**************************************************************************

Test holes shall be provided as indicated and shall be fitted with standard weight, 50 mm 2 inch diameter, black steel pipe. Sleeve shall extend from the exterior of the casing to not less than one-half the thickness of the refractory lining. Refractory opening shall be formed from the end of the pipe sleeve to the interior wall surface to shield the end of the sleeve from reflected heat. Sleeve shall be fitted with a brass screw cap and security chain. Each test pipe shall have two or more sturdy lugs welded in approximately the middle of its length to prevent the pipe from turning when the cap is being removed.

2.3.20 Safety Devices

Boilers shall be provided with safety devices providing automatic overheat shutdown and manual shutoff of the combustion equipment or flue gas dampers to bypass the boiler.

2.3.21 Freeze Protection

Low points of all piping and tubing shall be equipped with drains for freeze protection.

2.3.22 Fire Protection

Boilers shall meet the requirements of NFPA 85.

2.4 BOILER AUXILIARY EQUIPMENT

2.4.1 Boiler Fittings and Appurtenances

Boiler fittings, and all other boiler appurtenances shall comply with ASME BPVC SEC I. Boilers shall be provided with a continuous blowdown connection from an internal pipe running the length of the steam drum at the point of the highest concentration of dissolved solids. Blowoff provisions shall be provided from the mud drum or lower part of a fire-tube boiler. Pressure gauges for high-pressure steam units shall include a siphon, gauge cock, and test connection. Trim and appurtenances shall include a 150 mm 6 inch minimum pressure gauge and a safety valve. A chemical feed connection with internal distribution pipe shall be provided.
2.4.1.1 Water Column

Water column with straight-through type drain valve shall be provided. Water column shall be complete with gauge glass, high- and low-water alarm, and three quick-closing gauge valves and try cocks fitted with the necessary chains and handles for operation from the boiler room floor. Water column shall also include a test valve, blowdown valve, and a straight-through type drain valve. Water column shall not be combined with the low water cutoff. [Water column lighting shall be provided for ease of reading at all times.]

2.4.1.2 Low Water Cutoff

******************************************************************************
NOTE: When the boiler is used as a "heat recovery unit," an alternate path is usually provided to vent or bypass the hot gases in the event the boiler is unable to perform its function. In all other cases, activation of the low-water cutoff will cause the loss of all support to the combustion process including loss of combustion air and fuel.
******************************************************************************

A low-water cutoff, with alarm located on instrument panel, shall include either a float-actuated switch as a means of making electrical contact or an electrically-actuated probe type low water cutoff. The float chamber shall be provided with a blowdown connection. The cutoff shall cause a safety shutdown and sound an alarm when the boiler water level drops below a safe minimum level [and hot gases from the combustion equipment shall be routed to the bypass stack]. [Two low-water cutoffs shall be installed on each boiler. Low-water cutoffs for the boilers shall be piped separately with separate drum connections. Each low-water cutoff shall have a separate housing. Two elements in one housing will not be permitted.] A safety shutdown due to low-water cutoff shall require a manual reset before operation can be resumed and shall prevent recycling of the combustion equipment. The cutoff shall be in strict accordance to the latest version of code, ASME CSD-1, Controls and Safety Devices for Automatically Fired Boilers.

2.4.1.3 Feed and Check Valves

Feed and check valves shall be provided adjacent to each boiler feed nozzle.

2.4.1.4 Continuous Blowdown Valve

******************************************************************************
NOTE: Continuous blowdown equipment will be provided as required by UFC 3-410-01 or UFC 3-410-02. If a fire-tube boiler is specified, these paragraphs will be deleted.
******************************************************************************

Continuous blowdown valves shall be manual proportioning, fabricated of corrosion-resistant steel. Valves shall have a micrometer dial setting and shall be provided with a chart listing the capacities through the complete range of micrometer settings at the boiler pressure. Valves shall conform to ASME BPVC SEC I. Blowoff valves in tandem shall be provided at each point of blowdown as recommended by the boiler manufacturer. Piping shall
be extra-heavy weight, minimum, steel pipe conforming to ASTM A106/A106M Grade B. Slow opening valves shall be balanced, seatless type unless otherwise approved. Both surface and bottom blowdown connection points with required accessories shall be provided. Valves shall have a capacity equal to the capacity of the boiler and shall have forged steel bodies with socket weld connections. Valve shall have a solid Stellite disk with stainless steel seat sleeves. The bodies shall be designed for a minimum working pressure of 2.07 MPa 300 psig. Quick opening valves shall be lever operated, flat seat sliding disks with sealing bushing on the inlet side, and shall be double tightening on both sides of the disk. Quick opening valves shall be gear operated. All blowoff valves shall be suitable for safe blowdown through the piping system installed. All pipe, valves, and fittings shall be supplied as necessary to allow tie-in to a central point for surface and bottom blowdown.

2.4.1.5 Safety Valves

Safety valves of proper size and of the required number and construction and set pressures shall be in accordance with ASME BPVC SEC I and shall be installed so that the exhaust steam will discharge through pipes extending through the roof. Each exhaust riser shall have a drip-pan elbow to prevent the accumulation of water on the valve. A suitable slip joint shall be provided between the drip-pan elbow and the riser. Each exhaust head shall be one-piece construction of plate steel, semisteel, or cast iron, equipped with suitable baffle arrangement and drain connection for removing entrained condensate and oil. Flow area through the valve shall be larger than through the connecting pipe. Valves shall be set to discharge at 10 percent above the operating pressure of the system.

2.4.1.6 Steam Nonreturn Valves

Steam nonreturn valves of size and pressure rating shown shall be installed in the steam supply line from each boiler. Valves shall be arranged to close automatically when there is a pressure differential of 35 kPa 5 psi between the boilers and steam headers, and shall be arranged to operate as stop valves. Valves shall be set with stem up, either inclined or vertical, and shall be of the rising stem type. Valves shall be of the angle or straight-way type and shall operate without chattering, hammering, or sticking. Valves shall be cast steel.

2.4.1.7 Feedwater Regulator

Feedwater regulator, sized for the application, shall be connected complete with all necessary piping and accessories for automatic operation. Valved bypass shall be provided around the control valve. Units shall be provided with a device to lock the regulator in existing position in case of power failure. Unit shall be provided with a manual/automatic selector panel located on the instrument panel in the control room. The feedwater control element shall be provided with a drain valve. The feed-water line shall be fitted with a thermometer well. Mechanical linkages and chains to position the valve will not be allowed. Feed-water piping shall conform to the requirements of ASME BPVC SEC I. A hand wheel or a manual jacking device shall be provided to permit manual operation of the regulator valve.

2.4.1.8 Soot Blowers

************

NOTE: Soot blowers should be required for all
boilers when solid fuel is burned, and are advisable when burning No. 6 fuel oil. If only gas or No. 2 fuel oil is being burned, this paragraph may be deleted. Soot blowers are available for fire-tube boilers.

Soot blowers shall be provided in conjunction with the heat recovery or boiler section of each solid fuel fired steam generation system. Soot blower or cleaning nozzles shall be furnished in sufficient numbers, permanently mounted, and so arranged or spaced to effectively clean all tube surfaces. Each soot blowing system shall be an automatic sequencing, flexible operation using air or steam as the blowing medium. Elements within the boiler shall be constructed of heat-resisting alloys suitable for the flue gas temperature encountered and shall be removable without disturbing the boiler tubes. If the soot blowers are air operated, air compressors with sufficient capacity to accommodate the additional load of the soot blowers shall be provided. [Each boiler unit shall include a cyclone separator installed in conjunction with the boiler stack to capture particulate matter emitted during tube cleaning operations.] Frequency of the cleaning operation shall be automatically controlled by timers that shall be interlocked with the inspection doors to prevent cleaning when the doors are open. Each blower unit shall be furnished complete with all necessary auxiliaries, controls, and equipment and shall be connected according to the manufacturer's recommendations.

2.4.1.9 Drains

Drains consisting of a 20 mm 3/4 inch hose bib or a 25 mm 1 inch hose gate valve shall be installed at the lowest point in the return main near the boiler and at locations shown or as required for the convenient and thorough draining of the system.

2.4.2 Economizers

Economizers shall be of a type normally provided by the boiler manufacturer and shall include [finned tubes,] [bare tubes,] baffles and headers and shall have provision for cleaning and tube bundle removal. At maximum load, economizer exit water shall not be within 17 degrees C 30 degrees F lower than saturation temperature. Materials shall be capable of withstanding the maximum boiler exit gas temperature plus 28 degrees C 50 degrees F. Tubes shall conform to ASME BPVC SEC I. Overall design and installation shall preclude cold-end corrosion under any load condition. Economizer exit flue gas temperature shall not be less than 177 degrees C 350 degrees F and the tube metal temperature shall be above the maximum flue gas dew point for the fuel being fired under all load conditions.

2.4.3 Air Preheaters

NOTE: The economizer or air preheater will be selected to be compatible with any pollution control
Air preheaters shall be of a type normally provided by the boiler manufacturer and shall be recuperative, tube plate, or regenerative type constructed of materials adequate to withstand the corrosion effects of the flue gases. Overall design shall preclude cold-end corrosion of the air preheater under any load condition. Temperatures of all metals in contact with flue gas shall be above the flue gas maximum dew point temperature for the fuel being fired under all load conditions. Control shall be by steam preheat or by automatic bypass and shall be integrated with the combustion control system.

2.4.4 Draft Fans

NOTE: Where induced draft fans are installed directly after the heat recovery boiler, it may be necessary to provide liners for scroll sheets and rotor blades if the gases contain particulates in excess of 229 mg per dry standard cubic meter (0.10 gr/DSCF). The fan design and construction will be strongly influenced by the type of particulate control device used and its location relative to that device.

Furnish induced draft centrifugal fans, as specified, as an integral part of the boiler design. The unit shall consist of an electrical motor driven centrifugal fan, a housing (scroll and side plates), controls, guards and accessories. All components shall be attached to a common base which shall include provisions for fastening to a foundation. The unit shall be completely assembled, ready for installation and operation.

a. Fan assemblies shall be suitable for continuous boiler draft operation to handle flue gases having temperatures up to 800 degrees F. Fans shall comply with AMCA 99 standard applicable to centrifugal furnace fans and shall be rated for flow rate, pressure, power, speed of rotation and efficiency in accordance with AMCA 210 and ASME PTC 10. The supplier shall submit to the Contracting Officer satisfactory evidence that the fan furnished meets the requirements of AMCA 210. Acceptable evidence of meeting the requirements of this standard will be the AMCA Certified Rating Seal or a certified inspection report from an independent testing laboratory indicating that the fan conforms to the requirements of AMCA 210.

b. Fans shall be centrifugal with backward curved blades or radial tip blades. Each fan shall be sized for operation at an elevation of [_____] meters feet, with an output volume and equipment, leaks, and temperature and elevation corrections for a dirty boiler with worst ambient conditions, all at full combustion. In addition, fan sizing shall include margins of 10 percent excess volume against a 21 percent static pressure and air temperature 22 degrees C 40 degrees F above operating temperature.

c. Induced draft fans shall be designed for handling hot flue gas at the maximum boiler outlet temperature adjusted for boiler surface fouling. Fans shall be of the [single] [or] [double] width centrifugal type. [When the fan is a double-width centrifugal type, it shall have a
double inlet.] The direction of fan rotation shall be [clockwise] [or] [counterclockwise] as determined from the drive side of the fan. The direction of discharge shall be [top horizontal] [top angular down] [down blast] [bottom angular down] [top angular up] [up blast] [bottom angular up] [or] [bottom horizontal]. The position of inlet box shall be [45] [90] [135] [180] [225] [270] [315] [or] [360]. The fans shall have a static efficiency of not less than 0 percent in standard air at best efficiency point. Fan wheel shall be constructed of [steel] [or] [aluminum]. The shaft shall be turned, ground, and polished. The fan wheel and shaft assembly shall be balanced statically and dynamically. The complete rotating assembly of the fan shall be dynamically balanced within the limits of the following formula:

\[
\text{Vibration displacement} \quad \frac{1.620}{\text{mills-peak-to-peak} \quad \text{revolutions per minute}}
\]

Noise levels for fans shall not exceed 85 dBA at a 914.4 mm 3 foot station. The fan housing shall be carbon steel of a nominal thickness not less than that selected in Table I.

<table>
<thead>
<tr>

</tbody>
</table>

Scroll and sideplate joints shall be continuously welded. The housing shall be reinforced with steel member to provide a rigid structure and to minimize vibration. [A threaded drain connection to accommodate a 25 mm 1 inch standard pipe shall be located at the lowest point in the scroll. A flush-type access door shall be included in the scroll and held by quick-release clamps and located as specified. Inlet and outlet duct connections shall be flanged]. [The inlet of the fan shall be equipped with an inlet box of the same steel thickness as the housing.] Seals shall be provided to minimize leakage where the shaft passes through the housing or inlet box. [Scroll sheets and rotor blades shall have liners.]

a. Induced draft fans shall be insulated as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. Fans shall be factory painted with the manufacturer's standard finish. If drawings so indicate, the induced-draft fan housing shall be designed to support the portion of the boiler stack that is resting on the housing. Fans shall have [inlet vane control] [inlet damper control] [variable speed control]. Inlet vanes or dampers shall be suitable for use with combustion control equipment. The fan shall be equipped with [precision anti-friction bearings that meet the requirements for a minimum rating life of 100,00 hours] [the self-aligning sleeve type] [or] [roller bearings mounted in suitable pillow blocks]. Fans with backward curved blades may have self-aligning anti-friction bearings.

b. Fan bearings shall be air cooled. Air balanced pillow blocks or auxiliary seals shall be provided to prevent the aspiration of oil from oil slinger type bearings. The oil reservoir shall be provided with
heat slingers for control of air movement over the bearing housing in order to prevent a buildup of ambient temperature. Means for lubrication shall be provided in accordance with the manufacturer's standard practice. Parts requiring lubrications shall be so located as to make the lubricating points easily visible and accessible. Hydraulic lubrication fittings shall be in accordance with SAE J534. Where use of high-pressure lubricating equipment, 1000 pound-force per square inch or higher, will damage grease seals or other parts, a suitable warning shall be affixed to the equipment in a conspicuous location. All parts requiring lubrication shall be properly lubricated before delivery.

c. Fans shall be driven by electric motors. Electric motor shall be [drip proof] [totally enclosed, nonventilated] [totally enclosed, fan-cooled] [totally enclosed, fan-cooled, suitable for installation in a Class 1, Division 1, Group F, hazardous location conforming to NFPA 70]. Motor starter shall be magnetic [across-the-line] [reduced voltage start] with [general-purpose] [weather resistant] [watertight] [dust-tight] [explosion-proof] enclosure and shall be furnished with four auxiliary interlock contacts. Fans shall be directly or indirectly connected to the driving motor. If the fan is indirectly connected, a V-belt designed for 50 percent overload capacity shall be provided, and the motor shall be mounted on the base in a manner that will permit tightening of the belt.

2.4.5 Flue Ducting

Each boiler shall be connected to the stack or flue by means of a smoke connection constructed of black iron or steel sheet not less than 1.214 mm 0.0478 inch, nominal thickness. Clear distance between any portion of the smoke connection surface and any combustible material shall be not less than that specified in NFPA 211. Joints and seams shall be securely fastened and made airtight. Suitable clean-outs shall be provided to permit cleaning the entire smoke connections without dismantling. Duct construction shall conform to SMACNA 1966. Plastic materials polyetherimide (PEI) and polyethersulfone (PES) are forbidden to be used for vent piping of combustion gases.

2.4.6 Breaching

Breaching shall be constructed of not less than 3.416 mm 10 gauge steel sheets conforming to ASTM A36/A36M. Breaching shall be adequately reinforced and braced with structural steel angles not smaller than 50.8 by 50.8 by 6.4 mm 2 by 2 by 1/4 inch and all joints and seams in the sheets and angles shall be welded. Expansion joints shall be installed as indicated and as required to suit the installation and shall be flexible type requiring no packing. Breaching shall have angle flanges and gaskets for connection to boilers, fans, equipment, or stacks with breaching to be the full size of the opening. Breaching shall be lined with a minimum of 76.2 mm 3 inch thick refractory. Breaching connections shall be gas-tight, caulked tight all around and sealed with cement to form an air-tight joint. Clean-out openings of suitable size and at approved locations shall be provided for access to all sections of the breaching and shall have tight-fitting hinged doors with frames. One 400 by 400 mm 16 by 16 inch inspection door shall be located in the side of the breaching just preceding the boiler unit. A similar inspection door shall be located just following the boiler unit. Breaching may be supplied in bolted or welded sections for ease of handling and erection and shall be constructed in accordance with SMACNA 1966. Connectors shall be in accordance with...
NFPA 211. Plastic materials polyetherimide (PEI) and polyethersulfone (PES) are forbidden to be used for vent piping of combustion gases.

2.4.7 Flue Gas Inlet Damper

**************************************************************************
NOTE: Optional wording is applicable to
guillotine-type dampers.
**************************************************************************

A [guillotine] [butterfly] [shutter] damper [of the thickness indicated] [at least 63 mm 2-1/2 inches thick] and consisting of refractory material enclosed in a steel frame shall be installed at the entrance of the waste heat recovery boiler to isolate it from the combustion equipment during emergency boiler repairs. A [chain hoist] [manual lever] [electrical control] for raising and lowering the damper shall be furnished and shall be of a size and design to ensure free movement by the damper. [The hoist cable shall be secured to the damper frame by shackles and bolts. The damper slot shall have a steel plate cover 6.4 mm 1/4 inch thick and of the proper length and width. The cover shall have a slot to permit passage of the damper cable, and for easy removal of the damper. The hoist shall be a product of a manufacturer regularly engaged in the manufacture of hoists. Hoist shall be spur geared. Unit shall be designed for high-speed lifting, have high mechanical efficiency, an automatic load brake, and a built-in load limit.] The operator shall be able to move the required load freely and maintain the damper in any desired position within the limits of the flue opening. Maximum pull to operate the unit shall not exceed 310 Newtons 70 pounds.

2.4.8 Flue Gas Discharge Dampers

A controller-actuated, refractory-lined damper shall be installed at the boiler exit. Another damper shall be installed in the dump stack and shall open if any of the following conditions occur:

a. Excess boiler steam pressure.
b. Induced draft fan failure.
c. Boiler is shut off.

Boiler dampers shall be operated by a controller-actuated motor based on the [boiler steam pressure] [boiler water temperature]. Boiler and dump stack dampers shall be reverse acting, i.e., when the boiler damper is open, the dump stack damper will be closed.

2.4.9 Blowoff Tank

Blowoff tank [shall be constructed of 4000 psi reinforced concrete as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE, and shall be fitted with a bolted steel manhole cover and frame. Blowoff pipe, vent pipe, and drain pipe to sewer shall be installed in pipe sleeves built into the concrete. Space between the pipe and sleeves shall be filled and caulked with lead wool or similar material to make a water-tight connection. Tank shall be divided into two sections by a baffle to form a sediment chamber] [shall be constructed of steel].
2.4.10 Boiler Feed Pumps

Boiler feed pumps shall be sized and designed for the specific application. Pumps having a combined rating of flow and head that results in a horsepower rating less than \(186 \text{ kW} \) 250 bhp shall be furnished to meet the design requirements of API STD 610. The pump shall be either end-suction or top suction, top-discharge and be supported at the center line. Pump size with higher ratings than the above shall be horizontal-split case, multistage centrifugal pumps. All pump ratings shall have, nominally, an excess capacity of 10 percent above the maximum continuous rating of the service. The required net positive suction head (NPSH) at the pump design flow, head, and speed shall not exceed 80 percent of the available system NPSH at the same flow, assuming a low level in the storage tank. The guaranteed NPSH requirements shall reflect 3 percent breakdown criteria. The pump's head-capacity (H-Q) curve shall be constantly rising to shutoff with no point of inflection. There shall be no restriction to operation at any point from continuous flow to design flow. Pumps shall be turbine type, bronze fitted throughout, with impellers of bronze or other corrosion-resistant metal as approved. Pump barrel assemblies shall be fitted with lifting rings. Capacities and characteristics shall be as indicated.

2.4.10.1 Casings

Casing construction shall be either volute or diffuser design and shall be supported at its centerline. Pumps shall have integrally cast suction and discharge flanges that shall be drilled to meet the design pressure of the application. The maximum operating temperature, for design purposes, of any feedpump shall not be less than 204 degrees C 400 degrees F. Casings shall be drilled, tapped, and provided with vent, gauge, and drain connections. Pumps designed for this service shall not require cooling at ratings below 370 kW 500 bhp. This applies to both frame cooling or seal cooling. Below 370 kW 500 bhp, pumps shall employ antifriction radial and thrust bearings lubricated by figner rings in a sealed housing. Seals shall be mechanical and air-cooled flush piping conforming to API STD 610, Plan 23. Above 370 kW 500 bhp, pumps shall employ a single cooling circuit for both cooling and the oil being delivered by a forced-oil system to sleeve radial bearings, and a floating shoe thrust bearing, coupled with the seal coolers for both stuffing boxes. Mechanical seals shall also be provided, and an extra seal replacement kit shall be provided for each pump. In both cases, stuffing boxes shall be site-convertible to a packed box. Leakage shall be not more than 25 cc/hr for a seal life of not less than 25,000 hours. Bearing rating shall be not less than 100,000 hours (L-10 life) at the point of maximum load, as defined by ABMA 9. Sump cooling shall be by indirect coil. Pump casings shall be designed to allow the pump barrel assembly to be removed as a unit, from the drive shaft end to the impeller, without disturbing the main piping or the drive [motor] [or] [turbine].

2.4.10.2 Pump Base

Pumps shall be supported on structural steel bases that do not require grouting in order to impart strength to the pump for static and dynamic loading from the piping system. Bases for pump and drive assembly and support shall be complete with drain lip and pitched to a low-point drain. The complete pump and motor assembly shall be shop aligned using shims on both the pump and motor. Pumps shall be installed on their concrete foundations where shown on the drawings.
2.4.10.3 Pump Couplings

All pumps shall be furnished with nonlubricated flexible-disk couplings and a coupling guard. Couplings shall be spacer type to permit removal of the mechanical seals and limited-end-float-type for pumps with sleeve bearings.

2.4.10.4 Pump Relief Valve

**************************************************************************
NOTE: If automatic recirculation valve is utilized, delete this paragraph.
**************************************************************************

Where an automatic boiler feedwater recirculation valve is not used, each boilerfeed pump shall be arranged for continuous operation and shall be furnished with a suitable relief valve for bypassing the boiler feed to the deaerating feedwater tank to maintain a minimum flow of 5 percent under shutoff conditions. Feedwater regulating valve shall maintain a constant feed-pump discharge pressure. Valve shall be an internal-pilot-operated piston valve, single-seated, V port or tapered plug, and shall be adjusted to maintain within 7 kPa 1 pound of the desired terminal pressure, regardless of fluctuations in the initial pressure or fluctuations in the rate of flow. Valve body shall be constructed of bronze with renewable disks and seats of hardened stainless steel and shall be designed for a working pressure of not less than [1.72] [_____] MPa [250] [_____] psig. A position indicator shall be provided with the valve.

2.4.10.5 Pump Shutoff Valve

Each pump shall be fitted with a shutoff valve on the suction inlet line and with a nonslam check valve and a shutoff valve on the discharge line. On pump sizes over 3 L/second 50 gpm, an automatic recirculating bypass valve unit shall be provided on each pump discharge to prevent the pump from overheating and consequent damage at low flows. Where the automatic recirculating valve is so designed, it may be used as a combination check valve and recirculating valve and the separate nonslam check valve may be omitted.

2.4.10.6 Steam Turbines

**************************************************************************
NOTE: Steam driven boiler auxiliaries will not be used unless the exhaust steam can be used completely. It is recommended that a life cycle cost study be performed to determine if this section is applicable. Reference to steam drives will be deleted if inapplicable for the equipment specified.
**************************************************************************

Steam turbines for boilerfeed pump shall operate the pump properly in a steam pressure range of [_____] kPa psig with steam back-pressure of [_____] kPa psig. Turbines shall have horizontally-split, two-piece, centerline supported casings, water-cooled bearing cases with ring-oiled, babbitt lined, bronze packed sleeve bearings. Turbines shall also be equipped with a mechanical shaft speed governor and valve, independent over-speed emergency governor and trip valve, reed tachometer, constant pressure type governor, insulation with removable metal jacket, oil-sight glasses with guards, stainless steel steam strainer that is removable without disconnecting piping, any special wrenches and tools required for servicing.

SECTION 23 52 30.00 10  Page 36
the turbine, and a sentinel warning on the exhaust casings. Turbines shall conform to NEMA SM 23.

2.4.10.7 Electric Motor Drives

Electric motors shall be selected for continuous duty and nonoverloading characteristics suitable for the power characteristics available. Motors shall be [splashproof] [totally enclosed, nonventilated] [totally enclosed, fan-cooled type] [totally enclosed, fan-cooled type, suitable for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70]. Motor starter shall be magnetic, reduced voltage start type with [general-purpose] [weather-resistant] [water-tight] [dust-tight] [explosion-proof] enclosure.

2.4.10.8 Shop Hydrostatic Testing

All pumps shall be subjected to shop hydrostatic testing. One pump in each service shall be subjected to a complete shop performance test to demonstrate that, at rated capacity, head is within a margin of plus 3 percent and minus 0 percent of design; efficiency is within a tolerance of minus 0 percent; NPSH at the pump's BEP and at the rated condition is within a margin of plus 0 percent and minus 10 percent. Performance tests shall be in accordance with API STD 610. Procedures and results shall be subject to the approval of the Contracting Officer.

2.4.10.9 Control Location

Boiler feedwater pumps shall be started through the combustion equipment/boiler panel, manual/automatic switch.

2.4.11 Condensate Pumps

**************************************************************************
NOTE: If inadequate NPSH is available, the designer shall give consideration to substituting either a double suction or positive displacement pump.
**************************************************************************

Condensate pumps shall be horizontal, end-suction, single-stage, centrifugal, motor-driven pumps. Casing shall be of proper material for the pressure involved, and the pumps shall be bronze or Monel trimmed, with stainless steel shafts or shaft sleeves, and bronze impellers. Pumps shall be provided with stuffing boxes. Lubrication shall be by splash oil with oil level sightglass provided. Pumps shall be subject to the same tests specified for the boiler feedpumps. Condensate pumps shall be installed on suitable concrete foundations. Each pump shall have the capacity to pump 100 percent of the design load continuously. Pumps will pump a mixture of condensate and sodium zeolite softened water from the condensate tank to the deaerator. The NPSH required for all pumps shall not exceed [_____] meters feet, and the pumps shall be capable of handling water up to 99 degrees C 210 degrees F under these conditions without cavitating. Ball bearings amply sized for any and all thrust loads expected shall be water-or oil-cooled and shall be self-aligning. All necessary vents, drains, petcocks, oil sight glasses, etc., and the proper packing materials for mixed condensate and makeup water service shall be of the manufacturer's highest standards. Horizontal pumps shall be factory assembled to the motor drives on a rigid structural steel or cast iron baseplate. Each pump shall be directly connected to a motor through a flexible coupling with approved coupling guards.
2.4.11.1 Design Conditions

The design conditions are:

a. [_____] L/second gpm.

b. [_____] head.

c. Water pumped at 16 to 99 degrees C 60 to 210 degrees F.

2.4.11.2 Condensate Pump Drives

Condensate pump motor drives shall be amply sized to handle the pump power with low discharge heads and shall not exceed 1750 revolutions per minute (rpm). Motors shall be supplied for the power characteristics available and shall be ball bearing and of totally enclosed fan-cooled construction. Condensate pump motors shall be provided with a magnetic across-the-line starter equipped with thermal overload protection. Starters shall be located in the motor control center.

2.4.11.3 Condensate Pump Auxiliaries

Condensate tank and pumps shall be complete with all piping, suction strainers, suction and discharge valves, check valves, and fittings required for an integrated unit. Provisions shall be made in the pump suction and discharge lines for thermal expansion and vibration isolation. Piping shall be factory assembled. All pumps shall be furnished with isolating valves on suction and discharge, suction strainers, startup strainers, silent check valves, and recirculating piping. Pumps shall be arranged with bypass line and orifice in accordance with manufacturer's specifications to recirculate pumped fluid. All controllers, alarms, gauges, sight glasses, control valves, etc., shall be provided with shutoff and/or bypass valves as required for maintenance of the system while in operation.

2.4.12 Emergency Interlock

Emergency interlocks shall be provided to bypass the flue gas or shut down the combustion source, in case of low water, high or low pressure, power failure, or control failure. The system shall act automatically.

2.4.13 Calorimeter

A calorimeter connection shall be provided in the steam main and a flange nozzle shall be provided between the stop gate and the nonreturn valve to permit release to atmosphere when testing the boiler at maximum capacity. The flanged nozzle shall be equipped with blind flange and gaskets.

2.5 CONDENSATE TANK AND ACCESSORIES

2.5.1 Condensate Tank

Condensate tank shall be designed for a working pressure of 103 kPa 15 psig and shall conform to ASME BPVC SEC VIII D1. Tank shall have a storage capacity equal to or greater than indicated and shall be installed complete with all piping and accessories. Condensate tank shall be factory primed with the manufacturer's standard paint.
2.5.2 Feedwater Makeup Valve

A float-controlled valve shall be provided for emergency feedwater makeup to the tank. Valve shall be operated by a float-control mechanism connected to the surge tank and shall maintain a suitable minimum water level in the tank. Float box shall be outside the tank and the connections shall be properly valved to permit blowdown and servicing.

2.5.3 Overflow Trap

An overflow trap designed for the service shall be installed with the condensate tank. The trap shall operate to prevent the water level in the surge tank from rising above a predetermined point by automatically discharging the excess water and shall be designed to prevent the escape of steam and air.

2.5.4 Tank Connection and Controls

Tank shall be provided with all necessary threaded and flanged openings for condensate return, 300 by 400 mm 12 by 16 inch (minimum) access manhole, overflow, drain, pump suction, gauge glass with cocks and drains, and other openings as required. Tank shall be provided with a low-level alarm and pump shutoff and high-level alarm. Alarms shall consist of an alarm horn and warning lights mounted on the control panel as specified.

2.5.5 Design Conditions

2.5.6 Detail Specifications

Tank shall be butt fusion welded steel plate with a maximum diameter of [_____] and a maximum straight side length of [______]. Tank shall be tested under pressure to assure no leaks. Provisions shall be made in the tank for all connections. After fabrication, the interior of the tank shall be cleaned of all mill scale, oil, and weld splatter and then coated with a baked-on phenolic lining or approved equivalent material that shall be suitable and guaranteed for continuous immersion in condensate and softened water from a sodium zeolite softener at 99 degrees C 210 degrees F. Condensate tank shall be shop assembled and checked for proper fit of accessories. Vendor shall determine what items should be removed and shipped loose for field assembly. Condensate tank shall be erected in a horizontal position.
2.5.7 Condensate Tank Trim

Condensate tank shall have the following trim:

a. Water gauge glasses with shutoff valves to cover the full water level travel.

b. Thermometer.

c. Makeup water control valve with inlet, outlet, and bypass valves. Mechanical linkage control will not be acceptable.

d. Pneumatic level controller.

e. Level switches with provisions to attach an alarm or 120 volt control signal.

f. Drain valve.

g. Insulation clips for \(25 \text{ mm } 1 \text{ inch}\) block insulation.

h. All controllers, alarms, gauges, sight glasses, control valves, etc., shall be provided with shut off and/or bypass valves as required for maintenance of the system while in operation.

2.5.8 Additional Requirements

All required foundations, anchor bolts, concrete work, and grouting shown in the manufacturer's load diagram and anchor bolt plan shall be provided. Insulation and covering shall conform to Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. All wiring incidental to the operation of controls and instrumentation shall be provided. All piping to connect to the tank for accessories shall be provided.

2.6 HEAT EXCHANGERS

******************************************************************************

NOTE: If the bulk of the condensate return is at a high temperature, as from a laundry, a heat exchanger will be used. If the bulk of the condensate is returned to a heating pump unit, a heat exchanger will not be required for that application. Heat exchangers can be used for either heating or cooling the condensate.

******************************************************************************

a. Heat exchangers shall be designed, fabricated, tested, and stamped in accordance with ASME BPVC SEC VIII D1. Additionally, heat exchanger designs shall meet the requirements of HEI 2623. Closed feedwater heater designs shall meet the requirements of HEI 2622. All heat exchangers shall be provided with relief valves as required by ASME BPVC SEC VIII D1 and HEI 2623 and shall be designed for a working steam pressure of \([586] \text{ [_____] kPa} [85] \text{ [_____] psig}]. \text{[Heat exchangers using service water shall be designed to have the service water inside the tubes.] [The exchangers shall be of straight tube design with bolted full diameter access channel covers to facilitate tube maintenance as required.]} \text{Return bonnets are acceptable when there are no tubeside connections at the far end.}
b. Materials of construction shall be all carbon steel, except the service water side which shall reflect the service water available. When the water quality permits, the tubes shall be stainless steel in accordance with \textit{ASTM A249/A249M}, Grade TP 304; the remainder of the tube side shall be all carbon steel. When the service water is known to contain chloride levels harmful to stainless steels, the tubes shall be 90-10 Copper-Nickel in accordance with \textit{ASTM B111/B111M} Alloy 706; the remainder of the service water side shall be as follows: tubesheets, Monel-clad steel; channel covers, carbon steel lined with Monel; channels and bonnets, Monel.

c. Fixed tubesheet designs are preferred when operating conditions do not impose a large differential movement that cannot be readily accommodated with a simple thin-wall metal bellows expansion joint. For larger differentials, a packed floating tubesheet with lantern ring is acceptable up to 1.03 MPa (150 psig) design pressure. For pressures above 1.03 MPa (150 psig), a split-ring floating-head design shall be used.

d. Heat exchangers, steam-to-heat domestic water or other fluids such as glycol-water mixtures or fuel oil shall have the steam in the shell side. The exchangers shall be of U-tube designs with bolted full-diameter channel covers to facilitate tube maintenance as required. The tubesheet shall be the full diameter to match the shell flange and shall have sufficient threaded holes so that a shell hydro test may be applied without the channel in place. Materials of construction shall be all carbon steel with the exception of the tubes which should typically be specified as stainless steel in accordance with \textit{ASTM A688/A688M}, Grade TP 304, stress relief annealed temper with the U-bends stress relieved after bending. Fuel oil heaters shall have carbon steel tubes in accordance with \textit{ASTM A179/A179M} and be furnished in the stress relief annealed temper with the U-bends stress relieved after bending.

e. Feedwater heaters shall be of all-welded construction with bolted full diameter channel covers to facilitate tube maintenance as required. The channel barrel shall be integral with the tubesheet and have an internal pass partition bolted cover design that shall be readily removable when the channel cover is removed. Pass partitions that are sealed with a gasketed groove in the channel cover are prohibited. Materials of construction shall be all carbon steel except the tubes. Pressure boundary material shall be in accordance with \textit{ASTM A516/A516M}, Grade C, when plate material is required, or \textit{ASTM A350/A350M} when forging material is required. Shroud plate material for desuperheating and subcooling zones shall be in accordance with \textit{ASTM A285/A285M}, Grade C. Tubes shall be stainless steel in accordance with \textit{ASTM A688/A688M}, Grade TP 304, stress relief annealed temper with U-bends stress relieved after bending. Shell shall be coated on the outer surfaces with an approved rust-inhibiting paint. Coils shall be designed for a working pressure of [_____] kPa psig. [A heat exchanger shall also be employed to reduce the temperature of high-pressure condensate by heating domestic or boiler feedwater, to prevent excessive flashing in the condensate tank.]

2.7 \textbf{DEAERATING FEEDWATER HEATER}

Deaerating feedwater heater shall be installed where indicated and shall be the size and capacity indicated. Shell shall be steel plate. [Tray system for a Type I unit shall be corrosion-resistant steel.] Floats shall be of
Overflow control shall be a [loop seal] [float-controlled overflow trap]. A heater shall be provided with a pressure relief valve, thermometers, pressure gauge, and oil separator. A combination temperature-pressure recorder shall be installed for each feedwater heater. Steam pressure readings shall be taken from the shell, and the temperature bulb shall [indicate] [record] the temperature of the feedwater after it passes over the trays and sprays. An alarm shall be provided to turn on a red pilot signal lamp and to sound a bell in the event that the water level in the feedwater heater storage tank falls to 300 mm 12 inches above the bottom of the tank. System shall be operated by an approved type of external electric float switch connected to the tank. Signal lamp and bell shall be mounted where directed. Float operator for the deaerator level control valve shall be of the externally connected cage type of semisteel construction and noncorrodible float, both designed for 858 kPa 125 psig working pressure, piped with shut-off and drain valves.

### 2.7.2 Detail Specifications

**************************************************************************

NOTE: In general, use tray system for fluctuating loads and the spray system for steady loads.

**************************************************************************

Heater shall be spray type with spray valve vent condenser in accordance with ASME BPVC SEC I and shall be designed for [___] kPa psig working pressure. Deaerator shall be ASME stamped. All steel plate used in construction of the heater and storage tank shells shall be ASTM A285/A285M Grade C. Where thickness makes it desirable, ASTM A515/A515M or ASTM A516/A516M steel may be used as appropriate. At least 2.0 mm 1/16 inch corrosion allowance shall be included over the calculated ASME Code thickness. Heater and storage tank shall be tested at a pressure 50 percent in excess of the design pressure. Heater shall be designed so that
corrosive gases do not come in contact with the outer shell or heads of the unit. However, units not complying with this provision will be accepted providing the upper head and the heater shell sections in contact with gases are clad with 304 stainless steel, 2.0 mm 1/16 inch minimum thickness. Heater shall be provided with adequate supports, manholes, gauge glasses denoting full water travel in the storage section, and all other connections as necessary for a complete working unit, along with those called out as accessories. Heater shall be provided with an internal vent condenser fabricated entirely of stainless steel which shall include a vent hood and vent orifice or separate vent valve. Heater section shall contain spring-loaded spray valves mounted in a stainless steel water box and a stainless steel vent condenser. Spray valves shall be constructed of 18/8 stainless steel and provide a constant angle of spray at ranges from 10 to 150 percent of capacity. Valves shall be hydraulically balanced, thus requiring no guides that might bind, scale, or otherwise clog. Spray valves shall be located to allow their servicing, inspection, and removal. Maximum tank dimensions shall be [_____] outside diameter. Internal parts of the deaerating heater, including baffles, distributing nozzles, vent pipe, and vent collecting hood shall be constructed of heavy gauge stainless steel. A drawing showing the "internal" construction of the heater shall accompany each bid. Deaerator shall include an internal sparger tube for chemical treatment injection. Boiler feedwater pump suction nozzle shall include a vortex breaker. Deaerator shall be provided with all of the connections shown on the drawings, as a minimum.

2.7.3 Deaerator Trim

Deaerator shall be provided with the following trim:

a. Safety relief valve set to open at 83 kPa 12 psig, and of sufficient capacity to protect the deaerator from excessive steam pressure with the steam regulating valve in fully open position.

b. Vacuum breaker valve.

c. Water gauge glasses with shutoff valves to cover the full water level range.

d. Pressure gauges shall conform to ASME B40.100 and shall be complete with siphon and isolation valve.

e. Makeup steam control valve with strainer, bypass, inlet and outlet valves. Valves to reduce steam pressure from [_____] kPa psig to [_____] kPa psig, with capability to operate at up to [2.07] [3.45] MPa [300] [500] psig inlet pressure. Reducing valve shall be adjusted to maintain the desired terminal pressure, regardless of fluctuations in the initial pressure. Valves shall be single-seated, spring loaded, quiet in operation, and guaranteed not to stick. Valve body 65 mm 2-1/2 inches and larger shall be cast steel; 50 mm 2 inches and smaller shall be of bronze. Valve trim shall be stainless steel, Monel metal, or approved corrosion-resisting material. All parts subject to wear shall be readily replaceable. Valves shall have seats and plugs faced with cobalt tungsten carbide mixture, or be made of heat treated stainless steel or high chromium steel guaranteed to resist erosion. Seat and plug facing shall have a Brinell hardness of not less than 450. Valve shall be installed with a strainer, a bypass, [safety valve on deaerator] as indicated. Sensing line shall be connected to the steam space in the deaerator. Control valve shall be sized for a minimum capacity of [_____] kg/hour lb/hour at design conditions, but
shall not have a capacity greater than [_____] kg/hour lb/hour for the same conditions. Valve trim shall be selected to result in a noise level not to exceed 85 dBA, measured 914 mm 3 feet from valve.

f. Makeup water control valve with bypass and inlet and outlet valves. Valve to operate at an inlet pressure of up to 552 kPa 80 psig.

g. Pneumatic level controller. Mechanical linkage control of makeup will not be acceptable.

h. Overflow trap or valve with float control.

i. Insulation clips for 38 mm 1-1/2 inch block insulation.

j. Lifting lugs as required.

k. Multiport relief valve with exhaust head for mounting in piping supplied by others.

l. Manual air vent valve.

m. Drain valve.

n. Chemical injection valve.

o. Sample valve.

p. High and low level switches.

q. All support steel.

2.7.4 Additional Requirements

All required foundations, anchor bolts, concrete work, and grouting, will be in accordance with Manufacturer's Load Diagram and Anchor Bolt Plan. Installation and covering shall conform to Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. All wiring incidental to the operation of controls and instrumentation will be provided. All steam and water piping to connect to the deaerator will be provided. Testing outfit conforming to ASTM D888 shall be provided, complete with chemicals for 100 tests. All controllers, alarms, gauges, sight glass, control valves, etc., shall be provided with shutoff and/or bypass valves as required for maintenance of the system while in operation.

2.7.5 Performance Guarantee

The manufacturer's guarantee shall provide that the deaerator shall:

a. Be of sufficient design to reduce the oxygen content of the feedwater to [_____] cc/liter when tested by the accepted modified Winkler or ASTM method.

b. Be of sufficient design to reduce free carbon dioxide to zero.

c. Be of sufficient design to ensure essentially noiseless operation at all rates up to and including maximum capacity.

d. Meet all performance requirements at all loads from 3 to 100 percent of capacity.
2.8 PIPING

Unless otherwise specified, pipe and fittings shall conform to Section 33 63 23 EXTERIOR ABOVEGROUND STEAM DISTRIBUTION.

2.9 CHEMICAL TREATMENT AND WATER SOFTENING EQUIPMENT

2.9.1 Chemical Feeder

**************************************************************************
NOTE: Chemical feeder shall conform to requirements of UFC 3-410-01 or UFC 3-410-02.
**************************************************************************

A feeder unit shall be provided for each boiler. Chemical feeders shall be automatic proportioning, shot, or pump type. All appurtenances necessary for satisfactory operation shall be provided. Size and capacity of feeder shall be based upon local requirements and water analysis. Feed piping shall be installed to feed chemicals directly to each boiler, as shown on the drawings or as required for the equipment supplied.

2.9.2 Pumps and Tanks

Chemical feed pumps and tanks shall be furnished as a package with the pumps mounted on and piping connected to the tank. Pump cylinders, plungers, ball check valves, and check valve bodies shall be of corrosion-resistant materials suitable for the chemicals being pumped. Volumetric accuracy of the pumps shall be within one percent over the range indicated. Pump capacities shall be adjustable by positioning the crankpin with micrometer setscrews. Stroke length scale shall be divided in percentage graduations engraved on the scale. Cylinders shall be replaceable for increased or reduced pressure or capacity ranges. Drive motors shall be suitable for the electric power available and shall have drip-proof enclosures. Each pump shall be driven by a separate motor. Tanks shall be made of polypropylene and mounted on legs. Tanks shall have filling and drain connections, and gauge glass. Each tank shall be furnished with one pump, mounted and piped with black iron pipe and fittings, with suction strainer and stainless steel screen, and with 13 mm 1/2 inch relief valve with steel body and stainless steel trim. Each tank shall have a hinged cover. Tank bottom shall be dished concave to a radius equal to the diameter of the tank. Units shall be for phosphate or caustic feed and sulfate feeding. Motor-driven agitator shall be provided. The pump shall be designed to feed the chemical solutions into the boiler feedwater system.

2.9.3 Water Softening Equipment

**************************************************************************
NOTE: Need for softening equipment for makeup water will be as determined in accordance with UFC 3-410-01 or UFC 3-410-02. If water softening is not required, delete the paragraph.
**************************************************************************

A complete sodium zeolite cycle water softening system shall be provided as specified in Section 22 31 00 WATER SOFTENERS, CATION-EXCHANGE (SODIUM
CYCLE). Equipment shall be sized to run 24 hours before regeneration when operating at a sustained softening rate of [_____] L/second gpm. Tanks shall be complete with cover and designed to eliminate the need for a gravel supporting bed.

2.10 BOILER CONTROL EQUIPMENT

**************************************************************************

NOTE: Positioning type control equipment will be specified for boilers with capacities of 13 MW 45 MBtuh or less. Metering type equipment will be used for larger boilers. Positioning type controls may be furnished for boilers with capacity of 13 MW 45 MBtuh or more in lieu of metering type.

A continuous emissions monitoring system (CEMS) is required by the Clean Air Act Amendment (CAA) of 1990 if the fuel utilized is oil or coal and the heat input is 3 MW 10 million BTU/HR or greater. A CEMS may also be required by state or local laws. If a CEMS is necessary the designer should review the CAAA and the relevant state or local law early in the project to allow time to incorporate the requires CEMS specifications and to determine which flue gas emissions will be included in the required reports.

**************************************************************************

a. An automatic control system shall be installed for each boiler in accordance with the manufacturer's recommendations. All locally indicating instrumentation and controls shall be provided and installed complete, as required to suit equipment furnished and as shown. All remote instrumentation, controls, and their connection points will also be provided and installed as indicated. If the controls are manufactured by a manufacturer other than the boiler manufacturer, installation of the controls shall be in accordance with the control manufacturer's instructions. Automatic controllers shall be located on the control room panel as specified.

b. Equipment shall operate either pneumatically, electrically, or electronically. Pneumatic control systems shall conform to CAGI B19.1. Air filter regulator sets shall be installed at each control valve and transmitter in the system. Master air filter regulator set on the control panel shall be of the dual type where one side can be cleaned and repaired while the other is in operation. Exterior control air piping and devices shall be protected from freezing by use of a regenerative desiccant dryer. Each system shall be provided with a selector switch or other means to permit manual control of the firing rate when required. Electrical control devices shall be rated at 120 volts and shall be connected as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Operating and limit controls shall be wired to interrupt the ungrounded circuit conductor.

c.[ Steam and energy generating equipment shall include instrumentation and sufficient metering for accountability interface with a future Energy Monitoring and Control System (EMCS).] If pneumatic controls are provided, duplex air compressors with a drier between the compressors and tank shall be provided. Air compressor units shall be sized to run not more than 60 percent of the time when all controls are
2.10.1 Positioning Type

Positioning type control equipment shall be capable of maintaining boiler steam pressure within plus or minus 2 percent of the set pressure over the complete range of boiler operation. Set point controllers may be used for on/off functions only. Combustion efficiency shall be maintained without appreciable manual adjustment. System shall be capable of maintaining the specified pressure provided that the load does not exceed a 15 percent per minute change in capacity at any one time. Master transmitter shall be connected to the main steam header where the steam pressure is to be controlled. The signal transmitted from this point to the master controller shall be a function of steam pressure. On multiple boiler installations, a means shall be provided to base load on individual boilers while on automatic, and each boiler unit shall be individually controlled. Provision shall be made on the control system for adding on other boilers to the system with only minor wiring or piping changes on the panel. Each automatic controller shall have a manual-to-automatic station and indicator on the control panel that will provide for selecting either automatic control or manual control and also will provide for manual operation. Manual controls shall be arranged to allow any one or more of the functions of the control system to be controlled manually while the other functions remain on automatic control. The manual control station shall be complete with all necessary indicators to facilitate changing from automatic control to manual control and vice versa. Controllers mounted on the instrument panel shall indicate and control measurement in the areas shown, and shall have a manual adjustment on the front of the instrument. Controllers shall be installed complete with wiring or piping between the controller, transmitter, and the final control device.

2.10.2 Equipment

Control equipment and instruments shall include fan controls, time clocks, relays, operating switches, indicating lights, gauges, motor starters, fuses, alarms, and circuit elements of the control system, and other controls and instruments necessary for unit operation. Control system shall be in accordance with FM APP GUIDE. Operating controls and instruments shall be mounted on one or more free-standing control panels conveniently located and placed so that operating personnel may effectively monitor boiler operations but not in a position that would interfere with those operations. Indicating and recording instruments will be provided for pressure, flow of air and liquids, and alarm circuitry. Automatic-control circuit systems and manual switches shall be interlocked to prevent hazardous conditions or the discharge of excessive amounts of air pollutants.

2.10.3 Boiler System Operation

******************************************************************************
NOTE: If the fuel being burned contains any significant pollutants, some states may not allow the flue gases to be vented to the atmosphere without going through an air pollution control device.
******************************************************************************

When steam is demanded, gases shall be directed through the boiler. As long as maximum energy is required, this shall be the mode of operation.
If less than full energy production is required, gas flow shall be modulated to reduce steam production by the boiler. Specified steam pressure shall be maintained within plus or minus 1 pound by means of a pressurestat and a boiler-draft regulator. The pressurestat with necessary relays shall stop and start the flow of gases by means of the induced draft fan so as to maintain the desired steam pressure.

2.10.4 Damper Control

Power units for the movement of dampers shall be sized to operate the device to be positioned, and shall be mounted so that a rigid mechanical connection to the device being operated can be used. Units shall automatically close in the event of failure of the operating medium. Manual operation of the controller shall not necessitate disconnecting the linkages during power failure or other emergency. Position switches shall be included on fuel and air-drive units for interlock with safety systems. Retransmitting devices shall be placed on all power units for remote indication on the control panel of the position of the mechanism at any time. If electric operators are utilized, gear trains on the units shall be oil immersed.

2.10.5 Draft Fan Control

Induced draft centrifugal fans shall have outlet dampers [and variable speed control]. [Axial propeller fans shall have variable propeller pitch control.] Means shall be provided for operating the induced draft fan for 15 minutes after the combustion equipment has ceased operation.

2.10.6 Soot Blower

All controls, lights, switches, and indicators provided for operation of soot blower shall be mounted on the control cabinet.

2.10.7 Boiler Limit Controls

Limit controls and interlock switches shall conform to UL 353.

2.10.7.1 Low-Water Cutoffs

Two low-water cutoffs shall be provided to prevent startup and to shut down the combustion equipment if the boiler water level is below the preset safe level. Primary interlock may be automatic or manual reset type. Secondary interlock shall be the manual reset type.

2.10.7.2 High-Pressure Limit Switch

A high-pressure limit switch shall be provided to shut down the combustion equipment when steam pressure exceeds the preset safe limit. This equipment shall be additional to the operating controls.

2.10.7.3 Draft Loss Interlock

A draft loss interlock and an airflow switch or a suction switch shall be provided to prevent startup and to shut down or bypass the combustion equipment when air is inadequate to safely support combustion. Limit and operating controls shall be provided for operation on a two-wire grounded branch circuit.
2.10.8 Instrument Control Panel

Panel shall be a NEMA ICS 6 Type 4 unit prewired, of steel, weathertight, and conforming to UL 50. Unless enclosed in a booth or separate room, the panel shall also be constructed to protect the instruments and controls from dust. The boiler control panel shall be located next to the control panel for the combustion equipment, or one panel may be used for both. Wiring of all instrument connectors and cable termination connectors shall be done in the factory by the instrumentation fabricator. All controls, instruments, and other equipment shall be flush mounted at the factory and be assembly-tested before shipment. A lock and two keys shall be furnished. All controls and instruments shall be identified with nameplates. [A thermostatically controlled heater to prevent condensation shall be provided.]

2.10.8.1 Panel Details

a. Instrument and control panel shall be sized to contain all controls, instruments, gauges, and meters. Panels shall be freestanding with a faceplate of not less than 7 mm 3/16 inch steel, properly reinforced, and shall be finished with the manufacturer's standard finish coating. The units shall be mounted flush on the panel as far as practicable. All controls, instruments, and other equipment shall be flush mounted, each fitting neatly into a cutout, and completely covering the cutout and any mounting screws or bolts.

b. Back of the panel shall be enclosed with sheet metal and with adequate removable access panels or doors for maintenance and removal of any unit without interfering with other units. Proper latching equipment and hardware shall be provided. Each recorder, indicator, and control unit shall be identified with nameplates securely fastened to the panel. Nameplates shall be black over white laminated plastic with the lettering penetrating the black surface to expose the white. Panel shall have continuous rapid-start fluorescent light fixtures mounted with reflectors providing suitable shielding to illuminate all controls, instruments, gauges, and meters.

c. All field piping connections shall terminate in one bulkhead-mounted manifold, located to conform with the installation requirements of the system. All field electrical wiring shall terminate in a color-coded terminal strip to conform with the installation requirements of the system. All electrical tubing or piping connections to controls, instruments, or other devices on the panel shall be inside the panel and not visible from the panel front. A suitable plug-in strip shall be provided in the rear of the panel for any required plug-in electrical connections of the instruments. All necessary transformers, separate relays, switches, and fuses shall be installed in a fully enclosed junction box. A fused safety switch shall serve the 120-volt power supply required for control circuits.

d. If a pneumatic control system is provided, the panel shall include duplex air supply filter and regulator set mounted on the rear of the panel with properly identified pneumatic terminal blocks and low point drain. High pressure lines will not be allowed to enter the panel. [If packaged burner units with integral controls are furnished, the control equipment may be mounted on a separate panel for each unit. Controllers and indicators specified or required shall be panel mounted and tested at the factory complete with relays, transformers, switches, wiring, valves, piping, and other appurtenances. All wiring and piping
within the panel shall be color-coded or otherwise identified.]  
Thermocouple and low energy signal conductors shall be completely 
isolated from power and alarm conductors, subject to approval by the 
Contracting Officer. Visual and audible alarms shall be provided to 
protect personnel and equipment.

2.10.8.2 Recorders

Recorders shall be servo-mechanism type, or multiple-pen type. [Circular] 
[Strip] chart shall be provided. Minimum chart width is 100 mm 4 inches. 
Accuracy shall be plus or minus 1/2 percent. Each pen shall have a 
separate scale calibrated in engineering units. Chart drive shall be 120 
volts ac. One year's supply of chart paper shall be provided. The record 
shall be made in ink on a [24-hour] [31-day] chart driven by an electric 
clock mechanism. Each recorder point shall be made with a different color 
ink. Recorders shall be installed complete with all necessary wiring or 
pipe between the recorder and the transmitter in the boiler room. 
Recorders mounted on the instrument panel shall record and indicate 
measurement in the areas shown.

2.10.8.3 Panel Display

The panel shall include visual indication of the various modes of the main 
system components (i.e., damper positions, I.D. fans). As a minimum, the 
following parameters shall be displayed on the panel:

a. Temperature recorder (boiler inlet exit).

b. Steam flow and pressure recorder (pressure immediately after second 
block valve, steam flow totalizer).

c. Clock with minimum 200 mm 8 inch diameter face (one panel only).

d. Steam gauge conforming to ASME B40.100 to indicate boiler shell or drum 
pressure.

2.10.8.4 Identification

All field items shall be furnished with a permanent metal tag suitable for 
tag number or service identification; back of panel items shall be included 
in this category. Wires and cables shall be installed without joints or 
splices except at terminal points. Wires shall be identified at both ends 
by labels.

2.10.8.5 System Diagram

Laminated, color-coded system diagram mounted on the control panel 
indicating all system components and location of all sensors and alarm 
points shall be furnished.

2.10.9 Pilot Lights

Pilot lights shall be assembled in a factory-built cabinet, suitable for 
flush mounting in cutouts in the control cabinet, complete with extruded 
trim, clamps, and sheet metal rear housing, and finished in baked black 
enamel. Components shall be integrated through appropriate 
electro-mechanical devices with push-to-test indicating lights. Industrial 
oil-tight construction shall be provided in the following colors for the 
indication functions:
a. Amber for power on the system.
b. Green for boiler purge completion (one per boiler).
c. White or manufacturer's standard color for energizing main fuel valves.
d. Red for alarms.
   (1) High temperature in combustion chamber.
   (2) High temperature at induced draft fan inlet.
   (3) System operation.
   (4) Emergency damper closed.

2.10.10 Clock

Clock shall be electric synchronous motor type. The clock shall be for surface mounting and suitable for operation on 115-volt, 60-Hz single-phase electric service. The clock shall have a shatterproof, crystal-covered white dial, easy-to-read black Arabic numerals, black hour and minute hands, red sweep second hand, and external manual reset knob at bottom of case. The motor gear train shall be sealed in a permanent oil bath.

2.10.11 Alarm Annunciator Panel

**************************************************************************
NOTE: Edit to indicate the number of points desired and specific items in the list.
**************************************************************************

An annunciator system shall be mounted on each control panel. Visual signals shall be backlit nameplates for each point. A common audible alarm signal and a common acknowledge push button shall be provided for each control panel. A common alarm-silencing relay shall be included in the alarm circuit which will permit the boiler operator to silence the audible horn while retaining visual indication until the malfunction or abnormal condition has been cleared. Nameplate size of alarm modules shall be nominal 70 mm 2-3/4 inches high by 75 mm 3 inches wide in translucent white acrylic plexiglass and all nomenclature shall be engraved on front surface in black lettering. Flasher module shall be mounted and prewired with silence and test pushbuttons. Alarm points and window engraving shall be as shown below.

2.10.12 Steam Flowmeters

Steam flowmeters shall be provided to measure the steam flow from each boiler and each main steam header outlet. Flow meters shall also be provided to measure feedwater flow to each boiler. Nozzles and orifice plates shall be flange-mounting type and made of stainless steel. Orifice plates shall be of the square edge, concentric, paddle type designed for flange taps. Condensate pots shall be provided for steam service. Meters shall be designed to accurately measure saturated steam at a gauge pressure of [_____] kPa psi. Meters shall be direct connected and of the indicating, recording, and integrating type with electric chart drives. Instrument cases shall be dust-tight metallic or plastic, finished in manufacturer's standard black, and arranged for flush-panel mounting. Flow records shall be in thousands of kg pounds per hour on an ink chart recorder. Steam flow shall be totalized in kg pounds by an integrator having not less than a six-digit counter. The installation of stainless steel orifice plates shall include shutoff valves, equalizing valves, and blowdown valves. Each meter shall have a guaranteed accuracy of plus or minus 1/2 of 1 percent while operating at 20 to 100 percent of capacity. Steam-flow orifices and associated steam piping shall be installed in accordance with the manufacturer's recommendations and labeled with the following tags:

</tbody>
</table>
2.10.12.1 Orifice Plate

The orifice plate shall be sized to produce a 25.42 kPa 100 inch W.G. pressure differential at the rated flow of the meter as shown on the drawings. Orifice plates shall be 3.2 mm 1/8 inch thick 316 or 304 SS, chambered with the sharp edge orifice facing upstream, fitted with a tab extending beyond flanges showing bore size, differential, and maximum flow. Calculation of flow shall be made by the manufacturer under ASME MFC-3M, or equivalent by Spink or American Gas Association. Plates for steam or condensibles service shall have a weep hole drilled in them when installed in horizontal meter runs.

2.10.12.2 Flow Transmitters

Pressure differential and transmitting components shall have an accuracy of plus or minus 1 percent, 0.15 percent repeatability, 4-20 milliamp dc signal into 0-500 ohms, (if electronic) internal square root extractor, adjustable zero and span, and equalizing valves. Span range, and working pressure shall be as shown on the drawings. Transmitters shall be installed with condensate reservoirs where required to protect transmitter from excessive temperature.

2.10.13 Boiler Feedwater Flow Meters

**************************************************************************
NOTE: For boilers having less than 4500 kg/hour 10,000 lb/hour steaming capacity, a mechanical feedwater meter may be provided. Plants having metered zeolite softeners used exclusively for boiler makeup will not require an additional cold water makeup water meter. Boilers over 4500 kg/hour 10,000 lb/hour capacity will have indicating-recording meters and they will be integrating type where indicated.
**************************************************************************

Flow meters for boiler feedwater measurement shall be Differential Pressure Type, Venturi Style. Venturi flow tubes shall be pound-rated with a series of nozzles around the inner surface to sense and average the velocity head. Tubes 150 mm 6 inches and larger shall be flanged and smaller tubes shall be installed between welded neck flanges. Smaller flow tubes shall be corrosion-resistant steel and flanged tubes shall have corrosion-resistant steel throat inserts. Metering shall be for water flow (and feedwater temperature). The receiver for each boiler shall be mounted on the boiler instrument panel. Equipment shall be complete with differential pressure transmitter, shutoff valves, equalizing valves, and blowdown valves as required for a complete installation.

2.10.13.1 Indicating Feedwater Meter Receivers

Meter receivers shall match other panel components in appearance and shall indicate water flow in [_____] . Where indicating feedwater meter only is utilized, a companion indicating feedwater temperature receiver shall be
2.10.13.2 Indicating, Recording, and Integrating Receivers

Meter receivers shall be indicating, recording, [and integrating] furnished in a dust-tight metallic or plastic case finished in manufacturer's standard black finish and arranged for flush panel mounting. The indicator shall show with a pointer the rate of water flow. The record of flow, in thousands of kg pounds per hour, shall be made in ink on a 24 hour, 300 mm 12 inch diameter, equally graduated circular chart driven by an electric clock mechanism. Sufficient blank charts and ink shall be provided for 400 days of operation. Meter shall also record boiler feedwater temperature in degrees C and degrees F on the same chart. [Water shall be totalized in kg pounds by an integrator having not less than a six-digit counter.]

2.10.14 Blowoff Sample Cooler

Sample cooler shall be a water-cooled, shell-and-tube or shell-and-coil type heat exchanger with stainless steel tubes and cast-iron or steel shell suitable for cooling the blowoff before sampling. Cooler shall be connected to a header and valved so the operator can obtain a sample of properly cooled blowoff from any boiler as desired. Cooler shall be properly supported and shall have a brass or bronze sampling cock with lever or compression handle. A sampling glass container suitable for handling the water temperature to be encountered and a hydrometer or equivalent device suitable for measuring the concentration of solids in the water and reading in parts per million shall be provided.

2.10.15 Temperature Indicators

The Contractor may install any of the following temperature measuring devices as indicated. Gauges shall match pressure gauges in appearance and shall match requirements of the transmitters supplied. Remote temperature indicators shall include condensate and steam temperature.

2.10.15.1 Thermometers

Thermometers shall conform to ASME PTC 19.3 TW, Type 1, Class 3, dial with wells and separable corrosion-resistant steel sockets, and temperature range suitable for the use encountered. Mercury shall not be used in thermometers. Thermometer shall be a dial, 90 mm 3-1/2 inch diameter chromium-plated case, remote bulb or direct bulb as required, with plus or minus 1 degree C 2 degree F accuracy, and white face with black digits graduated in 2 degree increments. Thermometers shall be installed so as to be easily read from the operating floor.

2.10.15.2 Thermocouples

Thermocouples shall be suitable for continuous operation and control at temperatures up to 1260 degrees C 2300 degrees F, accurate to 0.75 percent, and shall be long enough to be inserted 150 mm 6 inches into the boiler. Thermocouples conforming to ASTM E230/E230M, Type K shall be provided with an adjustable flange and with a high-temperature metal alloy closed-end protection tube suitable for inserting into the furnace without support of the projecting end. One hundred feet of 16-gauge compensating lead wire with a weatherproof braid shall be supplied for connecting the thermocouple to the instrument. Installed unit shall indicate gas passage temperatures and shall control combustion equipment operation. Temperature shall be
transmitted to the instrument in the control panel as shown.

2.10.15.3 Indicating, Recording Pyrometers

The instrument shall have a temperature range from minus 18 to plus 1316 degrees C (0 to 2400 degrees F), and shall be accurate to within plus or minus 1/4 of 1 percent of the range. Temperature shall be indicated on a large scale with prominent black letters on a white background and shall be recorded by chart recorder. The instrument shall have automatic cold-junction compensation. A simple means of pyrometer standardization shall be provided. Instrument shall not be affected by vibration, dust, or air currents when the door of the instrument is open. Lighting circuit for 110 volts ac shall be available.

2.10.16 Draft Indicator and Control

An indicator continuously showing pressure in the boiler shall be provided. A separate draft-controlling instrument maintaining a constant balanced (atmospheric) pressure in the boiler shall also be provided. Gauges shall conform to ASME B40.100, Style 1 with a diaphragm or bellows actuating system and a circular scale. Gauges shall have a zero adjustment screw and a connection to atmosphere. Suitable shutoff cocks shall be provided. Gauges shall be remote reading to the control panel and shall be installed complete with all necessary piping between the gauges and the points at which the drafts are measured. Gauge piping shall be copper tubing conforming to ASTM B68/B68M, Type K or L.

2.10.17 Pressure Gauges

Gauges shall be heavy-duty industrial type conforming to ASME B40.100, Type I, Class 1 or 2, as applicable, style as required, suitable for specified pressure or vacuum with minimum 115 mm (4-1/2 inch) diameter dial, except as otherwise specified. Pressure gauges shall be installed on the low-pressure side of each pressure-reducing valve, on the suction and discharge side of each pump, on inlets and outlets of heat exchangers, on the feedwater heater, and where shown or required for proper operation. Pressure gauge shall be installed on each boiler and shall have a [250 mm (10 inch)] [300 mm (12 inch)] dial face. Gauges shall be installed so as to be accessible and easily read from the operating floor. Gauges shall be equipped with integral or separate siphons, and pulsation dampeners and shall be connected by brass pipe and fittings with shutoff cocks. Where pressure reducing valves are used, upstream and downstream gauges shall be placed close to the pressure reducing assembly, but connected approximately 3 m (10 feet) therefrom. Operating ranges of the gauges shall be approximately twice the normal operating pressure.

2.10.17.1 Pressure Gauges (Panel)

[Three] 150 mm (6 inch) dial size, phenol or brass, black enamel finished case, gauges shall be furnished and installed to indicate main steam, boiler feedwater, and deaerator makeup. Gauges shall be Bourdon tube style with back connections and white dials with black lettering. Steam gauges shall be equipped with siphons and all gauges shall have shutoff valves at the panel. Panel entry shall be through bulk-head connectors located in the upper part of the panel. Gauge accuracy shall be at least 1/2 of 1 percent and normal readings shall be approximately 50 to 75 percent of full scale reading. The gauges shall be labeled:
### Pressure Gauges (Local)

[115 mm 4-1/2 inch dial size, phenol or brass, black enamel finished case, gauges shall be furnished and installed for the services shown below. Gauges shall be Bourdon-tube style with bottom connections and white dials with black lettering. Steam gauges shall be equipped with siphons and all shall be installed with shutoff valves. Gauge accuracy shall be at least 1/2 of 1 percent and normal readings shall be approximately 50 to 75 percent of full scale reading.]

</table>

Gauges shall conform to ASME B40.100 and shall be of pressure detecting class, single, Bourdon tube style, suitable for detecting air pressure. Gauges shall be remote reading to the control panel.

### Feedwater Temperature and Pressure Recorder

Feedwater temperature and pressure recorder shall be installed on the boiler plant central metering panel to record the deaerated feedwater temperature and the pressure of steam space in the deaerating heater. Recorder shall be as specified. Unit shall be provided with interconnecting tubing and separable sockets for elements located in the feedwater heater. Electrical connections shall be totally enclosed. Accuracy shall be within plus or minus 1 percent of the chart range.
2.10.19 Condensate Flowmeter

A 40 mm 1-1/2 inch in-line disk meter shall be furnished and installed in the makeup line to the deaerator. Meter shall have a bronze housing, stainless steel trim, and disk suitable for an operating temperature of 105 degrees C 220 degrees F. Meter shall be equipped with a register of at least six digits and have a capacity of at least 3 L/second 50 gallons per minute.

2.11 TOOLS

Special tools only shall be furnished and shall include all uncommon tools necessary for the operation, cleanout, and maintenance of the boilers, pumps, fans, controls, meters, special piping systems, and other auxiliary equipment. Small hand tools shall be furnished with a suitable cabinet, mounted where directed. The following tools shall also be furnished.

2.11.1 Tube Cleaner

For water-tube boiler installations, a water-driven cleaner shall be provided with three rotary cutters, the necessary length of armored water hose, valves, and all other appurtenances necessary for operation. Tube cleaner shall be provided for each size of watertube in the boiler, with one extra set of cutters for each size cleaner. Necessary valves and fittings shall be provided to permit convenient connection of the cleaner hose to one of the boiler feed pumps to supply cold raw water for operation of the cleaner. Piping arrangement shall be such that one boiler feed pump may be used to operate the cleaner without interfering with normal operation.

2.11.2 Tube Brush

Tube brush (for fire-tube boiler installations), with steel bristles and jointed handle of sufficient length to clean full length of fire-tubes, shall be provided.

2.11.3 Smoke Pipe Cleaner

Cleaner shall be provided to clean the breaching and smoke connections. Cleaner shall have jointed handle of sufficient length to clean breaching and smoke connections without dismantling.

2.11.4 Wrenches and Gaskets

Wrenches shall be provided as required for opening boiler manholes, handholes, and cleanouts. One set of extra gaskets shall be provided for all boiler manholes and handholes, for pump barrels, and other similar items of equipment. All gaskets shall be packaged and properly identified.
2.12 PAINTING AND FINISHING

2.12.1 Preventing Corrosion

Unless otherwise specified, surfaces of ferrous metal subject to corrosion shall be factory painted in accordance with the manufacturer's standard practice. All exposed pipe covering shall be painted as specified in Section 09 90 00 PAINTS AND COATINGS. Aluminum sheath over insulation shall not be painted. All metallic materials shall be protected against corrosion. Where connected to dissimilar metal, aluminum shall be protected by approved fittings and treatment. All parts such as boxes, bodies, fittings, guards, etc., made of ferrous metals, but not of corrosion-resistant steel, shall be zinc coated in accordance with ASTM A123/A123M or ASTM A153/A153M, except where other equivalent protective treatment is specifically approved in writing by the Contracting Officer. Where a rust-inhibiting coating or hot-dip galvanizing is specified, any protective treatment system that will pass the salt-spray fog test is acceptable.

2.12.2 Treatment

All surfaces of castings, forgings, molded parts, stampings, welded parts, exterior surfaces of the boiler, before application of the insulation, and all interior surfaces of the sheet jacket, before assembly, shall be cleaned to bare metal to remove oil, rust, sand, dirt, fins, spurs, scale, slag, flux, etc., before primer is applied at the factory. External surfaces shall be smooth and all edges shall be rounded or beveled, unless sharpness is required to perform a necessary function.

2.12.3 Boiler Coating

Boiler shall be finished with one coat of silicone aluminum heat-resisting (up to 648 degrees C 1200 degrees F) paint. Paint shall be applied directly to clean bare metal surfaces and shall attain a minimum dry film thickness of 1 mil. After assembly, all exposed surfaces of the equipment normally painted in good commercial practice shall be cleaned to bare metal and finished with two coats of silicone aluminum heat-resisting paint, with each coat being a minimum dry film thickness of 0.025 mm 1 mil. Component parts procured factory finished need not be repainted. Mechanical cleaning need not be performed on the sheet steel jacket if the surfaces are free of all mill scale and rust. However, the surfaces shall be cleaned to remove all grease and other foreign matter. Paint shall not be applied when the temperature is below 10 degrees C 50 degrees F or above 32 degrees C 90 degrees F.

2.12.4 Equipment Coating

Equipment and component items, when fabricated from ferrous metal, shall be factory finished with the manufacturer's standard finish if located within buildings. Items located outside shall have weather-resistant finishes that will withstand 500 hours of exposure to the salt-spray test specified in ASTM B117, using a 20 percent sodium chloride solution. This test may be performed on test specimens coated and finished in the same manner as the actual equipment. Immediately after the test, the specimens shall show no sign of blistering, wrinkling, cracking, or loss of adhesion and no sign of rust beyond 3 mm 1/8 inch on either side of the scratch mark.
2.13 FACTORY TESTS

Initial capacity and performance tests of factory-assembled boiler components shall be conducted at the manufacturer's plant. Any material or equipment rejected shall be either repaired or replaced before installation.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancies before performing the work. Because of the small scale of the drawings, it is not possible to detail all runs and indicate all required offsets, fittings, and accessories. Investigate structural and finish conditions affecting the work, arrange the work accordingly as required, and furnish the fittings and accessories required to meet such conditions. The plans are generally diagrammatic and the work of the different trades shall be coordinated so interference between conduit, piping, equipment, architectural, and structural work will be avoided. Building design modifications necessitated by the proposed equipment shall be the responsibility of the Contractor and shall be approved before proceeding with the work.

3.2 INSTALLATION

******************************************************************************
NOTE: All pertinent piping and related equipment supports will be designed for seismic forces as specified in subparagraph Support Steel below.
******************************************************************************

Equipment and material shall be installed as indicated and in accordance with manufacturer's instructions. A manufacturer's representative experienced in installation of this type of boiler, shall supervise the erection of the boiler and associated equipment.

3.2.1 Piping

Unless otherwise specified, pipe and fittings shall conform to Section 33 63 23 EXTERIOR ABOVEGROUND STEAM DISTRIBUTION.

3.2.2 Field Painting

******************************************************************************
NOTE: Where identification of piping is required by the using service, this paragraph will be amplified to include appropriate requirements either directly or by reference to a separate section. Air Force requirements are covered in AFM 88-15.
******************************************************************************

All ferrous metals not specified to be coated at the factory shall be cleaned, prepared, and painted as specified in Section 09 90 00 PAINTS AND COATINGS. All exposed pipe covering shall be painted as specified in Section 09 90 00 PAINTS AND COATINGS. Aluminum sheath over insulation shall not be painted.
3.2.3 Insulation

Shop- and field-applied insulation shall be as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS unless otherwise specified. Breaching, unjacketed boilers, [dust collectors,] and induced draft fan housings shall be insulated with magnesia, mineral wool, calcium silicate, or approved mineral insulation. Insulation may be either block or blanket. Joints in the insulation shall be filled with magnesia, mineral wool, or a suitable cement.

3.2.4 Foundation

Boiler foundation shall be constructed of [21] [_____] MPa [3000] [_____] psi concrete as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE. Anchor bolts shall be set accurately and shall be of adequate length to install the boiler. When embedded in concrete, anchor bolts shall be provided with plates welded on the head and shall be protected against damage until the equipment is installed. Plates shall conform to ASTM A36/A36M.

3.2.5 Equipment Structural Support

3.2.5.1 Structural Steel

Design structural steel equipment supports in accordance with Section 05 12 00 STRUCTURAL STEEL.

3.2.5.2 Support Steel

**************************************************************************
NOTE: Provide seismic requirements, if a Government designer (Corps office or A/E) is the Engineer of Record, and show on the drawings. Delete the bracketed phrase if seismic details are not included. UFC 3-301-01 and Sections 13 48 73 and 23 05 48.19, properly edited, must be included in the contract documents.
**************************************************************************

Design support steel to resist all applicable dead and live loads. Design for seismic loads shall be as specified in UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MECHANICAL EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC [as indicated]. Show a complete loading and support diagram on the detail drawings. Equipment supports shown on the contract drawings are for a general equipment layout and may not conform to the system furnished. Piers and footings may be relocated to suit equipment furnished if no interference with other footings is encountered. Support steel shall comply with ASTM A242/A242M and be fabricated in accordance with the provisions of Section 05 05 23.16 STRUCTURAL WELDING or field bolted using ASTM A325M ASTM A325 high strength bolts. Submit manufacturer's design data and structural computations for walls, roof, foundations, and other features for specialty type of construction, with design data for lateral forces that may be encountered due to wind loads and seismic forces. Include in the design data manufacturer's equipment design data.

3.2.5.3 Column Base Plates

Design column base plates to bear on a [21] [_____] MPa [3000] [_____] psi
concrete floor slab.

3.2.5.4 Anchor Bolts

Anchor bolts shall be ASTM A307 anchor bolts. Anchor bolt sizes and locations shall be shown on the detail drawings.

3.2.6 Stack Support

**************************************************************************

NOTE: Indicate wind force the stack design will have to withstand. Structural design will also include seismic resistance as specified in subparagraph Support Steel above.

**************************************************************************

Stack support shall be in accordance with NFPA 211, as applicable. Vertical and lateral supports for exterior chimneys shall withstand wind forces of \([130] \ [\underline{\phantom{00}}] \ \text{km/hour} \ [80] \ [\underline{\phantom{00}}] \ \text{mph}\).

3.2.7 Catwalks and Access Platforms

All necessary platforms, ladders, handrails, and stairs needed for safe and efficient operation and maintenance of the equipment shall be furnished and installed. They may be relocated from the wall openings and passageways shown in order to suit the boiler equipment provided. All railings shall have 100 mm 4 inch wide toe-board located not more than 6 mm 1/4 inch above the floor level. Construction shall conform as close as practical to items indicated. Fabrication, materials, and coatings shall conform to Section 05 12 00 STRUCTURAL STEEL.

3.2.8 Control System Installation

Install equipment in accordance with the manufacturer's instructions and approval by the Contracting Officer. All control conduit, wiring and/or tubing not specified elsewhere, but required to provide a complete and operable system shall be furnished and installed under this section of the specifications. This shall include material and items required to arrange the system to compensate for the actual field conditions encountered. Copper, stainless steel, or nonmetallic tubing may be used as appropriate. Copper shall be ASTM B88M ASTM B88, Type K; with flared cast brass or wrought copper fittings. Pneumatic tubing shall be 6.4 mm 1/4 inch OD with a minimum wall thickness of 0.762 mm 0.030 inch unless otherwise indicated. Where 9.5 mm 3/8 inch or 12.7 mm 1/2 inch OD tubing is used, the wall thickness shall be a minimum of 1.245 mm 0.049 inch. The extent, general location, and arrangement of the system shall be as indicated. Control panels shall be located as indicated and placed so that operating personnel may effectively monitor boiler operations, but shall not be in a position that would interfere with those operations. Equipment, instruments, piping, wiring, and tubing shall fit into the space allotted and allow adequate clearances for entry, servicing, and maintenance. Locally mounted instruments shall be installed in such a manner as to prevent interference with mechanical installations and to ensure readability from the front aisles or operating area of the equipment. Installation of the instrumentation system shall be carefully coordinated with the work of other trades.
3.2.9 Field Tubing

Tube fittings shall be compression type and compatible with tubing material (e.g., brass for copper tubing, stainless steel for stainless steel tubing, and nonmetallic for nonmetallic tubing). Each connection shall be checked for proper tightness and installation. All piping between primary connections and instruments shall be a minimum of 9.5 mm 3/8 inch OD tubing. All copper instrument single connecting lines shall be provided with brass, ASTM B61, 20.7 MPa 3000 psi rating, forged body screws or tube ends.

3.2.9.1 Tubing Supports

PVC-coated expansion metal troughs or epoxy-coated vertical unistrut racks shall be used as tubing supports. No elbows, tees, or crosses shall be used. Where the trough branches or changes direction, a suitable gap for the transition will be acceptable. The tubing shall be unsupported over the gap.

3.2.9.2 Air Supply

Instrument air supply headers shall be as shown. Instrument air shall be distributed through the area at nominally 620 kPa 90 psig. Pressure shall be reduced to that required at the instrument by a local regulator. An air set unit shall be furnished and installed for each instrument that has a pneumatic output signal (e.g., transmitter, transducer, controllers, positioner, and relay). Air set units shall have a filter regulator with integral drip-well and drain cock and output gauge.

3.2.10 Electrical

Instrumentation and power-interconnecting wiring shall be as [shown] [recommended by the manufacturer] and as specified in NFPA 70. All external wiring to the control panels shall terminate on terminal boards or on devices in the panels. All cable wire and cable runs shall be carried in conduit or wireways. All signal wiring used for alarm or measurement of control circuits shall be run in conduit separate from power circuits. Direct current signals used for electronic transmission may be run in multiconductor cables. Wiring for control, shutdown, or interlock circuits may be run in the same conduit with power wiring as shown. Instruments shall not be fed from lighting branch circuits. Termination of all wires on instrument binding screws shall be made with solderless insulated shoulder ring-tongue lugs of the proper size for the wire and binding screw. Lugs shall be properly and securely crimped to the wire using the tool recommended by the lug manufacturer. Any termination that is made improperly shall be cut off and a new lug installed. Stripping of all wire shall be done with an approved stripping tool or in such a manner as not to damage the conductor.

3.2.10.1 Cable Conductor Identification

Identification shall be permanently attached to each wire terminating on a terminal board or binding screw to facilitate maintenance. Identification shall be by means of plastic sleeving with printed markings, permanently attached stamped foil markers, or other approved means. Wire numbers shall correspond to wire numbers shown.
3.2.10.2 Relays

Industrial relays shall be provided for interlocking circuits. Contacts and coils shall be accessible for cleaning and replacement.

3.2.11 Steam Flowmeter Installation

Transmitters shall be mounted at the orifice flanges. Impulse lines shall be sloped to eliminate liquid or gas pockets. Meter manifolds shall be three-valved, except a five-valve manifold shall be used when the meter is sealed or purged.

3.3 MANUFACTURER'S SERVICES

Provide the services of a manufacturer's representative who is experienced in the installation, adjustment, and operation of the equipment specified. The representative shall supervise the installing, adjusting, and testing of the equipment. Ensure that sufficient lead time is given to prevent installation delay resulting from late delivery of equipment and materials.

3.4 TESTING

3.4.1 General

Before requesting the performance and acceptance test, final checking of systems installations and preliminary operation testing and adjustments of all systems shall be conducted in accordance with the manufacturer's recommendations and the requirements of the specifications. All tests shall be scheduled in advance and conducted at times approved. Perform testing in the presence of the Contracting Officer. Submit test reports in booklet form showing all field tests performed to adjust each component and all field tests performed to prove compliance with the specified performance criteria, upon completion and testing of the installed system. Each test report shall indicate the final position of controls. Submit a written statement from the manufacturer's representative certifying that control equipment has been properly installed and is in proper operating condition, upon completion of the installation. Provide the action settings for all automatic controls in the form of a typed, tabulated list indicating the type of control, location, setting, and function. The test report booklet shall include logs, thermal efficiency calculations, tabulated results, and conclusions.

3.4.1.1 Schedule for Testing

Notify the Contracting Officer in writing at least [20] [_____] days in advance of the intent to test the boilers, and submit a testing schedule. The Contracting Officer will notify the appropriate authorities.

3.4.1.2 Visual Inspection

Examine each boiler for defects outlined below:

a. Parts of components missing.

b. Improper assembly.

c. Parts or components not functioning properly.

d. Workmanship not as specified.
e. Exposed edges of metal not smooth.

f. Materials not as specified.

3.4.1.3 Repairs

Replace all defective parts furnished and installed by the Contractor and complete all repairs identified during capacity and operating tests.

3.4.2 Instrumentation Tests

Test all instrument systems after completing the following activities:

a. Inspect complete work and make any nonoperating checks required to assure operability in the manner required for the process application.

b. Check instrument air lines and wiring for proper hookup.

c. Test air lines for tightness according to the requirement of the Instrument Society of America Recommended Practice ISA 7.0.01.

d. Commission instruments, controls, interlocks, alarms, and related items. Include operating checks, provision and installation of seals as required, checking and adjusting settings, standardizing and calibration, and proof tests.

e. Install relief valves and filter regulator sets.

f. Insulate and winterize instruments.

If all of the above cannot be completed before startup, advise the Contracting Officer in writing 2 weeks before testing.

3.4.3 Dielectric Tests

Test electrical system for dielectric strength. Electrical system, excluding control and recording instruments, shall be subject to a voltage of twice its rated voltage, plus 500 volts, for a period of not less than 1 minute. Before testing, all instruments and operating mechanisms that could be damaged shall be disconnected. After the test, the circuit shall still register a resistance of not less than 1 megohm at 600 volts dc. This test shall apply between all insulated circuits and external metal parts.

3.4.4 Control Tests

Test boiler under actual firing conditions. Verify with the tests that all controls function within the maximum and minimum limits for temperature or timing. Unsafe conditions, such as high temperatures, shall be simulated during the tests by reducing the settings for activation of limit and safety controls.

3.4.5 Necessary Temporary Piping

Necessary temporary test piping not less than 100 mm [4] inches in diameter shall be furnished. A steam silencer to exhaust excess steam to the atmosphere in the event the boiler load is insufficient to meet the capacity specified shall be provided. A control valve for
exhausting excess steam to atmosphere shall be provided in a convenient location inside the boiler room.

3.4.6 Test of Deaerating Feedwater Heater

Test of the deaerating feedwater heater shall comply with ASME PTC 12.3 and demonstrate that the equipment installed shall meet the requirements specified as to performance, capacity, and quality of effluent. During the operating test of the boilers, tests shall be conducted to determine oxygen content in accordance with ASTM D888, Method A. Boilers shall be operated at varying loads up to maximum heater capacity while oxygen tests are being made.

3.4.7 Test of Water Treatment Equipment

Test of water treatment equipment shall meet the requirements specified as to capacity and quality of effluent. Tests for ion exchange units shall cover at least two complete regenerations and capacity runs. Boiler water conditioning shall include chemical treatment and blowdown periods to prevent scale and corrosion in boilers and in supply and return distribution systems from the initial start of the system, through the testing period, and to final acceptance of the completed work. Approved chemicals and method of treatment shall be used.

3.4.8 Hydrostatic Tests

Following erection, each boiler shall be tested hydrostatically and proved tight under a gauge pressure of 1-1/2 times the working pressure specified. Following the installation of all piping and boiler house equipment, but before the application of any insulation, hydrostatic tests shall be made and the system shall be proved tight under gauge pressures of 1-1/2 times the specified working pressure. Boilers shall be tested and the piping connections inspected by an NBBI-commissioned boiler inspector for determining compliance with all requirements in ASME BPVC SEC VIII D1, and the Contracting Officer shall be supplied with a certificate of approval for each boiler. Shop foam shall be applied to all seams to detect leaks. Boiler shall not lose more than [1.27] [_____] kPa [5] [_____] inches water gauge in [10] [_____] minutes.

3.4.9 Test for Steam Purity and Water Level Stability

Test for steam purity, in accordance with ASTM D1066, and water level stability shall be simultaneous under the operating conditions specified.

3.4.9.1 Steam Tests

Steam tests for boiler over [2.07] [_____] MPa [300] [_____] psig, without superheaters, not used for power generation or large turbine drive, shall be made on steam sampled in accordance with ASTM D1066, using the conductivity method in ASTM D2186. The conductivity of the steam corrected for carbon dioxide and ammonia content shall not exceed 30 microhms at 18 degrees C. Steam for boilers less than [2.07] [_____] MPa [300] [_____] psig, with or without superheat, used for power generation or turbine drive for air-conditioning equipment shall be sampled in accordance with ASTM D1066 and shall be tested in accordance with the conductivity method in ASTM D2186. The conductivity of the steam corrected for carbon dioxide and ammonia content shall not exceed 4.0 microhms at 18 degrees C 60 degrees F. Steam shall be tested for moisture in accordance with calorimetric method outlined in Part II of ASME PTC 19.11.
3.4.9.2 Water Level Stability Test

Water level stability test first shall be conducted by use of the manual bypass around the feedwater regulator. Test then shall be repeated using the automatic feedwater regulator. Boiler shall maintain specified water level stability under both conditions.

3.4.10 Performance Tests

Submit a proposed performance test procedure for the operating [and environmental] tests, 30 days prior to the proposed test date. The procedure shall contain a complete description of the proposed test with calibration curves or test results furnished by an independent testing laboratory of each instrument, meter, gauge, and thermometer to be used in the tests. The test shall not commence until the procedure has been approved. The Contractor's complete plan for water treatment, including proposed chemicals to be used and nationally recognized testing codes applicable to the system, shall be included and approved prior to system startup.

a. Upon completion of installation, the boiler and associated equipment and instrumentation shall be subjected to such operating tests as may be required to demonstrate satisfactory functional operation. [Stack sampling for compliance with applicable emission limits is covered under Section 23 52 00 HEATING BOILERS.] Testing shall be in accordance with the test procedures indicated below and shall be in accordance with the requirements of ASME PTC 19.10. All pressure measurements are to be taken in accordance with ASME PTC 19.2, and all temperature measurements are to be taken in accordance with ASME PTC 19.3 TW. Furnish all instruments, equipment, and personnel required for the tests. The Government will supply water, electric power, and fuel. Two instruction manuals shall be available at all times during the tests.

b. An efficiency and capacity test shall be run on one boiler of each size installed, conducted in strict accordance with ASME PTC 4, abbreviated efficiency test, utilizing the input-output method, except for use of alternate measuring or metering devices properly calibrated before the test, for the purpose of metering the water used and change in the temperature of flue gas. Combustion gases entering the heat recovery boiler shall be analyzed and recorded. Record CO, CO2, H2O, O2, N2, HCl, SO2 and temperature. Water meter used in the test shall be suitable for hot water. Efficiency shall be not less than specified. Maximum moisture content of saturated steam leaving the boiler shall be as specified. Efficiency and general performance tests on the boilers shall be conducted by a qualified test engineer. Calibration curves or test results furnished by an independent testing laboratory of each instrument, meter, gauge, and thermometer to be used in efficiency and capacity tests shall be furnished before the test. All indicating instruments shall be read at 1/2-hour intervals unless otherwise directed. Instruments required for conducting the boiler tests are contained in ASME PTC 4 and ASME PTC 19.11.

3.5 CLEANING OF BOILERS AND PIPING

**************************************************************************
NOTE: Local guidelines may dictate the maximum discharge rate for cleaning chemicals into the
sanitary sewer system.

After the hydrostatic tests, but before the operating tests, clean the boilers of foreign materials. Wherever possible, surfaces in contact with water shall be wire brushed to remove loose material.

a. The following procedure may be used or submit other standard procedure for review and approval by the Contracting Officer. Fill boilers with a solution consisting of the following proportional ingredients for every 1000 liters gallons of water and operated at approximately 200 to 350 kPa 30 to 50 psig for a period of 24 to 48 hours, exhausting steam to the atmosphere:

1. 2875 g 24 pounds caustic soda.
2. 2875 g 24 pounds disodium phosphate (anhydrous).
3. 960 g 8 pounds sodium nitrate.
4. 60 g 1/2 pound approved wetting agent.

b. Chemicals in the above proportions or as otherwise approved shall be thoroughly dissolved in the water before being placed in the boilers. After the specified boiling period, the boilers shall be allowed to cool, then drained and thoroughly flushed. Piping shall be cleaned by operating the boiler for approximately 48 hours, wasting the condensate.

c. Provide boiler water conditioning, including chemical treatment and blowdown during periods of boiler operation to prevent scale and corrosion in boilers and in supply and return distribution systems from the initial startup of the system, through the testing period and to final acceptance of the completed work. Approved chemicals and method of treatment shall be used.

3.6 FRAMED INSTRUCTIONS

Provide framed instructions under glass or in laminated plastic, including wiring and control diagrams showing the complete layout of the entire system, equipment, piping, valves, and control sequence. Post the instructions where directed. Condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation, and procedures for safely starting and stopping the system shall be prepared in typed form, framed and posted beside the wiring and control diagrams. Submit posted diagrams, instructions, and other sheets, before posting. Post framed instructions before acceptance testing of the systems.

3.7 FIELD TRAINING

Provide a training course for designated operating, maintenance, and supervising staff members. Provide training for a total period of [_____]
hours of normal working time, starting after the system is functionally complete, but prior to final acceptance tests. Field training shall cover all of the items contained in the approved operating and maintenance instructions as well as demonstrations of routine maintenance operations. Submit [6] [_____] complete copies of operating instructions outlining the step-by-step procedures required for system startup, operation, and emergency shutdown. The instructions shall include the manufacturer's name, model number, service manual, parts list, and brief description of all equipment and their basic operating features. Submit [6] [_____] complete copies of maintenance instruction listing routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guides. The instructions shall include piping layout, equipment layout, and simplified wiring and control diagrams for the system as installed, and other information necessary for equipment maintenance. Field training shall also include recommendations for total staffing and job descriptions. Notify the Contracting Officer at least 14 days prior to date of proposed conduction of the training course.

3.8 OPERATING TEST

Perform test at full-scale for 24 hours, or longer if required by the combustion equipment specifications. During this period, the boilers shall supply the rated amount of steam at the temperature, pressure, and thermal efficiency specified when the unit is supplied with the rated amount of hot gases at the specified temperature. The entire unit shall maintain this efficiency during the entire test period. After [4] [_____] hours, temperature readings of the outer shell, taken at not less than five random locations, shall not exceed the temperature limitation specified. Boilers shall also demonstrate the ability to operate well with the combustion equipment and to follow changing load demands while maintaining specified steam temperature and pressure based upon the limitations of the equipment. At the conclusion of testing, the boilers shall be inspected for deterioration such as slagged or spalling refractory, warping of parts, and discolored exterior paint.

1.2 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for
Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
   Steam-Generating Units; G[, [______]]
   Equipment Erection; G[, [______]]

SD-03 Product Data
   Steam-Generating Units
   Spare Parts
   Framed Instructions
   Welding

SD-06 Test Reports
   Tests

SD-10 Operation and Maintenance Data
   Steam-Generating Units; G[, [______]]

1.3 QUALITY ASSURANCE

1.3.1 Welding

**************************************************************************
NOTE: Where pipeline, structural, or other welding is required on the same project, tests will be required accordingly. Testing may be by the coupon method as prescribed in the welding code or by special radiographic methods. If the need exists for more stringent requirements for weldments, delete the first bracketed statement and delete the welding submittal.

**************************************************************************

[Submit a copy of qualified procedures and a list of names and identification symbols of qualified welders and welding operators, and a
proposed performance test procedure, 30 days prior to the proposed test date, containing a complete description of the proposed test along with calibration curves or test results furnished by an independent testing laboratory of each instrument, meter, gauge, and thermometer to be used in the tests. The test shall not commence until the procedure has been approved. Submit complete plan for water treatment, including proposed chemicals to be used and nationally recognized testing codes applicable to the system, prior to system startup. Piping shall be welded in accordance with qualified procedures using performance qualified welders and welding operators. Procedures and welders shall be qualified in accordance with ASME BPVC SEC IX. Welding procedures qualified by others, and welders and welding operators qualified by another employer may be accepted as permitted by ASME B31.1. The Contracting Officer shall be notified 24 hours in advance of tests and the tests shall be performed at the work site if practicable. The welder or welding operator shall apply his assigned symbol near each weld he makes as a permanent record. [Structural members shall be welded in accordance with Section 05 05 23.16 STRUCTURAL WELDING. Welding and nondestructive testing procedures are specified in Section 40 05 13.96 WELDING, PRESSURE PIPING.]

1.3.2 Use of Asbestos Products

**************************************************************************
NOTE: The first clause in brackets should be used when it is known that substitutes are available for any asbestos products which might be included with the equipment. The second clause in brackets should be used when it is possible or definitely known that asbestos products for which no technically acceptable substitute exists may be included with the equipment.
**************************************************************************

[Products which contain asbestos are prohibited. This prohibition includes items such as packings or gaskets, even though the item is encapsulated or the asbestos fibers are impregnated with binder material.] [Except as provided below, products which contain asbestos are prohibited. This prohibition includes items such as packings and gaskets, even though the item is encapsulated or the asbestos fibers are impregnated with binder material. Asbestos products are acceptable only in exceptional cases where the Contractor states in writing that no suitable substitute material exists, and, in addition, the Contractor furnishes to the Contracting Officer a copy of U.S. Department of Labor, Occupational Safety and Health Administration, "Safety Data Sheet" (Form OSHA-20), completed by the asbestos manufacturer stating that the product is not an asbestos health hazard.]

1.4 DELIVERY, STORAGE, AND HANDLING

Protect all equipment delivered and placed in storage from the weather, humidity and temperature variation, dirt and dust, or other contaminants.

1.5 EXTRA MATERIALS

Submit spare parts data for each item of equipment specified, after approval of the detail drawings and not later than [_____] months before the date of beneficial occupancy. Include in the data a complete list of spare parts and supplies, with current unit prices and source of supply, and a list of the parts recommended by the manufacturer to be replaced.

PART 2 PRODUCTS

2.1 MATERIALS AND EQUIPMENT

2.1.1 Standard Products

Provide materials and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of the products and that essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Equipment shall be supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.

2.1.2 Nameplates

Each major item of equipment shall have the manufacturer's name, address, type or style, model or serial number, and catalog number on a plate secured to the item of equipment.

2.1.3 Prevention of Rust

Unless otherwise specified, surfaces of ferrous metal subject to corrosion shall be factory prime painted with a rust inhibiting coating and subsequently factory finish painted in accordance with the manufacturer's standard practice. Equipment exposed to high temperature when in service shall be prime and finish painted with the manufacturer's standard heat resistant paint to a minimum thickness of 0.025 mm 1 mil.

2.1.4 Equipment Guards and Access

Belts, pulleys, chains, gears, couplings, projecting setscrews, keys, and other rotating parts exposed to personnel contact shall be fully enclosed or guarded. High temperature equipment and piping exposed to contact by personnel or where it creates a fire hazard shall be properly guarded or covered with insulation of a type specified. Items such as catwalks, operating platforms, ladders, and guardrails shall be provided where shown and shall be constructed in accordance with Section [08 31 00 ACCESS DOORS AND PANELS] [05 51 33 METAL LADDERS].

2.2 BOILERS

**************************************************************************
NOTE: Specify steam outlet temperature in cases where the boiler includes a superheater.
**************************************************************************

Each boiler shall have the capacity indicated. The equipment design and accessory installations shall permit accessibility for maintenance and service. Boilers shall be designed for a maximum allowable working pressure of [_____] Pa psig with an operating pressure of [_____] Pa psig. Design conditions shall be as follows:

<table>
<thead>
<tr>
<th>Rated capacity</th>
<th>[_____] kg/hour pounds/hour</th>
</tr>
</thead>
<tbody>
<tr>
<td>Steam outlet temperature</td>
<td>[_____] degrees C degrees F</td>
</tr>
</tbody>
</table>
The boiler shall be capable of operating continuously at maximum specified capacity without damage or deterioration to the boiler, setting, firing equipment, or auxiliaries. The boiler shall be capable of automatically controlled operation while burning the fuel specified.

2.2.1 Capacity

Rated capacity shall be the capacity at which the boilers will operate continuously without exceeding the specified furnace heat release and transfer rates, furnace exit temperature, and gas exit temperature. Boiler auxiliaries including fans, motors, drives, and similar equipment shall be provided with at least 10 percent excess capacity to allow for field variations in settings and to compensate for any unforeseen increases in pressure losses in appurtenant piping and ductwork. [Stoker and grate capacities shall also be provided with 10 percent excess capacity to allow for variations in coal analysis.]

2.2.2 Electrical Equipment

Electric motor-driven equipment specified shall be provided complete with motors and necessary motor control devices. Motors and motor control devices shall be in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM including requirements for hazardous area locations. Integral size motors of shall be premium efficiency type in accordance with NEMA MG 1.

2.2.2.1 Motor Ratings

Motors shall be suitable for the voltage and frequency provided. Motors 373 W 1/2 horsepower and larger shall be three phase, unless otherwise indicated. Ratings shall be adequate for the duty imposed, but shall not be less than indicated.

2.2.2.2 Motor Starters

NOTE: Where motor starters for mechanical equipment are provided in motor control centers, delete the reference to motor starters.

Where a motor starter is not shown in a motor control center on the electrical drawings, a motor starter shall be provided. Where required, motor starters shall be provided complete with properly sized thermal overload protection and other equipment at the specified capacity, including an allowable service factor and other appurtenances necessary for the motor starter specified. Manual or automatic control and protective or signal devices required for operation specified and any wiring required to such devices not shown on the electrical drawings shall be provided. Where two-speed or variable-speed motors are indicated, solid-state variable-speed controllers may be provided to accomplish the same function.
2.2.3  Boiler Design Requirements

2.2.3.1  Radiant Heating

******************************************************************************
NOTE: The following is a guide to determine maximum radiant heat release:

<table>
<thead>
<tr>
<th>Boiler Type</th>
<th>Maximum kJ/sq meter Btuh/sq ft</th>
</tr>
</thead>
<tbody>
<tr>
<td>Controlled circulation</td>
<td>1,419,500 125,000</td>
</tr>
<tr>
<td>watertube boilers</td>
<td></td>
</tr>
<tr>
<td>Natural circulation</td>
<td>1,135,650 100,000</td>
</tr>
<tr>
<td>watertube boilers</td>
<td></td>
</tr>
<tr>
<td>Firetube boilers</td>
<td>1,135,650 100,000</td>
</tr>
</tbody>
</table>

******************************************************************************

The maximum effective radiant heating surface shall be limited to [_____] watt per square meter input Btu input per square foot per hour.

2.2.3.2  Heat Input

The maximum heat input per cubic meter cubic foot of furnace volume shall be [931.5 Megajoules/cubic meter 25,000 Btu/cubic foot with spreader stokers] [1.7 Gigajoules/cubic meter 45,000 Btu/cubic foot with underfeed stokers].

2.2.3.3  Combustion Gas

The combustion gas temperature at the furnace exit shall be a minimum of 38 degrees C 100 degrees F less than the ash fusion softening temperature (reducing atmosphere) of the coal specified.

2.2.3.4  Ash Discharge

[Spreader stoker units with continuous or intermittent automatic mechanical ash discharge grates, or one of the traveling grate type, shall have a maximum loading of 2.2 Mega watts/square meter 700,000 Btuh/square foot of grate area.] [Underfeed dumping grate units shall have a maximum loading 1.4 Mega watts/square meter 450,000 Btuh/square foot of grate, assuming a 10 percent maximum ash content and 1205 degrees C 2,200 degrees F minimum ash softening temperature. The area shall not include side dumping areas.]

2.2.3.5  Radiant Heating Surface

Effective radiant heating surface shall be as specified in ASME BPVC SEC I. For firetube steel firebox boilers it shall be the total water backed area within the furnace boundaries exposed to the flame. The mean circumference shall be used for corrugated crown sheets.

2.2.3.6  Furnace Volume

Furnace volume for watertube or firetube boilers is defined as the cubical volume between the top of the grate and the first plane of entry into, or between, the tubes. If screen tubes are utilized, they constitute the plane of entry.
2.2.3.7 Boiler Operating Capacity

The boiler shall maintain continuous capacity within the specified range at the specified pressure with boiler feedwater at a temperature of approximately [_____] degrees C degrees F. The flue gas outlet temperature shall be [_____] degrees C degrees F, based on excess air of [_____] percent and carbon loss of [_____] percent at maximum continuous capacity. Moisture in steam and boiler water concentrations shall be in accordance with ABMA Boiler 402.

2.2.3.8 Boiler Output Capacity

Output capacity of the boiler shall be based on tests of the boiler as a unit.

2.2.3.9 Boiler Markings

**************************************************************************
NOTE: Delete brackets if the boiler does not include a superheater.
**************************************************************************

Each boiler shall be stamped with:

a. Maximum continuous capacity in Watts Btuh.

b. Radiant heating surface in square meters feet.

c. Total heating surface in square meters feet.

d. Furnace volume in cubic meters feet.

e. Boiler unit design maximum allowable working pressure.

[ f. Superheater final steam temperature in degrees C degrees F.]

[ g. Superheater heating surface in square meters feet.]

2.3 BOILER DETAILS

2.3.1 Packaged Steam-Generating Units

Submit manufacturer's design data and structural computations for walls, roof, foundations, and other features, for specialty type of construction. Include design data for lateral forces that may be encountered due to wind loads and seismic forces.

Submit [6] [_____] complete copies of operating instructions, prior to the training course, outlining the step-by-step procedures required for system startup, operation, and shutdown. The instructions shall include the manufacturer's name, model number, service manual, parts list, and brief description of all equipment and their basic operating features. Submit [6] [_____] complete copies of maintenance instructions, prior to the training course listing routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guides. The instructions shall include piping layout, equipment layout, and simplified wiring, and control diagrams of the system as installed.
2.3.1.1 Firebox Type (for Boiler Capacities Less Than 2.9 Mega watts 10,000,000 Btuh)

Units shall be furnished complete with coal burning equipment, [fly ash collector,] brickwork, insulation with steel jacket, safety and operating controls, forced- and induced-draft fans, low water cutoff and alarm, and other required appurtenances. The unit shall be complete, self-contained, fully automatic, and ready for service upon completion of utility connections except that firing equipment, safety and operating controls may be packaged separately from the boiler, fully assembled, factory wired, and completely ready for field mounting. The firebox boiler shall be of the watertube or firetube type in conformance with ASME BPVC SEC I. Control panel shall be prewired and totally enclosed. Over-fire air jets shall be provided for furnace turbulence. Positioning controls shall be provided. [The boiler shall be equipped with soot blowers.]

2.3.1.2 Watertube, Waterwall Type (Boiler Capacities Over 2.9 Mega watts 10,000,000 Btuh)

Except as modified, the steam-generating unit shall comply with the requirements of ASME BPVC SEC I. Steam generating unit shall be furnished complete with stoker, [fly ash collector,] forced- and induced-draft fans, control and instrument panel with limit and automatic controls, soot blowers, over-fire air system feedwater regulator, low water cutoff and alarm, feed piping and all other fittings, auxiliaries, and appurtenances necessary for safe and efficient operation. The steam generator shall be factory fabricated and [assembled on a steel foundation or foundations] [top supported].

2.3.2 Watertube Boilers

Watertube type boilers shall be of the [site assembled] [shop assembled] type with either two or three drums and arranged to suit the fuel burning equipment specified. Boilers shall be capable of continuous operation at the indicated capacity.

2.3.2.1 Drums

Drums shall be steel plate, fusion welded in conformance with ASME BPVC SEC I, including stress relieving and x-raying of welded seams. The main steam drums shall be of sufficient size to accommodate steam separators and drum internals with provisions and space for accomplishment of maintenance. Baffling shall be provided to separate the steam from the water in the drum and to maintain a stable water level under a fluctuating load. Variations in normal water level shall not exceed 50 mm 2 inches, with an increasing load change of 20 percent of rated capacity per minute. Steam separators shall be provided to deliver saturated steam with maximum specified moisture content. Each drum shall have two 304.8 x 406.4 mm 12 x 16 inch elliptical manholes, with the exception of the mud drum which shall have at least one 304.8 x 406.4 mm 12 x 16 inch elliptical manhole. Each manhole shall have cover, yoke, and gaskets.

2.3.2.2 Tubes

Tubes shall be not less than 50 mm 2 inches in diameter, shall be electric welded or seamless steel, and shall be connected to the drums and headers by expanding into bored tube seats. Boilers shall have water-cooled furnace walls of a design suitable for the application. Lower header of sidewalls shall be round design with tubes welded to header stubs. Each
waterwall header shall have enough supply and riser tubes to ensure that no portion of the waterwalls will become water starved at maximum capacity.

2.3.2.3 Baffles

Baffles shall be arranged to bring the products of combustion into contact with the heating surfaces without excessive loss of draft. Baffles shall be gas-tight and shall be either a refractory material or metal suitable for temperatures encountered.

2.3.2.4 Access Doors

Access doors in sufficient number, of adequate size, and properly located shall be provided for cleaning, inspection, and repair of all areas in the complete assembly. Doors shall be gas-tight and interior surfaces exposed to direct radiation and high temperatures shall be lined with approved refractory material to prevent excessive heat losses and warping of doors. Doors too large or bulky for hand removal shall be hinged. At least one observation port with cast-iron cover shall be provided on the front and rear wall of the furnace.

2.3.2.5 Miscellaneous Pipe Connections

Miscellaneous pipe connections shall be provided for steam outlet, safety valves, feedwater, feedwater regulator, water column, blowoff, steam supply to soot blowers, steam gauge and vent, continuous blowdown, continuous chemical feed, and instrument connections. Boilers shall be provided with necessary jets for furnace turbulence, the number and arrangement of which shall be as recommended by the boiler manufacturer. Soot blowers shall be provided, if required by the manufacturer. A suitable smoke outlet with steel frame, damper, and damper shaft shall be provided. Damper shall have external high temperature roller or ball bearings at both ends of the shaft, and shall have a suitable operating arm and rod.

2.3.2.6 Superheater Design

*****************************************************************************************************************************************
NOTE: Delete if the boiler does not include a superheater.
*****************************************************************************************************************************************

The design of the superheater shall be such that at any given load, and to the extent feasible, all elements have the same outlet temperature. The superheater tube and support materials shall be chosen so that with any reasonably expectable excess air and the worst expected unbalance in air, steam, and fuel distribution, there is an ample and conservative margin of safety to prevent damage by overheating or corrosion to the components. Pad-type permanent thermocouples shall be installed on superheater tubes in sufficient number and so located as to indicate the variation in, and maximum value of, the tube temperature across the furnace width. The thermocouples shall be located outside of the gas stream. The superheater outlet header shall be capable of absorbing the reactions from the main steam piping. The superheater terminals shall be extended sufficiently clear of the boiler walls to facilitate connecting thereto. Any superheater piping must be extended beyond the boiler front wall line, 900 mm 3 feet beyond casing. Header penetrations through the casing shall be minimized. Adequate superheater piping to mount the safety valves shall be provided. The design shall be such as to minimize external corrosion on the superheater and reheater due to molten slag or fouling. The location
of headers in the gas stream shall be minimized. Spray desuperheaters shall be complete with thermal sleeves of sufficient length to prevent droplets of water from coming in contact with the hot wall of the pipe. The sleeves shall be arranged for attaching securely to the pipe, but in a manner that will permit differential expansion.

2.3.2.7 Boilers and Firing Equipment

Boilers and firing equipment shall be supported from the foundations with structural steel independent of all brickwork. Boiler supports shall permit free expansion and contraction of each portion of the boiler without placing undue stress of any part of the boiler or setting.

2.3.3 Boiler Settings

2.3.3.1 Boiler Material

Materials shall conform to the following:

2.3.3.1.1 Firebrick

ASTM C27, class as recommended by the boiler manufacturer.

2.3.3.1.2 Insulating Brick

ASTM C155

2.3.3.1.3 Castable Refractory

ASTM C401. The minimum modulus of rupture for transverse strength shall not be less than 4.1 MPa 600 psi after being heat-soaked for 5 hours or more at a temperature in excess of 1371 degrees C 2,500 degrees F.

2.3.3.1.4 Mortar, Air-Setting, Refractory

As recommended by the boiler manufacturer.

2.3.3.1.5 Brick, Common

ASTM C62

2.3.3.1.6 Galvanized Steel Sheets

ASTM A659/A659M, ASTM A653/A653M. Gauges specified are manufacturer's standard gauge.

2.3.3.1.7 Uncoated Steel Sheets and Strips, Low Carbon

ASTM A36/A36M. Gauges specified are manufacturer's standard gauge.

2.3.3.2 Firebox, Packaged Type

Boiler refractories and insulation shall be installed to permit free expansion without placing undue stress on the boiler or refractory. Insulation and jacket shall provide a casing temperature not exceeding 77 degrees C 170 degrees F in an ambient temperature of 38 degrees C 100 degrees F with a surface wind velocity not exceeding 254.0 mm/second 50 fpm while operating at full load.
2.3.3.3 Watertube, Waterwall Type

**************************************************************************

NOTE: On watertube type boilers that will be used intermittently, welded wall construction is recommended to minimize corrosion. In other applications or with fuels containing not more than 0.5 percent sulfur, a casing type enclosure is suitable.

**************************************************************************

Boiler walls shall be [steel-encased wall construction with fabrication details as recommended by the boiler manufacturer. Boiler wall and boiler roof lining shall consist of a continuous screen of closely spaced finned, tangent, or intermittent watertubes. Steel-encased walls shall have casing constructed of not thinner than 3.416 mm 10 gauge black steel sheets, either bolted or welded. Casing shall be gas-tight and shall be reinforced with structural steel to provide rigidity and prevent buckling. Provision shall be made for expansion and contraction. [Refractory behind the waterwall tubes shall be high-duty refractory, not less than 63.5 mm 2-1/2 inches thick.] High temperature block and mineral wool blanket insulation shall be provided between the refractory backup and steel casing, or between an inner and outer casing, and shall be of sufficient thickness to limit the maximum casing temperature in the furnace area to [54] [_____] degrees C [130] [_____] degrees F with a surface air velocity of 508.0 mm/second 100 fpm and an ambient air temperature of 27 degrees C 80 degrees F when operating at full capacity. When boilers are provided with double casings, the inner casing shall be constructed of not thinner than 1.897 mm 14 gauge steel sheets. Alloy steel conforming to ASTM A568/A568M shall be used where temperatures over 370 degrees C 700 degrees F occur.] [of welded wall construction. The width of the fins shall be limited to 19 mm 3/4 inch to prevent overheating of the fins under all operating conditions. Designs exceeding 19 mm 3/4 inch may only be used when provided with supporting calculations and subject to the approval of the Contracting Officer. Tubes shall be seamless type. The fin-to-tube weld shall be continuous and on both the front (fireside) and back side of the fin. The fin shall not be less than 6.4 mm 1/4 inch thick. The construction shall form a pressure-tight structure capable of transferring a maximum amount of heat to the tube. All welded joints and openings shall be checked by a pressure test. Any casing leakage shall be repaired and made pressure-tight. The maximum deflection of the reinforced panels shall not exceed 1/360 of the length of the maximum span. The structure tested shall be capable of holding a pressure of 1.5 times the predicted maximum furnace operating pressure.]

**************************************************************************

NOTE: For personnel safety, the design temperature of the casing surface should not exceed 66 degrees C 150 degrees F. Should the designer wish to use a design surface temperature between 54 and 66 degrees C 130 and 150 degrees F, an economic evaluation must be performed. The evaluation must determine if the additional capital costs for insulation outweigh the cost savings due to reduced boiler radiation losses.

**************************************************************************

2.3.3.3.1 Boiler Roof

Boiler roof shall have a casing constructed of not thinner than 3.416 mm 10
gauge black steel sheet. Refractory lining shall consist of 63.5 mm 2-1/2 inches, minimum, of high-duty refractory backup behind the roof tubes and sufficient thickness of high temperature block insulation or mineral wool blanket to limit the maximum casing temperature in the furnace area to [54] [_____] degrees C [130] [_____] degrees F with a surface air velocity of 508.0 mm/second 100 fpm and an ambient air-temperature of 27 degrees C 80 degrees F when operating at full capacity. Exposed portions of the boiler drums shall be insulated with 75 mm 3 inches of suitable mineral wool blanket or block insulation. Manholes and other inspection and access openings, identification plates, and stamps shall have insulation finished neatly against a metal ring provided for this purpose.

2.3.3.3.2 Bridge Walls

Bridge walls exposed on all sides to radiant heat and to the products of combustion shall be constructed of super-duty refractory not less than 450 mm 18 inches thick, conforming to the boiler manufacturer's requirements; walls having only the front side exposed to radiant heat and to the products of combustion shall have front facing and cap constructed of 225 mm 9 inches of super-duty refractory and a back facing of not less than 225 mm 9 inches of low-duty firebrick. Base of the wall shall be common brick.

2.3.3.3.3 Settling Chamber

Settling chamber [, equipped with suitable means for frequent cleaning without shutting down the boilers,] shall be provided below the last pass of each boiler for the removal of fly ash.

2.3.3.3.4 Expansion Joints

Expansion joints shall be provided where indicated and else-where as required to permit all brickwork to expand freely without interference with the boiler. Joints shall be of adequate width, tightly sealed against leakage, and free from mortar, with the outer 100 mm 4 inches sealed with resilient mineral wool suitable for 930 to 1095 degrees C 1,700 to 2,000 degrees F. In addition, to allow for expansion of the inner face, a series of 3.2 mm 1/8 inch wide vertical openings spaced 1.8 m 6 feet apart shall be provided on the furnace side of the wall. Proper provision shall be made for expansion and contraction between boiler foundation and floor.

2.3.3.3.5 Firebrick

Firebrick shall be laid up in air-setting mortar. Each brick shall be dipped in mortar, rubbed, shoved into its final place, and then tapped with a wooden mallet until it touches the adjacent bricks. Mortar thick enough to lay with a trowel will not be permitted. Maximum mortar joint thickness shall not exceed 3.2 mm 1/8 inch and average joint thickness shall not exceed 1.6 mm 1/16 inch.

2.3.3.3.6 Plastic Refractory

Install plastic refractory in accordance with the manufacturer's recommendations and by workmen skilled in its application.

2.3.3.4 Watertube, Waterwall (Packaged Type) Unit

Boiler setting, refractory, insulation, and casing shall be in accordance with ASME BPVC SEC I.
2.3.4 Boiler Fittings and Appurtenances

Boiler fittings and appurtenances suitable for a steam working pressure of [_____] Pa psig and [_____] degrees C degrees F shall be installed with each boiler in accordance with ASME BPVC SEC I.

2.3.4.1 Water column

Water column with straight-through type drain valve shall be provided. Water column shall be complete with gauge glass, high- and low-water alarm, and three quick-closing gauge valves and try cocks fitted with the necessary chains and handles for operation from the boiler room floor. [Water column lighting shall be provided for ease of reading at all times.]

2.3.4.2 Water Gauge

Water gauge drain valve of the straight-through type shall be provided.

2.3.4.3 Low Water Cutoff

Low water cutoff with alarm located on instrument panel shall include either a float-actuated switch as a means of making electrical contact or an electrically-actuated probe type low water cutoff. The float chamber shall be provided with a blowdown connection. The cutoff shall cause a safety shutdown and sound an alarm when the boiler water level drops below a safe minimum level. A safety shutdown due to low water cutoff shall require a manual reset before operation can be resumed and shall prevent recycling of the [burner] [stoker].

2.3.4.4 Bypass Button

A spring-loaded shunt bypass button shall be provided to prevent nuisance shutdowns during sightglass blowdown.

2.3.4.5 Steam Gauge

Steam gauge shall be provided for each boiler in a visible location on the boiler.

2.3.4.6 Feed and Check Valves

Feed and check valves shall be provided adjacent to each boiler feed nozzle.

2.3.4.7 Continuous Blowdown Valve

**************************************************************************
NOTE: Continuous blowdown equipment will be provided if required by UFC 3-410-01 or UFC 3-410-02. If a firetube boiler is specified, these paragraphs will be deleted.
**************************************************************************

Continuous blowdown valve shall be manual proportioning type fabricated of corrosion-resistant steel. The valve shall be equipped with a micrometer dial and pointer to indicate the proportional setting.

2.3.4.8 Safety Valves

Safety valves of proper size and of the required number and construction
and set pressures shall be in accordance with the ASME BPVC SEC I and shall be installed so that the exhaust steam will discharge through pipes extending through the roof. Each exhaust riser shall have a drip-pan elbow to prevent the accumulation of water on the valve. A suitable slip joint shall be provided between the drip-pan elbow and the riser.

2.3.4.9 Blowoff Valves

Blowoff valves in tandem shall be provided at each point of blowdown as recommended by the boiler manufacturer. Piping shall be extra-heavy weight, minimum, steel pipe conforming to ASTM A106/A106M Grade B. Blowoff valves shall be the balanced seatless type unless otherwise approved.

2.3.4.10 Steam Nonreturn Valve

Steam nonreturn valve of size and pressure rating shown shall be installed in the steam supply line from each boiler. Valves shall be arranged to close automatically when there is a pressure differential of 34.5 kPa 5 psi between the boilers and steam headers and shall also be arranged to operate as stop valves. Valves shall be set with the stem up, either inclined or vertical, and shall be of the rising stem type. Valves shall be of the angle or straight-way type and shall operate without chattering, hammering, or sticking. Valves shall be cast steel.

2.3.4.11 Feedwater Regulator

Feedwater regulator, sized for the application, shall be connected complete with all necessary piping and accessories for automatic operation. Valved bypass shall be provided around control valve. Units shall be provided with device to lock regulator in existing position in case of power failure. Units shall be provided with manual/automatic selector panel located on instrument panel. Feedwater control element shall be provided with a drain valve. The feedwater line shall be fitted with a thermometer well.

2.3.4.12 Soot Blowers

******************************************************************************
NOTE: Manually operated rotary soot blowers are normally supplied on boilers up to 6 Megawatts 20 million Btuh. Delete the inappropriate type of soot blower.
******************************************************************************

Soot blowers shall be furnished as required to effectively clean all tube surfaces within the boiler. Steam blowing pressure shall be adjustable. Elements within the boiler shall be constructed of heat-resisting alloys suitable for the flue gas temperature encountered and shall be removable without disturbing the boiler tubes. Soot blowers shall be furnished complete with necessary auxiliaries and shall be connected in accordance with the manufacturer’s recommendations. Soot blowers shall be [permanently-mounted, rotary type manually-operated by a single chain. Valve shall be quick-opening, positive-closing type located in the blower head, external to the boiler, with the working parts protected from the furnace gases, and valve shall be operated by the same chain that rotates the element. Chains shall be continuous extending to within easy reach of the operating floors. Blowers shall be furnished complete with necessary auxiliaries and shall be connected in accordance with the manufacturer's recommendations.] [electrically-operated rotary or retractable type, except
that soot blowers exposed to flue gas temperatures over 815 degrees C 1,500 degrees F shall be retractable type only. Rotary type soot blowers shall be provided with a quick-opening, positive closing type valve located in the blower head, external to the boiler, with the working parts protected from the furnace gases, and valve shall be operated by the same motor that rotates the element. Electrically-operated retractable type soot blowers shall have either single motor-driven, totally-enclosed drive carriage with dual rack-and-pinion drives or dual-motor electric drive enclosed in a protective steel housing. Electrically-operated soot blowers shall include starters and pushbutton stations.]

2.4 STOKER EQUIPMENT

The boiler manufacturer shall certify that the stoker selected will be satisfactory for the boiler design. Stokers shall be capable of efficiently burning coal with fuel sizing conforming to ABMA Boiler 203, approximately [_____] mm inches in size with an approximate moisture content of [_____] percent and having the following analyses:

### 2.4.1 Spreader Stokers

**NOTE:** Any paragraphs describing stoker equipment not necessary for the system specified will be deleted. Stokers and stoking equipment selected will be based on the following:

Boilers having output capacities of 3.5 Megawatts or more will be equipped with mechanically-driven grates operating continuously or intermittently. Dump grates will not be permitted in boilers in this size range. Spreader stokers will be specified for watertube boilers using bituminous coal with ash content on a dry basis in excess of 8 percent or ash fusion temperature lower than 1204 degrees C or 2200 degrees F.

Underfeed or pulsating grate stokers may be specified for firebox packaged boilers when bituminous coal of any composition is used. Underfeed stokers will be the screw-feed type for boilers with capacity of less than 1635 kg (3600 pounds) of steam per hour, and the ram type for larger boilers. Pulsating grate units will be water-cooled and complete with automatic coal feed and continuous ash removal. Conveyor stokers may be specified for watertube boilers if suitable for the type of coal available. Chain or traveling grate may be specified by deletion of the inapplicable
type of grate, or the choice between the two types may be left to the Contractor by including both types in the description. If steam drives are specified, plant must have an auxiliary boiler or an alternate source of steam for startup. The following is a general guide in determining which type of grates to investigate:

Spreader stokers shall be the overfeed self-feeding type suitable for burning a portion of the coal in suspension, but sized assuming 100 percent combustion on the grate. Coal shall be evenly distributed across the full width of the grate by not less than [_____] feeder units. Unit shall be designed for operation of any feeder independently of the others, or it shall be possible to operate all feeders simultaneously. Feeders shall be capable of handling and uniformly distributing coal over the grate area. Feeders shall be the mechanical-rotating type, shall have no moving parts within the combustion chamber, and where moving parts are exposed to excessive heat, such parts shall have all bearings protected by suitable water jackets. Grease or oil lubrication shall be provided for all bearings. Stoker shall be designed for readily adjustable feed distribution of coal on the grates.

2.4.1.1 Spreader Stoker Grates

NOTE: Steam driven boiler auxiliaries will not be used unless the exhaust steam can be utilized completely. Reference to steam drives will be deleted if inapplicable for the equipment specified.

Grates for spreader stoker firing shall be of the high air-resistant type especially designed and arranged for powered mechanical or compressed air actuated dumping in sections. Openings shall provide proper distribution of air under the fuel bed. Grates shall be heavy-duty, heat-resisting cast-iron. Mechanical dumping shall be with [steam-] [air-] [water-] actuated power cylinders connected to the grates, and grates shall be furnished complete with cylinders, linkages, valves, and piping as required. Each section shall dump independently of other sections. Necessary over-fire air jets complete with fans, ducts, and air control valves shall be provided as required for proper turbulence and combustion. Grate drives shall be
independent of feeder drives to provide independent speed variation of feeders and grates.

2.4.1.2 Traveling Grates

Traveling grates shall be high air-resistant type especially designed for spreader stoker firing and for continuous ash discharge. Openings shall provide proper distribution of air under the fuel bed. Grates shall be heavy-duty, heat-resisting cast-iron, and individual sections shall be replaceable without taking the grate out of service. Air seals around grate shall hold air leakage to a minimum. Moving grates shall be furnished complete with supporting steel, shafts, sprockets, chain, gears, skid bars, and bearings as required. The front end of the grates where the ash is discharged shall be enclosed with a dust-tight enclosure made of heavy cast-iron plates not less than 15.9 mm 5/8 inch thick and properly protected with firebrick where exposed to the furnace, or shall be of refractory-lined steel plate. The vertical fronts of the enclosure shall be fitted with refractory-lined inspection and access doors, one for each feeder. The roof of the enclosure shall be sealed with refractory to protect the metal parts from the furnace temperature. The underside of the grates shall be enclosed to form a chamber. Hopper for receiving the ashes shall be constructed as indicated or as recommended by the manufacturer. Over-fire air jets shall be provided as required for proper turbulence and combustion.

2.4.1.3 Vibrating Grate

Vibrating grate of high air-resistant type shall be especially designed for spreader stoker firing and for continuous ash discharge. Grates shall be either air- or water-cooled with openings to provide proper distribution of air under the fuel bed. Grates shall be heavy-duty, heat-resisting cast iron and individual sections shall be replaceable. A manual adjustment shall be provided to regulate the ash bed thickness and ashes shall be automatically discharged to the ash pit. The front of the grates where the ash is discharged shall be enclosed with a dust-tight enclosure made of heavy cast-iron plates not less than 15.9 mm 5/8 inch thick and properly protected with firebrick where exposed to the furnace, or shall be of refractory-lined steel plate. The vertical fronts of this enclosure shall be fitted with refractory-lined inspection and access doors, one to each feeder. Roof of this enclosure shall be sealed with refractory for protecting the metal parts from the furnace temperature. The underside of the grates shall be enclosed to form a chamber with a hopper for receiving the ashes. Over-fire air jets shall be provided for turbulence and combustion.

2.4.1.4 Stoker Controls

Stoker controls that accurately regulate the coal feed rate shall be of the type required for connection to the combustion control system. Manual setting of the coal feed rate with variation of stoker feed, as required to maintain any desired capacity between 50 and 110 percent of boiler capacity, shall be possible without disconnecting linkage. Separate feeder and grate drives shall be provided. Grate shall be driven through a variable speed transmission with devices for changing speed interlocked with fuel feed regulation. Manual adjustment of grate speed shall only be for allowing synchronization with fuel feed. All gears and chains of the variable speed transmission and gear reduction units, as required, shall run in a bath of oil and be enclosed in a dust-tight and oil-tight case. Front and rear shafts of the grates shall be fitted with a forced
lubrication system with fittings located outside the setting. All bearings shall be of the antifriction type with hardened inner and outer races fitted with dust seals and easily accessible forced lubrication fittings. Stoker [and grate] shall be provided with safety release devices to protect the mechanism from foreign materials or obstructions. Stoker shall be driven by [electric motor] [steam turbine]. [Electric motor shall be totally enclosed fan-cooled for installation in Class II, Division 1, Group F hazardous location in accordance with NFPA 70. Motor starter shall be magnetic [across-the-line] [reduced voltage start] type with [general-purpose] [dust-tight] [explosion-proof] enclosure.] [Steam turbines utilized for stoker drives shall conform to NEMA SM 23.]

2.4.1.5 Hoppers

Hoppers shall be constructed of steel plates not less than 6.4 mm 1/4 inch thick and shall have a capacity of not less than [_____] kg pounds per feeder. Hoppers shall be provided with clean-out doors in the front of each feeder. Coal feed to the hoppers shall be fitted with concave type transitions to ensure the proper distribution of coal and coal fines across the width of the hoppers. Stoker front plate shall form the front of the boiler for the full width of the boiler and from the firing floor to some point above the stoker where it shall connect to the boiler structural framing. Front shall be cast-iron or steel plate refractory lined with [auxiliary firing doors and] clean-out doors of refractory lined cast-iron. Structural framing as required shall support the stoker and its components from the boiler foundation or boiler room floor. The area under the grates shall be divided into not less than four airtight zones for supply of forced draft having zone control dampers with external indicating operating and locking devices. All pressure parts for water-cooled grates including watertubes, headers, and valves furnished by the stoker manufacturer shall be for boiler pressure specified and shall be constructed in conformance with ASME BPVC SEC I.

2.4.1.6 Over-Fire Turbulence and Cinder and Dust Reinjection System

Spreader stokers shall be provided with over-fire turbulence and cinder-and-dust reinjection systems. Either air or steam may be used as the transport medium. Air systems shall be provided with operating air by a single, low volume, high-pressure fan, driven by a splashproof electric motor. The reinjection system ejectors shall be properly designed, located, and sized for maximum fly ash pickup from all points. Nozzles for each system shall be equipped with manometer connections and heavy-duty adjustable dampers fitted with locking devices and position indicators. Nozzles shall provide maximum combustion efficiency and furnace turbulence. A manometer connection and a permanent manometer shall be provided immediately downstream from the main reinjection air supply damper. A portable manometer shall be provided.

2.4.2 Underfeed Stokers

**************************************************************************
NOTE: Any paragraphs describing stoker equipment not necessary for the system specified will be deleted.
**************************************************************************

2.4.2.1 Single Retort, Heavy-Duty Ram-Type Stokers

Single retort, heavy-duty ram-type stokers shall be equipped with
stationary or moving grates and side dump plates, and shall be provided with [steam] [electric motor] drive and all necessary auxiliary equipment. Dumping power cylinders shall be compressed air actuated. Coal shall be fed from the hopper into the retort by means of a ram and shall be evenly distributed along the full length of the retort with auxiliary pusher blocks on a pusher rod located at the bottom of the retort and actuated by the coal ram. Dampers shall be provided between ash pits and main air chamber under stoker to permit control of air distribution to the grate surface. Dampers shall be arranged for operation from the front plate of the boiler. Air distribution shall be such that the air pressure is greatest where the fuel bed is the thickest. Air quantity shall vary in direct proportion with coal feed rate and shall be controlled automatically.

2.4.2.1.1 Grate Surface

Grate surface shall include the underfeed retort area, air admitting tuyeres, side combustion grates, and the side dumping plates. Retorts shall be sectional construction of large capacity and proper shape to distribute coal uniformly over the entire grate surface with a minimum of moving parts within the furnace. Stokers having total grate width of more than 2.1 m 7 feet shall have movable grates providing positive lateral feeding of the coal from the retort toward the dump plates. Retort and grate sections shall be constructed of heavy-duty, heat-resisting cast iron, shall be cored for proper air distribution, and shall be designed for easy replacement of individual sections. Ash dump plates shall be provided with necessary levers and linkage for hand operation from the front of the boiler.

2.4.2.1.2 Ram Feed

Ram feed shall be mechanical [steam] [pneumatic or hydraulic] [driven by an electric motor connected through an efficient gear reduction unit, crankshaft, and connecting rod]. [Motors shall be totally enclosed fan-cooled type [for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70]]. [Motor starter shall be magnetic [across-the-line] [reduced voltage start] type with [general-purpose] [dust-tight] [explosion-proof] enclosure.] Stoker controls shall be for connection to the combustion control system to accurately regulate the coal feed rate. Manual setting of the coal feed rate shall be possible without disconnecting linkage, with variation of stoker feed as required to maintain any desired capacity between 25 and 110 percent of boiler capacity in 10 or more equal increments. Regulation of the coal feed rate shall be by varying the time increments between strokes of the ram. A throw-out release shall protect the coal feeding mechanism from injury in case foreign materials obstruct normal operation.

2.4.2.1.3 Hoppers

Hoppers shall be constructed of steel plates not less than 6.4 mm 1/4 inch thick and shall have a capacity of not less than [_____] kg pounds. Hoppers shall be provided with clean-out doors. Stoker front plate shall form the front of the boiler for the full width of the boiler and extend from the firing floor to some point above the stoker where it shall connect to the boiler structural framing. Front shall be cast-iron or steel plate, refractory lined with [auxiliary firing doors and] clean-out doors of refractory lined cast-iron. Structural framing, as required, shall support the stoker and its components from the boiler foundation or boiler room floor. Water spray pipes and nozzles shall be provided for quenching the ashes in the ash pit.
2.4.2.2 Single Retort Screw Type Stokers

Single retort, heavy-duty, screw feed stokers shall be equipped with rectangular firepot, side dump grates, forced-draft fan, electric-motor drive, and all necessary auxiliary equipment. Coal shall be fed from the hopper into the retort with a spiral worm conveyor designed to feed a constant amount of coal and to prevent coal from packing in the worm. [Dampers shall be provided between ash pits and main air chamber under stoker to permit control of air distribution to the grate surface. Dampers shall be arranged to be operated manually from the front plate of the boiler.] The stoker shall be provided with an integral, forced-draft fan driven by the stoker motor. Air quantity shall vary in direct proportion with the coal feed rate and shall be controlled automatically. Retorts and grates shall be constructed of heavy-duty, heat-resisting cast-iron, shall be cored for proper air distribution, and shall be designed for easy replacement of individual sections. Retorts shall be of proper size and shape to distribute coal uniformly over the entire grate surface. Stationary grates shall be provided on all sides of the retort as required to suit the firebox. [Ash dump grates shall be provided on each side of the retort complete with necessary levers and linkages for hand operation from the front of the boiler.] Electric motor shall be belt-connected to an efficient gear reduction unit which shall drive the feed screw and forced-draft fan. Gear reduction unit shall be immersed in oil in a dustproof housing. Stoker controls shall be suitable for connection to the combustion control system to accurately regulate the coal feed rate. Feed rate control shall allow manual setting for not less than three speeds and neutral, in equal increments, with speed changes possible while stoker is running. A suitable release shall protect the coal feeding mechanism from injury in case foreign materials obstruct normal operation. Motors shall be totally enclosed fan-cooled type [for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70]. Motor starter shall be [manual] [[magnetic] [across-the-line] [reduced voltage start] type with [general-purpose] [dust-tight] [explosion-proof] enclosure.] Hoppers shall be constructed of 6.4 mm 1/4 inch steel sheet, minimum, shall be reinforced, and shall have a capacity of not less than [_____] kg pounds. Hoppers shall be provided with suitable cleanout. Feed screw shall be removable and conveyor compartment shall have cleanout. Stoker shall rest on boiler room floor.

2.4.3 Conveyor Stokers

**************************************************************************
NOTE: Any paragraphs describing stoker equipment not necessary for the system specified will be deleted.
**************************************************************************

Conveyor stokers shall be of the grate level feed, forced-draft [chain grate] [traveling grate] type with hoppers, feed gate, drive shaft, sprocket wheels, grate, [electric motor] [steam] drive, and all necessary auxiliary equipment. Coal shall be fed automatically at a constant rate from the hopper onto the moving grate and shall be evenly distributed across the full width of the grate. The stoker frame shall be provided with not less than four air-tight zones for supply of forced draft and shall have suitable zone control dampers with external indicating, operating, and locking devices.
2.4.3.1 Grates

Grates shall have individual sections constructed of heavy-duty, heat-resisting cast-iron, shall be fitted or cored for proper air distribution, and shall be designed for easy replacement of individual sections. [Chain grates shall have staggered links connected by pins to form a continuous flat chain the full width of the furnace.]

[Traveling grates shall have grate blocks mounted on carrier bars which, in turn, shall be fastened to two or more drive chains to form a continuous flat grate surface the full width of the furnace.] Continuous grates shall be supported at the ends by suitable sprockets and at intermediate points on suitable tracks or skids.

2.4.3.2 Grate Operation

**************************************************************************
NOTE: Steam driven boiler auxiliaries will not be used unless the exhaust steam can be utilized completely. Reference to steam drives will be deleted if inapplicable for the equipment specified.
**************************************************************************

Conveyor grate shall be driven by [electric motor connected through a suitable speed reduction unit] [steam] [hydraulically operated variable speed drive]. Gears and chains required for the drive shall be enclosed in a dustproof and oil-tight housing. Main shafts for the grates shall have a forced system of lubrication with fittings located outside the casing or have self lubricating bearings. If the forced lubrication system is supplied, bearings shall be fitted with dust seals and easily accessible forced lubrication fittings. Stoker controls shall be suitable for connection to the combustion control system to accurately regulate the coal feed rate. Manual setting of the coal feed rate by varying stoker feed, as required to maintain any desired capacity between 25 to 125 percent of boiler capacity, shall be possible without disconnecting linkage. Feed rate shall be changed by varying the speed of the grate. Air volume shall automatically vary in direct proportion with the feed rate. Possible feed rate shall vary in not less than 10 equal increments. [Electric motor shall be totally enclosed fan-cooled type [for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70.]] [Motor starter shall be [manual] [magnetic] [across-the-line] [reduced voltage start] type with [general-purpose] [dust-tight] [explosion-proof] enclosure.]
iron. Structural framing, as required, shall support the stoker and its components from the boiler foundation or boiler room floor. At the end of the grate, the ash shall be discharged into a bunker or pit as indicated. The bunker shall have a dust-tight enclosure made of steel plates not less than 15.9 mm 5/8 inch thick, properly protected with firebrick where exposed to the furnace; shall be fitted with cast-iron, refractory lined inspection and access doors; and shall have provisions for ash removal.

2.4.4 Vibrating Grate Stokers

Vibrating grate stokers shall be the grate level feed, forced-draft type with the vibrating action of the grate used to feed the coal from the hopper through the furnace and discharge the ashes into the ash pit. Stokers shall be complete with hopper, feed gate, grate, drive mechanism, and all necessary auxiliary equipment. Coal shall be automatically fed from the hopper onto the grate and shall be evenly distributed across the full width of the grate. A manual adjustment shall be provided to regulate the fuel bed thickness. Ashes shall be automatically and continuously discharged to the ash pit. The area under the grates shall be divided into not less than four airtight zones for forced draft supply and shall have suitable zone control dampers with external indicating, operating, and locking devices.

2.4.4.1 Grates

Grates shall be either air cooled or water cooled with grate bars in intimate contact with the watertubes. Grates shall have individually replaceable sections of iron or steel suitable for the temperatures encountered. Pressure parts, including watertubes, headers, and valves shall be suitable for boiler pressure specified and shall be constructed in accordance with ASME BPVC SEC I. Grate sections shall be properly designed for even air distribution over the entire grate area.

2.4.4.2 Stoker Controls

Stoker controls shall be designed for connection to the combustion control system to accurately regulate the coal feed rate and shall be arranged for manual operation independent of the combustion control system. Variation of coal feed rate shall be accomplished by changing the length of time of vibrations. Vibration generator shall be belt connected or gear connected to the electric motor. Unit shall be free of any vibration that may damage other parts of the boiler or the building structure. Bearings requiring lubrication shall be provided with easily accessible lubrication fittings. Combustion air volume shall automatically vary in direct proportion with the coal feed rate. Stoker shall be driven by [electric motor] [steam turbine]. [Motor shall be high-starting torque [totally enclosed, nonventilated] [totally enclosed, fan-cooled] [totally enclosed, fan-cooled suitable for installation in a Class II, Division 1, Group F hazardous location in accordance with the NFPA 70].] [Motor starter shall be magnetic, reversing, [across-the-line] [reduced voltage start] type with [general-purpose] [dust-tight] [explosion-proof] enclosure.]
2.4.4.3 Hoppers

Hoppers shall be constructed of steel plates not less than 6.4 mm 1/4 inch thick, shall have a capacity not less than [_____] kg pounds, and shall be provided with a suitable method of cleanout. Furnace arches of a design suitable for the intended use and a type that will ensure proper combustion of the fuel shall be provided. Lower furnace sidewall headers in a waterwall boiler shall be inclined to accommodate the inclined grate arrangement. Stoker front shall form the front of the boiler for the full width of the boiler and shall extend from the firing floor to some point above the stoker where it shall connect to the boiler structural framing. Front shall be cast-iron or steel plate refractory lined with cleanout and access doors of refractory lined cast-iron. Structural framing, as required, shall support the stoker and its components from the boiler foundation or boiler room floor. At the end of the grate the ash shall be discharged into a bunker or pit as indicated. The bunker shall have a dust-tight enclosure made of steel plates not less than 15.9 mm 5/8 inch thick properly protected with firebrick where exposed to the furnace and shall be fitted with cast-iron, refractory lined inspection and access doors, and provisions for ash removal as indicated.

2.5 PULVERIZED COAL BOILERS

**************************************************************************

NOTE: Pulverized coal boilers require special consideration since they are usually designed to operate on one specific type of coal and usually are utilized for large units where a steady minimum load of 68,040 to 90,720 kg per hour 150,000 to 200,000 pounds per hour is assured.

Small horizontal type units down to 36,290 kg per hour 80,000 pounds per hour of steam are available, but horizontal units also will range up to 113,400 kg per hour 250,000 pounds per hour of steam. Larger units are usually the vertical type.

The type of pulverizer will be determined from the coal analysis and the boiler manufacturer's requirements. The pulverizer selected also affects the control system requirements. The furnace ash disposal system components will depend on the ash characteristics and EPA requirements. Volumetric heat release should be 745.2 Megajoules/cubic meter 20,000 Btu/per cubic foot of furnace volume. Coal is crushed in a central plant and stored in bunkers. Each boiler has two pulverizers, fed by a drag type coal feeder, and in turn feed the burners. This system requires room within the plant to accommodate the coal pulverizers. Fineness of pulverized coal may vary with different designs, and fine pulverized coal will significantly affect the selection of ash handling and pollution control equipment and will require special consideration for erosion control on induced-draft fan. Where pulverized coal boilers are specified, reference to stoker fired boilers will be deleted.

**************************************************************************
Where indicated, pulverized coal boilers shall be provided. Boiler and boiler accessories shall be specifically designed to operate on the fuel specified. Boilers shall be complete with coal feeders, crushers, dryers, burners, ignition system, air preheater, economizer, soot blowers, controls, and complete furnace ash handling facilities. Fly ash collection and pollution control equipment is specified in Section 44 10 00 AIR POLLUTION CONTROL. Boilers shall be [horizontal] [vertical] type and shall be [top] [bottom] supported. Ash hoppers shall be dry, refractory-lined type divided into compartments, each of which shall have a hydraulically-operated clean-out door. The hopper shall be supported from the boiler and a dry seal shall provide gastight connection. Forced draft and induced draft fans shall be furnished with the boiler.

2.5.1 Coal Pulverizers

Each boiler shall be provided with a minimum of two pulverizers arranged to allow operation of boiler at reduced capacity when one pulverizer is taken out of service either for maintenance or for operation of low loads. Coal pulverizer shall be provided complete with all required accessories such as rotary drum feeder unit, air preheater, fans for drying coal by either the primary air or suction system, coal classifier distributor unit, and shut off coal valves to allow isolation of individual burners. Drum feeder unit shall have a tramp metal rejection device incorporated in the unit.

2.5.2 Burners

Pulverized coal burners shall be specifically designed for the boiler provided. Burner shall include an ignition system designed for ignition of pulverized coal.

2.5.3 Furnace Ash System

**************************************************************************
NOTE: Detail of piping supported in trenches will appear on the drawings.
**************************************************************************

The boiler shall be the dry bottom type, discharging ash to the hopper compartments. Pulverized coal boiler ash shall be handled hydraulically rather than pneumatically. Facilities for pulverized coal boiler ash handling shall be as indicated. Fly ash shall not be mixed with furnace ash but economizer ash can be combined with furnace ash as indicated. Dual ash dewatering bins to allow recirculation of ash conveying water shall be as indicated. Each bin shall be provided with automatic controls and hydraulically operated gate for ash unloading to trucks or railroad cars. Hopper shall be maintained in flooded condition and hydraulically operated sluice gates shall allow for periodic removal of ash. Each ash hopper compartment shall be fitted with double-roll, electric motor driven clinker grinders fitted with manganese steel crusher rolls and teeth. Discharge from the grinders shall be to an adaptor or to a sump for feed to the centrifugal pump. Centrifugal pump for each hopper compartment shall be provided and shall incorporate special abrasive resistant metals and special seals for abrasive slurry handling. Drives shall be totally enclosed electric motors as indicated. Ash slurry conveying pipelines shall be made of abrasive resistant alloy metal with a Brinell hardness number of approximately 280. Wall thickness shall be not less than 13 mm 1/2 inch and pipe lengths shall not exceed 5.5 m 18 feet. Fittings shall be of the tangent end type. Fittings shall have a Brinell hardness number of approximately 400 and shall have removable wearbacks, where applicable,
or shall be of the integral wearback type. Loading facilities for ash removal of dewatering bins shall be as indicated.

2.5.4 Pulverizer Rejects

Pulverizer rejects such as tramp iron or pyrites shall be collected in hoppers adjacent to each mill discharge spout. High-level hopper indicators shall be provided to initiate reject removal, in sequence, from each hopper to the central holding bin by properly sized jet pumps. Mill discharge control gates shall be provided and the control system shall be interlocked with the furnace ash removal system to provide a completely automatic disposal system. Discharge of mill rejects into the ash hopper is not acceptable. The central holding bin and loading facilities shall be as indicated.

2.5.5 Control Systems

Pulverized coal plant control systems shall be in accordance with NFPA 85 and shall be interlocked to provide for a completely automatic boiler operation. Automatic controls for coal feed, pulverizer operation, combustion, and ash disposal systems shall be coordinated.

2.5.5.1 Coal Master Control System

Coal master control system shall regulate the total coal feed from the coal [bunkers] [silos] to the pulverizers in response to changing demand. A parallel metering combustion control system that limits the firing rate to the actual total air flow available shall be provided. The cross limiting of air and fuel shall be arranged so the air leads the fuel on load increase and trails the fuel on a load decrease. A gain changer shall be provided to compensate the fuel system for the number of pulverizers in service. Depending on the requirements of the pulverizer, the coal master control system shall be actuated by the coal feeder speed or by the coal/air mixture. The total fuel controller shall be a standard, proportional plus integral controller with a derivative or rate term on the master demand only. Change in master demand shall be multiplied by the derivative circuit to assist in overfiring on load increase and underfiring on a load decrease. Provision shall be made for taking any one of the pulverizers for each boiler out of service with firing continuing at reduced rates for extended periods during maintenance or during low demand intervals. Alarms and interlocks of the fuel master control shall be as required by the boiler but shall include, as a minimum, a unit trip to run the fuel master to zero and alarm contacts for "fuel master at maximum," "fuel master at minimum," "fuel greater than air," and "air demand limiting fuel."

2.5.5.2 Primary Air

Primary air fan or suction air fan control for each system shall be provided with all required damper operating and sensing control devices. Primary air system fans shall exhaust into a duct common with individual pulverizer primary air flow dampers in order to control the flow required by each pulverizer. Common duct pressure shall be maintained at a given set point by modulating fan inlet dampers. Gain compensation shall be provided to maintain system response with a different number of fans in operation. Biasing between fans shall be provided.
2.5.5.3 Air Temperature Control

Pulverizer coal air temperature control, for each pulverizer coal air exit, shall assume the maximum safe mixture temperature required to increase the firing efficiency at the furnace and to remove additional residual moisture that may be present in the coal. Tempering air inlet with controls shall be provided to prevent combustion in the pulverizer.

2.5.5.4 Flame Safety System

A burner control/flame safety system shall be provided with the boiler. The system shall meet the requirements specified in NFPA 85 as a minimum. An interface shall be provided between the analog control system and the flame safety system or burner control system. As a minimum, coal feeders and pulverizer air dampers shall be positioned to respond to "unit tripped" and "pulverizer tripped" signals. Burner controls shall incorporate a pulverized coal ignition system. The burner control system shall incorporate boiler shutdown as well as normal monitoring of startup sequencing and normal operation. Each burner shall have a scanner for the lighting system as well as a scanner for the main flame.

2.6 FLUIDIZED BED COMBUSTION BOILERS

**************************************************************************
NOTE: The designer will perform an economic analysis to compare the installation and operating costs of a fluidized bed combustion boiler against the use of a conventional boiler and its associated air pollution control equipment.
**************************************************************************

Where indicated, fluidized bed combustion boilers shall be provided. The Contractor may provide either bubbling bed (AFB) or circulating bed (CFB) boilers. Fluidizing velocities shall range from 1.2 to 3.7 m/second 4 to 12 fps for AFB boilers and range from 4.3 to 9.1 m/second 14 to 30 fps for CFB boilers. Each boiler shall be in compliance with sulfur dioxide, nitrogen oxides, particulate, carbon monoxide, and all other emission regulations, as specified. The bed temperature shall be controlled within the appropriate range, normally 815 to 900 degrees C 1500 to 1650 degrees F to enhance sulfur capture, inhibit the formation of nitrogen oxides, enhance combustion efficiency, and limit carbon monoxide formation. In AFBs, generally all the air required for combustion shall be introduced through the nozzles in the distribution plate in order to reduce the potential of forming reducing conditions within the bed that could cause severe corrosion of in-bed surfaces. The use of over-fire air in applications where it is needed to complete the burnout of carbon monoxide and the combustion of fines in the freeboard shall require the approval of the Contracting Officer who shall be satisfied that reducing conditions will not exist. CFB boilers may introduce as much as 40 to 50 percent of the combustion air as secondary air in one or more stages at various locations above the distribution plate. The boiler and boiler accessories shall be specifically designed to operate with the specified fuel and sorbent. The boilers shall be complete with the required crushers, dryers, coal and sorbent handling systems, burners, igniters, air preheater, economizer, soot blowers, boiler controls and instrumentation, furnace ash handling system, draft systems, and superheater, where required.
2.6.1 General

The design, materials, and construction of equipment furnished shall conform to the applicable requirements of ASME BPVC SEC I and NFPA 85. Furnish the Manufacturer's Data Report required by ASME BPVC SEC I certified by the Authorized Inspector located in the manufacturer's shop. Full provision shall be made so that each component can expand and contract under the operating cycle of temperatures without damage to itself or to any adjoining component, and without the leakage of any contained fluid outwards, or of air either inwards or outwards. The design of the unit shall accommodate thermal movement without side effects such as tearing, buckling, distortion, or vibration. The design of the unit shall prevent destructive vibration during normal operation. The furnace shall be of the balanced draft type. The ducts and equipment from the forced draft fan, including the fluidized bed plenums, shall be designed for pressures in accordance with NFPA 85. Access and observation doors shall be provided to permit access to compartments and the observation of critical portions of the furnace and fluid bed. Door frames shall be securely anchored. Doors shall have a suitable durable gasket, a device which when closed will force the door to an air-or gas-tight seal, and an interior design which will minimize erosion or deterioration of the inner surface from exposure to the internal conditions at that point. Refractory shall be an integral part of the door. Access doors shall be the manufacturer's standard that approaches in size 450 mm 18 inch wide by 400 mm 16 inch high. All observation ports and lance doors shall be provided with sealing and aspirating air facilities. The convection pass velocity shall not be greater than 15.2 m/second 50 fps. The convection pass velocity shall be based on maximum guaranteed excess air at Maximum Continuous Rating (MCR) plus five percentage points (i.e., if excess air is 20 percent, the convection pass velocity shall be based on 25 percent excess air). In CFB designs where convection surface exists in the high solids circulation passes, a velocity not greater than 4.6 m/second 15 fps is permitted between the tubes, based on 25 percent excess air. The design of the equipment shall be such that the interior surfaces of all water-filled pressure parts and superheater sections shall be capable of being chemically cleaned. Furnish, as required, fill and drain connections. Each header shall be drainable. Provide the secondary air and flue gas system resistance curves.

2.6.2 Furnace and Boiler

The boiler shall be of the water-tube welded-wall type, having in-bed tube surface for APB offerings with natural and/or forced circulation. Tubes shall be seamless and all connections shall be welded. Tubes of the electric resistance welding process, where used, shall be identified by the Contractor and shall be ultrasonically tested along their entire length by the Contractor. Provide permanent thermocouples, as required, run to a terminal box outside the boiler casing. As a minimum, these thermocouples shall indicate:

a. Water wall temperature in critical locations (risers, etc.).
b. Heat absorption rates (cordial type t/c).
c. Air and gas temperatures.
d. Water and steam temperatures.

Drums shall be fusion welded throughout and fitted with manholes and hinged
covers at both ends. The hydrostatic test temperature shall be carefully monitored, as indicated in paragraph "TESTS," to avoid brittle failure. Boiler drains shall be furnished sufficient in size and number to completely drain the water from the entire unit in not more than 1 hour at 0 kPa psig pressure. The drum shall be equipped with internals for steam separation.

2.6.3 Forced Circulation System

Boiler designs utilizing horizontal in-bed evaporating surfaces shall be provided with a forced circulation system. The number and capacity of the pumps installed shall be such that with one pump out of service, the maximum rating of the boiler can be carried with complete safety. In addition, loss of all pumps, with the unit at MCR, shall allow for a safe and orderly shutdown (without fans) without damage to the boiler. The pumps shall be single stage, centrifugal, driven by constant speed motors. Pumps shall be complete with all necessary accessories, including welded suction and discharge connections, lubrication system, casing drain valves in duplicate, and any necessary auxiliary pumps, heat exchangers, or other equipment. The pumps shall withstand the boiler test pressure and all operating pressures and temperatures without distortion, binding, or other effects. The casings shall withstand the forces and moments imposed upon them by the connecting piping without disturbing the alignment or successful operation of the pumping units. The construction shall be such as to permit inspection of the rotating parts without dismantling the suction and discharge piping. The pumps shall operate satisfactorily at all loads, either by themselves or in parallel with the other pumps furnished. The pump suction valves shall be motor operated. Bypasses with valves shall be furnished around the pump isolating valves to maintain operating temperature in the idle pumps and piping. The discharge valves shall have impactor handwheels and lugs for air motor drive. Orifices, with protecting strainers as required, shall be provided to assure adequate circulation to all parts of the boiler circuits. All materials that may come in contact therewith shall be suitable to withstand acid and caustic boiler cleaning solutions. Connecting lines with stop valves shall be provided between the main distributing header and the economizer inlet header for use as a circulating line to the economizer when the boiler is acid cleaned.

2.6.4 In-Bed Tube Surface (AFB Designs)

In-bed tube surface shall be provided as required to achieve steam generation or superheat temperature as defined in the data sheets. The in-bed tubes shall be completely clear of bed material when the fluid bed (at the bed weight specified by the manufacturer at boiler MCR) is slumped. Alternatively, the manufacturer shall ensure that the tubes are protected from overheating due to contact with a slumped bed and/or maintenance problems due to moisture in a slumped bed.

2.6.5 Coal and Sorbent Feed Systems

All equipment required to provide a boiler feed system to convey coal and sorbent to the boiler injection inlets shall be furnished. All components of these systems shall be sized to provide flow of fuel and sorbent based on MCR condition in the boiler and the design coal and sorbent specified. The system shall be designed to minimize the segregation or generation of fines.
2.6.5.1 AFB Coal Feed System

Coal feed systems for AFB may be either pneumatic under bed or spreader stoker over-bed. For pneumatic under-bed feed systems, a feed point every 1.7 to 2.3 square meters 18 to 24 square feet shall be provided. The system shall consist of a complete integrated system including weigh belt feeder, lock hoppers, and/or other components necessary for the pneumatic fuel injection system. Rotary type feeders shall not be used as the primary pressure sealing device. The conveying air shall be considered part of the combustion air. Coal feed shall be crushed to approximately 6.4 mm 1/4 inch and shall be capable of being used with fluidizing velocities ranging from 1.2 to 3.7 m/second 4 to 12 fps. For these systems, sorbent may be mixed with the coal in the appropriate proportion and fed with the fuel. However, a separate sorbent feed system is acceptable. Over-bed feed systems shall be designed to provide even distribution over the entire bed. Heavy duty standard production spreader/injector/feeders shall be provided for dispersing the specified fuels into the boiler. The spreader/feeders shall be the chain type or equal, as approved by the Contracting Officer. The feeder portion shall be of the chain type with infinitely adjustable feed rate from 0 to 100 percent of rated capacity. The spreaders shall consist of adjustable rotating paddles on a shaft designed to disperse the specified coals into the boiler at the required locations and to minimize side throw into adjacent bed compartments which may not be in operation. The spreaders shall be capable of rotating at variable rates of speed. The spreader/feeders shall have overfire capability to the extent required by the design for use in compensating for a spreader/feeder out of service. For spreader stoker coal feed systems, sorbent feed shall be by separate systems. These systems shall consist of a method to feed the correct proportion of sorbent over the load range to keep the sulfur oxides emission in compliance. These systems shall feed over-bed or in-bed and may be gravity, pneumatic, or a combination. Under-bed coal feed systems shall be provided with coal dryers unless approved.

2.6.5.2 CFB Coal Feed Systems

For CFB systems, feed systems capable of providing the appropriate coal feed over the load range shall be provided. These systems shall include weigh belt feeders, rotary feeders, screw conveyors or air swept feeders, or gravity-feed metered by weigh belt. Rotary type feeders shall not be used as the primary pressure sealing device. The fluidizing velocity in systems ranges from 4.3 to 9.1 m/second 14 to 30 fps. The design shall permit maintenance of full load with loss of a single feed point. Screw conveyors shall be designed to operate continuously. Sorbent feed for CFB systems shall be capable of providing the required proportion of sorbent over the load range. These systems shall consist of a sorbent metering device weigh belt feeder and be fed by gravity, pneumatic injection, or air swept feeder. The sorbent shall be fed in-bed, under-bed, or over-bed, and shall be fed separately from the fuel.

2.6.6 Fluidized Bed Combustion Area

Parts subject to severe wear or deterioration shall be replaceable with a minimum of dismantling. The fluid bed combustor shall be designed to insure that no combustion air entering the bed is allowed to bypass contact with bed solids. Air distribution to the fluid bed will be through a number of nozzles located in the bed support plate. Average superficial velocity above the bed at the point of fuel and limestone feed shall be between 1.2 to 3.7 m/second 4 to 12 fps at bed temperature and mix zone.
pressure. The pressure drop through the air distributor plate shall be 3.7 kPa (15 inches water gauge) minimum. The walls of the fluid bed combustor shall be constructed of water-cooled tubes which form a part of the steam water circuit of the boiler. These walls shall be of membrane wall type of construction. The distributor shall be designated to assist with removal of large tramp material, where expected.

2.6.7 Bed Material Letdown System

The bed material letdown system shall be capable of removing and cooling solids from the bed including spent sorbent, unfired fuel, bottom ash, rocks, and debris. The system shall be designed to operate continuously and to cool all the solids going to disposal to 135 degrees C (275 degrees F) or less. The system shall be sized to continuously remove at least 80 percent of the total solids generated from the boiler, unless otherwise approved. The design of the bed letdown system shall include personnel safety considerations such as prevention of spillage of hot bed material from the unit.

2.6.8 Burners and Fuel Piping

The burners and burner equipment shall be suitable for continuous service. Parts subject to severe wear or deterioration shall be replaceable with a minimum of dismantling. All valves or controls shall be mounted outside the boiler front and air housing. The burner design shall provide positive and uniform mixing of the air and fuel at all loads, and shall produce sufficient turbulence to preclude stratification. The burner design shall permit the firing of No. 2 fuel oil. In-duct/over-bed burners shall be of the air atomizing type. The burners and/or ignitors shall have an aggregate capacity capable of bringing a cold unit up to ignition temperature using either precalcined limestone or spent bed material in 4 hours for AFBs, and 8 to 12 hours for CFBs, depending upon refractory limitations. Equipment for remote positioning shall be furnished, if required, of each burner gun at either the fully retracted or fully inserted position. The positioning equipment shall be air operated; shall include limit switches to indicate the position of the gun and all necessary drives, linkages, and mechanisms; and shall automatically purge the fuel from the guns before retracting.

2.6.9 Air Distribution System

The air distribution system shall provide uniform air distribution to the fluid bed under any mode of operation. The system must also meet the mechanical and structural requirements of the boiler such as bed material dead load support, effective seal with the enclosure wall, and nonsifting air nozzles.

2.6.10 Mechanical Collector and Solids Recycle System for AFB Boilers

A mechanical cyclone dust collector at the outlet of the boiler shall be provided. The mechanical dust collector shall be of the high efficiency multicyclone type designed for maximum operating temperatures encountered under all operating conditions. The collectors shall be designed to resist erosion and minimize plugging, shall be gas-tight, and shall have a collection efficiency of 85 to 95 percent on particles greater than 20 microns aerodynamic diameter, depending upon the recycle rate selected by the manufacturer. No refractory lining will be acceptable in the mechanical dust collector. The collection hopper shall have a valley angle of at least 60 degrees below the horizontal. The line carrying recycle
solids back to the bed shall be fabricated of carbon steel with an allowance for wear and be installed at an angle of no less than 60 degrees below the horizontal. The solids collection hopper and dipleg shall be provided with pressure differential measurement to indicate pluggage. The design shall include provisions for sampling of recycle solids hopper contents. The hopper shall be fabricated of material capable of enduring the conditions imposed by a flue gas atmosphere. Provision for continuous disposal of ash from the recycle hoppers shall be provided.

2.7 IGNITION OIL SYSTEM

******************************************************************************
NOTE: Wherever light oil is required as a support and/or ignition fuel, a complete ignition oil system must be provided. The system should include two full-size rail/truck unloading pumps, capable of unloading a rail shipment in one 8 hour shift or a truck shipment in 1 hour; one ignition oil storage tank capable of storing either 88 hours continuous plant ignition fuel demand or one rail shipment, whichever is larger; two full size ignition oil supply pumps per boiler unit, each capable of supplying the maximum ignition oil demand for each boiler unit; and one ignition oil day tank per boiler unit capable of storing 8 hours of continuous boiler ignition oil demand. Both the ignition oil transfer and boiler ignition supply pumps should be centrifugal type, where allowed by suction conditions and discharge flow/pressure requirements; otherwise, positive displacement pumps shall be used.
******************************************************************************

2.7.1 Ignition Oil Pumps

Ignition oil pumps shall be furnished as duplex types assuring 100 percent standby. Pumps shall be provided complete with coupling, coupling guard, and electric motor shop-mounted and aligned on a common skid.

2.7.2 Burners

Where indicated and specified, each boiler shall be provided with oil-fired burner or burners. The burner assembly and control systems shall conform to UL 296, UL 726 and NFPA 85, except as otherwise specified. Supervised manual semiautomatic and fully automatic combustion safety controls shall conform to, NFPA 85 and ASME CSD-1.

2.7.3 Aboveground Oil Storage Tanks

Aboveground oil storage tanks and associated piping systems shall be in accordance with Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.

2.7.4 Underground Oil Storage Tanks

Underground oil storage tanks and associated piping shall be in accordance with Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.

2.8 COMBUSTION CONTROL EQUIPMENT
NOTE: Subparagraphs describing inapplicable types of combustion control equipment will be deleted. Positioning type combustion control equipment will be specified for boilers with capacity of 13.2 MW 45,000,000 Btuh or less. Metering type equipment will be used for larger boilers. Positioning type controls with oxygen compensation may be furnished for boilers with capacity of 13.2 MW 45,000,000 Btuh or more in lieu of metering type. Oxygen compensated controls may be specified for boilers having output capacities of 7.3 MW 25,000,000 Btuh and greater if a life cycle cost analysis indicates it to be favorable.

Combustion control equipment shall be provided as a system by a single manufacturer. An automatic combustion control system shall be installed for each boiler in accordance with the manufacturer's recommendations. The controllers shall be located on the boiler room panel specified in paragraph BOILER ROOM PANELS AND INSTRUMENTS. The equipment shall operate either pneumatically, electrically, or electronically. Pneumatic control systems shall conform to CAGI B19.1. Air filter regulator sets shall be installed at each control valve and transmitter in the system. The master air filter regulator set on the control panel shall be of the dual type where one side can be cleaned and repaired while the other is in operation. Exterior control air piping and devices shall be protected from freezing by use of a regenerative desiccant dryer. Each system shall be provided with a selector switch or other means of manual control of the firing rate when required. Electrical control devices shall be rated at 120 volts and shall be connected as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Operating and limit controls shall be wired to interrupt the ungrounded circuit conductor. [Steam and energy generating equipment shall include instrumentation and sufficient metering for accountability interface with a future Energy Monitoring and Control System (EMCS).]

2.8.1 Positioning Type

Positioning type combustion control equipment shall be capable of maintaining boiler steam pressure within plus or minus 2 percent of the set pressure over the complete range of boiler operation. The system shall maintain excess air within plus or minus 10 percent of the original control setting. The efficiency will be maintained without appreciable manual adjustment. The system shall be capable of maintaining the specified pressure provided that the load does not exceed a 15 percent per minute change in capacity at any one time. The master transmitter shall be connected to the main steam header where the steam pressure is to be controlled. The signal transmitted from this point to the master controller shall be a function of steam pressure. On multiple boiler installations, a means shall be provided to base load on individual boilers while on automatic, and each boiler unit shall be individually controlled. Provision shall be made on the control system for adding on other boilers to the system with only minor wiring or piping changes on the panel. The fuel-to-air ratio on this system shall be adjustable from one knob that indicates increase and decrease of air in proportion to fuel. The range of this adjustment shall be limited to prevent operation below safe combustion limits.
2.8.2 Metering Type Combustion Control Equipment

******************************************************************************
NOTE: This paragraph will be deleted if controls with oxygen compensation specified in paragraph COMBUSTION CONTROLS WITH OXYGEN TRIM are used.
******************************************************************************

2.8.2.1 Fuel-Flow, Air-Flow Type Combustion Control

******************************************************************************
NOTE: This paragraph will be used for spreader stokers.
******************************************************************************

[Fuel-flow, air-flow type combustion control equipment shall be the proportioning and reset type, and shall position the fuel feed or air flow and then adjust one to the other by a ratio controller operating from air flow and fuel feed. The controls shall include fuel-flow measuring elements and air-flow measuring elements. Separate fuel feed and air-flow controllers shall be panel-mounted along with a fuel-to-air ratio controller. The air-flow index shall be set by a measuring element in the air stream. Systems controlling fuel and air by line shafting and mechanical connections will not be acceptable.]

2.8.2.2 Two Element (Steam Pressure, Steam Flow)

******************************************************************************
NOTE: If underfeed, traveling grate, or vibrating grate stokers are specified, use this paragraph.
******************************************************************************

[Two element (steam pressure, steam flow) combustion control equipment shall be the proportioning and reset type, and shall control the fuel feed or air flow either in parallel or series. The controls shall include measuring elements for steam flow, fuel feed, and air flow. Separate steam pressure, fuel flow, and air flow controllers shall be panel-mounted along with a fuel-to-air ratio controller. The actual steam flow shall be measured by an orifice or other flow measuring device in the steam line. The air-flow shall be set by a measuring element in the combustion air stream. Systems controlling fuel and air by line shafting and mechanical connections will not be acceptable.]

2.8.2.2.1 Master Pressure Transmitter

A master pressure transmitter shall be provided and connected to the main steam header at a point where the steam pressure is to be controlled. The master controller, which is located on the panel, shall load the various individual boiler controllers according to steam pressure changes. On multiple boiler installations, an operator station shall be provided to base load or bias each individual boiler while keeping its fuel and air controllers on automatic. This boiler master station shall be mounted on the control panel between the master controller and the remainder of the control system. Indicators shall be provided to show the loading impulse from the master controller to the boiler master station and each boiler master station output.
2.8.2.2  [Fuel Feed] [Steam-Flow] Transmitter

A [fuel feed] [steam-flow] transmitter shall be provided for each boiler and shall feed a signal to a fuel feed controller. Each fuel feed controller shall be loaded by the master controller for the rate of [fuel feed] [steam-flow] corresponding to the rating of the respective boiler. The controller shall operate the fuel device controlling the rate of fuel feed. The controller shall incorporate proportional plus reset control features.

2.8.2.2.3  Air-Flow Transmitter

Air-flow transmitter shall be provided for each boiler. The air-flow controller shall control from this signal or in such other manner as to maintain a predetermined ratio of air to fuel. An indicator shall be provided showing the amount of any manual adjustment to the air-to-fuel ratio. The controller shall have proportional plus reset modes of control.

2.8.2.2.4  Automatic Controller

Each automatic controller shall have a manual-to-automatic station and indicator on the control panel that will provide for selecting either automatic control or manual control and also will provide for manual operation. The manual controls shall be arranged to allow any one or more of the functions of the control system to be controlled manually while the other functions remain on automatic control. The manual control station shall be complete with all necessary indicators and provide bumpless balanceless transfer from automatic control to manual control and vice versa.

2.8.2.2.5  Power Units

Power units for the movement of dampers and fuel feed levers shall be sized to operate the device to be positioned and shall be so mounted that a rigid mechanical connection to the device being operated can be used. The units shall remain in the last position to which they moved in event of failure of the operating medium. Manual operation of the controller shall not necessitate disconnecting the linkages during power failure or other emergency. Position switches shall be included on fuel and air-drive units for interlock with safety systems. Retransmitting devices shall be placed on all power units for remote indication on the boiler panel of the position of the operator at any time. If electric operators are utilized, gear trains on the units shall be oil-immersed.

2.8.2.2.6  Furnace Draft Controller

Furnace draft controller of the modulating type shall be provided with each boiler. The draft controller shall be designed to maintain automatically within \( 2.5 \text{ Pa} \) \( 0.01 \text{ inch water column} \) the desired furnace draft for which it has been set manually. The draft controller shall fix the position of the boiler outlet damper through a power operator. An indicator shall be provided to show the amount of any manual adjustment that might be made. The draft regulator shall be equipped with a manual-automatic switch.

2.8.3  Combustion Controls with Oxygen Trim

Flue gas oxygen trim may be furnished with combustion controls specified. An oxygen analyzer and oxygen controller shall be provided. The oxygen controller shall be of the proportional band and reset type and shall feed its signal in a biasing fashion into the fuel-to-air ratio system. The oxygen setpoint shall be a function of boiler load with operator biasing.
The amount of oxygen controller trim shall be limited to prevent potentially hazardous conditions caused by equipment failure or misoperation.

2.8.4 Boiler Limit Controls

a. Two low-water cutoffs shall be provided to prevent startup and to shutdown the fuel if the boiler water level is below the preset safe level. The primary interlock may be automatic or manual reset type. The secondary interlock shall be the manual reset type.

b. A high-pressure limit switch shall be provided to shutdown the fuel when steam pressure exceeds the preset safe limit. This equipment shall be additional to the operating controls.

c. A draft loss interlock and air-flow switch or a suction switch shall be provided to prevent startup and to shutdown fuel supply when air is inadequate to safely support combustion. Limit and operating controls shall be provided for operation on a two-wire grounded branch circuit.

d. Safety interlocks required by the applicable NFPA standard shall be provided.

2.8.5 Burner Control/Fuel Safety System

2.8.5.1 Design Requirements

The control system shall be of the microprocessor-based (distributed digital or programmable controller) or relay type. A dedicated hardwired insert panel shall be furnished for monitoring and operator interface with the burner control/fuel safety system. This insert panel shall also provide the operator with direct fuel tripping capability in emergency situations. The burner control system shall be sufficiently subdivided to permit inservice checkout and maintenance without impairing the reliability of the overall control system. The logic cabinets shall include status indicating lights for logic inputs and outputs, and for monitoring availability of control power to subsystems as required to facilitate troubleshooting. Indication of equipment status and system permissives shall be provided at the operator interfaces. Where common power supplies internal to the system are furnished, a full-capacity on-line backup supply shall be included. Failure of either power supply shall be alarmed.

2.8.5.1.1 Maintenance and Reliability Requirements

In general, maintenance shall be accomplished on-line and without imposing any special restrictions on overall plant operation. Diagnostic routines, interchangeable electronic cards or boards, and clear written procedures shall be provided. Reliability, both software and hardware, shall be incorporated into the system design. This shall include redundancy, loop distribution, component specifications and testing, and quality control to assure the highest level of system reliability.

2.8.5.1.2 Adverse Electrical Conditions

Equipment shall be capable of operating as specified and without damage within the electrical environment of the plant. This environment includes high-voltage, high-frequency surges caused by electromechanical equipment, energy coupled between conductors by capacitance and mutual inductance, and imperfect grounds. Input and output isolation, shielding, separation of
circuits, surge suppression, or other measures which may be required to meet these provisions shall be provided. Inputs, outputs, and other connections shall meet the surge to withstand requirements of IEEE C37.90.

2.8.5.2 System Design

The burner control system shall be compatible in all respects with the boiler and auxiliary equipment. The system design shall meet the requirements specified in NFPA 85. The burner control system shall incorporate a continuous purge of the furnace to insure that the boiler is free of any accumulation of combustibles. The burner control system shall also supervise the operation of the fuel-air equipment associated with the pulverizer and fuel oil burners. The system shall accept operator commands and, if the required permissives are met, perform the required operation. Equipment shall be continuously monitored, and any deviation shall be alarmed while the system either corrects the deviation or shuts down equipment as necessary to avoid hazardous furnace conditions or equipment damage. The system shall monitor the operation of the fuel equipment and, if the equipment fails to respond to commands from the burner control system, the equipment trip sequence shall be initiated. Indications shall be provided to allow the operator to determine the equipment which initiated a trip of fuel equipment. Tripped equipment shall be successfully shut down before reset of the trip is permitted. The burner control system shall include a fuel safety subsystem which shall include a master fuel trip (MFT) system, ignitor fuel trip system, and pulverizer mill trip systems. Each system shall include a hardwired relay which may be directly operated from the operator insert panel. Inputs to the MFT shall include, in addition to those associated with the burner control, those that are required to provide overall boiler protection. Also, the system shall interface with the combustion control system to position and monitor devices for startup and shutdown which are normally modulated during on-line operation. The burner control system shall be designed to operate reliably and to minimize the number of false trips.

2.8.5.3 System Functional Requirements

2.8.5.3.1 Operating Modes

The operator shall have the responsibility for initiating the start and stop sequence listed below. Once initiated, the burner control system shall automatically place the mill or oil burner in service or remove it from service. The steps, each of which requires operator initiation, are:

(1) Purge
(2) Igniter control
(3) Pulverizer control
(4) Feeder control

2.8.5.3.2 Furnace Purge and Boiler Monitor

The furnace purge control shall incorporate prelight off and post purges of the furnace to ensure that the boiler is free of any accumulation of combustibles. Completion of the furnace purge shall be indicated to the operator, after which the operator shall reset the master fuel trip relay. A furnace purge shall be required on any master fuel trip. The boiler monitor shall prevent starting any fuel equipment if the furnace firing
permissives are not met. The furnace purge control shall provide indications to the operator of the status and the progress of the furnace purge. Permissive indications shall be extinguished when the MFT is reset.

2.8.5.3.3 Mill Start-Stop Sequences

The operator shall start and stop the mill in three steps (ignitor, pulverizer, feeder) following fixed sequences. The system shall be capable of transferring between the startup and shutdown sequences at any time. Each mill shall be monitored and should any unsafe conditions occur, that mill shall be tripped. A mill first out indication shall be provided to indicate the initiating cause of trip. The first out indication shall be deleted only upon reset of the mill trip relay. Startup and shutdown sequence indications shall be provided to allow the operator to follow the progress of the mill startup or shutdown sequences. These indications shall show the next step to be performed, as well as the progress through the sequences.

2.8.5.3.4 Ignitor Control

An ignitor group consists of the ignitors associated with a pulverizer burner group. Ignitors associated with a burner group shall be controlled from a separate electropneumatic ignitor control package. Sequential starting of ignitors between burner groups shall be provided. The ignitors associated with a burner group shall be started and stopped from the insert panel and local push buttons. An ignitor fuel trip (IFT) first out indication shall be provided to indicate the initiating cause of the IFT. This indication shall be extinguished only when the IFT relay is reset.

2.8.5.3.5 Fuel Safety Subsystem

The fuel safety subsystem comprises the MFT system, IFT system, and pulverizer mill trip (MT) systems. A mill trip system shall be provided for each mill. Each fuel safety system shall provide the protection for its respective fuel and shall include a dedicated hardwired relay which may be directly operated from the operator insert panel. The master fuel trip system shall provide overall boiler protection, shall also include a dedicated hardwired relay, and shall directly trip all other fuel safety system relays. The system shall be designed to deenergize to trip.

2.8.5.3.6 Flame Monitoring

Individual self-checking flame scanners are required for each burner. Ignitor flame safety devices shall discriminate individually from any flame that may exist at other burner locations. Burner flame shall be discriminated individually from the associated ignitor flame and any other flame that may exist in the furnace. Ignitor and burner flame discrimination shall cover the range from startup to full load operation. Blocking interlocks from closed valves in flame discrimination circuits to avoid false flame indication are not acceptable. If required to obtain satisfactory flame discrimination, extended tube scanners shall be included. Individual flame detector output level indicators are required. Provisions for cooling and cleaning shall be provided, if required.

2.8.5.3.7 Enclosures

The system logic cabinets shall contain control devices, power supplies, circuit protective devices, cable plugs, and terminal blocks. Spare space shall be provided to accommodate a minimum of 20 percent additional
devices. The cabinets shall be accessible from both front and back, and each shall have gasketed hinged doors with latches. Each door shall not exceed 600 mm 24 inches in width. Natural draft cooling of the control system cabinets is preferred. If cabinet cooling fans are furnished, the loss of any fan shall be alarmed.

2.8.5.3.8 Local Termination Boxes

The system shall include local junction boxes, one at each burner level and one at each pulverizer. Burner level junction boxes shall contain separate push buttons and indicating lights for local control of each ignitor group. In addition, the terminal boxes shall contain terminals for field wiring, internal wiring, cable connectors for intersystem wiring, circuit breakers and, if required by the system, relays and reversing starters. Terminal boards for field wiring shall include 20 percent spare connections. Also, the system shall include local pulverizer junction boxes for terminating field wiring associated with each mill. These junction boxes shall meet the requirements described above, except local control is not required.

2.8.5.3.9 Interconnecting Cable Requirements

Interconnecting cables between the logic cabinet, insert panel, local burner junction boxes, and local mill junction boxes shall be via prefabricated plug-in cables, including connectors. Flame scanner cables shall also be furnished.

2.8.5.3.10 Buffered Output Signals

Output signals required for tripping, control, and monitoring shall be fully isolated from each other. The isolation shall be such that an open or short circuit in the related equipment shall not affect other control systems.

2.9 BOILER ROOM PANELS AND INSTRUMENTS

2.9.1 Instrument Control Panel

Instrument and control panel shall be sized to contain all controls, instruments, gauges, and meters. The panel shall be free-standing with faceplate of not less than 4.8 mm 3/16 inch steel, properly reinforced, and shall be finished with the manufacturer's standard finish coating. The units shall be mounted flush on the panel as far as practicable. Controls, instruments, and other equipment shall be flush mounted, each fitting neatly into a cutout, and completely covering the cutout and any mounting screws or bolts. The back of the panel shall be enclosed with sheet metal and with adequate removable access panels or doors for maintenance and removal of any unit without interfering with other units. Proper latching equipment and hardware shall be provided. Each recorder, indicator, and control unit shall be identified with nameplates securely fastened to the panel. Nameplates shall be black over white laminated plastic with the lettering penetrating the black surface to expose the white. Nameplates shall be mounted not more than 25 mm 1 inch below the instrument or gauge, on the centerline. The panel shall have continuous, rapid-start, fluorescent light fixtures mounted with reflectors providing suitable shielding to illuminate controls, instruments, gauges, and meters. Field piping connections shall terminate in one bulkhead-mounted manifold, located to conform with the installation requirements of the system. Field electrical wiring shall terminate in a color-coded terminal strip so
located as to conform with the installation requirements of the system. Electrical tubing or piping connections to controls, instruments, or other devices on the panel shall be inside the panel and not visible from the panel front. A suitable plug-in strip shall be provided in the rear of the panel for any required plug-in electrical connections of the instruments. Necessary transformers, separate relays, switches, and fuses shall be installed in a fully enclosed junction box. A fused safety switch shall serve the 120-volt power supply required for control circuits. If a pneumatic control system is provided, the panel shall include duplex air supply filter and regulator set mounted on the rear of the panel with properly identified pneumatic terminal blocks and low point drain. No high-pressure lines will be allowed to enter the panel. [If packaged boiler burner units with integral controls are furnished, the control equipment may be mounted on a separate free-standing panel for each boiler. Controllers and indicators specified or required shall be panel-mounted and tested at the factory complete with relays, transformers, switches, wiring, valves, piping, and other appurtenances. Wiring and piping within the panel shall be color-coded or otherwise identified.]

2.9.2 Indicators

Indicator shall be flush mounted with a vertical scale of 100 to 150 mm 4 to 6 inch length. Indicators may be either electronic or pneumatic with zero adjustment, receiving standard signals from locally mounted transmitters. Scales shall be in engineering units with an accuracy of plus or minus 1 percent.

2.9.3 Recorders

Recorders shall be servo mechanism type, or multiple pen type. [Circular] [Strip] chart type shall be provided. Minimum chart width is 100 mm 4 inches. Accuracy shall be plus or minus 0.5 percent. Each pen shall have a separate scale calibrated in engineering units. Chart drive shall be 120 volts ac. One year's supply of chart paper shall be provided.

2.9.4 Panel Display

**************************************************************************
NOTE: Steam flow meters will be specified for boilers having a continuous steam capacity of 4,540 kg 10,000 pounds or more per hour and shall be integrating type where indicated. Feedwater meter will be provided on individual boilers not having steam flow meter.
**************************************************************************

As a minimum, the following parameters shall be displayed on the panel:

<table>
<thead>

### 2.9.5 Panel Piping and Wiring

High-pressure and high temperature values shall be pneumatically or electrically transmitted, or both, to the panel. Pneumatic signals shall be 21 to 103 kPa 3 to 15 psig. Piping connectors to indicators shall be 6 mm 1/4 inch OD copper tubing conforming to ASTM B68/B68M. Flow signals shall be transmitted either pneumatically or electrically to the panel-mounted receiver. Copper tubing connections and electric wiring shall be run to a terminal block located on the inside of the panel front near the bottom. Wiring shall be terminated at an identified terminal strip. Wiring shall be suitable for boiler room requirements and installed according to NFPA 70.
2.9.6  Pilot Lights

Pilot lights shall be assembled in a factory-built cabinet, suitable for flush mounting in cutouts in boiler control panel, complete with extruded trim, clamps, and sheet metal rear housing, and finished in baked black enamel. Lens shall be white plastic and engraved in black ink. Lettering shall be 19 mm 3/4 inch high and black. Two lamps per pilot shall be provided and independently wired. Lamps shall be 6 watts, 24 volts dc, S-6 incandescent type, supplied with color caps, one red and one green per pilot light. Lens bezels shall be black unless otherwise indicated.

2.9.7  Clock

The clock shall be electric synchronous motor type. The clock shall be for surface mounting and suitable for operation on 115-volt, 60 Hz single-phase electric service. The clock shall have a white dial, easy-to-read black numerals, black hands, red sweep second hand, and external manual reset knob at bottom of case. The motor gear train shall be sealed in a permanent oil bath. The clock dial shall be 381.0 mm 15 inch size.

2.9.8  Alarm Annunciator Panel

Layout of annunciator panel shall be as shown. Panel shall consist of a flush-mounted cabinet, mounting trim with clamps, removable rear cover, and alarm modules. Cabinet shall be finished with black baked enamel, aluminum trim, and black alarm bezels. Nameplate size of alarm modules shall be nominal 70 mm 2-3/4 inches high by 75 mm 3 inches wide in translucent white acrylic plexiglass and all nomenclature shall be engraved on front surface in black lettering. Plug-in alarm module shall include epoxy circuit board, one reversible plug-in relay, one general-purpose plug-in relay, relays with dust covers, two selector switches for relay contact selection, and two lamps wired in parallel at 24 volts dc, 6 watts. Flasher module shall be mounted and prewired with silence and test pushbuttons. Alarm horn shall be remotely mounted and of general-purpose construction. Input voltage shall be 120 volts ac, 60 cycle. Power supply of 120 volts to 24 volts dc output of volt-ampere capacity shall be provided to suit load. Alarm sequences of panel shall provide for "first alert" sequence, with manual reset and ringback sequences. Annunciator panel shall be prewired internally to a rear terminal strip.

2.9.9  Combustion Control Components

Components shall conform to the requirements of paragraph COMBUSTION CONTROL EQUIPMENT.

2.9.10  Steam and Feedwater Flow Measurement

Flow nozzles shall be provided to measure the steam flow from each boiler and each main steam header outlet. Orifice plates shall be provided to measure feedwater flow to each boiler. Nozzles and orifice plates shall be flange-mounting type and made of stainless steel. Orifice plates shall be of the square edge, concentric, paddle type designed for flange taps. Minimum straight pipe runs shall be in accordance with AGA XR0603. Condensate pots shall be provided for steam service.

2.9.11  Flue Gas Opacity Monitor

A flue gas monitoring system shall provide continuous measurement, indication, and recording of smoke opacity from each boiler. The stack
units shall include a light source and a light detecting or receiving unit mounted in the stack or main breeching as recommended by the manufacturer. The control or transmitter unit shall have electronic solid-state circuitry and meter or digital type indicator, and provide an output signal of 4 to 20 mA dc for 0 to 100 percent opacity. In addition, the control unit shall have calibration and alarm adjustments for compliance with Federal, State, and local environmental regulations. The control or transmitter unit and recorder shall have dust-tight metal enclosure. A purging air system shall be provided to clean light source lens and light detector lens. The control unit shall have adjustable alarm output contacts for various smoke densities.

2.9.12 Sample Cooler

Sample cooler shall be a water cooled shell and tube or shell and coil type heat exchanger with stainless steel tubes and cast-iron or steel shell suitable for cooling the blowoff before sampling. The cooler shall be connected to a header and valved so that the operator can obtain a sample of properly cooled blowoff from any boiler as desired. The cooler shall be properly supported and shall have a brass or bronze sampling cock with lever or compression handle. A sampling glass container suitable for handling the water temperature to be encountered and a hydrometer or equivalent device suitable for measuring the concentration of solids in the water and reading in parts per million shall be provided.

2.9.13 Oxygen Analyzer

If oxygen compensation controls are furnished, an oxygen analyzer shall be provided to indicate, record, and control the percentage of net excess oxygen in, and the average temperature of the flue gas leaving, the boiler. The oxygen analyzer shall be of the direct probe type utilizing an in situ zirconium sensing element. The element shall be inserted directly into the process flue gas stream and shall directly contact the process gases. The sensing element shall be contained within a protective shield mounted to the ductwork by an adapter plate, furnished by the manufacturer. The analyzer shall be equipped to allow daily automatic calibration check without removing the analyzer from the process. That is, sample gases may be injected directly on the sensing element while the analyzer is in the process. The analyzer shall include any temperature compensation of control required. The output signal range shall be 4 to 20 mA dc and shall represent 0 to 10 percent as a linear function.

2.9.14 Continuous Blowdown

**************************************************************************
NOTE: Continuous blowdown equipment will be provided if required by UFC 3-410-01 or UFC 3-410-02. If a firetube boiler is specified, these paragraphs will be deleted.

Blowdown system will be deleted if not required for the project.
**************************************************************************

Package type blowdown system shall be rated as indicated. The system shall automatically proportion blowdown to amount of makeup. The unit shall include [the heat exchanger's flow control valve,] strainer, sample cooler (if required), solenoid valve, and surge tank. [An extra-heavy blowdown heat exchanger shall be provided. Tubes shall be of stainless steel. A
removable tube bundle shall be provided with U-tubes having bends twice the thickness of the tubing. A rear baffle shall support all tubes at the return bend. A sample cooler shall be installed so that shell and tubing can be removed without disturbing piping or mounting. Continuous blowdown valve shall be the manual proportioning type fabricated of corrosion-resistant steel. The valve shall be equipped with a micrometer dial and pointer to indicate the proportional setting.

2.9.15 Continuous Emissions Monitoring

**************************************************************************
NOTE: A continuous emissions monitoring system (CEMS) is required by the Clean Air Act Amendment (CAAA) of 1990 if the fuel utilized is oil or coal and the heat input is 3 megawatts 10 million BTU/HR or greater. A CEMS may also be required by state or local laws. If a CEMS is necessary the designer shall review the CAAA and the relevant state or local law early in the project to allow time to incorporate the required CEMS specification and to determine which flue gas emissions will be included in the required reports. Before acceptance of the installation, the Contracting Officer shall be furnished a written test report which provides documentation that the CEMS equipment has passed factory and field certification tests required by federal, state and local regulations. The investigation will determine if the reported values may be calculated or should be direct measurements. Fill in the data to state what method of measurement or calculation will be utilized for the determination of the report variable.

Emerging flue gas flow monitor technologies are available. The traditional differential pressure technique specified uses familiar equipment that can be maintained by plant personnel. This type of measurement device has reliably satisfied regulatory requirements. The possible use of other technologies should include a thorough investigation of flue gas flow monitor regulatory requirements and in-house maintenance capabilities.

**************************************************************************
a. Continuous emissions monitoring system (CEMS) equipment shall be provided as a system by a single manufacturer. A CEMS, meeting the requirements of applicable federal regulations, State of [_____] and local regulations, shall be provided for each boiler in accordance with manufacturer's recommendations and under the direct supervision of the CEMS equipment manufacturer.

b. The reported data shall include [sulfur dioxide (SO2)] [oxides of nitrogen (NOx)] [carbon dioxide (CO2)] [particulate matter (PM)] and other information required by federal, state, and local regulations. SO2 reporting shall be based on [analyzer measurement] [fuel flow and percent sulfur calculation] [daily heat input calculation]. Nitrous oxides, carbon dioxide and particulate matter reporting shall be based on analyzers.
c. The CEMS equipment shall include the central processing unit, printer, hard disk drive, and floppy disk drive. The floppy disk drive shall function as a recorder. The manufacturer shall provide the software to generate the required reports in a format acceptable to the federal, state and local regulatory agencies. The operator interface to the CEMS equipment shall be via CRT screen.

2.10 WASTE HEAT RECOVERY EQUIPMENT

********************************************************************************
NOTE: Economizer or preheater will be selected to be compatible with pollution control equipment being utilized.
********************************************************************************

Each boiler shall be equipped with [an economizer] [an air preheater]. Units may be separate from or integral with the boiler and shall be complete with insulation and jackets, casings, supports and access doors, and shall have provision for tube or tube bundle removal and for cleaning. Soot blowers shall be provided as specified in paragraph BOILERS.

2.10.1 Economizers

Economizers shall be of a type normally provided by the boiler manufacturer and shall include [finned tubes] [bare tubes] baffles and headers and shall have provision for cleaning and tube bundle removal. At maximum load, economizer exit water shall not be within 17 degrees C 30 degrees F lower than saturation temperature. Materials shall be capable of withstanding the maximum boiler exit gas temperature plus 28 degrees C 50 degrees F. The tubes shall conform to ASME BPVC SEC I. The overall design and installation shall preclude cold-end corrosion under any load condition. Economizer tube metal temperature shall be above the maximum flue gas dewpoint for the fuel being fired under all load conditions.

