY

Description/ Usage	This optional Laundry Room may be used for washing sports uniforms or other items associated with the operation and maintenance of a Youth Center. It is sized in one of two modules: a one-washer room or a two-washer room. The **Navy** normally does not provide laundry without justification.
Min. Ceiling Ht.	2.74 m (9 ft.) minimum.
Finishes	**Walls.** Painted water-resistant gypsum wallboard. **Floor.** VCT or seamless vinyl. **Ceiling.** None or Acoustical Ceiling Panels. Consider washable and humidity resistant panels. Gypsum wallboard ceiling may also be used.
Plumbing	Hot and cold water to each of the washing machines and one laundry sink. Floor drains. Provide recessed plumbing cabinets for each utility connection to the machines.
HVAC	20 C (68 F) minimum, 26 C (78 F) maximum. Provide separate vents to the outside for the dryers. Provide adequate dehumidification as part of the building systems.
Fire Protection	Provide system per paragraph 3-5.3. Note requirement for 1-hour rated construction and 45 min.-rated door with self closer.
Power	Provide outlets per code. Provide power to each washer and dryer.
Lighting	540 lux (50 fc) general ambient lighting.
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** Provide one speaker. **Telephone.** None required. **Data.** None required. **Security.** Provide a vision panel in the door.
Casework	None required.
Furnishings Fixtures & Equipment (FF&E)	Large, high capacity washers and dryers—provide one more dryer than washer (either one washer and two dryers, or two washers and three dryers). Provide for storage of laundry supplies. Consider providing a folding table and hanging rack.
Special Requirements	Provide easy access to rear of dryers to allow easy maintenance and cleaning of vents (see HVAC).
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Patrons/Youth.
Min. net m^2 (ft^2)	

TABLE 4-4.1. SAC ACTIVITY ROOMS

Description/ Usage	These rooms accommodate a variety of activities and program options for youth in the SAC program. These rooms may be used for multiple activities such as arts/crafts, hobbies, performing arts/drama, science, and study. The room should be able to accommodate multiple activities at the same time. **Note**: the Services vary on how they configure these rooms; see floor finishes below for more information.	
Min. Ceiling Ht.	2.44 m (8 ft.) minimum and (12 ft.) maximum.	
Finishes	**Walls.** Gypsum wallboard—first 1.22 m (4 ft.) with a protective wall covering wainscot and paint above 1.22 m (4 ft.). **Floor.** Provide 100% hard surface flooring (prefer vinyl composition tile) and the use of area carpets to allow flexibility of room configuration. Vinyl or rubber base. **Air Force** requires 50% carpet (in clean area), 50% seamless, impervious, non-skid, non-textured hard-surface flooring (in play area). Vinyl or rubber base. Navy will allow stained concrete for hard-surface flooring. **Ceiling.** ACP.	
Plumbing	Provide one two-compartment sink with hot and cold water. To facilitate arts and crafts activities, consider making this a deep sink. To prevent scalding of youth, limit water temperature to 43 C (110 F). Provide a floor drain.	
HVAC	20 C (68 F) minimum, 26 C (78 F) maximum.	
Fire Protection	Provide system per paragraph 3-5.3.	
Power	Provide duplex outlets at 2.44 m (8 ft.) on center at perimeter walls; provide at least one GFI duplex above countertop; provide duplex outlets for TV (near cable outlet), refrigerator, and microwave.	
Lighting	540 lux (50 fc) minimum. Consider providing as much as 750 lux (70 fc) to accommodate arts and craft activities.	
Communication (in each room)	**CCTV.** Provide minimum one outlet. Consider the shape of the room and the panning range of the camera to determine if additional outlets will be necessary. **CATV/Internal Video.** Provide one outlet. **Navy** does not support CATV in this space. **PA/Audio.** Provide a speaker. **Telephone.** Provide one line with internal two-way communication. **Data.** Consider providing at least two outlets. **Security.** Do not create corners or “nooks” not visible from other areas of the room.	
Casework	Provide lockable base and wall cabinets with adjustable shelves. Solid surface countertops are required where water is present and preferred elsewhere.	
Furnishings Fixtures & Equip. (FF&E)	Tables, chairs, soft seating areas, computers, tack board, and marker board. Consider age-appropriate dimensions for all furniture and fixtures. Consider providing undercounter refrigerator and microwave for life skills training. Provide storage for each youth. Consider individual lockers.	
Special Requirements	Provide tackable surfaces on the walls. Include vision panels in interior doors and large windows in the interior walls. Provide exterior doors to outside activity area. **Army** requires exterior doors to be alarmed. Navy does not require exterior doors. Provide a dedicated storage closet (the space for this has been included in the space program) with hanging rods and/or shelves for each SAC Activity Room.	
For use during project execution by the appropriate Service agency		
Occupancy	Staff. Patrons/Youth.	
Min. net m^2 (ft^2)	Room.	Storage Closet.

TABLE 4-4.2 OUTDOOR ACTIVITY AREA

Description/ Usage	The Outdoor Activity Area should be designed to meet the requirements for NSACA accreditation. It should be conducive to creative play and must include three zones: hard-surface area, shaded area, and an open area. A certified playground safety inspector should be involved in the design of the Outdoor Activity Area or, at a minimum, the design review.
Min. Ceiling Ht.	N/A
Finishes	**Walls.** N/A **Floor.** Hard-surface Areas—cast-in-place concrete over well-compacted sub-grade is generally the most durable, low-maintenance surface material. Consider color additives or surface finishes to improve the appearance and reduce glare. Avoid smooth steel trowel finishes, which can become slippery when wet. Use Zones—Use zones are the areas under and around playground equipment and are defined by ASTM 1487. Use surface materials that meet the shock absorbency criteria recommended by CPSC and ASTM guidelines. Generally, poured-in place resilient safety surfaces are the best option. **Ceiling.** N/A
Plumbing	Provide a keyed, tamper-resistant hose bibb. Consider providing misters in hot, dry climates—connect to potable water system and provide code-compliant back-flow prevention. Consider providing an irrigation system—consider safety factors such as tripping hazards and the use zones in the design.
HVAC	N/A
Fire Protection	N/A
Power	N/A
Lighting	Provide security lighting on a timer for after-hours activation and on a switch for staff control.
Communication	**CCTV.** None required. The **Army** provides outdoor camera coverage. **CATV/Internal Video.** None required. **PA/Audio.** Provide speakers for adequate coverage. Speakers to be outdoor type. Consider outdoor noise levels when spacing speakers. **Telephone.** None required. **Data.** None required. **Security.** Do not create blind spots or hidden areas.
Casework	Provide an enclosed, weather-tight, vandal-proof storage shed for outdoor equipment. It should be readily accessible to the major play zones and be architecturally or thematically compatible with the Youth Center, including the roof design. Ventilate the storage shed and provide concrete floors sloped to the door for drainage. Provide visibility into the shed and eliminate blind spots created by the shed for child-abuse concerns. Locks must be selected to operate at the exterior of the door but not allow children to be trapped inside the structure.
Furnishings Fixtures & Equip. (FF&E)	CPSC-compliant, age-appropriate play equipment. Consider other items such as sports equipment, balls, outdoor tables and chairs, etc.
Special Requirements	Per paragraph 3-7, comply with ADAAG Amendment 15.6 for play areas. It includes technical provisions for ground level and elevated play components, accessible routes, ramps and transfer systems, ground surfaces and soft contained play structures.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Patrons/Youth.
Min. net m^2 (ft^2)	

TABLE 4-5.1. COMMONS

Description/ Usage	This is the "heart" of the facility. It is the space that connects the basic components of a youth center such as the activity rooms, computer room, teen room, multipurpose room, and the SAC area. The area should be open and inviting and offer defined areas where smaller groups of youth can gather for such activities as eating, gaming, and group conversations. The Commons should naturally "grow" out of the Lobby. The entrances to the other youth center components should be well defined and act as "portals" to these other areas. The game area, snack bar/eating area, and vending area could be sub areas within the Commons. The **Navy** normally does not provide a vending area. The Commons should also provide access to the outdoor activity areas but not the Teen Patio.	
Min. Ceiling Ht.	2.4 m (8 ft.) minimum with 3.66 m (12 ft.) recommended; up to 5.49 m (18 ft.) may be considered. Consider varying the ceiling heights to provide interest and variety of scale.	
Finishes	**Walls.** Painted gypsum wallboard or vinyl wall covering. **Floor.** VCT with vinyl or rubber base. If budget allows, consider stained concrete, terrazzo tile, or some other natural stone tile. **Ceiling.** Along with the height, vary the ceiling finishes to help define the sub areas of the Commons. Consider painted gypsum board or decorative finishes.	
Plumbing	None required. Consider providing a drinking fountain.	
HVAC	20 C (68 F) minimum, 26 C (78 F) maximum.	
Fire Protection	Provide system per paragraph 3-5.3.	
Power	Provide outlets per code. Additional outlets are required in the game area and for the CCTV and CATV system. Also consider other additional outlets for special events held in this space, e.g. like a dance.	
Lighting	215 to 430 Lux (20 to 40 ft. candles) general ambient lighting. Provide a variety of other accent and task lighting fixtures to create interest. Provide dedicated fixtures over the pool and gaming tables. Consider providing dimming in some areas.	
Communication	**CCTV.** Provide sufficient quantity to allow adequate coverage. **CATV/Internal Video.** One or two outlets. **PA/Audio.** Provide at least one speaker. **Telephone.** None required. **Data.** None required. **Security.** None required.	
Casework	None required.	
Furnishings Fixtures & Equipment (FF&E)	Tables, chairs, soft and padded furniture, and television(s). Additional specific furniture requirements are described in the associated areas.	
Special Requirements	This space will be greatly enhanced by skylights or clerestory windows. **Army** requires the exterior doors to be alarmed. A general Youth Program storage closet is programmed and generally provides storage for the Commons and Game Area. It is likely located off of the Commons. If it is a separate room, provide a vision panel in the door.	
For use during project execution by the appropriate Service agency		
Occupancy	Staff. Patrons/Youth.	
Min. net m^2 (ft^2)	Area.	Storage Closet.

TABLE 4-5.2. GAME AREA

Description/ Usage	This area is used for table games such as pool, ping pong, foosball, or air hockey. May also be used for board and video games. The Game Area may be a part of the Commons, but some passive separation should be provided to give this area a unique feel.
Min. Ceiling Ht.	2.44 m (8 ft.) minimum. Provide at least 3.35 m (11 ft.) above pool tables.
Finishes	**Walls.** Painted gypsum wallboard or vinyl wall covering. Provide a wainscot if budget permits. **Floor.** Consider varying floor finishes to help define zones within the game area. Consider VCT with vinyl or rubber base and carpet for acoustical protection. **Ceiling.** ACP or painted gypsum board ceiling may be used to help define this area from the Commons.
Plumbing	None required.
HVAC	20 C (68 F) minimum, 26 C (78 F) maximum.
Fire Protection	Provide system per paragraph 3-5.3.
Power	Provide outlets per code and for games that require electricity.
Lighting	Provide lighting levels appropriate to the individual games.
Communication	**CCTV.** Provide sufficient quantity to allow adequate coverage. **CATV/Internal Video.** One or two outlets. **PA/Audio.** Provide at least one speaker. **Telephone.** None required. **Data.** None required. **Security.** None required.
Casework	Consider providing a game cabinet. If provided, consider its location with respect to how it may limit the flexibility of the room.
Furnishings Fixtures & Equipment (FF&E)	Table games such as pool, ping pong, foosball, or air hockey. Board games and video games. Chairs, tables, and stools.
Special Requirements	Consider the acoustics of this area as games can get noisy.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Patrons/Youth.
Min. net m^2 (ft^2)	

TABLE 4-5.3. SNACK BAR/EATING/VENDING AREA

Description/ Usage	This area provides the snack and beverage service for the center. It may have various configurations depending on the Service branch, size of facility, and types of programs offered. The snack bar is a service counter that offers a limited menu such as chips, sandwiches, and sodas. Vending supports the snack area with a limited selection of food and beverages. There are usually no more than three vending machines in a youth facility. The **Navy** normally does not provide a vending area. The eating area is directly adjacent to these functions and is part of the Commons. Seating should be comfortable and easily arranged. Consider two- and four-top tables.
Min. Ceiling Ht.	2.44 m (8 ft.) minimum with the eating area complying with the requirements of the Commons.
Finishes	**Walls.** Ceramic wall tile or other hard surfaces approved for the snack bar to a minimum of 1.22 m (4 ft.) from finished floor. **Floor.** Provide hard-surface flooring such as VCT, seamless vinyl, or quarry tile or other durable material. **Ceiling.** ACP or painted gypsum board.
Plumbing	Two-compartment countertop sink with hot and cold water supply. Floor drain. If an ice-maker is desired, provide a cold-water connection
HVAC	20 C (68 F) minimum, 26 C (78 F) maximum.
Fire Protection	Provide system per paragraph 3-5.3.
Power	Provide dedicated outlets for the vending machines and countertop height convenience outlets for microwave and other equipment as required.
Lighting	430 lux (40 fc) general ambient lighting. Provide task lighting. Consider accent fixtures and lighting to provide special ambience.
Communication	**CCTV.** Provide sufficient quantity to allow adequate coverage. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker and intercom connection. **Telephone.** None required. **Data.** Provide one outlet. **Security.** None required.
Casework	Countertop with base and wall cabinets at the front opening. Behind the service corridor, provide base and wall cabinets. Countertop at sink area to be solid-surface. Drink rail.
Furnishings Fixtures & Equipment (FF&E)	Under cabinet or counter microwave, refrigerator, freezer, and other small appliances as required. Also provide a menu board. Vending machines. Tables and chairs/stools in the eating area. Consider an icemaker.
Special Requirements	Provide a roll-up door for the snack bar.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Patrons/Youth.
Min. net m^2 (ft^2)	Snack Bar. Eating Area.

