Provide metal panels having[ field-insulation][ insulation core][ insulation and vapor barrier] material with the following surface-burning characteristics as determined by testing identical products according to ASTM E84 by a qualified testing agency. Identify products with appropriate markings of applicable testing agency showing:

a. Flame-Spread Index: [25] [_____] or less.

b. Smoke-Developed Index: [450] [_____] or less.
1.6.11 Fabrication

Fabricate and finish the switchgear house at the factory to greatest extent possible, by manufacturer's standard procedures and processes and as necessary to fulfill indicated performance requirements. Comply with indicated profiles with dimensional and structural requirements.

Provide metal panel profile, including major ribs and intermediate stiffening ribs, if any, for full length of panel. Aluminum and aluminum-alloy sheet and plate must conform to ASTM B209.

Fabricate metal panel side laps with factory-installed captive gaskets or separator strips that provide a tight seal and prevent metal-to-metal contact, in a manner that will seal weather-tight and minimize noise from movements within panel assembly.

Sheet Metal Accessories: Fabricate flashing and trim to comply with recommendations in SMACNA 1793 that apply to the design, dimensions, metal, and other characteristics of item indicated:

a. Form exposed sheet metal accessories that are without excessive oil canning, buckling, and tool marks and that are true to line and levels indicated, with exposed edges folded back to form hems.

b. End Seams: Fabricate nonmoving seams with flat-lock seams. Form seams and seal with epoxy seam sealer. Rivet joints for additional strength.

c. Sealed Joints: Form non-expansion but movable joints in metal to accommodate elastomeric sealant to comply with SMACNA standards.

d. Conceal fasteners and expansion provisions where possible. Exposed fasteners are not allowed on faces of accessories exposed to view.

e. Fabricate cleats and attachment devices of size and metal thickness recommended by SMACNA or by metal building system manufacturer for application, but not less than thickness of metal being secured.

1.6.12 Certifications

The switchgear house must be Third Party certified by UL as NEC (National Electric Code) compliant and / or UL 3R RAIN TEST and / or IEEE C37.20.2A RAIN TEST compliant and must bear a UL Label.

[ The switchgear house design must be accomplished by a Professional Engineer and drawings and supporting calculations will bear the Professional Engineer's seal.

]1.6.13 Finishes

Comply with NAAMM AMP 500 for recommendations for applying and designating finishes.

Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.
1.6.14 Pre-Erection Conference

After submittals are received and approved but before metal building system work, including associated work, is performed, the Contracting Officer will hold a pre-erection conference to review the following:

a. The detail drawings, specifications, and manufacturer's descriptive and technical literature.

b. Finalize construction schedule and verify availability of materials, erector's personnel, equipment, and facilities needed to make progress and avoid delays.

c. Methods and procedures related to metal building system erection, including, but not limited to: qualification of manufacturer, qualification of erector, manufacturer's catalog data, manufacturer's building design analysis, lateral force calculations, written instructions and test reports. Lateral force calculations must include all analysis and confirmation of system components required to transfer lateral forces to the foundation.

d. Support conditions for compliance with requirements, including alignment between and erection of structural members.

e. Flashing, special roofing and siding details, roof and wall penetrations, openings, and condition of other construction that will affect the metal building system, including coatings and base metals, factory color finish performance requirements, system components, and coil stock certification.

f. Governing regulations and requirements for, certificates, insurance, tests and inspections if applicable.

g. Temporary protection requirements for metal panel assembly during and after installation.

h. Samples of roof panels, wall panels, aluminized steel repair paint, galvanizing repair paint, and enamel repair paint.

1.6.14.1 Pre-Roofing and Siding Installation Conference

After structural framing system erection and approval but before roofing, siding[, insulation and vapor barrier] work, including associated work, is performed; the Contracting Officer will hold a pre-roofing and siding conference to review the following:

a. Examine purlins, sub-girts and formed shapes conditions for compliance with requirements, including flatness and attachment to structural members.

b. Review structural limitations of purlins, sub-girts and formed shapes during construction and after roofing and siding.

c. Review flashings, special roof and wall details, roof drainage, roof and wall penetrations, roof equipment curbs, and condition of other construction that will affect the metal building system.

d. Review temporary protection requirements for metal roof and wall panels' assembly during and after installation.
e. Review roof and wall observation and repair procedures after metal building system erection.

1.7 SHIPPING, HANDLING AND STORAGE

1.7.1 Delivery

Package and deliver the assembly and other manufactured items so as not to be damaged or deformed and protected during transportation and handling.

For a building that must be shipped in multiple shipping sections, junction boxes must be provided at the shipping splits for easy breakdown of the building wiring for shipment and reconnection at the job site. Prior to shipment the open end/sides of each shipping section will be crated (weatherproofed) for transit to the job site.

Each shipping piece must be designed for lifting by lugs located along the base perimeter members at 4.5 m 15 feet approximate intervals. All lifting lugs must be removable.

1.8 PROJECT CONDITIONS

1.8.1 Weather Limitations

Proceed with installation preparation only when existing and forecasted weather conditions permit Work to proceed without water entering into the switchgear house.

1.8.2 Field Measurements

1.8.2.1 Established Dimensions for Foundations

Comply with established dimensions on approved anchor-bolt plans, established foundation dimensions, and proceed with fabricating structural framing. Do not proceed without verifying field measurements. Coordinate anchor-bolt installation to ensure that actual anchorage dimensions correspond to established dimensions.

1.8.2.2 Verification Record

Verify locations of all framing and opening dimensions by field measurements before metal panel fabrication and indicate measurements on Shop Drawings.

1.9 COORDINATION

Coordinate size and location of concrete foundations and casting of anchor-bolt inserts into foundation walls and footings. Concrete, reinforcement, and formwork requirements are specified in section on 03 30 00 CAST-IN-PLACE CONCRETE.

[Coordinate installation of [fire suppression system] [equipment supports] [piping and supports][ and ] [accessories], which are specified in Division 21 - FIRE SUPPRESSION.

][Coordinate installation of [plumbing system] [equipment supports] [piping and supports][ and ] [accessories], which are specified in Division 22 - PLUMBING.
Coordinate installation of HVAC system equipment supports, ductwork and supports, piping and supports, and accessories, which are specified in Division 23 - HEATING, VENTILATING AND AIR-CONDITIONING (HVAC).

Coordinate installation of equipment supports and roof penetrations, which are specified in Division 07 - THERMAL AND MOISTURE PROTECTION.

Coordinate metal panel assemblies with rain drainage work, flashing, trim, and construction of supports and other adjoining work to provide a leak-proof, secure, and non-corrosive installation.

1.10 WARRANTY

1.10.1 Building System Warranty

Furnish manufacturer's no-dollar-limit warranty for the metal building system. The warranty period is to be no less than 10, 15, or 20 years from the date of acceptance of the work and be issued directly to the Government. The warranty must provide that if within the warranty period, the switchgear house shows evidence of deterioration resulting from defective materials and/or workmanship, correcting of any defects is the responsibility of the metal building system manufacturer. Repairs that become necessary because of defective materials and workmanship while metal building system is under warranty are to be performed within 32 hours after notification, unless additional time is approved by the Contracting Officer.

1.10.2 Roof System Weather-Tightness Warranty

Furnish manufacturer's no-dollar-limit warranty for the metal panel system. The warranty period is to be no less than 10, 20, or _____ years from the date of acceptance of the work and be issued directly to the Government.

The warranty is to provide that if within the warranty period the roof panel system shows evidence of corrosion, perforation, rupture, lost of weather-tightness or excess weathering due to deterioration of the panel system resulting from defective materials and correction of the defective workmanship is to be the responsibility of the metal building system manufacturer.

Repairs that become necessary because of defective materials and workmanship while roof panel system is under warranty are to be performed within 24 hours after notification, unless additional time is approved by the Contracting Officer. Immediate follow-up and completion of permanent repairs must be performed within _____ days from date of notification.

1.10.3 Roof and Wall Panel Finish Warranty

Furnish manufacturer's no-dollar-limit warranty for the metal panel system. The warranty period is to be no less than 10, 20, or _____ years from the date of acceptance of the work and be issued directly to the Government.

The warranty is to provide that if within the warranty period the metal panel system shows evidence of checking, delaminating cracking, peeling, chalk in excess of a numerical rating of eight, as determined by ASTM D4214.
test procedures; or change colors in excess of five CIE or Hunter units in accordance with ASTM D2244 or excess weathering due to deterioration of the panel system resulting from defective materials and finish or correction of the defective workmanship is to be the responsibility of the metal building system manufacturer.

Liability under this warranty is exclusively limited to replacing the defective coated materials.

Repairs that become necessary because of defective materials and workmanship while roof and wall panel system is under warranty are to be performed within [32] [_____] hours after notification, unless additional time is approved by the Contracting Officer.

PART 2   PRODUCTS

2.1 STRUCTURAL FRAMING MATERIALS

2.1.1 W-Shapes

ASTM A992/A992M; ASTM A572/A572M or ASTM A529/A529M.

2.1.2 Channel, Angles, M-Shapes and S-Shapes

ASTM A36/A36M; ASTM A572/A572M or ASTM A529/A529M.

2.1.3 Plate and Bar

ASTM A36/A36M, ASTM A572/A572M or ASTM A529/A529M.

2.1.4 Steel Pipe

ASTM A36/A36M, ASTM A53/A53M, ASTM A572/A572M or ASTM A529/A529M.

2.1.5 Cold-Formed and Hot Formed Hollow Structural Sections

Cold formed: ASTM A500/A500M or ASTM B221, ASTM B221M. Hot-formed: ASTM A501/A501M.

2.1.6 Structural-Steel Sheet

Hot-rolled, ASTM A1011/A1011M or cold-rolled, ASTM A1008/A1008M.

2.1.7 Metallic-Coated Steel Sheet

ASTM A653/A653M, ASTM A606/A606M.

2.1.8 Metallic-Coated Steel Sheet Pre-painted with Coil Stock Coating

Steel sheet metallic coated by the hot-dip process and pre-painted by the coil-coating process to comply with ASTM A755/A755M.

[ a. Zinc-Coated (Galvanized) Steel Sheet: ASTM A653/A653M, and ASTM A123/A123M.

] [b. Aluminum-Zinc Alloy-Coated Steel Sheet: ASTM A792/A792M, and ASTM A463/A463M.
2.1.9 Joist Girders

Refer to Section 05 21 00 STEEL JOIST FRAMING.

2.1.10 Steel Joists

Refer to the following sections subject to project design requirements:

Section 05 21 00 STEEL JOIST FRAMING.

2.1.11 High-Strength Bolts, Nuts, and Washers

ASTM A325M ASTM A325 heavy hex steel structural bolts; ASTM A563M ASTM A563 heavy hex carbon-steel nuts; and ASTM F436M ASTM F436 hardened carbon-steel washers.

Finish:  [Hot-dip zinc coating, ASTM A153/A153M] [Mechanically deposited zinc coating, ASTM B695] [Stainless steel].

Tension-Control, High-Strength Bolt-Nut-Washer Assemblies: ASTM F1852, heavy-hex-head steel structural bolts with spline.

Finish:  [Mechanically deposited zinc coating, ASTM B695] [Mechanically deposited zinc coating, ASTM B695 baked epoxy coated] [Stainless steel].

2.1.12 Anchor Rods

[ASTM F1554] [ASTM A572/A572M] [ASTM A36/A36M] [ASTM A307].

c. Plate Washers: Stainless steel.

d. Washers: Stainless steel.

e. Finish:  [Hot-dip zinc coating, ASTM A153/A153M] [Mechanically deposited zinc coating, ASTM B695].

2.1.13 Threaded Rods

[ASTM A193/A193M] [ASTM A572/A572M] [ASTM A36/A36M] [ASTM A307].

b. Washers: Stainless steel.

c. Finish:  [Hot-dip zinc coating, ASTM A153/A153M] [Mechanically deposited zinc coating, ASTM B695].

2.1.14 Floors

Floor must be 6 mm 1/4 inch minimum thickness flat ASTM A36/A36M steel plate, welded to all longitudinal and transverse base members. Floor plate seams must be continuously welded at all joints, and ground smooth to minimize visibility of seams. Welding of floor plate must be staggered to produce a flat and ripple free surface.
2.1.15 Primer

SSPC Paint 15, Type I, red oxide.

2.2 FABRICATION

2.2.1 General

All facets of construction through coating and weatherproofing must be performed indoors, protected from outdoor weather conditions. Construction prior to this stage out-of-doors is not acceptable.

All permanent coatings and finishes must be applied inside a dedicated paint booth with ventilation and filtration provisions in compliance with the coating manufacturer's requirements. Coatings applied in outside, ambient air conditions must not be acceptable.

2.3 STRUCTURAL FRAMING

2.3.1 General

Clean all framing members to remove loose rust and mill scale. Provide one shop coat of primer to an average dry film thickness of 1 mil according to SSPC SP 2. Balance of painting and coating procedures must conform to SSPC Paint 15 and SSPC Painting Manual.

2.3.2 Primary Framing

Manufacturer's standard structural primary framing system includes transverse and lean-to frames; rafter, rakes, and canopy beams; sidewall, intermediate, end-wall, and corner columns; and wind bracing designed to withstand required loads and specified requirements. Provide frames with attachment plates, bearing plates, and splice members.

Shop fabricate framing components by welding or by using high-strength bolts to the indicated size and section with base-plates, bearing plates, stiffeners, and other items required.

[ a. Rigid Clear-Span Frames: I-shaped frame sections fabricated from shop-welded, built-up steel plates or structural-steel shapes. Interior columns are not permitted.

] [b. Rigid Modular Frames: I-shaped frame sections fabricated from shop-welded, built-up steel plates or structural-steel shapes. Provide interior columns fabricated from [steel round pipe] [steel tube] [shop-welded, built-up steel plates].

] c. Frame Configuration: [Single gable] [One-directional sloped] [Lean to, with high side connected to, and supported by, another structure] [Multiple gables] [Load-bearing-wall type] [Multistory].

d. Exterior Column Type: [Uniform depth] [Tapered].
e. Rafter Type: [Uniform depth] [Tapered].

2.3.3 Secondary Framing

Manufacturer's standard secondary framing members, including purlins, girts, eave struts, flange bracing, base members, gable angles, clips,
headers, jambs, and other miscellaneous structural members. Fabricate framing from cold-formed, structural-steel sheet or roll-formed, metallic-coated steel sheet pre-painted with coil coating, unless otherwise indicated.

Shop fabricate framing components by roll-forming or break-forming to the indicated size and section with base-plates, bearing plates, stiffeners, and other plates required for erection. Cut, form, punch, drill, and weld secondary framing for bolted field connections to primary framing.

a. Purlins: C or Z-shaped sections; fabricated from steel sheet, built-up steel plates, or structural-steel shapes; minimum depth [as indicated] [as required to comply with system performance requirements] [______].

b. Girts: C or Z-shaped sections; fabricated from steel sheet, built-up steel plates, or structural-steel shapes. Form ends of Z-sections with stiffening lips angled 40 to 50 degrees to flange minimum depth [as indicated] [as required to comply with system performance requirements] [______].

c. Eave Struts: Unequal-flange, C-shaped sections; fabricated from steel sheet, built-up steel plates, or structural-steel shapes; to provide adequate backup for metal panels.

d. Flange Bracing: Structural-steel angles or cold-formed structural tubing to stiffen primary frame flanges.

e. Sag Bracing: Structural-steel angles.

f. Base or Sill Angles: Zinc-coated (galvanized) steel sheet.

g. Purlin and Girt Clips: Steel sheet. Provide galvanized clips where clips are connected to galvanized framing members.

h. Secondary End-Wall Framing: Manufacturer's standard sections fabricated from [zinc-coated (galvanized) steel sheet] [structural-steel sheet].

i. Framing for Openings: Channel shapes; fabricated cold-formed, structural-steel sheet or structural-steel shapes. Frame head and jamb of door openings, and head, jamb, and sill of other openings.

j. Miscellaneous Structural Members: Manufacturer's standard sections fabricated from cold-formed, structural-steel sheet; built-up steel plates; or zinc-coated (galvanized) steel sheet; designed to withstand required loads.

2.3.4 Bracing

Provide adjustable wind bracing as follows:

a. Rods: ASTM A36/A36M; ASTM A572/A572M; or ASTM A529/A529M [threaded full length] [threaded a minimum of [______]] at each end.

b. Cable: ASTM A475, [_____] diameter, extra-high-strength grade, zinc-coated, [_____]-strand steel; with threaded end anchors.

c. Angles: Fabricated from structural-steel shapes to match primary framing, of size required to withstand design loads.
d. Rigid Portal Frames: Fabricate from shop-welded, built-up steel plates or structural-steel shapes to match primary framing; of size required to withstand design loads.

e. Fixed-Base Columns: Fabricate from shop-welded, built-up steel plates or structural-steel shapes to match primary framing; of size required to withstand design loads.

f. Diaphragm Action of Metal Panels: Design metal building to resist wind forces through diaphragm action of metal panels.

g. Bracing: Provide wind bracing using any method specified above, at manufacturer's option.

2.4 PANEL MATERIALS

2.4.1 Aluminum Sheet

Roll-form aluminum [roof] [wall] (liner] panels to the specified profile, with \( f_y = [30] [40] [50] [80] \) ksi \([.032] [.040] [.050] \) inch thickness and depth as indicated. Material must be plumb and true, and within the tolerances listed:

b. Individual panels to have continuous length to cover the entire length of any [roof slope] [wall area] with no joints or seams and formed without warping, waviness, or ripples that are not part of the panel profile and free of damage to the finish coating system.

c. Provide panels with thermal expansion and contraction consistent with the type of system specified.

**************************************************************************

NOTE: Select the desired profile from below and delete remaining items.
**************************************************************************

(1) Profile and coverage to be a minimum height and width from manufacturer's standard for the indicated [roof slope] [wall area].

[ (2) Profile to be a 38 mm 1-1/2 inch high rib at 304.8 mm 12 inches o.c. with small stiffening ribs, 965.2 mm 38 inch overall width with 914.4 mm 36 inch coverage and exposed fasteners.

] [ (3) Profile to be a 38 mm 1-1/2 inch high rib at 182.9 mm 7.2 inches o.c., 987.4 mm 38-7/8 inch overall width with 914.4 mm 36 inch coverage and exposed fasteners.

] [ (4) Profile to be a 25.4 mm 1 inch high rib at 101.6 mm 4 inches o.c., 1260.5 mm 49-5/8 inch overall width with [1219.2] [1117.6] mm [48] [44] inch coverage and exposed fasteners.

] [ (5) Profile to be a 25.4 mm 1 inch high rib at 203.2 mm 8 inches o.c., 1057.3 mm 41-5/8 inch overall width with 1016 mm 40 inch coverage and exposed fasteners.
(6) Profile to be a 44.5 mm 1-3/4 inch high V-beam rib at 127 mm 5 inches o.c., 1139.9 mm 44-7/8 inch overall width with 1066.8 mm 42 inch coverage and exposed fasteners.

(7) Profile to be a 22.2 mm 7/8 inch high corrugated rib at 50 mm 2 inches o.c., 987.4 mm 38-7/8 inch overall width with 914.4 mm 36 inch coverage and exposed fasteners.

(8) Profile to be a 76 mm 3 inch high standing seam, 609.6 mm 24 inch coverage, factory-caulked and mechanical crimping or snap-together seams with concealed clips and fasteners.

(9) Profile to be a [25.4] [44.5] [50.8] [63.5] mm [1] [1-3/4] [2] [2-1/2] inch high standing seam, [304.8] [406.4] [457.2] mm [12] [16] [18] inch coverage, with mechanical crimping or snap-together seams with concealed clips and fasteners.

(10) [Smooth, flat] [Embossed] Surface Texture.

(11) Custom profile to be [_____] [as shown on drawings].

2.4.2 Steel Sheet

Roll-form steel [roof] [wall] [liner] panels to the specified profile, with fy = [30] [40] [50] [80] ksi [26] [24] [22] [20] [18] gauge and depth as indicated. Material must be plumb and true, and within the tolerances listed:

[ a. Galvanized Steel Sheet conforming to ASTM A653/A653M and AISI SG03-3.

[ b. Aluminum-Zinc Alloy-coated Steel Sheet conforming to ASTM A792/A792M and AISI SG03-3.

[ c. Individual panels to have continuous length to cover the entire length of any unbroken [roof slope] [wall area] with no joints or seams and formed without warping, waviness, or ripples that are not part of the panel profile and free of damage to the finish coating system.

[ d. Provide panels with thermal expansion and contraction consistent with the type of system specified;

[ profile and coverage to be a minimum height and width from manufacturer's standard for the indicated [roof slope] [wall area].

[ profile to be a 38 mm 1-1/2 inch high rib at 304.8 mm 12 inches o.c. with small stiffening ribs, 965.2 mm 38 inch overall width with 914.4 mm 36 inch coverage and exposed fasteners.

[ profile to be a 38 mm 1-1/2 inch high rib at 182.9 mm 7.2 inches o.c., 987.4 mm 38-7/8 inch overall width with 914.4 mm 36 inch coverage and exposed fasteners.

[ profile to be a 25.4 mm 1 inch high rib at 101.6 mm 4 inches o.c., 1260.5 mm 49-5/8 inch overall width with [1219.2] [1117.6] mm [48] [44] inch coverage and exposed fasteners.

[ profile to be a 25.4 mm 1 inch high rib at 203.2 mm 8 inches o.c., 1057.3 mm 41-5/8 inch overall width with 1016 mm 40 inch coverage and exposed fasteners.
profile to be a **22.2 mm 7/8 inch** high corrugated rib at 50 mm 2 inches o.c., 987.4 mm 38-7/8 inch overall width with 914.4 mm 36 inch coverage and exposed fasteners.

profile to be a **76 mm 3 inch** high standing seam, 609.6 mm 24 inch coverage, factory-caulked and mechanical crimping or snap-together seams with concealed clips and fasteners.

profile to be a **[25.4] [44.5] [50.8] [63.5] mm [1] [1-3/4] [2] [2-1/2] inch** high standing seam, **[304.8] [406.4] [457.2] mm [12] [16] [18] inch** coverage, with mechanical crimping or snap-together seams with concealed clips and fasteners.

profile to be custom as shown on drawings.

2.4.3 Foam-Insulation Core Wall Panel

Provide factory-formed [aluminum] [steel] [roof] [wall] panel assembly fabricated from two sheets of metal with modified polyisocyanurate or polyurethane foam insulation core [foamed-in-place] [board] during fabrication with joints between panels designed to form weather-tight seals. Include accessories required for weather-tight installation.

a. **Closed-Cell Content:** 90 percent when tested according to ASTM D6226, ASTM C1289.

b. **Density:** 32 to 42 kg/cu. m 2.0 to 2.6 lb/cu. ft. when tested according to ASTM D1622/D1622M.

c. **Compressive Strength:** Minimum 140 kPa 20 psi when tested according to ASTM D1621.

d. **Shear Strength:** 179 kPa 26 psi when tested according to ASTM C273/C273M.

2.4.4 Insulated Panel Construction

Shop fabricate or field assemble insulated panel construction with specified exterior and interior [aluminum] [steel] sheet in accordance with manufacturer's printed instructions.

Insulation to be [glass-fiber-ASTM C991] [slag-wool-fiber] [rock-wool-fiber] conforming to ASTM C553 and ASTM C612 of thickness and density as required for the geographical area where construction will take place. Glass-Fiber and Mineral-Wool-Fiber are materials listed in the EPA's Comprehensive Procurement Guidelines (CPG), and are a component of sustainable acquisition compliance.

Insulation fasteners to be adhesively attached, plate welded to projecting spindle anchors; capable of holding insulation of thickness indicated, secured in position with self-locking washer and complying with the following requirements:

a. **Plate:** Perforated galvanized carbon-steel sheet, 0.762 mm 0.030 inch thick by 50 mm 2 inches square.

b. **Spindle:** Copper-coated, low carbon steel; fully annealed; 2.67 mm
c. Insulation-Retaining Washers: Self-locking washers formed from 0.41-mm-0.016-inch-thick galvanized steel sheet, with beveled edge for increased stiffness, sized as required to hold insulation securely in place, but not less than 38 mm 1-1/2 inches square or in diameter.

d. Anchor adhesive to be a product with demonstrated capability to bond insulation anchors securely to substrates indicated without damaging insulation, fasteners, and substrates.

2.4.5 Finishes

All panels are to receive a factory-applied [polyvinylidene fluoride] [Kynar 500/Hylar 5000] [_____] finish consisting of a baked-on top-coat with a manufacturer's recommended prime coat conforming to the following:

a. Metal Preparation: All metal is to have the surfaces carefully prepared for painting on a continuous process coil coating line by alkali cleaning, hot water rinsing, application of chemical conversion coating, cold water rinsing, sealing with acid rinse, and thorough drying.

b. Prime Coating: A base coat of epoxy paint, specifically formulated to interact with the top-coat, is to be applied to the prepared surfaces by roll coating to a dry film thickness of 0.20 plus 0.05 mils. This prime coat must be oven cured prior to application of finish coat.

c. Exterior Finish Coating: Apply the finish coating over the primer by roll coating to dry film thickness of 0.80 plus 5 mils (3.80 plus 0.50 mils for Vinyl Plastisol) for a total dry film thickness of 1.00 plus 0.10 mils (4.00 plus 0.10 mils for Vinyl Plastisol). This finish coat must be oven-cured.

d. Interior Finish Coating: Apply a wash-coat on the reverse side over the primer by roll coating to a dry film thickness of 0.30 plus 0.05 mils for a total dry film thickness of 0.50 plus 0.10 mils. The wash-coat must be oven-cured.

e. [Color: The exterior finish chosen from the manufacturer's color charts and chips.] [____]

f. Physical Properties: Coating must conform to the industry and manufacturer's standard performance criteria as listed by the following certified test reports:

Chalking: ASTM DEFONLINE

Color Change and Conformity: ASTM D2244

Weatherometer: ASTM G152, ASTM G153 and ASTM D822

Humidity: ASTM D2247 and ASTM D714

Salt Spray: ASTM B117

Chemical Pollution: ASTM D1308

Gloss at 60 degrees: ASTM D523
2.4.6 Repair Of Finish Protection

Repair paint for color finish enameled metal panel must be compatible paint of the same formula and color as the specified finish furnished by the metal panel manufacturer, conforming to ASTM A780/A780M.

2.5 MISCELLANEOUS METAL FRAMING

2.5.1 General

Cold-formed metallic-coated steel sheet conforming to ASTM A653/A653M and specified in Section 05 40 00 COLD-FORMED METAL FRAMING unless otherwise indicated.

2.5.2 Fasteners for Miscellaneous Metal Framing

Refer to the following paragraph FASTENERS.

2.6 FASTENERS

2.6.1 General

Type, material, corrosion resistance, size and sufficient length to penetrate the supporting member a minimum of 25.4 mm 1 inch with other properties required to fasten miscellaneous metal framing members to substrates in accordance with the metal panel manufacturer's and ASCE 7 requirements.

2.6.2 Exposed Fasteners

Fasteners for metal panels to be corrosion resistant coated steel, aluminum, stainless steel, or nylon capped metal steel compatible with the sheet panel or flashing and of a type and size recommended by the manufacturer to meet the performance requirements and design loads. Fasteners for accessories to be the manufacturer's standard. Provide an integral metal washer matching the color of attached material with compressible sealing EPDM gasket approximately .09 mm 3/32 inch thick.

2.6.3 Screws

Screws to be corrosion resistant coated steel, aluminum and/or stainless steel being the type and size recommended by the manufacturer to meet the performance requirements.

2.6.4 Rivets

Rivets to be closed-end type, corrosion resistant coated steel, aluminum or stainless steel where watertight connections are required.
2.6.5 Attachment Clips

Fabricate clips from steel hot-dipped galvanized in accordance with ASTM A653/A653M or Series 300 stainless steel. Size, shape, thickness and capacity as required meeting the insulation thickness and design load criteria specified.

2.7 FRAMES AND MATERIALS FOR OPENINGS

2.7.1 Doors

The switchgear house must be provided with a minimum of [two] [_____] entrance doors. The doors must be double wall construction, with brushed aluminum panic hardware with cylinder lock and thumb latch, brushed aluminum automatic closure with built-in hold open device, stainless steel hinges, threshold, weather-stripping, drip shields/water flashing, "DANGER, HIGH VOLTAGE, KEEP OUT" sign.[ Provide a [304 mm] [12-inch] [_____] removable transom above the equipment door to allow for future equipment removal.] The personnel door must be [914 mm by 2438 mm] [36-inch by 96-inch] [______]. The equipment door must be [1219 mm by 2438 mm] [48-inch by 96-inch] [______].

Fire-Rated and Non-Fire-Rated Door Assemblies conforming with NFPA 80 and based on testing according to NFPA 252 as specified in Division 08 - OPENINGS unless otherwise indicated. Doors must open in the direction of egress from the electrical space and be equipped with listed panic hardware and wind safety chain.

Entrance and egress from the electrical equipment working space must be in accordance with NFPA 70, Article 110.

[ For equipment requiring rear access, provide rear access doors in exterior walls. Doors must be equipped as follows:

a. Posts (mullions) must be easily removable (allowing total door and post removal) providing full open access, of (at least) any four continuous doors without temporary structural reinforcement, for potential equipment replacement or the addition of future equipment.

b. Stainless steel continuous piano type hinge.

c. Stainless steel pad lockable vault handle.

d. Three-point latching system.

e. Full gasketing and drip shield.

f. Signage as appropriate for internal equipment.

g. Hold open device.

h. Metal inner skin over insulation welded to door.

i. "Danger High Voltage / Keep Out" signs.
2.8 ACCESSORIES

2.8.1 General

All accessories to be compatible with the metal panels; sheet metal flashing, trim, metal closure strips, caps and similar metal accessories must not be less than the minimum thickness specified for the metal panels. Exposed metal accessories/finishes to match the panels furnished, except as otherwise indicated. Molded foam rib, ridge and other closure strips to be non-absorbent closed-cell or solid-cell synthetic rubber or pre-molded neoprene to match configuration of the panels.

2.8.2 Roof and Wall Accessories and Specialties

[Aluminum ][Steel ]roof curbs, equipment supports, roof hatches, dropout-type heat and smoke vents, hatch-type heat and smoke vents, gravity and roof ridge ventilators, wall louvers and other miscellaneous roof and wall equipment or penetrations conforming to AAMA, ASTM, and UL as specified in Division 07 unless otherwise indicated.

2.8.3 Insulation

Faced, Glass-Fiber Blanket Insulation: ASTM C665, Type [I, blankets without membrane coverings][ and ][II, blankets with non-reflecting coverings][ and ][III, blankets with reflective coverings]; Class [A, membrane-faced surface with a flame spread of 25 or less] [B, membrane-faced surface with a flame propagation resistance; critical radiant flux of 0.12 W/m² 0.11 Btu/ft² or greater], except a flame spread rating of [25] [75] [100] or less[ and a smoke developed rating of 150 or less] when tested in accordance with ASTM E84.

2.8.3.1 Polyethylene Vapor Retarder

Install polyethylene vapor retarder membrane over entire [wall][ and roof] surface. Use fully compatible polyethylene tape to seal the edges of the sheets to provide a vapor tight membrane. Lap sheets not less than 150 mm 6 inch. Provide sufficient material to avoid inducing stresses in sheets due to stretching or binding. All tears or punctures visible in the finished surface, at anytime during the construction process, must be sealed with polyethylene tape.

2.8.3.2 Wall Liner

Securely fasten wall liner into place in accordance with the manufacturer's recommendation and in a neatly presented appearance.

2.8.4 Rubber Closure Strips

Closed-cell, expanded cellular rubber conforming to ASTM D1056 and ASTM D1667; extruded or molded to the configuration of the specified metal panel and in lengths supplied by the metal panel manufacturer.

2.8.5 Metal Closure Strips

Factory fabricated [aluminum] [steel] closure strips to be the same [gauge] [thickness], color, finish and profile of the specified [roof] [wall] panel.
2.8.6 Joint Sealants

2.8.6.1 Sealants

Sealants are to be an approved gun type for use in hand or air-pressure caulking guns at temperatures above 4 degrees C 40 degrees F (or frost-free application at temperatures above minus 12 degrees C 10 degrees F with minimum solid content of 85 percent of the total volume. Sealant is to dry with a tough, durable surface skin which permits it to remain soft and pliable underneath, providing a weather-tight joint. No migratory staining is permitted on painted or unpainted metal, stone, glass, vinyl, or wood.

Prime all joints to receive sealants with a compatible one-component or two-component primer as recommended by the metal panel manufacturer.

2.8.6.2 Shop-Applied

Sealant for shop-applied caulking must be an approved gun grade, non-sag one component polysulfide or silicone conforming to ASTM C920, Type II, and with a curing time to ensure the sealant's plasticity at the time of field erection.

2.8.6.3 Field-Applied

Sealant for field-applied caulking must be an approved gun grade, non-sag one component polysulfide or two-component polyurethane with an initial maximum Shore A durometer hardness of 25, and conforming to ASTM C920, Type II. Color to match panel colors.

2.8.6.4 Tape Sealant

Pressure sensitive, 100 percent solid with a release paper backing; permanently elastic, non-sagging, non-toxic and non-staining as approved by the metal panel manufacturer.

2.8.6.5 Floor Cutouts

Floor Cutouts: Under equipment for cable entry and exit from below floor with gasketed 1.214 mm 12 ga galvanized top cover plates attached to the floor by screws.

2.8.6.6 Stairs and Landings

Where required for access, provide landings and stairs for the building. The stairs must be hot-dipped galvanized after fabrication.

2.9 SHEET METAL FLASHING AND TRIM

2.9.1 Fabrication

Shop fabricate sheet metal flashing and trim where practicable to comply with recommendations in SMACNA 1793 that apply to design, dimensions, metal, and other characteristics of item indicated. Obtain field measurements for accurate fit before shop fabrication.

Fabricate sheet metal flashing and trim without excessive oil canning, buckling, and tool marks and true to line and levels indicated, with exposed edges folded back to form hems.

SECTION 26 13 14 Page 38
2.10 FINISHES

2.10.1 General

Comply with NAAMM AMP 500 for recommendations for applying and designating finishes.

2.10.2 Appearance of Finished Work

Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

2.11 HEATING VENTILATION AND AIR CONDITIONING (HVAC)

2.11.1 HVAC Performance

[a. Redundancy: NONE. One or multiple units as required to meet atmospheric and internal heating and cooling requirements.

][b. Redundancy: N+1. Multiple units as required to meet atmospheric and internal heating and cooling requirements plus one additional unit for redundancy purposes.

][c. Redundancy: 100 percent. Two independent systems consisting of multiple units as required meeting atmospheric and internal heating and cooling requirements.

] d. Exterior Design Temperatures:

(1) Summer: (Per ASHRAE 2.5 percent design temperature).

(2) Winter: (Per ASHRAE 97.5 percent design temperature).

e. Interior Design Temperatures:

(1) Summer: 27 degrees C 80 degree F.

(2) Winter: 16 degrees C 60 degree F.

f. Occupancy: Number of Persons [____].

g. Ventilation Air (cfm): [____].

2.11.2 General

The switchgear house must be provided with self-contained, package type HVAC system. It must consist of through-the-wall type units. The system must have a free or ducted air discharge and return. The total design load for the system must include infiltration, ventilation load and heat generated by the equipment within the house. Provide at least 0.762 (l/s)/sq m 0.15 cfm/sq feet of mechanical induced outside air for ventilation. The HVAC system must be provided with an electronic, automatic changeover thermostat.

HVAC system must maintain the maximum interior temperature required with consideration to ambient conditions and the specified internal equipment.
total heat load.

HVAC Unit(s): Size and quantity as required to maintain interior design temperatures and redundancy requirements. Industrial quality, vertical, self-contained, wall mounted unit(s) with aluminum fin, and copper coils:

a. Cooling capacity: [_____] tons capacity as required to meet design temperatures as specified.

b. Heating capacity: [_____] Kw as required to meet design temperatures as specified.

c. Thermostat, Auto Change Over, Digital, F or C Display:
   (1) Smart recovery (heating mode).
   (2) Droopless control, 4 cycles/hr.
   (3) Backlit display.
   (4) Settings never lost during power failure.
   (5) 5-minute compressor protection.
   (6) Separate set points for heating and cooling.
   (7) Battery-less operation.
   (8) Electro-Mechanical relay design.

d. Low Pressure Switch.

e. High Pressure Switch.

f. Low Ambient Control.

g. Compressor anti-cycle relay.

h. Alarm Relay.

i. Barometric Damper.

j. Supply and Return Grills.

k. Pleated Filter 51 mm 2 inches MERV 8.

l. R410A Refrigerant.

2.12 ELECTRICAL

2.12.1 General

Provide conductors, conduits, fittings, panelboards, circuit breakers, receptacles, GFI receptacles, toggle switches, [dry-type transformers,][ automatic transfer switches,] surge protective devices, lighting contactors, grounding and related switchgear house accessories in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. All electrical equipment and devices must be UL listed. All wiring must be
installed in metallic conduit. Utilize EMT for interior locations and rigid galvanized steel for exterior locations and areas subject to physical damage. Access and working space must be maintained about all electrical equipment to permit ready and safe operation and maintenance of such equipment in accordance with NFPA 70, Article 110.

2.12.2 Interior Lighting

Provide surface mounted interior LED lighting fixtures in accordance with Section 26 51 00 INTERIOR LIGHTING. The interior lighting system must provide a minimum light level of 300 lux with a 3:1 average to minimum ratio. Provide toggle switch type control at each entry door to the switchgear house.

2.12.3 Exit Signs

Provide LED lamp exit sign that operates in normal, AC input with emergency battery power backup in accordance with Section 26 51 00 INTERIOR LIGHTING.

2.12.4 Emergency Lighting

Provide battery backup type emergency lighting units at each entry door. The emergency lighting units must be in accordance with Section 26 51 00 INTERIOR LIGHTING.

2.12.5 Wiring

Provide normal lighting and exit-emergency combo units lighting on the same branch circuit. Wire exit-emergency combo units ahead of the local switch within the same area.

2.12.6 Exterior Lighting

Provide wall pack LED luminaires that are suitable for outdoor applications in accordance with Section 26 56 00 EXTERIOR LIGHTING. Mount wall pack LED luminaires exterior of the switchgear house and above personnel exit doors. Wall packs must utilize LED sources. Wall packs must be constructed of rugged, weather resistant, die cast aluminum housing with an integral photocell. Control for exterior lighting must be in accordance with ASHRAE 90.1 - IP.

2.12.7 Metal-Clad Switchgear

Provide in accordance with Section 26 13 13 METAL-CLAD SWITCHGEAR.

2.12.8 Grounding

Provide grounding system in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide listed grounding pads welded to the switchgear house skid base for bonding of the steel structure in two places.

2.12.9 Lightning Protection System

Provide lightning protection system in accordance with Section 26 41 00 LIGHTNING PROTECTION SYSTEM.
PART 3   EXECUTION

3.1   EXECUTION

3.1.1   Examination

Before the installation begins, conduct an inspection with the erector present. The inspection must ensure that the following items are in compliance with the switchgear house manufacturer's approved shop drawings.

a. Concrete foundation dimensions and layout.
b. Anchor bolt size, type and placement.
c. Survey information showing the foundation elevations.
d. Location of bearing plates and other embedment's to receive structural framing.

Examine roughing-in for electrical feeders serving the contained switchgear and equipment within the switchgear house to ensure proper placement.

Submit to the Contracting Officer a written report, endorsed by Erector, listing conditions detrimental to performance of the Work.

Proceed with erection only after unsatisfactory conditions have been corrected.

3.2   INSTALLATION

Electrical installations must conform to IEEE C2, NFPA 70, and to the requirements specified herein.

3.3   GROUNDING

NFPA 70 and IEEE C2, except that grounds and grounding systems must have a resistance to solid earth ground not exceeding 5 ohms.

3.3.1   Grounding Electrodes

Provide driven ground rods as specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION.

3.3.2   Connections

Connections must be installed as specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION. Inaccessible connections or connections below finished grade must be exothermic weld type.

3.3.3   Grounding and Bonding Equipment

Grounding and bonding of equipment must be in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. The switchgear house steel structure must be bonded to the grounding system.

3.4   INSTALLATION OF EQUIPMENT AND ASSEMBLIES

Install and connect the switchgear house furnished under this section as indicated on project drawings, the approved shop drawings, and as specified
herein.

3.5  FOUNDATION FOR EQUIPMENT AND ASSEMBLIES

Mount the switchgear house on concrete slab as required to satisfy the required loading. The mounting design must be performed by a registered structural engineer and included in the Structural Design Report which is sealed by the structural engineer of record. Provide conduit turn-ups and cable entrance space required by the equipment to be mounted. Seal voids around conduit openings in slab with water and oil-resistant caulking or sealant.

3.6  FIELD QUALITY CONTROL

3.6.1  Performance of Acceptance Checks and Tests

Perform in accordance with the manufacturer's recommendations and include the following visual and mechanical inspections and electrical tests, performed in accordance with NETA ATS.

3.6.2  Grounding System

a.  Visual and Mechanical Inspection

   (1) Inspect ground system for compliance with contract plans and specifications.

b.  Electrical Tests

   (1) Perform ground-impedance measurements utilizing the fall-of-potential method. On systems consisting of interconnected ground rods, perform tests after interconnections are complete. On systems consisting of a single ground rod perform tests before any wire is connected. Take measurements in normally dry weather, not less than 48 hours after rainfall. Use a portable ground testing megger in accordance with manufacturer's instructions to test each ground or group of grounds. The instrument must be equipped with a meter reading directly in ohms or fractions thereof to indicate the ground value of the ground rod or grounding systems under test.

   (2) Submit the measured ground resistance of each ground rod and grounding system, indicating the location of the rod and grounding system. Include the test method and test setup (i.e., pin location) used to determine ground resistance and soil conditions at the time the measurements were made.

3.6.3  Follow-Up Verification

Upon completion of acceptance checks, settings, and tests, the Contractor must show by demonstration in service that circuits and devices are in good operating condition and properly performing the intended function. Circuit breakers must be tripped by operation of each protective device. Test must require each item to perform its function not less than three times. As an exception to requirements stated elsewhere in the contract, notify the Contracting Officer 10 working days in advance of the dates and times for checks, settings, and tests.
3.7 WARRANTY

3.7.1 Manufacturer's Warranty

Submit all manufacturers' signed warranties to Contracting Officer prior to final commissioning and acceptance.

3.7.2 Contractor's Warranty for Installation

Submit warranty for installation to the Contracting Officer prior to final commissioning and acceptance.

NOTE: This guide specification covers the requirements for surge and lightning arresters of the distribution, intermediate, and station types. Show type, voltage, mounting, and connection details on drawings.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1   GENERAL

1.1   REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically
place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text are automatically deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

**ASTM INTERNATIONAL (ASTM)**

ASTM A123/A123M  

ASTM A153/A153M  
(2016a) Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware

**INSTITUTE OF ELECTRICAL AND ELECTRONICS ENGINEERS (IEEE)**

IEEE 386  
(2016) Separable Insulated Connector Systems for Power Distribution Systems Rated 2.5 kV through 35 kV

IEEE C2  

IEEE C62.11  
(2020) Standard for Metal-Oxide Surge Arresters for Alternating Current Power Circuits (>1kV)

**NATIONAL AERONAUTICS AND SPACE ADMINISTRATION (NASA)**

RCBEA GUIDE  

**NATIONAL FIRE PROTECTION ASSOCIATION (NFPA)**

NFPA 70

1.2 **SUBMITTALS**

**NOTE:** Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other
submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data
  Surge Arrester; G[, [___]]

SD-08 Manufacturer's Instructions
  Installation Instructions

SD-10 Operation and Maintenance Data
  Operation and Maintenance Manuals

1.3 QUALITY CONTROL

1.3.1 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Ensure equipment, materials, installation, and workmanship are in accordance with the mandatory and advisory provisions of NFPA 70, IEEE C2 unless more stringent requirements are specified or indicated.
1.3.2 Standard Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship. Provide products which have been in satisfactory commercial or industrial use for 2 years prior to bid opening. Ensure the 2-year period includes applications of equipment and materials under similar circumstances and of similar size. Ensure the product has been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period. Where two or more items of the same class of equipment are required, these items must be products of a single manufacturer.

Products manufactured more than 3 years prior to date of delivery to site are not to be used, unless specified otherwise.

1.3.3 Predictive Testing and Inspection Technology Requirements

**************************************************************************
NOTE: The Predictive Testing and Inspection (PT&I) tests prescribed in Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS are MANDATORY for all NASA assets and systems identified as Critical, Configured, or Mission Essential. If the system is non-critical, non-configured, and not mission essential, use sound engineering discretion to assess the value of adding these additional test and acceptance requirements. See Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS for additional information regarding cost feasibility of PT&I.
**************************************************************************

This section contains systems and equipment components regulated by NASA's Reliability Centered Building and Equipment Acceptance Program. This program requires the use of Predictive Testing and Inspection (PT&I) technologies in conformance with RCBEA GUIDE to ensure building equipment and systems have been installed properly and contain no identifiable defects that shorten the design life of a system and its components. Satisfactory completion of all acceptance requirements is required to obtain Government approval and acceptance of the work.

Perform PT&I tests and provide submittals as specified in Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS.

PART 2 PRODUCTS

Submit surge arrester equipment and performance data including life, test, system functional flows, safety features, and fabrication drawings that show assembly and fabrication details performed in the factory.

Submit manufacturer's installation instructions for surge arresters including special provisions required to install equipment components and system packages. Provide special notices that detail impedances, hazards and safety precautions.
2.1 EQUIPMENT

Provide arresters that comply with IEEE C62.11 for design, fabrication, testing, and performance.

**************************************************************************

NOTE: Provide a voltage rating of arresters in accordance with manufacturer's recommendations to meet the maximum continuous line-to-ground operating voltage (MCOV). Consider system neutral, whether grounded, ungrounded, or effectively grounded for all possible conditions of operations, including Phase-to-ground faults, when selecting arrestors.

**************************************************************************

Provide [gapped][gapless] metal oxide varistor (MOV) type, single-phase, single-pole surge arresters that comply with IEEE C62.11 for design, fabrication, testing, and performance. Ensure surge arresters are rated minimum [15][18][21][ ] kilovolts (kV) duty cycle and [12.7][15.3][17][ ] kV Maximum Continuous Operating Voltage (MCOV) with creepage distance in accordance with manufacturer's specifications for the duty cycle and specific type of arrester. Ensure arrester is designed as non-fragmenting.

Provide porcelain surge arrestors consisting of [tube][cage] style fiberglass reinforced plastic epoxy resin structural hollow core surrounding the MOV elements with [silicon rubber polymer][porcelain] housing. Ensure end fittings are attached to the structural hollow core using a pressure controlled crimping process. Seal the interface between the structural hollow core and end fittings to prevent ingress of moisture.

Ensure silicon rubber polymer housing is chemically bonded to the structural hollow core with bond strength greater than the tearing strength of the housing. Provide silicon polymer housing manufactured as a single, continuous part using a high temperature vulcanizing and high pressure injection molding process. Ensure the silicon polymer material is formulated such that it is hydrophobic, non-tracking, erosion resistant, and non-weathering.]

2.1.1 Distribution Class

Provide heavy duty distribution class arresters. Provide corrosion resistant mounting hardware and insulated brackets for riser-pole type arrestors. Provide arrestors installed in a pre-molded rubber elbow for underground distribution systems in accordance with IEEE 386[ and 26 05 13.00 98 MEDIUM-VOLTAGE CABLES].

2.1.2 Intermediate Class

Provide arresters for cubicle, pedestal, platform, or bracket mounting as indicated.

2.1.3 Station Class

Provide single-phase, single-pole, self-supporting type arresters for pedestal, platform, or bracket mounting as indicated.

2.1.4 Mounting Brackets

Provide arresters equipped with suitable mounting brackets for the
applicable method of mounting. For arresters utilizing a hanger frame type
mounting bracket, provide a frame that is a non-corrosive track resistant
glass filled polyester or other suitable non-corrosive and non-conductive
material that provides high mechanical strength. [ Provide arrester
mounting hardware designed for installation in a severe salt-spray
atmosphere and is a zinc-coated or corrosion-resistant metal in accordance
with [ASTM A123/A123M] [ASTM A153/A153M].]

PART 3  EXECUTION

3.1  INSTALLATION

Install and connect arresters in accordance with the manufacturer's
installation instructions.

Make ground connection to a driven ground rod, counterpoise, or station
grounding system and meet the intent of the National Electrical Code,
NFPA 70.

Connect lightning arresters as close as practicable to the apparatus being
protected. When connecting arresters to overhead conductors, use a hot
line clamp. Provide a hot line clamp that is compatible with the conductor
material being used, i.e. aluminum or copper.

Ensure all installations comply with the requirements and recommendations
of NFPA 70 and IEEE C2.

3.2  FIELD QUALITY CONTROL

**************************************************************************
NOTE: If the specified system is identified as
critical, configured, or mission essential, use
Section 01 86 26.07 40 RELIABILITY CENTERED
ACCEPTANCE FOR ELECTRICAL SYSTEMS to establish
predictive and acceptance testing criteria.
**************************************************************************

Perform PT&I tests and provide submittals as specified in Section
01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS.

3.3  CLOSEOUT ACTIVITIES

Submit operation and maintenance manuals for the specified surge arresters.

   2.9.7 Wire and Cable for 400 Hertz (Hz) Circuits
   2.9.8 Metal-Clad Cable
   2.9.9 Armored Cable
   2.9.10 Mineral-Insulated, Metal-Sheathed Cable
   2.9.11 Flat Conductor Cable
   2.9.12 Cable Tray Cable or Power Limited Tray Cable
   2.9.13 Cord Sets and Power-Supply Cords

2.10 SPLICES AND TERMINATION COMPONENTS

2.11 DEVICE PLATES

2.12 SWITCHES
   2.12.1 Toggle Switches
   2.12.2 Switch with Red Pilot Handle
   2.12.3 Breakers Used as Switches
   2.12.4 Disconnect Switches

2.13 FUSES
   2.13.1 Fuseholders
   2.13.2 Cartridge Fuses, Current Limiting Type (Class R)
   2.13.3 Cartridge Fuses, High-Interrupting Capacity, Current Limiting Type (Classes J, L, and CC)
   2.13.4 Cartridge Fuses, Current Limiting Type (Class T)

2.14 RECEPTACLES
   2.14.1 Split Duplex Receptacles
   2.14.2 Weatherproof Receptacles
   2.14.3 Ground-Fault Circuit Interrupter Receptacles
2.14.4 Special Purpose Receptacles
2.14.5 Plugs
2.14.6 Range Receptacles
2.14.7 Dryer Receptacles
2.14.8 Tamper-Resistant Receptacles
2.14.9 Arc-Fault Circuit Interrupter Receptacles

2.15 PANELBOARDS
2.15.1 Enclosure
2.15.2 Panelboard Buses
  2.15.2.1 Panelboard Neutrals for Non-Linear Loads
2.15.3 Circuit Breakers
  2.15.3.1 Multipole Breakers
  2.15.3.2 Circuit Breaker With Ground-Fault Circuit Interrupter
  2.15.3.3 Arc-Fault Circuit Interrupters
2.15.4 Fusible Switches for Panelboards
2.15.5 400 Hz Panelboard and Breakers
2.15.6 Branch Circuit Monitoring Panelboards
2.15.7 Lighting Control Panelboards

2.16 RESIDENTIAL LOAD CENTERS
2.16.1 RLC Buses
2.16.2 Circuit Breakers
  2.16.2.1 Multipole Breakers
  2.16.2.2 Circuit Breaker With Ground-Fault Circuit Interrupter
  2.16.2.3 Arc-Fault Circuit-Interrupters

2.17 LOAD CENTERS FOR HOUSING UNITS
2.17.1 Panelboard Buses
2.17.2 Circuit Breakers
  2.17.2.1 Multipole Breakers
  2.17.2.2 Arc-Fault Circuit-Interrupters

2.18 ENCLOSED CIRCUIT BREAKERS

PART 3 EXECUTION

3.1 INSTALLATION
   3.1.1 Underground Service
   3.1.2 Overhead Service
   3.1.3 Hazardous Locations
   3.1.4 Service Entrance Identification
      3.1.4.1 Labels
   3.1.5 Wiring Methods
      3.1.5.1 Pull Wire
      3.1.5.2 Metal-Clad Cable
      3.1.5.3 Armored Cable
      3.1.5.4 Flat Conductor Cable
   3.1.6 Conduit Installation
      3.1.6.1 Restrictions Applicable to Aluminum Conduit
      3.1.6.2 Restrictions Applicable to EMT
      3.1.6.3 Restrictions Applicable to Nonmetallic Conduit
      3.1.6.4 Restrictions Applicable to Flexible Conduit
      3.1.6.5 Underground Conduit
      3.1.6.6 Conduit Interior to Buildings for 400 Hz Circuits
      3.1.6.7 Conduit for Circuits Rated Greater Than 600 Volts
      3.1.6.8 Conduit Installed Under Floor Slabs
      3.1.6.9 Conduit Through Floor Slabs
      3.1.6.10 Conduit Installed in Concrete Floor Slabs
      3.1.6.11 Stub-Ups
      3.1.6.12 Conduit Support
      3.1.6.13 Directional Changes in Conduit Runs
      3.1.6.14 Locknuts and Bushings
      3.1.6.15 Flexible Connections
      3.1.6.16 Telecommunications and Signal System Pathway
      3.1.6.17 Community Antenna Television (CATV) System Conduits
   3.1.7 Busway Installation
   3.1.8 Cable Tray Installation
   3.1.9 Telecommunications Cable Support Installation
3.1.10 Boxes, Outlets, and Supports
  3.1.10.1 Boxes
  3.1.10.2 Pull Boxes
  3.1.10.3 Extension Rings
3.1.11 Mounting Heights
3.1.12 Nonmetallic Sheathed Cable Installation
3.1.13 Mineral Insulated, Metal Sheathed (Type MI) Cable Installation
3.1.14 Conductor Identification
  3.1.14.1 Marking Strips
3.1.15 Splices
  3.1.15.1 Splices of Aluminum Conductors
3.1.16 Terminating Aluminum Conductors
  3.1.16.1 Termination to Copper Bus
  3.1.16.2 Termination to Aluminum Bus
3.1.17 Covers and Device Plates
3.1.18 Electrical Penetrations
3.1.19 Grounding and Bonding
  3.1.19.1 Ground Rods
  3.1.19.2 Grounding Connections
  3.1.19.3 Ground Bus
  3.1.19.4 Resistance
  3.1.19.5 Telecommunications System
3.1.20 Equipment Connections
3.1.21 Elevator
3.1.22 Government-Furnished Equipment
3.1.23 Repair of Existing Work
  3.1.23.1 Workmanship
  3.1.23.2 Existing Concealed Wiring to be Removed
  3.1.23.3 Removal of Existing Electrical Distribution System
  3.1.23.4 Continuation of Service
3.1.24 Watthour Meters
3.1.25 Surge Protective Devices
3.2 FIELD FABRICATED NAMEPLATE MOUNTING
3.3 WARNING SIGN MOUNTING
3.4 FIELD APPLIED PAINTING
3.5 FIELD QUALITY CONTROL
  3.5.1 Devices Subject to Manual Operation
  3.5.2 600-Volt Wiring Test
  3.5.3 Transformer Tests
  3.5.4 Ground-Fault Receptacle Test
  3.5.5 Arc-Fault Receptacle Test
  3.5.6 Grounding System Test
  3.5.7 Watthour Meter
  3.5.8 Phase Rotation Test

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for the procurement, installation, and testing of electrical wiring systems for construction projects.

Telecommunications cabling is covered in Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLEING SYSTEM. These wiring systems primarily involve voltages of 1,000 volts and less and mainly involve interior systems. When voltages greater than 1,000 volts are brought into a facility, consult and use Section 26 11 16 SECONDARY UNIT SUBSTATIONS; Section 26 12 21 SINGLE-PHASE PAD-MOUNTED TRANSFORMERS; and Section 33 71 01 OVERHEAD TRANSMISSION AND DISTRIBUTION. Also consult Section 33 71 02, UNDERGROUND ELECTRICAL DISTRIBUTION and Section 26 11 14.00 10 MAIN ELECTRIC SUPPLY STATION AND SUBSTATION. Add requirements for materials and procedures for special or unusual design as necessary to fit specific projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).
NOTE: Ensure the following information is shown on the project drawings:

1. Location of equipment

2. Single-line diagrams elevations, limiting dimensions, and equipment ratings which are not covered in the specifications

3. Remote indicating or control requirements.

PART 1   GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 DEFINITIONS

Unless otherwise specified or indicated, electrical and electronics terms used in these specifications, and on the drawings, are as defined in IEEE 100.

1.3 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 QUALITY ASSURANCE

1.4.1 Fuses

Submit coordination data as specified in paragraph, FUSES of this section.

1.4.2 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "must" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Provide equipment, materials, installation, and workmanship in accordance with NFPA 70 unless more stringent requirements are specified or indicated. NECA NEIS 1 shall be considered the minimum standard for workmanship.

1.4.3 Standard Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship and:
a. Have been in satisfactory commercial or industrial use for 2 years prior to bid opening including applications of equipment and materials under similar circumstances and of similar size.

b. Have been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period.

c. Where two or more items of the same class of equipment are required, provide products of a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in this section.

1.4.3.1 Alternative Qualifications

Products having less than a 2-year field service record will be acceptable if a certified record of satisfactory field operation for not less than 6000 hours, exclusive of the manufacturers' factory or laboratory tests, is furnished.

1.4.3.2 Material and Equipment Manufacturing Date

Products manufactured more than 3 years prior to date of delivery to site are not acceptable.

1.5 MAINTENANCE

**************************************************************************
 NOTE: Select the option below only if the system is considered complex and there is a need for detailed system information.
**************************************************************************

1.5.1 Electrical Systems

Submit operation and maintenance data in accordance with Section 01 78 23, OPERATION AND MAINTENANCE DATA and as specified herein. Submit operation and maintenance manuals for electrical systems that provide basic data relating to the design, operation, and maintenance of the electrical distribution system for the building. Include the following:

a. Single line diagram of the "as-built" building electrical system.

b. Schematic diagram of electrical control system (other than HVAC, covered elsewhere).

c. Manufacturers' operating and maintenance manuals on active electrical equipment.

1.6 WARRANTY

Provide equipment items supported by service organizations that are reasonably convenient to the equipment installation in order to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

1.7 SEISMIC REQUIREMENTS
NOTE: Do not use this paragraph for Navy projects. When directed to meet seismic requirements, edit Sections 13 48 73 SEISMIC CONTROL FOR MECHANICAL EQUIPMENT and 26 05 48.00 10 SEISMIC PROTECTION FOR ELECTRICAL EQUIPMENT to suit the project and include in the contract documents. Edit the following paragraph and include it in the project specification. When a Government designer is the Engineer of Record, provide seismic requirements on the drawings.

**************************************************************************
Provide seismic details conforming to Section 13 48 73 SEISMIC CONTROL FOR MECHANICAL EQUIPMENT and Section 26 05 48.00 10 SEISMIC PROTECTION FOR ELECTRICAL EQUIPMENT as indicated.

PART 2   PRODUCTS

2.1 MATERIALS AND EQUIPMENT

As a minimum, meet requirements of UL, where UL standards are established for those items, and requirements of NFPA 70 for all materials, equipment, and devices.

2.2 CONDUIT AND FITTINGS

**************************************************************************
NOTE: The Uses Permitted are as modified by UFC 3-520-01 (See Table 3-1), "Interior Electrical Systems." The Uses Not Permitted are as specified in NFPA 70 and when restricted by other UFCs for specific types of buildings, such as medical facilities. Do not use flexible metal conduit in damp and wet locations and for pumps. Do not use Electrical Nonmetallic Tubing (ENT).

Use malleable iron seal electrical fittings in fuel valve pits and similar locations where fittings are exposed to potential freeze thaw environments. Nonmetallic fittings have failed in these environments.

**************************************************************************
Conform to the following:

2.2.1 Rigid Metallic Conduit

2.2.1.1 Rigid, Threaded Zinc-Coated Steel Conduit

ANSI C80.1, UL 6.

2.2.1.2 Rigid Aluminum Conduit

ANSI C80.5, UL 6A.

2.2.2 Rigid Nonmetallic Conduit

PVC Type EPC-40[, and EPC-80] in accordance with NEMA TC 2,UL 651[, or fiberglass conduit, in accordance with NEMA TC 14].
2.2.3  Intermediate Metal Conduit (IMC)

UL 1242, zinc-coated steel only.

2.2.4  Electrical, Zinc-Coated Steel Metallic Tubing (EMT)

UL 797, ANSI C80.3.

2.2.5  Plastic-Coated Rigid Steel and IMC Conduit

NEMA RN 1, Type 40 (1 mm 40 mils thick).

2.2.6  Flexible Metal Conduit

UL 1, limited to 1829 mm 6 feet.

2.2.6.1  Liquid-Tight Flexible Metal Conduit, Steel

UL 360, limited to 1829 mm 6 feet.

2.2.7  Fittings for Metal Conduit, EMT, and Flexible Metal Conduit

UL 514B. Ferrous fittings: cadmium- or zinc-coated in accordance with UL 514B.

2.2.7.1  Fittings for Rigid Metal Conduit and IMC

Threaded-type. Split couplings unacceptable.

2.2.7.2  Fittings for EMT

**************************************************************************
NOTE: Moisture absorbed within die-cast fittings may cause them to deteriorate more rapidly than steel fittings. Utilize steel fittings in damp or wet locations, or when requested by Activity on Installations and Bases that have high ambient humidity environments.
**************************************************************************

*[Die Cast][Steel]* compression type.

2.2.8  Fittings for Rigid Nonmetallic Conduit

NEMA TC 3 for PVC[ and NEMA TC 14 for fiberglass], and UL 514B.

2.2.9  Liquid-Tight Flexible Nonmetallic Conduit

**************************************************************************
NOTE: Do not use liquid-tight flexible nonmetallic conduits in Continental United States (CONUS). In overseas locations, only use when specifically allowed by the Authority Having Jurisdiction.
**************************************************************************

UL 1660.
2.3 SURFACE RACEWAY

2.3.1 Surface Metal Raceway

**************************************************************************
NOTE: UFC 3-520-01 authorizes the use of surface metal raceway only for building improvements, renovations or for applications where a variety of cord-and-plug connected equipment will be utilized in a limited space, such as in some areas of medical facilities, shops, and laboratories. Authorized for use on acoustic-rated walls to limit the number of penetrations and maintain acoustical integrity. Typical applications include spaces such as Sensitive Compartmented Information Facilities (SCIF) and Special Access Program Facilities (SAPF).
**************************************************************************

UL 5, two-piece painted steel, totally enclosed, snap-cover type.[ Provide multiple outlet-type raceway with grounding-type receptacle where indicated. Provide receptacles as specified herein, spaced a minimum of one every [455] [_____] mm [18] [_____] inches.][ Wire alternate receptacles on different circuits.]

2.3.2 Surface Nonmetallic Raceway

**************************************************************************
NOTE: The UFC 3-520-01 definition of "subject to physical damage" prohibits the use of nonmetallic wireways for exterior applications installed less than 2.4 meters 8 feet above finished grade or 2.4 meters 8 feet above floor elevation for raceways on elevated platforms, loading docks, or stairwells. Coordinate with the Authority Having Jurisdiction responsible for the construction contract regarding the use of this wiring method in the project.
**************************************************************************

UL 5A, nonmetallic totally enclosed, snap-cover type.[ Provide multiple outlet-type raceway with grounding-type receptacle where indicated. Provide receptacles as specified herein, spaced a minimum of one every [455] [_____] mm [18] [_____] inches.][ Wire alternate receptacles on different circuits.]

2.4 BUSWAY

**************************************************************************
NOTE: Ensure phase sequence of voltages and orientation are indicated on the drawings for existing transformers, switchboards, switchgear, and motor control centers.
**************************************************************************

NEMA BU 1.1, UL 857. Provide the following:

a. Buses: [ copper][ or ] [ aluminum].

b. Busways: rated [_____] volts, [_____] continuous current amperes, three-phase,[ three-][ four-] wire, and include integral or internal[
50-percent ground bus.

c. Short circuit rating: [ [_____] root mean square (rms) symmetrical amperes minimum][ as indicated].

]

] e. Enclosures: [ steel] [ aluminum] [ metallic].

] f. Hardware: plated or otherwise protected to resist corrosion.

] g. Joints: one-bolt type with through-bolts, which can be checked for tightness without de-energizing system.

] h. Maximum hot spot temperature rise at any point in busway at continuous rated load: do not exceed 55 degrees C above maximum ambient temperature of 40 degrees C in any position.

] i. Internal barriers to prevent movement of superheated gases.

] j. Coordinate proper voltage phasing of entire bus duct system, for example where busway interfaces with transformers, switchgear, switchboards, motor control centers, and other system components.

2.4.1 Feeder Busways

Provide[ ventilated, except that vertical busways within 1830 mm 6 feet of floors must be unventilated,][ unventilated, totally enclosed] low-impedance busway. Provide bus bars fully covered with insulating material, except at stabs. Provide an entirely polarized busway system.

2.4.2 Plug-In Busways

Unventilated type. Provide the following:

a. Plug-in units: [ fusible, handle-operated, switch type, horsepower-rated][ circuit breaker-type][ handle-operated, switch type, equipped with high interrupting-capacity, current-limiting fuses].

b. Bus bars: covered with insulating material throughout, except at joints and other connection points.

] c. A hook stick of suitable length for operating plug-in units from the floor.

]2.5 CABLE TRAYS

**************************************************************************
NOTE: Indicate cable tray layout on the drawings.
When multiple types and sizes are used, indicate size and type of cable trays on the drawings. When using "as indicated" option, ensure information required is shown on the drawings.
**************************************************************************

NEMA VE 1. Provide the following:

] Submit cable tray design, including dimensional layout, load and seismic calculations, and fill calculations. Dimensional layout includes cable
spacings, cable tray splices, and supports. Fill calculations include an
index of cables for each section and identification of the lb/ft, cross
sectional area, and insulation voltage class for each cable.

a. Cable trays: form a wireway system, with a nominal [75] [100] [150] mm

b. Cable trays: constructed of [aluminum] [copper-free aluminum] [steel
   that has been zinc-coated after fabrication].

c. Cable trays: include splice and end plates, dropouts, and
   miscellaneous hardware.

d. Edges, fittings, and hardware: finished free from burrs and sharp edges.

e. Fittings: ensure not less than load-carrying ability of straight tray
   sections and have manufacturer's minimum standard radius.

f. Radius of bends: [305] [610] [915] mm [12] [24] [36] inches. [as
   indicated.]

2.5.1 Basket-Type Cable Trays

******************************************************************************
NOTE: Basket cable tray is a fabricated structure
consisting of wire mesh bottom and side rails.
******************************************************************************

Provide [size as indicated] [of nominal [50,] [100,] [150,] [200,] [300,]
[450,] [and] [600] mm [2,] [4,] [6,] [8,] [12,] [18,] [and] [24] inch width
and [25,] [50,] [and] [100] mm [1,] [2,] [and] [4] inch depth] with
maximum wire mesh spacing of 50 by 100 mm 2 by 4 inch.

2.5.2 Trough-Type Cable Trays

******************************************************************************
NOTE: Trough or ventilated cable tray is a
fabricated structure consisting of integral or
separate longitudinal rails and a bottom having
openings sufficient for the passage of air and
utilizing 75 percent or less of the plan area of the
surface to support cables.
******************************************************************************

Provide [size as indicated] [of nominal [150] [305] [455] [610] [760] [915]
mm [6] [12] [18] [24] [30] [36] inch width]. [Cable tray must be suitable
for use as an equipment grounding conductor.]

2.5.3 Ladder-Type Cable Trays

******************************************************************************
NOTE: Ladder cable tray is a fabricated structure
consisting of two longitudinal side rails connected
by individual transverse members (rungs).
******************************************************************************

Provide [size as indicated] [of nominal [150] [305] [455] [610] [760] [915]
mm [6] [12] [18] [24] [30] [36] inch width] with maximum rung spacing of
[150] [225] [305] [455] mm [6] [9] [12] [18] inches. [Cable tray must be
suitable for use as an equipment grounding conductor.]

2.5.4 Channel-Type Cable Trays

**************************************************************************

NOTE: Channel cable tray is a fabricated structure consisting of a one-piece ventilated-bottom or solid-bottom channel section, not exceeding 152 mm 6 inches in width.

**************************************************************************

Provide[ size as indicated][ of nominal [75] [100] [150] mm [3] [4] [6] inch width]. Provide trays with one-piece construction having slots spaced not more than 115 mm 4 1/2 inches on centers.[ Cable tray must be suitable for use as an equipment grounding conductor.]

2.5.5 Solid Bottom-Type Cable Trays

**************************************************************************

NOTE: Solid bottom or non-ventilated cable tray is a fabricated structure consisting of a bottom without ventilation openings within integral or separate longitudinal side rails.

**************************************************************************

Provide[ size as indicated][ of nominal [150] [305] [455] [610] [760] [915] mm [6][12][18][24][30][36] inch width].[ Provide solid covers.][ Do not provide solid covers.]

2.5.6 Cantilever

Cantilever-type, center-hung cable trays may be provided at the Contractor's option in lieu of other cable tray types specified.

[2.6 OPEN TELECOMMUNICATIONS CABLE SUPPORT

**************************************************************************

NOTE: Utilize open telecommunications cable supports (J-Hooks / J-Supports / D-rings) only as specifically permitted in UFC 3-580-01, Telecommunications, Building Cabling System.

**************************************************************************

2.6.1 Open Top Cable Supports

Provide open top cable supports in accordance with UL 2043. Provide[[ galvanized][ zinc-coated][ stainless] steel] open top cable supports[ as indicated].

2.6.2 Closed Ring Cable Supports

Provide closed ring cable supports in accordance with UL 2043. Provide[[ galvanized][ zinc-coated][ stainless] steel] closed ring cable supports[ as indicated].

2.7 OUTLET BOXES AND COVERS

UL 514A, cadmium- or zinc-coated, if ferrous metal. UL 514C, if nonmetallic.
2.7.1 Floor Outlet Boxes

Provide the following:

a. Boxes: [ adjustable][ nonadjustable] and concrete tight.

c. Telecommunications outlets: consisting of [ surface-mounted, horizontal][ flush], aluminum or stainless steel housing with a receptacle as specified and 25 mm one inch bushed side opening[ 19 mm 3/4 inch top opening].

d. Receptacle outlets: consisting of [ surface-mounted, horizontal][ flush] aluminum or stainless steel housing with duplex-type receptacle as specified herein.

e. Provide gaskets where necessary to ensure watertight installation.

f. Provide plugs with installation instructions to the Contracting Officer for 5 percent of outlet boxes for the capping of outlets upon removal of service fittings.

2.7.2 Outlet Boxes for Telecommunications System

**************************************************************************
NOTE: When using "as indicated" option, ensure information required is shown on the drawings.
Choose 100 mm 4 inch square boxes for single gang, four outlet, copper telecommunications configurations that do not have provision for fiber optic cabling. Choose 120 mm 4 11/16 inch square boxes for 35 mm 1 1/4 inch conduit installations and for outlet boxes that have or may require fiber optic cabling. Larger boxes are required to meet bend radii requirements for fiber optic cable.
**************************************************************************

Provide the following:

a. Standard type [ 100 mm square by 54 mm deep][ 120 mm square by 54 mm deep][ 4 inches square by 2 1/8 inches deep][ 4 11/16 inches square by 2 1/8 inches deep].

b. Outlet boxes for wall-mounted telecommunications outlets: 100 by 54 by 54 mm 4 by 2 1/8 by 2 1/8 inches deep.

c. Depth of boxes: large enough to allow manufacturers' recommended conductor bend radii.

d. Outlet boxes for fiber optic telecommunication outlets: include a minimum 10 mm 3/8 inch deep single or two gang plaster ring as shown and installed using a minimum 27 mm one inch conduit system.

e. Outlet boxes for handicapped telecommunications station: 100 by 54 by
54 mm 4 by 2 1/8 by 2 1/8 inches deep.

2.7.3 Clock Outlet for Use in Other Than Wired Clock System

**************************************************************************
NOTE: Battery-operated clocks are Navy standard.
Retain this paragraph only under special conditions.
**************************************************************************

Provide the following:

a. Outlet box with plastic cover, where required, and single receptacle with clock outlet plate.

b. Receptacle: recessed sufficiently within box to allow complete insertion of standard cap, flush with plate.

c. Suitable clip or support for hanging clock: secured to top plate.

d. Material and finish of plate: as specified in paragraph DEVICE PLATES of this section.

2.8 CABINETS, JUNCTION BOXES, AND PULL BOXES

UL 50; volume greater than 1640 mL 100 cubic inches, NEMA Type 1 enclosure; sheet steel, hot-dip, zinc-coated. Where exposed to wet, damp, or corrosive environments, NEMA Type [3R][4X][_____[as indicated].

2.9 WIRES AND CABLES

Provide wires and cables in accordance applicable requirements of NFPA 70 and UL for type of insulation, jacket, and conductor specified or indicated. Do not use wires and cables manufactured more than 12 months prior to date of delivery to site.

2.9.1 Conductors

**************************************************************************
NOTE: UFC 3-520-01 allows the use of aluminum conductors of equivalent ampacity instead of copper for #4 AWG and larger sizes. If only copper is desired for these applications, select the bracketed option below. The second bracketed option follows the UFC guidance.
**************************************************************************

**************************************************************************
NOTE: In overseas locations, for conductors No. 10 AWG and smaller diameter, give consideration to the use of stranded wires, if suitable terminal devices can be applied which enable proper connection. Also, stranded wires in sizes No. 10 AWG and smaller diameter may be required for projects involving uninterrupted power supply (UPS) installations.
**************************************************************************

Provide the following:

a. Conductor sizes and capacities shown are based on copper, unless.....
indicated otherwise.

b. Conductors No. 8 AWG and larger diameter: stranded.

c. Conductors No. 10 AWG and smaller diameter: solid.

d. Conductors for remote control, alarm, and signal circuits, classes 1, 2, and 3: stranded unless specifically indicated otherwise.

e. [All conductors: copper.][Conductors indicated to be No. 6 AWG or smaller diameter: copper. Conductors indicated to be No. 4 AWG and larger diameter: either copper or aluminum, unless type of conductor material is specifically indicated, or specified, or required by equipment manufacturer.]

[2.9.1.1 Equipment Manufacturer Requirements]

**************************************************************************

NOTE: Use this paragraph only if aluminum conductors are allowed.

**************************************************************************

When manufacturer's equipment requires copper conductors at the terminations or requires copper conductors to be provided between components of equipment, provide copper conductors or splices, splice boxes, and other work required to satisfy manufacturer's requirements.

[2.9.1.2 Aluminum Conductors]

**************************************************************************

NOTE: In certain instances it may be necessary to require compact stranding, i.e., when outside diameter of cable must be limited. When necessary, specify the following: "Provide conductors with compact stranded utilizing method of stranding specified in ASTM B400/B400M; however, provide conductor material as specified herein."

**************************************************************************

Provide aluminum conductors of AA-8000 series electrical grade aluminum alloy conductors. Type EC/1350 aluminum is not acceptable. If Contractor chooses to provide aluminum for conductors No. 4 AWG and larger diameter, Contractor is responsible for increasing conductor size to have same ampacity as copper size indicated; increasing conduit and pull box sizes to accommodate larger size aluminum conductors in accordance with NFPA 70; ensuring that pulling tension rating of aluminum conductor is sufficient; providing panelboards[ and motor control centers] that are UL listed for use with aluminum, and so labeled; relocating equipment, modifying equipment terminations, resizing equipment; and resolving problems that are direct results of providing aluminum conductors in lieu of copper.

[2.9.1.3 Minimum Conductor Sizes]

Provide minimum conductor size in accordance with the following:

a. Branch circuits: No. 12 AWG.

b. Class 1 remote-control and signal circuits: No. 14 AWG.
c. Class 2 low-energy, remote-control and signal circuits: No. 16 AWG.
d. Class 3 low-energy, remote-control, alarm and signal circuits: No. 22 AWG.
e. Digital low voltage lighting control (DLVLC) system at 24 Volts or less: Category [5 UTP] cables in EMT conduit in accordance with DLVLC system manufacturer requirements.

2.9.2 Color Coding

Provide color coding for service, feeder, branch, control, and signaling circuit conductors.

2.9.2.1 Ground and Neutral Conductors

Provide color coding of ground and neutral conductors as follows:

a. Grounding conductors: Green.

c. Exception, where neutrals of more than one system are installed in same raceway or box, other neutrals color coding: white with a different colored (not green) stripe for each.

2.9.2.2 Ungrounded Conductors

Provide color coding of ungrounded conductors in different voltage systems as follows:

a. 208/120 volt, three-phase

(1) Phase A - black

(2) Phase B - red

(3) Phase C - blue

b. 480/277 volt, three-phase

(1) Phase A - brown

(2) Phase B - orange

(3) Phase C - yellow

c. 120/240 volt, single phase: Black and red

d. On three-phase, four-wire delta system, high leg: orange, as required by NFPA 70.

2.9.3 Insulation

**************************************************************************

NOTE: Be sure conduit fill calculations are based on largest diameter insulation type allowed. Designer may select other insulation types which may be more suitable for a particular project. For
rewiring project where existing conduit is to be utilized, specify types THHN and THWN.

Conductors must be sized for ampacity at 60 degrees C or 75 degrees C as required in accordance with Section 110.14 of NFPA 70 for the lowest termination value in the circuit; however, ambient temperature correction may be based on the actual conductor insulation temperature rating per NFPA 70 Section 110.14. This requirement also applies to feeders protected by 100 percent rated circuit breakers.

Unless specified or indicated otherwise or required by NFPA 70, provide power and lighting wires rated for 600-volts,[ Type THWN/THHN conforming to UL 83][ or][ Type[ XHHW][ or][ RHW] conforming to UL 44], except that grounding wire may be type TW conforming to UL 83; remote-control and signal circuits: Type TW or TF, conforming to UL 83. Where equipment or devices require 90-degree Centigrade (C) conductors, provide only conductors with 90-degree C insulation or better.

2.9.4 Bonding Conductors

ASTM B1, solid bare copper wire for sizes No. 8 AWG and smaller diameter; ASTM B8, Class B, stranded bare copper wire for sizes No. 6 AWG and larger diameter.

2.9.4.1 Telecommunications Bonding Backbone (TBB)

NOTE: A Telecommunication Bonding Backbone (TBB) is required between the Primary Bonding Busbar (PBB) and all Secondary Bonding Busbars (SBBs). A TBB is not required for installation with only a single SBB or PBB.

<table>
<thead>
<tr>
<th>Sizing of the TBB</th>
<th>TBB Size (AWG)</th>
</tr>
</thead>
<tbody>
<tr>
<td>less than 4 13</td>

<tr>
<td>greater than 20 66</td>
<td>3/0</td>
</tr>
</tbody>
</table>

Choose the second bracketed options where lightning
protection system is provided in the job and specified in other sections.

Choose insulated TBB when pathway is a dissimilar metal than copper. See TIA-607-D Section 6.3.1 through 6.3.6 for further information.

**************************************************************************

Provide a copper conductor TBB in accordance with TIA-607 with No. 6 AWG minimum size, and sized at 2 kcmil per linear foot of conductor length up to a maximum size of 750 kcmil. Provide insulated TBB with insulation as specified in the paragraph INSULATION and meeting the fire ratings of its pathway.

2.9.4.2 Bonding Conductor for Telecommunications

Provide a copper conductor Bonding Conductor for Telecommunications between the telecommunications main grounding busbar (PBB) and the electrical service ground in accordance with TIA-607. Size the bonding conductor for telecommunications the same as the TBB.

[2.9.5 Service Entrance Cables]

Service Entrance (SE) and Underground Service Entrance (USE) Cables, UL 854.

[2.9.6 Nonmetallic Sheathed Cable]

**************************************************************************

NOTE: UFC 3-520-01 authorizes Type NC and NMC cables only in one- and two-family dwellings including attached or detached garages and storage buildings.

**************************************************************************

UL 719, Type NM or NMC.

[2.9.7 Wire and Cable for 400 Hertz (Hz) Circuits]

Insulated copper conductors.

[2.9.8 Metal-Clad Cable]

**************************************************************************

NOTE: Type MC cable is UL listed and NFPA 70 recognized for most common building applications. Review NFPA 70. MC cable does not protect conductors as well as rigid conduit but is more flexible to install and relocate. For Navy projects, consult with NAVFAC cognizant FEC electrical design branch manager and obtain written approval before specifying this wiring method.

**************************************************************************

NOTE: UFC 3-520-01 prohibits using Type MC cable except for branch circuits in the following dry locations: new construction and renovations in exposed locations; concealed in renovations in existing areas where walls and ceilings are not
**disturbed; and cable trays.**

UL 1569; NFPA 70, Type MC cable.

][2.9.9 Armored Cable

**************************************************************************

**NOTE:** UFC 3-520-01 prohibits using Type AC cable except for branch circuits in the following dry locations: new construction and renovations in exposed locations; concealed in renovations in existing areas where walls and ceilings are not disturbed; and cable trays.

**************************************************************************

UL 4; NFPA 70, Type AC cable.

][2.9.10 Mineral-Insulated, Metal-Sheathed Cable

**************************************************************************

**NOTE:** Type MI cable is used for low temperature, high temperature, hazardous locations, life safety, and heating applications. Refer to NFPA 70. Clearly show the MI cable on the drawings. If MI cable utilized in hazardous areas is likely to be subject to high voltage surges, consider the use of surge suppressors in electrical panels serving the load from outside of the hazardous area. Locate suppressors in appropriately rated enclosures within the hazardous area only if there is no other option. MI cable is not available in ratings above 600 volts.

**************************************************************************

UL listed; NFPA 70, Type MI cable. Do not use sheathing containing asbestos fibers.

][2.9.11 Flat Conductor Cable

**************************************************************************

**NOTE:** Type FCC cable has been listed by UL and recognized by NFPA 70 for under carpet tile applications. Review NFPA 70. FCC cable is available off the shelf for power and telecommunications transmission applications.

**************************************************************************

UL listed; NFPA 70, Type FCC.

][2.9.12 Cable Tray Cable or Power Limited Tray Cable

UL listed; type TC or PLTC.

][2.9.13 Cord Sets and Power-Supply Cords

**************************************************************************

**NOTE:** Include this paragraph when equipment utilizing cord sets is permanently connected to
boxes in lieu of use of plug and receptacles.

**************************************************************************
UL 817.

2.10 SPLICES AND TERMINATION COMPONENTS

UL 486A-486B for wire connectors and UL 510 for insulating tapes. Connectors for No. 10 AWG and smaller diameter wires: insulated, pressure-type in accordance with UL 486A-486B or UL 486C (twist-on splicing connector). Provide solderless terminal lugs on stranded conductors.

2.11 DEVICE PLATES

**************************************************************************
NOTE: Use last item below for brig facilities only.
**************************************************************************

Provide the following:

a. UL listed, one-piece device plates for outlets to suit the devices installed.

b. For metal outlet boxes, plates on unfinished walls: zinc-coated sheet steel or cast metal having round or beveled edges.

c. For nonmetallic boxes and fittings, other suitable plates may be provided.

d. Plates on finished walls: nylon or lexan, minimum 0.792 mm 0.03 inch wall thickness and same color as receptacle or toggle switch with which they are mounted.

e. Plates on finished walls: satin finish stainless steel or brushed-finish aluminum, minimum 0.792 mm 0.03 inch thick.

f. Screws: machine-type with countersunk heads in color to match finish of plate.

g. Sectional type device plates are not be permitted.

h. Plates installed in wet locations: gasketed and UL listed for "wet locations."

i. Device plates in areas normally accessible to prisoners: brown or ivory finish nylon-device plates rated for high abuse. Test device plates for compliance with UL 514A and UL 514C for physical strength. Attach device plates with spanner head bolts.

2.12 SWITCHES

2.12.1 Toggle Switches

**************************************************************************
NOTE: Do not use solderless pressure type toggle switches on Navy projects.
**************************************************************************

NEMA WD 1, UL 20, [ single pole][, double pole][, three-way][, and
four-way], totally enclosed with bodies of thermoplastic or thermoset plastic and mounting strap with grounding screw. Include the following:

a. Handles: [white][ivory][brown] thermoplastic.

b. Wiring terminals: screw-type, side-wired[ or of the solderless pressure type having suitable conductor-release arrangement].

c. Contacts: silver-cadmium and contact arm - one-piece copper alloy.

d. Switches: rated quiet-type ac only, 120/277 volts, with current rating and number of poles indicated.

2.12.2 Switch with Red Pilot Handle

*NEMA WD 1.* Provide the following:

a. Pilot lights that are integrally constructed as a part of the switch's handle.

b. Pilot light color: red and illuminate whenever the switch is closed or "on".

c. Pilot lighted switch: rated 20 amps and 120 volts or 277 volts as indicated.

d. The circuit's neutral conductor to each switch with a pilot light.

2.12.3 Breakers Used as Switches

For 120- and 277-Volt fluorescent fixtures, mark breakers "SWD" in accordance with *UL 489.*

2.12.4 Disconnect Switches

**************************************************************************
NOTE: Select heavy duty-type for those switches requiring frequent operation and indicate as such on the drawings. Use NEMA 4X stainless steel switch enclosures for switches located on building exteriors in areas where salt spray or extended high humidity is a concern.
**************************************************************************

*NEMA KS 1.* Provide heavy duty-type switches where indicated, where switches are rated higher than 240 volts, and for double-throw switches. Utilize Class R fuseholders and fuses for fused switches, unless indicated otherwise. Provide horsepower rated for switches serving as the motor-disconnect means. Provide switches in NEMA[ 1][ 3R][ 4X Type 304 stainless steel][4X fiberglass][4X plastic][____], enclosure[ as indicated] per NEMA ICS 6.

2.13 FUSES

**************************************************************************
NOTE: Determine the proper fuse class and type based on the requirements of the electrical system and the equipment serviced. This note briefly summarizes some of the UL fuse standards and their

SECTION 26 20 00 Page 31
application. In addition to 200,000 ampere rms symmetrical UL listing, 300,000 ampere rms symmetrical special purpose rating has been witnessed on UL tested and certified Class RK1, J and Class L.

UL 248-12, Class R: 200,000 ampere, rms symmetrical interrupting rating, RK1 is labeled current limiting, and is available in dual-element time-delay and non-time-delay options. RK5 fuses are dual-element time-delay and labeled current-limiting. Both RK1 and RK5 fuses are rejection type which should be used with rejection mounting on new equipment to satisfy high current interrupting listing by UL. However, these fuses may be used on existing equipment that is non-rejection type as a direct replacement for UL 248-12 fuses.

UL 248-8, UL 248-10, UL 248-4, Classes J, L, and CC: 200,000 ampere, rms symmetrical interrupting rating is available with time-delay option, is not interchangeable with any other UL fuse class, is labeled current-limiting, and is rated 600 volts ac.

UL 248-6, Class H: Maximum 10,000 ampere, symmetrical interrupting rating. Use only in existing equipment where the available fault is known to be less than 10,000 amperes.

UL 248-15, Class T: Maximum 200,000 ampere symmetrical interrupting rating. Is not interchangeable with other UL fuse classes.

NEMA FU 1. Provide complete set of fuses for each fusible[ switch][ panel][ and control center]. Coordinate time-current characteristics curves of fuses serving motors or connected in series with circuit breakers[ or other circuit protective devices] for proper operation. Submit coordination data for approval. Provide fuses with a voltage rating not less than circuit voltage.

2.13.1 Fuseholders

Provide in accordance with UL 4248-1.

2.13.2 Cartridge Fuses, Current Limiting Type (Class R)

UL 248-12, Class[ RK-1][ RK-5][ time-delay type]. Provide only Class R associated fuseholders in accordance with UL 4248-12.

2.13.3 Cartridge Fuses, High-Interrupting Capacity, Current Limiting Type (Classes J, L, and CC)

UL 248-8, UL 248-10, UL 248-4, Class J for zero to 600 amperes, Class L for 601 to 6,000 amperes, and Class CC for zero to 30 amperes.
2.13.4 Cartridge Fuses, Current Limiting Type (Class T)

**UL 248-15**, Class T for zero to 1,200 amperes, 300 volts; and zero to 800 amperes, 600 volts.

2.14 RECEPTACLES

**************************************************************************

NOTE: 1. Provide general purpose convenience receptacles that are specification grade, 20 A, 120 V, duplex. Identify locations where split receptacles will be used with one receptacle controlled by a separate toggle switch. Provide GFI and AFCI protection in accordance with NFPA 70. Use hospital grade receptacles only for those applications that exceed capabilities of specification grade receptacles. Residential grade receptacles are not acceptable.

2. Thermoplastic components provide superior resistance to impacts, chemicals and solvents as compared to thermoset materials. Nylon, Polycarbonate, Polyester, Acrylic and Polypropylene are examples of thermoplastic material. Phenolic. Urea and Melamine are examples of thermoset materials which do not provide high degrees of resistance to impact.

**************************************************************************

Provide the following:

a. [UL 498, general purpose specification grade,] [UL 498, hospital grade,] grounding-type. Residential grade receptacles are not acceptable.

b. Ratings and configurations: as indicated.

c. Bodies: [white] [ivory] [brown] as per NEMA WD 1.

d. Face and body: thermoplastic supported on a metal mounting strap.

e. Dimensional requirements: per NEMA WD 6.

f. Screw-type, side-wired wiring terminals or of the solderless pressure type having suitable conductor-release arrangement.

g. Grounding pole connected to mounting strap.

h. The receptacle: containing triple-wipe power contacts and double or triple-wipe ground contacts.

[i. Controlled receptacles: as required per ASHRAE 90.1. Provide marking for controlled receptacle per NFPA 70.]

2.14.1 Split Duplex Receptacles

Provide separate terminals for each ungrounded pole. One receptacle must be controlled separately.
2.14.2 Weatherproof Receptacles

**************************************************************************
NOTE: Provide die-cast metal/aluminum cover plate when matching existing installation.
**************************************************************************

Provide receptacles, UL listed for use in "wet locations" with integral GFCI protection. Include cast metal box with gasketed, hinged, lockable and weatherproof while-in-use, [polycarbonate, UV resistant/stabilized][die-cast metal/aluminum] cover plate.

2.14.3 Ground-Fault Circuit Interrupter Receptacles

**************************************************************************
NOTE: Ground-fault circuit interrupters are spelled out rather than abbreviated as "GFCI" to avoid a potential conflict with "government furnished, contractor installed equipment".
**************************************************************************

UL 943, duplex type for mounting in standard outlet box. Provide device capable of detecting current leak when the current to ground is 6 milliamperes or higher, and tripping per requirements of UL 943 for Class A ground-fault circuit interrupter devices. Provide screw-type, side-wired wiring terminals or pre-wired (pigtail) leads.

2.14.4 Special Purpose Receptacles

Receptacles serving [_____] are special purpose.[ Provide in ratings indicated.][ NEMA [_____] configuration, rated [_____] amperes, [_____] volts.][ Furnish one matching plug with each receptacle.]

2.14.5 Plugs

Provide heavy-duty, rubber-covered[ three-][ four-][ or][ five-]wire cord of required size, install plugs thereon, and attach to equipment. Provide UL listed plugs with receptacles, complete with grounding blades. Where equipment is not available, turn over plugs and cord assemblies to the Government.

2.14.6 Range Receptacles

NEMA 14-50 configuration,[ flush mounted for housing units,] rated 50 amperes, 125/250 volts.[ Furnish one matching plug with each receptacle.]

2.14.7 Dryer Receptacles

NEMA 14-30 configuration, rated 30 amperes, 125/250 volts.[ Furnish one matching plug with each receptacle.]

2.14.8 Tamper-Resistant Receptacles

**************************************************************************
NOTE: NFPA 70 defines a tamper-resistant receptacle as one which by its construction limits improper access to its energized parts.
**************************************************************************
Provide duplex receptacle with mechanical sliding shutters that prevent the insertion of small objects into its contact slots.

2.14.9 Arc-Fault Circuit Interrupter Receptacles

UL 1699, duplex type for mounting in standard outlet box. Provide device capable of detecting series arcing current when the current to ground is 5 amperes or higher, and tripping per requirements of UL 1699.

2.15 PANELBOARDS

**************************************************************************
NOTE: For residential applications, use paragraph RESIDENTIAL LOAD CENTERS or LOAD CENTERS FOR HOUSING UNITS instead of PANELBOARDS unless required by the local Activity.
**************************************************************************
**************************************************************************
NOTE: For Navy projects, use the first bracketed paragraph. Select item m. below for unique applications involving non-standard frequencies or voltages.

Limit each panelboard to a maximum of 54 poles. Panelboards with up to 54 poles may be used in electrical renovations where the existing panelboards are replaced and wall space for additional panelboards is limited. Do not use dual section panelboards.

**************************************************************************
Provide panelboards in accordance with the following:

[ a. UL 67 and UL 50 having a short-circuit current rating[ as indicated][ of 10,000 amperes symmetrical minimum for voltages 240 V and below][ of 14,000 amperes symmetrical minimum for 480 V].

b. Panelboards for use as service disconnecting means: additionally conform to UL 869A.

d. Designed such that individual breakers can be removed without disturbing adjacent units or without loosening or removing supplemental insulation supplied as means of obtaining clearances as required by UL.

e. "Specific breaker placement" is required in panelboards to match the breaker placement indicated in the panelboard schedule on the design drawings. If it is not possible to match "specific breaker placement" during construction, obtain Government approval prior to device installation.

f. Use of "Subfeed Breakers" is not acceptable.

g. Main breaker: "separately" mounted[ "above"] [ or][ "below"] branch breakers.

h. Where "space only" is indicated, make provisions for future
installation of breakers.

i. Directories: indicate load served by each circuit in panelboard.

j. Directories: indicate source of service to panelboard (e.g., Panel PA served from Panel MDP).

k. Provide new directories for existing panels modified by this project as indicated.

l. Type directories and mount in holder behind transparent protective covering.

m. Panelboards: listed and labeled for their intended use.

n. Panelboard nameplates: provided in accordance with paragraph FIELD FABRICATED NAMEPLATES.

[a. UL 67 and UL 50.

b. Panelboards for use as service disconnecting: additionally conform to UL 869A.

d. Designed such that individual breakers can be removed without disturbing adjacent units or without loosening or removing supplemental insulation supplied as means of obtaining clearances as required by UL.

e. Where "space only" is indicated, make provisions for future installation of breaker sized as indicated.

f. Directories: indicate load served by each circuit of panelboard.

g. Directories: indicate source of service (e.g., upstream panel, switchboard, motor control center) to panelboard.

h. Type directories and mount in holder behind transparent protective covering.

i. Panelboard nameplates: provided in accordance with paragraph FIELD FABRICATED NAMEPLATES.

2.15.1 Enclosure

**************************************************************************

NOTE: For all outdoor applications at project locations with Environmental Severity Classification (ESC) factors of C4 and C5 and all indoor applications in a harsh environment, select NEMA 4X option below. In other outdoor locations, select NEMA 3R option. See UFC 1-200-01 for determination of ESC for project location. Designer to coordinate NEMA designation on drawings.

**************************************************************************

Provide panelboard enclosure in accordance with the following:

a. UL 50.
b. Cabinets mounted outdoors or flush-mounted: [hot-dipped galvanized after fabrication] [fiberglass enclosure].

c. Cabinets: painted in accordance with paragraph PAINTING.

d. Outdoor cabinets: [NEMA 3R raintight] [NEMA 4x] with conduit hubs welded to the cabinet [a removable steel plate 7 mm 1/4 inch thick in the bottom for field drilling for conduit connections].

e. Front edges of cabinets: form-flanged or fitted with structural shapes welded or riveted to the sheet steel, for supporting the panelboard front.

f. All cabinets: fabricated such that no part of any surface on the finished cabinet deviates from a true plane by more than 3 mm 1/8 inch.

g. Holes: provided in the back of indoor surface-mounted cabinets, with outside spacers and inside stiffeners, for mounting the cabinets with a 15 mm 1/2 inch clear space between the back of the cabinet and the wall surface.

h. Flush doors: mounted on hinges that expose only the hinge roll to view when the door is closed.

i. Each door: fitted with a combined catch and lock latch.

j. Keys: two provided with each lock, with all locks keyed alike.

k. Finished-head cap screws: provided for mounting the panelboard fronts on the cabinets.

2.15.2 Panelboard Buses

Support bus bars on bases independent of circuit breakers. Design main buses and back pans so that breakers may be changed without machining, drilling, or tapping. Provide isolated neutral bus in each panel for connection of circuit neutral conductors. Provide separate ground bus identified as equipment grounding bus per UL 67 for connecting grounding conductors; bond to steel cabinet. [In addition to equipment grounding bus, provide second "isolated" ground bus, where indicated.]

**************************************************************************
NOTE: Select the bracketed option below only if the non-linear loads are expected to be a majority of the downstream loads.
**************************************************************************

[2.15.2.1 Panelboard Neutrals for Non-Linear Loads]

Provide in accordance with the following:

a. UL listed, with panelboard type specifically UL heat rise tested for use on non-linear loads.

b. Panelboard: heat rise tested in accordance with UL 67, except with the neutral assembly installed and carrying 200 percent of the phase bus current during testing.
c. Verification of the testing procedure: provided upon request.

d. Two neutral assemblies paralleled together with cable is not acceptable.

e. Nameplates for panelboard rated for use on non-linear loads: marked "SUITABLE FOR NON-LINEAR LOADS" and in accordance with paragraph FIELD FABRICATED NAMEPLATES.

f. Provide a neutral label with instructions for wiring the neutral of panelboards rated for use on non-linear loads.

]2.15.3 Circuit Breakers

**************************************************************************
NOTE: For residential and BEQ/BOQ facility applications, use paragraph RESIDENTIAL LOAD CENTERS or LOAD CENTERS FOR HOUSING UNITS instead of PANELBOARDS unless panelboards with bolt-on breakers are required by the local Activity.
**************************************************************************

UL 489, [thermal magnetic-type] [solid state-type] having a minimum short-circuit current rating equal to the short-circuit current rating of the panelboard in which the circuit breaker will be mounted. Breaker terminals: UL listed as suitable for type of conductor provided. [Where indicated on the drawings, provide circuit breakers with shunt trip devices.] Series rated circuit breakers and plug-in circuit breakers are unacceptable.

2.15.3.1 Multipole Breakers

Provide common trip-type with single operating handle. Design breaker such that overload in one pole automatically causes all poles to open. Maintain phase sequence throughout each panel so that any three adjacent breaker poles are connected to Phases A, B, and C, respectively.

2.15.3.2 Circuit Breaker With Ground-Fault Circuit Interrupter

UL 943 and NFPA 70. Provide with auto-monitoring (self-test) and lockout features, "push-to-test" button, visible indication of tripped condition, and ability to detect and trip when current imbalance is 6 milliamperes or higher per requirements of UL 943 for Class A ground-fault circuit interrupter devices.

2.15.3.3 Arc-Fault Circuit Interrupters

**************************************************************************
NOTE: NFPA 70 requires that all branch circuits that supply 120 volt, single phase, 15 and 20 ampere outlets installed in dwelling unit kitchens, laundry areas, family rooms, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sunrooms, recreation rooms, closets, hallways, or similar rooms or areas and in dormitory units bedrooms, living rooms, hallways, closets, and similar rooms or areas are protected by an arc-fault circuit interrupter to provide protection of entire branch circuit.
**************************************************************************
NOTE: The one pole arc-fault circuit-interrupter is not designed for use on circuits in which the neutral conductor is shared with other circuits (defined as a multiwire branch circuit in NFPA 70) and will nuisance trip on shared neutral circuits. Provide and indicate on the drawings one pole arc-fault circuit-interrupter breakers for each circuit, and do not use shared neutral for these circuits in new construction projects. Where wiring is existing and not replaced and where a shared neutral exists, a two pole, 120/240 volt arc-fault circuit-interrupter for shared neutral circuits may be required. It may also be required in new construction if 120/240 volt equipment or circuit is located in the bedroom. Coordinate the requirement with the cognizant Activity.

UL 489, UL 1699 and NFPA 70. Molded case circuit breakers: rated as indicated. [ Two pole arc-fault circuit-interrupters: rated 120/240 volts. The provision of (two) one pole circuit breakers for shared neutral circuits in lieu of (one) two pole circuit breaker is unacceptable.] Provide with "push-to-test" button.

[2.15.4 Fusible Switches for Panelboards

NEMA KS 1, hinged door-type. Provide switches serving as motor disconnect means rated for kilowatt horsepower.

][2.15.5 400 Hz Panelboard and Breakers

Provide panelboards and breakers for use on 400 Hz systems rated and labeled "400 Hz."

][2.15.6 Branch Circuit Monitoring Panelboards

Provide a microprocessor-based panelboard monitoring system having the following features:

a. ANSI C12.1 and IEC 62053-21 Class 1 energy revenue metering accuracy.

b. Direct reading metered or calculated values for up to forty-two branch circuits.

c. Monitored values at the branch circuit level for current (A), power (kW), and energy (kWh).

d. Four user-configurable alarm thresholds.

e. Communications with building automation system using Modbus RTU protocol via RS-485 cable connection.

][2.15.7 Lighting Control Panelboards

Provided a lighting control panelboard having the following features:

a. Minimum sixteen schedules including a 7-day repeating schedule with
sixteen daily on/off periods.

b. Minimum sixteen lighting zones grouping branch breakers that are controlled by schedules, manual inputs, or override commands.

c. Electronic clock including real-time, astronomical clock, and leap year and daylight savings time adjustments.

d. Burn-hour tracking.

e. Remote circuit breaker operation.

[f. Master Lighting Control Panelboard with controller to control up to [8] [_____] control bussed located [individually][in slave panelboard] up to [400] [_____] feet away from the master panelboard.

] g. Communications with building automation system using Modbus RTU protocol via RS-485 cable connection.

][2.16 RESIDENTIAL LOAD CENTERS

********************************************************************************
NOTE: Use the following paragraph and subparagraphs in lieu of the paragraph PANELBOARD and its subparagraphs if designer has chosen to specify residential load centers in the design. Load centers are permitted only for family housing construction/repair projects. Delete for other projects.
********************************************************************************

Provide residential load centers (RLCs) in accordance with the following:

a. UL 67 and UL 50.

b. RLCs for use as service disconnecting means: additionally conform to UL 869A.

c. Circuit breaker equipped.

d. Designed such that individual breakers can be removed without disturbing adjacent units or without loosening or removing supplemental insulation supplied as means of obtaining clearances as required by UL.

e. Where "space only" is indicated, make provisions for future installation of breakers sized as indicated.

[f. Provide load centers with keyed locks.

] g. Provide printed directories.

2.16.1 RLC Buses

Support bus bars on bases independent of circuit breakers. Design main buses and back pans so that breakers may be changed without machining, drilling, or tapping. Provide isolated groundable neutral bus in each panel for connection of circuit neutral conductors. Provide separate ground bus identified as equipment grounding bus per UL 67 for connecting grounding conductors; bond to steel cabinet.
2.16.2 Circuit Breakers

**UL 489**, thermal magnetic-type with interrupting capacity[ as indicated][ of 10,000 minimum amperes rms symmetrical]. Breaker terminals: UL listed as suitable for the type of conductor provided.

2.16.2.1 Multipole Breakers

Provide common trip-type with single operating handle. Provide a breaker design such that overload in one pole automatically causes all poles to open. Maintain phase sequence throughout each panel so that any two adjacent breaker poles are connected to alternate phases in sequence.

2.16.2.2 Circuit Breaker With Ground-Fault Circuit Interrupter

**************************************************************************

NOTE: Include for all locations required by NFPA 70.

**************************************************************************

**UL 943** and **NFPA 70**. Provide with auto-monitoring (self-test) and lockout features, "push-to-test" button, visible indication of tripped condition, and ability to detect and trip when current imbalance is 6 milliamperes or higher per requirements of **UL 943** for Class A ground-fault circuit interrupter devices.

2.16.2.3 Arc-Fault Circuit-Interrupters

**************************************************************************

NOTE: NFPA 70 requires that all branch circuits that supply 120 volt, single phase, 15 and 20 ampere outlets installed in dwelling unit family rooms, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sunrooms, recreation rooms, closets, hallways, or similar rooms or areas are protected by an arc-fault circuit interrupter to provide protection of entire branch circuit.

**************************************************************************

NOTE: The one pole arc-fault circuit-interrupter is not designed for use on circuits in which the neutral conductor is shared with other circuits (defined as a multiwire branch circuit in NFPA 70) and will nuisance trip on shared neutral circuits. Provide and indicate on the drawings one pole arc-fault circuit-interrupter breakers for each circuit, and do not use shared neutral for these circuits in new construction projects. Where wiring is existing and not replaced and where a shared neutral exists, a two pole, 120/240 volt arc-fault circuit-interrupter for shared neutral circuits may be required. It may also be required in new construction if 120/240 volt equipment or circuit is located in the bedroom. Coordinate the requirement with the cognizant Activity.

**************************************************************************

**UL 489**, **UL 1699** and **NFPA 70**. Molded case circuit breakers: rated as
indicated. [Two pole arc-fault circuit-interrupters: rated 120/240 volts. The provision of (two) one pole circuit breakers for shared neutral circuits in lieu of (one) two pole circuit breaker is unacceptable.] Provide with "push-to-test" button.

[2.17 LOAD CENTERS FOR HOUSING UNITS]

**************************************************************************
NOTE: UFC 3-520-01 allows load center style panelboards, with plug-in breakers, which can be used in housing units and BEQ/BOQ rooms.
**************************************************************************

Provide single-phase panelboards for housing units on this project in accordance with the following:

a. Load center type, circuit breaker equipped, conforming to UL 67 and UL 50.

b. Panelboards series short-circuit current rating: 22,000 amperes symmetrical minimum for the main breaker and the branch breakers.

c. Panelboards for use as service disconnecting means: additionally conform to UL 869A.

d. Designed such that individual breakers can be removed without disturbing adjacent units or without loosening or removing supplemental insulation supplied as means of obtaining clearances as required by UL.

e. "Specific breaker placement" is required in panelboards to match the breaker placement indicated in the panelboard schedule on the drawings.

f. Where "space only" is indicated, make provisions for future installation of breakers.

g. Provide cover with latching door.

h. Directories: indicate load served by each circuit in panelboard.

i. Directories: indicate source of service to panelboard (e.g., Panel PA served from panel MDP)

j. Type directories and mount behind in holder with transparent protective covering on inside of panel door.

2.17.1 Panelboard Buses

Support bus bars on bases independent of circuit breakers. Design main buses and back pans so that breakers may be changed without machining, drilling, or tapping. Provide copper or aluminum bus bars, either tin plated or silver plated. Provide isolated neutral bus in each panel for connection of circuit neutral conductors. Provide separate ground bus identified as equipment grounding bus per UL 67 for connecting grounding conductors; bond to steel cabinet.

2.17.2 Circuit Breakers

UL 489 thermal magnetic type having a minimum short-circuit current rating equal to the short-circuit current rating of the panelboard in which the
circuit breaker will be mounted. Breaker terminals: UL listed as suitable for type of conductor provided. Half-size and tandem breakers are not acceptable. Provide switch duty rated 15 and 20 ampere breakers. Breakers must not require use of panel trim to secure them to the bus.

2.17.2.1 Multipole Breakers

Provide common trip-type with single operating handle. Design breaker such that overload in one pole automatically causes all poles to open. Maintain phase sequence throughout each panel so that any two adjacent breaker poles are connected to Phases A and B respectively.

2.17.2.2 Arc-Fault Circuit-Interrupters

**************************************************************************
NOTE: NFPA 70 requires that all branch circuits that supply 120 volt, single phase, 15 and 20 ampere outlets installed in dwelling unit family rooms, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sunrooms, recreation rooms, closets, hallways, or similar rooms or areas are protected by an arc-fault circuit interrupter to provide protection of entire branch circuit.
**************************************************************************
**************************************************************************
NOTE: The one pole arc-fault circuit-interrupter is not designed for use on circuits in which the neutral conductor is shared with other circuits (defined as a multiwire branch circuit in NFPA 70) and will nuisance trip on shared neutral circuits. Provide and indicate on the drawings one pole arc-fault circuit-interrupter breakers for each circuit, and do not use shared neutral for these circuits in new construction projects. Where wiring is existing and not replaced and where a shared neutral exists, a two pole, 120/240 volt arc-fault circuit-interrupter for shared neutral circuits may be required. It may also be required in new construction if 120/240 volt equipment or circuit is located in the bedroom. Coordinate the requirement with the cognizant Activity.
**************************************************************************

UL 489, UL 1699 and NFPA 70. Molded case circuit breakers: rated as indicated.[ Two pole arc-fault circuit-interrupters: rated 120/240 volts. The provision of (two) one pole circuit breakers for shared neutral circuits in lieu of (one) two pole circuit breaker is unacceptable.] Provide with "push-to-test" button.

2.18 ENCLOSED CIRCUIT BREAKERS

UL 489. Individual molded case circuit breakers with voltage and continuous current ratings, number of poles, overload trip setting, and short circuit current interrupting rating as indicated. Enclosure type as indicated.[ Provide solid neutral.]
**NOTE:** MSCPs, also called motor circuit protectors (MCPs), are components of combination motor controllers rather than fuses or circuit breakers and are permitted if the motor short-circuit protector is part of a listed combination motor controller.

Motor short-circuit protectors, also called motor circuit protectors (MCPs): UL 508 and UL 489, and provided as shown. Provide MSCPs that consist of an adjustable instantaneous trip circuit breaker used only in conjunction with a combination motor controller which provides coordinated motor branch-circuit overload and short-circuit protection. Rate MSCPs in accordance with the requirements of NFPA 70.

**NOTE:** Coordinate the location of dry-type transformers with the mechanical designer to ensure adequate ventilation. This specification does not apply to transformers over 500 kVA, substation transformers, and transformers rated greater than 600 volts; for these types, see Section 26 12 19.10 THREE-PHASE, LIQUID-FILLED PAD-MOUNTED TRANSFORMERS, Section 26 12 21 SINGLE-PHASE PAD-MOUNTED TRANSFORMERS, or Section 26 11 16 SECONDARY UNIT SUBSTATIONS for all projects; or Section 26 11 13.00 20 PRIMARY UNIT SUBSTATIONS for Navy projects; or Section 26 11 14.00 10 MAIN ELECTRIC SUPPLY STATION AND SUBSTATION for Army projects. Specify 80 degrees C rise for dry-type transformers rated less than 15 kVA or 115 degrees C rise for dry-type transformers rated 15 kVA or larger at a maximum ambient temperature of 40 degrees C. Delete quiet type where noise level does not affect personnel. Relative to noise: the least desirable location for the transformer is in a corner of a room, especially when there is a low ceiling.

**NOTE:** NEMA ST 20 is used below as a requirement for general purpose dry-type transformers. Although this document has been withdrawn by NEMA, it is still used as a requirement because manufacturers still use it as a design guide.

**NOTE:** Transformer taps may be Full Capacity Above Nominal (FCAN) which designates the transformer will deliver its rated kVA when connected to a voltage source which is higher than the rated primary voltage, or Full Capacity Below Nominal (FCBN) which designates the transformer will deliver its rated
kVA when connected to a voltage source which is lower than the rated primary voltage. There may be taps plus/minus 2.5 percent or plus/minus 5 percent of the rated primary voltage and different numbers of taps FCAN and FCBN. Use available Cut Sheets or contact the transformer manufacturers to find out the required taps combinations.

Provide transformers in accordance with the following:

a. **NEMA ST 20**, general purpose, dry-type, self-cooled, [ventilated][unventilated][sealed].

b. Provide transformers in NEMA[1][3R][_____] enclosure.

c. Taps for transformers 15 kVA and larger: [Two 2.5 percent taps Full Capacity Above Nominal (FCAN) and four 2.5 percent taps Full Capacity Below Nominal (FCBN)] [Two 2.5 percent taps Full Capacity Above Nominal (FCAN) and two 2.5 percent taps Full Capacity Below Nominal (FCBN)] [_____].

d. Transformer insulation system:

  (1) 220 degrees C insulation system for transformers 15 kVA and greater, with temperature rise not exceeding [115] [80] degrees C under full-rated load in maximum ambient of 40 degrees C.

  (2) 180 degrees C insulation for transformers rated 10 kVA and less, with temperature rise not exceeding 80 degrees C under full-rated load in maximum ambient of 40 degrees C.

e. Transformer of 150 degrees C temperature rise is not acceptable.

f. Transformer of 115 degrees C temperature rise: capable of carrying continuously 115 percent of nameplate kVA without exceeding insulation rating.

g. Transformer of 80 degrees C temperature rise: capable of carrying continuously 130 percent of nameplate kVA without exceeding insulation rating.

h. Transformers: quiet type with maximum sound level at least 3 decibels less than NEMA standard level for transformer ratings indicated.

**2.20.1 Specified Transformer Efficiency**

**NOTE:** Energy Star or energy efficient transformers are generally only available in ventilated enclosures.

Transformers, indicated and specified with: 480V primary, 80 degrees C or 115 degrees C temperature rise, kVA ratings of 37.5 to 100 for single phase or 30 to 500 for three phase, energy efficient type. The transformer is not acceptable if the calculated transformer efficiency is less than the efficiency indicated in 10 CFR 431, Subpart K.
[2.20.2 Transformors With Non-Linear Loads]

NOTE: Complete an analysis of the connected loads to determine the harmonic contents and the appropriate K-Factor rating. K-Factor is defined as the sum from $h=1$ to infinity of $I_h^2 h^2$ where $I_h$ (pu) is the rms current at harmonic "h" (per unit of rated rms load current) and $h$ is the harmonic order. Transformer K-factor ratings must be based on full-load conditions. K-Factor rated transformers ensure the transformer does not overheat and possibly fail. Use K-4 rating when connected loads are comprised of a large number of 100 percent non-linear single phase electronic equipment. Use K-13 rating when connected loads are comprised of single, large electronic loads, or small numbers of comparatively large single phase loads (i.e. mainframe computers or on-line UPS systems). Use caution in specifying K-ratings above K-13, as the impedance generally decreases as the K-ratings increase. Impedances below 3 percent are not recommended for computer loads connected to transformers with high K-ratings, as even higher neutral currents could result and possibly cause malfunctions or damage sensitive load equipment. Derated transformers also may be used to prevent overheating. Use harmonic mitigating transformer (HMT) if standard transformer has to be derated by more than 10 percent. HMT designed to greatly reduce certain harmonics based on their design, and thus reduce exposure to the rest of the electrical system from current harmonics drawn by downstream loads.

Provide transformers for non-linear loads in accordance with the following:

a. Transformer insulation: UL recognized 220 degrees C system. Neither the primary nor the secondary temperature is allowed to exceed 220 degrees C at any point in the coils while carrying their full rating of non-sinusoidal load.

b. Transformers are to be UL listed and labeled for K-4, K-9, K-13, K-Factor rating as indicated in accordance with UL 1561.

c. Transformers evaluated by the UL K-Factor evaluation: listed for 115 80 degrees C average temperature rise only.

d. Transformers with K-Factor ratings with temperature rise of 150 degrees C rise are not acceptable.

e. K-Factor rated transformers impedance: allowed range of 3 percent to 5 percent, with a minimum reactance of 2 percent to prevent excessive neutral current when supplying loads with large amounts of third harmonic.
**NOTE:** Motor and motor controller specifications must be thoroughly coordinated with and cross-referenced in all affected mechanical sections. Apply premium efficiency ratings per the Energy Policy Act of 2005 (EPACT 2005) to all motors. Specify Inverter-Rated motors that feature improved insulation systems for equipment with variable torque loads working with adjustable speed drive (ASD) (also referred to as variable frequency drive VFD) and specify Inverter-Duty motors for equipment with constant torque loads working with ASD per ASD manufacturer requirements including the manufacturer recommended cable type and length. Refer to NEMA MG-1.30. Use three-phase motors if more than 0.5 hp rating. If three-phase service is not available, operate motors larger than 0.5 hp at phase-to-phase voltage. Motors 0.5 hp and smaller should be single phase, with phase-to-phase voltage preferred over phase-to-neutral voltage.

Provide motors in accordance with the following:

a. NEMA MG 1[ except provide fire pump motors as specified in Section 21 30 00] FIRE PUMPS.

b. Hermetic-type sealed motor compressors: Also comply with UL 984.

c. Provide the size in terms of kW HP, or kVA, or full-load current, or a combination of these characteristics, and other characteristics, of each motor as indicated or specified.

d. Determine specific motor characteristics to ensure provision of correctly sized starters and overload heaters.

e. Rate motors for operation on 208-volt, 3-phase circuits with a terminal voltage rating of 200 volts, and those for operation on 480-volt, 3-phase circuits with a terminal voltage rating of 460 volts.

f. Use motors designed to operate at full capacity with voltage variation of plus or minus 10 percent of motor voltage rating.

g. Unless otherwise indicated, use continuous duty type motors if rated 746 Watts 1 HP and above.

h. Where fuse protection is specifically recommended by the equipment manufacturer, provide fused switches in lieu of non-fused switches indicated.

i. Use [Inverter-Rated] [Inverter-Duty] motors designed to operate with adjustable speed drive (ASD).

### 2.21.1 High Efficiency Single-Phase Motors

Single-phase fractional-horsepower alternating-current motors: high efficiency types are not acceptable. In exception, for special purpose
motors and motor-driven equipment with a minimum seasonal or overall efficiency rating, such as a SEER rating, provide equipment with motor to meet the overall system rating indicated.

2.21.2 Premium Efficiency Polyphase and Single-Phase Motors

Select polyphase and continuous-duty single phase motors based on high efficiency characteristics relative to typical characteristics and applications as listed in NEMA MG 10 and NEMA MG 11. In addition, continuous rated, polyphase squirrel-cage medium induction motors must meet the requirements for premium efficiency electric motors in accordance with NEMA MG 1, including the NEMA full load efficiency ratings. In exception, for motor-driven equipment with a minimum seasonal or overall efficiency rating, such as a SEER rating, provide equipment with motor to meet the overall system rating indicated.

2.21.3 Motor Sizes

Provide size for duty to be performed, not exceeding the full-load nameplate current rating when driven equipment is operated at specified capacity under most severe conditions likely to be encountered. When motor size provided differs from size indicated or specified, make adjustments to wiring, disconnect devices, and branch circuit protection to accommodate equipment actually provided. Provide controllers for motors rated 1-hp and above with electronic phase-voltage monitors designed to protect motors from phase-loss, undervoltage, and overvoltage. Provide protection for motors from immediate restart by a time adjustable restart relay.

2.21.4 Wiring and Conduit

Provide internal wiring for components of packaged equipment as an integral part of the equipment. Provide power wiring and conduit for field-installed equipment [using adjustable speed drive (ASD) manufacturer required wiring type and length] [, and motor control equipment forming part of motor control centers or switchgear assemblies, the conduit and wiring connecting such centers, assemblies, or other power sources to equipment] as specified herein. Power wiring and conduit: conform to the requirements specified herein. Control wiring: provided under, and conform to, the requirements of the section specifying the associated equipment.

2.22 MOTOR CONTROLLERS

**************************************************************************

NOTE: Motor and motor controller specifications must be thoroughly coordinated with and cross-referenced in all affected mechanical sections. Indicate NEMA size of controller on mechanical drawings. Provide manual control capability for all installations having automatic control that operates the motor directly. Use a double-throw, three-position switch or other suitable device (marked MANUAL-OFF-AUTOMATIC) for the manual control. Confirm that all safety control devices, such as low-high-pressure cutouts, high-temperature cutouts, and motor overload protective devices, remain connected in the motor control circuit in both the manual and automatic positions. Provide motor controllers (starters) for
motors larger than 0.125 horsepower and apply the design criteria of NEMA ICS 1 and NEMA ICS 2.

Provide motor controllers in accordance with the following:

a. UL 508, NEMA ICS 1, and NEMA ICS 2[; except fire pump controllers as specified in Section 21 30 00 FIRE PUMPS].

b. Provide controllers with thermal overload protection in each phase, and one spare normally open auxiliary contact, and one spare normally closed auxiliary contact.

c. Provide controllers for motors rated 1-hp and above with electronic phase-voltage monitors designed to protect motors from phase-loss, undervoltage, and overvoltage.

d. Provide protection for motors from immediate restart by a time adjustable restart relay.

e. When used with pressure, float, or similar automatic-type or maintained-contact switch, provide a hand/off/automatic selector switch with the controller.

f. Connections to selector switch: wired such that only normal automatic regulatory control devices are bypassed when switch is in "hand" position.

g. Safety control devices, such as low and high pressure cutouts, high temperature cutouts, and motor overload protective devices: connected in motor control circuit in "hand" and "automatic" positions.

h. Control circuit connections to hand/off/automatic selector switch or to more than one automatic regulatory control device: made in accordance with indicated or manufacturer's approved wiring diagram.

i. Provide selector switch with the means for locking in any position.

j. Provide a disconnecting means, capable of being locked in the open position, for the motor that is located in sight from the motor location and the driven machinery location. As an alternative, provide a motor controller disconnect, capable of being locked in the open position, to serve as the disconnecting means for the motor if it is in sight from the motor location and the driven machinery location.

k. Overload protective devices: provide adequate protection to motor windings; be thermal inverse-time-limit type; and include manual reset-type pushbutton on outside of motor controller case.

l. Cover of combination motor controller and manual switch or circuit breaker: interlocked with operating handle of switch or circuit breaker so that cover cannot be opened unless handle of switch or circuit breaker is in "off" position.

m. Minimum short circuit withstand rating of combination motor controller: [_____] rms symmetrical amperes.

n. Provide controllers in hazardous locations with classifications as indicated.
2.22.1 Control Wiring

Provide control wiring in accordance with the following:

a. All control wire: stranded tinned copper switchboard wire with 600-volt flame-retardant insulation Type SIS meeting UL 44, or Type MTW meeting UL 1063, and passing the VW-1 flame tests included in those standards.

b. Hinge wire: Class K stranding.

c. Current transformer secondary leads: not smaller than No. 10 AWG.

d. Control wire minimum size: No. 14 AWG.

e. Power wiring for 480-volt circuits and below: the same type as control wiring with No. 12 AWG minimum size.

f. Provide wiring and terminal arrangement on the terminal blocks to permit the individual conductors of each external cable to be terminated on adjacent terminal points.

2.22.2 Control Circuit Terminal Blocks

Provide control circuit terminal blocks in accordance with the following:

a. NEMA ICS 4.

b. Control circuit terminal blocks for control wiring: molded or fabricated type with barriers, rated not less than 600 volts.

c. Provide terminals with removable binding, fillister or washer head screw type, or of the stud type with contact and locking nuts.

d. Terminals: not less than No. 10 in size with sufficient length and space for connecting at least two indented terminals for 10 AWG conductors to each terminal.

e. Terminal arrangement: subject to the approval of the Contracting Officer with not less than four spare terminals or 10 percent, whichever is greater, provided on each block or group of blocks.

f. Modular, pull apart, terminal blocks are acceptable provided they are of the channel or rail-mounted type.

g. Submit data showing that any proposed alternate will accommodate the specified number of wires, are of adequate current-carrying capacity, and are constructed to assure positive contact between current-carrying parts.

2.22.2.1 Types of Terminal Blocks

a. Short-Circuiting Type: Short-circuiting type terminal blocks: furnished for all current transformer secondary leads with provision for shorting together all leads from each current transformer without first opening any circuit. Terminal blocks: comply with the requirements of paragraph CONTROL CIRCUIT TERMINAL BLOCKS above.
b. Load Type: Load terminal blocks rated not less than 600 volts and of adequate capacity: provided for the conductors for NEMA Size 3 and smaller motor controllers and for other power circuits, except those for feeder tap units. Provide terminals of either the stud type with contact nuts and locking nuts or of the removable screw type, having length and space for at least two indented terminals of the size required on the conductors to be terminated. For conductors rated more than 50 amperes, provide screws with hexagonal heads. Conducting parts between connected terminals must have adequate contact surface and cross-section to operate without overheating. Provide each connected terminal with the circuit designation or wire number placed on or near the terminal in permanent contrasting color.

2.22.3 Control Circuits

************************************************************************************
NOTE: Choose one of the following options.
************************************************************************************

[ Control circuits: maximum voltage of 120 volts derived from control transformer in same enclosure. Transformers: conform to UL 506, as applicable. Transformers, other than transformers in bridge circuits: provide primaries wound for voltage available and secondaries wound for correct control circuit voltage. Size transformers so that 80 percent of rated capacity equals connected load. Provide disconnect switch on primary side. [ Provide fuses in each ungrounded primary feeder]. Provide one fused secondary lead with the other lead grounded. [ For designated systems, as indicated, provide backup power supply, including transformers connected to [ emergency power source] [_____. Provide for automatic switchover and alarm upon failure of primary control circuit.]

] [Control circuits: maximum voltage of 120 volts derived from a separate control source. Provide terminals and terminal boards. Provide separate control disconnect switch within controller. Provide one fused secondary lead with the other lead grounded. [ For designated systems, as indicated, provide backup power supply, including connection to [ emergency power source] [_____. Provide for automatic switchover and alarm upon failure of primary control circuit.]

] 2.22.4 Enclosures for Motor Controllers

************************************************************************************
NOTE: Indicate NEMA type of enclosure on the mechanical drawing to suit the application.
************************************************************************************

NEMA ICS 6.

2.22.5 Multiple-Speed Motor Controllers and Reversible Motor Controllers

Across-the-line-type, electrically and mechanically interlocked. Multiple-speed controllers: include compelling relays and multiple-button, station-type with pilot lights for each speed.

2.22.6 Pushbutton Stations

Provide with "start/stop" momentary contacts having one normally open and one normally closed set of contacts, and red lights to indicate when motor is running. Stations: heavy duty, oil-tight design.
2.22.7  Pilot and Indicating Lights

**************************************************************************
NOTE:  Choose one of the following bracketed items.
LED cluster lamps have an approximate life of 20,000 hours and will fit incandescent lamp bases.
Incandescent lamps have an approximate life of 1,000 hours.  LED colors are red, amber, yellow, and green
and are not available in clear or white.
**************************************************************************

[Provide LED cluster lamps.][Provide transformer, resistor, or diode type.]

[2.22.8 Reduced-Voltage Controllers

**************************************************************************
NOTE:  The designer determines, based on the power system characteristics, motor usage, and voltage drop where reduced-voltage controllers are necessary.  See UFC 3-520-01 for additional information on selection and application.
**************************************************************************

Provide for polyphase motors [_____] kilowatt horsepower and larger.
Reduced-voltage starters:  single-step, closed transition[ autotransformer,][ reactor,][ primary resistor-type,][ solid state-type,]
or as indicated, with an adjustable time interval between application of reduced and full voltages to motors.[ Wye-delta reduced voltage starter or part winding increment starter having adjustable time delay between application of voltage to first and second winding of motor may be used in lieu of the reduced-voltage starters for starting of[ motor-generator sets,][ centrifugally operated equipment,][ or][ reciprocating compressors provided with automatic unloaders].]

2.23  MANUAL MOTOR STARTERS  (MOTOR RATED SWITCHES)

[Single][Double][Three] pole designed for[ flush][ surface] mounting with overload protection[ and pilot lights].

2.23.1  Pilot Lights

**************************************************************************
NOTE:  Choose either the incandescent or LED bracketed sentence.
**************************************************************************

[Provide yoke-mounted, seven element LED cluster light module.  Color:[ green][ red][ amber][ in accordance with NEMA ICS 2].][Provide yoke-mounted, candelabra-base sockets rated 125 volts and fitted with glass or plastic jewels.  Provide clear, 6 watt lamp in each pilot switch.  Jewels for use with switches controlling motors:  green; jewels for other purposes:[ white][ red][ amber].]

2.24  MOTOR CONTROL CENTERS

**************************************************************************
NOTE:  Specify motor control center for groups of large motors requiring coordinated control.  In
other applications, use individual controllers or motor control panelboards. Generally, motor control centers should be NEMA, Class I, Type B. Coordinate controller specifications with the mechanical equipment requirements.

Class I motor control centers consist of mechanical groupings of combination motor-control units, feeder-tap units, other units and electrical devices arranged in a convenient assembly. Class II motor control centers are the same as Class I except with the addition of manufacturer-furnished electrical interlocking and wiring between units as specifically described by the designer on the construction drawings.

Submit wiring diagrams and installation details of equipment indicating proposed location, layout and arrangement, control panels, accessories, piping, ductwork, and other items that must be shown to ensure a coordinated installation. Identify circuit terminals on wiring diagrams and indicate the internal wiring for each item of equipment and the interconnection between each item of equipment. Indicate on the drawings adequate clearance for operation, maintenance, and replacement of operating equipment devices.

Provide motor control centers in accordance with the following:

a. UL 845, NEMA ICS 2, NEMA ICS 3.

b. Wiring: Class[ I][ II], Type[ A][ B][ C], in NEMA Type[ 1][ 3R][ 12][_____] enclosure.

c. Provide control centers suitable for operation on [_____]-volt, [_____]-phase, [_____]-wire, [_____] Hz system with minimum short-circuit withstand and interrupting rating of[ 100,000][ 65,000][ 42,000][ 25,000][_____] amperes rms symmetrical.

d. Incoming power feeder: [ bus duct][ cable] entering at the[ top][ bottom] of enclosure and terminating on[ terminal lugs][ main protective device].

e. Main protective device: [ molded case circuit breaker][ low-voltage power circuit breaker][ fusible switch] rated at [_____] amperes rms symmetrical interrupting capacity.

f. Arrange busing so that control center can be expanded from both ends.

g. Interconnecting wires: copper.

h. Terminal blocks: plug-in-type so that controllers may be removed without disconnecting individual control wiring.

2.24.1 Bus Systems

Provide the following bus systems. Power bus: be braced to withstand fault current of[ 100,000][ 65,000][ 42,000][ 25,000][_____] amperes rms symmetrical. Wiring troughs: isolated from horizontal and vertical bus bars.
2.24.1.1 Horizontal and Main Buses

NOTE: 1,600-ampere, 2,000-ampere, and 2,500-ampere ratings are also available. However, equipment at those ratings may not be UL listed and have not been included as an option.

Horizontal bus: continuous current rating of [600][800][1000][1200][_____] amperes. Main bus: [aluminum, tin-plated][copper, silver-plated] enclosed in isolated compartment at top of each vertical section. Main bus: isolated from wire troughs, starters, and other areas.

2.24.1.2 Vertical Bus

NOTE: Select from the bracketed options below. Higher ratings might be available; however, equipment at those ratings may not be UL listed and have not been included as an option.

Vertical bus: continuous current rating of [300][450][600][_____] amperes, and [aluminum, tin-plated][copper, tin-plated][copper, silver-plated]. Vertical bus: enclosed in flame-retardant, polyester glass "sandwich."

2.24.1.3 Ground Bus

Copper ground bus: provided full width of motor control center and equipped with necessary lugs.

2.24.2 Combination Motor Controllers

NOTE: Select Combination Motor Controllers if required by project documents. Select options below and include short circuit rating requirement.

UL 508 and other requirements in paragraph, MOTOR CONTROLLERS. Provide in controller a[ molded case circuit breaker][fusible switch with clips for [_____] -type fuses for branch circuit protection].[Minimum short circuit withstand rating of combination motor controller: [_____] rms symmetrical amperes.][Circuit breakers for combination controllers: [thermal magnetic][magnetic only].]

2.24.3 Space Heaters

NOTE: Heaters should be connected to an external
power source in installations where the motor control center will not be energized continuously.

Provide space heaters where indicated on the drawings, controlled using an adjustable 10 to 35 degrees C 50 to 90 degrees F thermostat, magnetic contactor, and a molded-case circuit breaker and a 480-120 volt single-phase transformer. Provide space heaters equipped with 250-watt, 240 volt strip elements operated at 120 volts and supplied from the motor control center bus wired to terminal blocks for connection to 120-volt single-phase power sources located external to the control centers. Contactors: open type, electrically-held, rated 30 amperes, 2-pole, with 120-volt ac coils.

2.25 LOCKOUT REQUIREMENTS

Provide circuit breakers, disconnecting means, and other devices that are electrical energy-isolating capable of being locked out for machines and other equipment to prevent unexpected startup or release of stored energy in accordance with 29 CFR 1910.147, NFPA 70E and 29 CFR 1910.303. Comply with requirements of Division 23, "Mechanical" for mechanical isolation of machines and other equipment.

2.26 TELECOMMUNICATIONS SYSTEM

NOTE: This paragraph provides information related to telecommunications system requirements for pathway and electrical service. Complete system cabling and interconnecting hardware are specified in Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLED SYSTEM, and Section 33 82 00 TELECOMMUNICATIONS OUTSIDE PLANT (OSP). Where Section 27 10 00 is not provided and an empty conduit system is required for telecommunications service, copy and paste the subparagraph BACKBOARDS under the major paragraph COMMUNITY ANTENNA TELEVISION (CATV) SYSTEM as a subparagraph to this paragraph.

Provide system of telecommunications wire-supporting structures (pathway), including: outlet boxes, conduits with pull wires, wireways, cable trays, and other accessories for telecommunications outlets and pathway in accordance with TIA-569 and as specified herein. Additional telecommunications requirements are specified in Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLED SYSTEM.

2.27 COMMUNITY ANTENNA TELEVISION (CATV) SYSTEM

NOTE: 1. Use paragraph CATV OUTLETS and CATV FACEPLATES for empty conduit systems only, where cable is not provided in the project.

2. Designer: provide riser diagram of system on drawings and provide empty conduit to exterior location for CATV service entrance.
3. Use Section 27 05 13.43 TELEVISION DISTRIBUTION SYSTEM where complete CATV system is provided. Delete paragraphs CATV OUTLETS and CATV FACEPLATES when Section 27 05 13.43 TELEVISION DISTRIBUTION SYSTEM is used on the project.

------------------------------------------

[ Additional CATV requirements are specified in Section 27 05 13.43 TELEVISION DISTRIBUTION SYSTEM.

][2.27.1 CATV Outlets

Provide flush mounted, 75-ohm, F-type connector outlet rated from 5 to 1000 MHz in standard electrical outlet boxes[ with isolation barrier] with mounting frame.

][2.27.2 CATV Faceplates

Provide modular faceplates for mounting of CATV Outlets.[ Faceplate: include designation labels and label covers for circuit identification.] Faceplate color: match outlet and switch coverplates.

][2.27.3 Backboards

------------------------------------------

NOTE: Choose the first bracketed sentence when providing an empty conduit system or choose the second bracketed sentence when Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLING SYSTEM is used. When using "as indicated" option, ensure information required is shown on the drawings.

------------------------------------------

[Provide void-free, fire rated interior grade plywood, 19 mm 3/4 inch thick, [1200 by 2400 mm] [4 by 8 feet][ as indicated]. Do not cover the fire stamp on the backboard.][ Coordinate CATV backboard requirements with telecommunications backboard requirements as specified in Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLING.]

][2.28 GROUNDING AND BONDING EQUIPMENT

------------------------------------------

NOTE: Select ground rod type. Most applications will only need copper-clad steel.

In high resistivity soils, 3000 mm 10 foot sectional rods may be used to obtain the required resistance to ground; however, where rock is encountered, additional rods, a ground ring electrode, or ground grid may be necessary. Coordinate and standardize rod selection for individual facilities with other specification sections.

------------------------------------------

2.28.1 Ground Rods

UL 467. Ground rods: cone pointed[ copper-clad steel][ solid copper][ stainless steel], with minimum diameter of 19 mm 3/4 inch and minimum length [of 3050 mm][of 6100 mm] 10 feet. Sectional type rods may be used for
rods 20 feet or longer.

2.28.2  Ground Bus
Copper ground bus: provided in the electrical equipment rooms as indicated.

2.28.3  Secondary Bonding Busbar

**************************************************************************
NOTE: 1. Minimum width for the Primary bonding busbar (PBB) is 100 mm 4 in and for the Secondary bonding busbar (SBB) is 50 mm 2 in.
Telecommunications grounding busbar provides grounding termination for voice, data and video (CATV) systems.

2.  Choose the bracketed option for Secondary bonding busbars (SBB) when there are more than one telecommunications room or telecommunications equipment rooms included in the project.
**************************************************************************

Provide corrosion-resistant grounding busbar suitable for indoor/outdoor installation in accordance with TIA-607. Busbars: plated for reduced contact resistance. If not plated, clean the busbar prior to fastening the conductors to the busbar and apply an anti-oxidant to the contact area to control corrosion and reduce contact resistance. Provide a Primary bonding busbar (PBB) in the telecommunications entrance facility and a Secondary bonding busbar (SBB) in all other telecommunications rooms and equipment rooms. The Primary bonding busbar (PBB) and the Secondary bonding busbar (SBB): sized in accordance with the immediate application requirements and with consideration of future growth. Provide Secondary bonding busbars with the following:

a. Predrilled copper busbar provided with holes for use with standard sized lugs,

b. Minimum dimensions of 6 mm 0.25 in thick by 100 mm 4 in wide for the PBB[ and 50 mm 2 in wide for SBBs] with length as indicated;

c. Listed by a nationally recognized testing laboratory.

2.29  HAZARDOUS LOCATIONS

**************************************************************************
NOTE: Indicate very clearly the limits of all hazardous locations. Edit the last sentence for actual equipment required in hazardous locations.
**************************************************************************

Electrical materials, equipment, and devices for installation in hazardous locations, as defined by NFPA 70: specifically approved by Underwriters' Laboratories, Inc., or Factory Mutual for particular "Class," "Division," and "Group" of hazardous locations involved. Boundaries and classifications of hazardous locations: as indicated. Equipment in hazardous locations: comply with UL 1203 for electrical equipment and industrial controls and UL 674 for motors.
2.30 MANUFACTURER'S NAMEPLATE

Provide on each item of equipment a nameplate bearing the manufacturer's name, address, model number, and serial number securely affixed in a conspicuous place; the nameplate of the distributing agent will not be acceptable.

2.31 FIELD FABRICATED NAMEPLATES

**************************************************************************

NOTE: Use the following paragraph where nameplates are fabricated to identify specific equipment designated on the drawings. Provide note on panelboard schedules to indicate where red labels are required.

**************************************************************************

Provide field fabricated nameplates in accordance with the following:

a. ASTM D709.

b. Provide laminated plastic nameplates for each equipment enclosure, relay, switch, and device; as specified or as indicated on the drawings.

c. Each nameplate inscription: identify the function and, when applicable, the position.

d. Nameplates: melamine plastic, 3 mm 0.125 inch thick, white with [black] [_____] center core.

e. Provide red laminated plastic label with white center core where indicated.

g. Minimum size of nameplates: 25 by 65 mm one by 2.5 inches.

h. Lettering size and style: a minimum of 6.35 mm 0.25 inch high normal block style.

2.32 WARNING SIGNS

**************************************************************************

NOTE: For the Navy, use general NFPA 70 Arc Flash Warning Label in accordance with UFC 3-560-01, Section 1-12.1 when no arc flash risk assessment program, including documented periodic maintenance and testing, is in place. A detailed arc flash warning label may only be used when the requirements of UFC 3-560-01, Section 1-12.3 have not been met.

**************************************************************************

Provide warning signs for flash protection in accordance with NFPA 70E and NEMA Z535.4 for switchboards, panelboards, industrial control panels, and motor control centers that are in other than dwelling occupancies and are likely to require examination, adjustment, servicing, or maintenance while energized. Provide field installed signs to warn qualified persons of potential electric arc flash hazards when warning signs are not provided by
the manufacturer. Provide marking that is clearly visible to qualified persons before examination, adjustment, servicing, or maintenance of the equipment.

2.33 FIRESTOPPING MATERIALS

Provide firestopping around electrical penetrations in accordance with Section 07 84 00 FIRESTOPPING.

2.34 WIREWAYS

UL 870. Material: steel[ epoxy painted][ galvanized] 16 gauge for heights and depths up to 150 by 150 mm 6 by 6 inches, and 14 gauge for heights and depths up to 305 by 305 mm 12 by 12 inches. Provide in length[ indicated][ required for the application] with[ hinged-][ screw-] cover NEMA[ 1][ 3R][ 12] enclosure per NEMA ICS 6.

[2.35 METERING

**************************************************************************

NOTE: Include "metering" information when a single-phase self contained meter base is required. Coordinate with Section 26 12 21 SINGLE-PHASE PAD-MOUNTED TRANSFORMER and Section 33 71 01 OVERHEAD TRANSMISSION AND DISTRIBUTION. Add appropriate verbiage to identify the exterior equipment (such as metering, supports, and disconnect switches) that would then be covered by this section. When a three-phase service is designed, modify meter requirements accordingly.

For the Air Force, delete this option and use Section 26 27 13.10 30 ELECTRIC METERS.

For the Navy, delete this option and use Section 26 27 14.00 20 ELECTRICITY METERING.

**************************************************************************

ANSI C12.1. Provide a self-contained, socket-mounted, electronic programmable outdoor watthour meter. Meter: either programmed at the factory or programmed in the field. Turn field programming device over to the Contracting Officer at completion of project. Coordinate meter to system requirements. Coordinate meter, system components, and meter location to be compatible with the Activity's central advanced metering system.

**************************************************************************

NOTE: Form 2S, in text below, is for single-phase, three-wire systems. For other system configurations, determine the appropriate form designation. Class 200 meters are for 100A and 200A services.

**************************************************************************

a. Design: Provide watthour meter designed for use on a single-phase, three-wire, [ 240/120][ 480/240] volt system. Include necessary KYZ pulse initiation hardware for Energy Monitoring and Control System (EMCS).

b. Class: 200; Form: [ 2S][____], accuracy: plus or minus 1.0 percent;
Finish: Class II.

c. Cover: Polycarbonate and lockable to prevent tampering and unauthorized removal.

d. Kilowatt-hour Register: five digit electronic programmable type.

e. Demand Register:

(1) Provide solid state.

(2) Meter reading multiplier: Indicate multiplier on the meter face.

(3) Demand interval length: programmed for [15][30][60] minutes with rolling demand up to six subintervals per interval.

f. Socket: ANSI C12.7. Provide NEMA Type 3R, box-mounted socket, ringless, having manual circuit-closing bypass and having jaws compatible with requirements of the meter. Provide manufacturers standard enclosure color unless otherwise indicated.

} [2.36 METER BASE ONLY

**************************************************************************
NOTE: Use METER BASE ONLY paragraph for projects where meters are not currently required, but may be required in the future, for example, military housing units.
**************************************************************************

ANSI C12.7. Provide NEMA Type 3R, box-mounted socket, ringless, having jaws compatible with requirements of a class: 200 and Form: [2S][_____] self contained watthour meter. Provide gray plastic closing cover and bypass links. Provide manufacturers standard enclosure color unless otherwise indicated.

} [2.37 SURGE PROTECTIVE DEVICES

**************************************************************************
NOTE: Surge protection should be provided for the following types of facilities: Medical facilities; Air navigation aids and facilities; Petroleum, oil and lubricant (POL) storage and dispensing facilities; Critical utility plants and systems; Communication facilities and telephone exchanges; Fire stations, including fire alarm, fire control and radio equipment; Critical computer automatic data processing facilities; Air traffic control facilities; Base weather stations; Surveillance and warning facilities; Photovoltaic system Solar Arrays (refer to NFPA 70 and NFPA 780); Command and control facilities; Weapon systems; Security lighting systems; Mission, property and life support facilities at remote and not readily accessible sites.

Consider surge protection for all types of facilities located in regions with a high lightning strike probability (refer to IEEE C62.41.1 and
C62.41.2) and facilities located near commercial utility systems with routine substation capacitor switching. The IEEE Emerald book recommended practice is that SPDs be applied to service entrance electrical switchboards and panelboards, and panelboards located on the secondary of separate derived systems that support ITE, telephone, telecommunications, signaling, television, or other form of electronic load equipment.

There are 3 types of surge protective devices (SPDs):

1. Type 1 SPDs are line side permanently installed, hard-wired surge protectors which are permitted to be connected to the supply side of the service disconnect following NFPA 70 requirements, and as specified for Type 2 SPDs.

2. Type 2 SPDs are load side permanently installed, hard-wired surge protectors which are permitted to be connected on the load side of a dedicated circuit breaker of the associated main distribution or branch panelboard, switchboard, or switchgear.

3. Type 3 SPDs are load side point-of-use (plug-in type) surge protectors which are protected specific critical equipment that plugs into receptacles. Type 3 SPD may be an integral component of a receptacle. UFC 3-520-01 does not apply to Type 3 SPDs.

Refer to UFC 3-520-01 for additional criteria.

**************************************************************************

NOTE: Whenever possible, connect surge protectors to a spare circuit breaker in the associated panel. Locate the surge protectors immediately adjacent to the protected equipment. Do not allow SPD inside a panelboard or switchboard enclosure due to fire risk causing loss of power to entire panelboard or switchboard. Do not allow fuses integral to SPDs due to lack of repetitive capability to protect from surges.

It is not necessary to provide surge protection on all panelboards; the selection of which panelboards should have surge protective devices depends on the importance of the loads served and the sensitivity of electronic equipment connected to the circuits.

Switching loads such as motor control centers should have surge protection to limit the transmission of switching transients to the rest of the facility.

HVAC equipment usually contain electronic controls that are sensitive to surges.

**************************************************************************

Provide parallel type surge protective devices (SPD) which comply with
UL 1449 at the service entrance[, load centers] [, panelboards] [, MCC][and] [____]. Provide surge protectors in a NEMA [1][____] enclosure per NEMA ICS 6. SPD must have the same short-circuit current rating as the protected equipment and must not be installed at a point of system where the available fault current is in excess of that rating. Use Type 1 or Type 2 SPD and connect on the load side of a dedicated circuit breaker. Submit performance and characteristic curves.

Provide the following modes of protection:

FOR SINGLE PHASE AND THREE PHASE WYE CONNECTED SYSTEMS-
- Phase to phase (L-L)
- Each phase to neutral (L-N)
- [Neutral to ground (N-G)]
- [Phase to ground (L-G)]

FOR DELTA CONNECTIONS-
- Phase to phase (L-L)
- Phase to ground (L-G)

SPDs at the service entrance: provide with a minimum surge current rating of 80,000 amperes for L-L mode minimum and 40,000 amperes for other modes (L-N, L-G, and N-G) and downstream SPDs rated 40,000 amperes for L-L mode minimum and 20,000 amperes for other modes (L-N, L-G, and N-G).

**************************************************************************
NOTE: Select the first bracketed section below when surge protection is installed as part of a lightning protection system per NFPA 780. Select the second bracketed option below if the surge protection is not part of a lightning protection system; the second bracketed option values are based on manufacturers' standard products and are not as restrictive as NFPA 780.
**************************************************************************

Provide SPDs per NFPA 780 for the lightning protection system.

Maximum L-N, and N-G Voltage Protection Rating:
- [600V for 120V, single phase system]
- [1,000V for 120/240V, single phase system]
- [600V for 120/240V, three phase system]
- [600V for 208Y/120V, three phase system]
- [1,200V for 480Y/277V, three phase system]

Maximum L-G Protection Rating:
- [700V for 120V, single phase system]
- [1,000V for 120/240V, single phase system]
- [700V for 120/240V, three phase system]
- [700V for 208Y/120V, three phase system]
- [1,200V for 480Y/277V, three phase system]

Maximum L-L Voltage Protection Rating:
- [1,200V for 120/240V, three phase system]
- [1,200V for 208Y/120V, three phase system]
- [1,800V for 480Y/277V, three phase system]
Provide SPDs. Maximum L-N, L-G, and N-G Voltage Protection Rating:

- 700V for 120V, single phase system
- 700V for 120/240V, single phase system
- 700V for 208Y/120V, three phase system
- 1,200V for 480Y/277V, three phase system

Maximum L-L Voltage Protection Rating:

- 1,200V for 120V, single phase system
- 1,200V for 120/240V, single phase system
- 1,200V for 208Y/120V, three phase system
- 2,000V for 480Y/277V, three phase system

The minimum MCOV (Maximum Continuous Operating Voltage) rating for L-N and L-G modes of operation: 120 percent of nominal voltage for 240 volts and below; 115 percent of nominal voltage above 240 volts to 480 volts.

**************************************************************************
NOTE: Provide EMI/RFI filtering when required by project documents.
**************************************************************************

Provide EMI/RFI filtering per UL 1283 for each mode with the capability to attenuate high frequency noise. Minimum attenuation: 20db.

2.38 FACTORY APPLIED FINISH

**************************************************************************
NOTE: This paragraph covers only the basic painting requirements for most electrical equipment. Include any special finishes for high or low temperatures and corrosive atmospheres.
**************************************************************************

Provide factory-applied finish on electrical equipment in accordance with the following:

a. **NEMA 250** corrosion-resistance test and the additional requirements as specified herein.

b. Interior and exterior steel surfaces of equipment enclosures: thoroughly cleaned followed by a rust-inhibitive phosphatizing or equivalent treatment prior to painting.

c. Exterior surfaces: free from holes, seams, dents, weld marks, loose scale or other imperfections.

d. Interior surfaces: receive not less than one coat of corrosion-resisting paint in accordance with the manufacturer's standard practice.

e. Exterior surfaces: primed, filled where necessary, and given not less than two coats baked enamel with semigloss finish.

f. Equipment located indoors: ANSI Light Gray,[ and equipment located outdoors: ANSI[ Light Gray][ Dark Gray]].

g. Provide manufacturer's coatings for touch-up work and as specified in

SECTION 26 20 00 Page 63
2.39 SOURCE QUALITY CONTROL

2.39.1 Transformer Factory Tests

Submittal: include routine NEMA ST 20 transformer test results on each transformer and also provide the results of NEMA "design" and "prototype" tests that were made on transformers electrically and mechanically equal to those specified.

[2.40 COORDINATED POWER SYSTEM PROTECTION

**************************************************************************
NOTE: Do not use on Navy projects.
NOTE: The requirement for studies in this paragraph depends on the complexity and extent of the power system. Delete this requirement for projects of limited scope, projects having protective devices which are not adjustable or for which coordination is not possible (standard molded case circuit breakers); projects involving simple extension of 600 volt level service to a building or facility from an existing transformer (750 kVA or less); or projects involving simple extension of 600 volt level service to a building or facility from a new transformer (750 kVA or less).
**************************************************************************

Prepare analyses as specified in Section 26 28 01.00 10 COORDINATED POWER SYSTEM PROTECTION.

]PART 3 EXECUTION

3.1 INSTALLATION

Electrical installations, including weatherproof and hazardous locations and ducts, plenums and other air-handling spaces: conform to requirements of NFPA 70[ and IEEE C2] and to requirements specified herein.

[3.1.1 Underground Service

**************************************************************************
NOTE: Choose this paragraph or the paragraph, OVERHEAD SERVICE. When using this paragraph, designer may insert additional details describing the specific project.
**************************************************************************

Underground service conductors and associated conduit: continuous from service entrance equipment to outdoor power system connection.

][3.1.2 Overhead Service

**************************************************************************
NOTE: Use Section 33 71 01 OVERHEAD TRANSMISSION AND DISTRIBUTION for overhead service requirements (typical throughout this section).
Overhead service conductors into buildings: terminate at service entrance fittings or weatherhead outside building. Overhead service conductors and support bracket for overhead conductors are included in Section 33 71 01 OVERHEAD TRANSMISSION AND DISTRIBUTION.

[3.1.3 Hazardous Locations]

Perform work in hazardous locations, as defined by NFPA 70, in strict accordance with NFPA 70 for particular "Class," "Division," and "Group" of hazardous locations involved. Provide conduit and cable seals where required by NFPA 70. Provide conduit with tapered threads.

[3.1.4 Service Entrance Identification]

Service entrance disconnect devices, switches, and enclosures: labeled and identified as such.

3.1.4.1 Labels

Wherever work results in service entrance disconnect devices in more than one enclosure, as permitted by NFPA 70, label each enclosure, new and existing, as one of several enclosures containing service entrance disconnect devices. Label, at minimum: indicate number of service disconnect devices housed by enclosure and indicate total number of enclosures that contain service disconnect devices. Provide laminated plastic labels conforming to paragraph FIELD FABRICATED NAMEPLATES. Use lettering of at least 6.35 mm 0.25 inch in height, and engrave on black-on-white matte finish. Service entrance disconnect devices in more than one enclosure: provided only as permitted by NFPA 70.

3.1.5 Wiring Methods

Provide insulated conductors installed in rigid steel conduit, IMC, rigid nonmetallic conduit, or EMT, except where specifically indicated or specified otherwise or required by NFPA 70 to be installed otherwise. Grounding conductor: separate from electrical system neutral conductor. Provide insulated green equipment grounding conductor for circuit(s) installed in conduit and raceways.[ Shared neutral, or multi-wire branch circuits, are not permitted with arc-fault circuit interrupters.] Minimum conduit size: 16 mm 1/2 inch in diameter for low voltage lighting and power circuits. Vertical distribution in multiple story buildings: made with metal conduit in fire-rated shafts, with metal conduit extending through shafts for minimum distance of 150 mm 6 inches. Firestop conduit which penetrates fire-rated walls, fire-rated partitions, or fire-rated floors in accordance with Section 07 84 00 FIRESTOPPING.

3.1.5.1 Pull Wire

Install pull wires in empty conduits. Pull wire: plastic having minimum 890-N 200-pound force tensile strength. Leave minimum 915 mm 36 inches of slack at each end of pull wire.

[3.1.5.2 Metal-Clad Cable]

NOTE: Type MC cable is UL listed; NFPA 70 is recognized for most common building applications.
MC cable does not protect conductors as well as rigid conduit but is more flexible to install and relocate. Refer to PART 2 PRODUCTS paragraph METAL-CLAD CABLE for UFC 3-520-01 requirements.

Install in accordance with NFPA 70, Type MC cable.

3.1.5.3 Armored Cable

NOTE: Type AC cable has more restricted applications than MC cable but offers the same advantages. Review NFPA 70 and refer to PART 2 PRODUCTS paragraph ARMORED CABLE for UFC 3-520-01 requirements.

Install in accordance with NFPA 70, Type AC cable.

3.1.5.4 Flat Conductor Cable

NOTE: Type FCC cable has been listed by UL and recognized by NFPA 70 for under carpet tile applications. FCC cable is available off the shelf for power, and telecommunications transmission applications.

Install in accordance with NFPA 70, Type FCC cable.

3.1.6 Conduit Installation

NOTE: Where exposed conduit is installed and subject to vandalism or misuse, such as in toilet or locker rooms, do not allow perpendicular or right angle to ceiling structural members. Provide details on drawings to identify special treatments or offsets as needed.

NOTE: Do not install exposed conduit systems in inmate housing areas and other areas normally accessible to inmates unless such installations are specifically indicated. Where exposed conduit is indicated, provide rigid metallic type conduit and cast metal-type outlet boxes with threaded hubs. Install conduits flat against wall; offsets or "kicks" are permitted only to enter outlet box. Support conduits on 1525 mm 5 foot maximum centers and within 305 mm 12 inches of each outlet box using two-hole conduit straps attached to surface with nonremovable break off security type bolts.

Unless indicated otherwise, conceal conduit under floor slabs and within
finished walls, ceilings, and floors. Keep conduit minimum 150 mm 6 inches away from parallel runs of flues and steam or hot water pipes. Install conduit parallel with or at right angles to ceilings, walls, and structural members where located above accessible ceilings and where conduit will be visible after completion of project. [Run conduits in crawl space][under floor slab] as if exposed.

3.1.6.1 Restrictions Applicable to Aluminum Conduit

a. Do not install underground or encase in concrete or masonry.

b. Do not use brass or bronze fittings.

c. Do not use when the enclosed conductors must be shielded from the effects of High-altitude Electromagnetic Pulse (HEMP).

3.1.6.2 Restrictions Applicable to EMT

a. Do not install underground.

b. Do not encase in concrete, mortar, grout, or other cementitious materials.

c. Do not use in areas subject to physical damage including but not limited to equipment rooms where moving or replacing equipment could physically damage the EMT.

d. Do not use in hazardous areas.

e. Do not use outdoors.

f. Do not use in fire pump rooms.

g. Do not use when the enclosed conductors must be shielded from the effects of High-altitude Electromagnetic Pulse (HEMP).

3.1.6.3 Restrictions Applicable to Nonmetallic Conduit

a. PVC Schedule 40.

(1) Do not use where subject to physical damage, including but not limited to, mechanical equipment rooms, electrical equipment rooms, fire pump rooms, and where restrictions are applying to both PVC Schedule 40 and PVC Schedule 80.

(2) Do not use above grade, except where allowed in this section for rising through floor slab or indicated otherwise.

b. PVC Schedule 40 and Schedule 80.

(1) Do not use where subject to physical damage, including but not limited to, hospitals, power plant, missile magazines, and other such areas.

(2) Do not use in hazardous (classified) areas.

(3) Do not use in penetrating fire-rated walls or partitions, or fire-rated floors.
3.1.6.4 Restrictions Applicable to Flexible Conduit

Use only as specified in paragraph FLEXIBLE CONNECTIONS. Do not use when the enclosed conductors must be shielded from the effects of High-altitude Electromagnetic Pulse (HEMP).

3.1.6.5 Underground Conduit

NOTE: Soil conditions in some locations require that underground conduit be supported to prevent damage due to settlement. The designer determines if the problem exists, and, if so, determines the best method for supporting the conduit.

Plastic-coated rigid steel; plastic-coated steel IMC; PVC, Type EPC-40; or fiberglass. Convert nonmetallic conduit, other than PVC Schedule 40 or 80, to plastic-coated rigid, or IMC, steel conduit before rising through floor slab. Plastic coating: extend minimum 150 mm 6 inches above floor.

3.1.6.6 Conduit Interior to Buildings for 400 Hz Circuits

Aluminum or nonmetallic. Where 400-Hz circuit runs underground or through concrete, provide PVC Schedule 40 conduit.

3.1.6.7 Conduit for Circuits Rated Greater Than 600 Volts

Rigid metal conduit or IMC only.

3.1.6.8 Conduit Installed Under Floor Slabs

NOTE: Designer must closely coordinate with the design of building floor slab and soil conditions and evaluate the acceptability of conduit being installed directly beneath the floor slab. Consider whether it will be necessary to support conduit in case of soil settlement problems and vapor barrier penetrations. Provide details on the drawings to clarify specification.

Conduit run under floor slab: located a minimum of [305] [_____] mm [12] [_____] inches below the vapor barrier. Seal around conduits at penetrations thru vapor barrier. Use NECA NEIS 1 Table 2a (Minimum Raceway Spacing) to determine under floor slab conduit spacing unless greater spacing is required elsewhere in this section.

3.1.6.9 Conduit Through Floor Slabs

Where conduits rise through floor slabs, do not allow curved portion of bends to be visible above finished slab. Where conduit rises through slab-on grade, seal all electrical penetrations to address radon mitigation and prevent infiltration of air, insects, and vermin.

3.1.6.10 Conduit Installed in Concrete Floor Slabs

SECTION 26 20 00 Page 68
NOTE: When this option is included, (such as in BBQ’s and similar projects with precast planks and topping slabs), indicate specific locations and provide installation details on the electrical drawings. Electrical designer must closely coordinate this information with the designer of the slab to ensure that slab thickness, conduit placement/separation, and reinforcement spacing is sufficient to meet requirements of this paragraph. Do not specify metal conduit in concrete that contains coral aggregate or is made with salt or brackish water. This type of concrete is rarely allowed.

For Navy projects, use second bracketed option, limiting conduit type to PVC EPC-40, unless required otherwise for medical facilities.

[Rigid steel; steel IMC; fiberglass, or PVC, Type EPC-40.] [PVC, Type EPC-40, unless indicated otherwise.] Locate so as not to adversely affect structural strength of slabs. Install conduit within middle one-third of concrete slab. [Do not stack conduits.] [Do not stack conduits more than two diameters high with minimum vertical separation of [_____] mm inches.] Space conduits horizontally not closer than three diameters, except at cabinet locations. Curved portions of bends must not be visible above finish slab. Increase slab thickness as necessary to provide minimum 25 mm one inch cover over conduit. Where embedded conduits cross building expansion joints, provide suitable watertight expansion/deflection fittings and bonding jumpers. Expansion/deflection fittings must allow horizontal and vertical movement of raceway. Conduit larger than 27 mm one inch trade size: installed parallel with or at right angles to main reinforcement; when at right angles to reinforcement, install conduit close to one of supports of slab. [Where nonmetallic conduit is used, convert raceway to plastic coated rigid steel or plastic coated steel IMC before rising above floor, unless specifically indicated.]