2.10.2 Air Preheaters

Air preheaters shall be a type normally provided by the boiler manufacturer and shall be the recuperative tube plate or regenerative type constructed of materials adequate to withstand the corrosion effects of the flue gases. The overall installation shall preclude cold-end corrosion of the air preheater under any load condition. Temperatures of metals in contact with flue gas shall be above the flue gas maximum dewpoint temperature for the fuel being fired under all load conditions. Control shall be by steam-preheat or by automatic bypass and shall be integrated with the combustion control system.

2.11 DRAFT FANS

********************************************************************************
NOTE: Where fans are not protected by electrostatic precipitators or baghouse filters on boilers of 4540 kg per hour 10,000 pounds per hour and larger, provide liners for scroll sheets and rotor blades.
Induced draft fan outlet dampers may not be required in single fan/single boiler installations, except to eliminate the stack effect during outages.
********************************************************************************
Centrifugal fans conforming to AMCA 801 [Type I] [Type II] [forced-draft] [and] [induced-draft] shall be furnished as an integral part of boiler design. Fans shall be centrifugal with [backward curved blades] [radial tip blades] [or] [axial flow type]. Each fan shall be sized for an output volume and static pressure rating sufficient for pressure losses, excess air requirements at the burner or grate, leakages, temperature and elevation corrections for a dirty boiler with worst ambient conditions, all at full combustion to meet net rated output at normal firing condition. In addition, fan sizing shall include margins of 10 percent volume and 21 percent static pressure, plus margins of 5 degrees C 10 degrees F for forced draft fans and 22 degrees C 40 degrees F for induced draft fans. Induced-draft fans shall be designed for handling hot flue gas at the maximum boiler outlet temperature adjusted for boiler surface fouling. [Induced draft fans shall be provided with outlet dampers.] Noise levels for fans shall not exceed 85 decibels at 914.4 mm 3 foot station. Fan bearings shall be [air-cooled] [or] [water-cooled], and backward curved fan blade type with bearings not requiring water cooling may be of the self-aligning antifriction type. [Scroll sheets and rotor blades shall have liners.]

2.11.1 Draft Fan Control

******************************************************************************
NOTE: Variable speed control, inlet vane control, and inlet damper control are, in descending order of efficiency, capable of control draft fan conditions. The choice is based on economics. However, in erosive services, inlet vane control is not desirable.
******************************************************************************

Forced-draft centrifugal fans shall have [inlet vane controls] [variable speed control] where indicated. Induced-draft centrifugal fans shall have [inlet vane control] [inlet damper control] [variable speed control]. [Axial propeller fans shall have variable propeller pitch control.] Inlet vanes or dampers shall be suitable for use with combustion control equipment.

2.11.2 Draft Fan Drives

******************************************************************************
NOTE: Where motor starters for mechanical equipment are provided in motor control centers, delete the reference to motor starters.
Steam driven boiler auxiliaries will not be used unless the exhaust steam can be utilized completely. Reference to steam drives will be deleted if inapplicable for the equipment specified.
******************************************************************************

Fan shall be driven by [an electric motor] [or] [a steam turbine]. [Electric motor shall be [drip-proof] [totally enclosed nonventilated] [totally enclosed fan-cooled] [totally enclosed fan-cooled, suitable for installation in a Class II, Division 1, Group F, hazardous location conforming to NFPA 70].] [Motor starter shall be magnetic [across-the-line] [reduced voltage start] type with [general-purpose] [weather-resistant] [watertight] [dust-tight] [explosion-proof] enclosure and shall be furnished with four auxiliary interlock contacts.]
turbines shall operate properly in a steam pressure range of [_____] Pa psig with steam back pressure of [_____] Pa psig. Turbines shall have horizontally-split, centerline supported casings, water-cooled bearing housings with ring-oiled, babbitt-lined, bronze packed sleeve bearings. Turbines shall also be equipped with a mechanical shaft speed governor and valve, and independent emergency overspeed governor and trip valve, reed tachometer, constant pressure type governor, insulation with removable metal jacket, oil-sight glasses with guards, removable stainless steel steam strainer [without disconnecting piping], any special wrenches and tools required for servicing turbine, and a sentinel warning on the exhaust casings. Turbines shall conform to NEMA SM 23.

2.12 AIR DUCTS

Air ducts connecting the forced-draft fan units with the plenum chamber shall chamber shall be designed to convey air with a minimum of pressure loss due to friction. Ductwork shall be galvanized sheet metal conforming to ASTM A653/A653M. Ducts shall be straight and smooth on the inside with laps made in direction of air flow. Ducts shall be externally braced and shall be so installed and anchored as to be free of vibration. Access and inspection doors shall be provided as indicated and required. Ducts shall be constructed with long radius elbows having a centerline radius 1-1/2 times the duct width, or where the space does not permit the use of long radius elbows, short radius or square elbows with factory-fabricated turning vanes may be used. Duct joints shall be substantially air-tight and shall have adequate strength for the service, with 38.1 x 38.1 x 3.2 mm 1-1/2 x 1-1/2 x 1/8 inch structural steel angles used where required for strength or rigidity. Duct walls thickness shall be as follows:

<table>
<thead>
<tr>
<th>Ducts, Maximum Dimension</th>
<th>Steel Sheet, Minimum Thickness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up thru 1.5 m (60 inches)</td>
<td>1.519 mm (16 gauge) 16 gauge</td>
</tr>
<tr>
<td>Up through 60 inches</td>
<td></td>
</tr>
<tr>
<td>1.6 m (60 inches) 61</td>
<td>2.657 mm (12 gauge) 12 gauge</td>
</tr>
<tr>
<td>inches and larger</td>
<td></td>
</tr>
</tbody>
</table>

2.13 BREECHING

Breeching shall be constructed of not less than 3.416 mm 10 gauge steel sheets conforming to ASTM A36/A36M. Breeching shall be adequately reinforced and braced with structural steel angles not smaller than 50 x 50 x 6.4 mm 2 x 2 x 1/4 inches, and all joints and seams in the sheets and angles shall be welded. Expansion joints shall be installed as indicated and as required to suit the installation and shall be flexible type requiring no packing. Breeching shall have angle flanges and gaskets for connection to boilers, fans, equipment, or stacks. Breeching connections shall be gas-tight and be caulked tight all around and sealed with cement to form an air-tight joint. Clean-out openings of suitable size and at approved locations shall be provided for access to all sections of the breeching and shall have tight-fitting, hinged, cast-iron doors with cast-iron frames. Plastic materials polyetherimide (PEI) and polyethersulfone (PES) are forbidden to be used for vent piping for combustion gases.

2.14 STACKS

Stacks for individual boilers shall be self-supporting double-wall insulated type. Unless otherwise indicated, each stack shall be complete
with structural steel base, base plates, anchor bolts and nuts, clean-out
door, [induced-draft fan] [boiler] connection and a thermometer well. Stub
stacks for packaged boiler units may be supported directly on the boiler
providing the boiler structure is designed to accommodate such an
arrangement. Insulation shall be suitable for sustained flue gas
temperature of 480 degrees C 900 degrees F with intermittent temperatures
up to 650 degrees C 1200 degrees F and the wall section shall provide a "U"
factor of approximately 0.26. Stacks shall be fabricated of steel
conforming to ASTM A242/A242M for both inner and outer shell. Inner shells
of each section shall be provided with an air-sealed and concealed
expansion and contraction device to allow for differential expansion of
inner and outer shells. Stacks shall be extended above the roof to the
height indicated. Plastic materials polyetherimide (PEI) and
polyethersulfone (PES) are forbidden to be used for vent piping for
combustion gases.

2.15 BLOWOFF TANK

Blowoff tank [shall be constructed of 28 MPa 4000 psi reinforced concrete
as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE, and shall be
fitted with a bolted steel manhole cover and frame. Blowoff pipe, vent
pipe, and drain pipe to sewer shall be installed in pipe sleeves built into
the concrete. The space between the pipe and sleeves shall be filled and
caulked with lead wool or similar material to make a water-tight
connection. The tank shall be divided into two sections by a baffle to
form a sediment chamber] [shall be constructed of steel in accordance with
NBBI NB-23 PART 1.]

2.16 PUMPS

2.16.1 Boiler Feed Pumps

Boiler feed pumps shall be sized and designed for the specific application.
Pumps having a combined rating of flow and head that results in a wattage
horsepower rating less than 185 kW 250 bhp shall be furnished to meet the
design requirements of API STD 610. The pump shall be end-suction, top
discharge and be supported at its centerline. Pump sizes with higher
ratings than the above shall be horizontal-split case, multistage
centrifugal pumps. Casing construction shall be either volute or diffuser
design and shall also be supported at its casing centerline. All pump
ratings shall have, nominally, an excess in capacity of 10 percent above
the maximum continuous rating of the service. The required net positive
suction head (NPSH) at the pump design flow, head, and speed shall not
exceed 80 percent of the available system NPSH at the same flow, assuming a
low level in the storage tank. The pump's suction specific speed shall not
exceed 9000 at the pump's best efficiency point (BEP). The guaranteed NPSH
requirements shall reflect 3 percent breakdown criteria. The pump's
head-capacity (H-Q) curve shall be constantly rising to shutoff with no
point of inflection. There shall be no restriction to operation at any
point from minimum continuous flow to design flow.

2.16.1.1 Casings

Pumps shall have integrally cast suction and discharge flanges that shall
be drilled to meet the design pressure of the application. The maximum
operating temperature, for design purposes, of any feedpump shall not be
less than 204 degrees C 400 degrees F. Casings shall be drilled, tapped,
and provided with vent and drain connections. Pumps designed for this
service shall not require cooling at ratings below 375 kW 500 bhp. This
applies to both frame cooling or seal cooling. Below 375 kW 500 bhp, pumps shall employ antifriction radial and thrust bearings lubricated by flinger rings in a sealed housing. Seals shall be mechanical and air-cooled flush piping conforming to API STD 610, Plan 23. Above 375 kW 500 bhp, pumps shall employ a single cooling circuit for both cooling the oil being delivered by a forced oil system to sleeve radial bearings and a floating shoe thrust bearing, coupled with the seal coolers for both stuffing boxes. Mechanical seals shall also be provided. In both cases, stuffing boxes shall be site-convertible to a packed box. Leakage shall be no more than 25 mm/hour 25 cc/hr for a seal life of no less than 25,000 hours. Bearing rating shall be not less than 100,000 hours (L-10 life) at the point of maximum load, as defined by ABMA 9.

2.16.1.2 Base

Pumps shall be supported on structural steel bases that do not require grouting in order to impart strength to the pump for static and dynamic loading from the piping system. The bases shall be pitched to a low point drain. The complete pump and motor assembly shall be shop-aligned using shims on both the pump and the motor.

2.16.1.3 Couplings

All pumps shall be furnished with nonlubricated flexible-disc couplings and a coupling guard furnished to OSHA requirements. Couplings shall be spacer-type to permit removal of the mechanical seals and limited-end-float-type for pumps with sleeve bearings.

2.16.1.4 Automatic Recirculation

**************************************************************************
NOTE: If automatic recirculation valve is utilized, delete this paragraph.
**************************************************************************

All pumps shall be furnished with a self-contained automatic recirculation control valve that shall be sized for nominally 25 percent of the pump's BEP flow.

2.16.1.5 Turbines

Steam turbines for boiler feed pump shall operate the pump properly in a steam pressure range of [_____] Pa psig with steam backpressure of [_____] Pa psig. Turbines shall have horizontally-split, two-piece, centerline supported casings, water-cooled bearing cases with ring-oiled, babitt-lined, bronze packed sleeve bearings. Turbines shall also be equipped with a mechanical shaft speed governor and valve, independent overspeed emergency governor and trip valve, reed tachometer, constant pressure type governor, insulation with removable metal jacket, oil-sight glasses with guards, stainless steel steam strainer that is removable without disconnecting piping, any special wrenches and tools required for servicing the turbine, and a sentinel warning on the exhaust casings. Turbines shall conform to NEMA SM 23.

2.16.1.6 Electric Motors

Electric motors shall be selected for continuous duty and non-overloading characteristics suitable for the power characteristics available. Motors shall be [splashproof][totally enclosed, nonventilated][totally enclosed,
fan-cooled type] [totally enclosed, fan-cooled type, suitable for installation in a Class II, Division 1, Group F hazardous location in accordance with the NFPA 70]. [Motor starter shall be [manual] [[magnetic] [across-the-line] [reduced voltage start]] type with [general-purpose] [weather-resistant] [water-tight] [dust-tight] [explosion-proof] enclosure.] Integral size motors shall be the premium efficiency type in accordance with NEMA MG 1.

2.16.1.7 Shop Hydrostatic Testing

All pumps shall be subjected to shop hydrostatic testing. One pump in each service shall be subjected to a complete shop performance test to demonstrate that, at rated capacity, head is within a margin of plus 3 percent and minus 0 percent of design; efficiency is within a tolerance of minus 0 percent; NPSH at the pump's BEP and at the rated condition is within a margin of plus 0 percent and minus 10 percent. Performance tests shall be in accordance with API STD 610. Procedures and results shall be subject to the approval of the Contracting Officer.

2.16.2 Condensate Pumps

*************************************************************************
NOTE: If inadequate NPSH is available, the designer shall give consideration to substituting either a double suction or positive displacement pump.
*************************************************************************

Condensate pumps shall be horizontal, end suction, single stage, centrifugal, motor-driven pumps. Pumps shall have stainless steel shafts and bronze impellers. Pumps shall be provided with stuffing boxes. Lubrication shall be by splash oil with oil level sightglass provided. Pumps shall be subjected to the same tests specified for the Boiler Feedpumps.

2.17 CONDENSATE TANK AND ACCESSORIES

2.17.1 Condensate Tank

Condensate tank shall be designed for a working pressure of 103 kPa 15 psig and shall conform to ASME BPVC SEC VIII D1. The tank shall have a storage capacity equal to or greater than indicated and shall be installed complete with piping and accessories.

2.17.2 Feedwater Makeup Valve

Float-controlled valve shall be provided for emergency feedwater makeup to the tank. The valve shall be operated by a float-control mechanism connected to the surge tank and shall maintain a suitable minimum water level in the tank. The float box shall be outside the tank and the connections shall be properly valved to permit blowdown and servicing.

2.18 HEAT EXCHANGERS

Heat exchangers shall be designed, fabricated, tested, and stamped in accordance with ASME BPVC SEC VIII D1. Additionally, heat exchanger designs shall meet the requirements of HEI 2623. Closed feedwater heater designs shall meet the requirements of HEI 2622. Heat exchangers shall be provided with relief valves as required by ASME BPVC SEC VIII D1 and the HEI Standards. Heat exchangers using service water shall be designed to

SECTION 23 52 30.01 10  Page 64
have the service water inside the tubes. The exchangers shall be of straight tube designs with bolted full diameter access channel covers to facilitate tube maintenance as required. Return bonnets are acceptable when there are no tubeside nozzle connections at the far end. Materials of construction shall be all carbon steel, except the service water side which shall reflect the service water available. When the water quality permits, the tubes shall be stainless steel in accordance with ASTM A249/A249M, Grade TP 304, the remainder of the tube side shall be all carbon steel. When the service water is known to contain chloride levels harmful to stainless steels, the tubes shall be 90-10 Copper-Nickel in accordance with ASTM B111/B111M Alloy 706; the remainder of the service water side shall be as follows: tubesheets, monel-clad steel; channel covers, carbon steel lined with monel; channels and bonnets, monel. Fixed tubesheet designs are preferred when operating conditions do not impose a large differential movement that cannot be readily accommodated with a simple thin-wall metal bellows expansion joint. For larger differentials, a packed floating tubesheet with lantern ring is acceptable up to 1.03 MPa 150 psig design pressure. For pressures above 1.03 MPa 150 psig, a split ring floating head design shall be used. Heat exchangers using steam to heat domestic water or other fluids such as glycol-water mixtures or fuel oil shall have the steam in the shell side. The exchangers shall be of U-tube designs with bolted full diameter channel covers to facilitate tube maintenance as required. The tubesheet shall be the full diameter to match the shell flange and shall have sufficient threaded bolt holes so that a shell hydro test may be applied without the channel in place. Materials of construction shall be of all carbon steel with the exception of the tubes which should typically be specified as stainless steel in accordance with ASTM A688/A688M, Grade TP 304, stress relief annealed temper with the U-bends stress relieved after bending. Fuel oil heaters shall have carbon steel tubes in accordance with ASTM A179/A179M and be furnished in the stress relief annealed temper with the U-bends stress relieved after bending. Feedwater heaters shall be of all welded construction with bolted full diameter channel covers to facilitate tube maintenance as required. The channel barrel shall be integral with the tubesheet and have an internal pass partition bolted cover design that shall be readily removable when the channel cover is removed. Pass partitions that are sealed with a gasketed groove in the channel cover are prohibited. Materials of construction shall be all carbon steel except the tubes. Pressure boundary material shall be in accordance with ASTM A516/A516M, Grade C, when plate material is required, or ASTM A350/A350M when forging material is required. Shroud plate material for desuperheating and subcooling zones shall be in accordance with ASTM A285/A285M, Grade C. Tubes shall be stainless steel in accordance with ASTM A688/A688M, Grade TP 304, stress relief annealed temper with the U-bends stress relieved after bending.

2.19 DEAERATING FEEDWATER HEATER

**************************************************************************
NOTE: Economizer or preheater will be selected to be compatible with pollution control equipment being utilized.
**************************************************************************

Deaerating feedwater heater shall be installed where indicated and shall be size and capacity indicated. Shell shall be [cast iron] [steel plate]. [Tray system for unit shall be [cast-iron] [corrosion-resistant steel].] Floats shall be of [copper] controlled overflow-trap type. Heater shall be provided with [a pressure relief valve,] [thermometers,] [pressure gauge,] [and] [oil separator]. [A combination temperature-pressure
A recorder shall be installed for each feedwater heater. Steam pressure readings shall be taken from the shell, and the temperature bulb shall be so placed as to indicate the temperature of the feedwater after it passes over the trays and sprays. An alarm shall be provided to turn on a red pilot signal lamp and to sound a bell gong in the event that water level in the feedwater heater storage tank falls to 300 mm 12 inches above the bottom of the tank. The system shall be operated by an approved type of external electric float switch connected to the tank. The signal lamp and bell shall be mounted where directed. The deaerating feedwater heater shall have a capacity of [_____] pounds of water per hour at a discharge temperature of [_____] degrees F at the following inlet conditions:

2.20 STEAM TRAPS

**********

NOTE: The design engineer, when designating steam-using equipment or special steam applications, will indicate the type of steam trap required in accordance with the following data:

a. Inverted Bucket Traps: This type of trap continuously vents air and carbon dioxide at steam temperature and is recommended for modulating loads. The bucket floats on steam to close the outlet and sinks into condensate to open the condensate outlet. Any trapped air is discharged first into the condensate return line and is followed by condensate discharge. This type of trap has the longest life on systems under modulated control. When large amounts of air are anticipated, an external thermostatic air vent should be installed on a line bypassing the trap to bleed air from the steam line and discharge it to the condensate return line. This system will give optimum performance at low steam pressures with maximum dependability. These traps will handle condensate from fan coil units where condensate must be lifted to return lines located above the equipment. They operate best at near full load conditions where loads do not vary over a wide range. Before operation, traps must be primed by filling them with water.

b. Vertical Open-Top Bucket Trap: Trap construction is more complex than inverted bucket type but is suitable for applications having wide variation of load and pressure, and is recommended.
for constant pressure systems. Bucket sinks into condensate when condensate reaches top of trap and the discharge port opens. After discharge, the bucket floats on incoming condensate keeping the discharge port closed.

c. Impact-Operated Traps: These traps depend on steam velocity to keep the disc closed. As steam velocity decreases, the disc lifts off the seat and allows flow of condensate. These traps allow some steam leakage and do not vent air at low pressure. They are not recommended for service lower than 70 kPa 10 psig or where back pressure may exceed 50 percent of inlet pressure. These traps are less expensive and have poor performance in the presence of dirt.

d. Thermostatic Traps: These traps are bellows-actuated and contraction of bellows at a few degrees below saturated steam pressure allows condensate air and noncondensable gases to be discharged. As steam reaches the bellows, the expansion of the bellows closes the discharge port. These traps can also be utilized to vent air from a steam system and can be used in conjunction with an inverted bucket type steam trap previously described.

e. Float and Thermostatic Trap: These traps provide optimum performance on modulating systems at lowest first cost. Where steam pressures modulate down to zero, large amounts of air may be liberated. They are ideal for dripping ends of steam risers, heels of up-feed steam risers, bottoms of down-feed steam risers. These traps are also ideal for fan coil units and unit heaters.

f. Any trap selected must be sized for the expected condensate load with an applicable safety factor applied for the particular type of equipment serviced. Manufacturer’s application manuals should be consulted to assist in sizing traps. Safety factors vary from 2:1 to 10:1. An average 3:1 safety factor value will cover most applications.

g. Service life between repairs or replacement of traps may be a determining factor in the choice of traps. One manufacturer of all types of traps offers the following experience record:

<table>
<thead>
<tr>
<th>Type of Trap</th>
<th>Average Service Life Between Replacement or Repairs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inverted bucket traps</td>
<td>42 months</td>

<td>24 months</td>
</tr>
<tr>
<td>Thermostatic traps</td>
<td>24 months</td>
</tr>
</tbody>
</table>
Steam traps shall be in accordance with ASTM F1139, type, style, and class as applicable.

### 2.20.1 Bucket Traps

Bucket traps shall be, either the inverted bucket type or the vertical bucket type with automatic air discharge. The traps shall be designed for a working pressure of 1.03 MPa 150 psig, but shall be in the correct pressure class to operate properly at the actual steam supply pressure indicated for the system. Valve and seat shall be constructed of stainless steel. All other interior parts shall be of corrosion-resistant metal and the traps may be sealed type with corrosion-resistant steel bodies. Traps shall discharge the condensate to the return line and shall be connected as indicated. A suitable strainer with blow-off valve shall be installed in the intake connection to each trap. Capacity of traps shall be not less than that indicated.

### 2.20.2 Impact-Operated Traps

Impact-operated traps, impulse-operated traps, or thermodynamic traps with continuous discharge may be installed in lieu of bucket traps if applicable, subject to approval of the Contracting Officer.

### 2.20.3 Thermostatic Traps

Thermostatic traps designed for a steam working pressure suitable for the application may be furnished in lieu of the traps specified above if applicable. Thermostatic trap capacities shall be based on a pressure differential not in excess of the following:

<table>
<thead>
<tr>
<th>Steam working pressure</th>
<th>Differential pressure</th>
</tr>
</thead>
<tbody>
<tr>
<td>275-350 kPa 40-50 psig</td>
<td>240 kPa 35 psig</td>
</tr>
<tr>
<td>620-690 kPa 90-100 psig</td>
<td>550 kPa 80 psig</td>
</tr>
</tbody>
</table>

### 2.20.4 Float and Thermostatic Traps

Float and thermostatic traps shall be designed for a steam working pressure of 103 kPa 15 psig but shall operate with the supply pressure indicated for the system. The trap capacity shall be based on a pressure differential of 15 kPa 2 psi. The inlet to each trap shall be provided with a brass or stainless steel strainer either separately or as an integral part of the trap.

### 2.21 PRESSURE GAUGES

Pressure gauges shall be heavy-duty industrial type with phenolic case, solid front, rear blowout, threaded ring, shatterproof glass, and 13 mm 1/2 inch NPT bottom connection suitable for specified pressure or vacuum with
minimum 114.3 mm 4-1/2 inch diameter dial, except as otherwise specified. Pressure gauges shall be installed on the low-pressure side of each pressure reducing valve, on the suction and discharge side of each pump, on inlets and outlets of heat exchangers, on the feedwater heater, and where shown or required for proper operation. Pressure gauge shall be installed on each boiler and shall have a [254.0 mm 10 inch dial] [304.8 mm 12 inch dial] face. Gauges shall be installed so as to be accessible and easily read from the operating floor. Gauges shall be equipped with integral or separate siphons, and pulsation dampeners and shall be connected by brass pipe and fittings with shutoff cocks. Where pressure reducing valves are used, upstream and downstream gauges shall be placed close to the pressure reducing assembly, but connected approximately 3 m 10 feet therefrom. The operating ranges of the gauges shall be approximately twice the normal operating pressure.

2.22 THERMOMETERS

Thermometers shall be bimetallic type with stainless steel case and stem, separable stem, separable thermowells, and temperature range suitable for the use encountered. Thermometers shall be installed in the feedwater heater storage and steam areas, boiler feed pump; in the main condensate return line before entering the surge tank; in the combustion air inlets and outlets of air preheaters, water inlets, and outlets of economizers; in the suction and discharge of boiler feed pumps; in air inlets to forced and induced draft fans; in the flue gas inlets and outlets of economizers and air preheaters; and elsewhere as indicated or specified. Thermometers shall have a universal joint and shall be easily read from the operating floor. Thermometers shall have 127.0 mm 5 inch scales except where 304.8 mm 12 inch scales are required for remote reading and plus or minus 1 percent accuracy.

2.23 WATER METER

**************************************************************************
NOTE: For boilers having less than 4,540 kg 10,000 lbs per hour steaming capacity, a mechanical type feedwater meter may be provided in accordance with this paragraph. Plants having metered zeolite softeners used exclusively for boiler makeup purposes will not require an additional cold water makeup water meter. Boilers over 4,540 kg 10,000 lbs per hour capacity will have indicating-recording meters and they shall be integrating type where indicated.
**************************************************************************

Water meter, including the three-valve bypass and connections, shall be provided in the cold water makeup line [and in each boiler feedwater line]. Water meters shall be disk type with reinforced disk for hot water above 65 degrees C 150 degrees F and rubber or synthetic polymer disk for cold water, and shall be constructed of bronze composition and cast-iron protected by noncorrosive coating. Moving parts subject to wear shall be easily removable. Meters shall conform to the requirements of AWWA C700.

2.24 CHEMICAL TREATMENT AND WATER SOFTENING EQUIPMENT

**************************************************************************
NOTE: Inapplicable type of chemical feeder will be deleted in accordance with the requirements of UFC
**************************************************************************
2.24.1 Chemical Feeder

A feeder unit shall be provided for each boiler. Chemical feeder shall be automatic proportioning, shot, or pump type. All appurtenances necessary for satisfactory operation shall be provided. Size and capacity of feeder shall be based upon local requirements and water analysis. Chemical feed pumps and tanks shall be furnished as a package with the pumps mounted on and piping connected to the tank. The pump cylinders, plungers, ball check valves, and check valve bodies shall be of corrosion-resistant materials suitable for the chemicals being pumped. Volumetric accuracy of the pumps shall be within one percent over the range indicated. Pump capacities shall be adjustable by positioning crank pin with micrometer setscrews. Stroke length scale shall be divided in percentage graduations engraved on scale. Cylinders shall be replaceable for increased or reduced pressure or capacity ranges. Drive motors shall be suitable for the electrical power available and shall have drip-proof enclosures. Tanks shall be made of polypropylene and mounted on legs. Tanks shall have filling and drain connections and gauge glass. Each tank shall be furnished with one pump, mounted and piped with black iron pipe and fittings, with suction strainer and stainless steel screen, and with 13 mm 1/2 inch relief valve with steel body and stainless steel trim. Each tank shall have hinged cover. Tank bottom shall be dished concave to a radius equal to the diameter of the tank. Units shall be for phosphate or caustic feed and sulfite feeding. Motor-driven agitator shall be provided. The pump shall be designed to feed the chemical solutions into the boiler feedwater system.

2.24.2 Water Softening Equipment

NOTE: Need for softening equipment for makeup water will be as determined in accordance with UFC 3-410-01 or UFC 3-410-02. If water softening is not required, delete the paragraph.

A [single] [double] unit automatic water softener system shall be provided as indicated. The system shall be designed for a working pressure of [_____] Pa psig. The system shall be complete with raw and regenerate water distribution; under drain; inlet and outlet connection in upper and lower header respectively; resin removal connecting pipe legs; control valve for service, backwash, regenerate, and rinse; water meters, pressure gauges, brine storage, and measuring tank and controls for automatic operation. Brine tank shall be either hot-dipped galvanized after fabrication or polypropylene. Brine piping shall be either all copper pipe and fittings or Schedule 80 PVC. The equipment shall have a total capacity between regenerations of not less than [_____] liters gallons of water of [_____] grams grains hardness when operating at a sustained softening rate of [_____] L/second gpm. The system shall be based on the data below. Test sets shall be provided for pH comparator for the range [_____] to [_____] sulfite comparator, and phosphate comparator.

2.24.2.1 Water Analysis

The source of the raw water is [_____] . The analysis of the water is approximately as follows:
## Constituents*

<table>

*Numbers in parentheses are subscripts.

### 2.24.2.2 Zeolite

Zeolite shall be the high capacity polystyrene base sulphonic synthetic type. Not less than [_____] cubic meter feet of zeolite shall be provided with each reactor tank.

### 2.24.2.3 Reactor Tank

Reactor tank sizes shall be based on allowing a freeboard above the zeolite bed of not less than 50 percent of the zeolite bed depth, and a maximum flow rate of 11.3 mL/square meters per second one gallon/square foot per minute for each 111 mm 4-3/8 inches of zeolite bed depth.
2.24.2.4  Softening System

The softening system shall be complete with all piping, control, and power wiring. A complete initial charge of rock salt shall be installed in the brine tank as recommended by the softener manufacturer.

2.24.2.5  Water Test Kit

A kit complete with test containers, reagents, and instructions for testing the raw and effluent water shall be provided in a strong carrying case.

2.24.2.6  Treated Water Storage Tank

Treated water storage tank shall be fabricated from steel plates not less than 4.7625 mm 0.1875 inch thick for shell and heads, and shall be constructed in accordance with ASME BPVC SEC VIII D1 for unfired pressure vessels for a design working pressure of 517 kPa 75 psig. Heads shall be dished concave to pressure to a radius equal to the diameter of the tank. The tank shall be provided with the connections indicated, an 203.2 mm 8 inch copper ball float, level-operated control valve, valve bypass and accessories, and a protected gauge glass. The tank shall be the diameter shown and shall have a capacity of not less than [_____] liters gallons. The tank shall be hydrostatically tested at the factory at not less than 690 kPa 100 psig.

2.25  BUILDING HEATING EQUIPMENT

2.25.1  Unit Heaters

2.25.1.1  General

The manufacturer of the unit heaters shall not select individual heaters with a capacity in excess of 125 percent of the value specified for the heater. Orifice plates shall be provided to reduce the joule Btu output where required. The noise level of each unit heater shall be appropriate for the space in which the heater is installed. The sound power level [_____] decibels reference shall not exceed the following values in each octave band at the midfrequency, cycles per second:

<table>
<thead>
<tr>
<th>Octave Bands</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>

<tr>
<td>Shops, Factories</td>
<td>69 62 61 58 57</td>
</tr>
</tbody>
</table>

The sound power level data for these units shall be based on tests conducted in accordance with ASA S1.13.

2.25.1.2  Propeller Type Unit Heater

Heater shall be designed for suspension and arranged for horizontal or
vertical discharge of air as indicated. The casings shall be not lighter than 0.912 mm 20 gauge steel. Suitable stationary or rotating air deflectors shall be provided to assure proper air and heat penetration at floor level. Suspension from heating pipes will not be permitted. Vertical discharge heaters shall operate at speeds not in excess of 1200 rpm, except that units with 53 Megajoules 50,000 Btu output capacity or less may operate at speeds up to 1,800 rpm. Horizontal discharge unit heaters shall have discharge or face velocities not greater than the following:

<table>
<thead>
<tr>
<th>Unit Capacity</th>
<th>Face Velocity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up to 0.472 cu m/second</td>
<td>4.0 m per second 800 feet per minute</td>

<td>4.6 m per second 900 feet per minute</td>
</tr>
<tr>
<td>1.4 and over cu m/second</td>
<td>5.1 m per second 1,000 feet per minute</td>
</tr>
</tbody>
</table>

2.25.1.3 Cabinet Unit Heaters

Heaters shall be centrifugal fan type arranged for floor or ceiling mounting as indicated. The heating elements and fans shall be housed in steel cabinets with angle iron frames. The cabinets shall be of not lighter than 0.912 mm 20 gauge steel. Each unit heater fan discharge shall be provided with an approved adjustment for air diffusion and distribution. The fans shall be mounted on a common shaft with one fan to each air outlet. The fan shaft shall be equipped with self-aligning ball or roller bearings accessible for lubrication. The fan shaft shall be either directly connected to the driving motor or indirectly connected by adjustable V-belt drive rated at 150 percent of motor capacity. All exposed moving parts shall have guards. All fans in any one unit heater shall be the same size.

2.25.1.4 Heating Elements

Heating coils shall be copper, and radiating fins may be copper, aluminum, or suitable ferrous alloy. The heating elements shall be free to expand or contract without developing leaks and shall be properly pitched for drainage. The elements shall be tested under a hydrostatic pressure of 1.4 MPa 200 psi and a certified report of the test shall be submitted to the Contracting Officer.

2.25.1.5 Manual Selection Switches

Motors shall be provided with manual selection switches for [on, off, and automatic] [on-off] operation and shall be equipped with thermal-overload protection.

2.25.1.6 Automatic Operation

2.25.1.6.1 Thermostatic Control by Fan Regulation

The unit heaters shall be controlled automatically by thermostats located where indicated. The thermostats shall be adjustable and fitted with thermometers. Each thermostat shall operate on not more than a 2 degrees C 3 degrees F differential over a temperature range of approximately 13 to 24 degrees C 55 to 75 degrees F. The thermostat shall start or stop the
respective unit heater fan motor when the room temperature falls below or rises above the thermostat set point. Summer-winter switches for fan operation shall be provided adjacent to the thermostat for each unit heater.

2.25.1.6.2 Thermostatic Control by Steam Valve Regulation

Cabinet type unit heaters shall be controlled automatically by proportioning type thermostats and modulating steam valves located where indicated. On-Off switches for fan operation shall be provided adjacent to the thermostat for each fan unit. The thermostats and valves shall maintain the desired room temperature within 1 degree C 2 degrees F of the thermostat set point by regulating the steam supplied to the coil.

2.25.2 Radiator and Convектор

Each [radiator] [convector] unit shall be provided with a top supply connection with a control valve and a bottom return connection with a thermostatic trap. Each unit shall be tested hydrostatically at the factory and proved tight at a pressure of not less than 690 kPa 100 pounds. Extended surface tube-type radiators shall consist of suitable metal fins permanently bonded to copper or steel pipe cores threaded at each end for connecting to external piping. Radiator capacities shall be determined in accordance with the HYI-005 Rating Code. Radiators shall be equipped with [expanded metal cover grilles fabricated from steel sheets not lighter than 1.519 mm 16 gauge, secured either directly to radiators or to independent brackets] [solid front, slotted, horizontal top grilles fabricated from steel sheets not lighter than 1.214 mm 0.0478 inch thick, secured either directly to radiators or to independent brackets] [solid front, slotted, sloping, top cover grilles fabricated from steel sheets not lighter than 1.214 mm 0.0478 inch thick independently secured to masonry with brackets]. [Nonferrous convectors shall be tested hydrostatically at the factory and proved tight under a pressure of not less than 585 kPa 85 psig.]

2.26 AIR COMPRESSOR UNITS

Air compressor shall conform to ASME PTC 10, except as specified otherwise. Compressor speed shall not exceed 900 rpm. Motor speed shall not exceed 1750 rpm.

2.26.1 Service Air Compressors

The service air requirements shall be as indicated with receivers sized as indicated. The units shall be suitable for heavy-duty service (soot blowing). The compressors shall be simplex type, single-stage, double-acting, with water-jacketed cylinder; fitted with intake and discharge valves of the lightweight feather, disc, or plate type; and shall be provided with necessary controls, water-cooled aftercooler, moisture separator, drive, receiver, relief valves, and cooling water controls as indicated or required. The compressor air intake shall be provided with a low drop-type air suction filter/silencer suitable for outdoor installation. The aftercooler shall be the shell-and-tube type designed for air flow through the tubes with steel shell internal baffle plates and Admiralty metal tubes expanded into Muntz metal tube sheets. The moisture separator shall be provided with an automatic water discharge trap and level gauge. The air receiver shall be vertical type, constructed in accordance ASME BPVC SEC VIII D1 for unfired pressure vessels for 1.4 MPa 200 psi working pressure, and shall be equipped with flanged inlet and outlet connections, valved drain connection, 152 mm 6 inch dial pressure gauge, pop safety valves, and regulator connections. Cooling water
controls for regulating compressor cylinder water temperature and aftercooler water temperature shall be thermostatic valve type and shall be installed with a three-valve bypass in the water outlet lines ahead of open sight drain funnels. The compressor shall be equipped with adjustable, pressure-type unloader controls suitable for continuous compressor operation.

2.26.2 Instrument Air Compressors

**************************************************************************
NOTE: The designer should determine if two redundant full-size instrument air compressors will be required as loss of air will cause unit shutdown unless other provisions are made, such as crossties to the soot blower/service air system. Delete paragraph if not required.
**************************************************************************

An electric motor-driven oil-free automatic air compressor unit and a refrigerating drying unit shall be provided. The air compressor shall be capable of delivering, at a pressure of \([_____] \text{ Pa} \text{ psig}\), not less than 0.00472 standard cubic meters/second \(10 \text{ scfm}\) dry air at an atmospheric dew point of -23 degrees C -10 degrees F with entering air at 35 degrees C 95 degrees F, saturated. The air compressor unit shall be sized to run not more than 60 percent of the time when all controls are in service. The air compressor unit shall be complete with all necessary accessories including automatic pressure control equipment, relief valves, check valves, air filters, moisture traps, and a receiver with ample capacity for emergency operation of the controls for 15 minutes after compressor shutdown. The receiver shall be of vertical construction, in accordance, ASME BPVC SEC VIII D1 with relief valve and drain fittings. The air dryer shall be a self-contained, refrigerated type, complete with refrigeration compressor, heat exchanger, automatic controls, and moisture removal trap, or a regenerative desiccant type dryer, as required. The refrigeration unit shall be the hermetically-sealed type capable of continuous operation at maximum load conditions.

2.27 PIPING

Unless otherwise specified herein, pipe and fittings shall conform to ASME B31.1.

2.27.1 Pipe

Pipe material shall be as specified in TABLE I.

2.27.2 Fittings

Pipe fittings shall be as specified in TABLE II.

2.27.3 Nipples

Nipples shall conform to ASTM A733, Type I or II, as required to match adjacent piping.

2.27.4 Unions

Unions shall conform to ASME B16.39, type as required to match adjacent piping.
2.27.5 Pipe Threads

Pipe threads shall conform to ASME B1.20.2 and ASME B1.20.1, right- or left-hand tapered thread as required.

2.27.6 Expansion Joints

2.27.6.1 Guided, Slip-Tube Type Expansion Joints

**************************************************************************
NOTE: Wherever possible, provision for expansion of steam supply and return pipes will be made by changes in the direction of the run of the pipe or by field-fabricated expansion bends. If expansion joints are not required, applicable paragraphs will be deleted. Where space limitations prevent such provisions for expansion, expansion joints will be installed.
**************************************************************************

Guided, slip-tube expansion joints shall conform to EJMA Stds and ASME B31.1. End connections shall be flanged. Anchor bases or support bases shall be provided as indicated or required. The joints shall be designed for a steam working pressure not less than [_____] Pa psig. Joints shall provide for either single or double slip of the connected pipes, as indicated, and for not less than the traverse indicated. [Service outlets shall be provided where indicated or required.]

2.27.6.2 Bellows Type Expansion Joints

Bellows type joints shall be flexible, guided expansion joints conforming to EJMA Stds and ASME B31.1. The expansion element shall be stainless steel. Guiding of piping on both sides of expansion joint shall be in accordance with the published recommendations of the manufacturer of the expansion joint. The joints shall be designed for the working temperature and pressure suitable for the application, but design pressure shall not be less than 1.03 MPa 150 psig.

2.27.6.3 Flexible Ball Type Expansion Joints

Flexible ball joints shall be [stainless steel] [malleable-iron] [ductile iron] [carbon steel] [bronze] or other alloys as appropriate for the service intended. The joints may be threaded, flanged, or welded end, as required, and shall be capable of absorbing the normal operating axial, lateral, or angular movements or combination thereof. The ball-type joint shall be designed and constructed in accordance with ASME B31.1 and EJMA Stds, where applicable. Flanges shall conform to the diameter and drilling provisions of ASME B16.5. Molded gaskets furnished shall be suitable for the service intended.

2.27.7 Valves

Valves shall be installed at indicated locations, where specified, and where required for proper functioning and servicing of the system. Valves shall be of the pressure class shown. Motor-operated valves shall be capable of closing speeds of 2.5 to 5.1 mm/sec 6 to 12 inches/minute. Motor operators shall be equipped with position indicators, valve stem protectors above the motor operating units, and auxiliary handwheels for
manual operation of the valves in the event of power failure. Motors shall be suitable for operation on the electrical current characteristics indicated.

2.27.7.1 Check Valves

**************************************************************************
NOTE: The designer shall indicate the type of valves, vertical lift or horizontal, on the drawings.
**************************************************************************

a. Valves for 125 pound class steel piping shall conform to the following:
   (1) Sizes 65 mm 2-1/2 inches and less, bronze: MSS SP-80, Type 3 or 4, Class 125.
   (2) Sizes 80 mm 3 inches through 600 mm 24 inches, cast-iron: MSS SP-71, Type III or IV, Class 125.

b. Valves for 150 pound class steel piping shall conform to the following:
   (1) Sizes 65 mm 2-1/2 inches and less, bronze: MSS SP-80, Class 150 minimum.
   (2) Sizes 80 mm 3 inches through 600 mm 24 inches, steel: ASME B16.34, Class 150 minimum, flanged ends, swing disc.

c. Valves for system operating pressure greater than 1.4 MPa 200 psi shall be swing check or lift check valves having a steel body and shall be suitable for specified operating pressure, but not less than Class 300 300 pound class. Valves 40 mm 1-1/2 inches and smaller shall be cast or forged steel with socket welded ends. Valves 50 mm 2 inch and larger shall be steel with butt welded ends. Check valves shall have renewable composition discs or shall have metallic discs of the regrindable type which permits regrinding without removing valve from the line.

2.27.7.2 Gate Valves

Gate valves used as shutoff valves in the boiler leads to the steam headers, and elsewhere as indicated, shall be of the chain-operated type, with enough chain for easy operation from the operating floor or walkway. Gate valves 200 mm 8 inches and larger used on high-pressure steam lines, and elsewhere as indicated shall be provided with a globe valve bypass.

a. Valves for 125 pound class steel piping shall conform to the following:
   (1) Sizes 65 mm 2-1/2 inches and less, bronze: MSS SP-80, Type 1 or 2, Class 125.
   (2) Sizes 80 mm 3 inches through 1200 mm 48 inches, cast-iron: MSS SP-70, Type I, Class 125, Design OT or OF (OS&Y), bronze trim.

b. Valves for 150 pound class steel piping shall conform to the following:
   (1) Sizes 65 mm 2-1/2 inches and less, bronze: MSS SP-80, Type 1 or 2, Class 150 minimum.
   (2) Sizes 80 mm 3 inches through 600 mm 24 inches, steel: ASME B16.34,
Class 150 minimum, flanged ends.

c. Valves for system operating pressure greater than **1.4 MPa 200 psi** shall be split wedge disc type, outside screw and yoke, steel and shall be suitable for specified operating steam pressure, but not less than **Class 300 300 pound class**. Valves 50 mm 2 inch and smaller shall be forged steel with socket welded ends. Valves 65 mm 2-1/2 inches and larger shall be steel and shall have butt welded ends.

2.27.7.3 Globe Valves and Angle Valves

Globe type valves shall have outside screw and yoke with bolted bonnets, stainless steel trim, and flat seats, but shall not be the reversed cup type. The stuffing boxes shall be large and deep. Valves shall be installed with the stem horizontal or above.

a. Valves for 125 pound class steel piping shall conform to the following:

(1) Sizes 65 mm 2-1/2 inches and less, bronze: **MSS SP-80**, Type 1, 2, or 3, Class 125.

(2) Sizes 80 mm 3 inches through 300 mm 12 inches, cast-iron: **MSS SP-85**, Type III and Type IV, Class 125.

b. Valves for 150 pound class steel piping shall conform to the following:

(1) Sizes 65 mm 2-1/2 inches and less, bronze: **MSS SP-80**, Type 1, 2, or 3, Class 150 minimum.

(2) Sizes 80 mm 3 inches through 600 mm 24 inches, steel: **ASME B16.34**, Class 150 minimum, flanged ends.

c. Valves for system operating pressure greater than **1.4 MPa 200 psi** shall be suitable for specified operating conditions, but not less than 300 pound class. Valves 50 mm 2 inch and smaller shall be forged steel with socket welded ends. Valves 65 mm 2-1/2 inches and larger shall be steel and shall have butt welded ends. Valves shall have renewable flat metal seats.

2.27.7.4 Steam Pressure Reducing Valves

******************************************************************************************

NOTE: Single-seated valves should be used when a dead-end shutoff of the steam is required. When a thermostatically-controlled valve is installed after and near the reducing valve in a manner to cut off the passage of steam, the single-seated valve should be used. Double-seated valves may be used where the low (reduced) pressure lines will condense enough steam to offset normal leakage through the valve. Under conditions of widely varying initial pressure, double-seated valves usually give closer control of reduced pressure.

******************************************************************************************

Reducing valves designed for the working pressure shown, but not for less than **1.4 MPa 200 psig**, shall be provided wherever indicated or required. Each reducing valve shall be adjusted to maintain the desired terminal pressure, regardless of fluctuations in the initial pressure. The valves
shall be [single seated] [doubled seated], spring-loaded, quiet in operation, and shall not stick internally. Pilot-operated valves or other controllers using steam or compressed air for operating medium shall be provided. Valves 65 mm 2-1/2 inches and larger shall be cast steel, cast-iron, or semisteel as required for the steam pressure. Valves 50 mm 2 inches and smaller shall be bronze. Valve trim for iron body valves shall be stainless steel, nickel copper, or other approved corrosion-resisting material. All parts subject to wear shall be readily renewable. Valves shall have seats and plugs faced with a cobalt-tungsten carbide mixture, or made of heat-treated stainless steel or a high chromium steel designed to resist erosion. Seat and plug facing shall have a Brinell hardness of not less than 450. Each valve shall be installed with a strainer, a three-valve bypass, and a safety relief valve as indicated. Where pressure reducing valves are used for reducing the steam pressure to the deaerating heater, the valves shall be the single seated type. The sensing lines shall be connected to the steam space in the deaerator or at least 3 m 10 feet downstream of the pressure reducing valve.

2.27.7.5 Thermostatic Regulating Valves

**************************************************************************
NOTE: If a hot water generator is not installed, this subparagraph will be deleted.
**************************************************************************

Valves of the self-contained type to control water temperature within the domestic hot water generator by regulating the steam supplied to the heating coil shall be installed in the steam supply line to each generator. Thermostatic regulating valves shall be designed for a steam working pressure of 1.4 MPa 200 psig and shall operate at the pressure shown. The valves shall be adjustable within an operating range of approximately 38 to 71 degrees C 100 to 160 degrees F and shall maintain the desired water temperature within plus or minus 3 degrees C 5 degrees F.

2.27.7.6 Back Pressure Relief Valves

Valves shall have cast-iron or steel bodies and shall be equipped with corrosion-resistant trim and valve seats. The valves shall be properly guided and shall be positive closing to prevent leakage. Adjustment of the desired back pressure shall cover a range between 34 to 103 kPa 5 to 15 psig. The adjustment shall be effected externally, and any shafts extending through the valve body shall be provided with adjustable stuffing boxes having renewable packing.

2.27.7.7 Boiler Automatic Feedwater Recirculating Control Valve

**************************************************************************
NOTE: If automatic recirculation valve is not utilized, delete this paragraph.
**************************************************************************

Valve shall be the self-contained self-powered type. The unit shall automatically program the recirculation flow when required and assume all functions for prevention of the backflow of the main feedwater flow, for detection of low flow, for cycling of the control valve, and for the pressure reduction for liquid delivery to the low-pressure feedwater heater. The valve assembly shall be flanged type with flanged spools provided in both the main line and recirculation line for ease of disassembly.
2.27.8 Exhaust Heads

Exhaust heads for the discharge of steam to atmosphere shall be one-piece plate steel, semisteel, or cast-iron construction with internal baffle arrangement for the removal of entrained condensate and oil, and with provision for drain connection. Flow area through unit shall be larger than connecting pipe.

2.27.9 Strainers

The strainer body connections shall be of the same size as the pipelines in which the connections are installed. The strainer bodies shall be heavy and durable cast steel [or gray cast-iron]. The bodies shall have arrows clearly cast on the sides to indicate the direction of flow. Each strainer shall be equipped with an easily removable cover and sediment basket. The basket shall be not less than 0.63 mm 0.025 inch thick corrosion-resistant steel [or sheet brass] with enough small perforations to provide a net free area through the basket of at least 3.30 times that of the diameter of the entering pipe.

2.27.10 Pipe Hangers, Inserts, and Supports

Pipe hangers, inserts and supports shall conform to MSS SP-58, except as modified herein:

a. Types 5, 12, and 32 shall not be used.

b. Type 3 shall not be used on insulated pipe which has a vapor barrier. Type 3 may be used on insulated pipe that does not have a vapor barrier if clamped directly to the pipe and if the clamp bottom does not extend through the insulation and the top clamp attachment does not contact the insulation during pipe movement.

c. Type 18 inserts shall be secured to concrete forms before concrete is placed. Continuous inserts which allow more adjustment may be used if they otherwise meet the requirements for Type 18 inserts.

d. Type 19 and 23 C-clamps shall be torqued in accordance with MSS SP-58 and have both locknuts and retaining devices furnished by the manufacturer. Field-fabricated C-clamp bodies or retaining devices are not acceptable.

e. Type 20 attachments used on angles and channels shall be furnished with an added malleable-iron heel plate or adaptor.

f. Type 24 may be used only on trapeze hanger systems or on fabricated frames.

g. Where Type 39 saddle or Type 40 shield is permitted for a particular pipe attachment application, the Type 39 saddle shall be used on all pipe 100 mm 4 inches and larger.

h. Horizontal pipe supports shall be spaced as specified in MSS SP-58 and a support shall be installed not over 300 mm 1 foot from the pipe fitting joint at each change in direction of the piping. Pipe supports shall be spaced not over 1.5 m 5 feet apart at valves. In the support of multiple pipe runs on a common base member, a clip or clamp shall be used where each pipe crosses the base support member. Spacing of the
base support members shall not exceed the hanger and support spacing required for any of the individual pipes in the multiple pipe run. The clips or clamps shall be rigidly connected to the common base member. A clearance of 3 mm 1/8 inch shall be provided between the pipe and clip or clamp for all piping which may be subjected to thermal expansion.

i. Vertical pipe shall be supported at each floor, except at slab-on-grade, and at intervals of not more than 4.5 m 15 feet, not more than 2.4 m 8 feet from end of risers, and at vent terminations.

j. Type 35 guides using steel, reinforced polytetrafluoroethylene (PTFE) or graphite slides shall be provided, where required, to allow longitudinal pipe movement. Lateral restraints shall be provided as required. Slide materials shall be suitable for the system operating temperatures, atmospheric conditions, and bearing loads encountered.

(1) Where steel slides do not require provisions for restraint of lateral movement, an alternate guide method may be used. On piping 100 mm 4 inches and larger, a Type 39 saddle may be welded to the pipe and freely rest on a steel plate. On piping under 100 mm 4 inches, a Type 40 protection shield may be attached to the pipe or insulation and freely rest on a steel slide plate.

(2) Where there are high system temperatures and welding to piping is not desirable, then the Type 35 guide shall include a pipe cradle, welded to the guide structure and strapped securely to the pipe. The pipe shall be separated from the slide material by at least 100 mm 4 inches, or by an amount adequate for the insulation, whichever is greater.

k. Pipe hangers on horizontal insulated pipes, except for Type 3, shall be the size of the outside diameter of the insulation.

l. Piping in trenches shall be supported as indicated.

2.28 INSULATION

Shop and field applied insulation shall be as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

2.29 TOOLS

Special tools only shall be furnished and shall include all uncommon tools necessary for the operation and maintenance of boilers, stokers, pumps, fans, controls, meters, special piping systems, and other equipment. Small hand tools shall be furnished with a suitable cabinet, mounted where directed. The following tools shall also be furnished.

2.29.1 Tube Brush

**************************************************************************
NOTE: Applies to firetube boilers.
**************************************************************************

Tube brush, with steel bristles and jointed handle of sufficient length to clean full length of firetubes, shall be provided.
2.29.2 Smoke Pipe Cleaner

Cleaner shall be provided to clean the breeching and smoke connections. Cleaner shall have jointed handle of sufficient length to clean breeching and smoke connections without dismantling.

2.29.3 Firing Tools

Firing tools including hoe, poker, and slice bar shall be provided for each boiler.

2.29.4 Wrenches and Gaskets

Wrenches shall be provided as required for opening boiler manholes, handholes, and cleanouts. One set of extra gaskets shall be provided for all boiler manholes and handholes, for pump barrels, and other similar items of equipment. All gaskets shall be packaged and properly identified.

2.30 COAL HANDLING EQUIPMENT

2.30.1 Screw Conveyor

**************************************************************************

NOTE: Where motor starters for mechanical equipment are provided in motor control centers, delete the reference to motor starters.
**************************************************************************

Screw conveyor for the lateral distribution of coal shall consist of steel screw conveyor with capacity of not less than [_____] cubic meters/second cubic feet/hour when handling coal of the specified maximum lump size. Maximum capacity of the conveyor shall be based on the screws carrying not more than 30 percent of their cross section (except feeder conveyors), and the maximum speed of conveyor shall be 60 rpm. Conveyor and housing shall be assembled in sections. The sectional flights shall be mounted on steel pipe and connected by coupling shafts. A feeder conveyor may be installed to assume the proper distribution of the load. Both the feeder screw and the extended screw shall have their flights mounted on the same pipe. The conveyor shall be provided with sectional supporting hanger bearings of the babbitted type. Conveyor length between bearings shall not exceed 3.7 m 12 feet. Trough ends shall be fabricated cast-iron type with feet and fitted with babbitted bearings. The drive shall be at the discharge end of the conveyor and shall consist of an electric gear motor and chain drive. The chain drive from the motor to the reducer shall be enclosed in an oil-tight casing. Thrust in either direction shall be absorbed by the thrust bearings. The motor may be mounted on top of the trough. The trough conveyor housing shall be not less than 4.8 mm 3/16 inch steel with a 1.897 mm 14 gauge steel cover and shall be dust-proof. Discharge spout and coal gate shall be furnished as indicated. An approved type of supporting saddle shall be provided. Supports shall be spaced at not more than 3 m 10 foot intervals. Motor enclosure shall be [totally enclosed, nonventilated] [totally enclosed, fan-cooled type suitable for installation in a Class II, Division 1, Group F hazardous location in conformance with NFPA 70]. [Motor starter shall be [manual] [[magnetic] [across-the-line] [reduced voltage start]] type with [weather-resistant] [dust-tight] [explosion-proof] enclosure.] Dust controlling covers and inlet and discharge enclosures shall be provided for each conveyor.
2.30.2 Belt Conveyor

Belt conveyor shall be of the trough type, as shown. Maximum incline of the belt conveyor shall not exceed 15 degrees. The conveyor support frame shall have sufficient rigidity to maintain belt alignment, at least 75 mm 3 inches clearance to prevent damage to the edge of the belt on its return run, and adjustments for aligning shafts. Decking to protect the return belt from coal sifting and to provide lateral stiffness shall be placed on top of the stringers. Idlers shall be accurately made to provide a rigid framework that will maintain permanent alignment of well balanced, smooth-running, easy turning idler rolls. All idlers and return rolls shall be CEMA Belt Book, Series C5. Pressure lubrication shall be provided to ball or roller bearings. Idlers shall be 20-degree or 35-degree three-roll type spaced on 1.2 m 4 foot centers, except under loading points and skirts. Return idlers shall be spaced on 3 m 10 foot centers. The belting shall be Grade 2 as defined in RMA IP-1. The belting shall have field-vulcanized splices. Pulleys shall be designed in accordance with CEMA B105.1, shall be heavy welded steel, true to diameter and accurately bored, key seated and tightly fitted to the shafts. Pulley face width for belts 1067 mm 42-inches wide and smaller, that are 150 m 500 feet or more in length, shall be belt width plus 100 mm 4 inches; less than 150 m 500 feet in length, shall be belt width plus 75 mm 3 inches. Pulley face width for belts 1.2 m 48 inches and larger shall be belt width plus 150 mm 6 inches. Drive pulleys shall be provided with 19 mm 3/4 inch thick vulcanized and grooved lagging. Snub pulleys shall be provided with 9.5 mm 3/8 inch vulcanized smooth lagging. All conveyor pulley shaft assemblies shall be supported by two heavy-duty antifriction bearings having a minimum life expectancy of 50,000 hours for 90 percent of bearings in accordance with ABMA 11 for roller bearings. The pulley diameter shall be sufficiently large to meet the requirements of the duck weight and ply of the belt to permit flexing of the belt around the pulley circumference without damaging the belt or shortening the belt life. The conveyor shall be driven by a [totally enclosed, nonventilated type] [totally enclosed, fan-cooled type] [totally enclosed, fan-cooled type suitable for installation in Class II, Division 1, Group F hazardous location in conformance with NFPA 70] electric motor connected to a drive-shaft-mounted speed reducer unit by a [roller chain drive] [V-belt drive] [flexible coupling]. [The motor starter shall be [manual] [[magnetic] [across-the-line] [reduced voltage start]] type with [general-purpose] [weather-resistant] [watertight] [dust-tight] [explosion-proof] enclosure.] All belt conveyors shall be provided with belt misalignment switches, emergency stop pull cords and pull switches, galvanized expanded metal shields over tail pulley, zero speed switches, loading skirts, plugged chute switches, walkways, supports, belt take-ups, belt cleaners, skirt boards, and pulley scrapers. Dust controlling covers and inlet and discharge enclosures shall be provided for each conveyor.

2.30.3 Flight Conveyor

[Scraper] [Shoe-suspended] flight conveyor arranged generally as shown and of the single-strand type shall have capacity not less than [_____] metric tons/hour tons/hour when handling coal with approximate weight of 800 kg/cubic meter 50 pcf and with maximum lump size of [_____] mm inches diameter. Capacity shall be based on a maximum speed of 0.508 m/sec 100 fpm with conveyor operating up a [_____] degree incline. Chain shall be drop-forged steel type with flights made of either steel or malleable-iron, spaced at least three times the largest lump size. Foot shaft shall have protected screw take-up with adjustment of not less than 300 mm 12 inches. Trough shall be made of 4.8 mm 3/16 inch steel plate, minimum. All sliding
surfaces in contact with the chain or flights shall be lined with 19 mm 3/4 inch thick, removable, ultra high molecular weight polyethylene liners. Both sides of trough shall be provided with a warning sign "DANGER - DO NOT WELD - FLAMMABLE PLASTIC LINER." Signs shall be visible on each floor and at frequent intervals. Conveyor shall be provided with discharge openings as indicated, each of which shall be provided with rack-and-pinion-operated gates with handwheels. Motor shall drive conveyor through a speed reduction unit which is either direct-connected or roller-chain-connected to the drive shaft. Motor shall be [totally enclosed, nonventilated type] [totally enclosed, fan-cooled type] [totally enclosed, fan-cooled type suitable for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70]. [Motor starter shall be [manual] [magnetic] [across-the-line] [reduced voltage start]] type with [general-purpose] [weather-resistant] [water-tight] [dust-tight] [explosion-proof] enclosure.) Conveyor frame shall be constructed essentially as indicated, with additional bracing as required for rigidity. Dust controlling covers and inlet and discharge enclosures shall be provided for each conveyor.

2.30.4 Bucket Elevators

Vertical bucket elevators shall be furnished dust tight, complete with continuous chain and attached buckets, upper and lower sprockets, gears, shafts, bearings, casing with flanged connections including top hood and discharge spout, bottom boot, access doors, electric motor drive, and all accessories. Bucket elevators shall be [vertical spaced centrifugal discharge] [positive discharge] [continuous bucket type]. The capacity of the elevator shall be not less than [_____] metric tons/hour tons/hour when handling coal weighing approximately 800 kg/cubic meter 50 pcf. Linear velocity shall be as indicated below:

<table>
<thead>
<tr>
<th>Type of Bucket Elevator</th>
<th>Linear Velocity (meters per second)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Centrifugal discharge</td>
<td>1.1-1.6225-305</td>
</tr>
<tr>
<td>Continuous bucket</td>
<td>0.508-0.686100-135</td>
</tr>
<tr>
<td>Positive discharge</td>
<td>0.610 120 Max</td>
</tr>
</tbody>
</table>

The head shaft and foot shaft shall be constructed of cold-rolled steel with the shaft diameters in accordance with manufacturers' standards. Both shafts shall be mounted in roller bearings with forced-type lubricating fittings. Foot shaft shall have screw take-up with adjustment of not less than 225 mm 9 inches. An automatic backstop shall be installed on the head shaft to prevent any backward motion of the chain. Boot plates [loading legs of continuous bucket elevator,] and bottom plate of stub discharge chute shall be 4.8 mm 3/16 inch thick, minimum. All other flat casing members shall be 2.657 mm 12 gauge steel thick, minimum. Corner angles and stiffeners shall be provided to make the elevator self-supporting. In addition, the elevator shall be tied to the adjoining structure at close enough spacing to increase the rigidity of the elevator. The boot section shall be provided with clean-out doors, as well as front and back removable panels. An inspection door large enough to remove a bucket from either run of the chain shall be provided in the intermediate section at operating level. The elevator shall be driven by an electric motor installed in a suitable housing at the top of the flight. Motors shall be [totally enclosed, nonventilated] [totally enclosed, fan-cooled type] [totally enclosed, fan-cooled type suitable for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70].
enclosed, fan-cooled type suitable for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70. [Motor starter shall be [manual] [magnetic] [across-the-line] [reduced voltage start] type with [general-purpose] [weather resistant] [water-tight] [dust-tight] [explosion-proof] enclosure.] A platform shall be installed adjacent to the motor for servicing the motor and equipment mounted in the hood. Access to the platform shall be by an approved type of safety ladder. Controls for the operation of the elevator shall be located as indicated. Dust control covers and inlet and discharge enclosures shall be provided for each conveyor.

2.30.5 Vibrating Conveyor

Vibrating conveyor shall be the electric-motor driven mechanical vibrating type with a capacity of [_____] metric tons/hour tons/hour when handling coal weighing approximately 800 kg/cubic meter 50 pcf and with maximum lump size of [_____] mm inches in diameter. Conveyor shall have a conveying length as shown. The conveyor trough shall be fabricated of [_____] mm gauge steel, [_____] mm inches in width and [_____] mm inches deep [and provided with dust-tight cover]. Conveyor pans of 9.5 mm 3/8 inch thick, Type 304L solid stainless steel plate shall be provided. The trough shall be mounted on vibrator bars, torsion bars, or coil springs attached to yoker legs of rigid cross brace construction and fabricated of corrosion-resistant material with hardened steel encased rubber bushings at articulation points. The base shall be fabricated of steel channels or angles bolted directly to [building support] [concrete foundations]. The drive shall be through an eccentric shaft supported by a double row of self-aligning ball-or roller-bearing pillow blocks. Positive action motion shall be imparted to the trough by a cast steel connecting rod attached to the trough by rubber-bushed wristpin and securely locked by taper lock bushings. The conveyor shall be driven by a [totally enclosed, nonventilated type] [totally enclosed, fan-cooled type suitable for installation in Class II, Division 1, Group F hazardous location in accordance with NFPA 70] electric motor connected to the eccentric shaft by V-belt drive. [The motor starter shall be [manual] [magnetic] [across-the-line] [reduced voltage start] type with [general-purpose] [weather-resistant] [water-tight] [dust-tight] [explosion-proof] enclosure.]

2.30.6 Gravimetric Weigh Feeder

The weigh feeder shall be a metering belt type device designed to operate at a variable rate ranging from 10 percent of maximum capacity to [_____] metric tons/hour tons/hour. Flow rate shall be automatic. A silicon-controlled, rectifier dc drive shall automatically adjust the belt speed to maintain the rate of material flow, as set on the controller. The weigh feeders shall meet or exceed the requirements of NIST HB 44 [Southern] [Eastern] [Western] Weighing and Inspection Bureau. They shall have an accuracy of 1/2 of 1 percent of flow rates over their total variable rated capacity. The feeder shall be provided with a flexible boot for connecting the gate to the feeder inlet chute, which in turn shall be flared to produce a feed opening tapering from [_____] wide to [_____] wide with the direction of flow of material. The belts for feeders shall meet RMA IP-1 requirements, conforming to the Conveyor and Elevator Belt Handbook, fire-resistant type conforming to the standards of Part 18.65, of the 30 CFR 1. Top belt cover thickness shall be 6.4 mm 1/4 inch with bottom cover 3.2 mm 1/8 inch thick. Belt edges shall have minimum 25 mm 1 inch flanges and shall be sealed by carrying the cover around the carcass edges during manufacture. Cover and skim coat material shall be comparable to those meeting the requirements of the RMA IP-1 for impact and abrasion.
resistance. The weight sensor shall be a heavy-duty, industrial, electronic force transducer flexure-mounted to the force collection system. Each sensor shall have a remote indicating meter and a six-digit totalizing counter located, installed, and connected in the boiler control panel. Unit frame shall provide rigid support for the material load, belt, and idlers. The unit shall be shop assembled complete with drive and all appurtenances, and shall be dust-tight in operation.

2.30.7 Track Hoppers

Track hoppers shall be standard double hopper design with a belt or vibrating-type feeder as indicated. The hoppers shall have a capacity of approximately [_____] metric tons and shall be constructed of not less than 9.5 mm 3/8 inch thick, Type 304L stainless steel plates, with slopes of not less than 55 degrees, and shall be stiffened with angles. The hoppers may also be of ASTM A36/A36M mild steel, minimum 6.4 mm 1/4 inch thick with replaceable liners 6.4 mm 1/4 inch thick, ASTM A167, Type 304L stainless steel. All rivets and field bolts inside the hopper shall have flat heads. The hopper shall be suspended from the track girders by heavy bolts and cast washers, or the sides shall be carried to the bottom of the track and supported by flanges fastened to concrete ledge continuously around the hopper with the concrete forming the top portion of hopper sides. Track girders shall consist of wide flange beams conforming to the AREMA Eng Man for loading plus impact. They shall be complete with bearing plates, WF cross struts, and rail clips. Top of hopper shall be fitted with properly sized sections of grating made with steel bars sized [_____] by [_____] mm inches, and cross rods [_____] mm inches in diameter, to form openings [_____] mm inches square.

2.30.7.1 Hopper Gates

A rack-and-pinion gate shall be provided at each hopper outlet and shall be a self-cleaning type. [Hand-] [Motor-] operated sliding plate shall be 9.5 mm 3/8 inch thick carbon steel, formed into the shape of a winged U. The gate plate surface shall be completely protected by an overlapping liner of 3.2 mm 1/8 inch thick ASTM A167, Type 304 stainless steel. The gate body material, except for the dust cover, shall be of 4.5 mm 3/16 inch thick ASTM A167, Type 304L stainless steel where in contact with coal flow.

2.30.7.2 Hopper Feeders

The vibrating or belt feeders of manufacturer's standard design shall be provided for the service required. Motor shall be [totally enclosed, nonventilated] [totally enclosed, fan-cooled type] [totally enclosed, fan-cooled type suitable for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70]. [Motor starter shall be [manual] [magnetic] [across-the-line] [reduced voltage start]] type with [weather-resistant] [dust-tight] [explosion-proof] enclosure.

2.30.8 Truck Hoppers

Truck hoppers shall be of standard double hopper design with a belt or vibrating type feeder as indicated. The hoppers shall have a capacity of approximately [_____] metric tons and shall be constructed of 9.5 mm 3/8 inch thick Type 304L stainless steel plates, minimum, with slopes of at least 55 degrees, and shall be stiffened with 6.4 mm 1/4 inch angles, minimum. The hopper may also be of ASTM A36/A36M mild steel, minimum 6.4 mm 1/4 inch thick, with replaceable liners 6.4 mm 1/4 inch thick, ASTM A167, Type 304L stainless steel. Rivets and field bolts inside the hopper shall
be flat-head type. The hopper shall be supported by a flange fastened to the concrete ledge continuously around the hopper, with the concrete forming the top portion of hopper sides. Top of hopper shall be fitted with properly sized section of bar grating made with [___] by [___] mm inch mild steel bars and [___] mm inch diameter cross rods to form openings [___] mm inches square. A supporting beam not less than [___] mm inches deep, [___] kg/meter pounds/foot, in a wide flange member, shall be provided under the grating.

2.30.8.1 Hopper Gates

A rack-and-pinion gate shall be provided at each hopper outlet and shall be a self-cleaning type. [Hand-] [Motor-] operated sliding plate shall be 9.5 mm 3/8 inch thick carbon steel, formed into the shape of a winged U. The gate plate surface shall be completely protected by an overlapping liner of 3.2 mm 1/8 inch thick ASTM A167, Type 304 stainless steel. The gate body material, except for the dust cover, shall be of 4.5 mm 3/16 inch thick ASTM A167, Type 304L stainless steel where in contact with coal flow.

2.30.8.2 Hopper Feeders

The vibrating or belt feeders, complete with control of manufacturer's standard design for the service required, shall be provided. Motor shall be [totally enclosed, nonventilated] [totally enclosed, fan-cooled] [totally enclosed, fan-cooled type, suitable for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70]. [Motor starter shall be [manual] [magnetic] [across-the-line] [reduced voltage start]] type with [weather-resistant] [dust-tight] [explosion-proof] enclosure.

2.30.9 Vibrator

Vibrator shall be electromagnetic type with variable power control that produces mechanical pulsating motion. The net weight of the vibrator shall be [___] kg pounds and power input shall be [___] watts, [___] amperes at [___] volts ac. Vibrator shall provide 3600 vibrations per minute or 7200 vibrations for heavy duty applications. The vibrator shall be semi-noiseless and shall be provided with mounting plates for welding to hoppers, as indicated, each complete with an eye bolt for attaching a safety chain. The electric control suitable for separate wall mounting shall be complete with an electronic valve for changing alternating current to mechanical pulsating waves and a dial switch or rheostat to vary the power of vibration. Vibrators shall be provided with Division I, Class II, Group F rating in the areas where coal dust is present, in accordance with NFPA 70.

2.30.10 Car Heaters

**************************************************************************
NOTE: The designer shall determine if electrical facilities are sufficient to provide the power requirements of electric car heaters or if gas-fired heaters must be used. The designer will determine if the location and climatic conditions will require sidecar panels or undercar heaters, or a combination of both types of heaters.
**************************************************************************
2.30.10.1 Gas-Fired Heaters

Gas-fired heaters shall be the infrared radiant type and shall be located between rails and along the walls of the shed. Heater shall have an input of approximately 90 kW (300,000 Btuh). Heater shall have perforated, heavy-gauge stainless steel cover that is not affected by water or coal falling from the car. Burner shall have windproof pilot, main gas solenoid valve, and safety switch to interrupt gas supply to burner if pilot is not burning, and shall be furnished with manual cutoff valves and pressure regulator. Heater shall be supplied with electric blower for furnishing combustion air to the burner and with all other controls and accessories as recommended by the heater manufacturer for a complete installation, and shall comply with ANSI Z83.19/CSA 2.35 and UL 795.

2.30.10.2 Electric Infrared Radiant Heaters

Electric infrared radiant heaters shall be weatherproof car thawing equipment with radiating surfaces of alloy tubing enclosing electrically insulated conductors. The equipment shall be in modular lengths suitable for both 45 and 90 metric tons (50 and 100 tons) capacity cars and shall be designed for [manual] [automatic] disconnection of units not required during thawing operations. Car heaters shall include sidecar or undercar heating banks, or both, capable of operating as independent units designed for maintaining a balanced three-phase distribution system. Heaters shall have heating conductor units, including factory assembled connections for attachment to water-tight terminal boxes, supported on corrosion-resistant metal framing and shall have rust-resistant steel reflectors with an approved coating. Heaters and connections shall be wired using NEMA 4 enclosures, in accordance with NEMA ICS 1, suitable for cleaning by hosing down with water.

2.30.11 Coal Spouts, Chutes, Inlet Boxes, and Outlet Hoppers

Coal spouts, chutes, inlet boxes, and outlet hoppers shall be constructed of ASTM A36/A36M steel members not lighter than 3.416 mm (10 gauge), adequately reinforced and braced with angle frames, and with all joints dust tight. Slopes shall be as steep as possible, but not less than 55 degrees off horizontal. Liners shall be stainless steel or ultra-high molecular weight polyethylene (UHMWP). If UHMWP liners are used, each side of chute at each floor level shall be provided with a warning sign "DANGER DO NOT WELD - FLAMMABLE PLASTIC LINER." Impact liners shall also be used. Access openings and inspection openings with cover plates shall be provided as indicated and required. [Silo frames shall be constructed of heavy channel frames the full size of the silo opening and shall be provided with concealed steam pipe and coil around opening.] [Outlet hoppers shall be provided with rack-and-pinion type gates and shall be lined with austenitic stainless steel [_____] mm inches thick, conforming to ASTM A167, Type 304L]. Rack-and-pinion gates shall be of the type specified for track hoppers.

2.30.12 Car Spotter

Car spotter shall be electric-motor driven having a capstan mounted vertically on a rigid housing that completely encloses the gears. The gears shall include helical gears and worm gear; the helical gears shall be fabricated of high grade steel accurately finished and splash-lubricated, and the worm gear shall be fabricated of bronze. All of the mechanism shall be mounted on a steel base rigidly welded to maintain alignment. The unit shall be coupled to, and driven by, a separate, [_____] W hp, totally...
enclosed, nonventilated, hoist-type motor with a full-load speed of 1720 rpm. The coupling shall be roller-chain flexible type enclosed in a revolving casing and protected by a heavy steel guard. The unit shall have a starting pull of 22 kN 5000 pounds, a running pull of 11 kN 2500 pounds, and an average rope speed not in excess of 230 mm/sec 45 fpm. The unit shall be complete with [_____] m feet of [32 mm 1-1/4 inch diameter manila rope with a breaking strength of 60 kN 13,500 pounds, minimum,] [19 mm 3/4 inch diameter marline-covered standard steel wire rope with a breaking strength of 170 kN 37,600 pounds, minimum,] and a steel car pulling hook with an allowable rope pull of 45 kN 10,000 pounds, so fabricated as to be readily attachable to, and removable from, the car frames.

2.30.13 Coal Bunkers

Suspension coal bunkers of size and capacity indicated shall be constructed of ASTM A36/A36M steel plate reinforced and braced as required and installed dust-tight. Bunkers shall be provided of a design optimized for coal flow, not susceptible to rat-holing or hangups. Cylindrical or silo type bunkers to reduce stagnation shall be provided for each boiler, each with conical discharge hoppers and slopes not less than 70 degrees. The outlet cone shall be manufactured of, or lined with, ASTM A167, Type 304 stainless steel. Bunkers shall be provided with rack and pinion type coal shutoff valves, self-cleaning, and dust tight. Valve materials exposed to flowing-coal shall be of corrosion resistant steel. An emergency diverter shall be provided for emptying the bunker.

2.30.14 Coal Storage Silos

2.30.14.1 Silo Design

Silo walls may be slip-formed, cast-in-place reinforced concrete, precast concrete, or other approved construction materials. Concrete shall have a 28-day compressive strength in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE. Silo roof shall be reinforced concrete complete with 600 mm 24 inch square, weatherproof, hinged access door. Handrail and steel toe-board shall be provided all around the roof of the silo. Live storage shelf for the silo shall be reinforced concrete, sloped not less than 60 degrees from horizontal and supported by steel beams corbelled from the inside walls of the silo. Live storage outlet hopper to chute and feeders shall be built of not lighter than 9.5 mm 3/8 inch steel. Silo reserve storage floor shall be reinforced concrete, sloped not less than 60 degrees and laid on well-tamped fill material. Reclaim outlet hopper to the chute feeding the flight feeder shall be built of not lighter than 9.5 mm 3/8 inch steel.

2.30.14.2 Silo Interior Finish

In a concrete stave silo, the interior finish shall consist of a three-coat concrete parget. A brush coat, scratch coat, and a finish trowel coat shall be applied, one after the other, to produce a smooth monolithic finish. The parget shall be worked into the vertical and horizontal grooves to permanently interlock the concrete staves.

2.30.14.3 Silo Exterior Finish

The exteriors of stave and concrete silos shall be covered with a brush coat of gray cement. This coating shall be applied over all hoops, lugs, and staves to produce a homogeneous finish.
2.30.14.4 Silo Level Controls

A normal high-level and emergency high-level control switch shall be mounted at the top of the silo to shut off the feeding system when the silo is full of coal. A low-level switch shall be furnished at the low level of the silo’s live storage shelf, as indicated, to signal by light that coal is at a low level in the live storage compartment. Switches shall also be furnished near the bottom of the silo, as indicated, to signal by light that coal is at a low level in the reserve storage compartment. Switches shall be for Class II, Division 1, Group F hazardous location in accordance with NFPA 70.

2.30.15 Coal Crusher

**************************************************************************

NOTE: The designer shall select the appropriate type of crushe based on the throughput requirements and an economic analysis.

**************************************************************************

Coal crusher shall be [roll crusher][hammermill][granulator][impactor] designed to reduce run-of-mine or lump coal to a maximum lump size of [_____] mm inches. Crusher shall have a minimum capacity of [_____] metric tons/hour tons/hour when handling average size bituminous coal. Housings shall be made of heavy castings or welded heavy steel plate. Interior of the housing shall have replaceable liners, constructed of abrasion resistant steel. Breaker plate, grates, rolling rings, swing hammers, and other parts of the unit subject to excessive wearing shall be replaceable. Crusher shall have provisions to trap and reject hard foreign objects without damaging the crusher. Shafts shall be forged, heat-treated alloy steel with bearings mounted in dust-tight housings. Motor shall be [totally enclosed, nonventilated type][totally enclosed, fan-cooled type][totally enclosed, fan-cooled type suitable for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70]. [Motor starter shall be [manual][magnetic][across-the-line][reduced voltage start][magnetic][across-the-line][reduced voltage start] type with [general-purpose][weather-resistant][water-tight][dust-tight][explosion-proof] enclosure.] Integral size motors shall be the premium efficiency type in accordance with NEMA MG 1.

2.30.16 Vibrating Feeders

Vibrating feeders shall be the [electromagnetic][electromechanical] [single input (Brute Force)] type with a capacity of 0 to [_____] metric tons/hour tons/hour when handling coal weighing approximately 800 kg/cubic meter 50 pcf and with maximum lump size of [_____] mm inches in diameter. Feeder pans and skirts shall be replaceable [6.4][9.5][12.7] mm [1/4][3/8][1/2] inch thick, Type 304 solid stainless steel plate without liners. The feeder pan shall be fabricated [_____] mm inches in length and [_____] mm inches deep. Dust control covers of 3.416 mm No. 10 gauge thick steel shall be provided for each unit. [Two][Four] rectangular poke holes (one[two] each side) shall be provided with 6.4 mm 1/4 inch thick No. 304 stainless steel sliding covers. All feeder parts coming in contact with coal shall be made of, or lined with, Type 304 stainless steel. All feeders shall automatically compensate for material headloads and weight effect to maintain a constant feed and must not damper out when operating under full silos or bins. Slopes on pan shall not exceed 10 degrees. The vibratory feeders shall be [foot][suspension] mounted and shall be completed with supports. Suspended feeders shall be provided with safety cables. The feeders shall have their drives located
2.30.17 Tripper

The tripper shall be of steel construction, motor-propelled, automatically reversible, or manually controlled. It shall be equipped with antifriction bearings throughout, rolled or forged steel wheels, hand-operated rail clamps for optional operation in a fixed location, scraper, and crossover walk with handrail. The traversing speed shall not exceed 127 mm/sec 25 fpm, and the motor shall include a motor brake. The chute shall be one way toward the center of the silo and shall slope at not less than 55 degrees. Its seal shall be provided with all necessary components for installation to suit the bunker/silo slot. Seal shall be of the plow type. The tripper shall be provided with [_____] W hp motor, all reversing and end travel limit switches, cable reel, and 14 No. 12 AWG conductor cable (13 slip rings) and supports for the starter. Two pushbutton stations shall be mounted, one on each side of the tripper. Both stations shall include forward-reverse and tripper stop-run pushbuttons. The conveyor frame shall include a ladder type cable tray to contain the cable from the reel. Reversing switches shall be mounted on the tripper and be actuated by track dogs to permit reversal of the tripper over each extreme silo. Limit switches shall be mounted on the tripper to operate immediately beyond both extreme limits of tripper reversal. A plugged chute switch shall also be furnished. All tripper controls, including limit switches and reversing switches shall be furnished in explosion-proof enclosures approved for Class II, Division 1, Group F service, in accordance with NFPA 70. The complete tripper shall also include pulley assemblies, shafts, bearings, carrying and return idlers, tripper framing, and supports.

2.30.18 Trackmobile

Trackmobile shall be provided with a [_____] liter cubic inch industrial gasoline engine for moving/switching [_____] rail cars on the track and hauling carts and other portable vehicles while traveling on its road wheels. The trackmobile shall be designed to ride on [_____] mm inch gauge track. Rail wheels shall be heat treated, cast steel, keyed on tapered axles, solidly mounted suspension system. Road wheels shall be, heavy duty, [_____] ply, [_____] by [_____] tires, roller-bearing mounted wheels, with retractable suspension. The coupler shall be heavy-duty, cast steel, remotely controlled from cab. Maximum speed shall be provided on rail km/hour mph low [_____] , high [_____] ; on road, low [_____] , high [_____] . The trackmobile shall be able to operate on a maximum grade of [_____] percent and minimum curve of [_____] m foot radius. Trackmobile shall be also equipped with [air brakes] [self-energizing drum and shoe type, hydraulic service], cab heater and defroster, sanders, [electric horn] [air horn] strobe light, front and rear lights, backup alarm, [enclosed cab] [open cab] with windshield wipers [, radio remote control,] and power steering.

2.30.19 En-Masse Chain Conveyors

These conveyors shall move materials horizontally and/or vertically, with multiple discharge points and in a dust-tight and completely enclosed unit. Conveyors shall have a length as shown but not to exceed 75 m 250 feet. Conveyor capacity shall be [_____] metric tons/hour tons/hour when
handling coal with approximate weight of 800 kg/cubic meter 50 pcf and with maximum lump size of [_____] mm inches diameter. Maximum capacity shall be based on a chain speed not to exceed 813 mm/second 160 fpm. Chain shall be drop-forged, case hardened, steel alloy of the single-strand type with flights welded to the chain links or integral chain and flights type. The hardness of the links shall be 500-600 BHN. The conveyor casing shall be dust tight and shall be of 6.4 mm 1/4 inch thick ASTM A242/A242M high strength, low alloy steel with 3.416 mm No. 10 gauge cover of the same material. The casing shall be provided with T-1 steel (ASTM A514/A514M Type B) removable liners. The liners shall be 19 mm 3/4 inch thick on the bottom and 13 mm 1/2 inch thick on the sides, 19 mm 3/4 inch T-1 steel wear bars shall be provided for the empty run of the conveyor. Liners and wear bars shall be attached to the casing using countersunk stainless steel bolts with stainless steel nuts and washers. Drive sprocket shall be heat treated, induction hardened to a minimum depth of 6.4 mm 1/4 inch. Drive shaft shall be heat treated, designed, and sized based on ANSI/AGMA 6113 AGMA 6013 requirements. Bearings shall be spherical double roller bearings. A dust seal shall be provided where the drive shaft ends go through the casing. The conveyor shall have inlet and outlet spouts, inspection doors giving access to the drive sprocket, cleaner, and wear surfaces. Chain tension is achieved by a screw take-up. Each discharge opening shall be provided with rack-and-pinion-operated gates with [hand wheels][motor operated][air operated]. Motor shall drive conveyor through a speed reduction unit which is either direct connected or roller chain connected to the drive shaft. Motor shall be [totally enclosed, nonventilated type][totally enclosed, fan cooled type][totally enclosed, fan-cooled type suitable for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70]. [Motor starter shall be [manual] [magnetic] [across-the-line] [reduced voltage start] type with [general-purpose] [weather resistant] [water-tight] [dust-tight] [explosion-proof] enclosure.] Conveyor frame shall be constructed essentially as indicated, with support and additional bracing as required for rigidity. Integral size motors shall be the premium efficiency type in accordance with NEMA MG 1.

2.31 ASH HANDLING SYSTEM

2.31.1 Boiler Room Ash Handling System

**************************************************************************
NOTE: When specifying boilers with capacity of 4.1 MW 14,000,000 Btu/h per boiler or less, this paragraph and subsequent paragraphs will be deleted, except applicable portions.
**************************************************************************

The ash handling system shall be the dry pneumatic type in stoker fired boilers. This system shall gather ash from the boiler forward ash discharge grate hopper and from [economizer] [air preheater] ash discharge hopper and other filtration systems and shall discharge to the ash storage silo located outside of the building. The entire system shall be coordinated to fit the equipment supplied. Ash dust control conditioners shall be used to reduce fugitive dust emissions during discharge of ash from the storage silo.

2.31.1.1 Ash Hopper

Ash removal hopper for each boiler shall be constructed of 6.4 mm 1/4 inch thick steel plate, minimum, with suitable external structural steel
supports for connection to boiler ash hopper and necessary internal anchors for holding refractory lining in place. Refractory lining shall be 225 mm 9 inches thick on vertical walls and 150 mm 6 inches thick on feed plates. Each hopper shall be furnished with a sliding ash gate. Each boiler sliding gate unit shall be provided with an access compartment to allow gathering and cooling of ash. A cast-iron grate shall be provided along with a manually-operated air-tight inlet valve for feeding ash into the pneumatic gathering line. A hinged, steel access gate shall be provided at each compartment. Spring loaded air intakes shall be provided at the end of each header. The structural integrity of the hopper shall be based on the ash weight of 1120 kg/cubic meter 70 pcf.

2.31.1.2 Clinker Grinder

**************************************************************************
NOTE: Delete this paragraph if coal analysis indicates no possibility of slag formation.
**************************************************************************

Clinker grinder unit shall be provided with [_____] mm inch wide double roll for each hopper outlet gate housing. The grinders shall have manganese steel rolls and cast-iron housings with grinder shafts mounted on outboard bearings protected by a stuffing box and gland assembly. Grinder shafts shall pass through stuffing boxes equipped with packing rings and lantern rings for seal water flow. Clinker grinder shall be provided with a reversing mechanism to reverse direction of the grinder rolls should an obstruction stall the grinder. A 9.5 mm 3/8 inch steel plate ejector feed hopper shall be furnished below each clinker grinder to feed the inlet of the pneumatic ash gathering system. Fixed passages in the clinker grinders shall prevent discharge of particles too large to be handled by the pneumatic conveying system. Each clinker grinder shall be driven by a totally enclosed type motor and shall be provided with a reversing starter, pressure switch for seal water control, diaphragm-operated seal water valve, and a solenoid valve. Units shall be designed for the characteristics of the coal specified and shall be capable of handling bottom ash at a rate exceeding the conveying system capacity.

2.31.1.3 Conveyor Piping

Conveyor pipe and fittings shall be made of an abrasive-resisting alloy metal cast by the sand-spun process, having a minimum Brinell hardness of 280. Wall thickness shall not be less than 13 mm 1/2 inch and pipe lengths shall not exceed 5.5 m 18 feet. Joints shall be made with flanges or sleeve pipe couplings and shall be airtight. Fittings shall have a Brinell hardness number of approximately 400 and shall be provided with removable wearbacks, where applicable, or shall be of the integral wearback type. Ash inlet fittings shall be designed so that the ash cannot overload or clog the conveyor pipeline. Suitable adjustable supports or hangers shall be provided. Vacuum hose connections shall be provided as indicated. Provide 4.6 meters 15 foot lengths of vacuum hose with quick connectors and four floor sweep-up nozzles.

2.31.1.4 Vacuum and Combination Vacuum/Pressure Systems

2.31.1.4.1 Vacuum System

The ash conveying equipment shall be pneumatic suction type, complete with vacuum pumps and all component parts necessary for complete and successful operation. The ash conveying equipment shall be sized approximately twice
the predicted accumulation rate. The system shall have the capacity to convey and empty not less than [_____] metric tons/hour tons/hour of ash weighing approximately [_____] kg/cubic meter pcf. The tonnage shall be based on average handling rate and not on the instantaneous rate.

2.31.1.4.2 Combination Vacuum/Pressure Systems

Vacuum/pressure equipment shall be commercially produced for this particular type of service and shall include a pressure vessel equipped with a filter section at the top and an aeration ring at the bottom. Material shall be drawn into the unit by vacuum, with the air separated from the material in the top filter section and exhausted through a silencer. A high level indicator within the vessel shall then reverse the action of the vacuum/pressure pump by aspirating air through a silencer and filter unit and discharging the pressurized air into the vessel. Part of the air shall be utilized to clean the filter and part of the air shall pass through the aeration ring of the vessel to pick up material and convey it under pressure to the storage silo. The unit shall be furnished complete with all automatic air control valves to control air flow to and from the vessel continuously through the two modes of the operating cycle. Unit operation shall continue automatically until switched off at the control cabinet. All automatic valves, interconnecting piping, and the vacuum/pressure vessel shall be skid-mounted. Vacuum/pressure pump shall be mounted separately. The control cabinet may be mounted separately or skid-mounted on the vacuum/pressure vessel skid. Capacity of the unit shall be approximately [_____] metric tons/hour tons/hour of ash weighing approximately [_____] kg/cubic meter pcf. Piping sizes for ash collection system shall be designed to fit the unit supplied. The vacuum/pressure system shall be used where storage silo is more than 150 m 500 feet from the boiler plant. A vacuum system should be used for capacities of less than 45 metric tons/hour 50 tons/hour per system.

2.31.1.4.3 Pump Unit

**************************************************************************
NOTE: Where characteristics of the fly ash require additional treatment, a water spray shall be incorporated in the filtering unit. If not required, delete the portion included in the brackets. Air discharged to the atmosphere must meet the local air pollution standards.
**************************************************************************

Vacuum or vacuum/pressure pump unit shall be sized to match system design requirements. Pump unit shall be liquid-ring type having round rotor with curved blades rotating in an elliptical casing. Water alternately entering and leaving the chambers within the rotor vanes shall provide the required pumping action. Water within the casing shall act as an air cleansing agent and the operation and maintenance of the unit shall not be affected by dust-laden air. Unit shall be base-mounted with electric motor drive and all required heat exchangers, separators, and control valves. The vacuum pump inlet piping shall be provided with a vacuum filter unit to remove the fly ash obtained from the economizer ash hopper. The filter unit shall include a metal housing containing filter bags and an automatic air purge back-washing system. [A water spray shall be incorporated into the filtering unit.] The filtering unit shall remove all fly ash before discharge to the atmosphere.
2.31.1.4.4 Control Cabinet

Control cabinet for the complete operation of the system shall be supplied and shall include all running indicating lights as required. A push-button switch shall be conveniently located in the boiler house to start and stop the system. A vacuum breaker, operating automatically from a timer, shall be provided in the bottom ash conveyor line to break the system vacuum.

2.31.1.4.5 Controls

Controls for a combination vacuum/pressure system shall have a selector switch set to automatic position to start the unit in the vacuum cycle. High-level indicator in vacuum/pressure vessel shall actuate necessary controls to cut off the vacuum gathering system and pressurize the vessel for pressure discharge of collected material. A low-pressure switch in the control panel shall sense the pressure drop in conveying pressure and shall return the unit to vacuum operation. The unit shall operate continuously in this manner until manually shut down. Setting selector switch in manual position shall shut the unit down after filling. Discharge shall then be accomplished by pressing the manual discharge button. A high vacuum switch with time delay shall be provided to shut the system down automatically in the event none of the inlet valves are actuated. Switches and controls shall be heavy-duty type in accordance with NEMA ICS 1.

2.31.1.4.6 Automatic Air Valve

Automatic air valve shall be provided at economizer or air preheater ash inlet hopper discharge slide gate to allow air into system without causing a vacuum within the boiler ash hopper. Slide gate shall be provided as part of the ash system and shall be manually-operated and interlocked to actuate the automatic air inlet valve.

2.31.1.5 Ash Silo

The ash storage silo shall have a capacity of not less than [_____] metric tons of ash and fly ash considered to have an average weight of [_____] kg/cubic meter. This capacity shall be based on a minimum of 24 hours[ 60 hours if ash cannot be removed on weekends]. The silo shall be made of welded steel with a cone bottom for truck filling and shall be supported on a structural steel tower. All elements exposed to the exterior shall be designed for wind loads of [_____] kg/square meter. A 4.3 m 14 foot clearance shall be provided under the hopper outlet fitting or appurtenance. Silo shall be provided with steel ladder and safety cage from the ground level to roof, steel ladder inside storage bin, and an angle railing around the roof perimeter. Minimum plate thickness shall be 6.4 mm 1/4 inch. Silo shall be complete with all accessories required for an operable installation including, but not limited to, high ash level detector, roof manhole, pressure and relief valve, and other roof openings, as necessary. Interior coating shall be coal-tar epoxy conforming to SSPC Paint 16.

a. Ash storage silo for vacuum system shall be provided with two stage separators[ and a tertiary bag filter]. The primary receiver shall be cylindrical and shall be constructed entirely of sectional steel or cast plates suitable for this special service. The receiver shall be not less than 900 mm 3 feet in diameter. Flanges and bolts shall be on the outside, and the impact of ash shall be directed against heavy iron wear plates of abrasive-resistant alloy. The receiver shall be provided with an air-tight discharge passage not less than 450 mm 18
inches in diameter for free flow of clinkers. The receiver shall have means for positive, periodic, and automatic operation in dumping its entire contents into the silo; in addition, the system shall be so designed that all suction is positively shut off from the receiver during its dumping period so that no dust can be sucked out through the exhaust while the discharge of the receiver is open or opening. The air from the primary receiver shall enter an external secondary separator which shall remove 90 percent of the dust not collected by the primary receiver. The combined efficiency of the primary and external secondary separators[ and tertiary bag filter] shall be not less than 98 percent. The secondary separator shall be similar to the primary receiver in construction, but may be smaller and of lighter material. No part of the discharger shall extend into the main storage bin. A housing constructed of 6.2 mm 1/4 inch steel plate with a tight-closing access door shall be provided as an enclosure for the discharger.

b. The silo vent filter unit shall be mounted on top of the silo and shall act as an air release unit to separate the air from the ash. The ash shall drop into the silo. Back cleaning of the bag filters shall be automatic, utilizing plant air at approximately 690 to 860 kPa 100 to 125 psig. Back cleaning unit shall be actuated whenever the ash handling system is in use. Dust released from the filter bags in the back cleaning operation shall fall into the storage silo. Housing shall be provided to allow the unit to operate exposed to the weather in ambient temperatures ranging from minus 40 to plus 55 degrees C minus 40 to plus 130 degrees F.

c. A rotary, dustless unloader shall be provided to eliminate all dust in unloading ash and dust from the ash storage silo. No water shall be added to the ashes in the conveyor or in the storage bin. The dustless unloader shall add water to the ash in controlled quantities so that no surplus water runs or drips from the ash after discharge. The discharged ash shall be muddy but loose and free flowing. Water valve shall open only when drive motor is running. Unloader shall have a capacity of not less than 27 metric tons 30 tons of conditioned ash per hour. The rotating unit shall be designed so that all bearings are located on the outside and not in contact with the material handled. Platform shall be provided for access to unit and shall have a handrail and a safety ladder to grade. Motor shall be totally enclosed type for outdoor operation. [Motor starter shall be [manual] [magnetic] [across-the-line] [reduced voltage start] type with [weather-resistant] [water-tight] [dust-tight] enclosure.]

2.31.1.6 Conveyer Type Ash Handling System

**************************************************************************
NOTE: When specifying boilers with capacity greater than 4.1 Megawatts 14 million Btuh per boiler, the following paragraphs will be edited.
**************************************************************************

Ash pits shall be funnel shaped, constructed of 6.2 mm 1/4 inch steel plate, minimum, and covered with a heavy grating with openings approximately 50 mm 2 inches square. Ashes and clinkers shall be discharged from the boiler ash hoppers into ash pits located directly below the ash hopper doors. A combination drag chain conveyor for horizontal conveying and an elevator conveyor for vertical conveying of ashes shall be arranged, as indicated, to take ashes from the bottom of the ash pits for
discharge into the ash silo. Conveyors shall have a capacity of not less than [_____] metric tons/hour when handling ashes weighing approximately [_____] kg/cubic meter at a maximum speed of 508 mm/sec 100 fpm. Doors shall be provided for access to all parts, as required. Motor shall be [totally enclosed, nonventilated type] [totally enclosed, fan-cooled type] [totally enclosed, fan-cooled type suitable for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70]. [Motor starter shall be [manual] [magnetic] [across-the-line] [reduced voltage start] type with [general-purpose] [weather-resistant] [water-tight] [dust-tight] [explosion-proof] enclosure.

2.31.1.6.1 Drag Chain Conveyor

Drag chain conveyor shall be of a single strand of wide, heat treated, high alloy, drop forged, rivetless drag chain with a [_____] mm pitch, [_____] mm overall width, and [_____] kg pounds working strength, and shall have a hardness of 460-510 Brinell. The upper strand of the chain shall convey the ash in a trough constructed of 9.5 mm 3/8 inch cast-iron extending from [_____] mm inches in front of the foot shaft to [_____] mm inches behind the head shaft and set flush with the floor. The return strand of chain shall be carried in angle runways set flush with the trench floor. The drag chain conveyor shall be driven by a [_____] mm pitch roller chain and [_____] mm pitch diameter, [_____] tooth sprocket on the drive shaft, and a [_____] mm pitch diameter, [_____] tooth sprocket on the elevator foot shaft.

2.31.1.6.2 Casing

The casing shall be constructed of 2.656 mm 12-gauge thick steel, minimum, with 9.5 mm 3/8 inch thick boot plates. The head-end drive shall include a gear motor and steel roller chain complete with drive brackets, guards, and backstop. The elevator shall be equipped with head-end platform and ladder.

2.31.2 Ash Handling Controls

The ash handling system control panel shall contain all necessary instrumentation, including selector switches, annunciators, push buttons, and ammeters required for monitoring and operation of the ash handling system. The panel shall graphically display the system. In addition, the panel shall contain all necessary timers, relays, and terminal blocks that are required for the control system. Control and monitoring of the ash removal system shall be from a single panel. This panel shall have push buttons to start automatic operation of each system and also push buttons for individual control of each component. The panel shall have sufficient instrumentation to observe the removal operations and controls to permit effective emergency control. Local control stations at each ash removal point for local manual operation shall also be provided. Local selector switches shall be provided so that equipment may be operated manually for test and maintenance purposes. The operation of the bottom ash system shall be controlled by a microprocessor-based control system, a solid-state programmable controller or an electromechanical system. All controls and instrumentation for location indoors shall have NEMA 12 rating in accordance with NEMA ICS 1. All outdoor components shall have NEMA 4 rating, in accordance with NEMA ICS 1. All major equipment components, including control panels and devices, shall be factory-mounted, prewired, tubed, and tested to the maximum practical extent. The system shall include controls for fully automatic and sequential operation of the ash handling system. These controls shall be designed so that manual steps,
such as continuous monitoring and regulation, will not be required. Suitable safety interlocks shall be incorporated to assure that proper permissive conditions have been met prior to changing the operating status of major system components. Shutdown of the ash handling system, or portion thereof, shall be automatically initiated, with alarms, should unsafe conditions arise during operation of the system. Facilities for monitoring and control of the ash handling system shall be provided for the following functions:

a. Manual start of the automatic control operations.

b. Selection of operating components.

c. Override of the automatic control sequences, both at the ash handling control panel and locally.

d. Manual operation, either remotely from the control center or locally.

e. Emergency shutdown on a unit or system basis.

f. Status monitoring at the ash handling control panel of the operation of the ash handling system and its components.

The automatic controls for bottom ash collection transport shall operate as specified. When a start command has been manually initiated, the automatic ash collection and transport sequences for the unit shall progress through their complete cycles, and after completion of the cycles, the system shall automatically shut down. The system shall include an annunciator system, complete with audio and visual alarms, as part of the ash handling control panel. The annunciator system shall receive inputs from devices and system logic which shall indicate any out of specification or trip condition. Recorders shall be furnished to provide a permanent record of selected variables that relate to the ash handling system's performance and operation. Control stations supplied with analog control loops shall provide bumpless transfer between the manual and automatic modes of operation. The manual mode of operation shall provide direct control of the end device with no intervening analog control components unless those components are powered by the same source as the end device.

2.31.3 Submerged Drag Chain Conveyor (SDCC)

Submerged drag chain conveyor shall be designed to extract ash at normal capacity [_____] metric tons/hour TPH and maximum capacity [_____] metric tons/hour TPH, based on a dry ash density of approximately [_____] kg/cubic meter pcf. The maximum chain speed shall be 76 mm/second 15 fpm. The SDCC shall be designed for continuous operation and shall have a storage capacity of [_____] cubic meter cu ft accumulation. The SDCC shall have an upper compartment filled with water and a dry lower compartment. The equipment shall be provided to maintain water temperature at approximately 60 degrees C 140 degrees F. The dewatering slope shall be at an angle of [_____] degrees with the horizontal. The top trough shall be not less than 9.5 mm 3/8 inch thick carbon steel plate, welded construction, lined with renewable abrasion resistant steel wear plates, with a minimum thickness of 13 mm 1/2 inch and 300 BHN. All welds shall be ground smooth. The necessary track guide angles, hold-down angles, and carbon steel chain protectors shall be provided. The minimum depth of water in the upper trough shall be [_____] m feet. The return chain bottom trough shall be dry, constructed of 9.5 mm 3/8 inch thick steel plate, stiffened and braced with structural shapes and shall be water-tight. Chain track angles shall
be provided with a minimum 13 mm 1/2 inch thick steel replaceable wear flats with a minimum 300 BHN. Wear strips shall be also provided under the return flights, minimum 13 mm 1/2 inch thick and 50 mm 2 inch wide. The conveyor chain shall be a double strand round-link or ship-type chain, case hardened, corrosion and abrasion resistant, chrome-nickle-alloy, annealed and carburized with surface hardness between 500-600 BHN. Design strength and pitch shall be based on operating conditions. The conveyor flights shall be [_____] mm inches deep by [_____] mm inches thick T-1 steel plates attached on both ends to the chain. The flight shall be provided with top wear pads and bottom wear strips of abrasion resistant steel plate of 300 BHN minimum. A chain tensioner shall be provided at the tail end of SDCC for maintaining proper tension in both strands of the chain. The assembly shall include cast-iron idler wheel, bearings, shaft, guide block and bearing housing. Idler assemblies for both troughs shall include heavy duty spherical roller type bearings with external lubrication fittings. The chain drive assembly shall include cast-iron wheels with removable, surface hardened, toothed segments, drive shaft, bearings. The conveyor shall be driven by a hydrostatic drive unit coupled with a low speed, high torque hydraulic motor, built-in torque limiting valves for preventing damage to load train or electric motor. Speed regulation, self-lubrication, internal cooling, and dynamic braking shall be provided with this drive. Inching capability shall be provided. Hinged inspection doors, windows, and removable panels shall be provided along the conveyor to permit access and observation at critical points. All inspection doors, windows, and removable panels in mild steel shall be provided with stainless steel hardware and must be made completely water-tight. Water cooling and drainage connections shall be provided through flanged connections to the conveyor trough. Provision shall be made for continuous water flow into the top trough of the conveyor including two overflow connections, one for normal level and one high level; including high level alarm and an overflow weir box to prevent drain clogging. Chain cleaning spray shall also be provided.

2.31.4 Dense Phase Ash Handling

The ash conveying system shall be pneumatic dense phase type, complete with transfer vessels, solenoid valves, air receiver tank, air producer, and ash conveying piping. The ash handling system shall be designed to handle [_____] metric tons/hour tons/hour of ash weighing approximately [_____] kg/cubic meter pcf. Each transport vessel shall be bolted to the hopper discharge flange where ash shall flow into the vessel by gravity until a level indicator indicates the vessel is full. The transport vessel inlet valve then closes, and transport air between 175 to 350 kPa 25 to 50 psi enters the vessel through a fluidizing unit located at the bottom of the vessel. When the vessel has been brought to transport air pressure, the transport line valve opens and a "slug" of fly ash is transported to the storage silo. The transporting pipe shall be Schedule 40 standard black iron pipe [_____] mm inches diameter. The material velocities in the transportation pipe shall be [_____] meters/second fpm. The system shall be provided with 210 to 410 kPa 30 to 60 psi compressed air to fluidize and transmit ash. The conveying velocity shall not exceed 5.1 meters/second 1000 fpm.

2.31.5 Fly Ash Collectors

Fly ash collectors shall be as specified in Section 44 10 00 AIR POLLUTION CONTROL. Fly ash collectors shall be sized to handle total flue gas at maximum boiler load and stack temperature, and shall be provided along with induced draft equipment. Fly ash collector requirements shall be
coordinated with boiler draft and control requirements.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 EARTHWORK

Excavation and backfilling for tanks and piping shall be as specified in Section 31 00 00 EARTHWORK, except backfill for fiberglass reinforced fuel tanks shall conform to the manufacturer's installation instructions.

3.3 EQUIPMENT ERECTION

Install boiler and auxiliary equipment as indicated and in accordance with manufacturers' instructions. Submit detail drawings, consisting of schedules, performance charts, brochures, diagrams, drawings, and instructions necessary for installation of the steam-generating units and associated equipment. Include drawings for piping, pipe anchors, wiring devices, trenches and related foundations, and setting plans certified by the boiler manufacturer and burner manufacturer including coal and ash handling equipment. Drawings shall indicate clearances required for maintenance and operation and shall also contain complete wiring and schematic diagrams, equipment layout and anchorage, and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Include manufacturer's written instructions indicating optimum pressures at all manometer connectors.

3.4 STORAGE TANK INSTALLATION

Install storage tank in accordance with Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.

3.5 PIPING INSTALLATION

Pipe shall be cut accurately to measurements established at the jobsite, shall be installed without cold springing, and shall properly clear windows, doors, and other openings. Cutting or other weakening of the building structure to facilitate piping installation will not be permitted. Pipes shall be free of burrs, oil, grease, and other foreign matter. Pipes shall be installed to permit free expansion and contraction without damaging building structure, pipe, joints, or hangers. Changes in direction shall be made with fittings, except that bending of pipe 100 mm 4 inches and smaller will be permitted provided a pipe bender is used and wide sweep bends are formed. The centerline radius of bends shall not be less than 6 diameters of the pipe. Bent pipe showing kinks, wrinkles, flattening, or other malformations will not be accepted. Carbon steel piping to be bent shall conform to ASTM A53/A53M, Grade A, standard, or Grade B extra-heavy weight. Vent pipes shall be carried through the roof as directed and shall be properly flashed. Unless otherwise indicated, horizontal supply mains shall pitch down in the direction of flow, with a grade of not less than 25 mm in 12 m 1 inch in 40 feet. Open ends of pipelines and equipment shall be properly capped or plugged during installation to keep dirt or other foreign materials out of the systems. Pipe not otherwise specified shall be uncoated. Unless otherwise specified
or shown, connections to equipment shall be made with malleable-iron unions for steel pipe 65 mm 2-1/2 inches or less in diameter and with flanges for pipe 80 mm 3 inches or more in diameter. Unions for copper pipe or tubing shall be brass or bronze. Connections between ferrous piping and copper piping shall be electrically isolated from each other with dielectric couplings or other approved methods. Reducing fittings shall be used for changes in pipe sizes. In horizontal steam lines, reducing fittings shall be the eccentric type to maintain the top of the lines at the same level.

3.5.1 Pipe Sleeves

Pipe passing through concrete or masonry walls or concrete floors or roofs shall be provided with pipe sleeves fitted into place at the time of construction. A waterproofing clamping flange shall be installed as indicated. Sleeves shall not be installed in structural members except where indicated or approved. All rectangular and square openings shall be as detailed. Each sleeve shall extend through its specified wall, floor, or roof, and shall be cut flush with each surface, except that sleeves through floors and roofs shall extend above the top surface at least 150 mm 6 inches for proper flashing or finishing. Membrane clamping rings shall be provided where membranes are penetrated. Unless otherwise indicated, sleeves shall be sized to provide a minimum clearance of 6 mm 1/4 inch between bare pipe and sleeves or between jacket over insulation and sleeves. Sleeves in bearing walls, waterproofing membrane floors, and wet areas shall be galvanized steel pipe. Sleeves in nonbearing walls, floors, or ceilings may be galvanized steel pipe, or galvanized sheet metal with lock-type longitudinal seam. Except in pipe chases or interior walls, the annular space between pipe and sleeve or between jacket over insulation and sleeve in nonfire rated walls and floors shall be sealed as indicated and specified in Section 07 92 00 JOINT SEALANTS, and in fire rated walls and floors shall be sealed as indicated and specified in Section 07 84 00 FIRESTOPPING. Metal jackets for insulated pipes passing through exterior walls, firewalls, fire partitions, floors, and roofs shall not be thinner than 0.15 mm 0.006 inch thick aluminum if corrugated, and 0.41 mm 0.016 inch thick aluminum if smooth, and shall be secured with aluminum or stainless steel bands not less than 9.5 mm 3/8 inch wide and not more than 200 mm 8 inches apart. Where penetrating roofs, before fitting the metal jacket into place, a 13 mm 1/2 inch wide strip of sealant shall be run vertically along the inside of the longitudinal joint of the metal jacket from a point below the backup material to a minimum of 900 mm 36 inches above the roof. If the pipe turns from vertical to horizontal, the sealant strip shall be run to a point just beyond the first elbow. When penetrating waterproofing membrane for floors, the metal jacket shall extend from a point below the backup material to a minimum distance of 50 mm 2 inches above the flashing. For other areas, the metal jacket shall extend from a point below the backup material to a point 300 mm 12 inches above floor; or when passing through walls above grade, jacket shall extend at least 100 mm 4 inches beyond each side of the wall.

3.5.1.1 Pipes Passing Through Waterproofing Membranes

In addition to the pipe sleeves referred to above, pipes passing through roof or floor waterproofing membrane shall be provided with a 1.8 kg 4 pound lead flashing or a 448 g 16 ounce copper flashing, each within an integral skirt or flange. Flashing shall be suitably formed, and the skirt or flange shall extend not less than 200 mm 8 inches from the pipe and shall set over the roof or floor membrane in a troweled coating of bituminous cement. The flashing shall extend up the pipe a minimum of 250 mm 10 inches above the roof or floor. The annular space between the flashing and the
bare pipe or between the flashing and the metal-jacket-covered insulation shall be sealed as indicated. Pipes up to and including 250 mm 10 inches in diameter passing through roof or floor waterproofing membrane may be installed through a galvanized steel sleeve with caulking recess, anchor lugs, flashing clamp device, and pressure ring with brass bolts. Waterproofing membrane shall be clamped into place and sealant shall be placed in the caulking recess. In lieu of a waterproofing clamping flange and caulking and sealing of annular space between pipe and sleeve or conduit and sleeve, a modular mechanical-type sealing assembly may be installed. The seals shall consist of interlocking synthetic rubber links shaped to continuously fill the annular space between the pipe/conduit and sleeve with corrosion protected carbon steel bolts, nuts, and pressure plates. The links shall be loosely assembled with bolts to form a continuous rubber belt around the pipe with a pressure plate under each bolt head and each nut. After the seal assembly is properly positioned in the sleeve, tightening of the bolts shall cause the rubber sealing elements to expand and provide a water-tight seal between the pipe/conduit and the sleeve. Each seal assembly shall be sized as recommended by the manufacturer to fit the pipe/conduit and sleeve involved. The Contractor electing to use the modular mechanical type seals shall provide sleeves of the proper diameters.

3.5.1.2 Optional Counterflashing

As alternates to caulking and sealing the annular space between the pipe and flashing or metal-jacket-covered insulation and flashing, counterflashing may be accomplished by one of the following methods:

a. Standard roof coupling for threaded pipe up to 150 mm 6 inches in diameter.

b. Lead flashing sleeve for dry vents and turning the sleeve down into the pipe to form a waterproof joint.

c. A tack-welded or banded-metal rain shield around the pipe and sealing as indicated.

3.5.2 Pipe Joints

Joints between sections of pipe and fittings shall be welded or flanged. Except as otherwise specified, fittings 25 mm 1 inch and smaller shall be threaded; fittings 32 mm 1-1/4 inches up to, but not including, 65 mm 2-1/2 inches may be either threaded or welded; and fittings 65 mm 2-1/2 inches and larger shall be either flanged or welded. Pipe and fittings 32 mm 1-1/4 inches and larger installed in inaccessible conduits or trenches beneath concrete floor slabs shall be welded. Connections to equipment shall be made with black malleable-iron unions for pipe 50 mm 2 inches or smaller in diameter, and with flanges for pipe 65 mm 2-1/2 inches or larger in diameter.

3.5.2.1 Threaded Joints

Threaded joints shall be made with tapered threads properly cut and shall be made perfectly tight with a stiff mixture of graphite and oil, or polytetrafluoroethylene tape or equal, applied to the male threads only, and in no case to the fittings.
3.5.2.2 Welded Joints

Welded joints shall be fusion welded in accordance with ASME B31.1, unless otherwise required. Changes in direction of piping shall be made with welding fittings only; mitering or notching pipe to form elbows and tees or other similar type construction will not be acceptable. Branch connections may be made with either welding tees or forged branch outlet fittings, either being acceptable without size limitation. Branch outlet fittings, where used, shall be forged, flared for improvement flow where attached to the run, reinforced against external strains, and designed to withstand full pipe bursting strength.

3.5.2.2.1 Beveling

Field and shop bevels shall be in accordance with the recognized standards and shall be done by mechanical means or flame cutting. Where beveling is done by flame cutting, surfaces shall be cleaned of scale and oxidation before welding.

3.5.2.2.2 Alignment

Parts to be welded shall be aligned so that no strain is placed on the weld when finally positioned. Height shall be so aligned that no part of the pipe wall is offset by more than 20 percent of the wall thickness. Flanges and branches shall be set true. This alignment shall be preserved during the welding operation. Tack welds shall be of the same quality and made by the same procedure as the completed weld; otherwise, tack welds shall be removed during the final welding operation.

3.5.2.2.3 Erection

Where the temperature of the component parts being welded reaches 0 degrees C 32 degrees F or lower, the material shall be heated to approximately 38 degrees C 100 degrees F for a distance of 900 mm 3 feet on each side of the weld before welding, and the weld shall be finished before the materials cool to 0 degrees C 32 degrees F.

3.5.2.2.4 Defective Welding

Defective welds shall be removed and replaced. Repairing of defective welds shall be in accordance with ASME B31.1.

3.5.2.2.5 Electrodes

After filler metal has been removed from its original package, it shall be protected or stored so that its characteristics or welding properties are not affected. Electrodes that have been wetted or that have lost any of their coating shall not be used.

3.5.2.3 Flanges and Unions

Flanges and unions shall be faced true and made square and tight. Gaskets shall be nonasbestos compressed material in accordance with ASME B16.21, 1.6 mm 1/16 inch thickness, full face or self-centering flat ring type. The gaskets shall contain aramid fibers bonded with styrene butadiene rubber (SBR) or nitrile butadiene rubber (NBR). NBR binder shall be used for hydrocarbon service. Union or flange joints shall be provided in each line immediately preceding the connection to each piece of equipment or material requiring maintenance, such as coils, pumps, control valves, and...
other similar items.

3.5.3 Supports

3.5.3.1 General

**************************************************************************

NOTE: Mechanical and electrical layout drawings and specifications for ceiling suspensions should contain notes indicating that hanger loads between panel points in excess of 23 kg 50 pounds shall have the excess hanger loads suspended from panel points.

**************************************************************************

Hangers used to support piping 50 mm 2 inches and larger shall be fabricated to permit adequate adjustment after erection while still supporting the load. Pipe guides and anchors shall be installed to keep pipes in accurate alignment, to direct the expansion movement, and to prevent buckling, swaying, and undue strain. All piping subjected to vertical movement when operating temperatures exceed ambient temperatures, shall be supported by variable spring hangers and supports or by constant support hangers. [Pipe hanger loads suspended from steel joist between panel points shall not exceed 23 kg 50 pounds. Loads exceeding 23 kg 50 pounds shall be suspended from panel points.]

3.5.3.2 Seismic Requirements

**************************************************************************

NOTE: Provide seismic requirements if a Government designer (either Corps office or A/E) is the Engineer of Record, and show on the drawings. Delete the bracketed phrase if seismic details are not included. Pertinent portions of UFC 3-301-01 and Sections 13 48 73 and 23 05 48.19, properly edited, must be included in the contract documents.

**************************************************************************

Seismic Requirements for Pipe Supports and Structural Bracing: All piping and attached valves shall be supported and braced to resist seismic loads as specified under UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MECHANICAL EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC[ as shown.] Structural steel required for reinforcement to properly support piping, headers, and equipment, but not shown, shall be provided under this section. Material used for supports shall be as specified under Section 05 12 00 STRUCTURAL STEEL.

3.5.3.3 Structural Attachments

Structural steel brackets required to support piping, headers, and equipment, but not shown, shall be provided under this section. Material used for supports shall be as specified under Section 05 12 00 STRUCTURAL STEEL.

3.5.4 Anchors

Anchors shall be provided wherever necessary or indicated to localize expansion or prevent undue strain on piping. Anchors shall consist of heavy steel collars with lugs and bolts for clamping and attaching anchor braces, unless otherwise indicated. Anchor braces shall be installed in
the most effective manner to secure the desired results, using turnbuckles where required. Supports, anchors, or stays shall not be attached where they will injure the structure or adjacent construction during installation or by the weight of expansion of the pipeline.

3.5.5 Pipe Expansion

3.5.5.1 Expansion Loops

**************************************************************************
NOTE: Wherever possible, provision for expansion of steam supply and return pipes will be made by changes in the direction of the run of the pipe or by field-fabricated expansion bends.
**************************************************************************

Expansion loops shall provide adequate expansion of the main straight runs of the system within the stress limits specified in ASME B31.1. The loop shall be cold-sprung and installed where indicated. Pipe guides shall be provided as indicated. Except where otherwise indicated, expansion loops and bends shall be utilized to absorb and compensate for expansion and contraction instead of expansion joints.

3.5.5.2 Expansion Joints

**************************************************************************
NOTE: If expansion joints are not required, this paragraphs will be deleted. Where space limitations prevent such provisions for expansion, expansion joints will be installed, and blanks will be filled as appropriate.
**************************************************************************

Expansion joints shall provide for either single or double slip of the connected pipes, as required and indicated. Initial setting shall be made in accordance with the manufacturer’s recommendations to allow for ambient temperature at time of installation. Pipe alignment guides shall be installed as recommended by the joint manufacturer, but in any case shall not be more than 1.5 m 5 feet from expansion joint, except in lines 100 mm 4 inches or smaller where guides shall be installed not more than 600 mm 2 feet from the joint.

3.5.6 Valves

Gate or globe valves shall be installed with stems horizontal or upright. Swing check valves shall be installed in horizontal piping with the cap or bonnet up, or in vertical piping with the flow upward. Lift or piston check valves shall be installed in horizontal piping with the cap or bonnet up.

3.6 BURIED PIPING INSTALLATION

3.6.1 Protective Coating for Underground Steel Pipe

All steel pipe installed underground shall be given a protective covering, mechanically applied in a factory or field plant especially equipped for the purpose. Specials and other fittings which cannot be coated and wrapped mechanically shall have the protective covering applied by hand, preferably at the plant, applying the covering to the pipe. Coatings shall
not be field applied until the piping has satisfactorily passed the leak or hydrostatic test. All field joints shall be coated and wrapped by hand. All hand coating and wrapping shall be done in a manner and with materials that will produce a covering equal in effectiveness to that of the mechanically-applied covering.

3.6.2 Cleaning of Surfaces to be Coated

Steel surfaces shall be solvent-washed to assure an oil-and-grease-free surface and blast-cleaned to bare metal as specified in SSPC SP 6/NACE No.3. Areas that cannot be cleaned by blasting shall be cleaned to bare metal by powered wire brushing or other mechanical means. The air supply for blasting shall be free from oil and moisture. Following cleaning, the surfaces shall be wiped with coal-tar solvent naphtha and allowed to dry. The surfaces to be coated shall be free of all mill scale and foreign matter such as rust, dirt, grease, oil, and other deleterious substances. Surfaces shall be coated as soon as practicable after the cleaning operation.

3.6.3 Coating Materials

Buried steel piping shall be coated with one of the following methods:

3.6.3.1 Bituminous Pipe Coating

**************************************************************************
NOTE: If coating system similar to coal tar coating and wrapping is required using different materials, this paragraph shall be rewritten. If double wrap system is required, the designer shall remove the brackets.
**************************************************************************

Bituminous protective system shall be a coal-tar enamel and primer coating system, and shall consist of a coal-tar priming coat, a coal-tar enamel coat, a wrapper of coal tar saturated felt, and a wrapper of kraft paper, or a coat of water-resistant whitewash, applied in the order named and conforming to the requirements of AWWA C203 in all respects as to materials, methods of application, tests, and handling, except that an interior lining shall not be applied. [In addition, where excessively corrosive soils are encountered, the piping shall be given a second coating of coal-tar enamel and a second wrapper of felt.] Joints and fittings shall be coated and wrapped.

3.6.3.2 Polyethylene Pipe Coating

Continuous extruded polyethylene coating and adhesive undercoat application procedure, including surface preparation, shall be a factory-applied system conforming to NACE SP0185, Type A. Joints, valves, flanges, and other irregular surfaces shall be tape-wrapped as outlined under the tape-wrapping system, except that the tape shall be applied half-lapped, and all extruded polyethylene coating and adhesive undercoat surfaces to be tape-wrapped shall be primed with a compatible primer before application of tape. The primer shall be as recommended by the tape manufacturer and approved by the applicator of the extruded polyethylene coating. Damaged areas of extruded polyethylene coating shall be repaired by tape-wrapping as described under the tape-wrapping system, except that any residual material from the extruded polyethylene coating shall be pressed into the break or shall be trimmed off. All areas to be taped shall be primed and
the tape shall be applied half-lapped.

3.6.3.3 Tape-Wrap Pipe Coating

Cleaned surfaces shall be primed before applying tape as recommended by the manufacturer of the tape. The tape shall be an approved, pressure-sensitive, organic plastic tape with a minimum nominal thickness of 0.51 mm 0.020 inch. The tape shall conform to ASTM G21 for fungus resistance. Tape shall be applied to clean, dry, grease-free, and dust-free surfaces only. Weld beads shall be wire-brushed. All burrs and weld spatter shall be removed. Weld beads shall be covered with one wrap of tape before spiral wrapping. At each end of straight runs, a double wrap of one full width of tape shall be applied at right angles to the axis of the spiral wrapping. Kraft paper protective wrapping, if any, shall be removed from the pipe before the tape is applied. Material which is wrapped before it is placed in its final position shall have the wrapping protected at sling points with roofing felt or other approved heavy shielding material, or shall be handled with canvas slings. Damaged wrapping shall be repaired as specified. Pipe in straight runs shall be wrapped spirally, half-lapping the tape as it is applied. For pipe smaller than 100 mm 4 inches, one layer half-lapped shall be used. For pipe 100 mm 4 inches and larger, two layers half-lapped shall be used with the second layer wrapped opposite-hand to the first. Joints, coupling fittings, and similar units, and damaged areas of wrapping, shall be wrapped spirally beginning with one complete wrap 75 mm 3 inches back from each edge of the corresponding size of straight pipe. On irregular surfaces such as valves and other accessories, one layer half-lapped and stretched sufficiently to conform to the surface shall be applied, followed by a second layer half-lapped and applied with tension as it comes off the roll.

3.6.3.4 Epoxy Coating System

The epoxy coating system shall conform to AWWA C213, Type II. Fittings, valves, and joints shall be factory coated with materials identical to those used on the pipe, or may be field coated with a two-part epoxy system recommended by the manufacturer of the pipe coating system. Field protection may also be provided for joints and fittings with a coal tar tape hot-applied over a compatible primer.

3.6.3.5 Coating Inspection and Testing

After field coating of the pipe joints, the entire pipe shall be inspected with an electric holiday detector having an operating crest voltage of from 12,000 to 15,000 volts when using a full-ring, spring-type coil electrode. The holiday detector shall be equipped with a bell, buzzer, or other audible signal which operates when a holiday is detected. All detected holidays in the protective covering shall be repaired. Occasional checks of holiday detector potential will be made by the Contracting Officer to determine suitability of the detector. The inspection for holidays shall be performed just before covering the pipe with backfill and every precaution shall be taken during backfill to prevent damage to the protective covering. Equipment and labor necessary for inspection shall be furnished by the Contractor.

3.6.4 Installing Buried Piping

Pipe and accessories shall be handled carefully to assure a sound, undamaged condition. Care shall be taken not to damage coating when lowering pipe into a trench and when backfilling. Nonmetallic pipe shall
be installed in accordance with pipe manufacturer’s instructions. Underground pipelines shall be laid with a minimum pitch of 25 mm per 15 m (1 inch per 50 feet). Horizontal sections shall have a minimum coverage of 450 mm (18 inches). Piping shall be free of traps and shall drain toward tank. The full length of each section of underground pipe shall rest solidly on the pipe bed. Piping connections to equipment shall be as indicated, or as required, by the equipment manufacturer. Tank connections shall be made with two elbow swing joints [or flexible connectors] to allow for differential settlement. The interior of the pipe shall be thoroughly cleaned of all foreign matter before being lowered into the trench and shall be kept clean during installation. The pipe shall not be laid in water or when the trench or weather conditions are unsuitable. When work is not in progress, open ends of pipe and fittings shall be securely closed so that water, earth, or other substances cannot enter the pipe or fittings. Any pipe, fittings, or appurtenances found defective after installation shall be replaced. Threaded joints shall be made with tapered threads and shall be made perfectly tight with joint compound applied to the male threads only. This requirement shall not apply for the gauging hatch or similar connections directly over the tank where the line terminates in a fitting within a cast-iron manhole designed to allow for differential setting. Where steel piping is to be anchored, the pipe shall be welded to the structural steel member of the anchor and the abraded area shall be patched with protective coating or covering as specified. Piping passing through concrete or masonry construction shall be fitted with sleeves. Each sleeve shall be of sufficient length to pass through the entire thickness of the associated structural member and shall be large enough to provide a minimum clear distance of 13 mm (1/2 inch) between the pipe and sleeve, except where otherwise indicated. Sleeves through concrete may be 0.912 mm (20 gauge) metal, fiber, or other approved material. Sleeves shall be accurately located on center with the piping and shall be securely fastened in place. The space between the sleeves and the pipe shall be caulked and filled with bituminous plastic cement or mechanical caulking units designed for such use.

3.6.5 Fiberglass Reinforced Plastic (FRP) Pipe

Field assembly of the pipe shall be done in conformance with the manufacturer’s written instructions and installation procedures. Several pipe joints having interference-fit type couplings may be field-bonded and cured simultaneously. However, the pipe shall not be moved nor shall additional joints be made until the previously laid joints are completely cured. Joints not having interference-fit type couplings shall be fitted with a clamp which shall hold the joint rigidly in place until the joint cement has completely cured. The clamps shall have a protective material on the inner surface to prevent damage to the plastic pipe when the clamp is tightened in place. The pipe shall be provided with a device or method to determine when the joint is pulled against the pipe stop. A gauge provided by the pipe manufacturer shall be used to measure the diameter of the spigot ends to insure the diameter conforms to the tolerances specified by the manufacturer. All pipe ends shall be gauged. FRP pipe shall be utilized for buried piping only. No aboveground FRP pipe is allowed. Cutting shall be done with a hacksaw or circular saw with an abrasive cutting wheel.

3.6.5.1 Installation

Pipe shall be buried to the elevation shown on the profiles, except that in no case shall pipe under roadways be buried less than 900 mm (36 inches). Backfill shall not include large or sharp-edged rocks of any size in direct
contact with the pipe surfaces. Compacting shall be done so as to avoid
damage to the pipeline. Conduits or sleeves of steel pipe at least \( 50 \text{ mm} \times 2 \text{ inches} \) in diameter larger than the FRP pipe size shall be provided under
heavy traffic roadways. Bending of pipe to follow ditch contours shall be
limited to long trench curvatures and will not be permitted for abrupt
changes in pipe direction. Bend radii shall not be less than shown in the
manufacturer's installation procedures.

3.6.5.2 Thrust Blocks

Concrete thrust blocks shall be provided at all tees, valves, blind
flanges, reducers, or whenever the pipe alignment changes direction. They
shall be sized in accordance with the pipe manufacturer's instructions to
suit local soil conditions, operating pressures, test pressures, pipe size,
and thermal conditions. In case of a conflict, the most stringent
requirements shall govern.

3.6.5.3 Curing of Field-Bonded Joints

All field-bonded epoxy-cemented joints, regardless of ambient temperatures,
shall be cured with a self-regulating, thermostatically controlled
electrical heating blanket for the time and temperature recommended by the
manufacturer for the applicable size and type of joint, or by an alternate
approved heating method. The joined sections shall not be moved during
heating or before the joint has cooled to \( 27 \text{ degrees C} \) \( 80 \text{ degrees F} \) or to
ambient temperature, whichever is higher.

3.6.5.4 Metal to FRP Connections

Metal to FRP connections shall be made with flanged connections. Steel
flanges for bolting to FRP flanges shall be flat-faced type. Where
raised-face steel flanges are used, spacer rings shall be utilized to
provide a flat-face seat for FRP flanges. A full-face Buna-N gasket, \( 3.2 \text{ mm} \times 1/8 \text{ inch} \) thick with a shore hardness of 50 to 60, shall be used between
all flanged connections. The FRP flange shall have raised sealing rings.
Flat washers shall be used under all nuts and bolts on FRP flanges. Bolts
and nuts shall be of noncorrosive metal and torqued to not more than \( 135 \text{ newton meters} \times 100 \text{ ft-lbs} \). Flanges shall not be buried. A concrete pit
shall be provided for all flanged connections.

3.6.6 Buried Fuel Piping

Buried fuel piping shall be in accordance with Section 33 56 10
FACTORY-FABRICATED FUEL STORAGE TANKS.

3.7 CATHODIC PROTECTION

Cathodic protection shall be in accordance with Section 33 56 10
FACTORY-FABRICATED FUEL STORAGE TANKS.

3.8 FIELD PAINTING

**************************************************************************
NOTE: Where identification of piping is required by
the using service, this paragraph will be amplified
to include appropriate requirements either directly
or by reference to a separate section. Air Force
requirements are covered in AFM 88-15.
**************************************************************************
All ferrous metals not specified to be coated at the factory shall be cleaned, prepared, and painted as specified in Section 09 90 00 PAINTS AND COATINGS. Exposed pipe covering shall be painted as specified in Section 09 90 00 PAINTS AND COATINGS. Aluminum sheath over insulation shall not be painted.

3.9 CLEANING OF BOILERS AND PIPING FOR TESTING

3.9.1 Boiler Cleaning

After the hydrostatic tests but before the operating tests, the boilers shall be cleaned of foreign materials. Wherever possible, surfaces in contact with water shall be wire-brushed to remove loose material. The Contractor may use the following procedure or may submit his own standard procedure for review and approval by the Contracting Officer. Boilers shall be filled with a solution consisting of the following proportional ingredients for every 3785 liters 1000 gallons of water and operated at approximately 207 to 350 kPa 30 to 50 psig for a period of 24 to 48 hours, exhausting steam to the atmosphere:

\[
\begin{align*}
11 \text{ kg} & \quad 24 \text{ pounds caustic soda} \\
3.6 \text{ kg} & \quad 8 \text{ pounds sodium nitrate} \\
11 \text{ kg} & \quad 24 \text{ pounds disodium phosphate, anhydrous agent} \\
230 \text{ mg} & \quad 1/2 \text{ pound approved wetting} \\
\end{align*}
\]

Chemicals in the above proportions or as otherwise approved shall be thoroughly dissolved in the water before being placed in the boilers. After the specified boiling period, the boilers shall be allowed to cool and then drained and thoroughly flushed. Piping shall be cleaned by operating the boilers for a period of approximately 48 hours, wasting the condensate.

3.9.2 Boiler Water Conditioning

Provide boiler water conditioning including chemical treatment and blowdown during periods of boiler operation to prevent scale and corrosion in boilers and in supply and return distribution systems from the initial startup of the system, through the testing period, and to final acceptance of the completed work but for at least 30 days of operation. Approved chemicals and method of treatment shall be used.

Note 1: Conform to ASME B31.1 for wall thickness. Match requirements for steam piping.

Note 2: Conform to ASME B31.1 for wall thickness, except minimum shall...

### 3.10 MANUFACTURERS' FIELD SERVICES

Provide the services of a manufacturer's representative who is experienced in the installation, adjustment, and operation of the equipment specified. The representative shall supervise the installing, adjusting, and testing of the equipment.

### 3.11 FIELD TRAINING

Provide a field training course for designated operating staff members. Training shall be provided for a total period of [_____] hours of normal working time and shall start after the system is functionally complete, but prior to final acceptance tests. Field training shall cover all of the items contained in the approved operating and maintenance instructions as...
well as demonstrations of routine maintenance operations. Contracting Officer shall be notified at least 14 days prior to date of proposed conduction of the training course.

3.12 FRAMED INSTRUCTIONS

Submit proposed diagrams, instructions, and other sheets, before posting. Post framed instructions under glass or in laminated plastic, including wiring and control diagrams showing the complete layout of the entire system, where directed. Condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation, and procedures for safely starting and stopping the system shall be prepared in typed form, framed as specified above for the wiring and control diagrams, and posted beside the diagrams. The framed instructions shall be posted before acceptance testing of the systems.

3.13 TESTS

**************************************************************************
NOTE: Before occupancy of a facility the boilers shall be inspected in accordance with the Code of Boiler and Pressure Vessel Inspectors (BPVI) and the American Society of Mechanical Engineers (ASME). Inspectors must be certified in accordance with BPVI standards.

References to inapplicable types of boilers will be deleted.
**************************************************************************

Submit test reports in booklet form showing all field tests performed to adjust each component and all field tests performed to prove compliance with the specified performance criteria, upon completion and testing of the installed system. Each test report shall indicate the final position of controls. Submit a written statement from the manufacturer's representative certifying that combustion control equipment has been properly installed and is in proper operating condition, upon completion of the installation. The action settings for all automatic controls in the form of a typed, tabulated list indicating the type of control, location, setting, and function.

3.13.1 Hydrostatic Tests

Following erection, each boiler shall be tested hydrostatically and proved tight under a gauge pressure of 1-1/2 times the working pressure specified. Following the installation of piping and boiler house equipment, but before the application of any insulation, hydrostatic tests shall be made and the system proved tight under gauge pressures of 1-1/2 times the specified working pressure. The boilers shall be tested and the piping connections inspected by a NBBI-commissioned boiler inspector for determining compliance with all requirements in ASME BPVC SEC VIII D1 and the Contracting Officer shall be supplied with a certificate of approval for each boiler. After flushing and operationally testing, underground portions of oil containing piping systems shall be leak tested. The test shall be the [standpipe method][buoyancy device] type and shall conform to the requirements in NFPA 329. The test method shall not involve pressurization of the system in any way which could increase the rate of product escape through an established leak.
3.13.2 Efficiency and Operating Tests

Upon completion of installation, the boiler plant shall be subjected to operating tests required to demonstrate satisfactory functional operation. Adjust equipment and controls before the scheduled operating test. A testing schedule shall be submitted to the Contracting Officer at least 15 days before the scheduled test. Each operating test shall be conducted as directed by Contracting Officer.

a. An efficiency and capacity test shall be run on one boiler of each size installed, conducted in accordance with ASME PTC 4 abbreviated efficiency test utilizing the heat loss method, except for use of measuring or metering devices properly calibrated before the test, for the purpose of metering the water used and weighing the amount of fuel burned. Water meter used in the test shall be suitable for hot water. Instruments, test equipment, and test personnel required to properly conduct tests shall be provided by the Contractor. The necessary fuel, water, and electricity will be furnished by the Government.

b. The performance tests shall, in each case, cover the periods for the capacities tabulated below:

<table>
<thead>
<tr>
<th>Time (Minimum)</th>
<th>Waterwall and Watertube Boilers</th>
<th>Firetube and Boilers</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>Next 4 hours*</td>
<td>100</td>
<td>100</td>
</tr>
<tr>
<td>Next 2 hours</td>
<td>110</td>
<td></td>
</tr>
</tbody>
</table>

*The efficiency tests may be conducted either concurrently with the operating tests or separately, at the option of the Contractor. Efficiency shall be not less than specified. Maximum moisture content of saturated steam leaving the boiler shall be as specified.

c. The efficiency and general performance tests on the boilers shall be conducted by a qualified test engineer, and observed by the Contracting Officer. All testing apparatus shall be set up, calibrated, tested, and ready for testing the boiler before the arrival of the Contracting Officer.

d. Calibration curves or test results furnished by an independent testing laboratory of each instrument, meter, gauge, and thermometer to be used in efficiency and capacity tests shall be furnished before the test. A test report including logs, heat-balance calculations, and tabulated results together with conclusions shall be delivered in quadruplicate. An analysis of the fuel being burned on the test shall be submitted to the Contracting Officer.

e. The analysis shall include all pertinent data tabulated in the ASME PTC 4 abbreviated efficiency test. Necessary temporary test piping not less than 100 mm 4 inches in diameter and steam silencer to exhaust excess steam to atmosphere, in the event the boiler load is
insufficient to meet the capacity specified, shall be provided. Control valve for exhausting excess steam to atmosphere shall be provided in a convenient location inside the boiler room. Instruments required for conducting the boiler tests are contained in ASME PTC 19.11.

3.13.3 Test of Fuel Burning Equipment

Test of fuel burning equipment shall demonstrate that equipment installed will meet the requirements of the specifications. Oil burners shall meet the test requirements of UL 296. The accuracy range and smoothness of operation of the combustion controls shall be demonstrated by varying the demand throughout the entire firing range required by the turndown ratio specified for the [burner][ and ][stoker] and, in the case of automatic sequenced burners, by further varying the firing rate to require on-off cycling. The control accuracy shall be as specified. The specified turndown ratio shall be verified by firing at the minimum firing rate. The operation of the flame safeguard control shall be verified by simulated flame and ignition failures.

3.13.4 Test of Deaerating Feedwater Heater

Test of deaerating feedwater heater shall demonstrate that the equipment installed shall meet the requirements specified as to performance, capacity, and quality of effluent. During the operating test of the boilers, tests shall be conducted to determine oxygen content in accordance with ASTM D888, Method A. Boilers shall be operated at varying loads up to maximum heater capacity while oxygen tests are being made.

3.13.5 Test of Water Treatment Equipment

Test of water treatment equipment shall meet the requirements specified as to capacity and quality of effluent. Tests for ion-exchange units shall cover at least two complete regenerations and capacity runs.

3.13.6 Test for Steam Purity and Water Level Stability

Test for steam purity, in accordance with ASTM D1066, and water level stability shall be simultaneous under the operating conditions specified.

[3.13.6.1 Conductivity Tests for Boilers without Superheaters

**************************************************************************

NOTE: Delete the inapplicable paragraph.
**************************************************************************

Steam tests for boilers without superheaters, not used for power generation or large turbine drive, shall be made on steam sampled in accordance with ASTM D1066. The conductivity of the steam corrected for carbon dioxide and ammonia content shall not exceed 30 microhms at 18 degrees C65 degrees F.

]3.13.6.2 Conductivity Test, Boilers with or without Superheaters

The steam for boilers, with or without superheat, used for power generation or turbine drive for air-conditioning equipment shall be sampled in accordance with ASTM D1066 with the conductivity of the steam corrected for carbon dioxide and ammonia content not to exceed 4.0 microhms at 18 degrees C65 degrees F.
3.13.6.3 Water Level Stability Test

[Water level stability test first shall be conducted by use of the manual bypass around the feedwater regulator. Test then shall be repeated using the automatic feedwater regulator. Boiler shall maintain specified water level stability under both conditions.]

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for steam generation plants based on operating pressure above 200 kPa 30 psig to a maximum of 1030 kPa 150 psig.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Sustainable design factors which should be considered during design of steam generating systems include, but are not limited to, the following: use of cleaner burning fuels (natural gas, low sulfur No. 2 oil); design for minimal air emissions; specification of boilers and ancillary equipment in the upper 25 percent of available efficiency for the capacity range used; proper insulation of piping, fittings, and other heated surfaces; returning condensate to the steam plant for reuse; blowdown heat recovery; appropriate use of water treatment systems and chemicals; use of electric rather than
steam turbine motor drives; recycling of dismantled or demolished material and equipment; and for new plants, building on a previously developed or "brownfield" site if possible. These factors are generally subject to life-cycle cost analysis.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 DEFINITIONS

The definitions of the terms relating to process control instrumentation technology shall be those given in ISA 51.1. Logic symbols shall be in accordance with ISA 5.2. Graphic symbols for distributed control shall be in accordance with ISA 5.3.

1.3 SYSTEM DESCRIPTION

1.3.1 Design Analysis and Calculations

Submit manufacturer's design data and structural computations, and design analyses and calculations for walls, roofs, foundations, and other features, for specialty type of construction, with design data for lateral forces that may be encountered due to wind loads and seismic forces. Instrumentation on equipment shall be mounted in accordance with paragraph Supports in PART 3.

1.3.2 Electrical Environment

Provide electrical and electronic equipment that operate satisfactorily, both independently and in conjunction with other equipment. The operation of electrical and electronic equipment shall not be adversely affected by interference voltages and fields from external sources, and that equipment provided shall not be a source of interference that might adversely affect the operation of other equipment. The basic design of equipment, components, and assemblies shall limit the effects of radio frequency interference and electromagnetic interference.
1.4 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor’s Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Detail Drawings; G[, [_____]]

Variable Spring Hangers

SD-10 Operation and Maintenance Data
Operation and Maintenance Instructions; G[, [____]]

1.5 QUALITY ASSURANCE

1.5.1 Experience

Submit evidence of the Contractor's prior experience in installing similar equipment, including a list of 5 combustion control installations on boilers of equal or larger size that have been in satisfactory operation for 2 years prior to bid opening; also, the location of the combustion
control installations.

1.5.2 Welding

**************************************************************************
NOTE: If the need exists for more stringent requirements for weldments, delete the first bracketed statement regarding welds and the welding submittal, and use the second bracketed sentence.
Non return valves are only required on multiple boiler installations.
**************************************************************************

Submit a copy of qualified procedures and a list of names and identification symbols of qualified welders and welding operators. This information regarding welds, internal to packaged boilers, shall be furnished if requested by the Government.

a. Steam piping between the boiler [steam nozzle] [nonreturn valve] and the second stop valve shall be welded and stamped in accordance with ASME BPVC SEC I. [Other piping shall be welded in accordance with qualified procedures using performance qualified welders and welding operators. Procedures and welders shall be qualified in accordance with ASME BPVC SEC IX. Welding procedures qualified by others, and welders and welding operators qualified by another employer may be accepted as permitted by ASME B31.1.]

b. The Contracting Officer shall be notified 24 hours in advance of tests. The welder or welding operator shall apply the personally assigned symbol near each weld made as a permanent record.

c. Structural members shall be welded in accordance with Section 05 05 23.16 STRUCTURAL WELDING] [Welding and nondestructive testing procedures are specified in Section 40 05 13.96 WELDING PROCESS PIPING].

1.5.3 Use of Asbestos Products

Products that contain asbestos are prohibited. This prohibition includes items such as packings or gaskets, even though the item is encapsulated or the asbestos fibers are impregnated with binder material.

1.5.4 Detail Drawings

Submit detail drawings consisting of schedules, performance charts, brochures, diagrams, drawings, and instructions necessary for installation of the steam-generating units and associated equipment, and for piping, wiring devices, trenches and related foundations. Detail drawings for steam generators and appurtenances, including the fuel system. Drawings shall indicate clearances required for maintenance and operation and shall also contain complete wiring and schematic diagrams, equipment layout and anchorage, and other details required to demonstrate that the system has been coordinated and will function properly as a unit. Manufacturers' confidential information concerning manufacturing techniques and proprietary data such as detailed fabrication shop drawings are not required.

1.6 DELIVERY, STORAGE, AND HANDLING

Protect equipment delivered and placed in storage from the weather,
excessive humidity and excessive temperature variation; and dirt, dust, or other contaminants.

1.7 PROJECT/SITE CONDITIONS

Design instruments located in furnace rooms for 79 degrees C 175 degrees F ambient temperature operation. Design other instruments for 40 degrees C 104 degrees F ambient temperature operation.

1.8 EXTRA MATERIALS

Submit spare parts data for each item of equipment provided, after acceptance of the detail drawings and not later than [_____] months before the date of beneficial occupancy. Include in the data a complete list of spare parts and supplies, with current unit prices and sources of supply. Include special tools necessary for the operation and maintenance of boilers, burners, pumps, fans, and other equipment. Furnish small hand tools with a suitable hardwood cabinet mounted where directed. Provide special wrenches for opening boiler manholes, handholes, and cleanouts.

PART 2 PRODUCTS

2.1 MATERIALS AND EQUIPMENT

2.1.1 Standard Products

Provide materials and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of such products and that essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Equipment shall be supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.

2.1.2 Nameplates

Each major item of equipment shall have the manufacturer's name, address, type or style, model or serial number, and catalog number on a plate secured to the item of equipment.

2.1.3 Equipment Guards and Access

Fully enclose or guard belts, pulleys, chains, gears, couplings, projecting setscrews, keys, and other rotating parts exposed to personal contact. High temperature equipment and piping exposed to contact by personnel or where they create a fire hazard shall be properly guarded or covered with insulation of the type specified. Items such as catwalks, operating platforms, ladders, and guardrails shall be provided where shown and shall be constructed in accordance with Section [08 31 00 ACCESS DOORS AND PANELS][05 51 33 METAL LADDERS].

2.2 MATERIALS

Submit outline drawings, data sheets, parts lists, schedules, performance charts, installation instructions, brochures, diagrams, and other information to illustrate equipment, wiring related components, and material. Performance charts shall provide information necessary to determine compliance to the specified and indicated requirements and shall include minimum capacity for stable operation of the equipment. Submit manufacturer's installation recommendations for each item of
instrumentation. Provide product data including catalogs, and characteristic curves; and manufacturer recommended cleaning procedure, interior and exterior, for applicable items. Materials shall comply with the following:

2.2.1 Brick, Common
ASTM C62.

2.2.2 Bricks, Refractory
ASTM A653/A653M, class as recommended by the boiler manufacturer.

2.2.3 Bricks, Refractory, Insulating
ASTM C155.

2.2.4 Coal-Tar Primer and Enamel
AWWA C203.

2.2.5 Draft Gauge
ASME B40.100, Style 1. Draft gauges for the windbox, combustion chamber, and last boiler pass shall be mounted in the panel front. Operating range for the draft gauges shall be field-verified with normal reading in the middle of the scale range. Draft gauges shall include piping between the gauges and the boiler.

2.2.6 Exhaust Head
One piece construction of plate steel, semisteel, or cast iron equipped with suitable baffle arrangement and drain connection for the removal of entrained condensate and oil. Flow area through unit shall be larger than connecting pipe.

2.2.7 Expansion Joint
EJMA Stds Book of Standards and ASME B31.1. Expansion joint shall be packless, leak proof, externally pressurized bellows type. The expansion joint shall include integral guide rings, full thickness cover designed to contain full system pressure, and self-draining convolutions. The expansion joint shall be insensitive to flow direction. The expansion joint shall be provided with a drain connection for condensate removal. The expansion joint shall be welded construction with ASTM A240/A240M T-304 stainless steel bellows, ASTM A106/A106M GR B cover and ASTM A106/A106M GR B standard wall pipe with flanged ends. For pumped condensate, Schedule 80 pipe shall be used. Expansion joint shall be rated for 1.03 MPa 150 psig and 425 degrees C 800 degrees F and have maximum axial movement rating of 100 or 200 mm 4 or 8 inches with a rated cycle life of 1,000 for the full rated movement.

2.2.8 Gauge, Pressure and Vacuum
ASME B40.100, Type I, Class 1 or 2, as applicable, style as required, suitable for pressure or vacuum specified, with 150 mm 6 inch minimum diameter dial except as otherwise specified.
2.2.9 Low Water Cutoff

Low water cutoff shall be float actuated switch or electrically actuated probe type. Float chamber shall be provided with a blowdown connection. Low water cutoff shall cause a safety shutdown and sound an alarm when the boiler water level drops below a safe minimum. A safety shutdown due to low water shall require manual reset before operation can be resumed and shall prevent recycling of the burner. Low water cutoff shall be in strict accordance with the ASME CSD-1.

2.2.10 Mortar, Refractory

As recommended by the boiler manufacturer.

2.2.11 Pipe and Fittings

2.2.11.1 Clay Pipe

ASTM C700, Class 1, Type I, Style a.

2.2.11.2 Nipple

ASTM A733, standard or extra strong weight to match adjacent piping.

2.2.11.3 Pipe

As specified in TABLE I for service use and size. Underground fuel piping shall be in accordance with Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.

2.2.11.4 Flanges

As specified in TABLE II for service use and size. Convoluted steel flanges conforming to ASME BPVC SEC VIII D1 may be provided in lieu of flanges conforming to ASME B16.5. Convoluted flanges shall be cold-formed steel conforming to ASTM A516/A516M. Flanges shall mate with ASME B16.5, Class 150 flanges.

2.2.11.5 Flange Gasket

Gasket shall be nonasbestos compressed material in accordance with ASME B16.21, 1.6 mm 1/16 inch thickness, of self centering flat ring type. The gasket shall contain aramid fibers bonded with styrene butadiene rubber (SBR) or nitrile butadiene rubber (NBR). NBR binder shall be used for hydrocarbon service. Metallic spiral wound nonasbestos gaskets shall be used for steam lines.

2.2.11.6 Flexible Connector

**************************************************************************
NOTE: Listed flexible connectors may be used when allowed by NFPA 30 and when approved by local codes as an alternative for swing joints.
**************************************************************************

Flexible metal hose, corrugated type with braided wire sheath covering, close pitch annular corrugations, rated for a working pressure of at least 1.03 MPa 150 psig, 300 mm 12 inch minimum live length, threaded end connections and shall conform to requirements of UL 567. Metal for hose
and braided wire sheath shall be stainless steel, any type of AISI series.

2.2.11.7 Union

ASME B16.39, limited to 690 kPa 100 psig, type to match adjacent piping. For higher pressure, union shall be ground joint cast steel or forged steel. Unions with appropriate pressure and temperature ratings shall be used.

2.2.12 Pipe Support

MSS SP-58.

2.2.13 Pipe Threads

ASME B1.20.2/ASME B1.20.1.

2.2.14 Steel Sheet

Carbon, zinc-coated (galvanized) by the hot-dip process: ASTM A653/A653M. Gauges specified are Manufacturer's Standard Gauge.

2.2.15 Strainer

Unless otherwise specified, strainer shall have screwed ends to 50 mm 2 inches, flanged for 65 mm 2-1/2 inches and larger.

2.2.15.1 Body

For systems up to 1.03 MPa 150 psi, Class 150 150 pound WSP class, cast steel; and for higher pressure, 2.06 MPa 300 psi, Class 300 300 pound WSP class forged steel or cast steel shall be used.

2.2.15.2 Screen

**************************************************************************
NOTE: Specify screen size for the needs of the equipment.
**************************************************************************

Screen shall be Type 304 stainless steel, with free area not less than 2.5 times inlet area. For water system, perforation shall be 6.4 mm 1/8 inch for strainer size up to 200 mm 8 inches, and 4 mm 5/32 inch for strainer 250 mm 10 inches and larger. For steam and condensate system, the perforation shall be 0.4 mm 1/64 inch for strainer size up to 50 mm 2 inches, 0.8 mm 1/32 inch for strainer 65 mm 2-1/2 inches through 100 mm 4 inches, and 1.2 mm 3/64 inch for strainers 125 mm 5 inches and larger. Screen shall be reinforced wire gauge, with continuous magnetic field around entire circumference of screen and magnets with stainless steel retaining lugs and threaded rods.

2.2.15.3 Y-Type Strainer

Y-type strainer shall be provided as shown. Y-type strainer shall be full line size of connecting piping, with ends matching piping system materials. Y-type strainers shall be provided with a globe valve blowdown.
2.2.15.4 Tee Strainer

Tee strainer shall be provided as shown. Tee strainer shall be the full line size of the connecting piping with ends matching the piping system materials. Tee strainer shall have a swing bolt closure.

2.2.15.5 Basket Strainer, including Duplex Basket Strainer

Basket strainer shall be provided as shown. Basket strainer shall have bolted covers to allow removal of the basket for cleaning. Duplex basket strainer shall include a multiport plug valve to allow the operator to switch active strainer baskets without interrupting system operation.

2.2.16 Tape

2.2.16.1 Threaded Pipe Joint

ASTM D3308.

2.2.16.2 Pipe Joint Coating

AWWA C203.

2.2.17 Tile, Load Bearing, Hollow

ASTM C34, Grade LPX.

2.2.18 Traps, Steam and Air

ASTM F1139.

2.2.19 Thermometer

Unless otherwise specified, thermometer shall be dial type, 90 mm 3-1/2 inch diameter, chromium plated case for indoor use and stainless steel for outdoor use, remote or direct type bulb as required, with plus or minus 0.5 Degrees C 1 degree F accuracy and white face with black digits in 2 degree increments. Well and temperature range shall be suitable for use encountered. Thermometer shall be installed so as to be easily read from the operating floor. Mercury shall not be used in thermometers.

2.2.20 Valve

**************************************************************************
NOTE: Valves operating above 170 kPa/130 degrees C
25 psig/267 degrees F will be minimum Class 150.
Pressure class will be suitable for intended service.
**************************************************************************

2.2.20.1 Reference Standards

ASTM A126 and ASTM A278/A278M as applicable.

2.2.20.2 Check, Globe, Angle, and Gate

a. Sizes 40 mm 1-1/2 inches and smaller that are operating at or below 170 kPa 25 psig and also operating at or below 130 degrees C 267 degrees F, saturation temperature at 170 kPa 25 psig shall be bronze, MSS SP-80, Class 125 with threaded connections.
b. Sizes 40 mm 1-1/2 inches and smaller operating above either 170 kPa 25 psig or 130 degrees C 267 degrees F, saturation temperature at 170 kPa 25 psig, shall be [forged] [cast] steel, stainless steel trim, rising stem, Class [_____] with handwheels. Connections shall be [socket weld] [threaded] end connections.

c. Sizes 50 mm 2 inches and larger shall be cast steel, stainless steel trim, rising stem, outside screw and yoke, Class 150 with handwheels. Connections shall either be butt weld or flanged.

2.2.20.3 Back Pressure Relief

ASME PTC 25 back pressure relief valve shall have stainless steel or cast steel body with valve internals and seats constructed of stainless steel. Back pressure relief valve shall have guides and shall be positive closing. Adjustment of the desired back pressure shall cover a range between 14 and 70 kPa 2 and 10 psig. The adjustment shall be effected externally and any shafts extending through the valve body shall be provided with adjustable stuffing boxes having renewable packing. Back pressure relief valve shall be self contained, internal pilot piston operated. An external positioner shall be provided on each valve.

2.2.20.4 Blowoff and Quick Opening

Blowoff and quick opening valves shall be as required in ASME BPVC SEC I. The valve shall be the balanced seatless type or the double seated rotating disk type. Quick opening valve shall be the straightway type. Blowoff and quick opening valves shall be designed for a working pressure of 2.06 MPa 300 psig and shall be suitable for safe blowdown through the installed piping system.

2.2.20.5 Pressure Reducing

******************************************************************************
NOTE: Valves requiring tight shutoff for steam service will be ANSI Class IV. Where a thermostatically controlled valve is installed after and near the reducing valve in a manner to cut off the passage of steam, valves with ANSI Class IV shutoff will be used. Where valves are used for reducing pressure to the deaerating heater, valves will have ANSI Class IV shutoff.

Consider silencers in pressure reducing valve trains where acoustics to adjacent spaces or maximum noise level in mechanical room is an issue.
******************************************************************************

Pressure reducing valve shall be designed for a working pressure of not less than 1.03 MPa 150 psig, and shall be quiet and nonsticking in operation. Pressure reducing valve shall be spring loaded, internal pilot piston operated type with an external position indicator. Pressure reducing valve body 65 mm 2-1/2 inches and larger shall be cast steel. Pressure reducing valve shall have raised face flanges to match the raised face flanges on connecting piping. Pressure reducing valve 38 mm 1-1/2 inches and smaller shall be bronze with screwed connections. Pressure reducing valve trim shall be stainless steel or monel metal. Parts subject to wear shall be renewable. Pressure reducing valve shall have seat and
plug faced with cobalt tungsten carbide mixture, or made of heat treated stainless steel or high chromium steel. Seat and plug facing shall have a Brinell hardness of not less than 450. Pressure reducing valve shall be designed for dead-end service. Resulting noise level shall not exceed [_____] dBA.

2.2.20.6 Plug

Plug valve shall be tapered plug, lubricated type. Lubricant shall be suitable for the intended application. Body shall be cast steel. Plug shall be carbon steel. Pressure class shall be minimum ANSI Class 150. Plug valve 38 mm1-1/2 inches and smaller shall be screwed. Plug valve 50 mm 2 inches and larger shall be flanged.

2.2.20.7 Safety Relief

Safety relief valve shall be sized and constructed and shall fully comply with requirements set forth in ASME BPVC SEC I. Safety relief valve shall have a manual lifting device for testing.

2.2.20.8 Steam Nonreturn

Steam nonreturn valve shall be either angle type or straight type with rising stem as shown. Steam nonreturn shall operate without chattering, hammering, or sticking over the entire operating range of the boiler. Valve shall comply with ASME BPVC SEC I. Steam nonreturn valve shall have Class 300 ASTM A216/A216M cast steel body. Steam nonreturn shall be bronze trim, rising stem, bolted bonnet, outside screw and yoke and flanged ends.

2.2.20.9 Thermostatic Regulating

Thermostatic regulating valve shall be designed for a steam working pressure of 1.03 MPa 150 psig. Thermostatic regulating valve shall be adjustable with an operating range of approximately 54 to 88 degrees C 130 to 190 degrees F and shall maintain the desired fluid temperature within plus or minus 2.5 degrees C 5 degrees F. Body shall be of [bronze] or [cast] [forged] steel or stainless steel.

2.2.20.10 Ball

Ball valve shall be Teflon seated and packed. Ball valve shall provide bubble tight shutoff. Body shall be of [bronze] or [cast] [forged] steel or of stainless steel. Ball valve shall be two-piece full-port design.

2.2.20.11 Feedwater Control

Feedwater control valve shall be provided with the boiler. Feedwater control valve shall be supplied with filter, regulator, supply and control pressure gauges, [metric] converter and positioner with charactering cam. Control system shall provide 4 to 20 mA dc control signal.

2.2.21 Water Column

Water column valve shall be constructed in accordance with ASME BPVC SEC I, fitted with gauge glass and quick-closing gauge valves with chains and handles for operation from the boiler room floor. [Mirror and illuminating light shall be provided to allow water levels to be read from the boiler room floor] [Gauge glass with illuminating light shall be provided].
2.2.22 Meters

2.2.22.1 Natural Gas Flow

NOTE: Ensure the turndown ratio (TDR) of the natural gas flow meter is wider than that of the boiler burner TDR firing on natural gas.

Natural gas flow meter shall be of the positive displacement type, provided with a pressure correcting device that will correct flow readings to atmospheric pressure. Body shall be aluminum. Minimum meter design pressure shall be 690 kPa 100 psig. Accuracy shall be plus or minus 1 percent of calibrated span minimum. Turndown shall be [____]. Connections shall be threaded for sizes 38 mm 1-1/2 inches and smaller. Connections shall be flanged for sizes 50 mm 2 inches and larger.

2.2.22.2 Water Flow

Water flow meter shall be disk type with reinforced disk for hot water above 65 degrees C 150 degrees F, and rubber or carbon disk for cold water, and constructed of bronze composition and cast iron protected by noncorrosive coating. Moving parts subject to wear shall be easily replaceable. Waterflow meters shall conform to the requirements of AWWA C700.

2.2.22.3 Fuel Oil Flow

NOTE: Ensure the turndown ratio (TDR) of the oil flow meter is wider than that of the boiler burner TDR firing on fuel oil.

Fuel oil flow meter shall be nutating disc, positive displacement with direct mechanical shaft drive from meter to register. Construction materials shall be cast iron housing, bronze internals, aluminum ball and web disc, and Type 316 stainless steel diaphragm. Register shall be totalizing and shall be as specified. Flow oil meter shall be suitable for maximum oil temperature.

2.2.23 Natural Gas Pressure Regulator

Natural gas pressure regulator shall be pilot operated type. Diaphragms shall be nitrile. Natural gas pressure regulator valve body shall be steel. Minimum pressure rating shall be 1.03 MPa 150 psig. Vent connection shall be in accordance with NFPA. Natural gas pressure regulator shall be provided with an external position indicator.

2.2.24 Fractional and Integral Horsepower Motors

Provide premium efficiency type integral size motors shall be the in accordance with NEMA MG 1.

2.3 ELECTRICAL WORK

Electric motor driven equipment specified shall be provided complete with motor, motor starter, and controls. Electrical equipment and wiring shall be in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Electrical characteristics shall be as specified or indicated. Motor
starters shall be provided complete with thermal overload protection and other appurtenances necessary for the motor control specified. Motor shall be of sufficient size to drive the equipment at the specified capacity without exceeding the nameplate rating of the motor. Manual or automatic control and protective or signal devices required for the operation specified, and control wiring required for controls and devices specified, shall be provided.

2.4 BOILER AND APPURTENANCES

**************************************************************************
NOTE: Delete types of boilers that are not used.
Select appropriate fuels and fill in pressure and temperature requirements. Select efficiency in the upper 25 percent of the competitive range. Specify efficiencies that correlate to the fuel(s) required. Select applicable burner type and combustion control system. To accommodate shipping limitations or installation access requirements in existing boiler plants, the boiler may be specified to be knocked down and field assembled.
**************************************************************************

2.4.1 Boiler

**************************************************************************
NOTE: Coordinate turndown ratio with subparagraph "Fuel Oil Burner" and subparagraph "Natural Gas Burner" in paragraph FUEL BURNING EQUIPMENT.
**************************************************************************

Boiler shall be provided as complete boiler-burner package, including integral forced draft burner, boiler trim, refractory, controls, fuel train and accessory components. Boiler-burner package shall be provided [fully assembled] [field assembled] ready for floor mounting and connection to steam, feedwater, electrical, [fuel oil], [natural gas], vent, chemical feed, blowdown and control lines in accordance with the Setting Plans. Submit complete setting plans certified by the boiler manufacturer and burner manufacturer. Boiler shall have the capacity indicated. Equipment design and accessory installations shall permit accessibility for maintenance and service. Boiler shall comply with NFPA 85. Boiler shall be designed for working pressure of [_____] kPa psig and operating pressure of [_____] kPa psig. Each boiler shall be capable of continuously producing [_____] kg pounds per hour saturated steam [_____] degrees C degrees F while being supplied with [_____] degrees C degrees F feedwater. Boiler operation shall be stable at a turndown ratio of [______]. [Natural gas] [fuel oil] [combination natural gas fuel oil] burners shall be of type, size and so located and arranged that in no case shall the flame impinge on any surface in the boiler nor shall the flame extend beyond the limits of the furnace.

2.4.2 Performance

Boiler shall have the specified capacity at the operating pressure, feedwater temperature and boiler site elevation specified. Capacity shall be based on the evaporation rate in kg pounds per hour at boiler specified outlet steam temperature and pressure while firing [No.[_____] fuel oil] [natural gas] [No. [_____] fuel oil or natural gas]. [Fuel oil supply temperature and pressure shall be [_____] degrees C degrees F and [_____]
[Natural gas supply pressure shall be [_____] \text{kPa psig}]. Boiler shall be capable of continuous operation at full rated capacity. Minimum efficiency shall be not less than [_____] percent when fired continuously at full rated capacity with [natural gas] [fuel oil] [natural gas or fuel oil]. Stable firing and efficiency shall both be maintained over the entire firing range required by the turndown ratio. Output capacity of the boiler shall be based on tests of the boiler and burner as a unit. Moisture in the steam shall not exceed 0.5 percent at maximum continuous rated boiler capacity and during a load swing of 10 percent of boiler capacity per minute with boiler water dissolved solids concentration at approximately 3,500 ppm and total alkalinity not in excess of 700 ppm.

2.4.3 Construction

Boiler shall be built and stamped in accordance with \text{ASME BPVC SEC I} and as specified.

2.4.4 Identification

Boiler shall be stamped as follows:

a. Maximum capacity in MW Btu/Hr.

b. Maximum allowable working pressure.

c. Radiant heating area.

d. Total heating surface area.

e. Furnace volume.

2.4.5 Watertube, Packaged Type Steam Boiler

Boiler shall be shop assembled type with either 2 or 3 drums and water cooled furnace roof, floor, front, rear and side walls. The furnace side and rear walls shall be completely suitable for pressurized firing. Boiler faces shall be arranged to give maximum cooling effect to furnace refractories. Furnace waterwall tubes shall enter steam drum below the normal operating drum level. Tube inspection ports shall be provided in furnace to boiler division wall, along both the steam and lower drums. Furnace shall be sized for complete combustion of fuel in the furnace with no flame impingement on the water-cooled surfaces and no combustion in the convection area. The furnace heat release rate, based on fuel analysis and required fuel input, shall not exceed [_____] \text{gigajoules/hr per cubic meter Btu/hr per cubic foot} of furnace volume. Furnace heating surface shall not be less than [_____] \text{square meters square feet} on a flat protected area.

2.4.5.1 Drum

a. Drums shall extend beyond the entire length of furnace setting. Drum shall be fabricated of steel plate, welded in accordance with \text{ASME BPVC SEC I}, including stress relieving and X-raying of welded seams. Steam drum shall be provided with steam separators and drum internals required to maintain the specified steam moisture content, and provisions for maintenance. Necessary baffling shall be provided to separate steam from water in the drum and to maintain stable water level under a fluctuating load. Variations in normal water level shall not exceed boiler manufacturer's recommendations as approved during the shop drawing submittal stage with an increasing load change of 10
percent of boiler capacity per minute. The steam drum diameter shall not be less than the following:

1. **915 mm 36 inch** (steam flow of **5,455 to 31,800 kg/hr 12,000 to 70,000 pounds/hr**).
2. **1,070 mm 42 inch** (steam flow of 31,800 to 45,450 kg/hr 70,000 to 100,000 pounds/hr).
3. **1,220 mm 48 inch** (steam flow of 45,450 to 68,180 kg/hr 100,000 to 150,000 pounds/hr).
4. **1,370 mm 54 inch** (steam flow of 68,180 to 81,800 kg/hr 150,000 to 180,000 pounds/hr).

b. Lower drum shall not be less than **610 mm 24 inches** in diameter.

c. Drum shall be provided with two **300 by 400 mm 12 by 16 inch** elliptical manholes with double clamps, studs and gaskets.

d. Boiler shall be provided with connections as shown.

2.4.5.2 Tubes

2.4.5.2.1 Furnace and Boiler

Furnace and boiler tubes shall not be less than **50 mm 2 inches** in diameter and the thickness shall conform to that given in ASME BPVC SEC I for the pressure specified. Tubes shall be bent to a true radius. Tubes that are distorted in bending, flattened or ridged are not acceptable. Tube holes in the drum shall be drilled, reamed and serrated. Design of the tubes shall permit drums and tubes to drain by gravity.

2.4.5.2.2 Furnace Waterwall

Furnace waterwall shall extend the entire length of furnace setting and shall consist of **50 mm 2 inch** tangential electric resistance welded steel tubes or welded furnace membrane wall. Tubes connected to the drums and/or lower headers shall be expanded into bored tube seats. If headers are provided, lower headers of sidewalls shall be round or square design. Lower header shall be provided with gasketed handhole covers for easy access to each wall tube. Tube bend radii shall be sized for standard turbine type cleaners for easy pass through for cleaning of the full length of the tubes.

2.4.5.2.3 Convection Tubes

Convection tubes shall be electric resistance welded construction in accordance with ASME BPVC SEC I. Convection tubes shall be arranged to ensure proper and effective soot blowing. Convection tubes in the boiler section shall be expanded into the upper and lower drums.

2.4.5.3 Baffles

Baffles shall be arranged to direct products of combustion into contact with heating surfaces without short circuit of flue gas at the outlet or excessive loss of draft. Baffles shall be either a refractory material, tangent tubes or a metal suitable for the temperature encountered.
2.4.5.4 Supports

Boiler and firing equipment shall be supported from the foundation with structural steel independent of brickwork. Boiler supports shall permit free expansion and contraction of each portion of the boiler without placing undue stress on any part of the boiler or setting. For lifting and handling of the boiler, lifting lugs shall be welded to the steam drum. Boiler skid shall be reinforced and provided with space beneath the end of the beam for jacking the unit during installation. Holes shall be provided in the main beam for use by a rigger to drag or lift the unit by its base frame for final positioning, if this method recommended by boiler manufacturer.

2.4.5.5 Boiler Casing and Insulation

Boiler shall be completely encased in a double casing and filled with blanket insulation. Casing shall be constructed of not lighter than 3.4 mm 10 gauge welded black steel sheets. Casing shall be gastight and shall be reinforced with structural steel to provide rigidity and prevent buckling. Refractory or insulation behind the waterwall tubes shall be not less than 65 mm 2 1/2 inches thick. Insulation shall be of sufficient thickness to ensure an average casing temperature in the furnace area not in excess of 60 degrees C 140 degrees F with a surface air velocity of 0.25 meters per second 50 fpm and an ambient air temperature of 38 degrees C 100 degrees F when operating at full capacity. Insulation material and installation shall be as recommended by the boiler manufacturer. Exposed portion of the boiler drum shall be insulated with mineral wool block and enclosed in a welded 3.4 mm 10 gauge steel casing, field installed. Refractory and insulation shall be factory installed.

2.4.5.6 Access Door and Observation Port

The boiler shall be provided with access doors in sufficient number, size and location for cleaning, inspection and repair. Access door shall be gastight and interior surfaces exposed to direct radiation and high temperature shall be lined with approved refractory material to prevent excessive heat loss. Access doors that are large or weigh more than 23 kg 50 pounds shall be hinged. In addition, at least two observation ports with cast iron covers shall be provided, one on the front and one on the rear wall of the furnace, so that the entire inner surface of the furnace is visible from one or more ports.

2.4.5.7 Settling Chamber

**************************************************************************
NOTE: Specify for No. 4 and No. 6 fuel oil.
**************************************************************************

Settling chamber for the removal of fly ash shall be provided below the last pass of the boiler with suitable means for frequent cleaning without shutting down the boiler.

2.4.5.8 Soot Blower

**************************************************************************
NOTE: Specify for No. 4 and No. 6 fuel oil.
**************************************************************************

Boiler shall be provided with soot blower for convection bank cleaning.
Soot blower shall be steam operated, valve-in-head type and shall be furnished complete with wall sleeve, clamps, hangers, supports, manual operating chains and other appurtenances required for a complete installation. The blower elements shall be so arranged that all parts of the heating surfaces shall be cleaned of soot deposits when rotated by electric motor actuated by [automatic sequence from boiler control panel] [manual switch from boiler control panel]. Soot blower elements shall be of such length, diameter and total nozzle area that for the operating pressure involved there will be no significant difference in the cleaning effect between the nozzle nearest the inlet and those farthest from the inlet of the element. Soot blower shall be made of a material that will satisfactorily withstand the temperature in the zone where it is installed.

2.4.5.9 Economizer

a. Boiler shall be furnished with a rectangular, package extended surface economizer. Economizer shall be shop assembled and shipped complete with structural steel frame, inner casing, shop applied insulation and [_____] mm gauge box ribbed metal lagging. Economizer shall be designed and fabricated in accordance with ASME BPVC SEC I. Flue gas flow through economizer shall be vertical with orientation of economizer as shown.

b. Economizer shall be of continuous tube, loop tube design and shall be completely drainable by gravity after installation. Design and arrangement of economizer shall be such that there will be no steaming in the economizer under any load or operating condition. Minimum design temperature of the economizer shall be [370 degrees C 700 degrees F]. Economizer shall be hydrostatically factory tested at 1.5 times the tube side design pressure or at least [2.07 MPa 300 psi] in the presence of a Code Inspector. The unit shall be ASME code stamped and shall include nameplate and code documentation.

c. Extended surface shall be of solid continuous, resistance welded carbon steel fins. Maximum fin spacing shall be [_____] fins per meter foot. Pins shall be not less than [1.9 mm 0.075 inches] thick.

d. Headers shall be SA-106-B with minimum Schedule 40 wall thickness and equipped with minimum ANSI Class [_____] raised face weld neck flanged connections. Header wall thickness and flange rating shall be dependent on tube side design pressure in accordance with ASME BPVC SEC I requirements. Tube arrangement shall be of the open lattice design. Drilled tube sheets are not acceptable.

e. Hot structure design shall be gastight and designed for a minimum of [250 mm 10 inches] wc gas side pressure.

f. Pressure parts shall not be in contact with tube sheets.

g. Inner casing shall be a minimum of [3.4 mm 10 gauge] carbon steel.

h. The economizer shall be designed for the maximum operating conditions of the boiler and shall be capable of reducing boiler stack exit flue gas temperature to [148 degrees C 300 degrees F] when the boiler is being fired with natural gas or oil and being supplied with feedwater at [107] [_____] degrees C [225] [_____] degrees F at all boiler loads.

i. The boiler feedwater head loss through the economizer shall not exceed [103 Pa 15 psi] at maximum boiler load.
j. The economizer shall be insulated with a minimum 50 mm 2 inch thick blanket type mineral wool or approved equal.

k. Outer casing shall be weatherproof with a minimum 7.5 mm 22 gauge corrugated galvanized carbon steel lagging. Exposed surfaces not enclosed by outer casing shall be painted with high temperature aluminum paint.

l. Minimum 19 mm 3/4 inch vent and drain connections shall be provided on feedwater headers.

m. Economizer shall be provided with electrically operated soot blowers. The quantity of the soot blowers shall be as recommended by the manufacturer. Soot blowers shall be installed transversely to provide maximum cleaning capabilities.

n. Access door of carbon steel construction shall be provided in the economizer design. Access door shall be insulated.

o. The economizer shall be designed to accept piping reactions without distortion or creating overstressed conditions in the piping.

2.4.6 Firetube, Package Type Steam Boiler

Boiler pressure vessel shall be constructed and stamped in accordance with the rules of Section 1 of the ASME BPVC SEC I ASME manufacturer's data reports shall be executed by the manufacturer and an authorized inspector who holds a valid commission issued by the National Board of Boiler and Pressure Vessel Inspectors prior to shipment. ASME manufacturer's data shall be furnished to the Contracting Officer, the inspection agency and the state and local authorities at the place of installation. Pressure vessel shall be stamped for 1030 kPa 150 psig design pressure.

2.4.6.1 Heating Surface

Boiler furnace tube shall have its centerline below the boiler centerline for maximum water coverage. Boiler shall have a minimum of 0.465 square meters 5 square feet of fireside heating surface per rated BHP. Furnace shall be large enough for complete combustion of fuel at maximum capacity without flame impingement. Heating surface shall be fully accessible for inspection and cleaning without disturbing the burner equipment. Observation and sight ports shall be located at each end of the boiler to allow inspection of flame conditions. A rear access opening with observation port shall be provided. Handholes and manholes shall be provided in accordance with ASME BPVC SEC I.

2.4.6.2 Boiler Firetubes

Boiler firetubes shall be not less than 50 mm 2 inches in diameter, seamless steel tubing expanded to the tube sheets. Welded welded firetubes are not acceptable.

2.4.6.3 Flue Gas Exhaust

Flue gas exhaust connection and stack thermometer shall be located on the top centerline. Boiler flue outlet shall be furnished with a manual cast iron locking damper.
2.4.6.4 Boiler Supports

Boiler and firing equipment shall be supported from the foundation. Boiler supports shall be heavy duty structural steel base with lifting lugs and rigging holes in the skid to facilitate installation. Two (2) or more lifting lugs shall be located on top of pressure vessel.

2.4.6.5 Refractory

Front boiler door shall be either hinged or davited, as required, to provide access to firetubes without disconnecting the burner or fuel train. Front boiler door shall be configured such that front tube sheets are fully accessible for inspection and cleaning when open. Rear door shall be davited. "Dry back" boilers having rear door refractory are not acceptable. Doors shall be sealed with ceramic fiber rope gaskets and fastened securely using lugs and nuts threaded onto studs welded into the vessel. Rear door shall be insulated with blanket insulation with a steel covering. The front door refractory and insulation shall be contained in the formed door which must swing open for inspection of brick work. Submit Safety Data Sheets detailing refractory materials contained within the boiler.

2.4.6.6 Boiler Insulation

Boiler insulation shall be minimum 50 mm 2 inch fiberglass blanket covering entire circumference of pressure vessel and shall be protected by preformed sheet metal lagging. Insulation shall be covered with minimum 0.8 mm 22 gauge preformed sheet metal and factory painted before shipment using a hard finish enamel coating.

2.4.7 Boiler Trim

Boiler shall be provided complete with the following trim:

a. Water column consisting of gauge glass set, gauge glass and water column blowdown valve.

b. Low water cutoff, as an integral part of the boiler feedwater control. Cutoff shall be factory wired into the burner control circuit to prevent burner operation if the boiler water level falls below the safe operating level.

c. An auxiliary low water cutoff shall be mounted below the primary unit, wired in series with the primary unit, and provided with a manual reset device.

d. Steam pressure gauge, range to suit operating pressure, shall be provided on the boiler front, including siphon, cock and test connection.

e. Steam safety valve of type and size to comply with ASME Code requirements.

f. Two bottom blowdown connections, one at the bottom front and one at the bottom rear of the vessel.

g. A minimum of [_____] surface blowdown connection[s].
2.4.8 Prevention of Rust

Unless otherwise specified, surfaces of ferrous metal subject to corrosion shall be factory prime painted with a rust-inhibiting coating and subsequently factory finish painted in accordance with the manufacturer's standard practice. Equipment exposed to high temperature when in service shall be prime and finish painted with the manufacturer's standard heat resistant paint to a minimum thickness of 0.025 mm (1 mil). Internal surfaces of tubes and piping that will not be in storage more than three months prior to being placed in service shall not be painted, but shall be coated with a water soluble pipe oil for rust protection. Surfaces which will be exposed directly to the flue gases (fireside furnace surfaces, OD surface of convection pass surfaces, inside of flues and ducts) need not be coated with a high temperature heat resistant paint, but shall be protected with a suitable coat of the manufacturer's standard primer. Surfaces that will be covered by insulation and lagging shall be painted with a high temperature heat resistant paint.

2.4.9 Factory Coating

Equipment and component items, when fabricated from ferrous metal, shall be factory finished with the manufacturer's standard finish unless otherwise specified.

2.5 FUEL BURNING EQUIPMENT

**************************************************************************
NOTE: Determine the boiler emissions NO_x requirements. Boiler emissions must comply with local environmental permits. State regulations may be more stringent than Federal Regulations. Delete flue gas recirculation (FGR) if not required.
**************************************************************************

Fuel burning equipment shall be provided complete with flame safeguard system, forced draft low NO_x burner, combustion air windbox, piping, fuel trains and instrumentation supplied as a factory assembled and mounted package on the boiler front. Packaged burner shall be capable of firing the boiler at a continuous rating as scheduled, using [natural gas at 69 Pa (10 psi)] [No. [2] [4] [6] fuel oil] as an [integral] [combination] unit[.]. Suitable for firing either fuel separately, designed to permit a quick changeover without modification of equipment]. Provisions shall be incorporated for withdrawing, shielding or otherwise preventing the oil burner from cooking while firing gas. Emissions guarantees shall apply through specified turndown range. Flue gas recirculation shall be utilized to lower emissions, but shall be limited to 15 percent and shall be induced by the combustion air fan. Burner shall have a stable flame over the turndown range. Primary air spinner zone, zone divider and main burner shall be removable without removing the entire register or windbox. Register front plate shall have a swivel scanner and observation port. Submit an Environmental Permit Compliance certificate regarding the boiler emissions.

2.5.1 Pilot

**************************************************************************
NOTE: Select one type of pilot (natural gas, liquefied petroleum gas or fuel oil) and remove the others.
**************************************************************************
a. Pilot burner shall be natural gas-electric type with the capacity required to reliably light off the boiler. A 6,000 volt secondary side ignition transformer shall be supplied and mounted backside of the windbox.

b. Pilot shall be liquefied petroleum gas (LPG) type. Two 18 kg 40 lb cylinders shall be located on concrete pads outside of the building as shown. Manifold and valves for cylinders to allow removal and filling of one tank without interrupting service to pilot shall be included. Regulators and gauges shall have adequate capacity to serve pilot.

c. Pilot shall be straight mechanical or atomizing type as specified for the burner. Pilot system shall be designed to fire No. 2 oil and shall be provided complete with fuel oil pump, safety shut-off valve, integral metallic screen strainers and a cartridge type filter. Ignition transformer shall be rated at not less than 10,000 volts on the secondary side.

d. Provision shall be made in the burner housing for inspection of the pilot flame.

e. Pilot shall be provided with individual manual shut-off valve, pressure gauge, pressure regulation separate from the main burner, self closing solenoid valve and vent valve in accordance with FM APP GUIDE and UL 795. Pilot and valving shall be in accordance with NFPA 85.

2.5.2 Burner Refractory Throat

Burner refractory throat shall be made of high quality castable refractory suitable for 1650 degrees C 3000 degrees F. The precast refractory in a steel retaining ring with stainless steel anchors shall be shipped separately for field mounting on the boiler. Burner refractory throat shall be concentric with the burner, contoured to ensure complete mixing of [air and natural gas] [air and oil] [air and natural gas and air and oil], and designed to assist in complete combustion by radiating heat to the fuel. Burner shall be so positioned that the flame parallels the contour of the burner refractory throat but avoids striking the refractory.

2.5.3 Windbox

NOTE: Intent is to provide capability for flue gas recirculation (FGR) on all boilers specified, either for present use or future installation.

Windbox shall provide even airflow. Windbox shall not interfere with boiler smoke box door operation and shall have a flange bottom for easy firm mounting on a support structure. Windbox shall be provided with an induced flue gas recirculation (FGR) inlet adaptor assembly.

2.5.4 Combustion Air Fan

Combustion air fan shall be centrifugal type with backwardly inclined air foil bladed wheel. Combustion air-fan wheel shall be directly driven by a TEFC NEMA frame motor and shall be complete with inlet cone and screen and flange outlet. Combustion air fan shall be bottom flanged to be mounted on
same structural member as windbox. Combustion air-fan shall be sized to provide sufficient static pressure to overcome system losses when providing 15 percent excess air at maximum firing rate, plus the amount of flue gas induced to comply with the NO\textsubscript{x} emission requirements.

2.5.5 Combustion Air Damper

Combustion air damper shall be flanged and located between combustion air fan and windbox. Combustion air damper shall be suitable for specified turndown and shall provide same turndown performance when up to 15 percent flue gas is induced and mixed in the airstream.

2.5.6 Fuel Oil Burner

Fuel oil burner shall be [mechanical pressure atomizing] [steam atomizing] [air atomizing] type conforming to UL 296, UL 726 and NFPA 85, capable of burning [heated] [unheated] [No. 6] [No. 4] [No. 2] fuel oil. Fuel oil burner shall be capable of firing boiler to maximum capacity with turndown range of [eight (8) to one (1) for boiler above 2452 kW 250 horsepower] [four (4) to one (1) for boiler 2452 kW 250 horsepower or less]. Fuel oil burner shall be quiet in operation without blowtorch effect or tendency to localize heat at any one part of combustion chamber and without depositing unburned oil on any part of combustion chamber or boiler. Fuel oil burner shall be easily moved out of firing position for cleaning, inspection, adjustment and maintenance.

2.5.7 Natural Gas Burner

Natural gas burner shall be a multi-spud burner with gas feed pipe in center of air register for easy removal. Natural gas burner shall be forced draft type and shall be suitable for efficiently burning natural gas having a calorific value of [_____] Joules per cubic meter Btu per cubic foot when supplied at a pressure of approximately [_____] kPa psig. Natural gas shall be discharged in burner throat area. Natural gas-air premix or natural gas discharged outside of burner throat are not acceptable. Main natural gas burner shall be capable of firing the boiler to maximum capacity with a turndown of [ten (10) to one (1) for boilers above 2452 kW 250 horsepower] [four (4) to one (1) for boilers 2452 kW 250 horsepower or less].

2.5.8 Flame Safeguard System

**************************************************************************
NOTE: Edit for fuel choice and select appropriate options.
**************************************************************************

a. The flame safeguard system shall be manufactured by burner manufacturer and mounted in boiler control panel as a panel insert. Flame safeguard system components shall be UL listed. Complete and automatic flame safeguard system shall be provided in accordance with NFPA requirements safe start-up, on-line operation and shut-down of package burner.

b. Flame safeguard system shall be micro-processor based system including, but not limited to, automatic burner sequencing, flame supervision, status indication, fire-out annunciation and self diagnostics.

c. Flame safeguard system cabinet shall house overcurrent protective devices, and motor starters for the combustion air fan motor, burner
damper motor and electric oil heater. Control transformers and an RS-232C serial communication port shall also be included.

d. Flame scanner shall not require a separate purge air supply. Flame scanner output signal shall be connected to flame amplifier module in microprocessor based unit. Within four seconds after loss of flame, flame safeguard controller shall shut the automatic safety shut-off fuel valve[s] and open the gas automatic vent valve. Flame failure signal shall be displayed on flame safeguard display or burner control panel.

e. Logic provided with flame safeguard system shall:

1. Prevent introduction of igniter flame (pilot) or main fuel flame to furnace until furnace, boiler passes, breeching and stack have been purged of combustible gases.

2. Prevent opening of automatic fuel shut-off valves in main fuel line until igniter flame is proven.

3. Limit trial for main fuel ignition to ten (10) seconds from time igniter flame is proven.

4. In event of burner failure, operator intervention shall be required to manually reset flame safeguard controller prior to restart.

f. First-out annunciation shall be provided by an expansion module. Alarms and flame-outs shall be individually annunciated at panel front and transmitted along with other process points monitored by the panel to [Central Monitoring System (CMS)] [Supervisory Computer Workstation[s]] for graphic display. Following points, at a minimum, shall be individually annunciated by flame safeguard system:

1. Low water level.

2. Low water cutoff.

3. High water level.

4. High steam pressure.

5. Low atomizing [steam pressure] [or] [air pressure].

6. Low fuel oil pressure.

7. Low fuel oil temperature.

8. High natural gas pressure.

9. Low oxygen concentration.

g. Flame safeguard system cabinet shall be provided with [natural gas] [No. 6] [No. 4] [and] [No. 2] oil fuel selector. Selector shall be integrated into controls such that when No. 2 oil is selected, low oil temperature switch [and electric heater] [is] [are] taken off line from oil train.

h. Indicating lights shall also be provided for following:
(1) Limits satisfied.
(2) Purging.
(3) Pilot ON.
(4) Main flame ON.
(5) Flame failure.
(6) Fuel oil ON.
(7) Natural gas ON.

i. Indicating pilot lights shall be industrial, oil-tight construction with push-to-test feature or "All-Pilot Lights" test button.

2.5.9 Boiler Piping Trains

**************************************************************************
NOTE: Delete oil heater, oil temperature switches and oil temperature gauge for plants which will not burn oil heavier than No. 2 fuel oil now or in the near future. When heavy oil is burned, steam is typically used to heat it nearly to burning temperature and electric heat is used for trimming (approx. 11 to 17 degrees C 20 to 30 degrees F).
However, full capacity electric oil heating (approx. 56 degrees C 100 degrees F rise) or other independent heat source is needed to cold-start the plant. Cold start capability should be provided for at least two boilers for multiple boiler plants. If the plant is operable on emergency power, consideration should be given to supplying the full capacity electric oil heaters from the emergency source.
**************************************************************************

Piping train shall be completely prepiped, wired and mounted on boiler. [Fuel oil and [steam] [Air] atomizing systems] [and] [natural gas] train shall be in accordance with NFPA and FM standards and requirements and shall include but not be limited to following items:

2.5.9.1 Fuel Oil Train

a. NFPA 31.

b. Adjustable fuel oil pressure regulating and relief device.

c. Fuel oil flow control valve with characterizing adjustments to match airflow.

d. Dual (NC) motorized oil shut-off valve with proof of closure.

e. Low fuel oil pressure switch.

f. Fuel oil flow transmitter.
g. Fuel oil pressure gauge for fuel oil supply and burner pressure.

h. Manual shut-off valves at connections to supply and return headers.

i. "Y" type strainer.

j. Fuel oil check valve.

k. High fuel oil temperature switch.

l. Low fuel oil temperature switch.

m. Fuel oil temperature gauge.

n. Electric fuel oil preheater capable of raising oil temperature 56 degrees C 100 degrees F at rated firing rate and comply with UL 574.

2.5.9.2 Steam Atomizing Train

b. Y-type strainer in atomizing steam line.

c. Automatic shut-off solenoid and check valve in atomizing steam branch line to allow automatic purging of burner.

d. Check valve to prevent backflow in steam line.

e. Pressure gauge with isolating valve for servicing in atomizing steam supply and at burner.

f. Solenoid shut-off valve to close when burner shuts down.

g. One self-contained pressure regulating valve to maintain atomizing steam pressure.

h. Low atomization steam pressure switch.

i. Steam trap.

2.5.9.3 Air Atomizing Train

a. Manual shutoff valve at connection to atomizing supply.

b. Y-Type strainer in atomizing air line.

c. Automatic shutoff solenoid and check valve in atomizing air line to allow automatic purging of burner.

d. Check valve to prevent backflow in air line.

e. Pressure gauge with isolation valve for servicing in atomizing air supply and at burner.

f. Solenoid shutoff valve to close when the burner shuts off.

g. One self-contained pressure regulating valve to maintain atomizing air pressure.
h. Low atomization air pressure switch.

2.5.9.4 Natural Gas Trains

a. NFPA 54.

b. Natural gas flow control valve with characterizing adjustments to match airflow.

c. Manual shut-off valve (NO) at supply and discharge of vent and drain valves.

d. Manual shut-off valve (NO) at igniter natural gas supply and discharge of vent and drain valve.

e. Y-type strainer supplied in igniter natural gas and main natural gas lines.

f. Two (NC) solenoid safety shut-off valves, in series, in igniter line with one (NO) solenoid vent valve located between safety shut-off valves, piped to atmosphere through the roof.

g. Two shut-off valves with proof of closure, piped in series in main gas line with one (NO) solenoid vent valve located between safety shut-off valves, piped to atmosphere through the roof.

h. One pressure regulating valve in igniter natural gas line to regulate natural gas pressure to igniter.

i. One pressure regulating valve to regulate main natural gas pressure at natural gas train inlet.

j. Natural gas meter.

k. Natural gas flow transmitter for main natural gas to burner.

l. Pressure gauge, with shut-off valve for main natural gas supply.

m. Pressure gauge, with shut-off valve for main natural gas at burner.

n. Pressure gauge, with shut-off valve for natural gas supply to igniter.

o. Pressure gauge, with shut-off valve for natural gas igniter.

p. Low natural gas pressure switch.

p. High natural gas pressure switch.