TABLE 4-6. OPTIONAL KITCHEN

Description/ Usage	This optional area provides a commercial-grade kitchen with an adequate cooking battery and storage for both cold and dry goods. The kitchen is generally used to prepare refreshments for day-to-day consumption by patrons and for special events. There are two size options: a small kitchen generally adequate for preparing ad hoc meals for day-to-day patrons, and a larger kitchen capable of preparing a planned menu for a larger group of people. The **Navy** normally does not provide a kitchen.
Min. Ceiling Ht.	2.44 m (8 ft.) minimum.
Finishes	**Walls.** Ceramic wall tile or hard surfaces approved for kitchen to a minimum of 2.44 m (8 ft.) from finished floor. **Floor.** Quarry tile or other non-slip, durable material. **Ceiling.** Water and mildew resistant lay-in panels or painted gypsum wall board.
Plumbing	As necessary to support the cooking and cleaning battery designed for the kitchen, including an ice machine. Floor drains must also be provided that comply with all local building and health codes.
HVAC	20 C (68 F) minimum, 26 C (78 F) maximum. Provide exhaust.
Fire Protection	Provide system per paragraph 3-5.3. Provide commercial hood and duct system and listed fire suppression system for the range.
Power	Provide outlets per code and dedicated circuits for the specified kitchen equipment.
Lighting	540 Lux (50 ft. candles).
Communication	**CCTV.** None required. The **Army** provides camera coverage for both the kitchen and the dry storage area. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. **Telephone.** Provide one line with internal two-way communication. **Data.** None required. **Security.** None required.
Casework	Design the counters and cabinetry with consideration of the overall kitchen design and equipment selection.
Furnishings Fixtures & Equipment (FF&E)	Commercial-grade, stainless steel equipment for the preparation, cooking, and cleaning areas, and may include the following: frozen and refrigerated food cabinets, three-compartment dish table, dish wash spray assembly, baking and convection oven, minimum four-burner cook top, storage racks, dishwashers, ice machine, and prep-tables.
Special Requirements	Consider providing a pass-through window to the snack bar.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Patrons/Youth.
Min. net m^2 (ft^2)	

TABLE 4-7.1. COMPUTER ROOM

Description/ Usage	This area serves primarily for computer use by SAC, youth, and teens. Consider that computer use must be monitored for appropriate use. Provide direct visual access into this room from public areas to highlight this room as a showcase. In **Air Force** facilities, the area should also provide an area designated for homework. Air Force prefers this space to be more private for study activities.
Min. Ceiling Ht.	2.44 m (8 ft.).
Finishes	**Walls.** Painted gypsum wallboard or vinyl wall covering. **Floor.** Anti-static carpet with vinyl or rubber wall base. **Ceiling.** ACP.
Plumbing	None required.
HVAC	20 C (68 F) minimum, 26 C (78 F) maximum with 24/7 operation.
Fire Protection	Provide system per paragraph 3-5.3.
Power	As necessary to support all the equipment in this room. Locations of outlets should be specific to the layout of the room and may include recessed, flush, floor-mounted junction boxes. Provide an Isolated Ground Panel Board.
Lighting	430 lux (40 fc) general ambient indirect lighting. Provide fixtures designed for use in computer environments to reduce glare and reflections.
Communication	**CCTV.** Provide at least one outlet. **CATV/Internal Video.** Provide one outlet. **Navy** does not allow CATV in this space. **PA/Audio.** Provide a speaker. **Telephone.** Provide one line with internal two-way communication. **Data.** Provide one outlet for each computer and additional outlets, as required, for other equipment and printers. **Security.** Lockable doors. Provide a vision panel in the door.
Casework	Consider built-in countertops for computers, monitors, printers, etc. If counters are provided, ensure access to power and data outlets. Consider ergonomically correct seating heights for the range of ages that will be using the computers when considering built-in counters.
Furnishings Fixtures & Equipment (FF&E)	Tables, chairs, computers, printers, tack boards, and marker boards. Consider modular computer workstations. Consider providing lockable storage. Consider ergonomically correct seating heights for the range of ages that will be using the computers when selecting the furniture. Height-adjustable furniture may be required.
Special Requirements	If exterior windows are provided, equip with shading devices.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Patrons/Youth.
Min. net m^2 (ft^2)	

TABLE 4-7.2. ARMY HOMEWORK ROOM

Description/ Usage	Only the **Army** provides a dedicated homework room. This area provides a private, dedicated space that is conducive to study and completion of homework. In small facilities, the Army combines this with the Computer Room. The Navy and Marine Corps accommodate this function in the activity rooms and the Air Force accommodates this function in the Computer Room.
Min. Ceiling Ht.	2.44 m (8 ft.).
Finishes	**Walls.** Painted gypsum wallboard or vinyl wall covering. **Floor.** Carpet with vinyl or rubber base. **Ceiling.** ACP.
Plumbing	None required.
HVAC	20 C (68 F) minimum, 26 C (78 F) maximum.
Fire Protection	Provide system per paragraph 3-5.3.
Power	Provide outlets per code.
Lighting	Provide 540 lux (50 fc) general ambient lighting.
Communication	**CCTV.** Provide at least one outlet. **CATV/Internal Video.** Consider providing one outlet. **PA/Audio.** Provide a speaker. **Telephone.** Provide one line with internal two-way communication. **Data.** Consider providing at least two outlets. **Security.** Provide a vision panel in the door and wall.
Casework	None required.
Furnishings Fixtures & Equipment (FF&E)	Consider items such as the following: tables, chairs, desks, soft and padded furniture for reading, tack boards, and marker boards.
Special Requirements	If exterior windows are provided, equip with shading devices.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Patrons/Youth.
Min. net m^2 (ft^2)	

TABLE 4-7.3. GENERAL ACTIVITY ROOM

Description/ Usage	This shared activity room should be versatile and open to allow for a variety of indoor activities for up to 30 youth. As with all of the activity rooms, it is sized as a basic module to afford flexibility in use. This space allows youth to socialize during group games, hold club meetings, do homework, theater/drama, and receive instruction in topics like arts and crafts and the sciences. 
Min. Ceiling Ht.	3.05 m (10 ft.) clear.
Finishes	**Walls.** Gypsum wallboard—first 1.22 m (4 ft.) with a protective wall covering wainscot and paint above 1.22 m (4 ft.). **Floor.** Provide durable, low-maintenance hard surface flooring such as VCT (consider seamless or moisture-resistant flooring in wet/crafts areas). Consider area carpets or rugs. Vinyl or rubber base. . **Ceiling.** ACP.
Plumbing	Provide a sink with hot and cold water and a floor drain.
HVAC	20 C (68 F) minimum, 26 C (78 F) maximum.
Fire Protection	Provide system per paragraph 3-5.3.
Power	As a minimum, provide duplex outlets at 2.44 m (8 ft.) on-center and provide one duplex outlet at each CATV outlet. Consider additional duplex outlets depending on intended usage. Outlets at the sink must be GFI and comply with all codes.
Lighting	Provide 540 Lux (50 ft. candles) in game/play areas. Consider providing dimmable lighting and down lights at individual activity areas. Coordinate fixture locations so lights are not obstructed or shadows cast.
Communication	**CCTV.** Provide at least one outlet. **CATV/Internal Video.** Consider providing one outlet. **Navy** does not permit CATV in the General Activity Room. **PA/Audio.** Provide a speaker. **Telephone.** Provide one line with internal two-way communication. **Data.** Consider providing at least two outlets. **Security.** Do not create corners or “nooks” that are not visible from other areas of the room. Provide vision panels in interior doors and large windows in the interior walls to corridor and/or Commons.
Casework	Provide solid-surface countertop with base cabinets. Also consider providing wall storage cabinets for arts and craft supplies and projects.
Furnishings Fixtures & Equip. (FF&E)	Consider items such as the following depending on intended usage: tables, chairs, soft and padded furniture, bookshelves, large pillows, area rugs, television, video games, table games, tack board, dry-erase board, easels.
Special Requirements	Provide tackable surfaces on the walls. Provide exterior doors to outside activity area. **Army** requires exterior doors to be alarmed. The Navy does not require exterior doors. Provide a dedicated storage closet (included in the space program) with hanging rods and/or shelves. Consider providing a folding room partition. The **Navy** does not recommend folding partitions.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Patrons/Youth.
Min. net m^2 (ft^2)	Room. Storage Closet.

TABLE 4-7.4. SPECIAL ACTIVITY ROOM

Description/ Usage	This shared activity room is designed to be versatile and open to allow for a variety of indoor activities. As with all of the activity rooms, it is sized as a basic module to afford flexibility in use. The primary difference between this room and the General Activity Room is that it is designed for more active functions such as dance, yoga, or martial arts instruction. However, this room is not intended to accommodate team sports.
Min. Ceiling Ht.	3.05 m (10 ft.) clear.
Finishes	**Walls.** Painted concrete masonry unit (CMU) wall or impact-resistant gypsum wallboard (GWB) or high-density polyethylene (HDPE). **Navy** and **Air Force** do not permit CMU in these spaces. **Floor.** Varies depending on intended functions, but may include hard-wood dance floor, athletic flooring, etc. **Ceiling.** ACP.
Plumbing	None required.
HVAC	20 C (68 F) minimum, 26 C (78 F) maximum. Consider the active functions with regard to air changes and humidity control.
Fire Protection	Provide system per paragraph 3-5.3.
Power	Provide outlets per code.
Lighting	540 lux (50 fc).
Communication	**CCTV.** Provide at least one outlet. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. **Telephone.** Provide one line with internal two-way communication. **Data.** Consider providing at least two outlets. **Security.** Do not create corners or “nooks” that are not visible from other areas of the room.
Casework	Varies depending on intended functions, but may include a segmented, height-adjustable dance (ballet) bar; full-height, shatter-proof mirrors; etc.
Furnishings Fixtures & Equipment (FF&E)	Varies depending on intended functions, but may include resilient athletic flooring, martial arts equipment, and other specialized equipment to suit the selected function.
Special Requirements	Include vision panels in interior doors and large windows in the interior walls. Provide exterior doors to outside activity area. **Army** requires exterior doors to be alarmed. The Navy does not require exterior doors. Provide a dedicated storage closet (included in the space program). Consider acoustical requirements for these active function rooms. Consider providing a folding room partition.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Patrons/Youth.
Min. net m^2 (ft^2)	

TABLE 4-7.5. OPTIONAL MUSIC/MULTIMEDIA ROOM

Description/ Usage	This optional room is smaller than the basic activity room module and is used for musical instrument instruction for one to two students or as a video and/or photography lab.
Min. Ceiling Ht.	2.44 m (8 ft.).
Finishes	**Walls.** Painted CMU or other material with consideration for acoustical separation from adjacent spaces. **Navy** and **Air Force** do not permit CMU in these spaces. **Floor.** VCT or Carpet with vinyl or rubber base. **Ceiling.** ACP.
Plumbing	None required.
HVAC	20 C (68 F) minimum, 26 C (78 F) maximum.
Fire Protection	Provide system per paragraph 3-5.3.
Power	Provide outlets per code.
Lighting	540 Lux (50 ft. candles).
Communication	**CCTV.** Provide at least one outlet. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. **Telephone.** None required. **Army** requires one line with two-way internal communication. **Data.** None required. **Security.** Provide a vision panel in the door.
Casework	None required.
Furnishings Fixtures & Equipment (FF&E)	May include chairs, music stands, etc.
Special Requirements	Integrate equipment storage spaces with the design of these rooms. Music rooms require acoustical separation from the remainder of the facility. Provide soundproof walls from floor to roof deck. Consider providing an acoustical vestibule at the entrance to this room or, at a minimum, a door with sound gaskets on all edges. Provide a vision panel in the door.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Patrons/Youth.
Min. net m^2 (ft^2)	