3.1.6.11 Stub-Ups

Provide conduits stubbed up through concrete floor for connection to free-standing equipment with adjustable top or coupling threaded inside for plugs, set flush with finished floor. Extend conductors to equipment in rigid steel conduit, except that flexible metal conduit may be used 150 mm 6 inches above floor. Where no equipment connections are made, install screwdriver-operated threaded flush plugs in conduit end.

3.1.6.12 Conduit Support

Support conduit by pipe straps, wall brackets, threaded rod conduit hangers, or ceiling trapeze. Plastic cable ties are not acceptable. Fasten by wood screws to wood; by toggle bolts on hollow masonry units; by concrete inserts or expansion bolts on concrete or brick; and by machine screws, welded threaded studs, or spring-tension clamps on steel work. Threaded C-clamps may be used on rigid steel conduit only. Do not weld conduits or pipe straps to steel structures. Do not exceed one-fourth proof test load for load applied to fasteners. Provide vibration resistant and shock-resistant fasteners attached to concrete ceiling. Do not cut main reinforcing bars for any holes cut to depth of more than 40 mm 1 1/2 inches in reinforced concrete beams or to depth of more than 20 mm 3/4 inch.
in concrete joints. Fill unused holes. In partitions of light steel construction, use sheet metal screws. In suspended-ceiling construction, run conduit above ceiling. Do not support conduit by ceiling support system. Conduit and box systems: supported independently of both (a) tie wires supporting ceiling grid system, and (b) ceiling grid system into which ceiling panels are placed. Do not share supporting means between electrical raceways and mechanical piping or ducts. Coordinate installation with above-ceiling mechanical systems to assure maximum accessibility to all systems. Spring-steel fasteners may be used for lighting branch circuit conduit supports in suspended ceilings in dry locations. Support exposed risers in wire shafts of multistory buildings by U-clamp hangers at each floor level and at 3050 mm 10 foot maximum intervals. Where conduit crosses building expansion joints, provide suitable watertight expansion fitting that maintains conduit electrical continuity by bonding jumpers or other means. For conduits greater than 63 mm 2 1/2 inches inside diameter, provide supports to resist forces of 0.5 times the equipment weight in any direction and 1.5 times the equipment weight in the downward direction.

3.1.6.13 Directional Changes in Conduit Runs

Make changes in direction of runs with symmetrical bends or cast-metal fittings. Make field-made bends and offsets with hickey or conduit-bending machine. Do not install crushed or deformed conduits. Avoid trapped conduits. Prevent plaster, dirt, or trash from lodging in conduits, boxes, fittings, and equipment during construction. Free clogged conduits of obstructions.

3.1.6.14 Locknuts and Bushings

Fasten conduits to sheet metal boxes and cabinets with two locknuts where required by NFPA 70, where insulated bushings are used, and where bushings cannot be brought into firm contact with the box; otherwise, use at least minimum single locknut and bushing. Provide locknuts with sharp edges for digging into wall of metal enclosures. Install bushings on ends of conduits, and provide insulating type where required by NFPA 70.

3.1.6.15 Flexible Connections

******************************************************************************
NOTE: For Navy projects, do not use flexible nonmetallic conduit.
******************************************************************************

Provide flexible steel conduit between 915 and 1830 mm 3 and 6 feet in length for recessed and semirecessed lighting fixtures; for equipment subject to vibration, noise transmission, or movement; and for motors. Install flexible conduit to allow 20 percent slack. Minimum flexible steel conduit size: 16 mm 1/2 inch diameter. Provide liquid tight flexible nonmetallic conduit in wet and damp locations and in fire pump rooms for equipment subject to vibration, noise transmission, movement or motors. Provide separate ground conductor across flexible connections. Plastic cable ties are not acceptable as a support method.

3.1.6.16 Telecommunications and Signal System Pathway

******************************************************************************
NOTE: For guidelines on conduit sizing, see UFC 3-580-01, "Telecommunications Building Cabling
******************************************************************************
Install telecommunications pathway in accordance with **TIA-569**.

a. **Horizontal Pathway**: Telecommunications pathways from the work area to the telecommunications room: installed and cabling length requirements in accordance with **TIA-568.1**. Size conduits, wireways, and cable trays in accordance with **TIA-569** as indicated.

b. **Backbone Pathway**: Telecommunication pathways from the telecommunications entrance facility to telecommunications rooms, and, telecommunications equipment rooms (backbone cabling): installed in accordance with **TIA-569**. Size conduits, wireways, and cable trays for telecommunications risers in accordance with **TIA-569** as indicated.

### 3.1.6.17 Community Antenna Television (CATV) System Conduits

**NOTE**: Choose the bracketed item depending on the CATV system design. Delete this paragraph if an empty conduit CATV system is not used.

Install a system of CATV wire-supporting structures (pathway), including: outlet boxes, conduits with pull wires, wireways, cable trays, and other accessories for CATV outlets and pathway in accordance with **TIA-569**. 

**Provide distribution system with star topology with empty conduit and pullwire from each outlet box to the telecommunications room and empty conduit and pullwire from each telecommunications room to the headend equipment location**.

### 3.1.7 Busway Installation

Comply at minimum with **NFPA 70**. Install busways parallel with or at right angles to ceilings, walls, and structural members. Support busways at 5 mm maximum intervals, and brace to prevent lateral movement. Provide fixed type hinges on risers; spring-type are unacceptable. Provide flanges where busway makes penetrations through walls and floors, and seal to maintain smoke and fire ratings. Provide waterproof curb where busway riser passes through floor. Seal gaps with fire-rated foam and caulk. Provide expansion joints, but only where bus duct crosses building expansion joints. Provide supports to resist forces of 0.5 times the equipment weight in any direction and 1.5 times the equipment weight in the downward direction.

### 3.1.8 Cable Tray Installation

**NOTE**: For Navy projects, use the second bracketed paragraph. Include bracketed second sentence where cable tray is used for telecommunications system.

[ Install and ground in accordance with **NFPA 70**. In addition, install and ground telecommunications cable tray in accordance with **TIA-569**, and **TIA-607**. ]

---

**UFGS**

---
Install cable trays parallel with or at right angles to ceilings, walls, and structural members. Cable tray and tray supports must not partially or completely obstruct access to the room. Support in accordance with manufacturer recommendations but at not more than [1830 mm [6] [_____] foot intervals as indicated]. Coat contact surfaces of aluminum connections with an antioxidant compound prior to assembly. Adjacent cable tray sections: bonded together by connector plates of an identical type as the cable tray sections. For grounding of cable tray system provide No. 2 AWG bare copper wire throughout cable tray system, and bond to each section, except use No. 1/0 aluminum wire if cable tray is aluminum. Terminate cable trays 255 mm 10 inches from both sides of smoke and fire partitions. Install conductors run through smoke and fire partitions in 103 mm 4 inch rigid steel conduits with grounding bushings, extending 305 mm 12 inches beyond each side of partitions. Seal conduit on both ends to maintain smoke and fire ratings of partitions. Firestop penetrations in accordance with Section 07 84 00, FIRESTOPPING. Provide supports to resist forces of 0.5 times the equipment weight in any direction and 1.5 times the equipment weight in the downward direction.

3.1.9 Telecommunications Cable Support Installation

******************************************************************************
NOTE: Utilize open telecommunications cable supports (J-Hooks / J-Supports / D-rings) only as specifically permitted in UFC 3-580-01, Telecommunications, Building Cabling System.
******************************************************************************

Install open top and closed ring cable supports on 1.2 m 4 ft to 1.5 m 5 ft centers to adequately support and distribute the cable’s weight. Use these types of supports to support a maximum of 50 6.4 mm 0.25 in diameter cables. Install suspended cables with at least 75 mm 3 in of clear vertical space above the ceiling tiles and support channels (T-bars). Open top and closed ring cable supports: suspended from or attached to the structural ceiling or walls with hardware or other installation aids specifically designed to support their weight.

3.1.10 Boxes, Outlets, and Supports

Provide boxes in wiring and raceway systems wherever required for pulling of wires, making connections, and mounting of devices or fixtures. Boxes for metallic raceways: cast-metal, hub-type when located in wet locations,
when surface mounted on outside of exterior surfaces,[ when surface mounted on interior walls exposed up to 2135 mm 7 feet above floors and walkways,][ or when installed in hazardous areas] and when specifically indicated.

Boxes in other locations: sheet steel, except that aluminum boxes may be used with aluminum conduit, and nonmetallic boxes may be used with nonmetallic[ sheathed cable] conduit system. Provide each box with volume required by NFPA 70 for number of conductors enclosed in box. Boxes for mounting lighting fixtures: minimum 100 mm 4 inches square, or octagonal, except that smaller boxes may be installed as required by fixture configurations, as approved. Boxes for use in masonry-block or tile walls: square-cornered, tile-type, or standard boxes having square-cornered, tile-type covers. Provide gaskets for cast-metal boxes installed in wet locations and boxes installed flush with outside of exterior surfaces. Provide separate boxes for flush or recessed fixtures when required by fixture terminal operating temperature; provide readily removable fixtures for access to boxes unless ceiling access panels are provided. Support boxes and pendants for surface-mounted fixtures on suspended ceilings independently of ceiling supports. Fasten boxes and supports with wood screws on wood, with bolts and expansion shields on concrete or brick, with toggle bolts on hollow masonry units, and with machine screws or welded studs on steel.[ Threaded studs driven in by powder charge and provided with lock washers and nuts[ or nail-type nylon anchors] may be used in lieu of wood screws, expansion shields, or machine screws.] In open overhead spaces, cast boxes threaded to raceways need not be separately supported except where used for fixture support; support sheet metal boxes directly from building structure or by bar hangers. Where bar hangers are used, attach bar to raceways on opposite sides of box, and support raceway with approved-type fastener maximum 610 mm 24 inches from box. When penetrating reinforced concrete members, avoid cutting reinforcing steel.

3.1.10.1 Boxes

Boxes for use with raceway systems: minimum 40 mm 1 1/2 inches deep, except where shallower boxes required by structural conditions are approved. Boxes for other than lighting fixture outlets: minimum 100 mm 4 inches square, except that 100 by 50 mm 4 by 2 inch boxes may be used where only one raceway enters outlet. Telecommunications outlets: a minimum of [100 mm square by 54 mm deep][120 mm square by 54 mm deep][4 inches square by 2 1/8 inches deep][4 11/16 inches square by 2 1/8 inches deep][, except for [wall mounted telephones][ and][ outlet boxes for handicap telephone stations]]. Mount outlet boxes flush in finished walls.

3.1.10.2 Pull Boxes

Construct of at least minimum size required by NFPA 70[ of code-gauge aluminum or galvanized sheet steel,][ and][ compatible with nonmetallic raceway systems,] except where cast-metal boxes are required in locations specified herein. Provide boxes with screw-fastened covers. Where several feeders pass through common pull box, tag feeders to indicate clearly electrical characteristics, circuit number, and panel designation.

3.1.10.3 Extension Rings

Extension rings are not permitted for new construction. Use only on existing boxes in concealed conduit systems where wall is furred out for new finish.
3.1.11 Mounting Heights

NOTE: In Hazardous Areas extending up to 455 mm 18 inches above the finished floor, the mounting height of receptacles that are not explosion-proof, must be measured to the bottom of the outlet box in lieu of to the center. Coordinate the mounting height with the height indicated on the drawings and use the last bracketed sentence.

Mount panelboards, [enclosed] circuit breakers, [motor controller] and disconnecting switches so height of center of grip of the operating handle of the switch or circuit breaker at its highest position is maximum 2007 mm 79 inches above floor or working platform or as allowed in Section 404.8 per NFPA 70. Mount lighting switches.[ and handicapped telecommunications stations][ 1220 mm 48 inches above finished floor]. Mount receptacles[ and telecommunications outlets] 460 mm 18 inches above finished floor[,] unless otherwise indicated.[ Wall-mounted telecommunications outlets: mounted at height[ 1525 mm 60 inches above finished floor][ indicated].] [ Mount other devices as indicated.][ Measure mounting heights of wiring devices and outlets[ in non-hazardous areas] to center of device or outlet.][ Measure mounting heights of receptacle outlet boxes in the[ hazardous area][_____] to the bottom of the outlet box.]

3.1.12 Nonmetallic Sheathed Cable Installation

NOTE: Use this paragraph only when Type NM or NMC cable is indicated.

Where possible, install cables concealed behind ceiling or wall finish. Thread cables through holes bored on approximate centerline of wood members; notching of end surfaces is not permitted. Provide sleeves through concrete or masonry for threading cables. Install exposed cables parallel to or at right angles to walls or structural members. Protect exposed nonmetallic sheathed cables less than 1220 mm 4 feet above floors from mechanical injury by installation in conduit or tubing. When cable is used in metal stud construction, insert plastic stud grommets in studs at each point through which cable passes, prior to installation of cable.

3.1.13 Mineral Insulated, Metal Sheathed (Type MI) Cable Installation

NOTE: Type MI cable used for low temperature, high temperature, hazardous locations, life safety, and heating applications. Refer to NFPA 70. Clearly show on drawings the MI cable. Consider surge suppressors in hazardous locations and where high voltage surges are likely. MI cable is not available in ratings above 600 volts.

Mineral-insulated, metal-sheathed cable system, Type MI, may be used in lieu of exposed conduit and wiring. Conductor sizes: not less than those indicated for the conduit installation. Fasten cables within 305 mm 12 inches of each turn or offset and at 830 mm 33 inches maximum intervals.
Make cable terminations in accordance with NFPA 70 and cable manufacturer's recommendations. Terminate single-conductor cables of a circuit, having capacities of more than 50 amperes, in a single box or cabinet opening. Color code individual conductors in all outlets and cabinets.

3.1.14 Conductor Identification

Provide conductor identification within each enclosure where tap, splice, or termination is made. For conductors No. 6 AWG and smaller diameter, provide color coding by factory-applied, color-impregnated insulation. For conductors No. 4 AWG and larger diameter, provide color coding by plastic-coated, self-sticking markers; colored nylon cable ties and plates; or heat shrink-type sleeves. Identify control circuit terminations in accordance with Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS for Navy projects only.

3.1.14.1 Marking Strips

Provide marking strips for identification of power distribution, control, data, and communications cables in accordance with the following:

a. Provide white or other light-colored plastic marking strips, fastened by screws to each terminal block, for wire designations.

b. Use permanent ink for the wire numbers

c. Provide reversible marking strips to permit marking both sides, or provide two marking strips with each block.

d. Size marking strips to accommodate the two sets of wire numbers.

e. Assign a device designation in accordance with NEMA ICS 1 to each device to which a connection is made. Mark each device terminal to which a connection is made with a distinct terminal marking corresponding to the wire designation used on the Contractor's schematic and connection diagrams.

f. The wire (terminal point) designations used on the Contractor's wiring diagrams and printed on terminal block marking strips may be according to the Contractor's standard practice; however, provide additional wire and cable designations for identification of remote (external) circuits for the Government's wire designations.

g. Prints of the marking strips drawings submitted for approval will be so marked and returned to the Contractor for addition of the designations to the terminal strips and tracings, along with any rearrangement of points required.
3.1.15 Splices

Make splices in accessible locations. Make splices in conductors No. 10 AWG and smaller diameter with insulated, pressure-type connector. Make splices in conductors No. 8 AWG and larger diameter with solderless connector, and cover with insulation material equivalent to conductor insulation.

3.1.15.1 Splices of Aluminum Conductors

Make with solderless circumferential compression-type, aluminum-bodied connectors UL listed for AL/CU. Remove surface oxides from aluminum conductors by wire brushing and immediately apply oxide-inhibiting joint compound and insert in connector. After joint is made, wipe away excess joint compound, and insulate splice.

3.1.16 Terminating Aluminum Conductors

3.1.16.1 Termination to Copper Bus

Terminate aluminum conductors to copper bus either by: (a) inline splicing a copper pigtail, of ampacity at least that of aluminum conductor, or (b) utilizing circumferential, compression-type, aluminum-bodied terminal lug UL listed for AL/CU, and steel Belleville cadmium-plated hardened steel spring washers, flat washers, bolts, and nuts. Carefully install Belleville spring washers with crown up toward nut or bolt head, with concave side of Belleville bearing on heavy-duty, wide series flat washer of larger diameter than Belleville. Tighten nuts sufficiently to flatten Belleville, and leave in position. Lubricate hardware with joint compound prior to making connection. Wire brush and apply joint compound to conductor prior to inserting in lug.

3.1.16.2 Termination to Aluminum Bus

Terminate aluminum conductors to aluminum bus by using aluminum nuts, bolts, washers, and compression lugs. Wire brush and apply joint compound to conductor prior to inserting in lug. Lubricate hardware with joint compound prior to making connection. When bus contact surface is unplated, scratch-brush and coat with joint compound, without grit.

3.1.17 Covers and Device Plates

Install with edges in continuous contact with finished wall surfaces without use of mats or similar devices. Plaster fillings are not permitted. Install plates with alignment tolerance of 0.58 mm 1/16 inch. Use of sectional-type device plates are not permitted. Provide gasket for plates installed in wet locations.

3.1.18 Electrical Penetrations

Seal openings around electrical penetrations through fire resistance-rated walls, partitions, floors, or ceilings in accordance with Section 07 84 00 FIRESTOPPING.

3.1.19 Grounding and Bonding

**************************************************************************

NOTE: Use reference to NFPA 780 and last bracketed sentence where lightning protection is provided. In
Provide in accordance with NFPA 70 and NFPA 780. Ground exposed, non-current-carrying metallic parts of electrical equipment, metallic raceway systems, grounding conductor in metallic and nonmetallic raceways, telecommunications system grounds, [grounding conductor of nonmetallic sheathed cables,] and neutral conductor of wiring systems. Make ground connection at main service equipment, and extend grounding conductor to point of entrance of metallic water service. Make connection to water pipe by suitable ground clamp or lug connection to plugged tee. If flanged pipes are encountered, make connection with lug bolted to street side of flanged connection. Supplement metallic water service grounding system with additional made electrode in compliance with NFPA 70. Make ground connection to driven ground rods on exterior of building. Bond additional driven rods together with a minimum of 4 AWG soft bare copper wire buried to a depth of at least 300 mm 12 inches. Interconnect all grounding media in or on the structure to provide a common ground potential. This includes lightning protection, electrical service, telecommunications system grounds, as well as underground metallic piping systems. Make interconnection to the gas line on the customer's side of the meter. Use main size lightning conductors for interconnecting these grounding systems to the lightning protection system. In addition to the requirements specified herein, provide telecommunications grounding in accordance with TIA-607. Where ground fault protection is employed, ensure that connection of ground and neutral does not interfere with correct operation of fault protection.

3.1.19.1 Ground Rods

Provide ground rods and measure the resistance to ground using the fall-of-potential method described in IEEE 81. Do not exceed 25 ohms under normally dry conditions for the maximum resistance of a driven ground. If this resistance cannot be obtained with a single rod, [_____] additional rods, spaced on center. Spacing for additional rods must be a minimum of 3 meters 10 feet[, or if sectional type rods are used, [_____] additional sections may be coupled and driven with the first rod]. In high-ground-resistance, UL listed chemically charged ground rods may be used.] If the resultant resistance exceeds 25 ohms measured not less than 48 hours after rainfall, notify the Contracting Officer who will decide on the number of ground rods to add.

3.1.19.2 Grounding Connections

Make grounding connections which are buried or otherwise normally inaccessible,[ excepting specifically those connections for which access for periodic testing is required,] by exothermic weld or high compression connector.

a. Make exothermic welds strictly in accordance with the weld manufacturer's written recommendations. Welds which are "puffed up" or
which show convex surfaces indicating improper cleaning are not acceptable. Mechanical connectors are not required at exothermic welds.

b. Make high compression connections using a hydraulic or electric compression tool to provide the correct circumferential pressure. Provide tools and dies as recommended by the manufacturer. Use an embossing die code or other standard method to provide visible indication that a connector has been adequately compressed on the ground wire.

3.1.19.3 Ground Bus

Provide a copper ground bus in the electrical equipment rooms as indicated. Noncurrent-carrying metal parts of [transformer neutrals and other electrical][electrical] equipment: effectively grounded by bonding to the ground bus. Bond the ground bus to both the entrance ground, and to a ground rod or rods as specified above having the upper ends terminating approximately 100 mm 4 inches above the floor. Make connections and splices of the brazed, welded, bolted, or pressure-connector type, except use pressure connectors or bolted connections for connections to removable equipment. [For raised floor equipment rooms in computer and data processing centers, provide a minimum of four, one at each corner, ground buses connected to the building grounding system. Use bolted connections in lieu of thermoweld, so they can be changed as required by additions and alterations.]

3.1.19.4 Resistance

*****************************************************************************************************************************************
NOTE: If difficulties are encountered in obtaining the proper resistance, the Contracting Officer will make a decision on the number of ground rods to be used, based on local conditions and on the type and size of electrical installation in the project. Insulated grounding conductors will be required where electrolytic corrosion may be encountered. In most applications, it is desirable to have a maximum resistance of much less, typically 5 ohms or less. NFPA 70, approves the use of a single made electrode for the system-grounding electrode, if its resistance does not exceed 25 ohms.*****************************************************************************************************************************************

3.1.19.5 Telecommunications System

*****************************************************************************************************************************************
NOTE: 1. Include this paragraph when telecommunications service is provided in job and specified in this section and other sections.

2. Choose the bracketed option for Secondary bonding busbars (SBB) when there are more than one telecommunications room or telecommunications equipment rooms included in the project.*****************************************************************************************************************************************
3. Choose Telecommunications Bonding Conductors
bracketed option when more than one
telecommunications grounding busbar is installed as
part of the project.
**************************************************************************
Provide telecommunications grounding in accordance with the following:

a. Telecommunications Grounding Busbars: Provide a Primary bonding busbar (PBB) in the telecommunications entrance facility. Install the PBB as close to the electrical service entrance grounding connection as practicable. Provide a Secondary bonding busbar (SBB) in all other telecommunications rooms and telecommunications equipment rooms. Install the SBB as close to the telecommunications room panelboard as practicable, when equipped. Where a panelboard for telecommunications equipment is not installed in the telecommunications room, locate the SBB near the backbone cabling and associated terminations. In addition, locate the SBB to provide for the shortest and straightest routing of the grounding conductors. Where a panelboard for telecommunications equipment is located within the same room or space as a SBB, bond that panelboard's alternating current equipment ground (ACEG) bus (when equipped) or the panelboard enclosure to the SBB. Install Secondary bonding busbars to maintain clearances as required by NFPA 70 and insulated from its support. A minimum of 50 mm 2 inches separation from the wall is recommended to allow access to the rear of the busbar and adjust the mounting height to accommodate overhead or underfloor cable routing.

b. Telecommunications Bonding Conductors: Provide main telecommunications service equipment ground consisting of separate bonding conductor for telecommunications, between the PBB and readily accessible grounding connection of the electrical service. Grounding and bonding conductors should not be placed in ferrous metallic conduit. If it is necessary to place grounding and bonding conductors in ferrous metallic conduit that exceeds one m 3 feet in length, bond the conductors to each end of the conduit using a grounding bushing or a No. 6 AWG conductor, minimum. Provide a telecommunications bonding backbone (TBB) that originates at the PBB extends throughout the building using the telecommunications backbone pathways, and connects to the SBBs in all telecommunications rooms and equipment rooms. Install the TBB conductors such that they are protected from physical and mechanical damage. The TBB conductors should be installed without splices and routed in the shortest possible straight-line path. Make the bonding conductor between a TBB and a SBB continuous. Where splices are necessary, the number of splices should be a minimum. Make the splices accessible and located in telecommunications spaces. Connect joined segments of a TBB using exothermic welding, irreversible compression-type connectors, or equivalent. Install all joints to be adequately supported and protected from damage. Whenever two or more TBBs are used within a multistory building, bond the TBBs together with a grounding equalizer (GE) at the top floor and at a minimum of every third floor in between. Do not connect the TBB and GE to the pathway ground, except at the PBB or the SBB.

c. Telecommunications Grounding Connections: Telecommunications grounding connections to the PBB[ or SBB]: utilize listed compression two-hole lugs, exothermic welding, suitable and equivalent one hole non-twisting lugs, or other irreversible compression type connections. Bond all metallic pathways, cabinets, and racks for telecommunications cabling.
and interconnecting hardware located within the same room or space as the PBB[ or SBB] to the PBB[ or SBB respectively]. In a metal frame (structural steel) building, where the steel framework is readily accessible within the room; bond each PBB[ and SBB] to the vertical steel metal frame using a minimum No. 6 AWG conductor. Where the metal frame is external to the room and readily accessible, bond the metal frame to the SBB or PBB with a minimum No. 6 AWG conductor. When practicable because of shorter distances and, where horizontal steel members are permanently electrically bonded to vertical column members, the SBB may be bonded to these horizontal members in lieu of the vertical column members. All connectors used for bonding to the metal frame of a building must be listed for the intended purpose.

3.1.20 Equipment Connections

Provide power wiring for the connection of motors and control equipment under this section of the specification. Except as otherwise specifically noted or specified, automatic control wiring, control devices, and protective devices within the control circuitry are not included in this section of the specifications and are provided under the section specifying the associated equipment.

3.1.21 Elevator

**************************************************************************
NOTE: To achieve a complete specification, ensure that the controls for HVAC, fire alarm system, elevators, cranes, and special systems are definitely and properly covered by the other sections of the project specification. Should controls appear in this section of the project specification, modify this paragraph accordingly. Indicate on the drawings required equipment connections. Coordinate elevator paragraph with Section 14 21 13 ELECTRIC TRACTION FREIGHT ELEVATORS or Section 14 21 23 ELECTRIC TRACTION PASSENGER ELEVATORS and Section 14 24 13 HYDRAULIC FREIGHT ELEVATORS or 14 24 23 HYDRAULIC PASSENGER ELEVATORS for all projects. Where more than one driving machine disconnecting means is supplied by a single feeder, the overcurrent protective devices in each disconnecting means must be selectively coordinated with any other supply side overcurrent protective devices. Coordinate ELEVATOR paragraph and requirements with UFC 3-490-06.
**************************************************************************

Provide circuit to line terminals of elevator controller, and disconnect switch on line side of controller, outlet for control power, outlet receptacle and work light at midheight of elevator shaft, and work light and outlet receptacle in elevator pit.

[3.1.22 Government-Furnished Equipment]

Contractor[ rough-in for Government-furnished equipment][ make connections to Government-furnished equipment] to make equipment operate as intended, including providing miscellaneous items such as plugs, receptacles, wire, cable, conduit, flexible conduit, and outlet boxes or fittings.
3.1.23 Repair of Existing Work

Perform repair of existing work[, demolition, and modification of existing electrical distribution systems] as follows:

3.1.23.1 Workmanship

Lay out work in advance. Exercise care where cutting, channeling, chasing, or drilling of floors, walls, partitions, ceilings, or other surfaces is necessary for proper installation, support, or anchorage of conduit, raceways, or other electrical work. Repair damage to buildings, piping, and equipment using skilled craftsmen of trades involved.

3.1.23.2 Existing Concealed Wiring to be Removed

Disconnect existing concealed wiring to be removed from its source. Remove conductors; cut conduit flush with floor, underside of floor, and through walls; and seal openings.

3.1.23.3 Removal of Existing Electrical Distribution System

Removal of existing electrical distribution system equipment includes equipment's associated wiring, including conductors, cables, exposed conduit, surface metal raceways, boxes, and fittings,[ back to equipment's power source] as indicated.

3.1.23.4 Continuation of Service

Maintain continuity of existing circuits of equipment to remain. Maintain existing circuits of equipment energized. Restore circuits wiring and power which are to remain but were disturbed during demolition back to original condition.

3.1.25 Surge Protective Devices

**************************************************************************
NOTE: Do not allow surge protective devices inside a panelboard or switchboard enclosure due to fire risk causing loss of power to entire panelboard or switchboard.
**************************************************************************

Connect the surge protective devices in parallel to the power source, keeping the conductors as short and straight as practically possible. Maximum allowed lead length is 900 mm 3 feet avoiding 90 degree bends. Do not locate surge protective devices inside a panelboard or switchboard enclosure.

3.2 FIELD FABRICATED NAMEPLATE MOUNTING

Provide number, location, and letter designation of nameplates as indicated. Fasten nameplates to the device with a minimum of two sheet-metal screws or two rivets.
3.3  WARNING SIGN MOUNTING

Provide the number of signs required to be readable from each accessible side. Space the signs in accordance with NFPA 70E.

3.4  FIELD APPLIED PAINTING

**************************************************************************

NOTE: Use and coordinate paint and coating requirements with Section 09 90 00 PAINTS AND COATINGS when provided in the job. Use the second bracketed option when Section 09 90 00 is not provided or when requirements are beyond what is specified in Section 09 90 00.

**************************************************************************

Paint electrical equipment as required to match finish of adjacent surfaces or to meet the indicated or specified safety criteria. [Painting: as specified in Section 09 90 00 PAINTS AND COATINGS.] [Where field painting of enclosures for panelboards, load centers or the like is specified to match adjacent surfaces, to correct damage to the manufacturer's factory applied coatings, or to meet the indicated or specified safety criteria, provide manufacturer's recommended coatings and apply in accordance to manufacturer's instructions.]

3.5  FIELD QUALITY CONTROL

**************************************************************************

NOTE: Provide any additional test requirements for equipment requiring running tests or tests that must be coordinated with mechanical equipment.

**************************************************************************

Furnish test equipment and personnel and submit written copies of test results. Give Contracting Officer[ 5] [_____] working days notice prior to[ each] [_____] test[s]. Where applicable, test electrical equipment in accordance with NETA ATS.

3.5.1  Devices Subject to Manual Operation

Operate each device subject to manual operation at least five times, demonstrating satisfactory operation each time.

3.5.2  600-Volt Wiring Test

Test wiring rated 600 volt and less to verify that no short circuits or accidental grounds exist. Perform insulation resistance tests on wiring No. 6 AWG and larger diameter using instrument which applies voltage of 1,000 volts DC for 600 volt rated wiring and 500 volts DC for 300 volt rated wiring per NETA ATS to provide direct reading of resistance. All existing wiring to be reused must also be tested.

3.5.3  Transformer Tests

Perform the standard, not optional, tests in accordance with the Inspection and Test Procedures for transformers, dry type, air-cooled, 600 volt and below; as specified in NETA ATS. Measure primary and secondary voltages for proper tap settings. Tests need not be performed by a recognized independent testing firm or independent electrical consulting firm.
3.5.4  **Ground-Fault Receptacle Test**

**************************************************************************
NOTE: If Ground-Fault Receptacle "line" and "load" leads are reversed, "test" will trip downstream loads but not trip the receptacle.
**************************************************************************

Test ground-fault receptacles with a "load" (such as a plug in light) to verify that the "line" and "load" leads are not reversed. Press the TEST button and then the RESET button to verify by LED status that the device is a self-test model as specified in UL 943.

3.5.5  **Arc-Fault Receptacle Test**

**************************************************************************
NOTE: If Arc-Fault Receptacle "line" and "load" leads are reversed, "test" will trip downstream loads but not trip the receptacle.
**************************************************************************

Test arc-fault receptacles with a "load" (such as a plug in light) to verify that the "line" and "load" leads are not reversed. Press the TEST button and then the RESET button to verify by LED status that the device is a self-test model as specified in UL 1699.

3.5.6  **Grounding System Test**

Test grounding system to ensure continuity, and that resistance to ground is not excessive. Test each ground rod for resistance to ground before making connections to rod; tie grounding system together and test for resistance to ground. Make resistance measurements in dry weather, not earlier than 48 hours after rainfall. Submit written results of each test to Contracting Officer, and indicate location of rods as well as resistance and soil conditions at time measurements were made.

3.5.7  **Watthour Meter**

a.  Visual and mechanical inspection

   (1) Examine for broken parts, shipping damage, and tightness of connections.

   (2) Verify that meter type, scales, and connections are in accordance with approved shop drawings.

b.  Electrical tests

   (1) Determine accuracy of meter.

   (2) Calibrate watthour meters to one-half percent.

   (3) Verify that correct multiplier has been placed on face of meter, where applicable.
3.5.8 Phase Rotation Test

Perform phase rotation test to ensure proper rotation of service power prior to operation of new or reinstalled equipment using a phase rotation meter. Follow the meter manual directions performing the test.

PART 3 EXECUTION

3.1 PAINTING
3.2 INSTALLATION

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for 480-volt station service switchgear and transformers normally used for hydroelectric power plant facilities, navigation locks and pumping plants. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1  GENERAL

NOTE: If this guide specification is used for procurement of items to be installed by the Government or to be furnished to the Contractor as Government furnished equipment, or is used to obtain services which are not part of a construction contract, the following guidance applies:

a. Applicable parts of this guide specification should be adapted to the procurement and included in Section C of the Uniform Contract Format contracts for products or the scope of work portion of
b. The following provides information and requirements to be included in a contract for procurement of the specified supplies or services.

**PART I -- THE SCHEDULE**

**Section B Supplies or Services and Prices**

Select the appropriate schedule applicable to the procurement.

**TOTAL** [_____]
these specifications shall be tested in accordance with the requirements of the referenced standard specifications specified herein, except as otherwise indicated or where such tests are waived in writing by the Contracting Officer. In case the Contractor desires to use stock material not manufactured specifically for the work covered by these specifications, he shall submit evidence satisfactory to the Contracting Officer that such material conforms to the requirements of these specifications, in which case detailed tests on these materials may be waived.

Unless waived in writing, all tests or trials shall be made in the presence of a Quality Assurance Representative (QAR) and copies of all test reports shall be furnished by the Contractor as soon as practicable after the tests are made and shall be submitted in such form as to provide means of determining compliance with the applicable specifications for the material tested. Where the presence of a QAR is waived, certified copies of the test reports shall be furnished to the Contracting Officer.

Test specimens and samples for analysis shall be plainly marked to indicate the materials they represent and, if required, they shall be properly boxed and prepared for shipment.

Except as provided elsewhere, all costs of all test and trials, excepting the pay and expense of the QAR, shall be borne by the Contractor and no separate payment will be made therefor.

Section E Special Contract Requirements

Include the following:

Contractor's Drawings and Data.

1. Within [_____] calendar days after [date of award] [date of receipt of notice of award], submit for approval outline drawings of all equipment to be furnished under this contract, together with weights and overall dimensions to enable the Contracting Officer to proceed with the final design of the [powerhouse] [pumping plant] [navigation lock]. These drawings must show space requirements, details of any floor supports to be embedded in concrete, location of terminal blocks, and top and bottom conduit entrance areas.

2. Within [_____] calendar days after [date of award] [date of receipt of notice of award], submit for approval such assembly and detailed drawings and data as required to demonstrate fully that all parts of the equipment will conform to the requirements and intent of the specifications. The drawings and
data shall include applicable schematic diagrams with wire designations, equipment lists, accessories and spare parts lists, nameplate schedules, all necessary descriptive data, and wiring diagrams showing panel connections, panel interconnections, terminal block and conductor designations, and external cables.

3. All drawings and data submitted and approved will form a part of the contract. The sequence of submission of drawings shall be such that all information is available for checking each drawing when it is received.

4. [_____] reproducible, of a quality that will make legible prints,] [and] black and white copies or blueprints of each drawing for approval shall be furnished. Each submission of drawings by the Contractor must be accompanied by a letter of transmittal containing a list of drawings giving titles and numbers. Transmittals shall be addressed to [______]. Decisions on these drawings, either approval or disapproval, will be given by the Contracting Officer by letter or telegram. Within [15] [_____] calendar days after receipt, the Contracting Officer will return one copy to the Contractor marked "Approved", "Approved Except as Noted", or "Returned for Correction". The notations "Approved" and "Approved Except as Noted" authorize the Contractor to proceed with the fabrication of the equipment covered by such drawings, subject to the correction, if any, indicated thereon or described in the letter of transmittal. When prints of drawings have been "Returned for Correction", the Contractor shall make the necessary revisions on the drawings and shall submit [reproducibles] [and] [_____] prints for approval in the same routine as before. Every revision made during the life of the contract shall be shown by number, date, and subject in a revision block and a notation shall be made in the drawing margin to permit rapid location of the revision. The time consumed by the Contractor in submitting and obtaining approval of assembly and shop drawings shall be included in the time allowed for completion of the contract.

5. Upon receipt of prints which have been marked "Approved Except as Noted" or "Returned for Correction", the Contractor shall within 30 calendar days after receipt, submit correct [reproducibles] [and] [_____] prints of each drawing. If revisions are made after a drawing has been "Approved", the Contractor shall furnish [reproducibles] [and] [corrected prints] subsequent to each revision.

6. All of the applicable requirements of this paragraph with reference to drawing submittals shall apply equally to catalog cuts, illustrations, printed specifications, weld qualifications, mill
tests, factory tests, field tests, or other required
data, except that two additional copies shall be
submitted in lieu of any reproducibles. All
correspondence, drawings, literature, instruction
books, data, and nameplates shall be in the English
language, with Metric (English) units as currently
used in the United States.

7. Any manufacturing work performed prior to the
approval of the drawings will be at the Contractor's
risk. The Contractor shall make any changes in the
design which are necessary to make the equipment
conform to the provisions and intent of these
specifications without additional cost to the
Government. Approval of the drawings shall not be
construed as a complete check but will indicate only
that the general method of construction and
detailing is satisfactory. Approval by the
Contracting Officer of the Contractor's drawing
shall not be held to relieve the Contractor of any
part of the Contractor's' obligation to meet all of
the requirements of these specifications or of the
responsibility for the correctness of the
Contractor's drawings.

8. Upon completion of the work under this contract,
the Contractor shall furnish a complete set of [CADD
files] [process tracings together with complete sets
of black and white prints or blue-prints] of added
drawings as finally approved. [The CADD files shall
be furnished in Microstation format on electronic
media; i.e., 3½ inch floppy disks, compact disks,
etc.] [The process tracings shall be full size
reproducibles made on cloth, Mylar, or equal, from
the original tracings by photographic-type
reproduction, and shall be of such quality and
clarity as to permit sharp and thoroughly legible
microfilm copying.] These [CADD files] [tracings]
[tracings and prints] shall show all changes and
revisions, including any field changes made up to
the time that the equipment is completed and
accepted and the contract number shall be shown
thereon. The number shall be located immediately
above the title block if possible.

9. Parts catalogs, where applicable, the operating
instructions especially prepared covering all
equipment furnished under this contract which may be
needed or useful in operation, maintenance, repair,
dismantling, or assembling, and for repair and
identification of parts for ordering replacements
shall be assembled under a suitable common cover and
[_____] copies of the assembled material shall be
furnished. The assembled material shall include
complete identification of the spare parts furnished
in compliance with the requirements of these
specifications.

Part III -- LIST OF DOCUMENTS, EXHIBITS, AND OTHER
ATTACHMENTS

Section F  List of Documents, Exhibits, and Other Attachments

Suitable drawings showing the location and general arrangements of the equipment, a single-line diagram of the main power connections, and tabulations of feeder circuit data should be included with the procurement specifications. The drawings should include all features not adequately covered in the specifications which will affect the design of related equipment or the structure.

1.1 PAYMENT PROCEDURES

The 480-Volt Station Service Switchgear and Transformers will be paid by the lump sum job basis for costs associated with [furnishing] [and] [installing] the 480-Volt Station Service Switchgear and Transformers and other completed work, as specified.

1.2 REFERENCES

**NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.3 SUMMARY

a. The location and general arrangement of the low-voltage metal-enclosed switchgear assembly, [metal-enclosed bus structures] [and station service transformers] are shown. Modifications of the equipment arrangement or the equipment device requirements shown shall be subject to approval. The switchgear assembly shall be completely assembled and wired at the factory. Assemble at the factory the metal-enclosed bus structures in sections of sufficient length for convenience of tests, shipment, and installation. After complete assembly, disassemble the switchgear group into sections, for convenience of handling, shipment, and installation.

b. Each shipping section of the switchgear shall be properly matchmarked to facilitate reassembly, and shall be provided with removable lifting channels with eye bolts for attachment of crane slings to facilitate lifting and handling. The equipment shall be shipped as completely assembled and wired as feasible so as to require a minimum of installation work. Switchgear groups and metal-enclosed buses which are disassembled into sections for shipment shall have the associated parts properly matchmarked to facilitate installation by the Government. Any relay (, indicating instrument) or other device which cannot withstand the hazards of shipment when mounted in place on the switchgear shall be carefully packed and shipped separately. These pieces shall be marked with the number of the panel on which they are to be mounted and fully identified so they can be readily mounted and connected.

c. All finished painted surfaces and metal work shall be wrapped suitably or otherwise protected from damage during shipment. All parts shall be prepared for shipment so that slings for handling may be attached readily while the parts are in a railway car or transport truck. Switchgear sections crated for shipment shall be of such size, including crates, that they will pass through a [_____]-meter by [_____]-meter [_____]-foot by [_____]-foot hatch opening, and a [_____]-meter by [_____]-meter [_____]-foot by [_____]-foot wall opening.

1.4 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.
For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.5 EXTRA MATERIALS

Submit a list of spare parts as specified herin. Spare parts shall be duplicates of the original parts furnished, and shall be interchangeable therewith. Furnish the following spare parts for each type and frame size of drawout circuit breaker, except that only one spare is required where
parts are applicable to all types and frame sizes of the circuit breakers:

a. One complete set of main, intermediate and arcing contacts and associated springs for one three pole breaker.

b. One complete set of arc chute assemblies for one three pole breaker.

c. One set of primary disconnecting devices for one three pole breaker.

d. One set of secondary disconnecting devices for one three pole breaker.

e. One shunt trip coil.

f. One Spring-charging motor or solenoid for electrically-operated breakers.

g. One Control relay of each type and rating for electrically-operated breakers.

h. One Auxiliary switch complete for electrically-operated breakers.

i. One manual operating mechanism handle for drawout feeder air circuit breakers.

j. Twelve fuses of each type and size for voltage transformers.

k. Six Indicating lamp assemblies (three red lens and three green lens.)

l. Ten Indicating lamp color caps of each color.

m. One spring for stored-energy closing mechanism.

n. Four spare blank nameplates for operating unit doors.

o. One lot spare bulbs for indicating lamp assemblies, package to contain not less than 20.

PART 2   PRODUCTS

2.1  NAMEPLATES

Submit samples of engraved nameplates with a schedule of nameplate sizes and lettering. The Contractor will be permitted to supply and attach to the switchgear assembly a nameplate or trademark. Include a drawing or illustration showing the proposed nameplate, its size and location. Provide each item of equipment mounted on the switchgear, which does not have a suitable designation included as an integral part of the device, with an engraved nameplate or with other approved suitable means of identification. Nameplates shall be made of laminated sheet plastic or of anodized aluminum approximately 3 mm 1/8 inch thick, engraved to provide white letters on a black background. Provide equipment of the withdrawal type with nameplates mounted on the removable equipment in locations visible when the equipment is in place. The nameplates shall be fastened to the panels in proper positions with black finished roundhead screws. Each control switch shall be provided with an escutcheon clearly marked to show each operating position. The switch identifications shall be engraved on the escutcheon plates or on separate nameplates. The escutcheon and nameplate markings shall be subject to approval.
2.2 COPPER AND ALUMINUM BARS AND RODS

Copper or aluminum bars and shapes for main bus and ground bus conductors may be provided at the option of the Contractor and shall conform to the requirements of ASTM B187/B187M, ASTM B188, ASTM B236M ASTM B236, and ASTM B317/B317M.

2.3 CONDUIT AND ELECTRICAL METALLIC TUBING

Rigid conduit shall conform to ANSI C80.1 and shall, be zinc-coated (galvanized) both inside and outside by the hot-dip method. Electrical metallic tubing shall conform to ANSI C80.3. Fittings for rigid metal conduit and electrical metallic tubing shall conform to NEMA FB 1.

2.4 CONNECTIONS

All bolts, studs, machine screws, nuts, and tapped holes shall be in accordance with ASME B1.1. Threads for sizes 6 to 25 mm 1/4 to 1 inch, inclusive, shall be NC or UNC series. The sizes and threads of all valves, pipe and fittings, conduit and fittings, tubing and fittings, and connecting equipment shall be in accordance with ASME B1.20.2MA and ASME B1.20.1. Manufacturer's standard thread and construction may be used on small items which, in the opinion of the Contracting Officer, are integrally replaceable, except that threads for external connections to these items shall meet the above requirements.

2.5 480-VOLT STATION SERVICE SWITCHGEAR

2.5.1 General

Except as otherwise specified or indicated, the design, construction and tests of the switchgear shall conform to the applicable requirements of IEEE C37.13, and [IEEE C37.20.1A][IEEE C37.20.2A][IEEE C37.20.3]. The switchgear will be used to distribute power from two [_____] kVA, [_____]-480 volt [13,800-480 volt], 3-phase, 60-Hz, station service transformers to 480-volt power distribution centers and to other station service loads. The switchgear assembly shall contain two main bus sections connected by a bus tie circuit breaker. Each main bus section will be connected to a supply transformer through a main supply circuit breaker. The two main supply circuit breakers and the bus tie circuit breaker shall be electrically operated and will normally be remotely controlled. Automatic bus transfer shall be provided as specified in paragraph Automatic Bus Transfer. The switchgear shall have instruments, control accessories, and other equipment mounted on the front panels and inside the switchgear as shown and as specified. The annunciator window group will be furnished by the Government for mounting and wiring by the Contractor.

2.5.2 Enclosure and Framework

2.5.2.1 Switchgear

The switchgear shall be of the totally-enclosed, free-standing, dead-front type built on a suitable framework of structural steel, or by an equivalent approved method, which shall provide a self-supporting and stable structure. Metal-enclosed switchgear construction consisting of ribbed side sheets and fabricated framework which is functionally equivalent to the structural steel framework specified will be acceptable. The framework and structure shall be sufficiently rigid to withstand operation of the equipment or any stresses due to short circuits. Each shipping assembly
shall also be sufficiently rigid, with the addition of temporary members if required, to withstand handling during shipment and installation.

2.5.2.2 Enclosure

The enclosure shall be made of selected smooth sheet steel panels, suitably supported. Doors and panels used to support instruments and other devices and barriers between compartments shall not be less than No. 11 MSG. Exposed panels on the front and ends of the enclosure shall be bent angle or channel edges with all corner seams welded and ground smooth, or shall be the manufacturer's equivalent construction as approved. The front outside surfaces shall not be drilled or welded for the purpose of attaching wires or mounting devices if such holes or fastenings will be visible from the front.

2.5.2.3 Drawout Circuit Breaker

Each drawout type circuit breaker shall be completely enclosed in a metal compartment. Access to the circuit breakers shall be provided through hinged steel doors. Access to instrument and relay wiring, instrument transformers and fuses, shall also be through hinged doors. All hinged doors shall have bent angle or channel edges, invisible hinges and suitable latches or fastenings. Access to bus compartments shall be through removable bolted panels, cover plates or hinged doors.

2.5.2.4 Ventilating Opening

Ventilating openings shall be provided as required and shall preferably be of the grille type. All ventilating openings shall be provided with corrosion-resistant insect-proof screens on the inside.

2.5.2.5 Foundations

Continuous channel iron foundations, complete with bolts and drilled holes for grouting and anchoring to the floor, shall be furnished by the Contractor for the complete length (front and rear) of each [substation] [switchgear assembly]. Channel construction and drilling shall be as required for mounting the equipment. The channels shall be designed for flat mounting and maximum channel depth shall be \( 63 \text{ mm} \) \( 2-1/2 \text{ inches} \). The foundation channels shall be placed on top of the floor, fastened in place, and then filled with grout. Additional channel or substantial metal trim shall be provided flush with the end panels to completely enclose the bases across the ends of the equipment assemblies where exposed to view.

2.5.3 Buses and Connections

a. The buses in each main bus section shall have a continuous current-carrying capacity of not less than \( [1,200] \) \( [1,600] \) \( [2,000] \) \( [3,000] \) amperes without exceeding the temperature limits specified in [IEEE C37.20.1A][IEEE C37.20.2A][IEEE C37.20.3]. The buses shall have mechanical and thermal capacities coordinated with the interrupting rating of the power supply circuit breakers. Bus bars shall be of hard-drawn copper, aluminum, or aluminum-alloy. Shop splices and tap connections shall be brazed, pressure-welded or bolted. All splices for field assembly shall be bolted. Where bolted connections are used, contact surfaces shall be silver-plated except that contact surfaces for aluminum-alloy may be tin-plated and shall be equipped with provisions for adequate clamping. The buses shall be mounted on insulating supports of wet process porcelain, glass polyester, or
All primary connections including the power connections to the line side of the circuit breakers shall be by bus bar.

b. The standard phasing within equipment housing for AC power circuits shall be A-B-C from left to right when facing the front of the equipment, A-B-C from top to bottom, and A-B-C from front to back. Nonstandard phasing in any compartment will be permitted only upon approval and providing each phase is identified and a warning sign, "Nonstandard Phasing," is incorporated within such a compartment.

c. Blank compartments without buses and small spare compartments with buses and complete provisions for installing future feeder circuit breakers shall be provided where shown.

2.5.4 Power Circuit Breakers

2.5.4.1 General

The power supply, bus tie, and feeder air circuit breakers shall be 3-pole, dead-front, drawout type rated 600 volts AC, conforming to the requirements of IEEE C37.13; IEEE C37.16; and IEEE C37.17. All circuit breakers of the same frame size and type of operation (electrical or manual) shall be interchangeable. Suitable means shall be provided for removing and handling the drawout circuit breakers. These means may include support from the top of the switchgear enclosure without interference with incoming or outgoing wiring. The Government reserves the right to change the indicated current ratings, within frame limits, of the tripping devices at the time the shop drawings are submitted for approval. Overcurrent trip alarm contacts, with means for manual reset, shall be furnished as indicated. Covers shall be provided over readily accessible energized portions to prevent hazards to personnel when withdrawing or inserting the breakers.

2.5.4.2 Power Supply and Bus Tie Circuit Breakers

The 2 power supply circuit breakers and the bus tie circuit breaker shall be electrically-operated drawout type with the closing mechanism designed for operation on 125 volts DC. The circuit breakers shall be rated 600 volts AC, [600] [1,600] [3,000] ampere frame size, [22,000] [42,000] [65,000] amperes symmetrical interrupting capacity at 600 volts AC, with continuous current ratings as indicated. Each circuit breaker shall be provided with functional components in accordance with Table 1 of IEEE C37.13, including means for manual emergency tripping and manual closing for maintenance operation. Each power supply breaker and the bus tie circuit breaker shall be provided with a solid-state direct-acting over-current tripping device consisting of long-time-delay and short-time-delay elements. The bus tie circuit breaker shall be furnished without an overcurrent trip device but shall be provided with a 125-volt DC shunt trip device. Long-time and short-time-delay operation bands shall be selected to provide maximum selectivity between the primary supply protective relays, power supply breakers, bus tie breaker, feeder breakers and motor control center molded case breakers for a fault on a feeder circuit. Information on primary relays and molded case breakers will be supplied to the Contractor. The 2 power supply circuit breakers and the bus tie circuit breaker shall be electrically interlocked so that only 2 of the 3 breakers can be in the closed position at the same time. A local test control switch shall be provided for each electrically-operated circuit breaker which shall be electrically interlocked through cell
switches or secondary disconnects to prevent breaker operation except when the breaker is in the test position. Sufficient breaker auxiliary switch contacts and cell switches shall be provided to accomplish the required breaker control and interlocking system as shown. At least 4 auxiliary switch contacts shall be provided on each breaker. At least 2 spare auxiliary switch contacts, one normally-open and one normally-closed, shall also be provided on each electrically-operated breaker.

2.5.4.3 Feeder Air Circuit Breakers

Feeder breakers shall be independent manually-operated type with manually-charged stored energy closing mechanism and with frame sizes as indicated, and shall be rated 600 volts AC. Circuit breakers with 600-ampere frames shall have a short-circuit interrupting capacity of not less than 22,000 rms symmetrical amperes at 600 volts AC. Each feeder breaker, except as specified otherwise, shall be provided with a solid-state direct-acting overcurrent tripping device consisting of a long-time-delay element and a short-time-delay element. The long-time-delay trip elements for direct-acting overcurrent tripping devices shall be adjustable over an approximate range of 80 to 110 percent of the trip ampere rating. The short-time-delay trip elements, for the direct-acting overcurrent tripping devices shall be adjustable over a range of approximately 4 to 10 times the ampere rating. Manually-operated drawout type circuit breakers shall be fitted with suitable operating handles, preferably of the pistol grip type, or vertical lever type, designed to close the breaker with a rotary motion of less than 180 degrees. All breakers shall be designed for tripping by a rotary motion in the opposite direction or by pressing a readily accessible trip button. The operating handles shall be easily removable when it is necessary to open the compartment door and easily replaceable for operating the breaker in the withdrawn or test position. Duplicate feeder breakers shall be key interlocked. Each breaker shall be equipped with a conspicuous mechanical target visible with the breaker in the normal operating position to indicate whether the breaker is open or closed and shall be provided with a manually-reset bell alarm contact to energize the annunciator circuit only when the breaker is automatically tripped on a fault or overload. The circuit breaker for the powerhouse crane feeder shall be manually-operated type equipped with a 125-volt DC shunt trip attachment for emergency operation from remote stations.

2.5.4.4 Automatic Bus Transfer

The stations shall be provided with automatic bus transfer. The automatic transfer arrangement shall be as shown by the schematic diagrams and shall incorporate the following (normal operation will be with both supply breakers closed and the bus tie breaker open):

a. Loss of voltage on one bus shall cause the associated supply breaker to trip and the bus tie breaker to close.

b. Automatic transfer control will cease to function if either of the supply breakers or the bus tie breaker trip on overcurrent.

c. Recovery of voltage from 1 of the 2 normal sources shall (after a time delay) open the bus tie breaker and close the associated supply breaker.

d. Recovery of voltage from both normal sources shall (after a time delay) open the bus tie breaker and close the supply breakers.
e. After pickup by the voltage relays, the bus transfer operation shall be accomplished within approximately 1 second.

2.5.5 Wiring

2.5.5.1 Control Panel and Power Wiring

Control panel wiring shall be stranded copper switchboard wire with 600-volt insulation. The wire shall be Type SIS as listed in NFPA 70 and shall meet the requirements of NEMA WC 70. Hinge wire shall have class K stranding. Current transformer secondary leads shall be not smaller than No. 10 AWG. The minimum size of wire for all other control wiring shall be No. 14 AWG. Power wiring for 480-volt circuits and below shall be of the same type as control panel wiring and the minimum size shall be No. 12 AWG.

2.5.5.2 Terminals and Installation

a. Control wiring within the assembly housings shall be furnished and installed by the Contractor as specified. All control wiring leaving equipment shall be run to and terminated on terminal blocks. Terminal blocks and internal wiring shall be provided for connection of remote circuits to all spare auxiliary and alarm contacts, remote annunciators, remote control switches, and pilot devices and remote indicating lights where such devices are specified and applicable to the equipment involved. Each individual potential transformer lead shall be brought out to a terminal block. Potential transformers for ground detecting circuits shall be grounded at the equipment. Potential transformers for metering circuits will be remotely grounded by the Government. There shall be no splices in the wiring and all connections shall be made at terminal studs or blocks. Terminal blocks shall be added for wiring to devices having leads instead of terminals. Indented terminals, Burndy Type YAV10 or an approved equal, shall be used on all wires terminated on screw or stud terminals. All screw terminals shall have toothed lock washers and all stud terminals shall have contact nuts and either locking nuts or lock washers.

b. All external control cables and power cables will enter the switchgear in [conduit] [cable trays] [from above] [from below]. Space for cables as shown shall be provided. The 600-volt metal-enclosed buses shall enter the switchgear from [above] [below through floor slots]. Matching openings shall be provided in the switchgear to permit the entrance of the bus into the switchgear through the concrete openings. Clam-style terminals of sizes indicated shall be provided for all main power cable leaving the switchgear. The terminals shall be of the heavy-duty, full clamp type, Burndy "Qiklug", or approved equal. Adequate provisions shall be included for supporting the Government's cables between the conductor terminating points and where they enter or leave the switchgear.

2.5.5.3 Terminal Blocks

Submit prints of wiring and terminal drawings in accordance with Contract Clause CONTRACTOR’S DRAWINGS AND DATA, which will be marked and returned to the Contractor for addition of the designations to the terminal strips and tracings, along with any rearrangement of points required.

a. Terminal blocks for control wiring shall be molded or fabricated type with barriers, rated not less than 600 volts, type [______]. The terminals shall be removable binding, fillister or washer head screw
type, or stud type with contact and locking nuts. The terminals shall be not less than No. 10 in size and shall have sufficient length and space for connecting at least 2 indented terminal connectors for No. 19/22 AWG conductors to each terminal. The terminal arrangement shall be subject to approval. Not less than 10 percent, but in no case less than 2, spare terminals shall be provided on each block or group of blocks.

b. Short-circuiting type terminal blocks shall be furnished for all current transformer secondary leads and shall have provision for shorting together all leads from each current transformer without first opening any circuit. These terminal blocks shall be made by the same manufacturer as the terminal blocks for control wiring listed above, type [_____].

c. White or other light-colored plastic marking strips, fastened by screws to each terminal block, shall be provided for control wire designations. The manufacturer's wire number and the Government's wire number shall both be shown for each connected terminal on the marking strips with permanent marking fluid. The marking strips shall be reversible to permit marking both sides, or two marking strips shall be furnished with each block, to accommodate the two sets of wire numbers.

d. Load terminal blocks rated not less than 600 volts and of adequate capacity shall be provided for the conductors of power circuits except those supplied from air circuit breakers. The terminals shall be of either the stud type with contact nuts and locking nuts or of the removable screw type, having length and space for at least two indented terminal connectors of the size required on the conductors to be terminated. For conductors rated more than 50 amperes all screws shall have hexagonal heads. For conductors rated 50 to 99 amperes the minimum screw size shall be 8 mm 5/16 inch. Conducting parts between connected terminals shall have adequate contact surface and cross section to operate without overheating. Each connected terminal shall have the circuit designation or wire number marked on or near the terminal in permanent contrasting color.

e. Give special attention to wiring the terminal arrangement on the terminal blocks to permit the individual conductors of each external Government-furnished cable to be terminated on adjacent terminal points. The wire (terminal point) designations used on the Contractor's wiring diagrams and printed on terminal block marking strips may be according to the Contractor's standard practice; however, additional wire and cable designations for identification of remote (external) circuits may be required.

2.5.6 Grounding

The switchgear assembly shall include a full-length interior ground bus of copper or aluminum bar to which the housing, framework, cable supports, bus supports, and non-current carrying metallic parts of all equipment and conduits shall be grounded insofar as practicable. No soldered connections shall be used in the ground leads. If the operating mechanism of drawout units is not permanently grounded, ground contacts shall be provided to automatically connect the movable element to the ground buses. These connections shall make before the main disconnecting devices upon insertion, and break after the main disconnecting devices upon withdrawal. Grounding shall conform to [IEEE C37.20.1A][IEEE C37.20.2A][IEEE C37.20.3] except that the ground bus shall have a continuous current-carrying
capacity not less than 25 percent of the continuous rating of the power supply circuit breakers.

2.5.7 Molded Case Circuit Breakers

2.5.7.1 General

Molded case circuit breakers shall conform to the applicable requirements of UL 489 and NEMA AB 3, shall be fully rated, and shall have voltage ratings and interrupting ratings stated. For circuit breakers of the same ampere frame size, 3 pole and 2 pole circuit breakers shall be the same width as 3 single pole and 2 single pole circuit breakers respectively. The circuit breakers shall be manually-operated and shall have trip-free operating mechanisms of the quick-make, quick-break type. All poles of each breaker shall be operated simultaneously by means of a common handle, and shall be enclosed in a common molded plastic case. The contacts of multi-pole breakers shall open simultaneously when the breaker is tripped manually or automatically. The operating handles shall clearly indicate whether the breakers are in "On", "Off", or "Tripped" position. The circuit breakers shall be of the individually-mounted, stationary type, shall all be products of the same manufacturer, and shall be interchangeable when of the same frame size. Each circuit breaker shall be provided with mechanical pressure type terminal lugs for single-conductor stranded copper cables of the size required by the specifications or shown.

2.5.7.2 Trip Units

The circuit breakers shall be of the automatic type provided with combination thermal and instantaneous magnetic trip units. Instantaneous magnetic trip units shall be set at approximately 10 times the continuous current ratings of the circuit breakers.

2.5.7.3 480-Volt AC Circuits

Circuit breakers for 480-volt AC circuits shall be rated 600 volts AC, and shall have a minimum NEMA interrupting capacity of [14,000] [_____ symmetrical amperes at 600 volts AC.

2.5.7.4 120-Volt and 208-Volt AC Circuits

Circuit breakers for 120-volt and 208-volt AC circuits shall be rated not less than 250 volts DC, and either 120/240 or 240 volts AC, and shall have a minimum NEMA interrupting capacity of 10,000 symmetrical amperes.

2.5.7.5 125 Volt DC Circuits

Circuit breakers for 125 volt DC circuits shall be 2-pole rated 125/250 or 250 volts DC, and shall have a minimum NEMA interrupting capacity of 10,000 amperes DC.

2.5.8 Instrument Transformers

2.5.8.1 Voltage Transformers

Five 480-120 volt, 200 volt-ampere capacity, voltage transformers shall be provided for each main 480-volt bus section. Two of the transformers shall be used for metering and 3 of the transformers shall be used with the ground detection equipment. Voltage transformers shall conform to IEEE C57.13 and shall have an ANSI accuracy classification of 0.3W, 0.3X,
and 1.2Y or better. The full-wave impulse level shall be not less than 10 kV. Each voltage transformer shall be protected with removable primary and secondary fuses. Fuses shall be installed in each ungrounded lead and located adjacent to the transformers in an easily accessible place.

2.5.8.2 Current Transformers

Dry type current transformers as shown shall be furnished, installed and wired to the specified terminal blocks. These current transformers shall conform to IEEE C57.13, and shall have the ratios indicated. The current transformers shall be rated not less than 600 volts AC, 10 kV BIL, and the ANSI accuracy classification shall be in accordance with [IEEE C37.20.1A][IEEE C37.20.2A][IEEE C37.20.3], or better. If cable connections to the transformer primary are required, terminals of an approved solderless type and proper size shall be furnished. If transformers are connected to buses, proper connections shall be furnished, complete with bolts, nuts, washers and other accessories.

2.5.9 Ground Detection Equipment

Ground detection equipment shall be furnished for each bus section of the switchgear, to be used for indication and annunciation of grounds of the 480-volt system. The equipment shall consist of 3 instrument voltage transformers complete with primary and secondary fuses, connected wye-delta, with neutral of primary wye grounded and with the coil of a voltage ground detector relay connected in the broken delta corner of the secondary windings of the 3 voltage transformers in accordance with [IEEE C37.20.1A][IEEE C37.20.2A][IEEE C37.20.3]. Two ground detector relays shall be provided, one for each bus section of the switchgear.

2.5.10 Relays

2.5.10.1 General

a. Relays shall conform to the applicable requirements of IEEE C37.90. The relays shall be back-connected, semi-flush-mounted, switchboard type with black, rectangular, dust-tight cases, removable covers with windows, and means of sealing against tampering. Relays, except auxiliary relays, shall be drawout type with built-in test facilities arranged so that the relays can be tested in position or withdrawn from the fronts of the cases without opening current transformer secondary circuits, disturbing external circuits, or requiring disconnection of leads from the relay terminals. The test devices shall permit testing with energy from either the instrument transformers or an external power supply.

b. Submit descriptive data, including manufacturer types and catalog numbers for equipment. Curve sheets for power supply and bus tie circuit breakers combining characteristics of the trip elements to show the proposed selectivity. In addition, [_____] sets of characteristic curves of the individual breaker trip elements shall be included to permit checking and for power supply and bus tie circuit breakers. The breaker trip ampere ratings and lug sizes shall be as indicated.

c. Protective relays shall be provided with all required auxiliaries, including auxiliary instrument transformers and reactors, to adjust currents, potentials and phase angles for proper operation. External relay auxiliaries shall be mounted in compact assemblies back of the panels and adjacent to the relays. AC relays shall be suitable for use
on 60-Hz circuits and for operation with the instrument transformer ratings and connections shown. Relay current coils shall be able to withstand 35 times normal current for 1/2 second, and relay voltage coils shall be able to withstand 110 percent rated voltage continuously without damage. Time delay features shall not depend upon oil dashpots or other devices which are appreciably affected by temperature. Each relay shall be provided with 1 or more operation indicators and/or indicating Contractor switches with targets and external target reset devices, and the circuits shall be arranged for positive target operation. Seal-in Contractor and suitable loading resistors shall be provided where required. Separate relay operating function, such as instantaneous trip attachments and different zones for distance relays, shall have separate targets and contacts.

d. Relay contacts shall be silver-to-silver, electrically independent, chatterproof and non-bouncing, and suitable for use on 125-volt ungrounded DC circuits unless otherwise specified or shown. Where more than one electrically-independent relay contact is required, as indicated, and it is not feasible to provide more than 1 such contact, or if 2 contacts are available but are not electrically independent, auxiliary relays shall be furnished to provide the required additional contacts.

2.5.10.2 AC Voltage Relays

Voltage relays other than ground detector relays shall be induction-disc inverse-time type with adjustable time and voltage settings and with semiflush mounting, drawout case type [______]. Ground detector relays shall be induction-disc inverse-time overvoltage type rated 199 volts AC with low pickup, semiflush mounting in drawout case with circuit closing contacts suitable for 125-volt DC ungrounded circuits. They shall be from the same manufacturer as the AC voltage relays, type [______].

2.5.10.3 Auxiliary relays

Auxiliary relays for bus transfer control shall be semiflush back-connected type for front-of-panel mounting. The semiflush cases shall be black and shall match in appearance other relay cases on the switchgear. Auxiliary relays for interior mounting shall be provided with covers. Relay coils and contacts shall be suitable for continuous operation at 125 volts DC, shall be furnished with resistors where required, and shall be of a type to require a minimum continuous current. The auxiliary relays shall be high-speed, multi-contact, self-reset type, from the same manufacturer as the AC voltage relays, type [______].

2.5.11 Control and Instrument Switches

2.5.11.1 General

All control switches shall be of the rotary switchboard type with handles on the front and the operating contact mechanisms on the rear of the panels, type [______]. Each switch shall be provided with ample contact stages to perform the functions of the control system. Contacts shall be self-aligning and shall operate with a wiping action. A positive means of maintaining high pressure on closed contacts shall be provided. Compression springs or pivotal joints shall not carry current. The covers or plates on the switches shall be readily removable for inspection of contacts. All control switches shall be suitable for operation on 600-volt AC or 250-volt DC circuits. All such switches shall be capable of
satisfactorily withstanding a life test of at least 10,000 operations with rated current flowing in the switch contacts. The switches shall be capable of continuously carrying 20 amperes without exceeding a temperature rise of 30 degrees C. The single-break inductive load interrupting rating of switches shall be not less than 1.5 amperes for 125 volts DC or 10 amperes for 115 volts AC.

2.5.11.2 Switch Features

a. Control and instrument switches shall be suitable for the intended use and shall have the features shown on the schematic diagrams and switch development drawings. The switches shall have modern handles or keys of pistol grip, oval, round notched or knurled type, and shall be black color unless otherwise specified.

b. Control switches for electrically-operated circuit breakers shall be 3 position momentary-contact type with spring return to neutral position, and shall have modern-black, heavy duty pistol grip handles. Circuit breaker control switches shall have mechanical operation indicators to show the last manual operation of the switches, and shall have slip contacts when so indicated or required.

c. Instrument and meter transfer switches and selector switches shall be the maintained-contact type with the required number of positions, and shall have round notched or knurled handles. Ammeter switches shall not open the secondary circuits of current transformers at any time. Instrument switches for potential selection shall have oval handles.

2.5.12 Indicating Lamp Assemblies

Indicating lamp assemblies shall be of the switchboard type, insulated for 125-volt DC service, with appropriately colored caps and integrally mounted resistors for nominal 125-volt DC service (140 volts maximum). Lamps shall be long-life low-wattage type replaceable from the front of the panels and any special tools required for lamp replacement shall be furnished. Color caps shall be made of transparent or translucent material which will not be softened by the heat from the lamps. Insofar as practicable, all color caps shall be similar and interchangeable, and all lamps shall be of the same type and rating.

2.5.13 Indicating Instruments

2.5.13.1 General

Electrical indicating instruments shall conform to the applicable requirements of ANSI C39.1 and the accuracy rating shall be within 1 percent of full-scale value. The instruments shall be back-connected semiflush mounting. Instruments shall have white dials, circular scales, black scale markings, and black tapered antiparallax pointers. Instrument cases shall be dust tight with shadowproof covers and anti-glare windows. Taut-band suspension shall be provided where this design is available. Zero adjustments accessible from the front without removal of covers shall be provided for instruments with spring control. AC instruments shall be designed and calibrated for use on 60-Hz circuits and for operation from 120-volt secondaries of voltage transformers and 5-ampere secondaries of current transformers, as shown. AC instrument potential coils shall be designed for continuous operation at 150-volts, and AC instrument current coils shall be capable of withstanding 40 times rated current for two seconds. Instrument identification legends shall be neatly printed on the
dials or on separate legend plates inside the cases. Instrument scales shall be as specified, or as approved if scales are not specified, and appropriate for the application.

2.5.13.2 Rectangular Switchboard Instruments

Instruments shall be 108 mm 4-1/4 inch minimum rectangular type with nominal 250-degree scale angle and zero-left scales.

2.5.13.3 AC Voltmeters

AC voltmeters shall be provided with expanded type scales.

2.6 METAL-ENCLOSED BUS

Submit the proposed methods for grounding bus housing.

2.6.1 General

The electrical connections between the 480-volt terminals of the station service transformers and the power supply air circuit breakers in the main 480-volt station service switchgear shall consist of 3-phase, nonventilated, nonsegregated-phase, metal-enclosed bus conforming to the applicable requirements of [IEEE C37.20.1A][IEEE C37.20.2A][IEEE C37.20.3]. The bus shall be rated 600 volts AC [1,600] [_____] amperes continuous current carrying capacity, and the momentary current rating shall be not less than [25,000][50,000] rms asymmetrical amperes. The metal-enclosed bus shall be fabricated in sections to suit the arrangement shown. Necessary frames and flange sections required at the bus terminals at the transformers and switchgear, and all required structural supports for the bus structures shall be provided. Expansion sections shall be provided wherever the bus crosses a contraction joint in the building. All electrical and mechanical connections at the station service transformers shall be coordinated with the station service transformer manufacturer. Flexible connections shall be provided at the switchgear and transformer connections. Connections at the switchgear shall be coordinated with the design of the 480-volt station service switchgear.

2.6.2 Conductors

The bus phase conductors shall be of bare copper, aluminum or aluminum-alloy, and when assembled shall withstand the specified dielectric tests. Field joints in the conductors shall be silver-plated except that contact surfaces of aluminum-alloy conductors may be tin plated. The joints shall be provided with sufficient bolts to provide adequate low-resistance contacts.

2.6.3 Enclosure

The three phase conductors with insulating supports and spacers shall be mounted inside a common nonventilated dust tight enclosure made of sheet metal not less than No. 14 MSG. Covers for enclosure openings shall be not less than No. 14 MSG. The design of the enclosure shall permit the installation and alignment of all bus sections and the completion of field joints in the conductors before the enclosure is completely closed.

2.6.4 Grounding

All sections of the housing shall be connected to the powerhouse ground.
system. Bus housing sections shall be bonded together or connected to a common ground bus to facilitate connection to the powerhouse ground system. The proposed method of metal-enclosed bus grounding shall be subject to approval.

2.7 SECONDARY UNIT SUBSTATION

2.7.1 General

The secondary unit substation shall be indoor metal-enclosed secondary selective (double-ended) type rated [13,800-480] [____]-480 volts, [____]kVA, 3-phase, 3-wire, with incoming, transforming, and outgoing sections arranged as indicated. Except as otherwise specified or indicated, the unit substation shall conform to the applicable requirements of NEMA TR 1.

2.7.2 Incoming Sections

Incoming sections for terminating the high-voltage power cables shall be as specified for Station Service Transformers.

2.7.3 Transforming Sections

The transforming section shall be metal enclosed containing ventilated dry type (Class AA) transformers as specified for Station Service Transformers.

2.7.4 Transformer Bus Connections

The transformer low-voltage terminals shall be connected to the power supply breakers in the adjacent 480-volt, outgoing switchgear section by means of copper or aluminum bus with thermal and mechanical capacities coordinated with the ratings of the 480-volt power supply circuit breakers. The transformer high-voltage and low-voltage bus connections shall be arranged so that the front of the transformer enclosures will line up with the front of adjoining incoming sections and the 480-volt outgoing switchgear section. Suitable bus transition compartments shall be provided if required.

2.7.5 Outgoing Section

The outgoing section shall be an indoor metal-enclosed 480-volt power circuit breaker switchgear assembly, with drawout type circuit breakers, as specified for 480-volt Station Service Switchgear.

2.8 STATION SERVICE TRANSFORMER

2.8.1 Type and Rating

The station service transformers shall be indoor ventilated dry-type, self-cooled, NEMA Class AA, with 150 or 220 degrees C 300 or 428 degrees F limiting temperature insulation and shall conform to the applicable requirements of IEEE C57.12.01, IEEE C57.12.50, IEEE C57.12.1, and NEMA TR 1. The transformers shall be rated [____]kVA, 3-phase, 60-Hz, [13,800-480 volts], [____]480 volts and the windings shall be connected delta-delta. The transformer impedance shall be [____] percent subject to ANSI standard tolerance. The transformer shall be designed to carry rated load continuously without exceeding 80 degrees C (Class 150 degrees C) or 150 degrees C (Class 220 degrees C) 176 degrees F (Class 302 degrees F) or 302 degrees F (Class 428 degrees F) temperature limits.
rise above 40 degrees C 104 degrees F ambient temperature when installed in its ventilated sheet metal enclosure and cooled by natural air circulation.

2.8.2 Core and Coils

The core, coils and metal enclosure of the transformer shall be rigidly attached to a structural steel base suitable for moving the complete transformer by the use of rollers. Jacking facilities and removable lifting eyes shall be provided on the core and coil assembly. The core laminations shall be free from burrs which may puncture the insulation between laminations and shall be securely fastened to prevent excessive vibration in normal service or displacement under short-circuit conditions. Four 2-1/2 percent full-capacity taps, 2 above rated voltage and 2 below rated voltage, shall be provided in the high-voltage windings, and suitable means shall be provided for changing the taps while the transformer is de-energized. The terminal board shall be accessible through a door or removable panel in the enclosure. All transformer leads and taps shall be securely braced to prevent displacement or injury during transit or installation and under short-circuit condition. Wiring for transformer accessories shall be adequately supported to prevent breaking of the conductors due to vibration of the transformer and shall be connected to accessible terminal blocks.

2.8.3 Enclosure

The transformer shall be provided with a ventilated sheet steel enclosure as specified for 480-volt Station Service Switchgear, except that a formed enclosure of not less than No.13 MSG may be used. Doors or removable panels shall be provided in the enclosure to permit access to the transformer, and suitable removable lifting eyes or other approved means shall be provided to permit lifting the enclosure alone and also the complete transformer by the use of a crane. The enclosure shall be adequately braced and stiffened on the inside, and shall be coated with sound-deadening material if necessary, so that the audible sound level of the enclosed transformer when operating at rated load will not exceed the value permitted in Table 0-3 of NEMA TR 1.

2.8.4 Incoming Sections

Metal-enclosed compartments shall be provided for terminating the incoming high-voltage power cables with stress cones as indicated. Access to the interior of the compartment shall be through removable bolted panels or bolted hinged doors. Connections between the terminals of the incoming cables and the high-voltage winding terminals of the adjacent transformers shall be by means of copper or aluminum bus with not less than [600] amps. continuous current-carrying capacity and [_____] asymmetrical amperes momentary current rating. Heavy-duty clamp type terminal lugs shall be provided for connecting the high-voltage cables to the transformer high-voltage bus.

2.9 ACCESSORIES

Furnish handling and testing accessories needed to remove, replace, test and maintain the drawout type air circuit breakers. The accessories shall include the following:

a. One Closing Lever for manually closing the electrically-operated circuit breakers.
b. One set of couplers (if required) for test operation of the electrically-operated breakers.

c. One set of test plugs for drawout relays.

d. Two sets of keys for key interlocks.

e. One Hoist, cart or other suitable means for breaker removal and handling.

f. One complete set of all special wrenches and tools required for the installation, maintenance and repair of the switchgear.

g. Four one-quart containers of paint for outside finish.

h. One portable test set by the same manufacturer as the static trip devices to check the operation of the static trip devices without the need for high primary circuit current.

i. One indicating lamp replacement tool (if required).

2.10 FACTORY INSPECTION AND TESTS

Submit five certified copies of the reports of all tests, including complete test data, and five sets of calibration curves for each trip.

2.10.1 General

Each item of equipment supplied under this contract shall be given the manufacturer's routine factory tests and also other tests, as specified below, to insure successful operation of all parts of the assemblies. All tests required shall be witnessed by the Contracting Officer, unless waived in writing, and no equipment shall be shipped until it has been approved for shipment. Notify the Contracting Officer sufficiently in advance of the test date, so that the Contracting Officer can make arrangements to be present. The factory test equipment and test methods used shall conform to the applicable requirements of ANSI, IEEE and NEMA standards, and shall be subject to approval. The witnessing representatives of the Contractor and the Contracting Officer shall sign all test reports.

2.10.2 Switchgear Assembly Tests

Each low-voltage air circuit breaker switchgear assembly shall be subjected to the [_____] ["Production Tests"] described in [IEEE C37.20.1A][IEEE C37.20.2A][IEEE C37.20.3], except as modified or supplemented below:

2.10.2.1 Assembled Equipment

The assembled equipment shall be checked for mechanical adjustment, alignment of panels and devices mounted thereon, adequacy of fastenings and general good workmanship.

2.10.2.2 Wiring

Control, instrument and relay wiring shall be given a point-to-point check, and the correctness of the control wiring shall be verified by actual operation of the compartment devices.
2.10.2.3 Switchgear Assembly

Each switchgear assembly, with all circuit breakers in operating position and contacts closed, shall be subjected to a 1-minute power frequency withstand dielectric test of 2,200 volts AC. Control, instrument and relay wiring shall be subjected to a 1-minute, power frequency withstand dielectric test of 1,500 volts AC to ground.

2.10.2.4 Circuit Breaker

Each low-voltage power circuit breaker shall be given the production tests described in [NEMA C37.50] [NEMA C37.51]. Each circuit breaker shall be thoroughly checked for proper operation and all necessary adjustments shall be made. Shunt trip coils shall be checked for proper operation.

2.10.3 Instrument Transformer Test

The voltage and current transformers shall be subjected to routine tests in accordance with paragraph 4.7.2 of IEEE C57.13.

Five copies of typical ratio and phase angle tests shall be furnished for each type and rating of instrument transformer.

2.10.4 Metal-enclosed Bus Test

Each shop-assembled section of metal-enclosed bus shall be subjected to a low-frequency dielectric withstand test of 2,200 volts for 1 minute between each conductor and the other conductors, and between all conductors connected together and the grounded metal housing in accordance with [IEEE C37.20.1A] [IEEE C37.20.2A] [IEEE C37.20.3].

2.10.5 Station Service Transformer Test

The station service transformers shall be subjected to the routine tests listed in paragraph 8.3 of IEEE C57.12.01, except that the temperature tests, if made, shall be made with the transformers in their enclosures in order to simulate actual operating conditions.

PART 3 EXECUTION

3.1 PAINTING

Metal surfaces of the low-voltage metal-enclosed switchgear assembly and the enclosures for the metal-enclosed bus and station service transformers shall be finished and painted in accordance with [IEEE C37.20.1A] [IEEE C37.20.2A] [IEEE C37.20.3], except that all outside surfaces shall be given not less than 2 coats of quick air drying lacquer or synthetic enamel, [ANSI] Indoor Light Gray No. 61 in color, with semi-gloss finish. Accessories and interior surfaces shall be finished in accordance with manufacturer's standard practices.

3.2 INSTALLATION

**************************************************************************
NOTE: Add appropriate requirements to specify installation by the Contractor.

-- End of Section Table of Contents --
NOTE: This is a revised guide specification that, in part, replaces 26 23 00, SWITCHBOARDS AND SWITCHGEAR. The original guide specification was separated into two specifications: 26 23 00, LOW-VOLTAGE SWITCHGEAR, and 26 24 13, SWITCHBOARDS.

This guide specification covers the requirements for metal-enclosed low-voltage power circuit-breaker switchgear assemblies in either interior or exterior locations. This guide specification is intended for alternating current applications; additional editing will be necessary to tailor it for direct current applications.

Per UFC 3-520-01, specify metal-enclosed switchgear for service entrance equipment only when the service is 1200 amperes or larger, and all branch and feeder circuits are large, such as 600 amperes or 800 amperes each. Specify switchboards in accordance with 26 24 13 SWITCHBOARDS for service entrance equipment when the service is 1200 amperes or larger, and branch and feeder circuits are combined sizes from 20 amperes up to 800 amperes. Utilize switchboards throughout the distribution system where feeders are 1200 amperes or larger.

When the proposed switchgear is connected to a secondary unit substation, coordinate with Section 26 11 16 SECONDARY UNIT SUBSTATIONS.

This specification is not intended to be used for generator control switchgear without extensive modification and coordination with applicable engine-generator set guide specifications.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide
specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

**************************************************************************
**************************************************************************
NOTE: Verify that the following information is indicated on the project drawings:

1. Single-line diagram showing buses and interrupting devices with interrupting capacities; current transformers with ratings; instruments and meters required; and description of instruments and meters.

2. Location, space available, arrangement, and elevations of switchgear.

4. Type and number of cables, size of conductors for each power circuit, and point of entry (top or bottom).

5. Special conditions, such as altitude, temperature and humidity, exposure to fumes, vapors, dust, and gases; and seismic requirements.

8. Locations with arc energy reduction methods specified.

**************************************************************************
**************************************************************************
NOTE: In corrosive and humid environments, use materials, systems, components, and coatings that are durable and minimize the need for preventative and corrective maintenance over the expected service life of the component or system. Corrosive project locations are those with Environmental Severity Classification (ESC) of C3, C4, and C5. Humid locations are those in ASHRAE climate zones 0A, 1A, 2A, 3A, 4C, and 5C (as identified in ASHRAE 90.1).
See UFC 1-200-01 for determination of ESC for project location.

**************************************************************************
NOTE: Include Section 26 08 00 APPARATUS INSPECTION AND TESTING on all projects involving medium voltage and specialized power distribution equipment
**************************************************************************

Section 26 08 00 APPARATUS INSPECTION AND TESTING applies to this section, with the additions and modifications specified herein.

1.3 DEFINITIONS

Unless otherwise specified or indicated, electrical and electronics terms used in these specifications, and on the drawings, are as defined in IEEE 100.

1.4 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions
**************************************************************************
in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

**************************************************************************
NOTE: NFPA 70 Article 110.24 requires an available fault current label to be applied at the service entrance. Select "Available Fault Current Label" below if the switchgear is part of the service entrance equipment. Coordinate with the person developing the Division 1 Sections and ensure that Division 1 Sections identify the person responsible for providing the short circuit calculation for the project. This may vary for design/build versus design/bid/build projects.
**************************************************************************
[ Service Entrance Available Fault Current Label; G[, [____]]

]1.5 QUALITY ASSURANCE

1.5.1 Product Data
Include manufacturer's information on each submittal for each component, device and accessory provided with the switchgear including:
a. Circuit breaker type, interrupting rating, and trip devices, including available settings.

b. Manufacturer's instruction manuals and published time-current curves (in electronic format) of the main secondary breaker and largest secondary feeder device.

1.5.2 Switchgear Drawings

Include wiring diagrams and installation details of equipment indicating proposed location, layout and arrangement, control panels, accessories, piping, ductwork, and other items that must be shown to ensure a coordinated installation. Identify circuit terminals on wiring diagrams and indicate the internal wiring for each item of equipment and the interconnection between each item of equipment. Indicate on the drawings adequate clearance for operation, maintenance, and replacement of operating equipment devices. Include the nameplate data, size, and capacity on submittal. Also include applicable federal, military, industry, and technical society publication references on submittals. Include the following:

a. One-line diagram including breakers, fuses, current transformers, and meters.

b. Outline drawings including front elevation, section views, footprint, and overall dimensions.

c. Bus configuration including dimensions and ampere ratings of bus bars.

d. Markings and NEMA nameplate data, including fuse information (manufacturer's name, catalog number, and ratings).

e. Circuit breaker type, interrupting rating, and trip devices, including available settings.

f. Wiring diagrams and elementary diagrams with terminals identified, and indicating prewired interconnections between items of equipment and the interconnection between the items.

g. Manufacturer's instruction manuals and published time-current curves (in electronic format) of the main secondary breaker and largest secondary feeder device. Use this information (designer of record) to provide breaker settings that ensures protection and coordination are achieved. [For Navy installations, provide electronic format curves using SKM's Power Tools for Windows device library electronic format or EasyPower device library format depending on installation modeling software requirements.]

**************************************************************************
NOTE: If selecting provisions for future expansion, ensure the facility and room size is adequate for the additional equipment.
**************************************************************************

h. Provisions for future expansion by adding switchgear sections.
1.5.3 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" or "must" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Provide equipment, materials, installation, and workmanship in accordance with the mandatory and advisory provisions of NFPA 70 unless more stringent requirements are specified or indicated.

1.5.4 Standard Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship, and:

a. Have been in satisfactory commercial or industrial use for 2 years prior to bid opening including applications of equipment and materials under similar circumstances and of similar size.

b. Have been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period.

c. Where two or more items of the same class of equipment are required, provide products of a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in this section.

1.5.4.1 Alternative Qualifications

Products having less than a 2-year field service record will be acceptable if a certified record of satisfactory field operation for not less than 6000 hours, exclusive of the manufacturers' factory or laboratory tests, is furnished.

1.5.4.2 Material and Equipment Manufacturing Date

Products manufactured more than 1 year prior to date of delivery to site are not acceptable.

1.6 MAINTENANCE

1.6.1 Switchgear Operation and Maintenance Data

Submit Operation and Maintenance Manuals in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

1.6.2 Assembled Operation and Maintenance Manuals

Assemble and securely bind manuals in durable, hard covered, water resistant binders. Assemble and index the manuals in the following order with a table of contents:

a. Manufacturer's O&M information required by the paragraph SD-10, OPERATION AND MAINTENANCE DATA.

b. Catalog data required by the paragraph SD-03, PRODUCT DATA.
c. Drawings required by the paragraph SD-02, SHOP DRAWINGS.

d. Prices for spare parts and supply list.

[ e. Information on metering.

] f. Design test reports.

g. Production test reports.

[1.6.3] Spare Parts

**************************************************************************
NOTE: Do not use this paragraph for Navy projects.  For other services, coordinate with Contracting Officer on whether this paragraph can be included.
Edit as required if additional spare parts are required for a specific project.
**************************************************************************

Provide spare parts as specified below. Provide spare parts that are of the same material and workmanship, meet the same requirements, and are interchangeable with the corresponding original parts furnished.

a. Quantity 2 - Fuses of each type and size.

[ b. [_____] ]

]1.7 WARRANTY

Provide equipment items that are supported by service organizations reasonably convenient to the equipment installation in order to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

PART 2 PRODUCTS

2.1 PRODUCT COORDINATION

Products and materials not considered to be switchgear and related accessories are specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION, and Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

2.2 SWITCHGEAR

IEEE C37.20.1A and UL 1558.

2.2.1 Ratings

Provide equipment with the following ratings:

**************************************************************************
NOTE: Select "as indicated" if there are multiple switchgear with details of each shown on drawings. Most switchgear will be 4-wire, but might be a 3-wire design for delta-connected or ungrounded systems.
**************************************************************************
a. Voltage rating: [480Y/277][208Y/120][___] volts AC, [3][4]-wire [three-phase, [3][4]-wire][as indicated].

b. Continuous current rating of the main bus: [____ amperes][as indicated].

c. Short-circuit current rating: [____ rms symmetrical amperes][as indicated].

d. UL listed and labeled[ for its intended use][ as service entrance equipment].

2.2.2 Construction

**************************************************************************
NOTE: Edit the selection options below as needed for the intended project configuration.

Determine if an arc-resistant design will be specified for the installation. A selection of arc-resistant switchgear can affect the installation design. Arc-resistant switchgear is tested and certified to IEEE C37.20.7, and is intended to provide added protection for internal arcing faults. Select Type 1 if arc protection is only required for the freely accessible front of the enclosure. Select Type 2 if arc protection is required for freely accessible front, sides and rear of the enclosure. Select the 'B' suffix for additional protection applied to compartments designated as low voltage control or instrumentation compartments. Select the 'C' suffix where isolation from the effects of an internal arcing fault is desired between all adjacent compartments within a switchgear assembly. Most manufacturers produce Type 2B as a standard product, which could increase the switchgear cost by about 20 percent. Review IEEE C37.20.7 for additional information.

**************************************************************************

Provide the following:

a. Switchgear: consisting of vertical sections bolted together to form a rigid assembly and [rear][front and rear] aligned[ as indicated].

b. All circuit breakers: front accessible with rear load connections.

c. Compartmentalized switchgear: vertical insulating barriers between the front device section, the main bus section, and the cable compartment[ with full front to rear vertical insulating barriers between adjacent sections].

d. Where indicated, "space for future" or "space" means to include all necessary components and hardware to be fully equipped for racking in a circuit breaker element.

e. Insulating barriers: provided in accordance with NEMA LI 1, Type GPO-3, 6.35 mm 0.25 inch minimum thickness.
[ f. Moisture resistant coating: applied to all rough-cut edges of barriers.

] [g. Switchgear: Arc-resistant[ Type 1[B][C]] [ Type 2[B][C]], tested in accordance with IEEE C37.20.7.

] 2.2.2.1 Enclosure

**************************************************************************

NOTE: Choose the level of corrosion protection required for the specific project location. Most switchgear products will be constructed of a cold rolled steel and painted, which is adequate for most indoor locations. Use galvanized steel or stainless steel enclosures or bases for outdoor applications where corrosion is a concern; specify stainless steel for project locations with Environmental Severity Classifications (ESC) of C4 and C5, galvanized is acceptable for project locations with ESC of C3. See UFC 1-200-01 for determination of ESC for project locations.. Not all manufacturers offer galvanized steel or stainless steel products as a standard design.

Select IEEE C57.12.28 for galvanized enclosures.
Select IEEE C57.12.29 for stainless steel enclosures.

Infrared viewing windows are typically installed in the switchgear rear covers to facilitate the use of IR cameras for thermally scanning cable terminations.

**************************************************************************

Provide the following:

a. Enclosure: [outdoor] NEMA ICS 6 Type [3R][1][_____] [as indicated] [fabricated entirely of 12 gauge ASTM A240/A240M type 304 or 304L stainless steel].

b. Enclosure: bolted together with removable bolt-on side and [hinged] rear covers[, and sloping roof downward toward rear].

c. Front[ and rear] doors: provided with[ stainless steel] padlockable vault handles with a three point catch.

d. Bases, frames and channels of enclosure: corrosion resistant and fabricated of [ASTM A240/A240M type 304 or 304L stainless steel][ or][galvanized steel].

e. Base: includes any part of enclosure that is within 75 mm [3 inches] of concrete pad.

[ g. Paint color: ASTM D1535 light gray No. 61 or No. 49 over rust inhibitor.

SECTION 26 23 00 Page 14
[ h. Paint coating system: comply with IEEE C57.12.28 for galvanized steel] [and] [IEEE C57.12.29 for stainless steel].

[i. Infrared viewing windows: install to allow the use of an infrared camera or thermal imager direct line of site to inspect electrical connections without requiring the opening of panels and doors. These windows are intended to allow thermographers the ability to inspect the electrical equipment without directly exposing themselves to live electrical components and energized devices.

2.2.2.2 Bus Bars

******************************************************************************
NOTE: Use copper with silver-plated contact surfaces in exterior or damp locations or for heavy motor loads.

Delete the neutral bus bracketed option if a 3-wire system was selected.

Only choose the bracketed option requiring insulation on the bus bars for outdoor locations with a high concentration of airborne contaminants. Choose this option primarily for corrosive and high humidity applications as defined in UFC 3-501-01. Most manufacturers will apply an insulating sleeve rather than an epoxy coating.
******************************************************************************

Provide the following:

a. Bus bars: [copper with silver-plated contact surfaces] [or] [aluminum with tin-plated contact surfaces].

(1) Phase bus bars: [ uninsulated] [insulated with an epoxy finish coating powder or insulating sleeve providing a minimum breakdown voltage of 16,000 volts per ASTM D149].

(2) Neutral bus: rated [100][_____] percent of the main bus continuous current rating [as indicated].

b. Make bus connections and joints with hardened steel bolts.

c. Main-bus (through bus): rated at the full ampacity of the main throughout the switchgear.

d. Minimum 6.35 mm by 50.8 mm one-quarter by 2 inch copper ground bus secured to each vertical section along the entire length of the switchgear.

2.2.2.3 Main Section

******************************************************************************
NOTE: Current-limiting fuses should only be needed if the available fault current exceeds the circuit breaker short circuit rating.
******************************************************************************

Provide the main section consisting of [main lugs only] [an individually
mounted][ drawout][ air power circuit breaker[ with current-limiting fuses]][ and utility transformer compartment].

2.2.2.4 Distribution Sections

******************************************************************************
NOTE: Current-limiting fuses should only be needed if the available fault current exceeds the circuit breaker short circuit rating. Utility transformer compartments are rarely used and will require additional review if this bracketed option is selected.
******************************************************************************

Provide the distribution section[s] consisting of[ [individually mounted,][drawout,]][ air power circuit breakers[ with current-limiting fuses]][ and utility transformer compartments] as indicated.

2.2.2.5 Auxiliary Sections

Provide auxiliary sections consisting of indicated[ instruments,][ metering equipment,][ control equipment,][ transformer,][ and][ current transformer compartments] as indicated.

2.2.2.6 Handles

Provide handles for individually mounted devices of the same design and method of external operation. Label handles prominently to indicate device ampere rating, color coded for device type. Identify ON-OFF indication by handle position and by prominent marking.

2.2.3 Protective Device

******************************************************************************
NOTE: Switchgear should be placed where the ambient temperature is less than 40 degrees C, which is the basis for rating in accordance with IEEE C37.13. However, should the ambient temperature be expected to exceed 40 Deg. C, the designer must require a special calibration for the circuit breakers and confirm the equipment ratings.

This paragraph assumes that circuit breakers are available rated for the specified short circuit current. For very high short circuit currents, the manufacturer might have to install current-limiting fuses upstream of the circuit breaker.

Provide ground fault protection of equipment for solidly grounded wye electrical services of more than 150 volts to ground for each service disconnect rated 1000 amperes or more in accordance with NFPA 70.

If 48 Vdc or 125 Vdc electrically operated circuit breakers are required, the appropriate DC control power supply information must be added to the specification.
******************************************************************************
Provide main and branch protective devices as indicated.

Provide the following:

a. **IEEE C37.13.** [120 Vac] [electrically] [manually] operated drawout, [unfused] [fused], low-voltage power circuit breaker with a short-circuit current rating of [_____] rms amperes symmetrical [as indicated] at [_____] volts.

b. Breaker frame size: [as indicated] [_____] amperes.

c. Equip electrically operated breakers with motor-charged, stored-energy closing mechanism to permit rapid and safe closing of the breaker against fault currents within the short time rating of the breaker, independent of the operator's strength or effort in closing the handle.

[2.2.4 Drawout Breakers]

Equip drawout breakers with disconnecting contacts, wheels, and interlocks for drawout application. Provide main, auxiliary, and control disconnecting contacts with silver-plated, multifinger, positive pressure, self-aligning type. Provide drawout compartment shutters to protect operators from accidental contact with breaker stabs when the breaker is withdrawn from its cubicle. Provide each drawout breaker with four-position operation with each position clearly identified by an indicator on the circuit breaker front panel as follows.

a. Connected Position: Primary and secondary contacts are fully engaged. Breaker must be tripped before racking into or out of position.

b. Test Position: Primary contacts are disconnected but secondary contacts remain fully engaged. This position allows complete test and operation of the breaker without energizing the primary circuit.

c. Disconnected Position: Primary and secondary contacts are disconnected.

[2.2.5 Remote Racking]

**************************************************************************
NOTE: UFC 3-520-01 requires consideration of remote racking methods for switchgear circuit breakers. Determine if this feature is desired by electrical personnel that will operate and maintain this equipment. The remote racking mechanism design varies among manufacturers; however the method of connection to the racking mechanism tends to be similar. Determine if the project budget can fund this device (might cost as much as $40,000 with all options including camera and wireless system). Do not select this option if other remote racking mechanisms are available within the activity and can be used for this location.
**************************************************************************
Provide a remote racking mechanism to allow an operator to rack a circuit breaker in or out from at least 20 feet away from the front of the equipment.

2.2.6 Electronic Trip Units

**************************************************************************
NOTE: Switchgear circuit breakers will be supplied with electronic trip units. Select from the bracketed options below. In the items below, choose the bracketed item "main" when the item only applies to the main breaker.

A digital display for the main breaker will typically not be selected if digital metering is provided per the paragraph DIGITAL METERS is selected.

Provide ground fault protection of equipment for solidly grounded wye electrical services of more than 150 volts to ground for each service disconnect rated 1000 amperes or more in accordance with NFPA 70.

NFPA 70 requires arc energy reduction where the highest continuous current trip setting for which the actual overcurrent device installed in a circuit breaker is rated or can be adjusted to 1200 amperes or higher. The option identified below is based on an energy-reducing maintenance switch. Add the additional appropriate information if other methods such as differential relaying or an active arc flash mitigation system are included. Identify locations of alternate arc energy reduction methods in the design.

**************************************************************************

Equip[ main and][ distribution] breakers[ as indicated] with a solid-state tripping system consisting of three current sensors and a microprocessor-based trip unit that provides true rms sensing adjustable time-current circuit protection. Include the following:

a. Current sensors ampere rating: [ as indicated][ [_____] amperes][ the same as the breaker frame rating].

b. Trip unit ampere rating: [ as indicated][ [_____] amperes].

c. Ground fault protection: [ as indicated][ zero sequence sensing][ residual type sensing].

d. Electronic trip units: provide additional features[ as indicated]:

   (1) [Indicated ]Breakers: include long delay pick-up and time settings, and indication of cause of circuit breaker trip.

   (2) Main breakers: include[ short delay pick-up and time settings][ and][, instantaneous settings][ and][ ground fault settings][ as indicated].
(3) Distribution breakers: include short delay pick-up and time settings, instantaneous settings, and ground fault settings as indicated.

(4) [Main ]Breakers: include a digital display for phase and ground current.

(5) [Main ]Breakers: include a digital display for watts, vars, VA, kWh, kvarh, and kVAh.

(6) [Main ]Breakers: include a digital display for phase voltage, and percent THD voltage and current.

(7) [Main ]Breakers: include provisions for communication via a network twisted pair cable for remote monitoring and control. Provide the following communications protocol: [DNP3] [Modbus] [IEC 61850].

(8) For electronic trip units that are rated for or can be adjusted to 1,200 amperes or higher, provide arc energy reduction capability with an energy-reducing maintenance switch with local status indicator.

2.2.7 Metering

2.2.7.1 Digital Meters

**************************************************************************
NOTE: Digital metering incorporates newer technology and provides additional information, often without additional cost. A control power transformer (115 V or 130 V) is usually required with this type of metering.

Digital meters are continually improving. The display capability can be a simple display of numerical values or a more sophisticated display showing waveforms. Over-specification of the meter physical or software characteristics will likely result in specification of an older obsolete meter.
**************************************************************************

IEEE C37.90.1 for surge withstand. Provide true rms, plus/minus one percent accuracy, programmable, microprocessor-based meter enclosed in a sealed case with the following features.

a. Display capability:

(1) Multi-Function Meter: Display a selected phase to neutral voltage, phase to phase voltage, percent phase to neutral voltage THD, percent phase to phase voltage THD; a selected phase current, neutral current, percent phase current THD, percent neutral current; selected total PF, kW, KVA, kVAR, FREQ, kVAr, kWh. Detected alarm conditions include over/under current, over/under voltage, over/under KVA, over/under frequency, over/under selected PF/kVAR, voltage phase reversal, voltage imbalance, reverse power, over percent THD. Include a Form C KYZ pulse output relay on the meter.
(2) Power Meter: Display Watts, VARs, and selected KVA/PP. Detected alarm conditions include over/under KVA, over/under PF, over/under VARs, over/under reverse power.

(3) Volt Meter: Provide capability to be selectable between display of the three phases of phase to neutral voltages and simultaneous display of the three phases of the phase to phase voltages. Detected alarm conditions include over/under voltage, over/under voltage imbalance, over percent THD.

(4) Ammeter: Display phase A, B, and C currents. Detected alarm conditions include over/under current, over percent THD.

(5) Digital Watthour Meter: Provide a single selectable display for watts, total kilowatt hours (kWh) and watt demand (Wd). Include a Form C KYZ pulse output relay on the meter.

b. Design meters to accept input from standard 5A secondary instrument transformers and direct voltage monitoring range to 300-600 volts, phase to phase.

c. Provide programming via a front panel display and a communication interface accessible by a computer.

d. Provide password secured programming stored in non-volatile EEPROM memory.

f. Provide meter that calculates and stores average max/min demand values with time and date for all readings based on a user selectable sliding window averaging period.

g. Provide meter with programmable hi/low set limits with two Form C dry contact relays when exceeding alarm conditions.

h. Provide meter with a display of Total Harmonic Distortion (THD) measurement to a minimum of the thirty-first order.

[ i. Include historical trend logging capability with the ability to store up to 100,000 data points with intervals of 1 second to 180 minutes. Provide a unit that can store and time stamp up to 1000 programmable triggered conditions.

[j. Provide event waveform recording triggered by the rms of 2 cycles of voltage or current exceeding programmable set points. Store waveforms for all 6 channels of voltage and current for a minimum of 10 cycles prior to the event and 50 cycles past the event.

*[2.2.7.2 Electronic Watthour Meter

**************************************************************************

NOTE: For the Air Force, use Section 26 27 13.10 30 ELECTRIC METERS.

For the Navy, use Section 26 27 14.00 20 ELECTRICITY METERING.

SECTION 26 23 00 Page 20
For the Army, coordinate meter requirements in accordance with Engineering and Construction Bulletin ECB 2015-2, Advanced Metering and Connectivity.

**************************************************************************

[ Provide as specified in Section [26 27 14.00 20 ELECTRICITY METERING][26 27 13.10 30 ELECTRIC METERS].

[ANSI C12.1. Provide a switchgear style electronic programmable watthour meter, semi-flush mounted, as indicated. Meter can be either programmed at the factory or programmed in the field. Turn field programming device over to the Contracting Officer at completion of project. Coordinate meter to system requirements.

a. Design: Provide meter designed for use on a 3-phase, 4-wire, [208Y/120][480Y/277] volt system with 3 current transformers. Include necessary KYZ pulse initiation hardware for Energy Monitoring and Control System (EMCS).

b. Coordination: Provide meter coordinated with ratios of current transformers and transformer secondary voltage.

c. Class: 20. Accuracy: plus or minus 1.0 percent. Finish: Class II.

d. Kilowatt-hour Register: five digit electronic programmable type.

e. Demand Register:

   (1) Provide solid state.

   (2) Display actual values and readings of the metered circuit. No multipliers must be required.

   (3) Demand interval length: programmed for [15][30][60] minutes with rolling demand up to six subintervals per interval.

f. Meter fusing: Provide a fuse block mounted in the metering compartment containing one fuse per phase to protect the voltage input to the watthour meter. Size fuses as recommended by the meter manufacturer.

g. Provide meter with a communications port, RS485, with Modbus RTU serial or Ethernet, Modbus-TCP communications.

**************************************************************************

NOTE: Select the appropriate current transformer (CT) ratio, continuous-thermal-current rating factor (RF) at 30 degrees C and ANSI Metering Accuracy Class values based on the CT Ratio which is just below the rating of the main protective device.

Select an ANSI Metering Accuracy Class in accordance with the following table:
<table>
<thead>
<tr>
<th>CT Ratio</th>
<th>RF</th>
<th>Accuracy Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>200/5</td>
<td>4.0</td>
<td>0.3 thru B-0.1</td>

IEEE C57.13. Provide single ratio transformers, 60 hertz, [_____] to 5-ampere ratio, [_____] rating factor, with a metering accuracy class of 0.3 through [______].

[ Provide a fuse block mounted in the metering compartment containing one fuse per phase to protect the voltage input to voltage sensing meters. Size fuses as recommended by the meter manufacturer.

]][2.2.7.3 Submetering

NOTE: For bases and activities that have an active submetering policy in place and written authorization has been received, edit this section as necessary to specify the desired level of submetering and locations.

UFC 1-200-02 references ASHRAE 90.1-2010. But ASHRAE 90.1-2010 does not address submetering criteria. The intended reference for this section is ASHRAE 90.1-2013, which does address submetering criteria.

If submetering is selected as an option, coordinate references to ASHRAE 90.1 with the lead person editing the Division 1 Sections. Typically, references to ASHRAE 90.1 in this Section will be to the 2013 edition, whereas references to ASHRAE 90.1 in other Sections will be to the 2010 edition.

ASHRAE 90.1 - IP. Provide submetering for [______].

]][2.2.8 Transformer

**************************************************************************
NOTE: Coordinate with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, when transformer section is provided.

Provide transformer section in switchgear in accordance with UL 1558 and as indicated. Provide the transformer and section that is suitable for the installation. Provide a transformer conforming to the requirements of Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

[2.2.9 Heaters

NOTE: Select the heater option if the switchgear will be installed in a non-environmentally controlled area.

Provide 120-volt heaters in each switchgear section. Provide heaters of sufficient capacity to control moisture condensation in the section, 250 watts minimum, and controlled by a thermostat and humidistat located in the section. Provide industrial type thermostat, high limit, to maintain sections within the range of 15 to 32 degrees C 60 to 90 degrees F. Provide humidistat with a range of 30 to 60 percent relative humidity. Obtain supply voltage for the heaters from a control power transformer within the switchgear. If heater voltage is different than switchgear voltage, provide transformer rated to carry 125 percent of heater full load rating. Provide transformer with a 220 degrees C insulation system with a temperature rise not exceeding 115 degrees C and conforming to NEMA ST 20. Energize electric heaters in switchgear assemblies while the equipment is in storage or in place prior to being placed in service. Provide method for easy connection of heater to external power source. Provide temporary, reliable external power source if commercial power at rated voltage is not available on site.

2.2.10 Terminal Boards

Provide with engraved plastic terminal strips and screw type terminals for external wiring between components and for internal wiring between removable assemblies. Provide short-circuiting type terminal boards associated with current transformer. Terminate conductors for current transformers with ring-tongue lugs. Provide terminal board identification that is identical in similar units. Provide color coded external wiring that is color coded consistently for similar terminal boards.

2.2.11 Wire Marking

Mark control and metering conductors at each end. Provide factory installed, white, plastic tubing, heat stamped with black block type letters on factory-installed wiring. On field-installed wiring, provide white, preprinted, polyvinyl chloride (PVC) sleeves, heat stamped with black block type letters. Provide a single letter or number on each sleeve, elliptically shaped to securely grip the wire, and keyed in such a manner to ensure alignment with adjacent sleeves. Provide specific wire markings using the appropriate combination of individual sleeves. Indicate on each wire marker the device or equipment, including specific terminal number to which the remote end of the wire is attached.
2.3 MANUFACTURER'S NAMEPLATE

Provide a nameplate on each item of equipment bearing the manufacturer's name, address, model number, and serial number securely affixed in a conspicuous place; the nameplate of the distributing agent is not acceptable. This nameplate and method of attachment may be the manufacturer's standard if it contains the required information.

2.4 FIELD FABRICATED NAMEPLATES

**************************************************************************
NOTE: Use the bracketed sentence to specify labels for switchgear where emergency breakers are located within the switchgear. Provide note on the drawings to indicate where red labels are required.
**************************************************************************

ASTM D709. Provide laminated plastic nameplates for each switchgear, equipment enclosure, relay, switch, and device; as specified in this section or as indicated on the drawings. Identify on each nameplate inscription the function and, when applicable, the position. Provide nameplates of melamine plastic, 3 mm 0.125 inch thick, white with [black][_____] center core. [Provide red laminated plastic label with white center core where indicated.] Provide matte finish surface. Provide square corners. Accurately align lettering and engrave into the core. Provide nameplates with minimum size of 25 by 65 mm one by 2.5 inches. Provide lettering that is a minimum of 6.35 mm 0.25 inch high normal block style.

2.5 SOURCE QUALITY CONTROL

2.5.1 Equipment Test Schedule

The Government reserves the right to witness tests. Provide equipment test schedules for tests to be performed at the manufacturer's test facility. Submit required test schedule and location, and notify the Contracting Officer 30 calendar days before scheduled test date. Notify Contracting Officer 15 calendar days in advance of changes to scheduled date.

Provide the following as part of test equipment calibration:

a. Provide a calibration program which assures that all applicable test instruments are maintained within rated accuracy.

b. Accuracy: Traceable to the National Institute of Standards and Technology.

c. Instrument calibration frequency schedule: less than or equal to 12 months for both test floor instruments and leased specialty equipment.

d. Dated calibration labels: visible on all test equipment.

e. Calibrating standard: higher accuracy than that of the instrument tested.

f. Keep up-to-date records that indicate dates and test results of instruments calibrated or tested. For instruments calibrated by the manufacturer on a routine basis, in lieu of third party calibration, include the following:
(1) Maintain up-to-date instrument calibration instructions and procedures for each test instrument.

(2) Identify the third party/laboratory calibrated instrument to verify that calibrating standard is met.

2.5.2 Switchgear Design Tests

**************************************************************************
NOTE: Use the first bracketed option for standard switchgear. Use the second bracketed option for arc-resistant switchgear.
**************************************************************************

[IEEE C37.20.1A and UL 1558][IEEE C37.20.1A, IEEE C37.20.7, and UL 1558].

2.5.2.1 Design Tests

Furnish documentation showing the results of design tests on a product of the same series and rating as that provided by this specification.

a. Short-circuit current test.

b. Enclosure tests.

c. Dielectric test.

[2.5.2.2 Additional Design Tests

**************************************************************************
NOTE: Include additional design tests when the switchgear main bus is rated greater than 4000 amperes.
**************************************************************************

In addition to normal design tests, perform the following tests on the actual equipment. Furnish reports which include results of design tests performed on the actual equipment.

a. Temperature rise tests.

b. Continuous current.

]2.5.3 Switchgear Production Tests

IEEE C37.20.1A and UL 1558. Furnish reports which include results of production tests performed on the actual equipment for this project. These tests include:

a. 60-hertz dielectric tests.

b. Mechanical operation tests.

c. Electrical operation and control wiring tests.

d. Ground fault sensing equipment test.
[2.5.4] Cybersecurity Equipment Certification

**************************************************************************

NOTE: Coordinate equipment certification with Government’s cybersecurity requirements and interpretations. Select this option if the switchgear includes remote control or remote access capability.
**************************************************************************

Furnish a certification that control systems are designed and tested in accordance with DoD Instruction 8500.01, DoD Instruction 8510.01, and as required by individual Service Implementation Policy.

[2.6] COORDINATED POWER SYSTEM PROTECTION

**************************************************************************

NOTE: Use this paragraph only for Army projects.

The requirement for studies in this section depends on the complexity and extent of the power system. Delete this requirement for projects of limited scope, projects having protective devices which are not adjustable or for which coordination is not possible (standard molded case circuit breakers); projects involving simple extension of 600 volt level service to a building or facility from an existing transformer (750 kVA or less); or projects involving simple extension of 600 volt level service to a building or facility from a new transformer (750 kVA or less).
**************************************************************************

Provide a power system study as specified in Section 26 28 01.00 10 COORDINATED POWER SYSTEM PROTECTION.

[2.7] ARC FLASH WARNING LABEL

**************************************************************************

NOTE: Include the Arc Flash Warning Label detail on the drawings. See the technical note at the beginning of section to obtain the AutoCAD drawing file of the label.
**************************************************************************

Provide warning label for switchgear. Locate this self-adhesive warning label on the outside of the enclosure warning of potential electrical arc flash hazards and appropriate PPE required. Provide label format as indicated.

[2.8] SERVICE ENTRANCE AVAILABLE FAULT CURRENT LABEL

**************************************************************************

NOTE: NFPA 70 requires that service equipment in other than dwelling units be legibly marked in the field with the maximum available fault current, including the date the fault-current calculation was performed. In addition, include the contact information for the organization that completed the
calculation. Select this option if the switchgear will be used as service entrance equipment.

Coordinate with the person developing the Division 1 Sections and ensure that Division 1 Sections identify the person responsible for providing the short circuit calculation for the project. This may vary for design/build versus design/bid/build projects.

Provide label on exterior of switchgear used as service equipment listing the maximum available fault current at that location. Include on the label the date that the fault calculation was performed and the contact information for the organization that completed the calculation. Locate this self-adhesive warning label on the outside of the switchgear. Provide label format as indicated.

[2.9 MIMIC BUS LABELING

NOTE: Include a mimic bus if the system complexity warrants providing a one-line of the system configuration.

Provide a mimic bus on the front of the equipment to diagrammatically show the internal bus structure of the lineup.

PART 3 EXECUTION

3.1 INSTALLATION

Conform to IEEE C2, NFPA 70, and to the requirements specified herein. Provide new equipment and materials unless indicated or specified otherwise.

NOTE: Include the grounding section below for installations involving a switchgear installed in an exterior application. If the switchgear is installed adjacent to a pad-mounted distribution transformer, then coordinate the grounding requirements between the applicable specifications.

3.2 GROUNDING

NOTE: Where rock or other soil conditions prevent obtaining a specified ground value, specify other methods of grounding. Where it is impractical to obtain the indicated ground resistance values, make every effort to obtain ground resistance values as near as possible to the indicated values.

Select 25 ohms resistance unless the installation requires a lower resistance to ground.
NFPA 70 and IEEE C2, except that grounds and grounding systems with a resistance to solid earth ground not exceeding [25][_____] ohms.

3.2.1 Grounding Electrodes

Provide driven ground rods as specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION. Connect ground conductors to the upper end of the ground rods by exothermic weld or compression connector. Provide compression connectors at equipment end of ground conductors.

3.2.2 Equipment Grounding

Provide bare copper cable not smaller than No. 4/0 AWG not less than 610 mm 24 inches below grade connecting to the indicated ground rods. When work in addition to that indicated or specified is directed to obtain the specified ground resistance, the provision of the contract covering "Changes" applies.

3.2.3 Connections

Make joints in grounding conductors and loops by exothermic weld or compression connector. Install exothermic welds and compression connectors as specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION.

3.2.4 Grounding and Bonding Equipment

UL 467, except as indicated or specified otherwise.

3.3 INSTALLATION OF EQUIPMENT AND ASSEMBLIES

Install and connect equipment furnished under this section as indicated on project drawings, the approved shop drawings, and as specified herein.

3.3.1 Switchgear

IEEE C37.20.1A.

3.3.2 Meters and Instrument Transformers

ANSI C12.1.

3.3.3 Field Applied Painting

Where field painting of enclosures is required to correct damage to the manufacturer's factory applied coatings, provide manufacturer's recommended coatings and apply in accordance with manufacturer's instructions.

3.3.4 Galvanizing Repair

Repair damage to galvanized coatings using ASTM A780/A780M, zinc rich paint, for galvanizing damaged by handling, transporting, cutting, welding, or bolting. Do not heat surfaces that repair paint has been applied to.

3.3.5 Field Fabricated Nameplate Mounting

Provide number, location, and letter designation of nameplates as indicated. Fasten nameplates to the device with a minimum of two sheet-metal screws or two rivets.
3.4 FOUNDATION FOR EQUIPMENT AND ASSEMBLIES

**************************************************************************
NOTE: Mounting slab connections may have to be given in detail depending on the requirements for the seismic zone in which the equipment is located. Include construction requirements for concrete slab only if slab is not detailed in drawings.
**************************************************************************

3.4.1 Exterior Location

Mount switchgear on concrete slab as follows:

a. Unless otherwise indicated, provide the slab with dimensions at least 200 mm 8 inches thick, reinforced with a 150 by 150 mm 6 by 6 inch No. 6 mesh placed uniformly 100 mm 4 inches from the top of the slab.

b. Place slab on a 150 mm 6 inch thick, well-compacted gravel base.

c. Install slab such that the top of the concrete slab is approximately 100 mm 4 inches above the finished grade.

d. Provide edges above grade with 15 mm 1/2 inch chamfer.

e. Provide slab of adequate size to project at least 200 mm 8 inches beyond the equipment.

f. Provide conduit turnups and cable entrance space required by the equipment to be mounted.

g. Seal voids around conduit openings in slab with water- and oil-resistant caulking or sealant.

h. Cut off and bush conduits 75 mm 3 inches above slab surface.

i. Provide concrete work as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

3.4.2 Interior Location

Mount switchgear on concrete slab as follows:

a. Unless otherwise indicated, provide the slab with dimensions at least 100 mm 4 inches thick.

b. Install slab such that the top of the concrete slab is approximately 100 mm 4 inches above the finished grade.

c. Provide edges above grade with 15 mm 1/2 inch chamfer.

d. Provide slab of adequate size to project at least 200 mm 8 inches beyond the equipment.

e. Provide conduit turnups and cable entrance space required by the equipment to be mounted.

f. Seal voids around conduit openings in slab with water- and oil-resistant caulking or sealant.
g. Cut off and bush conduits 75 mm 3 inches above slab surface.

h. Provide concrete work as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

3.5 FIELD QUALITY CONTROL

******************************************************************************

NOTE: Select "Request for Settings" below if protective device settings will be government furnished. Select "Required Settings" below if protective device settings are furnished by the Designer of Record. Coordinate with the person developing the Division 1 Sections and ensure that Division 1 Sections identify the person responsible for providing the final protective device settings for design/build versus design/bid/build projects. Do not rely on the manufacturer's default settings.

******************************************************************************

[ Submit request for settings of breakers to the Contracting Officer after approval of switchgear and at least 30 days in advance of their requirement. ]

][Submit Required Settings of breakers to the Contracting Officer after approval of switchgear and at least 30 days in advance of their requirement.]

3.5.1 Performance of Acceptance Checks and Tests

Perform in accordance with the manufacturer's recommendations and include the following visual and mechanical inspections and electrical tests, performed in accordance with NETA ATS.

******************************************************************************

NOTE: Select the options below that apply to the specified equipment.

******************************************************************************

3.5.1.1 Switchgear

a. Visual and Mechanical Inspection

   (1) Compare equipment nameplate data with specifications and approved shop drawings.

   (2) Inspect physical, electrical, and mechanical condition.

   (3) Verify appropriate anchorage, required area clearances, and correct alignment.

   (4) Clean switchgear and verify shipping bracing, loose parts, and documentation shipped inside cubicles have been removed.

   (5) Inspect all doors, panels, and sections for paint, dents, scratches, fit, and missing hardware.

   (6) Verify that fuse and circuit breaker sizes and types correspond to approved shop drawings as well as to the circuit breaker’s address for microprocessor-communication packages.
(7) Verify that current transformer ratios correspond to approved shop drawings.

(8) Inspect all bolted electrical connections for high resistance using low-resistance ohmmeter, verifying tightness of accessible bolted electrical connections by calibrated torque-wrench method, or performing thermographic survey.

(9) Confirm correct operation and sequencing of electrical and mechanical interlock systems.

(10) Confirm correct application of manufacturer's recommended lubricants.

(11) Inspect insulators for evidence of physical damage or contaminated surfaces.

(12) Verify correct barrier and shutter installation and operation.

(13) Exercise all active components.

(14) Inspect all mechanical indicating devices for correct operation.

(15) Verify that filters are in place and vents are clear.

(16) Test operation, alignment, and penetration of instrument transformer withdrawal disconnects.

(17) Inspect control power transformers.

b. Electrical Tests

(1) Perform insulation-resistance tests on each bus section.

(2) Perform dielectric withstand voltage tests.

(3) Perform insulation-resistance test on control wiring; Do not perform this test on wiring connected to solid-state components.

(4) Perform control wiring performance test.

(5) Perform primary current injection tests on the entire current circuit in each section of assembly.

(6) Perform phasing check on double-ended switchgear to ensure correct bus phasing from each source.

(7) Verify operation of switchgear heaters.

3.5.1.2 Circuit Breakers - Low Voltage - Power

a. Visual and Mechanical Inspection

(1) Compare nameplate data with specifications and approved shop drawings.

(2) Inspect physical and mechanical condition.
(3) Inspect anchorage, alignment, and grounding.

(4) Verify that all maintenance devices are available for servicing and operating the breaker.

(5) Inspect arc chutes.

(6) Inspect moving and stationary contacts for condition, wear, and alignment.

(7) Verify that primary and secondary contact wipe and other dimensions vital to satisfactory operation of the breaker are correct.

(8) Perform all mechanical operator and contact alignment tests on both the breaker and its operating mechanism.

(9) Inspect all bolted electrical connections for high resistance using low-resistance ohmmeter, verifying tightness of accessible bolted electrical connections by calibrated torque-wrench method, or performing thermographic survey.

(10) Verify cell fit and element alignment.

(11) Verify racking mechanism.

(12) Confirm correct application of manufacturer's recommended lubricants.

b. Electrical Tests

(1) Perform contact-resistance tests on each breaker.

(2) Perform insulation-resistance tests.

(3) Adjust Breaker(s) for final settings in accordance with Government provided settings.

(4) Determine long-time minimum pickup current by primary current injection.

(5) Determine long-time delay by primary current injection.

******************************************************************************************************
NOTE: Coordinate each option with each breaker type.
******************************************************************************************************

[ ] (6) Determine short-time pickup and delay by primary current injection.

][ (7) Determine ground-fault pickup and delay by primary current injection.

][ (8) Determine instantaneous pickup value by primary current injection.

][ (9) Activate auxiliary protective devices, such as ground-fault or undervoltage relays, to ensure operation of shunt trip devices; Check the operation of electrically-operated breakers in their cubicle.

SECTION 26 23 00 Page 32
(10) Verify correct operation of any auxiliary features such as trip and pickup indicators, zone interlocking, electrical close and trip operation, trip-free, and antipump function.

(11) Verify operation of charging mechanism.

3.5.1.3 Current Transformers

a. Visual and Mechanical Inspection

(1) Compare equipment nameplate data with specifications and approved shop drawings.

(2) Inspect physical and mechanical condition.

(3) Verify correct connection.

(4) Verify that adequate clearances exist between primary and secondary circuit.

(5) Inspect all bolted electrical connections for high resistance using low-resistance ohmmeter, verifying tightness of accessible bolted electrical connections by calibrated torque-wrench method, or performing thermographic survey.

(6) Verify that all required grounding and shorting connections provide good contact.

b. Electrical Tests

(1) Perform resistance measurements through all bolted connections with low-resistance ohmmeter, if applicable.

(2) Perform insulation-resistance tests.

(3) Perform polarity tests.

(4) Perform ratio-verification tests.

3.5.1.4 Metering and Instrumentation

a. Visual and Mechanical Inspection

(1) Compare equipment nameplate data with specifications and approved shop drawings.

(2) Inspect physical and mechanical condition.

(3) Verify tightness of electrical connections.

b. Electrical Tests

(1) Determine accuracy of meters at 25, 50, 75, and 100 percent of full scale.

(2) Calibrate watthour meters according to manufacturer's published data.

(3) Verify all instrument multipliers.
(4) Electrically confirm that current transformer and voltage transformer secondary circuits are intact.

3.5.1.5 Grounding System

a. Visual and Mechanical Inspection

   (1) Inspect ground system for compliance with contract plans and specifications.

b. Electrical Tests

   (1) IEEE 81. Perform ground-impedance measurements utilizing the fall-of-potential method. On systems consisting of interconnected ground rods, perform tests after interconnections are complete. On systems consisting of a single ground rod perform tests before any wire is connected. Take measurements in normally dry weather, not less than 48 hours after rainfall. Use a portable ground resistance tester in accordance with manufacturer's instructions to test each ground or group of grounds. Use an instrument equipped with a meter reading directly in ohms or fractions thereof to indicate the ground value of the ground rod or grounding systems under test.

   (2) Submit the measured ground resistance of each ground rod and grounding system, indicating the location of the rod and grounding system. Include the test method and test setup (i.e., pin location) used to determine ground resistance and soil conditions at the time the measurements were made.

[3.5.1.6 Cybersecurity Installation Certification

**************************************************************************
NOTE: Coordinate equipment certification with Government's cybersecurity requirements and interpretations. Select this option if the switchgear includes remote control or remote access capability.
**************************************************************************

Furnish a certification that control systems are installed in accordance with DoD Instruction 8500.01, DoD Instruction 8510.01, and as required by individual Service Implementation Policy.

]3.5.2 Follow-Up Verification

Upon completion of acceptance checks, settings, and tests, show by demonstration in service that circuits and devices are in good operating condition and properly performing the intended function. Trip circuit breakers by operation of each protective device. Test each item to perform its function not less than three times. As an exception to requirements stated elsewhere in the contract, provide the Contracting Officer 5 working days advance notice of the dates and times for checks, settings, and tests.

NOTE: This guide specification covers the requirements for free-standing, deadfront switchboard assemblies rated 6000 amperes or less, 600 volts or less, and metal-enclosed low-voltage power circuit breaker switchgear assemblies in either interior or exterior locations. Rename the section appropriately if this section is used to specify only switchboards or only switchgear. Use Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, for power and distribution panelboards rated 1200 amperes or less and consisting of only group-mounted, stationary, molded-case circuit breakers, and fusible or nonfusible switches designed to be placed in a cabinet or cutout box.

When the proposed switchboard or switchgear is connected to a secondary unit substation, coordinate with Section 26 11 16 SECONDARY UNIT SUBSTATIONS.

This guide specification is not intended to be used for generator control switchboards without extensive modification and coordination with applicable diesel engine-generator guide specifications.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be
submitted as a Criteria Change Request (CCR).

**************************************************************************

NOTE: Ensure that the following information is indicated on the project drawings or specified in the project specifications:

1. Single-line diagram showing buses and interrupting devices with interrupting capacities; current transformers with ratings; instruments and meters required; and description of instruments and meters.

2. Location, space available, arrangement, and elevations of switchboards or switchgear.

4. Type and number of cables, size of conductors for each power circuit, and point of entry (top or bottom).

5. Special conditions, such as altitude, temperature and humidity, exposure to fumes, vapors, dust, and gases; and seismic requirements.

**************************************************************************

PART 1   GENERAL

Section 26 08 00 APPARATUS INSPECTION AND TESTING applies to this section, with the additions and modifications specified herein.

1.1 PRODUCT COORDINATION

**************************************************************************

NOTE: When the project is designated to be designed to Antiterrorism Construction Standards, the electrical design addresses limiting critical infrastructure damage. If the project scope does not address special (Switchboard) (Switchgear) requirements, check with the Project Manager to see if, as a minimum, Seismic Zone 1 criteria should be incorporated.

**************************************************************************

Products and materials that are not considered to be switchboards or switchgear and related accessories are specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION and Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

1.2 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date,
Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to in the text by the basic designation only.

1.3 DEFINITIONS

Unless otherwise specified or indicated, electrical and electronics terms used in these specifications, and on the drawings, are as defined in IEEE Stds Dictionary.

1.4 SUBMITTALS

******************************************************************************
NOTE: Choose between switchboards and switchgear in brackets throughout this specification. Modify appropriately if both are used in a job.
******************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.5 QUALITY CONTROL

1.5.1 Predictive Testing And Inspection Technology Requirements

**************************************************************************
NOTE: The Predictive Testing and Inspection (PT&I) tests prescribed in Section 01 86 26.07 40
RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS are MANDATORY for all [NASA] [_____] assets
and systems identified as Critical, Configured, or Mission-Essential. If the system is noncritical, nonconfigured, and not mission essential, use sound engineering discretion to assess the value of adding these test and acceptance requirements. See Section
01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS for additional information
regarding cost feasibility of PT&I.
**************************************************************************

This section addresses systems or equipment components regulated by NASA's Reliability Centered Building and Equipment Acceptance Program. This program requires the use of Predictive Testing and Inspection (PT&I) technologies in conformance with RCEBA GUIDE to ensure that building equipment and systems have been installed properly and contain no identifiable defects that shorten the design life of a system or its components. Satisfactory completion of all acceptance requirements is required in order to obtain Government approval and acceptance of the Contractor's work.

Perform PT&I tests and provide submittals as specified in Section
01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS.

1.5.2 [Switchboard][Switchgear] Product Data

Include on each submittal the manufacturer's information for each component, device and accessory provided with the [switchboard][switchgear] including the following:

a. Circuit breaker type, interrupting rating, and trip devices, including
available settings

b. Manufacturer's instruction manuals and published time-current curves (on full-size logarithmic paper) of the main secondary breaker and largest secondary feeder device

1.5.3 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word "shall" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Ensure that equipment, materials, installation, and workmanship are in accordance with the mandatory and advisory provisions of NFPA 70 unless more stringent requirements are specified or indicated.

1.5.4 Standard Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products that are of equal material, design and workmanship. Ensure that the products have been in satisfactory commercial or industrial use for 2 years before bid opening. The 2-year period includes applications of equipment and materials under similar circumstances and of similar size. Use products that have been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period. Where two or more items of the same class of equipment are required, use products of a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in this section.

1.5.4.1 Alternative Qualifications

Products having less than a 2-year field service record are acceptable if a certified record of satisfactory field operation for not less than 6000 hours, exclusive of the manufacturers' factory or laboratory tests, is furnished.

1.5.4.2 Material and Equipment Manufacturing Date

Do not use products manufactured more than 3 years before the date of delivery to the site, unless specified otherwise.

1.6 Warranty

Provide the Contracting Officer with warranties associated with the equipment. Ensure that the equipment items are supported by service organizations that are reasonably convenient to the equipment installation in order to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

PART 2 PRODUCTS

2.1 Design Requirements

Show wiring diagrams and installation details of equipment indicating proposed location, layout and arrangement, control panels, accessories, piping, ductwork, and other items to ensure a coordinated installation.
2.1.1 [Switchboard] [Switchgear] Drawings

Drawings include the following:

a. One-line diagram, including breakers[, fuses][, current transformers, and meters]

b. Outline drawings, including front elevation, section views, footprint, and overall dimensions

c. Bus configuration, including dimensions and ampere ratings of bus bars

d. Markings and NEMA nameplate data[, including fuse information (manufacturer's name, catalog number, and ratings)]

e. Circuit breaker type, interrupting rating, and trip devices, including available settings

f. Three-line diagrams, elementary diagrams, and wiring diagrams with terminals identified and indicating prewired interconnections between items of equipment and the interconnection between the items.

g. Manufacturer's instruction manuals and published time-current curves (on full-size logarithmic paper) of the main secondary breaker and largest secondary feeder device.

[ h. Provisions for future extension.]

2.1.2 Ratings

The voltage rating of the [switchboard][switchgear] is [480Y/277][208Y/120][125][_____] volts [AC][DC], [2][3][4]-wire [single][3] phase [as indicated]. The continuous-current rating of the main bus is [_____] amperes [as indicated]. The short-circuit current rating is [_____] RMS symmetrical amperes [as indicated]. Provide a [switchboard][switchgear] that is UL-listed and labeled[ for its intended use][ as service entrance equipment].

2.2 COMPONENTS

Provide [SWITCHBOARD][SWITCHGEAR] that conforms to [NEMA PB 2 and UL 891][IEEE C37.20.1A and UL 1558].

2.2.1 Construction

**************************************************************************
NOTES: The switchboard specified below is not intended for applications where the available fault current is above 65,000 amps. Where drawout breakers, and high short-circuit current ratings are desired, use UFGS Section 26 22 00.00 10 480-VOLT STATION SERVICE SWITCHGEAR AND TRANSFORMERS.

Ensure that the short-circuit current rating assigned to the switchboard is in accordance with NEMA PB 2.
**************************************************************************

[ Provide dead front switchboards conforming to NEMA PB 2 and labeled under

SECTION 26 23 00.00 40 Page 12
UL 891. Ensure that the switchboards are completely enclosed self-supporting metal structures with the required number of vertical panel sections, buses, molded-case circuit breakers, [and other devices] as shown on the drawings. Provide switchboards that are fully rated for a short-circuit current of [14,000] [22,000] [65,000] [_____] symmetrical amperes RMS AC.

] [Switchboard][Switchgear] consists of vertical sections bolted together to form a rigid assembly and is [rear-][front- and rear-] aligned[ as indicated]. All circuit breakers are front-accessible.[ Rear-aligned switchboards have front-accessible load connections.][ Front- and rear-aligned switchboards have rear-accessible load connections.][ Ensure that compartmentalized [switchboards have][switchgear has] vertical insulating barriers between the front device section, the main bus section, and the cable compartment[ with full front-to-rear vertical insulating barriers between adjacent sections].] Where indicated, "space for future" or "space" means to include bus, device supports, and connections. Provide insulating barriers in accordance with NEMA LI 1, Type GPO-3, 6.35 mm (0.25 inch) 0.25 inch minimum thickness. Apply moisture-resistant coating to all rough-cut edges of barriers. Provide a switchboard that is completely factory-engineered and factory-assembled, including protective devices and equipment indicated with necessary interconnections, instrumentation, and control wiring.

2.2.1.1 Enclosure

**************************************************************************
NOTE: Choose the level of corrosion protection required for the specific project location. Use galvanized steel in most indoor applications. Use stainless-steel bases for most outdoor applications. In less corrosive environments, galvanized steel can be included as an alternative to stainless-steel. Manufacturer's standard construction material is acceptable only in noncoastal and noncorrosive environments.

In the last sentence, use IEEE C57.12.28 for galvanized enclosures. Use IEEE C57.12.29 for stainless-steel enclosures.
**************************************************************************

Ensure that the [switchboard][switchgear] enclosure is [an outdoor] NEMA ICS 6 Type [3R][1][_____] [as indicated][ fabricated entirely of 12-gauge ASTM A240/A240M type 304 or 304L stainless-steel]. Bolt the enclosure together with removable bolt-on side and[ hinged] rear covers[, and slope the roof downward toward the rear].[ Provide front[ and rear] doors with[ stainless-steel] padlockable vault handles with a three-point catch.] Ensure that bases, frames and channels of enclosure are corrosion resistant and fabricated of[ ASTM A240/A240M type 304 or 304L stainless-steel][ or][ galvanized steel]. Base includes any part of enclosure that is within 75 mm 3 inches of concrete pad.[ Galvanized steel conforms to ASTM A123/A123M, ASTM A653/A653M G90 coating, and ASTM A153/A153M, as applicable. Galvanize after fabrication where practicable.] Paint the enclosure, including the bases, ASTM D1535 light gray No. 61 or No. 49. Ensure that the paint coating system complies with[ IEEE C57.12.28 for galvanized steel][ and][ IEEE C57.12.29 for stainless-steel].
NOTE: Include mounting sills for all new construction to provide structural integrity. NEMA PB2 90 inch height includes these sills.

Provide a NEMA Type [2] [3R] switchboard enclosure, built with selected smooth sheet steel panels of not less than 1.9 mm No. 14 gage. Ensure that the exposed panels on the front and ends have bent-angle or channel edges with all corner seams welded and ground smooth. Ensure that the front outside surfaces are not drilled or welded for the purpose of attaching wires or mounting devices if such holes or fastenings are visible from the front. Make the front panels in sections, flanged on four sides and attached to the framework by screws, and arranged for ready removal for inspection or maintenance. [Provide rear access to the bus and device connections.] Provide grille ventilating openings. Provide all ventilating openings with corrosion-resistant insectproof screens on the inside. [Provide each switchboard with a channel iron base at front, rear, and sides, with exposed ends covered by welded steel plates. Provide grout holes. Bolt the switchboard sections to the base.] [Mount switchboards as shown on the drawings and furnish mounting materials as indicated.] Treat all interior and exterior steel parts to inhibit corrosion and paint the enclosure.

2.2.1.2 Bus Bars

NOTE: Use copper with silver-plated contact surfaces in exterior or damp locations or for heavy motor loads.

Only choose the bracketed option requiring epoxy coating on the bus bars for outdoor locations with a high concentration of airborne contaminants. Choose this option primarily for outdoor waterfront or dirty industrial applications.

Ensure that the bus bars are copper with silver-plated contact surfaces or aluminum with tin-plated contact surfaces. Ensure that plating is at least 0.005 mm 0.0002 inches thick. Make bus connections and joints with hardened-steel bolts. Rate the through-bus at the full ampacity of the main throughout the switchboard. Provide a copper ground bus at least 6.35 mm by 50.8 mm 0.25 inch by 2 inches secured to each vertical section along the entire length of the switchboard. Rate the neutral bus [100%] percent of the main bus continuous-current rating [as indicated]. [Insulate bus bars with an epoxy finish coating powder providing a minimum breakdown voltage of 16,000 volts in accordance with ASTM D149.]

NOTE: When either copper or aluminum bus is allowed, the manufacturers will generally provide the less expensive aluminum. Use ASTM 317 when aluminum bus is permitted. Silver plating allows for a greater temperature rise on the bus.

Ensure that all buses are copper [or aluminum] and [all bolted splices and
connections between buses and for extensions or taps for equipment] are
tin-plated or silver-plated [throughout]. Ensure that copper [or aluminum]
bars and shapes for bus conductors conform to the applicable requirements of ASTM B187/B187M [, and ASTM B317/B317M]. Bolt all splices for field assembly with at least two bolts, and employ the use of "Belleville" washers in the connection. Ensure that horizontal and vertical power buses have the minimum current ratings shown on the drawings. Insulate buses for not less than 600 volts. Braze, pressure-weld, or bolt, splices and tap connections. Bolt the splices for field assembly. Mount the buses on insulating supports of wet-process porcelain, glass polyester, or suitable molded material, and brace to withstand not less than [14,000] [22,000] [65,000] [_____] symmetrical amperes ac. Near the bottom of the enclosure, mount a copper [or aluminum] ground bus, rated not less than 300 amperes, extending the entire length of the assembled structure. Provide a full-clamp solderless copper or copper alloy lug for No. 2/0 AWG stranded copper cable at each end of the bus for connection to the station grounding system.

2.2.1.3 Main Section

The main section consists of[ main lugs only][ an individually mounted[ drawout][ air power circuit breaker[ with current-limiting fuses]][ insulated-case circuit breaker][ molded-case circuit breaker][ bolted pressure switch][ fusible switch][ and utility transformer compartment].

2.2.1.4 Distribution Sections

The distribution section[s] consist of[ individually mounted,][drawout,)][ air power circuit breakers[ with current-limiting fuses]][ insulated-case circuit breakers][ molded-case circuit breakers][ bolted pressure switches][ fusible switches][ and utility transformer compartments] as indicated.

2.2.1.5 Combination Sections

Combination sections consist of[ molded-case circuit breakers][ fusible switches] for the[ main and] branch devices as indicated.

2.2.1.6 Auxiliary Sections

Auxiliary sections consist of indicated[ instruments,][ metering equipment,][ control equipment,][ transformer,][ and][ current transformer compartments] as indicated.

2.2.1.7 Handles

Ensure that handles for individually mounted devices are of the same design and method of external operation. Label handles prominently to indicate device ampere rating, color-coded for device type. Identify ON-OFF indication by handle position and by prominent marking.

2.2.2 Protective Device

**************************************************************************

NOTE: Place switchboards where the ambient temperature is less than 40 degrees C 104 degrees F. However, should the ambient temperature be expected to exceed 40 degrees C 104 degrees F, call for special calibration for the circuit breakers.
Provide ground fault protection of equipment for solidly grounded wye electrical services of more than 150 volts to ground for each service disconnect rated 1000 amperes or more in accordance with NFPA 70.

If 48 Vdc or 125 Vdc electrically operated circuit breakers are required, add the appropriate DC control power supply information to the specification. Reference information can be obtained from Section 26 11 13.00 20 PRIMARY UNIT SUBSTATION.

**************************************************************************

Provide[ main and] branch protective devices as indicated.

[2.2.2.1 Power Circuit Breaker]

Provide breakers conforming to IEEE C37.13. Provide [120 Vac][ electrically][ manually] operated [stationary][drawout], [unfused][fused],[ steel frame,] low-voltage power circuit breaker with a short-circuit current rating[ of [_____] RMS amperes symmetrical][ as indicated] at [_____] volts. The breaker frame size is [ as indicated][ [_____] amperes].[ Equip the electrically operated breakers with a motor-charged, stored-energy closing mechanism to permit rapid and safe closing of the breaker against fault currents within the short time rating of the breaker, independent of the operator's strength or effort in closing the handle.]

[2.2.2.2 Insulated-Case Breaker]

Provide a UL-listed, 100-percent rated,[ stationary][ drawout], [120 Vac],[ electrically][ manually] operated, low-voltage, insulated-case circuit breaker, with a short-circuit current rating[ of [_____] RMS symmetrical amperes][ as indicated] at [_____] volts. The breaker frame size is [ [_____] amperes][ as indicated].[ Equip the electrically operated breaker with a motor-charged, stored-energy closing mechanism to permit rapid and safe closing of the breaker against fault currents within the short time rating of the breaker, independent of the operator's strength or effort in closing the handle.]

[2.2.2.3 Molded-Case Circuit Breaker]

Provide breakers conforming to UL 489. Ensure that breakers are UL-listed and labeled, 100-percent rated,[ stationary][ drawout], [120 Vac],[ electrically][ manually] operated, low-voltage molded-case circuit breaker, with a short-circuit current rating of[ [_____] RMS symmetrical amperes][ as indicated] at [_____] volts. Breaker frame size is [ [_____] amperes][ as indicated]. Series-rated circuit breakers are unacceptable.

[ Equip each switchboard with molded-case circuit breakers with trip ratings and terminal connectors for attachment of outgoing power cables as shown on the drawings. Ensure that the circuit breakers are operable and removable from the front. Where shown on the drawings, enclose circuit breakers in individual compartments.]

[2.2.2.4 Fusible Switches]

Provide quick-make, quick-break, hinged-door fusible switches.[ Ensure
that the switches serving as motor disconnects are horsepowerrated.

Ensure that the fuses have current-limiting cartridges conforming to UL 198M, Class J for 0 to 600 amperes and Class L for 601 to 6000 amperes.[UL 198M, Class [RK1][RK5] for 0 to 600 amperes].

Ensure that fuseholders conform to UL 4248-12.

[2.2.2.5 Integral Combination Breaker and Current-Limiting Fuses]

Provide fuses conforming to UL 489. Provide integral combination molded-case circuit breaker and current-limiting fuses[ as indicated][ rated [_____] amperes] with a minimum short-circuit current rating equal to the short-circuit current rating of the [switchboard][switchgear] in which the circuit breaker is mounted. Series-rated circuit breakers are unacceptable. Ensure that overcurrent devices of the circuit breaker and current-limiting fuses are coordinated such that on overloads or fault currents of relatively low value, the overcurrent device of the breaker is operated to clear the fault. For high-magnitude short circuits above a predetermined value[ crossover point], ensure that the current-limiting fuses operate to clear the fault. Ensure that the housing for the current-limiting fuses is an individual molding readily removable from the front and located at the load side of the circuit breaker. If the fuse housing is removed, ensure that a blown fuse is readily evident by means of a visible indicator. Ensure that the removal of the fuse housing causes the breaker contacts to open, and that it is not possible to close the breaker contacts with the fuse housing removed. Ensure that it is not possible to insert the fuse housing with a blown fuse or with one fuse missing. Ensure that the the blowing of any of the fuses causes the circuit breaker contacts to open.

[2.2.3 Drawout Breakers]

Equip drawout breakers with disconnecting contacts, wheels, and interlocks for drawout application. Ensure that the main, auxiliary, and control disconnecting contacts are silver-plated, multifinger, positive-pressure, and self-aligning. Provide each drawout breaker with four-position operation. Clearly identify each position by an indicator on the circuit breaker front panel.

a. Connected Position: Primary and secondary contacts are fully engaged. Ensure that the breaker is tripped before racking into or out of position.

b. Test Position: Primary contacts are disconnected but the secondary contacts remain fully engaged. Ensure that the position allows complete test and operation of the breaker without energizing the primary circuit.

c. Disconnected Position: Primary and secondary contacts are disconnected.

[2.2.4 Electronic Trip Units]

Equip[ main and][ distribution] breakers[ as indicated] with a solid-state tripping system consisting of three current sensors and a microprocessor-based trip unit that provides true RMS-sensing adjustable
time-current circuit protection. The ampere rating of the current sensors are [as indicated] [_____] amperes [the same as the breaker frame rating]. The trip unit ampere rating is [as indicated] [_____] amperes. [Ground fault protection is [as indicated] [zero-sequence sensing] [residual-sensing].] [Provide the electronic trip units with the following features [as indicated].]

**************************************************************************

NOTE: In the items below, choose the bracketed item "main" when the item applies only to the main breaker.

Provide ground fault protection of equipment for solidly grounded wye electrical services of more than 150 volts to ground for each service disconnect rated 1000 amperes or more in accordance with NFPA 70.

**************************************************************************

[ a. [Indicated breakers] Breakers have long-delay pickup and time settings, and LED indication of cause of circuit breaker trip.

] [b. Main breakers have [short-delay pickup and time settings] [and] [, instantaneous settings] [and] [ground fault settings] [as indicated].

] [c. Distribution breakers have [short-delay pickup and time settings] [, instantaneous settings] [, and ground fault settings] [as indicated].

] [d. [Main ] Breakers have a digital display for phase and ground current.

] [e. [Main ] Breakers have a digital display for watts (W), volt-amperes (VA), kilovolt-ampere hours (kVAh) volt-amperes reactive (VAR), kilovolt-ampere reactive hours (kVARh), and kilowatt hour vars, VA, (kWh).

] [f. [Main ] Breakers have a digital display for phase voltage, and percentage total harmonic distortion (THD) voltage and current.

] [g. [Main ] Breakers have provisions for communication via a network twisted-pair cable for remote monitoring and control.

][2.2.5 Electronic Trip Unit Central Monitor

Provide a microprocessor-based device designed to monitor and display parameters of the circuit breaker electronic trip units. Ensure that the central monitor has the following features:

a. Alphanumeric display

b. Indication of circuit breaker status: tripped, open, closed

c. Cause of circuit breaker trip

d. Phase, neutral, and ground current for each breaker

e. Energy parameters for each breaker

f. Provisions for communicating directly to a remote computer
2.2.6 Instruments

Provide electrical indicating switchboard instruments, with 2-percent accuracy. Provide ac ammeters and voltmeters at least 50.8 mm square, with a 250-degree scale. Provide single-phase indicating instruments with flush-mounted transfer switches for reading three phases.

2.2.6.1 AC Ammeters

Provide a [self-contained, transformer-rated, 5-ampere input ac ammeter, for use with a [_____] to 5-ampere current transformer ratio, 0-to-[_____]-ampere scale range, 60 hertz.

2.2.6.2 AC Voltmeters

Provide self-contained voltmeters.

2.2.6.3 Instrument Control Switches

Provide rotary cam-operated instrument control switches with positive means of indicating contact positions. Ensure that switches have silver-to-silver contacts enclosed in a protective cover that can be removed to inspect the contacts.

2.2.7 Watthour and Digital Meters

**************************************************************************
NOTE: When Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC is used, coordinate meter requirements. Form 9S, in text below, is for three-phase, four-wire wye systems; for other system configurations, the designer determines the appropriate form designation.
**************************************************************************

2.2.7.1 Digital Meters

**************************************************************************
NOTE: Digital metering incorporates the latest technology and provides additional information, often without additional cost. A control power transformer (115 V or 130 V) is normally required with this type of metering.
**************************************************************************

Ensure that meters conform to IEEE C37.90.1 for surge-withstand requirements. Provide true RMS, plus/minus 1-percent accuracy, programmable, microprocessor-based meters enclosed in sealed cases with a simultaneous 3-line, 12-value LED display. Ensure that meters have 16 mm) 0.56-inch, minimum, LEDs. [Watthour meters have 16 mm 0.56-inch, minimum, LEDs.] Ensure that the meters accept[ input from standard 5A secondary instrument transformers][ and][ direct-voltage monitoring range to [300][600] volts, phase to phase]. Ensure the programming is via a front-panel display and a communication interface with a computer. Store password-secured programming in nonvolatile EEPROM memory. Ensure that digital communications are Modbus [ASCII][RTU] protocol via a [RS232C][RS485] serial port[ and an independently addressable [RS232C][RS485] serial port]. Ensure that the meter calculates and stores average max/min demand values for all readings based on a user-selectable
sliding-window averaging period. Ensure that the meter has programmable high/low set limits with two Form C dry-contact relays when exceeding alarm conditions. [Provide a meter with THD measurement to the thirty-first order. ] Ensure that the historical-trend logging capability can to store up to [100,000] [_____ ] data points with intervals of 1 second to 180 minutes. Ensure that the unit can also store and time-stamp up to 100 programmable triggered conditions. [Ensure that event waveform recording is triggered by the RMS of two cycles of voltage or current exceeding programmable set points. Ensure that the meter stores waveforms for all six channels of voltage and current for a minimum of 10 cycles before the event and 50 cycles past the event.]

[a. Multifunction Meter: Meter simultaneously displays a selected phase-to-neutral voltage, phase-to-phase voltage, percent phase-to-neutral voltage THD, percentage phase-to-phase voltage THD; a selected phase current, neutral current, percent phase current THD, percentage neutral current; and selected total picofarad (PF), kW, kVA, kVAr, frequency (FREQ), kVAh, and kWh. Detected alarm conditions include over/under current, over/under voltage, over/under kVA, over/under frequency, over/under selected PF/kVAr, voltage phase reversal, voltage imbalance, reverse power, and over percentage THD. Ensure that the meter has a Form C KYZ pulse output relay.

]b. Power Meter: Meter simultaneously displays watts (W), VAr, and selected kVA/PF. Detected alarm conditions include over/under kVA, over/under PF, over/under VAr, and over/under reverse power.

]c. Voltmeter: Meter is selectable between simultaneous display of the three phases of phase-to-neutral voltages and simultaneous display of the three phases of the phase-to-phase voltages. Detected alarm conditions include over/under voltage, over/under voltage imbalance, and over percentage THD.

]d. Ammeter: Meter simultaneously displays phase A, B, and C currents. Detected alarm conditions include over/under current and over percentage THD.

]e. Digital Watthour Meter: Meter has a single selectable display for W, total kWh and watt demand (Wd). The meter has a Form C KYZ pulse output relay.

][2.2.7.2 Electronic Watthour Meter

Provide a switchboard-style electronic programmable watthour meter, semi-drawout, semiflush-mounted, as indicated. Meter is either programmed at the factory or programmed in the field. After field programming is complete, turn the field programming device over to the Contracting Officer.

a. Design: Provide a meter designed for use on a 3-phase, 4-wire, [208Y/120][480Y/277] volt system with three current transformers. Include the necessary KYZ pulse initiation hardware for the Energy Monitoring and Control System (EMCS) [as specified in Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC].

b. Coordination: Provide a meter coordinated with ratios of current transformers and transformer secondary voltage.

c. Class: 20. Form: [9S][__]. Accuracy: plus/minus 1.0 percent. Finish: Class II.
d. Kilowatt hour Register: five-, digit electronic programmable.

e. Demand Register:

(1) Meter reading multiplier: Indicate multiplier on the meter face.

(2) Demand interval length: Program for [15][30][60] minutes with rolling demand up to six subintervals per interval.

f. Meter fusing: Provide a fuse block-mounted in the metering compartment containing one fuse per phase to protect the voltage input to the watthour meter. Size fuses as recommended by the meter manufacturer.

]2.2.8 Current Transformers

**************************************************************************

NOTE: Select the appropriate current transformer ratio, continuous-thermal-current rating factor (RF) at 30 degrees C 86 degrees F and ANSI Metering Accuracy Class values based on the current transformer ratio that is just below the rating of the main protective device.

Select an ANSI metering accuracy class in accordance with the current transformer (CT) ratios and rating factors (RFs) in the following table:

<table>
<thead>
<tr>
<th>CT Ratio</th>
<th>RF</th>
<th>Accuracy Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>200/5</td>
<td>4.0</td>
<td>0.3 through B-0.1</td>
</tr>

</tbody>
</table>

**************************************************************************

Provide transformers that conform to IEEE C57.13. Ensure that transformers are single-ratio, 60 hertz, [_____] to 5-ampere ratio, [_____] rating factor, with a metering accuracy class of 0.3 through [_____].

[2.2.9 Transformer

**************************************************************************

NOTE: Coordinate with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, when transformer section is provided. Use UL 891 for switchboards and UL 1558 for switchgear.

**************************************************************************

Provide transformer section in [switchboard][switchgear] in accordance with [UL 891][UL 1558] and as indicated. Ensure that the transformer and section are suitable for the installation.[ Test transformers greater than 10 kVA in accordance with UL 891.} Ensure that transformers conform to the requirements of Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.
2.2.10 Meter Fusing

Provide a fuse block-mounted in the metering compartment, containing one fuse per phase to protect the voltage input to voltage sensing meters. Size the fuses as recommended by the meter manufacturer.

2.2.11 Heaters

Provide 120-volt heaters in each switchboard section. Provide heaters that can control moisture condensation in the section, are a minimum 250 watts, and are controlled by a thermostat and humidistat located in the section. Provide an industrial, high-limit thermostat to maintain sections within the range of 15 to 32 degrees C (60 to 90 degrees F). Humidistat has a range of 30 to 60 percent relative humidity. Obtain supply voltage for the heaters from a control power transformer within the switchboard. If heater voltage is different from switchboard voltage, provide a transformer rated to carry 125 percent of heater full-load rating. Ensure that the transformer has a 220-degrees C insulation system with a temperature rise not exceeding 115 degrees C and conforms to IEEE C57.12.01. Energize electric heaters in the switchboard assemblies while the equipment is in storage or in place before the heaters are placed in service. Provide a method to easily connect the heater to an external power source. Provide reliable, temporary, external power source if the commercial power at the rated voltage is not available on site.

2.2.12 Terminal Boards

Provide terminal boards with engraved plastic terminal strips and screw terminals for external wiring between components and for internal wiring between removable assemblies. Ensure that the terminal boards associated with current transformers are short-circuiting type. Terminate conductors for current transformers with ring-tongue lugs. Ensure that the terminal board identification is identical in similar units. Color-code external wiring consistently for similar terminal boards.

2.2.13 Wire Marking

Mark the control and metering conductors at each end. Provide factory-installed, white, plastic tubing, heat-stamped with black block letters on factory-installed wiring. On field-installed wiring, provide white, preprinted, polyvinyl chloride (PVC) sleeves, heat-stamped with black block letters. Ensure that each sleeve contains a single letter or number, is elliptically shaped to securely grip the wire, and is keyed to align with the adjacent sleeves. Provide specific wire markings using the appropriate combination of individual sleeves. Ensure that each wire marker indicates the device or equipment, including the specific terminal number to which the remote end of the wire is attached.

2.2.14 Manufacturer's Nameplate

Ensure that each item of equipment has a nameplate bearing the manufacturer's name, address, model number, and serial number, securely affixed in a conspicuous place. The nameplate of the distributing agent is not acceptable. This nameplate and method of attachment may be the manufacturer's standard if it contains the required information.

2.2.15 Field-Fabricated Nameplates

**************************************************************************

SECTION 26 23 00.00 40  Page 22
NOTE: Use the bracketed sentence to specify labels for switchboards or switchgear where emergency breakers are located within the switchboards or switchgear. Provide a note on the drawings to indicate where red labels are required.

Ensure that nameplates conform to ASTM D709. Provide laminated plastic nameplates for each[ switchboard,][ switchgear,] equipment enclosure, relay, switch, and device, as specified in this section or as indicated on the drawings. Ensure that each nameplate inscription identifies the function and, when applicable, the position. Construct the nameplates of melamine plastic, 3 mm 0.125 inch thick, white with [black] center core.[ Provide a red laminated plastic label with a white center core where indicated.] Provide a matte finish with square corners. Accurately align lettering and engrave into the core. Ensure that nameplates measure at least 25.4 by 63.5 mm 1 inch by 2.5 inches. Provide block lettering at least 6.35 mm 0.25 inch high.

2.3 TESTS, INSPECTIONS, AND VERIFICATIONS

2.3.1 Equipment Test Schedule

The Government reserves the right to witness tests. Provide schedules for equipment to be tested at the manufacturer’s test facility. Submit required test schedule and location, and notify the Contracting Officer 30 calendar days before the scheduled test date. Notify the Contracting Officer 15 calendar days before changes to the scheduled test date.

a. Test Instrument Calibration Requirements

(1) The manufacturer has a calibration program ensuring that all applicable test instruments are maintained within rated accuracy.

(2) The accuracy is directly traceable to the National Institute of Standards and Technology.

(3) The instrument calibration frequency schedule cannot exceed 12 months for both test floor instruments and leased specialty equipment.

(4) Dated calibration labels are visible on all test equipment.

(5) The calibrating standard is of higher accuracy than that of the instrument tested.

(6) Records that indicate dates and test results of instruments calibrated or tested are kept up to date. For instruments calibrated by the manufacturer on a routine basis, in lieu of third-party calibration, the following are included:

(a) Up-to-date instrument calibration instructions and procedures for each test instrument

(b) Identification of instruments calibrated by a third party or laboratory to verify that the calibrating standard is met
2.3.2 [Switchboard][Switchgear] Design Tests

**************************************************************************
NOTE: Use the first bracketed option for
switchboards and the second bracketed option for
switchgear.
**************************************************************************

[NEMA PB 2 and UL 891][IEEE C37.20.1A and UL 1558].

2.3.2.1 Design Tests

Furnish documentation showing the results of design tests on a product of
the same series and rating as that provided by this specification.

a. Short-circuit current test
b. Enclosure tests
c. Dielectric test

2.3.2.2 Additional Design Tests

**************************************************************************
NOTE: Include additional design tests when the
switchboard or switchgear main bus is rated greater
than 4000 amperes.
**************************************************************************

In addition to normal design tests, perform the following tests on the
actual equipment. Furnish reports that include results of design tests
performed on the actual equipment.

a. Temperature rise tests
b. Continuous current

2.3.3 [Switchboard][Switchgear] Production Tests

**************************************************************************
NOTE: Use the first bracketed option for
switchboards and the second bracketed option for
switchgear.
**************************************************************************

[NEMA PB 2 and UL 891][IEEE C37.20.1A and UL 1558]. Furnish reports that
include results of production tests performed on the actual equipment for
this project. These tests include the following:

a. 60-hertz dielectric tests
b. Mechanical operation tests
c. Electrical operation and control wiring tests
d. Ground fault sensing equipment test
2.4 COORDINATED POWER SYSTEM PROTECTION

******************************************************************************
NOTE: Use this paragraph only for Army projects.

The requirement for studies in this section depends on the complexity and extent of the power system. Delete this requirement for projects of limited scope, projects having protective devices that are not adjustable or for which coordination is not possible (standard molded-case circuit breakers); projects involving simple extension of 600-volt-level service to a building or facility from an existing transformer (750 kVA or less); or projects involving simple extension of 600-volt-level service to a building or facility from a new transformer (750 kVA or less).

******************************************************************************

Provide a power system study as specified in Section 26 28 01.00 10 COORDINATED POWER SYSTEM PROTECTION.