2.6 CONTROLS

**************************************************************************

NOTE: This paragraph specifies several levels of available control systems. Bracketed text or section denotes designer's options. The base level of required controls is an integrated system of local control and monitoring panels. An upgrade to this system would include a remote supervisory workstation to monitor and alarm functions of the boiler plant via a network controller LAN.
a. Boiler controller and plant master controller systems, and other 
sub-control systems specified herein shall be provided by a single 
control manufacturer.

b. For multiple boiler installation, boiler No. 1 control panel shall act 
as the plant master control and contain controls common to all 
boilers. Interfaces between flame safeguard, combustion control and 
burners shall be provided.

c. System components shall be electronic, solid state, microprocessor 
type. Control components shall operate on 120 VAC power.

d. Analog signals to and from field-mounted devices shall be 4-20 mA DC. 
Analog signals between rack or panel-mounted devices shall be [4-20 mA] 
[1-5V] DC.

2.6.1 Instrument System

Instrument systems shall be powered by 120 volts alternating current, 60 
Hertz or 24 volts direct current 2-wire system. The 24 volts direct 
current powered systems shall receive power from the central control 
system. Instrument enclosures shall conform to Section 26 20 00 INTERIOR 
DISTRIBUTION SYSTEM. Transmitter output signals shall be 4 to 20 mA DC.

2.6.2 Indicating Instruments

Indicating instruments shall have the normal operating point marked in 
green on instrument. Transmitters shall include output meters in 
integrially mounted housings. Calibration shall be set by manufacturer, and 
adjustment access shall be internal only.

2.6.3 Factory Tests

Instruments, units, and other accessories shall be inspected, calibrated, 
and tested. Calibration shall be to manufacturer's standard for accuracy 
of input versus output. Submit Certificates of inspection, test, and 
calibration tags of instrumentation to be used during boiler acceptance 
test ensuring compliance with standards; certificate of compliance with 
applicable codes after boiler installation and one certificate for each 
boiler. Control system manufacturer shall configure, program, stage, and 
burn-in the control system prior to shipment to construction site. 
Programming of configuration and constants data shall be performed at this 
time, and stored on disks. Burn-in shall be for a minimum of 10 days of 
continuous operation. The Government reserves right to witness factory 
tests. A thirty-day advance notice shall be given to the Government prior 
to commencing any factory tests.

2.6.4 Sequence of Operation

a. Plant master controller shall vary firing rate of [all] boiler[s] [in 
parallel]. Plant master controller shall receive a pressure signal 
from main steam header and generate a signal to drive boiler master 
controller[s].

b. Boiler master controller shall increase or decrease firing rate based 
on comparison to setpoint.
c. Steam pressure control shall include proportional plus reset control modes.

d. Combustion controls shall be fully integrated with flame safeguard system to assure low-fire startup and complete purge regardless of boiler master output signal.

e. Combustion control strategy shall be single point positioning with oxygen trim.

f. Boiler firing rate shall be controlled by actuating burner jackshaft drive motor to move jackshaft that mechanically links fuel and combustion airflow.

g. Boiler oxygen trim shall be accomplished by modulating combustion air damper to alter fuel-air ratio based on input from oxygen analyzer.

h. Control loops shall include manual-automatic stations to provide for control of system. Each manual-automatic station shall contain a built in indicator to graphically depict variable being controlled.

i. Control system shall be arranged so that failure of control system for one boiler does not affect automatic and manual operation of other boilers. Common electrical signals shall be electrically isolated in each boiler section.

2.6.5 Enclosures

a. Free-standing or boiler-mounted factory-assembled steel enclosure with indicators, control switches, flame safeguard cabinet and indicating lights on cabinet front and relays and other components mounted on interior subbases shall be provided for each boiler. For multiple boiler installations, the boiler No. 1 panel shall contain controls common to all boilers. Enclosure shall have locking doors and shall comply with NEMA ICS 6.

b. Enclosure shall be NEMA 12, 11 gage steel, all welded construction with minimum radius corners, stiffened as required and framed with angles. Door shall be constructed of 14 gage steel with key-locking vault handle and three (3)point latches. Doors shall be fully gasketed.

c. Metal surfaces shall be cleaned, phosphatized, primed and finished. Interior shall be glass white enamel. Exterior shall be gray texture polyurethane enamel to provide resistance to fuel oil, solvents and abrasion. Engraved plastic laminated nameplates shall be provided for devices on the front of the cabinet except where devices themselves are provided with a service engraving. Nameplates shall have white letters on a black background and be minimum 6.5 mm 0.25 inch height, mounted with screws or epoxy or secured by pilot light or switch. Equipment title and identification number shall be listed. Abbreviations are not acceptable.

d. Enclosure mounted devices shall be properly supported, front and rear and shall occupy the upper portion of the enclosure front.

e. Enclosure wiring shall comply with acceptable standard panel practice.

f. The 120 volt, 60 Hz circuit wiring shall be number 16 AWG minimum, THWN 600 volt insulation, color coded. Signal circuits, less than 50 volts,
shall be number 18 AWG minimum or number 20 AWG in multi-conductor cable.

g. Devices requiring power shall be wired so that when wires are removed from one device, power will not be interrupted to other devices. Enclosure-mounted devices shall be wired to numbered lug and screw terminals so that field wiring can easily be terminated in the panel.

h. Signal common and power common buses shall be supplied. Signal common shall be connected to earth ground at one point.

2.6.6 Controllers

**************************************************************************
NOTE: Single loop controllers are specified.
Consider programmable logic controllers (PLCs) as an option.
**************************************************************************

a. Controller shall be microprocessor-based and shall be of single loop design. Controller shall be flush-mounted in control cabinet and shall have splash-proof mylar faces. Operator pushbuttons shall be of the membrane type and have tactile feedback. A 4-1/2 digit numeric display shall be provided on front of controller.

b. Two bar graphs shall be provided on the front of controller to give an analog interpretation of process variables, setpoints or deviation. These shall be of the 100 segment LED type. A dedicated 20 segment LED bar graph shall be provided for the controller main output.

c. Each controller that drives a final control device (damper, valve or other) shall be provided with a hard manual backup station to ensure operator control in the event of a memory failure or service requirement.

d. Controller output logic shall include proportional, plus integral, plus derivative (PID) modes.

e. Multiple loops on single controller are not acceptable. During integral hard manual backup mode, operator shall have control of output via up-down pushbutton and shall have output indication.

f. Should the controller or memory fail, controller shall deenergize a dead-man relay and alert operator to use backup station.

g. Backup station may be separate station or may be integral to main controller. If Integral, backup circuitry must function when controller is removed for servicing.

h. Controller shall be capable of being configured in field without use of external computers, hand-held terminals, EPROM programmers or other devices.

i. Configuration changes and tuning adjustments shall be accomplished by means of key pad on controller front. Controller digital circuitry shall be protected from power surges and spikes by optical isolation or by uninterruptible power supply.

j. Configuration shall be maintained in (2) removable battery backed RAM
chips. Failure in primary memory shall cause backup memory to be downloaded automatically.

k. Equipment Controller Self-Tuning PID Loop Routine

(2) The tuning utility shall display following information on display upon operator request: Control loop being tuned, Input process variable, Output control variable, setpoint of loop, Integral reset interval, and Proportional band, Derivative rate interval.

(3) Above information shall be displayed on supervisory workstation in graphic format with automatic scaling such that the input and output variable are superimposed on a graph of time versus variable. Program shall allow operator to affect output variable by modifying setpoint, and tuning parameters, and view results on display.

(4) Automatic Tuning: Provide controller with on-line or manual utility to disturb process. Utility shall monitor the results and calculate new parameters for sample interval, Proportional band, Integral gain, and Derivative gain. Utility shall be usable during commissioning process to establish reasonable values, then turned off.

(5) Adaptive Tuning: Provide controller with on-line utility which may run continuously.

(6) Adaptive tuning shall be initiated automatically whenever operator-defined change in the process input variable is detected. Utility shall monitor process (control loop) after natural disturbance, and automatically recalculate Proportional gain, Integral gain, and Derivative gain. This utility shall be used to keep a system tuned, as the equipment ages and occupancy and loads change, after commissioning.

l. The tuning utility shall display following information on the CRT upon operator request:

(1) Adaptive control is enabled or disabled.

(2) Maximum bump: output step change required to produce a change in input, greater than noise level, but not so great as to damage equipment.

(3) Setting time: time it takes PID output process variable to settle down after a process disturbance. For automatic tuning, time interval between setting PID output to control point and beginning of tuning cycle. For adaptive tuning, minimum time that will be observed between parameter calculations.

(4) Maximum overshoot: percent allowed.

(5) Target damping: desired reduction in process variable overshoot from first overshoot (maximum overshoot) to second, in percent.
(6) Noise band: minimum process variable perturbation that will initiate adaptive calculation of PID parameters, in percent of input range.

m. Controller shall be provided with protocol converter/gateways with TIA-485 multi-drop communications port for controller LAN network interconnection to field panel controller [and to supervisory computer workstation].

2.6.7 Plant Master Controller

a. Plant master controller [shall match individual boiler master controller[s] and] shall provide for proportional, integral, and derivative (PID) control of firing rate demand based on steam header pressure. [The plant master controller shall be located in the boiler No.1 cabinet.] The output of the plant master controller shall go to the boiler master plant master controller. The controller shall provide for digital display of the following:

(1) Controller output.
(2) Steam pressure.
(3) Steam pressure setpoint.
(4) Outdoor temperature.
(5) Total plant steam flow.

b. Inputs shall be as follows:

(1) Steam pressure (Analog).
(2) Steam flow signal from individual boiler (Analog.)
(3) Outdoor temperature (Analog).

[ (4) Fuel oil temperature (Analog).]
[ (5) Fuel oil pressure (Analog).]
[ (6) Natural Gas pressure (Analog).]

c. Outputs shall be as follows:

(1) Boiler master signal (Analog).
(2) Total plant steam flow.
(3) Totalized steam flow pulse.

d. Controller shall be provided with protocol converter/gateway with TIA-485 multi-drop communications port for controller LAN network interconnection to field panel controllers [and to supervisory computer workstation.]
2.6.8 Boiler Master Controller

a. Each boiler shall have a boiler master controller. This controller shall control jackshaft in response to plant master demand signal or in response to boiler pressure and local setpoint. Primary analog output shall modulate jackshaft actuator of boiler. Logic required to ensure that prepurge, postpurge, lightoff and burner modulate cycles are handled correctly and according to local regulation shall be the burner manufacturer's responsibility. Controller digital display shall include the following in their respective engineering units:

1. Controller output.
2. Natural Gas flow.
3. Fuel Oil flow.
4. Local setpoint.

b. Controller inputs shall be:

1. Plant master signal.
2. Steam flow.
3. Steam pressure (Analog).
5. Fuel oil flow (Analog).
6. Firing rate hold (Contact).
7. Purge from flame safeguard system (Contact).
8. Auto from flame safeguard system (Contact).
9. Remote alarm silence (Contact).

c. Controller outputs shall be:

2. Remote audible alarm (Contact).
3. Flow pulse for natural gas flow totalizer (Contact).
4. Pulse for fuel oil flow totalizer (Contact).

d. Controllers shall be provided with protocol converter/gateways with an TIA-485 multi-drop communications port for controller LAN network interconnection to field panel controllers [and to supervisory computer workstation.]

2.6.9 Feedwater Controller

**************************************************************************
NOTE: Specify two-element boiler water level control for smaller capacity plants with relatively
**************************************************************************
stable loads, such as space heating. Specify three-element control for larger capacity plants and unstable loads, such as industrial process and Navy pier facilities.

******************************************************************************

a. Feedwater controller shall match other controllers in system and shall provide [two] [three] element PID control of boiler water level in response to changing boiler level and feed forward signal of steam flow. Controller shall automatically switch to single element feedwater control strategy during cold startup when steam and feedwater flow signals are not active. Controller digital displays shall be as follows in their respective engineering units:

(1) Controller output.
(2) Water level.
(4) Steam flow.
(5) Feed water flow.

b. Controller inputs shall be:

(1) Water level.
(2) Steam flow.
(3) Feed water flow.
(4) Remote alarm silence (Contact).

c. Controller outputs shall be:

(1) Feedwater control valve (Analog).
(2) Remote audible alarm (Contact).
(3) Steam flow (Analog).

d. Controllers shall be provided with protocol converter/gateways with TIA-485 multi-drop communications port for controller LAN network interconnection to field panel controllers [and to supervisory computer workstation.]

2.6.10 Draft Controller

a. Draft controller shall match other controllers in system and shall have capability of PI control of furnace draft in response to changing furnace pressure and feed forward signal of boiler load.

b. Control system shall include logic required to interface with flame safeguard system so as to insure that prepurge, postpurge, lightoff and burner modulate cycles are handled correctly and in accordance with local regulations.

c. Controller shall have characterizable setpoint curves for feed forward signal based on load.
d. Controller digital displays shall be as follows in their respective engineering units:

   (1) Controller output.
   (2) Furnace draft.
   (3) Furnace draft setpoint.

e. Controller inputs shall be:

   (1) Jackshaft output (Analog)
   (2) Furnace draft (Analog).
   (3) Purge from flame safeguard system (Contact).
   (4) Auto from flame safeguard system (Contact).
   (5) Remote alarm silence (Contact).

f. Controller outputs shall be:

   (1) Flue gas damper actuator (Analog).
   (2) Remote audible alarm (Contact).

g. Controller shall be provided with protocol converter/gateways with TIA-485 multi-drop communications port for controller LAN network interconnection to field panel controllers [and to supervisory computer workstation].

2.6.11 Oxygen Trim Controller

a. Oxygen trim controllers shall match other controllers in the system and shall have the capability of PID control of fuel/air ratio in response to flue gas oxygen content.

b. Controller shall be capable of calculating and displaying boiler efficiency using ASME "By Losses" method.

c. Control system shall include logic required to interface with flame safeguard system so as to ensure the prepurge, postpurge, lightoff and burner modulation cycles are handled correctly and in accordance with local regulations.

d. Controller digital displays shall be as follows in their respective engineering units:

   (1) Controller output.
   (2) Flue gas temperature.
   (3) Combustion air temperature.
   (4) Boiler efficiency.
   (5) Flue gas oxygen percentage.
(6) Jackshaft position.

e. Controller inputs shall be:
(1) Fuel flow (oil or natural gas) (Analog).
(2) Flue gas temperature (Analog).
(3) Flue gas oxygen (Analog).
(4) Combustion air temperature (Analog).
(5) Fuel selection (Contact).
(6) Remote alarm silence (Contact).
(7) Jackshaft position (Analog).

f. Controller outputs shall be:
(1) Oxygen trim actuator (Analog).
(2) Boiler efficiency.
(3) Remote audible alarm (Contact).

g. Controllers shall be provided with protocol converter/gateways with TIA-485 multi-drop communications port for controller LAN network interconnection to field panel controllers [and to supervisory workstation.]

2.6.12 Alarm Annunciator

a. Each boiler master panel shall be provided with single horn and single alarm silencing pushbutton. First out alarm annunciation shall be provided for following alarm points and they shall activate alarm horn:
(1) Low steam pressure.
(2) High steam pressure.
(3) Low water level.
(4) Low oxygen.
(5) Low draft.
(6) Low efficiency.
(7) High flue gas temperature.
(8) High opacity.

b. Each alarm condition shall activate separate visual indication to allow operator to locate cause of alarm. This may be accomplished with first out annunciator having labeled windows and individual clearly labeled lights or with microprocessor based English language alarm message display. Horn shall sound for every new alarm, even if previously silenced.
c. Controllers shall be provided with protocol converter/gateways with TIA-485 multi-drop communications port for controller LAN network interconnection to field panel controllers [and to supervisory workstation.]

2.6.13 Opacity Monitor

a. Opacity monitor shall be double pass system to provide continuous stack opacity indication.

b. System shall consist of transceiver and retro-reflector module mounted on opposite sides of the stack, and electronic monitor.

c. Bi-directional digital communications link shall connect electronics processor and transceiver module.

d. Transceiver shall be provided with backlit pushbutton for calibration offline.

e. Light source and receiver shall be provided with air purge system for use with plant air.

f. Electronics shall withstand air failures and shall maintain on-line service without shutdown. Field-mounted device shall be in NEMA 4 enclosure.

g. System shall be suitable for operation on 120 volt single-phase power.

h. System shall be in compliance with latest requirements of [_____] City air pollution control code, [_____] City engineering criteria for fuel burning equipment and [_____] State Department of Environmental Protection Opacity Monitoring Requirements.

i. When performing on-stack calibration, each component of opacity system shall be checked including: light, source, receiver, optics on stack and associated electronics.

j. System shall provide a minimum of two (2) months unattended operation. At selected intervals the system shall perform fully automatic, on-stack calibration including zero and span. System shall automatically and continuously correct the measurement for variations in temperature, line voltage, lamp aging and component drift. Dirty lens detection system with alarm and four independently selectable optical density filters with range switches shall be provided. System shall sample and mold control output during calibration.

k. The output from the system shall include:

(1) 4-20 mA DC output.

(2) Digital display of opacity.

(3) Two digital violation occurrence meters, one for total elapsed time and one for number of occurrences.

l. Program shall be as follows: When opacity exceeds setpoint, instant flashing alert light signals; at 20 seconds, alarm light lights and contacts close. At 60 seconds, lights and contacts lock and require
2.6.14 Vertical Scale Indicators

Vertical scale indicators shall be 150 mm 6 inches high for steam header pressure, outdoor air temperature and combustion air temperature.

2.6.15 Digital Indicators

Oversized digital indicators shall be provided for fuel oil flow and gas flow. [At manufacturer option, controller displays may be used if they show each value in engineering units, include 16 character alphanumeric display describing what is displayed and include dedicated bar graph that can be used for each value.]

2.6.16 Draft Gauge

Draft gauges for wind box, combustion chamber and last boiler pass shall be mounted on panel front. Operating ranges for draft gauges shall be field verified with normal reading in middle of scale range. Draft gauge shall include piping between gauge and boiler with three (3) way cocks for shutoff and zero check.

2.6.17 Recorder

a. Recorder shall be circular chart type, direct reading having evenly divided graduation. Charts shall be driven by 120 volt, 60 Hz motors. Pens shall be provided with different color ink and arranged to pass each other without interference. Each chart shall show 24 hours.

b. Recorder shall be capable of recording up to four points. Recorder unit shall be fully programmable in order that each channel can be configured to accept 4-20 mA DC voltage, thermocouple and RTD inputs. NonLinear inputs shall be linearized and provisions made for special linearizations.

c. In addition to recording, recorder shall have provisions for individual 16 character tags and messages per channel and up to four integrators which shall be selectable either as reset or non-reset type. Each channel shall be fitted with two alarms selectable as absolute, rate of change or deviation.

d. Recorder shall measure the following points:

   (1) Steam flow.

   (2) Percent oxygen.

   (3) Flue gas temperature.

   (4) Opacity.

e. Recorder shall be provided with protocol converter/gateways with TIA-485 multi-drop communications port for controller LAN network interconnection to field panel controllers [and to supervisory workstation.]
2.6.18 Totalizer

Eight-digit, non-resettable totalizers shall be provided for: natural gas, fuel oil and steam flow flush-mounted in each boiler control panel. Totalizers shall display directly in engineering units. Only powers of ten (10) shall be allowable as scale factors. Power shall be backed up by a lithium battery with a life span of not less than 8 years. [Smart transmitters may be used to communicate to associated controllers on a device level network LAN. Smart transmitters shall not reside on controller LAN]

2.7 FIELD DEVICES

The following field devices shall be furnished and installed to provide a complete working system.

2.7.1 Oxygen Analyzer

**************************************************************************

NOTE: Consider specifying a reference and calibration gas system for plants having two or more boilers at 11,700 kW 40,000 lb/hr or greater capacity. Otherwise, delete.
**************************************************************************

a. Oxygen analyzer shall be provided for each boiler. Oxygen analyzer shall be stack-mounted and shall utilize zirconium sensing element. Sensing element shall be inserted directly in flue gas stream and shall be in direct contact with process gases. Sensing element shall be contained within a protective housing mounted to flue gas outlet by means of adapter plate, both furnished by manufacturer.

b. Oxygen analyzer shall be equipped to allow daily calibration check without removing analyzer from process.

c. Sample gases may be injected directly on sensing element while analyzer is in process.

d. In order to eliminate temperature effect of flue gases, externally-mounted temperature controller shall be provided. Temperature controller output shall be isolated 4-20 mA DC representing 0-10 percent oxygen content as linear function.

e. Reference and calibration gas system shall be provided for each boiler consisting of gas supply, regulator with relief valve, gauge and necessary valving and piping. Electrical power connections and piping for distribution to calibration gas connection on each analyzer shall be provided.

2.7.2 Fuel Oil Flow Transmitter

a. Fuel oil flow transmitter shall be provided for each fuel oil flow meter. Transmitter output shall be isolated 4-20 mA dc.

b. Panel-mounted totalizer shall be connected to transmitter. Necessary signal conditioning devices shall be provided to integrate fuel oil flow transmitter with control and recording instrument panels.

c. Smart transmitters may be used to communicate to associated controllers
2.7.3 Natural Gas Flow Transmitter

Natural gas flow transmitter shall be provided for each natural gas meter. Smart transmitters may be used to communicate to associated controllers on device level network LAN. Smart transmitters shall not reside on controller LAN.

2.7.4 Steam Flow Meter-Transmitter

a. Steam flow meter-transmitter shall be a Vortex-Bar meter probe designed for pipe insertion type installation by means of hot tap or other non-disruptive method. A steam flow transmitter shall measure media flow by means of a vortex shedding flow element located in flow stream.

b. Steam flow meter-transmitter shall have sliding-type stem passing through two pressure seals allowing proper positioning of sensor in flow stream and isolation valve so that transmitter can be completely removed from pipeline without disruption of process. Steam flow meter shall be supplied with a two-wire preamplifier with analog 4 to 20 mA dc output signal.

c. Steam flow meter shall meet following performance criteria:

   (1) Pressure Rating: To [950 kPa 125 psig] [205 degrees C 400 degrees F]

   (2) Seals: Teflon.

   (3) Wetted Parts: Type 316 stainless steel with 304 stainless steel body.

   (5) Linearity: Plus or minus 1.0 percent (to 24 mA output).

   (6) Repeatability: Plus or minus 0.25 percent at maximum.

   (7) Current Limit: To approximately 30 mA.

d. Steam flow meter-transmitter shall meet following materials of construction criteria:

   (1) Sensor: Type 316 stainless steel.

   (2) Sensor Support: Type 304 stainless steel.

   (3) Bushings: Stellite or stainless steel hardened with stellite.

   (4) Stem: 300 Series stainless steel.

e. Provide with steam flow meter-transmitter a full port gate valve with proper flanged connection that allows steam flow sensor to be inserted and removed from pipe under full pressure. Both valve and pipe tap shall have a minimum [48 mm 1.875 inches] internal diameter clearance.
f. Electronics enclosure shall be NEMA [4] [4X].

g. Smart transmitters may be used to communicate to associated controllers on device level network LAN. Smart transmitters shall not reside on controller LAN.

2.7.5 Temperature Transmitter

a. Platinum resistance temperature detector (RTD) temperature transmitter shall be provided. Resistance shall be 100 ohms at [0 degrees C 32 degrees F] [_____] with tolerances in accordance with BS 101-4 and DIN 43760.

b. Connections to control cabinet shall be via three identical copper conductors of No. 14 AWG minimum.

c. RTD shall be inserted in protective sheath or well suitable for the environment.

d. Transmitter shall utilize platinum RTD input to provide 4-20 mA dc output to control cabinet. Transmitter shall be plus/minus 0.2 percent accuracy of calibration span, to include combined effects of transmitter repeatability, hysteresis, linearity and adjustment resolution.

e. [Smart transmitters may be used to communicate to associated controllers on device level network LAN. Smart transmitters shall not reside on controller LAN.]

f. The following temperatures shall be monitored.

(1) [Fuel oil (each boiler)].

(2) Flue gas (each boiler).

(3) Combustion air (each boiler).

(4) Outdoor air (one (1) per plant).

2.7.6 Electric Drive

a. Electric drive shall be provided for jackshaft and flue gas dampers. Electric drive shall accept signal input from control system and provide feedback of actuator position by means of integral potentiometer. Electric drive shall include four adjustable end switches.

b. Electric drive shall have 90 degree rotation in 15 seconds and be capable of [_____] Newton Meter ft-lbs of torque under continuous duty.

2.7.7 Pressure Transmitter

A pressure transmitter shall have 0.25 percent of full scale accuracy, process fluid isolating diaphragms, 5:1 field calibration adjustability, NEMA 4 housing and 4-20 mA dc output. Pressure transmitter shall be provided with a calibration valve manifold. Pressure transmitter for steam service shall include an isolating siphon. Following transmitters shall be provided:
a. Steam pressure (one per plant).
[ b. Fuel oil pressure.]
[ c. Natural gas pressure.]

d. Furnace draft.

2.7.8 Differential Pressure Water Level Transmitter

a. Boiler shall be provided with differential pressure type water level transmitter.

b. Differential pressure type water level transmitter shall have 0.25 of full scale accuracy, process fluid isolating diaphragms, 5:1 field calibration adjustability, NEMA 4 housing and 4-20 mA dc output.

[ c. Smart transmitters may be used to communicate to associated controllers on a device level network LAN. Smart transmitters shall not reside on the controller LAN.]

2.7.9 Pressure Switch

Pressure switch shall have repetitive accuracy of plus or minus 1 percent of the operating range. Pressure switch actuation shall be adjustable over the operating range. Pressure switch shall have snap-action Form C contacts rated for the application.

2.7.10 Temperature Switch

Temperature switch shall have repetitive accuracy of plus or minus 1 percent of the operating range. Temperature switch actuation shall be adjustable over operating temperature range. Temperature switch shall have a snap-action Form C contacts rated for the application.

2.7.11 Oxygen Trim Drive

Oxygen trim drive shall be in-line piston type actuator in linkage from jackshaft to combustion air damper. Oxygen trim drive shall act to position combustion air damper based on signal from oxygen trim controller.

2.7.12 Supervisory Computer Workstation

**************************************************************************
NOTE: For new central steam plants or as an upgrade of existing central steam plants consider the following section to provide remote monitoring capability trend logging and graphical system interface.
**************************************************************************

a. Dedicated monitoring and data collection system supervisory computer workstation, complete with custom software shall be provided as specified. Supervisory computer workstation computer shall collect and store data transmitted from system controllers and other sensing and monitoring devices, shall log alarms, and shall use software described to generate periodic reports. Data collection function shall take priority over report generation function and shall not be interrupted by generation of reports.
b. Supervisory computer workstation computer shall log data at five (5) second interval that is adjustable as required. In event of alarm condition or unusual plant operating condition, supervisory computer shall immediately initiate data logging.

c. Supervisory computer workstation computer shall be designed such that a failure of the CPU, the storage disk, or any other device shall not result in the loss of any previously stored data.

d. Supervisory computer workstation shall include the computer, keyboard, printer, monitor, and other peripherals and shall be located as shown. Provide cabling between the work station and the system controllers. Provide all prefabricated cabling required between the work station and peripheral devices.

e. Authorized personnel shall be capable of editing and modifying programs with access code. Password protection shall be provided for all levels of access. The multiple level password protection system shall be acceptable to the Owner.

f. Supervisory computer workstation computer shall be microprocessor based personal computer. Computer shall be provided with eight expansion slots. Computer shall be Microsoft Windows® compatible, each with a floppy disk drive, 17 inch high resolution SVGA color monitor for graphic displays. The hard disk drive shall have sufficient capacity to perform required data substitution routines without accessing other data storage media. [Provide a 650 MB CD-RW reader-writer-rewriter drive with minimum of 8X write, 4X rewrite and 24X read speeds and 25 preformatted rewritable and 100 preformatted writable CD media disks or archival and routine backup.] Following minimum equipment shall be part of the supervisory computer workstation:

(1) Intel Pentium III Class 633 Mhz Micro Processor or approved equal.

(2) 128 MB RAM.

(3) 4 MB RAM video adapter.

(4) [20] [_____] GB hard disk.

(5) 2 Parallel Ports.

(6) 2 Universal Serial Bus (USB) Ports.

(7) 56,600 Baud Modem.

(8) Synchronous adapter with dual port compatible with supervisory computer workstation interface hardware.

(9) The keyboard shall be equipped with thirty-two function keys with custom legends for each key, to allow report generation, graphic display selection, alarm silencing, and data retrieval with single key strokes. The keyboard shall be provided with a high resolution track ball.

g. Following additional peripheral equipment shall be provided as shown:

(1) Inkjet printer, 1200 dpi by 1200 dpi, tri-color and black ink
cartridges or four ink cartridges (red, blue, yellow and black).

(2) Inkjet printer, 1200 dpi by 1200 dpi, dual ink cartridges (tri-color and black) or red, blue, yellow and black ink cartridges or color laser printer.

2.7.12.1 Software

**************************************************************************
NOTE: Text within brackets denotes the designer's options.
**************************************************************************

a. Software required for efficient operation of automatic system functions required by this specification shall be provided. Software shall be modular in design.

b. Available supervisory computer workstation application and system software shall be provided with system, and shall reside in supervisory computer workstation computer. Unbundled software packages for which vendor can charge user extra fees, require dedicated work stations or require system rebooting for access, are unacceptable.

c. Licensing agreement from PC manufacturer shall be provided for each software program or package specified to ensure customer support from PC manufacturer for each copy of software program or package provided at supervisory computer workstations.

d. Software in system shall consist of both firmware, resident in the controller, and software resident in the supervisory computer workstation computer. Architecture of system, application software and firmware shall be distributed, with no single system component responsible for a control function for entire LAN. Each controller shall contain the necessary firmware, control software and I/O capability to function independently in case of network failure. Controller shall be able to stage, rotate and fully control the equipment during a communication failure with network LAN. No active control sequences shall be resident in supervisory computer workstation or central control unit. Workstation and controllers shall be removable from system without loss of control function. Only alarm monitoring, long-term history collection and operator monitor, command, and edit functions may be lost.

e. Provide software upgrades while maintaining full operational control of loss of any operating features for five years after Government acceptance of system at no additional cost. Software upgrades shall include new versions, releases, upgrades and wholesale revisions in software. This does not include labor required to update graphic pages or revise control sequences, except as caused by revisions in software.

f. Necessary hardware, software and programming shall be provided to allow remote access to system via the Internet. Access will allow user located off-site to view and monitor current conditions at site. Acceptable configurations are software program making the host PC accessible through the Internet or development of Internet web pages specifically for site.
2.7.12.2 Software Capabilities

[ a. Primary operator interface to system shall be through graphical, object oriented, and interactive presentation using mouse and cursor for object selection and commands. Plant management software shall be Microsoft Windows based.]

[ b. System shall support pop-up windows for point commands. On selecting object with cursor, a window shall open up to present operator with choices corresponding to operator's password authorizations. These point commands shall include state changes, manual override of application software, test mode activation and test value entry. This window shall include the point descriptor (name), the point hardware address and alarm status.]

[ c. System shall support pop-up windows for point editing. On selecting object with cursor, a window shall open up to present operator with a list of active point data base editors, if permitted by the operator's password level. Selecting one of these editors shall allow operator to modify basic parameters associated with a point, as well as access to programs assigned to the point such as time schedules, calculations, and events.]

[ d. System shall be based on interactive prompts and choices, using dialogue boxes as opposed to memorization of commands, syntax or exact spellings. Interactive prompt and choices approach shall be used in monitoring, issuing commands, and editing. Command choices shall entail clicking cursor to select correct work choice prompts, for example: ON-OFF, without typing in letters. Editing mode choices shall prompt ranges or options, for example: 16 CHARACTERS for point name, or DIRECT-REVERSE for control action.]

[ e. Zoom: It shall be possible for operator to locate system point to monitor status, issue commands, or edit associated database without knowledge of the point name, address, or associated controller, and without having to refer to a tree directory. Operator shall be able to locate control points by, for example, zooming in on a floor in a building graphic or zooming in on a system in a floor plan graphic.]

f. System software shall be compiled for faster execution speeds and shall offer the following features and capabilities that follow.

(1) Input/Output Capabilities: From the connected supervisory computer workstation, the system operator shall have ability to:

(2) Request displays of current values or status using a tabular [or graphic format.] [A global data base sorting utility shall allow an expanded tabular display of only points on current graphic display.] This [expanded tabular] display shall list point name, hardware address, dynamic state or value, alarm status, override and test mode status.

(3) Initiate logs and reports.

(4) Change analog limits.

(5) Change point input and output descriptors, status, alarm descriptors and engineering unit descriptors while system is on-line.
(6) Modify and set up maintenance scheduling parameters.

(7) Develop, modify, delete or display full range of color graphic displays. Development, editing and display work shall be possible with system fully on-line and in full communications with the Controller LAN without disruption of system function.

(8) Select discrete or analog sample data from the field to be automatically archived in the assigned workstation. This archiving shall occur even if workstation is running third party software such as word processing or electronic spreadsheets.

(9) Comprehensive report writer capability to sort and extract data from archived files and to generate finished custom reports. Reports shall be initiated manually or automatically printed. System shall have capability to print reports on daily, weekly, monthly, yearly or scheduled basis. Report writer shall provide capability for statistical data manipulation and extraction. As a minimum, the custom report writer shall provide capability to generate following types of reports:

(a) Statistical detail reports
(b) Summary reports.
(c) Trend graphic plots.
(d) X-Y graphic plots.

(10) Report function shall be on-line for both development and printout, and shall not require export to a third party spreadsheet program for execution.

(11) In addition to on-line function, historical database shall be capable of being converted to Data Interchange Format (DIF) for use in spreadsheet for off-line manipulation. Transmission to DIF files shall be manual or automatic based on operator selectable parameters including: time of day, frequency (daily, weekly, monthly, yearly), scheduled days (32 days minimum).]

(12) File transfer shall support appending new data to existing file data.

(13) Printer shall print alarm annunciations and normal operator acknowledgments, action messages, system alarms, operator sign-on and sign-off. Operator control activities shall include the operator's initials in the printed and disk record. The data printer will be reserved for printing reports, page prints, and data base prints.

(14) Operator shall have the option of selecting daily, weekly or monthly scheduled frequency to synchronize time and data in controllers from the supervisory computer workstation. Synchronization shall be performed for dialup as well as direct connected locations. This program shall accommodate automatic daylight savings time adjustments.

(15) Supervisory computer workstation shall have a feature to
indicate audibly [and visually,] when Off-Normal conditions and messages exist.

(16) Operator shall be able to request a summary of points on controller LAN currently in test mode or in off-normal condition.

g. Supervisory Computer Workstation: The supervisory computer workstation shall:

(1) Accept data from Controller LAN on an as needed basis without having to scan entire network for updated point data.

(2) Interrogate Controller LAN for updated point data as requested by operator.

(3) Allow operator command of equipment connected to controllers.

(4) Store duplicate data base on file for every controller and allow database to be downloaded to remote panel while system is on-line.

(5) Develop, store and modify dynamic color graphics utilizing system supplied mouse and mouse supported software.

(6) Provide data archiving of assigned points throughout system [and to support overlaid graphing of utilizing up to four (4) variables.]

h. Alarm Processing: System shall have following alarm processing features, all of which shall be definable through the input keyboard:

(1) Each OFF-NORMAL condition shall cause an alarm and appropriate message, including time and date of alarm, system and point descriptor and alarm condition. Operator shall have the ability to select, at any time, which state or value shall be considered alarms and which alarms shall cause automatic dial-out to occur.

(2) Each critical alarm or change-of-state message shall be displayed. Controller LAN network alarm messages shall be stored on disk and may be reviewed on the display printed on operator selected printer at any time. It shall be possible to sort this alarm and change-of-state database by date, time or item fields.

(3) Automatic user defined time delay of alarms during equipment start-up or shut-down shall be provided.

(4) Unacknowledged alarms will continue to blink even if alarm condition has returned to normal.

(5) Only operator acknowledgment can remove the blinking alarm indication.

(6) Operator workstation will notify an operator of an alarm condition in one or more points or controllers anywhere in the system.

(7) Alarm notification shall consist of an automatic print of the alarm condition.

i. Prepared Historical Report: Provide an on-line, historical, data base
sort report utility with: Prompts to select data base sort by time, by date, by point or range of points with system supplied default values of 24 hours, today, all Controller LAN points, respectively. Prompts for activating "conditional" sorts, including: changes-of-state, alarms, returns to normal, operator sign on/off, operator acknowledgements, command errors, program control of a point, test on/off, manual on/off, program control (Demand, Event) override, power restore, LAN reconfiguration, controller off line, time/data modifications and archive disk memory 90 percent full, 95 percent full and full. Single keystroke retrieval resulting in a report listing the most recent condition first, along with the time, date, address, name, condition type, and value. The supervisory computer workstation shall provide functions listed below.

2.7.12.3 Graphics Screen Format

Submit graphics screen format showing process variable in engineering units, such as process variable setpoints, analog or digital input or output conditions, and to meet requirements of the Centralized Monitoring System of this specification. Submittal shall include the proposed input conditions shown on flow diagrams created by the Contractor based on Drawings, including process and instrumentation drawings and shop drawings from boiler manufacturer.

2.7.12.4 Graphic Display

At a minimum, the following screens shall be available:

a. Plant overview.

b. Individual Boilers.

c. Individual controllers.

d. Display of all measured variables and setpoints.

2.7.12.5 Historical Trending

System shall be capable of storing values from transmitters as well as system computed values, such as efficiency and compensated flow rates, at selected intervals for archival storage and future analysis.

2.7.12.6 Totalization of Data

a. The system shall be capable of totalizing the following data:

(1) Steam Utilization.

(2) Total Feedwater Flow.

(3) Total Natural Gas Consumption.

(4) Run Time for monitored motors.

(5) Total Fuel Oil Consumption.

b. Run time logged for each motor driven equipment shall enable the plant maintenance to schedule regular maintenance for each motor driven device. Once a motor driven device has been serviced or repaired as a
part of regular maintenance or due to emergency, plant maintenance shall be able to log servicing or repair data in the supervisory computer. Plant maintenance shall also be capable of logging servicing or repair data for equipment monitored in the steam plant.

2.7.13 Centralized Monitoring System (CMS)

**************************************************************************
NOTE: The CMS paragraphs apply to existing plants without a supervisory computer workstation.
**************************************************************************

a. CMS shall be used for centralized monitoring and data acquisition of various plant variables.

b. Provide services required for installation, programming, testing and startup of system.

c. Equipment employed in CMS shall be industrial grade and Underwriter Laboratories (UL) listed.

d. Provide CMS to include, but not be limited to, the following functions:
   (1) System engineering.
   (2) System hardware.
   (3) System programming and configuring.
   (4) System documentation.
   (5) System installation.
   (6) System testing.
   (7) Packing and shipping.
   (8) Maintenance training program.
   (9) Operator training program.
   (10) System startup.
   (11) Scheduled system maintenance.
   (12) Attend construction review meetings and provide progress reports.

2.7.13.1 System Controller

a. System controller shall monitor various plant variables, log data and generate summary reports as required by plant operations. System controller shall be capable of data reduction and backup data logging. Data and alarm interfaces between CMS equipment and Government equipment shall be performed at system controller.

b. System controller shall be an industry standard programmable logic controller (PLC), or direct digital controller (DDC), rack mounted in NEMA 12 CMS equipment cabinets. Interconnecting cabling and fittings shall be compatible and shall be clearly labeled as to the equipment
and termination points they are to interconnect.

c. System controller shall provide backup digital storage of CMS data. Backup data storage device shall have sufficient memory to store at least seventy two (72) hours of CMS data in event of failure of monitoring and data acquisition system computer or communications hardware. Upon restoration of communications with monitoring and data acquisition system computer, data logged during communications failure period shall be automatically transferred to monitoring and data acquisition system computer. Battery backup shall be provided for backup data storage device if required to preserve data in event of a power supply failure.

d. System controller shall consist of solid-state control system which has a user programmable memory for storage of instructions to implement specific instructions such as input-output control, Boolean logic, timing, counting, arithmetic, and data manipulation. System controller shall consist of central processors, input-output interfaces, memory, power supplies, a programming device, and tape or disk drive for storing and rapidly loading programs. Provision for portable operator interface panel shall be provided with CMS system to provide the capability of viewing access to data stored in the CPU and input of constants required by system controller.

e. Central processing unit shall be of solid-state design on modular printed circuit boards. Provide hardware, source code, and programming parameters required for internal programming of controller.

2.7.13.2 Interface Requirements

a. The system controller shall be capable of interfacing with plant controllers, computers, or printers in accordance with TIA-232 or another communications interface common to all plant microprocessor-based control equipment.

b. Inputs and outputs shall be electrically isolated from other input-output and from all cabinet wiring.

2.7.13.3 Alarm Interface

CMS shall be provided with 2 annunciator cabinets, each equipped with one (1) white indicating light, one (1) flashing red indicating light, 1 audible horn, 1 Acknowledge pushbutton and 1 Test pushbutton as shown. One of these annunciator cabinets shall be located [_____] and the other shall be located in the plant control room. The Acknowledge and Test pushbuttons shall be momentary. Equipment in these cabinets shall be directly connected to the CMS input-output ports as shown. When alarm condition is detected, horn at both annunciator cabinets shall sound and the red indicating lights shall flash. When Acknowledge button is pressed in any one of the annunciator cabinets, or when the alarm is acknowledged at either of the work stations, horn shall be silenced, red flashing lights shall go off, and the white indicating light shall come on. At this point the system shall be ready to annunciate new alarm condition detected. The white indicating light shall stay on until the alarm condition is removed. If the Test pushbutton is pressed, the horn shall sound and the red indicating light shall flash. Pressing the Acknowledge button shall silence horn and reset alarm system. Lamptest pushbutton shall be provided to allow verification that all indicating lights are operational.
2.7.14 Monitoring Requirements

2.7.14.1 Monitoring of Boilers

Boiler may be supplied from manufacturer with stand-alone controller. System controller shall receive output signals from stand-alone boiler controller by means of data communication link. Other variables requiring monitoring shall be sent to CMS as analog or discrete contact closure signals. If existing boiler control system is utilized, provision shall be made to acquire data from these controllers, preferably by means of serial communication links. If it is not feasible to establish serial communication links, variables to be monitored shall be sent to CMS as appropriate analog or discrete signals. CMS controller shall apply calibration factors to analog inputs accessed from recorders, controllers and transmitter as required.

2.7.14.2 Variables to be Accessed from Boiler Control systems

At a minimum, data for the following variables shall be accessed from boiler control system:

a. Steam pressure in kPa psig.
b. Steam pressure setpoint in kPa psig.
c. Steam flow in thousands of kg/hr lb/hr.
d. Flue gas temperature in degrees C degrees F.
e. Flue gas oxygen in percent.
f. Opacity in percent.
g. Fuel oil flow in R/sec GPH.
h. Fuel oil supply pressure in kPa psig.
i. Fuel oil supply temperature in degrees C degrees F.
j. Natural gas flow in thousand standard cubic meters.
k. Natural gas supply pressure in psig.
l. Boiler control system power ON or OFF.
m. Fuel selected: GAS, OFF or OIL.
n. Purging.
o. Ready.
p. Pilot ON.
q. Fuel oil ON.
r. Natural gas ON.
s. Emergency trip.
t. Boiler efficiency.

2.7.14.3 Alarms to be Accessed from Boiler Control Systems

At a minimum, following alarms shall be accessed from boiler control system:

a. High steam pressure.
b. High water level alarm.
c. Low water level alarm.
d. Low water cutoff.
e. High natural gas pressure.
f. Low natural gas pressure.
g. Low atomizing steam pressure.
h. Low fuel oil pressure.
i. Low fuel oil temperature.
j. Low oxygen level.
k. Flame failure.
l. High opacity.

2.7.15 Balance of Plant (BOP) Variables

a. Status of equipment common to all boilers and any other plant variables not part of any boiler control system shall be monitored directly by the CMS controller via input-output interface modules. Input-output modules shall be analog, discrete or communication ports as required. Discrete inputs-outputs shall be isolated or nonisolated as required by prevailing conditions. System controller shall apply calibration factors to raw analog transmitter output as required.

b. Controller inputs-outputs shall include, but shall not be limited to, those indicated.

2.7.15.1 BOP Variables to be Monitored:

Following balance of plant variables shall be accessed from dedicated instruments or controllers:

a. Outside air temperature in degrees C.
b. Steam header pressure in [ KPA] [MPA].
c. Boiler feedwater temperature in degrees C.
d. Boiler feedwater flow in liters gallons per minute.
e. Boiler feedwater pressure in [KPA] [MPA] PSI.
f. Boiler water makeup flow in liters gallons per minute.
g. Air Compressor status (one per compressor).

h. Boiler Feed Pump status (one per pump).

i. Condensate Transfer Pump status (one per pump).

j. City water supply valve status ("OPEN" or "CLOSE").

k. Fuel Oil Pump status (one per pump).

2.7.15.2 BOP Alarms

Following alarms shall be accessed from dedicated instruments or controllers:

a. Air Compressor Low Pressure (one per compressor).

b. Condensate Transfer Pump Trip (one per pump).

c. Fuel Oil Pump Trip (one per pump).

d. Deaerator Tank Level High.

e. Deaerator Tank Level Low.

f. Atmospheric Condensate Receiver Level High.

g. Atmospheric Condensate Receiver Level Low.

h. Heating Plant Pressure Receiver Trouble.

i. Water Softener Trouble.

j. Blow Off Separator High Level.

2.7.16 Uninterruptible Power Supply (UPS)

Provide a [_____] kVA UPS, with a minimum run time of thirty five (35) minutes at full load to power work stations and their peripherals, controllers and input-output systems.

2.7.17 Monitoring and Communication Cables and Associated Raceways

Monitoring and communication cables, wiring, and associated raceways, including conduit, junction boxes, and fittings shall be provided in accordance with applicable sections of specifications. Contractor is responsible for providing cables required as indicated in these specifications and to provide a complete and working system. Cables shall be as required for connection between CMS equipment, boiler controllers and field devices.

2.7.18 Remote Communication Interface Modem

System shall have auto dial-auto answer modem suitable for use with voice grade telephone lines. Communications shall be in English language and limited to ASCII character codes. System shall be capable of automatically dialing up in both pulse and tone dial mode.
2.7.19 Instrument Power Supply

Instrument power supplies, as necessary, shall be provided to power panel and field mounted instruments, including instruments within instrument cabinets and back-of-panel components. Power supplies shall provide regulated plus-minus 24 V dc or as required for transmitter and transducer power requirements. Select power supply current rating based on loop burden. Instrument power supply shall meet the following requirements:

a. Input power to the instrument power supply shall be 120 V ac, 60 Hz, single-phase. Power supply shall be wired as a tap circuit through a separate pull-out type fusible block rated 300 V ac minimum at rated amperes, and shall be wired to the same branch circuit as CMS controller.

b. Power supply shall be provided with output current protection.

c. Power supply shall be supplied with brackets for installation on mounting panels within the CMS cabinet.

2.7.20 System Architecture

System shall be designed in modular fashion. Provide spare capacity of the following:

a. Input, digital - 25 percent.

b. Input, analog - 25 percent.

c. Controller memory - 25 percent spare.

d. Output digital - 10 percent.

e. Output analog - 10 percent.

2.7.20.1 Inputs

CMS controller shall be capable of accepting inputs as described below:

a. Analog Inputs (AI): Analog inputs originating from sensing elements shall be monitored and buffered as AI, except that automatic conversion to proper engineering units shall occur without any additional signal conditioning as follows:

(1) Temperature inputs from thermistors or RTDs or temperature transmitters shall be converted to degree C,

(2) Flow inputs from flow transmitters shall be converted to liter per minute, cubic meter per minute or as specified in process and instrumentation diagram.

(3) Valve or damper position from potentiometer or similar device shall be converted to percent open.

(4) Pressure input from pressure transmitter shall be converted to mm of water kPa as specified in process and instrumentation diagram.

b. Discrete Inputs: CMS controller shall accept discrete signal from
device such as contactor, relay, limit switch, pressure switch, and temperature switch. Input shall be device capable of withstanding continuous shorting to 120 V ac or to 1500 volts for fifty (50) microseconds.

2.7.20.2 Outputs

Controllers shall be capable of directing outputs as follows:

2.7.20.2.1 Analog Outputs (AO)

Analog outputs as direct or reverse function of associated analog inputs shall modulate final elements in response to controller algorithms. Final element actuators shall be industrial grade capable of accepting a modulated [electronic] [pneumatic] signal from the controller [via a signal converter, current to pneumatic]. Electronic signal shall be 4-20 mA dc with a minimum of 16 [_____] bit resolution. [The pneumatic signal shall be 21 to 34 kPa 3 to 15 psi. Each pneumatic output shall have feedback for monitoring of the actual pneumatic signal.]

2.7.20.2.2 Digital Outputs (DO)

Digital outputs shall command equipment to the selected position via schedules and programs. Contact closure with contacts rated at a minimum of 1 ampere at 24 volts shall be provided. The output signals shall include, but not limited to:

a. Enable-Disable.
b. Start-Stop.
c. On-Off.
d. Open-Close.
e. Demand Limit
f. Temperature Reset.
g. Boiler Selection
h. Floating Control.

2.7.20.3 Program Storage

CMS controller shall be able to store programs on a solid state memory PC card, a hard disk drive, or a CD-RW reader-writer-rewriter disk drive requiring no front end computer for the data conversion.

2.7.21 System Software

CMS controller program code shall be documented sufficiently that operator can modify controller logic and setpoints. Software provided shall include, but not be limited to, operating systems, communication control, definition of process, operator interface, and system services. Provide Read Only Memory [ROM] and Programmable Read Only Memory [PROM] as required, as resident operating system. Application software shall be RAM resident. Bulk storage devices, such as magnetic disks, shall not be used in an interactive on-line mode, but may be added for extended data storage.
2.7.21.1  Trend Logging.

Operator shall be able to initiate a custom log for any variable value in the control program. Operator shall select type of log, number of values log shall contain, and time interval between values. Trend log activation period shall be assignable from keypad by day, month, year, and time span desired for each log.

2.7.21.2  Alarm Reporting.

Control system shall be capable of analyzing any variable in the program and evaluating for alarm condition. Alarm can be generated based on analog value out of limits or based on a programmed sequence of events. System shall store alarms in log upon each occurrence and shall be capable of reporting them immediately.

2.7.21.3  Alarm Lockout Routine.

Alarm lockout routine shall be provided to inhibit nuisance alarms.

2.7.22  Documentation

Following documentation shall be provided:

2.7.22.1  List of Hardware

Complete list of hardware required to provide a complete and fully functional CMS.

2.7.22.2  Input and Output Point List.

Complete input and output point list.

2.7.22.3  Operating and Maintenance Manuals.

Operating and maintenance manuals providing functional description of proposed equipment, and descriptions of maintenance on system components. Operating and maintenance manuals shall cover inspection, periodic preventive maintenance, fault diagnosis, replacement and repair of defective components.

2.7.22.4  Equipment Installation Details.

Detail drawings shall be submitted showing installation requirements for each component of the CMS.

2.7.22.5  System Interconnection Block Diagram.

System interconnection block diagram shall show the interconnection of components in the CMS network.

2.7.22.6  Software Manual

Software manuals describing programming and testing for CMS controller and containing system overview with detailed description of software features. Software manuals shall instruct operator on programming CMS controller, including control programs, algorithms, mathematical equations, variable, setpoints, time periods, messages, and other information necessary to load,
alter, test, and execute system operation. Software manual shall include:

a. Complete description of programming language, including commands, algorithms, printouts and logs, mathematical calculations, and passwords.

b. Instructions on modifying any algorithm or parameter, verifying errors, status, changing passwords, and initiating or disabling control programs.

c. Software documentation providing easy reference from summary sheets which compare pertinent information about hardware, and wiring information in the field. Documentation shall include:

(1) Complete point identification, including terminal number, symbol, engineering units, control program reference number, and logic printout.

(2) Setpoints for various analog input loops.

(3) Field information including location, device, device type and functions.

(4) Location identification of the CMS hardware.

2.7.23 Equipment Cabinet Factory Wiring

Internal equipment cabinet wiring shall be factory installed, color coded and bundled neatly or routed via wiring duct. Installation of cables and wiring shall be as specified.

2.7.23.1 Termination

Terminations shall be made with pressure type connectors or lugs. Stranded conductors shall not be wrapped around screw type terminals. Incoming cables shall be connected to CMS controller via terminal blocks. Internal wiring shall be terminated at one side of the terminal blocks.

2.7.23.2 Nameplate for Device Inside Equipment Cabinets.

Nameplate for device mounted inside equipment cabinet shall be stamped with the device number only. Nameplate shall be 10 mm 3/8 inches wide stainless steel tape, attached to the device with stainless steel wire.

2.7.24 Continuous Emissions Monitoring

***************************************************************
NOTE: A continuous emissions monitoring system (CEMS) is required by the Clean Air Act Amendment (CAAA) of 1990 if the fuel utilized is oil or coal and the heat input is 3 megawatt 10 million BTU/HR or greater. A CEMS may also be required by state or local laws. If a CEMS is necessary the designer shall review the CAAA and the relevant state or local law early in the project to allow time to incorporate the required CEMS specification and to determine which flue gas emissions will be included in the required reports. Before acceptance of the installation, the Contracting Officer shall be
furnished a written test report which provides documentation that the CEMS equipment has passed factory and field certification tests required by federal, state and local regulations. The investigation will determine if the reported values may be calculated or should be direct measurements. The CAAA includes measurement options for gas/oil fired units depending upon the particular category of unit as defined by the regulations. Fill in the data to state what method of measurement or calculation will be utilized for the determination of the report variable.

Emerging flue gas flow monitor technologies are available. The traditional differential pressure technique specified uses familiar equipment that can be maintained by plant personnel. This type of measurement device has reliably satisfied regulatory requirements. The possible use of other technologies should include a thorough investigation of flue gas flow monitor regulatory requirements and in-house maintenance capabilities.

**************************************************************************

a. Continuous emissions monitoring system (CEMS) equipment shall be provided as a system by a single manufacturer. CEMS, meeting requirements of applicable federal regulations, State of [_____] and local regulations, shall be provided for boiler in accordance with manufacturer's recommendations and under direct supervision of CEMS equipment manufacturer.

b. Reported data shall include [sulfur dioxide (SO$_2$)] [oxides of nitrogen (NO$_x$)] [carbon monoxide (CO)] [carbon dioxide (CO$_2$)] [particulate matter (PM)] and other information required by federal, state, and local regulations. SO$_2$ reporting shall be based on [analyzer measurement] [fuel flow and percent sulfur calculation] [daily heat input calculation]. Nitrous oxides, carbon oxides and particulate matter reporting shall be based on analyzers.

c. The CEMS equipment shall include central processing unit, printer, hard disk drive, and floppy disk drive. Floppy disk drive shall function as recorder. Manufacturer shall provide software to generate required reports in format acceptable to federal, state and local regulatory agencies. Operator interface to CEMS equipment shall be by means of CRT display.

2.7.24.1 Gaseous Emissions Monitor

Extractive or in-situ gaseous emissions monitors shall be provided. Combination of extractive and in-situ monitors is not acceptable. Gaseous emissions monitors shall include automatic calibration checks. Alarm horn and annunciator shall be provided to alarm when any monitored parameter is out of range or gaseous emissions monitor malfunctions. Surfaces exposed to corrosive gas of boiler shall be constructed of noncorrosive materials such as 316 SS, Teflon or Hastelloy.

Extractive systems shall be [wet] [dry] [diluted]. Analyzing equipment for extractive system shall be [rack-mounted] [located in a walk-in cabinet].
2.7.24.2 Flue Gas Flow Monitor

Flue gas flow monitor shall utilize the pitot tube principle to measure flue gas flow. Flue gas flow monitor base shall be across-the-duct average pitot tube and shall be properly designed and located to obtain representative measurement. Differential pressure transmitters shall be used to sense the difference between the static and total pressure of the flowing flue gas stream. Calibrations shall be stable.

2.7.24.3 Particulate Matter Opacity Monitor

Particulate matter opacity monitor shall be based on principle of transmissometry. Transmissometer shall include automatic simulation of zero opacity and up scale check of calibration while boiler is in service without dismounting monitor. Calibration check shall include analyzer internal circuitry and electronic circuitry. Alarm horn and annunciator shall be provided to annunciate excess opacity and system malfunction. Monitor shall be provided with fans to keep sending and receiving lenses pressurized and blown clean at all times.

2.7.24.4 Wiring

CEMS equipment shall be provided with plug in prefabricated cable for interconnection between components. Power supply to the equipment shall be 2 wire, 120 volt nominal or less, 60 Hz, with one side grounded. Electrical devices shall be connected as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

2.8 BOILER FEEDWATER SYSTEM

2.8.1 Deaerators

**************************************************************************
NOTE: Deaerator manufacturers should be consulted regarding specific features of construction for a particular application. Specifications are included for atomizing spray-type, tray-type, and atomizing spray, two tank type deaerators. Careful consideration will be given to the type of deaerator selected. Tray type is preferred however it requires more space than the other types. To satisfy shipping requirements or where access is limited, the deaerator may be knocked down and field assembled. Select applicable pump type and control.
**************************************************************************

2.8.1.1 Components

Deaerator shall be complete package by one manufacturer including receiver with deaerating section, pumps, electrical control and accessories. Deaerator components shall include but not be limited to the following:

a. Storage tank.

b. Deaerator [spraymaster] [or ] [column.] ASME PTC 12.3.

c. Water inlet atomizing valve.

d. Steam inlet atomizing valve.
e. Deaerator manual and automatic vents.
f. Gauge glass.
g. Steam pressure gauge.
h. Feedwater thermometer.
i. Tappings.
j. Water level controller with makeup valve.
k. Three valve by-pass and strainers for control devices.
l. Steam relief valve.
m. High water level alarm.
n. Low water level alarm.
o. High temperature condensate diffuser.
p. Boiler feed pump and motor sets.
q. Recirculation orifice.
r. Pump suction shutoff valve.
s. Suction strainer.
t. Suction flexible fitting.
u. Pump discharge shutoff valve.
v. Pump discharge pressure gauge.
w. Pump discharge manifold.
x. Overflow drain connection.
y. Control panel.
z. Chemical feed quill.
aa. Vacuum breaker.
bb. Sentinel relief valve.
c. Tank drain valve.

2.8.1.2 Deaerator, General Requirements

Deaerator water storage tank shall be [_____] mm inches diameter, [_____] mm inches long.

a. Storage tank section shall have [_____] minutes of storage and have a capacity of [_____] liters gallons measured to overflow. An 280 by 380 mm 11 by 15 inch elliptical manhole shall be provided for access.
Deaerator shall be rated at [_____] kg pounds of steam per hour.

b. Deaerator shall be designed to remove dissolved oxygen in boiler feedwater to 0.005 cc/liter or less and eliminate carbon dioxide at any load between 5 and 100 percent of rated capacity.

c. Tank shall be of welded steel construction built in accordance with Section VIII of the ASME pressure vessel code for 345 kPa 50 psig at [_____] degrees C degrees F and stamped accordingly. Internal surfaces which come in contact with underaerated water shall be constructed of Type 316 stainless steel.

d. Deaerator shall be provided with manual and automatic vent valves. Automatic vent valve shall be thermostatically controlled to provide fast venting of sudden buildup of gases. Manual vent valve shall have an orifice for continuous minimum venting. Manual minimum venting rate shall not exceed 0.1 percent of rated deaerator capacity. Deaerator shall be suitable to operate from 13.6 to 102 kPa 2 to 15 psig.

e. Deaerator stand shall be steel fabricated of appropriate height for the feed pump-motor set, and mounted on a solid base. The base shall be reinforced to prevent vibration.

f. Nozzles 100 mm 4 inches and under shall be 1350 kg 3000 pounds forged steel couplings. Nozzles 63.5 mm 2-1/2 inches and over shall be 1.03 MPa 150 psig rated flat face flanges.

g. Pump-motor set shall be mounted on individual base before mounting on the stand base. Individual suction piping, including strainer, shutoff valve and flexible connector, shall be provided for pump. Pump suction nozzle shall be provided with vortex breakers to eliminate loss in NPSH and cavitation. Connections shall be as shown.

h. Interior of the tank shall be factory-lined with high quality baked epoxy lining. Lining shall be applied to white metal surface in accordance SSPC SP 5/NACE No. 1. Four to six coats shall be applied with each dry coat being approximately 0.38 mm 1.5 mils dry, for a total thickness of 0.152 mm 6 mils dry minimum. Lining shall be holiday spark tested using low voltage and a wet sponge to ensure uniform coating free of pin holes.

i. Exterior shall be primed with a high heat silicone acrylic primer, 0.05 mm 2 mil minimum DFT.

2.8.1.3 Deaerator, Atomizing Spray-Type

Deaerator shall be atomizing spray-type, pressurized horizontal type. Heads shall be ASME torispherical type constructed of ASTM A516/A516M GR 70 carbon steel with a minimum thickness of 6.35 mm 0.25 inch. Shell plate shall be fabricated of ASTM A36/A36M carbon steel with minimum thickness of 6.35 mm 0.25 inch. Main deaerating portion, located internally, shall consist of water collector and steam atomizing valve. Spring loaded water spray nozzle which includes automatic and manual vent valves shall be built into a flange on top of the tank.

2.8.1.4 Deaerator, Tray-Type

Deaerator shall be tray-type with spray manifold in a 300 Series stainless steel deaeration dome with integral cascade trays, pressurized horizontal
Deaeration dome with integral cascade trays containing a spray manifold with stainless steel spray nozzles shall be flange mounted to the boiler feed receiver. Spray manifold shall be flange mounted to the dome. Flange opening shall be large enough to permit the manifold to be easily withdrawn for servicing. Direct injection steam heating assembly shall be installed in the receiver. Heating assembly shall consist of double flange mounted injection pipe, steam control valve, pressure-temperature regulator, wye strainer and pressure gauge.

2.8.1.5 Deaerator, Atomizing Spray Two-Tank Type

a. Deaerator shall be atomizing spray-type two-tank, divided into two separate sections. Deaerator water storage and condensate surge sections shall be divided by a double inner head. Air space between 2 inner spaces shall be packed with fiberglass insulation and shall have a breather and drain connections. Shell plate shall be fabricated of ASTM A36/A36M carbon steel with minimum thickness of 6.35 mm 0.25 inch. Heads shall be ASME torospherical type constructed of ASTM A516/A516M GR 70 carbon steel with a minimum thickness of 6.35 mm 0.25 inch.

b. Surge tank section shall have [_____] minutes of storage and shall have a capacity of [_____] liters gallons flooded. A 280 by 380 mm 11 by 15 inch elliptical manhole shall be provided for access. ASME stamp is not required for the surge tank.

c. Surge tank shall receive returning condensate and be supplemented by makeup by water to maintain desired operating level. Surge tank shall be vented to the atmosphere. Collected water shall be transferred to deaerator. Main deaerating portion shall be located in deaerator storage tank and shall consist of water collector and steam atomizing valve. Built into a flange on top of deaerator storage tank is a spring loaded water spray nozzle which includes an automatic and manual vent valve.

d. Deaerator and surge tank support shall be of appropriate height to meet the NPSH requirements of the transfer pumps and feedwater pump/motor set.

e. Height of deaerator support shall not exceed 1220 mm 48 inches.

2.8.1.6 Chemical Feed Quill

Chemical feed quill shall be located beneath the normal tank water level. Chemical feed quill material shall be stainless steel. Chemical feed quill shall provide even distribution and bleeding of chemicals.

2.8.2 Boiler Feed Pump

**************************************************************************
NOTE: Pump manufacturers should be consulted regarding specific features of construction for a particular application. In general, for lower pressure and flow applications vertical in-line pumps with stainless steel shafts and impellers can be applied. Cast iron or cast steel casings could also be used for these applications. Horizontally split pump casing specifications should require nozzles on the suction and discharge and feet on the lower half of the casing so the top half of the
casing can be removed without disturbing the main piping. Designer is required to determine the upper temperature limit for pumps based on the project requirements. Delete design conditions if pump schedule is shown on the drawings.

For installations including more than one boiler feed pump, each boiler feed pump shall be identical [_____] L/hour gpm, [vertical in-line] (horizontally split case, multi-volute or diffuser), centrifugal, self-contained, multistage pump. The nomenclature used in these specifications pertaining to pumps and hydraulic conditions is as used by the Hydraulic Institute Standards for Centrifugal, Rotary and Reciprocating Pumps.

2.8.2.1 Design Conditions

| Number of pumps | [_____] |
| Rated capacity of each pump | [_____] L gpm |
| Total dynamic head at rated capacity | [_____] L gpm |
| Net positive suction head available | [_____] m Feet |
| Maximum allowable shutoff head | [_____] m Feet |
| Minimum allowable shutoff head | [_____] m Feet |
| Type of fluid pumped | Boiler Feedwater |
| Max. expected temp. of fluid | [_____] degrees C degrees F |
| Maximum speed of pump | 3600 rpm |

2.8.2.2 Construction Materials

Pump shall have [_____] Class [_____] suction flange and [_____] Class [_____] discharge flange. Shaft, impeller, and internals including sleeves and wearing rings shall be stainless steel containing not less than 11 percent chromium. [Horizontal pump impellers shall be closed type, cast in one piece.] Casing shall be 11 to 13 percent chromium steel. [Suction and discharge chamber shall be cast iron.] [Horizontal pump shall be designed to pump water at any temperature from 10 to [_____] degrees C 50 to [_____] degrees F without undue temperature strains within pump. Rotating parts shall be properly balanced. Assembled rotor shall be dynamically balanced. Casing volutes shall be staggered to ensure radial balance of the assembled rotor under operating conditions. On volute pumps, impeller shall be mounted on the shaft half facing in one direction and the other half facing in the opposite direction to give axial balance to the motor.]

2.8.2.3 Cooling Water Piping

Pump shall be furnished with complete cooling water system which connects jacket cooler to common header. Piping shall be factory assembled as completely as possible on the pump. Seal flush piping shall be Type 316...
stainless steel. Seal flush cooler tubing shall be Type 304 stainless steel. Flow regulating valve and 6.35 mm 1/4 inch bypass needle-valve shall be provided on each supply branch.

2.8.2.4  Bearings

[Horizontal pump shall include a double row ball type thrust bearing on the outboard end and a single row deep groove radial bearing on the inboard end. Splash type bearing lubrication shall be provided.]

[Vertical type pump bearings shall be water lubricated sleeve type constructed of babbitted graph alloy with Type 304 stainless steel shaft sleeves.] The bearings shall be designed for L-10 bearing life of [_____].

2.8.2.5  Shaft Sealing System

[Vertical pump shall be equipped with an effective mechanical shaft seal to seal.] [Horizontal pump shall be fitted with balanced mechanical seals, pressurized type, tungsten carbide and carbon sealing faces especially designed for high temperature, high pressure boiler feed pump service. Mechanical seals shall be provided with pumping rings. Complete field flush piping from each mechanical seal to its respective seal cooler shall be provided with a temperature alarm thermometer, adjustment for silencing, range of 10 to 204 degrees C 50 to 400 degrees F with contacts suitable for 100 milliamperes at 125 V dc, closing on rise of temperature.]

2.8.2.6  Shaft Coupling

[Shaft coupling between vertical pump and drive shall be direct coupled type.] [Horizontal pump shall be direct connected to its motor by means of a spacer disc type coupling. Spacer piece provided between motor and pump shall facilitate removal of coupling flanges and mechanical seals without disturbing the pump or motor hold-down bolts. Disc coupling shall be limited and float. Disc shall be stainless steel. Suitable coupling guards shall be furnished.]

2.8.2.7  Special Tools

Complete set of special tools shall be furnished as required for assembly, disassembly or maintenance of pumps.

2.8.2.8  Pump Characteristics

a. Pump discharge head shall be such that the maximum discharge head occurs at shutoff and continually decreases as pump delivery increases. Head capacity characteristics shall permit stable operation when pump is operating alone or in parallel with another pump.

b. Pump shall have shutoff head of not greater than 150 percent and not less than 115 percent of design head. Design point capacity on the selected pump curve shall be within 25 percent of the capacity at the best efficiency point for the impeller selected. Minimum flow required for continuous pump operation shall not be greater than 30 percent of the specified design flow for each pump.

c. Pump shall have efficiency of 60 percent or greater at rated capacity.
2.8.2.9 Horizontal Pump Accessory Equipment

Following shall be provided as package from pump manufacturer:

a. Pump and drive, mounted on a suitable, full length baseplate.

b. Suitable vent valves for the pump.

c. Stainless steel orifice plate for minimum flow across the pump.

d. Standard accessories and integral piping required for complete unit.

e. One flanged end suction tee type strainer of corrosion resistant materials, of size compatible with suction piping. Tee type strainer shall have fine mesh screen fitted over it for use during startup period. Fine mesh screen shall be removed after condensate system is clean.

f. One set of spare pump gaskets and "O" rings.

g. Renewal parts for mechanical pump seal.

2.8.3 Deaerator Control

Deaerator manufacturer shall furnish completely wired control cabinet, mounted on pump unit or free-standing. Cabinet shall have hinged door and include the following:

a. Combination magnetic starters having 3 overload relays, with circuit breakers and cover interlocks.

b. Auto Lead-Lag-Off-Continuous selector switches.

c. Pilot lights indicating pump operation.

d. Control circuit disconnect switch.

e. Terminal block.

f. Control circuit transformer, fused.

g. Momentary contact Test pushbuttons.

h. Deaerator Control Panel meeting the following requirements:

(1) Construction: Deaerator control panel shall be properly sized to contain control devices, instrument gauges and meters. Deaerator control panel shall be unit mounted or free-standing with face-plate of not less than 4.7 mm 3/16 inch reinforced steel plate. Control cabinet shall be factory-assembled steel enclosure with locking door. Panel shall be NEMA 4 construction, 12 gauge steel all welded construction with minimum radius corners, stiffened as required and framed with angles. The door shall be constructed of 12 gauge steel with door clamps and continuous hinge. Door shall be fully gasketed.

(2) Wiring: Deaerator control panel shall be wired in accordance with NPPA 70 and shall have individual motor starter with 120 volt holding coil and fuse protection. Individual green oil-tight pump
run lights shall be provided. Switches and light shall be NEMA 4 rated and have nameplate identification. Paralleling of individual control power transformers will not be permitted. Panel shall be provided with main disconnect device, consisting of nonfused disconnect or nonautomatic circuit breaker. Disconnect shall be equipped with mechanical door interlock preventing door opening the disconnect in closed position. Fusing shall be cartridge type. Dual element, current limiting, time delay safety switches shall be multiple horsepower rated, heavy duty type. Magnetic motor starter for motor assembly shall be NEMA type, full voltage, non-reversing, overload protected for each phase, with auxiliary contacts. Overload relay shall be trip-free, thermal bimetallic, manual reset with trip heaters based on actual full load current of motor. Spare NO and NC auxiliary contacts wired to the terminal block shall be provided. Control power transformer with primary fuse disconnect and secondary fusing shall be provided. Factory mounted and wired control shall be provided, arranged to receive a signal from the boiler plant master controller and water regulating valve assembly. Quantity of deaerator feedwater pumps shall match quantity of boilers. Panel mounted Lead-Lag-Off-Continuous switch for each feedwater pump shall be provided.

(3) Sequence of Operation: From cold start of plant, when plant master controller indicates one boiler to start, lead pump shall start. When second boiler is indicated to start, lag pump shall start and this process shall continue for additional boiler starts. Feedwater pumps shall run continuously. When one boiler shuts down, one feedwater pump shall shut down. When all boilers are off, all pumps shall be off. Should there be a failure of any pump, the next pump in sequence shall operate automatically. Audible and visual high and low water level alarms shall be provided by bell or horn with silence switch and individual red oil tight lights. A low-low water level signal shall cut off feedwater pumps. Deaerator water level control system shall provide a 4-20 mA dc signal to the condensate receiver control panel to start transfer pumps.

2.9 CONDENSATE RETURN SYSTEM

**************************************************************************
NOTE: Coordinate the components of this system with the deaerator selection. Some components are specified with the two tank-type deaerator.
**************************************************************************

Condensate return system shall be factory assembled package system including condensate surge tank, transfer pumps, controls, auxiliary equipment and piping as shown.

2.9.1 Condensate Surge Tank

The condensate surge tank shall be [___] mm inch diameter by [___] mm inch long with 280 by 380 mm 11 by 15 inch elliptical manhole. Condensate surge tank shall have [___] minutes of storage and capacity of [___] liters gallons flooded. Condensate surge tank, base, piping nozzle construction shall be as specified. The condensate surge tank shall include the following:
a. Required tappings and manway.
b. Thermometer.
c. Gauge glass.
d. Water level controller with make-up valve.
e. Three-valve bypass and strainer for control devices.
f. Suction shutoff valve.
g. Suction strainer.
h. Suction flexible fitting.
i. Pump discharge check valve.
j. Discharge shutoff valve.
k. Pump suction and discharge gauge.
l. Discharge manifold.
m. Chemical feed quill.
n. Sparge tube.
o. High water level alarm.
p. Low water level alarm.
q. Low water pump cut-off.
r. Recirculation orifice.
s. Insulation and lagging.
t. Transfer pump and motor.
u. Control panel.

2.9.1.1 Gauge Glass

Surge tank shall have gauge glass assembly that covers entire tank diameter. Gauge glass shall be quartz 16 mm 5/8 inch diameter by 610 mm 24 inch maximum length. Gauge glass shall be furnished with bronze gauge cock set and protector rods.

2.9.1.2 Makeup Valve and Controller

a. Makeup valve shall be motorized with steel body and threaded connections. Makeup valve actuator shall be gear type directly coupled to the valve stem and shall be electronically controlled by solid state controller with internally mounted capacitance probes. Controller shall maintain water level setpoint. Controller shall be provided with hand selector for automatic and manual operation. Makeup valve shall not exceed 69 kPa 10 psig pressure drop and shall be rated for 150 degrees C 300 degrees F.
b. Makeup valve shall be rated for [_____] kPa psi 1/hr. inlet pressure and valve C_v shall not exceed [______]. Controller shall include two additional probes for high and low water level alarms.

2.9.1.3 Sparge Tube

Sparge tube shall be located beneath normal tank water level. Sparge tube shall be constructed of 50 mm 2 inch pipe. Sparge tube shall provide even distribution of high pressure condensate return.

2.9.2 Condensate Pump

******************************************************************************
NOTE: Pump manufacturers should be consulted regarding specific features of construction for a particular application. Specifications are included for horizontal end suction and vertical type pumps. Careful consideration will be given to the type of pump selected. The Pump Column paragraph applies only to vertical type pumps and should be deleted if horizontal type pumps are selected. Delete design conditions if pump schedule is shown on drawings.
******************************************************************************

Condensate pumps shall be [_____] identical [_____] L/hour gpm, [horizontal end suction ANSI size A70 type pumps][vertical type pumps with suction barrels] type. Nomenclature used in this specification pertaining to pumps and hydraulic conditions is that used by the Hydraulic Institute Standards for Centrifugal, Rotary and Reciprocating Pumps.

2.9.2.1 Design Conditions

| Number of pumps | [_____] |
| Rated capacity of each pump | [_____] L gpm |
| Total dynamic head at rated capacity | [_____] L gpm |
| Net positive suction head available | [_____] m Feet |
| Maximum allowable shutoff head | [_____] m Feet |
| Type of fluid pumped | Boiler Feedwater |
| Maximum expected temperature of fluid | [_____] degrees C degrees F |
| Maximum speed of pump | 1800 rpm |

2.9.2.2 Construction and Materials

Pump shall be [centrifugal, horizontal end suction, top discharge type] [vertical, multistage, self contained type with suction barrel]. The pumps shall include [_____] Class [_____] suction flange and [_____] Class [_____] discharge.
2.9.2.3 Casing and Casing Bowls

Pump [casing] [casing bowls] shall be flanged and bolted with jacketing top bolt.  [Casing shall be constructed of ductile iron ASTM A395/A395M, Grade 60-40-18.]  Casing bowls shall be flanged, constructed of ASTM A48/A48M Class 30 cast iron equipped with pinned, replaceable wearing rings constructed of ASTM A276/A276M Type 316 stainless steel with 11 to 13 percent chrome hardened to 450 BHN.  Bowls shall be unlined.  Bowl assemblies shall be designed to withstand an operating pressure of 4.3 MPa 630 psi.  [Minimum casing thickness for horizontal pumps shall be 12.7 mm 1/2 inch thickness with an additional 3.2 mm 1/8 inch corrosion allowance.]

2.9.2.4 Impeller

[Impeller for horizontal type pump shall be totally open type, screw mounted directly to shaft with an O-ring seal and constructed of ductile iron ASTM A536, Grade 60-40-18.  Impeller shall be dynamically balanced to the maximum rated speed.]  [Impeller for vertical can type pumps shall be enclosed, split ring, key mounted type and shall be constructed of 11 to 13 percent chrome steel in accordance with ASTM A743/A743M or 316 SS ASTM A290/A290M GR CF-8M.  Impeller shall have replaceable wearing rings constructed of 11 to 13 percent chrome hardened to 300 BHN.  Impeller shall be statically and dynamically balanced to maximum rated speed.  Impeller shall be 95 percent of maximum allowable impeller diameter.]

2.9.2.5 Pump Shaft

[Pump shaft and shaft sleeve for horizontal pumps shall be constructed of Type 316 stainless steel.  Shaft diameter and design shall be sufficient to transmit at least 2.5 times rated motor power of the pump.]  [The pump shaft for vertical type pumps shall be one piece and constructed of ASTM A582/A582M Type 416 stainless steel.  Largest diameter shaft available for use with selected impeller shall be supplied and shall be able to transmit at least 2.5 times rated motor power.]

2.9.2.6 Pump Construction

[Pump and bearing frame and housing shall be constructed of cast iron, ASTM A48/A48M.]  [Discharge head and suction barrel with mounting flange shall be constructed of carbon steel, designed in accordance with ASME BPVC SEC VIII D1 with a 7.6 mm 300 mil corrosion allowance.  Sole plate shall also be provided constructed of a minimum of 25 mm 1 inch thick carbon steel plate with a minimum of four 19 mm 3/4 inch anchor bolts.  Welds on the pressure containing section of the pump shall be the full penetration type with welders and welding procedures in accordance with ASME BPVC SEC IX.  Suction barrel shall be sized so that the velocity in the barrel does not exceed 915 mm 3 feet per second at 150 percent of design flow.  Discharge head and can type shall be the "T" type configuration so that discharge and suction are above baseplate.  Suction barrel shall be of sufficient length to accommodate installation of 2 additional turbine stages.]

2.9.2.7 Pump Column

Pump column shall be flanged and constructed of carbon steel.  Pump column assembly shall be designed to withstand 4.1 MPa 600 psig and incorporate 7.6 mm 300 mil corrosion allowance.  Bearing retainers located in the pump column shall be constructed in a manner that will assure concentric alignment of the shaft within 0.13 mm 0.005 inches.
2.9.2.8 Miscellaneous Hardware

Bolts, lock washers, nuts and miscellaneous hardware used with casing, pump frame and gland shall be Type 316 stainless steel.

2.9.2.9 Shaft Sealing System

Pump shall be equipped with effective mechanical shaft seal to seal against discharge pressure when pump is operating. Seals shall be cartridge type with Hastalloy "C" bellows mounted on Type 316 stainless steel shaft sleeve. Seal faces shall be tungsten carbide versus silicon carbide. One spare mechanical seal shall be provided. Gland shall be flush vent and drain type constructed of ASTM A276/A276M Type 316 stainless steel. Bypass line, constructed of ASTM A269/A269M Type 316 stainless steel, from the stuffing box to the suction side of the pump shall also be provided.

2.9.2.10 Pump Bearings

[Horizontal end suction pump bearings shall be anti-friction type and shall operate in oil bath. Pump bearings shall be designed for radial and unbalanced axial loads imposed by the pump.] [Vertical type pump bearings shall be water lubricated sleeve type constructed of babbitted graph alloy with Type 304 stainless steel shaft sleeves.] The bearings shall be designed for L-10 bearing life of [_____] hours.

2.9.2.11 Shaft Coupling

Shaft coupling between the pumps and motors shall be the flanged, adjustable, rigid, spacer type with OSHA approved coupling guard. [On horizontal end suction type pump, this coupling shall facilitate removal of the mechanical seal without removing the driver.] Shaft coupling shall also be designed to transmit at least 2 1/2 times the motor power rating.

2.9.2.12 Painting and Corrosion Protection

Pumps, motors and accessories shall be protected prior to initial startup. Exposed unfinished work shall be thoroughly cleaned and smoothed. Surfaces which will not be in contact with the pumping fluid shall be factory painted with a finish coat. Internal surfaces shall be coated with a water soluble rust preventative material.

2.9.2.13 Special Tools

Complete set of special tools shall be provided, if required for assembly, disassembly or maintenance of pump.

2.9.2.14 Bedplate

Horizontal type pump shall include single bedplate long enough to accommodate pump, motor drive and cooler. Bedplate shall be in accordance with API and shall be of heavy rigid construction, made of suitably structural steel members and plate to provide a stable platform for pump, drive and accessories. Bedplate shall be suitably reinforced and braced to minimize deflection or bending during shipment and erection. Sufficient grout holes, minimum 75 mm 3 inch diameter, and grouting area vent holes in each corner of each grout space shall be provided. Bedplate shall include horizontal jacking screws and vertical leveling screws along the length and width. Provisions shall be made on the bedplate to collect drainage from
the unit at one point. The hold down bolts and dowel holes shall be located and drilled in field. Pump shall be mounted on bedplate at factory and shipped as unit with bedplate mounted on a suitable skid to prevent deformation of the bedplate during shipment and erection.

2.9.2.15  Alignment

Pump unit shall be precision aligned. Pump coupling, mechanical seal and motor shall be mounted and matchmarked prior to shipment. Maximum allowable shaft runout shall be \(0.05\) mm \(0.002\) inch as measured at impeller end.

2.9.2.16  Pump Characteristics

a. Pump discharge head shall be such that maximum discharge head occurs at shutoff and continually decreases as the capacity increases. Head capacity characteristics shall permit stable operation when pump is operating alone or in parallel with another pump.

b. Pump shall have a shutoff head of no greater than 150 percent and no less than 115 percent of design head. Design point capacity on the selected pump curve shall be within 25 percent of capacity at best efficiency point for impeller diameter selected to meet design point conditions. Minimum flow required for continuous pump operation shall not be greater than 30 percent of specified design flow for each pump.

c. Pump shall have efficiency of 50 percent or greater at rated capacity.

2.9.3  Sump Pump

Sump pump shall be provided for sump pit shown. Sump pump shall be heavy duty, upright type, certified by the Sump and Sewage Pump Manufacturers’ Association.

2.9.3.2  Construction

Bronze fitted cast iron volute with non-clogging cast bronze impeller and stainless steel sediment screen. Upright column shall be brass. Discharge connection shall be ISO NPT. High efficiency non-clogging impeller shall be furnished with stainless steel shaft journal and bearing suitably designed for intended service.

2.9.3.3  Backwater Valve

A backwater valve shall be provided in the pump discharge.
2.9.3.4 Float Switch

Float switch shall be actuated by an adjustable copper float mounted on stainless steel rod.

2.9.4 Pump Drive

**************************************************************************
NOTE: Delete the Steam Turbine Drives paragraph if all-electric motor drives are used and the Electric Drives paragraph if all-steam turbine drives are used.
**************************************************************************

2.9.4.1 Steam Turbine Drive

Steam turbine drive shall be rated for the specified operating conditions and designed in accordance with NEMA SM 23. Turbine shall be of the single or multiple valve design and utilize impulse type blading. Flexible support for thermal expansion shall be provided at governor end of turbine. Turbine shall be horizontally or vertically split case with metal to metal joints without the use of gaskets. Journal bearings shall be properly lubricated as recommended by turbine manufacturer for operating conditions. Anti-friction bearings shall have L-10 bearing life of [_____] hours. Thrust bearings shall be of [ball] [tilting pad] design. Turbine blading shall not be welded, shall be securely anchored, and shall be renewable. Blading material shall be minimum stainless steel and shall be suitable for steam quality and purity. Steam glands [interstage diaphragms] shall be sealed with carbon rings or labyrinths. Turbine shaft shall be finished with hard chrome in gland sealing zones. Turbine shall be provided with single governor to control valve(s). Governor shall be NEMA SM 23 Class [______]. Hand valves shall be furnished in cases where operating conditions will be substantially different than design or where future operating conditions will change. Overspeed trip set at 110 percent of the normal operating speed shall be provided. Overspeed trip shall be NEMA SM 23 Class [______]. Manual trip lever shall be included. Turbine shall be factory tested to check operation.

2.9.4.2 Electric Drive

Motor shall be [splashproof] [totally enclosed, nonventilated] [totally enclosed, fan cooled] [totally enclosed, fan cooled suitable for installation in a class II, division 1, group G hazardous location as defined in NFPA 70]. Motor starter shall be [manual] [magnetic] [across the line] [reduced voltage] type with [general purpose] [weather resistant] [watertight] [dust tight] [explosion proof] enclosure.

2.9.5 Condensate Return System Control

The condensate return system manufacturer shall furnish completely wired control cabinet, mounted on condensate return equipment or free-standing. Cabinet shall have hinged door and include the following:

a. Auto Lead-Lag-Off-Continuous selector switch.

b. Pump running Pilot light.

c. Control circuit disconnect switch.
d. Terminal block.
e. Control circuit transformer, fused.
f. Momentary contact Test pushbutton.
g. Control Panel meeting the following requirements:

(1) Construction: The condensate return surge tank control panel shall be properly sized to contain all control devices, instrument gauges and meters. Control cabinet shall be factory assembled steel enclosure with locking door. Panel shall be NEMA 12 construction, 11 gauge steel with key-locking vault handle, three (3) point latches, and continuous hinge. The door shall be fully gasketed.

(2) Wiring: Control panel shall be wired in accordance with NFPA 70 and shall have individual motor starter with 120 volt holding coil and fuse protection. Individual green oil-tight pump run lights shall be provided. Switches and lights shall have nameplate identification. Paralleling of individual control power transformers shall not be permitted. Panel shall be provided with a non-fuse disconnect or non-automatic circuit breaker main disconnect device. Disconnect shall be equipped with mechanical door interlock preventing door opening with the disconnect in the closed position. Fusing shall be cartridge type. Dual element, current limiting, time delay safety switches shall be multiple horsepower rated, heavy duty type. Magnetic motor starter for each motor assembly shall be NEMA type, full voltage, non reversing, overload protected for each phase, with auxiliary contacts. Overload relay shall be trip-free, thermal bimetallic, manual reset with trip heaters based on actual full load current of motor. Spare NO and NC auxiliary contacts wired to the terminal block shall be provided. Control power transformer with primary fuse disconnect and secondary fusing shall be provided. Factory mounted and wired control shall be provided, arranged to receive a signal from the deaerator water level assembly. A panel mounted Lead-Lag-Off-Continuous switch for feedwater pump shall be provided.

(3) Sequence of Operation: From a cold start, when the plant master controller indicates one boiler to start, the lead pump shall start and operate continuously. When all boilers are off, all pumps shall be off. Should there be a failure of any pump the next pump in sequence shall operate automatically.

2.10 BOILER BOTTOM BLOWDOWN TANK

Blowdown tank shall be [_____] mm inches diameter by [_____] mm inches high. Supports, associated accessories and appurtenances shall be as specified and shown. Blowdown tank shall be of welded steel construction built in accordance with ASME BPVC SEC VIII D1 and stamped for a 1.03 MPa 150 psig rating. Blowdown shall include a tangential inlet, size to match boiler blowdown pipe, stainless steel striking plate at point of inlet impingement, internal stainless steel flow restrictor plates, waterleg type drain vent, gauge glass opening, inspection opening and clean-out connections. Materials used in fabrication of boiler blowdown tank equipment shall comply with ASME BPVC SEC II-C. Inspection openings on tank shall be as required in paragraphs UG-45 and 46 of
ASME BPVC SEC VIII D1 and as shown. Connections shall be as shown. Interior surface preparation shall be in accordance with SSPC SP 5/NACE No. 1 and the coating manufacturer's recommendations. Interior shall be coated with a suitable baked epoxy phenolic coating, minimum 0.13 mm 5 mil DFT. Exterior surface preparation shall be in accordance with SSPC SP 6/NACE No.3 and the coating manufacturer's recommendations. Exterior shall be primed with a high heat silicone acrylic primer, minimum 0.05 mm 2.0 mil DFT. The blowdown tank shall be supplied with drain aftercooler and temperature regulating valve. Aftercooler shall be provided with cold water inlet, flanged body for easy removal, 6.35 mm 1/4 inch NPTF connection for temperature regulating valve sensing bulb. Valve adjustable range shall be 43 to 65 degrees C 110 to 150 degrees F. A thermostatic regulating valve shall inject potable water to maintain acceptable discharge temperature to the sewer.

2.11 BOILER SURFACE BLOWDOWN HEAT RECOVERY SYSTEM

2.11.1 General Requirements

Blowdown flush separator shall be [_____] mm inches in diameter by [_____] mm inches high. Supports, associated accessories and appurtenances shall be in accordance with these specifications and as shown. Steel tank shall be of welded construction in accordance with ASME BPVC SEC VIII D1 and stamped for a 1.0 MPa 150 psig rating. Tank shall be provided with a tangential inlet connection sized to match the boiler blowdown pipe, stainless steel striking plate at the point of inlet impingement, internal stainless steel flow restrictor plates, float level control, gauge glass openings, inspection opening and clean-out connection. Thermostatic regulating valve shall inject potable water to maintain acceptable discharge temperature to sewer.

2.11.2 Materials

Materials used in fabrication of boiler blowdown equipment shall comply with ASME BPVC SEC II-C. Inspection openings on tank shall be as required in Paragraphs UG-45 and 46 of ASME BPVC SEC VIII D1 and as shown. Connections shall be as shown. Interior surface preparation shall be in accordance with SSPC SP 5/NACE No. 1 and the coating manufacturer's recommendation. Interior shall be coated with a suitable baked epoxy phenolic coating, minimum 0.13 mm 5 mil DFT. Exterior surface shall be in accordance with SSPC SP 6/NACE No.3 and coating manufacturer's recommendations. Exterior shall be primed with high heat silicone acrylic primer, minimum 0.05 mm 2.0 mil DFT. Flash separator shall be piped to heat exchanger. Heat exchanger shall be horizontal U-tube with removable tube bundle and shall be of self-draining type. Blowdown water shall pass through shell and cooling water shall pass through tubes. Tubes shall be stainless steel with rear supporting baffle. Steel side welded shell shall be provided with anti-vibration hold-down clamps, ASME Code stamping for 1.03 MPa 150 psig rating for 208 degrees C 400 degrees F and supporting structural steel stand. Heat exchanger shall be supplied with drain aftercooler and temperature regulating valve. Aftercooler shall be provided with cold water inlet, flanged body for easy removal, 6.35 mm 1/4 inch NPT connection bimetallic thermometer, and 25.4 mm 1 inch NPTE connection for temperature regulating valve sensing bulb. Valve adjustable range shall be 43 to 65 degrees C 110 to 150 degrees F.

2.11.3 Monitor-Controller

One electronic monitor-controller for use in boiler surface blowdown line
shall be provided for each boiler, consisting of:

a. Monitor-controller shall control concentration of total dissolved solids (TDS). Monitor-controller shall be housed in a painted steel NEMA 12 enclosure. Boiler surface blowdown control shall be interlocked with boiler operation.

b. Panel display shall include:
   (1) Long-life LED indicators on front panel and labeled power and control.
   (2) Manually-operated two position switch to allow operator to turn monitor-controller on or off. Manually-operated two position switch to allow operator to test the output circuits.
   (3) Manually operated two position switch to allow the operator to select either a low or high scale of conductivity.
   (4) A manually operated two position switch to allow the operator to continuously read system conductivity level or to set or read the front panel operator adjustable trip point.
   (5) Calibration adjustment.
   (6) Timer for adjustment of intervals between sampling periods.

c. One prepiped blowdown piping assembly installed in each boiler surface blowdown line shall be provided. Assembly shall consist of:
   (1) Shut-off valve 19 mm 3/4 inch rated for system operating pressure and temperature.
   (2) Conductivity probe.
   (3) Normally closed motorized flow control valve [[19 mm 3/4 inch] rated for system operating pressure of [1150 kPa 150 psig] and temperature up to [200 degrees C 400 degrees F] [____].
   (4) Throttling valve [19 mm 3/4 inch] [____] rated for system operating pressure and temperature.
   (5) Temperature compensation probe.

2.12 CHEMICAL FEED SYSTEM

Chemical feed system shall be provided for steam and condensate chemical treatment consisting of introduction of chemical solutions into deaerator, boiler and boiler feedwater lines. Chemical feed system shall be automatic proportioning pump type for single or multiple boiler installation and shall consist of pumps, tank, piping, control and accessories. Chemical feed system shall be completely preassembled package, factory tested, hydraulically and electrically, and shall be furnished with required special tools, lubricants, and installation instructions. Chemical feeding and control equipment shall be provided for the following:

a. For each boiler:
   (1) Boiler scale inhibitor and antifoaming chemical treatment.
(2) Alkalinity supplement.

(3) Neutralizing amines.

b. For deaerator feedwater condensate return systems: chemical treatment consisting of oxygen scavenger such as sodium sulfite.

Chemical treatment manufacturer shall provide a 1 year supply of chemicals. Chemical products shall be compatible with system materials of construction and operating conditions and shall comply with all applicable regulatory agencies. The chemical feeder shall be interlocked with boiler and deaerator operation.

2.12.1 Chemical Feed Pump and Tank

Chemical feed pump and tank shall be provided as indicated. Chemical feed pump and tank shall be a package with pump mounted and piping connected to the tank. Chemical feed pump capacity shall be as indicated. Chemical feed pump shall be positive displacement metering type. Chemical feed pump shall have micrometer capacity adjustment from 0-100 percent while the chemical feed pump is running and metering accuracy within plus or minus one (1) percent. Chemical feed pump components shall be constructed of materials suitable for the chemicals being pumped. Drive motors shall be 120 volts ac, 60 Hz, single phase, with general purpose dripproof enclosure. Chemical feed tank shall be fabricated of materials suitable for chemicals used and shall be provided with fill and chemical feed drain connections and gauge glass. Chemical feed tank shall be furnished with one chemical feed pump, mounted and piped with piping and fittings constructed of materials suitable for the chemicals being pumped, and shall include a suction strainer and 13 mm 1/2 inch relief valve. Chemical feed tank shall have hinged cover. Chemical feed tank bottom shall be dished concave to radius equal to diameter of tank.

2.12.2 Agitator

Chemical feed tank shall be equipped with agitator. Agitator shall be motor driven with Type 316 stainless steel impeller and drive shaft. Maximum speed shall be 1750 rpm. Agitator and support shall be mounted on of chemical feed tank.

2.12.3 Boiler Chemical Treatment System

**************************************************************************
NOTE: For steam boiler plant with more than one boiler select a bulk storage system 800 liters 200 gallons for each chemical or dedicated feeder system for each chemical with individual drums 200 liters 50 gallons for the chemical treatment for boilers listed above.
**************************************************************************

The following shall be provided for each boiler:

a. Three chemical feed pumps. Each pump shall be provided with a pressure relief valve piped on discharge side of the pump to divert overpressurized chemical solution back to the storage tank. Chemical feed pumps shall have capability of accepting 4 to 20 mA dc signal.
b. One 800 liter 200 gallon bulk storage tank.

c. Three 200 liter 50 gallon drums.

d. One connecting head water meter. Maximum operating pressure shall be 1650 kPa 225 psig and maximum temperature shall be 120 degrees C 250 degrees F. Water meters shall be turbine type with cast iron Maine cases.

e. Proportional chemical feed controller and electronic pulse timer. Pulse timer shall control proportional feed of treatment chemicals based on feedwater as measured by a contacting head water meter. Controller shall have following features:

(1) Painted steel NEMA 12 enclosure.

(2) Panel display including: proportional pulse timer, automatic-off-manual switch, push-to-test momentary switch which simulates a water meter pulse and runs the timer for one cycle, 12-volt signal to water meter, and pulse accumulator.

2.12.4 Deaerator Condensate Return System Chemical Treatment System

**************************************************************************
NOTE: Select 200 liters 50 gallons drum for boiler plant up to 22,650 kg/hr
**************************************************************************

One feedwater chemical treatment system for deaerator shall be provided including the following:

a. One chemical feed pump. Chemical feed pump shall be provided with pressure relief valve piped on discharge side of chemical feed pump to divert overpressurized chemical solution back to the storage tank. Chemical feed pump shall have capability of accepting 4 to 20 mA dc signal.

b. One 8000 liter 200 gallon tank. [ or ] One 200 liter 50 gallon tank.

c. One contacting head water meter shall be provided. Maximum operating pressure shall be 1650 kPa 225 psig and maximum temperature shall be 120 degrees C 250 degrees F. Meter shall be turbine type with cast iron Maine case.

d. Proportional chemical feed controller and electronic pulse timer. Electronic pulse timer shall control proportional feed of treatment chemicals based on makeup water as measured by contacting head water meter. Controller shall have following features:

(1) Painted steel NEMA 12 enclosure

(2) Panel display including one proportional pulse timer, Automatic-Off-Manual switch. Test momentary switch which simulates a water meter pulse and runs timer for one cycle, and pulse accumulator.
2.12.5 Testing Equipment

Testing equipment, including carrying case and spare reagent, for maintaining control of a program of water treatment standards in steam boiler system shall be provided in accordance with the water treatment plan. Submit a plan for water treatment, including proposed chemicals to be used and nationally recognized testing codes applicable to the system, prior to system startup. Testing equipment shall consist of the following:

a. Reagents and apparatus for determination of phosphate and sulfite levels in the boiler water.

b. Reagents and apparatus for determination of PH, P and M alkalinity and chloride.

c. Reagents and apparatus for determination of neutralizing amine level in the steam and condensate return lines.

d. One conductivity meter with temperature compensation and multiple measurements ranges of 0-10, 0-100, and 0-10,000 micromhos.

e. Wall mounting test equipment cabinet for storage of testing glassware and reagents. Cabinet shall have one shelf, keylock door and fluorescent light. Cabinet shall be constructed of 1 mm No. 18 gauge thick cold-rolled steel, primed and painted with white polyurethane enamel for corrosion protection.

f. Prefabricated steel corrosion nipple bypass assembly to monitor program effectiveness. Assembly shall include inlet and outlet shut-off valve, wye strainer, and two corrosion nipples.

2.13 WATER SOFTENING EQUIPMENT

**************************************************************************
NOTE: Insert water analysis specific to the site.
Insert desired water treatment conditions, e.g. pH level, hardness, chemical concentrations.
**************************************************************************

a. A [single] [double] unit automatic water softener system shall be provided as indicated. Water softener system shall be designed for working pressure of [_____] MPa psi. Water softener system shall be complete with raw and regenerate water distribution; under drain, inlet and outlet connections in upper and lower header respectively; resin removed connecting pipe legs; control valve for service, backwash, regenerate, and rinse; water meters, pressure gauges, brine storage, measuring tank and controls. Test sets shall be provided for pH comparator for range [_____] to [______], sulfide comparator, and phosphate comparator.

b. Influent water analysis for which system shall be designed is [______].

c. Treatment conditions to be maintained in circulation water are [______].

2.14 MAINTENANCE EQUIPMENT

2.14.1 Tube Cleaner

Water turbine driven tube cleaner shall include three rotary cutters,
complete with necessary length of armored water hose, valves, and other appurtenances necessary for operation. Tube cleaner shall be provided for each size of watertube in boiler, with one extra set of cutters for each size cleaner. Necessary valves and fittings shall be provided to permit convenient connection of tube cleaner hose boiler feed pump to supply cold raw water for operation of tube cleaner. Piping arrangement shall be such that one boiler feed pump may be used to operate tube cleaner without interfering with normal operation.

2.14.2 Tube Brush

**************************************************************************
NOTE: The tube brush applies only to firetube boilers and will be deleted if not applicable.
**************************************************************************

Brush with steel bristles and jointed handle of sufficient length to clean full length of fire tubes shall be provided.

2.15 FACTORY COATING

Equipment and component items, when fabricated from ferrous metal, shall be factory finished with the manufacturer's standard finish unless otherwise specified.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 INSTALLATION, EXCEPT FUEL SYSTEM

Work shall be installed as indicated and in accordance with manufacturer's diagrams and recommendations and applicable requirements of FM and NFPA.

3.2.1 Piping

a. Unless otherwise specified, pipe and fittings shall conform to requirements of ASME B31.1. Pipe shall be cut to measurements established at the jobsite and worked into place without springing or forcing, completely clearing windows, doors, and other openings.

b. Pipes shall be minimum 2.4 m 8 feet above walkway elevations.

c. Cutting or other weakening of the building structure to facilitate piping installation will not be permitted without written approval.

d. Pipes shall have burrs removed by reaming and shall be so installed as to permit free expansion and contraction without causing damage to building structure, pipe, joints, or hangers. Filings, dust, or dirt shall be wiped from interior of pipe or tubing before connections are made.

e. Changes in direction shall be made with fittings, except that bending of pipe 100 mm 4 inches and smaller will be permitted, provided a pipe bender is used and wide sweep bends are formed. Centerline radius of
bends shall not be less than 6 diameters of pipe. Bent pipe showing kinks, wrinkles, flattening, or other malformations will not be accepted. Vent pipes shall be carried through the roof as directed and shall be flashed.

f. Unless otherwise indicated, horizontal supply mains shall pitch down in direction of flow with a grade of not less than 25 mm in 12 meters 1 inch in 40 feet.

g. Open ends of pipelines and equipment shall be capped or plugged during installation to keep dirt or other foreign materials out of the system.

h. Pipe not otherwise specified shall be uncoated. Unions for copper pipe or tubing shall be brass or bronze.

i. Connections between ferrous piping and copper piping shall be electrically isolated from each other with dielectric couplings or other approved methods.

j. Pipe and fittings shall be of the types indicated in TABLES I and II for the applicable service and pressure.

3.2.2 Joints

Joints between sections of pipe and between pipe and fittings shall be threaded, flanged, or welded as specified. Except as otherwise specified, fittings 38 mm 1-1/2 inches and smaller shall be either threaded or socket welded, and fittings 50 mm 2 inches and larger shall be either flanged or butt welded. Pipe and fittings 32 mm 1-1/4 inches and larger installed in inaccessible conduits or trenches under concrete floor slabs shall be welded. Unless otherwise specified or indicated, connections to equipment shall be made with black malleable iron unions for pipe 38 mm 1-1/2 inches or smaller in diameter, and with flanges for pipe 50 mm 2 inches or larger in diameter.

3.2.2.1 Threaded Joints

Threaded joints shall be made with tapered threads properly cut, and shall be made tight with PTFE tape, or equivalent joint compound material applied to the male threads only. Joint compound shall not be applied to fittings.

3.2.2.2 Welded Joints

a. Welded joints shall be made as specified. Changes in direction of piping shall be made with welding fittings only.

b. Branch connection may be made with either welding tees or branch outlet fittings. Branch outlet fittings shall be forged, flared for improvement of flow where attached to the run, and reinforced against external strains.

c. Beveling, alignment, heat treatment, and inspection of weld shall conform to ASME B31.1.

d. Weld defects shall be removed and repairs made to the weld, or weld joints shall be entirely removed and rewelded.

e. Electrodes shall be stored and dried in accordance with AWS D1.1/D1.1M or as recommended by manufacturer. Electrodes that have been wetted or
that have lost any of their coating shall not be used.

3.2.2.3 Expansion Joints

Guiding of piping on both sides of expansion joint shall be in accordance with published recommendations of manufacturer.

3.2.2.4 Flanges and Unions

Flanges shall be faced true, provided with metallic spiral wound nonasbestos gaskets, and made square and tight. Union or flange joints shall be provided in each line immediately preceding the connection to each piece of equipment or material requiring maintenance such as coils, pumps, control valves, and other similar items.

3.2.3 Supports

3.2.3.1 General

**************************************************************************
NOTE: Mechanical and electrical layout drawings and specifications for ceiling suspensions will contain notes indicating that hanger loads between panel points in excess of 22.7 kg 50 lbs steel joist shall have the excess hanger loads suspended from panel points.

Provide seismic details, if a Government designer (either Corps office or A/E) is the Engineer of Record, and show on the drawings. Delete the bracketed phrase in item a. if no seismic details are provided. Pertinent portions of UFC 3-301-01 and Sections 13 48 73 and 23 05 48.19, properly edited, will be included in the contract documents.

Support for steam piping from boiler nozzle to steam header and steam lines 150 mm 6 inches and larger will be detailed on the drawings as excessive stress and movement can occur in these piping systems due to thermal expansion. Each spring hanger location will be clearly indicated. They will be assigned a number in a schedule on the drawings that lists hanger details, load, and movement.

**************************************************************************

Hangers used to support piping 50 mm 2 inches and larger shall be fabricated to permit adequate adjustment after erection while supporting the load. Pipe guides and anchors shall be installed to prevent buckling, swaying, and undue strain. Piping subjected to vertical movement when operating temperatures exceed ambient temperatures shall be supported by variable spring hangers and supports or by constant support hangers. Submit detailed drawings of spring type pipe hangers, before installation. Pipe hanger loads suspended from steel joists between panel points shall not exceed 23 kg 50 pounds. Loads exceeding 23 kg 50 pounds shall be suspended from panel points.

a. Seismic Requirements for Pipe Supports and Structural Bracing: Piping and attached valves shall be supported and braced to resist seismic loads as specified in UFC 3-301-01 and Sections 13 48 73 SEISMIC
CONTROL FOR MECHANICAL EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC. Structural steel required for reinforcement to properly support piping, headers, and equipment but not shown shall be provided under this section. Material used for supports shall be as specified under Section 05 12 00 STRUCTURAL STEEL.

b. Structural Attachments: Structural steel brackets required to support piping, headers, and equipment, but not shown, shall be provided under this section. Material and installation shall be as specified under Section 05 12 00 STRUCTURAL STEEL.

3.2.3.2 Pipe Hangers, Inserts, and Supports

Pipe hangers, inserts and supports shall conform to MSS SP-58 except as otherwise specified.

a. Types 5, 12, and 26 shall not be used.

b. Type 3 shall not be used on insulated pipe which has a vapor barrier. Type 3 may be used on insulated pipe that does not have a vapor barrier if clamped directly to the pipe and if the clamp bottom does not extend through the insulation and the top clamp attachment does not contact the insulation during pipe movement.

c. Type 18 inserts shall be secured to concrete forms before concrete is placed. Continuous inserts which allow more adjustment may be used if they otherwise meet the requirements for type 18 inserts.

d. Type 19 and 23 shall be torqued in accordance with MSS SP-58 and shall have both locknuts and retaining devices furnished by the manufacturer. The C-clamp body shall not be constructed from bent plate.

e. Type 20 attachments used on angles and channels shall be furnished with an added malleable iron heel plate or adapter.

f. Type 24 may be used only on trapeze hanger systems or on fabricated frames.

g. Where type 39 saddle or type 40 shield is permitted for a particular pipe attachment application, the type 39 saddle shall be used on pipe 100 mm 4 inches and larger.

h. Horizontal pipe supports shall be spaced as specified in the tables in MSS SP-58 and a support shall be installed not over 300 m 1 foot from the pipe fitting joint at each change in direction of the piping. Pipe support spacing shall be as required for specified hydrostatic tests. Pipe supports shall be spaced not over 1.5 m 5 feet apart at valves. In the support of multiple pipe runs on a common base member, a clip or clamp shall be used where each pipe crosses the base support member. Spacing of the base support members shall not exceed the hanger and support spacing required for any of the individual pipes in the multiple pipe run. The clips or clamps shall be rigidly connected to the common base member. A clearance of 3.2 mm 1/8 inch shall be provided between the pipe and clip or clamp for piping which may be subjected to thermal expansion.

i. Vertical pipe shall be supported at each floor, except at slab on grade, and at intervals of not more than 4.5 meters 15 feet, nor more
than 2.4 m 8 feet from ends of risers, and at vent terminations.

j. Type 35 guides using steel, reinforced PTFE or graphite slides shall be provided where required to allow longitudinal pipe movement. Lateral restraints shall be provided as required. Slide materials shall be suitable for the system operating temperatures, atmospheric conditions, and bearing loads encountered.

(1) Where steel slides do not require provisions for restraint of lateral movement, an alternate guide method may be used. On piping 100 mm 4 inches and larger, a type 39 saddle may be welded to the pipe and freely rest on a steel plate. On piping under 100 mm 4 inches, a type 40 protection shield may be attached to the pipe or insulation and freely rest on a steel slide plate.

(2) Where there are high system temperatures and welding to piping is not desirable, type 35 guide shall include a pipe cradle, welded to the guide structure and strapped securely to the pipe. The pipe shall be separated from the slide material by at least 100 mm 4 inches, or by an amount adequate for the insulation, whichever is greater.

(3) Insulated pipes: Except for type 3, pipe hangers on horizontal insulated pipe shall be the size of the outside diameter of the insulation.

3.2.3.3 Piping in Trenches

**************************************************************************
NOTE: Detail pipe in trenches on the drawings. Show exact locations of pipe supports. Include individual hanger identification. Provide schedule of data to include, but not be limited to identification number, detail references, load, and movement.
**************************************************************************

Piping shall be supported as indicated.

3.2.4 Pipe Anchors

Anchors shall be provided wherever necessary or indicated to localize expansion or prevent undue strain on piping. Anchors shall consist of heavy steel collars with lugs and bolts for clamping and attaching anchor braces, unless otherwise indicated. Anchor braces shall be installed in the most effective manner to secure the desired results, using turnbuckles where required. Supports, anchors, or stays shall not be attached in places where they will injure the construction during installation, or by the weight of expansion of the pipeline. Submit detailed drawings of pipe anchors for approval before installation.

3.2.5 Pipe Sleeves

Pipe passing through concrete or masonry walls or concrete floors or roofs shall be provided with pipe sleeves fitted into place at the time of construction. Sleeves shall not be installed in structural members except where indicated or approved. Rectangular and square openings shall be as indicated. Each sleeve shall extend through its respective wall, floor, or roof, and shall be cut flush with each surface. Unless otherwise
indicated, sleeves shall be of a size that will provide a minimum of 6.35 mm
1/4 inch all around clearance between bare pipe or insulation jacket and
sleeves. Sleeves in bearing walls, waterproofing membrane floors, and wet
areas shall be steel pipe or cast iron pipe. Sleeves in non-bearing walls,
Floors, or ceilings may be steel pipe, cast iron pipe, or galvanized sheet
metal with lock type longitudinal seam and of the metal thickness
indicated. Except in pipe chases or interior walls, the annular space
between pipe and sleeve or between jacket over insulation and sleeve in
non-fire rated walls and floors shall be sealed as indicated and specified
in Section 07 92 00 JOINT SEALANTS and in fire rated walls and floors shall
be sealed as indicated and specified in Section 07 84 00 FIRESTOPPING.
Pipes passing through wall waterproofing membrane shall be sleeved as
described above. In addition, a waterproofing clamping flange shall be
installed as indicated.

3.2.5.1 Pipes Passing Through Roof or Floor Waterproofing Membrane

Pipes shall be installed through a 1.8 kg 4 pound lead flashing sleeve, a
0.450 kg 16 ounce copper sleeve, or a 0.8 mm 0.032 inch thick aluminum
sleeve, each having an integral skirt or flange. Flashing sleeve shall be
suitably formed, and the skirt or flange shall extend not less than 200 mm
8 inches from the pipe and shall be set over the roof or floor membrane in
a troweled coating of bituminous cement. Flashing sleeve shall extend up
the pipe a minimum of 50 mm 2 inches above the highest flood level of the
roof or a minimum of 250 mm 10 inches above the roof, whichever is greater,
or 250 mm 10 inches above the floor. The annular space between the
flashing sleeve and the bare pipe or metal jacket covered insulation shall
be sealed as indicated. Pipes up to and including 250 mm 10 inches in
diameter passing through roof or floor waterproofing membrane may be
installed through a cast iron sleeve with caulking recess, anchor lugs,
flashing clamp device, and pressure ring with brass bolts. Waterproofing
membrane shall be clamped into place and sealant shall be placed in the
caulking recess.

3.2.5.2 Counterflashing

As an alternate to caulking and sealing the annular space between the pipe
and flashing sleeve or metal jacket covered insulation and flashing sleeve,
counterflashing may be by standard roof coupling for threaded pipe up to
150 mm 6 inches in diameter; lead flashing sleeve for dry vents and turning
the sleeve down into the pipe to form a waterproof joint; or tack welded or
banded metal rain shield round the pipe and sealing as indicated.

3.2.5.3 Sealing Uninsulated Pipes or Conduits

A modular mechanical type sealing assembly may be installed in lieu of a
waterproofing clamping flange and caulking and sealing, as specified, of
annular space between pipe and sleeve or conduit and sleeve. The seals
shall consist of interlocking synthetic rubber links shaped to continuously
fill the annular space between pipe/conduit and sleeve with corrosion
protected carbon steel bolts, nuts, and pressure plates. The links shall
be loosely assembled with bolts to form a continuous rubber belt around the
pipe with a pressure plate under each bolt head and each nut. After the
seal assembly is properly positioned in the sleeve, tightening of the bolt
shall cause the rubber sealing elements to expand and provide a watertight
seal between the pipe/conduit and sleeve. Each seal assembly shall be
sized as recommended by the manufacturer to fit the pipe/conduit and sleeve
involved. The Contractor electing to use the modular mechanical type seals
shall provide sleeves of the proper diameters.
3.2.6 Escutcheons

Escutcheons shall be provided at finished surfaces where exposed piping, bare or insulated, passes through floors, walls, or ceilings except in boiler, utility, or equipment rooms. Where sleeves project slightly from floors, special deep type escutcheons shall be used. Escutcheons shall be fastened securely to pipe or pipe covering and shall be chromium plated iron or chromium plated brass, either one piece or split pattern, held in place by internal spring tension or setscrew.

3.2.7 Clay Sewer Pipe

Pipe shall be installed where indicated for housing steam supply and condensate return lines. The sewer pipe shall be installed on properly graded and well tamped earth or gravel base. Joints shall be packed with twisted jute packing and sealed with bituminous sealing compound or portland cement mortar.

3.2.8 Pipe Expansion

**************************************************************************
NOTE: Detail expansion loops on the drawings.
**************************************************************************

Expansion loops and pipe guides shall be installed where indicated.

3.2.9 Valves

Valves shall be installed at locations indicated and where specified. Gate valves shall be used for isolation service unless otherwise indicated or specified. Globe valves shall be used for throttling service unless otherwise specified. Valves shall be installed with stems horizontal or vertical, except steam nonreturn valves shall be installed as specified. Gate valves used as shutoff valves in the boiler lines to and from steam headers, and elsewhere as indicated, shall be the chain operated type if walkways are not provided for their operation. Chain operated valves shall have sufficient chain for easy reach of the operating personnel from the operating floor or walkway. Gate valves 200 mm 8 inches and larger used on high pressure steam lines, and elsewhere as indicated, shall be provided with a valve bypass integral with the valve body.

3.2.9.1 Back Pressure Relief

Backpressure valve shall be set to exhaust at the pressure indicated.

3.2.9.2 Steam Pressure Reducing

Steam pressure reducing valve shall be adjusted to maintain desired terminal pressure, regardless of fluctuations in the inlet steam pressure. Steam pressure reducing valves shall fail closed. Pilot, or auxiliary operated valves using steam for operating medium, or sliding gate and plate valves shall be provided. Steam pressure reducing valve shall be installed with strainer, 3 valve bypass, and safety valve as indicated. Where steam pressure reducing valves is used for reducing steam pressure to deaerating heater, the valve shall be of pneumatic pilot operated type. Sensing line shall be connected to the steam space in the deaerator.
3.2.9.3 Thermostatic Regulating

Thermostatic regulating valve to control temperature of water within hot water generator, by regulating steam supplied to the heating coil, shall be provided in the steam supply line to each generator.

3.2.10 Flow Meter

**************************************************************************
NOTE: Specify which meters should receive 3-way bypass to maintain service during a meter service or replacement (suggest that fuel oil flow meters have a 3-way valve bypass if service is critical.)
**************************************************************************

Flow meter shall be installed in straight line pipe of at least [_____] pipe diameters to maintain accuracy. [A 3-way valve bypass shall be provided for [_____] flow meters.]

3.3 FUEL OIL SYSTEM INSTALLATION

3.3.1 Fuel Storage Tank Installation

Fuel storage tank installation shall be in accordance with Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.

3.3.2 Underground Ferrous Metallic Piping

Underground ferrous metallic piping shall be in accordance with Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.

3.4 FIELD PAINTING AND FINISHING

Painting required for surfaces not otherwise specified, and finish painting of items only primed at the factory, are specified in Section 09 90 00 PAINTS AND COATINGS.

3.5 ELECTRICAL

3.5.1 General

Field run conduit, wiring and terminations shall be in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

3.5.2 Splice

Stranded conductors shall be spliced by solder or pressure type connectors. Wirenut connectors shall not be used on stranded conductors. Splices shall be covered with electrical insulation equivalent to, or of higher rating than, insulation of conductors being spliced. Splices will not be allowed in control or signal wiring, except where sensors or controlled devices are provided with pigtails for connecting to incoming cable.

3.5.3 Identification

Both ends of wires shall be labeled.
3.5.4 Grounding of Drain Wire of Shielded Cable.

Shield cable drain wire shall be grounded at the source end, terminated at a copper bus ground bar 3.175, 12.7, by 100 mm 1/8, 1/2, by 4 inches minimum.

3.5.5 Analog Signal Cable Connections

Analog signal cables shall be connected to controller by means of terminal blocks with knife isolation switches with test plugs to enable isolation of each instrument without disconnecting common instrument power supply. These terminal blocks shall be double level terminal blocks with knife disconnect point with test plugs at the upper level and feed through terminal at lower level. Minimum of thirty percent (30 percent) spare terminal points shall be provided.

3.5.6 Digital Input-Output

Digital input-output cables shall be connected to controller by means of terminal blocks. Minimum of thirty percent (30 percent) spare terminal points shall be provided.

3.6 INSULATION

Thickness of insulation materials for piping and equipment and application shall be in accordance with Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

3.7 BOILERS AND AUXILIARY EQUIPMENT

**************************************************************************
NOTE: Before occupancy of a facility the boilers shall be inspected in accordance with the Code of Boiler and Pressure Vessel Inspectors (BPV I) and American Society of Mechanical Engineers (ASME). Inspectors must be certified in accordance with BPV I standards.
**************************************************************************

3.7.1 Inspection

Inspect areas and conditions under which boiler and auxiliary equipment are to be installed. Field verify location of connections to piping, equipment and supports and make connection to said items utilizing field-verified dimensions. Notify Contracting Officer of discrepancies and ensure that unsatisfactory conditions have been corrected in an acceptable manner.

3.7.2 Preparation

a. Coordinate the installation of equipment and appurtenances prior to installation with other work.

b. Provide work required to correct situations resulting from the Contractor's failure to coordinate with the work of other trades, at no additional cost.

c. Take into consideration priority needs for location and space of work of all trades. Failure to do so will require the Contractor to remove and relocate the work at no additional cost.
3.7.3 Installation

****************************************************************************************
NOTE: Delete reference to local city and state codes if not applicable.
****************************************************************************************

3.7.3.1 Boiler

Boiler shall be installed in accordance with the manufacturer's written instructions, [in accordance with boiler installation requirements of local, city, state codes] and in accordance with applicable provisions of NFPA and ASME code standards. Boiler and associated components shall be located where indicated. Boiler shall be installed level to a tolerance of 3 mm in 3 m 1/8 inch in 10 feet in all directions. Electrical connections shall be made in accordance with Section [____].

3.7.3.2 Protection

It is the Contractor's responsibility to protect boiler and components from damage after installation, until Government takes custody. After installation, touchup paint shall be provided to damaged areas on shop and finish-coated surfaces of the equipment. Surfaces shall be free of rust, scale and foreign substances before application of touchup paint. The touchup paint shall be equivalent to the shop and/or finish paint.

3.7.3.3 Adjusting, Inspecting, and Cleaning

Submit test reports, in booklet form showing field tests performed to adjust each component and field tests performed to prove compliance with the specified performance criteria, upon completing and testing the installed system. Each test report shall indicate the final position of controls. A written statement from the manufacturer's representative certifying that combustion control equipment has been properly installed and is in proper operating condition, upon completion of the installation. The action settings for automatic controls in the form of a typed, tabulated list indicating the type of control, location, setting, and function shall be included.

a. Thoroughly clean inside of boiler by performing boil-out, flushing and cleaning in accordance with manufacturer's instruction prior to startup.

b. Final adjustment to boiler shall be in accordance with manufacturer's recommendations, but not less than following:

(1) Verify lubrication of moving parts.
(2) Verify fan rotation direction.
(3) Adjust water level control for proper operating level.
(4) Adjust firing rate control.
(5) Confirm operation of safety devices.
(6) Adjust controls and verify operation.
3.7.3.4 Field Quality Control.

a. Provide trained field representative to supervise installation of boiler and its components. Field representative shall inspect alignment and balancing of rotating and moving parts. After completion of installation, provide services of factory-trained field representative to start and adjust boiler.

b. Manufacturer shall provide trained field representative for final inspection of boiler for proper installation, alignment and leveling prior to boiler startup.

c. Coordinate with other representatives on startup of other items and building services as required.

d. Contractor's representative shall be available to instruct and train Government personnel for not less than two (2) days after boilers are operational.

3.7.4 Gaseous Emissions Monitor

Extractive or in-situ gaseous emissions monitor shall be provided. Combination of extractive and in-situ monitors is not acceptable. Gas monitors shall include automatic calibration checks. Alarm horn and annunciator shall be provided to alarm when any monitored parameter is out of range or gaseous emission monitor malfunctions. Surfaces exposed to corrosive gas of boiler shall be constructed of noncorrosive materials such as 316 SS, Teflon or Hastalloy.

a. In-situ gaseous emissions monitor shall be mounted on ductwork at location [shown on plans] [recommended by the manufacturer]. The in-situ system shall not be affected by presence of particulate matter in flue gas.

b. Extractive systems shall be [wet] [dry] [diluted]. Analyzing equipment for extractive system shall be [rack-mounted] [located in a walk-in cabinet].

c. Equipment shall be arranged to provide access for maintenance. Extractive system sampling between probes and analyzers shall be heat traced to maintain temperature recommended by manufacturer when ambient temperature is [______]. Probes shall be mounted on ductwork at the location [shown on the plans] [recommended by manufacturer].

d. Submit a Boiler Emissions Report of air pollutants showing compliance with the limits established in the environmental permit.

3.7.5 Flue Gas Flow Monitor

Flue gas monitor shall utilize pitot tube principle to measure flow. Flue gas flow monitor probe shall be across-the-duct average pitot tube and shall be properly designed and located to obtain representative measurement. Differential pressure transmitters shall be used to sense the difference between the static and total pressure of the flowing flue gas stream. Lines shall be arranged to prevent collection of condensate. Purge system shall be provided to keep pitot pressure taps clear.
3.7.6 Testing

ASME PTC 19.3 TW.

3.7.6.1 Factory Testing

Boilers shall be guaranteed to perform in accordance with stated operating conditions. Complete packaged boiler shall be hydrostatically and fire tested at boiler manufacturer's factory to check construction, operation and function of all controls. Submit certification of factory tests. Tests may be witnessed by Contracting Officer or Representative of Contracting Officer. Contracting Officer shall be notified two (2) weeks prior to factory testing.

3.7.6.2 Field Testing

a. Furnish personnel, equipment, instrumentation, and supplies necessary to perform field testing. Upon completion, and prior to acceptance of the work, boiler plant shall be subjected to such operating tests as may be required to demonstrate satisfactory functional operation of the plant, including safety devices. Operating tests shall be conducted at such times as the Contracting Officer may direct.

b. Submit proposed test procedure to Contracting Officer, 30 days prior to the proposed test date, for approval. The submittal shall contain a complete description of the proposed test with calibration curves or test results furnished by an independent testing laboratory of each instrument, meter, gauge, and thermometer to be used in the tests. The test shall not commence until the procedure has been approved. The Government will witness the field tests. Written permission shall be obtained from the Contracting Officer before proceeding with testing. Tests shall be supervised by respective manufacturers.

c. Original copies of data produced, including results of each test procedure during field testing, shall be turned over to the Government at the conclusion of testing prior to Government approval of the test.

d. Testing shall not be scheduled during seasonal off-periods of heating systems. Testing shall be performed in accordance with approved test procedures. The Test Procedures shall cover actual equipment and functions specified for the project.

3.7.6.3 Hydrostatic Test

**************************************************************************
NOTE: Delete boiler isolation valve test for single-boiler plants. This test is critical for multiple-boiler plants as it verifies that individual boilers can be isolated for maintenance or replacement while the steam system is in operation.
**************************************************************************

a. General: Submit a written field hydrostatic test schedule [7] [_____] days in advance to Contracting Officer for approval. Schedule will be approved by the Contracting Officer.

b. After installation is completed and prior to startup, furnish the services of local boiler and pressure vessel inspector to observe field
hydrostatic test, inspect installation and piping and certify that installation is in accordance with ASME code.

c. Following installation of piping and boiler plant equipment, but before application of piping and boiler insulation, a hydrostatic test shall be completed, including boiler and associated piping within boiler plant. System shall be proved tight for at least two hours under gauge pressure of 1.5 times the working pressure specified and not less than the following:

- **Low pressure lines up to** 448 kPa 65 psig *working - Test pressure 590 kPa 100 psig.*
- **Medium pressure from 448 to 690 kPa 65 to 100 psig, working - test pressure 1.03 MPa 150 psig.**
- **High pressure 1.03 MPa 150 psig working - Test pressure 1.55 MPa 225 psig.**

d. Boiler isolation valves shall be individually tested to isolate against the specified hydrostatic test pressure. At the conclusion of the system hydrostatic test, each boiler's isolation valves (steam discharge, boiler feedwater, etc.) shall be closed; the boiler drained down; and pressure monitored on both sides of each isolation valve for a minimum of two hours to verify that the valves isolate each boiler.

e. Boilers shall be tested and piping connections inspected by a certified boiler inspector for compliance with **ASME BPVC SEC I**.

f. Submit certificate of compliance with **ASME BPVC SEC I** for each boiler to Contracting Officer.

### 3.7.6.4 Inner Casing Air Tests for Packaged Force Draft Boilers

Following installation, each packaged forced draft boiler shall be air tested up to **2.5 kPa 10 inches water gauge.** Soap foam shall be applied to seams to detect leaks. The boiler shall not lose more than **1.3 kPa 5 inches water gauge in 10 minutes.** This test shall be performed prior to installing insulation.

### 3.7.6.5 Efficiency and Capacity Test

a. Efficiency and capacity test shall be run on one boiler of each size installed, conducted in strict accordance with **ASME PTC 4**, abbreviated efficiency test.

b. Measuring devices used for measuring feedwater evaporated and amount of fuel burned shall be properly calibrated prior to test. Water flow meter used in the test shall be suitable for hot water. Furnish instruments, test equipment, test personnel, and fuel oil required to properly conduct tests. Submit a **fuel oil analysis report** of Independent Agency for fuel oil used during efficiency testing.

c. Calibration curves or test results furnished by an independent testing laboratory of each instrument, meter, gauge, and thermometer to be used in the efficiency and capacity test shall be furnished prior to test.

d. Obtain necessary natural gas, water and electricity as specified in the **[SPECIAL CONTRACT REQUIREMENTS]** [Section 01 50 00 TEMPORARY CONSTRUCTION... ]
FACILITIES AND CONTROLS] Provide necessary quantities of propane gas or No. [_____] fuel oil when propane gas or fuel oil is required for testing.

e. Efficiency and general performance tests on boiler shall be conducted by a qualified test engineer furnished by Contractor.

f. Efficiency tests may be conducted concurrently with operating tests, or separately. Thermal efficiency shall be not less than specified. Maximum moisture content of saturated steam leaving boiler shall be as specified.

g. Submit Performance Test report including logs, heat balance calculations, and tabulated results together with conclusions to Contracting Officer in quadruplicate.

h. An analysis by an independent testing laboratory of fuel being burned during test shall be submitted to the Contracting Officer. Analysis shall include pertinent data tabulated in ASME PTC 4, abbreviated efficiency test.

i. Contracting Officer will observe and approve tests.

3.7.6.6 Control System Operational Testing

**************************************************************************
NOTE: For operational functional testing, consider adding project specific equipment and sequences of operation, alarms and other critical interface points between contracts (such as mechanical and instrumentation) for field operational tests. Consider integrating these tests into a larger project commissioning plan and specification.
**************************************************************************

a. Full operational test of boiler plant control system shall be conducted to demonstrate compliance with sequences of operation, safety interlocks and control functions of the specification.

b. Field Installation Test: Following the installation of the control system, all hardware shall be aligned and adjusted, and all test readings recorded in accordance with the manufacturer and installer recommended tests and maintenance procedures. Manufacturer and installer shall include in the associated test report a list of all hardware or components replaced or changed between the completion of
factory tests and the start of field installation test. All hardware
shall be demonstrated to be operational by running off-line
diagnostics. Field installation test shall include electrical
continuity, complete exercising of each Input and Output point, and
simulation of each control loop. The field installation test shall be
considered complete only after all variances generated during
installation are resolved and tested.

c. Startup Test and Punchout: Prior to on-line operation, conduct a
complete demonstration and readout of the control system scope of
surveillance and control. Demonstration of controls shall include
simulation of analog inputs and observation of the action of system
final control elements. Generate a hardcopy printout and perform
punchout of all Input and Output points. Submit startup test hardcopy
printout to Contracting Officer two (2) weeks prior to demonstrating
the control system. Full functional test shall be conducted in
accordance with the control system sequences of operation. Conduct
startup test and punchout in the presence of the Contracting Officer.
The Contracting Officer shall be notified no later than ten (10) days
prior to scheduled startup testing.

d. Operational Acceptance Test: After all previous testing has been
successfully completed, operate control system for thirty (30) days to
the complete satisfaction of the Contracting Officer. Submit to
Contracting Officer a bound log reporting all control system failures
that occur red during operational acceptance test. Log shall show the
point name and number, time and date of failure, and time and date of
return to service. During the 30-day acceptance test, any operational
failures due to malfunction of the control panels, wiring, or Control
Room Equipment shall require that the 30 day test begin again when
repairs are completed. Any failures between field-sensing equipment
and the control panels shall be corrected, and the testing shall
continue from the day of failure. During the last seven (7) calendar
days of testing, no failures of any kind will be accepted or the last
seven (7) days shall be repeated. If the season of the year prevents
complete testing of any individual component of the control system,
acceptance will be conditional upon the successful demonstration of the
specific component at the appropriate season.

e. Final Acceptance: The control system will not be considered accepted
by the Government until all tests are successfully completed.
Beneficial use of the system by the Government will not be considered
as acceptance. The Government will deem the control system to be fully
accepted when:

1. Structured, unstructured and availability tests have been
   successfully completed, and all incidents and variances have been
   resolved to the Government's satisfaction.

2. Documentation and training requirements have been completed and
   are satisfactory to the Government.

3. Maintenance and related contracts and releases of subcontractors
   have been duly executed and submitted to the Government.

4. Identified defects have been corrected to the Government's
   satisfaction.
3.7.6.7 Boiler Room Panels and Instruments

After inspections of installation and calibration of instruments, and after boiler test, provide a certificate of compliance to Contracting Officer stating that controls and instrumentation operate satisfactorily and within the operating parameters as specified for each fuel. If units fail to operate satisfactorily or fail to achieve specified performance, make adjustments, modifications, repairs, or replacements as necessary at no additional cost until specified performance has been achieved and certified by Contracting Officer.

3.7.6.8 Temporary Piping for Testing

Necessary temporary piping, of not less than 100 mm 4 inches in diameter, shall be furnished and a muffler shall be provided to exhaust excess steam to atmosphere in event boiler load is insufficient to meet capacity specified. Control valve for exhausting excess steam to atmosphere shall be provided in a convenient location inside the boiler room. Instruments required for conducting boiler tests shall be as described in ASME PTC 4 and ASME PTC 19.11. Provide temporary piping, valves, pipe hangers, mufflers and test equipment at no additional cost. Muffler shall have level of noise of exhaust steam within requirements as set forth by Occupational Safety and Health Act.

3.7.6.9 Fuel Burning Equipment Testing

a. Test of fuel burning equipment shall demonstrate that equipment installed will meet requirements of specifications, and that overall efficiency is as specified, with not over 15 percent excess air, can be obtained with boiler operating at 100 percent capacity without flame impingement on any combustion chamber wall, floor, baffle or watertube.

b. Test shall include all boiler and burner interlocks, safety interlocks, combustion controls, actuators, valves, controllers, gauges, thermometers, pilot lights, switches, etc. prior to combustion testing. All malfunctioning components shall be replaced. Submit an itemized data record sheet of this component testing.

c. Each boiler control system and all boiler appurtenances shall be calibrated and set to ensure the specified performance. The fuel burner, forced-draft fan, controls, etc. shall be fully coordinated, manually capable, and automatically controllable to hold the required settings. The boiler fuel burning system shall be continuously variable throughout the specified operating range without manual adjustment of burner, register or nozzle, and turndown shall be achieved without manual adjustment. Testing apparatus shall be set up, calibrated, tested and ready for use prior to final combustion testing. Calibration certificates for all test instruments shall be furnished with test data.

3.7.6.10 Deaerating Feedwater Heater Testing

Test of deaerating feedwater heater shall demonstrate that equipment installed meets specified requirements as to performance, capacity, and quality of effluent. During operating test of boiler, tests shall be conducted to determine oxygen content in accordance with ASTM D888, Method B or C, or ASTM D5543. Boilers shall be operated at varying loads, up to maximum heater capacity, while oxygen tests are being made. Means and equipment shall be furnished to perform this test.
3.7.6.11 Water Treatment Testing

Test of water treatment equipment shall meet requirements specified as to capacity and quality of effluent. Tests for ion exchange units shall cover at least 2 complete regenerations and capacity runs. Test for hot process or other precipitation type softeners shall cover a minimum continuous period of 48 hours with samples being taken at 2 hour intervals.

3.7.6.12 Steam Quality Testing

Test for steam quality and water level stability shall be simultaneous under operating conditions specified.

3.7.6.13 Water Level Stability Testing

Boiler water level stability shall be specified by boiler manufacturer in writing to Contracting Officer prior to test. Test shall first be conducted by use of manual bypass around feedwater regulator. Test shall be repeated using automatic feedwater regulator. To be acceptable, boiler shall maintain specified water level stability as specified by boiler manufacturer under both conditions.

3.7.6.14 Testing of Piping Systems

a. General: Submit a written schedule 7 days in advance of test to Contracting Officer for approval, and a detailed manufacturer's acceptance testing plan, for approval, for each item of instrumentation; including procedures for pressure testing and repair of piping and tubing materials failing pressure tests.

b. Piping shall be hydrostatically tested before piping insulation is applied. Hydrostatic test pressure at any point in piping system shall not be less than 1.5 times the design pressure, but shall not exceed the maximum allowable test pressure of nonisolated components.

c. Underground lines in pressure service shall be tested prior to backfilling, as specified, with pressure to be maintained for 12 hours without drop. Furnish accessories required for test.

d. When particular circumstances prohibit hydrostatic tests, Contracting Officer may exercise option to have Contractor perform air pressure and soap solution test. If this type of test is approved by Contracting Officer, Contractor shall perform air pressure and soap solution test at weld and flange joints. Pneumatic test pressure shall not be less than 1.2 nor more than 1.5 times the design pressure of piping system. The test pressure shall not exceed maximum allowable test pressure of non-isolated components. Leaks discovered during test shall be corrected and successive tests performed. Test shall be repeated until leaks are sealed. Test shall be conducted before insulation is applied. A portable sprayer shall be used to spray soap solution on joints to detect leaks. Temporary pumps and air compressors shall be provided as required to pressurize system prior to and during tests. Tests shall be in accordance with ASME B31.1.

3.7.7 Cleaning of Boiler and Piping

After hydrostatic tests have been made, and prior to performance of operating tests, boiler shall be thoroughly and effectively cleaned of
foreign materials by mechanical cleaning, initial chemical cleaning, a chemical boiling period and finally by operating steam system at 100 percent (100 percent) makeup water and wasting the condensate. Submit procedure for cleaning, prior to connecting tubing and piping to instruments and prior to pressure testing, test equipment use, and cleaning after completion of testing and installation. Wherever possible, water contacted surfaces shall be wire brushed to remove loose material, following which, boiler shall be filled with solution consisting of following proportional ingredients and circulated at approximately 207 to 344 kPa 30 to 50 psig for period of 24 to 48 hours:

<table>
<thead>
<tr>
<th>Chemical</th>
<th>Quantity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Caustic soda</td>
<td>10.9 kg (24 lbs)</td>
</tr>
<tr>
<td>Disodium phosphate, anhydrous</td>
<td>10.9 kg (24 lbs)</td>
</tr>
<tr>
<td>Sodium nitrate</td>
<td>3.6 kg (8 lbs)</td>
</tr>
<tr>
<td>Approved wetting agent</td>
<td>0.23 kg (1/2 lb)</td>
</tr>
<tr>
<td>Water</td>
<td>3,785 liters (1,000 gallons)</td>
</tr>
</tbody>
</table>

Chemicals in proportions above, or as approved by Contracting Officer, shall be thoroughly dissolved in water before being placed in boiler. After this initial chemical cleaning, boiler shall be drained and refilled with the above chemical solution and boiled in accordance with the manufacturer's instructions. After specified boiling period, boiler shall be allowed to cool, after which boiler shall be drained and thoroughly flushed. Finally, piping shall be cleaned by operating boiler for period of approximately 48 hours with 100 percent (100 percent) makeup water, wasting the steam and condensate.

3.7.8  Boiler Water Conditioning

Boiler water conditioning by chemical treatment and blowdown shall be provided during periods of boiler operation from the initial starting of system, through testing period, and to final acceptance of completed work by the Government. Chemicals used and method of treatment shall be approved by Contracting Officer.

3.7.9  Fuel Oil Leak Test

Fuel oil leak tests for the underground portion of the system shall be conducted in accordance with Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.

3.8  MANUFACTURER'S SERVICES

Services of a manufacturer's representative who is experienced in installation, adjustment, and operation of equipment specified shall be provided. Representative shall supervise installing, adjusting, and testing of equipment. Contractor personnel will not be allowed to render specified services. Manufacturer's test representatives shall be on manufacturer's payroll on a continuing eight hour pay basis, especially trained, and regularly rendering such services.
3.9 FIELD TRAINING

**************************************************************************
NOTE: Consult equipment manufacturer for hours required to train plant personnel for equipment operation and then insert the hours.
**************************************************************************

a. Field training course shall be provided for designated operating staff members. Training shall be provided for a total period of [_____] hours of normal working time and shall start after system is functionally complete, but prior to final acceptance tests. Field training shall cover items contained in approved operation and maintenance instructions as well as demonstrations of routine maintenance operations. Contracting Officer shall be notified in writing at least 14 days prior to start of training.

b. Submit [6] [_____] complete copies of operation manual outlining the step-by-step procedures required for system startup, operation and shutdown. The manuals shall include the manufacturer's name, model number, service manual and a brief description of equipment and their basic operating features.

c. Submit [6] [_____] complete copies of maintenance manual listing routine maintenance procedures, possible breakdowns and repairs, preventative maintenance schedule, and troubleshooting guides. The manuals shall include piping layout, equipment layout, and simplified wiring and control diagrams of the system as installed. The manuals shall also include equipment lubrication requirements and schedules, recommended spare parts list, index, instruction book binders with hard back covers and printing to identify the name of the facility, Government entity operating the facility, Contractor, shop order, equipment, and volume number if required. Operation and maintenance manuals shall be approved prior to the training course.

d. Distributed control system manufacturer shall provide a minimum of [_____] days of training for [_____] of Government's representatives at [plant site] [factory]. Training shall include, but not be limited by following:

(1) Use of operating console display; their interface with process; their aid in system diagnostics; all with hands on experience with equipment for trainees.

(2) Training to emphasize process control techniques, with demonstrations to show variations that can be implemented with algorithms and system configuration instructions.

(3) Training to acquaint the operators with specifics of this process, and how system operates.

(4) Training to include theory of operation, maintenance, and troubleshooting techniques, using flow charts and diagnostics with equipment in operation, and framed instructions containing wiring and control diagrams under glass or in laminated plastic, to be posted where directed. Condensed operating instructions, prepared in typed form, shall be framed as specified above and posted beside the diagrams. The framed instructions shall be posted before acceptance testing of the systems.
e. Field training shall be video taped. Provide reproducible copies of each training session video tape, printed training materials for each designated operating staff member, and two spare copies for file.

PART 3 EXECUTION

3.1 INSTALLATION
  3.1.1 Boiler and Equipment Installation
    3.1.1.1 Boiler and Equipment Foundations
    3.1.1.2 Installing Stoker Ash Pit Firebrick
    3.1.1.3 Forced and Induced Draft Fans
    3.1.1.4 Stack
    3.1.1.5 Horizontal Fuel Oil Tanks (Below Ground)
    3.1.1.6 Horizontal Fuel Oil Tanks (Above Ground)
    3.1.1.7 Vertical Fuel Oil Tank
  3.1.2 Piping
    3.1.2.1 Fittings
    3.1.2.2 Grading of Pipe Lines
    3.1.2.3 Anchoring, Guiding, and Supporting Piping
    3.1.2.4 Copper Tubing
    3.1.2.5 Sleeves
    3.1.2.6 Flashing for Buildings
    3.1.2.7 Outlets for Future Connections
    3.1.2.8 Screwed Joints in Piping
    3.1.2.9 Welded Joints
    3.1.2.10 Cleaning of Piping
3.1.2.11 Reduction in Pipe Size
3.1.2.12 Expansion Control
3.1.2.13 Connection to Equipment
3.1.2.14 Valve Installation
3.1.2.15 Traps and Connections
3.1.2.16 Pressure Gage Installation
3.1.2.17 Thermometers and Thermal Sensing Element of Control Valves
3.1.2.18 Strainer Locations
3.1.2.19 Dissimilar Piping Materials
3.1.2.20 Surface Treating, and Pipe Wrapping

3.1.3 PAINTING
3.1.3.1 Piping, Fittings, and Mechanical and Electrical Equipment
3.1.3.2 Painting
3.1.3.3 Boilers
3.1.3.4 Vertical Fuel Oil Tank
3.1.3.5 Surfaces Not to be Painted

3.1.4 INSULATION

3.2 FIELD QUALITY CONTROL
3.2.1 Tests and Inspections (Piping)
3.2.1.1 Hydrostatic and Leak Tightness Tests
3.2.2 Preliminary Operation
3.2.3 General Start-Up Requirements
3.2.4 Plant Equipment Tests
3.2.4.1 Plant Air Compressors
3.2.4.2 Instrument Air Compressors
3.2.4.3 Coal Handling System
3.2.4.4 Ash Handling System
3.2.4.5 Horizontal Fuel Oil Tanks (Below Ground)
3.2.4.6 Vertical Fuel Oil Tank
3.2.4.7 Blowdown Valves and Try Cocks
3.2.4.8 Draft Fans, Fuel Oil Heaters, Fuel Pumps, and Electric Motors
3.2.5 Boilers and Auxiliaries Tests and Inspections
3.2.5.1 Strength and Leak Tightness Tests
3.2.5.2 Boiler Inspection
3.2.5.3 Boiler Cleaning and Startup
3.2.5.4 Boiler Preliminary Operational Tests
3.2.5.5 General Operational Tests
3.2.5.6 Auxiliary Equipment and Accessory Tests
3.2.5.7 Feedwater Equipment Tests
3.2.5.8 Capacity and Efficiency Tests
3.2.5.9 Temporary Waste Steam Connection
3.2.5.10 Fire Safety for Oil-Fired Boilers
3.2.5.11 Plant Acceptance Operation
3.2.5.12 NAVFACENGCOM Acceptance

3.2.6 Manufacturers Field Services
3.2.6.1 Erection/Installation Supervisors and Service Engineers
3.2.6.2 Boiler and System Representatives
3.2.7 Instruction to Government Personnel
3.2.8 SCHEDULE

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for equipment for a steam heating plant which will generate from 2 1/2 to 9 1/2 kg per second 20,000 to 75,000 pounds per hour of steam.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: This specification is intended to be used in the procurement and installation of heating plant equipment. Requirements for materials and procedures for special or unusual design shall be added to and modifications made to this specification as necessary to fit specific projects. This guide specification shall be used in conjunction with the following NAVFAC definitive drawings and UFC 3-410-06N, "Central Heating Plants Operation and Maintenance".

NAVFAC NO./DRAWING TITLE

1429327 - STEAM HEATING PLANT NO. 4 2 1/2 to 9 1/2 KG PER SECOND 20,000 to 75,000 POUNDS PER HOUR
WATERTUBE (SHOP ASSEMBLED) COAL/OIL OR COAL RESERVE
COAL STORAGE

1429341 - STEAM HEATING PLANT NO. 4 2 1/2 TO 9 1/2
KG PER SECOND 20,000 TO 75,000 POUNDS PER HOUR
WATERTUBE (SHOP ASSEMBLED) COAL/OIL OR COAL SITE
PLAN - ELECTRICAL

1429342 - STEAM HEATING PLANT NO. 4 2 1/2 TO 9 1/2
KG PER SECOND 20,000 TO 75,000 POUNDS PER HOUR
WATERTUBE (SHOP ASSEMBLED) COAL/OIL OR COAL FLOOR
PLAN - ELECTRICAL

1429343 - STEAM HEATING PLANT NO. 4 2 1/2 TO 9 1/2
KG PER SECOND 20,000 TO 75,000 POUNDS PER HOUR
WATERTUBE (SHOP ASSEMBLED) COAL/OIL OR COAL ONE-LINE
DIAGRAM - ELECTRICAL

PART 1   GENERAL

1.1 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the
publications cited in the text of the guide
specification. The publications are referred to in
the text by basic designation only and listed in
this paragraph by organization, designation, date,
and title.

Use the Reference Wizard's Check Reference feature
when you add a Reference Identifier (RID) outside of
the Section's Reference Article to automatically
place the reference in the Reference Article. Also
use the Reference Wizard's Check Reference feature
to update the issue dates.

References not used in the text will automatically
be deleted from this section of the project
specification when you choose to reconcile
references in the publish print process.

1.2 RELATED REQUIREMENTS

The following guide specification sections apply to this section with the additions and modifications as stated in the paragraph cited:

- **01 78 23** OPERATION AND MAINTENANCE DATA
- **03 30 00** CAST-IN-PLACE CONCRETE
- **05 12 00** STRUCTURAL STEEL
- **09 97 13.15** LOW VOC POLYSULFIDE INTERIOR COATINGS FOR WELDED STEEL PETROLEUM FUEL TANKS
- **09 97 13.28** PROTECTION OF BURIED STEEL PIPING AND BULKHEAD TIE RODS
- **09 90 00** PAINTS AND COATINGS
- **21 13 13** WET PIPE SPRINKLER SYSTEMS, FIRE PROTECTION
- **41 22 13.14** BRIDGE CRANES, OVERHEAD ELECTRIC, TOP RUNNING
DEFINITIONS

a. Standard Commercial Product: A product which has been sold or is being currently offered for sale on the commercial market through advertisements or manufacturer's catalogs, or brochures, and represents the latest production model.

b. System Supplier: A manufacturer, fabricator, erector, corporation or firm that regularly is employed in the design, fabrication, erection, or erection supervision, testing and startup of systems comparable in size and type to those specified and indicated. The system supplier shall arrange the equipment selected, design the equipment interconnections, produce related shop drawings, supervise the erection, and start up and test the equipment.

SYSTEM DESCRIPTION

1.4.1 Design Requirements

1.4.1.1 Boiler

Boiler design and service conditions:

a. Design pressure: [_____] kPa (gage) psig

b. Operating pressure: [_____] kPa (gage) psig

c. Steam temperature: [_____] degrees C F

d. Feedwater temperature: [_____] degrees C F

e. Site elevation: [_____] meters feet

f. Ambient air temperatures:
   (1) Minimum: [_____] degrees C F
   (2) Maximum: [_____] degrees C F

g. Maximum continuous output (steam): [_____] kg/sec lb/hr
h. Minimum continuous output (steam): [_____] kg/sec lb/hr (without smoking)

i. Continuous blowdown: [_____] percent

**************************************************************************
NOTE: Regarding the text below, the specified efficiency for the boiler at maximum continuous load shall be not less than 80 percent for coal and 82 percent for oil. If an economizer is used, use 82 and 84 percent respectively for coal and oil firing. Depending on the particular application and fuel used, these efficiencies could be higher.
**************************************************************************

j. Efficiency at maximum continuous rating [includes economizer]
   (1) Coal: [_____] percent
   (2) [Oil]: [_____] percent

1.4.1.2 Economizer

**************************************************************************
NOTE: Economizers shall be specified for all boilers with operating pressure greater than 345 kPa (gage) 50 psig and a capacity of 2 1/4 kg/sec 18,000 pounds per hour and larger. For boilers from 1/2 to 2/14 kg/sec 4,000 to 18,000 pounds per hour the designer shall make the decision based upon a specific economic analysis. This paragraph shall be included as applicable.
**************************************************************************
**************************************************************************
NOTE: Unless a coal or a fuel oil to be burned has an uncommon tendency to foul tubes, finned tube economizers should be suitable for both fuels. Feedwater temperatures should be 110 degrees C 230 degrees F when sulphur (S) content of oil is 0.5 percent; 116 degrees C 240 degrees F, S=1.5 percent - 2 percent; 121 degrees C 250 degrees F, S=2.0 percent - 2.7 percent. Where fuels having more than 1.5 percent sulfur content are to be fired, finned tubes shall not be used unless they are steel tubes covered with cast iron finned casing.
**************************************************************************

a. Design pressure: [_____] kPa (gage) psig
b. Operating pressure: [_____] kPa (gage) psig
c. Fuel: Coal [and No.: [_____] fuel oil]
d. Specific heat of the flue gas: [_____] kJ/kg - degrees C Btu/lb - degrees F
e. Feedwater flow: [_____] L/s gpm
f. Flue gas temperature entering economizer: [_____] degrees C F

g. Flue gas temperature leaving economizer: [_____] degrees C F

h. Feedwater temperature entering economizer: [_____] degrees C F

i. Maximum pressure drop, economizer gas side: [_____] Pa inches water

j. Maximum pressure drop, economizer water side: [_____] kPa psi

k. Fouling factor on feedwater side: [_____

l. Fouling factor on gas side: [____]}

1.4.1.3 Forced Draft Fan (Coal Firing)

Design fan to handle air at temperatures from [_____] to [_____] degrees C F. Fan shall be [single] [double] width inlet, [single] [double] width outlet, with [clockwise] [counter clockwise] rotation when viewed from the motor end.

1.4.1.4 Induced Draft Fan Design

Design fan of materials which will withstand flue gas temperatures up to 316 degrees C 600 degrees F without damage. Fan shall be [single] [double] width inlet, [single] [double] width outlet, with [clockwise] [counterclockwise] rotation when viewed from the motor end.

1.4.1.5 Expansion Joints

a. Stacks (for installation without flue gas scrubbers):

   (1) Temperature:

   Maximum ambient: [_____] degrees C F

   Minimum ambient: [_____] degrees C F

   Inlet gas at maximum gas flow (coal): [_____] degrees C F

   Inlet gas at maximum gas flow (oil): [_____] degrees C F

   Inlet gas at minimum gas flow (coal): [_____] degrees C F

   Inlet gas at minimum gas flow (oil): [_____] degrees C F

   (2) Gas flow at inlet

   Maximum: [_____] kg/sec lb/hr

   Minimum: [_____] kg/sec lb/hr

   (3) Required net available draft at stack inlet

   At maximum gas flow: [_____] Pa inches water

   (4) Gas exit velocity (cone exit)

   Maximum at maximum conditions: [_____] m/sec ft/sec
(5) Flue gas acid dew point
   Coal: [_____] degrees C F
   Fuel oil: [_____] degrees C F
(6) Test pressures
   Shop test: [_____] Pa inches water
(7) Thermal efficiency of stack: 96 to 98 percent
(8) Stack friction, max. at design condition: [_____] Pa inches water
(9) Stack height
   Ground elevation: [_____] m ft
   Roof elevation: [_____] m ft
   Stack height: [_____] m ft
   Foundation or footing elevation: [_____] m ft
(10) Wind pressure: [_____] kg/m2 psf
(11) Wind velocity, gusting: [_____] km/hr mph
(12) Stack Diameter, min. (below exit cone): [_____] mm inches
(13) Max. stack deflection (from vertical center line): [_____] mm inches
(14) Soil bearing stress, maximum: [_____] kg/m2 psf
(15) Seismic zone: [_____]

1.4.1.6 Fuel Oil Pump

**************************************************************************
NOTE: The values enclosed in brackets are for No. 6 low sulfur fuel oil. Adjust values to suit fuel oil used if other than No. 6.

Tabulated pump data is included in the specifications but it is preferred that such information to be shown on the drawings instead.
**************************************************************************

a. Transfer pumps (for fuel oil tank truck or railroad tank car unloading and transfer to tanks):
   (1) Number of assemblies: [_____] 
   (2) Tag numbers: As indicated 
   (3) Capacity each: [_____] L/s gpm at 450 ssu 

SECTION 23 52 33.01 20 Page 23
(4) Suction lift required: [_____] kPa ft of water

(5) Discharge pressure: [_____] kPa (gage) psig

(6) Operating temperature: [27 to 54] [_____] to [_____] degrees C
[80 to 130] [_____] to [_____] degrees F

(7) Viscosity range: [450 to 5000] [_____] to [_____] ssu

(8) Specific gravity: [.92 to .99] [_____] to [_____]

(9) Viscosity at brake power selection point: [9000] [_____] ssu

(10) Maximum pump speed: 1750 rpm

(11) Motor kW hp: [_____]

(12) Fuel oil: No. [6, low sulfur] [_____

b. Transfer pumps (for fuel oil transfer from tanks to heating plant):

(1) Number of assemblies: [_____] 

(2) Tag numbers: As indicated 

(3) Capacity: [_____] L/s gpm at 450 ssu 

(4) Suction lift required: [_____] kPa ft of water 

(5) Discharge pressure: [_____] kPa (gage) psig 

(6) Operating temperature: [49] [_____] degrees C [120] [_____] degrees F 

(7) Viscosity range: [450 to 3000] [_____] to [_____] ssu 

(8) Specific gravity: [.92 to .99] [_____] to [_____] 

(9) Viscosity at brake power selection point: [5000] [_____] ssu 

(10) Maximum pump speed: 1750 rpm 

(11) Motor kW hp: [_____] 

(12) Fuel oil: No. [6, low sulfur] [_____] 

c. Fuel oil recirculation pump sets (at remote storage):

(1) Number of assemblies: [_____] 

(2) Tag numbers: As Indicated 

(3) Capacity: 1.60 L/s 25 gpm at 450 ssu 

(4) Suction lift required: [_____] kPa ft of water 

(5) Discharge pressure: [_____] kPa (gage) psig 

(6) Operating temperature: [49] [_____] degrees C [120] [_____]
degrees F

(7) Viscosity range: [450 to 3000] [_____] to [_____] ssu
(8) Specific gravity: [.92 to .99] [_____] to [_____]  
(9) Viscosity at brake power selection point: [5000] [_____] ssu
(10) Maximum pump speed: 1750 rpm
(11) Motor kW hp: [_____]  
(12) Fuel oil: No. [6, low sulfur] [_____] 

1.4.1.7 Fuel Oil Pump and Heater Set

a. Capacity each pump and each steam heater: [_____] L/s gpm
b. Suction lift: [_____] kPa ft of water
c. Discharge pressure at outlet of heater: [_____] kPa (gage) psig
d. Maximum pump speed: 1750 rpm
e. Specific gravity range: [.92 to .99] [_____] to [_____]  
f. Viscosity at brake power selection point: 5000 ssu
g. Viscosity range: [500 to 5000] [_____] to [_____] ssu
h. Oil temperature at inlet of heater: [_____] degrees C F
i. Oil temperature at outlet of heater: [_____] degrees C F
j. Maximum oil pressure drop through heater: [_____] kPa psi
k. Heating medium: Steam
l. Steam pressure available: [_____] kPa (gage) psig
m. Steam temperature: [_____] degrees C F
n. Heater type: [Bare Tube] [Extended Surface]

1.4.1.8 Electric Startup Heater

a. Oil temperature at inlet of heater: [_____] degrees C F
b. Oil temperature at outlet of heater: [_____] degrees C F
c. Maximum oil pressure drop through heater: [_____] kPa psi
d. Capacity of heater: [_____] L/s gpm
e. Heating power supply at three phase, 60 Hz: [_____] volts
f. Control power supply 120 volts, single phase, 60 Hz
1.4.1.9 Ash Handling System (Pneumatic)

a. Capacity:

(1) Ash Handling System: Estimated capacities at maximum plant output are listed below; ash handling system capacity shall be sized for twice the amounts listed.

[_____] Mg tons per hour for fly ash

[_____] Mg tons per hour for bottom ash at the farthest ash intake from the exhauster

[_____] Mg tons per hour in main ash line leaving the boiler house (minimum).

(2) Ash silo: Storage capacity of ash silo is specified in the paragraph ASH STORAGE SILO.

(3) Rotary unloader: [_____] Mg tons per hour

b. General Data

(1) Available water pressure: [_____] kPa (gage) psig

(2) Available air pressure: [_____] kPa (gage) psig

(3) Seismic Zone: [_____] km/hr mph

(4) Wind Velocity (Gusts): [_____] km/hr mph

(5) Altitude of plant: [_____] m ft

(6) Steam rating of plant: [_____] kg/sec lb/hr

(a) Maximum continuous rating of boiler No. 1 [_____] kg/sec lb/hr

(b) Maximum continuous rating of boiler No. 2 [_____] kg/sec lb/hr

(c) Maximum continuous rating of boiler No. 3 [_____] kg/sec lb/hr

(d) Maximum continuous rating of boiler No. 4 [_____] kg/sec lb/hr

(7) Coal Analysis

(a) Ash: [_____] percent

(b) Carbon: [_____] percent

(c) Hydrogen: [_____] percent

(d) Sulfur: [_____] percent

(e) Moisture: [_____] percent

(f) Nitrogen: [_____] percent

(g) Oxygen: [_____] percent
(8) Ash Analysis
   (a) Carbon: [_____] percent
   (b) Calcium: [_____] percent

(9) Minimum velocities required for materials
   (a) Fly Ash: 19.30 meters per second (m/s) 3800 feet per minute (fpm)
   (b) Bottom Ash [Single Retort Underfeed] 28.40 m/s 5600 fpm
       [Traveling Grate] stoker

1.4.1.10 Ash Handling System (Mechanical)
   a. Capacity:
      (1) Ash Handling System: Estimated capacities at maximum plant output
         are listed below; ash handling system capacity shall be sized for
         twice the amounts listed.
         [_____] Mg tons per hour for fly ash
         [_____] Mg tons per hour for bottom ash
         [_____] Mg tons per hour in bucket elevator leaving the boiler
         house (minimum).
      (2) Ash Silo: Storage capacity of ash silo is specified in the
         paragraph ASH STORAGE SILO.
      (3) Rotary unloader: [_____] Mg tons per hour

   b. General Data:
      (1) Available water pressure: [_____] kPa (gage) psig
      (2) Available air pressure: [_____] kPa (gage) psig
      (3) Seismic Zone: [_____]
      (4) Wind Velocity (Gusts): [_____] km/hr mph
      (5) Altitude of plant: [_____] m ft
      (6) Steam rating of plant: [_____] kg/sec lb/hr
         (a) Maximum continuous rating of boiler No. 1 [_____] kg/sec lb/hr
         (b) Maximum continuous rating of boiler No. 2 [_____] kg/sec lb/hr
         [c] Maximum continuous rating of boiler No. 3 [_____] kg/sec lb/hr
         [d] Maximum continuous rating of boiler No. 4 [_____] kg/sec lb/hr

   (7) Coal Analysis
      (a) Ash: [_____] percent
(b) Carbon: [_____] percent
(c) Hydrogen: [_____] percent
(d) Sulfur: [_____] percent
(e) Moisture: [_____] percent
(f) Nitrogen: [_____] percent
(g) Oxygen: [_____] percent

8. Ash Analysis
(a) Carbon: [_____] percent
(b) Calcium: [_____] percent

1.4.1.11 Deaerating Heater

a. Design pressure: 207 kPa (gage) 30 psig
b. Normal steam operating pressure: [_____] kPa (gage) psig
c. Maximum steam operating pressure: [_____] kPa (gage) psig
d. Capacity (minimum): [_____] kg/sec lb/hr of feedwater
e. Inlet Conditions at Heater:

h. Heating steam enthalpy: [_____] kJ/kg Btu/lb

i. Storage capacity to overflow of storage tank: [_____] liters gallons

1.4.1.12 Water Softening System

Base the water softening system on the following:

**************************************************************************
NOTE: Analysis of the water available for makeup shall govern the softener system selected. A competent water treating consultant shall be obtained to formulate specific system recommendations if the makeup water analysis indicates any of the following:

1. Iron in excess of 0.1 ppm as Fe.

2. Mg Alkalinity in excess of 50 ppm as CaCO3.

**************************************************************************

a. Raw Water Analysis: Source of raw water is [______]. Raw water is available at pressures of [_____] to [_____] kPa (gage) psig. Analysis of water available for makeup is approximately as follows:

TABLE 1: MAKEUP WATER ANALYSIS

### Softener Effluent Analysis:

---

**NOTE:** Total solids of 175 ppm in the feedwater concentrated 20 times give 3,500 ppm in the boiler water.

---
(1) Hardness: Maintain hardness of softened feedwater near zero and in no case allow it to exceed 1.0 part per million (ppm) as CaCO3.

(2) Total Solids: Maintain total solids in softened feedwater at a level to ensure a total solids concentration in the boiler water of less than 3,500 ppm without excessive blowdown.

1.4.2 Detail Drawings

1.4.2.1 Steam Generating Unit

Submit steam generating unit (boiler) manufacturer's drawing for the following:

a. Refractory details, expansion joints;

b. Certified outline, general arrangement (setting plan), and anchor bolt detail drawings including foundation loading diagrams;

c. Plans and elevations detailing piping connections;

d. Detailed dimensional drawings of auxiliaries furnished with unit;

e. Piping schematics for auxiliaries, such as sootblowers or hydraulic stoker drives (when used);

f. Shop fabrication details of boiler/furnace: Including details showing tubing, spacing, radii, dimensions, and gage; sections through walls and expansion joints showing refractory construction and replacement details; internal and external dimensions of boiler;

g. Wiring diagrams for subsystems;

h. Economizer and economizer inlet breeching;

i. Sootblowers;

j. Auxiliaries furnished with boilers;

k. Forced draft fan, drives and ductwork;

l. Induced draft fan, drives and ductwork;

m. Structural steel and loading diagrams; and

n. Overfire air fan system.

1.4.2.2 Boiler Room Auxiliary Equipment

Include equipment arrangements, wiring diagrams, piping diagrams and details of valves and piping. Submit descriptive information for each item on the drawings.

a. Water softening equipment;

b. Brine storage tank;

c. Condensate receiver;
d. Condensate transfer pumps including certified performance curves;

e. Deaerator;

f. Boiler feed pumps including certified performance curves;

g. Steam turbines;

h. Continuous blowdown system;

i. Chemical feed units;

j. Air compressors;

k. Air dryers;

l. Cranes and hoists; and

m. Plant heating and ventilating equipment showing related ductwork.

1.4.2.3  Stokers

Include the following:

a. General arrangement drawings;

b. Foundation drawings;

c. Front plates;

d. Ash hoppers;

e. Fuel gate mechanism;

f. Grate details;

g. Zone dampers;

h. Air seal details;

i. Overfire air nozzle arrangement;

j. Coal feeder details;

k. Fuel feeder drives;

l. Piping schematics;

m. Wiring schematics; and

n. Access doors.

1.4.2.4  Ash Handling System

Include the following:

a. General arrangement;

b. Construction details of ash storage silo complete with loading diagrams;
c. Control panel arrangement and schematics;

d. Wiring and control diagrams;

e. Ash piping arrangement drawings and schematic drawings;

f. Wear back fitting details;

g. Piping and fittings;

h. Details of [steam] [motor driven mechanical] exhauster [and air washer - steam condenser];

i. Details of separators, tertiary bag filter, and ash silo vent bag filter; and

j. Silo fluidizing system and rotary ash conditioner.

1.4.2.5 **Burners**

Include the following:

a. General arrangement;

b. Piping details;

c. Burner control schematics;

d. Flame safety schematics;

e. Component details; and

f. Throat tile details.

1.4.2.6 **Stacks, Dampers, and Breechings**

Include the following:

a. General arrangement;

b. Breeching, reinforcing details;

c. Breeching hangers and support details;

d. Dampers and operators;

e. Access doors and frames;

f. Expansion joints; and

g. Stack details including anchor bolt and foundation details, stack sampling ports, platforms, and accessories.

1.4.2.7 **Coal Handling Equipment Drawings**

Include the following:

a. Certified outline and general arrangement drawings for complete coal
handling system;

b. Dimensional equipment and fabrication drawings, including equipment weights, equipment locations, support details, and anchor bolt arrangements for items and equipment specified under the paragraph COAL HANDLING EQUIPMENT;

c. Control panel, coal presence indicators, and equipment response switch details; and

d. Control schematic diagrams and complete wiring diagrams.

1.4.2.8 Fuel Oil Equipment

Manufacturer's standard size for pumps, pump curves, valves, strainers and pump wiring and include the following:

a. Certified outline and general arrangement drawings;

b. Certified pump curves;

c. Equipment detail sheets including viscosity controller, heater and valves;

d. Electrical wiring diagrams; and

e. Oil tanks, foundations, tank heaters, appurtenances, water drawoff and level indication.

1.4.2.9 Piping and Specialty Items

Manufacturer's standard size and include the following:

a. Details of valves and fittings;

b. Feedwater regulator details and schematics;

c. Details and schematics of feedwater automatic recirculation; and

d. Installation details for ball expansion joints for saturated steam piping including allowable angular flex and minimum offset dimensions.

1.4.2.10 Furnishing Approved Drawings

Furnish one reproducible mylar shop drawing of each approved drawing sheet to the Contracting Officer for the following items:

a. Boiler layout, foundations, construction and details including economizers, and auxiliaries;

b. Breeching layout, construction and details;

c. Burner control and flame safety schematics;

d. Burner details;

e. Wiring diagrams;

f. Fuel tanks, foundations and appurtenances;
g. Feedwater automatic recirculation system;

h. Piping schematics;

i. Control diagram schematics including control panel construction and layouts;

j. Coal handling system;

k. Stoker details; and

l. Ash handling system.

1.4.3 Posted Operating Instructions

Provide posted operating instructions for each piece of equipment installed.

1.4.4 Performance Requirements

1.4.4.1 Boiler

Efficiency listed for coal burning shall be based on stoker firing with [_____] percent excess air. Efficiency for fuel oil firing shall be based on [_____] percent excess air.] Efficiency shall allow for [_____] percent continuous blowdown and 1.5 percent unaccounted losses and manufacturer's margin. Base boiler performance on burning fuels in accordance with the Coal Analysis [and Fuel Oil Analysis] listed below.

a. Coal Analysis

(1) Ultimate Analysis (percent by weight)

<p>| | |</p>
<table>
<thead>

Heating Value: [_____] kJ/kg Btu per pound
Specific Gravity: [_____] degrees API
Viscosity at burner
[_____] (SSF at 50 degrees C 122 degrees F
[_____] Water and Sediment (percent by volume)
[_____] Flash Point degrees C F

Submit predicted economizer performance along with and as a part of the boiler predicted performance.

1.4.4.2 Economizer

Increase in efficiency due to the economizer shall be not less than [_____] percent at full load. Fully coordinate economizer with the boiler to which it is to be applied.

1.4.4.3 Oil Burner/Windbox Package

Burner turndown ratio on specified fuel oil shall be not less than eight to one, with excess air not over 15 percent at full steam load, and excess air not over 22 percent at 20 percent steam load.[ Air flow shall be modulated through a single set of register louvers.]

1.5 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

SECTION 23 52 33.01 20  Page 37
For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

Make submittals within [60] [75] [90] days after award of the contract.

SD-02 Shop Drawings

Steam Generating Unit
Boiler Room Auxiliary Equipment
Stokers
Ash Handling System
Burners
Stacks, Dampers, and Breechings
Coal Handling Equipment
Fuel Oil Equipment
Piping and Specialty Items

Each drawing size shall be A1 841 by 594 mm 34 by 22 inches, unless otherwise noted.

SD-03 Product Data

Steam Generating Unit (Boiler)
Coal Handling System

Insulation

Fans

Pumps

SD-04 Samples

Insulation

Submit samples of each type of insulation with indications of its intended application and manufacturer's stamp or label attached giving name of manufacturer, brand and description of material.

SD-05 Design Data

Stack Manufacturer's Calculations

Submit as specified under the paragraph MANUFACTURER'S CALCULATIONS REQUIRED.

SD-06 Test Reports

Boiler Predicted Performance

Economizer Performance

Instrument Air Compressor Package

Variable Speed Motor Controller

Submit certified copies of variable speed motor controller design, production and conformance tests for approval before delivery of the equipment.

Heating Plant

Submit for tests and inspections specified under the paragraph FIELD QUALITY CONTROL.

SD-07 Certificates

List of Equipment Manufacturers

Proof of Experience; G[,] [____]

Manufacturer's Installation Approval

Boiler Inspector's Report

System and Equipment Installation

Vertical Fuel Oil Tank Calibration

Backflow Preventer
1.6 QUALITY ASSURANCE

Equipment shall be factory assembled except for steam generators, coal handling equipment and ash handling equipment which shall utilize shop assembled components to the maximum extent to facilitate erection and minimize field labor.

1.6.1 Standard Commercial Product

Boilers and equipment shall, as a minimum, be in accordance with requirements of this specification and shall be the manufacturer’s standard commercial product. Include additional or higher quality features which are not specifically prohibited by this specification, but which are a part of the manufacturer's standard commercial product, in the boilers and equipment being provided.

1.6.2 Equipment Furnished

Equipment furnished by the Contractor shall be furnished by the manufacturers listed in the submittal letter listing equipment manufacturers.

1.6.3 Responsibility

The contract drawings show the required general arrangement configuration and location of equipment items. However, the contract allows for selection of any vendor's equipment at the option of the Contractor, provided the vendor's experience and equipment meet the requirements of these specifications and drawings. Because there may be significant variation between the drawings and the individual vendor's equipment as to foundations, physical dimensions and detailed arrangement of equipment items, the Contractor shall furnish detailed design and shop drawings and calculations for the systems selected. Show foundation arrangements, walkways and other information as required for a completely coordinated, useable and properly functional system. A single system supplier shall be responsible for a complete system including erection or erection supervision for each of the following systems:

a. Boiler system, including but not limited to the following: Boiler, stoker, oil burners, [economizer,] refractories, insulation, induced draft fan, sootblowers, steam separator, forced draft fan, overfire air fan, boiler trim, blowdown valves, safety valves and trim, and breeching. Ensure that the system manufacturer coordinates the required instrumentation and control logic with the controls and instrumentation supplier. Controls and instrumentation are specified in Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS.
b. Coal handling system, including but not limited to the following: Track and reclaim hoppers, belt feeders, belt conveyors and tube galleries, telescoping chute, flight conveyor, coal bunker, under bunker conveyor and triple valves, coal scale, controls, coal chutes and gates.

c. Ash handling system including ash piping, fittings, intakes, ash silo, separators, tertiary filter, [mechanical exhauster] [steam exhauster, air washer-condenser], and rotary unloader.

d. Stack system including steel stack, internal acid resistant lining and external coating.

1.6.4 Certification of Backflow Preventer

Certificate of Full Approval or current Certificate of Approval for each backflow preventer being provided for the project shall be from the Foundation for Cross-Connection Control Research, University of Southern California and shall attest that the design, size, and make of backflow preventer has satisfactorily passed the complete sequence of performance testing and evaluation for the respective level of approval. A Certificate of Provisional Approval will not be acceptable in lieu of the above.

1.6.5 Modification of References

In the API publications referred to in this specification, the advisory provisions shall be considered mandatory, as though the word "shall" had been substituted for "should" and "suggested" wherever they appear.

1.6.6 Certificates

1.6.6.1 List of Equipment Manufacturers

Submit to the Contracting Officer a letter listing the equipment manufacturers for the following equipment:

a. Boilers and stokers;

b. Boiler feedwater pumps;

c. Coal car handling equipment;

d. Induced draft fans;

e. Coal handling equipment; and

f. Ash handling equipment.

When the Contracting Officer determines that a manufacturer does not meet the qualification or experience requirements of the specifications, the Contractor shall submit, to the Contracting Officer, the name of another manufacturer within 15 days of notification.

1.6.6.2 Proof of Experience

Submit proof of experience of manufacturers, system suppliers and installers as follows.

a. Experience, Responsibility and Certification: Submit to the
Contracting Officer, the required information and experience certificates within 30 days after award and prior to commencing work on the site.

**************************************************************************
NOTE: Regarding the text below, verify number of manufacturers' installations operating and years of operation for boiler, coal handling systems, ash handling systems, forced draft fan, burner/windbox package and control systems to avoid an unnecessarily restrictive experience requirement.
**************************************************************************

b. Experience Requirements: Boilers and equipment installed within or as a part of the heating plant shall be of proven designs. Each manufacturer or system supplier shall be regularly engaged in designing, fabricating, erecting or erection supervision, testing and starting up of the equipment or system. Within 30 days after contract award, or at any time during performance of the contract, if the Contractor is required to use a different manufacturer or system supplier from one that was designated previously, through no fault of the Contractor, the Contractor shall submit certification and other evidence of acceptable experience from each replacement manufacturer or system supplier. Such certification shall show that equipment and systems made or furnished by the manufacturers or system suppliers have operating characteristics which are substantially similar to the equipment or systems specified. The certification shall also state that essentially equivalent equipment or systems supplied by the manufacturer or system supplier have been successfully installed and reliably operated in at least [one] [two] [three] installation[s] under comparable operating conditions for a period of not less than two years.

c. Information Required: Submit to the Contracting Officer, evidence or proof of experience required from the equipment manufacturer or system supplier containing the following information:

(1) List of installations meeting requirements of the paragraph EXPERIENCE REQUIREMENTS including detailed description of equipment furnished for each one;

(2) Owner and location of each installation;

(3) Name and phone number of supervisory person at each installation; and

(4) Date of Owner acceptance of such installation.

[ d. Vertical Fuel Oil Tank Calibration Experience: Submit to the Contracting Officer evidence or proof that the tank calibration organization has at least 2 years of prior successful and accurate experience in calibrating tanks of comparable type and size.

]1.6.6.3 Manufacturer's Installation Approval

Submit manufacturer's installation approval for the following systems and equipment as specified under the paragraph SYSTEM AND EQUIPMENT INSTALLATION:

a. Steam generating units (boilers) and auxiliary equipment;
b. Coal handling system;
c. Ash handling system;
d. Plant air compressors;
e. Steam turbines;
f. Variable speed motor controller; and
g. [____].

1.6.6.4 Boiler Inspector's Report

Submit as specified under the paragraph BOILER INSPECTION.

1.6.6.5 System and Equipment Installation

Submit from each system supplier and each manufacturer of the equipment, written certification that the system and equipment installation is in accordance with the system supplier's and equipment manufacturer's instructions and recommendations, that the unit or system has been run, rotating parts have been dynamically balanced, fluid (including air) flows have been balanced, instrumentation and controls are properly functioning, adjusted and have been calibrated, and the equipment or system is ready for final testing. Certificates shall be submitted before the entire boiler plant may be given an acceptance test.

[1.6.6.6 Vertical Fuel Oil Tank Calibration

Submit four copies of the certified record.

]1.6.6.7 Backflow Preventer

Submit a Certificate of Full Approval or a current Certificate of Approval for each design, size, and make of backflow preventer being provided for the project.

1.7 ENVIRONMENTAL REQUIREMENTS

Boiler plant shall comply with all applicable Federal, State, and local environmental regulations.

1.7.1 Air Permits

Permits for construction and operation of the boiler plant must be obtained from and/or submitted to the local environmental regulatory agency prior to the start of construction.

1.7.2 Burner Emission Requirements

The emission requirements shall be met at the maximum required continuous output. The burner shall meet all applicable environmental rules and regulations. Emission requirements to be considered are oxides of nitrogen (NOx), opacity, particulate, sulfur dioxide, and carbon monoxide. Other emission requirements may be imposed.
1.7.2.1 NOx Emission Regulations

Compliance shall be met using [one] [a combination] of the following:

a. Low NOx burners
b. Flue gas recirculation equipment which conforms to UL 795
c. Other NOx reduction techniques. See Nitrogen oxide control for stationary combustion sources.

1.8 DELIVERY, STORAGE, AND HANDLING

Each assembly of components packaged as a unit shall be of a size that can be transported by common carrier without disassembly insofar as shipping clearances are concerned.

1.9 EXTRA MATERIALS

Furnish a spare set of refractory bricks for each railroad hopper car thawing system.

PART 2 PRODUCTS

2.1 MATERIALS

Provide materials free of defects which would adversely affect the performance or maintainability of individual components or of the overall assembly. Materials not specified shall be of the same quality used for the intended purpose in commercial practice. Unless otherwise specified, equipment, material, and articles incorporated in the work covered by this specification shall be new.

2.1.1 Identical Items

Provide physically and mechanically identical boilers and equipment of the same classification, size or capacity to permit the interchangeability of replacement parts. This requirement includes parts, assemblies, components, and accessories. Parts provided on the same type unit regardless of size and identifiable by identical part numbers shall be functionally and dimensionally interchangeable. No deviation is acceptable without prior written approval of the Contracting Officer.

2.2 BOILER

[Coal/Oil] [Coal] Fired. Submit steam generating unit (boiler) data for the following:

a. Safety valve calculation sheets;

b. Boiler predicated performance data, and

c. Economizer predicted efficiency calculations.

2.2.1 Packaged Watertube Boiler

Provide Type I boiler conforming to FS F-B-2902 except as modified below. Provide lifting attachments.
2.2.2 Operational Requirements

Boiler shall be capable of operating continuously at the maximum specified conditions without damage or deterioration to the boiler, settings, firing equipment or auxiliaries. Boiler shall be capable of automatically controlled operation while burning the specified fuel[s].

2.2.3 Tubes

**************************************************************************
NOTE: Use this paragraph if tube diameters larger than specified in FS F-B-2902 are desired and insert minimum acceptable diameter.
**************************************************************************

Boiler and furnace tubes shall be not less than [_____] mm inches in outside diameter. Furnace tubes and first two rows of main boiler bank shall be one gage heavier than other tubes.

2.2.4 Boiler Trim

Fitting, drain valves, drain piping, feed piping, pressure gages, feed valves, stop valves, check valves, safety valves, and remaining appurtenances shall comply with applicable requirements of the ASME Boiler and Pressure Vessel Code. Components shall conform to the following:

2.2.4.1 Boiler Blowoff Valves

Provide flanged [Class 250 cast iron] [Class 300 cast steel] body, seatless, sliding plunger type valves mounted in tandem at each boiler blowoff connection.

2.2.4.2 Steel Gate, Globe and Angle Valves

ASME B16.34.

2.2.4.3 Safety, Relief, and Safety Relief Valves

ASME BPVC SEC I.

2.2.4.4 Steam Gage

**************************************************************************
NOTE: Select gage scale to operate within the middle third of range.
**************************************************************************

Provide a 300 mm 12 inch diameter indicating steam gage with chromium plated trim and zero to [_____] kPa (gage) psig scale. Gage shall be complete with syphon, valve, piping, and fittings to properly connect same. Gage shall be flush mounted on a 368 mm square by 5 mm 14 1/2 inch square by 3/16 inch thick steel plate. Provide plugged tee connection for connection to remote steam gage.

2.2.4.5 Water Column

Provide a safety water column with high and low water alarm suitable for the design pressure of the boiler. Column shall be complete with three-chain-operated gage cocks, heavy duty inclined gage glass, and
quick-closing water gage valves having cross leavers and chains operated from floor. Gage glass shall be readable from any point directly below unit. Make connections to water column from boiler with extra strong steel pipe and forged steel fittings. Provide crosses instead of tees or elbows, with screwed plugs in open ends. Terminate bottom of water column and water column gage glass with plug-type valves accessible from operating floor. Provide screwed plugged connections in water column piping for remote level indicator. Provide gate valves immediately below water column and gage glass. Provide a suitable lamp fixture to illuminate water column.

2.2.4.6 Safety Valves

Provide not less than [_____] cast steel or cast iron body high capacity safety valves to give a total steam relieving capacity in accordance with the ASME BPVC SEC I requirements as to total boiler and water wall heating surface. Valves shall be set with a set pressure of [_____] kPa (gage) psig, [_____] kPa (gage) psig [, [_____] kPa (gage) psig] [and [_____] kPa (gage) psig] respectively. Valves shall have flanged inlet and outlet connections.

2.2.4.7 Non-Return Valve

Provide a non-return valve on each boiler steam outlet. Valve shall be a stop check angle body valve, flanged, [Class 250 cast iron] [Class 300 steel] body with handwheel shutoff, pressure operated disc and external equalizer. Assembly for manual operation shall be outside screw and yoke type.

2.2.4.8 Blowoff Connections

Bottom drum blowoff connection on boiler shall be [_____] mm inch diameter and extended to outside of setting terminating with tandem flanged blowoff valves as specified above. Boiler water wall blowoff connections and economizer inlet pipe blowoff shall be 40 mm 1 1/2 inch diameter and extended to outside of setting and equipped with same type valves. Provide stop valves for water column blowoff connections. Boiler blowoff connections shall conform to the applicable requirements of ASME BPVC SEC I, Part PG-59.

2.2.4.9 Miscellaneous Stop Valves

Provide stop valves near boiler for each connection to boiler; include valves for soot blowers, chemical feed, vent, continuous blowoff, and required drains.

2.2.4.10 Tube Cleaner

Provide one tube cleaner suitable for cleaning boiler tubes. Tube cleaner shall operate on water at 1034 kPa (gage) 150 psig pressure. Tube cleaner shall be complete with one motor, one wrench, one cutter head assembled, one universal coupling for cutter head, two sets of cutters, two sets of cutter pins, one set of arm pins, one set of keeper pins, one brush with a set of refills, one tool box, and two 15 meters 50 foot lengths of heavy duty hose with 20 mm 3/4 inch diameter pipe connections.

2.2.4.11 Wrenches

Provide special wrenches required for proper maintenance of equipment.
2.2.5 Boiler Limit Interlocks

Provide applicable boiler limit interlocks required by FS F-B-2910 and connect to effect safety shutdown of the stoker[ and oil burners]. Interlocks shall be compatible with and integrated into the control and instrumentation system.

2.2.6 Sootblowers

Provide boiler [and economizer] with a sootblowing system using [steam] [compressed air] for removing deposits of soot and fly ash from heat transfer surfaces. Sootblower elements shall be of a sufficient number and in a proper location to clean every heat transfer surface susceptible to soot or fly ash deposition. Fixed position, multi-nozzle rotating elements may be used in applications where flue gas temperatures do not exceed 982 degrees C 1800 degrees F. Retractable soot blowers shall be provided where flue gas temperatures exceed 982 degrees C 1800 degrees F.

2.2.6.1 Fixed Position Soot Blowers (Steam)

**************************************************************************
NOTE: Choose this paragraph or the paragraph below, FIXED POSITION SOOTBLOWERS (AIR PUFF).
**************************************************************************

Steam, fixed position, multi-nozzled, rotating, valve-in-head type with electric motor operation to permit proper cleaning of heat transfer surfaces with cam operated valves arranged to automatically open steam valve through proper arc of rotation. Cams shall be adjustable to give proper operating arc or shall be specially designed for each location. Furnish and install soot blowers complete, including valve-in-head blower heads, wall sleeve bushings, high temperature elements, low temperature elements, [_____] volt, [_____] Hz, [_____] kW hp motor operators, hand operated drain valve, with drilled orifice and disc to prevent tight shutoff, element supports, clamps, bolts, and other required hardware. Furnish necessary piping and valves including drain lines, shutoff valves, piping supports and insulation. Weld sootblower piping and fittings. No screwed piping or fittings will be permitted. Install sootblower elements with care so that they do not rub on tubes and cause eventual tube failure. Provide scavenging air connections from forced draft fan where required to protect blower in non-blowing position. Provide a single control station containing start and stop pushbuttons and necessary relays to control motor operators.

2.2.6.2 Fixed Position Sootblowers (Air Puff)

**************************************************************************
NOTE: Choose this subparagraph or the subparagraph above FIXED POSITION SOOTBLOWERS (STEAM).
**************************************************************************

Air puff type, fixed position, multi-nozzled rotating element type complete with air master controller for each boiler, entirely air-operated and designed for controlled automatic sequential operation. Units shall be operated in such a manner that air issues from the element in a series of sustained high pressure puffs of approximately one second duration each. During each puff, element shall be rotated through a predetermined and measured short arc (17 degrees) by means of a ratchet mechanism in the sootblower head. Between each puff, no air shall flow through blowers and...
there shall be sufficient time for system to be restored to full pressure. When each blowing cycle is complete, the controller shall automatically stop its operating sequence. Provide sootblowers complete, with wall sleeve bushings, element supports, clamps, bolts, and other required hardware. Provide necessary piping and valves, including shutoff valves, piping, and supports. Sootblower piping and fittings shall have welded connections. No threaded piping or fittings will be permitted. Install sootblower elements with care so that they do not rub on tubes and cause eventual tube failure.

2.2.6.3 Retractable Sootblowers

Provide in lieu of fixed position type and use where flue gas temperatures exceed 982 degrees C 1800 degrees F. Sootblowers shall be [air] [electric] motor operated. Rotation of sootblower shall be continuous from the moment the lance or element begins to extend. Rotational and translational speeds shall be independently adjustable by changing sprockets. Sootblowers shall be complete with heavy steel housing, outside adjustment of nozzle pressure, alloy element or lance, wall sleeve, supports, and necessary hardware required for a completely workable system.

2.2.6.4 Sootblower Elements

Provide sootblowers with elements specially designed for use with [steam] [air]. Elements subjected to temperatures of 482 to 816 degrees C 900 to 1500 degrees F shall be chromium covered extra heavy carbon steel tubing or a chrome alloy as specified for high temperatures; between 817 to 927 degrees C 1501 to 1700 degrees F, elements shall contain not less than 20 to 23 percent chrome; from 928 to 982 degrees C 1701 to 1800 degrees F, not less than 24 to 27 percent chrome. Provide a flexible connection between each head and element.

2.2.6.5 Pushbutton

On the operating floor provide a pushbutton for each boiler for starting and stopping sootblower system.

2.2.6.6 Control for Sootblowing System

Provide sootblowing system with an automatic programmable control system which will automatically start and stop each soot blower in programmable sequence and monitor and display operation of soot blowers. Provide an override control which will permit manual start-stop operation of sootblowers.

2.2.7 Combustion Controls

As specified in Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS.

2.3 ECONOMIZER

**************************************************************************

NOTE: Economizers shall be specified for all boilers with operating pressures greater than 345 kPa (gage) 50 psig and a capacity of 2 1/4 kg/sec 18,000 pounds per hour and larger. For boilers from 1/2 to 2 1/4 kg/sec, 4,000 to 18,000 pounds per hour the designer shall make the decision based upon a specific economic analysis. This paragraph shall be
included as applicable.

**************************************************************************

NOTE: Unless a coal or a fuel oil to be burned has an uncommon tendency to foul tubes, finned tube economizers should be suitable for both fuels. Feedwater temperatures should be 110 degrees C 230 degrees F when sulphur (S) content of oil is 0.5 percent; 116 degrees C 240 degrees F, S=1.5 percent - 2 percent; 121 degrees C 250 degrees F, S=2.0 percent - 2.7 percent. Where fuels having more than 1.5 percent sulfur content are to be fired, finned tubes shall not be used unless they are steel tubes covered with cast iron finned casing.

**************************************************************************

Provide a modular [bare tube] [cast iron finned, steel tube] unit constructed in accordance with the ASME BPVC SEC I. Water flow shall be parallel to flue gas flow (incoming water shall enter at the same end that the flue gasses enter the economizer).

2.3.1 Construction

Provide manufacturer's standard economizer design for the operating conditions and the fuel(s) specified. Coordinate the amount of heating surface with the flue gas conditions exiting the boiler or boilers on which the economizer is to be applied to preclude reaching the "acid dew point" for specified fuels. When necessary (sulfur is present in the specified fuel and the designed inlet temperature could fall below the "acid dew point"), provide a feedwater temperature control system. Provide casing of not less than 12 gage steel plate reinforced with steel support lugs and breeching flanges. Provide building framing steel to properly support the economizer.[ Provide built-in rotary chain operated soot blowers for each economizer to thoroughly clean surfaces exposed to flue gas.] Economizer shall be designed so that internal construction can be easily cleaned and inspected.

2.3.2 Equipment

Provide the following equipment for each unit:

a. Relief valve

b. Shutoff gate valve on feedwater outlet and shutoff globe valve on inlet with globe valve bypass. Size valves as shown in economizer piping detail

c. Temperature indicator on feedwater outlet
d. Temperature indicator on feedwater inlet
e. Temperature indicator on flue gas outlet
f. Temperature indicator on flue gas inlet
g. Temperature alarm switches for high and low flue gas temperatures
h. Alarm with trouble light and silencing switch
i. Panel with annunciator and temperature indicators for feedwater inlet, feedwater outlet, flue gas inlet, flue gas outlet of each economizer

j. A drain valve downstream of the economizer before the shutoff valve

k. A stack flue gas temperature control system to control and limit flue gas temperature to not less than 149 degrees C 300 degrees F by modulating a motorized feedwater control valve in a bypass around the economizer. Provide a shutoff valve on each side of the control valve with a strainer upstream of each valve. Provide this system parallel to the manual shutoff and bypass described above

l. Differential pressure indicator on water side

m. Differential pressure indicator on gas side

n. Pressure gages on feedwater inlet and outlet

2.3.3 Insulation

Submit manufacturer's literature of each insulation type and installation, adhesives, coating mastic and accessories. Make reference to specification paragraph numbers where they apply. Insulate economizer with not less than the equivalent of 50 mm 2 inches of mineral wool insulation and lag with not less than 27 gage galvanized, weatherproof lagging.