TABLE 4-7.6 OPTIONAL PARENT WAITING AREA

Description/ Usage	This optional space is in addition to the lobby waiting area and provides a comfortable area for family and friends to view youth participating in the individual programs. This area should have visual access at a minimum into the Special Activity Rooms. **Navy** does not permit this optional area.
Min. Ceiling Ht.	2.44 m (8 ft.).
Finishes	**Walls.** Painted gypsum wallboard or vinyl wall covering. **Floor.** Carpet with vinyl or rubber base. **Ceiling.** ACP.
Plumbing	None required.
HVAC	20 C (68 F) minimum, 26 C (78 F) maximum.
Fire Protection	Provide system per paragraph 3-5.3.
Power	Provide outlets per code.
Lighting	540 Lux (50 ft. candles).
Communication	**CCTV.** Provide at least one outlet. **CATV/Internal Video.** None required. **PA/Audio.** Provide a speaker. **Telephone.** None required. **Data.** None required. **Security.** None required.
Casework	None required.
Furnishings Fixtures & Equipment (FF&E)	Soft padded furniture for seating/waiting area, tables, magazine-rack.
Special Requirements	
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Patrons/Youth.
Min. net m^2 (ft^2)	

TABLE 4-8. SAC/YOUTH/TEEN TOILETS

Description/ Usage	See Table 3-1 for Service specific toilet requirements. Separate toilets for male and female youth. These toilets are not for use by adults. **Navy** Youth toilets are shared with the SAC youth, but not the teens while the center is occupied by pre-teens—see Table 4-9 for Navy Teen (unisex) toilet criteria.
Min. Ceiling Ht.	2.44 m (8 ft.) minimum.
Finishes	**Walls.** Epoxy or enamel painted, moisture-resistant gypsum wallboard with a ceramic tile wainscot. Provide full-height ceramic tile on wet walls; consider full-height ceramic tile on all walls. **Floor.** Ceramic tile. **Ceiling.** Painted, moisture-resistant gypsum board.
Plumbing	Provide water closets, urinals, and lavatories based on the applicable code for the calculated occupancy. To prevent scalding of youth, limit water temperature to 43 C (110 F). Provide a floor drain. Provide a keyed hose bibb. Consider providing a drinking fountain outside this room. Provide wall-hung water closets and urinals. The **Navy** requires floor-mounted urinals.
HVAC	20 C (68 F) minimum, 26 C (78 F) maximum. Provide at minimum 4 – 6 air changes per hour. Ventilate to the exterior per code.
Fire Protection	Provide system per paragraph 3-5.3.
Power	Provide outlets per code.
Lighting	540 lux (50 fc).
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** None required. **Telephone.** None required. **Data.** None required. **Security.** Ensure entrance can be audibly and visually monitored from Check-in.
Casework	Solid-surface countertop supported at both ends with either underhung or integral sink. Phenolic or solid composite toilet and urinal partitions secured at floor and ceiling.
Furnishings Fixtures & Equipment (FF&E)	Toilet accessories: toilet paper dispensers, paper towel dispenser with integrated trash receptacle, robe hooks, grab bars, and soap dispensers. Mirror.
Special Requirements	
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Patrons/Youth.
Min. net m^2 (ft^2)	

TABLE 4-9. NAVY TEEN/STAFF/VISITOR TOILETS

Description/ Usage	**Navy** provides multiple (as needed) unisex toilets for use by Teens, Staff and visitors. Quantity of toilets is based on the applicable code for the calculated occupancy. The other Services do not use unisex toilets. See Table 3-1 for Service-specific toilet requirements.
Min. Ceiling Ht.	2.44 m (8 ft.) minimum.
Finishes	**Walls.** Epoxy or enamel painted, moisture-resistant gypsum wallboard with a ceramic tile wainscot. Provide full-height ceramic tile on wet walls; consider full-height ceramic tile on all walls. **Floor.** Ceramic tile. **Ceiling.** Painted, moisture-resistant gypsum board.
Plumbing	One wall-hung water closet and lavatory. Provide a floor drain.
HVAC	20 C (68 F) minimum, 26 C (78 F) maximum. Ventilate to the exterior per code.
Fire Protection	Provide system per paragraph 3-5.3.
Power	Provide outlets per code.
Lighting	540 lux (50 fc).
Communication	**CCTV.** None required. **CATV/Internal Video.** None required. **PA/Audio.** None required. **Telephone.** None required. **Data.** None required. **Security.** Lockable door.
Casework	Solid-surface countertop supported at both ends with either underhung or integral sink. A wall-hung lavatory is also acceptable. Wall-hung water closets.
Furnishings Fixtures & Equipment (FF&E)	Toilet accessories: toilet paper dispensers, paper towel dispenser with integrated trash receptacle, robe hooks, grab bars, and soap dispensers. Mirror.
Special Requirements	This room must be ADA-compliant.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Patrons/Youth.
Min. net m^2 (ft^2)	

TABLE 4-10.1. TEEN ROOM/LOUNGE

Description/ Usage	This space allows teens to socialize during group games as well as have access to more independent activities like computers or watching television in a home-like environment. Consider an irregular shaped room that can be zoned for different activities. However, do not create blind spots. This room must feel private but still connected to the rest of the center. Consider visual access from the Check-in. **Navy** requires visual access from Check-in.
Min. Ceiling Ht.	2.4 m (8 ft.) minimum with 3.66 m (12 ft.) recommended. Consider varying the ceiling heights and finishes to provide interest and a variety of scale. If a pool table is included, provide at least 3.35 m (11 ft.) over the table.
Finishes	**Walls.** Gypsum wallboard—first 1.22 m (4 ft.) with a protective wall covering wainscot and paint above 1.22 m (4 ft.). **Floor.** VCT, seamless vinyl, or carpet with vinyl or rubber base. Also see Special Requirements below. **Ceiling.** Primarily ACP with painted gypsum board used to help define other areas.
Plumbing	None required.
HVAC	20 C (68 F) minimum, 26 C (78 F) maximum.
Fire Protection	Provide system per paragraph 3-5.3.
Power	As a minimum, provide duplex outlets at 2.44 m (8 ft.) on-center. An area within the Teen Room/Lounge should provide duplex outlets at 1.22 m (4 ft.) on-center for video games and provide one duplex outlet at each TV cable outlet. Also provide outlets at counter height for portable electronic devices such as CD players and laptops. Provide power at data outlet locations.
Lighting	215 to 430 lux (20 to 40 fc) general ambient lighting. Provide a variety of accent lighting fixtures to create interest. Consider providing dimming in some areas.
Communication	**CCTV.** Provide at least one outlet. **CATV/Internal Video.** Provide at least one outlet. **PA/Audio.** Provide a speaker. **Telephone.** Provide one line with internal two-way communication. **Data.** Provide at least two outlets. **Security.** Provide vision panels on all doors. Do not create corners or “nooks” that are not visible from other areas of the room.
Casework	Consider counter and base cabinets.
Furnishings Fixtures & Equip. (FF&E)	Tables, chairs, stools, soft and padded furniture, lamps, bookshelves, coffee table, television, stereo, CD player, computers, video games, table games (foosball, pool), and tack board.
Special Requirements	Provide tackable surfaces on the walls. Consider large windows in the interior walls, but avoid putting the Teens “on display” to other patrons. Interior windows work best in walls common with staff areas for supervision. Provide lockable exterior doors to patio. **Navy** requires that exterior doors are visible from Check-in. Provide a dedicated storage closet (included in the space program) with hanging rods and/or shelves. For **Navy** facilities, provide an eating area with hard-surfaced floor (consider stained concrete) and two- and four-top tables and chairs. Consider providing a separate pass-through from the Snack Bar into the Teen Room/Lounge.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Patrons/Youth.
Min. net m^2 (ft^2)	

TABLE 4-10.2. TEEN PATIO

Description/ Usage	This exterior space should work in conjunction with and be accessible from the Teen Room/Lounge. It needs to allow for privacy for teens from the other outdoor areas. It could benefit from being adjacent to the snack/vending/kitchen area. The **Navy** requires a separate, exterior entrance via the Teen Patio with visual control from Check-in.	
Min. Ceiling Ht.	Not Applicable.	
Finishes	**Walls.** Not Applicable. **Floor.** Brick or concrete pavers, wood, or exposed concrete for hardscape areas. Grass, mulch, or sand for softscape areas. **Ceiling.** Not Applicable.	
Plumbing	Keyed, tamper-resistant hose bibb.	
HVAC	None required.	
Fire Protection	A sprinkler system may be required if the space is covered. The system will need to be designed for the exterior conditions.	
Power	Provide several exterior grade convenience outlets.	
Lighting	Ground level, low lumen 55 lux (5 fc) decorative lighting. Provide security lighting on a timer for after-hours activation and on a switch for staff control. Consider lighting paths also.	
Communication	**CCTV.** None required. The **Army** provides outdoor camera coverage. **CATV/Internal Video.** None required. **PA/Audio.** Provide several speakers for adequate coverage. Speakers to be outdoor type. Consider outdoor noise levels when spacing speakers. **Telephone.** None required. **Data.** None required. **Security.** None required.	
Casework	None required.	
Furnishings Fixtures & Equipment (FF&E)	Benches and/or chairs, patio tables, BBQ grill. Waste receptacles (must meet antiterrorism criteria).	
Special Requirements	Consider providing a privacy fence and/or half-height brick or stone walls. Consider providing shade structures, if budget allows. Consider landscaping appropriate to an outdoor recreation area.	
For use during project execution by the appropriate Service agency		
Occupancy	Staff. Patrons/Youth.	
Min. net m^2 (ft^2)	Covered.	Open.

TABLE 4-11.1 MULTIPURPOSE ROOM

Description/ Usage	This room serves as a large activity room and will be used for skill building, sports, fitness activities, gymnastics, basketball, volleyball, theatrical plays, dances, in-line/roller skating, and other large area activities.
Min. Ceiling Ht.	7.62 m (25 ft.) clear height below structure and lights.
Finishes	**Walls.** CMU with glazed wall coating or heavy-duty epoxy up to 3.66 m (12 ft.). Above 3.66 m (12 ft.), use semi-gloss enamel and consider acoustic panels. **Floor.** Multipurpose, resilient, athletic flooring. **Ceiling.** Exposed, painted structure. Provide acoustical banners.
Plumbing	None required. Consider access to drinking fountains and bathrooms.
HVAC	18 C (65 F) minimum, 26 C (78 F) maximum; 15 cfm/person outside air, with CO_2 sensors or other type of energy conservation system; 10 air changes/hour.
Fire Protection	Provide system per paragraph 3-5.3. Provide protection for sprinkler heads, exit signs, manual pull stations, and other exposed components; minimize equipment that protrudes into activity space or raise it above 1.83 m (6 ft.) for safety considerations. Provide 1-hour fire separation from core areas of building.
Power	Provide outlets per code. Provide power for a scoreboard and a high, wall-mounted clock. Consider power requirements for other activities like stage sound and lighting.
Lighting	Metal halide, 540 lux (50 fc), with perimeter compact fluorescents multi-level switched for non-sport activities. Provide keyed light switches. Provide protection for all fixtures. Do not locate fixtures directly above basketball backboards.
Communication	**CCTV.** Provide at least one outlet in each divided space. **CATV/Internal Video.** None required. **PA/Audio.** Provide speakers with proper spacing. **Telephone.** Provide one line with internal two-way communication. **Data.** None required. **Security.** Provide large, shatter-resistant vision panels in the doors.
Casework	None required.
Furnishings Fixtures & Equip. (FF&E)	Protective wall mats, moveable stage, stage seating, scoring table and chairs.
Special Requirements	Provide 3.05 m (10 ft.) minimum safety distance between “out of bounds” line and nearest walls and bleachers. Acoustical control is required through the use of sound baffles, banners, acoustical materials, etc. **Built-in equipment:** Provide retractable basketball nets/backboards at two per half court or six per full court. Nets and backboards should be adjustable from 2.44 m to 3.05 m (8 to 10 ft.) for two opposite goals on the half court. Consider floor inserts for volleyball and gymnastics standards. Motor-operated, vertical-acting divider curtain with manual override. Electronic scoreboard—provide control for scoreboard and divider curtain on side of room opposite of bleachers (if bleachers are provided). Bleachers. Provide game lines on flooring for full- and half-court basketball and volleyball. Provide exterior double doors with removable latch post for equipment access.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Patrons/Youth.
Min. net m^2 (ft^2)	

TABLE 4-11.2 MULTIPURPOSE ROOM STORAGE/GEAR ISSUE

Description/ Usage	This area is used to store athletic equipment and tables and chairs for the center. It should be divided into two areas: one for sports equipment and one for tables and chairs. The sports equipment area should include space for the equipment monitor's desk.
Min. Ceiling Ht.	2.44 m (8 ft.). 3.5 m (10 ft.) is desirable.
Finishes	**Walls.** CMU or painted gypsum wall board. **Floor.** Sealed concrete. **Ceiling.** None required.
Plumbing	None required. Consider providing a connection for an icemaker and a floor drain.
HVAC	18 C (65 F) minimum, 29 C (85 F) maximum.
Fire Protection	Provide system per paragraph 3-5.3.
Power	Provide outlets per code. Provide two duplex outlets by the desk.
Lighting	215 lux (20 fc).
Communication	**CCTV.** Provide at least one outlet. **CATV/Internal Video.** None required. **PA/Audio.** Provide speakers with proper spacing. **Telephone.** Provide one line with internal two-way communication. **Data.** None required. **Security.** None required.
Casework	None required.
Furnishings Fixtures & Equipment (FF&E)	Shelving and storage cabinets, one desk, one chair, and one file cabinet.
Special Requirements	Area must be accessible from both interior and exterior though lockable double doors with kick-plates. Consider providing "dutch" doors at interior for equipment issue. **Navy** does not permit dutch doors. Provide ramp at exterior door to facilitate equipment issue/delivery, if necessary. The area must be at least 2.44 m (8 ft.) wide.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Patrons/Youth.
Min. net m^2 (ft^2)	