PART 3 EXECUTION

3.1 INSTALLATION

Ensure that the electrical installations conform to IEEE C2, NFPA 70, and to the requirements specified herein.

3.1.1 Grounding

******************************************************************************
NOTE: Where rock or other soil conditions prevent obtaining a specified ground value, specify other methods of grounding. Where it is impractical to obtain the indicated ground resistance values, make every effort to obtain ground resistance values as near as possible to the indicated values.

******************************************************************************

Meet the requirements of NFPA 70 and IEEE C2, except that grounds and grounding systems have a resistance to solid earth ground not exceeding 5 ohms.

3.1.1.1 Grounding Electrodes

Provide driven ground rods as specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION. Connect ground conductors to the upper end of the ground rods by exothermic weld or compression connector. Provide compression connectors at the equipment end of the ground conductors.

3.1.1.2 Equipment Grounding

Provide bare copper cable not smaller than No. 4/0 AWG and not less than 610 mm 24-inches below grade connecting to the indicated ground rods. When work in addition to that indicated or specified is directed in order to obtain the specified ground resistance, the provision of the Contract covering "Changes" applies.
3.1.1.3 Connections

Make the joints in grounding conductors and loops by exothermic weld or compression connector. Install exothermic welds and compression connectors as specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION, paragraph GROUNDING CONNECTIONS.

3.1.1.4 Grounding and Bonding Equipment

Ensure that the equipment conforms to UL 467, except as indicated or otherwise specified.

3.1.2 Installation of Equipment and Assemblies

Install and connect equipment furnished under this section as indicated on approved project or shop drawings and as specified herein.

3.1.2.1 [Switchboard

ANSI/NEMA PB 2.1.

]3.1.2.2 [Switchgear

IEEE C37.20.1A.

]3.1.2.3 [Meters and Instrument Transformers

ANSI C12.1.

]3.1.2.4 Field-Applied Painting

Where field painting of enclosures is necessary to correct damage to the manufacturer's factory-applied coatings, provide the manufacturer's recommended coatings and apply in accordance with the manufacturer's instructions.

3.1.2.5 Galvanizing Repair

Repair damage to galvanized coatings in conformance with ASTM A780/A780M, using zinc-rich paint, for galvanizing surfaces damaged by handling, transporting, cutting, welding, or bolting. Do not heat surfaces that the repair paint has been applied to.

3.1.2.6 Field-Fabricated Nameplate Mounting

Provide the number, location, and letter designation of nameplates as indicated. Fasten nameplates to the device with a minimum of two sheet-metal screws or two rivets.

3.1.3 Foundation For Equipment And Assemblies

**************************************************************************
NOTE: Mounting-slab connections may have to be given in detail depending on the requirements for the seismic zone in which the equipment is located. Include construction requirements for concrete slab only if slab is not detailed in drawings.
**************************************************************************
3.1.3.1 Exterior Location

Mount the [switchboard][switchgear] on a concrete slab. Unless otherwise indicated, ensure that the slab is at least 200 mm 8 inches thick, reinforced with a 150 by 150 mm 6 inch by 6 inch No. 6 mesh placed uniformly 100 mm 4 inches from the top of the slab. Place the slab on a 150 mm 6 inch thick, well-compacted gravel base. Set the top of the concrete slab approximately 100 mm 4 inches above the finished grade. Form the edges above grade to have a 15 mm 0.5 inch chamfer. Ensure that the slab projects at least 200 mm 8 inches beyond the equipment. Provide conduit turn-ups and cable entrance space required by the equipment to be mounted. Seal voids around conduit openings in the slab with water- and oil-resistant caulking or sealant. Cut off and bush conduits 75 mm 3 inches above the slab surface. Ensure that concrete work is as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

3.1.3.2 Interior Location

Mount the [switchboard][switchgear] on the concrete slab. Unless otherwise indicated, ensure that the slab is at least 100 mm 4 inches thick. Place the top of the concrete slab approximately 100 mm 4 inches above the finished floor. Form edges above the floor to have a 15 mm 0.5 inch chamfer. Size the slab to project at least 100 mm 8 inches beyond the equipment. Provide conduit turnups and cable entrance space required by the equipment to be mounted. Seal voids around conduit openings in the slab with water- and oil-resistant caulking or sealant. Cut off and bush conduits 75 mm 3 inches above the slab surface. Ensure that concrete work is as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

3.2 FIELD QUALITY CONTROL

Submit a request for settings of breakers to the Contracting Officer after approval of the [switchboard][switchgear] and at least 30 days before their requirement.

3.2.1 Performance of Acceptance Checks and Tests

******************************
NOTE: If the specified system is identified as critical, configured, or mission-essential, use Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS to establish predictive and acceptance testing criteria, above and beyond that listed below.
******************************

Perform PT&I tests and provide submittals as specified in Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS.

Perform tests in accordance with the manufacturer's recommendations and include the following visual and mechanical inspections and electrical tests, performed in accordance with NETA ATS.

[3.2.1.1 Switchboard Assemblies

a. Visual and Mechanical Inspection

(1) Compare equipment nameplate data with specifications and approved shop drawings.
(2) Inspect physical, electrical, and mechanical condition.

(3) Confirm correct application of manufacturer's recommended lubricants.

(4) Verify appropriate anchorage, required area clearances, and correct alignment.

(5) Inspect all doors, panels, and sections for paint, dents, scratches, fit, and missing hardware.

(6) Verify that fuse and circuit breaker sizes and types correspond to approved shop drawings.

(7) Verify that current transformer ratios correspond to approved shop drawings.

(8) Inspect all bolted electrical connections for high resistance using a low-resistance ohmmeter, verifying tightness of accessible bolted electrical connections by using the calibrated torque-wrench method or performing a thermographic survey.

(9) Confirm correct operation and sequencing of electrical and mechanical interlock systems.

(10) Clean switchboard.

(11) Inspect insulators for evidence of physical damage or contaminated surfaces.

(12) Verify correct barrier and shutter installation and operation.

(13) Exercise all active components.

(14) Inspect all mechanical indicating devices for correct operation.

(15) Verify that vents are clear.

(16) Test the operation, alignment, and penetration of instrument transformer withdrawal disconnects.

(17) Inspect control power transformers.

b. Electrical Tests

(1) Perform insulation-resistance tests on each bus section.

(2) Perform overpotential tests.

(3) Perform insulation-resistance test on control wiring; do not perform this test on wiring connected to solid-state components.

(4) Perform control wiring performance test.

(5) Perform primary current injection tests on the entire current circuit in each section of assembly.

(6) Perform phasing check on double-ended switchboard to ensure correct bus phasing from each source.
(7) Verify operation of switchboard heaters.

3.2.1.2 Switchgear

a. Visual and Mechanical Inspection

(1) Compare equipment nameplate data with specifications and approved shop drawings.

(2) Inspect physical, electrical, and mechanical condition.

(3) Confirm correct application of manufacturer's recommended lubricants.

(4) Verify appropriate anchorage, required area clearances, and correct alignment.

(5) Inspect all doors, panels, and sections for paint, dents, scratches, fit, and missing hardware.

(6) Verify that fuse and circuit breaker sizes and types correspond to approved shop drawings.

(7) Verify that current transformer ratios correspond to approved shop drawings.

(8) Inspect all bolted electrical connections for high resistance using low-resistance ohmmeter, verifying tightness of accessible bolted electrical connections by calibrated torque-wrench method or performing a thermographic survey.

(9) Confirm correct operation and sequencing of electrical and mechanical interlock systems.

(10) Clean switchgear.

(11) Inspect insulators for evidence of physical damage or contaminated surfaces.

(12) Verify correct barrier and shutter installation and operation.

(13) Exercise all active components.

(14) Inspect all mechanical indicating devices for correct operation.

(15) Verify that vents are clear.

(16) Test the operation, alignment, and penetration of instrument transformer withdrawal disconnects.

(17) Inspect control power transformers.

b. Electrical Tests

(1) Perform insulation-resistance tests on each bus section.

(2) Perform overpotential tests.
(3) Perform insulation-resistance test on control wiring; do not perform this test on wiring connected to solid-state components.

(4) Perform control wiring performance test.

(5) Perform primary current injection tests on the entire current circuit in each section of assembly.

(6) Perform phasing check on double-ended switchgear to ensure correct bus phasing from each source.

(7) Verify operation of switchgear heaters.

3.2.1.3 Circuit Breakers - Low Voltage - Power

a. Visual and Mechanical Inspection

(1) Compare nameplate data with specifications and approved shop drawings.

(2) Inspect physical and mechanical condition.

(3) Confirm correct application of manufacturer's recommended lubricants.

(4) Inspect anchorage, alignment, and grounding. Inspect arc chutes. Inspect moving and stationary contacts for condition, wear, and alignment.

(5) Verify that all maintenance devices are available for servicing and operating the breaker.

(6) Verify that primary and secondary contact wipe and other dimensions vital to satisfactory operation of the breaker are correct.

(7) Perform all mechanical operator and contact alignment tests on both the breaker and its operating mechanism.

(8) Inspect all bolted electrical connections for high resistance using low-resistance ohmmeter, verifying tightness of accessible bolted electrical connections by using the calibrated torque-wrench method or performing a thermographic survey.

(9) Verify cell fit and element alignment.

(10) Verify racking mechanism.

b. Electrical Tests

(1) Perform contact-resistance tests on each breaker.

(2) Perform insulation-resistance tests.

(3) Adjust breakers for final settings in accordance with Government-provided settings.

(4) Determine long-time minimum pickup current by primary current injection.
(5) Determine long-time delay by primary current injection.

**************************************************************************
NOTE: Coordinate each option with each breaker type.
**************************************************************************

(6) Determine short-time pickup and delay by primary current injection.

(7) Determine ground fault pickup and delay by primary current injection.

(8) Determine instantaneous pickup value by primary current injection.

(9) Activate auxiliary protective devices, such as ground-fault or undervoltage relays, to ensure the operation of shunt trip devices; check the operation of electrically operated breakers in their cubicle.

(10) Verify correct operation of any auxiliary features, such as trip and pickup indicators, zone interlocking, electrical close and trip operation, trip-free, and antipump function.

(11) Verify operation of charging mechanism.

3.2.1.4 Circuit Breakers

a. Visual and Mechanical Inspection

(1) Compare nameplate data with specifications and approved shop drawings.

(2) Inspect circuit breaker for correct mounting.

(3) Operate circuit breaker to verify smooth operation.

(4) Inspect case for cracks or other defects.

(5) Inspect all bolted electrical connections for high resistance using low-resistance ohmmeter, verifying tightness of accessible bolted connections or cable connections by using the calibrated torque-wrench method or performing a thermographic survey.

(6) Inspect mechanism contacts and arc chutes in unsealed units.

b. Electrical Tests

(1) Perform contact-resistance tests.

(2) Perform insulation-resistance tests.

(3) Perform breaker adjustments for final settings in accordance with Government-provided settings.

(4) Perform long-time-delay time-current characteristic tests.
NOTE: Coordinate each option with each breaker type.

[  (5) Determine short-time pickup and delay by primary current injection.
][  (6) Determine ground fault pickup and time delay by primary current injection.
][  (7) Determine instantaneous pickup current by primary injection.
][  (8) Verify correct operation of any auxiliary features such as trip and pickup indicators, zone interlocking, electrical close and trip operation, trip-free, and antipump function.
]

3.2.1.5 Current Transformers (CTs)

a. Visual and Mechanical Inspection
   (1) Compare equipment nameplate data with specifications and approved shop drawings.
   (2) Inspect physical and mechanical condition.
   (3) Verify correct connection.
   (4) Verify that adequate clearances exist between primary and secondary circuit.
   (5) Inspect all bolted electrical connections for high resistance using low-resistance ohmmeter, verifying tightness of accessible bolted electrical connections by using the calibrated torque-wrench method or performing a thermographic survey.
   (6) Verify that all required grounding and shorting connections provide good contact.

b. Electrical Tests
   (1) Perform resistance measurements through all bolted connections with low-resistance ohmmeter, if applicable.
   (2) Perform insulation-resistance tests.
   (3) Perform polarity tests.
   (4) Perform ratio-verification tests.

3.2.1.6 Metering and Instrumentation

a. Visual and Mechanical Inspection
   (1) Compare equipment nameplate data with specifications and approved shop drawings.
   (2) Inspect physical and mechanical condition.
   (3) Verify tightness of electrical connections.
b. Electrical Tests

(1) Determine accuracy of meters at 25, 50, 75, and 100 percent of full scale.

(2) Calibrate watthour meters according to the manufacturer's published data.

(3) Verify all instrument multipliers.

(4) Electrically confirm that current transformer and voltage transformer secondary circuits are intact.

3.2.1.7 Grounding System

a. Visual and Mechanical Inspection

(1) Inspect ground system for compliance with contract plans and specifications.

b. Electrical Tests

(1) Perform tests in conformance with IEEE 81. Measure ground impedance, using the fall-of-potential method. On systems consisting of interconnected ground rods, perform tests after interconnections are complete. On systems consisting of a single ground rod, perform tests before any wire is connected. Take measurements in normally dry weather, not less than 48 hours after rainfall. Use a portable ground testing megger in accordance with the manufacturer's instructions to test each ground or group of grounds. Ensure that the instrument is equipped with a meter reading directly in ohms or fractions thereof to indicate the ground value of the ground rod or grounding systems under test.

(2) Submit the measured ground resistance of each ground rod and grounding system, indicating the location of the rod and grounding system. Include the test method and test setup (that is, pin location) used to determine ground resistance and soil conditions at the time the measurements were made.

3.2.2 Follow-Up Verification

Upon completion of acceptance checks, settings, and tests, show by demonstration in service that circuits and devices are in good operating condition and properly performing the intended function. Trip circuit breakers by operation of each protective device. Testing requires each item to perform its function not less than three times. Submit test results to the Contacting Officer. As an exception to requirements stated elsewhere in the contract, notify the Contracting Officer of the dates and times for checks, settings, and tests 5 working days in advance.

3.3 CLOSEOUT ACTIVITIES

3.3.1 [Switchboard][Switchgear] Operation and Maintenance Data

Submit operation and maintenance manuals in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.
3.3.2  Assembled Operation and Maintenance Manuals

Assemble and bind manuals securely in durable, hard-covered, water-resistant binders. Assemble and index the manuals in the following order with a table of contents

a. Manufacturer's O&M information required by paragraph SD-10 OPERATION AND MAINTENANCE DATA
b. Catalog data required by paragraph SD-03 PRODUCT DATA
c. Drawings required by paragraph SD-02 SHOP DRAWINGS
d. Prices for spare parts and supply list
[ e. Information on metering
] f. Design test reports
g. Production test reports

3.3.3  Spare Parts List

**************************************************************************
NOTE: Spare parts are specified in Section 01 78 23
OPERATION AND MAINTENANCE DATA for Navy projects.
Do not use this paragraph for Navy projects.
Edit as required if additional spare parts are required for a specific project.
**************************************************************************

Furnish a list of spare parts.

-- End of Section Table of Contents --
NOTE: This guide specification, in part, replaces UFGS 26 23 00, SWITCHBOARDS AND SWITCHGEAR. The original guide specification was separated into two specifications: 26 23 00, LOW-VOLTAGE SWITCHGEAR, and 26 24 13, SWITCHBOARDS.

This guide specification covers the requirements for free standing deadfront switchboard assemblies rated 6000 amperes or less, 600 volts or less. This guide specification is intended for alternating current applications; additional editing will be necessary to tailor it for direct current applications.

Per UFC 3-520-01, specify switchboards for service entrance equipment when the service is 1200 amperes or larger, and branch and feeder circuits are combined sizes from 20 amperes up to 800 amperes. Utilize switchboards throughout the distribution system where feeders are 1200 amperes or larger. Specify metal-enclosed switchgear in accordance with Section 26 23 00 LOW-VOLTAGE SWITCHGEAR for service entrance equipment only when the service is 1200 amperes or larger, and all branch and feeder circuits are large, such as 600 amperes or 800 amperes each. Use Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, for power and distribution panelboards rated less than 1200 amperes.

When the proposed switchboard is connected to a secondary unit substation, coordinate with Section 26 11 16 SECONDARY UNIT SUBSTATIONS.

This specification is not intended to be used for generator control switchboards without extensive modification and coordination with applicable engine-generator set guide specifications.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing.
this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

**************************************************************************

NOTE: Verify that the following information is indicated on the project drawings:

1. Single-line diagram showing buses and interrupting devices with interrupting capacities; current transformers with ratings; instruments and meters required; and description of instruments and meters.

2. Location, space available, arrangement, and elevations of switchboards.

4. Type and number of cables, size of conductors for each power circuit, and point of entry (top or bottom).

5. Special conditions, such as altitude, temperature and humidity, exposure to fumes, vapors, dust, and gases; and seismic requirements.

8. Locations with 100 percent rated circuit breakers.

9. Locations with arc energy reduction methods specified.

**************************************************************************

PART 1   GENERAL

1.1 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

NFPA 70 (2020; ERTA 20-1 2020; ERTA 20-2 2020; TIA 20-1; TIA 20-2; TIA 20-3; TIA 20-4) National Electrical Code

UNDERWRITERS LABORATORIES (UL)

1.2 RELATED REQUIREMENTS

**************************************************************************
NOTE: Include Section 26 08 00 APPARATUS INSPECTION AND TESTING on all projects involving medium voltage and specialized power distribution equipment
**************************************************************************

Section 26 08 00 APPARATUS INSPECTION AND TESTING applies to this section, with the additions and modifications specified herein.

1.3 DEFINITIONS

Unless otherwise specified or indicated, electrical and electronics terms used in these specifications, and on the drawings, are as defined in IEEE 100.

1.4 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that
require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

]}1.5 QUALITY ASSURANCE

1.5.1 Product Data

Include manufacturer's information on each submittal for each component, device and accessory provided with the switchboard including:

a. Circuit breaker type, interrupting rating, and trip devices, including available settings.

b. Manufacturer's instruction manuals and published time-current curves (in electronic format) of the main secondary breaker and largest secondary feeder device.
1.5.2 Switchboard Drawings

Include wiring diagrams and installation details of equipment indicating proposed location, layout and arrangement, control panels, accessories, piping, ductwork, and other items that must be shown to ensure a coordinated installation. Identify circuit terminals on wiring diagrams and indicate the internal wiring for each item of equipment and the interconnection between each item of equipment. Indicate on the drawings adequate clearance for operation, maintenance, and replacement of operating equipment devices. Include the nameplate data, size, and capacity on submittal. Also include applicable federal, military, industry, and technical society publication references on submittals. Include the following:

a. One-line diagram including breakers, fuses, current transformers, and meters.

b. Outline drawings including front elevation, section views, footprint, and overall dimensions.

c. Bus configuration including dimensions and ampere ratings of bus bars.

d. Markings and NEMA nameplate data, including fuse information (manufacturer's name, catalog number, and ratings).

e. Circuit breaker type, interrupting rating, and trip devices, including available settings.

f. Wiring diagrams and elementary diagrams with terminals identified, and indicating prewired interconnections between items of equipment and the interconnection between the items.

g. Manufacturer's instruction manuals and published time-current curves (in electronic format) of the main secondary breaker and largest secondary feeder device. Use this information (designer of record) to provide breaker settings that ensures protection and coordination are achieved.[For Navy installations, provide electronic format curves using SKM's Power Tools for Windows device library electronic format or EasyPower device library format depending on installation modeling software requirements.]

**************************************************************************
NOTE: If selecting provisions for future expansion, ensure the facility and room size is adequate for the additional equipment.
**************************************************************************

[ h. Provisions for future expansion by adding switchboard sections.]

1.5.3 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" or "must" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Provide equipment, materials, installation, and workmanship in accordance with the mandatory and advisory provisions of NFPA 70 unless more stringent requirements are specified or indicated.
1.5.4 Standard Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship, and:

a. Have been in satisfactory commercial or industrial use for 2 years prior to bid opening including applications of equipment and materials under similar circumstances and of similar size.

b. Have been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period.

c. Where two or more items of the same class of equipment are required, provide products of a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in this section.

1.5.4.1 Alternative Qualifications

Products having less than a 2-year field service record will be acceptable if a certified record of satisfactory field operation for not less than 6000 hours, exclusive of the manufacturers' factory or laboratory tests, is furnished.

1.5.4.2 Material and Equipment Manufacturing Date

Products manufactured more than one year prior to date of delivery to site are not acceptable.

1.6 MAINTENANCE

1.6.1 Switchboard Operation and Maintenance Data

Submit Operation and Maintenance Manuals in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

1.6.2 Assembled Operation and Maintenance Manuals

Assemble and securely bind manuals in durable, hard covered, water resistant binders. Assemble and index the manuals in the following order with a table of contents:

a. Manufacturer's O&M information required by the paragraph SD-10, OPERATION AND MAINTENANCE DATA.

b. Catalog data required by the paragraph SD-03, PRODUCT DATA.

c. Drawings required by the paragraph SD-02, SHOP DRAWINGS.

d. Prices for spare parts and supply list.

[ e. Information on metering.

] f. Design test reports.

g. Production test reports.
[1.6.3  Spare Parts

**************************************************************************
NOTE:  Do not use this paragraph for Navy projects. For other services, coordinate with Contracting Officer on whether this paragraph can be included.

Edit as required if additional spare parts are required for a specific project.
**************************************************************************

Provide spare parts as specified below. Provide spare parts that are of the same material and workmanship, meet the same requirements, and are interchangeable with the corresponding original parts furnished.

a. Quantity 2 - Fuses of each type and size.

b. [____]

1.7  WARRANTY

Provide equipment items that are supported by service organizations reasonably convenient to the equipment installation in order to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

PART 2  PRODUCTS

2.1  PRODUCT COORDINATION

Products and materials not considered to be switchboards and related accessories are specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION, and Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

2.2  SWITCHBOARD

NEMA PB 2 and UL 891.

2.2.1  Ratings

Provide equipment with the following ratings:

**************************************************************************
NOTE:  Select "as indicated" if there are multiple switchboards with details of each shown on drawings. Most switchboards will be 4-wire, but might be a 3-wire design for delta-connected or ungrounded systems.
**************************************************************************

a. Voltage rating:  [480Y/277][208Y/120][____] volts AC, [three-phase, [3][4]-wire][as indicated].

b. Continuous current rating of the main bus:  [____ amperes][as indicated].

c. Short-circuit current rating:  [____ rms symmetrical amperes][as indicated].
2.2.2 Construction

NOTE: Edit the selection options below as needed for the intended project configuration. Rear aligned switchboards are likely the lowest cost design practice. Front and rear aligned switchboards provide a more appealing installation. Do not specify rear connections if the switchboard will be installed against a wall.

Provide the following:

a. Switchboard: consisting of one or more vertical sections [bolted together to form a rigid assembly] and [rear][front and rear] aligned [as indicated].

b. All circuit breakers: front accessible.

c. Rear aligned switchboards: front accessible load connections.

d. Front and rear aligned switchboards[: rear accessible load connections].

e. Where indicated, "space for future" or "space" means to include a vertical bus provided behind a blank front cover. Where indicated, "provision for future" means full hardware provided to mount a breaker suitable for the location.

f. Completely factory engineered and assembled, including protective devices and equipment indicated with necessary interconnections, instrumentation, and control wiring.

2.2.2.1 Enclosure

NOTE: Choose the level of corrosion protection required for the specific project location. Most switchboard products will be constructed of a cold rolled steel and painted, which is adequate for most indoor locations. Use galvanized steel or stainless steel enclosures or bases for outdoor applications where corrosion is a concern. Not all manufacturers offer galvanized steel or stainless steel products as a standard design.

Select IEEE C57.12.28 for galvanized enclosures.
Select IEEE C57.12.29 for stainless steel enclosures.

Provide the following:

a. Enclosure: NEMA ICS 6 Type [3R] [1] [_____] [as indicated] [fabricated entirely of 12 gauge ASTM A240/A240M type 304 or 304L stainless steel].

b. Enclosure: bolted together with removable bolt-on side and[ hinged]
rear covers[, and sloping roof downward toward rear].

[ c. Front[ and rear] doors: provided with[ stainless steel] padlockable vault handles with a three point catch.

[ d. Bases, frames and channels of enclosure: corrosion resistant and fabricated of[ ASTM A240/A240M type 304 or 304L stainless steel][ or][ galvanized steel]. Separate sections using vertical steel barriers.

] e. Base: includes any part of enclosure that is within 75 mm 3 inches of concrete pad.

] g. Paint color: ASTM D1535 light gray No. 61 or No. 49 over rust inhibitor.

[ h. Paint coating system: comply with[ IEEE C57.12.28 for galvanized steel][ and][ IEEE C57.12.29 for stainless steel].

2.2.2.2 Bus Bars

**************************************************************************
NOTE: Use copper with silver-plated contact surfaces in exterior or damp locations or for heavy motor loads.

Delete the neutral bus bracketed option if a 3-wire system was selected.

Only choose the bracketed option requiring insulation on the bus bars for outdoor locations with a high concentration of airborne contaminants. Choose this option primarily for corrosive and high humidity applications as defined in UFC 3-501-01. Most manufacturers will tape wrap rather than apply an insulating sleeve for low voltage equipment.

**************************************************************************

Provide the following:

a. Bus bars: [copper with silver-plated contact surfaces][ or][aluminum with tin-plated contact surfaces].

   (1) Phase bus bars: [uninsulated][insulated with a tape wrap or insulating sleeve providing a minimum breakdown voltage of 16,000 volts per ASTM D149].

   (2) Neutral bus: rated [100][_____] percent of the main bus continuous current rating[ as indicated].

b. Make bus connections and joints with hardened steel bolts.

c. Main-bus (through bus): rated at the full ampacity of the main throughout the switchboard.

d. Minimum 6.35 mm by 50.8 mm one-quarter by 2 inch copper ground bus
secured to each vertical section along the entire length of the switchboard.

2.2.2.3 Main Section

**************************************************************************
NOTE: Select from the options below the configuration to be specified. Refer to UFC 3-520-01 for allowed configurations.

Simpler switchboards will often have a single section that contains the main circuit breaker and branch circuit breakers, referred to here as a Combination Section. Larger switchboards can have multiple sections involving a main section, one or more distribution sections, and one or more auxiliary sections.

Low-voltage power circuit breakers are not normally required for switchboard applications. Utility transformer compartments are rarely used and will require additional review if this bracketed option is selected.
**************************************************************************

Provide the main section consisting of a combination section with molded-case circuit breakers for the main and branch devices as indicated, main lugs only, an individually mounted [fixed][ drawout][ air power circuit breaker[ with current-limiting fuses]][ insulated-case circuit breaker][ molded-case circuit breaker][ other transformer compartment].

2.2.2.4 Distribution Sections

**************************************************************************
NOTE: Select distribution sections as an option if the main section is not a combination section that includes main and branch circuit breakers.
**************************************************************************

Provide the distribution section[s] consisting of [individually mounted,][drawout,][ air power circuit breakers[ with current-limiting fuses]][ insulated-case circuit breakers][ molded-case circuit breakers][ other transformer compartments] as indicated.

2.2.2.5 Auxiliary Sections

Provide auxiliary sections consisting of indicated instruments, metering equipment, control equipment, transformer, and utility transformer compartments as indicated.

2.2.2.6 Handles

Provide handles for individually mounted devices of the same design and method of external operation. Label handles prominently to indicate device ampere rating, color coded for device type. Identify ON-OFF indication by handle position and by prominent marking.
2.2.3 Protective Device

**************************************************************************
NOTE: Switchboard should be placed where the ambient temperature is less than 40 deg. C. However, should the ambient temperature be expected to exceed 40 deg. C, the designer must require a special calibration for the circuit breakers and confirm the equipment ratings.

Provide ground fault protection of equipment for solidly grounded wye electrical services of more than 150 volts to ground for each service disconnect rated 1000 amperes or more in accordance with NFPA 70.

If 48 Vdc or 125 Vdc electrically operated circuit breakers are required, the appropriate DC control power supply information must be added to the specification.

**************************************************************************
Provide main and branch protective devices as indicated.

[2.2.3.1 Power Circuit Breaker

**************************************************************************
NOTE: Low-voltage power circuit breakers can be installed in larger switchboards, but are not normally required for switchboard applications. If power circuit breakers are selected, coordinate the ratings and protective device settings with the ratings of the switchboard.

**************************************************************************
Provide the following:

a. IEEE C37.13. [120 Vac] [electrically] [manually] operated [stationary] [drawout], [unfused] [fused], low-voltage power circuit breaker with a short-circuit current rating[ of [_____] rms amperes symmetrical] [as indicated] at [_____] volts.

b. Breaker frame size: [as indicated] [_____] amperes.

c. Equip electrically operated breakers with motor-charged, stored-energy closing mechanism to permit rapid and safe closing of the breaker against fault currents within the short time rating of the breaker, independent of the operator's strength or effort in closing the handle.

][2.2.3.2 Insulated-Case Breaker

Provide the following:

**************************************************************************
NOTE: Electrically operated insulated-case circuit breakers are rarely used and would be accomplished by an accessory.

If 100 percent circuit breakers are utilized in the
design, select the 100 percent rated circuit breaker option below and indicate the specific locations on the drawings.

**************************************************************************

a. **UL 489.** UL listed and labeled, [100 percent rated main breaker], [standard rated branch breakers], [electrically] [manually] operated, low voltage, insulated-case circuit breaker, with a short-circuit current rating of [_____] rms symmetrical amperes [as indicated] at [_____] volts.

b. Breaker frame size: [ [_____] amperes] [as indicated].

c. Series rated circuit breakers are unacceptable.

}[2.2.3.3 Molded-Case Circuit Breaker

Provide the following:

**************************************************************************

NOTE: If 100 percent circuit breakers are utilized in the design, select the 100 percent rated circuit breaker option below and indicate the specific locations on the drawings.

**************************************************************************

a. **UL 489.** UL listed and labeled, [100 percent rated main breaker], [standard rated branch breakers], [electrically] [manually] operated, low voltage molded-case circuit breaker, with a short-circuit current rating of [_____] rms symmetrical amperes [as indicated] at [_____] volts.

b. Breaker frame size: [ [_____] amperes] [as indicated].

c. Series rated circuit breakers are unacceptable.

}[2.2.3.4 Fusible Switches

**************************************************************************

NOTE: Do not use fusible overcurrent devices except when necessary to comply with NFPA 70 requirements for selective coordination. Fusible switches are prohibited by UFC 3-520-01 and were not listed as an option above. Their use will require approval by the authority having jurisdiction to allow their use in switchboards.

If specified, select UL 4248-1 fuseholders for Class J or L fuses. Select UL 4248-12 for Class R fuses.

**************************************************************************

Provide the following:

[ b. Switches serving as motor disconnects: horsepower rated.

} c. Fuses: current-limiting cartridge type conforming to UL 198M, Class J for 0 to 600 amperes and Class L for 601 to 6000 amperes [UL 198M,
Class [RK1][RK5] for 0 to 600 amperes.

d. Fuseholders: [UL 4248-1][UL 4248-12].

2.2.3.5 Integral Combination Breaker and Current-Limiting Fuses

**************************************************************************
NOTE: Current-limiting fuses should only be needed if the available fault current exceeds the circuit breaker short circuit rating. This option will not typically be selected.
**************************************************************************

Provide the following:

a. **UL 489**.

b. Integral combination molded-case circuit breaker and current-limiting fuses: as indicated [rated [_____] amperes] with a minimum short-circuit-current rating equal to the short-circuit-current rating of the switchboard in which the circuit breaker will be mounted.

c. Series rated circuit breakers are unacceptable.

d. Coordination of overcurrent devices of the circuit breaker and current-limiting fuses: for overloads or fault currents of relatively low value, the overcurrent device of the breaker operates to clear the fault. The current-limiting fuses operate to clear the fault for high magnitude short circuits above a predetermined value [crossover point].

e. Housing for the current-limiting fuses: an individual molding readily removable from the front and located at the load side of the circuit breaker. If the fuse housing is removed, a blown fuse is readily evident by means of a visible indicator.

f. Removal of fuse housing causes the breaker contacts to open, and the breaker contacts can not close with the fuse housing removed. The fuse housing can not be inserted with a blown fuse or with one fuse missing. The blowing of any of the fuses causes the circuit breaker contacts to open.

2.2.4 Drawout Breakers

**************************************************************************
NOTE: Determine which circuit breakers should be equipped with drawout mechanisms.
**************************************************************************

Provide drawout breakers [as indicated] [____]. Equip drawout breakers with disconnecting contacts, wheels, and interlocks for drawout application. Provide main, auxiliary, and control disconnecting contacts with silver-plated, multifinger, positive pressure, self-aligning type. Provide each drawout breaker with four-position operation with each position clearly identified by an indicator on the circuit breaker front panel as follows.

a. Connected Position: Primary and secondary contacts are fully engaged. Breaker must be tripped before racking into or out of position.
b. Test Position: Primary contacts are disconnected but secondary contacts remain fully engaged. This position allows complete test and operation of the breaker without energizing the primary circuit.

c. Disconnected Position: Primary and secondary contacts are disconnected.

2.2.5 Electronic Trip Units

**************************************************************************
NOTE: Switchboards can have a variety of circuit breaker sizes. Determine which circuit breakers or other protective devices should have electronic trip units and edit the options below accordingly. Smaller circuit breakers will typically have thermal-magnetic trip units.
**************************************************************************

Equip[ main and][ distribution] breakers[ as indicated] with a solid-state tripping system consisting of three current sensors and a microprocessor-based trip unit that provides true rms sensing adjustable time-current circuit protection. Include the following:

a. Current sensors ampere rating: [ as indicated][ [_____] amperes][ the same as the breaker frame rating].

b. Trip unit ampere rating: [ as indicated][ [_____] amperes].

c. Ground fault protection: [ as indicated][ zero sequence sensing][ residual type sensing].

d. Electronic trip units: provide additional features[ as indicated]:

**************************************************************************
NOTE: In the items below, choose the bracketed item "main" when the item only applies to the main breaker.

Provide ground fault protection of equipment for solidly grounded wye electrical services of more than 150 volts to ground for each service disconnect rated 1000 amperes or more in accordance with NFPA 70.

NFPA 70 requires arc energy reduction where the highest continuous current trip setting for which the actual overcurrent device installed in a circuit breaker is rated or can be adjusted to 1200 amperes or higher. The option identified below is based on an energy-reducing maintenance switch. Add the additional appropriate information if other methods such as differential relaying or an active arc flash mitigation system are included. Identify locations of alternate arc energy reduction methods in the design.

**************************************************************************
(1) [Indicated] Breakers: include long delay pick-up and time settings, and LED indication of cause of circuit breaker trip.

(2) Main breakers: include short delay pick-up and time settings, instantaneous settings, and ground fault settings as indicated.

(3) Distribution breakers: include short delay pick-up and time settings, instantaneous settings, and ground fault settings as indicated.

(4) [Main] Breakers: include a digital display for phase and ground current.

(5) [Main] Breakers: include a digital display for watts, vars, VA, kWh, kvarh, and kVAh.

(6) [Main] Breakers: include a digital display for phase voltage, and percent THD voltage and current.

(7) [Main] Breakers: include provisions for communication via a network twisted pair cable for remote monitoring and control. Provide the following communications protocol: [DNP3] [Modbus] [IEC 61850].

(8) For electronic trip units that are rated for or can be adjusted to 1,200 amperes or higher, provide arc energy reduction capability with an energy-reducing maintenance switch with local status indicator.

[2.2.6] Metering

**************************************************************************
NOTE: When Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC is used, coordinate meter requirements.
**************************************************************************

[2.2.6.1] Digital Meters

**************************************************************************
NOTE: Digital metering incorporates newer technology and provides additional information, often without additional cost. A control power transformer (115 V or 130 V) is usually required with this type of metering.

Digital meters are continually improving. The display capability can be a simple display of numerical values or a more sophisticated display showing waveforms. Over-specification of the meter physical or software characteristics will likely result in specification of an older obsolete meter.
**************************************************************************

IEEE C37.90.1 for surge withstand. Provide true rms, plus/minus one percent accuracy, programmable, microprocessor-based meter enclosed in a sealed case with the following features.
a. Display capability:

1. Multi-Function Meter: Display a selected phase to neutral voltage, phase to phase voltage, percent phase to neutral voltage THD, percent phase to phase voltage THD; a selected phase current, neutral current, percent phase current THD, percent neutral current; selected total PF, kW, KVA, kVAR, FREQ, kVAh, kWh. Detected alarm conditions include over/under current, over/under voltage, over/under KVA, over/under frequency, over/under selected PF/kVAR, voltage phase reversal, voltage imbalance, reverse power, over percent THD. Include a Form C KYZ pulse output relay on the meter.

2. Power Meter: Display Watts, VARs, and selected KVA/PP. Detected alarm conditions include over/under KVA, over/under PP, over/under VARs, over/under reverse power.

3. Volt Meter: Provide capability to be selectable between display of the three phases of phase to neutral voltages and display of the three phases of the phase to phase voltages. Detected alarm conditions include over/under voltage, over/under voltage imbalance, over percent THD.

4. Ammeter: Display phase A, B, and C currents. Detected alarm conditions include over/under current, over percent THD.

5. Digital Watthour Meter: Provide a single selectable display for watts, total kilowatt hours (kWh) and watt demand (Wd). Include a Form C KYZ pulse output relay on the meter.

b. Design meters to accept input from standard 5A secondary instrument transformers and direct voltage monitoring range to 300 or 600 volts, phase to phase.

c. Provide programming via a front panel display and a communication interface accessible by a computer.

d. Provide password secured programming stored in non-volatile EEPROM memory.

f. Provide meter that calculates and stores average max/min demand values with time and date for all readings based on a user selectable sliding window averaging period.

g. Provide meter with programmable hi/low set limits with two Form C dry contact relays when exceeding alarm conditions.

h. Provide meter with a display of Total Harmonic Distortion (THD) measurement to a minimum of the thirty-first order.

i. Include historical trend logging capability with the ability to store up to 100,000 data points with intervals of 1 second to 180 minutes. Provide a unit that can store and time stamp up to 1000 programmable triggered conditions.
j. Provide event waveform recording triggered by the rms of 2 cycles of voltage or current exceeding programmable set points. Store waveforms for all 6 channels of voltage and current for a minimum of 10 cycles prior to the event and 50 cycles past the event.

2.2.6.2 Electronic Watthour Meter

**************************************************************************
NOTE: For the Air Force, use Section 26 27 13.10 30 ELECTRIC METERS.

For the Navy, use Section 26 27 14.00 20 ELECTRICITY METERING.

For the Army, coordinate meter requirements in accordance with Engineering and Construction Bulletin ECB 2015-2, Advanced Metering and Connectivity.
**************************************************************************

Provide as specified in Section [26 27 14.00 20 ELECTRICITY METERING][26 27 13.10 30 ELECTRIC METERS].

ANSI C12.1. Provide a switchboard style electronic programmable watthour meter, semi-flush mounted, as indicated. Meter can be either programmed at the factory or programmed in the field. Turn field programming device over to the Contracting Officer at completion of project. Coordinate meter to system requirements.

a. Design: Provide meter designed for use on a 3-phase, 4-wire, [208Y/120][480Y/277] volt system with 3 current transformers. Include necessary KYZ pulse initiation hardware for Energy Monitoring and Control System (EMCS).

b. Coordination: Provide meter coordinated with ratios of current transformers and transformer secondary voltage.

c. Class: 20. Accuracy: plus or minus 1.0 percent. Finish: Class II.

d. Kilowatt-hour Register: five digit electronic programmable type.

e. Demand Register:
   (1) Provide solid state.
   (2) Meter reading multiplier: Indicate multiplier on the meter face.
   (3) Demand interval length: programmed for [15][30][60] minutes with rolling demand up to six subintervals per interval.

f. Meter fusing: Provide a fuse block mounted in the metering compartment containing one fuse per phase to protect the voltage input to the watthour meter. Size fuses as recommended by the meter manufacturer.

g. Provide meter with a communications port, RS485, with Modbus RTU serial or Ethernet, Modbus-TCP communications.

**************************************************************************
NOTE: Select the appropriate current transformer
(CT) ratio, continuous-thermal-current rating factor (RF) at 30 degrees C and ANSI Metering Accuracy Class values based on the CT Ratio which is just below the rating of the main protective device.

Select an ANSI Metering Accuracy Class in accordance with the following table:

<table>
<thead>
<tr>
<th>CT Ratio</th>
<th>RF</th>
<th>Accuracy Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>200/5</td>
<td>4.0</td>
<td>0.3 thru B-0.1</td>

</tbody>
</table>

**************************************************************************

IEEE C57.13. Provide single ratio transformers, 60 hertz, [_____] to 5-ampere ratio, [_____] rating factor, with a metering accuracy class of 0.3 through [_____].

[ Provide a fuse block mounted in the metering compartment containing one fuse per phase to protect the voltage input to voltage sensing meters. Size fuses as recommended by the meter manufacturer. ]

[2.2.6.3 Submetering]

**************************************************************************

NOTE: For bases and activities that have an active submetering policy in place and written authorization has been received, edit this section as necessary to specify the desired level of submetering and locations.

UFC 1-200-02 references ASHRAE 90.1-2010. But ASHRAE 90.1-2010 does not address submetering criteria. The intended reference for this section is ASHRAE 90.1-2013, which does address submetering criteria.

If submetering is selected as an option, coordinate references to ASHRAE 90.1 with the lead person editing the Division 1 Sections. Typically, references to ASHRAE 90.1 in this Section will be to the 2013 edition, whereas references to ASHRAE 90.1 in other Sections will be to the 2010 edition.
ASHRAE 90.1 - IP. Provide submetering for [____].

][2.2.7 Transformer

NOTE: Coordinate with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, when transformer section is provided.

Provide transformer section in switchboard in accordance with UL 891 and as indicated. Provide the transformer and section that is suitable for the installation. Test transformers greater than 10 kVA in accordance with UL 891. Provide a transformer conforming to the requirements of Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

][2.2.8 Heaters

NOTE: Select the heater option if the switchboard will be installed in a non-environmentally controlled area.

Provide 120-volt heaters in each switchboard section. Provide heaters of sufficient capacity to control moisture condensation in the section, 250 watts minimum, and controlled by a thermostat and humidistat located in the section. Provide industrial type thermostat, high limit, to maintain sections within the range of 15 to 32 degrees C 60 to 90 degrees F. Provide humidistat with a range of 30 to 60 percent relative humidity. Obtain supply voltage for the heaters from a control power transformer within the switchboard. If heater voltage is different than switchboard voltage, provide transformer rated to carry 125 percent of heater full load rating. Provide transformer with a 220 degrees C insulation system with a temperature rise not exceeding 115 degrees C and conforming to NEMA ST 20. Energize electric heaters in switchboard assemblies while the equipment is in storage or in place prior to being placed in service. Provide method for easy connection of heater to external power source. Provide temporary, reliable external power source if commercial power at rated voltage is not available on site.

][2.2.9 Terminal Boards

Provide with engraved plastic terminal strips and screw type terminals for external wiring between components and for internal wiring between removable assemblies. Provide short-circuiting type terminal boards associated with current transformer. Terminate conductors for current transformers with ring-tongue lugs. Provide terminal board identification that is identical in similar units. Provide color coded external wiring that is color coded consistently for similar terminal boards.

][2.2.10 Wire Marking

Mark control and metering conductors at each end. Provide factory installed, white, plastic tubing, heat stampled with black block type letters on factory-installed wiring. On field-installed wiring, provide white, preprinted, polyvinyl chloride (PVC) sleeves, heat stampled with
provide a single letter or number on each sleeve, elliptically shaped to securely grip the wire, and keyed in such a manner to ensure alignment with adjacent sleeves. Provide specific wire markings using the appropriate combination of individual sleeves. Indicate on each wire marker the device or equipment, including specific terminal number to which the remote end of the wire is attached.

2.3 MANUFACTURER'S NAMEPLATE

Provide a nameplate on each item of equipment bearing the manufacturer's name, address, model number, and serial number securely affixed in a conspicuous place; the nameplate of the distributing agent is not acceptable. This nameplate and method of attachment may be the manufacturer's standard if it contains the required information.

2.4 FIELD FABRICATED NAMEPLATES

**************************************************************************

NOTE: Use the bracketed sentence to specify labels for switchboards where emergency breakers are located within the switchboard. Provide note on the drawings to indicate where red labels are required.

**************************************************************************

ASTM D709. Provide laminated plastic nameplates for each switchboard, equipment enclosure, relay, switch, and device; as specified in this section or as indicated on the drawings. Identify on each nameplate inscription the function and, when applicable, the position. Provide nameplates of melamine plastic, 3 mm 0.125 inch thick, white with [black][_____] center core. Provide red laminated plastic label with white center core where indicated. Provide matte finish surface. Provide square corners. Accurately align lettering and engrave into the core. Provide nameplates with minimum size of 25 by 65 mm one by 2.5 inches. Provide lettering that is a minimum of 6.35 mm 0.25 inch high normal block style.

2.5 SOURCE QUALITY CONTROL

2.5.1 Equipment Test Schedule

The Government reserves the right to witness tests. Provide equipment test schedules for tests to be performed at the manufacturer's test facility. Submit required test schedule and location, and notify the Contracting Officer 30 calendar days before scheduled test date. Notify Contracting Officer 15 calendar days in advance of changes to scheduled date.

Provide the following as part of test equipment calibration:

a. Provide a calibration program which assures that all applicable test instruments are maintained within rated accuracy.

b. Accuracy: Traceable to the National Institute of Standards and Technology.

c. Instrument calibration frequency schedule: less than or equal to 12 months for both test floor instruments and leased specialty equipment.

d. Dated calibration labels: visible on all test equipment.
e. Calibrating standard: higher accuracy than that of the instrument tested.

f. Keep up-to-date records that indicate dates and test results of instruments calibrated or tested. For instruments calibrated by the manufacturer on a routine basis, in lieu of third party calibration, include the following:

   (1) Maintain up-to-date instrument calibration instructions and procedures for each test instrument.

   (2) Identify the third party/laboratory calibrated instrument to verify that calibrating standard is met.

2.5.2 Switchboard Design Tests

   NEMA PB 2 and UL 891.

2.5.2.1 Design Tests

Furnish documentation showing the results of design tests on a product of the same series and rating as that provided by this specification.

   a. Short-circuit current test.

   b. Enclosure tests.

   c. Dielectric test.

[2.5.2.2 Additional Design Tests

   **************************************************************************
   NOTE: Include additional design tests when the switchboard main bus is rated greater than 4000 amperes.
   **************************************************************************

In addition to normal design tests, perform the following tests on the actual equipment. Furnish reports which include results of design tests performed on the actual equipment.

   a. Temperature rise tests.

   b. Continuous current.

]2.5.3 Switchboard Production Tests

   NEMA PB 2 and UL 891. Furnish reports which include results of production tests performed on the actual equipment for this project. These tests include:

   a. 60-hertz dielectric tests.

   b. Mechanical operation tests.

   c. Electrical operation and control wiring tests.

   d. Ground fault sensing equipment test.
[2.6] COORDINATED POWER SYSTEM PROTECTION

**************************************************************************
NOTE: Use this paragraph only for Army projects.

The requirement for studies in this section depends on the complexity and extent of the power system. Delete this requirement for projects of limited scope, projects having protective devices which are not adjustable or for which coordination is not possible (standard molded case circuit breakers); projects involving simple extension of 600 volt level service to a building or facility from an existing transformer (750 kVA or less); or projects involving simple extension of 600 volt level service to a building or facility from a new transformer (750 kVA or less).
**************************************************************************

Provide a power system study as specified in Section 26 28 01.00 10 COORDINATED POWER SYSTEM PROTECTION.

[2.7] ARC FLASH WARNING LABEL

**************************************************************************
NOTE: Include the Arc Flash Warning Label detail on the drawings. See the technical note at the beginning of section to obtain the AutoCAD drawing file of the label.
**************************************************************************

Provide warning label for switchboards. Locate this self-adhesive warning label on the outside of the enclosure warning of potential electrical arc flash hazards and appropriate PPE required. Provide label format as indicated.

[2.8] SERVICE ENTRANCE AVAILABLE FAULT CURRENT LABEL

**************************************************************************
NOTE: NFPA 70 requires that service equipment in other than dwelling units be legibly marked in the field with the maximum available fault current, including the date the fault-current calculation was performed. In addition, include the contact information for the organization that completed the calculation. Select this option if the switchboard will be used as service entrance equipment.

Coordinate with the person developing the Division 1 Sections and ensure that Division 1 Sections identify the person responsible for providing the short circuit calculation for the project. This may vary for design/build versus design/bid/build projects.
**************************************************************************

Provide label on exterior of switchboards used as service equipment listing the maximum available fault current at that location. Include on the label the date that the fault calculation was performed and the contact...
information for the organization that completed the calculation. Locate this self-adhesive warning label on the outside of the switchboard. Provide label format as indicated.

] [2.9 MIMIC BUS LABELING

**************************************************************************

NOTE: Include a mimic bus if the system complexity warrants providing a one-line of the system configuration.

**************************************************************************

Provide a mimic bus on the front of the equipment to diagrammatically show the internal bus structure of the lineup.

] PART 3 EXECUTION

3.1 INSTALLATION

Conform to IEEE C2, NFPA 70, and to the requirements specified herein. Provide new equipment and materials unless indicated or specified otherwise.

**************************************************************************

NOTE: Include the grounding section below for installations involving a switchboard installed in an exterior application. If the switchboard is installed adjacent to a pad-mounted distribution transformer, then coordinate the grounding requirements between the applicable specifications.

**************************************************************************

[3.2 GROUNDING

**************************************************************************

NOTE: Where rock or other soil conditions prevent obtaining a specified ground value, specify other methods of grounding. Where it is impractical to obtain the indicated ground resistance values, make every effort to obtain ground resistance values as near as possible to the indicated values.

Select 25 ohms resistance unless the installation requires a lower resistance to ground.

**************************************************************************

NFPA 70 and IEEE C2, except that grounds and grounding systems with a resistance to solid earth ground not exceeding [25][_____] ohms.

3.2.1 Grounding Electrodes

Provide driven ground rods as specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION. Connect ground conductors to the upper end of the ground rods by exothermic weld or compression connector. Provide compression connectors at equipment end of ground conductors.

3.2.2 Equipment Grounding

Provide bare copper cable not smaller than No. 4/0 AWG not less than 610 mm 24 inches below grade connecting to the indicated ground rods. When work
in addition to that indicated or specified is directed to obtain the specified ground resistance, the provision of the contract covering "Changes" applies.

3.2.3  Connections

Make joints in grounding conductors and loops by exothermic weld or compression connector. Install exothermic welds and compression connectors as specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION.

3.2.4  Grounding and Bonding Equipment

UL 467, except as indicated or specified otherwise.

3.3  INSTALLATION OF EQUIPMENT AND ASSEMBLIES

Install and connect equipment furnished under this section as indicated on project drawings, the approved shop drawings, and as specified herein.

3.3.1  Switchboard

ANSI/NEMA PB 2.1.

3.3.2  Meters and Instrument Transformers

ANSI C12.1.

3.3.3  Field Applied Painting

Where field painting of enclosures is required to correct damage to the manufacturer's factory applied coatings, provide manufacturer's recommended coatings and apply in accordance with manufacturer's instructions.

3.3.4  Galvanizing Repair

Repair damage to galvanized coatings using ASTM A780/A780M, zinc rich paint, for galvanizing damaged by handling, transporting, cutting, welding, or bolting. Do not heat surfaces that repair paint has been applied to.

3.3.5  Field Fabricated Nameplate Mounting

Provide number, location, and letter designation of nameplates as indicated. Fasten nameplates to the device with a minimum of two sheet-metal screws or two rivets.

3.4  FOUNDATION FOR EQUIPMENT AND ASSEMBLIES

**************************************************************************
NOTE: Mounting slab connections may have to be given in detail depending on the requirements for the seismic zone in which the equipment is located. Include construction requirements for concrete slab only if slab is not detailed in drawings.
**************************************************************************

3.4.1  Exterior Location

Mount switchboard on concrete slab as follows:
a. Unless otherwise indicated, provide the slab with dimensions at least 200 mm 8 inches thick, reinforced with a 150 by 150 mm 6 by 6 inch No. 6 mesh placed uniformly 100 mm 4 inches from the top of the slab.

b. Place slab on a 150 mm 6 inch thick, well-compacted gravel base.

c. Install slab such that the top of the concrete slab is approximately 100 mm 4 inches above the finished grade.

d. Provide edges above grade with 15 mm 1/2 inch chamfer.

e. Provide slab of adequate size to project at least 200 mm 8 inches beyond the equipment.

f. Provide conduit turnups and cable entrance space required by the equipment to be mounted.

g. Seal voids around conduit openings in slab with water- and oil-resistant caulking or sealant.

h. Cut off and bush conduits 75 mm 3 inches above slab surface.

i. Provide concrete work as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

3.4.2 Interior Location

Mount switchboard on concrete slab as follows:

a. Unless otherwise indicated, provide the slab with dimensions at least 100 mm 4 inches thick.

b. Install slab such that the top of the concrete slab is approximately 100 mm 4 inches above the finished grade.

c. Provide edges above grade with 15 mm 1/2 inch chamfer.

d. Provide slab of adequate size to project at least 200 mm 8 inches beyond the equipment.

e. Provide conduit turnups and cable entrance space required by the equipment to be mounted.

f. Seal voids around conduit openings in slab with water- and oil-resistant caulking or sealant.

g. Cut off and bush conduits 75 mm 3 inches above slab surface.

h. Provide concrete work as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

3.5 FIELD QUALITY CONTROL

**************************************************************************
NOTE: Select "Request for Settings" below if protective device settings will be government furnished. Select "Required Settings" below if protective device settings are furnished by the Designer of Record. Coordinate with the person

SECTION 26 24 13  Page 30
developing the Division 1 Sections and ensure that Division 1 Sections identify the person responsible for providing the final protective device settings for design/build versus design/bid/build projects. Do not rely on the manufacturer's default settings.

**************************************************************************

[ Submit request for settings of breakers to the Contracting Officer after approval of switchboard and at least 30 days in advance of their requirement.]

[Submit Required Settings of breakers to the Contracting Officer after approval of switchboard and at least 30 days in advance of their requirement.]

3.5.1 Performance of Acceptance Checks and Tests

Perform in accordance with the manufacturer's recommendations and include the following visual and mechanical inspections and electrical tests, performed in accordance with NETA ATS.

**************************************************************************

NOTE: Select the options below that apply to the specified equipment.

**************************************************************************

3.5.1.1 Switchboard Assemblies

a. Visual and Mechanical Inspection

(1) Compare equipment nameplate data with specifications and approved shop drawings.

(2) Inspect physical, electrical, and mechanical condition.

(3) Verify appropriate anchorage, required area clearances, and correct alignment.

(4) Clean switchboard and verify shipping bracing, loose parts, and documentation shipped inside cubicles have been removed.

(5) Inspect all doors, panels, and sections for paint, dents, scratches, fit, and missing hardware.

(6) Verify that[ fuse and] circuit breaker sizes and types correspond to approved shop drawings as well as to the circuit breaker’s address for microprocessor-communication packages.

[ (7) Verify that current transformer ratios correspond to approved shop drawings.]

(8) Inspect all bolted electrical connections for high resistance using low-resistance ohmmeter, verifying tightness of accessible bolted electrical connections by calibrated torque-wrench method, or performing thermographic survey.

(9) Confirm correct operation and sequencing of electrical and mechanical interlock systems.
(10) Confirm correct application of manufacturer's recommended lubricants.

(11) Inspect insulators for evidence of physical damage or contaminated surfaces.

(12) Verify correct barrier installation and operation.

(13) Exercise all active components.

(14) Inspect all mechanical indicating devices for correct operation.

(15) Verify that filters are in place and vents are clear.

(16) Test operation, alignment, and penetration of instrument transformer withdrawal disconnects.

(17) Inspect control power transformers.

b. Electrical Tests

(1) Perform insulation-resistance tests on each bus section.

(2) Perform dielectric withstand voltage tests.

(3) Perform insulation-resistance test on control wiring; Do not perform this test on wiring connected to solid-state components.

(4) Perform control wiring performance test.

(5) Perform primary current injection tests on the entire current circuit in each section of assembly.

(6) Perform phasing check on double-ended switchboard to ensure correct bus phasing from each source.

(7) Verify operation of switchboard heaters.

3.5.1.2 Circuit Breakers - Low Voltage - Power

a. Visual and Mechanical Inspection

(1) Compare nameplate data with specifications and approved shop drawings.

(2) Inspect physical and mechanical condition.

(3) Inspect anchorage, alignment, and grounding.

(4) Verify that all maintenance devices are available for servicing and operating the breaker.

(5) Inspect arc chutes.

(6) Inspect moving and stationary contacts for condition, wear, and alignment.

(7) Verify that primary and secondary contact wipe and other dimensions vital to satisfactory operation of the breaker are
(8) Perform all mechanical operator and contact alignment tests on both the breaker and its operating mechanism.

(9) Inspect all bolted electrical connections for high resistance using low-resistance ohmmeter, verifying tightness of accessible bolted electrical connections by calibrated torque-wrench method, or performing thermographic survey.

(10) Verify cell fit and element alignment.

(11) Verify racking mechanism.

(12) Confirm correct application of manufacturer's recommended lubricants.

b. Electrical Tests

(1) Perform contact-resistance tests on each breaker.

(2) Perform insulation-resistance tests.

(3) Adjust Breaker(s) for final settings in accordance with Government provided settings.

(4) Determine long-time minimum pickup current by primary current injection.

(5) Determine long-time delay by primary current injection.

**************************************************************************

NOTE: Coordinate each option with each breaker type.
**************************************************************************

(6) Determine short-time pickup and delay by primary current injection.

(7) Determine ground-fault pickup and delay by primary current injection.

(8) Determine instantaneous pickup value by primary current injection.

(9) Activate auxiliary protective devices, such as ground-fault or undervoltage relays, to ensure operation of shunt trip devices; Check the operation of electrically-operated breakers in their cubicle.

(10) Verify correct operation of any auxiliary features such as trip and pickup indicators, zone interlocking, electrical close and trip operation, trip-free, and antipump function.

(11) Verify operation of charging mechanism.

3.5.1.3 Circuit Breakers

[Low Voltage - Insulated-Case] [and] [Low Voltage Molded Case with Solid State Trips]

a. Visual and Mechanical Inspection
(1) Compare nameplate data with specifications and approved shop drawings.

(2) Inspect circuit breaker for correct mounting.

(3) Operate circuit breaker to ensure smooth operation.

(4) Inspect case for cracks or other defects.

(5) Inspect all bolted electrical connections for high resistance using low resistance ohmmeter, verifying tightness of accessible bolted connections and/or cable connections by calibrated torque-wrench method, or performing thermographic survey.

(6) Inspect mechanism contacts and arc chutes in unsealed units.

b. Electrical Tests

(1) Perform contact-resistance tests.

(2) Perform insulation-resistance tests.

(3) Perform Breaker adjustments for final settings in accordance with Government provided settings.

(4) Perform long-time delay time-current characteristic tests

**************************************************************************
NOTE: Coordinate each option with each breaker type.
**************************************************************************

(5) Determine short-time pickup and delay by primary current injection.

(6) Determine ground-fault pickup and time delay by primary current injection.

(7) Determine instantaneous pickup current by primary injection.

(8) Verify correct operation of any auxiliary features such as trip and pickup indicators, zone interlocking, electrical close and trip operation, trip-free, and anti-pump function.

3.5.1.4 Current Transformers

a. Visual and Mechanical Inspection

(1) Compare equipment nameplate data with specifications and approved shop drawings.

(2) Inspect physical and mechanical condition.

(3) Verify correct connection.

(4) Verify that adequate clearances exist between primary and secondary circuit.

(5) Inspect all bolted electrical connections for high resistance using low-resistance ohmmeter, verifying tightness of accessible
bolted electrical connections by calibrated torque-wrench method, or performing thermographic survey.

(6) Verify that all required grounding and shorting connections provide good contact.

b. Electrical Tests

(1) Perform resistance measurements through all bolted connections with low-resistance ohmmeter, if applicable.

(2) Perform insulation-resistance tests.

(3) Perform polarity tests.

(4) Perform ratio-verification tests.

3.5.1.5 Metering and Instrumentation

a. Visual and Mechanical Inspection

(1) Compare equipment nameplate data with specifications and approved shop drawings.

(2) Inspect physical and mechanical condition.

(3) Verify tightness of electrical connections.

b. Electrical Tests

(1) Determine accuracy of meters at 25, 50, 75, and 100 percent of full scale.

(2) Calibrate watthour meters according to manufacturer's published data.

(3) Verify all instrument multipliers.

(4) Electrically confirm that current transformer and voltage transformer secondary circuits are intact.

3.5.1.6 Grounding System

a. Visual and Mechanical Inspection

(1) Inspect ground system for compliance with contract plans and specifications.

b. Electrical Tests

(1) IEEE 81. Perform ground-impedance measurements utilizing the fall-of-potential method. On systems consisting of interconnected ground rods, perform tests after interconnections are complete. On systems consisting of a single ground rod perform tests before any wire is connected. Take measurements in normally dry weather, not less than 48 hours after rainfall. Use a portable ground resistance tester in accordance with manufacturer's instructions to test each ground or group of grounds. Use an instrument equipped with a meter reading directly in ohms or fractions.
thereof to indicate the ground value of the ground rod or grounding systems under test.

(2) Submit the measured ground resistance of each ground rod and grounding system, indicating the location of the rod and grounding system. Include the test method and test setup (i.e., pin location) used to determine ground resistance and soil conditions at the time the measurements were made.

[3.5.1.7 Cybersecurity Installation Certification]

**************************************************************************
NOTE: Coordinate equipment certification with Government's cybersecurity requirements and interpretations. Select this option if the switchboard includes remote control or remote access capability.
**************************************************************************

Furnish a certification that control systems are installed in accordance with DoD Instruction 8500.01, DoD Instruction 8510.01, and as required by individual Service Implementation Policy.

]3.5.2 Follow-Up Verification

Upon completion of acceptance checks, settings, and tests, show by demonstration in service that circuits and devices are in good operating condition and properly performing the intended function. Trip circuit breakers by operation of each protective device. Test each item to perform its function not less than three times. As an exception to requirements stated elsewhere in the contract, provide the Contracting Officer five working days advance notice of the dates and times for checks, settings, and tests.

3.1 INSTALLATION
3.2 FIELD QUALITY CONTROL
3.3 CLOSEOUT ACTIVITIES

-- End of Section Table of Contents --
NOTE: This guide specification covers the
requirements for power-distribution panelboards and
lighting and appliance branch-circuit panelboards.

Indicate on drawings the ampere rating of
panelboards, the number of bus bars, and the voltage
characteristics of the system to which they are
connected. Indicate frame size, trip rating, number
of poles, and class of molded-case branch-circuit
breakers. Show interrupting rating for power
distribution panelboards and also for lighting and
appliance branch-circuit panelboards.

Adhere to UFC 1-300-02 Unified Facilities Guide
Specifications (UFGS) Format Standard when editing
this guide specification or preparing new project
specification sections. Edit this guide
specification for project specific requirements by
adding, deleting, or revising text. For bracketed
items, choose applicable item(s) or insert
appropriate information.

Remove information and requirements not required in
respective project, whether or not brackets are
present.

Comments, suggestions and recommended changes for
this guide specification are welcome and should be
submitted as a Criteria Change Request (CCR).

PART 1  GENERAL

Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM applies to work specified in
this section.

1.1  REFERENCES
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 SUBMITTALS

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that
require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

Use the "S" Classification only in SD-11 Closeout Submittals. The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Panelboards; G[, [___]]
[Filtered Panelboards; G[, [___]]
] SD-06 Test Reports

Acceptance Tests; G[, [___]]
SD-08 Manufacturer's Instructions

Manufacturer's Instructions

1.3 QUALITY CONTROL

1.3.1 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears. Interpret references in
these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Ensure equipment, materials, installation, and workmanship are in accordance with the mandatory and advisory provisions of NFPA 70, IEEE C2 unless more stringent requirements are specified or indicated.

1.3.2 Standard Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship. Provide products which have been in satisfactory commercial or industrial use for 2 years prior to bid opening. Ensure the 2-year period includes applications of equipment and materials under similar circumstances and of similar size. Ensure the product has been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period. Where two or more items of the same class of equipment are required, these items must be products of a single manufacturer.

Products manufactured more than 3 years prior to date of delivery to site are not to be used, unless specified otherwise.

1.3.3 Predictive Testing and Inspection Technology Requirements

**************************************************************************
NOTE: The Predictive Testing and Inspection (PT&I) tests prescribed in Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS are MANDATORY for all NASA assets and systems identified as Critical, Configured, or Mission Essential. If the system is non-critical, non-configured, and not mission essential, use sound engineering discretion to assess the value of adding these additional test and acceptance requirements. See Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS for additional information regarding cost feasibility of PT&I.
**************************************************************************

This section contains systems and equipment components regulated by NASA's Reliability Centered Building and Equipment Acceptance Program. This program requires the use of Predictive Testing and Inspection (PT&I) technologies in conformance with RCBEA GUIDE to ensure building equipment and systems installed by the Contractor have been installed properly and contain no identifiable defects that shorten the design life of a system and its components. Satisfactory completion of all acceptance requirements is required to obtain Government approval and acceptance of the Contractor's work.

Perform PT&I tests and provide submittals as specified in Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS.

PART 2 PRODUCTS

2.1 PANELBOARDS

Provide panelboards in accordance with NEMA PB 1, UL 67, and UL 50. Ensure panelboards for use as service equipment are also in accordance with UL 869A. Ensure panelboards have current rating, number of phases, and number of
wires as indicated or specified herein. Ensure panelboards are rated for [240-volt (maximum), single-phase] [120/208-volt, three-phase] [277/480-volt, three-phase], 60-hertz. Ensure each panelboard, as a complete unit, has a short-circuit current rating equal to or greater than the integrated equipment rating indicated, but in no case less than 10,000 amperes symmetrical.

Provide panelboards with bolt-on circuit breakers only. Use of plug-in style breaker is not permitted. Ensure panelboards are designed such that individual breakers can be removed without disturbing adjacent units or without loosening or removing supplemental insulation supplied as means of obtaining required clearance. Provide main lugs or main circuit breakers mounted[ "above"] [or] [ "below"] branch breakers with current ratings as indicated. Use of sub-feed breakers is not acceptable unless specifically indicated otherwise. Where "space only" is indicated, make provisions for future installation of breakers.

Submit detail drawings and manufacturer's standard product data for panelboards. Detail drawings consist of fabrication and assembly drawings for all parts of the work in sufficient detail to verify conformity with all requirements. Ensure drawings for panelboards indicate details of bus layout, overall physical features, dimensions, ratings, service requirements, and weights of equipment.

2.2 COMPONENTS

2.2.1 Enclosure

Ensure panelboard enclosures are NEMA 250, Type [I][3R][_____] as indicated and in accordance with UL 50 and NEMA PB 1.

Provide [flush-mounted][[and ] [or ]][surface mounted] panelboard cabinets[ as indicated]. Ensure cabinets are constructed of 2 millimeter 12 gauge sheet steel and hot-dipped galvanized after fabrication. Ensure front of cabinet is form-flanged or fitted with structural shapes welded or riveted to the sheet steel for supporting the panelboard front. Provide panelboard cabinets fabricated such that no part of any surface on the finished cabinet deviates from a true plane by more than 3 mm 1/8 inch.[ Provide holes in the back of indoor surface-mounted cabinets, with outside spacers and inside stiffeners, for mounting the cabinets with a 13 mm 1/2 inch clear space between the back of the cabinet and the wall surface.]

[Provide front cover with center door for access to circuit breakers.][Provide door-in-door style cover where entire front is hinged on one side with a piano hinge for the full height and has [captive screws][keyed latch mechanism] opposite the hinged side. Provide side gutters in enclosure measuring minimum 145 millimeters 5.75 inches for routing of wiring. Where panelboards are installed flush with the walls, ensure that the hinged front can be opened without damage to the adjacent wall surfaces.] Ensure circuit breaker access doors are equipped with pin-tumbler cylinder locks. Ensure all locks provided[, including locks for hinged covers,] are identically keyed and properly tagged. Provide two keys for each enclosure.

Finish panelboards with [baked] [fast drying] enamel. Finish color is ASTM D1535 No. 61 gray conforming to FED-STD-595.[

Where indicated, provide panelboards with circuit breakers rated for use on 400 Hz systems and labeled "400 Hz." ]
2.2.2 Panelboard Buses

Provide[tinned copper][aluminum] buses of the rating indicated, with main lugs or main circuit breaker. Provide all panelboards for use on grounded ac systems with a separate grounding bus in accordance with UL 67 bonded to the panelboard enclosure. [Ensure grounding bus is a solid bus bar of rectangular cross section equipped with binding screws for the connection of equipment grounding conductors. ][In addition to equipment grounding bus, provide second "isolated" ground bus, where indicated. ]Provide three-phase, four-wire and single-phase, three-wire panelboards with an isolated full-capacity bus providing spaces for single-pole circuit breaker switches and spaces indicated as spare.

Provide bus bar connections to the branch circuit breakers that are the "distributed phase" or "phase sequence" type. Ensure single-phase, three-wire panelboard busing is such that when any two adjacent single-pole breakers are connected to opposite phases, two-pole breakers can be installed in any location. Ensure that three-phase, four-wire panelboard busing is such that when any three adjacent single-pole breakers are individually connected to each of the three different phases, two- or three-pole breakers can be installed at any location. Ensure current-carrying parts of the bus assembly are plated.

Support bus bars on bases independent of circuit breakers. Design main buses and back pans so that breakers may be changed without machining, drilling, or tapping.

**************************************************************************

NOTE: Select the bracketed option below only if the non-linear loads are expected to be a majority of the downstream loads.
**************************************************************************

[2.2.2.1 Panelboard Neutrals for Non-Linear Loads]

Where indicated, provide panelboard specifically listed for use on non-linear loads. Ensure panelboards are heat rise tested in accordance with UL 67, except with the neutral assembly installed and carrying 200 percent of the phase bus current during testing. [Provide verification of testing procedure. ]Two neutral assemblies paralleled together with cable is not acceptable. Ensure panel is marked "SUITABLE FOR NON-LINEAR LOADS" with field fabricated nameplate and provide a neutral label with instructions for wiring of panelboard.

]2.2.3 Circuit Breakers

**************************************************************************

NOTE: Include Section 26 05 71.00 40 LOW VOLTAGE OVERCURRENT PROTECTIVE DEVICES in the project specification or include the requirements herein.
**************************************************************************

Provide circuit breakers that conform to UL 489 and NEMA AB 3 [and as specified in Section 26 05 71.00 40 LOW VOLTAGE OVERCURRENT PROTECTIVE DEVICES ]with frame a trip ratings as indicated.

Provide bolt-on type, molded-case, manually operated, trip-free circuit breakers, with inverse-time thermal-overload protection and instantaneous
magnetic short-circuit protection. Completely enclose circuit breakers in a molded case, with a factory-sealed, calibrated sensing element to prevent tampering. Plug-in type, tandem, and half-size circuit breakers are not permitted.

Provide inverse-time-delay thermal-overload protection and instantaneous magnetic short-circuit protection. Provide an instantaneous [thermal-magnetic][electronic][solid-state] tripping element that is adjustable and accessible from the front of the breaker on frame sizes larger than [100][250][_____] ampere. Provide circuit breakers with frame sizes [100][250][_____] ampere and larger with [electronic] [solid-state] [trip units equipped with adjustable long-time][,][short-time][and][ground-fault] settings in addition to instantaneous.]

Provide sufficient interrupting capacity of the panel and lighting branch circuit breakers to successfully interrupt the maximum short-circuit current imposed on the circuit at the breaker terminals. Provide circuit breaker interrupting capacities with a minimum of 10,000 A and that conform to NEMA AB 3. Series rating of circuit breakers or overcurrent protective devices to achieve indicated interrupt rating is [not ]permitted.

Provide the common-trip-type multipole circuit breakers having a single operating handle and a two-position on/off indication. Provide circuit breakers with temperature compensation for operation in an ambient temperature of 40 degrees C 104 degrees F. Provide circuit breakers that have root mean square (rms) symmetrical interrupting ratings sufficient to protect the circuit being supplied. Interrupting ratings may have selective-type tripping (time delay, magnetic, thermal, or ground fault).

Provide a phenolic-composition breaker body capable of having such accessories as handle-extension, handle-locking, and padlocking devices attached where required to meet lock-out/tag-out requirements of NFPA 70E.

Provide shunt trips where indicated.

Ensure branch circuit breakers supplying convenience receptacle circuits have sensitive instantaneous trip settings of not more than [10] [_____] times the trip rating of the breaker to prevent repeated arcing shorts resulting from frayed appliance cords. Provide UL listed single-pole 15- and 20-ampere circuit breakers as "Switching Breakers" at [120 volts ac][277 volts ac].

When multiple wires per phase are specified, furnish the circuit breakers with connectors made to accommodate multiple wires.

Ensure circuit breaker spaces called out on the drawings are complete with mounting hardware to permit ready installation of the circuit breakers.

2.2.3.1 Multipole Breakers

Provide common trip-type with single operating handle. Design breaker such that overload in one pole automatically causes all poles to open. Maintain phase sequence throughout each panel so that any three adjacent breaker poles are connected to Phases A, B, and C, respectively.

2.2.3.2 Circuit Breaker With Ground-Fault Circuit Interrupter

UL 943 and NFPA 70. Provide with "push-to-test" button, visible indication
of tripped condition, and ability to detect and trip on current imbalance
of 6 milliamperes or greater per requirements of UL 943 for Class A
ground-fault circuit interrupter. Tripping of a branch circuit breaker
containing ground fault circuit interruption is not to disturb the feeder
circuit to the panelboard.

2.2.3.3 Circuit Breakers for HVAC Equipment

Provide circuit breakers for HVAC equipment having motors (group or
individual) marked for use with HACR type and UL listed as HACR type.

2.2.3.4 Arc-Fault Circuit Interrupters

**************************************************************************
NOTE: NFPA 70 requires that all branch circuits
that supply 120 volt, single phase, 15 and 20 ampere
outlets installed in dwelling unit family rooms,
dining rooms, living rooms, parlors, libraries,
dens, bedrooms, sunrooms, recreation rooms, closets,
hallways, or similar rooms or areas are protected by
an arc-fault circuit interrupter to provide
protection of entire branch circuit.
**************************************************************************
**************************************************************************
NOTE: The one pole arc-fault circuit-interrupter is
not designed for use on circuits in which the
neutral conductor is shared with other circuits
(defined as a multiwire branch circuit in NFPA 70)
and will nuisance trip on shared neutral circuits.
Provide and indicate on the drawings one pole
arc-fault circuit-interrupter breakers for each
circuit, and do not use shared neutral for these
circuits in new construction projects. Where wiring
is existing and not replaced and where a shared
neutral exists, a two pole, 120/240 volt arc-fault
circuit-interrupter for shared neutral circuits may
be required. It may also be required in new
construction if 120/240 volt equipment or circuit is
located in the bedroom. Coordinate the requirement
with the cognizant Activity.
**************************************************************************

UL 489, UL 1699 and NFPA 70. Molded case circuit breakers: rated as
indicated. [ Two pole arc-fault circuit-interrupters: rated 120/240
volts. The provision of (two) one pole circuit breakers for shared neutral
circuits in lieu of (one) two pole circuit breaker is unacceptable.]
Provide with "push-to-test" button.

2.2.4 Directory Card and Holder

Provide a directory card on the inside of hinged fronts and doors [under
glass][under non-flammable plastic][ in a metal frame], with spaces for
circuit numbers and load supplied. Where hinged fronts or doors are not
required, provide the directory card [under glass][under plastic][ in a
metal frame] mounted on the left-hand side of the front trim. Ensure the
directory card includes type written designations identifying each branch
circuit with its respective and numbered circuit breaker.
[2.2.5  Filtered Panelboards

2.2.5.1 General

[ Design panelboards for the distribution, control, and protection of electrical circuits, providing filtering and shielding performance and, when specified, conforming to MIL-HDBK 232.

] Provide panelboard cabinet with [two (2)][_____] millimeter [12][_____]-gauge steel minimum, corrosion-resistant finish and four external mounting brackets welded to the case. Provide code-gauge steel front door and trim, with ASTM D1535 No. 61 gray finish, equipped with directory, holder, adjustable trim clamps, hinges, self-latching catch, tumbler lock and key and bears the UL label. Provide a red diagonal strip across the outside surface of door and trim.

2.2.5.2 RF Shielding

Ensure circuit breaker and filter compartments are completely radio-frequency (RF) shielded and in compliance with specified shielding requirements with front door open. Ensure case seams are continuous inert gas welded. Fit removable circuit breaker actuator faceplate and the filter compartment cover with corrosion-resistant RF gasketing material. Install in place with suitable fasteners having a maximum spacing of [75] [_____] millimeter [3] [_____] inches on center. Mount RF filter units to the internal shield wall with similar RF gasketing to ensure RF shielding integrity.

2.2.5.3 Circuit Breaker Actuators

Design circuit breaker operating mechanisms to maintain RF shielding effectiveness without limit to time or number of operations.

2.2.5.4 Terminals

Ensure filter terminals are high-temperature alumina ceramic, continuously brazed to filter case. Do not use soft solder. Provide ceramic terminals that incorporate a permanently attached flexible lead, with a suitable electric lug. Make incoming service connections to the filter lead at a UL-approved, flame-retardant standoff insulator, mounted in the filter compartment.

2.2.5.5 Attenuation

Ensure each filter provides a minimum insertion loss of [100] [_____]dB over the frequency range of [14 kilohertz (kHz) to 10 gigahertz (GHz)] [______]. Ensure each filter provides a full rated load insertion loss of [100] [_____]dB in the frequency range [14 kHz to 20 megahertz (MHz)], to [14] [_____]kHz as measured by a Government-approved laboratory.

2.2.5.6 Current

Ensure each filter unit is capable of carrying its full rated current continuously without heat rise exceeding 50 [_____] degrees C 122 [_____] degrees F above ambient temperature. Ensure each filter is capable of withstanding a [100] [_____] -percent overload for [30] [_____] seconds without damage.
2.2.5.7 Voltage

Ensure each filter unit is capable of continuous operation at its full rated voltage and withstanding an initial voltage test of twice its rated voltage without damage.

2.2.5.8 Circuit Breakers

Ensure circuit breakers are rated a minimum 10,000 amperes asymmetrical ac interrupting capacity, 5,000 amperes dc, and are in accordance with UL 489.

2.2.5.9 RF Filters

Design RF filter units to suppress and reduce the amplitude of undesired RF energy conducted by power service lines. Design RF filter units in compliance with the applicable requirements of ECIA RS-416.

Provide filter cases made of steel, 1.2 [_____] millimeter [16][_____]-gauge minimum, corrosion-resistant finish with a blue lacquer over zinc chromate primer. Use conductive grounding surfaces that are either plated or made of corrosion-resistant steel. Use continuous inert gas welds for hermetic seams; do not use soft solder. Firmly mount internal components to withstand applicable shock and vibration test requirements without damage.

Ensure internal components are fully impregnated and immersed in the fluid to obtain the full benefit of cooling by convection flow through the liquid medium to filter case. Completely fill filter case with the fluid. Ensure fluid conforms to UL nonflammable classification.

2.2.5.10 Filter Discharge Unit

Provide a filter discharge unit for three-filtered circuits on the panelboard. Install in accordance with NFPA 70. Ensure unit meets applicable requirements of ECIA/IS 46.

[2.2.6 Surge Protective Devices]

******************************************************************************

NOTE: Surge protection should be provided for the following types of facilities: Medical facilities; Air navigation aids and facilities; Petroleum, oil and lubricant (POL) storage and dispensing facilities; Critical utility plants and systems; Communication facilities and telephone exchanges; Fire stations, including fire alarm, fire control and radio equipment; Critical computer automatic data processing facilities; Air traffic control facilities; Base weather stations; Surveillance and warning facilities; Command and control facilities; Weapon systems; Security lighting systems; Mission, property and life support facilities at remote and not readily accessible sites.

Consider surge protection for all types of facilities located in regions with a high lightning strike probability (refer to IEEE C62.41.1 and C62.41.2) and facilities located near commercial utility systems with routine substation capacitor switching.
Refer to UFC 3-520-01 for additional criteria.

**************************************************************************

NOTE: Whenever possible, connect surge protectors to a spare circuit breaker in the associated panel. Locate the surge protectors immediately adjacent to the protected equipment.

It is not necessary to provide surge protection on all panelboards; the selection of which panelboards should have surge protective devices depends on the importance of the loads served and the sensitivity of electronic equipment connected to the circuits.

Switching loads such as motor control centers should have surge protection to limit the transmission of switching transients to the rest of the facility.

HVAC equipment usually contain electronic controls that are sensitive to surges.

**************************************************************************

Provide parallel type surge protective devices (SPD) which comply with UL 1449 at the service entrance, load centers, panelboards, and [______]. Provide surge protectors in a NEMA[1][_____] enclosure per NEMA ICS 6. Use Type 1 or Type 2 SPD and connect on the load side of a dedicated circuit breaker. Ensure SPDs are of the Metal Oxide Varistor (MOV) type and rated have fault current rating equal to or greater than the rating of the device to be protected. Where internal fuses are used, ensure fuses will allow maximum rated surge to pass without operating fuse.

Provide SPDs that are [external to][factory installed and integrated with] the equipment to be protected. [Ensure factory installed SPDs are supplied through a dedicated circuit breaker or are directly connected to the bus with no wire between bus bare and SPD.][ Ensure SPDs are installed with external protective device sized in accordance with manufacturer's recommendations. Install SPD parallel to equipment to be protected and as close as possible to minimize wire length between SPD and equipment to be protected.]

Provide the following modes of protection:

FOR SINGLE PHASE AND THREE PHASE WYE CONNECTED SYSTEMS-
   Phase to phase ( L-L )
   Each phase to neutral ( L-N )
   [Neutral to ground ( N-G )]
   [Phase to ground ( L-G )]

FOR DELTA CONNECTIONS-
   Phase to phase ( L-L )
   Phase to ground ( L-G )

SPDs at the service entrance: provide with a minimum surge current rating of 80,000 amperes for L-L mode minimum and 40,000 amperes for other modes (L-N, L-G, and N-G) [and downstream SPDs rated 40,000 amperes for L-L mode minimum and 20,000 amperes for other modes (L-N, L-G, and N-G)].
**NOTE:** Select the first bracketed section below when surge protection is installed as part of a lightning protection system per NFPA 780. Select the second bracketed option below if the surge protection is not part of a lightning protection system; the second bracketed option values are based on manufacturers' standard products and are not as restrictive as NFPA 780.

<table>
<thead>
<tr>
<th>Voltage Protection Rating</th>

<tr>
<td>1,200V</td>
<td>For 480Y/277V, three phase system</td>
</tr>
</tbody>
</table>

**NOTE:** Provide SPDs per NFPA 780 for the lightning protection system.

Maximum L-N, L-G, and N-G Voltage Protection Rating:

- 600V for 120V, single phase system
- 600V for 120/240V, single phase system
- 600V for 208Y/120V, three phase system
- 1,200V for 480Y/277V, three phase system

Maximum L-L Voltage Protection Rating:

- 1,200V for 120V, single phase system
- 1,200V for 120/240V, single phase system
- 1,200V for 208Y/120V, three phase system
- 1,200V for 480Y/277V, three phase system

**NOTE:** Provide EMI/RFI filtering when required by project documents.

2.2.7 Precautionary Label

To ensure persons are aware of immediate or potential hazard in the application, installation, use, or maintenance of panelboards, conspicuously mark each panelboard on the trim or dead front shield with the text (or equivalent) **DANGER** symbol. If the panel is supplied with a door, ensure the label is visible when the door is in the open position.
2.3 TESTS, INSPECTIONS, AND VERIFICATIONS

Provide panelboards in compliance with UL 67.

PART 3 EXECUTION

3.1 INSTALLATION

Install panelboards in accordance with the manufacturer's instructions. Fully align and mount panels so that the height of the top operating handle does not exceed [1800][2000][_____] millimeter [72][79][_____] inches above the finished floor.

Ensure directory-card information is typewritten in capital letters to indicate loads served by each circuit and is mounted in holders behind protective covering.

3.2 FIELD QUALITY CONTROL

**************************************************************************
NOTE: If the specified system is identified as critical, configured, or mission essential, use Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS to establish predictive and acceptance testing criteria, above and beyond that listed below.
**************************************************************************

Perform PT&I tests and provide submittals as specified in Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS.

Do not energize panelboards until the recorded test data has been submitted to and approved by the Contracting Officer.

Provide test equipment, labor, and personnel as required to perform the acceptance tests as specified. Record and submit test data. Include the location and identification of panelboards and megohm readings versus time.

Conduct continuity tests using a dc device with [bell] [buzzer] [____]. Document results as pass-fail.

Conduct continuity and insulation tests on the panelboards after the installation has been completed and before the panelboard is energized. Document results as pass-fail.

Conduct insulation tests on 480-volt panelboards using a 1,000-volt insulation-resistance test set. Record readings every minute until three equal and consecutive readings have been obtained. Ensure resistance between phase conductors and between phase conductors and ground is not less than 50 megohms.

Conduct insulation tests on panelboards rated 300 volts or less using a 500-volt minimum insulation-resistance test set. Record readings after 1 minute and until the reading is constant for 15 seconds. Ensure resistance between phase conductors and between phase conductors and ground is not less than 25 megohms.

Conduct phase-rotation tests on all panelboards using a phase-rotation
indicating instrument. Perform phase rotation of electrical connections to connected equipment in a clockwise direction, facing the source.

3.3 CLOSEOUT ACTIVITIES

Submit manufacturer's instructions for panelboards including special provisions required to install equipment components and system packages. Provide special notices details impedances, hazards and safety precautions.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for motor control centers.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1   GENERAL

NOTE: This section includes the technical requirements for the types of equipment provided at navigation locks and dams, flood control pumping plants, and hydroelectric power plants to supply auxiliary power to the power plant, switchyard, dam and other project facilities.

Applicable portions of this document will be incorporated into electrical specifications when equipment is purchased using a CONSTRUCTION-type contract. Modifications needed to do this include: Modifying submittal requirements to eliminate submittals tied to notice to proceed dates, adding a PART 3 EXECUTION section covering installation of the equipment, adding installation material, such as
conduit and wire, and quality information to PART 2 PRODUCTS. Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM may be used as a basis for the EXECUTION section.

Include suitable drawings showing the general arrangement and single-line diagram of each motor control center and panelboard with the procurement specifications. Ensure the drawings show the locations of conduit and cable entrances, details of nameplates, and tabulations showing the NEMA size of contactors and motor controllers, trip ratings of circuit breakers, solid state trips where required, alarm and bell contacts and shunt trips where required, sizes of feeder and branch circuit conductors, and ratings of motors and other loads.

This guide specification covers NEMA Class II motor control centers where interlocking and remote control are required as is engineering effort on the part of the manufacturer. Where cost savings may be realized by grouping motor controls together, but where motor operations are not interlocked, locally or remotely, and no manufacturer's engineering effort required, use NEMA Class I. This guide specification may be modified for NEMA Class I motor control centers by deleting the following paragraphs from PART 2:

WIRING

TERMINAL BLOCKS

MOTOR CONTROL CENTERS - change references to Class II, type B and C.

Horizontal Wireways - the option for master terminal block compartment should generally not be included.

Wiring for Motor Control Centers

Alternators

Operational Tests

1.3 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
**************************************************************************
NOTE: For DB, delete 01 33 00 SUBMITTAL PROCEDURES, and replace with 01 33 00.05 20 CONSTRUCTION SUBMITTAL PROCEDURES, and 01 33 10.05 20 DESIGN SUBMITTAL PROCEDURES.
**************************************************************************
**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
Motor Control Center Equipment Drawings

SD-03 Product Data
Motor Control Center Equipment[; G[, [___]]]

SD-06 Test Reports
Factory Test Procedures
Factory Test Results
Final Test Reports
Acceptance Tests

SD-07 Certificates

**************************************************************************
NOTE: Include this requirement only when contractual certification is required and Factory Test Reports without certification are not acceptable.

Manufacturer's Instructions

1.4 QUALITY CONTROL

1.4.1 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Ensure equipment, materials, installation, and workmanship are in accordance with the mandatory and advisory provisions of NFPA 70, IEEE C2 unless more stringent requirements are specified or indicated.

1.4.2 Qualifications

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship. Provide products which have been in satisfactory commercial or industrial use for 2 years prior to bid opening. Ensure the 2-year period includes applications of equipment and materials under similar circumstances and of similar size. Ensure the product has been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period. Where two or more items of the same class of equipment are required, these items must be products of a single manufacturer.

1.4.3 Predictive Testing And Inspection Technology Requirements

**************************************************************************
NOTE: The Predictive Testing and Inspection (PT&I) tests prescribed in Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS are MANDATORY for all [NASA] [____] assets
**************************************************************************
and systems identified as Critical, Configured, or Mission Essential. If the system is non-critical, non-configured, and not mission essential, use sound engineering discretion to assess the value of adding these additional test and acceptance requirements. See Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS for additional information regarding cost feasibility of PT&I.

This section contains systems and/or equipment components regulated by NASA's Reliability Centered Building and Equipment Acceptance Program. This program requires the use of Predictive Testing and Inspection (PT&I) technologies in conformance with RCBEA GUIDE to ensure building equipment and systems installed have been installed properly and contain no identifiable defects that shorten the design life of a system and/or its components. Satisfactory completion of all acceptance requirements is required to obtain Government approval and acceptance of the Contractor's work.

Perform PT&I tests and provide submittals as specified in Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS.

1.4.4 Standard Products

Ensure material and equipment are standard products of a manufacturer regularly engaged in their manufacture and essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Ensure all materials conform to the requirements of these specifications. Materials are to be of high quality, free from defects and imperfections, of recent manufacture, and of the classification and grades designated. Ensure all materials, supplies, and articles not manufactured by the Contractor are the products of other recognized reputable manufacturers.

1.5 DELIVERY, STORAGE, AND HANDLING

**NOTE:** ABC phasing should be in accordance with NFPA 70 front-to-back, top-to-bottom, and left-to-right. Avoid alternate phasing but where this cannot be done the drawings should clearly reflect alternate phasing, and these specifications be modified to include requirement for marking the equipment.

Ship the motor control center equipment as completely assembled and wired as feasible so as to require a minimum of installation work. Ensure each shipping section is properly match marked to facilitate reassembly. Provide equipment with removable lifting channels with eye bolts for attachment of crane slings to facilitate lifting and handling.

Carefully pack and ship separately any relay or other device which cannot withstand the hazards of shipment when mounted in place on the equipment. Mark these devices with the number of the panel which they are to be mounted on and fully identified.

Wrap all finished painted surfaces and metal work to protect from damage during shipment. Prepare all parts for shipment so that slings for handling may be attached readily while the parts are in a railway car or
transport truck.

Carefully package and clearly mark all spare parts and accessories.

Ensure sections of equipment crated for shipment are of such size, including crates, that they will pass through a [_____] by [_____]-meter-foot hatch opening and a [_____] by [_____]-meter-foot wall opening.

Locate motor control center equipment in well ventilated areas, free from excess humidity, dust and dirt and away from hazardous materials with ambient temperature between minus 30 and plus 40 degrees C (minus 22 and 104 degrees F). Ensure motor control center equipment is protected to prevent moisture from entering enclosure. Handle motor control center equipment in accordance with NEMA ICS 2.

1.6 MAINTENANCE

1.6.1 Accessories and Tools

Furnish a complete set of accessories and special tools unique to the equipment provided and required for erecting, handling, dismantling, testing and maintaining the apparatus.

1.6.2 Spare Parts

**************************************************************************

NOTE: If three or more motors of the same size and manufacturer are required, specify more spare heater elements.
**************************************************************************

Furnish a list of spare parts as recommended by the manufacturer for the equipment. Ensure all spare parts are of the same material and workmanship, meet the same requirements, and are interchangeable with the corresponding original parts furnished.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

These specifications include the design, fabrication, assembly, wiring, testing, delivery, installation and testing of the items of equipment and accessories and spare parts listed in the Schedule and shown on the drawings.

Submit motor control center equipment drawings, including all motor control units and protective devices. Provide a single-line diagram, equipment list and nameplate schedule. Includes descriptive data showing typical construction of the types of equipment proposed, including the manufacturer's name, type of molded case circuit breakers or motor circuit protectors, performance capacities and other information pertaining to the equipment. Ensure drawings show the general arrangement and overall dimensions of the motor control centers space requirements, details of any floor supports to be embedded in concrete and provisions for conduits for external cables. [Include within the NEMA Class II[S] motor control center drawings a connection diagram with wire designations and schematic diagrams to illustrate operation of associated motor unit controls.] Include complete wiring diagrams for each motor control center. [Provide wiring diagrams in a form showing physical arrangement of the control center with...
interconnecting wiring shown by lines or by terminal designations (wireless).]

**************************************************************************
NOTE: The intent of this submittal is to require NEMA Class II drawing packages. When it is desirable for the Government's wire numbers to be included on the drawings or custom drawing sizes and title blocks are required, specify NEMA Class IIS.

Should this specification be used in procurement of NEMA Class I equipment, the drawing packages are less involved and the second and fourth sentences deleted from this paragraph.
**************************************************************************

2.1.1 Compliance

**************************************************************************
NOTE: Many manufacturers represent IEC ratings as equivalent to NEMA ratings or UL labeling. The two are different standards philosophies and are not interchangeable. IEC ratings are not acceptable under this specification. For further information, see NEMA ICS 2.4, "NEMA AND IEC DEVICES FOR MOTOR SERVICE - A GUIDE FOR UNDERSTANDING THE DIFFERENCE."
**************************************************************************

Provide equipment conforming to the requirements of NFPA 70 unless more stringent requirements are indicated herein or shown. NEMA rated and UL listed equipment has been specified when available. Equipment to meet NEMA and UL construction and rating requirements as specified. No equivalent will be acceptable. Immediately notify the Contracting Officer of any requirements of the specifications or proposed materials or assemblies that do not comply with UL or NEMA. International Electrotechnical Commission (IEC) rated equipment will not be considered an acceptable alternative to specified NEMA ratings.

2.1.2 Coordination

**************************************************************************
NOTE: Combination motor controllers, using motor circuit protectors (MCP's) instead of thermal-magnetic circuit breakers, are offered as standard by several major manufacturers; however, the thermal-magnetic type is still offered as an option. The MCP is designed especially for motor circuits and generally provides better protection for motors, controllers, and circuit conductors than the thermal-magnetic type. Specify one or the other so that all bids are on the same basis. Generally, specify thermal magnetic breakers for reduced voltage starters because MCP do not have high enough current settings to avoid nuisance tripping from current inrush and switching transients generated during start to run sequence.

This guide specification does not cover the use of fused motor protection. Fuses are the least cost
alternative, but require more maintenance. They are not recommended for powerhouse applications. Fuses may be acceptable for other applications, provided that suitable phase-voltage-unbalance protection for motors is specified.

When PART 3 criteria are added for CONSTRUCTION contracts, take care to prevent conflicts, gaps, or omissions.

The general arrangement of the motor control centers is shown on the contract drawings. Any modifications of the equipment arrangement or device requirements as shown on the drawings is subject to the approval of the Contracting Officer. If any conflicts occur necessitating departures from the drawings, submit details of and reasons for departures and approved prior to implementing any change. Completely assemble all equipment at the factory. The motor control centers may be disassembled into sections, if necessary, for convenience of handling, shipping, and installation.

2.1.3 Nameplates

Provide nameplates of laminated sheet plastic in accordance with ASTM D709. Ensure nameplates are melamine plastic 4 mm 1/8 inch thick, black matte finish with white center core and square corners. [Fasten the nameplates to the equipment in proper positions with anodized round-head screws.] Accurately align lettering and engrave into the core. Lettering is a minimum 13 mm 1/2-inch high normal block style. Nameplate designations are in accordance with lists on the drawings, and as a minimum provide for the following equipment:

a. Motor Control Centers

b. Individual items of equipment mounted in the Motor Control Centers

Provide equipment of the withdrawal type with nameplates mounted on the removable equipment in locations visible when the equipment is in place.

2.2 FABRICATION

2.2.1 Ratings

Provide equipment with the following ratings:

NOTE: Select "as indicated" if there are multiple motor control centers with details of each shown on drawings. Most motor control centers will be 3-wire, but might be a 4-wire design for equipment that supplies other than motor loads.

a. Voltage rating: [480Y/277][208Y/120][_____] volts AC, [3][4]-wire [three-phase, [3][4]-wire][as indicated].

b. Continuous current rating of the main bus: [_____] amperes][as indicated].
c. Short-circuit current rating: [____ rms symmetrical amperes][as indicated].

d. UL listed and labeled[ for its intended use][ as service entrance equipment].

2.2.2 Enclosures

**************************************************************************
NOTES: Stand alone front access line-ups are most desirable for ease of operation and maintenance, but particular installations may require specialized arrangements, such as back-to-back mounted units. Consult manufacturers for specialized requirements.

NFPA 70 Article 430H lists the various NEMA enclosure types for Motor Control Centers. Ensure that the NEMA type specified meets design requirements.
**************************************************************************

Each motor control center consists of the required number of vertical sections of 2250 mm 90 inches nominal height, bolted together, with steel channel sills and suitable for mounting against a wall. Vertical sections are nominally 2250 mm 90 inches high and [330.2][406.4][508][____] mm [13][16][20][____] inches deep with buses, control wiring, control transformers, small power transformers, terminal blocks, line terminals, cable supports, and clamps accessible from the front. Enclosure is NEMA Type [1] [1A gasketed] [12] [3R]. Fabricate the motor control centers from smooth select steel sheets shaped and reinforced to form rigid free-standing structures. Ensure metal thickness for enclosures is no less than specified in NEMA ICS 6 without exception. Fabricate and bolt vertical edges of sections exposed to view so that the joints do not pass a 1.6 mm 1/16 inch gauge. [Design each structure for addition of future sections. ]Equip vertical sections with full length vertical isolating barriers between sections. Make provisions for leveling the assembled motor-control center sections and bolting them together so that they form a contiguous structural enclosure.

Provide removable 4.8 mm gauge 7 gauge lifting angles on the top of each section, extending the entire width of the section, capable of supporting the entire weight of the motor control center section without distortion. Provide base channels with holes to facilitate floor mounting and leveling.

2.2.2.1 Arc Resistant Enclosure

**************************************************************************
NOTE: Determine if an arc-resistant design will be specified for the installation. A selection of arc-resistant equipment can affect the installation design. Arc-resistant switchgear is tested and certified to IEEE C37.20.7, and is intended to provide added protection for internal arcing faults. Select Type 1 if arc protection is only required for the freely accessible front of the enclosure. Select Type 2 if arc protection is required for freely accessible front, sides and rear of the enclosure. Select the 'B' suffix for additional protection applied to compartments.
**************************************************************************
designated as low voltage control or instrumentation compartments. Select the 'C' suffix where isolation from the effects of an internal arcing fault is desired between all adjacent compartments within a switchgear assembly. Most manufacturers produce Type 2B as a standard product, which could increase the switchgear cost by about 20 percent. Review IEEE C37.20.7 for additional information.

Delete this section if Arc Resistant enclosure is not required.

**************************************************************************

Provide arc resistant Type [1[B][C)][2[B][C]] enclosure tested in accordance with IEEE C37.20.7.

2.2.2.2 Unit Compartments

Provide each operating unit with equipment as shown on the drawings, mounted in an individual cell. The unit assembly, except main circuit breakers, panelboards and auxiliary control devices, is drawout type removed from the front, without rear access or disturbing other units in the control center assembly. Ensure all drawout type unit assemblies have a positive guide rail system to ensure alignment of connection to vertical bus. Mechanically interlock units with the door to prevent removal while in the energized position. Provide each removable unit with a provision for padlocking in a position in which it is disconnected from the vertical bus, although not removed from the stationary structure. Provide all ventilating openings with corrosion-resistant insect-proof screens on the inside. Provide bus closing plugs for all unused openings in vertical bus barriers.

Ensure compartments for future motor-control units are complete with hardware, buses, and hinged doors ready to receive future draw-out units. Compartments for spare motor-control units are complete with buses, hinged doors, and draw-out units but without load terminal connections. Spare spaces are complete with buses and screwed-on front cover plates.

2.2.2.3 Motor Control Center Doors and Covers

Provide each unit compartment, including blank compartments for future use, with either a flange-formed or a rolled-edge door. Mount each door on fully-concealed or continuous full-length piano-type hinges and provide with positive fasteners. Prevent door sag by proper alignment of hinges made of sufficiently strong material. Interlock the door fastenings to prevent opening when the equipment is energized. Ensure the external operating handle clearly indicates whether the equipment is in an "ON", "OFF" or "TRIPPED" position.

2.2.2.4 Horizontal Wireways

[Provide a structure with a minimum 300 mm 12 inches high wireway at the top and a 150 mm 6 inches minimum wireway at the bottom.] [Provide a structure with a minimum 150 mm 6 inches high wireway at the top and a 300 mm 12 inches minimum wireway at the bottom.] Both horizontal wireways to run the length of the structure. [Provide a master terminal block compartment with full length wireway space at the [top] [bottom] [where indicated] in all Type C assemblies.] [Provide cover plates on the side of the assembly to permit extension of the horizontal bus and wireway when
vertical sections are added.]

2.2.2.5 Vertical Wireways

Provide vertical wireways in all vertical sections. Connect vertical wireways with horizontal wireways at the top and bottom and be a minimum 100 mm 4 inches wide. Provide barriers in sections containing both ac and dc circuits. Provide doors on each vertical wireway with the exposed surface of any door not deviating more than 1.5 mm 1/16 inch from a true plane. Provide cable tie supports in the vertical wireway to hold cable and wiring in place.

If communication wiring is required, add metal shielding in the vertical wiring trough to provide isolation from power and control wiring within the vertical wiring trough.

2.2.2.6 Sills

**************************************************************************
NOTE: Structural sills are options provided by most manufacturers and provide the structural stability desired for equipment subject to the vibration of a powerhouse. When equipment is to be mounted on sills and on a maintenance pad, the 78" NFPA 70 requirement for height to operating handle may not be exceeded unless space for operator to stand on a pad is provided.
**************************************************************************

Furnish channel iron foundations, complete with bolts and drilled holes for grouting and anchoring to the floor, for the complete length (front and rear) of each motor control center assembly. Design the channels for flat mounting, maximum channel depth is 38 mm 1-1/2 inches. Provide additional channel or substantial metal trim flush with the end panels to completely enclose the bases across the ends of the equipment assemblies.

2.2.2.7 NEMA 3R Enclosures

**************************************************************************
NOTE: Enclosures covered by this specification are intended to be non walk-in type. Walk-in front-aisle, walk-in common aisle and walk through common aisle styles are available, and where required should be specified. Verify the latter styles of enclosures comply with NFPA 101 for means of egress and lighting.
Delete this section if NEMA 3R Enclosures are not required.
**************************************************************************

Provide a non-walk in, NEMA Type 3R, rainproof enclosure motor control center. The outside enclosure consists of smooth select [steel sheets on a structural steel frame][stainless steel sheets on a stainless steel structural frame]. Provide full-length single or double doors with top and bottom bolts and a center latch operated by means of a keyed handle. Ensure steel sheets and doors are not less than 3.5 mm gauge No. 10 gauge thick. Doors have bent angle or channel edges with all corner seams welded and ground smooth. Assemble the motor control center within the enclosure.
with adequate gaskets and structure to assure a measure of vandal resistance. Ventilate openings and provide an effective insulating air space of approximately 50 mm 2 inches below the roof of the structure which slopes from front to back for adequate drainage. Permit easy sealing of the outside edges of the control center base at the concrete surface with mastic compound. Provide two duplex receptacle units within the outer weatherproof enclosure.

[Furnish a 200-watt outdoor lighting fixture with globe and guard to light the front of the assembly. Ensure all lighting connections are watertight. Furnish a weatherproof switch installation on the front or side of the enclosure so that the light can be switched prior to opening the assembly doors. The exterior manual switch is "ac" rated, 15 amperes, 120/277 volts.] Wire the[ lighting fixture and] receptacles to [120-volt external source as indicated][the 120-volt ac panelboard located in the control center], and run external wiring in rigid galvanized steel conduit.

]2.2.2.8 Shutters

Provide drawout units with shutters which close when the unit is withdrawn to isolate the vertical bus.

]2.2.2.9 Thermostatically Controlled Strip Heaters

**************************************************************************
NOTE: Delete this paragraph when not required.
**************************************************************************

Provide thermostatically controlled strip heaters as specified in paragraph SPACE HEATERS [in all motor control centers] [where indicated].

]2.2.3 Buses

**************************************************************************

NOTES: When either copper or aluminum bus are allowed the manufacturers will generally provide the less expensive aluminum. Use ASTM 317 when aluminum bus is permitted.

NEMA ICS 1 allows a 65 degrees Celsius149 degrees Fahrenheit temperature rise on the buses, irrespective of the equipment used. UL 845 allows 65 degrees Celsius149 degrees Fahrenheit temperature rise only under certain conditions. In general this means all buses are plated and devices are UL labeled for the higher temperatures. If this is not the case, the UL standard for temperature rise is 50 degrees Celsius122 degrees Fahrenheit creating a conflict with NEMA. The designer should be aware of this difference. This guide specification references the UL standard and bases the rise on the exceptions it permits.

**************************************************************************

Ensure all buses are [[tinned ]([copper])[aluminum], and all bolted splices and connections between buses and for extensions or taps for equipment [are tin or silver-plated][are tin or silver-plated throughout]. [Copper][Aluminum] bars and shapes for bus conductors conform to the applicable requirements of ASTM B187/B187M[, and ASTM B317/B317M]. Bolt
all splices for field assembly with at least two bolts and employ the use of "Belleville" washers in the connection. Base the bus ratings on a 65 degree Celsius maximum temperature rise in accordance with UL 845 requirements. Ensure bus has a short-circuit current rating of not less than [42,000][65,000][100,000][_____] RMS symmetrical amperes. Support all bus work on wet process porcelain insulators, glass polyester, or suitable molded material.

2.2.3.1 Horizontal Bus

Provide each control center assembly with a three-phase main horizontal bus, with a continuous current rating not less than [600] [800] [1,000] [1,200] [_____] amperes, located across the top of each vertical section. Drill the ends of horizontal buses for future extensions. [Fully insulate the main horizontal bus.]

2.2.3.2 Vertical Bus

Provide each vertical section with a three-phase vertical bus with a continuous current rating of [300] [600] [_____] amperes connected to the horizontal bus by brazing, welding, or bolting. Where the incoming feeder breakers are located at the bottom of a control center, rate the vertical bus in that section the same as the main horizontal bus. Extend vertical buses from the horizontal bus to the bottom of the lowest available unit mounting space. Isolate the vertical bus from wireways and equipment in compartments.

2.2.3.3 Ground Bus

**************************************************************************
NOTE: Delete this paragraph when not required.
**************************************************************************

Provide a [[tin-plated ]][copper][aluminum] ground bus full width at the bottom of the motor control center line-up. Provide a full clamp-type solderless [copper][copper alloy] lug for No. [2/0][4/0][_____] AWG stranded copper cable at each end of the bus for connection to the grounding system. Ensure the ground bus is capable of carrying the rated short-circuit current available in the motor-control center.

2.2.3.4 Neutral Bus

**************************************************************************
NOTE: Delete this paragraph when not required.
**************************************************************************

Furnish a [half] [fully] rated neutral bus continuous through the control center with appropriate capacity.

2.2.4 Painting

Thoroughly clean the interior and exterior steel surfaces of equipment enclosures and then receive a rust-inhibitive phosphatizing or equivalent treatment prior to painting. Ensure exterior surfaces are free from holes, seams, dents, weld marks, loose scale or other imperfections. Interior surfaces receives not less than one coat of corrosion-resisting paint in accordance with the manufacturer's standard practice. Prime exterior surfaces, fill where necessary, and give no less than two coats baked enamel with semigloss finish. Ensure equipment located indoors is ANSI
2.3 EQUIPMENT

2.3.1 Connections

Ensure bolts, studs, machine screws, nuts, and tapped holes are in accordance with ASME B1.1. Ensure the sizes and threads of all conduit and fittings, tubing and fittings, and connecting equipment are in accordance with ASME B1.20.1. Provide ferrous fasteners with rust-resistant finish, and all bolts and screws equipped with approved locking devices. Manufacturer's standard threads and construction may be used on small items which are integrally replaceable, except threads for external connections to these items meet the above requirements.

2.3.2 Molded Case Circuit Breakers

Ensure molded case circuit breakers conform to the applicable requirements of UL 489. Provide manually-operated circuit breakers of the quick-make, quick-break, common trip type. Furnish automatic-trip breakers unless otherwise specified or indicated on the drawings. Provide the common-trip multipole circuit breakers having a single operating handle and a two-position on/off indication and with provisions for padlocking in the "Off" position. Provide personnel safety line terminal shields for each breaker. Ensure the circuit breakers are products of only one manufacturer, and interchangeable when of the same frame size. [Where indicated on the drawings, provide circuit breakers with shunt trip devices.] [Where indicated on the drawings, provide circuit breakers with bell alarm contacts that close on automatic operation only. Provide contacts suitable for [125] [____] volts dc and be reset when the breaker is reset.]

Size breakers as required for the continuous-current rating of the circuit. Provide the breaker class as required. The Government reserves the right to change the indicated trip ratings, within frame limits, of the trip devices at the time the shop drawings are submitted for approval.

Provide sufficient interrupting capacity maximum short-circuit current imposed on the circuit at the breaker terminals as indicated. Provide circuit breaker interrupting capacities with a minimum of 10,000 A and that conform to NEMA AB 3. Series rating of circuit breakers is not permitted.

Provide circuit breakers with temperature compensation for operation in an ambient temperature of 40 degrees C 104 degrees F. Provide circuit breakers that have root mean square (rms) symmetrical interrupting ratings sufficient to protect the circuit being supplied.

2.3.2.1 Trip Units

**************************************************************************
NOTE: Both thermal magnetic and solid state trip units have been included in this specification. Solid state units can be more reliable and permit more selective coordination since they can have long time pick-up, long time delay, short time pick-up, short time delay, instantaneous pick-up, ground fault pick-up, and ground fault time delay settings. Solid state units have come down in price
and are becoming competitive with thermal magnetic units. Indicate specific locations where solid state trips are required on the drawings.

NOTE: Coordinate circuit breaker setting requirements in this section with project requirements. If solid state trip circuit breakers with adjustable settings are specified ensure appropriate overcurrent protective device coordination study is included in project requirements.

Except as otherwise noted, provide the circuit breakers, of frame sizes and the trip unit ratings as shown on the drawings, with inverse-time thermal-overload protection and instantaneous magnetic short-circuit protection or solid state trip units. Provide [instantaneous magnetic trip units are adjustable][Solid state trip units equipped with adjustable [long time pick-up and delay],[short time pick-up and delay], [and ground fault pick-up and delay]] on frame sizes larger than [150][250][_____] amperes. [Set all protective devices in accordance with approved coordination study.][Set nonadjustable instantaneous magnetic trip units at approximately 10 times the continuous current ratings of the circuit breakers.]

2.3.2.2 480-Volt AC Circuits

Rate circuit breakers for 480-volt or 277/480-volt ac circuits 600 volts ac, and have an UL listed minimum interrupting capacity of [14,000] [_____] symmetrical amperes at 600 volts ac.

2.3.2.3 120/240-Volt AC Circuits

Rate circuit breakers for 120-volt ac circuits not less than 120/240 or 240 volts ac, and have a UL listed minimum interrupting capacity of [10,000] [_____] symmetrical amperes.

2.3.2.4 125-Volt DC Circuits

Provide two-pole circuit breakers for 125-volt dc circuits rated 125/250 or 250 volts dc, and have an UL listed minimum interrupting capacity of [5,000] [10,000] [_____] amperes dc.

2.3.3 Wiring

Provide NEMA Class [I][II], Type [A][BD][BT][C]. [Where Type C wiring is required, locate the master terminal blocks at the [top][bottom] of the vertical section.] Wire out combination starter units to split type terminal blocks for easy removal of the starter unit without disturbing either factory or field installed wiring. Ensure all control terminal boards are accessible from the front.

All control wire is stranded tinned copper switchboard wire with 600-volt flame-retardant insulation Type SIS meeting UL 44 or Type MTW meeting UL 1063, and passes the VW-1 flame tests included in those standards. Hinge wire has Class K stranding. Current transformer secondary leads cannot be smaller than No. 10 AWG. The minimum size of control wire is No. 14 AWG. Power wiring for 480-volt circuits and below is of the same type as control wiring and the minimum size is No. 12 AWG. Give special
attention to wiring and terminal arrangement on the terminal blocks to permit the individual conductors of each external cable to be terminated on adjacent terminal points.

2.3.4 Terminal Blocks

Use molded or fabricated circuit terminal blocks for wiring with barriers, rated not less than 600 volts. Provide terminals with removable binding, fillister or washer head screw type. Ensure terminals are no less than No. 10 in size and having sufficient length and space for connecting at least two indented terminals for 10 AWG conductors to each terminal. The terminal arrangement is subject to the approval of the Contracting Officer. Modular, pull apart, terminal blocks are acceptable provided they are of the channel or rail-mounted type. Submit data showing that the proposed alternate accommodates the specified number of wires, are of adequate current-carrying capacity, and are constructed to assure positive contact between current-carrying parts.

2.3.4.1 Short-Circuiting Type

Provide short-circuiting type terminal blocks for all current transformer secondary leads with provision for shorting together all leads from each current transformer without first opening any circuit.

2.3.4.2 Load Type

Provide load terminal blocks rated no less than 600 volts and of adequate capacity for the conductors for NEMA Size 3 and smaller motor controllers and for other power circuits except those for feeder tap units. Provide the terminals of of the screw type, having length and space for at least two indented terminals of the size required on the conductors to be terminated. For conductors rated more than 50 amperes, use screws with hexagonal heads. Provide adequate contact surface and cross-section for conducting parts between connected terminals to operate without overheating. Each connected terminal has the circuit designation or wire number placed on or near the terminal in permanent contrasting color.

2.3.4.3 Marking Strips

Provide white or other light-colored plastic marking strips, fastened by screws to each terminal block, for wire designations. Mark the wire numbers with permanent ink. Provide reversible marking strips to permit marking both sides, or furnish two marking strips with each block. Provide marking strips that accommodate the two sets of wire numbers. Assigned a device designation to each device to which a connection is made in accordance with NEMA ICS 1. Mark each device terminal to which a connection is made with a distinct terminal marking corresponding to the wire designation used on the Contractor's schematic and connection diagrams. The wire (terminal point) designations used on the Contractor's wiring diagrams and printed on terminal block marking strips may be according to the Contractor's standard practice; however, provide additional wire and cable designations for identification of remote (external) circuits for the Government's wire designations. Prints of shop drawings submitted for approval will be so marked and returned for addition of the designations to the terminal strips and tracings, along with any rearrangement of points required.
[2.3.5  Space Heaters

**************************************************************************
NOTE: Heaters should be connected to an external power source in installations where the motor control center is not energized continuously.
**************************************************************************

Provide space heaters where indicated on the drawings. Control the heaters using an adjustable 10 to 35 degrees C 50 to 95 degrees F thermostat, magnetic contactor, and a molded-case circuit breaker [and a 480-120 volt single-phase transformer]. Provide the space heaters with 250-watt, 240 volt strip elements operated at 120 volts and [supplied from the motor control center bus] [wired to terminal blocks for connection to 120-volt single-phase power sources located external to the control centers]. The contactors are open type, electrically-held, rated 30 amperes, 2-pole, with 120-volt ac coils.

]2.4  COMPONENTS

**************************************************************************
NOTES: This guide specification covers single stand alone lineup with front access. Not all arrangements can be listed and labeled under UL 845. Consult manufacturer's literature and UL listing availability for specific arrangements.

Auxiliary motor control centers should be NEMA Class II, Type B or C, as applicable. Type C construction includes master section terminal boards at the top or bottom of each vertical section and complete control wiring and power wiring for NEMA Size 3 and smaller controllers between the unit assemblies in each section and the master terminal boards. Type C construction is preferred and should be specified whenever a considerable amounts of interpanel control wiring or external control circuits is required. Consider number of terminal blocks required for type C construction and ensure that there is sufficient space and access.

Where the unit assemblies consist primarily of feeder tap units with circuit breakers to supply power loads or starter units for individually controlled motors (such as for pumps in pumping stations), and very little interpanel and external control wiring is required, specify the less expensive Type B construction, which does not include master section terminal boards. If the procurement includes both types of control centers, clearly indicate the type of each control center.

Coordinate NEMA class and construction type with "Wiring" paragraph.
**************************************************************************

Design each motor control center for operation on [480] [_____] -volts ac, 3-phase, 60-Hz system, and the ensure that equipment conforms to all the applicable requirements of NEMA ICS 1, NEMA ICS 2, NEMA ICS 4, NEMA ICS 6,
UL 845 and NFPA 70. List and label vertical sections and individual units under UL 845 where ever possible. In lieu of the UL listing, certification from any nationally recognized, adequately equipped, testing agency that the individual units and vertical sections have been tested and conform to the UL requirements of that agency will be acceptable when approved by the Contracting Officer. Provide NEMA Class [I] [II], [Type B] [Type C] [Type B or C as indicated in the bid item list], motor control centers in accordance with NEMA ICS 2.

2.4.1 Combination Starters

**************************************************************************

NOTES: The minimum bus short-circuit rating for most manufacturers is 42,000 amps rms symmetrical. Most combination starters without current limiting type circuit breakers or motor circuit protectors have a short circuit rating of 25,000 amps. Evaluate the available short circuit current for a particular installation and place that value in the space provided.

When short-circuit ratings above 25,000 amps are required, consult manufacturer's data for the availability of non-current limiting devices at the specific rating and where needed, show current limiting circuit breakers or motor circuit protectors the drawings.

In accordance with NEMA ICS 2, the motor control center short-circuit rating is the maximum available rms symmetrical current in amperes permissible at its line terminals which are computed as the sum of the maximum available current of the system at the point of connection and the short-circuit current contribution of the motors connected to the control center. In the absence of more precise information, the motor short-circuit current contribution may be assumed to equal four times the continuous current rating of the motor control center.

Reduced voltage type starters are specified in the following paragraph. They should be used in specialized applications, and indicated on the drawings. Avoid reduced voltage starting where possible.

This guide specification does not cover reversing starters. Where a reversing starter is required, indicate reversing and non-reversing starters on the drawings, and modify the specification for clarity.

NEMA sizes are based on continuous duty motors. Where acceleration time exceeds 10 seconds, or plugging or jogging duty are required, consult the manufacturer.

For high efficiency motors, investigate time-current curve characteristics of the circuit breaker or MCP overcurrent protection to ensure that the increased
starting current of these motors does not exceed the NFPA 70 standard ratings.

To determine whether to select motor circuit protectors or molded-case circuit breakers, see subparagraph Coordination in Part 1.

Provide full-voltage, non-reversing combination motor controller units containing [motor circuit protectors] [molded-case circuit breakers], auxiliary and pilot devices and [a magnetic contactor with thermal overload relays] [[or] [and]] reduced voltage starter where indicated on the drawings. Show the ratings of [motor circuit protectors,] [circuit breakers,] contactors, motor controllers and other devices on the drawings. Ensure all combination motor controller units have short circuit ratings equal to [_____] or greater. Where control push-buttons, indicating lamps, "Hand-Off-Automatic" switches, and similar control devices are associated with a unit, mount them on the unit compartment door. Door-mounted components cannot interfere with access within the compartments. [Molded case circuit breakers for use in combination starters meet the requirements of paragraph MOLDED CASE CIRCUIT BREAKERS.] [Motor circuit protectors are only part of the combination starters as required by NFPA 70 and conform to all requirements of paragraph MOLDED CASE CIRCUIT BREAKERS, except that trip units have provisions for locking the selected trip setting.]

2.4.1.1 Magnetic Contactors

Provide magnetic contactors of the NEMA sizes as indicated on the drawings. The rating, performance and service characteristics conforms to the requirements of NEMA ICS 2 for contactors with continuous current ratings for the duty indicated. Rate motor control contactors for full-voltage starting (Class A controllers). Provide contactors suitable for at least 200,000 complete operations under rated load without more than routine maintenance. Minimize the interruption arc and flame by suitable arc chutes or other means so that no damage is done to other portions of the device. If provided, ensure the arc chutes are easily removable without removing or dismantling other parts. All current-carrying contact surfaces are silver-surfaced or of other approved material. Ensure the contactor operates without chatter or perceptible hum while energized. Provide coils suitable for continuous operation [120-volt ac] [480-volt ac] [125-volt dc] circuits. Provide three-pole alternating-current contactors, except where otherwise noted, and insulated for 600 volts ac, electrically-operated, magnetically-held type. Direct-current contactors are two-pole, suitable for controlling circuits operating at 125 volts dc, insulated for 250 volts dc, electrically-operated, magnetically-held type and adequate for full-voltage motor starting service.

2.4.1.2 Reduced Voltage Starters

NOTES: Ensure motor loads using reduced voltage starting are able to operate with reduced starting torque.

Use autotransformer starters when voltage drop due to motor starting current is a problem. Solid state starters may also be used. Designer to determine best alternative.
Solid state starters provide a smooth acceleration and are suitable for pump starting. Coordinate acceleration requirements to specific motor.

Delete this paragraph when reduced voltage starters are not required.

Provide an integrated unit with microprocessor logic board and door mounted digital display and keypad. Comply with UL 508.

Rate autotransformers for medium duty and have taps according to NEMA ICS 2. For thermal over load protection, ensure the autotransformer has normally closed thermostat wired in series with the normally closed thermal overload contact of the starter. Initial connection is to the [65] [%] percent tap. [Solid State soft-start starters are three phase SCR controlled for stepless reduced voltage starting of induction motors. Ensure controllers are equipped with a minimum of two SCRs per phase.] Current transformers provide feedback signal to regulate torque during start up and to prevent overload conditions while motor is running. Provide the starter with a starting current of 300 percent of full load amps for thirty seconds, bypass/isolation contactor, and three phase thermal overload relay.

Provide manufacturer's standard front accessible keypad and digital display for programming the controller parameters, functions, and features. Include the following functions:

a. Adjusting motor full-load amperes, as a percentage of the controller's rating.

b. Adjusting current limitation on starting, as a percentage of the motor full-load current rating.

c. Adjusting linear acceleration and deceleration ramps, in seconds.

d. Setting initial torque, as a percentage of the nominal motor torque.

e. Adjusting torque limit, as a percentage of the nominal motor torque.

f. Adjusting maximum start time, in seconds.

g. Adjusting voltage boost, as a percentage of the nominal supply voltage.

h. Selecting stopping mode and adjusting parameters.

i. Selecting motor thermal-overload protection class between 5 and 30.

j. Activating and deactivating protection modes.

k. Selecting or activating communications modes.

Provide manufacturer's standard front accessible digital display for showing motor, controller, and fault status. Include the following displays at a minimum:

a. Controller Condition: Ready, starting, running, stopping.

b. Motor Condition: Amperes, voltage, power factor, power, and thermal
state.

c. Fault Conditions: Controller thermal fault, motor overload alarm and
trip, motor underload, overcurrent, shorted SCRs, line or phase loss,
phase reversal, and line frequency over or under normal.

Provide integral controller diagnostics and protection to include:

a. Microprocessor-based thermal protection system for monitoring SCR and
motor thermal characteristics, and providing controller overtemperature
and motor overload alarm and trip; settings selectable via the keypad.

b. Protection from line-side reverse phasing; line-side and motor-side
phase loss; motor jam, stall, and underload conditions; and line
frequency excursions to over- or under-normal. Provide protection
using [input isolation contactor that opens when the controller
diagnostics detect a faulted solid state component, or when the motor
is stopped.][shunt trip that opens the disconnecting means when the
controller diagnostics detect a faulted solid state component.]

**************************************************************************
NOTE: The following features are typical options
for most manufacturers. Coordinate with project
requirements for inclusion in specification.
**************************************************************************

Provide the additional optional features:

a. Analog output for field-selectable assignment of motor operating
characteristics; 4- to 20-mA dc.

b. [Two] additional field-assignable Form C contacts for alarm outputs.

c. Full-voltage/BYPASS selector switch. Ensure power contacts are totally
enclosed, double break, made of silver-cadmium oxide, and assembled to
allow inspection and replacement without disturbing line or load wiring.

2.4.1.3 Variable Frequency Controllers

Provide variable frequency controllers meeting the requirements of Section
26 29 23 ADJUSTABLE SPEED DRIVE (ASD) SYSTEMS UNDER 600 VOLTS.

2.4.1.4 Auxiliary Contacts

Provide each controller with a minimum of three auxiliary contacts which
can be easily changed from normally open to normally closed. Where
indicated on the drawings, provide a fourth auxiliary contact and red and
green indicating lights.

2.4.1.5 Overload Relays

**************************************************************************
NOTE: The standard NEMA Class 20 overload relay
operates at 600 percent of its rating after a
maximum of 20 seconds. Other standards are Class 10
and Class 30, operating at a maximum of 10 and 30
seconds. This may be required for special
applications.
**************************************************************************
Except as otherwise indicated, provide each controller with [solid state][bi-metallic [non-]ambient compensated] NEMA Class [20][_____] thermal overload relays including external manual reset.[

Provide bi-metallic relays with interchangeable heaters, calibrated for 1.0 and 1.15 service factor motors, electrically isolated normally open and normally closed contacts, visual trip indication, test trip feature operable without removing components or the motor starter. Overload to have (+/-) 24 percent adjustability, single-phase sensitivity, isolated alarm contact, and [manual] [or] [automatic reset].[ ]

Provide solid state, ambient insensitive, self-powered relays with adjustable full-load amperage, phase unbalance, phase loss protection, built-in thermal memory, isolated auxiliary contacts and [manual][automatic] reset.]

[2.4.1.6 Individual Control Transformers

**************************************************************************

NOTE: Delete this paragraph as well as requirement for spare control transformer when a single control transformer for the motor control center is mounted in a unit compartment or external control source is provided.

Primary fuses for individual control transformers are given as an option. For less than 50 VA, they are not required or desired. Please refer to NFPA 70 section 430-72(c).

**************************************************************************

Where 120 volt ac control of contactors is indicated or required, provide an individual control transformer on the load side of the unit disconnect. Rate the control transformers 480-120 volts and conform to the requirements for control transformers in UL 506. Verify control transformers have adequate volt-ampere capacity for the control functions indicated. Install transformers [without] [with] [Class J] primary fuses. Except as otherwise indicated on the drawings, provide each control transformer with a fuse in one secondary lead and have the other secondary lead grounded.

][2.4.1.7 Voltage Fault Protection

**************************************************************************

NOTE: Evaluate voltage fault protection requirements and delete this paragraph when not required.

**************************************************************************

Where shown, provide starters with protection against [voltage faults,] [phase unbalance,] [phase loss,] [phase reversal,] [undervoltage] [and overvoltage]. Upon sensing one of these faults, the protector de-energizes the starter. The protector uses a combination of voltage and phase-angle sensing to detect phase loss even when regenerated voltages are present. Connect the protector to the load side of the motor circuit disconnect. The protector has an adjustable line voltage trip level, adjustable trip delay, automatic reset [and manual reset by an external normally closed push-button,] and Double Pull Double Throw (DPDT) output contacts. Protector operation has a repeatability of +1 percent of set point, maximum, and a dead band of 2 percent maximum. Provide a protector with a
green indicator to show normal status and red indicator to show tripped status. Ensure indicators are visible through the compartment door, when LED's are used cover the protector with a clear unbreakable cover, when lamps are used provide nameplates and group with other indicating lights.

2.4.1.8 Control Circuit Disconnects

**************************************************************************
NOTE: The requirement for disconnect of the control circuit is required by, NFPA 70 Article 430 Part VI section 430.75. Generally, manufacturers do not disconnect control voltage except when racking out the starter unit which is not NFPA compliant as currently written. This paragraph is a specialized requirement to avoid potential safety hazard and ensure compliance. Specific designs may require a variance. There are available high density pull apart terminals in the unit compartments to disconnect control voltage, after the unit is open. The latter meets the intent of NFPA, but not the letter. Investigate specific project requirements for interlocking and safety, and modify this paragraph accordingly.
**************************************************************************

Arrange motor control circuits to ensure that all sources of supply power are disconnected when the disconnecting means is in the open position in accordance with NFPA 70. Where separate disconnecting means are provided, locate disconnects immediately adjacent to each other.

[2.4.2 Panelboards for Motor Control Centers

Provide panelboards meeting the requirements of Section 26 24 16.00 40 PANELBOARDS.

[2.4.3 Distribution Transformers

Provide [drawout,] dry type, two-winding, 60 hertz transformers for power and lighting loads with voltage and kVA ratings as indicated on the drawings. Ensure the transformers conform to the requirements for general-purpose transformers in IEEE C57.12.01 and NEMA ST 20. Protect each transformer on the primary side with a molded case circuit breaker as indicated on the drawings.

For 15 kVA and greater provide transformers with 220 degrees C 428 degrees F insulation system for temperature rise not exceeding 115 degrees C 239 degrees F under full-rated load in maximum ambient of 40 degrees C 104 degrees F and capable of carrying continuously 115 percent of nameplate kVA without exceeding insulation rating.

[2.4.4 Ground Detector Indicator

**************************************************************************
NOTE: Evaluate ground detectors requirements. Delete paragraph when not required.
**************************************************************************

Provide ground-detector indicator (GDI) rated for 120-volts. Ensure GDI has three lamps, one per phase, three 480-120 volt transformers connected
delta-wye, an adjustable loading resistor for balancing capacitive charging current, and a push-to test-switch. GDI provides visual indication of a single ground-fault on any phase (A, B, or C) of a three-phase, three-wire ungrounded power system. When no phase is grounded, ensure all lamps glow at partial brightness, giving long lamp life, the push-to test switch does not affect the brightness of any lamp. When a single ground-fault occurs on any phase, and the lamp that corresponds to the faulted phase is dark and the other two lamps glow at full brightness. The push-to-test switch causes all lamps to return to partial brightness, showing the GDI is functioning properly.

2.4.5 Wiring for Motor Control Centers

Provide wiring meeting the requirements of paragraph WIRING. Provide heavy-duty type terminals for terminating all power cables entering the control centers.

2.4.5.1 Contractor's Wiring

Form wiring into groups, suitably bound together, properly supported and run straight horizontally or vertically with no splices in the wiring. The manufacturer's standard pressure-type wire terminations for connections to internal devices is acceptable. Add terminal blocks for wiring to devices having leads instead of terminals. Use ring tongue indented terminals on all wires terminated on control terminal blocks for external or interpanel connections and at shipping splits. Provide stud terminals with contact nuts and either locking nuts or lockwashers.

2.4.5.2 External Connections

**************************************************************************
NOTE: For NEMA 3R enclosures, power cables enter from the bottom.
**************************************************************************

Power and control cables enter the control centers at the [bottom] [top] [where shown on the drawings]. [Where power and control entry points are not shown, and terminal blocks are not given on the drawings, the Government will furnish this information after award of contract.]

2.4.5.3 Terminal Blocks

In no case, the terminals provided for circuit breakers or contactors accommodate less than the number or size of conductors shown on the drawings. Give special attention to wiring and terminal arrangement on the terminal blocks to permit the individual conductors of each external cable to be terminated on adjacent terminal points.

2.4.6 Control Power

**************************************************************************
NOTE: Delete when individual control transformers are specified are provided.
**************************************************************************

[ Provide 120-volt control power to individual starters from an external source as indicated.
][Provide control power for motor control centers using an integrated control system.

SECTION 26 24 19.00 40 Page 30
power transformer. Mount control power transformers for several starter units in a separate compartment and connect its primary windings to the main bus through a molded case circuit breaker of suitable rating. Rate the control power transformers 480-120 volts and conform to the requirements for control power transformers in UL 506. Provide control power transformers with adequate volt-ampere capacity for the control functions indicated and an additional 10 percent capacity. Install control power transformers without primary fuses. Except as otherwise indicated, provide each unit compartment a fuse for control power in one secondary lead and have the other secondary lead grounded.

2.4.7 Accessories and Control Devices

**********************************************************************
NOTE: Retain only paragraphs for accessories actually used for a given procurement.
**********************************************************************

Provide control accessories, and are suitable for mounting on the front of, or inside, the control centers as indicated on the drawings. Control accessories to meet the applicable requirements of NEMA ICS 2. Mount relays and other equipment so that mechanical vibration does not cause false operation.

2.4.7.1 Control Stations

Ensure push-button stations and selector switches conform to NEMA ICS 2, are of the heavy-duty, oil-tight type, rated 600 volts ac, and have a contact rating designation of A600. Provide switches with escutcheon plates clearly marked to show operating positions. [Provide sufficient contact blocks to make up the electrically separate contacts required for lead-lag selector switches.]

2.4.7.2 LED Indicating Lights

Furnish red and green LED's where shown on the drawings, indicating contact "open" and "closed" position. The LED's are accessible and replaceable from the front of the control center through a finished opening in the compartment door. The LED assemblies are the heavy duty oiltight, watertight, and dusttight type.

2.4.7.3 Control Relays

Control relays are the electrically operated, magnetically held, self-reset, open type, suitable for mounting inside the starter compartments, [125-volt dc] [120-volt ac]. Contacts are as indicated on the drawings and have a contact rating designation of A600 or N600, as required, in accordance with NEMA ICS 2.

2.4.7.4 Timing Relays

Provide pneumatic type timers, suitable for mounting inside the control center and rated 120 volts ac, 60 Hz. Provide instantaneous and time delay contacts as indicated on the drawings, and have a contact rating designation of A600 or N600, as required, in accordance with NEMA ICS 2. Provide means for manual adjustment over a range as indicated on the drawings.
2.4.7.5 Alternators

Alternators 120-volt, 60 Hz, single-phase, open type, suitable for mounting inside of control center as indicated. Alternators to automatically cycle two motor starters in such a manner that No. 1 will lead and No. 2 will lag during the first cycle, and during the second cycle No. 2 will lead and No. 1 will lag, and the third cycle repeats the first cycle. The duration of a cycle is determined by an [external device] [adjustable time delay]. Provide contacts with a minimum contact rating designation of A600 or N600, as required, in accordance with NEMA ICS 2.

2.4.7.6 Elapsed-Time Meters

Provide nonreset type hour-indicating time meters with 6-digit registers with counter numbers at least 6 mm 1/4-inch high. White numbers on black backgrounds provide hour indication with the last digit in contrasting colors to indicate tenths of an hour. Provide an enclosure 90 mm 3-1/2 inches square and dust resistant. Operating voltage is 120 volts ac.

2.4.8 Feeder Tap Units

Provide feeder tap units as indicated on the drawings. Feeder tap units include externally operable molded-case circuit breakers in combination motor-control unit enclosures for the protection of non-motor loads or remotely located magnetic motor-controllers. Contain not more than two molded-case circuit breakers in feeder tap units.

2.4.9 Metering Section

Provide metering section with instruments as indicated on the drawings.

2.4.9.1 Instrument Transformers

Comply with the interference requirements listed below, measured in accordance with IEEE C63.2 and IEEE C63.4 for instrument transformers.

2.4.9.1.1 Current Transformers (CT)

Provide current transformers conforming to IEEE C57.13 for installation in metal-clad switchgear. Use standard multi-ratio 5A secondary transformers. Ensure CTs are coordinated to the rating of the associated switchgear, relays, and instruments and CTs for relaying have a thermal rating factor of 2.0.

Provide [wound] [bushing] [bar] [window] type transformers.

Provide transformers that have [single] [double] secondary winding.

Provide transformers that are complete with secondary short-circuiting device.

Provide indoor dry type construction for window type transformers with secondary current ratings as indicated with specified burden, frequency, and accuracy.

2.4.9.1.2 Potential Transformers

Provide potential transformers conforming to IEEE C57.13 for installation in metal-clad switchgear. Use standard 120-volt secondary, drawout type,
60 Hz transformers with voltage ratings and ratios coordinated to the ratings of the associated switchgear, relays, and instruments. Ensure potential transformers are equipped with two current limiting fuses in the primary sized as recommended by the potential transformer manufacturer.

Provide transformers with [single] [tapped] [double] secondary.

Provide burden, frequency, and accuracy as required.

Provide indoor dry type two-winding construction for disconnecting potential transformers with integral fuse mountings and current-limiting fuses with primary and secondary voltage ratings as required.

[2.4.10 Power-Factor-Correction Capacitors

**************************************************************************
NOTES: Do not use power factor correction capacitors on the load side of solid state starters. Motor control center manufacturers do not normally contact the motor manufacturers, so where possible show KVAR ratings on the drawings, coordinating these requirements with actual motors used.

When power factor correction is not needed, delete this paragraph.
**************************************************************************

Provide three-phase, delta-connected capacitors for power factor improvement rated [_____] volts, 60 Hz. [Capacitors have KVAR capacity as shown on the drawings] [The capacitor KVAR capacity is selected to achieve no less than [_____] percent leading nor more than [_____] percent lagging power factor at nameplate value of motor full load current. The KVAR capacity of the capacitors cannot be greater than that recommended by the motor manufacturer or if no such recommendation exists, that value which gives with a lagging power factor at no-load.] If size permits, mount the capacitors in an adjacent compartment, or otherwise mount separately and connect to the motor at the motor terminal box. [For reduced voltage starters, separately switch the capacitors with a time-delayed contactor rated according to NEMA ICS 2 for capacitor switching.]

][2.4.11 Space for Mounting PLC's

**************************************************************************
NOTE: Delete this paragraph when PLC's are not used.
**************************************************************************

Provide space for mounting of Programmable Logic Controllers (PLC's) as indicated on the drawings.

2.5 TESTS, INSPECTIONS, AND VERIFICATIONS

Submit, within a minimum of [14] [_____] days prior to the proposed date of tests, [six] [_____] copies of manufacturer's routine factory test procedures and production line tests for all motor control centers.

Each item of equipment supplied under this contract is given the manufacturer's routine factory tests and tests as specified below, to insure successful operation of all parts of the assemblies. All tests required herein is witnessed by the Contracting Officer unless waived in
writing, and no equipment shipped until it has been approved for shipment by the Contracting Officer. Notify the Contracting Officer a minimum of [14] [_____] days prior to the proposed date of the tests so that arrangements can be made for the Contracting Officer to be present at the tests. The factory test equipment and the test methods used conforms to the applicable NEMA Standards, and is subject to the approval of the Contracting Officer. Reports of all witnessed tests are signed by witnessing representatives of the Contractor and Contracting Officer. Bear the cost of performing all tests and include in the prices bid in the schedule for equipment.

2.5.1 Motor Control Centers Tests

2.5.1.1 Dielectric Tests

Completely assemble the motor control center and perform dielectric tests in accordance with NEMA ICS 1.

2.5.1.2 Operational Tests

Check the correctness of operation of each air circuit breaker [or motor circuit protector] and magnetic contactor and of all control devices, accessories and indicating lamps. These checks are made at rated voltage with power supplies to the main buses. Check all magnetic contactors for proper operation with power at 90 percent of rated voltage.

2.5.1.3 Short Circuit Tests

If the unit is not UL labeled for the specified short circuit, design tests may be submitted demonstrating that satisfactory short-circuit tests, as specified in NEMA ICS 2, have been made on a motor control center of similar type of construction and having the same available short circuit current at the motor terminals, including any motor contributions, as the motor control centers specified to be furnished under these specifications.

2.5.1.4 Test Results

Submit [six] [_____] complete reproducible copies of the factory inspection results and [six] [_____] complete reproducible copies of the factory test results in booklet form, including all plotted data curves, all test conditions, a listing of test equipment complete with calibration certifications, and all measurements taken. Contractor's and Contracting Officer's Representatives to sign and date report.

[ Provide Motor Control Center Certification signed by official authorized to certify on behalf of the manufacturer, attesting that the motor control center meets the specified requirements. Ensure the statement is dated after the award of this contract, stating the Contractors name and address, name of the project and location, and list the specific requirements which are being certified.

]PART 3 EXECUTION

*********************************************************************************************************************************************

NOTE: PART 3 will be used for construction contracts only; take care to prevent conflicts, gaps or omissions.

******************************************************************************
3.1 INSTALLATION

Complete assembly is electrically and mechanically connected and assembled from coordinated subassemblies shipped in complete sections from the manufacturer. Align, level and secure the installation to the supporting construction in accordance with the manufacturer's recommendations.

3.2 FIELD TESTING

**************************************************************************
NOTE: If the specified system is identified as critical, configured, or mission essential, use Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS to establish predictive and acceptance testing criteria, above and beyond that listed below.
**************************************************************************

Perform PT&I tests and provide submittals as specified in Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS.

**************************************************************************
NOTE: Select site tests for motor-control centers from the following paragraphs to suit the project requirements.
**************************************************************************

3.2.1 Acceptance Tests

Perform all applicable inspections and electrical tests, including optional tests, in accordance with NETA ATS.

Engage a factory-authorized service representative to perform startup services. Verify complete system operation including all hardware, software and communication devices. Start units to confirm proper motor rotation and unit operation. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment. Perform final equipment adjustments:

a. Set field-adjustable switches, auxiliary relays, time-delay relays, timers, and overload relay pickup and trip ranges.

b. Adjust overload relay [heaters] [settings for power factor correction capacitors connected to the load side of the overload relays].

c. Adjust the trip settings of motor circuit protectors and thermal-magnetic circuit breakers with adjustable.

d. Set field-adjustable switches and program microprocessors for required start and stop sequences in reduced-voltage, solid state controllers.

Final acceptance depends upon the satisfactory performance of the motor-control centers under test. Do not energize the motor-control center until recorded test data have been approved by the Contracting Officer. Provide final test reports.

3.3 CLOSEOUT ACTIVITIES

Submit manufacturer's instructions for the motor control units and
protective devices including special provisions required to install equipment components and system packages. Detail within special notices hazards and safety precautions.

Provide the warranty to the Contracting Officer.

NOTE: This guide specification covers the requirements for the installation of poly-phase electricity meters suitable for billing, allocation of costs, and recording of data for energy management and control applications and is intended to comply with the metering requirements of EPACT05.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Since metering for energy management and costs allocation varies widely, it is expected that the designer will make significant adjustments and additions to this guide specification.

NOTE: Use the following related guide specifications for power distribution equipment:

- - Section 26 12 19.10 THREE-PHASE, LIQUID-FILLED PAD-MOUNTED TRANSFORMERS

- - Section 26 11 14.00 10 MAIN ELECTRIC SUPPLY
NOTE: This specification provides guidance for the facility energy manager or design engineer after determining what data will be gathered and what analysis procedures will be used.

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

INSTITUTE OF ELECTRICAL AND ELECTRONICS ENGINEERS (IEEE)

IEEE C57.13 (2016) Standard Requirements for Instrument Transformers
1.2 DEFINITIONS

Unless otherwise specified or indicated, electrical and electronics terms used in this specification and on the drawings shall be as defined in IEEE 100.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for
Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

a. Maintenance manual shall provide:
   1. Condensed description of how the equipment operates.
   2. Block diagram indicating major assemblies.
   3. Troubleshooting information
   4. Preventive maintenance.
   5. Spare parts information.

b. Provide operation and maintenance manuals required by submittal item "SD-10 Operation and Maintenance Data."

1.4 QUALITY ASSURANCE

1.4.1 Installation Drawings

Drawings shall indicate but not be limited to the following:

a. Elementary diagrams and wiring diagrams with terminals identified of kilowatt meters, current transformers, potential transformers, protocol modules, communications modules, Ethernet connections, telephone lines. [For each meter installation, provide a diagram identified by the building number.]

b. One-line diagram, including meters, switch(es), current transformers, potential transformers, protocol modules, communications modules, Ethernet connections, telephone outlets, and fuses. [For each meter installation, provide a diagram identified by the building number.]

1.4.2 Standard Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship. Products shall have been in satisfactory commercial or industrial use for 2 years prior to bid opening. The 2-year period shall include applications of equipment and materials under similar circumstances and of similar size. The product shall have been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period. Where two or more items of the same class of equipment are required, these items shall be products of a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in this section.

1.4.3 Alternative Qualifications

Products having less than a 2-year field service record will be acceptable if a certified record of satisfactory field operation for not less than 6000 hours, exclusive of the manufacturers' factory or laboratory tests, is furnished.

1.4.4 Material and Equipment Manufacturing Data

Products manufactured more than 2 years prior to date of delivery to site shall not be used, unless specified otherwise.
1.5 WARRANTY

The equipment items shall be supported by service organizations which are reasonably convenient to the equipment installation in order to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

1.6 SYSTEM DESCRIPTION

1.6.1 System Requirements

The metering and reading system, consisting of commercial, off-the-shelf meters, protocol modules, communications modules, and communication channels, will be used to record the electricity consumption and other values as described in the sections that follow and as shown on the drawings.

1.6.2 Selection Criteria

******************************************************************************
NOTE: Coordinate with the Public Works Department - when an installation-wide energy and utility monitoring system exists, include the last sentence.
******************************************************************************

Metering components are part of a system that includes the physical meter, data recorder function and communications (modem) method. Every building site identified shall include sufficient metering components to measure the electrical parameters identified and to store and communicate the values as required in the following sections. Contractor shall verify that the metering system installed on any building site is compatible with the facility-wide communication and meter-reading protocol system.[ Contractor must connect the metering system to the facility-wide energy and utility monitoring and control system.]

PART 2 PRODUCTS

2.1 POWER METERS

******************************************************************************
NOTE: This specification is designed for projects where multiple metering systems will be installed on the same project. It is expected that different buildings may have different metering systems depending on the metering system that can be installed economically for any specific building and that meets the needs of the facility analysis and billing system.

Metering features that are unique to a building should be listed in a schedule either in this specification or on accompanying drawings.
******************************************************************************

2.1.1 Physical and Common Requirements

******************************************************************************
NOTE: Meters will generally be installed outside
******************************************************************************
the building in a readily accessible location. In that case, use the socket-mount design. In the situations where panel-mounting is required, add the panel-mounting section.

**************************************************************************

a. Metering system components shall be installed according to the Metering System Schedule shown[ in this specification][ on the drawings].

[ b. Power meter shall be socket-mount design.]

[ c. Power meter shall be panel-mounted design. Meters shall be semi-flush, back-connected, dustproof, draw-out switchboard type. Cases shall have window removable covers capable of being sealed against tampering. Meters shall be of a type that can be withdrawn through approved sliding contacts from fronts of panels or doors without opening current-transformer secondary circuits, disturbing external circuits, or requiring disconnection of any meter leads. Necessary test devices shall be incorporated within each meter and shall provide means for testing either from an external source of electric power or from associated instrument transformers or bus voltage.]

d. If existing meter base is usable, the meter base determines meter form factor. If a new meter is being installed, use meter and base form factor of 9S.

**************************************************************************

NOTE: If the measured load is less than 220 amps, use Class 200 meters for direct current reading without current transformers.

**************************************************************************

[ e. Use Class 200 meters for direct current reading without current transformers.]

f. Meter shall be a Class 20, transformer rated design.

g. Meter shall be rated for use at temperature from -40 [_____] degrees Centigrade to +70 [_____] degrees Centigrade.

h. Meter shall have NEMA 3R enclosure for surface mounting.

**************************************************************************

NOTE: Select if the recorded data will be in a module inside the meter or external in a data logger. The preferred method is to install the recording module inside the meter case. Some retrofit applications may require an external data logger.

**************************************************************************

i. Surge withstand shall conform to IEEE C37.90.1.

k. Meter shall comply with IEC 62053-22 (Part 21: Static Meter for Active Energy, classes 0.2S and 0.5S), certified by a qualified third party test laboratory.
2.1.2 Voltage Requirements

a. Meter shall be capable of connection to the service voltage phases and magnitude being monitored. If the meter is not rated for the service voltage, provide suitable potential transformers to send an acceptable voltage to the meter.

b. Meter shall be capable of connection to the service voltage indicated in the Metering System Schedule:

c. Meter shall accept independent voltage inputs from each phase. Meter shall be auto-ranging over the full range of input voltages.

d. Voltage input shall be optically isolated to 2500 volts DC from signal and communications outputs. Components shall meet or exceed IEEE C37.90.1 (Surge Withstand Capability).

e. The Contractor shall be responsible for determining the actual voltage ratio of each potential transformer. Transformer shall conform to IEEE C57.13 and the following requirements.

   1. Type: Dry type, of two-winding construction.
   2. Weather: Outdoor or Indoor rated for the application.
   3. Frequency: Nominal 60Hz, 50Hz for those bases that operate on 50Hz.
   4. Accuracy: Plus or minus 0.3% at 60Hz or 0.3% for those systems that operate at 50Hz.

2.1.3 Current Requirements

a. Meter shall accept independent current inputs from each phase. Current transformer shall be installed with a full load rating as shown in the schedule.

b. Single ratio current transformer shall have an Accuracy Class of [ 0.3][0.6][1.2] with a maximum error of +/- [ 0.3%][0.6%][1.2%] at 5.0 amps.

c. Current transformer shall have:

   1. Insulation Class: All 600 volt and below current transformers shall be rated 10 KV BIL. Current transformers for 2400 and 4160 volt service shall be rated 25 KV BIL.
   2. Frequency: Nominal 60Hz, 50Hz for bases that operate on 50Hz.
   3. Burden: Burden class shall be selected for the load.
   4. Phase Angle Range: 0 to 60 degrees.

d. Meter shall accept current input from standard instrument transformers (5A secondary current transformers.)

e. Current inputs shall have a continuous rating in accordance with IEEE C57.13.
NOTE: Since loads in building can vary over time, multi-ratio current transformers allow the flexibility to change the ratio of the current transformer to match the load. The accuracy of current transformer performance decreases when the actual current is in the lower band of its measuring range.

f. Multi-ratio current transformer where indicated shall have a top range equal to or greater than the actual load. The Contractor shall be responsible for determining the actual ratio of each transformer. Current transformer shall conform to IEEE C57.13.

2.1.4 Electrical Measurements

Power meter shall measure and report the following quantities:

**NOTE:** Select each of the following measuring capabilities that are required and include the abbreviation in the Metering System Schedule for each building. Since power meters have a service life greater that 10 years, include optional features that are expected to be used and analyzed over the life of the meter.

a. Kilowatt-hours ("kWh" in Metering Systems Schedule) of consumption. Cumulative.

b. Kilowatts of demand ("kW" in Metering Systems Schedule). Peak average over a selectable demand interval between 5 and 60 minutes (typically 15 minutes).

c. Reactive power ("kVAR" in Metering Systems Schedule). Measured over the same interval as the peak kW reading.

d. Power factor ("PF" in Metering Systems Schedule). Measured over the same interval as the peak kW reading.

**NOTE:** At locations where time of use (TOU) billing is required by the electric company, this specification provides that all TOD meters cover the same periods as defined in the next section.

e. Time of use consumption ("TOU" in Metering Systems Schedule). Kilowatt-hours recorded separately for each period set by programming into the meter. Time periods shall be capable of being changed without removal from service. The meter shall internally record and store Time of Use data.

1. [Four (4)] minimum [_____] TOU Rates (Registers)

2. [Twenty (20)][_____] Year Calendar

3. [Two (2)] minimum [_____] seasons per year

SECTION 26 27 13.10 30  Page 11
Interval recording is an important tool for analyzing energy consumption within a building. For billing purposes, real-time reporting is not required. For non EPACT05 meters, the meter can be read nominally once per month with all recorded interval data captured at that time. Where real-time data is needed by an energy management control system (EMCS) or other system, the systems may have their own connection to the meter or its own current and potential transformers.

f. Interval recording ("IR" in Metering Systems Schedule). Kilowatt-hours shall be recorded for each 15 minute interval and shall accumulate for 30 days. Memory for recording the interval readings shall be internal to the meter and ANSI C12.19 compliant. Meter shall provide time-stamped readings for every measured parameter.

g. Meter readings shall be true RMS.

2.1.5 Meter Accuracy

Power meter shall provide the following accuracies. Accuracies shall be measured as percent of reading at standard meter test points.

a. Power meter shall meet ANSI C12.20 for Class 0.2 and IEC 62053-22 accuracy requirements.

2.1.6 An on the Meter Display, Output and Reading Capabilities

Meter shall include the following output signals.

a. The meter will have a face display plate and shall display every electrical parameter indicated to be recorded. Meters shall not be required to indicate interval data collected in a data logger with a communications output feature. Peak values, instantaneous and cumulative values shall be displayed.

b. Meter shall include optical output port capable of 9600 bps communication with a hand-held reading device. Optical device shall be compatible with ANSI C12.18.

c. Meter shall include output options for analog milliamp signals.
[ d. Meter shall have two channels of analog output, 0-1mA or 4-20mA, for positive[ and negative] watt/hour readings.]

[ e. Meter shall include output option for pulse output. KYZ pulse output related to kWatts/HR.]

[ f. Meter shall have two form C, dry contact relay outputs for alarm or control.]

2.1.7 Installation Methods

**************************************************************************

NOTE: Pad-mounted transformers have proven to be very reliable over a long life span. Installing the meters on the outside of the secondary wiring compartment has become somewhat a standard installation for military facilities, resulting in minimal maintenance. However, meters may be installed on the sides of buildings or within buildings.

**************************************************************************

a. Transformer mounted (XFMR)

1. Meter base shall be located outside on the secondary side of the pad-mounted transformer.

**************************************************************************

NOTE: Do not use the stand-mounted method unless the transformer pad is being poured and the instrumentation conduit can be installed before the pour. Provide a drawing to show details for mounting and routing conduit and wires.

**************************************************************************

b. Stand-mounted adjacent to transformer ("STAND" in Metering Systems Schedule)

1. Meter base shall be mounted on a structural steel pole approximately 4 feet from the transformer pad. See detail on the drawings.

**************************************************************************

NOTE: Provide a drawing to show details for building mounting and routing conduit and wires.

**************************************************************************

c. Building mounted ("BLDG" in Metering Systems Schedule)

1. Meter base shall be mounted on the side of the existing building near the service entrance. See detail on the drawings.

d. Panel mounted. ("PNL" in Metering Systems Schedule)

1. Meter shall be mounted where directed. See detail on the drawings.

e. Common features.

1. PTs (if required for proper voltage range) and CTs shall be
physically connected to the service entrance cables inside the service entrance disconnect enclosure.

2.1.8 Disconnecting Switches

**************************************************************************
NOTE: Shorting-type wiring blocks are recommended to allow connections to be corrected and changed without the necessity of disconnecting power to the transformer, resulting in another power outage to the building being served.
**************************************************************************

a. Disconnecting wiring blocks shall be provided between the current transformer and the meter. A shorting mechanism shall be built into the wiring block to allow the current transformer wiring to be changed without removing power to the transformer. The wiring blocks shall be located where they are accessible without the necessity of disconnecting power to the transformer. For multi-ratio current transformers, provide a shorting block from each tap to the common lead.

b. Voltage-monitoring circuits shall be equipped with disconnect switches to isolate the meter base or socket from the voltage source.

**************************************************************************
NOTE: If programming capability is not required, omit the following section.
**************************************************************************

2.1.9 Meter Programming

a. Power meter shall be programmable by software supplied by the meter manufacturer.

b. Software shall have a user-friendly, Windows-compatible interface.

c. Software shall operate on [Windows][_____] operating systems.

d. Software shall allow the user to configure the meter, troubleshoot meter, query and display meter parameters and configuration data and stored values.

e. Meter firmware shall be upgradeable through one of the communications ports without removing the unit from service.

2.2 COMMUNICATIONS

**************************************************************************
NOTE: Communications features may not be needed. Data logging of one month of data may be recorded inside the meter. Recorded data may be read simply by a handheld instrument, if read daily.
**************************************************************************

2.2.1 Communications Methods

2.2.1.1 Optical Port

The optical port shall communicate with a hand-held reading device
according to the following requirements.

a. Communications standards
   1. ANSI C12.18
   2. MV90 protocol
   3. ANSI C12.20

b. Read operations
   1. Current kWh values
   2. Demand (kW) values since last reset
   3. Last reset value
   4. Meter status
   [ 5. Load profile]

c. Write operations
   1. Meter setup

2.2.1.2 Serial Port

Provide serial port for connection to modem module where required in this specification.

[ a. On-Board serial port types]
   [ 1. RS232]
   [ 2. \[RS485]]

2.2.1.3 Ethernet

For those meters using the Ethernet, logged information shall be sent using open standard Internet Protocols.

a. On-board Ethernet port support
   1. HTTP
   2. SMTP
      (a) Modbus

b. Distribute stored data by
   1. PTP
   [ 2. E-Mail]
   [   (a) On-board web server]
2.2.2 Communications Protocols and Methods

Communications protocols and methods shall be native to the meter. Provide communications module(s) as required to accomplish the following.

a. Meter shall include an IR port ("IR" in Metering Systems Schedule) for communication to external devices such as handheld readers that support a minimum speed of 9600 baud.

b. Meter shall include[ one][ RS-232 ("RS232" in Metering Systems Schedule)] or[ one][ RS-485 ("RS485" in Metering Systems Schedule)] digital communication port. Each port shall be user configurable with regard to speed, protocol, address, and other communications parameters. Ports shall support a minimum communication speed of 9600 baud for the RS232 port.

c. Meter shall have a port that can be configured as a[ 10/100 Base-T Ethernet port ("BaseT" in Metering Systems Schedule)]

[ 1. A communication module that converts serial RS232 or RS485 to Ethernet will be acceptable.]

d. Auto Answer minimum 1200 baud internal modem ("A56K" in Metering Systems Schedule). Internal modem shall include automatic data buffering to provide faster, more reliable communications and the ability to automatically answer on a connected line.

e. Meter shall be equipped with one pulse output channel ("Pulse" in Metering Systems Schedule) that can be configured for operation as KYZ pulse output.

2.2.3 Communications Channels Surge Protection

Communications equipment shall be protected against surges induced on its communications channels. Communication interfaces to all field equipment shall be protected to meet the requirements of IEEE C37.90.1 or the requirements of IEC 61000-4-5, test level 4, while the equipment is operating. Fuses shall not be used for surge protection. Metallic cables and conductors which serve as communications channels between buildings shall have surge protection installed at equipment rated for the application installed at each end, within 3 feet 0.9 meters of the building cable entrance. Surge protectors shall meet the requirements of the applicable extension of ANSI C62 (for example, ANSI C62.61).

**************************************************************************
NOTE: Communication methods, modules and software can be used for automatic meter reading (AMR). AMR may not be needed. If automatic meter reading (AMR) is to be implemented, considerable coordination of the communications sending, receiving and protocols will be required.
**************************************************************************

2.3 METER DATA PROTOCOL

Power meters shall have communicating data protocols native or provided in supplemental modules to communicate with the communications methods that follow.
2.3.1 Open Protocol

**************************************************************************
NOTE: This section should be modified to be facility specific.
**************************************************************************

Power meter shall support the following open protocols. Contractor shall verify that the meter native protocol is consistent with the facility data recording and communication and data storage system. Contractor shall provide additional converters and modules as required for a complete measurement, recording, communicating and data storage system.

a. Meter shall be fully supported by MV-90 software system or existing AMR software that is MV-90 compatible.

b. For systems that use proprietary software, an alternative, competitive software system must be available.

Systems capable of using more than one brand of commercially available meters are expected. In addition, if proprietary meter reading software is used, meters are to be capable of being read by more than one manufacturer's software.

2.4 SPARE PARTS

2.4.1 Parts List

Provide spare parts as follows:

a. Power meter - two for each type used.

b. Current transformer - three for each type used.

c. Potential transformer - three for each type used.

d. Communications module - one for each type used.

e. Protocol module - one for each type used.

f. Other electronic and power components - one for each type used.

2.5 METERING SYSTEM SCHEDULE

**************************************************************************
NOTE: Each building should be listed on a separate row. Identify the characteristics for the specific meter and communications method for each building. The following completed data is an example only. Delete existing values.
**************************************************************************

Metering System Schedule is available at http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/forms-graphics-

**************************************************************************
NOTE: Provide a drawing to show locations and details for mounting and routing conduit and wires.
**************************************************************************
PART 3 EXECUTION

3.1 INSTALLATION

Electrical installations shall conform to IEEE C2, NFPA 70, and to the requirements specified herein. Provide new equipment and materials unless indicated or specified otherwise.