2.4 COAL STOKERS

*******************************************************************************
NOTE: The single retort underfeed stoker can be used for up to a maximum continuous rating of approximately 3 kilogram per second (kg/s) 25,000 pounds per hour steam flowrate and a two hour peak rating of 3.75 kg/s 30,000 pounds per hour depending upon the manufacturer.
******************************************************************************

*******************************************************************************
NOTE: If the boiler is not part of this project insert Coal Analysis at end of this paragraph and delete the last sentence.
******************************************************************************

Provide for each boiler a single retort underfeed stoker with moving grates arranged for side dump ash discharge. Stoker shall be capable of continuous operation at such rate as required for continuous output of not less than that specified for the boiler and shall satisfactorily provide for automatic operation, by means of a combustion control system, within the range given when burning specified coal and operated in accordance with manufacturer supplied instructions. Satisfactory operating conditions shall be obtained throughout the full operating range of the stoker. Stoker shall be considered as an integral part of the steam generator and shall be subject to applicable provisions of the boiler design and service conditions together with requirements of tests, performance guarantees and other warranties specified for the boiler. Coal analysis shall be as specified in the Coal Analysis Schedule for the boiler.
2.4.1 Stoker Grate Area and Heat Release Rate

**************************************************************************
NOTE: The designer shall refer to the graph of Stoker Allowable Rating - Percent Of Full Load Rating Versus Ash Fusion Temperature shown in NAVFAC DM-3.6, NAVFAC Design Manual, Figure 11 and select the appropriate combustion rate.
**************************************************************************

Provide a grate with area sufficient to give specified steam output when burning specified coal. Grate shall fit between furnace side wall headers and between the inside face of the front wall and face of the bridge wall. Maximum stoker heat release rate shall be not greater than [_____] watt per square meter Btu per square foot per hour at the specified maximum continuous rating for the boiler.

2.4.2 Construction

2.4.2.1 Coal Fuel Feed Control

Provide a stoker ram with a constant stroke for feeding fuel to the central retort and necessary auxiliary rams or pushers to secure an even distribution of fuel throughout the entire length of the retort and over the grate surface. Determine rate of coal feed by the length of the rest period between full strokes. Provide for control by adjustment at a single point. Design stoker controls for connection to a combustion control system.

2.4.2.2 Coal Hopper

Provide a [_____] mm inch thick Type 316 stainless steel coal hopper having a capacity of not less than [_____] kg pounds at the front of each stoker.

2.4.2.3 Stoker Front Enclosure

Provide stoker front with dusttight enclosure of cast iron, or not less than 10 gage steel plate, of height and width to match boiler front to eliminate dust from the boiler room and prevent air infiltration to grate.

2.4.2.4 Stoker Grates

Grate surface shall consist of air cooled lateral firebars or grates inclined downward from the central retort toward side walls of furnace. Provide for agitation of fuel bed by either an alternating arrangement of moving and stationary grate bars or an undulating grate bar motion. Moving grates shall be adjustable to obtain the degree of movement necessary to suit characteristics of the fuel. Adjustments shall be capable of being made while unit is in operation. Design firebars or grates to prevent sifting of coal through spaces provided for air admission to the fuel bed. As a minimum, construct stoker grates of alloyed cast iron.

2.4.2.5 Stoker Drive

Stoker may be hydraulically or mechanically driven through cranks and machine cut, double reduction worms and gears, fully enclosed in an oiltight case and running in a bath of oil. Bearings shall be antifriction type, with hardened inner and outer races and fitted with forced lubrication fittings.
2.4.2.6 Stoker Drive Electric Motor

[_____] volt, [_____] phase, 60 Hz, [_____] rpm, totally enclosed, fan cooled not less than [_____] kW hp as specified in the paragraph MOTORS AND DRIVES.

2.4.2.7 Air Distribution Control

Divide stoker plenum chamber into high and low pressure zones. High pressure zone shall be adjacent to retort where fuel bed is normally heaviest. Low pressure zone shall be under end of grate furthest from retort and shall compensate for thinner fuel bed normally carried in that area. Make provisions to admit air under pressure through the dump grates by manually operated blast gates.

2.4.2.8 Overfire Air System

Overfire air system shall consist of a blower, damper, manifold with properly sized nozzles and connecting air piping to ensure full penetration and proper turbulence. Blower volume shall not be less than 15 percent of total volume of combustion air. Blower pressure shall be sufficient for penetration of the full length of the furnace. Nozzles shall be located in rear of furnace wall and nozzle spacing shall be approximately 150 to 230 mm (6 to 9 inches) o.c. Utilizing air from forced draft fan for overfire air system is not acceptable. Design shall conform to requirements of the stoker manufacturer to suit the boiler furnished.

2.4.2.9 Ash Discharge System

Provide each stoker with power operated dump grates extending from front wall to bridge wall on both sides adjacent to side walls and of sufficient area to handle ash resulting from burning of coal specified at the maximum capacity specified. Stoker dump cylinders shall be [steam] [air] [hydraulically] operated. Perforate dump grates for admission of air to burn out combustibles before refuse is discharged to ash pit. Provide ash spray pipes with manually operated valves on front of stoker beneath each dump grate.

2.4.2.10 Doors

Provide stoker front with not less than two lined furnace access doors not less than 460 mm wide by 400 mm high 18 inches wide by 16 inches high with observation ports, two ash pit doors not less than 350 mm wide by 300 mm high 14 inches wide by 12 inches high, and two air plenum cleanout doors.

2.4.2.11 Lubrication

Provide stoker drive mechanism with grease cups, oil cups, or splash pans to provide proper lubrication.

2.5 OIL BURNER/WINDBOX PACKAGE

**************************************************************************
NOTE: The designer shall fill in the appropriate information as defined in FS F-B-2910.
**************************************************************************

Provide a fully modulating, oil burner conforming to FS F-B-2910, Class
[____], except as modified below. Provide burner with windbox, burner blower fan, dampers, fuel train and associated controls to comprise a complete factory assembled package. Total heat input to the boiler furnace shall be provided by [____] burners. Burner package shall be considered an integral part of the steam generator and shall be subject to applicable provisions of the boiler design and service together with the requirements of tests, performance guarantees and other warranties specified for the boiler.

2.5.1 Burner

2.5.1.1 Burner Characteristics

Burner shall be quiet in operation and shall operate with a balanced flame so as not to localize heat in any part of the combustion chamber. Burner shall be capable of completely atomizing and effectively mixing oil with air so as to ensure complete combustion. Air admitted shall be of sufficient quantity for complete combustion, but not of such quantity as to produce an undue percentage of excess air with attendant high stack loss. Oil burner shall operate without clogging or failure, and shall have sufficient capacity to develop not less than the specified capacity. Burner unit shall be easily removed from firing position and readily accessible for inspection, cleaning, and other purposes. Provide adequate observation ports on burner. Burner manufacturer shall guarantee that there will be no flame impingement on sidewalls, top, bottom, or rear walls of furnace. Install burner manufacturer furnished refractory throat tiles or other items required for proper installation of burner.

2.5.1.2 Atomization

**************************************************************************
NOTE: For boilers below 7100 kW 25,000 pounds per hour the designer shall select either compressed air or steam atomization after performing an economic analysis. For 7100 kW 25,000 pounds per hour and above, atomization shall be by compressed air unless steam pressure is required for greater turndown.
**************************************************************************

Burner shall be [steam atomizing; steam pressure at header is [____] kPa (gage) psig; steam temperature at header is [____] degree C F] [air atomizing; filtered compressed air shall be available for burner atomization and the maximum requirement for each burner shall not exceed [____] L/s scfm of air at [____] kPa (gage) psig]. Provide pressure reducing valve and controls as required.

2.5.1.3 Electric Ignition System

**************************************************************************
NOTE: Natural gas pilot ignition system may be considered only when natural gas is available at the site.
**************************************************************************

**************************************************************************
NOTE: Choose this subparagraph or the subparagraph below, NATURAL GAS PILOT IGNITION SYSTEM.
**************************************************************************
Burner shall be equipped with an electric ignition system. System shall be either high energy ignition or glow rod type. Gas ignition system is not acceptable. High energy ignition system shall use stored energy to develop 2000 Vdc pulses. Glow rod system shall use a low voltage, carbon rod electrode which develops a tip temperature of 1427 degrees C 2600 degrees F. Provide ignition system complete.

2.5.1.4 Natural Gas Pilot Ignition System

**************************************************************************
NOTE: Natural gas pilot ignition system may be considered only when natural gas is available at the site.
**************************************************************************

**************************************************************************
NOTE: Choose this subparagraph or the subparagraph above, ELECTRIC IGNITION SYSTEM.
**************************************************************************

Provide a complete interrupted type natural gas-fired, spark ignited pilot system for the burner assembly. Combustion air supply shall be from the burner windbox. Lighting system shall have capacity to stabilize firing during startup periods. Lighter shall be arranged for easy removal and servicing while boiler is in operation. Furnish igniter complete with spark rod and power pack. Power pack shall operate on 120 volt, 60 cycle, single phase power. Provide gas piping, to one point of supply, including necessary gas pressure regulators. Igniter system shall include controls, gages, flame safety systems, interlocks and accessories to comply with Industrial Risk Insurers' (I.R.I.) (formerly F.I.A.) requirements and applicable codes and regulations.

2.5.1.5 Windbox

Construct of carbon steel plate not less than 10 gage thickness with 6 mm 1/4 inch thick front plate. Design windbox to provide even and uniform air entrance into the burner register and seal weld to the boiler front wall. Provide windbox with support legs.

2.5.1.6 Purge Connection

Provide [steam] [air] purge connection, properly valved, for purging oil from gun prior to removal from burner.

2.5.1.7 Aspirating System

**************************************************************************
NOTE: Provide aspirating system only for boilers in which the expected furnace pressure exceeds 1245 Pa 5 inches water.
**************************************************************************

Provide an air aspirating system for fuel oil atomizer guide pipes to prevent blowback of hot furnace gases. Aspirating system shall use approximately [_____] L/s scfm of [_____] kPa (gage) psig compressed air.

2.5.1.8 Piping

Provide piping and flexible hoses for guide pipe purge[ and aspirating]
system[s]. Air from forced draft fan shall be used for guide pipe purging during normal operation.

2.5.1.9 Metal Parts

Metal parts exposed to radiant heat, including atomizer shield, shall be of stainless steel or other approved alloy.

2.5.1.10 Fuel Oil Control Valve

Fuel oil will be supplied at [_____] kPa (gage) psig and [_____] degrees C F at the inlet of the fuel piping train. Size fuel oil automatic control valve for 103 kPa 15 psi differential pressure.

2.5.1.11 Fuel

ASTM D396, Grade No. [____].

2.5.1.12 Burner Blower Fan For Oil Fired Burner

Provide fan fully integrated with and mounted on windbox. Provide an inlet silencer, when required, to ensure operation at noise level below 85 dBA as specified in Section 22 05 48.00 20 MECHANICAL SOUND, VIBRATION AND SEISMIC CONTROL.

2.5.1.13 Electric Motor

Motor shall be [two speed,] [_____] volt, [_____] phase, 60 Hz, [totally enclosed, non-ventilated] [totally enclosed, fan cooled], not less than [_____] kW hp as specified in the paragraph MOTORS AND DRIVES.

2.5.2 Flame Safeguard Controls

Provide a complete system of valves, interlocks and controls in accordance with NFPA 85 and as approved by Factory Mutual Engineering and Research.

2.5.2.1 Fuel Oil Train

Provide fuel oil train consisting of [steam] [air] atomizing oil gun, auxiliary [steam] [air] atomizing oil gun for changing guns without a shutdown, fuel oil control valve, two safety shutoff valves, recirculation valve, strainer, and flexible hose connections to oil burner. Provide low oil pressure and low atomizing air pressure switches, and all other safety interlocks and devices as required. Provide in panel mounted on burner package the following gages. Gages shall be 150 mm 6 inch with white coated dials and black figures:

a. Fuel oil supply pressure (0 to 1034 kPa (gage) 150 psig)

b. Fuel oil pressure at burner (0 to 1034 kPa (gage) 150 psig)

[ c. Atomizing air pressure at burner (0 to 1034 kPa (gage) 150 psig)

]d. Atomizing steam pressure at burner (0 to 1034 kPa (gage) 150 psig).

2.5.2.2 Control Sequencing

Flame safeguard system shall be designed to ensure safe purge, light-off and shutdown procedures, and to monitor light-off, main flame and boiler
operating conditions.

a. Flame safeguard system shall be automatically sequenced type with programming timed and sequenced by a heavy duty, industrial type timer. Timer shall be tamper-proof and shall be designed so that advancement of timer to shorten purge will shut down unit.

b. Provide system with [ultraviolet] [infrared] scanner and electronic relay located in the front wall which will shut down the fuel within 2 to 4 seconds of loss of flame.

c. Provide scanner output meter in panel for indication of scanner signal strength.

d. Safety system shall include the following limit devices incorporated into a limit circuit:

   (1) Flame failure
   (2) High boiler outlet pressure
   (3) Low fuel oil pressure
   (4) Low water level cutout
   (5) Low combustion air flow
   (6) Low atomizing [air] [steam] pressure
   (7) Any additional as required by FM or NFPA

   (8) Low fuel oil temperature

e. Safety System Limits: Safety system limits specified above shall be displayed on a first out annunciator mounted in the burner panel. Provide a common alarm contact to be wired to the operator control console.

2.5.2.3 Light Off

Failure shall require a manual restart of the programmer. Safety system shall provide a mandatory purge with forced draft fan vanes proven open, and a return to proven low fire position before light off. Main fuel valve shall open for a timed period of 10 seconds during trial for ignition.

2.5.2.4 Circuit Analyzer

Provide a circuit analyzer system, which, by means of 12 or more lights, will indicate which circuits are energized at any specific time, and will thereby indicate improperly operating circuits.

2.5.2.5 Control Panel

Programmer, limit control, relays, annunciator, shall be mounted in a [NEMA MG 1 control panel, modified with fully gasketed doors and panels mounted on burner package] [control panel as specified under Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS].
2.6 FANS

Submit fans and blowers characteristic curves.

2.6.1 Forced Draft Fan (Coal Firing)

**************************************************************************
NOTE: The designer shall make a technical evaluation to determine if the coal forced draft fan should be integrated with the stoker front or mounted separately on the floor.
**************************************************************************

CID A-A-59222, Type [____], Class 1, except as specified otherwise.

2.6.1.1 Fan Size

Size fans for complete combustion of fuel at maximum firing rate taking into account design allowances, corrections for burner pressure drop, furnace pressure, combustion air temperature, plant elevation, and other design factors[ including allowance for economizer]. After fans have been sized in accordance with the above, add the following allowances for momentary overloads and normal deterioration of fans, firing equipment and boilers to obtain the required test block rating:

a. Excess volume: 20 percent

b. Excess pressure: 32 percent

2.6.1.2 Fan Construction

Construct fan wheel of steel. Direction of fan discharge shall be easily changed at angles of 45 degrees. Provide fan with roller bearings mounted in pillow blocks. Provide one coat manufacturer's shop prime paint over interior and exterior of fan and wheel.

2.6.1.3 Electric Motor

**************************************************************************
NOTE: The designer shall perform an economic analysis and make a technical evaluation to determine if the fan drive motor shall be provided with variable speed control. Generally variable speed drives for fans over 7 1/2 kW 10 hp will be cost effective.
**************************************************************************

Motor for driving forced draft fan shall be [variable speed] [two speed], [____] volt, three phase, 60 Hz, [open drip-proof] [totally enclosed, fan cooled] not less than [____] kW hp, as specified in the paragraph MOTORS AND DRIVES, and shall not overload at the specified capacity with unheated cold air. Provide [____] mm inch thick steel soleplate for motor. Soleplate shall be common for all four motor mounting bolts. Separate parallel soleplate bars are not acceptable.

2.6.1.4 Noise Level for Forced Draft Fan

Not to exceed 85 dBA sound pressure level at 1 1/2 meters 5 feet above floor and 1 1/2 meters 5 feet from fan in any direction. Provide heavy
duty sound attenuator with screen on fan inlet when required to meet sound pressure level requirements.

2.6.2 Induced Draft Fan

CID A-A-59222, Type [______], Class 2 except as specified otherwise.

2.6.2.1 Fan Size

Size fans to handle combustion gases at maximum firing rate. Maximum fan speed shall not exceed [_____] rpm at test block rating. Design allowances and corrections for furnace, economizer, [scrubber,] [baghouse,] [dust collector,] breeching pressure drop when operating at [10] [20] [40] percent excess air, flue gas temperature, plant elevation and other design factors shall be made. Add the following allowances for momentary overloads and normal deterioration of fans, firing equipment and boilers after sizing in accordance with the above, to obtain the required test block rating:

2.6.2.2 Fan Construction

Fan wheel shall be radial tip design constructed of steel. Balance fan wheel both statically and dynamically at factory. Direction of fan discharge shall be easily changed at angles of 45 degrees. Provide fan with [air] [water] cooled sleeve type or roller bearings mounted in pillow blocks.

2.6.2.3 Dampers

Provide inlet dampers with multi-parallel-stream flow blades with anti-friction bearings with 80 mm 3 inch minimum spacers and stuffing boxes to keep bearings cool. Dampers shall be mounted in 200 mm 8 inch channel frames and interconnected with one extended, ball bearing mounted control level for connection to control actuator.

2.6.2.4 Painting

Interior of fan, including wheel, shall be coated with protective coatings suitable for flue gas conditions expected to be encountered by this fan. Exterior surface of fan shall have coatings of quality weather and heat resistant paint. Fan shall be shop assembled and match-marked by manufacturer before dismantling for shipment. Surface cleaning and painting shall be in accordance with manufacturer's standards for service expected.

2.6.2.5 Electric Motor
NOTE: The designer shall perform an economic analysis and make a technical evaluation to determine if the fan drive motor shall be provided with variable speed control. Generally variable speed drives for fans over 7 1/2 kW 10 hp will be cost effective.

Motor for driving induced draft fan shall be [variable speed] [two speed], [_____] volt, three phase, 60 Hz, [open drip-proof,] [totally enclosed fan cooled,] not less than [_____] kW hp, as specified in the paragraph MOTORS AND DRIVES, and shall not overload over the range of the fan with unheated air. Provide [_____] mm inch thick steel soleplate for motor. Soleplate shall be common for all four motor mounting bolts. Separate parallel soleplate bars are not acceptable.

2.6.2.6 Noise Level for Induced Draft Fan

Noise level shall not exceed 85 dBA sound pressure level at 1 1/2 meters 5 feet above floor and 1 1/2 meters 5 feet from the fan in any direction. Provide sound attenuation to meet sound pressure level requirements.

2.7 COMPRESSED AIR SYSTEM

NOTE: Refer to utilities schedule on definitive drawings for suggested plant air requirements.

2.7.1 Plant Compressed Air System

Provide two packaged units conforming to PS XX-C-2816, Type [_____,] except as modified below. Each compressor capacity shall be not less than [_____] standard L/s scfm of air, at 20 degrees C 68 degrees F and [_____] kPa (gage) psig (equivalent to pressure at an elevation of [_____] meters feet), compressed to 1379 kPa (gage) 200 psig at the discharge. Compressor speed shall not exceed [_____] rpm. Number of stages shall be [_____.] Compressor shall have water cooled cylinders and heads. Oil free delivery is required. Provide a safety valve between each compressor discharge and its shutoff valve. Provide a shutoff valve on the discharge piping of each compressor. Provide an electric thermostatically controlled immersion heater. Provide compressor with [[air] [water] cooled intercooler and] aftercooler. Compressor and motor shall be tank mounted. Provide lifting lugs and tie down attachments.

2.7.1.1 Air Filter

Air Filter on inlet shall act as a muffler. Provide filter of the [oil wetted type] [dry type] readily removable for cleaning.

2.7.1.2 Oil Filter

Provide full flow type filter for positive forced feed lubrication conforming to PS F-F-351.

2.7.1.3 Air Receiver

Receiver shall be [_____] liter cubic feet minimum volume designed in conformance with PS XX-C-2816 except that working pressure shall be 1724
kPa (gage) 250 psig.  Provide the receiver, with a safety valve set for 1792 kPa (gage) 260 psig, a drain valve and an air trap with shutoff valve.  Provide a stand for mounting the receiver.  Provide a dial gage, not less than 114 mm 4 1/2 inches diameter, range zero to 2068 kPa (gage) 300 psig, on the receiver.

2.7.1.4 Electric Motor

Motor shall be [_____] volt, [_____] phase, 60 Hz, totally enclosed, fan cooled not less than [_____] kW hp, as specified in the paragraph MOTORS AND DRIVES.  Control circuits for motors shall be nominal 120 volts.

2.7.1.5 Controls

Provide [constant speed] [dual control] regulation and the "optional safety controls" as specified in Table I of FS XX-C-2816 for the compressor system.  In addition, provide a lead-lag control system with alternating lead-lag cycles.

2.7.2 Instrument Compressed Air System

Provide air compressor package with two compressors, two electric motors, one horizontal receiver, and control panel, [mounted on one supporting steel base with skids] [mounted separately].

2.7.2.1 Air Compressor

Each shall be a single stage, cross head type, vertical, double acting, water cooled, nonlubricated head type.  Compressor shall be specially designed for non-lubricated service, with a honed cylinder, piston rod packing, piston rings and piston wear rings.  Valve guide inserts and wear rings shall be TFE.  Valves shall be reversible and hardened, with stainless steel seat plates for nonlubricated service. Provide necessary sleeves, baffles, and collars to prevent oil carryover. Provide air operated, piston type, free air unloaders for capacity reduction and starting.  Mount filter-silencer directly on air inlet to cylinder.

Design and Performance:  Each compressor shall deliver not less than [_____] standard L/s scfm of free air at a discharge pressure of 690 kPa (gage) 100 psig.

2.7.2.2 Air Receiver

Horizontal tank with a volume not less than [_____] liters cubic feet.  Design unit for 1034 kPa (gage) 150 psig working pressure in accordance with the ASME BPVC SEC VIII D1.  A receiver bearing the ASME Code Symbol stamp will be accepted as meeting these requirements.  Provide an automatic condensate trap, safety valve, and outlet connection.

2.7.2.3 Aftercooler

Aftercoolers shall be water cooled, with counter current flow, and shall be installed directly between each compressor cylinder and the air receiver.  Design cooler to cool total output air flow of compressor to within 9 degrees C 15 degrees F of inlet cooling water temperature.  Tube bundle shall be removable for cleaning and inspection.
2.7.2.4 Electric Motor

Each compressor shall be V-belt driven by a [_____] volt, [_____] phase, 60 Hz motor not less than [_____] kW hp as specified in the paragraph MOTORS AND DRIVES. Provide a removable, totally enclosed belt guard.

2.7.2.5 Controls

Provide controls and shutdowns necessary for automatic operation of compressor package. House controls in NEMA 12 control cabinet. Controls shall include two, full voltage, automatic across-the-line starters; alternator to switch compressors from lead to lag and to run both compressors when needed; 120 volt control transformer; air discharge pressure gage; selector switches for constant speed or automatic dual control, along with necessary time delay and control relays. Provide automatic solenoid operated cooling water valve in the cooling water line to the compressors and aftercoolers. Factory wire control cabinet and mount as part of package.

2.7.2.6 Accessories

Factory assemble compressors, electric motors, controls, air receiver, aftercoolers, and miscellaneous hardware and mount on steel supporting base. Provide lifting lugs and tiedown attachments. Provide air, water, and condensate piping and terminate them at the edge of the supporting base.

2.7.2.7 Desiccant Air Dryer

**************************************************************************
NOTE: Choose this subparagraphs or the subparagraph below, REFRIGERATED AIR DRYER.
**************************************************************************

Provide for systems exposed to freezing temperatures a compressed air desiccant dryer with noncorrosive desiccant housed in twin pressure vessels, capable of drying [_____] standard L/s scfm of air to [_____] degrees C F pressure dewpoint. Unit shall be field adjustable to maintain pressure dewpoint of dried air at any preselected value below operating temperature, to minus 40 degrees C F. As an integral part of the unit, provide an indicator showing the water content of the dry air and a calibrated adjustment control to change water content to any preselected level.

a. Design: Design unit for maximum temperature of not less than 49 degrees C 120 degrees F and maximum operating pressure of not less than 1034 kPa (gage) 150 psig. Pressure drop through unit operating at full rated flow shall not exceed 27 kPa 4 psi.

b. Controls: Provide continuous supply of dry air by automatically cycling operation of desiccant beds. Dryer shall be complete with panel mounted gages showing pressure in each drying tower and spark suppressor to protect microswitch in timer circuit. Total electrical power requirements shall not exceed 75 watts at 110 Vac.

c. Filters: Provide prefilter upstream of dryer to remove oil vapor, liquid water, and solid particles. It shall have greater than 99 percent efficiency in removing both 0.5 micron diameter solid particles and 0.5 micron diameter oil aerosol. Filter shall have replaceable oil absorbing filter element which turns red to indicate saturation with
oil and which shall be mounted in a transparent cast methyl methacrylate tube for visibility and inspection while on stream. Protect transparent acrylic tube by a safety shield. Provide afterfilter for removal of solid particles down to 5 microns size.

2.7.2.8 Refrigerated Air Dryer

**************************************************************************

NOTE: Choose this subparagraph or the subparagraph above, DESICCANT AIR DRYER.
**************************************************************************

Provide for systems not exposed to freezing temperatures a compressed air dryer of the self contained refrigerated type complete with heat exchanger, a commercial quality refrigeration system, a moisture separator and condensate trap, and internal wiring and piping. Install dryer between receiver and distribution line.

a. Heat Exchanger: Provide air and refrigerant coils surrounded by aluminum granules of sufficient mass to ensure adequate cooling capacity for varying air flow loads without causing excessive refrigeration cycling. Provide an automatic control system, for heat exchanger with a sensing element located in the aluminum granules, to shut down refrigeration system on low or no-load conditions. Provide means to determine exchanger temperature.

b. Moisture Separator: Provide a centrifuge type located within the heat exchanger to provide for moisture separation at point of minimum air temperature.

c. Refrigeration Unit: Provide hermetically sealed type which operates intermittently at all but maximum load conditions. Unit shall be capable of drying [_____] standard L/s scfm of air to an atmospheric dew point of not less than minus 23 degrees C 10 degrees F with entering air at 38 degrees C 100 degrees F, saturated. Maximum operating pressure of dryer shall be [_____] kPa (gage) psig. House entire unit in a steel cabinet. Provide cabinet with access door and panel for easy access to parts for maintenance and inspection.

2.7.3 Pressure Reducing Regulator

Provide self-operating type designed for not less than a 1724 kPa (gage) 250 psig operating pressure, and a normal operating temperature range of minus 29 degrees C 20 degrees F to plus 65 degrees C 150 degrees F. Regulator shall have an adjustable outlet pressure range not less than 34 to 690 kPa (gage) 5 to 100 psig with not less than four ranges. Provide external adjusting screw for adjustment throughout each spring range. Provide internal pressure tap for outlet pressure regulation.

2.8 BREECHING, EXPANSION JOINTS, STACKS, DAMPERS, AND ACCESSORIES

2.8.1 Breeching

Provide with rectangular cross section stiffened on sides, top and bottom and fabricated of not less than 5 mm 3/16 inch thick black steel plate unless otherwise noted. Stiffeners shall be not less than 65 by 50 by 6 mm 2 1/2 by 2 by 1/4 inch steel angles welded to exterior with 50 mm 2 inch leg outstanding. Stiffeners shall not exceed one meter 3 feet on center. Breeching shall connect to [each boiler flue gas outlet,] [intermediate
heat recovery equipment,] [air pollution control equipment,] [and to stack as required].

2.8.1.1 Breeching Connections and Joints

Weld or bolt breeching joints unless indicated otherwise. Welding shall conform to AWS D1.1/D1.1M and AWS D1.3/D1.3M. Bolts for bolted connections shall be not less than 15 mm 1/2 inch diameter and spaced not more than 80 mm 3 inches apart, with bolts, lockwashers and nuts being hot-dipped galvanized. Provide bolted joints with a minimum of 3 mm 1/8 inch thick non-asbestos gaskets, suitable for the intended use. Bolt breeching connections to all boilers, equipment items, dampers, expansion joints, and breeching accessories. Flanged breeching connections to equipment shall be drilled to match flanges on equipment. Seal weld flanged joints to make connection gas-tight.

2.8.1.2 Uninsulated Breeching

Thoroughly wire brush breeching which is not to be insulated and clean by degreasing with nonflammable solvent such as trichloroethylene prior to painting.

2.8.1.3 Breeching Access Doors

Provide where indicated. Construct access doors with frame and hinged door of cast iron or reinforced steel plate. Frame shall be not less than 635 by 940 mm 25 by 37 inches with access opening of 457 by 762 mm 18 by 30 inches. Connection to breeching shall be gasketed and made with minimum 15 mm 1/2 inch diameter hot-dipped galvanized bolts, lockwashers, and nuts spaced not more than 125 mm 5 inches on center. Each side of access door shall have not less than two quick-clamp positive closing latches, with long side opposite hinges containing three clamps to give a gastight seal. Side of access door opposite hinges shall contain a minimum 80 by 125 mm 3 by 5 inch size handle. Provide a gasket consisting of 10 mm 3/8 inch diameter fire resistant resilient rope seal and mastic compound between access door and access door frame.

2.8.1.4 Breeching Cleanout Doors

Provide where indicated. Construct cleanout doors of not less than 5 mm 3/16 inch thick steel plate. Secure cleanout doors to a 32 by 32 by 5 mm 1 1/4 by 1 1/4 by 3/16 inch thick angle frame with 10 mm 3/8 inch hot-dipped galvanized mounting bolts welded to the angle frame and spaced not more than 150 mm 6 inches on center. Weld frame to breeching and provide a 1.60 mm 1/16 inch non-asbestos gasket suitable for the intended service between frame and cleanout door. Cleanout doors shall be not less than 610 mm 24 inches square except where breeching dimensions are smaller, in which case cleanout door shall be full height of the breeching and not less than 305 mm 12 inches in length.

2.8.1.5 Breeching Structural Materials

**************************************************************************

NOTE: The designer shall detail breeching supports and breeching stiffening. Breeching hangers shall be designed to carry not less than 5 times the breeching weight, or the breeching weight plus 136 kg 300 pounds whichever is greater. Hangers for rectangular breeching shall be of the trapeze type
with angle or channel support members and hanger rods. Breeching shall be stiffened with angle or channel members as required to withstand internal breeching static pressure.

Structural and support materials shall be steel and shall comply with applicable sections of the AISC 360. Support and stiffen breeching as indicated.

2.8.2 Expansion Joints

2.8.2.1 Metallic Breeching Expansion Joints

Provide factory fabricated metallic breeching expansion joints where indicated. Expansion joints shall be guided metal bellows type capable of a minimum of [_____] mm inches of axial travel. Form metal bellows from not less than 1.60 mm 1/16 inch thick type 321 stainless steel plate. Cover plates shall be not less than 3 mm 1/8 inch thick steel plate.

2.8.2.2 Non-Metallic Expansion Joints

Provide factory fabricated non-metallic breeching expansion joints 3 mm 1/8 inch minimum thickness where indicated. Expansion joints shall be constructed of a fluoroelastomer vulcanized to two plies of knitted wire mesh capable of a minimum of [_____] mm inches of axial compression, [_____] mm inches of axial extension and [_____] mm inches of lateral offset unless indicated otherwise. Joints shall have a continuous operating temperature rating of 204 degrees C 400 degrees F, with excursion design standards up to 400 degrees C 750 degrees F. Operating pressure range shall be minus 34 kPa (gage) 5 psig to plus 34 kPa (gage) 5 psig. Expansion joints shall be preformed with integrally molded corners, suitable for mounting against a 150 mm 6 inch flange. Provide carbon steel backup bars with slotted holes, bolts, and nuts.

2.8.3 Stacks (For Installation Without Flue Gas Scrubbers)

Free standing, dual wall with insulated annular space, self supporting, steel construction. Provide stack manufacturer's calculations for supporting steel and concrete foundations, that suit specified design conditions. Provide each stack complete with accessories and appurtenances, including test ports, sampling platforms, caged safety ladders, anchors, sleeves, insulation, base and chair rings, and cleanout door.

2.8.3.1 Manufacturer's Calculations Required

a. Foundation (including bearing and moment forces) and anchor bolts

b. Stack (Static and Dynamic Analysis)

(1) Stresses due to various loading conditions including wind and seismic loads

(2) Damping of vortex shedding and seismic response

(3) Vibration and damping

(4) Heat transfer at various design and ambient conditions
(5) Expansion profiles

(6) Shipping and erection stress analysis

2.8.3.2 Construction

a. Provide in annular air space between the two steel shells insulation with sealing means to accommodate thermal expansion differentials and lateral deflections or sway of inner and outer shells.

b. Provide openings with adequate reinforcement to minimize stress concentrations.

c. Design wall thickness of inner shell to be 1.60 mm 1/16 inch thicker than that required by dynamic and static structural design but not less than 5 mm 3/16 inch.

d. Construct outer shell of ASTM A242/A242M steel with a plate thickness not less than [_____] mm inch.

e. Construct expansion devices of corrosion resistant stainless steel suitable for the temperatures and flue gas combinations to be experienced by stacks.

f. Base construction of stack shall transmit forces and moments in the shell to the [foundation] [supporting steel] without local stresses of appreciable magnitude being induced in the shell or exceeding allowable stresses of the supporting [concrete] [steel].

g. Provide openings in breeching and stack for test equipment for sampling flue gas and for monitoring devices. Openings shall be properly reinforced and designed for differential expansion. Breeching opening shall be of double wall construction. Penetrations through inside shell of stack shall be completely welded to provide proper sealing between the stack and the opening.

h. Provide top 1.22 meters 4 feet cone section of stack of corrosion resistant steel.

i. Provide suitable anchor bolts furnished by the stack manufacturer.

j. Accessories to be provided.

(1) Provide double wall insulated steel plate door cleanout complete with 25 mm one inch round hinge pin, gasket and not less than 18 swing bolts.

(2) Provide a ring of Type 304 Corrosion Resistant Steel (CRES) to support an inspection or painter’s trolley. Weld ring and support from stack plates with not less than three brackets 10 by 65 by 381 mm 3/8 by 2 1/2 by 15 inches. Space brackets at not more than 610 mm 2 feet on center around circumference of stack.

(3) Provide a three wheel CRES flat rail trolley of 227 kg 500 lbs capacity. Trolley shall have guides to prevent it from leaving the track [_____] meters of 8 mm feet of 1/4 inch CRES plow steel cable.
(4) Provide each stack with an external ladder with cage for full height of stack. Construct ladder and cage of corrosion resistant steel.

(5) Provide a flue gas sensing thermocouple well with thermocouple one meter 3 feet above breaching opening and 1 1/2 meters 5 feet below top of stack. Wells shall be CRES and shall extend about halfway into stack.

2.8.3.3 Finish

Stacks shall be shop coated prior to shipping from factory.

2.8.3.4 Obstruction Lighting

**************************************************************************
NOTE: Stack obstruction lighting requirements are dependent on a number of factors including the location and height of the stack. The designer shall refer to NAVFAC DM-23.1, NAVFAC DM-23.2, and FAA AC 150/5345 to determine if obstruction lighting is required.
**************************************************************************

Provide an obstruction lighting system for each heating plant stack, consisting of one red, flashing, 300 millimeter hazard beacon atop each stack, two steady burning, red obstruction marker lights halfway up each stack, photoelectric and flasher controls, weather-tight terminal boxes, cable, and conduit.

b. Obstruction Lights: FAA AC 150/5345-43 Type L-810.

2.8.3.5 Stack Sampling Platform

**************************************************************************
NOTE: Designer shall detail a stack sampling platform if required. If not required delete this paragraph. If required the platform will have to be located at a point as approved by air pollution control agency having jurisdiction. Many local and state codes incorporate Title 40 Code of Federal Regulations, Part 60. Depending upon final air pollution control equipment arrangement this location may be on the stack or possibly on a long length of horizontal breeching. Stack sampling platform should have the following features:

1. Sampling ports located according to 40 CFR 60 Appendix A, Method.

2. Platform should be 914 mm 36 inches wide but at ports location it should project away from breeching or stack a minimum of 610 mm 2 feet plus the diameter of the breeching or stack for up to 3 meters 10 feet in diameter stack.

3. If any type of continuous air pollution
monitoring devices are located at stack sampling point or anywhere else on breeching, a non-vertical access (stairs or catwalk) is required. For stack sampling purposes a non vertical ladder is preferred but is not required. Platform with grating shall be designed for a live loading of 1464 kg/m² 300 lbs/sq. ft; platform should have railing with two intermediate railings and 100 mm 4 inch toeplate. Four 30 amp weatherproof receptacles and adequate lighting including lights over the test ports should be provided.

**************************************************************************

]2.8.4 Dampers

2.8.4.1 Multilouver Dampers

**************************************************************************

NOTE: Opposed blade dampers shall be used for throttling service and parallel blade dampers shall be used for two-position service.

**************************************************************************

Provide factory fabricated multilouver dampers with [parallel] or [opposed] blade type operation. Construct damper frame of distortion resistant welded steel channels with raised seat to ensure free nonbinding operation of blades and to keep blades square in the frame. Construct blades of 6 mm 1/4 inch thick steel plate in a stressed skin airfoil-shape with fully welded seams containing no external ribs. Blade shafts shall be stainless steel. Blades shall be pinned to blade shafts. Louver shaft bearings shall be outboard type and shall be self-lubricating and self-cleaning. Bearing seals shall be gas-tight.

a. Multilouver damper linkage shall be adjustable and of pinned construction for easy removal and shall be designed to handle full operation torque. Linkage on dampers in clean flue gas areas shall operate from a single connection point. Design linkage on dampers in dirty flue gas areas, between boiler outlet and inlet to air pollution equipment, so that bottom blade linkage arm is not connected to above linkage, to allow this blade to operate separately. Remaining linkage for this damper shall be constructed to operate from a single operating point.

b. Provide control damper operators as noted. Operators may be either electrically or pneumatically operated with positive positioning, manual override, and hydraulic or oil immersed gear trains. Each operator shall be full-proportioning type, with spring return to position indicated in case of loss of power. Damper operating speeds shall be selected or adjusted so that operators will remain in step with controller. Operators acting in sequence with other operators shall have adjustment of control sequence as required by operating characteristics of system.

c. Two-position damper operators shall be pneumatically operated with air cylinder, four way valve, and solenoid valve arrangement.
2.8.4.2 Guillotine Dampers

**************************************************************************
NOTE: Guillotine dampers shall be used for open-shut service where tight shutoff is required; for example, for air pollution control equipment bypass dampers.
**************************************************************************

Provide factory fabricated guillotine dampers with heavy structural frame rigid enough to support extended blade and external loads through the breeching flange. Damper shall be capable of operating without precleaning or manual assistance under normal operating conditions. Enclosed bonnets will only be required where indicated. Provide 80 mm 3 inch diameter cleanout ports on both sides for cleaning bottom sections.

a. Provide stress-relieved flat plate guillotine damper blades. Damper blade shall be nonwarping. Intermediate blade supports are acceptable to limit blade deflection. Leading edge of damper blade shall be beveled and capable of guiding damper blade into frame seat. Blade guides shall be continuous and self-cleaning and capable of preventing binding from deposits and damage from misalignment. Bonnet guides shall be removable. Design damper so that a damper blade can be replaced without opening the frame.

b. Provide guillotine damper bonnet seal to effectively seal against atmospheric leakage under normal operating conditions.

c. Guillotine damper drive shall be a positive dual endless chain drive capable of driving damper in both directions. Chain drive headshaft shall have sufficient torsional rigidity to prevent binding of blade when blade is stalled. Damper shall be motor operated with manual override. Design drive mechanism to prevent back driving of motor. Entire drive mechanism shall be of a simple design and require no routine maintenance other than inspection. Chain shall be capable of operating up to the stall torque of the damper drive motor.

d. Electric motor shall be [_____] volt, [_____] phase, 60 Hz, [totally enclosed, fan cooled] [open drip-proof], not less than [_____] kW hp, as specified in the paragraph MOTORS AND DRIVES. Provide removable, totally enclosed chain guard.

2.9 COAL HANDLING EQUIPMENT

Submit coal handling system manufacturer's data for the following:

a. Railroad hopper car thawing system;
b. Railroad hopper car shaker;
c. Railroad hopper car puller;
d. Coal scale;
e. Belt scraper; and
f. Coal dust suppression system.
2.9.1 Railroad Hopper Car Thawing System

**************************************************************************
NOTE:  Pit type railcar thawing system is capable of operating on natural gas, liquified petroleum gas or No. 2 fuel oil. The radiant heat (infrared) type railcar thawing system can only burn natural gas or liquified petroleum gas or use electric resistance heaters. The radiant heat (infrared) type provides a slower method of thawing but causes less damage to the railroad car finish and is preferred provided natural gas or liquified petroleum gas or electrical power is economically available and permitted by current DoD policy.
**************************************************************************

[Pit-type] [Prefabricated surface mounted enclosed type] [or electric radiant type] hopper car thawing unit including burners, controls, combustion air blowers, fuel storage and handling, and related work. Design system to thaw 56 Mg, 71 Mg and 102 Mg 55 ton, 70 ton and 100 ton capacity coal cars. System shall be capable of thawing [_____] bottom hopper unloading coal cars simultaneously. Railroad hopper car thawing system shall utilize [No. 2 fuel oil] [natural gas] [liquified petroleum gas] as a fuel. Provide a sufficient number of heaters to have a minimum heat input of 2198 kW 7,500,000 Btu/hr per car station, with heaters distributed under hopper car, or under and beside hopper car, such that entire car is heated. Locate [burner pits] [heater units] for even heating of hopper cars without subjecting air hoses, air brake equipment, and bearings to excessive heat.

[2.9.1.1 Pit-Type Railroad Hopper Car Thawing System

**************************************************************************
NOTE:  Choose this subparagraph or the subparagraph below SURFACE MOUNTED ENCLOSED RAILROAD HOPPER CAR THAWING SYSTEM.
**************************************************************************
a. Pit-Type Thawing Unit:  Pit-type hopper car thawing unit shall be complete with a refractory lined steel box, burner assemblies, steel burner enclosure with cover, valves, piping, and hinged main pit protective covers. Each pit shall have the capacity to generate 366 kW 1,250,000 Btu/hr when burning [No. 2 fuel oil] [natural gas] [liquified petroleum gas]. Burners shall fire horizontally and tangentially into pit from opposite sides to heat refractory lined pit up to radiant temperature. Heat shall be transferred to hopper car by radiation from hot refractory surfaces and by convection from exhaust gases and evaporated moisture to rail car bottom and sides. Construct pit outer shell of not less than 6 mm 1/4 inch thick corrosion resistant steel plate, with end plates of 10 gage (3.42 mm 0.1345 inch) steel. Provide supporting flanges and handling loops on both ends and provide cap strips on top of both sides. Place cast iron heat deflecting plates with overlapping edges on pit sides and bottom supported off ledge on outer shell. Provide a minimum 25 mm one inch air space between plates and outer shell. Pit side walls and bottom shall have a minimum 65 mm 2 1/2 inch thickness of standard firebrick with one course of standard end skew brick along top of side walls. Firebrick shall be easily replaceable. End section shall have not less than 114 mm 4 1/2 inch thick precast high temperature refractory panels.
Provide burner refractory ignition tiles with steel jacket casings having mounting lugs for bolting to end plates of pit. Provide concrete railroad ties adjacent to each thawing pit. Deliver combustion air to burners by means of pressure blowers which take fresh air from outside thawing area. Factory wire and assemble heaters, control panels, blowers, and zone controls. Shop fabricate burner piping and control valve assemblies.

**************************************************************************
NOTE: Designer shall make selections in the text below based on fuel to be used in thawing system.
**************************************************************************

b. Fuel System: Provide complete fuel system for operation with, [natural] [liquified petroleum] gas including piping, regulators, low and high pressure limit switches interlocked with combustion controls, gages, solenoid valves, shutoff valves, and accessories which may be required for each manufacturer's particular system. Provide complete fuel system for operation with duplex fuel oil pump set with [___] liters gallon horizontal [below] [above] ground fuel tank and accessories which may be required for each manufacturer's particular system. Provide fuel oil system in accordance with the requirements specified under the paragraph FUEL OIL SYSTEM.

c. Burner controls shall meet Industrial Risk Insurers' (I.R.I.) (formerly F.I.A.) requirements. Connect fuel system piping to fuel supply piping as indicated. Burners shall be controlled (modulate) to regulate heat output to suit the operating requirements. Provide a manual light-off, low pressure [gas] [oil] pilot for automatic light-off of each thawing unit.

d. Air System: Provide complete air systems for operation with blowers, inlet silencers, gages, shutoff valves, low pressure limit switches interlocked with combustion controls, and accessories which may be required for each manufacturer's particular system.

e. Control Panel: Provide centrally located control panel, with panel front consisting of a graphic display of the thawing system. Display shall be approximately to scale and coordinated with control and light indication for combustion air blowers and on-off control of convenient groups of heaters. Provide on-off control with indicating light for each thawing pit. Panel shall have a NEMA [12] [3R-8], dust-tight enclosure with internal equipment and wiring accessible from panel front. Provide nameplates on panel front to designate function of switches and indicating lights. Controls shall be suitable for [___] volt, [___] phase, 60 Hz operation. Provide and mark terminals for connections with the exception of the neutral. Terminal blocks shall be 600 volt rated. Control relays shall have convertible contacts and shall have rating suitable for intended services but not less than 10 amp, 600 volt rating. Components shall be oiltight type. Connections to panel shall be watertight. Motor starters for combustion air blowers shall be installed in each respective blower cabinet.

}[2.9.1.2 Surface Mounted Enclosed Railroad Hopper Car Thawing System

**************************************************************************
NOTE: Choose this subparagraph or the subparagraph above PIT-TYPE RAILROAD HOPPER CAR THAWING SYSTEM.
**************************************************************************
NOTE: Choose item a. or item b. that follows.

[ a. Surface Mounted Enclosed Thawing Unit (Gas): Burner shall be of multiport cast iron construction and provide for even heating of radiant elements. Heater design shall be essentially the same for undercar and sidecar heaters, with heat transmitted to hopper car by both radiation and convection. Design burner and radiant element for radiation being the primary mode of heat transfer. Radiant element over burner shall be of a heavy corrosion-resistant metal material. Design burner to operate on [natural gas] [liquified petroleum gas], and such that open flame from combustion will not extend beyond emitter surface either during normal operation or in the event of emitter deterioration or burnout. Provide shields where necessary to direct radiation and hot exhaust gases to hopper car surface. Provide means for shielding car air hoses, air brake equipment, and bearings from excessive heat. Provide each heater with individual heater control boxes constructed as to provide positive air pressure inside control box. Control boxes shall contain mixing valve for maintaining proper gas-air ratio for satisfactory combustion. Locate gas and air piping connections for easy removal of individual burners. Deliver combustion air to heaters by means of pressure blowers which take fresh air from outside thawing area to ensure continued satisfactory combustion of gaseous fuels. Factory wire and assemble thawing units, control panels, blowers, and zone controls.

NOTE: Choose item b. or item a. above.

[ b. Surface Mounted Enclosed Thawing Unit (Electric): Thawing unit may be an electric radiant heat thawing unit which includes self-contained heater banks such as under-car heater sections, outside the rail heater sections, lower side car heater sections and vertical side car heater sections, with reflectors, hinged cover, waterproof and weatherproof wired terminal blocks and zone controls for flexibility of operation.

c. Burner Controls (for Gas Fired Units): Burners shall be electrically ignited with controls meeting Industrial Risk Insurers' requirements. Provide a gas pressure regulator for serving not more than eight individual burners. Regulator shall reduce gas pressure in supply line to pressure required for burners. Provide each burner with an air regulating valve for fuel-air ratio adjustment. Regulating valve shall contain positive vibration-proof locking device for maintaining critical adjustment.

d. Control Panel: Provide centrally located control panel with panel front having a graphic display of the thawing system. Display shall be approximately to scale and coordinated with control and light indication for combustion air blowers and on-off control of individual heaters. Provide a modulating control for each heater to regulate heat output to suit the operating requirements. Panel shall be NEMA [12] [3R-8], dust-tight enclosure with internal equipment and wiring accessible from the panel front. Provide nameplates on panel front to designate function of switches and indicating lights. Controls shall be suitable for [_____] volt, [_____] phase, 60 Hz operation. Provide and mark terminals for connections, with the exception of the neutral.
Terminal blocks shall be 600 volt rated. Control relays shall have convertible contacts and shall have rating suitable for intended service but not less than 10 amp, 600 volt rating. Components shall be an industrial design of the oiltight type. Connections to the panel shall be watertight. Motor starters for combustion air blowers shall be installed in each respective blower cabinet.

2.9.1.3 Shed

******************************************************************************
NOTE: Shed should be used in the severe climate areas.
******************************************************************************

Provide shed of pre-engineered metal space frame construction with corrugated siding as indicated. Provide ventilation with roof vents and openings along bottom of sides.

2.9.2 Top-Mounted Railroad Hopper Car Shaker (Unloader)

******************************************************************************
NOTE: If noise is a major factor of concern, design a shaker enclosure with acoustical treatment which will be capable of reducing the noise to a tolerable level.
******************************************************************************

Provide top-mounted rail car shaker complete with shaker, frame, vibrator, motors, hoists, hoist frame, [enclosure,] and controls. Design unit for operation under all weather conditions.

2.9.2.1 Shaker

Shaker shall operate with a nominal \(4 \text{ mm}\) \(5/32\) inch stroke at 1200 rpm. Stroke shall be generated by large eccentric SAE 1045 steel shaft mounted in high capacity, self-aligning, spherical roller bearings. Seal bearings with a double piston ring labyrinth seal and dust and water slinger to retain lubricant and prevent entry of contaminants. Shaker frame shall be stress-relieved, all welded steel construction. Fabricate frame of heavy steel plate, with bearing housing seats machined after stress relieving. Provide four lifting eyebolts of heat-treated forged alloy steel for connecting to hoist chains.

Shaker Electric Motor and Drive:

Motor shall be totally enclosed, fan cooled, 1800 rpm, \(15 \text{ kW}\) \(20 \text{ hp}\), as specified in the paragraph MOTORS AND DRIVES. Motor shall be mounted on heavy spring isolated supporting frame with adjustable motor base. Shaker shall be belt driven with special deep groove sheaves, taper locking type hubs, and constant belt tensioning spring.

2.9.2.2 Shaker Hoist

Twin hook type having a rated capacity exceeding the weight of the shaker unit. Hoist shall have a lift of not less than 7.50 meters \(25\) feet with a hoist speed of not less than 0.08 m/sec \(16\) fpm. Hoist shall have not less than \(460 \text{ mm}\) \(18\) inch long sling chains for connecting hoist to shaker lifting eyes, and hooks shall have U-bolt safety latches. Hoist shall be
mounted on an electrified trolley as specified in Section 41 22 13.14
BRIDGE CRANES, OVERHEAD ELECTRIC, TOP RUNNING.

Shaker Hoist Electric Motor:

Totally enclosed, [fan cooled,] [non ventilated,] 1800 rpm, [_____] volt, three phase, 60 Hz, not less than 5 1/2 kW 7 1/2 hp as specified in the paragraph MOTORS AND DRIVES. Motors shall be high slip type with thermal overload protection embedded in the windings.

2.9.2.3 Controls

Provide [remote] [pendant] pushbutton station for both shaker and hoist operation. Provide automatic controls with upper and lower screw type limit switches to limit hook travel, slack cable limit switch to stop lowering of hooks when car shaker has been lowered on top of car, electrical interlock to prevent operation of car shaker motor until shaker is lowered on car, and electrical interlock to prevent operation of hoist motor while car shaker is running. Mount electrical equipment in NEMA 4 enclosures.

2.9.2.4 Frame [and Enclosure]

**************************************************************************
NOTE: If noise is a major factor of concern, design a shaker enclosure with acoustical treatment which will be capable of reducing the noise to a tolerable level.
**************************************************************************

Provide frame [and enclosure] as indicated for support of hoist and shaker unit[ and for attenuation of noise].

[2.9.3 Capstan Car Puller

**************************************************************************
NOTE: Designer shall select either a capstan type or drum type car puller. A capstan type puller is satisfactory for handling rail cars on level grade provided the pulling capacity is not exceeded. For high pulling capacities and locations where rails are not on level grade, the drum type puller should be used. Designer shall detail required footings and foundations based on the selected puller and soil conditions at each plant site.
**************************************************************************

**************************************************************************
NOTE: Choose this paragraph and subparagraphs or the paragraph REVERSIBLE DRUM TYPE CAR PULLER, and its subparagraphs below.
**************************************************************************

Capstan-type designed with capacity of not less than 4540 kg 10,000 pounds of starting pull and an average rope speed of approximately 0.23 m/sec 45 fpm. Assembly shall be totally enclosed, weatherproof, and suitable for exterior installation with vertical capstan. Capstan shall be semisteel alloy construction designed for use with marlin-covered wire rope.
2.9.3.1 Accessories

Provide capstan complete with accessories, including controls, rope, rope storage reel, car hooks, sheaves, snatch blocks, anchors, and ratchet holdback.

2.9.3.2 Rope

Capstan rope shall be not less than 25 mm one inch o.d. marlin clad wire rope with a breaking strength of not less than 13,620 kg 30,000 pounds.

2.9.3.3 Rope Storage Reel

Construct of metal, hand operated with the drum not less than 300 mm 12 inches in diameter and the reel faces not less than one meter 3 feet in diameter. Drum shall have not less than [_____] mm inches face width and store not less than [_____] meters of 25 mm feet of one inch diameter marlin clad wire rope.

2.9.3.4 Electric Motor

Totally enclosed, [fan cooled,] high starting torque, reversing type, [_____] volt, three phase, 60 Hz, not less than 7 1/2 kW 10 hp as specified in the paragraph MOTORS AND DRIVES.

][2.9.4 Reversible Drum Type Car Puller

**************************************************************************
NOTE: Designer shall select either a capstan type or drum type car puller. A capstan type puller is satisfactory for handling rail cars on level grade provided the pulling capacity is not exceeded. For high pulling capacities and locations where rails are not on level grade, the drum type puller should be used. Designer shall detail required footings and foundations based on the selected puller and soil conditions at each plant site.
**************************************************************************

**************************************************************************
NOTE: Choose this paragraph and subparagraphs or the paragraph CAPSTAN CAR PULLER, and its subparagraphs above.
**************************************************************************

[SINGLE drum reversing] [DOUBLE drum] type designed with a capacity of not less than [_____] kg pounds of running rope pull. Starting pull capacity shall be not less than twice the running pull capacity. Provide assembly on one-piece heavy steel base with weatherproof motor and gear reducers suitable for exterior location.

2.9.4.1 Puller

Unit shall consist of a [_____] mm inch pitch diameter by [_____] mm inch face, spirally grooved for [_____] mm inch diameter wire rope with sealed anti-friction bearings, alloy steel ring mounted spur gear and SAE 1045 steel shaft. Provide an SAE 1045 steel countershaft with anti-friction pillow blocks and heat-treated alloy steel spur pinion roller chain drive with steel sprockets and enclosed guard. Speed shall be a minimum of
[_____] m/sec fpm.

a. Electric Motor: [Totally enclosed,] [fan cooled,] high starting torque, reversing type, [_____] volt, [_____] phase, 60 Hz, not less than [_____] kW hp, as specified in the paragraph MOTORS AND DRIVES. Provide clutch for engaging and disengaging power to drum.

b. Reduction Gears: AGMA Class I sized for the motor power with motor base and coupling. Motor shall include motor mounted disc brake in dust and watertight enclosure. Provide rope overwind switch assembly and rotary type limit assembly.

2.9.4.2 Accessories

a. Rope Sheaves: Provide four stationary type, 762 mm 30 inch pitch diameter single sheaves and one 762 mm 30 inch takeup sheave assembly. Sheave shall be cast steel, grooved for [_____] mm inch diameter rope and shall be oriented horizontally and mounted in a welded steel frame with self-lubricating bronze bushings. Provide removable steel rope guards over sheaves.

b. Wire Rope: Not less than [_____] mm inch in diameter with a breaking strength of not less than [_____] kg pounds. Rope shall consist of six 19 wire strands of improved plow steel rope with hemp center.

c. Safety Warning System: Provide a safety warning system, including an audible horn and three flashing lights to indicate cars in motion. System shall activate 30 seconds before puller motor is energized and shall not deactivate until puller motor is de-energized. Provide a permanent warning sign at each light indicating "Railcar in Motion."

d. Miscellaneous: Provide reversing controls, car hooks, snatch blocks, and anchors.

]2.9.5 Track Hopper

*****************************************************************************************************************************************

NOTE: Determine if a track hopper will be required.
*****************************************************************************************************************************************

Welded construction of not less than 6 mm 1/4 inch thick [410 stainless steel] [structurally reinforced steel plate lined with 8 gage ( 4.18 mm 0.1644 inch) 410 stainless steel] plate not less than 4.50 meters wide and 8.50 meters long 14 feet wide and 28 feet long. Side slopes not less than 60 degrees from horizontal. Interior bolts shall have flat heads. Support hopper from concrete pit walls as indicated.

2.9.5.1 Track Girders

Two wide flanged beams designed for Cooper's E-[_____] loading with 50 percent impact allowance and sized at W [_____] by [_____]. Provide beams with cross struts for rigidity and bearing plates for mounting on pit wall as indicated.

2.9.5.2 Grating

Hopper grating between the rails of [_____] by 10 mm 3/8 inch steel bars and [_____] by 10 mm 3/8 inch steel cross bars with openings [100] [150] by [100] [150] mm [4] [6] by [4] [6] inches. Grating outside rails shall have
openings 100 by 100 mm 4 by 4 inches and be constructed of same size steel bars as specified above. Construct grating in removable panels and support from concrete pit walls and by steel angle supports resting on track girders.

2.9.5.3 Cover

Structurally reinforced 5 mm 3/16 inch thick raised pattern floor plate. Cover for portions of hopper outside rails shall be hinged with edges turned down. Construct cover between rails in easily removable sections with handles.

2.9.5.4 Hopper Outlet

Planged not less than [_____] by [_____] mm inches. Outlet shall contain a water-collecting reclaim hopper type coal gate not less than [_____] by [_____] mm inches in size along with a dusttight all metal slip joint, constructed of not less than 6 mm 1/4 inch thick [410 stainless steel] [structurally reinforced steel plate lined with 8 gage (4.18 mm 0.1644 inch) 410 stainless steel] plate. Slip joint shall be of split construction to allow for disassembly and replacement. Design slip joint to allow for necessary flexibility to take care of deflection of the hopper outlet due to varying coal loads and temperature variations without imposing load on the feeder enclosure. Provide rope packing or other resilient gasket material to make the slip joint completely dusttight.

2.9.6 Truck Hopper

**************************************************************************
NOTE: Determine if a track hopper will be required.
**************************************************************************

Welded construction of not less than 6 mm 1/4 inch thick [410 stainless steel] [structurally reinforced steel plate lined with 8 gage (4.18 mm 0.1644 inch) 410 stainless steel] plate not less than 3 meters wide and 3 meters long 10 feet wide and 10 feet long. Side slopes not less than 60 degrees from horizontal. Interior bolts shall have flat heads. Support hopper from concrete pit walls as indicated.

2.9.6.1 Grating

Hopper grating shall have openings 90 by 90 mm 3 1/2 by 3 1/2 inches. Construct grating of 125 by 13 mm 5 by 1/2 inch steel bars and 25 by 10 mm one by 3/8 inch steel cross bars. Weld grating and make in sections for ease of removal. Provide two intermediate support beams sized not less than W8 by 31 arranged for a maximum grating span of 1016 mm 3 feet 4 inches.

2.9.6.2 Hopper Outlet

Planged not less than [_____] by [_____] mm inches. Outlet shall contain a water-collecting reclaim hopper type coal gate not less than [_____] by [_____] mm inches size.

2.9.6.3 Cover

Structurally reinforced 5 mm 3/16 inch thick raised pattern floor plate. Construct cover in sections with handles for ease of removal.
2.9.7  Reclaim Hoppers

Welded construction of not less than 6 mm 1/4 inch thick structurally reinforced steel plate lined with 8 gage (4.18 mm 0.1644 inch) 410 stainless steel plate not less than 3 meters wide and 3 meters long 10 feet wide and 10 feet long. Side slopes not less than 60 degrees from horizontal. Interior bolts shall have flat heads. Support hopper from concrete pit walls as indicated.

2.9.7.1 Grating

Hopper grating shall have openings 90 by 90 mm 3 1/2 by 3 1/2 inches. Construct grating of 125 by 13 mm 5 by 1/2 inch steel bars and 25 by 10 mm one by 3/8 inch steel cross bars. Weld grating and make in sections for ease of removal. Provide two intermediate support beams sized not less than W8 by 31 arranged for a maximum grating span of 1016 mm 3 feet 4 inches.

2.9.7.2 Hopper Outlet

Flanged not less than [_____] by [_____] mm inches. Outlet shall contain a special reclaim hopper gate not less than [_____] by [_____] mm inches.

2.9.7.3 Cover

Structurally reinforced 5 mm 3/16 inch thick raised pattern floor plate. Construct cover in sections with handles for ease of removal.

2.9.8  Belt Feeder

Totally enclosed, dusttight, approximately [_____] meters feet between pulley centers, designed to operate at a speed not to exceed [_____] m/sec fpm, and having a capacity of not less than [_____] Mg tons per hour of [_____] size coal. Provide belt feeder complete with continuous belt, shafts, pulleys, idlers, belt cleaner, frame, enclosure, reduction gear, and drive motor.

2.9.8.1 Head and Foot Shafts

Cold rolled steel, not less than [_____] and [_____] mm [_____] and [_____] inches in diameter respectively. Mount shafts in antifriction roller bearings with forced lubricating type fittings. Mount head shaft in fixed pillow blocks. Foot shaft shall have screw-type takeups with not less than a [_____] mm inch adjustment. Shafts shall fit tight in pulley hubs.

2.9.8.2 Pulleys

Welded steel type with detachable compression grip-type hubs, steel plate ends, and crown faces 50 mm 2 inches wider than the belt width. [Provide an adjustable spring loaded or counter weighted type rubber bladed belt wiper beneath the head pulleys.]

2.9.8.3 Belt

Mine Safety and Health Administration (MSHA) approved fire resistant construction, belt not less than [_____] mm inches wide, [_____] ply, [_____] kg per square meter ounces per square foot, with 3 mm 1/8 inch thick oil and chemical resistant cover on carrying side, 0.79 mm 1/32 inch thick oil and chemical resistant rubber cover on under side. Cover shall be fire resistant. Belt shall have a cover tensile strength of not less
than [_____] kPa pounds per square inch (psi) and friction between plies of not less than [_____] kPa pounds per inch. Belt shall have vulcanized splice.

2.9.8.4 Electric Motor

Totally enclosed, fan cooled, high torque, [_____] volt, [_____] phase, 60 Hz, not less than [_____] kW hp as specified in the paragraph MOTORS AND DRIVES. Motor shall be direct connected by means of flexible coupling with guard to a reduction gear.

2.9.8.5 Reduction Gear

Alloy steel helical gear type enclosed in oiltight housing. Provide an adjustable base for motor and reducer unit. Drive from the output shaft of the speed reducer to the conveyor head shaft shall be by means of finished steel roller chain conforming to ASME B16.39 running over cut tooth sprockets conforming to ASME B29.100 and complete with steel plate chain guard. Roller chain attachments shall also conform to ASME B29.100. Properly tension drive chain.

2.9.8.6 Backstop

Differential band brake type, cam type, or internal type to prevent reversal of belt.

2.9.8.7 Idlers

Flat type with 125 mm 5 inch diameter steel shells, malleable iron end brackets, grease sealed roller-type antifriction bearings, and self-cleaning angle bases. Idler spacing shall be not greater than 1372 mm 4 feet 6 inches. Return idler shall be of the flat single-pulley type having 125 mm 5 inch diameter steel shells, grease sealed roller-type antifriction bearings spaced on not more than [_____] meters feet on center. Provide self-aligning training type idlers, as required, to ensure proper training of the belt. Provide additional idlers, as required, beneath track or truck hopper for support of belt and coal and to properly protect belt from impact caused by coal. Extend grease pipes to one side for four point lubrication from tunnel walkway.

2.9.8.8 Load Skirts

Steel plate 6.35 mm 1/4 inch thick supported by structural brackets from conveyor frame. Skirts shall have rubber strips along bottom edge to seal the belt. Strips shall be easily adjustable by means of a clamp bar arrangement not requiring slotted bolt holes.

2.9.8.9 Frame, Supports, and Enclosure

Construct frame of either structural steel channel side stringers properly tied and braced for support of head and foot shafts with 12 gage (2.66 mm 0.1046 inch) steel deck plate full length of feeder, or integrally formed plate conveyor and deck frame. Support idlers from conveyor frame. Support frame from floor of tunnel [by steel channel legs] [as indicated]. Completely enclose feeder in a dust-tight enclosure constructed of not less than 10 gage (3.42 mm 0.1345 inch) steel plate with easily removable gasketed side panels containing handles at each panel end.
2.9.8.10 Loading Hopper

Constructed of not less than **10 mm 3/8 inch** thick steel plate connected to bottom flange of the track or truck hopper. Provide an adjustable regulating gate adjacent to loading hopper for regulating height of coal on the belt.

2.9.8.11 Vibrating Feeder

Flat pan type vibrating feeder to convey coal from day hopper to belt conveyor. Pan shall be [_____] mm inches wide by [_____] mm inches long, with 150 mm 6 inch sides, constructed of 6 mm 1/4 inch thick stainless steel. Provide feeder with integral electromechanical drive and a remote controller. Controller shall contain operating switches and rate of flow adjustment and the power source for the feeder drive. Controller shall be designed for 460 volt, 60 Hz. supply voltage. Support feeder from hopper.

[2.9.9 Shallow-In-Built Bar Flight Feeder and Receiving Hopper]

**************************************************************************
NOTE: Determine by an economic analysis and a technical evaluation if shallow-in-built bar flight feeders and receiving hoppers might be used instead of track or truck hoppers with belt feeders.
**************************************************************************

Bar flight feeder shall be totally enclosed, dusttight type with shallow-in-built [track] [truck] hopper. Bar flight feeder shall have a horizontal length of [_____] meters feet [_____] mm inches between sprocket centers, operate at not greater than [_____] m/s fpm, and have a capacity of not less than [_____] Mg tons per hour of [_____] size coal. Provide feeder complete with continuous chains and attached bars, terminal sprockets, gears, shafts, bearings, troughs, enclosure, frames, [truck] [track] hopper, grating, regulating gate, hinged inspection doors, discharge chute, electric motor, reduction gear, and supports.

2.9.9.1 Head and Foot Shafts

Head and foot shafts shall be not less than [_____] and [_____] mm [_____] and [_____] inches in diameter, respectively. Construct shafts of cold rolled steel and mount in antifriction roller bearings. Mount head shaft in fixed pillow blocks and foot shaft shall have screw-type takeups with not less than [_____] mm inches adjustment.

2.9.9.2 Terminal Sprockets

Cast iron with chilled rims not less than **380 mm 15 inches** in diameter. Foot shaft sprockets shall be split type in two 180 degree sections to facilitate removal in shallow pit.

2.9.9.3 Chains and Flights

Chains shall be bar link type each having a pitch of not greater than **150 mm 6 inches** and an ultimate strength of not less than 20,430 kg 45,000 pounds. Construct chain of heat treated carbon steel components with not less than a 22 by 38 mm 7/8 by 1 1/2 inch wide center link, 10 mm wide by 38 mm 3/8 inch wide by 1 1/2 inch thick side bars, fastened with 18 mm 5/8 inch diameter pins. Construct bar flights of **10 mm 3/8 inch** thick steel bars not less than **50 mm 2 inches** high with flight width of not less than [_____]
mm inches. Flight spacing shall be such that feeder shall move the required coal with a head shaft speed not greater than [_____] rpm.

2.9.9.4 Frame and Enclosure

Construct feeder frame of structural steel properly tied and braced, complete with guides and track for both carrying and return runs, of not less than 80 by 80 by 10 mm 3 by 3 by 3/8 inch steel angles with not less than 6 mm 1/4 inch high reneweable carbon steel wear bars. Enclosure shall be dusttight of not less than 10 gage (3.42 mm 0.1345 inch) commercial hot rolled steel plate. Enclosure shall be removale in sections. Top and side panels at head and foot sections shall be hinged and removale for access to chain sprockets.

2.9.9.5 Trough

Construct with flat bottom of not less than 10 mm 3/8 inch thick steel plate. Trough shall be removable and constructed with flanged discharge opening.

2.9.9.6 Hopper

Construct not less than 2 1/2 meters long and 3 meters wide 8 feet long and 10 feet wide of structurally reinforced 10 mm 3/8 inch thick steel plate lined with 10 gage (3.42 mm 0.1345 inch) 410 stainless steel plate. Hopper sides shall not slope less than 55 degrees from the horizontal. Construct hopper with a shield over return run so that coal is fed directly to bottom conveying run.

2.9.9.7 Grating

Hopper grating shall have openings 90 by 90 mm 3 1/2 by 3 1/2 inches. Construct grating of 65 by 10 mm 2 1/2 by 3/8 inch steel bars and 20 mm 3/4 inch diameter steel rods. Weld grating and make in sections for ease of removal. Provide intermediate beams to support grating.

2.9.9.8 Flight Feeder Drive

Flight feeder shall be driven by an electric motor direct connected by means of flexible coupling to a reduction gear unit having alloy steel helical or herringbone gears and antifriction bearings enclosed in oiltight housing. Provide an adjustable base for motor and gear. Drive from output speed shaft of the reduction gear to the conveyor head shaft shall be by means of standard finished steel roller chain running over cut tooth sprockets, both conforming to ASME B29.100 and complete with steel plate chain guard. Roller chain attachments shall also conform to ASME B29.100. Properly tension drive chain.

2.9.9.9 Electric Motor

Totally enclosed, fan cooled, high torque, [_____] volt, three phase, 60 Hz not less than [_____] kW hp as specified in the paragraph MOTORS AND DRIVES.

2.9.10 Bucket Elevator

Dusttight [centrifugal discharge] [continuous bucket] type having approximately [_____] meters feet [_____] mm inch sprocket centers, vertical chain and bucket, operating at a speed not to exceed [_____] m/s fpm, and having a capacity of not less than [_____] Mg tons per hour of
[_____] size coal. Provide bucket elevator complete with continuous double chains and attached buckets, upper and lower sprockets, gears, shafts, bearings, casing, top hood, discharge spout, bottom boot, access doors, electric motor drive, reduction gear, service platform, and accessories.

2.9.10.1 Head and Foot Shafts

Cold rolled steel not less than [_____] and [_____] mm [_____] and [_____] inches in diameter, respectively. Mount shafts in antifriction roller bearings with forced lubricating type fittings. Mount head shaft in fixed pillow blocks. Foot shaft shall have screw-type takeups with not less than a [_____] mm inch adjustment. Shafts shall fit tight in sprocket hubs.

2.9.10.2 Terminal Sprockets

Cast iron with chilled rims. Head sprockets shall be not less than [_____] mm inches in diameter and foot sprockets not less than [_____] mm inches in diameter.

2.9.10.3 Buckets and Chain

Construct buckets of [malleable iron] [not less than [_____] mm inch steel plate] not less than [_____] mm inches long, [_____] mm inches wide, and [_____] mm inches deep. Buckets shall be mounted by not less than four bolt attachments to double strand of steel bushed chain each having an ultimate strength of not less than [_____] kg pounds and pitch of [_____] mm inches. Bucket spacing shall not be greater than [_____] mm inches.

2.9.10.4 Backstop

Differential band brake type, cam type or internal type to prevent reversal of chain and buckets in case of power failure.

2.9.10.5 Elevator Casing

Not less than [_____] by [_____] mm inches inside of not less than [_____] [gage] [ mm inch thick] commercial hot rolled mild steel plate with 50 by 50 by 6 mm 2 by 2 by 1/4 inch corner angles for full height of elevator casing. Construct casing in standard sections from 3048 to 3658 mm 10 to 12 feet high with 50 by 50 by 6 mm 2 by 2 by 1/4 inch angle flanges at the end of each section. Provide a hinged inspection door not less than 610 by 760 mm 24 by 30 inches in the section immediately above the boot section [and where indicated]. Casing and inspection doors shall be of dust-tight construction with flange angles continuously welded and gasketed. No makeshift repairs or field patching to overcome leakage shall be permitted. Casing interior shall be given a 1.60 mm 1/16 inch thick coating of coal tar primer and enamel in accordance with SSPC PS 11.01.

2.9.10.6 Head Section

Not less than [_____] mm inch thick commercial hot rolled mild steel plate in heavy angle frame with split, hinged, and removable top cover hood. Construct hood of not less than [_____] mm inch thick commercial hot rolled mild steel plate with flanged discharge throat built of not less than [_____] mm inch thick commercial hot rolled mild steel plate. Design head section to support drive machinery and head bearings. Provide maintenance access ladder and platform conforming to applicable OSHA regulations [as indicated].
2.9.10.7  Boot Section

Not less than [_____] mm inch thick commercial hot rolled mild steel plate in heavy rolled mild steel plate in heavy angle frame with curved and renewable bottom plate built of not less than [_____] mm inch thick commercial hot rolled mild steel plate, and flanged inlet. Mount take up and foot terminal bearing on one side of boot in a bolted removable side panel so foot shaft and [sprocket] [sprockets] may be removed through side of door. Bolt end panels so they are removable for cleanout and inspection.

2.9.10.8  Electric Motor

Totally enclosed, fan cooled, high torque, [_____] volt, three phase, 60 Hz not less than [_____] kW hp, as specified in the paragraph MOTORS AND DRIVES. Motor shall be direct connected by means of flexible coupling to a reduction gear.

2.9.10.9  Reduction Gear

Alloy steel herringbone or helical gear type enclosed in oiltight housing. Provide an adjustable base for motor and reduction gear unit. Drive from the output shaft of the reduction gear to the elevator head shaft shall be by means of standard finished steel roller chain running over cut tooth sprockets, both conforming to ASME B29.100 and complete with steel plate chain guard. Roller chain attachments shall also conform to ASME B29.100. Properly tension drive chain.

2.9.10.10  Anchoring Brackets

Provide steel brackets at intervals [as indicated] at [not less than [_____] meters feet over centers] for anchoring elevator and to increase rigidity.

2.9.11  Flight Conveyor

Dusttight double strand chain-type with [_____] meters feet sprocket centers, operating speed not greater than [_____] m/s fpm, and having a capacity of not less than [_____] Mg tons per hour of [_____] size coal. Provide flight conveyor complete with continuous chain and attached flights, terminal sprockets, gears, shafts, bearings, trough, casing, frame, hinged inspection doors, electric motor drive, reduction gear, and supports. [Design flight conveyor for future length of [_____] meters feet for future plant expansion.]

2.9.11.1  Head and Foot Shafts

SAE 1045 steel not less than [_____] and [_____] mm [_____] and [_____] inches in diameter, respectively, mounted in antifriction tapered roller bearings with forced lubricating type fittings. Mount head shaft in fixed pillow blocks. Foot shaft shall have screw-type takeups with not less than [_____] mm inches adjustment.

2.9.11.2  Terminal Sprockets

Cast iron with chilled rims and not less than 8 teeth. One sprocket shall be keyed on shaft and the other shall be free to turn.

2.9.11.3  Flights and Chain

Construct flights not less than [457] [508] [610] [762] mm [18] [20] [24]
[30] inches long and [200] [250] mm [8] [10] inches high of not less than 6 mm 1/4 inch thick abrasion resistant steel. Mount flights at not greater than [457] [508] [610] [914] mm [18] [20] [24] [36] inch intervals between two matched strands of steel bushed roller chain having [_____] mm inch pitch and an ultimate strength of not less than [_____] kg pounds per each strand. Chain shall have [_____] by [_____] mm inch high carbon steel side bars, high carbon steel, heat-treated pins, carbon steel case-hardened bushings, and [_____] mm diameter single flange chilled gray iron or chrome iron rollers. Support chain so that chain does not lie or run in coal.

2.9.11.4 Frame and Enclosure

Construct conveyor frame of structural steel properly tied and braced, complete with track for both the carrying and return run of chain of not less than 80 by 80 by 10 mm 3 by 3 by 3/8 inch steel angles with not less than 6 mm 1/4 inch high renewable molybdenum steel wear bars. Enclosure shall be dust-tight of not less than 10 gage (3.42 mm 0.1345 inch) hot rolled steel plate with easily removable side panels containing handles at each panel end. Enclosure shall have hinged inspection doors 600 mm 24 inches wide and full height of the enclosure opposite loading hopper and at each discharge chute. End panels shall be hinged and removable for access to the chain sprockets.

2.9.11.5 Trough

Not less than 6 mm 1/4 inch thick corrosion resistant steel plate made in boxlike U-shape. Trough shall be removable in not more than 2.44 meters 8 foot long sections and constructed with flanged discharge openings where indicated.

2.9.11.6 Loading Hopper

Steel plate not less than 6 mm 1/4 inch thick sloped at not less than 60 degrees.

2.9.11.7 Outlets

Bottom of trough shall have [_____] outlets not less than [457] [508] [610] [762] mm [18] [20] [24] [30] inches long with gates to discharge coal into cylindrical bunkers. Provide outlets with deflection plate type baffle designed to make coal drop straight down into bunker.

2.9.11.8 Electric Motor

Totally enclosed, fan cooled, high torque, [_____] volt, three phase, 60 Hz, not less than [_____] kW hp as specified in the paragraph MOTORS AND DRIVES. Motor shall be directly connected by means of flexible coupling to a reduction gear.

2.9.11.9 Gates

Provide coal gates on bottom trough of flight conveyor, immediately under outlets. Opening shall be [_____] mm inch square with motor operated slide gates for controlling discharge to each bunker. Provide double rack and pinion type gates driven by not less than 0.56 kW 3/4 hp motor. Provide limit switches for signal lights, control and interlocking. Provide outlets from gates with a 6 mm 1/4 inch abrasion resistant steel plate discharge chute.

SECTION 23 52 33.01 20  Page 83
2.9.11.10 Reduction Gear

Alloy steel helical or herringbone gear type with antifriction bearings enclosed in oiltight housing. Provide an adjustable base for motor and reduction gear. Drive from output shaft of motor reducer to conveyor head shaft shall be by means of standard finished steel roller chain conforming to ASME B29.100 running over cut tooth sprockets conforming to ASME B29.100 and complete with steel plate chain guard. Roller chain attachments shall conform to ASME B29.100. Provide means to properly tension drive chain.

2.9.12 Belt Conveyor

Inclined and approximately [_____] meters feet between pulley centers, operated at a speed not to exceed [_____] m/s fpm, and have a capacity of not less than [_____] Mg tons per hour of [_____] size coal. Provide belt conveyor complete with continuous belt, shafts, pulleys, idlers, takeups, belt cleaner, frame with conveyor cover and walkway, transfer chute, hopper, emergency stop cord and switch, alignment switch, reduction gear, electric motor, bin high level limit switch and alarm.

2.9.12.1 Head and Foot Shafts

Construct shafts of turned and polished cold rolled steel not less than [_____] and [_____] mm [_____] and [_____] inches in diameter, respectively. Mount shafts in antifriction roller bearings with forced lubricating type fittings. Mount head shaft in fixed pillow blocks. Foot shaft shall have screw-type takeups with not less than [_____] mm inches adjustment.

2.9.12.2 Takeups

[Three pulley guided vertical counter weighted type] [Screw type] to maintain proper belt tension. Shafts shall be as specified above and not less than [_____] mm inches in diameter. Provide a safety device to prevent free fall of takeup pulley. Takeups shall provide a minimum adjustment of 1.5 percent of total belt length.

2.9.12.3 Pulleys

Welded steel type with detachable compression grip-type hubs, steel plate ends, and crown faces 50 mm 2 inches wider than the belt width. Provide a multiple belt scraper at each head pulley.

2.9.12.4 Magnetic Pulley

Drive pulley of [_____] conveyor shall be a nonelectric permanent magnet type designed to remove tramp iron. Provide a removable pan to collect tramp iron.

2.9.12.5 Belt

Synthetic fabric, not less than [_____] mm inches wide, a minimum of [_____] ply, with 3 mm 1/8 inch thick oil and chemical resistant cover on carrying side, [1.59] [0.79] mm [1/16] [1/32] inch thick oil and chemical resistant rubber cover on under side. Cover shall be fire resistant. Belt shall have a tension pull strength of not less than [_____] N per mm pounds per inch of belt width. Belt shall have vulcanized splice.
2.9.12.6  Electric Motor

Totally enclosed, fan cooled, high torque, [_____] volt, three phase, 60 Hz, not less than [_____] kW hp as specified in the paragraph MOTORS AND DRIVES. Motor shall be direct connected by means of flexible coupling with guard to a reduction gear.

2.9.12.7  Reduction Gear

Alloy steel helical gear type enclosed in an oiltight housing. Provide an adjustable base for mounting motor and reducing unit. Drive from output shaft of speed reducer to conveyor head shaft shall be by means of finished steel roller chain conforming to ASME B29.100 running over cut tooth sprockets conforming to ASME B29.100 and complete with steel plate chain guard. Roller chain attachments shall conform to ASME B29.100. Provide means to properly tension drive chain.

2.9.12.8  Backstop

Differential band brake type, cam type, or internal type to prevent reversal of belt.

2.9.12.9  Emergency Stop Cord and Switch

Provide emergency stop cord the length of the conveyor to actuate a switch for stopping the conveyor. Switch shall have flag to indicate actuated switch and shall have positive safety lock that cannot be accidentally reset. Cord shall be not less than 2.38 mm 3/32 inch galvanized aircraft cable with a minimum 1.19 mm 3/64 inch vinyl or nylon protective coating. Provide sufficient number of switches to prevent cable weight from actuating switch.

2.9.12.10  Belt Alignment Switch

Provide belt alignment switches on each side of the belt mounted off conveyor frame or discharge chute to stop conveyor under belt misalignment or runoff conditions. Mount switches on breakaway mounts to prevent damage from runaway belt.

2.9.12.11  Idlers

Troughing idlers shall be [20] [35] degree three-pulley type with 125 mm 5 inch diameter steel shells, malleable iron end brackets, grease sealed roller type antifriction bearings, and self-cleaning angle bases. Troughing idler spacing shall be not greater than 1.37 meters 4 feet 6 inches, with additional idlers at the loading point. Return idler shall be flat single-pulley type having 125 mm 5 inch diameter steel shells, grease sealed roller type antifriction bearings and spaced not more than 3 meters 10 feet on center. Provide self-aligning training type trough and return idlers at not greater than 15.24 meters 50 foot intervals to ensure proper training of belt. Extend grease pipes to one side for four point lubrication from walkway.

2.9.12.12  Load Skirts

Not less than 6 mm 1/4 inch thick steel plate and supported by structural brackets from conveyor frame. Skirts shall have rubber strips along bottom edge to seal belt. Strips shall be easily adjustable by means of a clamp.
bar arrangement not requiring slotted bolt holes.

2.9.12.13 Frame, Supports, and Walkway

Frame shall be structural steel truss type with head and foot terminals framed of structural steel. Support frame from grade on structural A-frames set on concrete footings as indicated. Support idlers on not less than 150 mm 6 inch channel stringers braced and tied to structural steel truss frame. Provide a 12 gage (2.66 mm 0.1046 inch) steel deck plate for full length of conveyor. Provide a curved belt cover constructed of not less than 16 gage (1.52 mm 0.0598 inch) corrugated galvanized metal having removable panels on walkway side for access to idlers. Provide walkway not less than 914 mm 36 inches wide, supported from structural steel framing for entire length of conveyor. Walkway shall be complete with handrails and metal nonslip grating meeting requirements of 29 CFR 1910-SUBPART D, Walking and Working Surfaces.

2.9.12.14 Discharge Hopper

Construct of not less than 6 mm 1/4 inch thick steel plate to discharge on a discharge chute. Provide a discharge hood built of 10 gage (3.42 mm 0.1345 inch) steel plate enclosing top, front, and sides above discharge hopper.

2.9.13 Coal Scales

Stationary, automatic, dust-proof, belt-fed, batch type with rated capacity of not less than [_____] Mg tons per hour and a hopper capacity of 91 kg 200 pounds. Coal scales shall be complete units, including body, belt feeder, feeder drive, bypass, weighing mechanism, weigh hopper, controls, counters, and remaining items required to make a completely automatic coal scale.

2.9.13.1 Body

Dusttight, of welded heavy steel plate construction with base angles not less than 6 mm 1/4 inch thick. Top plate, bypass plate, and reducer mounting plate shall be not less than 6 mm 1/4 inch thick, with other plates of not less than 11 gage (3.04 mm 0.1196 inch) steel plate. Provide large, gasketed, dusttight doors with adjustable pre-set compression type latches and forged steel hinges for inspection and maintenance purposes. Door openings shall be sufficient to allow removal of feeder and hopper without removal of screws or bolts.

2.9.13.2 Feeder

A self-contained unit with an endless belt which is capable of being removed from one end or side. Construct feeder of heavy rigid steel frame with an 11 gage (3.04 mm 0.1196 inch) stainless steel plate to support the belt on the carrying run. Head and takeup shafts shall be cold rolled steel carried on self-aligning ball bearings equipped with dust seals and fitted for pressure lubrications. Bearings shall be capable of being lubricated during scale operation. Takeup shaft shall have screw-type takeup bearings and pulleys shall be crown faced steel for proper belt tracking.

2.9.13.3 Feed Belt

Channel type and of endless construction without splice. Belt shall be not
less than 7.94 mm 5/16 inch thick of three ply heavy fabric core construction with chemical and abrasion resistant rubber coating. Feeder skirts and leveling plate shall be stainless steel and shall be arranged to provide a continuous stream of constant width and depth coal on the feed belt.

2.9.13.4 Electric Motor And Drive

Totally enclosed [_____] volt, [_____] phase, 60 Hz, with heavy duty reduction gear not less than 0.56 kW 3/4 hp as specified in the paragraph MOTORS AND DRIVES. Scale shall be capable of bypassing coal without disconnection of drive. Drive disconnection shall not be required for feeder removal unless special provisions are made for a quick and simple drive disconnection.

2.9.13.5 Coal Bypass

Provide a quick-operating coal bypass with an easily operable lever located on the outside of scale body. Operating lever operation shall instantly bypass coal around the feeder section and weighing mechanism without release of belt tension to prevent entry of coal between belt and pulley or support plates. Bypass construction shall not restrict inlet opening size for normal scale operation.

2.9.13.6 Weighing Mechanism

Enclose in a dusttight compartment. Construct of cold rolled steel for minimum deflection, warp, and twist. Pivot points shall be self-aligning with hardened double bearing surfaces. Weighing mechanism shall be complete with weight lever, tare adjustment, and compensator [, with design subject to approval by the Contracting Officer] and scale shall be guaranteed to weigh coal accurately within 0.25 percent.

2.9.13.7 Scale Weigh Hopper

Construct scale weigh hopper and discharge gate of not less than 14 gage stainless steel plate, continuously welded and stiffened with angle irons. Weigh hopper shall be of such design and construction to ensure clean discharge.

2.9.13.8 Controls

Provide controls, except those required for weigh hopper discharge, prewired and located in a NEMA [12] [3] dusttight enclosure. Provide circuit breaker interlocked with electrical panel door. Control circuits shall be two wire nominal 120 volt systems obtained by using an isolation transformer with one side grounded and wired to a single terminal block which shall be included in the electrical panel. Segregate circuits of different voltage levels. Controls shall include large, oiltight, industrial type pushbuttons for use as "start-stop," "test," and "dump" switches mounted on the scale body adjacent to the electrical panel.

2.9.13.9 Counters

Mount a mechanical type coal counter on the scale body. Counter shall be rugged, reliable, with heavy duty register and designed so that double counting is impossible.[ A remote motor operated counter shall be furnished located on the coal handling control panel in the control room. Counter shall be designed so that double counting is impossible.][ Provide
a contact closure for sending a pulse signal of each weigh hopper discharge to the operator control console.

2.9.13.10 Scale Inlet

Scale inlet shall contain coal gate with opening not less than 457 by 457 mm or 406 by 508 mm 18 by 18 inches or 16 by 20 inches along with a duastight all metal slip joint constructed of not less than 4.76 mm 3/16 inch thick steel plate. Slip joint shall be of split construction to allow for installation after coal scale is in place. Design slip joint to allow necessary flexibility to take care of deflection of [bunker] [silo] outlet due to varying load and temperature variations without imposing load on the scale. Provide rope packing or other resilient gasket material to make slip joint completely dusttight.

2.9.13.11 Scale Outlet Hopper

Not less than 6 mm 1/4 inch thick 410 stainless steel plate of capacity not less than 227 kg 500 pounds and 13 mm 1/2 inch thick steel plate flanges.

2.9.14 Stoker Hopper Extension

Dusttight and bolted to hopper furnished with stokers. Construct hopper extensions as indicated of 6 mm 1/4 inch thick 410 stainless steel plate with structural stiffeners. Hopper extension shall hold not less than [_____] Mg tons of coal at a density of 800 kg per cubic meter 50 pounds per cubic foot. Hopper extensions shall have bolted emergency firing doors of not less than 610 by 610 mm 24 by 24 inches which shall contain a 152 by 152 mm 6 by 6 inch glass observation window. Connections shall be dusttight.

2.9.15 Coal Valve

Dusttight and dripproof of the double ladder rack-and-pinion type sized as indicated for each valve. Valve shall be capable of closing through a standing coal column. Valve opening shall be full size with no bridges, internal braces, or other barriers.

2.9.15.1 Valve Body

Not less than 6 mm 1/4 inch thick formed 410 stainless steel with heavy 19 mm 3/4 inch thick flanges. Continuously weld joints in contact with coal both inside and out and grind smooth. Valve body shall have dusttight steel gate assembly cover with molded gasket for removal of gate without removing coal valve. Provide a minimum of two dusttight poke holes with rigid covers and molded gaskets.

2.9.15.2 Valve Gate

Dripproof and siftproof of 10 mm 3/8 inch thick steel plate with an 11 gage (3.04 mm 0.1196 inch) 410 stainless steel liner. Support gate by ball bearing rollers with 16 gage (1.52 mm 0.0598 inch) stainless steel shells equipped with felt grease seals and stainless steel grease retainers. Provide rollers with grease fittings extended through valve body for pressure lubrication. Design gate so that supporting rollers, racks, and pinions are located completely out of the coal stream. Provide cold formed, self cleaning racks, with stainless steel self cleaning pinions located over racks for positive tooth engagement.
2.9.15.3 Operating Shaft

Mount operating shaft in ball bearings with felt seals, stainless steel shells, stainless steel grease retainers, and grease fittings. Provide handwheels with proper finger clearance or pocket sheaves with heavy hot-dipped galvanized chain and chain guard as indicated. Handwheels and sheaves shall be not less than 457 mm 18 inches in diameter. Provide valves with mechanical type position indicator consisting of large pointer and legend to indicate position of valve gate.

2.9.15.4 Electric Motor Operators

Provide motor operators where indicated and capable of remote operation from the coal handling control panel. Operator shall consist of totally enclosed, fan cooled, high torque, [_____] volt, [_____] phase, 60 Hz motor as specified in the paragraph MOTORS AND DRIVES with reduction gear, clutch and limit switches. Motor horsepower shall be as recommended by the manufacturer. Provide motorized valves that have manual operators, with fail-safe interlocks that make manual operation impossible while motor is operating.

2.9.16 Track and Reclaim Hopper Valves

Dusttight, double rack and pinion type, with water collecting trough. Valve shall have inlet opening not less than [_____] by [_____] mm inches in direction of gate travel with a larger outlet opening. Inlet and outlet shall be flanged and constructed of mild steel.

2.9.16.1 Valve Body

Not less than 10 mm 3/8 inch thick mild steel continuously welded both internally and externally and lined with 11 gage (3.04 mm 0.1196 inch) 410 stainless steel plate where body comes in direct contact with coal. Construct inlet skirt of not less than 6 mm 1/4 inch thick 410 stainless steel with outlet body plates constructed of 10 mm 3/8 inch thick mild steel lined with 11 gage (3.04 mm 0.1196 inch) 410 stainless steel plate. Construct water collecting trough of not less than 11 gage (3.04 mm 0.1196 inch) 410 stainless steel plate and containing water sprays for flushing. Valve body shall have dust-tight steel gate assembly cover with molded gasket for removal of gate without removing the coal valve. Provide a hinged access panel not less than [_____] by [_____] mm inches in the direction of gate travel with compression-type latches over water collecting trough for removing obstructions.

2.9.16.2 Valve Gate

Slope gate plate toward water collecting trough and mount it on large ball bearing rollers with 16 gage (1.52 mm 0.0598 inch) stainless steel shells equipped with felt grease seals and stainless steel grease retainers. Provide rollers with grease fittings extended through valve body for pressure lubrication. Gate shall be U-shaped with ladder racks on both sides and shall be constructed of not less than 15.90 mm 5/8 inch thick mild steel lined with 11 gage (3.04 mm 0.1196 inch) 410 stainless steel plate. Gate design shall be such that supporting rollers, racks, and pinions are located completely out of coal stream. Racks shall be cold formed and self-cleaning, with stainless steel, self cleaning pinions over racks.
2.9.16.3 Operating Shaft

Mount operating shaft in ball bearings with felt seals, stainless steel shells, stainless steel grease retainers, and grease fittings. Mount a reduction gear on the gate shaft and provide an ample gate clearance pocket in the body to ensure ease of operation through a standing column of coal. Handwheel for operating valve shall be not less than 457 mm 18 inches in diameter.

2.9.17 Chutes

Construct coal chutes dusttight as indicated of not less than 6 mm 1/4 inch thick 410 stainless steel plate. Weld chutes with flanges located as indicated to facilitate equipment and chute section removal. Flanges shall be not less than 10 mm 3/8 inch thick steel and gasketed to maintain dust-tight seal. Provide poke holes and access panels where indicated.

2.9.18 Coal Presence Indicators and Equipment Response Switches

May be of the following types and shall be interlocked with coal handling controls to indicate equipment failures, coal stoppages, and provide for a semi-automatic system. Enclosures for components shall meet requirements of NEMA Type 7, Class I, Division I, Groups C and D, and NEMA Type 9, Class II, Division I, Groups E, F, and G.

2.9.18.1 Type A - Diaphragm Type Presence Indicator

Pressure-sensitive to presence of coal consisting of housing, diaphragm, limit switches, wiring, and mounting bracket flanges. Housing shall be either cast iron, stainless steel, or protected cast aluminum, with synthetic diaphragm as recommended for coarse slightly abrasive materials. Diaphragm deflection shall actuate a limit switch to indicate coal presence. Design unit so that maintenance, diaphragm replacement and sensitivity adjustment can be made from outside the bin. Type and number of contacts and voltages shall be as indicated on control diagrams.

2.9.18.2 Type B - Paddle Type Presence Indicator

Paddle mounted on a counterweighted horizontal shaft so that deflection of paddle rotates a cam which actuates a limit switch in a control box mounted on the shaft. Unit shall consist of paddle, shaft, enclosure, limit switches, wiring, and mounting brackets. Shaft shall be cold rolled steel and paddle shall be stainless steel with control enclosure of cast iron, stainless steel, or suitably protected cast aluminum. Type and number of contacts and voltages shall be as indicated on control diagram. Mount shaft in ball bearings equipped with suitable dust seals and fittings for pressure grease lubrication.

2.9.18.3 Type C - Tilt Type Presence Indicator

Conical steel float that shall be tilted by presence of coal. Unit shall consist of housing, conical float, universal pivot-collar, pendant mechanism, dust seal, limit switches, wiring, and mounting brackets. Unit shall operate so that tilting of float actuates a limit switch in enclosed housing above. Provide a hood constructed according to manufacturer’s recommendations for the indicator’s location of not less than 5 mm 3/16 inch thick steel plate. Provide access panel for servicing the unit. Tilt type indicator may be a totally enclosed type in which tilting causes a ball to roll off the center actuating a limit switch. Design unit to be
cable hung and to tilt on presence of coal. Type and number of contacts and voltages shall be as indicated on control diagram.

2.9.18.4 Type D - Rotating Type Presence Indicator

Rotating paddle where presence of coal stalls motor and actuates a limit switch. Unit shall have either cast iron or cast aluminum housing, stainless steel paddle, couplings, and flexible shaft. Shaft seal shall be spring loaded and shall prevent buildup of fines between shaft and hub. Operation shall be such that when paddle stalls motor continues to operate until limit switch is actuated, which in turn shuts off current to motor. Vane and baffle arrangements shall be according to manufacturer's recommendations for each indicator location. Type and number of contacts and voltages shall be as indicated on control diagrams.

2.9.18.5 Type E - Vibrating Type Presence Indicator

Vibrating sensing rod so that presence of coal dampens vibrations actuating a control signal. Sensing rod shall be stainless steel not less than 10 mm 3/8 inch in diameter. Control unit shall be solid state, with type and number of contacts and voltages as indicated on control diagrams.

2.9.18.6 Equipment Speed Response Switch

Actuates a control signal when preset abnormal equipment operating conditions are encountered. Switch shall be adjustable so that it may be used as an underspeed switch, overspeed switch, or zero speed switch. Switch shall consist of input shaft from which the equipment speed is measured and compared to a preset point. Enclosure shall be cast iron or suitably protected cast aluminum. Mount speed response switches as indicated. Type of switch adjustment, type and number of contacts, and voltages shall be as indicated on control diagrams.

2.9.18.7 Presence Indicators and Response Switches

Provide at hoppers and conveyor discharges located and protected according to manufacturer's recommendations to ensure safe and reliable operation. Mount presence indicators in such a manner that they will not be damaged by occasional large lumps or falsely operated by stray lumps or collected amounts of coal.

2.9.19 Control Panel and Controls

Provide a semi-automatic control system for coal handling system as indicated.

2.9.19.1 Control Panel

NEMA 12 construction, centrally located in main plant control room. Panel front shall include a system graphic display as indicated. Display shall be approximately to scale and painted with an industrial acrylic enamel. Outline each item with 3 mm 1/8 inch wide black lines. Lettering shall be on engraved plastic screwed to front of panel, with white letters on a black background. Provide controls for operation on [_____] volt, [_____] phase, 60 Hz ac. Panel shall be complete with an annunciator and interlocks, relays, switches, running and safety lights, and auxiliary parts necessary to safely control and operate the system. Items located in door shall be dust-tight and oil tight with push-to-test transformer type indicating lights. Control relays shall be 10 amp, 600 volt class with
convertible contacts. Provide and mark terminals for connections with the exception of the neutral. Panel shall contain [_____] percent spare terminals. Wiring shall be No. 14 AWG type THHN stranded. Neutral wire shall be white. Color code and label wiring of 120 volts or less. Provide plastic wire duct of sufficient size to provide [_____] percent cross sectional spare. Wiring shall be in accordance with requirements of NFPA 70.

a. Panel Devices: Control panel shall include the following indicating lights and color:

b. Provide momentary contact pushbuttons or selector switches for the following:

(1) System START (3 required)
Rail unloading hopper to boiler plant
Rail unloading hopper to storage yard
Reclaim hopper to boiler plant

(2) System - STOP (red head)

(3) Rail unloading surfactant spray system - ON-OFF

(4) Rail unloading hopper surfactant spray - START/STOP

(5) Reclaim surfactant spray system - ON-OFF

(6) Reclaim hopper surfactant spray - START/STOP

(7) Coal to stackout tube (SELECT)

(8) Alarm - ACKNOWLEDGE

c. Annunciator panel shall include the following:

(1) Bunker - HIGH LEVEL

(2) Bunker - LOW LEVEL

(3) Stoker hopper (one required for each hopper) - HIGH LEVEL

(4) Stoker hopper (one required for each hopper) - LOW LEVEL

(5) EMERGENCY SHUTDOWN (Auxiliary contacts for remote alarm)

(6) Blank (3 required)

d. Size panel to accommodate future addition of one stoker hopper and associated equipment.

e. Provide auxiliary devices required for control functions indicated above.

f. Provide laminated plastic name plates for devices on panel face.

2.9.19.2 Remote Controls

Provide controls for the following items in the main plant control room as specified in Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS:

a. Conveyor system - EMERGENCY STOP

b. Bunker - HIGH LEVEL ALARM

c. Bunker - LOW LEVEL ALARM

d. Stoker hopper (one required for each hopper) - HIGH LEVEL

e. Stoker hopper (one required for each hopper) - LOW LEVEL

f. Under Bunker conveyor system - START/STOP

g. Coal scale - START/STOP
2.9.19.3 Control Sequence

To ensure that coal does not back up during system startup or shutdown, design controls so that on startup, the last piece of equipment to handle coal starts first and on shutdown, stops last.

2.9.19.4 Additional Controls

Provide as shown. These controls include local START and STOP pushbuttons or three-position selector switches for the following:

a. Belt feeders
b. Belt conveyors (at head pulley)

c. Flight conveyor
d. Coal scale
e. EMERGENCY STOP pushbuttons which stop the entire system shall be provided where indicated.

2.9.20 Multiple Belt Scrapers

Equip conveyor belts at the head pulley, with multiple belt scrapers. Provide adequate room and service access in head chute design for multiple cleaners. Provide a doctor blade on face of head pulley to remove most of the carryback material and a torsion arm type multiple blade cleaner to scrape and remove material that bypasses primary cleaner. Provide tail pulley takeups with a plow to protect against material being carried back between belt and pulleys. Both cleaners and plows shall have features that enable the operator to safely inspect and adjust the blades. Dribble chutes shall be designed to resist material buildup and shall be plastic lined. Provide a convenient dust tight door for clean out and inspection purposes on each side of the dribble chute.

2.9.21 Steel Coal Bunker

Cylindrical shaped type having a storage capacity of not less than [_____] Mg tons of coal having a density of 800 kg per cubic meter 50 pounds per cubic foot.

2.9.21.1 Construction

All welded construction, not less than [_____] meters feet in diameter with a vertical cylindrical section [_____] meters feet [_____] mm inches high. Construct vertical cylindrical section of not less than 7.90 mm 5/16 inch thick steel plate. Slope bottom cone shaped hopper section at not less than 55 degrees and fabricate from not less than 10 mm 3/8 inch thick 410 stainless steel plate. Top of bunker shall be conical 35 degree sloped structurally reinforced 6 mm 1/4 inch thick steel plate. Provide ladder inside bunker. Provide dusttight, weather tight access hatch of not less than 610 by 610 mm 24 by 24 inches in bunker top immediately above ladder. Shell and bottom plates shall be beveled for full penetration butt weld on inside of bunker and a finish weld on outside of bunker. Provide bunker with flanged outlet drilled to match inlet of gate.

a. Responsibility: Ensure that full responsibility for final design and details of construction of steel coal bunker is assumed by the
manufacturer.

b. Supports: Bunker shall be self supporting from four stub columns which shall be supported from on top horizontal structural steel framing. Structural steel framing for supporting the stub columns is specified in Section 05 12 00 STRUCTURAL STEEL.

c. Liner: Surface blast vertical inside surfaces of the bunker to a near white metal, and then coat with 6 mm 1/4 inch thick troweled-on heavy duty three compound corrosion resistant liner consisting of a resin, a hardener and graphite aggregate. Liner shall have an operating temperature limitation of not less than 66 degrees C 150 degrees F.

2.9.21.2 Accessories:

a. Alarm Switches: Provide bunker with two automatic bin level indicators with neoprene rubber diaphragm and a single pole, double throw switch mounted in explosion proof aluminum housing to signal high and low level alarms. Provide mounting plates on bunker shell and holes for installation of indicator housing on outside of bunker. Wiring shall be as specified in Division 26.

b. Vibrators: Provide on cone bottom of coal bunker a heavy duty pulsating magnet electric vibrator, semi-noiseless type, complete with mounting plate. Provide one vibrator controller panel arranged for mounting in wall mounted control panel. Panel shall contain an "ON-OFF" switch, power control dial, fuses and rectifier. Power supply to panel shall be 460 volt, single phase, 60 Hz current.

2.9.22 Stackout Tube

Provide a stackout type discharge tube not less than 10 mm 3/8 inch thick, reinforced, stainless steel plate for discharging coal from stackout conveyor to coal storage yard. Tube shall be 1220 mm 4 feet in diameter, and designed as the structural support for a portion of the stackout conveyor and support steel as indicated. Tube shall be a window chute designed to discharge coal at not more than 1829 meters 6 feet above coal pile.

2.10 FUEL OIL SYSTEM

********************************************************************************
NOTE: In reference to the following text, choose either Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS, for below ground tanks, or Section 33 52 10 FUEL SYSTEMS PIPING (SERVICE STATION), for above ground tanks. The rest of the fuel oil system is covered in Section 33 52 10 FUEL SYSTEMS PIPING (SERVICE STATION).
********************************************************************************

The fuel oil system shall be designed and built in accordance with Section 33 52 10 FUEL SYSTEMS PIPING (SERVICE STATION)[.][, except for below grade level fuel tanks, which shall be constructed to Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.]

2.11 ASH HANDLING SYSTEM (PNEUMATIC)
NOTE: Designer shall select type of ash handling system most suited for each project. For plants over
4 kg per second 31,500 pounds per hour steam ultimate capacity use a pneumatic ash handling system. For plants under 4 kg per second 31,500 pounds per hour steam ultimate capacity use a mechanical system. Refer to NAVFAC DM-3.6, Section 5, paragraph 4d for design criteria.

**************************************************************************

NOTE: Choose this article (and the paragraphs and subparagraphs following) or the article, (paragraphs and subparagraphs) below, ASH HANDLING SYSTEM (MECHANICAL).

**************************************************************************

2.11.1 System Requirements

Provide a complete integrated, pneumatic, semi-automatic sequencing, ash handling system with air intakes, material intakes, ash doors and enclosures, iron alloy conveyor line, fittings, rotary slide gates, primary and secondary material separators, tertiary bag filter, steam exhauster, electric motor driven positive displacement blower (mechanical exhauster), air washer, silo vent filter, ash silo, rotary ash conditioner, and equipment that may be necessary for a complete pneumatic ash handling system. Provide related electrical work required to operate the ash handling system. Design system so that the ash silo is never placed under a partial vacuum.

2.11.2 Type

System shall be the intermittent vacuum type, whereby the vacuum is interrupted permitting periodic discharge of collected materials into the silo on a programmed time cycle. System shall have sufficient air velocity to pick up ash that may be deposited in the pipe.

2.11.3 Ash Silo

System shall receive, and on a sequenced basis convey to the ash silo, ash from the stoker fired boiler ash storage hoppers, ash storage pits, siftings hoppers, soot hoppers, economizer hoppers, baghouse hoppers, and other pollution control equipment hoppers. Convey ash from only one pickup point at a time.

2.11.4 Ash

Discharge ash into the ash storage silo in a dry condition. Arrange silo equipment for disposal of conditioned ash to trucks. The operation shall be as nearly dustless as possible.

2.11.5 Maximum Noise Level

The noise level of the operation shall not exceed 85 decibels sound pressure level 1.50 meters 5 feet from the equipment in any direction.

2.11.6 Dry Ash Storage Hopper

Provide for each boiler to receive and store bottom ash as it is discharged
from the traveling grate. Hopper shall be compatible with the grate ash discharge enclosure and shall have a net volume to receive and to store material for an 8 hour period at maximum boiler output. Size hopper for mean ash level for one meters 3 feet below the stoker floor with ash density of 640 kg per cubic meter 40 pounds per cubic foot for volumetric sizing.

2.11.6.1 Construction

Not less than 6 mm 1/4 inch thick, ASTM A36/A36M, steel plate, dusttight, floor supported steel structure with refractory lining. Provide required steel columns, beams stiffeners and cross bracing. Bolt top section of hopper to stoker support steel. Base design load of hopper on 1120 kg per cubic meter 70 pounds per cubic foot. Slope sides at not less than 45 degrees from horizontal to maintain positive feed to outlet.

2.11.6.2 Refractory Materials

As recommended by the manufacturer; minimum total thickness of refractory and insulating block lining shall not be less than 178 mm 7 inches. Refractory shall be minimum of 114 mm 4 1/2 inches thick.

2.11.6.3 Discharge Doors or Gates

Provide each hopper with refractory lined, dusttight, water cooled, vertical lift doors, of an opening size not less than 560 by 560 mm 22 by 22 inches. Each door shall be [air-cylinder operated] [chain wheel operated]. Provide intermediate positioning capability with air cylinder operators. Provide each door with guide rollers and support arms to ensure smooth operation without binding. When doors are vertical, minimum number of guide rollers shall be 4; for a sloping surface, minimum number of guide rollers shall be 6.

2.11.6.4 Hopper Lift Door Enclosure

Provide not less than 6 mm 1/4 inch thick steel, dusttight, enclosure, for each vertical lift door. Match enclosure to housing of clinker crusher and make enclosure large enough to enclose the outlet and the vertical lift door. Provide hinged inspection and cleanout door on enclosure front.

2.11.6.5 Hinged Hopper Access Door

Provide on one side wall of each hopper. Door shall be cast iron, air tight swingaway locking type with refractory lining. Install door so that it is conveniently accessible and easy to use.

2.11.7 Clinker Crusher

Provide mounted below each hopper discharge outlet, under vertical lift door enclosure, capable of reducing clinkers from bottom ash to a maximum size of 50 mm 2 inches at a rate not less than conveyor system capacity.

2.11.7.1 Construction

Single roller crusher unit with extra heavy housing, outboard bearings sealed against grit infiltration, motor and drive. Housing shall be 15 mm 1/2 inch thick. Crusher rollers shall have replaceable cam segments (teeth) with a minimum Brinell hardness of 450. Each cam tooth shall be designed to permit resurfacing with hard material. Stationary heavy cast
iron or manganese steel abrasion resistant wear plates, of a Brinell hardness not less than 350, shall be mounted about the crusher rollers. Cam shaft rotational speed shall not exceed 20 rpm.

2.11.7.2 Fluid Gear Drive

Crushers shall be driven by a fluid gear drive including a totally enclosed, fan cooled, [_____] volt, three phase, 60 Hz electric motor not less than 3.75 kW 5 hp, as specified in the paragraph MOTORS AND DRIVES, fluid coupling and reduction gear, integrally mounted in dust and oil tight enclosures. Fluid drive shall protect unit from excessive shock. Drive shall automatically reverse when stalled; crusher shall reverse and move forward three times and, after third time, shut down and alarm when still stalled.

2.11.8 System Valving

2.11.8.1 Side Intake Valves for Fly Ash Collection

Provide at each hopper, including dust collection hoppers and rear pass hoppers, and other collection points. Side intake valve shall be pneumatically opened, spring closed, totally enclosed disc valve of cast iron construction with wearing surfaces of Brinell hardness not less than 350. Provide valve complete with flanged inlet hopper, handhole with gasketed cover and clamp and couplings. Side intake valve shall feed ash to conveyor line on an angle, thus permitting air to mingle with ash in the proper proportion to eliminate clogging. Valves shall provide positive and automatic air tight shutoff and dust tight pickup. Valve shall close on failure of operating air and before discharge cycle of intermittent conveyor operation. A full load regulating switch shall control each valve to prevent overloading of conveyor system.

[2.11.8.2 Manual Valve Intakes for Bottom Ash

**************************************************************************

NOTE: Choose this subparagraph or the subparagraph

ROTARY VALVE INTAKE FOR BOTTOM ASH.

**************************************************************************

Provide in front of stoker ash pit doors, a 610 by 610 mm 24 by 24 inch cast iron grid and hopper complete with a self-feeding bottom ash intake, seal plug and pull-out rod that may be lifted to permit ash to enter system.

]2.11.8.3 Rotary Valve Intakes for Bottom Ash

Provide a rotary valve, designed for regulating bottom ash to the a conveyor pipeline, under each crusher. Valve shall provide intake isolation and prevent overfilling or plugging of the conveyor line. Construction of valve shall be of cast iron with wearing surfaces of Brinell hardness not less than 350. Valve shall be pneumatically operated.

]2.11.8.4 Air Intake

Provide spring loaded, swing disc, check valve type air intake, designed for air induction, at the end of each conveyor branch. When intake is located exposed to weather, provide a rain hood.
2.11.8.5 Isolating Valves (Line Valves)

Provide an air operated, totally enclosed rotary slide gate isolating valve at each branch pipe line connection to prevent air flow through an unused branch line. Construct valve of abrasion resistant metal, machined and fitted to ensure a vacuum tight fit and guard against leakage and excessive maintenance. Provide purge air connection and a solenoid valve in the valve housing or cavity for purging the gate cavity of ash.

2.11.8.6 Silo Discharge Valve

Provide a rotary feeder for discharging bottom ash and fly ash from the ash silo. Feeders shall be of ductile iron or cast steel and shall be complete with motor, motor support, chain drive, and necessary guards. Chain shall be driven through a torque limiting clutch on the driven sprocket equipped with electric cutout switch and alarm. Feeder shall have spring-loaded hinged bypass plate to permit passage of clinkers. Inlet and outlet flanges shall be standard drilled pipe flange. Rotor blades and sealing arrangement shall be the manufacturer's standard for the intended service. When rotors are equipped with adjustable tips, provide a service door in the valve body for tip adjustment. Provide packing gland type shaft seals with suitable packing materials. Shaft bearings shall be outboard sealed ball bearings. Periphery seals shall be such that a complete seal is accomplished at a differential of \[\text{\[\text{Pa}\] inches of water static pressure.}\]

2.11.9 Ash Conveyor Pipe and Fittings

Abrasion resistant cast iron alloy free of blowholes and other defects and suitable for use in ash conveying systems.

2.11.9.1 Conveyor Piping

Centrifugally cast, abrasion resistant cast iron alloy pipe with a Brinell hardness of not less than 280.

2.11.9.2 Elbows and Fittings

Cast iron alloy with a Brinell hardness of not less than 350 and shall have renewable wearbacks not less than 25 mm one inch thick.

2.11.9.3 Hangers and Supports

Provide adjustable roller supports and pipe hangers to properly support the pipe. System supplier shall design support system and furnish supports.

2.11.9.4 Contractor's Option

At the Contractor's option, conveyor pipe handling only fly ash may be Schedule 80 black steel pipe in lieu of the iron alloy pipe; however outlet fitting, elbows, tees and laterals shall be iron alloy with wearbacks. Pipe for a distance of one meter 3 feet after the cast iron alloy fittings shall be cast iron alloy pipe. Provide pipe with couplings or split flanges, bolts and gaskets all rated not less than 538 degrees C 1000 degrees F.

2.11.9.5 Expansion Joints

Stainless steel bellows type with abrasion resistant liners of a Brinell
hardness not less than 350 or slip tube expansion joints fabricated of cast 
iron alloy, of Brinell hardness not less than 280, machined for smooth 
sliding fit with its mating part to absorb system thermal movement and 
shock loads.

2.11.10 Vacuum Air Piping

Provide from the secondary separator to the tertiary bag filter and from 
the tertiary bag filter to the [steam exhauster] [mechanical exhauster] not 
less than 10 gage, ASTM A211, spiral welded, vacuum air piping with 
ASTM A1011/A1011M, standard radius, mitered 10 gage elbows.

2.11.11 Compressed Air Piping and Accessories

Provide pressure reducing valves, safety valves, pressure gages, manual 
plug or ball valves, compressed air piping, as specified under the 
paragraph PIPING and other items required for a complete, operable, 
pneumatic system.

2.11.12 Primary Ash Receiver-Separator and Secondary Ash Separator

Provide on top of ash silo two stages of receiving and separating, with 
each stage a complete self-contained unit with efficient dust and air 
separation and gravity dump bottom gates to open with interruption of 
vacuum and discharge into a silo. Design system so that suction is 
positively shut off from receiver during its dumping period, so that no 
dust can be sucked out through exhaust while discharge of the receiver is 
open or opening. Air from the primary receiver shall enter the external 
secondary separator which shall remove approximately 85 percent of the dust 
not collected by the primary receiver. Combined efficiency of primary and 
external secondary separators shall be not less than 95 percent. Provide 
completely contained gate assemblies in a dust-tight enclosure fitted with 
access doors large enough to remove the entire gate assembly. Provide 
receivers of hard abrasion-resistant cast alloy iron with a Brinell 
hardness of not less than 500 constructed as specified below:

2.11.12.1 Primary Receiver-Separator

Not less than [914] [1219] mm [36] [48] inches inside diameter with cast 
sections 19 mm 3/4 inch thick and 50 mm 2 inch thick impingement section. 
Cylinder, along with discharge hopper shall be of segmental bolted 
construction. Construct receiver to ensure dropping of maximum quantity of 
solids from transporting air. Provide carbon steel outlet pipe and 
discharge gate. Receiver-separator shall have an internal baffle assembly 
to prevent reentrainment of ash.

2.11.12.2 Secondary Separator

Not less than [406] [508] [610] mm [16] [20] [24] inches inside diameter of 
not less than 8 mm 5/16 inch thick one piece construction with at least 13 
mm 1/2 inch thick inlet wear section. Design receiver to minimize 
carryover of fly ash into the [air washer] [tertiary bag filter]. 
Separator shall have an internal baffle assembly to prevent reentrainment 
of ash once it has fallen into the collection hopper of the separator.

2.11.12.3 Dusttight Enclosure

Support primary and secondary receivers on not less than 6 mm 1/4 inch 
thick, dust tight, carbon steel support boxes with hinged access doors or
removable panels on each side for servicing the receiver swing gates. Provide support box with airtight roller bearings, hinged, counterweighted swing gates with removable neoprene seals. Gates may as an option, be air cylinder operated gates in lieu of the counterweighted gates.

2.11.13 Mechanical Exhausters

**************************************************************************
NOTE: When environmental restraints, availability of steam or water or economics preclude the use of steam exhausters, use a mechanical (electrical driven) exhauster with a pulse jet bag filter to produce the required system air flow.
**************************************************************************

Provide two, V-belt drive, positive displacement, blowers with electric motors and accessories with each capable of producing a vacuum of at least 41 kPa 12 inches of mercury and with air flow necessary for handling ashes through the system. One blower (exhauster) shall be used as a prime mover and the other as a standby unit.

2.11.13.1 Isolation Gates

Each exhauster shall include a manual bolt-up type gate for isolation and crossover. Gates shall include limit switches for status indication.

2.11.13.2 Accessories

Exhauster shall be complete with belt guard, air inlet silencer, air discharge snubber, support stand, expansion joint on inlet and outlet, belt and shaft guards, high temperature safety switch and vacuum relief valve.

2.11.13.3 Electric Motor

Totally enclosed, fan cooled, [_____] volts, three phase, 60 Hz as specified in the paragraph MOTORS AND DRIVES.

2.11.13.4 Noise Level

Not to exceed 85 dBA sound pressure level at 1.50 meters 5 feet above the floor and 1.50 meters 5 feet from blower in any direction.

2.11.14 Pulse Jet Self-Cleaning Bag Filter Assembly

Provide as a tertiary means of removing fine ash particles from the conveying air system. Installation of the assembly shall be on the silo roof, downstream of the two-stage cyclone type mechanical separator so as to permit a combined minimum separating efficiency of 99.5 percent (by weight), with a guaranteed outlet emission less than 0.005 grains particulate per dry standard cubic foot of exhaust air. Filter assembly shall include a main housing, bag assemblies, bag cleaning mechanism, discharge gate and control panel. Equipment shall be integrated with cyclone type separators, vacuum breakers, vacuum switches and conveying system controls as specified elsewhere. Bag filter shall be capable of operating at 25 percent above the system design vacuum. Filter housing shall be capable of withstanding a vacuum of 96 kPa 28.5 inches of mercury.
2.11.14.1 Cloth Area

Size filter on the basis of not greater than 25.40 L/s 5 acfm of air per square meter foot of cloth area. The acfm shall be calculated on the maximum system air flow.

2.11.14.2 Filter Construction

All welded construction housing or body of, ASTM A36/A36M plate with an upper clean gas plenum, bag compartment, hopper bottom, internal access platform and support structure. Plate thickness shall be a minimum of 6 mm 1/4 inch with exception of plenum tube sheet, which shall be a minimum of 13 mm 1/2 inch thick. Housing shall be cylindrical, having a minimum diameter of [_____] meters feet [_____] mm inches.

a. Upper Gas Plenum: Dished head, with flanged inlet and discharge connections, tube sheet, venturis and blow tubes. These appurtenances shall be welded airtight. Venturis shall be fabricated from carbon steel having a minimum thickness of 16 gage. Minimum centerline spacing between venturis shall be 191 mm 7 1/2 inches. A series of blow tubes shall be employed over the venturis. Each tube shall extend through dished housing wall and be manifolded externally. Include support of external manifold.

b. Bag Compartment: Of sufficient height to allow internal access by maintenance personnel. Base of compartment shall include metal platform supported by steel angle cross bracing. Platform shall extend over entire base area of compartment. Sidewall of compartment shall include a hinged access door with locking handle. Door shall be gasketed and opening shall be a minimum of 762 mm high by 406 mm wide 30 inches high by 16 inches wide.

c. Hopper Bottom: Conical having a slope angle of not greater than 45 degrees with a flanged outlet.

d. Access Platform: With [stairs] [ladder] and safety handrail for external mounting to filter housing. Mount platform at a height to allow convenient access through hinged door located on bag compartment sidewall. Platform floor area shall be not less than 1.40 square meter 15 square feet.

e. Provide filter housing with required columns and cross bracing to support structure from silo roof to discharge directly into silo. This support shall be of sufficient height to allow convenient installation of filter discharge gate.

2.11.14.3 Discharge Gate

Air cylinder operated swing disc type. A rotary feeder type gate is not acceptable. When in the open position, gate disc shall swing out of the path of material being discharged. Both gate disc and seal shall be replaceable. Include handhole on gate housing for easy access to both disc and seat.

2.11.14.4 Bag Cleaning Mechanism

Provide venturis, blow tubes, manifold, solenoid air valves, diaphragm valves and differential pressure switch conveniently located at the filter unit. Operation of these devices shall be on a sequential basis.
UFGS

(adjustable setting) to allow periodic surges of compressed air through the filter venturi sections. Compressed air requirement for bag cleaning shall not be greater than 7.08 standard L/s at 690 kPa (gage) 15 scfm at 100 psig.

2.11.14.5 Filter Bag Assemblies

Each shall include the filtering media, wire retainer and stainless steel clamping device. Filter bag shall slide over retainer and both shall be clamped to the venturi by a stainless steel common band clamp. Top portion of retainer shall have the inside dimension equal to the mating venturi to ensure a tight fit.

a. Retainers: Cage type construction, fabricated from No. 1018 rounds or equal, using minimum of 3 mm 1/8 inch diameter rounds on vertical strands and 5 mm 3/16 inch diameter rounds on horizontal strands. Coat retainer with nickel and zinc after completion of fabrication.

b. Filter Bags: Not less than 474 g per square meter 14 ounces per square yard felted material. Provide felted polyester or dacron bags when operating temperatures are below 135 degrees C 275 degrees F. Provide Nomex bags or bags of similar abrasion and temperature resistant qualities when temperatures are above 135 degrees C 275 degrees F but not greater than 218 degrees C 425 degrees F. Bags shall have an exterior finish to aid in dust release.

2.11.14.6 Control Panel

NEMA 4, wall mounted control panel to sequentially control bag cleaning and dump operations of the filter unit. Locate panel near filter unit to permit easy field adjustment of sequence timers. Panel overall dimensions shall be not less than 610 mm wide by 762 mm high by 200 mm deep 24 inches wide by 30 inches high by 8 inches deep. As a minimum, panel instrumentation shall include a dump cycle timer, pulse valve sequence timer, two high differential pressure delay relays, alarm relay, time delay relay, manual/auto selector switch, pulse valve "ON" indicating light, high differential indicating light, terminal blocks and internal wiring. Welds and scratches of panel enclosure shall be polished smooth and thoroughly cleaned before painting. Surface finish shall be free from blemishes. Paint panel exterior with manufacturer's standard enamel. Interior of panel shall be white enamel. Shop inspect panel and test prior to shipment.

2.11.14.7 Vacuum Breakers

Provide two air cylinder operated vacuum breakers. One shall be a pop-up or single ported type for installation in the air line between the secondary separator and tertiary bag filter. Second breaker shall be a three-ported type for locations in the air line between the tertiary bag filter and the exhauster. Each breaker shall use a disc type gate or equivalent to ensure full closure of the gate against its mating seat.

2.11.15 Steam Exhauster

**************************************************************************
NOTE: The steam exhauster system requires 0.32 kg os stream per second 2500 pounds of steam per hour
for a 150 mm 6 inch system ( 8 to 23 Mg 9 to 25 tons per hour) and 0.44 kg of steam per second 3500
pounds of steam per hour for an 200 mm 8 inch system
( 13.60 to 31.75 Mg 15 to 35 tons per hour) and
approximately 1.89 L/s 30 gpm of water to the air washer. A steam condenser, air washer and silencer should be used when the steam exhauster is used and should not be used when a mechanical exhauster is specified.

**************************************************************************

Provide a steam jet exhauster of cast iron construction with venturi throat of the high efficiency type for producing the vacuum necessary for handling ashes through the system. Make inlet air connection on the steam jet exhauster through a special spiral fitting so that air enters the exhauster unit tangentially, avoiding direct impingement on the nozzle. Provide a unit capable of producing a vacuum of at least 40.56 kPa 12 inches of mercury column at shutoff and not requiring more than [0.32] [0.44] kg of steam per second at 690 kPa (gage) [2,500] [3,500] pounds of steam per hour at 100 psig.

2.11.15.1 Steam Condenser, Air Washer and Silencer

**************************************************************************

NOTE: The steam exhauster system requires 0.32 kg of steam per second 2500 pounds of steam per hour for a 150 mm 6 inch system (8 to 23 Mg 9 to 25 tons per hour) and 0.44 kg of steam per second 3500 pounds of steam per hour for a 200 mm 8 inch system (13.60 to 31.75 Mg 15 to 35 tons per hour) and approximately 1.89 L/s 30 gpm of water to the air washer. A steam condenser, air washer and silencer should be used when the steam exhauster is used and should not be used when a mechanical exhauster is specified.

**************************************************************************

Provide a double stage cyclone type steam condenser, which also extracts the remaining solids from the steam-air system. Construct steam condenser body of hard metal castings not less than 16 mm 5/8 inch thick suitable for this special service except that inlet connector shall be not less than 19 mm 3/4 inch thick. Castings shall have a Brinell hardness of not less than 250. Remaining metal used in the condenser shall be at least 6 mm 1/4 inch thick steel with the top not less than 13 mm 1/2 inch thick steel plate. Provide drain connection not less than 76 mm 3 inches and water connection not less than 38 mm 1 1/2 inches. Provide silencer as required for quiet operation.

2.11.16 Ash Storage Silo

**************************************************************************

NOTE: Use enclosure for silo roof and unloader level in climates where protection of equipment and personnel from the weather is desired.

**************************************************************************

[_____] meters feet in diameter with [_____] meters feet high walls with a live bottom and flyash storage capacity of not less than [_____] Mg tons, based on ash bulk density of 640 kg per cubic meter 40 pounds per cubic foot for volumetric sizing. Structural joints shall be dusttight and watertight. Provide columns, beams, bracing, and other structural members as required for complete erection of silo and accessories. Live storage capacity shall allow for 20 degree angle of repose from silo outlet.
Height of silo storage shall not be more than twice the diameter. Provide a minimum of one meter 3 feet of freeboard above the ash level. Design of support steel shall be approved by the ash system supplier. Design silo in accordance with the ICC UBC. Design shall take into account seismic load, wind load, snow load, equipment loads and an ash bulk density of 1120 kg per cubic meter 70 pounds per cubic foot. Ash silo support shall be free standing and shall be of sufficient height to allow gravity discharge of ash through the rotary ash conditioner to a [truck] [railroad car]. Provide access stair tower with intermediate platforms at 3.66 meters 12 feet intervals for access to ash conditioner level, silo floor level and silo roof level. Platforms from adjacent structures with stair access may be provided in lieu of the stair tower, but ladders with safety cages and access platforms must then be also provided. Provide ladder with stainless steel fall prevention device on inside of silo from manhole in top of silo to bottom of silo. Provide silo roof enclosure and unloader room enclosure each with single one by two meters 3 by 7 feet access door, [_____] by [_____] meters feet double door, two windows, ventilator, [heater,] insulated metal panel siding to match boiler plant walls and electrical lighting and convenience receptacles. Unloader room enclosure shall have reinforced concrete floor.

2.11.16.1 Construction

Construct silo of steel with refractory lining or of concrete staves with steel hoops and concrete roof. Roof accessories shall include manhole, relief valve and vent filter. Bottom of silo shall be [conical, sloped a minimum of 45 degrees] [flat with a steel plate feeding hopper in bottom of silo to funnel the ash into the inlet of the rotary vane feeder]. Provide hopper with expansion joints and sufficient poke holes with cover or cap.

2.11.16.2 Concrete Stave Silo

Construct of either lightweight solid or hollow precast concrete staves with post-tensioned steel reinforcing hoops around the exterior. Mechanically measure and mix materials in concrete staves. Vibrate and shape staves under pressure and steam or air cure.

a. Wall Coating: Coat interior surface with a three-step process of a brush coat, scratch coat, and finish trowel coat of a mixture of fine sand and portland cement in accordance with silo manufacturer's recommendations. Apply each coat successively to produce a smooth interior surface. Work mixture into the formed horizontal and vertical grooves to permanently interlock the concrete staves. Brush coat the exterior surface with a double application of waterproof mixture. Mixture shall include a chemical agent for waterproofing and portland cement, sand, and water. Work coating into joints and over the steel reinforcing hoops to form a weatherproof protective coating.

b. Steel Reinforcing Hoops: Galvanized steel rods not less than 14 mm 9/16 inch in diameter with not less than 16 mm 5/8 inch rolled threads. Join hoop ends together with nuts and heavy malleable galvanized iron lugs or heavy duty galvanized steel lugs to a close tolerance for a tight fit. Electrogalvanize rods, nuts, and lugs to ensure adequate protection against corrosion. Rods shall be high quality, metallurgically sound steel with tensile strength not less than 448 MPa 65,000 pounds per square inch, yield point not less than 276 MPa 40,000 pounds per square inch, and a minimum elongation of 14 percent in 229 mm 9 inches. Reinforcing shall be sufficient to resist maximum lateral pressure and loads imposed by ash pressure within the
silo. Structurally connect together hoop rods that pass through silo outlets on inspection frames.

c. Hollow Concrete Stave Silos: Construct silo of precast concrete staves with lateral air spaces. Cast staves from a well proportioned mix of portland cement and an expanded clay light weight aggregate. Minimum compressive strength of concrete at 28 days shall be 34.50 MPa 5,000 psi. Hollow staves shall be 92 mm thick by 250 mm wide by 762 mm long 3 5/8 inches thick by 10 inches wide by 30 inches long with five lateral air cores per stave, except that shorter starter staves may be used to permit horizontal joints to be staggered.

d. Solid Concrete Stave Silos: Construct silo of solid lightweight precast concrete staves. Solid staves shall be not less than 92 mm thick and 250 mm wide by 762 mm long 3 5/8 inches thick and 10 inches wide by 30 inches long, except starter staves may be shorter. Solid staves shall be constructed from a well proportioned mix of portland cement, washed sand and gravel which is free from injurious organic impurities and contains less than 5 percent of deleterious substances. Grade aggregate from coarse to fine. Compressive strength of solid concrete staves at 28 days shall be 34.50 MPa 5,000 psi.

2.11.17 Bag Filter Vent

**************************************************************************
NOTE: Consult the manufacturer of ash handling equipment for venting requirements.
**************************************************************************

Provide pulse jet bag filter vent for silo constructed of 10 gage steel plate, fitted with rain hood. Bag material shall be sateen cotton capable of withstanding not less than 91 degrees C 195 degrees F, weighing 0.33 kg per square meter 9.75 ounces per square yard, having thread count of 4 by 2 per square mm 96 by 60 per square inch and permeability of 76 to 102 L/s per square meter at 249 Pa 15 to 20 cfm per square foot at one inch water column. Vent shall have not less than [_____] square meter feet effective cloth filtering area, with each bag having a maximum effective cloth filtering area of 0.56 square meter 6 square feet.

2.11.18 Rotary Ash Conditioner (Unloader)

Provide a complete dustless horizontal, floor mounted unloading device to discharge ashes from silo to a [truck] [railroad car]. Unloader (ash conditioner) shall include a 762 mm 30 inch diameter revolving drum which rotates about fixed spray nozzles, and shall be complete with conditioner and discharge compartments, scrapers, and other accessories as required. Unloader drum shall be constructed of steel plate not less than 10 mm 3/8 inch thick and shall be roller chain driven by a totally enclosed, fan cooled, [_____] volt, three phase, 60 Hz electric motor not less than 3.75 kW 5 hp as specified in the paragraph MOTORS AND DRIVES. Unloader shall discharge conditioned ashes to a truck through a 6 mm 1/4 inch thick steel plate chute. Unloader shall be designed to eliminate most dust in unloading ash from the ash silo. Unloaders that utilize screws as a means of mixing are not acceptable. Dustless unloader shall add water to ash, but not to the extent that there is free or surplus water running or dripping from the ash after discharge. Discharge ash shall be in a semi-fluid, loose, free flowing condition.
2.11.19 Fluidizing System

**************************************************************************
NOTE: Delete fluidizing system if not necessary.
**************************************************************************

Provide a fluidizing system on the silo floor to ensure a constant and uniform feed of ash through silo discharge outlet. System shall consist of a series of diffuser modules, a conical diffuser hood, designed to support the total weight of ash when the silo is full, and compressed air piping. Each diffuser module shall be mounted on the silo floor using sloped concrete pads. System shall operate from plant air system. Provide pressure reducing valves, safety valves, and controls for a complete system.

2.11.20 Control Panel and Controls

Provide a semi-automatic control system for the ash handling system[ as indicated].

2.11.20.1 General

Provide a centrally controlled operation, with auxiliary local operation, and a monitoring control system with graphic display for the ash conveying system. Provide local control stop-start pushbuttons and indication stations for [clinker crusher and ash hopper vertical lift door at each bottom ash hopper] [mechanical exhausters] and rotary ash conditioner. Ash handling system manufacturer shall provide measuring devices, status switches, solenoid valves, and auxiliary parts necessary to safely control and operate the system. Provide related electrical work required to operate the ash handling system.[ Provide detailed control logic diagrams from ash handling system manufacturer to the manufacturer of the digital process control and data acquisition system.]

2.11.20.2 Control Panel

Provide a [separate control panel] [subpanel mounted in the main plant control panel] of NEMA 12 construction, centrally located in the main plant control room. Panel front shall include a system graphic display as indicated. Display shall be approximately to scale and painted with an industrial acrylic enamel. Outline items with 3 mm 1/8 inch wide black lines. Lettering shall be on engraved plastic screwed to front of panel, with white letters on a black background. Provide controls for operation on [_____] volt, [_____] phase, 60 Hz ac. Panel shall be complete with an annunciator and interlocks, relays, switches, running and safety lights, and auxiliary parts necessary to safely control and operate the system. Items located in the door shall be dusttight and oil tight with push-to-test transformer type indicating lights. Control relays shall be 10 amp, 600 volt class with convertible contacts. Provide and mark terminals for connections with the exception of the neutral. Panel shall contain [_____] percent spare terminals. Wiring shall be No. 14 AWG type THHN stranded. Neutral wire shall be white and remaining wiring of 120 volts or less shall be color coded and labeled. Provide a plastic wire duct of sufficient size to provide [_____] percent cross sectional spare. Wiring shall be in accordance with requirements of NFPA 70.

a. Provide capability to perform the following functions from the ash handling system control panel[ operator interface console].

(1) System Start
(2) System Stop

(3) Auto/Manual/Index Mode of Operation Selection

(4) Selection of Bypass of any Boiler [Bottom Ash,] [Siftings,] [Economizer] Hoppers

(5) Manual Index to any Intake

(6) Selection of Ash Silo for Baghouse Ash

b. Provide sensors or contact closures for status indication on the ash handling system control panel annunciator[ operator interface console].

   (1) Conveyor On

   (2) Unit on (one required for each unit)

   (3) Final Line Purge On/Complete

   (4) Baghouse Ash to Ash Silo

(c. Provide sensors such that the following items can be alarmed on the ash handling system control panel annunciator[ operator interface console].

   [ ] (1) Blower Failure

   [ ] (2) Blower High Temperature

   ] (3) Bag Filter Failure

   (4) Bag Filter High Differential

   (5) Bag Filter Off

   (6) Plugged Hopper

   (7) Conveying Complete

   [ ] (8) Clinker Crusher Abnormal Shutdown

   (1 required for each boiler)

   ] (9) Low Conveying Air

   (10) High Conveying Vacuum

d. Vacuum Transmitter: To measure conveying system vacuum. Range shall be zero to 101 kPa 30 inches mercury with 4 to 20 mA dc linear transmitter output. Display vacuum on the ash handling system control panel[ operator interface console].

2.11.20.3 Operation

a. Normally operated in the automatic mode. Automatically sequence through the automatic intakes except [clinker crusher] [bottom ash intake] for each boiler after system is started. When a unit is not in operation, selecting the "bypass mode" shall cause intakes on that unit to be skipped. For manual operation, "index" is used to select the
desired intake. As conveying system shuts down automatically, main conveyor line shall be purged for approximately one minute to remove ash remaining in it.

b. Sequence system under control of vacuum switches and timers. Maximum vacuum will be when system is conveying material. When a hopper is empty, vacuum will drop and a "no load" vacuum switch shall cause system to shift to the next intake. Prevent premature sequencing due to momentary low vacuum with a timer. When a plugged hopper occurs, vacuum will be between "no load" and normal value. Provide a timer to allow packed or arched material to break loose before alarming the condition.

c. Provide solenoid air valves for each air operated device, timers, contactors, relays and devices and equipment required for system control, measuring and operation. Identify each device with an engraved plastic identification plate[ in accordance with a system graphic display] to be provided by the ash handling system supplier.

d. Bottom Ash Hopper Local Control Stations: Provide a wall mounted, NEMA [_____] control station at each bottom ash hopper with front access door, lock, circuit breakers, selector switches, lights and pushbuttons.

(1) Selector Switches:

(a) Crusher: three position switch, "Reverse (momentary)-Off-Forward"

(b) Rotary Valve Intake: two position switch "Open-Close"

(c) Vertical Lift Door: position switch "Open-Intermediate-Close"

(2) Emergency "Stop" Pushbutton, for clinker crusher, with manual reset.

(3) Indicating Lights:

(a) "On-Manual"

(b) "Crusher Stalled"

[2.12 ASH HANDLING SYSTEM (MECHANICAL)]

**************************************************************************
NOTE: Designer shall select type of ash handling system most suited for each project. For plants over 4 kg per second 31,500 pounds per hour steam ultimate capacity use a pneumatic ash handling system. For plants under 4 kg per second 31,500 pounds per hour steam ultimate capacity use a mechanical system. Refer to NAVFAC Design Manual DM-3.6, Section 5, paragraph 4d for design criteria.
**************************************************************************
NOTE: The designer shall perform an economic analysis and make a technical evaluation to determine the degree of sophistication of the mechanical ash handling system. Preference should be given to keeping the system as simple as possible. An example of this would be an arrangement where the plant would not require an ash silo and ash is simply removed by the operators raking the ash pits and shoveling the ash into wheeled dumpsters for removal. Mechanical collector hoppers would have ash removed by means of rotary airlock valves dumping through chutes into additional wheeled covered dumpsters. For greater ash removal rates screw conveyors could be used for removing ash from the stoker ash pits. These could convey ash to wheeled ash dumpsters or into a drag conveyor, bucket elevator, ash silo system.

Provide a complete integrated, mechanical, semi-automatic, ash handling system with chain drag conveyor, screw conveyors, bucket elevator, material intakes, rotary valves, [ash doors and enclosures,] silo vent filter, ash silo, rotary ash conditioner, and other equipment that may be necessary for a complete mechanical ash handling system. Provide related electrical work required to operate the ash handling system.

2.12.1 Ash Silo

The system shall receive, and convey to the ash silo, ash from the stoker fired boiler ash storage pits, [economizer hoppers,] [baghouse hoppers,] and other pollution control equipment hoppers.

2.12.2 Ash

Discharge ash into the ash storage silo in a dry condition. Arrange silo equipment for disposal of conditioned ash to trucks. Operation shall be as dustless as possible.

2.12.3 Maximum Noise Level

Noise level of operation shall not exceed 85 decibels sound pressure level 1.50 meters 5 feet from the equipment in any direction.

2.12.4 System Valving

2.12.4.1 Rotary Valves

Provide rotary valve feeders of carbon steel construction complete with drive, guard, motor mount and gaskets, carbon steel adjustable blade tips, adjustable shoe type air seal and right angle gearhead drive motor. Rotor blade tips and shoes shall have a minimum Brinell hardness of 500. Valves requiring part of the housing to form an airlock seal are not acceptable. The electric motor for the rotary valve feeders shall be totally enclosed, fan cooled, [_____] volt, [_____] phase, 60 Hz., and not less than [_____] kW hp, as specified in the paragraph MOTORS AND DRIVES.
2.12.4.2 Manual Valve Intakes for Bottom Ash

Provide in front of stoker ash pit doors, a 610 by 610 mm 24 by 24 inch cast iron grid and hopper with opening approximately sized for the conveyor. Provide intake with dusttight, removable 6 mm 1/4 inch thick checkered steel plate cover.

2.12.4.3 Silo Discharge Valve

Provide a rotary feeder for discharging bottom ash and fly ash from the ash silo. Feeders shall be of ductile iron or cast steel and shall be complete with motor, motor support, chain drive, and necessary guards. Chain shall be driven through a torque limiting clutch on the driven sprocket equipped with electric cutout switch and alarm. Feeder shall have spring-loaded hinged bypass plate to permit passage of clinkers. Inlet and outlet flanges shall be standard drilled pipe flange. Rotor blades and sealing arrangement shall be manufacturer's standard for the intended service. When rotors are equipped with adjustable tips, provide a service door in body of valve for tip adjustment. Provide packing gland type shaft seals with suitable packing materials. Shaft bearings shall be outboard sealed ball bearings. Periphery seals shall be such that a complete seal is accomplished at a differential of [_____] Pa inches of water static/pressure.

2.12.5 Conveyors

2.12.5.1 Chain Drag Conveyor

Provide with endless chain for dragging coal ashes from front of boilers along a recessed trough to the inlet chute of a bucket elevator. Conveyor shall have [_____] meter feet sprocket centers, operate at speed not greater than 35 mm/sec 7 fpm, and have a capacity of not less than [_____] Mg tons per hour of 640 kg per cubic meter 40 pounds per cubic foot ash. Provide conveyor complete with continuous chain, drive, and take up terminals, gears, shafts, bearings, return rolls, hard white iron trough, ash intake gratings, floor plates, discharge chute, electric motor, reduction gear, and supports. Chain drag conveyor shall be designed for future length of [_____] meters feet.

a. Head and Foot Shafts: Provide SAE-1045, steel head and foot shafts not less than [_____] and [_____] mm [_____] and [_____] inches in diameter, respectively, mounted in anti-friction roller bearings in pillow blocks. Foot shaft shall have screw-type takeups with not less than [_____] mm inches adjustment.

b. Terminal Sprockets: Gray iron chilled rim not less than [_____] mm inches in diameter with solid web and not less than eight teeth each.

c. Chain: Combination drag type of riveted construction. Design chain symmetrically so that it can be turned over after one side is worn. Chain shall be [_____] mm inches wide with a pitch not greater than 200 mm 8 inches and an ultimate strength of not less than [187] [249] kN [42,000] [56,000] pounds. Construct chain of promal, a pearlitic malleable iron, center links not less than [_____] mm inches high, and heavy [_____] mm inch thick heat treated carbon steel side bars. Steel pins shall be cold rolled steel not less than [_____] mm inch in diameter, press-fitted into sidebars, and machined flat on one side to prevent rotation. Center section shall be rugged block type forming a rigid rectangle for maximum resistance to distortion with broad wearing
shoes contoured to prevent snagging and damage to chain or trough. Barrels of center section shall be chambered to provide lubricant reservoir and still provide maximum bearing area for pins. Shape barrel with pushing surface on one side and for contact with sprocket on the other side.

d. Trough: Concrete lined with not less than [_____] mm inch thick hard white iron approximately as indicated. Trough shall be [_____] mm inches wide with hinged 6 mm 1/4 inch thick checkered steel plate covers. Covers shall be installed to be dusttight. Coordinate concrete work with conveyor manufacturer’s requirements.

e. Return Rollers: Chilled rim, single flange, enclosed-oiling type on [_____] mm inch diameter carbon steel shafts spaced at not more than 3 meters 10 feet apart.

f. Discharge Chute: Construct of not less than 10 mm 3/8 inch steel plate and slope at not less than 60 degrees.

g. Electric Motor and Drive: Totally enclosed, fan cooled, high torque, [_____] volt, [_____] phase, 60 Hz not less than [_____] kW hp as specified in the paragraph MOTORS AND DRIVES, in this section, direct connected by means of flexible coupling to a reduction gear unit having alloy steel helical or herringbone gears and antifriction bearings enclosed in oiltight housing. Provide an adjustable base for motor and reduction gear. Drive, from output shaft of reduction gear to conveyor head shaft, shall be by means of finished steel roller chain running over cut tooth sprockets complete with steel plate chain guard. Roller chain, sprockets and roller chain attachments shall conform to ASME B29.100.

2.12.5.2 Screw Conveyors

Provide each screw conveyor dusttight and furnished complete, with trough, screw, inlet and discharge spouts, discharge gates, bearings, bearing hangers, dust cover, electric motor, reduction gear,[ service platform,] and supports. Each screw conveyor shall meet the following minimum design and performance specifications when handling dry flyash of density not greater than [_____] kg per cubic meter pounds per cubic foot:

a. Inlet and Discharge Spouts: Arrange as indicated. Spouts shall be flanged and square with opening dimensions equal to inside diameter of trough.

b. Screw Trough: Provide dusttight screw trough with trough covers. Support trough by 6 mm 1/4 inch thick steel plate feet at not less than 3 meter 10 foot intervals. Individual trough sections shall not be greater than 3 meters 10 feet long with steel angle end flanged connections.

c. Bearings and Hangers: Provide thrust bearings and trough end dust seals for both drive and tail bearings. Thrust bearings shall be bronze in antifriction pillow blocks. Screw hanger bearings shall be babitted-type, with cast iron hangers having removable bearing caps held in place by a U-bolt. Design hangers to fit inside the conveyor trough and equip bearings for grease lubrication with grease fittings penetrating dust cover to allow bearings to be greased without removing dust cover. Hangers shall not be located at trough joints, feed, or discharge openings. Locate hangers at not less than [3.66 meter 12 foot intervals for screw diameters larger than 250 mm 10 inches][ and ][3 meter 10 foot intervals for screw diameters 250 mm 10 inchesin diameter and smaller].

d. Conveyor Screws and Couplings: Construct conveyor screws of helicoid-type flights and connect with cold rolled steel couplings. Assemble conveyor screws so that at the hangers there is 180 degrees
rotation between flight ends of each adjacent screw section. Screw flight shall end over last discharge spout so bare pipe extends across this area to prevent material carry-over.

e. Electric Motor: Totally enclosed, fan cooled, high torque, [_____] volt, three phase, 60 Hz, not less than [_____] kW hp as specified in the paragraph MOTORS AND DRIVES. Install motor at discharge end of conveyor. Motor shall be supported by a unit bracket attached to the screw conveyor trough end plate and connected to reduction gear through a V-belt drive. Reduction gear shall be shaft mounted, double reduction type mounted directly on the conveyor shaft. Provide tie rods, when required, to prevent reduction gear rotation and for adjusting belt tension.

f. Service Platforms: Conform to OSHA regulations as indicated to properly maintain and service conveyor drive unit.

2.12.6 Bucket Elevator

Provide a dusttight bucket elevator centrifugal discharge type, having approximately [_____] meters feet [_____] mm inch sprocket centers, vertical chain and bucket, operating at a speed not to exceed [_____] m/s fpm, and having a capacity of not less than [_____] Mg tons per hour of 640 kg per cubic meter 40 pounds per cubic foot ash. Provide bucket elevator complete with continuous chain and attached buckets, sprockets, gears, shafts, bearings, casing, top hood, discharge spout, bottom boot, access doors, electric motor, reduction gear, service platform, and accessories.

2.12.6.1 Head and Foot Shafts

Not less than [_____] and [_____] mm [_____] and [_____] inches in diameter, respectively. Construct shafts of cold rolled steel and mount in antifriction roller bearings with forced lubricating type fittings. Mount foot shaft in fixed pillow blocks. Head shaft shall have screw-type takeups with not less than [_____] mm inches adjustment.

2.12.6.2 Terminal Sprockets

Cast iron with chilled rims. Head sprocket shall be not less than [_____] mm inches in diameter and foot sprocket not less than [_____] mm inches in diameter.

2.12.6.3 Buckets and Chain

Construct buckets of malleable iron not less than 200 mm long, 127 mm wide, and 140 mm deep 8 inches long, 5 inches wide, and 5 1/2 inches deep. Buckets shall be mounted by not less than four bolt attachments to a single strand of steel bushed chain having an ultimate strength of not less than 178 kN 40,000 pounds and pitch of 100 mm 4 inches. Bucket spacing shall not be greater than 406 mm 16 inches.

2.12.6.4 Backstop

Differential band brake type to prevent reversal of chain and buckets in case of power failure.

2.12.6.5 Elevator Casing

Not less than 298 by 991 mm 11 3/4 by 39 inch internal dimension and
constructed of not less than 5 mm 3/16 inch commercial hot rolled mild steel plate with 50 by 50 by 6 mm 2 by 2 by 1/4 inch corner angles for full height of elevator casing. Fabricate casing in standard sections from 3 to 3.66 meters 10 to 12 feet high with 50 by 50 by 6 mm 2 by 2 by 1/4 inch angle flanges at the end of each section. Provide a hinged inspection door not less than 610 by 762 mm 24 by 30 inches in the section immediately above the boot section and where indicated. Casing and inspection doors shall be of dusttight construction with flange angles continuously welded and gasketed. No makeshift repairs or field patching to overcome leakage shall be permitted. Coat casing interior with not less than 1.60 mm 1/16 inch thick coal tar primer and enamel conforming to SSPC PS 11.01.

2.12.6.6 Head Section

Construct of not less than 5 mm 3/16 inch commercial hot rolled mild steel plate in heavy angle frame with split, hinged, and removable top cover hood built of not less than 10 gage (3.42 mm 0.1345 inch) commercial hot rolled mild steel plate and flanged discharge throat built of not less than 5 mm 3/16 inch commercial hot rolled mild steel plate. Design head section to support the drive machinery and head bearings. Provide access ladder and service platform conforming to applicable OSHA regulations as indicated for providing proper service and maintenance of elevator.

2.12.6.7 Boot Section

Construct of not less than 5 mm 3/16 inch commercial hot rolled mild steel plate in heavy angle frame with curved and renewable bottom plate and renewable internal loading leg, both built of not less than 5 mm 3/16 inch commercial hot rolled mild steel plate, and flanged inlet. Mount take-up and foot terminal bearing on one side of boot in a bolted removable side panel so foot shaft and sprocket may be removed through side of the door. Bolt end panels so they are removable for cleanout and inspection.

2.12.6.8 Electric Motor

Totally enclosed, fan cooled, high torque, [_____] volt, three phase, 60 Hz, not less than [_____] kW hp as specified in the paragraph MOTORS AND DRIVES, direct connected by means of flexible coupling to a reduction gear unit having alloy steel herringbone or helical gears and antifriction bearings enclosed in oiltight housing. Provide an adjustable base for motor and reduction gear unit. Drive, from the output speed shaft of the reduction gear to the elevator head shaft, shall be by means of finished steel roller chain running over cut tooth sprockets, complete with steel plate chain guard. Roller chain, sprockets, and roller chain attachments shall conform to ASME B29.100.

2.12.6.9 Anchoring Brackets

Provide steel brackets as indicated at intervals for anchoring elevator to increase rigidity.

2.12.6.10 Discharge Chute

Construct of not less than 10 mm 3/8 inch thick steel plate and attach to ash silo.

2.12.7 Ash Storage Silo

**************************************************************************
NOTE: Use enclosures for silo roof and unloader level in climates where protection of equipment and personnel from the weather is desired.

[_____] meters feet in diameter with [_____] meters feet high walls with a live bottom and flyash storage capacity of not less than [_____] Mg tons, based on ash bulk density of 640 kg per cubic meter 40 pounds per cubic foot for volumetric sizing. Structural joints shall be dusttight and watertight. Provide columns, beams, bracing, and other structural members as required for complete erection of silo and accessories. Live storage capacity shall allow for 20 degree angle of repose from silo outlet. Height of silo storage shall not be more than twice the diameter. Provide a minimum of one meter 3 feet of freeboard above the ash level. Provide support steel design approved by the ash system supplier. Design silo in accordance with ICC UBC. Design shall take into account seismic load, wind load, snow load, equipment loads and an ash bulk density of 1120 kg per cubic meter 70 pounds per cubic foot. Ash silo support shall be free standing and of sufficient height to allow gravity discharge of ash through the rotary ash conditioner to a [truck] [railroad car]. Provide access stair tower with intermediate platforms at 3.66 meters 12 feet intervals for access to ash conditioner level, silo floor level and silo roof level. Platforms from adjacent structures with stair access may be provided in lieu of the stair tower, but ladders with safety cages and access platforms shall then be also provided. Provide ladder with stainless steel fall prevention device on inside of silo from manhole in top of silo to bottom of silo.[ Provide silo roof enclosure and unloader room enclosure each with single one by 2 meters 3 by 7 feet access door, [_____] by [_____] meter [_____] by [_____] feet double door, two windows, ventilator, [heater,] insulated metal panel siding to match boiler plant walls and electrical lighting and convenience receptacles. Unloader room enclosure shall have reinforced concrete floor.]

2.12.7.1 Construction

Construct silo of steel with refractory lining or of concrete staves with steel hoops and concrete roof. Roof accessories shall include manhole, relief valve and vent filter. Bottom of silo shall be [conical, sloped a minimum of 45 degrees] [flat with a steel plate feeding hopper in bottom of silo to funnel the ash into the inlet of the rotary vane feeder]. Provide hopper with expansion joints and sufficient poke holes with cover or cap.

2.12.7.2 Concrete Stave Silo

Construct of either lightweight solid or hollow precast concrete staves with post-tensioned steel reinforcing hoops around the exterior. Mechanically measure and mix materials in concrete staves. Vibrate and shape staves under pressure and steam or air cure.

a. Wall Coating: Coat interior surface with a three-step process of a brush coat, scratch coat, and finish trowel coat of a mixture of fine sand and portland cement in accordance with silo manufacturer's recommendations. Apply each coat successively to produce a smooth interior surface. Work mixture into the formed horizontal and vertical grooves to permanently interlock the concrete staves. Brush coat exterior surface with a double application of waterproof mixture. Mixture shall include a chemical agent for waterproofing and portland cement, sand, and water. Work coating into joints and over steel reinforcing hoops to form a weatherproof protective coating.
b. Steel Reinforcing Hoops: Galvanized steel rods not less than 14 mm (9/16 inch) in diameter with not less than 16 mm (5/8 inch) rolled threads. Join hoop ends together with nuts and heavy malleable galvanized iron lugs or heavy duty galvanized steel lugs to a close tolerance for a tight fit. Electrogalvanize rods, nuts, and lugs to ensure adequate protection against corrosion. Rods shall be high quality, metallurgically sound steel with tensile strength not less than 488 MPa (65,000 pounds per square inch), yield point not less than 276 MPa (40,000 pounds per square inch), and a minimum elongation of 14 percent in 229 mm (9 inches). Reinforcing shall be sufficient to resist the maximum lateral pressure and loads imposed by the ash pressure within the silo. Structurally connect together hoop rods that pass through silo outlets on inspection frames.

c. Hollow Concrete Stave Silos: Construct silo of precast concrete staves with lateral air spaces. Cast staves from a well proportioned mix of portland cement and an expanded clay light weight aggregate. Minimum compressive strength of the concrete at 28 days shall be 34.50 MPa (5,000 psi). Hollow staves shall be 92 mm thick by 250 mm wide by 762 mm long (3 5/8 inches thick by 10 inches wide by 30 inches long) with five lateral air cores per stave, except that shorter starter staves may be used to permit the horizontal joints to be staggered.

d. Solid Concrete Stave Silos: Construct silo of solid lightweight precast concrete staves. Solid staves shall be not less than 92 mm thick by 250 mm wide by 762 mm long (3 5/8 inches thick and 10 inches wide by 30 inches long), except starter staves may be shorter. Solid staves shall be constructed from a well proportioned mix of portland cement, washed sand and gravel which is free from injurious organic impurities and contains less than 5 percent of deleterious substances. Grade the fine aggregate from coarse to fine. Compressive strength of the solid concrete staves at 28 days shall be 34.50 MPa (5,000 psi).

2.12.8 Pulse Jet Bag Filter Vent

**************************************************************************
NOTE: Consult the manufacturer of ash handling equipment for venting requirements.
**************************************************************************

Provide for the silo constructed of 10 gage steel plate, fitted with rain hood. Bag material shall be sateen cotton capable of withstanding not less than 91 degrees F, weighing 0.33 kg per square meter (9.75 ounces per square yard), having thread count of 4 by 2 per square mm (96 by 60 per square inch) and permeability of 76 to 102 L/s 15 to 20 cfm per square meter foot at 249 Pa one inch water column. Vent shall have not less than [_____] square meter feet effective cloth filtering area, with each bag having a maximum effective cloth filtering area of 0.56 square meter (6 square feet).

2.12.9 Rotary Ash Conditioner (Unloader)

Provide a complete dustless horizontal, floor mounted unloading device to discharge ashes from silo to a [truck] [railroad car]. Unloader (ash conditioner) shall include a 762 mm (30 inch) diameter revolving drum which rotates about fixed spray nozzles, and be complete with conditioner and discharge compartments, scrapers, and other accessories as required. Unloader drum shall be constructed of steel plate not less than 10 mm (3/8 inch)
inch thick and shall be roller chain driven by a totally enclosed, fan cooled, [_____] volt, three phase, 60 Hz electric motor not less than 3.75 kW 5 hp as specified in the paragraph MOTORS AND DRIVES. Unloader shall discharge conditioned ashes to a truck through a 6 mm 1/4 inch thick steel plate chute. Unloader shall be designed to eliminate most dust when in operation. Unloader may utilize screws as a means of mixing. Dustless unloader shall add water to ash, but not to the extent that free or surplus water is running or dripping from ash after discharge. Discharge ash shall be in a semi-fluid, loose, free flowing condition.

2.12.10 Fluidizing System

**************************************************************************
NOTE: Delete fluidizing system if not necessary.
**************************************************************************

Provide a fluidizing system on silo floor to ensure a constant and uniform feed of ash through the silo discharge outlet. System shall consist of a series of diffuser modules, a conical diffuser hood, designed to support the total weight of ash when silo is full, and compressed air piping. Each diffuser module shall be mounted on the silo floor using sloped concrete pads. System shall operate from the plant air system. Provide pressure reducing valves, safety valves, and controls for a complete system.

2.12.11 Control Panel and Controls

Provide a semi-automatic control system for the ash handling system[ as indicated]. Provide a centrally controlled operation, with auxiliary local operation, and a monitoring control system with graphic display for the ash conveying system. Provide local control stop-start pushbuttons and indication stations for chain drag conveyor, screw conveyors, bucket elevator, and rotary ash conditioner. Ash handling system manufacturer shall provide measuring devices, status switches, solenoid valves, and auxiliary parts necessary to safely control and operate the system. Provide related electrical work required to operate the ash handling system.[ Provide detailed control logic diagrams from ash handling system manufacturer to manufacturer of the digital process control and data acquisition system.]

2.12.11.1 Control Panel

Provide a [separate control panel] [subpanel mounted in the main plant control panel] of NEMA 12 construction, centrally located in the main plant control room. Panel front shall include a system graphic display as indicated. Display shall be approximately to scale and painted with an industrial acrylic enamel. Outline items with 3 mm 1/8 inch wide black lines. Lettering shall be on engraved plastic screwed to front of panel, with white letters on a black background. Provide controls for operation on [_____] volt, [_____] phase, 60 Hz ac. Panel shall be complete with an annunciator and interlocks, relays, switches, running and safety lights, and auxiliary parts necessary to safely control and operate the system. Items located in the door shall be dusttight and oil tight with push-to-test transformer type indicating lights. Control relays shall be 10 amp, 600 volt class with convertible contacts. Provide and mark terminals for connections with the exception of the neutral. Panel shall contain [_____] percent spare terminals. Wiring shall be No. 14 AWG type THHN stranded. Neutral wire shall be white and remaining wiring of 120 volts or less shall be color coded and labeled. Provide a plastic wire duct of sufficient size to provide [_____] percent cross sectional spare.
Wiring shall be in accordance with requirements of **NFPA 70**.

a. Panel Devices: Control panel shall include the following indicating lights and color:

<p>| | |</p>

b. Provide momentary contact pushbuttons or selector switches for the following:

(1) System - START (3 required)
   - Bucket elevator
   - Chain drag conveyor
   - Screw conveyors

(2) System - STOP (red head)

c. Provide sensors such that the following items can be alarmed on an ash handling system control panel annunciator.

(1) Ash silo - HIGH LEVEL
(2) Bucket elevator - EMERGENCY SHUTDOWN
(3) Screw conveyor - EMERGENCY SHUTDOWN
(4) Chain drag conveyor - EMERGENCY SHUTDOWN
(5) Silo vent filter - OFF
(6) Plugged Hopper

d. Provide auxiliary devices required for the control functions above and laminated plastic name plates for devices on the panel front.

e. Provide local control panel for operating and indication of the rotary ash conditioner with the following functions:

(1) Power - ON (red)
(2) Water - ON/OFF
(3) Ash feeder - ON/OFF
(4) Rotary ash conditioner - START/STOP/JOG

(5) Normal Stop

(6) Wash out - START/STOP

(7) Emergency Stop: Provide control panel mounted at grade level for remote operation of the rotary ash conditioner with the following functions:

(a) Rotary ash conditioner - START/STOP

(b) Normal stop

(c) Emergency stop

2.13 AIR POLLUTION CONTROL EQUIPMENT

**************************************************************************

NOTE: Mechanical cyclone collectors should be used for soot blowing and as a prefilter on baghouse fabric filters or electrostatic precipitators. The fabric filter should be used where necessary to meet local, state or federal regulations or statutes for particulate emissions, when sulfur emissions are within regional limits through the burning of low sulfur "compliance coal." When coal containing more than 2 percent sulfur is burned, an electrostatic precipitator is generally more economical for control of particulates than the fabric filters, if sulfur emissions will meet regional limitations. When sulfur emissions are not within the regional limits, a scrubber with a prefilter mechanical cyclone and possibly a baghouse filter may be required to meet the emission limitations.

**************************************************************************

2.13.1 Mechanical Cyclone Collectors

As specified in Section 23 51 43.01 20 MECHANICAL CYCLONE DUST COLLECTOR OF FLUE GAS PARTICULATES.

2.13.2 Fabric Filter Baghouse

As specified in Section 23 51 43.03 20 FABRIC FILTER DUST COLLECTOR OF FLYASH PARTICULATES IN FLUE GAS.

2.13.3 Electrostatic Precipitator Filters

As specified in Section 23 51 43.01 20 MECHANICAL CYCLONE DUST COLLECTOR OF FLUE GAS PARTICULATES.

2.13.4 Scrubbers

**************************************************************************

NOTE: Insert appropriate Section number and title in blank below using format per UFC 1-300-02.

**************************************************************************
As specified in [____].

2.14 MISCELLANEOUS EQUIPMENT

2.14.1 Condensate Receiver

Provide a [horizontal] [vertical] type tank not less than [_____] meters 
feet [_____] mm inches in diameter by [_____] meters feet [_____] mm inches 
[long] [high] overall with a storage capacity of not less than [_____] 
liters gallons. Tank shall be constructed of welded steel plate not less 
than 10 mm 3/8 inch thick. Provide condensate tank with a 610 mm 24 inch 
diameter manway, dual gage glasses with protective guards, saddles, and 
other connections as indicated.

2.14.1.1 Coating

Surface blast interior of tank to bare metal and coat with a bake-on 
phenolic lining or corrosion resistant liner consisting of a resin and 
hardener suitable for immersion in water at not less than 121 degrees C 250 
degrees F. Coat exterior of tank with one shop coat of manufacturer's 
standard primer rated for service of not less than 121 degrees C 250 
degrees F.

2.14.1.2 Accessories

Provide condensate receiver with the following:

a. Connections for condensate pumped return, vent, water outlet, drain, 
sampling outlet, level transmitter and controls.

b. [_____] mm inch vent.

c. Reflex type water gage glasses with shutoff valves and guards.

d. One, 125 mm 5 inch dial, thermometer, 10 to 149 degrees C 50 to 300 
degree F range, with lagging extension type wells, for steam and water 
space.

e. [_____] mm inch overflow trap.

f. One high water alarm switch with stainless steel float and trim. 
Circuit shall close as liquid level rises. Locate switch to close 
circuit when water level rises to 25 mm one inch below overflow level 
of receiver.

g. One low water alarm switch with stainless steel float and trim. Circuit 
shall close as liquid level falls. Locate switch to close circuit when 
water level drops to 25 percent of the storage capacity of the storage 
tank.

h. Install switches on a single column with valved connections to tank. 
Provide unions in pipe on each side of each float switch.

i. Furnish pipe, fittings, controls, specialties, bolts, gaskets, drains, 
valves, necessary for a complete unit and install at jobsite.

j. Provide automatic control system to control level in condensate tank by 
modulating discharge from condensate pumps.
2.14.2 Deaerating Heater

Provide a deaerating feedwater heater with storage tank conforming to FS W-H-2904, except as modified below and to ASME BPVC SEC VIII D1. Tank shall be ASME Code stamped. Provide stainless steel trays. No test model will be required.

a. Model A - Pressurized operation.

b. Type I - Tray-type heating and deaerating element.

c. Class 3 - 10 minute water storage capacity (minimum).

d. Grade A - Guaranteed removal from water of all dissolved oxygen in excess of 0.005 cubic centimeters (cc) per liter 0.0012 cubic inches per gallon, over a ten to one load swing.

2.14.2.1 Heater Capacity

Provide deaerating heater capable of heating and deaerating makeup water consisting of [_____] kg per second pounds per hour of softened makeup water from [_____] to [_____] degrees C F (outlet temperature).

2.14.2.2 Inlet Water Characteristics

Softened makeup water:

a. Ph: [_____]

b. Total hardness (as CaCO3): [_____]

2.14.2.3 Storage Tank

Horizontal design with steel supports[ drilled for bolting] of approved design. Provide storage tank with not less than a 410 by 510 mm 16 by 20 inch minimum size manhole and cover and provide heater section with not less than a 300 by 460 mm 12 by 18 inch minimum size tray access handhole and door.

2.14.2.4 Vent Condensing Arrangement

Provide deaerating heater with a vent condenser which shall condense vented steam when heater is operating at full capacity with inlet water mixture at a temperature not exceeding 82 degrees C 180 degrees F. Construct vent condenser, when of the direct contact type, with stainless steel baffling.

2.14.2.5 Materials

Construct trays, tray supports, water distributors, and all other parts coming in contact with underaerated water or air laden steam of 430 stainless steel.

2.14.2.6 Accessories

Provide the deaerating heater with the following accessories:

a. Pressure Relief Valve: Sized in accordance with FS W-H-2904.
b. Thermometers: Two, 125 mm 5 inch dial thermometers, 10 to 149 degrees C 50 to 300 degrees F, with lagging extension type wells for the storage tank and heater section. Provide a thermometer similar to above but with range of minus [_____] degrees C F to plus [_____] degrees C F for the makeup water connection.

c. Lifting attachments for tray section and storage tank.

d. Water Gage Glasses: Reflex type with shutoff valve and guards.

e. Pressure Gages: One 150 mm 6 inch dial compound pressure gage for the heater section with range from [_____] kPa inches of mercury (vacuum) to [_____] kPa (gage) psig.

f. Float Controllers:
   (1) Inlet condensate controller
   (2) Makeup water controller
   (3) Overflow controller

g. Overflow Control Valve: With pneumatic controller arranged for local automatic operation.

h. Storage Tank Gage Glass: Full height, shielded, for storage tank including shutoff valve and drain cocks.

i. Makeup Water Inlet Control Valve: With pneumatic controller.

j. Switches: For low water level alarm in the storage tank, high water level alarm, condensate pump shutdown in the storage tank, and low steam pressure alarm. Install switches on a single column with connections valved and unions provided in pipe on each side of each float switch.

k. Special Tools: One set for maintenance.

l. Condensate Pump Reset: With stainless steel float and trim to reset pump shutdown switch on fall of liquid level in tank to [_____] mm inches below level of overflow level of storage tank.

m. Furnish pipe, fittings, controls, specialties, bolts, gaskets, drains, and valves, necessary for proper attachment of accessories and trimmings and install.

| n. Oil separator |

2.14.2.7 Connections

Provide necessary connections for condensate, steam, makeup water, removal of vented gases, vacuum breakers, discharge of deaerated water, and instruments and controls.

a. Provide heater connections as follows:
   (1) [_____] mm inch steam inlet
   (2) [_____] mm inch makeup water inlet
(3) [_____] mm inch condensate
(4) [_____] mm inch high pressure trap return
(5) [_____] relief valves sized as required
(6) [_____] mm inch vent
(7) [_____] mm inch for thermometer well
(8) [_____] mm inch for pressure gage
(9) Vacuum Breakers: As required
(10) [_____] mm inch heater drain
(11) [_____] mm inch spare [capped] [flanged]
(12) [_____] mm inch spare [capped] [flanged]
(13) Handholes And Manhole: With covers

b. Tank connections shall include:

(1) [_____] mm inch drain
(2) [_____] mm inch boiler feed recirculation ([_____] required)
(3) 25 mm One inch sampling
(4) 25 mm One inch chemical feed
(5) [_____] mm inch for sight glass ([_____] sets required)
(6) [_____] mm inch for high and low level alarm switches
(7) [_____] mm inch thermometer well
(8) Vacuum Breakers: As required
(9) [_____] mm inch spare (capped)
(10) [_____] mm inch spare (flanged)
(11) [_____] mm inch level transmitter and controller ([_____] sets required)
(12) Downcomer And Equalizer: As required
(13) [_____] mm inch feedwater outlet
(14) [_____] mm inch overflow outlet with internal water seal

2.14.2.8 Level Control

Provide an automatic control system to control the water level in the storage tank, by modulating valves in the makeup water lines. Output of condensate pump shall be controlled by level in condensate storage tank.
a. Controllers: Provide external cage type air operated level controllers for both the condensate and makeup water lines complete with 40 mm 1 1/2 inch screwed connections, external cage, and controller. Cage body shall be Class 125 cast iron construction. Internal components including displacer, torque tube, displacer rod, displacer rod driver and bearings shall be 316 stainless steel. Displacer shall be 356 mm 14 inches long. Controller shall be direct acting with 20 to 103 kPa (gage) 3 to 15 psig range with proportional band adjustment. Locate controller to maintain an operating level at 2/3 full point of storage tank. Provide level controller with air pressure reducing valve, filter, gages and isolating valves for float cage. Provide unions on each side of float cage.

b. Air Operated Regulating Valves: Provide air operated control valves for both the condensate and makeup water lines. Valves shall have Class 125 or Class 150 rating with iron or semi-steel bodies and 316 stainless steel internals. Provide condensate valve which fails open on loss of air and makeup water valve with an air lock mounted on valve diaphragm to hold valve in last position on loss of air. Design valves for the following conditions:

2.14.2.9 Low Pressure Steam Control

Provide an automatic control system to control steam to the deaerating heater. Maintain steam pressure in the heater by modulating a pressure reducing valve in the steam supply line. Control shall be local and remote from the control panel.

a. Controller: Adjustable proportional band, 0 to 103 kPa (gage) 15 psig brass bellows for input signal, and 20 to 103 kPa (gage) 3 to 15 psig output air pressure range, pilot controller complete with air set
(valve, filter, drier and pressure regulator) mounted on control valve yoke.

b. Pressure Reducing Station Control Valve: Provide a [_____] mm inch air operated pressure reducing valve with proper internals to pass a flow of [_____] kg per second pounds per hour of steam. Steam at the valve inlet shall be [_____] kPa (gage) psig saturated, and outlet shall be controlled at [_____] kPa (gage) psig. Minimum steam flow shall be approximately [_____] kg per second pounds per hour. Minimum valve Cv shall be [_____] at 100 percent open. Valve shall be Class 250 or Class 300 flanged, iron or semi-steel body with stainless steel internals equal percentage flow characteristics and a full size port. Provide valve actuator including travel indicator, hand jack, valve positioner, and air supply filter-reducer set. Valve shall move to open position in case of failure.

2.14.2.10 Gage Glasses

Provide to cover the entire range of water level in the storage section. Gage glasses shall not be greater than 610 mm 24 inches center-to-center. Provide gage glasses complete with ball check shutoff and drain cock valves and safety shield.

2.14.2.11 Alarms

Provide high and low water level alarms for storage tank as follows:

a. High Water Level Alarm: Switch with stainless steel float and trim. Locate switch to close circuit when water level rises to 25 mm one inch below overflow level of storage tank.

b. Low Water Level Alarm: Switch with stainless steel float and trim. Locate switch to close circuit when water level falls to [_____] meters feet [_____] mm inches above bottom of storage tank.

c. Coordinate alarms with annunciator panel as indicated.

2.14.2.12 Multiport Back Pressure Relief Valve

******************************************************************************
NOTE: Use multiport valve on systems where deaerating heater will be subject to occasional overpressuring.
******************************************************************************

Provide valve capable of relieving not less than [_____] kg per second pounds per hour of steam with not more than a [_____] kPa (gage) psig pressure rise when set at [_____] kPa (gage) psig initial operating pressure. Set pressure shall be fully adjustable by means of an external handwheel or chain operator for a range of zero to 172 kPa (gage) 25 psig. Locate on low pressure steam header manifold for the deaerating heater. Valve shall be multiport vapor cushion type rated for operating temperatures up to but not greater than 149 degrees C 300 degrees F with Class 125 cast iron body, bronze trim and carbon steel springs.

2.14.2.13 Exhaust Head

Type [I (cast iron)] [II (fabricated steel plate)] of [_____] mm inch size with [_____] mm inch diameter drain, and a capacity of [_____] kg per second
2.14.3 Boiler Feed Pumps

************************************************************************************
NOTE: Use this paragraph for centrifugal boiler feed pumps. If regenerative type turbine pumps are required for the smaller capacities, they must be specified. Use Style 1, horizontal split case pumps in all sizes where available. Pump service requirements shall include pump capacity of a minimum of 135 percent of boiler requirements at maximum load for modulating service and 200 percent for on-off service. Discharge head must include all change in elevation, friction losses through pipe, valves and fittings and be sufficient to deliver water to the boiler at a pressure 6 percent higher than the setting of the lowest set boiler safety valve.
************************************************************************************

CID A-A-50562, Type II (boiler feed), Style 1 (horizontal split case), Class [1 single] [2 multi-] stage except as modified below. Submit pump characteristic curves superimposed on system curves at various pumping rates, 20, 40, 60, 80, 100 percent capacity.

2.14.3.1 Pump Service Requirements

a. Capacity: [_____] L/s gpm
b. Pumping temperature: [_____] degrees C F
c. Liquid pH: [_____] 
d. Discharge head: [_____] meters feet
e. Available NPSH: [_____] meters feet
f. In addition to the operating point established above, pump curve shall run through the following points:

<table>
<thead>
<tr>
<th>Capacity</th>
<th>Discharge Head</th>

</tr>
</tbody>
</table>

2.14.3.2 Construction

Bronze fitted including bronze impeller and impeller wear rings, and ASTM A48/A48M, Class 30, cast iron casing. Provide casing with suction and
discharge gages in tapped openings. Mount each pump and prime mover on a fabricated steel bed plate having a drip collection chamber with tapped drain openings. Provide lifting attachments to enable equipment to be set into its normal position and to enable pumps to be easily dismantled in place.

2.14.3.3 Drives

**************************************************************************
NOTE: The designer shall perform an economic analysis and make a technical evaluation to determine if the boiler feed or condensate pump motors shall be provided with variable speed control. Generally variable speed drives for pumps over 5 1/2 kW 7 1/2 hp will be cost effective.
**************************************************************************

[Variable speed] electric motors [or turbines] direct connected to respective pumps with a gear type, forged steel, flexible coupling. Provide a shaft and coupling guard.

a. Electric Motors: [Variable speed,] [open dripproof,] [totally enclosed,] [fan cooled,] [____] volt, three phase, 60 Hz of not less than [____] kW hp, as specified in paragraph[s] MOTORS AND DRIVES [and VARIABLE SPEED CONTROL FOR MOTORS].

b. Steam Turbines: Single stage, rated at not less than [____] kW hp, with inlet steam pressure of [____] kPa (gage) psig and [____] degrees C F and normal exhaust back pressure of 34 kPa (gage) 5 psig or a maximum back pressure of 103 kPa (gage) 15 psig. Water rate at full load and normal steam conditions shall not exceed [____] kg per BkW pounds per BHP per hour. Provide a stainless steel steam strainer, sentinel relief valve, sight oil level indicator and one hand valve.

(1) Turbine Construction: Turbine casing split on the horizontal centerline constructed of ASTM A48/A48M cast iron, with a design pressure rating of 1724 kPa (gage) at 232 degrees C 250 psig at 450 degrees F at inlet, and 379 kPa (gage) at 232 degrees C 55 psig at 450 degrees F at the outlet.

(2) Turbine Bearings and Shaft: Horizontal split, ring oiled, sleeve type, water cooled. Shaft shall be stainless steel or chrome plated under the packing glands. Shaft seals shall be segmented carbon rings with springs and stops.

(3) Speed Governor: Variable speed oil relay, NEMA SM 23, Class D governor for speed control and pneumatic operator to maintain an adjustable, preset pump discharge header pressure by variation of turbine speed. Input to the operator shall be a 20 to 103 kPa (gage) 3 to 15 psig pneumatic signal. Provide an electro-pneumatic transducer to accept the 4 to 20 mA signal from the control acquisition system.

(4) Emergency Overspeed Governor: Completely independent of the speed governor and shall operate a separate trip valve.

(5) Insulation: Turbine shall be insulated and lagged by the manufacturer as specified in Section 23 07 00 THERMAL INSULATION.
2.14.3.4 Minimum Flow Protection for Boiler Feed Water Pumps

a. Automatic Flow Control Valve: Provide with each pump an automatic bypass valve. Valve shall automatically program recirculation flow, detection of low flow, cycling of control valve and pressure letdown for high pressure boiler feedwater return to the feedwater heater. Bypass valve shall be cast steel with stainless steel internals, and shall have a rating of not less than 2068 kPa (gage) at 204 degrees C 300 psig at 400 degrees F. Valve shall have a line size body with a 25 mm one inch recirculation connection.

b. Boiler Feedwater Automatic Recirculation System: (Option to Automatic Valve). Provide to protect feedwater pumps at low flow conditions. System shall be capable of recirculating the minimum flow recommended by the pump manufacturer. System shall be an engineered system consisting of various functional components specified or shall be a self-contained and self-powered mechanical system. Components of the engineered system shall include a flow transmitter with orifice in feedwater line, bypass flow controller with bypass flow control valve, and a bypass pressure reducing orifice.

   (1) System Bypass Flow Controller: Include detection of low flow and modulation of a control valve in a bypass line returning to a low pressure sink. Incorporate a pressure let-down feature or device to reduce pressure from boiler feedwater pump discharge pressure to that of the low pressure sink.

   (2) System Bypass Control Valve: Modulate to provide minimum flow recommended by the pump manufacturer and to provide shutoff or recirculation flow when feedwater flow to boilers exceeds minimum flow required for pump protection.

2.14.3.5 Feedwater Stop and Check Valves

Provide a Class 300, flanged, cast steel feedwater stop gate valve and check valve on the feedwater outlet of each pump. Provide piping from valves to economizer inlet, and from economizer to flanged connection on boiler drum. Provide connection on pipe at economizer outlet for remote recording thermometer.

2.14.4 Condensate Pumps

**************************************************************************
NOTE: Use this paragraph for centrifugal condensate pumps. If regenerative type turbines are required for the smaller capacities, they must be specified. Use Style 1, horizontal split case pumps in all sizes where available. Pump service requirements shall include pump capacity of a minimum of 135 percent of boiler requirements at maximum load for modulating service to the deaerator and 200 percent for on-off service. Discharge head must include all change in elevation and friction loses through pipe, valves and fittings.
**************************************************************************

CID A-A-50562, Type I (general service), Style [1 (horizontally split
2.14.4.1 Pump Service Requirements

a. Capacity: [_____] L/s gpm

b. Pumping temperature range: [_____] to [_____] degrees C F

c. Liquid pH: [_____] 

d. Discharge head: [_____] meters feet

e. Available NPSH: [_____] meters feet

f. In addition to the operating point established above, pump curve shall also run through the following points:

2.14.4.2 Construction

Bronze impellers and impeller wear rings. [Cast iron] [ductile iron] pump casing designed for the specified conditions. Bearings shall be oil lubricated. Equip casing with tapped openings for suction and discharge gages. Provide gages in openings. Mount pump and driver on a fabricated steel bed plate having a drip collection chamber with tapped drain openings. Provide lifting attachments for installation and maintenance.

2.14.4.3 Drives

**************************************************************************
NOTE: The designer shall perform an economic analysis and make a technical evaluation to determine if the boiler feed or condensate pump motors shall be provided with variable speed control. Generally variable speed drives for pumps over 5 1/2 kW 7 1/2 hp will be cost effective.
**************************************************************************

[Variable speed] electric motors or [turbines] direct connected to respective pumps with a gear type flexible coupling. Provide shaft and coupling guards.

a. Electric Motors: [Variable speed,] [open dripproof,] [totally enclosed,] [fan cooled,] [_____] volt, three phase, 60 Hz of not less than [_____] kW hp, as specified in paragraph[s] MOTORS AND DRIVES [and VARIABLE SPEED CONTROL FOR MOTORS].
b. Steam Turbines: Single stage, rated at not less than [_____] kW hp, with inlet steam pressure of [_____] kPa (gage) psig and [_____] degrees C F, normal exhaust back pressure of 34 kPa (gage) 5 psig and a maximum back pressure of 103 kPa (gage) 15 psig. Water rate at full load and normal steam conditions shall not exceed [_____] kg per BkW per second pounds per BHP per hour. Provide a stainless steel steam strainer, sentinel relief valve, sight oil level indicator and one hand valve.

(1) Turbine Construction: Turbine casing split on the horizontal or vertical centerline constructed of ASTM A48/A48M cast iron, with a design pressure rating of 1724 kPa (gage) at 232 degrees C 250 psig at 450 degrees F at inlet, and 379 kPa (gage) at 232 degrees C 55 psig at 450 degrees F at the outlet.

(2) Turbine Bearings Shaft: Ring oiled, anti-friction type. Shaft shall be stainless steel or chrome plated under the packing glands. Shaft seals shall be segmented carbon rings with springs and stops.

(3) Speed Governor: Variable speed governor for speed limiting and pneumatic operator to maintain an adjustable preset level in [deaerator tank] [condensate receiver] by variation of turbine speed. Input to the operator shall be a 20 to 103 kPa (gage) 3 to 15 psig pneumatic signal and vary the turbine speed from minimum to full speed in a linear response. Maximum and minimum speed shall be adjustable. Provide an electro-pneumatic transducer to accept the 4 to 20 mA signal from the controller.

(4) Emergency Overspeed Governor: Completely independent of the speed governor and shall operate a separate trip valve.

(5) Insulation: Turbine shall be insulated and lagged as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

2.14.5 Variable Speed Motor Control

Remotely installed cabinet housed units with solid state rectification and inverter equipment to vary frequency of electrical power to drive motors.

2.14.5.1 Housing

House controller in a [wall] [floor] mounted, NEMA [_____] enclosure finished with manufacturers standard painted finish. Provide control panel complete with fused disconnect switches, magnetic [across the line] [part winding] starters with thermal overload protection, transformer, hand-off-automatic selector switches, hand potentiometer for manual speed control, fuses and running lights.

a. Provide the manual switch within the control panel so that in the event failure of a component, motor can be put across the line at full voltage to maintain air or pump pressure. Provide a mechanical door interlock that allows panel to open only when fused disconnect is in the off position.

b. Variable Frequency Controllers: Variable frequency controllers shall use solid-state semiconductor power conversion equipment. Provide controllers as integrated and assembled products. Controllers shall be
furnished by the same manufacturer.

(1) Each controller shall be rated for a supply of [_____] volts, three phase, 60 Hz. Output shall be [_____] volts, three phase with frequency variable between zero and 60 Hz. Controllers shall be rated to operate motors continuously at their rated horsepower and frequency. Speed regulation shall be three percent or better without tachometer feedback. Electrical supply system has an available short circuit rating of [_____] amperes symmetrical.

(2) Each controller shall be capable of driving motor continuously at a lower speed no greater than 20 percent of full rated motor speed with stable operation and without overheating the motor under rated ambient conditions. Provide estimate of minimum speed at which motor can be operated continuously without overheating or problems of instability due to overhauling of load.

c. Provide controller fault protection so that a single or three phase short circuit at the controller terminals or inverter commutation failure will not result in damage to power circuit components. Provide overload protection so that motor and controller are protected against operating overloads.

d. Provide adjustable time delay undervoltage protection so that motors will continue to operate during momentary voltage fluctuation or loss of voltage. Time adjustment shall be zero to 5 seconds. Provide for orderly shutdown on undervoltage conditions exceeding the time delay interval.

e. Provide adjustable timed linear acceleration and deceleration.

f. Provide volts/Hz control to prevent motor overheating throughout the speed range.

g. Provide door interlocks to prevent opening of enclosure doors unless power is disconnected.

h. Controllers shall be self protecting and shall provide orderly shutdown for, but not limited to, the following conditions:

   (1) Loss of input power
   (2) Undervoltage
   (3) Sustained gradual overload
   (4) Fault or large instantaneous overload
   (5) Overtemperature
   (6) Failure of ventilating system
   (7) Overvoltage
   (8) Control circuit failure

Provide contacts for remote annunciation of shutdown or abnormal condition.

i. Electrical Bypass: Provide each controller with manual isolation and
bypass switching. Switch shall be manually operated with controller deenergized. Switch shall be two position with provisions for locking switch in either position.

(1) Normal Position: Bypass shall be open and controller shall be connected to supply circuit and load.

(2) Bypass Position: Bypass shall be closed and controller shall be electronically isolated from supply and load. Isolating contacts shall be located so that it is possible to verify by visual inspection that contacts are open and controller is electrically isolated. In the bypass position the motor shall be operated at constant speed and controlled from the air circuit breaker. Provide auxiliary contacts that close in the bypass position. Auxiliary contacts shall be used to activate the damper control to provide fan load control in the bypass position.

2.14.5.2 Controller Environmental Protection

a. Ventilation: Design controllers enclosed and ventilated for installation in a moderately dusty area. Provide forced filtered ventilation including fans, filters, controls and accessories required for operation. Enclosures shall be operated under positive pressure at all times. Provide filtered ventilating openings and gasketed doors to prevent infiltration of dust.

b. Heating: Provide electric heaters to prevent condensation in the enclosure and to prevent low ingoing air temperatures that exceed the equipment rating. Provide a low temperature alarm to sound when enclosure temperature falls below required minimum temperature. Provide contacts for remote annunciation of alarm condition.

2.14.5.3 Method of Control

Supply each controller from an electrically operated air circuit breaker or motor starter. Controller ventilation and heating shall be from another circuit.

a. Start Signal: Closes the electrically operated air circuit breaker or motor starter to energize the controller. Controller shall accelerate fan to operating speed. Fan speed shall be controlled from the load control signal.

b. Stop Signal: Opens electrically operated air circuit breaker or motor starter to deenergize the controller. Upon deenergization, controller control system shall revert to stop condition.

c. Boiler Feedwater Pump Speed Control System: Matches pump discharge to system demand and maintains a system header pressure controlled to the set point values. Provide Manual/Automatic control stations for master pressure and for each boiler feed pump. Provide indicators for feedwater header pressure and individual boiler feedwater pump flow.

2.14.5.4 Variable Speed Motor Controller

Conduct burn-in tests for at least 50 hours at rated conditions. If a component fails during burn-in test, replace it, and run test again on entire assembly for another 50 hours. Burn-in test shall not be complete until entire assembly has operated for 50 hours without failure.
2.14.6 Valve Actuators

[Electrically] or [pneumatically] operated and designed so that valve may be manually operated by removing drive pins. Actuators shall be operated by push button control. Locate one push button at a position adjacent to the valve. Locate a second push button within the boiler control room. Provide a valve position indicator utilizing indicating lights. A green light shall indicate valve is fully open and an amber light shall indicate valve is fully closed. Both lights on shall indicate when valve is partially open. [Provide torque limit controls to protect valve during opening and closing for electrically operated valves.] Actuator electric motor shall be totally enclosed, [_____] volts, [_____] phase, 60 Hz as specified in the paragraph MOTORS AND DRIVES. Provide NEMA 4 control enclosures.

2.14.7 Sump Pumps

CID A-A-50555 with automatic float switch and disconnect switch in NEMA 6 enclosure.

2.14.8 Water Softening System

********************************************************************************
NOTE: One hundred percent makeup shall be assumed in calculating the sustained softening rate.
********************************************************************************

Ion exchange resin type conforming to WQA S-100 except as modified below. [Manual] [Push button automatic] [Fully automatic] in operation with operating controls housed in a NEMA 12 enclosure having a minimum total capacity between regenerations of [_____] liters gallons of water of [_____] grams grains hardness when operated at a sustained softening rate of [_____] L/s gpm. Maximum effluent water temperature shall be [_____] degrees C F.

2.14.8.1 Softener Equipment

Including but not limited to the following:

a. Water Hardness Monitor: Provide with an alarm point at 1.0 ppm to ensure compliance for boilers rated above 3150 grams/sec 25,000 lb/hr.

b. Total Solids Monitor and Controller: Provide a continuous monitor and controller (when required) to control concentration of dissolved solids and treatment chemicals in water for boilers rated above 3150 grams/sec 25,000 lb/hr.

c. Water Meter: Provide a [_____] mm inch cold water meter on each softener unit.

d. Ion Exchange Resin: High capacity, polystyrene base, sulfonated synthetic type except that exchange capacity shall be not less than 68.70 kg per cubic meter 30 kilograins per cubic foot at a salt dosage of 240 kg per cubic meter 15 pounds per cubic foot.

e. Tank Sizing: Minimum acceptable bed depth of 762 mm 30 inches; maximum acceptable bed depth of 1829 mm 72 inches. Base reactor tank sizes on allowing a freeboard above the resin bed of not less than 75 percent of
resin bed depth, and flow rate between 1.11 and 7.13 L/s per cubic meter
0.5 and 3.2 gpm per cubic foot of resin.