TABLE 4-11.3 SMALL MULTIPURPOSE ROOM

Description/ Usage	This space is optional for the Army and Navy and provides an active function room slotting in size between the Special Activity Room and the smallest Multipurpose Room option. It also generally has less sophisticated equipment than the Multipurpose Room. It is used for a variety of activities including four-square, dances, martial arts, movies, and dance classes.
Min. Ceiling Ht.	3.66 m (12 ft.). Generally, 4.88 m (16 ft.) is the maximum ceiling height, but consider the intended usage of the room.
Finishes	**Walls.** Impact-resistant painted gypsum wallboard. **Floor.** VCT or consider synthetic athletic flooring or rubber tile. **Ceiling.** Exposed, painted structure or ACP with hold-down clips.
Plumbing	None required.
HVAC	18 C (65 F) minimum, 26 C (78 F) maximum; 15 cfm/person outside air, with CO_2 sensors or other type of energy conservation system; 10 air changes/hour.
Fire Protection	Provide system per paragraph 3-5.3. Provide protection for sprinkler heads, exit signs, manual pull stations, and other exposed components; minimize equipment that protrudes into activity space or raise it above 1.83 m (6 ft.) for safety considerations. Provide 1-hour fire separation from core areas of building.
Power	Provide outlets per code.
Lighting	540 lux (50 fc), provide dual-level lighting for games and dances, fluorescent fixtures, multi-level switched, and dimmable compact fluorescent for multiple light levels. Provide protection for all fixtures.
Communication	**CCTV.** Provide at least one outlet. **CATV/Internal Video.** None required. **PA/Audio.** None required. **Telephone.** Provide one line with internal two-way communication. **Data.** None required. **Security.** None required.
Casework	None required.
Furnishings Fixtures & Equipment (FF&E)	None required.
Special Requirements	Provide at least one pair of doors to the interior of the building. Translucent wall panels or windows for natural lighting are desirable—provide suitable protection to windows from ball impacts. Provide good visual access into the room from public areas of the facility. **Acoustics:** Anticipated peak noise level is 70-80 dBA. Preferred sound criterion is 35-45 dBA. Maximum reverberation time is 1.5 seconds. STC 55 minimum at perimeter walls and ceiling.
For use during project execution by the appropriate Service agency	
Occupancy	Staff. Patrons/Youth.
Min. net m^2 (ft^2)

APPENDIX B SPACE PROGRAM DATA

B-1 SPACE PROGRAM DATA.

The data in Figures B-1 through B-5 are the bases for the Space Program Interactive Spreadsheet discussed in paragraph 2-2 and are provided here for reference only. Do not use these tables to program a Youth Center. The Interactive Spreadsheet combines this data in the correct manner and incorporates the necessary Service Exceptions—which may not be apparent from these Figures.

FIGURE B-1. SAC SPACE PROGRAM DATA

	Functional Component	Space Allocation Standard m^2	$ft.^2$	Standard	Single Room Standard No.	m^2	$ft.^2$						
Building	**Army/Air Force/Marine Corps SAC**												
	Activity Room	125.42	1,350	per room (2 ratio groups)	1	125.42	1350						
	Storage	5.57	60	per room	1	5.57	60						
	SAC toilets	4.18	45	per water closet/lav.	2	8.36	90						
	Total Building Net Area & Support					**139.35**	**1,500.00**						
	Circulation and Mechanical Building Factor @				**14%**	**19.51**	**210**						
	Total Building Gross Area & Support					**158.86**	**1,710**						
Building	**Navy SAC**												
	Activity Room	97.55	1,050	per room (2 ratio groups)	1	97.55	1050						
	Storage	2.79	30	per room	1	2.79	30						
	SAC toilets			per water closet/lav.									
	Total Building Net Area & Support					**100.33**	**1,080.00**						
	Circulation and Mechanical Building Factor @				**14%**	**14.05**	**151**						
	Total Building Gross Area & Support					**114.38**	**1,231**						
						One OAA		**Two OAA**			**Three OAA**		
Site	Outdoor Activity Area (OAA)	348.38	3,750	per OAA	1	348.38	3,750	2	696.75	7,500	3	1,045.13	11,250

FIGURE B-2.1. YOUTH SPACE PROGRAM DATA A (up to 90)

	Functional Component	Space Allocation Standard m^2	$ft.^2$	Standard	Up to 60 Youth No.	m^2	$ft.^2$	61 to 90 Youth No.	m^2	$ft.^2$
Building	Commons			sum of below + 10% factor		59.88	644.60		108.32	1166.00
	Game Area	32.52	350	per rec unit [3]	1	32.52	350	2	65.03	700
	Snack Bar					7.43	80		9.29	100
	Eating Area	1.11	12	per youth	8	8.92	96	15	16.72	180
	Snack Bar storage	1.86	20	per storage area	1	1.86	20	2	3.72	40
	Vending Area [1]	1.86	20	per machine	2	3.72	40	2	3.72	40
	Shared Spaces									
	General or Special Activity Room	97.55	1,050	per room	1	97.55	1050	2	195.09	2,100
	Activity Room Storage	5.57	60	per room	1	5.57	60	2	11.15	120
	Activity Room Storage (Navy)	2.79	30	per room	1	2.79	30	2	5.57	60
	Homework/Computer Room [2]	48.77	525	per room	1	48.77	525	1	48.77	525
	Youth Toilets	4.18	45	per water closet/lav.	2	8.36	90	4	16.72	180
	General Storage	7.43	80	per storage room	1	7.43	80	1	7.43	80
	Total Building Net Area & Support					**230**	**2,480**		**393**	**4,231**
	Circulation and Mechanical Building Factor @				**14%**	**32.25**	**347**	**14%**	**55.03**	**592**
	Total Building Gross Area & Support					**262.60**	**2,827**		**448.09**	**4,823**

[1] Navy does not permit Vending.

[2] Navy and Marine Corps provide a Computer Room and accommodate the homework function in the Activity Rooms. The Air Force combines the Homework function with the Computer Room. The Army provides a separate, dedicated Homework Room in the 61 to 90 Youth category.

[3] "Rec. Unit" equals the area of a standard gaming table (such a pool or foosball) and space around it that is required to play.

FIGURE B-2.2. YOUTH SPACE PROGRAM DATA B (91 to 155)

	Music/MM Room (incl. 20% bldg fac)	6.69	72	per room	1	6.69	72	2	13.38	144
Site	Youth Outdoor Activity Area	11.61	125	per child	30	348.38	3750			
	Storage	7.43	80	per storage room	1	7.43	80			
	Youth Outdoor Activity Subtotal					**355.81**	**3830.00**			
	Open Outdoor Area	10,730	115,500	per area	1	10729.95	115500			

[1] In addition to the other Multipurpose Room size options, the Army and Navy offer an option for a Small Multipurpose Room at 232.25 m^2 (2500 $ft.^2$) plus 9.29 m^2 (100 $ft.^2$) of storage space.
[2] Navy does not normally permit the Kitchen, Laundry, or Additional Parent Waiting options.

FIGURE B-5.2. OTHER OR OPTIONAL SPACE PROGRAM DATA B

	Functional Component	Space Allocation Standard			Full Court w/ Bleachers			NCAA Full Court w/ Bleach		
		m^2	$ft.^2$	Standard	No.	m^2	$ft.^2$	No.	m^2	$ft.^2$
Building	Multipurpose Room [1]					706.04	7,600		776.64	8,360
	Equipment Storage	14.86	160	per storage room	2	29.73	320	2	29.73	320
	Circulation and Mechanical Building Factor @					59	634		65	694
	Multipurpose Rm Subtotal					**794.83**	**8553.60**		**870.88**	**9374.40**
					Other/Optional Spaces			**Other/Optional Spaces**		
	Laundry [2] (incl. 20% bldg fac)	10.22	110	per room	2	20.44	130	2	20.44	130
	Parent Waiting [2] (incl. 20% bldg fac)	1.67	18	per person	15	25.08	270	15	25.08	270
	Music/MM Room (incl. 20% bldg fac)	6.69	72	per room	3	20.07	216			

[1] Navy, Air Force, and Marine Corps do not permit the “NCAA Full Court with Bleachers” size option. In addition to the other Multipurpose Room size options, the Army and Navy offer an option for a Small Multipurpose Room at 232.25 m^2 (2500 $ft.^2$) plus 9.29 m^2 (100 $ft.^2$) of storage space.
[2] Navy does not normally permit the Kitchen or Additional Parent Waiting options.

APPENDIX C ILLUSTRATIVE DIAGRAMS

C-1 ILLUSTRATIVE DIAGRAMS.

The illustrative diagrams include Figures C-1 through C-3. They do not represent mandatory or even suggested layouts but are provided to expand on the Figure 2-3 Bubble Diagram and convey a *possible means* to accommodate the needed adjacencies. SE Note that Figure C-3 captures several critical Navy Service Exceptions and is the appropriate diagram for planning Navy facilities.

C-1.1 Figure C-1.

This diagram illustrates a potential layout with the Multipurpose Room located near the front of the facility. This layout precludes visitors from traveling through the Commons to get to events held in the Multipurpose Room. However, it does separate the Administrative Area from the check-in function, which is a desirable adjacency.

FIGURE C-1. ILLUSTRATIVE LAYOUT DIAGRAM A

1 = Check-in
* Commons includes the Game Area and the Eating Area.
† Kitchen is optional for all Services except Navy for which it is not permitted.

C-1.2 **Figure C-2**.

This diagram locates the Administrative Area adjacent to the Check-in.

FIGURE C-2. ILLUSTRATIVE LAYOUT DIAGRAM B

1 = Check-in
* Commons includes the Game Area and the Eating Area.
† Kitchen is optional for all Services except Navy for which it is not permitted.

C-1.3 **Figure C-3**.

As noted above, this diagram addresses several Navy concerns and desires, specifically the provision for a separate teen entrance through the patio and the snack bar located adjacent to the Teen room.

FIGURE C-3. ILLUSTRATIVE LAYOUT DIAGRAM C

1 = Check-in
* Commons includes the Game Area and the Eating Area.

APPENDIX D AIR FORCE FURNISHINGS, FIXTURES, AND EQUIPMENT SCHEDULE

D-1 AIR FORCE SCHEDULE OF FURNISHINGS, FIXTURES, AND EQUIPMENT.

Table D-1 provides a schedule of furnishings, fixtures, and equipment (FF&E) for Air Force Youth Centers.

TABLE D-1. AIR FORCE FF&E LIST FOR YOUTH CENTERS

Equipment Item	RP[1]	NRP[2]	Equipment Item	RP[1]	NRP[2]

Change No.	Date	Location

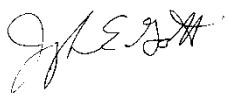
This FC supersedes UFC 4-740-14, Design: Child Development Centers, dated 1 August 2002 and Final Draft UFC 4-740-14, Design: Child Development Centers, dated January 2009.

FOREWORD

Facilities Criteria (FC) provide functional requirements (i.e., defined by users and operational needs of a particular facility type) for specific DoD Component(s), and are intended for use with unified technical requirements published in DoD Unified Facilities Criteria (UFC). FC are applicable only to the DoD Component(s) indicated in the title, and do not represent unified DoD requirements. Differences in functional requirements between DoD Components may exist due to differences in policies and operational needs.

All construction outside of the United States is also governed by Status of Forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA), and in some instances, Bilateral Infrastructure Agreements (BIA.) Therefore, the acquisition team must ensure compliance with the most stringent of the UFC (replace w/ FC), the SOFA, the HNFA, and the BIA, as applicable.

Because FC are coordinated with unified DoD technical requirements, they form an element of the DoD UFC system applicable to specific facility types. The UFC system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and applicable to the Military Departments, Defense Agencies, and the DoD Field Activities. The UFC System also includes technical requirements and functional requirements for specific facility types, both published as UFC documents and FC documents.



FC are living documents and will be periodically reviewed, updated, and made available to users as part of the Services' responsibility for providing criteria for military construction. Headquarters, U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering Command (NAVFAC), and the Air Force Civil Engineer Center (AFCEC) are responsible for administration of the UFC system. Defense agencies should contact the preparing service for document interpretation and improvements. Technical content is the responsibility of the cognizant DoD working group. Recommended changes with supporting rationale should be sent to the respective service proponent office by the following electronic form: Criteria Change Request. The form is also accessible from the Internet site listed below.

FC are effective upon issuance and are distributed only in electronic media from the following source:

- Whole Building Design Guide web site http://dod.wbdg.org/**.**

Refer to UFC 1-200-01, *General Building Requirements*, for implementation of new issuances on projects.