3.1.1 Existing Condition Survey

**NOTE: Remove the following section if existing condition surveys are not required.**

The Contractor shall perform a field survey, including inspection of all existing equipment, resulting clearances, and new equipment locations intended to be incorporated into the system, and furnish an existing conditions report to the Government. The report shall identify those items that are non-workable as defined in the contract documents. The Contractor shall be held responsible for repairs of modifications necessary to make the system perform as required.

3.1.2 Scheduling of Work and Outages

**NOTE: Installation of current transformers and potential transformers will require that power be disconnected from the transformer and/or building. Provide coordination steps for the work and require Contractor to perform the work after normal hours.**

The Contract Clauses shall govern regarding permission for power outages, scheduling of work, coordination with Government personnel, and special working conditions.

3.2 FIELD APPLIED PAINTING

Where field painting of enclosures is required to correct damage to the manufacturer's factory-applied coatings, provide manufacturer's recommended coatings and apply in accordance with manufacturer's instructions.

3.3 FIELD QUALITY CONTROL

3.3.1 Performance of Acceptance Checks and Tests

3.3.1.1 Meter Assembly

   a. Visual and mechanical inspection
      
      1. Compare equipment nameplate data with specification and approved shop drawings.
      
      2. Inspect physical and mechanical condition.

4. Verify grounding of metering enclosure.

5. Verify the presence of surge arresters.

6. Verify that the CT ratio and the PT ratio are properly included in the meter multiplier or the programming of the meter.

b. Electrical tests

[ 1. Calibrate watthour meters according to manufacturer's published data.]

2. Verify that correct multiplier has been placed on face or meter where applicable.

3. Prior to system acceptance, the Contractor will demonstrate and confirm the meter is properly wired and is displaying correct and accurate electrical information.

3.3.1.2 Current Transformers

a. Visual and mechanical inspection

1. Compare equipment nameplate data with specification and approved shop drawings.

2. Inspect physical and mechanical condition.

3. Verify correct connection.

5. Verify that required grounding and shorting connections provide good contact.

b. Electrical tests

1. Perform resistance measurements through all bolted connections with low-resistance ohmmeter, if applicable.

3. Perform a polarity test.

4. Perform a ratio-verification test.

3.3.1.3 Potential Transformers

a. Visual and mechanical inspection

1. PT's are rigidly mounted.

2. PT's are correct voltage.
3. Verify that adequate clearances exist between primary and secondary circuit.

b. Electrical tests

1. Perform a ratio-verification test.

### 3.3.2 Follow-Up System Function Verification

Upon completion of acceptance checks and tests, the Contractor shall show by demonstration in service that circuits and devices are in good operating condition and properly performing the intended function. As an exception to requirements stated elsewhere in the contract, the Contracting Officer shall be given 5 working days' advance notice of the dates and times of checking and testing.

### 3.3.3 Training

The Contractor shall conduct a training course for meter configuration, operation, and maintenance of the system as specified. The training shall be oriented for all components and systems installed under this contract. Training manuals shall be delivered for [_____] trainees with two additional copies delivered for archiving at the project site. The Contractor shall furnish all audiovisual equipment and all other training materials and supplies. A training day is defined as eight hours of classroom instruction, including two 15-minute breaks and excluding lunchtime, Monday through Friday, during the daytime shift in effect at the training facility. For guidance in planning the required instruction, the Contractor shall assume that attendees have a high school education or equivalent, and are familiar with utility systems. Approval of the planned training schedule shall be obtained from the Government at least 30 days prior to the training.

a. Training: The course shall be taught at the project site within thirty days after completion of the installation for a period of one [_____] day(s). A maximum of [6][_____] personnel will attend the course. The training shall include:

1. Physical layout of each piece of hardware.
2. Meter configuration, troubleshooting and diagnostics procedures.
3. Repair instructions.
4. Preventive maintenance procedures and schedules.
5. Testing and calibration procedures.

-- End of Section Table of Contents --
NOTE: Many Activities have, or are in the process of, converting to basewide metering systems.

This Navy guide specification covers the requirements for the installation of electricity meters suitable for billing, allocation of costs, and recording of data for energy management and control applications for Navy projects. This specification is intended to comply with the metering requirements of EPACT05.

Although a unified metering specification is under development, some Air Force projects may require use of Section 26 27 13.10 30 ELECTRIC METERS.

Coordinate with the Activity and provide specific requirements "to match existing systems" when necessary. If specifying proprietary products, insure that appropriate "Justification and Authorization (J & A)" documentation has been obtained by project manager and "proprietary language requirements" have been added to Division 1 as well as adding the following lines above the section number and title at the top of the first page of this section of the specifications:

"****************************************************************
This specification section contains proprietary products.
****************************************************************

If there are any components (such as meters, housing, or current transformers) that will be Government Furnished Contractor Installed (GFCI), or Government Furnished Government Installed (GFGI), edit Division 1 and this specification section appropriately.

The following related guide specifications for power
distribution equipment may contain outdated meter information. Avoid duplication and ensure conflicting information has been removed from project documents.

- Section 26 12 19.10 THREE-PHASE, LIQUID-FILLED PAD-MOUNTED TRANSFORMERS
- Section 26 12 21 SINGLE-PHASE PAD-MOUNTED TRANSFORMERS

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: This section utilizes the following sketches, details, and forms (Graphics), and are available in metric (SI) and U.S. Customary (IP) system dimensions. Sketch titles and style numbers are unchanged for both types. The metric values indicated are a conversion of the IP system dimensions.

Do not include this list of sketches, or the sketches themselves, in project specifications. Use sketches as details on drawings whenever possible.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 SUBMITTALS

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

******************************************************************************

NOTE: In this specification, special submittals are required for Contract Data Requirements List (CDRL). The CDRL submittals are indicated as bracketed options.

When used, include a completed DD Form 1423, Contract Data Requirements List with the project specifications. This form is essential to obtain delivery of all documentation. Each deliverable must be clearly specified, with both description and quantity required. A sample CDRL and an editable blank CDRL are included in the graphics list at the
front of this specification, as Graphics ES-4 and ES-5.

The acquisition of all technical data, data bases and computer software items that are identified herein will be accomplished strictly in accordance with the Federal Acquisition Regulation (FAR) and the Department of Defense Acquisition Regulation Supplement (DOD FARS).

Those regulations as well as the Services implementation thereof should also be consulted to ensure that a delivery of critical items of technical data is not inadvertently lost. Specifically, the Rights in Technical Data and Computer Software Clause DFARS 252.227-7013, and the Data Requirements Clause DOD FAR 52.227-7031, as well as any requisite software licensing agreements will be made a part of the CONTRACT CLAUSES or SPECIAL CONTRACT REQUIREMENTS. In addition, the appropriate DD Form 1423 Contract Data Requirements List (CDRL), will be filled out for each distinct deliverable data item and made a part of the contract. Where necessary, a DD Form 1664, Data Item Description, will be used to explain and more fully identify the data items listed on the DD Form 1423. It is to be noted that all of these clauses and forms are required to ensure the delivery of the data in question and that such data is obtained with the requisite rights to use by the Government.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES[, the CONTRACT CLAUSES and DD Form 1423]:

[ Technical data packages consisting of technical data and computer software (meaning technical data which relates to computer software) which are specifically identified in this project and which may be defined/required in other specifications must be delivered strictly in accordance with the CONTRACT CLAUSES and in accordance with the Contract Data Requirements List, DD Form 1423. Data delivered must be identified by reference to the particular specification paragraph against which it is furnished. All submittals not specified as technical data packages are considered 'shop drawings' under the Federal Acquisition Regulation Supplement (FARS) and must contain no proprietary information and be delivered with unrestricted rights.

] SD-02 Shop Drawings

   Installation Drawings; G[, [_____]]

SD-03 Product Data

   Electricity Meters; G[, [_____]]

SECTION 26 27 14.00 20 Page 9
NOTE: Determine if a Technical Data Package will be required for electrical meters as described in the above note. If a Technical Data Package is required, include the bracketed option below.

[ ] The most recent meter product data must be submitted as a Technical Data Package and must be licensed to the project site. Any software must be submitted on CD-ROM and [____] hard copies of the software user manual must be submitted for each piece of software provided.

[ ] Current Transformer; G[, [____]]
[ ] Potential Transformer; G[, [____]]
[ ] External Communications Devices; G[, [____]]
[ ] Configuration Software; G[, [____]]

The most recent version of the configuration software for each type (manufacturer and model) must be submitted as a Technical Data Package and must be licensed to the project site. Software must be submitted on CD-ROM and [____] hard copies of the software user manual must be submitted for each piece of software provided.

[ ] SD-06 Test Reports

Acceptance Checks and Tests; G[, [____]]
System Functional Verification; G[, [____]]
Building Meter Installation Sheet, per Building; G[, [____]]
Completed Meter Installation Schedule; G[, [____]]
Completed Meter Data Schedule; G[, [____]]
Meter Configuration Template; G[, [____]]

Contractor must fill in the meter configuration template and submit to the Activity for concurrence.

Meter Configuration Report; G[, [____]]

The meter configuration report must be submitted as a Technical Data Package.

SD-10 Operation and Maintenance Data

Electricity Meters and Accessories, Data Package 5; G[, [____]]

Submit operation and maintenance data in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA and as specified herein.

SD-11 Closeout Submittals
1.3 QUALITY ASSURANCE

**************************************************************************
NOTE: Select from the identified bracketed options the information that is to be provided on the drawings. Delete the items not needed for the project. Determine if communications information will be addressed in the drawings for the metering project or as a separate documentation package. The level of detail required might vary with the project.

Identify the required electronic drawing format in the selection below.
**************************************************************************

1.3.1 Installation Drawings

Drawings must be provided in hard-copy and [_____] electronic format, and must include but not be limited to the following:

a. Wiring diagrams with terminals identified of [kilowatt] [advanced] meter, [current transformers,] [potential transformers,] [protocol modules,] [communications interfaces,] [Ethernet connections,] [telephone lines]. [For each typical meter installation, provide a diagram.]

b. One-line diagram, including meters, [switch(es),] [current transformers,] [potential transformers,] [protocol modules,] [communications interfaces,] [Ethernet connections,] [telephone outlets,] [and fuses]. [For each typical meter installation, provide a diagram.] Provide one-line diagram to the local Public Works department.

1.3.2 Standard Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship. Products must have been in satisfactory commercial or industrial use for one year prior to bid opening. The one-year period must include applications of equipment and materials under similar circumstances and of similar size. The product, or an earlier release of the product, must have been on sale on the commercial market through advertisements, manufacturers catalogs, or brochures during the prior one-year period. Where two or more items of the same class of equipment are required, these items must be products of a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in this section.

1.3.3 Material and Equipment Manufacturing Data

Products manufactured more than 1 year prior to date of delivery to site must not be used, unless specified otherwise.
1.4 MAINTENANCE

1.4.1 Additions to Operation and Maintenance Data

In addition to requirements of Data Package 5, include the following on the actual electricity meters and accessories provided:

a. A condensed description of how the system operates
b. Block diagram indicating major assemblies
c. Troubleshooting information
d. Preventive maintenance
e. Prices for spare parts and supply list

1.5 WARRANTY

The equipment items and software must be supported by service organizations which are reasonably convenient to the equipment installation in order to render satisfactory service to the equipment and software on a regular and emergency basis during the warranty period of the contract.

1.6 SYSTEM DESCRIPTION

1.6.1 System Requirements

Electricity metering, consisting of meters and associated equipment, will be used to record the electricity consumption and other values as described in the requirements that follow and as shown on the drawings. Communication system requirements are contained in a separate specification section as identified in paragraph COMMUNICATIONS INTERFACES.

1.6.2 Selection Criteria

**************************************************************************
NOTE: Select a bracketed option below if it is intended that the new meter system be compatible with the existing system components.
**************************************************************************

Metering components and software are part of a system that includes the physical meter, data recorder function and communications method. Every building site identified must include sufficient metering components to measure the electrical parameters identified and to store and communicate the values as required.

[ Contractor must verify that the electricity meter installed on any building site is compatible with the base-wide metering system with respect to the types of meters selected and the method used to program the meters for initial use. Software and meter programming tools are necessary to set up the meters described by this specification. New software tools different from the meter programming methods currently used by base personnel will require an Authority to Operate (ATO) by Command Information Office at the Enterprise level.]

[Contractor must verify that the metering system installed on any building site is compatible with the facility-wide or base-wide communication and]
PART 2   PRODUCTS

2.1   ELECTRICITY METERS AND ACCESSORIES

**************************************************************************
NOTE: When an activity has a metering system installed, provide meters to match. Coordinate with the project manager and include proprietary specification information.

Metering features that are unique to a building should be listed in a schedule either in this specification or on accompanying drawings. See Graphic ES-2 for a sample "Metering System Schedule".

Provide meter(s) and connect the meter(s) to the existing AMI DAS. The contractor must use the existing government laptop computers to configure the meter using existing software loaded on the computer. The contractor will not be allowed to modify any software or add any additional software to the computer. Alternatively, the government will configure the meter(s), which must be compatible with the existing system, using existing software. Contractor must insure that the meter(s) will transmit the specified data to the DAS. The current meters being used by [_____] are: [ION 8600C] [ION 8650C] [PM 8000] [SHARK 270] [NEXUS 1272] [____].

2.1.1 Physical and Common Requirements

NOTE: This specification is designed for projects where multiple metering systems will be installed as part of the same project. It is expected that different buildings may have different metering systems depending on the metering system that can be installed economically for any specific building and that meets the needs of the facility analysis and billing system.

This specification has been developed for 60-Hz applications. Designer must review and provide additional modifications necessary for 50-Hz use.

Sub-metering (versus single-metering at a facility) is not specifically addressed and the specification will require modification to address unique sub-metering requirements.
If the "Two-Way Automatic Communications System (TWACS)" is used for communications, this system has additional wire size and fuse requirements. The use of TWACS might limit the maximum voltage provided at each meter. Edit this specification to address these unique needs.

Class 320 meters are not allowed by this specification.

Define the configuration that is required to be initially programmed into each meter. If possible, define a standard programming profile and identify any exceptions to that profile.

**************************************************************************

a. Provide metering system components in accordance with the Metering System Schedule shown [in this specification][on the drawings]. Provide Meter configuration template.

**************************************************************************

NOTE: The bracketed option below allows the selection of whether to use or replace existing meter bases.

Meter bases should be inspected if they are to be re-used. The second bracketed option requires an assessment of their physical condition before use.

For existing panelboard, switchboard, and switchgear installations, provide the same style meter. A direct replacement with a similar configuration can minimize the need for a design change and avoid clearance issues inside the enclosure.

The designer must have concurrence from the Activity and should exercise caution if changing an existing installation to a socket arrangement using a Form 9S adaptor kit. This can reduce the number of unique meters styles to maintain for spares, but can also cost more during the initial installation and can result in inadequate clearances within the equipment and the exterior.

**************************************************************************

b. [Replace all existing meter bases. For socket arrangements, use meter and base form of 9S unless installation-specific limitations require the use of a different form type. For panelboards, switchboards, and switchgear, match the existing installation with the new meter base. ][Existing meter bases can be re-used if they are electrically functional, in physically good condition, and show no signs of corrosion on the electrical contacts. If the existing meter base is usable, the meter base determines meter form factor. If a new meter is being installed, use meter and base form factor of 9S unless installation-specific limitations require the use of a different form type. ][If use of a socket adaptor arrangement has been approved by the activity, contractor must verify that all clearances are met and doors are able to be properly closed.]
NOTE: Select the bracketed option below if the meter will be installed in an enclosure. A stainless steel enclosure might be necessary for coastal or high humidity areas.

[ c. Meter must have NEMA [3R] [3R stainless steel] enclosure for surface mounting with bottom or rear penetrations.
]

d. Surge withstand capability must conform to IEEE C37.90.1.

NOTE: Modify the color scheme below if the activity uses a different identification system. This color scheme is for metering wiring only and does not match the color coding requirements for power conductors.

Wire labeling is also an acceptable approach to identification. If wire labeling is selected, modify the color scheme listed below to identify the label information for each wire.

e. Use #12 SIS (XHHW, or equivalent) wiring with ring lugs for all meter connections. Color code and mark the conductors as follows:

(1) Red - Phase A CT - C1
(2) Orange - Phase B CT - C2
(3) Brown - Phase C CT - C3
(4) Gray with white stripe - neutral current return - C0
(5) Black - Phase A voltage - V1
(6) Yellow - Phase B voltage - V2
(7) Blue - Phase C voltage - V3
(8) White - Neutral voltage

NOTE: The electricity meters covered by this section are intended for low voltage applications and should be capable of receiving input nominal voltages of 120 to 480 volts. This section assumes that the available low voltage will be used as the meter supply. Potential transformers are not required.

If new medium voltage applications are planned, then include potential transformer requirements as part of the associated switchgear specification. If this section is applied to an existing installation, then use the bracketed options below to establish the potential transformer requirements.

2.1.2 Potential Transformer Requirements

a. Meter must be capable of connection to the service voltage phases and magnitude being monitored. If the meter is not rated for the service voltage, provide suitable potential transformers to send an acceptable
Voltage to the meter.

b. Voltage input must be optically isolated to 2500 volts DC from signal and communications outputs. Components must meet or exceed IEEE C37.90.1.

**************************************************************************

NOTE: Fusing is required to provide circuit protection and to minimize arc flash levels. Include bracketed option if pull-out type arrangement is required.
**************************************************************************

c. Provide [a pull-out type fuse block containing] one fuse per phase, Class RK type, to protect the voltage input to the meter. Size fuses as recommended by the meter manufacturer. Fusing must either be inside the secondary compartment of the transformer or inside the same enclosure as the CT shorting device.

**************************************************************************

NOTE: Select the following bracketed option if potential transformers will be used to transform 480 volt inputs to 120 volts.
**************************************************************************

d. Potential transformers will be used to convert 480 volt inputs to 120 volts for the locations shown on the metering schedule. Potential transformers must be rated indoor or outdoor, as required for the specific application. Voltage rating must provide 120 volts, wye-connected, 3 phase, 4 wire, [60 Hz][50 Hz], insulation class, 600 volts. Potential transformers BIL must be 10 kV and must have an accuracy class of 0.3 at burdens w, x, and y. Thermal rating must be 500 VA.

 **************************************************************************

NOTE: The following paragraphs are necessary only for medium voltage applications.
**************************************************************************

e. The Contractor must be responsible for determining the actual voltage ratio of each potential transformer for medium voltage applications. Transformer must conform to IEEE C57.13 and the following requirements.

(1) Type: Dry type, of two-winding construction.

(2) Weather: Outdoor or indoor rated for the application.

(3) Frequency: Nominal [60 Hz][50 Hz].

(4) Accuracy: Plus or minus 0.3 percent at [60 Hz][50 Hz].

f. Potential transformers installed inside switchgear and panels must be rated for interior use. Voltage rating must provide 120 volts, wye-connected, 3 phase, 4 wire, [60 Hz][50 Hz], insulation class, 600 volts. Potential transformers BIL must be a minimum of 10 kV, and have an insulation class and BIL rating that equals or exceeds the ratings of the associated switchgear. Potential transformers must have an accuracy class of 0.15 at burdens w, x, and y. Thermal rating must be 500 VA. Potential transformers must be accessed from the front and
mounted in a metering section.

2.1.3 Current Transformer Requirements

a. Current transformer must be installed with a rating as shown in the schedule.

b. Current transformers must have an Accuracy Class of 0.15 (with a maximum error of plus/minus 0.3 percent at 5.0 amperes) when operating within the specified rating factor.

c. Current transformers must be solid-core, bracket-mounted for new installations using ring-tongue lugs for electrical connections. Current transformers must be accessible and the associated wiring must be installed in an organized and neat workmanship arrangement. Current transformers that are retrofitted onto existing switchgear busbar can be a busbar split-core design.

d. Current transformers must have:

**************************************************************************
NOTE: Include the bracketed option below only if medium voltage current transformers are used for the electricity metering covered by this specification.
**************************************************************************

(1) Insulation Class: All 600 volt and below current transformers must be rated 10 KV BIL. Current transformers for 2400 and 4160 volt service must be rated 25 KV BIL.

(2) Frequency: Nominal [60 Hz][50 Hz].

(3) Burden: Burden class must be selected for the load.

(4) Phase Angle Range: 0 to 60 degrees.

e. Meter must accept current input from standard instrument transformers (5A secondary current transformers).

f. Current inputs must have a continuous rating in accordance with IEEE C57.13.

**************************************************************************
NOTE: Single-ratio current transformers (CTs) are specified below and are based on a per-meter application. Dual-ratio or multi-ratio CTs are only allowed if future requirements are expected to change the load demand.
This specification will require additional editing if dual-ratio or multi-ratio CTs are used.
**************************************************************************

g. Provide one single-ratio current transformer for each phase per power transformer with characteristics listed in the following table.

**************************************************************************
NOTE: This specification uses the CT rating factor and requires 55 degrees C as the basis for
selection. Many CTs are installed outdoors; relying on the CT 30 degrees C rating is not appropriate for these installations.

Select the appropriate CT ratio, continuous-thermal-current rating factor (RF) at 55 degrees C (versus 30 degrees C which was used for previous guidance) and ANSI Metering Accuracy Class values based on transformer kVA size and secondary voltage. The basis for the 55 degrees C value is to allow for CT heating effects and higher ambient temperatures during operation.

The rating factor establishes the minimum electrical current range that will meet the CT accuracy rating. The CT should meet its accuracy requirement for measured current between 10 percent of the CT ratio and the rating factor multiplier applied to the CT ratio.

Example #1: for a 500 kVA transformer at 208 volts - select 1200:5, 1.33, 0.3 - B-0.5. For this selection, the CT should be accurate within its specifications for an input current between 10 percent to 133 percent of the rating, or 120 to 1,600 amperes. The transformer full-load current rating is 1,388 amperes.

Example #2: for a 150 kVA transformer at 480 volts - select 200:5, 2.0, 0.3 - B-0.1. For this selection, the CT should be accurate within its specifications for an input current between 10 percent to 200 percent of the rating, or 20 to 400 amperes. The transformer full-load current rating is 180 amperes.

The table below lists the minimum allowed rating factor. Some manufacturers might be capable of higher rating factors.

#### 2.1.4 Meter Requirements

**************************************************************************

**NOTE:** If J&A documentation has been obtained, use the first bracketed option below and fill in the manufacturer and complete model number that defines the intended meter characteristics. Otherwise select the second bracketed option below and edit the general list of meter characteristics.

**************************************************************************

[ Notwithstanding any other provision of this contract, meters must be [____]; no other product will be acceptable. All meters must meet NAVFAC Cyber Security Requirements.]

**Electricity meters** must include the following features:

- **a.** Meter must comply with ANSI C12.1, NEMA C12.19, and ANSI C12.20 and must match existing AMI meter system at the installation and be the newest version with ATO.

- **b.** Meter sockets must comply with ANSI C12.7.

**************************************************************************

**NOTE:** Select the following bracketed industry standards if applicable for an OCONUS application.

**************************************************************************

[ c. Meter must comply with IEC 62053-22, certified by a qualified third party test laboratory.]

[ d. Meter must be certified by a qualified 3rd party test laboratory.]

[ e. Provide socket-mounted or panel mounted meters as indicated on the meter schedule.]

[ (1) Panel-mounted meters must be semi-flush, back-connected, dustproof, draw-out switchboard type. Cases must have window removable covers capable of being sealed against tampering. Meters must be of a type that can be withdrawn through approved sliding contacts from fronts of panels or doors without opening current-transformer secondary circuits, disturbing external circuits, or requiring disconnection of any meter leads. Necessary test devices must be incorporated within each meter and must provide means for testing either from an external source of electric power or from associated instrument transformers or bus voltage.]

**************************************************************************

**NOTE:** The default design is a Class 20, transformer rated meter. If the measured or expected load is less than 200 amperes, Class 200 meters can be used...
for direct current reading without current transformers. Specify the location of these meters.

f. Meter must be a Class 20, transformer rated design.

g. Use Class 200 meters for direct current reading without current transformers for applications with an expected load less than 200 amperes, where indicated.

h. Meter must be rated for use at temperature from minus 40 [_____] degrees Centigrade to plus 70 [_____] degrees Centigrade.

i. The meters must have an electronic demand recording register and must be secondary reading as indicated. The register must be used to indicate maximum kwh demand as well as cumulative or continuously cumulative demand. Demand must be measured on a block-interval basis and must be capable of a 5 to 60 minute interval and initially set to a 15-minute interval. It must have provisions to be programmed to calculate demand on a rolling interval basis. Meter readings must be true RMS.

j. The meter electronic register must be of modular design with non-volatile data storage. Downloading meter stored data must be capable via an [optical][USB] port. Recording capability of data storage with a minimum capability of 89 days of 15 minute, 2 channel interval data. The meter must be capable of providing at least 2 KYZ pulse outputs (dry contacts). Default initial configuration (unless identified otherwise by base personnel) must meet NAVFAC CIRCUITS Call for Consistency document located on the NAVFAC CIRCUITS Portal and must be:

(1) First channel - kWh
(2) Second channel - kVARh
(3) KYZ output #1 - kWh
(4) KYZ output #2 - kVARh

k. All meters must have identical features available in accordance with this specification. The meter schedule identifies which features must be activated at each meter location.

l. Enable switches for Time of Use (TOU), pulse and load profile measurement module at the factory.

m. Meter must have an optical port on front of meter. Optical device must be compatible with ANSI C12.18.

n. Meters must be 120-480 volts auto ranging.

----------

NOTE: Include the bracketed option below only if potential transformers are used.

----------

o. Provide blank tag fixed to the meter faceplate for the addition of the meter multiplier, which will be the product of the current transformer [and potential transformer ]ratio and will be filled in by base personnel on the job site. The meter's nameplate must include:
(1) Meter ID number.
(2) Rated voltage.
(3) Current class.
(4) Metering form.
(5) Test amperes.
(6) Frequency.
(7) Catalog number.
(8) Manufacturing date.

p. On switchboard style installations, provide switchboard case with disconnect means for meter removal incorporating short-circuiting of current transformer circuits.

q. Meter covers must be polycarbonate resins with an optical port and reset. Backup battery must be easily accessible for change-out after removing the meter cover.

r. The normal billing data scroll must be fully programmable. The normal billing data scroll requirements provided in the CIRCUITS Call for Consistency Document located on the NAVFAC CIRCUITS Portal. Data scroll display must include the following.

(1) Number of demand resets.
(2) End-of-interval indication.
(3) Maximum demand.
(4) New maximum demand indication.
(5) Cumulative or continuously cumulative.
(6) Time remaining in interval.
(7) Kilowatt hours.

s. The register must incorporate a built-in test mode that allows it to be tested without the loss of any data or parameters. The following quantities must be available for display in the test mode:

(1) Present interval's accumulating demand.
(2) Maximum demand.
(3) Number of impulses being received by the register.

T. Pulse module simple I/O board with programmable ratio selection.

u. Meters must be programmed after installation via an [optical][USB] port. Optical display must show TOU data, peak kWh, semi-peak kWh, off peak kWh, and phase angles.

v. Self-monitoring to provide for:

(1) Unprogrammed register.
(2) RAM checksum error.
(3) ROM checksum error.
(4) Hardware failure.
(5) Memory failure.
(6) EPROM error.
(7) Battery status (fault, condition, or time in service).

w. Liquid crystal alphanumeric displays, 9 digits, blinking squares confirm register operation. Six Large digits for data and smaller digits for display identifier.

x. Display operations, programmable sequence with display identifiers.
Display identifiers must be selectable for each item. Continually sequence with time selectable for each item.

y. The meters must support three modes of registers: Normal Mode, Alternate Mode, and Test Mode. The meter also must support a "Toolbox" or "Service Information" (accessible in the field) through an optocom port to a separate computer using the supplied software to allow access to instantaneous service information such as voltage, current, power factor, load demand, and the phase angle for individual phases.

**************************************************************************
NOTE: Determine the desired warranty period and update the bracketed option below.
**************************************************************************

z. Meter must have a standard [4] [____]-year warranty.

2.1.5 Disconnect Method

**************************************************************************
NOTE: The standard design must include a 10-pole safety disconnect. This permits meter removal without service interruption and includes shorting type wiring blocks so that CTs are not inadvertently open circuited.

The options for the disconnecting wiring blocks requires approval by the authority having jurisdiction and would only be used when installing a meter system using individual components rather than an integrated switch.
**************************************************************************

a. Provide a 10-pole safety disconnect complete with isolation devices for the voltage and current transformer inputs, including a shorting means for the current transformers.

b. Disconnecting wiring blocks must be provided between the current transformer and the meter. A shorting mechanism must be built into the wiring block to allow the current transformer wiring to be changed without removing power to the transformer. The wiring blocks must be located where they are accessible without the necessity of disconnecting power to the transformer.

c. Voltage monitoring circuits must be equipped with disconnect switches to isolate the meter base or socket from the voltage source.

2.1.6 Installation Methods

**************************************************************************
NOTE: Pad-mounted transformers have proven to be very reliable over a long life span. Installing one meter on the outside of the secondary wiring compartment has become the standard installation for military facilities resulting in minimal maintenance. However, to prevent additional compromise of the transformer enclosure integrity, if more than one meter is required for a location or service, add a separate free-standing unistrut frame
with each meter in its own enclosure or use commercial meter pedestals for each meter.

Meters may be installed on the sides of buildings. Installing meters inside of a building and behind locked doors has proven to be a burden for meter readers in some instances and is not recommended.

******************************************************************************

a. Transformer Mounted ("XFMR" in Metering Systems Schedule). Meter base must be located outside on the secondary side of the pad-mounted transformer.

b. Stand Mounted Adjacent to Transformer ("STAND" in Metering Systems Schedule). Meter base must be mounted on a structural steel pole approximately 1.2 meters 4 feet from the transformer pad. This can be used for multiple meters associated with a single transformers.

******************************************************************************

NOTE: Provide a drawing to show details for building mounting and routing conduit and wires. Typical detail drawings are referenced at the beginning of this specification.

******************************************************************************

c. Building Mounted ("BLDG" in Metering Systems Schedule). Meter base must be mounted on the side of the existing building near the service entrance.

d. Panel Mounted. ("PNL" in Metering Systems Schedule). Meter must be mounted where directed.

e. Commercial meter pedestal ("PED" in Metering Systems Schedule).

2.2 COMMUNICATIONS INTERFACES

******************************************************************************

NOTE: The default metering condition is to provide two-way communication with an existing DAS, if installed at the Activity already. If a DAS is not installed or is outdated (inadequate), then coordinate with the activity to determine if a new DAS should be provided as part of the contract. If a new DAS is determined to be necessary, edit the requirements below as needed to identify the DAS requirements. New meters must connect to the Control Systems Platform Enclave at the regional level.

The communications requirements must be determined for each location and are not addressed by this specification. A hardwired or optical connection is preferred. Possible communications options include:

RS-232
RS-485
Optical port
Ethernet (RJ-45)
Fiber-optic ST connection
RF (Wireless) Module
Power line carrier and
LTE radio

Determine the communications requirements for the
metering system and modify the paragraph below as
necessary to define the selected communication
system.

Meter must have two-way communication with the existing data acquisition
system (DAS). Provide a communications interface utilizing [____]. [Refer to Section [____] for the communication interface requirements for
these meters.]

Provide interfacing software if a meter is used that is different than the
existing meters at the Activity to ensure compatibility within the metering
system.

NOTE: Determine the connections requirements for
the AMI network and modify the paragraph below as
necessary to provide equipment for the system. This
could be as simple as providing a fiber optic link
to the closest connection point or could be more
extensive and requires close coordination with the
Activity.

Connect to the AMI network utilizing [____].

NOTE: Determine what modifications need to be done
to the existing DoD Information Assurance
Certification and Accreditation Process (DIACAP) to
maintain accreditation. Check with the local
Command Information Officer (CIO) for the latest
requirements.

[ Provide [____].
]

[2.3 SPARE PARTS

NOTE: Spare parts are not normally included as part
of the construction contract or on contracts
involving a small number of meters. On large
projects, involving ten or more meters, the
following may be an example of spare parts
requirements.

Provide the following spare parts:

a. Power Meter - two for each type used with batteries.
b. Communications interface - one for each type used.

SECTION 26 27 14.00 20 Page 26
2.4 METERING SYSTEM SCHEDULE

**************************************************************************
NOTE: A schedule of meters and their associated requirements are preferentially included on a separate drawing. As an alternate, the required tabular information can be provided below. In each case, identify the characteristics for the specific meter and communications method for each building.
**************************************************************************

[_____]
installations with existing meters:

**************************************************************************
NOTE:  Coordinate with the activity for the desired
re-use or disposition of existing PTs.
**************************************************************************

a.  Replace any meters that do not comply with this section.

b.  If CTs are installed, verify that they comply with this section.  If
they do not comply, replace them with CTs that comply with this
section.  One CT per phase is required for wye-connected systems.

c.  If potential transformers are installed on low-voltage systems, remove
the PTs as part of the installation.

d.  Install disconnect switches as specified in this section.

3.1.2 Scheduling of Work and Outages

**************************************************************************
NOTE:  Installation of current transformers and
potential transformers will require that power be
disconnected from the transformer and building.
Provide coordination steps for the work and require
the Contractor to perform the work after normal
hours.  Coordinate with Division 1 Sections.
**************************************************************************

The Contract Clauses must govern regarding permission for power outages,
scheduling of work, coordination with Government personnel, and special
working conditions.[______]

3.1.3 Configuration Software

The standard meter must include the latest available version of firmware
and software.  Meter must either be programmed at the factory or must be
programmed in the field.  Meters must have a password that must be provided
to the contracting officer upon project completion.  When field programming
is performed, turn field programming device over to the Contracting Officer
at completion of project.  When interfacing software is used for a meter
that is different than the existing meters in use at the Activity, turn the
software over to the Contracting Officer at completion of the project.

3.2 FIELD QUALITY CONTROL

**************************************************************************
NOTE:  Apply 100 percent checks for smaller
projects.  Use random sampling of acceptance checks
and tests for large projects.  If no problems are
identified in the acceptance checks and tests of the
random sample, then the results would be accepted.
If problems are identified in the acceptance checks
and tests of the random sample, then an additional
random sample would be selected for verification.
**************************************************************************

Perform the following acceptance checks and tests on all installed meters.
3.2.1 Performance of Acceptance Checks and Tests

Perform in accordance with the manufacturer's recommendations and include the following visual and mechanical inspections and electrical tests, performed in accordance with NETA ATS.

a. Meter Assembly

**************************************************************************
NOTE: The following requirements are derived from NETA ATS and have been modified for this specification.
**************************************************************************

(1) Visual and mechanical inspection.

(a) Compare equipment nameplate data with specifications and approved shop drawings.

(b) Inspect physical and mechanical condition. Confirm the meter is firmly seated in the socket, the socket is not abnormally heated, the display is visible, and the ring and seal on the cover are intact.

(c) Inspect all electrical connections to ensure they are tight. For Class 200 services, verify tightness of the service conductor terminations for high resistance using low-resistance ohmmeter, or by verifying tightness of accessible bolted electrical connections by calibrated torque-wrench method.

(d) Record model number, serial number, firmware revision, software revision, and rated control voltage.

(e) Verify operation of display and indicating devices.

(f) Record password and user log-in for each meter.

(g) Verify grounding of metering enclosure.

(h) Set all required parameters including instrument transformer ratios, system type, frequency, power demand methods/intervals, and communications requirements. Verify that the CT ratio and the PT ratio are properly included in the meter multiplier or the programming of the meter. Confirm that the multiplier is provided on the meter face or on the meter.

(i) Provide building meter installation sheet, per building for each facility. See example Graphic E-S1.

(j) Provide the completed meter installation schedule for the installation if multiple meters are to be used. See example Graphic E-S2

(k) Provide the completed meter data schedule for the installation if multiple meters are to be used. See example Graphic E-S3.

(2) Electrical tests.

(a) Apply voltage or current as appropriate to each analog input
and verify correct measurement and indication.

(b) Confirm correct operation and setting of each auxiliary input/output feature including mechanical relay, digital, and analog.

(c) After initial system energization, confirm measurements and indications are consistent with loads present.

(d) Make note of, and report, any "Error-Code" or "Caution-Code" on the meter's display.

(3) Provide meter configuration report.

b. Current Transformers

(1) Visual and mechanical inspection.

(a) Compare equipment nameplate data with specification and approved shop drawings.

(b) Inspect physical and mechanical condition.

(c) Verify correct connection, including polarity.

(d) Inspect all electrical connections to ensure they are tight.

(e) Verify that required grounding and shorting connections provide good contact.

(2) Electrical Tests.

Verify proper operation by reviewing the meter configuration report.

**************************************************************************

NOTE: Include the following inspections and tests if potential transformers are included within the scope of the project.
**************************************************************************

[ c. Potential Transformers

(1) Visual and mechanical inspection.

(a) Verify potential transformers are rigidly mounted.

(b) Verify potential transformers are the correct voltage.

(c) Verify that adequate clearances exist between the primary and secondary circuit.

(2) Electrical Tests.

(a) Verify by the meter configuration report that the polarity and phasing are correct.
3.2.2 System Functional Verification

Verify that the installed meters are working correctly in accordance with the meter configuration report:

a. The correct meter form is installed.

b. All voltage phases are present.

c. Phase rotation is correct.

d. Phase angles are correct.

e. The new meter accurately measures power magnitude and direction, and can communicate as required by paragraph COMMUNICATIONS INTERFACES.

3.4 SCHEDULE

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for procurement, installation, and testing of electrical wiring systems for construction projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: These wiring systems primarily involve voltages of 600 volts and less and exterior systems. When voltages greater than 600 volts are brought to a facility, consult and use Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION; Section 26 11 16 SECONDARY UNIT SUBSTATIONS; Section 33 71 01 OVERHEAD TRANSMISSION AND DISTRIBUTION; and Section 26 12 19.10 THREE-PHASE, LIQUID-FILLED PAD-MOUNTED TRANSFORMERS or 26 12 21 SINGLE-PHASE PAD-MOUNTED TRANSFORMERS as required. Requirements for materials and procedures for special or unusual design should be added as necessary to fit specific projects.
NOTE: The following information must be shown on the project drawings.

1. Where specification identifies type, size, color, finish, or other definitive information to be "as indicated," the engineer must include the information on the drawings.

2. Location of manholes, handholes, ducts, and cables.

3. Types of wire and cable; number and sizes of conductors.

4. Limits of each hazardous location, clearly indicating class, division, and group classification of each hazard.

5. Special conditions.

PART 1   GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 RELATED REQUIREMENTS

26 20 00 INTERIOR DISTRIBUTION SYSTEM, applies to this section with additions and modifications specified herein.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item
if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

NOTE: Modify submittals paragraphs to ensure that an appropriate submittal is required for each item in the project.

SD-02 Shop Drawings

Solar Power Station; G[, [____]]

Submit coordination data as specified in paragraph SOLAR POWER STATION.

1.4 QUALITY ASSURANCE

1.4.1 Grounding System Tests

Submittal must include written results of each test and indicate location of rods as well as resistance and soil conditions at the time measurements were made.

PART 2 PRODUCTS

2.1 MATERIALS AND EQUIPMENT

**************************************************************************
NOTE: Where possible use nonmetallic enclosures, conduits, and mounting hardware.
**************************************************************************
Materials, equipment, and devices must, as a minimum, meet requirements of UL where UL standards are established for those items, and requirements of NFPA 70 and NFPA 303.

2.2 CONDUIT AND FITTINGS

[Rigid nonmetallic conduit][Plastic-coated rigid steel conduit] conforming to the following:

2.2.1 Rigid Nonmetallic Conduit

PVC Type EPC-80[ and EPC-40] in accordance with NEMA TC 2, or fiberglass conduit in accordance with NEMA TC 14.

2.2.2 Plastic-Coated Rigid Steel Conduit

NEMA RN 1, Type 40 one millimeter thick 40 mils thick.

2.2.3 Fittings for Metal Conduit and Liquidtight Flexible Metal Conduit

UL 514B. Ferrous fittings must be cadmium or zinc coated in accordance with UL 514B.

2.2.3.1 Fittings for Rigid Metal Conduit

Threaded type. Split couplings unacceptable.

2.2.3.2 Fittings for Use in Hazardous Locations

UL 1203.

2.2.4 Fittings for Rigid Nonmetallic Conduit

UL 514B and UL 651.

2.2.5 Expansion Joints

Provide conduit expansion joints having 150 mm 6 inch expansion at each expansion joint in the pier and in each conduit run exceeding 75 meters 250 feet. Provide expansion joints having 50 mm 2 inch expansion in each conduit run of less than 75 meters 250 feet.

2.3 POWER PEDESTAL

A complete factory-assembled and prewired unit specifically constructed for marine applications. Power center must be a [two][ or ][four] outlet [pedestal][surface] mounted type having a separate circuit breaker for each outlet. Circuit breaker size must be the same size as outlet to which it is connected. Power outlets must be single, locking and grounding type, size and voltage as indicated. Power center enclosure must be stainless steel, fiberglass, or foamed thermoplastic with polyurethane coating. Each individual outlet and circuit breaker enclosure must have a separate gasketed weatherproof cover. Entire exterior surface of power center must be nonmetallic design for exposure to saltwater environment.[ Provide photo controlled LED station light.][ Provide with [one] [_____] telephone outlet[s].]
2.3.1 Warning Sign

Provide permanently mounted waterproof warning sign at each power center. Sign must have red letters on a white background with letters no less than 6 mm .25 inch in height. Sign must be worded as follows:

"WARNING
To minimize shock and fire hazards:
Turn off the boat's shore connection switch before connecting or disconnecting shore cable.
Connect shore power cable at the boat first.
Disconnect shore power cable at shore outlet first.
Close shore power inlet cover tightly.
DO NOT ALTER SHORE POWER CABLE CONNECTORS"

2.4 OUTLET BOXES AND COVERS

UL 514C.

2.4.1 Outlet Boxes in Hazardous Locations

UL 1203. Suitable for wet locations.

2.5 CABINETS, JUNCTION BOXES, AND PULL BOXES

Volume greater than 3280 mL 200 cubic inches, UL 50, NEMA 4X [nonmetallic][ or ][stainless steel].

2.6 WIRES AND CABLES

Must meet applicable requirements of NFPA 70 and UL for type of insulation, jacket, and conductor specified or indicated. Do not provide wires and cables manufactured more than 12 months prior to date of delivery to site.

2.6.1 Conductors

**************************************************************************
NOTE: In overseas locations, for conductor sizes No. 10 AWG and smaller diameter, consideration may be given to the use of stranded wires, if suitable terminal devices can be applied which enable proper connection. Also, stranded wires in sizes No. 10 AWG and smaller diameter may be required for projects involving uninterrupted power supply (UPS) installations.
**************************************************************************

No. 8 AWG and larger diameter must be stranded; No. 10 AWG and smaller must be solid, except that conductors for remote control, alarm, and signal circuits, Classes 1, 2, and 3, must be stranded. Conductors must be copper. Conductor sizes and ampacities shown are based on copper.
2.6.1.1 Minimum Conductor Sizes

Minimum size for branch circuits must be No. 12 AWG; for Class 1 remote-control and signal circuits, No. 14 AWG; for Class 2 low-energy, remote-control and signal circuits, No. 18 AWG; and for Class 3 low-energy, remote-control, alarm, and signal circuits, No. 22 AWG.

2.6.2 Color Coding

Provide for service, feeder, branch, control, and signaling circuit conductors. Color must be green for grounding conductors and white for neutrals; except where neutrals of more than one system are installed in same raceway or box, other neutral must be white with colored, except green, stripe. Color of ungrounded conductors in different voltage systems must be as follows:

a. 120/208 volt, three phase:
   (1) Phase A - black
   (2) Phase B - red
   (3) Phase C - blue
b. 277/480 volt, three phase:
   (1) Phase A - brown
   (2) Phase B - orange
   (3) Phase C - yellow
c. 120/240 volt, single phase: red and black

[ d. On three-phase, four-wire delta system, high leg must be orange, as required by NFPA 70.]

2.6.3 Insulation

**************************************************************************
NOTE: Be sure conduit fill calculations are based on largest diameter insulation type allowed. Designer may select other insulation types which may be more suitable for a particular project. For rewiring project where existing conduit is to be utilized, specify types THHN and THWN. If conduit is sized for conductors other than THW, ensure the specification is properly edited and a note indicating the conductor type specified is added to the drawings. Type RHW insulation is not allowed on Navy projects.
**************************************************************************

Unless otherwise required by NFPA 70, power and lighting wires must be 600-volt, Type THWN, XHHW, [or RHW, ] except that grounding wire may be Type TW; remote-control and signal circuits must be Type TW, THW, or TF. Conductors must conform to UL 83. Where lighting fixtures require 90-degree C conductors, provide only conductors with 90-degree C insulation or better.
2.6.4 Bonding Conductors

ASTM B1, solid bare copper wire for sizes No. 8 AWG and smaller diameter; ASTM B8, Class B, stranded bare copper wire for sizes No. 6 AWG and larger diameter.

2.6.5 Splice and Termination Components

UL 486A-486B, for wire connectors, and UL 510 for insulating tapes. Connectors for No. 10 AWG and smaller diameter wires must be insulated, pressure type in accordance with UL 486A-486B, twist-on splicing connector. Provide solderless terminal lugs on stranded conductors.

2.6.5.1 Watertight Pin Connectors

Connectors must be rated 600 volts, and individual pins must have ampere rating equal to or greater than the cable to which they are joined. Connectors must be molded-to-cable, quick-disconnect, polarized type having full male shroud so that when male and female assemblies are joined the shroud must provide a completely sealed connection. Connector material must be neoprene resistant to oil, dust, acids, and sunlight and must be watertight.

2.7 DEVICE PLATES

Provide UL listed, one-piece device plates for outlets to suit the devices installed. Plates must be nylon or lexan, minimum 2.54 mm 0.10 inch wall thickness. Plates must be same color as receptacle with which they are mounted. Screws must be stainless steel machine type with countersunk heads in color to match finish of plate. Use of sectional-type device plates will not be permitted. Plates must be gasketed and UL listed for wet locations.

2.8 DISCONNECT SWITCHES

**************************************************************************

NOTE: Switches requiring frequent operation should be the heavy-duty type and should be so indicated on the drawings.

**************************************************************************

NEMA KS 1. Switches serving as motor-disconnect means must be horsepower rated. Provide heavy duty-type switches where indicated, where switches are rated greater than 240 volts, and for double-throw switches. Provide switches in NEMA 4X [nonmetallic][ or ][stainless steel] enclosure in accordance with NEMA ICS 6.

2.9 RECEPTACLES

UL 498 and NEMA WD 1, heavy-duty, grounding type. Bodies must be of [brown] [ivory] thermosetting plastic supported on a metal mounting strap. Provide screw type, side wired wiring terminals. Connect grounding pole to mounting strap.

2.9.1 Duplex Receptacles

Receptacles must be 20 amperes, 125 volts, specification grade.
2.9.2 Weatherproof Receptacles

Provide in nonmetallic box with gasketed, weatherproof, nonmetallic cover plate and gasketed cap over each receptacle opening. Provide caps with a spring-hinged flap. Provide UL listed receptacle for use in wet locations.

2.9.3 Ground-Fault Protection of Equipment (GFPE) and Ground-Fault Circuit Interrupter (GFCI) Receptacles

UL 943. Receptacles providing shore power must have individual GFPE set to open at currents not exceeding 30 milliamperes.

GFCI protection for personnel, duplex type for mounting in standard outlet box. Device must be capable of detecting current leak of 5 milliamperes or greater and tripping in accordance with UL 943 for Class A GFCI devices.

2.9.4 Special-Purpose Receptacles

Receptacles serving [_____] are special purpose.[ Provide in ratings indicated.][ NEMA [_____] configuration, rated [_____] amperes, [_____] volts.][ Furnish one matching plug with each receptacle.]

2.10 PLUGS

[ Provide heavy-duty, rubber-covered[ three,][ four,][ or][ five]-wire cord of required size, install plugs thereon, and attach to equipment. Provide UL listed plugs with receptacles, complete with grounding blades. Where equipment is not available, turn in plugs and cord assemblies to the Government.

]2.10.1 Weatherproof Cord and Plug Assemblies

Furnish [one] [_____] cord and plug assembly[ies] consisting of a [30-ampere, 125-volt twist-lock plug on one end, a 8 meter 25 foot length of three conductor, No. 10 type STO cord, and two 20-ampere, 125-volt twist-lock receptacles on the other end][ and ][furnish [one] [_____] cord and plug assembly[ies] consisting of a 20-ampere, 125-volt twist-lock plug on one end, a 8 meter 25 foot length of three conductor, No. 12 type STO cord and a 20-ampere twist-lock receptacle on the other end.][ Plugs must be compatible with power center outlets.

]2.11 PANELBOARDS

UL 67 and UL 50 having a short-circuit current rating of [10,000] [_____] amperes symmetrical minimum. Panelboards for use as service disconnecting means must additionally conform to UL 869A. Panelboards must be circuit breaker equipped. Design must be such that individual breakers can be removed without disturbing adjacent units or without loosening or removing supplemental insulation supplied as means of obtaining clearances as required by UL. Where "space only" is indicated, make provisions for future installation of breakers. Key panelboard locks the same. Directories must indicate load served by each circuit in panelboard and main source of service to panelboard, such as Panel PA served from Panel MDP. Type directories and mount in holder behind transparent protective covering. When panelboards are used as a service disconnecting means, conform to UL 869A
2.11.1 Panelboard Buses

Copper. Support bus bars on bases independent of circuit breakers. Design main buses and back pans so that breakers may be changed without machining, drilling, or tapping. Provide isolated neutral bus in each panel for connection of circuit neutral conductors. Provide separate ground bus identified as equipment grounding bus in accordance with UL 67 for connecting grounding conductors; bond to steel cabinet.

2.11.2 Circuit Breakers

UL 489 thermal magnetic type having a minimum short-circuit current rating equal to the short-circuit rating of the panelboard in which the circuit breaker will be mounted. Breaker terminals must be UL listed as suitable for type of conductor provided. Circuit breakers must be bolt-on type. Din-rail mounted and half-width circuit breakers are not acceptable. Plug-in circuit breakers and series rated circuit breakers are unacceptable.

2.11.2.1 Multipole Breakers

Provide common trip type with single operating handle. Breaker design must be such that overload in one pole automatically causes all poles to open. Maintain phase sequence throughout each panel so that any three adjacent breaker poles are connected to Phases A, B, and C respectively.

2.11.2.2 Circuit Breaker With GFCI

UL 943 and NFPA 70. Provide with push-to-test button, visible indication of tripped condition, and ability to detect and trip on current imbalance of 6 milliamperes or greater in accordance with UL 943 for Class A GFCI devices.

2.11.3 Panelboard Enclosure

NEMA 4X [nonmetallic] [or] [stainless steel]. Hardware must be stainless steel.

2.12 ENCLOSED CIRCUIT BREAKERS

UL 489. Individual molded case circuit breakers with short-circuit current rating of [10,000] [_____] amperes symmetrical minimum. Circuit breakers must be bolt-on type. Plug-in circuit breakers and series rated circuit breakers are not acceptable. Enclosure must be NEMA 4X [nonmetallic] [or] [stainless steel] type. [Provide solid neutral.]

2.13 TRANSFORMERS

NEMA ST 20, general purpose, dry-type, self-cooled, [unventilated] [sealed]. Provide transformers in NEMA [3R] [stainless steel] [_____] enclosure. Transformer must have 220 degrees C insulation system for transformers 15 kVA and greater and must have 180 degrees C insulation for transformers rated 10 kVA and less, with temperature rise not exceeding [150] [115] [80] degrees C under full-rated load in maximum ambient of 40 degrees C.[ Transformer of 150 degrees C temperature rise must be capable of carrying continuously 100 percent of nameplate kVA without exceeding insulation rating.][ Transformer of 115 degrees C temperature rise must be capable of carrying continuously 115 percent of nameplate kVA without exceeding insulation rating.][ Transformer of 80 degrees C temperature rise must be capable of carrying continuously 130 percent of nameplate kVA]
without exceeding insulation rating.[ Transformers must be quiet type with maximum sound level of 3 decibels less than NEMA standard level for transformer ratings indicated.]

[ Submit manufacturer factory test reports with transformers provided.

2.14 TELEPHONE SYSTEM

**************************************************************************
NOTE: This paragraph applies only if provision is made for telephone system by others. If a complete system is provided by contract, refer to Section 27 51 23 INTERCOMMUNICATION SYSTEM and Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLING SYSTEM.
**************************************************************************

Provide system of telephone wire-supporting structures, including conduits with pull wires, terminal boxes, outlet and junction boxes, [and ]other accessories for telephone outlets[, and telephone cabinets].

2.14.1 Outlet Boxes

Standard type, as specified herein, [[_____] mm inches by [_____] mm inches ]. Mount at height [indicated][specified for telephone outlet receptacles].

2.14.2 Cover Plates

Blank cover with same finish specified for receptacle and switch cover plates.

2.14.3 Conduit Sizing

**************************************************************************
NOTE: For guidelines on conduit sizing, see UFC 3-520-01. Telephone raceway requirements should be coordinated with the entity providing the telephone wires and cable.
**************************************************************************

Conduit for single outlets must be minimum of 21 mm 3/4 inch and for multiple outlets minimum of 27 mm one inch.

2.14.4 Terminal Cabinets

**************************************************************************
NOTE: For guidelines on sizing cabinets, see UFC 3-580-01. Coordinate with entity providing telephone service.
**************************************************************************

NEMA 4X [nonmetallic][ or ][stainless steel] with backboard. Hardware must be stainless steel.

2.15 MOUNTING STRAPS

[Fiberglass][ or ][PVC coated steel], two-hole type designed for rigid steel conduit support. PVC coating must be between 0.5 and one mm 20 and 40 mil thickness.
2.16 GROUNDING AND BONDING EQUIPMENT

UL 467. Ground rods must be copper-clad steel, with minimum diameter of 19 mm 3/4 inch and minimum length of 3050 mm 10 feet.

2.16.1 Grounding Connections

Make grounding connections which are buried or otherwise normally inaccessible, [excepting specifically those connection for which access for periodic testing is required,] by exothermic weld or high compression connector.

a. Make exothermic welds strictly in accordance with the weld manufacturer's written recommendations. Welds which are "puffed up" or which show convex surfaces indicating improper cleaning are not acceptable. Mechanical connectors are not required at exothermic welds.

b. Make high compression connections using a hydraulic or electric compression tool to provide the correct circumferential pressure. Provide tools and dies as recommended by the manufacturer. Use an embossing die code or other standard method to provide visible indication that a connector has been adequately compressed on the ground wire.

2.16.2 Ground Rod Mounting Straps

Provide mounting straps to support ground rods at fueling pier. Do not use dissimilar metals.

2.16.3 Alligator Clips

Heavy duty type, copper, insulated handles, rated 100 amperes and up to 250 volts for maximum No. 2 AWG.

2.17 HAZARDOUS LOCATIONS

**********************************************************************
NOTE: The following information must be shown on
the project drawings.

1. Where specification identifies type, size, color, finish, or other definitive information to be 
as indicated," the engineer must include the information on the drawings.

2. Location of manholes, handholes, ducts, and cables.

3. Types of wire and cable; number and sizes of conductors.

4. Limits of each hazardous location, clearly indicating class, division, and group classification of each hazard.

5. Special conditions.
**********************************************************************

Electrical materials, equipment, and devices for installation in hazardous
locations must be specifically approved by UL or Factory Mutual Research Corporation (FM) for particular class, division, and group of hazardous locations involved. Equipment must be waterproof and suitable for marine environment.

2.18 WIREWAYS

UL 870. Material must be [nonmetallic] [or] [stainless steel], 16 gage for size[s] [63.5 by 63.5] [100 by 100] [150 by 150] mm, [2 1/2 by 2 1/2] [4 by 4] [6 by 6] inches, 14 gage for size[s] [200 by 200] [300 by 300] mm [8 by 8] [12 by 12] inches. Provide in length [indicated] [required for the application] with gasketed [hinged] [screw] cover NEMA 4X enclosure in accordance with NEMA ICS 6.

2.19 FIELD FABRICATED NAMEPLATES

**************************************************************************
NOTE: Use the following paragraph where nameplates are fabricated to identify specific equipment designated on the drawings.
**************************************************************************

Provide field fabricated nameplates in accordance with the following:

a. ASTM D709.

b. Provide laminated plastic nameplates for each equipment enclosure, relay, switch, and device; as specified or as indicated on the drawings.

c. Each nameplate inscription: identify the function and, when applicable, the position.

d. Nameplates: melamine plastic, 3 mm 0.125 inch thick, white with [black] [_____] center core.

e. Surface: matte finish. Corners: square. Accurately align lettering and engrave into the core.

f. Minimum size of nameplates: 25 by 65 mm one by 2.5 inches.

g. Lettering size and style: a minimum of 6.35 mm 0.25 inch high normal block style.

2.20 ARC FLASH WARNING LABEL

**************************************************************************
NOTE: Include the Arc Flash Warning Label detail on the drawings. See UFC 3-560-01 for more information.
**************************************************************************

Provide arc flash warning labels on electrical equipment likely to require examination, servicing, or maintenance while energized. Some typical types of equipment include pad-mounted transformers, switchgears, switchboards, panelboards, and disconnect switches. Place label on the outside of the enclosure warning of potential electrical arc flash hazards and appropriate PPE required. Provide label format as indicated.
2.21  MARINE SIGNAL LANTERN

Provide with nonmetallic base, [155-mm] [______], [red] [______] [acrylic][UV stable polycarbonate] fresnel lens, LED light source, [solid state flasher,] [lamp changer,] [solar power station,] [1220 mm] [4 foot] [______] nonmetallic support pedestal, and photo control. The entire system must be watertight and approved for marine environment.

2.21.1  Flasher

**************************************************************************

NOTE: Refer to "USCG Aids to Navigation Manual - Short Range Aids to Navigation" for signaling sequence for lanterns.
**************************************************************************

Flasher must have a [______]-second cycle period with [______]-second "ON" time] [Morse code letter "[______]" [______].

2.21.2  Lamp Changer

[120 volt ac, four place automatic lamp changer with LED lamps] [6] [12] volt dc, six place automatic lamp changer with [______] ampere lamps. When lamps burn out, lamp changer must stop operation[ and power must turn off].

2.21.3  Ac to Dc Converter

Converter must convert [120] [240] [______] volts ac input into a [6] [12] volt dc output. Converter must be sized for the signal lantern specified.

2.21.4  Solar Power Station

Power station must consist of encased silicon solar energy cells, nonmetallic battery box with blocking diodes, rechargeable sealed batteries, and mounting brackets. The solar power station must be a complete unit supplied and coordinated by a single manufacturer, sized to provide adequate year-round power to fully operate the signal lantern specified at the exact geographic location of the signal lantern.

2.22  PIER LIGHTING

**************************************************************************

NOTE: Fixture enclosures located on marina piers must be watertight and constructed on nonmetallic material or cast aluminum with baked enamel or powdered polyester finish. Hardware must be nonmetallic or stainless steel. Conduit or cable entrances into lighting fixtures must be watertight.
**************************************************************************

Provide as specified in Section 26 56 00 EXTERIOR LIGHTING.

PART 3  EXECUTION

3.1  INSTALLATION

Electrical installations must conform to requirements of NFPA 70 and to requirements specified herein.
[3.1.1 Underground Service

**************************************************************************
NOTE: Choose this paragraph or the paragraph OVERHEAD SERVICE below. When using this paragraph, designer may insert additional details describing the specific project.
**************************************************************************

Underground service conductors and associated conduit must be continuous from service equipment to the power system connection.

][3.1.2 Overhead Service

**************************************************************************
NOTE: When using this paragraph, coordinate with Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION or Section 33 71 01 OVERHEAD TRANSMISSION AND DISTRIBUTION (if in project).
**************************************************************************

Overhead service conductors must terminate at service equipment weatherhead. Overhead service conductors and support bracket for overhead conductors are included in Section 33 71 01 OVERHEAD TRANSMISSION AND DISTRIBUTION.

][3.1.3 Hazardous Locations

Perform work in hazardous locations, as defined by NFPA 70, in strict accordance with NFPA 70 for particular class, division, and group of hazardous locations involved. Provide conduit and cable seals where required by NFPA 70. Conduit must have tapered threads.

][3.1.4 Service Entrance Identification

Label or identify service entrance disconnect devices, switches, and enclosures.

3.1.4.1 Nameplates

Where work results in service disconnect devices in more than one enclosure, as permitted by NFPA 70, label each enclosure, new and existing, as one of several enclosures containing service entrance disconnect devices. Label, at minimum, must indicate number of service disconnect devices housed by enclosure and must indicate total number of enclosures that contain service disconnect devices. Provide laminated nameplates with letters no less than 6 mm 0.25 inch in height; and engrave on black-on-white matte finish. Fasten nameplates to the device with a minimum of two sheet-metal screws or two rivets.

3.1.5 Wiring Methods

Provide insulated conductors installed in rigid conduit, except where specifically indicated or specified otherwise or required by NFPA 70 to be installed otherwise. Grounding conductor must be separate from electrical system neutral conductor. Provide insulated, green equipment grounding conductors for circuits installed in conduit and raceways. Minimum conduit size must be 16 mm 1/2 inch in diameter for low-voltage lighting and power circuits.
3.1.5.1 Plastic-Coated Galvanized Rigid Steel

Use only for service entrance conduit and as required by NFPA for hazardous locations.

3.1.5.2 PVC Schedule 40 and PVC Schedule 80

a. Do not install PVC Schedule 40 in areas subject to physical damage.

b. Do not install PVC Schedule 80 in areas subject to severe physical damage.

c. Do not install in hazardous areas.

3.1.5.3 Service Entrance Conduit, Overhead

PVC, Type EPC-40, plastic-coated galvanized rigid steel from service entrance to service weatherhead.

3.1.5.4 Service Entrance Conduit, Underground

PVC, Type EPC-40, plastic-coated galvanized rigid steel. Encase underground portion in a minimum of 75 mm 3 inches of concrete. Install a minimum of 460 mm 18 inches below slab or grade.

3.1.5.5 Liquidtight Flexible Metal Conduit

Install in accordance with NFPA 70.

3.1.5.6 Underground Conduit Other Than Service Entrance

**************************************************************************
NOTE: Soil conditions in some locations require that underground conduit be supported to prevent damage due to settlement. The designer must determine if the problem exists, and, if so, determine the best method for supporting the conduit.
**************************************************************************

PVC, Type EPC-40, plastic-coated rigid steel, or fiberglass. Convert nonmetallic conduit, other than PVC Schedule 40 or 80, to plastic-coated rigid conduit before rising through pier deck. Plastic coating must extend minimum 150 mm 6 inches above pier deck.

3.1.6 Conduit Installation

Run conduit [exposed on side of [wood] [ and ] [existing concrete] pier structures], [supported by hangers under pier structure] [concealed in new concrete pier structure]. Install conduit parallel with or at right angles to structural members.

3.1.6.1 Conduit Support

Support conduit by nonmetallic pipe straps, wall brackets, hangers, or trapeze. Fasten by stainless steel wood screws to wood and by concrete inserts or expansion bolts on concrete. Threaded C-clamps may be provided on rigid steel conduit only. Load applied to fasteners must not exceed one-fourth proof test load. Fasteners attached to concrete ceiling must be
vibration resistant and shock resistant. Holes cut to depth of more than 40 mm 1 1/2 inches in reinforced concrete beams or to depth of more than 20 mm 3/4 inch in concrete joints must not cut main reinforcing bars. Fill unused holes. Where conduit crosses expansion joints, provide suitable [watertight expansion fitting that maintains conduit electrical continuity by bonding jumpers or other means.

3.1.6.2 Directional Changes in Conduit Runs

Make changes in direction of runs with symmetrical bends or molded fittings. Make field-made bends and offsets with conduit-bending machine suitable for type of conduit used. Do not install crushed or deformed conduits. Avoid trapped conduits. Prevent dirt or trash from lodging in conduits, boxes, fittings, and equipment during construction. Free clogged conduits of obstructions.

3.1.6.3 Expansion Joints

Install as recommended by the manufacturer for the temperature conditions at time of installation.

3.1.6.4 Pull Wire

Install in empty conduits in which wire is to be installed by others. Pull wire must be plastic having minimum 890 N 200 pound tensile strength. Leave minimum 300 mm 12 inches of slack at each end of pull wire.

3.1.6.5 Telephone and Signal System Conduits

Install in accordance with specified requirements for conduit and with additional requirement that no length of run must exceed 45 meters 150 feet for trade sizes 50 mm 2 inches and smaller and must not contain more than two 1.57 rad 90 degree bends or equivalent. Provide pull or junction boxes where necessary to comply with these requirements. Inside radii of bends in conduits 16 mm one inch trade size and larger must be minimum five times nominal diameter. Terminate conduit in terminal cabinet with two locknuts and plastic bushing.

3.1.6.6 Conduit Installed in Concrete

**************************************************************************
NOTE: Electrical designer must closely coordinate this information with the designer of the slab to ensure that slab thickness, conduit placement/separation, and reinforcement spacing is sufficient to meet requirements of this paragraph.
**************************************************************************

Locate so as not to adversely affect structural strength of slabs. Install conduit within middle one-third of concrete slab. [Do not stack conduits.][ Do not stack conduits more than two diameters high with minimum vertical separation of [_____] millimeters inches.] Space conduits horizontally minimum three diameters, except at cabinet locations. Curved portions of bends must not be visible above finish slab. Increase slab thickness as necessary to provide minimum 25 mm one inch cover over conduit. Where embedded conduits cross expansion joints, provide suitable watertight expansion fittings[ and bonding jumpers when using metallic conduits]. Conduit larger than 27 mm one inch trade size must be parallel with or at right angles to main reinforcement; when at right angles to
reinforcement, conduit must be close to one of supports of slab.

3.1.6.7 Locknuts and Bushings

Fasten conduits to sheet metal boxes and cabinets with two locknuts where required by NFPA 70, where insulated bushings are provided, and where bushings cannot be brought into firm contact with the box; otherwise, provide minimum single locknut and bushing. Locknuts must have sharp edges for digging into wall of metal enclosures. Install bushings on ends of conduits, and provide insulating type where required by NFPA 70.

[3.1.6.8 Stub-Ups

Provide conduits stubbed up through concrete structures for connection to freestanding equipment with adjustable top or coupling threaded inside for plugs, set flush with finished structure. Extend conductors to equipment in rigid conduit. Where no equipment connections are made, install screwdriver-operated threaded flush noncorroding plugs in conduit end.

]3.1.6.9 Conduit and Cable Connections

Provide watertight connectors for conduit and cable connections to boxes and cabinets.

3.1.7 Boxes, Outlets, and Supports

Provide boxes in wiring or raceway systems wherever required for pulling of wires, making connections, and mounting of devices or fixtures. Boxes for metallic raceways must be stainless steel type 304, hub type, and when specifically indicated. Boxes in other locations must be nonmetallic boxes provided with nonmetallic conduit system. Each box must have volume required by NFPA 70 for number of conductors enclosed in a box. Provide gaskets for boxes. Provide separate boxes for flush or recessed fixtures when required by fixture terminal operating temperature. Fasten boxes and supports with wood screws on wood and with bolts and expansion shields on concrete.[ Threaded studs driven in by powder charge and provided with lockwashers and nuts[ or nail-type nylon anchors] may be provided in lieu of wood screws, expansion shields, or machine screws.] Support boxes directly from structure or by [nonmetallic][ or ][stainless steel] hangers. Where [nonmetallic] stainless steel bar hangers are provided, attach bar to raceways on opposite sides of box, and support raceway with approved-type fastener maximum 600 mm 24 inches from box. When penetrating reinforced concrete members, avoid cutting reinforcing steel.

3.1.7.1 Boxes

Boxes for use with raceway systems must be minimum 38 mm 1 1/2 inches deep, except where shallower boxes required by structural conditions are approved. Boxes must be minimum 100 mm 4 inches square, except that100 by 50 mm 4 by 2 inch boxes may be provided where only one raceway enters outlet. Telephone outlets must be minimum of 100 mm square by 38 mm 4 inches square by 1 1/2 inches deep.

3.1.7.2 Pull Boxes

Construct of at least minimum size required by NFPA 70 compatible with nonmetallic raceway systems, except where stainless steel boxes are required in locations specified herein. Furnish boxes with screw-fastened covers. Where several feeders pass through common pull box, tag feeders to
indicate clearly electrical characteristics, circuit number, and panel designation.

3.1.8 Mounting Heights

Mount panelboards, circuit breakers, and disconnecting switches so maximum height of operating handle is 1980 mm 78 inches above finished structure. Mount receptacles a minimum of [460] [_____] mm [18] [_____] inches above finished structure. In no case must entire or part of panelboards, boxes, cabinets, receptacles, and other electrical devices be mounted below the electrical datum plane as defined in NFPA 303. Measure mounting heights of wiring devices and outlets to center of device or outlet.

3.1.9 Conductor Identification

Provide within each enclosure where tap, splice, or termination is made. For conductor sizes No. 6 AWG and smaller diameter, color coding must be by factory-applied, color-impregnated insulation. For conductor sizes No. 4 AWG and larger diameter, color coding must be by plastic-coated, self-sticking markers; colored nylon cable ties and plates; or heat shrink-type sleeves. Identify control circuit terminations.

3.1.10 Splices

Make splices in accessible locations. Make splices in conductor sizes No. 10 AWG and smaller diameter with insulated, pressure-type connector. Make splices in conductor sizes No. 8 AWG and larger diameter with solderless connector, and cover with insulation material equivalent to conductor insulation.

3.1.11 Covers and Device Plates

Install gasketed plates with alignment tolerance of 1.6 mm 1/16 inch.

3.1.12 Grounding and Bonding

NFPA 70. Ground-exposed, noncurrent-carrying metallic parts of electrical equipment, metallic raceway systems, grounding conductor in metallic and nonmetallic raceways, and neutral conductor of wiring systems. Make ground connection at main service equipment, and extend grounding conductor to point of entrance of metallic water service. Make connection to water pipe by suitable ground clamp or lug connection to plugged tee. When flanged pipes are encountered, make connection with lug bolted to street side of flanged connection. Supplement metallic water service grounding system with additional made electrode in compliance with NFPA 70. Make ground connection to driven ground rods. Where ground-fault protection is employed, ensure that connection of ground and neutral does not interfere with correct operation of fault protection.

3.1.12.1 Resistance

[3.1.12.2 Telephone Service

Provide main telephone service equipment ground consisting of separate No. 6 AWG ground wire in conduit between equipment backboard and readily
accessible grounding connection. Equipment end of ground wire must consist of coiled length at least twice as long as terminal cabinet.

3.1.13 Equipment Connections

Provide power wiring for the connection of motors and control equipment under this section. Except as otherwise noted or specified, automatic control wiring, control devices, and protective devices within the control circuitry are not included in this section, but must be provided under the section specifying associated equipment.

3.1.14 Government-Furnished Equipment

Contractor must rough-in for Government-furnished equipment to make equipment operate as intended, including providing miscellaneous items such as plugs, receptacles, wire, cable, conduit, and outlet boxes or fittings.

3.2 REPAIR AND SERVICE OF EXISTING STRUCTURES AND EQUIPMENT

Perform repair of existing structures and equipment[, demolition, and modification of existing electrical distribution systems] as follows:

3.2.1 Workmanship

NECA NEIS 1. Lay out work in advance. Exercise care where cutting, channeling, chasing, or drilling of existing surfaces is necessary for proper installation, support, or anchorage of conduit, raceways, or other electrical work. Repair damage to structure, piping, and equipment using skilled craftsmen of trades involved.

3.2.2 Existing Concealed Wiring to be Removed

Disconnect from its source. Remove conductors, cut exposed conduit flush with structure, and seal openings with material to match adjacent surfaces.

3.2.3 Existing Electrical Distribution System Removal

Include removal of equipment's associated wiring, including conductors, cables, exposed conduit, boxes, fittings, anchors, supports, and other such items, [back to equipment's source][as indicated]. Fill holes in structure where electrical equipment is removed with material to match adjacent surface. Provide unused openings in remaining boxes, fittings, and equipment with watertight nonmetallic knockout seals.

3.2.4 Continuation of Service

Maintain continuity of service to existing circuits of equipment to remain. Existing circuits of equipment must remain energized. Circuits which are to remain but were disturbed during demolition must have circuits wiring and power restored back to original condition.

3.3 FIELD QUALITY CONTROL

********************************************************************************

NOTE: Provide any additional test requirements for equipment requiring running tests or tests that must be coordinated with mechanical equipment.

********************************************************************************
Furnish test equipment and personnel. Notify Contracting Officer [5] [_____] working days prior to [each] [_____] test[s].

3.3.1 Devices Subject to Manual Operation

Operate each device subject to manual operation at least five times, demonstrating satisfactory operation each time.

3.3.2 Transformer Tests

Perform tests classified as routine in accordance with NEMA ST 20 on each transformer.

3.3.3 600-Volt Wiring Test

Test wiring rated 600 volts and less to verify that no short circuits or accidental grounds exist. Perform insulation resistance tests on wiring No. 6 AWG and larger diameter using instrument which applies voltage of approximately 500 volts to provide direct reading of resistance. Minimum resistance must be 250,000 ohms.

3.3.4 Grounding System Test

Test grounding system to ensure continuity and resistance to ground is not excessive. Test each ground rod for resistance to ground before making connections to rod; tie grounding system together and test for resistance to ground. Make resistance measurements in dry weather, not earlier than 48 hours after rainfall. Submit written results of each test to Contracting Officer, and indicate location of rods as well as resistance and soil conditions at time measurements were made.

3.3.5 Solar Power Station Test

Test solar power station for proper operation in accordance with manufacturer's recommendation.

3.4 SCHEDULE

Some metric measurements in this section are based on mathematical conversion of inch-pound measurements, and not on metric measurement commonly agreed to by the manufacturers or other parties. The inch-pound and metric measurements are as follows:

<table>
<thead>
<tr>
<th>PRODUCTS</th>
<th>INCH-POUND</th>
<th>METRIC</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Device plate (thickness)</td>
<td>0.10 inch</td>

PART 3 EXECUTION (Not Applicable)

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for motor control centers, switchboards and panelboards by formal advertising, using a SUPPLY-type contract. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

**PART 1 GENERAL**

NOTE: This section includes the technical requirements for the types of equipment provided at navigation locks and dams, flood control pumping plants, and hydroelectric power plants to supply auxiliary power to the power plant, switchyard, dam and other project facilities.

Applicable portions of this document will be incorporated into electrical specifications when equipment is purchased using a CONSTRUCTION-type contract. Modifications needed to do this will include: Modifying submittal requirements to
eliminate submittals tied to notice to proceed dates, adding a PART 3 EXECUTION section covering installation of the equipment, adding installation material, such as conduit and wire, and quality information to PART 2 PRODUCTS. Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM may be used as a basis for the EXECUTION section.

Suitable drawings showing the general arrangement and single-line diagram of each motor control center, switchboard, and panelboard should be included with the procurement specifications. The drawings should show the locations of conduit and cable entrances, details of nameplates, and tabulations showing the NEMA size of contactors and motor controllers, trip ratings of circuit breakers, solid state trips where required, alarm and bell contacts and shunt trips where required, sizes of feeder and branch circuit conductors, and ratings of motors and other loads.

This specification covers NEMA Class II motor control centers where interlocking and remote control are required as is engineering effort on the part of the manufacturer. Where cost savings may be realized by grouping motor controls together, but where motor operations are not interlocked, locally or remotely, and no manufacturer’s engineering effort required, NEMA Class I should be used. This specification may be modified for NEMA Class I motor control centers by deleting the following paragraphs from PART 2:

WIRING (except when applicable to switchboards)

TERMINAL BLOCKS (except when applicable to switchboards)

MOTOR CONTROL CENTERS - change references to Class II, type B and C.

Horizontal Wireways - the option for mater terminal block compartment should generally not be included.

Wiring for Motor Control Centers

Alternators

Operational Tests

**************************************************************************
1.1 SUMMARY

**************************************************************************

NOTE: Drafts of specifications submitted to higher authority for review and approval will consist of printed copies of this guide specification combined with pertinent sections of procurement documents as call for on Standard Form 33, both revised as
required for the particular procurement. Instructions for the preparation and submission of specifications for approval are included in ER 1110-2-1200.

The following is a bid item list to be included in section B of Standard Form 33 of a supply contract. This example should be modified to fit the individual contract requirements. Dissimilar motor control centers, switchboards and panelboards should be entered as separate bid items.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity.
or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**SD-02 Shop Drawings**

- Drawings; G[, [____]]
- Shop Drawings; G[, [____]]
- Motor Control Centers; G[, [____]]
- Switchboards; G[, [____]]
- Panelboards; G[, [____]]

**SD-03 Product Data**

- Equipment; G[, [____]]
- Factory Tests

**SD-06 Test Reports**

- Factory Tests

**SD-07 Certificates**

- Motor Control Centers
1.4  DELIVERY, STORAGE, AND HANDLING

**************************************************************************

NOTE: ABC phasing should be in accordance with NFPA 70 front-to-back, top-to-bottom, and left-to-right. Alternate phasing should be avoided, but where this cannot be done, the drawings should clearly reflect alternate phasing, and these specifications be modified to include requirement for marking the equipment.

**************************************************************************

Submit [6] copies of such descriptive cuts and information as are required to demonstrate fully that all parts of the equipment will conform to the requirements and intent of the specifications, within [30] calendar days after [date of award] for approval. Data shall include descriptive data showing typical construction of the types of equipment proposed, including the manufacturer's name, type of molded case circuit breakers or motor circuit protectors, performance capacities and other information pertaining to the equipment. [Also 6] sets of characteristic curves of the individual breaker trip element.] Ship the equipment as completely assembled and wired as feasible so as to require a minimum of installation work. Each shipping section shall be properly match marked to facilitate reassembly, and shall be provided with removable lifting channels with eye bolts for attachment of crane slings to facilitate lifting and handling. Any relay or other device which cannot withstand the hazards of shipment when mounted in place on the equipment shall be carefully packed and shipped separately. These devices shall be marked with the number of the panel which they are to be mounted on and fully identified. All finished painted surfaces and metal work shall be wrapped suitably or otherwise protected from damage during shipment. All parts shall be prepared for shipment so that slings for handling may be attached readily while the parts are in a railway car or transport truck. [Sections of equipment crated for shipment shall be of such size, including crates, that they will pass through a [_____] by [_____] hatch opening and a [_____] by [_____] wall opening.] All spare parts and accessories shall be carefully packaged and clearly marked.

1.5  MAINTENANCE

1.5.1  Accessories and Tools

Furnish a complete set of accessories and special tools unique to equipment provided and required for erecting, handling, dismantling, testing and maintaining the apparatus.

1.5.2  Extra Materials

**************************************************************************

NOTE: If three or more motors of the same size and manufacturer are required, the designer should specify more spare heater elements.

**************************************************************************

Furnish spare parts as specified below. All spare parts shall be of the same material and workmanship, shall meet the same requirements, and shall be interchangeable with the corresponding original parts furnished.
**SPARE PARTS**

**PART 2 PRODUCTS**

2.1 MATERIALS AND EQUIPMENT

Provide materials and equipment which are standard products of a manufacturer regularly engaged in their manufacture and that essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening and that conform to the requirements of these specifications. Materials shall be of high quality, free from defects and imperfections, of recent manufacture, and of the classification and grades designated. All materials, supplies, and articles not manufactured by the Contractor shall be the products of other recognized reputable manufacturers.

2.1.1 Rules

**************************************************************************

NOTE: Many manufacturers represent IEC ratings as equivalent to NEMA ratings or UL labeling. The two are different standards philosophies and are not interchangeable. IEC ratings are not acceptable

**************************************************************************
Provide equipment conforming to the requirements of NFPA 70 unless more stringent requirements are indicated herein or shown. NEMA rated and UL listed equipment has been specified when available. Equipment shall meet NEMA and UL construction and rating requirements as specified. No equivalent will be acceptable. Immediately notify the Contracting Officer of any requirements of the specifications or Contractor proposed materials or assemblies that do not comply with UL or NEMA. International Electrotechnical Commission (IEC) rated equipment will not be considered an acceptable alternative to specified NEMA ratings.

2.1.2 Coordination

**NOTE:** Combination motor controllers, using motor circuit protectors (MCP's) instead of thermal-magnetic circuit breakers, are offered as standard by several major manufacturers; however, the thermal-magnetic type is still offered as an option. The MCP is designed especially for motor circuits and will generally provide better protection for motors, controllers, and circuit conductors than the thermal-magnetic type. In any case, one or the other should be specified, so that all bids will be on the same basis. Generally, thermal magnetic breakers should be specified for reduced voltage starters because MCP do not have high enough current settings to avoid nuisance tripping from current inrush and switching transients generated during start to run sequence.

This specification does not cover the use of fused motor protection. Fuses are the least cost alternative, but require more maintenance. They are not recommended for powerhouse applications. Fuses may be acceptable for other applications, provided that suitable phase-voltage-unbalance protection for motors is specified.

When PART 3 criteria are added for CONSTRUCTION contracts, take care to prevent conflicts, gaps, or omissions.

The general arrangement of the motor control centers, switchboards and panelboards is shown on the contract drawings. Any modifications of the equipment arrangement or device requirements as indicated will be subject to the approval of the Contracting Officer. If any conflicts occur necessitating departures from the drawings, details of and reasons for departures shall be submitted and approved prior to implementing any change. Completely assemble all equipment at the factory. The motor control centers and switchboards may be disassembled into sections, if necessary, for convenience of handling, shipping, and installation.
2.2 NAMEPLATES

Provide nameplates made of laminated sheet plastic or of anodized aluminum approximately 4 mm 1/8 inch thick, engraved to provide white letters on a black background. The nameplates shall be fastened to the panels in proper positions with anodized round-head screws. Lettering shall be minimum 13 mm 1/2 inch high. Nameplate designations shall be in accordance with lists on the drawings, and as a minimum shall be provided for the following equipment:

a. Motor Control Centers
b. Individual items of equipment mounted in the Motor Control Centers
c. Switchboards
d. Individually-mounted circuit breakers in Switchboard
[e. Group-mounted circuit breakers in Switchboard]
f. Panelboards
g. Individually-mounted circuit breakers in Panelboard

Provide equipment of the withdrawal type with nameplates mounted on the removable equipment in locations visible when the equipment is in place.

2.3 CONNECTIONS

All bolts, studs, machine screws, nuts, and tapped holes shall be in accordance with ASME B1.1. The sizes and threads of all conduit and fittings, tubing and fittings, and connecting equipment shall be in accordance with ASME B1.20.2M ASME B1.20.1. All ferrous fasteners shall have rust-resistant finish and all bolts and screws shall be equipped with approved locking devices. Manufacturer's standard threads and construction may be used on small items which, in the opinion of the Contracting Officer, are integrally replaceable, except that threads for external connections to these items shall meet the above requirements.

2.4 MOLDED CASE CIRCUIT BREAKERS

Molded case circuit breakers shall conform to the applicable requirements of UL 489 and UL 489. The circuit breakers shall be manually-operated, shall be quick-make, quick-break, common trip type, and shall be of automatic-trip type unless otherwise specified or indicated on the drawings. All poles of each breaker shall be operated simultaneously by means of a common handle. The operating handles shall clearly indicate whether the breakers are in "On," "Off," or "Tripped" position and shall have provisions for padlocking in the "Off" position. Personnel safety line terminal shields shall be provided for each breaker. The circuit breakers shall be products of only one manufacturer, and shall be interchangeable when of the same frame size. [Where indicated on the drawings, circuit breakers shall be provided with shunt trip devices.] [Where indicated on the drawings, circuit breakers shall be provided with bell alarm contacts that close on automatic operation only. The contacts shall be suitable for [125] [_____] volts dc and shall reset when the breaker is reset.]
2.4.1 Trip Units

**************************************************************************
NOTE: Both thermal magnetic and solid state trip units have been included in this specification. Solid state units can be more reliable and permit more selective coordination since they can have long time pick-up, long time delay, short time pick-up, short time delay, instantaneous pick-up, ground fault pick-up, and ground fault time delay settings. Solid state units have come down in price and are becoming competitive with thermal magnetic units. Specific locations where solid state trips are required should be indicated on the drawings.
**************************************************************************

Except as otherwise noted, the circuit breakers, of frame sizes and the trip unit ratings as shown on the drawings, shall be provided with combination thermal and instantaneous magnetic or solid state trip units. The Government reserves the right to change the indicated trip ratings, within frame limits, of the trip devices at the time the shop drawings are submitted for approval. Submit [6] copies of outline drawings of all equipment to be furnished under this contract, together with weights and overall dimensions, within [30] calendar days after [date of award] [date of receipt of notice to proceed], for the approval of the Contracting Officer. The breaker trip units shall be interchangeable and the instantaneous magnetic trip units shall be adjustable on frame sizes larger than 150 amperes. Nonadjustable instantaneous magnetic trip units shall be set at approximately 10 times the continuous current ratings of the circuit breakers. [Solid state trip units, where indicated, shall also have adjustable [long time pick-up and delay], [short time pick-up and delay], [and ground fault pick-up and delay]].

2.4.2 480-Volt AC Circuits

Circuit breakers for 480-volt or 277/480-volt ac circuits shall be rated 600 volts ac, and shall have an UL listed minimum interrupting capacity of [14,000] symmetrical amperes at 600 volts ac.

2.4.3 120/240-Volt AC Circuits

Circuit breakers for 120-volt ac circuits shall be rated not less than 120/240 or 240 volts ac, and shall have a UL listed minimum interrupting capacity of [10,000] symmetrical amperes.

2.4.4 125-Volt DC Circuits

Circuit breakers for 125-volt dc circuits shall be two-pole rated 125/250 or 250 volts dc, and shall have an UL listed minimum interrupting capacity of [5,000] [10,000] amperes dc.

2.5 WIRING

All control wire shall be stranded tinned copper switchboard wire with 600-volt flame-retardant insulation Type SIS meeting UL 44 or Type MTW meeting UL 1063, and shall pass the VW-1 flame tests included in those standards. Hinge wire shall have Class K stranding. Current transformer secondary leads shall be not smaller than No. 10 AWG. The minimum size of control wire shall be No. 14 AWG. Power wiring for 480-volt circuits and
below shall be of the same type as control wiring and the minimum size shall be No. 12 AWG. Special attention shall be given to wiring and terminal arrangement on the terminal blocks to permit the individual conductors of each external cable to be terminated on adjacent terminal points.

2.6 TERMINAL BLOCKS

Control circuit terminal blocks for control wiring shall be molded or fabricated type with barriers, rated not less than 600 volts. The terminals shall be removable binding, fillister or washer head screw type, or of the stud type with contact and locking nuts. The terminals shall be not less than No. 10 in size and shall have sufficient length and space for connecting at least two indented terminals for 10 AWG conductors to each terminal. The terminal arrangement shall be subject to the approval of the Contracting Officer and not less than four (4) spare terminals or 10 percent, whichever is greater, shall be provided on each block or group of blocks. Modular, pull apart, terminal blocks will be acceptable provided they are of the channel or rail-mounted type. Submit data showing that the proposed alternate will accommodate the specified number of wires, are of adequate current-carrying capacity, and are constructed to assure positive contact between current-carrying parts.

2.6.1 Types of Terminal Blocks

2.6.1.1 Short-Circuiting Type

Short-circuiting type terminal blocks shall be furnished for all current transformer secondary leads and shall have provision for shorting together all leads from each current transformer without first opening any circuit. Terminal blocks shall meet the requirements of paragraph CONTROL CIRCUIT TERMINAL BLOCKS above.

2.6.1.2 Load Type

Load terminal blocks rated not less than 600 volts and of adequate capacity shall be provided for the conductors for NEMA Size 3 and smaller motor controllers and for other power circuits except those for feeder tap units. The terminals shall be of either the stud type with contact nuts and locking nuts or of the removable screw type, having length and space for at least two indented terminals of the size required on the conductors to be terminated. For conductors rated more than 50 amperes, screws shall have hexagonal heads. Conducting parts between connected terminals shall have adequate contact surface and cross-section to operate without overheating. Each connected terminal shall have the circuit designation or wire number placed on or near the terminal in permanent contrasting color.

2.6.2 Marking Strips

White or other light-colored plastic marking strips, fastened by screws to each terminal block, shall be provided for wire designations. The wire numbers shall be made with permanent ink. The marking strips shall be reversible to permit marking both sides, or two marking strips shall be furnished with each block. Marking strips shall accommodate the two sets of wire numbers. Each device to which a connection is made shall be assigned a device designation in accordance with NEMA ICS 1 and each device terminal to which a connection is made shall be marked with a distinct terminal marking corresponding to the wire designation used on the Contractor's schematic and connection diagrams. The wire (terminal point)
designations used on the Contractor's wiring diagrams and printed on terminal block marking strips may be according to the Contractor's standard practice; however, additional wire and cable designations for identification of remote (external) circuits shall be provided for the Government's wire designations. Drawings shall show the general arrangement and overall dimensions of the motor control centers, switchboards, and panelboards. These drawings shall show space requirements, details of any floor supports to be embedded in concrete and provisions for conduits for external cables. Prints of drawings submitted for approval will be so marked and returned to the Contractor for addition of the designations to the terminal strips and tracings, along with any rearrangement of points required.

2.7 SPACE HEATERS

**************************************************************************
NOTE: Heaters should be connected to an external power source in installations where the motor control center will not be energized continuously.
**************************************************************************

Space heaters shall be provided where indicated on the drawings and shall be controlled using an adjustable 10 to 35 degrees C 50 to 90 degrees F thermostat, magnetic contactor, and a molded-case circuit breaker [and a 480-120 volt single-phase transformer]. The space heaters shall be 250-watt, 240 volt strip elements operated at 120 volts and shall be [supplied from the motor control center bus] [wired to terminal blocks for connection to 120-volt single-phase power sources located external to the control centers]. The contactors shall be open type, electrically-held, rated 30 amperes, 2-pole, with 120-volt ac coils.

2.8 MOTOR CONTROL CENTERS

**************************************************************************
NOTES: This specification covers single stand alone lineup with front access. Not all arrangements can be listed and labeled under UL 845. Consult manufacturer's literature and UL listing availability for specific arrangements.
**************************************************************************

Auxiliary motor control centers should be NEMA Class II, Type B or C, as applicable. Type C construction includes master section terminal boards at the top or bottom of each vertical section and complete control wiring and power wiring for NEMA Size 3 and smaller controllers between the unit assemblies in each section and the master terminal boards. Type C construction is preferred and should be specified whenever a considerable amounts of interpanel control wiring or external control circuits is required. Designer should consider number of terminal blocks required for type C construction and ensure that there is sufficient space and access.

Where the unit assemblies consist primarily of feeder tap units with circuit breakers to supply power loads or starter units for individually controlled motors (such as for pumps in pumping stations), and very little interpanel and external
control wiring is required, the less expensive Type B construction, which does not include master section terminal boards, should be specified. If the procurement includes both types of control centers, the type of each control center should be clearly indicated.

The intent of the submittals below is to require NEMA Class II drawing packages. When it is desirable for the Government's wire numbers to be included on the drawings or custom drawing sizes and title blocks are required, NEMA Class IIS should be specified.

Should this specification be used in procurement of NEMA Class I equipment, the drawing packages are less involved and this paragraph edited accordingly.

Include this requirement only when contractual certification is required and Factory Test Reports without certification are not acceptable.

**************************************************************************

Each motor control center shall be designed for operation on 480-volts ac, 3-phase, 60-Hz system, and the equipment shall conform to all the applicable requirements of NEMA ICS 1, NEMA ICS 2, NEMA ICS 4 and NEMA ICS 6. Vertical sections and individual units shall be listed and labeled under UL 845 where ever possible. In lieu of the UL listing, certification from any nationally recognized, adequately equipped, testing agency that the individual units and vertical sections have been tested and conform to the UL requirements of that agency will be acceptable when approved by the Contracting Officer.

a. Certification of factory test reports. Certification shall be signed by official authorized to certify on behalf of the manufacturer, attesting that the motor control center meets the specified requirements. The statement shall be dated after the award of this contract, shall state the Contractor's name and address, shall name the project and location, and shall list the specific requirements which are being certified.

b. The motor control center shall be NEMA Class II, [Type B] [Type C] [Type B or C as indicated in the bid item list], motor control centers in accordance with NEMA ICS 2. Submit [6] [_____] copies of electrical equipment drawings, within [30] [_____] calendar days after [date of award] [date of receipt of notice to proceed], for the approval of the Contracting Officer. [The NEMA Class II[S] motor control center drawings shall include a connection diagram with wire designations and schematic diagrams to illustrate operation of associated motor unit controls.]

c. Submit an individual wiring diagram for each motor control center. [Wiring diagrams shall be in a form showing physical arrangement of the control center with interconnecting wiring shown by lines or by terminal designations (wireless).] Provide a single-line diagram, equipment list and nameplate schedule for each switchboard and panelboard.
2.8.1 Enclosures

**************************************************************************
NOTES: Stand alone front access line-ups are most desirable for ease of operation and maintenance, but particular installations may require specialized arrangements, such as back-to-back mounted units. Consult manufacturers for specialized requirements.

NFPA 70 Article 430H lists the various NEMA enclosure types for Motor Control Centers. Designer should ensure that the NEMA type specified meets design requirements.
**************************************************************************

Each motor control center shall consist of the required number of vertical sections of 2250 mm 90 inches nominal height, bolted together, with steel channel sills and suitable for mounting against a wall. Vertical section shall be 510 mm 20 inches deep and buses, control wiring, control transformers, small power transformers, terminal blocks, line terminals, cable supports, and clamps shall be accessible from the front. Enclosure shall be NEMA Type [1 gasketed] [12] [3R]. The control centers shall be fabricated from smooth select steel sheets shaped and reinforced to form rigid free-standing structures. Metal thickness for enclosures shall be not less than specified in NEMA ICS 6 without exception. Vertical edges of sections exposed to view shall be so fabricated and bolted that the joints will not pass a 1.6 mm 1/16 inch gage. Each structure shall be designed for addition of future sections required. Individual compartments shall be isolated from adjacent compartments.

2.8.1.1 Unit Compartments

Each operating unit shall contain equipment as shown on the drawings, mounted in an individual cell. The unit assembly, except main circuit breakers, panelboards and auxiliary control devices, shall be drawout type removed from the front, without rear access or disturbing other units in the control center assembly. All drawout type unit assemblies shall have positive guide rail system to ensure alignment of connection to vertical bus. Units shall be mechanically interlocked with the door to prevent removal while in the energized position. Each removable unit shall have provision for padlocking in a position in which it is disconnected from the vertical bus although not removed from the stationary structure. All ventilating openings shall be provided with corrosion-resistant insect-proof screens on the inside. Bus closing plugs shall be provided for all unused openings in vertical bus barriers.

2.8.1.2 Motor Control Center Doors and Covers

Each unit compartment, including blank compartments for future use, shall be provided with either a flange-formed or a rolled-edge door. Each door shall be mounted on fully-concealed or continuous full-length piano-type hinges and shall be provided with positive fasteners. Door sag shall be prevented by proper alignment of hinges made of sufficiently strong material. The door fastenings shall be so interlocked to prevent opening when the equipment is energized. The external operating handle shall clearly indicate whether the equipment is in an "ON", "OFF" or "TRIPPED" position.
2.8.1.3 Horizontal Wireways

[Structure shall have a minimum 300 mm 12 inches high wireway at the top and a 150 mm 6 inches minimum wireway at the bottom.] [Structure shall have a minimum 150 mm 6 inches high wireway at the top and a 300 mm 12 inches minimum wireway at the bottom.] Both horizontal wireways shall run the length of the structure [A master terminal block compartment with full length wireway space shall be provided at the [top] [bottom] [where indicated] in all Type C assemblies.] Cover plates shall be provided on the side of the assembly to permit extension of the horizontal bus and wireway when vertical sections are added.

2.8.1.4 Vertical Wireways

Vertical wireways shall be provided in all vertical sections accepting multiple plug-in components. Vertical wireways shall connect with horizontal wireways at the top and bottom and be a minimum 100 mm 4 inches wide. Barriers shall be provided in sections containing both ac and dc vertical buses. Doors shall be provided on each vertical wireway. The exposed surface of any door shall not deviate more than 1.5 mm 1/16 inch from a true plane.

2.8.1.5 Sills

**************************************************************************
NOTE: Structural sills are options provided by most manufacturers and provide the structural stability desired for equipment subject to the vibration of a powerhouse. When equipment is to be mounted on sills and on a maintenance pad, the 78" NFPA 70 requirement for height to operating handle may be exceeded unless space for operator to stand on pad is provided.
**************************************************************************

Channel iron foundations, complete with bolts and drilled holes for grouting and anchoring to the floor, shall be furnished for the complete length (front and rear) of each motor control center assembly. The channels shall be designed for flat mounting and maximum channel depth shall be 38 mm 1-1/2 inches. Additional channel or substantial metal trim shall be provided flush with the end panels to completely enclose the bases across the ends of the equipment assemblies.

2.8.1.6 NEMA 3R Enclosures

**************************************************************************
NOTE: Enclosures covered by this specification are not intended to be non walk-in type. Walk-in front-aisle, walk-in common aisle and walk through common aisle styles are available, and where required should be specified. The latter styles of enclosures shall comply with NFPA 101 for means of egress and lighting.
**************************************************************************

The motor control center shall be non-walk in NEMA Type 3R rainproof enclosure as shown on the drawings. The outside enclosure shall consist of smooth select steel sheets on a structural steel frame. Full-length single or double doors shall be provided with top and bottom bolts and a center
latch operated by means of a keyed handle. Steel sheets and doors shall be not less than 3.5 mm No. 10 gage thick and doors shall have bent angle or channel edges with all corner seams welded and ground smooth. The motor control center within the enclosure shall be assembled with adequate gaskets and structure to assure a measure of vandal resistance. Ventilating openings and an effective insulating air space of approximately 50 mm 2 inches shall be provided below the roof of the structure which shall slope from front to back for adequate drainage. The outside edges of the control center base shall permit easy sealing at the concrete surface with mastic compound. A 200-watt outdoor lighting fixture with globe and guard shall be furnished to light the front of the assembly. All lighting connections shall be watertight. A weatherproof switch installation shall be furnished on the front or side of the enclosure so that the light can be switched prior to opening the assembly doors. The exterior manual switch shall be "ac" rated, 15 amperes, 120/277 volts. Two duplex receptacle units shall be provided within the outer weatherproof enclosure. The lighting fixture and receptacles shall be wired to the 120-volt ac panelboard located in the control center, and external wiring shall be run in rigid galvanized steel conduit.

2.8.1.7 Shutters

Drawout units shall have shutters which close when the unit is withdrawn to isolate the vertical bus.

2.8.1.8 [Thermostatically Controlled Strip Heaters

**************************************************************************
NOTE: Delete this paragraph when not required.
**************************************************************************
Thermostatically controlled strip heaters as specified in paragraph SPACE HEATERS shall be provided [in all motor control centers] [where indicated].

2.8.2 Buses

**************************************************************************
NOTES: When either copper or aluminum bus are allowed the manufacturers will generally provide the less expensive aluminum. Use ASTM 317 when aluminum bus is permitted.

NEMA ICS 2 allows a 65 degrees C 117 degrees F temperature rise on the buses, irrespective of the equipment used. UL 845 allows 65 degrees C 117 degrees F temperature rise only under certain conditions. In general this means all buses must be plated and devices must be UL labeled for the higher temperatures. If this is not the case, the UL standard for temperature rise is 50 degrees C 90 degrees F creating a conflict with NEMA. The designer should be aware of this difference. This specification references the UL standard and bases the rise on the exceptions it permits.

**************************************************************************

All buses shall be of copper [or aluminum] and [all bolted splices and connections between buses and for extensions or taps for equipment shall be tin or silver-plated] [shall be tin or silver-plated throughout]. Copper
[or aluminum] bars and shapes for bus conductors shall conform to the applicable requirements of ASTM B187/B187M [and ASTM B317/B317M]. All splices for field assembly shall be bolted with at least two bolts and shall employ the use of "Belleville" washers in the connection. The bus ratings shall be based on a 65 degree Celsius maximum temperature rise in accordance with UL 845 requirements. Bus shall have a short-circuit current rating of not less than [42,000] [65,000] [100,000] RMS symmetrical amperes. All bus work shall be supported on wet process porcelain insulators, glass polyester, or suitable molded material.

2.8.2.1 Horizontal Bus

Each control center assembly shall be provided with a three-phase main horizontal bus, with a continuous current rating not less than [600] [800] [1,000] [1,200] amperes, located across the top of each vertical section. The ends of horizontal buses shall be drilled for future extensions. [The main horizontal bus shall be fully insulated.]

2.8.2.2 Vertical Bus

Each vertical section shall be provided with a three-phase vertical bus with a continuous current rating of [300] [600] amperes connected to the horizontal bus by brazing, welding, or bolting. Where the incoming feeder breakers are located at the bottom of a control center, the vertical bus in that section shall be rated the same as the main horizontal bus. Vertical buses shall extend from the horizontal bus to the bottom of the lowest available unit mounting space. The vertical bus shall be isolated from wireways and equipment in compartments.

2.8.2.3 [Ground Bus

******************************************************************************

NOTE: Delete this paragraph when not required.
******************************************************************************

A copper [or aluminum] ground bus shall be provided full width at the bottom of the motor control center line-up. A full clamp-type solderless copper or copper alloy lug for No. 2/0 AWG stranded copper cable shall be provided at each end of the bus for connection to the station grounding system.]

2.8.2.4 [Neutral Bus

******************************************************************************

NOTE: Delete this paragraph when not required.
******************************************************************************

A [half] [fully] rated neutral bus shall be furnished continuous through the control center. Lugs of appropriate capacity will be furnished.]

2.8.3 Combination Starters

******************************************************************************

NOTES: The minimum bus short-circuit rating for most manufacturers is 42,000 amps rms symmetrical. Most combination starters without current limiting type circuit breakers or motor circuit protectors have a short circuit rating of 25,000 amps. The designer shall evaluate the available short circuit
current for a particular installation and place that value in the space provided.

When short-circuit ratings above 25,000 amps are required, the designer should consult manufacturer's data for the availability of non-current limiting devices at the specific rating and where needed, show current limiting circuit breakers or motor circuit protectors the drawings.

In accordance with NEMA ICS 2, the motor control center short-circuit rating is the maximum available rms symmetrical current in amperes permissible at its line terminals which are computed as the sum of the maximum available current of the system at the point of connection and the short-circuit current contribution of the motors connected to the control center. In the absence of more precise information, the motor short-circuit current contribution may be assumed to equal four times the continuous current rating of the motor control center.

Reduced voltage type starters are specified in the following paragraph. They should be used in specialized applications, and indicated on the drawings. Reduced voltage starting should be avoided where possible.

This specification does not cover reversing starters. Where a reversing starter is required, indicate reversing and non-reversing starters on the drawings, and modify the specification for clarity.

NEMA sizes are based on continuous duty motors. Where acceleration time exceeds 10 seconds, or plugging or jogging duty are required, consult the manufacturer.

For high efficiency motors, the designer shall investigate time-current curve characteristics of the circuit breaker or MCP overcurrent protection to ensure that the increased starting current of these motors does not exceed the NFPA 70 standard ratings.

To determine whether to select motor circuit protectors or molded-case circuit breakers, see subparagraph Coordination in Part 1.

**************************************************************************
Combination motor controller units shall contain [motor circuit protectors] [molded-case circuit breakers], auxiliary and pilot devices and [a magnetic contactor with thermal overload relays] [[or] [and] reduced voltage starter where indicated on the drawings]. The ratings of [motor circuit protectors,] air circuit breakers, contactors, motor controllers and other devices shall be as shown on the drawings. All combination motor controller units shall have short circuit ratings equal to [_____] or greater. Where control push-buttons, indicating lamps, "Hand-Off-Automatic" switches, and similar control devices are associated with a unit, they shall be mounted on the unit compartment door.
Door-mounted components shall not interfere with access within the compartments. [Molded case circuit breakers for use in combination starters shall meet the requirements of paragraph MOLDED CASE CIRCUIT BREAKERS.] [Motor circuit protectors shall be only part of the combination starters as required by NFPA 70 and shall conform to all requirements of paragraph MOLDED CASE CIRCUIT BREAKERS, except that trip units shall have provision for locking the selected trip setting.]

2.8.3.1 Magnetic Contactors

Magnetic contactors shall be of the NEMA sizes indicated on the drawings. The rating, performance and service characteristics shall conform to the requirements of NEMA ICS 2 for contactors with continuous current ratings for the duty indicated. Contactors for motor control shall be rated for full-voltage starting (Class A controllers). Contactors shall be suitable for at least 200,000 complete operations under rated load without more than routine maintenance. The interruption arc and flame shall be minimized by suitable arc chutes or other means so that no damage will be done to other portions of the device. The arc chutes, if provided, shall be easily removable without removing or dismantling other parts. The contacts shall be easily removable. All current-carrying contact surfaces shall be silver-surfaced or of other approved material to prevent the formation of high resistance oxides. The contactor shall operate without chatter or perceptible hum while energized. Coils shall be suitable for continuous operation [120-volt ac] [480-volt ac] [125-volt dc] circuits. Alternating-current contactors shall be three-pole, except where otherwise noted, and shall be insulated for 600 volts ac and of the electrically-operated, magnetically-held type. Direct-current contactors shall be two-pole, suitable for controlling circuits operating at 125 volts dc, insulated for 250 volts dc, electrically-operated, magnetically-held type and adequate for full-voltage motor starting service.

2.8.3.2 [Reduced Voltage Starters

**************************************************************************

NOTES: Motor loads using reduced voltage starting must be able to operate with reduced starting torque.

Autotransformer starters should be used when voltage drop due to motor starting current is a problem. Solid state starters may also be used. Designer to determine best alternative.

Solid state starters provide a smooth acceleration and are suitable for pump starting. Acceleration requirements must be coordinated to specific motor.

Delete this paragraph when reduced voltage starters are not required.

**************************************************************************

[Autotransformers shall be rated for medium duty and have taps according to NEMA ICS 2. For thermal overload protection, the autotransformer shall have normally closed thermostat wired in series with the normally closed thermal overload contact of the starter. Initial connection shall be to the [65] [_____] percent tap.] [Solid State soft-start starters shall be three phase SCR controlled for stepless reduced voltage starting of induction motors.] Current transformers shall provide feedback signal to regulate torque during start up and to prevent overload conditions while
motor is running. Starter shall have starting current of 300 percent of full load amps for thirty seconds, bypass/isolation contactor, and three phase thermal overload relay.)

2.8.3.3 Auxiliary Contacts

Each controller shall be provided with a minimum of three auxiliary contacts which can be easily changed from normally open to normally closed. Where indicated on the drawings, a fourth auxiliary contact and red and green indicating lights shall be provided.

2.8.3.4 Overload Relays

**************************************************************************
NOTE: The standard NEMA Class 20 overload relay operates at 600 percent of its rating after a maximum of 20 seconds. Other standards are Class 10 and Class 30, operating at a maximum of 10 and 30 seconds. This may be required for special applications.
**************************************************************************

Except as otherwise indicated, each controller shall be provided three NEMA Class 20 thermal overload relays with external manual reset. Prior to shipment of the control centers, the Contracting Officer will furnish the ratings of the heater elements to be installed in the relays by the Contractor.

2.8.3.5 [Individual Control Transformers

**************************************************************************
NOTE: Delete this paragraph as well as requirement for spare control transformer when a single control transformer for the motor control center is mounted in a unit compartment or external control source is provided.

Primary fuses for individual control transformers are given as an option. For less than 50 VA, they are not required or desired. Please refer to NFPA 70 section 430-72(c).
**************************************************************************

Where 120 volt ac control of contactors is indicated or required, individual control transformer shall be provided on the line side of the unit disconnect. The control transformers shall be rated 480-120 volts and shall conform to the requirements for control transformers in NEMA ST 1. Control transformers shall have adequate volt-ampere capacity for the control functions indicated. Transformers shall be installed [without] [with] primary fuses. [Primary fuses shall be Class J.] Except as otherwise indicated on the drawings, each control transformer shall be provided with a fuse in one secondary lead and shall have the other secondary lead grounded.)

2.8.3.6 [Voltage Fault Protection

**************************************************************************
NOTE: Voltage fault protection requirements should be evaluated and this paragraph deleted when not
Where shown, starters shall be provided with protection against [voltage
faults,] [phase unbalance,] [phase loss,] [phase reversal,] [undervoltage]
[and overvoltage]. Upon sensing one of these faults, the protector shall
de-energize the starter. The protector shall use a combination of voltage
and phase-angle sensing to detect phase loss even when regenerated voltages
are present. The protector shall be connected to the load side of the
motor circuit disconnect. The protector shall have an adjustable line
voltage trip level, adjustable trip delay, automatic reset [and manual
reset by an external normally closed push-button,] and Double Pull Double
Throw (DPDT) output contacts. Protector operation shall have repeatability
of +1 percent of set point, maximum, and a dead band of 2 percent maximum.
Protector shall have green indicator to show normal status and red
indicator to show tripped status. Indicators will be visible through the
compartment door, when LED's are used protector shall be covered with a
clear unbreakable cover, when lamps are used they shall have nameplates and
be grouped with other indicating lights.]

2.8.3.7 Control Circuit Disconnects

************ The requirement for disconnect of the control
circuit when the unit compartment is open complies
with NFPA 70 Article 430 F section 430-74.
Generally, manufacturers do not disconnect control
voltage except when racking out the starter unit,
meeting California code, but not NFPA as currently
written. With racking, control circuit voltage is
present when the unit compartment is open, which may
be a safety risk. This paragraph is a specialized
requirement to avoid such a safety hazard. Specific
designs may require a variance. There are available
high density pull apart terminals in the unit
compartments to disconnect control voltage, after
the unit is open. The latter meets the intent of
NFPA, but not the letter. The designer shall
investigate specific project requirements for
interlocking and safety, and modify this paragraph
accordingly.

Control circuit power shall disconnect when the unit compartment is opened.

2.8.4 Molded Case Circuit Breakers in Unit Compartments

Molded case circuit breakers for installation in unit compartments shall
meet the requirements of paragraph MOLDED CASE CIRCUIT BREAKERS above.

2.8.5 Panelboards for Motor Control Centers

Panelboards shall meet the requirements of paragraph PANELBOARDS.

2.8.6 Distribution Transformers

Dry type transformers for power and lighting loads shall be furnished with
voltage and kVA ratings as indicated on the drawings. The transformers
shall conform to the requirements for general-purpose transformers in
NEMA ST 20. Each transformer shall be protected on the primary side with a molded case circuit breaker as indicated on the drawings. [Transformers shall be drawout type.]

2.8.7 [Ground Detector Indicator]

**************************************************************************
NOTE: Ground detectors requirements should be evaluated and this paragraph deleted when not required.
**************************************************************************

Ground-detector indicator (GDI) shall be rated 120-volts; have three lamps, one per phase, three 480-120 volt transformers connected delta-wye, adjustable loading resistor for balancing capacitive charging current, and push-to test-switch. GDI shall provide visual indication of a single ground-fault on any phase (A, B, or C) of a three-phase, three-wire ungrounded power system. When no phase is grounded, all lamps shall glow at partial brightness, giving long lamp life, the push-to test switch shall not affect the brightness of any lamp. When a single ground-fault occurs on any phase, the lamp that corresponds to the faulted phase shall be dark and the other two lamps shall glow at full brightness. The push-to-test switch shall cause all lamps to return to partial brightness, showing the GDI is functioning properly.]

2.8.8 Wiring for Motor Control Centers

All wiring shall meet the requirements of paragraph WIRING above. Provide heavy-duty clamp type terminals for terminating all power cables entering the control centers.

2.8.8.1 Contractor's Wiring

The Contractor's wiring shall be formed into groups, suitably bound together, properly supported and run straight horizontally or vertically. There shall be no splices in the wiring. The manufacturer's standard pressure-type wire terminations for connections to internal devices will be acceptable. Terminal blocks shall be added for wiring to devices having leads instead of terminals. Ring tongue indented terminals shall be used on all wires terminated on control terminal blocks for external or interpanel connections and at shipping splits. All stud terminals shall have contact nuts and either locking nuts or lockwashers.

2.8.8.2 External Connections

**************************************************************************
NOTE: For NEMA 3R enclosures power cables shall enter from the bottom.
**************************************************************************

Power and control cables will enter the control centers at the [bottom] [top] [where shown on the drawings]. [Where power and control entry points are not shown, and terminal blocks are not given on the drawings, the Government will furnish this information to the Contractor after award of contract.]

2.8.8.3 Terminal Blocks

Terminal blocks shall meet the requirements of paragraph TERMINAL BLOCKS
above. In no case shall the terminals provided for circuit breakers or contactors accommodate less than the number or size of conductors shown on the drawings. Special attention shall be given to wiring and terminal arrangement on the terminal blocks to permit the individual conductors of each external cable to be terminated on adjacent terminal points.

2.8.9  [Control Transformers]

**************************************************************************
NOTE: Delete when individual control transformers are specified or external control circuit is provided.
**************************************************************************

Control transformers for several starter units shall be mounted in a separate compartment and its primary windings shall be connected to the main bus through a molded case circuit breaker of suitable rating. The control transformers shall be rated 480-120 volts and shall conform to the requirements for control transformers in NEMA ST 1. Control transformers shall have adequate volt-ampere capacity for the control functions indicated and an additional 10 percent capacity. Transformers shall be installed without primary fuses. Except as otherwise indicated on the drawings, each unit compartment shall provide a fuse for control power in one secondary lead and shall have the other secondary lead grounded. The unit disconnect shall be equipped with a normally open contact to isolate the control circuit from the source when the controller disconnect is open.]

2.8.10  Accessories and Control Devices

**************************************************************************
NOTE: Retain only paragraphs for accessories actually used for a given procurement.
**************************************************************************

Control accessories shall be provided, and shall be suitable for mounting on the front of, or inside, the control centers as indicated on the drawings. Control accessories shall meet the applicable requirements of NEMA ICS 2. Relays and other equipment shall be so mounted that mechanical vibration will not cause false operation.

2.8.10.1  Control Stations

Push-button stations and selector switches shall conform to NEMA ICS 2, shall be of the heavy-duty, oil-tight type, rated 600 volts ac, and have a contact rating designation of A600. Switches shall be provided with escutcheon plates clearly marked to show operating positions. [Sufficient contact blocks shall be provided to make up the electrically separate contacts required for lead-lag selector switches.]

2.8.10.2  LED Indicating Lights

Red and green LED's shall be furnished where shown on the drawings, indicating contact "open" and "closed" position. The LED's shall be accessible and replaceable from the front of the control center through a finished opening in the compartment door. The LED assemblies shall be of the heavy duty oiltight, watertight, and dusttight type.
2.8.10.3 Control Relays

Control relays shall be of the electrically operated, magnetically held, self-reset, open type, suitable for mounting inside the starter compartments, and shall be [125-volt dc] [120-volt ac]. Contacts shall be as indicated on the drawings and shall have a contact rating designation of A600 or N600, as required, in accordance with NEMA ICS 2.

2.8.10.4 Timing Relays

Timers shall be pneumatic type. They shall be suitable for mounting inside the control center and shall be rated 120 volts ac, 60 Hz. Instantaneous and time delay contacts shall be provided as indicated on the drawings, and shall have a contact rating designation of A600 or N600, as required, in accordance with NEMA ICS 2. Means shall be provided for manual adjustment over a range as indicated on the drawings.

2.8.10.5 Alternators

Alternators 120-volt, 60 Hz, single-phase, open type, suitable for mounting inside of control center as indicated. Alternators shall automatically cycle two motor starters in such a manner that No. 1 will lead and No. 2 will lag during the first cycle, and during the second cycle No. 2 will lead and No. 1 will lag, and the third cycle will repeat the first cycle. The duration of a cycle will be determined by an [external device] [adjustable time delay]. Contacts shall have a minimum contact rating designation of A600 or N600, as required, in accordance with NEMA ICS 2.

2.8.10.6 Elapsed-Time Meters

Hour-indicating time meters shall have 6-digit registers with counter numbers at least 6 mm 1/4 inch high. White numbers on black backgrounds shall provide hour indication with the last digit in contrasting colors to indicate tenths of an hour. The enclosure shall be 90 mm 3-1/2 inches square and dust resistant. Operating voltage shall be 120 volts ac. They shall be of the nonreset type.

2.8.11 Feeder Tap Units

Feeder tap units shall be provided as indicated on the drawings.

2.8.12 Metering Section

Metering section shall be provided with instruments as indicated on the drawings.

2.8.12.1 Instrument Transformers

All transformers used for metering shall meet the requirements of NEMA/ANSI C12.11 and IEEE C57.13. Voltage transformers shall be protected with removable primary and secondary fuses. Fuses shall be installed in each ungrounded lead and located adjacent to the transformers in an easily accessible place. If cable connections to current transformer primary are required, terminals of an approved solderless type and proper size shall be furnished. If current transformers are connected to busses, proper connections shall be furnished, complete with bolts, nuts, washers and other accessories.
2.8.12.2 Ammeters

Switchboard type ammeter shall be provided where indicated on the drawings. Ammeter, range 0 to [_____] amperes, complete with selector switch having off position and positions to read each phase current. Meters shall be long scale 175 mm 6.8 inches), semiflush rectangular, indicating type mounted at eye level.

2.8.12.3 Voltmeters

Switchboard type voltmeter shall be provided where indicated on the drawings. Voltmeter, range 0 to 600 volts, complete with selector switch having off position and positions to read each phase to phase voltage. Meters shall be long scale 175 mm 6.8 inches, semiflush rectangular, indicating type mounted at eye level.

2.8.12.4 Watthour Meters

Watthour meters shall conform to ANSI C12.1 and NEMA/ANSI C12.10, except numbered terminal wiring sequence and case size may be the manufacturer's standard. Watthour meters shall be of the drawout switchboard type having a 15-minute, cumulative form, demand register meeting NEMA C12.4 and provided with not less than two and one-half stators. [Watthour demand meters shall have factory installed electronic pulse initiators meeting the requirements of ANSI C12.1.]

2.8.12.5 Switches

All metering switches shall be of the rotary switchboard type with handles on the front and operating contact mechanisms on the rear of the panels. Control switches shall be suitable for operation on 600-volt AC or 250-volt DC circuits. All such switches shall be capable of satisfactorily withstanding a life test of at least 10,000 operations with rated current flowing in the switch contacts. Selector switches shall be maintained-contact type with the required number of positions, and shall have round notched, or knurled handles. Ammeter switches shall not open the secondary circuits of current transformers at any time. Instrument switches for potential selection shall have oval handles.

2.8.13 [Power-Factor-Correction Capacitors

*****************************************************************************************************************************************
NOTES: Power factor correction capacitors should not be used on the load side of solid state starters. Motor control center manufacturers do not normally contact the motor manufacturers, so where possible the designer shall show KVAR ratings on the drawings, coordinating these requirements with actual motors used.

When power factor correction is not needed, delete this paragraph.
*****************************************************************************************************************************************

Three-phase, delta-connected capacitors for power factor improvement shall be rated [_____] volts, 60 Hz. [Capacitors shall have KVAR capacity as shown on the drawings] [The capacitor KVAR capacity shall be selected to achieve no less than [_____] percent leading nor more than [_____] percent lagging power factor at nameplate value of motor full load current. The
KVAR capacity of the capacitors shall not be greater than that recommended by the motor manufacturer or if no such recommendation exists, that value which gives with a lagging power factor at no-load. If size permits, the capacitors shall be mounted in an adjacent compartment, or otherwise shall be mounted separately and connected to the motor at the motor terminal box. [For reduced voltage starters, the capacitors shall be separately switched with a time-delayed contactor rated according to NEMA ICS 2 for capacitor switching.]

2.8.14 [Space for Mounting PLC's

**************************************************************************

NOTE: Delete this paragraph when PLC's are not used.
**************************************************************************

Space for mounting of Programmable Logic Controllers (PLC's) shall be provided as indicated on the drawings.]

2.9 SWITCHBOARDS

**************************************************************************

NOTES: The switchboard specified below is not intended for applications where the available fault current is above 65,000 amps. Where drawout-type breakers, and high short circuit current ratings are desired, Section 26 22 00.00 10 480-VOLT STATION SERVICE SWITCHGEAR AND TRANSFORMERS should be used.

The short-circuit current rating assigned to the switchboard shall be in accordance with NEMA PB 2.

**************************************************************************

The switchboards shall be dead-front switchboards conforming to NEMA PB 2 and labeled under UL 891. The switchboards shall be completely enclosed self-supporting metal structures with the required number of vertical panel sections, buses, molded-case circuit breakers, [and other devices] as shown on the drawings. Switchboards shall be fully rated for a short-circuit current of [14,000] [22,000] [65,000] [_____] symmetrical amperes RMS AC.

2.9.1 Enclosure

**************************************************************************

NOTE: Mounting sills should be included for all new construction to provide structural integrity. NEMA PB 2 90° height includes these sills.

**************************************************************************

Each switchboard enclosure shall be NEMA type [2] [3R], built with selected smooth sheet steel panels of not less than 1.9 mm No. 14 gage. Exposed panels on the front and ends shall have bent angle or channel edges with all corner seams welded and ground smooth. The front outside surfaces shall not be drilled or welded for the purpose of attaching wires or mounting devices if such holes or fastenings will be visible from the front. The front panels shall be made in sections flanged on four sides and attached to the framework by screws and arranged for ready removal for inspection or maintenance. [Rear access to the bus and device connections shall be provided.] Ventilating openings shall be provided as required and shall preferably be of the grille type. All ventilating openings shall be provided with corrosion-resistant insect-proof screens on the inside.
[Each switchboard shall be provided with a channel iron base at front, rear, and sides, with exposed ends covered by welded steel plates. Grout holes shall be provided. The switchboard sections shall be bolted to the base.] [Switchboards shall be mounted as shown on the drawings and mounting materials shall be furnished as indicated.] All interior and exterior steel parts shall be treated to inhibit corrosion and shall be painted as specified in paragraph PAINTING.

2.9.2 Bus

******************************************************************************

NOTE: When either copper or aluminum bus is allowed the manufacturers will generally provide the less expensive aluminum. Use ASTM 317 when aluminum bus is permitted. Silver plating allows for a greater temperature rise on the bus.

******************************************************************************

All buses shall be of copper [or aluminum] and [all bolted splices and connections between buses and for extensions or taps for equipment shall be tin or silver-plated [throughout]. Copper [or aluminum] bars and shapes for bus conductors shall conform to the applicable requirements of ASTM B187/B187M [, and ASTM B317/B317M]. All splices for field assembly shall be bolted with at least two bolts and shall employ the use of "Belleville" washers in the connection. Horizontal and vertical power buses have minimum current ratings as shown on the drawings. The buses shall be insulated for not less than 600 volts. Shop splices and tap connections shall be brazed, pressure-welded or bolted. All splices for field assembly shall be bolted. The buses shall be mounted on insulating supports of wet process porcelain, glass polyester, or suitable molded material, and shall be braced to withstand not less than [14,000] [22,000] [65,000] [_____] symmetrical amperes ac.

2.9.3 Grounding Bus

******************************************************************************

NOTE: Delete this paragraph when not required.

******************************************************************************

A copper [or aluminum] ground bus, rated not less than 300 amps, extending the entire length of the assembled structure, shall be mounted near the bottom of enclosure. A full clamp-type solderless copper or copper alloy lug for No. 2/0 AWG stranded copper cable shall be provided at each end of the bus for connection to the station grounding system.]

2.9.4 Components

Each switchboard shall be equipped with molded-case circuit breakers conforming to paragraph MOLDED CASE CIRCUIT BREAKERS and with frame sizes, trip ratings, and terminal connectors for attachment of outgoing power cables as shown on the drawings. The circuit breakers shall be individually stationary mounted, as shown on the drawings, and shall be operable and removable from the front. Where shown on the drawings, circuit breakers shall be enclosed in individual compartments. [The group-mounted circuit breakers shall be provided complete with bus work in an integrated assembly on the switchboard and shall conform to the applicable requirements of paragraph PANELBOARDS.]
2.10  PANELBOARDS

**************************************************************************
NOTE: The short-circuit current rating assigned to
the panelboard shall be in accordance with NEMA PB 1.
**************************************************************************

Panelboards shall consist of assemblies of molded-case circuit breakers
with buses and terminal lugs for the control and protection of branch
circuits to motors, heating devices and other equipment operating at 480
volts ac or less. Panelboards shall be UL 67 labeled. "Loadcenter" type
panels are not acceptable. Panelboards shall be designed for installation
in surface-mounted or flush-mounted cabinets accessible from the front
only, as shown on the drawings. Panelboards shall be fully rated for a
short-circuit current of [14,000] [22,000] [_____] symmetrical amperes RMS
ac.

2.10.1  Enclosure

Enclosures shall meet the requirements of UL 50. All cabinets shall be
fabricated from sheet steel of not less than 3.5 mm No 10 gage if
flush-mounted or mounted outdoors, and not less than 2.7 mm No 12 gage if
surface-mounted indoors, with full seam-welded box ends. Cabinets mounted
outdoors or flush-mounted shall be hot-dipped galvanized after
fabrication. Cabinets shall be painted in accordance with paragraph
PAINTING. Outdoor cabinets shall be of NEMA 3R raintight and [conduit hubs
welded to the cabinet] [a removable steel plate 6 mm 1/4 inch thick in the
bottom for field drilling for conduit connections.] Front edges of
cabinets shall be form-flanged or fitted with structural shapes welded or
riveted to the sheet steel, for supporting the panelboard front. All
cabinets shall be so fabricated that no part of any surface on the finished
cabinet shall deviate from a true plane by more than 3 mm 1/8 inch. Holes
shall be provided in the back of indoor surface-mounted cabinets, with
outside spacers and inside stiffeners, for mounting the cabinets with a 13
mm 1/2 inch clear space between the back of the cabinet and the wall
surface. Flush doors shall be mounted on hinges that expose only the hinge
roll to view when the door is closed. Each door shall be fitted with a
combined catch and lock, except that doors over 600 mm 24 inches long shall
be provided with a three-point latch having a knob with a T-handle, and a
cylinder lock. Two keys shall be provided with each lock, and all locks
shall be keyed alike. Finished-head cap screws shall be provided for
mounting the panelboard fronts on the cabinets. Enclosure shall have
nameplates in accordance with paragraph NAMEPLATES. Directory holders,
containing a neatly typed or printed directory under a transparent cover,
shall be provided on the inside of panelboard doors.

2.10.2  Buses

**************************************************************************
NOTE: When either copper or aluminum bus is allowed
the manufacturers will generally provide the less
expensive aluminum. Use ASTM 317 when aluminum bus
is permitted. Silver plating the bus allows for
higher temperature rise and is not generally
required.
**************************************************************************

All panelboards shall be of the dead-front type with buses and circuit
breakers mounted on a plate or base for installation as a unit in a
cabinet. All buses shall be of copper [or aluminum] [and shall be tin or silver-plated throughout]. Copper [or aluminum] bars and shapes for bus conductors shall conform to the applicable requirements of ASTM B187/B187M [and ASTM B317/B317M]. The sizes of buses and the details of panelboard construction shall meet or exceed the requirements of NEMA PB 1. Suitable provisions shall be made for mounting the bus within panelboards and adjusting their positions in the cabinets. Terminal lugs required to accommodate the conductor sizes shown on the drawing, shall be provided for all branch circuits larger than No. 10 AWG. A grounding lug suitable for 1/0 AWG wire shall be provided for each panelboard.

2.10.3 Components

Each branch circuit, and the main buses where so specified or shown on the drawings, shall be equipped with molded-case circuit breakers having overcurrent trip ratings as shown on the drawings. The circuit breakers shall be of a type designed for bolted connection to buses in a panelboard assembly, and shall meet the requirements of paragraph MOLDED CASE CIRCUIT BREAKERS. Circuit breakers of the same frame size and rating shall be interchangeable. [Bell alarm contacts shall be furnished as indicated on the drawings and shall be wired to terminal blocks mounted in the cabinet. Terminal blocks shall conform to requirements of paragraph TERMINAL BLOCKS.]

2.11 FACTORY TESTS

Each item of equipment supplied under this contract shall be given the manufacturer's routine factory tests and tests as specified below, to insure successful operation of all parts of the assemblies. All tests required herein shall be witnessed by the Contracting Officer unless waived in writing, and no equipment shall be shipped until it has been approved for shipment by the Contracting Officer.

a. Submit [6] [_____] copies of manufacturer's routine factory test procedures and production line tests for all motor control centers and switchboards, within a minimum of [14] [_____] days prior to the proposed date of tests. Notify the Contracting Officer a minimum of [14] [_____] days prior to the proposed date of the tests so that arrangements can be made for the Contracting Officer to be present at the tests.

b. The factory test equipment and the test methods used shall conform to the applicable NEMA Standards, and shall be subject to the approval of the Contracting Officer. Submit [6] [_____] complete reproducible copies of the factory inspection results and [6] [_____] complete reproducible copies of the factory test results in booklet form, including all plotted data curves, all test conditions, a listing of test equipment complete with calibration certifications, and all measurements taken.

c. Report shall be signed and dated by the Contractor's and Contracting Officer's Representatives. Reports of all witnessed tests shall be signed by witnessing representatives of the Contractor and Contracting Officer. The cost of performing all tests shall be borne by the Contractor and shall be included in the prices bid in the schedule for equipment.
2.11.1 Motor Control Centers Tests

2.11.1.1 Dielectric Tests

Each motor control center shall be completely assembled and given dielectric tests in accordance with NEMA ICS 1.

2.11.1.2 Operational Tests

The correctness of operation of each air circuit breaker [or motor circuit protector] and magnetic contactor and of all control devices, accessories and indicating lamps, shall be checked. These checks shall be made at rated voltage with power supplies to the main buses. All magnetic contactors shall also be checked for proper operation with power at 90 percent of rated voltage.

2.11.1.3 Short Circuit Tests

If the unit is not UL labeled for the specified short circuit, the Contractor may submit design tests demonstrating that satisfactory short-circuit tests, as specified in NEMA ICS 2, have been made on a motor control center of similar type of construction and having the same available short circuit current at the motor terminals, including any motor contributions, as the motor control centers specified to be furnished under these specifications.

2.11.2 Switchboards Tests

2.11.2.1 Production Tests

Each switchboard shall be completely assembled and given applicable production tests for assembled switchgear as specified in NEMA PB 2.

2.11.2.2 Short Circuit Tests

If the unit is not UL labeled for the specified short circuit, the Contractor may submit design tests demonstrating that satisfactory short-circuit tests have been made on a switchboard of similar type of construction and of the same short-circuit rating as the switchboards specified to be furnished under these specifications.

2.11.3 Panelboards Tests

Each panelboard shall be assembled with cabinet and front to the extent necessary to check the fit and provisions for installing all parts in the field. Each panelboard shall be given a dielectric test in accordance with NEMA PB 1. All circuit breakers shall be operated to check mechanical adjustments. All doors and locks shall be checked for door clearances and fits and the performance of lock and latches.

2.12 PAINTING

Interior and exterior steel surfaces of equipment enclosures shall be thoroughly cleaned and then receive a rust-inhibitive phosphatizing or equivalent treatment prior to painting. Exterior surfaces shall be free from holes, seams, dents, weld marks, loose scale or other imperfections. Interior surfaces shall receive not less than one coat of corrosion-resisting paint in accordance with the manufacturer's standard practice. Exterior surfaces shall be primed, filled where necessary, and
given not less than two coats baked enamel with semigloss finish. Equipment located indoors shall be ANSI Light Gray, [and equipment located outdoors shall be ANSI [Light Grey] [Dark Gray].] All touch-up work shall be done with manufacturer's coatings as supplied under paragraph SPARE PARTS.

PART 3   EXECUTION (Not Applicable)

**************************************************************************
NOTE: PART 3 will be used for construction contracts only; take care to prevent conflicts, gaps or omissions.

PART 3  EXECUTION

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for the coordinated protection of power systems.

Adhere to \textit{UFC 1-300-02} Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a \textit{Criteria Change Request (CCR)}.

\section*{1.1 REFERENCES}

\textbf{NOTE:} This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature.
to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

INSTITUTE OF ELECTRICAL AND ELECTRONICS ENGINEERS (IEEE)

IEEE 242 (2001; Errata 2003) Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems - Buff Book

1.2 SYSTEM DESCRIPTION

**************************************************************************

NOTE: Provide brief, general description of the electrical power system project.

Coordinate with Section 26 11 14.00 10 MAIN ELECTRIC SUPPLY STATION AND SUBSTATION; Section 33 71 01 OVERHEAD TRANSMISSION AND DISTRIBUTION; Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION; Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM; Section 26 08 00 APPARATUS INSPECTION AND TESTING.

**************************************************************************

The power system covered by this specification consists of: [______].

1.3 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for
Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Fault Current Analysis

Protective Device Coordination Study

System Coordinator

1.4 QUALITY ASSURANCE

1.4.1 System Coordinator

System coordination, recommended ratings and settings of protective devices, and design analysis must be accomplished by a registered professional electrical power engineer with a minimum of [3] [_____] years of current experience in the coordination of electrical power systems. Submit verification of experience and license number, of a registered Professional Engineer as specified above. Provide experience data consisting of at least five references for work of a magnitude comparable to this contract, including points of contact, addresses and telephone numbers.

PART 2 PRODUCTS

2.1 COORDINATED POWER SYSTEM PROTECTION

**************************************************************************

NOTE: The requirements for the studies in these paragraphs depend on the complexity and extent of the power system. Delete these requirements for: projects of limited scope; projects having protective devices which are not adjustable or for which coordination is not possible (standard molded case circuit breakers); projects involving simple extension of 600 volt level service to a building or
facility from an existing transformer (750 kVA or less); or projects involving simple extension of 600 volt level service to a building or facility from a new transformer (750 kVA or less).

The designer will be responsible for showing and specifying the requirements for fuses, circuit breakers, protective relays, or other protective devices associated with the project. The protective devices should be selected and specified to protect electrical power system conductors or equipment against sustained overloads, in-rush conditions, electrical faults, or other abnormal power system or equipment operating conditions, in accordance with UFC 3-520-01, IEEE 242, and IEEE Std 141.

The complexity and extent of coordinated power system protection depends on the type of buildings or facilities required, on the load demand of facilities, and on the quantity and types of facilities to be constructed. Facilities having a relatively-low power demand (e.g., 2500 kVA or less) generally require protection of: an incoming aerial distribution line or underground, medium-voltage feeder; low-voltage feeders to individual items of equipment, or to power distribution equipment, and branch circuits. More complex projects such as facilities with generating capacity, large motors, or larger load demands, will require more detailed and extensive coordinated power system protection.

Independent of the type or types of facilities or load demands, the coordinated power system protection will be based on: economics, simplicity, and the electrical power availability dictated by the Using Agency or Service, or by the functional use of the facilities or utilities; requirement to provide maximum power service with a minimum of power interruptions; and the operating speed of protective devices required to minimize damage to electrical components or items of equipment and to prevent injury to personnel and nuisance tripping.

Unless otherwise approved, a dc power source will be shown and specified to ensure proper closing and tripping of protective devices which require a reliable power source during outage of the normal alternating-current power source.

Prepare analyses to demonstrate that the equipment selected and system constructed meet the contract requirements for ratings, coordination, and protection. Include a load flow analysis, a fault current analysis, and a protective device coordination study. Submit the study along with protective device equipment submittals. No time extensions or similar contact modifications will be granted for work arising out of the requirements for this study. Approval of protective devices proposed will be based on recommendations of this study. The Government is not responsible for any changes to equipment, device ratings, settings, or
additional labor for installation of equipment or devices ordered and/or procured prior to approval of the study. The studies must be performed by a registered professional engineer with demonstrated experience in power system coordination in the last [3] [_____] years. Provide a list of references complete with points of contact, addresses and telephone numbers. The selection of the engineer is subject to the approval of the Contracting Officer.

2.1.1 Scope of Analyses

The fault current analysis and protective device coordination study must begin at: [the source bus and extend down to system buses where fault availability is 10,000 amperes (symmetrical) for building/facility 600 volt level distribution buses.] [the source bus and extended through the secondary side of transformers for medium voltage distribution feeders.] [the source bus and extend through [outgoing breakers] [outgoing medium voltage feeders, down to the individual protective devices for medium voltage radial taps] [outgoing medium voltage feeders, through the secondary side of transformers] [as indicated] for main electric supply substations.] [the nearest upstream device in the existing source system and extend through the downstream devices at the load end.]

2.1.2 Determination of Facts

**************************************************************************
NOTE: Require the Contractor to obtain an available fault capacity at the power source or provide a fault capacity on which to base the analysis.
Delete the unused option.
**************************************************************************

Determine and document the time-current characteristics, features, and nameplate data for each existing protective device. [Coordinate with the [commercial power company] [_____] for fault current availability at the site.] [Utilize the fault current availability indicated as a basis for fault current studies.]

2.1.3 Single Line Diagram

Prepare a single line diagram to show the electrical system buses, devices, transformation points, and all sources of fault current (including generator and motor contributions). A fault-impedance diagram or a computer analysis diagram may be provided. Each bus, device or transformation point must have a unique identifier. If a fault-impedance diagram is provided, show impedance data. Show location of switches, breakers, and circuit interrupting devices on the diagram together with available fault data, and the device interrupting rating.

2.1.4 Fault Current Analysis

2.1.4.1 Method

Perform the fault current analysis in accordance with methods described in IEEE 242, and IEEE 399.

2.1.4.2 Data

Utilize actual data in fault calculations. Bus characteristics and transformer impedance must be those proposed. Document data in the report.
2.1.4.3 Fault Current Availability

Provide balanced three-phase fault, bolted line-to-line fault, and line-to-ground fault current values at each voltage transformation point and at each power distribution bus. Show the maximum and minimum values of fault available at each location in tabular form on the diagram or in the report.

2.1.5 Coordination Study

Demonstrate that the maximum possible degree of selectivity has been obtained between devices specified, consistent with protection of equipment and conductors from damage from overloads and fault conditions. Include a description of the coordination of the protective devices in this project. Provide a written narrative describing: which devices may operate in the event of a fault at each bus; the logic used to arrive at device ratings and settings; situations where system coordination is not achievable due to device limitations (an analysis of any device curves which overlap); coordination between upstream and downstream devices; and relay settings. Provide recommendations to improve or enhance system reliability, and detail where such changes would involve additions or modifications to the contract and cost damages (addition or reduction). Provide composite coordination plots on log-log graph paper.

2.1.6 Study report

a. Include a narrative describing: the analyses performed; the bases and methods used; and the desired method of coordinated protection of the power system.

b. Include descriptive and technical data for existing devices and new protective devices proposed. Include manufacturers published data, nameplate data, and definition of the fixed or adjustable features of the existing or new protective devices.

c. Document [utility company data including system voltages, fault MVA, system X/R ratio, time-current characteristic curves, current transformer ratios, and relay device numbers and settings;] [and] [existing power system data including time-current characteristic curves and protective device ratings and settings].

d. The report must contain fully coordinated composite time-current characteristics curves for each bus in the system, as required to ensure coordinated power system protection between protective devices or equipment. Include recommended ratings and settings of all protective devices in tabulated form.

e. Provide the calculation performed for the analyses, including computer analysis programs utilized. Provide the name of the software package, developer, and version number.

NOTE: This guide specification covers the requirements for automatic transfer switches for use with engine-generator sets for standby power.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1   GENERAL

Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM applies to work specified in this section.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of
the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text are automatically deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION (NASA)

NATIONAL ELECTRICAL MANUFACTURERS ASSOCIATION (NEMA)

NEMA 250 (2020) Enclosures for Electrical Equipment (1000 Volts Maximum)

NATIONAL FIRE PROTECTION ASSOCIATION (NFPA)

NFPA 70 (2020; ERTA 20-1 2020; ERTA 20-2 2020; TIA 20-1; TIA 20-2; TIA 20-3; TIA 20-4) National Electrical Code

UNDERWRITERS LABORATORIES (UL)

UL 508 (2018; Reprint Jul 2021) UL Standard for Safety Industrial Control Equipment

UL 1008 (2014) Transfer Switch Equipment

1.2 SUBMITTALS

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

A “G” following a submittal item indicates that the submittal requires Government approval. Some
submittals are already marked with a "G". Only delete an existing "G" if the submittal item is not complex and can be reviewed through the Contractor’s Quality Control system. Only add a “G” if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Connection Diagrams; G[, [___]]
Fabrication Drawings; G[, [___]]
Installation Drawings; G[, [___]]

SD-03 Product Data

Equipment and Performance Data; G[, [___]]
Contacts; G[, [___]]
Indicating Lights; G[, [___]]
Terminal Board; G[, [___]]
Enclosures; G[, [___]]

SD-06 Test Reports
1.3 QUALITY CONTROL

1.3.1 Product Installations

Submit listing of product installations for automatic transfer switches showing the manufacturer has successfully manufactured automatic transfer switches of the size specified for a minimum period of 10 years. Include on the list, purchaser, address of installation, service organization, and date of installation.

1.3.2 Predictive Testing and Inspection Technology Requirements

*******************************************************************************
NOTE: The Predictive Testing and Inspection (PT&I) tests prescribed in Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS are MANDATORY for all [NASA] [_____] assets and systems identified as Critical, Configured, or Mission Essential. If the system is non-critical, non-configured, and not mission-essential, use sound engineering discretion to assess the value of adding these test and acceptance requirements. See Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS for additional information regarding cost feasibility of PT&I.
*******************************************************************************

This section contains systems and equipment components regulated by NASA's Reliability Centered Building and Equipment Acceptance Program. This program requires the use of Predictive Testing and Inspection (PT&I) technologies in conformance with the RCBEA GUIDE to ensure building equipment and systems have been installed properly and contain no identifiable defects that shorten the design life of a system or its components. Satisfactory completion of all acceptance requirements is necessary to obtain Government approval and acceptance of the Contractor's work.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Provide an automatic transfer switch with a time-delay feature that is field-adjustable from 2 to 30 minutes. The switch delays the automatic transfer back to normal power until the normal source voltage and frequency reach at least 95 percent of the rated voltage. However, if the emergency power fails and the normal source is again available at 90 percent of the rated voltage, bypass the time-delay circuitry, and transfer the load.
immediately back to the normal source. Provide the capability for manual transfer in either direction. Operate sensing relays without contact chatter or false response during voltage variations between dropout and pickup.

Submit connection diagrams showing the relations and connections of contacts, indicating lights, and terminal board by showing the general physical layout of all controls and the interconnection of one system (or portion of system) with another.

Submit fabrication drawings for contacts, indicating lights, terminal board enclosures, and accessories, consisting of fabrication and assembly details to be performed in the factory.

Submit installation drawings for automatic transfer equipment in accordance with paragraph INSTALLATION.

Submit equipment and performance data for automatic transfer equipment including useful life, test, system functional flows, safety features, and mechanical automated details.

2.1.1 Performance Requirements

2.1.1.1 Application

Provide an automatic transfer switch capable of transferring the load from the normal power source to emergency power source, and from an emergency source to the normal power source. Locate the switch where indicated. Provide a switch that is solenoid-operated, mechanically held, double-throw, rated for continuous duty, capable of transferring in 100 milliseconds or less, and conforming to the applicable requirements of UL 1008 and NFPA 70, Article 700, except as herein modified. Ensure that the control and protective devices associated with automatic transfer switches are in accordance with Section 26 05 70.00 40 HIGH VOLTAGE OVERCURRENT PROTECTIVE DEVICES and Section 26 05 71.00 40 LOW VOLTAGE OVERCURRENT PROTECTIVE DEVICES.

**************************************************************************
NOTE: Show required automatic transfer switch amperage, voltage, and frequency ratings on the drawings.
**************************************************************************

Provide an automatic transfer switch of the two-pole type for single-phase application, and three-pole type for three-phase application. [Provide a solid neutral conductor connection for neutral transfer from the normal source to the emergency source.] [Provide an additional switched neutral pole.]

Ensure that the automatic transfer switch is capable of being placed in either the normal or the emergency position.

**************************************************************************
NOTE: Add to this specification or to the drawings the short-circuit withstand current rating of the switch based on the calculated short-circuit current available at the switch location. Sample: have the switch withstand symmetrical three-phased short circuits of [_____] amperes for a period of [_____]
2.1.1.2 Operation

Monitor the normal source voltage across phase lines by sensing devices. If the normal source voltage in phase drops to 90 percent or less for a timed period, ensure that the automatic transfer switch starts the emergency source and transfers the load to the emergency source when voltage and frequency reach rated values; or, if the emergency source is on, verify the voltage and frequency of the alternate source and transfer the load to the alternate source. Field-adjust this time period from 1 to 30 seconds. Provide a voltage and frequency sensor relay to monitor the rated values on the emergency side to prohibit transfer until the emergency source voltage and frequency reach at least 95 percent of the required rating. Provide phase failure protection, with a 65- to 70-percent drop and a 92- to 95-percent voltage pickup rating.

2.1.1.3 Self-Test Capability

Provide an automatic transfer switch with a control-circuit self-test feature capable of verifying the proper operation of the switch control circuit without moving the main contactor or causing discontinuity of service to the load. Include the following characteristics in the self-test circuit:

a. [A key-operated test switch that includes an auto, off, no-load engine test and a load test position. Include a white light to indicate that the switch is in the off position.] Ensure that the transfer switch controller includes a programmable engine exerciser with the following selections: Disabled; 7-, 14- and 28-day intervals; and 15 minutes fixed time, load or no load with Failsafe.] Design the key-operated switch to prevent removal of the key while the switch is in the self-test mode.

OR

b. A power-failure simulator switch that removes voltage from the voltage-sensing devices so that emergency power activates the test light.

2.2 COMPONENTS

2.2.1 Contacts

Provide main contacts with a wiping-action silver alloy that, when rated for operation at 50 amperes or greater, are protected against arcing. Ensure that auxiliary contacts and control transfer relay contacts have a minimum continuous-current rating of not less than 10-amperes inductive at 120 volts ac. Provide the following for auxiliary contacts:

a. Generator-control contacts, normally open, that close on undervoltage or loss of normal power as specified, remaining closed until transfer back to normal power

b. Emergency-position contacts, normally open when the switch is in the normal position, that close when the switch is in the emergency position

c. An automatic transfer switch with a switched neutral. Ensure that the
switched neutral has: normal position contacts that are normally closed when the switch is in the normal position and opens when the switch is in the emergency position. Ensure that the neutral pole is fully rated and part of the main pole assembly, so that it is switched simultaneously with the main bus contacts.

Use two-pole auxiliary contacts.

**************************************************************************
** NOTE: Describe the automatic transfer switch mounting location, such as: on door of enclosure, remote, or mounted externally on switchgear.**
**************************************************************************

Provide a test automatic transfer switch mounted [_____] with contacts rated for operation at [_____] [10] amperes.

Provide an automatic transfer switch with overlapping neutral transfer contacts in addition to the two- or three-pole main bus contacts. Ensure that normal and emergency neutral contacts are connected together only during the transfer and retransfer operation. Ensure contacts remain connected only until the power source contacts close/open to transfer from one source to the other. Ensure that the connection time of the overlapping neutral transfer contacts does not exceed 100 milliseconds.

2.2.2 Indicating Lights

Furnish an automatic transfer switch with two indicating lamps: one light to indicate that the switch is operating on normal power, and the other light to indicate that the switch is operating on emergency power. Fuse each indicating circuit.

2.2.3 Terminal Board

Provide a contactor automatic transfer switch terminal board for internally wired control devices, indicating lights, auxiliary contacts, and internal control devices or auxiliary switches to a common output terminal board. Wire the internal functions to facilitate remote connections or monitoring.

[2.2.4 Microprocessor Control Panel

Provide a control panel to direct the operation of the transfer switch. Connect the panel to the transfer switch with an interconnecting wiring harness. Include with the harness a disconnect plug for transfer switch routine maintenance.

Enclose the control panel with a protective cover and mount separately from the transfer switch. Provide plug-in type interfacing relays.

2.2.5 Enclosures

Provide an automatic transfer switch enclosure with solid, code-gage, 14-gage, minimum sheet metal, NEMA 250, Type 1, with the manufacturer's standard finish.
2.3 TESTS, INSPECTIONS, AND VERIFICATIONS

2.3.1 Qualification Testing

Provide test data for the furnished unit or an identical unit. Ensure tests meet the general use requirements of UL 508. Subject the complete automatic transfer switch to a test as outlined in NEMA ICS 10 Part 2. One cycle of operation tests under the UL 508 test requirements consists of a transfer of load from the normal source to the emergency source and retransfer to the normal source. Test the switch operating time and the sense relay pickup and dropout times.

PART 3 EXECUTION

3.1 INSTALLATION

Install automatic transfer switches as indicated, and in accordance with the manufacturer's instructions. Fully align and install wall-mounted enclosures at the indicated mounting height using a minimum of six M10 3/8-inch bolts. Do not use sheet metal screws or small machine screws.

3.2 FIELD QUALITY CONTROL

**************************************************************************
NOTE: If the specified system is identified as critical, configured, or mission-essential, use Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS to establish predictive and acceptance testing criteria, above and beyond that listed below.
**************************************************************************

Perform PT&I tests and provide submittals as specified in Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS.

Demonstrate the automatic transfer switch operates in accordance with the specification requirements in conjunction with the normal and emergency power sources.

PART 3 EXECUTION

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for procurement of 3-phase vertical induction motors for driving storm-water pumps for local flood-control pumping stations. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1  GENERAL

NOTE: This section covers motors with special features of construction which are considered necessary to provide maximum insurance against failures where the motors are to be operated only for short periods of time, at infrequent intervals, and at locations where the average relative humidity of the air is high. Where operating characteristics or features of motor construction differ from this specification but are considered desirable, this specification may be modified accordingly. The designer must also consider unusual service
conditions such as direct exposure to the sun, vermin infestation, or high altitude.

In adapting this specification to any project, the form and phraseology will be changed as necessary to properly specify the work contemplated. When deviations from this specification are considered necessary, prior approval from HQ USACE will be obtained.

******************************************************************************************

1.1 REFERENCES

******************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

******************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN BEARING MANUFACTURERS ASSOCIATION (ABMA)

ABMA 9 (2015) Load Ratings and Fatigue Life for Ball Bearings

ABMA 11 (2014) Load Ratings and Fatigue Life for Roller Bearings

ASTM INTERNATIONAL (ASTM)

1.2 SUMMARY

The work under this section includes providing all labor, equipment, and material and performing all operations required to design, manufacture, assemble, test, and package and deliver the vertical induction motors for driving pumps specified under Section 35 45 01 VERTICAL PUMPS, AXIAL-FLOW AND MIXED-FLOW IMPELLER TYPE.

a. These motors shall be supplied complete with all accessories, spare parts, tools, and manufacturer's data and instructions as specified herein.

b. Submit [6] [_____] copies of complete instructions for the proper installation, inspection, and maintenance of the machines provided for this particular service. Instruction manuals shall be submitted to the Contracting Officer not later than the date the equipment is shipped from the manufacturer's plant. The instructions shall include a cross-sectional drawing indicating the major component parts of the motor and the procedure for disassembly.

c. Submit [6] [_____] copies of a complete list of renewal parts with prices for each different rating of motor. This list shall accompany the instruction manual.

1.3 SUBMITTALS

******************************************************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.
The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
   Motors; G[, [______]]

SD-03 Product Data
   Insulated Windings; G[, [______]]

   Power Factor and Efficiency
   Factory Tests

SD-10 Operation and Maintenance Data
   Instructions; G[, [______]]

1.4 QUALITY ASSURANCE

1.4.1 Corrosion Prevention and Finish Painting

The equipment provided under these specifications will be subjected to severe moisture conditions and shall be designed to render it resistant to corrosion from such exposure. The general requirements to be followed to mitigate corrosion are specified below. Any additional special treatment or requirement considered necessary for any individual items is specified under the respective item. However, other corrosion-resisting treatments that are the equivalent of those specified herein may, with the approval of the Contracting Officer, be used.
1.4.1.1 Fastenings and Fittings

Where practicable, all screws, bolts, nuts, pins, studs, springs, washers, and other similar fittings shall be of corrosion-resisting material or shall be treated in an approved manner to render them resistant to corrosion.

1.4.1.2 Corrosion-Resisting Materials

Corrosion-resisting steel, copper, brass, bronze, copper-nickel, and nickel-copper alloys are acceptable corrosion-resisting materials.

1.4.1.3 Corrosion-Resisting Treatments

Hot-dip galvanizing shall be in accordance with ASTM A123/A123M or ASTM A153/A153M as applicable. Other corrosion-resisting treatments may be used if approved by the Contracting Officer.

1.4.1.4 Frames

Motor frames, end bells, covers, conduit boxes, and any other parts, if of steel, and if they will be coated during the process of insulating the windings, shall be cleaned of rust, grease, millscale, and dirt, and then treated and rinsed in accordance with manufacturer's standard process. If any of the above-listed parts are not coated during the process of insulating the windings then, in addition to the above, they shall be given one coat of primer and then two coats of manufacturer's standard moisture-resistant coating, processed as required.

1.4.1.5 Cores

The assembled motor core shall be thoroughly cleaned and then immediately primed by applying a minimum of two coats of a moisture-resisting and oil-resisting insulating compound. Air gap surfaces shall be given a minimum of one coat.

1.4.1.6 Shafts

Exposed surfaces of motor shafts shall be cleaned of rust, grease, and dirt and, except for bearing surfaces, given one coat of a zinc molybdate or equivalent primer and two coats of a moisture-proof coating, each cured as required. Shafts of a corrosion-resisting steel may be used in lieu of the above treatment.

1.4.1.7 Finish Painting

**************************************************************************
NOTE: If severely moist conditions exist, a separate paint system should be specified using Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES, system 21, epoxy finish or equivalent. When such painting is specified, care must be taken to specify a paint that will adhere to and not be injurious to the protective painting provided under these specifications.
**************************************************************************

Finish painting of all equipment shall be in accordance with the standard practice or recommendation of the manufacturer, as approved by the
Contracting Officer.

1.4.2 Government Study

**************************************************************************

NOTE: Item d. may be used only when the pump and motor are furnished under the same procurement.
**************************************************************************

Submit [6] [_____] copies of the specified data. Supply to the Government, for completion of its Motor Torque and Accelerating Time Studies (MTATS), the following data:

a. Complete equivalent circuit data referred to the stator with friction, windage, and stray load losses.

b. Current, power factor, and torque versus speed (0-100 percent, inclusive, in 1 percent increments up to 95 percent and in 0.1 percent increments above 95 percent) and load (0-125 percent, inclusive, in 25 percent increments) as a function of line voltage (from 80 percent to 110 percent, inclusive, in 5 percent increments), for rated and 90 percent of rated voltage at starter. Only tabulated data will be required.

c. Load inertia, Wk2 of motor rotating parts, pound-feet.

[ d. Load inertia, Wk2 of pump rotating parts (wet), pound-foot2.]

PART 2 PRODUCTS

2.1 NAMEPLATES

Nameplate data shall include rated voltage, rated full-load amperes, rated horsepower, service factor, number of phases, RPM at rated load, frequency, code letter, locked-rotor amperes, duty rating, insulation system designation, and maximum ambient design temperature.

2.2 MOTORS

**************************************************************************

NOTE: For weak source (high thevenin source impedance), the electric utility shall be contacted to determine starting restrictions, maximum inrush, or voltage dip limits. This is especially critical for motors over 75kW 100 hp. The designer shall then perform a Motor Torque and Accelerating Time Study (MTATS) to evaluate the motor starting torque and voltage dip requirement. The selection of a reduced voltage starter shall then be based on the electric utility requirements and the motor pump arrangement.
**************************************************************************

The motors to be supplied under these specifications shall be of the vertical shaft type as required by the pump manufacturer, normal or low starting torque, low starting current, squirrel-cage induction type, designed for full voltage starting, of drip-proof construction, and shall conform to the applicable requirements of NEMA MG 1, except as hereinafter specified.
a. Submit [6] [_____] copies of equipment foundation dimensions; outline drawings with weights, nameplate data, and details showing method of mounting and anchoring the motor. Contracting Officer's approval shall be obtained in writing prior to the commencement of manufacture of motors.

b. [Six] [_____] copies of complete descriptive specification of each type and size motor provided, with necessary cuts, photographs, and drawings to clearly indicate the construction of the motor, the materials and treatments used to prevent corrosion of parts, bearing construction, and type of insulation used on all windings.

c. Submittal shall include all information required for selection of protective and control equipment and for operational setting, such as, but not limited to, normal and maximum operation temperature for windings and bearings, overload trip setting for motor at pump maximum head condition and starting times for starting at rated and 90 percent starter voltage.

2.2.1 Rating

**************************************************************************
NOTE: NEMA MG 1, Parts 12 and 20, cover medium and large induction motors, respectively. Any motor specified by speed and horsepower will be included in either Part 12 or Part 20. References to both parts are listed in some cases, as either or both parts may apply to a particular project.
**************************************************************************

Each motor shall be wound for 3-phase, 60-Hz, alternating current, and for the respective operating voltage listed below:

<table>

The motor shall be designed for operation in a 40 degrees C 105 degrees F ambient temperature and all temperature rises shall be above this ambient temperature. The rated horsepower of the motor shall be not less than 110 percent of the determined maximum load requirement of the pump. Motors shall have a service factor of 1.0 or shall be applied using a service factor of 1.0 if standard service factor is greater than 1.0. The temperature rise above the ambient temperature for continuous rated full-load conditions and for the class of insulation used shall not exceed the values given in NEMA MG 1, paragraph 12.42 or paragraph 20.8.

2.2.2 Operating Characteristics

2.2.2.1 Torques

**************************************************************************
NOTE: The "Operating Characteristics" specified are to limit the locked-rotor current to a value sufficiently low to permit full-voltage starting.
**************************************************************************
Manufacturer's standard is to limit locked-rotor current to 600 percent of design full-load current. However, if local conditions are such that lower starting current is desirable, the locked-rotor current may be specified not to exceed 500 percent of the design full-load current. When 500 percent is specified, the breakdown torque of 150 percent of full-load torque will be used. The designer will note that these percentages are for design full-load current at rated power factor and will vary based on actual load and supply conditions. Designer should consult local utility for actual requirements for limitations on inrush currents. When inrush current cannot be sufficiently limited by motor design, a reduced voltage starter will be used.

When reduced voltage starting is required, closed transition autotransformer type reduced voltage starters should be used. These starters provide the most flexibility during installation since both input voltage and inrush current may be adjusted. This specification is not meant to limit the selection of a reduced voltage starter to only autotransformer type. The use of a wye-delta type starter may be appropriate in certain situations. The reduced starter cost for use of other than autotransformer type starters must be weighed against the increased cost in motor designs; however each design should be evaluated for the most suitable type starter. All reduced voltage starters will reduce the motor starting torque, so the designer should evaluate the load characteristics to ensure that motor torque will be sufficient under all starting conditions. If reduced-kVA starters are required, EM 1110-2-3105 should be consulted for further guidance and possible pump design considerations.

Starting torque shall be sufficient to start the pump to which the motor will be connected under the maximum conditions specified, but in no case shall the starting torque be less than 60 percent of full-load torque. Breakdown torque shall be not less than 200 percent of full-load torque.

2.2.2.2 Locked-Rotor Current

NOTE: The locked-rotor current will increase with a power factor or lower than rated load. This information shall be taken into account when the designer is specifying the motor. When inrush current is particularly critical, due to system limitations on voltage dip or current, the designer shall obtain limits from the local utility and supply this information in this paragraph. The requirements for locked-rotor current (inrush) shall be coordinated with power factor and efficiency requirements of for power factor efficiency.
specified below.

The locked-rotor current shall not exceed [600] [500] percent of normal full-load running current. [The locked-rotor current shall not exceed [_____] amps at 90 percent of rated voltage during any point in the starting cycle under worst case starting conditions. For reduced voltage starting, the above criteria shall apply to supply side of the starter.]