2.14.8.2 Brine Storage System

Provide complete, including fiberglass storage tank, sight level gage, bulk
salt delivery tube, internal distribution system, level control system,
tank vent with dust collection system, top and side manholes, access
ladder, and other required appurtenances.

a. Storage Tank: Filament wound fiberglass with flat bottom and domed top
as recommended by the manufacturer for brine storage. Tank shall be
[___] meters feet [___] mm inch in diameter by [___] meters feet
[___] mm inch wall height with a nominal capacity of [___] liters
gallons and a dry salt storage capacity of [___] Mg tons. Design
water distribution system, internal piping distributors, and brine
collection system so that system shall be capable of dissolving [___]
kg pounds of rock salt per second minute to produce [___] L/s gpm
of brine. System shall be able to dissolve [___] Mg tons of salt before
cleanout.

b. Accessories: Provide the following accessories:

(1) Steel holddown lugs securely bonded to tank in adequate number to
properly anchor tank to concrete base;

(2) Side bottom flanged drain not less than 100 mm 4 inches in
diameter;

(3) Side and top manholes not less than 559 mm 22 inches in diameter;

(4) Flanged top connections for delivery pipe and vent;

(5) Ladder for access to top manhole;

(6) Water inlet connection;

(7) Brine outlet connection;

(8) Level control system; and

(9) Sight level gage

c. Pneumatic Delivery Pipe: Not less than 100 mm 4 inches in diameter.

d. Dust Collection Vent System and Safety Relief Valve: Provide storage
tank with dust collection vent system and safety relief valve.

e. Access Ladder: Of steel construction to be bolted to tank by means of
FRP (fiberglass reinforced plastic) mounting lugs complete with safety
cage. Platform shall connect ladder to tank for safe access to the
manhole.

f. Tank Internals: Construct tank internals including water distribution
piping and brine collectors of FRP or polyvinyl chloride (PVC).

g. Tank Nozzles: ASME B16.5, Class 150, FRP or PVC flanges.

h. Level Control System: Electrode holder and electrodes mounted in a
standpipe exterior to the tank. Position electrodes so that a solenoid operated water makeup valve will be opened or closed to maintain liquid level to within plus or minus 25 mm one inch of the set level. Provide tank with a high water alarm. Electrodes shall be easily removable for cleaning and constructed of materials, that will allow continual immersion in brine.

2.14.9 Chemical Feed Systems

Provide systems complete with storage tank, supporting framework, hinged cover, mixer, strainers, level indicators, proportioning pumps, relief valves and interconnecting piping for a complete chemical feed packaged unit.

2.14.9.1 Storage Tank

Capacity of 190 liters 50 gallons constructed of FRP. Provide removable, hinged cover.

2.14.9.2 Exterior Gage Glass

Protected, full height of tank complete with gage cocks.

2.14.9.3 Low Level Alarm

Provide tank with a low level switch to sound alarm and shut down pumps should level drop to preset minimum.

2.14.9.4 Dissolving Baskets

**************************************************************************
NOTE: The chemical feed solution to be used shall be inserted here.
**************************************************************************

Construct baskets of a corrosion resistant material suitable for continuous immersion in a [_____] solution.

2.14.9.5 Tank Strainer

In suction line to pump.

2.14.9.6 Supporting Steelwork

Provide to adequately support tank, mixer, and the number of proportioning pumps specified.

2.14.9.7 Agitator

Provide with mounting bracket to mount to storage tank. Agitator shaft and propeller shall be of stainless steel.

2.14.9.8 Proportioning Pumps

Provide [two] [three] [_____] [simplex] [duplex] proportioning pump[s]. Each pump shall have a minimum capacity of [_____] L/s gallons per hour at a [_____] kPa (gage) psig discharge pressure. Capacity shall be adjustable from zero to 100 percent by a convenient screw adjustment of stroke length. Provide pump with integral check valves. Electric motors shall be
[totally enclosed,] [fan cooled,] [_____] volts, [_____] phase, 60 Hz as specified in the paragraph MOTORS AND DRIVES.

2.14.9.9 Safety Relief Valve

Provide for each pump to discharge back into the tank in event of excessive line pressure.

2.14.10 All Welded Blowdown Tank

Provide in accordance with the NBBI NB-27 (supplemental to the National Board Inspection Code) latest edition published by the National Board of Boiler and Pressure Vessel Inspectors, Columbus, Ohio.

2.14.10.1 Construction

**************************************************************************
NOTE: The volume of the blowdown tank shall be calculated to be twice the volume of water removed from one boiler when the normal water level is reduced not less than 100 mm 4 inches.
**************************************************************************

Construct equipment and accessories in accordance with requirements of ASME BPVC SEC VIII D1 for a working pressure of at least the maximum allowable working pressure of the boiler but in no case shall plate thickness be less than 10 mm 3/8 inch. Provide corrosion allowance of 2.54 [_____] mm [0.1] [_____] inch. Tank dimensions shall be [_____] meters feet [_____] mm inches o.d. by [_____] meters feet [_____] mm inches long over the heads (overall). Provide tank with wear plate not less than 10 mm 3/8 inch thick and [279 by 381 mm] [457 by 508 mm] [11 by 15 inch] [18 by 20 inch] manhole.

a. Provide the following tank connections:

(1) Blowdown inlet for bottom blowdown: [20] [25] mm [3/4] [one] inch;

(2) Tangential blowdown inlet: [_____] mm inch;

(3) Steam vent, flanged: [_____] mm inch;

(4) Discharge water outlet, flanged: [_____] mm inch with internal water seal and 20 mm 3/4 inch siphon breaker;

(5) Drain: 50 mm 2 inch;

(6) Thermometer connection: 20 mm 3/4 inch;

(7) Pressure gage connection: 6 mm 1/4 inch;

(8) Cold water inlet: [_____] mm inch with temperature regulating valve and backflow preventer; and

(9) Two gage glass connections: 15 mm 1/2 inch.

b. Angle Supports and Coating: Provide tank with steel angle support legs extending [_____] meters feet below bottom of tank. Coat tank with one coat of manufacturer's standard high temperature primer.
2.14.10.2 Accessories

a. Gage Glass: 300 mm 12 inch reflex type with shutoff valves and guard.

b. Thermometer: Bi-metal dial type with separable socket, 125 mm 5 inch dial, 10 to 149 degrees C 50 to 300 degrees F range.

c. Pressure Gage: Zero to 172 kPa (gage) 25 psig range.

d. Internal Baffles and Pipes: As detailed.

2.14.10.3 Controls

Provide a self operating regulator to control the flow of cooling water to the tank. Regulator shall include a 20 mm 3/4 inch screwed bronze body with stainless steel trim, reverse acting actuator (for cooling), capillary tubing and a union connection bulb with a stainless steel well. Control setting shall be 60 degrees C 140 degrees F with a minimum Cv of [____].

2.14.11 Continuous Blowdown System

Provide a complete automatic continuous boiler blowdown system which shall include a controller/programmer unit and flow assembly for each boiler, plus a continuous blowoff heat exchanger, flash tank and boiler water sample cooler.

2.14.11.1 Automatic Blowdown Controller

Intermittent type boiler blowdown system rated for not less than 1724 kPa (gage) 250 psig steam pressure.

a. Flow Assembly: Include a 25 mm one inch ball valve with 316 stainless steel ball and stem and stainless steel electrode assembly.

b. Controller/Programmer: Include a conductivity meter with zero to 6000 microhms range, valve open/closed indicators and manual/auto control switch. Cycle interval and sample duration shall both be adjustable over a wide range. Mount units at the operating floor near the boiler front.

c. Accessories and Connections:

(1) Continuous Blowdown Connection: At each boiler, provide a gate valve and extend piping to header at flash tank.

(2) Header Connections: Provide with a tee with valved sampling connection. Provide a 20 mm 3/4 inch, three globe valve bypass around each flow assembly.

(3) Common Header: Provide from valved outlet connections on flow assembly units to connection on flash tank.

2.14.11.2 Flash Tank

Designed for [_____] kPa (gage) psig and constructed in accordance with ASME BPVCP SEC VIII D1. Tank shall be [_____] mm inches in diameter by [_____] mm inches long including heads and shall be ASME Code stamped.

a. Provide tank with blowdown inlet, steam outlet, gage glass, float
operated outlet valve, relief valve, and inspection openings. Tank shall have steel angle legs with plate feet for bolting to floor. Legs shall be of sufficient length so that bottom of lower head of tank will be not less than 457 mm 18 inches above floor.

b. Automatic Control System: Control level in the flash tank, by modulating a valve in the water outlet line.

(1) Level Controller: External cage type air operated level controller, complete with 40 mm 1 1/2 inch screwed connection, 350 mm 14 inch stainless steel float and Class 125 cast iron body. Controller shall be direct acting with 20 to 103 kPa (gage) 3 to 15 psig range with proportional band. Locate controller to maintain an operating level at center line of storage tank. Provide level controller with air pressure reducing valve, filter, gages and isolating valves for float cage. Provide unions on each side of float cage.

(2) Outlet Water Valve: [_____] mm inch air operated control valve with a capacity to pass [_____] L/s gpm at a pressure drop of [_____] kPa (gage) psig. Cv shall not be less than [_____] at 100 percent open. Valve shall be Class [______], flanged, iron or semi-steel body with stainless steel internals. Valve shall have equal percentage flow characteristics with a full size port. Provide an air lock mounted on valve diaphragm and piped to hold valve in last position on air failure.

2.14.11.3 Sample Cooler

Water cooled shell and tube type with valves and accessories required to safely withdraw a water sample from the boiler drum. Provide drain under sampling valve terminating with a 20 mm 3/4 inch splash proof funnel, 229 mm 9 inches below outlet of valve.

2.14.11.4 Heat Exchanger

Provide an ASME code stamped continuous blowoff heat exchanger designed and constructed in accordance with ASME BPVC SEC VIII D1, to transfer heat from the continuous blowoff water leaving continuous blowoff flash tank to treated makeup water entering the feedwater heater. Heat exchanger shall be a bare tube, helical coiled bundle, installed in a one piece casing with removable front plate. Bundle shall be removable. Tube diameter shall be not less than 20 mm 3/4 inch. Tubes shall be ASTM B111/B111M copper alloy with cast iron shell. Design tube side for not less than [_____] kPa (gage) psig pressure at [_____] degrees C F. Design shell side for not less than [_____] kPa (gage) psig pressure at [_____] degrees C F.

2.15 PIPING

Piping work shall include the provision of piping systems, including valving and specialty items, for steam plant and related external auxiliary equipment. Piping shall be in accordance with ASME B31.1 except as modified below or indicated otherwise.

2.15.1 Expansion

Compute expansion of pipe with operating temperatures above minus 19 degrees C zero degrees F with minus 19 degrees C zero degrees F in lieu of 21 degrees C 70 degrees F specified in ASME B31.1.
2.15.2 Steam Heating and Distribution and Hot Water

Requirements of ASME B31.1 apply to building steam heating and steam distribution piping designed for 103 kPa (gage) 15 psig or lower and hot water heating systems 207 kPa (gage) 30 psig or lower.

2.15.3 Materials

Suitable for the maximum pressure at the maximum temperature at which equipment must operate.

2.15.3.1 Pipe Materials

a. Steel Pipe:

   (1) Steam Pipe, Boiler Feedwater Pipe, Relief Pipe and Steam Tracer Pipe: Black, ASTM A53/A53M or ASTM A106/A106M seamless steel pipe, Grade A or B. Wall thickness not less than Schedule 40. Steam tracer pipe, with steam up to 103 kPa (gage) 15 psig, may be ASTM B88M ASTM B88, Type K copper tubing.

   (2) Condensate Pipe and Boiler Blowdown Pipe: Black, welded or seamless ASTM A53/A53M or ASTM A106/A106M, steel pipe, Grade A or B. Wall thickness not less than extra strong (XS or Schedule 80).

   (3) Chemical Feed Pipe: ASTM A312/A312M austenitic stainless steel.

   (4) Fuel Oil Pipe: ASTM A53/A53M or ASTM A106/A106M, seamless black steel pipe, Grade A or B.

   (5) Treated Water, Hot Water Heating, High Temperature Water, Drains (Other Than Sanitary), and Overflow Pipe: ASTM A53/A53M or ASTM A106/A106M, Grade A or B.

   (6) Gas Pipe and Compressed Air Pipe: ASTM A53/A53M or ASTM A106/A106M, Grade A or B.

b. Copper Tubing:

   (1) Instrument Air Pipe: ASTM B88M ASTM B88hard copper tubing, Type K or L; except in a corrosive atmosphere or outside pipe shall be copper tubing, Type K or L, with ASTM D1047 PVC jacketing.

   (2) Steam Tracer Pipe: Contractor may provide ASTM B88M ASTM B88, Type K, copper tubing for steam up 103 kPa (gage) 15 psig.

   (3) Potable Water, Sanitary Drains and Storm Drains: As specified in Section 22 00 00 PLUMBING, GENERAL PURPOSE unless otherwise specified. Chlorinated polyvinyl chloride (CPVC) and other plastic tubing and fittings shall not be used in the steam heating plant.

2.15.3.2 Fittings

a. Fittings for Steel Pipe:

   (1) Sizes 6 to 50 mm 1/8 to 2 inches: ASME B16.3 malleable iron, screwed end fittings, for working pressures not greater than 2068
kPa (gage) 300 psig at temperatures not greater than 232 degrees C
450 degrees F or ASME B16.11 forged steel.

(2) Sizes 6 to 50 mm 1/8 to 2 inches: ASME B16.11 steel, socket
welded end fittings.

(3) Sizes 6 to 65 mm 1/8 to 2 1/2 inches: ASME B16.9 steel, butt
welding fittings.

(4) Sizes 65 to 600 mm 2 1/2 to 24 inches: ASME B16.5 forged steel,
flanged fittings.

b. Welded Outlets and Welding Saddles: Make branch connections of 45 and
90 degrees either with ASME B16.9 forged steel welded outlet fittings
or welding saddles. Welding outlets and saddles shall not be smaller
than two pipe sizes less than main pipe sizes.

c. Fittings For Copper Tubing: ASME B16.18 cast bronze solder joint or
ASME B16.22 wrought copper solder joint. For instrument air, fittings
may be ASME B16.26 compression joint type.

d. Unions:

(1) Unions For Steel Pipe: ASME B16.11, ASME B16.39 threaded. Unions
for zinc coated pipe shall be zinc coated.

(2) Unions For Copper Tubing: ASME B16.22. For instrument air,
unions may be compression joint type.

2.15.3.3 Flanges

ASME B16.5, forged steel, welding type. Remove raised faces on flanges
when used with flanges having a flat face. Unless specified otherwise,
pressure and temperature limitations shall be as specified in ASME B16.5
for the proper class and service, and type face specified.

2.15.3.4 Valves

a. Valves for maximum working pressure of 1034 kPa (gage) 150 psig
saturated steam or 1550 kPa (gage) 225 psig W.O.G. (Water, Oil, Gas) at
93 degrees C 200 degrees F (non-shock service). For working pressures
not exceeding 862 kPa (gage) 125 psig saturated steam or 1379 kPa (gage)
200 psig water at 93 degrees C 200 degrees F non shock service, Class
125 may be used in lieu of Class 150 or Class 250.

(1) Valve Sizes 50 mm 2 Inches and Smaller:

   (a) Non Throttling Valves: Gate valves, bronze, wedge disc,
rising stem, Class 150, MSS SP-80 or ball valves, bronze, double
stem seals, stainless steel ball and shaft, tight shutoff.

   (b) Globe Valves and Angle Valves: Bronze, Class 150, MSS SP-80.

   (c) Check Valves: Bronze, Type [IV, swing check] [III, lift
check], Class 150, MSS SP-80.

(2) Valve sizes 65 mm 2 1/2 inches and larger.

   (a) Gate Valves: Flanged, cast iron, Class 250, MSS SP-70 or
steel, Class 150, ASME B16.34. Valves shall have wedge disc, outside screw and yoke (OS&Y), rising stem; valves 200 mm 8 inches and larger shall have globe valved bypass.

(b) Globe Valves and Angle Valves: Flanged, cast iron, Class 250, MSS SP-85 or steel, Class 150, ASME B16.34.

(c) Check Valves: Flanged, cast iron, Class 250 or steel, Class 150, Type [____], [lift] [swing] check, style [____], ASME B16.34.

b. Valves for maximum working pressure of 1724 kPa (gage) 250 psig steam at a maximum temperature of 232 degrees C 450 degrees F or 3447 kPa (gage) 500 psig W.O.G. at 93 degrees C 200 degrees F (non-shock).

(1) Valve sizes 65 mm 2 1/2 inches and larger:

(a) Gate Valves: Flanged or butt welded, cast iron, Class 250, MSS SP-70 (Maximum size 300 mm 12 inches) or steel, Class 300, ASME B16.34. Valves shall have wedge disc, OS&Y, rising stem; each valve 200 mm 8 inches and larger shall have globe valved bypass.

(b) Gate Valves, Globe Valves and Angle Valves: Flanged or butt welded, cast iron, Class 250, MSS SP-85 or steel, Class 300, ASME B16.34.

(c) Check Valves: Flanged or butt welded, iron body, Class 250 or steel, Class 300, Type [____] [lift] [swing] check, style [____], ASME B16.34.

c. Valves for maximum working pressure of 2068 kPa (gage) 300 psig steam at a maximum temperature of 454 degrees C 850 degrees F or a maximum W.O.G. pressure of 4653 kPa (gage) at 149 degrees C 300 degrees F (non shock).

(1) Valve sizes 65 mm 2 1/2 inches and larger:

(a) Gate Valves, Globe Valves, and Angle Valves: Flanged or butt welded, ASME B16.34, steel, Class 300, rising stem, OS&Y. Gate valves 200 mm 8 inches and larger shall have globe valved bypass.

(b) Check Valves: Flanged or butt welded, steel, Class 300, Type [____], [lift] [swing] check, style [____], ASME B16.34.

d. Ball Valves: ASME B16.5 and API Std 607 double stem seal type for bubble tight shutoff. Seats and seals shall be TFE material. Ball and shaft shall be stainless steel. Provide mechanical stops to prevent cycling valve in wrong direction and self-aligning stem seal.

e. Valve Accessories: Valve operating mechanisms include chain wheels, gear operators, floor stands, electric motors, air motors and cylinder-type actuating devices. Provide accessories as follows and as indicated.

(1) Power Operators: [Electric] [Pneumatic]. Power operated valves shall open and close at rates no slower than 254 mm 10 inches per minute for gate valves and 100 mm 4 inches per minute for globe and angle valves. Valves shall open fully or close tightly without requiring further attention when actuating control is
moved to the open or closed position. A predetermined thrust exerted on the stem during operation resulting from an obstruction in the valve shall cause motor to automatically stop. Power operators shall be complete with gearing and controls necessary for size of valve being provided. Power operators shall be designed to operate on the [electric] [compressed air] power supply indicated. Provide power operators with remote position indicators on the following valves: soot blowers, [____], [____].

(2) Floor Stands and Extension Stems: Floor stands shall be cast iron or steel, constructed for bolting to floor and shall include an extension stem, an operating handwheel and a position indicator for non-rising stems. Floor stand shall be not less than 762 mm 30 inches high. Handwheel shall identify rotation direction for closing valve and shall be of such diameter as to permit operation of valve with a force of not more than 18 kg 40 pounds. Extension stems shall be corrosion resisting steel designed for rising and non-rising stems, as applicable, and for connection to valve stem by a sleeve coupling or universal joint. Provide in length required to connect valve stem and [handwheel] [operating mechanism] and of sufficient cross section to transfer torque required to operate valve. Provide floor stands and valve extensions on floors and platforms for the following valves: deaerator drain valves, [____] [____].

(3) Provide motorized actuators or chain wheels with chain and guides on valves with handwheel centerline higher than 2 meters 7 feet above floor or platform except where specified otherwise. Chainwheel operator shall be fabricated of cast iron or steel and shall include a wheel, endless chain and a guide to keep the chain on the wheel. Provide galvanized steel endless chain extending from valve to within one meter 3 feet of floor or platform. Provide impact chain wheels on steam headers and other locations where the valve has a tendency to stick. When a valve is motorized, provide hand operation for emergency.

(4) Provide gear operators on ball valves larger than 80 mm 3 inches and on gate valves 200 mm 8 inches and larger.

f. Steam Pressure Regulating Valves: CID A-A-50558, minimum of Class [125] [150] [250] [300], except as specified otherwise. [Cast iron], [cast steel] valve body with valve seats and disc of replaceable heat treated stainless steel. Valves shall be single seated, shall seat tight under dead end conditions, and shall go to the closed position in the event of pressure failure of the operating medium. Valves shall be spring loaded diaphragm operated type, except valves exposed to ambient temperature of less than 2 degrees C 35 degrees F or exposed to the weather shall be piston operated type. Capacity of valves shall be not less than that indicated. Pilot valves shall have strainer at inlet from external feeder piping:

(1) Spring Loaded Diaphragm Operated Valves: Fabricate main spring of stainless steel, and it shall not be in the path of steam flow through the valve. Control valve by pilot valve through external feeder piping.

(2) Piston Operated Valves: Control valve by integral pilot valve through external feeder piping.
g. Safety Relief Valves: ASME BPVC SEC I, with Class [150] [300] inlet flange, with test lever, designed for the intended service.

2.15.3.5 Bolts and Nuts

a. Bolts: ASTM A193/A193M, Grade B8. Lengths of bolts shall be such that not less than two full threads will extend beyond nut with bolts tightened to the required tensions and washers seated.

2.15.3.6 Gaskets

ASME B31.1 and as specified below, except provide spiral wound metal covered non-asbestos gaskets in lieu of compressed sheet non-asbestos. Gaskets shall be as thin as the finish of surfaces will permit. Do not use paper, vegetable fiber, rubber, or rubber inserted gaskets for temperatures greater than 121 degrees C 250 degrees F. Provide metal or metal jacketed non-asbestos gaskets with small male and female and small tongue-and-groove flanges and flanged fittings; they may be used with steel flanges with lapped, large male and female, large tongue-and-groove, and raised facings. Provide fullface gaskets with flat-faced flanges. Raised face cast iron flanges, lapped steel flanges, and raised faced steel flanges shall have ring gaskets with an outside diameter extending to inside of bolt holes. Widths of gaskets for small male and female and for tongue-and-groove joints shall be equal to widths of male face and tongue. Gaskets shall have an inside diameter equal to or larger than port opening. Dimensions for nonmetallic gaskets shall be in accordance with ASME B16.21. Materials for flanged gaskets shall be as listed below for service specified:

a. Steam, Boiler Blowdown, Exhaust Steam: Spiral wound metal composition or copper

b. Boiler Feed Water: Metal jacketed non-asbestos, copper or monel

c. Hot Water, (above 38 degrees C 100 degrees F): Spiral wound metal non-asbestos

d. Cold Water: Red rubber or neoprene rubber

e. Heavy Fuel Oil (No. 6): Spiral wound metal non-asbestos, soft steel, or monel

f. Diesel Fuel (No. 2): ASME B16.21 metallic

g. Compressed Air: Spiral wound metal non-asbestos

2.15.3.7 Expansion Joints

a. Slip Tube Expansion Joints: ASTM F1007, single or double slip tube as indicated, designed for [1034] [2068] kPa (gage) [150] [300] psig saturated steam working pressure. Expansion joints shall be of the type which permits injection of semi plastic type packing while joint is in service under full line pressure. Slip tube shall be of chromium plated, wrought steel construction, guided by internal and external guides integral with joint body. Fit slip tube ends with forged steel pipe flanges or bevel for welding into pipe line where indicated. Deliver joints complete with packing and ready for installation.
b. Ball Expansion Joints: Capable of 360 degrees rotation plus 15 degrees angular flex movement. Ball joints shall have steel bodies and polished steel balls. Provide end connections to suit class of piping hereinbefore specified. Seals shall be of pressure molded composition designed for the working pressure. Design joints for [1034] [2068] kPa (gage) [150] [300] psig saturated steam working pressure. Cold set joints as necessary to compensate for temperature at time of installation. Do not use ball joints on superheated steam or on joints subject to frequent flexure. Ball joints shall be installed in strict accordance with recommendations of the manufacturer.

c. Bellows Expansion Joints: ASTM F1120 flexible guided type with stainless steel expansion element, internal sleeves and external covers. Joints shall be designed for a working pressure of [_____] kPa (gage) psig and a temperature of [_____] degrees C F.

2.15.3.8 Pipe Hangers and Supports

MSS SP-58 and MSS SP-69, Type [_____] or Type [_____] of the adjustable type, except as specified or indicated otherwise. Suspended steam and condensate piping shall have pipe hangers Type [_____] with insulation protection saddles Type [______]. Provide insulated piping, except steam and condensate piping, with insulation protection shields Type 40. Provide bronze or copper plated collars on uninsulated copper piping. Support rods shall be steel. Rods, hangers and supports shall be zinc plated, except for uninsulated copper piping which shall be copper plated; cast iron rollers, bases and saddles may be painted with two coats of heat resisting aluminum paint in lieu of zinc plating. Axles for cast iron rollers shall be stainless steel. Size hanger rods with a 150 percent safety factor for a seismic design.

2.15.3.9 Instrumentation

a. Pressure and Vacuum Gages: Conform to applicable requirements of ASME B40.100.

b. Indicating Thermometers: Liquid-in-glass or MIL-T-19646 dial type. Thermometer shall include a separable immersion well.

2.15.3.10 Miscellaneous Pipeline Components

a. Cold and Hot Water Meters: CID A-A-59224 for maximum flow of [_____] L/s at 38 degrees C gpm at 100 degrees F and reduced flow of up to [_____] L/s at 121 degrees C gpm at 250 degrees F.

b. Air Traps: Float controlled valves arranged to close properly when water enters traps. Air traps shall conform to requirements for float operated steam traps (non-thermostatic), CID A-A-60001, except that valve mechanism shall be inverted so as to be closed, not opened, by rising water.

c. Steam Traps: CID A-A-60001. Inverted bucket high pressure steam traps designed for use at [_____] kPa (gage) psig at [_____] degrees C F. Low pressure steam traps shall be float and thermostatic type for pressures up to 103 kPa (gage) 15 psig. Provide traps with separate strainers unless specified otherwise.

d. Strainers: FS WW-S-2739, Style Y for Class [125] [250] with blow off
Construct strainers for Class 300 of cast carbon steel in accordance with ASME B16.5 for minimum of 2068 kPa (gage) 300 psig saturated steam pressure. Provide blow off outlet with pipe nipple and gate valve.

2.15.3.11 Backflow Preventers

Reduced pressure principle type conforming to applicable requirements of [AWWA C510 and AWWA C511] [Section 22 00 00 PLUMBING, GENERAL PURPOSE].

2.15.3.12 Insulation

Materials and application shall be as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

2.15.3.13 Pipe Sleeves

a. Floor Slabs, Roof Slabs, and Outside Walls Above and Below Grade: Galvanized steel pipe having an inside diameter at least 15 mm 1/2 inch larger than outside diameter of pipe passing through it. Provide sufficient sleeve length to extend completely through floors, roofs, and walls, so that sleeve ends are flush with finished surfaces except that ends of sleeves for floor slabs shall extend 13 mm 1/2 inch above finished floor surface. Sleeves located in waterproofed construction shall include flange and clamping ring.

b. Partitions: Galvanized sheet steel, 26 gage or heavier, of sufficient length to completely extend through partition thickness with sleeve ends flush with partition finished surface.

2.15.3.14 Piping Identification

Conform to MIL-STD-101 and place in clearly visible locations; except paint piping in the boiler room the primary color of the color code. Provide labels and tapes conforming to ASME A13.1 in lieu of band painting or stenciling. Labels shall be outdoor grade acrylic plastic. Markings on labels shall indicate direction of flow, flowing media, and media design pressure and temperature. Spacing of identification marking shall not exceed 3 meters 10 feet. Provide two copies of complete color and stencil codes used. Frame codes under glass and install where directed.

2.16 FIRE PROTECTION SYSTEM

Provide fuel oil room with a wet sprinkler system as specified in Section 21 13 13 WET PIPE SPRINKLER SYSTEMS, FIRE PROTECTION.

2.17 MARKING

Identify equipment, valves, switches, motor controllers, and controls or indicating elements by printed, stamped or manufactured identification plates or tags of rigid plastic or non-ferrous material. Lettering for identification plates or tags shall be not less than 5 mm 3/16 inch high. Nomenclature and identification symbols used on the identification plates or tags shall correspond to those used in maintenance manuals, operating instructions, and schematic diagrams. Rigidly affix identification plates or tags to the equipment or devices without impairing functions or, when this is not possible, attach using a non-ferrous wire or chain. In addition to identification plate or tag, each major component of equipment shall have a nameplate listing manufacturer's name, model number, and when
applicable, electrical rating and other information required by pertinent standards or codes.

2.18 TOOLS AND TESTING EQUIPMENT

Provide special tools and wrenches required for installation, maintenance, and operation of equipment. Testing equipment to be provided shall include necessary equipment to perform routine tests:

a. On lubricating oil for acidity (pH-potentiometer), viscosity (saybolt test), and dirt (gravimetric).

b. On softened water for hardness (soap test or colorimetric test), and boiler blowdown water for pH (colorimetric) and conductivity (potentiometer).

c. For water (distillation) and sediment (gravimetric) in fuel oil.

2.19 WELDING MATERIALS

Comply with ASME BPVC SEC II-C. Welding equipment, electrodes, welding wire, and fluxes shall be capable of producing satisfactory welds when used by a qualified welder or welding operator using qualified welding procedures.

2.20 MOTORS AND DRIVES

Alternating current electric motors shall meet requirements of NEMA MG 1. Motors shall be designed for continuous operation at rated load under usual service conditions as defined by NEMA. Unless specifically noted otherwise, motors less than 3/8 kW 1/2 hp shall be 115 volt, 60 Hz, single phase, capacitor-start, or permanent split capacitor, with Class B insulation for 40 degrees C 104 degrees F ambient. Unless specifically noted otherwise, motors 3/8 kW 1/2 hp and larger shall be 460 volt, 60 Hz, three phase, Design B, squirrel cage induction with a minimum insulation of Class F for 40 degrees C 104 degrees F ambient. Size motors to meet power requirements of driven unit at design conditions, including drive and coupling losses which are incurred, without loading motor beyond its nameplate horsepower rating. Minimum service factor for open drip-proof motors shall be 1.15 and for totally enclosed, fan cooled motors 1.0. Motor shall be quiet operating. Bearings shall be heavy duty, grease lubricated, anti-friction, single shielded, regreasable type and shall have approved lubricating fittings extended to an easily accessible location for field servicing. Provide sole plates for motors installed on concrete pads. Motor shall have copper windings.

2.20.1 Motors

Motors used to drive equipment specified under "Coal Handling Equipment" shall be designed to operate in Class II, Division II, Group F atmosphere.

2.20.2 SOURCE QUALITY CONTROL

2.20.3 Instrument Air Compressor Package

Factory test air compressor package at full load for not less than 2 hours. Check capacity, smoothness of operation, alternation of units, and proper operation of air unloaders during test.
PART 3  EXECUTION

3.1  INSTALLATION

Install materials and equipment as indicated and in accordance with manufacturer's recommendations.

3.1.1  Boiler and Equipment Installation

Boiler and equipment installation shall be strictly in accordance with this specification, and installation instructions of the manufacturers. Grout equipment mounted on concrete foundations before installing piping. Install piping in such a manner as not to place a strain on equipment. Do not bolt flanged joints tight unless they match adequately. Expansion bends shall be adequately extended before installation. Grade, anchor, guide and support piping, without low pockets.

3.1.1.1  Boiler and Equipment Foundations

Of sufficient size and weight, and proper design to preclude shifting of equipment under operating conditions, and under abnormal conditions which could be imposed upon equipment. Design boiler foundation to accommodate and support stoker and incorporate stoker ash pits. Limit equipment vibration to within acceptable limits, and isolate. Foundations shall be adequate for soil conditions of the site and shall meet requirements of the equipment manufacturer. Trowel exposed foundation surfaces smooth except properly roughen surfaces to receive grout.

3.1.1.2  Installing Stoker Ash Pit Firebrick

Lay up in air-setting mortar. Dip each brick in mortar, rub, place into its final position, and then tap with a wooden mallet until it touches adjacent bricks. Mortar thick enough to lay with a trowel will not be permitted. Maximum mortar joint thickness shall not exceed 3 mm 1/8 inch and average joint thickness shall not exceed 1.60 mm 1/16 inch.

3.1.1.3  Forced and Induced Draft Fans

Set, shim level, anchor and grout each fan assembly into place prior to setting driver. Properly shim driver on base plate using steel shim stock. Shims shall be full size of feet and shall have slotted hole for installation. After drive has been properly aligned and shimmed, by an approved millwright, millwright shall drill and ream foot and base plate and install taper pins with nut on top for pullout removal. One front foot and diagonally opposite rear foot shall be pinned to base plate. Equipment shall be adequately bolted in place in an approved manner. Level and grout fan and bearing pedestal sole plates in place.

3.1.1.4  Stack

Install level and plumb. Erected stack shall be no more than 25 mm one inch out of plumb per 15 meters 50 feet. Remove roughness, marks, and lifting lugs, from stack and grind surfaces smooth and flush with surrounding surfaces.

[3.1.1.5  Horizontal Fuel Oil Tanks (Below Ground)]

**************************************************************************

NOTE: Choose this subparagraph or the subparagraph

SECTION 23 52 33.01 20  Page 148
below, HORIZONTAL FUEL OIL TANKS (ABOVE GROUND), or the following subparagraph VERTICAL FUEL OIL TANK.

Provide concrete ballast slabs for tanks and concrete protective ground level slabs for FPR tanks. Ballast slabs shall be full length and width of tanks and protective slabs shall extend 610 mm 2 feet beyond tanks. Concrete work shall be as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

a. Install and backfill fiberglass reinforced tanks as recommended by the manufacturer; backfill adjacent to tanks shall be pea gravel unless otherwise recommended by the manufacturer. Backfill for steel tanks shall be sand.

b. Set steel tanks on a bed of sand not less than 152 mm 6 inches deep over the concrete slab and strap in place with stainless steel hold-down straps with stainless steel turnbuckles. Set FRP tanks on a bed of pea gravel not less than 305 mm 12 inches thick and pre-shape for tank contours for FRP tanks. Fabricate straps for FRP tanks from FRP resins reinforced with stainless steel to prevent breaking of straps and floating of empty tanks.

c. Slope tank toward sump not less than 25 mm one inch in each 1 1/2 meters 5 feet.

3.1.1.6 Horizontal Fuel Oil Tanks (Above Ground)

Continuously support steel tank saddles along the full length of the base and level and grout to ensure full bearing.

3.1.1.7 Vertical Fuel Oil Tank

Provide [sand, crushed stone or fine gravel cushion] [concrete base].

a. Sand, Crushed Stone or Fine Gravel Cushion: Cover area beneath tank with a fuel resistant plastic membrane with a thickness of not less than 0.51 mm 20 mils. Carefully fuse or cement plastic membrane seams. Lay plastic over a thoroughly compacted select subgrade free from rocks that could puncture the plastic. Over plastic, provide a bed of sand, crushed stone or fine gravel not less than 152 mm 6 inches thick. Stabilize bed with an approved material and shape to tank bottom. Slope bed down to center sump approximately 152 mm 6 inches for each 3 meters 10 feet of tank radius. When in place, tank shell shall be plumb.

b. Concrete base shall be as indicated and in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE.

c. Mastic Seal: Place mastic seal between tank and concrete ring to the cross section indicated. Compact mastic thoroughly. Immediately before placing mastic, coat tank surfaces to be in contact with concrete ring with a coat of AASHTO M 118 bituminous material.

3.1.2 Piping

Unless specified otherwise, erection, welding, brazing, testing and inspection of piping shall be in accordance with ASME B31.1 and Section 40 17 26.00 20 WELDING PRESSURE PIPING. Piping shall follow the general
arrangement shown. Cut piping accurately to measurements established for the work. Work piping into place without springing or forcing, except where cold-springing is specified. Piping and equipment within buildings shall be entirely out of the way of lighting fixtures and doors, windows, and other openings. Locate overhead piping in buildings in the most inconspicuous positions. Do not bury or conceal piping until piping has been inspected, tested, and approved. Where pipe passes through building structure, conceal pipe joints but locate where they may be readily inspected and building structure not be weakened. Avoid interference with other piping, conduit, or equipment. Except where specifically shown otherwise, run vertical piping plumb and straight and parallel to walls. Install piping connected to equipment to provide flexibility for vibration. Support and anchor piping so that strain from weight of piping is not imposed on equipment.

3.1.2.1 Fittings

Provide long radius ells on welded piping to reduce pressure drops. Mitering of pipe to form elbows, notching straight runs to form full sized tees, or similar construction shall not be used. Make branch connections with welding tees, except factory made forged welding branch outlets or nozzles having integral reinforcements conforming to ASME B31.1 may be provided.

3.1.2.2 Grading of Pipe Lines

Unless indicated otherwise, install horizontal lines of steam and return piping to grade down in the direction of flow with a pitch of not less than 25 mm in 9 meters one inch in 30 feet, except in loop mains and main headers where flow may be either direction. Pitch air lines to source of supply, and make provisions for draining off condensate. Install water lines to drain to a shutoff valve.

3.1.2.3 Anchoring, Guiding, and Supporting Piping

Anchor and support piping in a manner such that expansion and contraction will take place in the direction desired, prevent vibration by use of vibration dampeners, and prevent undue strains on boilers and equipment served. Fabricate hangers used for the support of piping of 50 mm 2 inch nominal pipe size and larger to permit adequate adjustment after erection while still supporting the load. Provide wall brackets where pipes are adjacent to walls or other vertical surfaces which may be used for supports. Provide supports to adequately carry weight of the lines and maintain proper alignment. Provide inserts and sleeves for supports in concrete where necessary and place in new construction before pouring concrete. Provide insulated piping with a pipe covering protection saddle at each support. Provide pipe guides and anchors of approved type at points where necessary to keep pipes in accurate alignment, to direct expansion movement, and to prevent buckling and swaying and undue strain. Provide pipe guides for alignment of pipe connected to free unanchored end of each expansion joint. Support pipe rollers in concrete conduits and trenches by extra strong steel pipe with ends inserted in slots provided in concrete walls. Set pipe supports for rollers at correct elevations either by metal shims or by cutting away of concrete and after pipe lines have been placed in alignment, grout ends of pipe supports and fix in place. Space pipe supports to provide adequate support for pipes. Pipe shall not have pockets formed in the span due to sagging of pipe between supports, caused by weight of pipe, medium in the pipe, insulation, valves, and fittings. Maximum spacing for pipe supports for steel pipe shall be in
accordance with ASME B31.1; maximum spacing for supports for copper tubing shall be in accordance with MSS SP-69.

### 3.1.2.4 Copper Tubing

Copper tubing shall have solder joints with solder suitable for pressure-temperature ratings of piping system. Tubing 20 mm 3/4 inch and smaller for instrument air may be compression joint in lieu of soldered joint. Tin-antimony (95/5) solder is suitable for saturated steam up to 103 kPa (gage) 15 psig but tin lead (50/50) solder is not acceptable for steam service. Flux shall be non corrosive. Wipe excess solder from the joints.

### 3.1.2.5 Sleeves

Provide pipe sleeves where pipes and tubing pass through masonry and concrete walls, floors, and partitions. Space between pipe, tubing, or insulation and the sleeve shall be not less than 6 mm 1/4 inch. Hold sleeves securely in proper position and location before and during construction. Sleeves shall be of sufficient length to pass through entire thickness of walls, partitions, and slabs. Sleeves in floor slabs shall extend 13 mm 1/2 inch above the finished floor. Firmly pack space between pipe or tubing and the sleeve with oakum and caulk on both ends of sleeve with elastic cement.

### 3.1.2.6 Flashing for Buildings

Where pipes pass through building roofs and outside walls, provide proper flashing and counter flashing and make tight and waterproof.

### 3.1.2.7 Outlets for Future Connections

Locate as directed capped or plugged outlets for connections to future equipment, when not located exactly by project drawings.

### 3.1.2.8 Screwed Joints in Piping

Use teflon tape or suitable pipe joint compound applied to male threads only for making up screwed joints. Piping shall be free from fins and burrs. Ream or file out pipe ends to size of bore, and remove chips.

### 3.1.2.9 Welded Joints

Weld joints in piping by the metal-arc or gas welding processes in accordance with ASME B31.1 and as specified in Section 40 17 26.00 20 WELDING PRESSURE PIPING. Number or mark each weld to identify the work of each welder on welds on which stress relieving or radiographic inspection is required.

a. Contracting Officer reserves the right to require the Contractor to provide re-examination and recertification of welders.

b. Radiographic testing of circumferential butt welded joints of pipe with operating temperature of 177 degrees C 350 degrees F and above shall be required on ten percent of the joints, the location of which will be determined by the Contracting Officer; when more than ten percent of the radiographically tested joints show unacceptable defects radiographically test every joint of this type piping.
c. Equipment and Protection: Items of equipment for welding shall be so designed and manufactured, and shall be in such condition as to enable qualified operators to follow procedures and to attain results specified. Protect welders and gas cutters from the light of the arc and flame by approved goggles, shields, helmets, and gloves. Replace cover glasses in helmets and shields when they become sufficiently marred to impair the operator's vision. Take care to avoid risk of explosion and fire when welding and gas cutting near explosive or flammable materials. Ventilate welding and gas cutting operations in accordance with paragraph 1910.252 (f) of 29 CFR 1910-SUBPART Q.

d. Surface Conditions: Do not weld when atmospheric temperature is less than minus 18 degrees C zero degrees F, when surfaces are wet, when rain or snow is falling or moisture is condensing on surfaces to be welded, nor during periods of high wind, unless welder and work are protected properly. At temperatures between 0 degrees C and minus 18 degrees C 32 degrees F and zero degrees F, heat with a torch the surface for an area within 80 mm 3 inches of the joint to be welded to a temperature warm to the hand before welding. Free surfaces to be welded from loose scale, slag, rust, paint, oil, and other foreign material. Joint surfaces shall be smooth, uniform and free from fins, tears, and other defects which might affect proper welding. Remove slag from flame-cut edges to be welded by grinding, but temper color need not be removed. Thoroughly clean each layer of weld metal by wire brushing prior to inspection or deposition of additional weld metal.

3.1.2.10 Cleaning of Piping

Before installing pipe, thoroughly clean pipe of sand, mill scale and other foreign material. After erection but before making final connections to apparatus, thoroughly clean interior of piping. Flush piping with water except air and fuel lines. In addition, blow out steam lines with intermittent high pressure steam blows to promote shedding of internal scale. Blow compressed air and fuel oil lines clean with 552 to 690 kPa (gage) 80 to 100 psig air dried to a 2 degrees C 35 degree F dew point at 552 kPa (gage) 80 psig. Sterilize potable water piping by means of liquid chlorine or hypochlorite in accordance with AWWA C651 before placing water system in service. Take care during fabrication and installation, to keep piping, valves, fittings and specialties free of loose welding metal chips of metal or slag, welding rods and foreign matter. Blowing or flushing shall in no case be channeled through equipment, pump, control valve, regulating valve, instrument gage or specialty in the system. Provide temporary screens, strainers, connections, spool pieces and bypasses consisting of piping or hoses, pumps and other required equipment temporarily installed for the purpose of cleaning and flushing piping. Drain flushing water and test water to the sanitary sewer system.

3.1.2.11 Reduction in Pipe Size

Provide reducing fittings for changes in pipe size; bushings will not be permitted. In horizontal steam lines, reducing fittings shall be the eccentric type to maintain bottom of lines in the same plane. In horizontal water mains, reducers shall be set to maintain top of lines in the same plane.

3.1.2.12 Expansion Control

Provide bends, loops, and offsets wherever practical to relieve overstressed piping systems due to thermal expansion and to provide
adequate flexibility. Cold spring piping system as indicated but not more than 50 percent of the total linear expansion.

3.1.2.13 Connection to Equipment

Provide unions or flanges where necessary to permit easy disconnection of piping and apparatus. Provide unions and gate valves at each connection to threaded end control valves, strainers and equipment.

3.1.2.14 Valve Installation

Install valves in positions accessible for operation and repair. Install stems in a vertical position with handwheels or operators on top or in a horizontal position. Do not install handwheels on stop valves below the valve. When centerline of valve is more than 2 meters 7 feet above floor or platform, provide valve with a chain-operated handwheel. When valve is motorized, provide hand operation for emergency use.

a. Gate Valves: Arrange back outlet gate valves for turbine exhaust for hand operation and provide with a floor stand.

b. Globe Valves: Pressure shall be below the disc. Install globe valves with stems horizontal on steam and exhaust lines, when better drainage is required or desired.

c. Steam Pressure-Reducing Valves: Provide steam line entering each pressure-reducing valve with a strainer. Provide each pressure-reducing valve unit with two shutoff valves and with a globe or angle bypass valve and bypass pipe. A bypass around a reducing valve shall be of reduced size to restrict its capacity to approximately that of the reducing valve. Provide each pressure-reducing valve unit with indicating steam gages to show reduced pressure and upstream pressure and an adequately sized safety valve on low pressure side.

d. Valve Tags and Charts: Permanently tag each valve with a black and white engraved laminated plastic tag showing valve number, valve function and piping system and whether another valve must be opened or closed in conjunction with this valve. Furnish a typed chart which will show required valve tagging plus the location of each valve. Frame valve charts under glass and install as directed.

3.1.2.15 Traps and Connections

Traps shall be of the type and capacity for the service required, and shall be properly supported and connected. Except for thermostatic traps in pipe coils, radiators, and convectors, install traps with a dirt pocket and strainer between trap and piping or apparatus it drains. When it is necessary to maintain in continuous service, apparatus or piping which is to be drained, provide a three valve bypass so that trap may be removed and repaired and condensate drained through the throttled bypass valve. Provide a check valve on the discharge side of the trap when trap is installed for lift or operating against a back pressure, or trap discharges into a common return line. Provide test connections on the discharge side of the high and medium pressure traps when specifically required. Test connection shall include a 1/2-inch globe valve with open blow.
3.1.2.16 Pressure Gage Installation

Provide with a shutoff valve or petcock between the gage and the line, and provide gage on steam lines with a siphon installed ahead of the gage.

3.1.2.17 Thermometers and Thermal Sensing Element of Control Valves

Provide with a separable socket. Install separable sockets in pipe lines in such a manner to sense the temperature of the flowing fluid and minimize obstruction to flow.

3.1.2.18 Strainer Locations

Provide strainers with meshes suitable for the services upstream of each control valve and where dirt might interfere with the proper operation of valve parts, orifices, or moving parts of equipment.

3.1.2.19 Dissimilar Piping Materials

Provide dielectric unions or flanges between ferrous and nonferrous piping, equipment, and fittings, except that bronze valves and fittings may be used without dielectric couplings for ferrous-to-ferrous or nonferrous-to-nonferrous connections. Dielectric fittings shall utilize a nonmetallic filler which will prevent current flow from exceeding one percent of the short circuit current. Spacer shall be suitable for pressure and temperature of the service. Fittings shall otherwise be as specified in this section.

3.1.2.20 Surface Treating, and Pipe Wrapping

Uninsulated steel piping buried in the ground shall have exterior surfaces protected with a tape wrapping system or a continuously extruded polyethylene coating system as specified in Section 09 97 13.28 PROTECTION OF BURIED STEEL PIPING AND STEEL BULKHEAD TIE RODS.

3.1.3 PAINTING

3.1.3.1 Piping, Fittings, and Mechanical and Electrical Equipment

Equipment shall be factory finished to withstand the intended end use environment in accordance with the specifications for particular end item. Retouch damaged areas on factory finished equipment on which finish has been damaged and then give a complete finish coat to restore finish to original condition. Finish coat shall be suitable for exposure in the intended end use environment.

3.1.3.2 Painting

Unless specified otherwise, paint pipe hangers, structural supports, pipe and pipe fittings, conduit and conduit fittings, air grilles, pipe coverings, insulation, and metal surfaces associated with mechanical and electrical equipment including zinc-coated steel ducts as specified in Section 09 90 00 PAINTS AND COATINGS. Zinc-coated steel duct in unpainted areas shall not be painted. Apply a protective coating to piping to be insulated, except zinc-coated and copper pipe, prior to installing insulation.
3.1.3.3 Boilers

After erecting and testing boilers, clean as necessary exposed surfaces of the boiler normally painted in commercial practice to remove grease, coal dust, flyash and other foreign matter and finish with one coat of aluminum heat resisting paint applied to minimum dry film thickness of 0.025 mm one mil.

3.1.3.4 Vertical Fuel Oil Tank

Clean interior surfaces to bare metal in accordance with SSPC SP 10/NACE No. 2. Clean to bare metal by powered wire brushing or other mechanical means surfaces that cannot be cleaned satisfactorily by blasting. Wash members which become contaminated with rust, dirt, oil, grease, or other contaminants with solvents until thoroughly clean. Remove weld backing plates prior to blast cleaning; when left in place, round off corners prior to blast cleaning and coating. Tanks shall be internally coated in accordance with Section 09 97 13.15 LOW VOC POLYSULFIDE INTERIOR COATING OF WELDED STEEL PETROLEUM FUEL TANKS.

3.1.3.5 Surfaces Not to be Painted

Unless specified otherwise, do not paint equipment having factory applied permanent finish, switchplates and nameplates, motor starters, and concrete foundations.

3.1.4 INSULATION

Insulate mechanical equipment, systems and piping as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

3.2 FIELD QUALITY CONTROL

Provide labor, equipment, test apparatus and materials required for preparation and performance of tests and inspections specified to demonstrate that boilers and auxiliary equipment as installed are in compliance with contract requirements. During start up and during tests, ensure that factory trained engineers or technicians employed by the boiler manufacturer and system suppliers or manufacturers of such components as the boiler, burner, forced draft fan, feedwater treatment equipment, and other auxiliary equipment be present, to ensure the proper functioning, adjustment, and testing of the individual components and systems. Furnish a detailed written record of test conditions, test procedures, field data, and start up and operational performance of the entire heating plant to the Contracting Officer before the Contractor's operational and test personnel leave the site. The Government will furnish, if available, water, electricity and fuel for the tests, except fuel required for retesting. The Contractor shall rectify defects disclosed by tests and retest equipment. The Contractor's boiler plant personnel shall be experienced in starting up and operating boiler plants.

3.2.1 Tests and Inspections (Piping)

Examine, inspect, and test piping in accordance with ASME B31.1 except as modified below. Rectify defects disclosed by tests. Necessary subsequent tests required to prove system tight after additional work by the Contractor shall be provided by the Contractor. Make tests under the direction of and subject to the prior approval of the Contracting Officer.
3.2.1.1 Hydrostatic and Leak Tightness Tests

a. Perform hydrostatic and leak tightness test on piping systems attached to the boilers and included under jurisdiction of ASME BPVC SEC I in accordance with requirements of that Code. Piping bearing ASME Code symbol stamp will be accepted only as indicating compliance with the design and material requirements of the code.

b. Test piping which is a part of the steam generation or auxiliary systems, including piping within the boiler room and external to the boiler room, by the following methods:

(1) Perform hydrostatic test at 150 percent of design pressure for welded and screwed steel piping systems except those for air, oil, and gas. Hold hydrostatic tests for a period of one hour with no pressure loss. Temperature of testing fluid shall not exceed 38 degrees C 100 degrees F.

(2) Test air and oil lines in accordance with requirements of ASME B31.1 for pneumatic tests with exception that the test pressure shall be held for one hour. Examination for leaks shall be by a soap or other foaming agent test.

(3) Inspection and test of gas piping shall conform to the requirements of NFPA 54.

c. For tests install a calibrated test pressure gage in the system to observe loss in pressure.

3.2.2 Preliminary Operation

The Contractor under the direction of the respective manufacturer's representative shall place in operation equipment provided by the Contractor except as specifically noted otherwise. Make adjustments to equipment that are necessary to ensure proper operation as instructed by the equipment manufacturer.

a. Lubricate equipment prior to operation in accordance with manufacturer's instructions. Provide lubricants. Furnish lubrication gun with spare cartridges of lubricant to operating personnel.

b. Dry out motors before operation as required to develop and maintain proper and constant insulation resistance.

c. Check drive equipment couplings for proper alignment at both ambient and operating temperature conditions.

3.2.3 General Start-Up Requirements

Prior to initial operation of complete system, check each component as follows:

a. Inspect bearings for cleanliness and alignment and remove foreign materials found. Lubricate as necessary and in accordance with manufacturer's recommendations. Replace bearings that run roughly or noisily.

b. Adjust direct drives for proper alignment of flexible couplings. Provide lubrication when a particular coupling so requires.
security of couplings to driver shafts. Set drive components to ensure free rotation with no undesirable stresses present on the coupling of attached equipment.

c. Check motors for amperage comparison to nameplate value. Correct conditions that produce excessive current flow and that exist due to equipment malfunction.

d. Check speeds of each motor and driven apparatus to ensure that motors are operating at the desired point.

e. Check actual suction and discharge pressure of each pump against desired performance curves.

f. Check pump packing glands or seals for cleanliness and adjustment before running each pump. Inspect shaft sleeves for scoring and proper placement of packing; replace when necessary. Ensure piping system is free of dirt and scale before circulating liquid through pumps.

g. Inspect both hand and automatic control valves. Clean bonnets and stems, tighten glands to ensure no leakage, but permit valve stems to operate without galling. Replace packing in valves that require same to retain maximum adjustment after system is judged complete. Replace entire packing in valves that continue to leak after adjustment. Remove and repair bonnets that leak. Coat packing gland threads and valve stems with a suitable surface preparation after cleaning.

h. Inspect and make certain that control valve seats are free from foreign matter and are properly positioned for intended service.

i. Check flanges and packing glands after system has been placed in operation. Replace gaskets in flanges that show signs of leakage after tightening.

j. Inspect screwed joints for leakage and remake each joint that appears to be faulty. Do not wait for rust to form. Clean threads on both parts, apply compound and remake joint.

k. Thoroughly blow out strainers through individual valved blow-off connection on each strainer prior to placing in operation.

l. Thoroughly blow out or dismantle and clean strainers after systems have been in operation one week. Thoroughly clean, repair, and place back in service traps or other specialties in which foreign matter has accumulated, causing malfunction or damage.

m. Adjust pipe hangers and supports for correct pitch and alignment.

n. Remove rust, scale and foreign materials from equipment and renew defaced surfaces. When equipment is badly marred, the Contracting Officer shall have authority to request new materials be provided.

o. Adjust and calibrate temperature, pressure and other automatic control systems.

p. Inspect each pressure gage and thermometer for calibration, and replace those that are defaced, broken or read incorrectly.

q. Vertical Fuel Oil Tank Calibration: After completing installation of
tank, prepare a calibration table for the tank showing fuel volume in liters, gallons in the tank to any height of liquid in meters and mm feet, inches, and eighths of an inch when measured by a steel tape lowered through the roof. Calibrate tank in accordance with API MPMS 2.2A for "critical measurement" "operating control." Perform calibration of tank by a qualified organization that can certify to at least 2 years of prior successful and accurate experience in calibrating tanks of comparable type and size. Correct data obtained for use with product to be stored.

3.2.4 Plant Equipment Tests

3.2.4.1 Plant Air Compressors

Test plant air compressors in service to determine compliance with contract requirements and warranty. During tests, test equipment under every condition of operation. Test safety controls to demonstrate performance of their required function. Completely test system for compliance with specifications.

3.2.4.2 Instrument Air Compressors

Test air compressor package at full load for not less than 2 hours. Check capacity, smoothness of operation, alternation of units, and proper operation of the air unloaders during the test.

3.2.4.3 Coal Handling System

Test coal handling system under operating conditions and demonstrate that work is in conformance with the specified requirements. Conduct this test in the presence of the Contracting Officer.

3.2.4.4 Ash Handling System

Test ash handling system under operating conditions and demonstrate that work is in conformance with specified requirements. Conduct test in the presence of the Contracting Officer.

3.2.4.5 Horizontal Fuel Oil Tanks (Below Ground)

**************************************************************************
NOTE: Choose this subparagraph or the subparagraph below, VERTICAL FUEL OIL TANK.
**************************************************************************

a. Test tanks before placing in service, in accordance with applicable paragraphs of the code under which tanks were built. An UL label, ASME Code Stamp, or API monogram on a tank shall be evidence of compliance with code requirements.

b. Holiday Detection Test: Inspect coal tar epoxy coating system for film imperfections using a low voltage (75 volt) holiday tester. Inspect FRP coated tanks with a 10,000 volt spark test for imperfections or holidays. Repair holidays or pinholes in the coatings.

3.2.4.6 Vertical Fuel Oil Tank

**************************************************************************
NOTE: Choose this subparagraph or the subparagraph
**************************************************************************
Inspect and test vertical fuel oil tank as specified in API Std 650. Use the radiographic method of inspection of butt welds as required by API Std 650; sectioning method will not be acceptable as an alternative to radiographic inspection.

3.2.4.7 Blowdown Valves and Try Cocks

Test blowdown valves and try cocks for proper operation.

3.2.4.8 Draft Fans, Fuel Oil Heaters, Fuel Pumps, and Electric Motors

Test draft fans, fuel oil heaters, fuel pumps, and electric motors to determine compliance with the referenced standards. Standard symbols and certifications from the referenced organization may be accepted at the discretion of the Contracting Officer. Closely observe the operation of fans, fuel oil heaters, fuel pumps, and electric motors (including variable speed motor controllers) and correct defects.

3.2.5 Boilers and Auxiliaries Tests and Inspections

The Contractor, with qualified personnel provided by the Contractor, shall make tests and inspections at the site under the direction of and subject to the approval of the Contracting Officer. The Contractor's boiler plant personnel under the direction of the respective manufacturer's representatives and consultants, shall operate each boiler and appurtenances through the entire testing period and shall ensure that necessary adjustments have been made. Notify the Contracting Officer in writing at least 7 days in advance that equipment is ready for testing. The Contractor shall provide testing equipment, including gages, thermometers, calorimeter, Orsat apparatus, thermocouple pyrometers, fuel flow meters, water meters and other test apparatus and calibrate instruments prior to testing. Draft, fuel pressure and steam flow may be measured by permanent gages and meters installed under the contract. The Contractor is responsible for providing an analysis of the fuel being used for the tests. Control of noise levels developed by exhaust steam shall be as directed by the Contracting Officer to satisfy environmental conditions of the surrounding area. Perform the following tests and, when feasible, in the sequence listed:

a. Strength and tightness tests
b. Standards compliance tests
c. Preliminary operational tests (steady state combustion test and variable load combustion test)
d. Tests of auxiliary equipment
e. Feedwater equipment test
f. Capacity and efficiency tests

3.2.5.1 Strength and Leak Tightness Tests

Subject the boiler[s] to the following strength and tightness tests:
a. Watersides Including Fittings and Accessories: Hydrostatically test watersides in accordance with requirements of ASME BPVC SEC I. The ASME label will be accepted as evidence of this test.

b. Boiler Casing, Breeching and Ductwork: Prior to installing breeching and ductwork, boiler[s] [on the furnace side] shall be pneumatically tested, at the maximum possible draft pressure of the boiler furnace; the soap bubble method [and] [or] a smoke test shall be used to verify tightness of the casing. Boiler casing, breeching and ductwork shall be pressurized with the forced draft fan to the maximum draft pressure; the smoke test shall be used to verify tightness of the casing, breeching and ductwork. Leaks observed or detected shall be sealed.

3.2.5.2 Boiler Inspection

Ensure that the Boiler Inspector is present to witness the appropriate tests which need to be observed in order to certify the safety of the boiler. The inspection shall include requirements of NAVFAC MO 324. The Boiler Inspector shall complete NAVFAC form 9-11014/40, Data Record Sheet; NAVFAC form 9-11014/41, Inspection Report; NAVFAC form 9-11014/32 Inspection Certificate for each boiler after boiler has been inspected and found to be safe. No boiler may be fired until it has passed the inspection of the Boiler Inspector. The boiler inspection forms shall be submitted through the Contractor to the Contracting Officer. Place the Inspection Certificate under framed glass, and mounted on or near the boiler in a conspicuous location.

3.2.5.3 Boiler Cleaning and Startup

Dry out, boil out, and operate the firing rate of the new boiler[s] under direct responsibility and supervision of the manufacturer[, and in the presence of the boiler room operating personnel]. Provide chemicals that are required. Allow sufficient time for the boiling out process to ensure interior surfaces are clean. This time shall be at least 24 continuous hours and generally not more than 36 hours; boil out shall continue until water is clear. Boil out, cleaning and starting procedures shall be in accordance with requirements of ASME BPVC SEC VII and FM DS 12-17.

3.2.5.4 Boiler Preliminary Operational Tests

Conduct a boiler operational test on each unit continuously for two weeks. Operate one boiler at a time to demonstrate control and operational conformance to requirements of the specifications including ability to respond to load swings from the specified capacity to minimum turndown. Operational test shall be under the supervision of a registered professional engineer or a licensed power plant operator and shall serve to prove safety, controls, maintenance of stable combustion at low loads, [proper coal distribution and combustion, and ability to operate without furnace slagging,] [proper flame lengths and patterns to avoid flame impingement on the tubes for oil firing,] and proper mechanical and electrical functioning of each system. Test shall include items specified in this section as well as items mentioned in the specification of the particular pieces of equipment. Conduct tests with factory trained combustion equipment engineers as previously specified. Test and record steam quality, steam flowrates, flue gas temperature, percentages of carbon dioxide, carbon monoxide, oxygen and nitrogen in flue gas and percent excess air for each boiler at tested load and graphically present the test data.
3.2.5.5 General Operational Tests

a. Steady State Combustion Tests: Test fuel burning and combustion control equipment with each of the specific fuels at the minimum limit of the turndown range and at increments of 50, 75 and 100 percent of full rated load. Each test run shall be at least two hours on each fuel and until stack temperatures are constant and capacity and efficiency requirements of this specification have been verified and recorded. Verify proper operation of instrumentation and gages during the tests.

b. Varying Load Combustion Tests: Test boiler continuously under varying load conditions to demonstrate proper operability of the combustion control, flame safeguard control, programming control and safety interlocks. Conduct these tests after adjustment of combustion controls has been completed under the steady state combustion tests. Continue variable load operational tests for a period of at least 8 hours.

(1) Sequencing: Boiler shall start, operate and stop in strict accordance with the specified operating sequence.

(2) Flame Safeguard: Verify operation of the flame safeguard controls by simulated flame and ignition failures. Verify trial-for-main flame ignition, combustion control reaction and valve closing times by stop watch.

(3) Immunity to Hot Refractory: Operate burner at high fire until combustion chamber refractory reaches maximum temperature. Main fuel valve shall then be closed manually. Combustion safeguard shall drop out immediately causing the safety shutoff valves to close within the specified control reaction and valve closing times.

(4) Pilot Intensity Required: Gradually reduce the fuel supply to the pilot flame to the point where the combustion safeguard begins to drop out (sense "no flame") but holds in until the main fuel valve opens. At this point of reduced pilot fuel supply, the pilot flame shall be capable of safely igniting the main burner. When the main fuel valve can be opened on a pilot flame of insufficient intensity to safely light the main flame, the boiler shall be rejected.

(5) Boiler Limit and Fuel Safety Interlocks: Safety shutdown shall be caused by simulating interlock actuating conditions for each boiler limit and fuel safety interlock. Safety shutdowns shall occur in the specified manner.

(6) Combustion Controls: Demonstrate accuracy, range and smoothness of operation of the combustion controls by varying steam demand through the entire firing range required by the turndown ratio specified for the burner. The control accuracy shall be as specified.

(7) Safety Valves: High pressure limit switch shall be locked out or otherwise made inoperative and boiler safety valves shall be lifted by steam. Determine relieving capacity, popping pressure, blowdown and reseating pressure by observation and measurement in accordance with ASME BPVC SEC I. The ASME standard symbol will be
accepted only as indicating compliance with design and material requirements of the code.

3.2.5.6 Auxiliary Equipment and Accessory Tests

Observe and test blowdown valves, stop valves, try cocks, draft fans, fuel oil heaters, pumps, electric motors, and other accessories and appurtenant equipment during operational and capacity tests for leakage, malfunctions, defects, and for compliance with referenced standards.

3.2.5.7 Feedwater Equipment Tests

Perform test of the feedwater treatment equipment in two steps. Conduct one test concurrently with the combustion tests. The Government will perform a second test during the first period of heavy loading after the plant has been accepted and put in service. Correct deficiencies revealed during the Government tests under the guarantee provisions of the contract. Both the first and second series of tests shall determine compliance with the limits for chemical concentrations of this specification. Supply equipment for taking samples and test kit for analyzing the samples. Sampling equipment and test kit shall become the property of the Government when tests are completed.

3.2.5.8 Capacity and Efficiency Tests

Perform capacity and efficiency tests after operating tests have been satisfactorily completed and boiler has been operated continuously for at least 14 days with no nuisance shutdowns and without the necessity for frequent or difficult adjustments. Perform capacity and efficiency tests on each boiler. Conduct tests using specified fuel(s). Test procedures shall be in accordance with the heat loss method[ and the input-output method] of ASME PTC 4. Before performing tests, the Contracting Officer and the Contractor shall reach agreement on those items identified in ASME PTC 4, Section 3, paragraph 3.01 "Items on Which Agreement Shall be Reached." A test run shall not start until boiler and accessories have reached an equilibrium and stabilization condition for at least one hour in duration. Duration of tests shall be sufficient to record necessary data but in no case shall each run be less than [4] [10] [24] hours.

a. Accomplish maximum output testing by means of a single 2 hour run at 110 percent load on the boiler under test. Calculate boiler efficiency, both input-output and heat loss, from the consistent readings taken during the runs. Runs shall be made at four different loads 30, 50, 70, and 100 percent of boiler rating during which both heat loss and input-output data shall be taken. Predict unmeasured losses used in conjunction with heat loss calculations and include with equipment data when submitted for approval. Subsequent tests required because of failure of the equipment to perform adequately during specified capacity and efficiency tests shall be the financial responsibility of the Contractor, including the cost of fuel.

b. Should analysis of the fuel being burned during performance tests vary from that specified as the performance fuel, adjust guarantees in accordance with accepted engineering practice to determine compliance. Carbon loss shall be determined in accordance with ABMA Boiler 103.

3.2.5.9 Temporary Waste Steam Connection

When necessary to obtain sufficient load for these tests, provide a
temporary steam line at a point outside the building. Provide necessary pipe, fittings, supports, anchors and appurtenances including a field fabricated silencer as directed by the Contracting Officer. Remove temporary piping and silencer after satisfactorily completing tests.

[3.2.5.10 Fire Safety for Oil-Fired Boilers]

Conduct tests as necessary to determine compliance with the applicable UL Safety Standards. The presence of the applicable Underwriters' label may be accepted as evidence of compliance in this respect.

a. Oil-fired Boilers: Meet test requirements of UL 726.

b. Oil Burners: Meet test requirements of UL 296.

[3.2.5.11 Plant Acceptance Operation]

*********************************************************************************************************************************************
NOTE: Include bracketed portion if project is for coal fired installation with flue gas desulfurization system.
*********************************************************************************************************************************************

After satisfactory completion of tests specified, operate the complete plant including each boiler[, its related flue gas cleaning equipment] and subsystems for a period of 30 continuous 24 hour operational days prior to final acceptance by the Government. Furnish labor, chemicals, test equipment and apparatus; the Government will furnish fuel, electricity and water. During this 30 day period, provide readily available, the services of qualified representatives from manufacturers of plant components and systems for the purpose of additional operational assistance, component and system adjustment and repairs. Government personnel will observe Contractor's operational procedures and will be asking pertinent questions, which the Contractor's representatives shall answer, about plant operation.

3.2.5.12 NAVFACENGCOM Acceptance

Operational, piping systems, auxiliary equipment and accessory tests shall be conducted prior to requesting an acceptance inspection by a Naval Facilities Engineering Command (NAVFACENGCOM) Boiler Inspector. The Contracting Officer, upon receipt of 14 calendar days advance notice from the Contractor, shall request the boiler be inspected by a NAVFACENGCOM Boiler Inspector. The Contractor shall perform final operational performance testing of all plant systems in the presence of the NAVFACENGCOM Boiler Inspector, at the discretion of the NAVFACENGCOM Boiler Inspector. The NAVFACENGCOM Boiler Inspector shall receive copies, and review the results, of all pertinent operational test reports before approving acceptance of the boiler plant by the Government.

3.2.6 Manufacturers Field Services

3.2.6.1 Erection/Installation Supervisors and Service Engineers

a. Boiler: Furnish the services of a competent supervisor who is in the direct employ of the boiler manufacturer. Supervisor shall remain on the construction site the full 8 hours per day, 5 days per week, or the same hours, that the boiler installation takes place. Supervisor shall be responsible for the complete steam generating unit, including steam generator, stoker,[ burner,] fans and related work, such as refractory,
or insulation regardless of whether stoker, [burner], fans or other related items of work are furnished by manufacturers other than the boiler manufacturer.

b. Stoker: Furnish a competent erection supervisor for the equipment furnished by the stoker manufacturer.

c. Fans: Furnish a company service engineer to advise on the erection or installation of fans and related equipment.

d. Service Engineers: Services of the manufacturing companies' service engineers and the system suppliers' service engineers shall be provided by the Contractor to advise during erection and installation of other systems and equipment such as control system, coal handlings system, ash handling system, air compressors, air dryers, boiler feedwater pumps, fuel oil pumps, condensate pumps, water treatment equipment, chemical feed pumps, deaerating feedwater heater and stacks.

3.2.6.2 Boiler and System Representatives

a. Furnish factory trained engineers or technicians who are representatives of the boiler manufacturer and system suppliers to supervise testing of the boilers and auxiliary equipment.

b. Furnish the services of a Boiler Inspector who is qualified and certified as such by the National Board of Boiler and Pressure Vessel Inspectors and who is presently employed full time by an independent firm, such as Hartford Steam Boiler Inspection and Insurance Company, which has a business of inspecting boilers.

3.2.7 Instruction to Government Personnel

In accordance with the provisions of Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS, supervisors and service engineers shall provide instruction for the Government's operators in the operation and maintenance of the equipment furnished under this section. The minimum number of hours provided shall be as follows:

<table>
<thead>
<tr>
<th>Equipment</th>
<th>Operation Instruction</th>
<th>Maintenance Instruction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boiler and auxiliaries</td>
<td>40 hours</td>
<td>16 hours</td>

      2.7.2.1  Air Compressor
      2.7.2.2  Aftercooler
      2.7.2.3  Air Receiver
      2.7.2.4  Electric Motor
      2.7.2.5  Accessories
      2.7.2.6  Controls
   2.7.3  Air Dryers
      2.7.3.1  Compressed Air Desiccant Air Dryer
      2.7.3.2  Compressed Air Refrigerated Air Dryer

2.8  BREECHING, EXPANSION JOINTS, STACKS AND DAMPERS
   2.8.1  Breeching
      2.8.1.1  Breeching Access Doors
      2.8.1.2  Breeching Cleanout Doors
      2.8.1.3  Breeching Connections and Joints
      2.8.1.4  Breeching Structural Materials
      2.8.1.5  Insulation
      2.8.1.6  Breeching Paint
   2.8.2  Expansion Joints
      2.8.2.1  Metallic Breeching Expansion Joints
      2.8.2.2  Non-metallic Expansion Joints
   2.8.3  Stacks
      2.8.3.1  Stacks With Flue Gas Scrubbers
   2.8.4  Dampers
      2.8.4.1  Multilouver Dampers
      2.8.4.2  Guillotine Dampers

2.9  COAL HANDLING EQUIPMENT
   2.9.1  Railroad Hopper Car Thawing System
      2.9.1.1  Pit-type Railroad Hopper Car Thawing System
      2.9.1.2  Surface Mounted Enclosed Railroad Hopper Car Thawing System
      2.9.1.3  Shed
   2.9.2  Top-Mounted Railroad Hopper Car Shaker
      2.9.2.1  Shaker
      2.9.2.2  Shaker Hoist
      2.9.2.3  Controls
      2.9.2.4  Frame [and Enclosure]
2.9.3 Car Pullers
   2.9.3.1 Capstan Car Puller
   2.9.3.2 Reversible Drum Type Car Puller

2.9.4 Track Hopper
   2.9.4.1 Track Girders
   2.9.4.2 Grating
   2.9.4.3 Cover
   2.9.4.4 Hopper Outlet

2.9.5 Truck Hopper
   2.9.5.1 Grating
   2.9.5.2 Hopper Outlet
   2.9.5.3 Cover

2.9.6 Reclaim Hoppers
   2.9.6.1 Grating
   2.9.6.2 Hopper Outlet
   2.9.6.3 Reclaim Hopper Cover

2.9.7 Belt Feeder
   2.9.7.1 Head and Foot Shafts
   2.9.7.2 Pulleys
   2.9.7.3 Belt
   2.9.7.4 Electric Motor
   2.9.7.5 Reduction Gear
   2.9.7.6 Backstop
   2.9.7.7 Idlers
   2.9.7.8 Load Skirts
   2.9.7.9 Frame, Supports, and Enclosure
   2.9.7.10 Loading Hopper
   2.9.7.11 Vibrating Feeder

2.9.8 Shallow-In-Built Bar Flight Feeder and Receiving Hopper
   2.9.8.1 Head and Foot Shafts
   2.9.8.2 Terminal Sprockets
   2.9.8.3 Chains and Flights
   2.9.8.4 Frame and Enclosure
   2.9.8.5 Trough
   2.9.8.6 Hopper
   2.9.8.7 Grating
   2.9.8.8 Flight Feeder Drive
   2.9.8.9 Electric Motor

2.9.9 Bucket Elevator
   2.9.9.1 Head and Foot Shafts
   2.9.9.2 Terminal Sprockets
   2.9.9.3 Buckets and Chain
   2.9.9.4 Backstop
   2.9.9.5 Elevator Casing
   2.9.9.6 Head Section
   2.9.9.7 Boot Section
   2.9.9.8 Electric Motor
   2.9.9.9 Reduction Gear
   2.9.9.10 Anchoring Brackets

2.9.10 Rotary Vane Feeder
   2.9.10.1 Body
   2.9.10.2 Feeder Vanes
   2.9.10.3 Drive Sprocket
   2.9.10.4 Electric Motor

2.9.11 Screw Conveyors
   2.9.11.1 Inlet and Discharge Spouts
   2.9.11.2 Screw Trough
   2.9.11.3 Bearings and Hangers
   2.9.11.4 Conveyor Screws and Couplings
2.9.11.5 Electric Motor
2.9.11.6 Service Platforms

2.9.12 Belt Conveyor
2.9.12.1 Head and Foot Shafts
2.9.12.2 Takeups
2.9.12.3 Pulleys
2.9.12.4 Magnetic Pulley
2.9.12.5 Belt
2.9.12.6 Electric Motor
2.9.12.7 Reduction Gear
2.9.12.8 Backstop
2.9.12.9 Emergency Stop Cord and Switch
2.9.12.10 Belt Alignment Switch
2.9.12.11 Idlers
2.9.12.12 Load Skirts
2.9.12.13 Frame, Supports, and Walkway
2.9.12.14 Discharge Hopper

2.9.13 Coal Scales
2.9.13.1 Body
2.9.13.2 Feeder
2.9.13.3 Feed Belt
2.9.13.4 Electric Motor And Drive
2.9.13.5 Coal Bypass
2.9.13.6 Weighing Mechanism
2.9.13.7 Scale Weigh Hopper
2.9.13.8 Controls
2.9.13.9 Counters
2.9.13.10 Scale Inlet
2.9.13.11 Scale Outlet Hopper

2.9.14 Stoker Hopper Extension
2.9.15 Coal Valve
2.9.15.1 Valve Body
2.9.15.2 Valve Gate
2.9.15.3 Operating Shaft
2.9.15.4 Electric Motor Operators

2.9.16 Track and Reclalm Hopper Valves
2.9.16.1 Valve Body
2.9.16.2 Valve Gate
2.9.16.3 Operating Shaft

2.9.17 Chutes
2.9.18 Coal Presence Indicators and Equipment Response Switches
2.9.18.1 Type A - Diaphragm Type Presence Indicator
2.9.18.2 Type B - Paddle Type Presence Indicator
2.9.18.3 Type C - Tilt Type Presence Indicator
2.9.18.4 Type D - Rotating Type Presence Indicator
2.9.18.5 Type E - Vibrating Type Presence Indicator
2.9.18.6 Equipment Speed Response Switch
2.9.18.7 Presence Indicators and Response Switches

2.9.19 Control Panel and Controls
2.9.19.1 Panel Devices
2.9.19.2 Switches and Pushbuttons
2.9.19.3 Annunciator Panel
2.9.19.4 Panel Size
2.9.19.5 Auxiliary Devices
2.9.19.6 Name Plates
2.9.19.7 Control Sequence
2.9.19.8 Additional Controls

2.9.20 Multiple Belt Scrapers
2.9.21 Steel Coal Bunker
2.9.21.1 Construction
2.9.21.2 Accessories
2.9.22 Stoker Surge Hoppers
2.9.23 Coal Meter
  2.9.23.1 Vane
  2.9.23.2 Counter
2.9.24 Stackout Tube

2.10 FUEL OIL SYSTEM

2.11 ASH HANDLING SYSTEM (MECHANICAL)
  2.11.1 General
    2.11.1.1 System Requirements
    2.11.1.2 Routing
    2.11.1.3 Discharge
    2.11.1.4 Maximum Noise Level
  2.11.2 System Valving
    2.11.2.1 Rotary Valves
    2.11.2.2 Manual Valve Intakes for Bottom Ash
    2.11.2.3 Silo Discharge Valve
  2.11.3 Conveyors
    2.11.3.1 Chain Drag Conveyor
    2.11.3.2 Screw Conveyors
    2.11.3.3 Inlet and Discharge Spouts
    2.11.3.4 Screw Trough
    2.11.3.5 Bearings and Hangers
    2.11.3.6 Conveyer Screws and Couplings
    2.11.3.7 Electric Motor
    2.11.3.8 Service Platforms
  2.11.4 Bucket Elevator
    2.11.4.1 Head and Foot Shafts
    2.11.4.2 Terminal Sprockets
    2.11.4.3 Buckets and Chain
    2.11.4.4 Backstop

PART 3 EXECUTION

3.1 INSTALLATION

3.1.1 Boiler

3.1.1.1 Installing Tubes In Headers
3.1.1.2 Installing Tubes In Drums
3.1.1.3 Inspecting Tubes
3.1.1.4 Installing Firebrick
3.1.1.5 Installing Plastic Refractory
3.1.1.6 Installing Casing Insulation

3.1.2 Equipment Installation

3.1.2.1 Equipment Foundations
3.1.2.2 Induced Draft Fan
3.1.2.3 Stack
3.1.2.4 Fuel Oil Tanks

3.1.3 Piping

3.1.3.1 Fittings
3.1.3.2 Grading of Pipe Lines
3.1.3.3 Anchoring, Guiding, and Supporting Piping
3.1.3.4 Copper Tubing
3.1.3.5 Sleeves
3.1.3.6 Flashing for Buildings
3.1.3.7 Outlets for Future Connections
3.1.3.8 Screwed Joints in Piping
3.1.3.9 Welded Joints
3.1.3.10 Cleaning of Piping
3.1.3.11 Reduction in Pipe Size
3.1.3.12 Expansion Control
3.1.3.13 Connection to Equipment
3.1.3.14 Valve Installation
3.1.3.15 Traps and Connections
3.1.3.16 Pressure Gage Installation
3.1.3.17 Thermometer and Sensing Element Installation
3.1.3.18 Strainer Locations
3.1.3.19 Dissimilar Piping Materials
3.1.3.20 Surface Treating, and Pipe Wrapping

3.1.4 Painting

3.1.4.1 Piping, Fittings, and Mechanical and Electrical Equipment
3.1.4.2 Boilers
3.1.4.3 Vertical Fuel Oil Tank
3.1.4.4 Surfaces Not to be Painted
3.1.5 Insulation

3.2 FIELD QUALITY CONTROL

3.2.1 Tests and Inspections (Piping)
   3.2.1.1 Hydrostatic and Leak Tightness Tests

3.2.2 Preliminary Operation

3.2.3 General Startup Requirements

3.2.4 Plant Equipment Tests
   3.2.4.1 Plant Air Compressors
   3.2.4.2 Coal Handling System
   3.2.4.3 Fuel Oil Tanks
   3.2.4.4 Blowdown Valves and Try Cocks
   3.2.4.5 Fans, Heaters, Pumps, and Motors

3.2.5 Boilers and Auxiliaries Tests and Inspections
   3.2.5.1 Strength and Leak Tightness Tests
   3.2.5.2 Boiler Inspection
   3.2.5.3 Boiler Cleaning and Startup
   3.2.5.4 Boiler Preliminary Operational Tests

3.2.6 General Operational Tests
   3.2.6.1 General Controls
   3.2.6.2 Steady State Combustion Tests
   3.2.6.3 Varying Load Combustion Tests
   3.2.6.4 Auxiliary Equipment and Accessory Tests
   3.2.6.5 Feedwater Equipment Tests
   3.2.6.6 Capacity and Efficiency Tests
   3.2.6.7 Temporary Waste Steam Connection
   3.2.6.8 Fire Safety for Oil-Fired Boilers
   3.2.6.9 Plant Acceptance Operation
   3.2.6.10 NAVFACENGCOM Acceptance

3.2.7 Manufacturer's Field Services
   3.2.7.1 Erection/Installation Supervisors and Service Engineers
   3.2.7.2 Boiler and System Representatives
   3.2.7.3 Instruction to Government Personnel

SECTION 23 52 33.02 20
STEAM HEATING PLANT WATERTUBE (FIELD ERECTED) COAL/OIL OR COAL
11/08, CHG 5: 02/22

NOTE: This guide specification covers the requirements for steam heating plants from 7 1/2 to 60 1/2 kg/sec 60,000 to 480,000 lbs/hr steam capacity using a field erected watertube boiler.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: This guide specification covers requirements for equipment for a steam heating plant which will generate from 7 1/2 to 60 1/2 kg of steam per second 60,000 to 480,000 pounds of steam per hour. This specification is intended to be used in the procurement and installation of heating plant equipment. Requirements for materials and procedures for special or unusual design shall be added to and modifications made to this specification as necessary to fit specific projects. This guide specification shall be used in conjunction with the following NAVFAC definitive drawings:

PART 1  GENERAL

1.1  REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically
place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 RELATED REQUIREMENTS

Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS applies to this section with the additions and modifications specified herein.

1.3 DEFINITIONS

******************************************************************************
NOTE: Information describing any specific project and site conditions which the Contractor would need to know in order to submit a firm price shall be specified in Division 1 of the project specifications. Such conditions include:

1. Allocated space for storage of materials.
2. Railway spurs and sidings available to the Contractor for delivery of materials.
3. Any restrictions on daily working hours.
4. Procedure for scheduling outages and tests.
5. Any noise or traffic restrictions.
6. Availability of utilities required for construction.
******************************************************************************

1.3.1 Effective Radiant Heating Surface

Heat exchange surface, exclusive of superheat elements, which is directly exposed to radiant heat of the flame on one side and to water or water-steam mixture being heated on the other. Effective radiant heating surface shall be calculated on the side receiving heat and shall consist of plain or finned tubes and headers which may be bare, metal covered, or metallic-ore covered. Refractory covered surfaces shall not be counted. Computations shall be made as follows:

a. Flat projected area of bare, metal covered, or metallic-ore covered tubes and headers shall be considered as effective radiant heating surface.

b. Metal and metallic surfaces extending from tubes or headers shall be considered to have an effective radiant heating surface equal to 60 percent of their flat projected area except that the following extended...
surfaces shall not be considered as effective radiant heating surface.

1. Metal blocks not integral with tubes or headers.

2. Extended surfaces less than 6 mm 1/4 inch thick.

3. That portion of the extended surface more than one tube or header radius from the tube or header from which it extends.

4. Extended surfaces larger than 32 mm 1 1/4 inches.

c. Flat projected areas of portions of first two rows of furnace exit tubes that receive radiant heat from the fire shall be considered as effective radiant heating surface.

1.3.2 Flue Gas Velocity

**************************************************************************
NOTE: The maximum velocity to prevent erosion will vary according to whether boiler is multipass or single pass, the type of stoker and the type of fuel. See DM-3.6, Table 4, Maximum Velocities (MPS FPS) in Convection Sections for Coal, Wood or Solid Waste Boilers.
**************************************************************************

Velocity of the gas entering the convection section shall not exceed [10] [15] [18] [23] meters per second (m/s) [35] [50] [60] [75] feet per second (fpm).

1.3.3 FRP

Fiberglass reinforced plastic.

1.3.4 Furnace Volume

The cubic volume of the space provided for combustion of the fuel between the top grate line and the first plane of entry into, or between the tubes, of the furnace face of the bridge wall. When screen or superheater tubes are utilized, they shall be considered as the first plane of entry. The manufacturer shall state the furnace volume of the boiler.

1.3.5 PVC

Poly-vinyl chloride.

1.3.6 Standard Commercial Product

Standard commercial product is a product which has been sold or is being currently offered for sale on the commercial market through advertisements or manufacturer's catalogs, or brochures, and represents the latest production model.

1.3.7 System Supplier

A manufacturer, fabricator, erector, corporation or firm that regularly is employed in the design, fabrication, erection (or erection supervision), testing and startup of systems comparable in size and type to those specified and indicated. System supplier shall arrange the equipment
selected, design equipment interconnections, produce related shop drawings, supervise erection, and startup and test the equipment.

1.4 SYSTEM DESCRIPTION

1.4.1 Design Requirements

1.4.1.1 Boiler

Design boiler in accordance with the ASME BPVC SEC I. Provide design data with computations and performance guarantees covering the full range of operation at full load, 75 percent load, 50 percent load and 30 percent load. Assemble tubes, drums, and headers so that the entire boiler can be drained dry. The furnace shall be water cooled on the side, top, front and back walls.

a. Boiler design and service conditions

(1) Steam capacity:
   Continuous peak for 2 hours: [___] kg/sec lb/hr
   Maximum continuous: [___] kg/sec lb/hr
   Minimum (without smoking): [___] kg/sec lb/hr

(2) Design pressure: [___] kPa (gage) psig

(3) Operating pressure: [___] kPa (gage) psig

(4) Steam temperature: [___] degrees C F

(5) Feedwater temperature to economizer: [___] degrees C F
   Continuous blowdown: [___] percent

(6) Maximum moisture content of steam leaving drum at peak rating:
   [___] percent

(7) Total solids concentration in drum: [___] PPM

(8) Fuel:
   Coal (see coal analysis):
   [Oil (see oil analysis)]:

(9) Heating surface, minimum:
   Radiant: [___] sq. m ft.
   Convective: [___] sq. m ft.

(10) Furnace volume, minimum: [___] cu. m ft.

(11) Maximum boiler flue gas exit
   Temperature: [___] degrees C F
   Continuous rating: [___] degrees C F

(12) Maximum economizer flue gas exit
   Temperature: [___] degrees C F
   Continuous rating: [___] degrees C F

(13) Efficiency at maximum continuous rating [includes economizer]
   Coal: [___] percent
   [Oil]: [___] percent
(14) Elevation above sea level: [_____] meters feet

(15) Boiler room & combustion air ambient: [_____] degrees C F

(16) Maximum allowable total draft loss furnace, boiler, exit damper, and economizer outlet at continuous rating: [_____] Pa inches of Water

(17) Steam drum, minimum diameter: [_____] mm inches

(18) Mud drum, minimum diameter: [_____] mm inches

(19) Seismic zone: [_____]

1.4.1.2 Economizer

**************************************************************************
NOTE: Feedwater temperatures should be 110 degrees C 230 degrees F when sulfur (S) content of fuel is 0.5 percent to 1.5 percent; 116 degrees C 240 degrees F, S = 1.5 percent to 2 percent; 121 degrees C 250 degrees F, S = 2.0 percent to 2.7 percent. Where fuels having more than 1.5 percent sulfur content are to be fired, finned tubes shall not be used unless the steel tubes are covered with cast iron fin casing.
**************************************************************************

a. Flue gas quantity: [_____] kg/s lbs/hr
b. Flue velocity: [_____] m/s ft/min
c. Flue gas temperature entering economizer: [_____] degrees C F
d. Flue gas temperature leaving economizer: [_____] degrees C F
e. Feedwater Temperature entering economizer: [_____] degrees C F
f. Feedwater Temperature leaving economizer: [_____] degrees C F
g. Fouling factor on feedwater side: [_____] 
h. Fouling factor on gas side: [_____] 
i. Boiler operating pressure: [_____] kPa (gage) psig
j. Design pressure: [_____] kPa (gage) psig
k. Steam loads shall be as specified under boiler[s]
l. Performance: The efficiency due to the economizer shall be included with and stated as part of the overall boiler efficiency.

1.4.1.3 Forced Draft Fan

Design fan to handle air at temperatures from [_____] to [_____] degrees C F. Fan shall be [single] [double] width inlet, [single] [double] width outlet, with [clockwise] [counter-clockwise] rotation; viewed from the [motor] [turbine] end.
1.4.1.4 Induced Draft Fan

Design fan of materials which will withstand flue gas temperatures up to 316 degrees C 600 degrees F without damage. Fan shall be [single] [double] width inlet, [single] [double] width outlet, with [clockwise] [counter clockwise] rotation when viewed from [motor] [turbine] end. Provide outboard pedestal bearings with sole plates[ and dual extension shaft].

1.4.1.5 Screw Conveyors for Coal Handling Equipment

Each screw conveyor shall meet the following minimum design and performance specifications when handling [_____] size coal:

<table>
<thead>
<tr>
<th></th>
<th>CONVEYOR NO. 1</th>
<th>CONVEYOR NO. 2</th>
</tr>
</thead>
<tbody>

### 1.4.1.7 Stacks With Flue Gas Scrubbers

Stacks with flue gas scrubbers, boilers 5 kg/sec 40,000 lb/hour and over:

a. Temperature
   (1) Maximum ambient: [_____] degrees C F
   (2) Minimum ambient: [_____] degrees C F
   (3) Inlet gas at maximum gas flow (coal): [_____] degrees C F
   (4) Inlet gas at maximum gas flow (oil): [_____] degrees C F
   (5) Inlet gas at minimum gas flow (coal): [_____] degrees C F
   (6) Inlet gas at minimum gas flow (oil): [_____] degrees C F

b. Gas Flow at Inlet
   (1) Maximum: [_____] kg/s lbs/hr
   (2) Minimum: [_____] kg/s lbs/hr

c. Required net available draft at stack inlet
   Maximum gas flow: [_____] Pa inches water

d. Gas exit velocity (cone exit)
   Maximum at maximum conditions: [_____] m/s ft/sec

e. Flue gas dew point
   (1) Fuel oil: [_____] degrees C F
   (2) Fuel-coal: [_____] degrees C F

f. Test pressures
   Shop test: [_____] Pa inches water

g. Thermal efficiency of stack: 96 to 98 percent

h. Stack friction
   Maximum at design conditions: [_____] Pa inches water

i. Stack height
   (1) Ground elevation: [_____] m ft

k. Wind velocity, gusting: [_____] km/hr mph

l. Stack inside diameter, minimum (below velocity cone): [_____] mm inches

m. Maximum stack deflection (from vertical center line): [_____] mm inches

n. Soil bearing stress, maximum: [_____] kg/m2 psf

o. Seismic zone: [_____]
1.4.1.8 Fuel Oil Pumps

a. Transfer pumps (for fuel oil tank truck or railroad tank car unloading and transfer to tanks):

******************************************************************************
NOTE: At the text below, the values enclosed in brackets are for No. 6 Low Sulfur fuel oil. Adjust values to suit fuel oil used when other than No. 6.
******************************************************************************

(1) Number of assemblies: [_____]
(2) Tag numbers: [_____] L/s gpm
(3) Capacity each at 450 ssu: [_____]
(4) Suction lift required: [_____] kPa ft of water
(5) Discharge pressure: [_____] kPa (gage) psig
(6) Operating temp.: [27 to 54] [80 to 130] [27 to 54] degrees C F
(7) Viscosity range: [450 to 5000] [_____]
(8) Specific gravity: [.92 to .99] [_____]
(9) Viscosity at brake power selection point: [9000] [_____]
(10) Maximum pump speed: 1750 rpm
(11) Motor kW hp: [_____]
(12) Fuel oil: No. [6, Low Sulfur] [_____]

b. Transfer pumps (for fuel oil transfer from tanks to heating plant):

******************************************************************************
NOTE: At the text below, the values enclosed in brackets are for No. 6 Low Sulfur fuel oil. Adjust values to suit fuel oil used when other than No. 6.
******************************************************************************

(1) Number of assemblies: [_____]
(2) Tag numbers: [_____] L/s gpm
(3) Capacity at 450 ssu: [_____]
(4) Suction lift required: [_____] kPa (gage) ft of water
(5) Discharge pressure: [_____] kPa (gage) psig
(6) Operating temp: [49 to 120] [_____] degrees C F
(7) Viscosity range: [450 to 3000] [_____] to [_____] ssu
(8) Specific gravity: [.92 to .99] [_____] to [_____]
(9) Viscosity at brake power point:  [5000] [_____] ssu
(10) Maximum pump speed:  1750 rpm
(11) Motor kW hp:  [_____]  
(12) Fuel oil:  No. [6, low sulfur] [_____] 

c. Fuel oil recirculation pump sets (at remote storage):

**************************************************************************
NOTE: At the text below, the values enclosed in brackets are for No. 6 Low Sulfur fuel oil. Adjust values to suit fuel oil used when other than No. 6.**************************************************************************

(1) Number of assemblies:  [_____]  
(2) Tag numbers:  As indicated  
(3) Capacity:  1.58 L/s 25 gpm at 450 ssu  
(4) Suction lift required:  [_____] kPa ft. water  
(5) Discharge pressure:  [_____] kPa (gage) psig  
(6) Operating temperature:  [49 120] [_____] degrees C F  
(7) Viscosity range:  [450 to 3000] [_____] to [_____] ssu  
(8) Specific gravity:  [.92 to .99] [_____] to [_____]  
(9) Viscosity at brake power point:  [5000] [_____] ssu  
(10) Maximum pump speed:  1750 rpm  
(11) Motor kW hp:  [_____]  
(12) Fuel oil:  No. [6, low sulfur] [_____]  

1.4.1.9 Fuel Oil Pump and Heater Set for Fuel Oil System

**************************************************************************
NOTE: At the text below, the values enclosed in brackets are for No. 6 Low Sulfur fuel oil. Adjust values to suit fuel oil used when other than No. 6.**************************************************************************

a. Pump/heater set
(1) Capacity each pump and each steam heater:  [_____] L/s gpm  
(2) Suction lift:  [_____] kPa ft water  
(3) Discharge pressure at outlet of heater:  [_____] kPa (gage) psig  
(4) Maximum pump speed:  1750 rpm  
(5) Specific gravity range:  [.92 to .99] [_____] to [_____]
(6) Viscosity at brake power point: 5000 ssu

(7) Viscosity range: [500 to 5000] [_____] to [_____] ssu

(8) Oil temperature at inlet of heater: [_____] degrees C F

(9) Oil temperature at outlet of heater: [_____] degrees C F

(10) Maximum oil pressure drop through heater: [_____] kPa psi

(11) Heating medium: Steam

(12) Steam pressure available: [_____] kPa (gage) psig

(13) Steam temperature: [_____] degrees C F

(14) Heater type: [Extended surface] [Bare tube]

b. Electric startup heater

(1) Oil temperature at heater inlet: [_____] degrees C F

(2) Oil temperature at heater outlet: [_____] degrees C F

(3) Maximum oil pressure drop through heater: [_____] kPa psi

(4) Capacity of heater: [_____] L/s gpm

(5) Heating power supply at three phase, 60 Hz [_____] volts

(6) Control power supply 120 volts, single phase, 60 Hz

1.4.1.10 Ash Handling System (Mechanical)

a. Capacity:

(1) Ash handling system: Estimated capacities at maximum plant output are listed below; ash handling system capacity shall be sized for twice the amounts listed.

[_____] Mg tons per hour for fly ash
[_____] Mg tons per hour for bottom ash
[_____] Mg tons per hour in bucket elevator leaving the boiler house (minimum).

(2) Ash silo: Storage capacity of ash silo is specified in the paragraph ASH STORAGE SILO.

(3) Rotary unloader: [_____] Mg tons per hour

b. General data

(1) Available water pressure: [_____] kPa (gage) psig

(2) Available air pressure: [_____] kPa (gage) psig

(3) Seismic zone: [_____]
(4) Wind velocity (gusts): [_____] km/hr mph

(5) Altitude of plant: [_____] m ft

(6) Steam rating of plant: [_____] kg/s lb/hr
   (a) Maximum continuous rating of boiler no. 1 [_____] kg/s lb/hr
   (b) Maximum continuous rating of boiler no. 2 [_____] kg/s lb/hr
   (c) Maximum continuous rating of boiler no. 3 [_____] kg/s lb/hr
   (d) Maximum continuous rating of boiler no. 4 [_____] kg/s lb/hr

(7) Coal analysis
   (a) Ash [_____] percent
   (b) Carbon [_____] percent
   (c) Hydrogen [_____] percent
   (d) Sulfur [_____] percent
   (e) Moisture [_____] percent
   (f) Nitrogen [_____] percent
   (g) Oxygen [_____] percent

(8) Ash Analysis
   (a) Carbon [_____] percent
   (b) Calcium [_____] percent

1.4.1.11 Ash Handling System (Pneumatic)

a. Capacity:
   (1) Ash handling system: Estimated capacities at maximum plant output are listed below; ash handling system capacity shall be sized for twice the amounts listed.

   [_____] Mg tons per hour for fly ash
   [_____] Mg tons per hour for bottom ash
   [_____] Mg tons per hour in bucket elevator leaving the boiler house (minimum).

   (2) Ash silo: Storage capacity of ash silo is specified in the paragraph ASH STORAGE SILO.

   (3) Rotary unloader: [_____] Mg tons per hour.

b. General Data
   (1) Available water pressure: [_____] kPa (gage) psig
   (2) Available air pressure: [_____] kPa (gage) psig
(3) Seismic zone: [____]

(4) Wind velocity (gusts): [_____] km/hr mph

(5) Altitude of plant: [_____] m ft

(6) Steam rating of plant: [_____] kg/s lb/hr

(a) Maximum continuous rating of boiler no. 1 [_____] kg/s lb/hr
(b) Maximum continuous rating of boiler no. 2 [_____] kg/s lb/hr
(c) Maximum continuous rating of boiler no. 3 [_____] kg/s lb/hr
(d) Maximum continuous rating of boiler no. 4 [_____] kg/s lb/hr

(7) Coal analysis

(a) Ash: [_____] percent
(b) Carbon: [_____] percent
(c) Hydrogen: [_____] percent
(d) Sulfur: [_____] percent
(e) Moisture: [_____] percent
(f) Nitrogen: [_____] percent
(g) Oxygen: [_____] percent

(8) Ash analysis

(a) Carbon: [_____] percent
(b) Calcium: [_____] percent

(9) Minimum velocities required for materials

(a) Fly ash: 19.30 m/s 3800 ft./min.
(b) Bottom ash (traveling grate stoker): 28.44 m/s 5600 ft./min.
(c) Bottom ash (spreader stoker): 26 m/s 5100 ft./min.

1.4.1.12 Miscellaneous Equipment

a. Deaerating heater: Design the deaerating heater for the following conditions:

(1) Design pressure: 207 kPa (gage) 30 psig
(2) Normal steam operating pressure: [_____] kPa (gage) psig
(3) Maximum steam operating pressure: [_____] kPa (gage) psig
(4) Capacity (minimum): [_____] kg/s lb/hr of feedwater
(5) Inlet Conditions at Heater:

(2) Softener effluent analysis:

Hardness: Maintain hardness of the softened feedwater near zero and in no case allow it to exceed 1.0 part per million as CaCO3.

**************************************************************************

NOTE: At the text below, total solids of 175 ppm in the feedwater concentrated 20 times give 3,500 ppm in the boiler water.

**************************************************************************

Total solids: Maintain total solids in the softened feedwater at a level to ensure a total solids concentration in the boiler water of less than 3,500 ppm without excessive blowdown.

1.4.2 Detail Drawings

1.4.2.1 Boiler Drawing

Submit safety valve calculation sheets or Manufacturer's standard sheets) and detail drawings for the following:

a. Refractory details, expansion joints

b. Certified outline, general arrangement (setting plan), and anchor bolt
detail drawings including foundation loading diagrams
c. Plans and elevations detailing piping connections
d. Detailed dimensional drawings of auxiliaries furnished with the unit
e. Piping schematics for auxiliaries, such as sootblowers or hydraulic stoker drives (when used)
f. Shop fabrication details of boiler/furnace: Include details showing tubing, spacing, radii dimensions, and gage; sections through walls and expansion joints showing refractory construction and replacement details; internal and external dimensions of the boiler
g. Wiring diagrams for subsystems
h. Economizers and economizer inlet breeching
i. Soot blowers
j. Auxiliaries furnished with the boilers
k. Forced draft fan, drives and duct work
l. Induced draft fan, drives and duct work
m. Structural steel and loading diagrams
n. Overfire air fan system

1.4.2.2 Boiler Room Auxiliary Equipment

Submit descriptive information for the following items on the drawings including arrangements, wiring diagrams, piping diagrams, and details of valves and piping.

a. Water softening equipment
b. Brine storage tank
c. Condensate receiver
d. Condensate transfer pumps including certified performance curves
e. Deaerator
f. Boiler feed pumps including certified performance curves
g. Steam turbines and their drives
h. Continuous blowdown system
i. Chemical feed units
j. Air compressors
k. Air dryers
l. Cranes and hoists
m. Plant heating and ventilation equipment showing related ductwork

1.4.2.3 Stokers

Include the following:

a. General arrangement
b. Foundation drawings
c. Front plates
d. Ash hoppers
e. Fuel gate mechanism
f. Grate details
g. Zone dampers
h. Air seal details
i. Overfire air nozzle arrangement, overfire air fan and drives
j. Coal feeder details
k. Fuel feeder drives
l. Piping schematics
m. Wiring schematics
n. Access doors

1.4.2.4 Ash Handling System

Include the following:

a. General arrangement
b. Construction details ash storage silo complete with loading diagrams
c. Control panel arrangement and schematics
d. Wiring and control diagrams
e. Ash piping arrangement drawings and schematic drawings
f. Wear back fitting details
g. Piping and fittings
h. Details of [steam] [motor driven mechanical] exhauster[ and air washer-steam condenser]
i. Details of separators, tertiary bag filter, and ash silo vent bag filter
j. Silo fluidizing system and rotary ash conditioner
k. Bottom ash hopper and vertical lift doors
l. Ash crusher

### 1.4.2.5 Burners

Include the following:

a. General arrangement
b. Piping details
c. Burner control schematics
d. Flame safety schematics
e. Component details
f. Throat tile details

### 1.4.2.6 Dampers, Stacks and Breechings

Include the following:

a. General arrangement
b. Breeching, reinforcing details
c. Breeching hangers and support details
d. Dampers and operators
e. Access doors and frames
f. Expansion joints
g. Stack details including anchor bolt and foundation details, stack sampling ports, platforms, and accessories

[Submit drawings stamped by a registered professional engineer for stacks with flue gas scrubbers, boilers 5 kg/sec 40,000 lb/hour and over.]

### 1.4.2.7 Coal Handling Equipment

Include the following:

a. Certified outline and general arrangement drawings for complete coal handling system
b. Dimensional equipment and fabrication drawings, including all equipment weights, equipment locations, support details, and anchor bolt arrangements for items and equipment specified under the coal handling section
c. Control panel, coal presence indicators, and equipment response switch details
d. Control schematic diagrams and complete wiring diagrams

1.4.2.8 **Fuel Oil Equipment**

Drawings may be manufacturer's standard size for pumps, pump curves, valves, strainers and pump wiring.

a. Certified outline and general arrangement drawings
b. Certified pump and performance curves and tabulations
c. Equipment detail sheets including viscosity controller, heater and valves
d. Electrical wiring diagrams
e. Oil tanks, foundations, tank heaters, appurtenances, water draw-off and level indication.

1.4.2.9 **Piping and Specialty Items**

Drawings may be manufacturer's standard size.

a. Details of valves and special fittings
b. Feedwater regulator details and schematics
c. Details and schematics of feedwater automatic recirculation

1.4.2.10 **Flexible Ball Expansion Joint Installation Details**

Include allowable angular flex and minimum offset dimensions for approval.

1.4.2.11 **Reinforced Concrete Foundation**

Concrete and reinforcing for the foundation shall be detailed on the Contractor's submitted shop drawings as specified under Section 03 30 00 CAST-IN-PLACE CONCRETE.

1.4.2.12 **Reproducible Drawings**

Submit one reproducible plastic shop drawing of each approved drawing sheet to the Contracting Officer for the following items:

a. Boiler layout, foundations, construction and details including [preheaters,] [economizers,] auxiliaries and details
b. Breeching layout, construction and details
c. Burner construction, control and flame safety schematics, and details
d. Burner details
e. Wiring diagrams
f. Fuel tanks, foundations and appurtenances
g. Feedwater automatic recirculation system
h. Piping schematics
i. Control diagrams schematics including panel construction and layout
j. Coal handling equipment
k. Stoker drawings and details
l. Ash handling system, including panels, schematics and details

1.4.3 Test Reports

1.4.3.1 Boiler Predicted Performance Data

Submit certified copies of design, production and conformance tests for approval before delivery of the equipment.

1.4.3.2 Fan Performance Data

Submit to the Contracting Officer manufacturer's fan performance data based on performance tests made in accordance with the requirements of AMCA 210. AMCA certified test data from prototype fan designs is acceptable.

1.4.4 Performance Requirements

1.4.4.1 Boiler

**************************************************************************

NOTE: The specified efficiency for the boiler at maximum continuous load shall be not less than 80 percent for coal and 82 percent for oil. When an economizer is provided, use 82 and 84 percent respectively for coal and oil firing. Depending on the particular application and fuel used, these efficiencies could be higher.

**************************************************************************

The efficiency listed for coal burning shall be based on stoker firing with [_____] percent excess air. The efficiency for fuel oil firing shall be based on [_____] percent excess air]. The efficiency shall allow for [_____] percent continuous blowdown and 1.5 percent unaccounted losses and manufacturer's margin. Base the performance on the boiler burning fuels in accordance with the Coal Analysis [Fuel Oil Analysis] listed below.

a. Coal analysis

   (1) Ultimate analysis (percent by weight)

<table>
<thead>
<tr>
<th>Carbon</th>

1.5 SUBMITTALS

*********************************************************************************************************************************************
NOTE:  Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal
items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**SD-02 Shop Drawings**
- Boiler Drawing
- Boiler Room Auxiliary Equipment
- Stokers
- Ash Handling System
- Burners
- Dampers, Stacks and Breechings

SECTION 23 52 33.02 20    Page 46
Flexible Ball Expansion Joint Installation Details

Reinforced Concrete Foundation

Reproducible Drawings

Submit for approval within [60] [75] [90] days after award of contract. Drawing size shall be A1 (841 by 594 mm) 34 by 22 inches.

SD-03 Product Data

Boiler

Boiler Room Auxiliary Equipment

Stacks

Coal Handling Equipment

******************************************************************************

NOTE: Include refrigerant submittal when a compressed air refrigerated air dryer is included.
******************************************************************************

Refrigerant (compressed air refrigerated air dryers) - Provide SDS sheets for all refrigerants

Insulation

Submit for approval within [60] [75] [90] days after award of contract.

SD-04 Samples

Each Type of Insulation

Include the intended application for each type of insulation and attach manufacturer's stamp or label giving name of manufacturer, brand and description of material.

SD-05 Design Data

******************************************************************************

NOTE: Choose this paragraph only if the paragraph STACKS WITH FLUE GAS SCRUBBERS, BOILERS 5 kg/sec 40,000 lb/hour AND OVER and its subparagraphs are chosen. Delete this paragraph if the paragraph STACKS WITH NO FLUE GAS SCRUBBERS, BOILERS 5 kg/sec 40,000 lb/hour & UNDER and its subparagraphs are chosen.
******************************************************************************

Stacks with Flue Gas Scrubbers, boilers 5 kg/sec 40,000 lb/hour and over

Submit design calculations for static and dynamic analysis and damping. Submit manufacturer's foundation and stack calculations. Submit as specified under the paragraph STACKS WITH FLUE GAS
SCRUBBERS, BOILERS 5 kg/sec 40,000 lb/hour AND OVER.

SD-06 Test Reports

Boiler Predicted Performance Data
Fan Performance Data
Instrument Air Compressors
Variable Speed Motor Controller

Submit certified copies of variable speed motor controller design, production and conformance tests for approval before delivery of the equipment.

Steam Heating Plant

Submit for tests and inspections specified under the paragraph FIELD QUALITY CONTROL.

SD-07 Certificates

List of Equipment Manufacturers
Proof of Experience

Submit the required information and experience certificates prior to commencing work on the site.

System and Equipment Installation
Vertical Fuel Oil Tank Calibration
Backflow Preventer
Ozone Depleting Substances Technician Certification

SD-10 Operation and Maintenance Data

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

Equipment, Data Package 3
Control Components, Data Package 4

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

SD-11 Closeout Submittals

Posted Operating Instructions

1.6 QUALITY ASSURANCE

Equipment shall be factory assembled except for steam generators, coal handling equipment, and ash handling equipment which shall utilize shop assembled components to the maximum extent to facilitate erection and
minimize field labor.

1.6.1 Standard Commercial Product

Boilers and equipment shall as a minimum, be in accordance with the requirements of this specification and shall be the manufacturer's standard commercial product. Include additional or better features which are not specifically prohibited by this specification, but which are a part of the manufacturer's standard commercial product in the boilers and equipment being provided.

1.6.2 Equipment Furnished

Equipment furnished by the Contractor shall be furnished by the manufacturers listed.

1.6.3 Responsibility

The Contract drawings show the required general arrangement configuration and location of equipment items. However, this contract allows selection of vendor's equipment, at the option of Contractor, provided that vendor's experience and equipment meet requirements of these drawings and specifications. Because there may be significant variation between the drawings and individual vendor's equipment as to foundations, physical dimensions and detailed arrangement of these equipment items, the Contractor is required to furnish detailed design and shop drawings and calculations for the systems selected. Foundation arrangements, walkways and other information as required shall be shown for a completely coordinated, usable and properly functional system. A single system supplier shall be responsible for a complete system including erection or erection supervision for each of the following systems:

a. Boiler system, including but not limited to the boiler, stoker, oil burners, [economizer,] [air preheater,] refractories, insulation, induced draft fan, sootblowers, steam separator, forced draft fan, overfire air fan, re-injection system, boiler trim, blowdown valves, safety valves and trim, and breeching. System manufacturer shall coordinate required instrumentation and control logic with controls and instrumentation supplier. Controls and instrumentation are specified in Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS.

b. Coal handling system, including but not limited to the track and reclaim hoppers, belt feeders, belt conveyors and tube galleries, telescoping chute, flight conveyor, coal bunker, under bunker conveyor with triple valves, coal scale and non-segregating distributor.

c. Ash handling system including clinker crushe, ash intakes, ash silo with baghouse filter, vacuum pump and rotary dustless filter.

d. Stack system including steel stack, internal acid resistant lining and external coating.

e. Emission equipment including precipitator, scrubber and baghouse.

1.6.4 Certification of Backflow Preventer

Certificate of Full Approval or current Certificate of Approval for each backflow preventer being provided for this project shall be from the Foundation for Cross-Connection Control Research, University of Southern
California, and shall attest that the design, size, and make of backflow preventer has satisfactorily passed the complete sequence of performance testing and evaluation for the respective level of approval. A Certificate of Provisional Approval will not be acceptable in lieu of the above.

1.6.5 Modification of References

In the API publications referred to in this paragraph, the advisory provisions shall be considered mandatory, as though the word "shall" had been substituted for "should" and "suggested" wherever they appear.

1.6.6 Certificates

1.6.6.1 List of Equipment Manufacturers

Submit a letter which names the equipment manufacturers for the following equipment. When the Contracting Officer determines that a manufacturer does not meet the qualification or experience requirements of the specifications, the Contractor shall submit, to the Contracting Officer, the name of another manufacturer within fifteen days of notification.

a. Boilers and stokers
b. Boiler feedwater pumps
c. Coal car handling equipment
d. Induced draft fans
e. Coal handling equipment
f. Ash handling equipment

1.6.6.2 Proof of Experience

Submit proof of experience of manufacturers, system suppliers and installers as follows:

a. Experience, Responsibility and Certification: Submit to the Contracting Officer, the required information and experience certificates within 30 days after award and prior to commencing work on the site.

**************************************************************************
NOTE: Verify number of manufacturers' installations operating and years of operation for coal handling systems, ash handling systems and control systems to avoid an unnecessarily restrictive experience requirement.
**************************************************************************

b. Experience Requirements: Boilers and equipment installed within or as a part of the heating plant shall be of proven designs. Each manufacturer or system supplier shall be regularly engaged in designing, fabricating, erecting or erection supervision, testing and starting up of the equipment or system. Within 30 days after award or at any time during performance of the contract, when the Contractor is required to use another manufacturer or system supplier is required through no fault of the Contractor, the Contractor shall submit a
certificate and other evidence from each manufacturer or each system supplier to show that equipment and systems, made or furnished by the manufacturers or system suppliers, have substantially comparable operating requirements to the equipment or systems specified under this section and that they have been successfully installed and reliably operated in at least [one] [two] [three] installations under substantially comparable operating conditions for a period of not less than two years.

c. Information Required: Submit to the Contracting Officer, evidence or proof of experience required from the equipment manufacturer or system supplier containing the following information:

(1) List of installations meeting the aforementioned requirements including detailed description of equipment furnished for each one.

(2) Owner and location of each installation.

(3) Name and phone number of supervisory person at each installation.

(4) Date of Owner acceptance of such installation.

d. Vertical Fuel Oil Tank Calibration Experience: Submit to the Contracting Officer evidence or proof that the tank calibration organization has at least 2 years of prior successful and accurate experience in calibrating tanks of comparable type and size.

1.6.6.3 System and Equipment Installation

Submit from each system supplier and each manufacturer of the equipment, written certification that the system and equipment installation is in accordance with the system supplier's and equipment manufacturer's instructions and recommendations, that the unit or system has been run, rotating parts have been dynamically balanced, fluid (including air) flows have been balanced, instrumentation and controls are properly functioning, adjusted and have been calibrated, and the sub-system (or equipment) is ready for final testing, before entire boiler plant may be given an acceptance test.

1.6.6.4 Vertical Fuel Oil Tank Calibration

Submit four copies of the certified record.

1.6.6.5 Backflow Preventer

Submit a Certificate of Full Approval or a current Certificate of Approval for each design, size, and make of backflow preventer being provided for the project.

1.6.6.6 Ozone Depleting Substances Technician Certification

**************************************************************************
NOTE: The following paragraph requires a certification for technicians who work on equipment that could release ozone depleting refrigerants into the atmosphere. This is required as of January 1, 2018 to meet the requirements of 40 CFR 82, Subpart F.
**************************************************************************
All technicians working on equipment that contain ozone depleting refrigerants must be certified as a Section 608 Technician to meet requirements in 40 CFR 82, Subpart F. Provide copies of technician certifications to the Contracting Officer at least 14 calendar days prior to work on any equipment containing these refrigerants.

1.6.7 Posted Operating Instructions

Provide posted operating instructions for each piece of equipment installed.

1.6.8 Operation and Maintenance Data

Submit operation and maintenance data for each equipment, including control components. Include the following supplemental information in addition to requirements of Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS.

a. Illustrations, catalog information, shop drawings, and certified drawings of each item of equipment and control components

b. Tests and test results

c. Adjustments

d. Fan and blower characteristics curves

e. Pump characteristic curves superimposed on system curves at various pumping rates (20, 40, 60, 80, 100 percent capacity)

f. Boiler predicted performance data

g. List of special tools required

1.7 DELIVERY, STORAGE AND HANDLING

1.7.1 Assembly of Components

Each assembly of components packaged as a unit shall be of the size that can be transported by common carrier without disassembly insofar as shipping clearances are concerned.

1.7.2 Storing Tubes

Grind tube ends before shipment and properly coat against elements that may cause rusting or decomposition prior to erection. Store tubes used in erection of boiler with full protection from elements and at no time shall tubes be stored upon the ground. Maintain sufficient space between bottom row of tubes and ground to give good circulation of air at all times. Before installing tubes, remove mill scale and other foreign matter.

1.8 ENVIRONMENTAL REQUIREMENTS

1.8.1 Air Permits

Permits for construction and operation of the boiler plant shall be obtained from the local environmental regulatory agency prior to the start of construction.
1.8.2 Boiler Emissions

Comply with local, state, and federal emission regulations for the fuel to be fired.

1.8.3 Oil Burner/Windbox Package

The emission requirements shall be met at the maximum required continuous output. The burner shall meet environmental rules and regulations. Emission requirements to be considered are oxides of nitrogen (NOx), opacity, particulates, sulfur dioxide, and carbon monoxide. Compliance with NOx emission regulations shall be met using one [a combination] of the following:

a. Low NOx burners
b. Flue gas recirculation
c. Other NOx reduction methods

1.9 EXTRA MATERIALS

a. Furnish two extra sets of air filters for each compressor.

**************************************************************************
NOTE: At the text below, choose one of the two following items in coordination with the option chosen in Part 2 "Compressed Air Desiccant Air Dryer" or "Compressed Air Refrigerated Air Dryer."
**************************************************************************

b. Furnish 4 spare prefilters and 4 spare afterfilters for compressed air desiccant air dryer.

c. Furnish 4 spare disposable cartridge type prefilters and afterfilters each, for compressed air refrigerated air dryer.

d. Furnish a spare set of refractory bricks for each thawing unit.

PART 2 PRODUCTS

2.1 MATERIALS

Provide materials free of defects which would adversely affect the performance or maintainability of individual components or of the overall assembly. Materials not specified herein shall be of the same quality used for the intended purpose in commercial practice. Unless otherwise specified herein, equipment, material, and articles incorporated in the work covered by this specification shall be new.

2.1.1 Identical Items

Provide physically and mechanically identical boilers and equipment of the same classification, size or capacity to permit the interchangeability of replacement parts. This requirement includes parts, assemblies, components, and accessories. Parts provided on the same type unit regardless of size and identifiable by identical part number shall be functionally and dimensionally interchangeable. No deviation is acceptable without prior written approval of the Contracting Officer.
2.2 [COAL/OIL] [COAL] FIRED BOILER

Multiple-drum, bent tube, field erected, cross drum, high static head, and vertical combustion chamber type designed for stoker [and oil] firing. Stoker [and oil burner] shall be as specified elsewhere in this section. Utilize shop assembled components to the maximum extent to facilitate erection and minimize field labor. Materials shall be as specified herein. Materials and piping shall meet requirements of ASME BPVC SEC I. Boiler shall be a fully erected water tube boiler, including engineering, labor, supervision, tools, materials, and testing required for a complete operational unit. Equipment shall include boiler, waterwalls, refractories, insulation, supporting structural steel, steel casing and lagging, windbox, ductwork, sootblowers, stoker, [oil burners], ASME required safety valves, valves and trim, forced draft fan, induced draft fan and overfire air fan. Boiler design shall be fully integrated with and coordinated with stoker, [fuel oil burner,] economizer, and forced draft fan, induced draft fan, and controls specified elsewhere in this section. Boilers with [welded wall,[ or ][tube and tile] are acceptable.

2.2.1 Operational Requirements

Boiler shall be capable of operating continuously at the maximum specified conditions without damage or deterioration to boiler, settings, firing equipment or auxiliaries. Boiler shall be capable of automatically controlled operation while burning specified fuel[s].

2.2.1.1 Furnace Heat Input

**************************************************************************

NOTE: See NAVFAC Design Manual DM-3.6, Table 12
Stoker Selection Criteria.
**************************************************************************

When boiler is operating at a maximum continuous rating, heat input to furnace shall not exceed either of the following limits:

a. [310] [362] kW [30,000] [35,000] Btu per hour per cubic meter foot of furnace volume.

b. 315 kW 100,000 Btu per hour per square meter foot of effective radiant heating surface.

Combustion gas temperature at furnace exit shall not exceed [ 1149 degrees C 2100 degrees F when firing oil and] 93 degrees C 200 degrees F below ash fusion temperature when firing coal.

2.2.2 Construction

2.2.2.1 Boiler Drums

**************************************************************************

NOTE: Boilers 11 1/4 kg of steam per second 90,000 pounds of steam per hour or more should have a steam drum of not less than 1372 mm 54 inches in diameter and a lower drum of not less than 1067 mm 42 inches in diameter.
**************************************************************************
Drums shall be steel plate, fusion welded in conformance with the ASME BPVC SEC I. The manufacturer shall determine the inside diameter and overall length of each drum except that the steam drum shall be sized sufficiently large to contain the steam-water separating equipment, to prevent excessive rise of water due to sudden change in steam demand, and to allow for ready access into the drum. The steam drum shall be at least [_____] mm inches internal diameter. The lower drum shall be at least [_____] mm inches internal diameter. Provide each drum with an elliptical manhole at each end not less than 300 by 400 mm 12 by 16 inches, with hinged manhole cover, yoke and gaskets and machined to fit manhole flange of head. Provide flat bar ring of not less than 10 gage steel plate welded to the exterior of the drum heads around the manholes for protection of the drum head insulation. Rings shall be continuous and shape shall conform to the general outline of the manhole opening. Groove the tube holes in the drums for maximum holding power. Fusion weld the longitudinal seams in drums and the circumferential joints between heads and shells. Remove excess welding material and clean drum surface. Relieve stresses caused by welding by heat treatment in annealing furnaces, and X-ray the seams to ensure complete and proper welding. Drum variation shall not exceed one percent between maximum and minimum diameters at any section and when necessary, reheat, reroll or reform drums to meet this requirement.

a. No part of the boiler drum or header surface shall be directly exposed to furnace radiation unless it is adequately protected by a water screen in such a manner that no part of the exposed drum or header surface shall be more than 50 mm 2 inches from the nearest water tube.

b. Fit the steam outlet drum of the boiler with easily removable efficient dry pipe, special baffle, or other separating device so that the steam delivered to the boiler header shall have not more than 1.0 ppm of total solids at maximum continuous load, and during change of load from 50 percent to 100 percent of continuous rated capacity within a three minute period, provided that the total solids concentration in the boiler water does not exceed 3500 parts per million, the total alkalinity concentration does not exceed 700 parts per million, and no organic matter is present.

c. Nozzles for safety valves, main steam outlet, feed and blowdown lines, shall be forged steel, straight neck type, flanged and fusion welded to drums. Weld threaded connections in the steam drum for the feed water regulator, continuous blowdown, vent gage, and chemical feed lines.

d. Provide steam drum with internals for continuous blowdown, running the length of the steam drum at the point of highest concentration of dissolved solids, and an internal distribution pipe for chemical feed. Continuous blowdown and chemical feed pipe inside of drum shall be stainless steel.

2.2.2.2 Headers

Horizontal lower and upper side wall headers shall preferably be square. However, round headers are acceptable, provided approved stoker seals are provided. Provide rear wall and front wall headers. Protect the front wall header by studs and pack with insulating cement. Provide headers with key caps or gasketed type handhole fittings.

2.2.2.3 Tubes

Boiler design pressure shall not be less than 1724 kPa (gage) 250 psig.
Water tube rows and first two rows of main boiler bank shall be one gage heavier than other tubes. Tubes shall be resistance welded or seamless, ASME BPVC SEC II-A SA-178/SA-178M, Grade A carbon steel not less than 63.50 mm 2 1/2 inches O.D.; tubes shall not be reduced in size at the boiler drums. Manufacturer shall indicate the size, weight, and kind of tubes on the submittal drawings. Furnace walls and roof shall be water cooled. Radii of bends in tubes shall be such that standard turbine type cleaners can easily pass through the full length of the tubes.

a. When a boiler is provided with welded wall construction, the tube side walls, front wall, and furnace roof shall be of gastight construction, tubes shall be skin cased for gastight construction.

b. The width of the water wall tubes, as determined by the outside diameter of the tubes, shall cover at least 50 percent of each of the front, rear furnace, side walls, and roof of the boiler.

c. Tube connections to upper drum shall be so arranged that the ends of downcomer tubes shall be covered with water when the water level in the steam drum is 50 mm 2 inches below the bottom of the gage glass with the gage glass being centered at the normal water level in the drum. Tube bends shall be free of wrinkles and at no point of the bend shall the diameter of the tube be more than 3 mm 1/8 inch less than the minimum allowable diameter of the tubes.

d. Space boiler and water wall tubes so that tubes may be removed and replaced without disturbing another tube.

2.2.3 Boiler Setting and Insulation

Provide a complete setting including firebrick, refractory tile, insulation, tile supports, supporting steel, steel casing, material for expansion joints, and necessary work and materials to provide a complete gas envelope for the convector and water walls.

2.2.3.1 Expansion Joints

Provide expansion joints where required to permit brickwork to expand freely without interference with the boiler. Joints shall be of adequate width, tightly sealed against leakage, and free from mortar, with the outer 100 mm 4 inches sealed with resilient material suitable for 927 to 1093 degrees C 1,700 to 2,000 degrees F. In addition, to allow for expansion of the inner face, a series of 3 mm 1/8 inch wide vertical openings spaced 1.83 meters 6 feet apart shall be provided on the furnace side of the wall. Proper provision shall be made for expansion and contraction between boiler foundation and floor.

2.2.3.2 Welded Wall

a. Inner Casing: Provide No. 10 gage inner casing for tangent tube construction.

b. Insulation and Firebrick: Back up the walls and roof of the furnace with not less than 63.50 mm 2 1/2 inches of block insulation ( 816 degrees C 1500 degrees F class) or ASTM C155 insulating firebrick. Provide standard welded casing or lagging to cover and protect insulation.

c. Furnace Roof Tube Openings: Where necessary, such as where the furnace
roof tubes are separated to enter the drum, the opening shall be completely inner cased and filled with ASTM C401 castable refractory.

2.2.3.3 Tube and Tile Furnace Construction

Sides, front and rear walls, and the roof of the boiler, as far as is practical, shall include water wall tubes backed up with not less than a thickness of 63.50 mm 2 1/2 inches of super duty Class, regular type, ASTM C27 fire brick followed by high temperature block insulation 816 degrees C 1500 degrees F Class or ASTM C155 insulating firebrick. Insulation shall not be less than 127 mm 5 inches thick on the furnace walls and roof, 100 mm 4 inches thick on the side walls beyond the furnace, and 76 mm 3 inches thick on the rear wall, consisting of two layers with staggered joints. Plaster the entire exterior of the setting with a thin coating of plastic high temperature cement before the casing is applied.

2.2.3.4 Drum, Header and Miscellaneous Insulation

a. Drum Heads: Insulate drum heads with a minimum thickness of 51 mm 2 inches of calcium silicate blocks applied in two 25 mm one inch layers with 25 mm one inch mesh wire fabric embedded between layers. Entire surface shall be neatly finished with 13 mm 1/2 inch coat of smooth, hard finish hydraulic setting insulating cement with one inch chicken wire mesh embedded therein. Neatly finish drum heads with a field applied 0.47 kg 14 ounce per square meter yard glass cloth.

b. Drum Top and Header: Insulate the top half of the steam drum as previously specified for drum heads, but finish with 16 gage welded steel casing. Provide insulation to the flange on smoke outlet of the boiler. Insulate headers and downcomer tubes with not less than 38 mm 1 1/2 inch thick calcium silicate blocks banded in place, covered with 13 mm 1/2 inch thick coat of hydraulic setting insulating cement and enclosed in an 18 gage metal lagging with openings for access to handhole fittings, as required.

c. Miscellaneous: Provide special firebrick and tile required in connection with fitting of doors and seals, and around stoker and headers. Build arches of wedge brick where arches are required for door openings. Line doors exposed to furnace radiation for full depth of door with plastic refractory properly fastened to door. Caulk expansion joints with temperature resisting caulking material at points where setting joins parts of boiler. Provide air passages in insulated walls or brick work required for the stoker.

2.2.3.5 Baffles

When provided, baffles shall be properly located and practically gastight. Maximum velocity at end of baffle where gas turns shall be 17 meter 55 feet per second, except at baffle above rear pass hopper where maximum velocity shall not exceed 12 meter 40 feet per second.

2.2.3.6 Casing

**************************************************************************

NOTE: Designer shall fill in this blank depending on type of air pollution equipment and maximum pressure possible to be exerted on boiler casing by induced draft fan. Do no use less than 4980 Pa 20 inches of water gage.
Provide the entire setting, other than the top half of the steam drum with a continuously welded tight skin steel casing of not less than 10 gage, or an integral wall construction with outer casing of not less than 12 gage construction. Weld other steel casing joints where practicable, and reduce the number of bolted joints to a minimum. In places where sections of the casing are subject to removal periodically for inspection and maintenance, the casing shall be bolted using 18 mm 5/8 inch bolts on not more than 76 mm 3 inch centers with joints gasketed. Design the steel cased settings to withstand an internal negative or positive pressure of not less than the maximum static pressure generated by the boiler fans at shutoff and test block, plus a 25 percent safety factor without objectionable deflection of sides, or damage to side walls, casing, or refractory materials, or other parts of the unit. The minimum design pressure shall be a [_____] Pa inch water column. Make proper provisions for expansion and contraction of the casing without creating breakage or air leaks. With a surface wind velocity of 0.07 meter 2 feet per second, the average surface temperature of the casing shall not exceed 66 degrees C 150 degrees F while the boiler is operated at full rated load in an ambient temperature of 38 degrees C 100 degrees F. Finish the top half of the steam drum with 16 gage welded steel casing, as previously specified for the setting.

2.2.3.7 Access and Observation Doors

a. General: Provide boiler with a sufficient number of access and observation doors, to give free and easy access and observation to parts of the interior of the boiler.

b. Access and Cleaning Doors: Provide a minimum of [_____] by 450 mm 18 inch access and cleaning doors to give free and easy access to parts of the interior of the setting and the convection section of boiler. Brick up the furnace access door openings with No. 1 firebrick or firebrick tile properly held in place, between door and furnace.

c. Observation Doors: Provide boiler with not less than [_____] by 250 mm 10 inch observation doors and [_____] 100 by 100 mm 4 by 4 inch peep doors.

d. Door and Opening Frames: Frames and front plates for openings for doors, soot blowers, overfire air openings, and other such items, in the pressure parts shall be completely gastight and airtight. Doors
shall close against planed seats or the equivalent and shall be provided with heavy latches. Anchor door frames securely. There shall be no air leaks between door frames and setting.

### 2.2.3.8 Draft Connections

Provide draft connections through setting and steel casing for draft and airflow connections for combustion control and metering. Provide draft connections for measuring furnace draft, boiler outlet gas pressure, [and] economizer outlet gas pressure[, and fly ash collector outlet gas pressure]. Provide other openings as required for temperature elements and other combustion control and metering items in accordance with ABMA Boiler 103, recommended standard instrument connections unless otherwise specified.

### 2.2.4 Support and Framing

a. Support the boiler entirely independent of the casing and tile work, in a manner that will allow for expansion and contraction without straining part of boiler or affecting the setting. Support boiler and stoker entirely on structural steel work extending down to foundations as indicated.

**NOTE:** At the text below, provisions must be made for adequate boiler foundations based on soil conditions at each plant location. Foundations should be typically detailed on the drawings.

b. Provide structural steel columns and beams to support the boiler [____], [____] [and] [stoker] [and the boiler operating floor adjacent to the boiler,] [walkways, and platforms] [as indicated]. Size steel to support the equipment dead loads imposed, plus a minimum live load of 976 kg 200 pounds per square meter foot.

**NOTE:** Designer should include here any provisions where boiler steel is to serve as support for portions of building, or equipment.
[ c. Boiler manufacturer shall furnish a drawing showing the magnitude and location of the loads imposed by the equipment and structural steel on the building structural steel.

] d. Provide anchor bolt setting plans along with anchor bolts with nuts and sleeves that shall be set in concrete for attachment in support of boiler and allied equipment. Provide bolts and nuts as required for items furnished.

2.2.5 Boiler Hoppers

2.2.5.1 Rear Pass Hoppers

**************************************************************************
NOTE: Delete bracketed portions with cinder return (fly ash reinjection) when a cinder return system will not be incorporated into the project.
**************************************************************************

Provide rear pass hoppers at the rear of the stoker or boiler setting. Construct hoppers of 6 mm 1/4 inch thick welded steel plate as approved. Hoppers shall have minimum storage capacity based on 8 hours of operation at full load with no cinder return (fly ash reinjection) and shall have 200 mm 8 inch diameter outlets with standard flanges on the bottom of the hoppers.[ Coordinate hoppers and hopper outlet flanges with overfire air-cinder return reinjection system furnished by the stoker manufacturer.] Provide insulation and lagging for the hoppers as specified for the boiler.

2.2.5.2 Plenum Chamber

Enclose the underside of the grates so as to form a plenum chamber and not permit any leakage of siftings onto the floor. Provide this chamber with a single hopper complete with access door and supporting steel. Provide manually operated double leaf stoker blast gates at duct connection to plenum chamber. Provide an 200 mm 8 inch diameter outlet with standard flange on bottom of the hopper.

2.2.5.3 Ash Storage Hopper

Hopper is specified under the paragraph ASH HANDLING EQUIPMENT in this section.

2.2.6 Boiler Trim

Fittings, drain valves, drain piping, feed piping, pressure gages, feed valves, stop valves, check valves, safety valves, and other appurtenances shall comply with the applicable requirements of the ASME Boiler and Pressure Vessel Code. Components shall conform to the following:

2.2.6.1 Boiler Blowoff Valve

Provide flanged [Class 250 cast iron] [Class 300 cast steel] body, seatless, sliding plunger type valves mounted in tandem at each boiler blowoff connection.

a. Steel gate, globe and angle valves: ASME B16.34.

b. Safety, relief, and safety relief valves: MIL-DTL-18436.
2.2.6.2 Steam Gage

**************************************************************************
NOTE: Select gage scale to operate within the middle third of the range.
**************************************************************************

Provide a 300 mm 12 inch diameter indicating steam gage with chromium plated trim and zero to [_____] kPa (gage) psig scale. Gage shall be complete with siphon, valve, piping, and fittings to properly connect same. Gage shall be flush mounted on a 368 mm 14 1/2 inch square by 5 mm 3/16 inch thick steel plate. Provide plugged tee connection for connection to remote steam gage.

2.2.6.3 Water Column

Provide a safety water column with high and low water alarm suitable for the design pressure of the boiler. Column shall be complete with three-chain-operated gage cocks, heavy duty inclined gage glass, and quick-closing water gage valves having cross levers and chains operated from floor. Gage glass shall be readable from any point directly below unit. Make connections to water column from boiler with extra strong steel pipe and forged steel fittings. Provide crosses instead of tees or elbows, with screwed plugs in open ends. Terminate bottom of water column and water column gage glass with plug-in type valves accessible from operating floor. Provide plugged, screw-in type connections in water column piping to accommodate a remote level indicator. Provide gate valves immediately below water column and gage glass. Provide a suitable lamp fixture to illuminate water column.

2.2.6.4 Safety Valves

Provide not less than [_____] cast steel or cast iron body high capacity safety valves to give a total steam relieving capacity in accordance with the ASME BPVC SEC I requirements as to total boiler and water wall heating surface. Valves shall be set with a set pressure of [_____] kPa (gage) psig, [_____] kPa (gage) psig, [_____] kPa (gage) psig, respectively. Valves shall have flanged inlet and outlet connections.

2.2.6.5 Non-Return Valve

Provide a non-return valve on each boiler steam outlet. The valve shall be a stop check angle body valve, flanged, Class 250 cast iron or Class 300 steel body with handwheel shutoff, pressure operated disc and external equalizer. The assembly for manual operation shall be outside screw and yoke type.

2.2.6.6 Blowoff Connections

Bottom drum blowoff connection on boiler shall be [_____] mm inch diameter and extended to outside of setting terminating with Class 250, tandem iron body, flanged blowoff valves, and shall be in accordance with ASME BPVC SEC I, Art. PG-59. Boiler water wall blowoff connections and economizer inlet pipe blowoff shall be 40 mm 1 1/2 inch diameter and extended to outside of setting and equipped with same type valves. Provide stop valves for water column blowoff connections.
2.2.6.7 Miscellaneous Stop Valves

Provide stop valves for each connection to boiler near boiler; include valves for soot blowers, chemical feed, vent, continuous blowoff, and required drains.

2.2.6.8 Tube Cleaner

Provide one tube cleaner suitable for cleaning tubes of the boiler. Tube cleaner shall operate on water at 1034 kPa (gage) 150 psig pressure. Tube cleaner shall be complete with one motor, one wrench, one cutter head assembled, one universal coupling for cutter head, two sets of cutters, two sets of cutter pins, one set of arm pins, one set of keeper pins, one brush with a set of refills, one tool box, and two 15 meter 50 foot lengths of heavy duty hose with 20 mm 3/4 inch diameter pipe connections.

2.2.6.9 Wrenches

Provide special wrenches required for proper maintenance of equipment.

2.2.7 Boiler Limit Interlocks

Provide applicable boiler limit interlocks required by FS F-B-2910 and connect to effect safety shutdown of the stoker and oil burners. Interlocks shall be compatible with and integrated into the instrumentation system as specified.

2.2.8 Sootblowers

Provide the boiler [and] [economizer] [and] [air preheaters] with a sootblowing system using [steam] [compressed air] for removing the deposits of soot and fly ash from the heat transfer surfaces. Sufficient number of blower elements shall be provided to adequately clean the heat transfer surfaces. Fixed position, multi-nozzle rotating elements may be provided in applications where flue gas temperatures do not exceed 982 degrees C 1800 degrees F. Retractable soot blowers shall be provided where flue gas temperatures exceed 982 degrees C 1800 degrees F.

2.2.8.1 Fixed Position Soot Blowers (Steam)

Soot blowers shall be steam, fixed position, multi-nozzled, rotating, valve-in-head type with electric motor operation to permit the proper cleaning of the heat transfer surfaces with cam operated valves arranged to automatically open the steam valve through the proper arc of rotation. Cams shall be adjustable to give the proper operating arc or shall be specifically designed for each location. Furnish and install soot blowers complete, including valve-in-head blower heads, wall sleeve bushings, high temperature elements, low temperature elements, [_____] volt, [_____] Hz., [_____] kW hp motor operators, hand operated drain valve, with drilled orifice and disc to prevent tight shutoff, element supports, clamps, bolts, and other such items. Furnish necessary piping and valves including drainlines, shut-off valves, piping supports and insulation. Weld soot blower piping and fittings. No screwed piping or fittings will be permitted. Blower elements shall be carefully installed to avoid rubbing on tubes which would cause eventual tube failure. Scavenging air connections from forced draft fan shall be provided where required to protect blowers in non-blowing position. Provide a single control station containing start and stop pushbuttons and necessary relays to control the motor operators.
2.2.8.2 Fixed Position Sootblowers (Air Puff)

Sootblowers shall be air puff type, fixed position, multi-nozzled rotating element type complete with air master controller for each boiler, entirely air-operated and designed for controlled automatic sequential operation. Units shall be operated in such a manner that air issues from the element in a series of sustained high pressure puffs of approximately one second duration each. During each puff, the element shall be rotated through a predetermined and measured short arc (17 1/2 degrees) by means of a ratchet mechanism in the sootblower head. Between each puff, no air shall flow through the blowers and there shall be sufficient time for the system to be restored to full pressure. When the blowing cycle has been completed, the controller shall automatically stop the sequence. Provide sootblowers complete with wall sleeve bushings, element supports, clamps bolts and other required components. Provide necessary piping and valves, including shutoff valves, piping and supports. Weld sootblower piping and fittings. No screwed piping or fittings will be permitted. Carefully install blower elements to avoid rubbing on tubes which would cause eventual tube failure.

2.2.8.3 Retractable Sootblowers

Provide in lieu of fixed position type and where flue gas temperatures exceed 982 degrees C 1800 degrees F. Sootblowers shall be [air] [electric] motor operated. Rotation of the blower shall be continuous from the moment the lance begins to extend. Rotating and traversing speeds shall be independently adjustable by changing sprockets. Blowers shall be complete with heavy steel housing, outside adjustment of nozzle pressure, alloy lance, wall sleeve, supports, and other necessary appurtenances required for a completely workable system.

2.2.8.4 Elements

Equip units with elements specially designed for use with [steam] [air]. Elements subjected to temperatures of 482 to 816 degrees C 900 to 1500 degrees F shall be chromium covered extra heavy carbon steel tubing or a chrome alloy as specified for a higher temperature; between 817 to 927 degrees C 1501 to 1700 degrees F, they shall contain not less than 20 to 23 percent chrome; from 928 to 982 degrees C 1701 to 1800 degrees F, not less than 24 to 27 percent chrome. Provide a flexible connection between each head and element.

2.2.8.5 Control

On the operating floor provide a pushbutton for each boiler for starting and stopping system.

2.2.8.6 Control for Sootblowing System

Provide sootblowing system with an automatic programmable control system which will automatically start and stop each sootblower in programmable sequence and monitor and display operation of sootblowers. Provide an overriding control which will permit manual start-stop operation of sootblowers.

2.3 ECONOMIZER

Provide economizer [separate from the boiler] [integral to and within the
boiler setting]. Economizer shall be of the [bare tube] [cast iron fin covered steel tube] design complete with feedwater piping between economizer and boiler drum. Economizer shall be constructed in accordance with the requirements of ASME BPVC SEC I meeting the design and operating conditions as specified for the boiler and bearing the ASME Code symbol stamp. Economizer shall be suitable for the operating conditions and the fuels specified. Materials provided shall withstand temperatures and pressures prevailing under maximum load conditions. Economizer casing, insulation, and lagging shall be specified for the boiler.

2.3.1 Accessories

Provide the following accessories and equipment for each economizer.

a. Sootblowers of the same manufacturer and construction as sootblowers to be provided for boilers;

b. Stack temperature control with sensor and motorized feedwater temperature control valves to function to limit flue gas temperature to a minimum of [_____] degrees C F by modulating feedwater to the bypass;

c. Temperature and pressure indicators on feedwater outlet;

d. Temperature and pressure indicator on feedwater inlet;

e. Temperature and pressure indicator on flue gas outlet;

f. Temperature and pressure indicator on flue gas inlet;

g. Manual shutoff and bypass piping and valving;

h. Low point drain pipe complete with two blowoff valves as specified for the boiler; and

i. Audible alarm with silencing switch and indicating lights for high feedwater exit temperature, low feedwater exit temperatures, low or high flue gas exit temperature, low feedwater entrance temperature or pressure.

2.4 COAL GRATE STOKERS

**************************************************************************
NOTE: Choose from either the paragraphs and subparagraphs below TRAVELING GRATE COAL STOKER or the paragraphs and subparagraphs TRAVELING GRATE SPREADER COAL STOKER that follow it.
**************************************************************************

[2.4.1 Traveling Grate Coal Stoker]

**************************************************************************
NOTE: Designer shall select type of stoker most suited for each project. Stoker Selection Criteria is shown in NAVFAC Design Manual DM-3.6, Table 12.
**************************************************************************

**************************************************************************
NOTE: When the boiler is not part of this project insert Coal Analysis at end of this paragraph.
**************************************************************************
Stoker shall be of the bar and key traveling grate type arranged for rear ash discharge. Stoker shall be capable of continuous operation at such rate as required for the continuous output of not less than that specified for the boiler and shall satisfactorily provide for automatic operation, by means of combustion control system, within the range given when burning the specified coal and operated in accordance with instructions supplied by the manufacturer. Obtain satisfactory operating conditions throughout the full operating range of the stoker. The stoker shall be considered as an integral part of the steam generator and shall be subject to applicable provisions of the boiler design and service conditions together with requirements of tests, performance guarantees and other warranties specified for the boiler. Coal analysis shall be as specified in the Coal Analysis Schedule for the boiler. The gate moving mechanism shall be positive, up and down, and equipped with suitable operating mechanism for manual control. Provide an indicator to show the vertical position of the gate and the thickness of the fuel bed.

2.4.1.1 Stoker Grate Heat Release Rate

NOTE: Normally the stoker grate heat release will be 1417 kW per square meter 450,000 Btu per square foot per hour when coal meeting the criteria set out in the Stoker Selection Criteria shown in NAVFAC Design Manual DM-3.6, Table 12 is used. When coal is specified which does not meet this criteria then the grate heat release will have to be lowered accordingly.

Not greater than [_____] kW per square meter Btu per square foot per hour at the specified maximum continuous rating for the boiler. The square meter feet of projected grate area shall be the product of the length measured between the inside of the coal gate and the centerline of the rear shaft or return bend and the width of the grate.

2.4.1.2 Construction

a. Fuel Feed Control: Control fuel feed to the stoker by the stoker speed and the vertical position of the coal regulating gate. Coal gate to vary the thickness of the fuel bed shall be of heavy cast iron with refractory facing to protect it from the furnace heat. The gate moving mechanism shall be positive, up and down, and equipped with suitable operating position of the gate and the thickness of the fuel bed.

b. Coal Hopper: Provide a coal hopper of 6 mm 1/4 inch thick Type 304 or 316 stainless steel plate at the front of each stoker. The capacity of the hoppers shall not be less than [_____] cubic meters feet.

c. Stoker Front Enclosure: Provide stoker fronts with dust tight enclosures of not less than 10 gage plate to eliminate dust from the boiler room and prevent air infiltration to the grate. Fit these fronts with access doors.

d. Air Plenum (Siftings Hopper) and Ducts: Provide an undergrate air plenum and air ducts for the stoker which will receive air from the
forced draft fan. Plenum and air ducts shall be not less than 10 gage steel plate. Provide concrete ducts or airways along the sides of the setting when adaptable to use by the stoker submitted. Provide ducts in accordance with drawings and requirements furnished by the stoker manufacturer. Provide unit with necessary observation doors or ports of the self-closing glass-covered type for side walls, including a minimum of four for observing the underside of the grate.

e. Stoker Air Zones: The stokers shall have not less than [_____] air zones with individual control to each zone in order to provide optimum control of combustion conditions for loads within the specified range and shall be so arranged that a positive air seal will be formed between each zone. Design the zones to provide removal of siftings. To ensure proper air distribution to each zone, provide an air control valve or damper for each zone. Control valves or dampers shall be hand controlled and shall be accessible for instant adjustment by the operator from the side of the stoker. Provide each zone with a pipe opening for a draft gage connection and provide connection in the overfire air duct for the same purpose.

f. Stoker Grate: Mount the traveling grate stoker grate keys (clips) on carrier bars supported from an endless heat treated type steel chain. Provide wearing shoes on the carrier bars to carry the grate weight on skid rails extending the length of the furnace. The chain links shall mesh with the shaft sprockets transmitting the driving force to the endless chain. Grate keys (clips) shall be chrome alloyed cast iron to resist growth. Links shall be uniform. Grates shall be made of the best quality, heavy duty, heat resisting, cast iron or cast alloy carefully cast to minimize initial strain. The sifting hoppers and removal system shall be so arranged that siftings may be removed from zones.

g. Grate Thermocouples: Provide two grate temperature sensing thermocouple arrangements on each grate to indicate and record grate temperatures on the operator's [interface console] [control panel].

h. Tension Adjustment: Provide a conveniently located adjustment accessible from outside of the boiler or through access plates in the stoker front cover for regulating the tension of the grate. Provide adequate adjustment for the chain length.

i. Stoker Seals: Provide the stoker with seals between the bottom of the sidewall header and the frame. Provide restraints in the boiler setting to prevent seals at rear of stoker from opening up.

j. Stoker Support: Stoker and drive shall be complete with supporting structural steel framework. Locate and protect structural supports so that they will not be overheated or damaged by heat from either the furnace or ash pit.

k. Grate Return Run Support: Adequately support the lower return run of the grate on a system of cross members and longitudinal members or skids. Provide an air seal between this lower drag frame and ash pit and siftings hopper.

2.4.1.3 Grate Ash Discharge Enclosure

Enclose rear end of grate, where ash is discharged into the hopper below the floor line, with a dust tight enclosure made of heavy steel plates.
properly protected with fire brick where exposed to the furnace. Fit vertical ends of this enclosure with cast iron, refractory lined inspection and access doors, one for each feeder. Seal off roof of this enclosure with refractory, protecting metal parts from the furnace temperature with refractory. Exposed metal parts in the enclosure are not acceptable. Enclosure shall be compatible with the ash storage hopper as specified under the paragraph ASH HANDLING SYSTEM in this section.

2.4.1.4 Stoker Grate Drive

Drive the grate of the stoker through hydraulic drive, or with electrical motor and transmission equipment as specified below. Drive shall have a variable speed ratio of not less than six to one with the speed changing device, controlled automatically by the combustion control system. Provide a manual and reversing adjustment so the grate speed can be operated independent of the combustion control system. Provide adequate safety release to prevent damage to the drive or grates due to foreign material or jamming of the grates. Provide the front and rear shafts of the grates with an adequate lubrication system with fittings located on the outside of the setting.

a. Electric Motor: Motor shall be [_____] volt, [_____] phase, [_____] rpm, 60 Hz, totally enclosed, fan cooled, not less than [_____] kW hp as specified under the paragraph MOTORS AND DRIVES in this section.

b. Mechanical Drive: Mechanical drive shall include variable speed transmission with gears and chains, enclosed in an oil tight case, and running in a bath of oil. Bearings shall be of the anti-friction type, with hardened inner and outer races and fitted with forced lubrication fittings.

c. Hydraulic Drive: Hydraulic drive shall include a complete hydraulic system with adequately sized reservoir, dual pumps, oil piping to and from drive, control and isolating valves, oil cooler, when required, with self-operated cooling water control valve, oil temperature indicator, and other accessories for a complete, satisfactory operating system.

2.4.1.5 Miscellaneous Equipment

Provide shafting, couplings, bearings, drives with guards, linkages, rods, and other miscellaneous equipment from the stoker manufacturer required or necessary for interconnecting of the stoker units and drives necessary for a complete operating system. Provide equipment even though it is not specifically mentioned herein. Gears, chains, belts, couplings, and other moving parts shall be properly enclosed or guarded.

2.4.1.6 Lubrication

The entire stoker mechanism shall have adequate provisions for proper lubrication where required and shall be equipped with conveniently located fittings for this purpose.

2.4.1.7 Overfire Air System

Provide an overfire air system from the stoker manufacturer to ensure good ignition at the stoker front and adequate control of smoking. System shall include necessary nozzles, ducts, and overfire air fan with motor drive. When more than one row of nozzles is supplied, provide individual air
volume control for each row or set as required. Locate nozzles or protect them with shields so as to prevent plugging of the nozzles in service. Nozzles shall be constructed of materials suitable for service at maximum temperatures anticipated. Provide necessary arrangements to the water wall tubes, arch construction, refractory, insulation, and casing from the boiler manufacturer, to permit installation of an adequate overfire air system. Overfire system shall be capable of providing a minimum of 15 percent of total combustion air at the required static pressure.

2.4.2 Traveling Grate Spreader Coal Stoker

**************************************************************************
NOTE: Choose this paragraph and its subparagraphs or the paragraphs and subparagraphs above, TRAVELING GRATE COAL STOKER.
**************************************************************************
**************************************************************************
NOTE: When the boiler is not part of this project insert Coal Analysis at end of this paragraph.
**************************************************************************

Stoker shall be of the overfeed, synchronized, self-feeding, spreader stoker type with continuous cleaning forward moving bar and key grates suitable for burning a portion of the coal in suspension and burning the balance on the grates. Stoker shall be capable of continuous operation at such rate as required for the continuous output of not less than that specified for the boiler, and shall satisfactorily provide for automatic operation by means of the combustion control system, within the range given when burning the specified coal and operated in accordance with instructions supplied by the manufacturer. Stoker shall be considered an integral part of the steam generator and shall be subject to all applicable provisions of the boiler design and service conditions together with requirements of tests, performance guarantees and other warranties specified for the boiler. Coal analysis shall be [as specified in the Coal Analysis Schedule for the boiler] [as listed below].

2.4.2.1 Stoker Grate Heat Release

**************************************************************************
NOTE: Normally the stoker grate heat release will be 2205 kW per square meter 700,000 Btu per square foot per hour when coal meeting the criteria set out in the Stoker Selection Criteria shown in NAVFAC Design Manual DM-3.6, Table 12 is used. When coal is specified which does not meet this criteria then the grate heat release will have to be lowered accordingly.
**************************************************************************

The active grate area shall be such that the heat release at the maximum continuous rating shall not exceed [___] kW per square meter Btu per hour per square foot. At minimum boiler rating the stoker grate heat release shall be a minimum of [2280] [2850] MJ per square meter [200,000] [250,000] Btu per square foot; this results in a guaranteed turndown ratio of [_____] to 1. Grate area shall be the product of the width between the inside faces of the sidewalk heaters at the grate line and the length of the air-supplied grate area. The grate shape shall be designed so that the heat release per front meter foot of stoker width does not exceed 2930 kW.
2.4.2.2 Construction

a. Fuel Feed Control: Coal shall be fed to and distributed in the furnace by not less than three overfeed type spreader stoker feeders for each boiler. Feeders shall be operated simultaneously and at synchronized speeds so that any one feeder may be taken out of service without affecting the operation of the others. Each feeder shall be readily adjustable to ensure proper fuel distribution within the furnace. Design and size the total combined width of the feeder openings for proper distribution of the fuel over the width of the stoker grate. Design shall be such that the combined width of the feeders shall not be less than 40 percent of the width of the stoker grate. The feeders shall be capable of handling and uniformly distributing coal varying in size from 6 to 32 mm 1/4 to 1 1/4 inches with no more than 40 percent passing a 6 mm 1/4 inch round mesh over the entire grate area. The feeder shall be capable of properly performing with moisture in the fuel as high as 15 percent by weight. Materials of construction shall be such that coal with high sulfur content can be satisfactorily used without extensive corrosion over the lifetime of the parts. Provide moving parts of the feeders with anti-friction type bearings and with a forced system of lubrication. Bearings subject to high temperatures shall be water cooled. Gear teeth shall be machine cut.

b. Coal Hopper: Provide a metal hopper for each spreader stoker feeder. Hoppers shall be not less than 6 mm 1/4 inch thick 304 stainless steel plate, rigidly reinforced and connected to the coal grates. Support hoppers from the floor or boiler columns to eliminate weight on the feeders. Provide hoppers with suitable cleanout doors located in the front.

c. Air Plenum (Siftings Hopper) and Ducts: The traveling grate/stoker shall be complete with under grate air plenum, manually operated blast gates and operating handles, and siftings hopper. Plenum and air ducts shall be not less than 10 gage steel plate. Locate and protect structural supports so that they will not be overheated or damaged by heat from either the furnace or ash pit. Provide unit with necessary observation doors or ports of the self-closing glass-covered type for side walls, including a minimum of four for observing the underside of the grate.

d. Stoker Grate: Grates shall be made of the best quality, heavy duty, heat resisting, cast iron or cast alloy carefully cast to minimize initial strain. Specially design the grates for spreader stoker firing. Grates shall be of high resistance, air metering type with closely and uniformly spaced self-cleaning air openings. The grates shall have close fitting, overlapping edges to prevent air leakage at the joints. Provide undergrate air seals at both the front and rear ends fabricated of cast iron and counterweighted so that they will always be in close contact with the under sides of the grates. Construct the rear seal to proportion the air flow through the rear end of the grate to expedite coking and ignition of the coal, thereby properly conditioning it for efficient combustion when the fuel bed reaches the active air admitting area. Side seals between edge of stoker grate and boiler shall be approved bellows type.

e. Grate Thermocouples: Provide two grate temperature sensing thermocouple arrangements on each grate to indicate and record grate
temperatures on the operator's [interface console] [control panel].

f. Tension Adjustment: Provide a conveniently located adjustment accessible from outside of the boiler or through access plates in the stoker front cover for regulating the tension of the grate. Provide adequate adjustment for the chain length.

g. Stoker Support: Stoker and drive shall be complete with supporting structural steel framework. Locate and protect structural supports so that they will not be overheated or damaged by heat from either the furnace or ash pit.

2.4.2.3 Grate Ash Discharge Enclosure

Enclose front end of grate, where ash is discharged into the hopper below the floor line, with a dust tight enclosure made of heavy steel plates properly protected with fire brick where exposed to the furnace. Fit vertical fronts of this enclosure with cast iron, refractory lined inspection and access doors, one for each feeder. Seal off roof of this enclosure with refractory, protecting the metal parts from the furnace temperature with refractory. Exposed metal parts in the enclosure are not acceptable. Enclosure shall be compatible with the ash storage hopper as specified under "Ash Handling System" this section.

2.4.2.4 Feeder Drives

At the option of the Contractor, the drives shall be either individually driven and controlled feeders or feeders driven by a line shaft with individual clutch arrangements.

a. Controlled Feeders: The individually driven and controlled feeders shall have a variable speed drive on each distributor and a silicon controlled rectifier (SCR) D.C. motor drive for each drum or feed box. A master controller shall receive a fuel demand signal from the combustion control system and control the individual slave controllers of the individual SCR units to satisfy the particular fuel demand. Control arrangement shall provide for simple adjustments between feeders for equal fuel delivery and also for single feeder biasing.

b. Line Shaft Feeder: The feeders driven by a line shaft shall be driven through a variable speed drive having a ratio of not less than three to one. Feeder drive shall be so arranged that each feeder is independently driven from a lineshaft so that any feeder can be engaged or disengaged without disturbing the operation of the remaining feeders. Fuel delivery shall be governed by the combustion control system.

c. For either stoker drive system, provide a complete operating unit with necessary shafting, couplings, bearings, drives with guards, linkages, rods, and other equipment, as required or necessary for any interconnecting of the stoker units and drives. This equipment shall be provided even though it is not specifically mentioned. Provide safety release to prevent damage to the units due to foreign materials in the coal or other causes of overload.

d. Distributor: The distributor shall be driven by a variable speed electric drive which is manually adjusted to achieve optimum distribution.
2.4.2.5  Stoker Grate Drive

Drive the grate the stoker by [hydraulic package] [electrical motor] [a steam turbine] through a variable speed device with a speed ratio of at least six to one, with the speed changing device, controlled automatically by the combustion control system. Provide a manual adjustment to regulate grate speed ratio to fuel feed in order to compensate for variations in the ash content. Provide a suitable safety release device to prevent damage to the drive or grates due to foreign material or other obstruction interfering with the grate operation.

**************************************************************************
NOTE: Make heat balance to determine whether it is more economical to use turbine drives rather than electric motors.
**************************************************************************

a. Electric Motor: Motor shall be [_____] volt, [_____] phase, [_____] rpm, 60 Hz, totally enclosed, fan cooled, not less than [_____] kW hp as specified under the paragraph MOTORS AND DRIVES in this section.

b. Steam Turbines: Drive shall be by steam turbine conforming to NEMA SM 23 as modified below. Turbine shall be noncondensing capable of producing braking power [_____] kW horsepower at [_____] rpm at a steam rate of not more than [_____] kg pounds per brake power hour. Inlet steam condition, upstream of built-in governor, shall be [_____] kPa (gage) psig and [_____] degrees C F. Exhaust steam conditions at exhaust nozzle shall be [_____] kPa (gage) psig. Turbine rotation shall be [clockwise] [counterclockwise] and shall be [direct connected] [geared] to the driven piece of equipment which shall operate at [_____] rpm. Piping connections 50 mm 2 inches and smaller shall be screwed. Connections 65 mm 2 1/2 inches and larger shall be flanged. Inlet flanges shall be raised face suitable for the inlet pressure specified. Exhaust flanges shall be Class 125 or Class 150 flat-faced flanges. Turbine shall be complete with insulation and lagging. Insulation shall be as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. Turbine governor shall be of direct oil relay type with 10 percent adjustable speed range. Lubrication shall be of the manufacturer's standard non-pressure type.

c. Mechanical Drive: Mechanical drive shall include variable speed transmission with gears, worm drives and bearings, enclosed in an oil tight case, and running in a bath of oil. Bearings shall be of the anti-friction type, with hardened inner and outer races and fitted with forced lubrication fittings.

d. Hydraulic Drive: Hydraulic drive when required shall include a complete hydraulic system with adequately sized reservoir, dual pumps, oil piping to and from drive, control and isolating valves, oil cooler, when required, with self-operated cooling water control valve, oil temperature indicator, and other accessories for a complete, operating system. Hydraulic drive system motor, shall be [_____] volt, [_____] phase, 1200 rpm, 60 Hz totally enclosed, fan cooled, not less than [_____] kW hp as specified under the paragraph MOTORS AND DRIVES in this section.

e. Miscellaneous Equipment: For a stoker drive system, provide a complete operating unit with necessary shafting, couplings, bearings, drives with guards, linkages, rods, and other equipment, as required or
necessary for any interconnecting of the stoker units and drives. This equipment shall be provided even though it is not specifically mentioned herein. The front and rear shafts of the grate are to be fitted with a forced system of lubrication with fittings located on the outside of the setting. The devices for changing the speed ratio of the grate drives shall be connected to the fuel feed regulation system, so both fuel feed and grate speed can be synchronized and controlled automatically by the combustion control system. A manual adjustment shall be provided to regulate grate speed ratio to fuel feed in order to compensate for variations in ash content of the fuel. A suitable safety release device shall be provided to prevent damage to the drives or grates, due to foreign material or other obstruction interfering with the grate operation. Gears, chains, belts, couplings, and other moving parts shall be properly enclosed or guarded.

2.4.2.6 Overfire Air System

******************************************************************************
NOTE: Designer should include bracketed sentence when cinder return (fly ash reinjection) will not be incorporated in the project.
******************************************************************************

Provide a high pressure overfire air system for each stoker, including fan, [motor drive,] ductwork, dampers and nozzles. The fan shall have a capacity of not less than 15 percent of the total air required at maximum steaming capacity when operating at the predicted amount of excess air in the furnace. Static pressure of the fan shall be sufficient to ensure full penetration of the furnace by the air jets, but not less than $6225 \text{ Pa}$. Overfire air distribution nozzles shall be fabricated from heat resistant alloy. Locate air jets properly and in sufficient numbers to create proper furnace turbulence for complete combustion at all ratings. Make modifications and additions to the system to ensure penetration and turbulence of areas of the furnace as required after startup. [There will be no cinder return system incorporated in the overfire air system.]

******************************************************************************
NOTE: At the text below, delete the following paragraph on pneumatic cinder return (fly ash reinjection) system when this system will not be incorporated in the project.
******************************************************************************

[a. Cinder Return System (Fly Ash Reinjection): Provide a pneumatic cinder return system to reinject collected fly ash and unburned combustibles into the furnace. The system shall operate in conjunction with the overfire air system and shall be complete with necessary air lines, nozzles, ducts, and dampers for returning the cinders from the rear convection pass hopper of the boiler and the economizer soot hopper or air heater hopper. Cinder return lines, shall be constructed of abrasion-resistant iron having a Brinnell hardness of not less than 350, with the exception that the straight conveyor lines, starting at a point not less than $600 \text{ mm} 2 \text{ feet}$ downstream from each cinder pickup nozzle or elbow extending to within not less than $600 \text{ mm} 2 \text{ feet}$ of the furnace, may be constructed of extra strong Schedule 80 steel pipe. Provide glass viewing ports at the end of each cinder return line so that interior of lines are visible all the way through to furnace.
2.5 OIL BURNER/WINDBOX PACKAGE

**************************************************************************
NOTE: Choose this paragraph and its subparagraphs when oil is used.
**************************************************************************

**************************************************************************
NOTE: The designer shall fill in the appropriate information as defined in FS F-B-2910.
**************************************************************************

Provide a fully modulating, oil burner conforming to FS F-B-2910 Rev F, Class [____], except as modified below. Provide burner with windbox, forced draft fan, dampers, fuel train and associated controls to comprise a complete factory assembled package. Total heat input to boiler furnace shall be provided by [____] burners. Burner package shall be considered an integral part of the steam generator and shall be subject to applicable provisions of the boiler design and service together with requirement of tests, performance guarantees and other warranties specified for the boiler.

2.5.1 Burner

2.5.1.1 Burner Characteristics

The burner shall be quiet in operation and operate with a balanced clean, stable flame so as not to localize heat in any part of the combustion chamber. Burner shall be capable of completely atomizing and effectively mixing oil with air so as to ensure complete combustion. Air admitted shall be of sufficient quantity for complete combustion, but not of such quantity as to produce an undue percentage of excess air with high stack loss. Oil burner shall operate without clogging and shall have sufficient capacity to develop not less than the specified capacity. Burner unit shall be easily removed from firing position and readily accessible for inspection, cleaning and other purposes. Provide adequate observation ports on burner. Burner manufacturer shall guarantee that there will be no flame impingement on sidewalls, top, bottom, or rear walls of furnace. Burner manufacturer shall furnish, and contractor shall install refractory throat tiles or other items required for proper installation of burner.

2.5.1.2 Atomization

**************************************************************************
NOTE: Burners may be air atomizing or steam atomizing. When a separate compressed air system is used the designer shall fill in blanks with the quantity and pressure of compressed air that will be available for fuel oil atomization. The designer should allow for an adequate amount of atomizing air. Atomizing air requirements will vary depending on many factors including burner design, fuel oil characteristics, fuel oil pressure, air pressure and even furnace conditions. See NAVFAC Design Manual DM-3.6 for empirical information.
**************************************************************************

Burner shall be [steam atomizing; steam pressure at header is [____] kPa (gage) psig; steam temperature at header is [____] degree C F] [air atomizing; filtered compressed air shall be available for burner]
atomization and the maximum requirement for each burner shall not exceed [_____] L/s scfm of air at [_____] kPa (gage) psig]. Provide pressure reducing valve and controls as required.

2.5.1.3 Electric Ignition System

Burner shall be equipped with an electric ignition system. System shall be either the high energy ignition or glow rod type. Gas ignition system is not acceptable. The high energy ignition system shall use stored energy to develop 2000 Vdc pulses. The glow rod system shall use a low voltage, carbon rod electrode which develops a tip temperature of 1427 degrees C 2600 degrees F. Provide ignition system complete in all respects.

2.5.1.4 Windbox

Construct of carbon steel plate not less than 10 gage thickness with 6 mm 1/4 inch thick front plate. Design windbox to provide even and uniform air entrance into the burner register and seal weld to the boiler front wall. Provide windbox with support legs.

2.5.1.5 Purge Connection

Provide [steam] [air] purge connection, properly valved, for purging oil from gun prior to removal from burner.

2.5.1.6 Aspirating System

**************************************************************************
NOTE: Provide aspirating system only for boilers in which the expected furnace pressure exceeds 1245 Pa 5 inches water.
**************************************************************************

Provide an air aspirating system for the fuel oil atomizer guide pipes to prevent blowback of hot furnace gases. Aspirating system shall use approximately [_____] L/s scfm of [_____] kPa (gage) psig compressed air.

2.5.1.7 Guide Pipe Purge

Provide piping and flexible hoses for the guide pipe purge and aspirating systems. Air from the forced draft fan shall be provided for guide pipe purging during normal operation.

2.5.1.8 Metal Parts

Metal parts exposed to radiant heat, including the atomizer shield, shall be of stainless steel or other approved alloy.

2.5.1.9 Fuel Oil Control Valve

Fuel oil will be supplied at [_____] kPa (gage) psig and [_____] degrees C F at the inlet of the fuel piping train. Size fuel oil automatic control valve for 103 kPa 15 psi differential pressure as specified in Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS.

2.5.1.10 Fuel

ASTM D396, Grade no. [_____].
2.5.1.11 Forced Draft Fan

NOTE: The designer shall make a technical evaluation to determine when the forced draft fan should be integrated with or mounted separately from the windbox on the floor next to the boiler. When the forced draft fan is to be mounted separately, delete this paragraph and specify the fan in the paragraph FANS.

Fan shall be fully integrated with and mounted on the windbox. Provide an inlet silencer, when required, to ensure operation at noise level below 85 dBA as specified in Section 22 05 48.00 20 MECHANICAL SOUND, VIBRATION, AND SEISMIC CONTROL.

2.5.1.12 Electric Motor

NOTE: The designer shall perform an economic analysis and make a technical evaluation to determine when forced draft fan motor shall be provided with variable speed control. Generally, variable speed drives for forced draft fans over 7 1/2 kW 10 hp will be cost effective.

Motor shall be [variable speed], [_____] volt, [_____] phase, 60 Hz, [totally enclosed, fan cooled], [totally enclosed, non-ventilated], not less than [_____] kW hp as specified under the paragraph MOTORS AND DRIVES in this section.

2.5.2 Flame Safeguard Controls

Provide a complete system of valves, interlocks and controls in accordance with NFPA 85 and as approved by Factory Mutual Engineering and Research.

2.5.2.1 Fuel Oil Train

Provide fuel oil train consisting of [steam] [air] atomizing oil gun, auxiliary [steam] [air] atomizing oil gun for changing guns without a shutdown, fuel oil control valve, two safety shutoff valves recirculation valve, strainer, and flexible hose connections to oil burner package the following gages. Gages shall be 150 mm 6 inch with white coated dials and black figures:

a. Fuel oil supply pressure (0 to 1034 kPa (gage) 150 psig)

b. Fuel oil pressure at burner (0 to 1034 kPa (gage) 150 psig)

[c. Atomizing air pressure at burner (0 to 1034 kPa (gage) 150 psig)

][d. Atomizing steam pressure at burner (0 to 1034 kPa (gage) 150 psig).

2.5.2.2 Control Sequencing

Flame safeguard system shall be designed to ensure safe purge, light-off and shutdown procedures, and to monitor light-off, main flame and boiler
operating conditions.

a. The flame safeguard system shall be of the automatically sequenced type with programming timed and sequenced by a heavy duty, industrial type timer. This timer shall be tamper-proof and shall be designed so that advancement of the timer to shorten purge will shut down the unit.

b. Provide system with [ultraviolet] [infrared] scanner and electronic relay located in the front wall which will shut down the fuel within 2 to 4 seconds of loss of flame.

c. Provide scanner output meter in panel for indication of scanner signal strength.

d. The safety system shall include the following limit devices incorporated into a limit circuit:

(1) Flame failure
(2) High boiler outlet pressure
(3) Low fuel oil pressure
(4) Low water level cutout
(5) Low combustion air flow
(6) Low atomizing [air] [steam] pressure
(7) Any additional devices as required by FM or NFPA

[ (8) Low fuel oil temperature ]

e. Safety system limits specified above shall be displayed on a first out annunciator mounted in the burner panel. [Provide a common alarm contact to be wired to the operator control console, specified under Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS.]

2.5.2.3 Light Off

Failure shall require a manual restart of the programmer. The safety system shall provide a mandatory purge with the forced draft fan vanes proven open, and a return to proven low fire position before light off. Main fuel valve shall open for a timed period of 10 seconds during trial for ignition.

2.5.2.4 Circuit Analyzer

Provide a circuit analyzer system, which, by means of 12 or more lights, will indicate which circuits are energized at specific time, and will thereby indicate any improperly operating circuit.

2.5.2.5 Control Panel

Programmer, limit control, relays, annunciator, shall be mounted in a [ NEMA MG 1 control panel, modified with fully gasketed doors and panels mounted on burner package] [control panel as specified under Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS].
2.6 FANS

2.6.1 Forced Draft Fan

**************************************************************************
NOTE: The fan type shall be specified in accordance with CID A-A-59222.
**************************************************************************

CID A-A-59222, Type [____], Class 1, except as specified otherwise.

2.6.1.1 Fan Size

Size fans for complete combustion of fuel at maximum firing rate. Maximum fan speed shall not exceed 1800 rpm at test block rating with [10] [20] [40] percent excess air, taking into account design allowances, corrections for burner or stoker pressure drop, furnace pressure, combustion air temperature, plant elevation, and other design factors. Minimum static efficiency at maximum continuous rating shall be [____] percent. Add the following allowances for momentary overloads and normal deterioration of fans, firing equipment, and boilers after sizing fans in accordance with the above to obtain the test block rating:

<table>

2.6.1.2 Fan Construction

Fan shall be arrangement [____] in accordance with AMCA 801. Fan shall have backward inclined or backward curved single thickness blades. Fan shall have stable characteristics with self-limiting power curve. Construct fan wheel of steel. Balance fan wheel both statically and dynamically at factory. Provide fan with air cooled roller bearings mounted in horizontally split pillow blocks. Fan housing shall be welded constructed of a minimum of 12 gage steel. Provide flanged inlet and outlet connections, 50 mm 2 inch plugged opening in low point of scroll and hinged, quick opening access door in scroll. Provide a multi-blade vortex ball bearing damper in fan inlet with an extended, ball bearing mounted control lever for field connections to control actuator. Interior of fan, including wheel, shall be painted with two coats of red primer and one coat of rust resistant enamel with a total dry film thickness of 0.152 mm 6 mils. Exterior surface of the fan shall have two coats of red primer with a total dry film thickness of 0.10 mm 4 mils. Cleaning and painting shall be in accordance with the manufacturer's standards.

2.6.1.3 Fan Drive

Equip fans with [both] [a motor] [and] [steam turbine] drive. The [motor] [and] [turbine] shall be direct connected to the fan [with a gear type flexible coupling] [with a roller type, hardened steel clutch coupling consisting of an over-running clutch and double flexing coupling to permit
instantaneous change-over from one drive to the other. One clutch coupling shall be provided between the fan and each driver. Clutch couplings shall be selected for the maximum torque requirement of the fan, with a 1.5 service factor. Provide a removable guard over each clutch coupling.

2.6.1.4 Electric Motor

Motor for driving the forced draft fan shall be [_____] volt, three phase, 60 Hz, [open drip-proof] [totally enclosed fan cooled] [two speed] [variable speed] not less than [_____] kW hp, as specified under MOTORS AND DRIVES in this section, and shall not overload at the specified capacity with unheated cold air. [Fan motor shall be suitable for installation in a hazardous location as defined by NFPA 70.] Provide [_____] mm inch thick steel soleplate for motor. Soleplate shall be common for four motor mounting bolts. Separate parallel soleplate bars are not acceptable.

2.6.1.5 Steam Turbine

Steam turbine shall drive the fan through a reduction gear shall be single stage, rated at not less than [_____] kW hp, with inlet steam pressure of [_____] kPa (gage) psig, [_____] degrees C F total temperature and a normal exhaust back pressure of [_____] kPa (gage) psig or a maximum back pressure of [_____] kPa (gage) psig. Water rate at full load and normal steam conditions shall not exceed [_____] kg pounds per brake power hour. Maximum turbine speed shall not exceed [_____] rpm.

a. Turbine Construction: Turbine casing split on the horizontal centerline constructed of ASTM A48/A48M cast iron, with design pressure rating of 1724 kPa (gage) 250 psig at 232 degrees C 450 degrees F at the inlet, and 379 kPa (gage) 55 psig at 232 degrees C 450 degrees F at the outlet. Turbine shall also include a stainless steel steam strainer, sentinel relief valve, sight oil level indicator and two hand valves.

b. Turbine Bearings and Shaft: Bearings horizontally split, ring-oiled, sleeve type water-cooled. Shaft shall be stainless steel sprayed or chrome plated under the packing glands. Shaft seals shall be segmented carbon rings with springs and stops.

c. Speed Governor: Variable speed oil relay NEMA Class [A] [D] governor for speed limiting [and pneumatic operator to maintain an adjustable turbine speed]. [Input to the operator shall be a 20 to 103 kPa (gage) 3 to 15 psig pneumatic signal.] [Provide an electro-pneumatic transducer to accept the 4 to 20 mA signal from the controller specified in Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS.] [Turbine shall go to maximum rated speed on air failure.]

d. Emergency Overspeed Governor: Completely independent of the speed governor and shall operate a separate trip valve.

e. Insulation: Turbine shall be insulated and lagged by the manufacturer as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

f. Reduction Gear: High speed, heavy duty, double helical, full pressure lubricated, horizontal offset type with a service factor not less than 2 provided in a horizontally split casing. The gear and pinion shall be spray lubricated from a pressure lubricating system. The pressure lubricating system shall include a shaft driven oil pump, strainer,
cooler, pressure gage, low oil pressure switch, relief valve, reservoir and piping. Provide a high speed, gear type, forge steel coupling between the turbine and the gear. Reduction gear and turbine shall be mounted on a common baseplate.

g. Turbine Trip: Provide solenoid valve to trip turbine on failure of induced draft fan.

2.6.1.6 Noise Level

Noise level shall not exceed 85 dBA sound pressure level at 1 1/2 meters 5 feet above the floor and 1 1/2 meters 5 feet from the fan in any direction. [Provide heavy duty sound attenuator with screen on fan inlet to meet the sound pressure level requirements.]

2.6.2 Induced Draft Fan

******************************************************************************
NOTE: The fan type shall be specified in accordance with CID A-A-59222.
******************************************************************************

CID A-A-59222, Type [_____,] Class 2.

2.6.2.1 Fan Size

Size fans to handle combustion gases at maximum firing rate. Maximum fan speed shall not exceed 1200 rpm at test block rating. Design allowances and corrections for furnace, economizer, [scrubber,] [baghouse,] dust collector, breaching pressure drop when operating at [10] [20] [40] percent excess air, flue gas temperature, plant elevation, and other design factors shall be made. Add the following allowances for momentary overloads and normal deterioration of fans, firing equipment and boilers after sizing fans in accordance with the above, to obtain the required test block rating:

2.6.2.2 Fan Construction

Fan shall be arrangement [_____] in accordance with AMCA 801. Fan wheel shall be radial tip design (forward curved-backward inclined) or straight radial blade with shrouds for high efficiency design. Blading shall be 8 gage minimum thickness steel [with the addition of 6 mm 1/4 inch thick steel partial blade wear strips, 125 mm 5 inch minimum width each side of centerplate]. A minimum number of blades is preferred; a maximum of twenty-four is acceptable. Balance fan wheels both statically and dynamically at factory. Minimum static efficiency at maximum rating including allowances shall be 67 percent.

******************************************************************************

SECTION 23 52 33.02 20 Page 79
NOTE: At the text below, heat slingers may not be necessary on low temperature flue gas applications.

******************************************************************************

a. Bearings and Pedestals: Provide fan with water-cooled self-aligning sleeve type bearings mounted in suitable pillow blocks. Bearings shall be independent high temperature, oil lubricated, pedestal type with dust seals. [Provide fan shaft heat slingers.] Cast iron or fabricated steel pedestals mounted on fabricated steel soleplates shall be provided. Provide a self-contained temperature control valve, with water piping to control temperature of bearings.

b. Housing: Fan shall have 5 mm 3/16 inch thick welded steel housing and inlet boxes which shall be split with flanged and gasketed joints. Construction shall permit one piece removal of rotor from rear of fan without disturbing duct connections. Provide hinged, quick opening access door in scroll and inlet boxes and 50 mm 2 inch plugged openings in low points of scroll and inlet boxes.

c. Dampers: Provide inlet dampers with multi-parallel-stream flow blades with anti-friction bearings with 80 mm 3 inch minimum spacers and stuffing boxes to keep bearings cool. Dampers shall be mounted in 200 mm 8 inch channel frames and interconnected with one extended, ball bearing mounted control level for connection to control actuator.

d. Welding: Welding of fan components shall be in accordance with current production standards. High stress fan wheels shall be continuously welded. Low stress exterior housing bracing, dampers, and other similar components shall be intermittently, plug or continuously welded.

e. Painting: Interior of fan, including wheel, shall be coated with protective coatings suitable for the flue gas conditions expected to be encountered by this fan. Exterior surface of fan shall have coatings of quality weather and heat resistant paint. Fan shall be shop assembled and match-marked by manufacturer before dismantling for shipment. Surface cleaning and painting shall be in accordance with the manufacturer's standards for the service expected.

2.6.2.3 Fan Drive

Fans shall be equipped with [both] [a motor] [and] [steam turbine] drive. The [motor] [and] [turbine] shall be directly connected to the fan [with a gear type flexible coupling] [with a roller type, hardened steel clutch coupling consisting of an over-running clutch and double flexing coupling to permit instantaneous change-over from one drive to the other. One clutch coupling shall be provided between the fan and each driver. Clutch couplings shall be selected for the maximum torque requirement of the fan, with a 1.5 service factor. Provide a removable guard over each clutch coupling].

2.6.2.4 Electric Motor

Motor for driving the induce draft fan shall be [_____] volt, three phase, 60 Hz, [open drip-proof,] [totally enclosed fan cooled,] variable speed not less than [_____] kW hp, as specified under the paragraph MOTORS AND DRIVES in this section, and shall not overload over the range of the fan with unheated air. [Fan motor shall be suitable for installation in a hazardous location as defined by NFPA 70.] Provide [_____] mm inch thick steel soleplate for motor. Soleplate shall be common for each of the four motor
mounting bolts. Separate parallel soleplate bars are not acceptable.

2.6.2.5 Steam Turbine

Steam turbine shall drive the fan through a reduction gear and shall be single stage, rated at not less than [_____] kW hp, with inlet steam pressure of [_____] kPa (gage) psig, [_____] degrees C F total temperature and a normal exhaust back pressure of [_____] kPa (gage) psig or a maximum back pressure of [_____] kPa (gage) psig. Water rate at full load and normal steam conditions shall not exceed [_____] kg pounds per brake power hour. Maximum turbine speed shall not exceed [_____] rpm.

a. Turbine Construction. Turbine casing shall be split on the horizontal centerline constructed of ASTM A48/A48M, cast iron, with design pressure rating of 1724 kPa (gage) 250 psig at 232 degrees C 450 degrees F at the inlet, and 379 kPa (gage) 55 psig at 232 degrees C 450 degrees F at the outlet. Turbine shall include a stainless steel steam strainer, sentinel relief valve, sight oil level indicator and two hand valves.

b. Turbine Bearings and Shaft. Turbine bearings shall be horizontally split, ring-oiled, sleeve type water-cooled. Shaft shall be stainless steel sprayed or chrome plated under the packing glands. Shaft seals shall be segmented carbon rings with springs and stops.

c. Speed governor variable speed oil relay NEMA Class D governor for speed limiting and pneumatic operator to maintain an adjustable, preset draft pressure in boiler by variation of turbine speed. Input to the operator shall be a 30 to 103 kPa (gage) 3 to 15 psig pneumatic signal. Provide an electro-pneumatic transducer to accept the 4 to 20 mA signal from the controller specified in Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS. [Turbine shall go to maximum rated speed on air failure.]

d. Emergency Overspeed Governor. Completely independent of the speed governor and shall operate a separate trip valve.

e. Insulation. Turbine shall be insulated and lagged by the manufacturer as specified under Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

f. Reduction Gear. High speed, heavy duty, double helical, full pressure lubricated, horizontal offset type with a service factor not less than 2 provided in a horizontally split casing. The gear and pinion shall be spray lubricated from a pressure lubricating system. The pressure lubricating system shall include a shaft driven oil pump, strainer, cooler, pressure gage, low oil pressure switch, relief valve, reservoir and piping. Provide a high speed, gear type, forged steel coupling between the turbine and the gear. Reduction gear and turbine shall [each] be provided with a [common] [_____] mm inch thick steel baseplate[s].

2.6.2.6 Noise Level

Not to exceed 85 dBA sound pressure level at 1 1/2 meters 5 feet above the floor and 1 1/2 meters 5 feet from the fan in any direction. Sound attenuation shall be provided to meet the sound pressure level requirements.
2.7 COMPRRESSED AIR SYSTEM

2.7.1 Plant Air Compressor

Provide two plant air compressor systems, each with a compressor, filters, intercooler, aftercooler, accessories, control panel and controls. Provide a receiver for each of the two compressor systems.

2.7.1.1 Air Compressor

**************************************************************************
NOTE: Select standard L/s SCFM of air to compensate for plant elevation.
**************************************************************************

Packaged unit, FS XX-C-2816, as modified below. Each compressor capacity shall be not less than [94] [118] [142] [165] standard L/s [200] [250] [300] [350] scfm of air, at 20 degrees C 68 degrees F and [862] [1379] kPa (gage) [125] [200] psig at the discharge. Compressor speed shall not exceed [_____] rpm. Compressor shall be [belt drive] [direct drive] double acting, two stage, with flange mounted water cooled cylinders and heads. Provide a safety valve between each compressor discharge and its shutoff valve which is required on the discharge piping of the compressor. Provide a full flow type oil filter for positive forced feed lubrication and an electric thermostatically controlled immersion heater. Provide lifting lugs and tie downs.

2.7.1.2 Air Filter

Provide a dry type air filter constructed of pleated filter paper with protective stainless steel cloth on each side. Filter shall also act as a muffler and shall be readily removed for cleaning.

2.7.1.3 Intercooler and Aftercooler

Compressed air intercooler and aftercooler heat exchangers shall each be water cooled, with counter current flow, and shall be integrally mounted with no external air piping between compressor cylinders and cooler. Design heat exchangers to cool the total output air flow of the compressor to within 9 degrees C 15 degrees F of the inlet cooling water temperature. The tube bundles shall be removable for cleaning and inspection.

2.7.1.4 Air Receiver

Vertical tank with a minimum volume of [1585] [1840] [2717] liters [56] [65] [96] cubic feet. Design unit for [1034] [1724] kPa (gage) [150] [250] psig working pressure in accordance with the ASME BPVC SEC VIII. A receiver bearing the ASME Code Symbol stamp will be accepted as meeting these requirements. Provide an automatic condensate trap, safety valve, outlet connection, and a 114 mm 4 1/2 inch pressure gage ( [1379] [2068] kPa (gage) [200] [300] psig range).

2.7.1.5 Electric Motor

Motor shall be [totally enclosed fan cooled], [open-drip proof], [_____] kW hp, [_____] volts, [_____] phase, 60 Hz as specified under the paragraph MOTORS AND DRIVES in this section. Control circuits for motor shall be nominal 120 volts. [Provide removable totally enclosed belt guard.]
2.7.1.6 Controls

Provide controls and shutdowns necessary for automatic operation of the compressor package. House controls in NEMA 12 control cabinet. Controls shall consist of alarm and running lights, push buttons and selection switches for automatic dual control, 120 volt control transformer connected to power circuit serving the compressor, along with necessary time delay and control relays, and indicators. Provide automatic solenoid-operating cooling

a. Start-and-Stop Control: When set for start and stop control, motor shall stop automatically when discharge pressure reaches maximum pressure setting and start automatically when discharge pressure falls to minimum setting. Cylinders shall unload during periods of motor shutdown.

b. Constant Speed Control: Compressor shall operate continuously at constant speed. Provide means to automatically load and unload compressor at preset minimum and maximum pressure settings respectively. Provide means for automatic release of pressure within cylinders when the unit is operating without load. Also provide means for manual or automatic unloading of cylinders during starting of unit. Equip each compressor with a timed control to stop compressor after a 10 minute unloaded period when air is not used. Compressor shall re-start automatically at a preset minimum pressure.

c. A lead-lag system shall be provided to alternate compressor start-ups and to operate both compressors when discharge pressure cannot be met with one operational compressor. The operator selector switch shall have the following positions:

(1) Both compressors alternating as specified above;
(2) Compressor "A" operation only;
(3) Compressor "B" operation only;
(4) Off.

Total elapsed time shall be recorded for operation time of each compressor.

d. Compressor Safety Controls and Management Panel:

(1) Provide light in panel, alarm and shutdown of compressor for the following functions:

(a) High Main Bearing Temperature
(b) High Discharge-air Temperature
(c) High Discharge-air Pressure
(d) High Water Temperature for [Water Supply,] [Intercooler,] [Aftercooler,] [Lubrication Oil Cooler]
(e) Excessively High Motor Temperature
(f) Excessive Vibration
(g) Low Crankcase Oil Level

(h) Low Oil Pressure

1. Provide light in panel and alarm for the following functions:
   a. High Lubrication Oil Temperature
   b. Low Suction Pressure (Dirty Filter)

2.7.2 Instrument Compressed Air System

Provide two instrument air compressor systems each with a compressor, filters, aftercooler, accessories control panel, controls and receiver, [mounted on one supporting steel base with skids] [mounted separately].

2.7.2.1 Air Compressor

Each compressor shall deliver a minimum of [_____] std. L/s scfm of air at 20 degrees C 68 degrees F at a discharge pressure of 862 kPa (gage) 125 psig. Compressor speed shall not exceed [_____] rpm. Air compressor shall be belt drive, single stage, crosshead type, vertical, double acting, water cooled, non-lubricated head type. Compressor shall be specially designed for non-lubricated service, with a honed cylinder, piston rod packing, piston rings, and piston wearing rings. Valve guide inserts and wear rings shall be TFE. Valves shall be reversible and hardened, with stainless steel seat plates for nonlubricated service. Provide necessary sleeves, baffles, and collars to prevent oil carryover. Provide air-operated, piston type, free air unloaders for capacity reduction and starting. Mount inlet filter-silencer directly on the air inlet to the cylinder.

2.7.2.2 Aftercooler

Water cooled, with counter current flow, and installed directly between each compressor cylinder and the air receiver. Design cooler to cool the total output air flow of the compressor to within minus 9 degrees C 15 degrees F of the inlet cooling water temperature. Tube bundle shall be removable for cleaning and inspection.

2.7.2.3 Air Receiver

Horizontal tank with a minimum volume of [_____] liters cubic feet. Design unit for 1034 kPa (gage) 150 psig working pressure in accordance with ASME BPVC SEC VIII receiver bearing the ASME Code Symbol stamp will be accepted as meeting these requirements. Provide an automatic condensate trap, safety valve, and outlet connection.

2.7.2.4 Electric Motor

Motor shall be [totally enclosed, fan controlled], [open drip proof], [_____] kW hp, [_____] volt, [_____] phase, 60 Hz as specified under the paragraph MOTORS AND DRIVES in this section. Provide a removable, totally enclosed belt guard.

2.7.2.5 Accessories

Factory assemble air compressors, drives, controls, air receiver, aftercoolers, and miscellaneous hardware and mount on a steel supporting base. Provide lifting lugs and tie down attachments. Air, water, and
condensate piping shall be provided and terminated at the edge of the supporting base.

2.7.2.6 Controls

Provide controls and shutdowns necessary for automatic operation of the compressor package. House controls in NEMA 12 control cabinet. Controls shall include alternator control to switch compressors from lead to lag and run both compressors when needed; 120 volt control transformer connected to power circuit of compressor; air discharge pressure gage; selection switches for constant speed for automatic dual control, along with necessary time delay and control relays. Provide automatic solenoid-operated cooling water valve in the cooling water line to the compressors and aftercoolers. Factory wire control cabinet and mount as a part of the package. Compressor safety controls and management panel shall be provided as specified in the paragraph PLANT AIR COMPRESSOR, located in this section.

2.7.3 Air Dryers

**************************************************************************
NOTE: Choose the following subparagraph or the subparagraph COMPRESSED AIR REFRIGERATED AIR DRYER.
**************************************************************************

2.7.3.1 Compressed Air Desiccant Air Dryer

**************************************************************************
NOTE: The refrigerated air dryer is limited with an atmospheric dew point of approximately minus 23 degrees C 10 degrees F equivalent to minus 12 degrees C plus 10 degrees F at 172 kPa (gage) 25 psig and 2 degrees C 35 degrees F at 690 kPa (gage) 100 psig, and where this may be a problem the desiccant air dryer should be used as a much lower dew point can be attained.
**************************************************************************

Provide for systems exposed to freezing temperatures [one] [two] compressed air dual chamber type desiccant dryer[s] each of sufficient capacity for each system listed below. Each dryer shall be equipped with an automatic regeneration system which uses [steam heated dry air] [unheated dry air] for the regenerative media. The capacity of each dryer shall be such that compressed air, in the quantities listed below will be dried from a saturated condition at [_____] degrees C F to a pressure dew point of minus 40 degrees C F.