AUTHORIZED BY:

JOSEPH E. GOTT, P.E.
Chief Engineer
Naval Facilities Engineering Command

FACILITIES CRITERIA (FC)
REVISION SUMMARY SHEET

Document: FC 4-740-14N, Navy and Marine Corps Child Development Centers
Superseding: UFC 4-740-14, Design: Child Development Centers, dated 1 August 2002 and Final Draft UFC 4-740-14, Design: Child Development Centers, dated January 2009.

Description of Changes: This FC separates the consolidated Tri-Service version and replaces the Final Draft Child Development Centers UFC version used by the Navy, into a Navy-only FC version for Child Development Center criteria.

Reasons for Changes: This FC contains the criteria for determining the appropriate size and complexity of Navy and Marine Corps Child Development Centers. It also provides non-Government standard resources that provide guidance in the design of these facilities.

Impact: The following improvements should result from this revision:

- This FC updates and clarifies the basic requirements for Navy and Marine Corps child development centers. This FC will reduce the initial cost of design and reduce costs associated with redesign of facilities that do not meet minimum standards.

- The improved performance-based criteria and coordination with the Navy's model RFP should reduce design-build proposals. Responders will be able to apply industry best-practices and more creativity to their proposals to reduce costs while still meeting the minimum technical design and construction standards outlined in Chapters 3, 4 and 5.

Non-unification Issues: There are unification issues:

- Table 2-1: Due to operational differences there are different quantities and types of offices and other spaces within the CDC's.
- 2-4.2.2: Navy only provides Multipurpose Rooms when climatic conditions warrant.
- Table 4-1: USMC allows carpet in corridors for noise abatement.
- Table 4-8: Navy does not permit ice makers due to the choking hazards.

CHAPTER 1 INTRODUCTION

1-1 PURPOSE AND SCOPE.

FC 4-740-14N provides requirements for evaluating and planning the site, determining programming requirements, establishing space distribution needs, determining building size, and designing all outdoor and indoor spaces for Navy and Marine Corps Child Development Center (CDC) facilities to support the child development program. Unless specifically indicated for only one of the 2 services, requirements in this FC apply to facilities for both Navy and Marine Corps. The information in this FC applies to the design of all new construction projects as well as renovation projects. Renovation projects should update existing facilities to meet the guidance and criteria within budgetary constraints. Further, this FC serves as an ongoing program management tool within the Navy and Marine Corps child development programs. This FC is not intended as a substitution during design for thorough review by individual Child Development Program Managers in each of the Services.

Chapter 1 provides an overview of the FC document, an overview of the facility, and the applicable regulatory authorities. Chapters 2 and 3 provide planning and design criteria that apply to the facility as a whole. Chapters 4 and 5 provide design criteria for the individual facility and site spaces and establish the baseline levels of features and finishes to be provided in those spaces. This FC also identifies desired or allowable design features. The objective of this FC is to promote centers that are child-oriented, developmentally appropriate, environmentally sensitive, safe, accessible and functional.

1-2 APPLICABILITY.

This FC applies to all military service elements and contractors involved in the planning, design, and construction of Navy and Marine Corps child development centers. Note: where one Service's criteria vary from the other Services' criteria, it is noted in the text as a **Service Exception.** If a Navy exception is noted, it does not apply to the Marine Corps unless specifically noted. Joint Bases should follow the Service criteria for the Supporting Component.

1-3 GENERAL BUILDING REQUIREMENTS.

Comply with UFC 1-200-01, *General Building Requirements*. UFC 1-200-01 provides applicability of model building codes and government unique criteria for typical design disciplines and building systems, as well as for accessibility, antiterrorism, security, high performance and sustainability requirements, and safety. Use this FC in addition to UFC 1-200-01 and the UFCs and government criteria referenced therein.

1-4 REFERENCES.

Appendix A contains a list of references used in this document. The publication date of the code or standard is not included in this document. In general, the latest available issuance of the reference is used.

1-5 GLOSSARY.

Appendix F contains acronyms, abbreviations, and terms.

1-6 USERS OF THE FACILITY.

The primary users of CDCs are as follows:

1-6.1 Children.

- Infants (6 weeks-12 months)
- Pre-toddlers (12 months-24 months)
- Toddlers (24 months-36 months)
- Preschool/Pre-K/Kindergarten Age (3-5 years)

1-6.2 Facility Staff.

- Program Administrators/ Directors
- Assistant Directors
- Training and Curriculum Specialists
- Group Leaders/Caregivers
- Family Child Care Director (USMC)/Child Development Home Directors (Navy)
- Receptionist or Operations Clerks/U.S. Department of Agriculture (USDA) Clerks/Monitors
- Cook and Food Service Staff
- Custodial Staff

1-6.3 Parents.

1-7 REGULATORY AUTHORITIES.

See Chapter 3, “General Design Criteria”, for references to the governing building and construction codes and statutes. The program regulatory authorities are included below.

1-7.1 Military Authorities.

The comprehensive authorities having jurisdiction for CDCs are the following:

1-7.1.1 Navy.

The following authorities must approve the acquisition methodology, the design team composition, site selection, facility requirements, the DD Form 1391, concept development, and the final design-build request for proposal (RFP) or final design:

- Commander of Naval Installations Command (CNIC) N926 Child and Youth Programs, and N944 Fleet and Family Readiness, Integrity Drive, Millington, TN 38055-6560.
- NAVFAC FAC/FEC

Planners must contact N926 and N944 during planning development and prior to final signature of the DD Form 1391.

1-7.1.2 Marine Corps.

The following authorities must approve the acquisition methodology, the design team composition, site selection, facility requirements, the DD Form 1391, concept development, and the final DB RFP or final design:

- HQMC, Marine Corps Installations Command (GF-4)
- HQMC, Marine and Family Programs Division (MFY-3)
- HQMC, Semper Fit and Exchange Services Division (MRD)

1-7.2 Occupancy Classification.

CDCs are classified as Day-Care Occupancy when applying NFPA 101, *Life Safety Code*, and I-4 when applying the *International Building Code* (IBC).

1-7.3 Certification.

The CDC must be certified by DoD and accredited by an external accrediting agency.

1-7.4 Additional Requirements.

See Chapter 5, “General Design Requirements” for additional certification requirements on the design of the outdoor activity area and the selection and installation of playground equipment.

This Page Intentionally Left Blank

CHAPTER 2 PLANNING AND LAYOUT

2-1 SCOPE OF FACILITY.

The CDC accommodates a Department of Defense (DoD) child care program per Public Law 104-106, Section 568 of Title 10, United States Code, and Department of Defense Instruction (DoDI) 6060.2, *Child Development Programs.* The MCCA of 1989 (Pub.L.101-89) was recodified as the Military Family Act and Military Child Care Act, February 10, 1996.

2-1.1 Functional Program Areas.

Table 2-1 lists and describes the CDC functional program areas. They are broken down into four categories: core administration, staff support, facility support, and child activity areas.

Table 2-1. Program Areas

Functional Program Area	Description
Core Administration	
Entrance/Lobby	Includes vestibule, circulation from the vestibule to the reception desk, the circulation in front of the reception desk, and areas dedicated to waiting.
Public/Staff Toilet	ABA-compliant.
Reception/Work Area	Accommodates staff workers behind the reception counter and any circulation to adjacent office spaces and the isolation area, if applicable. Includes office equipment general work space.
Administration Offices	The required offices will vary both by Service and Installation. Refer to Chapter 2, “Administrative Offices”, for Service contacts and additional guidance. Include associated storage.
Director’s	Work, securable storage and conference space for the CDC director.
Assistant Director	Workspace for an assistant director; not included for every Service or facility.
Nurses Office	**Marine Corps**-only space. Provides a private room to isolate a sick child from the rest of the children until a parent can pick him or her up.
Training and Curriculum Specialist	Workspace for a specialist, space for staff training, and file storage. May be combined with other spaces.
Family Child Care (FCC)	**USMC program**. Workspace for program staff (one staff per 15 FCC providers, i.e., licensed or in the process of becoming licensed), one clerical, and file storage. May require additional space for an FCC lending program. May be located in the CDC or combined with other spaces.

Table 2-1. Program Areas

Functional Program Area	Description
Child Development Home (CDH)	**Navy program**. Workspace for program staff (one staff per 30 CDH providers, i.e., licensed or in the process of becoming licensed), one clerical, one resource, one referral (as required), and file storage. May require additional space for a CDH lending program. Not included for every facility.
Resource and Referral	Workspace with securable storage. May be located in the CDC or combined with other spaces.
Staff Support	
Break/Staff Room	Includes counter/cabinet space for microwave and small appliances, sink and refrigerator; tables and chairs and soft seating; and individual lockable storage, if applicable.
Training	Space to facilitate staff training. Space may accommodate computers for TACS/T&C's and staff to facilitate training/distant learning. Provide shelving or storage for resources and training supplies. Trainer may be co-located in training room or in separate office.
Central Storage	Storage of both bulk and individual items used throughout the facility.
Staff/Public Toilet	ABA-compliant, distributed throughout facility.
Facility Support	
Kitchen	Accommodates all food preparation, dishwashing, cart storage, dry goods storage, coolers and freezers, and cook work stations.
Janitorial	Accommodates janitorial supplies, equipment, and mop sink. Large and Extra Large facilities may have more than one room.
Laundry	Accommodates washers and dryers, a sink, work surface for folding, storage cabinet for detergents, and space for laundry carts or baskets.
Security and Monitoring Systems	Accomodates closed circuit TV video equipment, intrusion detection system, access control system, and exit notification system
Other Facility Support	Includes building circulation, construction, mechanical rooms, and electrical rooms (see Chapter 4 for more information). Generally calculated at a percentage of total building area, ranging from 25 to 30 percent.
Child Activity Areas	
Child Activity Rooms (CAR)	Accommodates developmental and routine activities, children's displays, eating, and all other child care activities in a self-contained environment. Each room accomodates two ratio groups, and includes storage and toileting areas.
Infants and Pre-toddlers	Accommodates two groups of infants
Toddlers and Preschoolers	Accommodates two groups of toddlers or one group of Preschoolers
Preschoolers/Pre-K/Kindergarten	Accommodates two groups of Preschoolers/Pre-K/K
Nursing Space	Accomodates mothers in a breastfeeding friendly environment.

Table 2-1. Program Areas

Functional Program Area	Description
Multipurpose room/Active Play	Optional. Service contacts provided in Chapter 1, Regulatory Authorities, must provide approval for inclusion of this space. Space to accommodate children for large group activities, wheel toy play, exercise, group games, or indoor play. This room may also support other activities such as parenting classes and staff training.
Outdoor Activity Areas	Supervised outdoor areas with direct access from the CAR. Outdoor activity play areas serve as extensions of classroom space and must be provided to support programming. Playground to be divided into individual separate areas to accommodate the different age groups occupying the facility. Playground equipment is arranged to ensure that children are visible and supervision is maintained.
Infants and Pre-toddlers	Separate, fenced areas with visual and audible connections to the other outdoor activity areas and limited play equipment. Infant and pretoddler areas may be combined or may be separate if required to maintain direct access from the CARs.
Toddlers	Separate, fenced area with visual and audible connections to the other outdoor activity areas and additional play equipment.
Preschool/Pre-K/Kindergarten	Separate, larger fenced area with visual and audible connections to the other outdoor activity areas, additional play equipment, and more structured activity areas.

2-2 FACILITY PLANNING.

Evaluate the total childcare requirements for the populations and missions of the individual Installation. Plan and budget for durable materials and details. A CDC is used intensely, and the design must be sensitive to the life cycle cost of materials.

2-2.1 Facility Classification.

Once the demand has been determined, classify the facility size as follows:

- Small. Less than 100 children
- Medium. 100 to 200 children
- Large. 201 to 300 children
- Extra Large. 301 children and up

No CDC will accommodate less than 48 children without approval from the Service contacts identified in Chapter 1, “Regulatory Authorities”.

2-2.2 Age Groups and Group Sizes.

Children are grouped according to age and different age group sizes vary. Group sizes are used to determine the number and type of Child Activity Rooms (CARs) in the CDC.

2-2.2.1 Ages Accepted.

Child Development Programs (CDP) according to DoDI 6060.02 states CDP is for children birth through 12 years; however, this FC addresses design of Child Development Centers for children from six weeks through five years of age.

2-2.2.2 Group Size and Caregiver-Child Ratio.

Table 2-2 provides the age groups, ratios of caregiver and children, and the group limits. These ratios exceed NFPA and require additional life safety features – see Chapter 3 Section titled "Fire Protection and Life Safety" for these additional requirements. In any individual center, actual age ranges between groups may overlap. In some centers, children may be grouped in mixed-age activity rooms. In these cases, use the design criteria for the youngest children in the group. Appendix B provides more information on the age groups and their developmental needs.

Table 2-2. Caregiver/Child Ratios

Group	Age Range	Adult/Child Ratio	Group Limit*
Infants	6 wks. to 12 mos.	1 to 4	8
Pre-Toddlers	12 mos. to 24 mos.	1 to 5	10
Toddlers	24 mos. to 36 mos.	1 to 7	14
Pre School/Pre-K/K Age	3 yrs. to 5 yrs.	1 to 12	24

* The group limit is the limit for children only.