2.2.2.3 Starting Capabilities

NOTE: Frequency of starting must always be considered in motor applications. The starting capabilities to be met by all motors are set forth below. However, the actual motor duty cycle should be specified in paragraph DUTY CYCLE, along with the requirement for the special motor starting nameplate. Undoubtedly, these starting capabilities will be adequate in most cases since the actual load inertia, Wk2, of the pumps is much less than the NEMA values, the load torque is low, and the frequency of starting (number of starts per unit of time) is low. When the frequency of starting is several times per hour, or the load torque is high, a thorough study and perhaps a modified motor may be required. To ensure that all requirements of the specifications are met, submittal of the operating data should be required. It is possible that with higher starting frequencies the rotor may have to operate at temperatures higher than typical, so that modifications would be required.

Large motors, on the basis of the load torque characteristics and the load inertia Wk2 listed in NEMA MG 1, paragraphs 20.41 and 20.42, shall as a minimum be capable of making the starts required in NEMA MG 1, paragraph 20.43. Smaller motors shall conform to the requirements in NEMA MG 1, paragraph 12.50. Submit [6] [_____] copies of certified test reports, when available, of tests previously performed on motors of each type and size specified or calculated data to substantiate the motor's capability to conform to the specified requirements.

2.2.2.4 Duty Cycle

Submit an analysis to verify that the motor, when operated in accordance with the duty cycle specified, will not undergo injurious temperature rise. If the duty cycle cannot be met with a standard NEMA design motor, the motor manufacturer shall provide a description of proposed modifications to provide such compliance. Each motor, when operating at rated voltage and frequency and on the basis of the connected pump load inertia Wk2 and the speed-torque characteristics of the load during starting conditions as furnished by the pump manufacturer, shall be capable of performing on a continuous basis the following motor duty cycle without injurious temperature rise: [operation at rated load over a period of approximately [_____] [hours] [days]] [a running period at rated load of not less than [_____] [minutes] [hours] and a standstill period of not less than [_____] [minutes] [hours].] A starting information nameplate setting forth the starting capabilities shall be provided on each motor. This
nameplate shall also include the minimum time at standstill and the minimum running time prior to an additional start.

2.2.2.5 Balance

The balance for each motor when measured in accordance with NEMA MG 1, paragraph 12.06 or paragraph 20.53, shall not exceed the values specified. Each motor's characteristics shall be such that the provisions of Section 35 45 01 VERTICAL PUMPS, AXIAL-FLOW AND MIXED-FLOW IMPELLER-TYPE paragraph [_____] are met.

2.2.2.6 Noise

**************************************************************************
NOTE: The Department of Defense (DOD) considers hazardous noise exposure of personnel as equivalent to 85 decibels or greater A-weighted sound pressure level (dBA) for 8 hours in any one 24-hour period. On the assumption that pumping plant operating personnel may be exposed to noise levels approaching or exceeding that defined by the DOD as hazardous, the motor noise limit should be specified not to exceed 85 dBA. The additional cost of providing motors meeting this requirement should be investigated and weighed against an alternate of providing a room to isolate these personnel from the noise exposure.
**************************************************************************

All motors shall operate at a noise level less than 85 decibels A-weighted mean sound pressure level (dBA). Noise shall be determined in accordance with [______]. The specified noise limit applies for a reference distance of one meter for free-field conditions.

2.2.2.7 Power Factor and Efficiency

**************************************************************************
NOTE: List power factor and efficiency for each size. Motor efficiencies are not standardized and vary with manufacturer. Efficiency and its associated power factor are primarily a function of load, horsepower rating, and speed. Some general guidelines are as follows:

<table>
<thead>
<tr>
<th>Operation below - rated low</th>
<th>Decreased efficiency, lower power factor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Higher horsepower - higher power factor</td>
<td>Increased efficiency</td>
</tr>
<tr>
<td>Higher speeds - higher power factor</td>
<td>Increased efficiency</td>
</tr>
</tbody>
</table>

For motors above 75 kW 100 hp, efficiency and power factor may not be a consideration since most motors of this size have a rated efficiency of around 90 percent and a power factor of greater than 0.8. When this is the case, delete power factor efficiency requirements from paragraph MOTORS, and the certification requirement in paragraph SUBMITTALS. The designer should consult
manufacturer's literature and individual applications for efficiencies and power factor to specify. The designer should also weigh the cost of a more efficient motor vs a larger motor with increased efficiency due to size. Generic motor data are available which may be used if manufacturer's data are not available.

The power factor and efficiency at full load, 3/4 full load, and 1/2 full load shall be not less than [____], [____], [____] and [____], [____], [____], respectively. Motors will be rejected if factory tests specified in paragraph FACTORY TESTS do not demonstrate that these values will be met or exceeded. Submit certification of guaranteed value of power factor and efficiency for full load, 3/4 full load, and 1/2 full load.

2.2.3 Frames and Brackets

Frames and end brackets shall be of cast iron, cast steel, or welded steel. The mounting ring, unless otherwise approved, shall be built integral with the frame or lower end bracket and arranged for direct mounting on the pump, or station floor, or as required by the installation conditions. Treatment against corrosion shall be as specified in paragraph GENERAL REQUIREMENTS.

2.2.3.1 Stator Frame

The stator frame shall be rigid and sufficiently strong to support the weight of the upper bearing bracket load, the weight of the stator core and windings, and to sustain the operating torques without perceptible distortion. The stator frame, if not direct mounted on the pump, shall be supported on a motor base or drive pedestal which in turn will be supported on sole plates or other suitable structure installed in the concrete foundation constructed as part of the pumping station structure. The motor base or drive pedestal shall be provided with bolts and dowels for fastening to the sole plates or supporting structure for preserving the alignment.

2.2.3.2 Supporting Bracket

The upper bracket supporting the thrust bearing and upper guide bearings shall have sufficient strength and rigidity to support the weight of the entire rotating element of the motor, together with the pump impeller and shaft, and the hydraulic thrust of the pump impeller.

2.2.3.3 Overspeed Alternate

NOTE: NEMA MG 1 paragraphs 12.48 and 20.44 specify that overspeeds are for emergencies lasting no longer than one minute. Using this option will insure additional costs due to requirements well beyond standard limits.

Each motor shall be designed to withstand indefinitely, without injury, the maximum overspeed to which the motor will be subjected when the pump to which it is connected is acting as a hydraulic turbine under the maximum head with the pump discharge pipe open.
2.2.3.4 Antireverse Device Alternate

A self-actuated backstop device or antireversing ratchet, to prevent reverse rotation of the pump due to loss of power or failure of the electric prime mover, shall be installed as an integral part of the motor. The design of the device shall be submitted to and approved by the Contracting Officer. It shall have sufficient capacity to prevent reverse rotation with a back-flow through the pump due to a [_____] foot differential head. If the device requires a lubrication system, an oil reservoir independent of the one used for the thrust bearing and complete with visible oil level gauge and 120-volt a.c. rated high and low level contacts shall be provided. All electrical leads shall be terminated in the accessory terminal box specified in paragraph MOTOR TERMINALS AND BOXES. The lubricant for the antireverse device shall contain a corrosion inhibitor whose type and grade shall be shown on a special nameplate attached to the frame adjacent to the lubricating filling device.

2.2.3.5 Eyebolts

Eyebolts, lugs, or other approved means shall be provided for assembling, dismantling, and removing the motor, if required, from above using an overhead crane. All lifting devices required for use in conjunction with the crane shall be provided with the motor.

2.2.4 Cores

The cores for the stators and rotors shall be built up of separately punched thin laminations of low-hysteresis loss, nonaging, annealed, electrical silicon steel, assembled under heavy pressure, and clamped in such a manner as to insure that the assembled core is tight at the top of the teeth of the laminated core. Laminations shall be properly insulated from each other. Only laminations free from burrs shall be used, and care shall be taken to remove all burrs or projecting laminations from the slots of the assembled cores. Cores shall be keyed, dovetailed, or otherwise secured to the shaft or frame in an approved manner. Treatment against corrosion shall be as specified in paragraph GENERAL REQUIREMENTS.

2.2.5 Insulated Windings

**************************************************************************
NOTE: If motor temperature rise is of particular concern, the designer may specify Class F insulation with a Class B temperature rise instead of Class F insulation with 110 percent continuous overload factor. Use final sentence of item f. only when the pump and motor are furnished under the same procurement.
**************************************************************************

All motors shall have a nonhygroscopic, sealed, fungus-resisting insulation of a type designed and constructed to withstand severe moisture conditions, and insofar as practicable, to operate after long periods of idleness without previous drying out. All windings and connections shall be of the sealed type as defined in NEMA MG 1 paragraph 1.27.2. Submit a detailed description of and specification for the manufacturing process, the materials and the insulating varnish or compound used in insulating the windings shall be submitted to the Contracting Officer for approval before manufacture of the motors is commenced. If, in the opinion of the
Contracting Officer, the insulation proposed is not of the quality specified and if the methods of manufacture are not considered to be in accordance with best modern practice, the motors will not be accepted.

Submit [6] copies of motor design curves and [6] copies of motor speed-torque curves, as specified. Insulated windings, unless otherwise approved, shall be completely assembled in the motor core before impregnating with the insulating compound. The compound shall consist of 100 percent solid resin.

a. Impregnation of the windings with the insulating compound shall be by vacuum impregnation method followed by baking. The procedure shall be repeated as often as necessary to fill in and seal over the interstices of the winding, but in no case shall the number of dips and bakes be less than two dips and bakes when the vacuum method of impregnation is used. The completed stator shall be of a type that is capable of passing the submerged or sprayed water test, as applicable, required by NEMA MG 1 paragraph 20.49.

b. Random wound coils may be used on motors supplied in NEMA frame size 445 TP and smaller. The components of the insulation system and the conductor insulation of the coils shall be Class F insulation with a 110 percent continuous overload factor as defined in NEMA MG 1 paragraph 1.66. After winding, the completely wound stator shall be encapsulated with an insulating resin as defined in NEMA MG 1 paragraph 1.27.1.

c. Form wound coils shall be used on motors supplied in NEMA frames larger than 445 TP. The components of the insulation system and the coil insulation of the rectangular conductors shall conform to Class F insulation with a 110 percent continuous overload factor as defined in NEMA MG 1, paragraph 1.66. The completed stator windings and connections shall be of the sealed type as defined in NEMA MG 1 paragraph 1.27.2.

d. Insulation to ground shall be processed on the coil. Slot tubes or cells are not acceptable. The insulation shall be of adequate thickness and breakdown strength throughout the length of the coil. Mica shall be used in the slot portion and shall be of adequate thickness to withstand the dielectric tests specified in paragraph FACTORY TESTS. Form wound coils shall be of such uniformity that the stator windings on motors of equal ratings shall be alike, in shape and size, and be interchangeable.

e. Submit motor design (characteristic) curves or tabulated data (test or calculated), indicating the speed, power factor, efficiency, current, and kilowatt input, all plotted or tabulated against torque or percent load as abscissa. The base value shall be given whether ANSI or IEEE standard system is used. The maximum allowable reverse rotation speed for the motor shall also be provided.

f. Submit [pump and] motor speed-torque curves for the pump starting operation. The motor speed-torque curves shall be plotted for the following values of voltage at the motor terminals: The output of the [closed transition auto-transformer-type reduced voltage] starter supplied at rated and 90 percent of rated motor voltage [and connected on its 65 percent and 80 percent taps]. [The pump torque curve shall be plotted for starting and accelerating against maximum head. Computations shall be furnished to demonstrate that the motor furnished will carry the pump load under all the foregoing conditions.]
g. Coils of all windings shall be fully braced so that vibration is virtually eliminated during repeated starts as required by the duty cycle specified as well as during normal operation. If a tied system is used it shall be such that no tie depends upon the integrity of any other tie within the system.

2.2.6 Thermal Protection

For motors rated 500 hp or greater, resistance temperature detectors (two per phase) shall be provided in accordance with NEMA MG 1, paragraph 20.63. Detectors shall have a copper resistance element having a resistance of 10 ohms at 25 degrees C 76 degrees F. Leads shall be terminated on the terminal blocks specified in paragraph MOTOR TERMINALS AND BOXES. For motors rated less than 500 hp, positive-temperature-coefficient thermistors (one per phase) shall be embedded in the windings. The thermistors with all necessary additional equipment, as required, shall open a normally closed contact when the critical temperature is reached. All outgoing wiring shall terminate on the terminal blocks specified in paragraph MOTOR TERMINALS AND BOXES.

2.2.7 Winding Heaters

**************************************************************************
NOTE: The inclusion or omission of "Winding Space Heaters" will depend upon the decision reached after giving due consideration to the problem of prevention of moisture condensation on the station equipment. If winding space heaters are not required, this paragraph, including all subparagraphs, shall be deleted.
**************************************************************************

Heaters shall be wrapped around the winding end turns. They shall be designated for operation on 120 volts, 1-phase, 60 Hz, alternating current and of sufficient capacity or wattage that, when energized, they will hold the temperature of the motor windings approximately 10 degrees C above the ambient temperature. They shall be designed for continuous operation and to withstand at least 10 percent overvoltage continuously. The rate of heat dissipation shall be uniform throughout the effective length of the heater. Heaters installed around the winding end turns shall consist of the required turns of heating cable wrapped around the end turns and secured in place before the winding is impregnated.

2.2.7.1 Heating Element

Heating element shall conform to the requirements of ASTM B344 for an 80 percent nickel and 20 percent chromium alloy.

2.2.7.2 Sheath

Sheath shall be of a corrosion-resisting, nonoxidizing metal and shall have a wall thickness not less than 0.625 mm 0.025 inch.

2.2.7.3 Insulation

Insulation shall be a granular mineral refractory material, highly resistant to heat, and shall have a minimum specific resistance of 1,000 megohms per inch cubed at 535 degrees C 1,000 degrees F. Insulation for
the heating cable (winding wraparound type) type heaters shall be suitable for a conductor temperature of 180 degrees C 356 degrees F.

2.2.7.4 Terminals

Terminals of the heater, including the leads, shall be watertight and shall be provided with leads suitable for making connections to the drip-proof terminal box provided in paragraph MOTOR TERMINALS AND BOXES. [The terminal box shall be readily accessible through the crating so that winding heaters can be energized while motors are in storage.]

2.2.8 Shafts

**************************************************************************
NOTE: Hollow shaft pumps shall be used whenever possible, since they are more readily adjusted. Pumps requiring large motors (above 746 kW 1,000 hp) are limited by the available motors. The exact motor capabilities and sources of supply shall be investigated when using hollow shafts with motors above 746 kW 1,000 hp. Solid shafts shall be used only when the available motor designs require their use.
**************************************************************************

Shafts shall be made of high grade steel, finished all over, and of ample size to drive the pumps under maximum load conditions. Shafts shall be of [hollow] [solid] types as required by the pump manufacturer. See paragraph GENERAL REQUIREMENTS for treatment against corrosion.

2.2.9 Bearings

2.2.9.1 Loading

Bearings shall be capable of withstanding all stresses incidental to the normal operation of the unit [and the maximum speed of the pumping unit when operating in the reverse direction].

2.2.9.2 Thrust Bearings

**************************************************************************
NOTE: If the thrust requirements exceed the standard published ratings of commercially available anti-friction thrust bearings, plate-type bearings should be used. Should this condition exist, a specification for plate-type bearings may be obtained from CDR USACE (DAEN-CWE-E) WASH DC 20314.
**************************************************************************

Thrust bearings shall be of the antifriction type of either the ball or roller type. Tandem or series bearing assemblies shall not be used. Antifriction bearings shall conform to the requirements of ABMA 9 and d ABMA 11.

2.2.9.3 Guide Bearings

Guide bearings shall be of the sleeve or antifriction type of either the ball or roller type or a combination of sleeve and antifriction bearings.
2.2.9.4 Lubrication

Bearings shall be either oil or grease lubricated and the lubricant used shall contain a corrosion inhibitor. Type and grade of lubricant used shall be shown on a special nameplate which shall be attached to the frame of the motor adjacent to the bearing lubricant filling device. In addition to the quantity of lubricant required to fill the system initially, spare lubricant shall be provided in sufficient quantity to purge and refill the system.

2.2.9.5 Housings

Bearing housings shall be of a design and method of assembly that will permit ready removal of the bearings, prevent escape of lubricant and entrance of foreign matter, and protected by the lubricant when the motor is idle. Except for prelubricated antifriction bearings of an approved type, suitable means shall be provided to apply and drain the lubricant. Oil-lubricated bearing housings shall be provided with oil-level indicator gauges that will be readily visible.

2.2.9.6 Cooling

All bearings shall be self-cooling unless otherwise specifically approved by the Contracting Officer. If the use of cooling is approved, the means employed shall, unless otherwise approved by the Contracting Officer, require no auxiliary pumping equipment; and suitable means shall be provided to indicate the bearing temperature, actuate an alarm when the bearing temperature is above normal, and actuate a device to shut down the motor when the maximum safe operating temperature of the bearing is reached. Cooling coils shall be of copper tubing and designed for the operating pressure used to circulate the cooling water. Cooling water temperature will be [_____] degrees C.

2.2.9.7 Rating

Antifriction bearings shall be rated on the basis of a minimum life factor of 8,800 hours, based on the life expectancy of 90 percent of the group, unless otherwise approved by the Contracting Officer.

2.2.9.8 Shaft Currents

Bearings shall be insulated or otherwise protected against the damaging effects of shaft currents.

2.3 SURGE PROTECTION

2.3.1 Surge Capacitors

**************************************************************************
NOTE: To obtain the most reliable protection for 2,300- and 4,000-volt motors, surge capacitors and arresters, mounted at the motor terminals, should be specified. In addition, it is recommended that station-type arresters be installed on the line side of the supply transformers. For 480-volt systems, surge protection is not generally warranted if the station system is connected to the utility line through a transformer which has adequate surge protection on the high side. Each 480-volt
installation should be investigated, however, to
determine whether surge protection is required,
especially where excessive switching voltages may
occur or where the lightning incidence rate is high.

A three-pole capacitor unit, equipped with built-in discharge resistors and
using a non-polychlorinated biphenyl (PCB) insulating medium, shall be
provided in the main terminal box. Each pole shall be rated [0.5
microfarad and [2,400] [4,160] volts line-to-line] [1.0 microfarad and 650
volts line-to-line]. Removable bus links shall be provided for motor
testing. These links shall be treated to resist corrosion, shall be
designed to maintain a positive contact, and shall have low contact
resistance.

2.3.2 Surge Arresters

NOTE: Arrester maximum continuous operating voltage
(MCOV) rating shall be 3,000 volts line-to-ground
for 2,400-volt systems and for effectively grounded
4,160-volt systems, 4,500 volts line-to-ground
operating voltage for ungrounded or
resistance-grounded 4,160-volt systems, or other
ratings as required. An effectively grounded system
is defined as one in which X0/X1 is positive and
less than 3 and R0/X1 must be positive and less than
1 for all system conditions at the point of
application of the surge arrester.

Surge arresters of the station type with porcelain tops shall be provided
in the main terminal box. The arresters shall be of the metal-oxide type
rated [3,000] [4,500] [_____] volts maximum continuous operating voltage
(MCOV) line-to-ground. Removable bus links shall be provided for motor
testing. These links shall be treated to resist corrosion, shall be
designed to maintain a positive contact, and shall have low contact
resistance.

2.3.3 Space Heater

If recommended by the surge protection manufacturer, a space heater of
adequate capacity and rated 120 volts shall be provided. Space heaters
shall have a maximum watt density of 20 watts per square inch.

2.4 MOTOR TERMINALS AND BOXES

2.4.1 Stator Terminal Box

Drip-proof cast iron or steel conduit terminal boxes, treated as specified
for frames in paragraph GENERAL REQUIREMENTS, shall be supplied for housing
the stator lead connections [surge capacitors] [and surge arresters] and
shall have adequate space to facilitate the installation and maintenance of
cables and equipment. Boxes shall have a [bolted] [hinged securable] cover
providing unrestricted access, be mounted on the motor frame, and shall
have an auxiliary floor supporting structure, when required, supplied by
the motor manufacturer. Conduit entrance shall be from the bottom. The
boxes shall be designed to permit removal of motor supply leads when the
motor is removed. [A "HIGH VOLTAGE - [_____] VOLTS" warning sign shall be
provided on the cover of the box. [When looking down on the motor/pump assembly, the terminal box shall be located between degrees and degrees clockwise from the discharge elbow of the pump.]

2.4.2 Stator Terminals

Insulated terminal leads shall receive a treatment equal to that of the motor winding. Leads shall be brought out of the stator frame and shall be provided with terminal lugs for connection to the motor supply wiring.

2.4.3 Grounding

A ground bus and means for external connection to the station grounding system shall be provided in the stator terminal box when surge protection is provided.

2.4.4 Accessory Leads and Boxes

Terminal leads for motor winding space heaters, [surge protection equipment space heater], [resistance temperature detectors] [thermistors] and any other auxiliary equipment shall be brought into conveniently located terminal boxes provided with terminal blocks for extension by others. The terminal boxes shall be drip-proof and treated as specified for frames in paragraph GENERAL REQUIREMENTS. All auxiliary wiring shall be stranded copper conductors with 600-volt flame-retardant insulation, except temperature detector leads may be in accordance with the manufacturer's standard practice. All wiring and terminals shall be properly identified.

2.5 WRENCHES, TOOLS, AND SPECIAL EQUIPMENT

Provide all nonstandard and special equipment required for dismantling, reassembly, and general maintenance of the motor units. Provide one complete set of lifting attachments such as detachable eyebolts or special slings for handling various parts with a hoist.

2.6 FACTORY TESTS

**************************************************************************

NOTE: The designer should carefully consider whether to allow the Contracting Officer to waive these tests. Decision should be based on expertise in the field within the Division or District.

**************************************************************************

One motor of each rating type, selected at random by the Contracting Officer, shall be given a complete test. The remainder of the motors shall be given a check test.

a. Submit [6] [_____] copies of test reports recording all data obtained during the tests specified to the Contracting Officer for each motor used. Test reports shall include performance curves indicating the results of subparagraph COMPLETE TEST below.

b. Submit [6] [_____] certified copies of the results of a "Complete Test" for duplicate equipment. It will be accepted in lieu of the "Complete Test" as specified in subparagraph COMPLETE TEST below for equipment of the respective rating and type.

c. No substitute will be accepted for the "Check Test." The base value
shall be given whether ANSI or IEEE standard system is used. All complete tests shall be [witnessed by the Contracting Officer] [waived in writing].

2.6.1 Complete Test

A complete test of a motor shall include the following:

2.6.1.1 Excitation Test

Including a plot of volts as abscissa versus amperes and watts as ordinates.

2.6.1.2 Impedance Test

Including a plot of volts as abscissa versus amperes and watts as ordinates.

2.6.1.3 Performance Test

Including a plot of torque or percent load as abscissa versus efficiency, power factor, amperes, watts, and RPM or percent slip as ordinates.

2.6.1.4 Speed-Torque Test

Prony brake or other equivalent method. Including a plot of torque in foot-pounds as abscissa versus speed in RPM as ordinate.

2.6.1.5 Temperature Test

Made on completion of paragraph c above. (If screens are provided over openings, test will be made with screens removed and by thermometer).

2.6.1.6 Insulation Resistance-Temperature Test

Shall be taken following heat run, readings being taken at approximately 10 degrees C intervals. Temperature shall be determined by the resistance method. Test result values shall be plotted on semilogarithmic graphs, the insulation resistance values as logarithmic ordinates and the temperature values as uniform abscissas. For comparison purposes, a curve indicating the safe operating value of insulation resistance shall be plotted on the same sheet with the insulation resistance-temperature test curve.

2.6.1.7 Cold and Hot Resistance Measurement

2.6.1.8 Dielectric Test

2.6.1.9 Sound Level Test

In accordance with [______].

2.6.1.10 Vibration Measurement

In accordance with NEMA MG 1 paragraph 20.54.

2.6.1.11 Conformance Tests

In accordance with NEMA MG 1 paragraph 20.47.
2.6.2 Check Test

A check test of a motor shall include the following:

2.6.2.1 Routine Test

Test in accordance with NEMA MG 1 paragraph 12.51 or NEMA MG 1 paragraph 20.47.

2.6.2.2 Cold Resistance Measurement

2.6.2.3 Insulation Resistance and Winding Temperature

Insulation resistance and winding temperature at time the insulation resistance was measured.

2.6.2.4 Conformance Test

In accordance with NEMA MG 1 paragraph 20.47.

2.6.2.5 Vibration

Vibration measurement in accordance with NEMA MG 1 paragraph 12.07 or NEMA MG 1 paragraph 20.54.

2.6.3 Form Wound Coil Test

All form wound coils, either before or after they are placed in the slots, shall be tested for short circuits between turns of the individual coils by applying a high frequency voltage of not less than 75 percent of the voltage for which the machine is insulated, or by applying a surge test voltage of equivalent value to the terminals of each coil. Equivalent surge voltage shall be a wave whose peak value is equal to 1.06 times the voltage for which the motor is insulated.

2.6.4 Winding Space Heater Test

**********************************************************************************************
NOTE: Include this test only where winding space heaters are specified.
**********************************************************************************************

Each winding space heater unit shall be tested at the factory for successful operation and dielectric strength.

PART 3 EXECUTION
NOTE: This guide specification covers the requirements for the procurement of three-phase vertical synchronous motors, 1118 kW 1500 horsepower and above, for driving storm-water pumps for local flood-control pumping stations. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).
exposure to the sun, vermin infestation, or high altitude.

In adapting this specification to any project, the form and phraseology will be changed as necessary to properly specify the work contemplated. When deviations from this specification are considered, necessary prior approval from HQUSACE will be obtained.

Instructions for Section 35 45 01 VERTICAL PUMPS, AXIAL-FLOW AND MIXED-FLOW IMPELLER-TYPE, specify that Section 4 of Part IV, Technical Provisions, be reserved for insertion of the technical provisions of this guide specification.

The following should be included in section "L" of standard form 36, Information to Bidders.

"It is preferred that the field poles be secured to the rotor structure by means of dovetails, but an alternate method of construction will be acceptable, provided that evidence of its adequacy, satisfactory to the Contracting Officer, is submitted with the bid."

The designer should consider prequalifying the bidders based on past experience with this type and size of motor. Criteria for qualifying should be included in section "L" of standard form 36.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.
1.2 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving
authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 QUALITY ASSURANCE

1.3.1 Corrosion Prevention and Finish Painting

The equipment provided under these specifications will be subjected to severe moisture conditions and shall be designed to render it resistant to corrosion from such exposure. The general requirements to be followed to mitigate corrosion are specified below. Any additional special treatment or requirement considered necessary for any individual items is specified under the respective item. However, other corrosion-resisting treatments that are the equivalent of those specified herein may, with the approval of the Contracting Officer, be used.

1.3.1.1 Corrosion-Resisting Materials

Corrosion-resisting steel, copper, brass, bronze, copper-nickel, and nickel-copper alloys are acceptable corrosion-resisting materials.

1.3.1.2 Corrosion-Resisting Treatments

Hot-dip galvanizing shall be in accordance with ASTM A123/A123M or ASTM A153/A153M as applicable. Other corrosion-resisting treatments may be used if approved by the Contracting Officer.

1.3.1.3 Frames

Motor frames, end bells, covers, conduit boxes, and any other parts, if of steel, and if they will be coated during the process of insulating the windings, shall be cleaned of rust, grease, millscale, and dirt, and then treated and rinsed in accordance with manufacturers' standard process. If any of the above-listed parts are not coated during the process of insulating the windings then, in addition to the above, give them two coats of primer and then two coats of manufacturers' standard moisture-resistant coating, processed as required.

1.3.1.4 Cores

The assembled motor core shall be thoroughly cleaned and then immediately primed by applying a minimum of two coats of a moisture-resisting and oil-resisting insulating compound. Air gap surfaces shall be given a minimum of one coat.

1.3.1.5 Shafts

Exposed surfaces of motor shafts shall be cleaned of rust, grease, and dirt and, except for bearing surfaces, given one coat of a zinc molybdate or equivalent primer and two coats of a moisture-proof coating, each cured as required. Shafts of a corrosion-resisting steel may be used in lieu of the above-mentioned treatment.

1.3.1.6 Finish Painting

**************************************************************************

NOTE: If severely moist conditions exist, a separate paint system should be specified using Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES, system 21, epoxy finish or equivalent. When such painting is specified, care must be taken to specify a paint that will adhere to and not be injurious to
Finish painting of all equipment in accordance with the standard practice or recommendation of the manufacturer, as approved by the Contracting Officer.

1.3.1.7 Fastenings and Fittings

Where practicable, all screws, bolts, nuts, pins, studs, springs, washers, and other similar fittings shall be of corrosion-resisting material or shall be treated in an approved manner to render them resistant to corrosion.

1.3.2 Government Study

NOTE: Item d. may be used only when the pump and motor are furnished under the same procurement.

Submit [6] [_____] copies of the specified data. Supply to the Government, for completion of its Motor Torque and Accelerating Time Studies (MTATS), the following data:

a. Complete equivalent circuit data referred to the stator with friction, windage, and stray load losses.

b. Current, power factor, and torque versus speed (0-100 percent, inclusive, in 1 percent increments up to 95 percent and 0.1 percent increments above 95 percent) and load (0-125 percent, inclusive, in 25 percent increments) as a function of line voltage (from 80 percent to 110 percent, inclusive, in 5 percent increments), for rated and 90 percent of rated voltage at starter. Only tabulated data will be required.

c. Load inertia, Wk2 of motor rotating parts, pound-foot2.

d. Load inertia, Wk2 of pump rotating parts (wet), pound-foot2.

1.4 DELIVERY, STORAGE, AND HANDLING

Ship each motor in the vertical position with the rotor blocked inside the stator to prevent damage to the bearings. Securely mount the motor on a skid or pallet of ample size. All small parts or elements shall be boxed. Perform the skid mounting and boxing in a manner which will prevent damage or distortion to the motor during loading, shipment, unloading, indoor storage, and subsequent handling. Provide weatherproof covers as necessary to protect the motor during shipment. Any eyebolts, special slings, strongbacks, or other devices used in loading the equipment at the manufacturer's plant shall be furnished for unloading and handling at the destination and shall become the property of the Government.

1.4.1 Impact Recorder

Ship each motor with a three-way temporary impact recorder to measure magnitude and direction of longitudinal (Y), lateral (X), and vertical (Z) impacts suffered during shipment. If the recorder indicates impacts equal
to or greater than those determined by the Contractor prior to shipment for any of the three directions specified herein, inspect and test motor to determine extent of damage, if any, and repair or replace any damaged equipment.

1.4.2 Long Term Storage

**************************************************************************
NOTE: The designer will include this paragraph only when there is no available Government storage. The designer should also investigate storage to be used by the installation Contractor and the possibility of making this a requirement under the installation contract.
**************************************************************************

Store all equipment provided under this contract for [_____] [days] [months] at no cost to the Government. The storage site shall be subject to the approval of the Contracting Officer and shall meet the manufacturer's recommendations for indoor storage. The equipment will be subject to periodic inspection by the Government to ensure that proper storage conditions are maintained.

1.5 EXTRA MATERIALS

The following spare parts shall be furnished for each type and rating in addition to the assembled motors:

a. Two complete stator coils but not less than the number of coils to span one coil pitch with necessary wedges and material for installation for one motor.

b. Two complete field coils, including necessary materials for installation.

c. One complete exciter field coil, including necessary materials for installation.

d. One complete set of bearing parts for pump motors. Each set to include:
   (1) Stationary thrust bearing plate.
   (2) Rotating thrust bearing plate.
   (3) Upper guide bearing lining.
   (4) Lower guide bearing lining.
   (5) Two sets of oil rings for pump motors.
   [6) One complete set of parts necessary for replacement of antireverse device.]

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

The work under this section includes furnishing all labor, equipment, and material and performing all operations required to design, manufacture,
assemble, factory test, prepare for shipment and storage, and to deliver the vertical synchronous motors required to drive the flood-control pumps specified under Section 35 45 01 VERTICAL PUMPS, AXIAL-FLOW AND MIXED-FLOW IMPELLER-TYPE. Supply these motors complete with all accessories, spare parts, tools, and manufacturer's data and instructions as specified herein.

a. Submit a complete list of renewal parts for the motor. The list shall accompany the instruction manuals.

b. Submit [6] [_____] copies of printed and bound instructions manual for the proper installation, erection, inspection, and maintenance of the machines furnished under this contract not later than the date the equipment is shipped from the manufacturer's plant. Manuals shall include complete installation, maintenance, and service instructions for the motors, lube oil system, thrust bearings (including cooling water requirements), and other accessories.

c. The instructions shall include a cross-sectional drawing indicating the major component parts of the motor and procedure for disassembly. The description in the manual for the motor shall be coordinated with the installation erection instructions specified in Section 35 45 01 VERTICAL PUMPS, AXIAL-FLOW AND MIXED-FLOW IMPELLER-TYPE for the pump and integrated with same for a complete motor and pump assembly.

**************************************************************************
NOTE: Include contract specification number where service conditions are described.
**************************************************************************

d. Insulation for the stator, rotor field, and exciter windings shall be full class "F" insulation as defined in NEMA MG 1 paragraph 1.66 and as described herein. The insulation system shall be a combination of materials and processes which provides high resistance to moisture, fungus, and other contaminants as experienced by a motor in the service conditions specified herein.

e. The insulation system shall also be of a type designed and constructed to withstand severe humidity conditions and to function properly after long periods of idleness without first drying out. All windings and connections shall be of the sealed type as defined in NEMA MG 1 paragraph 1.27.2. Insulated windings, unless otherwise approved, shall be completely assembled in the motor core before impregnating with the insulating compound. The compound shall consist of 100 percent solid resin. Submit a detailed description of and specification for the manufacturing process, the materials and the insulating compound used in insulating the windings for approval before manufacture of the motors is commenced. If, in the opinion of the Contracting Officer, the insulation proposed is not of the quality specified and if the methods of manufacture are not considered to be in accordance with best modern practice, the motors will not be accepted. Impregnation of the windings with the insulating compound shall be by vacuum impregnation method followed by baking. Repeat the procedure as often as necessary to fill in and seal over the interstices of the winding, but in no case shall the number of dips and bakes be less than two dips and bakes when the vacuum method of impregnation is used.

f. Process insulation to ground on the coil. Slot tubes or cells are not acceptable. The insulation shall be of adequate thickness and breakdown strength throughout the length of the coil. Use mica in the
2.2 NAMEPLATES

Nameplate data shall include rated voltage, rated full-load amperes, rated horsepower, service factor, number of phases, RPM at rated load, frequency, code letter, locked-rotor amperes, duty rating, insulation system designation, and maximum ambient design temperature. Each motor shall have a nameplate listing motor characteristics in accordance with NEMA MG 1 paragraph 21.61. A separate starting information nameplate shall be furnished as specified in paragraph OPERATING CHARACTERISTICS. A starting information nameplate setting forth the starting capabilities shall be provided on each motor in accordance with NEMA MG 1 paragraph 21.43.3. This nameplate shall also include the minimum time at standstill and the minimum running time prior to an additional start.

2.3 GUARDS AND PROTECTIVE ENCLOSURES

All moving, energized, or other parts where accidental contact might be hazardous to personnel shall be equipped with adequate guards, rails, or other suitable enclosures to prevent accidental contact. All lubrication fittings shall be piped to convenient locations where they can be serviced from regularly utilized access ways without removal of the guards or enclosures.

2.4 MOTORS

******************************************************************************

NOTE: For weak source (high thevenin source impedance), the electric utility should be contacted to determine starting restrictions, maximum inrush, or voltage dip limits. This is especially critical for motors over 75 kW 100 hp. The designer must then perform a motor torque and accelerating time study (MTATS) to evaluate the motor starting torque and voltage dip requirement. The selection of a reduced voltage starter will be based on the electric utility requirements and the motor pump arrangement.

******************************************************************************

The motors to be supplied under these specifications shall be of the vertical [solid] [hollow] shaft type as required by the pump manufacturer, with direct-connected brushless exciter, designed for full voltage starting, of drip-proof construction, [complete with antireversing ratchet or backstop device], and shall conform to the applicable requirements of NEMA MG 1, except as hereinafter specified.

a. Submit [6] [_____] copies of equipment foundation dimensions; outline drawings for motor and rotor set-down fixture and jacking provisions with weights, nameplate data, and details showing method of mounting and anchoring the motor. Contracting Officer's approval shall be obtained in writing prior to the commencement of manufacture of motors.

b. Submit [6] [_____] copies of complete descriptive specification for each type and size motor furnished, with necessary cuts, photographs, and drawings to clearly indicate the construction of the motor, specifications for the materials and treatments used to prevent
corrosion of parts, and of bearing construction.

c. Submit a complete listing of motor performance data in the form provided in NEMA MG 1 paragraph 21.50. Include with the submittal all information required for the selection of protective and control equipment and for operational settings. Information such as, but not limited to, normal and maximum operating temperatures for windings and bearings, V-curves, field control and protective equipment to be mounted on the motor controller cubicle, locked-rotor current, permissible locked-rotor time, starting times for each type of start as indicated above, and subtransient, transient, and synchronous reactance.

d. If duplicate equipment has not been manufactured previously, calculations or tests shall be made as necessary and confirmed as required by paragraph FACTORY TESTS. Contracting Officer's approval shall be obtained in writing prior to the commencement of manufacture of motors.

2.4.1 Rating

******************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************** 2.4.2 Operating Characteristics

2.4.2.1 Torques

**************************************************************************

NOTE: This guide specification identifies closed transition autotransformer-type reduced voltage starters. These starters provide the most flexibility during installation, when exact load and line characteristics are not determined, since both input voltage and inrush current may be adjusted. This specification is not meant to limit the selection of reduced voltage starter to only autotransformer type. The use of wye-delta type starter may be appropriate in certain situations. The reduced starter cost must be weighed against the increase cost in motor designs; however each design should be evaluated for the most suitable type starter. All reduced voltage starters will reduce the motor starting torque, so the designer should evaluate the load characteristics to ensure that motor torque will be sufficient under all starting conditions. If reduced-kVA starters are required, EM 1110-2-3105 should be consulted for further guidance.

**************************************************************************

Starting and accelerating torque shall be sufficient to start the pump and accelerate it against all torques experienced in passing to the pull-in speed under maximum head conditions and with rated excitation current and a terminal voltage equal to [90 percent of rated value] [the output of a closed-transition autotransformer type reduced-voltage starter supplied at 90 percent of rated voltage and connected on its [80] [65] percent tap]. The pull-in torque shall exceed that required by the pump under maximum head conditions but shall not be less than 100 percent of motor full-load torque, with a terminal voltage equal to 90 percent of rated value. Pull-out torque shall not be less than 150 percent of motor full-load torque for one minute minimum and with a terminal voltage equal to 90 percent of rated value.

2.4.2.2 Locked-Rotor Current

**************************************************************************

NOTE: The objective of this specification is to limit the locked-rotor current to a value sufficiently low to permit full-voltage starting. The motor horsepower rating is to be a minimum of 110 percent of the maximum pump load at a service factor of 1.0. Manufacturer's standard is to limit locked-rotor current to 600 percent of full load current. However, local utilities may have additional limitations on inrush currents and should be consulted. Motor design will permit some reduction in inrush current in which case 500 percent should be used. If this is not sufficient, reduced-voltage starting should be used. The inrush current limit should be specified whenever possible.
The locked-rotor current shall not exceed 600% [500%] percent of rated nameplate full load running current. [The locked-rotor current shall not exceed [_____] amperes at 90 percent of rated voltage during any point in the starting cycle under worst case starting conditions. For autotransformer reduced voltage starting, the above criteria shall apply to primary side and at any prescribed tap.]

2.4.2.3 Starting Capability

Each motor, when operating at rated voltage and frequency and on the basis of the connected pump load inertia, Wk2, and the speed-torque characteristics of the maximum load during starting conditions as furnished by the pump manufacturer, shall be capable of making the starts required in NEMA MG 1 paragraph 21.43.

2.4.2.4 Balance

The balance for each motor when measured in accordance with NEMA MG 1 paragraph 20.53 shall not exceed the values specified in NEMA MG 1 paragraph 21.54. Each motor’s characteristics shall be such that the maximum vibration requirements of Section 35 45 01 VERTICAL PUMPS, AXIAL-FLOW AND MIXED-FLOW IMPELLER-TYPE are met.

2.4.2.5 Noise

The Department of Defense considers hazardous noise exposure of personnel as equivalent to 85 dB or greater: A-weighted sound pressure level for eight hours in any one 24-hour period. On the assumption that pumping plant operating personnel may be exposed to noise levels approaching or exceeding that defined by the DOD as hazardous, the motor noise limit should be specified not to exceed 85 dBA. The additional cost of providing motors meeting this requirement should be investigated and weighed against an alternate of providing a room to isolate these personnel from the noise exposure.

All motors shall operate at a noise level less than 85 decibels A-weighted mean sound pressure level (dBA). Noise shall be determined in accordance with NEMA MG 1 paragraph 21.53.

2.4.2.6 Overspeed Option

Design each motor to withstand indefinitely, without injury, the maximum overspeed to which the motor will be subjected when the pump to which it is
connected is acting as hydraulic turbine under the maximum head with the pump discharge pipe open.

2.4.2.7 [Antireverse Device]

Install a self-actuated backstop device or antireversing ratchet, to prevent reverse rotation of the pump due to loss of power or failure of the electric prime mover, as an integral part of the motor. Submit the design of the antireverse device for approval by the Contracting Officer, such that its action is without intentional delay or excessive backlash. It shall have sufficient capacity to prevent reverse rotation with a back flow through the pump due to a [___]-foot differential head. The device shall be precision machined and be complete with support housing and oil collector as required. An oil reservoir, independent of the one used for the thrust bearing, complete with oil-level gauge and 120-volt ac rated high and low level contacts shall be provided for the backstop device. The lubricant for the antireverse device shall contain a corrosion inhibitor, whose type and grade shall be shown on a special nameplate attached to the frame of the motor adjacent to the lubricating filling device.

2.4.2.8 [Power Factor and Efficiency]

**************************************************************************
NOTE: List power factor and efficiency for each size only if high efficiency motors are required. Generally manufacturers' standards will be used.
**************************************************************************

The power factor and efficiency at full load, 3/4 full load, and 1/2 full load shall be not less than [____], [____], [____] and [____], [____], [____], respectively. Submit 6 [____] copies of certification guaranteeing value of power factor and efficiency for full load, 3/4 full load, and 1/2 full load. Motors will be rejected if factory tests specified in paragraph FACTORY TESTS do not demonstrate that these values will be met or exceeded.

2.4.3 Frames and Brackets

Frames and end brackets shall be of cast iron, cast steel, or welded steel. The mounting ring, unless otherwise approved, shall be built integral with the frame or lower end bracket. Coordinate the motor installation with the mounting arrangement specified in Section 35 45 01 VERTICAL PUMPS: AXIAL-FLOW AND MIXED-FLOW IMPELLER-TYPE, paragraph BASE PLATE AND SUPPORTS. Furnish all equipment and materials required to mount the motor, such as a base or pedestal, sole plates, and bolts or dowels. Install sufficient bolts and dowels to prevent any possible movement of the motor assembly when the motor is subjected to stresses resulting from the most severe short-circuit conditions. Treatment against corrosion shall be as specified in paragraph GENERAL REQUIREMENTS.

2.4.3.1 Stator Frame

The stator frame shall be rigid and sufficiently strong to support the weight of the upper bearing bracket load, the weight of the stator core and windings, and to sustain the operating torques without perceptible distortion.
2.4.3.2 Supporting Brackets

The upper bracket supporting the thrust bearing and upper guide bearings shall have sufficient strength and rigidity to support the weight of the entire rotating element of the motor, together with the pump impeller and shaft, and the unbalanced hydraulic thrust of the pump impeller. The lower bracket supporting the lower guide bearing shall preferably be so designed and constructed that the entire rotor can be lifted out as a unit without disturbing the bearing alignment. If it is not feasible to construct the rotor so that it can be lifted out as a unit, then the lower bracket shall be supported on separate base plates or structure and shall be designed so that it can be removed through the stator. The maximum deflection of the thrust bearing support system at any point shall not exceed the limits set by the pump manufacturer to maintain proper clearances for any operating condition.

2.4.3.3 Eyebolts

Provide eyebolts, lugs, or other approved means for assembling, dismantling, and removing the motor from above, utilizing the overhead pumping station building crane. Furnish with the motor all lifting devices for use in conjunction with the building crane.

2.4.3.4 Platforms and Stairways

Furnish each motor with a platform and stairway complete with railing. An easily removed section of railing shall be provided so that the rotor shaft does not have to be hoisted above the railing when the rotor is removed. The platform shall also provide maintenance access as required by the motor furnished. Locate the stairway [_____] degrees [counter-] clockwise from the discharge elbow of the pump, when looking down on the motor/pump assembly.

2.4.4 Insulation Against Stray Currents

The motor shall be adequately insulated against stray currents which may be set up by the field of the motor and which might cause injury to the motor or pump bearings. This insulation shall be arranged to break the possible path of such currents in not less than two places in series.

2.4.5 Motor Cooling

Provide the motor with an open-type system of ventilation, taking cooling air from above the operating floor level and discharging the heated air into the operating room through upper openings in the stator frame. The circulation of air shall be induced by means of the fan action of the rotor. No openings to the air space below the operating level are to be used in the motor design for ventilation or other uses that are not reasonably airtight.

2.4.6 Stator

2.4.6.1 Stator Core

The cores shall be built up of separately punched thin laminations of low-hysteresis loss, nonaging, annealed, electrical silicon steel; assembled under heavy pressure; and clamped in such a manner as to ensure that the assembled core is tight at the top of the teeth of the laminated core. Laminations shall be properly insulated from each other. Only
laminations free from burrs shall be used, and care shall be taken to remove all burrs or projecting laminations from the slots of the assembled cores. Cores shall be keyed, dovetailed, or otherwise secured to the shaft or frame in an approved manner. Treatment against corrosion shall be as specified in paragraph GENERAL REQUIREMENTS.

2.4.6.2 Stator Coils

The coils shall be thoroughly insulated and treated with a moisture and fungus-resisting compound in such a way that air will be excluded and the insulation will be protected from the absorption of moisture. Provide additional insulation for those portions of each coil which are within the slots. The coils shall fit the slots accurately and they shall be form wound and interchangeable. The end turns shall be so designed and supported that they will not be distorted under the most severe short-circuit conditions to which the motor may be subjected.

2.4.6.3 Insulated Stator Windings

The stator windings shall be insulated as specified in paragraph GENERAL REQUIREMENTS. Coils shall be of such uniformity that the stator windings of all similarly rated motors will be alike, in shape and size, and interchangeable. The stator winding and end turn connections shall be fully braced to withstand repeated full voltage starts. The bracing system shall essentially eliminate coil vibration under these high current conditions as well as during normal operation. A tieless bracing system will be acceptable. If a tied system is used it shall be such that no tie depends upon the integrity of any other tie within the system.

2.4.6.4 Temperature Detectors

Six standard copper resistance-type temperature detectors, with a resistance of 10 ohms at 25 degrees C 75 degrees F, shall be provided in the stator in accordance with NEMA MG 1 paragraph 20.63. Detectors shall be wired in accordance with paragraph ACCESSORY WIRING AND BOXES.

2.4.6.5 Grounding

The stator frame shall have provisions for solidly grounding to the station ground system which will be furnished and installed by others.

2.4.7 Rotor

The rotor shall be built in accordance with the best modern practice and in such a manner as to secure adequate strength for the operating conditions described herein. The pole pieces shall be built up of thin steel laminations accurately aligned and securely riveted or bolted together. It is preferred that the field poles be secured to the rotor structure by means of dovetails, but an alternate method of construction will be acceptable, provided that evidence of its adequacy, satisfactory to the Contracting Officer, is submitted with the bid.

2.4.7.1 Field Windings

The field windings shall be insulated as specified in paragraph GENERAL REQUIREMENTS. The field coils shall be adequately insulated between turns and from the pole pieces and shall be thoroughly braced to withstand the stresses which could be imposed under maximum pump speed.
2.4.7.2 Starting Windings

Design the starting windings for full-voltage starting, securely built into the field poles and designed to ensure conservative stresses when the unit is operating at maximum pump speed. The bars shall be silver soldered or brazed to heavy end segments to form a low-resistance joint of high mechanical strength. Design the starting windings to permit any pole or group of poles to be removed.

2.4.8 Exciter

Provide each synchronous motor with a direct connected exciter without brushes, commutators, or additional bearings. The exciter shall be capable of supplying continuously, and without overheating, the excitation for the motor to which it is connected when the latter is operating at rated power factor, voltage, frequency, and horsepower. Accomplish the field-protective function and the field switching and application function by semiconductor elements mounted on suitable heat sinks supported on the motor rotor and ventilated by rotation of the rotor. The exciter shall be either built into or so arranged that it is ventilated from the main motor enclosure. The enclosure of the exciter shall be of drip-proof construction comparable to that of the motor. The control system shall apply excitation to the motor field at the speed and phase angle required to obtain maximum pull-in torque. Insulate the exciter windings as specified in paragraph GENERAL REQUIREMENTS. The field coils shall be adequately insulated between turns and from the pole pieces and shall be thoroughly braced to withstand the stresses which could be imposed under maximum pump speed.

2.4.9 Shaft

**************************************************************************
NOTE: Use hollow shaft pumps whenever possible, since they are more readily adjusted. Pumps requiring large motors (above 746 kW 1,000 hp) are limited by the available motors. Investigate the exact motor capabilities and sources of supply when using hollow shafts with motors above 746 kW 1,000 hp. Solid shafts will be used only when the available motor designs require their use.
**************************************************************************

Make the motor shaft of high grade steel, finished all over, and of ample size to drive the pump under maximum load conditions. The shaft shall be of the [solid type and shall be connected to the pump shaft with a rigid adjustable coupling.] [hollow type and shall be connected to the pump shaft above the thrust bearing in a manner that will permit the pump impeller to be adjusted vertically]. Coordinate the connection with the pump shaft and furnish a motor shaft with all provisions, fittings, and devices required to conform to the shafting arrangement specified in Section 35 45 01 VERTICAL PUMPS, AXIAL-FLOW AND MIXED-FLOW IMPELLER-TYPE, paragraph SHAFTS. See paragraph GENERAL REQUIREMENTS for treatment against corrosion.

2.4.10 Bearings

2.4.10.1 Thrust Bearings

Provide thrust bearings of the spring type located above the rotor. A design in which each pivot shoe rests upon a support of metal which may
take a permanent deformation in order to equalize the load on the bearing shoes, or in which individual shoe pivots are supported on spring plates or spring disks, is not considered to be of the self-equalizing type and will not be acceptable. The stationary shoes shall be babbitt-lined. The thrust bearing shall have ample capacity to support the maximum pump hydraulic thrust load plus the static load while operating under maximum rated pump conditions. The thrust bearing shall be capable of withstanding without injury the pump being started normally without prior jacking of the rotor. The thrust bearing shall have a removable runner and shall be arranged to permit adjustments, dismantling, and assembly of the runner and shoes without disturbing the stator or rotor, other than jacking the load from the bearing. A spacer plate between the thrust bearing runner plate and the thrust block will not be permitted.

2.4.10.2 Guide Bearings

Except as permitted below, provide the motor with two guide bearings, one located above the rotor and the other below the rotor. The guide bearings shall be capable of withstanding all stresses incident to the normal operation of the unit [and to the maximum runaway speed]. Both guide bearings shall be self-cooled, of the oil-immersed, self-oiling type, and adequate provision shall be made for preventing oil or oil vapor from entering the motor cooling system. The guide bearings shall be of the split-sleeve type and shall be designed and constructed so that they can be dismantled without disturbing the thrust bearing or the motor rotor. If desired, the Contractor may combine the thrust bearing and the upper guide bearing into a combination integral guide and thrust bearing assembly in a common housing. In such a combination bearing, the vertical side of the thrust-bearing block, but not the runner plate, shall be used as the journal surface.

2.4.10.3 Lubrication

Use lubricating oil containing a corrosion inhibitor. Type and grade of lubricant used shall be shown on a special nameplate which shall be attached to the frame of the motor adjacent to the bearing filling device. In addition to the quantity of lubricant required to initially fill the system, furnish spare lubricant in sufficient quantity to purge and refill the system. Each lubrication system shall include oil reservoirs, oil-level sight gauge, oil piping, valves, and necessary appurtenances.

2.4.10.4 Housing

Bearing housing shall be of a design and method of assembly that will permit ready removal of the bearings, and prevent escape of lubricant and entrance of foreign matter. The bearings shall be protected by the lubricant when the motor is idle. Provide suitable means to apply and drain the lubricant.

2.4.10.5 Cooling

Each thrust bearing shall be self-cooling whenever possible. When required by motor speed or load, provide an oil cooler with suitable coils of corrosion-resisting metal in the oil reservoir of sufficient capacity to maintain the oil at the proper temperature with [30 percent glycol] cooling water entering the coils at a temperature of [30] [_____] degrees C and with a minimum pressure of 40 pounds per square inch. Design the cooler for safe operation at a maximum working pressure of 345 kPa 50 psi and shall be subjected at the factory to a hydrostatic test pressure of 517 kPa.
75 psi for a period of one hour without leakage. Cooling water will be supplied by a central system, furnished by others, consisting of a radiator, circulating water pump, and piping system terminating at the exterior of each motor. If required an auxiliary-motor-driven circulating oil pump, rated at 480 volts, three-phase, with electrical leads terminated in a special terminal box on the motor, and an oil pressure sensing device shall be included in the bearing oil cooler system. Construct the cooler system so that the thrust bearing can be readily inspected or removed for repairs. Include a water flow indicator with adjustable alarm contacts in the water supply line. The oil reservoir shall have an oil-level gauge with high and low level normally open contacts rated 120 volts ac.

2.4.10.6 Temperature Detectors

Provide a standard copper resistance-type temperature detector, with a resistance of 10 ohms at 25 degrees C 75 degrees F, for each bearing. Casings shall be made of copper. Detectors shall be wired in accordance with paragraph ACCESSORY WIRING AND BOXES.

2.5 INSTRUMENTS AND GAUGES

Furnish the following instruments and gauges.

2.5.1 Thermometers

Indicating thermometers, 150 mm 6 inch vapor-tension [dial-type] [digital], with adjustable ungrounded alarm contacts suitable for 120 volts ac shall be provided for (a) the thrust bearing, (b) the thrust bearing oil reservoir, and (c) each guide bearing. The bulbs shall be located so as to indicate the temperatures of the hottest parts. The thermometers shall be mounted on a thermometer panel and located on the motor housing at a location approved by the Contracting Officer. Provide adequate length of tubing with each thermometer. The bulb and tubing shall be insulated where necessary to prevent bearing currents. [The dial-type thermometers shall be of the [round] [square] semiflush type with black cases, white dials, and black figures and pointers.] [The digital thermometers shall be square, semiflush type with black cases and minimum 25 mm 1 inch high display.]

2.5.2 Temperature Relay

Provide a pneumatic bearing temperature relay having two sets of electrically independent contacts, located close to the babbitt of the thrust bearing [and each guide bearing]. Each relay shall close its contacts when the bearing temperature reaches approximately 105 degrees C 220 degrees F. The contacts shall have a current-carrying capacity of not less than 10 amperes, shall be ungrounded, and shall be suitable for 120 volts ac. The relays shall be mounted in an approved accessible location and the leads brought to a terminal block mounted on the stator frames in an approved location. The bulbs for the temperature relays shall be easily accessible and constructed for removal and testing without disturbing the bearing or bearing housing. The tubing shall be insulated where necessary to prevent bearing currents.

2.5.3 Oil-Level Gauge

Provide an oil-level gauge for each oil reservoir, with scale of sufficient length to indicate the oil level at all room and operating temperatures. The gauges shall be located near the reservoirs in an approved, accessible location where they can be easily read. Each oil-level gauge shall have
adjustable high and low oil-level ungrounded alarm contacts suitable for 120 volts ac.

2.6 PIPING

Design and furnish all piping systems within the motor for bearings, including valves and fittings. Bring these connections out to approved positions at the bottom of the stator frame. All piping shall be clean inside and where ending in open connections for other work, ends shall be capped for protection. Valves and other operating devices shall be easily accessible, and gauges and indicating devices shall be mounted on a control panel as approved by the Contracting Officer. Piping and fittings shall be of copper or brass as required. Valves shall have bronze seats and stems and shall be suitable for the service intended. At all points where the piping system must be disconnected for dismantling operations, provide bolted flange connections or unions. Arrangement of piping and location of valves and joints shall be such that there will be a minimum of disturbance to piping or interference with other service when the motor is dismantled or parts are removed for inspection or repairs.

2.7 WINDING SPACE HEATERS

******************************************************************************
NOTE: The inclusion or omission of "Winding Space Heaters" will depend upon the decision reached after giving due consideration to the problem of prevention of moisture condensation on the station equipment.
******************************************************************************

Install heaters in the lower section of the frame or wrap them around the winding end turns. They shall be designed for operation on 120 volts, single-phase, 60-Hz, alternating current and of sufficient capacity or wattage that, when energized, they will hold the temperature of the motor windings approximately 10 degrees C above the ambient temperature. Heaters shall be de-energized when motor is operating.

2.7.1 Construction

The heaters, except for wrap-around type, shall be of the tubular type, constructed with a chrome-nickel heating element embedded in a refractory insulating material, and encased in an approved watertight metal sheath. They shall be designed for continuous operation and have a maximum watt density of 20 watts per square inch. The rate of heat dissipation shall be uniform throughout the effective length of the heater. Cartridge-type heaters of equivalent construction, as approved by the Contracting Officer, will be acceptable. Heaters installed around the winding end turns shall consist of the required turns of heating cable wrapped around the end turns and secured in place before the winding is impregnated.

2.7.2 Element

Heating element shall conform to the requirements of ASTM B344 for an 80 percent nickel and 20 percent chromium alloy.

2.7.3 Sheath

Sheath shall be of a corrosion-resisting, nonoxidizing metal and shall have a wall thickness not less than 0.625 mm 0.025 inch.
2.7.4 Insulation

Insulation shall be a granular mineral refractory material, highly resistant to heat, and shall have a minimum specific resistance of 1,000 megohms per inch cubed at 585 degrees C 1,000 degrees F. Insulation for the heating cable (winding wrap-around type heaters) shall be suitable for a conductor temperature of 180 degrees C 356 degrees F.

2.7.5 Terminals

Terminals of the heater, including the leads, shall be watertight and shall be provided with leads suitable for making connections to a separate drip-proof terminal box located on the motor frame. The terminal box shall be readily accessible through the crating, so that winding heaters can be energized while motors are in storage.

2.8 MAIN LEADS AND TERMINAL BOX

2.8.1 Stator Terminals

Insulated terminal leads shall receive a treatment equal to that of the motor winding. Six leads shall be brought out of the stator frame and connections shall be made as required for the current transformers in paragraph ACCESSORY WIRING AND BOXES. Provide terminal lugs for connection to the motor shielded single-conductor supply wiring.

2.8.2 Stator Terminal Box

Drip-proof cast iron or steel terminal boxes, treated in the same manner specified for frames to resist corrosion, shall be supplied for housing the stator lead connections, surge capacitors, surge arresters, and current transformers and shall have adequate space to facilitate the installation and maintenance of cables and equipment. Boxes shall have a [bolted] [hinged lockable] cover providing unrestricted access, be mounted on the motor frame, and shall have an auxiliary floor supporting structure, when required, supplied by the motor manufacturer. Conduit entrance shall be from the bottom. The boxes shall be designed to permit removal of the motor supply leads when the motor is removed. Provide a "HIGH VOLTAGE [_____] VOLTS" warning sign on the cover of the box. When looking down on the motor/pump assembly, the terminal box shall be located between [_____] degrees and [_____] degrees [counter-] clockwise from the discharge elbow of the pump. A ground bus and means for external connection to the station grounding system shall be provided in the stator terminal box.

2.9 SURGE PROTECTION

**************************************************************************
NOTE: To obtain the most reliable protection for 2,300- and 4000-volt motors, surge capacitors and arresters, mounted at the motor terminals, should be specified. In addition, it is recommended that station-type arresters be installed on the line side of the supply transformers.
**************************************************************************

2.9.1 Surge Capacitors

Furnish and install, in the main terminal box, a three-pole capacitor unit
equipped with built-in discharge resistors and using a non-polychlorinated biphenyl (non-PCB) insulating medium. Each pole shall be rated 0.5 microfarad and [2,400] [4,160] volts line-to-line. Provide removable bus links for motor testing. These links shall be treated to resist corrosion, shall be designed to maintain a positive contact, and shall have low contact resistance.

2.9.2 Surge Arresters

**************************************************************************
NOTE: Use 3,000 MCOV arresters for 2,400-volt systems or effectively grounded 4,160-volt systems.
Use 4,500-MCOV for ungrounded or resistance grounded 4,160-volt systems.
**************************************************************************

Surge arresters of the station type with porcelain tops shall be furnished and installed in the main terminal box. The arresters shall be of the metal-oxide type rated [3,000] [4,500] [_____] maximum continuous operating voltage line-to-ground. Provide removable bus links for motor testing. These links shall be treated to resist corrosion, shall be designed to maintain a positive contact, and shall have low contact resistance.

2.9.3 Space Heater

If recommended by the surge protection manufacturer, furnish a space heater of adequate capacity, rated 120 volts and install it in the terminal box. Space heater maximum watt density shall not exceed 20 watts per square inch.

2.10 CURRENT TRANSFORMERS

**************************************************************************
NOTE: For motor differential protection, the "Flux-Balancing Current Differential" scheme, as shown in Fig. 16 of IEEE C37.96, is preferred and will generally be applicable. In this case, the window-type current transformers should be used. However, when the KVA rating of a motor is approximately one-half the supply transformer KVA rating, or greater, it may be necessary to use the differential scheme shown in Fig. 15 of IEEE C37.96, in which case the "Differential Protection" scheme should be used.
**************************************************************************

Current transformer shall meet the applicable requirements of IEEE C57.13 and IEEE C37.96. Secondary circuits [shall] [shall not] be grounded at the motor, and all leads from each individual transformer shall be brought out to terminal blocks. They shall be of the dry or compound-insulated type and shall be provided with a suitable means of mounting and for grounding the frame. Each current transformer secondary lead shall be connected to a terminal block of the short-circuiting type and shall be conveniently located to permit short-circuiting the secondary windings without requiring access to the primary bus compartments. The polarity of the current transformers shall be plainly marked. [Each motor shall be provided with three indoor dry-type window transformers with single secondary and rated [50/5 amperes, 600 volts] [_____]]. Current transformers shall have minimum full-wave insulation level of 10 kV and, when installed, shall meet the requirements for a [60 kV] [_____] basic impulse level (BIL).
transfomers shall be mounted in the main terminal box and shall be arranged in the "flux-balancing" connection.] [Each motor shall be provided with three current transformers of rated [4,160] [_____] and [60 kV] [_____] basic impulse level (BIL). The transformers shall be mounted in the main terminal box and shall be connected in the wye point of the winding for use with differential relays.] All current transformers shall be suitable for continuous operation at the full-rated voltage and current at a frequency of 60 Hz. All current transformers shall be designed to withstand, without damage, the thermal and mechanical stresses resulting from short-circuit currents corresponding to ratings of the breakers in the circuits to which they are connected.

2.11 ACCESSORY WIRING AND BOXES

Except for current transformer leads and field control leads, all accessory wiring shall terminate in an accessory terminal box, unless otherwise approved by the Contracting Officer. Boxes shall be drip-proof and treated in the same manner specified for frames to resist corrosion. The accessory terminal box shall be furnished with a door hinged full length and shall be mounted on the motor in a location approved by the Contracting Officer.

Rigid galvanized steel conduit shall be used wherever practicable and shall be arranged to make removal unnecessary when the motor is dismantled. A wiring diagram within the enclosure shall be provided for all circuits and each conductor shall be identified with the designation shown on the diagram. All wiring shall terminate on terminal blocks as specified below.

2.11.1 Wiring

Except as otherwise approved, all wiring shall be 125 degrees C rated flexible copper conductors, No. 14 AWG minimum, with 600-volt insulation. The size and type of temperature detector leads may be in accordance with the manufacturer's standard practice and, where required, shall be suitable for contact with lubricating oil. Each detector shall be connected by three leads to terminal blocks, with one wire connected to a common point on the blocks. The common point for the stator detectors shall be separate from that for the bearing detectors.

2.11.2 Terminal Blocks

All terminal blocks shall be molded closed-back type as defined in NEMA ICS 4, rated not less than 600 volts and shall be provided with covers. The terminals shall be screw-clamp type or stud-and-nut type. White or other light-colored marking strips, fastened by screws to the molded sections at each block, shall be provided for circuit designation. Each connected terminal of each block shall have the circuit designation or wire number permanently marked on a strip. Reversible or spare marking strips shall be furnished with each block and at least 10 percent spare terminals shall be provided.

2.12 JACKING PROVISIONS

Provide suitable means for hydraulic jacking of the rotor to permit inspection, adjustment, or removal of the thrust bearing. Provisions shall also be made for blocking the rotor in the fully raised position. The blocking device shall not require maintenance of hydraulic pressure on the jacks while the assembly is in the raised position.
2.13 SPECIAL TOOLS AND EQUIPMENT

Provide special tools, jigs, fixtures, lifting tackle, and instruments which may be necessary in assembly, erection, operation, maintenance, and repair of equipment. Special tools and equipment are those the design, purpose, and use of which are peculiar to equipment furnished and which are not available from normal wholesale or retail outlets. The motor manufacturer shall provide hydraulic jacking devices as required in order to pull the thrust bearing thrust collar from the upper end of the shaft and shall also furnish one complete set of lifting attachments such as detachable eyebolts or special slings for handling various parts with a hoist.

2.14 SET-DOWN FIXTURES

Furnish one separate motor set-down fixture for each motor rating supplied. This fixture, when installed on the operating floor, shall provide sufficient clearance above the floor for the motor shaft and coupling extending below the motor frame. The fixture shall be suitable for holding the motor during assembly and disassembly. Furnish one separate rotor set-down fixture for each motor rating supplied. The fixture shall hold the rotor in the horizontal position above the floor without unduly stressing the rotor pole pieces or laminations. The motor and rotor fixtures shall be shipped to the pumping station prior to the shipment of any motor.

2.15 FACTORY TESTS

**************************************************************************
NOTE: The designer should carefully consider whether to allow the Contracting Officer to waive these tests. Decision should be based on expertise in the field within the Division or District.
**************************************************************************

Give one motor of each rating and type, selected at random by the Contracting Officer, a complete test. Check test the remainder of the motors. Submit [6] [_____] copies of test reports recording all data, calculations, and curves for each motor used. All complete tests shall be [witnessed by the Contracting Officer] [waived in writing].

2.15.1 Witness Test

When the Contractor is satisfied that a motor selected for a "Complete Test" performs in accordance with the requirements of the specifications, notify the Contracting Officer and submit two copies of the tabulated data, calculations, and curves required by paragraph COMPLETE TEST below.

a. Submit [6] [_____] copies of motor design (characteristic) curves or tabulated data indicating the efficiency, current, and kilowatt input at rated voltage and 110 and 90 percent rated voltage, all plotted or tabulated against torque or percent load as abscissas. Where values are given in percentages all base values will be indicated.

b. Three weeks will be required, after receipt, to review the foregoing information. Should the witness test indicate that a motor does not perform in accordance with the requirements of the specifications, changes or corrections shall be made and new complete witness tests run, at no additional cost to the Government.
c. Submit [6] [_____] copies of the motor torque curves plotted for the following values of voltage at the motor terminals: [rated and 90 percent of rated voltage] [the output of a closed-transition autotransformer type reduced-voltage starter supplied at rated and 90 percent of rated motor voltage and connected on its [80] [65] percent tap]. [The pump torque curve shall be plotted for starting, accelerating, and synchronizing against maximum head. Furnish computations to demonstrate that the motor will pull into synchronism under all of the foregoing conditions.]

2.15.2 Complete Test

NOTE: For the large motors (1118 kW 1,500 hp and above), the efficiency is high, i.e. 95 percent at 1/2 to full load, however, efficiency varies with motor design. In general, high efficiency motors are not cost effective in the large size motors covered by this specification. If other than manufacturer's standard efficiency is required, the designer should list those values in paragraph FACTORY TEST.

Submit [6] [_____] certified copies of the results of a "Complete Test" for duplicate equipment of the respective rating and type. Test will be accepted in lieu of the "Complete Test" specified for equipment of the respective rating and type. No substitute will be accepted for the "Check Test". A complete test of a synchronous motor shall including the following:

a. Resistance of armature and field windings.
b. Polarity of field coils.
c. High-potential tests of armature and field windings in accordance with NEMA MG 1 paragraph 21.52.
d. Air gap measurement.
e. V-curves (for zero, 1/2, 3/4, and full load).
f. Determination of the subtransient, transient, and synchronous reactance.
g. Conventional efficiency tests, in accordance with NEMA MG 1 paragraph 21.44. Motor shall meet manufacturer's published efficiency criteria for 1/2, 3/4, and full rated loads. Calculation of efficiency shall include [that portion of the thrust bearing loss produced by the motor itself] [bearing loss due to external thrust load].
h. Tests to determine temperature rise in accordance with NEMA MG 1 paragraph 21.40.
i. Insulation resistance-temperature test, in accordance with IEEE 43. Test result values shall be plotted on semilogarithmic graphs, the insulation resistance values as logarithmic ordinates and the temperature values as uniform abscissas. Readings shall be taken at approximately 10 degrees C intervals. Temperature shall be determined by the resistance method. Also, for comparison purposes, a curve indicating the safe operating value of insulation resistance shall be plotted on the same sheet.

j. Noise level tests in accordance with NEMA MG 1 paragraph 20-50.
k. Motor balance in accordance with NEMA MG 1 paragraph 20.54.
l. Conformance test in accordance with NEMA MG 1 paragraph 20.49.
m. Torques. Torque tests shall be performed in accordance with IEEE 115 to demonstrate that the values specified in paragraph "Torques," will be met or exceeded.

2.15.3 Check Tests

A check test of a synchronous motor and exciter shall include the following:

a. Routine test in accordance with NEMA MG 1 paragraph 21.51.
b. Cold resistance measurement.
c. Insulation resistance and winding temperature at time the insulation resistance was measured.
d. Conformance test in accordance with NEMA MG 1 paragraph 20.49.
e. Motor balance in accordance with NEMA MG 1 paragraph 20.54.

2.15.4 Stator Winding Coil Tests

All coils, either before or after they are placed in the slots, shall be tested for short circuits between turns of the individual coils by applying a high frequency voltage of not less than 75 percent of the voltage for which the machine is insulated, or by applying a surge test voltage of equivalent value to the terminals of each coil. Equivalent surge voltage shall be a wave whose peak value is equal to 1.06 times the voltage for which the motor is insulated.

2.15.5 Space Heater Tests

Each winding space heater unit shall be tested at the factory for successful operation and dielectric strength.

NOTE: This guide specification covers the requirements for ASD (also referred to as variable frequency drive (VFD)) for motors rated up to 575 volts, for use on electric power systems of 600 volts or less, 50/60 hertz.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Coordinate this guide specification with a mechanical designer for HVAC ASD application.

Military standard requirements for parent equipment with motors controlled via ASDs also apply to the ASDs. Examples include petroleum, oil and lubricant (POL) systems and Mobile/Tactical generators with ASDs hardening as a part of the generator equipment assembly.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Pulse width modulated (PWM) is the predominant type of adjustable speed drive (ASD). Other ASD types include current source inverter (CSI), voltage source inverter (VSI), and flux
vector drive (FVD). For guidance of the proper application of ASD's and installation, refer to Appendix B of UFC 3-520-01. Since the carrier-frequency pulse output voltage of a PWM cause rapid rise times in these pulses, the transmission line effects must be considered. The resulting voltage can produce overvoltages equal to twice the DC bus voltage or up to 3.1 times the rated line voltage, putting high stress on the cable and motor windings, and eventual insulation failure. Use ASD manufacturer recommended cable type and maximum safe cable distances before using the external protection devices. Use motors designed for use with ASD.

********************************************************************************
NOTE: The use of power capacitors for power factor correction and/or the use of surge protection capacitors on the load side of an electronic control connected to an induction motor is not recommended; damage to the control may occur. Contact the control vendor for suitability.
********************************************************************************

1.2 RELATED REQUIREMENTS

Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM applies to this section with additions and modifications specified herein.

1.3 SYSTEM DESCRIPTION

1.3.1 Performance Requirements

1.3.1.1 Electromagnetic Interference Suppression

Computing devices, as defined by 47 CFR 15 and EN 61800-3 rules and regulations, must be certified to comply with the requirements for class A computing devices and labeled.

1.3.1.2 Electromechanical and Electrical Components

Ensure electrical and electromechanical components of the Adjustable Speed Drive (ASD) do not cause electromagnetic interference to adjacent electrical or electromechanical equipment while in operation.

1.3.2 Electrical Requirements

1.3.2.1 Power Line Surge Protection

IEEE C62.41.1 and IEEE C62.41.2, IEEE 519, IEC 61000-3-12 Control panel must have surge protection, included within the panel to protect the unit from damaging transient voltage surges. Surge protective device must be mounted near the incoming power source and properly wired to all three phases and ground. Fuses must not be used for surge protection.

1.3.2.2 Sensor and Control Wiring Surge Protection

I/O functions as specified must be protected against surges induced on control and sensor wiring installed outdoors and as shown. Test the inputs and outputs in both normal mode and common mode using the following two waveforms:

a. A 10 microsecond by 1000 microsecond waveform with a peak voltage of 1500 volts and a peak current of 60 amperes.

b. An 8 microsecond by 20 microsecond waveform with a peak voltage of 1000 volts and a peak current of 500 amperes.
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.5 QUALITY ASSURANCE

1.5.1 Schematic Diagrams

Submit diagrams showing circuits and device elements for each replaceable module. Schematic diagrams of printed circuit boards are permitted to group functional assemblies as devices, provided that sufficient information is provided for government maintenance personnel to verify proper operation of the functional assemblies.

1.5.2 Interconnecting Diagrams

Show interconnections between equipment assemblies, and external interfaces, including power and signal conductors. Include for enclosures and external devices.

1.5.3 Installation Drawings

Show floor plan of each site, with ASD's and motors indicated. Indicate ventilation requirements, adequate clearances, and cable routes. Submit drawings for government approval prior to equipment construction or
integration. Immediately record modifications to original drawings made during installation for inclusion into the as-built drawings.

1.5.4 Equipment Schedule

Provide schedule of equipment supplied. Schedule must provide a cross reference between manufacturer data and identifiers indicated in shop drawings. Schedule must include the total quantity of each item of equipment supplied and data indicating compatibility with motors being driven. For complete assemblies, such as ASD's, provide the serial numbers of each assembly, and a sub-schedule of components within the assembly. Provide recommended spare parts listing for each assembly or component.

1.5.5 Installation Instructions

Provide installation instructions issued by the manufacturer of the equipment, including notes and recommendations, prior to shipment to the site. Provide operation instructions prior to acceptance testing.

1.5.6 Standard Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship and:

a. Have been in satisfactory commercial or industrial use for 2 years prior to bid opening including applications of equipment and materials under similar circumstances and of similar size.

b. Have been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period.

c. Where two or more items of the same class of equipment are required, provide products of a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in this section.

1.6 DELIVERY AND STORAGE

Store delivered equipment to protect from the weather, humidity and temperature variations, dirt and dust, or other contaminants.

1.7 WARRANTY

The complete system must be warranted by the manufacturer for a period of [one year] [[____] years]. Repair or replace any component failing to perform its function as specified and documented at no additional cost to the Government. Items repaired or replaced must be warranted for an additional period of at least one year from the date that it becomes functional again, as specified in FAR 52.246-21 Warranty of Construction.

1.8 MAINTENANCE

1.8.1 Spare Parts

Manufacturers provide spare parts in accordance with recommended spare parts list.
NOTE: Coordinate with Contracting Officer on whether this paragraph can be included. Edit as required if additional spare parts are required for a specific project. Do not use this paragraph for Navy projects.

[ Provide one [_____] spare ASD of each model provided for HVAC equipment, fully programmed and ready for back-up operation when connected. ]

1.8.2 Operation and Maintenance Data

Provide in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA. Provide service and maintenance information including preventive maintenance, assembly, and disassembly procedures. Include electrical drawings from electrical general sections. Provide additional information necessary to provide complete operation, repair, and maintenance information, detailed to the smallest replaceable unit. Include copies of as-built submittals. Provide routine preventative maintenance instructions, and equipment required. Provide instructions on how to modify program settings, and modify the control program. Provide instructions on drive adjustment, trouble-shooting, and configuration. Provide instructions on process tuning and system calibration.

1.8.3 Maintenance Support

During the warranty period, provide on-site, on-call maintenance services by drive manufacturer's personnel on the following basis: The service must be on a per-call basis with 36 hour response. Contractor is responsible for the maintenance of all hardware and software of the system during the warranty period. Various personnel of different expertise must be sent on-site depending on the nature of the maintenance service required. Costs must include travel, local transportation, living expenses, and labor rates of the service personnel while responding to the service request. The provisions of this Section are not in lieu of, nor relieve the Contractor of, warranty responsibilities covered in this specification. Should the result of the service request be the uncovering of a system defect covered under the warranty provisions, all costs for the call, including the labor necessary to identify the defect, must be borne by the Contractor.

1.8.4 Technical Support

Provide the ASDs with manufacturer's technical telephone support in English, readily available during normal working hours.

PART 2 PRODUCTS

2.1 ADJUSTABLE SPEED DRIVES (ASD)

Provide adjustable speed drive to control the speed of induction motor(s). The ASD must include the following minimum functions, features and ratings.

a. Input circuit breaker per UL 489 with a minimum of 10,000 amps symmetrical interrupting capacity and door interlocked external operator.

b. A converter stage per UL 61800-5-1 must change fixed voltage, fixed frequency, ac line power to a fixed dc voltage. The converter must utilize a full wave bridge design incorporating diode rectifiers.
Silicon Controlled Rectifiers (SCR) are not acceptable. The converter must be insensitive to three phase rotation of the ac line and must not cause displacement power factor of less than .95 lagging under any speed and load condition.

c. An inverter stage must change fixed dc voltage to variable frequency, variable ac voltage for application to a standard NEMA MG 1 Part 30 motor designed for use with adjustable frequency power supplies. Switch the inverter to produce a sine coded pulse width modulated (PWM) output waveform.

d. The ASD shall be capable of supplying 110 percent of rated full load current for one minute at maximum ambient temperature.

**************************************************************************
NOTE: If constant torque required, modify to 150 percent of rated full load. Examples of these constant torque loads include general machinery, hoists, conveyors, printing presses, positive displacement pumps, some mixers and extruders, reciprocating compressors, as well as rotary compressors. Use inverter-duty motors (Standard MG 1 Part 31) for the constant torque loads.

Example of the variable torque loads include fans, centrifugal blowers, centrifugal pumps, propeller pumps, turbine pumps, agitators, and axial compressors. Use inverter-rated motors (Standard MG 1 Part 310) for the variable torque loads.

**************************************************************************
e. The ASD must be designed to operate from a [_____] volt, plus or minus 10 percent, three phase, 60 Hz supply, and control motors with a corresponding voltage rating.

**************************************************************************
NOTE: Choose one of the bracketed sentences when more than an ASD inherent dynamic braking torque is required because an ASD system will produce only 10 to 15 percent of motor full-load torque as dynamic braking retarding torque.

External dynamic braking (also may be called "Shunt Regulator" and "Snubber") may be used when a shorter decelerating time is occasionally required. Dynamic braking method is releasing the motor generated energy in the form of heat through a voltage regulated switching transistor and resistor.

Regenerative braking may be used where a short deceleration time is needed, a high inertia is present, or large amounts of energy losses are undesirable. The regenerative braking method is changing the ASD DC bus energy into fixed frequency utility power.

Common DC bus tie braking may be used together with a dynamic braking as an alternative to dissipating the energy by a dynamic brake resistor when several
controls are used in a process and tied in parallel. During braking, energy is returned to the common DC bus tie and may be used by rest of controls and a resistor if not all energy is used by the controls.

Dynamic, regenerative, and common DC bus tie braking cannot provide holding torque.

f. Acceleration and deceleration time must be independently adjustable from one second to 60 seconds.

[Adjust decelerating time by[ providing an external dynamic braking resistor designed to meet NEMA ICS 61800-2 to be capable of decelerating six times the motor inertia with no more than 150 percent of rated current with the motor at its base speed.][ providing an ASD with a regenerative braking designed to return some of braking energy from the motor to the AC power distribution system.][ providing each of several ASD used in a process with a common DC bus tie designed to share the regenerative energy between tied in parallel controls. ] Required deceleration time may be achieved using not only dynamic braking resistor but with other methods described in NEMA ICS 7.2-2015 paragraph 5.2.5.

NOTE: Modify this paragraph if constant torque required.

**************************************************************************

NOTE: Modify this paragraph if constant torque required.

**************************************************************************

g. Adjustable full-time current limiting must limit the current to a preset value which must not exceed 110 percent of the controller rated current. The current limiting action must maintain the V/Hz ratio constant so that variable torque can be maintained. Short time starting override must allow starting current to reach 175 percent of controller rated current to maximum starting torque.

h. The controllers must be capable of producing an output frequency over the range of 3 Hz to 60 Hz (20 to one speed range), without low speed cogging. Over frequency protection must be included such that a failure in the controller electronic circuitry must not cause frequency to exceed 110 percent of the maximum controller output frequency selected.

i. Minimum and maximum output frequency must be adjustable over the following ranges: 1) Minimum frequency 3 Hz to 50 percent of maximum selected frequency; 2) Maximum frequency 40 Hz to 60 Hz.

j. The controller efficiency at any speed must not be less than 96 percent.

k. The controllers must be capable of being restarted into a motor coasting in the forward direction without tripping.

l. Protection of power semiconductor components must be accomplished without the use of fast acting semiconductor output fuses. Subjecting the controllers to any of the following conditions must not result in component failure or the need for fuse replacement:

(1) Short circuit at controller output
(2) Ground fault at controller output
(3) Open circuit at controller output
(4) Input undervoltage
(5) Input overvoltage
(6) Loss of input phase
(7) AC line switching transients
(8) Instantaneous overload
(9) Sustained overload exceeding 115 percent of controller rated current
(10) Over temperature
(11) Phase reversal

**************************************************************************
NOTE: Class 10 means that the protection will trip in 10 seconds when current will be at 600 percent, Class 20 means that the protection will trip in 20 seconds when current will be at 600 percent. Class II ground-fault protection is an equipment protection per NEC. Retain isolated overload alarm contacts on overload relays if they are required for local or remote alarm indication of a tripping overload relay.
**************************************************************************

m. Solid state motor overload protection must be included such that current exceeding an adjustable threshold must activate a 60 second timing circuit. Should current remain above the threshold continuously for the timing period, the controller will automatically shut down.[have sensor in each phase,][Class 10] [Class 20] [Class 10/20 selectable] tripping characteristic selected to protect motor against voltage and current unbalance and single phasing,[Class II ground-fault protection, with start and run delays to prevent nuisance trip on starting,][analog communication module,[NC] [NO] isolated overload alarm contact,[external overload, reset push button].]

n. Include slip compensation circuit that will sense changing motor load conditions and adjust output frequency to provide speed regulation of NEMA MG 1 Part 30 designed for use with adjustable frequency power supplies motors to within plus or minus 0.5 percent of maximum speed without the necessity of a tachometer generator.

**************************************************************************
NOTE: Retain the last bracketed sentences if the selected time delay may not prevent an ASD from an automatic restart after a power interruption until motor has stopped. Also retain the sentence if there will be an ASD field-selected automatic and manual bypass mode in subparagraph 2.1.r.
**************************************************************************
o. The ASD must be factory set for manual restart after the first protective circuit trip for malfunction (overcurrent, undervoltage, overvoltage or overtemperature) or an interruption of power. The ASD must be capable of being set for automatic restart after a selected time delay. If the drive faults again within a specified time period (adjustable 0-60 seconds), a manual restart will be required.[ Provide Bidirectional Autospeed Search capable of starting the ASD into rotating loads spinning in either direction and returning motor to set speed in proper direction, without causing damage to drive, motor, or load.]

p. The ASD must include external fault reset capability. All the necessary logic to accept an external fault reset contact must be included.

q. Provide critical speed lockout circuitry to prevent operating at frequencies with critical harmonics that cause resonant vibrations. The ASD must have a minimum of three user selectable bandwidths.

**************************************************************************

NOTE: Three-contactor-style bypass allows motor operation via the power converter or the bypass controller; with input isolating switch and barrier arranged to isolate the power converter input and output and permit safety testing and troubleshooting of the power converter, both energized and de-energized, while motor is operating in bypass mode.

If a bracketed sentence is chosen with a field-selectable automatic and manual bypass mode, retain requirements for a Bidirectional Autospeed Search in subparagraph 2.1.o. with a requirement for ASD to be capable of being set for automatic restart after a selected time delay.

**************************************************************************

r. Provide properly sized [NEMA][IEC] rated by-pass and isolation contactors to enable operation of motor in the event of ASD failure and for safety transfers motor between power converter output and bypass circuit using a field-selectable automatic and manual bypass mode. Install mechanical and electrical interlocks between the by-pass and isolation contactors. Provide a selector switch and transfer delay timer. Motor overload and short circuit protective features must remain in use during the bypass mode.

**************************************************************************

NOTE: Per NEMA ICS 7.2, the ASD must limit harmonic distortion reflected onto the utility system. 5 percent impedance line reactors have the same benefits as the 3 percent impedance line reactors except that the 5 percent impedance line reactors provide maximum harmonic mitigation without adding capacitance. Investigate ASD voltage performance before using line reactors.

Retain Harmonic Analysis Report bracketed sentence if an analysis from ASD manufacturer is required. IEC 61000-3-12, Table 4 limits the THDI (total
harmonic current distortion) produced by equipment connected to public low-voltage systems with input more than 16 A and less or equal to 75 A per phase to be less than 48 percent.

---------------------------------------------------------------------------------------------

**NOTE:** In the last bracketed sentence, insert specific requirements in addition to or in lieu of the manufacturer provided RFI/EMI mitigating method if the method does not comply with the specified limitations.

---------------------------------------------------------------------------------------------

s. Each individual ASD must meet the following Total Harmonic Distortion (THD) requirements at the input terminals to the factory assembly of the ASD or at the load disconnecting means serving the ASD and filter assembly. These measurements should be taken with the drive set at 90 percent frequency (rpms) and the motor under a minimum of 50 percent demand.

1. The Voltage THD should not exceed 2.0 percent THD.
2. The Current THD should not exceed 15.0 percent THD.
3. If the standard factory ASD does not meet or exceed these requirements the factory must install appropriate equipment (Harmonic Traps, Filters, different Drive technology, etc.) to mitigate the distortion to assure performance of the VFD is within the limits.
4. These tests should be performed at the Manufacturers Laboratory facilities and submitted as part of the Product Data Submittals, in order to prevent the necessity of adding mitigation equipment in the field. If the requirements listed above are met, IEEE 519 will also be met.

[ t. Minimum Operating Conditions. Designed and constructed ASD's to operate within the following service conditions:

1. Ambient Temperature Rating: 0 to 120 degrees F.
2. Non-condensing relative humidity rating: less than 95 percent.
3. Ambient rating: Not exceed 1,006 meters 3,300 feet.

][2.1.1 ASD for Industrial Application

Provide the following operator control and monitoring devices mounted on the front panel of the ASD:

b. Hand-Off-Auto (HOA) switch.
c. Power on light.
d. Drive run power light.
e. Local display capable of including ASD status, frequency, motor RPM, phase current, fault diagnostic in descriptive text, and all programmed parameters.

][2.1.2 ASD for HVAC Application

ASDs must have the following features:

a. A local operator control providing the following functions:
   (1) Remote/Local operator selection with password access.
   (2) Run/Stop and manual speed commands.
   (3) All programming functions.
   (4) Scrolling through all display functions.

b. A local operator control panel with the following data displayed:
   (1) ASD status.
   (2) Frequency.
   (3) Motor RPM.
   (4) Phase current.
   (5) Scrolling through all display functions.
   (6) Fault diagnostics in descriptive text.
   (7) All programmed parameters.

c. Standard PI loop controller with input terminal for controlled variable and parameter settings.

d. User interface terminals for remote control of ASD speed, speed feedback, and an isolated form C SPDT relay, which energizes on a drive fault condition.

e. An isolated form C SPDT auxiliary relay which energizes on a run command.

f. An adjustable carrier frequency with 16 KHz minimum upper limit.

**************************************************************************
NOTE: Line reactor is based upon the percent of line impedance. Investigate ASD voltage performance before using line reactors.
**************************************************************************

g. A built-in or external line reactor with 3 percent minimum impedance to protect the DC bus capacitors and rectifier section diodes, reduce power line transient voltage, line notching, DC bus over-voltage tripping and improve the inverter over-current and over-voltage conditions.

h. Historical logging information and displays:
NOTE: Retain first subparagraph below if time and date stamping is not accomplished through the DDC system for HVAC.

[1] Real-time clock with current time and date.
[4] Fault log, maintaining last [four] faults with time and data stamp for each.

i. The ASD must be capable of automatic control by a remote [4-20 mA][0 to 10 VDC][_____] signal, by [BACnet][LONworks][_____] network command, or manually by the ASD control panel.

j. ASDs must include the following operator programmable parameters:
   (1) Upper and lower limit frequency.
   (2) Acceleration and deceleration rate.
   (3) Variable torque volts per Hertz curve.
   (4) Starting voltage level.
   (5) Starting frequency level.
   (6) Display speed scaling.
   (7) Enable/disable soft stall feature.
   (8) Motor overload level.
   (9) Motor stall level.
   (10) Jump frequency and hysteresis band.
   (11) PWM carrier frequency.

k. ASD must have the following protective features:
   (1) An electronic adjustable inverse time current limit with consideration for additional heating of the motor at frequencies below 45Hz, for the protection of the motor.
   (2) An electronic adjustable soft stall feature, allowing the ASD to lower the frequency to a point where the motor will not exceed the full-load amperage when an overload ASD will automatically return to the requested frequency when load conditions permit.
   (3) A separate electronic stall at 110 percent ASD rated current, and a separate hardware trip at 190 percent current.
(4) The ability to shut down if inadvertently started into a rotating load without damaging the ASD or the motor.

(5) The ability to keep a log of a minimum of four previous fault conditions, indicating the fault type and time of occurrence in descriptive text.

(6) The ability to sustain 110 percent rated current for 60 seconds.

(7) The ability to shutdown safely or protect against and record the following fault conditions:

(a) Over current (and an indication if the over current was during acceleration, deceleration, or running).

(b) Over current internal to the drive.

(c) Motor overload at start-up.

(d) Over voltage from utility power.

(e) Motor running overload.

(f) Over voltage during deceleration.

(g) ASD over heat.

(h) Load and ground fault.

(h) Abnormal parameters or data in ASD EEPROM.

2.2 ENCLOSES

Provide equipment enclosures conforming to NEMA 250, NEMA ICS 7, and NEMA ICS 6, with a heater if located outdoors. An HMCP device shall provide the disconnecting means. The operating handle shall protrude through the door, but the disconnect shall not be mounted on the door. The handle shall indicate ON, OFF, and tripped conditions. The handle shall have provisions to accommodate a minimum of three padlocks in the OFF position. Interlocks shall prevent unauthorized opening or closing of the ASD door with the disconnect handle in the ON position. The door handle interlock should have provisions to be defeated by qualified maintenance personnel.

2.3 WIRES AND CABLES

All wires and cables must conform to NEMA 250, NEMA ICS 7, NFPA 70.

2.4 NAMEPLATES

Nameplates external to NEMA enclosures must conform with the requirements of Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide manufacturer's standard, permanent nameplates for internal areas of enclosures.
2.5  SOURCE QUALITY CONTROL

2.5.1  ASD Test Plan

To ensure quality, each ASD must be subject to a series of in-plant quality control inspections before approval for shipment from the manufacturer's facilities. Provide test plans.

2.5.2  ASD Test Report

To ensure quality, each ASD must be subject to a series of in-plant quality control inspections before approval for shipment from the manufacturer's facilities. Provide test reports.

PART 3   EXECUTION

3.1  INSTALLATION

Per NEMA ICS 3.1, install equipment in accordance with the approved manufacturer's printed installation drawings, instructions, wiring diagrams, and as indicated on project drawings and the approved shop drawings. A field representative of the drive manufacturer must supervise the installation of all equipment, and wiring.

3.2  GROUNDING

******************************************************************************

NOTE: Choose one of the bracketed sentences. AC power system grounding is a critical consideration. The control must be solidly grounded to the main distribution system ground. A ground common with electrical welding equipment or large current equipment (5x rating of the control) should not be used. If either of these two conditions exist, use an isolation transformer sized for the ASD control with a wye secondary neutral solidly grounded. Where more than one control is used, ground each directly to the system ground terminal, do not loop ground or install in series. Poor/improper grounding is providing nearly all electric noise issues.

******************************************************************************

Per NEMA ICS 7.2, ASD must be solidly grounded to the main distribution.

3.3  FIELD QUALITY CONTROL

Specified products must be tested as a system for conformance to specification requirements prior to scheduling the acceptance tests. Conduct performance verification tests in the presence of Government representative, observing and documenting complete compliance of the system to the specifications. Submit a signed copy of the test results, certifying proper system operation before scheduling tests.

3.3.1  ASD Test

A proposed test plan must be submitted to the contracting officer at least 28 calendar days prior to proposed testing for approval. The tests must conform to NEMA ICS 1, NEMA ICS 7, and all manufacturer's safety
regulations. The Government reserves the right to witness all tests and review any documentation. Inform the Government at least 14 working days prior to the dates of testing. Perform the ASD test [with the assistance of a factory-authorized service representative][engaging a qualified testing agency's field supervisor currently certified by NETA to supervise on-site testing].

3.3.2 Performance Verification Tests

"Performance Verification Test" plan must provide the step by step procedure required to establish formal verification of the performance of the ASD. Compliance with the specification requirements must be verified by inspections, review of critical data, demonstrations, and tests. The Government reserves the right to witness all tests, review data, and request other such additional inspections and repeat tests as necessary to ensure that the system and provided services conform to the stated requirements. Inform the Government 14 calendar days prior to the date the test is to be conducted.

3.3.3 Endurance Test

Immediately upon completion of the performance verification test, the endurance test must commence. The system must be operated at varying rates for not less than 192 consecutive hours, at an average effectiveness level of 0.9998, to demonstrate proper functioning of the complete PCS. Continue the test on a day-to-day basis until performance standard is met. The contractor is not allowed in the building during the endurance test. The system must respond as designed.

3.4 DEMONSTRATION

3.4.1 Training

Coordinate training requirements with the Contracting Officer. Provide video tapes, if available, of all training provided to the Government for subsequent use in training new personnel. Provide all training aids, texts, and expendable support material for a self-sufficient presentation shall be provided, the amount of which to be determined by the contracting officer.

3.4.1.1 Instructions to Government Personnel

Provide the services of competent instructors with minimum two-year field experience with the operation and maintenance of similar ASDs who will give full instruction to designated personnel in operation, maintenance, calibration, configuration, and programming of the complete control system. Orient the training specifically to the system installed. Instructors must be thoroughly familiar with the subject matter they are to teach. The number of training days of instruction furnished must be as specified. A training day is defined as eight hours of instruction, including two 15-minute breaks and excluding lunch time; Monday through Friday. Provide a training manual for each student at each training phase which describes in detail the material included in each training program. Provide one additional copy for archiving. Provide equipment and materials required for classroom training. Provide a list of additional related courses, and offers, noting any courses recommended. List each training course individually by name, including duration, approximate cost per person, and location of course. Unused copies of training manuals must be turned over to the Government at the end of last training session.
3.4.1.2 Operating Personnel Training Program

Provide one 2-hour training session at the site at a time and place mutually agreeable between the Contractor and the Government. Provide session to train 4 operation personnel in the functional operations of the system and the procedures that personnel will follow in system operation. This training shall include:

a. System overview
b. General theory of operation
c. System operation
d. Alarm formats
e. Failure recovery procedures
f. Troubleshooting

3.4.1.3 Engineering/Maintenance Personnel Training

Accomplish the training program as specified. Training must be conducted on site at a location designated by the Government. Provide a one-day training session to train four [_____] engineering personnel in the functional operations of the system. This training must include:

a. System overview
b. General theory of operation
c. System operation
d. System configuration
e. Alarm formats
f. Failure recovery procedures
g. Troubleshooting and repair
h. Maintenance and calibration
i. System programming and configuration

-- End of Section Table of Contents --
NOTE: This specification covers the requirements for facility-scale solar photovoltaic (PV) systems, and related equipment and materials. Facility-scale systems are typically less than 1 megawatt, maximum DC string input voltage not exceed 1,000 VDC, has the grid interconnection point at the facility's service entrance equipment and generally provides electricity for the facility. Large scale (Utility-scale) systems are considered greater than 1 megawatt and grid connected. Refer to UFC 3-540-08 Utility-Scale Renewable Energy Systems and UFGS-48 14 00 Solar Photovoltaic Systems for the large scale system requirements. Photovoltaic module requirements provided in this document also apply to Section 48 14 00 SOLAR PHOTOVOLTAIC SYSTEMS.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Ensure the following information is shown on the project drawings:

1. Mounting surface features (i.e. drains, hatches,
vents, and lightning protection).

2. Locations of solar PV modules, inverters, combiner and junction boxes, conduits and raceways, system monitoring panels, data acquisition sensors, cable tags with legend, control panels, overcurrent protection, surge protective devices (SPD) if lightning protection is required, and other related equipment and materials.

3. Circuit wiring diagram of solar PV energy system.

4. Mounting structure system for solar PV modules, including building roof or ground.

5. Number, location, and letter designation of nameplates.

6. Troubleshooting instructions.

PART 1   GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard’s Check Reference feature when you add a Reference Identifier (RID) outside of the Section’s Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard’s Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 RELATED REQUIREMENTS

**************************************************************************
NOTE: Include this optional reference to Section 26 08 00 APPARATUS INSPECTION AND TESTING when it is already being used and referred to for other electrical equipment on the project. Coordinate with optional paragraph in PART 3.

Coordinate photovoltaic equipment with Government's cybersecurity requirements and interpretations. Include this optional reference to Section 25 05 11 CYBERSECURITY FOR FACILITY-RELATED CONTROL SYSTEMS if the photovoltaic system includes remote control or remote access capability.

Use Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION for an exterior ground mount system.
**************************************************************************
Sections 26 20 00 INTERIOR DISTRIBUTION SYSTEM[, 26 08 00 APPARATUS INSPECTION AND TESTING][, 25 05 11 CYBERSECURITY FOR FACILITY-RELATED CONTROL SYSTEMS][ and 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION] apply to this section with additions and modifications specified herein.

1.3 DEFINITIONS

a. Unless otherwise specified or indicated, electrical and electronics terms used in these specifications, and on the drawings, are as defined in the IEEE Stds Dictionary.

b. Unless otherwise specified or indicated, solar energy conversion terms used in these specifications, and on the drawings, are as defined in ASTM E772.

1.4 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.
**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in
accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals
  Commissioning Plan; G[, [____]]

1.5 MAINTENANCE MATERIAL SUBMITTALS

Comply with requirements specified in Section 01 78 00 CLOSEOUT SUBMITTALS.
1.6 QUALITY ASSURANCE

1.6.1 Regulatory Requirements

Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officers. Provide equipment, materials, installation, and workmanship in accordance with the mandatory and advisory provisions of NFPA 70 unless more stringent requirements are specified or indicated.

1.6.2 Installation Drawings

Submit a minimum of three hard copies of drawings for government approval prior to manufacturing and equipment construction or integration. Submit site plan drawings and riser diagram and general notes at a minimum of 610 mm by 915 mm 24 by 36 inches. Submit installation and assembly details at a minimum of 610 mm by 915 mm 24 by 36 inches. Submit at minimum scale of 13 mm 1/2 inch per foot for overview and 51 mm 2 inches per foot for detail.

In addition to requirements in Section 01 33 00 SUBMITTAL PROCEDURES, include the following:

a. All details legible and all text no smaller than 2.54 mm 0.1 inches in height on any drawing. As needed, provide enlargements to ensure clarity of intent.

b. Submit shop drawings at a minimum of 280 mm by 432 mm 11 by 17 inches in size using a minimum scale of 7 mm 1/4 inch per foot, for the exception of drawings not required scale. Shop drawings must include [one][three]-wire diagrams and installation details of photovoltaic (PV) system equipment indicating location as proposed in design drawings, layout and arrangement of PV modules, support and mounting mechanism, inverters, combiner boxes, AC and DC disconnects, equipment enclosures, conduits, monitors, meters, security systems, and all other accessories associated with the installation of the PV system. Wiring diagrams must identify circuit terminals and indicate the internal wiring for each item of equipment and the interconnection between each equipment item.

c. Shop drawings may include legible copies of manufacturer's product literature, with selected items and specifications highlighted thereon.

d. Modifications to original drawings made during installation must be immediately recorded for inclusion into the as-built drawings. When items have changed relative to the approved design, the designer must provide certification indicating that the changes will not negatively affect the system's operation or the structure supporting the system.

1.6.2.1 Installation and Assembly Drawings and Details

Submit site plan drawings, components and interconnection wiring and general notes, and installation and assembly details drawings prior to start of construction. Drawings must include sufficient detail for all parts of the work to enable the Government to check conformity with the requirements of the contract documents. Include in the site plan drawings: topographic and utility survey; bore logs; soils report; site plan(s); site construction details; structural drawings; structural construction details; site electrical plan; and site electrical construction details. Include in the installation and assembly drawings and details: parts lists; assembly...
drawings; interconnection wiring diagrams; wire and cable schedules; wire and cable termination schedules; instrument plan; instrument and control wire, conduit and cable schedules; instrument wire and cable termination schedule; control diagrams; control sequence of operation; seismic restraint details; and wind restraint details.

1.6.2.2 "As-Built" and Record Drawings

After completion of construction, submit As-built drawings prepared and certified by the construction contractor, showing in red ink, on-site changes to the original construction details and all underground utilities measured from field benchmarks, accurate to within 1" of centerline of the utility. Immediately record for inclusion into the as-built drawings all modifications to original drawings made during installation. Indicate adequate clearance for operation, maintenance, and replacement of operating equipment devices.

After submittal and approval of "As-built" drawings, submit Record Drawings, prepared and by the project engineer(s) and architect(s), of the original design drawings reflecting all design changes and contractor noted changes in the "As-built" drawings.

1.6.3 System Operation

Provide a complete description of the function of each component including PV modules, DC wiring, combiner boxes, inverters, AC wiring, AC and DC disconnect switches, and monitoring system. Provide a discussion of the overall system operation.

1.6.4 Installer

Submit NABCEP (North American Board of Certified Energy Practitioners) PV Installation Professional certification, and a resume with references that details least [four] successful projects that, in aggregate, equal or exceed the size of the proposed project. Provide references for each of these referenced projects.

1.6.5 Standard Materials and Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship. Provide products with satisfactory commercial or industrial use for [2] years prior to bid opening, and past performance documentation with consistent design and bill of materials. Include applications of equipment and materials under similar circumstances and of similar size. Where [two] more items of the same class of equipment are required, products will be from a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in the technical section. Submit proof of compliance with requirements of UL, where material or equipment is specified to comply. The label of or listing in UL Electrical Construction Directory will be acceptable evidence. In lieu of the label or listing, a written certificate from an approved nationally recognized testing laboratory (NRTL) equipped to perform such services, stating that the items have been tested and conform to the requirements and testing methods of Underwriters Laboratories may be submitted.
1.6.5.1 Alternative Qualifications

Products having less than a 2-year field service record will be acceptable if the manufacturer has been regularly engaged in the design and production of solar photovoltaic products for a minimum of 5-years. Similar photovoltaic products must have been in satisfactory commercial or industrial use for 5-years prior to bid opening and must have been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 5-year period.

1.6.5.2 Material and Equipment Manufacturing Date

Products manufactured more than [3][_____] years prior to date of delivery to site must not be used, unless specified otherwise.

1.6.6 Cybersecurity Equipment Certification

**************************************************************************
NOTE: Select this option if the solar photovoltaic system includes remote control or remote access capability even if the system is separate from an energy management control system. Exercise a Risk Management Framework (RMF) for implementing cybersecurity. Refer to Section 25 05 11 CYBERSECURITY FOR FACILITY-RELATED CONTROL SYSTEMS and UFC 4-010-06 Cybersecurity of Facility-Related Control Systems for requirements on incorporating cybersecurity into control system and for general information on the Risk Management Framework (RMF) process as it applies to control system. Coordinate equipment certification with Government's cybersecurity requirements and interpretations.
**************************************************************************

Furnish a certification that control systems are designed and tested in accordance with DoD Instruction 8500.01, DoD Instruction 8510.01, and as required by individual Service Implementation Policy.

1.6.7 Operation and Maintenance Data

Submit Solar Photovoltaic Systems data package for the following items in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

**************************************************************************
NOTE: To aid in identifying locations of modules for troubleshooting, identify modules on as-built plans according to groups or zones.
**************************************************************************

a. Troubleshooting guide[ with as-built plans displaying modules identified according groups or zones, coordinated with activity to organize as required].

b. Warranty.

c. Operation instructions.

d. Preventive maintenance and inspection data, including a schedule for system operators.
1.6.7.1 Electrical Systems

Submit operation and maintenance data in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA. In addition to requirements of Data Package 5, include the following for the actual solar photovoltaic (PV) system provided:

a. Service and maintenance information including preventive maintenance, assembly, and disassembly procedures.

b. Complete operation, repair, and maintenance information, detailed to the smallest replaceable unit.

c. Adjustment, trouble-shooting, configuration, tuning, and system calibration instructions.

d. Programming information for the communications and monitoring interface.

e. An instruction manual with pertinent items and information highlighted.

f. A layout drawing showing locations as well as views of equipment; front, top, and side views.

g. A one-line drawing showing all components and interfaces to the electrical system.

**************************************************************************

NOTE: Option to provide spare modules and inverters is prohibited for the Navy, and do not provide for other Services without specific authority of Contracting Officer.

**************************************************************************

h. Prices for spare parts and supply list [including spare modules and inverters].

i. Inverter efficiency report and field acceptance test reports.

j. Actual nameplate diagram.

k. Date of purchase.

1.6.7.2 Training Course

Provide training by a factory trained instructor to provide full instructions to designated Government personnel in the operation, maintenance and programming of the specified systems and equipment. Include safety training for first responders including fire department[,][,] and [][representatives. The proposed Training Course Curriculum (including topics and dates of discussion) indicating that all of the items contained in the operating and maintenance instructions, as well as demonstrations of safety and routine maintenance operations, including testing procedures included in the maintenance instructions, are to be covered. The proposed Training Course must be video-recorded and provided with any PowerPoint slides as part of the final documentation for those that cannot attend. Submit training documentation along with the proposed training date[s], at least [14][_____] days prior to date[s] of proposed training course. Provide training session for
personnel specifically oriented to installed equipment, system layout, and user operations.

1.6.8 Bill of Materials

Submit a Bill of Materials listing each product being incorporated into the system. Bill of Materials includes a general description of the product, quantity, and exact manufacturer's model number. Where the manufacturer's model number does not fully identify the product, list options, accessories, or custom features by additional descriptions.

1.6.9 Qualified Testing Organization

Comply with requirements specified in Section 26 08 00 APPARATUS INSPECTION AND TESTING. Engage the services of a qualified testing organization, NABCEP-certified professional, or licensed electrician to provide inspection, testing, calibration, and adjustment of the solar photovoltaic electrical distribution system and equipment listed herein. Organization must be independent of the supplier, manufacturer, and installer of the equipment. The organization must be a first tier contractor.

Submit name and qualifications of organization. Organization must have been regularly engaged in the testing of electrical materials, devices, installations, and regularly engaged in solar PV systems for a minimum of five years.

Organization calibration program requirements:

a. Provide a calibration program which assures that all applicable test instruments are maintained within rated accuracy.

b. Accuracy: Traceable to the National Institute of Standards and Technology.

c. Instrument calibration frequency schedule: Less than or equal to 12 months for both test floor instruments and leased specialty equipment.

d. Dated calibration tables: Visible on all test equipment.

e. Calibrating standard: Higher accuracy than that of the instrument tested.

f. Keep up-to-date records that indicate dates and test results of instruments calibrated or tested. For instruments calibrated by the manufacturer on a routine basis, in lieu of third party calibration, include the following:

(1) Maintain up-to-date instrument calibration instructions and procedures for each test instrument.

(2) Identify the third party laboratory calibrated instrument to verify that calibrating standard is met.

1.6.10 Commissioning Agents

Commissioning Agents Qualifications: Engage commissioning service personnel, that specialize in the types of inspections and tests to be performed.
1.6.11 System Performance Calculations

Submit system performance calculations to show that the components provided will produce the minimum required production of power in accordance with PERFORMANCE REQUIREMENTS paragraph.

1.7 DELIVERY, STORAGE, AND HANDLING

a. Store solar PV modules in their original packaging according to the manufacturer's guidance, and do not remove from packaging until day of installation.

b. If a solar PV module is removed from its packaging, store it according to the manufacturer's guidance.

c. Do not store solar PV modules on-site for more than [12] months.

1.8 WARRANTY

**************************************************************************
NOTE: Option to provide spare modules and inverters is prohibited for the Navy, and do not provide for other Services without specific authority of Contracting Officer.
**************************************************************************

**************************************************************************
NOTE: Generally PV module degradation data is not readily available from the manufacturer. Environmental factors can significantly influence degradation. Long-term field degradation studies indicate 0.5-0.8 percent for monocrystalline and polycrystalline modules. Degradation is higher for thin-film modules at 0.7-1.0 percent. New PV module designs generally have improved degradation rates.
**************************************************************************

Provide a list of all applicable warranties for all equipment and components. Include warranty information, names, addresses, telephone numbers, and procedures for filing a claim and obtaining warranty services. The equipment items must be supported by service organizations which are reasonably convenient to the equipment installation in order to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

Warrant the overall system for both parts and labor for a minimum period of [5] years. Provide specific warranties for solar photovoltaic modules, inverters, combiner boxes, [and ]mounting system[, and cybersecurity].

1.8.1 Solar Photovoltaic Modules

Furnish the solar photovoltaic module manufacturer's written warranty. The warranty must be a 25-year linear 80 percent (minimum) power warranty (at the end of the 25th year after purchase an actual minimum power output of 80 percent based on the nameplate rating must be achieved) and not less than 10-years for workmanship material and manufacturing defects from the date of manufacture.
The warranty must state that the malfunctioning solar photovoltaic module must be exchanged by the manufacturer and promptly shipped to the using Government facility. The replacement solar module must be identical to, or an improvement upon, the original design of the malfunctioning solar module.[ Provide an extra [_____] percent of spare modules in the event of necessary replacement of malfunctioning installed module.]

1.8.2 Inverters

Furnish the inverter manufacturer's warranty. Inverter to be free from defects in material and workmanship for a minimum of [20][_____] years from the date of manufacture. Inverter device installation, transportation, and on-site storage must not exceed 12 months, thereby permitting [19][_____] years of the [20][_____] year warranty to be in service and energized.

The warranty must state that the malfunctioning inverter must be exchanged by the manufacturer and promptly shipped to the using Government facility, and arrive in no more than ten days. The replacement inverter must be identical to, or an improvement upon, the original design of the malfunctioning inverter.[ Provide an extra [_____] percent of spare inverters in the event of necessary replacement of malfunctioning installed inverter.]

1.8.2.1 Inverter Software Updates Title

Provide, at no cost or charge, any inverter software upgrades that become available during the warranty period.

1.8.3 Combiner Boxes

Combiner boxes to be free from defects in material and workmanship for a period of [5][_____] years.

1.8.4 Mounting System

Provide PV mounting system warranty of minimum 15 years.

1.8.5 Warranty Exclusion

The warranty must cover all system malfunctions and failures except those resulting from misuse, abuse, neglect, fire, vandalism, acts of nature, or other causes beyond the control of the Contractor or manufacturer.

1.8.6 Cybersecurity During Warranty Period

**************************************************************************
NOTE: Select this option if the solar photovoltaic system includes remote control or remote access capability.
**************************************************************************

All work performed on the control system after acceptance must be performed using Government Furnished Equipment or equipment specifically and individually approved by the Government.

1.9 CALCULATIONS

If construction deviates from design, provide relevant calculations to demonstrate that new design is satisfactory and approved by a licensed
professional engineer.

1.10 CERTIFICATIONS

Provide seismic certification and wind certification, prepared by a licensed professional engineer or National Recognized Testing Laboratory, (NRTL) for all components and assembled systems in accordance with ICC IBC, ASCE 7-16 state and local building codes. Seismic and wind certifications must demonstrate system must withstand wind and seismic requirements as installed and remain online and functional after a seismic or wind event.

1.11 HEALTH AND SAFETY RECOMMENDATIONS

Section 01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS, applies to this section with additions and modifications specified herein.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

**************************************************************************
NOTE: System voltage greater than 1,000 VDC is permitted for the utility-scaled PV systems. Refer to UFC 3-540-08 Utility-Scale Renewable Energy Systems and Section 48 14 00 SOLAR PHOTOVOLTAIC SYSTEMS. Air Force does not allow paralleling facility-scale renewable energy systems with any standby power regardless of whether it is for emergency, Critical Operations Power Systems (COPS), or other purposes.
**************************************************************************

a. The PV system described in this document is a facility-scale less than 1 megawatt with system voltage not exceeding 1,000 VDC, [single][multiple] PV systems with a single service, and is of the grid-connected type which provides a direct interconnection of PV system and grid power service supplying building [that do not utilize engine generators][have backup power systems that would never operate in parallel with the grid power and PV system because backup power generator is supplying power via an automatic transfer switch]. The PV system does not include battery/backup storage or secondary electrical generation devices. PV system feeds AC power into the local services when solar energy is available and immediately disconnects from the grid upon loss of grid power to the service in accordance with IEEE 1547 and local utility regulations.

b. PV system must comply with these specifications, all applicable construction document drawings, all applicable codes, and all local authorities having jurisdiction. System must comply with all policies and standards required by the electrical utility having jurisdiction and all applicable incentive program guidelines. PV system equipment includes, but is not limited to, PV modules and electrical insulating components such as encapsulants and backsheets, raceways, inverters, combiner boxes, disconnect switches, wire, conduit, junction boxes, mounting hardware, mounting structure for modules (racking), monitoring and communication equipment.

**************************************************************************
NOTE: Applies if PV array is roof-mounted.
**************************************************************************
c. Coordinate with roofing to provide certificate of roof warranty not invalidated by solar PV installation. For rigid solar cell PV systems on metal roofing panels, integrate with the roofing system, Section 07 60 00 FLASHING AND SHEET METAL.

NOTE: Applies if lightning protection system is required.

2.1.1 System Requirements

Conform electrical installations to IEEE C2, NFPA 70, and requirements specified herein.

NOTE: Input values generated from a solar PV computer program such as the System Advisor Model (SAM) computer program or PVWatts or from data supplemented by multiple programs. If another mounting structure is provided, the project documents must fully describe it.

a. Solar photovoltaic system characteristics provided includes:

   (1) [_____] minimum rated kW DC output
   (2) [_____] minimum rated kW AC output
   (3) [_____] minimum kWh AC per year for year one
   (4) [_____] system voltage
   (5) [Ground][Roof][_____] mounted.

b. All equipment must be listed and labeled in accordance with NFPA 70 and OSHA-listed nationally recognized testing laboratories (NRTL) and installed in accordance with the listing requirements and the manufacturer's instructions.

c. Provide all accessories needed for a complete, secure, operational grid-tied PV system.

d. Wiring and connections of inverters, PV source circuits, AC branch circuits, and all interconnections must be rated at a minimum for IP65 in accordance with NEMA IEC 60529.

2.1.1.1 System Wiring

NOTE: The possible exposure to a corrosive environment should be carefully examined. Even when the correct conductor size and the selected joining
(connecting) method have satisfied all the IEEE 837 test requirements, it may be prudent to choose a larger conductor size to compensate for some gradual reduction in the conductor cross section during the design life of the installation where the soil environment tends to promote corrosion. Coordinate soil environment with Geotechnical Engineer. All wiring must be copper conductor if the Navy eventually takes ownership of system.

System wiring must conform to Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM and must be in accordance with Section 690 of NFPA 70. Cabling exposed to sunlight must be UV resistant.[ All wiring must be copper conductor.]

Provide conduits in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Use galvanized rigid steel conduit above grade and mount on UV resistant high-density polyethylene (HDPE) supports. Conduit below grade must be [Schedule 40 PVC, 25.4 mm 1-inches minimum][Schedule 80 PVC, 25.4 mm 1-inches minimum][as required by Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION].

[2.1.1.2 Site Design]

NOTE: Facility-Scale PV system may be up to 1 megawatt. Apply if required.

Provide adequate space for personnel, vehicles and equipment throughout the PV array to facilitate installation, inspection and maintenance access to all modules.

[2.1.2 Performance Requirements]

NOTE: Provide minimum annual renewable energy production requirement of no less than 20 kWh/m^2 6.0 kBtu/ft^2 multiplied by total roof area for single-story buildings, and not less than 32 kWh/m^2 10 kBtu/ft^2 multiplied by total roof area for all other buildings, over the life of the system. This result refers to the rated DC nameplate capacity of the system.

System components provided must be selected to achieve a minimum calculated energy production of [_____] kWh per year as required by ICC IgCC.

2.2 PHOTOVOLTAIC MODULES

NOTE: For crystalline-silicon modules, manufacturer must submit a Letter of Conformance to certify the consistency and quality of materials used.

TO DOWNLOAD LETTER OF CONFORMANCE, go to: https://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/forms-graphics-tables
NOTE: IEC 61215 applies to crystalline-silicon modules and IEC 61646 applies to thin-film modules. Use UL 1703 applies to domestic projects and IEC 61730 applies to international projects.

a. PV modules must be [IEC 61215][IEC 61646] compliant and [IEC 61730-1 compliant] [listed to UL 1703], and manufactured in an ISO 9001 certified facility.

NOTE: Select commercially-available solar PV module technology that meets the requirements in this UFGS and with the guidance from UFC 3-440-01 Facility-Scale Renewable Energy Systems. The newest technology will provide solar cells made from organic materials, quantum dots, and hybrid organic-inorganic materials (also known as perovskites). The ultra-high efficiency perovskite compound material with a special crystal structure formed through chemistry which would replace silicon. Advance technology of the fine-tuning a mix of lead and tin would provide about 23 percent efficiency of the new solar cell. In comparison, silicon solar panels on the market today have around an 18 percent efficiency rating. Building-integrated photovoltaics (BIPV) seamlessly blend into building architecture in form of roofs, canopies, facades, and skylight systems. BIPV provides the following benefits: increased thermal and sound insulation; clean and free power output from the sun; decreased O&M costs; zero carbon footprint. Warning: Currently, only monocrystalline and polycrystalline can meet energy density requirements. If BIPV is the chosen technology, there must be at least three manufacturers that offer a viable product. If thin-film is the chosen technology, there must be at last three manufacturers that can be of different thin-film technologies.

b. PV modules must be of [monocrystalline ] [polycrystalline ] technology and
   (1) [for rack-mounting.]
   (2) [BIPV.]
   
[c. PV modules must be of thin-film technology and
   (1) [for rack-mounting.]
   (2) [amorphous.]
   (3) [BIPV.] ]
NOTE: Select efficiency appropriate to solar PV module technology. If selected technology is not given below, designer of record must have module efficiency measurement verified by a nationally-recognized testing laboratory (NRTL) under standard test conditions (STC): Irradiance of 1,000 W/m², solar spectrum of air mass (AM) 1.5, and module temperature of 25 degrees C (77 degrees F).

**NOTE:** Solar PV modules with single conductor output cables are commonly available. Conduit-ready junction boxes are only necessary in hazardous locations.

**NOTE:** UFC 3-540-08 Utility-Scale Renewable Energy Systems has same module requirements as are described in paragraph PHOTOVOLTAIC MODULES, list item "a." Facility-scale PV systems allow a maximum system voltage of 1000 VDC and Utility-scale PV systems allow a maximum system voltage greater than 1000 VDC. Use bracketed option for the Facility-scale PV systems if such a clarification is required.

**NOTE:** Select efficiency appropriate to solar PV module technology. If selected technology is not given below, designer of record must have module efficiency measurement verified by a nationally-recognized testing laboratory (NRTL) under standard test conditions (STC): Irradiance of 1,000 W/m², solar spectrum of air mass (AM) 1.5, and module temperature of 25 degrees C (77 degrees F).

**d.** PV module efficiency must be greater than [15 percent for crystalline][13 percent for thin film][10 percent for amorphous and BIPV][_____] technology.

e. PV modules must be of the same manufacturer and model number and consistent sub-components.

f. Submit on cutsheets PV module performance data from the manufacturer that must include a flash test data in accordance with IEC 61853-1, and temperature coefficients at: STC, nominal operating cell temperature (NOCT), low irradiance conditions (LIC), high temperature conditions (HTC), and low temperature conditions (LTC).

**g.** PV module bypass diodes must be inside the solar PV module's [conduit-ready][single conductor cable] junction box.

h. Photovoltaic wire, wiring methods, and utilization of locking-type connectors must comply with the requirements of NFPA 70 and UL 6703. Provide USE-2 or RHH or RHW-2 wire, and sunlight-resistant wire when exposed to sunlight.

2.2.1 Crystalline Photovoltaic Module Backsheet

a. Backsheet component must consist of a tri-layer construction (minimum thickness of 250 microns 9.8 mils) with outer layers of polyvinyl fluoride (PVF) and an inner layer of polyester for crystalline-silicon modules[ with a maximum system voltage of 1000 VDC].

b. Alternate polymeric backsheets consisting of different chemical
composition, thickness, or construction must fulfill the safety and performance specifications and acceptance criteria in Table 1. The required component properties in Table 1 must be verified by a test report provided by an OSHA-listed nationally recognized testing laboratory (NRTL) and a cutsheet submitted.

2.2.2 Crystalline Photovoltaic Module Encapsulant

a. Encapsulant component must consist of ethyl vinyl acetate (EVA) with a total nominal (prelamination) thickness of 900 microns 35 mils or greater in the completed module. The EVA must have a minimum of 28 percent VA content. Through statistical process control, the module manufacturer must ensure that the cured EVA has a minimum of 70 percent gel content per ASTM D7567 or ASTM D2765. The EVA must have a UV cutoff wavelength of 360 nm as measured according to ASTM E424. The EVA must have a minimum volume resistivity of 1X10^15 ohm-cm per ASTM D257.

b. Thermoplastic encapsulants consisting of different chemical
composition, thickness, or construction must fulfill the safety and performance specifications and acceptance criteria described in Table 2. The required component properties described in Table 2 must be verified by a test report provided by an OSHA-listed nationally recognized testing laboratory (NRTL) and a cutsheet submitted.

2.2.3 Electrical Characteristics

Provide high-power type PV module(s), with typical peak power of not less than [315][_____] watts, plus or minus [3][_____] percent power tolerance, under Standard Test Conditions (STC). The AC output must not be less than [80][_____] percent of the DC kWp rating. The individual current harmonics and TRD shall not exceed the limits specified in IEEE 1547.

The operating voltage corresponding to the power output mentioned above must be at least [54][_____] volts. The open circuit voltage of the PV modules under STC should be at least [64][_____] volts. Operate PV module at an ambient temperature range of [minus 40][_____] degrees C [minus 40][_____] degrees F to [plus 85][_____] degrees C [plus 185][_____] degrees F with [100][_____] percent relative humidity.

2.2.4 Terminal Box

Include a terminal box on the module having a provision for opening for replacing the cable, if required.

2.2.5 Nameplate

Include the following on the module nameplate so as to be clearly visible:

a. Name of the Manufacturer or distinctive logo;
b. Model or Type Number;
c. Serial Number;
d. Year of make;
e. Peak wattage rating;
f. Peak voltage; and
g. Peak current.
### 2.3 INVERTERS

**NOTE:** Where possible, employ maintainable design practices selecting number of inverters for project to prevent the failure of one inverter from affecting the entire system.

---

a. Array-to-inverter kW ratio must not exceed manufacturer recommendations. Inverter must be IEEE 1547 compliant, listed to UL 1741, comply with the latest applicable ANSI and FCC standards and addenda, and inspected before commissioning, testing, and operation of the system. Submit documentation validating system performance requirements.

b. Inverter must be approved by FCC Part 15, Class A as an unintentional radiator.

c. All same-sized inverters supplied must be of the same manufacturer and model number.

---

**NOTE:** Select the inverter mounting system appropriate for the project environment. Select support structure mount or module attached for microinverters.

---

d. Provide inverter utilizing a [floor-mount][wall-mount][support structure mount][module attached] system.

---

**NOTE:** Select the NEMA enclosure and enclosure material appropriate for the project environment. Verify that a minimum of three inverter manufacturers can provide inverter enclosure made of the selected material.

---

e. Provide inverter utilizing a [NEMA 6/6P outdoor for coastal environments][NEMA 3R outdoor][NEMA 1 indoor] enclosure in accordance with NEMA 250. Provide enclosure made of [steel][aluminum][stainless steel][polymeric].

---

f. Provide inverter with anti-islanding protection to prevent back-feeding inverter generated power to the grid in the event of a utility outage. Anti-islanding protection must be listed to UL 1741 and IEEE 1547.

g. Overcurrent protection, ground fault protection, arc fault circuit interrupter (AFCI), and rapid shutdown must comply with the requirements of NFPA 70.

---

h. Provide inverter with self-diagnostics routines, and remote and local display of operating status and remote monitoring capabilities. Provide inverter compatible with monitoring system and metering system. If capability for remote monitoring and control does not exist, then it must be added.
NOTE: Consider implementing an inverter with integrated monitoring system if design allows, for better safety, and operations and maintenance. Most microinverters have this feature as well as some source circuit inverters.

[ i. Provide inverter with integrated monitoring system. Data monitoring equipment must be able to sustain an overload across its output terminals up to the [150][_____] percent load, while supplying any load within its rating and without reducing its output voltage. Fuse power semiconductors in the inverter with fast acting fuses to prevent cascading failures. Provide each fuse with a blown fuse excluding String and Micro inverters and alarm indicating diodes on the control panel.

j. Rate inverter[s] output as [_____] AC kW at unity (1), [_____] phase, [_____] volts, [_____] maximum power point tracking (MPPT) voltage range. The peak inverter[s] power conversion efficiency must be [96][97][_____] percent or greater.

k. Match inverter DC input to the design of the PV module array outputs and account for the following:

(1) The inverter low voltage is 50 percent of the maximum system voltage, to account for 25 year degradation.

(2) Voltage decrease due to high temperatures at project site. Operate inverter at an ambient temperature range of [minus 20][_____] degrees C [minus 4][_____] degrees F to [plus 50][_____] degrees C [plus 122][_____] degrees F with [95][_____] percent humidity (non-condensing).

NOTE: Where possible, excluding String and Micro inverters, limit inverter size to 500 kW maximum, with a minimum 96 percent efficiency.

l. Provide isolation transformer via [built into each inverter][system central transformer for multiple inverters] to provide safe galvanic separation between the AC side of the inverter and the grid.

NOTE: String inverter with integral AC and DC disconnecting means is optional. Disconnecting means may be internal or external to the inverter. Integral disconnecting means is not an option for...
m. [Inverter must include AC and DC disconnecting means. DC and AC disconnecting means must be listed with ratings suitable for the intended use and purpose. ]System disconnecting means must meet the requirements of NFPA 70.

2.3.1 String Inverters

NOTE: String inverters sized greater than 600kW and DC-optimized string inverters of any size must have an efficiency of at least 98 percent. Conventional and smaller string inverters must have an efficiency of at least 96 percent.

a. Submit String Inverter Efficiency of having a weighted average inverter power conversion efficiency of [98 percent][96 percent][93 percent with external isolation transformer] or greater.

b. Allow the use of DC optimizers provided that a design which coordinates the DC optimizers and the inverter(s) is approved by the Contracting Officer.

NOTE: Apply if string inverter does not use DC power optimizer. DC power optimizer provides MPPT.

[ c. Inverter must feature maximum power point tracking (MPPT).]

2.3.2 Micro Inverters

NOTE: Micro-inverters may be provided preattached to each solar PV module, or may be installed on the racking or mounting system.

a. Provide microinverters [mounted on racking or mounting system by the installer][preinstalled on each solar PV module], and comply with applicable requirements in article INVERTERS.

NOTE: The California Energy Commission (CEC) weighted average inverter power conversion efficiency is a standardized method. Inverter efficiencies are updated on the CEC web site https://www.energy.ca.gov/programs-and-topics/programs/solar-equipment-lists

b. Submit Microinverter CEC Efficiency as verified by CEC SAND2007-5036 of having a weighted average inverter power conversion efficiency of 96 percent or greater.

c. Inverter must feature maximum power point tracking (MPPT).
2.4 COMBINER BOXES

NOTE: If photovoltaic system size becomes larger than 1 megawatt, refer to Section 48 14 00 SOLAR PHOTOVOLTAIC SYSTEMS for large-scaled PV systems.

a. All combiner boxes must be listed to UL 1741, and inspected before commissioning, testing, and operation of the system.

b. Provide combiner boxes [in wall-mount][support structure mount], [NEMA 6/6P outdoor for coastal environments][NEMA 4/4X outdoor][NEMA 3R outdoor][steel][aluminum][stainless steel][polymeric] enclosures in accordance with NEMA 250.

c. Supply combiner boxes designed for use with the inverter provided, and coordinated to the specific PV source circuit design.

d. Include in the combiner box[es] fuses and a bus to combine the outputs of the strings. Each combiner box must be UL 1741 listed and operate at an ambient temperature range of [minus 25][_____] degrees C [minus 13][_____] degrees F to [plus 57][_____] degrees C [plus 135][_____] degrees F. Provide combiner box capable of at least [12][_____] inputs and an input fuse rating of [15][_____] amps.

e. Provide combiner box output terminals for paralleling two conductors for the PV positive and negative, as well as the equipment ground conductors. Run set of wires from the combiner box to the inverter. Provide overcurrent protection and output disconnecting means listed for intended use and purpose that comply with the requirements of NFPA 70.

[2.5 ROOF MOUNTING STRUCTURE FOR MODULES (RACKING)]

NOTE: Delete paragraph if the project does not utilize a roof mounting structure.

NOTE: Coordinate with licensed professional engineer for the design of the mounting structure details and connection to existing building. Racking layout may include a gap between continuous rows of modules to allow for ventilation. Coordinate with UFC 3-110-03 Roofing, "Photovoltaic Systems – Rack Mounted Systems"

Coordinate with the Activity and determine if tracking is desired and ensure they understand the unique additional maintenance requirements involved. Refer to UFC 3-440-01 Facility-Scale Renewable Energy Systems for additional information.

a. Provide racking [with [single-axis][dual-axis] tracking ]for array as indicated on the drawings, including the module azimuth and tilt[ for
each inverter's separate array]. [See paragraph entitled PV TRACKING SYSTEM for tracking requirements.] Provide racking compliant with UL 2703.

**************************************************************************
NOTE: Indicate snow load and wind load requirements as applicable for the location and building occupancy category in accordance with UFC 3-301-01 Structural Engineering, ASCE 7-16, and IBC modifications in UFC 1-200-01 DoD Building Code.
**************************************************************************

b. Racking and PV array, including modules, hardware, and attachments, must withstand seismic loads, [snow loads], and wind loads as required by ASCE 7-16 and ICC IBC. Coordinate with structural engineer to insure roof will withstand the racking and PV array loads.

**************************************************************************
NOTE: Defer to local code where applicable, UFC 3-301-01 Structural Engineering, ASCE 7-16, and IBC modifications in UFC 1-200-01 DoD Building Code. Otherwise the structure's Seismic Design Category is based on the risk category of the structure, long and short period mapped acceleration parameters for the area, and site class based on soil conditions.
**************************************************************************

c. Racking must be suitable for Seismic Design Category [_____] as defined by ASCE 7-16 and ICC IBC.

d. Submit seismic and wind[ and snow] load design calculations for the array mounting system and its attachment to the structure showing compliance with seismic and wind[ and snow] requirements while supporting the PV modules.

e. Provide the mechanical hardware for mounting the PV arrays and all other hardware required for assembling the PV modules, and the attachments to the building structure.

**************************************************************************
NOTE: In hostile environments, the additional cost of stainless steel components may be justified. Manufacturer's standard construction material is acceptable only in noncoastal and noncorrosive environments defined as Environmental Severity Classification Category C1 and C2 as determined by Tables A-1 and A-2, Appendix A, UFC 1-200-01 DoD Building Code. Choose bracketed option for hostile environments. All fasteners for PV module aluminum frames must be stainless steel. Galvanized fasteners must not contact aluminum PV module frames or racking. Coordinate with structural engineer and geotechnical report.
**************************************************************************
f. Use array mounting hardware compatible with the site considerations and environment. [Select mechanical hardware for corrosion resistance and durability.] Use a stainless steel, galvanized steel, or aluminum support structure. Do not use wood or plastic components for support.
g. Use cathodic protection compatible with the site considerations and environment. Utilize galvanized anchor[ encased in concrete] driven into ground.

2.5.1 Mounting System Base Supports

Fabricate with fastening points integral to the mounting structure. Mounting system supports must be permanently affixed stanchions that are anchored to the building structure. Coordinate height with thickness of roof insulation.

2.5.2 Flashing Boot

Fabricate for precision fit over base support. Coordinate height with base supports.

2.5.3 Base Cap

Fabricate to overlap base support and flashing boot a minimum of 51 mm 2 inches.

2.5.4 Base Cap Gasket

EPDM with self-adhesive closed cell foam or other gasketing material compatible with the roofing material.

2.5.5 Framing

Provide with wall thickness as determined by structural calculations.

2.5.6 Hardware

Bolts, nuts, washers, and screws must be 18-8 stainless steel.

[2.6 GROUND MOUNTING STRUCTURE FOR MODULES]
SYSTEM for tracking requirements.] Design all structural components in a manner commensurate with attaining a minimum [50][_____] year design life. Provide racking compliant with UL 2703.

**************************************************************************
NOTE: Indicate snow load, seismic load, and wind load requirements as applicable for the location and building risk category in accordance with UFC 3-301-01 Structural Engineering, ASCE 7-16, and IBC modifications in UFC 1-200-01 DoD Building Code.
**************************************************************************

b. Racking and PV array, including modules, hardware, and attachments, must withstand [snow loads, ]seismic and wind loads as required by ASCE 7-16 and ICC IBC.

**************************************************************************
NOTE: Defer to local code where applicable, UFC 3-301-01 Structural Engineering, ASCE 7-16, and IBC modifications in UFC 1-200-01 DoD Building Code. Otherwise the structure's Seismic Design Category is based on the risk category of the structure, long and short period mapped acceleration parameters for the area, and site class based on soil conditions.
**************************************************************************

c. Racking must be suitable for Seismic Design Category [_____] as defined by ASCE 7-16 and ICC IBC.
d. Submit seismic and wind [and snow] load design calculations for the array mounting system and its attachment to the structure showing compliance with seismic and wind [and snow] requirements while supporting the PV modules.
e. Provide the mechanical hardware for mounting the PV arrays and all other hardware required for assembling the PV modules, and the attachments to the mounting structure.

**************************************************************************
NOTE: In hostile environments defined as Environmental Severity Classification Category C1 and C2 as determined by Tables A-1 and A-2, Appendix A, UFC 1-200-01 DoD Building Code, the additional cost of stainless steel components may be justified. Manufacturer's standard construction material is acceptable only in noncoastal and noncorrosive environments. Choose bracketed option for hostile environments. All fasteners for PV module aluminum frames must be stainless steel. Galvanized fasteners must not contact aluminum PV module frames or racking. Coordinate with structural engineer and geotechnical report.
**************************************************************************
f. Use array mounting hardware compatible with the site considerations and environment. [Select mechanical hardware for corrosion resistance and durability. ]Use a stainless steel, galvanized steel, or aluminum support structure. Do not use wood or plastic components for support.
g. Use cathodic protection compatible with the site considerations and environment. Utilize galvanized anchor [encased in concrete] driven into ground.

[2.6.1] Driven Pile

NOTE: For appropriate pile type, coordinate with structural engineer and geotechnical report.

Provide driven pile as indicated in accordance with PDCA Specification 103.

[2.6.2] Helical Pile

NOTE: For appropriate pile type, coordinate with structural engineer and geotechnical report.

Provide helical pile as indicated in accordance with ICC IBC. Coordinate helical pile requirements with Section 31 63 26.60 [GROUTED] HELICAL PILES.

[2.6.3] Wind and Seismic Ratings

The mounting system and overall installation must be capable to withstand winds of Category [1] [2] [3] [4] or [5] as defined by the Saffir-Simpson Hurricane Wind Scale for all attachment points and consistent with the manufacturer's installation instructions. Provide wind certifications for all components and assemblies.

All structures and structural elements must be suitable for Seismic Design Category [_____] in accordance with ICC IBC, ASCE 7-16, and all other applicable building codes and standards pertaining to the erection of such structures. Submit seismic and wind [and snow] load design calculations for the array mounting system and its attachment to the structure showing compliance with seismic and wind [and snow] requirements while supporting the PV modules.

[2.7] CAST-IN-PLACE CONCRETE

NOTE: Use the first bracketed paragraph when project includes a concrete section in Division 03; otherwise, the second bracketed paragraph may be used. Coordinate requirements with Section 03 30 00 CAST-IN-PLACE CONCRETE. Coordinate with structural engineer and geotechnical report.

Provide concrete associated with electrical work for other than encasement of underground ducts rated for 30 MPa 4000 psi minimum 28-day compressive strength unless specified otherwise. Conform to the requirements of
Provide concrete associated with electrical work as follows:

a. Composed of fine aggregate, coarse aggregate, Portland cement, and water so proportioned and mixed as to produce a plastic, workable mixture. Provide fine and course aggregates in compliance with requirements of ASTM C33, and Portland cement in accordance with requirements of ASTM C150.

b. Fine aggregate: hard, dense, durable, clean, and uncoated sand.

c. Coarse aggregate: reasonably well graded from 4.75 mm to 25 mm 3/16 inch to 1 inch.

d. Fine and coarse aggregates: free from injurious amounts of dirt, vegetable matter, soft fragments or other deleterious substances.

e. Water: fresh, clean, and free from salts, alkali, organic matter, and other impurities.

f. Concrete associated with electrical work for other than encasement of underground ducts: 30 MPa 4000 psi minimum 28-day compressive strength unless specified otherwise.

g. Slump: Less than 100 mm 4 inches. Retempering of concrete will not be permitted.

h. Exposed, unformed concrete surfaces: smooth, wood float finish.

i. Concrete must be cured for a period of not less than 7 days, and concrete made with high early strength Portland cement must be repaired by patching honeycombed or otherwise defective areas with cement mortar as directed by the Contracting Officer.

j. Air entrain concrete exposed to weather using an air-entraining admixture conforming to ASTM C260/C260M.

k. Air content: between 4 and 6 percent.

l. Welded wire fabric reinforcement must be in accordance with ASTM C185. Deformed bar reinforcement must be in accordance with ASTM 615, Grade 60.
2.7.1 Foundation Anchorage

Anchor mounting structure to concrete pad in accordance with Sections 03 30 00 CAST-IN-PLACE CONCRETE, 05 12 00 STRUCTURAL STEEL, and 05 05 20 POST-INSTALLED CONCRETE AND MASONRY ANCHORS, as required.

2.8 PV TRACKING SYSTEM

**************************************************************************
NOTE: For tracking array design, refer to UFC 3-440-01 Facility-Scale Renewable Energy Systems which provides the PV tracking system Pros and Cons, and coordinate with Activity.
**************************************************************************

Provide PV tracking system in accordance with IEC TS 62727.

2.9 PV SYSTEM MONITORING

a. Provide a PV system monitoring panel mounted as indicated.

**************************************************************************
NOTE: Select display option(s) as indicated. Bracketed attributes are optional. Select attribute's source based on use of micro-inverters or string-inverters.
**************************************************************************

b. The following quantities must be viewable [from a [remote][local] [touch ]screen display mounted at location as indicated]:

(1) DC Input Voltage from PV [array][modules]

(2) DC Input Power from PV [system][module]

(3) DC Input Current from PV [system][module]

(4) AC Phase Current from [inverter][PV system] (average)

(5) AC Voltage from [inverter][PV system] (average)

(6) AC Real Power from [inverter][PV system]

(7) Daily, Weekly, Monthly, Yearly, and Cumulative Energy Production

(8) Fault Status Report

(9) DC Ground Current Report

(10) AC Neutral Current from [inverter][PV system]

(11) AC Reactive Power from [inverter][PV system]

(12) AC Apparent Power from [inverter]

(13) AC Power Factor
NOTE: Select data acquisition sensors as indicated. Irradiance measures amount of sunlight available. Wind speed, ambient temperature, and PV module temperature can affect performance.

c. Provide additional data acquisition sensors to measure [irradiance] [wind speed] [ambient temperature] [PV module temperature]. Any additional data acquisition sensors require a conduit separate from the current conductor conduit.

2.10 PV SYSTEM METERING

NOTE: Navy projects require the use of Section 26 27 14.00 20 ELECTRICITY METERING. Air Force projects may require the use of Section 26 27 13.10 30 ELECTRIC METERS. Army projects refer to Section 26 12 21 SINGLE-PHASE PAD-MOUNTED TRANSFORMERS.

Use a revenue-grade meter if excess power will be sent back to the utility, otherwise use a non-revenue-grade meter.

a. Comply with metering requirements in [Section 26 27 14.00 20 ELECTRICITY METERING] [Section 26 27 13.10 30 ELECTRIC METERS] [Section 26 12 21 SINGLE-PHASE PAD-MOUNTED TRANSFORMERS].

b. Provide a [revenue-grade][non-revenue-grade] Interval Data Recording (IDR) meter complete with industry standard telemetry for communications with Ethernet, cellular, or other common output capabilities. Conform to CSI requirements and electrical utility requirements.

c. Connect to a monitoring/data collection recording solar production through time increments applicable to installation and utility standards, with a minimum of 15-minute intervals and 30-day memory.

d. UL listed and conform to ANSI C12.1.

e. Measure kWh, demand, instantaneous power, volts, amps, and watts.

f. Provide UL listed communication and annunciator panel.

2.11 POSTED OPERATING INSTRUCTIONS

Provide for each system and principal item of equipment as specified in the technical sections for use by the operation and maintenance personnel. The operating instructions include the following:
a. Wiring diagrams, schematic diagrams, interconnection diagrams, control diagrams, and control sequence for each principal system and item of equipment.

b. Array layout showing the locations of all DC and AC disconnects.

c. Start up, proper adjustment, operating, and shutdown procedures.

d. Safety precautions.

e. The procedure in the event of equipment failure.

f. Other items of instruction as recommended by the manufacturer of each system or item of equipment.

Print operating instructions and frame under glass or in approved laminated plastic. Post instructions where directed. For operating instructions exposed to the weather, provide weather-resistant materials or weatherproof enclosures. Operating instructions do not fade when exposed to sunlight and secure to prevent easy removal or peeling.

2.12 MANUFACTURER'S NAMEPLATE

Each item of equipment must have a nameplate bearing the manufacturer's name, address, model number, and serial number securely affixed in a conspicuous place; the nameplate of the distributing agent will not be acceptable. For PV modules, a label on the back of the module is acceptable.

2.13 FIELD FABRICATED NAMEPLATES

**************************************************************************
NOTE: Use the following paragraph where nameplates are fabricated to identify specific equipment designated on the drawings.
**************************************************************************

ASTM D709. Provide laminated plastic nameplates for each equipment enclosure, relay, switch, and device; as specified. Each nameplate inscription identifies the function and, when applicable, the position. Nameplates are of melamine plastic, 3.175 mm 0.125 inch thick, white with black center core. Surface is of matte finish. Square corners. Accurately align lettering and engrave into the core. Minimum size of nameplates is 25.4 mm by 63.5 mm 1 inch by 2.5 inches. Lettering is a minimum of 6.35 mm 0.25 inch high normal block style.

2.14 PV EQUIPMENT MARKING AND WARNING LABELS

Provide PV equipment listed or be evaluated for the application and have a field label applied in compliance with NFPA 70.

**************************************************************************
NOTE: Voltage must not exceed 1,000 VDC.
**************************************************************************

Provide warning signs for the enclosures of electrical equipment having a nominal rating exceeding 600 volts.
a. Provide PV equipment with UL 969 weather-resistant marking and warning labels in compliance with NFPA 1 and NFPA 70.

b. When such equipment is guarded by a fence, mount signs on the fence. Provide metal signs having nominal dimensions of 355 mm by 255 mm 14 inches by 10 inches with the legend "DANGER HIGH VOLTAGE KEEP OUT" printed in three lines of nominal 75 mm 3 inches high white letters on a red and black field.

2.15 CABLE TAGS IN MANHOLES, HANDHOLES, AND VAULTS

Provide tags for each power cable or wire located in manholes, handholes, and vaults. The tags must be polyethylene[ or sheet lead]. Do not provide handwritten letters.[ The first position on the power cable tag denotes the voltage. The second through [sixth] [_____] positions on the tag identify the circuit.[ The next to last position denotes the phase of the circuit and must include the Greek "phi" symbol.] The last position denotes the cable size.[ Tag legend must be as indicated.]

2.16 GROUNDING AND BONDING

a. Provide properly sized equipment grounding conductors. Equipment grounding conductors must be insulated stranded copper, except that sizes 10 AWG and smaller must be solid copper. Insulation color must be continuous green for all equipment grounding conductors, except that
wire sizes 4 AWG and larger shall be identified per NFPA 70.

b. Provide grounding lugs for aluminum PV solar module frames of either stainless steel or tin-coated copper.

c. Bonding conductors must be bare stranded copper, except that sizes 10 AWG and smaller must be bare solid copper. Bonding conductors must be stranded for final connection to motors, transformers, and vibrating equipment.

d. Provide bonding fittings on concentric/eccentric knockouts with metal conduits for circuits over 250 volts in accordance with NFPA 70.

e. Provide bonding fittings for ferrous metal conduits enclosing grounding electrode conductors in accordance with NFPA 70.

[2.17] PV LIGHTNING PROTECTION SYSTEM

**************************************************************************
NOTE: Provide a lighting risk assessment calculation in accordance with UFC 3-501-01 Electrical Engineering and UFC 3-575-01 Lightning and Static Electricity Protection Systems requirements, and if lighting protection is a design requirement, include this paragraph in the Specification.
**************************************************************************

Provide PV Lightning Protection for electrical and mechanical systems in accordance with Section 26 41 00 LIGHTING PROTECTION SYSTEM and NFPA 780.

PART 3 EXECUTION

3.1 MANUFACTURER'S INSTALLATION INSTRUCTIONS AND INSTALLATION DRAWINGS

a. Complete all electrical work in accordance with NFPA 70.

b. Provide all permanent and temporary shoring, anchoring, and bracing required by the nature of this work in order to make all parts absolutely stable and rigid, even when such shoring, anchoring, and bracing are not explicitly called for.

c. Install the solar PV system in accordance with this section, installation drawings, and the printed installation instructions of the manufacturer.

d. Follow the manufacturer's installation recommendations to ensure no electricity is being fed to the grid and that all available disconnects are in the open position and fuses are not installed during wiring operations. Utilize on-site measurements in conjunction with engineering designs to accurately cut wires and layout before making permanent connections. Locate wires out of the way of windows, doors, openings, and other hazards. Ensure wires are free of snags and sharp edges that have the potential to compromise the wire insulation. If the system is roof-mounted, it must have direct current ground fault protection in accordance with NFPA 70. Ensure breakers in combiner box are in the off position (or fuses removed) during combiner box wiring. Ensure wires and conduit are not installed as a trip hazard.
e. Attach solar PV modules to the mounting structure according to the manufacturer's instructions and approved plans.

f. Install instrumentation according to the manufacturer's instructions, with control panels located as indicated.

3.1.1 Wiring Methods

Furnish and install conductors required to connect incoming and outgoing circuits. Install conductors with conduits, boxes, and terminal cabinets in a totally enclosed installation. Install wiring in accordance with NFPA 70 and Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

3.1.2 Electrical Connections

a. Use twist on wire connectors listed for the environment (i.e. wet, damp, direct burial) and installed per manufacturer's instructions.

b. Use listed power distribution blocks.

c. Use terminals containing more than one conductor listed for multiple conductors.

d. Use connectors and terminals used for fine strand conductors that are listed for use with such conductors.

e. Utilize appropriate tools for connector type as recommended by the manufacturer.

f. Tighten and secure module connectors.

g. Provide corrosion protection in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, and by adding a stainless steel isolating washer between components of incompatible metals on the racking structure.

h. Rate all enclosures for electrical connections and interconnections for [NEMA 6 in accordance with NEMA 250] or [IP67 in accordance with ANSI IEC 60529].

3.1.3 Disconnects

**************************************************************************
NOTE: UFC 3-440-01 Facility-Scale Renewable Energy Systems and NFPA 70 requires providing a Rapid Shutdown of PV Systems on Buildings. PV system circuits installed on or in buildings must include a rapid shutdown function to reduce shock hazard for firefighters using the Rapid Shutdown Initiation Devices. Multiple PV system initiation device(s) must consist of not more than six switches or six sets of circuit breakers, or a combination of not more than six switches and sets of circuit breakers, mounted in a single enclosure, or a group of separate enclosures.
**************************************************************************

Provide disconnecting means in accordance with NFPA 70 requirements.
a. Install disconnects for all current carrying conductors of the PV source.

b. Install disconnects for the PV equipment. For inverters and other equipment that are energized from more than one source, group and identify the disconnecting means. Equipment disconnecting means or its remote operating device or the enclosure providing access to the disconnecting means must be capable of being locked in the open position when not within sight or not within 3 m 10 ft of the equipment.

c. Install disconnects and overcurrent protection for all ungrounded conductors in ungrounded (transformerless) PV power systems.

d. Install disconnecting means with a rapid shutdown function using the rapid shutdown initiation devices as specified in NFPA 70. Each device's "off" position must indicate that the rapid shutdown function has been initiated for all PV systems connected to that rapid shutdown initiation device.

e. Disconnecting means equipment that performs the rapid shutdown function, other than initiating devices, must be listed for providing rapid shutdown protection.

f. Buildings with rapid shutdown disconnecting means must have a permanent label as specified in NFPA 70.

3.1.4 Overcurrent and Overvoltage Protection

a. Install the PV interconnect overcurrent protective device as indicated in accordance with NFPA 70. Overcurrent devices used in PV system dc circuits must be listed for use in PV systems.

**************************************************************************
NOTE: Applies if lightning protection system is required. Use UFC 3-520-01 Interior Electrical Systems requirements also.
**************************************************************************

b. Install overvoltage surge protective device (SPD) as indicated and in accordance with NFPA 780 and NFPA 70. PV surge protective devices must be listed for use in PV system and marked "DC" or "PV SPD." If the system inverter is more than 30 m 100 ft from the closest combiner or recombiner box, provide additional PV SPDs at the PV output circuit adjacent to the inverter.

3.1.5 Fire Safety

**************************************************************************
NOTE: Follow UFC 3-440-01 Facility-Scale Renewable Energy Systems requirements for access to Smoke Ventilation. Office of State Auditor (OSA) may provide safety requirements for roof mounted equipment that requires access for periodic maintenance.
**************************************************************************

Firestop conduit that penetrates fire-rated walls, fire-rated partitions, or fire-rated floors in accordance with Section 07 84 00 FIRESTOPPING. For all buildings other than one and two-family dwellings and townhouses
provide access to roof mounted PV systems by providing a minimum 1.8 m 6 ft wide clear perimeter around the edges of the roof. [Follow OSA safety requirements for roof mounted PV system equipment that requires access for periodic maintenance.]

3.2 GROUNDING

3.2.1 PV System Grounding

**************************************************************************
NOTE: Racking manufacturers allow for different grounding schemes. Follow the racking manufacturer's grounding scheme. NFPA 70 approves the use of a single made electrode for the system-grounding electrode, if its resistance does not exceed 25 ohms. In most applications, it is desirable to have a maximum resistance of much less, typically 5 ohms or less.
**************************************************************************

NFPA 70 and IEEE C2, except provide grounding systems with a resistance to solid earth ground not exceeding [25] [_____] ohms. [Ground according to racking manufacturer's recommendations.]

Install grounding lugs in locations on the solar PV module as designated by the module manufacturer, using stainless steel machine screws of the thread size provided in the pre-tapped holes, along with a stainless steel star washer placed between the grounding lug and the solar module frame.

[3.2.2 Grounding Electrodes

**************************************************************************
NOTE: Include if grounding electrodes are provided.
**************************************************************************

Provide driven ground rods as specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION. Connect ground conductors to the upper end of ground rods by exothermic weld or compression connector. Provide compression connectors at equipment end of ground conductors.

**************************************************************************
NOTE: Include if lighting protection is a design requirement. Use UFC 3-550-01 Exterior Electrical Power Distribution requirements.
**************************************************************************

[ Provide ground ring electrode in accordance with NFPA 780 encompassing the perimeter of each ground-mounted PV array. Interconnect all building grounding electrode systems, including lighting protection.]

]}3.3 INSTALLATION OF EQUIPMENT AND ASSEMBLIES

3.3.1 Roof Mounted Structures

a. Ensure roof access points, paths, and clearances are as indicated.

b. The solar photovoltaic system details must be accepted by warranty roofing system manufacturer prior to installation. Upon completion of a rooftop system installation, obtain written certification that the
rooftop warranty is still valid.

(1) For installation on a new roof, coordinate with roof manufacturer of new roof and obtain certificate.

(2) For installation on existing roof, coordinate with activity to provide certificate of continued validity of warranty from manufacturer.

c. Flash and counter-flash all roof penetrations in accordance with ICC IBC.

******************************************************************************
NOTE: The latest analyses of the phenomenon of heat transfer arrived at optimized gap to be between 100 mm to 110 mm 3.94 inches to 4.33 inches beyond which the benefits are negligible.
******************************************************************************

d. Provide a minimum 115 mm 4.5 inches air gap between the solar PV module frame and the roof surface.

e. Comply with requirements in NRCA 3767 for working with different roof types.

[3.3.2 Ground Mounted Structures]

******************************************************************************
NOTE: Include if ground mounted structures are provided, and indicate appropriate foundation type.
******************************************************************************

[a. For concrete ballast or pad, install in accordance with Section 05 12 00 STRUCTURAL STEEL.

[b. For driven pile, install in accordance with PDCA Specification 103.

[c. For helical pile, install in accordance with ICC IBC.

3.3.2.1 Installation

******************************************************************************
NOTE: Indicate appropriate installation requirements. Account for snow depths and known snowdrift patterns to determine locations and mounting heights in Snowbelt locations.
******************************************************************************

In order to maximize potential energy output from each PV system, the system must be sited to maximize the amount of sunlight it receives daily, without shading from adjacent structures or trees. Existing and proposed land uses adjacent to the PV system must not be taller than the PV location.

a. Site Preparation:

Prepare the site for system installation by removing vegetation, grading for adequate drainage and avoid standing water on site[, and excavating and compacting foundations for individual module installation]. Provide access roads, pathways, fencing and other improvements as necessary for site access and security.]
vegetation barrier to keep surrounding area free from array-shading vegetation as required.]

[Provide walking and vehicle space throughout the PV array to facilitate installation, inspection, and maintenance access to all modules in accordance with NFPA 70 and IEEE C2.] [Maintain a minimum ground clearance of \(3\) \(m\) \(10\) \(ft\) around arrays.
Maintain a minimum ground clearance of \(1\) \(m\) \(3\) \(ft\) below arrays for all site-specific conditions including possible array-shading vegetation, ground/vegetation maintenance, and/or array-shading snowfall.]
[Account for snow depths and known snowdrift patterns to determine locations and mounting heights in Snowbelt locations.]

******************************************************************************
NOTE: Comply with UFC 3-260-01 Airfield and Heliport Planning and Design when PV system is sited near an airfield or related facilities and equipment used to sustain flight operations.
******************************************************************************

[ b. Airspace Coordination:

When PV system to be sited near an airfield or related facilities and equipment used to sustain flight operations submit plans to the airfield manager and safety officer (among other stakeholders) for approval. Contact the DoD Siting Clearinghouse and provide applicable data items required for the DoD Siting coordination. Avoid glare from solar panels following FAA interim policy. Provide Glare and Glint calculation using Sandia Labs software which is maintained by ForgeSolar now. Use link https://share-ng.sandia.gov/glare-tools.

][3.3.3 Tracking Equipment

******************************************************************************
NOTE: Apply if tracking equipment is provided.
******************************************************************************

Install solar tracking equipment in accordance with IEC TS 62727.

]3.4 FIELD APPLIED PAINTING

Paint electrical equipment as required to match finish of adjacent surfaces or to meet the indicated or specified safety criteria. Painting must be as specified in Section 09 90 00 PAINTS AND COATINGS.

3.5 FIELD FABRICATED NAMEPLATE MOUNTING

Provide number, location, and letter designation of nameplates as indicated. Fasten nameplates to the device with a minimum of two sheet-metal screws or two rivets.

3.6 WARNING SIGN MOUNTING

a. Display calculated maximum and minimum voltages and their respective amperages on engraved warning labels.

******************************************************************************
NOTE: Coordinate arc flash warning label

SECTION 26 31 00 Page 45
requirements with paragraph PV EQUIPMENT MARKING AND WARNING LABELS, list item "c" requirements.

**************************************************************************

b. Display information on the arc flash warning labels [in accordance with NFPA 70E][as indicated].

c. Provide the number of signs required to be clearly visible and readable from each accessible side. Space the signs in accordance with NFPA 70E.

3.7 CABLE TAG INSTALLATION

Install cable tags in each manhole, handhole, and vault as specified, including each splice.[ Tag only new wire and cable provided and existing wire and cable which are indicated to have splices and terminations provided.] Install cable tags over the fireproofing, if any, and locate the tags so that they are clearly visible without disturbing any cabling or wiring in the manholes, handholes, and vaults.

[3.8 FOUNDATION FOR EQUIPMENT AND ASSEMBLIES

**************************************************************************

NOTE: Provide if ground mounted system. Use the first bracketed option when project includes a concrete section in Division 03; otherwise, the second bracketed option (metric) or the third bracketed option (English) may be used.

**************************************************************************

Provide cast-in-place concrete work in accordance with the requirements of [Section 03 30 00 CAST-IN-PLACE CONCRETE][ ACI 318M][ ACI 318].

3.9 FIELD QUALITY CONTROL

**************************************************************************

NOTE: Use Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION for an exterior ground mount system.

**************************************************************************

Perform in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM [and 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION].

3.9.1 Performance of NABCEP Acceptance Checks and Tests

Perform all inspections using a NABCEP-certified professional and in accordance with NABCEP inspection procedures, and in accordance with the manufacturer's recommendations, and include the following visual and mechanical inspections and electrical tests.

3.9.1.1 PV Modules

a. Visual and Mechanical Inspection

   (1) Solar PV module manufacturer, model, and number of modules must match the approved plans.

   (2) Solar PV modules must be in good conditions (including but not limited to no broken glass or cells, no discoloration, frames not damaged).
b. Electrical Tests
   
   (1) Verify output of PV modules according to manufacturer's recommendations and NABCEP practices.

3.9.1.2 Inverters

a. Visual and Mechanical Inspection

   (1) Inverter manufacturer, model, and number of inverters must match the approved plans.

   (2) Inverters must be in good condition.

b. Electrical Tests

   (1) Verify output of inverters according to manufacturer's recommendations and NABCEP practices.

3.9.2 Performance of NETA Acceptance Checks and Tests

Perform in accordance with the manufacturer's recommendations, and include the following visual and mechanical inspections and electrical tests, performed in accordance with NETA ATS.

