SECTION 35 59 13.19
ARCH-TYPE RUBBER MARINE FENDERS

PART 1   GENERAL

1.1   REFERENCES
1.2   SUBMITTALS
1.3   DELIVERY HANDLING AND STORAGE

PART 2   PRODUCTS

2.1   CONFIGURATION
2.2   ELASTOMER
2.3   HARDWARE
   2.3.1   Plates and Angles
   2.3.2   Nuts, Bolts, and Washers
   2.3.3   Antiseize Compound
2.4   PERFORMANCE
   2.4.1   FENDER COMPRESSION TEST
   2.4.2   ANGULAR FENDER COMPRESSION TEST

PART 3   EXECUTION

3.1   INSTALLATION
   3.1.1   Antiseize Compound

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for arch-type rubber marine fenders.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: On the project drawings, show location of fenders and size and spacing of fasteners.

PART 1   GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically
place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS (ASME)

ASME B18.22M (1981; R 2017) Metric Plain Washers

ASTM INTERNATIONAL (ASTM)

ASTM D575 (1991; R 2012) Rubber Properties in Compression

1.2 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.
**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval.][for information only. When used, a designation following the "G" designation identifies the office that will review the
Submittal for the Government. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Fender
Hardware

SD-05 Design Data

Reaction--energy--percent compression curve
Dimension
Fender material specifications
Design calculations

SD-06 Test Reports

Minimum Tensile Strength
Shore Hardness (Durometer)
Modulus at 400 Percent Elongation
Maximum Compression Set
Tear Resistance
Minimum Elongation
Ozone Resistance
Low Temperature Impact Resistance
Water Absorption
Heat Resistance
Compression Deflection Resistance
Fender Compression Test
Angular Fender Compression Test

Tests shall have been performed on the specified fender within 5 years of submittal of the reports for approval. Test reports shall be accompanied by notarized certificates from the manufacturer certifying that the tested material is of the same type, quality, manufacture and make as that proposed to be supplied.

SD-08 Manufacturer's Instructions

Installation Instructions
1.3 DELIVERY HANDLING AND STORAGE

Fenders shall be undamaged when delivered and shall be handled and stored so as to prevent damage, such as bending or abrading end fittings, cutting of rubber, or damage to coating of hardware. Protect fenders from exposure to damaging liquids, oils, greases and extended exposure to sunlight.

PART 2 PRODUCTS

2.1 CONFIGURATION

**********

NOTE: Coordinate angle with angular compression test requirements.

**********

Fender shall be extruded and shall be continuous in the length indicated. The fenders shall have a truncated "A" cross section shape and be attached to the structure at the base, the widest dimension, of the arch. The connecting hardware shall be fully exposed. No encased hardware or molded fenders shall be allowed. The fender and hardware shall be designed and factory tested to the loads per linear meter foot of fender specified in paragraph entitled "PERFORMANCE," for angles of approach of 0 and 0.26 rad 0 and 15 degrees. Fender anchor bolts and method of anchorage shall be of the size and spacing required by the manufacturer's design and testing; however, the size and spacing of anchor bolts indicated on the drawings shall be construed to be the minimum required, unless exceeded by the requirements of the fender manufacturer's design.

2.2 ELASTOMER

The elastomer shall be the ethylene propylene dimonomer (EPDM), as specified in ASTM D2000, with the following properties:

**********

NOTE: Coordinate values with calculated design requirements.

### 2.3 HARDWARE

#### 2.3.1 Plates and Angles

*ASTM A479/A479M*, Type 316L stainless steel for plates, angles, and miscellaneous hardware required to attach the fenders to the structure.

#### 2.3.2 Nuts, Bolts, and Washers

#### 2.3.3 Antiseize Compound

*MIL-PRF-907.*

### 2.4 PERFORMANCE

**************************************************************************

**NOTE:** Coordinate values with calculated design requirements.

**************************************************************************

When vertically compressed by a plate extending the full length and width...
of a 0.30 m one foot section of the fender, the fender shall absorb [8950] [_____] joules [6,600] [_____] foot pounds of energy plus 10 percent when [48] [_____] percent compressed (i.e., to a dimension of [52] [_____] percent of its original height) with a corresponding load of not more than [85,402] [_____] N [19,200] [_____] pounds plus 10 percent.

2.4.1 FENDER COMPRESSION TEST

*************************************************
NOTE: Coordinate values with calculated design
requirements.
*************************************************

Compress fender along its longitudinal axis between two parallel flat plate surfaces to a compressed dimension of [48] [_____] percent of its original height. Record load and the corresponding deflection at 6 mm 1/4 inch increments and plot as a graph of load versus deflection. The Load-Deflection curve shall then be integrated to generate an Energy-Deflection curve for the fender. After compression of the fender to [48] [_____] percent of its original height, the fender shall be rebound to 98 percent of its original height within [ten] [_____] minutes after the load is removed.

2.4.2 ANGULAR FENDER COMPRESSION TEST

*************************************************
NOTE: Coordinate values with calculated design
requirements.
*************************************************

Compress fender along its longitudinal axis between two flat plate surfaces, at an angle of [0.26] [_____] rad [15] [_____] degrees to each other, to a compressed dimension of [48] [_____] percent of its original height. Record load and the corresponding deflection at 6 mm 1/4 inch increments and plot as a graph of load versus deflection. The Load-Deflection curve shall then be integrated to generate an Energy-Deflection curve for the fender. After compression of the fender to [48] [_____] percent of its original height, the fender shall rebound to 98 percent of its original height within [10] [_____] minutes after the load is removed.

PART 3 EXECUTION

3.1 INSTALLATION

Install fenders with the fender longitudinal axis vertical. Install the fenders in the position and at the spacing indicated on the drawings.

3.1.1 Antiseize Compound

Coat threads of bolts prior to applying washers and nuts. Reccoat bolt thread projection beyond nut after tightening.

-- End of Section --