2-2.3 Operational Considerations.

Some other programs accept children whose parents are not at home before and after school hours or who wish to place children in a care situation between school and family-gathering time. However, before and after school care programs usually occur somewhere other than a Child Development Center for DoD facilities. The three basic scheduling patterns are as follows:

- Full Day. Children attending for a full day, for example, as many as 12 hours.
- Part Day. Children attending part of a day, typically a half-day or less on a regular, scheduled basis.
- Hourly. Children attending for one hour or more on an infrequent or unscheduled basis.

2-3 SITE PLANNING.

2-3.1 Land Area Requirements.

Provide land area requirements as noted below. Ensure that the required antiterrorism set-back distances can be accommodated with any site selected. See UFC 2-000-05N, (P-80) *Facility Planning Criteria for Navy/Marine Corps Shore Installations* for land planning requirements.

2-3.2 Site Selection.

Select a site that meets the following criteria.

2-3.2.1 Noise Requirements.

Do not locate CDC's near airfields, industrial areas, or other areas with high noise levels. If noise levels at the CDC site exceed 70 dBA continuous, or 80 dBA intermittent, then comply with the acoustical criteria provided in Chapter 3, Exterior Design.

2-3.2.2 Natural Light.

Do not use locations without access to natural light for new CDCs.

2-3.2.3 Natural Environment.

Select a site with as many natural amenities as possible for a beneficial learning environment. These include the following: nontoxic plants and trees; non-dangerous animals; earth forms; rolling terrain; and natural protection from the sun, wind and rain. Develop a site plan that makes the most of the site's existing natural resources. Where possible, conserve existing natural areas and restore damaged areas to provide habitat and promote biodiversity.

2-3.2.4 Site Elevation.

Do not select a site that is near the installation's lowest elevation. Do not select a site near marsh areas, as mosquitos, flies, and other insects should be separated from CDC Outdoor Play environments.

2-3.2.5 Visibility.

Locate CDCs in areas of high visibility to deter crime and vandalism, e.g., locate amidst community facilities, housing, and parks.

2-3.2.6 Hazards.

Do not locate CDCs near the following hazards or nuisances:

- Fuel or other HAZMAT storage buildings
- Service stations

- Maintenance shops, including woodworking and painting areas
- Laundry facilities
- Large kitchen/food preparation facilities
- Aircraft runways
- Railroads
- Security areas
- Any facility producing odors, smoke, dust or pollution
- Unsafe buildings
- Explosives
- Radiation
- Utility substations and overhead power lines

2-3.2.7 Vehicular Traffic.

Avoid locations near busy streets and intersections. If this is not possible, provide mitigation measures, such as bollards, to increase safety at pedestrian areas and playgrounds.

Prepare a site traffic impact study to determine the traffic patterns and the peak demand for parking. Large and Extra Large CDC's will have a significant impact on peak traffic patterns. The circulation and parking demand includes the turnover for the hourly care program and the part-day care program. See Chapter 3, "Parking/Vehicular Circulation", for specific requirements.

2-3.2.8 Soil Testing.

Before selecting the site for the center and its playground, test the soil for the presence of dangerous contaminants. Also, check previous uses of the site. Investigate proposed playground locations adjacent to old structures, which may be painted with lead paint or contain other hazards. Check with the Environmental Installation Restoration Program and the Underground Storage Tank Program. Continue to monitor the site, at the direction of the environmental safety staff, to ensure that it does not become subsequently contaminated, especially by lead. This is particularly a concern in urban areas or where there is a heavy concentration of automobiles or industrial facilities.

2-3.2.9 Domestic Water Testing.

Test domestic water for levels of lead both during the site selection process and again after project completion, and mitigate as necessary.

2-3.3 Site Layout.

2-3.3.1 Internal Traffic Flow.

Site the CDC so the building is clearly visible to cars and pedestrians coming to the facility. Separate service and delivery access from the public and children's areas. Eliminate the potential for conflict between moving vehicles and children. See Chapter 3, “Exit Requirements”, for additional requirements.

2-3.3.2 Outdoor Areas.

Design the outdoor activity area to be directly accessible from the CARs. When planning the outdoor activity area, consider prevailing weather patterns that may affect children's comfort. For example, locate, as necessary in some geographical areas, the outdoor areas on the south side of the building where they will be protected from northerly winds. See Chapter 5 for more information.

2-4 SPACE REQUIREMENTS.

2-4.1 Introduction.

This FC states area requirements in terms of Net Floor Area (NFA) or Gross Floor Area (GFA). NFA is the net usable area of spaces, excluding the area required for building construction and mechanical and electrical equipment. GFA is the total building footprint measured to the exterior side of the exterior wall. Space requirements for individual spaces are expressed as NFA. GFA is determined, where appropriate, by adding to NFA totals an estimated area for building construction (including wall thickness, ventilation space, etc.) and mechanical/electrical equipment rooms.

2-4.2 Space Programs.

Sample space programs for the four CDC size classifications are illustrated in Tables 2-3 to 2-6. They are grouped according to the four functional program areas.

For Navy and USMC CDCs, an interactive spreadsheet is available to help develop a space program for a specific project. It is completed by first selecting the appropriate facility size classification. This generates a partial space program per Tables 2-3 through 2-6 of this FC. The programmer then must select the facility options and enter the quantity of age-specific CARs. The Child Development Center Space Program spreadsheet is available as a downloadable Microsoft© Excel© file from the Whole Building Design Guide Website (www.wbdg.org) under the NAVFAC Design-Build Master page, Design Guidance, located at http://www.wbdg.org/ndbm/design_guidance.php.

2-4.2.1 Core Administration, Staff Support and Facility Support.

The space programs illustrated in Tables 2-3 to 2-5 are purely sample programs and are not intended to establish fixed design programs for CDC planning teams. Determine the actual total space program for CDC Core Administrative functions, Staff

Support functions, and Facility Support functions by considering the anticipated number of children accommodated by the facility and the specific space and design criteria provided in this FC.

2-4.2.2 Child Activity and Multipurpose Rooms.

- The space requirements for CARs in Table 2-6 are mandatory and must not be changed. Determine the total number of activity rooms for specific age groups based on the number and ages of children to be accommodated per Chapter 2, “Facility Planning”.
- Provide a Nursing Room in close proximity to the Infant/Pre-toddler wing of the facility and visible to staff for monitoring.
- Verify the need for a multipurpose room with the Service contacts provided in Chapter 1, Regulatory Authorities. **Service Exception: Navy** contacts will determine when climatic conditions warrant the requirement for a multi-purpose room. As a general rule, only those Navy bases with extreme (heat, cold, rain) climates should consider programming a Multi-purpose room.

Table 2-3. Sample Program Space Requirements for Core Administration

Functional Spaces	Standard CDC Areas			
	Small	Medium	Large	Extra Large
	ft.^{2} (m^2)	ft.^{2} (m^2)	ft.^{2} (m^2)	ft.^{2} (m^2)
Entrance/Lobby. Includes vestibule, circulation space from the vestibule to the reception desk, the circulation space in front of the reception desk, and all areas dedicated to waiting.	120 (11.2)	180 (16.7)	400 (37.2)	450 (41.8)
Reception/Work Area. Generally includes space required for staff workers behind the reception counter and any circulation space leading to adjacent office space, to the isolation room and to the toilet. It does not include any space for general public. Includes the net space required to enclose any office equipment such as printers, faxes, copiers, computers, and video recording equipment, if any. It also includes general office work space (work tables or work surfaces).	280 (26.0)	380 (35.3)	520 (48.3)	520 (48.3)
Administration Offices. The required offices will vary both by Service and by Installation. Refer to Chapter 2, "Administrative Offices", for Service contact names and more information. These ranges are rough estimates.	400 to 600 (37.2 to 55.7)	450 to 650 (41.8 to 60.4)	550 to 750 (51.1 to 69.7)	800 to 1,000 (74.3 to 92.9)
Nurses Office. Marine Corps-only area for isolating and observing a sick child.	80 (7.4)	80 (7.4)	160 (14.9)	160 (14.9)
Nursing Room/Space. Area for mothers (1-2) to have privacy in breast-feeding friendly environment. Includes space for soft seating, sinks, table, counter and diaper changing table. Extra Large requires 2 rooms.	60 (5.6)	60 (5.6)	60 (5.6)	100 (9.3)

Table 2-4. Sample Program Space Requirements for Staff Support

Functional Spaces	Standard CDC Areas			
	Small	Medium	Large	Extra Large
	ft.^{2} (m^2)	ft.^{2} (m^2)	ft.^{2} (m^2)	ft.^{2} (m^2)
Break/Staff Room. Includes space for counter/cabinet space for microwave, sink and refrigerator, space for tables and chairs for staff. Provide closet or lockers for coats and jackets.	180 (16.7)	220 (20.4)	300 (27.9)	380 (35.3)
Training Room. Includes space for a conference room, resource bookshelves, and 2 workstations for computer-based training. Sized to accommodate 30% of staff.	280 (26.0)	380 (35.3)	480 (44.6)	580 (53.9)
Central Storage. Generally includes any space required for storage of both bulk and individual items for use within the CARs and in the office area. Includes space to store any equipment such as Audio/Visual equipment that is rotated in the CARs or used in training.	100 (9.3)	130 (12.1)	150 (13.9)	180 (16.7)
Staff/Public Toilet. This area must be sized based upon building code requirements (occupant load/occupancy) and must be ABA compliant.	120 (11.2)	200 (18.6)	280 (26.0)	360 (33.4)

Table 2-5. Sample Program Space Requirements for Facility Support

Functional Spaces	Standard CDC Areas			
	Small	Medium	Large	Extra Large
	ft.^{2} (m^2)	ft.^{2} (m^2)	ft.^{2} (m^2)	ft.^{2} (m^2)
Kitchen. Includes space for all food preparation and dishwashing, as well as cart storage, dry goods storage, coolers and freezers, and work station for cooks. Note: areas include walk-in freezers and refrigerators for medium CDC's and larger, sized for weekly deliveries	700 (65.0)	1,000 (92.9)	1200 (111.5)	1400 (130.1)
Janitorial. Includes all floor space required for storing janitorial supplies and equipment. Includes a mop sink. Large and Extra Large facilities may have more than one room	60 (5.6)	60 (5.6)	80 (7.4)	80 (7.4)
Bye-Bye Buggy Storage. Alcoves in the vicinity of the infants and pre-toddlers rooms for storage of bye-bye buggies.	25 (2.3)	50 (4.7)	75 (7.0)	100 (9.3)
Video Surveillance Room. Includes video equipment and electronic storage components for surveillance system.	60 (5.6)	60 (5.6)	60 (5.6)	60 (5.6)
Laundry. Includes area required for washers and dryers, one dryer more than the number of washers and a sink and work surface for folding.	80 (7.4)	110 (10.2)	130 (12.1)	220 (20.4)
Other Facility Support. Generally calculated at a percentage of total building area, this includes building construction, circulation/corridors, public restrooms, mechanical rooms, and electrical rooms (see Chapter 3, "Services", for more information). A rough percentage of total building area for these items would range from 25 to 30 percent; however, these spaces are inherently variable as a result of installation unique requirements. Consult with mechanical engineer and CDC Program Manager when programming these spaces.				

Table 2-6. Child Activity Room Space Requirements

Age Group(s) Accommodated	Room Area	
	m^2	$ft.^2$
Infants and Pre-toddlers. This room can accommodate two groups of infants (eight children total) or two groups of pre-toddlers (10 children total).	**78.97**	**850**
Toddlers and Preschoolers. This room can accommodate two groups of toddlers (14 children total) or one group of Preschoolers (12 children total).	**88.3**	**950**
Preschoolers/Pre-K/Kindergarten. This room can accommodate two groups of Preschoolers/Pre-K/K (24 children total).	**133.8**	**1440**
Multi-purpose Room (Optional) for Small and Medium CDC's. Space to accommodate children for large group activities, wheel toy play, exercise, group games, or indoor play. Space includes storage and a toilet. This room may also support other activities such as parenting classes and staff training.	**111.5**	**1,200**
Multi-purpose Room (Optional) for Large and Extra-Large CDC's.	**204.4**	**2,200**
Note: While the rooms are set-up to accommodate more than one age group in terms of space and facilities, usually two age groups will never share a room. See Chapter 2, "Child Activity Rooms" for more detailed breakdown of Child Activity Room spaces.		

2-4.3 Administrative Offices.

2-4.3.1 Quantity and Type.

The quantity and type of administrative offices are Service and facility specific. At a minimum, two offices are provided: One for the CDC director and one shared office. The shared office would accommodate the training and curriculum specialist and the FCC/CDH program (see Chapter 2, "Functional Program Areas", for a description of these programs). Larger facilities and programs will provide separate and even multiple training/curriculum and FCC/CDH offices, as well as an assistant director's office.