3.9.2.1 Grounding System

a. Visual and Mechanical Inspection

   (1) Inspect ground system for compliance with contract plans and specifications.

b. Electrical Tests

   (1) Perform ground-impedance measurements utilizing the fall-of-potential method. On systems consisting of interconnected ground rods, perform tests after interconnections are complete. On systems consisting of a single ground rod, perform tests before any wire is connected. Take measurements in normally dry weather, not less than 48 hours after rainfall. Use a portable ground resistance tester in accordance with manufacturer's instructions to test each ground or group of grounds. Use an instrument equipped with a meter reading directly in ohms or fractions thereof to indicate the ground value of the ground rod or grounding systems under test.

   (2) Submit the measured ground resistance of each ground rod and grounding system, indicating the location of the rod and grounding system. Include the test method and test setup (i.e. pin location) used to determine ground resistance and soil conditions at the time the measurements were made.

3.9.3 Functional Acceptance Tests

a. Provide final and complete commissioning of the solar PV system in accordance with IEEE 1547.

b. Verify that all electrical components are installed and connected
according to the requirements of the PV electrical drawings, specifications, and manufacturer's written instructions.

c. Before starting or operating the system, check continuity of all conductors and grounding conductors to verify that there are no faults and that all equipment has been properly installed according to the manufacturer's recommendations. Check factory instructions to see that installations have been made accordingly. Check equipment for any damage that may have occurred during shipment, after delivery, or during installation. Replace damaged equipment.

d. Before starting or operating the system, obtain a final inspection approval and final inspection from the Contracting Officer. Be present on site for both of these inspections.

e. Make final adjustments to all inverters and monitoring equipment so that they will be placed in an acceptable operating condition. Adjustable parameters must be set so that the PV system will produce the maximum possible amount of energy on an annual basis.

3.10 COMMISSIONING

**************************************************************************
NOTE: Section [01 91 00.15 10][01 91 00.15 20]
TOTAL BUILDING COMMISSIONING is intended for building systems, however, the basic requirements are applicable to PV commissioning processes. Section [01 91 00.15 10][01 91 00.15 20] will need to be tailored for PV systems when compiling project specifications.
**************************************************************************

Conduct Commissioning, after the system is installed and is ready for operation, in accordance with Section [01 91 00.15 10][01 91 00.15 20] TOTAL BUILDING COMMISSIONING, item (6) renewable energy generation, to verify that the completed and installed system meets the requirements of IEEE 1547. Tailor for non-building systems.

3.10.1 Commissioning Agent Qualification

Individual qualified in testing protective equipment (e.g., professional engineer, factory-certified technician, licensed electrician with experience in testing protective equipment) must perform or directly supervise commissioning tests.

3.10.2 Commissioning Plan and Schedule

 Develop and implement a commissioning plan and commissioning schedule in accordance with Section [01 91 00.15 10][01 91 00.15 20] TOTAL BUILDING COMMISSIONING.

3.10.3 Start-up Pre-functional Checklists

Carry out a checklist of startup requirements and conduct a series of safety tests to ensure proper installation, safe operation, and performance conforming to specification.
3.10.4 Functional Performance Testing

Prepare test procedures and conduct functional performance testing of the installed system. Include the following test requirements:

a. All inverter startup tests as specified by the inverter manufacturer in the inverter operation manual;

b. Actual power;

c. Loss of grid;

d. Grid resume;

e. Data monitoring check out;

f. $V_{oc}$ measurement of every source circuit and log it;

g. Verify tightness of all wiring terminations;

h. Verify proper markings and labeling of all wire terminations and enclosures;

i. Verify startup/shut down procedures;

j. Verify system [5][_____] minutes delay upon restart;

k. Verify PV array quick connectors are fully mated and wires are neatly secured;

l. Verify no debris on the modules, no damaged or broken modules;

m. Verification and inspections (see IEEE 1547.1 7.2)

n. Field-conducted type and production tests (see IEEE 1547.1)
o. Unintentional islanding functionality test (see IEEE 1547.1)
p. Cease-to-energize functionality test (see IEEE 1547.1)
q. Unintentional islanding functionality test (see IEEE 1547.1)
r. Cease-to-energize functionality test (see IEEE 1547.1 7.5)
s. Revised settings (see IEEE 1547.1 7.6)

3.10.5 Functional Performance Testing Results

Coordinate, observe and record the results of the functional performance testing. Coordinate retesting as necessary until satisfactory performance is verified. Verify the intended operation of individual components and system interactions under various conditions and modes of operation.

Document items of non-compliance in materials, installation or operation. Immediately address observed non-conformance and deficiencies in terms of notification to responsible parties, and provide recommended actions to correct deficiencies.
3.10.6 Final Commissioning Report

Prepare and submit final commissioning report. Summarize all tasks, findings, conclusions, and recommendations of the commissioning process in accordance with IEC 62446. Include the results of all tests and a listing of the final settings.

3.11 FINAL ACCEPTANCE

The acceptance of the solar PV system occurs only after all deficiencies identified by the functional acceptance tests and commissioning report are corrected[, and the system operates successfully during a [30][_____] day initial testing period].

The Contracting Officer must sign appropriate certificates, if equipment and systems are operating satisfactorily in accordance with the specifications, stating the system's operation has been tested and accepted at the end of the final start-up and testing.

3.12 CLOSEOUT ACTIVITIES

3.12.1 Demonstration

Upon completion of the work and at a time approved by the Contracting Officer, provide instructions by a qualified instructor to the Government personnel in the proper adjustment, system operation, and maintenance of the specified systems and equipment, including pertinent safety requirements as required. Government personnel must receive training comparable to the equipment manufacturer's factory training. Instructor must provide a separate training course for the monitoring system.

3.12.2 Instructor's Qualification Resume

***************************************************************
NOTE: Use the most appropriate and available option to provide the necessary training.
***************************************************************

Instructor(s) must be employee(s) of [installer] [manufacturer] [certified solar photovoltaic system training program]. Instructors must be thoroughly familiar with all parts of the installation and trained in operating theory as well as practical operation and maintenance work. Submit the name(s) and qualification resume(s) of instructor(s) to the Contracting Officer for approval.

3.12.3 Training

***************************************************************
NOTE: Use the most appropriate hours to provide the necessary training. Video record instruction for absent and future employees.
***************************************************************

Furnish training service by a factory-trained representative. Document that each qualified employee has received the required training in accordance with 29 CFR 1910. Maintain all training documentation in a central location for the entire employee's employment duration. Minimum documentation data includes employee's name, training name, and date(s) of training.
The training period must consist of a total of [2] [_____] hours of normal working time and begin after the system is functionally completed but prior to final acceptance tests. Submit the training course curriculum for approval, along with the proposed training date, at least 14 days prior to the date of proposed conduction of the training course. Instruction must be [video-recorded and ] given during the first regular work week after the equipment or system has been accepted and turned over to the Government for regular operation. Provide [video recording and ] any PowerPoint slides as part of the final documentation for those that cannot attend. Extend safety training to fire department representatives. Coordinate with Contracting Officer for Fire Department first responder training.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for stationary generator sets up to 2500 kilowatt capacity.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1   GENERAL

NOTE: This guide specification will require modification for applications where automatic transfer switches are not used. When generators are to be operated in parallel with utility or with other generators, and for medium voltage (greater than 600 volt) systems, contact the responsible Facilities Engineering Command (FEC) for determination as to which specification or sample specification is to be used. If Echelon III Reach-back Support from NAVFAC LANT or NAVFAC PAC is required for shop drawing review or field acceptance. 

SECTION 26 32 15.00  Page 6
testing, the FEC technical representative (electrical engineer) editing this document for a specific project must contact the appropriate Capital Improvements Electrical Engineering Office for consultation during the design stage of the project.

On drawings, show:

1. Engine-generator set foundation design and details.

2. Piping for ventilation of engine crankcase to atmosphere where required.

3. Details of exhaust, cooling water, and fuel piping, including penetrations through walls and roofs showing piping sleeves and exterior flashing where applicable.

4. Fuel day tank capacity where applicable.

5. Location of remote alarm annunciator where applicable.

6. Circuiting for the jacket coolant heating system, electric motor driven radiator fan where applicable, fuel supply system, starting battery charger, remote alarm annunciator storage battery charger where applicable, and generator space heater.

7. Grounding Plan. For applications using transfer switches, the transfer switch must be four pole and the generator must be grounded as a separately derived system.

This specification is for procurement of engine-generator sets which are suitable for serving general purpose and commercial-grade loads (loads which may be served by an electric utility). These are loads which can endure or recover quickly from transient voltage and frequency changes (as much as 30 percent transient voltage drop, and plus or minus 5 percent frequency deviation, with recovery time of 2 seconds). For applications where strict control of voltage, frequency, and transient response is required, provide uninterruptible power supplies.

This specification is for procurement of fossil-fueled engine-generator sets. Transient-load-response performance characteristics of natural gas, digester gas, propane, and liquefied petroleum gas engines differ significantly from those of diesel engines because of the fuel differences. Consult manufacturers for sample specifications.

Select the features and fill in blanks with values appropriate for the design condition. This
specification does not apply to 400 Hz applications.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.3 SUBMITTALS

NOTE: Review submittal definition (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office.
(Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-11 Closeout Submittals
1.4 QUALITY ASSURANCE

1.4.1 Conformance to Codes and Standards

Where equipment is specified to conform to requirements of any code or standard such as UL, NEMA, etc., the design, fabrication and installation must also conform to the code.

1.4.2 Site Welding

Weld structural members in accordance with Section 05 05 23.16 STRUCTURAL WELDING. For all other welding, qualify procedures and welders in accordance with ASME BPVC SEC IX.

a. Welding procedures qualified by others, and welders and welding operators qualified by a previously qualified employer may be accepted as permitted by ASME B31.1.

b. Submit a copy of qualifying procedures and a list of names and identification symbols of qualified welders and welding operators.

c. Submit a letter listing the welder qualifying procedures for each welder, complete with supporting data such as test procedures used, what was tested to, and a list of the names of all welders and their identification symbols.

d. Perform welder qualification tests for each welder whose qualifications are not in compliance with the referenced standards. Notify the Contracting Officer 24 hours in advance of qualification tests which must be performed at the work site, if practical.

e. The welder or welding operator must apply the personally assigned symbol near each weld made as a permanent record.

1.4.3 Vibration Limitation

Limit the maximum engine-generator set vibration in the horizontal, vertical, and axial directions to 0.15 mm 6 mils (peak-peak RMS), with an overall velocity limit of 24 mm/second 0.95 inches/second RMS, at rated speed for all loads through 110 percent of rated speed. [Install a vibration isolation system between the floor and the base to limit the maximum vibration transmitted to the floor at all frequencies to a maximum of [_____] (peak force).] [The engine-generator set must be provided with vibration isolation in accordance with the manufacturer's standard recommendation.] Where the vibration isolation system does not secure the base to the structure floor or unit foundation, provide seismic restraints in accordance with the seismic parameters specified.

1.4.4 Torsional Analysis

Submit torsional analysis including prototype testing or calculations which certify and demonstrate that no damaging or dangerous torsional vibrations will occur when the prime mover is connected to the generator, at synchronous speeds, plus/minus 10 percent.
1.4.5 Performance Data

Submit vibration isolation system performance data for the range of frequencies generated by the engine-generator set during operation from no load to full load and the maximum vibration transmitted to the floor. Also submit a description of seismic qualification of the engine-generator mounting, base, and vibration isolation.

1.4.6 Seismic Requirements

**************************************************************************
NOTE: Provide seismic requirements, if a Government designer (either Corps office or A/E) is the Engineer of Record, and show on the drawings. Delete the bracketed phrase if seismic details are not provided. Pertinent portions of UFC 3-301-01 and Sections 13 48 73, 23 05 48.19, and 26 05 48.00 10, properly edited, must be included in the contract documents.
**************************************************************************

[Seismic requirements must be in accordance with UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MECHANICAL EQUIPMENT, 23 05 48.19 [SEISMIC] BRACING FOR HVAC and 26 05 48.00 10 SEISMIC PROTECTION FOR ELECTRICAL EQUIPMENT] [as shown on the drawings].

1.4.7 Experience

Each component manufacturer must have a minimum of 3 years' experience in the manufacture, assembly and sale of components used with stationary engine-generator sets for commercial and industrial use. The engine-generator set manufacturer/assembler must have a minimum of 3 years' experience in the manufacture, assembly and sale of stationary engine-generator sets for commercial and industrial use. Submit a statement showing and verifying these requirements.

1.4.8 Field Engineer

The engine-generator set manufacturer or assembler must furnish a qualified field engineer to supervise the complete installation of the engine-generator set, assist in the performance of the onsite tests, and instruct personnel as to the operational and maintenance features of the equipment. The field engineer must have attended the engine generator manufacturer's training courses on installation and operation and maintenance of engine generator sets. Submit a letter listing the qualifications, schools, formal training, and experience of the field engineer.

1.4.9 Detailed Drawings

Submit detailed drawings showing the following:

a. Base-mounted equipment, complete with base and attachments, including anchor bolt template and recommended clearances for maintenance and operation.

b. Starting system.

c. Fuel system.
d. Cooling system.
e. Exhaust system.
f. Electric wiring of relays, breakers, programmable controllers, and switches including single line and wiring diagrams.
g. Lubrication system, including piping, pumps, strainers, filters, [heat exchangers for lube oil and turbocharger cooling,] [electric heater,] controls and wiring.
h. Location, type, and description of vibration isolation devices for all applications.
i. The safety system, including wiring schematics.
j. One-line schematic and wiring diagrams of the generator, exciter, regulator, governor, and instrumentation.
k. Panel layouts.
l. Mounting and support for each panel and major piece of electrical equipment.
m. Engine-generator set rigging points and lifting instructions.

1.4.10 **Auxiliary Systems** Engine-Generator Set and Auxiliary Equipment Drawing Requirements

Submit drawings pertaining to the engine-generator set and auxiliary equipment, including but not limited to the following:

a. Certified outline, general arrangement (setting plan), and anchor bolt details. Show total weight and center of gravity of assembled equipment on the steel sub-base.

b. Detailed elementary, schematic wiring, and interconnection diagrams of the engine starting system, jacket coolant heating system, engine protective devices, engine alarm devices, engine speed governor system, generator and excitation system, and other integral devices.

c. Detailed elementary, schematic wiring; and interconnection diagrams of the fuel system, starting battery system, engine-generator control panel, generator circuit breaker[, and remote alarm annunciator].

d. Dimensional drawings or catalog cuts of exhaust silencers, radiator, fuel day tanks, fuel oil cooler, valves and pumps, intake filters, vibration isolators, and other auxiliary equipment not integral with the engine-generator set.

1.4.11 **Auxiliary Systems Drawing Requirements**

**************************************************************************

**NOTE:** When the engine-generator set installation includes field installed exhaust, air intake, fuel oil cooler, or jacket coolant water systems (i.e., the engine-generator set is installed internal to a building in lieu of in a self-contained outdoor
Submit drawings showing floor plan arrangement of exhaust, air intake, fuel oil cooler, and jacket coolant water systems including arrangement of piping and pipe sizes.

1.4.12 Vibration Isolation System Certification

Submit certification from the manufacturer that the vibration isolation system will reduce the vibration to the limits specified in the paragraph VIBRATION ISOLATION.

1.4.13 Fuel System Certification

When the fuel system requires a fuel oil cooler as described in the paragraph FUEL OIL COOLER, submit certification from the engine manufacturer that the fuel system design is satisfactory.

1.5 DELIVERY, STORAGE, AND HANDLING

Properly protect materials and equipment, in accordance with the manufacturers recommended storage procedures, before, during, and after installation. Protect stored items from the weather and contamination. During installation, cap piping and similar openings to keep out dirt and other foreign matter.

Deliver equipment on pallets or blocking wrapped in heavy-duty plastic, sealed to protect parts and assemblies from moisture and dirt. Protect and prepare batteries for shipment as recommended by the battery manufacturer. Store auxiliary equipment at the site in covered enclosures, protected from atmospheric moisture, dirt, and ground water.

1.6 EXTRA MATERIALS

Provide [two] sets of special tools and [two] sets of filters required for maintenance. Special tools are those that only the manufacturer provides, for special purposes, or to reach otherwise inaccessible parts. One handset must be provided for each electronic governor when required to indicate and/or change governor response settings. Furnish 4 liters one gallon of identical paint used on engine-generator set in manufacturer's sealed container with each engine-generator set.

Wrenches and tools specifically designed and required to work on the new equipment, which are not commercially available as standard mechanic's tools, must be furnished to the Contracting Officer.

Provide proposed operating instructions for the engine-generator set and auxiliary equipment laminated between matte-surface thermoplastic sheets and suitable for placement adjacent to corresponding equipment. After approval, install operating instructions where directed.

1.7 MAINTENANCE SERVICES

Submit the operation and maintenance manuals and have them approved prior to commencing onsite tests.
1.7.1 Operation Manual

Provide [three] [_____] copies of the [manufacturers standard operation manual] [operation manual in 216 by 279 mm8-1/2 by 11 inch three-ring binders]. Sections must be separated by heavy plastic dividers with tabs which identify the material in the section. Fold drawings with the title block visible, and placed in 216 by 279 mm8-1/2 by 11 inch plastic pockets with reinforced holes. The manual must include:

a. Step-by-step procedures for system startup, operation, and shutdown;

b. Drawings, diagrams, and single-line schematics to illustrate and define the electrical, mechanical, and hydraulic systems with their controls, alarms, and safety systems;

c. Procedures for interface and interaction with related systems to include [automatic transfer switches] [fire alarm/suppression systems] [load shedding systems] [uninterruptible power supplies] [_____].

1.7.2 Maintenance Manual

Provide [three] [_____] copies of the [manufacturers standard maintenance manual] [maintenance manual containing the information described below in 216 x 279 mm8-1/2 x 11 inch three-ring binders]. Separate each section by a heavy plastic divider with tabs. Fold drawings with the title block visible, and placed in plastic pockets with reinforced holes. The manual must include:

a. [Procedures for each routine maintenance item.][Procedures for troubleshooting.][Factory-service, take-down overhaul, and repair service manuals, with parts lists.]

b. The manufacturer's recommended maintenance schedule.

c. A component list which includes the manufacturer's name, address, type or style, model or serial number, rating, and catalog number for the major components.

d. A list of spare parts for each piece of equipment and a complete list of materials and supplies needed for operation.

1.7.3 Assembled Operation and Maintenance Manuals

The contents of the assembled operation and maintenance manuals must include the manufacturer's O&M information required by the paragraph SD-10, OPERATION AND MAINTENANCE DATA and the manufacturer's O&M information specified in Section 26 36 23 AUTOMATIC TRANSFER SWITCHES AND BY-PASS/ISOLATION SWITCH.

a. Manuals must be in separate books or volumes, assembled and bound securely in durable, hard covered, water resistant binder, and indexed by major assembly and components in sequential order.

b. A table of contents (index) must be made part of the assembled O&M. The manual must be assembled in the order noted in table of contents.

c. The cover sheet or binder on each volume of the manuals must be identified and marked with the words, "Operation and Maintenance Manual."
1.8 SITE CONDITIONS

Protect the components of the engine-generator set, including cooling system components, pumps, fans, and similar auxiliaries when not operating and provide components capable of the specified outputs in the following environment:

a. Site Location: [____]

b. Site Elevation: [____] meters [____] feet above mean sea level.

c. Ambient Temperatures:

**************************************************************************
NOTE: Ambient temperatures, design wind velocity, and prevailing wind direction must be as defined by UFC 3-400-02, Design Engineering Weather Data.
**************************************************************************

(1) Maximum [____] degrees C [____] degrees F dry bulb, [____] degrees C [____] degrees F wet bulb.

(2) Minimum [____] degrees C [____] degrees F dry bulb.

d. Design Wind Velocity: [____] km/h [____] mph.

e. Prevailing Wind Direction: [____]

f. Seismic Zone: Zone [____] as defined by ICC IBC.

PART 2 PRODUCTS

2.1 SYSTEM REQUIREMENTS

a. Provide and install each engine-generator set complete and totally functional, with all necessary ancillary equipment to include: air filtration; starting system; generator controls, protection, and isolation; instrumentation; lubrication; fuel system; cooling system; and engine exhaust system. Each engine-generator set must satisfy the requirements specified in the Engine-Generator Parameter Schedule. Submit certification that the engine-generator set and cooling system function properly in the ambient temperatures specified.

b. Provide each engine-generator set consisting of one engine, one generator, and one exciter mounted, assembled, and aligned on one base; and all other necessary ancillary equipment which may be mounted separately. Assemble sets having a capacity of 750 kW or smaller and attach to the base prior to shipping. Sets over 750 kW capacity may be shipped in sections. Provide set components that are environmentally suitable for the locations shown and that are the manufacturer's standard product offered in catalogs for commercial or industrial use. Provide a generator strip heater for moisture control when the generator is not operating. Identify any nonstandard products or components and the reason for their use.
2.1.1 Engine-Generator Parameter Schedule

***********************

NOTE: Where multiple engine-generator sets of different sizes or applications are to be provided, a Parameter Schedule should be shown on the contract drawings (one for each engine-generator set to be installed). If only one engine-generator set is provided (or multiples of the same type, size, etc.), the schedule may be in the body of the specification. Note that the specifications refer to the Engine Generator Parameter Schedule and the designer must provide one each by that name.

Some load applications require precise generator output frequency, voltage, level waveform characteristics and control of transient response. Most loads do not require stricter control than most off-the-shelf engine generator sets can provide. The criticality of the output and response characteristics can affect: selection of the governor type, whether it is to be isochronous or droop, and its steady state bandwidth; selection of the voltage regulator parameters; transient recovery time for frequency and voltage; maximum voltage and frequency deviation for a transient event; and because of the maximum deviations and transient recovery times, the sizing or oversizing of the engine and generator. The notes below are included to assist the designer in making informed choices when filling in the Engine Generator Parameter Schedule.

Power Ratings and Industry Terminology. The following definitions are from the Electrical Generating Systems Association Standard 101P, Engine Driven Generating Sets. Stationary, diesel-engine-driven, electric generator sets are divided into the following four rating categories: EMERGENCY STANDBY, LIMITED RUNNING TIME, PRIME POWER, and INDUSTRIAL.

"EMERGENCY STANDBY RATING means the power that the generator set will deliver continuously under normal varying load factors for the duration of a power outage." It must be understood that this definition uses the term "normal varying load condition factors". Most manufacturers use this terminology to indicate that their units typically are not rated for continuous operation at the nameplate rating, but rather that the units provided are rated for continuous operation at 70 to 80 percent of their nameplate rating, with periodic loading up to 100 percent of the nameplate rating for short (cyclical) periods during a power outage. Additionally, the designer must analyze the load characteristics and profiles of the load to be served to determine the peak demand, maximum step load increase and decrease, motor starting requirements represented as
starting kVA, and the non-linear loads to be served. This information should be included in the engine-generator set parameter schedule or on the drawings for each different unit provided. For this application service load is the peak estimated loading to be placed on the engine generator set. Peak demand calculation provides a figure from which to determine the service load. When specifying an engine-generator be sure to specify what the peak load is and how much is continuous.

"LIMITED RUNNING TIME RATING means the power that the generator set will deliver when used as a utility type power source, typically in load curtailment type service, for a limited number of hours, where there are non-varying load factors and/or constant dedicated loads."

"PRIME POWER RATING means the power that the generator set will deliver when used as a utility type power plant under normal varying load factors to run continuously. This rating requires a minimum momentary overload capability of 10 percent."

"INDUSTRIAL RATING means the power that the generator set will deliver 24 hours per day when used as a utility type power plant where there are non-varying load factors and/or constant dedicated loads."

Overload Capacity. Overload capacity is only for PRIME rated units. Delete for standby applications.

Gross bhp rating of engine must be the total rated power output before deducting power requirements of electric motor-driven equipment or engine driven radiator fan.

Net brake power rating of engine must include deductions for the total power requirements of electric motor-driven or engine-driven accessories as defined in ISO 3046. Net ratings must include a deduction in power output for cooling media system power requirements including radiator fans and any other power consuming devices required to provide cooling as specified.

Power Factor. Commercial engine-generator power ratings are usually based on 0.8 power factor. Select 0.8 unless the application requires one more stringent.

Loading. When specifying engine-generator sets, the designer will analyze the load characteristics and profiles of the load to be served to determine the peak demand, maximum step load increase and decrease, motor starting requirements represented as starting kVA, continuous and non-continuous (cyclical / periodic), and the non-linear loads to
be served. This information should be included in the engine-generator set parameter schedule or on the drawings for each different unit provided. For this application, service load is the peak estimated loading (continuous plus non-continuous) to be placed on the engine generator set.

Peak demand calculation provides a figure from which to determine the service load. For prime applications the service load should include spare capacity for future load growth and spinning reserve (reserve generation beyond that required to satisfy immediate needs and/or system peak demands). Spare capacity for prime applications should be based on the facility master plan load projections.

Motor Starting Load. Motor starting requirements are important to properly size engine generator sets because the starting current for motors can be as much as six times the running current, and can cause generator output voltage and frequency to drop, even though the genset engine-generator has been sized to carry the running load. The designer must analyze the motor loads to determine if the starting characteristics of a motor or a group of motors to be started simultaneously will cause objectionable engine-generator performance. Provide a motor starting kVA value for the largest motor or combination of motors to be started simultaneously. An increase in the size rating of the engine-generator may be necessary to compensate for the inrush current. This assists the engine-generator supplier in properly sizing the engine generator set.

Maximum Speed. The maximum allowable speed for emergency standby applications is 1800 RPM. If there is not specific requirement or user requirement for slower speed machines, select 1800 RPM. Selection of the maximum 1800 RPM does not preclude provision of slower speed machines, for example, in the larger sizes (above 2000 kW), where 1800 RPM machines may not be available. However, for prime power or continuous duty plant applications, the lowest total cost of ownership would result by specifying a much lower speed, as recommended in UFC 3-540-04N, Section 5.1, Table 7. Lower speed engines require fewer overhauls, fewer oil changes, have a higher availability factor, and can be more fuel efficient. Even though prime duty power plants are the minority case, improper specification can result in very large increase in cost over the life of the installation. Frequently these plants are installed forward in contingency environments at FOBs or base camps which by nature demand reliable power at the lowest total cost. Furthermore, as prime sources of power these plants are relied upon as "the grid" and must perform as such for reliable power. Additionally, several
manufacturers' medium speed (600-1200 RPM) engines will tolerate the varieties of fuel found in CONUS and OCONUS with minimal or no power or durability degradation.

Heat Exchanger Type. Fin-tube heat exchangers (radiators) are the predominate method of cooling. Specify either a fin-tube or a shell-tube heat exchanger for each engine-generator set. Heat exchangers located remote from the engine-generator set (i.e., not mounted on the engine-generator set base) will be shown on the project plans, including the power source for associated fans and pumps.

Governor. The type of governor to be used on each engine generator set should be identified as isochronous or droop on the engine-generator set parameter schedule. Isochronous governors hold frequency at the setpoint frequency (within bandwidth) for all steady state loads from 0 to 100 percent load and are required for applications where severe demands are made on voltage and frequency regulation. Droop governors allow frequency to droop to the specified percentage proportional to steady state loads from 0 to 100 percent load and are generally acceptable for general purpose and commercial applications.

Engine-generator sets in stand alone service (isolated bus) may utilize either droop or isochronous governors. The designer should analyze the application and loads to determine if the more expensive isochronous unit is actually required. Droop units provide added stability (less engine cycling) in single unit applications where constant speeds are not critical and are less expensive than isochronous governors.

Engine-generator sets in parallel (on an isolated bus) may also utilize either droop or isochronous governors. Load swings are shared proportionally based on the governor droop settings. The load will be split equally among the units for all units equipped with isochronous governors with load sharing controls, or if all units have droop governors that are set with the same droop. "Lead units" are often designated in multiple unit applications for tighter frequency control by setting one governor at a much lower droop than the others. A "lead unit" can be designated for genset engine-generators equipped with isochronous governors if all units have governors with load sharing controls. In this case the "lead unit" will accept all load swings and the other units will remain at a constant load. When all units have droop governors, the "lead units" will accept most of the load swings and the other units will equally split a small portion of the load. If isochronous governors are specified for two or more units to be
paralleled on an isolated bus, the governors must be specified with load sharing controls. For applications involving units in parallel operation which are not operator supervised the designer should specify a load-sharing system which can proportionally load two or more sets in parallel, each having isochronous governors. Generators for use with existing generators in parallel applications must have similar characteristics. Droop paralleling is specified for electrical and electro-hydraulic governors where interconnection of all controls is not possible such as when paralleling to a large electrical utility grid network. When paralleling two or more droop units with a utility grid (or with other droop units), to achieve load sharing, the unit governors must be compatible, their speed settings must be matched, and the droop must be set the same on all units. Droop adjustment range of 0 to 7 percent is typical for mechanical-hydraulic governors, and 0 to 10 percent is typical for electro-hydraulic governors. Isochronous units should not be paralleled with an infinite bus (utility grid system) without also specifying synchronizing and governor-load sharing controls. Delete speed droop adjustment for isochronous governors in non-parallel applications.

Frequency Bandwidth. Governor frequency bandwidth defines the allowable steady state variation in frequency and is typically quite small for commercially available governors (typically less than plus or minus 0.4 percent with plus or minus 0.25 percent readily available). The predominant type of device loads which are susceptible to steady state frequency deviations less than plus or minus 0.4 percent are those which employ switching power supplies (computers and variable frequency drives). The designer should select the least restrictive value for bandwidth for the application.

Voltage Regulators. Solid state regulators are readily available which maintain the voltage level (regulation or voltage droop) to plus or minus 0.5 percent. Voltage regulator bandwidth is important relative primarily to transient response. EGSA Standard 100R-1992 defines three performance classes for voltage regulators: standard (2 percent bandwidth); high (1 percent bandwidth); and precision (0.5 percent bandwidth). Select the least restrictive bandwidth necessary to satisfy the application requirement.

Generator frequency and voltage should be shown on the engine-generator set schedule. (For example: 208Y/120 volts, 3-phase, 4-wire).

Sub-transient Reactance. The sub-transient reactance of a generator is the impedance characteristic which determines current during the
first cycle after a system short circuit condition is presented to the generator. Therefore, it is used to determine the necessary interrupting capacity of the engine-generator circuit interrupting device. It also is utilized to predict generator response to non-linear loads. Typical values for generator sub-transient reactance are found in IEEE Standard 141. Sub-transient reactance is specified in per unit of the generator rated kVA. Also, see the following discussion on non-linear loads.

Non-linear Loads: Non-linear loads are addressed in IEEE 519. They are loads that draw a non-sinusoidal current waveform when supplied by a sinusoidal voltage source. Typical non-linear loads include solid state switching power supplies, computer power supplies (including those found in desktop PC's, uninterruptible power supplies, variable frequency drives, radar power supplies, and solid state ballasts in fluorescent light fixtures. They cause distortion of the source voltage and current waveforms that can have harmful effects on many types of electrical equipment and electronics, including generators. Non-linear loads are similar to short circuits in that they provide momentary, sub-cycle-duration, short-circuiting of two phases. Switching power supplies consist of SCR/thyristor-controlled rectifier bridges which act as three single-phase loads, each connected across two phases of the power system. When the SCR/thyristors are switched on and off a notch in the voltage waveform will occur as a result of an instantaneous phase-phase short-circuit during the commutation of current. A low generator sub-transient reactance minimizes the voltage waveform distortion in the presence of such loads. For this reason when the non-linear loads comprise 25 percent or more of the loads served, the generator sub-transient reactance should be limited to no more than 0.12. Delete Sub-transient Reactance from the Engine-Generator Parameter Schedule where the engine-generator manufacturer is responsible for sizing the generator breaker and where the non-linear loads served are less than 25 percent.

Generators are particularly vulnerable to control problems and instability, excessive winding heating, neutral overheating, reduced efficiency, reduced torque, shaft fatigue, accelerated aging, and induced mechanical oscillations when non-linear loads are applied without careful consideration of the generator's capability to supply them. Measures which can be used to mitigate the effects of non-linear loads on generators include: procurement of low impedance generators with special windings to compensate for the additional heating; installation of harmonic filter traps; avoidance of self-excited
generators; use of 2/3 pitch factor (rather than 5/6 pitch) generator windings; and generator derating with oversized neutrals.

For large non-linear loads, filter traps which are tuned to the dominant harmonic frequencies of the non-linear loads should be procured/provided with the load component. This approach is normally less costly than procurement of specially designed or de-rated generators.

For combinations of linear and non-linear loads where the percentage of non-linear loads is small relative to the capacity rating of the generator (25 percent or less), standard generator configurations are normally acceptable.

Provide a list of the non-linear loads in the parameter schedule, either on the drawings (and denoted on the single-line diagram) or in tabular form in the specification section. The list should contain a description of the load including equipment type, whether the rectifier is 6-pulse or 12-pulse, kVA rating, and frequency. Provide a linear load value (kVA at PF) which represents the maximum linear load demand when non-linear loads will also be in use. The generator manufacturer will be required to meet the total harmonic distortion limits established in IEEE 519. Delete the non-linear load paragraph when non-linear loads are not served from the engine-generator set.

Maximum Step Load Increase. Maximum step load increase is used to account for the addition of block loads. These affect engine-generator set frequency and voltage output and usually initiate governor and regulator response. The change in engine-generator set output and the response of the governor and regulator defines the transient loading response. In the size range covered by this specification (and for standby applications) acquisition of full load in one step is typical for major engine-generator manufacturers (voltage deviation of 30 percent or less, frequency deviation of plus 5 percent, recovery time 3 to 5 seconds, typical). If the application requires a more stringent response, specify the actual maximum step load and add the allowable deviations and recovery times to the Engine Generator Set Parameter Schedule. If it is critical enough to add these requirements, also add the Transient Response Test to verify the results in the field. It should be noted that this adds significant cost to the cost of an engine-generator. The designer should provide the actual loads to be applied to the engine-generator set because specification of maximum step load increases of 75 or 100 percent requires significant oversizing of engines and generators and/or addition of mass to fly-wheel, all
of which add cost. Additionally, oversizing of engines causes maintenance problems and increases operating costs. The following percentages may be used when the actual load acquisition rate cannot be determined. A maximum step load increase of 25 percent should be used for prime rated sets, 50 percent for optional standby rated sets with step loading, and 100 percent for legally required standby (emergency) service with no step loading.

Transient Response Criteria (short time duration). Engine-generator-set response and recovery times vary according to the size of the set, the block load, and the controls specified. Normal response to addition of a block load will include dips in either output voltage or frequency or both and possible "overshoot" as the governor and voltage regulator respond to bring the voltage and frequency back within bandwidth. Normal response to loss of a block load will include an upward spike in output voltage or frequency back within bandwidth. The Maximum Voltage and Frequency Deviation apply to under-voltage / under-frequency ("dips") from the addition of block loads and any undershoot resulting from the recovery of an upward spike, as well as overvoltage / over-frequency (upward spikes) from the loss of block loads and any overshoot resulting from the recovery of a dip.

Cost Impact. If stringent transient-response requirements are specified, the manufacturer may select engine and generator models which have nominal rating much larger than the service load; may use an unnecessarily expensive governor; and may use a higher inertia flywheel. The designer should investigate what may actually be provided so that the cost estimate will be reasonably accurate and to confirm the selected transient requirements are not unnecessarily stringent. A maximum size for the engine-generator set may be needed to avoid the problems associated with a small load on a large capacity set.

The designer must determine the cost benefits of providing an uninterruptible power system for transient ride-through versus purchasing a generator with stringent transient response requirements. In determining the allowable voltage and frequency variation and recovery times, analyze the effects on equipment performance and recovery. Consult the NEMA utilization equipment standards to determine the maximum allowable voltage dips/overshoots (excursions).

Maximum Voltage Deviation. Select the 5 percent Maximum Voltage Deviation option only if communication equipment or other sensitive electronic equipment are a critical part of the load, and there is no UPS provided. Fluorescent
lights can tolerate a maximum of 10 percent voltage variation. NEMA induction motors and control relays can tolerate a maximum of 10 percent variation, for 30 cycles and one cycle respectively. Solenoids (brakes, valves, clutches) and ac and dc starter coils can tolerate a maximum of minus 30 percent variation, for 1/2 cycle, 2 cycles (dropout), and 5 - 10 cycles (dropout) respectively. (The times listed in cycles are not given to define the recovery time back to bandwidth, but to assist the designer in defining the maximum allowable voltage deviation.) The designer should realistically assess the need for limiting the transient voltage dip to less than 30 percent.

Maximum Frequency Deviation. Computers can usually tolerate only plus or minus 0.5 Hz variation, so an UPS is normally required where computer services should not be interrupted, or where system recovery times are critical. Inverters can tolerate plus or minus 2 Hz variation. NEMA induction motors and control relays can tolerate a maximum of 5 percent frequency variation. (The times listed in cycles are not given to define the recovery time back to bandwidth, but to assist the designer in defining the maximum allowable frequency deviation.) The designer must be realistic in assessing the needs of the facility to be served so that unnecessarily stringent requirements are not specified.

Maximum Frequency Deviation [2.5] [5] [_____] with Step Load Increase frequency.

Recovery Time Back to Bandwidth. The designer should determine the required recovery time for the loads served. The recovery time to bandwidth is not critical to operation of most equipment if the voltage and frequency do not deviate from the critical limits, or if momentary interruption is acceptable to the loads being served. The primary importance of this requirement is to ensure that the engine generator set recovers and stabilizes after load changes. Most engine generator sets can respond to 100 percent block loads and return to voltage and frequency bandwidths within 15 - 20 seconds, depending on the size of the machine (RPM, relative mass of the rotating elements, and ambient conditions).

Transient Recover Time [_____] seconds with Step Load Increase (Voltage).

Transient Recovery Time [_____] seconds with Step Load Increase (Frequency).

Maximum Step Load Decrease (without shutdown). An
engine generator set should be capable of being unloaded in a single step without tripping offline. In these situations the voltage and frequency transients are of no concern because there is no load being served.

Nominal Step Load Decrease. Step load decrease is used to account for dropping of block loads. This affects engine-generator set frequency and voltage output and usually initiates governor and regulator response. The change in engine-generator set output and the response of the governor and regulator defines the transient loading response. Where the load served may be sensitive to voltage and frequency variation due to significant load decrease, include the items below in the Parameter Schedule. The Nominal Step Load Decrease provides the engine-generator manufacturer with the information necessary to set the governor response for load decreases such than an over-speed (over-frequency) condition does not occur. The cost of engine-generator sets increase by large percentages for smaller frequency and voltage deviations from bandwidth and improved recover times. Carefully analyze the user's need for restrictions on frequency, voltage, and waveform characteristics. If required, add the following to the Engine Generator Set Parameter Schedule and also add the Transient Response Test to verify the results in the field.

Nominal Step Load [25] [50] [75] Decrease at [_____] PF percent of Service Load.

Transient Recovery Time [_____] seconds with Step Load Decrease (Voltage).

Transient Recovery Time [_____] seconds with Step Load Decrease (Frequency).

Maximum Frequency Deviation [2.5] [5] [_____] with Step load Decrease percent of rated frequency.

Maximum Time To Start and Assume Load. Choose 10 seconds for emergency-standby applications (critical for life safety). NFPA 70 requires that standby engine-generator sets used in emergency applications start and assume load in 10 seconds. Most commercially available engine generator sets are capable of starting and assuming load within 10 seconds, however, a default value of 20 seconds is non-restrictive and provides a reasonable maximum value for non-critical applications.

Temperature Management. The designer is responsible for temperature control in the space occupied by the
engine generator set. However, because the engine-generator supplier normally provides the engine cooling system (and block heaters where required), the designer must provide ambient conditions under which the engine generator must operate, so that the supplier can size the equipment. Typically, high temperature provides the most restrictive condition, therefore the designer must design air-flow of adequate temperature and sufficient quantity to maintain the temperature of the generator and engine space within acceptable limits. This requires the designer to consult manufacturers' literature and/or representatives to determine the nominal heat rejection to the surroundings at rated gensetengine-generator capacity (from all heat sources) to determine the required cooling or air flow through the engine generator set room or enclosure. In turn the manufacturer must submit the specific operating data in order for the contracting officer/designer to verify that the proposed equipment meets the design parameters.

Brake Mean Effective Pressure (BMEP) Calculations

Calculation must verify that the engine meets the specified maximum BMEP, as follows:

\[
\text{BMEP kPa psi} = \frac{120,000 \times \text{bkW}}{\text{rpm \times liters cu. in.}} \times \frac{792,000 \times \text{bhp}}{\text{liters cu. in.}}
\]

Where:

- \(\text{bkW bhp} = \text{bkW'} + \text{bkW'' bhp'} + \text{bhp''}\)
- \(\text{bkW'' bhp''} = \text{Brake kW horsepower required by engine driven fan for cooling radiator or motor driven fan for cooling radiator.}\)
- \(\text{bkW'} \text{ bhp'} = \text{kW/GEN.EFF. kW/(GEN.EFF. times 0.746)}\)
- \(\text{GEN.EFF.} = \text{Generator efficiency}\)
- \(\text{liters cu. in.} = \text{Total engine piston displacement in liters cubic inches}\)
- \(\text{rpm} = \text{Engine revolutions per minute}\)
- \(\text{kW} = \text{Minimum power rating}\)

Torsional Vibration Stress Analysis Computations
Torsional vibrational stresses in the crankshaft and generator shaft of assembled engine and driven generator must not exceed 34,450 kPa (5000 psi) when engine is driving generator at rated speed while assembled unit is loaded to rated engine-generator set power. Computations must be based on a mathematical model of the assembled generator set provided or based on calculations using measured values from tests on a unit identical to the one provided. Calculations based on models of, or measured data from, the unassembled engine and generator will not be acceptable. Calculations must include:

a. A description of the system relating information pertinent to analysis such as operating speed range and identification plate data.

b. A mass elastic assembly drawing, showing the arrangement of the units in the generator set and dimensions of shafting, including minimum diameters (or section moduli) of shafting in the system.

c. A labeled line diagram of the mass elastic system indicating values of masses, stiffness, equivalent lengths, and equivalent diameters including basic assumptions and definition of terms.

d. Sample computations showing procedures used to obtain resulting stress values.

e. Computations indicating assembled engine-generator speed of 1800 rpm with assembly loaded to rated generator power and the resulting computed critical torsional stress values in the assembled engine crankshaft and generator shaft.

---

**Turbocharger Load Calculations**

NOTE: When the engine-generator set installation includes field installed exhaust system (i.e., the engine-generator set is installed internal to a building in lieu of in a self-contained outdoor enclosure), include the following paragraph.

When the proposed exhaust system layout is different from that shown on the contract drawings, submit calculations showing that the external loads from the exhaust system such as weight and thermal expansion do not exceed the engine manufacturer's maximum allowed forces and moments on the turbocharger.

---

### 2.1.2 Rated Output Capacity

______________________________

NOTE: The service load for each engine-generator should be shown on the Engine-Generator Parameter Schedule. The designer must determine the service load. The Contractor, through the supplier's manufacturer/assembler, determines the efficiency and associated ancillary equipment loads. The
designer must examine spare capacity requirements for spinning reserve.

Provide each engine-generator-set with power equal to the sum of service load plus the machine's efficiency loss and associated ancillary equipment loads. Rated output capacity must also consider engine and/or generator oversizing required to meet requirements in paragraph Engine-Generator Parameter Schedule.

NOTE: Select the appropriate engine-generator set from three manufacturers that suit the intended application based on power rating (kW) and kind of power (i.e., number of operating hours per year and average power output). Using the specified kW and the total engine piston displacement per the selected engine-generator sets catalog data, calculate the BMEP to be specified in accordance with the paragraph CALCULATIONS FOR BMEP. A value of 0.9 may be used for generator efficiency.

The engine must meet the specified maximum BMEP requirements at rated speed as calculated in accordance with the calculations in the engine-generator parameter schedule. The engine capacity must be based on the following:

NOTE: Contact the activity to find out fuel type to be used.

a. Engine burning diesel fuel conforming to [MIL-DTL-16884] [ASTM D975, Grade 2-D], or [MIL-DTL-5624, Grade JP-5] at an ambient temperature of 29 degrees C 85 degrees F. For stationary engines operated in the United States, diesel fuel requirements are found in 40 CFR 60 Subpart IIII.

b. Engine cooled by a radiator fan mechanically driven by the engine or remote with a motor driven fan.

c. Engine cooled by coolant mixture of water and ethylene glycol, 50 percent by volume of each.

</tbody>
</table>

2.1.2.1 Engine Emission Limits

NOTE: Include the following paragraph when an air pollution permit is required by local, state, or federal law to install and operate the engine.
generator set. Contact the engine-generator set manufacturer for achievable limits. Contact the activities environmental department representative to determine permit requirements.

**************************************************************************

Engine must be certified by the manufacturer to meet applicable EPA emission standards found in 40 CFR 60 Subpart III. In addition, engine must meet any applicable state or local emission requirements (ex: California SCAQMD).

2.1.2.2 Performance Class

**************************************************************************

NOTE: See the following guidelines and table for selecting the appropriate performance class:

1. Select Class G1 where the connected loads are such that only basic parameters of voltage and frequency are needed, e.g., general purpose lighting and other simple electrical loads.

2. Select Class G2 where the demands on voltage characteristics are very much the same as for the commercial power system, e.g., lighting systems, pumps, fans, hoists.

3. Select Class G3 where the connected equipment may make severe demands on frequency, voltage, and waveform characteristics, e.g., telecommunications as thyristor-controlled loads.

4. Select Class G4 where the demands on the frequency, voltage, and waveform characteristics are exceptionally severe, e.g., data processing equipment or computer systems. Performance values for Class G4 must be determined by the designer and an appropriate table similar to the following table must be inserted into the Specification.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Performance Class</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>G1</td>
</tr>
<tr>
<td>100 Percent Load Increase Frequency Deviation (Percent)</td>
<td>less than minus 15</td>
</tr>
<tr>
<td>100 Percent Load Decrease Frequency Deviation (Percent)</td>
<td>less than plus 18</td>
</tr>
<tr>
<td>100 Percent Load Change Frequency Recovery Time (Seconds)</td>
<td>less than 10</td>
</tr>
</tbody>
</table>
### 2.1.3 Power Ratings

Power ratings must be in accordance with [EGSA 101P](#).

### 2.1.4 Transient Response

The engine-generator set governor and voltage regulator must cause the engine-generator set to respond to the maximum step load changes such that output voltage and frequency recover to and stabilize within the operational bandwidth within the transient recovery time. The engine-generator set must respond to maximum step load changes such that the maximum voltage and frequency deviations from bandwidth are not exceeded.

### 2.1.5 Reliability and Durability

*NOTE: Mean time between overhauls describes the average number of operating hours that the engine will operate satisfactorily without overhaul. Overhaul is a natural consequence of the engine in operation due to worn out parts after the indicated operating hours.*

*Provide prime engine-generator sets that have both an engine and a generator capable of delivering the specified power on a prime basis with an anticipated mean time between overhauls of not less than 10,000 hours operating with a 70 percent load factor. Cite two like engines and two*
like generators that have performed satisfactorily in a stationary power plant, independent from the physical location of the manufacturer's and assembler's facilities. The engine and generators should have been in operation for a minimum of 8000 actual hours at a minimum load of 70 percent of the rated output capacity. During two consecutive years of service, the units should not have experienced any failure resulting in a downtime in excess of 72 hours. Provide engines that are the same model, speed, bore, stroke, number and configuration of cylinders and rated output capacity. Provide generators that are the same model, speed, pitch, cooling, exciter, voltage regulator and rated output capacity. Provide engines that are the same model, speed, bore, stroke, number and configuration of cylinders, and rated output capacity. Provide engines that are the same model, speed, pitch, cooling, exciter, voltage regulator and rated output capacity.

Each standby engine-generator set must have both an engine and a generator capable of delivering the specified power on a standby basis with an anticipated mean time between overhauls of no less than 5,000 hours operating with a load factor of 70 percent. Cite two like engines and two like generators that have performed satisfactorily in a stationary power plant, independent and separate from the physical location of the manufacturer's and assembler's facilities, for standby without any failure to start, including all periodic exercise. Provide like engines and generators that have had no failures resulting in downtime for repairs in excess of 72 hours during two consecutive years of service. Provide engines that are the same model, speed, bore, stroke, number and configuration of cylinders, and rated output capacity. Provide generators that are the same model, speed, pitch, cooling, exciter, voltage regulator and rated output capacity.

Submit a reliability and durability certification letter from the manufacturer and assembler to prove that existing facilities are and have been successfully utilizing the same components proposed to meet this specification, in similar service. Certification may be based on components, i.e. engines used with different models of generators and generators used with different engines, and does not exclude annual technological improvements made by a manufacturer in the basic standard-model component on which experience was obtained, provided parts interchangeability has not been substantially affected and the current standard model meets the performance requirements specified. Provide a list with the name of the installations, completion dates, and name and telephone number of a point of contact.

2.1.6 Parallel Operation

**********************************************************************
NOTE: Specification of an engine-generator set capable of parallel operation with a utility requires a 2/3 pitch generator winding and special coordination of protective devices with the utility system protection scheme. Do not specify this option without also providing a design for the protective device coordination which has been approved by the utility involved.

**********************************************************************

Configure each engine-generator set specified for parallel operation for [automatic] [manual] parallel operation. Each set must be capable of parallel operation with [a commercial power source on an infinite bus] [one or more sets on an isolated bus] [a commercial power source on an infinite bus and with one or more sets on an isolated bus].
2.1.7 Load Sharing

Configure each engine-generator set specified for parallel operation to [manually load share with other sets.] [automatically load share with other sets by proportional loading. Proportional loading must load each set to within 5 percent of its fair share. A set's fair share is its nameplate-rated capacity times the total load, divided by the sum of all nameplate-rated capacities of on-line sets. Incorporate both the real and reactive components of the load.]

2.1.8 Engine-Generator Set Enclosure

Provide engine-generator set enclosures that are corrosion resistant and fully weather resistant. The enclosure must contain all set components and provide ventilation to permit operation at Service Load under secured conditions. Provide access doors to controls and equipment requiring periodic maintenance or adjustment. Provide removable panels for access to components requiring periodic replacement. The enclosure must be capable of being removed without disassembly of the engine-generator set or removal of components other than the exhaust system. The enclosure must reduce the noise of the generator set to within the limits specified in the paragraph SOUND LIMITATIONS.

2.1.9 Vibration Isolation

Vibration isolation systems should be applied where vibration transmitted through the genset support structure produces (either directly or by resonant frequencies of structural members) annoying or damaging vibration in the surrounding environment. Select the manufacturer's standard or provide the maximum allowable vibration force where necessary to...
limit the maximum vibration. Delete the vibration isolation requirement for applications where vibration does not affect the floor or foundation.

[Install a vibration isolation system between the floor and the base. The vibration isolation system must limit the maximum vibration transmitted to the floor at all frequencies to a maximum of [_____] (peak force).]

[Provide an engine-generator set with a vibration isolation system in accordance with the manufacturer's standard recommendation.] Submit vibration isolation system performance data for the range of frequencies generated by the engine-generator set during operation from no load to full load and the maximum vibration transmitted to the floor plus description of seismic qualification of the engine-generator mounting, base, and vibration isolation. Submit torsional analysis including prototype testing or and calculations which certify and demonstrate that no damaging or dangerous torsional vibrations will occur when the prime mover is connected to the generator, at synchronous speeds, plus 10 percent. Design and qualify vibration isolation systems as an integral part of the base and mounting system in accordance with the seismic parameters specified. Where the vibration isolation system does not secure the base to the structure floor or unit foundation, provide seismic restraints in accordance with the seismic parameters specified.

2.1.10 Harmonic Requirements

NOTE: Coordinate with paragraph ENGINE-GENERATOR PARAMETER SCHEDULE.

Non-linear loads to be served by each engine-generator set are as indicated. The maximum linear load demand (kVA at PF) when non-linear loads will also be in use is as indicated.

2.1.11 Starting Time Requirements

Upon receipt of a signal to start, each engine generator set will start, reach rated frequency and voltage and be ready to assume load within the time specified. For standby sets used in emergency power applications, each engine generator set will start, reach rated frequency and voltage, and power will be supplied to the load terminals of the automatic transfer switch within the starting time specified.

2.2 NAMEPLATES

NOTE: Delete any equipment not applicable to the project.

Provide the manufacturer's name, type or style, model or serial number and rating on a plate secured to the equipment for each major component of this specification. Provide plates and tags sized so that inscription is readily legible to operating or maintenance personnel and securely mounted to or attached in proximity of their identified controls or equipment. Lettering must be normal block lettering, a minimum of 6.4 mm0.25 inch high. As a minimum, provide nameplates for:
Engines
Generators
Regulators
Pumps and pump motors
Generator Breaker
Economizers

Relays
Transformers (CT & PT)
Day tanks
Governors
Heat exchangers (other than base mounted)

Where the following equipment is not provided as a standard component by the engine generator set manufacturer, the nameplate information may be provided in the maintenance manual in lieu of nameplates.

Battery charger
Switchboards
Battery

Heaters
Exhaust mufflers
Silencers
Exciters

2.2.1 Materials

Construct ID plates and tags of 16 gage minimum thickness bronze or stainless steel sheet metal engraved or stamped with inscription. Construct plates and tags not exposed to the weather or high operational temperature of the engine of laminated plastic, 3.2 mm 0.125 inch thick, matte white finish with black center core, with lettering accurately aligned and engraved into the core.

2.2.2 Control Devices and Operation Indicators

Provide ID plates or tags for control devices and operation indicators, including valves, off-on switches, visual alarm annunciators, gages and thermometers, that are required for operation and maintenance of provided mechanical systems. Plates or tags must be minimum of 13 mm 0.5 inch high and 50 mm2 inches long and must indicate component system and component function.

2.2.3 Equipment

Provide ID plates of a minimum size of 75 mm 3 inches high and 130 mm 5 inches long on provided equipment indicating the following information:

a. Manufacturer's name, address, type and model number, serial number, and certificate of compliance with applicable EPA mission standards;

b. Contract number and accepted date;

c. Capacity or size;

d. System in which installed; and
2.3 **SAFETY DEVICES**

Exposed moving parts, parts that produce high operating temperatures, parts which may be electrically energized, and parts that may be a hazard to operating personnel must be insulated, fully enclosed, guarded, or fitted with other types of safety devices. Install safety devices such that proper operation of the equipment is not impaired.

2.4 **MATERIALS AND EQUIPMENT**

Submit certification stating that where materials or equipment are specified to comply with requirements of UL, written proof of such compliance has been obtained. The label or listing of the specified agency, or a written certificate from an approved, nationally recognized testing organization equipped to perform such services, stating that the items have been tested and conform to the requirements and testing methods of the specified agency are acceptable as proof.

2.4.1 **Circuit Breakers, Low Voltage**

*UL 489.*

2.4.2 **Filter Elements**

Provide the manufacturer's standard fuel-oil, lubricating-oil, and combustion-air filter elements.

2.4.3 **Instrument Transformers**

*NEMA/ANSI C12.11.*

2.4.4 **Revenue Metering**

*IEEE C57.13.*

2.4.5 **Pipe (Fuel/Lube-Oil, Compressed Air, Coolant, and Exhaust)**

*ASTM A53/A53M,* or *ASTM A106/A106M* steel pipe. Pipe smaller than 50 mm 2 inches must be Schedule 80. Pipe 50 mm 2 inches and larger must be Schedule 40.

2.4.5.1 **Flanges and Flanged Fittings**

*ASTM A181/A181M,* Class 60, or *ASME B16.5,* Grade 1, Class 150.

2.4.5.2 **Pipe Welding Fittings**

*ASTM A234/A234M,* Grade WPB or WPC, Class 150 or *ASME B16.11,* 1360.7 kg 3000 lb.

2.4.5.3 **Threaded Fittings**

*ASME B16.3,* Class 150.

2.4.5.4 **Valves**

*MSS SP-80,* Class 150.
2.4.5.5 Gaskets

Manufacturer's standard.

2.4.6 Pipe Hangers

MSS SP-58.

2.4.7 Electrical Enclosures

NEMA ICS 6.

2.4.7.1 Switchboards

NEMA PB 2.

2.4.7.2 Panelboards

NEMA PB 1.

2.4.8 Electric Motors

Provide electric motors that conform to the requirements of NEMA MG 1. Motors must have sealed ball bearings and a maximum speed of 1800 rpm. Motors used indoors must have drip-proof frames; enclose those that are used outside. Alternating current motors larger than 373 W 1/2 Hp must be of the squirrel-cage induction type for operation on 200 volts or higher, [50] [60] Hz, and three-phase power. Alternating current motors 373 W 1/2 Hp or smaller, must be suitable for operation on 120 volts, [50] [60] Hz, and single-phase power. Direct current motors must be suitable for operation on [125] [___] volts.

2.4.9 Motor Controllers

Provide motor controllers and starters that conform to the requirements of NFPA 70 and NEMA ICS 2.

2.5 ENGINE

********************************************************************************

NOTE: Specify fuel type.

If units are required to operate on more than one fuel the designer must edit the components, performance requirements, and testing requirements of this specification to define the requirements for the fuels specified. If full performance is required for the weakest or poorest burning fuels, then the units will be overrated for other fuels.

********************************************************************************

Each engine must operate on [No. 2-D diesel fuel][_____] conforming to [ASTM D975][____], must be designed for stationary applications and must be complete with ancillaries. The engine must be a standard production model shown in the manufacturer's catalog describing and depicting each engine-generator set and all ancillary equipment in sufficient detail to demonstrate complete specification compliance. The engine must be naturally aspirated, supercharged, or turbocharged. The engine must be 2-
or 4-stroke-cycle and compression-ignition type. The engine must be vertical in-line, V- or opposed-piston type, with a solid cast block or individually cast cylinders. The engine must have a minimum of two cylinders. Opposed-piston type engines must have more than four cylinders. Each block must have a coolant drain port. Equip each engine with an over-speed sensor.

ISO 3046. Diesel engines must be four-cycle naturally aspirated, or turbocharged, or turbocharged and intercooled; vertical in-line or vertical Vee type; designed for stationary service. Engines must be capable of immediate acceleration from rest to normal speed without intermediate idle/warm up period or pre-lubrication to provide essential electrical power. Two-cycle engines are not acceptable.

2.5.1 Sub-base Mounting

Mount each engine-generator set on a structural steel sub-base sized to support the engine, generator, and necessary accessories, auxiliaries and control equipment to produce a complete self-contained unit as standard with the manufacturer. Design the structural sub-base to properly support the equipment and maintain proper alignment of the engine-generator set in the specified seismic zone. In addition, provide sub-base with both lifting rings and jacking pads properly located to facilitate shipping and installation of the unit. Factory align engine and generator on the sub-base and securely bolt into place in accordance with the manufacturer's standard practice. Crankshaft must have rigid coupling for connection to the generator.

2.5.2 Assembly

Completely shop assemble each engine-generator set on its structural steel sub-base. Paint entire unit with manufacturer's standard paints and colors. After factory tests and before shipping, thoroughly clean and retouch painting as necessary to provide complete protection.

2.5.3 Turbocharger

If required by the manufacturer to meet the engine-generator set rating, provide turbine type driven by exhaust gas from engine cylinders, and direct connected to the blower supplying air to the engine intake manifold.

2.5.4 Intercooler

Provide manufacturer's standard intercooler for engine size specified.

2.5.5 Crankcase Protection

**************************************************************************

NOTE: Include details on the drawings for the crankcase ventilation piping and associated penetrations through walls and roofs showing the piping sleeve and exterior flashing when the radiator is remote and the engine-generator set is to be installed inside a building. Provide manufacturer's standard method of preventing crankcase explosions and standard method of crankcase ventilation.[ Provide ventilation of crankcase via piping to the atmosphere as indicated on the drawings.]

SECTION 26 32 15.00 Page 48
2.5.6 Miscellaneous Engine Accessories

Provide the following engine accessories where the manufacturer's standard design permits:

a. Piping on engine to inlet and outlet connections, including nonstandard companion flanges.

b. Structural steel sub-base and vibration isolators, foundation bolts, nuts, and pipe sleeves.

c. Level jack screws or shims, as required.

d. Rails, chocks, and shims for installation of sub-base on the foundation.

e. Removable guard, around fan. Support guard, on engine sub-base, to suit manufacturer's standard.

2.5.7 Intercooler

Provide manufacturer's standard intercooler for engine size specified.

2.6 FUEL SYSTEM

Provide fuel system conforming to the requirements of NFPA 30 and NFPA 37 and containing the following elements.

*********************************************************
NOTE: The selection of a gas-fueled (natural or LP) over diesel-fueled engine-generator has significant impact depending on the load characteristics and application. The following general differences between gas and diesel fuels, and their use in engine-generator applications, should be considered:
*********************************************************

<table>
<thead>
<tr>
<th>Characteristic</th>
<th>Gas</th>
<th>Diesel</th>
</tr>
</thead>
<tbody>
<tr>
<td>Economy</td>
<td>Lower initial cost, but higher long-term costs, due to more maintenance and shorter installed life</td>
<td>Higher initial cost, but lower long-term costs, due to less maintenance and longer installed life</td>
</tr>
<tr>
<td>Availability</td>
<td>Non-renewable but available worldwide</td>
<td>Non-renewable, less available than gas</td>
</tr>
<tr>
<td>Environmental Emissions</td>
<td>No significant ground pollution, soot or sulfur dioxide emissions, lower CO2 emissions than diesel. Lean burn mode lowers emissions from traditional gas.</td>
<td>Higher viscosity, spills cause ground pollution, must meet EPA Tier 4 standards, except for emergency standby application.</td>
</tr>
<tr>
<td>Noise</td>
<td>Quieter</td>
<td>Louder, requires muffling and noise insulation</td>
</tr>
<tr>
<td>-------------</td>
<td>---------------------------------------------</td>
<td>----------------------------------------------</td>
</tr>
<tr>
<td>Step Loading</td>
<td>Step loading and unloading limited to 25-40 percent of load rating</td>
<td>Step loading and unloading not limited</td>
</tr>
<tr>
<td>Running Load</td>
<td>Less problems with light loading, due to higher burn temperature</td>
<td>Optimal loading 50-70 percent rated, light loading causes &quot;wet stacking&quot;, increasing buildup in exhaust</td>
</tr>
<tr>
<td>Startup Time</td>
<td>Typ. more than 10 seconds, from startup to ready to assume load</td>
<td>Typ. 10 seconds or less, from startup to ready to assume load</td>
</tr>
<tr>
<td>Sizing</td>
<td>Typ. same as diesel, but sometimes oversized to compensate for step loading</td>
<td>Sized to match existing load, plus anticipated future load growth</td>
</tr>
<tr>
<td>Safety</td>
<td>Extremely flammable, any leaks can be catastrophic</td>
<td>Less flammable, but water contamination during storage of fuel can cause engine damage</td>
</tr>
</tbody>
</table>

2.6.1 Pumps

**NOTE:** Delete this paragraph when remote fuel transfer pump(s) are provided. Select duplex pumps for facilities complying with UFC 4-510-01, "Design: Medical Military Facilities."

Fuel transfer pumps may be mounted on the day tank. Pump[s] must be [duplex,] horizontal, positive displacement. Direct-connect pump to motor through a flexible coupling. Equip each pump with a bypass relief valve, if not provided with an internal relief valve. Provide motor and controller in accordance with the paragraphs ELECTRIC MOTORS and MOTOR CONTROLLERS, respectively.

2.6.1.1 Main Pump

Provide engines with an engine driven pump. The pump must supply fuel at a minimum rate sufficient to provide the amount of fuel required to meet the performance indicated within the parameter schedule. Base the fuel flow rate on meeting the load requirements and all necessary recirculation.

2.6.1.2 Auxiliary Fuel Pump

**NOTE:** The auxiliary fuel pump is required to support the main pump if the length of pipe from the day tank to the main pump is greater than the value
recommended by the engine manufacturer. This value may be approximately 12 m 40 feet; however, engine manufacturers should be consulted during design to verify the pumping requirements.

**************************************************************************

Provide auxiliary fuel pumps to maintain the required engine fuel pressure, if either required by the installation or indicated on the drawings. The auxiliary pump must be driven by a dc electric motor powered by the starting/station batteries. Automatically actuate the auxiliary pump by a pressure-detecting device.

2.6.2 Fuel Filter

Provide a minimum of one full-flow fuel filter for each engine. The filter must be readily accessible and capable of being changed without disconnecting the piping or disturbing other components. Mark the inlet and outlet connections of the filter.

**************************************************************************

NOTE: Select the options for duplex filters when changing of the filter will be required while the engine-generator set is operating. Do not provide duplex filters when the engine-generator set is to be installed in an enclosure or provided with an engine-driven radiator.

**************************************************************************

Provide intake filter assemblies for each engine of the oil bath or dry type, as standard with the manufacturer. Filters must be capable of removing a minimum of 92 percent of dirt and abrasive 3 microns and larger from intake air. Size filters to suit engine requirements at 100 percent of rated full load. Design unit for field access for maintenance purposes.

2.6.3 Relief/Bypass Valve

Provide a relief/bypass valve to regulate pressure in the fuel supply line, return excess fuel to a return line and prevent the build-up of excessive pressure in the fuel system.

2.6.4 Integral Main Fuel Storage Tank

**************************************************************************

NOTE: Delete this paragraph if an integral main fuel storage tank is not desired.

An integral main fuel storage tank will be the only fuel source for the engine. These tanks may be useful for applications that require a minimal fuel storage capacity.

Due to the minimal storage capacity, integral main fuel storage tanks are not practical for prime power usage. They are also not practical for standby units that require large fuel quantities. The designer should consider the availability and anticipated frequency of fuel truck deliveries when deciding whether or not to use an integral main fuel storage tank. These tanks should also not be used in
locations where a truck fueling hose can not reach the generator set.

See NFPA 99 and NFPA 110 for guidance on fuel tank sizes.

See NFPA 37 restrictions on allowable tank sizes and enclosures. Integral tanks allow for 1 to 8 hours of operation depending on generator size and configuration. Consult generator set manufacturer for the proper hours of operation for the application of integral tanks. Standby applications for use with fire pumps will have tanks sized for 8 hours duration. The tank can be sized by the designer or the Contractor. The size of the tank should be based on a fuel flow rate that is equal to the value of a typical engine manufacturer for the indicated engine generator size. A value of 200 percent of the expected fuel consumption of the engine is not unusual for the flow rate of the main fuel pump. Since the excess fuel will be returned to the tank, the designer should consider the impact of heat buildup when sizing the tank. If a fuel oil cooler is not used, the day tank size may need to be increased to properly dissipate the heat absorbed by the fuel.

**************************************************************************

Provide each engine with an integral main fuel tank. Each tank must be factory installed and provided as an integral part of the generator manufacturer's product. Provide each tank with connections for fuel supply line, fuel return line, local fuel fill port, gauge, vent line, and float switch assembly. Provide a fuel return line cooler as recommended by the manufacturer and assembler. The temperature of the fuel returning to the tank must be below the flash point of the fuel. Mount the tank within the enclosure for each engine-generator set provided with weatherproof enclosures. The fuel fill line must be accessible without opening the enclosure.

**************************************************************************

NOTE: Use the following guidelines for specifying fuel integral base tanks:

1. Select integral base tank in skid where applicable and available. Tank capacity available varies from 100 gallons to 5,000 gallons.

2. See NFPA 37 for allowable tank sizes and restrictions.

3. Provide an overflow or return line between the fuel day tank and storage tank in accordance with NFPA 37 if the generator is equipped with both an external supply tank and a day tank.

4. Tank capacity must be in accordance with the following table for facilities complying with MIL-HDBK-1191, "DOD Medical and Dental Treatment Facilities Design and Construction Guide."
UFGS

50 KW - 100 KW GEN SET: 25 MIN - 50 MAX GAL
101 KW - 200 KW GEN SET: 50 MIN - 75 MAX GAL
201 KW - 300 KW GEN SET: 75 MIN - 100 MAX GAL
OVER 300 KW GEN SET: 100 MIN - 250 MAX GAL

**************************************************************************

a. All Tanks: UL 142. Provide [integral in skid] [free standing] double wall (110 percent containment) fuel tanks with a [minimum capacity of [_____] hours of engine-generator set operation at full-rated load] [capacity as indicated]. Epoxy coat day tanks inside and prime and paint outside. Construct tanks of not less than 4.76 mm 3/16 inch steel plate with welded joints and necessary stiffeners on exterior of tank. Provide a braced structural steel framework support. Weld tank top tight. Provide 114 mm 4 1/2 inch square inspection port with a 2 inch NPT fill connection and spill box. Provide proper normal and emergency venting for the primary tank and emergency venting only for the secondary tank / containment basin in accordance with UL 142 requirements.[ Provide an overflow or return line between the fuel day tank and storage tank in accordance with NFPA 37.]

b. Float Switches for Day Tanks: Provide tank-top mounted or external float cage, single-pole, single-throw type designed for use on fuel oil tanks. Arrange high level float switches to close on rise of liquid level, and low level float switches to close on fall of liquid level. Mount float cage units with isolating and drain valves. Contacts must be suitable for the station battery voltage.

   (1) Critical low level float switch which must activate at 5 percent of normal liquid level must shut engine off.

   (2) Low-low level float switch which must activate alarm at 30 percent of normal liquid level.

   (3) Low level float switch which must open the fuel oil solenoid valve and start the [remote] fuel transfer pump at 75 percent of normal liquid level.

   (4) High level float switch which must close the fuel oil solenoid valve and stop the [remote] fuel transfer pump at 90 percent of normal liquid level.

   (5) Critical high level float switch which must activate alarm at 95 percent of normal liquid level.

c. Leak Detector Switch for All Tanks: Actuates when fuel is detected in containment basin, stops fuel transfer pump, and closes the fuel oil solenoid valve.

d. Control Panel for All Tanks: Provide NEMA ICS 6, Type [1] [____:], enclosed control panel for each day tank. Control panel must include the following accessories.

   (1) Power available LED (green).

   (2) Critical low fuel alarm contacts for shut down of engine.

   (3) Low-low level fuel alarm LED.
(4) Low-low level fuel alarm contacts for remote annunciator.

(5) Critical high level fuel alarm LED.

(6) Leak detecting alarm LED.

(7) Alarm horn.

e. Tank Gages for All Tanks: Provide buoyant force type gages for fuel tanks with dial indicator not less than 100 mm 4 inches in size and arranged for top mounting. Calibrate each reading dial or scale for its specific tank to read from empty to full, with intermediate points of 1/4, 1/2, and 3/4.

f. Integral Base Tanks Used as Primary Tank: Provide a 2 inch opening at the tank fill port, fitted an overfill prevention valve (OPV). Additionally, the fill opening must be perpendicular to the tank in order to allow operation of the OPV. Integral base tank must be sized and configured such that the filling and venting nozzles are outside the generator cabinet for ease of accessibility, inspection, and maintenance. Level gage must be in the line of sight from the fill port.

g. Integral Base Tanks Located Inside Buildings. The tank vents must discharge outside the building in accordance with NFPA 30 and NFPA 37. The fill pipe must terminate outside the building. The fill pipe connection point must be housed in a sealed spill box. High level alarms or level gauges used as overfill protection mechanisms must annunciate at the fill connection point. Provide an overfill prevention valve (OPV) at the tank with a check valve mounted on the fill line in the spill box. The fill connection point must be labeled with tank contents and capacity.

h. External tanks (all non-integral base tanks) are specified in Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.

2.6.4.1 Fuel Transfer Pump[s]

******************************************************************************************************************************************
NOTE: Delete this paragraph when remote fuel transfer pump(s) are provided. Select duplex pumps for facilities complying with UFC 4-510-01, "Design: Medical Military Facilities."
******************************************************************************************************************************************

Fuel transfer pumps may be mounted on the day tank. Pump[s] must be [duplex,] horizontal, positive displacement. Direct-connect pump to motor through a flexible coupling. Equip each pump with a bypass relief valve, if not provided with an internal relief valve. Provide motor and controller in accordance with the paragraphs ELECTRIC MOTORS and MOTOR CONTROLLERS, respectively.

2.6.4.2 Capacity

Each tank must have capacity [as shown] [to supply fuel to the engine for an uninterrupted [4-hour][_____] period] at 100 percent rated load without being refilled.
2.6.4.3 Local Fuel Fill

Each local fuel fill port on the day tank must have a screw-on cap.

2.6.4.4 Fuel Level Controls

Provide tanks with a float-switch assembly to perform the following functions:

a. Activate the "Low Fuel Level" alarm at 70 percent of the rated tank capacity.

b. Activate the "Overfill Fuel Level" alarm at 95 percent of the rated tank capacity.

2.6.4.5 Arrangement

Integral tanks may allow gravity flow into the engine. Gravity flow tanks and any tank that allows a fuel level above the fuel injectors must have an internal or external factory installed valve located as near as possible to the shell of the tank. The valve must close when the engine is not operating. Provide integral day tanks with any necessary pumps to supply fuel to the engine as recommended by the generator set manufacturer. The fuel supply line from the tank to the manufacturer's standard engine connection must be welded pipe.

2.6.5 Day Tank

**************************************************************************

NOTE: Delete this paragraph if an integral main fuel storage tank is used.

See NFPA 99 and NFPA 110 for guidance on fuel tank sizes.

See NFPA 37 restrictions on allowable day tank sizes and enclosures. Select either self-supporting or integral day tank. Select the first option below for applications where fuel is returned to the day tank. Select the second option below for applications where fuel is returned to the main tank. Integral day tanks allow for 1 to 8 hours of operation. Consult generator set manufacturer for the proper hours of operation for the application of integral day tanks. Standby applications for use with fire pumps will have day tanks sized for 8 hours duration. Select day tank capacity for either prime or standby application. The day tank can be sized by the designer or the Contractor. The size of the day tank should be based on a fuel flow rate that is equal to the value of a typical engine manufacturer for the indicated engine generator size. A value of 200 percent of the expected fuel consumption of the engine is not unusual for the flow rate of the main fuel pump. The excess fuel may be returned to the day tank or main fuel tank. The designer should also consider the impact of heat buildup when sizing the day tank. If a fuel oil cooler is not used or if fuel is returned to the day tank.
tank, the day tank size may need to be increased to properly dissipate the heat absorbed by the fuel.

Provide engine with [a separate self-supporting] [integral] day tank. Submit calculations for the capacity of each day tank, including allowances for recirculated fuel, usable tank capacity, and duration of fuel supply. Provide connections for fuel supply line, [fuel return line, fuel overflow line, local fuel fill port, gauge, vent line, drain line, and float switch assembly for control for each day tank. Provide a fuel return line cooler as recommended by the manufacturer and assembler. The temperature of the fuel returning to the day tank must be below the flash point of the fuel. Install a temperature sensing device in the fuel supply line], [fuel overflow line, local fuel fill port, gauge, vent line, drain line, and float switch assembly for control]. Mount the day tank within the enclosure for each engine-generator set with weatherproof enclosures. The fuel fill line must be accessible without opening the enclosure.

2.6.5.1 Capacity, Prime

Provide day tank with the capacity [as shown] [to supply fuel to the engine for an uninterrupted [8-hour] [_____] period at 100 percent rated load without being refilled, plus any fuel which may be returned to the main fuel storage tank. Submit calculations for the capacity of each day tank, including allowances for recirculated fuel, usable tank capacity, and duration of fuel supply. The calculation of the capacity of each day tank must incorporate the requirement to stop the supply of fuel into the day tank at a "High" level mark of 90 percent of the ultimate volume of the tank].

2.6.5.2 Capacity, Standby

Provide day tank with the capacity [as shown] [to supply fuel to the engine for an uninterrupted [4-hour] [_____] period at 100 percent rated load without being refilled, plus any fuel which may be returned to the main fuel storage tank. Submit calculations for the capacity of each day tank, including allowances for recirculated fuel, usable tank capacity, and duration of fuel supply. The calculation of the capacity of each day tank must incorporate the requirement to stop the supply of fuel into the day tank at 90 percent of the ultimate volume of the tank].

2.6.5.3 Drain Line

Each day tank drain line must be accessible and equipped with a shutoff valve. Arrange self-supporting day tanks to allow drainage into a 305 mm 12 inch tall bucket.

2.6.5.4 Local Fuel Fill

Each local fuel fill port on the day tank must have a screw-on cap.

2.6.5.5 Fuel Level Controls

Provide day tank with a float-switch assembly to perform the following functions:

a. [When the main storage tank is located higher than the day tank, open the solenoid valve located on the fuel supply line entering the day tank and start the supply of fuel into the day tank] [Start the supply
of fuel into the day tank] when the fuel level is at the "Low" level mark, 75 percent of the rated tank capacity.

b. [When the main storage tank is located higher than the day tank, stop the supply of fuel into the day tank and close the solenoid valve located on the fuel supply line entering the day tank]  [Stop the supply of fuel into the day tank] when the fuel level is at 90 percent of the rated tank capacity.

c. Activate the "Overfill Fuel Level" alarm at 95 percent of the rated tank capacity.

d. Activate the "Low Fuel Level" alarm at 70 percent of the rated tank capacity.

e. Activate the automatic fuel supply shut-off valve located on the fill line of the day tank and shut down the fuel pump which supplies fuel to the day tank at 95 percent of the rated tank capacity. Stop the flow of fuel before any fuel can be forced into the fuel overflow line.

2.6.5.6 Fuel Oil Solenoid Valve

UL 429. Provide electric solenoid type control valve for each day tank. Solenoid must be rated for starting battery voltage. Valve body must have a minimum working pressure rating of 1033 kPa 150 psig at 93 degrees C 200 degrees F. Valve must be capable of passing 0 to 0.63 L/s 0 to 10 gpm of fuel oil. Valves must be two-way, direct acting, normally closed (open when energized, closed when de-energized), with stainless steel body and resilient seat material. Solenoid enclosures must be NEMA ICS 6, Type 1. Body connections must be same size as connecting piping. Valve must be in line before the fuel pump.

2.6.5.7 Arrangement

**************************************************************************

NOTE: Select between integral and self-supporting day tanks. Also, select between applications where the main fuel storage tank is located above the day tank and applications where the main fuel storage tank is located below the day tank. The location of all tanks, piping, and valves should also be indicated on the drawings.
**************************************************************************

[Integral day tanks may allow gravity flow into the engine. Provide gravity flow tanks with an internal or external valve located as near as possible to the shell of the tank. The valve must close when the engine is not operating. Provide integral day tanks with any necessary pumps to supply fuel to the engine as recommended by the generator set manufacturer. Arrange the overflow connection and the fuel supply line for integral day tanks which do not rely upon gravity flow so that the highest possible fuel level is below the fuel injectors.]  [Arrange self-supporting day tanks so that the fuel level in the day tank remains above the suction port of the engine driven fuel pump or be provided with a transfer pump to provide fuel to the engine driven pump. Arrange the overflow connection and fuel supply line so that the highest possible fuel level is below the fuel injectors.]  [When the main fuel storage tanks are located below the day tank, provide a check valve in the fuel supply line entering the day tank.]  [When the main fuel storage tanks are located above the day tank,
install a solenoid valve in the fuel supply line entering the day tank. The solenoid valve must be in addition to the automatic fuel shut off valve.] The fuel supply line from the day tank to the manufacturer's standard engine connection must be welded pipe.

2.6.6 Fuel Supply System

Provide the fuel supply from the main storage of fuel to the day tank as specified in Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.

2.6.7 Strainer

******************************************************************************
NOTE: Select the options for duplex filters when changing of the filter will be required while the engine-generator set is operating. Do not provide duplex filters when the engine-generator set is to be installed in an enclosure or provided with an engine-driven radiator.
******************************************************************************

[Simplex][Duplex] strainers must comply with Section 33 52 10 SERVICE PIPING, FUEL SYSTEMS.

2.6.8 Fuel Oil Meters

******************************************************************************
NOTE: Provide fuel oil meters when required by the using activity.
******************************************************************************

Fuel oil meter must comply with Section 33 52 10 SERVICE PIPING, FUEL SYSTEMS.

2.6.9 Fuel Oil Cooler

Provide an air cooled fuel oil cooler if the temperature of the fuel returned to the tank from the engine will cause overheating of the tank fuel above the maximum fuel temperature allowed by the engine manufacturer when operating at maximum rated generator power output and low fuel level in the tank. The fuel oil cooler must be furnished by the engine manufacturer for the application and the installation must be complete including piping and power requirements.

2.7 LUBRICATION

******************************************************************************
NOTE: Delete the adjustable requirement for pressure regulation on sets smaller than 1000 kW. Sets larger than 500 kW will utilize a pressure-relief valve on the crankcase. Show crankcase vent piping for indoor installations.
******************************************************************************

Provide engine with a separate lube-oil system conforming to NFPA 30 and NFPA 37. Pressurize each system by engine-driven pumps. Regulate system pressure as recommended by the engine manufacturer. Provide a pressure relief valve on the crankcase for closed systems. Vent the crankcase in accordance with the manufacturer's recommendation. Do not vent the
crankcase to the engine exhaust system. Crankcase breathers, if provided on engines installed in buildings or enclosures, must be piped to vent to the outside. The system must be readily accessible for service such as draining, refilling, etc. Each system must permit addition of oil and have oil-level indication with the set operating. The system must utilize an oil cooler as recommended by the engine manufacturer.

2.7.1 Lube-Oil Filter

Provide one full-flow filter for each pump. The filter must be readily accessible and capable of being changed without disconnecting the piping or disturbing other components. Mark inlet and outlet connections.

2.7.2 Lube-Oil Sensors

Equip each engine with lube-oil pressure sensors located downstream of the filters and provide signals for required indication and alarms. Submit two complete sets of filters, required for maintenance, supplied in a suitable storage box. Provide these filters in addition to filters replaced after testing.

2.7.3 Precirculation Pump

Provide a motor-driven precirculation pump powered by the station battery, complete with motor starter, if recommended by the engine manufacturer.

2.8 COOLING SYSTEM

**************************************************************************
NOTE: Coordinate with paragraph SYSTEM REQUIREMENTS.
**************************************************************************

Provide each engine with its own cooling system to operate automatically while its engine is running. The cooling system coolant must use a combination of water and ethylene-glycol sufficient for freeze protection at the minimum winter outdoor temperature specified. The maximum temperature rise of the coolant across each engine must not exceed that recommended below. Submit a letter which certifies that the engine-generator set and cooling system function properly in the ambient temperature specified, stating the following values:

a. The maximum allowable inlet temperature of the [coolant fluid][cooling air].

b. The minimum allowable inlet temperature of the [coolant fluid through the engine][cooling air across the engine].

c. The maximum allowable temperature rise in the [coolant fluid through the engine][cooling air across the engine].

d. The minimum allowable inlet fuel temperature.

2.8.1 Coolant Pumps

**************************************************************************
NOTE: Delete raw-water pump for closed-loop systems.
**************************************************************************

Provide centrifugal coolant pumps. Each engine must have an engine-driven
primary pump. Provide secondary pumps that are electric motor driven and have automatic controllers. Control raw-water circulating pump by manual-off-automatic controllers and must be electric motor driven.

2.8.2 Heat Exchanger

Provide heat exchanger with the size and capacity to limit the maximum allowable temperature rise in the coolant across the engine to that recommended and submitted for the maximum summer outdoor design temperature and site elevation. Submit manufacturer's data to quantify heat rejected to the space with the engine generator set at rated capacity. Provide heat exchangers that are corrosion resistant, suitable for service in ambient conditions of application.

2.8.2.1 Fin-Tube-Type Heat Exchanger (Radiator)

Heat exchanger may be factory coated with corrosion resistant film, provided that corrective measures are taken to restore the heat rejection capability of the radiator to the initial design requirement via over sizing, or other compensating methods. Provide internal surfaces that are compatible with liquid fluid coolant used. Materials and coolant are subject to approval by the Contracting Officer. Provide heat exchangers that are pressure type incorporating a pressure valve, vacuum valve and a cap. Design caps for pressure relief prior to removal. Provide heat exchanger and cooling system that is capable of withstanding a minimum pressure of 48 kPa 7 psi and protect with a strong grille or screen guard. Provide heat exchanger with at least two tapped holes; equip one tapped hole with a drain cock, and plug the rest.

Design Conditions: Each radiator unit must have ample capacity to remove not less than the total kW Btu per hour of heat rejected by its respective engine at 100 percent full-rated load to the jacket water, fuel oil, and lubricating oil system, and intercooler. Radiator
capacity must be rated at optimum temperature of coolant leaving the
engine and intercooler as recommended by the engine manufacturer with
an ambient dry bulb air temperature outside the enclosure of [___]
degrees C [___] degrees F maximum, and [___] degrees C [___]
degrees F minimum at the site elevation specified in the paragraph SITE
CONDITIONS, and with the coolant mixture specified in the paragraph
ENGINE CAPACITY. Pressure drop through the radiator must not exceed
41.34 kPa 6 psi when circulating the maximum required coolant flow.
Radiator air velocity must be a maximum of 7.6 meters per second 1500
feet per minute.

b. Engine Mounted Radiator Construction: Radiator fan must direct airflow
from the engine outward through the radiator. Fan must be V-belt
driven directly from the engine crankshaft. Radiator fan must have
sufficient capacity to meet design conditions against a static
restriction of [___] Pa [___] inch of water. Fan static capacity
must be adjusted to suit the ductwork furnished. Cooling section must
have a tube and fin-type core consisting of copper or copper base alloy
tubes with nonferrous fins. Select engine-driven fans for quiet
vibration-free operation. Make provision for coolant expansion either
by self-contained expansion tanks or separately mounted expansion
tanks, as standard with the manufacturer. Provide suitable guards for
each fan and drive.

******************************************************************************
NOTE: Radiator fan cycling controls should be
considered for engines to be operated above 500
hours per year.
******************************************************************************

c. Remote Radiator Construction: Provide radiators as described above,
except radiators must be remotely piped and provided with electric
motor driven fan. Drive must be multiple V-belt or reduction gears.
Expansion tanks must be separately mounted. Air flow must be vertical
or horizontal as indicated. Interlock fan with engine operation such
that fan must operate when engine operates when recommended by engine
manufacturer.[ Provide controls and control devices complete which
must cycle fan on and off based upon coolant temperature.] Provide
motors and controllers in accordance with the paragraphs ELECTRIC
MOTORS and MOTOR CONTROLLERS, respectively. Motors, controllers,
contactors, and disconnects must conform to Section 26 20 00 INTERIOR
DISTRIBUTION SYSTEM.

d. Coolant solution must be a mixture of clean water and ethylene glycol,
50 percent by volume each. Provide an anti-freeze solution tester
suitable for the mixture.

******************************************************************************
NOTE: Include the following paragraph when
providing cooling system with a remote radiator.
******************************************************************************

Field installed jacket coolant water piping must conform to the following:

a. Piping: Provide seamless steel pipe, Schedule 40, conforming to
ASTM A53/A53M, Grade A.

b. Fittings and Flanges: Fittings, 40 mm 1 1/2 inches or smaller, must be
malleable iron conforming to ASME B16.3 for Class 300 threaded type.
Fittings, 50 mm 2 inches and larger, must be steel butt welding conforming to ASME B16.9. Utilize either ASME B16.1 or Class A of ASTM A126 for Class 125 cast-iron flanged fittings. Flanges must be Class 150 slip-on forged steel welding flanges in accordance with ASME B16.5, with material in accordance with ASTM A181/A181M, Grade I. Provide flat face flanges for connecting to Class 125 standard cast-iron valves, fittings, and equipment connections.

c. Valves

(1) Gate Valves: For valves, 40 mm 1 1/2 inches and smaller, provide double disk, rising stem, inside screw, union bonnet type, Class 125 bronze material conforming to MSS SP-80. For valves, 50 mm 2 inches and larger, provide double-disk, parallel seat type, hydraulic-rated, Class 125, outside screw and yoke type with flanged ends and bronze trim conforming to MSS SP-70. Provide stem packing of material compatible with the system coolant.

(2) Globe Valves: For valves, 40 mm 1 1/2 inches and smaller, provide rising stem, inside screw, union bonnet type, Class 125 bronze valves conforming to MSS SP-80. For valves, 50 mm 2 inches and larger, provide Class 125 cast iron, flanged ends, bronze trim globe valves conforming to MSS SP-85. Valves must have renewable composition or cast iron discs compatible with the system coolant.

(3) Check Valves: MSS SP-71 or MSS SP-80, swing check type.

d. Hangers and Supports: MSS SP-59.

**************************************************************************
NOTE: Include on the drawings a detail of the cooling piping penetrations through walls and roofs showing the piping sleeve and exterior flashing.
**************************************************************************

e. Piping Sleeves: Provide where piping passes through masonry or concrete walls, floors, roofs, and partitions. Place sleeves during construction. Unless indicated otherwise, pipe sleeves must comply with following requirements: Sleeves in outside walls below and above grade, in floor, or in roof slabs, must be standard weight zinc coated steel pipe. Sleeves in partitions must be zinc coated sheet steel having a nominal weight of not less than 4.4 kg per square meter 0.90 pound per square foot. Space between piping insulation and the sleeve must be not less than 6 mm 0.25 inch. Sleeves must be held securely in proper position and location during construction. Sleeves must be of sufficient length to pass through entire thickness of walls, partitions, or slabs. Sleeves in floor slabs must extend 50 mm 2 inches above the finished floor. Space between the pipe and the sleeve must be firmly packed with insulation and caulked at both ends of the sleeve with plastic waterproof cement.

2.8.2.2 Shell and U-Tube Type Heat Exchanger

**************************************************************************
NOTE: Retain this paragraph and remove the one above as required by the project.
**************************************************************************

Provide multiple pass shell, U-tube type heat exchanger. Exchanger must
operate with low temperature water in the shell and high temperature water in the tubes. Provide exchangers that are constructed in accordance with ASME BPVC SEC VIII D1 and certified with ASME stamp secured to the unit. Provide U-tube bundles that are completely removable for cleaning and tube replacement and free to expand with the shell. Construct shells of seamless steel pipe or welded steel. Tubes must be cupronickel or inhibited admiralty, constructed in accordance with ASTM B395/B395M, suitable for the temperatures and pressures specified. Tubes less than 19 mm 3/4 inch unless otherwise indicated are not acceptable. Design shell side and tube side for 1.03 MPa 150 psig working pressure and factory tested at 2.06 MPa 300 psig. Locate high and low temperature water and pressure relief connections in accordance with the manufacturers standard practice. Water connections larger than 75 mm 3 inches must be ASME Class 150 flanged. Water pressure loss through clean tubes must be as recommended by the engine manufacturer. Minimum water velocity through tubes must be 300 mm/sec 1 fps and assure turbulent flow. Provide one or more pressure relief valves for each heat exchanger in accordance with ASME BPVC SEC VIII D1. The aggregate relieving capacity of the relief valves must be not less than that required by the above code. Install discharge from the valves indicated. Install the relief valves on the heat exchanger shell. Install a drain connection with 19 mm 3/4 inch hose bib at the lowest point in the system near the heat exchanger. Install additional drain connection with threaded cap or plug wherever required for thorough draining of the system.

2.8.3 Expansion Tank

**************************************************************************
NOTE: Delete this paragraph if a shell and U-tube type heat exchanger is not needed.
**************************************************************************

The cooling system must include an air expansion tank which will accommodate the expanded water of the system generated within the normal operating temperature range, limiting the pressure increase at all components in the system to the maximum allowable pressure at those components. The tank must be suitable for operating temperature of 121 degrees C 250 degrees F and a working pressure of 0.86 MPa 125 psi. Provide welded steel tank, tested and stamped in accordance with ASME BPVC SEC VIII D1 for the stated working pressure. Do not use a bladder type tank. Support the tank by steel legs or bases for vertical or steel saddles for horizontal installation.

2.8.4 Thermostatic Control Valve

Provide a modulating type, thermostatic control valve in the coolant system to maintain the coolant temperature range submitted in paragraph SUBMITTALS.

2.8.5 Ductwork

Provide ductwork as specified in Section [23 30 00 HVAC AIR DISTRIBUTION] except use a flexible connection to connect the duct to the engine radiator. Material for the connection must be wire-reinforced glass. Provide airtight connection.

2.8.6 Temperature Sensors

Equip each engine with coolant temperature sensors. Provide temperature sensors with signals for pre-high and high indication and alarms.
NOTE: The designer must perform an analysis in accordance with UFC 3-450-01 NOISE AND VIBRATION CONTROL. The designer must consider air intake, exhaust, and diesel generator casing noise. The designer must also coordinate with the architect for proper material selections for the sound transmittance characteristics of the mechanical equipment room and adjacent areas. The designer should consider sound within the equipment room, adjacent areas and building exterior. Acceptable sound levels will vary depending on the function of the space. As a minimum the design should comply with the following OSHA safety requirements; however, more stringent sound restrictions may be required to meet the functional requirements of the occupied spaces.

Typically, the generator manufacturer can provide information concerning the noise generated by the generator in a free field environment. The manufacturer does not have control over any other building parameters or additional mechanical equipment noise. Therefore the designer should indicate the required sound limits for each of the indicated octave bands for the sound pressure level of the generator set operating at 100 percent load in a free field. The designer should develop these numbers based on the desired sound levels that should exist at various locations after the generator is installed. This information should be based on the values used in the acoustical analysis and verified by coordination with equipment.
manufacturers during design. In some cases, a sound attenuated enclosure may be needed to achieve the desired result.

The designer should also indicate the desired sound pressure levels that will be measured in the field. The pressure levels should be based on the acoustical analysis and should consider the specified operating conditions of the generator operating in a free field, other mechanical equipment, the building’s sound absorption characteristics, OSHA requirements, and the building’s functional requirements. The location of the measurement points for the installed generator should be coordinated with the SAFETY RUN TEST paragraph. Modify the radial distance requirement from the engine, exhaust, and air-intake to account for obstructions, variations in site conditions, building configurations or indicate points on the contract drawings at which measurements are to be made.

*************************************************************************
Submit sound power level data for the packaged unit operating at 100 percent load in a free field environment. The data should demonstrate compliance with the sound limitation requirements of this specification. Submit certification from the manufacturer stating that the sound emissions meet the specification. Do not exceed the following sound pressure levels in any of the indicated frequencies when measured in a free field at a radial distance of 22.9 feet 7 meters at 45 degrees apart in all directions when operating at 100 percent load.

2.10 AIR INTAKE EQUIPMENT

Locate filters and silencers in locations that are convenient for servicing. Provide high-frequency filter type silencers and locate in the air intake system as recommended by the engine manufacturer. Provide
silencer to reduce the noise level at the air intake so that the indicated pressure levels specified in paragraph SOUND LIMITATIONS will not be exceeded. A combined filter-silencer unit meeting requirements for the separate filter and silencer items may be provided. Provide [copper] [rubber] expansion elements in air-intake lines.

Provide intake filter assemblies for each engine of the oil bath or dry type, as standard with the manufacturer. Filters must be capable of removing a minimum of 92 percent of dirt and abrasive 3 microns and larger from intake air. Size filters to suit engine requirements at 100 percent of rated full load. Design unit for field access for maintenance purposes.

2.11 EXHAUST SYSTEM

**************************************************************************
NOTE: Include on the drawings a detail of the exhaust piping that penetrates construction such as walls or roof.
**************************************************************************

Provide a separate and complete system for each engine. Support piping to minimize vibration. Where a V-type engine is provided, use a V-type connector, with necessary flexible sections and hardware, to connect the engine exhaust outlets.

2.11.1 Flexible Sections and Expansion Joints

Provide a flexible section at each engine and an expansion joint at each muffler. Provide flexible sections and expansion joints that have flanged connections. Provide flexible sections made of convoluted seamless tube without joints or packing. Provide bellows type expansion joints. Provide stainless steel expansion and flexible elements suitable for engine exhaust gas at the maximum exhaust temperature that is specified by the engine manufacturer. Provide expansion and flexible elements that are capable of absorbing vibration from the engine and compensation for thermal expansion and contraction.

2.11.2 Exhaust Muffler

**************************************************************************
NOTE: Muffler locations and mountings should be shown on the drawings.
**************************************************************************

Provide a chamber type exhaust muffler. Provide welded steel muffler designed for [outside] [inside] [vertical] [horizontal] mounting. Provide eyebolts, lugs, flanges, or other items as necessary for support in the location and position indicated. Do not exceed the engine manufacturer's recommended pressure drop. Outside mufflers must be zinc coated or painted with high temperature 204 degrees C 400 degrees F resisting paint. The muffler and exhaust piping together must reduce the noise level to less than the maximum acceptable level listed for sound limitations in paragraph SOUND LIMITATIONS. Provide muffler with a drain valve, nipple, and cap at the low-point of the muffler.

**************************************************************************
NOTE: The normal values given in the table for exhaust sound reduction are for installations in residential applications. If the installation is in
a critical environment (such as a hospital), more stringent criteria must be applied, including engine noise dampening, and the attenuation values in the table for critical class should be selected.

A [residential class][critical class] silencer must be provided for each engine which will reduce the exhaust sound spectrum by the following listed values at a 23 m 75 foot radius from the outlet, with generator set loaded to rated capacity and clear weather. Inlet and outlet connections must be flanged.

2.11.3 Exhaust Piping

**NOTE:** Exhaust piping will be sized at a gas velocity of less than 25.4 meters per second 5000 fpm. Show piping on the drawings.

Slope horizontal sections of exhaust piping downward away from the engine to a drip leg for collection of condensate with drain valve and cap. Changes in direction must be long radius. Insulate exhaust piping, mufflers and silencers installed inside any building in accordance with paragraph THERMAL INSULATION and covered to protect personnel. Provide vertical exhaust piping with a hinged, gravity-operated, self-closing, rain cover.

**NOTE:** Include the following paragraph when the engine-generator set is installed internal to a building in lieu of in a self-contained outdoor enclosure. The designer is responsible for ensuring that:

1. External loads from the exhaust system, such as weight and thermal expansion do not exceed the engine manufacturer's maximum allowed forces and moments on the turbocharger, and;

2. The exhaust piping system pressure loss is coordinated with the visible emission limits of the engine-generator set when air pollution permitting is required.

Field installed exhaust piping must conform to the following:

a. Exhaust Piping: Provide flanges for connections to engines, exhaust
mufflers, and flexible connections. Provide steel pipe conforming to ASTM A53/A53M for each engine complete with necessary fittings, flanges, gaskets, bolts, and nuts. Exhaust piping must be Schedule 40 pipe for 300 mm 12 inches and smaller, standard weight for sizes 350 mm 14 inches through 600 mm 24 inches, and 6 mm 0.25 inch wall thickness for sizes larger than 600 mm 24 inches. Flanges must be Class 150 slip-on forged steel welding flanges in accordance with ASME B16.5, with material in accordance with ASTM A181/A181M, Grade I. Fittings must be butt welding conforming to ASTM A234/A234M, with wall thickness same as adjoining piping. Fittings must be of same material and wall thickness as pipe. Built-up miter welded fittings may be used. Miter angles of each individual section must not exceed 22.5 degrees total and not more than 11.25 degrees relative to the axis of the pipe at any one cut. Gaskets for exhaust piping must be of high temperature asbestos-free material suitable for the service and must be ASME B16.21, composition ring, 1.6 mm 0.0625 inch thick. Bolting material for exhaust flanges must be alloy-steel bolt-studs conforming to ASTM A193/A193M, Grade B7 bolts and alloy-steel nuts conforming to ASTM A194/A194M, Grade 7. Bolts must be of sufficient length to obtain full bearing on the nuts and must project not more than two full threads beyond the nut. Provide stainless steel counterbalance type rain caps at termination of each exhaust pipe.

**************************************************************************
NOTE: Select option for liners in expansion joints when required to reduce exhaust pressure drop.
**************************************************************************

b. Expansion (Flexible) Joints: Provide sections of multiple corrugated stainless steel expansion joints [with liners] in the engine exhaust piping for each engine to absorb expansion strains and vibration transmitted to the piping. Flexible joints must be suitable for operation at 93 degrees C 200 degrees F above normal exhaust gas temperature at 100 percent load, 10,000 cycles, minimum. Joints must be flanged and located between engine exhaust manifold and exhaust piping, must be the same size as exhaust piping size, and must be designed and constructed for engine exhaust service.

**************************************************************************
NOTE: Include on the drawings a detail of the exhaust piping penetrations through walls and roofs showing the piping sleeve and exterior flashing.
**************************************************************************

d. Piping Sleeves: Provide where piping passes through masonry or concrete walls, floors, roofs, and partitions. Sleeves must be placed during construction. Unless indicated otherwise, pipe sleeves must comply with following requirements: sleeves in outside walls below and above grade, in floor, or in roof slabs, must be standard weight zinc coated steel pipe. Sleeves in partitions must be zinc coated sheet steel having a nominal weight of not less than 4.4 kg per square meter 0.90 pound per square foot. Space between piping insulation and the sleeve must not be less than 6 mm 0.25 inch. Sleeves must be held securely in proper position and location during construction. Sleeves must be sufficient length to pass through entire thickness of walls, partitions, or slabs. Sleeves in floor slabs must extend 50 mm 2 inches
above the finished floor. Space between the pipe and the sleeve must be firmly packed with insulation and caulked at both ends of the sleeve with plastic waterproof cement.

e. Piping Insulation: Provide exhaust piping insulation in accordance with Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

2.12 PYROMETER

**************************************************************************
NOTE: For sets smaller than 200 kW delete this paragraph. Pyrometers with individual thermocouples are not normally available and should not be specified for units smaller than 1000 kW.
**************************************************************************

Provide a pyrometer, [multi-point selector switch, and individual thermocouples] [and thermocouple] with calibrated leads to show the temperature [in each engine cylinder and the combined exhaust] [of the combined exhaust]. For a supercharged engine, provide additional points, thermocouples and leads to show the temperature in the turbocharger exhaust gas outlet and combustion air discharge passages. Graduated scale length less than 150 mm 6 inches is not acceptable. Provide double pole selector switch with an "off" position, one set of points for each thermocouple, and suitable indicating dial. Calibrate the pyrometer, thermocouples, leads and compensating devices to show true exhaust temperature within plus or minus 1 percent above the highest temperature encountered at 110 percent load conditions.

2.13 EMISSIONS

**************************************************************************
NOTE: The designer will coordinate emissions requirements with the installation (base/post) environmental office and provide a listing of the requirements. The identification of environmental requirements should be identified at the beginning of the project as a special study effort which requires funding separate from the normal design.
**************************************************************************

The finished installation must comply with Federal, state, and local regulations and restrictions regarding the limits of emissions, as listed here: [____]. Submit certification from the engine manufacturer stating that the engine exhaust emissions meet the federal, state, and local regulations and restrictions specified. At a minimum this certification must include emission factors for criteria pollutants including nitrogen oxides, carbon monoxide, particulate matter, sulfur dioxide, non-methane hydrocarbon, and for hazardous air pollutants (HAPs).

2.14 STARTING SYSTEM

**************************************************************************
NOTE: Either electrical or pneumatic starting system should be used and the other paragraphs deleted. Electrical starting will be used for most applications. Engines up to 750 kW should be equipped for electric starting. Starting battery system must be 24-volt dc for engine-generator sets.
greater than 100 kW and 12-volt dc for engine-generator sets rated 100 kW and less. See manufacturers literature to determine availability for sizes above 750 kW. For units used in emergency applications, select the first option and delete all other starting system paragraphs.

Provide starting system for [standby engine generator sets used in emergency applications in accordance with NFPA 99 and NFPA 110 and as follows.] [engine generator sets used in non-emergency applications as follows.]

2.14.1 Controls

Provide an engine control switch with functions including: run/start (manual), off/reset, and, automatic mode. Provide start-stop logic for adjustable cycle cranking and cool-down operation. Arrange the logic for [manual starting] [and] [fully automatic starting in accordance with paragraph AUTOMATIC ENGINE-GENERATOR-SET SYSTEM OPERATION]. Provide electrical starting systems with an adjustable cranking limit device to limit cranking periods from 1 second up to the maximum duration.

2.14.2 Capacity

Provide starting system with sufficient capacity, at the maximum [outdoor] [indoor] summer temperature specified to crank the engine without damage or overheating. The system must provide a minimum of three cranking periods with 15 second intervals between cranks. Each cranking period must have a maximum duration of 15 seconds. Starting must be accomplished using an adequately sized dc starter system with a positive shift solenoid to engage the starter motor and to crank the engine continuously for 60 seconds without overheating.

2.14.3 Electrical Starting

Manufacturers recommended dc system, utilizing a negative circuit ground. Starting motors must be in accordance with SAE ARP892.

2.14.3.1 Battery

NOTE: The ambient temperature selected must be the lowest temperature at which the engine might be cranked. Battery configuration must be two parallel sets of two 12-volt batteries for engine-generator sets rated 750 kW and above. Select nickel-cadmium only when the battery temperature cannot be maintained above minus 6 degrees C 22 degrees F.

Provide a starting battery system including the battery, battery rack, intercell connectors, spacers, automatic battery charger with overcurrent protection, metering and relaying. Provide battery in accordance with SAE J537. Size critical system components (rack, protection, etc.) to withstand the seismic acceleration forces specified. Provide [lead-acid] [nickel-cadmium] battery with sufficient capacity, at the minimum [outdoor] [indoor] and maximum [outdoor] [indoor] temperature specified, to provide the specified cranking periods. Valve-regulated lead-acid batteries are
not acceptable.

Provide maintenance free, sealed, lead-acid, SAE Type D engine starting batteries. [Battery configuration must be two parallel sets of two 12-volt batteries.] Batteries must have sufficient capacity to provide 60 seconds of continuous cranking of the engine in an ambient temperature of [_____] degrees C [_____] degrees F.

2.14.3.2 Battery Charger

Provide a current-limiting battery charger, conforming to UL 1236, that automatically recharges the batteries. Submit battery charger sizing calculations. The charger must be capable of an equalize charging rate [for recharging fully depleted batteries within [24] [_____] hours] [which is manually adjustable in a continuous range] and a floating charge rate for maintaining the batteries at fully charged condition. Provide an ammeter to indicate charging rate. Provide a voltmeter to indicate charging voltage. Provide a timer for the equalize charging-rate setting. A battery is considered to be fully depleted when the output voltage falls to a value which will not operate the engine generator set and its components.

Provide [120] [_____] volt ac, enclosed, automatic equalizing, dual-rate, solid-state, constant voltage type battery charger with automatic ac line compensation. DC output must be voltage regulated and current limited. Charger must have two ranges, float and equalize, and must provide continuous taper charging. The charger must have a continuous output rating of not less than 10 amperes and must be sized to recharge the engine starting batteries in a minimum of 8 hours while providing the control power needs of the engine-generator set. Enclosure must be NEMA ICS 6, Type [1] [_____] . The following accessories must be included:

a. DC ammeter
b. DC voltmeter
c. Equalize light
d. AC on light
e. Low voltage light
f. High voltage light
g. Equalize test button/switch
h. AC circuit breaker
i. Low dc voltage alarm relay
j. High dc voltage alarm relay
k. Current failure relay
l. AC power failure relay

2.14.4 Storage Batteries

Provide storage batteries of suitable rating and capacity to supply and
maintain power for the remote alarm annunciator for a period of 90 minutes minimum without the voltage applied falling below 87.5 percent of normal. Provide a [120] [_____] volt ac automatic battery charger.

2.14.5 Pneumatic

******************************************************************************
** NOTE: Pneumatic starting should be used on sets 750 kW and larger.**

The complete compressed air system should be shown on the drawings. Two receivers, redundant piping, and two compressors may be required so that starting capability is not lost when tank maintenance is required. Valve arrangement must permit any receiver to be removed from service, drained, repaired, or replaced without loss of starting air from the system. The designer must analyze the starting scenarios and determine the necessity to provide a gasoline or diesel-engine-driven compressor for a "black-plant" (no electrical sources available) startup.

Size each compressor to restore in 15 minutes the air used in one engine start.

Size each receiver to provide sufficient capacity to crank the largest engine for 60 seconds at an ambient temperature of 21 degrees C 70 degrees F without recharging.

Recommended working pressures are 2068.5 kPa (gauge) 300 psig for cylinder injection or, 1034.2 kPa (gauge) 150 psig for air-motor starting.

Either motors or cylinder injection should be used and the other type deleted.
******************************************************************************

Provide a pneumatic starting system. Provide compressed air system as specified in Section 22 00 00 PLUMBING, GENERAL PURPOSE, for a working pressure of [2.07 MPa 300 psi] [1.03 MPa 150 psi].

2.14.5.1 Air Driven Motors

Provide air driven motors complete with solenoid valve, strainer, and lubricator.

2.14.5.2 Cylinder Injection

Perform starting by admitting compressed air into two or more engine cylinders through a timing valve, or through a distributor into a sufficient number of cylinders to assure successful starting regardless of piston positions.

2.14.6 Starting Aids

******************************************************************************
** NOTE: Jacket coolant and/or lube-oil heaters are**
normally provided for most applications to aid starting. Some manufacturers may require glow plugs for combustion air temperatures significantly below 0 degrees C 32 degrees F. Consult manufacturers for availability in the application size range.

Provide one or more of other following methods to assist engine starting.

2.14.6.1 Glow Plugs

Design glow plugs to provide sufficient heat for combustion of fuel within the cylinders to guarantee starting at an ambient temperature of -32 degrees C -25 degrees F.

2.14.6.2 Jacket-Coolant Heaters

Mount a thermostatically controlled electric heater in the engine coolant jacketing to automatically maintain the coolant within plus or minus 1.7 degrees C 3 degrees F of the control temperature. The heater must operate independently of engine operation so that starting times are minimized. Power for the heaters must be [_____] volts ac. Include necessary equipment, piping, controls, wiring, and accessories.

2.14.6.2.1 Prime Rated Sets

The control temperature must be the higher of the manufacturer's recommended temperature or the minimum coolant inlet temperature of the engine recommended in paragraph SUBMITTALS.

2.14.6.2.2 Standby Rated Sets

The control temperature must be the temperature recommended by the engine manufacturer to meet the starting time specified at the minimum winter outdoor temperature.

2.14.6.3 Lubricating-Oil Heaters

Mount a thermostatically controlled electric heater in the engine lubricating-oil system to automatically maintain the oil temperature within plus or minus 1.7 degrees C 3 degrees F of the control temperature. The heater must operate independently of engine operation so that starting times are minimized. Power for the heaters must be [_____] volts ac.

2.14.7 Exerciser

**************************************************************************

NOTE: Coordinate the need for an exerciser with the user. The plant exerciser is required for stand-by rated sets only, so delete this paragraph for prime applications. Ensure that the exerciser is compatible with the automatic transfer scheme (see reset provisions). It is usually desirable to utilize system loads for genset exercise loads. Coordinate requirement with the user. The designer must ensure that the design provides warning signs in areas where the engine generator can start automatically.

**************************************************************************
Provide exerciser in accordance with Section 26 36 23 AUTOMATIC TRANSFER SWITCH AND BY-PASS/ISOLATION SWITCH.

2.15 GOVERNOR

**************************************************************************
NOTE: Coordinate with paragraph ENGINE GENERATOR PARAMETER SCHEDULE.
**************************************************************************

Provide a forward acting type engine speed governor system. Steady-state frequency band and frequency regulation (droop) must be in accordance with the operating limit values of the performance class specified in the paragraph PERFORMANCE CLASS.

Provide engine with a governor which maintains the frequency within a bandwidth of the rated frequency, over a steady-state load range of zero to 100 percent of rated output capacity. Configure the governor for safe manual adjustment of the speed/frequency during operation of the engine-generator set, without special tools, from 90 to 110 percent of the rated speed/frequency, over a steady state load range of 0 to 100 percent or rated capacity. Submit two complete sets of special tools required for maintenance (except for electronic governor handset). Special tools are those that only the manufacturer provides, for special purposes, or to reach otherwise inaccessible parts. Provide a suitable tool box for tools. Provide one handset for each electronic governor when required to indicate and/or change governor response settings. [Maintain the midpoint of the frequency bandwidth at the same value for steady-state loads over the range of zero to 100 percent of rated output capacity for isochronous governors.] [Maintain the midpoint of the frequency bandwidth linearly for steady-state loads over the range of zero to 100 percent of rated output capacity, [with 3 percent droop] [configured for safe, manual, external adjustment of the droop from zero to [7] [_____] percent] for droop governors.]

2.16 GENERATOR

**************************************************************************
NOTE: Armature and field winding insulation classes are specified based on the allowable temperature rise (the temperature in the windings above the temperature of the air used to cool the windings). See NEMA MG 1 for a discussion of the classes with respect to size range, elevation, method of measurement, and ambient temperature. Select the class insulation for each application based on operating conditions. Class F is considered industry standard. If a different class is required for different machines, specify the one for each application in the Parameter Schedule for the respective engine-generator.
**************************************************************************

Provide synchronous type, one or two bearing, generator conforming to the performance criteria in NEMA MG 1, equipped with winding terminal housings in accordance with NEMA MG 1, equipped with an amortisseur winding, and directly connected to the engine. Submit calculations of the engine and generator output power capability, including efficiency and parasitic load
a. Select NEMA MG 1, Part 16, standby duty, and temperature rise of 130 degrees C for engine-generator sets which are expected to operate for less than 300 hours per year. Select NEMA MG 1, Part 22, continuous duty, and temperature rise of 105 degrees C for engine-generator sets expected to operate 300 hours or greater per year or rated 300 kW and above.

b. Select 2/3 pitch design option for engine-generator sets rated 300 kW and above.

c. Select 10-12 lead re-connectable for engine-generator sets rated 300 kW to 800 kW.

d. For applications requiring high SCR loading or in harsh environments laden with salts and chemicals, select vacuum pressure impregnation (VPI) insulated coils. When engine-generator sets are rated 800 kW and larger, also select form wound coils.

e. Provide salient-pole type, ac, brushless-excited, revolving field, air-cooled, self-ventilated, [drip-proof guarded,] coupled type, synchronous generator conforming to NEMA MG 1, Part [16] [22], and IEEE C50.12. Generator must be rated for [standby] [continuous] duty at 100 percent of the power rating of the engine-generator set as specified in paragraph ENGINE-GENERATOR SET RATINGS AND PERFORMANCE. Temperature rise of each of the various parts of the generator must not exceed [130][105] degrees C as measured by resistance, based on a maximum ambient temperature of 40 degrees C. Winding insulation must be Class H.

f. Stator: Stator windings must be [2/3 pitch design] [,] [10-12 lead re-connectable] [with VPI insulated [and form wound] coils].

g. Rotor: The rotor must have connected amortisseur windings.

h. Generator Space Heater: Provide [120] [_____] volt ac heaters. Heater capacity must be as recommended by the generator manufacturer to aid in keeping the generator insulation dry.

i. Grounding: Provide non-corrosive steel grounding pads located at two opposite mounting legs.

j. Filters: Provide manufacturer's standard generator cooling air filter assembly.

k. Design generator to protect against mechanical, electrical and thermal damage due to vibration, 25 percent overspeeds, or voltages and temperatures at a rated output capacity of 110 percent for prime applications and 100 percent for standby applications.

l. Provide generator ancillary equipment meeting the short circuit requirements of NEMA MG 1. Select drip-proof guarded option for generators without weatherproof enclosures.

m. Submit manufacturer's standard data for each generator (prototype data at the specified rating or above is acceptable), listing the following information:
(1) Direct-Axis sub-transient reactance (per unit).

(2) The generator kW rating and short circuit current capacity (both symmetric and asymmetric).

2.16.1 Current Balance

At 100 percent rated output capacity, and load impedance equal for each of the 3 phases, the permissible current difference between any 2 phases must not exceed 2 percent of the largest current on either of the 2 phases. Submit certification stating that the flywheel has been statically and dynamically balanced and is capable of being rotated at 125 percent of rated speed without vibration or damage.

2.16.2 Voltage Balance

At any balanced load between 75 and 100 percent of rated output capacity, the difference in line-to-neutral voltage among the 3 phases must not exceed 1 percent of the average line-to-neutral voltage. For a single phase load condition, consisting of 25 percent load at unity power factor placed between any phase and neutral with no load on the other 2 phases, the maximum simultaneous difference in line-to-neutral voltage between the phases must not exceed 3 percent of rated line to neutral voltage. The single-phase load requirement must be valid utilizing normal exciter and regulator control. The interpretation of the 25 percent load for single phase load conditions means 25 percent of rated current at rated phase voltage and unity power factor.

2.16.3 Waveform

The deviation factor of the line-to-line voltage at zero load and at balanced rated output capacity must not exceed 10 percent. The RMS of all harmonics must be less than 5.0 percent and that of any one harmonic less than 3.0 percent of the fundamental at rated output capacity. Design and configure engine-generator to meet the total harmonic distortion limits of IEEE 519.

2.17 EXCITER

Provide brushless generator exciter. Provide semiconductor rectifiers that have a minimum safety factor of 300 percent for peak inverse voltage and forward current ratings for all operating conditions, including 110 percent generator output at 40 degrees C 104 degrees F ambient. The exciter and regulator in combination must maintain generator-output voltage within the limits specified.

**************************************************************************
NOTE: Select all options for engine-generator sets rated 300 kW and above.
**************************************************************************

Provide a brushless excitation system consisting of an exciter and rotating rectifier assembly [, and permanent magnet generator] integral with the generator and a voltage regulator. Insulation class for parts integral with the generator must be as specified in paragraph GENERATOR. System must provide a minimum short circuit of 300 percent rated engine-generator set current for at least 10 seconds. Steady state voltage regulation must be in accordance with the operating limit values of the performance class specified in the paragraph PERFORMANCE CLASS.
a. Exciter and Rotating Rectifier Assembly: Rectifiers must be provided with surge voltage protection.

b. Permanent Magnet Generator: Provide a voltage spike suppression device for permanent magnet generator (PMG) excitation systems.

c. Voltage Regulator: Voltage regulator must be solid state or digital, automatic, three-phase sensing, volts per hertz type regulator. Regulator must receive its input power from a PMG. Voltage variation for any 40 degree C change over the operating temperature range must be less than plus or minus 1.0 percent. Operating temperature must be minus 40 degree C to plus 70 degree C. Voltage adjust range must be plus to minus 5.0 percent of nominal. Inherent regulator features must include over excitation shutdown.

2.17.1 Electromagnetic Interference (EMI) Suppression

**************************************************************************
NOTE: Include electromagnetic interference (EMI) suppression for engine-generator set installations in the proximity of sensitive electronic equipment.
**************************************************************************

Provide as an integral part of the generator and excitation system, EMI suppression complying with MIL-STD-461.

2.18 VOLTAGE REGULATOR

**************************************************************************
NOTE: Delete reactive droop/differential compensation for non-parallel configuration.
**************************************************************************

Provide a solid-state voltage regulator, separate from the exciter, for each generator. Maintain the voltage within a bandwidth of the rated voltage, over a steady-state load range of zero to 100 percent of rated output capacity. Configure regulator for safe manual adjustment of the engine-generator voltage output without special tools, during operation, from 90 to 110 percent of the rated voltage over the steady state load range of 0 to 100 percent of rated output capacity. Regulation drift exceeding plus or minus 0.5 percent for an ambient temperature change of 20 degrees C 68 degrees F is not acceptable. Reactive droop compensation or reactive differential compensation must load share the reactive load proportionally between sets during parallel operation. Provide voltage regulator with a maximum droop of 2 percent of rated voltage over a load range from 0 to 100 percent of rated output capacity and automatically maintain the generator output voltage within the specified operational bandwidth.

2.19 GENERATOR ISOLATION AND PROTECTION

**************************************************************************
NOTE: Generator protection should be based on the application and size of the generator and should comply with the recommendations of IEEE 242 and IEEE Standard 446 for both generator breaker features and protection schemes. See AFMAN 32-1077 for recommended protection schemes for Air Force
projects. The designer must perform a power system coordination study (reference UFC 3-520-01, Coordinated Power System Protection) to specify the breaker ratings, breaker trip unit features and settings, relay protection scheme, and relay settings for coordination for each engine-generator installed. The configuration should always include a disconnecting means for isolation of the generator for maintenance purposes. If the scope of protection is small the designer may elect to incorporate the appropriate Section 26 28 01.00 10 COORDINATED POWER SYSTEM PROTECTION, paragraphs in this section. Show panelboard, switchboard, and switchgear ratings on the contract drawings for each engine-generator. Rating information should include voltage, phase, bus continuous capacity (amperes), and bus withstand capacity (amperes) (see NEMA PB 1 and NEMA PB 2 for necessary rating information). Show breaker frame, trip, and interrupting ratings on the contract drawings.

Surge capacitors and surge arresters should be provided when the sets are to be connected to exposed overhead lines directly or through transformers, even though connection may be only for transfer of load without service interruption. Surge arrester protection is not required for separately derived sets which serve single buildings isolated from overhead lines by automatic or manual transfer switches, where provision has been made to prevent simultaneous connection to both sources. The designer will specify the surge arrester rating.

Provide necessary devices for electrical protection and isolation of each engine-generator set and its ancillary equipment. The generator circuit breaker (IEEE Device 52) ratings must be consistent with the generator rated voltage and frequency, with continuous, short circuit withstand, and interrupting current ratings to match the generator capacity. Provide [manually operated] [electrically operated] [operated as indicated] generator circuit breaker. Mount a set of surge capacitors at the generator terminals. Provide monitoring and control devices as specified in paragraph GENERATOR PANEL.

The generator circuit breaker must comply with UL 489 requirements for molded case, adjustable thermal magnetic trip type circuit breaker. The circuit breaker continuous current rating must be adequate for the power rating of the engine-generator set and the circuit breaker must be rated to withstand the short circuit current provided by the generator set. Provide circuit breaker in a NEMA ICS 6, Type [1] [_____] enclosure mounted on the engine-generator set.

2.19.1 Switchboards

Provide free-standing, metal-enclosed, general purpose, 3-phase, 4-wire, [600] [_____] volt rated, with neutral bus and continuous ground bus, switchboards conforming to NEMA PB 2 and UL 891. Neutral bus and ground bus capacity must be [as shown] [full capacity]. Provide panelboards conforming to NEMA PB 1. Provide enclosure designs, construction,
materials and coatings [as indicated] [suitable for the application and environment]. Bus continuous current rating must be [at least equal to the generator rating and correspond to the UL listed current ratings specified for panelboards and switchboards] [as indicated]. Current withstand (short circuit rating) must be [equal to the breaker interrupting rating] [as indicated]. Provide copper buses.

2.19.2 Devices

Provide switches, circuit breakers, switchgear, fuses, relays, and other protective devices as specified in Section 26 28 01.00 10 COORDINATED POWER SYSTEM PROTECTION.

Furnish with respective pieces of equipment. Motors, controllers, contactors, and disconnects must conform to Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide electrical connections under Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide controllers and contactors with maximum of 120-volt control circuits, and auxiliary contacts for use with controls furnished. When motors and equipment furnished are larger than size indicated, the cost of providing additional electrical service and related work must be included under this section.

2.20 SAFETY SYSTEM

Provide and install devices, wiring, remote panels, and local panels, etc., as a complete system to automatically activate the appropriate signals and initiate the appropriate actions. Provide a safety system with a self-test method to verify its operability. Provide alarm signals that have manual acknowledgment and reset devices. The alarm signal systems must reactivate for new signals after acknowledgment is given to any signal. Configure the systems so that loss of any monitoring device will be dealt with as an alarm on that system element.

2.20.1 Audible Signal

******************************************************************************
NOTE: High dB levels are required for alarms located near engine. Specify over 100 dB for engine room application and show alarm location.
******************************************************************************

Provide audible alarm signal sound at a frequency of [70] [_____] Hz at a volume of [_____] [75] dB at 3.1 m 10 feet. The sound must be continuously activated upon alarm and silenced upon acknowledgment. Locate signal devices as shown.

2.20.2 Visual Signal

The visual alarm signal must be a panel light. The light must be normally off, activated to be blinking upon alarm. The light must change to continuously lit upon acknowledgement. If automatic shutdown occurs, the display must maintain activated status to indicate the cause of failure and must not be reset until cause of alarm has been cleared and/or restored to normal condition. Shutdown alarms must be red; all other alarms must be amber.
2.20.3 Alarms and Action Logic

2.20.3.1 Shutdown

Accomplish simultaneous activation of the audible signal, activation of the visual signal, stopping the engine, and opening the generator main circuit breakers.

2.20.3.2 Problem

Accomplish activation of the visual signal.

2.20.4 Safety Indications and Shutdowns

**************************************************************************

NOTE: The designer must provide design features in accordance with the requirements of NFPA 70 and NFPA 99 for medical facilities. The designer must provide design features in accordance with the requirements of NFPA 70 and NFPA 110 for emergency and standby applications. For emergency and standby applications select either Level 1 or Level 2. Level 1 defines the most stringent equipment performance requirements for applications where the failure of the equipment to perform could result in loss of human life or serious injury. Level 2 defines equipment performance where failure of the equipment to operate is less critical to human life. Edit the table to include all required shutdowns and alarms. Delete optional alarms which are not required. Delete all columns except the first column and the appropriate code reference column. Add necessary parameters to define critical limits for alarms or shutdown.

For example, references to day tanks should be removed if integral main fuel storage tanks are used.

Provide a local alarm panel with the following shutdown and alarm functions [as indicated] [in accordance with NFPA 99] [NFPA 110 level [1] [2]] mounted either on or adjacent to the engine generator set.

**************************************************************************

NOTE: Depending on the application, a remote alarm panel may also be required. The Remote Alarm Panel should be shown on the drawings. Delete remote alarm panel where not required. Select the first option if the application is prime power plant. For prime power units provide panel elevations depicting desired configurations, together with a listing of alarms and instruments. Select the second option for engine generator sets utilized on emergency or standby applications. The designer must provide design features in accordance with the requirements of NFPA 70, and NFPA 99 for medical facilities. The designer must provide design features in accordance with the requirements of NFPA 70 and NFPA 110 for emergency and standby applications. A remote panel is required for NFPA 99 and NFPA 110, Level 1.
applications. A remote panel is not required for NFPA 110, Level 2 applications. Edit the table to include all required alarms. Delete optional alarms which are not required. Delete all columns except the first column and the appropriate code reference column. Add necessary parameters where required to define critical limits for alarms.

A remote alarm panel is [is not] required for audible alarms, e.g., in the control room.

**Symbology:**
CV: Control panel-mounted visual.
S: Shutdown of EPS indication.
RA: Remote audible.

Provide panel as specified in paragraph PANELS and provide controls, gauges, meters, and displays to include:

a. Frequency meters, dial type, with a range of 90 to 110 percent of rated frequency. Do not use vibrating-reed type meters. One must monitor

---

**2.20.5 Time-Delay on Alarms**

For startup of the engine-generator set, install time-delay devices bypassing the low lubricating oil pressure alarm during cranking, and the coolant-fluid outlet temperature alarm. Submit the magnitude of monitored values which define alarm or action set points, and the tolerance (plus and/or minus) at which the devices activate the alarm or action for items contained within the alarm panels. The lube-oil time-delay device must return its alarm to normal status after the engine starts. The coolant time-delay device must return its alarm to normal status 5 minutes after the engine starts.

**2.21 SYNCHRONIZING PANEL**

**************************************************************************
NOTE: Delete the Synchronizing Panel if no parallel service is intended. All panels except the remote panel can be combined into a single panel paragraph.
**************************************************************************
generator output frequency ("Generator Frequency Meter") and the other must monitor the frequency of the parallel source ("Bus Frequency Meter").

b. Voltmeters, ac, dial type, 3-phase, with 4-position selector switch for the generator output ("Generator Volt Meter") and for the parallel power source ("Bus volt meter").

c. Automatic synchronizer.

d. Manual synchronizing controls.

e. Indicating lights for supplementary indication of synchronization.

f. Synchroscope.

g. Wattmeter, indicating.

2.22 PANELS

**************************************************************************
NOTE: All panels except the remote panel can be combined into a single panel paragraph.

Provide a panel-mounting location and detail for panels not mounted on the engine-generator base. The designer may elect other locations such as adjacent to engine-generator set, in the generator enclosure, in or on the exciter-regulator cabinet, or in or on the switchgear enclosure. Provide panel nameplate and instrument nameplate unique identifiers or user preferred identifiers. Provide sizes, materials and attachment preferences.

Delete either the "analog" or "electronic instruments" paragraph.
**************************************************************************

Each panel must be of the type and kind necessary to provide specified functions. Mount panels [on the engine-generator set base by vibration/shock absorbing type mountings] [as shown]. Mount instruments flush or semiflush. Provide convenient access to the back of panels to facilitate maintenance. Calibrate instruments using recognized industry calibration standards. Provide a panel identification plate identifying the panel function. Provide a plate identifying the device and its function for each instrument and device on the panel. Provide switch plates identifying the switch-position function.

2.22.1 Enclosures

Design enclosures for the application and environment, conforming to NEMA ICS 6. Locking mechanisms [are optional.] [must be keyed alike.]

Provide for each engine-generator set and fabricate from zinc coated or phosphatized and shop primed 16 gage minimum sheet steel in accordance with the manufacturer's standard design. Provide a complete, weatherproof enclosure for the engine, generator, and auxiliary systems and equipment. Support exhaust piping and silencer so that the turbocharger is not subjected to exhaust system weight or lateral forces generated in
connecting piping that exceed the engine manufacturer's maximum allowed forces and moments. The housing must have sufficient louvered openings to allow entrance of outside air for engine and generator cooling at full load. Design louvered openings to exclude driving rain and snow. Provide properly arranged and sized, hinged panels in the enclosure to allow convenient access to the engine, generator, and control equipment for maintenance and operational procedures. Provide hinged panels with spring type latches which must hold the panels closed securely and will not allow them to vibrate. Brace the housing internally to prevent excessive vibration when the set is in operation.

2.22.2 Analog

Provide analog electrical indicating instruments in accordance with UL 1437 with semi-flush mounting. Switchboard, switchgear, and control-room panel-mounted instruments must have 250 degree scales with an accuracy of not less than 99 percent. Unit-mounted instruments must have 100 degree scales with an accuracy of not less than 98 percent. The instrument's operating temperature range must be minus 20 to plus 65 degrees C minus 4 to plus 158 degrees F. Distorted generator output voltage waveform of a crest factor less than 5 must not affect metering accuracy for phase voltages, hertz and amps.

2.22.3 Electronic

Electronic indicating instruments must be true RMS indicating instruments, 100 percent solid state, state-of-the-art, microprocessor controlled to provide specified functions. Provide control, logic, and function devices that are compatible as a system, sealed, dust and water tight, and that utilize modular components with metal housings and digital instrumentation. Provide an interface module to decode serial link data from the electronic panel and translate alarm, fault and status conditions to set of relay contacts. Instrument accuracy less than 98 percent for unit mounted devices and 99 percent for control room, panel mounted devices, throughout a temperature range of minus 20 to plus 65 degrees C minus 4 to 158 degrees F is not acceptable. Provide LED or back lit LCD data display. Additionally, the display must provide indication of cycle programming and diagnostic codes for troubleshooting. Numeral height must be [13 mm 0.5 inch] [_____

2.22.4 Parameter Display

Provide indication or readouts of the tachometer, lubricating-oil pressure, ac voltmeter, ac ammeter, frequency meter, and safety system parameters. Specify a momentary switch for other panels.

2.23 SURGE PROTECTION

Electrical and electronic components must be protected from, or designed to withstand the effects of surges from switching and lightning.

2.24 AUTOMATIC ENGINE-GENERATOR-SET SYSTEM OPERATION

**************************************************************************
NOTE: Automatic operation is for standby. For hospital emergency/standby requirements, an emergency power plant of sufficient capacity to handle the essential load must be provided, arranged to operate automatically with the failure or

SECTION 26 32 15.00 Page 84
restoration of normal current. Delete automatic paralleling and loading where not required. Adapt to fit application and provide desired actuation sequence.

Provide fully automatic operation for the following operations: engine-generator set starting and load transfer upon loss of [normal] [preferred] source; retransfer upon restoration of the [normal] [preferred] source; sequential starting; paralleling, and load-sharing for multiple engine-generator sets; and stopping of each engine-generator set after cool-down. Devices must automatically reset after termination of their function.

2.24.1 Automatic Transfer Switch

Provide automatic transfer switches in accordance with Section 26 36 23 AUTOMATIC TRANSFER SWITCH AND BY-PASS/ISOLATION SWITCH.

2.24.2 Monitoring and Transfer

Provide devices to monitor voltage and frequency for the [normal] [preferred] power source and each engine-generator set, and control transfer from the [normal] [preferred] source and retransfer upon restoration of the [normal] [preferred] source. Describe functions, actuation, and time delays as described in Section 26 36 23 AUTOMATIC TRANSFER SWITCH AND BY-PASS/ISOLATION SWITCH.

2.24.3 Automatic Paralleling and Loading of Engine-Generator Sets

Provide an automatic loading system to load and unload engine-generator sets in the sequence indicated. Monitor the system load and cause additional engine-generator sets to start, synchronize, and be connected in parallel with the system bus with increasing load. Actuation of the additional engine-generator set start logic must occur when the load exceeds a percentage set-point of the operating set's rating for a period of approximately 10 seconds. Provide an adjustable set-point range from 50 to 100 percent. When the system load falls below the percentage set-point of the operating set's rating for a period of approximately [_____] the controller must unload and disconnect engine-generator sets from the system, stopping each engine-generator set after cool-down.

2.25 MANUAL ENGINE-GENERATOR-SET SYSTEM OPERATION

******************************************************************************

NOTE: Delete synchronization for non-parallel operation.
******************************************************************************

Provide complete facilities for manual starting and testing of each set without load, loading and unloading of each set, and synchronization of each set with an energized bus.

2.26 STATION BATTERY SYSTEM

******************************************************************************

NOTE: The station battery system should be shown on the drawings.
******************************************************************************
Delete this requirement when not needed. A station battery is required only when dc-operated devices other than engine starting motors are provided. The station battery and starting battery may be combined where all dc-operated devices are the same voltage level and are not affected by the voltage drop caused by engine starting. Because lead calcium batteries are more economical and require less maintenance, nickel cadmium batteries should be specified only where very high discharge rate with constant voltage over a short period of time is required, or for applications where the battery temperature cannot be maintained above minus 6 degrees C 22 degrees F. Slush does not begin to form in lead acid batteries until the temperature reaches minus 29 degrees C minus 20 degrees F, but the battery voltage output and current capacity fall below useful values at minus 6 degrees C 22 degrees F. The designer should provide measures to maintain battery temperature between 16 and 32 degrees C 60 and 90 degrees F; 25 degrees C 77 degrees F is the target temperature for optimum service life and performance. The engine starting battery for smaller size sets is sufficient for dc requirements and a station battery is not required.

Define loads which are to be served by the station battery.

Calculations of battery capacity utilize a median temperature of 25 degrees C 77 degrees F. If the predominate battery operating temperature varies by more than plus or minus 2.5 degrees C plus or minus 5 degrees F from 25 degrees C 77 degrees F, specify the median operating temperature.

**************************************************************************

Provide a station battery system including the battery, battery rack, spacers, automatic battery charger and distribution panelboard with overcurrent protection, metering and relaying. Size components to withstand the seismic acceleration forces specified. Provide batteries that have a rated life of 20 years and a manufacturer's 5-year, no cost replacement guarantee.

2.26.1 Battery

Provide [lead-acid] [nickel-cadmium] battery sized in accordance with IEEE 485 and conforming to the requirements of IEEE 484. Valve-regulated lead-acid batteries are not acceptable. Provide battery environment temperature range between [_____] and [_____] degrees. The battery must be rated for at least [_____] ampere hours at the 8-hour rate.

2.26.2 Battery Capacity

**************************************************************************

NOTE: Delete loads which are not to be served from the Station Battery System. Add the following load for engine-generators 1000 kW and larger: precirculating lube-oil pumps for diesels for...
The battery must be rated for at least [_____] ampere hours at the 8-hour rate, and must have sufficient capacity to serve the following loads without recharging for a period of [_____] hours. At the end of the discharge period, the battery must have the capacity to simultaneously close and trip all the circuit breakers provided, based on a 1-minute load to final voltage of [_____] volts per cell.

a. Diesel-generator safety circuits.

b. Switchgear indicating lights, control relays, protective relays, and other switchgear dc components as required for 24 hours.

c. Voltage regulator (dc power supplies).

d. Emergency-lighting and power load at [_____] watts for [_____] hours.

2.26.3 Battery Charger

Furnish a current-limiting, [_____]-volt battery charger to automatically recharge the batteries. Provide a charger that is capable of an equalize charging rate [for recharging fully depleted batteries within [8] [_____] hours] [which is continuously adjustable] and a floating-charge rate for maintaining the batteries in a fully charged condition. Equip the charger with a low-voltage alarm relay, 0- to 24-hour equalizing timer, an ammeter to indicate charging rate, and necessary circuit breakers. The charger must conform to the requirements of UL 1236. A battery is considered to be fully depleted when the voltage falls to a level incapable of operating the equipment loads served by the battery.

2.27 BASE

Provide a steel base. Design the base to rigidly support the engine-generator set, ensure permanent alignment of rotating parts, be arranged to provide easy access to allow changing of lube-oil, and ensure that alignment is maintained during shipping and normal operation. The base must permit skidding in any direction during installation and must withstand and mitigate the affects of synchronous vibration of the engine and generator. Provide base with [suitable holes for anchor bolts] [_____] diameter holes for anchor bolts] and jacking screws for leveling.

2.28 THERMAL INSULATION

Provide thermal insulation as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

2.29 PAINTING AND FINISHING

Clean, prime and paint the engine-generator set in accordance with the manufacturer's standard color and practice.

2.30 FACTORY INSPECTION AND TESTS

Submit [six] [_____] complete reproducible copies of the factory inspection result on the checklist format specified below. Perform the factory tests on each engine-generator set. The component manufacturer's production line test is acceptable as noted. Run each engine-generator set for at least 1
hour at rated output capacity prior to inspections. Complete inspections and make all necessary repairs prior to testing. Use engine generator controls and protective devices that are provided by the generator set manufacturer as part of the standard package for factory tests. When controls and switchgear are not provided as part of the generator set manufacturer's standard package, the actual controls and protective devices provided for the project are not required to be used during the factory test. The Contracting Officer may provide one or more representatives to witness inspections and tests.

2.30.1 Factory Inspection

**************************************************************************
NOTE: Delete inapplicable inspection items.
**************************************************************************

Perform inspections prior to beginning and after completion of testing of the assembled engine-generator set. Look for leaks, looseness, defects in components, proper assembly, etc. and note any item found to be in need of correction as a necessary repair. Use the following checklist for the inspection:

<table>

2.30.2 Factory Tests

**************************************************************************

NOTE: For dual fuel units, choose the fuel type to be used for the factory test. Decision should be based on providing satisfactory operation with the fuel which has the lowest heat value or on the fuel which presents the factors critical to satisfactory operation.

Delete Voltage Waveform tests for general purpose and commercial application categories.
Delete the Frequency and Voltage Stability and Transient Response Test for general-purpose and commercial-type applications. Perform this test either as a factory test or a field test (delete it from either the factory or field testing). This is not a standard manufacturer's test and requires most manufacturers to procure additional equipment (large reactive load banks) to test engine-generators over 1000 kW. Perform as a field test where required to ensure system operability using project loads. Revise the test steps to delete steps where the Maximum Step Increase is larger than final load to be placed on the engine-generator.

Voltage Unbalance with Unbalanced Load Test is not a standard manufacturer's test. Delete the test for applications where only balanced three phase loads are served.

Delete parallel operation where not required.

**************************************************************************
Submit a letter giving notice of the proposed dates of factory inspections and tests at least 14 days prior to beginning tests, including:

a. A detailed description of the manufacturer's procedures for factory tests at least [14] [_____] days prior to beginning tests.

b. [Six] [_____] copies of the Factory Test data described below in 216 by 279 mm 8-1/2 by 11 inch binders having a minimum of 3 rings from which material may readily be removed and replaced, including a separate section for each test. Separate sections by heavy plastic dividers with tabs. Provide full size (216 by 279 mm 8-1/2 by 11 inch minimum) data plots showing grid lines, with full resolution.

   (1) A detailed description of the procedures for factory tests.

   (2) A list of equipment used, with calibration certifications.

   (3) A copy of measurements taken, with required plots and graphs.

   (4) The date of testing.

   (5) A list of the parameters verified.

   (6) The condition specified for the parameter.

   (7) The test results, signed and dated.

   (8) A description of adjustments made.

On engine-generator set tests where the engine and generator are required to be connected and operated together, the load power factor must be [the power factor specified in the engine generator set parameter schedule] [_____] power factor]. For engine-generator set with dual-fuel operating capability, perform the following tests using [the primary fuel type] [_____] type fuel]. Perform electrical measurements in accordance with IEEE 120. Temperature limits in the rating of electrical equipment and for
the evaluation of electrical insulation must be in accordance with IEEE 1.
In the following tests where measurements are to be recorded after
stabilization of an engine-generator set parameter (voltage, frequency,
current, temperature, etc.), stabilization is considered to have occurred
when measurements are maintained within the specified bandwidths or
tolerances, for a minimum of four consecutive readings. Tests specifically
for the generator may be performed utilizing any prime mover.

a. Insulation Resistance for Stator and Exciter Test, IEEE 115 and IEEE 43,
to the performance criteria in NEMA MG 1, Part 22. Generator
manufacturer's production line test is acceptable.

b. High Potential Test, in accordance with IEEE 115 and NEMA MG 1, test
t voltage in accordance with NEMA MG 1. Generator manufacturer's
production line test is acceptable.

c. Winding Resistance Test, Stator and Exciter, in accordance with IEEE 115.
Generator manufacturer's production line test is acceptable.

d. Phase Balance Voltage Test, to the performance criteria specified in
paragraph GENERATOR. This test can be performed with any prime mover.
Generator manufacturer's production line test results are acceptable.

(1) Start and operate the generator at no load.

(2) Adjust a regulated phase voltage (line-to-neutral) to rated
voltage.

(3) Read and record the generator frequency, line-to-neutral
voltages, and the line-to-line voltages.

(4) Apply 75 percent rated load and record the generator frequency,
line-to-neutral voltages, and the line-to-line voltages.

(5) Apply rated load and record the generator frequency,
line-to-neutral voltages, and the line-to-line voltages.

(6) Calculate average line-neutral voltage and percent deviation of
individual line-neutral voltages from average for each load
condition.

e. Current Balance on Stator Winding Test, by measuring the current on
each phase of the winding with the generator operating at 100 percent
of Rated Output Capacity, with the load impedance equal for each of the
three phases: to the performance criteria specified in paragraph
GENERATOR.

f. Voltage Waveform Deviation and Distortion Test in accordance with
IEEE 115 to the performance criteria specified in paragraph GENERATOR.
Use high-speed recording instruments capable of recording voltage
waveform deviation and all distortion, including harmonic distortion.
Include appropriate scales to provide a means to measure and interpret
results.

g. Voltage and Frequency Droop Test. Verify that the output voltage and
frequency are within the specified parameters as follows:

(1) With the generator operating at no load, adjust voltage and
frequency to rated voltage and frequency. Record the generator
output frequency and line-line and line-neutral voltages.

(2) Increase load to Rated Output Capacity. Record the generator output frequency and line-line and line-neutral voltages.

(3) Calculate the percent droop for voltage and frequency with the following equations:

\[
\text{Voltage droop percent} = \frac{(\text{No-Load Volts}) - (\text{Rated Capacity Volts})}{(\text{Service-Load Volts})} \times 100
\]

\[
\text{Frequency droop percent} = \frac{(\text{No-Load Hertz}) - (\text{Rated Capacity Hertz})}{(\text{Service-Load Hertz})} \times 100
\]

(4) Repeat steps 1 through 3 two additional times without making any adjustments.

h. Frequency and Voltage Stability and Transient Response. Verify that the engine-generator set responds to addition and dropping of blocks of load in accordance with the transient response requirements. Document maximum voltage and frequency variation from bandwidth and verify that voltage and frequency return to and stabilize within the specified bandwidth, within the specified response time period. Document results in tabular form and with high resolution, high speed strip chart recorders or comparable digital recorders, as approved by the Contracting Officer. Include the following tabular data:

(1) Ambient temperature (at 15 minute intervals).

(2) Generator output current (before and after load changes).

(3) Generator output voltage (before and after load changes).

(4) Frequency (before and after load changes).

(5) Generator output power (before and after load changes).

(6) Graphic representations must include the actual instrument trace of voltage and frequency showing: charts marked at start of test; observed steady-state band; mean of observed band; momentary overshoot and undershoot (generator terminal voltage and frequency) and recovery time for each load change together with the voltage and frequency maximum and minimum trace excursions for each steady state load condition prior to and immediately following each load change. Generator terminal voltage and frequency transient recovery time for each step load increase and decrease.

(a) Perform and record engine manufacturer's recommended pre-starting checks and inspections.

(b) Start the engine, make and record engine manufacturer's after-starting checks and inspections during a reasonable warm-up period and no load. Verify stabilization of voltage and frequency within specified bandwidths.
(c) With the unit at no load, apply the Maximum Step Load Increase.

******************************************************************************
NOTE: For applications where the Maximum Step Load Increase is 100 percent, delete steps 4., 5., and 6.
******************************************************************************

(d) Apply load in steps equal to the Maximum Step Load Increase until the addition of one more step increase will exceed the Service Load.

(e) Decrease load to the unit such that addition of the Maximum Step Load Increase will load the unit to 100 percent of Service Load.

(f) Apply the Maximum Step Load Increase.

(g) Decrease load to zero percent in steps equal to the Maximum Step Load Decrease.

(h) Repeat steps (c) through (g).

j. Test Voltage Unbalance with Unbalanced Load (Line-to-Neutral) to the performance criteria specified in paragraph GENERATOR. Prototype test data is acceptable in lieu of the actual test. Submit manufacturer's standard certification that prototype tests were performed for the generator model proposed. This test may be performed using any prime mover.

(1) Start and operate the generator set at rate voltage, no load, rated frequency, and under control of the voltage regulator. Read and record the generator frequency, line-to-neutral voltages, and the line-to-line voltages.

(2) Apply the specified load between terminals L₁-L₂, L₂-L₀, and L₃-L₀ in turn. Record all instrument readings at each line-neutral condition.

(3) Express the greatest difference between any two of the line-to-line voltages and any two of the line-to-neutral voltages as a percent of rated voltage.

(4) Compare the largest differences expressed in percent with the maximum allowable difference specified.

PART 3 EXECUTION

******************************************************************************
NOTE: Provide an equipment layout on the plans, which provides the clear space for operation and maintenance in accordance with NFPA 70 and IEEE C2. Include requirements for a staging/laydown area for disassembly or removal and replacement of major parts of the engine-generator. Additionally, it is advisable to provide access to remove the unit and/or major parts of equipment from the room and building either through doors/passageways or equipment hatches.

SECTION 26 32 15.00 Page 93
3.1 EXAMINATION

After becoming familiar with all details of the job, perform a Site Visit to verify the information shown on the drawings, before performing any work. Submit a letter stating the date the site was visited and listing discrepancies found. Notify the Contracting Officer in writing of any discrepancies.

3.2 GENERAL INSTALLATION

Provide clear space for operation and maintenance in accordance with NFPA 70 and IEEE C2. Submit a copy of the manufacturer's installation procedures and a detailed description of the manufacturer's recommended break-in procedure. Install pipe, duct, conduit, and ancillary equipment to facilitate easy removal and replacement of major components and parts of the engine-generator set.

3.3 PIPING INSTALLATION

Weld piping. Provide flanged valve connections. Provide flanged connections at equipment. Provide threaded connections to the engine if the manufacturer's standard connection is threaded. Except where otherwise specified, use welded flanged fittings to allow for complete dismantling and removal of each piping system from the facility without disconnecting or removing any portion of any other system's equipment or piping. Make connections to equipment with vibration isolation-type flexible connectors. Support and align piping and tubing to prevent stressing of flexible hoses and connectors. Flash pipes extending through the roof. Install piping clear of windows, doors and openings, to permit thermal expansion and contraction without damage to joints or hangers, and install a 13 mm 1/2 inch drain valve with cap at each low point.

The installation of gas engines must conform to the requirements of NFPA 37 and its references therein, including NFPA 54, NFPA 58, and ASME B31.3.

3.3.1 Support

Provide hangers, inserts, and supports to accommodate any insulation and conforming to MSS SP-58. Space supports no more than 2.1 m 7 feet on center for pipes 50 mm 2 inches in diameter or less, no more than 3.6 m 12 feet on center for pipes larger than 50 mm 2 inches but smaller than 100 mm 4 inches in diameter, and not more than 5.2 m 17 feet on center for pipes larger than 100 mm 4 inches in diameter. Provide supports at pipe bends or change of direction.

3.3.1.1 Ceiling and Roof

Support exhaust piping with appropriately sized Type 41 single pipe roll and threaded rods; support all other piping with appropriately sized Type 1 clevis and threaded rods.

3.3.1.2 Wall

Make wall supports for pipe by suspending the pipe from appropriately sized Type 33 brackets with the appropriate ceiling and roof pipe supports.
3.3.2 Flanged Joints

Provide flanges that are Class 125 type, drilled, and of the proper size and configuration to match the equipment and engine connections. Provide gasketed flanged joints that are square and tight.

3.3.3 Cleaning

After fabrication and before assembly, piping interiors must be manually wiped clean of debris.

3.3.4 Pipe Sleeves

Fit pipes passing through construction such as ceilings, floors, or walls with sleeves. Extend each sleeve through and fasten in its respective structure and cut flush with each surface. Build the structure tightly to the sleeve. The inside diameter of each sleeve must be minimum 13 mm 1/2 inch, and where pipes pass through combustible materials 25 mm 1 inch larger than the outside diameter of the passing pipe or pipe insulation/covering.

3.4 ELECTRICAL INSTALLATION

Perform electrical installation in compliance with NFPA 70, IEEE C2, and Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. For vibration isolation, provide flexible fittings for conduit, cable trays, and raceways attached to engine-generator sets; provide flexible stranded conductor for metallic conductor cables installed on the engine generator set and from the engine generator set to equipment not mounted on the engine generator set; and provide crimp-type terminals or lugs for terminations of conductors on the engine generator set.

3.5 FIELD PAINTING

**************************************************************************
NOTE: For Air Force work, add that the exterior of all equipment must be finished in the base standard color.
**************************************************************************

Perform field painting as specified in Section 09 90 00 PAINTS AND COATINGS.

3.6 ONSITE INSPECTION AND TESTS

**************************************************************************
NOTE: Include the bracketed option below for projects located outside the continental United States (OCONUS).
**************************************************************************

Perform and report on factory tests and inspections prior to shipment. Provide certified copies of manufacturer's test data and results. Test procedures must conform to ASME, IEEE, [IEC,] and ANSI standards, and to ISO requirements on testing, as appropriate and applicable. The manufacturer performing the tests must provide equipment, labor, and consumables necessary for tests and measuring and indicating devices must be certified to be within calibration. Tests must indicate satisfactory operation and attainment of specified performance. If satisfactory, equipment tested will be given a tentative approval. Equipment must not be
shipped before approval of the factory test reports for the following tests.

Submit a letter giving notice of the proposed dates of onsite inspections and tests at least [14] [_____] days prior to beginning tests.

a. Submit a detailed description of the Contractor's procedures for onsite tests including the test plan and a listing of equipment necessary to perform the tests at least [_____] days prior to beginning tests.

b. Submit [six] [_____] copies of the onsite test data described below in 216 by 279 mm 8-1/2 by 11 inch binders having a minimum of 3 rings from which material may readily be removed and replaced, including a separate section for each test. Separate sections by heavy plastic dividers with tabs. Provide full size (216 by 279 mm 8-1/2 by 11 inch minimum) data plots showing grid lines, with full resolution.

(1) A detailed description of the procedures for onsite tests.
(2) A list of equipment used, with calibration certifications.
(3) A copy of measurements taken, with required plots and graphs.
(4) The date of testing.
(5) A list of the parameters verified.
(6) The condition specified for the parameter.
(7) The test results, signed and dated.
(8) A description of adjustments made.

3.6.1 Test Conditions

3.6.1.1 Data

Make and record measurements of all parameters necessary to verify that each set meets specified parameters. If the results of any test step are not satisfactory, make adjustments, replacements, or repairs and repeat the step until satisfactory results are obtained. Unless otherwise indicated, record data in 15 minute intervals during engine-generator set operation and include: readings of all engine-generator set meters and gauges for electrical and power parameters; oil pressure; ambient temperature; and engine temperatures available from meters and gauges supplied as permanent equipment on the engine-generator set. Perform electrical measurements in accordance with IEEE 120. Definitions of terms are in accordance with IEEE 100. Provide temperature limits in the rating of electrical equipment and for the evaluation of electrical insulations in accordance with IEEE 1.

3.6.1.2 Power Factor

Submit the generator capability curve showing generator kVA output capability (kW vs. kvar) for both leading and lagging power factors ranging from 0 to 1.0. For all engine-generator set operating tests the load power factor must be [the power factor specified in the engine-generator set parameter schedule] [[_____] power factor].
3.6.1.3 Contractor Supplied Items

Provide equipment and supplies required for inspections and tests including fuel, test instruments, and loadbanks at the specified power factors.

3.6.1.4 Instruments

Verify readings of panel gauges, meters, displays, and instruments provided as permanent equipment during test runs, using test instruments of greater precision and accuracy. Test instrument accuracy must be within the following: current plus or minus 1.5 percent, voltage plus or minus 1.5 percent, real power plus or minus 1.5 percent, reactive power plus or minus 1.5 percent, power factor plus or minus 3 percent, frequency plus or minus 0.5 percent. Calibrate test instruments by a recognized standards laboratory within 30 days prior to testing.

3.6.1.5 Sequence

Provide the sequence of testing as specified in the approved testing plan unless variance is authorized by the Contracting Officer. Perform field testing in the presence of the Contracting Officer. Schedule and sequence tests in order to optimize run-time periods; however, follow the general order of testing: Construction Tests; Inspections; Pre-operational Tests; Safety Run Tests; Performance Tests; and Final Inspection.

3.6.2 Construction Tests

**************************************************************************
NOTE: Coordinate the construction test requirements with the other specification sections to eliminate redundant tests and provide additional reference to necessary tests.
**************************************************************************

Perform individual component and equipment functional tests for fuel piping, coolant piping, and lubricating-oil piping, electrical circuit continuity, insulation resistance, circuit protective devices, and equipment not provided by the engine-generator set manufacturer prior to connection to the engine-generator set.

3.6.2.1 Piping Test

a. Flush lube-oil and fuel-oil piping with the same type of fluid intended to flow through the piping, until the outflowing fluid has no obvious sediment or emulsion.

b. Test fuel piping which is external to the engine-generator set in accordance with NFPA 30. Pressure all remaining piping which is external to the engine-generator set with air pressure at 150 percent of the maximum anticipated working pressure, but not less than 1.03 MPa (150 psi), for a period of 2 hours to prove the piping has no leaks. If piping is to be insulated, perform the test before the insulation is applied.

3.6.2.2 Electrical Equipment Tests

**************************************************************************
NOTE: Delete ground resistance tests where covered by other project specifications, or where no grounds
**************************************************************************
Perform low-voltage cable insulation integrity tests for cables connecting the generator breaker to the [automatic transfer switch] [panelboard] [main disconnect switch] [distribution bus] [____]. Test low-voltage cable, complete with splices, for insulation resistance after the cables are installed, in their final configuration, ready for connection to the equipment, and prior to energization. Apply a test voltage of 500 volts dc for one minute between each conductor and ground and between all possible combinations conductors in the same trench, duct, or cable, with all other conductors in the same trench, duct, or conduit. Provide the minimum value of insulation as follows:

1. \( R \) in meg-ohms = \( \frac{(\text{rated voltage in kV plus 1}) \times 304.8}{\text{length of cable in meters}} \)
2. \( R \) in meg-ohms = \( \frac{(\text{rated voltage in kV plus 1}) \times 1000}{\text{length of cable in feet}} \)
3. Each cable failing this test must be repaired or replaced. The repair cable must be retested until failures have been eliminated.

Perform medium-voltage cable insulation integrity tests for cables connecting the generator breaker to the [generator switchgear] [main disconnect switch] [distribution bus]. After installation and before the operating test or connection to an existing system, perform a high potential test on the medium-voltage cable system. Apply direct-current voltage on each phase conductor of the system by connecting conductors as one terminal and connecting grounds of metallic shields or sheaths of the cable as the other terminal for each test. Prior to making the test, isolate the cables by opening applicable protective devices and disconnecting equipment. Conduct the test with all splices, connectors, and terminations in place. Provide the method, voltage, length of time, and other characteristics of the test for initial installation in accordance with [NEMA WC 74/ICEA S-93-639] [____] for the particular type of cable installed, except provide 28kV and 35kV insulation test voltages in accordance with either AEIC CS8 or AEIC CS8 as applicable, and do not exceed the recommendations of IEEE 404 for cable joints and IEEE 48 for cable terminations unless the cable and accessory manufacturers indicate higher voltages are acceptable for testing. Should any cable fail due to a weakness of conductor insulation or due to defects or injuries incidental to the installation or because of improper installation of cable, cable joints, terminations, or other connections, make necessary repairs or replace cables as directed. Retest repaired or replaced cables.

c. Ground-Resistance Tests. Measure the resistance of [each grounding electrode] [each grounding electrode system] [the ground mat] [the ground ring] using the fall-of-potential method defined in IEEE 81. On systems consisting of interconnected ground rods, perform tests after interconnections are complete. Take measurements in normally dry weather, not less than 48 hours after rainfall. Provide site diagram indicating location of test probes with associated distances, and provide a plot of resistance vs. distance. The combined resistance of separate systems may be used to meet the requirements resistance, but the specified number of electrodes must still be provided as follows:

(2) Multiple rod electrodes - [_____] ohms.

(3) Ground mat - [_____] ohms.

d. Examine and test circuit breakers and switchgear in accordance with the manufacturer's published instructions for functional testing.

3.6.3 Inspections

Perform the following inspections jointly by the Contracting Officer and the Contractor, after complete installation of each engine-generator set and its associated equipment, and prior to startup of the engine-generator set. Submit a letter certifying that all facilities are complete and functional; that each system is fully functional; and that each item of equipment is complete, free from damage, adjusted, and ready for beneficial use. Perform checks applicable to the installation. Document and submit the results of those which are physical inspections (I) in accordance with paragraph SUBMITTALS. Present manufacturer's data for the inspections designated (D) at the time of inspection. Verify that equipment type, features, accessibility, installation and condition are in accordance with the contract specification. Provide manufacturer's statements to certify provision of features which cannot be verified visually.

3.6.4 **Engine Tests**

Perform customary commercial factory tests in accordance with ISO 3046 on...
each engine and associated engine protective device, including, but not limited to the following:

a. Perform dynamometer test at rated power. Record horsepower at rated speed and nominal characteristics such as lubricating oil pressure, jacket water temperature, and ambient temperature.

b. Test and record the values that the low oil pressure alarm and protective shutdown devices actuate prior to assembly on the engine.

c. Test and record values that the high jacket water temperature alarm and protective shutdown devices actuate prior to assembly on the engine.

3.6.5 Generator Tests

**************************************************************************
NOTE: Include the bracketed option below for projects located outside the continental United States (OCONUS).
**************************************************************************

Tests must be performed on the complete factory assembled generator prior to shipment. Conduct tests in accordance with IEEE 115[, IEC 60034-2A] and NEMA MG 1.

3.6.5.1 Routine Tests

Perform the following routine tests on the generators and their exciters:

a. Resistance of armature and field windings.

b. Mechanical balance.

c. Phases sequence.

d. Open circuit saturation curve and phase (voltage) balance test.

e. Insulation resistance of armature and field windings.

f. High potential tests.