<table>
<thead>
<tr>
<th>Service</th>
<th>Capacity (Each Tower)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Baghouses</td>
<td>[_____] L/s at 862 kPa (gage)</td>
</tr>
<tr>
<td>Ash Handling</td>
<td>[_____] L/s at 862 kPa (gage)</td>
</tr>
<tr>
<td>Instrumentation</td>
<td>[_____] L/s at 862 kPa (gage)</td>
</tr>
</tbody>
</table>
The contact time of the air in the chambers shall not be less than 4.5 seconds. Velocity of the air shall be less than that which will fluidize the desiccant bed. Pressure drop through the unit when operating at rated flow shall not exceed 27 kPa (4 psi). Units shall be field adjustable to maintain the pressure dew point of the dried air at any preselected value below operating temperature, to minus 40 degrees C F. Units shall have as an integral part of the construction an indicator showing the water content of the dry air and a calibrated adjustment control to change the water content to any preselected level. Desiccant dryers shall provide a continuous supply of dry air by automatically cycling operation of the desiccant beds.

a. Chambers: Designed for 1034 kPa (gage) 150 psig working pressure in accordance with the ASME BPVC SEC VIII, and so stamped. Each chamber shall be fitted with separate fill and drain ports so that inlet and outlet piping manifolds need not be removed to fill or drain the chambers. Each chamber shall be provided with stainless steel screens at the inlet and the outlet to contain the desiccant bed, pressure gage, and safety valve. Normal air flow during drying shall be upward through the desiccant chamber. Desiccant shall be spherical activated alumina.

b. Regeneration: Accomplish by depressurizing the chamber on reactivation and purging with a portion of the dry outlet air from the chamber on stream. Purge air flow shall be downward. Maximum allowable purge flow rate at design conditions shall be 10 percent of design capacity of dryer. Purge system shall be controlled by a cam timer such that each desiccant bed is regenerated as required. Provide a flow control valve, flow indicator, and exhaust muffler for the purge system.

c. Controls: Cam timer, switches and relays shall be housed in a NEMA 12 control panel, mounted as part of the dryer. Provide interconnecting wiring in accordance with Division 16. In the case of electrical power failure, automatic valves shall fail in the open position to allow the wet gas to pass through the chambers. Provide gages to indicate pressure in each chamber.

d. Accessories: Dryer shall be complete with necessary solenoid operated control valves, check valves, and interconnecting piping. Mount equipment on a steel base plate suitable for floor mounting. [Provide pressure reducing valve to reduce pressure to suit desiccant dryer.]

e. Prefilter: Provide prefilter upstream of dryer to remove oil vapor, liquid water, and solid particles. Prefilter shall have greater than 99 percent efficiency in removing both 0.5 micron diameter solid particles and 0.5 micro diameter oil aerosol. Filter shall have replaceable oil absorbing filter element which turns red to indicate saturation with oil and which shall be mounted in a transparent cast methyl methacrylate tube for visibility and inspection while on stream. Protect transparent acrylic tube by a safety shield.
f. Afterfilter: Provide an additional afterfilter for instrument air. Filter shall combine three filter mechanisms - mechanical separation, coalescence and absorption in a single, cartridge type unit. Filtration efficiency shall be greater than 99.99 percent at 0.5 micron particle size for oil and other contaminants. A visible color change shall indicate when element should be replaced.

[2.7.3.2 Compressed Air Refrigerated Air Dryer]

******************************************************************************
NOTE: Choose this subparagraph or the above subparagraph COMPRESSED AIR DESICCANT AIR DRYER.
******************************************************************************

******************************************************************************
NOTE: The refrigerated air dryer is limited with an atmospheric dew point of approximately minus 23 degrees C 10 degrees F equivalent to minus 12 degrees C plus 10 degrees F at 172 kPa (gage) 25 psig and 2 degrees C 35 degrees F at 690 kPa (gage) 100 psig, and where this may be a problem the desiccant air dryer should be used as a much lower dew point can be attained.
******************************************************************************

Provide for systems not exposed to freezing temperatures a self-contained refrigerated type compressed air dryer capable of drying [_____] std. L/s scfm of air to an atmospheric dew point of not less than minus 23 degrees C 10 degrees F with entering air at 38 degrees C 100 degrees F, saturated. Dryer shall be complete with heat exchanger, a commercial quality refrigeration system, a moisture separator and condensate trap. Maximum operating pressure of the dryer shall be [_____] kPa (gage) psig. Install dryer between the receiver and distribution line.

Provide internal tubing, wiring, and piping complete, such that only connections to air inlet and outlet, to refrigerant compressor contractor, and to condensate drain are necessary.

a. Heat Exchanger: Heat exchanger shall consist of air and refrigerant coils surrounded by aluminum granules of sufficient mass to ensure adequate cooling capacity for varying air flow loads without causing excessive refrigeration cycling. Moisture separator shall be of centrifuge type and shall be located within the heat exchanger to provide for moisture separation at point of minimum air temperature. Suitably control heat exchanger temperature and provide an automatic control system, whose sensing element is located in the aluminum granules, to shut down the refrigeration system on low or no load conditions. Provide means to ascertain exchanger temperature.

b. Refrigeration Unit: Hermetically sealed type and shall operate intermittently at all but maximum load conditions. House entire unit in a steel cabinet. Provide cabinet with access door and panel for easy access to each part for maintenance and inspection.

c. Refrigerant: CFC-based refrigerants are prohibited. Refrigerant must have an Ozone Depletion Potential (ODP) no greater than 0.0, with exception to R-123.
d. Instrumentation and Control: Include control panel in dryer cabinet containing:

(1) Indicators for the following services: Inlet air pressure gage, discharge air pressure gage, inlet air temperature gage, refrigeration compressor suction pressure gage, refrigeration compressor discharge pressure gage, power interruption light, and high temperature light.

(2) Electrical relays located in an enclosed portion of panel, accessible for ease of servicing.

(3) Green "POWER ON" indicating light.

(4) Controls and interlocks to maintain required compressed air dew point and to cycle air-cooled condenser with refrigeration compressor.

(5) Dryer capable of automatic zero to 100 percent capacity control. Dryer shall use an automatic control expansion valve with sensing bulb to control capacity; dryer to have automatic shutdown switch sensor located at point of lowest temperature to prevent freezing.

e. Filters: Provide a disposable cartridge type prefilter and afterfilter at the air dryer. Filter cartridges shall have a 517 kPa 75 psi differential pressure rating, and the design flow clean pressure drop shall not exceed 1.40 kPa 0.2 psi. Filter shall be designed to remove liquid water and oil particles 5 microns and larger. Provide an additional afterfilter for instrument air. Filter shall combine three filter mechanisms - mechanical separation, coalescence and absorption - in a single, cartridge type unit. Filtration efficiency shall be greater than 99.99 percent at 0.5 micron particle size for oil and other contaminants. A visible color change shall indicate when element should be replaced.

f. Pressure Reducing Regulator: Self-operating type designed for not less than a 1724 kPa (gage) 250 psig operating pressure, a normal operating temperature range of minus 29 degrees C 20 degrees F to plus 66 degrees C 150 degrees F, and shall deliver constant reduced pressure compressed air. Regulator shall have an adjustable outlet pressure range of at least 34 to 690 kPa (gage) 5 to 100 psig with not less than 4 ranges. Provide external adjusting screw for adjustment throughout each spring range. Provide internal pressure tap for outlet pressure registration.

2.8 BREECHING, EXPANSION JOINTS, STACKS AND DAMPERS

2.8.1 Breeching

Rectangular cross section, stiffened on sides, top and bottom, and fabricated of not less than 5 mm 3/16 inch thick black steel plate unless otherwise noted. Stiffeners shall be not less than 65 by 50 by 6 mm 2 1/2 by 2 by 1/4 inch steel angles welded to exterior with 50 mm 2 inch leg outstanding. Separation of stiffeners shall not exceed one meter 3 feet o.c. [Connect breeching to [each boiler flue gas outlet,] [intermediate heat recovery equipment,] [air pollution control equipment,] [and to stack as required].]
2.8.1.1 Breeching Access Doors

**************************************************************************
NOTE: Specify locations for breeching access and cleanout doors. Where practical show locations on project drawings. Show access and cleanout door details on project drawings.
**************************************************************************

Construct access doors with frame and hinged door of cast iron or reinforced steel plate. Frame shall be not less than 686 by 787 mm 27 by 31 inches with access opening of not less than 508 by 610 mm 20 by 24 inches. Connection to breeching shall be gasketed and made with minimum 15 mm 1/2 inch diameter hot-dipped galvanized bolts, lockwashers, and nuts spaced not more than 125 mm 5 inches on center. Sides of the access door shall have not less than two quick clamp positive closing latches, with the long side opposite the hinges containing three clamps to give a gastight seal. Side of access door opposite the hinges shall contain a minimum 80 by 125 mm 3 by 5 inch size handle. Provide a gasket consisting of 10 mm 3/8 inch diameter fire proof resilient rope seal and mastic compound between the hinged access door and the access door frame. Provide breeching access doors at the following locations [and where indicated]:

[ a. [_____]
][b. [_____].

]2.8.1.2 Breeching Cleanout Doors

**************************************************************************
NOTE: Specify locations for breeching access and cleanout doors. Where practical show locations on project drawings. Show access and cleanout door details on project drawings.
**************************************************************************

Construct cleanout doors of not less than 5 mm 3/16 inch thick steel plate. Secure cleanout doors to a 32 by 32 by 5 mm 1 1/4 by 1 1/4 by 3/16 inch thick angle frame with 10 mm 3/8 inch hot-dipped galvanized mounting bolts welded to the angle frame and spaced not over 150 mm 6 inches on center. Weld frame to breeching and provide a 3 mm 1/8 inch gasket between frame and cleanout door. Cleanout doors shall be not less than 610 by 610 mm 24 by 24 inches except where breeching dimensions are smaller, in which case the cleanout door shall be full height of the breeching and not less than 610 mm 24 inches in width. Provide breeching cleanout doors at the following locations [and where indicated]:

[ a. [_____]
][b. [_____].

]2.8.1.3 Breeching Connections and Joints

Weld breeching joints [unless indicated or specified otherwise]. Welding shall conform to AWS D1.1/D1.1M and AWS D1.3/D1.3M. Bolts for bolted connections shall be hot-dipped galvanized bolts not less than 15 mm 1/2 inch diameter and spaced not more than 80 mm 3 inches apart, with hot-dipped galvanized lockwashers, and nuts. Provide bolted joints with a minimum of 3 mm 1/8 inch thick gaskets. Bolt flanged breeching connections
to boilers, equipment items, dampers, expansion joints, and breeching accessories. Flanged breeching connections to equipment shall be drilled to match flanges on equipment. Flanged joints shall be sealed welded to make connection gas-tight.

2.8.1.4 Breeching Structural Materials

**************************************************************************
NOTE: Designer shall detail breeching supports and breeching stiffening. Breeching hangers shall be designed to carry not less than 5 times the breeching weight, or the breeching weight plus weight of fly ash when breeching is half full plus 136 kg 300 pounds whichever is greater. Hangers for rectangular breeching shall be of the trapeze type with angle or channel support members and hanger rods. Breeching shall be stiffened with angle or channel members as required to withstand internal breeching static pressure. Designer shall verify that expansion joint flexure for axial travel is suitable. Expansion joints shall be detailed on the drawings.
**************************************************************************

Structural and support materials shall be steel and comply with the applicable sections of the AISC 303 or AISC 360. [Support and stiffen breeching as indicated].

2.8.1.5 Insulation

Provide insulation on breeching as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

2.8.1.6 Breeching Paint

When breeching is shop fabricated, wire brush and clean interior and exterior with a nonflammable solvent and paint with FS TT-P-28 heat resistant paint, immediately after fabrication. When breeching is to be fabricated on the job, prime paint steel sheets, one coat each side, prior to delivery to job site.

2.8.2 Expansion Joints

2.8.2.1 Metallic Breeching Expansion Joints

Provide factory fabricated metallic breeching expansion joints [where indicated]. Expansion joints shall be guided metal bellows type capable of a minimum of [_____] mm inches of axial travel. Form metal bellows from not less than 1.60 mm 1/16 inch thick type 321 stainless steel plate. Cover plates shall be not less than 3 mm 1/8 inch thick steel plate.

2.8.2.2 Non-metallic Expansion Joints

Provide factory fabricated non-metallic breeching expansion joints 3 mm 1/8 inch minimum thickness [where indicated]. Expansion joints shall be constructed of fluoroelastomer vulcanized to two plies of knitted wire mesh capable of a minimum of [_____] mm inches of axial compression, [_____] mm inches of axial extension and [_____] mm inches of lateral offset [unless indicated otherwise]. Joints shall have a continuous operating temperature
rating of 204 degrees C 400 degrees F, with excursion design standards up to 400 degrees C 750 degrees F. Operating pressure range shall be minus 34 kPa (gage) 5 psig to plus 34 kPa (gage) 5 psig. Expansion joints shall be pre-formed with integrally molded corners, suitable for mounting against a 150 mm 6 inch flange. Provide carbon steel backup bars with slotted holes, bolts, and nuts.

2.8.3 Stacks

2.8.3.1 Stacks With Flue Gas Scrubbers

**************************************************************************
NOTE: Use stack with acid resistant lining if
temperatures below dew point of flue gas are
expected in stack. Designer has to consider down
drafts in stack at low firing rate.
**************************************************************************

Stacks shall be free standing, self-supporting, steel construction with an acid resistant lining system. Provide each stack complete with all accessories and appurtenances, including test ports, sampling platforms, ladders, safety climb devices, anchors, sleeves, insulation, stainless steel base and chair rings, and clean-out door.

a. Construction: Acid resistant lined steel stacks shall be fabricated of [ASTM A242/A242M, Type 1] [ASTM A36/A36M] structural steel plate with a 1.60 mm 1/16 inch corrosion allowance. Design shall include a static analysis of stack of wind loadings and critical wind velocity and dynamic analysis of stack including damping of vortex shedding and seismic response. Minimum steel plate thickness of stack shall not be less than 6 mm 1/4 inch. Stack sections shall be of welded construction and fabricated in sections not to exceed normal shipping limitations. Longitudinal seams shall have full penetration, continuous butt-welded joints. The section or horizontal joints of the stack shall also be full penetration continuous buttwelds. Welding shall be done by certified welders. Secure the stack to the foundation by a base plate with gussets, counterforts or steel beams provided as required. A reinforced concrete foundation, the design of which shall be approved by the stack manufacturer, shall be provided. Base construction of the stack shall transmit forces and moments in the shell to the [foundation] [supporting steel] without local stresses of appreciable magnitude being induced in the shell or exceeding the allowable stresses of the supporting [concrete] [steel].

b. Stack-Breeching Connection: A lined breeching connection of the same wall thickness as the stack shall be welded to the stack and the steel jacket of the stack reinforced as required to compensate for the structural strength of steel removed. A flange for bolting breeching to the connection shall be provided. A hinged cast iron or steel cleanout door with refractory lining and heavy duty steel frame shall be provided at the bottom of the stack. Frame and door shall be fitted gastight. Door shall be a minimum of 457 by 610 mm 18 by 24 inches in size.

c. Block Lining: Provide a lining consisting of inorganic borosilicate glass blocks bonded to the steel. Entire inside of each stack shall be sandblasted to a white metal blast finish. Block shall be 40 mm 1 1/2 inches thick, constructed of totally organic-free closed cell borosilicate glass. Blocks shall be shaped to reasonably match the
inside of the stack and beveled to match adjacent blocks such that no gaps between surfaces shall be greater than 3 mm 1/8 inch. Blocks shall be bonded to the steel and adjacent blocks with a two compound, urethane adhesive membrane. Adhesive membrane shall be trowelled to both the steel and block. Blocks shall be pressed into place in accordance with the manufacturer's instructions to provide a bond free of voids.

d. Optional Stack Lining: In lieu of the borosilicate glass block lining specified above an acid resistant cast insulating refractory lining with an acid resistant membrane liner over an anchoring system may be provided. Lining system shall be suitable for use in the pH range of 1.6 to 8. Liners composed of calcium aluminate or calcium silicate will not satisfy service requirements of the stack system.

(1) Membrane Liner: Urethane-Asphalt, or suitable similar material, which has been used successfully in similar installations to protect stacks from acid attack when flue gas temperatures are below their dew point. Service temperature range of the liner shall be minus 40 to plus 82 degrees C 180 degrees F, when applied to a thickness of 3 mm 1/8 inch.

(2) Refractory Lining: Potassium silicate single component chemically hardened cement or two component potassium silicate bonded cement with an inert filler material such as silica, or suitable similar material, gunite applied or cast monolithic insulating refractory, suitable for use on flue gas from 66 degrees C 150 degrees F and up to 232 degrees C 450 degrees F and resistant to continuous exposure of sulfuric acid, nitric and nitrous acid, carbonic acid and other liquids, in the pH range of 1.6 to 8 and formed when the surface of the stack is at a temperature at and below the flue gas dewpoint.

(3) Membrane/Refractory Lining Certification: Manufacturers of the membrane liner and the refractory lining shall certify that the lining system to be provided in the stack shall be suitable for the specific application, considering the flue gas temperature, velocities, moisture content and corrosive qualities of the fuel being burned.

(4) Refractory Lining Anchor System: Tinned metal anchors welded to the stack wall, or wire mesh fabric welded to anchors welded to stack wall, shall support the refractory lining of the stack. Tinned anchor system shall have anchors welded to stack shell on vertical spacing not greater than 200 mm 8 inches on center and horizontal spacing not greater than 100 mm 4 inches on center, in staggered rows to provide a minimum of 48 4.5 anchors per square meter foot. Wire mesh fabric shall be No. 10 or 12 wire gage made into a welded fabric approximately 50 by 50 mm 2 by 2 inches mesh size. Mesh shall be welded to anchors o.c. not to exceed [250] [300] mm [10] [12] inches. Mesh and anchors shall be of the same alloys.

(5) After anchor system is welded in place, blast clean entire inside surface of stack including stack base, and anchor system to a white metal blast finish and then coat with two coats of membrane liner to a total minimum thickness of 3 mm 1/8 inch. The stack base shall be included in the coating system. Prior to the installation of the refractory, spark test coated surfaces with a
holiday detector to ensure membrane is free of voids. Refractory lining shall be trowelled on or pneumatically applied to a minimum thickness of 76 mm, 3 inches.

(6) Design of anchor system and application of refractory lining shall permit expansion and prevent cracking of the refractory.

e. Manufacturer's Calculations Required for Foundation and Stack:

(1) Foundation (including bearing and moment forces) reinforcement and anchor bolts

(2) Stack

- Stresses due to various loading conditions including wind and seismic loads
- Vibration and damping
- Heat transfer at various design and ambient conditions
- Expansion profiles
- Shipping and erection stress analysis

f. Finish: Stacks shall be shop coated prior to shipping from the factory. After erection, touch-up damaged shop coated surfaces and apply a prime coat and two coats of finish paint suitable for the temperatures and environmental exposure as specified in Section 09 90 00 PAINTS AND COATINGS.

g. Platforms and Ladders: Stacks shall be provided with platforms for sampling tests, monitoring equipment maintenance and obstruction-lighting maintenance. Access to lower platform shall be by ASTM A242/A242M, Type 1, steel [stairway] [catwalk or platform] [ladder] from the [heating plant] [pollution control building] [ground level]. Design for a minimum live load on platforms to be 488 kg, 100 pounds per square meter, foot. Platforms shall be not less than 1220 mm, 48 inches wide and the sampling platform shall be a minimum width of 610 mm, 2 feet plus the stack diameter, but not more than 3 meters, 10 feet in width. Toe plates shall be not less than 150 mm, 6 inches high around the platform perimeter. Platform railings shall have two intermediate railings. Ladders shall be [caged] corrosion resistant steel, 406 mm, 16 inches wide with 305 mm, 12 inch rung spacing. Ladders shall be provided from the lower platform to the top of each stack and shall be provided with a full length stainless steel safety climb device. The climb device shall consist of a notched rail attached to the rings' centerline with a sleeve which rides on the rail and locks into position on a sudden downward pull. Two belts for attaching the device to the climber shall be furnished.

h. Anchor Bolts: Provide anchor bolts, nuts, washers and sleeves to properly anchor the stacks. Stack manufacturer shall furnish certified dimensional drawings showing location for setting bolts in concrete.

i. Miscellaneous:

(1) Sample Ports: Provide two sample ports at 90 degree orientation to each other about 1220 mm, 4 feet above platform. Each sample
port shall consist of a **100 mm 4 inch** diameter pipe welded to the steel jacket and provided with a flange and mating blind flange. Provide openings required for installation of opacity monitor and SO2 analyzer specified in Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS. [Locations of sample ports and instrumentation openings shall be as detailed on drawings].

(2) Obstruction Lighting: Provide an obstruction lighting system for each heating plant stack, consisting of one red, flashing, 300 millimeter hazard beacon atop each stack, two steady burning, red obstruction marker lights halfway up each stack, photoelectric and flasher controls, weather-tight terminal boxes, cable, and conduit.

(a) Hazard Beacons: Federal Aviation Administration FAA AC 150/5345-43, Type L-866.

(b) Obstruction Lights: FAA AC 150/5345-43 Type L-810.

(3) Painter’s Trolley: Provide a ring of Type 304 stainless steel to support an inspection or painter’s trolley. Provide a three wheel standard steel flat rail trolley of **227 kg 500 pounds** capacity. Guide trolley to prevent it from leaving the track.

**************************************************************************

**NOTE:** Velocity cones decrease cold air down drafts and increase velocity of discharged flue gas but increase flow resistance of stack; they may be used when justified.

**************************************************************************

(4) Velocity Cone: Provide stack with an acid resistant lined truncated velocity cone. Velocity cone shall be lined with the same insulating refractory as applied to the stack with a **80 mm 3 inch** minimum thickness. Cone shall be **1220 mm 4 feet** long, bolted to top of stack, and shall taper to a diameter of [_____] mm inches inside.

2.8.4 Dampers

2.8.4.1 Multilouver Dampers

Provide factory fabricated parallel multilouver dampers for two position service (open-closed) and opposed blade damper for modulating control. Construct damper frame of distortion resistant welded steel channels with raised seat to ensure free nonbinding operation of blades and to keep blades square in the frame. Construct blades of [_____] mm inch thick steel plate in a stressed skin airfoil-shape with fully welded seams containing no external ribs. Blade deflection in mm inches shall not exceed the length in mm inches divided by 360, consistent with AISC 360 beam deflection criteria. Blade shafts shall be stainless steel. Blades shall be pinned to blade shafts. Louver shaft bearings shall be outboard type and shall be self-lubricating and self-cleaning. Bearing seals shall be gastight.

a. Multilouver Damper Linkage: Damper linkage shall be adjustable and of pinned construction for easy removal and shall be designed to handle full operation torque. Linkage on dampers in clean flue gas areas shall operate from a single connection point.
b. Control Damper Operators: Provide control damper operators as shown. Operators shall be pneumatically operated with positive positioning, manual override, and hydraulic or oil immersed gear trains. Each operator shall be full-proportioning type, with spring return to position shown in case of loss of power. Damper operating speeds shall be selected and adjusted so that operators will remain in step with controllers. Operators acting in sequence with other operators shall have adjustment of control sequence as required by the operating characteristics of the system.

c. Two-Position Damper Operations: Two-position damper operators shall be pneumatically operated with air cylinder, four-way valve, and solenoid valve arrangement.

2.8.4.2 Guillotine Dampers

**************************************************************************
NOTE: Guillotine dampers shall be used for open-shut service where tight shutoff is required for example, for air pollution control equipment bypass dampers.
**************************************************************************

Provide factory fabricated guillotine dampers with heavy structural frame rigid enough to support the extended blade and external loads through the breeching flange. Damper shall be capable of operating without precleaning or manual assistance under normal operating conditions. Provide enclosed bonnets [where indicated]. Provide 80 mm 3 inch diameter cleanout ports on both sides for cleaning bottom sections.

a. Guillotine Damper Blade: A stress-relieved flat plate. Damper blade shall be nonwarping; intermediate blade supports are acceptable to limit blade deflection. Leading edge of damper blade shall be beveled and capable of guiding damper blade into frame seat. Blade guides shall be continuous and self-cleaning and capable of preventing binding from deposits and damage from misalignment. Bonnet guides shall be removable and damper shall be designed so that a damper blade can be replaced without opening the frame.

b. Guillotine Damper Bonnet Seal: Provide bonnet seal to effectively seal against atmospheric leakage under normal operating conditions.

c. Double-bladed Guillotine Dampers: Provide where indicated. Damper frame, blades, and bonnet seals shall be as specified for single-bladed guillotine dampers, except frame shall be thicker and two blades shall be provided instead of one. Double-bladed guillotine damper shall provide absolute zero leakage across damper blades. This shall be accomplished by utilizing a blower to introduce air into the space between the damper blades. Blower shall be mounted on damper frame complete with isolation valve. Blower shall have sufficient capacity to maintain a pressure of at least 498 Pa 2 inch water column over breeching pressure.

d. Guillotine Damper Drive: A positive dual endless chain drive capable of driving damper in both directions. Chain-drive head shaft shall have sufficient torsional rigidity to prevent binding of blade when the blade is stalled. Damper shall be motor-operated with manual override. Design drive mechanism to prevent back driving of motor. Entire drive mechanism shall be of a simple design and require no routine
maintenance other than inspection. Chain shall be capable of operating up to the stall torque of the damper drive motor.

e. Electric Motor: Motor shall be [totally enclosed fan cooled] [open drip-proof], [_____] kW [hp], [_____] volt, [_____] phase, 60 Hz, as specified under the paragraph MOTORS AND DRIVES in this section. Provide removable, totally enclosed chain guard.

2.9 COAL HANDLING EQUIPMENT

2.9.1 Railroad Hopper Car Thawing System

NOTE: Pit type railcar thawing system is capable of operating on natural gas, liquified petroleum gas or No. 2 fuel oil. The radiant heat (infrared) type railcar thawing system can only burn natural gas or liquified petroleum gas or use electric resistance heaters. The radiant heat (infrared) type provides a slower method of thawing but causes less damage to the railroad car finish and is preferred provided natural gas or liquified petroleum gas or electrical power is economically available and permitted by current D.O.D. policy.

Hopper car thawing system shall be pit-type or prefabricated surface mounted enclosed type [or electric radiant type] hopper car thawing unit and shall include burners, controls, combustion air blowers, fuel storage and handling, and related work. Design system to thaw 56 Mg 55 ton, 71 Mg 70 ton and 102 Mg 100 ton capacity coal cars. System shall be capable of thawing [_____] bottom hopper unloading coal cars simultaneously. Railroad hopper car thawing system shall utilize [No. 2 fuel oil] [natural gas] [liquified petroleum gas] as a fuel. Provide a sufficient number of heaters to have a minimum heat input of 2198 kW 7,500,000 Btu/hr per car station, with heaters distributed under hopper car, or under and beside hopper car, such that the entire car is heated. Locate burner pits or heater units for even heating of the hopper cars without subjecting air hoses, air brake equipment, and bearings to excessive heat.

2.9.1.1 Pit-type Railroad Hopper Car Thawing System

a. Pit-type Thawing Unit: Pit-type hopper car thawing unit shall be complete with a refractory lined steel box, burner assemblies, steel burner enclosure with cover, valves, piping, and hinged main pit protective covers. Each pit shall have the capacity to generate 366 kW 1,250,000 Btu/hr when burning [No. 2 fuel oil] [natural gas] [liquified petroleum gas]. Burners shall fire horizontally and tangentially into the pit from opposite sides to heat the refractory lined pit up to radiant temperature. Heat shall be transferred to the hopper car by radiation from hot refractory surfaces and by convection from exhaust gases and evaporated moisture to rail car bottom and sides. Construct pit outer shell of not less than 6 mm 1/4 inch thick corrosion resistant steel plate, with the end plates of 10 gage (3.42 mm 0.1345 inch) steel. Provide supporting flanges and handling loops on both ends and provide cap strips on top of both sides. Place cast iron heat deflecting plates with overlapping edges on pit sides and bottom supported off the ledge on the outer shell. Provide a minimum 25 mm one inch air space between plates and outer shell. Pit side walls and
bottom shall have a minimum 65 mm 2 1/2 inch thickness of standard firebrick with one course of standard end skew brick along the top of the side walls. Firebrick shall be easily replaceable. End section shall have not less than 114 mm 4 1/2 inch thick precast high temperature refractory panels. Provide burner refractory ignition tiles with steel jacket casings having mounting lugs for bolting to end plates of pit. Provide concrete railroad ties adjacent to each thawing pit. Deliver combustion air to burners by means of pressure blowers which take fresh air from outside thawing area. Factory wire and assemble heaters, control panels, blowers, and zone controls. Shop fabricate burner piping and control valve assemblies.

*********************
NOTE: Designer shall make selection here based on fuel to be used in thawing system.*********************

b. Fuel System: [Provide complete fuel system for operation with, [natural] [liquified petroleum] gas including piping, regulators, low and high pressure limit switches interlocked with combustion controls, gages, solenoid valves, shutoff valves, and other accessories which may be required for each manufacturer's particular system.] [Provide complete fuel system for operation with duplex fuel oil pump set with [_____] liters gallon horizontal [below] [above] ground fuel tank and other accessories which may be required for each manufacturer's particular system. Provide fuel oil system in accordance with the requirements specified under the paragraph FUEL OIL SYSTEM this section.]

c. Burner controls shall meet Industrial Risk Insurers' (I.R.I., formerly F.I.A.) requirements. Connect fuel system piping to fuel supply piping as indicated. Burners shall be controlled (modulate) to regulate heat output to suit the operating requirements. Provide a manual light-off, low pressure [gas] [oil] pilot for automatic light-off of each thawing unit.

d. Air System: Provide complete air systems for operation with blowers, inlet silencers, gages, shutoff valves, low pressure limit switches interlocked with combustion controls, and other accessories which may be required for each manufacturer's particular system.

e. Control Panel: Provide centrally located control panel, with panel front consisting of a graphic display of the thawing system. Display shall be approximately to scale and coordinated with control and light indication for combustion air blowers and on-off control of convenient groups of heaters. Provide on-off control with indicating light for each thawing pit. Panel shall have a [NEMA 12] [NEMA 3R-8], dust-tight enclosure with internal equipment and wiring accessible from the panel front. Provide nameplates on panel front to designate function of switches and indicating lights. Controls shall be suitable for [_____] volt, [_____] phase, 60 Hz operation. Provide and mark terminals for connections with the exception of the neutral. Terminal blocks shall be 600 volt rated. Control relays shall have convertible contacts and shall have rating suitable for intended services but in any case, not less than 10 amp, 600 volt rating. Components shall be oiltight type. Connections to panel shall be watertight. Motor starters for combustion air blowers shall be installed in each respective blower cabinet.
2.9.1.2 Surface Mounted Enclosed Railroad Hopper Car Thawing System

a. Surface Mounted Enclosed Thawing Unit: Burner shall be of multiport cast iron construction and provide for even heating of radiant elements. Heater design shall be essentially the same for undercar and sidecar heaters, with heat transmitted to hopper car by both radiation and convection. Design burner and radiant element for radiation being the primary mode of heat transfer. Make radiant element over the burner of a heavy corrosion-resistant metal material. Design burner to operate on [No. 2 fuel oil] [natural gas] [liquified petroleum gas], and such that open flame from combustion will not extend beyond the emitter surface either during normal operation or in the event of emitter deterioration or burnout. Provide shields where necessary to direct radiation and hot exhaust gases to hopper car surface. Provide means for shielding car air hoses, air brake equipment, and bearings from excessive heat. Provide each heater with individual heater control boxes constructed as to provide positive air pressure inside control box. Control boxes shall contain mixing valve for maintaining proper gas-air ratio for satisfactory combustion. Locate gas and air piping connections for easy removal of individual burners. Deliver combustion air to heaters by means of pressure blowers which take fresh air from outside thawing area to ensure continued satisfactory combustion of gaseous fuels. Factory wire and assemble thawing units, control panels, blowers, and zone controls. Fuel system and burner control for oil fired units shall be as specified under the paragraph PIT-TYPE RAILROAD HOPPER CAR THAWING SYSTEM above.

b. Burner Controls (for gas fired units): Burners shall be electrically ignited with controls meeting I.R.I. requirements. Provide a gas pressure regulator for serving not more than eight individual burners. Regulator shall reduce gas pressure in supply line to pressure required for burners. Provide each burner with an air regulating valve for fuel-air ratio adjustment. Regulating valve shall contain positive vibration-proof locking device for maintaining critical adjustment.

c. Control Panel: Provide centrally located control panel with panel front having a graphic display of the thawing system. Display shall be approximately to scale and coordinated with control and light indication for combustion air blowers and on-off control of individual heaters. Provide a modulating control for each heater to regulate heat output to suit the operating requirements. Panel shall be [NEMA 12] [NEMA 3R-8], dust-tight enclosure with internal equipment and wiring accessible from the panel front. Provide nameplates on panel front to designate function of switches and indicating lights. Controls shall be suitable for [_____] volt, [_____] phase, 60 Hz operation. Provide and mark terminals for connections, with the exception of the neutral. Terminal blocks shall be 600 volt rated. Control relays shall have convertible contacts and shall have rating suitable for intended service but not less than 10 amp, 600 volt rating. Components shall be an industrial design of the oiltight type. Connections to the panel shall be watertight. Motor starters for combustion air blowers shall be installed in each respective blower cabinet.

d. Thawing unit may be an electric radiant heat thawing unit which includes self-contained heater banks such as under-car outside the rail heater sections, lower side car heater sections and vertical side car heater sections, with reflectors, hinged cover, waterproof and weatherproof wired terminal blocks and zone controls for flexibility of operation.
2.9.1.3 Shed

**************************************************************************
NOTE: Shed should be used in the severe climate areas. Consult appropriate DM-2 series design manuals for design criteria for the shed.
**************************************************************************

Provide shed of pre-engineered metal space frame construction with corrugated siding as indicated. Provide ventilation with roof vents and openings along bottom of sides of shed.

2.9.2 Top-Mounted Railroad Hopper Car Shaker

**************************************************************************
NOTE: When noise is a major factor of concern, design a shaker enclosure with acoustical treatment which will be capable of reducing the noise to a tolerable level.
**************************************************************************

Provide top-mounted rail car shaker complete with shaker, frame, vibrator, motors, hoists, hoist frame, [enclosure], and controls. Design unit for operation under all weather conditions.

2.9.2.1 Shaker

Shaker shall operate with a nominal 4 mm 5/32 inch stroke at 1200 rpm. Stroke shall be generated by large eccentric SAE 1045 steel shaft mounted in high capacity, self-aligning, spherical roller bearings. Seal bearings with a double piston ring labyrinth seal and dust and water slinger to retain lubricant and prevent entry of contaminants. Shaker frame shall be stress-relieved, welded steel construction. Fabricate frame of heavy steel plate, with bearing housing seats machined after stress relieving. Provide four lifting eyebolts of heat-treated forged alloy steel for connecting to hoist chains.

Shaker Electric Motor and Drive: Motor shall be totally enclosed, fan cooled, 1,800 rpm, [_____] volt, three phase, 60 Hz, not less than 15 kW 20 hp, as specified under the paragraph MOTORS AND DRIVES in this section. Motor shall be mounted on heavy spring isolated supporting frame with adjustable motor base. Shaker shall be belt driven with special deep groove sheaves, taper locking type hubs, and constant belt tensioning spring.

2.9.2.2 Shaker Hoist

Hoist shall be twin hook type having a rated capacity exceeding the weight of the shaker unit. Hoist shall have a lift of not less than 7 1/2 meters 25 feet with a hoist speed of not less than 0.08 meter per second (m/s) 16 feet per minute (fpm). Hoist shall have not less than 460 mm 18 inch long sling chains for connecting hoist to shaker lifting eyes, and hooks shall have U-bolt safety latches. Hoist shall be mounted on an electrified trolley as specified in Section 41 22 13.14 BRIDGE CRANES, OVERHEAD ELECTRIC, TOP RUNNING.

Shaker Hoist Electric Motor: Motor shall be totally enclosed, [fan cooled], [non ventilated], 1,800 rpm, [_____] volt, three phase, 60 Hz, not
less than 5 1/2 kW 7 1/2 hp as specified under the paragraph MOTORS AND DRIVES in this section. Motors shall be high slip type and shall with thermal overload protection embedded in the windings.

2.9.2.3 Controls

Provide [remote] [pendant] pushbutton station for both shaker and hoist operation. Provide automatic controls with upper and lower screw type limit switches to limit hook travel, slack cable limit switch to stop lowering of hooks when car shaker has been lowered on top of car, electrical interlock to prevent operation of car shaker motor until shaker is lowered on car, and electrical interlock to prevent operation of hoist motor while car shaker is running. Mount electrical equipment in NEMA 4 enclosures.

2.9.2.4 Frame [and Enclosure]

Provide frame [and enclosure] as indicated for support of hoist and shaker unit [and for attenuation of noise].

2.9.3 Car Pullers

2.9.3.1 Capstan Car Puller

**************************************************************************
NOTE: Choose this subparagraph or the subparagraph REVERSIBLE DRUM TYPE CAR PULLER.
**************************************************************************

Designed with capacity of not less than 4540 kg 10,000 pounds of starting pull and an average rope speed of approximately 0.23 m/s 45 fpm. Assembly shall be totally enclosed, weatherproof, and suitable for exterior installation with vertical capstan. Capstan shall be semisteel alloy construction designed for use with marlin-covered wire rope.

a. Accessories: Provide capstan complete with accessories, including controls, rope, rope storage reel, car hooks, sheaves, snatch blocks, anchors, and ratchet holdback.

b. Rope: Capstan rope shall be not less than 25 mm one inch outside diameter marlin clad wire rope with a breaking strength of not less than 13,620 kg 30,000 pounds.

c. Rope Storage Reel: Construct rope storage reel of metal, hand operated with the drum not less than 300 mm 12 inches in diameter and the reel faces not less than one meter 3 feet in diameter. Drum shall have not less than [_____] mm inches face width and store not less than [_____] meters feet of 25 mm 1 inch diameter marlin clad wire rope.

d. Electric Motor: [Totally enclosed], [fan cooled], high starting torque, reversing type, [_____] volt, three phase, 60 Hz, not less than 7 1/2 kW 10 hp as specified under the paragraph MOTORS AND DRIVES in this section.

2.9.3.2 Reversible Drum Type Car Puller

**************************************************************************
NOTE: Choose this subparagraph or the above subparagraph CAPSTAN CAR PULLER.
**************************************************************************
NOTE: Designer shall detail required footings and foundations based on the selected puller and soil conditions at each plant site.

[Single drum reversing] [Double drum] type designed with a capacity of not less than [_____] kg pounds of running rope pull. Starting pull capacity shall be not less than twice the running pull capacity. Provide assembly on one-piece heavy steel base with weatherproof motor and gear reducers suitable for exterior location.

a. Puller: Unit shall consist of a [_____] mm inch pitch diameter by [_____] mm inch face, spirally grooved for [_____] mm inch diameter wire rope with sealed anti-friction bearings, alloy steel ring mounted spur gear and SAE 1045 steel shaft. Provide an SAE 1045 steel countershaft with anti-friction pillow blocks and heat-treated alloy steel spur pinion roller chain drive with steel sprockets and enclosed guard. Speed shall be a minimum of [_____] m/s fpm.

(1) Electric Motor: [Totally enclosed], [fan cooled], high starting torque, reversing type, [_____] volt, [_____] phase, 60 Hz, not less than [_____] kW hp, as specified under the paragraph MOTORS AND DRIVES in this section. Provide clutch for engaging and disengaging power to drum.

b. Accessories:

(1) Rope Sheaves: Provide four stationary type, 762 mm 30 inch pitch diameter single sheaves and one 762 mm 30 inch take up sheave assembly. Sheave shall be cast steel, grooved for [_____] mm inch diameter rope and shall be oriented horizontally and mounted in a welded steel frame with self-lubricating bronze bushings. Provide removable steel rope guards over sheaves.

(2) Wire Rope: Wire rope shall be not less than [_____] mm inch in diameter with a breaking strength of not less than [_____] kg pounds. Rope shall consist of six 19 wire strands of improved plow steel rope with hemp center.

(3) Safety Warning System: Provide a safety warning system, including an audible horn and three flashing lights to indicate cars in motion. System shall activate 30 seconds before puller motor is energized and shall not deactivate until puller motor is de-energized. Provide a permanent warning sign at each light indicating "RAILCAR IN MOTION."

(4) Miscellaneous: Provide reversing controls, car hooks, snatch blocks, and anchors.
2.9.4  Track Hopper

**************************************************************************

NOTE: Determine when a track hopper will be required.
**************************************************************************

Welded construction of not less than 6 mm 1/4 inch thick [410 stainless steel] [structurally reinforced steel plate lined with 8 gage (4.18 mm 0.1644 inch) 410 stainless steel] plate not less than 4 1/4 meters 14 feet wide and 8 1/2 meters 28 feet long. Side slopes not less than 60 degrees from horizontal. Interior bolts shall have flat heads. Support hopper from concrete pit walls as indicated.

2.9.4.1  Track Girders

Two wide flanged beams designed for Cooper's E-[_____] loading with 50 percent impact allowance and sized at W [_____] by [_____] mm. Provide beams with cross struts for rigidity and bearing plates for mounting on pit wall as indicated.

2.9.4.2  Grating

Hopper grating between rails of [_____] by 10 mm 3/8 inch steel bars and [_____] by 10 mm 3/8 inch steel cross bars with openings [100] [150] by [100] [150] mm [4] [6] by [4] [6] inches. Grating outside rails shall have openings 100 by 100 mm 4 by 4 inches and be constructed of same size steel bars as specified above. Construct grating in removable panels and support from concrete pit walls and by steel angle supports resting on track girders.

2.9.4.3  Cover

Structurally reinforced 5 mm 3/16 inch thick raised pattern floor plate. Cover for portions of hopper outside rails shall be hinged with edges turned down. Construct cover between rails in easily removable sections with handles.

2.9.4.4  Hopper Outlet

Flanged not less than [_____] by [_____] mm inches. Outlet shall contain a water-collecting reclaim hopper type coal gate not less than [_____] by [_____] mm inches in size along with a dust tight metal slip joint, constructed of not less than 6 mm 1/4 inch thick [410 stainless steel] [structurally reinforced steel plate lined with 8 gage (4.18 mm 0.1644 inch) 410 stainless steel] plate. Slip joint shall be of split construction to allow for disassembly and replacement. Design slip joint to allow for necessary flexibility to take care of deflection of hopper outlet due to varying coal loads and temperature variations without imposing load on feeder enclosure. Provide rope packing or other resilient gasket material to make the slip joint completely dust tight.

2.9.5  Truck Hopper

**************************************************************************

NOTE: Determine when a truck hopper will be required.
**************************************************************************
Welded construction of not less than 6 mm 1/4 inch thick [410 stainless steel] [structurally reinforced steel plate lined with 8 gage (4.18 mm 0.1644 inch) 410 stainless steel] plate not less than 3 meters 10 feet wide and 3 meters 10 feet long. Side slopes not less than 60 degrees from horizontal. Interior bolts shall have flat heads. Support hopper from concrete pit walls as indicated.

2.9.5.1 Grating

Hopper grating shall have openings 90 by 90 mm 3 1/2 by 3 1/2 inches. Construct grating of 125 by 13 mm 5 by 1/2 inch steel bars and 25 by 10 mm one by 3/8 inch steel cross bars. Weld grating and make in sections for ease of removal. Provide two intermediate support beams sized not less than W8 by 31 arranged for a maximum grating span of 1016 mm 3 feet 4 inches.

2.9.5.2 Hopper Outlet

Flanged not less than [_____] by [_____] mm inches. Outlet shall contain a water-collecting reclaim hopper type coal gate not less than [_____] by [_____] mm inches size.

2.9.5.3 Cover

Structurally reinforced 5 mm 3/16 inch thick raised pattern floor plate. Construct cover in sections with handles for ease of removal.

2.9.6 Reclaim Hoppers

Welded construction of not less than 6 mm 1/4 inch thick structurally reinforced steel plate lined with 8 gage (4.18 mm 0.1644 inch) 410 stainless steel plate not less than 3 meters 10 feet wide and 3 meters 10 feet long. Side slopes not less than 60 degrees from horizontal. Interior bolts shall have flat heads. Support hopper from concrete pit walls as indicated.

2.9.6.1 Grating

Hopper grating shall have openings 90 by 90 mm 3 1/2 by 3 1/2 inches. Construct grating of 125 by 13 mm 5 by 1/2 inch steel bars and 25 by 10 mm one by 3/8 inch steel cross bars. Weld grating and make in sections for ease of removal. Provide two intermediate support beams sized not less than W8 by 31 arranged for a maximum grating span of 1016 mm 3 feet 4 inches.

2.9.6.2 Hopper Outlet

Flanged not less than [_____] by [_____] mm inches. Outlet shall contain a special reclaim hopper gate not less than [_____] by [_____] mm inches.

2.9.6.3 Reclaim Hopper Cover

Structurally reinforced 5 mm 3/16 inch thick raised pattern floor plate. Construct cover in sections with handles for ease of removal.

2.9.7 Belt Feeder

Totally enclosed, dust tight, approximately [_____] meter feet between pulley centers, designed to operate at a speed not to exceed [_____] m/s fpm, and having a capacity of not less than [_____] Mg tons per hour of [_____] size coal. Provide belt feeder complete with continuous belt, shafts,
pulleys, idlers, belt cleaner, frame, enclosure, reduction gear, and drive motor.

2.9.7.1 Head and Foot Shafts

Cold rolled steel, not less than [_____] mm inches and [_____] mm inches in diameter respectively. Mount shafts in antifriction roller bearings with forced lubricating type fittings. Mount head shaft in fixed pillow blocks. Foot shaft shall have screw-type takeups with not less than a [_____] mm inch adjustment. Shafts shall fit tight in pulley hubs.

2.9.7.2 Pulleys

Welded steel type with detachable compression grip-type hubs, steel plate ends, and crown faces 50 mm 2 inches wider than the belt width. [Provide an adjustable spring loaded or counter weighted type rubber bladed belt wiper beneath the head pulleys].

2.9.7.3 Belt

Mine Safety and Health Administration (MSHA) approved fire resistant construction, belt not less than [_____] mm inches wide, [_____] ply, [_____] kg ounces per square meter foot, with 3 mm 1/8 inch thick oil and chemical resistant cover on carrying side 0.79 mm 1/32 inch thick oil and chemical resistant rubber cover on under side. Cover shall be fire resistant. Belt shall have a cover tensile strength of not less than [_____] kPa psi and friction between plies of not less than [_____] kPa psi. Belt shall have vulcanized splice.

2.9.7.4 Electric Motor

Totally enclosed, fan cooled, high torque, [_____] volt, [_____] phase, 60 Hz, not less than [_____] kW hp as specified under the paragraph MOTORS AND DRIVES. Motor shall be direct connected by means of flexible coupling with guard to a reduction gear.

2.9.7.5 Reduction Gear

Alloy steel helical gear type enclosed in oiltight housing. Provide an adjustable base for motor and reducer unit. Drive from output shaft of the speed reducer to the conveyor head shaft shall be by means of finished steel roller chain conforming to ASME B29.100 running over cut tooth sprockets conforming to ASME B29.100 and complete with steel plate chain guard. Roller chain attachments shall conform to ASME B29.100. Provide means to properly tension drive chain.

2.9.7.6 Backstop

Differential band brake type, cam type, or internal type to prevent reversal of belt.

2.9.7.7 Idlers

Flat type with 125 mm 5 inch diameter steel shells, malleable iron end brackets, grease sealed roller-type antifriction bearings, and self-cleaning angle bases. Idler spacing shall be not greater than 1372 mm 4 feet 6 inches. Return idler shall be of the flat single-pulley type having 125 mm 5 inch diameter steel shells, grease sealed roller-type antifriction bearings spaced on not more than [_____] meter feet centers.
Provide self-aligning training type idlers, as required, to ensure proper training of the belt. Provide additional idlers, as required, beneath track or truck hopper for support of belt and coal and to properly protect belt from impact caused by the coal. Extend grease pipes to one side for four point lubrication from tunnel walkway.

2.9.7.8 Load Skirts

Steel plate 6.35 mm 1/4 inch thick supported by structural brackets from conveyor frame. Skirts shall have rubber strips along the bottom edge to seal belt. Strips shall be easily adjustable by means of a clamp bar arrangement not requiring slotted bolt holes.

2.9.7.9 Frame, Supports, and Enclosure

Construct frame of either structural steel channel side stringers properly tied and braced for support of head and foot shafts with 12 gage (2.66 mm 0.1046 inch) steel deck plate the full length of the feeder, or integrally formed plate conveyor and deck frame. Support idlers from conveyor frame. Support frame from floor of tunnel [by steel channel legs] [as indicated]. Completely enclose feeder in a dust-tight enclosure constructed of not less than 10 gage (3.42 mm 0.1345 inch) steel plate with easily removable gasketed side panels containing handles at each panel end.

2.9.7.10 Loading Hopper

Constructed of not less than 10 mm 3/8 inch thick steel plate connected to bottom flange of the track or truck hopper. Provide an adjustable regulating gate adjacent to loading hopper for regulating height of coal on the belt.

2.9.7.11 Vibrating Feeder

Flat pan type vibrating feeder to convey coal from the day hopper to the belt conveyor. Pan shall be [_____] mm inches wide by [_____] mm inches long, with 150 mm 6 inch sides, constructed of 6.35 mm 1/4 inch thick stainless steel. Provide feeder with integral electromechanical drive and a remote controller. Controller shall contain operating switches and rate of flow adjustment and the power source for the feeder drive. Controller shall be designed for 460 volt, 60 Hz supply voltage. Support feeder from the hopper.

2.9.8 Shallow-In-Built Bar Flight Feeder and Receiving Hopper

Bar flight feeder shall be totally enclosed, dusttight type with shallow-in-built [track] [truck] hopper. Bar flight feeder shall have a horizontal length of [_____] meter feet [_____] mm inches between sprocket centers, operate at not greater than [_____] m/s fpm, and have a capacity of not less than [_____] Mg tons per hour of [_____] size coal. Provide feeder complete with continuous chains and attached bars, terminal sprockets, gears, shafts, bearings, troughs, enclosure, frames, [truck] [track] hopper, grating, regulating gate, hinged inspection doors, discharge chute, electric motor, reduction gear, and supports.

2.9.8.1 Head and Foot Shafts

Head and foot shafts shall be not less than [_____] mm inches and [_____] mm inches in diameter, respectively. Construct shafts of coal rolled steel and mount in antifriction roller bearings. Mount head shaft in fixed

SECTION 23 52 33.02 20  Page 105
pillow blocks and foot shaft shall have screw-type takeups with not less than [___] mm inches adjustment.

2.9.8.2 Terminal Sprockets

Cast iron terminal sprockets with chilled rims not less than 380 mm 15 inches in diameter. Foot shaft sprockets shall be split type in two 180 degree sections to facilitate removal in shallow pit.

2.9.8.3 Chains and Flights

Chains shall be bar link type each having a pitch of not greater than 150 mm 6 inches and an ultimate strength of not less than 20,430 kg 45,000 pounds. Construct chain of heat treated carbon steel components with not less than a 22 by 38 mm 7/8 by 1 1/2 inch wide center link, 10 mm 3/8 inch wide by 38 mm 1 1/2 inch thick side bars, fastened with 18 mm 5/8 inch diameter pins. Construct bar flights of 10 mm 3/8 inch thick steel bars not less than 50 mm 2 inches high with flight width of not less than [___] mm inches. Flight spacing shall be such that feeder shall move the required coal with a head shaft speed not greater than [___] rpm.

2.9.8.4 Frame and Enclosure

Construct feeder frame of structural steel properly tied and braced, complete with guides and track for both the carrying and return runs, of not less than 80 by 80 by 10 mm 3 by 3 by 3/8 inch steel angles with not less than 6 mm 1/4 inch high renewable carbon steel wear bars. Enclosure shall be dusttight of not less than 10 gage (3.42 mm 0.1345 inch) commercial hot rolled steel plate. Enclosure shall be removable in sections. Top and side panels at head and foot sections shall be hinged and removable for access to chain sprockets.

2.9.8.5 Trough

Construct trough with flat bottom of not less than 10 mm 3/8 inch thick steel plate. Trough shall be removable and constructed with flanged discharge opening.

2.9.8.6 Hopper

Construct hopper not less than 2 1/2 meters 8 feet long and 3 meters 10 feet wide of structurally reinforced 10 mm 3/8 inch thick steel plate lined with 10 gage (3.42 mm 0.1345 inch) 410 stainless steel plate. Hopper sides shall not slope less than 55 degrees from the horizontal. Construct hopper with a shield over the return run so that coal is fed directly to the bottom conveying run.

2.9.8.7 Grating

Hopper grating shall have openings 90 by 90 mm 3 1/2 by 3 1/2 inches. Construct grating of 65 by 10 mm 2 1/2 by 3/8 inch steel bars and 20 mm 3/4 inch diameter steel rods. Weld grating and make in sections for ease of removal. Provide intermediate beams to support the grating.

2.9.8.8 Flight Feeder Drive

Flight feeder shall be driven by an electric motor direct connected by means of flexible coupling to a reduction gear unit having alloy steel helical or herringbone gears and antifriction bearings enclosed in oiltight
housing. Provide an adjustable base for motor and gear. Drive from output speed shaft of the reduction gear to the conveyor head shaft shall be by means of standard finished steel roller chain conforming to ASME B29.100 running over cut tooth sprockets conforming to ASME B29.100 and complete with steel plate chain guard. Roller chain attachments shall conform to ASME B29.100.

2.9.8.9 Electric Motor

Totally enclosed, fan cooled, high torque, [_____] volt, three phase, 60 Hz not less than [_____] kW hp as specified under the paragraph MOTORS AND DRIVES in this section.

2.9.9 Bucket Elevator

Dusttight [centrifugal discharge] [continuous bucket] type having approximately [_____] meter feet [_____] mm inches sprocket centers, vertical chain and bucket, operating at a speed not to exceed [_____] m/s fpm, and having a capacity of not less than [_____] Mg tons per hour of [_____] size coal. Provide bucket elevator complete with continuous double chains and attached buckets, upper and lower sprockets, gears, shafts, bearings, casing, top hood, discharge spout, bottom boot, access doors, electric motor drive, reduction gear, service platform, and accessories.

2.9.9.1 Head and Foot Shafts

Cold rolled steel not less than [_____] mm inches and [_____] mm inches in diameter, respectively. Mount shafts in antifriction roller bearings with forced lubricating type fittings. Mount head shaft in fixed pillow blocks. Foot shaft shall have screw-type takeups with not less than a [_____] mm inch adjustment. Shafts shall fit tight in sprocket hubs.

2.9.9.2 Terminal Sprockets

Cast iron with chilled rims. Head sprockets shall be not less than [_____] mm inches in diameter and foot sprockets not less than [_____] mm inches in diameter.

2.9.9.3 Buckets and Chain

Construct buckets of [malleable iron] [not less than [_____] mm inch steel plate] not less than [_____] mm inches long, [_____] mm inches wide, and [_____] mm inches deep. Buckets shall be mounted by not less than four bolt attachments to double strand of steel bushed chain each having an ultimate strength of not less than [_____] kg pounds and pitch of [_____] mm inches. Bucket spacing shall not be greater than [_____] mm inches.

2.9.9.4 Backstop

Differential band brake type, cam type or internal type to prevent reversal of chain and buckets in case of power failure.

2.9.9.5 Elevator Casing

Not less than [_____] by [_____] mm inches inside of not less than [_____] [gage] [ mm inch thick] commercial hot rolled mild steel plate with 50 by 50 by 6 mm 2 by 2 by 1/4 inch corner angles for full height of elevator casing. Construct casing in standard sections from 3 to 3.66 meters 10 to 12 feet high with 50 by 50 by 6 mm 2 by 2 by 1/4 inch angle
flanges at the end of each section. Provide a hinged inspection door not less than 610 by 760 mm 24 by 30 inches in the section immediately above the boot section [and where indicated]. Casing and inspection doors shall be of dust-tight construction with flange angles continuously welded and gasketed. No makeshift repairs or field patching to overcome leakage shall be permitted. Casing interior shall be given a 1.60 mm 1/16 inch thick coating of coal tar primer and enamel in accordance with SSPC PS 11.01.

2.9.9.6 Head Section

Not less than [_____] mm inch thick commercial hot rolled mild steel plate in heavy angle frame with split, hinged, and removable top cover hood. Construct hood of not less than [_____] mm inch thick commercial hot rolled mild steel plate with flanged discharge throat built of not less than [_____] mm inch thick commercial hot rolled mild steel plate. Design head section to support the drive machinery and head bearings. Provide maintenance access ladder and platform conforming to applicable OSHA regulations [as indicated].

2.9.9.7 Boot Section

Not less than [_____] mm inch thick commercial hot rolled mild steel plate in heavy angle frame with curved and renewable bottom plate built of not less than [_____] mm inch thick commercial hot rolled mild steel plate, and flanged inlet. Take up and foot terminal bearing on one side of the boot shall be mounted in a bolted removable side panel so the foot shaft and [sprocket] [sprockets] may be removed through the side of the door. Bolt end panels so they are removable for cleanout and inspection.

2.9.9.8 Electric Motor

Totally enclosed, fan cooled, high torque, [_____] volt, three phase, 60 Hz not less than [_____] kW hp, as specified under the paragraph MOTORS AND DRIVES in this section. Motor shall be direct connected by means of flexible coupling to a reduction gear.

2.9.9.9 Reduction Gear

Alloy steel herringbone or helical gear type enclosed in oiltight housing. Provide an adjustable base for motor and reduction gear unit. Drive from output shaft of reduction gear to elevator head shaft shall be by means of standard finished steel roller chain conforming to ASME B29.100 running over cut tooth sprockets conforming to ASME B29.100 and complete with steel plate chain guard. Roller chain attachments shall conform to ASME B29.100. Provide means to properly tension drive chain.

2.9.9.10 Anchoring Brackets

Provide steel brackets at intervals [as indicated] at [not less than [_____] meters feet over centers] for anchoring elevator and to increase rigidity.

2.9.10 Rotary Vane Feeder

Provide a fully enclosed, dusttight, rotary vane feeder designed to feed [_____] size coal at a constant rate of not less than [_____] Mg tons per hour. Provide feeder complete with housing, feeder vanes, removable panels and inspection doors.
2.9.10.1  Body

Construct feeder body dusttight of not less than 12.7 mm 1/2 inch thick formed carbon steel plate with 19.05 mm 3/4 inch thick flanges. Continuously weld joints both inside and out. Top cover of feeder between inlet and outlet flanges shall be removable to allow access to interior of feeder. Provide hinged inspection doors in both sides of the outlet section.

2.9.10.2  Feeder Vanes

Feeder section shall consist of not less than four vanes, equally spaced, extending radially from drive shaft. Feeder section shall be not less than 457 mm 18 inches long and 457 mm 18 inches in diameter. Construct shaft of turned and polished cold rolled steel mounted in externally flanged babbitted type bearing blocks with forced lubrication type fittings. Protect bearings with felt seal between bearing blocks and feeder body.

2.9.10.3  Drive Sprocket

Provide cast iron drive sprocket with chilled rims. Coordinate diameter with drive motor and reduction gear for required feeder speed.

2.9.10.4  Electric Motor

Totally enclosed, fan cooled, high torque, [_____] volt, three phase, 60 Hz, not less than [_____] kW hp as specified under the paragraph MOTORS AND DRIVES in this section. Motor shall be directly connected by means of flexible coupling to a reduction gear unit having alloy steel helical or herringbone gears and antifriction bearings enclosed in oiltight housing. Provide an adjustable base for motor and reduction gear unit. Drive from output speed shaft of the reduction gear to the conveyor head shaft shall be by means of finished steel roller chain conforming to ASME B29.100 running over cut tooth sprockets conforming to ASME B29.100 complete with steel plate chain guard. Roller chain attachments shall conform to ASME B29.100.

2.9.11  Screw Conveyors

Provide each dusttight and furnished complete, with trough, screw, inlet and discharge spouts, discharge gates, bearings, bearing hangers, dust cover, electric motor, reduction gear, [service platform,] and supports.

2.9.11.1  Inlet and Discharge Spouts

Arrange as indicated. Spouts shall be flanged and square with opening dimensions equal to inside diameter of trough.

2.9.11.2  Screw Trough

Provide dusttight screw trough with trough covers. Support trough by 6 mm 1/4 inch thick steel plate feet at not less than 3 meters 10 foot intervals. Individual trough sections shall not be greater than 3 meters 10 feet long with steel angle end flanged connections.

2.9.11.3  Bearings and Hangers

Provide thrust bearings and trough end dust seals for both drive and tail bearings. Thrust bearings shall be bronze in antifriction pillow blocks.
Screw hanger bearings shall be rabitted-type, with cast iron hangers having removable bearing caps held in place by a U-bolt. Design hangers to fit inside the conveyor trough and equip bearing for grease lubrication with grease fittings penetrating the dust cover to allow bearings to be greased without removing dust cover. Hangers shall not be located at trough joints, feed, or discharge openings. Locate hangers at not less than [3.66 meter 12 foot intervals for screw diameters larger than 250 mm 10 inches] [and] [3 meters 10 foot intervals for screw diameters 250 mm 10 inches in diameter and smaller].

2.9.11.4 Conveyor Screws and Couplings

Construct conveyor screws of helocoid-type flights and connect with cold rolled steel couplings. Assemble conveyor screws so that at the hangers there is 180 degrees rotation between the flight ends of each adjacent screw section. Screw flight shall end over last discharge spout so bare pipe extends across this area to prevent material carry-over.

2.9.11.5 Electric Motor

Totally enclosed, fan cooled, high torque, [_____] volt, three phase, 60 Hz, not less than [_____] kW hp as specified under the paragraph MOTORS AND DRIVES in this section. Install motor at discharge end of conveyor. Motor shall be supported by a unit bracket attached to the screw conveyor trough end plate and shall be connected to reduction gear through a -belt drive. Reduction gear shall be shaft mounted, double reduction type mounted directly on conveyor shaft. Provide tie rods, when required, to prevent reduction gear rotation and for adjusting belt tension.

2.9.11.6 Service Platforms

Provide service platform conforming to OSHA regulations as indicated to properly maintain and service conveyor drive unit.

2.9.12 Belt Conveyor

Inclined and approximately [_____] meter feet between pulley centers, operated at a speed not to exceed [_____] m/s fpm, and have a capacity of not less than [_____] Mg tons per hour of [_____] size coal. Provide belt conveyor complete with continuous belt, shafts, pulleys, idlers, takeups, belt cleaner, frame with conveyor cover and walkway, transfer chute, hopper, emergency stop cord and switch, alignment switch, reduction gear, electric motor, bin high level limit switch and alarm.

2.9.12.1 Head and Foot Shafts

Construct shafts of turned and polished cold rolled steel not less than [_____] mm inches and [_____] mm inches in diameter, respectively. Mount shafts in antifriction roller bearings with forced lubricating type fittings. Mount head shaft in fixed pillow blocks. Foot shaft shall have screw-type takeups with not less than [_____] mm inches adjustment.

2.9.12.2 Takeups

[Three pulley guided vertical counter weighted type] [Screw type] to maintain proper belt tension. Shafts shall be as specified above and not less than [_____] mm inches in diameter. Provide a safety device to prevent free fall of take-up pulley. Takeups shall provide a minimum adjustment of 1.5 percent of total belt length.
2.9.12.3 Pulleys

Welded steel type with detachable compression grip-type hubs, steel plate ends, and crown faces 50 mm 2 inches wider than the belt width. Provide a multiple belt scraper at each head pulley.

2.9.12.4 Magnetic Pulley

Drive pulley of [_____] conveyor shall be a nonelectric permanent magnet type designed to remove tramp iron. Provide a removable pan to collect the tramp iron.

2.9.12.5 Belt

Synthetic fabric, not less than [_____] mm inches wide, a minimum of [_____] ply, with 3 mm 1/8 inch thick oil and chemical resistant cover on carrying side, [1.59] [0.79] mm [1/16] [1/32] inch thick oil and chemical resistant rubber cover on under side. Cover shall be fire resistant. Belt shall have a tension pull strength of not less than [_____] N per mm pounds per inch of belt width. Belt shall have Vulcanized splice.

2.9.12.6 Electric Motor

Totally enclosed, fan cooled, high torque, [_____] volt, three phase, 60 Hz, not less than [_____] kW hp as specified under the paragraph MOTORS AND DRIVES in this section. Motor shall be direct connected by means of flexible coupling with guard to a reduction gear.

2.9.12.7 Reduction Gear

Alloy steel helical gear type enclosed in an oil tight housing. Provide an adjustable base for mounting motor and reducing unit. Drive from the output shaft of the speed reducer to the conveyor head shaft shall be by means of finished steel roller chain conforming to ASME B29.100 running over cut tooth sprockets conforming to ASME B29.100 and complete with steel plate chain guard. Roller chain attachments shall conform to ASME B29.100. Provide means to properly tension drive chain.

2.9.12.8 Backstop

Differential band brake type, cam type, or internal type to prevent reversal of belt.

2.9.12.9 Emergency Stop Cord and Switch

Provide emergency stop cord the length of the conveyor to actuate a switch for stopping the conveyor. Switch shall have flag to indicate actuated switch and shall have positive safety lock that cannot be accidentally reset. Cord shall be not less than 2.38 mm 3/32 inch galvanized aircraft cable with a minimum 1.19 mm 3/64 inch vinyl or nylon protective coating. Provide sufficient number of switches to prevent cable weight from actuating switch.

2.9.12.10 Belt Alignment Switch

Provide on each side of belt mounted off conveyor frame or discharge chute to stop conveyor under belt misalignment or runoff conditions. Mount switches on breakaway mounts to prevent damage from runaway belt.
2.9.12.11 Idlers

Troughing idlers shall be the [20] [35] degree three-pulley type with 125 mm 5 inch diameter steel shells, malleable iron end brackets, grease sealed roller type antifriction bearings, and self-cleaning angle bases. Troughing idler spacing shall be not greater than 1.37 meters 4 feet 6 inches, with additional idlers at the loading point. Return idler shall be of the flat single-pulley type having 125 mm 5 inch diameter steel shells, grease sealed roller type antifriction bearings and spaced on not more than 3 meters 10 foot centers. Provide self-aligning training type trough and return idlers at not greater than 15.24 meters 50 foot intervals to ensure proper training of belt. Extend grease pipes to one side for four point lubrication from walkway.

2.9.12.12 Load Skirts

Not less than 6 mm 1/4 inch thick steel plate and supported by structural brackets from conveyor frame. Skirts shall have rubber strips along bottom edge to seal belt. Strips shall be easily adjustable by means of a clamp bar arrangement not requiring slotted bolt holes.

2.9.12.13 Frame, Supports, and Walkway

******************************************************************************
NOTE: Designer shall detail footings based on load and soil conditions at each plant site. Walkway shall be detailed.
******************************************************************************

Frame shall be of the structural steel truss type with head and foot terminals framed of structural steel. Support frame from grade on structural A-frames set on concrete footings as indicated. Support idlers on not less than 150 mm 6 inch channel stringers braced and tied to structural steel truss frame. Provide a 12 gage (2.66 mm 0.1046 inch) steel deck plate for full length of conveyor. Provide a curved belt cover constructed of not less than 16 gage (1.52 mm 0.0598 inch) corrugated galvanized metal having removable panels on the walkway side for access to the idlers. Provide walkway not less than 914 mm 36 inches wide, supported from the structural steel framing for the entire length of the conveyor. Walkway shall be complete with handrails and metal nonslip grating meeting the requirements of 29 CFR 1910-SUBPART D.

2.9.12.14 Discharge Hopper

Construct discharge hopper of not less than 6 mm 1/4 inch thick steel plate to discharge on a discharge chute. Provide a discharge hood built of 10 gage (3.42 mm 0.1345 inch) steel plate enclosing the top, front, and sides above the discharge hopper.

2.9.13 Coal Scales

Stationary, automatic, dust-proof, belt-fed, batch type with rated capacity of not less than [_____] Mg tons per hour and a hopper capacity of 91 kg 200 pounds. Coal scales shall be complete units, including the body, belt feeder, feeder drive, bypass, weighing mechanism, weigh hopper, controls, counters, and other items required to make a completely automatic coal scale.
2.9.13.1 Body

Dusttight, of welded heavy steel plate construction with base angles not less than 6 mm 1/4 inch thick. Top plate, bypass plate, and reducer mounting plate shall be not less than 6 mm 1/4 inch thick, with other plates of not less than 11 gage (3.04 mm 0.1196 inch) steel plate. Provide large, gasketed, dusttight doors with adjustable pre-set compression type latches and forged steel hinges for inspection and maintenance purposes. Door openings shall be sufficient to allow removal of feeder and hopper without removal of screws or bolts.

2.9.13.2 Feeder

Feeder shall be a self-contained unit with an endless belt which shall be capable of being removed from one end or side. Construct feeder of heavy rigid steel frame with an 11 gage (3.04 mm 0.1196 inch) stainless steel plate to support the belt on the carrying run. Head and take-up shafts shall be cold rolled steel carried on self-aligning ball bearings equipped with dust seals and fitted for pressure lubrications. Bearings shall be capable of being lubricated during scale operation. Take-up shaft shall have screw-type take-up bearings and pulleys shall be crown faced steel for proper belt tracking.

2.9.13.3 Feed Belt

Channel type and of endless construction without splice. Belt shall be not less than 7.94 mm 5/16 inch thick of three ply heavy fabric core construction with chemical and abrasion resistant rubber coating. Feeder skirts and leveling plate shall be stainless steel and shall be arranged to provide a continuous stream of constant width and depth coal on the feed belt.

2.9.13.4 Electric Motor And Drive

Totally enclosed [_____] volt, [_____] phase, 60 Hz, with heavy duty reduction gear not less than 0.56 kW 3/4 hp as specified under the paragraph MOTORS AND DRIVES in this section. Scale shall be capable of bypassing coal without disconnection of the drive. Drive disconnection shall not be required for feeder removal unless special provisions are made for quick and simple drive disconnection.

2.9.13.5 Coal Bypass

Provide a quick-operating coal bypass with an easily operable lever located on the outside of scale body. Operating lever operation shall instantly bypass coal around the feeder section and weighing mechanism without release of belt tension to prevent entry of coal between belt and pulley or support plates. Bypass construction shall not restrict inlet opening size for normal scale operation.

2.9.13.6 Weighing Mechanism

Enclose in a dusttight compartment. Construct weighing mechanism of cold rolled steel for minimum deflection, warp, and twist. Pivot points shall be self-aligning with hardened double bearing surfaces. Weighing mechanism shall be complete with weight lever, tare adjustment, and compensator, [with design subject to approval by the Contracting Officer], and scale shall be guaranteed to weigh coal accurately within 0.25 percent.
2.9.13.7 Scale Weigh Hopper

Construct scale weigh hopper and discharge gate of not less than 14 gage stainless steel plate, continuously welded and stiffened with angle irons. Weigh hopper shall be of such design and construction to ensure clean discharge.

2.9.13.8 Controls

Provide controls, except those required for weigh hopper discharge, prewired and located in a [NEMA 12] [NEMA 3] dusttight enclosure. Provide circuit breaker interlocked with the electrical panel door. Control circuits shall be two wire nominal 120 volt systems obtained by using an isolation transformer with one side grounded and shall be wired to a single terminal block which shall be included in the electrical panel. Segregate circuits of different voltage levels. Controls shall include large, oiltight, industrial type pushbuttons for use as "start-stop," "test," and "dump" switches mounted on the scale body adjacent to the electrical panel.

2.9.13.9 Counters

Mount a mechanical type coal counter on the scale body. Counter shall be rugged, reliable, with heavy duty register and designed so that double counting is impossible. [A remote motor operated counter shall be furnished located on the coal handling control panel in the control room. Counter shall be designed so that double counting is impossible.][Provide a contact closure for sending a pulse signal of each weigh hopper discharge to the operator control console, specified under Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS.]

2.9.13.10 Scale Inlet

Scale inlet shall contain coal gate with opening not less than 457 by 457 mm or 406 by 508 mm 18 by 18 inches or 16 by 20 inches along with a dusttight metal slip joint constructed of not less than 4.76 mm 3/16 inch thick steel plate. Slip joint shall be of split construction to allow for installation after coal scale is in place. Design slip joint to allow the necessary flexibility to take care of deflection of the [bunker] [silo] outlet due to varying load and temperature variations without imposing load on the scale. Rope packing or other resilient gasket material shall be provided to make the slip joint completely dusttight.

2.9.13.11 Scale Outlet Hopper

Not less than 6 mm 1/4 inch thick 410 stainless steel plate of capacity not less than 227 kg 500 pounds and 13 mm 1/2 inch thick steel plate flanges.

2.9.14 Stoker Hopper Extension

Stoker hopper extensions shall be dusttight and bolted to hopper furnished with stokers. Construct hopper extensions approximately as indicated of 6 mm 1/4 inch thick 410 stainless steel plate with structural stiffeners. Hopper extension shall hold not less than [_____] Mg tons of coal at a density of 800 kg per cubic meter 50 pounds per cubic foot. Hopper extensions shall have bolted emergency firing doors of not less than 610 by 610 mm 24 by 24 inches which shall contain a 152 by 152 mm 6 by 6 inch glass observation window. Connections shall be dusttight.
2.9.15  Coal Valve

Dusttight and drip proof of the double ladder rack-and-pinion type sized as indicated for each valve. Valve shall be capable of closing through a standing coal column. Valve opening shall be full size with no bridges, internal braces, or other barriers.

2.9.15.1  Valve Body

Not less than 6 mm 1/4 inch thick formed 410 stainless steel with heavy 19 mm 3/4 inch thick flanges. Continuously weld joints in contact with coal both inside and out and grind smooth. Valve body shall have dusttight steel gate assembly cover with molded gasket for removal of gate without removing the coal valve. Provide a minimum of two dusttight poke holes with rigid covers and molded gaskets.

2.9.15.2  Valve Gate

Drip proof and sift proof of 10 mm 3/8 inch thick steel plate with an 11 gage (3.04 mm 0.1196 inch) 410 stainless steel liner. Support gate by ball bearing rollers with 16 gage (1.52 mm 0.0598 inch) stainless steel shells equipped with felt grease seals and stainless steel grease retainers. Provide rollers with grease fittings extended through the valve body for pressure lubrication. Design gate so that supporting rollers, racks, and pinions are located completely out of the coal stream. Racks shall be cold formed and self cleaning, with stainless steel self cleaning pinions located over racks for positive tooth engagement.

2.9.15.3  Operating Shaft

Mount operating shaft in ball bearings with felt seals, stainless steel shells, stainless steel grease retainers, and grease fittings. Provide handwheels with proper finger clearance or pocket sheaves with heavy hot-dipped galvanized chain and chain guard as indicated. Handwheels and sheaves shall be not less than 457 mm 18 inches in diameter. Provide valves with mechanical type position indicator consisting of large pointer and legend to indicate the position of the valve gate.

2.9.15.4  Electric Motor Operators

Provide motor operators where indicated and capable of remote operation from the coal handling control panel. Operator shall consist of totally enclosed, fan cooled, high torque, [_____] volt, [_____] phase, 60 Hz motor as specified under the paragraph MOTORS AND DRIVES in this section with reduction gear, clutch and limit switches. Motor horsepower shall be as recommended by the manufacturer. Provide motorized valves that have manual operators, with fail-safe interlocks that make manual operation impossible while motor is operating.

2.9.16  Track and Reclaim Hopper Valves

Dusttight, double rack and pinion type, with water collecting trough. Valve shall have inlet opening not less than [_____] by [_____] mm inches in the direction of gate travel with a larger outlet opening. Inlet and outlet shall be flanged and constructed of mild steel.

2.9.16.1  Valve Body

Not less than 10 mm 3/8 inch thick mild steel continuously welded both
internally and externally and lined with 11 gage (3.04 mm 0.1196 inch) 410 stainless steel plate where body comes in direct contact with coal. Construct inlet skirt of not less than 6 mm 1/4 inch thick 410 stainless steel with outlet body plates constructed of 10 mm 3/8 inch thick mild steel lined with 11 gage (3.04 mm 0.1196 inch) 410 stainless steel plate. Construct water collecting trough of not less than 11 gage (3.04 mm 0.1196 inch) 410 stainless steel plate and containing water sprays for flushing. Valve body shall have dust-tight steel gate assembly cover with molded gasket for removal of gate without removing the coal valve. Provide a hinged access panel not less than [_____] by [_____] mm inches in the direction of gate travel with compression-type latches over the water collecting trough for removing obstructions.

2.9.16.2 Valve Gate

Slope gate plate toward water collecting trough and mount it on large ball bearing rollers with 16 gage (1.52 mm 0.0598 inch) stainless steel shells equipped with felt grease seals and stainless steel grease retainers. Provide rollers with grease fittings extended through the valve body for pressure lubrication. Gate shall be U-shaped with ladder racks on both sides and shall be constructed of not less than 16 mm 5/8 inch thick mild steel lined with 11 gage (3.04 mm 0.1196 inch) 410 stainless steel plate. Gate design shall be such that supporting rollers, racks, and pinions are located completely out of the coal stream. Racks shall be cold formed and self-cleaning, with stainless steel, self-cleaning pinions over racks.

2.9.16.3 Operating Shaft

Mount in ball bearings with felt seals, stainless steel shells, stainless steel grease retainers, and grease fittings. Mount a reduction gear on the gate shaft and provide an ample gate clearance pocket in the body to ensure ease of operation through a standing column of coal. Handwheel for operating the valve shall be not less than 457 mm 18 inches in diameter.

2.9.17 Chutes

Construct coal chutes dusttight as indicated of not less than 6 mm 1/4 inch thick 410 stainless steel plate. Weld chutes with flanges located as indicated to facilitate equipment and chute section removal. Flanges shall be not less than 10 mm 3/8 inch thick steel and gasketed to maintain dust-tight seal. Poke holes and access panels shall be provided where indicated.

2.9.18 Coal Presence Indicators and Equipment Response Switches

May be of the following types and shall be interlocked with the coal handling controls to indicate equipment failures, coal stoppages, and provide for a semi-automatic system. Enclosures for components shall meet the requirements of NEMA Type 7, Class I, Division I, Groups C and D, and NEMA Type 9, Class II, Division I, Groups E, F, and G.

2.9.18.1 Type A - Diaphragm Type Presence Indicator

Pressure-sensitive to presence of coal consisting of housing, diaphragm, limit switches, wiring, and mounting bracket flanges. Housing shall be either cast iron, stainless steel, or protected cast aluminum, with synthetic diaphragm as recommended for coarse slightly abrasive materials. Diaphragm deflection shall actuate a limit switch to indicate coal presence. Design unit so that maintenance, diaphragm replacement and
sensitivity adjustment can be made from outside the bin. Type and number of contacts and voltages shall be as indicated on the control diagrams.

2.9.18.2 Type B - Paddle Type Presence Indicator

Paddle mounted on a counterweighted horizontal shaft so that deflection of the paddle rotates a cam which actuates a limit switch in a control box mounted on the shaft. Unit shall consist of paddle, shaft, enclosure, limit switches, wiring, and mounting brackets. Shaft shall be cold rolled steel and paddle shall be stainless steel with control enclosure of cast iron, stainless steel, or suitably protected cast aluminum. Type and number of contacts and voltages shall be as indicated on the control diagram. Mount shaft in ball bearings equipped with suitable dust seals and fittings for pressure grease lubrication.

2.9.18.3 Type C - Tilt Type Presence Indicator

Conical steel float that shall be tilted by presence of coal. Unit shall consist of housing, conical float, universal pivot-collar, pendant mechanism, dust seal, limit switches, wiring, and mounting brackets. Unit shall operate so that the tilting of the float actuates a limit switch in the enclosed housing above. Provide a hood constructed according to manufacturer's recommendations for the indicator's location of not less than 5 mm 3/16 inch thick steel plate. Provide access panel for servicing the unit. Tilt type indicator may be a totally enclosed type in which tilting causes a ball to roll off the center actuating a limit switch. Design unit to be cable hung and to tilt on the presence of coal. Type and number of contacts and voltages shall be as indicated on the control diagram.

2.9.18.4 Type D - Rotating Type Presence Indicator

Rotating paddle where presence of coal stalls motor and actuates a limit switch. Unit shall have either cast iron or cast aluminum housing, stainless steel paddle, couplings, and flexible shaft. Shaft seal shall be spring loaded and shall prevent the buildup of fines between shaft and hub. Operation shall be such that when paddle stalls, motor continues to operate until the limit switch is actuated, which in turn shuts off the current to the motor. Vane and baffle arrangements shall be according to manufacturer's recommendations for each indicator location. Type and number of contacts and voltages shall be as indicated on the control diagrams.

2.9.18.5 Type E - Vibrating Type Presence Indicator

Vibrating sensing rod so that the presence of coal dampens the vibrations actuating a control signal. Sensing rod shall be stainless steel not less than 10 mm 3/8 inch in diameter. Control unit shall be solid state, with type and number of contacts and voltages as indicated on the control diagrams.

2.9.18.6 Equipment Speed Response Switch

Actuates a control signal when preset abnormal equipment operating conditions are encountered. Switch shall be adjustable so that it may be used as an underspeed switch, overspeed switch, or zero speed switch. Switch shall consist of input shaft from which the equipment speed is measured and compared to a preset point. Enclosure shall be cast iron or suitably protected cast aluminum. Mount speed response switches as indicated on drawings. Type of switch adjustment, type and number of
contacts, and voltages shall be as indicated on the control diagrams.

2.9.18.7 Presence Indicators and Response Switches

Provide at hoppers and conveyor discharges located and protected according to manufacturer's recommendations to ensure safe and reliable operation. Mount presence indicators in such a manner that they will not be injured by occasional large lumps nor falsely operated by stray lumps or collected amounts of coal.

2.9.19 Control Panel and Controls

Provide a semi-automatic control system for the coal handling system as indicated. Control panel NEMA 12 construction, centrally located in the main plant control room. Panel front shall include a system graphic display as indicated. Display shall be approximately to scale and painted with an industrial acrylic enamel. Outline items with 3 mm 1/8 inch wide black lines. Lettering shall be on engraved plastic screwed to the front of the panel, with white letters on a black background. Provide controls for operation on [_____] volt, [_____] phase, 60 Hz a.c. Panel shall be complete with an annunciator and interlocks, relays, switches, running and safety lights, and auxiliary parts necessary to safely control and operate the system. Items located in the door shall be dust-tight and oil tight with push-to-test indicating lights being of the transformer type. Control relays shall be 10 amp, 600 volt class with convertible contacts. Provide and mark terminals for connections with the exception of the neutral. Panel shall contain [_____] percent spare terminals. Wiring shall be No. 14 AWG type THHN stranded. Neutral wire shall be white and other wiring of 120 volts or less shall be color coded and labeled. Provide a plastic wire duct of sufficient size to provide [_____] percent cross sectional spare. Wiring shall be in accordance with requirements of NFPA 70.

2.9.19.1 Panel Devices

Control panel shall include the following indicating lights and color:

2.9.19.2 Switches and Pushbuttons

Provide momentary contact pushbuttons or selector switches for the following:

a. System- START (3 required)
   Rail unloading hopper to storage yard
   Reclaim hopper to boiler plant
   Bunker to boiler plant

b. System - STOP (red head)

c. Rail unloading hopper surfactant spray - START/STOP

d. Reclaim hopper surfactant spray - START/STOP

e. Alarm - ACKNOWLEDGE

2.9.19.3 Annunciator Panel

Annunciator panel shall include the following:

a. Bunker - HIGH LEVEL

b. Bunker - LOW LEVEL

c. Stoker surge hopper (one required for each hopper) - HIGH LEVEL
d. Stoker surge hopper (one required for each hopper) - LOW LEVEL

e. Stoker surge hopper (one required for each hopper) - LOW LOW LEVEL

f. EMERGENCY SHUTDOWN (Auxiliary contacts for remote alarm)

g. Blank (3 required)

2.9.19.4 Panel Size

Size panel to accommodate future addition of one stoker surge hopper and associated equipment.

2.9.19.5 Auxiliary Devices

Provide auxiliary devices required for the control functions indicated above.

2.9.19.6 Name Plates

Provide laminated plastic name plates for devices on panel face.

2.9.19.7 Control Sequence

To ensure that coal does not back up during system startup or shutdown, design the controls so that on startup, the last piece of equipment to handle coal starts first and on shutdown, stops last.

2.9.19.8 Additional Controls

Provide as shown. These controls include local START and STOP pushbuttons or three-position selector switches for the following:

a. Belt feeders

b. Rotary vane feeder

c. Belt conveyor (at head pulley)

d. Screw conveyors

e. Coal scale

f. EMERGENCY STOP pushbuttons which stop the entire system shall be provided where indicated.

2.9.20 Multiple Belt Scrapers

Equip conveyor belts at the head pulley, with multiple belt scrapers. Adequate room and service access shall be provided in the head chute design for multiple cleaners. Provide a doctor blade on the face of the head pulley to remove most of the carryback material and a torsion arm type multiple blade cleaner to scrape and remove material that bypasses the primary cleaner. Tail pulley takeups shall be provided with a plow to protect against material being carried back between the belt and the pulleys. Both cleaners and plows shall have features that enable the operator to safely inspect and adjust blades. Dribble chutes shall be designed to resist material buildup and shall be plastic lined. A convenient dust tight door for clean out and inspection purposes shall be
2.9.21 Steel Coal Bunker

Cylindrical shaped type having a storage capacity of not less than [_____] Mg tons of coal having a density of 800 kg per cubic meter 50 pounds per cubic foot.

2.9.21.1 Construction

Welded construction, not less than [_____] meters feet in diameter with a vertical cylindrical section [_____] meters feet [_____] mm inches high. Construct vertical cylindrical section of not less than 7.94 mm 5/16 inch thick steel plate. Slope bottom cone shaped hopper section at not less than 55 degrees and fabricate from not less than 10 mm 3/8 inch thick 410 stainless steel plate. Top of bunker shall be conical 35 degree sloped structurally reinforced 6 mm 1/4 inch thick steel plate. Provide ladder inside bunker and immediately above ladder the bunker top shall contain dusttight, weather tight access hatch of not less than 610 by 610 mm 24 by 24 inches. Shell and bottom plates shall be beveled for full butt weld on inside of bunker and a finish weld on outside of bunker. Provide bunker with flanged outlet drilled to match inlet of gate.

a. Responsibility: Contractor with whom contract is drawn shall assume full responsibility for the design and final details of construction of the steel coal bunker.

b. Supports: Bunker shall be self supporting from four steel columns which shall be supported from on top of a concrete foundation. Concrete work shall be as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

c. Liner: Surface blast vertical inside surfaces of the bunker to a near white metal, and then coat with 6 mm 1/4 inch thick troweled-on heavy duty three compound corrosion resistant liner consisting of a resin, a hardener and graphite aggregate. Liner shall have an operating temperature limitation of not less than 66 degrees C 150 degrees F.

2.9.21.2 Accessories

a. Alarm Switches: Provide bunker with two automatic bin level indicators with neoprene rubber diaphragm and a single pole, double throw switch mounted in explosion proof aluminum housing to signal high and low level alarms. Provide mounting plates on bunker shell and holes for installation of indicator housing on outside of bunker. Wiring shall be as specified in 26 11 16 SECONDARY UNIT SUBSTATIONS.

b. Vibrators: Provide on the cone bottom of the coal bunker a heavy duty pulsating magnet electric vibrator, semi-noiseless type, complete with mounting plate. Provide one vibrator controller panel arranged for mounting in wall mounted control panel. Panel shall contain an "ON-OFF" switch, power control dial, fuses and rectifier. Power supply to panel shall be 460 volt, single phase, 60 Hz current.

2.9.22 Stoker Surge Hoppers

Construct stoker surge hoppers dusttight approximately as indicated of 6 mm 1/4 inch, 410 stainless steel plate with structural stiffeners, to hold not less than [_____] Mg tons of coal at a density of 800 kg per cubic meter 50
pounds per cubic foot. Connection transition between surge hopper discharge chute and stoker hopper extension shall have bolted emergency firing door of not less than 610 by 457 mm 24 by 18 inches which shall contain a 150 by 150 mm 6 by 6 inch glass observation window. Connections shall be dusttight.

2.9.23 Coal Meter

Vane type, where a direct readout counter is directly connected by a flexible shaft to a vane projected into center of coal downspout.

2.9.23.1 Vane

Construct vane of stainless steel design so that each foot of coal travel in the downspout causes the vane to turn a definite amount.

2.9.23.2 Counter

Counter shall have not less than four 25 mm one inch high figures on translucent material, illuminated from within the counter. Counter shall record directly the number of pounds of coal passing through the downspout.

2.9.24 Stackout Tube

Provide a stackout type discharge tube not less than 10 mm 3/8 inch thick, reinforced, stainless steel plate for discharging coal from the stackout conveyor to the coal storage yard. Tube shall be 1220 mm 4 feet 0 inches in diameter, and shall be designed as the structural support for a portion of the stackout conveyor and support steel as indicated on the drawings. Tube shall be a window chute designed to discharge coal at not more than 1.83 meters 6 feet above coal pile.

2.10 FUEL OIL SYSTEM

*******************************************************************************
NOTE: In reference to the following text, choose Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS if specifying below grade level fuel oil tanks. The rest of the system (including above ground tanks) shall be constructed to Section 33 52 10 FUEL SYSTEMS PIPING (SERVICE STATION).
*******************************************************************************

The fuel oil system shall be designed and built in accordance with Section 33 52 10 FUEL SYSTEMS PIPING (SERVICE STATION)[.][, except when underground fuel oil tanks are specified. Below grade level fuel oil tanks shall be constructed in accordance with Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.]

2.11 ASH HANDLING SYSTEM (MECHANICAL)

*******************************************************************************
NOTE: Choose this article and its paragraphs and subparagraphs or the following article ASH HANDLING SYSTEM (PNEUMATIC) and its paragraphs and subparagraphs.
*******************************************************************************
2.11.1 General

2.11.1.1 System Requirements

Provide a complete integrated, mechanical, semi-automatic, ash handling system with chain drag conveyor, screw conveyors, bucket elevator, material intakes, rotary valves, [ash doors and enclosures,] silo vent filter, ash silo, rotary ash conditioner, and additional equipment required for a complete mechanical ash handling system. Provide related electrical work required to operate the ash handling system.

2.11.1.2 Routing

The system shall receive, and convey to the ash silo, ash from the stoker fired boiler ash storage pits, [economizer hoppers,] [baghouse hoppers,] and other pollution control equipment hoppers.

2.11.1.3 Discharge

Discharge ash into ash storage silo in a dry condition. Arrange silo equipment for disposal of conditioned ash to trucks. Operation shall be as dustless as possible.

2.11.1.4 Maximum Noise Level

Noise level of the operation shall not exceed 85 decibels sound pressure level 1.52 meters 5 feet from the equipment in any direction.

2.11.2 System Valving

2.11.2.1 Rotary Valves

Provide rotary valve feeders of carbon steel construction complete with drive, guard, motor mount and gaskets, carbon steel adjustable blade tips, adjustable shoe type air seal and right angle gearhead drive motor. Rotor blade tips and shoes shall have a minimum Brinnell hardness of 500. Valves requiring part of the housing to form an airlock seal are not acceptable.

Electric Motor: Totally enclosed, fan cooled, [_____] volt, [_____] phase, 60 Hz not less than [_____] kW hp as specified under the paragraph MOTORS AND DRIVES in this section.

2.11.2.2 Manual Valve Intakes for Bottom Ash

Provide in front of the stoker ash pit doors a 610 by 610 mm 24 by 24 inch cast iron grid and hopper with opening approximately sized for the conveyor. Provide intake with dusttight, removable 6 mm 1/4 inch thick checkered steel plate cover.

2.11.2.3 Silo Discharge Valve

Provide a rotary feeder for discharging bottom ash and fly ash from the ash silo. Feeders shall be of ductile iron or cast steel and shall be complete with motor, motor support, chain drive, and necessary guards. Chain shall be driven through a torque limiting clutch on the driven sprocket equipped with electric cutout switch and alarm. [Feeder shall have spring-loaded hinged bypass plate to permit passage of clinkers.] Inlet and outlet flanges shall be standard drilled pipe flange. Rotor blades and sealing arrangement shall be the manufacturer's standard for the intended
service. When rotors are equipped with adjustable tips, provide a service door in the body of the valve for tip adjustment. Shaft seals shall be of the packing gland type with suitable packing materials. Shaft bearings shall be outboard sealed ball bearings. Periphery seals shall be such that a complete seal is accomplished at a differential of [_____] Pa inches of water static pressure.

2.11.3 Conveyors

2.11.3.1 Chain Drag Conveyor

Provide endless chain for dragging coal ashes from front of boilers along a recessed trough to the inlet chute of a bucket elevator. Conveyor shall have [_____] meters feet sprocket centers, operate at speed not greater than 35 mm per second 7 feet per minute, and have a capacity of not less than [_____] Mg per hour of 640 kg per cubic meter tons per hour of 40 pounds per cubic foot ash. Provide conveyor complete with continuous chain, drive, and take up terminals, gears, shafts, bearings, return rolls, hard white iron trough, ash intake gratings, floor plates, discharge chute, electric motor, reduction gear, and supports. [Chain drag conveyor shall be designed for future length of [_____] meter feet.]

a. Head and Foot Shafts: Provide SAE 1045, steel head and foot shafts not less than [_____] and [_____] mm inches in diameter, respectively, mounted in anti-friction roller bearings in pillow blocks. Foot shaft shall have screw-type takeups with not less than [_____] mm inches adjustment.

b. Terminal Sprockets: Terminal sprockets shall be gray iron chilled rim not less than [_____] mm inches in diameter with solid web and not less than eight teeth each.

c. Chain: Combination drag type of riveted construction. Design chain symmetrically so that it can be turned over after one side is worn. Chain shall be [_____] mm inches wide with a pitch not greater than 200 mm 8 inches and an ultimate strength of not less than [187] [249] kN [42,000] [56,000] pounds. Construct chain of promal, a pearlitic malleable iron, center links not less than [_____] mm inches high, and heavy [_____] mm inch thick heat treated carbon steel side bars. Steel pins shall be cold rolled steel not less than [_____] mm inch in diameter, press-fitted into sidebars, and machined flat on one side to prevent rotation. Center section shall be rugged block type forming a rigid rectangle for maximum resistance to distortion with broad wearing shoes contoured to prevent snagging and damage to chain or trough. Barrels of center section shall be chambered to provide lubricant reservoir and still provide maximum bearing area for pins. Shape barrel with pushing surface on one side and for contact with sprocket on the other side.

d. Trough: Concrete lined with not less than [_____] mm inch thick hard white iron approximately as indicated. Trough shall be [_____] mm inches wide with hinged 6 mm 1/4 inch thick checkered steel plate covers. Covers shall be installed to be dusttight. Coordinate concrete work with conveyor manufacturer's requirements.

e. Return Rollers: Chilled rim, single flange, enclosed-oiling type on [_____] mm inch diameter carbon steel shafts spaced at not more than 3 meters 10 feet apart.
f. Discharge Chute: Construct of not less than 10 mm 3/8 inch steel plate and slope at not less than 60 degrees.

g. Electric Motor and Drive: Totally enclosed, fan cooled, high torque, [_____] volt, [_____] phase, 60 Hz not less than [_____] kW hp as specified under the paragraph MOTORS AND DRIVES in this section, direct connected by means of flexible coupling to a reduction gear unit having alloy steel helical or herringbone gears and antifriction bearings enclosed in oiltight housing. Provide an adjustable base for motor and reduction gear. Drive from output shaft of the reduction gear shall be by means of finished steel roller chain conforming to ASME B29.100 running over cut tooth sprockets conforming to ASME B29.100 complete with steel plate chain guard. Roller chain attachments shall conform to ASME B29.100.

2.11.3.2 Screw Conveyors

Provide each screw conveyor dusttight and furnished complete, with trough, screw, inlet and discharge spouts, discharge gates, bearings, bearing hangers, dust cover, electric motor, reduction gear, [service platform,] and supports.

2.11.3.3 Inlet and Discharge Spouts

Arrange as indicated. Spouts shall be flanged and square with opening dimensions equal to the inside diameter of the trough.

2.11.3.4 Screw Trough

Provide dusttight screw trough with trough covers. Support trough by 6 mm 1/4 inch thick steel plate feet at not less than 3 meters 10 foot intervals. Individual trough sections shall not be greater than 3 meters 10 feet long with steel angle end flanged connections.

2.11.3.5 Bearings and Hangers

Provide thrust bearings and trough end dust seals for both drive and tail bearings. Thrust bearings shall be bronze in antifriction pillow blocks. Screw hanger bearings shall be babitted-type, with cast iron hangers having removable bearing caps held in place by a U-bolt. Design hangers to fit inside the conveyor trough and equip bearings for grease lubrication with grease fittings penetrating the dust cover to allow bearings to be greased without removing dust cover. Hangers shall not be located at trough joints, feed, or discharge openings. Locate hangers at not less than [3.66 meter 12 foot intervals for screw diameters larger than 250 mm 10 inches] [and] [3 meters 10 foot intervals for screw diameters 250 mm 10 inches in diameter and smaller].

2.11.3.6 Conveyor Screws and Couplings

Construct conveyor screws of helocoid-type flights and connect with cold rolled steel couplings. Assemble conveyor screws so that at the hangers there is 180 degrees rotation between the flight ends of each adjacent screw section. Screw flight shall end over last discharge spout so bare pipe extends across this area to prevent material carry-over.

2.11.3.7 Electric Motor

Totally enclosed, fan cooled, high torque, [_____] volt, three phase, 60
Hz, not less than [_____] kW hp as specified under the paragraph MOTORS AND DRIVES in this section. Install motor at discharge end of the conveyor. Motor shall be supported by a unit bracket attached to the screw conveyor trough end plate and shall be connected to reduction gear through a V-belt drive. Reduction gear shall be shaft mounted, double reduction type mounted directly on the conveyor shaft. Provide tie rods, when required, to prevent reduction gear rotation and for adjusting belt tension.

2.11.3.8 Service Platforms

Provide service platform conforming to OSHA regulations as indicated to properly maintain and service conveyor drive unit.

2.11.4 Bucket Elevator

Provide a dusttight bucket elevator centrifugal discharge type, having approximately [_____] meter foot [_____] mm inch sprocket centers, vertical chain and bucket, operating at a speed not to exceed [_____] meters per second (m/s) feet per minute (fpm), and having a capacity of not less than [_____] Mg per hour of 640 kg per cubic meter tons per hour of 40 pounds per cubic foot ash. Provide bucket elevator complete with continuous chain and attached buckets, sprockets, gears, shafts, bearings, casing, top hood, discharge spout, bottom boot, access doors, electric motor, reduction gear, service platform, and accessories.

2.11.4.1 Head and Foot Shafts

Head and foot shafts shall be not less than [_____] and [_____] mm inches in diameter, respectively. Construct shafts of cold rolled steel and mount in antifriction roller bearings with forced lubricating type fittings. Mount foot shaft in fixed pillow blocks. Head shaft shall have screw-type takeups with not less than [_____] mm inches adjustment.

2.11.4.2 Terminal Sprockets

Cast iron with chilled rims. Head sprocket shall be not less than [_____] mm inches in diameter and foot sprocket not less than [_____] mm inches in diameter.

2.11.4.3 Buckets and Chain

Construct buckets of malleable iron not less than 200 mm long, 127 mm wide, 140 mm deep 8 inches long, 5 inches wide, and 12 inches deep. Buckets shall be mounted by not less than four bolt attachments to a single strand of steel bushed chain having an ultimate strength of not less than 178 kN 40,000 pounds and pitch of 100 mm 4 inches. Bucket spacing shall be not greater than 406 mm 16 inches.

2.11.4.4 Backstop

Differential band brake type to prevent reversal of chain and buckets in case of power failure.

2.11.4.5 Casing

Elevator casing shall be not less than 298 by 991 mm 11 3/4 by 39 inches inside and constructed of not less than 5 mm 3/16 inch thick commercial hot rolled mild steel plate with 50 by 50 by 6 mm 2 by 2 by 1/4 inch corner angles for full height of elevator casing. Fabricate casing in standard
sections from 250 to 300 meter high with 50 by 50 by 6 mm 10 to 12 feet high with 2 by 2 by 1/4 inch angles at both flanges for each section. Provide a hinged inspection door not less than 610 by 762 mm 24 by 30 inches in the section immediately above the boot section and at other indicated points. Casing and inspection doors shall be of dusttight construction with flange angles continuously welded and gasketed. No makeshift repairs or field patching to overcome leakage shall be permitted. Give casing interior a 1.60 mm 1/16 inch thick coating of coal tar primer and enamel conforming to SSPC PS 11.01.

2.11.4.6 Head Section

Construct of not less than 5 mm 3/16 inch thick commercial hot rolled mild steel plate in heavy angle frame with split, hinged, and removable top cover hood built of not less than 10 gage (3.42 mm 0.1345 inch) commercial hot rolled mild steel plate and flanged discharge throat built of not less than 5 mm 3/16 inch commercial hot rolled mild steel plate. Design head section to support the drive machinery and head bearings. Provide access ladder and service platform conforming to applicable OSHA regulations as indicated for providing proper service and maintenance of elevator.

2.11.4.7 Boot Section

Construct of not less than 5 mm 3/16 inch commercial hot rolled mild steel plate in heavy angle frame with curved and renewable bottom plate and renewable internal loading leg, both built of not less than 5 mm 3/16 inch commercial hot rolled mild steel plate, and flanged inlet. Mount take-up and foot terminal bearing on one side of the boot in a bolted removable side panel so the foot shaft and sprocket may be removed through the side of the door. Bolt end panels so they are removable for cleanout and inspection.

2.11.4.8 Electric Motor

 Totally enclosed, fan cooled, high torque, [_____] volt, three phase, 60 Hz, not less than [_____] kW hp as specified under the paragraph MOTORS AND DRIVES in this section, direct connected by means of flexible coupling to a reduction gear unit having alloy steel herringbone or helical gears and antifriction bearings enclosed in oiltight housing. Provide an adjustable base for motor and reduction gear unit. Drive from the output speed shaft of the reduction gear to the elevator head shaft shall be by means of finished steel roller chain conforming to ASME B29.100 running over cut tooth sprockets conforming to ASME B29.100 complete with steel plate chain guard. Roller chain attachments shall conform to ASME B29.100.

2.11.4.9 Anchoring Brackets

Provide steel brackets as indicated at intervals for anchoring elevator to increase rigidity.

2.11.4.10 Discharge Chute

Construct discharge chute to ash silo of not less than 10 mm 3/8 inch thick steel plate.

2.11.5 Ash Storage Silo

[_____] meters feet in diameter with [_____] meters feet high walls with a live bottom and flyash storage capacity of not less than [_____] Mg tons,
based on ash bulk density of 640 kg per cubic meter 40 pounds per cubic foot for volumetric sizing. Structural joints shall be dusttight and watertight. Provide columns, beams, bracing, and other structural members as required for complete erection of silo and accessories. Live storage capacity shall allow for 20 degree angle of repose from silo outlet. Height of silo storage shall not be more than twice the diameter. Provide a minimum of one meter 3 feet of freeboard above the ash level. Design of support steel shall be approved by the ash system supplier. Design silo in accordance with the Uniform Building Code. The design shall take into account seismic load, wind load, snow load, equipment loads and an ash bulk density of 1120 kg per cubic meter 70 pounds per cubic foot. Ash silo support shall be free standing and shall be of sufficient height to allow gravity discharge of ash through the rotary ash conditioner to a [truck] [railroad car]. Provide access to the stair tower with intermediate platforms at 3.66 meters 12 feet intervals which access the ash conditioner level, silo floor level and silo roof level. Platforms from adjacent structures with stair access may be provided in lieu of the stair tower, but ladders with safety cages and access platforms must be additionally provided. Provide ladder with stainless steel fall prevention device on inside of silo from manhole in top of silo to bottom of silo. Provide silo roof enclosure and unloader room enclosure each with a single one by 2 meters 3 by 7 foot access door, [_____] by [_____] meter foot double door, two windows, ventilator, [heater], insulated metal panel siding to match boiler plant walls and electrical lighting and convenience receptacles. Unloader room enclosure shall have reinforced concrete floor.]

2.11.5.1 Construction

Construct silo of steel with refractory lining or of concrete staves with steel hoops and concrete roof. Roof accessories shall include manhole, relief valve and vent filter. Bottom of silo shall be [conical, sloped a minimum of 45 degrees.] [flat with a steel plate feeding hopper in bottom of silo to funnel the ash into the inlet of the rotary vane feeder.] Provide hopper with expansion joints and sufficient poke holes with cover or cap.

2.11.5.2 Concrete Stave Silo

Construct concrete stave silo of either lightweight solid or hollow precast concrete staves with post-tensioned steel reinforcing hoops around the exterior. Mechanically measure and mix materials in concrete staves. Vibrate and shape staves under pressure and steam or air cure.

a. Wall Coating: Coat interior surface with a three-step process of a brush coat, scratch coat, and finish trowel coat of a mixture of fine sand and portland cement in accordance with silo manufacturer's recommendations. Apply each coat successively to produce a smooth interior surface. Work mixture into the formed horizontal and vertical grooves to permanently interlock the concrete staves. Brush coat the exterior surface with a double application of waterproof mixture. Mixture shall include a chemical agent for waterproofing and portland cement, sand, and water. Work coating into joints and over the steel reinforcing hoops to form a weatherproof protective coating.

b. Steel Reinforcing Hoops: Galvanized steel rods not less than 14 mm 9/16 inch in diameter with not less than 16 mm 5/8 inch rolled threads. Join hoop ends together with nuts and heavy malleable galvanized iron lugs or heavy duty galvanized steel lugs to a close tolerance for a tight fit. Electrogalvanize rods, nuts, and lugs to
ensure adequate protection against corrosion. Rods shall be high quality, metallurgically sound steel with tensile strength not less than 448 MPa (65,000 pounds per square inch (psi)), yield point not less than 276 MPa (40,000 psi), and a minimum elongation of 14 percent in 229 mm (9 inches). Reinforcing shall be sufficient to resist the maximum lateral pressure and loads imposed by the ash pressure within the silo. Hoop rods shall be structurally connected together where they pass through silo outlets on inspection frames.

c. Hollow Concrete Stave Silos: Construct silo of precast concrete staves with lateral air spaces. Cast staves from a well proportioned mix of portland cement and an expanded clay lightweight aggregate. The minimum compressive strength of the concrete at 28 days shall be 34.50 MPa (5,000 psi). Hollow staves shall be 92 mm thick by 250 mm wide by 762 mm long 3 5/8 inches thick by 10 inches wide by 30 inches long with five lateral air cores per stave, except that shorter starter staves may be used to permit the horizontal joints to be staggered.

d. Solid Concrete Stave Silos: Construct silo of solid lightweight precast concrete staves. Solid staves shall be not less than 92 mm thick and 250 mm wide by 762 mm long 3 5/8 inches thick and 10 inches wide by 30 inches long, except starter staves may be shorter. Solid staves shall be constructed from a well proportioned mix of portland cement, washed sand and gravel which is free from injurious organic impurities and contains less than 5 percent of deleterious substances. Grade fine aggregate from coarse to fine. Compressive strength of solid concrete staves at 28 days shall be 34.50 MPa (5,000 psi).

2.11.6 Pulse Jet Bag Filter Vent

Provide for the silo constructed of 10 gage steel plate, fitted with rain hood. Bag material shall be sateen cotton capable of withstanding not less than 91 degrees C (195 degrees F), weighing 0.33 kg per square meter (9.75 ounces per square yard), having thread count of 4 by 2 per square mm (96 by 60 per square inch) and permeability of 76 to 102 L/s per square meter at 249 Pa (15 to 20 cfm per square foot at one inch water column). Vent shall have not less than [_____] square meter feet effective cloth filtering area, with each bag having a maximum effective cloth filtering area of 0.56 square meter 6 square feet.

2.11.7 Rotary Ash Conditioner (Unloader)

Provide a complete dustless horizontal, floor mounted unloading device to discharge ashes from silo to a [truck] [railroad car]. Unloader (ash conditioner) shall include a 762 mm 30 inch diameter revolving drum which rotates about fixed spray nozzles, and shall be complete with conditioner and discharge compartments, scrapers, and other accessories as required. Unloader drum shall be constructed of steel plate not less than 10 mm 3/8 inch thick and shall be roller chain driven by a totally enclosed, fan cooled, [_____] volt, three phase, 60 Hz electric motor not less than 3.75 kW 5 hp as specified under the paragraph MOTORS AND DRIVES in this section. Unloader shall discharge the conditioned ashes to a truck through a 6 mm 1/4 inch thick steel plate chute. The unloader shall be designed to eliminate most dust in unloading ash from the ash silo. An unloader that utilizes screws as a means of mixing is unacceptable. The dustless unloader shall add water to the ash, but not to the extent that there is free or surplus water running or dripping from the ash after discharge. Discharge ash shall be in a semi-fluid, loose, free flowing condition.
2.11.8 Fluidizing System

Provide on the silo floor to ensure a constant and uniform feed of ash through the silo discharge outlet. System shall consist of a series of diffuser modules, a conical diffuser hood, designed to support the total weight of ash when the silo is full, and compressed air piping. Each diffuser module shall be mounted on the silo floor using sloped concrete pads. System shall operate from the plant air system. Provide pressure reducing valves, safety valves, and controls for a complete system.

2.11.9 Control Panel and Controls

Provide a semi-automatic control system for the ash handling system[ as indicated]. Provide a centrally controlled operation, with auxiliary local operation, and a monitoring control system with graphic display for the ash conveying system. Provide local control stop-start pushbuttons and indication stations for chain drag conveyor, screw conveyors, bucket elevator, and rotary ash conditioner. Ash handling system manufacturer shall provide measuring devices, status switches, solenoid valves, and auxiliary parts necessary to safely control and operate the system. Provide related electrical work required to operate the ash handling system.[ Ash handling system manufacturer shall provide detailed control logic diagrams to the manufacturer of the digital process control and data acquisition system specified under Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS.]

2.11.9.1 Control Panel

Provide a [separate control panel] [subpanel mounted in the main plant control panel] of NEMA 12 construction, centrally located in the main plant control room. Panel front shall include a system graphic display as indicated. Display shall be approximately to scale and painted with an industrial acrylic enamel. Outline items with 3 mm 1/8 inch wide black lines. Lettering shall be on engraved plastic screwed to the front of the panel, with white letters on a black background. Provide controls for operation on [_____] volt, [_____] phase, 60 Hz a.c. Panel shall be complete with an annunciator and interlocks, relays, switches, running and safety lights, and auxiliary parts necessary to safely control and operate the system. Items located in the door shall be dusttight and oil tight with push-to-test indicating lights being of the transformer type. Control relays shall be 10 amp, 600 volt class with convertible contacts. Provide and mark terminals for connections with the exception of the neutral. Panel shall contain [_____] percent spare terminals. Wiring shall be No. 14 AWG Type THHN stranded. Neutral wire shall be white and other wiring of 120 volts or less shall be color coded and labeled. Provide a plastic wire duct of sufficient size to provide [_____] percent cross sectional spare. Wiring shall be in accordance with the requirements of NFPA 70.

2.11.9.2 Control Panel Devices

a. Control panel shall include the following indicating lights and color:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>

<td>green</td>
</tr>
</tbody>
</table>
b. Provide momentary contact pushbuttons or selector switches for the following:

1. System - START (3 required)
   - Bucket elevator
   - Chain drag conveyor
   - Screw conveyors

2. System - STOP (red head)

c. Provide sensors such that the following items can be alarmed on an ash handling system control panel annunciator.

1. Ash silo - HIGH LEVEL
2. Bucket elevator - EMERGENCY SHUTDOWN
3. Screw conveyor - EMERGENCY SHUTDOWN
4. Chain drag conveyor - EMERGENCY SHUTDOWN
5. Silo vent filter - OFF
6. Plugged Hopper

d. Provide auxiliary devices required for the control functions above and laminated plastic name plates for devices on the panel front.

e. Provide local control panel for operating and indication of the rotary ash conditioner with the following functions:

1. Power - ON (red)
2. Water - ON/OFF
3. Ash feeder - ON/OFF
4. Rotary ash conditioner - START/STOP/JOG
5. Normal Stop
6. Wash out - START/STOP
7. Emergency Stop

f. Provide control panel mounted at grade level for remote operation of the rotary ash conditioner with the following functions:
(1) Rotary ash conditioner - START/STOP

(2) Normal stop

(3) Emergency stop

2.12 ASH HANDLING SYSTEM (PNEUMATIC)

******************************************************************************
NOTE: Choose this article and its paragraphs and subparagraphs or the above article ASH HANDLING SYSTEM (MECHANICAL) and its paragraphs and subparagraphs.
******************************************************************************

2.12.1 System Requirements

Provide a complete integrated, pneumatic, automatic sequencing, ash handling system with air intakes, material intakes, ash doors and enclosures, iron alloy conveyor line, fittings, rotary slide gates, primary and secondary materials separators, tertiary bag filter, [steam exhauster,] [electric motor driven positive displacement blower (mechanical exhauster,)] [air washer,] silo vent filter, ash silo, rotary ash conditioner, and any other equipment that may be necessary for a complete pneumatic ash handling system. Provide related electrical work required to operate the ash handling system. Design system so that the ash silo is never placed under a partial vacuum.

2.12.2 System Type

System shall be of the intermittent vacuum type, whereby the vacuum is interrupted permitting periodic discharge of collected materials into the silo on a programmed time cycle. System shall have sufficient air velocity to pick up ash that may be deposited in the pipe.

2.12.3 Hoppers

System shall receive, and on a sequenced basis convey to the ash silo, ash from the stoker fired boiler ash storage hoppers, siftings hoppers, soot hoppers, baghouse hoppers, and other pollution control equipment hoppers. Convey from only one pickup point at a time.

2.12.4 Discharge

Discharge ash into the ash storage silo in a dry condition. Arrange silo equipment for disposal of conditioned ash to trucks. Operation shall be as nearly dustless as possible.

2.12.5 Maximum Noise Level

The noise level of the operation shall not exceed 85 decibels sound pressure level 1.52 meters 5 feet from the equipment in any direction.

2.12.6 Ash Storage Hopper

Provide a dry storage hopper for each boiler to receive and store bottom ash as it is discharged from the traveling grate. Hopper shall be compatible with the grate ash discharge enclosure as specified under the paragraph COAL STOKERS and shall have a net volume to receive and store
material for an 8 hour period at maximum boiler output. Size hopper for mean ash level for one meter 3 feet below the step floor with ash density of 640 kg per cubic meter 40 pounds per cubic foot for volumetric sizing.

2.12.6.1 Construction

Not less than 6 mm 1/4 inch thick, ASTM A36/A36M, steel plate, dust tight, floor supported steel structure with refractory lining. Provide required steel columns, beams stiffeners and cross bracing. Bolt top section of the hopper to the stoker support steel. Design load of hopper shall be based on 1120 kg per cubic meter 70 pounds per cubic foot. Slope sides at not less than 45 degrees from the horizontal to maintain positive feed to the outlet.

2.12.6.2 Refractory Materials

As recommended by the manufacturer; the minimum total thickness of the refractory and insulating block lining shall not be less than 178 mm 7 inches. Refractory shall be minimum of 114 mm 4 1/2 inches.

2.12.6.3 Discharge Doors or Gates

Provide each hopper with refractory lined, dust tight, water cooled, vertical lift doors, of an opening size not less than 560 by 560 mm 22 by 22 inches. Each door shall be [air-cylinder operated] [chain wheel operated]. [Provide intermediate positioning capability with air cylinder operators.] Provide each door with guide rollers and support arms to ensure smooth operation without binding. When doors are vertical the minimum number of rollers shall be 4; for a sloping surface, the minimum number of rollers shall be 6.

2.12.6.4 Hopper Lift Door Enclosure

Provide not less than 6 mm 1/4 inch thick steel, dust tight, enclosure, for each vertical lift door. Match enclosure to housing of the clinker crusher and make it large enough to enclose the outlet and the vertical lift door. Provide hinged inspection and cleanout door on the front of the enclosure.

2.12.6.5 Hopper Access Door

Provide hinged access door on one side wall of each hopper. Door shall be cast iron, air tight swing-away locking type with refractory lining. Install door so that it is convenient and easy to use.

2.12.7 Clinker Crusher

Provide a clinker crusher mounted under each hopper discharge outlet, below the vertical lift door enclosure, capable of reducing clinkers from bottom ash to a maximum size of 50 mm 2 inches at a rate not less than the conveyer system capacity.

2.12.7.1 Construction

Single roller crusher unit with extra heavy housing, outboard bearings sealed against grit infiltration, motor and drive. Housing shall be 15 mm 1/2 inch thick. Crusher rollers shall have replaceable cam segments (teeth) with a minimum Brinell hardness of 450. Each cam tooth shall be designed to permit resurfacing with hard material. Stationary heavy cast iron or manganese steel abrasion resistant wear plates, of a Brinell hardness not less than 350, shall be mounted about the crusher rollers.
Cam shaft rotational speed shall not exceed 20 rpm.

2.12.7.2 Fluid Gear Drive

Crushers shall be driven by a fluid gear drive including a totally enclosed, fan cooled, [_____] volt, three phase, 60 Hz electric motor not less than 3.75 kW 5 hp, as specified under the paragraph MOTORS AND DRIVES in this section, fluid coupling and reduction gear, integrally mounted in dust and oil tight enclosures. Fluid drive shall protect the unit from excessive shock. Drive shall automatically reverse when stalled; crusher shall reverse and move forward three times and, after the third time, shall shut down and alarm when still stalled.

2.12.8 System Valving

2.12.8.1 Side Intake Valve for Fly Ash

Provide side intake valve for fly ash collection at each hopper, including dust collection hoppers and rear pass hoppers, and other collection points. Side intake valve shall be pneumatically opened, spring closed, totally enclosed disc valve of cast iron construction with wearing surfaces of Brinell hardness not less than 350. Provide valve complete with flanged inlet hopper, handhole with gasketed cover and clamp and couplings. Side intake valve shall feed ash to conveyor line on an angle, thus permitting air to mingle with the ash in the proper proportion to eliminate clogging. Valves shall provide positive and automatic air tight shutoff and dust tight pickup. Valve shall close on failure of operating air and before the discharge cycle of the intermittent conveyor operation. A full load regulating switch shall control each valve to prevent overloading of the conveyor system.

2.12.8.2 Rotary Valve Intakes for Bottom Ash

Provide a rotary valve, designed for regulating bottom ash to the conveyor pipeline, under each crusher. Valve shall provide intake isolation and prevent overfilling or plugging of the conveyor line. Construction of valve shall be of cast iron with wearing surfaces of Brinell hardness not less than 350. Valve shall be pneumatically operated.

2.12.8.3 Air Intake

Provide spring loaded, swing disc, check valve type air intake, designed for air induction, at the end of each conveyor branch. When intake is located exposed to the weather, provide a rain hood.

2.12.8.4 Isolating Valves (Line Valves)

Provide an air operated, totally enclosed rotary slide gate isolating valve at each branch pipe line connection to prevent air flow through an unused branch line. Construct valve of abrasion resistant metal, machined and fitted to ensure a vacuum tight fit and guard against leakage and excessive maintenance. Provide purge air connection and a solenoid valve in the valve housing or cavity for purging the gate cavity of ash.

2.12.8.5 Silo Discharge Valve

Provide a rotary feeder for discharging bottom ash and fly ash from the ash silo. Feeders shall be of ductile iron or cast steel and shall be complete with motor, motor support, chain drive, and necessary guards. Chain shall
be driven through a torque limiting clutch on the driven sprocket equipped with electric cutout switch and alarm. [Feeder shall have spring-loaded hinged bypass plate to permit passage of clinkers.] Inlet and outlet flanges shall be standard drilled pipe flange. Rotor blades and sealing arrangement shall be the manufacturer's standard for the intended service. When rotors are equipped with adjustable tips, provide a service door in the body of the valve for tip adjustment. Provide packing gland type shaft seals with suitable packing materials. Shaft bearings shall be outboard sealed ball bearings. Periphery seals shall be such that a complete seal is accomplished at a differential of [_____] inches of water static pressure.

2.12.9 Ash Conveyor Pipe and Fittings

Abrasion resistant cast iron alloy free of blowholes and other defects and suitable for use in ash conveying systems.

2.12.9.1 Conveyor Piping

Centrifugally cast, abrasion resistant cast iron alloy pipe with a Brinell hardness of not less than 280.

2.12.9.2 Elbows and Fittings

Cast iron alloy with a Brinell hardness of not less than 350 and shall have renewable wearbacks not less than 25 mm one inch thick.

2.12.9.3 Hangers and Supports

Provide adjustable roller supports and pipe hangers to properly support the pipe. System supplier shall design support system and furnish supports.

2.12.9.4 Contractor's Option

At the Contractor's option, conveyor pipe handling only fly ash may be Schedule 80 black steel pipe in lieu of the iron alloy pipe; however outlet fitting, elbows, tees and laterals shall be cast iron alloy with wearbacks and the pipe for a distance of one meter 3 feet after the cast iron alloy fittings shall be cast iron alloy pipe. Provide pipe with couplings or split flanges, bolts and gaskets, rated not less the 530 degrees C 1000 degrees F.

2.12.9.5 Expansion Joints

Stainless steel bellows type with abrasion resistant liners of a Brinell hardness not less than 350 or slip tube expansion joints fabricated of cast iron alloy, of Brinell hardness not less than 280, machined for smooth sliding fit with its mating part to absorb system thermal movement and shock loads.

2.12.10 Vacuum Air Piping

Provide from the secondary separator to the tertiary bag filter and from the tertiary bag filter to the [steam exhauster] [mechanical exhauster] not less than 10 gage, ASTM A211, spiral welded, vacuum air piping with ASTM A1011/A1011M, standard radius, mitered 10 gage elbows.
2.12.11 Compressed Air Piping and Accessories

Provide pressure reducing valves, safety valves, pressure gages, manual plug or ball valves, compressed air piping, as specified under the paragraph PIPING in this section and other items required for a complete, operable, pneumatic system.

2.12.12 Primary Ash Receiver-Separator and Secondary Ash Separator

Provide on top of ash silo two stages of receiving and separating, with each stage a complete self-contained unit with efficient dust and air separation and gravity dump bottom gates to open with interruption of vacuum and discharge into a silo. Design system so that suction is positively shut off from the receiver during its dumping period, so that no dust can be sucked out through the exhaust while the discharge of the receiver is open or opening. Air from the primary receiver shall enter the external secondary separator which shall remove approximately 85 percent of the dust not collected by the primary receiver. Combined efficiency of the primary and external secondary separators shall be not less than 95 percent. Provide completely contained gate assemblies in a dust-tight enclosure fitted with access doors large enough to remove entire gate assembly. Provide receivers of hard, abrasion-resistant, cast alloy iron with a Brinell hardness of not less than 500 constructed as described below:

2.12.12.1 Primary Receiver-Separator

Not less than [914] [1219] mm [36] [48] inches inside diameter with cast sections 19 mm 3/4 inch thick and 50 mm 2 inch thick impingement section. Cylinder, along with the discharge hopper shall be of segmental bolted construction. Construct receiver to ensure dropping of the maximum quantity of solids from the transporting air. Provide carbon steel outlet pipe and discharge gate. Receiver-separator shall have an internal baffle assembly to prevent re-entrainment of ash.

2.12.12.2 Secondary Separator

Not less than [406] [508] [610] mm [16] [20] [24] inches inside diameter of not less than 8 mm 5/16 inch thick one piece construction with at least 13 mm 1/2 inch thick inlet wear section. Design the receiver to minimize the carry-over of fly ash into the [air washer] [tertiary bag filter]. Separator shall have an internal baffle assembly to prevent re-entrainment of ash once it has fallen into the collection hopper of the separator.

2.12.12.3 Dust Tight Enclosure

Support primary and secondary receivers on not less than 6 mm 1/4 inch thick, dust tight, carbon steel support boxes with hinged access doors or removable panels on each side for servicing the receiver swing gates. Provide support box with airtight roller bearings, hinged, counterweighted swing gates with removable neoprene seals. Gates may, as an option, be air cylinder operated gates in lieu of the counterweighted gates.

2.12.13 Mechanical Exhausters

**************************************************************************
NOTE: When environmental restraints, availability of steam or water or economics preclude the use of steam exhausters, use a mechanical (electrical...
driven) exhauster with a pulse jet bag filter to produce the required system air flow.

Provide two, V-belt drive, positive displacement blowers with electric motors and accessories with each capable of producing a vacuum of at least 41 kPa 12 inches of mercury and with the air flow necessary for handling ashes through the system. One blower (exhauster) shall be used as a prime mover and the other as a standby unit.

2.12.13.1 Isolation Gates

Each exhauster shall include a manual bolt-up type gate for isolation and crossover. Gates shall include limit switches for status indication.

2.12.13.2 Accessories

Exhauster shall be complete with belt guard, air inlet silencer, air discharge snubber, support stand, expansion joint on inlet and outlet, belt and shaft guards, high temperature safety switch and vacuum relief valve.

2.12.13.3 Electric Motor

Totally enclosed, fan cooled, [_____] volt, three phase, 60 Hz, as specified under the paragraph MOTORS AND DRIVES in this section.

2.12.13.4 Noise Level

Noise level shall not exceed 85 dBA sound pressure level at 1.50 meters 5 feet above the floor and 1.50 meters 5 feet from the blower in any direction.

2.12.14 Bag Filter

Provide a pulse jet self-cleaning bag filter assembly to provide a tertiary means of removing fine ash particles from the conveying air system. Installation of this assembly shall be on the silo roof, downstream of the two-stage cyclone type mechanical separator so as to permit a combined minimum separating efficiency of 99.5 percent (by weight), with a guaranteed outlet emission less than 0.005 grains particulate per dry standard cubic foot of exhaust air. The filter assembly shall include a main housing, bag assemblies, bag cleaning mechanism, discharge gate and control panel. This equipment shall be integrated with cyclone type separators, vacuum breakers, vacuum switches and conveying system controls as specified elsewhere. Bag filter shall be capable of operating at 25 percent above the system design vacuum. Filter housing shall be capable of withstanding a vacuum of 96 kPa 28.5 inches of mercury.

2.12.14.1 Cloth Area

Size filter on the basis of not greater than 25.40 L/s 5 acfm of air per square meter foot of cloth area. Calculate acfm on the maximum system air flow.

2.12.14.2 Filter Construction

Welded construction housing or body of, ASTM A36/A36M plate with an upper clean gas plenum, bag compartment, hopper bottom, internal access platform and support structure. Plate thickness shall be a minimum of 6 mm 1/4 inch
with exception of the plenum tube sheet, which shall be a minimum of \(13 \text{ mm} \) \(1/2 \text{ inch}\) thick. Housing shall be cylindrical, having a minimum diameter of \([_____] \text{ meter feet} \) \([____]\) \text{ mm inches}\.

a. Upper Gas Plenum: Dished head, with flanged inlet and discharge connections, tube sheet, venturis and blow tubes. These appurtenances shall be welded airtight. Venturis shall be fabricated from carbon steel having a minimum thickness of 16 gage. Minimum centerline spacing between venturis shall be \(191 \text{ mm} \) \(7 1/2 \text{ inches}\). A series of blow tubes shall be employed over the venturis. Each tube shall extend through the wall of the dished housing and be manifolded externally. Include support of external manifold.

b. Bag Compartment: Of sufficient height to allow internal access by maintenance personnel. Base of this compartment shall include a metal platform supported by steel angle cross bracing. Platform shall extend over the entire base area of the compartment. Sidewall of this compartment shall include a hinged access door with locking handle. Door shall be gasketed and the opening shall be a minimum of \(762 \text{ mm high by 406 mm wide} \) \(30 \text{ inches high by 16 inches wide}\).

c. Hopper Bottom: Conical having a slope angle of not greater than 45 degrees with a flanged outlet.

d. Access Platform: With [stairs] [ladder] and safety handrail for external mounting to the filter housing. Mount platform at a height to allow convenient access through the hinged door located on the bag compartment sidewall. Platform floor area shall be not less than \(1.40 \text{ square meter 15 square feet}\).

e. Provide filter housing with required columns and cross bracing to support structure from the silo roof to discharge directly into the silo. This support shall be of sufficient height to allow convenient installation of the filter discharge gate.

### 2.12.14.3 Discharge Gate

Air cylinder operated swing disc type. A rotary feeder type gate is not acceptable. When in the open position, gate disc shall swing out of the path of material being discharged. Both gate disc and seal shall be replaceable. A handhole shall be included on the gate housing for easy access to both disc and seat.

### 2.12.14.4 Bag Cleaning Mechanism

Provide venturis, blow tubes, manifold, solenoid air valves, diaphragm valves and differential pressure switch conveniently located at the filter unit. Operation of these devices shall be on a sequential basis (adjustable setting) to allow periodic surges of compressed air through the filter venturi sections. Compressed air requirement for bag cleaning shall be not greater than \(7.08 \text{ cubic meter per second at 690 kPa (gage)} \) \(15 \text{ scfm at 100 psig}\).

### 2.12.14.5 Bag Assemblies

Each filter bag assembly shall include the filtering media, wire retainer and stainless steel clamping device. Filter bag shall slide over the retainer and both shall be clamped to the venturi by a stainless steel common band clamp. Top portion of the retainer shall have inside dimension
equal to the mating venturi to ensure a tight fit.

a. Retainers: Cage type construction, fabricated from No. 1018 rounds or equal, using minimum of 3 mm 1/8 inch diameter rounds on vertical strands and 5 mm 3/16 inch diameter rounds on horizontal strands. Coat retainer with nickel and zinc after completion of fabrication.

b. Filter Bags: Not less than 474 g per square meter 14 ounces per square yard felted material. Provide felted polyester or dacron bags when operating temperatures are below 135 degrees C 275 degrees F. Provide Nomex bags or bags of similar abrasion and temperature resistant qualities when temperatures are above 135 degrees C 275 degrees F but not greater than 218 degrees C 425 degrees F. Bags shall have an exterior finish to aid in dust release.

2.12.14.6 Control Panel

Provide NEMA 4, wall mounted control panel to sequentially control the bag cleaning and dump operations of the filter unit. Locate panel near the filter unit to permit easy field adjustment of sequence timers. Panel overall dimensions shall be not less than 610 mm wide by 762 mm high by 200 mm deep 24 inches wide by 30 inches high by 8 inches deep. As a minimum, the panel instrumentation shall include a dump cycle timer, pulse valve sequence timer, two high differential pressure delay relays, alarm relay, time delay relay, manual/auto selector switch, pulse valve "ON" indicating light, high differential indicating light, terminal blocks and internal wiring. Welds and scratches of panel enclosure shall be free from blemishes. Paint panel exterior with manufacturer's standard enamel. Interior of panel shall be white enamel. Shop inspect panel and test prior to shipment.

2.12.14.7 Vacuum Breakers

Provide two air cylinder operated vacuum breakers. One shall be a pop-up or single ported type for installation in the air line between the secondary separator and tertiary bag filter. Second breaker shall be a three-ported type for locations in the air line between the tertiary bag filter and the exhauster. Each breaker shall use a disc type gate or equivalent to ensure full closure of the gate against its mating seat.

2.12.15 Steam Exhauster

**********************************************************************************************************************************************
NOTE: The steam exhauster system requires 0.32 kg 2500 pounds of steam per second hour for a 150 mm 6 inch system (8 to 23 Mg 9 to 25 tons per hour) and 0.44 kg 3500 pounds of steam per second hour for an 200 mm 8 inch system (13.6 to 31.75 Mg 15 to 35 tons per hour) and approximately 1.89 L/s 30 gpm of water to the air washer. A steam condenser, air washer and silencer should be used when the steam exhauster is used and should not be used when a mechanical exhauster is specified.
**********************************************************************************************************************************************

Provide a steam jet exhauster of cast iron construction with venturi throat of the high efficiency type for producing the vacuum necessary for handling ashes through the system. Make inlet air connection on the steam jet exhauster through a special spiral fitting so that the air enters the
exhauster unit tangentially, avoiding direct impingement on the nozzle. Provide a unit capable of producing a vacuum of at least 40.56 kPa 12 inches of mercury column at shutoff and not requiring more than [0.32] [0.44] kg of steam per second at 690 kPa (gage) [2500] [3500] pounds of steam per hour at 100 psig.

2.12.16 Steam Condenser, Air Washer and Silencer

******************************************************************************
NOTE: The steam exhauster system requires 0.32 kg 2500 pounds of steam per second hour for a 150 mm 6 inch system (8 to 23 Mg 9 to 25 tons per hour) and 0.44 kg 3500 pounds of steam per second hour for an 200 mm 8 inch system (13.6 to 31.75 Mg 15 to 35 tons per hour) and approximately 1.89 L/s 30 gpm of water to the air washer. A steam condenser, air washer and silencer should be used when the steam exhauster is used and should not be used when a mechanical exhauster is specified.
******************************************************************************

Provide a double stage cyclone type steam condenser, which also extracts the remaining solids from the steam-air system. Construct steam condenser body of hard metal castings not less than 16 mm 5/8 inch thick suitable for this special service except that the inlet connector shall be not less than 19 mm 3/4 inch thick. Castings shall have a Brinell hardness of not less than 250. Other metal used in the condenser shall be at least 6 mm 1/4 inch thick steel with the top not less than 13 mm 1/2 inch thick steel plate. Provide drain connection not less than 76 mm 3 inches and water connection not less than 38 mm 1 1/2 inches. Provide silencer as required for quiet operation.

2.12.17 Ash Storage Silo

******************************************************************************
NOTE: Use enclosures for silo roof and unloader in climates where protection of equipment and personnel from the weather is desired.
******************************************************************************

[_____] meters feet in diameter with [_____] meters feet high walls with a live bottom and flyash storage capacity of not less than [_____] Mg tons, based on ash bulk density of 640 kg per cubic meter 40 pounds per cubic foot for volumetric sizing. Structural joints shall be dusttight and watertight. Provide columns, beams, bracing, and other structural members as required for complete erection of silo and accessories. Live storage capacity shall allow for 20 degree angle of repose from silo outlet. Height of silo storage shall not be more than twice the diameter. Provide a minimum of one meter 3 feet of freeboard above the ash level. The design of the support steel shall be approved by the ash system supplier. Design silo in accordance with the Uniform Building Code. The design shall take into account seismic load, wind load, snow load, equipment loads and an ash bulk density of 1120 kg per cubic meter 70 pounds per cubic foot. Ash silo support shall be free standing and shall be of sufficient height to allow gravity discharge of ash through the rotary ash conditioner to a [truck] [railroad car]. Provide access stair tower with intermediate platforms at 3.66 meters 12 foot intervals for access to ash conditioner level, silo floor level and silo roof level. Platforms from adjacent structures with stair access may be provided in lieu of the stair tower, but ladders with
safety cages and access platforms must be additionally provided. Provide ladder with stainless steel fall prevention device on inside of silo from manhole in top of silo to bottom of silo. [Provide silo roof enclosure and unloader room enclosure each with single one by 2 meter 3 by 7 foot access door, [_____] by [_____] meter foot double door, two windows, ventilator, [heater], insulated metal panel siding to match boiler plant walls and electrical lighting and convenience receptacles. Unloader room enclosure shall have reinforced concrete floor.]

2.12.17.1 Construction

Construct silo of steel with refractory lining or of concrete staves with steel hoops and concrete roof. Roof accessories shall include manhole, relief valve and vent filter. Bottom of silo shall be [conical, sloped a minimum of 45 degrees.] [flat with a steel plate feeding hopper in bottom of silo to funnel ash into inlet of rotary vane feeder.] Provide hopper with expansion joints and sufficient poke holes with cover or cap.

2.12.17.2 Concrete Stave Silo

Construct concrete stave silo of either lightweight solid or hollow precast concrete staves with post-tensioned steel reinforcing hoops around the exterior. Mechanically measure and mix materials in concrete staves. Vibrate and shape the staves under pressure and steam or air cure.

a. Wall Coating: Coat interior surface with a three-step process of a brush coat, scratch coat, and finish trowel coat of a mixture of fine sand and portland cement in accordance with the silo manufacturer's recommendations. Apply each coat successively to produce a smooth interior surface. Work mixture into the formed horizontal and vertical grooves to permanently interlock the concrete staves. Brush coat the exterior surface with a double application of waterproof mixture. Mixture shall include a chemical agent for waterproofing and portland cement, sand, and water. Work coating into joints and over the steel reinforcing hoops to form a weatherproof protective coating.

b. Steel Reinforcing Hoops: Galvanized steel rods not less than 14 mm 9/16 inch in diameter with not less than 16 mm 5/8 inch rolled threads. Join hoop ends together with nuts and heavy malleable galvanized iron lugs or heavy duty galvanized steel lugs to a close tolerance for a tight fit. Electrogalvanize rods, nuts, and lugs to ensure adequate protection against corrosion. Rods shall be high quality, metallurgically sound steel with tensile strength not less than 448 MPa 65,000 psi, yield point not less than 276 MPa 40,000 psi, and a minimum elongation of 14 percent in 229 mm 9 inches. Reinforcing shall be sufficient to resist the maximum lateral pressure and loads imposed by the ash pressure within the silo. Structurally connect hoop rods that pass through silo outlets on inspection frames together.

c. Hollow Concrete Stave Silos: Construct silo of precast concrete staves with lateral air spaces. Cast staves from a well proportioned mix of portland cement and an expanded clay light weight aggregate. Minimum compressive strength of the concrete at 28 days shall be 34.50 MPa 5,000 psi. Hollow staves shall be 92 mm thick by 250 mm wide by 762 mm long 3 5/8 inches thick by 10 inches wide by 30 inches long with five lateral air cores per stave, except that shorter starter staves may be provided to permit the horizontal joints to be staggered.

d. Solid Concrete Stave Silos: Construct silo of solid lightweight
precast concrete staves. Solid staves shall be not less than 92 mm thick and 250 mm wide by 762 mm long 3 5/8 inches thick and 10 inches wide by 30 inches long, except starter staves may be shorter. Solid staves shall be constructed from a well proportioned mix of portland cement, washed sand and gravel which is free from injurious organic impurities and contains less than 5 percent of deleterious substances. Grade fine aggregate from coarse to fine. Compressive strength of solid concrete staves at 28 days shall be 34.50 MPa 5,000 psi.

2.12.18 Pulse Jet Bag Filter Vent

**************************************************************************
NOTE: Consult the manufacturer of ash handling equipment for venting requirements.
**************************************************************************

Provide for the silo constructed of 10 gage steel plate, fitted with rain hood. Bag material shall be sateen cotton capable of withstanding not less than 91 degrees C 195 degrees F, weighing 0.33 kg per square meter 9.75 ounces per square yard, having thread count of 4 by 2 per square mm 96 by 60 per square inch and permeability of 76 to 102 L/s per square meter 15 to 20 cfm per square foot at 249 Pa one inch water column. Vent shall have not less than [_____] square meter feet effective cloth filtering area, with each bag having a maximum effective cloth filtering area of 0.56 square meter 6 square feet.

2.12.19 Rotary Ash Conditioner (Unloader)

Provide a complete dustless horizontal, floor mounted unloading device to discharge ashes from silo to a [truck] [railroad car]. Unloader (ash conditioner) shall include a 762 mm 30 inch diameter revolving drum which rotates about fixed spray nozzles, and shall be complete with conditioner and discharge compartments, scrapers, and other accessories as required. Unloader drum shall be constructed of steel plate not less than 10 mm 3/8 inch thick and shall be roller chain driven by a totally enclosed, fan cooled, [_____] volt, three phase, 60 Hz electric motor not less than 3.75 mm 5 hp as specified under the paragraph MOTORS AND DRIVES in this section. The unloader shall discharge the conditioned ashes to a truck through a 6 mm 1/4 inch thick steel plate chute. Unloader shall be designed to eliminate most dust in unloading ash from the ash silo. An unloader that utilizes screws as a means of mixing is unacceptable. Dustless unloader shall add water to the ash, but not to the extent that there is free or surplus water running or dripping from the ash after discharge. Discharge ash shall be in a semi-fluid, loose, free flowing condition.

2.12.20 Fluidizing System

**************************************************************************
NOTE: Delete fluidizing system when not necessary.
**************************************************************************

Provide a fluidizing system on the silo floor to ensure a constant and uniform feed of ash through the silo discharge outlet. System shall consist of a series of diffuser modules, a conical diffuser hood, designed to support the total weight of ash when the silo is full, and compressed air piping. Each diffuser module shall be mounted on the silo floor using sloped concrete pads. System shall operate from the plant air system. Provide pressure reducing valves, safety valves, and controls for a
2.12.21 General Controls

Provide a centrally controlled operation, with auxiliary local operation, and a monitoring control system with graphic display for the ash conveying system. Provide local control stop-start push buttons and indication stations for chain drag conveyor, screw conveyors, bucket elevator, and rotary ash conditioner. Ash handling system manufacturer shall provide measuring devices, status switches, solenoid valves, and auxiliary parts necessary to safely control and operate the system. Provide related electrical work required to operate the ash handling system. Ash handling system manufacturer shall provide detailed control logic diagrams to the digital process control and data acquisition system manufacturer specified under Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS.

2.12.21.1 Functions

Provide capability to perform any of the following functions from the operator interface console specified under Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS.

a. System Start
b. System Stop
c. Auto/Manual/Index Mode of Operation Selection
d. Selection of Bypass of any Boiler
e. Manual Index to any Intake
f. Selection of Ash Silo for Baghouse Ash

2.12.21.2 Status Indicators

Provide sensors or contact closures for status indication on the operator interface console specified under Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS, or on the annunciator over the central control panel, for the following:

a. Conveyor On
b. Unit On (one required for each unit)
c. Final Line Purge On/Complete
d. Baghouse Ash to Ash Silo

2.12.21.3 Alarms

Provide sensors such that the following items can be alarmed on the operator interface console specified under Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS, or on the annunciator over the central control panel:

a. Blower Failure
b. Blower High Temperature
c. Bag Filter Failure  
d. Bag Filter High Differential  
e. Bag Filter Off  
f. Plugged Hopper  
g. Conveying Complete  
h. Clinker Crusher Abnormal Shutdown (1 required for each boiler)  
i. Low Conveying Air  
j. High Conveying Vacuum  

2.12.21.4 Vacuum Transmitter  
To measure conveying system vacuum. Range shall be zero to 101 kPa 30 inches mercury with 4 to 20 mA dc linear transmitter output. Display vacuum on the operator interface console specified under Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS.

2.12.22 Controls Operation  
2.12.22.1 Automatic  
Normally operated in the automatic mode. Automatically sequence through automatic intakes except the clinker crusher for each boiler after the system is started. When a unit is not in operation, selecting the "bypass mode" shall cause intakes on that unit to be skipped. For Manual operation, "index" is used to select the desired intake. As the conveying system shuts down automatically, the main conveyor line shall be purged for approximately one minute to remove ash remaining in it.

2.12.22.2 Switching  
Sequence system under the control of vacuum switches and timers. Maximum vacuum will be when system is conveying material. When a hopper is empty, vacuum will drop and a "no load" vacuum switch shall cause the system to shift to the next intake. Prevent premature sequencing due to momentary low vacuum with a timer. When a plugged hopper occurs, vacuum will be between "no load" and normal value. Provide a timer to allow packed or arched material to break loose before alarming the condition.

2.12.22.3 Valves  
Provide solenoid air valves for each air operated device, timers, contactors, relays and devices and equipment required for system control, measuring and operation. Identify each device with an engraved plastic identification plate [in accordance with a system graphic display] provided by the ash handling system supplier.

2.12.22.4 Bottom Ash Hopper Local Control Stations  
Provide a wall mounted, NEMA 250, control station at each bottom ash hopper with front access door, lock, circuit breakers, selector switches, lights and push buttons.
a. Selector Switches:
   (1) Crusher: three position switch, "Reverse (momentary)-Off-Forward"
   (2) Rotary Valve Intake: two position switch "Open-Close"
   (3) Vertical Lift Door: position switch "Open-Intermediate-Close"

b. Emergency "Stop" Pushbutton, For clinker crusher, with manual reset.
   (1) "On-Manual"
   (2) "Crusher Stalled"

2.13 AIR POLLUTION CONTROL EQUIPMENT

**************************************************************************
NOTE: Mechanical cyclone collectors should be used
for soot blowing and as a prefilter on baghouse
fabric filters or electrostatic precipitators. The
fabric filter should be used where necessary to meet
local, state or federal regulations or statutes for
particulate emissions, when sulfur emissions are
within regional limits through the burning of low
sulfur "compliance coal." When coal containing more
than 2 percent sulfur is burned, an electrostatic
precipitator is generally more economical for
control of particulates than the fabric filters,
when sulfur emissions will meet regional
limitations. When sulfur emissions are not within
the regional limits, a scrubber with a prefilter
mechanical cyclone and possibly a baghouse filter
may be required to meet the emission limitations.
**************************************************************************

2.13.1 Mechanical Cyclone Collectors

As specified in Section 23 51 43.01 20 MECHANICAL CYCLONE DUST COLLECTOR OF
FLUE GAS PARTICULATES.

2.13.2 Fabric Filter Baghouse

As specified in Section 23 51 43.03 20 FABRIC FILTER DUST COLLECTOR OF
FLYASH PARTICULATES IN FLUE GAS.

2.13.3 Electrostatic Precipitator Filters

As specified in Section 23 51 43.02 20 ELECTROSTATIC DUST COLLECTOR OF FLUE
GAS PARTICULATES.

2.13.4 Scrubbers

As specified in Section [23 51 43.00 20 DUST AND GAS COLLECTOR DRY SCRUBBER
AND FABRIC FILTER TYPE.]
2.14 MISCELLANEOUS EQUIPMENT

2.14.1 Condensate Receiver

Provide a [horizontal] [vertical] type tank not less than [_____] meter feet [_____] mm inches in diameter by [_____] meter feet [_____] mm inches [long] [high] overall with a storage capacity of not less than [_____] liters gallons. Tank shall be constructed of welded steel plate not less than 10 mm 3/8 inch thick. Provide condensate tank with a 610 mm 24 inch diameter manway, dual gage glasses with protective guards, saddles, and other connections as indicated.

2.14.1.1 Coating

Surface blast interior of tank to bare metal and coat with a bake-on phenolic lining or corrosion resistant liner consisting of a resin and hardener suitable for immersion in water at not less than 121 degrees C 250 degrees F. Coat the exterior of the tank with one shop coat of manufacturer's standard primer rated for service of not less than 121 degrees C 250 degrees F.

2.14.1.2 Accessories

Provide the condensate receiver with the following:

a. Connections for condensate pumped return, vent, water outlet, drain, sampling outlet, level transmitter and controls.

b. [_____] mm inch vent.

c. Reflex type water gage glasses with shutoff valves and guards.

d. One, 125 mm 5 inch dial, thermometer, 10 to 149 degrees C 50 to 300 degree F range, with lagging extension type wells, for steam and water space.

e. [_____] mm inch overflow trap.

f. One high water alarm switch with stainless steel float and trim. Circuit shall close as liquid level rises. Locate switch to close circuit when water level rises to 25 mm one inch below overflow level of receiver.

g. One low water alarm switch with stainless steel float and trim. Close circuit as liquid level falls. Locate switch to close circuit when water level drops to 25 percent of the storage capacity of the storage tank.

h. Switches on a single column with valved connections to tank. Provide unions in pipe on each side of each float switch.

i. Pipe, fittings, controls, specialties, bolts, gaskets, drains, and valves, necessary for a complete unit.

j. Provide automatic control system to control level in condensate tank by modulating discharge from condensate pumps.
2.14.2 Deaerating Heater

Provide a deaerating feedwater heater with storage tank conforming to FS W-H-2904, except as modified below and to ASME BPVC SEC VIII. Tank shall be ASME Code stamped. Provide stainless steel trays. No test model will be required.

- Model A - Pressurized operation.
- Type I - Tray-type heating and deaerating element.
- Class 3 - 10 minute water storage capacity (minimum).
- Grade A - Guaranteed removal from water of dissolved oxygen in excess of .005 cubic centimeters (cc) per liter, over a ten to one load swing.

2.14.2.1 Heater Capacity

Provide deaerating heater capable of heating and deaerating makeup water consisting of [_____] kilograms per second (kg/sec) pounds per hour of softened makeup water from [_____] to [_____] degrees C F (outlet temperature).

2.14.2.2 Inlet Water Characteristics

Softened makeup water:

- Ph: [_____]  
- Total hardness (as CaCO3): [_____]  

2.14.2.3 Storage Tank

Horizontal design with steel supports [drilled for bolting] of approved design. Provide storage tank with not less than a 410 by 510 mm 16 by 20 inch minimum size manhole and cover and provide heater section with not less than a 300 by 460 mm 12 by 18 inch minimum size tray access handhole and door.

2.14.2.4 Vent Condensing Arrangement

Provide the deaerating heater with a vent condenser which shall condense the vented steam when the heater is operating at full capacity with the inlet water mixture at a temperature not exceeding 82 degrees C 180 degrees F. Construct the vent condenser, when of the direct contact type, with stainless steel baffling.

2.14.2.5 Materials

Construct trays, tray supports, water distributors, and other parts coming in contact with underaerated water or air laden steam of 430 stainless steel.

2.14.2.6 Accessories

Provide the deaerating heater unit with the following accessories:

a. Pressure relief valve: Sized in accordance with FS W-H-2904.

b. Thermometers: Two, 125 mm 5 inch dial thermometers, 10 to 149 degrees C 50 to 300 degrees F, with lagging extension type wells for the storage tank and the heater section. Provide a thermometer similar to above but with range of minus [_____] degrees C F to plus [_____] degrees C F.
for the makeup water connection.

c. Lifting attachments for the deaerator unit and the storage tank.

d. Water gage glasses: Reflex type with shutoff valve and guards.

e. Pressure gages: One 150 mm 6 inch dial compound pressure gage for the heater section with range from [_____] kPa inches of mercury (vacuum) to [_____] kPa (gage) psig.

f. Float controllers:
   (1) Inlet condensate controller
   (2) Makeup water controller
   (3) Overflow controller

g. Overflow control valve: With pneumatic controller arranged for local automatic operation.

h. Storage tank gage glass: Full height, shielded, for storage tank including shutoff valve and drain cocks.

i. Makeup water inlet control valve: With pneumatic controller.

j. Switches: For low water level alarm in the storage tank, high water level alarm, condensate pump shut-down in the storage tank, and low steam pressure alarm. Install switches on a single column with connections valved and unions provided in pipe on each side of each float switch.

k. Special tools: One set for maintenance.

l. Condensate pump reset: With stainless steel float and trim to reset pump shutdown switch on fall of liquid level in tank to [_____] mm inches below level of overflow level of storage tank.

m. Furnish pipe, fittings, controls, specialties, bolts, gaskets, drains, and valves, necessary for proper attachment of accessories and trimmings and install.

[ n. Oil separator

2.14.2.7 Connections

Provide necessary connections for condensate, steam, makeup water, removal of vented gases, vacuum breakers, discharge of deaerated water, and as required for instruments and controls.

a. Provide heater connections as follows:
   (1) [_____] mm inch steam inlet
   (2) [_____] mm inch makeup water inlet
   (3) [_____] mm inch condensate
   (4) [_____] mm inch high pressure trap return
(5) [_____] relief valves sized as required
(6) [_____] mm inch vent
(7) [_____] mm inch for thermometer well
(8) [_____] mm inch for pressure gage
(9) Vacuum breakers: As required
(10) [_____] mm inch heater drain
(11) [_____] mm inch spare [capped] [flanged]
(12) [_____] mm inch spare [capped] [flanged]
(13) Handholes And manhole: With covers

b. Tank connections shall include:
   (1) [_____] mm inch drain
   (2) [_____] mm inch boiler feed recirculation ([_____] required)
   (3) 25 mm one inch sampling
   (4) 25 mm one inch chemical feed
   (5) [_____] mm inch for sight glass ([_____] sets required)
   (6) [_____] mm inch for high and low alarm switches
   (7) [_____] mm inch thermometer well
   (8) Vacuum breakers: As required
   (9) [_____] mm inch spare (capped)
   (10) [_____] mm inch spare (flanged)
   (11) [_____] mm inch level transmitter and controller ([_____] sets required)
   (12) Downcomer and equalizer: As required
   (13) [_____] mm inch feedwater outlet
   (14) [_____] mm inch overflow outlet with internal water seal

2.14.2.8 Level Control

Provide an automatic control system to control the water level in the storage tank, by modulating valves in the makeup water lines. Output of the condensate pump shall be controlled by level in condensate storage tank.

   a. Controllers: Provide external cage type air operated level controllers for both the condensate and makeup water lines complete with 40 mm 1 1/2 inch screwed connections, external cage, and controller. Cage body
shall be Class 125 cast iron construction. Internal components including displacer, torque tube, displacer rod, displacer rod driver and bearings shall be 316 stainless steel. Displacer shall be 356 mm 14 inches long. Controller shall be direct acting with 20 to 103 kPa (gage) 3 to 15 psig range with proportional band adjustment. Locate controller to maintain an operating level at 2/3 full point of storage tank. Provide level controller with air pressure reducing valve, filter, gages and isolating valves for float cage. Provide unions on each side of float cage.

b. Air operated regulating valves: Provide air operated control valves for both the condensate and makeup water lines. Valves shall have Class 125 or Class 150 rating with iron or semi-steel bodies and 316 stainless steel internals. Provide open on air failure condensate valve and provide makeup water valve with an air lock mounted on valve diaphragm and piped to hold valve in last position on air failure. Design valves for the following conditions:

2.14.2.9 Low Pressure Steam Control

Provide an automatic control system to control the steam to the deaerating feedwater heater. Maintain steam pressure in the heater by modulating a pressure reducing valve in the steam supply line. Control shall be local and remote from the control panel.

a. Controller: Adjustable proportional band, 0 to 103 kPa (gage) 0 to 15 psig brass bellows for input signal, and 20 to 103 kPa (gage) 3 to 15 psig output air pressure range, pilot controller complete with air set (valve, filter, drier and pressure regulator) mounted on control valve yoke.

b. Pressure reducing station control valve: Provide a [_____] mm inch air...
operated pressure reducing valve with proper internals to pass a flow of [_____] kg per second pounds per hour of steam. Steam at the valve inlet shall be [_____] kPa (gage) psig saturated, and the outlet shall be controlled at [_____] kPa (gage) psig. Minimum steam flow shall be approximately [_____] kg per second pounds per hour. Minimum valve Cv shall be [_____] at 100 percent open. Valve shall be Class 250 or Class 300 flanged, iron or semi-steel body with stainless steel internals equal percentage flow characteristics and a full size port. Provide valve actuator including travel indicator, hand jack, valve positioner, and air supply filter-reducer set. Valve shall move to open position in case of failure.

2.14.2.10 Gage Glasses

Provide to cover the entire range of water level in the storage section. Gage glasses shall not be greater than 610 mm 24 inches center-to-center. Provide gage glasses complete with [chain operated] ball check shutoff and drain cock valves and safety shield.

2.14.2.11 Alarms

Provide high and low water level alarms for storage tank as follows:

a. High water level alarm: Switch with stainless steel float and trim. Locate switch to close circuit when water level rises to 25 mm one inch below overflow level of storage tank.

b. Low water level alarm: Switch with stainless steel float and trim. Locate switch to close circuit when water level falls to [_____] meters feet [_____] mm inches above bottom of storage tank.

c. Coordinate alarms with annunciator panel as indicated.

2.14.2.12 Multiport Back Pressure Relief Valve

Capable of relieving not less than [_____] kg per second pounds per hour of steam with not more than a [_____] kPa (gage) psig pressure rise when set at [_____] kPa (gage) psig initial operating pressure and fully adjustable by means of an external handwheel or chain operator for an initial set pressure of 0 to 172 kPa (gage) 0 to 25 psig. Locate on low pressure steam header manifold for the deaerating heater. Valve shall be multiport vapor cushion type rated for operating temperatures up to but not greater than 149 degrees C 300 degrees F with Class 125 cast iron body, bronze trim and carbon steel springs.

2.14.2.13 Exhaust Head

CID A-A-50494, Type [I (cast iron)] [II (fabricated steel plate)] of [_____] mm inch size with [_____] mm inch diameter drain, and a capacity of [_____] kg/sec pounds per hour of steam at [_____] kPa (gage) psig.

2.14.3 Boiler Feed Pumps

*****************************************************************************

NOTE: Use this paragraph for centrifugal boiler feed pumps. Use Style 1, horizontal split case pumps in all sizes. Pump service requirements shall include pump capacity of a minimum of 125 percent of boiler requirements at maximum load. Discharge head.
must be sufficient to deliver water to the boiler at a pressure 3 percent higher than the setting of the highest setting of the boiler safety valves and up to 6 percent over the maximum operating pressure of the boiler in accordance with ASME BPVC.

CID A-A-50562, Type II (boiler feed pump), Style 1 (horizontally split case), Class 2 (multi-stage) except as modified below. Each pump shall be two stage with horizontal split casing, enclosed single suction opposed type impellers, renewable casing and impeller wearing rings, stuffing box with quenching gland and flooded oil lubricated, water cooled bearings.

2.14.3.1 Construction

Bronze fitted including bronze impeller and impeller wear rings, and ASTM A48/A48M, Class 30, cast iron casing. Provide casing with suction and discharge gages in tapped openings. Mount each pump and prime mover on a fabricated steel bed plate having a drip collection chamber with tapped drain openings. Provide lifting attachments to enable equipment to be set into its normal position and to enable split case pumps to be easily dismantled in place.

2.14.3.2 Drives

Variable speed motors and turbines direct connected to respective pumps with a gear type, forged steel, flexible coupling. Provide a shaft and coupling guard.

a. Electric motors: Variable speed, [open drip proof], [totally enclosed], [fan cooled], [_____] volt, three phase, 60 Hz of not less than [_____] kW hp, as specified under the paragraphs MOTORS AND DRIVES and VARIABLE SPEED CONTROL FOR MOTORS in this section.

b. Steam turbine: Single stage, rated at not less than [_____] kW hp, with inlet steam pressure of [_____] kPa (gage) psig and [_____] degrees C F and normal exhaust back pressure of 34 kPa (gage) 5 psig or a maximum back pressure of 103 kPa (gage) 15 psig. Water rate at full load and normal steam conditions shall not exceed [_____] kg pounds per brake power hour. Provide a stainless steel steam strainer, sentinel relief valve, sight oil level indicator and one hand valve.

   (1) Turbine construction: Turbine casing split on the horizontal centerline constructed of ASTM A48/A48M, cast iron, with a design pressure rating of 1724 kPa (gage) at 232 degrees C 250 psig at 450 degrees F at inlet, and 379 kPa (gage) at 232 degrees C 55 psig at 450 degrees F at the outlet.

   (2) Turbine bearings and shaft: Horizontal split, ring oiled, sleeve type, water cooled. Shaft shall be stainless steel or chrome plated under the packing glands. Shaft seals shall be segmented carbon rings with springs and stops.

   (3) Speed governor: Variable speed oil relay, NEMA Class D, governor for speed control and pneumatic operator to maintain an adjustable, preset pump discharge header pressure by variation of turbine speed. Input to the operator shall be a 20 to 103 kPa (gage) 3 to 15 psig pneumatic signal. Provide an electro-pneumatic transducer to accept the 4 to 20 mA signal from...
the control system controller specified in Section 23 09 53.00 20
SPACE TEMPERATURE CONTROL SYSTEMS.

(4) Emergency overspeed governor: Completely independent of the speed
governor and shall operate a separate trip valve.

(5) Insulation: Turbine shall be insulated and lagged by the
manufacturer as specified in Section 23 07 00 THERMAL INSULATION
FOR MECHANICAL SYSTEMS.

2.14.3.3 Minimum Flow Protection for Boiler Feed Water Pumps

a. Automatic flow control valve: Provide with each pump an automatic
bypass valve. Valve shall automatically program the recirculation
flow, the detection of low flow, the cycling of control valve and
pressure letdown for high pressure boiler feedwater return to the
feedwater heater. Bypass valve shall be cast steel with stainless
steel internals, and shall have a rating of not less than 2068 kpa
(gage) at 204 degrees C 300 psig at 400 degrees F. Valve shall have a
line size body with a one inch recirculation connection. Provide pumps
and turbine with all trimmings which the manufacturer considers
essential for proper operation of units.

b. Boiler feedwater automatic recirculation system: (Option to Automatic
Valve). Provide a boiler feedwater automatic recirculation system to
protect the feedwater pumps at low flow conditions. System shall be
capable of recirculating the minimum flow recommended by the pump
manufacturer. System shall be an engineered system consisting of the
various functional components specified or shall be a self-contained
and self-powered mechanical system. Components of the engineered
system shall include a flow transmitter with orifice in feedwater line,
bypass flow controller with bypass flow control valve, and a bypass
pressure reducing orifice.

(1) System bypass flow controller: Include detection of low flow and
modulation of a control valve in a bypass line returning to a low
pressure sink. Incorporate a pressure let-down feature or device
to reduce the pressure from the boiler feedwater pump discharge
pressure to that of the low pressure sink.

(2) System bypass control valve: Modulate to provide minimum flow
recommended by the pump manufacturer and to provide shutoff or
recirculation flow when feedwater flow to boilers exceeds the
minimum flow required for pump protection.

2.14.3.4 Feedwater Stop and Check Valves

Provide a Class 300, flanged, cast steel feedwater stop gate valve and
check valve on the feedwater outlet of each pump. Provide piping from the
valves to the economizer inlet, and from the economizer to the flanged
connection on the boiler drum. Provide connection on pipe at economizer
outlet for remote recording thermometer.

2.14.4 Condensate Pumps

*************************************************************************
NOTE: Use this paragraph for centrifugal condensate
pumps. Pump service requirements shall include pump
capacity at a minimum of 125 percent of full load
boiler requirements. Discharge into deaerator heater shall be modulated.

CID A-A-50562, Type I, Style [1 (horizontally split cast)] [2 (end suction)], Class 1 (single stage) unless modified below.

2.14.4.1 Construction

Bronze impellers and impeller wear rings. [Cast iron] [ductile iron] pump casing designed for the specified conditions. Bearings shall be oil lubricated. Equip casing with tapped openings for suction and discharge gages. Provide gages in openings. Mount pump and driver on a fabricated steel bed plate having a drip collection chamber with tapped drain openings. Provide lifting attachments for installation and maintenance.

2.14.4.2 Drives

Variable speed motors and turbines direct connected to the respective pumps with a gear type flexible coupling. Provide shaft and coupling guards.

a. Electric motors: Variable speed, [open drip proof], [totally enclosed], [fan cooled], [_____] volt, three phase, 60 Hz of not less than [_____] kW hp, as specified under the paragraphs MOTORS AND DRIVES and VARIABLE SPEED CONTROL FOR MOTORS in this section.

b. Steam turbine: Single stage, rated at not less than [_____] with inlet steam pressure of [_____] kPa (gage) psig and [_____] degrees C F, normal exhaust back pressure of 34 kPa (gage) 5 psig and a maximum back pressure of 103 kPa (gage) 15 psig. Water rate at full load and normal steam conditions shall not exceed [_____] kg pounds per brake power hour. Provide a stainless steel steam strainer, sentinel relief valve, sight oil level indicator and one hand valve.

(1) Turbine construction: Turbine casing split on the horizontal or vertical centerline constructed of ASTM A48/A48M cast iron, with a design pressure rating of 1724 kPa (gage) at 232 degrees C 250 psig at 450 degrees F at inlet, and 379 kPa (gage) at 232 degrees C 55 psig at 450 degrees F at the outlet.

(2) Turbine bearings shaft: Ring oiled, anti-friction type. The shaft shall be stainless steel or chrome plated under the packing glands. Shaft seals shall be segmented carbon rings with springs and stops.

(3) Speed governor: Variable speed governor for speed limiting and pneumatic operator to maintain an adjustable preset level in [deaerator tank] [condensate receiver] by variation of turbine speed. Input to the operator shall be a 20 to 103 kPa (gage) 3 to 15 psig pneumatic signal and vary the turbine speed from minimum to full speed in a linear response. Maximum and minimum speed shall be adjustable. Provide an electro-pneumatic transducer to accept the 4 to 20 mA signal from the controller specified in Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS.

(4) Emergency overspeed governor: Completely independent of the speed governor and shall operate a separate trip valve.

(5) Insulation: Turbine shall insulated and lagged as specified in
2.14.5 Variable Speed Control for Motors

Remotely installed cabinet housed units with solid state rectification and inverter equipment to vary frequency of electrical power to drive motors.

2.14.5.1 Housing

a. House controller in a [wall] [floor] mounted, NEMA 250 enclosure finished with manufacturers standard painted finish. Provide control panel complete with fused disconnect switches, magnetic [across the line] [part winding] starters with thermal overload protection, transformer, hand-off-automatic selector switches, hand potentiometer for manual speed control, fuses and running lights.

b. Provide manual switch within control panel so that in the event of failure of a component, the motor can be put across the line at full voltage to maintain air or pump pressure. Provide a mechanical door interlock that will allow the panel to open only when the fused disconnect is in the off position.

2.14.5.2 Variable Frequency Controllers

Variable frequency controllers shall use solid-state semiconductor power conversion equipment. Provide controllers as integrated and assembled products. Provide controllers by the same manufacturer.

a. Each controller shall be rated for a supply of [_____] volts, three phase, 60 Hz. The output shall be [_____] volts, three phase with frequency variable between zero and 60 Hz. Controllers shall be rated to operate the motors continuously at their rated horsepower and frequency. Speed regulation shall be three percent or better without tachometer feedback. The electrical supply system has an available short circuit rating of [_____] amperes symmetrical.

b. Each controller shall be capable of driving the motor continuously at a lower speed no greater than 20 percent of full rated motor speed with stable operation and without overheating the motor under rated ambient conditions. Provide estimate of minimum speed at which motor can be operated continuously without overheating or problems of instability due to overhauling of the load.

c. Provide controller fault protection so that a single or three phase short circuit at the controller terminals or inverter commutation failure will not result in damage to power circuit components. Provide overload protection so that motor and controller are protected against operating overloads.

d. Provide adjustable time delay undervoltage protection so that motors will continue to operate during momentary voltage fluctuation or loss of voltage. Time adjustment shall be zero to 5 seconds. Provide for orderly shutdown on undervoltage conditions exceeding the time delay interval.

e. Provide adjustable timed linear acceleration and deceleration.

f. Provide volts/hertz control to prevent motor overheating throughout the speed range.
g. Provide door interlocks to prevent opening of enclosure doors unless power is disconnected.

h. Controllers shall be self protecting and shall provide orderly shutdown for, but not limited to, the following conditions:

(1) Loss of input power
(2) Undervoltage
(3) Sustained gradual overload
(4) Fault or large instantaneous overload
(5) Overtemperature
(6) Failure of ventilating system
(7) Overvoltage
(8) Control circuit failure

i. Provide contacts for remote annunciation of shutdown or abnormal condition.

j. Electrical bypass: Provide each controller with manual isolation and bypass switching. The switch shall be manually operated with controller deenergized. Switch shall be two position with provisions for locking the switch in either position.

(1) Normal position: Bypass shall be open and the controller shall be connected to the supply circuit and the load.

(2) Bypass position: Bypass shall be closed and controller shall be electronically isolated from the supply and the load. Isolating contacts shall be located so that it is possible to verify by visual inspection that the contacts are open and the controller is electrically isolated. In the bypass position the motor shall be operated at constant speed and controlled from the air circuit breaker. Provide auxiliary contacts that close in the bypass position. The auxiliary contacts shall be used to activate the damper control to provide fan load control in the bypass position.

2.14.5.3 Controller Environmental Protection

a. Ventilation: Design controllers enclosed and ventilated for installation in a moderately dusty area. Provide forced filtered ventilation including fans, filters, controls and accessories required for operation. Enclosures shall be operated under positive pressure at all times. Provide filtered ventilating openings and gasketed doors to prevent infiltration of dust.

b. Heating: Provide electric heaters to prevent condensation in the enclosure and to prevent low in going air temperatures that exceed the equipment rating. Provide a low temperature alarm to sound when enclosure temperature falls below required minimum temperature. Provide contacts for remote annunciation of alarm condition.
2.14.5.4 Method of Control

Supply each controller from an electrically operated air circuit breaker or motor starter. Controller ventilation and heating shall be from another circuit.

a. Start signal: Closes the electrically operated air circuit breaker or motor starter to energize the controller. Controller shall accelerate fan to operating speed. Fan speed shall be controlled from the load control signal.

b. Stop signal: Opens the electrically operated air circuit breaker or motor starter to de-energize the controller. Upon deenergization, the controller control system shall revert to the stop condition.

c. Boiler feedwater pump speed control system: Matches pump discharge to system demand and maintains a system header pressure controlled to the set point values. Provide Manual/Automatic control stations for master pressure and for each boiler feed pump. Provide indicators for feedwater header pressure and individual boiler feedwater pump flow. See Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS.

2.14.6 Valve Actuators

[Electrically] [or] [pneumatically] operated designed so that valve may be manually operated by removing the drive pins. Actuators shall be operated by push button control. Locate one push button at a position adjacent to the valve. Locate a second push button within the boiler control room. Provide a valve position indicator utilizing indicating lights. A green light shall indicate the valve is fully open and an amber light shall indicate the valve is fully closed. Both lights on shall indicate when the valve is partially open. [Provide torque limit controls to protect the valve during opening and closing for electrically operated valves.] Actuator electric motor shall be totally enclosed, [_____] volts, [_____] phase, 60 Hz as specified under the paragraph MOTORS AND DRIVES in this section. Provide NEMA 4 control enclosures.

2.14.7 Sump Pumps

CID A-A-50555 with automatic float switch and disconnect switch in NEMA 6 enclosure.

2.14.8 Water Softening System

**************************************************************************
NOTE: Size the system for 125 percent of the maximum expected steam load to 100 percent of plant capacity. Include losses from blowdown. Size with one tower regenerating. Frequency of regeneration should be between 12 and 24 hours at peak loading.
**************************************************************************

Ion exchange resin type, conforming to WQA S-100 except as modified below. [Manual] [Push button automatic] [Fully automatic] in operation with operating controls housed in a NEMA 12 enclosure having a total capacity between regenerations of not less than [_____] liters [gallons] of water of [_____] grams [grains] hardness when operated at a sustained softening rate of [_____] L/s [gpm]. Maximum effluent water temperature shall be [_____] degrees C [F].

SECTION 23 52 33.02 20 Page 157
2.14.8.1 Softener Equipment

Including but not limited to the following:

a. Water hardness monitor: Provide a water hardness monitor with an alarm point at 1.0 ppm to assure compliance for boilers rated above 3150 grams/sec 25,000 lbs./hr.

b. Total solids monitor/controller: Provide a continuous monitor and controller when required to control the concentration of dissolved solids and treatment chemicals in the water for boilers rated above 3150 grams/sec 25,000 lbs./hr.

c. Water meter: Provide a [_____] mm inch cold water meter on each softener unit.

d. Ion exchange resin: High capacity, polystyrene base, sulfonated synthetic type except that the exchange capacity shall be not less than 68.70 kg per cubic meter 30 kilograins per cubic foot at a salt dosage of 240 kg per cubic meter 15 pounds per cubic foot.

e. Tank sizing: Minimum acceptable bed depth of 762 mm 30 inches; maximum acceptable bed depth of 1829 mm 72 inches. Base reactor tank sizes on allowing a freeboard above the resin bed of not less than 75 percent of the resin bed depth, and flow rate between 1.11 and 7.13 L/s per cubic meter 0.5 and 3.2 gpm per cubic foot of resin.

2.14.8.2 Brine Storage System

Provide a complete brine storage system including fiberglass storage tank, sight level gage, bulk salt delivery tube, internal distribution system, level control system, tank vent with dust collection system, top and side manholes, access ladder, and other required appurtenances.

a. Storage tank: Filament wound fiberglass with flat bottom and domed top as recommended by the manufacturer for brine storage. The tank shall be [_____] meters feet [_____] mm inches in diameter by [_____] meters feet [_____] mm inches wall height with a nominal capacity of [_____] liters gallons and a dry salt storage capacity of [_____] Mg tons. Design the water distribution system, internal piping distributors, and brine collection system so that system shall be capable of dissolving [_____] kg pounds of rock salt per second minute to produce [_____] L/s gpm of brine. System shall be able to dissolve [_____] Mg tons of salt before cleanout.

b. Accessories: Provide the following accessories:

(1) Steel holddown lugs securely bonded to the tank in adequate number to properly anchor tank to concrete base

(2) Side bottom flanged drain not less than 100 mm 4 inches in diameter

(3) Side and top manholes not less than 559 mm 22 inches in diameter

(4) Flanged top connections for delivery pipe and vent

(5) Ladder for access to top manhole
(6) Water inlet connection
(7) Brine outlet connection
(8) Level control system
(9) Sight level gage

c. Pneumatic delivery pipe: Not less than 100 mm 4 inches in diameter.
d. Dust collection vent system and safety relief valve: Provide storage tank with dust collection vent system and safety relief valve.
e. Access ladder: Of steel construction to be bolted to tank by means of FRP mounting lugs complete with safety cage. Platform shall connect ladder to tank for safe access to manhole.
f. Tank internals: Construct tank internals including water distribution piping and brine collectors of FRP or polyvinyl chloride (PVC).
g. Tank nozzles: ASME B16.5, Class 150, reinforced FRP or PVC flanges.
h. Level control system: Electrode holder and electrodes mounted in a standpipe exterior to the tank. Position electrodes so that a solenoid operated water makeup valve will be opened or closed to maintain the liquid level to within plus or minus 25 mm one inch of the set level. Provide tank with a high water alarm. Electrodes shall be easily removable for cleaning and constructed of materials, that will allow continual immersion in brine.

2.14.9 Chemical Feed Systems

Provide systems complete with storage tank, supporting framework, hinged cover, mixer, strainers, level indicators, proportioning pumps, relief valves and interconnecting piping for a complete chemical feed packaged unit.

2.14.9.1 Storage Tank

190 liters50 gallon capacity constructed of FRP. Provide removable, hinged cover.

2.14.9.2 Exterior Gage Glass

Protected, full height of the tank complete with gage cocks.

2.14.9.3 Low Level Alarm

Provide tank with a low level switch to sound alarm and shut down pumps should level drop to preset minimum.

2.14.9.4 Dissolving Baskets

Construct baskets of a corrosion resistant material suitable for continuous immersion in a [____] solution.

**************************************************************************
NOTE: The chemical feed solution to be used shall be inserted here.
2.14.9.5  Tank Strainer

In suction line to pump.

2.14.9.6  Supporting Steelwork

Provide supporting steelwork to adequately support tank, mixer, and the number of proportioning pumps specified.

2.14.9.7  Agitator

Provide an agitator with mounting bracket to mount to storage tank. Agitator shaft and propeller shall be of stainless steel.

2.14.9.8  Proportioning Pumps

Provide two (three) of simplex (duplex) type. Each pump shall have a minimum capacity of ____ L/s gph at a ____ kPa (gage) psig discharge pressure. Capacity shall be adjustable from zero to 100 percent by a convenient screw adjustment of stroke length. Provide pump with integral check valves. Electric motors shall be totally enclosed, fan cooled, volts, phase, 60 Hz as specified under the paragraph MOTORS AND DRIVES in this section.

2.14.9.9  Safety Relief Valve

Provide for each pump to discharge back into the tank in event of excessive line pressure.

2.14.10  Welded Blowdown Tank

Provide in accordance with the Recommended Rules for the Design and Arrangement of Boiler Blowoff Equipment supplemental to the National Board Inspection Code latest edition published by the National Board of Boiler and Pressure Vessel Inspectors, Columbus, Ohio.

a. Construction: Construct equipment and accessories in accordance with the requirements of the ASME BPVC SEC VIII for a working pressure of at least the maximum allowable working pressure of the boiler but in no case shall the plate thickness be less than 10 mm 3/8 inch. Provide corrosion allowance of [2.55 mm] [0.1 inch] ____. Tank dimensions shall be ____ meters feet ____ mm inches O.D. by ____ meters feet ____ mm inches long over the heads (overall). Provide tank with wear plate not less than 10 mm 3/8 inch thick and [279 by 381 mm 11 by 15 inch] [457 by 508 mm 18 by 20 inch] manhole.

b. Tank connections: Provide the following connections:

**************************************************************************

NOTE: The volume of the blowdown tank shall be calculated to be twice the volume of water removed from one boiler when the normal water level is reduced not less than 100 mm 4 inches.

**************************************************************************
(2) Tangential blowdown inlet [_____] mm inch

(3) Steam vent, flanged [_____] mm inch

(4) Discharge water outlet, flanged [_____] mm inch with internal water seal and 20 mm 3/4 inch siphon breaker

(5) Drain 50 mm 2 inch

(6) Thermometer connection 20 mm 3/4 inch

(7) Pressure gage connection 6 mm 1/4 inch

(8) Cold water inlet [_____] mm inch with temperature regulating valve and backflow preventer

(9) Two gage glass connections 15 mm 1/2 inch

c. Angle supports and coating: Provide the tank with steel angle support legs extending [_____] meter feet below the bottom of the tank. Coat the tank with one coat of manufacturer's standard high temperature primer.

2.14.10.1 Accessories

a. Gage glass: 300 mm 12 inch reflex type with shutoff valves and guard.

b. Thermometer: Bi-metal dial type with separable socket, 125 mm 5 inch dial, 10 to 149 degrees C 50 to 300 degrees F range.

c. Pressure gage: Zero to 172 kPa (gage) Zero to 25 psig range.

d. Internal baffles and pipes: As detailed.

2.14.10.2 Controls

Provide a self operating regulator to control the flow of cooling water to the tank. Regulator shall include a 20 mm 3/4 inch screwed bronze body with stainless steel trim, reverse acting actuator for cooling, capillary tubing and a union connection bulb with a stainless steel well. Control setting shall be 60 degrees C 140 degrees F with a minimum Cv of [____].

2.14.11 Continuous Boiler Blowdown System

Provide a complete automatic continuous boiler blowdown system, in accordance with NBBI NB-27, which shall include a controller/programmer unit and flow assembly for each boiler, plus a continuous blowoff heat exchanger, flash tank and boiler water sample cooler.

2.14.11.1 Automatic Blowdown Controller

Intermittent type boiler blowdown system rated for not less than 1724 kPa (gage) 250 psig steam pressure.

a. Flow assembly: Include a 25 mm one inch ball valve with 316 stainless steel ball and stem and stainless steel electrode assembly.

b. Controller/programmer: Include a conductivity meter with zero to 6000 microhms range, valve open/closed indicators and manual/auto control
UFGS

switch. Cycle interval and sample duration shall both be adjustable over a wide range. Mount units at the operating floor near the boiler front.

c. Accessories and connections:

(1) Continuous blowdown connection: At each boiler, provide a gate valve and extend piping to header at flash tank.

(2) Header connections: Provide with a tee with valved sampling connection. Provide a 20 mm 3/4 inch, three globe valve bypass around each flow assembly.

(3) Common header: Provide from valved outlet connections on flow assembly units, to connection on flash tank.

2.14.11.2 Flash Tank

ASME code stamped and constructed in accordance with the ASME BPVC SEC VIII designed for [_____] kPa (gage) psig. Tank shall be [_____] mm inches in diameter by [_____] mm inches long including heads.

a. Provide tank with blowdown inlet, steam outlet, gage glass, float operated outlet valve, relief valve, and inspection openings. Tank shall have steel angle legs with plate feet for bolting to floor and legs shall be of sufficient length so that bottom of lower head of tank will be not less than 457 mm 18 inches above floor.

b. Automatic control system: Control level in the flash tank, by modulating a valve in the water outlet line.

(1) Level controller: External cage type air operated level controller, complete with 40 mm 1 1/2 inch screwed connection, 350 mm 14 inch stainless steel float and Class 125 cast iron body. Controller shall be direct acting with 20 to 103 kPa (gage) 3 to 15 psig range with proportional band. Locate controller to maintain an operating level at center line of storage tank. Provide level controller with air pressure reducing valve, filter, gages and isolating valves for float cage. Provide unions on each side of float cage.

(2) Outlet water valve: [_____] air operated control valve with a capacity to pass [_____] L/s gpm at a pressure drop of [_____] kPa (gage) psig. Cv shall not be less than [_____] at 100 percent open. Valve shall be Class [______], flanged, iron or semi-steel body with stainless steel internals. Valve shall have equal percentage flow characteristics with a full size port. Provide an air lock mounted on valve diaphragm and piped to hold valve in last position on air failure.

2.14.11.3 Sample Cooler

Water cooled shell and tube type with valves and accessories required to safely withdraw a water sample from the boiler drum. Provide drain under sampling valve terminating with a 20 mm 3/4 inch splash proof funnel, 229 mm 9 inches below outlet of valve.
2.14.11.4 Heat Exchanger

Provide an ASME code stamp continuous blowoff heat exchanger designed and constructed in accordance with the ASME BPVC SEC VIII, to transfer heat from the continuous blowoff water leaving the existing continuous blowoff flash tank to the treated makeup water entering the feedwater heater. Heat exchanger shall be a bare tube, helical coiled bundle, installed in a one piece casing with removable front plate. Bundle shall be removable. Tube diameter shall not be less than 20 mm 3/4 inch. Tubes shall be ASTM B111/B111M copper alloy, with cast iron shell. Design tube side for not less than [_____] kpa (gage) psig pressure at [_____] degrees C F. Design shell side for not less than [_____] kpa (gage) psig pressure at [_____] degrees C F.

2.15 PIPING

Piping work shall include the provision, of piping systems, including valving and specialty items, for the steam plant and related external auxiliary equipment.

a. Piping materials, design, and fabrication shall be in accordance with ASME B31.1 except as modified otherwise below or indicated otherwise.

b. Compute expansion of pipe with operating temperatures above minus 19 degrees C zero degrees F in lieu of 21 degrees C 70 degrees F specified in ASME B31.1.

c. Requirements of ASME B31.1 apply to the building steam heating and steam distribution piping designed for 103 kpa (gage) 15 psig or lower and hot water heating systems 207 kpa (gage) 30 psig or lower.

2.15.1 Materials

Suitable for the maximum pressure at the maximum temperature at which the equipment must operate.

2.15.1.1 Pipe Materials

a. Steel pipe

(1) Steam pipe, boiler feedwater pipe, relief pipe and steam tracer pipe: Black, ASTM A53/A53M or ASTM A106/A106M seamless steel pipe, Grade A or B. Wall thickness not less than Schedule 40. Steam tracer pipe, with steam up to 103 kPa (gage) 15 psig, may be ASTM B88M ASTM B88, type K copper tubing.

(2) Condensate pipe and boiler blowdown pipe: Black, welded or seamless ASTM A53/A53M or ASTM A106/A106M, steel pipe, Grade A or B. Wall thickness not less than extra strong (XS or Schedule 80).

(3) Chemical feed pipe and coal pile-runoff water sump pump discharge piping: ASTM A312/A312M austenitic stainless steel.

(4) Fuel oil pipe: ASTM A53/A53M or ASTM A106/A106M, seamless black steel pipe, Grade A or B.

(5) Treated water, hot water heating, high temperature water, drains (other than sanitary), and overflow pipe: black, welded or seamless steel up to a maximum pressure of 1724 kPa (gage) 250 psig.
or ASTM A53/A53M or ASTM A106/A106M, Grade A or B.

(6) Gas pipe and compressed air pipe: Welded or seamless pipe up to a maximum pressure of 1724 kpa (gage) 250 psig or ASTM A53/A53M or ASTM A106/A106M, Grade A or B.

b. Copper tubing

(1) Instrument air pipe: ASTM B88M ASTM B88 hard copper tubing, Type K or L; except in a corrosive atmosphere or outside pipe shall be copper tubing, Type K or L, with ASTM D1047 PVC jacketing.

(2) Steam tracer pipe: Contractor may at the Contractor's option provide ASTM B88M ASTM B88, Type K, copper tubing for steam up 103 kPa (gage) 15 psig.

(3) Potable water, sanitary drains and storm drains: As specified in Section 22 00 00 PLUMBING, GENERAL PURPOSE, unless otherwise specified. Chlorinated polyvinyl chloride (CPVC) and other plastic tubing and fittings shall not be used in the steam heating plant.

2.15.1.2 Fittings

a. Fittings for steel pipe:

(1) Sizes 6 to 50 mm 1/8 to 2 inches: ASME B16.3 malleable iron, screwed end fittings, for working pressures not greater than 2068 kpa (gage) 300 psig at temperatures not greater than 232 degrees C 450 degrees F or ASME B16.11 forged steel.

(2) Sizes 6 to 50 mm 1/8 to 2 inches: ASME B16.11 steel, socket welded end fittings.

(3) Sizes 6 to 65 mm 1/8 to 2 1/2 inches: ASME B16.9 steel, butt welding fittings.

(4) Sizes 65 to 600 mm 2 1/2 to 24 inches: ASME B16.5 forged steel, flanged fittings.

b. Welded outlets and welding saddles: Make branch connections of 45 and 90 degrees either with ASME B16.9 forged steel welded outlet fittings or welding saddles. Welding outlets and saddles shall not be smaller than two pipe sizes less than the main pipe sizes.

c. Fittings for copper tubing: ASME B16.18 cast bronze solder joint or ASME B16.22 wrought copper solder joint. For instrument air, fittings may be ASME B16.26 compression joint type.

d. Unions:

(2) Unions for copper tubing: ASME B16.22. For instrument air, unions may be compression joint type.
2.15.1.3 Flanges

ASME B16.5, forged steel, welding type. Remove the raised faces on flanges when used with flanges having a flat face. Except as specified otherwise, pressure and temperature limitations shall be as specified in ASME B16.5 for the proper class and service, and the type face specified.

2.15.1.4 Valves

a. Valves for maximum working pressure of 1034 kpa (gage) 150 psig saturated steam or 1550 kPa (gage) 225 psig W.O.G. (Water, Oil, Gas) at 93 degrees C 200 degrees F (non-shock service). (For working pressures not exceeding 862 kPa (gage) 125 psig saturated steam or 1379 kpa (gage) 200 psig water at 93 degrees C 200 degrees F non shock service, Class 125 may be used in lieu of Class 150 or Class 250).

(1) Valve sizes 50 mm 2 inches and smaller:

(a) Non throttling valves: Gate valves, bronze, wedge disc, rising stem, Class 150, MSS SP-80 or ball valves, bronze, double stem seals, stainless steel ball and shaft, tight shutoff.

(b) Globe valves and angle valves: Bronze, Class 150, MSS SP-80.

(c) Check valves: Bronze, Type [IV, swing check] [III, lift check], Class 150, MSS SP-80.

(2) Valve sizes 65 mm 2 1/2 inches and larger.

(a) Gate valves: Flanged, cast iron, Class 250, MSS SP-70 or steel, Class 150, ASME B16.34. Valves shall have wedge disc, outside screw and yoke (OS&Y), rising stem; valves 200 mm 8 inches and larger shall have globe valved bypass.

(b) Globe valves and angle valves: Flanged, cast iron, Class 250, MSS SP-85 or steel, Class 150, ASME B16.34.

(c) Check valves: Flanged, cast iron, Class 250 or steel, Class 150, Type [_____], [lift] [swing] check, style [_____], MIL-DTL-18436.

b. Valves for maximum working pressure of 1724 kPa (gage) 250 psig steam at a maximum temperature of 232 degrees C 450 degrees F or 3447 kPa (gage) 500 psig W.O.G. at 93 degrees C 200 degrees F (non-shock).

(1) Valve sizes 65 mm 2 1/2 inches and larger.

(a) Gate valves: Flanged or butt welded, cast iron, Class 250, MSS SP-70 (maximum size 300 mm 12 inches) or steel, Class 300, ASME B16.34. Valves shall have wedge disc, OS&Y, rising stem; each valve 200 mm 8 inches and larger shall have globe valved bypass.

(b) Globe valves and angle valves: Flanged or butt welded, cast iron, Class 250, MSS SP-85 or steel, Class 300, ASME B16.34.

(c) Check valves: Flanged or butt welded, iron body, Class 250 or steel, Class 300, Type [_____] [lift] [swing] check, style [_____], MIL-DTL-18436.
c. Valves for maximum working pressure of 2068 kPa (gage) 300 psig steam at a maximum temperature of 454 degrees C 850 degrees F or a maximum W.O.G. pressure of 4653 kPa (gage) 675 psig at 149 degrees C 300 degrees F (non shock).

(1) Valve sizes 65 mm 2 1/2 inches and larger:

   (a) Gate valves, Globe Valves, and Angle Valves: Flanged or butt welded, ASME B16.34, steel, Class 300, rising stem, OS&Y. Gate valves 200 mm 8 inches and larger shall have globe valved bypass.

   (b) Check valves: Flanged or butt welded, steel, Class 300, Type [_____], [lift] [swing] check, style [______], MIL-DTL-18436.

d. Ball valves: ASME B16.5 and API Std 607 double stem seal type for bubble tight shutoff. Seats and seals shall be TFE material. Ball and shaft shall be stainless steel. Provide mechanical stops to prevent cycling valve in wrong direction and self-aligning stem seal.

e. Valve accessories: ASME B16.34 valve operating mechanisms including chain wheels, gear operators, floor stands, electric motors, air motors and cylinder-type actuating devices. Provide the accessories as follows and as indicated.

   (1) Provide power operators with remote position indicators on the following valves: soot blowers, [______], [______].

   (2) Provide floor stands and valve extensions on platforms and floors for the following valves: deaerator drain valves, [______].

   (3) Provide motorized actuators or chain wheels with chain and guides on valves with handwheel centerline higher than 2 meters 7 feet above the floor or platform except where specified otherwise. Chains shall extend from the valve to within one meter 3 feet above the floor. Provide impact chain wheels on steam headers and other locations where the valve has a tendency to stick. When a valve is motorized, provide hand operation for emergency.

   (4) Provide gear operators on ball valves larger than 80 mm 3 inches and on gate valves 200 mm 8 inches and larger.

f. Steam pressure regulating valves: CID A-A-50558, minimum of Class [125] [150] [250] [300], except as specified otherwise. [Cast iron], [cast steel] valve body with valve seats and disc of replaceable heat treated stainless steel. Valves shall be single seated, shall seat tight under dead end conditions, and shall go to the closed position in the event of pressure failure of the operating medium. Valves shall be spring loaded diaphragm operated type, except valves exposed to ambient temperature of less than 2 degrees C 35 degrees F or exposed to the weather shall be piston operated type. Capacity of valves shall be not less than that indicated. Pilot valves shall have strainer at inlet from external feeder piping.

   (1) Spring loaded diaphragm operated valves: Fabricate main spring of stainless steel, and it shall not be in the path of steam flow through the valve. Control valves by pilot valve through external feeder piping.
(2) Piston operated valves: Control valves by integral pilot valve through external feeder piping.

g. Safety relief valves: MIL-DTL-18436, Style D or E, with Class [150] [300] inlet flange, with test lever, designed for the intended service.

2.15.1.5 Bolts and Nuts

a. Bolts: ASTM A193/A193M, Grade B8. Lengths of bolts shall be such that not less than two full threads will extend beyond the nut with bolts tightened to required tensions and washers seated.