Additional design criteria for these offices are provided in Chapter 4. Do not program CDC office space types and sizes without first consulting with the Service contacts identified in Chapter 1, "Regulatory Authorities".

2-4.3.2 Typical Sizes.

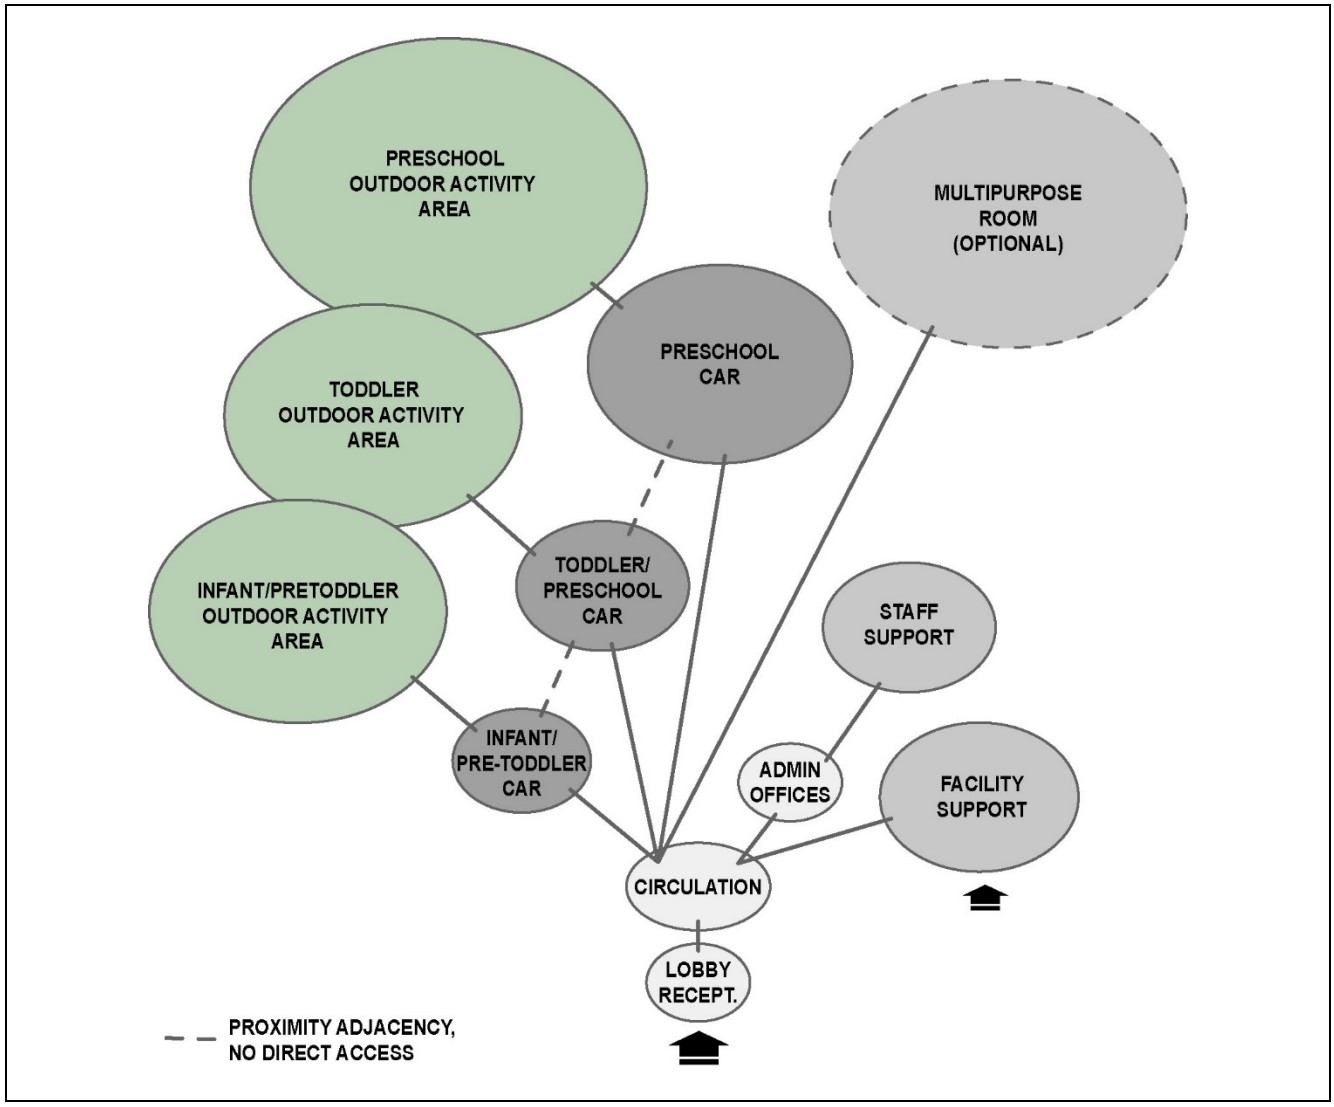
- Director's Office. Small at 100 $ft.^2$ (9.3 m^2) minimum; medium at 120 $ft.^2$ (11.2 m^2); and large and extra large at 140 $ft.^2$ (13 m^2).
- Training and Curriculum Specialist. One to two offices at 100 $ft.^2$ (9.3 m^2) minimum.
- FCC/CDH Office. Variable by program and size.
- Resource and Referral Office. If provided as a separate office, 100 $ft.^2$ (9.3 m^2) minimum.

2-4.4 Child Activity Rooms.

Each CAR includes required subspaces. These subspaces and their space requirements are identified in Table 2-7. One of these subspaces is uninterrupted activity space (UAS). UAS is defined as space used exclusively for activity, excluding diaper changing, food preparation, toilets, storage areas, installed millwork, door swings, and dedicated circulation space. Dedicated circulation space is built into the area for each of the subspaces. Sizes shown are net areas.

Table 2-7. Child Activity Room Space Requirement Breakdown

Age Group(s) Accommodated	Room Area	
	m^2	$ft.^2$
Infants and Pre-toddlers. This room can accommodate two groups of infants (eight children total) or two groups of pre-toddlers (10 children total).	**78.97**	**850**
Uninterrupted activity space	48.31	520
One child toilet	2.79	30
Children's hand washing station	1.39	15
Adult sink with counter	4.65	50
Diapering station, including sink and storage	4.65	50
Crib area	9.29	100
Cubby storage	2.32	25
General storage closet	5.57	60
Toddlers and Preschoolers. This room can accommodate two groups of toddlers (14 children total) or one group of Preschoolers (12 children total).	**88.3**	**950**
Uninterrupted activity space	58.53	630
Two child toilets	4.65	50
Two children's hand washing stations	2.79	30
Children’s art sink	1.39	15
Adult sink with counter	4.65	50
Diapering station, including sink and storage	4.65	50
Cubby storage	6.04	65
General storage closet	5.57	60
Preschoolers/Pre-Kindergarten/Kindergarten. This room can accommodate two groups of Preschoolers/Pre-K/K (24 children total).	**133.8**	**1,440**
Uninterrupted activity space	100.3	1,080
Two toilets	4.65	50
Two children's hand washing stations	2.79	30
Children’s art sink	1.39	15
Adult sink with counter	4.65	50
Diapering station, including sink and storage	4.65	50
Cubby storage	9.75	105
General storage closet	5.57	60



2-5 ORGANIZATION AND LAYOUT.

2-5.1 General Adjacencies.

2-5.1.1 Bubble diagram.

Figure 2-1, Functional Relationship Bubble Diagram, provides the general required adjacencies. The multipurpose room is optional and will only be provided at the discretion of the contacts provided in Chapter 1, Regulatory Authorities.

Figure 2-1. Functional Relationship Bubble Diagram

2-5.1.2 Noise Level Zoning.

Zone the building in terms of noise levels so that activity rooms and/or spaces are grouped together and separated by distance and/or barriers from quiet rooms and/or spaces.

2-5.2 Non-standalone CDC External Adjacencies.

Locate CDCs on a first floor, at-grade level permitting exit discharge directly outside the building. CDCs are not permitted in basements. CDCs must not be located in a mixed occupancy with high hazard or storage occupancies. In any permitted mixed occupancy, CDCs must be separated from other occupancies by a minimum of 1-hour rated construction. In mixed occupancies, the CDC and CDC outdoor areas must be separated from the other occupants; no access is allowed from upper fire exits or through the space to others' spaces.

Site selection must be approved prior to submission of DD Form 1391 by the contacts identified in Chapter 1, "Regulatory Authorities".

2-5.3 Child Activity Room Adjacencies.

2-5.3.1 Building and Site Adjacencies.

Organize and group CARs by age group (infant, pre-toddler, toddler, and preschool/Pre-K/K). Arrange age groups nearest the next age group to simplify and possibly consolidate playground areas. In small centers, design to allow for future expansion and addition of CARs.

Locate CARs along the exterior perimeter of the building to provide direct egress from each activity room to an age-appropriate playground and to maximize natural light admission. Provide direct access to the central circulation system and locate close to common use spaces. Locate the infant/pre-toddler rooms closest to the reception/lobby area because the child is usually carried to the room, along with diaper bags and other supplies.

2-5.3.2 Internal Adjacencies.

Internal room adjacencies are driven by the following key factors:

- **Visibility.** Do not create blind spots within the room. The caregivers should be able to see all areas of the room. Toilets positioned to provide semi-privacy from corridor and entry to CAR.
- **Sanitation.** Physically separate the adult sink and counter (where food preparation takes place) from the child hand washing/toilets and diaper changing.

2-6 ADDITIONS/ALTERATIONS/RENOVATIONS TO EXISTING FACILITIES.

Modernize existing facilities according to the design criteria established in this FC. The objective of all modernization projects is to meet new construction standards to the maximum extent possible within the programmed criteria.

2-6.1 Program.

For CDCs that will be located in existing, modernized facilities, the CAR size and distribution must follow the criteria given in Chapter 2, “Space Requirements”, and Chapter 4. Adapt the standard CDC activity areas to accommodate the existing structure. However, send all proposed modifications to the standard criteria to the contacts defined in Chapter 1, Regulatory Authorities.

2-6.2 Design.

When modifying an existing building, analyze its potential with regard to location, site services, architecture, structure, internal environmental systems, and functional adaptability. Enhance its architectural character in accordance with the local base architectural compatibility standards.

CHAPTER 3 GENERAL DESIGN CRITERIA

3-1 GENERAL.

UFC 1-200-01 provides applicability of model building codes and government criteria. UFC 1-200-01 identifies, through references, key unified facility criteria and requirements including accessibility, antiterrorism, security, sustainability, safety, discipline specific, and building systems. The facility-specific design requirements in this FC are to be used in addition to or to modify UFC 1-200-01 and the referenced UFCs and government criteria.

3-1.1 Authorized Building Program.

A DD1391 funding document is developed for all new construction projects which establishes the project requirements and authorized building size. The designer can use the functional diagrams contained herein to create the logical flow and individual space allocations for approved functions within the facility, however the design must not exceed the square footage allowances of the DD1391 or add functions in the facility if the functions are not authorized in the validated DD1391.

3-1.2 Accessibility.

The specifications in DoD, “ABA (Architectural Barriers Act) Accessibility Standard” contain alternate specifications based on children's dimensions and anthropometrics for ages 3 and up (preschool age). This FC contains alternate specifications for infants, pre-toddlers, and toddlers for drinking fountains/bubblers, water closets, toilet stalls, lavatories, sinks, and fixed or built-in seating and tables. All spaces, including toilets for preschool age and older, janitor’s closet, and storage rooms must be ABA compliant. Also note the following guidelines for children for the purpose of the CDC facility design:

- Infants, pre-toddlers, and toddlers are not considered to be self-mobile wheelchair users; they are assisted and transferred by caregivers.
- Preschool-age children are considered to be self-mobile wheelchair users.

3-2 STRUCTURAL FOUNDATION INSULATION.

In addition to the criteria established in UFC 1-200-01, the following requirements are specific to CDC’s. Since children spend a great deal of time on the floor, both temperature control and avoidance of drafts are very important. Maximize insulation of floors, including perimeter insulation of floor slabs, as required by project location.

3-3 ARCHITECTURE.

Refer to UFC 1-200-01 and comply with stated and cross referenced requirements for Architecture. Also comply with the following CDC- specific requirements.

3-3.1 Stories.

Unless approved by the Service regulatory authorities, newly constructed CDCs must be single-story structures.

3-3.2 Exterior Design.

3-3.2.1 Architectural Style and Scale.

Design CDCs to reflect a residential, non-institutional character to meet installation Architectural standards. For example, small-scale finish materials, such as bricks, are preferable to large pre-cast panels. The dimension of brick is more congruent with the size of a child and his or her home experience. Minimize the use of irregular geometry in the overall building design that results in any wall angle other than 90° in the offices, CARs, or service areas.

For new CDCs, contain the facility in one building. For annexes to existing buildings, they may be joined by an enclosed and covered walkway.

3-3.2.2 Entrance.