3.6.5.2 Design Tests

Submit the following design tests made on prototype machines that are physically and electrically identical to the generators specified.

a. Temperature rise test

b. Short circuit saturation curve and current balance test

3.6.6 Assembled Engine-Generator Set Tests

**************************************************************************
NOTE: Select the first option for engine-generator sets rated up to 250 kW. Select the second option for engine-generator sets rated greater than 250 kW.
**************************************************************************

[Submit the following tests made on prototype machines that are physically
3.6.6.1 Initial Stabilization Readings

Operate the engine-generator set and allow the set to stabilize at rated kW at rated power factor, rated voltage, and rated frequency. During this period record instrument readings for output power (kW), terminal voltage, line current, power factor, frequency (rpm) generator (exciter) field voltage and current, lubricating oil pressure, jacket water temperature, and ambient temperature at minimum intervals of 15 minutes. Adjust the load, voltage, and frequency to maintain rated load at rated voltage and frequency. Adjustments to load, voltage, or frequency controls must be recorded on the data sheet at the time of adjustment. Stabilization must be considered to have occurred when four consecutive voltage and current recorded readings of the generator (or exciter) field either remain unchanged or have only minor variations about an equilibrium condition with no evident continued increase or decrease in value after the last adjustment to the load, voltage, or frequency has been made.

3.6.6.2 Regulator Range Test

Remove load and record instrument readings (after transients have subsided). Adjust voltage to the maximum attainable value or to a value just prior to actuation of the overvoltage protection device. Apply rated load and adjust voltage to the minimum attainable value or a value just prior to activation of the under-voltage protection device. The data sheets must indicate the voltage regulation as a percent of rated voltage and the maximum and minimum voltages attainable. Voltage regulation must be defined as follows:

\[
\text{Percent Regulation} = \frac{(\text{No-Load Voltage}) - (\text{Rated-Load Voltage})}{(\text{Rated-Load Voltage})} \times 100
\]

3.6.6.3 Frequency Range Test

Adjust the engine-generator set frequency for the maximum attainable frequency at rated load. Record instrument readings. Adjust the engine-generator set frequency for the specified minimum attainable frequency at rated load. Record instrument readings. Reduce the load to zero and adjust the engine-generator set frequency for the maximum attainable frequency. Record instrument readings. Adjust the engine-generator set frequency for the minimum attainable frequency. Record instrument readings. The data sheet must show the maximum and minimum frequencies attained at rated load, and at no load.

3.6.6.4 Transient Response Test

Drop the load to no load and re-apply rated load three times to ensure that the no load and rated load voltage and frequency values are repeatable and that the frequency and voltage regulation is within the limits specified. Record generator terminal voltage and frequency using a high speed strip chart recorder. The data sheet must show the following results:

a. Frequency

(1) Stability bandwidth or deviation in percent of rated frequency.
(2) Recovery time.

(3) Overshoot and undershoot.

b. Voltage

(1) Stability bandwidth or deviation in percent of rated voltage.

(2) Recovery time.

(3) Overshoot and undershoot.

3.6.7 Pre-operational Tests

**************************************************************************
NOTE: Specify the protective devices to be tested. Devices which shut down the engine because of an abnormal electrical or generator condition should be detailed under Safety Run Tests. Delete current transformer tests when none are to be installed.
**************************************************************************

3.6.7.1 Protective Relays

**************************************************************************
NOTE: Delete the protective devices coordination study reference if the project does not require one. See UFC 3-520-01 and Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION, and Section 26 28 01.00 10 COORDINATED POWER SYSTEM PROTECTION, for guidance.
**************************************************************************

Visually and mechanically inspect, adjust, test, and calibrate protective relays in accordance with the manufacturer's published instructions. Include pick-up, timing, contact action, restraint, and other aspects necessary to ensure proper calibration and operation. Implement relay settings in accordance with the installation coordination study. Manually or electrically operate relay contacts to verify that the proper breakers and alarms initiate. Field test relaying current transformers in accordance with IEEE C57.13.1.

3.6.7.2 Insulation Test

Test generator and exciter circuits insulation resistance in accordance with IEEE 43. Take stator readings including generator leads to [switchgear] [switchboard] at the circuit breaker. Record results of insulation resistance tests. Readings must be within limits specified by the manufacturer. Verify mechanical operation, insulation resistance, protective relay calibration and operation, and wiring continuity of [switchgear] [switchboard] assembly. Do not damage generator components during test.

3.6.7.3 Engine-Generator Connection Coupling Test

When the generator provided is a two-bearing machine, inspect and check the engine-generator connection coupling by dial indicator to prove that no misalignment has occurred. Use the dial indicator to measure variation in radial positioning and axial clearance between the coupling halves. Take
readings at four points, spaced 90 degrees apart. Align solid couplings and pin-type flexible couplings within a total indicator reading of 0.012 to 0.025 mm 0.0005 to 0.001 inch for both parallel and angular misalignment. For gear-type or grid-type couplings, 0.05 mm 0.002 inch will be acceptable.

3.6.8 Safety Run Test

**************************************************************************

NOTE: For the sound level tests, modify the radial distance requirement from the engine intake and exhaust to account for obstructions, variations in site conditions, building configurations, or indicate points on the contract drawings at which measurements are to be made. Add item x. to the list below when a test for over/under frequency alarms are provided. Coordinate the requirement with paragraph Alarm Panels. Item x. should be included as follows:

x. Manually adjust the governor to speed up the engine to a level beyond the over frequency alarm set-point and record the frequency when the audible alarm sounds. Return the speed to the rated value. Shut down the engine-generator set.

**************************************************************************

For the following tests, repeat the associated safety tests if any parts are changed, or adjustments made to the generator set, its controls, or auxiliaries.

a. Perform and record engine manufacturer's recommended prestarting checks and inspections.

b. Start the engine, record the starting time, make and record engine manufacturer's after-starting checks and inspections during a reasonable warm-up period.

c. Activate the manual emergency stop switch and verify that the engine stops.

d. Remove the high and pre-high lubricating oil temperature sensing elements from the engine and temporarily install a temperature gauge in their normal locations on the engine (required for safety, not for recorded data). Where necessary provide temporary wiring harness to connect the sensing elements to their permanent electrical leads.

e. Start the engine, record the starting time, make and record engine manufacturer's after-starting checks and inspections during a reasonable warm-up period. Operate the engine-generator set at no load until the output voltage and frequency stabilize. Monitor the temporarily installed temperature gauges. If either temperature reading exceeds the value required for an alarm condition, activate the manual emergency stop switch.

f. Immerse the elements in a vessel containing controlled-temperature hot oil and record the temperature at which the pre-high alarm activates and the temperature at which the engine shuts down. Remove the temporary temperature gauges and reinstall the temperature sensors on the engine.
g. Remove the high and pre-high coolant temperature sensing elements from the engine and temporarily install a temperature gauge in their normal locations on the engine (required for safety, not for recorded data). Where necessary provide temporary wiring harness to connect the sensing elements to their permanent electrical leads.

h. Start the engine, record the starting time, make and record engine manufacturer's after-starting checks and inspections during a reasonable warm-up period. Operate the engine generator-set at no load until the output voltage and frequency stabilize.

i. Immerse the elements in a vessel containing controlled-temperature hot oil and record the temperature at which the pre-high alarm activates and the temperature at which the engine shuts down. Remove the temporary temperature gauges and reinstall the temperature sensors on the engine.

j. Start the engine, record the starting time, make and record engine manufacturer's after-starting checks and inspections during a reasonable warm-up period.

k. Operate the engine generator-set for at least 2 hours at 75 percent of Service Load.

l. Verify proper operation and set-points of gauges and instruments.

m. Verify proper operation of ancillary equipment.

n. Manually adjust the governor to increase engine speed past the over-speed limit. Record the RPM at which the engine shuts down.

o. Start the engine, record the starting time, make and record engine manufacturer's after-starting checks and inspections and operate the engine generator-set for at least 15 minutes at 75 percent of Service Load.

p. Manually adjust the governor to increase engine speed to within 2 percent of the over-speed trip speed previously determined and operate at that point for 5 minutes. Manually adjust the governor to the rated frequency.

q. Manually fill the day tank to a level above the overfill limit. Record the level at which the overfill alarm sounds. Verify shutdown of the fuel transfer pump. Drain the day tank down below the overfill limit.

r. Shut down the engine. Remove the time-delay low lube oil pressure alarm bypass and try to start the engine.

s. Attach a manifold to the engine oil system (at the oil pressure sensor port) that contains a shutoff valve in series with a connection for the engine's oil pressure sensor followed by an oil pressure gauge ending with a bleed valve. Move the engine's oil pressure sensor from the engine to the manifold. Open the manifold shutoff valve and close the bleed valve.

t. Start the engine, record the starting time, make and record engine manufacturer's after-starting checks and inspections and operate the engine generator-set for at least 15 minutes at 75 percent of Service Load.
u. Close the manifold shutoff valve. Slowly allow the pressure in the manifold to bleed off through the bleed valve while watching the pressure gauge. Record the pressure at which the engine shuts down. Catch oil spillage from the bleed valve in a container. Add the oil from the container back to the engine, remove the manifold, and reinstall the engine's oil pressure sensor on the engine.

v. Start the engine, record the starting time, make and record engine manufacturer's after-starting checks and inspections and operate the engine generator-set for at least 15 minutes at 100 percent of Service Load. Record the maximum sound level in each frequency band at a distance of [22.9] [_____] m [75] [_____] feet from the end of the exhaust and air intake piping directly along the path of intake and discharge for horizontal piping; or at a radius of [22.9] [10.7] [_____] m [75] [35] [_____] feet from the engine at 45 degrees apart in all directions for vertical piping. [If a sound limiting enclosure is provided, modify or replace the enclosure, the muffler, and intake silencer must be modified or replaced as required to meet the sound requirements contained within this specification] [If a sound limiting enclosure is not provided, the muffler and air intake silencer as required to meet the sound limitations of this specification. If the sound limitations can not be obtained by modifying or replacing the muffler and air intake silencer, notify the Contracting Officers Representative and provide a recommendation for meeting the sound limitations.]

w. Manually drain off fuel slowly from the day tank to empty it to below the low fuel level limit and record the level at which the audible alarm sounds. Add fuel back to the day tank to fill it above low level alarm limits.

3.6.9 Performance Tests

**************************************************************************

NOTE: The onsite tests have been developed from MIL-STD 705 methods with input from many sources including industry. Each designer must verify the adequacy of the tests that are needed for each application. Modifications to these specifications may be necessary beyond the removal of brackets.

Delete the Frequency and Voltage, Stability and Transient Response Test and the Voltage Regulator and Governor Range Test for general-purpose and commercial-type applications. Perform this test either as a factory test or a field test (delete it from either the factory or field tests). Perform as a field test where required to ensure system operability using project loads. Revise the test steps to delete steps where the Maximum Step Increase is larger than final load to be placed on the engine-generator.

If possible, specify an ambient temperature for the load run test which is typical for the average maximum temperature. This is most strenuous operating condition. Specify a month which
typically provides the most restrictive operating condition.

Delete all 110 percent load references from testing requirements for standby applications.

In the following tests, where measurements are to be recorded after stabilization of an engine-generator set parameter (voltage, frequency, current, temperature, etc.), stabilization is considered to have occurred when measurements are maintained within the specified bandwidths or tolerances, for a minimum of four consecutive readings. For the following tests, repeat the associated tests if any parts are changed, or adjustments made to the generator set, its controls, or auxiliaries.

3.6.9.1 Continuous Engine Load Run Test

Test the engine-generator set and ancillary systems at service load to demonstrate durability; verify that heat of extended operation does not adversely affect or cause failure in any part of the system; and check all parts of the system. If the engine load run test is interrupted for any reason, repeat the entire test. Accomplish the engine load run test during daylight hours, with an average ambient temperature of [_____] degrees C F, during the month of [____]. After each change in load in the following test, measure the vibration at the end bearings (front and back of engine, outboard end of generator) in the horizontal, vertical, and axial directions. Verify that the vibration is within the allowable range. Take data taken at 15 minute intervals and include the following:

- **Electrical:** Output amperes, voltage, real and reactive power, power factor, frequency.
- **Pressure:** Lube-oil.
- **Temperature:** Coolant, Lube-oil, Exhaust, Ambient.

a. Perform and record engine manufacturer's recommended prestarting checks and inspections. Include as a minimum checking of coolant fluid, fuel, and lube-oil levels.

b. Start the engine, make and record engine manufacturer's after-starting checks and inspections during a reasonable warmup period.

c. Operate the engine generator-set for 2 hours at 75 percent of Service Load.

d. Increase load to 100 percent of Service Load and operate the engine generator-set for 4 hours.

e. For prime rated units, increase load to 110 percent of Service Load and operate the engine generator-set for 2 hours.

f. Decrease load to 100 percent of Service Load and operate the engine generator-set for 2 hours or until all temperatures have stabilized.

 g. Remove load from the engine-generator set.
3.6.9.2 Voltage and Frequency Droop Test

For the following steps, verify that the output voltage and frequency return to and stabilize within the specified bandwidth values following each load change. Record the generator output frequency and line-line and line-neutral voltages following each load change.

a. With the generator operating at no load, adjust voltage and frequency to rated voltage and frequency.

b. Increase load to 100 percent of Rated Output Capacity. Record the generator output frequency and line-line and line-neutral voltages.

c. Calculate the percent droop for voltage and frequency with the following equations.

\[
\text{Voltage droop percent} = \frac{\text{No-load volts} - \text{rated output capacity volts}}{\text{Rated output capacity volts}} \times 100
\]

\[
\text{Frequency droop percent} = \frac{\text{No load hertz} - \text{rated output capacity hertz}}{\text{Rated output capacity volts}} \times 100
\]

d. Repeat steps a. through c. two additional times without making any adjustments.

3.6.9.3 Voltage Regulator Range Test

a. While operating at no load, verify that the voltage regulator adjusts from 90 to 110 percent of rated voltage.

b. Increase load to 100 percent of Rated Output Capacity. Verify that the voltage regulator adjusts from 90 to 110 percent of rated voltage.

3.6.9.4 Governor Adjustment Range Test

a. While operating at no load, verify that the governor adjusts from 90 to 110 percent of rated frequency.

b. Increase load to 100 percent of Rated Output Capacity. Verify that the governor adjusts from 90 to 110 percent of rated frequency.

3.6.9.5 Frequency and Voltage Stability and Transient Response

**************************************************************************
NOTE: For applications where the Maximum Step Load Increase is 100 percent, delete steps d, e, and f.
**************************************************************************

Verify that the engine-generator set responds to addition and dropping of blocks of load in accordance with the transient response requirements. Document maximum voltage and frequency variation from bandwidth and verify that voltage and frequency return to and stabilize within the specified bandwidth, within the specified response time period. Document results in tabular form and with high resolution, high speed strip chart recorders or comparable digital recorders, as approved by the Contracting Officer. Include the following tabular data:

(1) Ambient temperature (at 15 minute intervals).

(2) Generator output current (before and after load changes).

(3) Generator output voltage (before and after load changes).

(4) Frequency (before and after load changes).

(5) Generator output power (before and after load changes).

(6) Include the actual instrument trace of voltage and frequency in graphic representations showing:

Charts marked at start of test; observed steady-state band; mean of observed band; momentary overshoot and undershoot (generator terminal voltage and frequency) and recovery time for each load change together with the voltage and frequency maximum and minimum trace excursions for each steady state load condition prior to and immediately following each load change. Generator terminal voltage and frequency transient recovery time for each step load increase and decrease.

a. Perform and record engine manufacturer's recommended prestarting checks and inspections.

b. Start the engine, make and record engine manufacturer's after-starting checks and inspections during a reasonable warm-up period and no load. Verify stabilization of voltage and frequency within specified bandwidths.

c. With the unit at no load, apply the Maximum Step Load Increase.

d. Apply load in steps equal to the Maximum Step Load Increase until the addition of one more step increase will exceed the Service Load.

e. Decrease load to the unit such that addition of the Maximum Step Load Increase will load the unit to 100 percent of Service Load.

f. Apply the Maximum Step Load Increase.

g. Decrease load to zero percent in steps equal to the Maximum Step Load Decrease.

h. Repeat steps c. through g.

3.6.10 Parallel Operation Test

**************************************************************************

NOTE: Delete the generator paralleling/load sharing test if parallel sets are not intended. This test must be performed at a power factor other than unity to verify proportional reactive power sharing.
**************************************************************************

Test the capability of each engine-generator set to parallel and share load with other generator sets, individually and in all combinations. This test must be performed with the voltage regulator and governor adjustment settings used for the Frequency and Voltage Stability and Transient Response test. If settings are changed during the performance of this
test, a voltage and frequency stability and transient response test must be performed for each engine generator set using the setting utilized in this test. During operations record load-sharing characteristics of each set in parallel operation. Include the following data:

1. Ambient temperature (at 15 minute intervals).
2. Generator output current (before and after load changes).
3. Generator output voltage (before and after load changes).
4. Power division and exchange between generator sets.
5. Real power (watts) and reactive power (vars) on each set.

3.6.10.1 Combinations

Connect each set, while operating at no load, parallel with one other set in the system, operating at service load, until all possible combinations have been achieved. Verify stabilization of voltage and frequency within specified bandwidths and proportional sharing of real and reactive loads. Document stabilization of voltage and frequency within specified bandwidth, the active power division, active power exchange, reactive power division, and voltage and frequency stability and transient response in the following steps for each combination.

a. Divide the load proportionally between the sets and operate in parallel for 15 minutes.
b. Increase the load, in steps equal to the Maximum Step Increase, until each set is loaded to its service load.
c. Decrease the load, in steps equal to the Maximum Step Decrease, until each set is loaded to approximately 25 percent of its service load.
d. Increase the load, in steps equal to the Maximum Step Increase, until each set is loaded to approximately 50 percent of its service load. Verify stabilization of voltage and frequency within specified bandwidths and proportional sharing of real and reactive load.
e. Reduce the sum of the loads on both sets to the output rating of the smaller set.
f. Transfer a load equal to the output rating of the smaller of the 2 sets to and from each set. Verify stabilization of voltage and frequency within specified bandwidths and proportional sharing of real and reactive load.
g. Document the active power division, active power exchange, reactive power division, and voltage and frequency stability and transient response.

3.6.10.2 Multiple Combinations

Connect each set, while operating at no load, parallel with all multiple combinations of all other set in the system, while operating at service load, until all multiple combinations of parallel operations have been achieved.
3.6.11 Parallel Operation Test (Commercial Source)

**************************************************************************
NOTE: Delete the parallel to commercial source test if sets are not to be paralleled with the commercial power source.
**************************************************************************

Connect each set parallel with the commercial power source. Operate in parallel for 15 minutes. Verify stabilization of voltage and frequency within specified bandwidths. Record the output voltage, frequency, and loading to demonstrate ability to synchronize with the commercial power source.

3.6.12 Automatic Operation Tests

**************************************************************************
NOTE: Delete automatic operation test where not required. Adapt this paragraph based on the number of engine-generator sets, the desired starting order, and load sequencing. The designer will provide the sequence of operation (load sequences for load acquisition and load shedding) in the design documents.
**************************************************************************

Test the automatic operating system to demonstrate [automatic starting,] [loading and unloading,] [the response to loss of operating engine-generator sets,] and paralleling of each engine-generator set. Utilize [load banks at the indicated power factor] [and actual loads to be served] for this test, and the loading sequence is the indicated sequence. Record load-sharing characteristics during all operations. Perform this test for a minimum of two successive, successful tests. Include the following data:

(1) Ambient temperature (at 15 minute intervals).
(2) Generator output current (before and after load changes).
(3) Generator output voltage (before and after load changes).
(4) Generator output frequency (before and after load changes).
(5) Power division and exchange between generator sets.
(6) Real and reactive power on each set.

a. Initiate loss of the preferred power source and verify the specified sequence of operation.

b. Verify resetting of automatic starting and transfer logic.

3.6.13 Automatic Operation Tests for Stand-Alone Operation

**************************************************************************
NOTE: Substitute manual operation and transfer for automatic operation where automatic operation is not required by the project. Delete automatic loading system where not required. The designer will

SECTION 26 32 15.00  Page 111
provide the sequence of operation (load sequences for load acquisition and load shedding) in the design documents.

Test the automatic loading system to demonstrate [automatic starting,] [and] [loading and unloading] of each engine-generator set. Utilize the actual loads to be served for this test, and the loading sequence is the indicated sequence. Perform this test for a minimum of two successive, successful tests. Include the following data:

1. Ambient temperature (at 15 minute intervals).
2. Generator output current (before and after load changes).
3. Generator output voltage (before and after load changes).
4. Generator output frequency (before and after load changes).

a. Initiate loss of the primary power source and verify automatic sequence of operation.

b. Restore the primary power source and verify sequence of operation.

c. Verify resetting of controls to normal.

3.7 GROUNDING

NOTE: Where rock or other soil conditions prevent obtaining a specified ground value, other methods of grounding should be specified. Where it is impractical to obtain the indicated ground resistance values, make every effort within reason to obtain ground resistance values as near as possible to the indicated values.

NFPA 70 and IEEE C2, except that grounding systems must have a resistance to solid earth ground not exceeding 5 ohms.

3.7.1 Grounding Electrodes

Provide driven ground rods as specified in [Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION] [and] [Section 33 71 01 OVERHEAD TRANSMISSION AND DISTRIBUTION]. Connect ground conductors to the upper end of ground rods by exothermic weld or compression connector. Provide compression connectors at equipment end of ground conductors.

3.7.2 Engine-Generator Set Grounding

Provide separate copper grounding conductors and connect them to the ground system as indicated. When work in addition to that indicated or specified is required to obtain the specified ground resistance, the provision of the contract covering "Changes" must apply.

3.7.3 Connections

Make joints in grounding conductors by exothermic weld or compression
connector. Exothermic welds and compression connectors must be installed as specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION paragraph regarding GROUNDING.

3.7.4 Grounding and Bonding Equipment

UL 467, except as indicated or specified otherwise.

3.8 START-UP ENGINEER

Provide the services of a qualified factory trained start-up engineer, regularly employed by the engine-generator set manufacturer. The start-up services must include conducting preliminary operations and functional acceptance tests. The start-up engineer must be present at the engine generator set installation-site, full-time, while preliminary operations and functional acceptance tests are being conducted.

3.9 PREREQUISITES FOR FUNCTIONAL ACCEPTANCE TESTING

Completion of the following requirements is mandatory prior to scheduling functional acceptance tests for the engine-generator set and auxiliary equipment.

3.9.1 Piping Tests

Complete as specified in Section 33 52 10 SERVICE PIPING, FUEL SYSTEMS.

3.9.2 Performance of Acceptance Checks and Tests

The acceptance checks and tests must be accomplished by the testing organization as described in Section 26 08 00 APPARATUS INSPECTION AND TESTING.

3.9.3 Generator Sets

Complete as specified in the paragraph ACCEPTANCE CHECKS AND TESTS.

3.9.3.1 Automatic Transfer Switches

Complete acceptance checks and tests as specified in Section 26 36 23 AUTOMATIC TRANSFER SWITCHES AND BY-PASS/ISOLATION SWITCH.

3.9.4 Preliminary Operations

The start-up engineer must conduct manufacturer recommended start-up procedures and tests to verify that the engine-generator set and auxiliary equipment are ready for functional acceptance tests. Give the Contracting Officer 15 days' advance notice that preliminary operations will be conducted. After preliminary operation has been successfully conducted, the start-up engineer will notify the Contracting Officer in writing stating the engine-generator set and auxiliary equipment are ready for functional acceptance tests.

3.9.5 Preliminary Assembled Operation and Maintenance Manuals

Preliminary assembled operation and maintenance manuals must have been submitted to and approved by the Contracting Officer. Manuals must be prepared as specified in the paragraph ASSEMBLED OPERATION AND MAINTENANCE MANUALS.
3.9.6 Functional Acceptance Test Procedure

Test procedure must be prepared by the start-up engineer specifically for the engine-generator set and auxiliary equipment. The test agenda must cover the requirements specified in the paragraph FUNCTIONAL ACCEPTANCE TESTS. The test procedure must indicate in detail how tests are to be conducted. A statement of the tests that are to be performed without indicating how the tests are to be performed is not acceptable. Indicate what work is planned on each workday and identify the calendar dates of the planned workdays. Specify what additional technical support personnel is needed such as factory representatives for major equipment. Specify on which testing workday each technical support personnel is needed. Data recording forms to be used to document test results are to be submitted with the proposed test procedure. A list of test equipment and instruments must also be included in the test procedure.

3.9.7 Test Equipment

Test equipment and instruments must be on hand prior to scheduling field tests or, subject to Contracting Officer approval, evidence must be provided to show that arrangements have been made to have the necessary equipment and instruments on-site prior to field testing.

3.10 FIELD QUALITY CONTROL

******************************************************************************
NOTE: Include the bracketed option below for NAVFAC projects. Coordinate Echelon III Reach-back Support with NAVFAC LANT CI44 Office or NAVFAC PAC CI44 Office during the design stage of the specific project.
******************************************************************************

Give Contracting Officer [NAVFAC [____], Code [____]] 30 days' notice of dates and times scheduled for tests which require the presence of the Contracting Officer. The Contracting Officer will coordinate with the using activity and schedule a time that will eliminate or minimize interruptions and interference with the activity operations. The Contractor must be responsible for costs associated with conducting tests outside of normal working hours and with incorporating special arrangements and procedures, including temporary power conditions. The Contractor must provide labor, equipment, fuel, test load, and consumables required for the specified tests. The test load must be a cataloged product. Calibration of measuring devices and indicating devices must be certified. Refer to Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, for requirements for a cataloged product. Perform the following field tests.

3.10.1 Acceptance Checks and Tests

Perform in accordance with the manufacturer's recommendations, and include the following visual and mechanical inspections and electrical tests, performed in accordance with NETA ATS.

3.10.1.1 Circuit Breakers - Low Voltage Insulated Case/Molded Case

a. Visual and Mechanical Inspection

   (1) Compare nameplate data with specifications and approved shop
drawings.

(2) Inspect circuit breaker for correct mounting.

(3) Operate circuit breaker to ensure smooth operation.

(4) Inspect case for cracks or other defects.

(5) Verify tightness of accessible bolted connections and cable connections by calibrated torque-wrench method. Thermo-graphic survey is not required.

(6) Inspect mechanism contacts and arc chutes in unsealed units.

b. Electrical Tests

(1) Perform contact-resistance tests.

(2) Perform insulation-resistance tests.

(3) Adjust breaker(s) for final settings in accordance with engine-generator set manufacturer's requirements.

3.10.1.2 Current Transformers

a. Visual and Mechanical Inspection

(1) Compare equipment nameplate data with specifications and approved shop drawings.

(2) Inspect physical and mechanical condition.

(3) Verify correct connection.

(4) Verify that adequate clearances exist between primary and secondary circuit.

(5) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method. Thermo-graphic survey is not required.

(6) Verify that all required grounding and shorting connections provide good contact.

b. Electrical Tests

(1) Perform insulation-resistance tests.

(2) Perform polarity tests.

(3) Perform ratio-verification tests.

3.10.1.3 Metering and Instrumentation

a. Visual and Mechanical Inspection

(1) Compare equipment nameplate data with specifications and approved shop drawings.
(2) Inspect physical and mechanical condition.

(3) Verify tightness of electrical connections.

b. Electrical Tests

(1) Determine accuracy of meters at 25, 50, 75, and 100 percent of full scale.

(2) Calibrate watt-hour meters according to manufacturer's published data.

(3) Verify all instrument multipliers.

(4) Electrically confirm that current transformer secondary circuits are intact.

3.10.1.4 Battery Systems

a. Visual and Mechanical Inspection

(1) Compare equipment nameplate data with specifications and approved shop drawings.

(2) Inspect physical and mechanical condition.

(3) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method. Thermo-graphic survey is not required.

(4) Measure electrolyte specific gravity and temperature and visually check fill level.

(5) Verify adequacy of battery support racks, mounting, anchorage, and clearances.

b. Electrical Tests

(1) Set charger float and equalizing voltage levels.

(2) Verify all charger functions and alarms.

(3) Measure each cell voltage and total battery voltage with charger energized and in float mode of operation.

(4) Perform a capacity load test.

3.10.1.5 Engine-Generator Set

a. Visual and Mechanical Inspection

(1) Compare equipment nameplate data with specifications and approved shop drawings.

(2) Inspect physical and mechanical condition.

(3) Inspect for correct anchorage and grounding.

b. Electrical and Mechanical Tests
(1) Perform an insulation-resistance test on generator winding with respect to ground. Calculate polarization index.

(2) Perform phase rotation test to determine compatibility with load requirements.

3.10.1.6 Grounding System

a. Visual and Mechanical Inspection

(1) Inspect ground system for compliance with contract plans and specifications.

b. Electrical Tests

(1) Perform ground-impedance measurements utilizing the fall-of-potential method defined in IEEE 81. On systems consisting of interconnected ground rods, perform tests after interconnections are complete. Take measurements in normally dry weather, not less than 48 hours after rainfall. Provide site diagram indicating location of test probes with associated distances, and provide a plot of resistance vs. distance.

3.10.2 Functional Acceptance Tests

**************************************************************************
NOTE: Include the bracketed option below for NAVFAC projects.
**************************************************************************

The tests must be performed by the start-up engineer. Upon successful test completion, the start-up engineer must provide the Contracting Officer with a written test report within 15 calendar days showing the tests performed and the results of each test. The report must include the completed approved test data forms and certification from the start-up engineer that the test results fall within the manufacturer's recommended limits and meet the specified requirements performance. The report must be dated and signed by the start-up engineer, and submitted for approval by the Contracting Officer. The Contracting Officer [and NAVFAC [_____, Code [_____] will witness final acceptance tests. Testing must include, but not be limited to, the following:

a. Verify proper functioning of each engine protective shutdown device and pre-shutdown alarm device. Testing of the devices must be accomplished by simulating device actuation and observing proper alarm and engine shutdown operation.

b. Verify proper functioning of the engine over-speed trip device. Testing of the over-speed trip device must be accomplished by raising the speed of the engine-generator set until an over-speed trip is experienced.

c. Verify proper functioning of the crank cycle/terminate relay. Testing of the relay must be accomplished by engaging the starter motor with the engine being prevented from running. Observe the complete crank/rest cycle as described in the paragraph STARTING SYSTEM.

d. Verify proper functioning of the following automatic and manual operations. Testing must include, but not be limited to, the following:
(1) Loss of Utility: Initiate a normal power failure with connected test load of rated kW at 1.0 power factor. Record time delay on start, cranking time until engine starts and runs, time to come up to operating speed, voltage and frequency overshoot, and time to achieve steady state conditions with all switches transferred to emergency position.

(2) Return of Utility: Return normal power and record time delay on retransfer for each automatic transfer switch, and time delay on engine cool-down and shutdown.

(3) Manual starting.

(4) Emergency stop.

e. Operate the engine-generator set at rated current (amperes) until the jacket water temperature stabilizes. Stabilization will be considered to have occurred when three consecutive temperature readings remain unchanged. Continue to operate the generator set for an additional 2 hours. Record instrument readings for terminal voltage, line current, frequency (Hz), engine speed rpm, lubricating oil pressure, jacket water temperature, and ambient temperature at 5 minute intervals for first 15 minutes and at 15 minute intervals thereafter.

**************************************************************************

NOTE: Include the following paragraph when verification of engine emission limits are required by air pollution permit.

**************************************************************************

[ f. Emissions Tests. Provide on-site testing by a certified testing organization of each engine-generator set. Testing must be in accordance with an EPA approved method, 40 CFR 60, (Appendix, Method 7, 7A, 7B, 7C, 7D or 7E). Emissions at rated full load must be within the limits specified in the paragraph ENGINE EMISSIONS LIMITS.]

3.11 DEMONSTRATION

Upon completion of the work and at a time approved by the Contracting Officer, the Contractor must provide instructions by a qualified instructor to the Government personnel in the proper operation and maintenance of the equipment. Government personnel must receive training comparable to the equipment manufacturer's factory training. The duration of instruction must be for not less than one 8 hour working day for instruction of operating personnel and not less than one 8 hour working day for instruction of maintenance personnel.

3.11.1 Instructor's Qualification Resume

Instructors must be regular employees of the engine-generator set manufacturer. The instruction personnel provided to satisfy the requirements above must be factory certified by the related equipment manufacturer to provide instruction services. Submit the name and qualification resume of instructor to the Contracting Officer for approval.
3.11.2  **Training Plan**

Submit training plan 30 calendar days prior to training sessions. Training plan must include scheduling, content, outline, and training material (handouts). Content must include, but not be limited to, the following:

3.11.2.1  **Operating Personnel Training**

This instruction includes operating the engine-generator set, auxiliary equipment including automatic transfer switches in all modes, and the use of all functions and features specified.

3.11.2.2  **Maintenance Personnel Training**

Training must include mechanical, hydraulic, electrical, and electronic instructions for the engine-generator set and auxiliary equipment including automatic transfer switches.

a.  **Mechanical Training:** Must include at least the following:

   (1) A review of mechanical diagrams and drawings.
   (2) Component location and functions.
   (3) Troubleshooting procedures and techniques.
   (4) Repair procedures.
   (5) Assembly/disassembly procedures.
   (6) Adjustments (how, when, and where).
   (7) Preventive maintenance procedures.
   (8) Review of flow diagram.
   (9) Valve locations and function.
   (10) Valve and hydraulic equipment adjustment and maintenance procedures.
   (11) Hydraulic system maintenance and servicing.
   (12) Lubrication points, type, and recommended procedures and frequency.

b.  **Electrical and Electronic Maintenance Training:** Must include at least the following:

   (1) A review of electrical and electronic systems including wiring diagrams and drawings.
   (2) Troubleshooting procedures for the machine and control systems.
   (3) Electrical and electronic equipment servicing and care.
   (4) Use of diagnostics to locate the causes of malfunction.
   (5) Procedures for adjustments (locating components, adjustments to be...
made, values to be measured, and equipment required for making adjustments).

(6) Maintenance and troubleshooting procedures for microprocessor or minicomputer where applicable.

(7) Circuit board repair procedures where applicable (with schematics provided).

(8) Use of diagnostic tapes.

(9) Recommended maintenance servicing and repair for motors, switches, relays, solenoids, and other auxiliary equipment and devices.

3.12 **ONSITE TRAINING**

**************************************************************************

NOTE: Delete videotaping if not required.
**************************************************************************

Conduct a training course for the operating staff as designated by the Contracting Officer. The training period must consist of a total [_____] hours of normal working time and must start after the system is functionally completed but prior to final acceptance.

a. Submit a letter giving the date proposed for conducting the onsite training course, the agenda of instruction, a description of the digital video recording to be provided. The course instructions must cover pertinent points involved in operating, starting, stopping, servicing the equipment, as well as major elements of the operation and maintenance manuals. Additionally, the course instructions must demonstrate routine maintenance procedures as described in the operation and maintenance manuals.

b. Submit a digital video recording of the [entire training session] [manufacturers operating and maintenance training course].

c. One full size reproducible Mylar ach drawing must accompany the booklets. Mylars must be rolled and placed in a heavy cardboard tube with threaded caps on each end. The manual must include step-by-step procedures for system startup, operation, and shutdown; drawings, diagrams, and single-line schematics to illustrate and define the electrical, mechanical, and hydraulic systems together with their controls, alarms, and safety systems; the manufacturer's name, model number, and a description of equipment in the system. The instructions must include procedures for interface and interaction with related systems to include [automatic transfer switches] [fire alarm/suppression systems] [load shedding systems] [uninterruptible power supplies] [______]. Each booklet must include a CD containing an ASCII file of the procedures.

d. Provide approved operation and maintenance manuals for the training course. Post approved instructions prior to the beginning date of the training course. Coordinate the training course schedule with the using service's work schedule, and submit for approval 14 days prior to beginning date of proposed beginning date of training.
3.13 INSTALLATION

Installation must conform to the applicable requirements of IEEE C2, NFPA 30, NFPA 37, and NFPA 70.

3.14 FINAL TESTING AND INSPECTION

a. Start the engine, record the starting time, make and record all engine manufacturer's after-starting checks and inspections during a reasonable warm-up period.

b. Increase the load in steps no greater than the Maximum Step Load Increase to 100 percent of Service Load, and operate the engine-generator set for at least 30 minutes. Measure the vibration at the end bearings (front and back of engine, outboard end of generator) in the horizontal, vertical, and axial directions. Verify that the vibration is within the same range as previous measurements and is within the required range.

c. Remove load and shut down the engine-generator set after the recommended cool down period.

d. Remove the lube oil filter and have the oil and filter examined by the engine manufacturer for excessive metal, abrasive foreign particles, etc. Verify any corrective action for effectiveness by running the engine for 8 hours at Service Load, then re-examine the oil and filter.

e. Remove the fuel filter and examine the filter for trash, abrasive foreign particles, etc.

f. Visually inspect and check engine and generator mounting bolts for tightness and visible damage.

g. Replace air, oil, and fuel filters with new filters.

3.15 MANUFACTURER'S FIELD SERVICE

The engine generator-set manufacturer must furnish a qualified representative to supervise the installation of the engine generator-set, assist in the performance of the onsite tests, and instruct personnel as to the operational and maintenance features of the equipment.

3.16 POSTED DATA AND INSTRUCTIONS

**************************************************************************

NOTE: The designer should check with the customer to determine if framed instructions can be placed in the project area (requires wall space), and where they are to be placed. Select the 216 X 279 mm 8 1/2 X 11 inch notebook option where instructions will have to be placed in the engine-generator enclosure or a switchgear cubicle (or other suitable enclosure).

**************************************************************************

Post Data and Instructions prior to field acceptance testing of the engine generator set. [Provide two sets of instructions/data, typed and framed under weatherproof laminated plastic, and post side-by-side where directed. Include a one-line diagram, wiring and control diagrams and a
complete layout of the system in the first set. Include the condensed operating instructions describing manufacturer's pre-start checklist and precautions; startup procedures for test-mode, manual-start mode, and automatic-start mode (as applicable); running checks, procedures, and precautions; and shutdown procedures, checks, and precautions in the second set. Submit posted data including wiring and control diagrams showing the key mechanical and electrical control elements, and a complete layout of the entire system.

a. Include procedures for interrelated equipment (such as heat recovery systems, co-generation, load-shedding, and automatic transfer switches).

b. Include a one-line diagram, wiring and control diagrams and a complete layout of the system in the first set. Include the condensed operating instructions describing manufacturer's pre-start checklist and precautions; startup procedures for test-mode, manual-start mode, and automatic-start mode (as applicable); running checks, procedures, and precautions; and shutdown procedures, checks, and precautions in the second set. Include procedures for interrelated equipment (such as heat recovery systems, co-generation, load-shedding, and automatic transfer switches).

c. Submit instructions including: the manufacturers pre-start checklist and precautions; startup procedures for test-mode, manual-start mode, and automatic-start mode (as applicable); running checks, procedures, and precautions; and shutdown procedures, checks, and precautions. Include procedures for interrelated equipment (such as heat recovery systems, co-generation, load-shedding, and automatic transfer switches). Provide weatherproof instructions, laminated in plastic, and post where directed.

3.17 ACCEPTANCE

Submit drawings which accurately depict the as-built configuration of the installation, upon acceptance of the engine-generator set installation. Revise layout drawings to reflect the as-built conditions and submit them with the as-built drawings. Final acceptance of the engine-generator set will not be given until the Contractor has successfully completed all tests and all defects in installation material or operation have been corrected.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for static UPS to provide continuous ac power to critical loads and/or to improve the quality of ac power to critical loads. The specification is intended to cover three-phase systems starting with the smallest unit at 20 kVA. The upper end for a single module is around 750 kVA; however, parallel systems can have a larger total output. This guide specification is intended to be used with individual UPS units which contain a single module, parallel systems of the same size module, and scalable modular UPS systems. Single phase systems are not addressed. This specification covers UPS with electro-chemical batteries. Electro-mechanical (stored energy) UPS are not addressed. White paper TSEWG TP-19 is on Static Uninterruptible Power Supplies and should be reviewed while editing this specification. See https://www.wbdg.org/ffc/dod-supplemental-technical-criteria/tsewg-tp-19

This specification supercedes previous versions of UFGS-26 32 33.00 10 Static Uninterruptible Power Supply (UPS) and UFGS-26 33 53.00 20 Uninterruptible Power Supply (UPS).

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for
this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

**************************************************************************

NOTE: For Air Force projects only: UPS specifications, criteria, and purchases are to be approved by the Power Conditioning and Continuation Interfacing Equipment (PCCIE) Group Manager at Ogden Air Logistics Center (OO-ALC/LGHC). Contact the PCCIE Product Group Manager, 500 CBSS/GBLD, Building 1207-N, 6029 Wardleigh Road, Hill AFB, UT 84056-5838. If you have access to the Air Force portal, then search PCCIE.

**************************************************************************

NOTE: Show the following information on the project drawings:

1. Location of equipment

2. Single-line diagrams, elevations, limiting dimensions, and equipment ratings which are not covered in the specifications

3. Remote indicating requirements.

4. Maintenance bypass switching cabinet and configuration.

**************************************************************************

PART 1   GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a RID outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.
ACOUSTICAL SOCIETY OF AMERICA (ASA)

ASA S1.4 (1983; Amendment 1985; R 2006) Specification for Sound Level Meters (ASA 47)

ASTM INTERNATIONAL (ASTM)

INSTITUTE OF ELECTRICAL AND ELECTRONICS ENGINEERS (IEEE)

IEEE 450 (2020) Recommended Practice for Maintenance, Testing, and Replacement of Vented Lead-Acid Batteries for Stationary Applications

IEEE 485 (2020) Recommended Practice for Sizing Lead-Acid Batteries for Stationary Applications

IEEE C57.110 (2008) Recommended Practice for Establishing Liquid-Filled and Dry-Type Power and Distribution Transformer Capability When Supplying Nonsinusoidal Load Currents

INTERNATIONAL ELECTRICAL TESTING ASSOCIATION (NETA)

1.2 DEFINITIONS

Unless otherwise specified or indicated, electrical and electronics terms used in these specifications, and on the drawings, are as defined in IEEE 100.

1.3 SUBMITTALS

Note: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's
Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

    SD-02 Shop Drawings
        UPS Drawings; G[, [_____]]
        UPS Installation; G[, [_____]]

    SD-03 Product Data
        UPS Module; G[, [_____]]
        Technical Requirements UPS System
        Energy Star Label for Battery Charging Systems and AC-DC/AC-AC Power Supply Products; S

**************************************************************************
NOTE: Delete submittal for spare parts on Navy projects.
**************************************************************************

        Spare Parts; G[, [_____]]

    SD-06 Test Reports
        Work Plan; G[, [_____]]
Factory Test Plan; G[, [____]]  
Factory Test Report; G[, [____]]  
SD-09 Manufacturer's Field Reports  
  Initial Inspection and Tests; G[, [____]]  
  Performance Tests; G[, [____]]  
  Performance Test Plan; G[, [____]]  
  Performance Test Report; G[, [____]]  
SD-10 Operation and Maintenance Data  
  UPS Operation and Maintenance, Data Package 5; G[, [____]]  
  Submit operation and maintenance data in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA and as specified herein.  
SD-11 Closeout Submittals  
  Installation  
  1.4 OPERATION AND MAINTENANCE MANUALS  
  1.4.1 Additions to UPS Operation and Maintenance Manuals  
  In addition to requirements of SD-10 Data Package 5, include the followings on the actual UPS system provided:  
  a. An outline drawing, front, top, and side views.  
  b. Prices for spare parts and supply list.  
  c. Routine and field acceptance test reports.  
  d. Date of Purchase.  
  e. Corrective maintenance procedures.  
  1.4.2 Spare Parts  
 **************************************************************************  
  NOTE: Army Only. Do not provide spare parts for Navy projects.  
 **************************************************************************  
  Furnish the following spare parts, of the same material and workmanship, meeting the same requirements, and interchangeable with the corresponding original parts.  
  a. Fuses: Two of each type and rating.  
  b. Circuit boards: One circuit board for each critical circuit.  
  c. Air Filters: One set of filters, when used on the UPS unit.  
  d. Special tools, calibration devices, and instruments required for
operation, calibration, and maintenance of the equipment: One complete set.

1.5 QUALITY ASSURANCE

The manufacturer must have a documented quality assurance program including:

a. Inspections of incoming parts, modular assemblies and final product.

b. Final test procedure for the product including proof of performance specifications.

c. The on-site test procedure includes an inspection of controls and indicators after installation of the equipment.

d. ISO 9001 quality certification.

1.5.1 UPS Drawings

Drawings are to include the following: Detail drawings consisting of a complete list of equipment and materials, manufacturer's descriptive and technical literature, battery sizing calculations per IEEE 485, installation instructions, single-line diagrams, elevations, layout drawings, and details required to demonstrate that the system has been coordinated and will function properly as a unit.

a. One-line diagram.

b. Outline drawings including front elevation, section views, footprints, and overall dimensions.

c. Manufacturer's descriptive and technical literature.

d. Markings and NEMA nameplate data.

e. Battery sizing calculations per IEEE 485.

f. Wiring and control diagrams with terminals identified, and indicating prewired interconnections between items of equipment and interconnection between the items.

g. Complete list of materials and equipment covering major components. Ensure the bill of material and the schematic have a direct correlation between items in order to easily identify the various components.

h. Details required to demonstrate that the system has been coordinated and will function properly as a unit.

1.5.2 UPS Installation

Include wiring diagrams and installation details of equipment indicating proposed location, layout and arrangement, control panels, accessories, piping, ductwork, and other items that must be shown to ensure a coordinated installation. Wiring diagrams are to identify circuit terminals and indicate the internal wiring for each item of equipment and the interconnection between each item of equipment. Drawings are to indicate adequate clearance for operation, maintenance, and replacement of operating equipment devices. Submittals include the nameplate data, size, and capacity. Submittals also include applicable federal, military,
industry, and technical society publication references.

1.5.3 Work Plan

Submit schedules of dates for factory tests, installation, field tests, and operator training for the UPS system. Furnish a list of instrumentation equipment for factory and field test reports.

1.5.4 Factory Test Plan

Submit factory test plans and procedures at least [21] calendar days prior to the tests being conducted. Provide detailed description of test procedures, including test equipment and setups, to be used to ensure the UPS meets the performance specification and explain the test methods to be used. Provide test procedures that include the test required under the paragraph entitled "Factory Testing."

1.5.5 Factory Test Report

Submit a factory test report within [21] calendar days after completion of tests. Receive approval of test prior to shipping unit. Factory test reports are to be signed by an official authorized to certify on behalf of the UPS manufacturer of that the system meets specified requirements in accordance with the requirements set forth in paragraph entitled "Factory Testing". Provide test reports in booklet form tabulating factory tests and measurements performed, upon completion and testing of the installed system. Reports are to state the Contractor's name and address, the name of the project and location, and list the specific requirements which are being certified.

1.5.6 Performance Test Plan

Submit test plans and procedures at least [15] calendar days prior to the start of field tests. Provide detailed description and dates and times scheduled for performance of tests, and detailed description of test procedures, including test equipment (list make and model and provide functional description of the test instruments and accessories) and setups of the tests to be conducted to ensure the UPS meets the performance specification. Explain the test methods to be used. Provide test procedures that include the tests required under the paragraph entitled "Performance Tests."

1.5.7 Performance Test Report

Submit report of test results as specified by paragraph entitled "Performance Tests" within [15] calendar days after completion of tests. Field test reports are to be signed by an official authorized to certify on behalf of the UPS manufacturer that the system meets specified requirements in accordance with the requirements set forth in paragraph entitled "Performance Tests". Provide test reports in booklet form tabulating factory tests and measurements performed, upon completion and testing of the installed system. Reports are to state the Contractor's name and address, the name of the project and location, and list the specific requirements which are being certified.

1.5.8 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been
substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Provide equipment, materials, installation, and workmanship in accordance with the mandatory and advisory provisions of NFPA 70 unless more stringent requirements are specified or indicated.

1.5.8.1 Reference Standard Compliance

Where equipment or materials are specified to conform to industry and technical society reference standards of the organizations such as American National Standards Institute (ANSI), American Society for Testing and Materials (ASTM), National Electrical Manufacturers Association (NEMA), Underwriters Laboratories (UL), and Association of Edison Illuminating Companies (AEIC), submit proof of such compliance. The label or listing by the specified organization will be acceptable evidence of compliance.

1.5.8.2 Independent Testing Organization Certificate

In lieu of the label or listing, submit a certificate from an independent testing organization, competent to perform testing, and approved by the Contracting Officer. The certificate is to state that the item has been tested in accordance with the specified organization's test methods and that the item complies with the specified organization's reference standard.

1.5.9 Standard Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship and:

a. Have been in satisfactory commercial or industrial use for 2 years prior to bid opening including applications of equipment and materials under similar circumstances and of similar size.

b. Have been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period.

c. Where two or more items of the same class of equipment are required, provide products of a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in this section.

d. The service organization is to be, in the opinion of the Contracting Officer, reasonably convenient to the site.

e. Provide new parts and materials comprising the UPS system from the current manufacture, of a high grade and free of defects and imperfections, and has not been in prior service except as required during aging and factory testing.

1.5.9.1 Alternative Qualifications

Products having less than a 2-year field service record will be acceptable if a certified record of satisfactory field operation for not less than 6000 hours, exclusive of the manufacturers' factory or laboratory tests, is furnished.
1.5.9.2 Material and Equipment Manufacturing Date

Products manufactured more than 6 months prior to date of delivery to site are not acceptable.

1.6 INSPECTION

Inspection before shipment is required. The manufacturer must notify the Government at least 2 weeks before shipping date so that an inspection can be made.

1.7 DELIVERY AND STORAGE

Protect equipment placed in storage from humidity and temperature variations, moisture, water intrusion, dirt, airborne corrosives, or other contaminants. In harsh environments where temperatures exceed non-operational parameters established within this specification, provide an environmentally controlled equipment storage facility to ensure temperature parameters are within equipment specification. Provide documentation of same to the Government when storage is implemented.

1.8 PROJECT/SITE CONDITIONS

**************************************************************************
NOTE: Army Only. This paragraph and its associated subparagraphs is used by the Army. Delete for other projects.
**************************************************************************

1.8.1 Environmental Conditions

The UPS and battery system must be capable of withstanding any combination of the following external environmental conditions without mechanical or electrical damage or degradation of operating characteristics.

**************************************************************************
NOTE: Designer must show approximate elevation above sea level for project location if it exceeds 1,000 meters 3,300 feet. UPS system including batteries must be derated if 50 degrees C 122 degrees F operating temperature is required.
**************************************************************************

a. Operating altitude: Sea level to 1,000 meters 3,300 ft. (Systems applied at higher altitudes are to be derated in accordance with the manufacturer's instructions).

b. Non-operating altitude: Sea level to 11,000 meters 36,000 ft.

c. Operating ambient temperature range: 0 to 40 degrees C 32 to 104 degrees F. Range for batteries is 20 to 25 degrees C 68 to 77 degrees F. Provide batteries that are capable of operating in a larger ambient temperature range of 10 to 30 degrees C 50 to 86 degrees F, but some degradation of life span is understood when operating outside the range of 20 to 25 degrees C 68 to 77 degrees F.

d. Non-operating and storage ambient temperature range: Minus 20 to plus 50 degrees C Minus 4 to plus 122 degrees F. Range for batteries or UPS modules with internal batteries: 10 to 30 degrees C 50 to 86 degrees F.
e. Operating relative humidity: 0 to 95 percent, without condensation.

1.8.2 Sound Pressure Levels

**************************************************************************
NOTE: UPS modules rated up to 125 kVA should have a dB rating of 65 dBA or lower at 1 meter 39 inches.
UPS modules rated above 125 kVA should have a dBA rating of 75 dB or lower at 1.5 meters 5 feet.
**************************************************************************

Sound pressure levels produced by the UPS, when operating under full rated load, at a distance of [1.5 meters 5 feet] [1 meter 39 inches] [_____] in any direction from the perimeter of the unit, must not exceed [75] [65] [_____] dB as measured on the A scale of a Type 1 sound level meter at slow response conforming to ASA S1.4.

1.8.3 Verification of Dimensions

The Contractor is to become familiar with details of the work, verify dimensions in the field, and is to advise the Contracting Officer of any discrepancy before performing the work. Do not proceed until the discrepancy or unsatisfactory condition(s) have been corrected.

PART 2 PRODUCTS

[2.1 SYSTEM DESCRIPTION

**************************************************************************
NOTE: Connect alternate power source to bypass/maintenance bypass for systems requiring dual input. Edit for the configuration used in this project. There are other configurations that the UPS system can be configured, but these are the more common ones.

Note: Delete system cabinet when specifying a single module UPS system.
**************************************************************************

Provide continuous duty, three-phase, solid state, on-line double conversion reverse transfer static UPS(s). The UPS by means of solid state conversion techniques, must provide continuous regulated AC power to its output terminals, while operating from an input power source, cabinet or rack-mounted direct current (DC) storage battery or other approved means. The performance of the UPS must not be degraded when operating without a system battery, provided the input AC source is within tolerance. Provide an UPS system that conforms to UL 1778 and consists of UPS module, battery system, battery protective device, [system cabinet, ]static bypass transfer switch, controls and monitoring, system protective devices, means of isolating the UPS system from the critical load, and remote monitoring interfaces. Connect input ac power the normal source ac input of the UPS module. [Connect alternate power source bypass/maintenance bypass. ]Connect battery to the dc input of the UPS module through the battery protective device. The following configuration is used:

**************************************************************************
NOTE: Three main choices: Non-Redundant, Redundant System, and Scalable Units. The Redundant system herein is strictly various parallel configurations,
Scalable units are becoming the standard, since they allow modularity and reduce the number of UPS models for a manufacturer. Scalable units in a Redundant configuration would also need to indicate the Redundant System configuration.

**************************************************************************

[a. Non-Redundant.

(1) Single Module. On-line, single module UPS configuration capable of supplying power to the total load, with bypass availability.

(2) Parallel Multi-Module. Two or more UPS modules, of the same size, on-line, operating in parallel, with enough capacity to supply the total load.

] [ b. Redundant System.

(1) Isolated Redundant System (Segmented Redundant or Hot Standby). One unit on-line supporting the load, while the other unit is operating to provide the bypass source.

(2) Parallel Redundant System. Two or more UPS modules, of the same size, on-line, operating in parallel, with more capability than is required to support the total load. If any unit fails, the remaining unit or units is able to support the critical load.

(3) Split Bus System. Two parallel redundant systems that may be operated separately or through a tie breaker for increased redundancy. Each UPS system on either side of the split bus is able to support the total critical load.

(4) Distributed Redundant System. Distributed redundant configurations is also called tri-redundant. The basis of this design uses three or more UPS modules with independent input and output feeders. The independent output buses are connected to the critical load via multiple PDUs.

] [ c. Scalable Units.

**************************************************************************

NOTE: Scalable units are rack or cabinet mounted UPS power modules of the same size, which have scalable architecture to allow expansion/contraction to a different kVA size within the same vertical rack or cabinet lineup. The kVA is achieved by adding or subtracting power modules to achieve the desired kVA rating. Each power module, depending on the manufacturer, has a rectifier, inverter and battery converter. There is an UPS system module that works with these power modules to form the UPS. Scalable Units can be specified to have be non-redundant or be redundant. An explanation for each configuration is below.

**************************************************************************

(1) Scalable Unit Non-Redundant. Non-redundant:scalable unit consists of a UPS system module with one or more power modules. The power
modules provided are all required to handle the critical load.

(2) Scalable Unit Internal Redundant. Internal Redundant: scalable unit consists of a UPS system module with more than one power module. There is at least one additional power module that is not required to handle the load within the system. The additional power module or power modules can be sized to handle only part of the critical load or all the critical load. This is not a true parallel redundant system system since it still uses one UPS system module.

(3) Scalable Unit Redundant. Redundant: scalable unit consists of a UPS system module with one or more power modules. The number of power modules can be to just support the load or also have at least one extra power module to internal redundancy. This UPS system module is parallel with a matching scalable unit previously discussed under "Redundant System".

2.2 MODES OF OPERATION

2.2.1 Normal

The UPS module rectifier/charger must convert the incoming ac input power to dc power for the inverter and for float charging the battery. The inverter continuously converts the dc power to ac power to supply the critical load. The inverter output must synchronize with the bypass ac power source, provided that the bypass ac power source is within the specified voltage and frequency range.

2.2.2 Battery - Emergency Operation (Loss or deviation of AC Input Power)

Whenever the ac input power source deviates from the specified tolerances including complete failure, the inverter must draw power from the battery system and supply AC power to the critical load without any interruption or switching transient. The battery system must supply power to the inverter for the specified protection time or until return of ac input source. Provide an audible alarm to indicate the UPS is on battery and provide provisions for a remote alarm signal to be sent via the communication network and a relay output, allowing startup of a secondary power source or orderly shutdown of the critical load.

2.2.3 Failure of AC Input Power to Return

If the ac input power fail to return before the battery voltage reaches the discharge limit, then the UPS system must disconnect from the critical load to safeguard the battery.

2.2.4 Recharge

Upon restoration of normal power to the UPS unit, the input converter and output inverter must simultaneously recharge the batteries and provide regulated power to the critical load.

2.2.5 Transfer to Static Bypass AC Power Source

******************************

NOTE: Choose the first paragraph for non-redundant systems, i.e. single module, parallel multi-module, or scalable unit non-redundant UPS. Choose the second paragraph for redundant systems to include.
When the UPS controller senses an overload, two or more inverter shutdown signals or degradation of the inverter output, the static bypass switch automatically transfers the critical load from the inverter output to the bypass ac power source without an interruption of power. If the static bypass ac power source is outside of specified tolerance limits, the UPS and the critical load shut down. Transfer to static bypass can also be done manually (requested bypass). Transfer to bypass does not take place under these conditions: 100% stepload; and, loss or return of input power, momentary sags, surges or spikes on the input to the UPS.

Provide a static bypass switch that is capable of automatically transferring the load back to the inverter output after the inverter overload condition has returned to normal conditions. Transfer only occurs once the two sources are synchronized. UPS system logic is to monitor the number of retransfer’s within any one-hour period and is to allow 1 to 3 transfers in order to prevent cyclical transfers caused by overloads.

Provide the system with an external make-before-break maintenance bypass cabinet/panel to electrically isolate the UPS during routine maintenance and service. Manual transfer to the maintenance bypass circuit transfers the critical load from the inverter output to the bypass ac power source without disturbing the critical load bus.

Provide a battery protective device which disconnects the battery from the rectifier/charger and inverter for maintenance. The device may be located external to the UPS cabinet. The UPS module continues to function and meet the performance criteria specified except for the battery back-up time function.
2.2.9 Failure of a Module

NOTE: Delete for non-redundant systems, i.e. single module, parallel multi-module, or scalable unit non-redundant UPS.

In a redundant configuration, failure of one module causes that module to be disconnected from the system critical load bus by its internal protective devices and its individual output protective device. Remaining module(s) are to continue to carry the load.

2.2.10 UPS Module Servicing

NOTE: Delete for non-redundant systems, i.e. single module, parallel multi-module, or scalable unit non-redundant UPS.

Provide a means the manually disconnect the UPS modules from the critical load bus for maintenance without disturbing the critical load bus.

2.2.11 Component Performance

Do not exceed 75% of the working voltage and current ratings as established by the manufacturer on solid-state power components and electronic devices. Do not exceed 75% of the operating temperature of solid-state component sub-assemblies. Use computer grade electrolytic capacitors and operate at no more than 95% of the voltage rating at the rectifier charging voltage.

2.3 GENERAL UPS SYSTEM COMPONENTS AND FABRICATION

2.3.1 Semiconductor Fusing

Protect power semiconductors with fast-acting fuses to prevent cascaded or sequential semiconductor failures. Bolt fuses at both ends to bus bars to ensure mechanical and electrical integrity. Indicator lamp or display panel denoting blown fuse conditions must be readily observable by the operator without removing panels or opening cabinet doors.

2.3.2 EMI/RFI Protection

Provide an UPS that complies with and is labeled compliant, with FCC Part 15, Subclass B, Class A.

2.3.3 Internal Wiring

Wiring practices, materials, and coding must be in accordance with the requirements of NFPA 70, OSHA, UL 1778, and other applicable standards. Protect wire runs in a manner which separates power and control wiring. Provide control cabling that is at least No. 16 AWG extra-flexible stranded copper. Logic-circuit wiring may be smaller. Provide ribbon cables that are at least minimum No. 22 AWG. Provide control wiring with permanently attached wire numbers.

2.3.4 Internal Assembly

The printed circuit board (PCB) subassemblies are to be mounted in
pull-out swing-out trays where feasible. Provide cable connections to the
trays that are sufficiently long to allow easy access to all components.
Where not feasible to mount PCB subassemblies in pull-out or swing-out
trays, then mount them firmly mounted inside the enclosure. Monitor every
PCB subassembly. Include self-test and diagnostic circuitry in the logic
circuits such that a fault can be isolated down to the PCB subassembly
level. When used, control logic cards are to have test points or logic
indicators on the front edge of the control logic card and be labeled.

2.3.5 Cable Lugs and Terminations

2.3.5.1 Cable Lugs

Provide appropriate compression type lugs or pre-drilled bus bars on all ac
and dc power connections to the UPS system and battery as required.
Aluminum or bare copper cable lugs are not suitable.

2.3.5.2 Terminations

Supply terminals for making power and control connections. Provide terminal
block for field wiring terminals. Provide terminal blocks that are the
heavy-duty, strap-screw type or screw terminals that are integrated into
removable plugs. Locate terminal blocks for field wiring in one place in
each module. Extend control wiring to the terminal block location. Any
terminal point is limited to land a maximum of two wires. Where control
wiring is attached to the same point as power wiring, Provide a separate
terminal where control wiring is attached to the same point as power
wiring, . If bus duct is used, provide bus stubs where bus duct enters
cabinets.

2.3.6 Cabinets

**************************************************************************
NOTE: UPS units are normally made to be handled by
a fork lift.
**************************************************************************

Install the UPS system in cabinets of heavy-duty structure meeting the
NEMA PE 1 standards for floor mounting. Provide a structurally adequate UPS
module that can be forklift handled and lifted. [Provide removable lifting
eyes on top of each cabinet.] Provide the UPS module cabinet with hinged
and key lockable doors on the front only and with assemblies and components
accessible from the front. Provide dead-front construction behind the door
for those UPS module cabinets that are not lockable. Operating controls
are to be located outside the locked doors. Install input, output, and
battery cables through the top or bottom of the cabinet.

[2.3.6.1 Cabinet Finish

**************************************************************************
NOTE: On Army projects choose the bracketed option;
otherwise delete. Designer needs to coordinate with
the requirements found in UFC 3-560-01 for arc-flash
signage requirements.
**************************************************************************

Provide an equipment cabinet that is cleaned, primed and painted in the
manufacturer's standard colors, in accordance with accepted industry
standards. Cabinets are to be labeled in accordance with NFPA 70 and
NFPA 70E.
2.3.6.2 Factory Applied Finish

Provide electrical equipment with a factory-applied painting systems which, as a minimum, meets the requirements of NEMA 250 corrosion-resistance test.

2.3.6.3 Drawout Assemblies

**************************************************************************
NOTE: Drawout applies to large units for removing inverter modules, static switches assemblies, etc. This is not a standard option even on larger units. Delete for units smaller than 500 kVA.
**************************************************************************

Provide a means of lifting, either and overhead device or a hoisting device for drawout assemblies weighing 23 kg 50 lbs or more. Device can either be part of the UPS or a separate portable device that can be used to perform the lifting.

2.3.7 Manufacturer's Nameplates

Provide a nameplate for each item of equipment bearing the manufacturer's name, address, model number, and serial number securely affixed in a conspicuous place; the nameplate of the distributing agent will not be acceptable.

2.3.8 Field Fabricated Nameplates

ASTM D709. Provide laminated plastic nameplates for each equipment enclosure, relay, switch, and device; as specified or as indicated on the drawings. Provide an inscription on each nameplate that identifies the name of the item, calculated short circuit rating with date, and source of power e.g. 'Panel A in Electrical Room 103'. Provide nameplates that are made of melamine plastic, 3 mm 0.125 inch thick, white with [black][_____] center core. Provide the nameplate with a surface that is matte finished and that has square corners. Accurately align lettering and engrave into the core. Provide nameplates that are at least 25 by 65 mm 1.0 by 2.5 inches with a minimum lettering size of 6.35 mm 0.25 inch high normal block style.

2.3.9 Safety

Provide UPS with instruction plates including warnings and cautions, suitably located, and describing any special or important procedures to be followed in operating and servicing the equipment. Provide control panel displays, which also provide warning messages prior to performing a critical function.

2.3.9.1 Maintenance Isolation

All energized terminals, both AC and DC, and control voltage exposed points are to be insulated or enclosed to ensure the safety of maintenance personnel. Provide the system with the ability to isolate the static switch to enable repair when the UPS is bypassed.

2.3.9.2 Remote Emergency Power Off (REPO) Switch

Provide a remote emergency power off switch that is separate from the UPS. Provide a red, pushbutton with a cover with a label indicating "UPS Emergency Power Off". The switch disconnects all breakers or contactors.
including battery, input, output, and bypass breakers when activated.

2.4  **TECHNICAL REQUIREMENTS UPS SYSTEM RATINGS**

Unless stated otherwise, the parameters listed are under full output load over the range of 0.9 lagging power factor to 0.9 leading power factor, with batteries fully charged and floating on the dc bus and with nominal input voltage.

2.4.1  **UPS SYSTEM LOAD PROFILE**

**************************************************************************

**NOTE:**
The UPS may exhibit load interface problems with certain types of ac load. The items which present the greatest problems are motors, transformers, electric discharge lighting, and SCR and mag-amp power supplies. Problems with these loads are caused by either load nonlinearity or inrush currents required for their operation. The Contractor will be better able to accommodate specific applications if well-defined load data is available.

**************************************************************************

Provide an UPS system that is compatible with the load characteristics defined in the LOAD PROFILE below and load configuration. The UPS system is to provide compensation for UPS/load interaction problems resulting from nonlinear loads or transformer and motor inrush.

**LOAD PROFILE**

Type of load:

Data processing equipment. Size of load: [_____] [kVA] [kW], [_____] voltage, [[_____] power factor].

**************************************************************************

**NOTE:** If known, provide the actual nameplate full load amps and the locked rotor code letter. If not known, delete the option.

**************************************************************************

Motors - type [_____] . Size of load: [_____] horsepower, [_____] voltage[, [_____] full load amps, [_____] locked rotor code letter].

Electric Discharge Lighting. Size of load: [_____] [kVA] [kW], [_____] voltage, [[_____] power factor].

**************************************************************************

**NOTE:** Variable Frequency Drives that are powered from an UPS, need to be specified with input inductors.

**************************************************************************

Variable Frequency Drive(s). Size of load: [_____] horsepower, [_____] voltage

Load switching pattern: [unswitched] [cycled daily] [cycled hourly] [operated by thermostat] [building management system control] [_____] .

**************************************************************************

**NOTE:** Coordinate this with the UPS System Load Profile paragraph. Power factors have been
improving and it is becoming common to have 0.9 lagging or higher power factor.

Steady-state characteristics: [0.9 lagging][_____] power factor.

Special factors: [harmonic characteristics - Total Harmonic Distortion [_____] percent][high elevation][nonstandard input and output voltages][______].

2.4.2 System Requirements

NOTE: Typical capacities in kVA are 10, 15, 20, 30, 40, 50, 80, 100, 125, 150, 225, 250, 275, 300, 500 and 750.

NOTE: System capacity for single module UPS is same as module capacity. Paralleling can be for capacity or for redundancy. Parallel redundant UPS typically provide on additional module that can be down while still carrying the entire load.

NOTE: Scalable Unit sizes listed can vary from manufacturer to manufacturer as well as the number that can be paralleled. If paralleling more than 4 modules, check with the main manufacturers for availability.

The UPS is to support and maintain full battery charging under the following conditions: indicated environmental conditions, a.c input voltage range, air filters blocked up to 50% and a single failed fan. The UPS size and configuration is indicated below.

[ Single Module (non-redundant). Provide one UPS sized for [_____] kVA and [_____] kW. ]

[ Parallel System is comprised of [_____] UPS system-level redundancy. The parallel system is sized for [_____] kVA and [_____] kW.]

NOTE: Scalable units are flexible so there are several choices. The power module are the units that provide the load and can provide internal redundancy if desire. The total load is the estimated demand for the critical load. The UPS system module is the overall controlling module. Example: One can have a system module at 60 kVA and have two 20 kVA power modules to allow for future expansion.

[ Scalable Units. Each UPS power module is rated [10][20][25][_____] kVA. Provide at least [_____] UPS power modules to handle the system load. [Provide one additional UPS power modules for internal redundancy] The
total load is [_____] kVA and [_____] kW. The UPS system module is sized for [_____] kVA and [_____] kW.

2.4.3 Battery Capacity

**************************************************************************
NOTE: Typical battery discharge times are 5, 10, 12, 15, and 30 minutes. If no emergency source is available, longer battery discharge time may be required.

IEEE 450 defines end of life to be at 80% of the initial capacity. The industry standard is to size an end of life battery for 125% of initial capacity. Choose 125% unless another value is required.

**************************************************************************
Discharge time to end voltage: [10][15][30][_____] minutes, at 25 degrees C 77 degrees F. Provide a battery that is capable of delivering [125][_____] percent of full rated UPS kW load at 0.9 power factor at initial start-up.

2.4.4 Static Switch

**************************************************************************
NOTE: The static switch or static disconnect is a solid-state disconnect device used to apply or disconnect ac power. The interrupting capacity requirements must be determined for each project distribution system. Typical interrupting capacities are 30,000 AIC and 50,000 AIC. Interrupting capacities are normally found on the single line diagram or in the short circuit calculations provided with the drawings.

**************************************************************************
[_____] amperes (continuous duty)

2.4.5 Short Circuit Withstand Rating

Braced for at least [_____] amperes symmetrical interrupting capacity.

2.4.6 AC Input

**************************************************************************
NOTE: Be certain that units having foreign voltages are clearly specified since they are not standard for U.S. manufactured products.

**************************************************************************
a. Voltage [208][240][480][_____] volts line-to-line.

**************************************************************************
NOTE: Scalable unit systems do not come with an output transformer, so the input and output voltage needs to be the same when editing. Transformerless help with the efficiency of the UPS unit and keeps the foot-print smaller. Single unit UPS are still available with step-down output transformers

**************************************************************************
b. Number of phases: Three-phase[ + neutral] + ground configuration..

c. Voltage Range: Plus 10 percent, minus 15 percent nominal (no battery
discharge), without affecting battery float voltage or output voltage.

**************************************************************************
NOTE: Use 50 Hz for units shipped or purchased in Europe.
**************************************************************************
d. Frequency: [60][50] Hz, plus or minus 5 percent.

**************************************************************************
NOTE: For scalable units choose the second bracketed option. For other type units, choose the first bracketed option.
**************************************************************************
e. Power walk-in: [20 percent to 100 percent input current over 10 to 15 seconds.] [0 percent to 100 percent input current over 10 to 15 seconds with an adjustable setting that can be set from 5 seconds to 30 seconds.]

**************************************************************************
NOTE: Total harmonic current distortion (THD) is usually 5 percent. If UPS will be supplied from a generator, the generator capacity must be at least twice the UPS capacity if THD exceeds 5 percent.
**************************************************************************
f. Total harmonic current distortion (THD) reflected into the primary line: [5][10] percent maximum at full load.

g. Sub-cycle magnetizing inrush: [2 to 3][_____] times full load current for modules without an isolation transformer.

h. Input surge protection: per IEEE C62.41.1 and IEEE C62.41.2, meeting IEEE C62.41 requirement of Category B3 6kV, 100kHz ring wave and 6kV, combined wave.

i. Input power factor: Lagging from 1-100 percent load.

**************************************************************************
NOTE: Delete transformer inrush paragraph if input isolation transformer is not required. For transformer sub-cycle inrush, selecting a lower value like 6 or 4 in lieu of the range (4 to 8) is better for coordination of UPS feeder protection but might add some cost and extra components. If the range is selected than upstream breaker should have instantaneous current adjustment.
**************************************************************************
[ h. Transformer sub-cycle magnetizing inrush: [5 to 8][_____] times full load current with optional isolation transformer and optional input filter.
]

2.4.7 AC Output

**************************************************************************
NOTE: If the output voltage is 208Y/120 V and the same voltage is not available for the static bypass and maintenance bypass, a transformer will be
required in the bypass distribution system.

NOTE: Scalable units do not come with an output transformer, so the input and output voltage needs to be the same when editing. These scalable, expandable module systems are typically 208V, 480V, and 600V. Transformerless designs help with the efficiency of the UPS unit and keeps the foot-print smaller. Single unit UPS are still available with step-down output transformers.

**************************************************************************

a. Voltage [208][220][240][480][_____] volts line-to-line[, [120][127][277][_____] volts line-to-neutral].

b. Number of phases: Three-phase[ + neutral] + ground configuration.

c. Voltage regulation:
   (1) Balanced load: Plus or minus 1.0 percent.
   (2) 50 percent load imbalance, phase-to-phase: Plus or minus 2 percent.
   (3) 100 percent load imbalance, phase-to-phase: Plus or minus 3 percent.
   (4) Voltage drift: Plus or minus 1 percent over any 30 day interval (or length of test) at stated ambient conditions found in paragraph Environmental Conditions.

d. Voltage adjustment: Plus or minus 5 percent.

e. Frequency: [60][50] Hz.

f. Frequency regulation: Plus or minus 0.1 percent, when on internal oscillator. Internal oscillator is to be temperature compensated.

g. Frequency drift: Plus or minus 0.1 percent over any 24 hour interval (or length of test) at stated ambient conditions when on internal oscillator.

h. Harmonic content (RMS voltage): Provide a system that meets the following voltage THD levels: maximum of 4% RMS total, 2 percent total with 100 percent on any single harmonic (linear load) and 5 percent RMS total for up to 100 percent nonlinear load.

**************************************************************************

NOTE: The load factor range can vary with the presence of a transformer. Choose the first set of brackets in "i" when the UPS does not have a transformer and choose the second set of brackets when there is a transformer or provide own values. The load factor range is the range the UPS can operate at without derating.

**************************************************************************

i. Load power factor operating range (without derating): [0.9 leading to 0.9 lagging][0.95 leading to 0.9 lagging][______].

j. Phase angle displacement/imbalance:
   (1) Balanced load: 120 degrees plus or minus [0.5][1] degree of bypass
(2) 50 percent load imbalance phase-to-phase: 120 degrees plus or minus 3 degrees of input.

k. Inverter overload capability (at full voltage with plus or minus 2 percent regulation) (excluding battery):

   **************************************************************************
   NOTE: Designer needs to determine the overload requirements against protection for the load. Any number can be used that falls within the range for each percent overload. Default values are 10 minutes for 125 percent and 60 seconds for 150 percent.
   **************************************************************************

   (1) 125 percent load for [10 minutes][30 seconds][60 seconds][______].
   (2) 150 percent load for [60 seconds][40 ms].

   (3) Fault clearing. Provide an UPS that is able to maintain output current during a fault condition for 20 cycles if bypass is unavailable or 1 cycle with bypass available. If the fault is not cleared and a bypass is available, the UPS is to transfer to bypass without interruption to clear the fault.

l. Load sharing of parallel modules: Plus or minus 5 percent at full rated system load.

m. Bypass Overload Capability.

   **************************************************************************
   NOTE: For scalable units choose the second option. Choose the first option for all others.
   **************************************************************************

[ 150 percent load for 15 seconds.
]
[ Expandable units. 125 percent continuous at rated output voltage (phase-to-phase). 1000 percent for 1000 milliseconds.
]

2.4.8 Transient Response

2.4.8.1 Voltage Transients

   a. 100 percent load step: Plus or minus 5 percent.
   b. Loss or return of ac input: Plus or minus [1][5] percent.
   c. Automatic transfer of load from UPS to bypass: Plus or minus 1 percent.
   d. Manual retransfer of load from bypass to UPS: Plus or minus 5 percent.

   **************************************************************************
   NOTE: The default value is 20 milliseconds unless a faster recovery time is required. For scalable units, use 50 milliseconds.
   **************************************************************************
e. Response time: Recovery to 1 percent of nominal within [20][50][16] milliseconds where there was a maximum deviation from nominal system output of volts plus or minus 5 percent.

2.4.8.2 Frequency

a. Transients: Plus or minus 0.6 Hz maximum.

******************************************************************************
NOTE: If there is a generator in the project, which will power the UPS during a utility power outage, then choose the second option.
******************************************************************************

b. Slew Rate: under all conditions of operation, [provide 0.4 to 1.0 Hz per second] [0.25 to 0.8 Hz per second].

2.4.9 Efficiency

******************************************************************************
NOTE: Efficiencies do vary some with the size of the UPS; however, the variance between lower rated UPS and higher rated UPS have narrowed. Almost all sizes in double-conversion mode will meet 94%. The higher double-conversion efficiency is 97%. UPS systems loaded to 50 percent will typically see a reduction of 1-2 percentage in efficiency. Units with a transformer could have a lower efficiency.

Delete system efficiency requirements for single module UPS systems.

Energy Star only covers the battery charging systems and the AC-DC/AC-AC power supplies. Energy Star does not cover all components of the complete UPS System. Energy Star UPSs cannot be one of the following types:
(a) Products that are internal to a computer or other end load.
(b) Industrial UPSs designed to protect critical control, manufacturing or production processes.
(c) Utility UPSs that are part of electrical transmission and distribution
(d) Cable TV UPSs designed to power cable distribution systems.
(e) UPSs designed to comply with specific UL safety standards for safety-related applications e.g. emergency lighting, medical diagnostic equipment
(f) UPSs designed for mobile, ship board, marine or airborne applications.
******************************************************************************

[ a. Minimum Single-Module Efficiency: [94][_____] percent at full load kW and [92][_____] percent at 50 percent load.
]
[b. Minimum System Efficiency: 93 percent at full system load kW.
]
[c. Provide Energy Star labeled battery charging systems and AC-DC/AC-AC power supplies. Provide proof of Energy Star label for battery charging systems and AC-DC/AC-AC power supply products.
]
**2.4.10 Energy Saving Mode**

**************************************************************************

NOTE: The UPS industry has developed various energy saving methods. If this is desired then edit appropriately; otherwise, delete. Smaller units may not have this option available. There are some issues that need to be considered since energy saving methods typically do not regulate the voltage or the frequency. Areas with unstable power may not consider this appropriate. UPS installations that require the double-conversion to filter (clean-up) the incoming power should not enable an energy saving mode that allows facility power to the critical load. If the UPS unit is powering IT equipments (such as a data center), choose 2 milliseconds; otherwise 13 milliseconds is acceptable.

**************************************************************************

Provide the UPS with an energy saving mode that operates by having the inverter charged and batteries on at all times, while the main power to the output is through the static bypass switch. When a power problem is sensed, the system is to operate in double-conversion mode and revert to energy saving mode after a pre-set period of time. Maximum transition time is [2][13] milliseconds.

**2.5 UPS MODULE**

**2.5.1 General Description**

**************************************************************************

NOTE: This part is for Scalable units only. If a scalable unit is not desired, then delete this part.

**************************************************************************

UPS module consists of an input converter, output converter, with associated transformers, synchronizing equipment, protective devices, surge suppression, and accessories as required for operation.

**2.5.1.1 Interchangeability**

The subassemblies in one UPS module are to be interchangeable with the corresponding modules within the same UPS, and from one UPS system to another of identical systems.

**2.5.1.2 Rectifier/Charger Unit**

Scalable, expandable modular input converts for the system are to be housed within removable power modules. Input converters control the power from the mains input of the system, provide the necessary UPS power for precise regulation of the DC bus voltage, battery charging, and main inverter regulated output power.

**2.5.1.2.1 Input Protective Device**

**************************************************************************

NOTE: Calculate/verify AIC on the single line diagram at input of the UPS.

**************************************************************************

Provide the rectifier/charger unit with an input protective device. Size
the protective device to accept simultaneously the full-rated load and the battery recharge current. Provide a protective device that is capable of shunt tripping and has an amperes symmetrical interrupting rating of [____]. Provide the protective device with an under-voltage release to open automatically when the control voltage is lost.

[2.5.1.2.2 Input Isolation Transformer

**************************************************************************

NOTE: An input isolation transformer is not normally required. Delete unless specifically required to be part of the UPS. Also, delete when requiring scalable, expandable modular UPS systems. Isolation transformers provide isolation of line induced EMI, common mode noise and dc offsets. Some of the UPS manufacturers require a separate cabinet for the transformer.

UPS industry is transitioning away from transformers being part of the UPS. Having the transformer separate can save space, reduce cooling, improve energy efficiency, reduce weight and cost. In general, those unit smaller than 200 kW will benefit more by not having a transformer as part of the UPS. The threshold level of 200 kW is increasing as more manufacturers go to "transformerless" designs.

Transformers rated 500 kVA and higher typically have the transformer connections on the backside.

**************************************************************************

The rectifier unit is to use a dry-type, isolated-winding power transformer. The transformer's hottest spot winding temperature must not exceed the temperature limit of the transformer insulation material when operating at full load. Provide a transformer with Class H, 150 degrees C rise insulation. [Transformer connections are to be accessible from the front.] If there is a separate transformer cabinet, it is to match the UPS cabinet and attach to it. [Provide a Department of Energy CSL-3 transformer.]

]2.5.1.2.3 Power Walk-In

Input convert is to have an adjustable soft-start (either by manufacturer or owner), capable of limiting the input current form 0 percent to 100 percent of the input over a default 10 second period when returning to ac input bus from battery operation. The change in current over time is to be done in a linear manner.

2.5.1.2.4 Sizing

Size the rectifier/charger unit for the following two simultaneous operating conditions:

a. Supplying the full rated load current to the inverter.

b. Recharging a fully-discharged battery to 90 percent of rated ampere-hour capacity within ten times the discharge time after normal ac power is restored.
2.5.1.2.5  AC Input Current Limiting

Provide a circuit to the input converter that controls and limits the current draw from utility to 130 percent of the rated UPS output. During conditions where input current limit is active, the UPS system is to be able to support 100 percent of the load, charge the batteries at 10 percent of the UPS output rating, and provide voltage regulation with mains deviation of +15/-5 percent.

**************************************************************************
NOTE: Delete second step current limiting option if the UPS system will not be supplied with ac power from an auxiliary generator system or if the generator has been sized to accommodate the higher input current.
**************************************************************************

[ Second step current limiting: Provide the rectifier/charger unit with a second-step input current limit. Provide a separately adjustable second-step current limit that is adjustable from 85 percent to 125 percent of the maximum discharge current with initial setting at 100 percent. Activate the second-step current-limit circuit by a dry contact signal from the generator.
]

2.5.1.2.6  Battery Charging Current

a. Primary current limiting: Battery-charging current is to be voltage regulated and current limited. Provide a separately adjustable battery-charging current limit that is adjustable from 1 percent to 20 percent of the maximum discharge current. Set the limit at the factory to 10 percent. After the battery is recharged, the rectifier/charger unit maintains the battery at full float charge until the next operation under input power failure. Battery charger is capable of providing equalizing charge to the battery.

**************************************************************************
NOTE: Delete second step current limiting if the UPS system (paragraph below) will not be supplied with ac power from an auxiliary generator system or if the generator has been sized to accommodate the recharge current of the battery. Second step current limit is usually found in larger units of 150kVA and above.
**************************************************************************

[ b. Second step current limiting: The rectifier/charger unit is also to have a second-step battery current limit. Provide a separately adjustable second-step current limit that is adjustable from 0 percent to 20 percent of the maximum discharge current with initial setting at [1][10][__] percent. The second-step current-limit circuit is activated by a dry contact signal from the generator set controls and it will prevent normal rate battery recharging until utility power is restored.
]

2.5.1.2.7  DC Ripple (Output Filter)

Rectifier/charger unit is to minimize ripple current and voltage supplied to the battery; the ripple voltage into the battery is not to exceed 1 percent RMS of the float voltage. Ensure the AC ripple voltage of the
rectifier DC output does not exceed 0.5 percent of the float voltage.

[2.5.1.2.8 DC Voltage Adjustment

**************************************************************************

NOTE: Delete this requirement on units smaller than 50 kVA.
**************************************************************************

Provide a manual means at the rectifier/charger unit that allows for adjusting the dc voltage for battery equalization in order to provide voltage within plus 10 percent of nominal float voltage.

]2.5.1.2.9 Battery Isolation Protective Device

Provide the module or external battery system with a dc protective device to isolate the module from the battery system. The protective device size and interrupting rating are as required by system capacity and is to incorporate the trip required by circuit design. Provide the protective device with a provision for locking in the "off" position.

[2.5.1.2.10 Battery Equalize Charge

**************************************************************************

NOTE: Delete this requirement on units smaller than 50 kVA.
**************************************************************************

Equalize charge timer is to provide an equalizing charge automatically to the battery after a 30 second or longer utility outage. The equalize charging time is to be adjustable from 0-72 hours. Provide a manual override for the automatic equalize circuit.

]2.5.2 General Description

**************************************************************************

NOTE: This option applies to single-module and, in some remote cases, multi-module UPS systems that are not specifically required to be scalable. Most applications do not require an isolation transformer as part of the UPS, so delete unless required.
**************************************************************************

UPS module consists of a rectifier/charger unit and a 3-phase inverter unit with their associated transformers, synchronizing equipment, protective devices, surge suppression, [input isolation transformer,] and accessories as required for operation.

2.5.2.1 Interchangeability

The subassemblies in one UPS module are to be interchangeable with the corresponding modules within the same UPS, and from one UPS system to another of identical systems.

2.5.2.2 Rectifier/Charger Unit

Provide a solid state rectifier/charger unit that converts alternating current to direct current, and provides regulated direct current to the dc bus, supplying power to the inverter and charging the battery plant.

2.5.2.2.1 Input Protective Device

**************************************************************************

NOTE: Calculate/verify AIC on the single line

**************************************************************************
Provide the rectifier/charger unit with an input protective device. Size the protective device to accept simultaneously the full-rated load and the battery recharge current. Provide a protective device that is capable of shunt tripping and has an amperes symmetrical interrupting rating of [____]. Provide the protective device with an under-voltage release to open automatically when the control voltage is lost.

**2.5.2.2.2 Input Isolation Transformer**

NOTE: An input isolation transformer is not normally required. Delete unless specifically required to be part of the UPS. Also, delete when requiring scalable, expandable modular UPS systems. Isolation transformers provide isolation of line induced EMI, common mode noise and dc offsets. Some of the UPS manufacturers require a separate cabinet for the transformer.

UPS industry is transitioning away from transformers being part of the UPS. Having the transformer separate can save space, reduce cooling, improve energy efficiency, reduce weight and cost. In general, those unit smaller than 200 kW will benefit more by not having a transformer as part of the UPS. The threshold level of 200 kW is increasing as more manufacturers go to "transformerless" designs.

Transformers rated 500 kVA and higher typically have the transformer connections on the backside.

The rectifier unit is to use a dry-type, isolated-winding power transformer. The transformer's hottest spot winding temperature must not exceed the temperature limit of the transformer insulation material when operating at full load. Provide a transformer with Class H, 150 degrees C rise insulation. [Transformer connections are to be accessible from the front.] If there is a separate transformer cabinet, it is to match the UPS cabinet and attach to it.[ Provide a Department of Energy CSL-3 transformer.]

**2.5.2.2.3 Power Walk-In**

Protect the rectifier/charger unit with a power walk-in feature such that when ac power is returned to the ac input bus, the total initial power requirement will not exceed 20 percent of the rated full load current. This demand is to gradually increase to 100 percent of the rated full load current plus the battery charging current over the specified time interval.

**2.5.2.2.4 Sizing**

Size the rectifier/charger unit for the following two simultaneous operating conditions:

a. Supplying the full rated load current to the inverter.

b. Recharging a fully-discharged battery to 90 percent of rated ampere-hour capacity within ten times the discharge time after normal
ac power is restored.

2.5.2.2.5 AC Input Current Limiting
Provide a circuit on the rectifier/charger to limit AC input current to an adjustable level of 100 percent to 125 percent with a factory setting at [100][115] percent.

**************************************************************************
NOTE: Delete second step current limiting option if the UPS system will not be supplied with ac power from an auxiliary generator system or if the generator has been sized to accommodate the higher input current.
**************************************************************************

[ Second step current limiting: Provide the rectifier/charger unit with a second-step input current limit. Provide a separately adjustable second-step current limit that is adjustable from 85 percent to 125 percent of the maximum discharge current with initial setting at 100 percent. Activate the second-step current-limit circuit by a dry contact signal from the generator.

2.5.2.2.6 Battery Charging Current

a. Primary current limiting: Battery-charging current is to be voltage regulated and current limited. Provide a separately adjustable battery-charging current limit that is adjustable from 1 percent to 20 percent of the maximum discharge current. Set the limit at the factory to 10 percent. After the battery is recharged, the rectifier/charger unit maintains the battery at full float charge until the next operation under input power failure. Battery charger is capable of providing equalizing charge to the battery.

**************************************************************************
NOTE: Delete second step current limiting if the UPS system (paragraph below) will not be supplied with ac power from an auxiliary generator system or if the generator has been sized to accommodate the recharge current of the battery. Second step current limit is usually found in larger units of 150kVA and above.
**************************************************************************

[ b. Second step current limiting: The rectifier/charger unit is also to have a second-step battery current limit. Provide a separately adjustable second-step current limit that is adjustable from 0 percent to 20 percent of the maximum discharge current with initial setting at [1][10][__] percent. The second-step current-limit circuit is activated by a dry contact signal from the generator set controls and it will prevent normal rate battery recharging until utility power is restored.

]2.5.2.2.7 DC Ripple (Output Filter)

Rectifier/charger unit is to minimize ripple current and voltage supplied to the battery; the ripple voltage into the battery is not to exceed 1 percent RMS of the float voltage. Ensure the AC ripple voltage of the rectifier DC output does not exceed 0.5 percent of the float voltage.
2.5.2.2.8 DC Voltage Adjustment

**************************************************************************

NOTE: Delete this requirement on units smaller than 50 kVA.
**************************************************************************

Provide a manual means at the rectifier/charger unit that allows for adjusting the dc voltage for battery equalization in order to provide voltage within plus 10 percent of nominal float voltage.

2.5.2.2.9 Battery Isolation Protective Device

Provide the module or external battery system with a dc protective device to isolate the module from the battery system. The protective device size and interrupting rating are as required by system capacity and is to incorporate the trip required by circuit design. Provide the protective device with a provision for locking in the "off" position.

2.5.2.2.10 Battery Equalize Charge

**************************************************************************

NOTE: Delete this requirement on units smaller than 50 kVA.
**************************************************************************

Equalize charge timer is to provide an equalizing charge automatically to the battery after a 30 second or longer utility outage. The equalize charging time is to be adjustable form 0-72 hours. Provide a manual override for the automatic equalize circuit.

2.5.3 Inverter Unit

**************************************************************************

NOTE: Choose the first option for all systems except for scalable unit UPS systems. Second option is for scalable unit UPS systems.
**************************************************************************

Provide a solid-state inverter with sinusoidal output deriving its power from the dc bus (rectifier or battery source) and providing ac power within specified limits to the critical load. Inverter is to utilize microprocessor controlled solid state Pulse Width Modulation (PWM) controlled insulated gate bipolar transistor (IGBT) power transistor technology to shape the ac output.

Provide an output converter that constantly develops the UPS output voltage waveform by converting the dc voltage to ac voltage through a set of semiconductor power converters. In both normal operation and battery operation, the output inverters are creating and output voltage independent of the mains input voltage. Input anomalies such as brown-outs, spikes, surges, sags and outages do not affect the amplitude or sinusoidal nature of the output voltage sine wave of the inverters.

**************************************************************************

NOTE: Keep this option/paragraph when there is a generator available to supply power to the UPS.
**************************************************************************

Include a bypass phase synchronization window adjustment to optimize compatibility with local engine-generator-set power source.
2.5.3.1 Output Overload

**************************************************************************
NOTE: Choose the first option for all systems except for scalable unit UPS systems. Second option is for scalable unit UPS systems.
**************************************************************************

Provide an inverter that is able to sustain an overload as specified across its output terminals. The inverter is to remain on and continue to operate within rated parameters, with inverse-time overload shutdown protection. If the overload condition persists beyond the rated parameters of the inverter, the load is to be transferred to the bypass source where the inverter disconnects automatically from the critical load bus. If the bypass source is not available and the overload/fault condition continues, the inverter is to current limit for the time as determined by the manufacturer and then shut down to protect the internal components.

Provide the output inverter with overload capabilities that allows steady state overload conditions of up to 150 percent of system capacity to be sustained by for 30 seconds in normal and battery operation. If the overload condition persists beyond the rated parameters of the inverter, the load is to be transferred to the bypass source where the inverter disconnects automatically from the critical load bus.

2.5.3.2 Output Protective Device

Provide an output protective device that is capable of opening on an applied control signal and has the proper frame size and trip rating to supply overload current as specified. Provide the external output protective device with provision for locking in the "off" position. The inverter output protective device works in conjunction with the bypass protective device for both manual and automatic load transfers to and from bypass power.

2.5.3.3 Output Transformer

**************************************************************************
NOTE: Delete the output transformer unless required or when the design output voltage is different then the normal UPS output voltage. Some of the UPS manufacturers require a separate cabinet for the transformer. The preferred option is a harmonic mitigating transformer instead of a K rated transformer.
**************************************************************************

UPS industry is transitioning to transformerless UPS modules. Having the transformer separate can save space, reduce cooling, improve energy efficiency, reduce weight and cost. In general, those units smaller than 200 kW will benefit more by not having a transformer as part of the UPS. The threshold level of 200 kW is increasing as more manufacturers go to "transformerless" designs.

The inverter output transformer is [harmonic mitigating transformer type.]
[or] [capable of handling up to [K-13] [_____] nonlinear loads as described in IEEE C57.110]. [Provide a transformer that meets the requirements for Department of Energy CSL-3.]
2.5.4 External Protection

Provide the UPS module with built-in self-protection against undervoltage, overvoltage, overcurrent and surges introduced on the ac input source and/or the bypass source. Provide the UPS with built-in self-protection against overvoltage and voltage surges introduced at the output terminals by paralleled sources, load switching, or circuit breaker operation in the critical load distribution system.

2.5.5 Internal Protection

Provide the UPS module with the ability to be self-protected against overcurrent, sudden changes in output load and short circuits at the output terminals. Provide the UPS module with output reverse power detection which causes the module to be disconnected from the critical load bus when output reverse power is present. Provide the UPS module with built-in protection against permanent damage to itself and the connected load for predictable types of failure within itself and the connected load. At the end of battery discharge limit, the module shuts down without damage to internal components.

2.5.6 Battery Protection

Provide the inverter with monitoring and controls circuits to protect the battery system from damage due to excessive discharge. Inverter shutdown is be initiated when the battery has reached the end of discharge voltage. Manufacturer is to calculate the end-of-discharge voltage and automatically adjusted for partial load conditions to allow extended operation without damaging the battery. Automatic shutdown based on discharge time is not acceptable.

2.5.7 Modular Inverter Isolation

**************************************************************************
NOTE: Delete for single module UPS system.
**************************************************************************

Provide each inverter in the UPS system with fault sensing and static isolation as well as an output protective device, to remove a faulted module from the system without affecting the critical load bus beyond the stated limits.

2.5.8 Parallel Operation

**************************************************************************
NOTE: Delete for single module UPS system.
**************************************************************************

For parallel operation, ensure the protection system has control logic capable of isolating only the faulted module, and does not shut down the entire UPS system upon a fault in one module. Open protective devices are to be indicated by an alarm and indicator light.

2.6 STATIC BYPASS TRANSFER CIRCUIT

**************************************************************************
NOTE: Circuit breaker can be fixed or drawout type. In units 500 kVA and larger, the breaker will typically be drawout. 150 kVA or larger units may need to use fuses for the protection of the static switch
**************************************************************************
Provide the control logic with an automatic transfer circuit that senses the status of the inverter logic signals and alarm conditions and provides an uninterrupted transfer of the load to the static bypass ac power source, without exceeding the transient limits specified herein, during times when maintenance is required, when a malfunction occurs in the UPS or when an external overload condition occurs. [The power section of the static bypass transfer circuit consists of a plug-in type assembly to facilitate maintenance.] The static bypass transfer circuit is to be used to connect the input bypass ac power source to the critical load when required. Provide the static bypass transfer circuit with the following features:

2.6.1 Construction

Provide a static with a continuous duty rating of at least 100 percent of the UPS output rating. Provide a static bypass transfer circuit as an integral part of the UPS that consists of a static switch, made up of two reverse-paralleled SCRs (silicon-controlled rectifiers) per phase conductor, and a bypass protective device, made up of a [circuit breaker]circuit breaker and fuses. The bypass protective device is to be in series with the static switch. The inverter output protective device disconnects and isolates the inverter from the bypass transfer circuit.

[Provide a static switch that is of a modular design.]

2.6.2 Automatic Uninterrupted Transfer

The static bypass transfer switch automatically causes the bypass ac power source to assume the critical load without interruption when the bypass control logic senses one of the following conditions and the UPS inverter output is synchronized to the bypass ac power source:

a. Inverter overload exceeds unit's rating.
b. Battery protection period is expired and bypass is available.
c. System failure.
d. Inverter output undervoltage or overvoltage.

2.6.3 Interrupted Transfer

If an overload occurs and the UPS inverter output is not synchronized to the bypass ac power source, the UPS inverter output current-limits for 200 milliseconds minimum. The inverter then turns off and an interrupted transfer to the bypass ac power source is made.

If the bypass ac power source is beyond the conditions stated below, an interrupted transfer is made upon detection of a fault condition:

a. Bypass voltage greater than plus or minus 10 percent from the UPS rated output voltage.
b. Bypass frequency greater than plus or minus 0.5 Hz from the UPS rated output frequency.
c. Phase differential of ac bypass voltage to UPS output voltage greater than plus or minus 3 degrees.

2.6.4 Manual Load Transfer

It must be possible to make a manually-initiated static transfer from the system status and control panel by turning the UPS inverter off or by initiating it through the UPS display interface. The transfer is to make-before-break utilizing the UPS output and system bypass circuit breakers. Do not use the static switch for manual transfer unless there isn't a parallel by-pass circuit breaker or contactor.

2.6.5 Automatic Uninterrupted Forward Transfer

Automatic transfer of the load back to the inverter is to take place when the transfer was caused by an overload and only after the load has returned to a level within the inverter souse. Provide the ability to allow 1 to 3 transfers within any one-hour period to prevent cyclical transfers caused by overloads.

2.6.6 Forced Transfer

Provide control logic circuitry with the means of making a forced or reverse transfer of the static bypass transfer circuit on an interrupted basis. Minimum interruption is 200 milliseconds when the UPS inverter is not synchronized to the bypass ac power source.

2.6.7 Overload Ratings

**************************************************************************
NOTE: Select choice "c" for scalable unit UPS systems.
**************************************************************************

The static bypass transfer switch is to withstand the following overload conditions:

a. 1000 percent of UPS output rating for one cycle.

b. 125 percent of UPS output rating for 1 minute.

[ c. 110 percent of UPS output continuously. ]

2.6.8 System Protection

Incorporate into the static bypass circuit back-feed protection per UL 1778. To achieve back-feed protection, provide a back-feed protection breaker/mechanical contactor upstream and in series with the bypass switch that is controlled by the UPS/static switch, to open immediately upon sensing a condition where back-feeding of the static switch by any source connected to the critical output bus of the system is occurring.

2.6.9 Static Bypass Switch Disconnect

**************************************************************************
NOTE: Delete if the static switch is of the draw-out type or if the UPS module is 30 kVA or smaller.
**************************************************************************

Delete last option if a maintenance by-pass system is not provided/used.
Incorporate a static switch disconnect that can be used to isolate the static bypass transfer switch assembly so it can be removed for servicing. [Equip the device with auxiliary contacts and provisions for padlocking in either the "on" or "off" position.]

2.7 MAINTENANCE BYPASS CIRCUIT

2.7.1 General

NOTE: See the TP-19, Static Uninterruptible Power Supply for full discussion on maintenance bypass circuit configurations. UPS units typically come standard with certain internal circuit breakers or switches and these include: one ahead of the rectifier, one on the output of the rectifier, and one ahead of the static switch. In addition, the maintenance bypass switch can be internal to the UPS or external and typically consists of a circuit breaker(s). UPS units up to 500 kVA can have an internal maintenance bypass switch.

Multi-module UPS systems that have UPS modules rated 500 kVA (typically) and higher can have a different configuration. Each module can consist of a rectifier/battery/inverter without an internal maintenance bypass switch or a static switch. In this case, there is a centralized static switch that is sized for the entire load and has its own dedicated feeder. The maintenance by-pass cabinet will typically have two breakers and a single feed. The output of the UPS modules, centralized static switch are in a system control cabinet that connects to the maintenance bypass cabinet. Edit appropriately for multi-module systems.

Provide a maintenance bypass switch or arrangement of switch devices [in a matching NEMA 250, type 1 cabinet adjacent to the UPS cabinet][in a wall-mounted NEMA 250, type 1 enclosure][in a free-standing floor-mounted NEMA 250, type 1 enclosure]. [Provide a maintenance bypass enclosure configured as indicated.] [Provide a [two][three][four]switch maintenance bypass enclosure. ][Provide a two switch maintenance bypass with an input switch for each module.]

2.7.2 Interlock

NOTE: Choose the last sentence option for scalable unit UPS systems.

Electrically and mechanically interlock the switch(es) to prevent interrupting power to the load when switching to bypass mode. Key interlock requires unlocking bypass/isolating switch before switching from normal position with key that is released only when the UPS is bypassed by the static bypass transfer switch. Lock is designed specifically for mechanical and electrical component interlocking. [Provide auxiliary
contacts for the purpose of relaying status information of each circuit breaker/switch actuator to the UPS and static bypass.

2.7.3 Load Transfer

The maintenance bypass switch provides the capability of transferring the critical load from the UPS static bypass transfer switch to maintenance bypass and then back to the UPS static bypass transfer switch with no interruption to the critical load.

2.7.4 Load Bank Protection Device

NOTE: Delete if the ability to load bank test the UPS system if not required. It is not recommended under normal circumstances for units smaller than 225 kVA.

Provide a load bank protective device that allows the UPS system to be tested using a portable load bank. The load bank protective device is connected on the line side of the maintenance bypass switch isolation protective device. Provide a [full system load bank][partial system load bank] sized at[______].

2.7.5 Voltage Matching] [Isolation Transformer]

NOTE: Delete if the input and output voltages are the same and an isolation transformer is not required.

UPS industry is transitioning away from transformers being part of the UPS. Having the transformer separate can save space, reduce cooling, improve energy efficiency, reduce weight and cost. In general, those unit smaller than 200 kW will benefit more by not having a transformer as part of the UPS. The threshold level of 200 kW is increasing as more manufacturers go to "transformer less" designs.

The maintenance bypass cabinet contains [a voltage matching transformer][an isolation transformer] as required to match the output voltage requirements. Ensure the transformer and UPS are phase matched.

2.8 DISPLAY, CONTROLS AND ALARMS

NOTE: The first paragraph is for non-redundant systems, i.e. single module, parallel multi-module, or scalable unit non-redundant UPS. The second paragraph is for redundant systems to include scalable unit internal redundant and scalable unit redundant.

Provide the UPS module with a microprocessor-controlled display unit located on the hinged door on the front of the system. Provide a LCD color alphanumeric display that operated by touchscreen to access the various information. Controls, meters, alarms and indicators for operation of the...
UPS module are to be on this panel. Provide a menu driven graphical user interface for browsing the screens. All three-phases of three-phase parameters are to be displayed simultaneously.

[Provide the modules with separate, optically isolated, communication paths to the power and static switch modules. Provide redundant power supplies, each having a separate AC and DC input and output for the logic power for the control modules. Provide a microprocessor-controlled display unit with alphanumeric display with back or side lighting. Controls, meters, alarms and indicators for operation of the UPS module are to be on this panel. Provide a menu driven graphical user interface for browsing the screens. All three-phases of three-phase parameters are to be displayed simultaneously.]

*****************************************************************************
NOTE: Delete the output kilowatt hour meter information unless required. This option is rarely available with an UPS and if needed it would be better to consider a separate meter on the load.
*****************************************************************************

2.8.1 Module Meters

2.8.1.1 Monitored Functions

Display the actual value along with the ability to show the peak, average and low values over various periods of time. Monitor and display the following functions:

a. Input voltage, phase-to-phase (all three phases).

b. Input current, all three phases.

c. Input frequency.

d. Bypass voltage, phase-to-phase and phase-to-neutral (all three phases).

e. Bypass frequency.

f. Battery voltage.

g. Battery current (charge/discharge).

h. Output voltage, phase-to-phase and phase-to-neutral (all three phases).

i. Output current, all three phases.

j. Output frequency.

k. Input power factor.

l. Maintenance bypass voltage, phase-to-phase and phase-to-ground (all three phases).

[ m. Output kilowatts or kilovoltamps. ]

*****************************************************************************
NOTE: This option is available on all systems.
*****************************************************************************

[ n. Bypass voltage, phase-to-phase and phase-to-ground (all three phases).]
2.8.1.2 Meter Construction

Display alphanumeric parameters based on true RMS metering with 2 percent accuracy at full scale (minimum 4 significant digits) at the display panel.

2.8.2 Module Controls

Provide a module or equivalent features via touchscreen with the following controls:

a. Silence audible alarm.

b. Display or set the date and time.

c. Adjust setpoints on various alarms.

d. Alarm test/reset pushbutton.

e. Battery protective device trip pushbutton[, with guard].

f. Emergency off pushbutton, with guard. Provide a hard-wired pushbutton even if touchscreen system is provided.

g. DC voltage adjustment potentiometer, with locking guard or AC output voltage adjustment potentiometer. Provide potentiometer that is accessible only by authorized personnel.

h. Control power off switch.

i. Transfer load to and from static bypass circuit.

j. Display control pushbuttons: up, down, select.

**************************************************************************
NOTE: Delete UPS/bypass transfer switch reference except for parallel redundant or parallel multi-module systems. The parallel redundant multi-module configuration must also be specified to have a system control cabinet instead of having individual (distributed) bypass parallel system, so only keep if specified and used.
**************************************************************************

[ k. UPS/bypass transfer selector switch.

]}

**************************************************************************
NOTE: Module input and output protective device trip pushbuttons are only available when an Emergency Power Off feature is provided.
**************************************************************************

[ 1. Module input protective device trip pushbutton.

m. Module output protective device trip pushbutton.
]

2.8.3 Module or System Alarm Indicators

Provide the module with indicators for the following alarm items. Any one of these conditions is to turn on an audible alarm and the appropriate
summary indicator. The system is to register each new alarm without affecting any previous alarm. Provide a processor that time-date stamps each event.

a. Input ac power source failure.
b. Input protective device open.
c. Input power out of tolerance.
d. Overload.
e. Overload shutdown.
f. DC overvoltage/shutdown.
g. DC ground fault.
h. Low battery.
i. Battery discharged.
j. Battery protective device open.
k. Blower fan failure or overtemperature.
l. Overtemperature shutdown.
m. Hardware shutdown.
n. Equipment overtemperature.
o. Fuse blown with annunciation.
p. Control power failure.
q. Charger off/problem.
r. Inverter fault/off.
s. Emergency power off.
t. External shutdown (Remote Emergency Power Off) activated.
u. Output protective device open.
v. Operating on internal oscillator
w. UPS on battery
x. Critical load on static bypass.
y. Static bypass transfer switch disabled/failure.
z. Inverter output overvoltage.
aa. Inverter output undervoltage.
bb. Inverter output overfrequency.
cc. Inverter output underfrequency.

dd. Bypass source overvoltage.

ee. Bypass source undervoltage.

ff. Bypass source overfrequency.

gg. Bypass source underfrequency.

hh. Bypass source to inverter out of synchronization.

**************************************************************************
NOTE: The following additional alarms are only required when the system is scalable unit UPS system; otherwise, delete.
**************************************************************************

ii. Load no longer above alarm threshold.

jj. Intelligent module inserted or removed.

kk. Redundancy restored.

ll. Need battery replacement.

mm. Bad battery module.

nn. Bad power module.

oo. Redundant intelligent module installed and failed.

pp. Load above alarm threshold.

2.8.4 Module Emergency OFF Button

Provide an emergency off pushbutton with a protective cover. Pressing the emergency off button causes the module input, output, and battery circuit breakers or contactors to open, completely isolating the UPS system from sources of power and transfer of the load to bypass.

System Mimic Panel

Provide a mimic panel in the format of a single-line diagram that graphically depicts whether the load is supplied from the inverter, bypass, or battery. Provide on status on the following:

a. Module on-line, one per UPS module.

b. UPS output protective device status, one for closed (red), one for open (green), and one for withdrawn (amber).

c. Static bypass protective device status, one for closed (red), one for open (green), and one for withdrawn (amber).

d. Static switch status, one for connected (red), and one for disconnected (green).

e. Status on the AC input circuit breaker, battery circuit breaker,
and inverter circuit breaker. Connected (red) and disconnected (green).

[2.9 SYSTEM CONTROL CABINET
**************************************************************************
NOTE: This section is for multi-module UPS systems that has a system control cabinet that contains a single bypass static switch that handles the entire load provided by the multi-modules. Delete for single module UPS Systems and for scalable unit UPS systems.
**************************************************************************

2.9.1 General Description

Provide the multi-module UPS system with a separate control cabinet for system output that contains; bus bar connections to collect the output from each module, the static switch and its bypass breaker, the UPS system output protective device, and the UPS output switchgear.

2.9.2 UPS Output Switchgear

The UPS output switchgear consists of a main protective device feeding the UPS output switchgear critical load bus, a load bank protective device (connected on the line side of the main protective device), a maintenance bypass protective device and associated feeder protective devices for the critical loads.

2.9.2.1 Interlocking
**************************************************************************
NOTE: Delete references to load bank protective device if not used.
**************************************************************************

[The main protective device and the load bank protective device are interlocked to prevent both being closed at the same time. ]The maintenance bypass protective device is interlocked with the UPS system output protective device and the static bypass switch. The maintenance bypass protective device is not capable of closing until the static bypass switch is closed and the UPS system output protective device is open. Once the maintenance bypass protective device is closed, the UPS output switchgear main protective device is capable of opening to isolate the critical loads from the UPS output.[ The load bank protective device as well as the UPS system output protective device is then capable of closing to permit load bank testing.]

2.9.2.2 Switchgear
**************************************************************************
NOTE: Army only. This is only used on Army projects.
**************************************************************************

Provide the UPS output switchgear in accordance with Section 26 28 01.00 10 COORDINATED POWER SYSTEM PROTECTION.

] [2.10 SELF-DIAGNOSTIC CIRCUITS
**************************************************************************
NOTE: Delete if self-diagnostic circuits are not required. These circuits are normally required in

SECTION 26 33 53 Page 46
high reliability applications where it becomes critical to identify the faulty circuit card in the shortest time possible. This option is not normally available in off the shelf UPS units.

**************************************************************************

Provide control logic with status indicators for trouble-shooting the control circuits. These indicators are mounted on the circuit card edge or face such that they will be visible without repositioning the card, and are labeled with the function name.

][2.11 REMOTE MONITORING PANEL

**************************************************************************

NOTE: Delete if a remote monitoring panel is not required.

**************************************************************************

Provide a remote monitoring panel to monitor system status. Wall mount the panel near the critical load or as indicated.

2.11.1 Indicators

Provide indicators for the following (minimum):

a. Load on UPS.

b. Battery discharging.

c. Load on bypass.

d. Low battery.

e. Overload.

e. summary alarm.

f. New alarm (to alert the operator that a second summary alarm condition has occurred).

2.11.2 Audible Alarm

Any single indicator turns on the audible alarm. An audible alarm test/reset button and lamp test/reset button is to be included. The alarm on the module is not affected nor reset by the reset button.

][2.12 COMMUNICATIONS AND DATA ACQUISITION

**************************************************************************

NOTE: Delete the communication and data options that are not required. RS-485 port is not supported by some of the UPS manufacturers.

**************************************************************************

Provide an [RS 232][Internet Protocol (IP)][RS 485] communications and data acquisition port. This port allows the system parameters, status, alarm indication and control panel functions specified to be remotely monitored and controlled.
Additionally, provide additional ports for use with the following:

a. Provide the following Form C contacts for remote indication:
   (1) UPS on battery.
   (2) UPS on-line.
   (3) UPS load on bypass.
   (4) UPS in alarm condition.
   (5) UPS off (maintenance bypass closed).

b. Provide four spare Form C contacts rated at 120V, 0.5A.

c. Provide a SNMP (Simple Network Management Protocol) adapter to communicate UPS monitoring via a network or direct connection to [personal computer (PC)] [MODBUS] [BACnet].

d. Provide a standard Web Browser adapter to remotely view and monitor UPS functions over the Internet.

Provide communication ports and contacts that are capable of simultaneous communication.

2.12.1 Emergency Control Contacts

**************************************************************************

NOTE: Include this paragraph only when the UPS will be installed in conjunction with a generator/alternate source.

**************************************************************************

Provide normally open contacts to signal when power is supplied to the UPS from engine generators or alternate source. The signal connects to an automatic transfer switch.

2.13 TEMPERATURE CONTROL

2.13.1 General

**************************************************************************

NOTE: Default is to have the exhaust go out the top. If rack mounted UPS is specified, then choose the option to have a rear exhaust.

**************************************************************************

Ensure cabinet and enclosure ventilation is adequate to operate the components within their ratings. Forced-air cooled rectifier, inverter, and control unit will be acceptable. If UPS input power is lost, then the cooling fans are to continue to operate. Provide redundancy that ensures failure of one fan or associated circuit breaker does not cause an overheat condition. Cooling air is to enter the lower front of the cabinets and exhaust at the [top] or [rear]. Provide visual and audible alarms on the control panel that indicate blower power failure. Provide replaceable filters on air inlets, which may be located on the inside of the cabinet doors and are easily accessible for replacement.

2.13.2 Blower Power Source

**************************************************************************
NOTE: Select 'output side' for 10-225kVA; select 'input and output sides' for over 225kVA.

Provide a blower power source that is internally derived from the [output side] [input and output sides] of UPS module, with automatic transfer arrangement.

2.13.3 Temperature Sensors

Provide temperature sensors to monitor the air temperature. Provide a sensor or sensors to monitor the temperature of rectifier and inverter heat sinks. [Provide separate sensors to monitor the transformer temperature.] Provide critical equipment over-temperature indication that starts a timer that shuts down the UPS system if the temperature does not return below the setpoint level recommended by the UPS manufacturer.

2.14 BATTERY SYSTEM

NOTE: Ventilation of storage battery areas is required by NFPA 70. A safe environment for such areas exists where the concentration of gaseous hydrogen does not exceed 2 percent accumulation per unit volume. Factors used to determine this condition are the size and type of battery to be charged; room volume; maximum volume of hydrogen gas emitted during charging; and ventilation rate. Approximately 0.016 cubic foot per hour of hydrogen gas is produced from each fully charged wet cell per charging ampere. Valve-regulated cells typically produce considerably less. Once sufficient ventilation is produced, no need exists for explosion-proof wiring, vapor-proof fixtures, or other special provisions. Mechanical ventilation (an exhaust fan) should be provided in accordance with the battery manufacturer's recommendations.

Battery Room Temperature. Battery system performance may be affected by battery room temperatures above or below the nominal range of 23 degrees C (74 deg. F) to 27 degrees C (80 deg. F). Battery capacity is reduced at lower temperatures and battery life expectancy is reduced at sustained temperatures greater than 30 degrees C (86 deg. F). Batteries should be derated if battery room temperatures are expected to vary more than plus or minus 2 degrees from the standard 25 degrees C.

NOTE: Refer to UFC 3-520-01, "Interior Electrical System"s for battery types and selection information. UPS systems either use two basic types: wet cell (also called flooded cell) or valve-regulated lead-acid (VRLA). There are two types of VRLA: gel and absorbed glass mat(AGM). Provide AGM type for UPS applications when choosing between gel and AGM.
General

NOTE: Valve regulated lead acid (VRLA) batteries are predominately lead calcium and should be chosen for most applications. VRLA batteries that are pure lead have longer life when compared to lead calcium. If considering pure lead, a cost analysis should be performed. Wet cells can be lead calcium, lead antimony or lead selenium with lead calcium the most common. Lead antimony and lead selenium are better for deep cycle applications and should only be considered in areas where there are very frequent power outages e.g. in areas where the battery is normally on a stand-by do not use lead antimony or lead selenium. Lead selenium, or sometimes called low antimony batteries, have a higher cycle capability when compared to lead calcium (5+ times), but not as good a lead antimony batteries (about 70%). Note that lead selenium typically requires less maintenance when compared with lead antimony. If designer wants lead antimony or lead selenium, the choice needs to be added to the wet cell paragraph.

NOTE: Wet cell batteries require a dedicated room. Small UPS units will typically use the valve-regulated lead-acid type battery. Wet cells can last up to 20 years with proper maintenance. There are two "grades" of VRLA: one for 10 years and one for 20 years. Note that 10 yr batteries typically only get 5-6 years of life in UPS application. If a 20 year VRLA is desired, then a life cycle cost analysis should be performed since the cost can be significantly more than a 10 year VRLA. Refer to UFC 3-520-05, "Stationary Battery Areas" for guidance governing the architectural, mechanical, plumbing and electrical requirements for design of stationary secondary battery installations.

NOTE: The last option is for modular, expandable scalable cabinet mounted type UPS unit with their associated battery plant.

Battery system contains the battery cells, cabinets, racks, battery disconnect, and battery monitor. Provide a storage battery with sufficient ampere-hour rating to maintain UPS output at full capacity for the specified duration for each UPS module. Provide a battery that is heavy-duty, industrial design suitable for UPS service. Provide the cells with flame arrestor vents, intercell connectors and cables, cell-lifting straps, cell-numbering sets, and terminal grease. Size intercell connectors to maintain terminal voltage within voltage window limits when supplying full load under power failure conditions. Provide cell and connector hardware that is the type of stainless steel capable of resisting corrosion from the electrolyte used. The battery plant is to consist of the following:
[ a. Provide a [lead calcium][pure lead] battery that is of the float-type, absorbed glass mat (AGM) valve-regulated, lead-acid, sealed, non-gassing, recombinant type (VRLA) that is rated for [10][20] years. [Battery is factory assembled in an isolated compartment of the UPS cabinet complete with battery disconnect switch.][Battery is factory assembled in a separate matching cabinet, complete with battery disconnect switch.]

] [ b. Provide a [lead calcium][pure lead] battery that is of the wet cell (flooded) type. Provide heavy-duty industrial units in styrene acrylonitrile containers suitable for rack mounting. Assembly includes battery disconnect switch, hydrometer syringe, and thermometer with specific gravity-correction scales.

] [c. Provide a lead calcium battery that is of the float-type, absorbed glass mat (AGM) valve-regulated, lead-acid, sealed, non-gassing, recombinant type (VRLA) that is rated for 10 years. Provide the UPS battery plant of modular construction made up of replaceable, hot-swappable, fused, battery modules.

] [2.14.2 Battery Cabinet

**************************************************************************
NOTE: Delete if a battery cabinet is not required.
Cabinet or rack could be used for VRLA type batteries. Cabinets are the preferred method when VRLA are used. Racks are used for wet cell type batteries.
**************************************************************************

Furnish the battery pack assembly in a battery cabinet matching the UPS cabinet. Design the battery cabinet to allow for checking the torque on the connections in the battery system and to provide adequate access for annual housekeeping chores. Provide an external wiring interface through the bottom or top of the assembly. Provide a high temperature alarm that annunciates detection of high temperature within the battery cabinet.

] [2.14.3 Battery Rack

**************************************************************************
NOTE: Delete if a battery rack is not required.
Three tier racks should be used only where floor space is limited. They increase floor loading and make maintenance more difficult. Use battery rack for wet cell batteries.
**************************************************************************

Provide a suitable number of [two-tier][three-tier] racks to fit the room layout shown for the number of batteries provided. Provide a steel battery rack that is protected with electrolyte-resistant paint. Ship the battery rack unassembled with all necessary hardware for assembly. Provide each rack with a complete set with bus bars to accommodate cables from UPS module. Provide bus bar connectors for battery-to-battery connections and high-flex multi-stranded copper cable (ASTM B173 stranding class H) with proper cable supports for connecting top row of batteries to bottom row of batteries at rack ends. Cut end sections to length to prevent wasting floor space.

] [2.14.4 Cell-Terminal Covers

**************************************************************************
**NOTE:** Cell-terminal covers are only for wet cells.

Provide acid-resistant transparent cell-terminal covers not exceeding 1.83 meters 6 feet in length and with vent holes drilled on top where needed.

2.14.5 Battery Disconnect

Provide each battery string with a [circuit breaker][ or ][fused disconnect switch] provided in a NEMA 250, type 1 enclosure, finished with acid-resistant paint and located in line with the assembly. Provide each switch with line side and load side bus bars for connection to battery cells. Rate each switch [500][_____] V dc, [ampere rating per manufacturer][_____ amperes], 3-pole with interrupting rating as required by system capacity, and provide an external operator that is lockable in the "off" position. [Provide either a wall mounted disconnect or a cabinet mounted disconnecting means for cabinet mounted batteries. Disconnect is allowed to be in the battery cabinet.]

2.14.6 Modular Battery Enclosures

**NOTE:** Paragraph is for scalable unit UPS systems only. For all other delete.

Provide battery enclosures that house draw-out battery cartridges. Battery cartridges are to interlock in place within the battery enclosure to ensure proper contact.

2.14.7 Seismic Requirements

**NOTE:** Do not use this paragraph for Navy projects. When directed to meet Seismic Requirements, 13 48 73 SEISMIC CONTROL FOR MECHANICAL EQUIPMENT and Section 26 05 48.00 10 SEISMIC PROTECTION FOR ELECTRICAL EQUIPMENT must be edited to suit the project and be included in the contract documents. Edit the following paragraph and include it in the project specification. When a Government designer is the Engineer of Record, provide seismic requirements on the drawings.

Provide a seismic-restraint design for the battery [racks][cabinets], assemblies, subassemblies, and components to include fasteners, supports, mounting and anchorage devises [that conforms to UFC 3-301-01, Section 13 48 73, SEISMIC CONTROL FOR MECHANICAL EQUIPMENT and to Section 26 05 48.00 10, SEISMIC PROTECTION FOR ELECTRICAL EQUIPMENT][ as indicated].

2.14.8 Battery Monitor

**NOTE:** Provide a battery internal resistance monitoring system on and temperature-compensated charging only on mission critical systems.

For the scalable units UPS systems choose the battery module in the first sentence and for all other systems choose the "string in the system". Also, for the scalable unit UPS system choose the
temperature-compensated charging option.

Provide a battery monitor for each battery [string in the system][battery module]. Monitor the following minimum parameters by the device:

a. Total system voltage.

b. Ambient room temperature.

c. Minimum of 120 days activity history.

d. Programmable alarm functions.

e. Battery internal resistance.

f. Temperature-compensated charging. Provide a battery temperature sensing unit to automatically reduce the float charge in response to increases in battery temperature. Set the response per the manufacturer's requirements. Monitor is to only indicate when the temperature compensation circuit is active.

g. Provide a remote monitoring panel.

The monitor is to record the total accumulated discharge minutes and accumulated battery system discharge kW hours.

[2.15  BATTERY MONITOR - DISCHARGE

NOTE: This monitoring option is available on units that are 225 kVA and larger. If UPS system is smaller than 225 kVA then delete this option.

The UPS is to have a specialized battery monitor system that collects and stores data related to discharging the UPS battery. The information is to be displayed on a separate screen available through a menu selection. The system is to collect and retain (minimum of 50 events) the following information for each discharge cycle:

a. System time and date.

b. Duration of cycle.

c. DC bus voltage range.

d. kW carried by batteries at the start of the event.]

[2.16  HYDROGEN GAS MONITORING SYSTEM

NOTE: This system is recommended even when valve-regulated lead-acid batteries are used. These batteries can release high amounts of hydrogen outside the battery if there is a malfunction to the battery charging system and functions as a backup in case the charger does not take itself off line during a malfunction.
Provide a hydrogen gas monitoring system to monitor the hydrogen levels in the room. The system is to consist of a [remote monitoring panel, hydrogen sensor and monitor/control panel. Provide a single gas detector/sensor located to be located [near the UPS batteries][as shown]. When a sensor detects hydrogen gas at a level of 1 percent, the system is to initiate an exhaust fan operation and provide a warning on the control panel[ and remote monitoring panel]. When a sensor detects hydrogen gas at a level of 2 percent, the system is to initiate an audible alarm and provide an alarm on the control panel[ and remote monitoring panel].

2.17 FACTORY TESTING

**************************************************************************
NOTE: Edited as required for a single module system. The designer should carefully evaluate the UPS application and the user's mission to determine critical tests for the UPS that will ensure UPS/load compatibility. These tests should be conducted at the factory and the results validated prior to shipment to the site. The required UPS/load interaction can be achieved by requesting the following tests plus any other tests the designer deems necessary:

a. Tests to ensure that the UPS rated power factor is verified;

b. Tests to ensure that the UPS system will operate in total accord and support the rated load;

c. Tests to ensure that the UPS system can deal with load anomalies (odd harmonics, etc.) associated with the user's equipment load.

**************************************************************************

Factory test the UPS system to meet the requirements specified using a test battery (not the battery to be supplied with the system) or D.C. simulator. Factory load test the UPS module as an independent assembly with 3-phase ac input power and with battery power for a minimum of 8 hours, with meter readings taken every 30 minutes. Balance the load at rated kVA and rated power factor.

a. Submit a detailed description of proposed factory test and field test procedures, including proposed dates and steps outlining each test, how it is to be performed, what it accomplishes, and its duration, not later than [1][_____] months prior to the date of each test.

b. Run the factory test for each UPS module under full load that is witnessed by the Government. Should a malfunction occur, correct the problem and repeat the test. As a minimum, the factory tests are to include the parameters described in paragraphs ac Input, ac Output, Transient Response and Efficiency. Tests are to encompass all aspects of operation, such as module failure, static bypass operation, battery failure, input power failure and overload ratings.

c. Notify the Government in writing at least 2 weeks before testing. Do not use factory-test time for system debugging and/or checkout. Perform such work prior to notifying the Government that the system is
ready for testing. Perform factory tests during normal business hours. Interconnect and test the system for an additional 8 hours to ensure proper wiring and performance.

d. Submit factory and field test reports in booklet form tabulating factory and field tests and measurements performed, upon completion and testing of the installed system. An official authorized to certify on behalf of the manufacturer of the UPS system that the system meets specified requirements will sign the factory and field test reports. Date each report after the award of this contract, which states the Contractor's name and address, name the project and location, and list the specific requirements, which are being certified.

2.17.1 Transient Tests

Conduct transient tests using high-speed oscillograph type recorders to demonstrate the operation of the components to the satisfaction of the Government. These tests consist of 50 percent to 100 percent load changes, manual transfer, manual retransfer, low dc bus initiated transfer and low ac output bus transfer. Use a recording instrument equipped with an event marker.

2.17.2 Efficiency Tests

Perform testing for efficiency at zero output up to 100 percent of stated kW output in 25 percent steps with battery fully charged and floating on the dc bus, with nominal input voltage, and with module connected to represent actual operating conditions.

PART 3 EXECUTION

3.1 INSTALLATION

Conform electrical installations to IEEE C2, NFPA 70, and to requirements specified herein. Provide new equipment and materials unless indicated or specified otherwise. Set the UPS system in place that is wired and connected in accordance with the approved shop drawings and manufacturer's instructions.

3.1.1 Control Cable

**************************************************************************
NOTE: UPS sizes 200 KVA and above are shipped in sections. Control wiring between module sections will be connected by the UPS manufacturer's technical representative.
**************************************************************************

Install UPS control wiring in individual separate rigid steel conduits, unless connections are made between side by side matching cabinets of UPS. Tag control wires with numeric identification tags corresponding to the terminal strip location to where the wires are connected. In addition to manufacturer's requirements, provide four additional spare conductors between UPS module and remote alarm panel in same conduit. When routing control cables inside UPS module, maintain a minimum 155 mm 6 inches separation from power cables.
3.1.2 Grounding

3.1.2.1 Grounding Conductor Title

Provide a separate grounding conductor that is separate from the electrical system neutral conductor in feeder and branch circuits. Ground battery racks and battery breaker cabinets with a separate equipment grounding conductor to the UPS cabinet.

3.1.2.2 Separately Derived

If not part of a listed power supply for a data-processing room, comply with NFPA 70 requirements for connecting to grounding electrodes and for bonding to metallic pipe.

3.1.3 UPS Output Conductors

Isolate the UPS output conductors from the UPS cabinet to the critical load panels and from other conductors by installing in separate conduit.

3.1.4 DC Power Conductors

NOTE: Include this paragraph only when batteries are remote from the UPS cabinet.

When installed in conduits, place dc power conductors from the UPS cabinet to the battery circuit breaker such that each conduit contains an equal number of positive and negative conductors, for example, two positive and two negative conductors in each conduit. Size conductor for a maximum of 2 percent voltage drop at full discharge.

3.1.5 Seismic Protection

NOTE: Do not use this paragraph for Navy projects. When directed to meet Seismic Requirements, 13 48 73 SEISMIC CONTROL FOR MECHANICAL EQUIPMENT and Section 26 05 48.00 10 SEISMIC PROTECTION FOR ELECTRICAL EQUIPMENT must be edited to suit the project and be included in the contract documents. Edit the following paragraph and include it in the project specification. When a Government designer is the Engineer of Record, provide seismic requirements on the drawings.

Provide seismic details[ conforming to Section 13 48 73, SEISMIC CONTROL FOR MECHANICAL EQUIPMENT][ and to][ Section 26 05 48.00 10, SEISMIC PROTECTION FOR ELECTRICAL EQUIPMENT][ as indicated].

3.1.6 Conduit Entries

Ensure conduit entries use the available conduit areas shown on manufacturer's installation drawings. Do not make conduit entries through the front, side or rear panels of the UPS[ or Maintenance Bypass Cabinet][ or battery cabinet][ or battery disconnect enclosure].

3.1.7 Battery Rack Assembly

**************************************************************************
NOTE: Include this paragraph only when batteries are remote from the UPS cabinet.
**************************************************************************
NOTE: Choose this paragraph if racks are required for the batteries. This is typically required when the batteries are wet cell type.

Battery racks are typically shipped dismantled in separate rail, frame, and brace packages. Ensure that manufacturer furnished assembly hardware is used to assemble battery racks. Conform battery rack installation to the manufacturer's instructions.

][3.1.8 Battery Cabinet Assembly

NOTE: Choose this paragraph when VRLA batteries are required. Battery cabinets are typically factory assembled on units up to 500 kVA. Battery cabinets for larger units may require assembly at the site.

Conform battery rack installation to the manufacturer's instructions.

][3.1.9 Battery Installation

NOTE: Delete paragraph and subparagraphs for smaller UPS units that have batteries installed in the unit cabinet by the manufacturer at the factory.

Conform battery cabinet installation to the manufacturer's instructions.

][3.2 FIELD QUALITY CONTROL

NOTE: The UPS manufacturer's technical representative is required to inspect the completed UPS and battery installation. The representative's visit to the site must be scheduled by the Contractor.

Notify the Contracting Officer in writing at least 30 calendar days prior to completion of the UPS system installation. At this time the Contractor will schedule the UPS manufacturer's technical representative to inspect the completed installation. Provide instruction for activity personnel by the UPS technical representative as specified in paragraph titled "DEMONSTRATION".

3.2.1 Installation Preparation

Completely install the following items by the Contractor and be operational prior to the arrival of the UPS representative for inspection, unit start-up and testing:

a. Ventilation equipment in the UPS and battery rooms.

NOTE: In subparagraph b, choose the appropriate item based on what was previously specified.

b. Battery [cabinets][racks][modules] and cells.
c. Battery connections including cell-to-cell, tier-to-tier, and rack-to-rack connections, with correct polarity;

d. DC power and control connections between UPS and battery circuit breaker, with correct polarity;

e. DC power connection between battery circuit breaker and battery, with correct polarity;

f. Clockwise phase rotation of ac power connections;

g. AC power to rectifier input bus;

h. AC power to UPS bypass input bus;

i. AC power to UPS maintenance bypass circuit breaker;

j. AC power from UPS output to UPS maintenance bypass output circuit breaker;

k. Remote monitors and control wiring;

l. UPS system and battery system properly grounded;

m. Emergency shower and eye wash;

n. Control connections between UPS and emergency engine generator signal contacts;

*** NOTE: In subparagraph o. delete the bracketed statement when the project does not require a UPS maintenance bypass cabinet. ***

o. Control connections between UPS module [and UPS maintenance bypass cabinet];

p. Clean and vacuum UPS and battery room floors, battery cells, and UPS equipment, both inside and outside

q. Ensure that shipping members have been removed.

*** NOTE: Provide this option for IEEE 450 certification when wet cell ventilated batteries are used. ***

r. Provide IEEE 450 battery installation certification.

3.2.2 Initial Inspection and Tests

The UPS technical representative and the Contracting Officer, in the presence of the Contractor, will inspect the completed installation. The Contractor is responsible to correct construction or installation deficiencies as directed. Perform acceptance checks in accordance with the manufacturer's recommendations and include the following visual and mechanical inspections, performed in accordance with NETA ATS.
a. UPS Unit visual and mechanical inspection

(1) Compare equipment nameplate data with drawings, specifications and approved shop drawings.

(2) Inspect physical and mechanical condition. Inspect doors, panels, and sections for paint, dents, scratches, fit, and missing hardware. Inspect the displays for scratches, dark pixels or uneven brightness.

(3) Inspect anchorage, alignment, grounding, and required clearances.

(4) Verify that fuse sizes and types correspond to drawings.

(5) Verify the unit is clean inside and out.

(6) Test all electrical and mechanical interlock systems for correct operation and sequencing.

(7) Inspect bolted electrical connections for high resistance using one of the following methods:
   (a) Use a low-resistance ohmmeter.
   (b) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method.
   (c) Perform thermographic survey.

(8) Verify operation of forced ventilation.

(9) Verify that vents are clear and new clean filters are installed.

(10) Inspect batteries and chargers according to requirements in NETA ATS

b. UPS Batteries visual and mechanical inspection

(1) Compare equipment nameplate data with drawings, specifications and approved shop drawings.

(2) Inspect physical and mechanical condition. Inspect doors, panels, and sections for paint, dents, scratches, fit, and missing hardware. Inspect the displays for scratches, dark pixels or uneven brightness.

(3) Inspect anchorage, alignment, grounding, and required clearances.

(4) Verify that fuse sizes and types correspond to drawings.

(5) Verify the unit is clean inside and out.

(6) Verify the application of an oxide inhibitor on battery terminal connections.

(7) Inspect bolted electrical connections for high resistance using one of the following methods:
   (a) Use a low-resistance ohmmeter.
(b) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method.

(c) Perform thermographic survey.

3.2.3 Performance Tests

Provide equipment, test instruments, power, load bank, materials and labor required for tests. Contracting Officer will witness all tests and the tests are subject to his approval. Perform tests in accordance with the manufacturer's recommendations and include the following electrical tests.

3.2.3.1 UPS Unit Performance Tests

Upon completion of battery activation procedures, Contractor is to connect load bank to UPS output. Size load bank to the full kW rating of the system.

Performance test is to be run under the supervision of the UPS technical representative. Operate UPS unit under full kW load for a minimum of one hour. Operation of the feeder and bypass power feeder breakers during testing of the UPS is the responsibility of the Contractor.

a. Electrical Tests

(1) Test static transfer from inverter to bypass and back. Use normal load, if possible.

(2) Test dc undervoltage trip level on inverter input breaker/relay. Set according to manufacturer's published data.

(3) Test alarm circuits.

(4) Verify synchronizing indicators for static switch and bypass switches.

(5) Perform electrical tests for UPS system breakers.

(6) Perform electrical tests for UPS system batteries.
   (a) Measure negative post temperature.
   (b) Measure charger float and equalizing voltages.
   (c) Verify all charge functions and alarms.

b. Test Values

   Verify bolt-torque levels.

c. Maintenance Bypass Panel/Cabinet

Verify interlocks (Kirk-Key or other means) operate properly. Verify that the breaker arrangement operates in the manner required for the number of possible combinations.

d. Load Test

**************************************************************************

SECTION 26 33 53 Page 60
NOTE: Edit as required, depending upon whether a temporary or permanent load bank is to be provided or if a load bank is required. Small UPS systems are normally not required to have a load bank test.

[Provide a load bank that stays with the system. ]Load test the installed system for a continuous 24 hour period by means of resistive load banks. Continuously test the system at 1/2 load for 8 hours, 3/4 load for 8 hours and full load for 8 hours. Provide variable load banks sized to the full kW load of the system to facilitate startup under load conditions, and to conduct load tests described above. Record instrument readings every half hour for the following:

1. Input voltage (all three phases).
2. Input current (all three phases).
3. Input frequency.
4. Battery voltage.
5. Output voltage (all three phases).
6. Output current (all three phases).
7. Output kilowatts.
8. Output frequency.

][e. Full Load Burn In Test

NOTE: Delete emergency/alternative source testing requirements if no emergency/alternative source is available. This paragraph may be deleted for small UPS system.

Provide an additional full load burn-in period of 24 continuous hours for the installed system. If a failure occurs during the burn-in period, repeat the tests. Record instrument readings every half hour as above. Perform the following tests during the burn-in period:

1. With the UPS carrying maximum continuous design load and supplied from the normal source, switch [100 percent load][50 percent load] on and off a minimum of three times within [the burn-in period] [______].

2. With the UPS carrying maximum continuous design load and supplied from the emergency source, repeat the switching operations described in step (1). Also, verify that the UPS module rectifier charger unit(s) go into the second-step current limit mode.]

3. With the UPS carrying maximum continuous design load and operating on battery power, repeat the switching operations described in step (1) above.

4. Continue operation on battery power for 1 minute, then restore
Furnish a high-speed dual trace oscillograph to monitor ten or more cycles of the above tests at the ON and OFF transitions and two typical steady-state periods, one shortly after the load is energized (at 30 to 60 seconds) and one after operation has stabilized (at 8 to 10 minutes). Deliver four copies of the traces to the Contracting Officer.

NOTE: This paragraph may be deleted for small UPS system.

Allow UPS 24 hrs to recharge batteries and an additional 24 hrs cool down prior to commencing this test, if other tests such as the full load test were performed. With the UPS carrying maximum continuous design load and the battery fully charged, the system is to undergo a complete battery discharge test to full depletion and a recharge to nominal conditions. Record instrument readings every minute during discharge for the following:

1. Battery voltage.
2. Battery current.
3. Output voltage (all three phases).
4. Output current (all three phases).
5. Output kilowatts.
6. Output frequency.

NOTE: Include this paragraph only when the UPS will be installed in conjunction with a generator.

Test UPS to observe operation with generator service. UPS technical representative is to verify UPS battery current limiting feature functions properly.

NOTE: This paragraph is applicable for large wet-cell type battery systems. Delete for sealed (valve regulated) battery system.

Furnish all labor, material and test equipment necessary to conduct performance test under the direction of UPS technical representative. Accomplish the following:

a. Install a calibrated voltmeter across the battery terminals to measure voltage, and provide current transformers to measure the current from each string.
b. Record temperature of pilot cells in battery immediately prior to start of discharge performance test.

c. Read and record total battery voltage and battery current at start of discharge and every minute during discharge test.

d. Record minutes and seconds when battery voltage drops below minimum discharge voltage. On initial discharge test, a battery may be expected to deliver 95 percent of its rated capacity. This will increase to 100 percent after several complete discharge cycles or after 12 months of float charge service.

e. Should battery fail to meet the requirements of the first discharge performance test, place battery on equalizing charge as defined by the specific battery manufacturer's recommendations. Measure and record time and battery voltage. Run a second discharge performance test.

3.3 DEMONSTRATION

******************************************************************************
NOTE: Delete recording references if not required.
******************************************************************************

3.3.1 Instructing Government Personnel

Furnish the services of competent instructors to give full instruction to designated Government personnel in the adjustment, operation, and maintenance of the specified systems and equipment, including pertinent safety requirements as required. Instructors are to be thoroughly familiar with all parts of the installation and be trained in operating theory as well as practical operation and maintenance work. Provide instruction during the first regular work week after the equipment or system has been accepted and turned over to the Government for regular operation. Provide [8][_____] hours of instruction for [_____] personnel.[ When more than 4 man-days of instruction are specified, use approximately half of the time for classroom instruction. Use other time for instruction with equipment or system. When significant changes or modifications in the equipment or system are made under the terms of the contract, provide additional instructions to acquaint the operating personnel with the changes or modifications.][record the field training with the recording left with the Contracting Officer.][ Provide a factory training video or [on-line training] as part of the training materials.]

3.4 FINAL ADJUSTMENTS

a. Remove load bank and reconnect system for normal operation.

b. Equalize battery per manufacturer instructions.

******************************************************************************
NOTE: Delete this paragraph if battery is sealed (valve regulated) type.
******************************************************************************

c. Bring electrolyte level of all cells up to the bottom of the high level line by adding original filling gravity electrolyte.

d. Resume charging battery at normal float voltage as defined by battery manufacturer recommendations.

e. Prior to charging, check battery connections are properly torque to
manufacturer's specifications. Take and record, for cell-to-cell and terminal connections, detailed micro-ohm resistance readings. Remake connections having a resistance of more than 10 percent above the average.

f. Deliver all manufacturer's data and operation manuals, which are an integral part of, and shipped with UPS, to Contracting Officer.

3.5 NAMEPLATE MOUNTING

Provide number, location, and letter designation of nameplates as indicated. Fasten nameplates to the device with a minimum of two sheet-metal screws or two rivets.

3.6 FIELD APPLIED PAINTING

Paint electrical equipment as required to match finish of adjacent surfaces or to meet the indicated or specified safety criteria. Painting is to comply with Section 09 90 00 PAINTS AND COATINGS.

   3.2.1 Acceptance Testing
   3.2.2 Operation and Maintenance
NOTE: This guide specification covers the requirements for metal-enclosed shunt capacitor equipment. Ensure drawings show voltage and kilovar ratings and mounting and connection details.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also
use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM A1008/A1008M (2021a) Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, Solution Hardened, and Bake Hardenable

ASTM B187/B187M (2020) Standard Specification for Copper, Bus Bar, Rod and Shapes and General Purpose Rod, Bar and Shapes

INSTITUTE OF ELECTRICAL AND ELECTRONICS ENGINEERS (IEEE)

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION (NASA)

NATIONAL FIRE PROTECTION ASSOCIATION (NFPA)

NFPA 70 (2020; ERTA 20-1 2020; ERTA 20-2 2020; TIA 20-1; TIA 20-2; TIA 20-3; TIA 20-4) National Electrical Code

UNDERWRITERS LABORATORIES (UL)

1.2 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Fabrication Drawings; G[, [___]]
Installation Drawings; G[, [___]]

SD-03 Product Data

Metal-Enclosed Shunt Capacitor Equipment; G[, [___]]
Pole Line Capacitors; G[, [___]]
Metal-Enclosed Low-Voltage Capacitors; G[, [___]]
1.3 QUALITY CONTROL

1.3.1 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Ensure equipment, materials, installation, and workmanship are in accordance with the mandatory and advisory provisions of NFPA 70, IEEE C2 unless more stringent requirements are specified or indicated.

1.3.2 Qualifications

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship. Provide products which have been in satisfactory commercial or industrial use for 2 years prior to bid opening. Ensure the 2-year period includes applications of equipment and materials under similar circumstances and of similar size. Ensure the product has been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period. Where two or more items of the same class of equipment are required, these items must be products of a single manufacturer.

1.3.3 Predictive Testing and Inspection Technology Requirements

**************************************************************************
NOTE: The Predictive Testing and Inspection (PT&I) tests prescribed in Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS are MANDATORY for all NASA assets and systems identified as Critical, Configured, or Mission Essential. If the system is non-critical, non-configured, and not mission essential, use sound engineering discretion to assess the value of adding these additional test and acceptance requirements. See Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS for additional information regarding cost feasibility of PT&I.
**************************************************************************

This section contains systems and equipment components regulated by NASA's Reliability Centered Building and Equipment Acceptance Program. This program requires the use of Predictive Testing and Inspection (PT&I) technologies in conformance with RCBEA GUIDE to ensure building equipment
and systems installed by the Contractor have been installed properly and contain no identifiable defects that shorten the design life of a system and its components. Satisfactory completion of all acceptance requirements is required to obtain Government approval and acceptance of the Contractor's work.

Perform PT&I tests and provide submittals as specified in Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS.

1.4 DELIVERY, STORAGE, AND HANDLING

Handle and store equipment in accordance with manufacturer's instructions. Deliver materials to site in unopened cartons or bundles as appropriate, clearly identified with manufacturer's name, Underwriter's or other approved label, grade or identifying number.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Provide Power Factor Correction (PFC) equipment as a self-contained, [automatically and ]manually-controlled self-protecting capacitor bank [in self contained enclosure][ modified for the specified enclosure construction]. Ensure the equipment allows [automatic or ]manual switching of the capacitor bank kilovolt ampere reactive (kVAR) in minimum of [25][50][ ] kVAR per step for a total of [three][twelve][twenty-four][ ] steps when fully expanded to the total capacity from or to the bus for power factor correction. Connect the PFC equipment to the switchgear with cable connection through a separate circuit breaker.

2.2 FABRICATION

2.2.1 Drawings

Submit fabrication drawings for the fabrication and assembly performed in the factory. Ensure drawings show all connections and detail the relations and connections of the equipment by showing the general physical layout of all controls, the interconnection of one system (or portion of system) with another, and internal tubing, wiring, and other devices.

2.2.2 Corrosion Prevention

**************************************************************************

NOTE: For all outdoor applications and all indoor applications in a harsh environment refer to Sections 09 96 00 HIGH-PERFORMANCE COATINGS or 09 90 00 PAINTS AND COATINGS. High performance coatings are specified for all outdoor applications because ultraviolet radiation will break down most standard coatings, causing a phenomena known as chalking, which is the first stage of the corrosion process. For additional information contact The Coatings Industry Alliance, or specific suppliers such as Keeler and Long and PPG, and NACE International (NACE).

**************************************************************************

Protect metallic materials against corrosion. Ensure equipment has the standard finish by the manufacturer when used for most indoor
installations. For harsh indoor environments (any area subjected to
chemical and/or abrasive action), and all outdoor installations, refer to
Section [09 96 00 HIGH-PERFORMANCE COATINGS][09 90 00 PAINTS AND COATINGS].

2.3 EQUIPMENT

Submit catalog data and equipment and performance data for the following
items including life, test, system functional flows, safety features, and
mechanical automated details.

[2.3.1 Metal-Enclosed Shunt Capacitor Equipment

Ensure metal-enclosed shunt capacitor equipment for connection to 2,400-,
6,900-, and 13,200/13,800-volt, three-phase, 60-hertz circuits consists of
a complete assembly of capacitor units including buses, connectors,
current-limiting fuses, ventilating fans, switching devices, and controls
housed in a weatherproof NEMA [3R][4X] metal enclosure in accordance with
IEEE 18. Provide control and protective devices in accordance with Section
26 05 70.00 40 HIGH VOLTAGE OVERCURRENT PROTECTIVE DEVICES and Section
26 05 71.00 40 LOW VOLTAGE OVERCURRENT PROTECTIVE DEVICES.

Provide capacitor units consisting of [self-healing] polypropylene film and
aluminum foil sections with series-parallel connections and discharge
resistors contained in hermetically sealed welded steel cases with mounting
flanges, immersed in a nonflammable liquid dielectric impregnant. Provide
capacitor housings constructed with bonded zinc-coated steel that is
resistant to corrosion, weather, and abrasion. Seal two insulating
bushings with clamp tunnel connectors to the case of each unit,
electrically connected to the capacitor section assembly. Ensure
capacitors comply with UL 810 and NFPA 70 and characteristics of capacitor
bushings are in accordance with IEEE 18. Provide discharge resistors that
reduce the residual voltage of the capacitor unit to [50][_____] volts or
less within 5 minutes after disconnection from the source of supply. Each
capacitor has an individual insulating fuse. Ensure capacitors operate
satisfactorily at 135 percent of rated kVAR, 110 percent of rated voltage,
and at ambient temperatures between minus 40 degrees to plus 46 degrees C
minus 40 degrees to plus 115 degrees F. Ensure voltage and kVAR ratings
for enclosed outdoor capacitor units rated at 60-hertz is in accordance
with IEEE 18.

Ensure that capacitors for harmonic filter application or systems with high
harmonic content have the following characteristics: EXTREME duty rating
55 degree C, 131 degree F temperature rating, 125 percent continuous
over-voltage capability, 15kA fault handling capability, 100kA transient
current withstand capability, and meets IEEE 18.

For power entrance compartments, include an insulated phase and neutral
bus, a short-circuiting and grounding switch, and provisions for
terminating underground cables.

Mechanically interlock short-circuiting and grounding switch with all
capacitor compartment doors to prevent access to capacitor units unless
phase and neutral buses are short circuited and grounded. Provide a
key-interlocked short-circuiting and grounding switch with a remote circuit
disconnecting and protective device to ensure the proper sequence of
operation.
2.3.2 Pole Line Capacitors

Ensure pole line capacitors are power line, power factor connection type for 2.4 kilovolts (kV), 5 kV, and 13.2/13.8 kV, 60 hertz; located and installed as indicated. Provide pole supporting hardware that is hot-dip galvanized steel designed for NEMA standard capacitor units. Use corrosion resistant attachment hardware. Ensure poles supporting capacitors are greater than 200 millimeter (8 inches) in diameter at the point of attachment.

2.3.3 Metal-Enclosed Low-Voltage Capacitors

Provide metal-enclosed capacitors for 600-volt circuits and below consisting of individual enclosed units with insulators, connectors, and hardware housed in a protective enclosure. Ensure individual cells are fused and provided with discharge resistors to reduce voltage to 50 volts or less in 1 minute. Include a current-limiting air-core inductor designed to limit the capacitor in-rush current to a value equal to or less than the capacitor switching rating. Brace inductors to withstand symmetrical short circuit current as indicated.

Ensure capacitor cells are of the self-healing type utilizing a low-loss metalized polypropylene film dielectric system with a UL-recognized pressure sensitive interrupter in each capacitor cell and are impregnated with a nonflammable (PCB-free) dielectric. Ensure capacitors comply with UL 810 and NFPA 70. Provide capacitor units in banks with welded, zinc coated, 1.6 millimeter, 14 gauge, steel. Use steel in accordance with ASTM A1008/A1008M. All other requirements are as required for high-voltage installation.

2.4 COMPONENTS

2.4.1 Enclosure

Place pad-mounted capacitor equipment in weatherproof, self-supporting, ventilated unit sheet metal compartments joined together to form a continuous structure with hinged access doors, base and roof sections, roof seam covers, and end trims. Provide flanged access doors that close against rubber or similar weatherproof gasketing material. Provide ventilated openings with filtered louvers and stainless steel screened vents. Equip doors with latches, stops, and door-locking mechanism. Ensure base section is unit construction and supports capacitor equipment [102 millimeter (4 inches)] [152 millimeter (6 inches)] above the concrete foundation. Design the base for jacking and skidding. Provide lifting lugs for unloading and moving equipment.

Construct sheet metal enclosures from [cold-rolled carbon-steel sheets of commercial quality with stretcher-level flatness not less than two (2.0) millimeter 12 gauge, in accordance with ASTM A1008/A1008M][304][316] stainless steel in accordance with ASTM A240/A240M and ASTM A480/A480M as applicable]. Reinforce each compartment with structural members and weld members together. Grind welds to a smooth flat surface before painting. Provide capacitor equipment with a ground terminal for grounding the stationary structure and equipment.

Provide capacitor compartments with racks for mounting individual capacitor units in one, two, or three tiers, with not more than two rows of units per tier. Enclosures having one row of units per tier are accessible from one side only.
2.4.2 Buses

Provide phase and neutral buses for the connection to cables and capacitor units are bare rigid solid copper busbar of rectangular cross section, insulated from the enclosure. Ensure busbars are of ASTM B187/B187M solid copper and the contact surfaces of all main bus and cable tap connections are silver plated and bolted together to ensure maximum conductivity.

2.4.3 Fuses

Ensure each capacitor unit is individually fused with current-limiting fuses that have an short-circuit interrupting rating of 200,000 amperes minimum and provide visual indication of fuse operation.

2.4.4 Fans

Provide top of capacity compartments with thermostatically controlled fans for forced-air ventilation of capacitor units. Provide each enclosure section with two cooling fans. Select [115-volt][277-volt], single-phase, 60-hertz current fan motors that are individually fused or thermally protected. Ensure thermostats control the operation of fans within prescribed temperature limits.

2.5 FACTORY TESTING

Factory production tests on capacitor equipment include electrical and mechanical operational tests, capacitance tests, discharge resistor tests, leak tests, and dielectric strength tests. Ensure factory conducts dielectric tests in accordance with Testing Standards of IEEE 18 with 60-hertz withstand voltage rating equal to that of the switching device.

Certified copies of previous tests on similar equipment under actual conditions may be submitted for impulse tests, and short-circuit tests in lieu of factory tests on actual units furnished.

Submit factory test report containing results of all factory production tests.

PART 3 EXECUTION

3.1 INSTALLATION

Install and connect capacitor equipment in accordance with the manufacturer's installation instructions. Ensure proper ventilation is provided around all equipment.

Make ground connections to a driven ground rod or counterpoise, as indicated.

Submit installation drawings for the capacitor equipment. Include in drawings details of equipment [area][room] layout and design.

3.2 FIELD QUALITY CONTROL

3.2.1 Acceptance Testing

**************************************************************************

NOTE: If the specified system is identified as critical, configured, or mission essential, use
Perform PT&I tests and provide submittals as specified in Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS.

[ Disconnect main bus of high-voltage capacitor equipment from the circuit cables, and ground the capacitors and the equipment enclosure before conducting insulation and high-voltage tests.

] For the main bus of capacitor equipment, conduct an insulation-resistance test with a 5000-volt insulation test set for units 5 kV and above, 2,500-volt insulation-resistance test set for units 2.4 kV to 5 kV, and 1,000 volts for units 600 volts and below.

Apply tests for not less than 5 minutes and until three equal consecutive readings, 1 minute apart, are obtained. Record readings every 30 seconds during the first 2 minutes and every minute thereafter. Minimum acceptable resistance is 100 megohms.

Upon satisfactory completion of the insulation-resistance test, subject main bus to a high-voltage DC (Hi-pot) test. Use a test voltage is equal to 75 percent of the factory test values and apply for 1 minute.

Upon satisfactory completion of all bus testing, confirm the capacitor's value by performing a capacitance value test. Discharge the capacitor and measure the capacitance per the manufacturer's instructions. Satisfactory measurement is between 100 percent and 110 percent of nameplate. Values between 90 percent and 100 percent, and 110 percent and 120 percent require investigation. Values outside these limits indicate shorted groups of internal layers and the capacitor is considered defective.

Upon satisfactory completion of the capacitance test, subject the capacitor to a dielectric strength test using a DC voltage of 75 percent of the original factory test voltage. Test voltage should be held for 10 seconds. During application of test voltage listen for any indication of internal arcing. If any arcing is heard the unit is defective.

Upon satisfactory completion of the dielectric test, remeasure the capacitance of the capacitor to insure no damage had occurred during the dielectric test. Results cannot vary more than the manufacturer's IEEE tolerance.

Final acceptance depends upon the satisfactory performance of the PFC equipment under test. Do not energize capacitor equipment until the recorded test data has been approved by the Contracting Officer. Submit acceptance test report to the Contracting Officer containing the results of all acceptance tests.

3.2.2 Operation and Maintenance
Provide operation and maintenance manuals with each assembly and include instruction leaflets, instruction bulletins and renewal parts lists where applicable, for the complete assembly and each major component.

SECTION 26 35 43
400-HERTZ (HZ) SOLID STATE FREQUENCY CONVERTER
08/21

NOTE: This guide specification covers the requirements for the procurement, installation, and testing of 400 Hz solid state frequency converters.

1) Combination converters (having both "400 Hz and 28 VDC" power outputs) are no longer permitted on Navy projects. When a combination converter is required for a specific Army project, edit the title of the specification to "COMBINATION 400 HERTZ AND 28 VDC SOLID STATE CONVERTER", and select the appropriate bracketed options throughout the remainder of the specification.

2) Previous versions of this specification referred to equipment sized only in kVA at 0.8 lagging power factor. The specification now has the requirement to use kW instead of kVA as the unit of power measurement for converters here and on the project drawings. This is a significant change in equipment designation, intending to ensure that our equipment meets the full required load range, including full power at unity power factor. It has been made to eliminate the problems that have been occurring with existing equipment in the field, and to accommodate the increasing nonlinear load characteristics of Military equipment. NAVAIR documents, including their Facilities Requirements Documents (FRD)s, are being revised to coordinate with this change to kW. Army documents are in the review process.

Adhere to UFC_1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.
Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

**************************************************************************

NOTE: These converters are used to supply 400 Hz electrical power to aircraft and ships in shore facility environments. Typical applications include aircraft operating in flight line conditions or in hangars, avionics shops, laboratories, training buildings, flight simulators, and computer rooms.

This specification is not to be used for procurement of power converters installed on board aircraft or ships without specific authorization from Naval Air Warfare Center Aircraft Division (NAWCAD Power and Energy Division (AB43) at (301) 342-4161), and from the Naval Sea Warfare Command (contact the Technical Warrant Officer for the appropriate ship classification).

This specification is not intended for medium-voltage applications.

**************************************************************************

NOTE: For Navy projects, incorporate the special SUBMITTAL REVIEW PROCESS paragraph in the SUBMITTALS section. Coordinate with NAVAIR, NAVFAC, and the Activity to see whether the "review and approval", or the "surveillance only" options are required.

1) If "review and approval" (reach-back support) is desired, for a specific NAVFAC project, the technical representative (electrical engineer) editing this document for that project must contact the NAVFAC Atlantic (LANT), Code DC 44 - Electrical Criteria Manager at (757) 322-4327 for consultation during the design stage of the project, prior to including the requirement in the specification.

2) If "surveillance only" is agreed to, it requires the submittal information to be sent to NAVAIR and NAVFAC LANT for review and comment at the same time as the information is being sent to the Designer of Record for Review and Approval. The surveillance mode would give NAVAIR or NAVFAC LANT the opportunity to confirm compliance, without inadvertently holding up the project if the appropriate personnel are not available to do the review in a timely manner.

The Electrical Designer of Record must also insure that the Division 1, Section 01 33 00 SUBMITTAL
PROCEDURES, paragraphs FORWARDING SUBMITTALS REQUIRING GOVERNMENT APPROVAL and SUBMITTALS RESERVED FOR NAVFAC [_____] APPROVAL of the project document are edited to identify the agreed upon special process.

**************************************************************************

NOTE: Coordination is required between this section and the project power systems study to determine which of the standardized Arc Flash Warning labels are required on the equipment. These labels (Graphics) are available in metric (SI) and U.S. Customary (IP) system dimensions. Use these files to develop project specific drawings.

<table>
<thead>
<tr>
<th>File Name</th>
<th>Description</th>

</tbody>
</table>

NOTE: To download UFGS Forms, Graphics, and Tables, go to: https://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/forms-graphics-tables

Go to the specification section number, select the appropriate Electrical .ZIP file(s) and extract the desired details.

Do not include list of details, or details themselves, in project specifications. Insert the appropriate details on drawings and modify optional and blank items.

**************************************************************************

NOTE: The following information must be shown on the project drawings:

1. Show location of all equipment including converter, paralleling controls when required, and remote monitoring and control panels.

2. Provide functional block diagram, single line diagrams, power, and control wiring interconnection diagrams, wiring diagrams, conduit entry diagrams, equipment elevations, maintenance envelope, limiting dimensions, and equipment ratings which are not covered in the specifications.

3. Design equipment rooms with working spaces as required by NFPA 70 and manufacturers extra limitations. Provide ventilation for equipment rooms based on 400 Hz and 28 VDC components heat load generated when operating at 100 percent load. Provide 60 Hz convenience receptacles.