2.15.1.6 Gaskets

ASME B31.1 and as specified below, except provide spiral wound metal covered non-asbestos gaskets in lieu of compressed sheet non-asbestos. Gaskets shall be as thin as the finish of surfaces will permit. Do not use paper, vegetable fiber, rubber, or rubber inserted gaskets for temperatures greater than 121 degrees C 250 degrees F. Provide metal or metal jacketed non-asbestos gaskets with small male and female and small tongue-and-groove flanges and flanged fittings; they may be used with steel flanges with lapped, large male and female, large tongue-and-groove, and raised facings. Provide full face gaskets with flat-faced flanges. Raised face cast iron flanges, lapped steel flanges, and raised faced steel flanges shall have ring gaskets with an outside diameter extending to the inside of the bolt holes. Widths of gaskets for small male and female and for tongue-and-groove joints shall be equal to the widths of the male face and tongue. Gaskets shall have an inside diameter equal to or larger than the port opening. Dimensions for nonmetallic gaskets shall be in accordance with ASME B16.21. Materials for flanged gaskets shall be as listed below for service specified:

a. Steam, boiler blowdown, exhaust steam: Spiral wound metal composition or copper

b. Boiler feed water: Metal jacketed non-asbestos, copper or monel

c. Hot water, above 38 degrees C 100 degrees F: Spiral wound metal non-asbestos

d. Cold water: Red rubber or neoprene rubber

e. Heavy fuel oil (No. 6): Spiral wound metal non-asbestos, soft steel, or monel

f. Diesel fuel (No. 2): ASME B16.21 metallic

g. Compressed air: Spiral wound metal non-asbestos

2.15.1.7 Expansion Joints

a. Slip tube expansion joints: MIL-E-17814, Type IV, single or double slip tube as indicated, designed for [1034] [2068] kPa (gage) [150] [300] psig saturated steam working pressure. Expansion joints shall be of the type which permits the injection of semi plastic type packing while the joint is in service under full line pressure. Slip tube shall be of chromium plated, wrought steel construction, guided by
internal and external guides integral with joint body. Fit slip tube ends with forged steel pipe flanges or bevel for welding into pipe line where indicated. Deliver joints complete with packing and ready for installation.

b. Flexible ball expansion joint: Capable of 360 degrees rotation plus 15 degrees angular flex movement and shall be installed in strict accordance with recommendations of the manufacturer. Ball joints shall have steel bodies and polished steel balls. Provide end connections to suit class of piping herein before specified. Seals shall be of pressure molded composition designed for the working pressure. Design joints for [1034] [2068] kPa (gage) [150] [300] psig saturated steam working pressure. Cold set joints as necessary to compensate for temperature at time of installation. Do not use ball joints on superheated steam or on joints subject to frequent flexure.

c. Bellows expansion joints: MIL-DTL-17813 flexible guided type with stainless steel expansion element, internal sleeves and external covers. Joints shall be designed for a working pressure of [_____] kPa (gage) psig and a temperature of [_____] degrees C F.

2.15.1.8 Pipe Hangers and Supports

MSS SP-58 and MSS SP-69, Type [_____] or Type [_____] of the adjustable type, except as specified or indicated otherwise. Suspended steam and condensate piping shall have pipe hangers Type [_____] with insulation protection saddles Type [______]. Provide insulated piping, except steam and condensate piping, with insulation protection shields Type 40. Provide bronze or copper plated collars on uninsulated copper piping. Support rods shall be steel. Rods, hangers and supports shall be zinc plated, except for uninsulated copper piping which shall be copper plated; cast iron rollers, bases and saddles may be painted with two coats of heat resisting aluminum paint in lieu of zinc plating. Axles for cast iron rollers shall be stainless steel. Size hanger rods with a 150 percent safety factor for a seismic design.

2.15.1.9 Instrumentation

a. Pressure and vacuum gages: Conform to applicable requirements of ASME B40.100.

b. Indicating thermometers: MIL-T-19646 dial type. Thermometer shall include a separable immersion well.

2.15.1.10 Miscellaneous Pipeline Components

a. Cold and hot water meters: CID A-A-59224 for maximum flow of [_____] L/s at 38 degrees C gpm at 100 degrees F and reduced flow of up to [_____] L/s at 121 degrees C gpm at 250 degrees F.

b. Air traps: Float controlled valves arranged to close properly when water enters the traps. Air traps shall conform to requirements for float operated steam traps (non-thermostatic), CID A-A-60001, except that the valve mechanism shall be inverted so as to be closed, not opened, by rising water.

c. Steam traps: CID A-A-60001. Inverted bucket high pressure steam traps designed for use at [_____] kPa (gage) psig at [_____] degrees C F. Low pressure steam traps shall be float and thermostatic type for
pressures up to 103 kPa (gage) 15 psig. Provide traps with separate strainers unless specified otherwise.

d. Strainers: FS WW-S-2739 for Class [125] [250] with blow off outlet. Construct strainers for Class 300 of cast carbon steel in accordance with ASME B16.5 for minimum of 2068 kPa (gage) 300 psig saturated steam pressure. Provide blow off outlet with pipe nipple and gate valve.

2.15.1.11 Backflow Preventers

Reduced pressure principle type conforming to the applicable requirements of [AWWA C510 and AWWA C511.] [Section 22 00 00 PLUMBING, GENERAL PURPOSE.]

2.15.1.12 Insulation

Materials and application shall be as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

2.15.1.13 Pipe Sleeves

a. Floor Slabs, Roof Slabs, and Outside Walls Above and Below Grade: Galvanized steel pipe having an inside diameter at least 15 mm 1/2 inch larger than the o.d. diameter of the pipe passing through it. Provide sufficient sleeve length to extend completely through floors, roofs, and walls, so that sleeve ends are flush with finished surfaces except that ends of sleeves for floor slabs shall extend 13 mm 1/2 inch above finished floor surface. Sleeves located in waterproofed construction shall include flange and clamping ring.

b. Partitions: Galvanized sheet steel, 26 gage or heavier, of sufficient length to completely extend through partition thickness with sleeve ends flush with partition finished surface.

2.15.1.14 Piping Identification

Piping Identification shall conform to MIL-STD-101 and shall be placed in clearly visible locations; except that piping in the boiler room shall be painted the primary color of the color code. Labels and tapes conforming to ASME A13.1 shall be used in lieu of band painting or stenciling. Labels shall be outdoor grade acrylic plastic. Markings on labels shall indicate the direction of flow, flowing media, and media design pressure and temperature. Spacing of identification marking shall not exceed 3 meters 10 feet. Provide two copies of the complete color and stencil codes used. Frame codes under glass and install where directed.

2.16 FIRE PROTECTION SYSTEM

Provide the fuel oil room with a wet sprinkler system as specified in Section 21 13 13 WET PIPE SPRINKLER SYSTEMS, FIRE PROTECTION.

2.17 MARKING

Identify equipment, valves, switches, motor controllers, and controls or indicating elements, by printed, stamped or manufactured identification plates or tags of rigid plastic or non-ferrous material. Lettering for identification plates or tags shall be not less than 5 mm 3/16 inch high.
Nomenclature and identification symbols used on the identification plates or tags shall correspond to those used in the maintenance manuals, operating instructions, and schematic diagrams. Identification plates or tags shall be rigidly affixed to the equipment or devices without impairing functions or, when this is not possible, shall be attached using a non-ferrous wire or chain. In addition to the identification plate or tag, each major component of equipment shall have a nameplate listing the manufacturer's name, model number, and when applicable, electrical rating and other information required by pertinent standards or codes.

2.18 TOOLS AND TESTING EQUIPMENT

Provide special tools and wrenches required for the installation, maintenance, and operation of the equipment. Testing equipment to be provided shall include necessary equipment to perform routine tests:

a. On lubricating oil for acidity (pH-potentiometer), viscosity (saybolt test), and dirt (gravimetric).

b. On softened water for hardness (soap test or colorimetric test), and boiler blowdown water for pH (colorimetric) and conductivity (potentiometer).

c. For water (distillation) and sediment (gravimetric) in fuel oil.

2.19 WELDING MATERIALS

Welding materials shall comply with Section 2, ASME BPVC SEC II-C. Welding equipment, electrodes, welding wire, and fluxes shall be capable of producing satisfactory welds when used by a qualified welder or welding operator using qualified welding procedures.

2.20 MOTORS AND DRIVES

A.C. electric motors shall meet the requirements of NEMA MG 1. Motors shall be designed for continuous operation at rated load under usual service conditions as defined by NEMA. Unless specifically noted otherwise, motors less than 3/8 kW 1/2 hp shall be 115 volt, 60 Hz, single phase, capacitor-start, or permanent split capacitor, with Class B insulation for 40 degrees C 104 degrees F ambient. Unless specifically noted otherwise, motors 3/8 kW 1/2 hp and larger shall be 460 volt, 60 Hz, three phase, Design B, squirrel cage induction with a minimum insulation of Class F for 40 degrees C 104 degrees F ambient. Size motors to meet power requirements of the driven unit at design conditions, including drive and coupling losses which are incurred, without loading the motor beyond its nameplate horsepower rating. Minimum service factor for open drip-proof motors shall be 1.15 and for totally enclosed, fan cooled motors 1.0. Motor shall be quiet operating. Bearings shall be heavy duty, grease lubricated, anti-friction, single shielded, regreasable type and shall have approved lubricating fittings extended to an easily accessible location for field servicing. Provide sole plates for motors installed on concrete pads. Motors shall have copper windings.

2.21 SOURCE QUALITY CONTROL

2.21.1 Instrument Air Compressors

Factory test air compressor package at full load for not less than 2 hours. Check capacity, smoothness of operation, alternation of units, and
proper operation of the air unloaders during the test.

2.21.2 Variable Speed Motor Controller Factory Test

Burn-in tests shall be conducted for at least 50 hours at rated conditions. Replace each component that fails during the burn-in test, and the test shall be run on the entire assembly for the complete 50 hours. Burn-in test shall not be complete until the entire assembly has operated for 50 hours without failure.

PART 3 EXECUTION

3.1 INSTALLATION

Install materials and equipment as indicated and in accordance with manufacturer's recommendations.

3.1.1 Boiler

3.1.1.1 Installing Tubes In Headers

Tubes may be rolled into the headers provided the holes used for rolling will not be blocked for access in the future by any item of equipment or piping, provided under this contract. Otherwise, weld tubes into the headers by use of stubs or socket welds. Stub end tubes may be welded into headers in shop and tubes welded to same in field.

3.1.1.2 Installing Tubes In Drums

Before installing tubes, polish tube ends and tube seats in the drums to bright metal using a No. 60 grit cloth grinding band driven on a pneumatic or electric polishing motor. Do not polish these tubes until ready for immediate installation. Install the tubes and hold in place with proper width, hard maple wood spacers and by lapping the tubes in the tube sheet. Lap tubes only enough to hold them in place for rolling. Check tube stock on each end of the tube before rolling. Furnish 10 mm 3/8 inch stock on each tube end with no deviation. When, after the tubes are rolled in place, there remains more than 10 mm 3/8 inch stock due to extra length of tube, excess shall be milled off to 10 mm 3/8 inch using a milling wheel driven by a pneumatic or electric motor. At no time shall there be less than 10 mm 3/8 inch stock between end of tube and nearest surface of header. Tubes shall then be rolled with a bell roll of the proper size and tension. Tubes shall not be rolled to excess. Drive bell roll by a pneumatic or electric motor using a proper size mandrel pin. At no time will a manual operation of tube rolling be permitted. Lubricant for the expanding operation shall be a water soluble compound.

3.1.1.3 Inspecting Tubes

After tubes are rolled in place, provide, under manufacturer's supervision, one person in steam drum and one in mud drum. The person in the steam drum shall drop a ping pong ball through every tube to be sure that no foreign matter or misalignment obstructs the tube. After boiler tubes have been tested, follow the same procedure on the water wall tubes. Remove each tube that is not in alignment after being installed and install a new tube in its place.
3.1.1.4 Installing Firebrick

Lay up in air-setting mortar. Dip each brick in mortar, rub, shove into its final place, and then tap with a wooden mallet until it touches the adjacent bricks. Mortar thick enough to lay with a trowel will not be permitted. Maximum mortar joint thickness shall not exceed 3 mm 1/8 inch and average joint thickness shall not exceed 1.6 mm 1/16 inch.

3.1.1.5 Installing Plastic Refractory

Install in accordance with the manufacturer's recommendations and by workmen skilled in its application.

3.1.1.6 Installing Casing Insulation

Before application of the insulations, clean exterior surfaces of the boiler not covered by brick work by commercial blast and finish with one coat of FS TT-P-28 aluminum heat-resisting paint. Apply paint directly to cleaned metal surfaces to a minimum dry film thickness of 0.0254 mm one mil.

3.1.2 Equipment Installation

Install equipment in strict accordance with this specification, and with manufacturer's installation instructions. Grout equipment mounted on concrete foundations before installing piping. Install piping in such a manner as not to place strain on equipment. Flanged joints shall not be bolted to final torque settings until the flanges are aligned, gasketed and mated properly. Expansion bends shall be adequately extended before installation. Grade, anchor, guide and support piping, without low pockets.

3.1.2.1 Equipment Foundations

Provide foundations of sufficient size and weight, and proper design to preclude shifting of equipment under operating conditions, or under abnormal conditions which could be imposed upon the equipment. Equipment vibration shall be limited within acceptable limits, and shall be isolated. Foundations shall be adequate for soil conditions of the site and shall meet requirements of the equipment manufacturer. Trowel exposed foundation surfaces smooth except surfaces which are to receive grout, which shall be properly roughened.

3.1.2.2 Induced Draft Fan

Provide each driver and reduction gear with a 38 mm 1 1/2 inch thick steel base plate. Shim base plate level, using steel shim stock which is at least as large as the equipment foot and is slotted for installation around studs or bolts. Anchor and grout into place prior to setting driver. An approved millwright shall align and shim the drive unit. Millwright shall drill and ream foot and base plate and install taper pins with nut on top for pullout removal. One front foot and diagonally opposite rear foot shall be pinned to base plate. Bolt equipment in place in a manner approved by the manufacturer. Level and grout fan and bearing pedestal sole plates in place.

3.1.2.3 Stack

Stack shall be leveled and plumb during installation. Erected stack shall be no more than 25 mm one inch out of plumb per 15 meters 50 feet in height. Remove roughness, marks, and lifting lugs from stack. Grind
surfaces smooth and flush with surrounding surfaces.

3.1.2.4 Fuel Oil Tanks

**************************************************************************

NOTE: At the text below, choose one of the following fuel oil tanks found below.
**************************************************************************

[a. Horizontal Fuel Oil Tanks (Below Ground). Provide concrete ballast slabs for tanks and concrete protective ground level slabs for FRP tanks. Ballast slabs shall be full length and width of tanks and protective slabs shall extend 610 mm 2 feet beyond the tanks. Concrete work shall be as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

(1) Install backfill fiberglass reinforced tanks as recommended by the manufacturer; backfill adjacent to the tanks shall be pea gravel unless otherwise recommended by the manufacturer. Backfill for steel tanks shall be sand.

(2) Set steel tanks on a bed of sand not less than 152 mm 6 inches deep over the concrete slab and strap in place with stainless steel hold-down straps with stainless steel turnbuckles. Set FRP tanks on a bed of pea gravel not less than 305 mm 12 inches thick and pre-shape for the tank contours for FRP tanks. Fabricate straps for FRP tanks from FRP resins reinforced with stainless steel to prevent breaking of straps and floating of empty tanks.

(3) Slope tank toward sump not less than 25 mm in each 1.50 meters one inch in each 5 feet.

][b. Horizontal Fuel Oil Tanks (Above Ground). Continuously support steel tank saddles along the full length of the base and level and grout to ensure full bearing.

][c. Vertical Fuel Oil Tank. Provide [sand, crushed stone or fine gravel cushion] [concrete base].

**************************************************************************

NOTE: Choose for a base material either sand/crushed stone/fine gravel or a concrete base.
**************************************************************************

(1) Sand, Crushed Stone or Fine Gravel Cushion: Area beneath tank shall be covered with a fuel resistant plastic membrane with a thickness of not less than 0.50 mm 20 mils. Carefully fuse or cement plastic membrane seams. Lay plastic over a thoroughly compacted select subgrade free from rocks that could puncture the plastic. Over the plastic provide a bed of sand, crushed stone or fine gravel not less than 152 mm 6 inches thick. Stabilize the bed with an approved material and shape to the tank bottom. Slope bed down to the center sump approximately 152 mm 6 inches for each 3 meters 10 feet of tank radius. When in place, tank shell shall be plumb.

(2) Concrete base shall be as indicated and in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE.

(3) Mastic Seal: Place the mastic seal between the tank and the
concrete ring to the cross section indicated. Compact the mastic thoroughly. Immediately before placing the mastic, coat the tank surfaces to be in contact with the concrete ring with a coat of MIL-C-18480 bituminous material.

3.1.3 Piping

Unless specified otherwise, erection, welding, brazing, testing and inspection of piping shall be in accordance with ASME B31.1 and Section 40 17 26.00 20 WELDING PRESSURE PIPING. Piping shall follow the general arrangement shown. Cut piping accurately to measurements established for the work. Work piping into place without springing or forcing, except where cold-springing is specified. Piping and equipment within buildings shall be entirely out of the way of lighting fixtures and doors, windows, and other openings. Locate overhead piping in buildings in the most inconspicuous positions. Do not bury or conceal piping until piping has been inspected, tested, and approved. Where pipe passes through building structure, pipe joints shall not be concealed, but shall be located where they may be readily inspected and building structure shall not be weakened. Avoid interference with other piping, conduit, or equipment. Except where specifically shown otherwise, vertical piping shall run plumb and straight and parallel to walls. Piping connected to equipment shall be installed to provide flexibility for vibration. Support and anchor piping so that weight of the piping is not putting equipment under a load.

3.1.3.1 Fittings

Provide long radius elbows on welded piping to reduce pressure drops due to bends in the piping runs. Do not miter pipe to form elbows or notch straight runs to form full sized tees, or similar construction. Make branch connections with welding tees or factory made forged welding branch outlets and nozzles having integral reinforcements conforming to ASME B31.1.

3.1.3.2 Grading of Pipe Lines

Unless indicated otherwise, install horizontal lines of steam and return piping to grade down in the direction of flow with a pitch of not less than 25 mm in 9 meters one inch in 30 feet, except in loop mains and main headers where flow may be either direction. Pitch air lines to the source of supply, and make provisions for draining off condensate. Install water lines to drain to a shutoff valve.

3.1.3.3 Anchoring, Guiding, and Supporting Piping

**************************************************************************
NOTE: Pipe hangers and supports shall be spaced and designed to support steam piping filled with water for hydrostatic tests.
**************************************************************************

Anchor and support piping in a manner such that expansion and contraction will take place in the direction desired, prevent vibration by use of vibration dampeners, and prevent undue strains on boilers and equipment served. Fabricate hangers used for the support of piping of 50 mm 2 inch nominal pipe size and larger to permit adequate adjustment after erection while still supporting the load. Provide wall brackets where pipes are adjacent to walls or other vertical surfaces which may be used for supports. Provide supports to carry the weight of the lines and maintain...
proper alignment. Provide inserts and sleeves for the supports in concrete where necessary and place in new construction before pouring concrete. Provide insulated piping with a pipe covering protection saddle at each support. Provide pipe guides and anchors of approved type at points where necessary to keep pipes in accurate alignment, to direct expansion movement, and to prevent buckling and swaying and undue strain. Provide pipe guides for alignment of pipe connecting the free unanchored ends of each expansion joint. Support pipe rollers in concrete conduits and trenches by extra strong steel pipe with ends inserted in slots provided in concrete walls. Set pipe supports for rollers at correct elevations either by metal shims or by cutting away of concrete and after placing pipe lines in alignment, grout ends of pipe supports and fix in place. Space pipe supports to provide adequate support for pipes. Pipe shall not have pockets formed in the span due to sagging of the pipe between supports, caused by the weight of the pipe, medium in the pipe, insulation, valves, and fittings. Maximum spacing for pipe supports for steel pipe shall be in accordance with ASME B31.1; maximum spacing for supports for copper tubing shall be in accordance with NAPHCC NSPC.

3.1.3.4 Copper Tubing

Copper tubing shall have solder joints with solder suitable for the pressure-temperature ratings of the piping system. Tubing 20 mm 3/4 inch and smaller for instrument air may be compression joint in lieu of soldered joint. Tin-antimony (95/5) solder is suitable for saturated steam up to 103 kPa (gage) 15 psig but tin lead (50/50) solder is not acceptable for steam service. Flux shall be non corrosive. Wipe excess solder from the joints.

3.1.3.5 Sleeves

Provide pipe sleeves where pipes and tubing pass through masonry and concrete walls, floors, and partitions. Space between pipe, tubing, or insulation and the sleeve shall be not less than 6 mm 1/4 inch. Hold sleeves securely in proper position and location before and during construction. Sleeves shall be of sufficient length to pass through entire thickness of walls, partitions, and slabs. Sleeves in floor slabs shall extend 13 mm 1/2 inch above the finished floor. Firmly pack space between pipe or tubing and the sleeve with oakum and caulk on both ends of the sleeve with elastic cement.

3.1.3.6 Flashing for Buildings

Where pipes pass through building roofs and outside walls, provide proper flashing and counter flashing and make tight and waterproof.

3.1.3.7 Outlets for Future Connections

Locate as directed capped or plugged outlets for connections to future equipment, when not located exactly by the project drawings.

3.1.3.8 Screwed Joints in Piping

Provide teflon tape or suitable pipe joint compound applied to male threads only for making up screwed joints. Piping shall be free from fins and burrs. Ream or file out pipe ends to size of bore, and remove chips.
3.1.3.9 Welded Joints

Weld joints in piping by the metal-arc or gas welding processes in accordance with ASME B31.1 and as specified in Section 40 17 26.00 20 WELDING PRESSURE PIPING. Number or mark each weld to identify the work done by each welder on welds on which stress relieving or radiographic inspection is required.

a. Contracting Officer reserves the right to require the Contractor to provide re-examination and re-certification of welders.

b. Radiographic testing of circumferential butt welded joints of pipe with operating temperature of 177 degrees C 350 degrees F and above shall be required on ten percent of the joints, the location of which will be determined by the Contracting Officer; when more than ten percent of the radiographically tested joints show unacceptable defects radiographically test joints of this type piping.

c. Equipment and Protection: Items of equipment for welding shall be so designed and manufactured, and shall be in such condition as to enable qualified operators to follow procedures and to attain the results specified. Protect welders and gas cutters from the light of the arc and flame by approved goggles, shields, helmets, and gloves. Replace cover glasses in helmets and shields when they become sufficiently marred to impair the operator's vision. Take care to avoid risk of explosion and fire when welding and gas cutting near explosive or flammable materials. Ventilate welding and gas cutting operations in accordance with paragraph 29 CFR 1910-SUBPART Q (f) of Title 29 of the Code of Federal Regulations).

d. Surface Conditions: Do not weld when atmospheric temperature is less than minus 18 degrees C zero degrees F, when surfaces are wet, when rain or snow is falling or moisture is condensing on surfaces to be welded, nor during periods of high wind, unless welder and work are protected properly. At temperatures between zero and minus 18 degrees C 32 and zero degrees F heat with a torch the surface for an area within 80 mm 3 inches of the joint to be welded to a temperature warm to the hand before welding. Free surfaces to be welded from loose scale, slag, rust, paint, oil, and other foreign material. Joint surfaces shall be smooth, uniform and free from fins, tears, and other defects which might affect proper welding. Remove slag from flame-cut edges to be welded by grinding, but temper color need not be removed. Thoroughly clean each layer of weld metal by wire brushing prior to inspection or deposition of additional weld metal.

3.1.3.10 Cleaning of Piping

Before installing pipe, thoroughly clean it of sand, mill scale and other foreign material. After erection but before final connections are made to apparatus thoroughly clean interior of piping. Flush with water piping except air and fuel lines, in addition, blow out steam lines with intermittent high pressure steam blows to promote shedding of internal scale; blow compressed air and fuel oil lines clean with 552 to 690 kPa (gage) 80 to 100 psig air dried to a 2 degrees C 35 degree F dew point at 552 kPa (gage) 80 psig. Sterilize potable water piping by means of liquid chlorine or hypochlorite in accordance with AWWA C651 before placing water system in service. Take care during fabrication and installation, to keep piping, valves, fittings and specialties free of loose welding metal chips of metal or slag, welding rods and other foreign matter. Blowing or
flushing shall in no case be channeled through equipment, pump, control valve, regulating valve, instrument gage or specialty in the system. Provide temporary screens, strainers, connections, spool pieces and bypasses consisting of piping or hoses, pumps and other required equipment temporarily installed for the purpose of cleaning and flushing piping. Drain flushing water and test water to the sanitary sewer system.

3.1.3.11 Reduction in Pipe Size

Provide reducing fittings for changes in pipe size; the use of bushings will not be permitted. In horizontal steam lines, reducing fittings shall be the eccentric type to maintain the bottom of the lines in the same plane. In horizontal water mains, reducers shall be set to maintain top of lines in the same plane.

3.1.3.12 Expansion Control

Provide bends, loops, and offsets wherever practical to relieve overstressed piping systems due to thermal expansion and to provide adequate flexibility. Cold spring piping system as indicated but not more than an amount greater than 50 percent of the total linear expansion.

3.1.3.13 Connection to Equipment

Provide unions or flanges where necessary to permit easy disconnection of piping and apparatus. Provide unions and gate valves at each connection to threaded end control valves, strainers and equipment.

3.1.3.14 Valve Installation

Install valves in positions accessible for operation and repair. Install stems in a vertical position with handwheels or operators on top or in a horizontal position. Do not install handwheels on stop valves below the valve. When the centerline of any valve is more than 2 meters 7 feet above the floor or platform, provide the valve with a chain-operated handwheel. When the valve is motorized, provide hand operation for emergency use.

a. Gate Valves: Arrange back outlet gate valves for turbine exhaust for hand operation and provide with a floor stand.

b. Globe Valves: Pressure shall be below the disc. Install globe valves with stems horizontal on steam and exhaust lines, when better drainage is required or desired.

c. Steam Pressure-Reducing Valves: Provide the steam line entering each pressure-reducing valve with a strainer. Provide each pressure-reducing valve unit with two shutoff valves and with a globe or angle bypass valve and bypass pipe. A bypass around a reducing valve shall be of reduced size to restrict its capacity to approximately that of the reducing valve. Provide each pressure-reducing valve unit with indicating steam gages to show the reduced pressure and the upstream pressure and an adequately sized safety valve on the low pressure side.

d. Valve Tags and Charts: Permanently tag each valve with a black and white engraved laminated plastic tag showing valve number, valve function and piping system and whether another valve must be opened or closed in conjunction with this valve. Provide a typed chart which will show the required valve tagging plus the location of each valve;
frame valve charts under glass and install as directed.

3.1.3.15 Traps and Connections

Traps shall be of the type and capacity for the service required, and shall be properly supported and connected. Except for thermostatic traps in pipe coils, radiators, and convectors, install traps with a dirt pocket and strainer between it and the piping or apparatus it drains. Whenever it is necessary to maintain in continuous service apparatus or piping which is to be drained, provide a three valve bypass so that the trap may be removed and repaired and condensate drained through the throttled bypass valve. Provide a check valve on the discharge side of the trap whenever the trap is installed for lift or operating against a back pressure, or it discharges into a common return line. Provide test connections on the discharge side of the high and medium pressure traps when they are specifically required. Test connection shall include a 15 mm 1/2 inch globe valve with open blow.

3.1.3.16 Pressure Gage Installation

Pressure gages shall have a shutoff valve or petcock installed between the gage and the line, and gage on steam lines shall have a siphon installed ahead of the gage.

3.1.3.17 Thermometer and Sensing Element Installation

Provide thermometers and thermal sensing elements of control valves, with a separable socket. Install separable sockets in pipe lines in such a manner to sense flowing fluid temperature and minimize obstruction to flow.

3.1.3.18 Strainer Locations

Provide strainers with meshes suitable for the services upstream of each control valve and where dirt might interfere with proper operation of valve parts, orifices, or moving parts of equipment.

3.1.3.19 Dissimilar Piping Materials

Provide dielectric unions or flanges between ferrous and nonferrous piping, equipment, and fittings, except that bronze valves and fittings may be provided without dielectric couplings for ferrous-to-ferrous or nonferrous-to-nonferrous connections. Dielectric fittings shall utilize a nonmetallic filler which will prevent current flow from exceeding one percent of the short circuit current. Spacer shall be suitable for the pressure and temperature of the service. Fittings shall otherwise be as specified in this section.

3.1.3.20 Surface Treating, and Pipe Wrapping

Uninsulated steel piping buried in the ground shall have exterior surfaces protected with a tape wrapping system or a continuously extruded polyethylene coating system as specified in Section 09 97 13.28 PROTECTION OF BURIED STEEL PIPING AND STEEL BULKHEAD TIE RODS.

3.1.4 Painting

Unless specified otherwise, pipe hangers, structural supports, pipe and pipe fittings, conduit and conduit fittings, air grilles, pipe coverings, insulation, and metal surfaces associated with mechanical and electrical...
3.1.4.1 Piping, Fittings, and Mechanical and Electrical Equipment

Equipment shall be factory finished to withstand the intended end use environment in accordance with the specifications for particular end item. Factory finished equipment on which the finish has been damaged shall have damaged areas retouched and then be given a complete finish coat to restore the finish to its original condition. Finish coat shall be suitable for exposure in the intended end use environment.

3.1.4.2 Boilers

After erecting and testing boilers, clean as necessary exposed surfaces of boiler normally painted in commercial practice to remove grease, coal dust, flyash and other foreign matter and finish with one coat of aluminum heat resisting paint applied to minimum dry film thickness of 0.025 mm one mil.

3.1.4.3 Vertical Fuel Oil Tank

Clean interior surfaces to bare metal in accordance with SSPC SP 10/NACE No. 2. Clean to bare metal by powered wire brushing or other mechanical means surfaces that cannot be cleaned satisfactorily by blasting. Wash members which become contaminated with rust, dirt, oil, grease, or other contaminants with solvents until thoroughly clean. Remove weld backing plates prior to blast cleaning; when left in place, round off corners prior to blast cleaning and coating. Internally coat tanks in accordance with Section 09 97 13.17 THREE COAT EPOXY INTERIOR COATING OF WELDED STEEL PETROLEUM FUEL TANKS.

3.1.4.4 Surfaces Not to be Painted

Unless specified otherwise, do not paint equipment having factory applied permanent finish, switchplates and nameplates, motor starters, and concrete foundations.

3.1.5 Insulation

Insulate mechanical equipment, systems and piping as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

3.2 FIELD QUALITY CONTROL

Furnish labor, equipment, test apparatus required and materials for preparation and performance of tests and inspections specified to demonstrate that the steam heating plant as installed, are in compliance with contract requirements. During start-up and during tests, ensure the presence of factory trained engineers or technicians employed by the boiler manufacturer and system suppliers of such components as the boiler, stoker, burner, combustion controls, ash handling system, air pollution control system, feedwater treatment equipment, and other auxiliary equipment, to ensure proper functioning, adjustment, and testing of the individual components and systems. Furnish a detailed written record of test conditions, test procedures, field data, and the start-up and operational performance of the entire heating plant to the Contracting Officer before
the Contractor's operational and test personnel leave the site. The Government will furnish, when available, water, electricity and fuel for the tests, except fuel required for retesting. The Contractor shall rectify defects disclosed by the tests and retest the equipment. The Contractor's boiler plant personnel shall be experienced in starting up and operating boiler plants.

3.2.1 Tests and Inspections (Piping)

Examine, inspect, and test piping in accordance with ASME B31.1 except as modified below. The Contractor shall rectify defects disclosed by the tests. Necessary subsequent tests required to prove system tightness after additional work by the Contractor shall be furnished by the Contractor. Make tests under the direction of and subject to the prior approval of the Contracting Officer.

3.2.1.1 Hydrostatic and Leak Tightness Tests

a. Test piping systems attached to the boilers and included under the jurisdiction of ASME BPVC SEC I in accordance with the requirement of that Code. Piping bearing ASME Code symbol stamp will be accepted only as indicating compliance with the design and material requirements of the code.

b. Test piping which is a part of the steam generation or auxiliary systems, including piping within the boiler room and external to the boiler room, by the following methods:

   (1) Perform hydrostatic test at 150 percent of design pressure for welded and screwed steel piping systems except those for air, oil, and gas. Hold hydrostatic tests for a period of one hour with no pressure loss. Temperature of testing fluid shall not exceed 38 degrees C 100 degrees F.

   (2) Test air and oil lines in accordance with the requirements of ASME B31.1 for pneumatic tests with the exception that the test pressure must be held for one hour. Examine for leaks by a soap or other foaming agent test.

   (3) Inspection and test of gas piping shall conform to the requirements of NFPA 54.

c. For each test, install a calibrated test pressure gage in the system to observe loss in pressure.

3.2.2 Preliminary Operation

The Contractor under the direction of the respective manufacturer's representative shall perform the work of placing in operation equipment provided by the Contractor, except as specifically noted otherwise. Make adjustments to equipment that are necessary to ensure proper operation as instructed by the manufacturer of the equipment.

a. Lubricate equipment prior to operation in accordance with the manufacturer's instructions. Lubricants shall be provided by the Contractor. Contractor shall furnish lubrication gun with spare cartridges of lubricant to operating personnel.

b. Dry out motors before operation as required to develop and maintain
proper and constant insulation resistance.

c. Check drive equipment couplings for proper alignment at both ambient and operating temperature conditions.

3.2.3 General Startup Requirements

Prior to initial operation of complete system, check each component as follows:

a. Inspect bearings for cleanliness and alignment and remove foreign materials found. Lubricate as necessary and in accordance with the manufacturer's recommendations. Replace bearings that run roughly or noisily.

b. Adjust direct drives for proper alignment of flexible couplings. Provide lubrication when a particular coupling so requires. Check security of couplings to driver shafts. Set drive components to ensure free rotation with no undesirable stresses present on the coupling of attached equipment.

c. Check motors for amperage comparison to nameplate value. Correct conditions that produce excessive current flow and that exist due to equipment malfunction.

d. Check speeds of each motor and driven apparatus to ensure that they are operating at the desired point.

e. Check the actual suction and discharge pressure of each pump against the desired performance curves.

f. Check pump packing glands or seals for cleanliness and adjustment before running each pump. Inspect shaft sleeves for scoring and proper placement of packing; replace when necessary. Ensure piping system is free of dirt and scale before circulating liquid through pumps.

g. Inspect both hand and automatic control valves. Clean bonnets and stems, tighten glands to ensure no leakage, but permit valve stems to operate without galling. Replace packing in valves that require same to retain maximum adjustment after system is judged complete. Replace entire packing in valves that continue to leak after adjustment. Remove and repair bonnets that leak. Coat packing gland threads and valve stems with a suitable surface preparation after cleaning.

h. Inspect and make certain that control valve seats are free from foreign material and are properly positioned for the intended service.

i. Check flanges and packing glands after the system has been placed in operation. Replace gaskets in flanges that show signs of leakage after tightening.

j. Inspect screwed joints for leakage and remake each joint that appears to be faulty. Do not wait for rust to form. Clean threads on both parts, apply compound and remake joint.

k. Strainers installed shall be thoroughly blown out through individual valved blow-off connection on each strainer prior to placing in operation.
1. Thoroughly blow out or dismantle and clean strainers after systems have been in operation one week. Thoroughly clean, repair, and place back in service traps or other specialties in which foreign matter has accumulated, causing malfunction or damage.

m. Adjust pipe hangers and supports for correct pitch and alignment.

n. Remove rust, scale and foreign materials from equipment and renew defaced surfaces. When equipment is marred, the Contracting Officer shall have the authority to request that new materials be provided.

o. Adjust and calibrate temperature, pressure and other automatic control systems.

p. Inspect each pressure gage and thermometer for calibration, and replace those that are defaced, broken or read incorrectly.

q. Vertical Fuel Oil Tank Calibration: After completing installation of tank, prepare a calibration table for the tank showing volume of fuel in liters, gallons in tank to any height of liquid in meters and mm, feet, inches, and eighths of an inch when measured by a steel tape lowered through the roof. Calibrate tank in accordance with ASTM D1220 for "critical measurement" "operating control." Correct the data obtained for use with the product to be stored.

3.2.4 Plant Equipment Tests

3.2.4.1 Plant Air Compressors

Test plant air compressors in service to determine compliance with contract requirements and warranty. During the tests, test equipment under every condition of operation. Test safety controls to demonstrate performance of their required function. Completely test system for compliance with specifications.

3.2.4.2 Coal Handling System

Test coal handling system under operating conditions and demonstrate that the work is in conformance with the specified requirements. Conduct this test in the presence of the Contracting Officer.

3.2.4.3 Fuel Oil Tanks

**********************************************************************************************************
NOTE: Choose one of following subparagraphs.
**********************************************************************************************************
[ a. Horizontal Fuel Oil Tanks (Below Ground)

(1) Test tanks before placing in service, in accordance with the applicable paragraphs of the code under which they were built. A UL label, ASME Code Stamp, or API monogram on a tank shall be evidence of compliance with code requirements.

(2) Holiday Detection Test: Inspect coal tar epoxy coating system for film imperfections using a low voltage (75 volt) holiday tester. Inspect FRP coated tanks with a 10,000 volt spark test for imperfections or holidays. Repair holidays or pinholes in the coatings.
b. Vertical Fuel Oil Tank: Inspect and test as specified in API Std 650. Use the radiographic method of inspection of butt welds as required by API Std 650; sectioning method will not be acceptable as an alternative to radiographic inspection.

3.2.4.4 Blowdown Valves and Try Cocks

Test blowdown valves and try cocks for proper operation.

3.2.4.5 Fans, Heaters, Pumps, and Motors

Test draft fans, fuel oil heaters, fuel pumps, and electric motors to determine compliance with the referenced standards. Standard symbols and certifications from the referenced organization may be accepted at the discretion of the Contracting Officer. Closely observe the operation of fans, fuel oil heaters, fuel pumps, and electric motors for possible defects or nonconformance.

3.2.5 Boilers and Auxiliaries Tests and Inspections

The Contractor, with qualified personnel provided by the Contractor, shall make tests and inspections at the site under the direction of and subject to the approval of the Contracting Officer. Furnish direction of the Contractor's boiler plant personnel in the operation of each boiler and appurtenances through the entire testing period, from the respective manufacturer's representatives and consultants and ensure that necessary adjustments have been made. The Contractor shall notify the Contracting Officer in writing at least 7 days in advance that equipment is ready for testing. The Contractor shall furnish testing equipment, including gages, thermometers, calorimeter, Orsat apparatus, thermocouple pyrometers, fuel flow meters, water meters and other test apparatus and calibrate instruments prior to the test. Draft, fuel pressure and steam flow may be measured by permanent gages and meters installed under the contract. The Contractor is responsible for providing an analysis of the fuel being used for the tests. Control of noise levels developed by exhaust steam shall be as directed by the Contracting Officer to satisfy the environmental conditions of the surrounding area. The Contractor shall perform the following tests when feasible in the sequence as listed:

a. Strength and tightness tests
b. Standards compliance tests
c. Preliminary operational tests (steady state combustion test and variable load combustion test)
d. Tests of auxiliary equipment
e. Feedwater equipment test
f. Capacity and efficiency tests

3.2.5.1 Strength and Leak Tightness Tests

Subject boilers to the following strength and tightness tests:

a. Watersides Including Fitting and Accessories: Hydrostatically test watersides in accordance with the requirements of ASME BPVC SEC I The
ASME label will be accepted as evidence of this test.

b. Boiler Casing, Air Casing, and Ducts: Test air casing and ducts exterior to the furnace pneumatically at the maximum working pressure. Use the soap bubble method to verify tightness. Test gas sides of boilers normally operated under pressure for tightness at one and one half times the predicted operating pressure in the furnace at maximum continuous output. For this test, tightly seal the boiler with a suitable means to blank off openings. Admit air to the boiler until the test pressure is reached, and then hold. When, in a 10 minute period the pressure drop does not exceed \(1245 \text{ Pa} = 5 \text{ inches water gage}\), the casing shall be regarded as tight and accepted. Use air pressure and soap bubble tests or comparative carbon dioxide readings for induced draft boilers.

3.2.5.2 Boiler Inspection

The Boiler Inspector shall be present to witness the appropriate tests which need to be observed in order to certify the safety of the boiler. The inspection shall include the requirements of NAVFAC MO 324. The Boiler Inspector shall complete NAVFAC form 9-11014/40, Data Record Sheet; NAVFAC form 9-11014/41, Inspection Report; NAVFAC 9-11014/32 Inspection Certificate for each boiler after inspecting the boiler and finding it to be safe. No boiler may be fired until it has passed the inspection of the Boiler Inspector. The boiler inspection forms shall be submitted through the Contractor to the Contracting Officer. The Inspection Certificate shall be placed under framed glass, mounted on or near the boiler in a conspicuous location.

3.2.5.3 Boiler Cleaning and Startup

Dry out, boil out, and operate the firing rate of the new boiler(s) under direct responsibility and supervision of the manufacturer[, and in the presence of the boiler room operating personnel]. Provide chemicals that are required. Allow sufficient time for the boiling out process to ensure interior surfaces are clean. This time shall be at least 24 continuous hours and generally not more than 36 hours; boil out shall continue until water is clear. Boil out, cleaning and starting procedures shall be in accordance with requirements of ASME BPVC SEC VII, and FM DS 12-17.

3.2.5.4 Boiler Preliminary Operational Tests

Conduct a boiler operational test on each unit continuously for two weeks. Operate one boiler at a time to demonstrate control and operational conformance to specified requirements including ability to respond to load swings from the specified capacity to minimum turndown. Operational test shall be conducted under the supervision of a registered professional engineer or a licensed power plant operator and shall serve to prove safeties, controls, maintenance of stable combustion at low loads[, proper coal distribution and combustion, and ability to operate without furnace slagging][, proper flame lengths and patterns to avoid flame impingement on the tubes for oil firing], and proper mechanical and electrical functioning of systems. This test shall include each item mentioned in this specification as well as each item mentioned in the specification of the particular pieces of equipment. Conduct tests with factory trained combustion equipment engineers, as previously specified. Test and record steam quality rates of steam flow, flue gas temperature, percentages of carbon dioxide, carbon monoxide, oxygen and nitrogen in the flue gas and percent excess air for each boiler at tested load and
graphically present test data.

3.2.6 General Operational Tests

3.2.6.1 General Controls

Operational tests, performance tests, and demonstration tests shall be conducted with boiler controls functional and on line. No bypassing, use of jumpers, or other disablement of control systems will be allowed unless specified elsewhere.

3.2.6.2 Steady State Combustion Tests

Test fuel burning and combustion control equipment with each of the specific fuels at the minimum limit of the turndown range and at increments of 50, 75 and 100 percent of full rated load. Each test run shall be at least two hours on each fuel and until stack temperatures are constant and capacity and efficiency requirements of this specification have been verified and recorded. Verify proper operation of instrumentation and gages during the tests.

3.2.6.3 Varying Load Combustion Tests

Test boilers continuously under varying load conditions to demonstrate proper operability of the combustion control, flame safeguard control, programming control and safety interlocks. Conduct these tests after adjustment of combustion controls has been completed under the steady state combustion tests. Continue variable load operational tests for a period of at least 8 hours.

a. Sequencing: Boiler shall start, operate and stop in strict accordance with the specified operating sequence.

b. Flame Safeguard: Verify operation of flame safeguard controls by simulated flame and ignition failures. Verify trial-for-pilot ignition, trial-for-main flame ignition, combustion control reaction and valve closing times by stop watch.

c. Immunity to Hot Refractory: Operate burner at high fire until combustion chamber refractory reaches maximum temperature. Main fuel valve shall then be closed manually. Combustion safeguard shall drop out immediately causing safety shutoff valves to close within the specified control reaction and valve closing times.

d. Pilot Intensity Required: Gradually reduce fuel supply to the pilot flame to the point where the combustion safeguard begins to drop out (sense "no flame") but holds in until main fuel valve opens. At this point of reduced pilot fuel supply, the pilot flame shall be capable of safely igniting the main burner. When the main fuel valve can be opened on a pilot flame of insufficient intensity to safely light the main flame, the boiler shall be rejected.

e. Boiler Limit and Fuel Safety Interlocks: Safety shutdown shall be caused by simulating interlock actuating conditions for each boiler limit and fuel safety interlock. Safety shutdowns shall occur in the specified manner.

f. Combustion Controls: Demonstrate accuracy, range and smoothness of operation of the combustion controls by varying steam demand through
entire firing range required by turndown ratio specified for the burner. Control accuracy shall be as specified.

g. Safety Valves: High pressure limit switch shall be locked out or otherwise made inoperative and the boiler safety valves shall be lifted by steam. Determine the relieving capacity, popping pressure, blowdown and reseating pressure by observation and measurement in accordance with the ASME BPVC SEC I. The ASME standard symbol will be accepted only as indicating compliance with the design and material requirements of the code.

3.2.6.4 Auxiliary Equipment and Accessory Tests

Observe and test blowdown valves, stop valves, try cocks, draft fans, fuel oil heaters, pumps, electric motors, and other accessories and appurtenant equipment during the operational and capacity tests for leakage, malfunctions, defects, and for compliance with referenced standards.

3.2.6.5 Feedwater Equipment Tests

Perform the test of the feedwater treatment equipment in two steps. Conduct one test concurrently with the combustion tests. The Government will perform a second test during the first period of heavy loading after the plant has been accepted and put in service. Correct deficiencies revealed during the Government tests under the guarantee provisions of the contract. Both the first and second series of tests shall determine compliance with the limits for chemical concentrations of this specification. Supply equipment for taking samples and test kit for analyzing samples. Sampling equipment and test kit shall become the property of the Government when tests are completed.

3.2.6.6 Capacity and Efficiency Tests

Perform capacity and efficiency tests after operating tests have been satisfactorily completed and boiler has been operated continuously for at least 14 days with no nuisance shutdowns and without the necessity for frequent or difficult adjustments. Perform these tests on each boiler. Conduct tests using [the] [each] specified fuel. Test procedures shall be in accordance with the heat loss method [and the input-output method] of ASME PTC 4. Before performing tests, the Contracting Officer and the Contractor shall reach agreement on those items identified in ASME PTC 4 Section 3, paragraph 3.01 "Items on Which Agreement Shall be Reached." A test run shall not start until the boiler and accessories have reached an equilibrium and stabilization condition for at least one hour in duration. Duration of tests shall be sufficient to record necessary data but in no case shall each run be less than [4] [10] [24] hours.

a. Accomplish maximum output testing by means of a single 2 hour run at 110 percent load on the boiler under test. Calculate boiler efficiency, both input-output and heat loss, from the consistent readings taken during the runs. Runs shall be made at four different loads 30, 50, 70, and 100 percent of boiler rating during which both heat loss and input-output data shall be taken. Predict unmeasured losses used in conjunction with heat loss calculations and include with equipment data when submitted for approval. Subsequent tests required because of failure of the equipment to perform adequately during specified capacity and efficiency tests shall be the financial responsibility of the Contractor, including the cost of fuel.
b. Should analysis of the coal being burned during performance tests vary from that specified as the performance coal, the guarantees shall be adjusted in accordance with accepted engineering practice to determine compliance. Carbon loss shall be determined in accordance with American Boiler Manufacturers Association curves for carbon loss.

3.2.6.7 Temporary Waste Steam Connection

When necessary to obtain sufficient load for these tests, provide a temporary steam line at a point outside of building. Provide necessary pipe, fittings, supports, anchors and appurtenances including a field fabricated silencer as directed by the Contracting Officer. Remove temporary piping and silencer after tests have been satisfactorily completed.

3.2.6.8 Fire Safety for Oil-Fired Boilers

Conduct tests as necessary to determine compliance with the applicable UL Safety Standards. The presence of the applicable Underwriters' label may be accepted as evidence of compliance in this respect when equipment is manufacturer's standard commercial product.

a. Oil-Fired Boilers: Meet test requirements of UL 726.

b. Oil Burners: Meet test requirements of UL 296.

3.2.6.9 Plant Acceptance Operation

**************************************************************************

NOTE: Include bracketed portion when project is for coal fired installation with flue gas desulfurization system.

**************************************************************************

After satisfactory completion of tests specified, operate complete plant including each boiler [and its related flue gas cleaning equipment] and subsystems for a period of 30 continuous 24 hour operational days prior to final acceptance by the Government. Furnish labor, chemicals, test equipment and apparatus; the Government will furnish fuel, electricity and water. During this 30 day period, furnish readily available, services of qualified representatives from manufacturers of each plant component and system for the purpose of additional operational assistance, component and system adjustment and repairs. Government personnel will observe Contractor's operational procedures. The Contractor's representatives shall be prepared to answer pertinent questions from the Government about the plant operation.

3.2.6.10 NAVFACENGCOM Acceptance

Operational, piping systems, auxiliary equipment and accessory testing shall be completed prior to requesting an acceptance inspection by a Naval Facilities Engineering Command (NAVFACENGCOM) Boiler Inspector. The Contracting Officer, upon receipt of 14 calendar days advance notice from the Contractor, shall request that the boiler plant by a qualified NAVFACENGCOM Boiler Inspector. Contractor shall perform final operational performance testing of all plant systems in the presence of the NAVFACENGCOM Boiler Inspector, at the inspector's discretion. The NAVFACENGCOM Boiler inspector shall receive copies, and review the results, of all pertinent operational test reports before approving acceptance of
the boiler plant by the Government.

3.2.7 Manufacturer's Field Services

3.2.7.1 Erection/Installation Supervisors and Service Engineers

a. Boiler: Furnish the services of a competent supervisor who is in the direct employ of the boiler manufacturer. This supervisor shall remain on the construction site the full 8 hours per day, 5 days per week, or the same hours as the boiler erectors are on the job. This supervisor shall be responsible for the complete steam generating unit, including the steam generator, stoker, fans and related work, such as refractory, or insulation regardless of whether the stoker, fans or other related items of work are furnished by manufacturers other than the boiler manufacturer.

b. Stoker: Furnish a competent erection supervisor for the equipment furnished by the stoker manufacturer.

c. Fans: Furnish a company service engineer to advise on the erection or installation of fans and related equipment.

d. Service Engineers: Furnish services of the manufacturing companies' service engineers and the system suppliers' service engineers to advise during erection and installation of other systems and equipment such as control system, ash handling system, coal handling system, air compressors, air dryers, boiler feedwater pumps, fuel oil pumps, condensate pumps, water treatment equipment, chemical feed pumps, deaerating feedwater heater and stacks.

3.2.7.2 Boiler and System Representatives

Furnish factory trained engineers or technicians who are representatives of the boiler manufacturer and system supplier to supervise testing of the boilers and auxiliary equipment.

Furnish the services of a Boiler Inspector who is qualified and certified as such by the National Board of Boiler and Pressure Vessel Inspectors and who is presently employed full time by a firm, such as Hartford Steam Boiler Inspection and Insurance Company, which has a business of inspecting boilers.

3.2.7.3 Instruction to Government Personnel

Supervisors and service engineers shall provide instruction for the Government's operators in the operation and maintenance of the equipment furnished under this section. The minimum number of hours provided shall
be as follows:

<table>

2.5 FANS
   2.5.1 Forced Draft Fan
      2.5.1.1 Fan Size
      2.5.1.2 Fan Construction
      2.5.1.3 Electric Motor
      2.5.1.4 Noise Level

2.6 COMPRESSED AIR SYSTEM
   2.6.1 Plant Compressed Air System
      2.6.1.1 Air Filter
      2.6.1.2 Oil Filter
      2.6.1.3 Air Receiver
      2.6.1.4 Electric Motor
      2.6.1.5 Controls
   2.6.2 Instrument Compressed Air System
      2.6.2.1 Air Compressor
      2.6.2.2 Air Receiver
      2.6.2.3 Aftercooler
      2.6.2.4 Electric Motor
      2.6.2.5 Controls
2.6.2.6 Accessories
2.6.2.7 Air Dryers
2.6.3 Pressure Reducing Regulator

2.7 BREECHING, EXPANSION JOINTS, STACKS, AND DAMPERS:

2.7.1 Breeching
2.7.1.1 Breeching Connections and Joints
2.7.1.2 Uninsulated Breeching
2.7.1.3 Breeching Access Doors
2.7.1.4 Breeching Cleanout Doors
2.7.1.5 Breeching Structural Materials

2.7.2 Expansion Joints
2.7.2.1 Metallic Breeching Expansion Joints
2.7.2.2 Non-Metallic Expansion Joints

2.7.3 Stacks (For Installation Without Flue Gas Scrubbers)
2.7.3.1 Construction
2.7.3.2 Construction Accessories
2.7.3.3 Finish
2.7.3.4 Stack Sampling Platform

2.7.4 Dampers
2.7.4.1 Multilouver Dampers
2.7.4.2 Guillotine Dampers

2.7.5 Sampling Ports

2.8 FUEL OIL SYSTEM

2.9 MISCELLANEOUS EQUIPMENT

2.9.1 Condensate Receiver
2.9.1.1 Coating
2.9.1.2 Accessories

2.9.2 Deaerating Heater
2.9.2.1 General
2.9.2.2 Heater Capacity
2.9.2.3 Inlet Water Characteristics
2.9.2.4 Storage Tank
2.9.2.5 Vent Condensing Arrangement
2.9.2.6 Materials
2.9.2.7 Accessories
2.9.2.8 Connections
2.9.2.9 Level Control
2.9.2.10 Low Pressure Steam Control
2.9.2.11 Gage Glasses
2.9.2.12 Alarms
2.9.2.13 Multiport Back Pressure Relief Valve
2.9.2.14 Exhaust Head

2.9.3 Boiler Feed Pumps
2.9.3.1 Pump Service Requirements
2.9.3.2 Construction
2.9.3.3 Electric Motors
2.9.3.4 Steam Turbines
2.9.3.5 Minimum Flow Protection for Boiler Feed Water Pumps

2.9.4 Condensate Pumps
2.9.4.1 Condensate Pump Service Requirements
2.9.4.2 Construction
2.9.4.3 Electric Motors
2.9.4.4 Steam Turbines

2.9.5 Variable Speed Motor Controller
2.9.5.1 Housing
2.9.5.2 Variable Frequency Controllers
2.9.5.3 Ratings
2.9.5.4 Minimum Speed
2.9.5.5 Fault Protection
2.9.5.6 Time Delay
2.9.5.7 Acceleration/Deceleration
2.9.5.8 Voltage/Frequency Control
2.9.5.9 Door Interlocks
2.9.5.10 Shutdown Conditions
2.9.5.11 Electrical Bypass
2.9.5.12 Controller Environmental Protection
2.9.5.13 Method of Control

2.9.6 Valve Actuators

2.9.7 Sump Pumps

2.9.8 Water Softening System
  2.9.8.1 Raw Water Analysis
  2.9.8.2 Softener Effluent Analysis
  2.9.8.3 Softener Equipment
  2.9.8.4 Brine Storage System
  2.9.8.5 Brine Storage System Accessories
  2.9.8.6 Storage Tank

2.9.9 Chemical Feed Systems
  2.9.9.1 Storage Tank
  2.9.9.2 Exterior Gage Glass
  2.9.9.3 Low Level Alarm
  2.9.9.4 Dissolving Baskets
  2.9.9.5 Tank Strainer
  2.9.9.6 Supporting Steelwork
  2.9.9.7 Agitator
  2.9.9.8 Proportioning Pumps
  2.9.9.9 Safety Relief Valve

2.9.10 Blowdown Tank
  2.9.10.1 Construction
  2.9.10.2 Tank Connections
  2.9.10.3 Angle Supports and Coating
  2.9.10.4 Accessories
  2.9.10.5 Controls

2.9.11 Continuous Blowdown System
  2.9.11.1 Automatic Blowdown Controller
  2.9.11.2 Flow Assembly
  2.9.11.3 Controller/Programmer
  2.9.11.4 Accessories and Connections
  2.9.11.5 Flash Tank
  2.9.11.6 Blowdown Inlet
  2.9.11.7 Automatic Control System
  2.9.11.8 Sample Cooler
  2.9.11.9 Heat Exchanger

2.10 PIPING

2.10.1 Piping Materials
2.10.2 Chlorinated Polyvinyl Chloride (CPVC)

2.10.3 Fittings
  2.10.3.1 Fittings for Steel Pipe
  2.10.3.2 Welded Outlets and Welding Saddles
  2.10.3.3 Fittings For Copper Tubing
  2.10.3.4 Unions

2.10.4 Flanges

2.10.5 Valves
  2.10.5.1 Low Pressure
  2.10.5.2 Medium Pressure
  2.10.5.3 High Pressure
  2.10.5.4 Ball Valves
  2.10.5.5 Valve Accessories
  2.10.5.6 Steam Pressure Regulating Valves
2.10.5.7 Safety Relief Valves
2.10.6 Bolts and Nuts
2.10.7 Gaskets
2.10.8 Expansion Joints
   2.10.8.1 Slip Tube Expansion Joints
   2.10.8.2 Flexible Ball Expansion Joints in Piping
   2.10.8.3 Bellows Expansion Joints
2.10.9 Pipe Hangers and Supports
2.10.10 Instrumentation
   2.10.10.1 Pressure and Vacuum Gages
   2.10.10.2 Indicating Thermometers
2.10.11 Miscellaneous Pipeline Components
   2.10.11.1 Cold and Hot Water Meters
   2.10.11.2 Air Traps
   2.10.11.3 Steam Traps
   2.10.11.4 Strainers
2.10.12 Backflow Preventers
2.10.13 Insulation Types and Installation Procedures
2.10.14 Pipe Sleeves
   2.10.14.1 Floor Slabs, Roof Slabs, and Outside Walls Above and
   Below Grade
2.10.14.2 Partitions
2.10.15 Piping Identification
2.11 FIRE PROTECTION SYSTEM
2.12 MARKING
2.13 TOOLS AND TESTING EQUIPMENT
2.14 WELDING MATERIALS
2.15 MOTORS AND DRIVES
2.16 SOURCE QUALITY CONTROL
   2.16.1 Plant Equipment Tests
      2.16.1.1 Plant Air Compressors
      2.16.1.2 Instrument Air Compressors
      2.16.1.3 Variable Speed Motor Controller Factory Test

PART 3 EXECUTION

3.1 INSTALLATION
   3.1.1 Equipment Installation
      3.1.1.1 Equipment Foundations
      3.1.1.2 Forced Draft Fan
      3.1.1.3 Stack
      3.1.1.4 Fuel Oil Tanks
   3.1.2 Piping
      3.1.2.1 Fittings
      3.1.2.2 Grading of Pipe Lines
      3.1.2.3 Anchoring, Guiding, and Supporting Piping
      3.1.2.4 Copper Tubing
      3.1.2.5 Sleeves
      3.1.2.6 Flashing for Buildings
      3.1.2.7 Outlets for Future Connections
      3.1.2.8 Screwed Joints in Piping
      3.1.2.9 Welds and Welded Joints
      3.1.2.10 Cleaning of Piping
      3.1.2.11 Reduction in Pipe Size
      3.1.2.12 Expansion Control
      3.1.2.13 Connection to Equipment
      3.1.2.14 Valve Installation
      3.1.2.15 Traps and Connections
      3.1.2.16 Pressure Gage Installation
3.1.2.17 Thermometer and Sensing Element Installation
3.1.2.18 Strainer Locations
3.1.2.19 Dissimilar Piping Materials
3.1.2.20 Surface Treating, and Pipe Wrapping
3.1.3 Painting
  3.1.3.1 Piping, Fittings, and Mechanical and Electrical Equipment
  3.1.3.2 Other Items
  3.1.3.3 Boilers
  3.1.3.4 Vertical Fuel Oil Tank
  3.1.3.5 Surfaces Not to be Painted
3.1.4 Insulation
3.2 FIELD QUALITY CONTROL
  3.2.1 Tests and Inspections (Piping)
    3.2.1.1 General Requirements
    3.2.1.2 Hydrostatic and Leak Tightness Tests
  3.2.2 Preliminary Operation
  3.2.3 General Startup Requirements
  3.2.4 Fuel Oil Tanks
    3.2.4.1 Blowdown Valves and Try Cocks
    3.2.4.2 Fans, Heaters, Pumps, and Motors
  3.2.5 Boilers and Auxiliaries Tests and Inspections
    3.2.5.1 Strength and Leak Tightness Tests
    3.2.5.2 Boiler Inspection
    3.2.5.3 Boiler Cleaning and Startup
    3.2.5.4 Boiler Preliminary Operational Tests
    3.2.5.5 General Controls Operational Tests
    3.2.5.6 Steady State Combustion Tests
    3.2.5.7 Varying Load Combustion Tests
    3.2.5.8 Auxiliary Equipment and Accessory Tests
    3.2.5.9 Feedwater Equipment Tests
    3.2.5.10 Capacity and Efficiency Tests
    3.2.5.11 Test Runs
    3.2.5.12 Fuel Analysis
    3.2.5.13 Temporary Waste Steam Connection
    3.2.5.14 Fire Safety for Oil-fired Boilers
    3.2.5.15 Plant Acceptance Operation
  3.2.6 Manufacturer’s Field Services
    3.2.6.1 Erection/Installation Supervisors and Service Engineers
    3.2.6.2 Boiler and System Representatives
    3.2.6.3 Instruction to Government Personnel
3.3 SCHEDULE

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for steam heating plants from 2 1/2 to 47 1/4 kg/sec 20,000 to 375,000 lbs/hr of steam capacity using packaged watertube boilers which burn either oil or gas or both fuels combined.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: This specification is intended to be used in the procurement and installation of heating plant equipment. Requirements for materials and procedures for special or unusual design shall be added to and modifications made to this specification as necessary to fit specific projects. This guide specification shall be used in conjunction with the following NAVFAC definitive drawings and UFC 3-410-06N, "Central Heating Plants Operation and Maintenance".

NAVFAC NO. DRAWING TITLE
1429301 - STEAM HEATING PLANT NO.2 2 1/2 - 47 1/4 kg
NOTE: Information describing any and all specific project and site conditions which the Contractor would need to know in order to submit a firm price shall be specified in Division 1 of the project specifications. Such conditions include:

1. Allocated space for storage of materials.
2. Railway spurs and sidings available to the Contractor for delivery of materials.
3. Any restrictions on daily working hours.
4. Procedure for scheduling outages and tests.
5. Any noise or traffic restrictions.
6. Availability of utilities required for construction.
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS (AASHTO)

AASHTO M 118 (1979) Coal-Tar Bitumen Used in Roofing, Damp-Proofing, and Waterproofing

### 1.2 RELATED REQUIREMENTS

The following UFGS sections apply to this section, with the additions and modifications specified herein:

a. **01 78 23** OPERATION AND MAINTENANCE DATA

b. **03 30 00** CAST-IN-PLACE CONCRETE

c. **09 90 00** PAINTS AND COATINGS

d. **09 97 13.17** THREE COAT EPOXY INTERIOR COATING OF WELDED STEEL PETROLEUM FUEL TANKS

e. **09 97 13.28** PROTECTION OF BURIED STEEL PIPING AND STEEL BULKHEAD TIE RODS

f. **33 56 10** FACTORY-FABRICATED FUEL STORAGE TANKS
1.3 SYSTEM DESCRIPTION

1.3.1 Design Requirements

**************************************************************************
NOTE: The Energy Policy Act of 2005 and UFC 1-200-02 require new buildings to use 30 percent less energy than the ASHRAE 90.1 - SI ASHRAE 90.1 - IP baseline.
**************************************************************************

1.3.1.1 Boiler Design and Service Conditions

a. Design pressure: [_____] kPa (gage) psig
b. Operating pressure: [_____] kPa (gage) psig
c. Steam temperature: [_____] degrees C F
d. Feedwater temperature: [_____] degrees C F
e. Site elevation: [_____] meters feet
f. Ambient air temperature:
   Minimum: [_____] degrees C F
   Maximum: [_____] degrees C F
g. Maximum continuous output (steam): [_____] kg/sec lb/hr
h. Excess air leaving the boiler: [_____] percent
i. Gas temperature leaving boiler: [_____] degrees C F
j. Total forced draft fan static pressure: [_____] Pa inches WC
k. Gas draft at boiler outlet: [_____] Pa inches WC
l. Oxygen (O2) concentration in flue gas: [_____] percent
m. Carbon monoxide (CO) flue gas concentration: [_____] ppm
n. Nitrogen oxide (NOx) conc. in flue gas: [_____] ppm

******************************************************************************
NOTE: Due to limited manufacturer and boiler size options for FEMP stated efficiency requirements, this document includes boiler efficiency requirements in conformance with ASHRAE 90.1. ASHRAE 90.1 requires that low and medium pressure boilers used primarily in commercial space heating applications meet the following thermal (Et) or combustion (Ec) efficiencies.

Natural Gas-fired Steam (excluding natural draft) rated at 88 kW 300,000 Btuh capacity and larger, Et = 79 percent.

Natural Gas-fired - Natural Draft Steam rated at 88 kW 300,000 Btuh capacity and larger, Et = 77 percent.

#2 Oil-fired Steam rated at 88 kW 300,000 Btuh capacity and larger, Et = 81 percent.

Include all equipment efficiencies on the equipment schedules on the drawings.

******************************************************************************

o. Boiler thermal efficiency: [_____] [_____] percent

1.3.1.2 Economizer

a. Design pressure: [_____] kPa (gage) psig

b. Operating pressure: [_____] kPa (gage) psig

c. Fuel [Natural Gas] [No.: [_____] Fuel Oil]

d. Specific heat of the flue gas: [_____] kJ/kg. C Btu/lb-degree F

e. Feedwater flow: [_____] L/s gpm

f. Flue gas temperature entering economizer: [_____] degrees C F

g. Flue gas temperature leaving economizer: [_____] degrees C F

h. Feedwater temperature entering economizer: [_____] degrees C F

i. Feedwater temperature leaving economizer: [_____] degrees C F

******************************************************************************
NOTE: Unless fuel oil to be burned has an uncommon tendency to foul tubes, finned tube economizers should be suitable for gas and oil. Feedwater temperatures should be 110 degrees C 230 degrees F when sulphur (S) content of oil is 0.5 percent to 1.5 percent; 116 degrees C 240 degrees F, S=1.5 percent to 2 percent; 121 degrees C 250 degrees F, S=2.0 percent to 2.7 percent.

******************************************************************************
j. Maximum pressure drop, economizer gas side: [_____] Pa in. WC

k. Maximum pressure drop, economizer water side: [_____] kPa psi

l. Fouling factor on feedwater side: [_____] 
m. Fouling factor on gas side: [_____] 

1.3.1.3 Fans

Design fan to handle air at temperatures from [_____] to [_____] degrees C F. Fan shall be [single] [double] width inlet, [single] [double] width outlet, with [clockwise] [counter clockwise] rotation when viewed from the motor end.

1.3.1.4 Expansion Joints and Stacks

a. Temperature:
   (1) Maximum ambient: [_____] degrees C F
   (2) Minimum ambient: [_____] degrees C F
   (3) Inlet gas at maximum gas flow (gas): [_____] degrees C F
   (4) Inlet gas at maximum gas flow (oil): [_____] degrees C F
   (5) Inlet gas at minimum gas flow (gas): [_____] degrees C F
   (6) Inlet gas at minimum gas flow (oil): [_____] degrees C F.

b. Gas Flow at Inlet
   (1) Maximum: [_____] kg/s lb/hr
   (2) Minimum: [_____] kg/s lb/hr

c. Required Net Available Draft at Stack Inlet At maximum gas flow: [_____] Pa inches water

d. Gas Exit Velocity (Cone Exit) Maximum at maximum conditions: [_____] m/s ft/sec

e. Flue Gas Acid Dew Point Fuel oil: [_____] degrees C F

f. Test Pressures Shop Test: [_____] Pa inches water

g. Thermal Efficiency of Stack: 96 to 98 percent

h. Stack Friction Maximum at design conditions: [_____] Pa inches water

i. Stack Height
   (1) Ground elevation: [_____] m ft
   (2) Roof elevation: [_____] m ft
   (3) Stack height: [_____] m ft
(4) Foundation or footing elevation: [_____] m ft

j. Wind pressure: [_____] Pa psf

k. Wind velocity, gusting: [_____] km/h mph

l. Stack Diameter Minimum (below exit cone): [_____] mm inches

m. Stack deflection Maximum (from vertical center line): [_____] mm inches

n. Soil bearing stress, maximum: [_____] kg/m2 psf

o. Seismic zone: [_____]  

1.3.1.5 Vertical Fuel Oil Storage Tanks

Design the tank to resist the following loads and forces:

Wind: [_____] Pa pounds per square foot

Seismic zone: [_____]  

Roof live load: [_____] kg/m2 pounds per square foot

Density of liquid: [_____] kg/m3 pounds per cubic foot.

Allow the following combinations of loads, with corresponding percentages of basic stresses to be used in design:

<table>
<thead>
<tr>
<th>Load Combination</th>
<th>Percent of Basic Stress</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dead load plus live load</td>
<td>100</td>
</tr>
<tr>
<td>Dead load plus live load plus wind load</td>
<td>133</td>
</tr>
<tr>
<td>Dead load plus live load plus seismic load</td>
<td>133</td>
</tr>
</tbody>
</table>

1.3.1.6 Fuel Oil Pump and Heater Set

**************************************************************************
NOTE: Tabulated pump data is included in the specifications but it is preferred that such information be shown on the drawings instead.
**************************************************************************

a. Pump/Heater Set

(1) Capacity each pump and each steam heater: [_____] L/s gpm

(2) Suction lift: [_____] kPa ft of water

(3) Discharge pressure at outlet of heater: [_____] kPa (gage) psig

(4) Maximum pump speed: 1750 rpm

(5) Specific gravity range: [.92 to .99] [____to____]
(6) Viscosity at BHP selection point: 5000 ssu
(7) Viscosity range: [500 to 5000] ssu
(8) Oil temperature at inlet of heater: [_____] degrees C F
(9) Oil temperature at outlet of heater: [_____] degrees C F
(10) Maximum oil pressure drop through heater: [_____] kPa psi
(11) Heating medium: Steam
(12) Steam pressure available: [_____] kPa (gage) psig
(13) Steam temperature: [_____] degrees C F
(14) Heater type: [Bare Tube] [Extended Surface]

b. Fuel Oil Heater Set With Electric Startup Heater
   (1) Oil temperature at inlet of heater: [_____] degrees C F
   (2) Oil temperature at outlet of heater: [_____] degrees C F
   (3) Maximum oil pressure drop through heater: [_____] kpa psi
   (4) Capacity of heater: [_____] L/s gpm
   (5) Heating power supply at three phase, 60 Hz: [_____] volts
   (6) Control power supply 120 volts, single phase, 60 Hz.

1.3.1.7 Deaerating Heater
   a. Design pressure: 207 kpa (gage) 30 psig
   b. Normal steam operating pressure: [_____] kPa (gage) psig
   c. Maximum steam operating pressure: [_____] kPa (gage) psig
   d. Capacity (minimum): [_____] kg/sec lb/hr of feedwater
   e. Inlet Conditions at Heater:

f. Outlet temperature of feedwater from heater at design capacity: [_____] degrees C F

g. Heating steam pressure: [_____] kPa (gage) psig

h. Heating steam enthalpy: [_____] kJ/kg Btu/lb

i. Storage capacity to overflow of tank: [_____] liters gallons storage.

1.3.2 Detail Drawings

1.3.2.1 Boiler

Show arrangement and details of foundations, plans, elevations, wall sections, insulation, tubing details, expansion joints, external piping details and schematics, wiring schematics, [economizer and economizer structural details]. Submit descriptive information with the drawings on each item of the drawings.

1.3.2.2 Boiler Room Auxiliary Equipment

Drawings shall show equipment arrangements, wiring and piping diagrams. Include descriptive information for each item shown. Submit drawings showing the following:

a. Water softening equipment

b. Brine storage tank

c. Condensate receiver

d. Condensate transfer pumps including certified performance curves

e. Deaerator

f. Boiler feed pumps including certified performance curves

g. Steam turbines

h. Continuous blowdown system

i. Chemical feed units

j. Air compressors
k. Air dryers
l. Cranes and hoists
m. Plant heating and ventilating equipment and related ductwork

1.3.2.3 Burners
Submit drawings showing the following:
  a. General arrangement
  b. Piping details
  c. Burner control schematics
  d. Flame safety schematics
  e. Component details
  f. Throat tile details

1.3.2.4 Dampers, Stacks, and Breechings
Submit drawings showing the following:
  a. General arrangement
  b. Breeching and reinforcing details
  c. Breeching hangers and support details
  d. Dampers and operators
  e. Access doors and frames
  f. Expansion joints
  g. Stack details

For stack details, include anchor bolt and foundation details, stack sampling ports, platforms, and accessories.

1.3.2.5 Fuel Oil Equipment
Drawings may be manufacturer's standard size for pumps, pump curves, valves, strainers manufacturer's standard size for pumps, pump curves, valves, strainers and pump wiring. Submit drawings showing the following:
  a. Certified outline and general arrangement
  b. Certified pump curves
  c. Equipment detail sheets including viscosity controller, heater, valves
  d. Electrical wiring diagrams
  e. Oil tanks, foundations, tank heaters, appurtenances, water drawoff,
level indication

1.3.2.6 Piping and Specialty Items

Drawings may be manufacturer's standard size. Submit drawings showing the following:

a. Details of special valves and fittings
b. Feedwater regulator details and schematics
c. Details and schematics of feedwater automatic recirculation

1.3.2.7 Ball Joint Installation Details

Include allowable angular flex and minimum offset dimensions for approval.

1.3.2.8 Reproducible Drawings

Submit one reproducible mylar shop drawing of each approved drawing sheet to the Contracting Officer for the following items:

a. Boiler layout, construction and details
b. Breeching layout and details
c. Burner control schematics and burner details
d. Wiring diagrams
e. Fuel oil tanks, foundations and appurtenances
f. Automatic feedwater recirculation system
g. Piping schematics

1.3.3 Design Data

1.3.3.1 Engineering Calculations

Furnish the following calculations from the manufacturer:

a. Foundation (including bearing and moment forces) and anchor bolts.

b. Stack

   (1) Stresses due to various loading conditions including wind and seismic loads.

   (2) Vibration and damping.

   (3) Heat transfer at various design and ambient conditions.

   (4) Expansion profiles.

   (5) Shipping and erection stress analysis.
1.3.4 Test Reports

Submit the predicted economizer performance along with and as part of the boiler predicted performance report.

1.3.5 Performance Requirements

1.3.5.1 Boiler

**************************************************************************
NOTE: When analyses of the specific fuels to be burned are known, insert the proper values in this paragraph. When unknown and the analyses given in FS F-B-2902 are sufficient, omit this paragraph.
**************************************************************************

Base performance requirements, including furnace heat release rates, on the following ultimate analysis and high heating values.

a. Fuel Oil Analysis

(1) Grade of fuel oil: [_____]

(2) Ultimate analysis (percent by weight, as fired)

<table>

Hydrogen: [_____] percent
Carbon: [_____] percent
Nitrogen: [_____] percent
Oxygen: [_____] percent
Miscellaneous: [_____] percent
TOTAL [_____] percent

(3) Heating value: [_____] kJ/m³ Btu/cu ft

(4) Heating value: [_____] kJ/kg Btu/lb

(5) Density: [_____] kg/m³ lb/cu ft

(6) Specific gravity: [____].

1.3.5.2 Economizer

The increase in efficiency due to the economizer shall be not less than [_____] percent at full load. Fully coordinate the economizer with the boiler to which it is to be applied.

1.3.5.3 Oil Burner/Windbox Package

Burner turndown ratio on specified fuel oil shall be not less than eight to one, with excess air not over 15 percent at full steam load, and excess air not over 22 percent at 20 percent steam load. [Air flow shall be modulated through a single set of register louvers.]

1.3.5.4 Oil and Gas Burner/Windbox Package

Burner turndown ratio shall not be less than eight to one, when firing fuel oil only and ten to one when firing natural gas only with excess air not over 15 percent at full steam load, and excess air not over 22 percent at 20 percent steam load. [Air flow shall be modulated through a single set of register louvers.]
**NOTE:** Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

Submittals required by this section require the approval of the Contracting Officer. Within [60] [75] [90] days after award of the contract, shop drawings accompanied with complete manufacturer's descriptive information shall be submitted for approval as specified in Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS. Drawing size shall be 841 by 594 mm 34 by 22 inches.

1.5 QUALITY ASSURANCE

1.5.1 Experience

1.5.1.1 Experience Requirements

**************************************************************************
NOTE: Verify number of manufacturers' installations operating and years of operation for boiler, forced draft fan, burner/windbox package and control systems to avoid an unnecessarily restrictive experience requirement.
The boiler(s), with auxiliary equipment installed, within, or as a part of the heating plant, shall be of a proven design; the manufacturer shall be regularly employed in designing, fabricating, erecting, testing and startup of the equipment.

1.5.2 Responsibility of the Boiler Manufacturer

Contractor shall ensure that the manufacturers of boiler components and auxiliaries provide equipment compatible with the boiler. Equipment includes but is not limited to the following: Blowdown valves, burner/windbox package, combustion control system, emission control components, fans, economizer, refractories, insulation, sootblowers, steam separator, scanner, [air preheater,] dust collector, breeching between boiler outlet and stack inlet, boiler trim, safety valves and drains.

1.5.3 Standard Commercial Product

Boilers and equipment shall be manufactured in accordance with the requirements of this specification and shall be the manufacturer's standard commercial product. Additional or higher quality features which are not specifically prohibited by this specification, but which are a part of the manufacturers' standard commercial product, shall be included in the boilers and equipment being provided. A standard commercial product is a product which has been sold or is being currently offered for sale on the commercial market through advertisements or manufacturer's catalogs, or brochures, and represents the latest production model.

1.5.4 Modification of References

In API Std 650, the advisory provisions shall be considered mandatory, as though the word "shall" had been substituted for "should" and "suggested" wherever they appear.

1.5.5 Assembly of Components

The equipment shall be factory assembled except for steam generators which may utilize factory assembled components to the maximum extent to facilitate erection and minimize field labor.

1.5.6 Certificates

1.5.6.1 Backflow Preventer

Certificates of Approval for each backflow preventer from the Foundation for Cross-Connection Control Research, University of Southern California, and shall attest that this design, size, and make of backflow preventer has satisfactorily passed the complete sequence of performance testing and evaluation for the respective level of approval. A Certificate of Provisional Approval will not be acceptable in lieu of the above.

1.5.6.2 Compatibility of Boiler Components and Equipment

Contractor shall submit certifications from the boiler manufacturer stating that boiler components, including auxiliary equipment, are compatible with the boiler. Certificates of compatibility for boiler components and auxiliary equipment not directly produced by the boiler manufacturer may be submitted through the boiler manufacturer.
1.5.6.3 System and Equipment Installation

Contractor shall submit written certification from each system supplier and each manufacturer of the equipment that the system and equipment installation is in accordance with the system supplier's and equipment manufacturer's instructions and recommendations, that the unit or system has been run, rotating parts have been dynamically balanced, fluid (including air) flows have been balanced, instrumentation and controls are properly functioning, adjusted and have been calibrated, and the equipment or system is ready for final testing. Certificates shall be submitted before the entire boiler plant may be given an acceptance test.

1.5.6.4 Tank Calibration

Submit four copies of a certified record of the vertical fuel oil tank calibration.

1.5.6.5 Backflow Preventer

Submit a Certificate of Full Approval or a current Certificate of Approval for each design, size, and make of backflow preventer being provided for the project.

1.5.6.6 Identical Equipment

Contractor shall submit evidence from the equipment manufacturer to show that substantially identical equipment produced by the manufacturer and of comparable operating parameters (within plus or minus 20 percent) has been successfully installed and operated in not less than [one] [two] [three] installations under comparable operating conditions for a period of not less than two years.

1.5.6.7 Ozone Depleting Substances Technician Certification

**************************************************************************
NOTE: The following paragraph requires a certification for technicians who work on equipment that could release ozone depleting refrigerants into the atmosphere. This is required as of January 1, 2018 to meet the requirements of 40 CFR 82, Subpart F.
**************************************************************************

All technicians working on equipment that contain ozone depleting refrigerants must be certified as a Section 608 Technician to meet requirements in 40 CFR 82, Subpart F. Provide copies of technician certifications to the Contracting Officer at least 14 calendar days prior to work on any equipment containing these refrigerants.

1.6 DELIVERY, STORAGE, AND HANDLING

Each assembly of components packaged as a unit shall be of a size that can be transported by common carrier without disassembly insofar as shipping clearances are concerned.
1.7 ENVIRONMENTAL REQUIREMENTS

1.7.1 Burner Emission Requirements

The emission requirements shall be met at the maximum required continuous output. The burner shall meet environmental rules and regulations. Emission requirements to be considered are oxides of nitrogen (NOx), opacity, particulate, sulfur dioxide, and carbon monoxide. Other emission requirements may be imposed.

1.7.1.1 NOx Emission Regulations

Compliance shall be met using [one] [a combination] of the following:

a. Low NOx burners
b. Flue gas recirculation equipment which conforms to UL 795
c. Other NOx reduction techniques. See Nitrogen oxide control for stationary combustion sources.

1.7.1.2 Aquatic Toxicity

Assess potential effects of all lubricants on aquatic organisms in accordance with ASTM D6081 and submit aquatic toxicity reports. Assess biodegradation in accordance with ASTM D5864. In accordance with EM 1110-2-1424 Chapter 8, aquatic toxicity shall exceed 1,000 ppm at LL50 and biodegradation shall exceed 60 percent conversion of carbon to carbon dioxide in 28 days.

PART 2 PRODUCTS

2.1 MATERIALS

Provide materials free of defects which could adversely affect the performance or maintainability of individual components or of the overall assembly. Materials not specified herein shall be of the same quality used for the intended purpose in commercial practice. Unless specified otherwise herein, equipment, material, and articles incorporated in the work covered by this specification shall be new.

2.1.1 Identical Equipment

Provide physically and mechanically identical boilers and equipment of the same classification size or capacity to permit the interchangeability of replacement parts. This requirement includes parts, assemblies, components, and accessories. Parts provided on the same type unit regardless of unit size and identifiable by identical part number shall be functionally and dimensionally interchangeable. No deviation is acceptable without prior written approval of the Contracting Officer.

2.2 BOILERS

2.2.1 Packaged Watertube Boiler

FS F-B-2902, Type [_____] except as modified below. Provide lifting attachments.
2.2.2 Tubes

**************************************************************************
NOTE: Use this paragraph when tube diameters larger than specified in FS F-B-2902 are desired and insert minimum acceptable diameter.
**************************************************************************

Boiler and furnace tubes shall be at least [_____] mm inches in outside diameter.

2.2.3 Furnace

**************************************************************************
NOTE: When a D-type boiler is acceptable, use this paragraph and insert desired hand.
**************************************************************************

Furnaces for D-type boilers shall be on the [_____] hand side of the drums when viewed from the front of the boiler.

2.2.4 Transition

**************************************************************************
NOTE: This paragraph should be used when a breeching transition piece is desired to be provided with the boiler.
**************************************************************************

Provide a transition piece to permit adapting the [boiler] [economizer] outlet to the [stack] [breeching]. Design transition pieces for [vertical] [horizontal] discharge.

2.2.5 Combustion Controls

As specified in Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS.

2.2.6 Access and Observation Doors

Provide boiler with sufficient number of access doors and observation doors, to give free and easy access and observation to all parts of the interior of the boiler.

2.3 ECONOMIZERS

**************************************************************************
NOTE: Economizers shall be specified for all boilers with operating pressure greater than 345 kPa (gage) 50 psig and a capacity of 2 1/4 kg per second 18,000 pounds per hour and larger. For boilers from 1/2 to 2 1/4 kg per second 4,000 to 18,000 pounds per hour the designer shall make the decision based upon a specific economic analysis. This paragraph shall be included as applicable.
**************************************************************************

**************************************************************************
NOTE: Unless fuel oil to be burned has an uncommon tendency to foul tubes, finned tube economizers
**************************************************************************
should be suitable for gas and oil. Feedwater temperatures should be 110 degrees C 230 degrees F when sulphur (S) content of oil is 0.5 percent to 1.5 percent; 116 degrees C 240 degrees F, S=1.5 percent to 2 percent; 121 degrees C 250 degrees F, S=2.0 percent to 2.7 percent.

Provide a modular unit constructed in accordance with the ASME Boiler and Pressure Vessel Code, Section 1, of one of the following types:

a. Internal Tubular Type: Boiler feedwater flows through the outer shell and flue gases circulate up through internal tubes provided with removable flue gas spinners.

b. Finned or Spiral Wound Tube Type: Feedwater circulates through finned tubes and flue gas flows through outer shell.

2.3.1 Construction

Provide manufacturer's standard economizer design for the operating conditions and the fuel(s) specified. Coordinate the amount of heating surface with the flue gas conditions exiting the boiler or boilers on which the economizer is to be applied to preclude reaching the "acid dew point" for the fuels specified. When necessary (if there is sulfur in the specified fuel, and the designed inlet temperature could fall below the acid dew point), provide a feedwater temperature control system to maintain temperatures above the acid dew point. Provide casing of not less than 12 gage steel plate reinforced as required with support lugs and breeching flanges. Provide building framing steel to support the economizer. [Provide built-in soot blower for each economizer to thoroughly clean the surfaces exposed to the flue gas.] Design the economizer so that internal construction can be easily cleaned and inspected.

2.3.2 Equipment

Provide the following equipment for each unit:

a. Relief valve.

b. Shutoff gate valve on feedwater outlet and shutoff globe valve on inlet with globe valve bypass. Size valves as shown in economizer piping detail.

c. Temperature indicator on feedwater outlet.

d. Temperature indicator on feedwater inlet.

e. Temperature indicator on flue gas outlet.

f. Temperature indicator on flue gas inlet.

g. Temperature alarm switches for high and low flue gas temperatures.

h. Alarm with trouble light and silencing switch.

i. Panel with annunciator and temperature indicators for feedwater inlet, feedwater outlet, flue gas inlet and flue gas outlet for each economizer.
j. A drain valve downstream of the economizer before the shutoff valve.

k. A stack flue gas temperature control system to control and limit flue gas temperature to not less than 149 degrees C (300 degrees F) by modulating motorized feedwater control valves in a bypass around the economizer. Provide shutoff valve on each side of the control valves with a strainer upstream of each valve. Provide this system in parallel to the manual shutoff and bypass described above.

l. Differential pressure indicator on water side.

m. Differential pressure indicator on gas side.

n. Pressure gages on feedwater inlet and outlet.

2.3.3 Insulation

Insulate the economizer with not less than the equivalent of 50 mm (2 inches) of mineral wool insulation and lag with not less than 27 gage galvanized, weatherproof lagging.

2.4 BURNER AND WINDBOX PACKAGES

2.4.1 Oil Burner/Windbox Package

******************************************************************************

NOTE: The designer shall fill in the appropriate information as defined in FS F-B-2910.
******************************************************************************

Provide a fully modulating, oil burner conforming to FS F-B-2910, Size [____], Class [____], Control sequence [____], Combustion control system [____] except as modified below. Provide burner with windbox, [forced draft fan], dampers, fuel train and associated controls to comprise a complete factory assembled package. Total heat input to the boiler furnace shall be provided by [____] burners. The burner package shall be considered an integral part of the steam generator and shall be subject to applicable provisions of the boiler design and service together with requirement of tests, performance guarantees and other warranties specified for the boiler.

2.4.1.1 Oil Burner

******************************************************************************

NOTE: At the text below, for boilers below 3.15 kg/sec (25,000 pounds per hour) the designer shall select either compressed air or steam atomization after performing an economic analysis. For 3.15 kg/sec (25,000 pounds per hour) and above, atomization shall be by compressed air unless steam pressure is required for greater turndown.
******************************************************************************

a. Oil Burner Characteristics: The burner shall be quiet in operation and shall operate with a balanced clean stable flame so as not to localize heat in any part of the combustion chamber. The burner shall be capable of completely atomizing and effectively mixing the oil with air so as to insure complete combustion. The air admitted shall be of
sufficient quantity for complete combustion, but not of such quantity as to produce an undue percentage of excess air with attendant high stack loss. The burner shall operate without clogging or failure, and shall have sufficient capacity to develop not less than the specified capacity. The burner unit shall be easily removed from firing position and readily accessible for inspection, cleaning, and other purposes. Provide observation ports to view operation of burner. There shall be no flame impingement on the sidewalls, top, bottom or rear walls of the furnace. Burner manufacturer shall furnish, and Contractor shall install refractory throat tiles or other items required for proper installation of burner.

b. Atomization: Burner shall be [steam atomizing; steam pressure at header is [_____] kPa (gage) psig; steam temperature at header is [_____] degree C F] [air atomizing; filtered compressed air shall be available for burner atomization and the maximum requirement for each burner shall not exceed [_____] standard L/s scfm of air at [_____] kPa (gage) psig]. Provide pressure reducing valve and controls as required.

c. Electric Ignition System: Burner shall be equipped with an electric ignition system. System shall be either the high energy ignition or glow rod type. Gas ignition system is not acceptable. The high energy ignition system shall use stored energy to develop 2000 Vdc pulses. The glow rod system shall use a low voltage, carbon rod electrode which develops a tip temperature of 1427 degrees C 2600 degrees F. Provide ignition system complete in all respects.

d. Windbox: Construct of carbon steel plate not less than 10 gage thickness with 6 mm 1/4 inch thick front plate. Design windbox to provide even and uniform air entrance into the burner register and seal weld to the boiler front wall. Provide windbox with support legs.

e. Purge Connection: Provide [steam] [air] purge connection, properly valved, for purging oil from gun prior to removal from burner.

**************************************************************************
NOTE: At the text below, provide aspirating system only for boilers in which the expected furnace pressure exceeds 1245 Pa 5 inches water.
**************************************************************************

[f. Aspirating System: Provide an air aspirating system for the fuel oil atomizer guide pipes to prevent blowback of hot furnace gases. Aspirating system shall use approximately [_____] L/s scfm of [_____] kPa (gage) psig compressed air.

] g. Piping: Provide piping and flexible hoses for the guide pipe purge [and aspirating] system[s]. Air from the forced draft fan shall be used for guide pipe purging during normal operation.

h. Material: All metal parts exposed to radiant heat, including the atomizer shield, shall be of stainless steel or other approved alloy.

i. Fuel Oil Control Valve: Fuel oil will be supplied at [_____] kPa (gage) psig and [_____] degrees C F at the inlet of the fuel piping train. Size fuel oil automatic control valve for 103 kPa 15 psi differential pressure as specified in Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS.
j. Fuel: ASTM D396, Grade no. [____].

*****************************************************************
NOTE: At the text below, the designer shall make a technical evaluation to determine if the forced draft fan should be integrated with or mounted separately from the windbox on the floor next to the boiler. If the forced draft fan is to be mounted separately, delete this paragraph and specify the fan in the paragraph FANS.
*****************************************************************

[ k. Forced Draft Fan: Fan shall be fully integrated with and mounted on the windbox. Provide an inlet silencer, if required, to insure operation at noise level below 85 dBA as specified in Section 22 05 48.00 20 MECHANICAL SOUND VIBRATION AND SEISMIC CONTROL.

l. Electric Motor: Motor shall be [variable speed], [_____] volt, [_____] phase, 60 Hz, [totally enclosed, non-ventilated] [totally enclosed, fan cooled], not less than [_____] hp as specified under MOTORS AND DRIVES in this section.

]2.4.1.2 Flame Safeguard Controls

a. General: Provide a complete system of valves, interlocks and controls in accordance with NFPA 85 and FM DS 12-17.

b. Fuel Oil Train: Provide fuel oil train consisting of [steam] [air] atomizing oil gun, auxiliary [steam] [air] atomizing oil gun for changing guns without a shutdown, fuel oil control valve, two safety shutoff valves, recirculation valve, strainer, and flexible hose connections to oil burner. Provide low oil pressure and low atomizing air pressure switches, and other safety interlocks and devices as required. Provide in panel mounted on burner package the following gages. Gages shall be 150 mm 6 inch diameter with white coated dials and black lettering:

(1) Fuel oil supply pressure (0 to 1034 kPa (gage) 150 psig)
(2) Fuel oil pressure at burner (0 to 1034 kPa (gage) 150 psig)

[ (3) Atomizing air pressure at burner (0 to 1034 kPa (gage) 150 psig)
][ (4) Atomizing steam pressure at burner (0 to 1034 kPa (gage) 150 psig)
]

c. Control Sequencing: Flame safeguard system shall be designed to insure safe purge, light-off and shutdown procedures, and to monitor light-off, main flame and boiler operating conditions.

[ (1) Control Type: Flame safeguard system shall be of the automatically sequenced type with programming timed and sequenced by a heavy duty, industrial type timer. This timer shall be tamper-proof and shall be designed so that advancement of the timer to shorten purge will shut down the unit.

] (2) Scanner and Relay: Provide system with [ultraviolet] [infrared] scanner and electronic relay located in the front wall which will shut down the fuel within 2 to 4 seconds of loss of flame.
(3) Output Meter: Provide scanner output meter in panel for indication of scanner signal strength.

(4) Limit Devices: Safety system shall include the following limit devices incorporated into a limit circuit:

(a) Flame failure
(b) High boiler outlet pressure
(c) Low fuel oil pressure
(d) Low water level cutout
(e) Low combustion air flow
(f) Low atomizing [air] [steam] pressure
(g) Any additional as required by FM DS 12-17 or NFPA 85

(h) Low fuel oil temperature

(5) Annunciator: Safety system limits specified above shall be displayed on a first out annunciator mounted in the burner panel. [Provide a common alarm contact to be wired to the operator control console, specified under Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS.]

d. Light Off: Failure shall require a manual restart of the programmer. Safety system shall provide a mandatory purge with the forced draft fan vanes proven open, and a return to proven low fire position before light off. Main fuel valve shall open for a timed period of 10 seconds during trial for ignition.

e. Circuit Analyzer: Provide a circuit analyzer system, which, by means of 12 or more lights, will indicate which circuits are energized at any specific time, and will thereby indicate improperly operating circuit.

f. Control Panel: Programmer, limit control, relays, annunciator, shall be mounted in a [NEMA 1 control panel, modified with fully gasketed doors and panels mounted on burner package] [control panel as specified under Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS.]

2.4.2 Oil and Gas Burner/Window Package

**************************************************************************
NOTE: Choose this paragraph and subparagraphs or the paragraph and subparagraphs above, OIL BURNER/WINDBOX PACKAGE.
**************************************************************************

Provide, fully modulating, dual fuel burner conforming to PS F-B-2910, Class [____], Combustion control system [____] except as modified below. Provide burner with windbox, [forced draft fan,] dampers, fuel train and associated controls to comprise a complete factory assembled package. Total heat input to the boiler furnace shall be provided by [_____] burners. Burner package shall be considered an integral part of the steam generator and shall be subject to applicable provisions of the boiler design and service together with requirement of tests, performance
2.4.2.1 Burner

a. Burner Characteristics: The burner shall be quiet in operation and shall operate with a balanced clean stable flame so as not to localize heat in any part of the combustion chamber. The burner shall be capable of completely atomizing and effectively mixing the oil with air so as to insure complete combustion. The air admitted shall be of sufficient quantity for complete combustion, but not of such quantity as to produce an undue percentage of excess air with attendant high stack loss. The oil burner shall operate without clogging or failure, and shall have sufficient capacity to develop not less than the specified capacity. The burner unit shall be easily removed from firing position and readily accessible for inspection, cleaning, and other purposes. Provide adequate observation ports on burner. There shall be no flame impingement on the sidewalls, top, bottom or rear walls of the furnace. Contractor shall install refractory throat tiles or other items provided by the burner manufacturer which may be required for proper installation of the burner.

b. Atomization: Burner shall be [steam atomizing; steam pressure at header is [_____] kPa (gage) psig; steam temperature at header is [_____] degree C F] [air atomizing; filtered compressed air shall be available for burner atomization and the maximum requirement for each burner shall not exceed [_____] L/s scfm of air at [_____] kPa (gage) psig]. Provide pressure reducing valve and controls as required.

c. Electric Ignition System: Burner shall be equipped with an electric ignition system. System shall be either the high energy ignition or glow rod type. Gas ignition system is not acceptable. High energy ignition system shall provide stored energy to develop 2000 volt DC pulses. Glow rod system shall provide a low voltage, carbon rod electrode which develops a tip temperature of 1427 degrees C 2600 degrees F. Provide ignition system complete in all respects.

 **************************************************************************
 NOTE: At the text below, a gas pilot ignition system is optional for a combination oil/gas burner. **************************************************************************

d. Natural Gas Pilot Ignition System: Provide a complete interrupted type natural gas-fired, spark ignited pilot system for the burner assembly. Combustion air supply shall be from the burner windbox. Lighting system shall have capacity to stabilize the firing during startup periods. Lighter shall be arranged for easy removal and servicing while the boiler is in operation. Furnish igniter complete with a spark rod and a power pack. Power pack shall operate on 120 volt, 60 cycle, single phase power. Provide gas piping, to one point of supply, including necessary gas pressure regulators. Igniter system shall include controls, gages, flame safety systems, interlocks and accessories to comply with Industrial Risk Insurers' (I.R.I) (formerly F.I.A.) requirements and applicable codes and regulations.

e. Windbox: Construct of carbon steel plate not less than 10 gage thickness with 6 mm 1/4 inch thick front plate. Design windbox to provide even and uniform air entrance into the burner register and seal weld to the boiler front wall. Provide windbox with support legs.
f. Purge Connection: Provide [steam] [air] purge connection, properly valved, for purging oil from gun prior to removal from burner.

[ g. Aspirating System: Provide an air aspirating system for the fuel oil atomizer guide pipes to prevent blowback of hot furnace gases. Aspirating system shall use approximately [_____] L/s scfm of [_____] kPa (gage) psig compressed air.

] h. Guide Pipe Purging: Provide piping and flexible hoses for the guide pipe purge [and aspirating] system[s]. Air from the forced draft fan shall be provided for guide pipe purging during normal operation.

i. Materials: Metal parts exposed to radiant heat, including the atomizer shield, shall be of stainless steel or other approved alloy.

j. Natural Gas Control Valve: Natural gas shall be supplied at [_____] kPa (gage) psig and [_____] degrees C F at the inlet of the fuel piping train. Size the natural gas automatic control valve for [_____] kPa psi differential pressure as specified in Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS.

k. Fuel Oil Control Valve: Fuel oil will be supplied at [_____] kPa (gage) psig and [_____] degrees C F at the inlet of the fuel piping train. Size fuel oil automatic control valve for 103 kPa 15 psi differential pressure as specified in Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS.

l. Fuel: ASTM D396, Grade no. [_____] and natural gas.

[ m. Forced Draft Fan: Fan shall be fully integrated with and mounted on the windbox. Provide an inlet silencer, when required, to insure operation at noise level below 85 dBA as specified in Section 22 05 48.00 20 MECHANICAL SOUND VIBRATION AND SEISMIC CONTROL. The F. D. Fan Electric Motor shall be [variable speed], [_____] volt, [_____] phase, 60 Hz, [totally enclosed, non-ventilated] [totally enclosed, fan cooled], not less than [_____] kW hp as specified under MOTORS AND DRIVES in this section.

2.4.2.2 Flame Safeguard Controls

Provide a complete system of valves, interlocks and controls in accordance with NFPA 85 and as approved by Factory Mutual Engineering and Research.

a. Natural Gas Train: Provide natural gas train consisting of gas ring, gas control valve, two safety shutoff valves, high gas valve, and manual shutoff cock. Provide low gas pressure switch, high gas pressure switch, and other safety interlocks and devices as required. Provide in panel mounted on burner package the following gages. Gages shall be 150 mm 6 inch with white coated dial and black figures.

(1) Natural gas supply (0 to 172 kPa (gage) 25 psig)

(2) Burner gas supply pressure (0 to 172 kPa (gage) 25 psig)

b. Fuel Oil Train: Provide fuel oil train consisting of [steam] [air] atomizing oil gun, auxiliary [steam] [air] atomizing oil gun for changing guns without a shutdown, fuel oil control valve, two safety shutoff valves, recirculation valve, strainer, and flexible hose connection(s) to oil burner. Provide low oil pressure and low
atomizing air pressure switches, and other safety interlocks and devices as required. Provide in panel mounted on burner package the following gages. Gages shall be 150 mm 6 inch with white coated dials and black figures:

(1) Fuel oil supply pressure (0 to 1034 kpa (gage) 150 psig)
(2) Fuel oil pressure at burner (0 to 1034 kPa (gage) 150 psig)
(3) Atomizing air pressure at burner (0 to 1034 kPa (gage) 150 psig)
(4) Atomizing steam pressure at burner (0 to 1034 kPa (gage) 150 psig)

c. Control Sequencing: Flame safeguard system shall be designed to ensure safe purge, light-off and shutdown procedures, and to monitor light-off, main flame and boiler operating conditions.

(1) Control Type: The flame safeguard system shall be of the automatically sequenced type with complete programming timed and sequenced by a heavy duty, industrial type timer. This timer shall be tamper-proof and shall be designed so that advancement of the timer to shorten purge will shut down the unit.

(2) Scanner and Relay: Provide system with ultraviolet [and infrared] scanner[s] and electronic relay located in the front wall which will shut down the fuel within 2 to 4 seconds of loss of flame.

(3) Output Meter: Provide scanner output meter in panel for indication of scanner signal strength.

(4) Limit Devices: The safety system shall include the following limit devices incorporated into a limit circuit:

(a) Flame failure
(b) High boiler outlet pressure
(c) Low fuel oil pressure
(d) Low natural gas pressure
(e) High natural gas pressure
(f) Low water level cutout
(g) Low combustion air flow
(h) Low atomizing [air] [steam] pressure
(i) Any additional as required by FM DS 12-17 or NFPA 85

(5) Annunciator: Safety system limits specified above shall be displayed on a first out annunciator mounted in the burner panel. [Provide a common alarm contact to be wired to the operator control console, specified under Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS.]

d. Light Off: Failure shall require a manual restart of the programmer. Safety system shall provide a mandatory purge with the forced draft fan
vanes proven open, and a return to proven low fire position before light off. Main fuel valve shall open for a timed period of 10 seconds during trial for ignition.

e. Circuit Analyzer: Provide a circuit analyzer system, which, by means of 12 or more lights, will indicate which circuits are energized at any specific time, and will thereby indicate improperly operating circuit.

f. Control Panel: Programmer, limit control, relays and annunciator, shall be mounted in a [NEMA 1 control panel, modified with fully gasketed doors and panels mounted on burner package] [control panel as specified under Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS.]

2.5 FANS

******************************************************************************************************************************************
NOTE: The designer shall make a technical evaluation to determine if the forced draft fan should be integrated with or mounted separately from the windbox on the floor next to the boiler. If the forced draft fan is to be mounted separately, delete this paragraph and specify the fan in the paragraph FANS.
******************************************************************************************************************************************

2.5.1 Forced Draft Fan

CID A-A-59222, Type [____], Class 1, except as specified otherwise.

2.5.1.1 Fan Size

Size fans for complete combustion of fuel at maximum firing rate taking into account design allowances, corrections for burner pressure drop, furnace pressure, combustion air temperature, plant elevation, and other design factors [including allowance for economizer]. After fans have been sized in accordance with the above, add the following allowances for momentary overloads and normal deterioration of fans, firing equipment and boilers:

a. Excess volume: 10 percent

b. Excess pressure: 20 percent

2.5.1.2 Fan Construction

Construct fan wheel of steel. Direction of fan discharge shall be easily changed at angles of 45 degrees. Provide fan with roller bearings mounted in pillow blocks.

2.5.1.3 Electric Motor

******************************************************************************************************************************************
NOTE: The designer shall perform an economic analysis and make a technical evaluation to determine if the forced draft fan motor shall be provided with variable speed control. Generally, variable speed drives for forced draft fans over 7 1/2 kw 10 HP will be cost effective.
******************************************************************************************************************************************
Motor for driving the forced draft fan shall be [variable speed], [two speed], [_____] volt, three phase, 60 Hz, [open drip-proof] [totally enclosed, fan cooled] not less than [_____] kW hp, as specified under MOTORS AND DRIVES in this section, and shall not overload at the specified capacity with unheated cold air. [Provide [_____] mm inch thick steel soleplate for motor. Soleplate must be common for all four motor mounting bolts. Separate parallel soleplate bars are not acceptable.]

2.5.1.4 Noise Level

Noise level shall not exceed 85 dBA sound pressure level at 1 1/2 meters 5 feet above the floor and 1 1/2 meters 5 feet from the fan in any direction. [Provide heavy duty sound attenuator with screen on fan inlet, if required, to meet the sound pressure level requirements.]

2.6 COMPRESSED AIR SYSTEM

NOTE: Refer to utilities schedule on definitive drawings for suggested plant air requirements.

2.6.1 Plant Compressed Air System

Provide [two] packaged units conforming to FS XX-C-2816 Type [____], and ASME BPVC SEC VIII D1, except as modified below. Each compressor capacity shall be not less than [_____] L/s scfm of air, at 20 degrees C 68 degrees F and [_____] kPa (gage) psig (equivalent to pressure at an elevation of [_____] meters feet), compressed to 1379 kPa (gage) 200 psig at the discharge. Compressor speed shall not exceed [_____] rpm. Number of stages shall be [______]. [Compressor shall have water cooled cylinders and heads.] [Oil free delivery is required.] Provide a safety valve between each compressor discharge and its shutoff valve. Provide a shutoff valve on the discharge piping of each compressor. Provide an electric thermostatically controlled immersion heater. Provide compressor with [air cooled] [water cooled] [intercooler and] aftercooler. [Compressor and motor shall be tank mounted.] Provide lifting lugs and tie down attachments.

2.6.1.1 Air Filter

Air filter on inlet shall act as a muffler. Provide filter of the [oil wetted type] [dry type] readily removable for cleaning.

2.6.1.2 Oil Filter

Provide full flow type filter for positive forced feed lubrication conforming to FS F-F-351.

2.6.1.3 Air Receiver

Receiver shall be [_____] cubic meters feet minimum volume designed in conformance with FS XX-C-2816 and ASME BPVC SEC VIII D1, except that working pressure shall be 1724 kPa (gage) 250 psig. Provide the receiver, with a safety valve set at a pressure not to exceed the maximum allowable working pressure of the receiver, a drain valve and an air trap with shutoff valve. [Provide a stand for mounting the receiver.] Provide a dial
gage, not less than **114 mm 4 1/2 inches** diameter, range zero to **2068 kPa (gage) 300 psig**, on the receiver.

### 2.6.1.4 Electric Motor

Motor shall be [_____] volt, [_____] phase, 60 Hz, totally enclosed, fan cooled not less than [_____] kW hp, as specified under MOTORS AND DRIVES in this section. Control circuits for motors shall be nominal 120 volts.

### 2.6.1.5 Controls

Provide [constant speed] [dual control] regulation and the "optional safety controls" as specified in Table I of **FS XX-C-2816** for the compressor system. In addition, provide a lead-lag control system with alternating lead-lag cycles.

### 2.6.2 Instrument Compressed Air System

Provide air compressor package with two compressors, two electric motors, one horizontal receiver, and control panel, [all mounted on one supporting steel base with skids] [mounted separately].

#### 2.6.2.1 Air Compressor

Each air compressor shall be a single stage, cross head type, vertical, double acting, water cooled, nonlubricated head type. Compressor shall be specially designed for non-lubricated service, with a honed cylinder, piston rod packing, piston rings and piston wear rings. Valve guide inserts and wear rings shall be TFE. Valves shall be reversible and hardened, with stainless steel seat plates for nonlubricated service. Provide necessary sleeves, baffles, and collars to prevent oil carryover. Provide air operated, piston type, free air unloaders for capacity reduction and starting. Mount filter-silencer directly on the air inlet to the cylinder.

*Design and Performance:* Each compressor shall deliver not less than [_____] L/s scfm of free air at a discharge pressure of **690 kPa (gage) 100 psig**.

#### 2.6.2.2 Air Receiver

Air receiver shall be a horizontal tank with a volume not less than [_____] cubic meters feet. Design unit for **1034 kPa (gage) 150 psig** working pressure in accordance with **ASME BPVC SEC VIII D1**. A receiver bearing the ASME Code Symbol stamp will be accepted as meeting these requirements. Provide an automatic condensate trap, safety valve, and outlet connection.

#### 2.6.2.3 Aftercooler

Aftercoolers shall be water cooled, with counter current flow, and shall be installed directly between each compressor cylinder and the air receiver. Design cooler to cool the total output air flow of the compressor to within minus **9 degrees C 15 degrees F** of the inlet cooling water temperature. The tube bundle shall be removable for cleaning and inspection.

#### 2.6.2.4 Electric Motor

Each compressor shall be V-belt driven by a [_____] volt, [_____] phase, 60 Hz motor not less than [_____] kW hp as specified under MOTORS AND DRIVES in this section. Provide a removable, totally enclosed belt guard.
2.6.2.5 Controls

Provide controls and shutdowns for automatic operation of the compressor package. House controls in NEMA 12 control cabinet. Controls shall include two, full voltage, automatic across-the-line starters; alternator to switch compressors from lead to lag and to run both compressors when required; 120 volt control transformer; air discharge pressure gage; selection switches for constant speed for automatic dual control, along with necessary time delay and control relays. Provide automatic solenoid operated cooling water valve in the cooling water line to the compressors and aftercoolers. Factory wire control cabinet and mount as a part of the package.

2.6.2.6 Accessories

Factory assemble compressors, electric motors, controls, air receiver, aftercoolers, and miscellaneous hardware and mount on steel supporting base. Provide lifting lugs and tiedown attachments. Provide air, water, and condensate piping and terminate them at the edge of the supporting base. Lubricate inspection ports so that they can easily be removed for visual inspections.

2.6.2.7 Air Dryers

**************************************************************************
NOTE: Choose this item or item (b) below
REFRIGERATED AIR DRYER.
**************************************************************************

[a. Desiccant Air Dryer: Provide for systems exposed to freezing temperatures a compressed air desiccant dryer with noncorrosive desiccant housed in twin pressure vessels, capable of drying [_____] L/s scfm of air to [_____] degrees C [F] pressure dewpoint. Unit shall be field adjustable to maintain the pressure dewpoint of the dried air at any preselected value below operating temperature, to minus 40 degrees C [F]. As an integral part of the unit provide an indicator showing the water content of the dry air and a calibrated adjustment control to change the water content to any preselected level.

(1) Design: Design unit for maximum temperature of not less than 49 degrees C [120 degrees F] and maximum operating pressure of not less than 1034 kPa (gage) 150 psig. Pressure drop through the unit operating at full rated flow shall not exceed 28 kPa 4 psi.

(2) Controls: Provide continuous supply of dry air by automatically cycling operation of the desiccant beds. Dryer shall be complete with panel mounted gages showing pressure in each drying tower and spark suppressor to protect microswitch in timer circuit. Total electrical power requirements shall not exceed 75 watts at 110 Vac.

(3) Filters: Provide prefilter upstream of dryer to remove oil vapor, liquid water, and solid particles. It shall have greater than 99 percent efficiency in removing both 0.5 micron diameter solid particles and 0.5 micron diameter oil aerosol. Filter shall have replaceable oil absorbing filter element which turns red to indicate saturation with oil and which shall be mounted in a transparent cast methyl methacrylate tube for visibility and inspection while on stream. Protect transparent acrylic tube by a
safety shield. Provide afterfilter for removal of solid particles down to 5 microns size.

NOTE: Choose this item or item (a) above DESICCANT AIR DRYER.

b. Refrigerated Air Dryer: Provide for systems not exposed to freezing temperatures a compressed air dryer of self-contained refrigerated type complete with heat exchanger, a commercial quality refrigerated system, a moisture separator and condensate trap, and internal wiring and piping. Install dryer between the receiver and distribution line.

   (1) Heat Exchanger: Provide air and refrigerant coils surrounded by aluminum granules of sufficient mass to insure adequate cooling capacity for varying air flow loads without causing excessive refrigeration cycling. Provide an automatic control system, for the heat exchanger with a sensing element located in the aluminum granules, to shut down the refrigeration system on low or no-load conditions. Provide means to determine exchanger temperature.

   (2) Moisture Separator: Provide centrifuge type located within the heat exchanger to provide for moisture separation at point of minimum air temperature.

   (3) Refrigeration Unit: Provide hermetically sealed type which operates intermittently at all but maximum load conditions. The unit shall be capable of drying [_____] L/s scfm of air to an atmospheric dew point of not less than minus 23 degrees C 10 degrees F with entering air at 38 degrees C 100 degrees F, saturated. The maximum operating pressure of the dryer shall be [_____] kPa (gage) psig. House the entire unit in a steel cabinet. Provide cabinet with access door and panel for easy access to parts for maintenance and inspection.

   (4) Refrigerant: CFC-based refrigerants are prohibited. Refrigerant must have an Ozone Depletion Potential (ODP) no greater than 0.0, with exception to R-123.

2.6.3 Pressure Reducing Regulator

Provide self-operating type designed for not less than a 1724 kPa (gage) 250 psig operating pressure, and a normal operating temperature range of minus 29 degrees to plus 66 degrees C minus 20 degrees F to plus 150 degrees F. Regulator shall have an adjustable outlet pressure range not less than 34 to 690 kPa (gage) 5 to 100 psig with not less than four ranges. Provide external adjusting screw for adjustment throughout each spring range. Provide internal pressure tap for outlet pressure regulation.

2.7 BREECHING, EXPANSION JOINTS, STACKS, AND DAMPERS:

2.7.1 Breeching

Provide with rectangular cross section and fabricate of not less than 5 mm 3/16 inch thick black steel plate unless otherwise noted. Stiffeners shall be not less than 65 by 50 by 6 mm 2 1/2 by 2 by 1/4 inch steel angles welded to exterior with 50 mm 2 inch leg outstanding. Stiffeners shall not exceed one meter 3 feet on centers. Breeching shall connect to [each
boiler flue gas outlet,] [intermediate heat recovery equipment,] [air pollution control equipment,] [and to stack as required].

2.7.1.1 Breeching Connections and Joints

Weld or bolt breeching joints unless indicated otherwise. Welding shall conform to AWS D1.1/D1.1M and AWS D1.3/D1.3M. Bolts for bolted connections shall be not less than 15 mm 1/2 inch diameter and spaced not more than 80 mm 3 inches apart, with bolts, lockwashers and nuts being hot-dipped galvanized. Provide bolted joints with a minimum of 3 mm 1/8 inch thick gaskets. Bolt breeching connections to boilers, equipment items, dampers, expansion joints, and breeching accessories. Flanged breeching connections to equipment shall be drilled to match flanges on equipment. Flanged joints shall be seal welded to make connection gas-tight.

2.7.1.2 Uninsulated Breeching

Thoroughly wire brush breeching which is not to be insulated and clean by degreasing with nonflammable solvent such as trichloroethylene prior to painting.

2.7.1.3 Breeching Access Doors

Provide breeching access doors where indicated. Construct access doors with frame and hinged door of cast iron or reinforced steel plate. Frame shall be not less than 635 by 940 mm 25 by 37 inches with access opening of 457 by 762 mm 18 by 30 inches. Connection to breeching shall be gasketed and made with minimum 15 mm 1/2 inch diameter hot-dipped galvanized bolts, lockwashers, and nuts spaced not less than 127 mm 5 inches on center. Each side of the access door shall have not less than two quick-clamp positive closing latches, with the long side opposite the hinges containing three clamps to give a gastight seal. Side of access door opposite hinges shall contain a minimum 80 by 125 mm 3 by 5 inch size handle. Provide a gasket consisting of 10 mm 3/8 inch diameter fire resistant resilient rope seal and mastic compound between the access door and the access door frame.

2.7.1.4 Breeching Cleanout Doors

Provide breeching cleanout doors where indicated. Construct cleanout doors of not less than 5 mm 3/16 inch thick steel plate. Secure cleanout doors to a 32 by 32 by 5 mm 1 1/4 by 1 1/4 by 3/16 inch thick angle frame with 10 mm 3/8 inch hot-dipped galvanized mounting bolts welded to the angle frame and spaced not more than 150 mm 6 inches. Weld frame to breeching and provide a 1.50 mm 1/16 inch gasket between frame and cleanout door. Cleanout doors shall be not less than 610 mm 24 inches square except where breeching dimensions are smaller, in which case the cleanout door shall be full height of the breeching and not less than 305 mm 12 inches in length.

2.7.1.5 Breeching Structural Materials

****************************************************************************************************************************
NOTE: The designer shall detail breeching supports and breeching stiffening. Breeching hangers shall be designed to carry not less than 5 times the breeching weight, or the breeching weight plus 136 kg 300 pounds whichever is greater. Hangers for rectangular breeching shall be of the trapeze type with angle or channel support members and hanger rods. Breeching shall be stiffened with angle or
channel members as required to withstand internal breeching static pressure.

Structural and support materials shall be steel and shall comply with the applicable sections of AISC 360. [Support and stiffen breeching as indicated.]

2.7.2 Expansion Joints

2.7.2.1 Metallic Breaching Expansion Joints

Provide factory fabricated metallic breaching expansion joints [where indicated]. Expansion joints shall be guided metal bellows type capable of a minimum of [_____] mm inches of axial travel. Form metal bellows from not less than 1.50 mm 1/16 inch thick type 321 stainless steel plate. Cover plates shall be not less than 3 mm 1/8 inch thick steel plate.

2.7.2.2 Non-Metallic Expansion Joints

Provide factory fabricated non-metallic breaching expansion joints 3 mm 1/8 inch minimum thickness [where indicated]. Expansion joints shall be constructed of fluoroelastomer vulcanized to two plies of knitted wire mesh capable of a minimum of [_____] mm inches of axial compression, [_____] mm inches of axial extension and [_____] mm inches of lateral offset [unless indicated otherwise]. Joints shall have a continuous operating temperature rating of 204 degrees C 400 degrees F, with excursion design standards up to 400 degrees C 750 degrees F. Operating pressure range shall be minus 34 kPa (gage) to plus 34 kPa (gage) minus 5 psig to plus 5 psig. Expansion joints shall be preformed with integrally molded corners, suitable for mounting against a 150 mm 6 inch flange. Provide carbon steel backup bars with slotted holes, bolts, and nuts.

2.7.3 Stacks (For Installation Without Flue Gas Scrubbers)

Stacks shall be free standing, dual wall with insulated annular space, self supporting, steel construction. Contractor shall assure that the design of the stack and supporting steel or concrete foundations meets or exceeds the design conditions listed below. Provide each stack complete with accessories and appurtenances, including test ports, sampling platforms, caged safety ladders, anchors, sleeves, insulation, base and chair rings, and cleanout door.

2.7.3.1 Construction

a. Air Space: Provide in the annular air space between the two steel shells insulation with sealing means to accommodate thermal expansion differentials and lateral deflections or sway of the inner and outer shells.

b. Opening Reinforcement: Provide openings with adequate reinforcement to minimize stress concentrations.

c. Inner Shell: Design wall thickness of the inner shell to be 1.50 mm 1/16 inch thicker than that required by dynamic and static structural design but not less than 5 mm 3/16 inch.

d. Outer Shell: Construct of ASTM A242/A242M steel with a plate thickness not less than [_____] mm inch.
e. Expansion Devices: Construct of corrosion resistant stainless steel suitable for the temperatures and flue gas combinations to be experienced by the stacks.

f. Base construction of the stack shall transmit forces and moments in the shell to the [foundation] [supporting steel] without local stresses of appreciable magnitude being induced in the shell or exceeding the allowable stresses of the supporting [concrete] [steel].

g. Provide openings in breeching and stack for test equipment for sampling flue gas and for metering devices. Openings shall be properly reinforced and designed for differential expansion. Breeching opening shall be of double wall construction. All penetrations through inside shell of stack shall be completely welded to provide proper sealing between the stack and the opening.

h. Provide top 1.22 meters 4 feet cone section of the stack of corrosion resistant steel.

i. Anchor Bolts: provide suitable anchor bolts.

2.7.3.2 Construction Accessories

Accessories to be provided:

a. Cleanout Door: Provide double wall insulated steel plate door complete with 25 mm one inch round hinge pin, gasket and not less than 18 swing bolts.

b. Inspection Trolley: Provide a ring of Type 304 Corrosion Resistant Steel (CRES) to support an inspection or painter's trolley. Weld ring and support from the stack plates with not less that three brackets 10 by 65 by 381 mm 3/8 by 2 1/2 by 15 inches. Space brackets at not more than 610 mm 2 feet on centers around the circumference of the stack.

Provide a three wheel CRES flat rail trolley of 227 kg 500 pound capacity. The trolley shall have guides to prevent it from leaving the track and a hole shall be provided in the hinge plate for the attachment of [_____] meters feet of 6 mm 1/4 inch CRES plow steel cable.

c. Ladder: Provide each stack with an external ladder with cage for the full height of the stack. Construct ladder and cage of corrosion resistant steel in accordance with ALI A14.3.

d. Thermocouples: Provide a flue gas sensing thermocouple well with thermocouple one meter 3 feet above the breeching opening and 1 1/2 meters 5 feet below the top of the stack. The wells shall be CRES and shall extend about halfway into the stack.

2.7.3.3 Finish

Stacks shall be shop coated prior to shipping from the factory.

2.7.3.4 Stack Sampling Platform

**************************************************************************
NOTE: Designer shall detail a stack sampling
platform if required. If not required delete this paragraph. If required the platform will have to be located at a point as approved by air pollution control agency having jurisdiction. Many local and state codes incorporate Title 40 Code of Federal Regulations, Part 60. Depending upon final air pollution control equipment arrangement this location may be on the stack or possibly on a long length of horizontal breaching. Stack sampling platform should have the following features:

1. Location of sampling ports would be according to 40 CFR 60 Appendix A, Method.

2. Platform should be one meter 36 inches wide but at ports location it should project away from breeching or stack a minimum of 600 mm 2 feet plus the diameter of the breeching or stack for up to 3 meters 10 feet in diameter stack.

3. If any type of continuous air pollution monitoring devices are located at stack sampling point or anywhere else on breeching, a non-vertical access (stairs or catwalk) is required. For stack sampling purposes a non-vertical ladder is preferred but is not required. Platform with grating shall be designed for a live loading of 1464 kg/m2 300 lbs/sq. ft; platform should have railing with two intermediate railings and 100 mm 4 inch toeplate. Four 30 amp weatherproof receptacles and adequate lighting including lights over the test ports should be provided.

**************************************************************************

Provide stack sampling platform conforming to the requirements of 29 CFR 1910-SUBPART D.

2.7.4 Dampers

2.7.4.1 Multilouver Dampers

**************************************************************************

NOTE: Opposed blade dampers shall be used for throttling service and parallel blade dampers shall be used for two-position service.

**************************************************************************

Provide factory fabricated multilouver dampers with [parallel] [or] [opposed] blade type operation. Construct damper frame of distortion resistant welded steel channels with raised seat to ensure free nonbinding operation of blades and to keep blades square in the frame. Construct blades of 6 mm 1/4 inch thick steel plate in a stressed skin airfoil-shape with fully welded seams containing no external ribs. Blade shafts shall be stainless steel. Blades shall be pinned to blade shafts. Louver shaft bearings shall be outboard type and shall be self-lubricating and self-cleaning. Bearing seals shall be gas-tight.

a. Multilouver Damper Linkage: Damper linkage shall be adjustable and of pinned construction for easy removal and shall be designed to handle
full operation torque. Linkage on dampers in clean flue gas areas shall operate from a single connection point. Design linkage on dampers in dirty flue gas areas, between boiler outlet and inlet to air pollution equipment, so that the bottom blade linkage arm is not connected to the above linkage, to allow this blade to operate separately. The remaining linkage for this damper shall be constructed to operate from a single operating point.

b. Control Damper Operators: Provide control damper operators as noted. Operators may be either electrically or pneumatically operated with positive positioning, manual override, and hydraulic or oil immersed gear trains. Each operator shall be full-proportioning type, with spring return to position indicated in case of loss of power. Damper operating speeds shall be selected or adjusted so that the operators will remain in step with the controller. Operators acting in sequence with other operators shall have adjustment of control sequence as required by the operating characteristics of the system.

c. Two-Position Damper Operators shall be pneumatically operated with air cylinder, four way valve, and solenoid valve arrangement.

2.7.4.2 Guillotine Dampers

*******************************************************
NOTE: Guillotine dampers shall be used for open-shut service where tight shutoff is required; for example, for air pollution control equipment bypass dampers.
*******************************************************

Provide factory fabricated guillotine dampers with heavy structural frame rigid enough to support the extended blade and external loads through the breeching flange. Damper shall be capable of operating without precleaning or manual assistance under normal operating conditions. Enclosed bonnets will only be required where indicated. Provide three inch diameter cleanout ports on both sides for cleaning bottom sections.

a. Guillotine Damper Blades: Provide stress-relieved flat plate guillotine damper blades. Damper blade shall be nonwarping. Intermediate blade supports are acceptable to limit blade deflection. The leading edge of the damper blade shall be beveled and capable of guiding damper blade into frame seat. Blade guides shall be continuous and self cleaning and capable of preventing binding from deposits and damage from misalignment. Bonnet guides shall be removable. Design damper so that a damper blade can be replaced without opening the frame.

b. Guillotine Damper Bonnet Seal: Provide bonnet seal to effectively seal against atmospheric leakage under normal operating conditions.

c. Guillotine damper drive shall be a positive dual endless chain drive capable of driving damper in both directions. Chain drive headshaft shall have sufficient torsional rigidity to prevent binding of blade if the blade is stalled. Damper shall be motor operated with manual override. Design drive mechanism to prevent back driving of motor. Entire drive mechanism shall be of a simple design and require no routine maintenance other than inspection. Chain shall be capable of operating up to the stall torque of the damper drive motor.

d. Electric Motor: Shall be [_____] volt, [_____] phase, 60 Hz, [totally
enclosed, fan cooled] [open drip-proof], not less than [_____] kW hp, as specified under MOTORS AND DRIVES in this section. Provide removable, totally enclosed chain guard.

2.7.5 Sampling Ports

Weld two sampling ports to [breeching] [stack] at 90 degrees apart. Each port shall consist of a section of 100 mm 4 inch diameter steel pipe with threaded cap.

2.8 FUEL OIL SYSTEM

Provide fuel oil system as specified in Section 33 52 10 FUEL SYSTEMS PIPING (SERVICE STATION), for tanks located above grade, and Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS, for tanks below grade.

2.9 MISCELLANEOUS EQUIPMENT

2.9.1 Condensate Receiver

Provide a [horizontal] [vertical] type tank not less than [_____] meters feet [_____] mm inches in diameter by [_____] meters feet [_____] mm inches [long] [high] overall with a storage capacity of not less than [_____] liters gallons. Tank shall be constructed of welded steel plate not less than 10 mm 3/8 inch thick. Provide condensate tank with a 600 mm 24 inch diameter manway, dual gage glasses with protective guards, saddles, and other connections as indicated.

2.9.1.1 Coating

Surface blast interior of tank to bare metal and coat with a baked-on phenolic lining or corrosion resistant liner consisting of a resin and hardener suitable for immersion in water at not less than 121 degrees C 250 degrees F. Coat tank exterior with one shop coat of manufacturer's standard primer rated for service of not less than 121 degrees C 250 degrees F.

2.9.1.2 Accessories

Provide the condensate receiver with the following:

a. Connections for condensate pumped return, vent, water outlet, drain, sampling outlet, level transmitter and controls.

b. [_____] mm inch vent.

c. Reflex type water gage glasses with shutoff valves and guards.

d. One, 125 mm 5 inch dial, thermometer, 10 to 149 degrees C 50 to 300 degree F range, with lagging extension type wells, for steam and water space.

e. [_____] mm inch overflow trap.

f. One high water alarm switch with stainless steel float and trim. Circuit shall close as liquid level rises. Locate switch to close circuit when water level rises to 25 mm one inch below overflow level of receiver.
g. One low water alarm switch with stainless steel float and trim. Close circuit as liquid level falls. Locate switch to close circuit when water level drops to 25 percent of the storage capacity of the storage tank.

h. Install switches on a single column with valved connections to tank. Provide unions in pipe on each side of each float switch.

i. Furnish pipe, fittings, controls, specialties, bolts, gaskets, drains, valves, necessary for a complete unit. Install at the jobsite.

j. Provide automatic control system to control level in condensate tank by modulating discharge from condensate pumps.

2.9.2 Deaerating Heater

2.9.2.1 General

Provide a deaerating feedwater heater with storage tank conforming to FS W-H-2904 and to ASME BPVC SEC VIII D1, except as modified below. Tank shall be ASME Code stamped. Provide stainless steel trays. No test model will be required.

Model A - Pressurized operation.

Type I - Tray-type heating and deaerating element.

Class 3 - 10 minute water storage capacity (minimum).

Grade A - Guaranteed removal from water of dissolved oxygen in excess of 0.005 cubic centimeters(cc) per liter 0.0012 in3/gal, over a ten to one load swing.

2.9.2.2 Heater Capacity

Provide deaerating heater capable of heating and deaerating makeup water consisting of [] kg per second pounds per hour of softened makeup water from [] degrees C F to [] degrees C F (outlet temperature).

2.9.2.3 Inlet Water Characteristics

Softened makeup water:

Ph: []
Total hardness (as CaCO3): []

2.9.2.4 Storage Tank

Horizontal design with steel supports [drilled for bolting] of approved design. Provide storage tank with not less than a 400 by 500 mm 16 by 20 inch minimum size manhole and cover and provide heater section with not less than a 300 by 450 mm 12 by 18 inch minimum size tray access handhole and door.

2.9.2.5 Vent Condensing Arrangement

Provide the deaerating heater with a vent condenser which shall condense the vented steam when the heater is operating at full capacity with the inlet water mixture at a temperature not exceeding 82 degrees C 180 degrees
F. Construct the vent condenser, when of the direct contact type, with stainless steel baffling.

2.9.2.6 Materials

Construct trays, tray supports, water distributors, and other parts coming in contact with underaerated water or air laden steam of 430 stainless steel.

2.9.2.7 Accessories

Provide deaerating heater with the following accessories:

a. Pressure Relief Valve: Sized in accordance with FS W-H-2904.

b. Thermometers: Two, 125 mm 5 inch dial thermometers, 10 to 149 degrees C 50 to 300 degrees F, with lagging extension type wells for the storage tank and the heater section. Provide a thermometer similar to above but with range of minus [_____] degrees C F to plus [_____] degrees C F for the makeup water connection.

c. Lifting attachments for the tray section and the storage tank.

d. Water Gage Glasses: Reflex type with shutoff valve and guards.

e. Pressure Gages: One 150 mm 6 inch dial compound pressure gage for the heater section with range from [_____] kPa inches of mercury (vacuum) to [_____] kPa (gage) psig.

f. Float Controllers:

   (1) Inlet condensate controller
   (2) Makeup water controller
   (3) Overflow controller

g. Overflow Control Valve: With pneumatic controller arranged for local automatic operation.

h. Storage Tank Gage Glass: Full height, shielded, for storage tank including shutoff valve and drain cocks.

i. Makeup Water Inlet Control Valve: With pneumatic controller.

j. Switches: For low water level alarm in the storage tank, high water level alarm, condensate pump shutdown in the storage tank, and low steam pressure alarm. Install switches on a single column with connections valved and unions provided in pipe on each side of each float switch.

k. Special tools: One set for maintenance.

l. Condensate Pump Reset: With stainless steel float and trim to reset pump shutdown switch on fall of liquid level in tank to [_____] mm inches below level of overflow level of storage tank.

m. Furnish pipe, fittings, controls, specialties, bolts, gaskets, drains, and valves, necessary for proper attachment of accessories and
trimmings and install.

[ n. Oil separator

2.9.2.8 Connections

Provide necessary connections for condensate, steam, makeup water, removal of vented gases, vacuum breakers, discharge of deaerated water, and instruments and controls.

a. Provide heater connections as follows:

(1) [_____] mm inch steam inlet
(2) [_____] mm inch makeup water inlet
(3) [_____] mm inch condensate
(4) [_____] mm inch high pressure trap return
(5) [_____] relief valves sized as required
(6) [_____] mm inch vent
(7) [_____] mm inch for thermometer well
(8) [_____] mm inch for pressure gage
(9) Vacuum breakers as required
(10) [_____] mm inch heater drain
(11) [_____] mm inch spare [capped] [flanged]
(12) [_____] mm inch spare [capped] [flanged]
(13) Handholes and manhole with covers

b. Tank connections shall include:

(1) [_____] mm inch drain
(2) [_____] mm inch boiler feed recirculation ([_____] required)
(3) 25 mm One inch sampling
(4) 25 mm One inch chemical feed
(5) [_____] mm inch for sight glass ([_____] sets required)
(6) [_____] mm inch for high and low level alarm switches
(7) [_____] mm inch thermometer well
(8) Vacuum breakers as required
(9) [_____] mm inch spare (capped)
(10) [_____] mm inch spare (flanged)
2.9.2.9 Level Control

Provide an automatic control system to control water level in the storage tank, by modulating valves in makeup water lines. Condensate pump output shall be controlled by level in condensate storage tank.

a. Controllers: Provide external cage type air operated level controllers for both the condensate and makeup water lines complete with 40 mm 1/2 inch screwed connections, external cage, and controller. Cage body shall be Class 125 cast iron construction. Internal components including displacer, torque tube, displacer rod, displacer rod driver and bearings shall be 316 stainless steel. Displacer shall be 350 mm 14 inches long. Controller shall be direct acting with 20 to 103 kPa (gage) 3 to 15 psig range with proportional band adjustment. Locate controller to maintain an operating level at 2/3-full point of storage tank. Provide level controller with air pressure reducing valve, filter, gages and isolating valves for float cage. Provide unions on each side of float cage.

b. Air Operated Regulating Valves: Provide air operated control valves for both the condensate and makeup water lines. Valves shall have Class 125 or Class 150 rating with iron or semi-steel bodies and 316 stainless steel internals. Provide condensate valve which fails open on loss of air and makeup water valve with an air lock mounted on valve diaphragm to hold valve in last position on loss of air. Design valves for the following conditions:

2.9.2.10  Low Pressure Steam Control

Provide an automatic control system to control the steam to the deaerating heater. Maintain steam pressure in the heater by modulating a pressure reducing valve in the steam supply line. Control shall be local and remote from the control panel.

a. Controller: Adjustable proportional band, 0 to 103 kPa (gage) 15 psig brass bellows for input signal, and 20 to 103 kPa (gage) 3 to 15 psig output air pressure range, pilot controller complete with air set (valve, filter, drier and pressure regulator) mounted on control valve yoke.

b. Pressure Reducing Station Control Valve: Provide a [_____] mm inch air operated pressure reducing valve with proper internals to pass a flow of [_____] kg per second pounds per hour of steam. Steam at the valve inlet shall be [_____] kPa (gage) psig saturated, and the outlet shall be controlled at [_____] kPa (gage) psig. Minimum steam flow shall be approximately [_____] kg per second pounds per hour. Minimum valve Cv shall be [_____] at 100 percent open. Valve shall be Class 250 or Class 300 flanged, iron or semi-steel body with stainless steel internals equal percentage flow characteristics and a full size port. Provide valve actuator including travel indicator, hand jack, valve positioner, and air supply filter-reducer set. Valve shall move to open position in case of failure.

2.9.2.11  Gage Glasses

Provide gage glasses to cover the entire range of water level in the storage section. Gage glasses shall not be greater than 600 mm 24 inches center-to-center. Provide gage glasses complete with [chain operated] ball check shutoff and drain cock valves and safety shield.

2.9.2.12  Alarms

Provide high and low water level alarms for storage tank as follows:

a. High Water Level Alarm: Switch with stainless steel float and trim. Locate switch to close circuit when water level rises to 25 mm one inch below overflow level of storage tank.

b. Low Water Level Alarm: Switch with stainless steel float and trim. Locate switch to close circuit when water level falls to [_____] meters feet [_____] mm inches above bottom of storage tank.

c. Coordination: Coordinate alarms with annunciator panel as indicated.

2.9.2.13 Multiport Back Pressure Relief Valve

**************************************************************************
SECTION 23 52 33.03 20  Page 55
NOTE: Use multiport valve on systems where deaerating heater will be subject to occasionally overpressuring.

Provide valve capable of relieving not less than [_____] kg per second pounds per hour of steam with not more than a [_____] kPa (gage) psig pressure rise when set at [_____] kPa (gage) psig initial operating pressure. Set pressure shall be fully adjustable by means of an external handwheel or chain operator for a range of zero to 172 kPa (gage) 25 psig. Locate on low pressure steam header manifold for the deaerating heater. Valve shall be multiport vapor cushion type rated for operating temperatures up to but not greater than 149 degrees C 300 degrees F with Class 125 cast iron body, bronze trim and carbon steel springs.

2.9.2.14 Exhaust Head

CID A-A-50494, Type [I (cast iron)] [II (fabricated steel plate)] of [_____] mm inch size with [_____] mm inch diameter drain, and a capacity of [_____] kg per second pounds per hour of steam at [_____] kPa (gage) psig.

2.9.3 Boiler Feed Pumps

NOTE: Use this paragraph for centrifugal boiler feed pumps. Use Style 1, horizontal split case pumps in all sizes. Pump service requirements shall include a minimum pump capacity of 125 percent of boiler requirements at maximum load. Discharge head must be sufficient to deliver water to the boiler at a pressure 3 percent higher than the boiler safety valves setting and up to 6 percent over the maximum operating pressure of the boiler in accordance with the ASME Boiler and Pressure Vessel Code.

CID A-A-50562, Type II (boiler feed pump), Style 1 (horizontally split case), Class 2 (multi-stage) except as modified below. Each pump shall be two stage with horizontal split casing, enclosed single suction opposed type impellers, renewable casing and impeller wearing rings, stuffing box with quenching gland and flooded oil lubricated, water cooled bearings.

2.9.3.1 Pump Service Requirements

a. Capacity: [_____] L/s gpm

b. Pumping temperature: [_____] degrees C F

c. Liquid pH: [_____] 

d. Discharge head: [_____] Pa feet

e. Available NPSH: [_____] Pa feet

f. In addition to the operating point established above, the pump curve shall also run through the following points:
### 2.9.3.2 Construction

Boiler feed pumps shall be bronze fitted including bronze impeller and impeller wear rings, and ASTM A48/A48M, Class 30, cast iron casing. Provide casing with suction and discharge gages in tapped openings. Mount each pump and prime mover on a fabricated steel bed plate having a drip collection chamber with tapped drain openings. Provide lifting attachments to enable equipment to be set into its normal position and to enable pumps to be easily dismantled in place.

### 2.9.3.3 Electric Motors

<table>

**NOTE:** The designer shall perform an economic analysis and make a technical evaluation to determine if the boiler feed or condensate pump motors shall be provided with variable speed control. Generally, variable speed drives for boiler feed or condensate pumps over 5 1/2 kW 7 1/2 HP will be cost effective.

| Variable speed | open dripproof | totally enclosed | fan cooled | [_____] volt, three phase, 60 Hz of not less than [_____] kW hp, as specified under MOTORS AND DRIVES and VARIABLE SPEED CONTROL FOR MOTORS in this section. [Variable speed] electric motors [or turbines] direct connected to respective pumps with a gear type, forged steel, flexible coupling. Provide a shaft and coupling guard.

### 2.9.3.4 Steam Turbines

<table>
<thead>
<tr>
<th>Capacity</th>

</tr>
</tbody>
</table>

Single stage, rated at not less than [_____] kW hp, with inlet steam pressure of [_____] kPa (gage) 15 psig or a maximum back pressure of 34 kPa (gage) 5 psig or 103 kPa (gage) 15 psig. Water rate at full load and normal steam conditions shall not exceed [_____] kg per BkW per second pounds per BHP per hour. Provide a stainless steel steam strainer, sentinel relief valve, sight oil level indicator and one hand valve. [Variable speed] turbines direct connected to respective pumps with a gear type, forged steel, flexible coupling. Provide a shaft and coupling guard.

a. **Turbine Construction:** Turbine casing split on the horizontal centerline constructed of ASTM A48/A48M cast iron, with a design pressure rating of 1724 kpa (gage) 250 psig at 232 degrees C 450 degrees F at inlet, and 379 kpa (gage) 55 psig at 232 degrees C 450
degrees F at the outlet.

b. Turbine Bearings and Shaft: Horizontal split, ring oiled, sleeve type, water cooled. The shaft shall be stainless steel or chrome plated under the packing glands. The shaft seals shall be segmented carbon rings with springs and stops.

c. Speed Governor: Variable speed oil relay, NEMA Class D governor for speed control and pneumatic operator to maintain an adjustable, preset pump discharge header pressure by variation of turbine speed. Input to the operator shall be a 20 to 103 kPa (gage) 3 to 15 psig pneumatic signal. Provide an electro-pneumatic transducer to accept the 4 to 20 mA signal from the control system controller specified in Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS.

d. Emergency Overspeed Governor: Completely independent of the speed governor and shall operate trip valve.

e. Insulation: Turbine shall be insulated and lagged by the manufacturer as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

2.9.3.5 Minimum Flow Protection for Boiler Feed Water Pumps

a. Automatic Flow Control Valve: Provide with each pump an automatic bypass valve. Valve shall automatically program the recirculation flow, the detection of low flow, the cycling of control valve and pressure letdown for high pressure boiler feedwater return to the feedwater heater. Bypass valve shall be cast steel with stainless steel internals, and shall have a rating of not less than 2068 kpa (gage) 300 psig at 204 degrees C 400 degrees F. Valve shall have a line size body with a 25 mm one inch recirculation connection.

b. Boiler Feedwater Automatic Recirculation System: (Option to Automatic Valve). Provide a boiler feedwater automatic recirculation system to protect the feedwater pumps at low flow conditions. System shall be capable of recirculating the minimum flow recommended by the pump manufacturer. The system shall be an engineered system consisting of the various functional components specified or shall be a self-contained and self-powered mechanical system. Components of the engineered system shall include a flow transmitter with orifice in feedwater line, bypass flow controller with bypass flow control valve, and a bypass pressure reducing orifice.

(1) System Bypass Flow Controller: Include detection of low flow and modulation of a control valve in a bypass line returning to a low pressure sink. Incorporate a pressure let-down feature or device to reduce the pressure from the boiler feedwater pump discharge pressure to that of the low pressure sink.

(2) System Bypass Control Valve: Modulate to provide minimum flow recommended by the pump manufacturer and to provide shutoff or recirculation flow when feedwater flow to the boilers exceeds the minimum flow required for pump protection.

c. Feedwater Stop and Check Valves: Provide a Class 300, flanged, cast steel feedwater stop gate valve and check valve on the feedwater outlet of each pump. Provide piping from the valves to the economizer inlet, and from the economizer to the flanged connection on the boiler drum.
Provide connection on pipe at economizer outlet for remote recording thermometer.

2.9.4 Condensate Pumps

**************************************************************************
NOTE: Use this paragraph for centrifugal condensate pumps. Pump service requirements shall include pump capacity a minimum of 125 percent of boiler requirements. Discharge into deaerator heater shall be modulated.
**************************************************************************

CID A-A-50562, Type I, Style [1 (horizontally split case)] [2 (end suction)], Class 1 (single stage) unless modified below.

2.9.4.1 Condensate Pump Service Requirements

a. Capacity: [_____] L/s gpm
b. Pumping temperature range: [_____] to [_____] degrees C F
c. Liquid pH: [_____] 
d. Discharge head: [_____] Pa feet
e. Available NPSH: [_____] Pa feet

f. In addition to the operating point established above, the pump curve shall also run through the following points:

<table>
<thead>
<tr>
<th>Capacity</th>
<th>Discharge Head</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

2.9.4.2 Construction

Condensate pumps shall have bronze impellers and impeller wear rings. Pump casings shall be [cast iron] [ductile iron], and shall be designed for the specified conditions. Bearings shall be oil lubricated. Casings shall have tapped openings for suction and discharge pressure gages. Provide suction and discharge pressure gages in openings. Mount pump and driver on a fabricated steel bed plate having a drip collection chamber with tapped drain openings. Provide lifting attachments for installation and maintenance.
2.9.4.3 Electric Motors

**************************************************************************
NOTE: The designer shall perform an economic analysis and make a technical evaluation to determine if the boiler feed or condensate pump motors shall be provided with variable speed control. Generally, variable speed drives for boiler feed or condensate pumps over 5 1/2 kW 7 1/2 HP will be cost effective.
**************************************************************************

[Variable speed], [open dripproof], [totally enclosed], [fan cooled], [_____] volt, three phase, 60 Hz of not less than [_____] kW hp, as specified under the paragraph MOTORS AND DRIVES [and VARIABLE SPEED CONTROL FOR MOTORS] in this section. [Variable speed] electric motors direct connected to the respective pumps with a gear type flexible coupling. Provide shaft and coupling guards.

2.9.4.4 Steam Turbines

Single stage, rated at not less than [_____] kW hp, with inlet steam pressure of [_____] kPa (gage) psig and [_____] degrees C F, normal exhaust back pressure of 20 kpa (gage) 5 psig and a maximum back pressure of 103 kPa (gage) 15 psig. Water rate at full load and normal steam conditions shall not exceed [_____] kg per BkW per second pounds per BHP per hour.

Provide a stainless steel steam strainer, sentinel relief valve, sight oil level indicator and one hand valve. [Variable speed] turbines direct connected to the respective pumps with a gear type flexible coupling. Provide shaft and coupling guards.

a. Turbine Construction: Turbine casing split on the horizontal or vertical centerline constructed of ASTM A48/A48M cast iron, with a design pressure rating of 1724 kPa (gage) 250 psig at 232 degrees C 450 degrees F at inlet, and 379 kpa (gage) 55 psig at 232 degrees C 450 degrees F at the outlet.

b. Turbine Bearings Shaft: Ring oiled, anti-friction type. Shaft shall be stainless steel or chrome plated under the packing glands. Shaft seals shall be segmented carbon rings with springs and stops.

c. Speed Governor: Variable speed governor for speed limiting and pneumatic operator to maintain an adjustable preset level in [deaerator tank] [condensate receiver] by variation of turbine speed. Input to the operator shall be a 34 to 103 kPa (gage) 3 to 15 psig pneumatic signal and vary the turbine speed from minimum to full speed in a linear response. Maximum and minimum speed shall be adjustable. Provide an electro-pneumatic transducer to accept the 4 to 20 mA signal from the controller specified in Section 23 09 53.00 SPACE TEMPERATURE CONTROL SYSTEMS.

d. Emergency Overspeed Governor: Completely independent of the speed governor and shall operate a separate trip valve.

e. Insulation: Turbine shall insulated and lagged as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.
2.9.5 Variable Speed Motor Controller

Remotely installed cabinet housed units with solid state rectification and inverter equipment to vary frequency of electrical power to the drive motors.

2.9.5.1 Housing

House the controller in a [wall] [floor] mounted, NEMA [_____] enclosure finished with manufacturers standard painted finish. Provide control panel complete with fused disconnect switches, magnetic [across the line] [part winding] starters with thermal overload protection, transformer, hand-off-automatic selector switches, hand potentiometer for manual speed control, fuses and running lights.

Manual Switch: Locate the manual switch within the control panel so that in the event failure of any of the components the motor can be put across the line at full voltage to maintain air or pump pressure. Provide a mechanical door interlock that allows the panel to open only when the fused disconnect is in the off position.

2.9.5.2 Variable Frequency Controllers

Variable frequency controllers shall use solid-state semiconductor power conversion equipment. Provide controllers as integrated and assembled products. Controllers shall be furnished by the same manufacturer.

2.9.5.3 Ratings

Each controller shall be rated for a supply of [_____] volts, three phase, 60 Hz. The output shall be [_____] volts, three phase with frequency variable between zero and 60 Hz. Controllers shall be rated to operate the motors continuously at their rated kilowatt horsepower and frequency. Speed regulation shall be within (plus or minus) three percent of set point without tachometer feedback. Electrical supply system shall have an available short circuit rating of [_____] amperes symmetrical.

2.9.5.4 Minimum Speed

Each controller shall be capable of driving the motor continuously at a lower speed no greater than 20 percent of full rated motor speed with stable operation and without overheating the motor under rated ambient conditions. Provide estimate of minimum speed at which motor can be operated continuously without overheating or problems of instability due to overhauling of the load.

2.9.5.5 Fault Protection

Provide controller fault protection so that a single or three phase short circuit at the controller terminals or inverter commutation failure will not result in damage to power circuit components. Provide overload protection so that motor and controller are protected against operating overloads.

2.9.5.6 Time Delay

Provide adjustable time delay under voltage protection so that motors will continue to operate during momentary voltage fluctuation or loss of voltage. Time adjustment shall be zero to 5 seconds. Provide for orderly
shutdown on undervoltage conditions exceeding the time delay interval.

2.9.5.7 Acceleration/Deceleration

Provide adjustable timed linear acceleration and deceleration.

2.9.5.8 Voltage/Frequency Control

Provide volts/Hz control to prevent motor overheating throughout the speed range.

2.9.5.9 Door Interlocks

Provide door interlocks to prevent opening of enclosure doors unless power is disconnected.

2.9.5.10 Shutdown Conditions

Controllers shall be self protecting and shall provide orderly shutdown for, but not limited to, the following conditions:

a. Loss of input power
b. Undervoltage
c. Sustained gradual overload
d. Fault or large instantaneous overload
e. Overtemperature
f. Failure of ventilating system
g. Overvoltage
h. Control circuit failure

Provide contacts for remote annunciation of shutdown or abnormal condition.

2.9.5.11 Electrical Bypass

Provide each controller with manual isolation and bypass switching. Switch shall be manually operated with controller deenergized. Switch shall be two position with provisions for locking the switch in either position.

a. Normal Position: Bypass shall be open and connect controller to the supply circuit and the load.

b. Bypass Position: Bypass shall be closed and the controller shall be electronically isolated from the supply and the load. Isolating contacts shall be located so that it is possible to verify by visual inspection that the contacts are open and the controller is electrically isolated. In the bypass position the motor shall be operated at constant speed and controlled from the air circuit breaker. Provide auxiliary contacts that close in the bypass position. Auxiliary contacts shall be used to activate the damper control to provide fan load control in the bypass position.
2.9.5.12 Controller Environmental Protection

a. Ventilation: Design controllers enclosed and ventilated for installation in a moderately dusty area. Provide forced filtered ventilation including fans, filters, controls and accessories required for operation. Enclosures shall be operated under positive pressure at all times. Provide filtered ventilating openings and gasketed doors to prevent infiltration of dust.

b. Heating: Provide electric heaters to prevent condensation in the enclosure and to prevent low ingoing air temperatures that exceed the equipment rating. Provide a low temperature alarm to sound when enclosure temperature falls below required minimum temperature. Provide contacts for remote annunciation of alarm condition.

2.9.5.13 Method of Control

Supply each controller from an electrically operated air circuit breaker or motor starter. Controller ventilation and heating shall be from another circuit.

a. Start Signal: Closes the electrically operated air circuit breaker or motor starter to energize the controller. The controller shall accelerate the fan to operating speed. Fan speed shall be controlled from the load control signal.

b. Stop Signal: Opens the electrically operated air circuit breaker or motor starter to deenergize the controller. Upon deenergization, the controller control system shall revert to the stop condition.

c. Boiler Feedwater Pump Speed Control System: Matches pump discharge to system demand and maintains a system header pressure controlled to the set point values. Provide Manual/Automatic control stations for master pressure and for each boiler feed pump. Provide indicators for feedwater header pressure and individual boiler feedwater pump flow. See Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS.

2.9.6 Valve Actuators

[Electrically] [or] [pneumatically] operated and designed so that valve may be manually operated by removing the drive pins. Actuators shall be operated by push button control. Locate one push button at a position adjacent to the valve. Locate a second push button within the boiler control room. Provide a valve position indicator utilizing indicating lights. A green light shall indicate the valve is fully open and an amber light shall indicate the valve is fully closed. Both lights on shall indicate when the valve is partially open. [Provide torque limit controls to protect the valve during opening and closing for electrically operated valves.] Actuator electric motor shall be totally enclosed, [_____] volts, [_____] phase, 60 Hz as specified under the paragraph MOTORS AND DRIVES in this section. Provide NEMA 4 control enclosures.

2.9.7 Sump Pumps

CID A-A-50555 with automatic float switch and disconnect switch in NEMA 6 enclosure.
2.9.8 Water Softening System

**************************************************************************
NOTE: One hundred percent makeup shall be assumed in calculating the sustained softening rate.
**************************************************************************

Ion exchange resin type conforming to WQA S-100 except as modified below. [Manual] [Push button automatic] [Fully automatic] in operation with operating controls housed in a NEMA 12 enclosure having a total capacity between regenerations of not less than [_____] liters gallons of water of [_____] grains hardness when operated at a sustained softening rate of [_____] L/s gpm. The maximum effluent water temperature shall be [_____] degrees C F.

2.9.8.1 Raw Water Analysis

**************************************************************************
NOTE: Regarding the text below: Analysis of the water available for makeup shall govern the softener system selected. A competent water treating consultant shall be obtained to formulate specific system recommendations if the makeup water analysis indicates any of the following:

1. Iron in excess of 0.1 ppm as Fe.
2. Mg Alkalinity in excess of 50 ppm as CaCO3.
**************************************************************************

The source of the raw water is [______]. It is available at pressures of [_____] to [_____] kPa (gage) psig. The analysis of the water available for makeup is approximately as follows:

### 2.9.8.2 Softener Effluent Analysis

************************************************************************************

**NOTE:** At the text below, total solids of 175 ppm (parts per million) in the feedwater concentrated 20 times give 3,500 ppm in the boiler water.

************************************************************************************
a. **Hardness:** Maintain hardness of the softened feedwater near zero and in no case allow it to exceed 1.0 ppm (parts per million) as CaCO₃.

b. **Total Solids:** Maintain total solids in the softened feedwater at a level to ensure a total solids concentration in the boiler water of less than 3,500 parts per million (ppm) without excessive blowdown.

### 2.9.8.3 Softener Equipment

Including but not limited to the following:

a. **Water Hardness Monitor:** Provide a water hardness monitor with an alarm point at 1.0 ppm to ensure compliance for boilers rated above 3150 gram per second (g/s) 25,000 lb/hr.

b. **Total Solids Monitor/Controller:** Provide a continuous monitor and controller (when required) to control the concentration of dissolved solids and treatment chemicals in the water for boilers rated above 3150 g/s 25,000 lb/hr.

c. **Water Meter:** Provide a [_____] mm inch cold water meter on each softener unit.

d. **Ion Exchange Resin:** High capacity, polystyrene base, sulfonated synthetic type except that the exchange capacity shall be not less than 2 kg per cubic meter 30 kilograins per cubic foot at a salt dosage of 240 kg per cubic meter 15 pounds per cubic foot.

e. **Tank Sizing:** Minimum acceptable bed depth of 760 mm 30 inches; maximum acceptable bed depth of 1830 mm 72 inches. Base reactor tank sizes on allowing a freeboard above the resin bed of not less than 75 percent of the resin bed depth, and flow rate between 1.11 and 7.14 L/s per cubic meter 0.5 and 3.2 gpm per cubic foot of resin.

### 2.9.8.4 Brine Storage System

Provide a complete brine storage system including fiberglass storage tank, sight level gage, bulk salt delivery tube, internal distribution system, level control system, tank vent with dust collection system, top and side manholes, access ladder, and other required appurtenances.

### 2.9.8.5 Brine Storage System Accessories

Provide the following accessories:

a. Steel holddown lugs securely bonded to the tank in adequate number to properly anchor tank to concrete base;

b. Side bottom flanged drain not less than 100 mm 4 inches in diameter;

c. Side and top manholes not less than 560 mm 22 inches in diameter;

d. Flanged top connections for delivery pipe and vent;

e. Ladder for access to top manhole;

f. Water inlet connection;

g. Brine outlet connection;
h. Level control system; and
i. Sight level gage.

2.9.8.6 Storage Tank

Filament wound fiberglass with flat bottom and domed top as recommended by the manufacturer for brine storage. Tank shall be [_____] meters feet [_____] mm inch in diameter by [_____] meters feet [_____] mm inch wall height with a nominal capacity of [_____] liters gallons and a dry salt storage capacity of [_____] Mg tons. Design the water distribution system, internal piping distributors, and brine collection system so that the system shall be capable of dissolving [_____] kg pounds of rock salt per second minute to produce [_____] L/s gallons per minute of brine. System shall be able to dissolve [_____] Mg tons of salt before cleanout.

a. Pneumatic Delivery Pipe: Not less than 100 mm 4 inches in diameter.

b. Dust Collection Vent System and Safety Relief Valve: Provide storage tank with dust collection vent system and safety relief valve.

c. Access Ladder: Of steel construction to be bolted to tank by means of fiberglass reinforced plastic mounting lugs complete with safety cage. Platform shall connect the ladder to the tank for safe access to the manhole. Safety requirements shall be in accordance with ALI A14.3.

d. Tank Internals: Construct tank internals including water distribution piping and brine collectors of fiberglass reinforced plastic (FRP) or polyvinyl chloride (PVC).

e. Tank Nozzles: ASME B16.5, Class 150, reinforced FRP or PVC flanges.

f. Level Control System: Electrode holder and electrodes mounted in a standpipe exterior to the tank. Position electrodes so that a solenoid operated water makeup valve will be opened or closed to maintain the liquid level to within plus or minus one inch of the set level. Provide tank with a high water alarm. Electrodes shall be easily removable for cleaning and constructed of materials, that will allow continual immersion in brine.

2.9.9 Chemical Feed Systems

Provide systems complete with storage tank, supporting framework, hinged cover, mixer, strainers, level indicators, proportioning pumps, relief valves and interconnecting piping for a complete chemical feed packaged unit.

2.9.9.1 Storage Tank

190 liters 50 gallon capacity constructed of fiberglass reinforced plastic. Provide removable, hinged cover.

2.9.9.2 Exterior Gage Glass

Protected, full height of the tank complete with gage cocks.
2.9.9.3 Low Level Alarm

Provide tank with a low level switch to sound alarm and shut down pumps should level drop to preset minimum.

2.9.9.4 Dissolving Baskets

**************************************************************************
NOTE: The chemical feed solution to be used shall be inserted here.
**************************************************************************

Construct baskets of a corrosion resistant material suitable for continuous immersion in a [_____] solution.

2.9.9.5 Tank Strainer

Install tank strainer in suction line to pump.

2.9.9.6 Supporting Steelwork

Provide supporting steelwork to adequately support tank, mixer, and the number of proportioning pumps specified.

2.9.9.7 Agitator

Provide an agitator with mounting bracket to mount to storage tank. Agitator shaft and propeller shall be of stainless steel.

2.9.9.8 Proportioning Pumps

Provide [two] [three] [_____] proportioning pump[s] of the [simplex] [duplex] type. Each pump shall have a minimum capacity of [_____] L/s gallons per hour at a [_____] kPa (gage) psig discharge pressure. Capacity shall be adjustable from zero to 100 percent by a convenient screw adjustment of stroke length. Provide pump with integral check valves. Electric motors shall be [totally enclosed], [fan cooled], [_____] volts, [_____] phase, 60 Hz as specified under the paragraph MOTORS AND DRIVES in this section.

2.9.9.9 Safety Relief Valve

Provide safety relief valve for each pump to discharge back into the tank in event of excessive line pressure.

2.9.10 Blowdown Tank

Provide a welded blowdown tank in accordance with NBBI NB-27, (supplemental to the National Board Inspection Code) latest edition published by the National Board of Boiler and Pressure Vessel Inspectors, Columbus, Ohio.

2.9.10.1 Construction

**************************************************************************
NOTE: The volume of the blowdown tank shall be calculated to be twice the volume of water removed from one boiler when the normal water level is reduced not less than 100 mm 4 inches.
**************************************************************************
Construct equipment and accessories in accordance with the requirements of the ASME BPVC SEC VIII D1 for a working pressure of at least the maximum allowable working pressure of the boiler but in no case shall the plate thickness be less than 10 mm 3/8 inch. Provide corrosion allowance of [2.54 mm] [0.1 inch] [______]. Tank dimensions shall be [_____] meters feet [_____] mm inches O.D. by [_____] meters feet [_____] mm inches long over the heads (overall). Provide tank with wear plate not less than 10 mm 3/8 inch thick and [280 by 380 mm 11 by 15 inch] [460 by 510 mm 18 by 20 inch] manhole.

2.9.10.2 Tank Connections

Provide the following connections:

b. Tangential blowdown inlet [_____] mm inch;
c. Steam vent, flanged [_____] mm inch;
d. Discharge water outlet, flanged [_____] mm inch with internal water seal and 20 mm 3/4 inch siphon breaker;
e. 50 mm Two inch drain;
f. Thermometer connection 20 mm 3/4 inch;
g. Pressure gage connection 6 mm 1/4 inch;
h. Cold water inlet [_____] mm inch with temperature regulating valve and backflow preventer; and
i. Two gage glass connections 5 mm 1/2 inch.

2.9.10.3 Angle Supports and Coating

Provide tank with steel angle support legs extending [_____] meters feet below bottom of the tank. Coat tank with one coat of manufacturer's standard high temperature primer.

2.9.10.4 Accessories

a. Gage Glass: 300 mm 12 inch reflex type with shutoff valves and guard;
b. Thermometer: Bi-metal dial type with separable socket, 125 mm 5 inch dial, 10 to 149 degrees C 50 to 300 degrees F range;
c. Pressure Gage: Zero to 172 kpa (gage) 25 psig range; and

d. Internal Baffles and Pipes: As detailed.

2.9.10.5 Controls

Provide a self operating regulator to control the flow of cooling water to the tank. Regulator shall include a 20 mm 3/4 inch screwed bronze body with stainless steel trim, reverse acting actuator (for cooling), capillary tubing and a union connection bulb with a stainless steel well. Control setting shall be 60 degrees C 140 degrees F with a minimum Cv of [______].
2.9.11 Continuous Blowdown System

Provide a complete automatic continuous boiler blowdown system which shall include a controller/programmer unit and flow assembly for each boiler, plus a continuous blowoff heat exchanger, flash tank and boiler water sample cooler.

2.9.11.1 Automatic Blowdown Controller

Intermittent type boiler blowdown system rated for not less than 1724 kPa (gage) 250 psig steam pressure.

2.9.11.2 Flow Assembly

Include a 25 mm one inch ball valve with 316 stainless steel ball and stem and stainless steel electrode assembly.

2.9.11.3 Controller/Programmer

Include a conductivity meter with zero to 6000 microhms range, valve open/closed indicators and manual/auto control switch. Cycle interval and sample duration shall both be adjustable over a wide range. Mount units at operating floor near boiler front.

2.9.11.4 Accessories and Connections

a. Continuous Blowdown Connection: At each boiler, provide a gate valve and extend piping to header at flash tank.

b. Header Connections: Provide with a tee with valved sampling connection. Provide a 20 mm 3/4 inch, three globe valve bypass around each flow assembly.

c. Common Header: Provide from valved outlet connections on flow assembly units to connection on flash tank.

2.9.11.5 Flash Tank

Designed for [_____] kPa (gage) psig and constructed in accordance with the ASME BPVC SEC VIII D1. Tank shall be [_____] mm inches in diameter by [_____] mm inches long including heads and shall be ASME Code stamped.

2.9.11.6 Blowdown Inlet

Provide tank with blowdown inlet, steam outlet, gage glass, float operated outlet valve, relief valve, and inspection openings. Tank shall have steel angle legs with plate feet for bolting to floor and legs shall be of sufficient length so that bottom of lower head of tank will be not less than 460 mm 18 inches above floor.

2.9.11.7 Automatic Control System

Control level in the flash tank, by modulating a valve in the water outlet line.

a. Level Controller: External cage type air operated level controller, complete with 40 mm 1 1/2 inch screwed connection, 350 mm 14 inch stainless steel float and Class 125 cast iron body. Controller shall
be direct acting with 20 to 103 kPa (gage) 3 to 15 psig range with proportional band. Locate controller to maintain an operating level at center line of storage tank. Provide level controller with air pressure reducing valve, filter, gages and isolating valves for float cage. Provide unions on each side of float cage.

b. Outlet Water Valve: [_____] mm inch air operated control valve with a capacity to pass [_____] L/s gpm at a pressure drop of [_____] kPa (gage) psig. Cv shall not be less than [_____] at 100 percent open. Valve shall be Class [______], flanged, iron or semi-steel body with stainless steel internals. Valve shall have equal percentage flow characteristics with a full size port. Provide an air lock mounted on valve diaghragm and piped to hold valve in last position on air failure.

2.9.11.8 Sample Cooler

Water cooled shell and tube type with valves and accessories required to safely withdraw a water sample from the boiler drum. Provide drain under sampling valve terminating with a 20 mm 3/4 inch splash proof funnel, 230 mm 9 inches below outlet of valve.

2.9.11.9 Heat Exchanger

Provide an ASME code stamped continuous blowoff heat exchanger designed and constructed in accordance with ASME BPVC SEC VIII D1 to transfer heat from the continuous blowoff water leaving the continuous blowoff flash tank to the treated makeup water entering the feedwater heater. Heat exchanger shall be a bare tube, helical coiled bundle, installed in a one piece casing with removable front plate. Bundle shall be removable. Tube diameter shall be not less than 20 mm 3/4 inch. Tubes shall be ASTM B111/B111M copper alloy with cast iron shell. Design tube side for not less than [_____] kPa (gage) psig pressure at [_____] degrees C F. Design shell side for not less than [_____] kPa (gage) psig pressure at [_____] degrees C F.

2.10 PIPING

Piping work shall include the provision of piping systems, including valving and specialty items, for the steam plant and related external auxiliary equipment. Piping materials, design, and fabrication shall be in accordance with ASME B31.1 except as modified below or indicated otherwise. The requirements of ASME B31.1 apply to the building steam heating and steam distribution piping designed for 103 kPa (gage) 15 psig or lower and hot water heating systems 207 kpa (gage) 30 psig or lower. Provide piping materials suitable for the maximum pressure at the maximum temperature at which the equipment must operate. Compute expansion of pipe with operating temperatures above minus 18 degrees C zero degrees F with minus 18 degrees C zero degrees F in lieu of 21 degrees C 70 degrees F specified in ASME B31.1.

2.10.1 Piping Materials

a. Steam Pipe, Boiler Feedwater Pipe, Relief Pipe and Steam Tracer: Pipe Black, ASTM A53/A53M or ASTM A106/A106M seamless steel pipe, Grade A or B. Wall thickness not less than Schedule 40. Steam tracer pipe, with steam up to 103 kPa (gage) 15 psig, may be ASTM B88M ASTM B88, Type K copper tubing.

b. Condensate Pipe and Boiler Blowdown Pipe: Black, welded or seamless
c. Chemical Feed Pipe: ASTM A312/A312M austenitic stainless steel.

d. Fuel Oil Pipe: ASTM A53/A53M or ASTM A106/A106M, seamless black steel pipe, Grade A or B.

e. Treated Water, Hot Water Heating, High Temperature Water, Drains (Other Than Sanitary), and Overflow Pipe: ASTM A53/A53M, black, welded or seamless steel up to a maximum pressure of 1724 kPa (gage) 250 psig or ASTM A106/A106M, Grade A or B.

f. Gas Pipe and Compressed Air Pipe: ASTM A53/A53M welded or seamless pipe up to a maximum pressure of 1724 kPa (gage) 250 psig or ASTM A106/A106M, Grade A or B.

g. Instrument Air Pipe: ASTM B88M ASTM B88 hard copper tubing, Type K or L; except in a corrosive atmosphere or outside pipe shall be copper tubing, Type K or L, with ASTM D1047 PVC jacketing.

h. Steam Tracer Pipe: As an option, the, contractor may provide ASTM B88M ASTM B88, Type K, copper tubing for steam up 103 kPa (gage) 15 psig.

2.10.2 Chlorinated Polyvinyl Chloride (CPVC)

Chlorinated polyvinyl chloride (CPVC) and other plastic tubing and fittings shall not be used in the steam heating plant, unless otherwise specified in Section 22 00 00 PLUMBING, GENERAL PURPOSE. Systems for potable water, sanitary drains and storm drains are also covered in Section 22 00 00 PLUMBING, GENERAL PURPOSE.

2.10.3 Fittings

2.10.3.1 Fittings for Steel Pipe

a. Sizes 6 to 50 mm 1/8 to 2 inches: ASME B16.3 malleable iron, screwed end fittings, for working pressures not greater than 2068 kPa (gage) 300 psig at temperatures not greater than 232 degrees C 450 degrees F or ASME B16.11 forged steel.

b. Sizes 6 to 50 mm 1/8 to 2 inches: ASME B16.11 steel, socket welded end fittings.

c. Sizes 6 to 65 mm 1/8 to 2 1/2 inches: ASME B16.9 steel, butt welding fittings.

d. Sizes 65 to 600 mm 2 1/2 to 24 inches: ASME B16.5 forged steel, flanged fittings.

2.10.3.2 Welded Outlets and Welding Saddles

Make branch connections of 45 and 90 degrees either with ASME B16.9 forged steel welded outlet fittings or welding saddles. Welding outlets and saddles shall not be smaller than two pipe sizes less than the main pipe sizes.
2.10.3.3 Fittings For Copper Tubing

ASME B16.18 cast bronze solder joint or ASME B16.22 wrought copper solder joint. For instrument air, fittings may be ASME B16.26 compression joint type.

2.10.3.4 Unions

b. Unions For Copper Tubing: ASME B16.22. For instrument air, unions may be compression joint type.

2.10.4 Flanges

ASME B16.5, forged steel, welding type. Remove the raised faces on flanges when used with flanges having a flat face. Except as specified otherwise, pressure and temperature limitations shall be as specified in ASME B16.5 for the proper class and service, and the type face specified.

2.10.5 Valves

2.10.5.1 Low Pressure

Valves for maximum working pressure of 1034 kPa (gage) 150 psig saturated steam or 1550 kPa (gage) 225 psig W.O.G. (Water, Oil, Gas) at 93 degrees C 200 degrees F, non-shock service. For working pressures not exceeding 862 kPa (gage) 125 psig saturated steam or 1379 kPa (gage) 200 psig water at 93 degrees C 200 degrees F non-shock service, Class 125 may be used in lieu of Class 150 or Class 250.

a. Valve Sizes 50 mm 2 Inches and Smaller:

(1) Non-Throttling Valves: Gate valves, bronze, wedge disc, rising stem, Class 150, MSS SP-80 or ball valves, bronze, double stem seals, stainless steel ball and shaft, tight shutoff.

(2) Globe Valves and Angle Valves: Bronze, Class 150, MSS SP-80.

(3) Check Valves: Bronze, Type [IV, swing check] [III, lift check], Class 150, MSS SP-80.

b. Valve sizes 65 mm 2 1/2 inches and larger.

(1) Gate Valves: Flanged, cast iron, Class 250, MSS SP-70 or steel, Class 150, ASME B16.34. Valves shall have wedge disc, outside screw and yoke (OS&Y), rising stem; valves 200 mm 8 inches and larger shall have globe valved bypass.

(2) Globe Valves and Angle Valves: Flanged, cast iron, Class 250, MSS SP-85 or steel, Class 150, ASME B16.34.

(3) Check Valves: Flanged, cast iron, Class 250 or steel, Class 150, Type [______], [lift] [swing] check, style [______], ASME B16.34.

2.10.5.2 Medium Pressure

Valves for maximum working pressure of 1723 kPa (gage) 250 psig steam at a
maximum temperature of 232 degrees C 450 degrees F or 3445 kPa (gage) 500 psig W.O.G. at 93 degrees C 200 degrees F (non-shock).

Valve sizes 65 mm 2 1/2 inches and larger:

a. Gate Valves: Flanged or butt welded, cast iron, Class 250, MSS SP-70 (maximum size 300 mm 12 inches) or steel, Class 300, ASME B16.34. Valves shall have wedge disc, OS&Y, rising stem; each valve 200 mm 8 inches and larger shall have globe valved bypass.

b. Globe Valves and Angle Valves: Flanged or butt welded, cast iron, Class 250, MSS SP-85 or steel, Class 300, ASME B16.34.

c. Check Valves: Flanged or butt welded, iron body, Class 250 or steel, Class 300, Type [_____] [lift] [swing] check, style [____], ASME B16.34.

2.10.5.3 High Pressure

Valves for maximum working pressure of 2068 kPa (gage) 300 psigsteam at a maximum temperature of 454 degrees C 850 degrees F or a maximum W.O.G. pressure of 4653 kPa (gage) 675 psig at 149 degrees C 300 degrees F (non-shock).

Valve sizes 65 mm 2 1/2 inches and larger:

a. Gate Valves, Globe Valves, and Angle Valves: Flanged or butt welded, ASME B16.34, steel, Class 300, rising stem, OS&Y. Gate valves 200 mm 8 inches and larger shall have globe valved bypass.

b. Check Valves: Flanged or butt welded, steel, Class 300, Type [____], [lift] [swing] check, style [____], ASME B16.34.

2.10.5.4 Ball Valves

ASME B16.5 and API Std 607 double stem seal type for bubble tight shutoff. Seats and seals shall be TFE material. Ball and shaft shall be stainless steel. Provide mechanical stops to prevent cycling valve in wrong direction and self-aligning stem seal.

2.10.5.5 Valve Accessories

ASME B16.34 valve operating mechanisms including chain wheels, gear operators, floor stands, electric motors, air motors and cylinder-type actuating devices. Provide accessories as follows and as indicated.

a. Provide power operators with remote position indicators on the following valves: soot blowers, [____], [____].

b. Provide floor stands and valve extensions on platforms and floors for the following valves: deaerator drain valves, [____].

c. Provide motorized actuators or chain wheels with chain and guides on valves with handwheel centerline higher than 2 meters 7 feet above the floor or platform except where specified otherwise. Chains shall extend from valve to within one meter 3 feet above floor. Provide impact chain wheels on steam headers and other locations where valve has a tendency to stick. When a valve is motorized, provide hand operation for emergency.
d. Provide gear operators on ball valves larger than 80 mm 3 inches and on gate valves 200 mm 8 inches and larger.

2.10.5.6 Steam Pressure Regulating Valves

CID A-A-50558, minimum of Class [125] [150] [250] [300], except as specified otherwise. [Cast iron], [cast steel] valve body with valve seats and disc of replaceable heat treated stainless steel. Valves shall be single seated, shall seat tight under dead end conditions, and shall go to the closed position in the event of pressure failure of the operating medium. Valves shall be spring loaded diaphragm operated type, except valves exposed to ambient temperature of less than 2 degrees C 35 degrees F or exposed to the weather shall be piston operated type. Capacity of valves shall be not less than that indicated. Pilot valves shall have strainer at inlet from external feeder piping.

a. Spring Loaded Diaphragm Operated Valves: Fabricate main spring of stainless steel, which shall not be in the path of steam flow through the valve. Control valve by pilot valve through external feeder piping.

b. Piston Operated Valves: Control valve by integral pilot valve through external feeder piping.

2.10.5.7 Safety Relief Valves

ASME BPVC SEC I ASTM F1508, Style D or E, with Class [150] [300] inlet flange, with test lever, designed for the intended service.

2.10.6 Bolts and Nuts

a. Bolts: ASTM A193/A193M, Grade B8. Lengths of bolts shall be such that not less than two full threads will extend beyond the nut with the bolts tightened to required tensions and washers seated.

2.10.7 Gaskets

ASME B31.1 and as specified below, except provide spiral wound metal covered non-asbestos gaskets in lieu of compressed sheet non-asbestos. Gaskets shall be as thin as the finish of surfaces will permit. Do not use paper, vegetable fiber, rubber, or rubber inserted gaskets for temperatures greater than 121 degrees C 250 degrees F. Provide metal or metal jacketed non-asbestos gaskets with small male and female and small tongue-and-groove flanges and flanged fittings; they may be used with steel flanges with lapped, large male and female, large tongue-and-groove, and raised facings. Provide fullface gaskets with flat-faced flanges. Raised face cast iron flanges, lapped steel flanges, and raised faced steel flanges shall have ring gaskets with an outside diameter extending to the inside of the bolt holes. Widths of gaskets for small male and female and for tongue-and-groove joints shall be equal to the widths of the male face and tongue. Gaskets shall have an inside diameter equal to or larger than the port opening. Dimensions for nonmetallic gaskets shall be in accordance with ASME B16.21. Materials for flanged gaskets shall be as listed below for service specified:

a. Steam, Boiler Blowdown, Exhaust Steam: Spiral wound metal composition or copper.
b. Boiler Feed Water: Metal jacketed non-asbestos, copper or monel.

c. Hot Water, (above 38 degrees C 100 degrees F): Spiral wound metal non-asbestos.

d. Cold Water: Red rubber or neoprene rubber.

e. Heavy Fuel Oil (No. 6): Spiral wound metal non-asbestos, soft steel, or monel.

g. Compressed Air: Spiral wound metal non-asbestos.

2.10.8 Expansion Joints

2.10.8.1 Slip Tube Expansion Joints

ASTM F1007, single or double slip tube as indicated, designed for [1034] [2068] kPa (gage) [150] [300] psig saturated steam working pressure. Expansion joints shall be of the type which permits the injection of semi plastic type packing while the joint is in service under full line pressure. Slip tube shall be of chromium plated, wrought steel construction, guided by internal and external guides integral with joint body. Fit slip tube ends with forged steel pipe flanges or bevel for welding into pipe line where indicated. Deliver joints complete with packing and ready for installation.

2.10.8.2 Flexible Ball Expansion Joints in Piping

Capable of 360 degrees rotation plus 15 degrees angular flex movement. Ball joints shall have steel bodies and polished steel balls. Provide end connections to suit class of piping here in before specified. Seals shall be of pressure molded composition designed for the working pressure. Provide joints for [1034] [2068] kPa (gage) [150] [300] psig saturated steam working pressure. Cold set the joints as necessary to compensate for temperature at time of installation. Do not use ball joints on superheated steam or on joints subject to frequent flexure. Install ball joints in strict accordance with manufacturer's recommendations.

2.10.8.3 Bellows Expansion Joints

ASTM F1120 flexible guided type with stainless steel expansion element, internal sleeves and external covers. Joints shall be designed for a working pressure of [_____] kPa (gage) psig and a temperature of [_____] degrees C F.

2.10.9 Pipe Hangers and Supports

MSS SP-58 and MSS SP-69, Type [_____] or Type [_____] of the adjustable type, except as specified or indicated otherwise. Suspended steam and condensate piping shall have pipe hangers Type [_____] with insulation protection saddles Type [______]. Provide insulated piping, except steam and condensate piping, with insulation protection shields Type 40. Provide bronze or copper plated collars on uninsulated copper piping. Support rods shall be steel. Rods, hangers and supports shall be zinc plated, except for uninsulated copper piping which shall be copper plated; cast iron rollers, bases and saddles may be painted with two coats of heat resisting aluminum paint in lieu of zinc plating. Axles for cast iron rollers shall
be stainless steel. Size hanger rods with a 150 percent safety factor for
a seismic design.

2.10.10 Instrumentation

2.10.10.1 Pressure and Vacuum Gages

Conform to the applicable requirements of ASME B40.100.

2.10.10.2 Indicating Thermometers

MIL-T-19646 dial type. Thermometer shall include a separable immersion
well.

2.10.11 Miscellaneous Pipeline Components

2.10.11.1 Cold and Hot Water Meters

CID A-A-59224 for maximum flow of [_____] L/s at 38 degrees C gpm at 100
degrees F and reduced flow of up to [_____] L/s at 121 degrees C gpm at 250
degrees F.

2.10.11.2 Air Traps

Float controlled valves arranged to close properly when water enters the
traps. Air traps shall conform to the requirements for float operated
steam traps (non-thermostatic), CID A-A-60001, except that the valve
mechanism shall be inverted so as to be closed, not opened, by rising water.

2.10.11.3 Steam Traps

CID A-A-60001. Inverted bucket high pressure steam traps designed for use
at [_____] kPa (gage) psig at [_____] degrees C F. Low pressure steam
traps shall be float and thermostatic type for pressures up to 103 kPa
(gage) 15 psig. Provide traps with separate strainers unless specified
otherwise.

2.10.11.4 Strainers

FS WW-S-2739, Style Y for Class [125] [250] with blow off outlet.
Construct strainers for Class 300 of cast carbon steel in accordance with
ASME B16.5 for minimum of 2068 kPa (gage) 300 psig saturated steam
pressure. Provide blow off outlet with pipe nipple and gate valve.

2.10.12 Backflow Preventers

Provide reduced pressure principle type conforming to applicable
requirements of AWWA C511, and as specified in Section 22 00 00 PLUMBING,
GENERAL PURPOSE.

2.10.13 Insulation Types and Installation Procedures

Materials and application shall be as specified in Section 23 07 00 THERMAL
INSULATION FOR MECHANICAL SYSTEMS.
2.10.14 Pipe Sleeves

2.10.14.1 Floor Slabs, Roof Slabs, and Outside Walls Above and Below Grade

Galvanized steel pipe having an i.d. at least 12.7 mm 1/2 inch larger than the o.d. of the pipe passing through it. Provide sufficient sleeve length to extend completely through floors, roofs, and walls, so that sleeve ends are flush with finished surfaces except that ends of sleeves for floor slabs shall extend 13 mm 1/2 inch above finished floor surface. Sleeves located in waterproofed construction shall include flange and clamping ring.

2.10.14.2 Partitions

Galvanized sheet steel, 26 gage or heavier, of sufficient length to completely extend through partition thickness with sleeve ends flush with partition finished surface.

2.10.15 Piping Identification

Conform to MIL-STD-101 and place in clearly visible locations; except that piping in the boiler room shall be painted the primary color of the color code. Labels and tapes conforming to ASME A13.1 shall be used in lieu of band painting or stenciling. Labels shall be outdoor grade acrylic plastic. Markings on the labels shall indicate the direction of flow, flowing media, and media design pressure and temperature. Spacing of identification marking shall not exceed 3 meters 10 feet. Provide two copies of the complete color and stencil codes used. Frame codes under glass and install where directed.

2.11 FIRE PROTECTION SYSTEM

Provide the fuel oil [and gas metering] room[s] with a wet sprinkler system as specified in Section 21 13 13 WET PIPE SPRINKLER SYSTEMS, FIRE PROTECTION.

2.12 MARKING

Identify equipment, valves, switches, motor controllers, and controls or indicating elements by printed, stamped or manufactured identification plates or tags of rigid plastic or non-ferrous material. Lettering for identification plates or tags shall be not less than 5 mm 3/16 inch high. Nomenclature and identification symbols used on identification plates or tags shall correspond to those used in the maintenance manuals, operating instructions, and schematic diagrams. Rigidly affix identification plates or tags to equipment or devices without impairing functions or, when this is not possible, attach using a non-ferrous wire or chain. In addition to the identification plate or tag, each major component of equipment shall have a nameplate listing the manufacturer's name, model number, and when applicable, electrical rating and other information required by pertinent standards or codes.

2.13 TOOLS AND TESTING EQUIPMENT

Provide special tools and wrenches required for the installation, maintenance, and operation of the equipment. Provide testing equipment necessary to perform routine tests:

a. On lubricating oil for acidity (pH-potentiometer), viscosity (saybolt test), and dirt (gravimetric).

SECTION 23 52 33.03 20  Page 78
b. On softened water for hardness (soap test or colorimetric test), and boiler blowdown water for pH (colorimetric) and conductivity (potentiometer).

c. For water (distillation) and sediment (gravimetric) in fuel oil.

2.14 WELDING MATERIALS

Comply with ASME BPVC SEC II-C. Welding equipment, electrodes, welding wire, and fluxes shall be capable of producing satisfactory welds when used by a qualified welder or welding operator using qualified welding procedures.

2.15 MOTORS AND DRIVES

Alternating current electric motors shall meet requirements of NEMA MG 1. Motors shall be designed for continuous operation at rated load under usual service conditions as defined by NEMA. Motors less than 3/4 kW 1 hp shall meet NEMA High Efficiency requirements. Motors 3/4 kW 1 hp and larger shall meet NEMA Premium Efficiency requirements. Unless specifically noted otherwise, motors less than 3/8 kW 1/2 hp shall be 115 volt, 60 Hz, single phase, capacitor-start, or permanent split capacitor, with Class B insulation for 40 degrees C 104 degrees F ambient. Unless specifically noted otherwise, motors 3/8 kW 1/2 hp and larger shall be 460 volt, 60 Hz, three phase, Design B, squirrel cage induction with a minimum insulation of Class F for 40 degrees C 104 degrees F ambient. Size motors to meet the power requirements of the driven unit at design conditions, including drive and coupling losses which are incurred, without loading the motor beyond its nameplate power rating. Minimum service factor for open drip-proof motors shall be 1.15 and for totally enclosed, fan cooled motors 1.0. Motor shall be quiet operating. Bearings shall be heavy duty, grease lubricated, anti-friction, single shielded, regreasable type and shall have approved lubricating fittings extended to an easily accessible location for field servicing. Provide sole plates for motors installed on concrete pads. Motors shall have copper windings.

2.16 SOURCE QUALITY CONTROL

2.16.1 Plant Equipment Tests

Tests specified below shall be conducted at factory prior to delivering equipment to job site.

2.16.1.1 Plant Air Compressors

Test plant air compressors in service to determine compliance with contract requirements and warranty. During the tests, test equipment under every condition of operation. Test safety controls to demonstrate performance of their required function. Completely test system for compliance with specifications.

2.16.1.2 Instrument Air Compressors

Factory test air compressor package at full load for not less than 2 hours. Check capacity, smoothness of operation, alternation of units, and proper operation of the air unloaders during the test.
2.16.1.3 Variable Speed Motor Controller Factory Test

Burn-in tests shall be conducted for at least 50 hours at rated conditions. If a component fails during the burn-in test it shall be replaced, and the entire test shall be run again on the complete assembly for another 50 hours. The burn-in test shall not be complete until the entire assembly has operated for 50 hours without failure.

PART 3 EXECUTION

3.1 INSTALLATION

Install materials and equipment as indicated and in accordance with manufacturer's recommendations.

3.1.1 Equipment Installation

Install equipment in accordance with this specification, and the installation instructions of the manufacturers. Equipment mounted on concrete foundations shall be grouted before installing piping. Install piping in such a manner that it will not impart a stress on equipment. Flanged joints shall not be bolted tight unless they match adequately. Expansion bends shall be adequately extended before installation. Support, grade, anchor, and guide all piping so that there are no low pockets, which could accumulate fluids, along the piping run.

3.1.1.1 Equipment Foundations

Equipment foundations shall be of sufficient size and weight, and proper design to prevent shifting of equipment under operating conditions, or under abnormal conditions which could be imposed upon equipment. Equipment vibration shall be limited within acceptable limits, and isolated. Foundations shall be adequate for soil conditions of the site and shall meet requirements of the equipment manufacturer. Trowel exposed foundation surfaces smooth except when properly roughened surfaces are necessary to receive grout.

3.1.1.2 Forced Draft Fan

Fan assembly shall be set, shimmed level, anchored and grouted in place prior to setting driver. Driver shall be properly shimmed on base plate using steel shim stock. Shims shall be full size of feet and shall have a slotted hole for installation. After the drive has been properly aligned and shimmed, by an approved millwright, the millwright shall drill and ream the foot and base plates and, install taper pins with nut on top for pullout removal. One front foot and diagonally opposite rear foot shall be pinned to base plate. Bolt equipment into place in an approved manner. Level and grout the fan and bearing pedestal sole plates into place.

3.1.1.3 Stack

Install, level and plumb. Erected stack shall be no more than 25 mm one inch out of plumb (out of vertical) per 15 meters 50 feet. Remove roughness, marks, and lifting lugs, from stack and grind surfaces smooth and flush with surrounding surfaces.

3.1.1.4 Fuel Oil Tanks

**************************************************************************

SECTION 23 52 33.03 20  Page 80
NOTE: At the text below, choose one of the following options.

[ a. Horizontal Fuel Oil Tanks (Below Ground): Provide concrete ballast slabs for tanks and concrete protective ground level slabs for FRP tanks. The ballast slabs shall be full length and width of the tanks and the protective slabs shall extend 600 mm 2 feet beyond the tanks. Concrete work shall be as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

(1) Installation: Install and backfill fiberglass reinforced tanks as recommended by the manufacturer; backfill adjacent to the tanks shall be pea gravel unless otherwise recommended by the manufacturer. Backfill for steel tanks shall be sand.

(2) Placement: Set steel tanks on a bed of sand not less than 150 mm 6 inches deep over the concrete slab and strap in place with stainless steel hold-down straps with stainless steel turnbuckles. Set FRP tanks on a bed of pea gravel not less than 300 mm 12 inches thick and pre-shape for the tank contours for FRP tanks. Fabricate straps for FRP tanks from FRP resins reinforced with stainless steel to prevent breaking of straps and floating of empty tanks.

(3) Slope tank toward sump not less than 25 mmone inch in each 1 1/2 meters 5 feet.

] [b. Horizontal Fuel Oil Tanks (Above Ground): Continuously support steel tank saddles along the full length of the base and level and grout to ensure full bearing.

] [c. Vertical Fuel Oil Tank: Provide [sand, crushed stone or fine gravel cushion] [concrete base].

(1) Sand, Crushed Stone or Fine Gravel Cushion: Cover area beneath tank with a minimum 0.51 mm 20 mil thick fuel resistant plastic membrane. Carefully fuse or cement plastic membrane seams. Lay plastic over a thoroughly compacted select subgrade free from rocks that could puncture the plastic. Over plastic, provide a bed of sand, crushed stone or fine gravel not less than 150 mm 6 inches thick. Stabilize bed with an approved material and shape to the tank bottom. Slope bed down to center sump approximately 150 mm 6 inches for each 3 meters 10 feet of tank radius. When in place, tank shell shall be plumb.

(2) Concrete base shall be as indicated and in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE.

(3) Mastic Seal: Place the mastic seal between the tank and the concrete ring to the cross section indicated. Compact the mastic thoroughly. Immediately before placing the mastic, coat the tank surfaces to be in contact with the concrete ring with a coat of AASHTO M 118 bituminous material.

] 3.1.2 Piping

Unless specified otherwise, erection, welding, brazing, testing and inspection of piping shall be in accordance with ASME B31.1 and Section

SECTION 23 52 33.03 20 Page 81
WELDING PRESSURE PIPING. Piping shall follow the general arrangement shown. Cut piping accurately to measurements established for the work. Work piping into place without springing or forcing, except where cold-springing is specified. Piping and equipment within buildings shall be entirely out of the way of lighting fixtures and doors, windows, and other openings. Locate overhead piping in buildings in the most inconspicuous positions. Do not bury or conceal piping until it has been inspected, tested, and approved. Where pipe passes through building structure, pipe joints shall not be concealed, but shall be located where they may be readily inspected and building structure shall not be weakened. Avoid interference with other piping, conduit, or equipment. Except where specifically shown otherwise, vertical piping shall run plumb and straight and parallel to walls. Install piping connected to equipment to provide flexibility for vibration. Support and anchor piping so that strain from weight of piping is not imposed on equipment.

3.1.2.1 Fittings

Provide long radius elbows on welded piping to reduce pressure drops. Do not miter pipe to form elbows, notch straight runs to form full sized tees, or use similar construction. Make branch connections with welding tees, except factory made forged welding branch outlets or nozzles having integral reinforcements conforming to ASME B31.1 may be used.

3.1.2.2 Grading of Pipe Lines

Unless indicated otherwise, install horizontal lines of steam and return piping to grade down in the direction of flow with a pitch of not less than 25 mm in 9 meters one inch in 30 feet, except in loop mains and main headers where flow may be either direction. Pitch air lines to the source of supply, and make provisions for draining off condensate. Install water lines to drain to a shutoff valve.

3.1.2.3 Anchoring, Guiding, and Supporting Piping

Anchor and support piping in a manner such that expansion and contraction will take place in the direction desired, prevent vibration by use of vibration dampeners, and prevent undue strains on boilers and equipment served. Fabricate hangers used for support of piping of 50 mm 2 inch nominal pipe size and larger to permit adequate adjustment after erection while still supporting the load. Provide wall brackets where pipes are adjacent to walls or other vertical surfaces which may be used for supports. Provide supports to carry weight of lines and maintain proper alignment. Provide inserts and sleeves for supports in concrete where necessary and place in new construction before pouring concrete. Provide insulated piping with a pipe covering protection saddle at each support. Provide pipe guides and anchors of approved type at points where necessary to keep pipes in accurate alignment, to direct expansion movement, and to prevent buckling and swaying and undue strain. Provide pipe guides for alignment of pipe connected to free unanchored end of each expansion joint. Support pipe rollers in concrete conduits and trenches by extra strong steel pipe with ends inserted in slots provided in concrete walls. Set pipe supports for rollers at correct elevations either by metal shims or by cutting away of concrete and after placing pipe lines in alignment, grout ends of pipe supports and fix in place. Space pipe supports to provide adequate support for pipes. Pipe shall not have pockets formed in the span due to sagging of pipe between supports, caused by weight of pipe, medium in pipe, insulation, valves, and fittings. Maximum spacing for pipe supports for steel pipe shall be in accordance with ASME B31.1; maximum
spacing for supports for copper tubing shall be in accordance with MSS SP-69.