The perimeter of the building and outdoor activity areas must have only one primary means of public access and egress. Control all other service and emergency egress points, with access limited to authorized individuals. Design the entry approach to be visible by inside staff. Incorporate a point of reference or landmark that serves as a welcome and a transition. Visually separate the primary entrance from other entrances and service areas. If budget allows, provide a covered main entry that connects to a covered walkway to short-term parking to protect arriving children and parents from inclement weather.

In cold climates, provide a canopy or recess at required egress doors to ensure that doors can completely open without obstruction from snow and ice.

3-3.2.3 Roof.

The preferred roof is a gable or hip with minimal level changes or projections. Roof overhangs assist with reducing glare in CARs and should be coordinated with shade structures in the outdoor activity areas. See Chapter 5, “Shade”, for more information on outdoor activity area shade structures.

3-3.2.4 Windows and Doors.

Windows and doors must replicate a residential style and scale. Locate windows so that children have visual access to the outside. Locate vision panels in doors so that small children at floor level can be seen and potential injury avoided. Recess or locate casement and other projecting types of windows to preclude dangerous protrusions at child and adult heights. For warm climate locations, give due diligence to material and color selection for exterior windows and doors that children may touch.

Natural lighting is essential in CDCs. Provide throughout to the highest degree possible. If budget permits, provide natural lighting coming from multiple directions.

3-3.2.4.1 General Window Criteria.

Construct, adapt or adjust all windows in areas used by children under 5 years of age to limit the exit opening accessible to children to less than 3.5 in. (90 mm), or be otherwise protected by guards that do not block outdoor light. Screen all openings used for ventilation. Use insulated glass for exterior window glazing. Provide light control and energy conservation features on all exterior windows, either by exterior or interior methods. In new construction, include exterior overhangs, low E-type glass, or both.

For exterior window sills accessible to children, avoid sharp edges and corners.

Adhere to the following safety glass standards:

- Consumer Product Safety Commission, 16 CFR, Part 1201, *Safety Standard for Architectural Glazing*.
- ANSI Z97.1, *Safety Glazing Materials Used in Buildings - Safety Performance Specifications and Methods of Test*.

3-3.2.4.2 Child Activity Room Window Criteria.

Provide child activity rooms with glass exterior walls from a maximum sill height of 11 in. (280 mm) above finished floor. Place the sill bottom on the finished floor for infant/pre-toddler rooms. Do not place sill heights between 3 and 10 in. (75 and 255 mm).

Comply with the following criteria:

- All exterior windows must be operable. A minimum of 25 percent of each window must be operable. Operable portion of the windows must be no lower than 48 in. (1220 mm) above finished floor. Windows must have an operating mechanism at a maximum height that meets ABA requirements and have draft deflectors, screens, and safety locks.
- Locate or recess casement and other projecting types of windows or awnings to preclude dangerous protrusions at child and adult heights at both the interior and exterior.
- Any glass lower than 36 in. (915 mm) above the finished floor must be tempered safety glass. Wire glass is not permitted.
- Sills must be of durable material such as solid surface materials or plastic laminate. Horizontal and vertical sill edges and corners must be rounded with a radius of .25-in. (6-mm) and must project no more than .75 in. (20 mm) from the wall.
- If window seats are provided, they must be between 10 and 12 in. (250 and 305 mm) above the finished floor and a minimum of 12 in. (305 mm) deep. Edges and corners of window seats must be rounded with a radius of .25-in. (6-mm).

- Use overhangs or tinted glass to prevent glare in CARs. Avoid excessive or heavy tinting.
- If protruding 2 in. (50 mm) or more, do not locate horizontal window muntins (horizontal mullions) between 12 in. to 43 in. (305 mm and 1100 mm) above the finished floor because they could be used as climbing support.
- If interior shades are used for daylighting control, use shade with 5% perforation opening, color to be medium to dark value, and child safety cords. Shades must not extend below 48 in. (1220 mm) AFF in CARs.

3-3.2.5 Exterior Acoustics.

Ensure windows and doors provide the following acoustical treatments:

- Use acoustically laminate glass with a Sound Transmission Coefficient (STC) rating of 35 to 45 for all window and door glazing.
- Use high-quality commercial doors with a minimum STC rating of 30 for exterior doors.

3-3.3 Interior Design.

Refer to UFC 1-200-01 and comply with stated and cross referenced requirements for Interior Design, with the following additions and exceptions for CDC's. Designer of record must coordinate with Service's regulatory authorities for current Interior Design processes, procedures and selections.

Design the interior spaces to dispel an institutional feeling, and use residential-style layouts, scales, and finishes. Ensure the interior design package is compatible throughout the facility and supportive of functional requirements. Ensure collaboration between interior designer, architect, and appropriate engineering discipline personnel.

3-3.3.1 Interior Construction.

3-3.3.1.1 Corridors.

Circulation corridors serving child activity rooms must be a minimum of 6.5 ft. (1980 mm) wide and a maximum of 8 ft. (2440 mm) wide.

3-3.3.1.2 Interior Glass.

All interior glass must be tempered safety glass and mirrors must be constructed with shatter-resistant materials.

3-3.3.1.3 Doors.

Provide vision panels at adult and child viewing heights in all doors, including closets and storage rooms, except school-age or adult toilets. Vision panels must be a minimum of 6 $ft.^2$ (.56 m^2) and placed so a person opening the door can see if children are sitting or standing in front of the door. Provide a full-height vision panel in all closet,

storage, and janitor closet room doors. Full-height panels must be 4 in. to 8 in. (100 mm to 200 mm) wide, located a minimum of 6 in (150 mm) from the lock-side of the door, and extend vertically from 6 in. (150 mm) from the top of the door to 12 in. (305 mm) from the bottom of the door.

Comply with the following additional door criteria and the door hardware schedule in Table 3-1:

- Dutch doors are not permitted.
- Sliding glass doors are only allowed at the main entry as the interior door of the vestibule. Ensure the doors meet ABA, antiterrorism requirements, and the Life Safety Code requirements for emergency and non-powered operation.
- Install finger-pinch protection devices on both push and pull sides of door hinges wherever doors are accessible to children.
- Cover the hand contact and splash areas of doors and walls with a finish that is easily cleaned. Enamel paint is acceptable.
- All locking doors must be openable from the inside without a key and with a single motion (emergency passage).

Table 3-1. Hardware Schedule

Hardware	Main Entry/ Exits**	Admin Areas	CAR Exterior Doors	CAR Interior Doors	Laundry, Janitor, Building Storage	Kitchen Exterior Door	Kitchen Interior Door	Outdoor Storage	Nursing Room Door	Corridor Door (Exit Only)+
Passage latch-set				✓						
Storage lock-set					✓			✓		
Office lock-set		✓							✓	
Panic hardware/ exterior lock cylinders	✓		✓			✓				✓
Door self-closer	✓	✓		✓	✓					✓
Door self-closer w/ integral hold-open*			✓			✓				
Automatic door closer							✓			
Door stops		✓	✓	✓	✓				✓	✓
Kick-plates	✓		✓	✓	✓	✓	✓			✓
Pinch guards/hinge cups	✓		✓	✓				✓	✓	

*Magnetic hold open must be connected to building fire alarm system
**Refer to Chapter 3, “Exit Requirements” for secondary exit requirements
+Corridor Doors, used as secondary exits, must be alarmed to Front Desk

3-3.3.1.4 Casework and Counters.

Casework, counters, and cabinets must be of high-quality and durable construction. Specify Architectural Woodwork Institute (AWI) Premium or Custom for finishes per *AWI Quality Standards Illustrated*. Casework, cabinet doors, and drawer faces should be provided as veneer panel core. Doors, drawers, and casework faces should be plastic laminate at a minimum. Countertops are to be solid surface/solid composite plastics only. Specify .75-in. (20-mm) minimum thickness for plywood, plywood backing, and solid wood panels.

All counters throughout the facility must have rounded safety corners with a .5-in. (12-mm) radius.

3-3.3.2 Interior Finishes.

See Chapter 4 for finish requirements in individual spaces.

3-3.3.2.1 Color and Texture.

Choose light to medium hues for large background areas and walls used for display. Do not use bright colors on walls, floors, and carpets/rugs in large quantities. Do not provide entire walls of graphics and designs that would compete with children's work or display materials. Do not use cartoon or fairy tale characters. Warm hues are preferred.

Do not use abrasive finishes such as stucco, knock-down finishes or high-relief tiles.

3-3.3.2.2 Soft Floor Coverings.

Carpet tile is allowed in Admin areas. Comply with the following for all carpet and area rugs in other areas:

- Do not select carpet with large patterned designs, for example, games or alphabets.
- Backings must be anti-microbial of synthetic or inorganic material. For carpets, use direct glue type with an attached cushion/pad for additional life of the carpet and fall protection. Ensure adhesive or binding components of the carpet do not emit toxic fumes.
- Fibers must be stain and soil resistant 100 percent solution-dyed nylon. Minimum yarn face weight must be 28 ozs/SY (950 g/SM). Use heavy commercial wear classification carpet of level loop construction to minimize snagging.
- Ensure there are no tripping hazards at carpet transition. Area Rugs must be secured with a commercial-grade, two-sided carpet tape around the perimeter. Binding on rugs must be heavy duty .375 in. to 1 in, (9.5 to 25 mm) wide.

- Use carpets tested for Volatile Organic Compounds (VOCs) and that bear a Green Label from the Carpet and Rug Institute indicating that the carpet emissions are within the acceptable range.
- Use products containing less than 0.05 parts per million (ppm) of formaldehyde. Any product purchased with formaldehyde levels above 0.05 ppm must bear a label in accordance with 29 CFR 1910.1048.

3-3.3.3 Interior Acoustics.

Design the facility to provide a comfortable acoustical environment and provide comprehensive sound isolation and sound absorption measures for individual spaces as appropriate. Provide acoustical design to prevent sound from noisy spaces such as corridors, toilets, and mechanical rooms from having negative impact on the adjacent spaces. Limit the reverberation time to 0.6-0.8 seconds. Design for less than 0.6 seconds in smaller spaces. Limit the ambient noise level from mechanical systems, outside noises, and adjacent spaces to 30-40 dBA. Do not allow mechanical peak noise level to exceed 85 dBA. Comply with the following:

- Extend all interior partitions dividing occupied spaces to the roof deck above the suspended ceiling. Partitions can be single layer gypsum wallboard but must have cavity insulation and be completely caulked at the top and bottom of the partition.
- Design all systems to prevent cross-talk between rooms. All air transfer air ducts must be acoustically lined and contain a minimum of one 90 degree elbow. Provide sound attenuators as required. Coordinate requirements for air transfer ducts with the Mechanical Engineer.
- Do not place electrical outlet boxes back-to-back.

At a minimum, provide the required sound transmission coefficient (STC) ratings for common building spaces as identified in UFC 3-101-01, "*Architecture"*. The STC ratings for spaces unique to CDC's are identified in Chapter 4, "Functional Data Sheets". STC ratings stated are for partitions, not windows and doors. Utilize gypsum board wall "improvements" to increase the STC of gypsum board "Stud Type" partitions to achieve the project sound requirements. Unless indicated in Chapter 4, STC ratings do not need to be field verified.

3-3.3.4 Interior Signage.

Develop a comprehensive signage package that addresses both way-finding and definition of all spaces within the facility. Signage should reflect and complement the environment through colors, images and materials used.

3-3.3.5 Kitchen Design.

Design team must include a kitchen designer with 5 years of experience in design of similar facilities. This consultant's involvement will include, but not be limited to, developing specifications and schedules for all kitchen equipment including utility connection sizes and capacities for all applicable items, location of floor sinks and floor

drains, and kitchen hoods. Kitchen designer must be independent of equipment providers. See Appendix E of this document for a listing of kitchen equipment for each facility size.

3-4 SERVICES.

3-4.1 Plumbing.

Refer to UFC 1-200-01 and comply with stated and cross referenced requirements for plumbing. Also comply with the following CDC- specific requirements. All floor drain traps must be self priming.

3-4.2 Fire Protection and Life Safety.

Refer to UFC 1-200-01 and comply with stated and cross referenced requirements for fire protection and life safety. Also comply with UFC 3-600-01, *Fire Protection Engineering for Facilities*, and the following CDC-specific requirements. The DoD CDC fire protection and life safety requirements exceed the minimum standards of the NFPA codes because the DoD ratio of children to child caregiver is greater than permitted in the NFPA codes. The additional features required in DoD facilities compensate for the reduced number of child caregivers.

3-4.2.1 Exit Requirements.

Comply with the following:

- All corridors must terminate at an exterior exit. Dead ends are not permitted.
- All doors in the egress paths must be a minimum of 36 in. (915 mm) and provide a minimum clear width of 32 in. (813 mm). The door must open not less than 90°.
- Equip all doors from the facility to the outside with full-width push pad panic hardware that meets Accessibility requirements. The contact or pressing surface must extend the full width of the door. This is to prevent snagging on evacuation cribs.
- Provide a door direct to the outside from every CAR.
- Equip every door from a CAR to the outside with an automatic hold open device integral to the door or door closer. Flip down door stops are not permitted.