**************************************************************************

NOTE: Ensure that the 400 Hz distribution system is
properly coordinated including the ratings of the power cables, ground cables, circuit breakers, transformers, filters, rectifiers, and control equipment. Provide calculations in Basis of Design per UFC 3-501-01, Electrical Engineering, including voltage drops, which can be very critical in 400 Hz systems. When replacing a motor generator set with a solid state converter ensure that the existing feeders circuit protective devices will operate properly without damage to electrical devices, including the solid state converter.

1.2 RELATED REQUIREMENTS

**************************************************************************
NOTE: Include this optional reference to Section 26 08 00 APPARATUS INSPECTION AND TESTING when it is already being used and referred to for other electrical equipment on the project. Coordinate with optional paragraph in PART 3.

Coordinate converter equipment with Government's cybersecurity requirements and interpretations. Include this optional reference to Section 25 05 11 CYBERSECURITY FOR FACILITY-RELATED CONTROL SYSTEMS if the 400 Hz system includes remote control or remote access capability.

**************************************************************************

Section [26 08 00 APPARATUS INSPECTION AND TESTING][ and 25 05 11 CYBERSECURITY FOR FACILITY-RELATED CONTROL SYSTEMS] applies to this section, with the additions and modifications specified herein.

1.3 DEFINITIONS

Unless otherwise specified or indicated, electrical and electronics terms used in these specifications, and on the drawings, must be as defined in IEEE 100.
**NOTE:** Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**NOTE:** Ensure the optional bracketed "28 VDC Aircraft Power Cable Assembly", and "Remote Monitoring and Control Panel" are not included when those items of equipment are not included in the body of the specification.

NOTE: On Navy projects, include at least one of the bracketed options below. The first option is for surveillance only, and the second option is for complete approval where "reach-back support" has already been coordinated with either NAVAIR or
NAVFAC LANT per the third introductory Technical Note. Add the appropriate information in Section 01 33 00 SUBMITTAL PROCEDURES to coordinate with the special requirements.

**************************************************************************

1.4.1 Government Submittal Review

[NAWCAD Air Vehicle Electrical Power Systems Group (AB43), (301) 342-4161 [and Code CI44, NAVFAC LANT, Naval Facilities Engineering Command] will provide surveillance. If they have comments or concerns, they will contact and coordinate resolution of their comments with the appropriate approving agent.]

[NAWCAD Air Vehicle Electrical Power Systems Group (AB43), (301) 342-4161][Code CI44, NAVFAC LANT, Naval Facilities Engineering Command][_____] will review and approve all submittals in this section requiring Government approval.

1.5 QUALITY ASSURANCE

1.5.1 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "must" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Equipment, materials, installation, and workmanship must be in accordance with the mandatory and advisory provisions of NFPA 70 unless more stringent requirements are specified or indicated.

1.5.2 Standard Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship. Products must have been in satisfactory commercial or industrial use for 5 years prior to bid opening. The 5-year period must include applications of equipment and materials under similar circumstances and of similar size. The product must have been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 5-year period. Where two or more items of the same class of equipment are required, these items must be products of a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in this section.

1.5.2.1 Alternative Qualifications

Products having less than a 5-year field service record will be acceptable if a certified record of satisfactory field operation for not less than 6000 hours, exclusive of the manufacturers' factory or laboratory tests, is furnished.

1.5.2.2 Material and Equipment Manufacturing Date

Products manufactured more than one year prior to date of delivery to site must not be used, unless specified otherwise.
1.5.3  **Converter Drawings**

**************************************************************************
**NOTE:** Provide a detail on the drawings that identifies the location, mounting and permitted maintenance access areas for each converter.

For Navy projects, include the bracketed options that require surface mounting against the wall, and prohibits rear access to converter.
**************************************************************************

Furnish scaled drawings of enclosure outline including front, top, side views, and overall dimensions. Include "maintenance envelope" dimensions confirming space limitations identified on the drawings, and surface mounting flush against the wall. Rear access for maintenance and repair purposes is prohibited. The "maintenance envelope" drawings must also indicate adequate clearance for operation, maintenance, and replacement of operating equipment devices. Provide external power and control wiring, cabling, connector, and backplane interconnect drawings. Provide single line, schematic, and wiring diagrams. Drawings must include details of input and output circuit breakers, contactors, rectifiers, surge protectors, control devices and conduit entry and exit locations. If parallel operation is included, provide an interconnection diagram. Submittals must include the nameplate data, size, and capacity.

1.5.4  **Qualifications of Manufacturer**

**************************************************************************
**NOTE:** The experience clause in this section has been approved by a Level I Contracting Officer in accordance with the requirements of Naval Facilities Acquisition Supplement (NFAS). NFAS can be found at the following link:

https://www.navfac.navy.mil/products_and_services/sb/opportunities/guidelines/navfac.html

This clause may be used without further approval or request for waiver.
**************************************************************************

Submit a certification stating that the manufacturer has a minimum of five years' experience in the design, manufacturing, and testing of 400 Hz solid state frequency converters at the equivalent or greater kW and voltage ratings for direct connection to aircraft electrical loads. When specifications require multiple converters operating in parallel, the manufacturer must provide specific experience with equal or greater kW rated converters.

Experience in manufacturing motor generator sets does not qualify as equivalent. Experience in manufacturing portable engine-driven 400-hertz power units does not qualify as equivalent. The manufacturer must be experienced in producing units for installation in permanent buildings in environmentally closed spaces or in weatherproof enclosures as applicable. The manufacturer must also document that converters are designed for connection to non-linear loads typically encountered in the aircraft and shipbuilding industries. The manufacturer must furnish documented experience with converters in various environmental conditions including...
exterior flight line, hangar, and environmentally enclosed spaces within buildings.

1.5.5 Work Plan

Submit a written work plan with the initial shop drawing submittal, which consists of a schedule of dates of the routine and special factory tests, installation of equipment, field tests, and operator training for the system. Furnish a list of the test instrumentation equipment complete with the documented calibration program, for the factory and the field tests.

1.5.6 Routine Factory Test Plan

**************************************************************************
NOTE: Coordinate calendar day requirements with Activity and with special review requirements.
**************************************************************************
Submit test plan and procedures at least [21][_____] calendar days prior to the tests being conducted. Provide detailed description of test procedures, including test equipment and setups complete with their current calibration dates, to be used to ensure the converter meets this specification and explain the test methods used. As a minimum, include the tests required under the paragraph ROUTINE FACTORY TESTS.

1.5.7 Special Factory Test Plan

Submit the Special Factory Test Plan and procedures with the Routine Factory Test Plan. Provide detailed description of test procedures, including test equipment and setups complete with their calibration dates, used to ensure the converter meets this specification and explain the test methods used. As a minimum, include the tests required under the paragraph SPECIAL FACTORY TESTS.

1.5.8 Field Test Plan

**************************************************************************
NOTE: Coordinate calendar day requirements with Activity and with special review requirements. For Navy projects, use 30 days to coordinate with NAVAIR requirement to have time to arrange attendance.
**************************************************************************
Submit test plan and procedures at least [30][15][_____] calendar days prior to the start of field tests. Provide detailed description and dates and times scheduled for performance of tests, and detailed description of test procedures, including test equipment and setups of the tests to be conducted to ensure the system meets this specification. List make, model, and current calibration dates, and provide functional description of the test instruments and accessories. Explain the test methods to be used. As a minimum, include the tests required under the paragraph FIELD QUALITY CONTROL. Test reports must include power quality measurement data collected in accordance with IEEE 1159.

1.5.9 Nationally Recognized Testing Laboratory (NRTL) Listing

**************************************************************************
NOTE: Choose the bracketed "Combination" option only for Army projects, and only when the converter

SECTION 26 35 43  Page 14
also has a separate 28 VDC Power output.

[Frequency][Combination] converters must be identified with a nationally recognized testing laboratory (NRTL) label or UL label prior to shipping.

1.5.9.1 Currently Listed Products

Submit NRTL or UL certification or UL file number for the actual [frequency][combination] converter to be shipped with the initial submittal to verify compliance of equipment.

1.5.9.2 Proposed Listed Products

Submit NRTL or UL certification or UL file number for same or similar rating or product size range of like design unit with the initial submittal to verify compliance of equipment.

1.5.10 Routine Factory Tests Certification

**************************************************************************

NOTE: Coordinate calendar day requirements with Activity and with special review requirements. Choose the bracketed "Combination" option only for Army projects and only when the converter also has a separate 28 VDC Power output.

**************************************************************************

Submit within [45][_____] calendar days after completion of tests. Receive approval of test prior to shipping unit. Certify tests were conducted on each [combination] converter in accordance with the requirements set forth in paragraph ROUTINE FACTORY TESTS and certify converter satisfactorily operated within specified limits. Include copies of the test procedures, test configuration diagrams and schematics, test data, and results.

1.5.11 Special Factory Tests Certification

**************************************************************************

NOTE: For Army projects, choose the bracketed "Combination" option only when the converter also has a separate 28 VDC Power output.

**************************************************************************

Certify tests were conducted on a [combination] converter of the same design, construction, kW rating, and voltage rating to be provided. Tests must be in accordance with the requirements set forth in paragraph SPECIAL FACTORY TEST and certify converter operated without malfunctioning within specified limits. Include copies of the test procedures, test configuration diagrams and schematics, test data, and results.

1.5.12 Field Test Certification

**************************************************************************

NOTE: Coordinate calendar day requirements with Activity and with special review requirements. Choose the bracketed "Combination" option only when the converter also has a separate 28 VDC Power output.
Submit report of test results as specified by paragraph FIELD QUALITY CONTROL within [15] calendar days after completion of tests. Certify tests were conducted on each [combination] converter in accordance with the paragraph FIELD QUALITY CONTROL and certify converter satisfactorily operated within specified limits. Include copies of the test procedures, test configuration diagrams and schematics, test data, and results.

1.6 OPERATION AND MAINTENANCE MANUALS

NOTE: Choose the bracketed "Combination" option only on Army projects and only when the converter also has a separate 28 VDC Power output. Coordinate the 28 VDC options throughout the specification based on the actual equipment required and specified.

NOTE: Choose the bracketed "Combination" option only on Army projects and only when the converter also has a separate 28 VDC Power output. Coordinate the 28 VDC options throughout the specification based on the actual equipment required and specified.

Submit [frequency][combination] converter Operation and Maintenance Manuals (O&MM) in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

1.6.1 Additions to Converter O&MM

NOTE: Include the paralleling bracketed option when paralleling has been included as a requirement of the equipment.

In addition to requirements of Data Package 5, include the following on the actual converter provided:

a. A "one-line diagram" from the building service entrance panel to the converter and out to the end utilization point(s).

b. A concise, duplicatable, single page data sheet with operating instructions for each unit including startup[, paralleling,] and shutdown procedures.

c. Routine and field test reports.

d. NRTL or UL certification or UL file number.

e. A list of all code required identification and warning signage and labels that have been provided on the converter.

1.6.2 Preliminary Converter O&MM

Prior to scheduling Field Tests, 2 bound copies of a Preliminary O&MM must be submitted to and approved by the Contracting Officer.

1.6.3 Spare Parts Information

Furnish recommended manufacturer's spare parts list, quantities, lead time to receive after ordering, and a schedule of prices,(guaranteed for one year after warranty expires), for each type of converter and other equipment specified in this section. Include the following:
a. Fuses
b. Human Machine Interface (HMI)
c. Indicator lamp/LED
d. Output switching modules
e. Plug-in logic cards
f. Power filter capacitors
g. Power semi-conductors
h. Ventilation system filters
i. 400 Hz Aircraft Power Cable Assembly
[ j. 28 VDC Aircraft Power Cable Assembly
]

1.7 WARRANTY

The equipment items must be supported by service organizations which are most convenient to the equipment installation in order to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

PART 2   PRODUCTS

2.1 [FREQUENCY][COMBINATION] CONVERTER

******************************************************************************
NOTE: Do NOT edit this paragraph to specify the internal architecture of the converter (e.g. type of power supply, rectifier type or switching technology to be utilized). Specifying this type of technology may make this a sole source specification which requires justification and approval per federal contract law.

For the options: Choose the bracketed "Combination" option only for Army projects and only when the converter also has a separate 28 VDC Power output. Choose 50 or 60 Hz based on the exterior power distribution system at the project location. Choose 24,000 for the MTBF unless the project has documented, more stringent requirements.

******************************************************************************

Provide [frequency][combination] converter consisting of modular construction solid-state components for [50][60] Hz to 400 Hz [and 28 VDC] conversion, input/output devices, and ancillary control devices. Converter must be a standard product of the manufacturer and the manufacturer's latest design that complies with the specification requirements. The converters provided under this contract must be products of the same manufacturer. Each unit must have a calculated Mean Time Between Failures (MTBF) exceeding [24,000][_____] hours as calculated when the converter is
provided with yearly servicing and maintenance. Provide converter with NRTL or UL listing complying with UL 1012. The converter must have minimum 12 pulse, active input rectification circuit or a demonstrated design achieving equal or better performance characteristics. Circuit breakers operating at 400 Hz [and 28 VDC] must be designed and UL tested for [50][60] Hz operation and derated for 400 Hz operation[ and 28 VDC operation, as appropriate]. Provide startup and shutdown instructions posted on the front of the unit using engraved plastic or aluminum plate. Provide a plastic encapsulated schematic diagram attached to the inside of the unit in clear view of maintenance personnel.

2.1.1 Electrical Characteristics

2.1.1.1 Input Voltage

**************************************************************************

NOTE: For units 15 kW and below, the input voltage should be 208 volts. For units over 15 kW, the preferred input voltage is 480 volts. Using input voltage other than 480 volts will increase the cost and weight and decrease the efficiency of the converter. Show input voltage on the construction drawings.

Choose 50 or 60 Hz based on the exterior power distribution system at the project location. Choose 10 percent voltage variation unless specific project documents require a higher percentage input variation to be permitted.

A voltage changing transformer is not permitted at the input of the converter unit on any new facilities. Adding a voltage changing transformer at the input is only permitted in the rare case when retrofitting an existing facility and there is no other voltage available. In this exception, remove the last sentence in the section below.

**************************************************************************

[480][208][380][_____] V, three phase, three wire, grounded, [60][50] Hz.
Converter must provide rated output voltage when input voltage is varied plus or minus [10][_____] percent. A voltage changing transformer is not permitted at the input of the converter unit.

2.1.1.2 Input Power Factor

Between 0.8 lagging and unity, under all conditions of steady state line and load variations specified herein.

2.1.1.3 Surge Protection

**************************************************************************

NOTE: Select Location Category C for outdoor locations only.
**************************************************************************

Provide converter capable of sustaining an input surge described in and tested in accordance with UL 1449, and IEEE C62.41.1 and IEEE C62.41.2, Location Category [B][C], and continue to operate with no alarms within the
specified tolerance.

2.1.1.4 Inrush Current

The inrush current must not exceed 100 percent of the rated full load input current.

2.1.1.5 Input Current Distortion

**************************************************************************

NOTE: Where total connected frequency converter load is a small percentage (less than 40 percent) of the total connected facility load, use 12 percent Total Harmonic Distortion (THD) and 8 percent individual. For large frequency converters (e.g. existing systems with 312 kW or larger) or where total connected frequency converter load is a significant percentage of the total connected facility load, use 5 percent THD and 3 percent individual. For installation in shipboard environments using Type 1 power (60 hertz per MIL Std 1399), use 5 percent THD and 3 percent individual.

Note that per NAVAIR request, the converter Special Tests paragraph requires data to be provided at the 25, 50, 75 and 100 percent load points. This is intentionally more stringent than the "full load" requirement below, and is intended for data acquisition only. It will be used to help develop a resolution to known field problems.

**************************************************************************

Input current Total Harmonic Distortion (THD) must not exceed [12][5] percent of the fundamental frequency with nominal input voltage at full load. Individual harmonic content must not exceed [8][3] percent of the fundamental frequency.

2.1.1.6 Output Voltage

**************************************************************************

NOTE: 1) Choose the first bracketed optional paragraph unless a combination unit is required on an Army project.

(a) Select the voltage requirement based on the Activity's location.

(b) Use MIL-STD-704, when 400 Hz power is required to power aircraft avionic equipment. Aircraft equipment is normally operated 200Y/115 V, three-phase, 400 Hz, grounded. Aircraft power monitors are only compatible with 200Y/115 Volts.

(c) If the voltage drop calculations (because of a required location of avionics shop units) are excessive, manufacturers upon request, are able to provide an avionics shop unit with 120/208 VAC output.
(d) Use MIL-STD-1399-300, Part 1 when 400 Hz power is required to power laboratory test benches simulating shipboard environments. Shipboard equipment in simulated shore laboratory environments is normally operated on a 440 V, three-phase, 400 Hz, ungrounded system.

2) Choose the second bracketed "Combination" option only for Army projects when the converter also has a separate 28 VDC Power output.

**************************************************************************

[ Provide a frequency converter with a [200Y/115 V, three phase, 400 Hz, grounded][440 V, three phase, 400 Hz, delta connected ungrounded] system, adjustable to plus or minus 10 percent of the rated voltage.

] a. The power characteristics must be within the requirements of MIL-STD-704 with the following clarifications:

(1) The voltage and frequency must be in accordance with the envelope of normal operating range of Figures 3 and 5, not just the limits of Figures 4 and 6.

(2) The steady state voltage must additionally be in accordance with the external power requirements as defined in the MIL-STD-704 Section 4.3, "External Power Source Requirement".

] b. The power characteristics must be within the requirements of MIL-STD-1399-300, Part 1, Type III power.

c. The phase rotation of the output voltage must be [A-B-C][AB-BC-CA] (per Figure 2 in MIL-STD-704, spinning in a counterclockwise direction).

][Provide a combination converter with both 400 Hz and 28 VDC voltages deliverable simultaneously from the converter on individual outputs.

a. The 400 Hz output must be a 200Y/115 V, three phase, 400 Hz, grounded system, adjustable to plus or minus 10 percent of the rated voltage.

b. The 28 VDC, must be adjustable between 24 and 32 VDC.

c. The power characteristics must be within the requirements of MIL-STD-704 with the following clarifications:

(1) For the 400 Hz output, the voltage and frequency must be in accordance with the envelope of normal operating range of Figures 3 and 5, not just the limits of Figures 4 and 6.

(2) For the 28 VDC output, the voltage must be in accordance with the envelope of normal operating range of Figure 13, not just the limits of Figure 14.

(3) The steady state voltage must additionally be in accordance with the external power requirements as defined in the MIL-STD-704.
Section 4.3, "External Power Source Requirement".

(4) The 28 VDC must additionally be in accordance with the requirements as defined in the MIL-STD-704 Section 5.3.2.4, "Electric Starting".

][d. The power characteristics must be within the requirements of MIL-STD-1399-300, Part 1 Type III power.

] e. The phase rotation of the output voltage must be [A-B-C][AB-BC-CA] (per Figure 2 in MIL-STD-704, spinning in a counterclockwise direction).

2.1.1.7 Power Output

**************************************************************************

NOTE: Previous versions of this specification referred to equipment sized only in kVA at 0.8 lagging power factor. The specification now has the requirement to use kW instead of kVA as the unit of power measurement for converters here and on the project drawings. This is a significant change in equipment designation, intending to ensure that our equipment meets the full required load range, including full power at unity power factor. It has been made to eliminate the problems that have been occurring with existing equipment in the field, and to accommodate the increasing nonlinear load characteristics of Military equipment. NAVAIR documents, including their Facilities Requirements Documents (FRD)s, are being revised to coordinate with this change to kW. Army documents are in the review process.

Size units that provide power for aircraft based on the type and number of aircraft to be supplied. Point of Use converters are required.

For Navy Projects, choose the first bracketed option. Use 90 kW for all fixed wing aircraft and use 45 kW for all rotary wing aircraft unless there are specific project design requirements approved by NAVFAC and NAVAIR. (One example, may be the direct replacement of an existing, larger kW converter.)

For Army projects, use the first bracketed option except when a combination converter is required.

**************************************************************************

[Provide a frequency converter rated at [_____] kW at unity power factor.]

[Provide a combination converter rated for continuous, simultaneous outputs of [_____] kW of 400 Hz at unity power factor and [_____] amps at 28 VDC. Combination converter must have a [_____] amp 28 VDC starting capacity for one minute.]

2.1.1.8 Load Range

**************************************************************************

NOTE: The intent of the load description below with the 15 percent current THD is to portray a 50
percent linear and 50 percent non-linear load, with a nonlinear load designed to emulate a six pulse rectifier supplying a resistive load. See UFC 3-555-01 App "xx" (Draft in Progress) for an example of the non-linear loadbank schematic. This loadbank would be used to validate factory testing requirements.

Converter must operate into a linear load with a power factor between 0.5 lagging and 0.7 leading and into a non-linear load with not less than 15 percent current THD, composed of not less than 6 percent of the 3rd harmonic and not less than 7 percent of the 5th harmonic.

2.1.1.9 Efficiency

******************************************************************************
NOTE: Use the table below to fill in the kW and the minimum efficiency.

<table>
<thead>
<tr>
<th>Rating (kW)</th>
<th>50 Percent Load</th>
<th>100 Percent Load</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>80</td>
<td>90</td>
</tr>
<tr>
<td>15</td>
<td>86</td>
<td>90</td>
</tr>
<tr>
<td>40</td>
<td>87</td>
<td>91</td>
</tr>
<tr>
<td>100</td>
<td>89</td>
<td>92</td>
</tr>
</tbody>
</table>

Electromagnetic Interference (EMI) filtering is rarely required, and has been removed from this specification. However, if EMI is needed for a specific project, and is added back into the specification, then for units with power rating larger than 15 kW, reduce the minimum efficiency by 2 percent.

In the rare case when a project is "permitted by exception" to have a voltage changing transformer at the input of the converter, reduce the specified efficiencies by 2 percent.

******************************************************************************
Provide [_____] kW units with a minimum efficiency of [_____] percent at 50 percent load and [_____] percent at 100 percent load.

2.1.1.10 No Load Input Losses

******************************************************************************
NOTE: Above 30 kW, use 7 percent. Below 30 kW, use 9 percent.

In the rare case when a project is "permitted by exception" to have a voltage changing transformer at the input of the converter, increase the specified no load input losses by 2 percent.

******************************************************************************
Provide frequency converter with no-load input losses no greater than [7][9][_____] percent of the output kW rating.

2.1.1.11 Overload

**************************************************************************
NOTE: For the Navy, include the bracketed 300 percent overload requirement in the table. However, units strictly for avionics shop use do not need the 300 percent requirement.
**************************************************************************

Satisfactory overload operating time is based on no more than one overload of the same or longer conditions, within the following specified time between overloads.

<table>
<thead>
<tr>
<th>Percent of Full Load</th>
<th>Satisfactory Operating Time</th>
<th>Time Between Overloads</th>
</tr>
</thead>
<tbody>
<tr>
<td>110 percent</td>
<td>60 minutes</td>
<td>4 hours</td>
</tr>
<tr>
<td></td>
<td>Note: Unit must still be capable of withstanding any of the other conditions for their respective operating times. e.g. Unit can still do 125 percent for less than 5 minutes, before tripping, etc.</td>
<td></td>
</tr>
<tr>
<td>125 percent</td>
<td>5 minutes</td>
<td>10 minutes</td>
</tr>
<tr>
<td>150 percent</td>
<td>2 minutes</td>
<td>10 minutes</td>
</tr>
<tr>
<td>200 percent</td>
<td>20 seconds</td>
<td>5 minutes</td>
</tr>
<tr>
<td>[300 percent]</td>
<td>4 seconds</td>
<td>5 minutes</td>
</tr>
</tbody>
</table>

After minimum operating time is achieved, unit must interrupt output power. Unit must be capable of sustaining the overload without damage until the protective device interrupts the overload.

2.1.1.12 Short Circuit

When a bolted line-to-line fault or a bolted three phase fault is applied to the unit, unit must be capable of sustaining the short circuit current without damage until the protective device interrupts the fault.

2.1.1.13 Crest Factor

The voltage crest factor must be between 1.31 and 1.51 over the entire load range in accordance with MIL-STD-704. The crest factor is the ratio of the peak value to the root mean square (RMS) value for each half cycle of the voltage waveform measured over a one second period under steady state conditions. Provide the crest factor for each condition in the paragraph LOAD RANGE.
2.1.1.14 Output Voltage THD

**************************************************************************
NOTE: The values indicated below meet MIL Std 704 requirements. Specifying lower percentages of THD requires more stringent power quality, may be a significant cost addition, and should only occur when a specific installation has different documented power quality requirements.
**************************************************************************

a. Balanced load:

(1) Output voltage THD: Not to exceed [3][_____] percent line-to-line and line-to-neutral for linear loads as specified in the paragraph LOAD RANGE.

(2) Output voltage THD: Not to exceed [5][_____] percent line-to-line and line-to-neutral for non-linear loads as specified in the paragraph LOAD RANGE.

(3) Maximum single harmonic distortion: Not to exceed [2][_____] percent of the fundamental at the nominal voltage for linear loads as specified in the paragraph LOAD RANGE.

(4) Maximum single harmonic distortion: Not to exceed [3][_____] percent of the fundamental at the nominal voltage for non-linear loads as specified in the paragraph LOAD RANGE.

b. Unbalanced load: Output voltage THD not to exceed 4 percent, line-to-neutral with 15 percent unbalanced linear load.

2.1.1.15 Output Voltage Amplitude Modulation

Provide output voltage amplitude modulation not exceeding 1/2 percent of nominal voltage at no load to full load.

[2.1.1.16 Voltage Regulation for Combination Converters with Multiple Outputs

**************************************************************************
NOTE: Combination Converters and Dual output converters are not permitted for Navy Projects. Navy requirement is for individual Point of Use Converters (PUCs).

For Army projects:

1) Dual output 400 Hz converters are no longer permitted.

2) When a combination converter (400 Hz and 28 VDC) is specified, verify with the Activity whether the converter will have a "simultaneous" or a "non-simultaneous" rating.

Include this voltage regulation option when the unit is required to simultaneously provide individually regulated power to each of the different voltage
outputs (400 Hz and 28 VDC). It may add significant cost and size to the converter.

(a) Simultaneous regulation ensures that the voltage at the end of output A does not change if: Output B is turned on or off; or if there is an increase or a decrease in the load on output B. This would not apply to system overloads and short duration transients.

(b) "Non-simultaneous" regulation applies where either the rated 400 Hz Output or the 28 VDC output is available and regulated, but not both at the same time.

For combination converter systems that provide 400 Hz and 28 VDC power each output must have isolated voltage regulation. The output voltage measured at the end of one servicing cable must not rise or fall as a result of any change in status of additional outputs (e.g. second output goes from ON to OFF, OFF to ON, or increase/decrease in applied load.) Voltage fluctuations as a result of short duration transients (non-steady state limits/times in accordance with MIL-STD-704) are exempt from this requirement.

2.1.1.17 Frequency Stability

Control output frequency of the 400 Hz converter within plus or minus 0.5 percent for all operating conditions, including maximum and minimum specified input voltages, ambient temperature and relative humidity. The frequency regulation must operate independent of supply frequency and load changes.

2.1.1.18 Phase Angle Regulation

Displacement angle between adjacent voltage phases must be 2.1 radians 120 degrees plus or minus 0.035 radians 2 degrees with balanced load and plus or minus 0.07 radians 4 degrees with three phase 15 percent unbalanced load. A 15 percent unbalanced load is defined as any combination of phasing where:

a. Phase A at full rated single phase load.

b. Phase B at 85 percent of Phase A.

c. Phase C at 85 percent of Phase A.

2.1.1.19 Transient Output Voltage Recovery

NOTE: Use MIL-STD-704, when 400 Hz power is required to power aircraft avionic equipment.

Use MIL-STD-1399-300, when 400 Hz power is required to power shipboard equipment.

[In accordance with MIL-STD-704. ][In accordance with MIL-STD-1399-300 for Type III power. ]Monitor and record output voltage at the load end of the
2.1.2 Environmental Rating

**************************************************************************
NOTE: Select 55 degrees C 130 degrees F (ambient temperature rating unless in areas subject to extreme temperatures (e.g. Middle East or desert environments). Use 0-95 percent relative humidity unless extreme condensation such as in a jungle climate.

Use 915 meters 3000 feet level unless location of installation will be at higher elevations.
**************************************************************************

The converter must be rated for continuous operation from no load to rated full load under the following conditions:

a. Ambient temperatures ranging from -20 to [55][60][65] degrees C. -4 to [130][140][150] degrees F.

b. Relative humidity from [0 to 95] [_____] percent noncondensing.

c. Ambient pressures from sea level to [915] [_____] meters [3,000] [_____] feet.

2.1.3 Monitoring and Control Panel

Provide converter with a control panel that is equipped with the following controls, indicators, instrumentation, data logging, diagnostics, and alarm functions.

2.1.3.1 Controls

Controls must be mounted on the front of the control panel, accessible without opening any doors or covers. Specific sequencing, or the requirement for simultaneous pushbutton operation, is not acceptable for any input or output control.

**************************************************************************
NOTE: Include the remote control panel option when unit is platform mounted or located out of sight of aircraft.
**************************************************************************

a. Start/stop pushbutton for input device control (circuit breaker or contactor).

b. Lamp/light emitting diode (LED) test - A push-to-test button or switch to test indicator lamps/LEDs. If panel lights all blink as part of the startup Built-in-Test (BIT) sequence, then a separate push to test button is not required.

c. Emergency power off - A separate pushbutton for emergency power off.

d. Output device ON/OFF.

e. Alarm silence and "silence" indicator - A switch that must disable the
audible alarm without clearing the alarm codes.

f. Additional individual controls for the following functions (Note - these may be included as part of the Human-Machine Interface (HMI) as described in paragraph HUMAN MACHINE INTERFACE REQUIREMENTS):

- Output voltage adjust
- Alarm reset - resets and clears the silenced audible alarm.

2.1.3.2 Indicators

a. The following are mandatory indicators. They must be included on the control panel on the exterior of the unit[, and on the exterior of the remote control panel] in addition to any that are included in the HMI:

- Input power available - Lamp/LED to indicate that the supply voltage is available.
- Output power On/Off - Lamp/LED to indicate that the converter output voltage is available.
- Output device "ON".
- Audible alarm.
- Aircraft interlock bypass - Lamp/LED to indicate that the Aircraft Interlock has been bypassed.

b. In addition, include the following additional indicators, if they are not included in the HMI:

- System alarm - Lamp/LED to indicate that a fault has been detected. This indicator must be latched in the "ON" position whenever an alarm condition described in paragraph ALARM ANNUNCIATOR, is detected and must remain "ON" until the alarm reset pushbutton is pressed.
- Indicating lamp/LED to indicate that the alarm silence switch is in the disable position.
- Elapsed time meter in hours; (may be internal or visible externally).

2.1.3.3 Human Machine Interface (HMI) Requirements

**************************************************************************
NOTE: For rarely used delta output frequency converters, delete the phase-to-neutral voltage requirement below.
**************************************************************************

Provide an HMI with a minimum of four by twenty (4 x 20) character backlit LED display for presenting the digital instrumentation, diagnostic system, and fault indicating system data. The HMI must be rated for harsh environments.

a. Digital Instrumentation. Provide true RMS, plus/minus one percent accuracy, microprocessor-based readings that include the following functions:
(1) Output phase-to-phase voltage.
(2) Output phase-to-neutral voltage.
(3) Output phase current.
(4) Output frequency.
(5) Inverter temperature. This function is desired for field diagnostics, but is not mandatory.

b. Alarm Annunciator. The unit must be capable of detecting and displaying the following abnormal conditions:

(1) Input overvoltage.
(2) Input undervoltage.
(3) Output undervoltage.
(4) Output overvoltage.
(5) Output overload.
(6) System alarm.
(7) Control logic failure.
(8) Over-temperature.
(9) Logic power supply failure.

2.1.4 Input/Output Devices

**************************************************************************
NOTE: Coordinate 50 Hz vs 60 Hz requirement with Activity. Provide appropriate short circuit ratings in accordance with Basis of Design Calculations per UFC 3-501-01, "Electrical Engineering".
**************************************************************************

Provide fully-rated, three-pole, UL approved devices for control of [60][50] Hz input and 400 Hz output from the converter. Derate devices and cables operating at 400 Hz in accordance with IEEE 519.

2.1.4.1 Input Device

Provide converter with a UL listed input device (circuit breaker conforming to requirements of UL 489 or contactor) as an integral part of the converter. Device must be operable from the front of the converter. Device must have a short-circuit current rating of [_____] amperes symmetrical minimum.

2.1.4.2 Output Contactor

**************************************************************************
NOTE: Include option for IEC on Oconus projects.
**************************************************************************
Provide converter output with an automatic magnetically-held contactor with interlock circuit. Output contactor must have sufficient capacity to handle rated load, overload, and available short circuit current. Contactor must open when any circuit identified in the paragraph SAFETY FUNCTIONS causes the system to shut down. Electrically interlock contactor with ON/OFF circuitry so that when the frequency converter is shut down, the contactor opens immediately and remains open.[ Conform to the requirements of IEC 60947-4-1.]

[2.1.4.3 Output Circuit Breaker

**************************************************************************

NOTE: Only add an output circuit breaker, (and delete the OUTPUT CONTACTOR paragraph above), if the converter is supplying a downstream distribution panelboard (such as in a shop or laboratory), or multiple outputs with distribution internal to the converter. Include the 28 VDC bracketed option only on Army projects with combination converters.

**************************************************************************

Provide converter output(s) with non-automatic manual circuit breaker(s), with appropriate frame size and a shunt trip coil derated for 400 Hz [and 28 VDC] operation. Trip circuit breaker by the unit's OFF circuit [local or remotely activated] and when any circuit identified in the paragraph SAFETY FUNCTIONS causes the system to shut down. Output breaker(s) must be operable from the front of the unit.

]2.1.4.4 Aircraft Interlock Circuit

**************************************************************************

NOTE: Coordinate with paragraph AIRCRAFT POWER CABLE ASSEMBLY.

1) For all new installations, use the first bracketed option; "Provide a Split F Type safety insertion interlock ..." in the first paragraph, and use the Split F option in item b.(1) "Normal...". See UFC 3-555-01 (Draft in Progress) and MIL-DTL-32180 for technical information and typical details and schematics on the operation of the interlock.

2) When the aircraft cable specification is used for existing converters, coordinate with the Activity to ensure they understand the new safety requirements in the UFC 3-555-01 (Draft in Progress) and have appropriate Standard Operating Procedures (SOPs) in place, per UFC 3-560-01, Operational and Maintenance: Electrical Safety" for the remainder of their existing equipment.

3) The 1997 NATO document "STANAG 7073", (titled Connectors for Aircraft Electrical Servicing Power) requires the EF pin to be jumpered in the ground servicing cable connector. The use of the Split F Insertion Interlock will meet that requirement.

For the Air Force: When involved with certain
"Legacy" Air Force Aircraft, they may use the "STANAG" Alternate connection circuit, and the 28 VDC may need to be changed to utilize one of the 115 V, 400 Hz phases instead. Coordinate with the Activity to confirm requirements.

**************************************************************************

Provide a Split F Type safety insertion interlock system (with the contacts integral to the cable head) in accordance with MIL-DTL-32180.

Utilize a control signal established by the converter to determine whether the servicing cable connector is installed to the aircraft or not. The converter control system must prevent the output control device from closing if the 28 VDC signal is not present. If the converter output control device is closed when the 28 VDC signal is lost, the converter control system must remove the 400 Hz power from the output servicing cable connector within 100 milliseconds. This 28 VDC control signal must not be referenced to the aircraft and cannot affect components on the aircraft.

[Provide interlock system that determines the presence or absence of the 28 VDC feedback signal from the aircraft. If the 28 VDC signal is not present within 5 seconds after initially closing the output disconnect, open the output disconnect. Once the interlock signal is received and the system is in operation, if the interlock signal is lost, the converter control system must remove the 400 Hz power from the output servicing cable connector within 100 milliseconds.

a. Converter must contain terminal block points for the connection of two wires from the aircraft cable assembly for the interlock circuit (sized to accept No. 18 and No. 12 AWG). Interlock circuit must not draw more than 20 milliamperes from the aircraft's 28 VDC circuit.

b. For field testing purposes, provide a switch inside the converter with two positions:

   (1) Normal - [Converter relying on signal from Split F connector] [For aircraft loads].

   (2) Bypass - For testing with dummy load or no load, or for use with aircraft with no 28 VDC. This switch needs to be "Inside" or "located within the HMI functions". It must be out of sight except for specific maintenance purposes.

2.1.5 Safety Functions

2.1.5.1 400 Hz Power Source

The 400 Hz power source internal buss must automatically discharge to below 30 VAC within 5 seconds after the following:

a. 400 Hz power source has been turned off.

b. Whenever any access panel is opened on the equipment. Under this condition, the interlock circuitry must open the input device and the 400 Hz output device, and not allow the input or output device to close. For maintenance purposes, provide an internal bypass switch to defeat the interlock circuitry.

c. Detection of system fault that results in a converter shut down
condition, including the following:

(1) Input undervoltage.
(2) Input overvoltage.
(3) Loss of phase (input or output).
(4) Loss of input power.

2.1.5.2 400 Hz Output Cable

The 400 Hz power must be removed from the output cable within 100 milliseconds after one of the following occurs:

a. Receiving a stop command.

b. Loss of 28 VDC control signal.

c. Detection of a fault that results in an output shut down, including the following:

(1) Output overvoltage - Protect by tripping output devices for instantaneous overvoltage of 30 percent or more and for 10 to 30 percent overvoltage lasting more than 0.25 seconds.

(2) Output undervoltage - Protect by preventing the closing of the output disconnect until the output voltage is 95 percent of the rated output. If, after closing, the voltage decreases to below 90 percent for longer than 5 seconds, provide relaying to trip output devices utilizing a field-adjustable time-delayed circuit with a range of 4 to 10 seconds.

(3) Output frequency - Protect by tripping output devices for frequency change in excess of plus or minus 5 percent of the rated output frequency (400 Hz).

(4) Output overload.

(5) Converter overtemperature protection.

2.1.6 Automatic Line Drop Compensation

Provide automatic line drop compensation from zero to ten percent; adjustable internally.

[2.1.7 Paralleling

**************************************************************************

NOTE: This is an additional cost item and should not be specified unless specifically requested by the user. Coordinate with the Activity on desired load sharing percentages, and on whether or not the manual paralleling bracketed option is needed.

**************************************************************************

Provide frequency converters capable of being paralleled. Paralleled units must be the same manufacturer and model number. Regulate and control units operated in parallel by a master unit. Design controls associated with
paralleling of the units such that each frequency converter can operate as a stand alone unit, or as either a slave or master unit in a parallel system. Units must parallel and synchronize within a 50 millisecond recovery time. Share the total load equally within plus or minus 5% percent by each unit. If paralleling for redundancy, failure of one system must not affect the other system(s). Provide manual paralleling which permits a paralleled unit to be added or removed from the system without interrupting the operation of other units.

][2.1.8 Auto Restart

**************************************************************************

NOTE: Auto restart should be considered when the converter is installed in a remote location that is not readily accessible to operating personnel and maintaining 400 Hz power is critical to operations. Use of auto restart should be studied carefully to ensure that it does not create a potential personnel safety hazard.

This is an additional cost item and should not be specified unless specifically requested by the user.

**************************************************************************

After a total input power outage the unit must be capable of automatically restarting and re-energizing loads upon restoration of normal power. Provide units with a manual/auto restart switch and with backup battery power supply if it is needed to meet the auto restart requirement. When interlock circuit has been interrupted or when interlock is in the maintenance position (manual restart), the system should not restart.

][2.1.9 Built-In Test Equipment

**************************************************************************

NOTE: Built-in test equipment (BIT) should be considered when the converter is installed in a remote location that is not readily accessible to operating personnel and maintaining 400 Hz power is critical to operations. It may also be needed when high reliability is a defined concern.

This may be an additional cost item and although some manufacturers include it at no cost, it should not be required unless specifically requested by the user.

**************************************************************************

Frequency converter must include Built-in test equipment (BIT), which monitors both primary circuits and protection circuits of the unit. Provide visual indication to assist diagnosis of unit failures to a modular level. Provide visual indication of converter status using cabinet mounted light emitting diodes and Human Machine Interface (HMI). As a minimum the indicator lights must include a "machine on" light, and an "output faulted" indicator light that comes on when the unit has shut down.

][2.1.10 Magnetic Components

**************************************************************************

NOTE: Magnetic components are used within the
converter unit. Do not delete this information. It is not included to imply permission to utilize transformers for modifying the input voltages to the converter.

Provide Class 180 power magnetic transformer and inductors in accordance with NEMA ST 20 and UL 506. The limits of Class 180 must not be exceeded at the maximum specified ambient temperature and at 100 percent load.

2.1.11 Acoustical Noise

NOTE: The following table serves as a guide for establishing the maximum allowable sound pressure level for each kW rating. The designer should take into consideration that converters are inherently noisy when physically locating the unit. Per manufacturers, 72 dBa is standard across the range of converters we specify.

Specifying one of the optional "Manufacturers Lowest Attainable - Maximum Acoustical Noise Values", which per the table below is possible, will have an additional cost associated with it.

<table>
<thead>
<tr>
<th>Rating (kW)</th>
<th>Mfrs Standard - Maximum Acoustical Noise Values (dBa)</th>
<th>Mfrs Lowest Attainable - Maximum Acoustical Noise Values (dBa)</th>
</tr>
</thead>
<tbody>
<tr>
<td>5 - 14</td>
<td>72</td>
<td>65</td>
</tr>
<tr>
<td>15 - 39</td>
<td>72</td>
<td>65</td>
</tr>
<tr>
<td>40 - 99</td>
<td>72</td>
<td>68</td>
</tr>
<tr>
<td>100 - 249</td>
<td>72</td>
<td>72</td>
</tr>
<tr>
<td>250 - up</td>
<td>72</td>
<td></td>
</tr>
</tbody>
</table>

NOTE: Do not go below the table values, unless specifically required by the Activity because of the location of the frequency converter, and unless the new values have been confirmed by multiple manufacturers as attainable.

If any value different than 72 dBa is used, include the "optional Acoustical Noise Test" in paragraph SPECIAL FACTORY TESTS, to verify that the equipment furnished meets the more stringent requirement. The test parameters (height and range) are included in that paragraph.

Provide unit with a maximum continuous acoustical noise level less than
[72][_____] dBa (A weighted scale).

2.1.12 Assembly Construction

**************************************************************************

NOTE: Per manufacturers, all converter enclosures require ventilation. Per NEMA 250 Tables 1 and 2, only NEMA Types 1,2,3R and 3RX are permissible to be ventilated. Verify availability by multiple manufacturers before using other enclosure types.

When location is outdoors, include the appropriate outdoor location coating and painting options.

When location is indoors, in item a:
  - For Navy and Air Force, choose first option requiring flush wall mounting.
  - For Army, choose second option and identify if pedestal mounted in hangars or floor mounted in lab or other locations.

**************************************************************************

Provide enclosures suitable for [indoor][outdoor][corrosive][direct spray][_____] environments in accordance with NEMA 250, Type [l][2][3R][3RX]. Arrange to provide required louvers, cooling air, entry and exit provisions for equipment within enclosures.

a. [Units must be mounted flush against the wall, must not require back access for maintenance, and must comply with the "Maintenance Envelopes" identified on the drawings.][Units must be [pedestal][floor] mounted as indicated and comply with the "Maintenance Envelopes" identified on the drawings.]

b. Construct unit(s) so that components, with the exception of control and monitoring components, are totally enclosed within the enclosure. Electronic circuits including power circuits must be modular construction readily accessible for maintenance, repair and module replacement from the front of the enclosure.[ For units installed outdoors or in corrosive environments, [provide a conformal (rust-inhibiting) coating for the printed circuit boards][enclose electronic circuits in a sealed electronics compartment that is not provided with direct cooling ventilation or forced air cooling].]

c. Provide permanent identification tags for wiring. Uniquely identify each wire. Use the same identification system in the wiring diagrams in the Operation and Maintenance Manual. Enclosures must be painted in accordance with paragraph FACTORY APPLIED FINISH and as specified herein. Provide each enclosure with a finish coat over a rust inhibiting substrate or a substrate that has been provided with a rust inhibiting treatment.[ For outdoor enclosures, if the unit is not painted using the powder coating process, provide two finish coats on the unit.]

d. Provide units with a Mean Time To Repair (MTTR) of 30 minutes from the time of the diagnosed failure based on documented manufacturer's historical data for the average time of repair for their top ten faults. Provide the supporting data with the equipment submittal.
2.2 AIRCRAFT POWER CABLE ASSEMBLY

**************************************************************************
NOTE: Coordinate with paragraph AIRCRAFT INTERLOCK CIRCUIT. Banded cables are not permitted for 400 Hz systems due to excessive phase unbalance and voltage drop.

NOTE: For the Army:
1) Coordinate the cable amperage and length for the aircraft on the project.
2) Include the bracketed 28 VDC cable option when a combination converter, with an additional 28 VDC output, is part of the project.

NOTE: For the Navy:
1) Use the 260 Amp and 32 meters 105 feet length options for all cable assemblies with the 90 kW converters, and the 180 Amp 32 meters 105 feet length for all 45 kW converters, unless the project requirements given to the designer of record specifically identify that the 27 meters 90 feet feet length is sufficient.
2) Delete the 28 VDC option. Combination 400 Hz and 28 VDC Converters are no longer permitted. Individual 28 VDC Converters are required. Contact NAVFAC Atlantic, Code DC 44 - Criteria Manager at (757) 322-4327, for a draft 28 VDC specification that can be modified for the specific project.

**************************************************************************
Comply with SAE AS7974. For 400 Hz wiring at 200Y/115 volts, provide 7-conductor type cable configured as 6 phase conductors (2xA, 2xB, 2xC) tightly wound around the center located neutral, twisted and single jacketed in accordance with SAE AS5756/6. Rate cable for [260] [180] amperes. Cable length must be [32 meters] [27 meters] [_____] [105 feet] [90 feet] [______]. Provide control cabling included within the jacket for interlock circuit. Terminate control wiring on accessible terminal blocks in unit. Provide cable assembly with integrally molded 400 Hertz connector capable of connecting to the aircraft 6 pole receptacle. Provide cable/connector assembly suitable for severe duty, with crimped contact terminations. Banded cables are not permitted.

[2.2.1 28 VDC Aircraft Power Cable Assembly]

For 28 VDC wiring provide 2-conductor cable assembly, banded in 600 mm 2 feet intervals maximum, in accordance with SAE AS5756. Provide cable assembly with integrally molded 28 VDC female connector aircraft plug in accordance with SAE AS7974.

[2.3 REMOTE MONITORING AND CONTROL PANEL]

**************************************************************************
NOTE: Delete this paragraph unless plans clearly indicate requirement for remote monitoring and
Provide remote monitoring and control panel and circuitry. Connect to clearly and permanently labeled terminal blocks located inside the converter's enclosure. Provide the circuitry such that indicator lamp/LED information and control function(s) can be extended from the terminals to a remote location in the future.

a. Pushbutton or switch for de-energizing the output terminals.

b. Indicator lamp/LED showing the unit status (energized or not energized).

c. Indicator lamp/LED showing the output control device position (open or closed).

d. System alarm.

2.4 MANUFACTURER'S NAMEPLATE

Each frequency converter, each major component within the frequency converter, and each item of other equipment must have a nameplate bearing the manufacturer's name, address, model number, and serial number securely affixed in a conspicuous place; the nameplate of the distributing agent will not be acceptable.

2.5 FACTORY APPLIED FINISH

NOTE: This paragraph covers only the basic painting requirements for most electrical equipment. Include any special finishes for high or low temperatures and extremely corrosive atmospheres. Use manufacturer's standard color unless the Activity requires a special color.

Electrical equipment must have factory-applied painting systems which must, as a minimum, meet the requirements of NEMA 250 corrosion-resistance test and the additional requirements as specified herein. Interior and exterior steel surfaces of equipment enclosures must be thoroughly cleaned and then receive a rust-inhibitive phosphatizing treatment, a primer powder coat, or equivalent treatment prior to painting. Exterior surfaces must be free from holes, seams, dents, weld marks, loose scale or other imperfections. Interior surfaces must receive not less than one coat of corrosion-resisting paint or powder coating process in accordance with the manufacturer's standard practice. When enclosure is aluminum, interior may optionally be coated with rust inhibiting treated film. Exterior surfaces must be primed, filled where necessary, and given not less than two coats baked enamel with semigloss finish, or finished with a powder coating process. [ Color must be the manufacturer's standard color. ] [ Equipment located indoors must be ANSI Light Gray, [ and equipment located outdoors must be ANSI[ Light Gray][ Dark Gray]]. ] Provide manufacturer's coatings for touch-up work and as specified in paragraph FIELD APPLIED PAINTING.
2.6 SOURCE QUALITY CONTROL

2.6.1 Factory Test Schedule

**************************************************************************
NOTE: For the Army: Choose the bracketed "Combination" option (throughout the specification) only when the converter also has a separate 28 VDC Power output.
**************************************************************************

The Government reserves the right to witness tests and reserves the right to request the raw data from the tests whether witnessed or not. Provide the [frequency][combination] converter test schedule for tests to be performed at the manufacturer's test facility. Submit required test schedule and location, and notify the Contracting Officer 30 calendar days before scheduled test date. Notify Contracting Officer 15 calendar days in advance of changes to scheduled date.

Test Instrument Calibration.

a. The manufacturer must have a documented calibration program which assures that all applicable test instruments are maintained within rated accuracy.

b. The accuracy must be directly traceable to the National Institute of Standards and Technology.

c. Instrument calibration frequency schedule must not exceed 12 months for both test floor instruments and leased specialty equipment.

d. Provide dated calibration labels, that are visible on all test equipment.

e. Calibrating standard must be of higher accuracy than that of the instrument tested.

f. Keep up-to-date records that indicate dates and test results of instruments calibrated or tested. For instruments calibrated by the manufacturer on a routine basis, in lieu of third party calibration, include the following:

(1) Maintain up-to-date instrument calibration instructions and procedures for each test instrument.

(2) Identify the third party/laboratory calibrated instrument to verify that calibrating standard is met.

2.6.2 Routine Factory Tests

**************************************************************************
NOTE: Include the bracketed option, "As an exception..." when there are multiple, identically sized (in kW) converters on the same contract. Intent is to only do the "automatic line drop compensation test" on the first converter.
**************************************************************************

In item c, the aircraft power cable assembly is normally included in the project. If for some
reason it is not part of the contract, modify the item and provide additional appropriate cable information (e.g. length and type) that the manufacturer should use for tests.

Perform routine tests by the manufacturer at the factory, on each of the actual [frequency][combination] converter(s) prepared for this project to ensure that the design performance is maintained in production. [As an exception, test automatic line drop compensation on only one unit on multiple unit orders of the same kW rating. If there are multiple units with different kW ratings, then testing one of each of the kW ratings is acceptable.] Submit test reports, by serial number and receive approval before delivery of equipment to the project site. Include a list of the current test equipment calibration dates. Required tests, test conditions, and testing sequence is as follows:

a. For tests which require full load, use 1.0 power factor unless otherwise noted.

b. All measurements must be true RMS measurements. Obtain measurements in accordance with IEEE 1159. Monitor and record all data at the load end of the cable.

c. Connect loads to the converter with the specified aircraft power cable assembly.

d. No adjustments to the frequency converter are allowed between load tests.

2.6.2.1 Test Conditions

Tests must include the following conditions:

a. Initial Safety Verification: Perform tests and checks to validate the safe and timely shutdown for each condition (for the power source and the output cable) identified in paragraph SAFETY FUNCTIONS.

b. Input current and power factor: Operate converter at low, nominal and high input voltage at full load. Measure and record input voltage, input power factor and input current in each phase.

**NOTE: The non-linear load tests below are based on the requirements in the paragraph LOAD RANGE. The intent of the required 15 percent current THD in LOAD RANGE is to portray a 50 percent linear and 50 percent non-linear load, with a nonlinear load designed to emulate a six pulse rectifier supplying a resistive load. See UFC 3-555-01 Specialty Power Systems (Draft in progress) for additional information.**

c. Output voltage, output voltage THD, output current, output power factor, and voltage regulation. Operate converter at nominal input voltage unless otherwise specified.

(1) 50 percent of rated capacity with 0.8 lagging power factor linear
load.

(2) 100 percent of rated capacity with 0.5 lagging power factor, 0.8 lagging power factor, 1.0 power factor, and 0.7 leading power factor linear loads.

(3) 50 percent of rated capacity with the non-linear load as specified in the paragraph LOAD RANGE.

(4) 100 percent of rated capacity at low and high input voltage.

(5) 100 percent of rated capacity with the non-linear load as specified in the paragraph LOAD RANGE.

(6) Note - Operate for not less than 10 minutes at each test condition in (1), (2), (3) and (4) above, and for not less than 30 minutes at test condition in (5) above.

(7) Note - Monitor and record each of the following at the beginning and end of each test condition: output voltage, output voltage waveform, output voltage THD, output voltage distortion spectrum, output voltage crest factor, output current, output current waveform, output current distortion spectrum, output power factor and frequency. Verify output remains within specified regulation limits.

d. Efficiency: Operate at nominal input voltage at half load and full load at 1.0 power factor. Measure and record input voltage, input current, input power factor, output voltage, output current, and output power factor. Calculate the unit efficiency.

e. No load losses: Operate at no load and nominal input voltage. Measure and record input voltage, input current, input power, input power factor, and output voltage. Calculate the no load losses.

f. Overload: Operate at nominal input voltage and output voltage with loads and in sequence listed below:

<table>
<thead>
<tr>
<th>Percent of Full Load</th>
<th>Time</th>

Monitor output to confirm there is no 400 Hz power interruption. After minimum operating time is achieved, unit must interrupt output power. Provide voltage and current waveforms [in accordance with NAVAIR Digital File Information] documenting the unit's response for each test.

**************************************************************************
**NOTE:** Utilize the identified burn-in hours, unless a validated reason has been identified by the Activity (such as a requirement for a higher uptime confidence limit) to either reduce or increase the number of hours.

The last sentence in the BURN-IN TEST paragraph permits not using the Aircraft power cable assembly that has been mandated for all the other tests. This exception has been added because the specified cable may not withstand the current draw for this length of time without overheating.

**************************************************************************

h. Automatic line drop compensation: Operate converter at nominal voltage and verify specified performance of the line drop compensation at the following loads.

   (1) No-load.
   
   (2) 50 percent of rated capacity with a 0.8 lagging power factor linear load.
   
   (3) 50 percent of rated capacity with the specified non-linear load.
(4) 100 percent of rated capacity with a 0.8 lagging power factor linear load.

(5) 100 percent of rated capacity with the specified non-linear load.

j. Post Routine Test Safety Verification: Repeat tests conducted under item a. Initial Safety Validation to confirm safety features were not affected by previous tests.

2.6.3 Special Factory Tests (Design Tests)

**************************************************************************
NOTE: Include the bracketed option "each of" when there are multiple sizes of converters in the project.
**************************************************************************

Submit special factory test (design test) reports (complete with test data, explanations, formulas, results, setup and cable information, and the list of the calibration dates of the test equipment used), in the same submittal package as the catalog data and drawings for [each of] the specified frequency converter(s). Tests must be certified and signed by a registered professional engineer or by a "company certified professional designee" within the manufacturers' organization. Submit designee's credentials with the initial design test report for approval. Tests must be on file based on a production model of converters of the same design, construction and kW rating provided.

**************************************************************************
NOTE: Include the first bracketed option below, "As an exception..." unless there are more than 5 units on the project, or the units are going to a severe or hard to reach environment / strategic location. When choosing the second option instead of the first, coordinate with the Activity to determine the number of "production units" that must be tested.
**************************************************************************

The "As an exception..." sentence has always permitted the Special Factory Tests to be done on one of the first units produced, at the same time scheduled for the Routine Tests. However it was rarely used, since it only applies when the manufacturer already meets the experience requirements in the QUALIFICATIONS OF MANUFACTURER paragraph in Part 1 of this specification, but was building a slightly different unit without the specific design tests already on file.

With the new change to "kW vs kVA" requirements, this exception may become more frequently used since test data indicating the kW ratings specifically, may not be on file. The manufacturer still has to meet the QUALIFICATIONS OF MANUFACTURER paragraph, and all of the Special Factory Tests will still be subject to being witnessed by the government with the Routine tests.
As an exception, when the manufacturer does not have the special factory tests for the specific unit characteristics already on file, the manufacturer may conduct the special factory tests on the first "production unit" along with the routine tests. The manufacturer must test [one] [_____] unit[s] at the same time scheduled for routine tests, of each rating and size converter. To assure compliance with the specification, these tests are also subject to government witnessing at the same time as the routine tests. For all tests which require full load, use 1.0 power factor unless otherwise noted. For all tests that are "not already on file", connect loads to the converter with an aircraft power cable assembly, 32 meters 105 feet long, similar to the specified project aircraft power cable assembly. Monitor and record all data at the load end of the cable, unless otherwise noted. The tests conducted on the unit must include the following:

**************************************************************************

NOTE: Select Location Category C for outdoor locations only.
**************************************************************************

a. Initial Safety Verification: Perform tests and checks to validate the safe and timely shutdown for each condition (for the power source and the output cable) identified in paragraph SAFETY FUNCTIONS.

b. Surge protection: Apply input surges in accordance with IEEE C62.41.1 and IEEE C62.41.2, Location Category [B][C] and monitor output. Conduct a minimum of three consecutive successful tests on each unit listed. Confirm there is no interruption to 400 Hz output power and voltage stays within specified regulation tolerances. Surge protection tests must be applicable on all frequency converter units utilizing same surge protection device by manufacturer and part number regardless of frequency converter kW size.

c. Input current: Perform the following tests at nominal input voltage. Conduct each test a minimum of three times. Monitor the input and output power to demonstrate the duration of the transients until the converter reaches steady state. Provide copies of waveforms and analysis in test report.

(1) Measure inrush current when initially turning on machine with no load.

(2) After applying power and unit is at steady state, conduct load application test, going from 0 to full load to measure affect on input.

d. Input current distortion: Operate at nominal input voltage at 0, 25, 50, 75, and 100 percent of rated full load. Measure and record the input current THD for the current in each phase.

**************************************************************************

NOTE: For the Navy:

1) Include the bracketed 300 percent overload requirement in the table. However, units strictly for avionics shop use do not need the 300 percent requirement.

2) Coordinate with NAVAIR (POC information is at
front of specification), to see if the NAVAIR Digital File Information has been completed before including the bracketed documentation option. Include bracketed option once NAVAIR has established a defined version of Digital File Requirements (still in progress). Verify at that time if need to add requirement for both input and output waveforms / data on the 300 percent test.

**************************************************************************

e. Overload: Operate at nominal input voltage and output voltage with loads as listed below:

<table>
<thead>
<tr>
<th>Percent of Full Load</th>
<th>Satisfactory Operating Time</th>
<th>Time Between Overloads</th>
<th>Iterations</th>
</tr>
</thead>
<tbody>
<tr>
<td>110 percent</td>
<td>60 minutes</td>
<td>4 hours</td>
<td>3</td>
</tr>
<tr>
<td>125 percent</td>
<td>5 minutes</td>
<td>10 minutes</td>
<td>3</td>
</tr>
<tr>
<td>150 percent</td>
<td>2 minutes</td>
<td>10 minutes</td>
<td>3</td>
</tr>
<tr>
<td>200 percent</td>
<td>20 seconds</td>
<td>5 minutes</td>
<td>3</td>
</tr>
<tr>
<td>[300 percent]</td>
<td>4 seconds</td>
<td>5 minutes</td>
<td>5</td>
</tr>
</tbody>
</table>

Monitor output to confirm there is no 400 Hz power interruption. After minimum operating time is achieved, unit must interrupt output power. Provide voltage and current waveforms[ in accordance with NAVAIR Digital File Information] documenting the unit's response for each test.

f. Short-circuit: Apply a bolted line-to-line fault and a bolted three phase fault directly to the output terminals of the unit. Conduct a minimum of three consecutive successful tests on each unit. Provide unit capable of carrying the fault current until the integral system protective devices interrupts the fault with no damage to the unit. Provide waveforms of short circuit current during short circuit tests.

g. Output voltage THD: Operate at nominal input voltage at full load with balanced and 15 percent unbalanced load. A 15 percent unbalanced load is defined as follows:

(1) Phase A at full rated single phase load.

(2) Phase B at 85 percent of Phase A

(3) Phase C at 85 percent of Phase A

Measure and record the output voltage THD for the line-to-neutral voltage of each phase.

h. Phase angle regulation: Operate at full load with balanced and 15 percent unbalanced loads. Measure and record output voltage and current, and identify RMS phase voltages and displacement angles between adjacent output voltage phases. A 15 percent unbalanced load is defined as follows:

(1) Phase A at full rated single phase load.

(2) Phase B at 85 percent of Phase A.

(3) Phase C at 85 percent of Phase A.
i. Transient recovery: Operate at the following load steps: 0 to 100 percent, 0 to 50 percent, 100 to 0 percent and 50 to 0 percent. Measure and record recovery time and output voltage deviation limits. Provide recordings or display of output voltage during transient recovery test.

**************************************************************************

NOTE: Delete bracketed acoustical noise test unless frequency converter is installed in special locations such as test laboratories or other confined spaces and a lower than 72 dBA value is specified.

The test parameters (Height and Range) identified below, meet the ANSI SI 4 requirements. However the standard is not referenced because it "allows units to be averaged over a certain production range/quantity", whereas we want each unit to be individually compliant.

**************************************************************************

[ j. Acoustical noise: Operate at no load, 50 percent and 100 percent of full load. Measure continuous steady sound pressure level 1525 mm 5 feet horizontally from the center of each side of the converter at a point 1525 mm 5 feet above the floor. Decibels (dB) are referenced to 20 micropascal.

**************************************************************************

NOTE: Delete optional paralleling test unless paralleling requirement is specified with the equipment.

**************************************************************************

[ k. Paralleling: Operate at nominal input voltage at 50 percent and 100 percent of full load at 0.8 lagging power factor. Measure and record the output voltage, output current and power factor provided by each individual unit.

l. Post Special Test Safety Verification: Repeat tests conducted under item a. Initial Safety Verification to confirm safety features were not affected by previous tests.

]2.7 ARC FLASH WARNING LABEL

**************************************************************************

NOTE: Include the Arc Flash Warning Label detail on the drawings. See the technical notes at the beginning of this section to obtain the AutoCAD drawing file of the label.

**************************************************************************

Provide arc flash warning labels for arc flash protection in accordance with NFPA 70E and NEMA Z535.4 for the enclosures of electrical equipment that are likely to require examination, adjustment, servicing, or maintenance while energized. Locate this self-adhesive warning label on the outside of the equipment compartment doors warning of potential electrical arc flash hazards and appropriate PPE required. Provide label format as indicated. The marking must be clearly visible to everyone,
including qualified persons, before examination, adjustment, servicing, or maintenance of the equipment.

2.8 FIELD FABRICATED NAMEPLATES

**************************************************************************
NOTE: Use the following paragraph where nameplates are fabricated to identify specific equipment designated on the drawings. Provide note on panelboard schedules to indicate where other than black center core labels are required.
**************************************************************************

ASTM D709. Provide laminated plastic nameplates for each equipment enclosure, relay, switch, and device; as specified or as indicated on the drawings. Each nameplate inscription must identify the function and, when applicable, the position. Nameplates must be melamine plastic, 3 mm 0.125 inch thick, white with [black] [_____] center core. Surface must be matte finish. Corners must be square. Accurately align lettering and engrave into the core. Minimum size of nameplates must be 25 by 65 mm 1 by 2.5 inches. Lettering must be a minimum of 6.35 mm 0.25 inch high normal block style.

2.9 GROUNDING AND BONDING

**************************************************************************
NOTE: Include the reference to Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION when equipment is also being provided outside.
**************************************************************************

UL 467. Provide grounding and bonding as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM[ and for exterior work, in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION].

2.10 CAST-IN-PLACE CONCRETE

**************************************************************************
NOTE: Include concrete requirements when equipment is also being provided outside on concrete pads.
**************************************************************************

Provide concrete associated with electrical work for other than encasement of underground ducts rated for 30 MPa 4000 psi minimum 28-day compressive strength unless specified otherwise. Conform to the requirements of Section 03 30 00 CAST-IN-PLACE CONCRETE.

PART 3 EXECUTION

3.1 INSTALLATION

Install products to operate at 400 Hz in the same manner as specified in other sections of this specification for products operating at [50] [60] Hz, unless indicated or specified otherwise. Conform to the requirements of NFPA 70 and IEEE C2 and to manufacturer's instructions and recommendations.
3.2  EQUIPMENT

3.2.1  Floor Mounted

Provide proper floor mounting channels and install in accordance with the manufacturer's drawings and instructions and as indicated. Align, level, and bolt units to channels to allow easy withdrawal or insertion of removable components and to permit proper operation and maintenance of equipment. When in a Class 1, Division 2 area, mount units at least 18 inches above finished floor.

3.2.2  Wall Mounted

**************************************************************************
NOTE: Wall mount units 5 kW or less. Floor mount all other units.
**************************************************************************
Bracket mount, but otherwise install as required for floor-mounted units.

3.2.3  Maintenance Platform Mounted

**************************************************************************
NOTE: When used, verify drawings identify:
1) An appropriate maintenance platform with safety details including the maintenance envelope.
2) The location of the remote control panel and interconnecting conduit and wiring.
**************************************************************************
Install as required for floor-mounted units.

3.2.4  Grounding and Bonding

In accordance with NFPA 70 and as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

3.2.5  Grounding and Bonding - Exterior Equipment

**************************************************************************
NOTE: When equipment in the project is located outdoors, include the optional grounding and foundation (concrete pad) requirements. Use 25 ohms unless the project requires more stringent requirements.
**************************************************************************
NFPA 70 and IEEE C2, except provide grounding systems with a resistance to solid earth ground not exceeding [25][_____] ohms.

3.2.5.1  Grounding Electrodes

Provide driven ground rods as specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION.
3.2.5.2 Pad-Mounted Equipment Grounding

NOTE: Ensure plans show the pad details and ground connections matching how this paragraph is edited. Converter is to have a ground ring and the normal number of ground rods is two. The one ground rod option should only be chosen if required by local installation requirements.

Provide a ground ring around the equipment pad with 4/0 AWG bare copper. [Provide two ground rods in the ground ring at opposite corners.] [Provide one ground rod in the ground ring with the ground rod located in the equipment cabinet.] Install the ground rods at least 3000 mm 10 feet apart from each other. Provide separate copper grounding conductors and connect them to the ground loop as indicated. When work in addition to that indicated or specified is required to obtain the specified ground resistance, the provision of the contract covering "Changes" applies.

3.2.5.3 Connections

Connect ground conductors to the upper end of ground rods by exothermic weld or compression connector. Provide compression connectors at equipment end of ground conductors. Make joints in grounding conductors and loops by exothermic weld or compression connector. Install exothermic welds and compression connectors as specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION.

3.2.6 Foundation for Equipment and Assemblies

NOTE: Mounting slab connections may have to be given in detail depending on the requirements for the seismic zone in which the requirement is located. Include construction requirements for concrete slab only if slab is not detailed on drawings.

Mount equipment on concrete slab as follows:

a. Unless otherwise indicated, provide the slab with dimensions at least 200 mm 8 inches thick, reinforced with a 152 by 152 mm MW19 by MW19 6 by 6 inches - W2.9 by W2.9 mesh placed uniformly 100 mm 4 inches from the top of the slab.

b. Place slab on a 150 mm 6 inch thick, well-compacted gravel base.

c. Install slab such that top of concrete slab is approximately 100 mm 4 inches above the finished grade with gradual slope for drainage.

d. Provide edges above grade with 15 mm 1/2 inch chamfer.

e. Provide slab of adequate size to project at least 200 mm 8 inches beyond the equipment.

Stub up conduits, with bushings, 50 mm 2 inches into cable wells in the concrete pad. Coordinate dimensions of cable wells with equipment cable.
training areas.

3.2.6.1 Cast-In-Place Concrete

Provide cast-in-place concrete work in accordance with the requirements of Section 03 30 00 CAST-IN-PLACE CONCRETE.

3.2.6.2 Sealing

******************************************************************************
NOTE: Require sealing of cable wells (windows) in the concrete pad if rodent intrusion is a problem.
******************************************************************************

When the installation is complete, seal all entries into the equipment enclosure with an approved sealing method. Provide seals of sufficient strength and durability to protect all energized live parts of the equipment from rodents, insects, or other foreign matter.

3.2.7 Wiring and Conduit

******************************************************************************
NOTE: Designers of Record must provide calculations and derate conductors, circuit breakers (50 Hz / 60 Hz), and devices operating at 400 Hz and at 28 VDC. Do not use ferrous (steel) conduit for 400 Hz wiring.
******************************************************************************

Use of a distributed 400 Hz power system (instead of a Point of Use system), is prohibited on new projects, and is limited to making modifications to existing systems. If used, a distributed system requires additional special calculations to accommodate for unbalance in the system, which may also require the use of the bracketed option for the special 7-conductor, 6 around 1 cable in conduit.

See UFC 3-555-01 (Draft in progress) for additional information.

Provide wiring and conduit as specified in Section 26 20 00, INTERIOR DISTRIBUTION SYSTEM. Use copper conductors [type XHHW, 7-conductor, 6 around 1, twisted] for 400 Hz systems. Use aluminum conduit for exposed 400 Hz feeders. Do not install aluminum conduit underground or encased in concrete. Use aluminum fittings and boxes with aluminum conduit. Use PVC conduit and fittings for underground or concrete encased 400 Hz feeders.

3.2.8 Manufacturer's Representative

The manufacturer's representative must place the system in operation and make necessary adjustments to ensure optimum operation of the equipment. The manufacturer's representative must have at least 2 years of practical experience in the installation and testing of 400 Hz solid state frequency converters.

3.3 FIELD FABRICATED NAMEPLATE MOUNTING

Provide number, location, and letter designation of nameplates as indicated. Fasten nameplates to the device with a minimum of two sheet-metal screws or two rivets.

3.4 WARNING SIGN MOUNTING

Provide the number of signs required to be readable from each accessible side. Space the signs in accordance with NFPA 70E.

3.5 FIELD APPLIED PAINTING

Where field painting of enclosures is required to correct damage to the manufacturer's factory applied coatings, provide manufacturer's recommended coatings and apply in accordance to manufacturer's instructions.

3.6 FIELD QUALITY CONTROL

3.6.1 Field Test Schedule

**NOTE: Include the bracketed options below on Navy projects where "reach-back support" has already been coordinated with NAVAIR / NAVFAC LANT per the third introductory Technical Note at the beginning of this specification section.**

Give Contracting Officer[ and (NAWCAD Air Vehicle Electrical Power Systems Group (AB43) (301) 342-4161]] 30 days notice of dates, times and scheduled tests which require the presence of the Contracting Officer. The
Contracting Officer will coordinate with the using activity[ and NAVAIR / NAVFAC LANT,] and schedule a time that will eliminate or minimize interruptions and interference with the activity operations.

3.6.2 Instruments

Provide test instruments capable of measuring and recording or displaying test data at a higher resolution and greater accuracy than specified for the converter's performance. The test instruments used in the field tests must have current valid calibration stickers issued by an approved calibration laboratory. Verify calibration and adjustments of converter instruments provided prior to field tests. Calibrate instruments for 400 Hz operation when measuring 400 Hz signals.

3.6.3 Initial Inspection and Tests

**************************************************************************
NOTE: Include the bracketed option for the NETA ATS Representative when Section 26 08 00 APPARATUS INSPECTION AND TESTING is included in the project.
Ensure that the list of identified specification sections that the NETA inspector is responsible for includes this section (see bracketed options in Section 26 08 00 APPARATUS INSPECTION AND TESTING).
**************************************************************************

Perform in accordance with the manufacturer's recommendations and include the following visual and mechanical inspections and electrical tests.[ In addition, coordinate with the NETA ATS representative to witness, document, and validate the converter Field Quality Control.]

a. Compare equipment nameplate information with specifications and approved shop drawings.

b. Inspect physical and mechanical condition. Inspect cables and wiring harnesses for damage and strain relief.

c. Inspect all bolted electrical connections for high resistance using low-resistance ohmmeter, verifying tightness of accessible bolted electrical connections by calibrated torque-wrench method, or performing thermographic survey. Perform thermographic survey while the unit is at full load during the loadbank test.

d. Perform specific inspections and mechanical tests as recommended by manufacturer.

e. Verify correct equipment grounding.

3.6.4 Field Performance Checks and Tests

**************************************************************************
NOTE: For the Navy, designers must coordinate with the Activity during the initial design phase. If the Activity has a reactive load bank on base that can be used during the field testing phase of the project, then:
**************************************************************************

1) Include the bracketed option to utilize the base equipment and perform the additional reactive load...
tests in the field.

2) Descriptions of the existing Activity owned loadbank, as well as information on where and how to obtain it, who is responsible to run it, and who has the liability for it, must also be included in the project documents, in Section 01 11 00 SUMMARY OF WORK.

Conduct converter field checks and tests under the supervision of the manufacturer's representative. Provide labor, equipment, test instruments, and incidentals required for the tests including resistive load banks, except the Government will furnish the electricity. For all electrical load tests, use 1.0 power factor unless otherwise noted. As an additional exception, utilize the Government furnished reactive load bank as specified in Section 01 11 00 SUMMARY OF WORK, under paragraph, GOVERNMENT FURNISHED EQUIPMENT, and additionally repeat the routine factory tests that address lagging and leading power factors, in the field.

All tests must be performed with the load connected to the load end of the specified aircraft cable assembly. The cable must be laid out / uncoiled to provide heat dissipation. No adjustment to the converter is allowed between tests. Successfully complete the safety verification, preliminary operation, and the control and protective devices check prior to performing load and transient tests. Load tests must be performed with the converter doors closed. If the converter fails to operate within the specified limits during any of the tests, discontinue the test, make necessary repairs to correct the failure, and restart testing of the converter. Repeat all previously completed tests and document the respective failed test data and new data.

3.6.4.1 Initial Safety Verification

Perform tests and checks to validate the safe and timely shutdown for each condition (for the power source and the output cable) identified in paragraph SAFETY FUNCTIONS. As an exception, a representative fault test will be sufficient at this time.

3.6.4.2 Preliminary Operation

For the Navy: NAVAIR is working on and will provide the requirements for a "digital manual" / type of "Data Acquisition system." All Manufacturers should also already have one of their own. The future goal is to include the standardized requirement as part of the specification so that NAVAIR will have the various manufacturer's equipment information, in a consistent format, submitted and then on file in the NAVAIR Database system for maintenance and problem solving. At that time, we will determine whether it will be possible to include as an attachment / sample in the specification or possibly as a reference to a UFC Appendix.

Inspect the converter and make adjustments necessary to assure proper operation in accordance with the manufacturer's instructions. Operate
converter at 0, 25, 50, 75, and 100 percent of rated full load. On both the input and the output, measure and record the voltage, current, frequency, and THDs (voltage and current) at each load. Calculate output voltage regulation. Verify converter is operating within specified limits at each load level.

Test data must include voltage and current harmonic distortion amplitudes of all individual harmonics presented in a spectrum analysis format up to the 15th order at the 50 percent and 100 percent load points.

3.6.4.3 Control and Protective Device Checks

Operate each control, switch, input/output device that is capable of being operated manually a minimum of three times, demonstrating satisfactory operation each time. Perform operation test on each protective device to ensure that devices function properly. After each operation measure and record the converter output frequency, voltage and current. Verify converter is operating within specified limits.

3.6.4.4 Load (Burn-in) Test

**************************************************************************
NOTE: Include the bracketed option "For converters used ..." only when one of the frequency converters, on a multi converter project, will not be connected to the aircraft cable assembly when in service; e.g. used in a lab setting instead.

In the rare condition, where there is only the one converter in a lab setting, then delete the entire sentence before the bracketed option as well.
**************************************************************************

Operate each unit continuously a minimum of 1 hour at 100 percent rated full load. Measure and record the converter output frequency, voltage and current at beginning, 30 minutes, and 1 hour. Verify converter is operating within specified limits. Load test must be performed with the converter doors closed and the test load connected to the converter at the cable head with specified aircraft cable assembly. [For converters used to supply test bench loads, perform load tests with the converter doors closed at the output of the converter.]

3.6.4.5 Post Load Test Verification

Repeat tests identified in paragraph PRELIMINARY OPERATION, to validate converter was not affected by the Load test. However apply loads in the reverse order (e.g. 100, 75, 50, 25, and 0 percent of the rated full load).

Conduct tests on each converter with the load connected to the load end of the specified aircraft power cable assembly. No adjustment to the converter is allowed between load tests. Monitor and record output voltage at the load end of the cable. Verify specified performance of the converter including the line drop compensation.

3.6.4.6 Final Safety Verification

Repeat tests conducted under paragraph INITIAL SAFETY VERIFICATION to confirm safety features were not affected by previous tests.
3.6.5 Grounding System

Inspect grounding system for compliance with contract plans and specifications.

3.7 DEMONSTRATION

3.7.1 Instructing Government Personnel

**************************************************************************
NOTE: For Navy: Include bracketed option requiring coordination with NAVAIR and coordination with Activity on availability of aircraft for conducting training.
**************************************************************************

Provide field training to Government personnel on the operation and maintenance of the converter provided at the same time as the Field Acceptance Testing.[ For Navy projects contact NAWCAD Air Vehicle Electrical Power Systems Group (AB43) at (301) 342-4161 to obtain the name and e-mail of the NAVAIR point-of-contact so they can attend the training. Coordinate with the Activity to establish availability and non-availability to train on actual aircraft.] Include up to a maximum of 2 hours of instruction on operation and up to a maximum of 4 hours of repair and maintenance of the converters. The instructor must be approved by the manufacturer of the unit provided. Submit training syllabus including each topic of training and a brief outline of each topic to the Contracting Officer at least 4 weeks prior to training for approval.

Training must be approved by the Contracting Officer at least 2 weeks in advance. The Government may record, video and audio, the training sessions and use these recordings to train personnel on the operation and maintenance of the converter system. Provide two copies of video or audio DVDs, and of any supplemental information and examples covered in the training sessions, to the Contracting Officer.

ATTACHMENTS:

Figure 263544-1: Transient Voltage Recovery Limits for 270 VDC

Figure 263544-2: Transient Voltage Recovery Limits for 28 VDC

-- End of Section Table of Contents --
NOTE: This guide specification has been specifically limited to cover the requirements for the procurement, installation, and testing of 72 kW, 270 VDC solid state converters.

For Navy projects, the use of any other size converter is no longer authorized. If a different size unit is required for a specific project, contact NAVFAC Atlantic (LANT), Code DC 44 - Electrical Criteria Manager at (757) 322-4327 for authorization, and for the additional requirements necessary to appropriately modify this specification.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: These converters are used to supply 270 VDC and limited amounts of 28 VDC electrical power to aircraft in shore facility environments. Typical applications include aircraft operating in flight line conditions or in hangars, avionics shops, laboratories, training buildings, flight simulators, and computer rooms.
This specification is not to be used for procurement of power converters installed on board aircraft or ships without specific authorization from Naval Air Warfare Center Aircraft Division (NAWCAD Power and Energy Division (AB43) at (301) 342-4161), and from the Naval Sea Warfare Command (contact the Technical Warrant Officer for the appropriate ship classification).

This specification is not intended for medium-voltage applications.

**************************************************************************

NOTE: For Navy projects, incorporate the special SUBMITTAL REVIEW PROCESS paragraph in the SUBMITTALS section. Coordinate with NAVAIR, NAVFAC, and the Activity to see whether the "review and approval", or the "surveillance only" options are required.

1) If "review and approval" (reach-back support) is desired, for a specific NAVFAC project, the technical representative (electrical engineer) editing this document for that project must contact NAVFAC LANT for consultation during the design stage of the project, prior to including the requirement in the specification. Point of Contact (POC) information is included in the first introductory technical note.

2) If "surveillance only" is agreed to, it requires the submittal information to be sent to NAVAIR and NAVFAC LANT for review and comment at the same time as the information is being sent to the Designer of Record for Review and Approval. The surveillance mode would give NAVAIR or NAVFAC LANT the opportunity to confirm compliance, without inadvertently holding up the project if the appropriate personnel are not available to do the review in a timely manner.

The Electrical Designer of Record must also insure that the Division 1, Section 01 33 00 SUBMITTAL PROCEDURES, paragraphs FORWARDING SUBMITTALS REQUIRING GOVERNMENT APPROVAL and SUBMITTALS RESERVED FOR NAVFAC [_____] APPROVAL of the project document are edited to identify the agreed upon special process.

**************************************************************************

NOTE: Coordination is required between this section and the project power systems study to determine which of the standardized Arc Flash Warning labels are required on the equipment. These labels (Graphics) are available in metric (SI) and U.S. Customary (IP) system dimensions. Use these files to develop project specific drawings.
NOTE: To download UFGS Forms, Graphics, and Tables, go to: https://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/forms-graphics-tables

Go to the specification section number, select the appropriate Electrical.ZIP file(s) and extract the desired details.

Do not include the Arc Flash Warning Labels in the project specifications. Insert the appropriate details on drawings and modify optional and blank items.

**************************************************************************
**************************************************************************

NOTE: To the Project Specification Editors: The following two Attachments are included with the pdf version of this specification section and are referenced several times.

<table>
<thead>
<tr>
<th>File Name</th>
<th>Description</th>
<th>Rev</th>
</tr>
</thead>
<tbody>
<tr>
<td>Figure 263544-1</td>
<td>Transient Voltage Recovery Limits for 270 VDC</td>
<td>07 26 21</td>
</tr>
<tr>
<td>Figure 263544-2</td>
<td>Transient Voltage Recovery Limits for 28 VDC</td>
<td>07 26 21</td>
</tr>
</tbody>
</table>

When developing your final project documents, you must download and attach the pdf versions of both figures to the end of this edited Section 26 35 44 270 VDC SOLID STATE CONVERTER.

NOTE: To download UFGS Forms, Graphics, and Tables, go to: https://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/forms-graphics-tables

Go to the specification section number, select Figure 263544 -1 and Figure 263544-2 and download.

**************************************************************************
**************************************************************************

NOTE: The following information must be shown on the project drawings:

1. Show location of all equipment including converter, paralleling controls when required, and remote monitoring and control panels.

2. Provide functional block diagram, single line diagrams, power, and control wiring interconnection diagrams, wiring diagrams, conduit entry diagrams, equipment elevations, maintenance envelope, limiting dimensions, and equipment ratings which are not covered in the specifications.
3. Design equipment rooms with working spaces as required by NFPA 70 and manufacturers extra limitations. Provide ventilation for equipment rooms based on converter components heat load generated when operating at 100 percent load. Provide 60 Hz convenience receptacles.

**************************************************************************
NOTE: Ensure that the 270 VDC distribution systems are properly coordinated including the ratings of the power cables, ground cables, circuit breakers, transformers, filters, rectifiers, and control equipment. Provide calculations in Basis of Design per UFC 3-501-01, Electrical Engineering, including voltage drops, which can be critical in DC systems.
**************************************************************************

PART 1   GENERAL

1.1 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

[1.2 RELATED REQUIREMENTS

**************************************************************************
NOTE: Include this optional reference to Section 26 08 00 APPARATUS INSPECTION AND TESTING when it is already being used and referred to for other electrical equipment on the project. Coordinate with optional paragraph in PART 3.

Coordinate converter equipment with Government's cybersecurity requirements and interpretations. Include this optional reference to Section 25 05 11 CYBERSECURITY FOR FACILITY-RELATED CONTROL SYSTEMS if the 270 VDC system includes remote control or remote access capability.

**************************************************************************

Section [26 08 00 APPARATUS INSPECTION AND TESTING] [and 25 05 11 CYBERSECURITY FOR FACILITY-RELATED CONTROL SYSTEMS] applies to this section, with the additions and modifications specified herein.

]1.3 DEFINITIONS

Unless otherwise specified or indicated, electrical and electronics terms used in these specifications, and on the drawings, must be as defined in IEEE 100.

1.4 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal
items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

******************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

******************************************************************************

NOTE: Ensure the optional bracketed "Remote Monitoring and Control Panel" is not included when that equipment is not included in the body of the specification.

NOTE: On Navy projects, include at least one of the bracketed options below. The first option is for surveillance only, and the second option is for complete approval where "reach-back support" has already been coordinated with either NAVAIR or NAVFAC LANT per the third introductory Technical Note. Add the appropriate information in Section 01 33 00 SUBMITTAL PROCEDURES to coordinate with the special requirements.
**************************************************************************
[1.4.1 Government Submittal Review

[NAWCAD Air Vehicle Electrical Power Systems Group (AB43), (301) 342-4161
[and Code DC 44, NAVFAC LANT, Naval Facilities Engineering Command] will
provide surveillance. If they have comments or concerns, they will contact
and coordinate resolution of their comments with the appropriate approving
agent.

][(NAWCAD Air Vehicle Electrical Power Systems Group (AB43), (301)
342-4161)[Code DC 44, NAVFAC LANT, Naval Facilities Engineering
Command][_____] will review and approve all submittals in this section
requiring Government approval.

]1.5 QUALITY ASSURANCE

1.5.1 Regulatory Requirements

In each of the publications referred to herein, consider the advisory
provisions to be mandatory, as though the word, "must" had been substituted
for "should" wherever it appears. Interpret references in these
publications to the "authority having jurisdiction," or words of similar
meaning, to mean the Contracting Officer. Equipment, materials,
installation, and workmanship must be in accordance with the mandatory
and advisory provisions of NFPA 70 unless more stringent requirements are
specified or indicated.

1.5.2 Standard Products

Provide materials and equipment that are products of manufacturers
regularly engaged in the production of such products which are of equal
material, design and workmanship. Products must have been in satisfactory
commercial or industrial use for 5 years prior to bid opening. The 5-year
period must include applications of equipment and materials under similar
circumstances and of similar size. The product must have been on sale on
the commercial market through advertisements, manufacturers' catalogs, or
brochures during the 5-year period. Where two or more items of the same
class of equipment are required, these items must be products of a single
manufacturer; however, the component parts of the item need not be the
products of the same manufacturer unless stated in this section.

1.5.2.1 Alternative Qualifications

Products having less than a 5-year field service record will be acceptable
if a certified record of satisfactory field operation for not less than
6000 hours, exclusive of the manufacturers' factory or laboratory tests, is
furnished.

1.5.2.2 Material and Equipment Manufacturing Date

Products manufactured more than 1 year prior to date of delivery to site
must not be used, unless specified otherwise.

1.5.3 Converter Drawings

*****************************************************************
NOTE: Provide a detail on the drawings that
identifies the location, mounting and permitted
maintenance access areas for each converter.

******************************************************************
For Navy projects, include the bracketed options that require surface mounting against the wall, and prohibits rear access to converter.

Furnish scaled drawings of enclosure outline including front, top, side views, and overall dimensions. Include "maintenance envelope" dimensions confirming space limitations identified on the drawings, and surface mounting flush against the wall. Rear access for maintenance and repair purposes is prohibited. The "maintenance envelope" drawings must also indicate adequate clearance for operation, maintenance, and replacement of operating equipment devices. Provide external power and control wiring, cabling, connector, and backplane interconnect drawings. Provide single line, schematic, and wiring diagrams. Drawings must include details of input and output circuit breakers, contactors, rectifiers, surge protectors, control devices and conduit entry and exit locations. If parallel operation is included, provide an interconnection diagram. Submittals must include the nameplate data, size, and capacity.

1.5.4 Qualifications of Manufacturer

NOTE: The experience clause in this section has been approved by a Level I Contracting Officer in accordance with the requirements of Naval Facilities Acquisition Supplement (NFAS). NFAS can be found at the following link:

https://www.navfac.navy.mil/products_and_services/sb/opportunities/guidelines/navfac.html

This clause may be used without further approval or request for waiver.

Submit a certification stating that the manufacturer has a minimum of five years' experience in the design, manufacturing, and testing of a 270 VDC solid state converter at the equivalent or greater kW and voltage ratings for direct connection to aircraft electrical loads. When specifications require multiple converters operating in parallel, the manufacturer must provide specific experience with equal or greater kW rated converters.

Experience in manufacturing motor generator sets does not qualify as equivalent. Experience in manufacturing portable engine-driven 28 VDC power units does not qualify as equivalent. The manufacturer must be experienced in producing units for installation in permanent buildings, in environmentally closed spaces, or in weatherproof enclosures as applicable. The manufacturer must furnish documented experience with converters in various environmental conditions including exterior flight line, hangar, and environmentally enclosed spaces within buildings.

1.5.5 Work Plan

Submit a written work plan with the initial shop drawing submittal, which consists of a schedule of dates of the routine and special factory tests, installation of equipment, field tests, and operator training for the system. Furnish a list of the test instrumentation equipment complete with the documented calibration program, for the factory and the field tests.
1.5.6 **Routine Factory Test Plan**

**************************************************************************
NOTE: Coordinate calendar day requirements with Activity and with special review requirements.
**************************************************************************

Submit test plan and procedures at least \([21][_____]\) calendar days prior to the tests being conducted. Provide detailed description of test procedures, including test equipment and setups complete with their current calibration dates, to be used to ensure the converter meets this specification and explain the test methods used. As a minimum, include the tests required under the paragraph ROUTINE FACTORY TESTS.

1.5.7 **Special Factory Test Plan**

Submit the Special Factory Test Plan and procedures with the Routine Factory Test Plan. Provide detailed description of test procedures, including test equipment and setups complete with their calibration dates, to be used to ensure the converter meets this specification and explain the test methods used. As a minimum, include the tests required under the paragraph SPECIAL FACTORY TESTS.

1.5.8 **Field Test Plan**

**************************************************************************
NOTE: Coordinate calendar day requirements with Activity and with special review requirements. For Navy projects, use 30 days to coordinate with NAVAIR requirement to have time to arrange attendance.
**************************************************************************

Submit test plan and procedures at least \([30][15][_____]\) calendar days prior to the start of field tests. Provide detailed description and dates and times scheduled for performance of tests, and detailed description of test procedures, including test equipment and setups of the tests to be conducted to ensure the system meets this specification. List make, model, and current calibration dates, and provide functional description of the test instruments and accessories. Explain the test methods to be used. As a minimum, include the tests required under the paragraph FIELD QUALITY CONTROL. Test reports must include power quality measurement data collected in accordance with IEEE 1159.

1.5.9 **Nationally Recognized Testing Laboratory (NRTL) Listing**

270 VDC converters must be identified with a nationally recognized testing laboratory (NRTL) label or UL label prior to shipping.

1.5.9.1 **Currently Listed Products**

Submit NRTL or UL certification or UL file number for the actual converter to be shipped with the initial submittal to verify compliance of equipment.

1.5.9.2 **Proposed Listed Products**

Submit NRTL or UL certification or UL file number for same or similar rating or product size range of like design unit with the initial submittal to verify compliance of equipment.
1.5.10  **Routine Factory Tests Certification**

**************************************************************************

NOTE: Coordinate calendar day requirements with Activity and with special review requirements.
**************************************************************************

Submit within [45] [_____] calendar days after completion of tests. Receive approval of test prior to shipping unit. Certify tests were conducted on each converter in accordance with the requirements set forth in paragraph ROUTINE FACTORY TESTS and certify converter satisfactorily operated within specified limits. Include copies of the test procedures, test configuration diagrams and schematics, test data, and results.

1.5.11  **Special Factory Tests Certification**

Certify tests were conducted on a converter of the same design, construction, kw rating, and voltage rating to be provided. Tests must be in accordance with the requirements set forth in paragraph SPECIAL FACTORY TEST and certify converter operated without malfunctioning within specified limits. Include copies of the test procedures, test configuration diagrams and schematics, test data, and results.

1.5.12  **Field Test Certification**

**************************************************************************

NOTE: Coordinate calendar day requirements with Activity and with special review requirements.
**************************************************************************

Submit report of test results as specified by paragraph FIELD QUALITY CONTROL within [15] [_____] calendar days after completion of tests. Certify tests were conducted on each converter in accordance with the paragraph FIELD QUALITY CONTROL and certify converter satisfactorily operated within specified limits. Include copies of the test procedures, test configuration diagrams and schematics, test data, and results.

1.6  **OPERATION AND MAINTENANCE MANUALS**

Submit converter Operation and Maintenance Manuals (O&MM) in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

1.6.1  **Additions to Converter O&MM**

**************************************************************************

NOTE: Include the paralleling bracketed option when paralleling has been included as a requirement of the equipment.
**************************************************************************

In addition to requirements of Data Package 5, include the following on the actual converter provided:

a. A "one-line diagram" from the building service entrance panel to the converter and out to the end utilization point(s).

b. A concise, duplicatable, single page data sheet with operating instructions for each unit including startup[, paralleling,] and shutdown procedures.
c. Routine and field test reports.

d. NRTL or UL certification or UL file number.

e. A list of all code required identification and warning signage and labels that have been provided on the converter.

1.6.2 Preliminary Converter O&MM

Prior to scheduling Field Tests, two bound copies of a Preliminary O&MM must be submitted to and approved by the Contracting Officer.

1.6.3 Spare Parts Information

Furnish recommended manufacturer's spare parts list, quantities, lead time to receive after ordering, and a schedule of prices, (guaranteed for one year after warranty expires), for each type of converter and other equipment specified in this section. Include the following:

a. Fuses

b. Human Machine Interface (HMI)

c. Indicator lamp/LED

d. Output switching modules

e. Plug-in logic cards

f. Power filter capacitors

g. Power semi-conductors

h. Ventilation system filters

i. 270 VDC Aircraft Power Cable Assembly

j. 28 VDC Aircraft Power Cable Assembly

1.7 WARRANTY

The equipment items must be supported by service organizations which are most convenient to the equipment installation in order to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

PART 2 PRODUCTS

2.1 270 VDC CONVERTER

***************************************************************************
NOTE: Do NOT edit this paragraph to specify the internal architecture of the converter (e.g. type of power supply, rectifier type or switching technology to be utilized). Specifying this type of technology may make this a sole source specification which requires justification and approval per federal
contract law.

For the options: Choose 50 or 60 Hz based on the exterior power distribution system at the project location. Choose 24,000 for the MTBF unless the project has documented, more stringent requirements.

Provide converter consisting of modular construction solid-state components for [50][60] Hz to 270 VDC conversion, input/output devices, and ancillary control devices. Converter must be a standard product of the manufacturer and the manufacturer's latest design that complies with the specification requirements. The converters provided under this contract must be products of the same manufacturer. Each unit must have a calculated Mean Time Between Failures (MTBF) exceeding [24,000][_____] hours as calculated when the converter is provided with yearly servicing and maintenance. Provide converter with NRTL or UL listing complying with UL 1012. The converter must have minimum 12 pulse, active input rectification circuit or a demonstrated design achieving equal or better performance characteristics. Circuit breakers operating at 270 VDC and 28 VDC must be designed and UL tested for [50][60] Hz operation [and derated] for the applicable VDC operation, as appropriate. Provide startup and shutdown instructions posted on the front of the unit using engraved plastic or aluminum plate. Provide a plastic encapsulated schematic diagram attached to the inside of the unit in clear view of maintenance personnel.

2.1.1 Electrical Characteristics

The 270 VDC output and the associated 28 VDC Interlock voltage, measured at the aircraft end of the servicing cable, must be in accordance with MIL-STD-704, must be controlled to the voltage regulation requirements within this document throughout all loadings defined, and must comply with the additional modifications identified herein.

2.1.1.1 Input Voltage

NOTE: Using input voltage other than 480 volts (US) or 380 volts (European) will increase the cost and weight and decrease the efficiency of the converter. Show input voltage on the construction drawings.

Choose 60 or 50 Hz based on the exterior power distribution system at the project location. Choose 10 percent voltage variation unless specific project documents require a higher percentage input variation to be permitted.

A voltage changing transformer is not permitted at the input of the converter unit on any new facilities. Adding a voltage changing transformer at the input is only permitted in the rare case when retrofitting an existing facility and there is no other voltage available. In this exception, remove the last sentence in the section below.

[480][380][_____] V, three phase, three wire, grounded, [60][50] Hz.
Converter must provide rated output voltage when input voltage is varied plus or minus [10][_____] percent. A voltage changing transformer is not permitted at the input of the converter unit.

2.1.1.2 Input Power Factor

Between 0.8 lagging and unity, under all conditions of steady state line and load variations specified herein.

2.1.1.3 Surge Protection

**************************************************************************
NOTE: Select Location Category C for outdoor locations only.
**************************************************************************

Provide converter capable of sustaining an input surge described in and tested in accordance with UL 1449, and IEEE C62.41.1 and IEEE C62.41.2, Location Category [B][C], and continue to operate with no alarms within the specified tolerance.

2.1.1.4 Inrush Current

The inrush current must not exceed 100 percent of the rated full load input current.

2.1.1.5 Input Current Distortion

**************************************************************************
NOTE: Where total connected converter load is a small percentage (less than 40 percent) of the total connected facility load, use 12 percent Total Harmonic Distortion (THD) and 8 percent individual. For large converters (e.g. 312 kW or larger) or where total connected converter load is a significant percentage of the total connected facility load, use 5 percent THD and 3 percent individual.

For installation in shipboard environments using Type 1 power (60 hertz per MIL-Std-1399-300, Part 1 (2018) Low Voltage Electric Power, Alternating Current), use 5 percent THD and 3 percent individual.

Note that per NAVAIR request, the converter Special Tests paragraph requires data to be provided at the 25, 50, 75 and 100 percent load points. This is intentionally more stringent than the "full load" requirement below, and is intended for data acquisition only. It will be used to help develop a resolution to known field problems.
**************************************************************************

Input current Total Harmonic Distortion (THD) must not exceed [12][5] percent of the fundamental frequency with nominal input voltage at full load. Individual harmonic content must not exceed [8][3] percent of the fundamental frequency.
2.1.1.6 Output Voltage

As an exception to the requirements of MIL-STD-704, the 270 VDC converter must simultaneously provide and regulate (when measured at the cable head) to the following steady state voltage limits:

a. 270 VDC (plus or minus 3 VDC).

b. 28 VDC (plus 1 VDC or minus 2 VDC).

2.1.1.7 Power Output

The 270 VDC converter must have a power output rating of:

a. 270 VDC: 267 amperes (72 kW) with overload / transient capability as defined herein.

b. 28 VDC: 15 amperes (0.42 kW) with overload / transient capability as defined herein.

2.1.1.8 Load Range

The 270 VDC converter must be capable of meeting the following load ranges:

a. 270 VDC: 0 to 72 kW of any combination of resistive and constant power loads with overload / transient capability as defined herein, in parallel with up to 2,500 microfarads of capacitance, with a minimum current demand rate of 200 Amperes per millisecond.

b. 28 VDC: 0 to 0.42 kW of any combination of resistive and constant power loads with overload / transient capability as defined herein, in parallel with up to 100 microfarads of capacitance, with a minimum current demand rate of 60 Amperes per millisecond.

2.1.1.9 Efficiency

******************************************************************************
NOTE: For the Navy, the use of any size converter other than 72 kW is no longer authorized. If a different size is required for a specific project, contact NAVFAC LANT for approval and for the appropriate efficiency modifications. The POC information is located at the beginning of this specification.
******************************************************************************

Provide 72 kW units with a minimum efficiency of 89 percent at 50 percent load and 92 percent at 100 percent load.

2.1.1.10 No Load Input Losses

Provide converter with no-load input losses no greater than 7 percent of the output kW rating.

2.1.1.11 Overload

The converter outputs, both 270 VDC and 28 VDC, must have overload capabilities in accordance with the following table. The satisfactory overload operating time is based on no more than one overload of the same
or longer conditions, within the following specified time between overloads.

<table>
<thead>
<tr>
<th>Percent of Full Load (Rated Output)</th>
<th>Satisfactory Operating Time</th>
<th>Time Between Overloads</th>
</tr>
</thead>
<tbody>
<tr>
<td>110 percent</td>
<td>30 minutes</td>
<td>2 hours</td>
</tr>
<tr>
<td>Note: Unit must still be capable of withstanding any of the other conditions for their respective operating times. e.g. Unit can still do 150 percent for less than 10 seconds, before tripping, etc.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>125 percent</td>
<td>5 minutes</td>
<td>10 minutes</td>
</tr>
<tr>
<td>150 percent</td>
<td>10 seconds</td>
<td>10 minutes</td>
</tr>
<tr>
<td>200 percent</td>
<td>2 seconds</td>
<td>5 minutes</td>
</tr>
<tr>
<td>250 percent</td>
<td>100 milliseconds</td>
<td>5 minutes</td>
</tr>
</tbody>
</table>

After minimum operating time is achieved, unit must interrupt output power. Unit must be capable of sustaining the overload without damage until the protective device interrupts the overload.

2.1.1.12 Short Circuit

When a bolted positive to negative fault is applied to the unit, unit must be capable of sustaining the short circuit current without damage until the protective device interrupts the fault. The output transient voltage recovery time and thresholds are more stringent than those required by MIL-STD-704, and must comply with the following:

a. During a bolted fault the current output must be regulated between 485 and 550 Amps for 5 seconds. If the fault condition clears in less than 5 seconds, the power source must recover to the voltage range of 250 to 280 volts within 40 milliseconds, and then settling out to the regulated voltage levels of 270 VDC (plus or minus 3 VDC) within 10 milliseconds, as shown in Figure 263544-1: Transient Voltage Recovery Limits for 270 VDC.

b. During this 270 VDC bolted fault condition, as well as for any high di/dt load or overload condition (e.g. over voltage, over current, under voltage, ripple), the 28 VDC interlock power output must not be disrupted and power quality must remain as defined in Figure 263544-2: Transient Voltage Recovery Limits for 28 VDC, throughout the fault isolation event.

2.1.1.13 Ripple Amplitude

Ripple amplitude is the maximum absolute value of the difference between the steady state and the instantaneous DC voltage. The maximum allowable ripple amplitude for the 270 VDC output is more stringent than what is required by MIL-STD-704. The maximum allowable ripple amplitude for the 28
VDC output must be in accordance with MIL-STD-704. These must comply with the following:

a. 270 VDC output: 1.5V (peak to mean).

b. 28 VDC output: 1.5V (peak to mean).

2.1.1.14 Distortion Spectrum

The converter output distortion spectrum must meet the following requirements:

a. 270 VDC: MIL-STD-704 Figure 18, inclusive of the fundamental voltage ripple component.

b. 28 VDC: MIL-STD-704 Figure 15.

2.1.1.15 Distortion Factor

The DC distortion factor is the ratio of the DC distortion to the DC steady state voltage. The maximum allowable distortion factor for the 270 VDC converter must be as follows per Table IV of MIL-STD-704:

a. 270 VDC output: 0.015.

b. 28 VDC output: 0.035.

2.1.1.16 Transient Output Voltage Recovery

The transient output voltage recovery time and thresholds are more stringent than those required by MIL-STD-704. Monitor and record output voltage at the load end of the cable. Comply with the following:

a. The 270 VDC output must remain within the range of 220 to 330 VDC for any step load change as defined in paragraph LOAD RANGE herein.

b. The 270 VDC output must begin recovery from the worst case transient excursion within 10 milliseconds and must be recovered to within the steady-state operating range specified in paragraph OUTPUT VOLTAGE within 40 milliseconds per Figure 263544-1: Transient Voltage Recovery Limits for 270 VDC.

c. The 28 VDC output must remain within a range of 26 to 40 VDC for any step load change as defined in paragraph LOAD RANGE herein. The voltage must not drop below 26 VDC for more than 50 microseconds.

d. The 28 VDC output must begin recovery from the worst case transient excursion within 15 milliseconds and must be recovered to within the steady-state operating range specified in paragraph OUTPUT VOLTAGE within 100 milliseconds per Figure 263544-2: Transient Voltage Recovery Limits for 28 VDC.

2.1.2 Environmental Rating

*********************************************************************************************************************************************

NOTE: Select 55 degrees C 130 degrees F for the ambient temperature rating unless in areas subject to extreme temperatures (e.g. Middle East and desert environments.). Use 0-95 percent relative humidity
unless extreme condensation such as in a jungle climate.

Use **915 meters 3000 feet** level unless location of installation will be at higher elevations.

The converter must be rated for continuous operation from no load to rated full load under the following conditions:

a. Ambient temperatures ranging from -20 to [55][60][65] degrees C. -4 to [130][140][150] degrees F.

b. Relative humidity from [0 to 95] [_____] percent noncondensing.

c. Ambient pressures from sea level to [915] [_____] meters [3,000] [_____] feet.

### 2.1.3 Monitoring and Control Panel

Provide converter with a control panel that is equipped with the following controls, indicators, instrumentation, data logging, diagnostics, and alarm functions.

#### 2.1.3.1 Controls

Controls must be mounted on the front of the control panel, accessible without opening any doors or covers. Specific sequencing, or the requirement for simultaneous pushbutton operation, is not acceptable for any input or output control.

#### NOTE: Include the remote control panel option when unit is platform mounted or located out of sight of aircraft.

a. Start/stop pushbutton for input device control (circuit breaker or contactor).

b. Lamp/light emitting diode (LED) test - A push-to-test button or switch to test indicator lamps/LEDs. If panel lights all blink as part of the startup Built-in-Test (BIT) sequence, then a separate push to test button is not required.

c. Emergency power off - A separate pushbutton for emergency power off.

d. Output device ON/OFF.

e. Alarm silence and "silence" indicator - A switch that must disable the audible alarm without clearing the alarm codes.

f. Additional individual controls for the following functions (Note - these may be included as part of the Human-Machine Interface (HMI) as described in paragraph HUMAN MACHINE INTERFACE REQUIREMENTS):

   - Output voltage adjust
   - Alarm reset - resets and clears the silenced audible alarm.
2.1.3.2 Indicators

a. The following are mandatory indicators. They must be included on the control panel on the exterior of the unit[, and on the exterior of the remote control panel] in addition to any that are included in the HMI:

- Input power available - Lamp/LED to indicate that the supply voltage is available.
- Output power On/Off - Lamp/LED to indicate that the converter output voltage is available.
- Output device "ON".
- Audible alarm.
- Aircraft interlock bypass - Lamp/LED to indicate that the Aircraft Interlock has been bypassed.

b. In addition, include the following additional indicators, if they are not included in the HMI:

- System alarm - Lamp/LED to indicate that a fault has been detected. This indicator must be latched in the "ON" position whenever an alarm condition described in paragraph ALARM ANNUNCIATOR, is detected and must remain "ON" until the alarm reset pushbutton is pressed.
- Indicating lamp/LED to indicate that the alarm silence switch is in the disable position.
- Elapsed time meter in hours; (may be internal or visible externally).

2.1.3.3 Human Machine Interface (HMI) Requirements

Provide an HMI with a minimum of four by twenty (4 x 20) character backlit LED display for presenting the digital instrumentation, diagnostic system, and fault indicating system data. The HMI display must be viewable in direct sunlight and the HMI must be rated for harsh environments.

a. Digital Instrumentation. Provide true RMS, plus/minus one percent accuracy, microprocessor-based readings that include the following functions:

(1) Output voltage.
(2) Output current.
(3) Inverter temperature. This function is desired for field diagnostics, but is not mandatory.

b. Alarm Annunciator. The unit must be capable of detecting and displaying the following abnormal conditions:

(1) Input overvoltage.
(2) Input undervoltage.
(3) Output undervoltage.
(4) Output overvoltage.
(5) Output overload.
(6) System alarm.
(7) Control logic failure.
(8) Over-temperature.
(9) Logic power supply failure.

2.1.4 Input/Output Devices

**************************************************************************
NOTE: Coordinate 50 Hz vs 60 Hz requirement with Activity. Provide appropriate short circuit ratings in accordance with Basis of Design Calculations per UFC 3-501-01, Electrical Engineering.
**************************************************************************

Provide fully-rated, UL approved devices for control of [60][50] Hz input and for control of DC outputs from the converter. Derate devices and cables operating at 270 VDC in accordance with IEEE 519.

2.1.4.1 Input Device

Provide converter with a UL listed input device (circuit breaker conforming to requirements of UL 489 or contactor) as an integral part of the converter. Device must be operable from the front of the converter. Device must have a short-circuit current rating of [_____] amperes symmetrical minimum.

2.1.4.2 Output Contactor

**************************************************************************
NOTE: Include option for IEC on Oconus projects.
**************************************************************************

Provide converter output with an automatic magnetically-held contactor with interlock circuit. Output contactor must have sufficient capacity to handle rated load, overload, and available short circuit current. Contactor must additionally be rated for make / break operation into a 2,500 microfarads capacitance without damage to the converter.

Contactor must open when any circuit identified in the paragraph SAFETY FUNCTIONS causes the system to shut down. Electrically interlock contactor with ON/OFF circuitry so that when the converter is shut down, the contactor opens immediately and remains open.[ Conform to the requirements of IEC 60947-4-1.]

[2.1.4.3 Output Circuit Breaker

**************************************************************************
NOTE: Only add an output circuit breaker, (and delete the OUTPUT CONTACTOR paragraph above), if the converter is supplying a downstream distribution panelboard (such as in a shop or laboratory), or

SECTION 26 35 44 Page 24
multiple outputs with distribution internal to the converter.

**************************************************************************

Provide converter output(s) with non-automatic manual circuit breaker(s), with appropriate frame size and a shunt trip coil rated for DC operation. Trip circuit breaker by the unit's OFF circuit [local or remotely activated] and when any circuit identified in the paragraph SAFETY FUNCTIONS causes the system to shut down. Output breaker(s) must be operable from the front of the unit.

2.1.4.4 Aircraft Interlock Circuit

The 270 VDC output power contactors must be interlocked with the unit's fault indicators, alarms, and the 28 VDC interlock power circuit. When the 28 VDC interlock power source is "broken" (e.g. when the power cord is removed from the aircraft receptacle), the 270 VDC output power source must be disabled.

2.1.5 Safety Functions

2.1.5.1 270 VDC Power Source

The 270 VDC power source internal 270 VDC buss must automatically discharge to below 12 VDC within 2 seconds after the following:

a. 270 VDC power source has been turned off.

b. Whenever any access panel is opened on the equipment. Under this condition, the interlock circuitry must open the input device and the 270 VDC output device, and not allow the input or output device to close. For maintenance purposes, provide an internal bypass switch to defeat the interlock circuitry.

c. Detection of system fault that results in a converter shut down condition, including the following:

   (1) Input undervoltage.

   (2) Input overvoltage.

   (3) Loss of input phase.

   (4) Loss of input power.

2.1.5.2 270 VDC Output Cable

The 270 VDC power must be removed from the output cable within 100 milliseconds after one of the following occurs:

a. Receiving a stop command.

b. Loss of 28 VDC interlock power.

c. Detection of a fault that results in an output shut down, including the following:

   (1) Output overvoltage - Protect by tripping output devices for instantaneous overvoltage of 30 percent or more and for 10 to 30
percent overvoltage lasting more than 0.25 seconds.

(2) Output undervoltage - Protect by preventing the closing of the output disconnect until the output voltage is 95 percent of the rated output. If, after closing, the voltage decreases to below 90 percent for longer than 5 seconds, provide relaying to trip output devices utilizing a field-adjustable time-delayed circuit with a range of 4 to 10 seconds.

(3) Output overload.

(4) Converter overtemperature protection.

2.1.6 Automatic Line Drop Compensation

Provide automatic line drop compensation (ALDC) from zero to ten percent adjustable internally. Separate ALDC functions are required for the 270 VDC power source and for the 28 VDC interlock power source.

[2.1.7 Auto Restart

**************************************************************************
NOTE: Auto restart should be considered when the converter is installed in a remote location that is not readily accessible to operating personnel and maintaining 270 VDC power is critical to operations. Use of auto restart should be studied carefully to ensure that it does not create a potential personnel safety hazard.

This is an additional cost item and should not be specified unless specifically requested by the user.
**************************************************************************

After a total input power outage the unit must be capable of automatically restarting and re-energizing loads upon restoration of normal power. Provide units with a manual/auto restart switch and with backup battery power supply if it is needed to meet the auto restart requirement. When interlock circuit has been interrupted or when interlock is in the maintenance position (manual restart), the system should not restart.

][2.1.8 Built-In Test Equipment

**************************************************************************
NOTE: Built-in test equipment (BIT) should be considered when the converter is installed in a remote location that is not readily accessible to operating personnel and maintaining 270 VDC power is critical to operations. It may also be needed when high reliability is a defined concern.

This may be an additional cost item and although some manufacturers include it at no cost, it should not be required unless specifically requested by the user.
**************************************************************************

Converter must include Built-in test equipment (BIT), which monitors both primary circuits and protection circuits of the unit. Provide visual
indication to assist diagnosis of unit failures to a modular level. Provide visual indication of converter status using cabinet mounted light emitting diodes and Human Machine Interface (HMI). As a minimum the indicator lights must include a "machine on" light, and an "output faulted" indicator light that comes on when the unit has shut down.

2.1.9 Magnetic Components

**************************************************************************
NOTE: Magnetic components are used within the converter unit. Do not delete this information. It is not included to imply permission to utilize transformers for modifying the input voltages to the converter.
**************************************************************************

Provide Class 180 power magnetic transformer and inductors in accordance with NEMA ST 20 and UL 506. The limits of Class 180 must not be exceeded at the maximum specified ambient temperature and at 100 percent load.

2.1.10 Acoustical Noise

**************************************************************************
NOTE: Converters are inherently noisy. Manufacturers standard for a 72 kW converter is 72 dBA, and their lowest attainable value is 68 dBA. If 68 dBA is specifically required by the Activity because of the location of the converter, include the "optional Acoustical Noise Test" in paragraph SPECIAL FACTORY TESTS, to verify that the equipment furnished meets the more stringent requirement. The test parameters (height and range) are included in that paragraph.

If a different size converter is required for a specific project, contact NAVFAC LANT for approval and for the appropriate acoustical noise modifications. The POC information is located at the beginning of this specification.
**************************************************************************

Provide unit with a maximum continuous acoustical noise level less than [72][68] dBA (A weighted scale).

2.1.11 Assembly Construction

**************************************************************************
NOTE: Per manufacturers, all converter enclosures require ventilation. Per NEMA 250 Tables 1 and 2, only NEMA Types 1,2,3R and 3RX are permissible to be ventilated. Verify availability by multiple manufacturers before using other enclosure types.

When location is outdoors, include the appropriate outdoor location coating and painting options.

When location is indoors, in item a:
- For Navy and Air Force, choose first option requiring flush wall mounting.
- For Army, choose second option and identify if pedestal mounted in hangars or floor mounted in lab or other locations.

**************************************************************************

Provide enclosures suitable for [indoor][outdoor][corrosive][direct spray] environments in accordance with NEMA 250, Type [1][2][3R][3RX]. Arrange to provide required louvers, cooling air, entry and exit provisions for equipment within enclosures.

a. [Units must be mounted flush against the wall, must not require back access for maintenance, and must comply with the "Maintenance Envelopes" identified on the drawings.] [Units must be [pedestal][floor] mounted as indicated and comply with the "Maintenance Envelopes" identified on the drawings.]

b. Construct unit(s) so that components, with the exception of control and monitoring components, are totally enclosed within the enclosure. Electronic circuits including power circuits must be modular construction readily accessible for maintenance, repair and module replacement from the front of the enclosure. [For units installed outdoors or in corrosive environments, [provide a conformal (rust-inhibiting) coating for the printed circuit boards][enclose electronic circuits in a sealed electronics compartment that is not provided with direct cooling ventilation or forced air cooling].]

c. Provide permanent identification tags for wiring. Uniquely identify each wire. Use the same identification system in the wiring diagrams in the Operation and Maintenance Manual. Enclosures must be painted in accordance with paragraph FACTORY APPLIED FINISH and as specified herein. Provide each enclosure with a finish coat over a rust inhibiting substrate or a substrate that has been provided with a rust inhibiting treatment. [For outdoor enclosures, if the unit is not painted using the powder coating process, provide two finish coats on the unit.]

d. Provide units with a Mean Time To Repair (MTTR) of 30 minutes from the time of the diagnosed failure based on documented manufacturer’s historical data for the average time of repair for their top ten faults. Provide the supporting data with the equipment submittal.

2.2 AIRCRAFT POWER CABLE ASSEMBLY

**************************************************************************

NOTE: Coordinate cable assembly requirements with unit voltage requirements, aircraft requirements, and with paragraph AIRCRAFT INTERLOCK CIRCUIT. Point of use systems are required. Distributing through pits is not permitted on new installations. Distributing through other areas that increase total length beyond 43 meters 140 feet is not permitted on new installations.

For the Navy:

1) Use the 333 Amperes option and the 25 meters 83 feet length for all cable assemblies.

2) If a different amperage is specifically
identified in the project requirements, or a longer length is required due to a specific aircraft layout, approval must be obtained from NAVFAC LANT. The POC information is located at the beginning of this specification.

**************************************************************************

Provide a single-jacketed 270 VDC aircraft power cable assembly in compliance with SAE AS7974 and SAE AS7974/5. The 270 VDC output cable assembly must be constructed and tested to meet the power requirements of this specification, to minimize cross coupling, to meet current demand rates and to ensure power regulation, ripple, distortion, and transient voltage recovery, as defined herein, is not exceeded.

Rate cable for [333] amperes. Cable length must be [43] meters [83] feet. Provide control cabling included within the jacket for interlock circuit. Terminate control wiring on accessible terminal blocks in unit. Provide cable assembly with integrally molded 270 VDC connector capable of connecting to the aircraft receptacle. Provide cable/connector assembly suitable for severe duty, with crimped contact terminations. Banded cables are not permitted. In addition, the assembly must comply with the following:

a. The 270 VDC and 28 VDC returns must be tied together only on the aircraft side of the on-aircraft external power receptacle.

b. The 28 VDC interlock output positive will be on pin "1" and output negative voltage will be on pin "2".

c. Pins "3" and "4" must be internally connected within the cable connector end to provide a "jumper" for interlock control (less than 0.1 ohms).

d. The contact section of the molded aircraft servicing connector must be capable of being repaired in the field. The contact section must be a one-piece, molded, replacement section or have individually replaceable pins and a molded one-piece cover. Installation of the replacement contact section must restore watertight integrity to the molded aircraft servicing connector. Repair must not include replacement of the entire aircraft servicing connector.

2.2.1 28 VDC Interlock

The 28 VDC interlock power must be within MIL-STD-704 "Normal Operating Limits", be available on power initiation, and must remain present throughout the duration of connection of power to the aircraft.

a. The 28 VDC interlock power must provide at least 15 amps of power capacity for aircraft equipment use.

b. The 270 VDC output must only be enabled when the 28 VDC interlock is present.

c. Power must only be available when the plug is fully seated in the aircraft receptacle.

d. The sensing back of the 28 VDC interlock from the aircraft must indicate a proper connection of the receptacle.
2.3 REMOTE MONITORING AND CONTROL PANEL

Provide remote monitoring and control panel and circuitry. Connect to clearly and permanently labeled terminal blocks located inside the converter's enclosure. Provide the circuitry such that indicator lamp/LED information and control function(s) can be extended from the terminals to a remote location in the future.

a. Pushbutton or switch for de-energizing the output terminals.
b. Indicator lamp/LED showing the unit status (energized or not energized).
c. Indicator lamp/LED showing the output control device position (open or closed).
d. System alarm.

2.4 MANUFACTURER'S NAMEPLATE

Each frequency converter, each major component within the frequency converter, and each item of other equipment must have a nameplate bearing the manufacturer's name, address, model number, and serial number securely affixed in a conspicuous place; the nameplate of the distributing agent will not be acceptable.

2.5 FACTORY APPLIED FINISH

Electrical equipment must have factory-applied painting systems which must, as a minimum, meet the requirements of NEMA 250 corrosion-resistance test and the additional requirements as specified herein. Interior and exterior steel surfaces of equipment enclosures must be thoroughly cleaned and then receive a rust-inhibitive phosphatizing treatment, a primer powder coat, or equivalent treatment prior to painting. Exterior surfaces must be free from holes, seams, dents, weld marks, loose scale or other imperfections. Interior surfaces must receive not less than one coat of corrosion-resisting paint or powder coating process in accordance with the manufacturer's standard practice. When enclosure is aluminum, interior may optionally be coated with rust inhibiting treated film. Exterior surfaces must be primed, filled where necessary, and given not less than two coats baked enamel with semigloss finish, or finished with a powder coating process. [Color must be the manufacturer's standard color.][ Equipment located indoors must be ANSI Light Gray, and equipment located outdoors must be ANSI Light Gray or Dark Gray]. Provide manufacturer's coatings for touch-up work and as specified in paragraph FIELD APPLIED PAINTING.
2.6 SOURCES QUALITY CONTROL

2.6.1 Factory Test Schedule

The Government reserves the right to witness tests and reserves the right to request the raw data from the tests whether witnessed or not. Provide the converter test schedule for tests to be performed at the manufacturer's test facility. Submit required test schedule and location, and notify the Contracting Officer 30 calendar days before scheduled test date. Notify Contracting Officer 15 calendar days in advance of changes to scheduled date.

Test Instrument Calibration.

a. The manufacturer must have a documented calibration program which assures that all applicable test instruments are maintained within rated accuracy.

b. The accuracy must be directly traceable to the National Institute of Standards and Technology.

c. Instrument calibration frequency schedule must not exceed 12 months for both test floor instruments and leased specialty equipment.

d. Provide dated calibration labels, that are visible on all test equipment.

e. Calibrating standard must be of higher accuracy than that of the instrument tested.

f. Keep up-to-date records that indicate dates and test results of instruments calibrated or tested. For instruments calibrated by the manufacturer on a routine basis, in lieu of third party calibration, include the following:

(1) Maintain up-to-date instrument calibration instructions and procedures for each test instrument.

(2) Identify the third party/laboratory calibrated instrument to verify that calibrating standard is met.

2.6.2 Routine Factory Tests

**************************************************************************
NOTE: Include the bracketed option, "As an exception..." when there are multiple, identically sized (in kW) converters on the same contract. Intent is to only do the "automatic line drop compensation test' on the first converter.

In item c, the aircraft power cable assembly is normally included in the project. If for some reason it is not part of the contract, modify the item and provide additional appropriate cable information (e.g. length and type) that the manufacturer should use for tests.
**************************************************************************
Perform routine tests by the manufacturer at the factory, on each of the actual converter(s) prepared for this project to ensure that the design performance is maintained in production. [As an exception, test automatic line drop compensation on only one unit on multiple unit orders of the same kW rating. If there are multiple units with different kW ratings, then testing one of each of the kW ratings is acceptable.] Submit test reports, by serial number and receive approval before delivery of equipment to the project site. Include a list of the current test equipment calibration dates. Required tests, test conditions, and testing sequence is as follows:

a. For tests which require full load, use the nameplate full load kW of the unit being tested unless otherwise noted.

b. All measurements must be true RMS measurements. Obtain measurements in accordance with IEEE 1159. Monitor and record all data at the load end of the cable.

c. Connect loads to the converter with the specified aircraft power cable assembly.

d. No adjustments to the frequency converter are allowed between load tests.

2.6.2.1 Test Conditions

Tests must include the following conditions:

a. Initial Safety Verification: Perform tests and checks to validate the safe and timely shutdown for each condition (for the power source and the output cable) identified in paragraph SAFETY FUNCTIONS.

b. Input current and power factor: Operate converter at low, nominal and high input voltage at full load. Measure and record input voltage, input power factor and input current in each phase.

c. Output voltage, output current, and voltage regulation. Operate converter at nominal input voltage unless otherwise specified.

(1) 50 percent of rated capacity.

(2) 100 percent of rated capacity.

(3) 50 percent of rated capacity with the loads as specified in the paragraph LOAD RANGE.

(4) 100 percent of rated capacity at low and high input voltage.

(5) 100 percent of rated capacity with the loads as specified in the paragraph LOAD RANGE.

(6) Note - Operate for not less than 10 minutes at each test condition in (1), (2), (3) and (4) above, and for not less than 30 minutes at test condition in (5) above.

(7) Note - Monitor and record each of the following at the beginning and end of each test condition: output voltage, output voltage waveform, output voltage ripple (peak-to-peak, distortion factor and distortion spectrum), output current, output current waveform, output current ripple (peak-to-peak, distortion factor and
d. Efficiency: Operate at nominal input voltage at half load and full load. Measure and record input voltage, input current, output voltage, and output current. Calculate the unit efficiency.

e. No load losses: Operate at no load and nominal input voltage. Measure and record input voltage, input current, input power, input power factor, and output voltage. Calculate the no load losses.

f. Overload: Operate at nominal input voltage and output voltage with loads and in sequence listed below:

<table>
<thead>
<tr>
<th>Percent of Full Load</th>
<th>Time</th>
<th>Time Between Overloads</th>
<th>Iterations</th>
</tr>
</thead>
<tbody>
<tr>
<td>250 percent</td>
<td>50 milliseconds</td>
<td>5 minutes</td>
<td>3</td>
</tr>
<tr>
<td>200 percent</td>

</tr>
</tbody>
</table>

(1) Monitor output to confirm there is no 270 VDC power interruption.

(2) Provide graph showing current magnitude over time in accordance with NAVAIR Digital File Information for each condition above.

(3) Provide graph showing Output Voltage Response is in accordance with paragraph TRANSIENT OUTPUT VOLTAGE RECOVERY time and thresholds.

(4) After minimum operating time is achieved, unit must interrupt output power.

**************************************************************************
NOTE: Utilize the identified burn-in hours, unless a validated reason has been identified by the Activity (such as a requirement for a higher uptime confidence limit) to either reduce or increase the number of hours.

The last sentence in the BURN-IN TEST paragraph permits not using the Aircraft power cable assembly that has been mandated for all the other tests. This exception has been added because the specified cable may not withstand the current draw for this
length of time without overheating.

******************************************************************************
g. Burn-in Test: Before delivery, burn-in all units [under full load conditions for at least [24][_____] hours] by cycling units [6][_____] hours "ON" under full load conditions and [3][_____] hours "OFF" at no load conditions for at least [4][_____] complete "ON" cycles. Perform burn-in test with the converter enclosure doors closed, load connected directly to the output terminals, and all ventilation in the final operating condition. The specified aircraft cable is not required to be used for this test.

h. Include harmonic frequency spectrum analysis depicting harmonic order across the range of individual harmonic occurrence, and harmonic magnitude for each load condition in the test reports. Conduct tests at the unit's input terminals (to the 37th harmonic) per IEEE standards. Output voltage distortion spectrum analysis must be measured out to 16,000 Hz.

i. Automatic line drop compensation: Operate converter at nominal voltage and verify specified performance of the line drop compensation at the following loads.

(1) No-load.

(2) 50 percent of rated capacity.

(3) 100 percent of rated capacity.

j. 28 VDC Interlock. Perform each of the above tests (a through h) at 50 percent and 100 percent of full 28 VDC load. Verify operation within specified limits. However, the burn-in test (item g) must be performed only at full load, and not at 50 percent load of 28 VDC.

k. Post Routine Test Safety Verification: Repeat tests conducted under item a. Initial Safety Validation to confirm safety features were not affected by previous tests.

2.6.3 Special Factory Tests (Design Tests)

******************************************************************************
NOTE: Include the bracketed option "each of" when there are multiple sizes of converters in the project.
******************************************************************************

Submit special factory test (design test) reports (complete with test data, explanations, formulas, results, setup and cable information, and the list of the calibration dates of the test equipment used), in the same submittal package as the catalog data and drawings for [each of] the specified converter(s). Tests must be certified and signed by a registered professional engineer or by a "company certified professional designee" within the manufacturers' organization. Submit designee's credentials with the initial design test report for approval. Tests must be on file based on a production model of converters of the same design, construction and kW rating provided.

******************************************************************************
NOTE: Include the first bracketed option below, "As
an exception..." unless there are more than 5 units on the project, or the units are going to a severe or hard to reach environment / strategic location. When choosing the second option instead of the first, coordinate with the Activity to determine the number of "production units" that must be tested.

The "As an exception..." sentence has always permitted the Special Factory Tests to be done on one of the first units produced, at the same time scheduled for the Routine Tests. However it was rarely used, since it only applies when the manufacturer already meets the experience requirements in the QUALIFICATIONS OF MANUFACTURER paragraph in Part 1 of this specification, but was building a slightly different unit without the specific design tests already on file.

With the new requirements in this specification, this exception may become more frequently used since test data may not be on file. The manufacturer still has to meet the QUALIFICATIONS OF MANUFACTURER paragraph, and all of the Special Factory Tests will still be subject to being witnessed by the government with the Routine tests.

[As an exception, when the manufacturer does not have the special factory tests for the specific unit characteristics already on file, the manufacturer may conduct the special factory tests on the first "production unit" along with the routine tests.]  The manufacturer must test [one][_____] unit[s] at the same time scheduled for routine tests, of each rating and size converter. To assure compliance with the specification, these tests are also subject to government witnessing at the same time as the routine tests. For all tests which require full load, use the nameplate full load kW of the unit being tested, unless otherwise noted. For all tests that are "not already on file", connect loads to the converter with an aircraft power cable assembly, 43 meters 140 feet long, similar to the specified project aircraft power cable assembly. Monitor and record all data at the load end of the cable, unless otherwise noted. The tests conducted on the unit must include the following:

NOTE: Select Location Category C for outdoor locations only.

a. Initial Safety Verification: Perform tests and checks to validate the safe and timely shutdown for each condition (for the power source and the output cable) identified in paragraph SAFETY FUNCTIONS.

b. Surge protection: Apply input surges in accordance with IEEE C62.41.1 and IEEE C62.41.2, Location Category [B][C] and monitor output. Conduct a minimum of three consecutive successful tests on each unit listed. Confirm there is no interruption to 270 VDC output power and voltage stays within specified regulation tolerances. Surge protection tests must be applicable on all converter units utilizing same surge protection device by manufacturer and part number regardless of converter kW size.
c. Input current: Perform the following tests at nominal input voltage. Conduct each test a minimum of three times. Monitor the input and output power to demonstrate the duration of the transients until the converter reaches steady state. Provide copies of waveforms and analysis in test report.

(1) Measure inrush current when initially turning on machine with no load.

(2) After applying power and unit is at steady state, conduct load application test, going from 0 to full load to measure affect on input.

d. Input current distortion: Operate at nominal input voltage at 0, 25, 50, 75, and 100 percent of rated full load. Measure and record the input current THD for the current in each phase.

e. Input current and power factor: Operate converter at low, nominal and high input voltage at full load. Measure and record input voltage, input power factor and input current in each phase and neutral if the neutral conductor is connected to the converter input.

f. Output voltage, output current, and voltage regulation. Operate converter at nominal input voltage unless otherwise specified.

(1) 50 percent of rated capacity.

(2) 100 percent of rated capacity.

(3) 50 percent of rated capacity with the loads as specified in the paragraph LOAD RANGE.

(4) 100 percent of rated capacity at low and high input voltage.

(5) 100 percent of rated capacity with the loads as specified in the paragraph LOAD RANGE.

(6) Note - Operate for not less than 10 minutes at each test condition in (1), (2), (3) and (4) above, and for not less than 30 minutes at test condition in (5) above.

(7) Note - Monitor and record each of the following at the beginning and end of each test condition: output voltage, output voltage waveform, output voltage ripple (peak-to-peak, distortion factor and distortion spectrum), output current, output current waveform, output current ripple (peak-to-peak, distortion factor and distortion spectrum). Verify converter is operating within specified regulation limits at each load level by overlaying the graph of Figure 263544 - 1 with the 270 VDC test data, and Figure 263544 - 2 with the 28 VDC test data.

g. Include harmonic frequency spectrum analysis depicting harmonic order across the range of individual harmonic occurrence, and harmonic magnitude for each load condition in the test reports. Conduct tests at the unit's input terminals (to the 37th harmonic) per IEEE standards. Output voltage distortion spectrum analysis must be measured out to 500,000 Hz per MIL-STD-704.
NOTE: For the Navy: Coordinate with NAVAIR (POC information is at front of specification), to see if the NAVAIR Digital File Information has been completed before including the bracketed documentation option. Include bracketed option once NAVAIR has established a defined version of Digital File Requirements (still in progress).

h. Overload: Operate at nominal input voltage and output voltage with loads as listed below:

<table>
<thead>
<tr>
<th>Percent of Full Load</th>
<th>Satisfactory Operating Time</th>
<th>Time Between Overloads</th>
<th>Iterations</th>
</tr>
</thead>
<tbody>
<tr>
<td>110 percent</td>
<td>30 minutes</td>
<td>2 hours</td>
<td>3</td>
</tr>
<tr>
<td>125 percent</td>
<td>5 minutes</td>
<td>10 minutes</td>
<td>3</td>
</tr>
<tr>
<td>150 percent</td>
<td>10 seconds</td>
<td>10 minutes</td>
<td>3</td>
</tr>
<tr>
<td>200 percent</td>
<td>2 seconds</td>
<td>5 minutes</td>
<td>3</td>
</tr>
<tr>
<td>250 percent</td>
<td>50 milliseconds</td>
<td>5 minutes</td>
<td>3</td>
</tr>
</tbody>
</table>

Monitor output to confirm there is no 270 VDC power interruption. After minimum operating time is achieved, unit must interrupt output power. Provide voltage and current waveforms [in accordance with NAVAIR Digital File Information] documenting the unit's response for each test.

i. Short-circuit: Apply a bolted positive to negative fault directly to the output terminals of the unit. Conduct a minimum of three consecutive successful tests on each unit. Provide unit capable of carrying the fault current until the integral system protective devices interrupts the fault with no damage to the unit. Provide waveforms of short circuit current during short circuit tests.

j. Transient Output Voltage Recovery: Operate at the following load steps: 0 to 100 percent, 0 to 50 percent, 100 to 0 percent and 50 to 0 percent. Measure and record recovery time and output voltage deviation limits. Provide recordings or display of output voltage during transient recovery test. Verify converter is operating within specified regulation limits at each load level by overlaying the graph of Figure 263544 - 1 with the 270 VDC test data, and Figure 263544 - 2 with the 28 VDC test data.

NOTE: Delete bracketed acoustical noise test unless converter is installed in special locations such as test laboratories or other confined spaces and a lower than 72 dBA value is specified.

The test parameters (Height and Range) identified below, meet the ANSI SI 4 requirements. However the standard is not referenced because it "allows units to be averaged over a certain production range/quantity", whereas we want each unit to be individually compliant.
The optional paralleling test has been removed from this version of the specification. If it is required because of a critical location, approval and specific verbiage must be obtained from NAVFAC LANT. The POC information is located at the beginning of this specification.

**************************************************************************

[ k.  Acoustical noise:  Operate at no load, 50 percent and 100 percent of full load. Measure continuous steady sound pressure level $1525 \text{ mm}$ horizontally from the center of each side of the converter at a point $1525 \text{ mm}$ above the floor. Decibels (dB) are referenced to 20 micropascal.]

] 1. Post Special Test Safety Verification: Repeat tests conducted under item a. Initial Safety Verification, to confirm safety features were not affected by previous tests.

2.7 ARC FLASH WARNING LABEL

**************************************************************************

NOTE: Include the Arc Flash Warning Label detail on the drawings. See the technical notes at the beginning of this section to obtain the AutoCAD drawing file of the label.

**************************************************************************

Provide arc flash warning labels for arc flash protection in accordance with NFPA 70E and NEMA Z535.4 for the enclosures of electrical equipment that are likely to require examination, adjustment, servicing, or maintenance while energized. Locate this self-adhesive warning label on the outside of the equipment compartment doors warning of potential electrical arc flash hazards and appropriate PPE required. Provide label format as indicated. The marking must be clearly visible to everyone, including qualified persons, before examination, adjustment, servicing, or maintenance of the equipment.

2.8 FIELD FABRICATED NAMEPLATES

**************************************************************************

NOTE: Use the following paragraph where nameplates are fabricated to identify specific equipment designated on the drawings. Provide note on panelboard schedules to indicate where other than black center core labels are required

**************************************************************************

ASTM D709. Provide laminated plastic nameplates for each equipment enclosure, relay, switch, and device; as specified or as indicated on the drawings. Each nameplate inscription must identify the function and, when applicable, the position. Nameplates must be melamine plastic, 3 mm 0.125 inch thick, white with [black] [_____] center core. Surface must be matte finish. Corners must be square. Accurately align lettering and engrave into the core. Minimum size of nameplates must be 25 by 65 mm 1 by 2.5 inches. Lettering must be a minimum of 6.35 mm 0.25 inch high normal block style.
2.9  GROUNDING AND BONDING

**************************************************************************

NOTE: Include the reference to Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION when equipment is also being provided outside.
**************************************************************************

UL 467. Provide grounding and bonding as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM[ and for exterior work, in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION].

2.10  CAST-IN-PLACE CONCRETE

**************************************************************************

NOTE: Include concrete requirements when equipment is also being provided outside on concrete pads.
**************************************************************************

Provide concrete associated with electrical work for other than encasement of underground ducts rated for 30 MPa 4000 psi minimum 28-day compressive strength unless specified otherwise. Conform to the requirements of Section 03 30 00 CAST-IN-PLACE CONCRETE.

PART 3  EXECUTION

3.1  INSTALLATION

Install products to operate at 270 VDC in the same manner as specified in other sections of this specification for products operating at [50] [60] Hz, unless indicated or specified otherwise. Conform to the requirements of NFPA 70 and IEEE C2 and to manufacturer's instructions and recommendations.

3.2  EQUIPMENT

3.2.1  Floor Mounted

Provide proper floor mounting channels and install in accordance with the manufacturer's drawings and instructions and as indicated. Align, level, and bolt units to channels to allow easy withdrawal or insertion of removable components and to permit proper operation and maintenance of equipment. When in a Class 1, Division 2 area, mount units at least 18 inches above finished floor.

3.2.2  Wall Mounted

**************************************************************************

NOTE: Wall mount units 5 kW or less. Floor mount all other units.
**************************************************************************

Bracket mount, but otherwise install as required for floor-mounted units.

3.2.3  Maintenance Platform Mounted

**************************************************************************

NOTE: When used, verify drawings identify:

1) An appropriate maintenance platform with safety
details including the maintenance envelope.

2) The location of the remote control panel and interconnecting conduit and wiring.

Install as required for floor-mounted units.

3.2.4 Grounding and Bonding

In accordance with NFPA 70 and as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

3.2.5 Grounding and Bonding - Exterior Equipment

NOTE: When equipment in the project is located outdoors, include the optional grounding and foundation (concrete pad) requirements. Use 25 ohms unless the project requires more stringent requirements.

NFPA 70 and IEEE C2, except provide grounding systems with a resistance to solid earth ground not exceeding [25] ohms.

3.2.5.1 Grounding Electrodes

Provide driven ground rods as specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION.

3.2.5.2 Pad-Mounted Equipment Grounding

NOTE: Ensure plans show the pad details and ground connections matching how this paragraph is edited. Converter is to have a ground ring and the normal number of ground rods is two. The one ground rod option should only be chosen if required by local installation requirements.

Provide a ground ring around the equipment pad with 4/0 AWG bare copper. [Provide two ground rods in the ground ring at opposite corners.] [Provide one ground rod in the ground ring with the ground rod located in the equipment cabinet.] Install the ground rods at least 3000 mm 10 feet apart from each other. Provide separate copper grounding conductors and connect them to the ground loop as indicated. When work in addition to that indicated or specified is required to obtain the specified ground resistance, the provision of the contract covering "Changes" applies.

3.2.5.3 Connections

Connect ground conductors to the upper end of ground rods by exothermic weld or compression connector. Provide compression connectors at equipment end of ground conductors. Make joints in grounding conductors and loops by exothermic weld or compression connector. Install exothermic welds and compression connectors as specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION.
3.2.6 Foundation for Equipment and Assemblies

**************************************************************************
NOTE: Mounting slab connections may have to be given in detail depending on the requirements for the seismic zone in which the requirement is located. Include construction requirements for concrete slab only if slab is not detailed on drawings.
**************************************************************************

Mount equipment on concrete slab as follows:

a. Unless otherwise indicated, provide the slab with dimensions at least 200 mm 8 inches thick, reinforced with a 152 by 152 mm MW19 by MW19 6 by 6 inches - W2.9 by W2.9 mesh placed uniformly 100 mm 4 inches from the top of the slab.

b. Place slab on a 150 mm 6 inch thick, well-compacted gravel base.

c. Install slab such that top of concrete slab is approximately 100 mm 4 inches above the finished grade with gradual slope for drainage.

d. Provide edges above grade with 15 mm 1/2 inch chamfer.

e. Provide slab of adequate size to project at least 200 mm 8 inches beyond the equipment.

Stub up conduits, with bushings, 50 mm 2 inches into cable wells in the concrete pad. Coordinate dimensions of cable wells with equipment cable training areas.

3.2.6.1 Cast-In-Place Concrete

Provide cast-in-place concrete work in accordance with the requirements of Section 03 30 00 CAST-IN-PLACE CONCRETE.

[3.2.6.2 Sealing

**************************************************************************
NOTE: Require sealing of cable wells (windows) in the concrete pad if rodent intrusion is a problem.
**************************************************************************

When the installation is complete, seal all entries into the equipment enclosure with an approved sealing method. Provide seals of sufficient strength and durability to protect all energized live parts of the equipment from rodents, insects, or other foreign matter.

]]3.2.7 Wiring and Conduit

**************************************************************************
NOTE: Designers of Record must provide calculations and ratings for conductors, circuit breakers (50Hz / 60Hz), and devices operating at 270 VDC and at 28 VDC.

Use of a distributed 270 VDC power system (instead of a Point of Use system), is prohibited on new
projects, and is limited to making modifications to existing systems. If used, a distributed system may require additional special calculations.

See UFC 3-555-01 (Draft in progress) for additional information.

Provide wiring and conduit as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Use copper conductors for DC systems.

3.2.8 Manufacturer's Representative

The manufacturer's representative must place the system in operation and make necessary adjustments to ensure optimum operation of the equipment. The manufacturer's representative must have at least 2 years of practical experience in the installation and testing of 270 VDC solid state converters.

3.3 FIELD FABRICATED NAMEPLATE MOUNTING

Provide number, location, and letter designation of nameplates as indicated. Fasten nameplates to the device with a minimum of two sheet-metal screws or two rivets.

3.4 WARNING SIGN MOUNTING

Provide the number of signs required to be readable from each accessible side. Space the signs in accordance with NFPA 70E.

3.5 FIELD APPLIED PAINTING

Where field painting of enclosures is required to correct damage to the manufacturer's factory applied coatings, provide manufacturer's recommended coatings and apply in accordance to manufacturer's instructions.

3.6 FIELD QUALITY CONTROL

3.6.1 Field Test Schedule

**NOTE: Include the bracketed options below on Navy projects where "reach-back support" has already been coordinated with NAVAIR / NAVFAC LANT per the third introductory Technical Note at the beginning of this specification section.**

Give Contracting Officer[ and (NAWCAD Air Vehicle Electrical Power Systems Group (AB43) (301) 342-4161)] 30 days notice of dates, times and scheduled tests which require the presence of the Contracting Officer. The Contracting Officer will coordinate with the using activity[ and NAVAIR / NAVFAC LANT,] and schedule a time that will eliminate or minimize interruptions and interference with the activity operations.

3.6.2 Instruments

Provide test instruments capable of measuring and recording or displaying test data at a higher resolution and greater accuracy than specified for
the converter's performance. The test instruments used in the field tests must have current valid calibration stickers issued by an approved calibration laboratory. Verify calibration and adjustments of converter instruments provided prior to field tests. Calibrate instruments for 270 VDC operation when measuring 270 VDC signals.

3.6.3 Initial Inspection and Tests

**************************************************************************
NOTE: Include the bracketed option for the NETA ATS Representative when Section 26 08 00 APPARATUS INSPECTION AND TESTING is included in the project.
Ensure that the list of identified specification sections that the NETA inspector is responsible for includes this section (see bracketed options in Section 26 08 00 APPARATUS INSPECTION AND TESTING).
**************************************************************************

Perform in accordance with the manufacturer's recommendations and include the following visual and mechanical inspections and electrical tests.[ In addition, coordinate with the NETA ATS representative to witness, document, and validate the converter Field Quality Control.]

a. Compare equipment nameplate information with specifications and approved shop drawings.

b. Inspect physical and mechanical condition. Inspect cables and wiring harnesses for damage and strain relief.

c. Inspect all bolted electrical connections for high resistance using low-resistance ohmmeter, verifying tightness of accessible bolted electrical connections by calibrated torque-wrench method, or performing thermographic survey. Perform thermographic survey while the unit is at full load during the loadbank test.

d. Perform specific inspections and mechanical tests as recommended by manufacturer.

e. Verify correct equipment grounding.

3.6.4 Field Performance Checks and Tests

Conduct converter field checks and tests under the supervision of the manufacturer's representative. Provide labor, equipment, test instruments, and incidentals required for the tests including load banks, except the Government will furnish the electricity.

All tests must be performed with the load connected to the load end of the specified aircraft cable assembly. The cable must be laid out / uncoiled to provide heat dissipation. No adjustment to the converter is allowed between tests. Successfully complete the safety verification, preliminary operation, and the control and protective devices check prior to performing load and transient tests. Load tests must be performed with the converter doors closed and the 28 VDC at full load. If the converter fails to operate within the specified limits during any of the tests, discontinue the test, make necessary repairs to correct the failure, and restart testing of the converter. Repeat all previously completed tests and document the respective failed test data and new data.
3.6.4.1 Initial Safety Verification

Perform tests and checks to validate the safe and timely shutdown for each condition (for the power source and the output cable) identified in paragraph SAFETY FUNCTIONS. As an exception, a representative fault test will be sufficient at this time.

3.6.4.2 Preliminary Operation

For the Navy: NAVAIR is working on and will provide the requirements for a "digital manual" / type of "Data Acquisition system." All Manufacturers should also already have one of their own. The future goal is to include the standardized requirement as part of the specification so that NAVAIR will have the various manufacturer's equipment information, in a consistent format, submitted and then on file in the NAVAIR Database system for maintenance and problem solving. At that time, we will determine whether it will be possible to include as an attachment / sample in the specification or possibly as a reference to a UFC Appendix.

Inspect the converter and make adjustments necessary to assure proper operation in accordance with the manufacturer's instructions. Operate converter at 0, 25, 50, 75, and 100 percent of rated full load. On the input measure and record the voltage, current, frequency, and THDs (voltage and current) at each load. On both the 270 VDC and the 28 VDC outputs, measure and record the voltage, current, DC ripple, distortion spectrum, and distortion factor at each load. Verify converter is operating within specified regulation limits at each load level by overlaying the graph of Figure 263544 - 1 with the 270 VDC test data, and Figure 263544 - 2 with the 28 VDC test data. Verify the operation of the 28 VDC Interlock Power.

Test data must include input voltage and current harmonic distortion amplitudes of all individual harmonics presented in a spectrum analysis format up to the 15th order at the 50 percent and 100 percent load points. Output voltage distortion spectrum analysis must be measured out to 6,000 Hz.

3.6.4.3 Control and Protective Device Checks

Operate each control, switch, input/output device that is capable of being operated manually a minimum of three times, demonstrating satisfactory operation each time. Perform operation test on each protective device to ensure that devices function properly. After each operation measure and record the converter output voltage and current. Verify converter is operating within specified limits.

3.6.4.4 Load (Burn-in) Test

NOTE: Include the bracketed option "For converters used ..." only when one of the converters, on a multi converter project, will not be connected to the aircraft cable assembly when in service; e.g. used in a lab setting instead.
In the rare condition, where there is only the one converter in a lab setting, then delete the entire sentence before the bracketed option as well.

Operate each unit continuously a minimum of 1 hour at 100 percent rated full load. Perform a concurrent load (burn in) test for the 270 VDC and the 28 VDC loads. Measure and record the converter output voltage and current (both 270 VDC and the 28 VDC Interlock Power), at beginning, 30 minutes, and 1 hour. Verify converter is operating within specified limits. Load test must be performed with the converter doors closed and the test load connected to the converter at the cable head with specified aircraft cable assembly.[ For converters used to supply test bench loads, perform load tests with the converter doors closed at the output of the converter.]

3.6.4.5 Post Load Test Verification

Repeat tests identified in paragraph PRELIMINARY OPERATION, to validate converter was not affected by the Load test. However apply loads in the reverse order (e.g. 100, 75, 50, 25, and 0 percent of the rated full load).

Conduct tests on each converter with the load connected to the load end of the specified aircraft power cable assembly. No adjustment to the converter is allowed between load tests. Monitor and record output voltage at the load end of the cable. Verify converter is operating within specified regulation limits at each load level by overlaying the graph of Figure 263544 - 1 with the 270 VDC test data, and Figure 263544 - 2 with the 28 VDC test data. In addition, verify specified performance of the line drop compensation.

3.6.4.6 Final Safety Verification

Repeat tests conducted under paragraph INITIAL SAFETY VERIFICATION to confirm safety features were not affected by previous tests.

3.6.5 Grounding System

Inspect grounding system for compliance with contract plans and specifications.

3.7 DEMONSTRATION

3.7.1 Instructing Government Personnel

Provide field training to Government personnel on the operation and maintenance of the converter provided at the same time as the Field Acceptance Testing.[ For Navy projects contact NAWCAD Air Vehicle Electrical Power Systems Group (AB43) at (301) 342-4161 to obtain the name and e-mail of the NAVAIR point-of-contact so they can attend the training. Coordinate with the Activity to establish availability and non-availability
to train on actual aircraft.] Include up to a maximum of 2 hours of instruction on operation and up to a maximum of 4 hours of repair and maintenance of the converters. The instructor must be approved by the manufacturer of the unit provided. Submit training syllabus including each topic of training and a brief outline of each topic to the Contracting Officer at least 4 weeks prior to training for approval.

Training must be approved by the Contracting Officer at least 2 weeks in advance. The Government may record, video and audio, the training sessions and use these recordings to train personnel on the operation and maintenance of the converter system. Provide two copies of video or audio DVDs, and of any supplemental information and examples covered in the training sessions, to the Contracting Officer.

3.4 TRAINING

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for low voltage applications (600V or less) of automatic transfer switches (ATS) and ATS with by-pass/isolation switches. See TSEWG TP-09 Automatic Transfer Equipment white paper at https://www.wbdg.org/ffc/dod/supplemental-technical-criteria/tsewg-tp-09. See TSEWG TP-19 Static Uninterruptible Power Supply (UPS) white paper at https://www.wbdg.org/ffc/dod/supplemental-technical-criteria/tsewg-tp-19. This specification supersedes previous versions of UFGS-26 36 00.00 10 Automatic Transfer Switch and By-Pass/Isolation Switch and UFGS-26 36 23.00 20 Automatic Transfer Switches.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).
specification applies to a stand-by generator system as defined in NFPA 70. The same terminology should be used when switching between different sets of service entrance conductors or between feeders supplied by different transformers. "Normal" and "emergency" should be used for the emergency system application described in NFPA 70.

This specification covers conventional, standard, commercially available equipment appropriate for most Department of Army/Air Force/Navy applications. Special applications may require synchronized, closed-transition transfer, or withdrawal features to facilitate rapid maintenance or repair. Manufacturers of standard ATS may be able to provide ATS for special applications.

Fire pumps may utilize an automatic transfer switch. NFPA 20 describes Arrangement I and Arrangement II. Arrangement I is the most common and it is where the ATS is part of the fire pump controller and Section 21 30 00 FIRE PUMPS is to be used instead of this specification. Arrangement II is a separate ATS from the controller. This is not as common since the switch has to be listed for electric-motor driven fire pump service and there are only a few manufacturers that have this listing.

**************************************************************************
**************************************************************************

NOTE: The following system design requirements are to be adhered to when providing automatic transfer switches:

1. The neutral conductor for each source of supply, including the neutral on separately derived systems, must be switched by the transfer switch.

2. Service rated automatic transfer switches are available (ATS and service entrance breaker included in one enclosure). In many cases it is more cost effective to include the service overcurrent protection internal to the enclosure in addition to the ATS and this is the recommended approach. Designer should consider cost savings due to elimination of additional cable and installation labor. If this is not possible or practical, then specify a service rated transfer switch with the appropriate integrated overcurrent protection as part of the transfer switch.

3. Do not use open type transfer switches installed in other equipment such as switchboards. Consideration should be made regarding overall installation cost and minimizing footprint.

**************************************************************************
**************************************************************************

NOTE: Use the following related guide
specifications for power distribution equipment:

--Section 26 08 00 APPARATUS INSPECTION AND TESTING
--Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM
--Section 26 23 00 LOW-VOLTAGE SWITCHGEAR

Do not use the following related guide specifications except for Army Civil Works projects. They have not been unified:

--Section 26 22 00.00 10 480-VOLT STATION SERVICE SWITCHGEAR AND TRANSFORMERS
--Section 26 28 00.00 10 MOTOR CONTROL CENTERS, SWITCHBOARDS AND PANELBOARDS

******************************************************************************
******************************************************************************

NOTE: Show the following information on the project drawings:

1. The available fault current at the bus feeding the automatic transfer switch.

2. The rating of the overcurrent device protecting the automatic transfer switch.

3. Identify automatic transfer switches to be provided with By-pass/Isolation Switches, when applicable.

4. Identify control type, i.e., Utility-Generator, Preferred Utility Source, or Generator-Generator, for each automatic transfer switch.

5. Identify automatic transfer switches to be provided with "transfer time delay"/"time delay transition" or "in-phase monitor" features, where applicable.

6. Identify automatic transfer switches to be used for fire pump service, when applicable.

******************************************************************************

PART 1 GENERAL

1.1 REFERENCES

******************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also
use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

******************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

INSTITUTE OF ELECTRICAL AND ELECTRONICS ENGINEERS (IEEE)

INTERNATIONAL ELECTRICAL TESTING ASSOCIATION (NETA)

NATIONAL ELECTRICAL MANUFACTURERS ASSOCIATION (NEMA)

NEMA 250 (2020) Enclosures for Electrical Equipment (1000 Volts Maximum)

NEMA ICS 2 (2000; R 2020) Industrial Control and Systems Controllers, Contactors, and Overload Relays Rated 600 V

NEMA ICS 6 (1993; R 2016) Industrial Control and Systems: Enclosures

NATIONAL FIRE PROTECTION ASSOCIATION (NFPA)

NFPA 20 (2022; TIA 21-1; TIA 21-2) Standard for the Installation of Stationary Pumps for Fire Protection

NFPA 70 (2020; ERTA 20-1 2020; ERTA 20-2 2020; TIA 20-1; TIA 20-2; TIA 20-3; TIA 20-4) National Electrical Code

NFPA 99 (2021; TIA 20-1) Health Care Facilities
1.2 RELATED REQUIREMENTS

**************************************************************************
NOTE: Include this paragraph on Navy projects; otherwise, delete.
**************************************************************************

Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, and Section 26 08 00 APPARATUS INSPECTION AND TESTING, applies to this section, with the additions and modifications specified herein.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL
PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

<table>
<thead>
<tr>
<th>SD-02 Shop Drawings</th>

1.4 OPERATION AND MAINTENANCE MANUAL

Assemble and bind manuals in durable, hard-covered, water resistant binders. Assemble and index the manuals per the following table of contents:

a. Manufacturer's O&M per "SD-10 Operation and Maintenance Data".

b. Catalog data required by "SD-03 Product Data"
c. Drawings required by "SD-02 Shop Drawings".

1.4.1 Additions to Operation and Maintenance Manuals

In addition to requirements of SD-10 Data Package 5, include the followings on the actual equipment provided:

a. An outline drawing, front, top, and side views.

b. Prices for spare parts and supply list.

c. Date of Purchase.

d. Corrective maintenance procedures.

f. Include simplified wiring and control diagrams in the manual for system as installed.

g. Provide typical contact voltage drop readings under specified conditions for use during periodic maintenance. Provide instructions for determination of contact integrity.

[1.4.2 Spare Parts

**************************************************************************

NOTE: Do not provide spare parts for Navy projects.
**************************************************************************

Furnish the following minimum spare parts and any other spare parts required in one-year operation, of the same material and workmanship, meeting the same requirements, and interchangeable with the corresponding original parts.

a. Fuses: Two of each type and rating.

]1.5 QUALITY ASSURANCE

1.5.1 Proof of Listing

Submit proof of listing by UL 1008.

1.5.2 Automatic Transfer Switch Drawings

Include the following as a minimum:

a. An outline drawing, including front, top, and side views.

b. Provide a nameplate of corrosion-resistant material with not less than 3 mm 1/8 inch tall characters showing manufacturer's name and equipment ratings. Mount nameplate to front of enclosure and meet the nameplate requirements of NEMA ICS 2.

c. Provide detail drawings that include manufacturer's name and catalog number, electrical ratings, total system transfer statement, reduced normal supply voltage at which transfer to the alternate supply is
initiated, transfer delay times, short-circuit current rating, wiring diagram, description of interconnections, testing instructions, acceptable conductor type for terminals, tightening torque for each wire connector, and other required UL 1008 markings.

d. Submit interface equipment connection diagram showing conduit and wiring between ATS and related equipment. Provide diagrams showing interlocking provisions and cautionary notes, if any.

e. Drawings are to indicate adequate clearance for operation, maintenance, and replacement of operating equipment devices.

1.5.3 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word "shall" or "must" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Equipment, materials, installation, and workmanship must be in accordance with the mandatory and advisory provisions of NFPA 70 unless more stringent requirements are specified or indicated.

1.5.4 Standard Product

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship, and:

a. Have been in satisfactory commercial or industrial use for 2 years prior to bid opening including applications of equipment and materials under similar circumstances and of similar size.

b. Have been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period.

c. Where two or more items of the same class of equipment are required, provide products of a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in this section.

1.5.4.1 Alternative Qualifications

Products having less than a 2-year field service record are acceptable if the manufacturer has been regularly engaged in the design and production of automatic transfer switches and if a certified record of satisfactory field operation for not less than 6000 hours, exclusive of the manufacturers' factory or laboratory tests, is furnished.

1.5.4.2 Material and Equipment Manufacturing Date

Products manufactured more than 1 years prior to date of delivery to site are not acceptable.

1.6 DELIVERY AND STORAGE

Protect equipment placed in storage from humidity and temperature variations, moisture, water intrusion, dirt, dust, or other contaminants. In harsh environments where temperatures exceed non-operational parameters
established within this specification, provide an environmentally
controlled equipment storage facility to ensure temperature parameters are
within equipment specification. Provide documentation of same to the
Government when storage is implemented.

1.7 ENVIRONMENTAL CONDITIONS

**************************************************************************
NOTE: Do not use this paragraph and subparagraphs
for the Navy.
**************************************************************************

Provide an ATS that is suitable for prolonged performance under following
service conditions:

a. Operating altitude: Sea level to 1,000 meters 3,300 ft. (Systems
applied at higher altitudes are to be derated in accordance with the
manufacturer's instructions).

b. Operating ambient temperature range:-[-4][_____] to [40][_____] degrees
C [40][_____] to [104][_____] degrees F.

c. Operating relative humidity: 0 to 90 percent, without condensation.

1.8 SEISMIC REQUIREMENTS

**************************************************************************
NOTE: Do not use this paragraph for Navy projects.
When directed to meet Seismic Requirements, 13 48 73
SEISMIC CONTROL FOR MECHANICAL EQUIPMENT and Section
26 05 48.00 10 SEISMIC PROTECTION FOR ELECTRICAL
EQUIPMENT must be edited to suit the project and be
included in the contract documents. Edit the
following paragraph and include it in the project
specification. When a Government designer is the
Engineer of Record, provide seismic requirements on
the drawings.
**************************************************************************

Provide seismic details[ conforming to[ Section 13 48 73, SEISMIC CONTROL
FOR MECHANICAL EQUIPMENT][ and to][ Section 26 05 48.00 10, SEISMIC
PROTECTION FOR ELECTRICAL EQUIPMENT][ as indicated].

PART 2 PRODUCTS

2.1 AUTOMATIC TRANSFER SWITCHES

**************************************************************************
NOTE: Withstand closing current ratings listed in
UL 1008 should be used when fault currents are less
than withstand closing current rating listed. However, in no case should withstand current rating
be less than 10,000 amperes.

Where closed-transition transfer is required,
coordinate system design requirements with power
supplier.