3.1.2.4 Copper Tubing

Copper tubing shall have solder joints with solder suitable for the pressure-temperature ratings of the piping system. Tubing 20 mm 3/4 inch and smaller for instrument air may be compression joint in lieu of soldered joint. Tin-antimony (95/5) solder is suitable for saturated steam up to 103 kPa (gage) 15 psig but tin-lead (50/50) solder is not acceptable for steam service. Flux shall be non-corrosive. Wipe excess solder from the joints.

3.1.2.5 Sleeves

Provide pipe sleeves where pipes and tubing pass through masonry and concrete walls, floors, and partitions. Space between pipe, tubing, or insulation and the sleeve shall be not less than 6 mm 1/4 inch. Hold sleeves securely in proper position and location before and during construction. Sleeves shall be of sufficient length to pass through entire thickness of walls, partitions, and slabs. Sleeves in floor slabs shall extend 15 mm 1/2 inch above the finished floor. Firmly pack space between pipe or tubing and the sleeve with oakum and caulk on both ends of the sleeve with elastic cement.

3.1.2.6 Flashing for Buildings

Where pipes pass through building roofs and outside walls, provide proper flashing and counter flashing and make tight and waterproof.

3.1.2.7 Outlets for Future Connections

Locate as directed capped or plugged outlets for connections to future equipment, when not located exactly by the project drawings.

3.1.2.8 Screwed Joints in Piping

Provide teflon tape or suitable pipe joint compound applied to male threads only for making up screwed joints. Piping shall be free from fins and burrs. Ream or file out pipe ends to size of bore, and remove chips.

3.1.2.9 Welds and Welded Joints

Weld joints in piping by the metal-arc or gas welding processes in accordance with ASME B31.1. Number or mark each weld to identify the work done by each welder on welds which stress relieving or radiographic inspection is required.

a. Recertification: The Contracting Officer reserves the right to require the Contractor to provide re-examination and recertification of welders.

b. Radiographic testing of circumferential butt welded joints of pipe with operating temperature of 177 degrees C 350 degrees F and above shall be required on ten percent of the joints, the location of which will be determined by the Contracting Officer; when more than ten percent of the radiographically tested joints show unacceptable defects radiographically test joints of this type piping.

c. Equipment and Protection: Items of equipment for welding shall be so designed and manufactured, and be in such condition as to enable...
qualified operators to follow procedures and to attain the results specified. Protect welders and gas cutters from the light of the arc and flame by approved goggles, shields, helmets, and gloves. Replace cover glasses in helmets and shields when they become sufficiently marred to impair the operator's vision. Take care to avoid risk of explosion and fire when welding and gas cutting near explosive or flammable materials. Ventilate welding and gas cutting operations in accordance with paragraph 29 CFR 1910-SUBPART Q.

d. Surface Conditions: Do not weld when atmospheric temperature is less than minus 18 degrees C zero degrees F, when surfaces are wet, when rain or snow is falling or moisture is condensing on surfaces to be welded, nor during periods of high wind, unless the welder and work are protected properly. At temperatures between zero degrees C 32 degrees F and minus 18 degrees C zero degrees F heat with a torch the surface for an area within 80 mm 3 inches of the joint to be welded to a temperature warm to the hand before welding. Free surfaces to be welded from loose scale, slag, rust, paint, oil, and other foreign material. Joint surfaces shall be smooth, uniform and free from fins, tears, and other defects which might affect proper welding. Remove slag from flame-cut edges to be welded by grinding, but temper color need not be removed. Thoroughly clean each layer of weld metal by wire brushing prior to inspection or deposition of additional weld metal.

3.1.2.10 Cleaning of Piping

Before installing pipe, thoroughly clean it of sand, mill scale and other foreign material. After erection but before final connections are made to apparatus thoroughly clean the interior of piping. Flush with water piping except air and fuel lines, in addition, blow out steam lines with intermittent high pressure steam blows to promote shedding of internal scale. Blow compressed air and fuel oil lines clean with 552 to 690 kPa (gage) 80 to 100 psig air dried to a 2 degrees C 35 degree F dew point at 552 kPa (gage) 80 psig. Sterilize potable water piping by means of liquid chlorine or hypochlorite in accordance with AWWA C651 before placing water system in service. Take care during fabrication and installation, to keep piping, valves, fittings and specialties free of loose welding metal chips of metal or slag, welding rods and other foreign matter. Blowing or flushing shall in no case be channeled through equipment, pump, control valve, regulating valve, instrument gage or specialty in the system. Provide temporary screens, strainers, connections, spool pieces and bypasses consisting of piping or hoses, pumps and other required equipment temporarily installed for the purpose of cleaning and flushing piping. Drain flushing water and test water to the sanitary sewer system.

3.1.2.11 Reduction in Pipe Size

Provide reducing fittings for changes in pipe size; the use of bushings will not be permitted. In horizontal steam lines, reducing fittings shall be the eccentric type to maintain the bottom of the lines in the same plane. In horizontal water mains, reducers shall be set to maintain the top of the lines in the same plane.

3.1.2.12 Expansion Control

Provide bends, loops, and offsets wherever practical to relieve overstressed piping systems due to thermal expansion and to provide adequate flexibility. Cold spring piping system as indicated but not more than 50 percent of the total linear expansion.
3.1.2.13 Connection to Equipment

Provide unions or flanges where necessary to permit easy disconnection of piping and apparatus. Provide unions and gate valves at each connection to threaded end control valves, strainers and equipment.

3.1.2.14 Valve Installation

Install valves in positions accessible for operation and repair. Install stems in a vertical position with handwheels or operators on top or in a horizontal position. Do not install handwheels on stop valves below the valve. When centerline of valve is more than 2 meters (7 feet) above floor or platform, provide valve with a chain-operated handwheel. When valve is motorized, provide hand operation for emergency use.

a. Gate Valves: Arrange back outlet gate valves for turbine exhaust for hand operation and provide with a floor stand.

b. Globe Valves: Pressure shall be below the disc. Install globe valves with the stems horizontal on steam and exhaust lines, when better drainage is required or desired.

c. Steam Pressure-Reducing Valves: Provide the steam line entering each pressure-reducing valve with a strainer. Provide each pressure-reducing valve unit with two shutoff valves and with a globe or angle bypass valve and bypass pipe. A bypass around a reducing valve shall be of reduced size to restrict its capacity to approximately that of the reducing valve. Provide each pressure-reducing valve unit with indicating steam gages to show the reduced pressure and the upstream pressure and an adequately sized safety valve on the low pressure side.

d. Valve Tags and Charts: Permanently tag each valve with a black and white engraved laminated plastic tag showing valve number, valve function and piping system and whether another valve must be opened or closed in conjunction with this valve. Provide a typed chart which will show the required valve tagging plus the location of each valve. Frame valve charts under glass and install as directed.

3.1.2.15 Traps and Connections

Traps shall be of the type and capacity for the service required, and shall be properly supported and connected. Except for thermostatic traps in pipe coils, radiators, and convectors, install traps with a dirt pocket and strainer between it and the piping or apparatus it drains. When it is necessary to maintain in continuous service apparatus or piping which is to be drained, provide a three valve bypass so that trap may be removed and repaired and condensate drained through the throttled bypass valve. Provide a check valve on discharge side of trap whenever trap is installed for lift or operating against a back pressure, or it discharges into a common return line. Provide test connections on discharge side of high and medium pressure traps when they are specifically required. Test connection shall include a 15 mm (1/2 inch) globe valve with open blow.

3.1.2.16 Pressure Gage Installation

Provide with a shutoff valve or petcock between the gage and the line, and gage on steam lines shall have a siphon installed ahead of the gage.
3.1.2.17 Thermometer and Sensing Element Installation

Provide thermometers and thermal sensing elements of control valves, with a separable socket. Install separable sockets in pipe lines in such a manner to sense flowing fluid temperature and minimize obstruction to flow.

3.1.2.18 Strainer Locations

Provide strainers with meshes suitable for the services upstream of each control valve and where dirt might interfere with the proper operation of valve parts, orifices, or moving parts of equipment.

3.1.2.19 Dissimilar Piping Materials

Provide dielectric unions or flanges between ferrous and nonferrous piping, equipment, and fittings, except that bronze valves and fittings may be used without dielectric couplings for ferrous-to-ferrous or nonferrous-to-nonferrous connections. Dielectric fittings shall utilize a nonmetallic filler which will prevent current flow from exceeding one percent of the short circuit current. Spacer shall be suitable for the pressure and temperature of the service. Fittings shall otherwise be as specified in this section.

3.1.2.20 Surface Treating, and Pipe Wrapping

Uninsulated steel piping buried in the ground shall have exterior surfaces protected with a tape wrapping system or a continuously extruded polyethylene coating system as specified in Section 09 97 13.28 PROTECTION OF BURIED STEEL PIPING AND STEEL BULKHEAD TIE RODS.

3.1.3 Painting

3.1.3.1 Piping, Fittings, and Mechanical and Electrical Equipment

Equipment shall be factory finished to withstand the intended end use environment in accordance with the specifications for particular end item. Factory finished equipment on which the finish has been damaged shall have damaged areas retouched and then be given a complete finish coat to restore the finish to its original condition. Finish coat shall be suitable for exposure in the intended end use environment.

3.1.3.2 Other Items

Unless specified otherwise, pipe hangers, structural supports, pipe and pipe fittings, conduit and conduit fittings, air grilles, pipe coverings, insulation, and metal surfaces associated with mechanical and electrical equipment including zinc-coated steel ducts shall be painted utilizing the painting systems as specified in Section 09 90 00 PAINTS AND COATINGS. Zinc-coated steel duct in unpainted areas shall not be painted. Except zinc-coated and copper pipe, give piping to be insulated, a protective coating prior to installing insulation.

3.1.3.3 Boilers

After erecting and testing boilers, clean exposed surfaces of the boiler normally painted in commercial practice to remove grease, coal dust, flyash and other foreign matter and finish with one coat of aluminum heat resisting paint applied to minimum dry film thickness of 0.025 mm one mil.
3.1.3.4 Vertical Fuel Oil Tank

Clean interior surfaces to bare metal in accordance with SSPC SP 10/NACE No. 2. Clean to bare metal by powered wire brushing or other mechanical means surfaces that cannot be cleaned satisfactorily by blasting. Wash members which become contaminated with rust, dirt, oil, grease, or other contaminants with solvents until thoroughly clean. Remove weld backing plates prior to blast cleaning; when left in place, round off the corners prior to blast cleaning and coating. Tanks shall be internally coated in accordance with Section 09 97 13.17 THREE COAT EPOXY INTERIOR COATING OF WELDED STEEL PETROLEUM FUEL TANKS.

3.1.3.5 Surfaces Not to be Painted

Unless specified otherwise, do not paint equipment having factory applied permanent finish, switchplates and nameplates, motor starters, and concrete foundations.

3.1.4 Insulation

Insulate mechanical equipment, systems and piping as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

3.2 FIELD QUALITY CONTROL

Provide labor, equipment, test apparatus and materials required for preparation and performance of tests and inspections specified to demonstrate that the boilers and auxiliary equipment as installed are in compliance with contract requirements. During startup and during tests, factory trained engineers or technicians employed by the boiler manufacturer and system suppliers or manufacturers of such components as the boiler, burner, forced draft fan, feedwater treatment equipment, and other auxiliary equipment shall be present, to ensure the proper functioning, adjustment, and testing of the individual components and systems. The Government will furnish, when available, water, electricity and fuel for the tests, except fuel required for retesting. The Contractor shall rectify defects disclosed by the tests and retest the equipment. The Contractor's boiler plant personnel shall be experienced in starting up and operating boiler plants.

3.2.1 Tests and Inspections (Piping)

3.2.1.1 General Requirements

Examine, inspect, and test piping in accordance with ASME B31.1 except as modified below. The Contractor shall rectify defects disclosed by the tests. Necessary subsequent tests required to prove system tight after additional work by the Contractor shall be provided by the Contractor. Make tests under the direction of and subject to the prior approval of the Contracting Officer.

3.2.1.2 Hydrostatic and Leak Tightness Tests

a. Test piping systems attached to the boilers and included under the jurisdiction of the ASME BPVC SEC I in accordance with the requirement of that Code. Piping bearing ASME Code symbol stamp will be accepted only as indicating compliance with the design and material requirements of the code.
b. Test piping which is a part of the steam generation or auxiliary systems, including piping within the boiler room and external to the boiler room, by the following methods:

(1) Perform hydrostatic test at 150 percent of design pressure for welded and screwed steel piping systems except those for air, oil, and gas. Hold hydrostatic tests for a period of one hour with no pressure loss. Temperature of the testing fluid shall not exceed 38 degrees C 100 degrees F.

(2) Test air and oil lines in accordance with the requirements of ASME B31.1 for pneumatic tests with the exception that the test pressure must be held for one hour. Examination for leaks by a soap or other foaming agent test.

(3) Inspection and test of gas piping shall conform to the requirements of NFPA 54.

c. For tests install a calibrated test pressure gage in the system to observe loss in pressure.

3.2.2 Preliminary Operation

The Contractor under the direction of the respective manufacturer's representative shall perform the work of placing into operation equipment provided except as specifically noted otherwise. Make adjustments to equipment that are necessary to ensure proper operation as instructed by the manufacturer of the equipment.

a. Lubricate equipment prior to operation in accordance with the manufacturer's instructions. Lubricants shall be provided by the Contractor. Contractor shall furnish lubrication gun with spare cartridges of lubricant to operating personnel.

b. Dry out motors before operation as required to develop and maintain proper and constant insulation resistance.

c. Check drive equipment couplings for proper alignment at both ambient and operating temperature conditions.

3.2.3 General Startup Requirements

Prior to initial operation of any complete system, check each component as follows:

a. Inspect bearings for cleanliness and alignment and remove foreign materials found. Lubricate as necessary and in accordance with manufacturer's recommendations. Replace bearings that run roughly or noisily.

b. Adjust direct drives for proper alignment of flexible couplings. Provide lubrication when a particular coupling so requires. Check security of couplings to driver shafts. Set drive components to ensure free rotation with no undesirable stresses present on the coupling of attached equipment.

c. Check motors for amperage comparison to nameplate value. Correct conditions that produce excessive current flow and that exist due to
equipment malfunction.

d. Check speeds of each motor and driven apparatus to ensure that they are operating at the desired point.

e. Check actual suction and discharge pressure of each pump against desired performance curves.

f. Check pump packing glands or seals for cleanliness and adjustment before running each pump. Inspect shaft sleeves for scoring and proper placement of packing; replace when necessary. Ensure piping system is free of dirt and scale before circulating liquid through pumps.

g. Inspect both hand and automatic control valves. Clean bonnets and stems, tighten glands to ensure no leakage, but permit valve stems to operate without galling. Replace packing in valves that require same to retain maximum adjustment after system is judged complete. Replace entire packing in valves that continues to leak after adjustment. Remove and repair bonnets that leak. Coat packing gland threads and valve stems with a suitable surface preparation after cleaning.

h. Inspect and make certain that control valve seats are free from foreign material and are properly positioned for the intended service.

i. Check flanges and packing glands after the system has been placed in operation. Replace gaskets in flanges that show signs of leakage after tightening.

j. Inspect screwed joints for leakage and remake each joint that appears to be faulty. Do not wait for rust to form. Clean threads on both parts, apply compound and remake joint.

k. Strainers installed shall be thoroughly blown out through individual valved blow-off connection on each strainer prior to placing in operation.

l. Thoroughly blow out or dismantle and clean strainers after systems have been in operation one week. Thoroughly clean, repair, and place back in service traps or other specialties in which foreign matter has accumulated, causing malfunction or damage.

m. Adjust pipe hangers and supports for correct pitch and alignment.

n. Remove rust, scale and foreign materials from equipment and renew defaced surfaces. When equipment is badly marred, the Contracting Officer shall have the authority to request that new materials be provided.

o. Adjust and calibrate temperature, pressure and other automatic control systems.

p. Inspect each pressure gage and thermometer for calibration, and replace those that are defaced, broken or read incorrectly.

q. Vertical Fuel Oil Tank Calibration: After completing installation of tank, prepare a calibration table for tank showing the volume of fuel in liters gallons in the tank to height of liquid in meters and mm feet and inches, when measured by a steel tape lowered through the roof. Calibrate tank in accordance with ASTM D1220 for "critical measurement"
"operating control." Calibration of the tank shall be done by a qualified organization that can certify to at least 2 years of prior successful and accurate experience in calibrating tanks of comparable type and size. Correct the data obtained for use with the product to be stored.

3.2.4 Fuel Oil Tanks

**************************************************************************

NOTE: Choose one of the following options.
**************************************************************************

[ a. Horizontal Fuel Oil Tanks (Below Ground):

(1) Test tanks before placing in service, in accordance with the applicable paragraphs of the code under which they were built. An UL label, ASME Code Stamp, or API monogram on a tank shall be evidence of compliance with code requirements.

(2) Holiday Detection Test: Inspect coal tar epoxy coating system for film imperfections using a low voltage (75 volt) holiday tester. Inspect FRP coated tanks with a 10,000 volt spark test for imperfections or holidays (voids). Repair holidays or pinholes in the coatings.

][b. Vertical Fuel Oil Tank: Inspect and test as specified in API Std 650. Use the radiographic method of inspection of butt welds as required by API Std 650; sectioning method will not be acceptable as an alternative to radiographic inspection.

3.2.4.1 Blowdown Valves and Try Cocks

Test blowdown valves and try cocks for proper operation.

3.2.4.2 Fans, Heaters, Pumps, and Motors

Test draft fans, fuel oil heaters, fuel pumps, and electric motors to determine compliance with the referenced standards. Standard symbols and certifications from the referenced organization may be accepted at the discretion of the Contracting Officer. Closely observe the operation of fans, fuel oil heaters, fuel pumps, and electric motors for possible defects or nonconformance.

3.2.5 Boilers and Auxiliaries Tests and Inspections

The Contractor, with qualified personnel provided by the Contractor, shall make tests and inspections at the site under direction of and subject to approval of the Contracting Officer. The respective manufacturer's representatives and consultants shall direct the Contractor's boiler plant personnel in the operation of each boiler and appurtenances through the entire testing period and shall ensure that necessary adjustments have been made. The Contractor shall notify the Contracting Officer in writing, at least 7 days in advance, indicating that equipment is ready for testing. The Contractor shall provide testing equipment, including gages, thermometers, calorimeter, flue gas analyzers, thermocouple pyrometers, fuel flow meters, water meters and other test apparatus and calibrate instruments prior to the test. Draft, fuel pressure and steam flow may be measured by permanent gages and meters installed under the contract. The Contractor is responsible for providing an analysis of the fuel being used.
for the tests. Control of noise levels developed by exhaust steam shall be as directed by the Contracting Officer to satisfy environmental conditions of the surrounding area. The Contractor shall perform the following tests in the sequence as listed when feasible:

a. Strength and tightness tests
b. Standards compliance tests
c. Preliminary operational tests (steady state combustion test and variable load combustion test)
d. Tests of auxiliary equipment
e. Feedwater equipment test
f. Capacity and efficiency tests

3.2.5.1 Strength and Leak Tightness Tests

Subject boiler[s] to the following strength and tightness tests:

a. Watersides Including Fitting and Accessories: Hydrostatically test watersides in accordance with the requirements of the ASME BPVC SEC I. Since damage to the boiler components may have occurred during shipping, the factory ASME label will not be accepted as evidence of this test. Therefore, the final hydrostatic test must be performed after the installation of the boiler and its auxiliary components have been installed.

b. Boiler Casing, Air Casing, and Ducts: Test air casing and ducts exterior to the furnace pneumatically at the maximum working pressure. Use the soap bubble method to verify tightness. Test gas sides of boilers normally operated under pressure for tightness at one and one half times the predicted operating pressure in the furnace at maximum continuous output. For this test, tightly seal the boiler with a suitable means to blank off openings. Admit air to the boiler until the test pressure is reached, and then hold. If in a 10 minute period the pressure drop does not exceed 1245 Pa 5 inches water gage, the casing shall be regarded as tight and accepted.

3.2.5.2 Boiler Inspection

The Boiler Inspector shall be on hand to witness the appropriate tests which need to be observed in order to certify the safety of the boiler. The inspection shall include the requirements of NAVFAC MO 324 Inspection and Certification of Boilers and Unfired Pressure Vessels. The Boiler Inspector shall complete NAVFAC form 9-11014/40, Data Record Sheet; NAVFAC form 9-11014/41, Inspection Report; NAVFAC 9-11014/32 Inspection Certificate for each boiler after boiler has been inspected and found to be safe. No boiler may be fired until it has passed the inspection of the Boiler Inspector. Boiler inspection forms shall be submitted through the Contractor to the Contracting Officer. Place Inspection Certificate under framed glass, mounted on or near the boiler in a conspicuous location.

3.2.5.3 Boiler Cleaning and Startup

Dry out, boil out, and operate firing rate of new boiler(s) under direct responsibility and supervision of the manufacturer, [and in the presence of
boiler room operating personnel]. Provide required chemicals. Allow sufficient time for boiling out process to ensure interior surfaces are clean. This time shall be at least 24 continuous hours and generally not more than 36 hours; boil out shall continue until water is clear. Boil out, cleaning and starting procedures shall be in accordance with requirements of ASME BPVC SEC VII and FM DS 12-17.

3.2.5.4 Boiler Preliminary Operational Tests

Conduct a boiler operational test on each unit continuously for two weeks. Operate one boiler at a time to demonstrate control and operational conformance to specified requirements including ability to respond to load swings from the specified capacity to minimum turndown. Conduct operational test under the supervision of a registered professional engineer or a licensed power plant operator and demonstrate operation of safety, controls, maintenance of stable combustion at low loads, proper flame lengths and patterns to avoid flame impingement on the tubes for oil firing [or gas firing], and proper mechanical and electrical functioning of systems. This test shall include items mentioned in this specification as well as items mentioned in the specification of the particular pieces of equipment. Conduct tests with factory trained combustion equipment engineers as previously specified. Test and record steam quality, steam flow rates, flue gas temperature, percentages of carbon dioxide, carbon monoxide, oxygen and nitrogen in the flue gas and percent excess air for each boiler at tested load and graphically present test data.

3.2.5.5 General Controls Operational Tests

Conduct operational tests, performance tests, and demonstration tests with boiler controls functional and on line. No bypassing, use of jumpers, or other disablement of control systems will be allowed unless specified elsewhere.

3.2.5.6 Steady State Combustion Tests

Test fuel burning and combustion control equipment with each of the specific fuels at the minimum limit of the turndown range and at increments of 50, 75 and 100 percent of full rated load. Each test run shall be at least two hours on each fuel and until stack temperatures are constant and capacity and efficiency requirements of this specification have been verified and recorded. Verify proper operation of instrumentation and gages during the tests.

3.2.5.7 Varying Load Combustion Tests

Test boilers continuously under varying load conditions to demonstrate proper operability of the combustion control, flame safeguard control, programming control and safety interlocks. Conduct these tests after the adjustment of the combustion controls has been completed under the steady state combustion tests. Continue the variable load operational tests for a period of at least 8 hours.

a. Sequencing: Boiler shall start, operate and stop in strict accordance with the specified operating sequence.

b. Flame Safeguard: Verify operation of flame safeguard controls by simulated flame and ignition failures. Verify the trial-for-pilot ignition, trial-for-main flame ignition, combustion control reaction and valve closing times by stop watch.
c. Immunity to Hot Refractory: Operate burner at high fire until combustion chamber refractory reaches maximum temperature. Main fuel valve shall then be closed manually. Combustion safeguard shall drop out immediately causing safety shutoff valves to close within the specified control reaction and valve closing times.

[ d. Pilot Intensity Required: Gradually reduce fuel supply to the pilot flame to the point where the combustion safeguard begins to drop out (sense "no flame") but holds in until the main fuel valve opens. At this point of reduced pilot fuel supply, the pilot flame shall be capable of safely igniting the main burner. When the main fuel valve can be opened on a pilot flame of insufficient intensity to safely light the main flame, the boiler shall be rejected.

] e. Boiler Limit and Fuel Safety Interlocks: Safety shutdown shall be caused by simulating interlock actuating conditions for each boiler limit and fuel safety interlock. Safety shutdowns shall occur in the specified manner.

f. Combustion Controls: Demonstrate accuracy, range and smoothness of operation of the combustion controls by varying the steam demand through the entire firing range required by the turndown ratio specified for the burner. Control accuracy shall be as specified.

g. Safety Valves: High pressure limit switch shall be locked out or otherwise made inoperative and the boiler safety valves shall be lifted by steam. Determine the relieving capacity, popping pressure, blowdown and reseating pressure by observation and measurement in accordance with the ASME BPVC SEC I. The ASME standard symbol will be accepted only as indicating compliance with the design and material requirements of the code.

3.2.5.8 Auxiliary Equipment and Accessory Tests

Observe and test blowdown valves, stop valves, try cocks, fans, fuel oil heaters, pumps, electric motors, and other accessories and appurtenant equipment during operational and capacity tests for leakage, malfunctions, defects, and for compliance with referenced standards.

3.2.5.9 Feedwater Equipment Tests

Perform tests of feedwater treatment equipment in two steps. Conduct one test concurrently with the combustion tests. The Government will perform a second test during the first period of heavy loading after plant has been accepted and put in service. Correct deficiencies revealed during the Government tests under the guarantee provisions of the contract. Both the first and second series of tests shall determine compliance with limits for chemical concentrations of this specification. Supply equipment for taking samples and test kit for analyzing samples. Sampling equipment and test kit shall become the property of the Government when tests are completed.

3.2.5.10 Capacity and Efficiency Tests

Perform capacity and efficiency tests after satisfactorily completing operating tests and after operating boiler continuously for at least 14 days with no nuisance shutdowns and without the necessity for frequent or difficult adjustments. Perform these tests on each boiler. Conduct tests using [the] [each] specified fuel. Test procedures shall be in accordance
with the heat loss method [and the input-output method] of ASME PTC 4. Before tests are performed, the Contracting Officer and the Contractor shall reach agreement on those items identified in ASME PTC 4, Section 3, paragraph 3.01 "Items on Which Agreement Shall be Reached." A test run shall not start until boiler and accessories have reached an equilibrium and stabilization condition for at least one hour in duration. Duration of tests shall be sufficient to record necessary data but in no case shall each run be less than [4] [10] [24] hours.

3.2.5.11 Test Runs

Accomplish maximum output testing by means of a single 2 hour run at 110 percent load on the boiler under test. Calculate boiler efficiency, using [the] [both input-output and] heat loss method[s], from the consistent readings taken during the runs. Make runs at four different loads 30, 50, 70, and 100 percent of boiler rating during which take both heat loss and input-output data. Predict unmeasured losses used in conjunction with heat loss calculations and include with equipment data when submitted for approval. Subsequent tests required because of failure of equipment to perform adequately during specified capacity and efficiency tests shall be financial responsibility of the Contractor, including fuel cost.

3.2.5.12 Fuel Analysis

When analysis of fuel being burned during performance tests vary from that specified as the performance fuel the guarantees shall be adjusted in accordance with accepted engineering practice to determine compliance. Carbon loss shall be determined in accordance with ABMA Boiler 103, American Boiler Manufacturers Association curves for carbon loss.

3.2.5.13 Temporary Waste Steam Connection

When necessary to obtain sufficient load for these tests, provide a temporary steam line at a point outside of the building. Provide necessary pipe, fittings, supports, anchors and appurtenances including a field fabricated silencer as directed by the Contracting Officer. Remove temporary piping and silencer after tests have been satisfactorily completed.

3.2.5.14 Fire Safety for Oil-fired Boilers

Conduct tests as necessary to determine compliance with the applicable UL Safety Standards. The presence of the applicable Underwriters' label will be accepted as evidence of compliance in this respect.

a. Oil-Fired Boilers: Oil fired boilers shall meet test requirements of UL 726.

b. Oil Burners: Oil burners shall meet test requirements of UL 296.

3.2.5.15 Plant Acceptance Operation

After satisfactory completion of tests specified, operate the complete plant including each boiler, [its related flue gas cleaning equipment] and subsystems for a period of 30 continuous 24 hour operational days prior to final acceptance by the Government. Furnish labor, chemicals, test equipment and apparatus; the Government will furnish fuel, electricity and water. During this 30 day period, furnish readily available, the services of qualified representatives from manufacturers of plant components and
systems for the purpose of additional operational assistance, component and system adjustment and repairs. Government personnel will observe Contractor's operational procedures. The Contractor's representatives shall be prepared to answer pertinent questions from the Government, about the plant operation.

3.2.6 Manufacturer's Field Services

3.2.6.1 Erection/Installation Supervisors and Service Engineers

a. Boiler: Furnish the services of a competent supervisor who is in the direct employ of the boiler manufacturer. This supervisor shall remain on the construction site the full 8 hours per day, 5 days per week, or the same hours, that the boiler installation takes place. This supervisor shall be responsible for the complete steam generating unit, including the steam generator, forced draft fan, burner and other related work, such as refractory, or insulation regardless of whether the forced draft fan, burner or the other related items of work are furnished by manufacturers other than the boiler manufacturer.

b. Forced Draft Fans: The Contractor shall furnish a company service engineer to advise on the erection or installation of fans and related equipment.

c. Service Engineers: Services of the manufacturing companies' service engineers and the system suppliers' service engineers shall be provided by the Contractor to advise during erection and installation of other systems and equipment such as air compressors, air dryers, boiler feedwater pumps, fuel oil pumps, condensate pumps, water treatment equipment, chemical feed pumps, deaerating feedwater heater and stacks.

3.2.6.2 Boiler and System Representatives

a. Furnish factory trained engineers or technicians who are representatives of the boiler manufacturer and system suppliers to supervise testing of the boilers and auxiliary equipment.

b. Furnish the services of a Boiler Inspector who is qualified and certified as such by the National Board of Boiler and Pressure Vessel Inspectors and who is presently employed full time by a firm, such as Hartford Steam Boiler Inspection and Insurance Company, which has a business of inspecting boilers.

3.2.6.3 Instruction to Government Personnel

In accordance with the provisions of Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS, supervisors and service engineers shall provide instruction for the Government's operators in the operation and maintenance of the equipment furnished under this section. The minimum number of hours of instruction provided shall be as follows:

<table>
<thead>
<tr>
<th>Equipment</th>
<th>Operation Instruction</th>
<th>Maintenance Instruction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boiler and auxiliaries</td>
<td>40 hours</td>
<td>16 hours</td>
</tr>

SECTION 23 52 43.00 20
LOW PRESSURE WATER HEATING BOILERS (UNDER 800,000 BTU/HR OUTPUT)
05/15, CHG 2: 08/18

NOTE: This guide specification covers the requirements for low pressure hot water heating boilers under 235 kilowatt 800,000 BTU/hr output.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature
to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

NFPA 70  (2020; ERTA 20-1 2020; ERTA 20-2 2020; TIA 20-1; TIA 20-2; TIA 20-3; TIA 20-4) National Electrical Code

1.2 RELATED REQUIREMENTS

Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS, applies to this section, with the additions and modifications specified herein.

1.3 DESIGN REQUIREMENTS

******************************************************************************
NOTE: Insert boiler output capacity or indicate in boiler schedule. Select boiler design working pressure, operating pressure, operating temperature, and return water temperature and indicate in boiler schedule on drawings.
******************************************************************************

Boiler must be suitable for installation in the space shown with ample room for opening doors and cleaning and removal and replacement of tubes. Boiler must have an output of [_____] kW BTU/hr. Boiler must be designed and tested in accordance with ASME BPVC SEC IV, ASME CSD-1, NFPA 54, NFPA 31, NFPA 70 and ANSI Z21.11/CSA 4.9. Boiler must be installed in accordance with NBBI NB-23 PART 1. Paint boiler in accordance with manufacturer's recommendations. Boiler design working pressure must be [207 kPa (gage)] [30 psig] [____]. Boiler operating pressure must be [83 kPa (gage)] [12 psig] [____]. Boiler operating temperature must be [82 degrees C] [180 degrees F] [____]. Boiler return water temperature must be [71 degrees C] [160 degrees C] [____]. Provide a thermostatically controlled three-way mixing valve on boiler suitable for operating conditions of the boiler.

1.3.1 Boiler Installation Requirements

1.3.1.1 Location

Install Boiler(s) and associated hot water pumps in a mechanical room inside the facility in accordance with NBBI NB-23 PART 1. Provide ample clearance around boilers to allow access for inspection, maintenance and repair. Passageways around all sides of boilers must have an unobstructed minimum width of 36 inches or the clearances recommended by the boiler manufacturer whichever is greater.

1.3.1.2 Combustion Air

Provide supply of air for combustion and ventilation. In accordance with
NFPA 54, NFPA 211 and manufacturer's installation manual, calculate the amount of combustion air necessary to operate the boiler. Install and locate properly sized combustion air dampers and louvers.

1.3.1.3 Sequence of Operation

Local, manual starting of boilers is required. Remote starting and stopping of the boiler by the HVAC control system is not permitted. This is to ensure that an operator witness the initial firing of the boiler at the beginning of each heating season to verify proper operation of the boiler and to promote proper maintenance.

1.3.2 Detail Drawings

1.3.2.1 Drawings

Show boiler hot water isolation valves, emergency disconnect switch, and complete boiler gas train on the contract drawings.

1.3.2.2 Fuel Train / Wiring Diagram

Submit fuel train and wiring diagram.

1.3.3 Water Analysis

Provide test reports of water analysis. UFC 3-240-13FN Industrial Water Treatment must be followed for all boiler installations.

1.4 SAFETY STANDARDS

Hot water boilers, burners and supplementary control devices, safety interlocks, or limit controls required under this specification, must meet requirements of the following standards as applicable:

a. Oil-Fired Units: UL 726, NFPA 31, NFPA 70, ASME CSD-1.

d. All Units: ASME BPVC SEC IV, NFPA 70 and ASME CSD-1.

Controls not covered by the above must have a UL label, UL listing mark, or must be listed in the Factory Mutual Approval Guide.

1.5 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's
Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

[ Submittals for this Section must be delivered to the project Contracting Officer, who will forward two complete sets of copies to the appropriate approving official for review and approval.

PART 2 PRODUCTS

2.1 BOILERS

**************************************************************************
NOTE: Select options based on fuel source, residential or commercial application, and boiler capacity. Efficiencies included below are based on Energy Star for residential applications and ASHRAE 90.1 for commercial applications.
**************************************************************************

Provide hot water heating boiler complete with firing equipment, combustion chamber, insulation with steel jacket, safety and operating controls, integral electrical wiring and other appurtenances, to make the boiler a complete, self-contained, fully-automatic unit, ready for service upon completion of utility connections.[ Gas fired residential boilers less than 88 kW 300,000 Btuh must have an Annual Fuel Utilization Efficiency (AFUE) of at least 90 percent, and be Energy Star labeled. Provide proof of Energy Star label for oil-fired residential boiler product.][ Oil-fired residential boilers less than 88 kW 300,000 Btuh must have an Annual Fuel Utilization Efficiency (AFUE) of at least 87 percent, and be Energy Star labeled. Provide proof of Energy Star label for gas fired residential boiler product.][ Commercial boilers less than 88 kW 300,000 Btuhmust have
an Annual Fuel Utilization Efficiency (AFUE) of at least 80 percent.][ Gas fired boilers greater than 88 kW 300,000 Btuh input must have a thermal efficiency of at least 80 percent when fired at the maximum and minimum capacities which are provided and allowed by the controls.][ Oil-fired boilers greater than 88 kW 300,000 Btuh output must have a thermal efficiency of at least 82 percent when fired at the maximum and minimum rated capacities which are provided and allowed by the controls.]

2.1.1 General Requirements

Design, construction, installation, testing, and operation of boiler and appurtenances shall comply with NBBI NB-23 PART 1, ASME BPVC SEC IV, ASME CSD-1, NFPA 54, NFPA 31, ANSI Z21.13/CSA 4.9, and the manufacturer's instructions.

2.2 BURNERS AND CONTROL EQUIPMENT

******************************************************************************
NOTE: Indicate fuel trains on the drawings.
Conform to the requirements of ASME CSD-1.
******************************************************************************

[2.2.1 Atmospheric-Type Gas Burner

Atmospheric-type gas burner (under 117 kW 400,000 BTU/hr input). ASME CSD-1 and ANSI Z21.13/CSA 4.9. Automatic recycling burner. ON-OFF type combustion control system. [Interrupted] [Intermittent] pilot type ignition system, and pilot must be electrode-ignited natural gas type. Design burner and combustion control equipment for firing natural gas having a specific gravity of [0.6] [___] and a heating value of approximately [37,300 kJ per cubic meter] [1000 BTU per cubic foot] and be an integral part of the boiler. Burner controls and safety equipment must conform to applicable requirements of ASME CSD-1 and ANSI Z21.13/CSA 4.9, including complete gas shut-off and pilot gas. Gas pressure available: [_____] inches of water gage (WC) kPa gage psig.

[2.2.2 Gas-Fired Power Burner

Gas-fired power burner (over 117 kW 400,000 BTU/hr input). Interrupted pilot type ignition system, and pilot must be the electrode-ignited natural gas type. Design burner and combustion control equipment for firing natural gas having a specific gravity of [0.6] [___] and a heating value of approximately [37,300 kJ per cubic meter] [1000 BTU per cubic foot] [_____] and be an integral part of the boiler. Burner controls and safety equipment must conform to applicable requirements of ASME CSD-1, NFPA 54, ANSI Z21.13/CSA 4.9 and UL 795. Mount controls; including operating switches, indicating lights, gages, alarms, motor starters, fuses, and circuit elements of control systems on a single control panel or cabinet designed for separate mounting not on the burner. The combustion control system must be the [on/off] [high-low-off] [positioning] [metering] type. Locate flame scanner such that testing and cleaning of scanner can be accomplished without disassembly of burner. Provide fuel train as indicated. Gas pressure available: [_____] Pa inches of water gage kPa (gage) psig.

[2.2.3 Oil-Fired Power Burner

Oil-fired power burner (under 117 kW 400,000 BTU/hr input). Direct electric-spark-ignited type ignition system. Burner controls and safety
equipment must conform to applicable requirements of ASME CSD-1, NFPA 31 and UL 726. The combustion control system must be the [on/off] [high-low-off] [positioning] [metering] type.

2.2.4 Oil-Fired Power Burner

Oil-fired power burner (over 117 kW 400,000 BTU/hr input). Pressure-atomizing type burner. Direct electric-spark-ignited type ignition system. Design burner and combustion control equipment for firing commercial grade number 2 fuel oil and be an integral part of the boiler. Burner controls and safety equipment must conform to applicable requirements of ASME CSD-1, NFPA 31 and UL 726. The combustion control system must be the [on/off] [high-low-off] [positioning] [metering] type. Mount controls; including operating switches, indicating lights, gages, alarms, motor starters, fuses, and circuit elements of control systems on a single control panel or cabinet designed for separate mounting not on the burner. Locate flame scanner such that testing and cleaning of scanner can be accomplished without disassembly of burner. Provide fuel train as indicated.

2.2.5 Gas and Light Oil-Fired Power Burner

Gas and light oil-fired power burner (over 117 kW 400,000 BTU/hr Input). The combustion control system must be the [on/off] [high-low-off] [positioning] [metering] type. Pressure-atomizing type oil burner. Interrupted-pilot type ignition system, and pilot be electrode-ignited natural gas type, except that the oil burner be direct electric-spark-ignited. Design burner and combustion control equipment for firing commercial grade number 2 fuel oil and natural gas having a specific gravity of [0.6] and a heating value of approximately [37,300 kJ per cubic meter] [1000 BTU per cubic foot] and be an integral part of boiler. Burner controls and safety equipment must conform to applicable requirements of ASME CSD-1, NFPA 31, UL 726, NFPA 54, ANSI Z21.13/CSA 4.9 and UL 795. Mount controls; including operating switches, indicating lights, gages, alarms, motor starters, fuses, and circuit elements of control systems on a single control panel or cabinet designed for separate mounting not on the burner. Locate flame scanner such that testing and cleaning of scanner can be accomplished without disassembly of burner. Provide fuel train as indicated. Gas pressure available: [_____] Pa [_____] kPa (gage) [_____] psig.

2.3 BOILER TRIM AND CONTROL EQUIPMENT

Provide in accordance with ASME CSD-1 and ASME BPVC SEC IV and additional requirements specified below.

2.3.1 Emergency Disconnect Switch

**************************************************************************
NOTE: Indicate location of emergency disconnect switch on drawings. Insert emergency switch amperage required.
**************************************************************************

Provide and locate on wall outside boiler room entrance or just inside door, when boiler room door is on building exterior as required by ASME CSD-1 to allow rapid and complete shutdown of the boiler in the event of an emergency. Emergency switch must be a [_____]-amp. fuse-type safety switch. Switch must be red and furnished with a label indicating function.
of switch.

2.3.2 Relief Valves

Provide relieving capacity for the full output of boiler installed. Safety relief-valve piping must conform to ASTM A53/A53M, schedule 40 steel pipe and be piped full-size (to a floor drain) (to 150 mm 6 inches above floor).

2.3.3 Pressure and Altitude Gage or Combination Pressure/Altitude Gage

Provide one located on supply water piping and one on return water piping.

2.3.4 Thermometer

Provide thermometer with a scale equivalent to 1.5 times outlet water temperature. Provide one located on supply water piping and one on return water piping.

2.3.5 Drain Tapping

Provide drain valve and piping (to a floor drain) (to 150 mm 6 inches above floor).

2.3.6 Make-up Water Station

2.3.6.1 Pressure Reducing Station

**************************************************************************
NOTE: Select operating pressure required.**************************************************************************

Provide a water pressure-reducing valve and relief valve, or a combination of the two in the makeup water line to the boiler to maintain a water pressure of [83 kPa (gage)] [12 psig] [_____] in the hot water system. Provide a 20 mm 3/4 inch globe valve by-pass around this valve.

2.3.6.2 Backflow Preventers

Section 22 00 00 PLUMBING, GENERAL PURPOSE. Locate upstream of by-pass.

2.3.7 Feedwater Treatment Feeder

Provide floor mounted, Type II - Shot-Type Feeder (manual, intermittent feed), as indicated for use with pressures up to 1379 kPa (gage) 200 psig maximum.

2.3.8 Combustion Regulator

Provide adjustable temperature, thermostatic immersion type that must limit boiler water temperature to a maximum of 121 degrees C 250 degrees F. Control must actuate burner through an electric relay system to maintain boiler water temperature within normal prescribed limits at loads within rated capacity of boiler.

2.3.9 Air Vent Valve

Provide with screwed connection, stainless steel disk, and stainless steel seats to vent entrapped air.
2.3.10 High Temperature Limit Switch

**************************************************************************
NOTE: Specify alarm and indicating lights if input exceeds 117 kW 400,000 BTU/hr.
**************************************************************************

Provide adjustable immersible aquastat type with a temperature setting above that of the combustion regulator and below that of the lowest relief valve setting. Aquastat must function to cause a safety shutdown by closing fuel valves[,] [and] shutting down burner equipment [, activating a red indicating light, and sounding an alarm] in the event that boiler water temperature rises to the high temperature limit setting. A safety shutdown due to high temperature must require manual reset before operation can resume and prevent recycling of burner equipment. Pre-set high temperature limit devices that cannot be easily tested are not allowed.

2.3.11 Low Water Level Cutoff Switch

**************************************************************************
NOTE: Specify alarm and indicating lights if input exceeds 117 kW 400,000 BTU/hr.
**************************************************************************

Low water level cutoff must cause a safety shutdown by closing fuel valves[,] [and] shutting down burner equipment [, activating a red indicating light, and sounding an alarm] in the event that water level drops below the lowest safe permissible water level established by the boiler manufacturer and ASME BPVC SEC IV. A safety shutdown due to low water must require manual reset before operation can resume and prevent recycling of burner equipment.

2.3.12 Boiler Safety Control Circuits

**************************************************************************
NOTE: Include draft fan if power burner is specified.
**************************************************************************

Provide boiler safety control circuits, including control circuits for burner [and draft fan], must be single-phase, two-wire on-side grounded, and not over 120 volts. Provide safety control switching in ungrounded conductors. Provide overcurrent protection. In addition to circuit grounds, ground metal parts which do not carry current to a grounding conductor.

2.3.13 Indicating Lights

**************************************************************************
NOTE: Delete entire paragraph if boiler input does not exceed 117 kW 400,000 BTU/hr. Include draft fan if power burner is specified.
**************************************************************************

Each safety interlock requiring a manual reset must have an individually labeled red indicating light. Non-recycling control interlocks must have the reset located on the control itself. Red indicating lights on the control panel may be omitted if the burner combustion control system has a Keyboard Display Module installed that will identify the lockout
information required in Item c. below. Indicating lights must have colors as follows:

a. Amber: Ignition on
b. Green: Main fuel safety shut-off valves open
c. Red (One for Each): Safety lockout, flame failure, low water level, and high temperature

d. Blue: Draft

2.3.14 Alarm Bell

******************************************************************************
** NOTE: Delete entire paragraph if boiler input does not exceed 117 kW 400,000 BTU/hr. **
******************************************************************************

Provide alarm bell, electrically operated, with a manual disconnect switch. Disconnect switch must be type and wired so that switching off alarm following a safety shutdown will not prevent alarm from sounding again upon recurrence of a subsequent safety shutdown condition.

2.3.15 Post-Combustion Purge

******************************************************************************
** NOTE: Delete entire paragraph if atmospheric burner is specified. **
******************************************************************************

Provide controls and wiring necessary to ensure operation of draft fan for a period of not less than 15 seconds or of sufficient duration to provide four complete air changes in the boiler combustion chamber (whichever is greater) following shutdown of burner upon satisfaction of heat demand and in accordance with ASME CSD-1. Upon completion of post-combustion purge period, draft fan must automatically shutdown until next restart.

2.3.16 Draft

Comply with boiler manufacturer's recommendations.

2.3.17 Stack, Breeching, and Supports

******************************************************************************
** NOTE: NFPA 211, Type B vent can only be used with an atmospheric burner. **
******************************************************************************

******************************************************************************
** NOTE: Boiler stacks must conform to the boiler manufacturer's installation and operational manual. **
******************************************************************************

[Provide boiler stack constructed of sheet steel having a thickness of not less than 2.47 mm 0.0972 inches with welded joints. Insulate stack located inside the building with 38 mm 1 1/2 inches of mineral wool conforming to applicable requirements of ASTM C592, Class II - for use up to 649 degrees C 1200 degrees F. Insulation must receive a finish coat of finishing cement]
not less than 19 mm 3/4 inch thick, trowelled to a smooth finish. Provide stack supports, umbrella collar and cap, and flue transition piece. Stack diameter and height must be in accordance with manufacturer's recommendations and conform to NFPA 211.]

[NFPA 211, [Type B - gas] [Type L - oil and gas/oil], prefabricated multi-wall type, flashed to the roof, and complete with rain cap. Stack diameter and height must be in accordance with manufacturer's recommendations and conform to NFPA 211.]

2.3.18 Hot Water Coils

**************************************************************************

NOTE: Delete entire paragraph unless hot water coils are required to instantaneously heat domestic water.
**************************************************************************

Provide coils capable of heating [_____] L/s GPM of water with [_____] degree C F rise conforming to ASME BPVC SEC IV.

2.3.19 Stack Thermometer

Provide flue gas dial type thermometer with scale calibrated from 66 to 399 degrees C 150 to 750 degrees F and mounted in flue gas outlet.

2.4 ELECTRIC MOTORS

Electric motors must meet requirements of NEMA MG 1. Motors less than 3/4 kW 1 hp must meet NEMA High Efficiency requirements. Motors 3/4 kW 1 hp and larger must meet NEMA Premium Efficiency requirements. Motors which are an integral part of the packaged boiler system must be the highest efficiency available by the manufacturer of the packaged boiler. Motors must be variable speed.

PART 3 EXECUTION

3.1 EQUIPMENT INSTALLATION

Install equipment in accordance with manufacturer's installation instructions and NBBI NB-23 PART 1. Grout equipment mounted on concrete foundations before installing piping. Install piping in such a manner as not to place a strain on equipment. Do not bolt flanged joints tight unless they match. Grade, anchor, guide, and support piping without low pockets. Feedwater treatment feeders must be mounted so that the top of the feeder is no higher than 1219 mm 48 inches above the finished floor.

3.2 EQUIPMENT FOUNDATIONS

Locate equipment foundations as indicated, designed, and made of sufficient size and weight to preclude shifting of equipment under operating conditions or under abnormal conditions that could be imposed upon the equipment. Foundations must meet requirements of the equipment manufacturer. Concrete and grout must conform to Section 03 30 00 CAST-IN-PLACE CONCRETE.

3.3 BOILER CLEANING

Before being placed in service, boiler must be boiled out for a period of
24 hours at a pressure not exceeding 83 kPa (gage) 12 psig. Solution to be used in the boiler for the boiling out process must consist of two pounds of trisodium phosphate per 379 liters 100 gallons of water. Upon completion of boiling out, flush out boiler with potable water, drain, and charge with chemically treated water. Protect boiler and appurtenances against internal corrosion until testing is completed and boiler is accepted. Professional services are required for cleaning/treatment process.

3.4 FIELD QUALITY CONTROL

Perform and furnish everything required for inspections and tests as specified herein to demonstrate that boiler and auxiliary equipment, as installed, are in compliance with contract requirements. Start-up and operate the system. During this time, clean strainers until no further accumulation of foreign material occurs. Exercise care to minimize loss of water when strainers are cleaned. Adjust safety and automatic control instruments as necessary to place them in proper operation and sequence. Test instrumentation must be calibrated and have full scale readings from 1.5 to 2 times test values.

3.4.1 Operational Tests

Furnish the services of an engineer or technician approved by the boiler manufacturer of installation, startup, operational and safety testing. This person must remain on the job until each boiler has been successfully operated. Furnish and perform everything required for inspections and tests of the boiler and auxiliary equipment. Test instrumentation must be calibrated and have full-scale reading from 1.5 to 2 times test values. Demonstrate proper operability of combustion control, flame safeguard control and safety interlocks. Provide a detailed description of all boiler startup and operational tests in the Commissioning Plan.

3.4.1.1 Preliminary Operational Test

Operate the boilers continuously for a period of at least 8 hours to demonstrate proper operability of the combustion control, flame safeguard control, and safety interlocks.

3.4.1.2 Acceptance Operational Test and Inspection

**********************************************************************************
NOTE: Insert the appropriate Facility Engineering Command Acceptance Operational test and inspection by NAVFAC Boiler Inspector only required for boilers with capacity of 400,000 Btu/hr or greater. 
**********************************************************************************

Prior to requesting an acceptance test, conduct a satisfactory operational test for at least 8 hours, and provide a certified statement that the equipment is installed per all requirements of this guide. Contracting Officer, upon receipt of the notice from the Contractor, will request a boiler inspection by a Naval Facilities Engineering and Expeditionary Warfare Center (EXWC) NAVFAC boiler inspector. Fifteen days advance notice is required for scheduling inspector to conduct acceptance operational test and inspection.
3.5 SCHEDULE

Some metric measurements in this section are based on mathematical conversion of inch-pound measurements, and not on metric measurements commonly agreed on by the manufacturers or other parties. The inch-pound and metric measurements shown are as follows:

<table>
<thead>
<tr>
<th>Products</th>
<th>Inch-Pound</th>

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for low pressure hot water heating boilers over 235 kilowatt 800,000 BTU/hr output.

Adhere to <a href=#>UFC 1-300-02</a> Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a <a href=#>Criteria Change Request (CCR)</a>.

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature
to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN NATIONAL STANDARDS INSTITUTE (ANSI)

AMERICAN SOCIETY OF MECHANICAL ENGINEERS (ASME)

ASME BPVC SEC IV (2017) BPVC Section IV-Rules for Construction of Heating Boilers

ASME CSD-1 (2021) Control and Safety Devices for Automatically Fired Boilers

ASTM INTERNATIONAL (ASTM)

NATIONAL BOARD OF BOILER AND PRESSURE VESSEL INSPECTORS (NBBI)

NATIONAL FIRE PROTECTION ASSOCIATION (NFPA)

NFPA 31 (2020) Standard for the Installation of Oil-Burning Equipment

NFPA 70 (2020; ERTA 20-1 2020; ERTA 20-2 2020; TIA 20-1; TIA 20-2; TIA 20-3; TIA 20-4) National Electrical Code

1.2 RELATED REQUIREMENTS

Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS, applies to this section, with the additions and modifications specified herein.

1.3 DESIGN REQUIREMENTS

**************************************************************************
NOTE: Insert boiler output capacity or indicate in boiler schedule. Select boiler design working pressure, operating pressure, operating temperature, and return water temperature and indicate in boiler schedule.
**************************************************************************

Boiler must be suitable for installation in the space shown with ample room for opening doors and cleaning and removal and replacement of tubes. Boiler must have an output of [_____] kW BTU per hour with an efficiency of not less than required by the applicable military specification. Boiler must be designed and tested in accordance with ASME BPVC SEC IV, ASME CSD-1, NFPA 70, NFPA 54, NFPA 31, and ANSI Z21.13/CSA 4.9. Install boiler in accordance with NBBI NB-23 PART 1. Boiler shall be complete with an explosion-relief door, located in accordance with manufacturer's recommendations. Paint boiler in accordance with manufacturer's standard requirements. Boiler design parameters must be as follows: working pressure of [207 kPa (gage)] [30 psig] [_____; operating pressure of [83 kPa (gage)] [12 psig] [_____; operating temperature of [82 degrees C] [180 degrees F] [_____; and return water temperature of [71 degrees C] [160 degrees F] [_____. Provide a thermostatically controlled three-way mixing valve on the water supply to the boiler suitable for operating conditions of the boiler.

1.3.1 Boiler Installation Requirements

1.3.1.1 Location

Install Boiler(s) and associated hot water pumps in a mechanical room inside the facility in accordance with NBBI NB-23 PART 1. Provide ample clearance around boilers to allow access for inspection, maintenance and repair. Passageways around all sides of boilers must have an unobstructed minimum width of 36 inches or the clearances recommended by the boiler manufacturer whichever is greater.

1.3.1.2 Combustion Air

Provide supply of air for combustion and ventilation. In accordance with NFPA 54, NFPA 211 and manufacturer's installation manual, calculate the
amount of combustion air necessary to operate the boiler. Install and locate properly sized combustion air dampers and louvers.

1.3.1.3 Sequence of Operation

Local, manual starting of boilers is required. Remote starting and stopping of the boiler by the HVAC control system is not permitted. This is to ensure that an operator witness the initial firing of the boiler at the beginning of each heating season to verify proper operation of the boiler and to promote proper maintenance.

1.3.2 Detail Drawings

1.3.2.1 Drawings

Show boiler hot water isolation valves, emergency disconnect switch, and complete boiler gas train on the contract drawings.

1.3.2.2 Fuel Train / Wiring Diagram

Submit fuel train and wiring diagram.

1.3.3 Water Analysis

Provide test reports of water analysis. Follow UFC 3-240-13FN Industrial Water Treatment for all boiler installations.

1.3.4 Safety Standards

Hot water boilers, burners, and any supplementary control devices, safety interlocks, or limit controls required under this specification must meet requirements of the following standards as applicable:

a. Oil-Fired Units: UL 726 or NFPA 70, NFPA 31, ASME CSD-1.

c. Combination Gas and Oil-Fired Units: ASME CSD-1, NFPA 54, NFPA 31, NFPA 70, UL 726, ANSI Z21.13/CSA 4.9, UL 795 or UL 296.

d. All Units: ASME BPVC SEC IV, NFPA 70 and ASME CSD-1.

Controls not covered by the above must have a UL label, UL listing mark, or be listed in the Factory Mutual Approval Guide.

1.4 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item

SECTION 23 52 46.00 20 Page 6
if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

[ Deliver submittals for this section to the project Contracting Officer, who will forward two complete sets of copies to the appropriate approving official for review and approval.

SD-11 Closeout Submittals

Posted Operating Instructions for Heating Water Boilers

PART 2   PRODUCTS

2.1   BOILERS

********************************************************************************

NOTE: Select boiler size required.
********************************************************************************

Conform to the applicable requirements of ASME BPVC SEC IV and ASME CSD-1. Hot-water boilers must be horizontal firetube, multipass, modified scotch-type of the dry or wet-back type, packaged units mounted on a skid-type structural steel base. Provide each boiler complete burner and fuel system, a forced or induced draft fan, an automatic electronic control system complete with combustion and flame safeguard controls, firing sequence programmer, safety interlocks, limit controls and central control panel, and such trim and appurtenances as are peculiar to water units as specified herein. Units must be factory-wired and assembled except for such readily installed appurtenances as safety valves, water columns, and pressure gages. Units must be complete and ready for operation when connected to water, fuel, and electrical supplies.

2.2   BURNERS AND CONTROL EQUIPMENT

********************************************************************************

********************************************************************************

SECTION 23 52 46.00 20  Page 8
2.2.1 Gas-Fired Power Burner

Automatic recycling burner. Interrupted pilot type ignition system, and pilot must be electrode-ignited natural gas type. The combustion control system must be the [high-low-off] [positioning] [metering] type. Design burner and combustion-control equipment for firing natural gas having a specific gravity of [0.6] [_____] and a heating value of approximately [_____] [37,300] kJ per cubic meter [_____] [1000] BTU per cubic foot and be an integral part of the boiler. Burner controls and safety equipment must conform to the applicable requirements of ASME CSD-1, NFPA 54, ANSI Z21.13/CSA 4.9 and UL 795. Mount controls; including operating switches, indicating lights, gages, alarms, motor starters, fuses, and circuit elements of control systems on a single control panel or cabinet designed for separate mounting not on the burner. Locate flame scanner such that testing and cleaning of scanner can be accomplished without disassembly of burner. Provide fuel train as indicated. Gas pressure available: [_____] Pa in. wc [_____] kPa (gage) psig.

2.2.2 Oil-Fired Power Burner

******************************************************************************
NOTE: Due to limited manufacturer and boiler size options for FEMP stated efficiency requirements, this document includes boiler efficiency requirements in conformance with ASHRAE 90.1.
******************************************************************************

Automatic recycling burner. [Pressure-atomizing] [Air-atomizing; compressor or pump furnished with the burner] type burner. The combustion control system must be the [high-low-off] [positioning] [metering] type. Ignition system must be [direct electric-spark-ignited type] [interrupted pilot type, and pilot must be [electrode-ignited [natural] [propane] gas type] [light oil spark-ignition type]]. Design burner and combustion control equipment for firing commercial grade no. 2 fuel oil and be an integral part of boiler. Burner controls and safety equipment must conform to applicable requirements of ASME CSD-1, NFPA 31 and UL 726. Mount controls; including operating switches, indicating lights, gages, alarms, motor starters, fuses, and circuit elements of control systems on a single control panel or cabinet designed for separate mounting not on burner. Locate flame scanner such that testing and cleaning of scanner can be accomplished without disassembly of burner. [Provide fuel train as indicated.] Oil fired boilers with inputs less than 732 kW 2,500,000 Btuh must have a thermal efficiency of at least 82 percent and oil fired boilers with inputs greater than 732 kW 2,500,000 Btuh must have a minimum steady state combustion efficiency of at least 84 percent.

2.2.3 Combination Gas and Light Oil-Fired Power Burner

Automatic recycling burner. The combustion control system must be the [high-low-off] [positioning] [metering] type. Partial pre-mix type gas burner, complete with primary air fan. [Pressure-atomizing] [Air-atomizing; compressor or pump furnished with burner] type oil burner. Ignition system for firing natural gas must be interrupted pilot type, and pilot be electrode-ignited natural gas type. Ignition system for firing light oil must be the [direct electric-spark-ignited type] [interrupted pilot type, and pilot must be [electrode-ignited [propane] [natural] gas
Design burner and combustion control equipment for firing commercial grade number 2 fuel oil and natural gas having a specific gravity of 0.6 and a heating value of approximately 37,300 kJ per cubic meter (1000 BTU per cubic foot) and be an integral part of boiler. Burner controls and safety equipment must conform to applicable requirements of ASME CSD-1, NFPA 31, UL 726, NFPA 54, ANSI Z21.13/CSA 4.9 and UL 795. Mount controls; including operating switches, indicating light, gages, alarms, motor starters, fuses, and circuit elements of control systems on a single control panel or cabinet designed for separate mounting not on the burner. Locate flame scanner such that testing and cleaning of scanner can be accomplished without disassembly of burner. Provide fuel train as indicated. Gas pressure available: [_____] Pa (in. WC) [_____] kPa (gage psig).

2.3 BOILER TRIM AND CONTROL EQUIPMENT

Provide in accordance with ASME CSD-1 and ASME BPVC SEC IV. Boiler trim must comply with ASME BPVC SEC IV and additional appurtenances specified below. Non-recycling control interlocks must have the reset located on control interlock.

2.3.1 Emergency Disconnect Switch

**************************************************************************
NOTE: Indicate location of emergency disconnect switch on drawings. Insert emergency switch amperage required.
**************************************************************************

Provide and locate on wall outside boiler room entrance or just inside door, when boiler room door is on the building exterior to allow rapid and complete shutdown of the boiler in the event of an emergency as required by ASME CSD-1. Emergency switch must be a [____]-amp. fuse-type safety switch. Switch must be red and furnished with a label indicating function of switch.

2.3.2 Relief Valves

Provide relieving capacity for the full output of boiler installed. Safety relief-valve piping must conform to ASTM A53/A53M, schedule 40 steel pipe and be piped full size [to a floor drain] [to 150 mm 6 inches above floor].

2.3.3 Pressure Gage

Provide with a scale equivalent to 1.5 time outlet water pressure with a 150 mm 6 inch diameter. Locate one on supply water piping and one on the return water piping.

2.3.4 Thermometers

Provide thermometers with a scale equivalent to 1.5 times the outlet water temperature. Provide one located on supply water piping and one on return water piping.

2.3.5 Drain Tapping

Provide drain valve and piping [to a floor drain] [to 150 mm 6 inches above floor].
2.3.6 Make-up Water Station

2.3.6.1 Pressure Reducing Station

**************************************************************************
NOTE: Select operating pressure required.
**************************************************************************

Provide a water pressure-reducing valve and relief valve, or a combination of the two in the makeup water line to the boiler to maintain a water pressure of [_____] [83] kPa (gage) [_____] [12] psig in the hot water system. Provide a 20 mm 3/4 inch globe valve by-pass around this valve.

2.3.6.2 Backflow Preventers

Section 22 00 00 PLUMBING, GENERAL PURPOSE. Locate upstream of by-pass.

2.3.7 Stack Thermometer

Provide flue gas-dial type thermometer with scale calibrated from 66 to 399 degrees C 150 to 750 degrees F and mount in flue gas outlet.

2.3.8 Air Vent Valve

Provide with screwed connections, stainless steel disk, and stainless steel seats to vent entrapped air from boiler.

2.3.9 Feedwater Treatment System

Provide floor mounted Type II - shot-type feeder (manual, intermittent feed), Style A - as indicated with pressure up to 1379 kPa (gage) 200 psig maximum.

2.3.10 Combustion Regulator

Provide adjustable temperature, thermostatic immersion type that limits boiler water temperature to a maximum of 121 degrees C 250 degrees F. Control must actuate burner through an electric relay system to maintain boiler water temperature within normal prescribed limits at loads within rated capacity of boiler.

2.3.11 High Temperature Limit Switch

Provide adjustable immersible aquastat type with a temperature setting above that of the combustion regulator and below that of the lowest relief valve setting. Aquastat will function to cause a safety shutdown by closing fuel valves, shutting down burner equipment, activating a red indicating light, and sounding an alarm in the event that boiler water temperature rises to the high temperature limit setting. A safety shutdown due to high temperature will require manual reset before operation can resume and prevent recycling of the burner equipment. Pre-set high temperature limit devices that cannot be easily tested are not allowed.

2.3.12 Low Water Level Cutoff Switch

Provide float actuated type. Low water level cutoff must cause a safety shutdown by closing fuel valves, shutting down burner equipment, activating a red indicating light, and sounding an alarm in the event that water level
drops below the lowest safe permissible water level established by the boiler manufacturer and ASME BPVC SEC IV. A safety shutdown due to low water level will require manual reset before operation can resume and prevent recycling of burner equipment.

2.3.13 Boiler Safety Control Circuits

Provide boiler safety control circuits, including control circuits for burner and draft fan, that are single-phase, two-wire one-side grounded, and not over 120 volts. Provide safety control switching in ungrounded conductors. Provide overcurrent protection. In addition to circuit grounds, ground metal parts which do not carry current to a grounding conductor.

2.3.14 Indicating Lights

******************************************************************************
NOTE: Include indicating lights for low gas pressure and high gas pressure on all but size 1 burners.
******************************************************************************

Each safety interlock requiring a manual reset must have an individually labeled red indicating light. Non-recycling control interlocks must have the reset located on the control itself. Red indicating lights on the control panel may be omitted if the burner combustion control system has a Keyboard Display Module installed that will identify the lockout information required in Item c. below. Indicating light colors are as follows:

a. Amber: Ignition on
b. Blue: Draft
c. Green: Main fuel safety shut-off valves open
d. Red (One for Each): Safety lockout, flame failure, low water level, and high temperature.

2.3.15 Alarm Bell

Provide alarm bell, electrically operated, with a manual disconnect switch. Disconnect switch must be type and wired so that switching off alarm following a safety shutdown will not prevent alarm from sounding again upon recurrence of a subsequent safety shutdown condition.

2.3.16 Post-Combustion Purge

******************************************************************************
NOTE: Select four-air-change purge for Size 1, Size 2, and Size 3 burners. Select eight-air-change purge for Size 4 burners.
******************************************************************************

Provide a post-combustion purge in accordance with ASME CSD-1. Provide controls and wiring necessary to assure operation of draft fan for a period of not less than 15 seconds or of sufficient duration to provide four or eight complete air changes in the boiler combustion chamber (whichever is
greater) following shutdown of burner upon satisfaction of heat demand. Upon completion of post-combustion purge period, draft fan must automatically shutdown until next restart.

2.3.17 Draft

Comply with boiler manufacturer's recommendations.

2.3.18 Stack, Breeching, and Supports

**************************************************************************
NOTE: Boiler stacks must conform to the boiler manufacturer's installation and operational manual.
**************************************************************************
Provide boiler stack constructed of sheet steel having a thickness of not less than 2.47 mm 0.0972 inches with welded joints. Insulate stack located inside the building with 38 mm 1 1/2 inches of mineral wool conforming to applicable requirements of ASTM C592, Class II - for use up to 649 degrees C 1200 degrees F. Insulation must receive a finish coat of finishing cement not less than 19 mm 3/4 inch thick, trowelled to a smooth finish. Provide stack supports, umbrella collar and cap, and flue transition piece. Stack diameter and height must be in accordance with manufacturer's recommendation and conform to NFPA 211.

2.3.19 Hot-Water Coils

**************************************************************************
NOTE: Delete entire paragraph unless hot-water coils are required to instantaneously heat domestic water.
**************************************************************************
Provide coils capable of heating [_____] L/s GPM of water with [_____] degrees C F rise conforming to ASME BPVC SEC IV.

2.3.20 Smoke Density Indicator

**************************************************************************
NOTE: Select ASME CSD-1 for input less than 3663 kW 12,500,000 Btuh. Select NFPA 85 for input greater than 3663 kW 12,500,000 Btuh.
**************************************************************************

2.3.21 Annunciator

**************************************************************************
NOTE: Specify only if input exceeds 1465 kW 5,000,000 BTU/hr.
**************************************************************************
Provide in accordance with ASME CSD-1 or NFPA 85.

2.4 ELECTRIC MOTORS

**************************************************************************
NOTE: Select standard efficiency for motors used less than 750 hours per year and high efficiency for motors used over 750 hours per year. Packaged
Boilers should utilize the manufacturer's standard efficiency motor.

Motors which are not an integral part of a packaged boiler must be rated for [standard] [high] efficiency service per Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Motors which are an integral part of the packaged boiler system must be the highest efficiency available by the manufacturer of the packaged boiler.

PART 3 EXECUTION

3.1 EQUIPMENT INSTALLATION

Install equipment in accordance with the manufacturer's installation instructions and NBBI NB-23 PART 1. Grout equipment mounted on concrete foundations before installing piping. Install piping in such a manner as not to place a strain on equipment. Do not bolt flanged joints tight unless they match. Grade, anchor, guide, and support piping without low pockets. Mount feedwater treatment feeders so that the top of the feeder is not higher than 1219 mm 48 inches above the finished floor.

3.2 EQUIPMENT FOUNDATIONS

Locate equipment foundations as indicated, designed, and made of sufficient size and weight to preclude shifting of equipment under operating conditions or under any abnormal conditions that could be imposed upon the equipment. Foundations must meet requirements of the equipment manufacturer. Concrete and grout must conform to Section 03 30 00 CAST-IN-PLACE CONCRETE.

3.3 MANUFACTURER'S FIELD SERVICES

Furnish the services of an engineer or technician approved by the boiler manufacture for installation inspection, startup, and tests of equipment as specified below. After installation of equipment the engineer or technician must provide a signed certificate or certified written statement that the equipment is installed in accordance with the manufacturer's recommendations. Services of more than one engineer or technician may be required based on types of specific equipment. One engineer or technician as appointed by the Contractor must supervise and be responsible for the overall installation, start-up, test, and check out of systems. This person must remain on the job until each unit has been in successful operation for 3 days and accepted.

3.4 BOILER CLEANING

Before being placed in service, boiler must be boiled out for a period of 24 hours at a pressure not exceeding 83 kPa (gage) 12 psig. Solution to be used in the boiler for the boiling out process will consist of two pounds of trisodium phosphate per 379 liters 100 gallons of water. Upon completion of boiling out, flush out boiler with potable water, drain, and charge with chemically treated water. Protect boiler and appurtenances against internal corrosion until testing is completed and boiler is accepted. Professional services are required for cleaning/treatment process.
3.5 FIELD QUALITY CONTROL

Perform and furnish everything required for inspections and tests as specified herein to demonstrate that boiler and auxiliary equipment, as installed, are in compliance with contract requirements. Start up and operate the system. During this time, clean strainers until no further accumulation of foreign material occurs. Exercise care to minimum loss of water occurs when strainers are cleaned. Adjust safety and automatic control instruments as necessary to place them in proper operation and sequence. During startup and during tests, factory-trained engineers or technicians employed by individual suppliers of such components as the burner, flame safeguard and combustion controls, and other auxiliary equipment must be present as required, to insure proper functioning, adjustment, and testing of individual components and systems. Test instrumentation must be calibrated and have full scale reading from 1.5 to 2 times test values.

3.5.1 Operational Tests

Furnish the services of an engineer or technician approved by the boiler manufacturer of installation, startup, operational and safety testing. This person must remain on the job until each boiler has been successfully operated. Furnish and perform everything required for inspections and tests of the boiler and auxiliary equipment. Test instrumentation must be calibrated and have full-scale reading from 1.5 to 2 times test values. Demonstrate proper operability of combustion control, flame safeguard control and safety interlocks. Provide a detailed description of all boiler startup and operational tests in the Commissioning Plan.

3.5.1.1 Preliminary Operational Test

Operate boilers continuously for a period of at least 8 hours to demonstrate proper operability of the combustion control, flame safeguard control, and safety interlocks.

3.5.1.2 Acceptance Operational Test and Inspection

Prior to requesting an acceptance test, conduct a satisfactory operational test for at least 8 hours, and provide a certified statement that the equipment is installed per all requirements of this guide. The Contracting Officer, upon receipt of the notice from the Contractor, will request a boiler be inspected by a Naval Facilities Engineering and Expeditionary Warfare Center (EXWC) NAVFAC boiler inspector. Fifteen days advance notice is required for scheduling inspector to conduct acceptance operational test and inspection.

3.6 SCHEDULE

Some metric measurements in this section are based on mathematical
conversion of inch-pound measurements, and not on metric measurements commonly agreed on by the manufacturers or other parties. The inch-pound and metric measurements shown are as follows:

<table>
<thead>
<tr>
<th>Products</th>
<th>Inch-Pound</th>
<th>Metric</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Pressure Gage Diameter</td>
<td>= 6 inches</td>
<td>= 150 mm</td>
</tr>
<tr>
<td>b. Stack Thermometer Scale Range</td>
<td>= 150-750 degrees F</td>
<td>= 66-399 degrees C</td>
</tr>
<tr>
<td>c. Alarm Bell Diameter</td>
<td>= 4 inches</td>

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for steam boilers and related equipment for capacities from 150 to 5275 kW 500,000 to 18,000,000 Btu/Hr.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: This guide specification supersedes the requirements for these boilers and equipment contained in specification 52Y. Some paragraphs may need to be supplemented to meet the project requirements. The boilers are equipped for oil-, gas-, or oil-and-gas combination firing, as specified.

NOTE: The following information shall be shown on the project drawings:

1. Dimensions of construction
2. Relationship of materials

3. Quantities, location and capacity of equipment.

PART 1 GENERAL

1.1 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 SYSTEM DESCRIPTION

Describe the performance or design requirements and tolerances of the boiler system.

1.2.1 Heating Surface and Volume Measurements

Submit heating surface and volume measurements, including heat release calculations and performance data at minimum, 25 percent, 50 percent, 75 percent, and 100 percent load sufficient to establish compliance of boilers with heat release requirements. Base calculations on the specified efficiency and capacity.

1.3 RELATED REQUIREMENTS

Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS applies, with the additions and modifications stated herein.

1.4 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force,
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Steam Boiler System

SD-05 Design Data

Heating Surface and Volume Measurements

Heat Release Calculations

Performance Data at Minimum, 25 Percent, 50 Percent, 75 Percent, and 100 Percent Load

SD-06 Test Reports

Boiler System Start-Up Tests

Submit test reports in accordance with section FIELD QUALITY CONTROL. Submit a detailed written record of the start-up performance, including burner setting data over the entire load range, before the Contractor's and sub-contractor's test personnel leave the site.

SD-07 Certificates

Report of Prior Installations

Qualifications of Engineer

Start-Up Plan

Start-Up Certification

Boilers

Submit evidence that boilers meet requirements of standards specified. Include with the certificate of compliance acceptable evidence that standards are met. Acceptable evidence will be the official UL listing mark prescribed in the UL gas and oil equipment list for oil-fired, gas-fired, or gas and oil-fired boiler assemblies, as applicable plus the appropriate official ASME symbol stamp. In lieu of the above certification, acceptable evidence will be a test report from an independent testing laboratory, indicating that the boilers and accessories have been inspected and tested and meet requirements of the applicable standards specified.

SD-10 Operation and Maintenance Data
Boilers, Data Package 4

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

1.5 QUALITY ASSURANCE

1.5.1 Report of Prior Installations

Boilers shall be shipped to the site of installation as [a] [an] [completely assembled packaged boiler-burner unit] [unassembled package. A competent installation engineer or technician as stated in paragraph QUALIFICATIONS OF ENGINEER shall assemble an unassembled boiler-burner package in strict accordance with the manufacturer's instructions. ]

Boilers and feedwater equipment installed shall be of proven design which has been tested, successfully installed, and operated in commercial or industrial installations. Submit a certified written report from the boiler and feedwater equipment manufacturer indicating date of installation, type, model, capacity, and address location of installed boilers along with maintenance records and operating conditions including operating load and load swings. Show that substantially identical equipment of comparable capacity, within 20 percent, has been successfully installed and operated in not less than three installations under similar operating conditions for a period of not less than 2 years.

1.5.2 Start-Up and Installation Engineer

Provide the services of a qualified engineer or technician for start-up and tests and installation of equipment as specified below. More than one engineer or technician may be employed based on the types of specific equipment. One engineer or technician appointed by the Contractor shall supervise and be responsible for the overall installation, start-up, test, and checkout of systems.

1.5.3 Qualifications of Engineer

Submit a printed certified qualification resume of the engineer or technician. The engineer's or technician's resume shall list applicable experience related to installation, start-up, and testing of equipment and applicable factory training and education. Qualifications require the engineer to have supervised two installations of similar size and type which are operating satisfactorily. If more than one engineer or technician is employed, provide a certified resume for each one indicating their specific specialty and item of work.

1.5.4 Installation

**************************************************************************
NOTE: Delete this paragraph for boilers under 2930 kW 10,000,000 Btu/hr capacity.
**************************************************************************

Provide an installation engineer or technician to install and supervise the installation of steam boiler system including instrumentation and boiler controls. Provide the technician or engineer until the installation of equipment is coordinated and checkout completed.
1.5.5 Start-Up Plan

Submit a written schedule with dates of start-up tests, installation, and checkout of equipment.

1.5.6 Start-Up and Test

Start-up and test engineer or technician shall be approved by the manufacturer of the specific piece of equipment including boiler, boiler controls, boiler instrumentation, and feedwater equipment. The start-up and test engineer or technician shall remain on the job until the unit has been in successful operation for [_____] days, and has been accepted by the Contracting Officer.

1.5.7 Start-Up Certification

After installation of equipment, the engineer or technician shall submit a signed certificate or certified written statement that the equipment is installed in accordance with the manufacturer's recommendations.

PART 2 PRODUCTS

2.1 BOILERS

***************************************************************************
NOTE: Only allow option of MIL-B-18897 for low pressure boilers of capacities less than 2930 kW 10,000,000 Btu/h. On/off combustion controls may be used for up to 880 kW 3,000,000 Btu/h, hi-low-off type may be used for 585 to 1465 kW 2,000,000 to 5,000,000 Btu/h, and modulating positioning type may be used for over 880 kW 3,000,000 Btu/h.
***************************************************************************
***************************************************************************
NOTE: Research local, state, and federal emission standards and place any new or unusual requirements in this specification section.
***************************************************************************
[Firetube, packaged type of standard duty conforming to FS F-B-2903] [or] [Firetube type (horizontal return tubular and horizontal fire box)] [Water tube type] [Cast iron, sectional type conforming to MIL-B-18897] [except that treatment and painting shall be in accordance with manufacturer's standard practice,] Boilers shall have gross output capacity of at least [_____] kW Btu per hour when operating at a steam pressure of [_____] kPa (gage) pounds per square inch gage (psig) at the site under design conditions when the burner is firing [[No. [_____] oil conforming to [ASTM D396] having a higher heating value of [_____] MJ/kg Btu per gallon] [or] [natural] [manufactured] [mixed] [liquified petroleum] gas having a higher heating value of [_____] MJ/kg Btu per cubic foot and a pressure of [_____] kPa (gage) psig at the fuel train connection].] [Gas fired boilers shall have a steady state combustion efficiency of at least 80 percent when fired at the maximum and minimum rated capacities which are provided and allowed by the controls.] [Oil fired boilers shall have a steady state combustion efficiency of at least 81 percent when fired at the maximum and minimum rated capacities which are provided and allowed by the controls.] Boilers shall comply with local, state, and federal emission regulations for the fuel being used. Smoke emission shall not exceed

SECTION 23 52 49.00 20 Page 10
Ringlemann No. 1, except during start-up, cleaning, or soot blowing. Boiler furnaces shall be equipped with combustion control safety devices conforming to [ASME CSD-1, for boilers of less than 3660 kW 12,500,000 BTU/HR thermal heating capacity.] [NFPA 85, for boilers with thermal heating capacity of 3660 kW 12,500,000 BTU/HR or larger.] [Burners and controls for boilers conforming to MIL-B-18897 shall conform to PS F-B-2910.] Burners of the rotary type are not acceptable. Programming controls shall be of the automatic [recycling] [non recycling] type and shall incorporate means for automatic self-checking of the circuit at the beginning of each start-up cycle. Include a repetitive self-checking circuit to check components at intervals not to exceed the specified flame failure response time in [FS F-B-2910] [or] [FS F-B-2903] [as applicable] during the entire period of burner operation. Combustion controls, shall be of the [on-off], [hi-low-off] [modulating-positioning] type. [Provide connections for remote starting or stopping of the boilers.] [Explosion relief doors are required.] [Provide steam operated feedwater injectors.] [Cast iron boilers shall be of the sectional type and shall conform to the requirements above and as specified. Boilers shall be [automatic] [semi-automatic] [or] [manual] start.] [For each boiler, provide a steam operated soot blower made of materials that shall withstand expected temperatures.]

2.1.1 Boiler Connections

Requirements for interconnecting piping, insulation, fuel supply, [vibration isolation,] [____], and other related work necessary to provide a complete and operable steam system, whether or not specifically mentioned above, shall conform to applicable requirements of other UFGS sections.

2.1.2 Boiler Instrumentation

In addition to the instruments required by the boiler specifications referenced above, provide the following instruments and locate where shown and where recommended by instrument manufacturer:

a. A flue gas temperature gage.

b. A draft gage, [single point] [two point], conforming to ASME B40.100.

**************************************************************************
NOTE: Select the applicable paragraph(s) from the following:
**************************************************************************

**************************************************************************
NOTE: These instruments are not normally required on boilers under 2930 kW 10,000,000 Btu/h.
**************************************************************************

[ c. A carbon dioxide recorder to measure, record, and indicate the percentage by volume of carbon dioxide detected in the flue gas. Flush mount the recording unit and furnish with locking device and master key. The carbon dioxide recorder shall in other respects conform to CID A-A-50566.]

**************************************************************************
NOTE: These instruments are not normally required on boilers under 2930 kW 10,000,000 Btu/h.
**************************************************************************
[ c. A complete oxygen analyzer system to measure oxygen content of flue gases generated by combustion of [gas] [or] [oil] as specified in paragraph BOILERS shall be provided for each boiler. The output of the analyzer shall range from zero to [_____] [25] percent oxygen:

(1) Provide a complete aspirating system with proper connection to stack, necessary steam or water aspirating facilities, and piping of proper specification to analyzer. Provide piping in accordance with the oxygen analyzer manufacturer's recommendations and install tight. Install equipment in accordance with the manufacturer's instructions.

(2) Provide a paramagnetic analyzer. Analyzer shall provide oxygen analysis in the zero and 25 percent oxygen range, and have means of calibration. Provide zero range and span adjustments as required.

(3) Analyzer output and recorder input shall be compatible. Provide, connect, and place in proper operation necessary transducers. Follow special instructions relating to electrical transmission between analyzer and recorder as to the application of shielded wiring in conduit.

(4) Check the system with two calibrating gases as follows: (a) 100 percent nitrogen, and (b) 3.5 percent oxygen and remainder nitrogen.

**************************************************************************
NOTE: These instruments are not normally required on boilers under 2930 kW 10,000,000 Btu/h.
**************************************************************************

[ c. Direct Probe In-Situ Type: Oxygen analyzer shall be the direct probe type utilizing an in-situ zirconium sensing element. Insert element directly in the process flue gas stream and in direct contact with process gasses. Sensing element shall be contained within a protective shield mounted to the duct work by means of an adapter plate, all furnished by the manufacturer. Analyzer shall be equipped with a facility to allow daily automatic calibration check without removing the analyzer from the process. That is, sample gases may be injected directly on the sensing element while the analyzer is in the process. In order to eliminate the temperature effect of the flue gases, maintain the cell temperature in the probe at 843 degrees C 1,550 degrees F by means of an externally mounted temperature controller equipped with cold junction compensation and coupled to the probe with at least 6 meters 20 feet of flexible cable. Analyzer shall be FM APP GUIDE approved and certified for "in-stack" analysis technique. Output signal range shall be 4 to 20 milliamps and shall represent 0.25 percent to 25 percent oxygen as a logarithmic function, 0.1 percent to 10 percent oxygen as a logarithmic function, or zero percent to 10 percent as a linear function. [Circular chart recorder shall consist of a two-pen recording control mechanism having 110 volt ac electric motor drive. Chart shall be 300 mm 12 inch diameter and have 24-hour revolution. Output control signal will be 20 to 103 KPa (gage) 3 to 15 psig pneumatic. Sufficient blank charts and four ink cartridges per pen for 400 days operation shall be provided. Recorder shall have a dual 30 degrees strip indicator. Strip indicator and chart paper scale shall be logarithmic or linear and consistent with the analyzer signal.
conditioning. [Strip chart recorder shall consist of a two pen solid state electronic recording/controlling mechanism. Strip chart shall be 100 mm 4 inches wide and shall be driven at a speed of 19 mm per hour 3/4 inch per hour. Recording/controlling mechanism will operate on 110 volt ac power. Recorder shall be furnished with twelve usable 24-hour logarithmic or linear charts consistent with the analyzer signal conditioning. Inking system shall be a breakaway inking system with replaceable fiber tip pens and 12 ink cartridges. Strip chart recorder/controller shall have vertical scale and horizontal driven chart. Output control signal will be 4 to 20 milliamps dc.] Flue gas temperature scale shall be 149 to 427 degrees C 300 to 800 degrees F. Entire system response shall be not more than 3 seconds.

**************************************************************************
NOTE: These instruments are not normally required on boilers under 2930 kW 10,000,000 Btu/h. However, smoke density recorders are mandatory for all residual oil fired boilers having capacities above 2930 kW 10,000,000 Btu/h.
**************************************************************************

d. A smoke density [indicator] [recorder] of the [density limit] [continuous density] type with a scale calibrated in Ringlemann units. Indicating and recording systems shall include circuits for the audible warning of the maximum smoke density-limit. Supply a vibrating electric horn to sound the audible signal. Otherwise the smoke density [indicator] [recorder] shall conform to CID A-A-50566.

2.1.3 Boiler Plant Controls and Instruments

Provide the following plant [controls and] instruments:

a. Orsat Gas Analyzer: Provide a flue gas analyzer, Orsat type, conforming to CID A-A-50504. Analyzer shall determine the CO2, CO, and O2 in the flue gas and shall be complete with chemicals and accessories for use in such determinations.

b. Steam flow recorder: to remotely indicate, record, and totaling the steam flow per hour through the steam header. Provide the panel-mounted indicating recorder with a tamper proof case.

**************************************************************************
NOTE: Insert section number(s) for oil and/or gas piping systems in the blanks below.
**************************************************************************

c. Volumetric fuel flow meters in accordance with [_____] [and [_____]].

**************************************************************************
NOTE: The value of tolerance limit shall be 3 percent for modulating positioning type, shall be 5 percent for high/low/off type, and shall be 6 percent for on/off type. See paragraph 3 for which type of combustion control is specified.
**************************************************************************

d. Master Combustion Control: Provide a common boiler master controller on the free standing boiler instrument and control panel to control all boilers with each individual boiler controller acting as a submaster.
controller. Boiler master control system shall provide for base loading one [or more] boilers. Base loaded boiler(s) shall be selected manually by an externally accessible switch. On call for heat, lead boiler shall cut in and moderate firing rate to satisfy demands. When maximum desired firing rate is reached, lag boiler or boilers shall cut in. Only one boiler shall be on modulating firing at one time. Maximum desired firing rate for base loaded boiler shall be adjusted initially for boiler peak efficiency and shall be capable of easy manual adjustment by operating engineer. Provide adequate indicators approved by the Contracting Officer to show the method of loading of each boiler, and load being carried by it. Make adjustments at front of panel and no linkage adjustment shall be necessary. Combustion control system shall be capable of maintaining the plant steam pressure at the main header within the tolerance limits of plus or minus [_____] percent expressed as a percent of the set point values. The specified tolerance shall apply to a load which, within a one-minute period, swings from a steady-state condition to an increase (or decrease) in load equal to a maximum of 10 percent of the plant. Regulation tolerances shall apply to any steady state condition within the plant turndown ratio of [______]. Combustion efficiency shall not be less than that specified in the boiler specifications.

e. Pressure gage conforming to ASME B40.100 or indicating steam pressure in main steam header, [for indicating atomizing steam pressure,] and for indicating feedwater pressure.

2.1.4 Boiler Control and Instrument Cabinet(s)

Provide boiler control and instrument cabinet(s) as specified in the referenced boiler specification(s) and may be mounted either on the boiler front or adjacent thereto. The arrangement may consist of a boiler mounted cabinet containing controls normally provided by the manufacturer and a supplementary cabinet containing additional controls and instruments required herein. Mount [plant master combustion control] [and] [steam flow recorder] on or adjacent to control panel for number [_____] boiler.

2.1.5 Free-Standing Multi-Boiler Plant Control and Instrument Panel

Provide a free-standing panel and locate as indicated. The panel shall contain all individual and multi-boiler controls, monitoring system, and panel-mounted instruments specified herein and in the reference specifications, except that flame safeguard system may remain separately mounted in a cabinet at each boiler.

[2.1.5.1 Control Panel Construction

**************************************************************************
NOTE: Select the applicable paragraph(s) from the following:
**************************************************************************
**************************************************************************
NOTE: Delete inapplicable paragraph(s).
**************************************************************************

Construct control panel of not less than 3 mm 11 gage reinforced steel for face, top, and sides. The enclosed panel shall be not less than 610 mm 24 inches in depth with inside rigidly welded braces. Design control panel so that all indicating and recording devices and manually operated switches
shall be flush mounted in a gasketed removable-top front panel with indicating and recording devices at eye-level. Provide a similar removable-top rear panel located opposite front panel to facilitate wiring, piping, and maintenance. Install other operating controls on a sub-panel within the enclosure. Access to panel enclosure shall be through gasketed, double piano-hinged doors of not less than 1.52 mm 16 gage steel. The doors shall be reinforced to prevent sagging and shall be provided with a three point compression type fastener and polished key lock handle. Include a full width fluorescent lighting canopy also. Prime coat complete control panel and lighting canopy and finished in baked enamel. Identify flush-mounted devices on panel with engraved lamicore nameplates. Adequately reinforce, skirt, and suitably design panel base to permit anchoring to the floor or foundation.

[2.1.5.2 Control Panel Wiring and Piping]

**************************************************************************
NOTE: Delete inapplicable paragraph(s).
**************************************************************************

Control panel shall be factory pre-wired in accordance with NFPA 70. Wire shall be thermoplastic Type THW, THWN, XHHW, or UL approved for the intended use, color or number coded, and run in plastic ducts to numbered terminal blocks. Control circuits shall be separately fused with properly rated cartridge type fuses. Power leads to and from magnetic starters and contractors shall terminate at terminal blocks so that field wiring is necessary only from terminal blocks to external equipment. Control leads to and from external control devices shall terminate at separate terminal blocks from power leads. Steam-, draft-, and air-operated devices shall be factory piped to permanently affixed external connections. Pneumatic signals shall be either 20 to 103 kPa (gage) 3 to 15 psig or 20 to 207 kPa (gage) 3 to 30 psig. Piping connections to indicators shall be copper tubing conforming to ASTM B88M ASTM B88. The boiler operating switch shall be a dust-tight sealed snap-action type. The precision switches shall have cadmium, silver, or platinum contacts, wiping action type, rated at 10 amperes. Electrically or pneumatically tested, controls and equipment shall be to simulate complete operational sequence.

]2.1.6 Hot Water Heater

**************************************************************************
NOTE: Hot water heaters are only used on boilers operating at 103 kPa 15 psi or less.
**************************************************************************

[The] [Each] [Number [_____] ] boiler shall be equipped with internal hot water heating coils conforming to the ASME BPVC SEC VIII. Heaters shall have gasketed cast iron or steel flange mountings and shall be designed, fabricated, and tested to withstand 207 kPa (gage) 30 psig maximum working pressure at 121 degrees C 250 degrees F. The heating coil shall be finned tube type not less than 19 mm 3/4 inch outside diameter and shall be constructed of seamless copper or copper alloy that meet the requirements of [ASTM B75/B75M,] [ASTM B111/B111M,] or [ASTM B395/B395M ASTM B395/B395M]. The heating coil while submerged in water under pneumatic pressure shall withstand 2068 kPa (gage) 300 psig. The pressure drop through the coil at maximum temperature and draw rate shall not exceed 34 kPa (gage) 5 psig, unless otherwise indicated. The coils shall terminate in threaded inlet and outlet connections on the exterior of the boiler and shall be designed for the indicated temperature rise and maximum draw rate. When
2.1.7 Noise Levels

Noise measurements and exposure analyses should be conducted under the overall supervision of an industrial hygienist or suitably qualified medical officer from the Navy Regional Medical Center (NRMC). Safety personnel, engineers and others who have been certified by the Chief, Bureau of Medicine and Surgery (BUMED) also may supervise the work. Exposure limits for potentially hazardous noise levels of 85 dBA, continuous or intermittent, and 140 dB peak sound pressure, impulse or impact, shall be maintained. The sound level meter shall conform as a minimum to the Type 2 requirements cited in ASA S1.4.

2.2 BOILER BREECHING

2.2.1 Round Breeching

Construct round breeching of black iron or steel in accordance with NFPA 211 for metal connectors for medium-heat appliances and shall be constructed with welded beams and joints. Round breechings also may consist of approved factory-built chimney sections for medium-heat appliances if the sections are joined together with continuous welds, flanges, or couplings. Provided suitable cleanouts that will permit cleaning the entire breeching without dismantling.

2.2.2 Rectangular Breeching

**************************************************************************
NOTE: Specifier should check structural steelwork section of the project specification, if used, as well as notes on structural drawings to ensure against conflict of requirements.
**************************************************************************

Structural materials shall comply with the applicable sections of AISC 360. Shop connections may be welded or bolted as required for joining breeching to equipment. Supply hot dipped galvanized bolts and lock washers for bolted connections. Bolts shall be not less than 10 mm 3/8 inch in diameter, and spaced not more than 76 mm 3 inches apart. Furnish bolted joints with 3.20 mm 1/8 inch thick non-asbestos gaskets. Breeching [plate] shall be not less than [12 MS gage steel][ 4.80 mm 3/16 inch thick]. Welds shall conform to AWS D1.1/D1.1M. Breeching system shall provide for maximum expansion and contraction. Expansion joints shall be of the guided flexible crease type with flexible element of not less than 1.60 mm 0.0625 inch thick stainless steel. Provide access doors and cast iron or reinforced steel plate with non-asbestos gaskets 3.20 mm 1/8 inch thick and positive closing latches of sufficient number to ensure a gas-tight seal. Thoroughly clean breeching of rust and scale after fabrication by commercial sand blasting.

2.2.3 Breeching Hangers

Design breeching hangers to carry not less than five times the breeching weight. Hangers for round breeching shall be of the band type with hanger rods. Provide steel trapeze type hangers for rectangular breeching with angle support member and hanger rods.
2.2.4 Cleanout Doors

Secure cleanout doors to the ends and sides of the breeching where indicated or where required to effectively clean the breeching. Construct cleanout doors of a gage steel not less than that of the breeching and secure to a 32 by 32 inch 1/4 by 1 1/4 inch angle frame not less than 3.20 mm 1/8 inch in thickness with mounting bolts welded to the angle frame and spaced not over 152 mm 6 inches on center; provide 1.60 mm 1/16 inch thick long fiber non-asbestos gasket between cleanout doors and frames. Doors shall be squared and shall be full height of diameter or side of breeching up to a size of 610 mm by 610 mm 24 inches by 24 inches maximum, except that cleanout doors less than 305 mm 12 inches in height shall be rectangular and shall be 305 mm 12 inches in length. Plug type cleanouts are not acceptable.

2.2.5 Stacks

Stacks shall be constructed of not less than [12] [10] MS gage steel, welded construction, and of proper size to adequately serve the respective boiler. Stacks shall project above the boiler house roof not less than that indicated and shall be supported by a substantial steel framework. Provide structural steel framework at boiler room roof around each stack and attached to roof joints to brace stack against swaying and to support new roof curb and stub stack. Construct stacks as indicated to include automatic damper access door, gas sampling connection, smoke density indicator, temperature sensing connection, and other features shown or required. When rain can fall into contact with internal boiler parts, provide stub stacks with rain caps or hoods. Provide stacks with the following:

a. Provide curb openings in roof and properly flash and counterblock to roofing. Furnish and install flashing hoods around stacks and over roof curbs.

b. Provide a bellows type flexible [fabric] [_____] type expansion joint approximately 152 mm 6 inches wide in the stacks at the location shown. Joint system shall consist of 4.80 mm 3/16 inch steel plate welded to inside of bottom section of stack. Top section of stack shall be free to move up and down outside the plate. Weld steel reinforcing angles around both top and bottom sections of stack. Fit and weld to the angles an expansion angle type bellows of 12 gage steel.

c. Clean stacks of dirt, rust, oil and grease by wire brushing and solvent degreasing and give one shop coat of heat-resisting aluminum paint conforming to FS TT-P-28 on the inside and outside. The coat of paint shall have a minimum dry film thickness of one mil.

2.3 BLOWDOWN EQUIPMENT

Furnish the [boiler] [plant] with all equipment, tanks, and controls necessary for bottom [and continuous] blowdown of the boilers. The equipment for bottom blowdown systems shall include a [blowdown tank] [and sample cooler]. [Continuous blowdown systems shall be of the packaged, proportional type consisting essentially of a heat exchanger, flow control valve, surge tank, [and] sample cooler, [and blowdown control console with test sink].] Install and pipe blowdown equipment as indicated, and conform to recommendations of the NBBI NB-27, Recommended Rules for National Board Boiler Blowoff Equipment.
2.3.1 Bottom Blowdown Tank

**************************************************************************
NOTE: Cathodic protection or magnesium anodes only required when steel tank is buried.
**************************************************************************

Blowdown tank shall be fabricated of welded steel plate in accordance with ASME BPVC SEC VIII. Tank shall be a vertical cylindrical tank designed for the working pressure of the boiler(s). Tank shall be equipped with a tangential blowdown inlet located so as to impinge on a carbon steel wear plate extending at least 180 degrees around the interior circumference of the tank from the point of inlet. Tank shall be equipped with an internal overflow, vent, drain, safety relief valve, and gauge glass with try cocks, blowdown cock, and guard. Tank interior shall be protected by an epoxy coating system suitable for continuous water immersion and operation at a minimum temperature of [121] [149] degrees C [250] [300] degrees F. The tank [shall be fitted [with renewable magnesium anodes] [with cathodic protection equipment] to minimize galvanic corrosion of the exterior.] [shall be constructed of Class A reinforced concrete and shall be fitted with a bolted steel manhole frame and cover. Install blowoff pipe, vent pipe, and drain pipe in pipe sleeves built into concrete. Fill the space between the pipe and sleeves and caulk with lead wool or equivalent to make a watertight seal. Tank shall be divided into two sections by means of a baffle to form a sediment chamber.] Size and locate blowoff tank shall be size and located as shown.

2.3.2 Sample Cooler

Provide a water-cooled, shell-and-tube, or shell-and-coil type heat exchanger designed for cooling sample of boiler water prior to chemical testing. Furnish the sample cooler as a component of the packaged continuous blowdown system when such a system is being furnished. The cooler shall consist of a cast iron or steel shell with copper coil or copper alloy tubes and shall be equipped with a brass or bronze sampling cock. [The cooler shall be connected to a header and so valved that a sample can be withdrawn from any boiler as desired.] [Furnish a concentrometer kit containing necessary glassware, reagents, and instructions for determining boiler water concentrations.]

2.3.3 Continuous Blowdown System

**************************************************************************
NOTE: Specify continuous blowdown only where makeup water ratio is in excess of 20 percent of the boiler output or where the total dissolved solids of this makeup water are in excess of 500 parts per million.
**************************************************************************

**************************************************************************
NOTE: Include last sentence if a console type unit is indicated.
**************************************************************************

Provide a complete packaged unit of the [automatic-proportioning] [manual-apportioning] type wherein the amount of blowdown from the [boiler] [plant] is automatically proportioned to the amount of make-up feedwater [and the total amount of blowdown from the plant is manually apportioned between boilers according to their steaming rate]. The system shall
include either an automatic-proportioning valve and a heat exchanger or a concentric tube automatic proportioning control which shall be provided with a separate heat exchanger when necessary to meet the performance requirements indicated or specified herein. The system shall be designed for not less than boiler design pressure and shall be capable of heating the feedwater from [_____] degrees C degrees F to [_____] degrees C degrees F at the flow rates indicated. Heat exchanger shall consist of a steel shell and heads with Type 304 stainless steel tubes arranged in a removable U-bend bundle. Construct and test shell in accordance with ASME BPVC SEC VIII for the specified boiler operating pressure. Automatic proportioning valve shall be provided with a sensing orifice on both the makeup and blowdown lines and shall be of the adjustable ratio type in which the ratio of makeup to blowdown may be set anywhere within a range of [30:1] [_____] to [4:1] [_____.] Automatic proportioning control shall consist of two concentric tubes, the inner tube being of a thermostatic design which acts directly against an adjustable seat in response to the temperature differential between the blowdown in the inner tube and the makeup water between the inner and outer tubes. [Manual apportioning valves shall have bronze bodies with stainless steel seats and disks and shall be of the indicating type specifically designed for blowoff service.] Blowdown system shall be complete with strainers, stop valves, [blowdown meters,] thermometers, and other accessories necessary to form complete packaged units. [Blowdown control console shall include illuminated sight flow indicators, automatic flushing and cooling valves, and complete panelboard instrumentation as well as a cabinet type laboratory sink with drain board, back splash, hot and cold service water faucets, [air cock,] and electrical outlets.]

2.4 FEEDWATER EQUIPMENT

2.4.1 Boiler Feed Pumps

Conform to CID A-A-50562 for motor driven, horizontal split case or support head boiler feed pumps except as otherwise specified herein. Pumps may be of either the centrifugal or peripheral-turbine type with [cast iron] [or] [alloy steel] casing and shall be [bronze] [or] [alloy steel] fitted. For turbine type pumps, provide pressure relief valves and for centrifugal type pumps, provide by-pass orifice. Packed stuffing boxes or mechanical seals suitable for the design conditions indicated shall be provided. Pumps shall be designed for the net positive suction head, discharge head, and water temperature indicated. [Capacity under the above condition shall be not less than indicated.] [Capacity of each pump under the above conditions shall be not less than the following percentage of maximum total boiler capacity: Centrifugal pumps 125 percent; Turbine pumps 150 percent.] Pump motors shall be [totally enclosed] [dripproof] [dripproof with encapsulated windings].

2.4.2 Boiler Feed Tank

Feed tank and stand construction shall conform to FS F-P-2908 for horizontal, cylindrical, stand-mounted receivers and shall be [hot dip galvanized or cement lined] [epoxy coated] [coated]. Provide tanks with vents, gage glass, drain and overflow connections, pressure gage, thermometer, [float operated makeup water feeder] [float switch and makeup water solenoid valve] [and preheater assembly consisting of corrosion resistant steam diffuser tube, steam corrosion resistant steam diffuser tube, steam pressure reducing valve, strainer, and thermostatic steam valve]. Boiler feed tank assembly shall include boiler feed pumps as herein specified, interconnecting piping including strainer and pump
control box. Tank capacity and connection sizes shall be as indicated.

2.4.3 Deaerator

Provide pressurized packaged type conforming to FS W-H-2904, be constructed and stamped in accordance with ASME BPVC SEC VIII D1, and requirements specified herein. Deaerating assembly and deaerated water storage may be in the same or separate shells. When external vent condensers are provided, they may be located as recommended by the manufacturer. Provide a pressure relief valve sized [as indicated] [in accordance with Table II of FS W-H-2904]. Inlet piping and accessories shall be as indicated. Provide feedwater pumps, as specified herein, interconnecting piping, and control box as part of the deaerator package. Deaerator capacity shall be not less than [indicated] [1.25 times that required to supply the boiler(s) at maximum firing rate]. The temperature of the water delivered at maximum capacity shall be equivalent to saturated steam temperature at the operating pressure of the deaerator, which shall be as indicated and the oxygen content shall not exceed [0.005] [0.003] cubic centimeters per liter as determined by the Referee Method A (Colorimetric Indigo Carmine) of ASTM D888. Water storage capacity shall be sufficient to operate the boilers at maximum capacity for [10] [_____] minutes.

2.4.4 Surge Tank and Transfer System

The condensate storage and surge tank shall be a cylindrical welded steel tank mounted and supported as indicated. The tank shall be designed and constructed in accordance with the ASME BPVC SEC VIII D1 for the indicated working pressure. Storage capacity shall be [as indicated] [sufficient to provide adequate water to the deaerator for [10] [_____] minutes of [boiler] [plant] operation at maximum capacity]. Inlet connections for condensate and make-up water shall be as indicated. The tank shall be equipped with liquid level controllers and valves and alarms as indicated. The tank shall be equipped with pressure and temperature gages, water level gage, vent, drain, and overflow. Tank shall be [hot dip galvanized or cement lined] [epoxy coated] [______]. Surge tank assembly shall include condensate transfer pumps and interconnecting piping including strainer and control box as indicated. Transfer pumps, except for head and temperature requirements which shall be as indicated, shall conform to requirements for boiler feed pumps specified herein.

2.4.5 Feedwater Treatment Equipment

2.4.5.1 Feedwater Characteristics

**************************************************************************
NOTE: Insert source of water supply.
**************************************************************************

Equipment for the chemical treatment of the boiler makeup feedwater shall be designed to reduce the boiler water concentrations to the limits specified herein when handling raw water having the following impurities reported as milligrams per liter (mg/liters) (formerly parts per million):

a. Total hardness as CaCO3_______________________

b. Calcium hardness as CaCO3_____________________

c. Magnesium hardness as CaCO3_________________
d. Alkalinity as CaCO3

e. Sodium as Na

f. Chlorides as Cl

g. Sulfates as SO4

h. Sulfites as SO4

i. Phosphate as PO4

j. Silica as SiO4

k. Nitrates as NO3

l. Iron as Fe

m. Free carbon dioxide as CO2

n. Total dissolved solids

o. Suspended solids

Raw water shall be delivered to the plant [from the water distribution system of the] [from [_____] at a normal pressure of [_____] kPa (gage) psig measured at the meter to the plant. See NAVFAC MO 225 for additional guidance on boiler water concentration limits.

2.4.5.2 Water Softener

Equipment shall be of the type, size, and arrangement indicated. When operating [under the indicated design conditions] [with an inlet water flow of [_____] liters per second gpm] effluent analysis shall be as follows:

a. Total hardness as CaCO3 less than [_____] Mg/liter

[ b. pH [_____] to [_____]]

c. Total dissolved solids less than [_____] Mg/liter

d. [_____] 

(1) Zeolite Water Softener: Conform to WQA S-100 and shall have [automatic] [manual] controls. The softener(s) shall be equipped for [a sodium cycle] [a hydrogen cycle] [the type of cycle necessary to provide the treated water analysis specified above]. [Each softener tank shall be provided an operating valve to permit the regeneration of one tank while the other is in service.]

(2) Lime Soda Softener: Conform to CID A-A-50573 for the type indicated.

(3) Ion Exchange Softener: Refer to NAVFAC MO 225 for additional information.

2.4.6 Pressure Filter

Provide [a] pressure filters of the type and arrangement indicated and with
[manual] [automatic] controls. The filter shall conform to CID A-A-59249. Performance shall be as specified in CID A-A-59249 with raw water analysis as specified herein, and operating conditions as indicated. Filter shall be equipped to operate properly for not less than 2 days without operator attention to renew or regenerate filter coatings, chemicals, or other filter media.

2.4.7 Chemical Feeder

Size and connect as indicated. Chemical feeder shall be suitable for the flow, pressure, and temperature conditions at the point of connections. Provide chemical feed storage as indicated. [The feeder shall be of the [automatic proportioning type] [shot-type] conforming to FS F-F-2901.] [The feeder shall be of metering pump type conforming to the requirements of CID A-A-50573 for chemical feeders.]

2.4.8 Feedwater Test Equipment

Provide for the determination of boiler water condition which includes an assembly of indicator solutions, standardized solutions, and test glassware with cabinet. The solution types shall permit tests for water hardness, total alkalinity, hydroxide, carbonite alkalinity, and chloride content in milligrams per liter. Feedwater test equipment shall employ a standardized soap solution for hardness test and a dilute sulfuric acid solution with a methyl orange indicator for total alkalinity. The hydroxide and carbonate alkalinity shall be determined with a phenolphthalein indicator and the chloride content, with a silver nitrate solution. Furnish standardized phenolphthalein color slides for accuracy in alkalinity tests.

2.5 ELECTRIC MOTORS

**************************************************************************
NOTE: Select standard efficiency for motors used less than 750 hours per year and high efficiency for motors used over 750 hours per year. Packaged boilers should utilize the manufacturer's standard efficiency motor.
**************************************************************************

Motors which are not an integral part of a packaged boiler shall be rated for [standard] [high] efficiency service per Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Motors which are an integral part of the packaged boiler system shall be the highest efficiency available by the manufacturer of the packaged boiler.

PART 3 EXECUTION

3.1 INSTALLATION

Arrange work in a neat and orderly manner so that minimum storage of equipment and material is required at the project site. Install equipment and material in accordance with the best commercial practices. A competent installation engineer or technician as stated in paragraph QUALIFICATIONS OF ENGINEER shall assemble an unassembled boiler-burner package in strict accordance with the manufacturer's instructions. Systems shall be neat in appearance, compact, adequate in construction and assembly, and installed for long and continuous service. Parts shall be readily accessible for inspection, repair, and renewal. Inspect equipment and material upon delivery and test after installation. Protect material and equipment from
the weather. Repair damage caused by the Contractor in execution of the work and leave in a condition equal to that existing before work was started.

3.1.1 Equipment Foundations

Locate as shown and construct of sufficient size and weight and of proper design to preclude shifting of equipment under operating conditions or under abnormal conditions that could be imposed upon the equipment. Foundations shall meet requirements of equipment manufacturer. Grout equipment mounted on concrete foundations before installing piping. Concrete shall conform to Army Corps of Engineers Guide Specification Section 03 30 00 CAST-IN-PLACE CONCRETE, and grout shall be non-shrinkable type approved by the Contracting Officer. Install piping in such a manner so as not to place a strain on equipment.

3.1.2 Welding

**************************************************************************
NOTE: Use of the ASME code or the Federal Construction Guide Specification section on welding depends upon the agency's requirements.
**************************************************************************
**************************************************************************
NOTE: Insert appropriate Section number in blank below.
**************************************************************************
Work shall be in accordance with [the applicable sections of the ASME BPVC SEC I] [_____ WELDING] and AWS Z49.1.

3.1.3 Painting

Equipment shall be factory finished to withstand the intended end use environment in accordance with the specifications for the particular end item. Field paint equipment not factory finished as specified herein. Retouch damaged areas of factory-finished equipment on which the finish has been damaged and then give a complete finish coat to restore the finish to its original condition. The finish coat shall be suitable for exposure in the intended end use environment. Spray painting shall comply with OSHA 29 CFR 1910.

3.1.3.1 Cleaning and Application

Remove dirt, rust, oil, and grease by wire brushing and solvent degreasing prior to application of paint. Apply paint to clean and dry surfaces only. Where more than one coat of paint is specified, apply the second coat after the first coat is thoroughly dry. Retouch damaged painting before applying the succeeding coat. Finished surfaces shall be smooth. The painting of zinc coated and other corrosion-resistant metal surfaces is not required unless otherwise specified herein.

3.1.3.2 Smoke Flues, Boiler Casing, and Draft Ducts

In unfinished areas, paint smoke flues, boiler casing, and black steel draft ducts with heat-resisting aluminum paint, two coats on the inside of flues and ducts and one coat on the outside, each coat to a minimum dry film thickness of 0.025 mm one mil applied directly to clean bare metal.
surfaces. Paint exposed surfaces of protective metal covering over insulation, including zinc-coated surfaces, with two coats of heat-resisting black paint to a minimum dry film thickness of 0.05 mm two mils applied directly to the clean bare metal surfaces. Do not paint zinc-coated ducts.

3.1.3.3 Gratings, Pipe Railings, and Pit Covers

Apply a pre-treatment coating to gratings, pipe railings, pit covers, and similar plant appurtenances to a dry film thickness of 0.008 to 0.013 mm 0.3 to 0.5 mil. After installation, touch up damaged surfaces with then paint with two coats of finish paint matching type and color of adjacent areas. Do not paint zinc-coated surfaces.

3.1.4 Boiler Cleaning

After installation, [the] [each] boiler shall be boiled out, under supervision of the manufacturer, with soda ash or equivalent solution to clean internal surfaces of oil, grease, mill scale, and dirt. Following treatment, the boiler(s) shall be flushed, drained and then opened and washed down and inspected to ensure that no traces of oil or foreign matter are present. The boiler and associated piping shall then be drained and refilled with treated softened water. At all times after initial cleaning, the Contractor shall protect the boiler, tanks, and piping against internal corrosion until testing is completed and the boiler(s) [is] [are] accepted. Provide chemicals, labor for introducing chemicals, and professional services for control and supervision of the treatment process.

3.1.5 Piping

Material and installation requirements including welding shall be as specified in Section 23 11 20 FACILITY GAS PIPING, Section 33 51 15 NATURAL-GAS / LIQUID PETROLEUM DISTRIBUTION PIPELINES, Section 33 52 10 FUEL SYSTEMS PIPING (SERVICE STATION), and Section 23 22 26.00 20 STEAM SYSTEM AND TERMINAL UNITS.

3.2 FIELD QUALITY CONTROL

Perform inspections and tests as specified herein to demonstrate that the boiler(s) and auxiliary equipment, as installed, are in compliance with contract requirements. During boiler system start-up tests, factory-trained engineers or technicians employed by individual suppliers of such components as the burner, flame safeguard and combustion controls, feedwater treatment equipment, and other auxiliary equipment shall be present, as required, to ensure the proper functioning, adjustment, and testing of individual components and systems. No bypassing, use of jumpers, or other disablement of control systems will be allowed unless specified elsewhere. Labor, equipment, fuel, and test apparatus required for testing shall be furnished by the Contractor. Rectify defects disclosed by the tests by the Contractor within time period specified by the Contracting Officer.

3.2.1 Inspections and Test

**************************************************************************
NOTE: These field tests shall not be mandatory for all size boilers but shall be employed where advisable due to largeness, type, or complexity of boiler plant. The designer shall determine, on a
case by case basis, which tests are appropriate.

**************************************************************************

Make inspections and tests at the site under the direction of and subject to the approval of the Contracting Officer. The Contractor shall operate [the] [each] boiler and appurtenances prior to final testing and shall ensure that necessary adjustments have been made. A [24-] [48-] [_____] hour written notice shall be submitted to the Contracting Officer indicating the equipment is ready for inspection or testing. Provide testing equipment, including gages, thermometers, calorimeter, Orsat apparatus, thermocouple pyrometers, fuel flow meters, water meters, and other test apparatus and set up and calibrate prior to the test. Draft, fuel pressure, and steam flow may be measured by permanent gages and meters installed under the contract. [Gas flow may be measured by utility company meters.] Provide an analysis of the fuel being used for tests. Control of noise levels developed by exhaust steam including muffler, globe, and gate valves shall be conducted in such a manner as not to create a nuisance or hazard and shall be subject to the approval of the Contracting Officer. Tests shall include the following, and shall be performed when feasible, in the sequence listed:

a. Strength and tightness tests
b. Standards compliance tests
c. Combustion tests
d. Operational tests
e. Capacity and efficiency tests
f. Tests of auxiliary equipment
g. Feedwater equipment test

3.2.2 Strength and Tightness Tests

**************************************************************************

NOTE: These field tests shall not be mandatory for all size boilers but shall be employed where advisable due to largeness, type, or complexity of boiler plant. The designer shall determine, on a case by case basis, which tests are appropriate.

**************************************************************************

Subject boiler to the following strength and tightness tests:

3.2.2.1 Hydrostatic Test

After installation and connection, subject [the] [each] boiler to an inspection and hydrostatic test to determine that the boiler and appurtenances have not been damaged in transit or handling. The hydrostatic test shall be in accordance with the ASME Code with the test pressure applied for a period required by the Contracting Officer. This test shall be in addition to the hydrostatic tests performed at the factory. [The hydrostatic test at the site shall be certified by an inspector holding an authorized commission from the National Board of Boiler and Pressure Vessel Inspectors.]
3.2.2.2 Pneumatic Tests

Pneumatically test air casing and ducts exterior to the furnace at the maximum working pressure. Use the soap bubble method to verify tightness. Test gas sides of boilers normally operated under pressure for tightness at 2.5 kPa (gage) 10 inches water gage. For this test, tightly seal the boiler with a suitable means to blank off openings. Admit air to the boiler until test pressure is reached and then hold. If in a 10-minute period the pressure drop does not exceed 250 kPa one inch water gage, the casing shall be regarded as tight and accepted. Use air pressure and soap bubble tests or comparative carbon dioxide readings for induced draft boilers.

3.2.2.3 Internal Component Pressure Tests

[Hydrostatically test at 1-1/2 times the maximum operating pressure] the part of the pre-assembled fuel oil system that is furnished integrally with the boiler. [The part of the pre-assembled gas system that is furnished integrally with the boiler shall be pneumatically tested at operating pressure. Use the soap bubble test method to verify tightness of the gas system.]

3.2.3 Combustion Tests

**************************************************************************
NOTE: These field tests shall not be mandatory for all size boilers but shall be employed where advisable due to largeness, type, or complexity of boiler plant. The designer shall determine, on a case by case basis, which tests are appropriate.
**************************************************************************

Test the fuel burning and combustion control equipment with [the] [each of the] specified fuel at the minimum limit of the turndown range and at increments of 50, 75, and 100 percent of full rated load [plus [_____] percent overload]. Tests shall be conducted by factory-trained combustion equipment engineers as previously specified. [The combustion control system shall demonstrate that equipment installed will meet the requirements of the specification, and that an overall efficiency as specified, with not over 15 percent excess air, can be obtained with boiler operating at 100 percent capacity.] Analyze test data and graphically present to show for [the] [each] boiler at tested loads: rates of steam flow; flue gas temperature; percent excess air; steam quality; and percentages of carbon dioxide, carbon monoxide, and oxygen in the flue gas. Monitor concentrations of sulfur oxides, particulate, and nitrogen oxides in the flue gas to ensure compliance with environmental requirements. Run tests on each fuel until stack temperatures are constant and conformance with the combustion requirements of this specification has been verified and recorded. Verify proper operation of instrumentation and gauges in the control panel during the test.

3.2.4 Operational Test

**************************************************************************
NOTE: These field tests shall not be mandatory for all size boilers but shall be employed where advisable due to largeness, type, or complexity of boiler plant. The designer shall determine, on a case by case basis, which tests are appropriate.
**************************************************************************
Continuously test the boiler(s) under varying load conditions to demonstrate proper operability of the combustion control, flame safeguard control, programming control, and safety interlocks. Conduct this test after the adjustment of the combustion controls has been completed under the combustion test. The operational test shall continue for a period of at least [8] hours and shall include the following:

3.2.4.1 Sequencing
The boiler shall start, operate, and stop in strict accordance with the specified operating sequence.

3.2.4.2 Flame Safeguard
Verify the operation of the flame safeguard controls by simulated flame and ignition failures. Test burners having intermittent pilots by simulating main flame failure while the pilot is burning. Verify by stop watch the trial-for-pilot ignition, trial-for-main flame ignition, combustion control reaction, and valve closing times.

3.2.4.3 Immunity to Hot Refractory
Operate the burner at high fire until the combustion chamber refractory reaches maximum temperature. Then manually close the main fuel valve. The combustion safeguard shall drop out immediately causing the safety shutoff valves to close within the specified control reaction and valve closing times.

3.2.4.4 Pilot Intensity Required
Gradually reduce the fuel supply to the pilot flame to the point at which the combustion safeguard begins to drop out (sense "no flame") but holds in until the main fuel valve opens. At this point of reduced pilot fuel supply, the pilot flame shall be capable of safely igniting the main burner. If the main fuel valve can be opened on a pilot flame of insufficient intensity to safely light the main flame, readjustment of fire eye is required.

3.2.4.5 Immunity to Ignition Spark
Where ultra violet flame detectors are employed, the pilot and main burner manual safety shut off valves shall be closed. The burner shall then be operated through the trial for pilot ignition period. The flame safeguard relay shall not respond to the presence of electric spark. If the flame safeguard relay responds to the presence of electric spark, reject the boiler.

3.2.4.6 Boiler Limit and Fuel Safety Interlocks
Safety shutdowns shall be caused by simulating interlock actuating conditions for each boiler limit and fuel safety interlock. Safety shutdowns shall occur in the specified manner.

3.2.4.7 Combustion Controls
Demonstrate the accuracy, range, and smoothness of operation of the combustion controls by varying the steam demand through the entire firing
range required by the turndown ratio specified for the burner [and in case of automatic recycling burners, by further varying the firing rate to require "on-off" cycling]. Control accuracy shall be as specified.

3.2.4.8 Safety Valves

The high-pressure limit switch shall be locked out or otherwise made inoperative, and the boiler safety valves shall be lifted by steam. Determine the relieving capacity, popping pressure, blowdown, and reseating pressure by observation and measurement to be in accordance with the ASME Boiler and Pressure Vessel Code. The ASME standard symbol will be accepted only as indicating compliance with the design and material requirements of the code.

3.2.5 Capacity and Efficiency Tests

Perform the capacity and efficiency tests after satisfactory completion of all tests previously specified herein and after the boilers have been operating [continuously] for [one] [5] [_____] days with no nuisance shutdowns and without the necessity for frequent or difficult adjustments. Perform these tests on each boiler. Conduct tests using [the] [each of the] specified fuels. Test procedures shall be in accordance with the heat loss method of the ASME PTC 4 and shall be reported on the ASME Test Form for Abbreviated Efficiency Test. The duration of the tests shall be sufficient to record necessary data but in no case shall test duration be less than [4] [_____] hours [on each fuel].

3.2.6 Auxiliary Equipment and Accessory Tests

Observe and check blowdown valves, stop valves, try cocks, draft fans, fuel oil heaters, pumps, electric motors, and other accessories and appurtenant equipment during the operational and capacity tests for leakage, malfunctions, defects, noncompliance with referenced standards, or overloading, as applicable.

3.2.7 Feedwater Equipment Tests

Perform the test of the feedwater treatment equipment in two steps. Conduct one test by the Contractor concurrently with either the combustion test or the capacity and efficiency test. A second test will be performed by the Government during the first period of heavy loading after the plant has been accepted and put in service. Deficiencies revealed during the Government tests will be corrected under the guarantee provisions of the contract. Both the first and second series of tests shall determine compliance with the limits for oxygen content and hardness concentrations of this specification. Equipment for taking samples and the test kit for analyzing the samples shall be supplied by the Contractor and shall revert to the Government when the tests are completed.

3.2.8 Preliminary Operational Test

Operate each boiler and appurtenances prior to final testing and insure that necessary adjustments have been made. Provide testing equipment required to perform tests. During this testing period, provide operating instructions and training to persons tasked with operation of the boiler. Tests shall be accomplished with both fuels on dual fuel units.

**************************************************************************
NOTE: Insert the appropriate Engineering Field
**************************************************************************
Conduct a preliminary operational test prior to requesting an acceptance operational test and inspection by a [_____] Division, Naval Facilities Engineering Command Boiler Inspector. The Contracting Officer, upon receipt of the notice from the Contractor, shall request the boiler be inspected by [_____] Division, Naval Facilities Engineering Command. Ten days advance notice is required for scheduling the inspector to conduct acceptance operational test and inspection.

3.3 SCHEDULE

Some metric measurements in this section are based on mathematical conversion of inch-pound measurements, and not on metric measurements commonly agreed on by the manufacturers or other parties. The inch-pound and metric measurements shown are as follows:

<table>
<thead>
<tr>
<th>Products</th>
<th>Inch-Pound</th>

NOTE: This guide specification covers the requirements for packaged steam boilers and equipment with gross outputs over 5275 kW 18,000,000 Btu's per hour.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: These boilers are equipped for oil-, gas-, or oil-and-gas combination firing, as specified.

NOTE: The following information shall be shown on the project drawings:

1. Dimensions of construction
2. Relationship of materials
3. Quantities, location and capacity of equipment.

1.2 SYSTEM DESCRIPTION

Describe the performance or design requirements and tolerances of the complete system. Section 23 52 33.01 20 STEAM HEATING PLANT WATERTUBE SHOP ASSEMBLED COAL/OIL OR COAL.

1.2.1 Heating Surface and Volume Measurements

Submit heating surface and volume measurements, including heat release calculations sufficient to establish compliance of boilers with heat release requirements. Base calculations on the specified efficiency and capacity.

1.3 RELATED REQUIREMENTS

Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS with the following additions and modifications applies.

1.4 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for
Contractor Quality Control approval.) [for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
Steam Boiler System

SD-03 Product Data
Boiler Efficiency

SD-05 Design Data
Heating Surface and Volume Measurements
Heat Release Calculations

SD-06 Test Reports
Boiler System Start-Up Tests
Submit in accordance with paragraph FIELD QUALITY CONTROLS. Submit detailed written record of the start-up performance, including burner setting data over the entire load range, to the cognizant authority before the Contractor's and sub-contractor's test personnel leave the site.

SD-07 Certificates
Report of Prior Installations
Engineer's Qualification Resume
Start-Up Plan
Start-Up Certification
Boilers
Submit evidence that boilers meet requirements of standards specified below. Include with the certificate of compliance acceptable evidence that standards are met. Acceptable evidence of meeting these standards will be the official UL listing for oil-fired, gas-fired or gas-oil fired boiler assemblies, as applicable, plus the appropriate official ASME symbol stamp.

SD-10 Operation and Maintenance Data
Boilers, Data Package 4
Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA. Submit evidence for boiler, boiler controls, instrumentation and feedwater equipment manufacturers that a permanent service organization is either maintained by each manufacturer or is trained and franchised by the equipment manufacturer, which will be able to render satisfactory service to the equipment on a regular and emergency basis. Provide the name
1.5 QUALITY ASSURANCE

The Contractor shall provide the service of a qualified engineer or technician for start-up, testing, and installation of equipment as specified below. Provide the services of technician or engineer until the installation of equipment is coordinated and completed with checkout. The Contracting Officer reserves the right to reject the engineer or technician proposed if the engineer or technician's qualifications are not suitable or are questionable. More than one engineer or technician may be provided based on the types of specific equipment. One engineer or technician as appointed by the Contractor shall supervise and be responsible for the overall installation, start-up, and testing and checkout of systems.

1.5.1 Report of Prior Installations

Boilers, burners, combustion controls, and feedwater equipment shall be of proven design. Submit evidence to show that substantially identical equipment of comparable capacity within 20 percent has been successfully installed and operated in not less than three installations under comparable operating conditions for a period of not less than 2 years.

1.5.2 Engineer's Qualification Resume

Submit a printed certified qualification resume of the engineer or technician to the Contracting Officer. The engineer or technician's resume shall list applicable experience related to installation, start-up and testing of equipment and applicable factory training and education. Qualifications require the engineer to have supervised two installations of similar size and type which are operating satisfactorily. More than one engineer or technician may be provided based on the types of specific equipment. In event more than one engineer or technician is provided, provide a certified resume for each one and indicate his specific specialty and item of work on the resume.

1.5.3 Start-Up, Testing, and Installation Engineer

The Contractor shall provide the services of a qualified engineer or technician for start-up, testing, and installation of equipment as specified under paragraph QUALIFICATIONS OF ENGINEER. The engineer or technician shall be an employee of the equipment manufacturer.

1.5.4 Installation

Provide an installation engineer or technician to install and supervise the installation of steam boiler system including instrumentation and boiler controls. Provide the technician or engineer until equipment installation is coordinated and completed with checkout.

1.5.5 Start-Up Plan

Submit a written schedule with dates of start-up, test, installation and checkout of equipment to the Contracting Officer.

1.5.6 Start-Up and Test

The specific equipment tested shall be the boiler, boiler controls, boiler instrumentation and feedwater equipment. The start-up and testing engineer
or technician shall remain on the job until the unit has been successfully operated for [_____] days and the unit has been accepted by the Contracting Officer.

1.5.7 Start-Up Certification

After installation of equipment, submit a certificate or certified written statement, signed by the engineer or technician, that the equipment is installed in accordance with the manufacturer's recommendations.

PART 2 PRODUCTS

2.1 BOILERS

**************************************************************************
NOTE: Steam-atomizing burners should be specified only if the boiler operating pressure exceeds 690 kPa (gage) 100 psig.
**************************************************************************

**************************************************************************
NOTE: Oil burners can have turndown ratio of 4,5, or 6 to 1.
**************************************************************************

**************************************************************************
NOTE: Repetitive self checking circuits are required only on boilers with modulating controls which operate for long periods of time without burner shutdown.
**************************************************************************

**************************************************************************
NOTE: Steam operated feedwater injectors should be specified only for boilers operating at or above 345 kPa (gage) 50 psig.
**************************************************************************

**************************************************************************
NOTE: Combustion units should have metering combustion controls. Investigate energy savings. Combustion units larger than 7034 kW 24,000,000 Btu/hr input should have oxygen trim in order to optimize fuel usage. CO trim should be considered for larger boiler installations as an adjunct to oxygen trim for increased efficiency.
**************************************************************************

Provide boilers that conform to FS F-B-2902 and have a gross output capacity of at least [_____] kW Btu per hour when operating at a steam pressure of [_____] kPa (gage) pounds per square inch gage (psig) at the site under design conditions when the burner is firing No. [_____] oil conforming to [ASTM D396] having a higher heating value of [_____] MJ/kg Btu per gallon [or] [natural] [manufactured] [mixed] [liquefied petroleum] gas having a higher heating value of [_____] MJ/kg Btu per cubic foot and a pressure of [_____] kPa (gage) psig at the fuel train connection. Provide [air-atomizing] [or] [steam atomizing] burners. Rotary type burners are unacceptable. Provide burners capable of operating at a turn down ratio of [______]. Provide automatic [recycling] [nonrecycling] programming controls.
and incorporate means for automatic self-checking of the circuit beginning of each start-up cycle. [Include a repetitive self-checking circuit to check all components at not more than the specified time interval in PS F-B-2910 during the entire period of burner operation, and sensor shall be of the ultraviolet type.] [Connections shall be provided for remote starting or stopping of the boilers.] [Provide steam operated feedwater injectors.] Provide combustion control system of the [modulating positioning type where the final control elements for fuel and air inputs, between minimum and maximum limits, are positioned in proportion to load] [semi-metering type where the final control element for one input, either fuel or air, is positioned in proportion to load; flow of the other input is measured and controlled in proportion to load as indicated by the position of the control element for the first input] [full metering (fuel flow/air flow basis) type where the final control element for one input, either fuel or air, is positioned in proportion to load, or the flow for that input is controlled in proportion to load, and the other input is measured and controlled in proportion to the measured flow of the first input] [Provide with oxygen compensation where one of the control elements is biased, modified slightly, on the basis of continuous flue gas analyses, to maintain the proper percentage of oxygen for various firing rates.] 

Boilers shall be designed in accordance with the applicable provisions of ASME BPVC SEC I and current addenda therein. Boilers shall be equipped with combustion control safety devices conforming to NFPA 85. The following design requirements and conditions shall apply:

a. Maximum allowable steam working pressure of [_____] kPa (gage) psig, as designated by the symbol "P" in the ASME Code and determined by employing the allowable stress values, design rules, and dimensions therein.

b. Operating pressure of [_____] kPa (gage) psig at the steam drum outlet.

c. Feedwater temperature of [_____] degrees C degrees F at entrance to the boiler plant.

d. Elevation of [_____] meter feet above sea level at the site.

e. Ambient air temperatures outside the plant of [_____] degrees C degrees F minimum to [_____] degrees C degrees F maximum; average inside temperature of [_____] degrees C degrees F and relative humidity of [_____] percent.

f. Steam quality of [99.5] [99.0] [_____] percent.

[ g. Make-up feedwater analysis of [_____] parts per million (ppm) total solids and [_____] ppm total alkalinity.

] [h. Steam temperature of [_____] degrees C degrees F at the steam drum outlet.

2.1.1 Boiler Connections

Requirements for interconnecting piping, insulation, fuel supply, vibration isolation [_____] and other related work necessary to provide a complete and operable steam system, whether or not specifically mentioned above, shall conform to applicable requirements of other sections of Division 15, and electrical work shall conform to applicable requirements in Division 16.
2.1.2 **Boiler Efficiency**

[Gas fired boilers shall have a steady state combustion efficiency of at least 80 percent.] [Oil fired boilers shall have a steady state combustion efficiency of at least 81 percent.] Boiler efficiency, when tested as specified herein, shall be not less than [79-83] [percent when firing No. [_____] fuel oil] [and] [78-82] [percent when firing [_____] gas]. Obtain efficiency at all loads in a range from the lower limit of the turndown ratio to 100 percent.

2.1.3 **Furnace Heat Input**

When boiler is operating at maximum rated output, heat input to furnace shall not exceed limits specified in FS F-B-2902 both for input per cubic meter foot of furnace volume and input per square meter foot of effective radiant heating surface.

2.1.4 **Steam Quality**

The steam releasing surface, drum internals, and steam passages out of the drum shall be such that, with load swings from [50] [75] to 100 percent of the rated capacity per [1] [3] minute period at a boiler feedwater solids concentration of [3500 ppm] [_____] ppm, the carryover shall not exceed [_____] ppm at the boiler nozzle, and moisture in the steam shall not exceed [0.5] [1.0] percent.

2.1.5 **Noise Levels**

**************************************************************************
NOTE: The value for decibels for boiler shall be that required for operating personnel and OSHA requirements taking into consideration room design and other requirements.
**************************************************************************

Conduct noise measurements and exposure analysis under the overall supervision of an industrial hygienist or suitably qualified medical officer from the Navy Regional Medical Center (NRMC). Safety personnel, engineers and others who have been certified by the Chief, Bureau of Medicine and Surgery (BUMED) also may supervise the work. Maintain exposure limits for potentially hazardous noise levels of 85 dB, continuous or intermittent and 140 dB peak sound pressure, impulse or impact. Sound level meter shall conform as a minimum to the Type 2 requirements cited in ASA S1.4.

2.1.6 **Air Pollution Control**

**************************************************************************
Note: Research local, state, and federal emission standards and place any unusual or new requirements in this specification section.
**************************************************************************

Provide fuel burning equipment, combustion control system(s) [and] stack(s) [and emission control equipment] designed, installed, and when applicable, adjusted so that emissions at any loading within the range of the boiler output specified do not exceed federal, state, and local environmental rules and regulations. Emission requirements to be considered include sulfur oxides, carbon monoxide, particulate, or nitrogen oxides. In
addition, the density of any emission to the atmosphere, except during start-up, cleaning of fires, or soot blowing, shall not exceed [No. 1] [No. 2] on the Ringlemann Scale or the Smoke Inspection Guide. The plant shall otherwise conform to applicable Federal, State and Local regulatory requirements. Air quality board "Permit to construct" [will be provided by the contracting officer][will be obtained by the contractor].

2.2 BOILER CONSTRUCTION

2.2.1 General

Provide boilers constructed for specified design conditions and performance requirements in accordance with applicable provisions of ASME BPVC SEC I, and current addenda thereto, and FS F-B-2902. Mount [the] [each] boiler on an internal structural steel base frame of welded construction designed to serve as skids in shipment and to permanently support the unit off the prepared foundation at the site. Assemble and install tubes, drums, and headers in a manner to permit the boiler(s) to be drained dry by gravity. [Show location of the flue gas outlet on drawings.]

2.2.2 Drums

Drums shall conform to FS F-B-2902 and requirements herein. Provide sufficient drum-internals to preclude thermal shock, ensure steam quality as specified herein, Ensure drum capacity addresses expected load swings to insure maintenance of drum level within set points during high load swings, and to properly condition the water in accordance with chemical feed and blowdown systems specified [indicated] [and] [specified]. Nuts, bolts, and other hardware used in assembling steam separators shall be stainless steel. Where drum internals interfere with inspection of part of the boiler drum, make provisions for the easy removal and replacement of whatever internals must be removed in order to effect a complete internal drum inspection and to provide access to tubes. Construct lower drums to preclude build-up of suspended solids, and to permit the complete drainage.

2.2.3 Tubes

Boiler and furnace tubes shall meet the applicable requirements of FS F-B-2902. Tangent tubes or tubes with welded flat studs or a combination thereof shall be provided for water cooling of the furnace rear wall, side walls, roof, and floor. Maximum tube spacing for tubes with welded flat studs should be given so that the problem of studs driving through tube sidewalls due to expansion and contraction does not occur. Burner wall shall be refractory-covered with optional tubes for water cooling. Tubes shall enter the steam drum below the normal water line.

2.3 BOILER TRIM

Boiler trim, including steam stop valves, feedwater stop and check valves, blowoff valves, water level indicators, water columns, pressure gages, safety valves and associated piping, and fittings located within the jurisdictional limits of the ASME Code shall conform to and be installed in accordance with the Code and shall meet supplemental requirements specified herein. Material selection and pressure ratings for valves and piping shall be in accordance with applicable ANSI standards cited in the ASME Code and shall be based on the maximum allowable boiler working pressure specified herein except as otherwise permitted by the ASME Code.
2.4 BOILER INSTRUMENTATION

In addition to the instruments required by the boiler specification referenced above, provide the following instruments:

a. Temperature gages to indicate temperature of [preheated oil] [air preheater inlet and outlet air] [steam temperature].

b. Meters for indicating air flow, drum level and indicating, recording, and totalizing steam and fuel flow. Installation and calibration of these meters shall confirm to ASME PTC 19.5.

c. Instruments to indicate and record flue gas temperature.

d. A draft gage, diaphragm or bellows type, conforming to ASME B40.100. Circular scale with graduations in Pa inches of water. Numerals shall be suitable for reading by persons with normal vision from a distance of 6 meters 20 feet. Select range for intended service and contain completely within the calibrated range. Encompassing no more than 80 percent of the total range. Gages shall be designed and constructed to ensure accuracy within plus or minus 2 percent of the full scale reading in ambient temperatures varying from 2 degrees C to 57 degrees C 35 degrees F to 135 degrees F. Operating mechanisms shall withstand, without affecting gage accuracy or damage to the instrument, surges equal to 100 percent above or below the entire scale range. Gages shall be calibrated prior to installation and shall require no further calibration or adjustment other than setting the pointer to zero. Provide gages with a single pressure connection to the diaphragm, or bellows. Provide pressure connections with a 3-way stopcock which will permit checking of the zero setting and calibration at any time without breaking service connections.

******************************************************************************
NOTE: Select the applicable paragraph(s) from the following
******************************************************************************

[ e. A carbon dioxide recorder which shall measure, record, and indicate the percentage by volume of carbon dioxide (CO2) detected in the flue gas. The recording unit shall be flush mounted and furnished with locking device and master key.

] [e. Provide complete oxygen analyzer system to measure oxygen content of flue gases generated by combustion of [gas] [or] [oil] as specified in paragraph BOILER PLANT CONTROLS AND INSTRUMENTS herein for each boiler. The output of the analyzer shall range from zero to 25 percent oxygen. The analyzer shall include the following:

(1) Provide complete aspirating system with proper connection to stack, necessary steam or water aspirating facilities, and piping of proper specification to analyzer. Provide piping in accordance with the oxygen analyzer manufacturer's recommendations and install tight. Install equipment install in accordance with manufacturer's instructions.

(2) Provide a paramagnetic analyzer. Analyzer shall provide oxygen analysis in the zero to 25 percent oxygen range, and have means of calibration. Provide zero range and span adjustments as required.
(3) Analyzer output and recorder input shall be compatible. Provide necessary transducers, connect, and place in proper operation. Follow special instructions relating to electrical transmission between analyzer and recorder as to the application of shielded wiring in conduit.

(4) Check system with two calibrating gases as follows: (a) 100 percent nitrogen, and (b) 3.5 percent oxygen and remainder nitrogen.

][e. Direct Probe In Situ Type: Oxygen analyzer shall be the direct probe type utilizing an in-situ zirconium sensing element. Determine flow characteristic and insert element in location where flue gas is in transition and is representative. Sensing element shall be contained within a protective shield mounted to the ductwork by means of an adapter plate, all furnished by the manufacturer. Analyzer shall be equipped with a facility to allow daily automatic calibration check without removing the analyzer from the process. That is, sample gases may be injected directly on the sensing element while the analyzer is in the process. In order to eliminate temperature effect of flue gases, maintain the cell temperature in the probe at 843 degrees C (1,550 degrees F) by means of an externally mounted temperature controller equipped with cold junction compensation and coupled to the probe with at least 6 meters (20 feet) of flexible cable. Analyzer shall be FM APP GUIDE approved and certified for "in-stack" analysis technique. Output signal range shall be 4 to 20 milliamps and shall represent 0.25 percent to 25 percent oxygen as a logarithmic function, 0.1 percent to 10 percent oxygen as a logarithmic function, or zero percent to 10 percent as a linear function. [Circular chart recorder shall consist of a two-pen recording control mechanism having 110 volt a.c. electric motor drive. Chart shall be 300 mm (12 inch) diameter and rotate once every 24 hours. Output control signal will be 20 to 103 kPa (gage) 3 to 15 psig pneumatic. Sufficient blank charts and four ink cartridges per pen for 400 days operation shall be provided. Recorder shall have a dual 30 degrees strip indicator. Strip indicator and chart paper scale shall be logarithmic or linear and consistent with the analyzer signal conditioning.] [Strip chart recorder shall consist of a two pen solid state electronic recording/controlling mechanism. Strip chart shall be 100 mm (4 inches) wide and shall be driven at a speed of 19 mm per hour (3/4 inch per hour). Recording/controlling will operate on 110 volt ac power. Recorder shall be furnished with twelve usable 24 hour logarithmic or linear charts consistent with the analyzer signal conditioning. Inking system shall be a breakaway inking system with replaceable fiber tip pens and 12 ink cartridges. Strip chart recorder/controller shall have vertical scale and horizontal driven chart. Output control signal will be 4 to 20 milliamps dc.] Flue gas temperature scale shall be 149 to 427 degrees C (300 to 800 degrees F). Entire system response shall be not more than 3 seconds.

] f. A smoke density [indicator] [recorder] of the [density limit] [continuous density] type with a scale calibrated in Ringlemann units. Indicating and recording systems shall include circuits for the audible warning of the maximum smoke density-limit. A vibrating electric horn shall be supplied to sound the audible signal. Otherwise the smoke density [indicator] [recorder] shall conform to CID A-A-50566.

[ g. The annunciator shall be of the solid state type and shall annunciate safety interlock and limit switch shut-downs, including flame failure,
high and low water, high steam pressure, [high gas pressure,] [low gas pressure,] [high oil pressure,] [low oil pressure,] [low atomizing steam pressure,] [draft fan failure,] [high and low temperature,] [and] [______]. Annunciator shall include at least [two] [______] spare points and audible alarms for at least high and low water conditions. Annunciator shall not require special or additional devices which could affect the sensitivity of the boiler limit switches. Annunciator shall provide means to indicate the first limit or off-limit condition causing burner shutdown and to sound an alarm. Annunciator shall have a test button and a feature capability to store information on additional causes of burner shutdown. Subsequent causes of burner shutdown will be indicated after the operator acknowledges the first burner shutdown. A dust tight enclosure shall be provided.

2.4.1 Instrumentation

[Instrumentation, such as the steam flow recorder, steam flow totalizer, air flow recorder, [carbon dioxide] [oxygen] recorder, and flue gas temperature recorder may be combined into one or more meters having multiple pens plus integrating capabilities as required for specified totalization functions.] [Instrumentation for recording and integrating steam flow, for recording percent of CO2 or O2 in the flue gas, and for recording flue gas temperature shall be combined in a single boiler operation meter having three pens using different colored ink.]

2.4.2 Control Panel

The boiler control panel shall include the following switches, controls, and accessories:

a. Boiler on-off pushbutton station with indicating lights.

b. Draft fan manual, start-stop, pushbutton station with indicating lights for on, off, and tripped.

c. Controllers for the combustion control system.

d. Manual-automatic stations for individual controllers of the combustion control system.

e. [Indicating lights and alarm with silencer switch to signal nonrecycling safety shutdowns as specified herein [and excess smoke density conditions].] [Annunciator.]

f. Manual switch to transfer combustion burner and controls from oil to gas and vice versa.

g. Switch and indicating lights to control emergency gas shut-off valve.

h. [Electric clock, 300 mm 12 inch dial, with second sweep hand and seal-in driving unit] [Digital clock that indicates hour, minutes, and seconds, with numerals suitable for reading by persons with normal vision from a distance of 6 meters 20 feet].

2.4.3 Control Systems

The flame safeguard and programming control systems shall be mounted in the central control panel or an auxiliary control panel located adjacent to the main panel adjacent to the boiler. Auxiliary panels, if provided, shall be
fabricated as specified herein for the main control panel.

2.5 BOILER PLANT CONTROLS AND INSTRUMENTS

Provide the following plant [controls and] instruments:

a. Instruments to indicate and record feedwater temperature and steam pressure in the deaerator.

b. Pressure gages to indicate steam pressure in main header, conforming to ASME B40.100 [gas pressure in main supply line] [oil pressure] [atomizing steam pressure].

c. A flue gas analyzer, Orsat type, conforming to CID A-A-50504. The analyzer shall determine the CO2, CO, O2 in the flue gas and shall be complete with chemicals and accessories for use in such determinations.

d. A steam flow recorder which shall remotely indicate, record, and totalize the steam flow per hour through the steam header. Provide panel-mounted indicating recorder with a tamper-proof case.

******************************************************************************
NOTE: Insert section numbers for oil and/or gas piping systems in the blanks below.
******************************************************************************

e. Volumetric fuel flow meters in accordance with [____], [and] [____].

******************************************************************************
NOTE: Master combustion controller should be used only for automatic recycling boilers.
******************************************************************************

f. A common boiler master combustion controller located on the free standing instrument and control panel to control all boilers with each individual boiler controller acting as a submaster controller. The boiler master control system shall provide for base loading one [or more] boilers. Base loaded boilers shall be selected manually by an externally accessible switch. On call for heat, lead boiler shall cut in and moderate firing rate to satisfy demands. When maximum desired firing rate is reached, lag boiler or boilers shall cut in. Only one boiler shall be on modulating firing at one time. Maximum desired firing rate for base loaded boiler shall be adjusted initially for boiler peak efficiency and shall be capable of easy manual adjustment by operating engineer. Adequate indicators shall be provided to show the method of loading of each boiler, and load being carried by it. Make adjustments at the front panel and no linkage adjustment shall be necessary.

g. The combustion control system shall be capable of maintaining the plant steam pressure at the main header within the tolerance limits of [____] percent expressed as a percent of the set point values. The specified tolerance shall apply to any load which, within a one minute period, swings from a steady-state condition to an increase (or decrease) in load equal to a maximum of 10 percent of the plant. Regulation tolerances shall apply to any steady state condition within the plant turndown ratio of [____]. After a load swing of 10 percent the concentration of oxygen in the flue gas shall not vary more than plus or minus [____] percent of the values established at time of
system set up within a time period of 30 seconds for firing rates of or above 33 percent of maximum, and plus or minus [_____] for firing rates below 33 percent of maximum. [For oxygen compensation, a continuous analysis of flue gases leaving the boiler shall be made and recorded by an oxygen indicator and recorder mounted on the control panel. From this analysis, a signal shall be sent to the fuel-air ratio system which shall be biased in response to the signal to maintain the oxygen levels within plus or minus [10] [_____] percent of the original setting for excess combustion air]. Combustion efficiency shall not be less than that specified in the boiler specification.

2.6 BOILER CONTROL AND INSTRUMENT CABINET(S)

Provide boiler control and instrument cabinet(s) as specified in FS F-B-2902, and may be mounted either on the boiler front or adjacent thereto. The arrangement may also consist of a boiler mounted cabinet containing controls normally provided by the manufacturer and a supplementary cabinet containing controls normally provided by the manufacturer and a supplementary cabinet containing additional controls and instruments required herein. [[Plant master combustion control] [and] [steam flow recorder] shall be mounted on or be adjacent to control panel for number [_____] boiler.]

2.7 FREE-STANDING MULTI-BOILER PLANT CONTROL AND INSTRUMENT PANEL

Provide a free-standing panel and locate as indicated. The panel shall contain all multi-boiler controls, monitoring systems, and panel mounted instruments specified herein and in the reference specifications, except that flame safeguard systems may remain separately mounted in a cabinet at each boiler.

2.7.1 Control Panel Construction

Control panel shall be constructed of not less than 11 gage (3 mm) (0.1196 inch) reinforced steel for face, top, and sides. The enclosed panel shall be not less than 610 mm 24 inches in depth with inside rigidly welded braces. Control panel shall be designed so that all indicating and recording devices and manually operated switches shall be flush mounted in a gasketed removable top front panel with indicating and recording devices at eye-level. A similar removable top rear panel located opposite front panel shall be provided to facilitate wiring, piping, and maintenance. Other operating controls shall be installed on a sub-panel within the enclosure. Access to panel enclosure shall be through gasketed, double piano-hinged doors of not less than 16 gage (1.52 mm) (0.0598 inch) steel. Reinforced doors to prevent sagging and provided with a 3 point compression type fastener and polished key lock handle. A full width fluorescent lighting canopy shall be prime coated and finished in baked enamel. Identify flush mounted devices with engraved lamicore nameplates. Adequately reinforce, suitably skirt, and suitably design panel base to permit anchoring to the floor or foundation.

2.7.2 Control Panel Wiring and Piping

Control panel shall be factory pre-wired in accordance with NFPA 70. Wire shall be thermoplastic Type THW, THWN, XHHW, or UL approved for the intended use, color or number coded, and run in plastic ducts to numbered terminal blocks. Control circuits shall be separately fused with properly rated cartridge type fuses. Power leads to and from magnetic starters and contactors shall terminate at terminal blocks so that no field wiring in
control compartment is necessary except from terminal blocks to external equipment. Control leads to and from external control devices shall terminate at separate terminal blocks from power leads. Steam, draft, and air operated devices shall be factory piped to permanently affixed external connections. Pneumatic signals shall be either 20 to 103 kPa (gage) 3 to 15 psig or 20 to 207 kPa (gage) 3 to 30 psig. Piping connections to indicators shall be copper tubing conforming to ASTM B88M ASTM B88. The boiler operating switch shall have a dust-tight sealed snap-action type. The precision switches shall have cadmium, silver, or platinum contacts, wiping action type, rated at 10 amperes. Electrically or pneumatically test controls and equipment to simulate complete operational sequence.

2.8 BREECHING

Connect breeching to [the] [each] boiler and to intermediate heat recovery equipment as required. Structural materials shall comply with the applicable sections of the AISC 360, "Structural Steel Buildings Allowable Stress Design and Plastic Design." Shop connections shall be welded gas-tight. Field connections may be welded or bolted as required for joining breeching to equipment. Hot dipped galvanized bolts and lock washers shall be supplied for all bolted connections, shall not be less than 10 mm 3/8 inch diameter and spaced not more than 76 mm 3 inches apart. Furnish bolted joints with 3.20 mm 1/8 inch non-asbestos gaskets. Breeching plate shall be not less than 10 gage (3.40 mm) (0.1345 inch) in thickness. Welding shall conform to AWS Z49.1 and AWS D1.1/D1.1M. Breeching system shall provide for maximum expansion and contraction. Expansion joints shall be of the guided, flexible-crease type with flexible element of not less than 16 gage (1.50 mm) (0.0598 inch) thick stainless steel. Provide access doors constructed of cast iron or reinforced steel plate with gaskets and positive closing latches of sufficient number to ensure a gas-tight seal. Clean breeching of rust and scale after fabrication. Insulation and covering for breeching shall be as specified in [Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS].

2.8.1 Round Breeching

Construct round breeching 305 mm 12 inches in diameter and smaller of not less than No. 10 gage (3.40 mm) (0.1345 inch) steel with longitudinal groove type seam. Joints between lengths of breeching shall be of the tight slip fit type with not less than 100 mm 4 inch engagement. Construct round breeching over 305 mm 12 inches in diameter of not less than No. 10 gage (3.40 mm) (0.1345 inch) steel with welded seams and joints. Construct round breeching over 457 mm 18 inches in diameter of not less than No. 10 gage (3.40 mm) (0.1345 inch) tank steel with seams and joints welded.

2.8.2 Expansion Joints

2.8.2.1 Metallic Breeching Expansion Joints

Provide factory fabricated metallic breeching expansion joints [where indicated]. Expansion joints shall be guided metal bellows type capable of a minimum of [_____] mm inches of axial travel. Form metal bellows from not less than 1.60 mm 1/16 inch thick type 321 stainless steel plate. Cover plates shall be not less than 3.20 mm 1/8 inch thick steel plate.

2.8.2.2 Non-Metallic Expansion Joints

Provide factory fabricated non-metallic breeching expansion joints 3.20 mm 1/8 inch minimum thickness [where indicated]. Expansion joints shall be
UFGS

constructed of a fluoroelastomer vulcanized to two plies of knitted wire mesh capable of a minimum of [_____] mm inches of axial compression, [_____] mm inches of axial extension and [_____] mm inches of lateral offset [unless indicated otherwise]. Joints shall have a continuous operating temperature rating of 204 degrees C 400 degrees F, with excursion design standards up to 400 degrees C 750 degrees F. Operating pressure range shall be minus 34 kPa (gage) 5 psig to plus 34 kPa (gage) 5 psig. Expansion joints shall be preformed with integrally molded corners, suitable for mounting against a 150 mm 6 inch flange. [Provide carbon steel backup bars with slotted holes, bolts, and nuts.]

2.8.3 Breeching Hangers

Design breeching hangers to carry not less than 5 times the breeching weight. Hangers for round breeching shall be of the band type, with hanger rods. Hangers for rectangular breeching shall be of the trapeze type, with angle support member and hanger rods. Make all hangers of steel.

2.8.4 Cleanout Doors

Secure cleanout doors to the ends and sides of the breeching where indicated or where required to effectively clean the breeching. Construct cleanout doors of a gage steel not less than that of the breeching and secure to a 32 by 32 mm 1 1/4 by 1 1/4 inch angle frame and spaced not over 152 mm 6 inches on center; provide 1.60 mm 1/16 inch thick fiber non-asbestos gasket between cleanout doors and frames. Doors shall be squared and shall be full height of diameter or side of breeching up to a size of 610 mm 24 inches maximum, except for cleanout doors less than 305 mm 12 inches in height shall be rectangular and shall be 305 mm 12 inches in length. Plug type cleanouts are not acceptable. Provide additional cleanout doors where needed.

2.9 BOILER STACKS

Provide [One] [_____] [refractory-lined], [dual wall insulated], steel stack(s), [each] [_____] mm inches in diameter inside [refractory] by [_____] meter feet overall length, and install where indicated.

2.9.1 Construction

[The] [Each] stack may be factory or field assembled. [The] [Each] stack shall be [prefabricated double or triple walled] [fabricated] of 6.40 mm 1/4 inch structural steel plates in accordance with ASTM A283/A283M. Stack sections shall be of welded construction and fabricated in sections not greater than 6 meters 20 feet nor less than 1.50 meters 5 feet in length. Longitudinal seams shall have continuous butt welded joints. The section or horizontal joints of [refractory lined] stacks shall be flanged with angles welded to the shell, and sections bolted together. Angles shall be not less than 50 mm by 50 mm by 6.40 mm 2 inches by 2 inches by 1/4 inch. [The refractory joint shall be "buttered" with a high temperature air setting bonding refractory before each section is assembled.] Stacks shall be set on a 13 mm 1/2 inch thick steel base plate having a diameter 50 mm 2 inches larger than the outside diameter of the base angle. Base angles and anchor shall be a minimum of 10 mm 3/8 inch thick and 13 mm 1/2 inch diameter. A reinforced concrete foundation shall be provided. Concrete for foundation and reinforcing shall be as detailed on drawings and as specified under the concrete section of this specification. Provide stacks with steel guide shoes and bearing plates on all four sides at the roof level. Guides and bearing plates shall be structural shapes not less than.
6.40 mm 1/4 inch thick. Guides shall be not less than 305 mm 12 inches long and shall be welded to the stacks. Bearing member shall be fastened with steel stud anchors welded to the bearing member. Provided a clearance of 3.20 mm 1/8 inch between guide and bearing member for stack diameter expansion after stacks are in normal operation. Provide flashing and counter-flashing around [the] [each] stack as detailed on drawings.

2.9.2 Breeching Connection

Provide a breeching connection of the same thickness as the stack and weld to [the] [each] stack and reinforce the stack externally with steel plates and/or structural members as required to compensate the stack for the structural strength of the metal removed. Provide a flange for bolting breeching to this connection. Provide a hinged cast-iron or steel cleanout door with a heavy duty cast steel frame at the bottom of each stack. Frame and door shall be fitted gas-tight. Doors shall be a minimum of 457 by 610 mm 18 by 24 inches in size.

2.9.3 Lining

Stack lining shall be an alumina-silica-base castable insulating refractory of the hydraulic setting type certified by the manufacturer to be suitable for the specific application, considering the flue gas temperature, velocities, moisture content, and corrosive qualities of the fuel being burned, applied to each stack under the direct supervision of a qualified representative of the manufacturer. The lining thickness shall be 76 mm 3 inches. Stack base plate exposed inside of each stack shall be covered with castable insulating refractory as specified for stack lining. Boiler stack lining shall have a minimum pyrometric cone equivalent (PCE) of 10 1304 degrees C 2380 degrees F with a maximum installed dry weight of 720 kilogram per cubic meter 45 pounds per cubic foot and a recommended service temperature of 1093 degrees C 2000 degrees F. The top 3 meters 10 feet of lining shall be a dense castable refractory 1840 kilograms per cubic meter 115 lb/ft 3 suitable for all weather and flue gas temperature conditions encountered in the top of stacks. Stack lining shall be fastened to each stack with heat and corrosion resistant alloy metal anchors which maintain their structural strength up to 760 degrees C 1400 degrees F. Anchor clips shall be spaced vertically not greater than 610 mm 24 inches on centers and closer horizontally as required by diameter of the stack. Types, size, and number per section shall be randomly located by the stack and refractory manufacturer to adequately support refractory lining to permit expansion and prevent cracking of refractory. A 50 mm 2 inch mesh galvanized wire screen of 8 gage (4.10 mm) (0.1620 inch) wire shall be attached to the clips for reinforcing the refractory. Locate screen at midpoint of the refractory thickness and cover end of clips with at least 25 mm one inch of refractory.

2.9.4 Stacks

Clean stacks of dirt, rust, oil, and grease by wire brushing and solvent degreasing and given one shop coat of heat-resisting aluminum paint conforming to FS TT-P-28 on the inside and outside. The coat of paint shall have a minimum dry film thickness of 0.025 mm one mil.

2.10 BLOWDOWN EQUIPMENT

Furnish [the boiler] [the plant] with equipment, tanks, and controls necessary for bottom [and continuous] blowdown of the boiler(s). The equipment for bottom blowdown systems shall include a [blowdown tank] [and
sample cooler]. [Continuous blowdown systems shall be of the packaged, proportional type consisting of a heat exchanger, flow control valve, surge tank, [and] sample cooler, [and blowdown control console with test sink]]. Install and pipe blowdown equipment as indicated and it shall conform to the recommendations of the NBBI NB-27.

2.10.1 Bottom Blowdown Tank

The blowdown tank shall be fabricated of welded steel plate in accordance with ASME BPVC SEC VIII D1. The tank shall be a vertical cylindrical tank designed for the working pressure of the boilers. The tank shall be equipped with a tangential blowdown inlet located so as to impinge on a 10 mm 3/8 inch carbon steel wear plate extending at least 180 degrees around the interior circumference of the tank from the point of inlet. The tank shall be equipped with an internal overflow, vent, drain, safety relief valve, and gage glass with try cocks, blowdown cock, and guard. The interior of the tank shall be protected by an epoxy coating system suitable for continuous water immersion and operation at a minimum temperature of [121] [149] degrees C [250] [300] degrees F. When buried, the tank [shall be fitted [with renewable magnesium anodes] [with cathodic protection equipment] to minimize galvanic corrosion.] [shall be constructed of Class A reinforced concrete and shall be fitted with a bolted steel manhole frame and cover. Install the blowoff pipe, vent pipe, and drain pipe in pipe sleeves built into the concrete. Fill and caulk the space between the pipe and sleeves with lead wool or equivalent to make a watertight seal. The tank shall be divided into two sections by means of a baffle to form a sediment chamber.] Size and locate the blowoff tank as shown.

2.10.2 Sample Cooler

Provide a water-cooled, shell-and-tube or shell-and-coil type heat exchanger designed for cooling sample of boiler water prior to chemical testing. The sample cooler shall be furnished as a component of the packaged continuous blowdown system when such a system is being furnished. The cooler shall consist of a cast iron or steel shell with copper coil or copper alloy tubes and shall be equipped with a brass or bronze sampling cock. [The cooler shall be connected to a header and so valved that a sample can be withdrawn from any boiler as desired.] [Furnish concentrometer kit containing necessary glassware, reagents, and instructions for determining boiler water concentrations.]

2.10.3 Continuous Blowdown System

**************************************************************************
NOTE: Specify continuous blowdown only where makeup water ratio is in excess of 20 percent of the boiler output or where the total dissolved solids of the makeup water are in excess of 500 ppm.
**************************************************************************

**************************************************************************
NOTE: Include this requirement if a console type unit is indicated.
**************************************************************************

Provide a complete packaged unit of the automatic-proportioning, [manual-apportioning] type wherein the amount of blowdown from the [boiler] [plant] is automatically proportioned to the amount of make-up feedwater [and the total amount of blowdown from the plant is manually apportioned

SECTION 23 52 53.00 20 Page 23
between boilers according to their steaming rate]. The system shall include either an automatic-proportioning valve and a heat exchanger, or a concentric tube automatic proportioning control which shall be provided with a separate heat exchanger when necessary to meet the performance requirements indicated or specified herein. The system shall be designed for not less than boiler design pressure and shall be capable of heating the feedwater from _____ degrees C to _____ degrees C at the flow rates indicated. The heat exchanger shall consist of a steel shell and heads with Type 304 stainless steel tubes arranged in a removable U-bend bundle. The shell shall be constructed and tested in accordance with ASME BPVC SEC VIII D1 for the specified boiler operating pressure. The automatic proportioning valve shall be provided with a sensing orifice on both the make-up and blowdown lines and shall be of the adjustable ratio type in which the ratio of make-up to blowdown may be set anywhere within a range of [30:1] [_____] to [4:1] [_____]. The automatic proportioning control shall consist of two concentric tubes, the inner tube being of a thermostatic design which acts directly against an adjustable seat in response to the temperature differential between the blowdown in the inner tube and the makeup water between the inner and outer tubes. Manual apportioning valves shall have bronze bodies with stainless steel seats and disks and shall be of the indicating type specifically designed for blowoff service. The blowdown system shall be complete with strainers, stop valves, [blowdown meters,] thermometers, and other accessories necessary to form complete packaged units. [The blowdown control console shall include illuminated sight flow indicators, automatic flushing and cooling valves, and complete panelboard instrumentation, as well as a cabinet type laboratory sink with drain board, back splash, hot and cold service water faucets, [air cock,] and electrical outlet.]

2.11 FEEDWATER EQUIPMENT

2.11.1 Boiler Feed Pumps

Boiler feed pumps shall conform to CID A-A-50562 for motor driven, horizontal split case or support head boiler feed pumps, except as otherwise specified herein. Pumps may be of either the centrifugal or peripheral-turbine type with alloy steel casing and shall be bronze or alloy steel fitted. For centrifugal type pumps, by-pass orifice shall be provided, and for turbine type pumps, pressure relief valves shall be provided. Packed stuffing boxes or mechanical seals suitable for [121 degrees C 250 degree F operation] [the design conditions indicated] shall be provided. Pumps shall be designed for the net positive suction head, discharge head, and water temperature indicated. Pump casings should be rated at suction head plus shutoff head at design temperature. [Capacity under the above condition shall be not less than indicated.] [Capacity of each pump under the above conditions shall be not less than the following percentage of maximum total boiler capacity: centrifugal pumps, 125 percent; turbine pumps, 150 percent.] Pump motors shall be [totally enclosed] [dripproof with encapsulated windings].

2.11.2 Boiler Feed Tank

Feed tank and stand construction shall conform to FS F-P-2908 for horizontal cylindrical stand mounted receivers, and shall be [hot dip galvanized or cement lined] [epoxy coated] [[_____] coated]. Tanks shall be provided with vents, gage glass, drain and overflow connections, pressure gage, thermometer, [float operated make-up water feeder] [float switch and make-up water solenoid valve] [and preheater assembly consisting of corrosion resistant steam diffuser tube, steam pressure reducing valve,
strainer and thermostatic steam valve]. The boiler feed tank assembly shall include strainer and pump control box. Tank capacity and connection sizes shall be as indicated.

2.11.3 Deaerator

The deaerator shall be of the pressurized type having an ASME stamped pressure vessel and conforming to FS W-H-2904 and requirements specified herein. Deaerating assembly and deaerated water storage may be in the same or separate shells. When external vent condensers are provided, they may be located as recommended by the manufacturer. Provide an ASME certified pressure relief valve sized [as indicated][in accordance with Table II of FS W-H-2904]. Inlet piping and accessories shall be as indicated. Feedwater pumps, as specified herein, interconnecting piping, and control box shall be provided as part of the deaerator package. Deaerator capacity shall be not less than [indicated] [1.25 times that required to supply the boiler(s) at maximum firing rate]. The temperature of the water delivered at maximum capacity shall be equivalent to saturated steam temperature at the operating pressure of the deaerator, which shall be as indicated, and the oxygen content shall not exceed [0.005] [0.003] cubic centimeters per liter as determined by the Referee Method A (Colorimetric Indigo Carmine) of ASTM D888 without O2 scavenging chemical addition. Water storage capacity shall be sufficient to operate the boilers at maximum capacity for [10] [____] minutes. A power and control panel shall be furnished with the package deaerator unit. The panel enclosure shall be NEMA ICS 6, Type 12 and shall be fabricated and painted in accordance with the manufacturer's standard practice. A separate compartment shall be furnished for each feedwater pump and each shall include a fused disconnect switch with external operating handle and a magnetic starter with three-leg overload protection. The panel shall include signal lights, an audible alarm to signal high and low levels in the deaerator, and required relays, transformers, and manual-automatic switches.

2.11.4 Surge Tank and Transfer System

The condensate storage and surge tank shall be a cylindrical welded steel tank mounted and supported as indicated. Design and construct the tank in accordance with the ASME BPVC for the indicated working pressure. Storage capacity shall be [as indicated] [sufficient to provide adequate water to the deaerator for [10] [____] minutes of [boiler] [plant] operation at maximum capacity]. Inlet connections for condensate and make-up water shall be as indicated. Equip the tank with liquid level controllers and valves and alarms as indicated. Equip tank with pressure and temperature gages, water level gage, vent, drain, and overflow. Tank shall be [hot dip galvanized or cement lined] [epoxy coated] [____ coated]. The surge tank assembly shall include condensate transfer pumps, interconnecting piping including strainer, and control box as indicated. The transfer pumps, except for head and temperature requirements which shall be as indicated, shall operate continuously with a float controlled flow and shall conform to the requirements for boiler feed pumps specified herein.

2.11.5 Feedwater Treatment Equipment

2.11.5.1 Feedwater Characteristics

*********************************************************************************************
NOTE: Insert source of water supply.
*********************************************************************************************
Equipment for the chemical treatment of the boiler make-up feedwater shall be designed to reduce the boiler water concentrations to the limits specified herein when handling raw water having the following impurities reported as milligrams per liter (mg/liter) (formerly parts per million):

a. Total hardness as CaCO3 __________________

b. Calcium hardness as CaCO3 __________________

c. Magnesium hardness as CaCO3 __________________

d. Alkalinity as CaCO3 __________________

e. Sodium as Na __________________

f. Chlorides as Cl __________________

g. Sulfates as SO4 __________________

h. Sulfites as SO3 __________________

i. Phosphate as PO4 __________________

j. Silica as SiO4 __________________

k. Nitrates as NO3 __________________

l. Iron as Fe __________________

m. Free carbon dioxide as CO2 __________________

n. Total dissolved solids __________________

o. Suspended solids __________________

Raw water shall be delivered to the plant [from the water distribution system of the [_____] [from [_____]]] at a normal pressure of [_____] kPa (gage) psig measured at the meter to the plant. See NAVFAC MO 225 for additional guidance.

2.11.5.2 Water Softener

Provide water softener equipment of the type, size, and arrangement indicated. When operating [under the indicated design conditions] [with an inlet water flow of [_____] liter per second gpm] effluent analysis shall be as follows:

a. Total hardness as CaCO3 less than [_____] mg/liter.

b. pH [_____] to [_____] .

c. Total dissolved solids less than [_____] mg/liter.

d. [_____] .

2.11.5.3 Zeolite Water Softener

**************************************************************************

NOTE: The type of equipment used shall be left to
the designer and local condition.

Conform to WQA S-100 and shall have [automatic] [manual] controls. The softener(s) shall be equipped for [sodium cycle] [hydrogen cycle] [the type of cycle necessary to provide the treated water analysis specified above]. [Each softener tank shall be provided an operating valve to permit the regeneration of one tank while the other is in service.]

2.11.5.4 Lime Soda Softener

NOTE: The type of equipment used shall be left to the designer and local condition.

Conform to CID A-A-50573 for the type indicated.

2.11.5.5 Salt Regeneration Dealkalizer

NOTE: The type of equipment used shall be left to the designer and local conditions.

Provide a salt regeneration dealkalizer as indicated.

2.11.5.6 Pressure Filter

Provide [a] pressure filters of the type and arrangement indicated, and with [manual] [automatic] controls. The filter shall conform to CID A-A-59249. Performance shall be specified in CID A-A-59249 with raw water analysis as specified herein, and operating conditions as indicated. Filter shall be equipped to operate properly for not less than 2 days without operator attention to renew or regenerate filter coatings, chemicals, or other filter media.

2.11.5.7 Chemical Feeder

Size and connect the chemical feeder as indicated. Chemical feeder shall be suitable for the flow, pressure, and temperature conditions at the point of connections. Provide chemical feed storage as indicated. [The feeder shall be of the [automatic proportioning type] [shot type] conforming to FS F-F-2901.] [The feeder shall be of metering pump type conforming to CID A-A-50573 for chemical feeders.]

2.11.5.8 Feedwater Test Equipment

Provide for determining boiler water condition which includes an assembly of indicator solutions, standardized solutions and test glassware, with cabinet. The solution types shall permit tests for water hardness, total alkalinity, hydroxide, carbonite alkalinity, and chloride content, in parts per million. Feedwater test equipment shall employ a standardized soap solution for the hardness test, and a dilute sulfuric acid solution with a methyl orange indicator for total alkalinity. Hydroxides and carbonate alkalinity shall be determined with a phenolphthalein indicator, and the chloride content with a silver nitrate solution. Furnish standardized phenolphthalein color slides shall be furnished for accuracy in alkalinity tests.
2.12 ELECTRIC MOTORS

**************************************************************************
NOTE: Select standard efficiency for motors used less than 750 hours per year and high efficiency for motors used over 750 hours per year. Packaged boilers should utilize the manufacturer's standard efficiency motor.
**************************************************************************

Motors which are not an integral part of a packaged boiler shall be rated for [standard] [high] efficiency service per Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Motors which are an integral part of the packaged boiler system shall be the highest efficiency available by the manufacturer of the packaged boiler.

PART 3 EXECUTION

3.1 INSTALLATION

Arrange work in a neat and orderly manner so that minimum storage space for equipment and material is required at the project site. Install equipment and material in accordance with the best commercial practices. Systems shall be neat in appearance, compact, workmanlike in construction and assembly, and installed for continuous service. Parts shall be readily accessible for inspection, repair, and renewal. Inspect equipment and material upon delivery and test after installation. Protect material and equipment from the weather. Contractor shall repair any damage to equipment, building or worksite that occurs during the execution of his work. Contractor shall leave worksite in a condition equal to or better than that existing before the work was started.

3.1.1 Equipment Foundations

Locate as shown and construct of sufficient size and weight, and proper design to preclude shifting of equipment under operating conditions, or under abnormal conditions which could be imposed upon equipment. Foundations shall meet requirements of equipment manufacturer. Maintain equipment vibration within acceptable limits, and shall be suitably damped and isolated. Grout equipment mounted on concrete foundations before installing piping. Install piping in such a manner as not to place a strain on equipment. When foundations submitted by Contractor shop drawings are different from those shown, submit calculations by the equipment supplier.

3.1.2 Welding

**************************************************************************
NOTE: Use of the ASME code or the Federal Construction Guide Specification section on welding depends upon the agency's requirements.
**************************************************************************

**************************************************************************
NOTE: Insert appropriate Section number in blank below.
**************************************************************************
Work shall be in accordance with [the applicable sections of the ASME BPVC SEC I] [[_____] WELDING] and AWS Z49.1.

3.1.3 Painting

Equipment shall be factory finished to withstand the intended end use environment in accordance with the specifications for the particular end item. Field paint equipment not factory finished as specified herein. Retouch damaged areas of factory-finished equipment on which finish has been damaged and then give a complete finish coat to restore the finish to its original condition. The finish coat shall be suitable for exposure in the intended end use environment. Spray painting shall comply with OSHA 29 CFR 1910-SUBPART D.

3.1.3.1 Cleaning and Application

Remove dirt, rust, oil, and grease by wire brushing and solvent degreasing prior to application of paint. Apply paint to clean and dry surfaces only. Where more than one coat of paint is specified, apply the second coat after the first coat is thoroughly dry. Retouch damaged painting before applying the succeeding coat. Finished surfaces shall be smooth. The painting of zinc coated and other corrosion-resistant metal surfaces is not required unless otherwise specified herein.

3.1.3.2 Smoke Flues, Boiler Casing, and Draft Ducts

In unfinished areas, paint smoke flues, boiler casing, and black steel draft ducts with heat-resisting aluminum paint, two coats on the inside of flues and ducts and one coat on the outside, each coat to a minimum dry film thickness of 0.025 mm one mil applied directly to clean bare metal surfaces. Paint exposed surfaces of protective metal covering over insulation, including zinc-coated surfaces, with two coats of heat-resisting black paint to a minimum dry film thickness of 0.05 mm two mils applied directly to the clean bare metal surfaces. Do not paint zinc-coated ducts.

3.1.4 Boiler Cleaning

After installation, boil out [the] [each] boiler, under supervision of the manufacturer, with a soda ash or another alkaline cleaning solution to cleanse internal surfaces of oil, grease, mill scale, and dirt. Dispose of the waste products from this process according to the requirements of the applicable federal, state, and local environmental regulations. Following initial cleaning, the boilers should be flushed, drained, washed down (internally and externally) and reinspected to ensure that no traces of oil or foreign matter are present. Next, drain the boiler and associated piping and refill it with treated, softened water. At all times after initial cleaning, the Contractor shall protect the boiler, tanks, and piping against internal corrosion until testing is completed and the boiler[s] [is] [are] accepted. Provide chemicals, labor for introducing chemicals, and professional services for control and supervision of the treatment process.

3.1.5 Marking

Equipment, switches, motor controllers, and other controls or indicating elements not located on the main control panel shall be identified by stencils or printed, stamped, or manufactured signs of rigid plastic or non-ferrous material. Lettering for identification signs shall be not less
than [4.80] [_____] mm [3/16] [_____] inch high. The nomenclature and identification symbols used on the signs shall correspond to those used in the maintenance manuals, operating instructions, and schematic diagrams. The signs shall be rigidly affixed to the equipment or devices without impairing functions or, if this is not possible, shall be attached as a tag using a wire or chain. In addition to the identification signs, each major component of equipment shall have a nameplate listing the manufacturer's name, model number, and when applicable, electrical rating and other information required by pertinent standards or codes.

3.2 FIELD QUALITY CONTROL

Performance of tests and inspections as specified herein to demonstrate that boilers and auxiliary equipment, as installed, are in compliance with contract requirements. During boiler system start-up tests, factory-trained engineers or technicians employed by manufacturer of such components as the burner, flame safeguard and combustion controls, feedwater treatment equipment, and other auxiliary equipment shall be present, as required, to ensure the proper functioning, adjustment, and testing of individual components and systems, and to train plant operation personnel in the operation and maintenance of them. No bypassing, use of jumpers, or other disablement of control systems will be allowed unless specified elsewhere. Labor, equipment, fuel, and test apparatus required for testing shall be furnished by the Contractor.

3.2.1 Inspections and Test

Inspections and tests at the site shall be made under the direction of and be subject to the approval of the Contracting Officer. The Contractor shall operate [the] [each] boiler and appurtenances prior to final testing and shall ensure that necessary adjustments have been made. A [24-] [48-] [_____] hour advance written notice shall be submitted to the Contracting Officer indicating the equipment is ready for testing. Provide testing equipment, including gages, thermometers, calorimeter, CO, O2, CO2 test equipment that independently analyzes each gas, thermocouple pyrometers, fuel flow meters, water meters, and other test apparatus and set up and calibrated prior to the test. Draft, fuel pressure, and steam flow may be measured by permanent gages and meters installed under the contract. [Gas flow may be measured by utility company meters.] Provide an analysis of the fuel being used for tests. Control of noise levels developed by exhaust steam, including muffler, globe, and gate valves, shall be conducted in such a manner as not to create a nuisance or hazard, and shall be subject to the approval of the Contracting Officer. Tests shall include the following, and shall be performed when feasible, in the sequence listed:

a. Strength and tightness tests - Hydro test per NAVFAC MO 324.

b. Standards compliance tests - All environmental compliance test as required by federal, state and local laws.

c. Combustion test

d. Operational tests

e. Capacity and efficiency tests per ASME PTC 4

f. Emission test

g. Tests of auxiliary equipment
h. Feedwater equipment test

3.2.2 Strength and Tightness Tests

Subject [_____] [_____] boilers to the following strength and tightness tests:

3.2.2.1 Hydrostatic Testing

After installation and connection, subject [_____] [_____] boilers to an inspection and hydrostatic test to determine that the boiler and appurtenances have not been damaged in transit or handling. The hydrostatic test shall be in accordance with ASME BPVC SEC I, with the test pressure applied for a period required by the Contracting Officer. This test shall be in addition to the hydrostatic tests performed at the factory. [The hydrostatic test at the site shall be certified by an inspector holding an authorized commission from the National Board of Boiler and Pressure Vessel Inspectors.]

3.2.2.2 Pneumatic Testing

Pneumatically test air casing and ducts exterior to the furnace at the maximum working pressure. Use the soap bubble method to verify tightness. Test gas side of boiler normally operated under pressure for tightness at 1-1/2 times the predicted operating pressure in the furnace at the maximum continuous output. For this test, tightly seal the boiler with suitable means to blank off all openings. Admit air to the boiler until the test pressure is reached and then hold. If in a 10-minute period the pressure drop does not exceed 1245 Pa 5 inches water gage, the casing shall be regarded as tight and accepted. Use air pressure and soap bubble tests or comparative carbon dioxide readings for induced draft boilers.

3.2.2.3 Internal Component Test

Hydrostatically test the part of the preassembled fuel oil system that is furnished integrally with the boiler at one and one-half times the maximum operating pressure. Pneumatically test the part of the preassembled gas system that is furnished integrally with the boiler at operating pressure. Use the soap bubble test method to verify tightness of the gas system.

3.2.3 Combustion Tests

Test the fuel burning and combustion control equipment with [the] [each of the] specified fuels at the minimum limit of the turndown range and at increments of 50, 75, and 100 percent of full rated load [plus [_____] percent overload]. [The combustion control system shall maintain 25 to 35 percent excess air at 20 percent of full rated load, and at 50, 75, and 100 percent of load shall maintain an excess air below 15 percent.] Tests shall be conducted by factory-trained combustion equipment engineers as previously specified. Analyze and graphically present test data to show for [the] [each] boiler at tested loads: rates of steam flow; flue gas temperature; percent excess air; steam quality; and percentages of carbon dioxide, carbon monoxide, and oxygen in the flue gas. Test concentrations of sulfur oxides, particulates, volatiles, and nitrogen oxides in the flue gas to ensure compliance with federal, state, and local environmental requirements. Run tests on each fuel after stack temperatures have stabilized with surroundings. Verify and record conformance to the combustion requirements of this specification. Verify proper operation of
instrumentation and gages in the control panel during the test.

3.2.4 Operational Test

Continuously test the boiler(s) continuously under varying load conditions to demonstrate proper operability of the combustion control, flame safeguard control, programming control, and safety interlocks. Conduct this test after the adjustment of the combustion controls has been completed under the combustion test. The operational test shall continue for a period of at least [8] [_____] hours and shall include the following:

3.2.4.1 Sequencing

The boiler shall start, operate, and stop in strict accordance with the specified operational sequence.

3.2.4.2 Flame Safeguard

Verify the operation of the flame safeguard controls by simulated flame and ignition failures. Test burners having intermittent pilots by simulating main flame failure while the pilot is burning. Verify the trial-for-pilot ignition, trial-for-main flame ignition, combustion control reaction, and valve closing times by stop watch.

3.2.4.3 Immunity to Hot Refractory

Operate the burner at high fire until the combustion chamber refractory reaches maximum temperature. The main fuel valve shall then be closed manually. The flame sensing safeguard device shall immediately cause the safety shutoff valves to close within the specified control reaction and valve closing times. This test ensures that the flame sensing device will not send a "false positive" signal from glowing refractory.

3.2.4.4 Pilot Intensity Required

Gradually reduce the fuel supply to the pilot flame to the point where the combustion safeguard begins to drop out (sense "no flame") but holds in until the main fuel valve opens. At this point of reduced pilot fuel supply, the pilot flame shall be capable of safely igniting the main burner. If the main fuel valve can be opened on a pilot flame of insufficient intensity to safely light the main flame, readjustment of the flame sensing device is required.

3.2.4.5 Boiler Limit and Fuel Safety Interlocks

Safety shutdown shall be caused by simulating interlock actuating conditions for high and low temperature, high and low steam pressure, high and low drum level, low feedwater, and fuel safety interlock. Safety shutdowns shall occur in the specified manner.

3.2.4.6 Combustion Controls

Demonstrate the accuracy, range, and smoothness of operation of the combustion controls by varying the steam demand through the entire firing range required by the turndown ratio specified for the burner and in case of automatic recycling burners, by further varying the firing rate to require "on-off" cycling. Control accuracy shall be as specified.
3.2.4.7 Safety Valves

The high-pressure limit switch shall be locked out or otherwise made inoperative, and the boiler safety valves shall be lifted by steam. The relieving capacity, popping pressure, blowdown, and reseating pressure shall be determined by observation and measurement to be in accordance with the ASME BPVC SEC I. The ASME standard symbol will be accepted only as indicating compliance with the design and material requirements of the code.

3.2.5 Capacity and Efficiency Tests

Perform the capacity and efficiency tests after satisfactory completion of all tests previously specified herein and after the boilers have been operating [continuously] for [one] [5] [_____] days with no nuisance shutdowns and without the necessity for frequent or difficult adjustments. The contractor is to continuously man the boiler during the test. Perform these tests on each boiler. Conduct tests using [the] [each of the] specified fuels. Test procedures shall be in accordance with the heat loss method of ASME PTC 4 and shall be reported on the ASME Test Form for Abbreviated Efficiency Test. Tests shall be performed at [25], 50, 75 and 100 percent loads. The duration of the tests shall be sufficient to record necessary data but in no case shall test duration be less than [4] [_____] hours [on each fuel].

3.2.6 Auxiliary Equipment and Accessory Tests

Observe and check blowdown valves, stop valves, try cocks, draft fans, oil heaters, pumps, electric motors, and other accessories and appurtenant equipment during the operational and capacity tests for leakage, malfunctions, defects, noncompliance with referenced standards, or overloading, as applicable.

3.2.7 Feedwater Equipment Tests

Perform test of the feedwater treatment equipment in two steps. One test shall be conducted by the Contractor concurrently with either the combustion test or the capacity and efficiency test. A second test will be performed by the Government during the first period of heavy loading after the plant has been accepted and put in service. Deficiencies revealed during the Government tests will be corrected under the guarantee provisions of the contract. Both the first and second series of tests shall determine compliance with the limits for oxygen content and hardness concentrations of this specification. Equipment for taking samples and the test kit for analyzing the samples shall be supplied by the Contractor and shall revert to the Government when the tests are completed.

3.2.8 Deaerating Feed-Water Heater

Test of deaerating feed-water heater shall demonstrate that the equipment installed shall meet the specified requirements as to performance, capacity, and quality of effluent. During the operating test of the boilers, conduct tests to determine oxygen content in accordance with ASTM D888, Method A. Test with no O2 scavenging chemical addition. Boilers shall be operated at varying loads, up to maximum heater capacity, while oxygen tests are being made.

3.2.9 Water Treatment Equipment

Test of water treatment equipment shall meet the requirements specified as
to capacity and quality of effluent. Tests for ion exchange units shall cover at least two complete regenerations and capacity runs. Test for hot process or other precipitation type softeners shall cover a minimum continuous period of 48 hours with samples being taken at 2 hour intervals.

3.2.10 Steam Quality

Test for steam quality and water level stability shall be simultaneous under the operating conditions specified.

3.2.11 Steam Tests

Tests for boilers over 2068 kPa (gage) 300 psig not used for power generation or large turbine drives and without super-heaters, shall be made on steam sampled in accordance with ASTM D1066, and tested for moisture in accordance with the calorimetric method outlined in Section 3, ASME PTC 19.11. Conductivity method may be used in lieu of the calorimetric method, in which case the conductivity of the steam corrected for carbon dioxide and ammonia content shall not exceed 30 microhms/cm at 18 degrees C. The steam for boilers less than 2068 kPa (gage) 300 psig used for power generation or turbine drive for air conditioning equipment or with super-heaters, and for boilers over 2068 kPa (gage) 300 psig, shall be tested in accordance with the conductivity method in ASTM D2186, with the conductivity of the steam corrected for carbon dioxide and ammonia content not to exceed 4.0 microhms/cm at 18 degrees C.

3.2.12 Water Level Stability Test

Test shall first be conducted by use of the manual bypass around the feed-water regulator. Test shall be repeated using the automatic feed-water regulator. To be acceptable, the boiler should maintain specified water level stability under both conditions.

3.3 SCHEDULE

Some metric measurements in this section are based on mathematical conversion of inch-pound measurements, and not on metric measurements commonly agreed on by the manufacturers or other parties. The inch-pound and metric measurements shown are as follows:

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for warm air heating systems for buildings (not including Family Housing) using direct or indirect; oil-fired or gas-fired; vented; forced air furnaces. It does not cover wall furnaces or floor furnaces. Warm air systems applications include but are not limited to barracks, offices, warehouses, maintenance, and production facilities.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Coordinate with the Installation and provide specific requirements "to match existing systems" when necessary. If specifying proprietary products, insure that appropriate "Justification and Authorization (J & A)" documentation has been obtained by project manager and "proprietary language requirements" have been added to Division 1 as well as adding the following lines above the section number and title at the top of the first
The use of brand name items has been the subject of many Contract claims. Project designers and specifiers must be aware of the restriction on the specification of brand name items and take special precautions to avoid their use unless formal written approval is obtained.

NOTE: Identical Terminology: It is highly unlikely that this section will use the same terminology as CADD programs or CADD drafters. Specifier should ensure that each piece of equipment, or item, or system is identified or marked identically in the section paragraphs as the item is identified on the drawings. If this is not done, confusion will result as to which specification paragraph applies to a particular item on the drawings, thereby affecting the quality of the design package.

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AIR MOVEMENT AND CONTROL ASSOCIATION INTERNATIONAL, INC. (AMCA)

AMCA 210 (2016) Laboratory Methods of Testing Fans
AMCA 300  (2014) Reverberant Room Method for Sound Testing of Fans

AMCA 301  (2014) Methods for Calculating Fan Sound Ratings from Laboratory Test Data

AIR-CONDITIONING, HEATING AND REFRIGERATION INSTITUTE (AHRI)

AHRI 410  (2001; Addendum 1 2002; Addendum 2 2005; Addendum 3 2011) Forced-Circulation Air-Cooling and Air-Heating Coils

NFPA 90A (2021) Standard for the Installation of Air Conditioning and Ventilating Systems

NFPA 90B (2021) Standard for the Installation of Warm Air Heating and Air Conditioning Systems
1.2 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up
to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit data packages in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 QUALITY CONTROL

1.3.1 Installing Contractor Qualifications

Submit contractor qualifications demonstrating successful completion of similar services by the mechanical contractor on at least five projects of similar award amount and scope with equipment submittal.

1.3.2 Service Contractor Qualifications

**************************************************************************
NOTE: Prior to selecting a bracketed distance (or inputting a custom distance), confirm a minimum of three suppliers are within the selected radius. Consult with the installation to determine if further edits to this paragraph are required to align with sole- or limited-source Justification and Approval's (J&A's) that would further restrict the manufacturer pool.
**************************************************************************

The submitted equipment must be supported by manufacturer-approved service organization[s]. Provide service organization names and locations along with the Operation and Maintenance submittal. The service organization[s] must have an office within [_____] [50] [100] miles of the site with factory certified technicians, spare parts inventory and all necessary test and diagnostic equipment for the installed system. The service organization must be able to render service to the equipment on both a regular and emergency basis during the warranty period of the contract as determined by the Contracting Officer.

Spare parts data for each different item of material and equipment specified, after approval of detail drawings and not later than [_____] months prior to the date of beneficial occupancy. The data must include a complete list of parts and supplies, with current unit prices and source of supply, a recommended spare parts list for 12 months operation, and a list of the parts recommended by the manufacturer to be replaced after [1] [and] [3] year(s) of service.

1.3.3 Modification to Reference

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word "must" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction", or words of similar meaning, to mean the Contracting Officer.

1.3.3.1 Definitions

For the International Code Council (ICC) Codes referenced in the contract documents, advisory provisions must be considered mandatory, the word "should" is interpreted as "must." Reference to the "code official" must be interpreted to mean the "Contracting Officer." For government owned property, references to the "owner" must be interpreted to mean the "Contracting Officer." For leased facilities, references to the "owner" must be interpreted to mean the "lessor." References to the "permit holder" must be interpreted to mean the "Contractor."
1.3.3.2 Administrative Interpretations

For ICC Codes referenced in the contract documents, the provisions of Chapter 1, "Administrator," do not apply. These administrative requirements are covered by the applicable Federal Acquisition Regulations (FAR) included in this contract and by the authority granted to the Officer in Charge of Construction to administer the construction of this project. References in the ICC Codes to sections of Chapter 1, must be applied appropriately by the Contracting Officer as authorized by his administrative cognizance and the FAR.

1.3.4 Equipment Layouts

Submit Equipment Layouts showing equipment assembly and installation details with electrical, ductwork layout, supports, utility connections, and details. Include any information required to demonstrate that the system has been coordinated and functions properly as designed.

1.3.5 System Diagrams

Proposed system diagrams, must be submitted, approved and posted prior to start of related testing. System diagrams that show the layout of equipment and ductwork, and typed condensed operation manuals explaining preventative maintenance procedures, methods of checking the system for normal safe operation, and procedures for safely starting and stopping the system must be framed under glass or laminated plastic. After approval, these items must be posted where directed.

1.4 DELIVERY STORAGE AND HANDLING

Handle, store, and protect equipment and materials to prevent damage before and during installation in accordance with the manufacturer's recommendations, and as approved by the Contracting Officer. Replace damaged or defective items.

1.5 ACCESSIBILITY
